## A 2.45GHz fully-differential CMOS image-reject mixer for Bluetooth application (2002 [RFIC])

---

*P.B. Khannur and Koh Soo Ling. "A 2.45GHz fully-differential CMOS image-reject mixer for Bluetooth application (2002 [RFIC])." 2002 Radio Frequency Integrated Circuits (RFIC) Symposium 02. (2002 [RFIC]): 439-442.*

The design of a 2.45GHz image-reject mixer (IRM) for Bluetooth application using low-cost 0.35um, double-poly four-metal standard CMOS process with the metal-insulator-metal (MIM) capacitor option is described. The proposed design uses Hartley architecture with temperature compensation to significantly reduce the gain variation with temperature (-40/spl deg/C to +85/spl deg/C). In-house extracted models were used for active and passive components to achieve image rejection ratio (IRR) better than 45dB, input referred third-order intercept point (IIP3) better than -7dBm, voltage conversion gain better than 20dB and noise figure less than 20dB under all process, temperature, and voltage supply conditions. The intermediate frequency (IF) is 2MHz. The circuit operates from a 3V /spl plusmn/ 10% supply and draws 10.4mA.
