Vol. 5 No. 5

$3.50 in USA
$4.50 in Canada

Now Expanded To Include ATARI COVERAGE!

Memoranda Processing

—Computer-Assisted Correspondence Comes Home

Featuring A Ready-To-Use Electronic Typewriter for:

- Memoranda Of All Kinds
- Quick & Easy Correspondence
- Short Lists, Notes, & Schedules
- Custom Text-Format Templates

Contains 41 Type-In Programs!

Special Apple, Atari, Commodore, IBM, & TI Software:

- Fantastic Voyage Through the Microprocessor
- Cardio-Vascular Bio-Simulation
- Cybernetic Card Capers
- King Arthur's Final Round

—Reviews Galore:

- ★ Home Print-Studio Tools
- ★ Computer Rock Videos
- ★ Music/Sound-Dazzler Enhancements
- ★ Inter-Galactic Hitchhiking

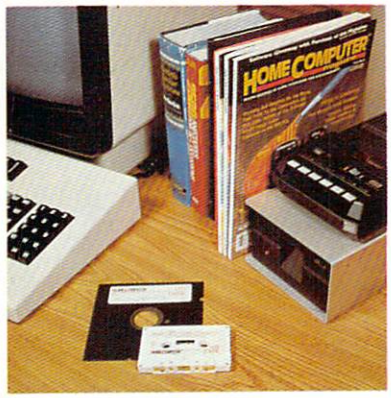
MISSING ANY VALUABLES?

If you're missing any back issues of HOME COMPUTER™ magazine you're missing more than you'll ever know . . .

Having each issue of *Home Computer Magazine* readily at hand provides you with direct access to a valuable reference library of home computer knowledge —unequaled anywhere!



A valuable reference library of each *Home Computer Magazine* issue is the One Essential Peripheral™ for your home computer.

Back issues of HCM's program service— ON DISK™ or ON TAPE™ are also available.

ON DISK™ and ON TAPE™ are the convenient, accurate and affordable ways to save hundreds of typing hours.

Collect all the programs from each magazine issue on a ready-to-RUN quality floppy disk or cassette tape available in separate versions for Apple, Commodore, IBM, and Texas Instruments home computers.

"Safeguard" Your Home Computer Knowledge— Order Valuable Back Issues Today!

To Order, Use Bind-In Card at Center of Magazine.

HCM BACK ISSUES

. . . and discover what's in store for you— an extraordinary resource value!

VERSIONS SUPPORTED:

Machine	Media
APPLE II Family (A)	ON DISK™
Atari (At) (coverage commenced with issue 5.5)	ON DISK™/ON TAPE™
COMMODORE 64 (C)	ON DISK™/ON TAPE™
IBM PC/PCjr (I)	ON DISK™
TI-99/4A (T)	ON DISK™/ON TAPE™

*** = No ON TAPE™ available, even if normally supported**
TX = Extended BASIC programs only
PCjr = Available for PCjr only

Apple owners: Please note that ON DISK™ Media for *HCM* 4.1-4.3 is in DOS 3.3 format only, and all Apple programs beginning with *HCM* 4.4 are in ProDOS format. All programs will RUN on a 64K Apple II+ (with Applesoft BASIC in ROM), an Apple *IIe*, or an Apple *IIc*.

Apple & IBM "clone" owners: Some *HCM* programs may not RUN (without modification) on your machines, because of differences in hardware and/or BASIC interpreters.

Issue 4.1:

Premier Issue * Uncle Larry's Fiddle Tunes * Electronic Sheet Music * Music in Mini Memory * PCjr: A Look Inside the Peanut's Shell * 66 Keys to Graphics Success: A Primer for the Commodore 64 * Have No Fear: Assembly Language Won't Byte, Part 3 * Porsches and other Pipedreams: Computer Assisted Savings * 3DIIe: Apple Graphics in Three Dimensions, Part 1 * Biting Into Your Apple * Don't Be A SlowPOKE * Down Memory Lane: Don't let programmable characters gobble up your memory * Easy As Pie: Apple programming for intricate works of art * Microcomputer Accuracy * What is LOGO? * Lyrical LOGO * LOGO Shoots for the Moon: A lesson in structured problem-solving * Product Reviews * Flak Attack * Slots * Meltdown * Challenging the Tower of Hanoi * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Flak Attack (A,C,I,T)
Air-to-ground battle game
Applesoft 3D (A)
Apple graphics in three dimensions
Tower of Hanoi (A,C,I,T)
An ancient brain teaser
Saving (A,C,I)
Computer-assisted savings plan
LOGO Poet (A,C*, I)
Recursion frees the poet in your console
LOGO Apollo (C*, T)
A lesson in structured problem-solving
Slots (T)
An intriguing Las Vegas simulation
Uncle Larry's Fiddle Tunes (C, I, T)
Play ten beloved fiddle tunes
Music Magic (TX)
"Joy to the World" in harmonious BASIC
Music Assembler (T)
Assembly language simplifies composition
Autosprite (C)
Routines to keep your graphics lively
Meltdown (TX)
Debug the reactor and save the world

Issue 4.2:

Graphics * Sea of States * San Francisco Tourist * Building Your Character: A Graphics Editor for the VIC-20 * Quick Pixel Tricks: A Graphics Editor for the C-64 * Follow the Bouncing Ball: On the rebound with graphics fundamentals * 3DIIe: Apple Graphics in Three Dimensions, Part 2 * Double Your Color, Double Your Fun: Sprites try on a layered look * Musical Mystery Words * Matrix Muncher * Elementary Addition and Subtraction for the VIC-20 * IBM Animation: Controlling the pallet on the PCjr * Jr. Sounds Off: Access Jr's Special Sound Enhancements * The Electronic Home Secretary * Files in LOGO * LOGO Spans the Generation Gap: A review of Commodore LOGO * FROGO: LOGO Invades the Arcade * Product Reviews * Tablut * Cannibals * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Cannibals (A, C, I, T)
Livingston Stew, I presume?
FROGO (T)
A logical LOGO learning lesson
The Home Secretary (A, C, I, T)
Address & inventory recordkeeping
LOGOFILES (A, C*, I, T)
Access your DATA files in LOGO
Sea of States (C, TX)
State Capitals and dive for booty
Tablut (C, I, TX)
14th-century strategy revisited
Matrix Muncher (C)
Solve unknowns simultaneously
Graphic Editor (C)
Pixel tricks create easeful graphics
Mystery Words (A, I)
Reading between the treble clefs
PCjr Animation (PCjr)
Exploring Junior's graphic modes
Applesoft 3-D IIe (A)
Edit your 3-D graphic shapes

Issue 4.3:

Productivity * Snap-Calc: A Homespun ready-to-use spreadsheet * Bars and Plots: Create colorful graphic charts of your records * Elementary Addition and Subtraction for the 99/4A and C-64: A powerful children's learning tool * Spider Graphics: Spin a colorful web on screen * Convertible for Comfort: Automatically convert your machine-language programs to DATA statements * Programming: The Name of the Game: Designing your own game—a complete tutorial * Colorfun on your VIC-20 * Product Reviews * Binary Forest: Branching out with LOGO * LOGO Flakes: Creative explorations with snowflake designs * Robochase * Cyber-Cipher * Wild Kingdom * Speeder * Boolean Brain * Missile Math * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Snap-Calc (A, C, I, TX)
Home sweet spreadsheet
Robochase (A, C, I)
Run from the rampaging robots
Spider Graphics (A, I)
Spin a myriad of rainbow filaments
Boolean Brain (A, I)
A graphic Adventure inside computers
Wild Kingdom (A, C, I, TX)
Flee ferocious felines
Missile Math (A, C, I, T)
Launching grade-school arithmetic
Binary Forest (A, C*, I)
Branching-out with leafy LOGO trees
Bars & Plots (T)
Color your chart factfully
Cyber-Cipher (T)
Decode correct color combinations
Elem. Addition & Subtraction (C, T)
BASIC preschool arithmetic skill-builder
LOGO Flakes (T)
Snowflakes in June? This must be LOGO
Convertible for Comfort (C)
Machine Language DATA auto-conversion

Issue 4.4:

Computer Sports * IIc: The Core of a New Machine * On the Home Court: Computer Sports Simulation * Razzle Dazzle: Quick Graphics Magic for the 99/4A * Simon Sez: Plug in 114 new BASIC commands to the Commodore 64 * Tax Deduction Filer: A complete tax recordkeeping program convinces you that makes tracking of deductions a breeze * Kaleido Computer: Creating a myriad of mosaic designs on your home computer * Multiplan Medium, Part 8 * Have No Fear: Assembly Language Won't Byte, Part 4 * The RS-232 Interface: Understanding Your Link to the Periphery * One for the Money, Two for the Slow—Adding a Second Drive to the PCjr * Missionary Impossible: A Logic Puzzle in LOGO pits you against hungry Cannibals * Product Reviews * Boolean Brain * Stadium Jumping * Market Madness * Elementary Addition and Subtraction: An arithmetic tutor (for Apple and IBM PC and PCjr systems) * HCM TECH NOTES: Apple, C-64, IBM and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Boolean Brain (C, TX)
A graphic Adventure inside computers
Tax Deduction Filer (A, C, I, TX)
SAVE-ing with your tax deductions
Market Madness (A, C, I, TX)
Exciting Stock market simulation
Stadium Jumping (A, C, I, T)
Horsing around an Olympic Stadium
LOGO Spreadsheet (A, C*, I, T)
And you thought LOGO was kidstuff
Missionary Impossible (A, C*, I, T)
Watch out for Cannibals with LOGO
Elem. Addition & Subtraction (A, I)
BASIC preschool arithmetic skill-builder

And There's More On The Next Page

Issue 4.5:

Building Up Your Software Library * Quiz Construction Set: Create a Quiz or Take a Quiz—a must for students and teachers * Personal Loan Calculator: Find out where your interest lies * Jumping Ahead With Game Programming: A complete game programming tutorial includes a program example * Sketch-64: Joystick graphics with just a flick of the wrist * Simon Sez: New string-related commands explained * Razzle Dazzle: Character manipulation on the 99/4A * Division Tutor: Teaching BASIC math learning skills * Putting The Puzzle All Together: Apple IIc Programming Considerations * Bird Brain * Slither * LOGO Clones: TI Graphics In a Turtle-Shell * Build A LOGO Adventure, Part 1 * Product Reviews * HCM One Liners * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Bird Brain (A, C, I, T)
Keep your fishing feathers dry
Division Tutor (A, C, I, TX)
Expand elementary math skills
Personal Loan Calc (A, C, I, T)
Find out where your interest lies
Sketch-64 (C)
Use a joystick to draw graphics
Quiz Construction Set:
Quiz-Make/Quiz-Take (A, C, I, T)
Complete tutorial with file examples
Peg Jump (A, C, I, T)
Learn BASIC game programming
Slither (A, C, I, T)
A maze of snake-like proportions
LOGO Clones (T)
TI-Graphics in a Turtle-Shell
LOGO Adventure (A, I, C*)
Pt. 1: Creating interactive fiction

Issue 5.1:

Thought Processing: A New Frontier in Home Computing * The Organizer: Store and organize your thoughts * Orbital Defender * Quiz-Print/Quiz-Print Tutorial: This educational enhancement is a tool for use with your Quiz Construction Set (see *HCM* 4.5) * Electronic Backgammon: A modern version of an ancient game of skill * Razzle Dazzle: Screen patterns with graphics characters on the 99/4A * Kors-Elf: An Arcade Typing-Tutor Game * Personal Loan Calculator: Find out where your interest lies * Apple Seedlings: A ProDOS Date-Setting Utility * IBMpressions: Create a beautiful pie chart * Build A LOGO Adventure, Part 2 * LOGO Sailing: A Premier Yachting Event * Simon Sez: Composing music is simple * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News * Group Grapevine, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Orbital Defender (A, C, I, T)
Split-second battle decisions
Electronic Backgammon (A, C, I, TX)
Pit your pips against the computer
Kors-Elf (A, C, I, TX)
An arcade typing adventure
The Organizer (A, C*, I, TX*)
A versatile Thought Processor
Quiz-Print (A, C, I, T)
Format printouts of your quizzes
Apple Seedling (A)
BASIC utility dates ProDOS files
LOGO Adventure (A, C*, I)
Pt. 2: Creating interactive fiction
Merging Files (C)
Experienced hackers only!
Personal Loan Calc (T)
Find out where your interest lies
Razzle Dazzle (T)
Wormwood your character graphics
LOGO Sailing (T)
Turtles race for the America's Cup
IBMpressions (I)
Create a beautiful pie chart

Issue 5.2:

Number Crunching: The Building Blocks of All Computing * It Figures: An equation calculator that'll crunch your numbers accurately * Evacu-Pod: See if you can rescue all the miners in this challenging space game * Switch 'n' Spell: Electronic anagram brain teasers to puzzle over (for children, and adults) * Laserithmetic: Strut your math skill with this space fantasy edu-game * Organizer Reports: An enchancement to print-out your organized thoughts (see The Organizer *HCM* 5.1) * Razzle Dazzle: Tinker with musical sounds, or Play it Maestro! * What is CP/M?: Learn the Basics of Control Programming for Microcomputers * Apple Seedlings: Sorting out your ProDOS Catalog * Commodore Hornblower: Discover what's inside the Commodore 64's SID chip * IBMpressions: Create 3-D surface drawings in BASIC * Field & Screen: A tutorial for using a Data Base System—correctly * Product Reviews * HCM One Liners * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A * Product News, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Evacu-Pod (A, C, I, TX)
Miner rescue in space
It Figures! (A, C, I, TX)
A mighty equation calculator
Laserithmetic (A, C, I, T)
Blast aliens with your math skills
Organizer Reports (A, C*, I, TX*)
Print your organized outlines
Switch 'n' Spell (A, C, I, T)
A spelling aid that's fun to boot
Apple Seedlings (A)
Sort your ProDOS catalogs
Commodore Hornblower (C)
Inside the SID chip
IBMpressions (I)
3-D surface drawing in BASIC

Issue 5.3

Computerized Budgeting: Featuring a ready-to-use budget processor (Budgetron) * Honing your Geometry skills (Geometrix) * LOGO Adventuring (Build A LOGO Adventure, Pt. 3) * Survive a nuclear plant disaster (Over-Reaction) * Guard the seaways with nuclear submarines (Torpedo Alley) * Turtles race with Zeno's theory (Achilles and the Turtle) * Apple Seedlings: Character graphics on the hi-res screen * Commodore Hornblower: Select waveforms and envelopes from SID * Razzle Dazzle: Multi-layered animation with TI sprites * IBMpressions: Blending sign waves into complex patterns * MAC-ROs: Expanding BASIC on Macintosh * Speeding Up a BASIC Program * Product Reviews * HCM One Liners * Group Grapevine * Product News, * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Budgetron (A, C, I, T)
Budget your income and expenses
Geometrix (A, C, I, T)
Sharpen your geometry skills
Over-Reaction (A, C, I, T)
You're at a nuclear plant's controls
Torpedo Alley (A, C, I, T)
Keep the enemy's ships at bay
Achilles & the Turtle (T)
A LOGO demonstration of Zeno's Theory
LOGO Adventure, Pt. 3 (A, C*, I)
Apple Seedlings (A)
Character graphics in hi-res
Commodore Hornblower (C)
Waveforms & envelopes from SID
Apple Tech Note (A)
Key-in checking routine
IBM Tech Note (I)
Selective keyboard input
Commodore Tech Note (C)
Merging programs from disk
TI Tech Note (T)
A full-screen editor

Issue 5.4

Time Management: Computer-Assisted Efficiency Comes Home * Run-Day-View: Let your computer streamline your day * Trig-Trix: Use the triangle as a measuring tool * Archeodroid: Participate in a future archeological dig * Mine Over Matter: Hone your business skills in this simulation of uranium mining operations * MAC-ROs: Create custom graphic shapes on Macintosh * IBMpressions: Create your own computer windows * Razzle Dazzle: Explore sound-on-sound recording with this 3-track recorder program * Apple Seedlings: Use a pie chart as a visual aid * Commodore Hornblower: Change filters on the SID chip * Algorithm-A-Tricks: Create invisible ripples * Speeding up a BASIC Program: Part 2 * Build a Logo Adventure: Part 4 * Product Reviews * HCM One Liners * Home Computer Industry Journal * Product News * HCM TECH NOTES: Apple, C-64, IBM, and 99/4A, and much, much more!

CONTENTS: ON TAPE™ & ON DISK™

Run-Day-View (A, C, I, T)
Organize your daily schedule
Trig-Trix (A, C, I, T)
The triangle makes measurement easy
Archeodroid (A, C, I, T)
Join a future archeological dig
Mine Over Matter (A, C, I, T)
Manage a uranium mine
LOGO Adventure, Pt. 4 (A, C, I)
Apple Seedlings (A)
Creating pie charts
Commodore Hornblower (C)
Changing filters on the SID chip
Apple Tech Note (A)
Exiting error routines
Commodore Tech Note (C)
Merging programs from tape
IBM Tech Note (I)
Using special character graphics

NOTE:
Programs for the IBM PC/PCjr will run on the Tandy 1000 with modifications specified on page 130.

This space reserved for Issue 5.5

Atari users please note that coverage in HCM didn't commence until Issue 5.5—the issue you are now viewing.

Also commencing with this issue, programs for the IBM PC/PCjr will run as is on the Tandy 1000.

◄◄◄◄ HCM BACK ISSUES

The Plain & Simple Truth About HOME COMPUTER™ magazine

Chock Full of Valuable Software & How-To Articles Without Filler

Every issue is a software "horn of plenty" with dozens of type-in-and-RUN programs printed in an easy-to-read listings format. Our programs are also available on inexpensive disks or cassettes for those who prefer the convenience of ready-to-RUN software. Step-by-step tutorials round out each issue, providing the solid facts you need without fluff or filler. Thus, each issue functions as an excellent reference work, as well as a valuable software source.

No Outside Advertising

Freed from the pressures of servicing *advertisers*, we concentrate on serving our *readers*. Each issue provides uninterrupted editorial flow and graphic layouts for better comprehension—plus unbiased product reviews which focus on true strengths and weaknesses, wherever the chips may fall . . . And we don't have to worry about losing advertisers because of publishing software in the magazine that is "too good." Consequently, we can provide the best free software available anywhere.

Focused on the 5 Hot Home Brands

We are 5 system-specific magazines under one wrapper—not a sprawling, "general interest" publication which attempts to cover too wide a field, only to spread itself too thin. The other side of the coin to this focused approach is the knowledge you gain from being exposed to the many tips, ideas, and techniques we provide for 4 of the 5 systems you may not even have. You'll learn more about your Apple, Atari, Commodore, IBM, or Texas Instruments home computer from this one magazine than from a host of more limited sources.

A Balanced Mix For a Perfect Recipe

In each issue we strive for a perfect balance of productivity, entertainment, education, utilities, and computer literacy—serving the needs of novice and pro alike. Every issue is a full-course meal, with a smorgasboard of tasty dishes for all palates. Whereas other computer magazines may dish out lumps of "editorial indigestion," we serve up a satisfying blend—one digestible byte at a time.

—Welcome to Our World of Home Computing

HOME COMPUTER magazine

Home Computer Magazine (ISSN 0747-055X) is published ten times per year by Emerald Valley Publishing Co., P.O. Box 70288, Eugene, OR 97401. The editorial office is located at 1500 Valley River Drive, Suite 250, Eugene, OR 97401 (Tel. 503-485-8796). Subscription rates in U.S. and its possessions are $25 for one year, $45 for two years, and $63 for three years. In Canada add $7 per year. Other foreign countries $43 for one year surface mail. Inquire for air delivery. Single copy price in U.S. and its possessions is $3.50, and $4.50 in Canada. Foreign subscription payment should be in United States funds drawn on a U.S. bank. Second-class postage paid at Eugene, OR 97401, and Columbia, MO 65201.

POSTMASTER: Send all address changes to **Home Computer Magazine**, P. O. Box 70288, Eugene, OR 97401. Subscribers should send all correspondence about subscriptions to above address.

Address all editorial correspondence to the Editor at **Home Computer Magazine**, 1500 Valley River Drive, Suite 250, Eugene, OR 97401. Antique typewriter provided by Earl Kelso (Vida, OR).

Outside HCM

What kind of contraption is this? If you've seen our last few covers, you know by now that we like to transform old gizmos into new ideas—illustrating how your home computer can go way beyond the abilities of past, single-purpose machines. We've depicted an antique coffee grinder as a "number cruncher," a classic alarm clock as a computerized scheduler, and now, an ancient typewriter (circa 1905) as still another transfigured electronic tool—the "memoranda processor." What next? If our imaginations are not limited, neither are the uses of our amazing home computers.

Inside HCM

Memory . . .in a machine? Remember the last time you sat in front of your computer. Was it like the time before? Or did your trusty machine show you an entirely different face? In fact, each time you boot up another piece of software, your computer seems to become almost a different machine.

In humans, such inconsistent behavior can either be sign of senility, or of acting ability. But your machine is not senile. Like the man of a thousand faces, the computer is a multi-faceted performer. Its versatility lies in its incredibly *flexible* memory. Software fills this memory with a *script*, telling the machine what to do, how to *act*.

In this issue of *HCM*, we give your computer many roles to play. Our software runs the gamut from memorable simulations to memory helpers. Take *Electronic Typewriter*, a simple tool for processing memos, letters, lists, and short schedules. This program has all the virtues of a memory typewriter—it combines quick and easy typing with line-by-line editing.

A computer's memory resides like a ghost in the machine. Hardware provides a storage place for memory; software provides memory-instructions which the computer must read and turn into action. Giving the computer a different set of instructions is a bit like changing its "face"—giving it a different appearance, and another purpose. *NanoProcessor* is a software simulation of the malleable machine on its most fundamental level. Learn how to enter simple instructions into this computer model *bit-by-bit*, creating programs (even music routines) in a language of ones and zeros.

From the heart of the machine, we move on to *Vital Signs*, a simulation of our own heart and respiratory system. If you can keep this heart model beating—as you respond *consciously* to the effects of exercise and changing air quality—you may learn how to prolong the beat of your own heart.

King Arthur has a place for the stout of heart on his final battlefield: *The Plains Of Salisbury*. One hint: In this strategic exercise—played out on a terrain much more complicated than a chessboard—the key to planning future moves is the ability to remember past ones.

And let us remind you: Each machine brand we cover gets its own quick and helpful program within a mini-tutorial column. In this issue, *Apple Seedlings* blends sine waves into vibrational applesauce; *Commodore Hornblower* sets sail with SID's special effects; *IBMpressions* casts 3-D shadow graphics; *Razzle Dazzle* calculates super-accurately on the 99/4A; and our new column, *Atari Atrium*, illuminates 4-channel sound-on-sound recording.

Can your computer become a source for print graphics? Discover the ins and outs of this new software genre in our comprehensive *Home Print Studio* review. Then examine several music and sound products, including *Music Construction Set*, *Music Video Kit*, *Music Synthesizer*, and *Mockingboard*, a sound board for the Apple II family. And , if you're in need of galactic guidance—and some cosmic humor, check out our review of the *Hitchhiker's Guide To the Galaxy*.

Fill your computer's memory with our software, and you can immediately see the variety of roles it can play in your life. Read our reviews, and find out what your machine *might* do with what's available in the commercial market.

As the machine remembers, it thinks about what to do next. *What* the machine remembers is what it *does*. So, go ahead—make use of *Home Computer Magazine* and give your computer some very useful memories. You're in for a "memorable" treat.

Until next time, have fun reading, learning, and RUNing HCM

On Screen

By Gary M. Kaplan
Publisher & Editor-in-Chief

"Many people have been put off . . . by the term 'electronic music' which unfortunately invokes auditory images of spacey-sounding squeaks and squeals right out of some '50s sci-fi movie."

This issue represents another milestone in the evolution of *Home Computer Magazine*. As we start mapping out the editorial content for our sixth publication year which commences this January, we do it as a larger magazine—expanded in size and content with coverage of a fifth major home-computer user base: the diverse family of Atari 800-compatible machines.

I would thus like to take this opportunity to welcome all our new Atari friends to the *HCM* fold. Many of our long-time readers may be wondering why we are adding this coverage now. For some time, we have been receiving a tremendous number of requests from the Atari community—coming in the form of letters, phone calls, and visits to our booth at Consumer Electronics Shows. The message to *HCM* is now crystal-clear: *Atari users want in*! It didn't take a proverbial "whack on the side of the head" for us to realize that a dual service and expansion opportunity now existed: We could provide new service to the large, active Atari user base; and we could foster additional cross-pollination of fresh ideas within a larger base of *HCM* readers. Before this expansion, however, we first wanted to put in place a series of format enhancements—including our Programmer's Windows, Glossary, Industry Journal, Counterpoints, sectional edge-tab IDs, and so on. You've seen all this implemented over the last several months.

In this issue we are presenting another major enhancement—our new debugging aid for readers who prefer to type in our program listings, rather than order them ready-to-run ON TAPE or ON DISK. We have optimized our Bug-Out Codes (BOCs) and checking utilities to make the job of catching typing errors as simple and painless as possible. And we've accomplished this without sacrificing any readability or clarity in *HCM*'s widely acclaimed listings format.

Long-term readers have witnessed a steady improvement in our published programs over the past year—demonstrating our commitment to excellence. Although we now craft *each* of our magazine programs with extra-special care and attention to detail, there is, on occasion a program that stands a little taller than the rest. A case in point is this issue's *NanoProcessor*. It artfully employs what a computer does best—dynamic simulation—to "demystify" the machine's own inner workings. In my opinion, this simulation is destined for the Software Hall of Fame. Though many have tried hard to *teach* the rudiments of machine language, most have only succeeded in *scaring off* the uninitiated. But, with *NanoProcessor*, even the meek can inherit this down-to-earth knowledge—*and have loads of fun doing it*! Next issue, we will follow with *NanoAssembler*, a tool for "playing" your way into the formerly esoteric realm of assembly language.

On another score, the hills around *HCM*'s Emerald Valley are alive with the sound of music, as we premiere "Soundbytes." This column bridges *HCM* to its new sister publication, *Music & Electronics*. I confess that we have somewhat of an ulterior motive for providing this bridge: We'd like to bring you all across! So, check out our two-page announcement following "Soundbytes" for details about the new magazine and how you can become a charter subscriber.

Preparing for the launch of *Music & Electronics* has, in fact, been a real "ear-opener" for me—providing a measure of excitement that I can only liken to the beginning of the home computer revolution. As I've discovered, the link-up with music synthesizers and other gadgets in the production of electronic music is truly a harmonious use for home computers. Many people have been put off, however, by the term "electronic music," which unfortunately invokes auditory images of spacey-sounding squeaks and squeals right out of some '50s sci-fi movie.

Let me assure all of you that both the sound quality and stylistic possiblilties of what is more aptly called "electronically produced music" must simply be heard to be believed. And what's even more amazing is that you don't have to be a *musician* to participate in all the creative fun. Even those of us who don't know the difference between treble and tribbles can produce musical recordings that are out of this world . . . Those of you who first want to "hear it with your own eyes" (or "see it with your own ears"), will get a small taste of all this sensory excitement in an upcoming issue of *HCM*—replete with some bound-in musical surprises.

In our next issue of *HCM*, we will have a new challenge for our readers as we launch the "Problems In Productivity" series. This first challenge requires the use of *HCM*'s *Snap-Calc* spreadsheet tool to analyze typical financial alternatives for a college education, and come up with a cost-effective solution. *Snap-Calc* was originally published in Volume 4, Number 3; so if you don't yet have the program, get ready by ordering the magazine and software ON DISK or ON TAPE now. And while you're at it, take the opportunity to fill in any other gaps in your *HCM* back-issue reference collection.

Machine	Requirements	Media
APPLE II family	At least 64K RAM & Applesoft BASIC	ON DISK
FRANKLIN ACE	At least 64K RAM	ON DISK
ATARI 800, 800XL, 130XE	-None-	ON DISK/ON TAPE
COMMODORE 64	-None-	ON DISK/ON TAPE
COMMODORE 128	Must be in 64 mode	ON DISK/ON TAPE
IBM PC	BASICA	ON DISK
IBM PCjr	Cartridge BASIC	ON DISK
TANDY 1000	GW-BASIC Version 2.02	ON DISK
TI-99/4A	TI BASIC or Extended BASIC	ON DISK/ON TAPE

SPECIAL NOTES

Apple Owners: Apple ON DISK media for *HCM*, Vol.4, No.1-Vol.4, No.3 is in DOS 3.3 format only. Beginning with *HCM,* Vol.4, No.4, all Apple programs are in ProDOS format. All programs **RUN** on Apple II+, Apple *IIe*, or Apple *IIc* computers.

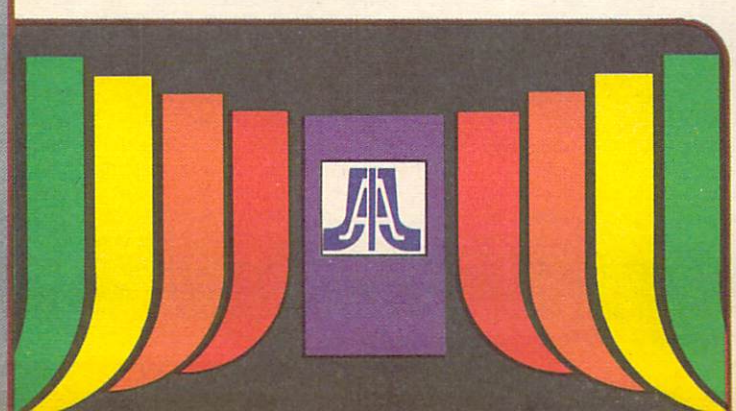
Franklin Owners: Beginning with *HCM*, Vol.4, No.4, all Apple ON DISK media is in ProDOS format only. Booting ProDOS on a Franklin requires the following steps:

1. Boot ProDOS. When the system hangs up, press [RESET].
2. Type 265B:EA EA and press [RETURN].
3. Type 2000G (insert no spaces between the last zero and the G) and press [RETURN].

See *HCM*, Vol. 5, No.4, page 13 for more information.

Tandy 1000 Owners: Starting with *HCM*, Vol.5, No.5, all of our IBM PC programs run on the Tandy 1000 without modifications. Programs prior to Vol.5, No.5 may need minor changes as explained on page 130 of *HCM*, Vol.5, No.4.

Errata: In Program Listing Contents on page 75, the Atari Tech Note is incorrectly shown as page 57. The correct location is page 52.



Letters to the Editor

Just In Atari Time

Dear Sir:

I would like to compliment you on your magazine. I find it to be one of the most useful and informative magazines I have read for home computers.

However, since subscribing to your magazine, I have sold my TI-99/4A and upgraded to an Atari 800 computer.

Frankly, I don't understand why you don't provide coverage for the Atari line of home computers.

Do you have plans to include them in your magazine now that Atari has introduced their new XE and ST lines?

Barry Gray
Sacramento, CA 95828

A timely question, Barry. You are one of many Atari users who have written in the past several months to ask for Atari coverage. Well . . . Surprise! In this very issue, as you can see, we are premiering full coverage of the Atari 800 family and compatibles. Each issue will include Atari versions of all our major programs, as well as an Atari Tech Note and "Atari Atrium." Starting with this issue, Atari programs are also available ON DISK and ON TAPE. Letters to the Editor from other Atari users will be published in this column commencing with our next issue. So hurry and get them in to us! This seems like the right time to make the following announcement:

ATTENTION:
ATARI USERS GROUPS

HCM periodically publishes Group Grapevine, a bulletin board of users group activities across the nation, and in other countries as well. Beginning in the next issue (Vol. 5, No. 6), Group Grapevine will cover Atari Users Groups in addition to our normal coverage of Apple II, Commodore 64, IBM PC & PCjr, and TI-99/4A users groups. We hereby issue an open invitation to Atari Users Groups everywhere to join our "grapevine" of computer enthusiasts. If you are an active member or officer of your local Atari Group, please write or call our office immediately to insure coverage of your organization. And if you have a message to put out to other groups, if you are starting a new group, or if you have an interesting item to share, send a note or picture—or better yet, a group newsletter—to the Users Group Editor, Home Computer Magazine, 1500 Valley River Drive, Suite 250, Eugene, OR 97401, Tel. (503) 485-8796.

Great Julian Date Mixup Fixed

Dear Sir:

In regard to Max A. Shelhorse's letter in HCM Vol. 5, No. 3, page 11:

As an avid amateur astronomer for almost 15 years, I've had occasion to write a program which calculates the positions of the planets in their orbits for any date and time. This, of course, includes a routine to determine the Julian date.

Upon examining Mr. Shelhorse's Julian date algorithm, I recognized it as being correct and could not see how it would determine Jan. 1 to Mar. 1 as 65 days. Closer scrutiny of your listing, however, revealed that the error seems to stem from a possible quirk in the TI-99/4A's interpreter.

Note that in line 130 the second parenthesis is not closed in the calculation of DP. While this would result in a syntax error on my Spectravideo SV-328 computer (which uses the same BASICA & GWBASIC as the IBM), it apparently goes undetected on the TI-99/4A for which the routine was written. I was able to duplicate your erroneous value of 65 by writing the calculation as DP – INT(30.6001)*(MF). It appears that somehow the TIs interpret the typographical error in this way, rather than refusing it.

Simply closing the last parenthesis should resolve the "Great Julian Date Mix-Up." Following is a slightly modified, Microsoft BASIC, version which creates fewer "local" variables and makes the routine somewhat more universal by also allowing for BASICs which do not have the ELSE clause:

```
500 'Julian Date subroutine (enter with
    YR=year, M=month #, D=day)
510 F=YR :MF=M :IF M<3 THEN
    F=YR-1 :MF=M+12
520 IF YR<=1582 AND M<=10 AND
    D<=15 THEN JD=0 :GOTO 540
530 JD=INT(F/100)
    :JD=2-JD-INT(JD/4)
540 JD=JD+INT(365.25*F)+INT(30.60
    01*(MF+1))+D+1720994.5
550 RETURN
```

Gregory S. Vigneault
Toronto, Ontario, Canada

Gregory, you discovered a typo in our listing, not a bug in the TI BASIC interpreter—line 130 does require a closing parenthesis just as you have noted. With this corrected, the more important bug from the original letter of Max Shelhorse is still apparent when this program is run. Line 130 of the original listing starts like this:

```
130 A=INT(F/100):: B=2-A+INT(A/4) . . . .
```

By comparing it with line 530 in your listing above, we discovered the real problem—the plus (+) should have been a minus (–). If you make these two fixes, Max Shelhorse's listing and yours give identical (and correct) Julian Dates. Thanks for helping us unravel this celestial mystery.

Commodoring In Argentina

Dear Sir:

I'm the happy owner of a Commodore 64 and I'm very interested in telecommunicating. I have several questions I'll be very happy if you could answer.

Could I telecommunicate if I have the Datasette or do I need the disk drive?

What things do I need to telecommunicate; is it enough only having the Vic-modem?

I'm also interested in making a RESET. How can I make it; can't a key be programmed for that?

Any assistance you can provide me will be greatly appreciated.

Ignacio Adrogue
Buenos Aires, Argentina

You need only two things to make telecommunicating easy: one is a VicModem, or any other C-64 compatible modem unit; the other is software that can send, receive, and handle data via modem. Although you can write your own software, you may want to obtain some type of commercially-available "terminal-emulation" software package, such as VIP Terminal from Softlaw, or SKIWriter II from Prentice Hall (reviewed in HCM Vol. 5, No. 4). As for the RESET feature, see the Commodore Tech Note, "Installing a Reset Switch" in Vol. 4, No. 4.

Wants Apple Frequency Blender

Dear Sir:

I own an Apple *IIc* computer and find your magazine very helpful. In your last issue (Vol. 5, No. 3), there was an article for the IBM entitled "Frequency Blender" which interested me. I have been trying to find a program which extracts cycle frequency and amplitude from data using fast Fourier analysis and also would like an Apple program which could blend the cycles into a composite curve like the IBM program. Could your magazine and staff include a program in Home Computer Magazine or suggest a source to find a program which would do this? Thank you.

Richard L. Laughlin
Tulsa, OK 74105

The answer to the second part of your request is right beneath your fingertips, Richard. In this issue, "Frequency Blender" for the Apple II family appears in our regular mini-tutorial, "Apple Seedlings." We have some doubt, however, that the 6502 processor in the Apple IIc is fast enough to do the kind of Fast Fourier Transformations (FFT's) you desire.

2nd Disk Drive and PCjr Warranty

Dear Sir:

Having sought information about adding a second disk drive to my PCjr for almost four months now, I have found that the only thing that exceeds the amount of information available from sales reps, shop techs, and other "experts" is the amount of misinformation one acquires during the search. The most valuable piece of information I acquired was relevant to your fine, fine magazine. I latched onto Volume 5.2 and 5.3—straight scoop without the poop! Obviously I require Vol. 4, No. 4 which contains the original article. Check enclosed.

One of the criteria established (in consultation with the wife) was that the addition of a second drive could not result in our version of the national debt. That ruled out third-party manufacturers. Hello! Do it yourself! Your instructions and kit seem to offer the only hope. Thanks, HCM.

As the result of this letter to you, I called Randall Baxter, who lives in my area, about the procedures you published for adding the second drive. A point he made was that any modification to the disk drive controller card would probably invalidate the balance of the year's warranty on my machine. Ah, serious consideration time. It would be most advisable for me to wait until my warranty expires. Mind you, I'm not superstitious, but I don't take chances either.

In light of my decision to wait until the magic November 1985 date when my warranty expires, do you suppose that the kit and instructions you have so thoughtfully provided at an extraordinarily reasonable cost would be available until then? I could invest in it now, but the way the PC market is now, I might have already moved into an IBM PC by that time. (That statement resulted in some mention of a dead body by my wife—it wasn't clear whom she meant!)

Not intended to cause palpitations, but anything in the works about a do-it-yourself project for adding a hard disk (or did I miss that too)?

Anyway, thanks for having a fine magazine with great articles and even better programs.

F. E. DiGirolomo, Jr.
Duncanville, TX 75116

Yes, Mr. DiGirolomo, installing the drive kit will indeed void your warranty, as we stated in the original article (Vol. 4, No. 4). However, we will continue to sell the kit as long as there is any demand for it—so if you want to wait, don't worry. We'll have it in November when you need it.

More SIDs for "Music of Sound"

Dear Sir:

Your reviews get better and better, and this two-part series on "The Music of Sound" for the C-64 is a prime example. Have you heard of anyone making a cartridge or interface to add more SID chips to the Commodore so more voices/tones could be created? The Commodore 64 Programmer's Reference Guide on the 6581 SID (sound interface device) chip suggests on page 460 that: "SID can process external audio signals, allowing multiple SID chips to be daisy-chained or mixed in complex polyphonic systems." Imagine, if you will, what such a successful addition would do to music—even speech synthesis! Can this not be done?

Souping-up the C-64 this way seems pretty cost-effective from this consumer's point-of-view. Can I make a general appeal to those IC wizards out there? Any word of this being attempted by anyone?

By the way, in hooking up your C-64 to a stereo amplifier any buzz produced from poor grounding can be stopped by reversing the outlet, or cables' plugs. Try 'em all until the buzzing quits or as in my case, make sure the entire setup is plugged into a grounded circuit.

Elizabeth Schelper
Ft. Myers, FL 33901

Thanks, Elizabeth, for the compliment on our "Music of Sound" reviews. All the effort put into these articles seems to have been well worth it—judging by the favorable response from our readers. If the link between music and computing is one of your chief interests, you'll love our soon-to-be-released sister publication, Music & Electronics. We share your intrigue with the idea of daisy-chaining multiple SIDs together to—as the manual states—"create complex polyphonic systems." According to Commodore, there is no definite source for the SID chip apart from the C-64 itself. However, we do know of one supplier: The Jameco catalog (1355 Shoreway Rd, Belmont, CA 94002, Tel. 415-592-8097) offers the SID chip for $32.95. Perhaps some of our readers know of other sources. You might also contact local computer repair shops to see if they have a "junkpile" of otherwise unrepairable C-64s with intact SID chips that you can salvage. If any HCM readers attempt this project, we'd be interested in hearing about the results.

Expanding His TI-99/4A

Dear Sir:

Since I have become a TI-99/4A owner just seven months ago, I have become very involved with learning and enjoying all aspects of the computer.

I then discovered HCM on a newsstand and have purchased many back issues and software from your firm, enhancing my knowledge and enjoyment, but the software is on cassette tape.

I now want to add a disk drive, but do not have an expansion box. Please tell me how to add one in the most practical and inexpensive manner.

I now subscribe to HCM and look forward to each new issue. Keep up the good work!

Joseph A. Nicosia
Auburn, CA 95603

We know of three disk drive expansion units currently marketed for the 99/4A: the Texas Instrument Peripheral Expansion Box (TI PEB), the Myarc Peripheral Expansion System, and the Corcomp 9900 Micro Expansion System. The TI PEB sells for about $300 and includes one single-sided/single-density disk drive, a disk controller card capable of handling up to three disk drives, and a 32K Memory Expansion Card. Myarc's system sells for about $600 and includes a double-sided/double-density disk drive, a double-density disk controller that can control up to 4 drives, and the 32K memory expansion. Corcomp's system sells for around $325 and comes with an RS232 port, a disk drive controller, and a disk-based disk manager—the disk drive is extra. All three systems are available through several major TI-related product catalogs (Triton, Unisource, TexComp, Tenex, etc.), although there may be other regional or local sources. Thanks for the good words, Joseph, and good luck!

A Better Way To Write Thank You?

Dear Sir:

I want to thank you for such a great magazine. I have a PCjr and find your magazine to give the best coverage for the PCjr. I also like your new coverage of the back issues of HCM Vol. 5, No. 3—I am ordering two more back issues to complete my total collection of HCM. I also want to thank you for your Tech Notes—especially Vol. 4, No. 3 on Format A:/S. This saves a lot of time and hassle and provides many hours of enjoyment with my PCjr. Would you run a program on some sort of word processing or something similar so that I can sit down and write a letter such as this without having to worry about margins or running out of screen room? At the present, I use the Function + Prtsc key to print a letter, but when my letter is of greater length than my screen allows, I lose part of my letter.

I am looking forward to each and every issue of HCM. Keep up the great work.

James R. Delaney
Tedxico, IL 62889

With this issue, your wish is our command, James! The Electronic Typewriter (starting on page 19) will just fit the bill. It is ideal for letters, memos, or any other short correspondence.

What Am I Doing Wrong?

Dear Sir:

The purpose of this letter is twofold. First, my congratulations to you on a fine magazine written without the normal advertising. Prior to last month, I always purchased the magazine at a bookstore. I now have subscribed and will look forward to receiving it through the mail on a timely basis.

The second reason [for writing] is I am not a very experienced computer operator, and I am having trouble updating your programs when corrections are to be made. When I follow the sequence of commands as directed by the flyer included with the disk and try to save the merged version, I get a PATH NOT FOUND message. If I type the correction, I am able to merge the program with the correction. But being a hunt-and-peck typist you can see the problem this presents.

Can you tell me what I'm doing wrong? Thank you.

Dorsey Williams
St. Louis, MO 63116

You do not say what brand of computer you own, Dorsey, but from the kind of error message you are receiving, we assume you have an Apple II operating under ProDOS. ProDOS (Apple's Professional Disk Operating System) is an improvement over all previous versions of DOS for the Apple—it Loads and Saves files more quickly and lacks several of the bugs that existed in the earlier operating systems. It does, however, contain a few new aspects which might cause trouble for the inexperienced, Dorsey. One thing that you're sure to encounter is Prefixing. Every disk formatted for ProDOS has a Volume Name which makes up the first part of the Prefix for any file you wish to access. All Apple HCM disks have the name ON.DISK followed by the volume and issue numbers that correspond to the issue of that software. For example, this issue's disk has the name /ON.DISK.5.5 (the slash is added by ProDOS as a delimiter). As ProDOS "boots-up" from our disks, the Prefix is set to the ON DISK volume name. If you wish to access a different disk, you must do one of two things: (1) null the Prefix, or (2) set the Prefix to a different disk. The easiest way to null the Prefix is to simply type PREFIX */then press [RETURN]. To reset the Prefix, you must place the new disk in the drive and execute a* PREFIX *command. If you know the Volume Name, you can type* PREFIX /name, *where* name *is the Volume Name of the disk. An alternative way to reset the Prefix is to place the disk in drive one and type* PREFIX,D1. *The system will then check that drive and reset the Prefix. If you are swapping a number of disks in and out (say, you are Cataloging a number of disks just to see what is on them), nulling the Prefix is most convenient. If, however, you want to make sure that a file is written to or read from a particular disk, Prefixing that disk is an added safety measure. For more information about Prefixing see the "Home Computer Tech-Note for Apple" in HCM Vol. 4, No. 5.*

The Elusive C-64 One-Liners

Dear Sir:

I think your magazine is the greatest! I work on a PCjr at school and have a Compaq and a TI-99/4A at home, so I get quite a lot of use out of each one of your magazines. My girlfriend, however, knows only four words for her Commodore 64 (LIST, RUN, LOAD, and PRINT). So, when she asked me to show her something that her C-64 could do, I got real excited! I figured I would type in one or two of your HCM one-liners and really impress her. First, I typed in your Graphics Spectacular (issue 4.5) and nothing happened. The computer simply responded with <READY>. Not too discouraged, I NEWed the first program (SYS64759) and typed in another (It's Alive!, issue 5.3). It flashed the bottom two rows of the screen in white for about half a second. Needless to say, she was real impressed. I checked what I typed in with what you printed twice for each program. What's the matter here? Is it simply my ineptitude on the Commodore computer?

Jason Harper
Fairfield, OH 45014

Debugging typed-in software through the mail is just about impossible, Jason, but your difficulties probably stemmed from a lack of familiarity with the C-64. Because a line on the Commodore can contain no more than 80 characters, One-Liners make use of a number of abbreviations (such as F [SHIFT] O for FOR and N [SHIFT] E for NEXT). After you've keyed in such abbreviations, however, the Commodore expands them to full-size commands again. This means that if you make an error when entering the program, you will have to change all the expanded commands back to abbreviations when you edit the line so that it still fits within the 80 character maximum. We hope this gives you some idea of the nature of your errors.

99/4A Disk Manager Available

Dear Sir:

Having read your Vol. 5, No. 3 issue of HCM, I decided to try and locate a TI Disk Manager II module. After only making two telephone calls, I found that the following business has these modules "sitting on their shelves." The cost is $19.95 plus $3.00 for S&H. Contact Altex Electronics, 10731 Gulfdale, San Antonio, TX 78216. You can even order via the telephone (1-800-531-5369).

Hope this will be of help to any other readers who are currently looking for the Disk Manager II. Evidently, Edward Stack didn't call or contact the right people.

Keep up the good work and thanks for not forgetting about all of us that have the TI-99/4A.

Jerry Petrel
Auburn, KS 66402

Thank you, Jerry. We have verified your information by phone. It's good that we can rely on people like you to help keep track of TI peripherals—considering that specific items are often available only from regional or local sources.

New PCjr Owner Gets More Help

Dear Sir:

After haunting the magazine section of our local bookstore for the past five months looking for PCjr articles, suddenly your magazine appeared. Feeling like the proverbial Edsel owner, it was with humble gratitude that I carried HCM home. I was hoping for a few crumbs such as I had been finding in other computer magazines; but such a feast! Thank you. The same day that I purchased Vol. 5, No. 1, one check was written for the subscription and another for all of the back issues I had missed. When the back issues arrived it was interesting to see the evolution of your format. The present format is extremely readable and the type-in programs the most legible I have seen. Also, the Debugs on Display has gone from relatively indecipherable to very clear.

With the compliments comes a request for help or information as the case may be. I have typed in several short graphics programs (Ripples and HCM One Liner, Vol. 5, No. 2 and IBM Animation, Vol. 4, No. 2) with no results. I know it takes time for the calculations to occur, but how much time is reasonable? I have left the computer alone for up to an hour with nothing to show for it except a black screen and an irregularly blinking cursor in the upper left corner. I received Ripples ON DISK and tried that too with the same results. I'm willing to wait to see results, but not for hours. Is there something I am missing in trying to run these programs? In case it makes any difference, I have the enhanced PCjr with the Tecmar Captain board for 256K and use a memory configuration program worked out by IBM that frees up the memory in better fashion than the Tecmar software.

Thanks again for a very useful magazine. I really enjoy the productivity programs and the Tech Notes.

Lynn Cox
Kerrville, TX 78028

We are always happy, Lynn, when readers applaud our efforts to constantly improve the quality of this magazine. As for the problem you are experiencing with running our software—it is probably due to the IBM software that reconfigures your memory for use with the Tecmar board. You can use such software when running applications (such as Lotus 1-2-3) which can employ more memory than the PCjr normally offers. IBM Cartridge BASIC can only access 64K of memory, however, so any extra memory will not be used. In addition, the reconfiguring software places memory into an arrangement that differs from what the BASIC interpreter expects to find. This can have disasterous results, especially with graphics routines. When you wish to work in BASIC, just boot up with a standard DOS 2.1 master disk, and you should have no trouble running our software. Of course, the Tecmar memory will not be active, but then, neither will it be necessary. In short, save the reconfiguration software for applications that can use it.

ProDOS For Franklin

Dear Sir:

I received your May edition (Vol. 5, No. 3) of HCM and started to read the "Letters to the Editor" column. I came to an article requesting information on how to boot ProDOS on a Franklin. I thought I might try to help a little considering that I also own a Franklin ACE 1200.

I had the same problem myself when I purchased an AppleMouse which included software written in ProDOS. I recently learned of how to permanently fix a disk so ProDOS will boot automatically on a Franklin.

You need to use a program such as Copy][+, Nibbles Away, Bag of Tricks, or Byte Zap (found on Apple Mechanics) with a "Sector Editor" option to change the data on a ProDOS disk. For ProDOS version 1.0.1, you need to alter two locations on Track 01, Sector 09 of the disk: locations 5B, and 5C hexadecimal. These two locations will contain a D0 and a 03 respectively. Change both of these to EA and your Disk will now boot on a Franklin without a hitch.

I hope I could be of some help to any other computer enthusiasts who own a Franklin.

I am 15 years old and I enjoy reading your magazine!

Henry James Curry
Hope Mills, NC 28348

Thanks, Henry, for the Franklin Disk modification. We checked out this ProDOS/Franklin fix and found that it works great and does not affect the disk's ability to run on Apple computers. Although any modification like this entails a certain amount of danger (you could "blow up" your disk if you made a mistake), Franklin owners may find it convenient to modify ProDOS startup disks this way.

Converts Father To TI-99/4A

Dear Sir:

Please enter this gift subscription as soon as possible. My father spent most of his life as an electronics engineer and later was chief test director for a large aerospace company which is part of the giant Textron conglomerate. He purchased a TI-99/4A for me about two years ago, and I was immediately hooked. Last year, over his protests, I bought him a TI and an Extended BASIC cartridge, and now he is equally addicted. Up until that point he had never used a computer and was afraid that he was too old to learn and enjoy the world of computing. Now, after less than a year, his acute mathematical and engineering abilities have made him a veritable whiz!

He inspected several issues of your fine magazine when he visited last time, and he is now writing an article for submission to you, dealing with the graphic representation of simple and complex mathematical equations, a task which he feels the TI-99/4A is over-qualified to perform. He also feels, after looking at the publications available, that your magazine is the only choice he would make as far as submitting an article.

One closing note. I have been computing about two years and I also feel that your magazine is the finest available and that your program listings are far and away the finest published anywhere.

Thanks for great entertainment and instruction. I'll be reading you faithfully.

Robert P. Marsh
Greensboro, NC 27407

We thank you for the encouraging words, Robert, and look forward to hearing from your father!

Response to Quadram Review

Dear Sir:

The content of HCM has been able to shake up my grey matter with bits and pieces of information. These pieces come from all parts of the magazine. It appears that IBM has inadvertently placed in the hands of six or seven hundred thousand people a rather remarkable machine. That is, of course, if we can figure out just what it is that we have in our hands.

Contrary to your review, I claim that the Quadram equipment that I have attached to my IBM PCjr will operate other programs while outputting to the printer from QSPOOL buffer.

Software used:

1. Quadram QuadMaster jr Version 1.03 of 2/01/85.
2. IBM Writing Assistant Version 1.01
3. IBM DOS 2.10

In Quadram CONFIG.SYS, it is absolutely essential that JRVIDEO.SYS be placed first for configuration. The configuration that works for me is as follows:

```
DEVICE = JRVIDEO.SYS
DEVICE = QUADCLOK.SYS
DEVICE = QSPOOL1.SYS 48 48
DEVICE = RAMDRIVE.SYS 295
```

When booting up with the above, I was able to make all features of Writing Assistant work perfectly, including the QSPOOL print buffer. I have to believe that there must be others experimenting as I do. BBS is OK. Media does what it can. As I have heard, "what the mind can conceive, machines can do." HCM just may be on the right track as an information dispenser for the Orphans of the computer society.

I am told that Racore Corporation, 10 Victor Square, Scotts Valley, CA 95066, (408) 438-7255 is the designer and producer of the hardware and software that I have described in this letter.

Lloyd E. Howard
Chelsea, MI 48118

Thank you, Lloyd, for the information. You say you use version 1.03 of the Quadram software. When we reviewed the product, we had version 1.02, and this apparently made all the difference between your experience and ours. We received the updated version shortly after your letter arrived, and we found that many of the functions that we reported as faulty, such as the QSPOOL, did indeed work great with the new software. In fact, the batch files that we reported having trouble with worked just fine once we used the new version of the software. Thanks for putting us on the right track. Your note about Racore also proves correct. Racore was the original manufacturer of the Quadram, and now also markets the enhancement unit described in the review. In addition, the company recently released a 10 MB harddisk (they quoted a $1299 price when we called them), and will soon release a DMA controller for the PCjr ($149). Racore claims that its software is entirely different from Quadram's. We found it to be quite similar, however, except that no QSPOOL is available. Racore also informed us that the printer buffer option will now come as part of the DMA board.

Two Commodore Questions

Dear Sir:

I have two questions about the Commodore 64. First, I would like to know if there is a company somewhere that sells programs that will change the C-64 to run Assembler programs. Second, I would like to know if there are any bulletin boards for Commodore in my area. Thanks for your time.

Tim Gitchel
Irving, TX 75060

Tim, any C-64 can run assembler programs. There are many assembler programs available for the C-64 that allow you to write routines in assembly language and then convert that code into machine language. Here are three such assembler packages: Assembler Development System from Commodore, Merlin-64 from Roger Wagner Publishing Co., and the MAE Assembler from Eastern House. It is very likely that most of the programs you are using are already in machine language. Such programs can be identified by the LOAD"name",8,1 format used to load them from disk. As for your second question, we suggest you call Bill Marshall of the Irving Commodore Users Group (214-256-1402). He will probably be happy to hook you up to the local BBS scene.

TI To Okidata—Come In, Please

Dear Sir:

In Home Computer Magazine Vol. 4, No. 4, a letter from Mr. Nisius states that one can hook the parallel output of the TI-99/4A to an Okidata with a cable where one wires:

TI-99/4A		OKIDATA	
Term.	Description	Term.	Description
1	Handshake Out	1	Data Strobe
2-9	Data	2-9	Data
270K-ohm resistor in series with:			
10	Handshake In	11	Busy
11	Logic Ground	10-30	Data Return

Does this mean 10-30 on one side, the Okidata side, is all run to 11 on the TI side? Or does it mean the only other change is to cross 10 and 11 and add a resistor? I'd like to make my own cable. Please advise.

Stanley Page
Vancouver, BC, Canada

According to Tom Nisius, his solution is sufficient for his printer, Stanley. He placed a 270K-ohm resister in series with pin 10 of the TI and pin 11 of his Okidata, and connected pin 11 of the TI directly to pins 10-30 of the Okidata. It is important that you realize that this procedure is not for the novice and that it might not work on your printer. We did a little checking with two companies that market cables necessary for the interface (Tenex, P. O. Box 6578, South Bend, IN 46660; and Innovative Electronics and Computing, 4150 Fox Street, A-5, Denver, CO 80216). They verified that the 270K-Ohm resistor solution will probably not work on many models of Okidata printers. Technicians at both these companies stated that, apart from the pin differences you've recanted above, the timing of the Handshake In and Busy signals is not compatible between the TI and Okidata printers. Both companies' cables contain capacitors and even have active circuitry to put the two units in sync with each other.

Junior Graphics Dump

Dear Sir:

First, I would like to congratulate you on your fine magazine and wish you continued success. HCM is the only magazine that is really a voice of the users—especially PCjr users. While all the "PC" magazines take their monthly shot at the PCjr, you tell everyone the many things it does very well. Some magazines can't seem to understand that they are comparing a $799.00 machine with a $2900.00 machine.

I recently had a problem that perhaps other IBM users can benefit from. I have a Star Gemini 10x printer that normally works fine. When I run GRAPHICS.COM on the DOS disk, however, and then do graphics screen dumps to the printer, the line spacing is incorrect (leaving 10/144 of an inch between lines). Using Debug, I located the line feed spacing and corrected it. Now the program works fine. The procedure is listed below:

```
A>debug graphics.com
-a0168
0905:0168 mov ax,000e
0905:016B <return>
-ngrprint.com
-w
Writing 0315 bytes
-q
A>
```

Now simply use GRPRINT.COM instead of GRAPHICS.COM> The 0e in 016a controls the line feed size.

Keep up the good magazine! PCjr owners need you!

Todd Vernon
Warrensburg, MO 64093

Many thanks, Tom, both for your encouragement, and for your helpful update. We discussed the problem in the "Home Computer Tech Note for IBM" in Vol. 5, No. 1 and presented a solution in BASIC. Using DEBUG.COM to actually alter the GRAPHICS.COM routine is a very interesting solution. We did find that in completing the process with our Gemini 10, the number 0008 worked better than 000E, so anyone who tries this fix might want to experiment a bit.

Trouble In ProDOS

Dear Sir:

My computer is a 64K Apple IIe and I have only one disk drive. Your notes with "ON DISK" say that I need not buy anything to use these disks, however I am having far too much trouble with ProDOS. I hope that you can help me.

I learned for the first time of Prefix,D1 from your Tech Note in Vol. 4, No. 5. After formatting a disk I have typed Prefix,D1 then saved programs to my disk but I can't get it to boot up. I get the message "UNABLE TO LOAD PRODOS."

Several weeks ago I called your Customer Relations and it was suggested to me that I try loading and saving Startup—that did not work either. I tried to run it and got "HAS TO BE BOOTED." Well, I got back the "UNABLE" message again.

I listed and read your "input.namefile" and saw in line 360 "link to disk access routine." It would seem that access routine is what I need. Could you get this routine to me in the simplest of terms (as I am a novice) before I pull my hair out!

If the "fixes" for the programs can't be made without booting up each time, I will never get them right. I love the type of programs that are offered—just what I need. The magazine is excellent, but personally I could use some simple "type this and that" sort of thing. I will be subscribing to the magazine soon as it is hard to find around my home. I will be waiting for your help anxiously.

Mrs. E. O. Coldiron
Bridgeview, IL 60455

No, Mrs. Coldiron, you don't need to re-boot every time you want to make a change. You normally need to boot up only when starting a session. To start a session, boot up with the ON DISK original disk, select Exit To Applesoft BASIC, and then place the disk with the files you wish to work with in the disk drive. Then type PREFIX,D1and you're ready to LOAD, RUN, or modify any programs on that disk. Each time you change disks, you should change the Prefix. For more tips on Prefixing, see our answer to the letter from Dorsey Williams ("What Am I Doing Wrong") in this section.

If, however, you re-boot the system either by turning the power off and on or by pressing [CONTROL] [OPEN-APPLE] [RESET] then you will need to put a disk in the drive that contains two very important files: PRODOS and BASIC.SYSTEM. If these files are not on the disk when you re-boot, then you will indeed get the UNABLE TO LOAD PRODOS message. Simply formatting a ProDOS disk does not add these files to the disk, and therefore the disk is not a "boot disk." All of our Apple ON DISK products since Vol 4, No. 4 contain these two startup files and are thus boot disks. If you wish to make additional startup disks, you will need a ProDOS filer utililty available from Apple.

MissingLink Inventor Comments

Dear Sir:

Thank you for your request for response to a review by Pat Swift of the Missing Link in Vol. 5, No. 3 of HCM. I cannot thank you enough for alerting TI owners of its existence as it has been an uphill battle, and I think Pat did a good review of it. I sent Pat some thoughts separately and do agree that the package was disorganized and have added additional sheets to help people find their way around (enclosed).

I think Pat may have emphasized one or two things too much and may have missed one or two things that deserve emphasis. If you left planet Earth three years ago with prices on the TI home computer, you would have realized that it took $500 to do word processing on a printer. If someone brought you back and told you that for $70 you could also do word processing on a printer, you might have trouble believing it. I've been living under that scourge for three years. MissingLink has worked flawlessly for me for three years and I have tested it to at least an error rate of 1 in a billion. Pat seemed to emphasize the problem with VPLinK too much (her OKI possesses different control codes from my Epson based printer) and I think some people would think (1) it doesn't convey information accurately, or (2) it's too complicated to use. The title "The Zero Bug" also was used; if I were skimming, I would think it meant that the device doesn't work reliably.

I also think many PES owners would like an inexpensive backup to their RS232 cards. A guy who owns the PES and RS232 almost surely has to own the 32K, hence for only $30 he can have a backup for his system if it ever fails. People who buy it like that feature.

George A. Bowman
Midwest Engineering Consultants
Vernon Hills, IL

Thanks, George, for the feedback on our review. We're glad to hear about the continuing demand for the Missing Link. Your added documentation does answer many of Pat Swift's concerns with the previously incomplete and disorganized documentation. We're glad that our reviewer's input has helped you to improve your package.

Some Copyright Considerations

Dear Sir:

I wish to compliment you on your fine magazine. After buying three issues from the supermarket stand, I have recently called in my subscription. I am most enthusiastic about the programs you provide at such modest cost! It has long been my opinion that software is almost always overpriced in comparison to say a fine technical manual. Your magazine offers some relief from this situation.

It is exactly this enthusiasm and respect that causes me to write at this time. What is the exact legal obligation connected with the copyright laws? I ask this question because several of my computer friends have asked me for copies of the programs. In addition, my "friends" on the lines of our local user's group have also been interested. I can see two concerns for this situation. The first being that the programs may be ripped off and in some manner commercially sold. That, of course, is always a possibility but your registration would be at the beginning of each program so that the thieves would have to make a conscious effort to do so. Secondly, I realize that you are in the business of selling magazines. I might point out that with the acknowledgement of your magazine as the source, these few programs would introduce and sell more subscriptions. In short, I am asking if it would be possible to share this program amongst these interested parties? What are the acceptable parameters to be used?

I do appreciate your work and especially the programming for the PCjr . . . an unfortunate orphan before its time. Keep up the good work and let me know about the copyright thing.

Adelia Ramey
South Bend, IN 46637

As much as we appreciate your glowing compliments, Adelia, we cannot permit you to give our software away. As stated on page 6 of this issue, "EVP [Emerald Valley Publishing—that's us!] grants to such purchaser only [that's you only!], the limited license to enter these program's into the purchaser's computer, and to place such programs on a diskette or cassette for the purchaser's personal use." In short, our licensing agreement doesn't allow you to copy these programs for a friend.

As you well know, HCM does not receive any revenues from outside advertising—as does virtually every other computer magazine—and is therefore largely supported by the revenue generated from its sale of media and back issues. Because this revenue is so crucial to our existence, we must take a firm stand on this copyright issue, and we request that our readers do the same to safeguard our (and your) material.

This, of course, does not prevent you from showing the software to your friends and letting them know where they can buy HCM and ON TAPE or ON DISK. We believe that the price of back issues and their ON DISK contents is so very reasonable that your friends should take advantage of the legitimate media availability. We also ask that our readers please report to us any observed copyright violations so that we can take appropriate action.

How About The TI Pro?

Dear Sir:

I will not bore you or insult your intelligence by arguing the merits of the Texas Instruments Professional compared with the IBM PC.

Neither can I blame you for your choice in publishing programs targeted to this (IBM) market. I am certain there are infinitely more IBM users out there than we fewer, but more discriminating TI owners.

As an architect, I use a TI Pro with AutoCad at the office and also have another unit at my home. My 15-year-old son is able to rewrite most IBM programs to run on the TI. I can't!

My question is this: Since most algorithms are so similar for both machines, why can't you list both in your programs? There are several hundred thousand TI Pro owners who would welcome any sort of entertainment programs. There is only one periodical devoted exclusively to the TIP and it is so business oriented that it is no fun at all.

Please give us a break. I would subscribe in a minute if there were programs I can use and enjoy.

John Vaden
Ft. Worth, TX 76107

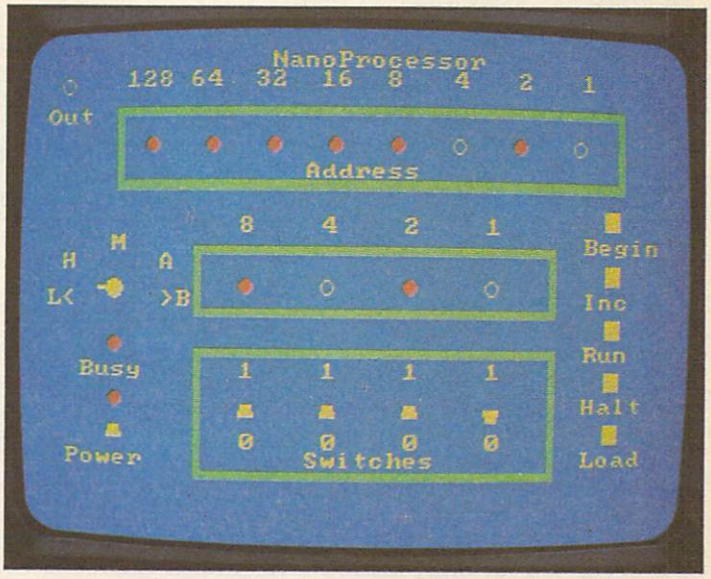
John, we agree that the TI-Pro is a fine machine—we use several in our offices. But, unfortunately, the machine does not run IBM BASICA, which is the language our IBM programs are written in. This makes it virtually impossible to convert our software to the TI -Pro without major changes to the IBM code. On the other hand, the Tandy 1000's BASIC is nearly identical to IBM's, and thus we have extended coverage to this machine. We would have to provide a complete new program listing for each TI-Pro version; at this time, we simply do not have the space in the magazine to provide that level of coverage. Not to be facetious, but perhaps your son could perform this conversion service for you when you become a subscriber.

HCM

The NanoProcessor

by Roger Wood
and
Wayne Koberstein
HCM Staff

With this simple simulation of the machine's inner workings, you can discover how easy (and fun!) it is to communicate with computers in their own language.



Since the premiere of the movie *Tron*—in which the hero has to fight his way out of a computer's microcircuits—many people have held a fascination for the inner workings of this "thinking machine." Are you one of them? Perhaps your interest has always been there, but you have not yet "taken the plunge" into machine-level programming. Or perhaps you know a great deal about this subject already, but would appreciate a very clear and simple demonstration of how computers "think." If so, you're ready for *NanoProcessor*—a program that emulates the computer at its most fundamental level.

At the heart of a computer, there is nothing but an immense set of on and off switches. But how can such a simple foundation foster such a complex information-handling system? In short, how are all these switches organized? A "real" computer, such as the one you have at home, is such a large system that it would be difficult to see the forest for the trees. But, with *NanoProcessor*, you have a chance to operate and see a much-simplified model of how a computer performs its tasks.

Brain Central

All computers—including the *NanoProcessor*—have a central "brain." It's called the CPU (Central Processing Unit). This brain recognizes and responds to different sets of numbers as instructions. These instructions direct the CPU to carry out certain operations—much as our brains store, handle, and act on information encoded in switch-like neurons. In a computer, information travels along parallel paths of wires and printed circuits called "buses."

As humans, we may think in English, Spanish, or any other language—some subtle, some exact. Computers also "think" in languages—such as BASIC and LOGO. CPU's like our own brains, must translate these high-level languages into encoded information. In computers, this information takes the form of machine language—a set of codes and numerical values expressed as binary numbers. Binary means "two," and implies two choices: on or off; or, in purely numerical terms, 1 or 0.

People tend to think in terms of a ten-based number system because they have ten fingers—but a switch has only two "fingers." (For a detailed look at converting between these number systems see the sidebar "Numbers To Bits And Back.") When you RUN *NanoProcessor* you will notice the row of switches at the bottom of the screen—your only means of shuttling information through this simulated computer (See Photos 1, 2, 3). Each switch only has two positions—up for *on* (1), or down for *off* (0). A switch is therefore the perfect means for conveying binary information.

Banking on Memory

Every computer has a memory area, called "Random Access Memory" (RAM), and a Central Processing Unit (CPU). Memory is the computer's capacity to store information, and is measured in terms of "bytes." A byte generally consists of 8 *bits* of information—where a bit is one binary (on or off) condition.

A CPU performs all the arithmetic that manipulates the numerically-encoded data—the ones and zeros—stored in a computer's RAM. This memory is made up of discrete "locations" in the machine, each of which has an "address." It helps to think of each memory location as a mailbox that not only has an address attached to it, but also a place to put the mail. This mail is the data stored at that location. Each "mailbox" has a limited amount of space that depends on the machine design. Because each of *NanoProcessor*'s memory locations can only store 4 bits, (one nibble), we say it is "nibble-addressable." By simply requesting a particular address, the CPU can immediately find what is contained at that address. This direct addressability of memory by the CPU is what gives a computer the power of *random access*.

The CPU and RAM are connected by three buses: the address bus (8 parallel wires), the data bus (4 parallel wires), and the control bus (See Figure 2). The first provides *access* to each memory location; the second simply moves data to and from each location; and the third carries control signals which control the flow of data between the CPU and memory. Furthermore, the CPU is organized into a system of discrete "registers" that serve as temporary stations for storing and shuffling data.

Look at the *NanoProcessor* front panel. On the middle-left side of the screen is a "rotary switch" with various letters positioned around it. The letters on the right-hand side of this switch—A and B—stand for the A and B registers in the CPU. It is between these two registers that the actual "arithmetic" and logic operations take place. The A register is also called the Accumulator because this is where the answers to many of the commands end up—or *accumulate*.

NUMBERS TO BITS AND BACK

One of the most important aspects of machine language programming (but sometimes most confusing for the novice) is converting digital numbers to binary and vice versa. To make this as easy as possible, we have employed two aids: 1) Whenever we list a *binary* number, we precede it with a percent (%) sign; and 2) *NanoProcessor* displays the decimal equivalent of each bit above the address and data windows of the front panel (see diagram below). We refer to these decimal equivalents as the "weight" of the bits.

To quickly convert a binary number to a decimal number, simply add up the weights of the "1" (on) bits. For example, to convert %1111 1010, refer to the following diagram:

	128	64	32	16	8	4	2	1
	*	*	*	*	*	*	*	*
%	1	1	1	1	1	0	1	0

Then add 128+64+32+16+8+2 and you can easily arrive at the correct decimal equivalent: 250. (Also, see Figure 1 for converting the numbers 0—15 to binary.)

Figure 1

Decimal	Binary
0	%0000
1	%0001
2	%0010
3	%0011
4	%0100
5	%0101
6	%0110
7	%0111
8	%1000
9	%1001
10	%1010
11	%1011
12	%1100
13	%1101
14	%1110
15	%1111

Turning On

First, press **P** to turn on the Power to your *NanoProcessor*. Make sure the rotary switch is pointing to the letter M, for Memory. You move this switch left (counter-clockwise)with the < (less than) key, and right (clockwise) with the > (greater than) key.

At the top of the screen, you should see an address box containing a long row of "lights" with numbers across the top. This is the "location counter" shown inside the CPU of Figure 2. It displays the 8-bit address of the location currently being interrogated by the CPU. Notice the vertical row of buttons at the right side of the screen. These buttons represent *NanoProcessor's* functions. Press the **B** (for **B**egin) key on your keyboard. This effectively turns off all the lights in the address box, indicating that you have returned to the first address in memory: the 0 (zero) location. Now press the **I** key, for **I**ncrement. This moves you to the next address: location 1. If you repeatedly press **I**, you will continue to step through successive locations.

Notice that, as you step through each location, the row of 8 lights in the address box changes. These lights display the *address* of the "mailbox." To view the *contents* of this mailbox, look at the row of 4 lights directly above the toggle switches. This shows the value stored at the current location. If you were to move the rotary switch pointer to A, you would see the contents of the A register. To examine the B register, point the switch to the letter B. Now, move the pointer to the letters H or L at left. These access the "high nibble" (the first or left-most 4 bits) and the "low nibble" (the last or right-most 4 bits) in the 8-bit address.

Entering Data

The next step is to "fill" these locations so that the processor has something to process. With the rotary switch in the M position, try toggling the switches in the switch box. Nothing happens? Don't worry; turn some of these switches "up" and then press **L**, for **L**oad. Now you have something. Any switch that is *on* has a corresponding light glowing just above it.

You have just entered your first "data" into the *NanoProcessor*. Now move the rotary switch to the H position and try the same exercise. This time, when you press **L**, lights not only come on in the "contents" box, but the same pattern of lights appears in the high (left-most) nibble of the address box. Moving the rotary switch to L (for Low nibble) and loading a value affects the low nibble (right-most) half of the 8-bit address in the same way. Once you have thus designated a full 8-bit address, move the pointer to the M position again to view the contents of *that same address*. By doing this, you have, in effect, moved to this address location, and can enter data there.

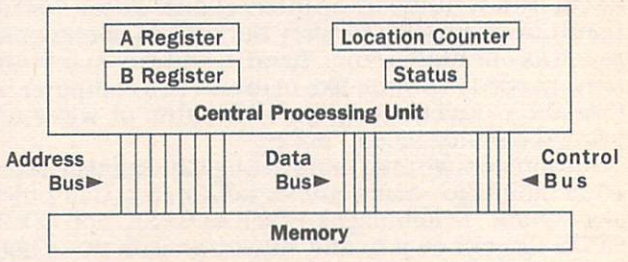
If you next move the rotary switch pointer to the A or B position and try to enter data, you will not be able to—because whatever goes in or out of these registers has to do so while the *NanoProcessor* is running instructions encoded into memory. You will also notice a small Output light (labeled "Out") at the upper left of the screen. We will explain the use of this in the *NanoAssembler* program next issue.

Your next job is to enter your first machine-language program on the *NanoProcessor*.

Programming The Machine

A CPU executes commands *sequentially*. As it runs a program, it steps through this sequence in much the same way you "incremented" through each memory location. However, the program may instruct the CPU to take other paths—"branching" to many different locations before completing its task. You are able to program this processor by entering three different kinds of data: 1) encoded commands; 2) pure numbers; and 3) addresses. As with any program, it is the *logic* of this sequence that determines what the processor will do.

Figure 2
Simplified Block Diagram of the NanoProcessor



NanoProcessor understands 16 different commands—its "instruction set." Although initially expressed in one nibble, some commands require additional memory locations to hold the data necessary to execute the command. Figure 3 lists these 16 commands, showing each corresponding binary code; how many nibbles in a program the instruction requires; its "mnemonic"; which (if any) flags in the status register the instruction affects; and a brief explanation of the command function. As you develop more complicated programs, you will have to understand and use more of these commands. But, for now, try a very short routine—one that simply adds two small numbers together.

Figure 3: Instructions Set

Dec.	Binary	Nibbles per instr.	Mnemonic	Flags* affected C Z	Function
0	%0000	1	ADD	Y Y	Add the contents of B register to the contents of A register—result in A.
1	%0001	2	LDA #	N Y	Load A with number following instruction.
2	%0010	3	LDA *addr*	N Y	Load A with number at location specified by *addr*.
3	%0011	3	STA *addr*	N N	Store the contents of A at location specified by *addr*.
4	%0100	1	TAB	N N	Transfer contents of A to B.
5	%0101	1	TBA	N Y	Transfer contents of B to A.
6	%0110	1	RRC	Y Y	Rotate A right one bit through carry.
7	%0111	1	RLC	Y Y	Rotate A left one bit through carry.
8	%1000	1	AND	Y Y	Logically AND A and B—Result in A.
9	%1001	1	OR	Y Y	Logically OR A and B—Result in A.
10	%1010	1	XOR	Y Y	Logically XOR A and B—Result in A.
11	%1011	3	BZ *addr*	N N	Branch to *addr* if Zero flag is set.
12	%1100	3	BNZ *addr*	N N	Branch to *addr* if Zero flag is not set.
13	%1101	3	BCS *addr*	N N	Branch to *addr* if Carry flag is set.
14	%1110	3	BCC *addr*	N N	Branch to *addr* if Carry flag is not set.
15	%1111	3	JMP *addr*	N N	Branch to *addr* unconditionally.

**Flags affected refers to whether or not the instruction has any effect on the flags in the status register. The C column stands for the Carry flag (did the operation result in a carry being generated?), and the Z stands for the Zero flag (did the operation result in a zero?). A Y appears in the column if the flag is affected by the instruction. An N indicates the flag is not changed by the instruction.*

Roundabout Addition

Sample Program 1 will add the numbers 7 and 3, and the answer will end up in the Accumulator. If you haven't already, turn on the power by pressing **P**. Now, press **B** for **B**egin, and confirm that the rotary is pointing at M (Memory). Now "key-in" this program with the following procedure:

1. Toggle the switches to the on and off positions corresponding to the bits of the number identified as Code in the program—up (or on) for 1, and down (or off) for 0. Notice that each binary code is preceded by a % (percent) sign to make it easy to distinguish binary numbers from decimal quantities (See "Numbers To Bits And Back" for details).
2. Check that the address indicated by the location counter is the correct one for that Code, and then Press **L** for **L**oad.
3. Press **I** for **I**ncrement. This will take you to the next address.
4. Repeat steps 1 through 3, loading the correct nibble into each address, and move on to the next set until you've loaded all the nibbles in the proper order.
5. Once you have completed loading the program, press **B** again to return to address 0. Then step through each memory location with the **I** key to be certain the program is entered properly.
6. Now press **B** for **B**egin once more, then **R** for **R**un. Note that you may **H**alt the program at any time (by pressing **H**) and continue again by pressing **R**.

Let's go over Sample Program 1 step-by-step to see exactly what it does when **L**oaded and **R**un. First it uses the "LoaD Accumulator immediate" instruction (abbreviated LDA #) to load the number stored at the address immediately following the instruction code (address 1) into the Accumulator. This number (in this case a %0011 or decimal 3) is one of the two to be added. At address 2 is an instruction to Transfer the number from the Accumulator into register B (TAB). Address

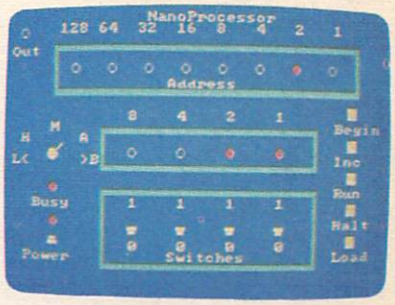

Photo 1: This shows the contents of the A register in the initial step of Sample Program 1. First, the program moves one number (3 or %0011) of an addition problem into A.

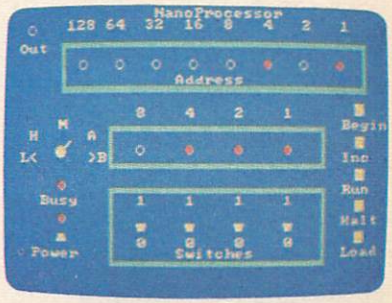

Photo 2: Next, after the first number moves to the B register, the second number (7 or %0111) is loaded in A.

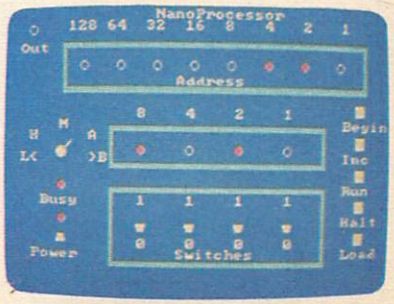

Photo 3. The A register now shows the result (10 or %1010) after the contents of A and B have been added together.

3 contains another LDA# instruction to Load a %0111 (7 decimal) from address 4 into register A. The instruction at address 5 actually ADDs the number in register B to the number in A, and places the answer in A. Address 6 contains a JuMP instruction (JMP *addr*), that tells the machine to jump to the address specified at the next two memory locations—7 and 8. All addresses are two nibbles, and the *NanoProcessor* follows a procedure standard to many microprocessors where the low nibble of the address is in the next location (7 in this case) and the high nibble in the following one (8). We call this a "jump self" because we specify address 6 (%0000 0110) as the place to jump to.

When you **R**un this program, the "busy light" remains on and both rows of lights flash different patterns as the CPU steps through the program. The *Nanoprocessor* has been made to **R**un slowly so that you can track each instruction as it is executing. When the program "hangs-up" at location 6, press **H** (for **H**alt) to make the busy light go off. Now turn the rotary switch to point at A. Here you find the answer to the addition problem: %1010 or 10 decimal. Keep the pointer in this position and run the program again, after pressing **B**egin. Watch the A register change values—first 3 (%0011), then 7 (%0111), then the answer, 10 (%1010). Photos 1 through 3 show this sequence.

Moving On

In Sample Program 1, the machine added two numbers and got an answer that it could express in one 4-bit nibble. But, what if this answer had been larger than one 4-bit nibble—say, a number like 23 (%0001 0111)? Fifteen (%1111) is the largest number that one nibble can express. When a processor adds two numbers together whose answer is bigger than its registers can hold, the answer "overflows" the register. When this happens in *NanoProcessor*, a "carry flag" is set to 1 in a special Status register of the CPU. (This register is not directly accessible to the user.) The program has to contain commands that recognize the condition of this flag (either 1 when an overflow has occurred, or 0 when there is no overflow) and take appropriate action. You can determine which instructions cause changes in the carry flag by studying the C column (under "Flags affected") of Figure 3. If there is a Y in the C column, the instruction will affect the carry flag —i.e., set it to 1 if an overflow occurs, or reset it to 0 if no overflow occurs.

Sample Program 2 adds the numbers 11 (%1011) and 12 (%1100) to arrive at 23 (%0001 0111). Not only does the program have to check the carry flag, but because the answer doesn't fit in one register, it has to place the answer someplace else. The solution is to designate certain memory locations as data areas—two for input and two for output. Program 2 fetches the two numbers to be added from memory locations 240 (%1111 0000) and 241 (%1111 0001). These addresses are input areas. This means that before you **R**un the program, you must manually **L**oad the numbers to be added at these locations—place 11 at address 240, and 12 at address 241.

Similarly, the output area is at locations 248 (%1111 1000) and 249 (%1111 1001). The low nibble of the answer (%0111 in our example above) appears at 248, and the high nibble (%0001) at address 249.

This program also handles the overflow condition described above. If the answer does overflow a nibble, the program places a 1 in the accumulator and stores it as the answer's high nibble. If, however, the answer is less than 15 (and fits into one nibble), the program branches to another address, where it loads a 0 into A and stores that instead. This introduces one of 4 "conditional jump commands," which we will explore more fully in next issue's companion "utility," *NanoAssembler*.

Program 3 is a "mystery program" that actually accesses the "sound chip" we've built into the *NanoProcessor*. Watch next issue for an explanation of how this program works. Or perhaps, in the meantime, you will learn enough by playing with *NanoProcessor* to figure this one out yourself. The best way to learn the details of operating the the *NanoProcessor* is to use it and experiment by creating your own machine-language programs.

Saving and Loading

With *NanoProcessor*, you can Save and Load the entire 256 memory locations (%0000 0000 through %1111 1111) to disk (and/or tape on The C-64, Atari, and TI-99/4A). Use the Save command listed in your Control Capsule and type in a file name in response to the prompt. To Load, use the Load command and type in the name of the file you wish to load.

HCM Glossary terms: CPU, bus, machine language, binary numbers, Random Access Memory (RAM), byte, address, nibble, location counter, accumulator, register, instruction set, mnemonic, branch, jump, conditional jump, status register, zero flag, carry flag, overflow, weight (of bits).

Electronic Typewriter

by Randy Thompson
HCM Staff

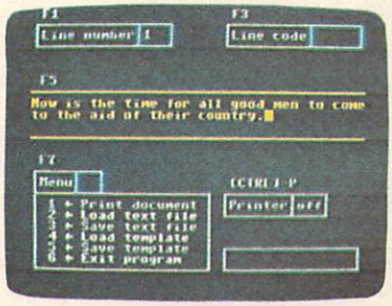
Turn your computer into an electronic typewriter with this super-easy-to-use "line processor."

NOTE TO TI-99/4A USERS:
Because the 99/4A has no keyboard buffer, *Electronic Typewriter* would work too slowly on that machine. However, the powerful **ACCEPT AT** statement in TI Extended BASIC allows us to bring you *TI CARD-TRIX* on page 21, another electronic productivity tool.

Using a full-blown word processor can be both frustrating and intimidating. When all you want to write is a simple letter or memo, most word processors are even more cumbersome than a typewriter. What the software industry needs is a typewriter simulator—something that enables you to just sit down and quickly put some words onto paper without limiting the computer's ability to remember text and correct information before it's output. We created the *Electronic Typewriter* to fulfill this need.

The "Line Processor"

The *Electronic Typewriter* is a combination computer/typewriter. It might be referred to as a "line processor." Instead of requiring that an entire document be entered, edited, and analyzed before printing, this program lets you enter and edit one line at a time. Once you're satisfied, simply press [RETURN] and that line immediately will be sent to the printer. Or, if you prefer, the line-print feature can be shut off so that you can first create all of your text and then print the entire document at a later time.



The main text-input screen and option boxes from the Commodore version.

Another useful feature included in this program is line coding. For each line of text, you may enter certain codes that center, indent, and print right-aligned text. You can save any combination of line codes to provide preset templates that will thereafter automatically format your text.

When you RUN this program, you are first asked to set the margins and line spacing. Margin settings are limited to 39 characters from both the left and right edge of the paper. Line spacing can be either single or double. These settings default to five-character-wide margins and double spacing. Once these settings are entered, the main editing screen will appear.

The editing screen has six basic parts: printer status, text entry, line number, line code, menu, and prompt window. A simple keypress will bring you to any of these six fields. (Refer to the Control Capsule for your computer to find the appropriate keys.)

Printer Access

The printer status box simply indicates whether the program is ready to access the printer. If the printer access is on, then every time you press [RETURN] from the text-entry section of the screen, your text will be sent to the printer.

Text Entry

Displaying one line at a time, this box on the screen is your window into the text file. All text is entered inside this window. Here all of the editing features of your computer (e.g., insert, delete, left and right cursor movement) are available. When you are satisfied with a line, press [RETURN] to advance to the next line. This program allows you to store up to 54 lines of text in memory.

Line Number

The line-number box informs you of the physical page line that you are working on. This number can range between 1 and 54. To change the current line number, move to the line-number field and enter the desired value. You may increment the line number from the text-entry box by pressing [RETURN], but to move back a line, or to jump ahead several lines, you will need to enter into the line-number section of the editing screen.

Line Code

Line codes allow you to optionally format any line of text. These codes are represented by the letters b, c, d, and e.

A b code is used to print a blank line. Any text that begins with a line code of b will never be printed. The c line code is used to center a line of text. This is great

for titles or page headers. To indent your text, use a code of d. Unlike the other line codes, the d code requires an added parameter—the number of spaces to indent. When you first enter a code of d, the computer moves the cursor over to the right and waits for you to input an indent value. If you do not enter anything, then the indent value defaults to zero. The line code e aligns text on the right edge (right justified, left ragged).

"What the software industry needs is a typewriter simulator —something that enables you to just sit down and quickly put some words onto paper . . ."

Line codes can be saved separately from the text. This is a very useful feature when you want to create a template for commonly used page formats. For instance, a letter template might have right-alignment codes (e) for the first three lines to position your name and address. The next line may have a blank line code, and so on. Once created, a template file can be used repeatedly. So, when you want to type a letter, just load your letter template and let the computer format your text automatically.

The Menu

The menu box allows you to choose from six options:

1) Print document
2) Load text file
3) Save text file
4) Load template
5) Save template
6) Exit program

Print Document

If you wish to print your text all at once, instead of line by line, then choose this option. Once selected, you will be asked to enter three items via the prompt window: line spacing, first line, and last line. The line spacing can be either single or double. The first line is the line number of the first line of text that you wish to print. The last line is the line number of the last line that you wish to print. When everything has been entered, the computer will prompt you to position the paper and press [RETURN]. Your text will now be sent to the printer regardless of the status of the "printer status" window.

Load/Save Text File

With these two options you can save and load text files. When you choose to save a text file, you are given the option to save your line codes with your text. This comes in handy when creating templates that require standard text such as "Dear," and "Respectfully."

Load/Save Template

These selections allow you to save and load the line codes that you enter. A template file consists of all 54 line codes that you input. Once you've created a template that you like and will use often, you should save it. By creating a library of such templates, you can save yourself a lot of time in formatting future documents such as letters, reports, and memorandums. Template files can be loaded and saved at any time, and do not destroy any text file that is present.

Exit Program

This option will "turn off" your *Electronic Typewriter*.

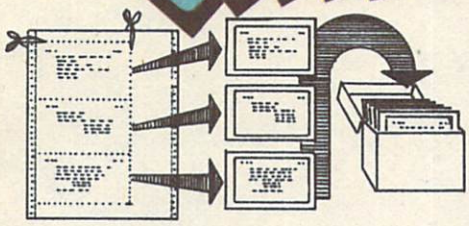
TI Card-Trix

Part 1

by Randy Thompson



Here's a real trick you can do with TI Card-Trix:

1. After you've created your electronic file cards on the computer, print them out on printer stock; then cut out each file as shown.
2. Tape or paste each file onto regular file card stock.
3. Store all cards in a file box.
4. You now can have *many* information "windows" opened up *simultaneously* on your *real* desk top for ease of use—a feat not practical even on a computer monitor.

In the next issue, Part 2 of this program will allow you to shuffle your file cards on the computer between many different cross-referenced file folders.

TI Card-Trix allows you to organize thoughts, book references, personal inventory—anything—on 3" by 5" cards. Such features as copy, search, and sort make creating the "cards" easy. And after editing a set (folder) of cards, you can print them out and/or save them to disk—your filebox for several folders of cards.

TI Card-Trix has seven main menu options:

1) Edit Cards
2) Search
3) Sort
4) Print
5) Save
6) Load
7) Exit Program

Edit Cards

Edit Cards immediately calls up the editing screen, which divides into four main fields: Index, Subject, Text, and Card number (represented by the # sign). Information for the Index can be both numbers and letters, but it is limited to 8 characters. If you wish to date your cards, or give them some other kind of identifying character sequence, the Index field is an ideal location. The Subject field can hold up to 28 characters, and may serve as a title for each of your cards. Most of your information will be placed in the Text field, where you have 9 lines, 28 characters wide. To move from one line to another within the text field, use [FCTN] E (↑) and [FCTN] X (↓).

The # field tells you on which of a maximum of 25 cards you are working. Every time you create a new card, the computer assigns it a number in this field. By changing this number, you change which card is currently on screen. For instance, changing the # field to a 15 is like putting the current card back into the folder and pulling out the 15th card so that you may work on it. You can edit cards in any order.

From the editing screen, you can Erase, Copy, and Paste cards. To flip through the cards one at a time, use the Forward and Backward functions. To access any of these features, simply enter the first character of the desired function at the CHOOSE ONE: prompt. For instance, to Copy the card that you are currently working on, enter a C. That card will now be copied into the hold buffer—a temporary storage location. Now, to Paste what you copied into the hold buffer onto another card, advance to the desired card and select P. The current card will now become identical to the card previously copied.

Search

This option allows you to search through your cards for any sequence of letters and/or numbers. You can search by Index, Subject, or Text. If the search yields a card with a corresponding character sequence, you are given the option to edit it, continue the search, or quit.

Sort

Here, you can have the computer sort your cards alphabetically by Index, Subject, or Text. Thus, you may save your folder of cards in a variety of different sequences. One folder might have cards sorted by Index, while another may be left in the order that was entered.

Print

To print out your cards, select this option. You can print out as many cards as you wish. When you enter the Print option, the computer asks you for the first and last card number of the cards to be printed. After you enter these numbers, a prompt will appear asking you to position the paper and press [ENTER]. Once you do this, the specified cards will print out.

Save

Here you can save your folder of cards. Saving different folders under unique names makes the cards easy to access and search through. This program stores in memory up to 25 cards per folder (or 15 completely filled cards). However, with memory expansion, this number can be raised. To do so, two numbers in line 210 have to be changed. To set the number of cards to 50, for example, change MX = 25 to MX = 50 and DIM C$(3,25) to DIM C$(3,50).

Load

This option loads a previously saved card folder.

Exit Program

Selecting this option allows you to quit the program. A prompt will ask whether you really want to exit. If you indicate No, the program will resume. Before indicating Yes, you should first save your folder of cards. All card data will be lost if you end the program before saving.

CONTROL CAPSULE

TI Card-Trix

KEY	FUNCTION
Edit Mode:	
I	Edit Index field.
S	Edit Subject field.
T	Edit Text field.
#	Move to another card.

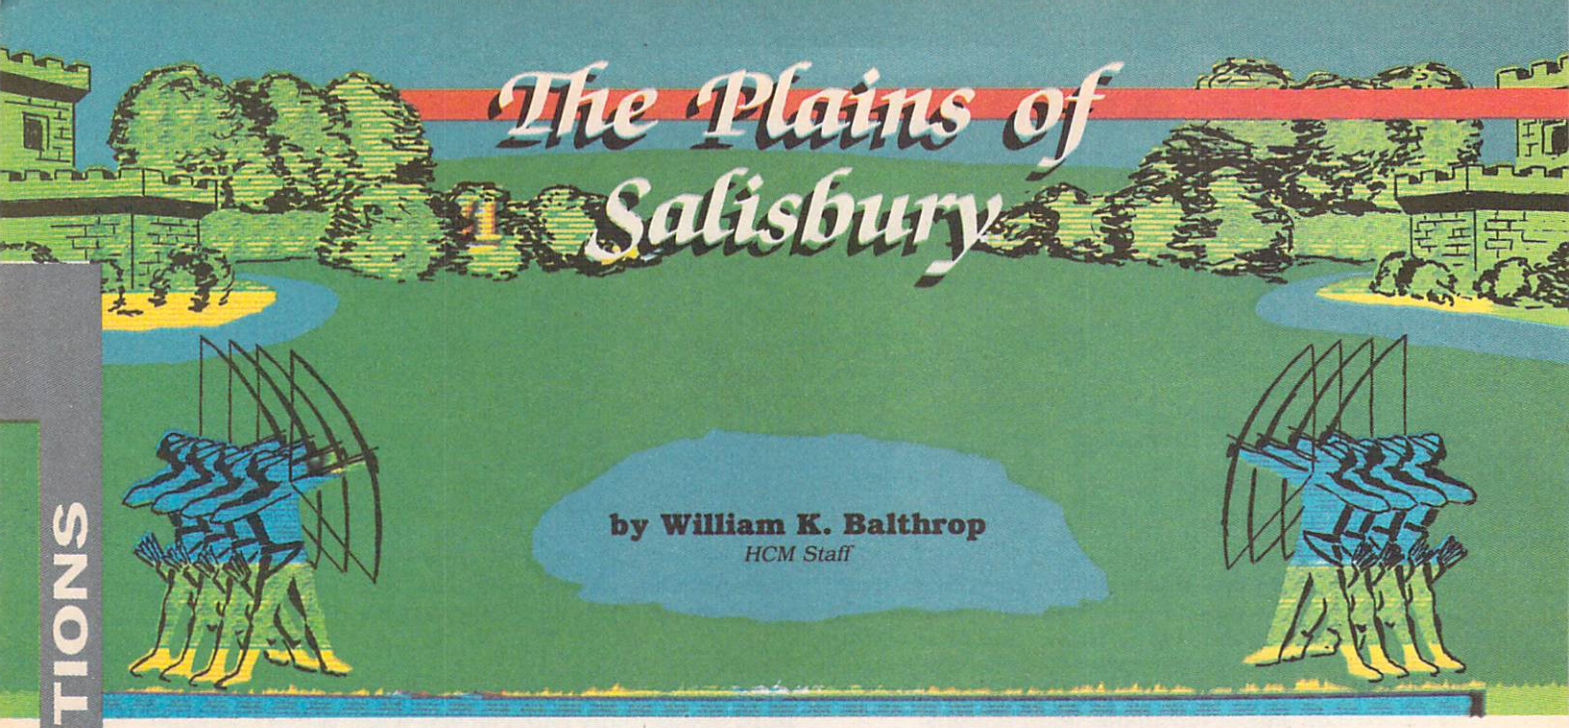
HCM

SOFTWARE INSTRUCTIONS



The Plains of Salisbury

by William K. Balthrop
HCM Staff

All is not well in Camelot. The kingdom is in chaos as King Arthur prepares his gallant knights for his final battle with his arch-enemy (and son) Mordred.

Arthur sits alone at his dimly lit table, a large map spread before him. As he struggles to concentrate on tomorrow's coming battle at Salisbury, time weighs heavily on his mind. So many years have passed since he first drew the sword from the stone. At dawn, he will make a last valiant stand against his evil son. With Merlin gone, who will come to Arthur's aid? Will it be someone from the distant future? Could it be you?

This program is an exciting simulation of King Arthur's last battle on *The Plains of Salisbury*. The game requires two players, each controlling an army of gallant knights. Players move the knights and engage in combat until one player defeats all of the opposing player's troops.

The Playing Screens

Three maps of terrain comprise the battleground for this mini-war. Each map lies adjacent to the others. (Moving off the right edge of the first map brings you to the left edge of the middle map, and so on.) You may not move off the left edge of the first map or the right edge of the last map—or off the top or bottom of any map.

The program will ask you to designate a map layout. You can enter any ordered combination of the three maps to indicate the layout sequence: e.g., 123, 321, 213, 232, etc.

Each map contains 6 types of terrain that affect movement and troop defense. You may move your knights into all terrains except water. Each type of terrain has a different movement/defense factor—the higher the number, the more strength it takes for your knight to travel. The 6 terrain types are:

TERRAIN	MOVEMENT/DEFENSE UNITS
Roads	1
Open grasslands	2
Forest	3
Buildings	4
Forts	5
Water	No movement allowed.

Obviously, roads offer the least resistance to movement and the least protection from attack. On the other hand, a fort is the most difficult to move through, but it offers the highest level of protection. Forts also possess an endless supply of arrows. Each knight, however, is capable of carrying no more than 4 arrows at a time. When these are used up, the knight must return to a fort to get more before he can participate in the combat phase. A knight who remains in a fort will always have a supply of 4 arrows.

Movement Phase

Two phases make up each player's turn: movement and combat. During the movement phase, a player is given an opportunity to move his or her knights, starting with knight number 1 and continuing through knight number 6.

Every knight can travel up to 9 movement units each turn. You may move your knights either left, right, up, or down by using the 4 keys indicated in your machine's Control Capsule. If you don't wish to move, or if you wish to stop moving a knight before all of his movement units are gone, then press [ENTER] or [RETURN]. This will start the next knight's turn; or, if he's the last knight, this will start the combat phase.

The number of movement units expended when entering a terrain type can be seen in Chart 1. If you stick to the roads, you could move your knight up to 9 squares at a time (a square is one character on the screen). Traveling through open grasslands, knights can move only 4 squares in one turn. Moving in the open grasslands requires 2 movement units for each of the 4 squares; so if your knight has only 1 movement unit left, he cannot continue. At this point, press [ENTER] or [RETURN] to begin the next knight's turn. When a knight's movement factor is exhausted, you will be prompted to move the next knight.

Every time a knight moves, he expends strength (.1 strength units per movement unit). Each knight starts the game with 9.9 units of strength, shown simply as a 9 on the screen (a strength of .9 will show up as 0). If a knight's strength level drops below zero for any reason, the knight cannot do battle. Each knight will automatically receive .5 units of strength every turn. If a knight stays away from battle, and only moves 5 movement units per turn, then his strength level will stay even. Not moving will increase his strength by .5 every turn. Marching at full speed (using all 9 movement units) will drain .4 strength units per turn.

Hand-to-Hand

A knight entering a square occupied by an enemy knight will automatically initiate hand-to-hand combat. This is a fight to the death, eliminating the losing knight from play.

Once hand-to-hand combat begins, your knight's strength level determines how much strength you can drain from the enemy; thus, the stronger your knight, the better his odds are of winning. If the strength for both knights drops below 0 at the same time, both knights will be eliminated.

If a knight has engaged in hand-to-hand combat and wins, he may not move until his next turn. The losing knight, obviously, may never move again.

After a knight has moved into a new square, the program updates and displays the number of movement units remaining and the knight's strength level. If a knight runs out of strength while moving, he is out of the game. The vanquished knight, however, will remain on the map until the map has been updated.

Combat Phase

After completing the movement phase, the combat phase starts. If any of your knights are adjacent to an enemy knight (horizontally or vertically, *not diagonally*), you can now attack that knight with bow and arrow. The enemy will not be able to fire back at you until your turn is over, so you have nothing to lose except one arrow. Every knight may fire one arrow per turn in the combat phase.

Select the knight that is to fire an arrow by pressing the number corresponding to that knight. Then indicate the direction of fire by pressing the key indicated in the Control Capsule for your machine. After a knight fires an arrow, that knight may not attack again until your next turn. Hitting an enemy lowers strength by a factor based on a random number and the attacking knight's strength level.

Every knight begins with only 4 arrows. If a knight uses all 4 arrows without replenishing them, that knight will not be allowed to initiate combat. A knight can replenish his supply of arrows at one of the forts.

You can terminate a knight's combat phase at any time by pressing [ENTER] or [RETURN].

Save Exit Return

Pressing the appropriate Exit/Save option key (designated in your system's Control Capsule) calls up a short submenu. When you reach this menu, you can either save your game to disk (or cassette on the TI-99/4A, Commodore, and Atari machines), or exit without saving. After saving, you can also quit the game or return to where you left off.

When you exit the game you are informed of the winner at that time. If you've saved a game where each player has at least one knight left, the game can be continued later—but, as you exit, the computer tells you the winner *as if the game were over*. The winner is determined by the following scoring rules: 50 points for each enemy knight defeated, and 10 points for each arrow that hits an enemy.

Load a Game

After the title screen, the program will ask whether you want to load an old game. If you reply with a `Y` for Yes, then it will ask for the file name. The old game will load and commence where it left off at the time it was saved.

VITAL SIGNS

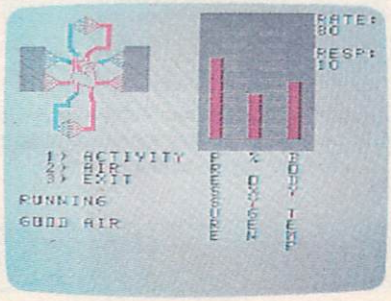
by William K. Balthrop
HCM Staff

Do you take your cardiovascular system for granted? With this simulation, you'll start paying attention to every breath you take and every beat of your heart.

An ambulance flashes a thick, red light. Another heart patient, with lungs nearly exhausted, exits the dense smog for the cool, conditioned air of the emergency room. Here, Intensive Care attempts to rescue this victim of long neglect—like restarting an engine that is terribly out of tune. But no amount of repair can make up for a lifetime's lack of care. For this person, it may be too late to start heeding those *Vital Signs*.

The heart and lungs play an extremely vital role in human existence: they supply life-giving oxygen to body tissues. If these two organs do not perform their job properly, you may end up looking at the clouds from the other side. Sometimes, to appreciate just how important this system is, we have to stop and attend to how it works.

Vital Signs is a program that provides a simplified simulation of the circulatory system. The many processes that occur in a living human body are far too complex for a computer program to handle (and remain small enough to publish in one issue of this magazine). For this reason, we have concentrated on a few key biological factors.



This screen photo from the C-64 version of Vital Signs shows the program in a Running mode—in which the player must adjust Heart and Respiration rates to compensate for the higher Activity level.

The Heart

The heart is responsible for pumping blood through the body. The blood carries—among other things—life-giving oxygen. The heart is really just a very complex pump. If we were to follow the path of a single blood cell through the body, the trip might go like this:

The blood cell's journey starts in the Right Atrium—one of four chambers in the heart. From here, the blood cell moves to the Right Ventricle (the second chamber), which then pumps the cell out of the heart and into a network of tiny capillaries in the lungs.

In the lungs, the blood cell picks up new oxygen and passes its load of carbon dioxide back into the small air sacs surrounded by the network of capillaries. From the lungs, the cell returns to the heart again, this time entering the Left Atrium (the third chamber). The Left Atrium sends the cell into the Left Ventricle (the fourth and last chamber), which is responsible for pumping fresh oxygenated blood cells to all organs and tissues. From here, the cell either goes through the upper circulatory system (arms and head), or through the lower circulatory system (abdomen and legs). After its journey through the body's tissues, the blood cell returns to the heart's Right Atrium for another trip.

If you listen to your heart, you will hear a short, hard "lub," then a long, soft "dub." The first sound is the heart contracting, pushing the blood out to the lungs and the rest of the body. The "dub," or second beat, is the heart relaxing, filling with blood for the next cycle.

The rate at which the heart beats is controlled by a natural pacemaker (or an artificial pacemaker surgically installed in people with heart problems).

In this program, *you* are the pacemaker. You can vary the heart rate from 0 to a maximum of 200 by using four keys on the keyboard. (See the Control Capsule for your machine.) Two keys increase or decrease the heart rate by one, while two other keys increase or decrease the heart rate by five.

The Lungs

The lungs are less complex than the heart, although they perform an equally essential role in the circulatory system. When you breathe in, your lungs fill with air. As blood circulates through the lungs, it picks up oxygen and gives off carbon dioxide, which you exhale.

Two major factors determine how much oxygen is transferred to the blood from the lungs: Respiration Rate and Air Quality (how much oxygen is in the air in proportion to other gases and pollutants).

The Respiration Rate is the speed at which you breathe—the number of breaths per minute. As you

breathe faster, more oxygen is placed in your lungs to be absorbed by the blood. Using two keys on the keyboard, you can increase or decrease the Respiration Rate from 0 to 30 breaths per minute.

Body Temperature

The amount of oxygen that the blood supplies to cell tissue determines the amount of energy available in the cell tissue. As you may know, this process of receiving and expending energy creates heat. This is why our bodies are warm. The more energy we expend, the more heat we generate (although our bodies usually regulate this temperature within a certain range). If the blood does not supply enough oxygen to the body tissues, then we create less heat, sometimes lowering the body's temperature below a tolerable level. If we have too much oxygen in our blood, then the body tries to burn it off, creating more heat and raising the body's temperature. The body automatically regulates its temperature by controlling the heart rate and respiration. In this progam, *you* are in charge of this process.

Body temperature can also be directly affected by the amount of blood flowing through our veins. The blood acts as a coolant, the capillaries in and near our skin as a radiator. The body can be cooled off by an increase in the flow of blood through these capillaries, or warmed up by a decrease in the flow of blood.

When the body starts to overheat due to exertion or a high external temperature, sweat cools the surface of the skin (the radiator for the blood). While the degree of sweating is not a direct factor in this program, it does have a limited influence on body temperature. When you choose either the Running or Swimming activities, the program simulates the heating of the body as energy is expended, and then the cooling of the body as the sweat glands start doing their job. You can see this process on the control-panel bar graph labeled BODY TEMP. The temperature increases for a little while, then it decreases as the sweat glands start working. The temperature graph ranges from 90 degrees to 107 degrees Fahrenheit.

"Sometimes, to appreciate just how important this system is, we have to stop and attend to how it works."

Percentage of Oxygen in the Blood

As mentioned earlier, the heart rate and the quality of the air (amount of oxygen available) control the amount of oxygen in the blood.

Another factor that determines the amount of oxygen in the blood is blood pressure. One method to increase blood *oxygen* is to increase the blood *pressure*. The higher the blood pressure, the more quickly blood flows. Consequently, higher blood pressure causes blood to receive oxygen from the lungs at a quicker rate. This program performs this function automatically. If the oxygen level drops below 50 percent, the blood pressure automatically increases to compensate. If the oxygen level exceeds 50 percent, the blood pressure drops.

If the blood pressure gets too high or too low, you will need to increase or decrease the oxygen level through the heart rate, the respiration level, or both to prevent the blood pressure from reaching more dangerous levels.

The oxygen level in the blood also has an effect on the body's temperature. A *high* oxygen level *increases* temperature, while a *low* oxygen level *decreases* temperature.

Blood Pressure

Blood pressure is the amount of force applied to the blood to push it through veins and arteries. High blood pressure can be quite serious if it persists over prolonged periods, and fatal if it's high enough over a short period. Although low blood pressure is not considered detrimental (it simply means the heart has to work less), extremely low pressure can be a problem.

As mentioned earlier, the oxygen level in the blood can affect blood pressure. The heart rate and the level of activity also affect blood pressure. Strenuous activities such as running or swimming increase blood pressure. Other factors affecting blood pressure—such as tension and disease—are not included in this program.

You can control your blood pressure directly by changing your heart rate, or indirectly by altering your respiration to change your blood oxygen level. The bar graph on the screen depicts a blood pressure range from 75 to 175. This value reflects the *systolic* pressure (or the pressure resulting as the heart contracts). This could be expressed, for example, as120/xx or 120 over xx, where xx is the *diastolic* pressure (the pressure from the expansion phase of the heartbeat). For simplicity, the program displays only the first number.

Using the Simulation

After the title screen, you see a control panel. The control panel is divided into several sections. In the upper-left corner is a graphics representation of the circulatory system. Below that are your Activity, Air, and Exit options. The area below these options is used to display the Activity and Air menus.

The bar graph in the center of the screen displays the body's blood pressure, the percent of oxygen in the blood, and the body's temperature. The height of these bars indicates their current level.

Pressure—Range is 75 to 175 (125 is normal).
% Oxygen—Range is 25% to 75% (50% is normal).
Body temp.—Range is 90 to 107 (98.6 is normal).

To the right of the bar graph are the Heart Rate (Rate) and Respiration Rate (Resp) indicators. These numeric readouts indicate beats-per-minute for the heart and breaths-per-minute for the lungs.

Options

You can select two options from the control panel. With the first option, you can alter the Activity level, thereby changing the demand for oxygen and affecting the body temperature. You can also select an Air Quality, which determines how much oxygen is in the air you breathe.

Activity—Your body's level of activity determines the amount of oxygen it actually uses. As you increase your

activity, your body burns more oxygen. This means that you need to breathe faster to get more oxygen to the lungs, or increase the heart rate to get more oxygen-carrying blood to your tissues, or both. You can select the activity level for the simulation with the Activity option (1) from the on-screen control panel:

A) Sleeping
B) Resting
C) Normal
D) Walking
E) Running
F) Swimming
G) Random

Option G causes the program to randomly change both the Activity level and the Air Quality. Your task is to regulate the Heart Rate and Respiration Rate to maintain a balanced system. If you are not careful, you might encounter a "blood clot," which will send your blood pressure soaring, or "lung cancer," which will reduce the amount of oxygen that your lungs are capable of supplying to the blood. The blood clot will be cured after a random amount of time, while lung cancer will be corrected after 50 cycles (beats of the heart simulator) through a lung transplant.

In *Vital Signs*, it is possible to get (simulated) lung cancer if you are using the Random option from the Activity menu. As established by research, the chance of getting lung cancer increases with a decrease in Air Quality.

"Vital Signs provides a hint of what it would be like if we had to control this process consciously, every minute of our lives."

Air Quality—the amount of oxygen in the air determines the amount of oxygen placed in your lungs with each breath. Four types of Air Quality are available:

A) Good air
B) Smoggy air
C) Smoking a cigarette
D) Smoking a cigarette with smoggy air

You can select the Air Quality with the Air option (2) from the control panel.

Keeping Score

As long as you maintain the system in a healthy condition (no warning lights), your score increases at a rate relative to your level of Activity and the Air Quality. Each healthy beat of the heart can add between 0 and 5 points to the score. The higher the level of Activity, and the worse the Air Quality, the more your score will increase. (When you are sleeping in good air, the score remains constant.) If, however, a warning light flashes in one of the three bar graphs, your score will decrement 40 points with each flash. You receive a final score display at the end of the game.

Staying Alive

Most of the time, if all goes well, our bodies take care of themselves—automatically regulating the entire cardiovascular system. *Vital Signs* provides a hint of what it would be like if we had to control this process *consciously*, every minute of our lives. So take advantage of this "lifelike" simulation to learn more about a system that most healthy people take completely for granted.

CONTROL CAPSULE
Vital Signs

KEY	FUNCTION
E	Increase respiration by 1.
X	Decrease respiration by1.
A	Decrease heart rate by 5.
S	Decrease heart rate by 1.
D	Increase heart rate by 1.
F	Increase heart rate by 5.
1	Select Activity option menu.
2	Select Air Quality menu.
3	Exit the program.

EXERCISE FOR HEALTHY HEART AND LUNGS

Heart disease is still the leading cause of death in the United States—killing almost a million people in 1982 alone. Cancer in its various forms, including lung cancer, comes in second—taking about half the number of lives attributed to heart disease. In many cases, the root causes of heart disease are not clear; but statistical evidence suggests that the risk of disease or death can be much lower for those that follow a low-fat diet and get adequate amounts of exercise.

Although fitness exists in various forms, the type that is important for the heart, lungs, and circulatory system is called *cardiovascular fitness*. Cardiovascular exercise improves the ability of the heart and blood vessels to supply oxygen to the entire body. It also enhances the body's capacity to utilize the oxygen in order to perform the work vital to the proper functioning of all organ systems. Oxygen is essential for the production of energy in every cell in the body. We rely on this energy for body maintenance, growth, and repair. The more oxygen that is supplied to and utilized by your cells, the greater your total work potential and cardiovascular capacity.

Five basic factors must be considered in developing a safe and effective cardiovascular conditioning exercise program: frequency, duration, intensity, type of exercise, and warm-up and cool-down periods.

[This material was condensed, by permission, from a reprint—entitled "The Principles of Conditioning"—of "Heart Briefs" (Spring, 1979), a publication of the American Heart Association, Alameda County Chapter, 11200 Golf Links Road, Oakland, CA 94605. "Heart Briefs" is copyright, 1979, American heart association. For more information on all aspects of the cardiovascular system and exercise, write or call the division headquarters of the American Heart Association in your area.]

HCM

HCM Review Criteria

Each month, *Home Computer Magazine* (*HCM*) reviews products designed for the Apple II family, Atari 800 family and compatibles, Commodore 64, IBM PC and PCjr, and Texas Instruments 99/4A computers. *HCM* reviews take a detailed look at the quality, utility, and value of commercially available packages for these machines. Because our publishing charter forbids accepting outside advertising, we strive to make the scope and content of our review pages shine with a unique blend of humanistic frankness and objectivity.

Not only will you find all relevant information for making a wise purchase decision, but in some special cases we also provide nuggets of compu-prestidigitation.* For example, we frequently include essential documentation not furnished by the manufacturer. Additionally, each issue of *HCM* tries to review at least one outstanding product—a "Diamond in the Rough"—which, because of company size, marketing clout, or for some other reason, has not received the attention it deserves.

At the beginning of each review, a review-at-a-glance box provides the user with an instant assessment of the product. Each item will be evaluated, where relevant, with the criteria below.

HCM Review

Name: Old Art
Program Type: Recycled Graphics
Machine: Apple II family, Atari 800XL, C-64 IBM PC & PCjr, TI-99/4A
Distributor: Hit 'n' RUN Software, Inc.
Price: $99.99 (or trade for '72 Pinto)

System Requirements:
Disk Drive, Joystick, Trash Can optional

	Poor	Fair	Good	Excellent
Performance:			■	
Engrossment:			■	
Documentation:			■	

Products may also be evaluated in the following areas:

*** Flexibility—**
Can the product be adapted to the specific needs of the users?

*** Cost/Benefit—**
Is the product worth the user's investment in time and money?

*** Necessity—**
Is the product a solution for which a problem already exists?

*** Originality—**
Is it unique in concept, or simply a "me too" product?

*** Longevity—**
The "Boredom Factor." Does the program sustain interest?

*** Rewards—**
Are the audio-visual rewards motivating and appropriate?

*** Concept Presentation—**
Are the concepts presented clearly, logically, and in depth?

*** Special Effects—**
How does quality of sound and visual effects rate? Do they enhance or detract from the product or learning process?

*** Performance—**
How well the product performs as intended; how well it takes advantage of a specific machine's capabilities; how well it responds to the user's commands; how effectively the graphics, sound effects, music, or speech are integrated with the software.

*** Engrossment—**
Whether the game or activity has that intangible quality that holds players on the edge of their seats while the hours tick by unnoticed.

OR

*** Ease of Use—**
The degree to which a user can interact with the product without outside help: the ease and effectiveness of error-handling features; whether the actual reading level of the activity is appropriate for the suggested audience.

OR

*** Ease of Set-up—**
How well the product design facilitates easy installation.

*** Documentation—**
The quality of the printed matter that comes with the product; whether the instructions are clear and comprehensive; whether the machine configuration requirements are spelled out. Information such as how to load a program, use the keyboard, and restart an activity contributes to the documentation rating, as do tips on performance peculiarities.

Attention Software Authors & Peripheral Inventors:

* WANT TO BE DISCOVERED? *

Home Computer Magazine Wants To Give You A Chance!

We are looking for home computer products that have not received the attention they deserve. Each month, we will be singling out one such package for special review. If you have a unique commercial product of exceptional quality—but your advertising and promotion budget has not allowed you to capture major media attention—we want to see it. We will consider reviewing any product that meets our high standards.

We are an Equal Opportunity Reviewer!

In order to qualify for possible review, your product must:

1. Currently be available for purchase to readers of this magazine.
2. Make a unique and important contribution to the home computer industry.
3. Be of outstanding merit, quality, and value.
4. Be consistent with the type of machines and products we normally cover.

If you feel that your product qualifies, mail it to:

Home Computer Magazine
Attn: Editorial Submissions
1500 Valley River Drive, Suite 250
Eugene, OR. 97401

We reserve the right *not* to reply to each inquiry, so please do *not* contact us except to request return of your product. If you want your product to be returned, please include sufficient return postage.

***Compu-prestidigitation** (kóm´• pū •prĕs´•teh•dĭ•jeh•tā´•shŭn) —*n* 1. The magical quality of unexpected comprehension that results from presenting technical information about computers in a lively, entertaining, visually attractive and easy-to-understand format. 2. The magical tricks that make a computer sing, dance, and do all sorts of wonderfully useful things.

Home Print Studio

by the HCM Staff

With just a little imagination, a simple home computer, and one of these new type/graphic design programs, you can start up your own print studio at home.

PRODUCT REVIEWS

PRINTING SOFTWARE—A NEW VALUE?

An Overview

In the heightened competitiveness of today's software market, many developers are seeking new ways of using the computer to perform tasks traditionally done outside the home. This movement has spawned such valuable program genres as music performance and home accounting. It has also fostered applications of more questionable value—everything from biofeedback to personality analysis. Right now one of the most rapidly growing genres is what we call "home print studio" software. But, even though this new application promises much, the major question still to be resolved is, on which side of the fence does it fall? Do these programs replace traditional print and graphic sources, thereby adding great value to home computers? Or, do they fall alongside those of questionable utility?

Do these programs replace traditional print and graphic sources, thereby adding great value to home computers? Or, do they fall alongside those of questionable utility?

In a limited way, several of these programs *can* fill the order of a traditional print store. Print-studio aficionados have found that they can now use their computer to make cards, newsletters, posters, resumes, letterheads, charts, certificates, graphs, announcements, fancy memos, advertisements, invitations, banners, floor plans, needlework designs, and more. Of course, a computer printout may suffice for memos and posters—but those who prefer embossed, pastel-colored greeting cards with gold lettering face a tradeoff in quality for the convenience and freedom of creating their own print products at home.

For one thing, *freedom* to create near-professional-quality print products with a home computer will remain limited until color is more readily available. Currently, there are three ways to print in color: 1) Use a color printer with a program that has a color option; 2) interchange color printer ribbons while running out your document several times (once for red borders, again for blue text, again for green graphics, etc.); or 3) use colored paper (which is also possible together with the other two options). At this time, only two of the nine programs we review here accommodate color.

The *convenience* afforded by these programs really depends on how well they fulfill their claims of being quick and easy to use. And that hinges on two major conditions: the compatibility of a print program with a given printer, and the compatibility of the print program with other software used to create text and graphics.

Basically, these programs print in various type styles either by: 1) sending the printer certain codes that cause the printer to change the form in which it prints its normal character set—i.e., changing it to boldface, italic, expanded type, etc.; or 2) using bit-mapped graphics with the graphics options of some printers to create much more extravagant fonts. The first method actually just reconfigures the printer with codes for options that most printers (or word processors) provide anyway; so this type of program is not providing users with any added advantage. The second method, on the other hand, allows you to easily access a printer's bit-map graphics capabilities and print out your own files using the fanciest of fonts imaginable.

Our biggest problem in researching this review turned out to be making the programs work with supposedly compatible printers. Difficulties ranged from printer-switch settings that needed to be adjusted, to programs that used improper codes to access a printer's bit-map capabilities. These codes are so printer-specific that what works on one printer does not always work on another. Even though a program may list several printers as "compatible," minor differences can cause big headaches. In some cases, it is apparent that the developer neglected to adequately test for these differences before releasing a product. In others, the program simply had been released before some of our newer printers hit the market.

Software compatibility problems occur when, for example, you must use a program like a word processor to create a file, and a separate print program to produce the hard copy. If a file from the word processor is not compatible with your print program, you may end up with a garbled mess. And if you must reboot the word processor after running the print program, you lose your previously specified printing parameters.

We also found that, because the packaging and documentation of some of these programs used such phrases as "Epson-compatible" and "works with most word processors" rather carelessly, the documentation can't always be trusted. It is beyond the scope of this article to specify the multitude of possible printer, system, software, and interface compatibilities for the nine products reviewed here—so be sure that the print program you select works on your system before you buy it. If possible, test it on a system setup identical to your own at the store or at a user-group meeting to avoid disappointment.

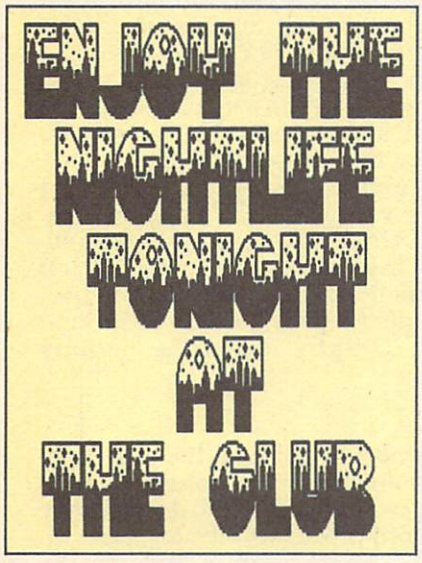
One other note: Many of these programs have a font-editor option that allows you to design your own character set pixel by pixel. However, you should be aware that there is no one-to-one correspondence between pixels on the screen and dots on a dot matrix printer. These relationships change due to varying screen resolutions and the way that systems make these pixel-to-dot translations. Although the representation is close, you won't get a one-to-one dot correspondence.

FEATURED PRINTERS

For this print studio review, in addition to the regular printer workhorses that we keep around the editorial department, we also tried out some new models provided for this review. The printers we used here include: the Apple Imagewriter, $595, $795 wide carriage (Apple Computer, Inc., 20525 Mariani Ave., Cupertino, CA 95014); the Texas Instruments 99/4A Impact Printer which is an Epson MX-80 (no longer being produced); the Epson HomeWriter 10, $269 and PIC interfaces, $60 each, tractor feeder $39.95, cut-sheet feeder $99.95; the Epson Spectrum LX-80, $299 (Epson America, Inc., 2780 Lomita Blvd., Torrance, CA 90505); and Okidata's Okimate 20, $268 (Okidata, Mt. Laurel, NJ 08054).

FONTRIX

Fontrix, by Data Transforms, is clearly the most sophisticated of the print-studio programs reviewed here, allowing you the greatest amount of freedom to design fonts, graphics, and entire pages. It brings the power of Macintosh's *MacWrite* and *MacPaint* programs to users of IBM computers and Apple II family machines, with just a little more work on the user's part. In fact, the manual and the program's capabilities are so overwhelming, it's easy to become intimidated by it all until you've had a chance to spend a good deal of time experimenting with it.



Fortunately, this is easy to do. A rather lengthy yet enjoyable tutorial in the manual guides you through each of the program's options as you create a birthday card and an invitation containing a map. You can take your pick from 12 fonts, 98 foreground and background colors and patterns, and a wide variety of drawing options. Commands such as Line, Box, Ellipse, and Airbrush (spray can) are highly reminiscent of *MacPaint*—minus the icons.

Two elements (at least) help make this program a typesetting/graphics standout: the additional font sets available separately (called *Fontpaks*), and a graphics option called Graffiles.

Although fonts are included with the program, they are limited to the all-too-common Roman, Script, and News style. *Fontpaks*, however, contain some of the most original fonts ever produced. The Skyline font from the *Incredible Novelty Fonts Fontpak* used in the printout here is just one example. Each package has ten complete character sets, most based on a certain theme—music, electronics, foreign alphabets, architecture symbols, and more. They are released periodically, and many are from *Fontrix* users who created them using *Fontrix*'s character editor.

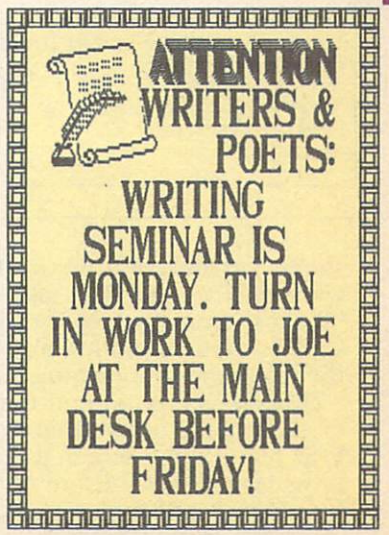
It's easy and fun to start with some of these sets and use the editor to alter them to your own taste. Like most other character editors, this one works by turning on and off screen dots that you specify by hitting a key. By changing the size of the cell, you can create different character sizes (maximum size is 32 x 32 screen dots). Each character set may have as many as 94 characters.

The Graffile concept is based on sectors. The high-resolution screen is about 5 x 6 *Fontrix* sectors, but you can create and scroll around on a Graffile that is *80 x 96* sectors. This allows you to create extremely intricate graphic and font designs—or combine them to, for example, throw together a newsletter with professional-looking headlines, charts, graphics, and justified columns of text. You can create these elements within the *Fontrix* program, or import text or graphics from outside programs and integrate it all on a Graffile, which can then be saved and printed out on your printer.

The only problem we had with this fine program occurred when we attempted to make a backup of the IBM version of *Fontrix as instructed*. After formatting a disk with the /s option (making the disk an MS-DOS startup), trying to copy the master provoked a message saying that there was insufficient space on the disk. Of the 24 files—only 20 would fit, leaving out 4 files. To use any of these missing fonts, you would have to delete some files from the backup and copy the desired files from the master copy.

THE PRINT SHOP

The Print Shop by Broderbund Software is the epitome of easy operation in a print program. Here, visually pleasing and informative menus rule, making the fine manual unnecessary. When the program encounters an illegal entry, it simply ignores it and returns you to the menu you were working from. Change your mind about something? Just back up through the menus and make your change, keeping the choices you've already selected, if you desire. You may also pause or stop printing at any time.



But what does *The Print Shop* offer? Its myriad options allow you to put together hundreds of combinations of ready-made graphics, fonts, and border designs for greeting cards, signs, letterheads, and banners. The package includes 50 pictures (like a birthday cake, Santa Claus, animals, hearts, etc.), 8 fonts (that can be set centered, left, or right, in solid, outline, or 3-dimensional letters), 9 border designs, and 10 background patterns, as well as colored pin-feed paper and envelopes. A separate package, *The Print Shop Graphics Library*, provides 120 more graphics pictures.

If you're the do-it-yourself type, the Graphic Editor option lets you make your own graphics from scratch, or alter *The Print Shop*'s graphics, through the use of the keyboard, a joystick, or a KoalaPad. Although you can't import graphics created in other programs, you *can* draw and erase, with the cursor as your guide and its X and Y coordinates displayed at the screen's bottom to aid in more precise drawing.

Screen Magic mode presents a series of constantly changing kaleidoscope and geometric patterns that may be "frozen," saved, and printed—with or without a text message and border. This mode can't be used with the others, and vice versa, because it functions in a lower-resolution mode.

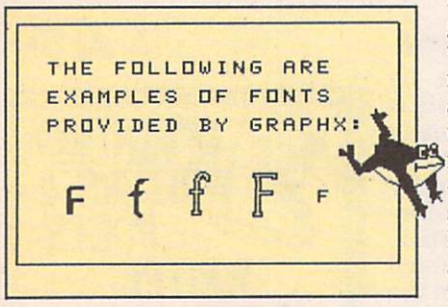
The Atari version of *The Print Shop* provides a pleasant surprise not found in many of the other programs here—it checks to see whether the printer supplies an automatic line feed. If it does, the progam accommodates it when setting up the disk. You don't even have to think about it.

Our biggest complaint with the program is that the actual printing takes *so long*. If you need multiple copies, you might consider using your *Print Shop* printout as a master and visiting a real print shop or a simple photocopy machine. Another disappointment is that you can only use one font and one picture in a document. You can repeat your graphic all over the page or pick one good spot for it, but you can use only one, until next time.

The best thing about this program? It's easy to use and the results look great.

GRAPHX

In the prolific outflow of printer programs for other home computers, the TI-99/4A has so far been largely ignored. The programs that *are* written for the TI machine are scant and few—often they neglect to make full use of the computer's considerable abilities. Fortunately, there are always exceptions, and TI-99/4A users need not feel slighted in the case of one such program. *Graphx*, a software package by R.L. and C.P. Davis, two talented "blokes" from Sydney, has made its way from Down Under. It is a program that will fill you once again with the excitement of owning a home computer.



Graphx has, as its name implies, a somewhat different focus than the other programs featured in this review. It is, above all, a screen-graphics program, yet it also provides most of the font and printing options offered by the best printing programs reviewed here.

Graphx is amazingly easy to use for a program that offers so many features. This ease-of-use is mainly due to concise help lines that appear at the top of each screen, logical menus, and a function-key overlay strip that identifies the keys used in the program. Freehand drawing and editing with either a joystick or the keyboard make creating graphics natural and comfortable. Additional program features include a multiple-speed option; an easy-erasing mode; a zoom function that magnifies portions of the screen for easy editing; circle, ellipse, and line functions; and copy and move functions that duplicate and shift images on the screen. A typewriter mode allows you to use the keyboard to add text and labels to your graphics.

The program includes an optional checkerboard pattern that you can temporarily substitute for the background. This pattern makes full-color drawing hassle-free by identifying eight-pixel cells that are limited to no more than two colors. Another function allows you to fill entire shapes with color rather than coloring one pixel at a time. As an added benefit to all of you assembly-language programmers, pictures may be saved and used as colorful and intricate backgrounds.

The program provides several printing options to be used on *Epson MX-80* or compatible printers. Four printing formats allow you to produce prints of two densities (single density and double density) and two sizes. The small-sized double-density option produces near-letter-quality print on the *Epson MX-80*.

The most useful aspect of the program is the Clipboard. It allows you to save and run sequenced images for an animated effect. It also provides four fonts: computer style, gothic, hollow lower-case, and hollow upper-case. These fonts may be edited to serve your particular needs—you may add new characters, alter characters, or fill in the hollow fonts. *Graphx* is a joy to use. Its multiple applications range from game programming and font and graphics production, to providing interactive, captivating entertainment. With its low cost and numerous features, *Graphx* deserves serious consideration.

FONTMASTER

Fontmaster is a unique entry among the other programs here because its creators have included a complete word-processing program on the disk. You may also convert outside word-processor files for use with this program.

Fontmaster's embedded-style typesetting commands allow you to: alternate among 8 fonts you've loaded in memory (from 16 that are on the disk); print in boldface, italic, inverse, expanded, or compressed type; print with sub- or superscripts; and format at 6 or 8 lines per inch. This program is very flexible, allowing you to change to several fonts within one word if you like. Although you can't change the size of the type, you can use the Fonteditor program and a little effort to change an existing font or create your own. Here, as in *Fontrix*, you get a grid in which you turn pixels on and off to design each character.

The program and the manual are presented in a straightforward manner—using this program involves little more than getting acquainted with the many varied word-processing commands summarized in a chart on the back cover of the manual. Unfortunately, a few are missing, such as the print commands. The rest of the manual also has a few problems, including grammatical errors. A "Figure 1" showing the word-processor screen is referred to early in the text, but it is buried way in the back of the book and is not listed in the Contents. In addition, the word processor's commands are listed according to command, not function, so it's tough to find what you want if you're in a hurry. It's actually more useful to stick to the nearly complete chart on the back cover.

Once you're in the word processor, you'll find that screen prompts appear whenever you choose an option, and a full screen of formatting parameters for your text is available by toggling the [←] key. Because this is an assembly-language program, you cannot just exit to BASIC to load another program (as with the Fonteditor) when you've finished with the word processor.

We found one flaw that seems to be a hardware problem: We could not get our text to print out on an *Epson MX-80* (the *TI-99/4A Impact Printer*) nor on the *Epson Spectrum LX-90*. According to a very helpful technical representative at Xetec, there are slight differences in Epson printers made for other companies, such as Texas Instruments. It seems that the *TI-99/4A Impact Printer* ignores a code sent to the printer that changes the line feed to its proper spacing. The technical representative was not sure whether Xetec's program is compatible with the Commodore interface on the new LX-90. He added that if one of *Fontmaster*'s print parameters is set at 80 columns, you'll get an extra line feed. It's therefore safer to change it to 81.

Shortly after this issue of *HCM* goes to press, a new version of *Fontmaster* is due to be released. Xetec said that its biggest change will be in accommodating newer printers and printer interfaces. It will also supposedly have an option to enter your own configuration codes if necessary; this would solve our problem with the line-feed code.

If the new version of *Fontmaster* performs as promised, its full-capability word processor, font sets, and font editor will offer much more than some programs that are priced $100 higher. Potential buyers should, however, be cautious and make sure that they first verify printer compatibility.

THE PRINTOGRAPHER

Although *The Printographer* does provide 9 font sets, it is chiefly a graphics dump that allows you to import or create a picture on the high- or low-resolution screen, add text, crop it, and easily print it all out. Images may be printed horizontally or vertically; in normal, inverse, or color mode; and from within your own program. You may also convert additional outside character

NAME	MACHINES	DISTRIBUTOR	PRICE	SYSTEM REQUIREMENTS	POOR FAIR GOOD EXCELLENT

sets for use here—this program will accommodate fonts with the same format as that used in Apple Computer's *DOS Tool Kit*.

Users may experiment on 3 amusing cartoon graphics screens and a chart that are provided on the program disk. The Crop option displays the selected graphics and blinks an L-shaped cursor at its upper-left or lower-right corner. By moving the cursor up, down, left, or right, you can crop your picture just as you would snip a photograph's edges to emphasize its best elements. The Diamond and Cameo suboptions trim your graphic to form, naturally, a diamond- or cameo-shaped picture. It's an unusual feature with interesting possibilities that afford one picture many different looks.

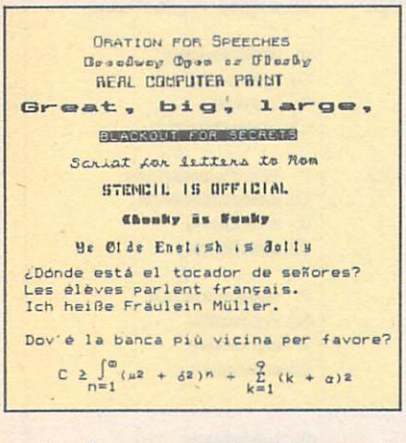
As for the fonts, they include the basic Roman, Old English, and Computer styles found everywhere, as well as a Greek character set. You may load 2 sets into memory for use at one time. Inverse mode is available to help make the text stand out from the picture.

The Magnify option increases the size of an image up to 99 times within *The Printographer* and up to 127 times when used in your own program. You probably wouldn't want to magnify an *entire screen* to such sizes, but to better see and print a few special graphics *characters*, it helps.

This is a good, solid screen-dump program, with a few unexpected extras (like the Crop and Magnify features) thrown in. The disk is set up to help you configure almost any printer, simply by following the screen instructions. The manual carefully explains each of the program options, and contains a bevy of appendices on special setups, charts, diagrams, and graphics routines for programmers interested in using *The Printographer*'s subroutines in their own programs.

PRINTWORKS

Printworks is strictly a font program, providing some ready-made standard and also foreign-language sets for quick printer dumps. In addition, a font editor lets you create your own characters.



Printworks is menu-driven and boots before your word-processing application, printing out your documents according to the options you specify. As mentioned in the overview, if you have a word processor that reinitializes the printer, you'll negate *Printworks*. However, tips for overcoming this are included in the manual.

Options available with *Printworks* allow you to print wide, condensed, small, tall, bold, italic, subscript, or superscript letters, to start with. Other options let you specify 6 or 8 lines per inch; margins; unidirectional printing, pica, elite, or proportional letter spacing; and variable line spacing.

Unfortunately, not all options are available with all of the printers that are listed as being "compatible" with this program. For example, some other options—such as download font (which is not necessary if you have a graphic printer), control code (prints printer-control codes so they can be used as regular characters), letter quality, left margin, quiet mode, and typewriter mode—were unavailable to us when using a PCjr with Epson's *Homewriter 10* printer.

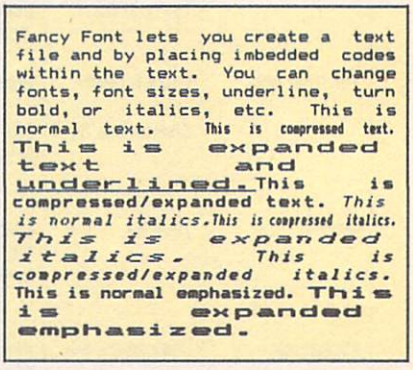
The Pivot Printing option rotates your text 90 degrees to print sideways on a page. This is quite handy for making banners or the ultimate endless spreadsheet. (In Condensed mode, however, it's possible to fit a 14-column, 8-character-per-column spreadsheet across the *width* of the page.)

Printworks' font editor screen displays a grid where you turn pixels on and off to create new characters or alter existing ones. The Replace mode is a nice touch here. With one command you can easily make your new character replace another in memory. Then you just call up the new character and begin editing where you left off—like when you want to turn an O into a C without repeating most of your work. Similar programs take you through elaborate copy, paste, and reloading procedures to do the same thing.

The Test Pattern option does what it says: it prints out all of the keyboard's characters using the options you've selected. This way you can determine whether "what you get is what you want" before you print out an entire file. It's a thoughtful addition.

FANCY FONT

This is another program that uses embedded commands to manipulate and format text. *Fancy Font* claims to work with almost any word processor—as long as it uses standard ASCII files. We tried it on several popular word processors, and found that unless the file is clean of tabs and other codes not entered via *Fancy Font*, it won't print at all.



The program comes in two versions: an MX version, which produces high-quality printouts at a resolution of 25,920 dots per square inch; and an FX version, which produces a higher quality printout at a resolution of 51,840 dots per square inch. Although *Fancy Font* is designed for use with Epson printers, it will work with other printers—but only in the MX version. Each version comes in 3 parts. Pfont is the part of the package that prints files, and is probably the one that most people will want to use. Efont and Cfont are supplied for those who may want to edit existing fonts or create their own.

Fancy Font provides more than 30 fonts (you can have up to 10 fonts active during a printout) ranging in size from 8 to 40 points. Font styles include Roman, Sans Serif, Script, and Old English. The program also features bold, italic, underline, and regular printing.

With *Fancy Font* we tried the *Epson Spectrum LX-80* printer, which works with the FX version of the program. The printer operated with no problems, although the first time we attempted to get a printout, we were unprepared for the extreme slowness of printing. The program directs the printer head to make from 6 to 12 passes in some cases. It took about 30 minutes to print out a sample of *Fancy Fonts*' features. If this is the price of being "fancy," it may be too much for some to pay . . .

Fancy Font lets you set up parameters to format your text (with indents, tabs, right or left justification, line width, etc.) by embedding codes in the text where

needed, or by placing them in the first command line. Placing the codes within your text file is a simple process, but it can become complicated very fast. As an example, here is the print command used to generate a sample file provided on disk with the program: `pfont sample.ff +fo romn12 romnb12 romni12`.

Once you become familiar with *Fancy Font*, you can print out near-letter-quality manuscripts, and enjoy a wide variety of fonts, print styles, and text formats. The ridiculously slow printing speed is a major handicap—although you can get draft-quality printouts (with all fonts) at a much faster speed.

In general, *Fancy Font* is an exercise in frustration. It offers many features, but it is much more complicated than it needs to be. Its manual is unclear, and assumes that the operator has a very good understanding of computing and coding. At $180, it is far and away the most expensive program we examined for this review, and frankly, we don't think that it warrants such a high price. Computer neophytes would be better off to look elsewhere for a typesetting program.

FACELIFT

Facelift, an attractively packaged font program by Companion Software, promises to enhance your computer's printing options by providing 92 different typestyles, sizes, and weights. It is available in several versions designed to work on the IBM PC, the Commodore 64, and Apple II family computers with Epson printers. It is supposed to enable you to create text in one of five fonts: condensed, babyface (an extremely small font), elite, pica, and trimline (a sans-serif font that looks like it has been squashed flat). These fonts can be used in conjunction with one or more commands that create italicized, heavy, double-strike, underlined, or wide-spaced print—at least that's the assertion. In reality, *Facelift* is an awkward program with minimal utility.

The program can be used only in conjunction with word processors, spreadsheets, or other programs with print functions. Because many of these programs already provide the same or similar printing options offered by *Facelift*, its value as an added utility is questionable. In addition, many programs that contain embedded commands will either over-ride or conflict with *Facelift* to produce unexpected results. The manual neglects to provide a list of compatible programs, but cautions that *Facelift* should be tested with the programs before use, and even suggests that the unexpected results of incompatibility might be "pleasant."

You may also expect to struggle through scant directions before getting *Facelift* to operate. The rewards for this struggle are few: *Facelift* sets the printer, not the computer, so once a typestyle is chosen, the entire file must be printed in that style—you can't underline, italicize, or otherwise alter particular words, lines, or sections.

If all this isn't enough to deter you from trying the program, there's more. The Apple version has a bug which makes it incompatible with *Epson MX-80* and *MX-100* printers. And that's not all—after several hours of concerted effort, we could get neither the Commodore nor the IBM versions to function. In a phone call, the manufacturers conceded that bugs might exist in these versions as well.

Despite its attractive package, the best we can say for *Facelift* is that it is appropriately named. Just as a facelift cannot cure old age—only hide the wrinkles—*Facelift*'s elegant wrapping does little more than conceal debilitating flaws.

SELECT-A-FONT

Select-A-Font gives your printer access to 9 different fonts, 3 type sizes, 9 character widths, and 2 print densities. *Select-A-Font* is designed to work with an IBM text editor or word processor like *Personal Editor*, but it will work with most word processors as long as they produce standard ASCII files.

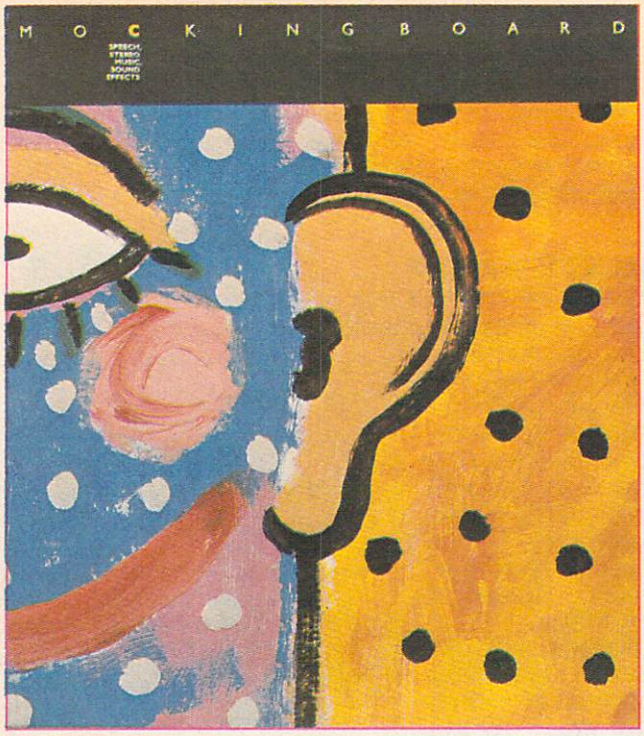
Select-A-Font uses embedded commands which you place inside your text next to the line or word that you want to alter. For example, to center a phrase in your text, enter .CE at the beginning of the line of text. The .CE command will center only one line at a time, so each subsequent line to be centered must have the command at the beginning.

The main thing that impressed us about this program is its simplicity of operation. The package doesn't come with an instruction manual, it's all on the disk (you can get a printout of the instructions if you wish). For some programs, this might be a problem, but *Select-A-Font*'s instructions are complete, and easily accessible. The instructions guide you through all of the various commands and operations, and you can also call up a help screen or use a quick-reference card.

We did discover one problem: changing the size of a font causes the line to become too long for the printer to print on one line. The program breaks the line, gives you an error message, and shows you the point in the line where you should have broken your sentence.

Operating this program was so easy that it was quite simply a lot of fun. And considering *Select-A-Font*'s low price and all of the features it offers, this is one program that ranks high on the cost/benefit curve.

HCM



Listen to the Mockingboard

A Review by Roger Wood
HCM Staff

The Apple II family's weakness is its lack of a built-in sound chip. Here's a product that fills the musical void and gives you a powerful speech system as well.

Apple is *the* pioneer in microcomputers for the home. But being first has its drawbacks. In particular, the Apple II family's lack of an internal sound chip severely limits its ability to produce musical sounds. Granted, some amazing effects can be created by "plucking the speaker." But when compared to the sophisticated sounds created by the Commodore 64, the TI-99/4A, or the IBM PCjr, Apple machines are at a distinct disadvantage. The *Mockingboard*, however, from Sweet Micro Systems, fills this Apple sound-void—plus, it provides a sophisticated, programmable speech system to boot.

Choose From Several Products

Mockingboard comes in 4 different configuration packages:

For Apple II, II+, and IIe
Mockingboard A - Sound, music board, no speech.
Mockingboard B - Speech upgrade (Used only in conjunction with Mockingboard A).
Mockingboard C - Both speech and sound.

For Apple IIc
Mockingboard D - Includes all the features of C, but with built-in speakers.

Products A, B, and C plug into one of the expansion slots (slot 4 is recommended, but not required) on your Apple II, II+, or *IIe* and require external speakers. *Mockingboard D* is a self-contained unit that interfaces with the Apple *IIc* modem port and comes in a *IIc*-colored box which includes speakers (see photos). Each product comes with a Demo/Utility disk. Although the software differs for each product (due to hardware differences in the computers), the programs operate almost identically.

In terms of setup, it's easy to start using all of the packages—just plug them in, place the *Demonstration* disk in the drive, and turn on the power. With A, B, and C you must provide 2-8 ohm speakers as well. For our simple tests, a couple of inexpensive Radio Shack speakers proved quite adequate.

Sweet Micro has an enhancement package for use with the A, B, and C packages: the *A-Max*. It includes two speakers and a jack for an earphone. It lists for $49.95. I found this product to be easy to install, and it works just fine. It takes the place of your internal Apple speaker and works with the *Mockingboard*, plus it adds an external stereo volume control. The price seems a bit steep, but it is a nice clean accessory for your machine.

Sounding Out the Mockingboard

After installing the *Mockingboard*, I first tested its music and sound capabilities. The board includes a sound chip capable of two different sounds—a musical tone and a noise waveform. (It has two speaker outputs for full stereophonic sound.) The musical tone and the noise waveform can be combined in a variety of ways and are variable over a wide frequency range, so countless stereo effects can be produced.

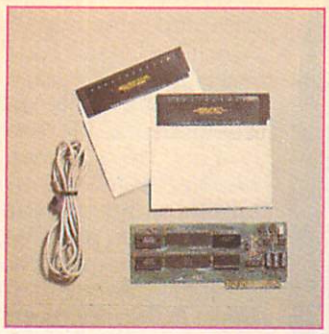
The *Demonstration* disk included with the package presents menu-driven programs giving quick and easy access to many sound effects and musical examples. The *Sound Utility* program (also accesssible from the menu) allows you to create your own effects and save the parameters to disk, or load the parameters used to make the sounds you hear on the demos. The program lets you modify the sound parameters by entering values on a relatively simple chart on the screen (see Figure 1).

The left column lists the parameters you may change. The Max Val column shows the upper limit of each parameter value so that you don't have to refer to the manual constantly when experimenting. The four columns on the right are for your entries. The All column affects all three voices, or channels, available for each speaker. Columns A, B, and C let you set separate values for each voice for several of the parameters.

The Tone Per Fine and Tone Per Course settings select the frequency of a musical tone. A table in the back of the manual gives the values for 8 octaves of notes. Because you can set the three voices for each speaker to different notes, you can use "frequency offsetting" to obtain many full synthesizer sounds. Noise Period determines the frequency of the noise, and the Amplitude on any channel can be either set to one of 15 levels or made variable—only when set to 16 (for variable) do the Envelope parameters have any effect.

Some of the parameter names are a bit cryptic—Enable, Envl Per Fine, and Envl Per Course—but the documentation clarifies them.

The Mockingboard D is a stand-alone unit that hooks up to the IIc Modem Port. Although there are certain software differences, the demonstration disk is functionally identical to the one supplied with the Mockingboard C.



Above is a picture of the Mockingboard C and its software. The product plugs into any slot, but the demonstration disk requires it to be plugged into slot 4.

Name:	Mockingboard
Product Type:	Speech and Music Board
Machines:	Apple *II*, II+, and *IIe* (Mockingboard A, B, and C), or *IIc* (Mockingboard D)
Distributor:	Sweet Micro Systems 50 Freeway Drive Cranston, RI 02920
Price:	Mockingboard A: $99 (no speech) Mockingboard B: $89 (speech upgrade for A) Mockingboard C: $179 (speech and sound) Mockingboard D: $195 (*IIc* only)
System Requirements:	For Mockingboard A, B and C: Apple *II*, II+, or *IIe*: 48K RAM, 1 Disk Drive, 2 external 8-ohm speakers. For Mockingboard D: Apple *IIc*.

Cost/Benefit:	■			

Enable determines whether a particular channel outputs noise, music, or both. Because 64 different on and off combinations are possible (2 ^6 = 64), Enable can vary from 0 to 63. Figure 1 demonstrates how you can view a menu of the functions of the 64 combinations to aid you in your selection.

The Envelope parameters are really my only complaint with the way that data is entered on the *Sound Utility* screen. I'm accustomed to the full Attack, Decay, Sustain, and Release (ADSR) settings used on many synthesizers and by the Commodore 64 Sound Interface Device (SID) chip. The terms Envl Per Fine, Envl Per Course, and Envl Shape don't correspond to the ADSR parameters normally specified with envelope generators. It turns out that there are only 16 different envelope shapes available on *Mockingboard*, and I found several that were not very useful. The Course and Fine adjustments determine how long it takes a particular envelope to run its course. Compared to a normal ADSR, the *Mockingboard* system seems limited and cumbersome.

To show the strengths and weaknesses of the *Mockingboard*, I've included a chart (Table 1) comparing its sound capabilities to those of the Commodore 64's sound chip.

Programmability

While looking at how the *Mockingboard* compares to the C-64, let's not forget "programmability." Without added software, the Commodore SID chip, though accessible from BASIC, is a tricky device for all but experienced programmers. Meanwhile, the *Mockingboard* for your Apple can be set up using rather friendly menu-driven programs. But, how workable is the *Mockingboard*'s sound in BASIC programs?

Sad to say, the package by itself isn't very easy to use for incorporating sound effects in BASIC. First, you must BLOAD certain utilities into memory before accessing any sound. Then, each individual tone must be translated into 16 different pieces of DATA and keyed-into your program. Finally, when you call the sound driver, your note is played. Alternatively, you can BLOAD each note and do a CALL to the driver, but this proves to be very slow. Sweet Micro does have an excellent *Developer's Toolkit* available which gives you many easier ways to put sound in your programs.

Talk Using English Words

When you compare *Mockingboard* to the Commodore's sound capabilities, remember that only *Mockingboard A* is strictly a sound board. With *Mockingboard*'s *B*, *C*, and *D* you also get a full-blown speech system—something not yet available on the unexpanded C-64. In fact, speech is this product's strongest suit.

The menu-driven *Text to Speech* program includes a short spoken message (and a little singing) by *Mockingboard* to give you an idea of what the robotic voice can do. Although the voice's main parameters are all programmable, it is still a synthesized voice with a definite robotic sound.

The program lets you create speech by simply typing in regular words. Many speech synthesizers let you input English words to access speech, but they are often limited to a fixed vocabulary. Others give you an unlimited vocabulary, except that the words are ex-

Figure 1: *The Sound Utility program lets you change all the parameters for creating music and sound effects. This particular setup creates a reedy synthesizer tone by frequency-offsetting three of the voices.*

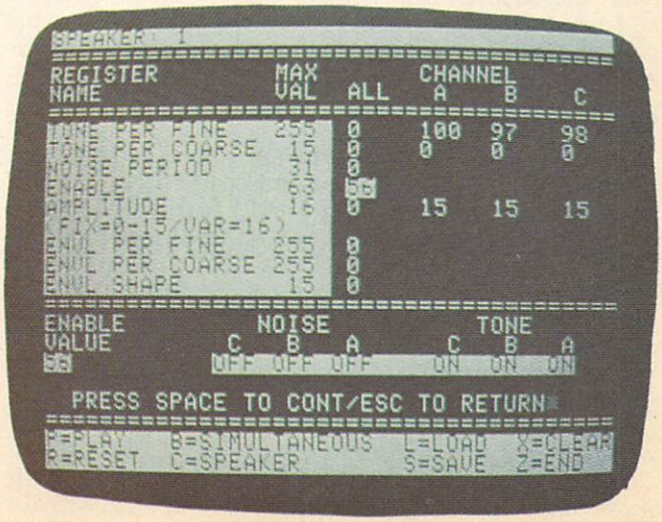

Table 1

MOCKINGBOARD VS. COMMODORE 64 SID CHIP

Feature	Mockingboard	C-64 SID
Number of Voices	6	3
Stereo Capability	Yes	No
Frequency Offset	Yes	Yes
No. & Types of Sound	2 (noise, music)	4 (triangle, sawtooth, pulse, noise)
Envelopes	16 fixed choices—with variable duration of envelope	Full ADSR (65536 combinations)
Filters	None	High-, low-, band-pass with resonance.
Ring Mod	No	Yes
Frequency Modulation	No	Yes

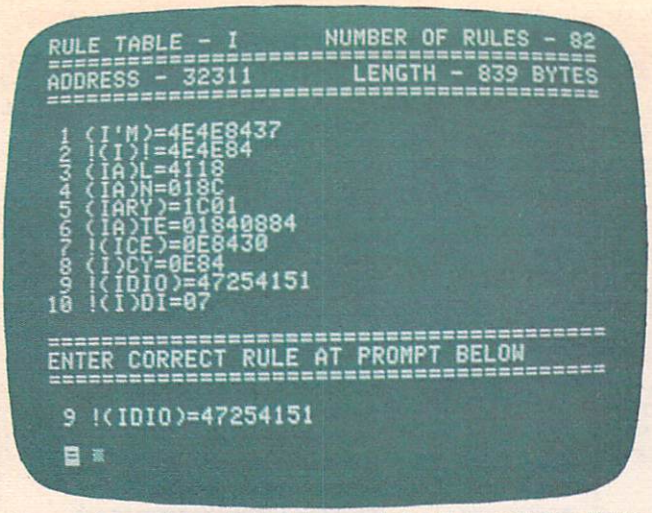

Figure 2: *A Speech Rule Table helps you define the way that particular combinations of lettters will be pronounced. This screen is the Rule Table for the letter I. The upper portion of the screen shows 10 different combinations and the phonemes used to pronounce those combinations. Here the letter combination IDIO is being edited at the bottom of the screen.*

pressed as larger vocabulary/phoneme codes. *Mockingboard* mixes these two in an ingenious way, giving the user the best of both worlds. If you want the *Mockingboard* to say hello, just type HELLO, and the word comes out. By putting a slash mark (/) in the middle of your words, you can make *Mockingboard* change inflection.

You may also call up from the menu a program that will take a regular disk-based text file as input and read it to you. Again, the limitation on pronunciation is the Rule Table.

Programming Speech With Rule Tables

Take a look at Figure 2. This is a picture of the Rule Table for the letter I. Whenever *Mockingboard* speaks a word, it starts by referencing the rule for the first letter. It then checks the Rule Table for that letter for the combination of letters in the word to be spoken. If the next letter does not match any combination in the first letter's Rule Table, it searches the second letter's Rule Table, and so on. Although the Phoneme Codes are a little strange at first, they are carefully detailed in the back of the manual. I found it fairly easy to successfully modify pronunciations of many words the first time I tried. The Rule Editor also lets you change parameters like Frequency, Speech Rate, Inflection, and Amplitude.

Again, the question of programmability comes to mind, but this time, thanks to disk drives, it really isn't very hard to incorporate speech into a program. Three separate files may be BLOADed into memory by your program, and then a simple assignment of words to a string (MB$), a CALL 26123 command, and the words placed into MB$ are spoken. Several easy-to-follow programs are included in the manual, so it's pretty easy to incorporate speech into a program right away.

What Next?

Even if you don't want to program your *Mockingboard*, there are many packages on the market that integrate this accessory into their programs. A partial list of some of the programs that use *Mockingboard* is included in Table 2.

Sweet Micro Systems has recently released 3 new packages to help software developers and home users alike take full advantage of their *Mockingboard*. One package is a *Foreign Language Rule Table* disk ($24.95) which includes French, German, and British English. Another package is the *Developers' Toolkit* ($29.95). This package includes utilities to move Rule Tables up into memory locations only available on computers with more memory—such as the Apple *IIc*, Apple *IIe* with an extended 80-column card, or a 64K Apple II+. One of the utilities included is called *AmperMock*. To install this Applesoft BASIC enhancement, you place the *Developers' Toolkit* disk in the drive and type BRUN AMPERMOCK. This makes all speech and sound commands accessible through the Ampersand (&) command. (For details on the Ampersand command, refer to an *Applesoft BASIC Programming Reference Manual*.) For example, to get *Mockingboard* to say a few words with *AmperMock*, all you have to type is &TALK followed by any string expression.

Finally, Sweet Micro has released a package called the *Speech Development System* ($39.95), for people who want to control *Mockingboard* even more completely, putting subtle nuances into each phrase spoken. This program uses a bar-graph scheme that makes changing parameters relatively easy, but the fine-tuning involved is a little time-consuming for the casual user.

All in all, the *Mockingboard* gives the Apple user something sorely lacking on an unexpanded Apple system—a high-quality sound and speech system. The documentation and optional software support make it a good educational and development tool for the serious computer user. The only drawback is that the package may be a little pricey for someone without a specific need for these computer applications.

Table 2

Some Mockingboard-Compatible Software

Distributor	Software Title
Avalon Hill	Tactical Armor Command
Datasoft	Zaxxon
D.T.I Data Trek	Maze Craze
Earthware	Zoomaster
Electronic Arts	Music Construction Set
Origin Systems	Exodus-Ultima III
Penguin Software	Adventure Magician
Strategic Systems, Inc.	Broadside

☞ COUNTERPOINT ☜

This bird can speak—but can it sing? Well, *Mockingboard* is no Prince, but it can at least carry a tune (even though it sounds like the tune is literally being carried in a bucket). Truth is, this Apple add-on brings a lot to a computer that, unaided, has some of the most limited sound ability of any home machine. Its producers are correct in stressing the importance of this addition, because it really does transform an almost mute system into a virtual jabberbox.

But what about *sound*? What about *music*? If you're looking—as I was—for the Apple equivalent of Commodore's SID, we are both in for a big disappointment. Even if there were software available to allow us full and easy access to the *Mockingboard* sound chip, we still could not produce the variety of sounds possible with SID. Lack of waveform, modulation, and envelope control dictate relatively bland results. Still, for Apple computer users, plugging in *Mockingboard* is like taking off a set of earmuffs.

As for speech, this system beats nearly all of its competitors. But despite *Mockingboard*'s current success in this field, anyone interested in computer speech should take into account developments on the horizon. Digital sampling techniques are already beginning to replace from-the-ground-up sound synthesis, leading to a more "natural" computer voice. Robotic speech, which once sounded futuristic, will increasingly seem old-fashioned. But for now (and who knows how long), this bird outsings all others in the Apple tree.

—Wayne Koberstein

HCM Glossary terms: ampersand (&) command, driver, frequency offsetting, modem port.

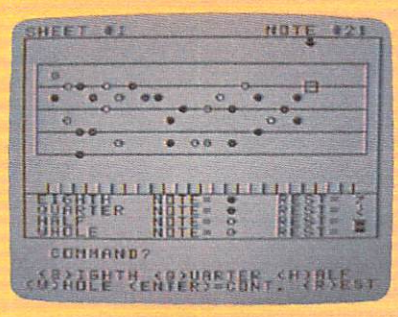
MUSIC SYNTHESIZER

A Review by
Laile L. Di Silvestro
HCM Staff

HCM Review



Name:	Music Synthesizer
Program Type:	Music composition
Machine:	TI-99/4A
Distributor:	Asgard Software P.O. Box 10306 Rockville, MD 20850
Price:	$22.95 (disk), $19.95 (tape)

System Requirements: Disk drive, 32K memory expansion, Extended BASIC cartridge.

	Poor	Fair	Good	Excellent
Performance:				■
Engrossment:				■
Documentation:			■	

Is this the program that will finally reveal the wonders of the TI music chip?

Recently, the world of music has been opening up to home computers. Imaginative music construction, composition, and player programs have transformed computer consoles into a melodious realm of endless possibilities. Now Asgard has created *Music Synthesizer*, a program that seemingly promises to introduce TI-99/4A users to this realm. But is this program really a music synthesizer?

Creating Music

Music Synthesizer is a simple music composition program. Its screen-oriented editor enables you to place notes on a staff by choosing commands from concise menus. The songs thus created can have as many as three voices, and may be played and saved in whole or in part.

The program was intended for the musically inexperienced. Indeed, its stark simplicity implies ease of use. The black and white graphics on the screen contain nothing to confuse or distract. You have only to consider five horizontal lines (a musical staff), a menu, and a number indicating the note being worked on. The first menu enables you to place a note on the staff, play, edit, and view the screens. In addition, it provides save, new, and load functions.

Placing notes on the staff is, of course, the main purpose of the program. Logical commands make it easy but time-consuming, as several steps are necessary. For each note, you must enter L (for Leave note); you must maneuver the note using the E, S, D, and X keys; you must choose between whole, half, quarter, eighth notes, or a rest (if you choose rest, the process is one step longer); and, finally, you must press [ENTER]. If you want two or three voices to play simultaneously, these notes must be placed in a vertical row known as a "note column."

Contrary to the program's intentions, a fundamental knowledge of music *is* necessary to place notes on the staff. If you are truly inexperienced in music composition, you might find it more gratifying to just enter notes at random, play them, and smile in surprise.

Dismaying Flaws

Upon receiving *Music Synthesizer*, I eagerly sampled the music provided. I found myself dismayed at its limited nature. *Music Synthesizer* produces notes of three voices over a limited range of one-and-a-half octaves. It produces only one instrument sound and lacks the option of sharps and flats. It does not allow variations in tempo or volume. *Music Synthesizer* is not actually a synthesizer, as it does not *manipulate* sounds. Rather, it is an unsophisticated program that enables the TI-99/4A to generate simple *tones*.

One would expect more from a music program created for the TI machine. The 99/4A contains a well-contrived music chip that generates three tones and one noise simultaneously. The tones can be varied according to duration (1 millisecond to 4.25 seconds), frequency (110 to 44733 hertz), and volume (0 to 30). The noise may be one of eight provided—four white noises and four periodic noises. Of these noises, the frequencies of one white and one periodic noise may be altered. Thus, the TI-99/4A is capable of generating a great variety of sounds. It is a shame that *Music Synthesizer* does not make full use of these extensive capabilities.

The program has more problems: because it is written in Extended BASIC, the program is slow. For example, from the time the PLAY command is entered, to the moment when the song begins, there is at least a 30-second interval. During this wait, I found myself wishing for more stimulating graphics—perhaps some color or some movement to engage my interest. A more serious flaw is the program's inability to scroll while songs are playing.

> ***"One would expect more from a music program created for the TI machine."***

Poorly written instructions containing grammar and spelling errors add to the already numerous faults. It is rather surprising, therefore, that *Music Synthesizer* is one of the most highly priced programs of its kind. Its $22.95 price is at least $10 higher than comparable programs with greater application. (Watch for reviews in coming issues.)

Unfortunately, programs like *Music Synthesizer* by Asgard allow users to catch only a glimpse of the infinite potential and startling variety inherent to computerized music. As seen through *Music Synthesizer*, the musical world of computers appears quite barren and small.

HCM Glossary terms: frequency, periodic noise, synthesizer, white noise.

PRODUCT REVIEWS

Music Construction Set

A Review by

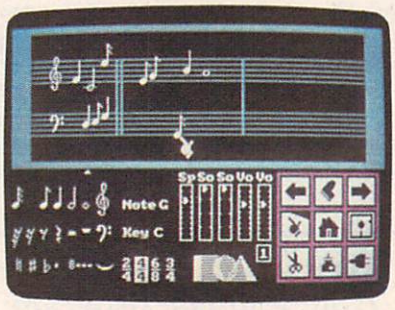
Steve Nelson
HCM Staff

You can have your computer belting out a tune before you know it with this easy-to-use product—but if you want to get serious, ease-of-use is not enough.

Even before Robert Moog built his first sound synthesizer, electronic devices were used to create music. Since then, these musical devices have continued to grow in sophistication—and now even home computers are flexing their musical muscles in a variety of ways.

Music Construction Set (*MCS*) by Electronic Arts is a program that lets you use your computer to compose music. After booting up the program, you are presented with a screen showing two staffs of music—a treble staff and a bass staff. Beneath these are the notes, rests, sound and volume controls, and other options for determining the musical output of your computer. *MCS* uses icons to represent the musical notations, as well as program functions such as accessing the disk, playing your composition, changing the sound, and editing.

Once booted up, *MCS* automatically goes into a demo mode that reveals just how musical your computer can be. The demonstration selections include: *Flight of the Bumblebee* by Rimsky-Korsakov, *Sonata in D Major, First Movement* by W.A. Mozart, and *Minuet* by Douglas Fulton. You can listen to these selections as they are, or you can copy and rearrange them to suit your tastes.



This photo from the IBM PCjr version shows the different icons and options that you can use to create music. Notice the pointing hand icon with note attached for placement.

Building a Song

MCS uses a cursor shaped like a hand with a pointing finger. You control it with the keyboard, a joystick, or a *KoalaPad*. Moving the cursor with the keyboard exclusively is quite slow and tedious. Using the option Keyboard Shortcuts with a joystick or a *KoalaPad* speeds up the composing process considerably. To make a composition, simply move the cursor to the musical notation that you want to place on the staff, select it, move it to the staff, and drop it into place. As soon as you set the note in position and release it, the computer plays it for you.

The musical notation—the different notes, rests, naturals, sharps, etc. that you can use to build your composition—determines the actual duration of each note and the space between notes. The program lets you choose five different note and rest lengths ranging from a whole to a sixteenth. A whole note (equal to four beats in any time signature) is twice as long as a half note, and four times as long as a quarter note, etc. You may further control duration with dots and ties—a dot after a note increases its length by one-half, and a tie binds two notes together.

For those of you who need a rest after all this music writing, *MCS* has provided a guessing game. Mystery Melodies reduces preset melodies (or your own) to their rhythmic core by placing all of their notes on one line. The result is a monotone melody that resembles the original song only in its rhythm. Your job is to figure out what the song is from that rhythm. As you may guess, the game is both difficult and inane. The memory could have been used to better ends.

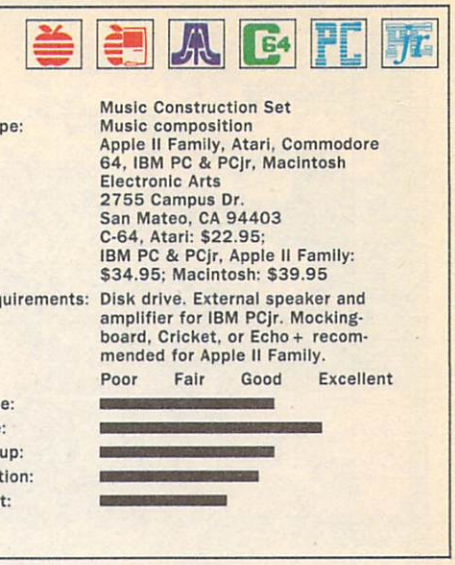
Different Voices

Each computer has different sound-producing hardware, thus each version produces somewhat different sounds. In the case of an unmodified Apple II Family computer or the IBM PC, no sound chip exists. Sound is generated by what is known as "plucking the speaker": PEEKing the hardware address of the speaker causes the speaker to move once. PEEKing it several times per second produces a musical note with a frequency dependent on how many times the speaker moves per second. *MCS* software is written in assembly language, and uses the IBM and Apple central processing units (CPU) to pluck the speaker so quickly that it appears to produce two tones at once. The display of music cannot scroll when two tones are being produced—there is simply not enough time for the CPU to produce the tones and still update the screen display.

If you have a *Mockingboard* (from Sweet Micro Systems), or *Echo II+* or *Cricket* (both from Street Electronics), you can play up to six notes simultaneously and scroll the music. With these Apple add-ons, you also have a choice of eight different musical sounds. The IBM PCjr, the Commodore 64, and the Atari versions of *MCS* are able to produce more tones simultaneously because they each contain dedicated sound chips. The Commodore 64 can scroll the music and play up to three notes simultaneously. In addition, you can determine the sound of the notes by choosing one of 13 musical settings, including eight different instruments and five special-effect sounds.

Using the PCjr, you can play and scroll up to three notes simultaneously. One thing not mentioned in the documentation is that an external speaker and amplifier are necessary to use *MCS* on the PCjr—that is, if you want to hear the music. The Atari version provides a 3-voice option and a 4-voice option, both with scrolling—and gives you a choice of 13 different sounds.

Name:	Music Construction Set
Program Type:	Music composition
Machines:	Apple II Family, Atari, Commodore 64, IBM PC & PCjr, Macintosh
Distributor:	Electronic Arts 2755 Campus Dr. San Mateo, CA 94403
Price:	C-64, Atari: $22.95; IBM PC & PCjr, Apple II Family: $34.95; Macintosh: $39.95
System Requirements:	Disk drive. External speaker and amplifier for IBM PCjr. Mockingboard, Cricket, or Echo+ recommended for Apple II Family.



Beat It

The documentation for *MCS* is brief. It includes short explanations of musical notations with some definitions and descriptions.

There is one section in the instruction manual that, if you have no musical background, is especially difficult to understand: the section on time signatures and beat counters. I had to read it several times before I really understood it, and even then I had a few implementation problems. A time signature is actually two figures, written like a fraction, that determine the number and duration of notes played in each measure. *MCS* uses the time signature to regulate the playback scrolling speed to match the tempo of a piece. *MCS* gives you four different time-signature settings: 2/4, 4/4, 6/8, and 3/4 time. The beat counter is a little box on the monitor screen that counts along as the song plays and changes color whenever there are too few or too many beats for the signature. If the number of notes doesn't match what the time signature specifies, the music's scrolling will not be accurate.

How does *MCS* sound anyway? Not bad, but not great either. The Apple version, with either the *Mockingboard*, *Echo II+*, or *Cricket*, produces the best sounds. The Atari and the Commodore versions are not far behind. The IBM versions bring up the rear, but have the best graphics of the bunch when used with an RGB monitor. The C-64 version is especially disappointing because of its poor use of the C-64's sound chip, and because of its lack of color.

"It's a well-done, tight little program that fulfills most of its promises —but falls short of being a truly useful music maker."

Music Tutor

I see *MCS* as a general introduction to music and your computer, rather than as a serious tool for making music. *MCS* does not allow you to alter sounds—you are limited to selecting from the preset instrument sounds, notes, or special effects. Be that as it may, *MCS* fills a gap between people who have absolutely no music or computer skills, and people who do. The program is very easy to use—although composing a complex song can be time-consuming, even with Keyboard Shortcuts.

MCS seems rather high-priced when compared to similar products, especially products written for the Commodore 64. So what does *MCS* do that makes it stand out? Well, not a whole lot. It's a well-done, tight little program that fulfills most of its promises—but it falls short of being a truly useful music maker. You can be as creative as you want in placing notes on the staff, but the actual process is kind of tiresome. Unless you can read music and really understand what you're doing, you are basically just setting down notes at random.

MCS is a few years old and, compared to what's available now, it seems to be somewhat outclassed. In the last few years, there has been an explosion of software and peripheral products that turn home computers into musical score writers and synthesizers. Electronic Arts needs to make this program a bit more flexible in order for it to stay competitive in such a rapidly expanding market.

Aside from this, *MCS* is a good starter program for learning the basics of computer sounds and musical composition—and it is one of the better music products available for the IBM PC. If you're searching for a program that turns your computer into a synthesizer, *MCS* isn't for you. On some computers—the IBM PC, in particular—no software package can overcome the limited hardware. *MCS* is primarily a *music* program, not a synthesizer package—which may explain its poor sound even on the C-64 and enhanced Apple *II* machines (with *Mockingboard* or *Cricket*!) that have adequate sound capabilities to exploit. But for those of you who want to experiment with music composition, *Music Construction Set* offers you a pleasant way to explore the world of music.

☞ COUNTERPOINT ☜

Computers and Music . . . two words we hear a lot these days, and with good reason. Currently, the most innovative and exciting trends in music are sponsored by the electronic revolution. Computers are generally used two ways in music: On a recreational level, a computer combined with special software can be turned into a simple synthesizer. On a more sophisticated level, a computer can control and program dedicated synthesizers and electronic musical instruments.

Music Construction Set definitely falls into the first category. This program strikes me as a perfect example of what I call a *playtool*. *MCS* is more than a toy, but less than a serious music composing and programming instrument. Probably the single most limiting factor is its sound—even on machines with better sound-producing hardware. (To my ears, *MCS* sounded best when used with the Atari and Commodore 64. Even then, the inescapable impression is one of a video arcade game.) For music newcomers seeking interactive entertainment from their computer, working with *MCS* could prove fun and educational. However, anyone with any musical background, as well as total beginners seriously interested in learning electronic music, will quickly outgrow it.

—Andy Widders-Ellis

HITCHHIKER'S GUIDE TO THE GALAXY

A Review by Scott Darroch

You won't make it through this trip with just your thumb—you'll need the Guide and more, to survive this sardonically humorous galactic adventure . . .

What an excellent idea! Take a first-rate, out-of-this-world (and several other worlds as well) adventure filled with exotic locales and bizarre aliens, and create an interactive adventure game. This was the challenge undertaken by Infocom Systems when they translated *Hitchhiker's Guide to the Galaxy*, a popular book and PBS/BBC series, into an interactive text-adventure game. As in any attempt to transfer works of entertainment from one medium to another, there are inevitable tradeoffs and losses in translation—but also valuable gains. In this respect, *Hitchhiker's Guide to the Galaxy*, as adapted by author Douglas Adams and game designer Steven Meretzky, is something of a mixed bag.

For those of you who are unfamiliar with the adventure, a brief description is due: The place is Earth. The setting is a day—any day—in the present. Arthur Dent wakes up one morning to find that his house sits in the path of a proposed freeway, and is doomed to destruction. In the course of the day, as he battles the inevitable demolition of his house, Arthur discovers that the entire Earth is to be destroyed to make way for an intergalactic freeway being built by the Vogons. Arthur escapes the Earth's destruction and becomes a Galactic Hitchhiker. He explores the universe with Ford Prefect as a companion, destined for adventures that sparkle with sardonic humor.

Hitchhiker, the game, conforms closely to the book—with one important exception. *You* are Arthur Dent, Galactic Hitchhiker. A word of advice—don't panic!

". . . an astounding, exciting, and above all, humorous universe —where your most casual words might well instigate interstellar conflict . . ."

Playing Ease

Hitchhiker is offered in various levels of difficulty for players aged 9 and up: junior, standard, advanced, and expert. We tried the standard level and found it to be all the challenge a presumably sound-minded adult would desire. It is an intricate, detailed, and demanding game—one in which nearly every conceivable avenue of action has been foreseen, and every consequence described in colorful, descriptive prose.

Your progress in the game is assessed according to points and rounds. Points are scored by actions such as picking up an object or swallowing a tablet. A round consists of one action, command, or question.

As a text-adventure system, *Hitchhiker* operates well. It is equipped with a wide variety of recognized verbs and the ability to accept simple commands, direct requests to other characters, and understand multipart, complex sentences. If the program cannot understand an entry, it specifies whether it does not understand the entire statement, does not recognize a word, or does not understand a word as it has been used in the command—thereby prompting a revision. If you direct a useless or ridiculous action, the system displays a wide variety of droll, smart, and sometimes deadly, responses.

Hitchhiker also boasts a variety of features that simplify the game. Unless you ask *who*, *what*, or *where*, the system automatically prefaces each command sentence with "I want to . . ." to save time in entering commands. Articles (a, the, etc.) need not be entered. Game play is facilitated by the abbreviation of commonly used commands (Wait, Again, and Look are Z, G, and L respectively), and by special purpose commands including Inventory, Diagnose, Save, Restore, and Restart.

The only drawback to the address and command system is that you are not allowed to ask direct questions of Ford Prefect or to make inquiries using the future tense. This requires you to operate with direct commands, or to use one of the three standard question forms. Even a query such as "What happens now?" will be rejected. But, for the most part, the game moves along with few of the frustrating "I don't understand that" replies that can kill a text adventure quicker than an industrial-strength sleeping potion.

The commands Save and Restore come under heavy use, as the game is fatal in many situations—most of them unexpected. At certain points, you will be summarily executed if you have not found the solution to

a particular puzzle. If you save your positions and character as you move through the game, the Restore command will return you to the last-saved position, even if you have been killed or otherwise hopelessly mucked up.

Because the Restore command is limited to returning you to the last-saved position, the Script and Unscript commands are a welcome option. These commands direct your printer to start and stop printing a transcript of your adventure. For most of the situations that you will encounter, a transcript of previous actions and results will prove to be a pearl beyond price.

Some Words of Advice

When playing the game, you must understand its limits and operate within its constraints. It is very important to *look* at everything in the surrounding environment in order to fortify your character with knowledge of the specific details that you encounter. In addition to looking about, you may garner information by smelling, touching, speaking, tasting, and a variety of other actions. The system provides the information through entertaining descriptions and direct responses that both enlighten and challenge the player.

An important maxim to remember is "all things come to he who waits." At many points in the game, all you can do is pass time and try to fathom your latest situation. Many times, repeated use of a command will achieve the desired response, whereas one try will yield only gibberish or a frustrating reply. It also helps to take advantage of commands that produce diagnoses of your physical condition and inventories of your possessions. These checkups help to prompt actions you might never have considered (or been desperate enough to try) before.

Hitchhiker, even at the standard difficulty level, is a challenging series of mental mazes which may require many attempts to navigate—or even to proceed beyond a specific point. In fact, the single major flaw in the system is that the master map and line-by-line hint book (an ingenious device which reveals only one hint at a time) are aftermarket items not included in the software package. The *Hitchhiker* manual says that solving the game will probably take several days. We found that, without using the hint book, it took several days just to escape the earth's destruction (the real beginning of the adventure).

A more-than-passing familiarity with other Infocom games is also valuable. In fact, *HCM*'s most experienced Infocom gamer is the one who unearthed the most important solutions without reference to the hint book (see Counterpoint).

We have an additional hint for Commodore 64 owners. The documentation we received for the C-64 disk incorrectly directs users to load the game by entering `LOAD "GAME",8`. The manual should have stated `LOAD "STORY",8`. [According to Infocom, newly issued packages correct this mistake—Ed.] The documentation for all the other versions appears to be fine. Each version is remarkably similar, and equally humorous.

Don't Panic!

Hitchhiker's Guide to the Galaxy comes in an attractive package, complete with a sales brochure, peril-sensitive sunglasses, pocket fluff, a microscopic space fleet, destruction orders for both your house and Earth, but no tea. Also included is the essential "Don't Panic!" button—required equipment for this adventure.

The hand of *Hitchhiker*'s creator, Douglas Adams, is easily recognizable in the text descriptions and programmed responses. His imaginative and witty approach helps to make even unsuccessful forays into this beautiful and deadly universe an exhilarating and enlightening experience.

Can You Take It?

Anyone willing to withstand the rigors of matter transference and the near inevitability of being tortured by a Vogon poetry reading, will find in *Hitchhiker* an astounding, exciting, and above all, humorous universe. Here your most casual words might well instigate interstellar conflict between the V1'Hurg and G'Gugvunt peoples, laying waste to over 250,000 solar systems, and destroying one-quarter of a small galaxy. "Please choose your words more carefully."

Once beyond the confines of Earth, you will be able to hobnob with Trillian and Zaphod Beeblebrox (erstwhile President of the Galaxy), attempt to escape the Bugblatter Beast of Traal (the most ravenous creature in the universe), ponder the mysteries of the Physics of Infinite Improbability, and otherwise have the time of your life—or several lives. So, if you are ready for really high adventure, put on your gown, save your character often, stick out your thumb on the Interstellar Interchange—and don't forget your towel!

☞ COUNTERPOINT ☜

Hitchhiker's Guide to the Galaxy was the perfect book to integrate into Infocom's computer-adventure format. After spending many hours of my life playing Infocom's *Zork* series and reading all four books of Douglas Adams' *Galaxy* "trilogy" (sic), playing this adventure game was quite a pleasure. The humor portrayed in the book is certainly not lost in the game. The authors succeeded in keeping the computer program faithful to the book.

One thing *did* disappoint me—inflexibility. This program is very linear in its play. In order to advance in score and position, things must be done in the proper sequence at the proper time. After playing many of Infocom's other adventures, I found this program to be a bit too limiting in that aspect. I suppose that since books are linear by nature, this hardwired chain of events is unavoidable. In order to live through this galactic adventure, knowledge of the *Hitchhiker's Guide to the Galaxy* book is very helpful.

Overall, this program is very well done. When the second book of the *Hitchhiker* "trilogy" comes out in adventure form, you can be sure that I'll be playing it.

—Randy Thompson

HCM

THE MAGIC OF MUSIC VIDEOS

A Review of the Sight & Sound Music Video Kit

by Laile L. Di Silvestro
HCM Staff

This union of music and graphics places you in the video producer's chair.

The captivating dazzle of television's rock videos has won its way into millions of homes. Who hasn't at times dreamed of perching in the director's seat, at the composer's table, or even on stage? Sight & Sound's *Music Video Kit* for the Commodore 64 provides a chance for the producer in each of us to create sound track, text, and animated graphics for an infinite variety of music videos.

One Step Beyond

Music Video Kit not so much capitalizes on the popularity of television videos as it provides a welcome addition to the extensive line of music software already available for the Commodore 64. [See Vol. 5, No. 2 and Vol. 5, No. 3 for a thorough review of music software available for the Commodore 64—Ed.] One program, Ryo Kawasaki's *Rhythm Rocker*, goes one step beyond such programs by incorporating some exciting, but mostly random, graphics. *Music Video Kit* carries this trend even further by coordinating visual images with the music.

The package consists of two sections—the performer and the graphics editor. The performing mode enables you to piece together videos using backgrounds, actors, and music scores already provided. The second section instructs you on creating your own videos from scratch. In both sections, the graphic and musical performance may be recorded.

In concert with the philosophy behind other Sight & Sound software, *Music Video Kit* is designed to entertain and challenge both the novice and the advanced computer video producer. The software package encompasses three approaches to music video production. The first employs five prerecorded videos. These may be viewed passively or they may be altered. The second approach offers entertainment similar to that of a child's building kit: the components are provided—your role is to decide where they go. The third approach is the most creative as well as the most complex. It consists of an editor mode which enables you to form videos from scratch using animation techniques. Incorporation of Sight & Sound's *Music Processor* provides the option of composing your own sounds to embellish the visual effects.

These approaches reflect a fundamental dichotomy present in the software package: *Music Video Kit* appears to be marketed toward the voracious rock-video viewer who is not likely to delve into complex computing. The procedure for creating animated graphics, however, is intricate and toilsome, and the manual too scant to provide adequate guidance.

The Producer: Limited Choices

Rather than a multitude of lights, cameras, and instruments, with *Music Video Kit* your main tool of production is the joystick. In the first two sections, menus with concise instructions provide choices in backgrounds, actors, and musical scores. Equally lucid menus enable you to create, record, and play performances. Backgrounds range from abstract designs to outer-space scenes and stage settings. The selection of musical scores is relatively limited (only 17 are provided). This limitation may be overcome by using the music provided by Sight & Sound's *Music Processor*, *Music Video Hits*, and *On Stage*, or by creating your own music using the *Music Processor*. These programs are absolutely necessary if the attraction of *Music Video Kit* is to survive beyond the trial run.

". . . even the simplest computer video requires both a creative mind and a patient temperament."

A greater array of actors is available. The choices are fascinating and creative, featuring such oddities as a skating rabbit and a roving eyeball. With the joystick, you move each actor in and out, over and under the background and each other. The actors' movements are automatically timed with the music. The program is easily executed. Slow-down and freeze functions enhance this quality and make this aspect of the package suitable for most age groups.

Ease of use:				
Engrossment:				
Documentation:				

The Graphics Editor: A Painstaking Process

The Commodore 64 is equipped with the ability to create up to eight separate shapes known as sprites. Sprites are programmable objects that can be moved in an animated fashion over and under each other. You can create sprites with your joystick in the 21 by 24 pixel editing grid. Just move the cursor, via the joystick, over the area that you want to highlight. When you fire the joystick, the pixel under the cursor turns on if it was off when you fired, or off if it was on. The control keys may be pressed to alter the color of the areas thus drawn.

The fundamentals behind the creation of sprites are relatively simple, yet the actual process is cumbersome and the joystick often proves to be an unwieldy tool. The manual's neglect in explaining built-in limitations exacerbates the problems. It is essential that you understand the mechanics of sprites before you attempt detailed animation. Sprites may be created in either high resolution or multicolored mode. In hi-res mode, the sprite is limited to two colors—the "off" color and the "on" color. In multicolored mode, the sprite may have three colors. However, this increase in color is accompanied by a decrease in detail: In order to conserve memory, the pixels are arranged in pairs. Either both pixels are on, or both pixels are off. Thus, figures that look good in hi-res mode might appear bulky and muddled in multicolored mode—a fact not explained in the manual. Imagine the consternation this would produce in the uninformed!

Animation is effected through sequencing separate shapes. Producing intricate movements is a time-consuming and painstaking process, as each minor change in position must be represented by a separate shape. For the most basic videos, one or two separate motions are sufficient (such as opening and closing a mouth or extending and retracting a foot). Yet, even the simplest computer video created with the editor requires both a creative mind and a patient temperament.

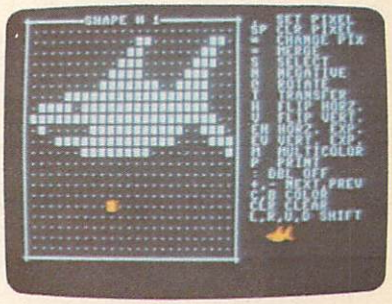

Photo 1. You can create figures by moving the cursor with your joystick and entering the appropriate command listed on the right.

Photo 2. By merging the first figure with this one, you can produce an animated effect.

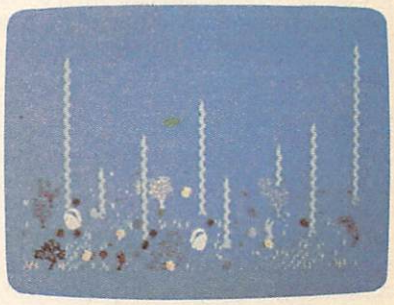

Photo 3. When complete, the animated figure can be transferred onto a preprogrammed background or one you create yourself.

Photo 4. A scene from a preprogrammed video. With imagination and diligence, you can create computer animations such as these.

Defects, Major and Minor

The program has several faults that may be attributed to its novelty. The rather lackluster prerecorded videos do little to inspire. Their elementary quality does not demonstrate the program's full potential, thus providing minimal motivation. Although a replay function is present, few will take advantage of it where these videos are concerned.

The performer section is also marred by both minor and major defects. Although the array of actors, backgrounds, and musical scores is large enough to allay boredom, its stark elementary character does not excite the imagination or dazzle the eye. A more serious problem is a difficulty in recalling the actors chosen to perform in the video. Although the manual vaguely indicates that the recall command `R` must be entered twice (to prepare for recall, and then to recall), it is normally necessary to enter the command several times, and even this does not always produce results.

Ironically, the true value of *Music Video Kit* lies in its difficult graphics-editor section. In this section, *Music Video Kit* has cleared the way for future programs by introducing the musically-inclined to a new level of computer interaction. A viable union of music and graphics in computer videos is no longer waiting around the corner. It is sparkling before our eyes. **HCM**

Apple Seedlings

Frequency Blender

by Roger Wood
HCM Staff

As nature always seems to work from the simple to the complex, the basic sine wave is the building block for all other waveforms. Learn how to blend these simple waves into complex patterns . . .

TUTORIALS

At the foundation of all physical vibration is the common sine wave. When this basic waveform is viewed on an oscilloscope, it resembles evenly spaced—but featureless—rolling hills. However, a pure sine wave, with a constant frequency and amplitude, is quite rare in nature. Most sound waves that we hear are invariably a simultaneous mixture of several frequencies at different amplitudes (heights).

When several sine waves blend together, what does the composite wave look like? You might be surprised at the result. The program listed here allows you to enter up to four frequencies, each with its own amplitude. The program then plots the sine waves of the four frequencies on the screen, followed by a fifth wave pattern. This fifth pattern is the algebraic sum, or "composite" of the first four.

Making Waves

When you RUN the program, it will ask you to enter first a frequency, and then an amplitude for the four sine waves. (For best results, the frequencies you enter should be close enough in value to be within a *viewable* range of each other, though this is not an absolute requirement.) Finally, you will need to specify the number of complete cycles of the lowest frequency wave that you wish to see on screen. This will determine the horizontal scale of the screen—the time scale. For example, if you choose waves with frequencies 100, 200, 300, and 400, and ask for five cycles of the lowest frequency wave, the program will display five of the 100 Hertz (Hz) waves, ten of the 200 Hz. waves, etc.

Any amplitude you enter is relative to the other specified amplitudes. The program totals all of the amplitudes, and then calculates how much "weight" each one has. If frequency 1 has an amplitude of 150 and frequency 2 has an amplitude of 50, then frequency 2 will have only one-third as much effect on the final wave as frequency 1.

One limitation in this program arises when you enter very high frequencies together with low frequencies, and ask to see numerous cycles of the lowest frequency. The display may show a lower-frequency sine wave instead of the expected high-frequency wave, which—if displayed properly—might resemble a thick white bar across the screen. This occurs because the computer is a digital device, not analog. The program takes 640 samples across the screen; if the number of cycles is greater than what can be displayed across one screen, the program may jump whole cycles in the sampling. This causes an erroneous sampling, and can produce a lower-frequency display.

[Note: Because of numerous requests to provide an Apple version of Frequency Blender, which appeared in the "IBMpressions" column of Vol. 5, No. 3, we are now offering such a version here in "Apple Seedlings"—Ed.]

Examples 3 and 4 illustrate the sort of screen display that you will obtain by using this program. For other interesting results, try these two examples:

Example 1:	**Example 2:**
FREQUENCY: 100	FREQUENCY: 100
AMPLITUDE: 100	AMPLITUDE: 100
FREQUENCY: 110	FREQUENCY: 200
AMPLITUDE: 100	AMPLITUDE: 100
FREQUENCY: 120	FREQUENCY: 300
AMPLITUDE: 100	AMPLITUDE: 100
FREQUENCY: 130	FREQUENCY: 400
AMPLITUDE: 100	AMPLITUDE: 100
Number of cycles of Lowest Frequency: 50	Number of cycles of Lowest Frequency: 10

Plotting and Calculating

The program to accomplish the seemingly complicated task of "melding" several waveforms into one is really quite simple.

Two arrays hold the frequency and amplitude values for the four sine waves input by the user: FR( ), and AMP( ). The value you enter for a frequency should always be positive, but the amplitude can be either positive or negative (see Example 4). A negative

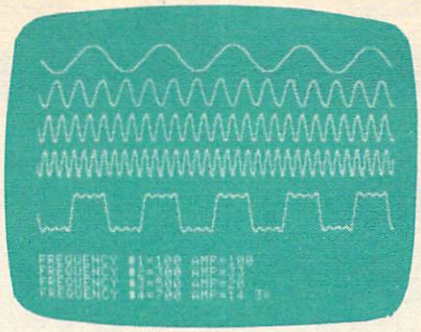
Example 3: *The following values entered into the program result in a close approximation of a square wave:*

FREQUENCY 1: 100
AMPLITUDE 1: 100

FREQUENCY 2: 300
AMPLITUDE 2: 33

FREQUENCY 3: 500
AMPLITUDE 3: 20

FREQUENCY 4: 700
AMPLITUDE 4: 14.3



Number of cycles of Lowest Frequency: 5

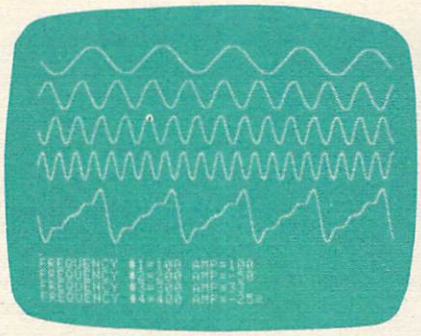
Example 4: *Here are the values to enter for the waveform pictured here. This approaches an alternating sawtooth wave:*

FREQUENCY 1: 100
AMPLITUDE 1: 100

FREQUENCY 2: 200
AMPLITUDE 2:-50

FREQUENCY 3: 300
AMPLITUDE 3: 33

FREQUENCY 4: 400
AMPLITUDE 4: -25



Number of cycles of Lowest Frequency: 5

amplitude creates a waveform 180 degrees out of phase with one of identical frequency and an identical (but positive) amplitude.

We define the function FN F( ) in line 280 to simplify the program. The parameter passed to this function is always a frequency value. The value returned is an offset that determines the vertical position of the next dot to be plotted by an HPLOT command.

Line 290 clears the screen, enables the high-resolution (hi-res) mode, and begins a FOR-NEXT loop (control variable J) for displaying the four sine waves.

Another FOR-NEXT loop (control variable I) controls the line plotting. You will notice that there is only one set of coordinates for the HPLOT command, with the word TO before it. This command plots a line *from* the last position plotted *to* the coordinates specified, thus ensuring a solid line. The control variable I determines the horizontal position of the line's destination. As the function in line 250 calculates each point of a wave, the program saves the value in the two-dimensional array FQ(,). The first dimension is the waveform number (1-4); the second dimension is a horizontal coordinate from 0 to 279.

It is important to note that the amplitude value affects only the display of the composite wave. Each of the four sine waves is displayed at the same height regardless of amplitude. The value returned by the function in line 280 is set to a standard size for easy viewing. An offset is then added to position the wave at its proper place on the display. Only the sign of the amplitude affects a sine wave's phase—i.e., negative waves are 180 degrees out of phase with positive ones.

Line 320 calculates the variable TA: the sum of all the amplitudes. The value added to TA is the ABSolute value of the amplitudes for each frequency. The ABS function converts a negative number to its positive counterpart (e.g. – 100 becomes 100). When we divide each frequency's amplitude by TA, we can determine that frequency's relative "weight" in the total amplitude of the composite wave. The control variable (I) of the FOR-NEXT loop in line 330 determines the horizontal position of the HPLOT statement. The vertical position is calculated by using the correct element of the FQ(,) array and multiplying by the correct weighted amplitude ((AMP(x)/TA)), where x is the number of each sine wave.

KEY VARIABLES

Here are the major variables used in *Frequency Blender*: **FR( )** = input frequency for each sine wave; **AMP( )** = input amplitude for each sine wave; **CY** = number of cycles of lowest frequency to be displayed; **FQ(,)** = two-dimensional array to hold values figured by function **FN F( )**; **FM** = highest frequency to be displayed; **TA** = sum of the four amplitudes; **OF** = offset used in drawing the four sine waves; **I** and **J** are loop-counter variables.

Whether it's a spreadsheet or an alien invasion, the ability to make a hardcopy of the computer's screen is a very useful feature. But with the Commodore, the program you are using determines whether a screen dump is possible, unless you have the short program listed here. This routine allows you to get a printout of your screen almost any time, simply by pressing **[CTRL] P**. It works in direct mode, as well as when a program is running.

To implement the screen-dump feature, you must first **LOAD** and **RUN** the accompanying program. Once **RUN**, the machine language for the dump routine is stored in memory at 49152 ($C000) to 49367 ($C0D7). Now, you can **LOAD**, **RUN**, **SAVE**, or just plain bang on the keyboard, and the screen-dump feature will remain intact. Whenever you want a screen dump, all you have to do is press **[CTRL] P**.

Every 60th of a second, the computer executes an **IRQ** (Interrupt **ReQ**uest) routine. This routine takes care of such things as reading the keyboard and flashing the cursor. In order for the screen dump routine to be able to check for a **[CTRL] P**, the normal **IRQ** routine has to be intercepted. Then, a **[CTRL] P** can be detected at any time during the computer's operation. Once **[CTRL] P** is pressed, a flag is set telling the computer to halt execution and print to the screen. This flag also keeps the print routine from being interrupted by another **[CTRL] P**.

The actual printing of the screen is accomplished in two steps. First, the program reads the Commodore's screen memory—located at 1024 ($0400) to 2023 ($07E7)—to get the screen code of a character. Second, the screen code is converted into ASCII and sent to the printer. During the conversion to ASCII another flag is used to determine whether the character should be printed in reverse. If the flag is set, the printer code for reversed characters is sent and the flag is cleared.

When using this routine, don't try to print a screen dump while accessing tape or disk. Both of these routines require accurate timing—timing that can be disrupted by the dump routine. Also, because the printer is opened with a logical file number of 127, any file using this same file number should be **CLOSE**d before you print a screen dump. Finally, this routine prints only the Commodore's text screen. If you are using the high-resolution screen, or if the text screen has been relocated, this screen dump will not work properly. Now, there's just one more thing to remember before using this routine—to turn on the printer.

—Randy Thompson

HCM Glossary terms: ASCII, interrupt request

Popping The Return Stack

TI Extended BASIC gives you the option of including your own error-handling routines in your programs. A common problem that you may encounter when doing so involves the pending of several **RETURN**s. When your BASIC program branches to a subroutine from a **GOSUB**, it places the return address in a buffer called the stack. The number of return addresses that can be placed in the stack is limited—if you place too many return addresses in the stack, you will get a **MEMORY FULL** error. To avoid this error, you must have the program **RETURN** from any subroutine called with a **GOSUB**.

    E START OF THE PROGRAM."
300 ON ERROR 320
310 RETURN 310
320 FOR TIMEDELAY=1 TO 500 :: NEXT TIME
    DELAY :: GOTO 200
```

A problem arises when your program branches to an error routine because of the **ON ERROR** statement: **RETURN**s remain pending in the stack. This could happen at almost any point in a program. To remedy this, you can simply exit the error routine with a **RETURN**. This method takes you back to the line that created the error, but it only works properly if the program has been able to correct the error in the error routine.

An alternative would be to use the **RETURN NEXT** statement to return the program to the statement immediately following the one which caused the error. This method works in many cases, but if an error is likely to repeat indefinitely, another solution is needed.

A third alternative is to use **RETURN** *line number*. When you specify a line number after the **RETURN** statement, program execution branches to that line. This method gives you absolute control over the exiting of the error routine. However, returning in this way pops only one return address off the stack. If the line on which the error occurred is embedded deeper than the line you return to, then return addresses remain on the stack. This may result in a **MEMORY FULL** message or in the program **RETURN**ing to an unpredictable location.

There is a way to clear the return stack, but you should use it with caution—if you don't do it properly, you may end up with a **RETURN WITHOUT GOSUB** error message. After clearing the return stack, you must go back to a place in the program that has no **RETURN** pending. You should not branch back to a subroutine. If you do, then the **RETURN** in that subroutine will cause an error message because the return stack has been cleared.

By telling the **RETURN** *line number* statement to **RETURN** to itself, you create a loop that repeats until the return stack is empty and a **RETURN WITHOUT GOSUB** error is generated. By trapping this new error, you can then branch back to a nonsubroutine part of your program with a clear stack.

The program listed here demonstrates this procedure. In line 200, the initial **ON ERROR** statement sets up the error trapping for the main body of the program. Lines 240, 250, and 260 place three return addresses on the gosub stack. Line 270 contains an intentional misspelling which causes a syntax error and sends the program to line 290 (the error routine). Line 280 can never be reached because of the error in line 270. Line 290 prints a message letting you know that it has entered the error routine. Line 300 sets up a new line to branch to in case of an error. Line 310 of the program loops back on itself continuously, taking a return address off of the return stack with every pass. When the stack becomes empty, an error is generated, and program flow branches to line 320. Line 320 simply contains a time-delay routine and a **GOTO** back to the start of the program. Lines 300 through 320 can be lifted and adapted to almost any error routine.

Ring Modulation & Synchronization

Get in sync with the SID chip and ring out some wild effects on the C-64.

by Randy Thompson
HCM Staff

TUTORIALS

Zing! Beeeezh! Pop! Ffzowee! New computer buzz words? Nope, these words are simply a feeble attempt to describe some of the numerous sound effects that Commodore's SID chip is capable of producing. The most impressive sound effects produced on the Commodore 64 (such as those listed above) are usually created with the aid of one or both of the SID chip *special effects:* ring modulation and synchronization. Of course, to fully appreciate these sounds, you have to hear them. With this program, you will be able to create and hear these sounds—as well as sounds that the most expressive writer can't convey through words.

Ringmodu-what?

Ring modulation and synchronization are sound effects that allow you to combine the frequencies of two different voices. Synchronization correlates two frequencies so that at the start of each new cycle of the "master" frequency, the "slave" frequency also begins a new cycle. With the proper frequency settings, synchronization can produce some bizarre sounds. Ring modulation, my personal favorite, suppresses the two original frequencies and outputs their sum and difference. This produces discordant overtones, and results in a percussive, gong-like tone. Ring modulation works only when used with a triangle waveform.

This is the program's main screen. Notice that Sustain and ring modulation are both activated.

Don't worry—*understanding* these two effects is not a prerequisite to *using* them. Experimentation is the secret behind putting these two sound modifiers to work.

Adjusting The Controls

The *Ringsync* program is pretty much self-explanatory—all options and directions on accessing them are displayed on the screen (see screen photo). Press the A through G keys to play the notes A though G. If you want to play a C sharp, hold down the [SHIFT] key in conjunction with the C key. You can also move up and down an octave with the + and - keys. Toggle Sustain on and off by pressing S. Select special functions with the function keys. F1, for example, allows you to activate ring modulation. Remember, ring modulation will be active only if you are using a triangle waveform. You can set synchronization into action by pressing F3. To select a different waveform, press F7. As the waveform changes, the current waveform is printed to the screen along with its graphic representation. If you choose a pulse waveform, then you must also enter a pulse width. The pulse width can range between 0 percent and 99 percent. [For a more detailed description of waveforms, refer to "Commodore Hornblower" in *HCM* Vol. 5, No. 2—Ed.] Whenever you want to quit, press the ← key located in the upper-left corner of the keyboard.

Two Different Frequencies

As mentioned before, both ring modulation and synchronization are affected by two frequencies. In this program, these two frequencies are provided by voices 1 and 3. The keys A through G control the first frequency (voice 1). Pressing (F5) changes the second frequency (voice 3). When you press (F5), you are prompted to enter the new frequency. This frequency can range between 0 and 65535 (this is not a measure of cycles per second—or Hertz—but a number relating to the SID chip register). Press [RETURN] when you are finished setting voice 3. When you first RUN *Ringsync*, voice 3's frequency is set to a default value of 2000. To fully exploit the various capabilities of ring modulation and synchronization, try using a wide variety of frequency settings. Remember, the best sounds are always discovered through experimentation.

HCM Glossary terms: frequency, fundamental, harmonic, overtone, register, ring modulation, SID, synchronization, waveform.

KEY VARIABLES

The key variables in the *Ringsync* program are: **CR** = Control Register; **AD** = Attack Decay; **SR** = Sustain Release; **VL** = Volume; **OC** = Octave; **SU** = Sustain (on or off); **W** = Waveform; **NT%** = SID Frequency values; **L1** = Voice 1's low frequency; **H1** = Voice 1's high frequency; **L3** = Voice 3's low frequency; and **H3** = Voice 3's high frequency. The control register, **CR**, is used mainly to turn sounds on and off, but it is also used to set ring modulation and synchronization.

Shadow Graphics

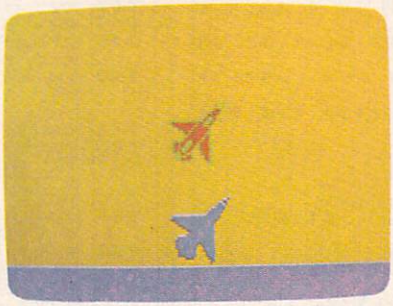
by William K. Balthrop
HCM Staff

3-D graphics can be simple when you apply a few tricks of the trade. Read on and discover keys to the mysterious world of computer graphics.

Have you ever gazed upon a good 3-D graphics program, wondering how the computer produces such a realistic scene? Quite often the method used to create the screen is much simpler than the innocent bystander might assume. Over the years, programmers have concocted a number of tricks to enable the two-dimensional computer screen to appear as a three-dimensional scene.

Adding a Third Dimension

One method of 3-D illusion involves shading. By giving an object a shadow, you convey a strong feeling of depth. This shadow, by its very nature, can provide the viewer with an added dimension.



This sample screen illustrates the illusion of depth that you can create by giving an object a shadow.

Take the problem of displaying a plane flying over the ground. It is an easy matter to show two of the plane's dimensions, such as its X and Y coordinates over the surface—its geographical location. But how can you show its altitude? You can't depict a change in altitude by moving the plane up and down the screen, because it's easy to lose the previous perspective. The plane could literally be at any altitude, regardless of its position on the screen, if there is no reference point.

The shadow makes a perfect reference point for an object. It provides the exact geographical location of the plane as long as we place the light source, such as the sun, directly above the plane.

In addition to locating the plane at a certain altitude, the shadow can indicate changes in altitude. Obviously, the higher the plane's altitude, the farther the shadow is from the plane.

You can also use the shadow as a reference point to determine whether the plane has landed—when both the shadow and the plane are at the same coordinates.

You can create the shadow effect on the IBM PC using BASICA, the IBM PCjr using Cartridge BASIC, or BASIC on the Tandy 1000. If the shadow is to be stationary, it might be most efficient to draw the shadow with the `DRAW` or `LINE` commands. If you need to animate the shadow, as you will with the plane, the best method is to use the `PUT` command. This allows you to quickly move blocks of graphics across the screen. The `PUT` command uses an array that stores an image from the screen. When you use this command, you must specify where on the screen you want the upper-left corner of the image to appear. For example,

```
PUT (100,100),A%
```

places the image stored in the integer array `A%()` on the screen, with the upper-left corner of the image at location 100,100.

Adding Color

It takes two bits of computer memory to determine the color of each pixel in medium-resolution mode (SCREEN 1). The pattern of those two bits determines the color of the pixel on the screen. (With two bits, four combinations are possible.) The actual color that appears also depends on the palette that you select. The chart below illustrates the bit pattern and color choices for the two available palettes:

Bits	#	Palette 1	Palette 2
00	0	BACKGROUND	BACKGROUND
01	1	GREEN	CYAN
10	2	RED	MAGENTA
11	3	BROWN	WHITE

A number of options can be used with the `PUT` command to get different special effects. The default mode is `XOR`. This option inverts the color of any pixel on the screen that matches a bit in the image when that bit is set to 1. For example, if you were to place a red pixel (10) on top of a brown pixel (11), the result would be a green pixel (01). Placing the red pixel on top of the green pixel will turn it back to brown, the original color. Thus, you can place an image on the screen using the `XOR` option, then place that same image on the screen a second time to restore the screen to its original state.

The one drawback to the `XOR` option is that the color of the image will change depending on what the image

is placed over. If this is an undesirable effect, you may prefer to use the PSET option of the PUT command. This option places the image on the screen exactly as it's recorded in the array. Unfortunately, it also erases any graphics that lie beneath the image. If, however, the destruction of the background is not a concern, PSET may be the best method to use.

Dealing with a Dilemma

In the program below, I have not defined any special background that needs to be preserved. This allows me to use the PSET option to place the images on the screen. This option is much quicker to use, and provides less "flicker" than the XOR option. A problem with flicker arises only when the plane and the shadow try to use the same area of the screen. You can alleviate this conflict by putting the shadow image on the screen first, and placing the image of the plane over it. The resulting image flickers back and forth when the plane is in motion, as first the shadow is displayed, then the plane. Because the plane is the last to be displayed, when it stops moving it will obscure the shadow wherever the shadow crosses the square area containing the shape.

"By giving an object a shadow, you convey a strong feeling of depth. This shadow, by its very nature, can provide the viewer with an added dimension."

The only alternative is to use the XOR option in place of the PSET. This presents problems of its own: the shapes flash all of the time, as the old location must be erased before the image can be placed at the new location. In addition, if you fly the plane so that it comes in contact with the shadow, a ghost of the shadow shows through the plane, distorting its color. Because of the additional work that the computer must do, the plane's motion is very slow. After examining both options, I decided to use the first method: PSET.

Try altering the program provided here to see what additional effects you can come up with. You might add a plane to the other side of the screen, control both planes with joysticks, and allow the planes to fire at each other. Now you're on your way to creating your own great 3-D game!

HCM Glossary terms: animate, bit, flicker, integer array, palette, perspective, pixel, shading.

HCM

Fast X-Ref

Here's a short cross-reference program that generates an indexed list of variables as they occur in Atari BASIC programs. Written entirely in machine language (except for the BASIC loader, of course), this routine can produce a variable cross-reference almost instantly. Furthermore, the program is not limited to the printer as an output device—when **RUN**, it can send the cross-reference to screen, disk, tape, or printer.

To load the cross-reference routine into memory, you must type-in and **RUN** the program listed on the next page. The computer then stores the machine-language program into memory, and prompts you to specify an output device. If you choose disk, the routine saves the cross-reference under the file name "D:X". After you select the output device, the BASIC loader program ends. Remember to **SAVE** the BASIC loader if you want to avoid keying it in again.

You can change the output device after you have **RUN** the BASIC loader, by **POKE**ing location 203 with the ASCII of the desired output device. For example, if you wish to output to the printer, enter:

POKE 203,ASC("P")

To redirect output to the screen, type:

POKE 203,ASC("E")

Of course, you can always reset the output device by re**LOAD**ing and **RUN**ing the BASIC loader.

This machine language program is stored in memory at page 6 ($0600-$06FF). Because this area of RAM is undisturbed by BASIC, you can **SAVE**, **LOAD**, and **RUN** almost any BASIC program, and still leave the cross-reference routine intact. Any time that you want a variable cross-reference of a program, simply **LOAD** that program into your computer and enter **X=USR(1536)**. The computer will begin generating a variable cross-reference immediately.

The program outputs the cross-reference in a standard format: Each variable is listed and immediately followed by a group of line numbers representing the program lines that contain the variable. Each line number is printed once for every time that the variable appears in the program line. So, if a variable is referred to twice in one program line, that line number is listed twice. Due to memory constraints, variables are not alphabetically sorted before they are listed. Instead, the variables are output in the order that you entered them.

The Atari stores variable names in a variable name table. This table contains all the variables that you have entered—even if they do not occur in a program. Because the **CLR** statement does not clear this table, and because there is no garbage collection (a method used by other computers to clear memory of unused variables to allocate space for new ones), the cross-reference may output variables that are not used inside a program. In this case the program prints the variable, but without any line numbers following it. When you **SAVE** programs to tape or disk, the variable name table is saved along with them. So, to truly clear a program of unused variables, you should first **LIST** the program to disk or tape, type **NEW**, and then **ENTER** it back into RAM.

This cross-reference program contains two main routines. The first routine finds each variable by searching through the variable name table. Upon finding a variable, the routine outputs that variable's name, then calls the second routine. The second routine searches through the BASIC program to find all occurrences of that variable. The Atari computer stores BASIC-program variables as token values consisting of the numbers 128 through 255. The position of a variable within the variable name table determines that variable's token value. The first variable listed in the table has a token value of 128, the next one a token value of 129. When the second routine searches for a variable, it simply checks for that variable's token value.

When it finds the variable, the routine outputs the line number of the program line in which the variable occured, and then continues the search. Once the entire program is searched, control returns to the first routine which finds the next variable. The cross-reference program terminates when it reaches the end of the variable name table.

Because certain reverse characters can have the same numeric value as a variable token, the cross-reference program ignores all **REM** and **DATA** statements and strings contained in **PRINT** statements. Avoiding **REM** and **DATA** statements is as easy as skipping over to the next program line. In order to avoid the strings contained in **PRINT** statements, the program searches for the string token (a numeric 15). The number that follows this token represents the length of the string and indicates the number of characters that should be ignored.

—Randy Thompson

ATARI ATRIUM

SOUND ON SOUND

Learn the secret of multi-track recording while laying down some musical tracks of your own.

by Scott Williams
HCM Staff

Many bands create a "big" sound by packing a recording studio full of glittering instruments and highly skilled musicians. The more musicians in the studio, the bigger (and better) the sound—right? This may be true in some cases, but today it's not uncommon to hear that same "big" sound performed by only one person. A one-man band? Not really. The secret to this trick is something called multi-track recording.

Multi-track recording is a technique that allows you to record complex music one instrument (or voice) at a time. As you listen to one recorded track played back, you can record another along with it—and so on, until all the tracks are full. When it's finished, you have a multi-voice composition.

Our program, *Sound on Sound*, is a 4-track recorder for the 4-voice Atari computer. You can record up to 1,000 notes in real time (as you play them) or in step mode (one note at a time). You can also save any tune you record to disk or tape.

When you run the program, the main menu appears on the screen, offering these 4 options:

1) COMPOSE MUSIC
2) PLAY MUSIC
3) SAVE/LOAD FILES
4) EXIT PROGRAM

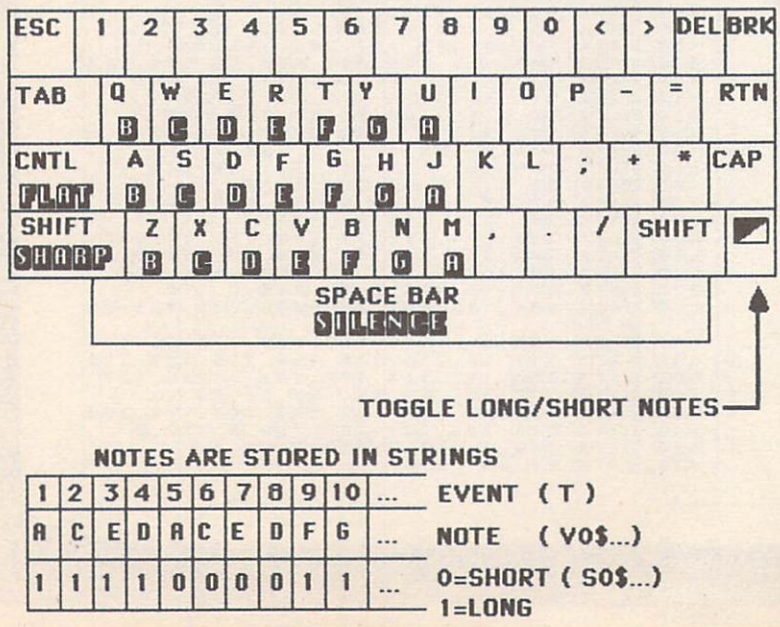
Compose Music

You might not be an accomplished musician, but with this option in *Sound on Sound* you're ready to piece together your own work of art. You can utilize any of the 5 composing tools (on the Compose Music submenu) to create your masterpiece:

1) RECORD IN REAL TIME
2) STEP MODE
3) SET TEMPO
4) CLEAR TRACK
5) SET VOICE TYPE
ESC) RETURN TO MAIN MENU

RECORD IN REAL TIME—This option simply records music exactly as you play it on the keyboard. In *Sound on Sound*, you can employ two kinds of notes—long and short. Long notes flow smoothly from one tone to the next. Short notes produce a distinct pause between each tone. A timer—displayed in the lower-left portion of your screen—runs while you play each note of your composition, as if you were playing a piano next to an inaudible metronome. The timer divides your composition into small segments or "events."

Figure 1.



To begin recording in real time, toggle the Atari key (in the lower-right section of your keyboard) until the desired note selection appears on the screen—either NOTES: LONG or NOTES: SHORT. Next, select a recording track (0,1,2, or 3). If you have recorded anything on the other three tracks, the program plays those voices back for you. You can, however, turn off these tracks, if you don't want to listen to them while you compose another track. (See SET TRACK section below.)

Now you're ready to start recording your composition. But remember that a note is recorded only as the timer advances, so be sure to hold the key down long enough to let the program record the note.

At any time, you can exit this option and return to the Compose Music menu by pressing (ESC).

STEP MODE—In this mode, you can scan forward or backward through a track to write or modify the notes in each event. Press (*) to count forward one event at a time, or press (+) to count backward one event at a time. When you release the key, a note from the event you have selected will play until you change it or turn it off. (Change the note by pressing another key, or turn it off by pressing the space bar.)

SET TEMPO—Select this option to adjust the play-back tempo. The current tempo setting is displayed along with a prompt asking you to enter the new tempo. The maximum tempo setting is 380 events per minute; the minimum is 1. Enter the new tempo, and press (RETURN) to return to the Play Music menu.

CLEAR TRACK—Use this option to completely clear a track. Simply select the track you wish to clear, and the program automatically clears each event on that track. Press (RETURN) if you decide not to clear any tracks.

SET VOICE TYPE—This option allows you to add distortion to the sound of any track (voice). When you select the track you wish to change, a prompt displays the current setting and asks you to enter a new setting. Because of the Atari sound-chip's design characteristics, only even numbers between 0 and 14 produce a tone. Odd-numbers silence the track. Experiment to create different sounds—you'll be surprised by some of the voices.

Play Music

With this main-menu option, you can listen to your newly created masterpiece. The following selections let you alter your composition as it plays:

```
1) SET TEMPO
2) SET TRACK
3) PLAY BACK MUSIC
ESC) RETURN TO MAIN MENU
```

SET TEMPO—This option performs the same function as the SET TEMPO option in the Compose Music Menu.

SET TRACK—This option allows you to turn any of the 4 tracks on or off. When you select this option, it displays the status of the 4 tracks at the bottom of the screen.

To change the track status from ON to OFF, press the number corresponding to the track. Press this key again to return the track to its original state. If you turn off a track, it will be disabled until you turn it on again. In other words, the tracks will remain off, even if you go back to the Compose Music option to create more music. Therefore, this option can be used to silence any unwanted recorded tracks during the creation of your composition. When you have achieved all of the desired settings, press (ESC) to return to the Play Music menu.

PLAY BACK MUSIC—Now you're ready to hear your composition. This selection plays back the tracks you select in the SET TRACK option. Watch out, Amadeus!

Save/Load Files

Select this option from the main menu to save your music to tape or disk or to recall previous work. When you select this option, you see another small menu:

```
1) LOAD DATA FILE
2) SAVE DATA FILE
ESC) RETURN TO MAIN MENU
```

If you select 1 or 2 from this menu, a prompt asks you to enter the desired file name. If you are using a cassette, simply enter C:. If you are using the default disk drive, enter the file name, using a maximum of 8 characters with no punctuation or spaces. To use a disk drive other than drive 1, enter D followed by the device number and a colon (:) before you enter the file name.

Exit Program

This cleverly named option from the main menu allows you to exit the program. But before you exit, the program asks you if you want to save your current recording as a file.

HCM Glossary terms: multi-track recording, track, real time, voice.

For your key-in listings, see HCM PROGRAM LISTINGS Contents.

LISTING ANNOTATIONS

***Sound On Sound* (Atari 800, 800XL, 130XE)**

Line Nos.	
100-190	Program header.
200-310	Initialization and main menu.
320-720	Compose music routine.
730-980	Play music routine.
990-1340	Load and Save data files.
1350-1380	Exit program routine.
1390-1610	Build sound strings, play music.
1620-1650	Clear sound string routines.
1660-1690	Program data.

KEY VARIABLES

These are the key variables for the Sound on Sound program: **V0$, V1$, V2$,** and **V3$** = Strings containing notes for each event; **S0$, S1$, S2$, S3$** = Strings containing flag for long or short notes; **PITCH( )** = List of note values for **SOUND**; **SHARP( )** = List of sharp notes for **SOUND**; **FLAT( )** = List of flat notes for **SOUND**; **KPRESS( )** = ATASCII to sound value array conversion; **CHAN( )** = On/off status of channels; **V( )** = Distortion setting for channels; **T** = Current event (time); **TMP** = Value used in a timing loop for the tempo; **TMPO** = Tempo value set by user.

Adding a screen dump feature to your programs can be very useful. Almost any type of software can be made better by including a screen dump option. But because the order of lines as they appear on the Apple screen is not identical to their order in screen memory, developing an efficient screen dump through BASIC can become quite a task. Here is a dump routine already written for you—in machine language. The listing presented here provides a short subroutine that will store the machine language data into memory starting at 768 ($0300). Designed for use within other programs, this subroutine only has to be executed once to initialize the screen dump routine. Once the screen dump routine is initialized by a **GOSUB 9000**, a **CALL 768** will print the text screen.

To use this dump routine in one of your own programs, merge the desired program with lines 9000-9080 of the listing shown here. Now, before you **CALL 768**, make sure that you have previously executed a **GOSUB 9000**.

This machine language routine works in a fairly straight-forward manner. First, it sets the printer as the output device and turns off the screen echo. Next, the routine executes a loop to read the display value of each character from screen memory. As the routine reads the display value, it converts the value to ASCII and sends it to the printer. At the end of each screen row, the routine outputs a carriage return and then reads the next row. When the whole screen has been printed, output returns to the screen and the routine ends.

Because of the awkward arrangement of Apple's screen memory, we've employed a look-up table that makes this screen dump routine shorter and faster.

—Randy Thompson

HCM Glossary terms: display value, machine language, pointer, screen memory, subroutine.

Debugging the DOS Directory

The supplemental program disk that comes with the IBM PC and PCjr Disk Operating System (MS-DOS 2.10) contains a utility called DEBUG.COM. A simple but useful application of this utility is to directly inspect and modify the directory of a disk. Before you try any modifications, however, heed a word of warning: Don't use your only copy of some treasured disk—use a backup. If you make a mistake in writing a directory back to the disk, your files could be *unrecoverable*. With some caution and a little practice, however, you will be able to hide files, reveal files normally hidden from a directory search, and even make it impossible to delete a file, except from DEBUG.

To introduce you to this application, we have prepared step-by-step instructions on altering a boot disk to reveal a hidden system file: IBMBIO.COM. Before you begin, format a blank disk using the /S option to create a DOS boot disk.

(1) To run DEBUG, place a disk containing DEBUG.COM into drive A and type **DEBUG**, then press [**ENTER**]. The prompt becomes a hyphen (-) when DEBUG is running.

(2) Next, place the disk you formatted into drive A and type **L 100 0 5 1** to **L**oad **1** sector (sector **5**—the beginning of the directory), into memory at address $**100** of the current data segment (the $ indicates a hexadecimal number—all numbers in DEBUG are hexadecimal).

Address	Hexadecimal Dump of Memeory																ASCII of Memory
08F1:0100	49	42	4D	42	49	4F	20	20	43	4F	4D	27	00	00	00	00	IBMBIO COM'....
08F1:0110	00	00	00	00	00	00	00	00	60	54	07	02	00	80	12	00	........'T.....
08F1:0120	49	42	4D	44	4F	53	20	20	43	4F	4D	27	00	00	00	00	IBMDOS COM'....
08F1:0130	00	00	00	00	00	00	00	00	60	54	07	07	00	80	42	00	........'T....B.
08F1:0140	43	4F	4D	4D	41	4E	44	20	43	4F	4D	20	00	00	00	00	COMMAND COM ....
08F1:0150	00	00	00	00	00	00	00	00	60	54	07	18	00	80	45	00	........'T....E.
08F1:0160	00	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	.vvvvvvvvvvvvvvv
08F1:0170	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	F6	vvvvvvvvvvvvvvvv

Figure 1

(3) Now type **D 100** to **D**ump the first $80 bytes of the memory that you just loaded to the screen. Figure 1 illustrates your screen display at this point. It consists of three data fields: The left field contains the memory addresses of the information displayed in the next two fields. $08F1 is the data segment register contents—the only data segment you will encounter in this example. $0100, $0110, etc. are the offset addresses into the data segment. Because you specified **100**, DEBUG displays information starting from that address. The field in the center contains the next $10 bytes of memory. The right-hand field is the ASCII representation of these memory locations. For example, $49 is the ASCII value of capital I. The first 8 bytes constitute the file name and the next three are the extension. The next byte is the File Attribute—this is what you will alter to reveal the system file IBMBIO.COM to directory searches. Most files (COMMAND.COM for example), have a file attribute of $20, which simply means the file was closed the last time it was written to. The low nibble (the 4 right-hand bits in the byte) of the File Attribute determines how the system views the file. Specifically, if bit 0 (the right-most bit) is set, the file is read-only; if bit 1 is set, the file is hidden from directory searches; and if bit 2 is set, it is a system file (and hidden). The IBMBIO.COM file has all three of these bits set.

(4) To alter the File Attribute, first type **E 10B** (using DEBUG's **E**nter command) to change the appropriate memory location: $10B. The screen now displays **08F1:010B 27.** with the cursor just right of the period, waiting for your entry. If you type 21 and press [**ENTER**], the contents of memory location $010B change to $21. Verify the change by typing **D 100** to dump memory to the screen again.

5) Next, make sure the disk you wish to modify has the write-protect notch uncovered. Then type **W 100 0 5 1** to effect the change to the disk. DEBUG now **W**rites the section of memory back to the disk, including the change in the File Attribute byte of the IBMBIO.COM file.

6) To view the modifications you have made, type **Q** to **Q**uit DEBUG and return to DOS. Now, type DIR and the computer displays the once-hidden file: **IBMBIO COM 4736 10-20-83 12:00p**.

Next issue, we will show you more about DEBUG, and demonstrate how to make a file impossible to delete, except from DEBUG.

Produce dazzling results with this computer-age number cruncher

The computer is a multi-talented machine. It helps us write, it organizes our activities, it educates and amuses. When face-to-face with such versatility, however, we sometimes forget that the computer is foremost a number-cruncher. *Cyber-Abacus* is dedicated to this primary function—it might even replace that extra appendage on your desk: the calculator. As a simple utility program, *Cyber-Abacus* performs almost all the operations that are found on a standard calculator, as well as many that are not.

Getting Started

To begin crunching numbers, simply RUN the program and press [ENTER] when the title screen appears. The screen now displays printing instructions and prompts you to enter the printer device parameters. (Enter parameters according to your printer manual's specifications.) If you don't have a printer, or simply don't want a printout, press [ENTER].

After the program initializes, the computer displays the *Cyber-Abacus* screen—a calculator consisting of 5 fields. Enter the first value of your mathematical problem (the number to be operated on) into Field 1, located at the top of the screen. This field displays all results from a calculation or function after the operation is completed.

Sample Printout

```
F
VALUE OF PI
3.141592654
M
3.141592654
MOVE FIELD 1 TO MEMORY
C

CLEAR

3963
^
3
6.22404E+10
*M
1.95534E+11
MULTIPLY MEMORY
*
4
7.82136E+11
/
3
2.60712E+11
```

Directly below Field 1 lies the Operator field. The characters that you enter here determine the type of operation to be performed on the number in Field 1. Refer to Figure 1 for a list of characters that can be entered into this field and the functions that they perform. If you select an illegal operation, *Cyber-Abacus* displays a list of the possible legal operations in the lower part of the screen.

Below the Operator you find Field 2. Here, enter the second numeric value in your problem—the number that works with the Operator to act on the value in Field 1.

The fourth field displays printer status. If you have indicated a valid device name and parameter list, the field should display PRINTER ON. With this status, the program outputs any operation to the printer as it is performed (see Sample Printout). If you don't want a printout, switch to PRINTER OFF. You can toggle the printer status by entering P into the Operation field.

Field 5 displays the contents of memory. *Cyber-Abacus* memory works just like the memory on most calculators—it remembers any value placed into it, allowing you to perform other operations without losing the value. You can use many of the operators in Figure 1 to manipulate memory.

Functional Power

You can perform a number of functions on the value in Field 1 by selecting F at the Operator field. The program then displays a list of the 12 available functions at the bottom of the screen. To select a function, enter the letter located beside the function you desire. See Figure 2 for a list of the available functions and the keys used to select them.

HCM Glossary terms: device parameters, number crunching.

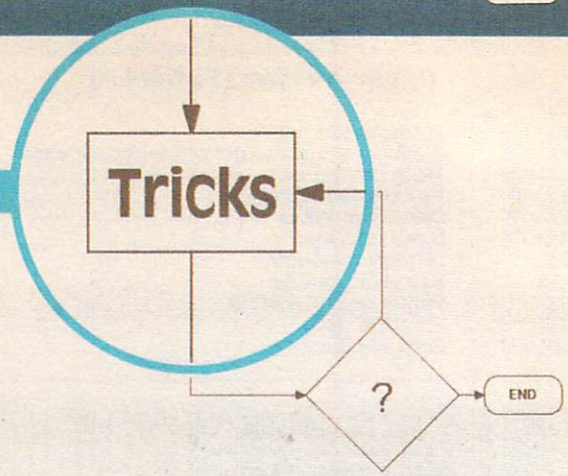
Algorithm-A-Tricks



ORGAN-IZING VITAL SIGNS

by the HCM Staff

WHAT IS AN ALGORITHM?

An algorithm is simply a procedure—one that a program uses to complete a task or solve a problem. Flow diagrams and flow charts are handy tools for representing the steps in this procedure. Any program can be viewed as a collection of separate procedures. In this column, we focus on and explain one unusual or interesting algorithm that is found in one of the programs we publish each issue.

Here are the mathematical secrets behind the Vital Signs simulation of the circulatory and respiratory systems.

The circulatory and respiratory systems are the most complex facets of the human body—with the exception of the brain. Designing the algorithm that mimics these two important systems in *Vital Signs* was a challenging task (and one that took full advantage of all our brains' intricate construction).

Our goal was to design a simulation/game in which the user controls these normally-automatic functions of the body. To have both educational and strategic value, the simulation had to display a relatively accurate representation of circulatory and respiratory functions, incorporating realistic processes as well as variable parameters.

There are so many factors involved in the control of even the simplest circulatory or respiratory process, we might need a super computer with 100 megabytes of memory to take them all into consideration. We therefore focus on only the most critical of the functions which affect the circulatory and respiratory systems.

Thus, there are three functions in the simulation to be maintained. These are blood pressure, oxygen level in the blood, and body temperature. These functions affect each other and are additionally affected by 4 parameters, which the user can manipulate directly: heart rate, respiration rate, activity, and air quality.

Before we get into the details of how these parameters affect each of the three functions, take a look at Figure 1. This flow diagram gives a general picture of how heart rate and respiration rate are associated with the three functions. It also demonstrates how the three functions actually alter each other. It is important to note that, although respiration has no direct effect upon either blood pressure or body temperature in the algorithm, it has an *indirect* effect as shown.

Blood Pressure Algorithm

The algorithm that controls blood pressure is the simplest that we employ in *Vital Signs*. The heart rate obviously affects blood pressure because a faster heart rate pushes more blood through the circulatory system, thereby raising the blood pressure. The body's activity directly influences the heart rate's effect on blood pressure: Blood pressure increases with higher activity levels. We can therefore use the heart rate to offset the activity level in order to maintain pressure. (See Figure 2.)

To make the program more interesting, we add the possibility of a blood clot. Notice in the equation below that we add 1 to this factor before multiplying it in, so it has no effect when `BC=0`.

Finally, we add the oxygen level to the other factors affecting blood pressure. If the oxygen level falls below normal, the blood pressure automatically starts to increase, supplying blood to the tissues at a faster rate. As the blood pressure increases, the oxygen level goes back up. (See the Oxygen Level Algorithm section below.)

We use the following primary equation (depicted in Figure 2) to calculate the blood pressure. The other numeric factors scale the various factors relative to one another.

```
P=SQR(A*HR)*1.3485*(1+BC*.5)+OX
```

Oxygen Level Algorithm

The oxygen level algorithm is by far the most complex because of the number of factors that affect it. Both the amount of blood that the heart pumps to the lungs and the amount of oxygen available in the lungs control the oxygen level in the blood. These in turn are influenced by several parameters.

The oxygen level is the only algorithm that respiration rate and air quality affect directly. These two factors determine the amount of oxygen present in the lungs for the blood to pick up. Thus, air quality and respiration rate combine at the lower left in Figure 3. Because poor air quality increases the chance of lung cancer, this factor is also multiplied into the equation.

Heart rate and blood pressure determine how much blood is available to the lungs. Both higher heart rate and higher blood pressure increase the flow of blood, thereby raising the oxygen level. Increasing the heart rate has a twofold effect on the oxygen level: It influences the oxygen level directly; and, as it raises the blood pressure, it again increases the oxygen level. Notice that the heart rate adds to the blood pressure in Figure 2, and that it combines with the blood pressure in Figure 3.

These factors thus determine the oxygen level of the blood and the amount of blood being pumped to the

lungs. We also must consider how much of the available oxygen is actually used. It is important that there be a balance between the amount of oxygen supplied and the amount used. We therefore subtract the activity level value because higher activity levels cause more oxygen to be used. (See Figure 3.)

The equation we use to calculate the oxygen level is as follows:

```
CO = (SQR((RS*8*AIR*(1 - LC*.4))*SQR(HR^2 + P^2)) - A)*.02
```

Body Temperature Algorithm

The temperature algorithm actually changes slightly depending on the activity selected. If the activity is set to running or swimming we take a "sweat factor" into account. (See Figure 4.) Otherwise, the activity level directly increments the body temperature.

The inclusion of a perspiration factor adds realism to the simulation. The body relies heavily on the sweat glands to cool the outer layers of the skin when other methods of cooling the body are insufficient. This process in turn cools off the blood when it is near the skin.

Activity level always affects the body temperature. The more active the body is, the more energy must be expended, causing heat. The sweat counter (above the activity box in Figure 4) keeps track of the how long an activity level has continued. As the sweat counter increases, the body temperature drops. The counter increases over time, so its effect gradually increases as the activity continues. If the activity persists too long, the body eventually dehydrates (runs out of water), and body temperature starts to rise again.

The heart rate also directly controls the body's temperature. When the heart rate increases, the resulting increase in blood that reaches the skin tends to lower the temperature. The box at the top of Figure 4 represents this part of the algorithm. Conversely, lowering the heart rate increases the temperature.

In addition, oxygen level (as depicted in Figure 3) indirectly controls the body temperature. When the oxygen level decreases, the body cannot expend as much energy. Therefore, the body temperature decreases. (See the oxygen level algorithm section for details on how it is regulated).

Here are the equations (depicted in Figure 4) we use to calculate the body temperature:

```
CNT = CNT + 1
IF (CNT< =40 OR CNT> =100) AND A>4 THEN
  T = SQR((250 - HR) ^2 + (OX*3) ^2)*.07588 + 81.4
  + ((A*(CNT + 1)*.001)*((CNT>100)*1.1 + 1))
ELSE
  T = SQR((250 - HR) ^2 + (OX*3) ^2)*.07588 + 81.4 - A*.0001
```

Variables used in equations:

P	is the blood pressure.
A	is the level of activity.
HR	is the heart rate.
BC	is the flag which indicates a blood clot.
OX	is the deviation in oxygen level from optimum.
RS	is the respiration rate.
CO	is the change in oxygen level.
AIR	is the air quality.
LC	is a flag which indicates lung cancer.
HR	is the heart rate.
CNT	is the sweat counter.

HCM Glossary terms: algorithm, automatic function, parameter, scale.

The New Age of Music-Making

by Andy Widders-Ellis
HCM Staff

The electronic revolution brings musical power to the people. Today's beginning composer can use his or her computer to conduct an electronic orchestra or band—at a cost starting under $500.

Music and computers—what is the connection? In the past decade, as computers have established themselves in millions of homes, they have also emerged as a major force in music. Computers are removing the years of physical training that formerly stood between the average person and the act of making music. If you have an interest in music but have hesitated to get involved because of this perceived "physical barrier," your time has come. Computer-assisted composing, recording, and synthesizer sound creation is a reality. Today, the world of music is opening to people who may not yet even realize that they, too, can work and play with sound.

Synthesizers Get Smart

Until recently, the synthesizer—fast becoming the dominant instrument in contemporary music—has served as an excellent sound-generating machine, but has required a skilled performer to play it. Computers, on the other hand, have developed into useful tools for creating musical compositions, but generally have *not* been very sophisticated sound-generating devices. As prices fall for these two forms of electronic instruments, new ways are evolving to create potent music-making *systems* that combine the strengths of both synthesizers and computers.

The Electronic Orchestra

Musical Instrument Digital Interface (MIDI) is a method of transmitting data from one computer or synthesizer to another. Through MIDI, a computer can memorize performances or store compositions produced by electronic instruments. A user can then arrange and edit this data with special software. Other programs can turn these computer-assisted compositions into printed scores. Finally, MIDI can link several electronic instruments to the computer to perform numerous parts. Today's beginning composer can thus use his or her computer to conduct an electronic orchestra or band—at a cost starting under $500.

The Music Computer

In addition to MIDI, another new trend is to combine the computer and synthesizer into one package. The Yamaha CX5M, for example, places an 8-voice, polyphonic, multi-timbral FM digital tone generator under the control of a 48K under-$500 MSX computer. With this machine, you can record and perform your compositions (in stereo), and create and store custom voices. You can also generate hardcopy printouts of music and voice data on standard paper.

The "Sound Camera"

One of the most exciting and controversial developments in electronic music—resulting from recent advances in digital recording—is sound-sampling. A sound (such as a bowed violin string) can be translated into binary code and stored in a microchip or on floppy disk. This technique has led to keyboards and drum machines that can either re-create the sound of traditional instruments very accurately—or use virtually *any* sampled sound as a new "instrument." Even trained ears sometimes cannot distinguish between these re-created sounds and the "real thing." Sound-sampling is now beginning to find its way into the home computer field. An example of this technology is the Decillionix DX-1. This under-$400 hardware/software package for the Apple II family allows digital recording and playback of any sound.

The New Folk Instrument

Computers have created an interesting situation for music makers. Do we seek the experience of producing music physically? Or do we simply "dream it up" and program electronic instruments to perform for us? Neither choice precludes the other. But the second option promises to have an impact not unlike the invention of other "folk instruments" of the past—such as the autoharp, the accordian, and the electric organ. It means that music is now more *accessible* to more people. This new music medium based on computers and electronics is indeed the folk instrument of our time.

All indications are that the computer is emerging as the ideal means of expressing the musical *vox populi*. The rules may have changed, but the game remains the same—human communication. Man's most universal language can now benefit from man's most powerful electronic tool.

Home computer owners can participate in this music revolution in many ways: Are you a budding musician? With your computer you can study sight-reading, theory, ear training, and composition, by tapping the wealth of music instruction software currently available. How about a musical "pen-pal" network, employing computers and modems? (Imagine "playing" your music for some friends who are sitting in their livingroom, thousands of miles away.) You can learn the rudiments of keyboard, guitar, or several other instruments from your friendly computer-tutor. Study the masters by entering their compositions part-by-part into computer memory. Experiment, orchestrating these parts with a synthesizer through MIDI. Re-arrange Beethoven! Digitally record environmental sounds, edit, and arrange them into sonic events and tone poems. The possibilities are almost endless, yet as near as your computer keyboard.

For in-depth information and recorded examples of the changing face of music, read our new sister publication *Music & Electronics: The Magazine of Creative Discovery Through Sound Technology*.*

HCM Glossary terms: MIDI, modem, MSX, polyphonic, multi-timbral, FM digital tone generator, voice, synthesizer, digital sound-sampling.

Keys To Personal Music
♪ Creation ♪ Performance ♪ Education ♪

MUSIC & ELECTRONICS™

The Magazine of Creative Discovery Through Sound Technology

Music & Electronics is devoted to "the musician in all of us." Each issue explores the many facets of personal music creation, performance, and education through the magic of computers and electronics. Editorial content spans a full range of subjects—from creating the Electronic Orchestra by interfacing musical devices with home computers, to analog and digital recording techniques, to computer-assisted music lessons. Bound into each issue is a sound demo record, that adds an extra dimension to articles and reviews, plus an assortment of Soundpatch Library Cards for re-creating unique sounds on current musical devices.

Electronic Music Lab™
Basic Principles of Music Synthesis
What is this thing called sound? What distinguishes one sound from another? How is sound created electronically? We answer these and many more questions in this basic primer on the physical phenomenon of sound and synthesis. Our clear explanation of this medium takes the mystery—but not the wonder—out of the new musical technology.

Synthesizer Soundings™
Hands-on Lessons
Here we demonstrate how anyone can "program" the most popular synthesizers. It's not just a matter of moving switches and pushing buttons. M & E's mandate is to teach the art of sound design.

The Digital Sampler™
From Physics to Numbers and Back
Digital recording is a fundamentally new way of capturing sound. Home computers can play a role in handling and manipulating this musical data. Learn how to work with this new technology, as M&E takes you along the digital path.

The M&E Soundpatch Library™
Ready-to-Use Synthesizer "Patches"
Looking for new and useful sounds on your electronic instrument? Each issue contains easy tear-out cards with original patches for popular synthesizers. When appropriate, soundpatch data from the magazine will also be available on tape or disk.

Computer Home Companion™
Home Computers and Music Magic
Home computers—some of which have small built-in synthesizers—are opening up the floodgates to popular participation in the creation and performance of music. Some software teaches music theory—while other programs convert the computer into an instrument itself. M & E also shows readers how computers can record and control musical devices.

The Home Music Studio™
The Art of Analog & Digital Recording & Mixing
Miniaturization and cost-reduction of electronic instruments, computers, and recorders have made compact, affordable home studios possible. In this series, we help you develop your own recording system—providing tips on design, construction, and operation, as well as advice on selecting the proper equipment. Learn multi-track and MIDI recording techniques, signal processing tricks, and how to achieve professional results from your personal studio.

M&E Rhythm Beat™
Programming Digital Drum Machines
Drumming has changed radically since Ringo struck up the band. Today, even those who never mastered the sticks can program a machine to both imitate drummers and play humanly impossible "licks." The digital drum machine is an extension of the traditional drum set—for which rhythmic skills are essential. Learn the rudiments of rhythm; enjoy lessons in style; explore the world of the big beat.

MIDI Melting Pot™
Plugging into the Industry's Common Communications Standard
MIDI (Musical Instrument Digital Interface) is an industry-standard interface that sends musical information in digital form between synthesizers, signal processors, and computers. This interface can link many electronic music devices in one large ensemble, or connect the synthesizers and signal processors to a computer for digital recording and editing. Learn how MIDI is indeed the key to the Electronic Orchestra.

Composer's Workshop™
Creating & Arranging a Musical Idea
Electronic instruments make it easy to write and arrange music, even for those with little or no previous experience. Let M & E show you how to generate and develop ideas—bringing your music out of the shower, into the streets.

In Session™
The Making of a "Track"
Listen to the bound-in sound recording, then follow us as we document the entire recording and mixing process step-by step, using text, diagrams, and color photographs.

Pro-Formance Playbill™
M & E's beat covers the exciting world of electronically-produced music through interviews with major artists plus reviews of concerts and new releases.

M & E Review Roundup™
M & E provides incisive reviews of electronic musical instruments and equipment plus in-depth analysis of the latest software products.

Ask M&E™
Here our readers get to sound-off with any questions related to electronics and music.

HCM Glossary

VOLUME 5 NUMBER 5

accumulator – The A register where, in most processors, the solutions to math and logic operations are placed.

address – The label referring to the hardware location of a piece of data.

algorithm – A set of rules or procedures used to solve a problem.

ampersand (&) command – An Applesoft BASIC extension command.

animate – To create the illusion of motion.

application – A program which performs one or more specific tasks.

ASCII – (American Standard Code for Information Interchange) The computer code most commonly used to represent upper- and lower-case letters, numbers, symbols, and punctuation marks.

automatic function – A function or operation that the computer carries out automatically and over which the user has no control.

BASIC loader – A BASIC program that stores, or "loads," a machine language program into memory.

binary numbers – A base-2 numbering system in which the only symbols used are 0 and 1.

bit – (binary digit) The most basic unit of information that the computer uses. Each bit is an electronic impulse, that, combined with other such impulses fed into the computer's circuitry, forms letters and numbers.

branch – A departure from the sequential execution of program instruction—usually due to the test of a condition.

bus – A set of wires or traces on a printed circuit board that that carry signals.

byte – A sequence of 8 bits used to represent one character.

carry flag – A flag in the status register that is set to one when an operation results in an overflow or carry.

character set – The set of characters that a computer can display on a screen.

conditional jump – A departure from the sequential execution of program instructions, due to the outcome of a test of a condition. (See "branch.")

CPU – (Central Processing Unit) The central brain and controller of the microcomputer.

device parameters – Instructions that tell the computer which output device to send information to and how to send that information.

digital sound sampling – A method of recording sound by translating it into binary code using computers. This data is stored in microchips or on disk for use in electronic instruments.

display value – The number that represents a character in the Apple computer's screen memory.

driver – The software that allows communication between a computer and a peripheral.

element – A specific item in an array.

error routine – A segment of a BASIC program that is designed to handle user-initiated problems that the programmer has predicted might occur in a program, so that the program will not stop running (causing data in memory to be lost).

field – A specified area for a particular category of data.

flag – A variable or a memory location that contains a value that represents a condition that the program needs to test.

flicker – The oscillation of a screen or an object on a screen at a speed visible to the human eye.

FM digital tone generator – A device that uses frequency-modulated (FM) sine waves to produce sound.

frequency – The rate of repetition of a waveform. It is perceived as pitch in the audio range.

frequency modulation – (FM) A technique of varying the frequency of a waveform (carrier) with the frequency of another waveform (modulator).

frequency offsetting – (detuning) Changing the frequency of an oscillator in relation to that of another oscillator, within a synthesizer patch.

fundamental – The principal frequency of a waveform. In the audio range, it is the perceived pitch.

garbage collection – A process used by many computers to clear out old or unused variables to make room for new ones.

graphics image file – A file that contains a bit-for-bit image of a screen or a section of a screen.

graphics mode – An optional mode, usually selected through software, that determines what parameters the computer uses when sending data to the screen.

harmonic – A frequency that is an integer multiple of the fundamental.

hexadecimal numbers – A base-16 numbering system using decimal digits 0 through 9 and the letters A through F.

high bit – The left-most bit of a binary number; e.g., the eighth bit of a byte.

high resolution graphics page – An area of memory that has been reserved for the display of graphics.

instruction set – The full complement of encoded instructions that a CPU can directly implement.

integer array – An array of integer numbers.

interrupt request – A signal that directs the computer away from the program sequence.

jump – A departure from the sequential execution of program instructions.

limit checking – A test, performed by programs, that prevents the program or the user from exceeding predefined boundaries, limits, or rules.

location counter – A register in the CPU which points to an address in memory where the next instruction or piece of data will be accessed.

loop – A sequence of instructions, in a program, that repeats until a set of conditions is satisfied.

loop counter –a variable used to count the number of iterations in a loop

machine language – The native language of the microprocessor in a computer expressed in terms of binary ones and zeros.

MIDI – (Musical Instrument Digital Interface) Specified protocols for transmitting digital information from one synthesizer, sequencer, computer, signal processor, etc., to another.

mnemonic – A code or symbol that helps people remember something specific, often made up of letters from the word or phrases it represents.

modem – (MODulator/DEModulator) This device converts digital information into analog information so that it can be sent across telephone lines.

modem port – A serial (RS-232C) port on the Apple *IIc*, specifically set up for intercomputer communications, but often used for interfacing peripherals.

MSX – A Z-80 based computer produced by several Japanese manufacturers according to agreed-upon standards.

multi-timbral – An instrument capable of producing two or more musical timbres (tone colors) simultaneously.

multi-track recording – A method of using a recorder with many synchronized channels to record and play back sounds, either individually or together.

nibble – 4 binary digits (bits) of data—a half byte.

number crunching – Processing data through the use of multiple complex operations.

offset – A value that locates a particular character in a string by determining a certain number of characters from the base character.

overflow – A situation in which the results of an operation cannot be expressed in the number of bits in a register.

overtone – A frequency component of a waveform, that is higher than the fundamental.

palette – The determinant of the colors available for a graphics display screen.

parameter – A variable used to control a particular process.

periodic noise – One of 4 pulse waves produced by the TI-99/4A sound chip.

perspective – The true relative position of an object perceived by the viewer.

pixel – The smallest dot that a computer is capable of generating on a display. The number of pixels your computer generates on the screen determines the video resolution. The more pixels packed onto one screen, the higher the resolution.

pointer – An address that gives the location of the next item of data to be accessed.

polyphonic – Music that contains two or more independent voices sounded simultaneously.

program flow – The order in which a program executes—not necessarily the way it appears when listed.

RAM – See Random Access Memory.

Random Access Memory (RAM) – The set of hardware locations in a computer where programs and data are stored.

real time recording – a method of recording musical data into a sequencer or computer precisely as it occurs.

redefined graphics character – A character whose shape has been changed by a program that rearranges the pixels which make up the character.

register – A small computer storage location in an integrated circuit.

resequence – To alter the line numbers of a BASIC program listing so that they are spaced equally.

reset – In binary, to zero a bit or memory location.

ring modulation – Mathematically combining two frequencies by outputting their sum and difference and suppressing the original frequencies. Most frequencies created through ring modulation are nonharmonic.

scale – To adjust a series of values so that they are in a predetermined proportion to one another.

screen code – The number that represents a character in the Commodore's screen memory.

screen memory – The memory locations in a computer that hold the data for the current screen display.

shading – Providing a two-dimensional object on the screen with a shadow so that a third dimension can be visualized.

SID – Sound Interface Device chip in the Commodore 64.

sine wave – A single frequency oscillation which produces a pure, fundamental tone without harmonics.

sound chip – An integrated circuit used to create sound.

sound sampling – See digital sound sampling.

split screen – A screen that has two or more areas isolated by either software or hardware.

stack – An area of memory reserved for the temporary storage of data in a linear fashion, in which items are added or retrieved off of one end.

status register – One of the internal registers in the CPU where certain conditions are recorded.

string – A consecutive set of similar data items—usually bits or characters.

string array – An arrangement of strings that the computer can easily search through.

subprogram – A self-contained routine used from within another program.

subroutine – A routine that is part of a larger program. In a BASIC program it is called by a GOSUB.

synchronization – The linking of two oscillators such that the start of the cycle of one oscillator triggers the start of the second oscillator's cycle. One oscillator acts as the master to which the other oscillator is slaved.

syntax error – An incorrect command that the computer rejects as unrecognizable.

synthesizer – An electronic musical instrument designed to generate, modify, and control the waveforms used to create sound.

template – In file management programs, a file used to define a format for other files.

token – An abbreviation of a basic statement, function, or (on the Atari computer) variable.

track – An independent storage area for recorded signals which can be monitored individually or in synchronization with other tracks. On magnetic recording tape, a track is assigned its own linear path. In a sequencer, a track occupies its own set of memory locations.

trap – The trapping of a specific event that causes the program to branch to a specific routine.

variable cross-reference – An indexed list of variables and their locations in a program.

variable-length element string array – A string array that contains lists of ASCII characters. These lists can be any length up to the maximum designed into the software (BASIC, etc.). All of the memory is not reserved for the array until that memory is required when more characters or lists are placed into the array.

voice – 1. An independent audio signal produced by a synthesizer, that can be simultaneously sounded with other voices: e.g., "My JX-8P is a 6-*voice* synthesizer." 2. A specific timbre, or "patch," created by programming a synthesizer: e.g., "*Voice* #22 is a bamboo flute."

waveform – A signal with periodic fluctuations, created by an oscillator.

weight (of bits) – In the binary number system, each bit's decimal equivalent.

white noise – Random frequencies dispersed uniformly across the audio spectrum.

zero flag – A flag in the status register that is set to one when an operation results in a zero.

Cassettes for Computer Literacy

Audio Tape as a Computer Education Tool

FlipTrack has released a "How to Operate" series of audio cassette courses designed to teach anyone to operate a home computer. The cassettes are available for the Commodore 64, VIC-20, TI-99/4A, and Atari 600XL/800XL computers. The tutorials start with instructions on setting up the computer system and then progress into programming commands; calculations; and use of color, graphics, and sound. At various stages in the lesson the tape may be flipped over for an excursion into optional activities that provide more practice and instruction. The Commodore 64 version

retails for $29.95, the Atari and VIC-20 versions for $19.95, and the TI-99/4A version for $16.95.

Saving Real Time

High-Speed Indexing for dBASE Users

Fox & Geller has announced the release of Quickindex, a program that provides high-speed indexing to dBASE users. It is available for IBM computers and operates in conjunction with Ashton-Tate's dBASE-II and dBASE-III programs. Utilization of an advanced algorithm for indexing and memory management enables Quickindex to produce index files at speeds up to 10 times that of dBASE alone. A copy-protected version retails for $69. A nonprotected version costs $99.

In Perspective: Stretching The Image

Graphic Distortion on the Mac

T/Maker Company has announced the release of Click Art: Effects, a graphics tool package for the Apple Macintosh. It operates as a desk accessory within MacPaint, making it possible to rotate, slant, distort or add perspective to MacPaint images. A selected image or portion of an image may be rotated one degree at a time or slanted backward, forward, up, or down. The distortion function makes an image pliable, allowing

the user to pull portions of it in any direction. The perspective function reduces an image's size with respect to a vanishing point. Click Art: Effects is available for $49.95.

Ed-Time For Gonzo

And Help for Students Taking the SAT

Simon & Schuster has introduced the second program in its Muppet Institute of Technology series, as well as a program aid for the college entrance exam. The Great Gonzo in Wordrider, like other programs in the MIT series, is an educational game for children. It is a strategy adventure game that aids the development of reading, vocabulary, and word-usage skills. In this program, children combine adjectives and nouns to help the Great Gonzo rescue his love, Camilla the Chicken, from the Swedish Chef. The Great Gonzo in Wordrider is available for the Commodore 64 ($29.95) and the Apple II family of computers ($34.95).

Simon & Schuster has also released Lovejoy's Preparation for the SAT—a comprehensive package offering information and drills that help students prepare for college. The program includes tutorials, tips, practice tests, techniques for test taking, and a copy of Lovejoy's Concise College Guide book. Versions are available for the IBM PC and PCjr, Commodore 64, and Apple II family of computers for $69.95.

Encore On the Mac

Music Construction for Macintosh

A state-of-the-art music composition program is now available for musically-inclined Apple Macintosh users. Deluxe Music Construction Set, produced by Electronic Arts, is an advanced version of Music Construction Set. With it, beginners can learn standard notation and basic composition skills. For the expert, the set provides professional composition capabilities, enabling users to compose music, view it on the screen, listen to it, and print it as sheet music. The set includes musical notation tools, playback equipment, and printing controls. It is $50.

Passport To Commodore MIDI

Program Links With Music Keyboards

Passport Designs has developed a MIDI version of Broderbund's The Music Shop for the Commodore 64. The program is designed to benefit both the accomplished musician and the user who has never before played a note. The program allows you to compose, store, edit, and print sheet music in piano or single-staff formats. Its composing and editing features are enhanced by eight voices that can be assigned to four different MIDI channels or keyboards. The Music Shop includes: a user interface with pull-down menus; windows and dialog boxes controlled by a joystick and the MIDI keyboard; legible on-screen notation; easy editing with cut, paste and copy features; and broad music capabilities. It retails for $99.95.

Tame Your Appliances

Electrical Control Interface

Powerhouse, a new computer interface, enables Commodore 64 and Apple II family computers to automatically control electrical devices in any house, store, or office. Developed by X-10 (USA) Inc., the interface is a small peripheral that sends signals over AC wiring to control up to 72 lights & appliances plugged into System X-10 modules, which are in turn plugged into 120 volt outlets. Powerhouse is actually a self-contained micro computer backed up by a battery that can sustain it without AC power for 100 hours. Powerhouse is programmed from the computer console. Graphics lead the user from room to room, and explain how lights & appliances may be selected and controlled.

Once programming is complete, Powerhouse may be disconnected from the computer, freeing the computer for other uses. The X-10 interface, software disk, and connecting cables retail for $120.

An International Printer

IBM PC-Printing In Nine Languages

ProWriter, a compact, lightweight dot matrix printer that enables IBM PC users to produce near-letter-quality documents in nine languages, is being offered by C. Itoh Digital Products. Its size (3.9 inches high, 15.2 inches wide and 11.3 inches deep) renders ProWriter versatile and portable while accommodating several useful features. A unique horizontal print head allows convenient front paper loading. A paper-saving feature prints documents on the first sheet fed into the printer. The printer is software-programmable in 9 foreign languages, making it ideal for international business uses. It prints at 105 characters per second and features a Centronics parallel interface. An Apple version will be available later this year. ProWriter retails for under $300.

A New Tongue for Atari

Pascal on the Atari XL, XE

Kyan Software has introduced Kyan Pascal, a programming package for the Atari XL and XE computers. The package includes a comprehensive tutorial manual and features a HELP screen, command menus, and a library of compiler error messages—all designed to assist the beginning programmer. Additional features include a 6502 machine-code compiler, a full-screen text editor, full-pass error detection, built-in assembler, and DOS 2.5 operating system. The package costs $69.95.

Electronic Adventure By The Book

Interactive Fiction

Synapse Software has announced the release of Essex, the second in its Electronic Novels series. Essex, like all programs in the series, is published as a hard-cover book that introduces the characters and sets the scene. A software disk then hurls the player into deep space to conduct an intergalactic search-and-rescue mission. Confined on a spaceship, surrounded by a crew of unlikely characters, the player must find a scientist capable of preventing the destruction of the universe. The Apple and IBM versions sell for $44.95, and Commodore and Atari versions are priced at $39.95.

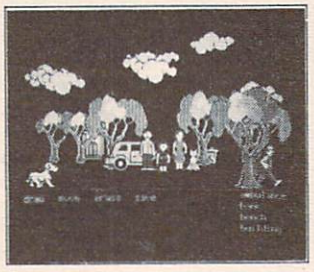
New Theories Mean New Education

Research Develops Active Learning Aids

Compu-Teach has introduced a new line of educational software for use on IBM PC, PCjr, and Apple computers. The 12 programs, for use by 4- to 10-year-olds, are based on research completed at Yale University on learning theory and artificial intelligence. They are highly interactive programs that teach basic educational skills—reading, arthmetic and spelling. Each program features several skill levels or changeable parameters



that tailor the game to a child's learning level, simple commands, color graphics, and active participation by the child.

Why Pay a Stockbroker?

Wall Street Wiz On a Disk

Synapse has released Synstock, a program for the IBM PC that analyzes stock portfolio information, stock patterns and market trends. With a modem, the program can automatically log-on and download stock data from Compuserve, Dow Jones News/Retrieval, and Warner Computers. The data can be displayed in four-color charts and graphics in different formats, including averages, relative strengths, and volume indicators. Synstock supports portfolios of up to 52 stocks each; and each stock's database can hold up to 550 days of trading information. It is now available for the IBM PC, PC XT, PC compatibles with a minimum of 192K of memory, and the PCjr (128K minimum). DOS 2.0 or later version and a Graphics Adapter Card are required. Suggested retail for the IBM version is $99.95.

Paint It, Then Print It

New Graphics for the TI Machine

Navarone Industries has introduced Paint 'N Print, a new graphics cartridge for the TI-99/4A computer. By manipulating a joystick or a trackball, the user can create, save and print complex images. A magnification feature permits precise control over each pixel for fine resolution work. The program will print in full color or shaded black and white on the Axiom GP-100 printer. Paint 'N Print is $39.95.

Interfacing Breadboard

Constructing Control Circuits

Group Technology has unveiled the BG-Board Interface Breadboard, a versatile interface that teaches the skills of interfacing by enabling the user to construct circuits and control the flow of information between the computer and external devices. Through BASIC programs, the user can employ IBM PC, Commodore 64, and VIC-20 computers in controlling and monitoring home appliances, analytical instruments, temperature control systems, security systems, and voice synthesizers. Texts and experiments provide instruction and guidance, and can be adapted to individual or classroom use. The IBM version retails for $355 (assembled) or $280 (kit). The Commodore 64 and VIC-20 versions retail for $334.95 (assembled) or $259.95 (kit).

High-Tech Armchair Quarterbacks

Predict Your Favorite NFL Winners with IBM PC

A new prediction program for NFL football fans has hit the software market. Scorecast from Tradewind is a database program with a 5-window format and "Z-bar" cursor control. Users have access to a database preload of over 20,000 statistics, including final scores, rushing, first downs, turnovers, penalties, punts, passes, and returns. Also provided are current season schedules, on-screen graphics, and forecasting formulas. 23 on-screen bar charts analyze every game before and after it has been played. Users can pick their own favorites or let the program select a choice from formulas and calculations based on comparisons between any two teams. First National 800 Data Bank, an on-line data retrieval system, updates Scorecast files on Tuesday nights. Scorecast operates on the IBM PC, PCjr, and compatibles (Compaq, Tandy 1000/1200, and AT&T 6300). The program retails for $49.95 (the unprotected version is $69.95).

HOME COMPUTER

VOL. V NO. 5 ★★★★ INTERNATIONAL EDITION

Corporate Cleanup

Big Blue Announces New Strategic Moves

Boca Honchos Head North More Price Cuts Expected As Lowe Disavows PC2

It looks like a late spring cleaning. IBM is making moves to tighten product development efforts among its various divisions.

The company recently decided to move its once-independent Boca Raton division from Florida to New Jersey, and to consolidate responsibility for its communications products in North Carolina. The firm hopes to integrate the highly successful PC division into the larger corporate structure.

As these changes were announced, IBM forecasters also revised their 1985 growth rate predictions—reducing their estimates from 30% to 20%. Forecasters therefore reduced their predictions for IBM earnings. And while the PC product line is a bright spot in the IBM picture, it's undermining sales of the company's mid-range computers.

Some market analysts believe that this decline demonstrates that IBM's influence on the PC standard is no longer absolute. Others expect the company will adjust its PC product strategy to revive overall sales. IBM has cut the prices of several of its products and is planning special promotions.

Meanwhile, dealers report that the PC AT's once-booming sales are decreasing now that adequate inventory exists. Buyers are turning to the PC XT—responding to price cuts to the XT line and President Lowe's announcement that the PC2 does not exist, never did exist, and that no new PC desktop models will be introduced this year.

Lowe reportedly made this announcement so that rumors of an impending PC2 release would not harm sales of PC-compatibles. Analysts say, however, that Big Blue's main concern is not for its competitors, but for moving its own multi-billion dollar inventory excess. They say the products which have been suffering the most from the rumor of the PC2 introduction has been IBM's own product line.

"QUOTABLES"

"I'm using electrons to activate brain circuits to get you high now. Fortunately, that's still legal."

—Timothy Leary, LSD-dropping guru of the '60s, discussing his new "womb-to-tomb" computer game.

What's News—

* * *

Lotus dropped VisiCalc, the pioneering computer spreadsheet it acquired with its purchase of Software Arts. The firm has also cut the price of Spotlight, another Software Arts product, to position it against Borland's best-selling SideKick.

* * *

Tandy is aggressively pushing its MS-DOS series of computers with a $300 price cut and the availability of an add-on hard disk drive for the Model 1000. A Bernoulli Box with removeable mass-storage media has been licensed from Iomega for the Tandy line.

* * *

Texas Instruments is now offering Font Gen, software that allows creation of custom fonts for Omni 800 family printers. TI continues to hype discounts on slow moving TI Pros to members of 99/4A users groups.

* * *

Microchip technology enters new territory with high-tech items such as computerized running shoes that measure distance and calorie expenditure, and teddy bears that talk, move, and sing. No computerized toilet paper has as yet been announced.

* * *

Commodore has completed a major reorganization and expansion of its customer service and support capabilities. A Customer Service Support Line (800-247-9000) is now available as part of the new service network.

* * *

Tandy is rumored to be considering the introduction of an Apple look-alike for under $500. This would be a major policy change for the firm, but based on its IBM-clone success, the move is not unprecedented. Tandy already conveniently sells Apple and IBM software.

Restructuring The Core

Apple Stakes New Growth On Same Old Seeds

Can New Mac Attack Crack Corporate Market?

A bushel of setbacks continues to sour Apple Computer Corp., as crucial products are delayed and the company reorganizes its operations and product lines.

Apple has announced that the release of the missing links in its Macintosh Office product line—a file server and external hard-disk drive—will be delayed. Originally intending to manufacture the items itself, Apple has turned to third-party manufacturers to supply the hard-disk and file-server hardware.

Finally, Apple's President Scully, with the backing of the Board of Directors—in what's been heralded as a "palace revolt"—has revamped the company's corporate structure along more traditional lines. The move put Steven Jobs, Chairman of the Board and head of the MacIntosh Division, in the dubious position of "product visionary," and removed him from day-to-day operations. This opens the way for a new Mac architecture, reportedly opposed by Jobs. Analysts expect a more powerful Mac with an open bus and color graphics—as well as a more powerful Apple II with a 16-bit processor.

Commodore's Gamble

Firm's Recovery Rests On Amiga's Success

Shelf Space A Question As Atari Joins Fray

Commodore is gambling heavily on its new, long-awaited Amiga computer, unveiled July 23, hoping that this latest techno-marvel will revive the computer market and stem Commodore's recent tide of red ink.

The machine, based on the 68000 microprocessor, will hit the market in two versions—a 256K unit priced at $1,295, and a 512K model with RGB monitor at $1,995. Both feature 3-D animation, 3½-inch disk drive, stereo sound, and 4,000+ colors. An IBM PC emulation package is forhtcoming.

With Atari's recent release of its 520ST, both firms are scrambling for shelf space. Most retailers, however, are leary of the new products, prefering to hold off stocking them until proven in the market place—thus putting both Commodore and Atari in a "Catch 22" situation. Without the support of the largest retail chains, both firms will be hard-pressed to demonstrate market acceptance.

Industry analysts cite Atari's financial instability, and Commodore's "image" problem as major hurdles that must be straddled—and don't expect to see Commodore's name mentioned in any advertising for the new Amiga.

Bigger Blooms for Apple

More Memory and Speed Enhance Apple II Line

Are Imminent Price Cuts Too Little, Too Late?

While Apple is struggling to push the Macintosh into the business world, the company is also refocusing its Apple II family for a rosier future.

New add-on boards from third-party manufacturers are being designed to expand Apple II's memory, increase operating speed, and add sound and music. Apple itself is reportedly working on a RAM board (the Slinky) that will expand the memory of the Apple II to 1.5 megabytes in 256K increments and plug into the IIe. Also rumored to be in the works are double-sided, double-density 3½-inch disk drives.

The ROM memory upgrade and 65C02 enhancement that Apple added to the line in March led to the present surge of Macintosh-like programs for the IIe and IIc, incorporating such popular features as mouse editing, pull-down menus, and advanced graphics.

Analysts feel, however, that it's going to take more than the much-talked-about $300 retail price cut to satisfactorily position the Apple II family against newer machines, such as the Amiga and the Atari ST.

Atari Straddles Fence

Smaller Version Of ST Slated For Mass Market

Software The Main Key To Sparking Future Sales

In an effort to keep both ends of the marketplace satisfied, Atari will be selling a less-powerful version of its new 520ST. The new 260ST system, with 256K-bytes of RAM and a built-in 3½-inch disk drive, is designed for sales in mass-market outlets at under $500.

The 520ST will be distributed through computer specialty stores, with an eye toward vertical markets. Atari claims it will have 30 to 40 vertical application programs available for the 520ST by September. VIP Professional, a Lotus 1-2-3 clone from VIP Technologies, is slated for ST debut at under $100.

Moody Market Blues

Computer Industry Slides Further Into Slump

Software Makers Eye Video Market As A Hedge

The atmosphere pervading the home computer market continues to be one of "gloom and doom." Revenues have plummeted over 20% since April 1984. Faint rumblings about a "saturated first-time buyers market" have surfaced—suggesting that the lion's share of new sales will come from owners upgrading to new machines, or from new business with government agencies.

In an effort to hedge against the market doldrums, some software manufacturers are also producing educational video tapes. The 20 million VCR owners in the U.S. is the attraction.

International Computing

Apricot Cuts Price and Pits Model Against U.S. Makers

Apple Chases Rising Sun, While IBM Hops "Down Under"

While U.S. consumers wait for the long-delayed arrival of Atari's ST, Commodore's Amiga, and IBM's PC2, foreign firms are making their move. The Apricot F1, a British machine, was cut in price by 33% to make it more attractive to U.S. consumers.

Meanwhile in Australia, IBM is marketing an English version of the JX, a machine that was previously introduced in Japan. And in an attempt to correct what has been termed a "classic failure," Apple is stepping up efforts to strengthen its weak foothold in the Japanese market with a KanaMacintosh, expected to arrive by the year's end.

THROUGH THE LOOKING GLASS

Optics May Eventually Enhance Electronics, Bringing Real Miracles To Home Computing

Electric Dreams, a hit movie about a computer falling in love, helped promote the popular notion that a home computer can do almost anything. But these inflated expectations may have led millions of new computer owners to the brink of disappointment—and to the discovery that their machines aren't able to soak up limitless databases or write hit songs on their own. Why not? Alas, fancy electronics may not be enough—even with promised advances—to perform such miracles.

What could be faster or more powerful than electrons streaming through microcircuits? The answer is *light*. New computers that use micro-optics rather than electronics to both store and greatly accelerate the flow of digital information are already in prototype. Light-based technology—ranging from optical disk drives to tiny light "gates"—may eventually replace electronic components at all levels of computer hardware. And with such light-based computers, true miracles may yet come to pass—even for home users—within the next 10 years.

At present, the most promising application of optics is in the area of computer "logic elements." Microscopic optical logic gates ("bi-stable semiconductors" built from gallium arsenide) can replace many of the logic gates in conventional microcircuits. With these components, it is much easier to construct super-large arrays that process information *in parallel*—rather than *serially*, as most computer circuits do. Optical computers should also have much faster "clock rates," based on the incredible switching speeds of optic gates. At their best, electronic gates can switch about 10^9 times a second, whereas optic gates can probably achieve up to 10^{15} switches-per-second.

Inevitably, the first applications of this technology will probably be industrial and military. "Star Wars" computers will have to think fast if they're going to shoot live missles out of the air. But will anyone think to build a computer that falls in love?

HCM ONE-LINERS

Here they are . . . the best of the one-line programs that we have received since printing the fourth "HCM One-Liners" column in *Home Computer Magazine* Vol. 5, No. 4. Although many interesting programs were submitted, we have selected what we felt were the best 6 of those that arrived prior to this issue's press date (one for each brand of computer covered in our magazine, including a TI BASIC "10-Liner"). If you have not yet submitted your masterpiece, it is not too late! As long as we keep getting great one-liners written in any computer language, we'll keep filling this page for you. Our prize winners this issue will each receive a check for $50 for sharing their ideas with our readers.

Shape-Make an Apple
[Applesoft BASIC on the Apple *IIe, IIc*]

Dear Sir:

The *Shape Maker* draws a variety of colorful geometric shapes and designs on your screen with the touch of a key. After the program has finished drawing an image, press any key, and it will automatically draw a new shape within seconds. Remember to type in the program without using spaces.

Kevin Cooney
Middleton, MA

```

```

A Spritely Design
[TI Extended BASIC on the TI-99/4A]

Dear Sir:

This program is called *MoTIon Art*. It creates a moving pattern of 26 sprites on your screen—a string of multi-colored squares swirl from the edge of the screen into its center. Type in the program until you hear the Input beep, press [ENTER], then [FCTN] 8, and finish typing the program in. You can change the vertical and horizontal motion of the sprites while the pattern is in motion—just type in new sets of numbers after each beep.

Bob Munro
Exton, PA

```

Shape Up Your Atari
[Atari BASIC on the Atari 800, 800 XL, and 130 XE]

Until this issue, *HCM* didn't cover Atari Computers. Therefore, we had no Atari One-Liner entries at press time. However, our staff has generated an Atari program that might help you get started producing your own Atari One-Liners. This program draws a variety of random geometric shapes on your screen. To type in this line, use command abbreviations and don't include spaces, otherwise the line will be too long. Double-check the line before pressing [RETURN]—which translates the shorthand commands back to their normal size (making the line longer than usually allowed).

```
1GR.24:A=159:C.3:B=INT(
RND(0)*12)/2:F.Z=0TO99S
TEP.1:PL.COS(Z)*A+A,SIN
(Z)*50+96:DR.SIN(Z*B)*A
+A.COS(Z*B)*90+96:N.Z
```

All One-Liner submissions are subject to the same publishing criteria as Letters to the Editor (explained in the magazine's masthead, page 6). If you have written a great One-Liner in any language on any computer covered by *HCM*, send it addressed to: Letters to the Editor, 1500 Valley River Drive, Ste. 250, Eugene, OR 97401. You too may win a cash prize and be immortalized in print!

CONTENTS

Apple Note: HCM Programs RUNing on the Apple II+ require 64K.
Atari Note: All HCM programs RUN on the Atari 800, 800-XL, 65-XE, and 130-XE. Shorter HCM programs should also RUN on other Atari models with less memory.
Commodore Note: All HCM Programs also RUN on the C-128 in C-64 mode.
Tandy Note: All programs for the IBM PC/PCjr commencing with the Vol. 5 No. 5 issue are designed to RUN without modification on the Tandy 1000.
Franklin Note: See page 9.

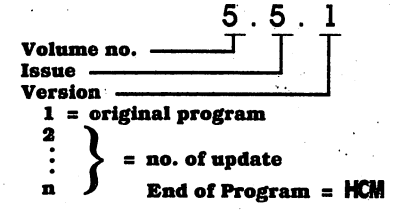
WHAT IS A PROGRAMMER'S WINDOW?

Home Computer Magazine strives to serve those eager to expand their programming knowledge by including specific information about the software published in these pages. This information is contained in a separate section: the "Programmer's Window." For each main program included in this section there are 5 different pages—one for each brand of machine we cover (Apple II family, Atari 800-compatible family, Commodore 64, IBM PC & PCjr, and TI-99/4A). Each page contains 4 separate windows as follows:

1) **Design Focus** (flow chart or diagram of a specific procedure or program structure)
2) **Remarks** (text explaining an aspect of the program version)
3) **Directory of Variables** (definition of all variables)
4) **Listing Annotations** (line-numbered program guide)

Program Identification

Each program header (the first few lines of the program) contains information giving the language the program is written in (e.g., TI Extended BASIC, Applesoft, etc.) and any special system components that are required (memory expansion cards, etc.). The first two digits of the version number tell you in which volume and issue of *HCM* the program *initially* appeared. The third digit of the version number indicates the version of the program. When a program initially appears, in *HCM*, it is version 1. Any subsequent revisions to the program, if later published in the magazine or in the software available on magnetic media from *HCM*, will bear a revised version number.



Your Guide to Typing in Programs from *HCM*

Within these pages is a software bonanza: entertainment, education, home and business applications, utilities, and tutorials—just for you. All you need to do is type them into your computer. *HCM* has taken most of the strain out of this process:

- Typeset listings with numbers in boldface.
- A bold, double vertical bar separating the line numbers from the program statements in BASIC listings.
- A vertical background grid to aid entry of the spaces.
- An error-reducing Bug-Out Code

Looking at the Character Reference Chart (Figure 1, below) will show you how each character actually appears in the program listings. By checking any questionable characters with this chart, you can reduce typing errors to a minimum.

Figure 1: Character Reference Chart

Before You Begin

Since *HCM* publishes for several different computers, the first thing you should do is make sure that you are looking at the listing designed for your machine. If, for example, you have an Apple *IIe*, make sure you look for the following black bar above the listing: APPLE II Family The computer model name will likewise appear on each subsequent page of each listing, so always look for the name before you begin typing from a new page of listings.

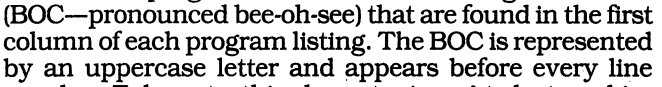
Before you begin typing-in the program, you will want to set up a system to save your program. Whether you are using a cassette or diskette storage system, now is the time to be certain it is properly connected, powered up, and loaded with a blank cassette or an initialized disk. As you type-in your program, you should get in the habit of saving your work after every 20 or so lines.

One of the most common errors in entering a listing is typing one symbol for another. These transpositions include substituting the letter O for the number 0, the letter l for the number 1, the letter S for the symbol $, and the uppercase B for the number 8. The last error is especially likely when working in hexadecimal numbers which are composed of the numbers 0-9 and the uppercase letters A-F.

The listings in *HCM* are always the same number of characters wide, but the number of characters put on any line of the video display will vary from computer to computer. Don't try to make your listings *look like* the type-set listing—instead make sure you type the listings character for character and space for space.

The Bug-Out Code (BOC)

All *HCM* programs are listed with Bug-Out Codes (BOC—pronounced bee-oh-see) that are found in the first column of each program listing. The BOC is represented by an uppercase letter and appears before every line number. Take note: this character is **not** to be typed-in. One of the main reasons that we are using letters instead of numbers is to make sure that the BOC is not entered as part of a line number.



To use BOCs for keeping bugs from creeping into your typed-in programs, see pages 77-79.

A Special Note to TI Users:

Due to architecture and language constraints with the TI-99/4A, users must have both Extended BASIC and a disk drive in order to use the BOC. We are currently developing a BOC program that will work with the Editor/Assembler Cartridge, and hope to have it soon.

A Special Note on Atari Listings

Atari has more special graphic characters available from the keyboard than any other computer that we cover. Reproducing these characters can often take up to three different key strokes. Instead of forcing our readers to translate each of these special characters into the correct key press, we include key-stroke intructions that are placed between two hands with pointing fingers. For example, when you find ☞CTRL ,☜ in an *HCM* listing, you will know to hold down the [CTRL] key and press the [,] key. The result of this key press is the ♥ symbol.

These instructions will include a number if the operation is to be repeated. For example, ☞5 CTRL A☜ tells you to hold down the [CTRL] key and press the [A] key 5 times.

Whenever you see the [CTRL] or [SHIFT] keys between two hands, hold them down while you press the key that follows them. The [ESC] key is an exception. This key represents a separate key press. So, when you see a ☞ESC CTRL +☜ you are to first *tap* the [ESC] key, and *then* hold down [CTRL] and press the [+] key.

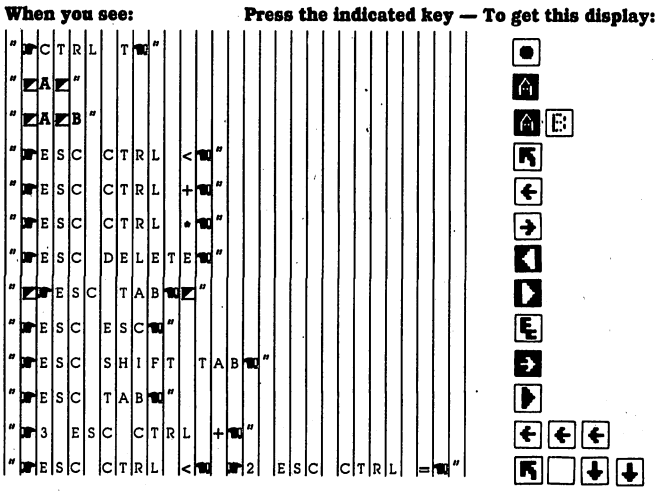
The Atari has one special key that none of the other computers have. This key looks like this ◩ and is used to print reverse characters. Whenever you come across ◩ in a listing, simply press this key.

When you come to the hand symbols, remember:

- **Each operation is enclosed in its own set of hand symbols.**
- **If any key action requires you to press [CTRL] or [SHIFT], press the control key or the shift key *first* and hold it down before pressing the second key.**
- **Both the [ESC] and ◩ keys are single key presses and should be pressed independently of the keys that follow them.**
- **Everything between a pair of hand symbols is set in a different typeface.**

In Figure 2 below, we have included a chart showing you a representative sample of the symbols that appear when you use keystrokes enclosed by the hand symbols.

Figure 2: Atari Special Symbols



A Special Note on C-64 Listings

Commodore uses more than 90 special symbols to represent various keyboard operations: for instance, the symbol [♥] in a program represents the operation of holding down the [SHIFT] key and pressing the key which has CLR on its upper half (second key from the right on the top row). This operation clears the screen.

Rather than reproducing these symbols, *HCM's* listings include key-stroke instructions, between two hands with pointing fingers. For example, when you find ☞SHIFT CLR☜ in an *HCM* listing, you will know to hold down the [SHIFT] key and press the key with CLR on it.

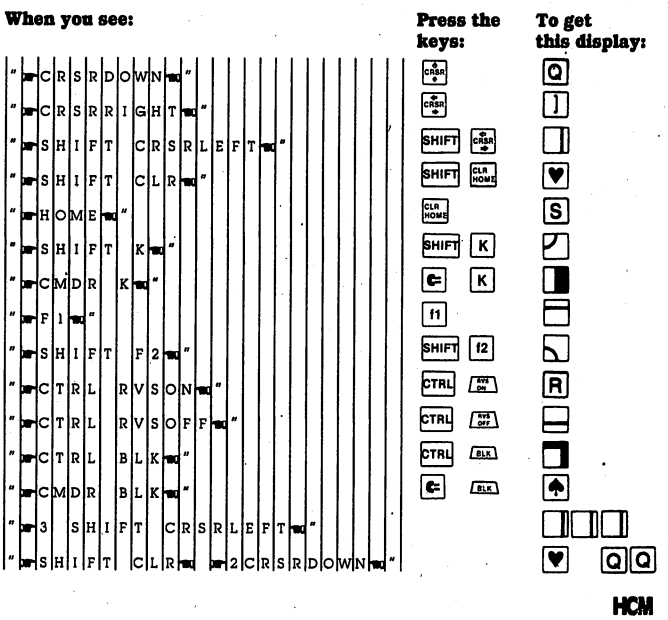
A number is included if you need to repeat the operation: ☞8 SHIFT CRSRLEFT☜ tells you to hold the [SHIFT] key down and press the cursor left key (on the bottom right of the keyboard) 8 times.

When you come to the hand symbols, remember:

- **Each operation is enclosed in its own set of hand symbols.**
- **If any key action requires you to press two keys, press the control key, the Commodore key, or the shift key *first* and hold it down before pressing the second key.**
- **Everything between a pair of hand symbols is set in a different typeface.**

In Figure 3, we have included a chart showing you a representative sample of the symbols that appear when you use keystrokes enclosed by the hand symbols. (Notice that the hand symbols always appear within quotation marks—as in a print statement.)

Figure 3: C-64 Special Symbols



HCM BUG-OUT

Bug-Out is an error detection program for catching type-in mistakes. It is available for every computer brand *HCM* covers—Apple, Atari, Commodore, IBM, and Texas Instruments. When you use this utility, typos are easily found and corrected.

Before you type-in another *HCM* program, type-in the *Bug-Out* program specified for your computer. Because a properly typed-in *Bug-Out* routine is essential for it to accurately detect typing errors in other programs, be extra careful to ensure accuracy. Once you have it entered, save *Bug-Out* to tape (an option for Atari and Commodore only) or disk.

Comparing Two Sets of BOC's

When you look at our listings, you will notice an upper-case letter placed in the left-most column at the beginning of each program line. Separated from the line numbers by a bold vertical bar, this letter is the correct BOC. Do **not** type these letters in. The BOC is a quality-control character. Each program line is carefully dissected, and mathematically compacted into a single-character representation.

These letters will help you detect key-in errors *after* you have a listing fully entered. When you RUN the *Bug-Out* program as directed below, it will generate another series of BOCs either on the screen, or to a printer. Compare the codes generated by the *Bug-Out* program with the codes published in the left-most column of our listings. If a published BOC for a line is different from a BOC for your typed version of the same line, you will know that line contains a typing error.

How To Do It

1. The first step is to type-in the desired program.
2. After typing the program in, SAVE it as usual.
3. Then also SAVE the program as an ASCII text file—this is the format needed for *Bug-Out* to do its job. Always use a different file name to distinguish between the program file SAVEd in step 2 and this text file. We suggest you add a suffix like .T (or _T on the 99/4A) to the end of the text file name for added clarity. The process of saving programs as ASCII text files on each machine is detailed on page 78 (see "Turning Programs Into Text Files").
4. After you've SAVEd your program as an ASCII text file, make sure that the disk or tape containing the text file is inserted, then RUN the *Bug-Out* program. Once RUN, *Bug-Out* will ask for the name of the ASCII file and whether you want the program's output to go to the screen or the printer. After all this has been entered, the computer will print out its list of BOCs and the corresponding line number. For example:

```
N 100
S 110
Q 120 . . .
```

5. Carefully go through the program listing in the magazine to find, and take note of, all the published BOCs that are different from the BOCs generated by the *Bug-Out* program. Every line that you find with a different BOC code has been typed incorrectly, and should be carefully examined and corrected.

To correct your mistakes (if any), LOAD (OLD on the 99/4A) the program version (not the text file) that you keyed in previously. Now, make the necessary changes to the incorrect program lines and repeat the previous 5 steps until all the BOC codes match. Once they all match, your program should be error free.

REM statements that are not typed correctly will result in erroneous BOCs. If the only differences between a typed-in program and the magazine listing are in REM statements, the program will still RUN as intended. So you needn't waste time concerning every REM statement before running your *HCM* programs. ***Continued***

TURNING PROGRAMS INTO TEXT FILES

The Apple method of making a program into a text file requires merging your typed-in program with a short *Capture* program (also included in this issue). Our version is based on the *Capture* program found on page 140 of the *BASIC Programming with ProDOS* manual published by Apple. If you do not have either *Apple Programmer's Assistant(APA)* or *Renumber* program in DOS 3.3, you must type-in *Capture* at the same time as the program you are **SAVE**ing as a text file.

In either case, with *Capture* (at lines 1 through 10), and the program you wish to capture as a text file in memory, just type **RUN**. The *Capture* program then **LIST**s the program in memory to disk as a text file under whatever name is **INPUT** when *Capture* first starts running. Because *HCM* programs always begin with line 100, the *Capture* program always **LIST**s starting at line 100, and does ***not*** **LIST** lines 1 through 10, which do the actual capturing.

Disk users enter:
LIST "D:PRGNAME.T"

Tape users enter:
LIST "C:PRGNAME.T"

Disk users enter:
OPEN 8,8,8,"PRGNAME.T,S,W" : CMD 8 : LIST
Wait till cursor returns to the screen and enter:
PRINT#8 : CLOSE 8

Tape users enter:
OPEN 1,1,1,"PRGNAME.T" : CMD 1 : LIST
Wait till cursor returns to the screen and enter:
PRINT#1 : CLOSE 1

Just **SAVE** program with the ASCII option like this:
SAVE"PRGNAME.T",A

You can **LIST** your program to disk from Extended BASIC by typing the following, with your newly typed-in program residing in memory: **LIST "DSK1.PRGNAME_T"**

Special Note to Apple Users:

Applesoft BASIC has an idiosyncracy concerning REM and DATA statements. When you press [RETURN] after entering one of these statements in a BASIC program, an extra space is added to the line between the word REM or DATA and the rest of the line. The Apple version of our Bug-Out program takes this one extra space into account. Therefore, to ensure identical BOCs, always make sure your REM and DATA statements are typed *exactly* as they appear in the listing. Although REM statements do not affect a program's performance, DATA statements are often a source of typing bugs. Therefore, after either typing in or editing a DATA statement, be sure that it has the same number of spaces as in the magazine.

1050-1100	Get device and file name.
1110-1170	Draw edit screen.
1180	Read keyboard.
1190-1210	Exit program?
1220	Character data.
1230	Box coordinates for edit screen.

REMARKS

One of the strongest features of TI Extended BASIC is the ACCEPT AT statement. ACCEPT AT enables your program to accept data at any location on the screen, *beep* when ready to accept the data, erase the screen or just the data field prior to input, limit the length of the data, and limit the type of characters that you can input. The versatility and control that the ACCEPT AT command provides for data entry made the TI machine a perfect choice for our *Card-Trix* program.

We did, however, run into a slight problem, when using ACCEPT AT for entering data into *Card-Trix*'s Text field. The ACCEPT AT statement allows you to enter only one screen line of data at a time. Because the Text field on a *Card-Trix* card contains 9 lines, we had to find a way to move from one line to another. The solution to this problem was using the CALL KEY function in conjunction with the ACCEPT AT statement.

There are three different ways to exit an ACCEPT AT—the [ENTER] key, FCTN E, and FCTN X. By putting a CALL KEY statement directly after the ACCEPT AT, we can tell which of the three keys was used to exit from the ACCEPT AT statement. The Design Focus on the left provides a flow chart of the Text editing portion of *Card-Trix*. This routine is located in program lines 380-440.

When you first enter the Text edit routine, the variable I is set to zero, signifying that the cursor is located on the first row of the Text field. Next, an ACCEPT AT statement executes using I as an offset to the vertical position of the cursor. Now, the CALL KEY subprogram is called, returning the ASCII code of the key used to exit the ACCEPT AT. If for some reason the CALL KEY is not quick enough to catch the exit key, the program loops back to the ACCEPT AT statement.

If you press a FCTN X (ASCII 10), then I is incremented, thus moving the cursor down a line in the Text field. If you enter a FCTN E (ASCII 11), then I is decremented, moving the cursor up a line. Finally, if you press an [ENTER], then the program exits the routine. Additional limit checking, such as making sure that I never equals anything less than zero or greater than 8, is not shown in the flow chart.

HCM Glossary terms: field, subprogram.

DIRECTORY OF VARIABLES

Variables	Functions
A	Utility variable.
A$	Used in search routine.
B	Utility variable.
C$(,)	Array used to hold card data.
E	Used to return file name error.
E$	String of editing command characters.
I	Loop counter.
J	Loop counter.
K	ASCII of keypress.
MX	Maximum number of cards in a folder.
N	Current card number.
S	Status variable in CALL KEY statement.
S$	Utility string.
X	Utility variable.
Y	Utility variable.

Electronic Typewriter

REMARKS

When a program is running, the Commodore 64's cursor normally flashes only when the machine is executing an INPUT statement. Although convenient, the INPUT statement is not the best method of obtaining information from a user—you could move the cursor off the input line during an INPUT, scroll, or even clear the screen! In addition, the INPUT command ignores commas and colons. Its drawbacks are numerous.

Because of the limitations of BASIC's INPUT command, the Commodore version of *Electronic Typewriter* uses the GET statement to receive all of its data. Now, what about the cursor? Won't it refuse to appear if you use a GET? It is true that the cursor cannot normally be used in anything but INPUT statements, but there is a devious way to "get" around this. By POKEing location 204 with a zero just before your GET command, you can fool the computer into displaying the cursor.

This method of turning on the cursor is not completely error free, however. There are some things you should watch for. When you turn the cursor on through POKEing 204, the cursor does not turn itself off when moved. In other words, letters are often left in reverse and little cursor footprints are left all over the screen. The input routine located in lines 920-1200 of *Electronic Typewriter* takes care of these problems. To erase the cursor's footprints, screen memory is POKEd to turn off the reverse status of the last position of the cursor. By clearing the high bit of a character's screen code, you turn off its reverse status. See the Design Focus for a more detailed look. Although this technique has its drawbacks, it provides a friendlier and safer method of input.

HCM Glossary terms: high bit, screen code.

REMARKS

The first thing you see when you RUN the Apple version of *Electronic Typewriter* is the title screen. When executed, the title screen seems to magically type the name of the program onto the screen. Although this part of the program may seem trivial, it does add a touch of class and entertainment to the program.

The title screen is created in lines 440-490. This routine is actually very simple. A string, T$, is set equal to the words "Electronic Typewriter." Once a screen position is defined, a simple FOR loop is used to print T$ onto the screen one letter at a time. As each letter is plotted onto the screen, using the Apple's VTAB and HTAB commands, a sound is produced to simulate the *thwack!* sound of a typewriter. After the title is "typed" onto the screen, you are prompted to press [RETURN] and continue with the program. The Design Focus shown on this page provides a flow chart of this routine.

HCM Glossary terms: loop, string.

DIRECTORY OF VARIABLES

Variables	Functions
BE$	Bell sound, CHR$(7).
BL$	80 blank characters.
C	Selects print mode from line code.
C$	First character of line code.
CN	Value of number input by user.
CN$	String equivalent of CN.
CN$( )	Array used to build CN$.
D$	Used for disk commands.
DI,IT	Loop counters.
DR$	Disk drive number.
E	Error code.
ESC$	Escape character, CHR$(27).
FL$	File name.

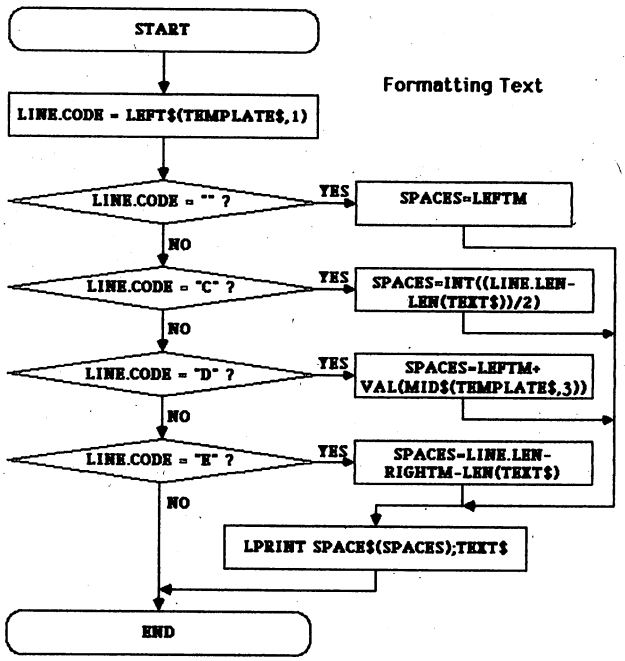
SV$	Flag to save template with text.
TP$( )	Template array.
TX$( )	Text array.
VC,VX	Vertical screen positions.
X	Utility variable.
XT	Pointer for truncating blanks from file.

Electronic Typewriter

DESIGN FOCUS



REMARKS

Lines 700-800 in the IBM version of *Electronic Typewriter* are the work horses behind printing formatted text. These few lines are responsible for interpreting line codes and sending the proper output to the printer. To further illustrate this process, we have provided a simple flowchart (see the Design Focus on this page). As you can see, the only real trick behind printing a formatted line is calculating the number of spaces to be used as an indent. For an explanation of variables, refer to the chart below.

2990-3150	Dimension strings.
3160-3180	Bell sound.
3190-3240	Print a series of messages.
3250-3690	Display edit screen.
3700-3790	Pick function input.
3800-4160	Output to printer.
4170-4550	Print a message.
4560-4780	Set margins and spacing.
4790-4870	Format indent.

REMARKS

One of the Atari computer's best features is the unique ability to use calculated GOTOs, GOSUBs, and RESTOREs. On most computers, commands such as RESTORE require that a constant be used as a parameter. The Atari version of *Electronic Typewriter* uses the calculated RESTORE command in lines 4170-4550 to print messages on the screen. All you have to do is set the variable MESP to point to one of the messages that are stored in DATA statements in lines 4240-4550, then GOSUB 4170. For an illustrated view of how this routine works, refer to the Design Focus on this page.

HCM Glossary terms: parameter.

DIRECTORY OF VARIABLES

Variables	Functions
A,P,Z	Utility variables
ADD	Address of string to be saved or loaded.
ADH	High byte of ADD.
ADL	Low byte of ADD.
BLANK$	A string of blanks.

TFLAG	Flag to save template with text.
WAIT	Loop counter.
WORK$	Utility string.
X	Column during input.
XBLANK	String of blank chars.
Y	Row during input.

The Plains of Salisbury

REMARKS

It is often necessary to write a separate input routine on the TI-99/4A computer when using BASIC, because the standard INPUT statement is inadequate. (If you have Extended BASIC, the ACCEPT AT statement is capable of handling most input needs.) TI BASIC offers a powerful but under-used function that can simplify input routines: POS. With this function, you can locate the position of a string of characters within another string.

Writing your own input routine can eat up a lot of memory, and slow down a program. In special cases, the POS function can help alleviate some of these problems. Often, we need the program to allow the user to enter only certain characters. These characters may be scattered throughout the character set, making limit checking very difficult and slow. By placing a list of legal keys in a string variable, we can use the POS function on each key entered to see if it is on the list.

Another benefit of the POS function, is that it will tell you the position of the character in the list that matches the character entered. This number can be used with an ON GOTO or an ON GOSUB statement to control program flow. This greatly decreases the amount of code needed to make a separate test for each legal character. An alternative to this method is to use the POS function to test for illegal keys (e.g., in an input routine for a file name).

HCM Glossary terms: character set, limit checking, program flow.

DESIGN FOCUS

USING POS()
TO VERIFY CHARACTER ENTRY

```
260 D$="EXSD"&CHR$(13)&CHR$(15)
*
1210 CALL KEY(0,K,S)
*
1260 K=POS(D$,CHR$(K),1)
1270 IF K=0 THEN 1210
1300 ON K GOTO 1310,1330,1350,1370,2020,1390
*
```

```
POS(D$,CHR$(K),1)
```

- 1 — CHARACTER POSITION WITHIN D$ TO START THE SEARCH FOR CHR$(K)— START SEARCH AT FIRST CHARACTER POSITION
- CHR$(K) — THE POSITION OF THIS CHARACTER WITHIN D$ WILL BE RETURNED— K IS THE VALUE RETURNED FROM CALL KEY
- D$ — D$ CONTAINS A LIST OF ALL LEGAL CHARACTERS; EXSD, CHR$(13)=[ENTER], CHR$(15)=[FCTN 9]

3910-3940	Routine to display one line of text.
3950-3970	Time-delay routine.
3980-4040	Save/Exit/Return option routine.
4050-4160	Exit routine; display score screen.
4170-4180	Return to game.
4190-4300	Save a game to tape or disk.
4310-4400	Load a game from tape or disk.

The Plains of Salisbury

REMARKS

The Commodore 64 offers more than one way to place graphics on the screen. In *The Plains of Salisbury*, we needed to display three full screens of graphics. The easiest method would have involved simply printing the redefined graphics characters to the screen. This was not desirable, however, because it would have consumed an excessive amount of program memory. So we designed a more memory efficient algorithm to display the screens.

The flow chart on this page shows the structure of the algorithm. The program reads DATA into a string variable, then takes two characters at a time from the string. The first character indicates which graphics character to display. The second character determines how many times that graphics character repeats. This method, while slower than printing entire screen lines at one time, does conserve quite a bit of memory.

HCM Glossary terms: algorithm, string, redefined graphics characters.

TD	Time delay loop counter.
TE	Current player.
VL	Flag used when changing screens.
X	Flag indicates if a knight is hit.
Y	Loop counter.
Z	Loop counter.
ZZ	Indicates a game was just loaded.

LISTING ANNOTATIONS

Line Nos.	
100-210	Program header.
220-340	Display the current map area and the knights.
350-490	Initialize program.
500-540	Title screen.
550-560	Load old game option.
570-600	Get players' names.
610-650	Get map arrangement.
660-680	Determine player's turn.
690-770	Update and check knight's vital statistics.
780-800	Get input and branch to appropriate routine.
810-840	Change screens for display only.
850	Start next knight.
860-900	Update knight.
910-1020	Move the knight.
1030-1200	Check for hand-to-hand combat and adjust for terrain type.
1210-1240	Check border limits.
1250-1420	Hand-to-hand combat.
1430-1460	Combat phase menu.
1470-1530	Pick knight for combat. Check for eligibility.
1540	Change screen if necessary.
1550-1580	Determine direction of fire.
1590-1790	Fire arrow and calculate the consequences.
1800-1810	Save/Exit menu.
1820-2010	Save game.
2020-2080	Exit game, display report screen.
2090-2300	Load old game.
2310-2360	Get a key from the keyboard.
2370-2400	Error routine.
2410-2700	Program data.

The Plains of Salisbury

REMARKS

The Apple II version of *The Plains of Salisbury* offers a solution to the inadequacy of the INPUT statement. In almost any BASIC language for most applications the INPUT statement provides virtually no automatic limit checking; you must write elaborate routines to scan the data after you have finished typing in the entire line and pressed [RETURN]. The optimum input routine would check for legal characters as they are entered or prohibit the use of illegal characters altogether.

If all of the legal or illegal characters fell into one or two ranges, the problem of sorting them out would be fairly simple (e.g., all letters between A and F, or X to Z). Suppose, however, that you wanted to allow a scattered list of keys to be entered (e.g., I, J, K, M, [RETURN], and [ESC]). This is a common problem in many game programs where only a few select keys are used, while many are not.

By keeping a list of either the legal or the illegal keys in a string, you can easily check any key pressed against the list to determine whether you should allow it or not. In *The Plains of Salisbury*, a simple FOR-NEXT loop searches the string.

You can then use the position of the key pressed within the string with an ON GOTO or ON GOSUB statement to further simplify a program. To change the keys used, simply change the list in the string. For a more versatile input routine, compile several lists of keys for different parts of the program. You can then pass the appropriate list to the input routine to do the proper checks.

HCM Glossary terms: application, limit checking.

V	Loop counter.
X	Horizontal direction to fire.
Y	Vertical direction to fire.
Z	Utility loop counter.

The Plains of Salisbury

REMARKS

Quite often, it is a challenge to get a large amount of graphics onto the screen in a short period of time. We can solve this problem on the IBM PC by using the BLOAD command. It is impractical, however, to publish an entire BLOAD file in the magazine, so we have come up with an alternative.

If a graphics image file is found during BLOADing, the program loads that file and continues. If no file is found, an error is generated. The program traps for that error condition and branches to a routine that uses another algorithm to paint the screen. The program then uses the BSAVE command to save the screen's image to the disk. In this program, there are three screens of graphics which must be saved to the disk. Unless you change data disks, the saving process will not be repeated, and your screens will be drawn very quickly.

HCM Glossary terms: graphics image file, trap.

YP	Vertical pixel position of a knight.
Z, ZZ	Utility variable.

The Plains of Salisbury

REMARKS

As you may know by now, the Atari BASICs that run on the 800, 800XL, and 130XE do not directly support string arrays. Don't lose faith too quickly, however, because it is possible to build your own array from a single string. Strings on the Atari can be any length—up to the limitations of your system's memory, of course. Therefore, if you plan the string requirements ahead of time, it is a simple matter of doing a few calculations, and *presto*, you have a functional string array.

The Plains of Salisbury requires a two-dimensional string array to store a screen image. This storage is necessary to speed up the re-painting of the character graphics screens during the game. Because the Atari does not support string arrays, we store the data in a single, long string. By extracting substrings from the single string, we simulate a multiple element array.

The Design Focus on this page illustrates how the program stores the array in a single, long string. One drawback to this method is that all elements of the array must be of the same length for you to use a simple mathematical algorithm to determine the array element locations. This particular array is designed to display three screens of graphics in graphics mode 1 with a split screen. A variable-length element string array would be much more complex, requiring a numeric array to keep track of each element's start and stop locations.

HCM Glossary terms: string, string arrays, elements, variable-length element string array, graphics mode, split screen.

DESIGN FOCUS

CREATING A STRING ARRAY FOR SCREEN GRAPHICS

129	00000000000000FF
130	000000000000FFFF
131	0000000000FFFFFF
132	00000000FFFFFFFF
133	000000FFFFFFFFFF
134	0000FFFFFFFFFFFF
135	00FFFFFFFFFFFFFF
136	FFFFFFFFFFFFFFFF

CHARACTER TO ERASE IN CASE BAR MOVES DOWN

```
3690 CALL HCHAR(INT((100-PB)*.1+1),18,128)
3700 CALL HCHAR(INT((100-PB)*.1+2),18,
     INT(128+(PB-INT(PB*.1)*10)*.69))
```

BLANK CHARACTER

CALCULATES CHARACTER FOR THIS BAR POSITION

* PB IS SCALED TO BE BETWEEN 0 AND 100, AND IS USED TO DETERMINE BOTH THE POSITION OF THE CHARACTER AND THE ASCII CHARACTER TO USE

REMARKS

If you think that the TI-99/4A graphics character set is limited when generating high-resolution graphics such as bar charts, take another look. In *Vital Signs* three bar charts display blood pressure, oxygen level, and body temperature. To create the chart, we had to redesign only 8 characters—the rest of the magic is all in the display algorithm.

The Design Focus on this page displays the hexadecimal codes that we used to redefine characters 128 through 136. The hexadecimal code is displayed next to the ASCII character number. These codes allow a vertical graduation of one pixel in the bar graphs. The two program lines appearing in the Design Focus are from the routine that plots the bar graph for blood pressure. Before the program reaches line 3690, it scales the value of PB to a figure between 0 and 100.

Lines 3690 and 3700 contain the expression (100-PB)*.1 which further scales PB to a value between 1 and 10 so that a vertical column can be plotted using the HCHAR statement. Line 3700 contains the value 18 which indicates column 18. In the same line, 2 is added to the expression to define the upper limit of the graph at the screen's second row. The rest of the line calculates which of the 8 graphic characters is required at this level of the bar. In line 3690, 1 is added to the expression to clear the space above the character in case the bar is going down.

HCM Glossary terms: hexadecimal, ASCII, algorithm, pixel.

Z	Utility and loop counter.

Vital Signs

REMARKS

In the C-64 version of *Vital Signs*, lines 500 to 610 hold what is commonly called the "main control routine." Main control routines may consist solely of a main menu routine, or they can encompass many operations. It is best to keep the routine simple—just a series of branches to more complex subroutines—to make it readable.

This routine in *Vital Signs* is responsible for the execution and maintenance of the rest of the program. Its purpose is to control the sequence of events. Among other tasks, the routine checks to see if the player has either lost, or decided to quit the game.

The main control routine's first operation is a branch to the input subroutine, which is responsible for getting the player's input and carrying out commands. After returning from the input routine, the main routine checks to see if the player has decided to exit the game.

The next operation is a branch to the update vital statistics subroutine. This routine calculates the new values for blood pressure, oxygen level, and body temperature. After exiting this subroutine, the main routine sets a flag to indicate the first position of the graphic heart on the screen, and then branches to a routine that draws the heart in its second position—thereby performing the simple animation of the beating heart. The main routine then calls a sound routine, and branches again to the heart graphics routine, repeating the process.

The last section of the main control routine branches to three subroutines to check the status of the vital signs. Any one of these routines could set a flag ending the game, at which time the program adds up the score.

HCM Glossary terms: flag.

240-280	Initialize program, graphics, and sound routines.
290-450	Draw the playing screen.
460-520	Main control loop.
530-590	Check for vitals beyond limits.
600-720	Update blood pressure, oxygen level, and body temperature.
730-810	Select a random Activity and Air Quality.
820-940	Routine for lung cancer and blood clots.
950-1060	Scan the keyboard and branch to the appropriate routines.
1070-1140	Change Activity routine.
1150-1210	Change Air Quality routine.
1220-1300	End-of-game routine, option to play again.
1310-1380	Display current conditions; Activity, Air Quality, lung cancer if present, and blood clot if present.
1390-1450	Misc. screen handling routines.
1460-1520	Display the bar graphs.
1530-1590	End-of-game messages.
1600-1650	Program data.

REMARKS

In accord with the old adage, "a picture is worth a thousand words," bar graphs can greatly enhance certain programs. Bar graphs on the Apple II family of computers are simple to make, using the Hi-resolution graphics page and the HPLOT command. Three useful subroutines, starting at line 1460 of the *Vital Signs* program, plot the three bar graphs which display blood pressure, blood oxygen level, and body temperature.

The key to these routines is that the program always plots from the old bar position to the new position—only the color changes as the bar moves up and down. The program compares the bar's last position with it's new position. It then turns the color either on or off, depending on whether the bar is to increase or decrease. A FOR-NEXT loop then counts from the last position to the current position, drawing a line to fill the bar in as it goes.

The flow chart in the Design Focus on this page illustrates the logical flow of this routine.

HCM Glossary terms: Hi-resolution graphics page.

DIRECTORY OF VARIABLES

Variables	Functions
AC$( )	Activity display text.
AR$( )	Air Quality display text.
A$	Used for input routines.
AC( )	Activity values used in calculations.
AR( )	Air Quality values used in calculations.
OLD( )	Used in the plotting of the bar graphs.
A0	Current Activity option.
A1	Current Activity level.
A2	Current Activity value used in calculations.
BC	Blood clot flag.
CH	Amount and direction of change in one of the bar graphs.
CNT	Counter to keep track of sweating.
CO	Amount of change in the oxygen level.
D	Flag that the game has terminated.
HR	Heart rate.
LC	Lung cancer flag.
LX	Counter to time lung cancer.
LZ	Air Quality variable.
N	Loop counter.
OC	Oxygen out-of-limits counter.
OX	Level of oxygen in the blood.
P	Current blood pressure.
PA	Change in blood pressure due to oxygen level.
PC	Blood pressure out-of-limits counter.
R1	Current Air Quality.
R2	Current Air Quality value used in calculations.
RS	Current respiration.
SC	Player's score.
SOUND	Constant for 786. Address of sound routine.
T	Current temperature.
TC	Temperature out-of-limits counter.
TP	Target blood pressure.
TTA	Target body temperature.
TX	Target oxygen level.
VL	Value used to position the bar graph in the bar graph routine.
X	Utility.
Y	Utility, used in the screen display routines.
Z	Loop counter, utility.

Vital Signs

REMARKS

In designing the IBM version of *Vital Signs*, we encountered a challenge in simulating the effects of heavy exercise such as running. In the real world, if the body temperature exceeds a certain level, or if the external ambient temperature becomes high enough, we start to sweat. The evaporation of the sweat causes our skin to cool, which in turn cools the blood traveling through the capillaries near the skin.

In order to simulate the body's ability to cool itself, we have given the program the ability to "sweat." If the Activity level is set to running or swimming, the body begins to perspire. The cooling-off of the blood is not instantaneous, however. At first, the body temperature starts to rise as a large amount of energy is expended and converted to heat. After 40 cycles (or 40 beats of the heart), the sweat glands start to work, and the body temperature begins to drop. If this same Activity is continued for 100 or more cycles, the temperature starts to rise again as the body dehydrates.

In the IBM version, the routine that controls this perspiration cycle starts at line 460. A flow chart of this routine appears in the Design Focus on this page. The routine uses the variable **SWEAT.COUNT** to keep track of the number of cycles the program has remained at the same high Activity level. If the Activity is running or swimming, the counter increments by one; otherwise, it resets back to zero.

Line 470 calculates the base body temperature. Two factors determine this value: heart rate and blood oxygen level. After it calculates the base temperature, the program tests **SWEAT.COUNT** to see whether or not the temperature is increasing—either because the sweat glands haven't yet started to work, or the body is dehydrating. After the counter passes 100, its effect on temperature is only one-tenth of what it is before the counter reaches 40.

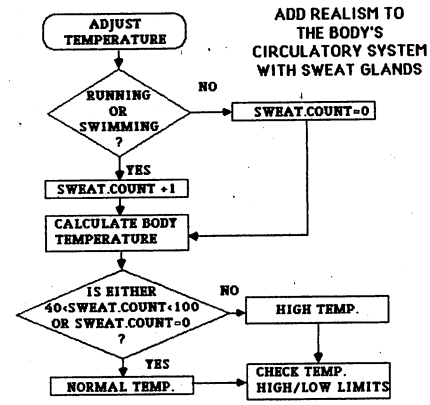
After the program performs the final calculation to adjust the body temperature, it checks the high and low temperature limits.

HCM Glossary terms: reset.

LISTING ANNOTATIONS

Line Nos.	
100-240	Program header.
250-350	Initialize program.
360-440	Get a character from the keyboard and make the heart beat.
450-840	Update vital statistics.
850-930	Change Air Quality option.
940-970	Display respiration and heart rates.
980-990	Display the main menu.
1000-1110	Main game input routine. Get key and branch to appropriate routines.
1120-1220	Change Activity level option.
1230-1280	Display current conditions on the screen.
1290-1420	Initialize bar graph screen area.
1430-1550	Display the bar graph levels.
1560-1710	Set up system variables.
1720-1830	Draw the heart graphics to be placed in an array.
1840-1890	Print end-of-game message from problems.
1900-1970	End the game and find out if player wants to play again.

DESIGN FOCUS



DIRECTORY OF VARIABLES

Variables	Functions
ACTIVITY$( )	Text for Activity levels.
AIR.OPTION$( )	Text for Air Quality levels.
A$, K$, S$	Used for input and display.
ACTIVITY.LEVEL( )	Values used for activity calculations.
AIR.QUALITY ( )	Array for Air Quality calculations.
CON( ), EX( )	Graphics image arrays used with PUT.
LUNG( ), OX( )	Graphics image arrays used with PUT.
PS( ), TP( )	Graphics image arrays used with PUT.
ACTIVITY	Current Activity.
ACTIVITY.OPTION	Current Activity option.
AIR.OPTION	Current Air Quality option.
BLACK, GOOD.AIR	Constant for 0.
SLEEPING	Constant for 0.
BLOOD.FLAG	Indicates there is a blood clot.
BROWN, WALKING	Constant for 3.
SMOKE.SMOG	Constant for 3.
TEMP.PROBLEMS	Constant for 3.
COL	Screen column.
D, I, TD	Utility, loop counter.
DONE	Indicates end of program.
G.ROW	Used in moving the bar graph.
GREEN, SMOGGY	Constant for 1.
PRESSURE.PROBLEMS	Constant for 1.
RESTING	Constant for 1.
HEART.CHANGE	Amount of change in heart rate.
HEART.RATE	Current heart rate.
LAST.ROW	Used in bar graph display.
LUNG.COUNTER	Timer for lung cancer.
LUNG.DAMAGE	Alters chances for lung cancer.
LUNG.FLAG	Indicates lung cancer.
NEW.ROW	Used in moving the bar graph.
NORMAL,RED,	Constant for 2.
SMOKE.CIG	Constant for 2.
OXYGEN.PROBLEMS	Constant for 2.
OC, OX.OB	Oxygen out-of-limits variables.
OX.TMP	Amount of change in oxygen level.
OXYGEN	Current percent of oxygen in blood.
OXYGEN.OLD	Used to display bar graph.
P	Used to determine which key pressed.
P.OB	Blood pressure out-of-limits flag.
PA	Effect of oxygen on blood pressure.
PC	Blood pressure out-of-limits counter.
PRESSURE	Current blood pressure.
PRESSURE.OLD	Used in the bar graph display.
RANDOM	Constant for 6.
RESP	Current respiration.
RESP.CHANGE	Amount of change in respiration.
RUNNING	Constant for 4
SCORE	Player's score.
SWEAT.COUNT	Amount of time sweating.
SWIMMING	Constant for 5.
T.OB, TC	Temperature out-of-limits variables.
TEMP	Body temperature.
TEMP.OLD	Used to display temperature graph.
TEMP.TMP	Target temperature.

Vital Signs

REMARKS

Atari BASIC offers a unique feature not available in most BASIC languages: the "calculated" GOTO or GOSUB. All BASICs place the line number to be branched to at the right of the GOTO or GOSUB; but Atari BASIC adds the ability to use a numeric expression in place of the line number. The computer calculates the actual line number as the program RUNs.

This method can add efficiency and clarity to program code. If line numbers of major routines are given descriptive variable names, these names in the GOTO or GOSUB statement make a program more readable. In addition, calculated GOTOs and GOSUBs allow branching to one of several statements.

A problem arises, however, when you wish to resequence the program (using a utility such as *Monkey Wrench* from Eastern House). It is impossible for these utilities to take variables and expressions into consideration when resequencing programs. But when expressions calculate one of several possible branches, you can solve the resequencing problem with a simple procedure.

First, place the first line number of the possible branches immediately after the GOTO or GOSUB statement so the utility will renumber that line. A multiplier in the expression that follows can then form an offset for the other possible line numbers. Notice that the numeric difference between line numbers of the different branches must always be the same. For example, if you use line number increments of 10, and each routine takes up only one line, then the expression of the calculated GOTO can include a multiplier of 10. The Design Focus on this page shows how this was done in *Vital Signs*. A1, which determines the routine branched to, is in a range from 0 to 6.

HCM Glossary terms: resequence.

NanoProcessor

REMARKS

The fact that math in Commodore 64 BASIC is entirely decimal based (as it is in most BASICs), creates difficulties in programs such as *NanoProcessor* where all math is binary. This problem becomes especially apparent when we create strictly binary routines such as the Rotate Left through Carry (RLC) instruction.

Fortunately, rotating a binary number left multiplies that number by 2. First, we set TEMP to zero, and then test the carry flag. If it is set, we make TEMP = 1. We next check if multiplication by 2 will result in overflow. If not, we clear the carry flag and simply multiply the A register by 2 and add TEMP. Otherwise, we set the carry flag and perform the same multiplication, but subtract 16.

The Design Focus on this page details the specifics of the algorithm for the RLC routine.

HCM Glossary terms: accumulator, binary, carry flag, zero flag.

ZF	Zero flag.
Z	Sound chip address.

NanoProcessor

REMARKS

Updating the address lights in the TI version of *NanoProcessor*, involves displaying a decimal number in binary. We first convert the current address (CA) into a string (AD$) of ones and zeros which correspond to the "on" and "off" bits of the binary equivalent. This conversion is simplified by storing each of the 16 possible binary arrangements of a nibble in a 16 element array: D$( ).

The FOR-NEXT loop in lines 1390-1460 contains the logic that displays the lights. The starting and ending limits of the loop counter IT (6 and 27) delineate the left- and right-most columns of the light display. IT is used as the column in the HCHAR statement of line 1450. To determine which of the two possible characters (on or off) is displayed, the loop counter is first divided by 3. Then in line 1410 we test whether or not that bit is a 1. If it is, we set CH2 to the character of the "on" light, otherwise we set it to the "off" character. The Design Focus on this page shows the details of this logic.

HCM Glossary terms: array, binary, element, loop counter, nibble.

3350-3460	Error handling.

REMARKS

The Apple version of *NanoProcessor* uses a combination of logic and simple math to display disk error messages. It is important that error messages are clearly stated so that the user will know just what action to take if a disk error occurs.

In line 3360 we first PEEK the error number from location 222. We then conduct a series of tests and multiplications in an ON-GOTO statement to control program flow so that the proper error message is displayed.

We check the most likely disk error numbers against the one that has occurred. When Applesoft BASIC evaluates an equality relationship, the result is expressed as either a one for true, or a zero for false. Because no more than one of the tests can prove true, when we multiply result by an assigned integer (from 1 to 5), program control GOes TO one of 5 locations to display the proper message. If none of the tests proves true, the control falls through to line 3370 where a general error message is displayed. The Design Focus on this page details the logic in a flow chart.

CHAR	Address of character define routine.
BI, D, DI, HZ	Loop counters.
IT, I, J, JI ,S	Loop counters.
IN, NB, P, XT	Utility variable.
ER	Error number.
HCHAR	Address of character display routine.
K	Utility variable.
M	Variable containing toggle switch positon.
OFF	Address to turn of hi-res PRINT routine.
OT	Flag for condition of the output lamp.
PRNT	Address of PRiNT to hi-res routine.
RF	Run flag.
RS	Temporary variable for rotary switch.
SOUND	Address of sound routine.
TEMP	Temporary variable.
TP	Tone address in music routine.
X	Temporary variable when doing logic instruction.

REMARKS

On the standard IBM PC and PCjr keyboards, there is no indication whether the keyboard is in CapsLock mode or not. This means that your input routines must be set up for both uppercase and lowercase characters on any given keypress. The *NanoProcessor* uses a unique "pairing" algorithm to take care of this.

Program lines 610-620 first check whether any key has been pressed, and if so, whether one of two function keys (Fn 6 or Fn 7) has been pressed. If any other key has been pressed, the INSTR function makes A equal to the position of the character in the string "PpBb<<,,>> . . 11223344IiRrLl" (the keys used to access the various buttons and switches on the front panel). Notice that each character is either paired with itself, or with its uppercase or lowercase rendition. We set C equal to the integer of (A+1)/2 at the end of line 630. This number is then used to control program flow in the main loop in lines 430-460.

HCM Glossary terms: algorithm, string.

3650-3730	Close NanoProcessor.
3740-3810	Save or load screen.
3820-3850	Increment address and check for wrap.

REMARKS

One of the major tricks involved in writing the *NanoProcessor*, is converting the binary input of the toggle switches into decimal numbers for Atari BASIC to work with.

During inititialization, we set the BIN$ string equal to the 16 combinations of binary numbers from 0000 to 1111. Then, if a key designating a switch (1-4) is pressed, the KEY variable is set to that number, and the program branches to line 1710. Here, we set A$ to the current binary equivalent of the switches by using SW (which contains the current decimal value that the switches represent) as an offset into BIN$. The KEY variable then controls the branch to one of 4 lines (1740, 1760, 1780, or 1800)—each of which causes a different switch to toggle.

For example, if the 1 key is pressed, the left-most bit needs to change. In preparation, A is set to −8. If the left-most bit of A$ is a one, then the switch needs to toggle down (into the zero position). In this case A is left at −8 and the program branches to line 1810 where A is added to SW. If, however, the left-most character of A$ is presently a zero, the switch needs to be toggled up. Therefore, A is set equal to +8 to increment SW by 8.

HCM Glossary terms: binary, offset, string.

DIRECTORY OF VARIABLES

Variables	Functions
ADDR( )	Memory array.
NT( )	Tone array.
BIN( )	Binary array.
RSX( ), RSY( )	Horizontal and vertical location for print to screen routine.
A$	Utility string variable.
AREG, BREG$	Binary strings of A and B registers.
BIN$	Binary string for display.
F$	File name variable.
LON$	string containing Light on condition.
PC$	Binary string of address.
RSC$	String of Print to screen temporary variables.
SW$	String for rotary switches.
A, B, C	Utility variables.
AREG, BREG	Decimal value of A and B registers.
CFLAG	Carry flag.
DELAY	Delay counter.
INC	Loop counter.
KEY	Key input variable.
LOC	Location of Player Missile POKE start.
LON	Light on flag.
MD	Save or Load flag.
PINC	Loop counter variable for POKEing Player Missile information.
PMBAS	Player Missile Base address.
POWER	Power on/off flag.
PPC$	Address location string.
MEM$	Memory location string.
PMEM$	Memory location temporary string.
PV	POKE value variable.
RF	Run flag.
S	Key-press status.
RSW	Current rotary switch position.
SW	Decimal value of toggle switches.
TEMP	Temporary variable.
XPOS	X position of cursor.
YPOS	Y position of cursor.
ZFLAG	Zero flag.

Issues No. 1-5 OUT OF PRINT

Contents available in book form as "Best of 99'er"—Vol. 1.

See Home Computer Digest or Inquire

THESE 2 MAGAZINES ARE OUT OF PRINT —TAPES AND DISKS ARE STILL AVAILABLE

ISSUE #6 (Partial Contents)
• How To Produce Sound Effects • Debugging a Game Program • How to Start a User's Group • Verbose: A speech Vocabulary Expansion Aid • Color Mapping • Dynamic Manipulation of Screen Character Graphics • The Beginner's Guide to Cassette Operation With the Home Computer • Pre-School Block Letters and Data Compaction • Picking the Ponies in TI BASIC • Battle Star Space Game • 3-D Animation on the Home Computer • Programing Tips • Who is LOGO for? • Tower of Hanoi in TI LOGO • A Review of the TI Lesson-Development Software • An Interview with a Game Designer • Learning Assembly Language with a Magic Crayon • and much, much more.

NOVEMBER 1982 (Partial Contents)
• Chatting with Your Micro: Languages for the Home Computer • A Review of the Smith Corona TP-1 Daisy Wheel Printer • The Micro Jaws Arcade Game • A Knight's Tour in TI BASIC • LOGO Has Style • ASPIC: A Language for Children • A p-System Beginner's Tutorial • An Interview with a p-System Pioneer • A Mini-Memory Screen Dump to the Home Computer Printer • Up Scope!—An exciting Undersea Combat Game • Strategy for Munch Man • A Brief Encounter with a TI Hand Held Computer • 99'er Shopping Bus • A Pocket Battleship • Sub-Programs in Extended BASIC • Arcade & Adventure Game Reviews • and much, much more

DECEMBER 1982 (Partial Contents)
• Tex-Scribe: A Text Editor for the Home Computer • A Christmas Computer Carol • Managing a Mailing List the Futura Way • Parsec: The Arcade Game • Plotting With the Home Computer—Pixel by Pixel • Preventing the Situation—Oh No! Memory Full • A Colorful Tour of TI-Fest: The Home Computer Show • Santa's Workshop: The Making of a Home Computer • The Turtle Arcade: Movies & Video Games in LOGO • Controlling a BASIC Termite • The 99'er Gold Rush—An Arcade/Adventure in the Home • 99'er Digest of News & Happenings in the TI World • Plus Games, Reviews, and much, much more.

JANUARY 1983 (Partial Contents)
• Computer Assisted Instruction for the Handicapped • p-System Basics • Debugging in LOGO • The Dow-4 Gazelle Flight Simulator • Note Whiz and Pitch Master Musical Game Reviews • Learning With the PLATO Computer Library • Strategies for Adventure Gaming • Death Drones • Using the Line By-Line Assembler • Close Encounters of the Simon Kind • Electrical Engineering Education Program • Interview With an Arcade Game Designer • TI Invaders • Programming With Pascal • Cyber-Dice • News and Happenings in the Home Computer World • Arcade Game Reviews • The Thief Adventure Game • Programming Tips • and much, much more.

FEBRUARY 1983 (Partial Contents)
• Texas Instruments at the Winter Consumer Electronics Show • Home Computer Printers on Review • How to Create Math Daisies in LOGO • Vectors in LOGO • ASPIC: A Language for Teachers • The Joys of Adventuring—Part 2 • Programming Pointers with Chuck-A-Luck—Part 4 • Interview With the Voice of Parsec • Why You Need a Printer for Your Home Computer • Lifeline to Titan Space Game • Night Blockade Battleship Game • Tower of Hanoi Pocket Program • Computer Gaming Software Reviews • News of Late Developments in the World of Home Computers • and much, much more.

HISTORICAL NOTE
99'er Magazine (founded in December, 1980) was the forerunner of Home Computer Magazine.

THE BEST OF 99'er™

SUPER CLOSE-OUT SPECIAL for TI-99/4A USERS

A Giant Home Computer Compendium™ for the Texas Instruments 99/4A

The largest, most comprehensive collection of programs and articles ever assembled for the TI Home Computer

VOLUME 1

- Over 200 thoroughly tested key-in-and-RUN programs and sub-programs typeset in a grid format for maximum clarity.
- Programming instruction in 4 languages—learn to use BASIC, Extended BASIC, LOGO and Assembly Language—for everything from record keeping and money management to arcade-quality action games.
- A selection of sensational game software featuring full-color graphics, animation, and sound effects.
- Beyond the owner's manual—tips and techniques for getting the most out of your computer system.
- Computer-Assisted Instruction—The home computer becomes your private tutor.
- Page after page of innovative applications—transforming your computer into a home productivity center.
