STUDIES IN AZIDE CHEMISTRY. PART 11. THERMOLYSIS OF

4-AZIDOTETRAFLUOROPYRIDINE: EVIDENCE FOR THE OCCURRENCE OF A

NITRENE-CARBENE REARRANGEMENT

SUMMARY

Flow pyrolysis of vaporized 4-azidotetrafluoropyridine at 280-300 °C and atmospheric pressure in platinum gave dark-coloured intractable material containing trans-perfluorof1,2-bis(pyrazinyl)ethene].

INTRODUCTION

Vapour-phase flow pyrolysis of nitrogen-diluted azidopentafluorobenzene in platinum at 280-300 °C and <u>ca</u>. 760 mm Hg gives carbonaceous material from which perfluoro-2,7'-diaza-heptafulvalene (<u>1</u>) can be isolated (yield, 10%) [1,2]. Clearly, it was of interest to perform a similar experiment using 4-azidotetrafluoropyridine as feedstock.

RESULTS AND DISCUSSION

^{*} To whom enquiries should be addressed.

In a typical experiment, a slow stream of dry nitrogen was passed through warm (75-80 °C) 4-azidotetrafluoropyridine (10.0 g, 52 mmol) and thence through a hot (280-300 °C) platinum pipe (97 x 1 cm; electricallyheated length 56 cm) connected to two cold (-196 °C) traps until the supply of the azido-compound was exhausted (15 hr.). Nothing collected in the traps, and the product took the form of a dark brown solid adhering to the walls of the pyrolysis tube near the exit. This solid was scraped out and subjected to vacuum sublimation (bath temp. 140 °C; ca.1 mmHg) to provide a pale-yellow solid (0.01 g, 0.3 mmol, 0.1%) (Found : C, 37.2; N, 16.4.Calc. for C₅F₄N₂: C, 36.6; N, 17.1%), m.p. 170-174 °C, which was shown by mass spectrometry to be a dimer of tetrafluoro-4-pyridylnitrene [m|z] 328 $(C_{10}F_8N_4+\cdot, 100\%)$, 309 $(M+\cdot-F\cdot,77\%)$; 70 eV electron beam ionisation energy]. 19F N.m.r. analysis (see below) revealed immediately that this dimer was not a tetra-azaheptafulvalene (2), i.e. the expected product by analogy with the formation of the corresponding diaza-compound (1) from azidopentafluorobenzene under the same conditions [2], but trans-perfluoro[1,2-bis(pyrazinyl)ethene] (3). The sublimation residue (Found: C, 39.2; H, 0.3; F, 26.9; N, 17.8%) did not melt below 360 °C and gave an i.r. spectrum comprised of broad, diffuse absorptions.

Formation of perfluoro[1,2-bis(pyrazinyl)ethene](3) can be accommodated in terms of a Crow-Wentrup [3] nitrene = carbene interconversion sequence (see the Scheme) which was used previously to rationalise the formation of tetrafluoropyrazine via pyrolysis of 4-(dichloroamino)tetrafluoropyridine [4]; naturally (cf. [1]), the Scheme allows for the formation of perfluoro-2,4',5,7'-tetra-azaheptafulvalene (2), so should an opportunity arise, we intend to investigate further the thermal decompositions of 4-azidotetrafluoropyridine and azidopentafluorobenzene to throw light on the mechanistic situation. The failure to obtain a heptafulvalene derivative from 4-azidotetrafluoropyridine means that formation of compound (1) in the case of azidopentafluorobenzene [1,2] is still unique, whereas production of the ethylenic dimer (3) finds analogy in the formation of small amounts (1-3% yield) of 1,2-bis(2-pyridyl)ethenes in thermolytic reactions designed to probe phenylnitrene - 2-pyridylcarbene interconversions of the hydrocarbon class [3,5].

The 19 F n.m.r. spectrum of the new pyrazinylethene (3) (measured in CDCl₃ at 75.29 MHz on a Bruker WP80 instrument) showed four absorption bands of equal intensity at (external CF₃CO₂H ref.) 3.3 (d x t x d; F-3; $|J_{3,6}| = 42.1$, $|J_{3,7}+J_{3,7}| = 47.0$, $|J_{3,5}| = 6.9$ Hz, -3.2 (d x d; F-5; $|J_{5,6}| = 20.2$ Hz), -11.9 (d x d; F-6), and -67.7 p.p.m. (t; F-7). The large magnitude of J_{36} is quite characteristic of fluoropyrazines [6], and the other coupling constants of ring fluorines fall within the usual ranges. The coupling to the ethene fluorines (F-7), which is of the 'deceptively simple' A_2X_2 -type, is presumably dominated by $J_{3,7}$ and reflects a through-space contribution. The chemical shifts of the ring fluorines are similar to those observed in perfluoro-(2-alkylpyrazines) [7], and, overall, the spectrum is entirely consistent with structure (3).
