Monothionated analogs **10a–d** and dithionated analogs **11a–d** were prepared in the yields of 31–42% and 24–33%, respectively. The yields were essentially the same as in the case of thionation with P_2S_5 [3d]. In the case of compounds **5–7** with hydroxyl group in position 8, 7 or 6, we did not succeed to isolate any desired product; except for compound **6c**, which gave only monothionation product **9c** in a 5% yield. Attempts to prepare desired thioxo derivatives using P_2S_5 instead of Lawesson's reagent also failed.

For monothionated compounds **9c** and **10a–d**, the presence of sulfur in position four was unequivocally corroborated by 2D NMR (gHMQC and gHSCQ experiments). All gHSQC correlations are shown in Figure 1.

***In vitro* antifungal activity.** All compounds were tested for their *in vitro* antifungal activity [17] against eight test strains. All experiments were performed in comparison with fluconazole, a known antifungal agent. Some compounds were not sufficiently soluble in the testing medium RPMI 1640 and precipitated during the testing period, therefore their minimum inhibitory concentrations MICs could not be determined accurately. The activities of the substances are shown in Table 2. Only compounds with MICs ≤ 125 μmol/L for at least one tested strain were included.

All compounds presented in Table 2 exhibited activities against *Aspergillus fumigatus* and *Absidia corymbifera* higher than or comparable with that of fluconazole. Generally, 2,3-dihydroxy derivatives **1** and 2,6-dihydroxy derivatives **4** were the most active compounds. As for the effect of the substituent in the aniline moiety, chloro substitution increased antifungal activity. Only compound **4c** was more active than fluconazole against *Trichophyton mentagrophytes* (MIC = 1.95 μmol/L after 120 h).

The cyclization of compounds **1–4** to corresponding 3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones **5–8** results in a decrease of antifungal activity. Only compound **5c** retained activity against at least one strain, *Candida glabrata*. No antifungal activity was observed in thionated compounds **9c** and **10a–11d** (Table 2).

CONCLUSIONS

We have described a convenient microwave-assisted method for the synthesis of dihydroxy-*N*-phenylbenzamides **1–4**, which were transformed into hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones **5–8** by a reaction with methyl chloroformate. We have been successful in thionation of benzoxazines with a free hydroxyl group in position five only, *i.e.* derivatives **8a–d**. In the case of derivatives **5–7**, attempts to prepare dithioxo-analogs failed, both with the use of P_2S_5 and Lawesson's reagent. The prepared compounds showed only moderate antifungal activity in comparison with the standard fluconazole. Cyclization of dihydroxy-*N*-phenylbenzamides **1–4** to produce benzoxazines **5–8** markedly decreased the activity and transformation to mono- and dithionated analogs destroyed the activity.

EXPERIMENTAL

The starting compounds were purchased from Sigma-Aldrich Company. Melting points were taken on a Büchi Melting Point B-545 apparatus and are uncorrected. IR spectra were taken on a Nicolet Impact 400 spectrometer in KBr pellets. The NMR spectra was recorded on a Varian Mercury-Vx BB 300 (300 MHz) and Bruker AC 250 (250 MHz). The samples were dissolved in hexadeuteriodimethyl sulfoxide (DMSO-d_6) or deuteriochloroform ($CDCl_3$). Chemical shifts were recorded as δ values, and were indirectly referenced to tetramethylsilane *via* the solvent signal. The elemental analyses were performed with a Perkin-Elmer 2400 CHNS/O analyzer. Microwave experiment was performed on a Millestone-MicroSYNTH (MLS ETHOS 1600 URM) instrument at 600 W output power. Column chromatography was carried out on silica gel 60 from E. Merck and purifications were monitored by TLC (UV detection) on aluminum sheets coated with silica gel 60 F_{254} (Merck).

General method for preparation of dihydroxy-*N*-phenylbenzamides (1a–4d) *via* microwave irradiation. A mixture of dihydroxybenzoic acid (3.08 g, 20 mmol) and respective aniline (30 mmol) in chlorobenzene (120 mL) was stirred. PCl_3 (0.87 mL, 10 mmol) was added, and the mixture was stirred and irradiated in a microwave reactor at 600 W for 20 min. The mixture was than cooled to room temperature and evaporated at reduced pressure. The crude product was purified by chromatography on a silica-gel column using acetone-hexane (1:5). The product was recrystallized from an ethanol/water mixture. For details see Table 1.

General method for preparation of hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones (5a–8d). Methyl chloroformate (0.5 mL, 6 mmol) was added dropwise to a stirred solution of dihydroxy-*N*-phenylbenzamide 1a–4d (5 mmol) in dry pyridine (40 mL) at 0°C. The mixture was heated on an oil bath for 2 h. After 10–h stirring at room temperature, the pH of the reaction mixture was adjusted to pH ≈ 6 (HCl aq., 5%). The resulting white heterogeneous mixture was cooled to obtain crystalline compound. The product was filtered off and recrystallized from ethanol. For details see Table 1.

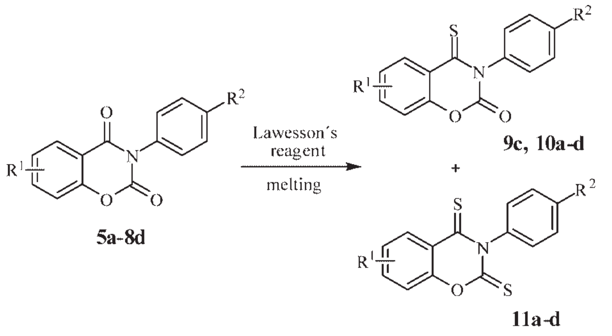
Scheme 3



R^1 = OH; R^2 = H, CH_3, Cl, OCH_3

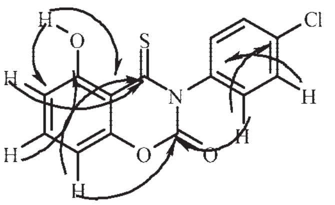


Figure 1. gHSCQ correlations present in **10c**.

Preparation of hydroxy-3-phenyl-4-thioxo-3,4-dihydro-2*H*-1,3-benzoxazin-2-ones (9c, 10a–d) and hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dithiones (11a–d). 5-Hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dione **5a–8d** (4 mmol) was melted with Lawesson's reagent (4 mmol) for 4 min at 190–200°C. After cooling to room temperature, the melt was dissolved in chloroform, washed with aq. $NaHCO_3$ (5%, 1 × 100 mL), water (1 × 100 mL) and the solvent was evaporated under reduced pressure. Column chromatography on silica gel using toluene-hexane (1:1) was performed to obtain 3-(4-chlorophenyl)-7-hydroxy-4-thioxo-3,4-dihydro-2*H*-1,3-benzoxazin-2-one (**9c**), 5-hydroxy-3-phenyl-4-thioxo-3,4-dihydro-2*H*-1,3-benzoxazin-2-ones **10a–d** (lower R_f) and 5-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dithiones **11a–d** (higher R_f) as orange-yellow solids. For details see Table 1.

***In vitro* antifungal susceptibility testing.** The broth microdilution test M27-A [17] was used for the assessment of *in vitro* antifungal activity of the synthesized compounds against *Candida albicans* ATCC 44859 (CA), *Candida tropicalis* 156 (CT), *Candida krusei* E28 (CK), *Candida glabrata* 20/I (CG), *Trichosporon asahii* 1188 (TA), *Trichophyton mentagrophytes* 445 (TM), *Aspergillus fumigatus* 231 (AF), and *Absidia corymbifera* 272 (AC). Fluconazole was used as the reference drug. The procedure was performed with two-fold dilution of the compounds in RPMI 1640 medium (Sevapharma, Prague, Czech Republic) buffered to pH 7.0 with 0.165 *M* of 3-morpholinopropane-1-sulfonic acid. Drug-free controls were included. The minimum inhibitory concentrations (MICs) were defined as 80% (IC_{80}) and higher reduction of growth in comparison with control. The values of MICs were determined after 24 h and 48 h of static incubation at 35°C. For *T. mentagrophytes*, the final MICs were determined after 72 h and 120 h of incubation. The results for selected substances are summarized in Table 2.

2,3-Dihydroxy*-N-*phenylbenzamide (1a). Received October 8, 2008
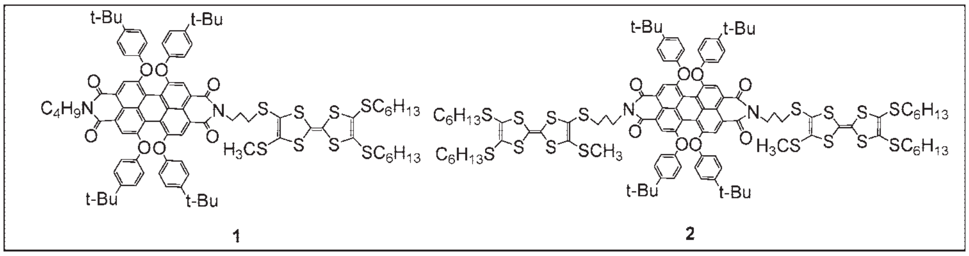
DOI 10.1002/jhet.160



Two highly soluble donor-σ-acceptor and donor-σ-accepter-σ-donor type fluorescence switches consisting tetrathiafulvalene (TTF) and 3,4,9,10-perylene tetracarboxylic diimides (PDI) were synthesized. The structure of the dyad and triad as well as their intermediates was characterized by ^{1}H NMR, ^{13}C NMR MS, elemental analysis. Their fluorescence behavior could be modulated by oxidization and reduction of the TTF unit using either chemical or electrochemical method.

J. Heterocyclic Chem., **46**, 881 (2009).

INTRODUCTION

Perylene diimide (PDI) [1–7] has been used in donor-acceptor supramolecules due to their optical, redox, and stability properties. Tetrathiafulvalene (TTF) and its derivatives [8–11] are well known for their π-electron-donor properties. They have been extensively investigated as building blocks in electrical conductors and superconductors [12]. Some electron donor–acceptor supramolecules with TTF units have been prepared for studies related to intramolecular photoinduced electron transfer processes, intramolecular charge-transfer (ICT) interactions and construction of molecular rectifiers [13–16].

However, the research of PDI-TTF type donor-acceptor system was confined because of the poor solubility of perylene diimide (PDI). Thus, we interested in the introduction of tetra-substituent tetra-butylphenoxy group to the bay region of PDIs to improve its solubility. In this article, electron donor-σ-acceptor dyad **1** and donor-σ-acceptor-σ-donor triad **2** containing PDI and TTF unit were synthesized and characterized (Scheme 1). The TTF unit is linked to PDI unit and the PDI unit is modified by *tert*-butylphenol to increase its solubility. TTF-type compounds are able to exist in three different stable redox states (TTF, TTF$^{\bullet+}$, TTF^{2+}). Therefore, the donating ability of TTF could be tuned by either chemical or electrochemical reversible redox reactions. And the optical absorption, fluorescent spectra, chemical, and electrochemical methods shows that two novel fluorescence switches were established.

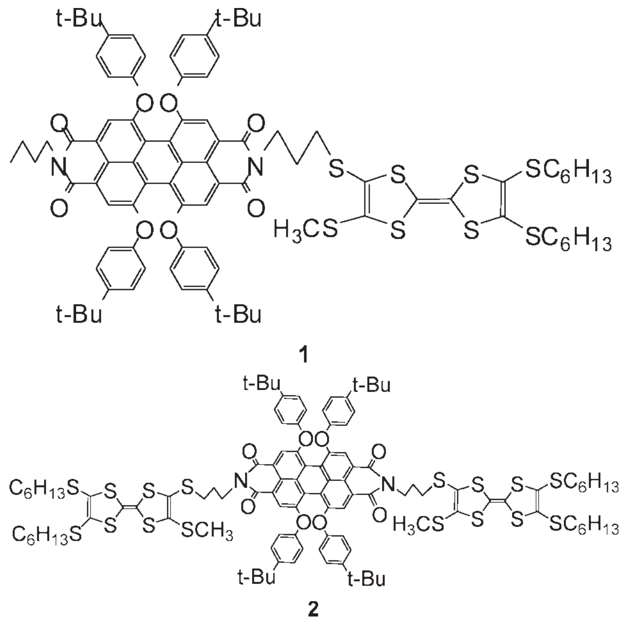
RESULTS AND DISCUSSION

The target compound **1** and **2** were synthesized starting from *N*-hexyl-1,6,7,12-tetra(4-*tert*-butylphenoxy)-perylene-3,4-anhydride-9,10-tetracarboxylicimide (**4**) and 1,6,7,12-tetrakis(4-*tert*-butylphenoxy)-3,4,9,10-perylene-tetracarboxy-anhydride (**5**) (Scheme 2).

Compounds **4**, **5**, and **6** were prepared by method previously reported [17–20]. The amino TTF **7** was synthesized through ammonization of TTF **6** with the presence of $LiAlH_4$ in THF. The reaction of compound **4** and amino TTF **7** led to dyad **1** (yield, 45%). The way to get compound **2** was just like the reaction to get compound **1**. Amino TTF **7**, compound **6** together with imidazole were heated to 175–180°C for 48 h, and compound **2** was finally achieved with a yield of 40% after column chromatography on silica gel (CH_2Cl_2: ethyl acetate = 1:1).

With tetrasubstitutions of p-t-butylphenoxy at the bay region, compound **1** and **2** were highly soluble in common organic solvents like CH_2Cl_2, $CHCl_3$, ethyl acetate, acetone, DMF, toluene, pyridine, and acetonitrile, slightly soluble in methanol, and insoluble in hexane and petroleum ether. The UV-vis spectra of dyad **1** and triad **2** were measured in CH_2Cl_2 (1.0×10^{-5} M) with CARY 100 Conc UV-vis spectrophotometer (Fig. 1).

Scheme 1. Structure of dyad **1** and triad **2**.



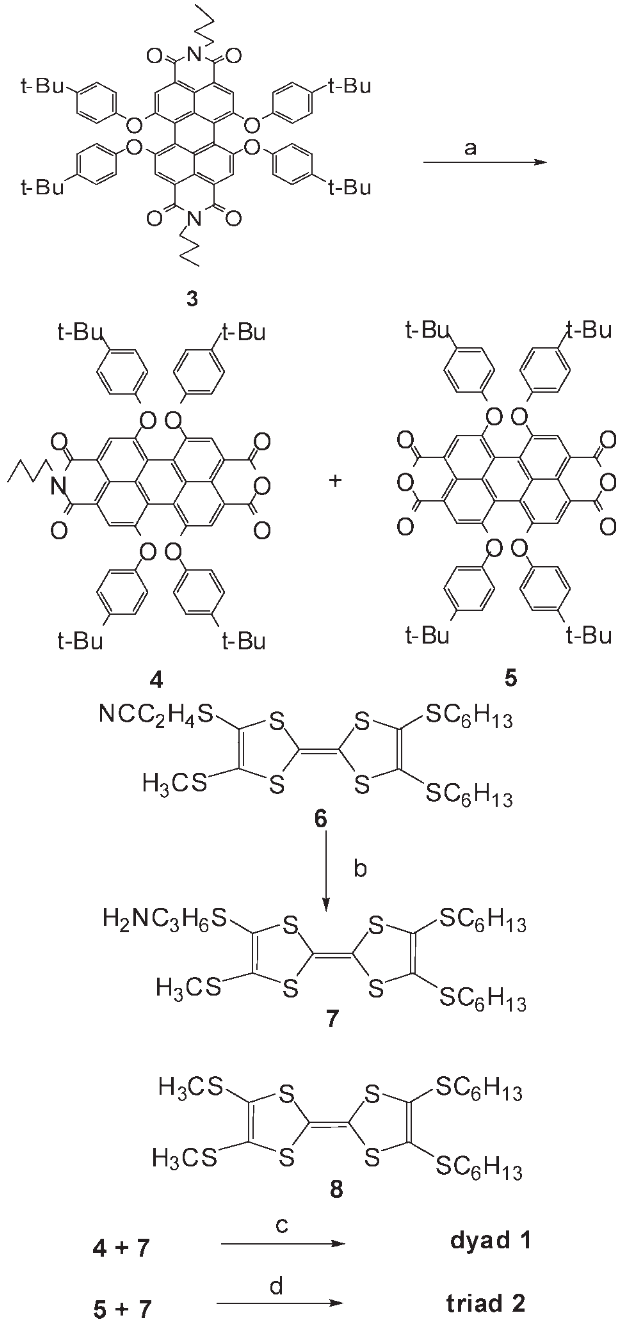
For comparison, the UV-vis spectra of model compound **3** and **8** (1.0×10^{-5} M in CH_2Cl_2) were also given. Their spectral data were listed in Table 1.

The absorption spectra of **1**, **2**, **3** showed a wide absorption between 300 and 650 nm with identical absorption maximum at about 451, 537, 577 nm. Compared with PDI **3**, compound **1** and **2** have a new band at about 331 nm which is coincide with the absorption of TTF **8**. The UV-vis absorption spectra of **1** and **2** were almost summation of the spectra of donor **8** and acceptor **3** and no new band or unique spectroscopic shoulder was observed, this implying neglectable ground state electronic interaction between perylene diimide and TTF unit.

The electrochemical characterization of **1**, **2** and reference compounds **3**, **8** were tested by cyclic voltammetry (CV) and their voltammetric data were listed in Table 2. All the experiments were performed in dichloromethane, using *n*-Bu_4NPF_6 (10^{-1} M) as the supporting electrolyte, platinum as the working and counter electrodes, and Ag/AgCl as the reference electrode; the scan rate was 50 mV s^{-1}. Dyad **1** and triad **2** show almost the same reduction potentials at about −0.90 and −0.60 V, which were ascribed to the successive formation of the anion radical PDI^- and dianion PDI^{2-}. In positive direction, **1** and **2** exhibited two one-electron reversible oxidation waves at about +0.58, +0.91, and +1.37 V, corresponding to the successive generation of the cation radical $TTF^{\bullet+}$, dication TTF^{2+} and cation radical PDI^+. Comparison of different values for dyad **1** and triad **2** with reference compounds **3** and **8** suggested that no significant interaction takes place between both electroactive moieties in the ground state. This result was coincident with that of the UV-vis absorption.

Fluorescence spectra of **1**, **2**, and **3** were carried out with a CARY Eclipse Fluorescence Spectrophotometer in a 1 cm quartz cell (Fig. 2). Compared to compound **3**, dyad **1** and triad **2** show a rather weak fluorescence. The fluorescence quantum yield ϕ_f (λ_{exc} = 540 nm) of

Scheme 2. Synthetic procedure for compound **1** and **2**: (a) KOH, isopropanol/H_2O, N_2, reflux; (b) $LiAlH_4$, THF, N_2; (c) imidazole, reflux in *m*-cresol for 24 h, yield: 6, 45%; 7, 10%; (d) imidazole, reflux in *m*-cresol for 48 h, yield 40%.



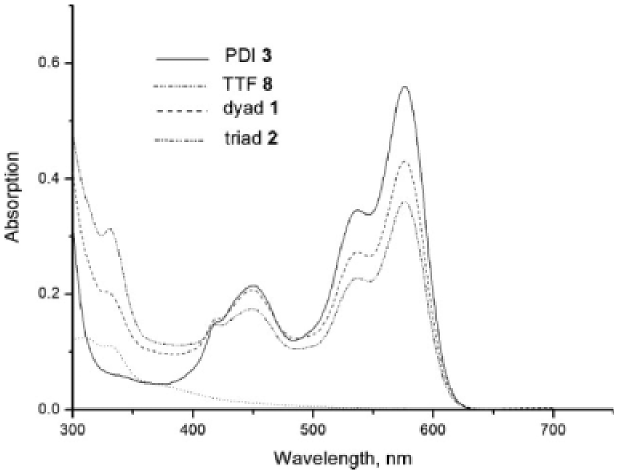


Figure 1. Absorption spectrum of compounds **1**, **2**, **3**, and **8** (1.0×10^{-5} M in CH_2Cl_2).

1 and **2** was 0.172 and 0.087 compared to PDI **3** ($\phi_f = 1$). This weakly fluorescence emission of **1** and **2** could be attributed to a photoinduced electron transfer (PET) reaction between PDI and TTF unit in the dyad and triad for two major reasons: (1) ΔG values of **1** and **2** calculated using the Rehm-Weller equation [21] for the photoinduced electron transfer reactions were −1.03 and −1.04 eV, thus these reactions are thermodynamically favorable; (2) there was no spectral overlap between the absorption spectrum of TTF unit and Fluorescence spectrum of PDI unit. Hence, the energy transfer process was prohibited according to Förster mechanism [4].

Figure 3 was fluorescence spectra of **1** and **2** after addition of different amount of Fe^{3+} and further reduction by $Na_2S_2O_3$ (1.0×10^{-5} M in CH_2Cl_2, $\lambda_{ex} = 540$ nm). It is known that TTF and its analogues can be oxidized stoichiometrically by Fe^{3+}. As TTF being oxidized to corresponding cation radical and dication species, the fluorescence of compound **1** and **2** both increased gradually after Fe^{3+} was added. The maximum fluorescent intensity of dyad **1** increased by 245% after reaction with 1.0 equiv of Fe^{3+} and the maximum fluorescent intensity of triad **2** increased by 663% after 2.0 equiv of Fe^{3+} was added. As expected, after react with excess sodium thiosulfate ($Na_2S_2O_3$) to the former chemically oxidized solution, both absorption and fluorescence spectrum of compound **1** and **2** restored (see Fig. 3). This is because the radical cation of TTF unit (TTF^{2+}) of compound **1** and **2** transferred into neutral unit after adding of $Na_2S_2O_3$. This indicates that the fluorescence of dyad **1** and triad **2** could be modulated by reversible chemical oxidation and reduction of TTF unit.

Table 1

The absorption data of compounds **1**, **2**, **3**, and **8** (1.0×10^{-5} M in CH_2Cl_2).

Compound	Absorption nm, $\varepsilon \times 10^5$ M^{-1} cm^{-1}
1	329(0.20), 448(0.21), 537(0.27), 577(0.43)
2	331(0.31), 449(0.17), 536(0.23), 577(0.37)
3	451(0.21), 537(0.34), 578(0.56)
8	312(0.12), 332(0.11)

Table 2

Oxidation potentials of compounds **1**, **2**, **3**, and **8** in dichloromethane (1.0×10^{-3} M).

	$E_{1/2}$ (V)				
Compound	PDI^{2-}	PDI^{-}	$TTF^{\bullet+}$	TTF^{2+}	PDI^{+}
3	−0.91	−0.60			1.37
8			0.54	0.91	
1	−0.90	−0.60	0.58	0.93	1.38
2	−0.89	−0.61	0.56	0.92	1.40

The fluorescence of dyad **1** and triad **2** could also be modulated by reversible electrochemical oxidation and reduction of TTF unit (see Fig. 4). Oxidation of compound **1** and **2** (1.0×10^{-5} M) containing n-Bu_4NPF_6 (1.0×10^{-1} M) was performed by applying an oxidation potential of 0.60 V (vs. Ag wire) to the solution. Figure 4 show that the oxidation led to the increase at 600 nm. This is similar to the fluorescence spectral variation observed after chemical oxidation which is discussed above. The application of a reduction potential of 0.1 V (vs. Ag wire) to former electrochemically oxidized solution for 5 min also led to the transformation of TTF^{2+} into neutral unit. Consequently, the fluorescence of dyad **1** and triad **2** restored (Fig. 4). As a result, electrochemically oxidization and reduction could also modulate the fluorescence of both dyad **1** and triad **2**.

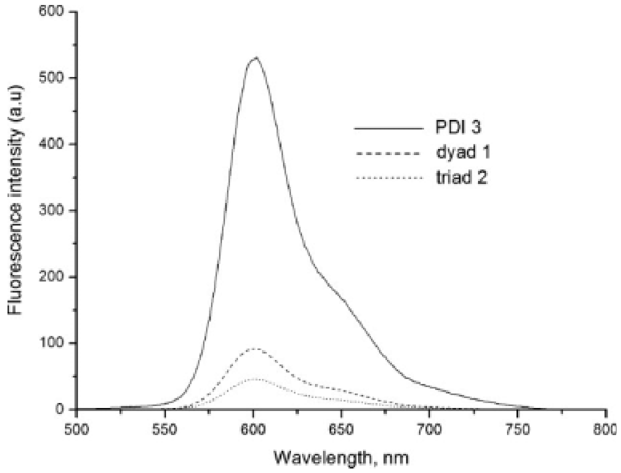

Figure 2. Fluorescence spectrum of compounds **1**, **2**, and **3** (1.0×10^{-5} M in CH_2Cl_2, $\lambda_{ex} = 540$ nm).

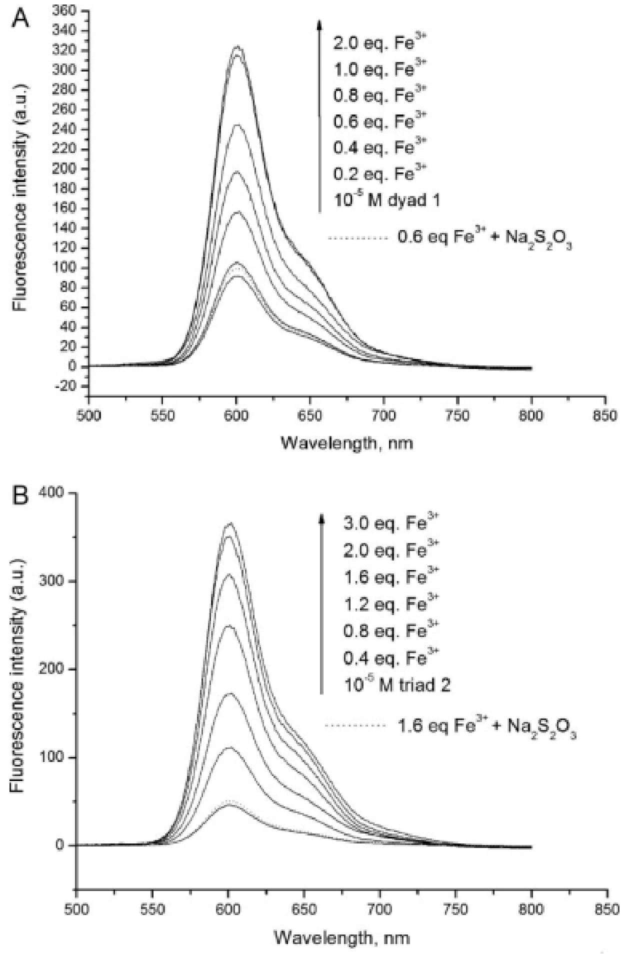

Figure 3. Fluorescence spectrum of dyad **1** (A) and triad **2** (B) (1.0×10^{-5} M in CH_2Cl_2, $\lambda_{ex} = 540$ nm) in the presence of different amounts of $Fe(ClO_4)_3$ and further reduction by $Na_2S_2O_3$.

CONCLUSIONS

We have designed and synthesized a new donor-σ-accepter (D-σ-A) type molecular fluorescence switches dyad **1** and a new donor-σ-accepter-σ-donor (D-σ-A-σ-D) type molecular fluorescence switch triad **2** containing PDI and TTF units. Compound **1** and **2** both have excellent solubility in most organic solvents because of the tetra-substituted p-t-butylphenoxy at the bay region. What's more, their fluorescent behavior could be modulated by reversible oxidation and reduction of TTF unit either chemically or electrochemically.

EXPERIMENTAL

***N*-Hexyl-1,6,7,12-tetra(4-*tert*-butylphenoxy)-perylene-3,4-anhydride-9,10-tetracarboxylicImide (4) and 1,6,7,12-tetra(4-*tert*-butylphenoxy)-perylene-3,4,9,10-tetracarboxylicbisanhydride (5).** *N,N′*-Dihexyl-1,6,7,12-tetra(4-*tert*-butylphenoxy)-perylene-3,4,9,10-tetracarboxylicdiimide (2.2 g, 2.0 mmol) with KOH (6 g,10 mmol) in isopropylalcohol (60 mL) and H_2O (6 mL) were heated to reflux temperature under argon for 10 h, followed by acidic work up and thorough washing and drying, yielded a mixture (1.0 g) of perylenemonooctylimide (**4**) and perylenebisanhydride (**5**) in a ratio of about 7:3. Compound **4** and **5** were separated by column chromatography on a silica gel with CH_2Cl_2/petroleumether (1:1). A series of 2-*p*-tolylthiopyridine derivatives was directly synthesized *via* three-component reactions of chalcones, malononitrile, and 4-methylbenzenethiol catalyzed by Et_3N in DMF under microwave irradiation. It is an efficient and promising synthetic strategy to construct 2-thiopyridine skeleton with the advantage of short time, excellent yield, and convenient operation.

J. Heterocyclic Chem., **46**, 886 (2009).

INTRODUCTION

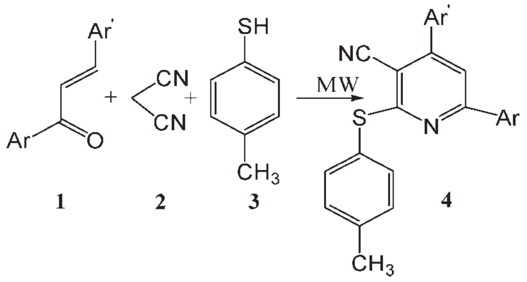
The pyridine nucleus, as the key constituent in a range of bioactive compounds, is one of the most well-known systems among the naturally occurring heterocycles [1]. Polysubstituted pyridines including the related 2-thiopyridines are prominent building blocks, exhibit antibacterial [2,3], pesticidal [4], antifungal [4,5], and acaricidal properties [5] and may have potential ability to form complexes with transition metals. Thus, the synthesis of pyridines and their analogs has attracted much attention. The majority of synthetic methods to the target compounds start from the condensation of α,β-unsaturated ketones or β-diketones with cyanothioacetamide, and then formed 2-alkylthio-pyridines by the reaction of the iodoalkane [6]. However, even these methods are still not satisfactory because of the narrow scope of substituted alkylthiopyridines produced and the multistep synthesis. Therefore, the development of a simple, one-pot, and directed synthetic route, which provides diverse of 2-thiopyridine compounds, is strongly desired for this important class of heterocycles.

As a part of our ongoing development of efficient protocols for the preparation of polysubstituted heterocycles [7] from common intermediates, we recently discovered technically simple microwave (MW) conditions for the synthesis of new 2-(*p*-tolylthio)-4,6-diarylpyridine-3-carbonitrile derivatives using α,β-unsaturated ketones as starting materials (Scheme 1).

RESULTS AND DISCUSSION

To choose the most appropriate medium in this heterocyclization reaction, the MW-assisted reaction of 3-(4-bromophenyl)-1-*p*-tolylprop-2-en-1-one (**1a**), malononitrile (**2**), and 4-methylbenzenethiol (**3**) was examined using the solvent of HOAc, glycol, THF, DMF, and EtOH as solvent at 100°C, respectively. The results are summarized in Table 1, the reaction in DMF gave the best yield. Therefore, DMF was chosen as the solvent of this reaction. Moreover, to further improve the reaction yields, different bases were examined for their ability to promote this reaction at 100°C. As shown in Table 2, the Et_3N afforded the target product **4a** in an 85% yield. Finally, to further optimize the reaction temperature, the synthesis of **4a** was performed in the presence of Et_3N at the temperatures ranging from 100 to 130°C. As illustrated in Table 3, the yield of product **4a** was increased and the reaction time was shortened as the temperature was increased from 100 to 120°C. The yield decreased slightly when the temperature was further increased from 120 to 130°C. So, the temperature of 120°C was chosen for all further microwave-assisted reactions.

Scheme 1



Under these optimized reaction conditions, we synthesized a series of products **4** using this simple procedure. The results are summarized in Table 4 (Entries 1–14). This methodology is applicable to aromatic and heteroaromatic chalcones. Furthermore, the electronic effect with various substituents on the chalcones was studied and had no significant effect on this reaction.

A mechanism for the formation of the products **4** is outlined in Scheme 2. The reaction occurs via initial formation of compounds **5** afforded by Michael addition reaction of chalcones and malononitrile followed by the thiolate nucleophilic attack in the presence of Et_3N. The intermediate **5** cyclizes to dihydropyridine **6** and subsequent afford the fully aromatized compound **4** with the loss of hydrogen. This type of oxidation is well precedented [8b,9]. In this study, all the products were characterized by mp, IR, and ^{1}H NMR spectral data and elemental analysis.

In summary, we demonstrated a rapid and direct method that offers a simple and efficient route for the one-pot, three-component synthesis of highly functionalized 2-thiopyridine derivatives in excellent yields. Particularly valuable features of this method include operational simplicity and increased safety for small-scale high-speed synthesis.

EXPERIMENTAL

Microwave irradiation was carried out with an Emrys^{TM} Creator microwave oven from Personal Chemistry, Uppsala, Sweden. Melting points were determined in open capillaries and were uncorrected. IR spectra were recorded on a FT-IR-Tensor 27 spectrometer in KBr. ^{1}H NMR spectra were measured on a DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. Elemental analyses were determined with a Perkin-Elmer 240c elemental analysis instrument.

5	Et_3N	12	85

General procedure for 2-(*p*-Tolylthio)-4,6-diphenylpyridine-3-carbonitrile derivatives (4). The reactions were performed in a 10 mL Emrys^{TM} reaction vial. Chalcones **1** (1 mmol), malononitrile **2** (1 mmol), and 4-methylbenzenethiol **3** (1 mmol) in DMF in the presence of Et_3N were mixed and then capped. The mixture was heated for a given time at 120°C under microwave irradiation (initial power 200 W and maximum power 250 W). Upon complete consumption of starting materials, as monitored by TLC, the reaction mixture was cooled to room temperature, and then filtered to give the crude product, which was further purified by recrystallization from EtOH (95%) to give pure target products **4**.

2-(*p*-Tolylthio)-4-(4-bromophenyl)-6-*p*-tolylpyridine-3-carbonitrile 4a. This compound was obtained according to the above general procedure; IR (potassium bromide): 3017, 2917, 2210, 1572, 1522, 1491, 1368, 1008, 820, 803, 761 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.92 (s, 1H, PyH),7.79 (t, J = 7.6 Hz, 4H, ArH), 7.68 (d, J = 8.4 Hz, 2H, ArH), 7.56 (d, J = 8.4 Hz, 2H, ArH), 7.38 (d, J = 8.0 Hz, 2H, ArH), 7.20 (d, J = 8.0 Hz, 2H, ArH), 2.44 (s, 3H, CH_3), 2.32 (s, 3H, CH_3); Anal. Calcd. for $C_{26}H_{19}BrN_2S$: C, 66.24; H, 4.06; N, 5.94; Found: C, 66.45; H, 4.10; N, 5.90.

2-(*p*-Tolylthio)-4-(4-chlorophenyl)-6-*p*-tolylpyridine-3-carbonitrile 4b. This compound was obtained according to above general procedure; IR (potassium bromide): 3063, 2918, 2210, 1595, 1523, 1367, 1093, 821, 801, 760 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.92 (s, 1H, PyH),7.79 (t, J = 7.6 Hz, 4H, ArH), 7.68 (d, J = 8.4 Hz, 2H, ArH), 7.56 (d, J = 8.4 Hz, 2H, ArH), 7.38 (d, J = 8.0 Hz, 2H, ArH), 7.20 (d, J = 8.0 Hz, 2H, ArH), 2.44 (s, 3H, CH_3), 2.32 (s, 3H, CH_3). Anal. Calcd. For $C_{26}H_{19}ClN_2S$: C, 73.14; H, 4.49; N, 6.56; Found: C, 73.29; H, 4.52; N, 6.63.

2-(*p*-Tolylthio)-4-(4-nitrophenyl)-6-*p*-tolylpyridine-3-carbonitrile 4c. This compound was obtained according to the above general procedure; IR (potassium bromide): 3071, 2207, 1604, 1567, 1526, 1353, 1018, 859, 820, 808 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 8.44 (d, J = 8.4 Hz, 2H, ArH), 8.05 (d, J = 8.0 Hz, 2H, ArH), 8.00 (s, 1H, PyH), 7.79 (d, J = 8.0 Hz, 2H, ArH), 7.57 (d, J = 8.0 Hz, 2H, ArH), 7.39 (d, J = 8.0 Hz, 2H, ArH), 7.22 (d, J = 8.0 Hz, 2H, ArH), 2.44 (s, 3H, CH_3), 2.33 (s, 3H, CH_3). Anal. Calcd. for $C_{26}H_{19}N_3O_2S$: C, 71.38; H, 4.38; N, 9.60; Found: C, 71.54; H, 4.40; N, 9.65.

2-(*p*-Tolylthio)-4-(3,4-dimethoxyphenyl)-6-*p*-tolylpyridine-3-carbonitrile 4d. This compound was obtained according to the above general procedure; IR (potassium bromide): 3003, 2935, 2214, 1604, 1569, 1523, 1506, 1270, 1140, 1022, 800, 662 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.84 (s, 1H, PyH), 7.73 (d, J = 8.0 Hz, 2H, ArH), 7.51 (d, J = 8.0 Hz, 2H, ArH), 7.35–7.29 (m, 4H, ArH), 7.17–7.11 (m, 3H, ArH), 3.83 (s, 3H, OCH_3), 3.81 (s, 3H, OCH_3), 2.39 (s, 3H, CH_3), 2.28 (s, 3H, CH_3). Anal. Calcd. for $C_{28}H_{24}N_2O_2S$: C, 74.31; H, 5.35; N, 6.19; Found: C, 74.11; H,5.51; N, 6.32.

2-(*p*-Tolylthio)-4-(benzo[*d*][1,3]dioxol-6-yl)-6-*p*-tolylpyridine-3-carbonitrile 4e. This compound was obtained according to the above general procedure; IR (potassium bromide): 2918, 2214, 1566, 1525, 1502, 1376, 1251, 1042, 816 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.85 (s, 1H, PyH), 7.77 (d, J = 8.0 Hz, 2H, ArH), 7.55 (d, J = 8.0 Hz, 2H, ArH), 7.39–7.37 (m, 3H, ArH), 7.30–7.27 (m, 1H, ArH), 7.19 (d, J = 8.0 Hz, 2H, ArH), 7.14 (d, J = 7.6 Hz, 2H, ArH), 6.16 (s, 2H, OCH_2O), 2.43 (s, 3H, CH_3), 2.32 (s, 3H, CH_3). Anal. Calcd. for $C_{27}H_{20}N_2O_2S$: C, 74.29; H, 4.62; N, 6.42; Found: C, 74.31; H, 4.76; N, 6.53.

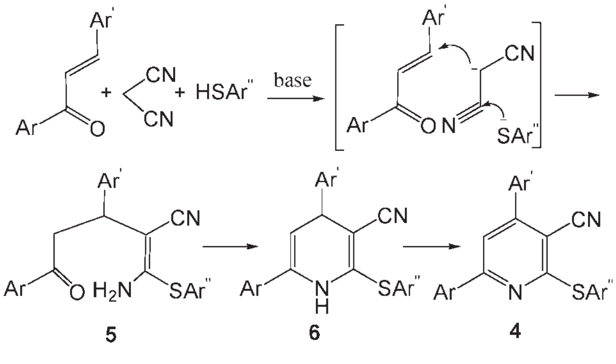
2-(*p*-Tolylthio)-4-(4-bromophenyl)-6-(4-methoxyphenyl)-pyridine-3-carbonitrile 4f. This compound was obtained according to the above general procedure; IR (potassium bromide): 3065, 2961, 2212, 1600, 1574, 1519, 1489, 1421, 1256, 1176, 1024, 1009, 983, 839, 820, 810 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.87 (s, 1H, PyH), 7.84–7.81 (m, 4H, ArH), 7.71 (d, J = 8.4 Hz, 2H, ArH), 7.56 (d, J = 8.0 Hz, 2H, ArH), 7.39 (d, J = 7.6 Hz, 2H, ArH), 6.93 (d, J = 9.2 Hz, 2H, ArH), 3.81 (s, 3H, OCH_3), 2.44 (s, 3H, CH_3). Anal. Calcd. for $C_{26}H_{19}BrN_2OS$: C, 64.07; H, 3.93; N, 5.75; Found: C, 64.26; H, 3.85; N, 5.89.

2-(*p*-Tolylthio)-6-(4-methoxyphenyl)-4-phenylpyridine-3-carbonitrile 4g. This compound was obtained according to the above general procedure; IR (potassium bromide): 3015, 2976, 2214, 1608, 1568, 1525, 1491, 1406, 1368, 1310, 1168, 1022, 834, 808, 773, 757, 698 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.88–7.86 (m, 3H, ArH, PyH), 7.77–7.75 (m, 2H, ArH), 7.61–7.57 (m, 5H, ArH), 7.39 (d, J = 8.0 Hz, 2H, ArH), 6.93 (d, J = 8.8 Hz, 2H, ArH), 3.81 (s, 3H, OCH_3), 2.45 (s, 3H, CH_3). Anal. Calcd. for $C_{26}H_{20}N_2OS$: C, 76.44; H, 4.93; N, 6.86; Found: C, 76. 04; H, 4.96; N, 6.88.

2-(*p*-Tolylthio)-4-(4-(dimethylamino)phenyl)-6-(4-methoxyphenyl)pyridine-3-carbonitrile 4h. This compound was obtained according to the above general procedure; IR (potassium bromide): 3070, 3014, 2889, 2208, 1610, 1567, 1506, 1406, 1365, 1310, 1246, 1202, 1167, 1060, 836, 808, 735 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.84 (d, J = 9.2 Hz, 2H, ArH), 7.77 (s, 1H, PyH), 7.65(d, J = 8.8 Hz, 2H, ArH), 7.55 (d, J = 8.0 Hz, 2H, ArH), 7.37 (d, J = 8.0 Hz, 2H, ArH), 6.92 (d, J = 9.2 Hz, 2H, ArH), 6.86 (d, J = 9.2 Hz, 2H, ArH), 3.80 (s, 3H, OCH_3), 3.02 (s, 6H, $N(CH_3)_2$), 2.43 (s, 3H, CH_3). Anal. Calcd. for $C_{28}H_{25}N_3OS$: C, 74.47; H, 5.58; N, 9.31; Found: C, 74.27; H, 5.65; N, 9.57.

2-(*p*-Tolylthio)-4-(3,4-dimethoxyphenyl)-6-phenylpyridine-3-carbonitrile 4i. This compound was obtained according to the above general procedure; IR (potassium bromide): 3034, 2998, 2210, 1606, 1570, 1551, 1491, 1368, 1266, 1252, 1172,

Scheme 2



1024, 828, 813, 781, 758, 691 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 7.96–7.93 (m, 3H, ArH, PyH), 7.56 (d, J = 8.0 Hz, 2H, ArH), 7.40–7.35 (m, 4H, ArH), 7.25 (t, J = 8.8 Hz, 2H, ArH), 7.17 (d, J = 8.0 Hz, 1H, ArH), 3.87 (s, 3H, OCH$_3$), 3.86 (s, 3H, OCH$_3$), 2.45 (s, 3H, CH$_3$). An efficient and convenient method for the preparation of 2-methyl-4,6-diarylpyrimidine derivatives by the multicomponent reactions of aromatic aldehydes, aromatic ketones, and acetamidine hydrochloride in the presence of sodium hydroxide under solvent-free conditions was reported. This method has the advantages of excellent yields, mild reaction conditions, easy workup, and environmentally friendly procedure.

J. Heterocyclic Chem., **46**, 890 (2009).

INTRODUCTION

In recent years, multicomponent reactions (MCRs) have emerged as a powerful strategy to construct useful molecules from simple starting materials [1]. Molecules synthesized by this method continue attracting the attention of medicinal and synthetic chemists [2]. The pyrimidines and their derivatives, as the important heterocyclic compounds, are an integral part of various natural products [3] and serve as a building block for various pharmaceuticals and biopolymers. It also has very good coordinating ability similar to pyridyl ligands in supramolecular metallogrid-like architecture [4]. In addition, pyrimidines are pharmacologically active and display anticonvulsant [5], anti-inflammatory [6], antibacterial [7], and antimycotic [8] activities. Therefore, synthesis of pyrimidine derivatives is always an important field for chemists. Some MCRs for the synthesis of pyrimidines or their derivatives have been reported [9].

Solvent-free organic synthesis is a well-established method for the synthesis of organic molecules [10] because it has some advantages, such as high efficiency and selectivity, easy separation and purification, and mild reaction conditions. As part of our continued interest in the development of highly expedient methods for the synthesis of organic compounds [11], herein, we would like to report a MCR for the synthesis of 2-methyl-4,6-diarylpyrimidine derivatives under solvent-free conditions.

RESULTS AND DISCUSSION

The first step of this synthetic approach consists of finding out the optimized reaction conditions. The optimization was begun by studying the effect of various solvents and solvent-free conditions on the model reaction of 4-chlorobenzaldehyde, acetophenone, and acetamidine hydrochloride in the presence of some different catalysts. As the data in Table 1 indicated, the results of reaction were quite different. When the reaction was carried out in solvent conditions using piperidine ($C_5H_{11}N$), triethylamine (Et_3N), and NaOH as catalyst, the results of reactions were not satisfying. We probably thought that acetamidine hydrochloride is the inorganic salt and does not easily dissolve in the organic solvents, so the reactions do not put out well. Then, the reaction was carried out under solvent-free conditions at 75°C. When piperidine ($C_5H_{11}N$) or triethylamine (Et_3N) was used as catalyst, the reaction was unsatisfactory. When the NaOH was chosen as catalyst, the reaction could be carried out smoothly, and the 4-(4-chlorophenyl)-2-methyl-6-phenylpyrimidine **4a** could be obtained with high yields (96%). We also investigated the reaction outcome using different amounts of NaOH. By increasing the quantity of NaOH from 0.05 to 0.3 g, the reaction gave different outcomes, resulting in the isolation of **4a** in about 85, 96, 92, and 90% yields, respectively. Higher loading of the catalyst did not improve the yields of the reaction. Perhaps, more NaOH could turn the reagents into solid more quickly, which hindered the reaction from completion.

With this optimum condition in hand, we synthesized 2-methyl-4,6-diarylpyrimidine derivatives under solvent-free conditions. The procedure of reaction was very facile: the mixture of aromatic aldehydes, aromatic ketones, and acetamidine hydrochloride was put into a flask, in

Table 1

Synthesis of **4a** under different conditions in the presence of different catalysts.[a]

Entry	Solvent	Amount	Yields[b] (%)
1	MeOH	$C_5H_{11}N$ (0.05 mL)	Trace
2	MeOH	Et_3N (0.05 mL)	Trace

[a] Reagents and conditions: 4-chlorobenzaldehyde, **1** (2 mmol), acetophenone aldehydes **2** (2 mmol), acetamidine hydrochloride **3** (2 mmol).

[b] Isolated yields.

the presence of 0.1 g NaOH as catalyst, and let them at 75°C under solvent-free conditions, a series of 2-methyl-4,6-diarylpyrimidine derivatives could be prepared with high yield. The results of the reactions are summarized in Table 2.

The reaction was efficiently completed under solvent-free conditions. From Table 2, we could find that the aldehydes or ketones bearing either electron-withdrawing or electron-donating groups perform well in this reaction. Therefore, we concluded that the electronic nature of the substituents has no significant effect on this reaction. The structure of each product **4a–w** was established on the basis of spectroscopic data, particularly ^{1}H NMR analysis and HRMS spectra.

In conclusion, we have successfully developed an efficient and facile method to prepare a variety of 2-methyl-4,6-diarylpyrimidine derivatives *via* the MCRs of different aromatic aldehydes, aromatic ketones, and acetamidine hydrochloride under solvent-free conditions. In this reaction, we found that NaOH was an excellent catalyst, because the reaction could be efficiently completed when it existed, and that do not consider the quality of substituent groups. Because no toxic organic solvent was used, the simplicity of the reaction procedure coupled with excellent yields, making this method one of the most efficient methods for the synthesis of these kinds of heterocyclic compounds.

EXPERIMENTAL

Melting points were determined on XT-5 microscopic melting-point apparatus and were uncorrected. IR spectra were recorded on a FT Bruker Tensor 27 spectrometer. ^{1}H NMR spectra were obtained from solution in DMSO-d_6 with Me$_4$Si as an internal standard using a Bruker-400 spectrometer. Microanalyses were carried out using a Perkin-Elmer 2400 II analyzer. HRMS spectra were obtained with a Bruker micrOTOF-Q 134 instrument.

General procedure for the synthesis of 2-methyl-4,6-diarylpyrimidine derivatives. The mixture of aromatic aldehydes **1** (2 mmol), aromatic ketones **2** (2 mmol), acetamidine hydrochloride **3** (2 mmol), and NaOH (0.1 g) was put in a reaction flask and let at 75°C for about 30 min. After completing the reaction, the reaction mixture was poured into water (0.5% HCl) and then washed with water thoroughly. The product was filtered, dried, and recrystallized from 95% ethanol.

4-(4-Chlorophenyl)-2-methyl-6-phenylpyrimidine (4a). This compound was obtained as white crystals, mp 95–96°C; IR: (KBr, ν, cm^{-1}): 3054, 2842, 1585, 1570, 1533, 1441, 1393, 1234, 1183, 1159, 1119, 1089, 1031, 1013, 1001, 990, 907, 867, 834, 779, 753, 713, 686, 642, 602, 582 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.73 (3H, s, CH$_3$), 7.56–7.58 (3H, m, ArH), 7.62 (2H, d, $J = 8.0$ Hz, ArH), 8.33–8.36 (3H, m, ArH), 8.40 (2H, $J = 8.0$ Hz, ArH). *Anal.* Calcd for $C_{17}H_{13}ClN_2$: C, 72.73; H, 4.67; N, 9.98. 4-(3-Chlorophenyl)-2-methyl-6-*p*-tolylpyrimidine (4l). This compound was obtained as white crystals, mp 76–77°C; IR: (KBr, ν, cm^{-1}): 3025, 2930, 1612, 1569, 1511, 1364, 1238, 1181, 1126, 1068, 989, 834, 815, 799, 761, 714, 690, 655, 646 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.40 (3H, s, CH_3), 2.74 (3H, s, CH_3), 7.37 (2H, d, J = 8.0 Hz, ArH), 7.57–7.64 (2H, m, ArH), 8.27 (2H, d, J = 8.4 Hz, ArH), 8.31 (1H, d, J = 7.6 Hz, ArH), 8.41 (2H, d, J = 9.2 Hz, ArH). *Anal.* Calcd for $C_{18}H_{15}ClN_2$: C, 73.34; H, 5.13; N, 9.50. Found: C, 73.45; H, 5.15; N, 9.47. HRMS *m/z* calculated for $C_{18}H_{15}ClN_2$ [M + H]: 295.1002; found: 295.1004.

4-(4-Fluorophenyl)-2-methyl-6-*p*-tolylpyrimidine (4m). This compound was obtained as white crystals, mp 95–96°C; IR: (KBr, ν, cm^{-1}): 3020, 2924, 1591, 1584, 1536, 1507, 1445, 1411, 1362, 1226, 1162, 1123, 1097, 1013, 847, 826, 814, 760, 642 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.39 (3H, s, CH_3), 2.72 (3H, s, CH_3), 735–7.41 (4H, m, ArH), 8.24 (2H, d, $J = 8.0$ Hz, ArH), 8.35 (1H, s, ArH), 8.38–8.42 (2H, dd, $J = 5.6$ Hz, $J = 5.6$ Hz, ArH).

Anal. Calcd for $C_{18}H_{15}FN_2$: C, 77.68; H, 5.43; N, 10.07. Found: C, 77.57; H, 5.40; N, 10.11. HRMS *m*/*z* calculated for $C_{18}H_{15}FN_2$ [M + H]: 279.1298; found: 279.1296.

2-Methyl-4,6-dip-tolylpyrimidine (4n). This compound was obtained as white crystals, mp 130–131°C, Lit. [14] 137–139°C; IR: (KBr, ν, cm^{-1}): 3026, 2920, 1582, 1508, 1444, 1408, 1365, 1240, 1208, 1122, 1017, 826, 813, 758, 600 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.40 (6H, s, 2 × CH_3), 2.73 (3H, s, CH_3), 7.37 (4H, d, $J = 8.0$ Hz, ArH), 8.24 (4H, d, $J = 8.0$ Hz, ArH), 8.32 (1H, s, ArH). *Anal*. Calcd for $C_{19}H_{18}N_2$: C, 83.18; H, 6.61; N, 10.21. Found: C, 83.27; H, 6.59; N, 10.24. HRMS *m*/*z* calculated for $C_{19}H_{18}N_2$ [M + H]: 275.1548; found: 275.1549.

4-(4-Chlorophenyl)-6-(4-fluorophenyl)-2-methylpyrimidine (4o). This compound was obtained as white crystals, mp 148–149°C; IR: (KBr, ν, cm^{-1}): 3044, 2972, 2950, 2851, 1600, 1548, 1509, 1491, 1415, 1391, 1364, 1229, 1162, 1088, 1012, 829, 762, 590 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.74 (3H, s, CH_3), 7.40 (2H, t, $J = 8.8$ Hz, $J = 8.8$ Hz, ArH), 7.63 (2H, d, $J = 8.4$ Hz, ArH), 8.37 (1H, s, ArH), 8.39–8.45 (4H, m, ArH). *Anal*. Calcd for $C_{17}H_{12}ClFN_2$: C, 68.35; H, 4.05; N, 9.38. Found: C, 68.21; H, 4.07; N, 9.35. HRMS *m*/*z* calculated for $C_{17}H_{12}ClFN_2$ [M + H]: 299.0751; found: 299.0740.

4,6-Bis(4-chlorophenyl)-2-methylpyrimidine (4p). This compound was obtained as white crystals, mp 144–146°C; IR: (KBr, ν, cm^{-1}): 3057, 2978, 2955, 2859, 1565, 1529, 1488, 1365, 1291, 1232, 1172, 1120, 1091, 1012, 827, 804, 763, 726 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.72 (3H, s, CH_3), 7.61 (4H, d, $J = 8.4$ Hz ArH), 8.35 (4H, d, $J = 8.4$ Hz, ArH), 8.42 (1H, s, ArH). *Anal*. Calcd for $C_{17}H_{12}Cl_2N_2$: C, 64.78; H, 3.84; N, 8.89. Found: C, 64.65; H, 3.82; N, 8.85. HRMS *m*/*z* calculated for $C_{17}H_{12}Cl_2N_2$ [M + H]: 315.0456; found: 315.0464.

4-(4-Chlorophenyl)-2-methyl-6-*p*-tolylpyrimidine (4q). This compound was obtained as white crystals, mp 120–121°C; IR: (KBr, ν, cm^{-1}): 3025, 2950, 2922, 2830, 1580, 1509, 1491, 1407, 1237, 1212, 1188, 1121, 1099, 1089, 1011, 825, 813, 778, 758, 708 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.40 (3H, s, CH_3), 2.73 (3H, s, CH_3), 7.37 (2H, d, $J = 8.4$ Hz, ArH), 7.62 (2H, d, $J = 8.4$ Hz, ArH), 8.25 (2H, d, $J = 8.4$ Hz, ArH), 8.37 (3H, d, $J = 8.8$ Hz, ArH).

Anal. Calcd for $C_{18}H_{15}ClN_2$: C, 73.34; H, 5.13; N, 9.50. Found: C, 73.46; H, 5.15; N, 9.47. HRMS *m*/*z* calculated for $C_{18}H_{15}ClN_2$ [M + H]: 295.1002; found: 295.1009.

4-(4-Chlorophenyl)-6-(4-methoxyphenyl)-2-methylpyrimidine (4r). This compound was obtained as white crystals, mp 120–121°C; IR: (KBr, ν, cm^{-1}): 3055, 2974, 2935, 2834, 1610, 1586, 1530, 1513, 1491, 1454, 1412, 1368, 1288, 1257, 1235, 1169, 1119, 1097, 1024, 1010, 819, 779, 761, 594, 575 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.71 (3H, s, CH_3), 3.85 (3H, s, OCH_3), 7.09 (2H, d, $J = 8.4$ Hz, ArH), 7.61 (2H, d, $J = 8.4$ Hz, ArH), 8.31 (1H, s, ArH), 8.33–8.37 (4H, t, $J = 7.2$ Hz, $J = 7.2$ Hz, ArH).

Anal. Calcd for $C_{18}H_{15}ClN_2O$: C, 69.57; H, 4.86; N, 9.01. Found: C, 69.45; H, 4.84; N, 9.04. HRMS *m*/*z* calculated for $C_{18}H_{15}ClN_2O$ [M + H]: 311.0951; found: 311.0948.

4-(4-Chlorophenyl)-6-(3,4-dimethylphenyl)-2-methylpyrimidine (4s). This compound was obtained as white crystals, mp 96–97°C; IR: (KBr, ν, cm^{-1}): 2967, 2942, 2920, 2855, 1581, 1530, 1490, 1443, 1407, 1369, 1340, 1283, 1244, 1132, 1104, 1086, 1023, 1011, 873, 832, 788, 763, 583 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.29 (3H, s, CH_3), 2.33 (3H, s, CH_3), 2.71 (3H, s, CH_3), 7.30 (1H, d, $J = 8.0$ Hz, ArH), 7.61(2H, d, $J = 8.8$ Hz, ArH), 8.06 (1H, d, $J = 8.0$ Hz, ArH), 8.12 (1H, s, ArH), 8.34 (2H, d, $J = 2.4$ Hz, ArH), 8.36 (1H, s, ArH).

Anal. Calcd for $C_{19}H_{17}ClN_2$: C, 73.90; H, 5.55; N, 9.07. Found: C, 73.81; H, 5.57; N, 9.11. HRMS *m*/*z* calculated for $C_{19}H_{17}ClN_2$ [M + H]: 309.1159; found: 309.1159.

4-(4-Chlorophenyl)-6-(3,4-dimethoxyphenyl)-2-methylpyrimidine (4t). This compound was obtained as white crystals, mp 135–137°C; IR: (KBr, ν, cm^{-1}): 3002, 2973, 2959, 2934, 2831, 1584, 1489, 1440, 1410, 1324, 1268, 1216, 1178, 1134, 1096, 1025, 843, 822, 808, 785, 767, 622, 612, 580 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.72 (3H, s, CH_3), 3.85 (3H, s, OCH_3), 3.90 (3H, s, OCH_3), 7.11(1H, d, $J = 8.4$ Hz, ArH), 7.62 (2H, d, $J = 8.8$ Hz, ArH), 7.87 (1H, d, $J = 2.0$ Hz, ArH), 7.97–7.99 (1H, dd, $J = 2.0$ Hz, J =2.0 Hz, ArH), 8.36 (2H, s, ArH), 8.38 (1H, s, ArH). *Anal*. Calcd for $C_{19}H_{17}Cl_2N_2O_2$: C, 66.96; H, 5.03; N, 8.22. Found: C, 66.82; H, 5.05; N, 8.18. HRMS *m*/*z* calculated for $C_{19}H_{17}ClN_2O_2$ [M + H]: 341.1057; found: 341.1057.

4-(3-Chlorophenyl)-6-(4-chlorophenyl)-2-methylpyrimidine (4u). This compound was obtained as white crystals, mp 111–113°C; IR: (KBr, ν, cm^{-1}): 3006, 2977, 2963, 2835, 1580, 1491, 1408, 1366, 1294, 1266, 1235, 1178, 1127, 1090, 1013, 845, 833, 812, 793, 766, 734, 695, 689, 654, 642 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.73 (3H, s, CH_3), 7.56–7.62 (4H, m, ArH) 8.30 (1H, d, $J = 7.2$ Hz, ArH), 8.37 (3H, d, $J = 8.8$ Hz, ArH), 8.47 (1H, s, ArH). *Anal*. Calcd for $C_{17}H_{12}Cl_2N_2$: C, 64.78; H, 3.84; N, 8.89. Found: C, 64.59; H, 3.86; N, 9.92. HRMS *m*/*z* calculated for $C_{17}H_{12}Cl_2N_2$ [M + H]: 315.0456; found: 315.0451.

4-(4-Chlorophenyl)-6-(3,4-dichlorophenyl)-2-methylpyrimidine (4v). This compound was obtained as white crystals, mp 178–179°C; IR: (KBr, ν, cm^{-1}): 3021, 2992, 2978, 2850, 1595, 1575, 1491, 1472, 1405, 1387, 1339, 1398, 1233, 1139, 1088, 1026, 1011, 866, 850, 824, 765, 752, 699, 675 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.73 (3H, s, CH_3), 7.62 (2H, d, $J = 8.4$ Hz, ArH), 7.81 (1H, d, $J = 8.4$ Hz, ArH), 8.32 (1H, d, $J = 8.4$ Hz, ArH), 8.37 (2H, d, $J = 8.4$ Hz, ArH), 8.50 (1H, s, ArH), 8.59 (1H, s, ArH). *Anal*. Calcd for $C_{17}H_{11}Cl_3N_2$: C, 58.40; H, 3.17; N, 8.01. Found: C, 58.56; H, 3.19; N, 8.04. HRMS *m*/*z* calculated for $C_{17}H_{11}Cl_3N_2$ [M + H]: 349.0066; found: 349.0053.

4-(4-Bromophenyl)-6-(4-chlorophenyl)-2-methylpyrimidine (4w). This compound was obtained as white crystals, mp 142–144°C; IR: (KBr, ν, cm^{-1}): 2968, 2943, 2921, 2856, 1582, 1526, 1485, 1439, 1407, 1388, 1365, 1241, 1292, 1232, 1097, 1088, 1069, 1010, 825, 805, 762 cm^{-1}; ^{1}H NMR: (400 Hz, DMSO-d_6), (δ, ppm): 2.72 (3H, s, CH_3), 7.60 (2H, d, $J =$ 8.8 Hz, ArH), 7.74 (2H, d, $J = 8.8$ Hz, ArH), 8.27 (2H, d, $J = 8.4$ Hz, ArH), 8.34 (2H, d, $J = 8.4$ Hz, ArH), 8.42 (1H, s, ArH). *Anal*. Calcd for $C_{17}H_{12}BrClN_2$: C, 56.77; H, 3.36; N, 7.79. Found: C, 56.65; H, 3.34; N, 7.75. HRMS *m/z* calculated for $C_{17}H_{12}ClBrN_2$ [M + H]: 358.9951; found: 358.9951.

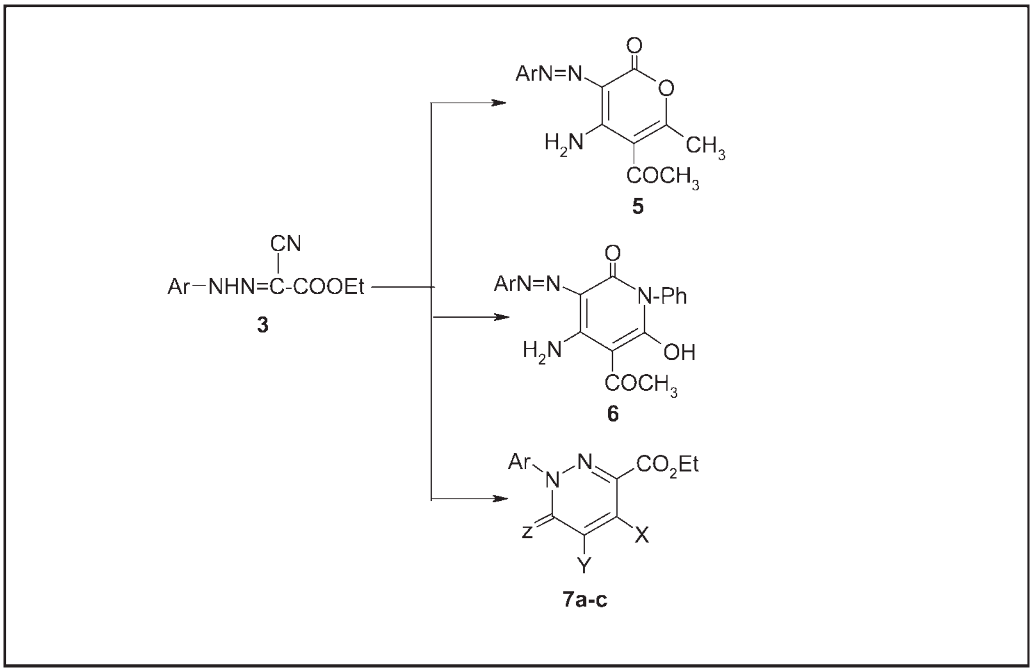
DOI 10.1002/jhet.176



An efficient and direct one-pot reaction of ethyl saccharinylcyanoacetate derivative **3** with a variety of active methylene reagents and nitrogen nucleophiles afforded novel series of polyfunctionally substituted heteroaromatic derivatives **5–13**, respectively. The pyrazole derivative **13** was seemed to be the excellent precursors for the synthesis of pyrazolo[1,5-a]pyrimidine derivatives **14–24**. The antimicrobial screening of some synthesized products was evaluated against some selected bacteria and fungi. The structures of the synthesized derivatives were established by elemental and spectral data.

J. Heterocyclic Chem., **46**, 895 (2009).

INTRODUCTION

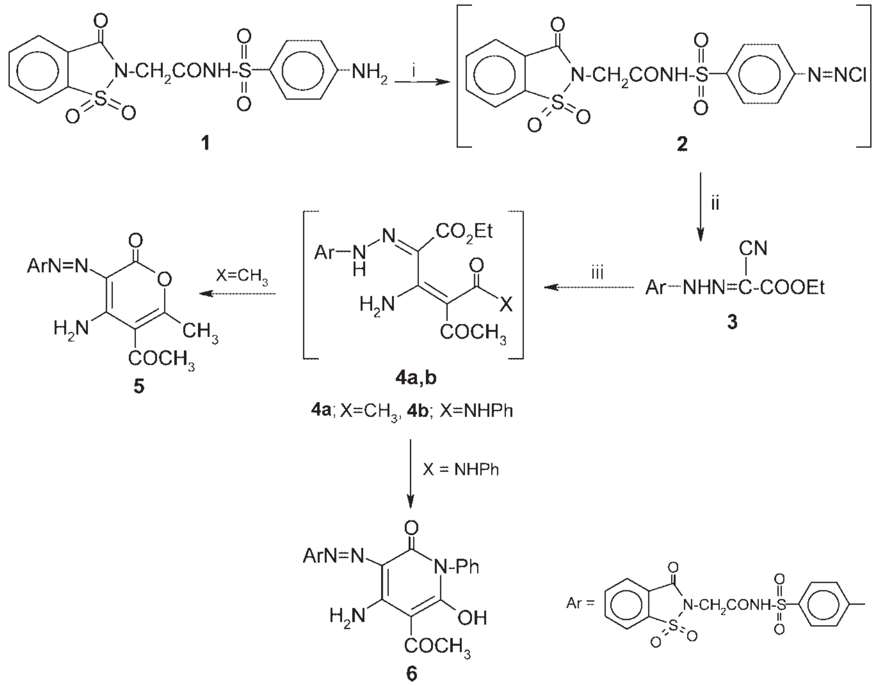
The increasing medicinal potential of both saccharine and sulfonamide derivatives as intermediate to biologically active compounds [1–5] and in continuation of our efforts [6,7] in the synthesis of heterocyclic systems incorporating saccharinyl and sulfonamide moieties as potential pharmaceuticals. We reported here on the utility of ethyl saccharinylcyanoacetate **3** as building blocks for synthesis of new polyfunctionally substituted heteroaromatic derivatives of pyran, pyridine, pyridazine, triazine, pyrimidine, and their analogues of sulfonamido moiety of promising therapeutic applications [8–13].

RESULTS AND DISCUSSION

The key starting material ethyl {4-[2-(saccharin-2-yl)-acetylsulfamoyl]phenylazo}cyanoacetate (**3**) was prepared by diazotization of the sulfanilamide derivative **1** followed by coupling the resulting intermediate **2** with ethyl cyanoacetate in ethanolic sodium acetate solution at 0–5°C. The structure of compound **3** was established on the basis of its elemental analysis and spectral data. Thus, its IR spectrum showed bands at 3320 and 3290 cm^{-1} for νNH groups, 2220 cm^{-1} for νCN, and at 1725, 1680 cm^{-1} for carbonyl groups. The ^{1}H NMR spectrum showed signals as triplet at $\delta = 1.53$ for methyl proton, quartet at 4.50, singlet at $\delta = 4.85$ for two methylene protons, multiplets at $\delta = 7.21$–8.35 for aromatic protons and two singlet at $\delta = 8.53$, 9.01 for 2NH protons, which disappeared upon addition of D$_2$O to the NMR sample (Scheme 1).

The reactivity of compound **3** toward 1,3-dicarbonyl compounds was investigated with respect to the synthesis of highly substituted pyran and pyridine. Thus, the reaction of equimolar amounts of compound **3** and acetylacetone and/or acetoacetanilide derivative in refluxing

Scheme 1. (i) $NaNO_2/AcOH/HCl$; (ii) $NCCH_2COOEt$, AcONa; (iii) $CH_3COCH_2COCH_3$ or $CH_3COCH_2CONHPh$, dioxane, Et_3N.



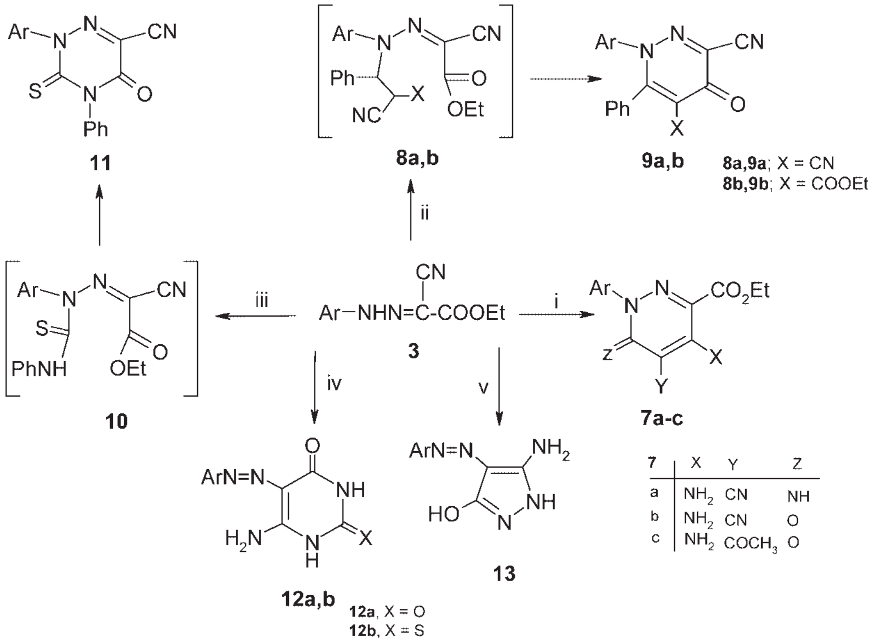
1,4-dioxane containing a few drops of triethylamine afforded 4-(5-acetyl-4-amino-6-methyl-2-oxo-2*H*-pyran-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (**5**) and 4-(5-acetyl-4-amino-6-hydroxy-2-oxo-1-phenyl-1,2-dihydropyridin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]-benzenesulfonamide (**6**), respectively. In a similar manner, the treatment of compound **3** with malononitrile or ethyl cyanoacetate and/or ethyl acetoacetate afforded the pyridazine derivatives **7a–c**, respectively (Scheme 2). Moreover, the reaction of compound **3** with 2-benzylidenemalononitrile and/or ethyl 2-cyano-3-phenylacrylate in refluxing 1,4-dioxane containing a few drops of triethylamine yielded the pyridazine derivatives **9a,b**.

The formation of compounds **9a,b** are assumed to proceed *via* Michael-type addition of the NH of the hydrazone moiety in **3** to the activated α,β-unsaturated center of substituted cinnamonitriles, yielding a cyclic Michael adducts **8a,b**, which are cyclized followed by the aromatization to the final products **9a,b** *via* elimination of an ethanol molecule and subsequent dehydrocyanation. The reaction of compound **3** with phenyl isothiocyanate afforded 4-(6-cyano-5-oxo-4-phenyl-3-thioxo-4,5-dihydro-3*H*-[1,2,4]triazin-2-yl)-*N*-[2-(saccharin-2-yl)-acetyl]benzenesulfonamide(**11**). Compound **11** was assumed to be formed *via* an initial nucleophilic attack of NH group of compound **3** on the isothiocyanate moiety giving the adduct **10**, which cyclized *via* the elimination of ethanol molecule to give compound **11**. The structure of compound **11** was assigned on the basis of their elemental analysis and spectral data. Its IR spectrum showed bands at 3290 cm^{-1} for νNH, 2215 cm^{-1} for νCN, and 1685–1675 cm^{-1} for νCO.

As an extension of such synthetic route, the behavior of hydrazonoester **3** toward some nitrogen nucleophiles was investigated with the aim of synthesizing a biologically active substituted pyrimidine and pyrazole derivatives. Thus, the reaction of compound **3** with equimolar amounts of urea or thiourea, in refluxing ethanolic sodium ethoxide solution gave the corresponding pyrimidine derivatives **12a,b**. While the reaction of compound **3** with hydrazine hydrate in refluxing absolute ethanol yielded, 4-(5-amino-3-hydroxy-1*H*-pyrazol-4-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (**13**). The structure of compound **13** was assigned on the basis of elemental analysis and spectral data which agree with the proposed structure (Scheme 2). 5-Aminopyrazole **13** has been emphasized as a new synthetic auxiliary used for the preparation of pyrazolo[1,5-a]pyrimidine derivatives [14,15], which associated with a great applications in pharmaceutical fields [16–19] and dyestuff industry [20,21]. Thus, the reaction of compound **13** with acetylacetone in refluxing glacial acetic acid afforded 4-(5,7-dimethyl-2-hydroxypyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (**14**). Reaction of compound **13** with aromatic aldehydes *viz* benzaldehyde and 4-methoxybenzaldehyde in absolute ethanol yielded Schiff bases **15a,b,** respectively (Scheme 3).

The study was extended to investigate the behavior of Schiff bases toward some active methylene compounds. Thus, the treatment of **15a,b** with malononitrile afforded

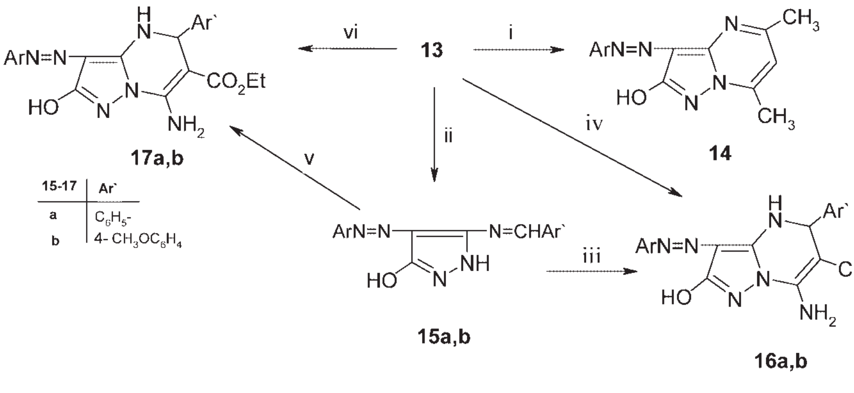
Scheme 2. (i) $NCCH_2CN$ or $NCCH_2CO_2Et$ or $CH_3COCH_2CO_2Et$, dioxane, Et_3N; (ii) $PhCH{=}C(CN)_2$ or $PhCH{=}C(CN)CO_2Et$, dioxane, Et_3N; (iii) PhNCS, dioxane, Et_3N; (iv) H_2NCONH_2 or H_2NCSNH_2, NaOEt; (v) $N_2H_4{\cdot}H_2O$, EtOH.



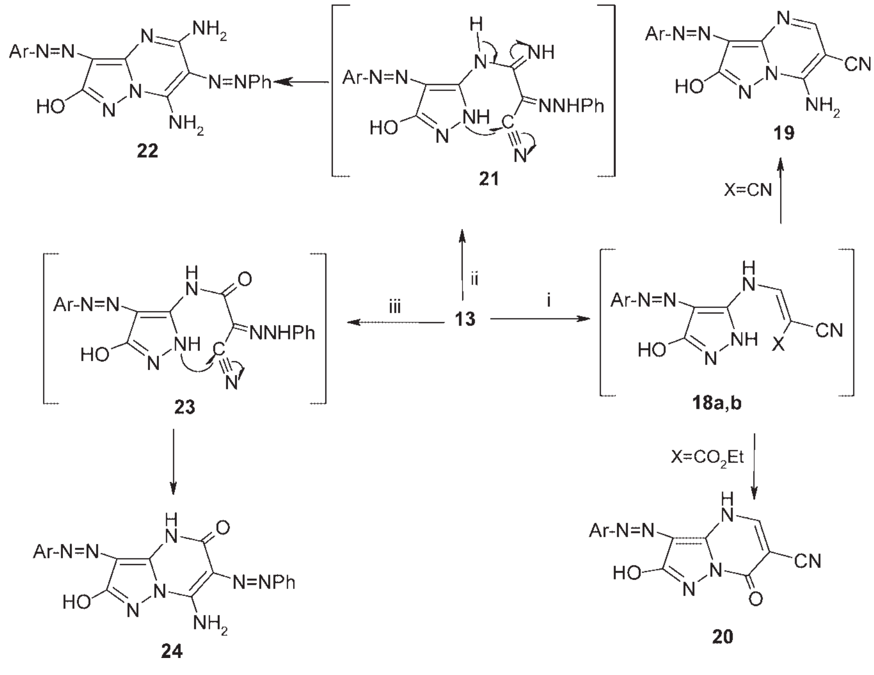
the pyrazolo[1,5-a]pyrimidines **16a,b**, which also obtained authentically, from the reaction of compound **13** with β-aryl-α-cyanoacrylonitrile derivatives in refluxing 1,4-dioxane, which are identical in all respects (m.p., m.m.p., and spectral data). The formation of compounds **16a,b** are assumed to proceed *via* initial addition of the active methylene of malononitrile to the double bond of the Schiff bases **15a,b** to form the non-isolable Michael adduct, which also formed *via* the initial attack of the exocyclic amino group of compound **13** on the activated double bond of acrylonitrile derivatives. This Michael adduct undergoes intramolecular cyclization to give compounds **16a,b**. Additionally, the reaction of Schiff bases **15a,b** with ethyl cyanoacetate yielded pyrazolo[1,5-a]pyrimidines **17a,b** which also obtained *via* independent synthesis from the reaction of compound **13** with β-aryl-α-cyanoacrylate derivatives, which are identical in all respects (m.p., m.m.p., and spectral data) (Scheme 3). Also, the treatment of compound **13** with ethoxymethylenemalononitrile and/or ethyl ethoxymethylenecyanoacetate in refluxing dimethylformamide containing a few drops of piperidine afforded the pyrazolopyrimidine derivatives **19** and **20**, respectively (Scheme 4).

The reaction of compound **13** with 2-phenylhydrazonomalononitrile [22] in refluxing absolute ethanol containing a few drops of pyridine afforded 4-(5,7-diamino-2-hydroxy-6-phenylazopyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-

Scheme 3. (i) $CH_3COCH_2COCH_3$, AcOH; (ii) Ar′CHO, EtOH; (iii) $CH_2(CN)_2$, EtOH, piperidine; (iv) Ar̀CH=C(CN)$_2$, 1,4-dioxane; (v) $NCCH_2CO_2Et$, EtOH, piperidine; (vi) Ar̀CH=C(CN)CO_2Et, 1,4-dioxane.



Scheme 4. (i) $EtOCH{=}C(X)CN$, DMF, piperidine; (ii) $PhNHN{=}C(CN)_2$, EtOH, pyridine; (iii) $PhNHN{=}C(CN)CO_2Et$, EtOH, pyridine.



[2-(saccharin-2-yl)acetyl]benzenesulfonamide (**22**). The formation of compound **22** was assumed *via* the condensation of the 5-NH_2 group of the pyrazole ring with the cyano group of malononitrile derivative to yield the intermediate **21**, in which internal nucleophilic attack of 1-NH group of the pyrazole ring on the other cyano group followed by a migration of 5-NH proton of the pyrazole ring to the nitrogen atom of imino group to yield the nonisolable adduct, which tautomerized forming the isolable product **22**. While, the reaction of compound **13** with ethyl 2-phenylhydrazonocyanoacetate [23] gave nonisolable intermediate **23**, which cyclized to afford 4-(7-amino-2-hydroxy-5-oxo-6-phenylazo-4,5-dihydropyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (**24**) (Scheme 4). The structures of the synthesized compounds were assigned on the basis of elemental analysis and spectral data (*c.f.*, experimental).

The antimicrobial activity. The antimicrobial activities of some synthesized compounds were screened *in vitro* using the hole plate and filter paper methods [24] for their antibacterial activity against *Escherichia coli* and *Pseudomonas aeruginosa* as gram-negative bacteria and *Staphylococcus aureus* as gram-positive bacteria.

Whereas the antifungal activity was tested against *Aspergillus niger* and *Fusarium oxysporium*. Ampicillin as an antibacterial agent and Clotrimazole as an antifungal were used as a reference drugs to evaluate the potency of the tested compounds under the same conditions. The minimal inhibitory concentration (MIC) values listed in Table 1 show that all the tested compounds have a similar or highest degree of inhibition area against the organisms relative to the reference drugs used.

EXPERIMENTAL

Melting points are uncorrected. IR spectra in KBr were recorded on a Perkin–Elmer 298 spectrophotometer.^{1}H and ^{13}C NMR spectra were obtained on an Varian Gemini 200 MHz instrument using TMS as internal reference with chemical shifts expressed as δ ppm. Mass spectra were recorded on a Shimadzu GCMS-QP 1000 instrument (70 eV EI mode).

^{13}C NMR values of saccharinylsulfonamide moiety for compounds **5–24** are the same as in compound **3** with $\delta \pm 0.1–0.5$ ppm.

Ethyl {4-[2-(saccharin-2-yl)acetylsulfamoyl]phenylazo}-cyanoacetate (3). A cold solution of diazonium chloride **2** (30 mmol) [prepared from the addition of a cold solution of sodium nitrite (0.69 g, 10 mmol) in H_2O (5 mL) to a cold solution of compound **1** (3.95 g, 10 mmol) in concentrated hydrochloric acid (10 mL) and glacial acetic acid (10 mL) at 0–5°C] was added dropwise to a solution of ethyl cyanoacetate (30 mmol) in ethanol (30 mL) containing sodium acetate (5.0 g). After the complete addition of the diazonium chloride, the reaction mixture was stirred at room temperature overnight. The precipitated product which separated upon dilution with cold water (40 mL) was filtered off, washed with water (3 × 30 mL), dried and recrystallized from *n*-butanol to give **3**. Yield, 3.79 g (73%); m.p. 141–143°C; IR: ν = 3320, 3290 (NH), 2220 (CN), 1725, 1680 (CO), 1350, 1130 cm^{-1} (SO_2); ^{1}H NMR ($CDCl_3$): δ = 1.53 (t, 3H, CH_3), 4.50 (q, 2H, CH_2), 4.85 (s, 2H, CH_2), 7.21–8.35 (m, 8H, ArH), 8.53, 9.01 (2s, 2H, 2NH, exchangeable); ^{13}C NMR: δ = 14.5 (CH_3), 36.3

4-(5-Acetyl-4-amino-6-methyl-2-oxo-2*H*-pyran-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (5). A mixture of compound **3** (1.04 g, 2 mmol) and acetylacetone (2 mmol) in 1,4-dioxane (25 mL) containing a catalytic amount of Et_3N (0.4 mL) was heated under reflux for 8 h. The reaction mixture was concentrated *in vacuo* and the formed solid product was collected by filtration and recrystallized from ethanol to give **5**. Yield, 0.70 g (61%); m.p. 166–168°C; IR: ν = 3405–3240 (multiple bands, NH_2, NH), 1710, 1690, 1680 cm^{-1} (CO); ^1H NMR ($CDCl_3$): δ = 1.95 (s, 3H, CH_3), 2.10 (s, 3H, CH_3CO), 4.75 (s, 2H, CH_2), 5.85 (br s, 2H, NH_2), 7.25–8.12 (m, 8H, ArH), 8.30 (s, 1H, NH, exchangeable); ^{13}C NMR: δ = 16.2 (CH_3), 20.1 (CH_3CO), 81.3 (C-5), 89.5 (C-3), 136.3 (C-4), 141.4 (C-6), 161.2 (CO), 165.7 (C-2); Anal. Calcd. for $C_{23}H_{19}N_5O_9S_2$ (573.56): C, 48.16; H, 3.34; N, 12.21%. Found: C, 48.32; H, 3.50; N, 12.01%.

4-(5-Acetyl-4-amino-6-hydroxy-2-oxo-1-phenyl-1,2-dihydropyridin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (6). A mixture of compound **3** (1.04 g, 2 mmol) and acetoacetanilide (2 mmol) in 1,4-dioxane (25 mL) containing a catalytic amount of Et_3N (0.4 mL) was heated under reflux for 8 h. The reaction mixture was concentrated *in vacuo* and the formed solid was collected by filtration and recrystallized from 1,4-dioxane to give **6**. Yield, 0.87 g (67%); m.p. 183–185°C; IR: ν = 3495–3200 (multiple bands, OH, NH_2, NH), 1705, 1680, 1675 cm^{-1} (CO); ^1H NMR ($CDCl_3$): δ = 1.95 (s, 3H, CH_3), 4.10 (s, 2H, CH_2), 5.95 (br s, 2H, NH_2), 7.30–8.3 (m, 13H, ArH), 8.35, 8.50 (2s, 2H, NH, and OH, exchangeable); Anal. Calcd. for $C_{28}H_{22}N_6O_9S_2$ (650.64): C, 51.69; H, 3.41; N, 12.92%. Found: C, 51.41; H, 3.19; N, 12.75%.

General procedure for the preparation of compounds 7a–c. A mixture of compound **3** (1.04 g, 2 mmol) and active methylene compounds *viz* malononitrile, ethyl cyanoacetate, and ethyl acetoacetate (2 mmol) in 1,4-dioxane (25 mL) containing a catalytic amount of Et_3N (0.4 mL) was heated under reflux for 10 h. The reaction mixture was cooled to room temperature, poured into crushed ice (20 g), and neutralized with diluted HCl. The resulting solid product was filtered off and recrystallized from proper solvent to give the compounds **7a–c**.

Ethyl 4-amino-5-cyano-6-imino-1-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenyl}-1,6-dihydropyridazine-3-carboxylate (7a). Yield, 0.69 g (59%) (DMF-H_2O); m.p. 173–175°C; IR: ν = 3310–3200 (NH_2, NH), 2215 (CN), 1730, 1680 cm^{-1} (CO); ^1H NMR (DMSO-d_6): δ = 1.65 (t, 3H, CH_3), 4.60 (q, 2H, CH_2), 4.80 (s, 2H, CH_2), 5.95 (s, 2H, NH_2), 7.18–8.15 (m, 8H, ArH), 8.20, 8.95 (2s, 2H, 2NH, exchangeable); Anal. Calcd. for $C_{23}H_{19}N_7O_8S_2$ (585.57): C, 47.18; H, 3.27; N, 16.74%. Found: C, 47.37; H, 3.51; N, 16.41%.

Ethyl 4-amino-5-cyano-6-oxo-1-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenyl}-1,6-dihydropyridazine-3-carboxylate (7b). Yield, 0.71 g (61%) (*n*-butanol); m.p. 220–222°C; IR: ν = 3340–3210 (NH_2, NH), 2220 (CN), 1725, 1680 cm^{-1} (CO); ^1H NMR ($CDCl_3$): δ = 1.45 (t, 3H, CH_3), 4.45 (q, 2H, CH_2), 4.75 (s, 2H, CH_2), 5.90 (br s, 2H, NH_2), 7.30–8.41 (m, 8H, ArH), 8.75 (s, 1H, NH, exchangeable); ^{13}C NMR: δ = 12.3 (CH_3), 50.3 (CH_2), 80.1 (C-5), 112.3 (CN), 140.2 (C-3), 150.2 (CO), 152.5 (C-6), 156.7 (C-4); Anal. Calcd. for $C_{23}H_{18}N_6O_9S_2$ (586.56): C, 47.10; H, 3.09; N, 14.33%. Found: C, 47.39; H, 3.34; N, 14.10%.

Ethyl 5-acetyl-4-amino-6-oxo-1-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenyl}-1,6-dihydropyridazine-3-carboxylate (7c). Yield, 0.86 g (71%) (1,4-dioxane); m.p. 212–214°C; IR: ν = 3230 (NH), 2225–2220 (CN), 1680–1675 cm^{-1} (CO); MS: *m*/*z* = 603 (M^+); Anal. Calcd. for $C_{24}H_{21}N_5O_{10}S_2$ (603.58): C, 47.76; H, 3.51; N, 11.60%. Found: C, 47.93; H, 3.75; N, 11.85%.

General procedure for the preparation of compounds 9a,b. A mixture of compound **3** (1.04 g, 2 mmol) and benzylidenemalononitrile or ethyl α-cyanocinnamate (2 mmol) in 1,4-dioxane (20 mL) containing a catalytic amount of triethylamine (0.4 mL) was heated under reflux for 9 h. The reaction mixture was cooled at room temperature, poured onto ice (20 g), and neutralized with diluted HCl. The formed solid product was filtered off and recrystallized from proper solvent to give **9a,b**.

4-(3,5-Dicyano-4-oxo-6-phenyl-4*H*-pyridazin-1-yl)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (9a). Yield, 0.88 g (73%) (benzene); m.p. 241–243°C; IR: ν = 3310 (NH), 2220–2215 (CN), 1705, 1680–1670, cm^{-1} (CO); ^{1}H NMR (DMSO-d$_6$): δ = 4.60 (s, 2H, CH$_2$), 7.40–8.31 (m, 13H, ArH), 8.45 (s, 1H, NH, exchangeable); Anal. Calcd. for $C_{27}H_{16}N_6O_7S_2$ (600.58): C, 54.00; H, 2.69; N, 13.99%. Found: C, 54.26; H, 2.81; N, 13.79%.

Ethyl 6-cyano-5-oxo-3-phenyl-2-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenyl}-2,5-dihydropyridazine-4-carboxylate (9b). Yield, 0.90 g (69%) (ethanol); m.p. 193–195°C; IR: ν = 3290 (NH), 2215 (CN), 1725, 1705, 1680 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 1.55 (t, 3H, CH$_3$), 4.30 (q, 2H, CH$_2$), 4.50 (s, 2H, CH$_2$), 7.20–8.35 (m, 13H, ArH), 8.40 (s, 1H, NH, exchangeable); Anal. Calcd. for $C_{29}H_{21}N_5O_9S_2$ (647.64): C, 53.78; H, 3.27; N, 10.81%. Found: C, 53.95; H, 3.51; N, 10.59%.

4-(6-Cyano-5-oxo-4-phenyl-3-thioxo-4,5-dihydro-3*H*-[1,2,4]triazin-2-yl)-*N*-[2-saccharin-2-yl]acetyl]benzenesulfonamide (11). A mixture of compound **3** (1.04 g, 2 mmol) and phenyl isothiocyanate (2 mmol) in 1,4-dioxane (20 mL) containing triethylamine (0.4 mL) was heated under reflux for 6 h. The reaction mixture was cooled at room temperature, poured onto cold water (40 mL) and neutralized with dilute HCl. The solid product that formed was collected by filtration and recrystallized from ethanol to give **11**. Yield, 0.93 g (76%); m.p. 211–213°C; IR: ν = 3290 (NH), 2215 (CN), 1685–1675 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 4.55 (s, 2H, CH$_2$), 7.12–8.25 (m, 13H, ArH), 8.35 (s, 1H, NH, exchangeable); Anal. Calcd. for $C_{25}H_{16}N_6O_7S_3$ (608.63): C, 49.34; H, 2.65; N, 13.81%. Found: C, 49.10; H, 2.31; N, 13.96%.

General procedure for the preparation of compounds 12a,b. To a solution of compound **3** (1.04 g, 2 mmol) in ethanolic sodium ethoxide solution (25 mL) [prepared by dissolving sodium metal (2.0 g) in absolute ethanol (20 mL)], urea or thiourea (2 mmol) was added. The reaction mixture was heated under reflux for 8 h. The solvent was evaporated *in vacuo* and the residue was triturated with cold water. The solid formed was collected by filtration and recrystallized from proper solvent to give **12a,b**.

4-(6-Amino-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (12a). Yield, 0.73 g (68%) (DMF); m.p. 251–253°C; IR: ν = 3400–3230 (NH$_2$, NH), 1680–1675 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 4.61 (s, 2H, CH$_2$), 5.85 (br s, 2H, NH$_2$), 7.25–8.05 (m, 8H, ArH), 8.10–8.50 (br s, 3H, 3NH, exchangeable); Anal. Calcd. for $C_{19}H_{15}N_7O_8S_2$ (533.50): C, 42.78; H, 2.83; N, 18.38%. Found: C, 42.96; H, 2.98; N, 18.10%.

4-(6-Amino-4-oxo-2-thioxo-1,2,3,4-tetrahydropyrimidin-5-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (12b). Yield, 0.80 g (73%); (1,4-dioxane); m.p. 230–232°C; IR: ν = 3395–3200 (NH$_2$, NH), 1685–1680 cm^{-1} (CO), 1260 cm^{-1} (CS); ^{1}H NMR (CDCl$_3$): δ = 4.65 (s, 2H, CH$_2$), 5.90 (br s, 2H, NH$_2$), 7.30–8.20 (m, 8H, ArH), 8.30–9.00 (br s, 3H, 3NH, exchangeable); Anal. Calcd. for $C_{19}H_{15}N_7O_7S_3$ (549.56): C, 41.52; H, 2.75; N, 17.84%. Found: C, 41.20; H, 2.49; N, 17.98%.

4-(5-Amino-3-hydroxy-1*H*-pyrazol-4-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (13). A mixture of compound **3** (5.19 g, 10 mmol) and hydrazine hydrate (0.6 g, 12 mmol) in absolute ethanol (25 mL) was heated under reflux for 2 h. The solid product which formed after cooling was filtered off and recrystallized from 1,4-dioxane to give **13**. Yield, 3.94 g (78%); m.p. 207–209°C; IR: ν = 3450–3200 (OH, NH$_2$, NH), 1675 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 4.50 (s, 2H, CH$_2$), 5.80 (br s, 2H, NH$_2$), 7.15–8.25 (m, 8H, ArH), 8.30–9.10 (br s, 3H, 2NH, and OH, exchangeable); ^{13}C NMR: δ 62.3 (C-4), 153.3 (C-5), 156.2 (C-3); Anal. Calcd. for $C_{18}H_{15}N_7O_7S_2$ (505.49): C, 42.77; H, 2.99; N, 19.40%. Found: C, 42.50; H, 2.71; N, 19.67%.

4-(5,7-Dimethyl-2-hydroxypyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (14). A mixture of compound **13** (1.01 g, 2 mmol) and acetylacetone (3 mmol) in glacial acetic acid (20 mL) was refluxed for 5 h. The reaction mixture was cooled, the separated solid was filtered off, washed with water and recrystallized from 1,4-dioxane to give **14**. Yield, 0.83 g (73%); m.p. 196–198°C; IR: ν = 3420–3290 (OH, NH), 1675 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 1.2–1.4 (br s, 6H, 2CH$_3$), 4.55 (s, 2H, CH$_2$), 7.13–8.10 (m, 9H, ArH), 8.30–8.50 (br s, 2H, NH, and OH, exchangeable); Anal. Calcd. for $C_{23}H_{19}N_7O_7S_2$ (569.57): C, 48.50; H, 3.36; N, 17.21%. Found: C, 48.28; H, 3.12; N, 17.36%.

General procedure for the preparation of compounds 15a,b. A mixture of compound **13** (1.01 g, 2 mmol), benzaldehyde and/or 4-methoxybenzaldehyde (2 mmol) in absolute ethanol (25 mL) was heated under reflux for 5 h. The reaction mixture was cooled and the formed solid was filtered off and recrystallized to give **15a,b**.

4-[5-(Benzylideneamino)-3-hydroxy-1*H*-pyrazol-4-ylazo]-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (15a). Yield, 0.80 g (67%) (ethanol); m.p. 174–176°C; IR: ν = 3490–3290 (OH, NH), 1670 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 4.60 (s, 2H, CH$_2$), 7.25–8.30 (m, 14H, ArH, and benzylic proton), 8.40, 8.60, 9.10 (3s, 3H, 2NH, and OH, exchangeable); Anal. Calcd. for $C_{25}H_{19}N_7O_7S_2$ (593.59): C, 50.58; H, 3.23; N, 16.52%. Found: C, 50.74; H, 3.49; N, 16.23%.

4-{3-Hydroxy-5[(4-methoxybenzylidene)amino]-1*H*-pyrazolo-4-ylazo}-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (15b). Yield–0.79 g (63%) (ethanol); m.p. 213–215°C; IR: ν = 3480–3210 (OH, NH), 1675 cm^{-1} (CO); Anal. Calcd. for $C_{26}H_{21}N_7O_8S_2$ (623.62): C, 50.08; H, 3.39; N, 15.72%. Found: C, 50.30; H, 3.63; N, 15.42%.

General procedure for the preparation of compounds 16a,b. Method A: A mixture of compounds **15a** or **15b** (2 mmol) and malononitrile (0.13 g, 2 mmol) in absolute ethanol (20 mL) containing piperidine (0.4 mL) was heated under reflux for 8 h. The separated solid was filtered off and recrystallized from 1,4-dioxane to give **16a,b**. Yield, 0.73 g (61% for **16a**) and 0.86 g (62% for **16b**).

Method B: A mixture of compound **13** (1.01 g, 2 mmol) and arylidene malononitriles (2 mmol) in 1,4-dioxane (25 mL) containing a few drops of piperidine (0.4 mL) was refluxed for 10 h. The obtained solid after cooling was recrystallized from 1,4-dioxane to give **16a,b**. Yield, 0.82 g (69% for **16a**) and 0.98 g (71% for **16b**).

4-(7-Amino-6-cyano-2-hydroxy-5-phenyl-4,5-dihydropyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (16a). m.p. 165–167°C, IR: ν = 3505–3200 (OH, NH$_2$, NH), 2215 (CN), 1680 cm^{-1} (CO); ^{1}H NMR (CDCl$_3$): δ = 4.50 (s, 2H, CH$_2$), 5.10 (s, 1H, CH), 5.70 (br s, 2H, NH$_2$), 7.21–8.11 (m, 13H, ArH), 8.20–9.10 (br s, 3H, 2NH, OH, exchangeable); ^{13}C NMR: δ = 36.3 (C-5), 47.8 (C-6), 60.1 (C-3), 110.3 (CN), 150.1 (C-3a), 151.2 (C-7), 156.3 (C-2), 120.1, 120.4, 123.2, 123.6, 124.2, 129.3 (phenyl ring); Anal. Calcd. for $C_{28}H_{21}N_9O_7S_2$ (659.65): C, 50.98; H, 3.21; N, 19.11%. Found: C, 50.63; H, 3.08; N, 19.37%.

4-[7-Amino-6-cyano-2-hydroxy-5-(4-methoxyphenyl)-4,5-dihydropyrazolo[1,5-a]pyrimidin-3-ylazo]-*N*-[2–(saccharin-2-yl)acetyl]benzenesulfonamide (16b). m.p. 190–192°C, IR: ν = 3490–3210 (OH, NH_2, NH), 2220 (CN), 1675 cm^{-1} (CO); ^{1}H NMR ($CDCl_3$): δ = 3.90 (s, 3H, OCH_3), 4.55 (s, 2H, CH_2), 4.95 (s, 1H, CH), 5.75 (br s, 2H, NH_2), 7.20–8.15 (m, 12H, ArH), 8.30–9.10 (br s, 3H, 2NH, OH, exchangeable); Anal. Calcd. for $C_{29}H_{23}N_9O_8S_2$ (689.68): C, 50.50; H, 3.36; N, 18.28%. Found: C, 50.76; H, 3.60; N, 18.10%.

General procedure for the preparation of compounds 17a,b. Method A: A mixture of compounds **15a** or **15b** (2 mmol) and ethyl cyanoacetate (2 mmol) in absolute ethanol (20 mL) containing piperidine (0.4 mL) was heated under reflux for 8 h. The formed solid was filtered off and recrystallized from *n*-butanol to give **17a,b**. Yield, 0.91 g (64% for **17a**) and 0.89 g (60% for **17b**).

Method B: A mixture of compound **13** (1.01 g, 2 mmol) and β-aryl-α-cyanoacrylate derivatives (2 mmol) in 1,4-dioxane (20 mL) containing piperidine (0.3 mL) was refluxed for 10 h. The resulting solid was filtered off and recrystalized from *n*-butanol to give **17a,b**. Yield, 1.02 g (72% for **17a**) and 1.08 g (73% for **17b**).

Ethyl 7-amino-2-hydroxy-5-phenyl-3-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenylazo}-4,5-dihydropyrazolo[1,5-a]pyrimidine-6-carboxylate (17a). m.p. 236–238°C, IR: ν = 3490–3180 (OH, NH_2, NH), 1730, 1675 cm^{-1} (CO); ^{1}H NMR ($CDCl_3$): δ = 1.60 (t, 3H, CH_3), 4.45 (q, 2H, CH_2), 4.65 (s, 2H, CH_2), 5.20 (s, 1H, CH), 5.70 (br s, 2H, NH_2), 7.20–8.15 (m, 13H, ArH), 8.50–9.55 (br s, 3H, 2NH, and OH, exchangeable); Anal. Calcd. for $C_{30}H_{26}N_8O_9S_2$ (706.71): C, 50.99; H, 3.71; N, 15.86%. Found: C, 50.81; H, 3.50; N, 15.97%.

Ethyl 7-amino-2-hydroxy-5-(4-methoxyphenyl)-3-{4-[2-(saccharin-2-yl)acetylsulfamoyl]phenylazo}-4,5-dihydropyrazolo[1,5-a]pyrimidine-6-carboxylate (17b). m.p. 203–205°C, IR: ν = 3490–3190 (OH, NH_2, NH), 1725, 1670 cm^{-1} (CO); ^{1}H NMR (DMSO-d$_6$): δ = 1.70 (t, 3H, CH_3), 3.95 (s, 1H, OCH_3), 4.40 (q, 2H, CH_2), 4.60 (s, 2H, CH_2), 5.15 (s, 1H, CH), 5.75 (br s, 2H, NH_2), 7.15–8.20 (m, 12H, ArH), 8.25–9.50 (br s, 3H, 2NH, and OH, exchangeable); Anal. Calcd. for $C_{31}H_{28}N_8O_{10}S_2$ (736.73): C, 50.54; H, 3.83; N, 15.21%. Found: C, 50.35; H, 3.60; N, 15.36%.

4-(7-Amino-6-cyano-2-hydroxypyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (19). A mixture of **13** (1.01 g, 2 mmol) and ethoxymethylenemalononitrile (0.22 g, 2 mmol) in DMF (25 mL) containing a few drops of piperidine (0.3 mL) was heated under reflux for 4 h. The reaction mixture was cooled and the formed solid was filtered off and recrystallized from 1,4-dioxane to give **19**. Yield, 0.67 g (58%); m.p. 211–213°C; IR: ν = 3480–3190 (OH, NH_2, NH), 2215 (CN), 1675 cm^{-1} (CO); ^{1}H NMR ($CDCl_3$): δ = 4.60 (s, 2H, CH_2), 5.95 (br s, 2H, NH_2), 7.15–8.20 (m, 9H, ArH), 8.60–9.10 (br s, 2H, NH, and OH, exchangeable); ^{13}C NMR: δ = 35.6 (C-6), 82.1 (C-3), 111.2 (CN), 140.2 (C-3a), 150.3 (C-5), 153.1 (C-7), 156.3 (C-2); Anal. Calcd. for $C_{22}H_{15}N_9O_7S_2$ (581.54): C, 45.44; H, 2.60; N, 21.68%. Found: C, 45.65; H, 2.81; N, 21.45%.

4-(6-Cyano-2-hydroxy-7-oxo-4,7-dihydropyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (20). A mixture of **13** (1.01 g, 2 mmol) and ethyl ethoxymethylenecyanoacetate (0.34 g, 2 mmol) in DMF (20 mL) containing a few drops of piperidine (0.4 mL) was refluxed for 4 h. The reaction mixture was cooled and the formed solid was filtered off and recrystallized from DMF to give **20**. Yield, 0.65 g (56%); m.p. 196–198°C; IR: ν = 3490–3180 (OH, NH), 2210 (CN), 1680–1675 cm^{-1} (CO); ^{1}H NMR (DMSO-d$_6$): δ = 4.55 (s, 2H, CH_2), 7.15–8.10 (m, 9H, ArH), 8.60–9.10 (br s, 3H, 2NH, and OH, exchangeable); Anal. Calcd. for $C_{22}H_{14}N_8O_8S_2$ (582.53): C, 45.36; H, 2.42; N, 19.24%. Found: C, 45.53; H, 2.61; N, 19.41%.

4-(5,7-Diamino-2-hydroxy-6-phenylazopyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (22). A mixture of **13** (1.01 g, 2 mmol) and 2-phenylhydrazonomalononitrile (0.34 g, 2 mmol) in absolute ethanol (20 mL) containing a few drops of pyridine (0.4 mL) was heated under reflux for 6 h, then allowed to cool at room temperature. The precipitated solid was filtered off, washed with water (3 × 30 mL) and recrystallized from *n*-butanol to give **22**. Yield, 0.85 g (63%); m.p. 186–188°C; IR: ν = 3495–3180 (OH, NH_2, NH), 1670 cm^{-1} (CO); ^{1}H NMR ($CDCl_3$): δ = 4.61 (s, 2H, CH_2), 5.85–6.10 (br s, 4H, 2NH_2), 7.10–8.15 (m, 13H, ArH), 8.50–8.75 (br s, 2H, NH, and OH, exchangeable); Anal. Calcd. for $C_{27}H_{21}N_{11}O_7S_2$ (675.66): C, 48.00; H, 3.13; N, 22.80%. Found: C, 48.26; H, 3.36; N, 22.51%.

4-(7-Amino-2-hydroxy-5-oxo-6-phenylazo-4,5-dihydropyrazolo[1,5-a]pyrimidin-3-ylazo)-*N*-[2-(saccharin-2-yl)acetyl]benzenesulfonamide (24). A mixture of **13** (1.01 g, 2 mmol) and ethyl 2-phenylhydrazonocyanoacetate (0.43 g, 2 mmol) in absolute ethanol (20 mL) containing a few drops of pyridine (0.5 mL) was heated under reflux for 6 h, then allowed to cool at room temperature. The formed solid was filtered off, washed with water (3 × 30 mL) and recrystallization from DMF to give **24**. Yield, 0.82 g (61%); m.p. 201–203°C; IR: ν = 3490–3200 (OH, NH_2), 1680–1675 cm^{-1} (CO); ^{1}H NMR (DMSO = d$_6$): δ = 4.50 (s, 2H, CH_2), 5.85 (br s, 2H, NH_2), 7.26–8.20 (m, 13H, ArH), 8.40–9.10 (br s, 3H, 2NH, and OH, exchangeable); ^{13}C NMR: δ = 67.1 (C-6), 68.5 (C-3), 131.5 (C-3a), 148.5 (C-7), 152.1 (C-2), 154.2 (C-5), 120.1, 120.9, 121.2, 121.8, 122.5, 123.1 (phenyl ring); Anal. Calcd. for $C_{27}H_{20}N_{10}O_8S_2$ (676.64): C, 47.93; H, 2.98; N, 20.70%. Found: C, 47.75; H, 2.71; N, 20.50%.

The carbodiimides **2**, obtained from reactions of iminophosphorane **1** with isocyanates, reacted with hydrazine to give selectively 3-amino-2-arylaminobenzothieno[3,2-*d*]pyrimidin-4(3*H*)-ones **4**. Reactions of **4** with triphenylphosphine, hexachloroethane, and Et_3N produced iminophosphoranes **5**. A tandem aza-Wittig reaction of iminophosphorane **5** with isocyanate, acyl chloride generated benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*]pyrimidin-5(1*H*)-ones **7** and **9** in satisfactory yields. The effects of the nucleophiles on cyclization have been investigated.

J. Heterocyclic Chem., **46**, 903 (2009).

INTRODUCTION

Thienopyrimidines are very important heterocycles because of their significant antifungal and antibacterial activities [1–4] as well as their good anticonvulsant and angiotensin or H_1 receptor antagonistic activities [5–7]. The chemistry of thienopyrimidinones have also received attention because of their starting materials, 2-amino-3-carboxythiophenes, which can be conveniently synthesized. On the other hand, heterocycles containing 1,2,4-triazole nucleus also exhibit various biological activities; several of them have been used as fungicidal, bactericidal, insecticidal, antitumor, and anti-inflammatory agents [8–13]. The introduction of a triazole ring into the thienopyrimidine system is expected to influence the biological activities significantly.

The aza-Wittig reactions of iminophosphoranes have received increasing attention in view of their useful utilities in the synthesis of nitrogen heterocyclic compounds under mild conditions [14,15]. Recently, we have been interested in the synthesis of triazolo-quinazolinones, thienopyrimidinones, and imidazolinones *via* aza-Wittig reaction, with the aim of evaluating their fungicidal activities [16–20]. Reported herein is a new efficient synthesis of 2-substituted benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*] pyrimidin-5(1*H*)-one **7** and **9** from easily accessible iminophosphorane **1** [21].

RESULTS AND DISCUSSION

Carbodiimides **2**, obtained from aza-Wittig reactions of iminophosphorane **1** with aromatic or alkyl isocyanates, reacted with hydrazine to give selectively 2-arylamino-3-aminobenzothieno[3,2-*d*]pyrimidin-4(3*H*)-ones **4** in 80–87% yields at room temperature (Table 1, Scheme 1).

The formation of **4** can be rationalized in terms of an initial nucleophilic addition of hydrazine to give intermediate **3** which directly cyclized across the strong nucleophilic hydrazine group rather than the aryl(alkyl)-amine one. Compounds **4** were further converted to functionalized iminophosphoranes **5** *via* reaction with triphenylphosphine, hexachloroethane, and Et_3N in 72–78% yields (Table 1, Scheme 1).

Table 1

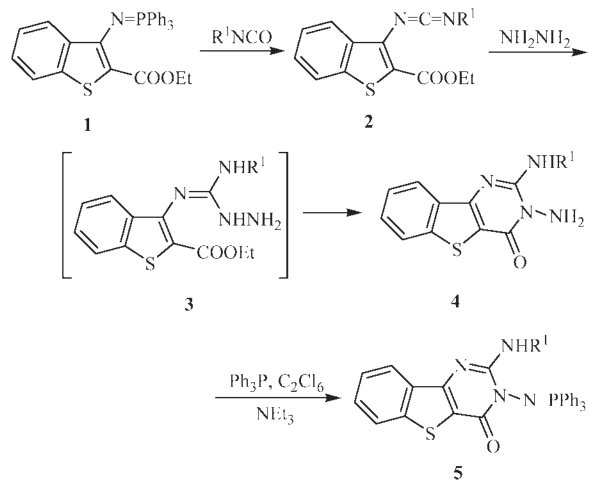
[a] Yields based on iminophosphorane **1** or **5**.

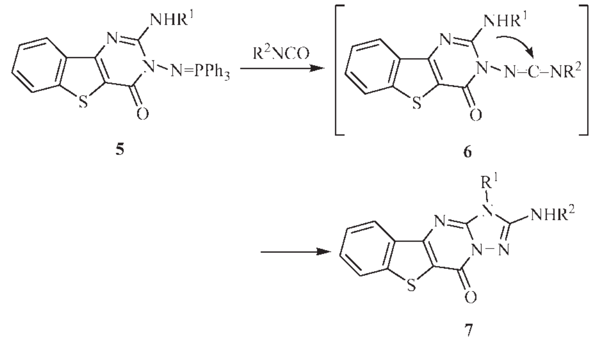
Scheme 1



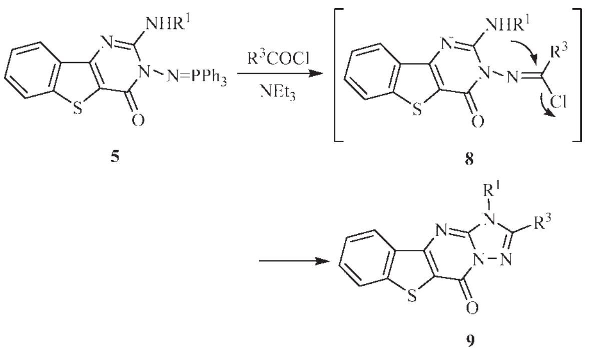
When iminophosphoranes **5** in anhydrous CH_2Cl_2 were treated with isocyanate at room temperature, the color of the reaction mixture quickly turned red, disappearing after few minutes, and 2-aminobenzothieno[3,2-*d*]-1,2,4-triazolo-[1,5-*a*]pyrimdin-5(1*H*)-ones **7** were isolated as crystalline solids in good yields (67–86%, Table 1, Scheme 2). Presumably, the conversion of **5** into **7** involves initial aza-Wittig reaction between the iminophosphorane **5** and the isocyanate to give a carbodiimide **6** as highly reactive intermediate, which easily undergoes ring closure across the amino group to give the otherwise not readily available 2-amino substituted benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*] pyrimidin-5(1*H*)-ones **7**. It is noteworthy that the reaction can be easily carried out at room temperature under mild, neutral condition, and the separation of **7** from the reaction mixture was also easily carried out by simple filtration.

Iminophosphorane **5** reacted with acyl chlorides in the presence of Et_3N in CH_2Cl_2 at room temperature to give 2-substituted benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*] pyrimidin-5(1*H*)-ones **9** in good yields (62–74%, Table 1, Scheme 3). The formation of **9** can be viewed as an initial aza-Wittig reaction between the iminophosphorane **5** and acyl chloride in the presence of Et_3N affording the intermediate imidoyl chloride **8**, which undergoes cyclization to give **9**.

Scheme 2



Scheme 3



The structure of the synthesized compound **5**, **7**, **9** were confirmed by their spectral data. For example, the IR spectra of **7k** revealed C=O absorption bands at 1672 cm^{-1}. The ^1H NMR spectral data of **7k** show the signals of —NH at 9.89 ppm as singlet. The Ar—H signals appeared at 7.50–8.34 (m, 4H, Ar—H). The MS spectrum of **7k** shows an obvious molecule ion peak at m/z 341 with 34% abundance.

In summary, we have developed an efficient synthesis of 2-substituted benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*] pyrimidin-5(1*H*)-one. Due to the easily accessible and versatile starting material, this method has the potential in the synthesis of many biologically and pharmaceutically active thienopyrimidinones derivatives.

EXPERIMENTAL

Melting points were determined using a X-4 model apparatus and were uncorrected. MS were measured on a Finnigan Trace MS spectrometer. NMR spectra were recorded in $CDCl_3$ on a Varian Mercury Plus 400 (400 Hz) spectrometer and chemical shifts (δ) were given in ppm using $(CH_3)_4Si$ as an internal reference ($\delta = 0$). IR were recorded on a PE-983 infrared spectrometer as KBr pellets with absorption in cm^{-1}. Elementary analyses were taken on a Vario EL III elementary analysis instrument.

Preparation of compounds 4. To a solution of imino-phosphorane 1 (1.44 g, 3 mmol) in anhyd. CH_2Cl_2 (10 mL) was added isocyanate (3 mmol) under N_2 at r.t. After the reaction mixture was left unstirred for 8–12 h at 0–5°C, the solvent was removed off under reduced pressure and Et_2O/petroleum ether (1:2, 12 mL) was added to precipitate triphenylphosphine oxide. Removal of the solvent gave carbodiimides 2, which were used directly without further purification. To the solution of 2 prepared above in CH_2Cl_2 (10 mL) was added hydrazine (0.18 g, 3 mmol). The mixture was stirred for 2 h at r. t. and filtered to give 4.

3-Amino-2-phenylamino-benzo[4,5]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (4a). ^1H NMR (400 MHz, $CDCl_3$): δ (ppm): 4.65 (s, 1H, NH), 4.72 (s, 2H, NH_2), 7.15–8.06 (m, 9H, Ar—H). IR

(KBr): 3412 (NH), 1674 (C=O), 1530, 1380, 698 cm^{-1}. MS: *m/z* (%) 308 (47, M$^+$), 292 (33), 200 (19), 145 (28), 77 (87).

3-Amino-2-(4-chlorophenylamino)-benzo[4,5]thieno[3,2-d] pyrimidin-4(3*H*)-one (4b). ^{1}H NMR (400 MHz, CDCl$_3$): δ (ppm): 4.71 (s, 1H, NH), 4.86 (s, 2H, NH$_2$), 7.43–7.68 (m, 6H, Ar—H), 7.87 (d, J = 8.0 Hz, 1H, Ar—H), 8.25 (d, J = 7.6 Hz, 1H, Ar—H). IR (KBr): 3428 (NH), 1676 (C=O), 1531, 1385, 693 cm^{-1}. MS: *m/z* (%) 342 (35, M$^+$), 327 (24), 200 (34), 146 (43), 77 (26).

3-Amino-2-(4-methylphenylamino)-benzo[4,5]thieno[3,2-*d*] pyrimidin-4(3*H*)-one (4c). ^{1}H NMR (400 MHz, CDCl$_3$): δ (ppm): 2.66 (s, 3H, CH$_3$), 4.73 (s, 1H, NH), 4.77 (s, 2H, NH$_2$), 7.23–8.46 (m, 8H, Ar—H). IR (KBr): 3420 (NH), 1678 (C=O), 1531, 1377, 693 cm^{-1}. MS: *m/z* (%) 322 (52, M$^+$), 306 (47), 200 (34), 146 (52), 77 (47).

3-Amino-2-isopropylamino-benzo[4,5]thieno[3,2-d]pyrimidin-4(3*H*)-one (4d). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 1.16 (d, J = 6.4 Hz, 6H, 2CH$_3$), 3.40–3.60 (m, 1H, NCH), 4.66 (d, J = 6.8 Hz, 1H, NH), 4.74 (s, 2H, NH$_2$), 7.40–7.61 (m, 2H, Ar—H), 7.83 (d, J = 8.4 Hz, 1H, Ar—H), 8.15 (d, J = 7.6 Hz, 1H, Ar—H). IR (KBr): 3417 (NH), 1676 (C=O), 1535, 1371, 694 cm^{-1}. MS: *m/z* (%) 274 (47, M$^+$), 258 (17), 200 (47), 146 (44), 77 (45).

3-Amino-2-butylamino-benzo[4,5]thieno[3,2-*d*]pyrimidin-4-(3*H*)-one (4e). ^{1}H NMR (400 MHz, CDCl$_3$): δ (ppm): 0.92 (t, J = 7.0 Hz, 3H, CH$_3$), 1.20–1.37 (m, 4H, CH$_2$), 3.55 (m, 2H, NCH$_2$), 4.61 (s, 1H, NH), 4.75 (s, 2H, NH$_2$), 7.43–7.58 (m, 2H, Ar—H), 7.85 (d, J = 8.0 Hz, 1H, Ar—H), 8.26 (d, J = 7.6 Hz, 1H, Ar—H). IR (KBr): 3411 (NH), 1676 (C=O), 1533, 1372, 694 cm^{-1}. MS: *m/z* (%) 288 (58, M$^+$), 272 (31), 200 (55), 146 (37), 77 (58).

Preparation of iminophosphorane 5. To a mixture of **4** (8 mmol), PPh$_3$ (3.14 g, 12 mmol) and C$_2$Cl$_6$ (2.84 g, 12 mmol) in dry CH$_3$CN (40 mL), was added dropwise NEt$_3$ (2.42 g, 24 mmol) at room temperature. The color of the reaction mixture quickly turned yellow and the mixture was stirred 4–6 h at room temperature. After completion of the reaction (monitored with TLC), the solvent was removed under reduced pressure and the residue was recrystallized from EtOH to give iminophosphoranes **5**.

2-Phenylamino-3-(triphenylphosphoranylidene)aminobenzo[4,5]thieno[3,2-d]pyrimidin-4(3*H*)-one (5a). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 4.66 (s, 1H, NH), 7.09–8.25 (m, 24H, Ar—H). IR (KBr): 3420 (NH), 1670 (C=O), 1533, 1381, 696 cm^{-1}. MS: *m/z* (%) 568 (52, M$^+$), 292 (20), 276 (57), 200 (13), 145 (24), 77 (50).

2-(4-Chlorophenyl)amino-3-(triphenylphosphoranylidene) amino-benzo[4,5]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (5b). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 4.73 (s, 1H, NH), 7.20–8.30 (m, 23H, Ar—H). IR (KBr): 3428 (NH), 1676 (C=O), 1531, 1385, 693 cm^{-1}. MS: *m/z* (%) 602 (32, M$^+$), 327 (9), 276 (26), 200 (12), 146 (51), 77 (22).

2-(4-Methylphenyl)amino-3-(triphenylphosphoranylidene) amino-benzo[4,5]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (5c). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 2.55 (s, 3H, CH$_3$), 4.78 (s, 1H, NH), 7.23–8.46 (m, 23H, Ar—H). IR (KBr): 3434 (NH), 1668 (C=O), 1529, 1378, 690 cm^{-1}. MS: *m/z* (%) 582 (56, M$^+$), 306 (31), 200 (14), 146 (55), 77 (83).

2-(Isopropylamino)-3-(triphenylphosphoranylidene) aminobenzo[4,5]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (5d). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 1.17 (d, J = 6.4 Hz, 6H, 2CH$_3$), 3.94 (m, 1H, NCH), 4.60 (s, 1H, NH), 7.23–8.20 (m, 19H, Ar—H). IR (KBr): 3430 (NH), 1673 (C=O), 1531, 1377, 696 cm^{-1}. MS: *m/z* (%) 534 (47, M$^+$), 272 (37), 200 (37), 146 (68), 77 (79).

2-(Butylamino)-3-(triphenylphosphoranylidene)aminobenzo [4,5]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (5e). ^{1}H NMR (400 MHz, CDCl$_3$) δ (ppm): 0.90 (t, J = 7.0 Hz, 3H, CH$_3$), 1.22–1.37 (m, J = 7.0 Hz, 4H, 2CH$_2$), 3.50(m, 2H, NCH$_2$), 4.61 (s, 1H, NH), 7.27–8.22 (m, 19H, Ar—H). IR (KBr): 3431 (NH), 1671 (C=O), 1529, 1376, 697 cm^{-1}. MS: *m/z* (%) 548 (58, M$^+$), 286 (25), 200 (56), 146 (52), 77 (71).

General procedure for the preparation of 2-arylamino benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*]pyrimidin-5(1*H*)-ones 7a–7p. To a solution of iminophosphorane 5 (1 mmol) in anhyd. CH$_2$Cl$_2$ (15 mL) was added aromatic isocyanate (1 mmol) under N$_2$ at r.t. The color of the reaction mixture became red, then decolorized after few minutes. The colorless solution was stirred at r.t for 4–8 h. The white precipitated solid was collected by filtration and recrystallized from CH$_2$Cl$_2$—EtOH to give 7a–7p.

1-(4-Methylphenyl)-2-phenylamino-benzo[4,5]thieno[3,2-*d*] [1,2,4]triazolo[1,5-a]pyrimidin-5(1*H*)-one (7a). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 2.54 (s, 3H, CH$_3$), 6.72–8.07 (m, 13H, Ar—H). IR (KBr): 3409 (NH), 1671 (C=O), 1575, 1487, 737 cm^{-1}. MS: *m/z* (%) 422 (43, M$^+$), 277 (62), 201 (28), 146 (86), 91 (77), 77 (58).

1-Phenyl-2-phenylamino-benzo[4,5]thieno[3,2-*d*][1,2,4] tri-azolo[1,5-*a*]pyrimidin-5(1*H*)-one (7b). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 7.10–8.13 (m, 14H, Ar—H). IR (KBr): 3412 (NH), 1671 (C=O), 1577, 1490, 744 cm^{-1}. MS: *m/z* (%) 408 (67, M$^+$), 277 (78), 201 (22), 146 (93), 77 (100).

2-(4-Chloro-phenylamino)-1-(4-methylphenyl)-benzo[4,5]-thieno[3,2-*d*][1,2,4]triazolo[1,5-a]pyrimidin-5(1*H*)-one (7c). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 2.55 (s, 3H, CH$_3$), 6.88–8.03 (m, 12H, Ar—H). IR (KBr): 3421 (NH), 1672 (C=O), 1572, 1496, 743 cm^{-1}. MS: *m/z* (%) 457 (23, M$^+$), 277 (64), 200 (35), 146 (90), 91 (77), 77 (76).

1-(4-Chlorophenyl)-2-(4-chloro-phenylamino)-benzo[4,5]-thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7d). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 6.82–8.09 (m, 12H, Ar—H). IR (KBr): 3420 (NH), 1673 (C=O), 1574, 1492, 742 cm^{-1}. MS: *m/z* (%) = 477 (34, M$^+$), 277 (75), 201 (19), 145 (89), 77 (63).

2-(4-Chloro-phenylamino)-1-phenyl-benzo[4,5]thieno[3,2-*d*] [1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7e). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 7.19–8.08 (m, 13H, Ar—H). IR (KBr): 3421 (NH), 1673 (C=O), 1573, 1490, 743 cm^{-1}. MS: *m/z* (%) = 442 (50, M$^+$), 277 (67), 201 (32), 145 (87), 77 (61).

1-(4-Methylphenyl)-2-(4-methyl-phenylamino)-benzo[4,5]-thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7f). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 1.80 (s, 3H, CH$_3$), 2.54 (s, 3H, CH$_3$), 6.72–8.02 (m, 12H, Ar—H). IR (KBr): 3419 (NH), 1671 (C=O), 1575, 1493, 742 cm^{-1}. MS: *m/z* (%) 436 (29, M$^+$), 277 (64), 201 (19), 146 (84), 91 (73), 77 (89).

1-(4-Chlorolphenyl)-2-(4-methyl-phenylamino)-benzo[4,5] thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7g). ^{1}H NMR (400 MHz, CDCl$_3$/TFA) δ (ppm): 2.41 (s, 3H, CH$_3$), 7.40–8.00 (m, 12H, Ar—H). IR (KBr): 3422 (NH), 1672 (C=O), 573, 1490, 744 cm^{-1}. MS: *m/z* (%) 457 (65, M$^+$), 277 (58), 200 (31), 146 (82), 91 (67), 77 (78).

2-(4-Methyl-phenylamino)-1-phenyl-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo[1,5-a]pyrimidin-5(1*H*)-one (7h). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 2.03 (s, 3H, CH_3), 6.76–8.06 (m, 13H, Ar—H). IR (KBr): 3412 (NH), 1671 (C=O), 1577, 1491, 742 cm^{-1}. MS: *m/z* (%) 423 (54, M^+), 277 (56), 201 (25), 146 (85), 91 (66), 77 (79).

1-(4-Chlorophenyl)-2-isopropylamino-benzo[4,5]thieno-[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7i). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 1.33 (d, *J* = 7.0 Hz, 6H, 2CH_3), 4.09 (d, *J* = 6.9 Hz, 1H, NCH), 7.37–8.14 (m, 8H, Ar—H). IR (KBr): 3414 (NH), 1672 (C=O), 1567, 1489, 743 cm^{-1}. MS: *m/z* (%) 409 (46, M^+), 277 (46), 201 (22), 145 (100), 77 (69).

2-Butylamino-1-(4-chlorophenyl)-benzo[4,5]thieno[3,2-*d*]-[1,2,4]triazolo[1,5-a]pyrimidin-5(1*H*)-one (7j). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 0.93 (t, *J* = 7.0 Hz, 3H, CH_3), 1.31–1.38 (m, 2H, CH_2), 1.60–1.69 (m, 2H, CH_2), 3.44 (t, *J* = 6.9 Hz, 2H, NCH_2), 7.47–8.13 (m, 8H, Ar—H). IR (KBr): 3415 (NH), 1673 (C=O), 1566, 1488, 742 cm^{-1}. MS: *m/z* (%) 423 (59, M^+), 277 (67), 200 (24), 146 (88), 77 (75).

1-Isopropyl-2-isopropylamino-benzo[4,5]thieno[3,2-*d*]-[1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7k). ^{1}H NMR (400 MHz, $CDCl_3$) δ (ppm): 1.35 (d, *J* = 7.0 Hz, 6H, 2CH_3), 1.75 (d, *J* = 7.0 Hz, 6H, 2CH_3), 4.05 (t, *J* = 6.9 Hz, 1H, NCH), 4.70 (s, 1H, NCH), 7.50–8.34 (m, 4H, Ar—H), 9.89 (s, 1H, NH). IR (KBr): 3411 (NH), 1672 (C=O), 1574, 1490, 741 cm^{-1}. MS: *m/z* (%) 341 (34, M^+), 277 (55), 201 (37), 146 (73), 77 (65).

1-Isopropyl-2-phenylamino-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7l). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 1.86 (d, *J* = 7.2 Hz, 6H, 2CH_3), 4.80–4.91 (m, 1H, CH), 6.90–8.35 (m, 9H, Ar—H). IR (KBr): 3416 (NH), 1672 (C=O), 1577, 1493, 743 cm^{-1}. MS: *m/z* (%) 375 (42, M^+), 277 (57), 201 (18), 146 (86), 77 (67).

1-Isopropyl-2-(4-methyl-phenylamino)-benzo[4,5]thieno-[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7m). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 1.86 (d, *J* = 7.0 Hz, 6H, 2CH_3), 2.10 (s, 3H, Ar—CH_3), 4.83 (d, *J* = 6.9 Hz, 1H, NCH), 6.97–8.37 (m, 8H, Ar—H). IR (KBr): 3415 (NH), 1670 (C=O), 1576, 1490, 742 cm^{-1}. MS: *m/z* (%) 389 (59, M^+), 277 (77), 201 (16), 146 (92), 91 (71), 77 (86).

1-Butyl-2-(4-methyl-phenylamino)-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7n). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 1.02 (t, *J* = 7.0 Hz, 3H, CH_3), 1.48–1.43 (m, 2H, CH_2), 1.91–1.98 (m, 2H, CH_2), 2.34 (s, 3H, Ar—CH_3), 4.47 (t, *J* = 6.9 Hz, 2H, NCH_2), 7.22–8.43 (m, 8H, Ar—H). IR (KBr): 3418 (NH), 1676 (C=O), 1572, 1495, 749 cm^{-1}. MS: *m/z* (%) 403 (67, M^+), 277 (69), 201 (21), 146 (80), 91 (68), 77 (79).

1-Butyl-2-(isopropylamino)-benzo[4,5]thieno[3,2-d][1,2,4]-triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7o). ^{1}H NMR (400 MHz, $CDCl_3$) δ (ppm): 0.98 (t, *J* = 7.0 Hz, 3H, CH_3), 1.35 (t, *J* = 7.0 Hz, 6H, 2CH_3), 1.40–1.49 (m, 2H, CH_2), 1.80–1.88 (m, 2H, CH_2),4.00–4.15 (m, 1H, NCH), 4.22 (t, *J* = 6.9 Hz, 2H, NCH_2), 7.55–8.33 (m, 4H, Ar—H), 9.83 (s, 1H, NH). IR (KBr): 3413 (NH), 1671 (C=O), 1571, 1493, 733 cm^{-1}. MS: *m/z* (%) 355 (55, M^+), 277 (64), 200 (26), 146 (89), 77 (67).

1-Butyl-2-phenylamino-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo[1,5-*a*]pyrimidin-5(1*H*)-one (7p). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 1.01 (t, *J* = 7.0 Hz, 3H, CH_3), 1.40–1.47 (m, 2H, CH_2), 1.85–1.99 (m, 2H, CH_2), 4.41 (q, *J* = 6.9 Hz, 2H, NCH_2), 7.23–8.40 (m, 9H, Ar—H). IR (KBr): 3418 (NH), 1675 (C=O), 1576, 1492, 742 cm^{-1}. MS: *m/z* (%) 389 (63, M^+), 277 (62), 201 (26), 146 (88), 77 (74).

General procedure for the preparation of 2-substituted benzothieno[3,2-*d*]-1,2,4-triazolo[1,5-*a*]pyrimidin-5(1*H*)-ones 9a–9d. To a solution of iminophosphorane 5 (2 mmol) in anhyd. CH_2Cl_2 (10 mL) were added acyl chloride (2 mmol) and Et_3N (0.20 g, 2 mmol) under N_2 at r.t. The solution was stirred at r.t for 24 h. The white precipitated ammonium salt was separated by filtration and the filtrate was concentrated to dryness. The residue was recrystallized from CH_2Cl_2—EtOH to give 9a–9d.

1-Butyl-2-methyl-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo-[1,5-*a*]pyrimidin-5(1*H*)-one (9a). ^{1}H NMR (400 MHz, $CDCl_3$) δ (ppm): 1.02 (t, *J* = 7.0 Hz, 3H, CH_3), 1.40–1.49 (m, 2H, CH_2), 1.81–1.88 (m, 2H, CH_2), 2.57 (s, 3H, CH_3), 4.13 (t, *J* = 6.9 Hz, 2H, NCH_2), 7.42–8.26 (m, 4H, Ar—H). IR (KBr): 1672 (C=O), 1572, 1493, 740 cm^{-1}. MS: *m/z* (%) 312 (57, M^+), 277 (69), 201 (17), 145 (60), 77 (86).

1-Butyl-2-phenyl-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo-[1,5-*a*]pyrimidin-5(1*H*)-one (9b). ^{1}H NMR (400 MHz, $CDCl_3$) δ (ppm): 0.92 (t, *J* = 7.0 Hz, 3H, CH_3), 1.30–1.39 (m, 2H, CH_2), 1.80–1.88 (m, 2H, CH_2), 4.30 (t, *J* = 6.9 Hz, 2H, NCH_2), 7.48–8.33 (m, 9H, Ar—H). IR (KBr): 1674 (C=O), 1573, 1495, 745 cm^{-1}. MS: *m/z* (%) 374 (65, M^+), 277 (68), 200 (24), 146 (87), 77 (83).

2-Methyl-1-phenyl-benzo[4,5]thieno[3,2-*d*][1,2,4]triazolo-[1,5-*a*]pyrimidin-5(1*H*)-one (9c). ^{1}H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 2.42 (t, *J* = 7.2 Hz, 3H, CH_3), 7. 44 –7. 99 (m, 9H, Ar—H). IR (KBr): 1671 (C=O), 1571, 1491, 741 cm^{-1}. MS: *m/z* (%) 332 (57, M^+), 277 (68), 201 (31), 146 (92), 77 (65).

1-Phenyl-2-phenyl-benzo[4,5]thieno[3,2-d][1,2,4]triazolo-[1,5-*a*]pyrimidin-5(1*H*)-one (9d). H NMR (400 MHz, $CDCl_3$/TFA) δ (ppm): 7.48–8.33 (m, 14H, Ar—H). IR (KBr): 1673 (C=O), 1575, 1494, 737 cm^{-1}. MS: *m/z* (%) 394 (100, M^+), 277 (64), 201 (25), 145 (73), 77 (76).

Isocarboxazid rearranges on heating to 5-acetonyl-2-benzyl-4-hydroxy-1,2,3-triazole in DMF at 150°C, in the ionic liquid, [bmin]HSO_4^- at 100°C or as a melt at 105°C. This is the first reported example of the Boulton–Katritzky rearrangement of an acyl hydrazide.

J. Heterocyclic Chem., **46**, 909 (2009).

INTRODUCTION

Control of process impurity formation is a critical aspect of pharmaceutical process research and development. Current guidelines by the ICH (International Committee on Harmonization) state that known impurities in the drug substance are acceptable at levels of 0.2%. Satisfactory levels of unknown impurities are 0.1% [1]. The melding of a mechanistic knowledge of impurity pathways coupled with solid process development has led to a generalized approach for statistical process control and control of impurity formation [2]. The necessity to characterize impurities and to synthesize quantities for analytical method development has afforded new synthetic methodology [3]. When an understanding of reactivity is required to elucidate potential degradation pathways in the drug product, experimental and computational methods have proven to be useful to accomplish this goal [4].

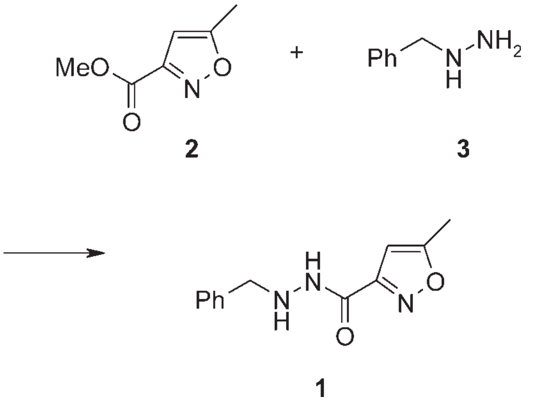
Isocarboxazid (**1**) is a monoamine oxidase inhibitor [5] and is used in the treatment of clinical depression [6]. The use of this compound in treatment is limited by side effects and its incompatibility with certain foods and the manifestation of the so-called ‘‘cheese effect’’ [7]. In the USP (United States Pharmacopoeia), the isocarboxazid (**1**) monograph requires a TLC test at a limit of 0.5% of two impurities: methyl 5-methylisoxazole-3-carboxylate (**2**) and 5-amino-1-benzyl-3-methylpyrazole (**6**). The respective visualization of these substances is done by short-wavelength ultraviolet light and by a spray of ferric chloride and potassium ferricycanide [8]. Isocarboxazid (**1**) is prepared by the reaction of the isoxazole ester **2** with benzylhydrazine (**3**) (Scheme 1) [9]. As a result of our efforts to characterize the pathway by which pyrazole **6** was formed, some interesting results on the thermolysis of isocarboxazid (**1**) were obtained. We wish to report on these findings.

RESULTS AND DISCUSSION

Although β-ketonitriles are known to have a propensity to dimerize and trimerize [10] and we are speculating about possible ways to form pyrazole **6**, we envisioned that a likely path for the formation of pyrazole **6** would be by loss of *N*-(benzylamino)isocyanate from the acidic α nitrogen of isocarboxazid (**1**) followed by isoxazole ring opening and formation of 3-oxobutanenitrile (**4**). Reaction of nitrile **4** with benzylhydrazine (**3**) would afford pyrazole **6** via the intermediacy of hydrazone **5** (Scheme 2). Many years ago, Gardener has commented on the formation of pyrazoles from isoxazole hydrazides and has indicated that their formation can be mitigated if the hydrazide-forming reaction is done at room temperature or under conditions by which the hydrazides will crystallize [11]. Alternatively, the route for the preparation of isocarboxazid (**1**) might be fundamentally flawed and the route could involve elimination of 3-oxobutanenitrile (**4**) in competition with loss of methanol.

Facile isoxazole ring opening of 3-acylisoxazoles is evident in the fact that when 3-acetyl-5-methylisoxazole (**7**) is reacted with sodium methoxide, nitrile **4** is formed. Nitrogen–oxygen bond cleavage of the isoxazole ring is initiated by the elimination of a neutral molecule, methyl acetate [12]. This chemistry parallels established behavior of isoxazole-3-yl lithium intermediates [13]. The enolate of nitrile **4** can be trapped with

Scheme 1. Synthesis of isocarboxazid (**1**).

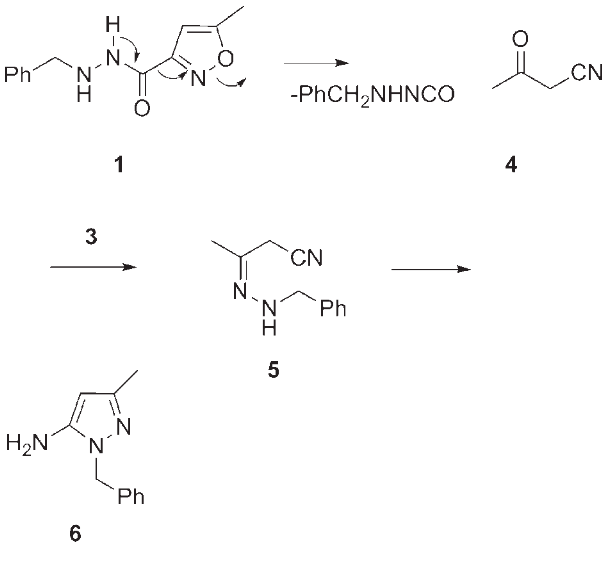


acetyl chloride and this route was used to prepare the (*E*) and (*Z*) isomers of 3-acetoxybut-2-ene nitrile (**8**) (Scheme 3) [14].

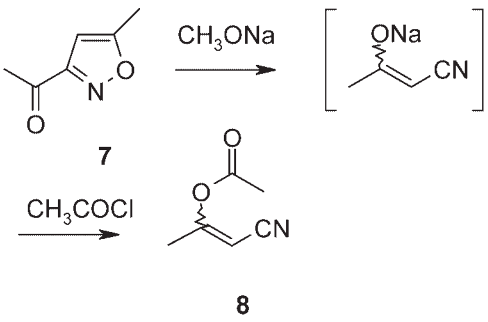
Unimolecular reactions of isocarboxazid (**1**) are known. As reported in the patent literature, isocarboxazid (**1**) rearranges to 5-acetonyl-2-benzyl-4-hydroxy-1,2-3-triazole (**9**) in refluxing toluene after an overnight hold in a 64% yield. No spectral data or purity assessment of the triazole **9** was reported [15]. We have repeated this experiment and found that the reaction follows first-order kinetics with $t_{1/2}$ of ~29 h (Scheme 4).

A significantly better conversion is observed when the rearrangement is conducted in DMF or in an ionic liquid at 150°C [16]. At 100°C in the ionic liquid, [bmin]HSO_4^-, close to the temperature of refluxing toluene, the reaction is essentially complete in 3 h as determined by HPLC analysis. Isocarboxazid (**1**) melts between 103 and 107°C and a 24% conversion to triazole **9** was observed when isocarboxazid (**1**) was heated at 105°C in a reaction vial for 2 h. For this drug substance, a validated HPLC method showed limits of detection (LOD) of 15 μg for the triazole **9** and 7.5 μg for the pyrazole **6** and no triazole **9** or pyrazole **6** was detected in the crude isocarboxazid (**1**).

Scheme 2. Thermal degradation of isocarboxazid (**1**) to nitrile **4**.



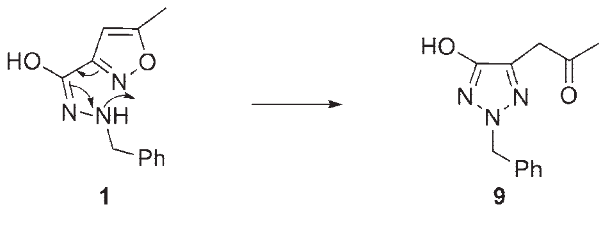
Scheme 3. Base-catalyzed ring opening of isoxazole **7**.



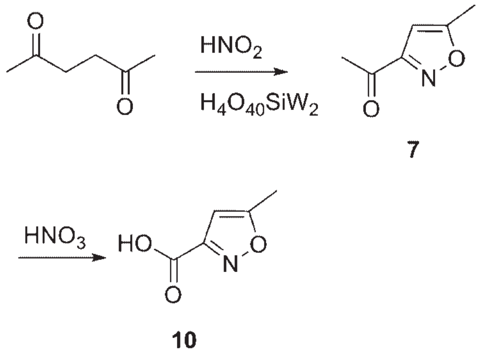
By analogy with the Boulton–Katritzky rearrangement of monoazoles, the driving force for this reaction would be the formation of the more aromatic triazole ring as opposed to the isoxazole ring [17]. In general, 1,2,4-oxadiazoles are the heterocycle involved in this rearrangement, although it has been observed in the case of an isoxazole [18]. Because of the increased acidity of the α-hydrogens of the hydrazide as opposed to an amide [19], we favor that the rearrangement occurs from the enol or imidic acid tautomer of the hydrazide. The rate acceleration that is observed in the ionic liquid as opposed to the nonpolar solvent toluene would support such an assertation. Nucleophilic attack of nitrogen on nitrogen followed by isoxazole nitrogen–oxygen bond cleavage would afford triazole **9**.

The expired Roche patent for the preparation of isocarboxazid (**1**) involves a purification of isocarboxazid (**1**) by the formation of a hydrochloride salt. Free-basing of the salt yields isocarboxazid (**1**) [9]. In a control experiment, we have found that isocarboxazid (**1**) is unstable in base and we would offer that pyrazole **6** originates, when isocarboxazid (**1**) is regenerated by treatment of the hydrochloride with base. For our current process, which is the result of additional development studies, the process has been refined and does not involve the formation of a hydrochloride salt.

Scheme 4. Thermolysis of isocarboxazid (**1**).



Scheme 5. Synthesis of isoxazole acid (**10**).



3-Oxobutanenitrile (**4**) or any precursors are not present in the starting ester **2** as both the isoxazole ester **2** and 5-methylisoxazole-3-carboxylic acid (**10**) are of exceptional quality [9,20]. Isoxazole acid (**10**) was prepared by the nitric acid oxidation of 2,5-hexanedione [20]. We have found that the violent exotherm of this oxidation [12] can be tempered when 3-acetyl-5-methylisoxazole (**7**) is prepared *in situ* by a heteropoly acid-catalyzed nitrosation with nitrous acid. When nitric acid is added to this reaction mixture, no uncontrolled exotherm is observed (Scheme 5). No yield improvement has yet been realized, however, as the heteropolyacid may also catalyze an aldol reaction or cyclization to 2,5-dimethylfuran.

An authentic sample of 5-amino-1-benzyl-3-methylpyrazole (**6**) was prepared by an adaptation of the Magnus β-ketonitrile process for the synthesis of 3-oxobutanenitrile (**4**) [21]. The procedure entails the reaction of β-ketonitrile **4** with benzylhydrazine (**3**), followed by ring closure of hydrazone **5** in a mixture of ethanol and hydrochloric acid [22]. The basis of this nitrile **4** process involves reaction of the enolate of acetonitrile with ethyl acetate and an inverse addition of the enolate suspension to an acetic acid solution of benzylhydrazine (**3**) [21]. Magnus' laboratory procedure involves the use of DMSO to solubilize the enolate. However, we found that stiff plastic tubing outfitted with standard adapters could accomplish this transfer in much the same way as the enolate suspension was transferred in the Magnus plant process. Although the yield was only 25%, byproducts could be readily removed from the relatively soluble pyrazole **6** and the pyrazole **6** was isolated as its hydrochloride salt **6a**. For comparison's sake, chromatography of the reaction mixture afforded the free base and the ^{1}H NMR spectrum agreed with the published values for this compound [23].

In conclusion, our requirement to control the formation of pyrazole **6** led to a more detailed investigation of the thermal rearrangement of isocarboxazid (**1**) to triazole **9**. By analogy with the Boulton–Katritzky rearrangement of monoazoles, the reaction would appear to proceed through the enol tautomer of the hydrazide. There is increased interest in monoamine oxidase inhibitors [24] and the crystal structures of monoamine oxidase A [25] and monoamine oxidase B [26] as well as the crystal structure of isocarboxazid (**1**) [27] have been solved. Combinatorial routes to 3-acylisoxazoles have been described [12,28]. The unmasking of a ketone functionality in this pericyclic rearrangement may have biochemical implications. The recent work of Edmonson and others have suggested that an aldehyde group may play a role in the inhibition of monoamine oxidase by arylalkylhydrazine-based therapeutics [26].

EXPERIMENTAL

Isocarboxazid (**1**) was a product of internal manufacture. An authentic sample of 5-amino-1-benzyl-3-methylpyrazole hydrochloride (**6a**) was obtained form the U.S. Pharmacopoeia, Rockville, MD [29]. The validated HPLC method consisted of gradient elution with a variable composition of 25 m*M* phosphate buffer and acetonitrile. The flow rate was 1.0 mL per minute. The initial conditions of the method consisted of 80% aqueous buffer and 20% acetonitrile. This condition was maintained for 10 min and over a 10 min period was changed to 60% buffer and 40% acetonitrile. After a further 10 min period, the conditions were changed to 50% aqueous buffer and 50% acetonitrile. The column temperature was maintained at 40°C and the wavelength was 232 nm. The buffer was prepared by dissolving 3.40 g of potassium hydrogen phosphate in 1 L of distilled water and by adjusting the pH to 2.5 with phosphoric acid. The column had dimensions of 250 mm × 4.6 mm and contained Luna C18(2), 5 μ, 100 Å packing. The column manufacturer was Phenomenex. The injection volume was 10 μL.

The respective retention times are 19.4 min for isocarboxazid (**1**), 15.9 min for the triazole **9**, 10.9 min for the isoxazole ester **2**, 6.9 min for the pyrazole **6**, 5.6 min for the isoxazole acid **10**, and 3.5 min for 5-methylisoxazole-3-carboxylic acid hydrazide (**11**). Similar retention time behavior is observed when 0.1% trifluoroacetic acid (v/v) is used as the aqueous phase.

For the validated method, 20 mg of isocarboxazid (**1**) was dissolved in 5.0 mL of acetonitrile in a 100 mL volumetric flask. The diluent was 0.1% trifluoroacetic acid (v/v) and the solution was diluted to volume with diluent. Serial dilutions of this solution allowed for the determination of the LOD from six replicate injections. The LOD of the known compounds was determined in a similar manner. The LOD for isocarboxazid (**1**), triazole **9**, isoxazole ester **2**, pyrazole **6**, isoxazole acid **10**, and isoxazole hydrazide **11** was 30, 15, 15, 7.5, 15, and 15 μg, respectively.

5-Acetonyl-2-benzyl-4-hydroxy-1,2,3-triazole (9). Under a nitrogen purge, isocarboxazid (**1**) (50.00 g) and 150 mL of anhydrous DMF were combined and heated to 150°C. When first at temperature, HPLC analysis showed the reaction to be 85% complete. After 2 h at 150°C, the conversion was essentially 100% and the triazole **9** was the only component present by HPLC. The reaction mixture was cooled and was added to 2.5 L of distilled water. Gummy material, which was associated with a white solid formed and the solution was decanted. The solid was washed with water. The solid was dissolved in 500 mL of isopropanol (IPA) and the IPA was evaporated to a minimum volume and was filtered. There was obtained 13.86 g of the triazole **9** as a pale yellow solid in a 27.4% yield and the solid was 100% pure by HPLC analysis. The crude solid was recrystallized from a 10:1 mixture of cyclohexane and IPA. Pure triazole **9** as a white solid was obtained in a 90.2% yield. The triazole **9** had melting point 95–96°C; IR (potassium bromide): 3033–2983 (br, OH), 1717 (C=O), 1226, 1180 cm^{-1}; ^{1}H NMR (deuteriochloroform) δ 2.29 (s, 3H, CH_3), 3.85 (s, 2H, CH_2), 5.32 (s, 2H, CH_2), 7.27–7.36 (m, 5H aromatic), 9.24 (b, 1H, OH); ms: *m/z* 232 (M + 1), 175 (M +1-CH_3COCH_2), 132; Anal. Calcd for $C_{12}H_{13}N_3O_2$ (231.26): C, 62.33; H, 5.67; N, 18.17. Found: C, 62.44; H, 5.74; N, 18.32.

Thermolysis of isocarboxazid (1) in [bmin] HSO_4^-. Isocarboxazid (**1**) (21.55 g) and 67.55 g of 1-butyl-3-methylimidazolium hydrogen sulfate were combined and heated to 150°C. At temperature, the reaction was essentially complete as evident by HPLC analysis. The reaction was cooled and the product was extracted with 5 × 150 mL of MTBE. The MTBE layer was isolated by vacuum decantation using a suction flask and the ionic liquid remained in the flask. After evaporation, there was obtained 11.41 g of the triazole **9** as a white solid in a 52.9% yield. The ionic liquid phase was extracted with 2 × 150 mL of ethyl acetate and 6.96 g of the remaining 10.14 g of triazole **9** was obtained. 20% IPA in ethyl acetate (150 mL) was used to extract the remaining amount of triazole **9**. After evaporation, 4.30 g of solid was obtained. The total mass balance was 105% with the overage being the ionic liquid, which was extracted when ethyl acetate or a mixture of IPA and ethyl acetate was used. No triazole **9** was detected in the ionic liquid phase. The ionic liquid was heated at 100°C for an overnight hold to remove solvent.

The ionic liquid was used in a recycle with 20.00 g of isocarboxazid (**1**) at 100°C. The reaction was monitored by HPLC once the reaction mixture reached temperature and every hour afterward. The reaction was 100% complete in 3 h.

Thermolysis of isocarboxaxzid (1) in toluene. Isocarboxazid (**1**) (50.00 g) and 150 mL of anhydrous toluene were combined under a nitrogen purge and the batch was heated to reflux. The solution was monitored periodically by HPLC over a time period of 60 h and the disappearance of isocarboxazid (**1**) was ascertained by this method. At an 88% conversion to triazole **9**, there was 4.6% of a polar impurity present along with <2.0% of other components.

Thermolysis of neat isocarboxazid (1). 20 mg of isocarboxazid (**1**) was heated at 105°C in a reaction vial for 2 h. The extent of the rearrangement was determined by HPLC. Triazole **9** was present to the extent of 24.4% by HPLC and trace levels (<0.2%) were observed for five unknowns.

5-Amino-1-benyzl-3-methylpyrazole hydrochloride (6a). Under a nitrogen purge, potassium *tert*-butoxide (87.90 g, 0.783 mol) and 825 mL of anhydrous tetrahydrofuran were combined in a 2 L flask with a mechanical stirrer. A mixture of 69.0 mL (62.2 g, 0.706 mol) of ethyl acetate and 45.0 mL (35.4 g, 0.862 mol) of acetonitrile was added over a 30 min period and the temperature was maintained below 30°C. The light beige suspension was stirred for 1 h at room temperature.

Benzylhydrazine dihydrochloride (**3a**) (55.65 g, 0.285 mol), 150 mL of ethanol, and 75 mL of concentrated ammonium hydroxide was added to a separate 3 L flask. Glacial acetic acid (225 mL) was added. The pH of the solution was 5 by paper and the suspension was cooled to 30°C. Under vacuum, the enolate suspension was transferred to the flask containing benzylhydrazine (**3**) with 1.0 cm (outer diameter) stiff plastic tubing, which had fitted into two standard 29/42 tubing adapters. The addition time was <5 min and the temperature was maintained at <30°C. The vessel was rinsed with 150 mL of THF. The suspension was stirred at room temperature for 22.5 h.

The solvent was removed under 10 mm of vacuum and a temperature of <45°C. Ethanol (500 mL) was added and this was followed by the addition of 120 mL of concentrated hydrochloric acid. The reaction mixture was refluxed for 24 h [22]. The reaction mixture was cooled and sodium carbonate was added. The pH of the solution was 5 to wet paper. The batch was filtered and washed with ethanol (2 × 300 mL). The filtrate was evaporated at 40–45°C under vacuum. After 500 mL of ethanol was removed, a white solid formed. The suspension was filtered and washed with ethanol. The concentration and filtration was repeated twice. To the residue was added 550 mL of isopropanol. The slurry was cooled, filtered, and washed with 2 × 50 mL of IPA. Concentrated hydrochloride acid (25 mL) was added. The slurry was cooled in an ice-bath, filtered, and dried. There was obtained in two crops, 16.16 g of 5-amino-1-benzy-3-methylpyrazole hydrochloride (**6a**) as a white solid in a 25.3% yield. Pyrazole hydrochloride **6a** had mp 221–223°C and the purity by HPLC was 100%.The melting point of the USP reference standard was 223–227°C [29].

5-Amino-1-benzyl-3-methylpyrazole (6). Using a similar protocol, the free base **6** was isolated in a 29% yield after chromatography on silica gel and with an eluent consisting of a mixture of 60% ethyl acetate and 40% heptane. Pyrazole **6** had mp 64–66°C (lit mp 67–70.5°C [23]) and ^{1}H NMR (deuteriochloroform) δ 2.14 (s, 3H), 3.46 (b, 2H), 4.92 (s, 2H), 5.40 (s, 1H), 7.15–7.36 (m, 5H, aromatic). The ^{1}H NMR agrees with the reported values [23]. Pyrazole **6** was freely soluble in IPA, the recrystallization solvent for isocarboxazid (**1**). The addition of hydrochloric acid causes the hydrochloride **6a** to precipitate from solution. Pyrazole **6a** had mp 223–227°C.

5-Methylisoxazole-3-carboxylic acid (10). 2,5-Hexanedione (42.8 g; 0.375 mol), 0.54 g (0.05 mol %) of silicotungstic acid, 17.9 mL (0.34 mol) of concentrated sulfuric acid, and 80 mL of water were combined and cooled to 5°C. Sodium nitrite (65.0; 0.94 mol) was added over a 100 min period and the temperature was maintained below 40°C. Copious gas evolution was observed with some nitrogen dioxide vapors. The mixture was held overnight. The reaction mixture was filtered and washed with ~5 mL of water. The filtrate contained two phases.

The reaction mixture was heated to between 75 and 80°C. 70% Nitric acid (85 mL, 1.3 mol) was added slowly over a 1 h period. The heat was shut off after the addition of 15 mL nitric acid. The batch temperature was maintained at 100–102°C for 19.5 h. The reaction was cooled to 15°C and the product was isolated by filtration. After drying to a constant weight, there was obtained 21.33 g of 5-methylisoxazole-3-carboxylic acid (**10**) as a white solid in a 45% yield. The purity by HPLC was 99% (Zorbax-SC-Cyano column, eluent: 95% 25 m*M* phosphate buffer and 5% methanol, flow rate: 1.0 mL per min) and the melting point was 171–173°C (decomposition). A reference standard, which was prepared by the Cusmano method [20] and was recrystallized from acetone had a melting point of 172–173°C with decomposition.

A number of *N*-heteroaryl aminonaphthols (Betti bases) were prepared from the reaction of 2-naphthol, 3-aminopyridine, and aromatic aldehydes. Subsequent condensation of the prepared Betti bases with oxalyl chloride afforded the novel naphth[1,2-f][1,4]oxazepine-3,4-dione heterocycles in moderate to high yields.

J. Heterocyclic Chem., **46**, 914 (2009).

INTRODUCTION

Although Betti's classical procedure for the preparation of 1-(α-aminobenzyl)-2-naphthol (Betti base) was published more than a century ago [1], the possibilities of the application of this versatile synthon in the ring-closure reactions to give naphthalene-condensed heterocyclic derivatives have not been thoroughly investigated. A few publications that have been appeared on this topic focus on the transformation reactions of the Betti base analog aminonaphthols with phosgene, ethyl benzimidate, 2-carboxybenzaldehyde, levulinic acid, salicylaldehyde/acetaldehyde, salicylaldehyde/formalin, benzaldehyde derivatives, and bis-aldehydes/NaBH$_3$CN to naphthoxazine derivatives [2–6]. Traditionally, the Betti base derivatives synthesis is carried out in organic solvents, such as, EtOH, MeOH, and Et$_2$O, at room temperature for long time or thermally under solvent-less conditions. As such, utilization of environmental friendly water as solvent not only provides the product in an easy work-up procedure but also is in accord with green sustainable chemistry principles [7–13].

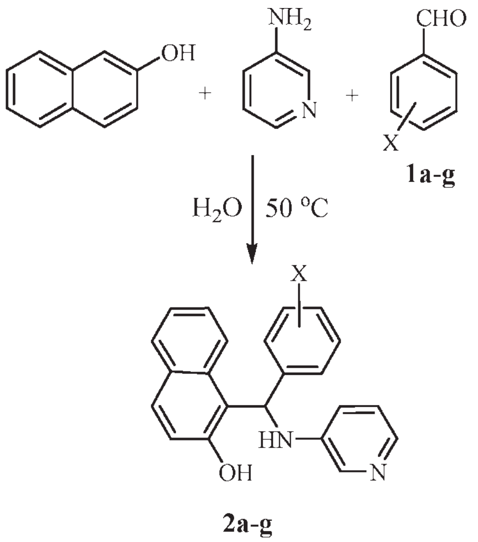
There are many methods for the synthesis of oxazepine ring systems [14]. In the reported synthetic approaches to the aryl-fused derivatives of 1,4-oxazepines, several bifunctional keto acids were used in Ugi condensation reaction [15]. Similarly, a number of 1,4-benzoxazepin-3-ones were obtained via Ugi three-component condensations using bifunctional starting materials containing aldehyde and carboxylic acid [16]. A synthetic procedure was also developed for the preparation of oxazepinedione derivatives by lactonization of some amides obtained from condensation of either 2-acetoxybenzoic acid chloride or the proper acethoxynaphthonic acid chloride with cyclic amino acids [17]. Oxazepine derivatives were described as effective protease inhibitors [18], integrin antagonists, squalene synthase [19], reverse transcriptase inhibitors [20], and antihistamines, which can be used for the efficient therapy of some allergic and dermatological infections [21]. To the best of our knowledge, synthesis of dioxo-1,4-naphthoxazepine via condensation of aminonaphthols (Betti bases) with oxalyl chloride has not been previously reported in literature.

Our very recently reported results on the successful uncatalyzed quantitative preparation of aminonaphthols (Betti bases) via one-pot three-component reaction of 2-naphthol, aromatic aldehydes, and heteroaryl amines, such as 2-aminopyrimidine, 2-aminopyrazine, and 2-aminopyridine [22] prompted us to utilize these bases in the synthesis of the novel dioxo-1,4-naphthoxazepines.

RESULTS AND DISCUSSION

Condensation of Betti bases containing the heteroaryls, such as 2-aminopyrimidine, 2-aminopyrazine, and 2-aminopyridine with oxalyl chloride failed to produce any product with the oxazepinedione structure. It was concluded that the Betti bases containing the very poor electron nature of 2-aminopyrimidine, 2-aminopyrazine, and 2-aminopyridine might have been responsible for

Scheme 1



X = **a**: H, **b**: 4-Cl, **c**: 3-Cl, **d**: 4-Br, **e**: 3-Br, **f**: 4-NO_2, **g**: 3-NO_2

the lack of expected reactivity. Therefore, it was decided to prepare the Betti bases obtained from one-pot condensation of 3-aminopyridine, 2-naphthol with different aromatic aldehydes. These aminonaphthols containing the 3-aminopyridine moiety with partially less electron deficiency with respect to the previously prepared heteroaryl amines were expected to successfully furnish the relevant oxazepine derivatives.

As the model reaction, the one-pot reaction of benzaldehyde, 2-naphthol, and 3-aminopyridine was carried out under our previously reported conditions. It was found that at least 2 h is needed for reaction to be completed at room temperature. The best result was obtained at 50°C, because the reaction was completed during 5 min. Therefore, three-component reactions of 2-naphthol, 3-aminopyridine, and aromatic aldehydes **1a–g** in water afforded aminonaphthol derivatives **2a–g** with excellent yields (Scheme 1). Reaction times and yields of the synthesized Betti base derivatives **2a–g** are presented in Table 1.

Identification of **2a–g** was carried out on the basis of spectroscopic information and elemental analysis. The ^{1}H NMR spectra of compounds **2a–g** show a sharp singlet for the hydroxyl group at δ 10.2 ppm, a doublet for NH proton at δ 6.7 ppm, and a doublet for methine proton at δ 6.5 ppm. D_2O is traditionally added into the NMR tube of compounds containing the OH or NH group to find the relevant signals and their coupling effects. Upon addition of D_2O into the **2a** NMR sample tube, the δ 10.2 ppm and δ 6.7 ppm signals disappeared and the proton of methine located at δ 6.5 ppm moiety collapsed into a singlet. The IR spectra of compounds **2a–g** display two absorption bands at 3373–3406 cm^{-1} for OH and NH groups. Compounds **2a–g** exhibit the expected parent ion peaks with medium intensity in the Mass spectra.

When the newly synthesized *N*-heteroaryl-substituted aminonaphthols **2a–g** were treated with oxalyl chloride in the presence of pyridine in dry 1,2-dichloroethane as solvent, the corresponding novel naphthoxazepine-condensed 1,4-naphthoxazepine-3,4-diones **3a–g** were obtained (Scheme 2).

Identification of **3a–g** was carried out on the basis of ^{1}H NMR, ^{13}C NMR, IR, Mass spectra, and elemental analysis. The absence of OH and NH protons in the ^{1}H NMR and IR spectra confirms the transformation of the starting aminonaphthols into the products by bonding of the oxalyl chloride sp^2 carbons to the hydroxyl and *N*-substituted groups. IR absorption bands appearing at 1633 and 1725 cm^{-1} reveals the presence of lactam and lactone carbonyl groups, respectively. The oxazepine-dione ring methine proton appears as a singlet at δ 6.5 ppm and the other protons are displayed in the aromatic regions. Mass spectra of **3a–g** reveal the presence of the molecular ion peaks and other fragments consistent with the assigned structures.

In summary, we have successfully developed a fast, convenient, and efficient method for the synthesis of new *N*-substituted-aminonaphthol (Betti base) derivatives in water. When compared with other previously reported procedures in literatures, this method with the advantages, such as omitting organic solvent, generality

Table 1

Reaction times, yields, and melting points of the products **2** in H_2O.

and simplicity of procedure, lower reaction time, elimination of acid catalyst, and obtaining excellent yields are worth noting. Moreover, we have developed a convenient synthetic strategy to novel naphthoxazepine-condensed derivatives 1,4-naphthoxazepine-3,4-diones. To the best of our knowledge, the synthesis of seven-membered rings consisting of 1,4-naphthoxazepine-3,4-diones have not been previously reported.

EXPERIMENTAL

All commercially available chemicals and reagents were used without further purification. Melting points were determined with an Electrothermal model 9100 apparatus and are uncorrected. IR spectra were recorded on a Shimadzu 4300 spectrophotometer. The ^{1}H and ^{13}C NMR spectra were recorded in DMSO-d_6 on Bruker DRX-500 AVANCE spectrometers. Chemical shifts (δ) are reported in ppm and are referenced to the NMR solvent. Mass spectra of the products were obtained with a HP (Agilent technologies) 5937 Mass Selective Detector. Elemental analyses were carried out by a CHN-O-Rapid Heraeus elemental analyzer (Wellesley, MA).

General procedure for the synthesis of 1-(X-substituted-phenyl(pyridine-3-ylamino)methyl)naphthalene-2-ol (2a–g). To a stirring suspension of 2-naphthol (1.44 g, 10 mmol) in water (15 mL), the appropriate aromatic aldehyde (10 mmol) and 3-aminopyridine (10 mmol) was added. The reaction mixture was stirred at 50°C for the appropriate time (see Table 1). Then water was decanted and the white precipitated product was separated upon addition of ethanol (10 mL) to the mixture with stirring, while cooling to 0–5°C. The precipitate was filtered, washed with cold EtOH, dried, and purified by recrystallization from EtOH to give the colorless crystals of **2a–g**.

1-(Phenyl(pyridine-3-ylamino)methyl)naphthalene-2-ol (2a). IR (potassium bromide): 3394, 3068, 2900, 1625, 1240, 804 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6): δ 6.55 (d, J = 6.6 Hz, 1H, methine-H), 6.72 (d, J = 6.6 Hz, 1H, NH), 7.00–8.15 (m, 15H, NPh-H, Ph-H, and Pyridine-H), 10.25 (s, 1H, OH) ppm; ^{1}H NMR (500 MHz, DMSO-d6 + D_2O): δ 6.57 (s, 1H, methine-H), 7.01–8.09 (m, 15H, NPh-H, Ph-H, and Pyridine-H) ppm; ^{13}C NMR (125 MHz, DMSO-d_6): δ 53.39, 119.08, 119.17, 119.56, 123.26, 124.34, 124.94, 126.91, 127.32, 127.59, 129.06, 129.45, 129.70, 130.19, 133.08, 136.73, 138.11, 143.11, 145.44, 153.88 ppm; ms: m/z (%) 326 (10) [M$^+$], 231 (100), 202 (50), 94 (40). *Anal.* Calcd for $C_{22}H_{18}N_2O$: C, 80.98; H, 5.52; N, 8.58%. General procedure for the synthesis of 1-(X-substituted-phenyl)-2-(pyridin-3-yl)-1,2-dihydronaphth[1,2-f][1,4]oxazepine-3,4-diones (3a–g). Oxalyl chloride (1.2 mmol) was added dropwise with ice cooling to a stirring solution of 1-(X-substituted-phenyl(pyridine-3-ylamino)methyl)naphthalene-2-ol **2a–g** (1 mmol) in dry 1,2-dichloroethane (15 mL) containing pyridine (2.4 mmol) under argon atmosphere. The mixture was stirred for 30 min at 0–5°C, then 30 min at room temperature, and refluxed for an additional 45 min. The solvent was then removed under reduce pressure to give a solid compound. It was then triturated in saturated sodium bicarbonate solution (15 mL), filtered, washed with distilled water, and dried. The crude product was recrystallized from EtOH to give colorless crystals of **3a–g**.

1-Phenyl-2-(pyridine-3-yl)-1,2-dihydronaphth[1,2-f][1,4]oxazepine-3,4-dione (3a). Yield: 85%; mp: 232–234°C; IR (potassium bromide): 1718, 1635 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 6.23 (s, 1H, methine-H), 7.22–8.62 (m, 15H, NPh-H, Ph-H, and Pyridine-H) ppm; ^{13}C NMR (125 MHz, DMSO-d$_6$): δ 65.41, 114.75, 117.35, 122.69, 124.23, 125.86, 128.06, 128.17, 129.18, 129.42, 129.54, 129.73, 131.28, 131.47, 136.41, 137.54, 139.39, 147.53, 149.50, 149.48, 149.53, 150.00 ppm; ms: *m*/*z* (%) 380 (5) [M$^+$], 352 (35), 231 (100), 202 (45). *Anal.* Calcd for $C_{24}H_{16}N_2O_3$: C, 75.79; H, 4.21; N, 7.37%. Found: C, 75.70; H, 4.25; N, 7.40%.

1-(4-Chlorophenyl)-2-(pyridine-3-yl)-1,2-dihydronaphth[1,2-f][1,4]oxazepine-3,4-dione (3b). Yield: 83%; mp: 245–246°C; IR (potassium bromide): 1718, 1635 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 6.73 (s, 1H, methine-H), 7.32–8.55 (m, 14H, NPh-H, Ph-H, and Pyridine-H) ppm; ^{13}C NMR (125 MHz, DMSO-d$_6$): δ 62.81, 115.42, 117.54, 124.06, 124.86, 126.33, 128.44, 129.20, 129.60, 130.03, 130.28, 131.48, 131.66, 131.66, 134.11, 136.61, 137.47, 139.75, 147.31, 149.41, 149.43, 149.94 ppm; ms: *m*/*z* (%) 415 (10) [M$^+$], 386 (15), 279 (40), 231 (50), 202 (20), 167 (90), 149 (100). *Anal.* Calcd For $C_{24}H_{15}ClN_2O_3$: C, 69.48; H, 3.62; N, 6.75%. Found: C, 69.51; H, 3.55; N, 6.70%.

1-(3-Chlorophenyl)-2-(pyridine-3-yl)-1,2-dihydronaphth[1,2-f][1,4]oxazepine-3,4-dione (3c). Yield: 76%; mp: 222–223°C; IR (potassium bromide): 1724, 1639 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 6.74 (s, 1H, methine-H), 7.28–8.56 (m, 14H, NPh-H, Ph-H, and Pyridine-H) ppm; ^{13}C NMR (125 MHz, DMSO-d$_6$): δ 62.82, 115.22, 117.57, 124.03, 124.85, 126.38, 127.00, 128.17, 128.54, 129.20, 129.61, 129.64, 131.49, 131.76, 132.08, 134.33, 136.60, 137.40, 143.09, 147.41, 149.40, 149.43, 149.48, 149.90 ppm; ms: *m*/*z* (%) 415 (10) [M$^+$], 386 (50), 265 (90), 231 (100), 202 (50). *Anal.* Calcd For $C_{24}H_{15}ClN_2O_3$: C, 69.48; H, 3.62; N, 6.75%. A short and efficient regioselective synthesis of a number of 1,4-disubstituted-1,2,3-triazole derivatives of oxindoles from *N*-terminal alkyne and alkynyl ether derivatives of Morita-Baylis-Hillman (MBH) adducts of isatin with *in situ* generated alkyl azide and copper(I) iodide as a catalyst in 1:1 mixture of *t*-BuOH:water as a solvent system has been achieved. The synthetic procedure tolerates most of the functional groups present in the MBH adducts and circumvents the problems associated with the isolation of potentially toxic and explosive organic azides.

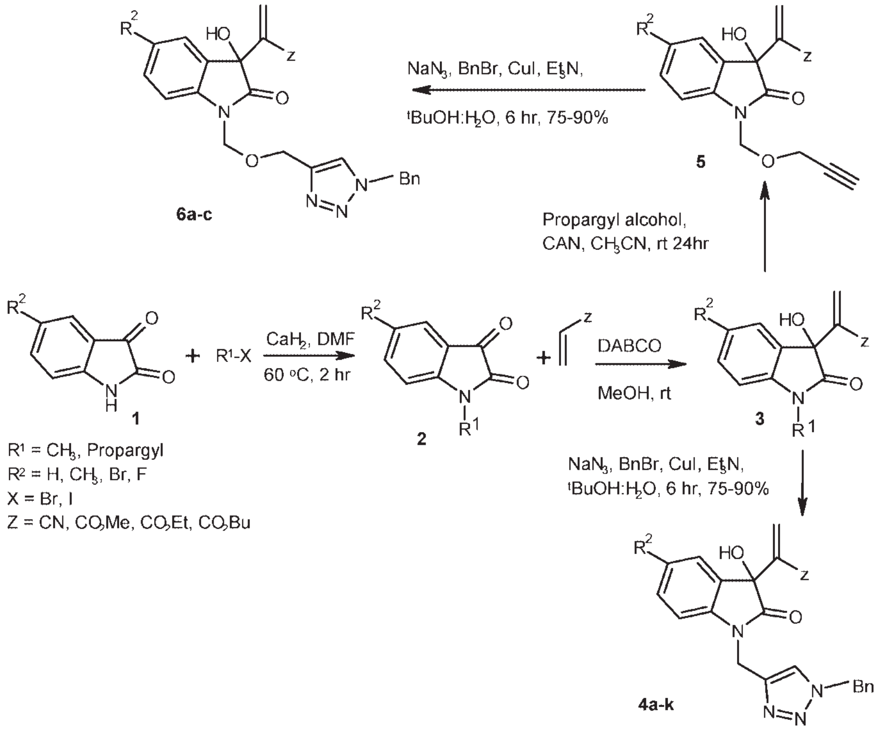
J. Heterocyclic Chem., **46**, 919 (2009).

INTRODUCTION

Oxindoles derivatized as 1,2,3-triazole are elegant synthetic targets in organic synthesis due to their significant biological activities [1]. Recently, click chemistry has been emerged as a fast and efficient method for the synthesis of novel diverse chemical entities and the generation of large number of drug-like molecules with triazole scaffolds [2]. The triazole scaffolds are considered as significant synthetic targets due to their significant biological activities, such as antibacterial [3], anti-HIV [4], and anti-allergic [5]. Hence, a number of synthetic routes have been developed for the preparation of these structural frameworks [6–9]. As a result, there has been considerable interest in developing efficient synthetic methods for these compounds with oxindole as core structure. The Morita-Baylis-Hillman (MBH) adduct and their derivatives, such as halides, acetates, ethers, etc. play an important role as synthons for a number of potential synthetic intermediates and natural product syntheses [10]. As part of our on going research on novel synthetic applications of MBH adducts [11–13], particularly for the construction of novel oxindole derivatives [14–18], we were interested to explore the synthesis of title compounds using the versatile ''click chemistry'' reaction methodology. Several methods have been reported for the synthesis of 1,2,3-triazoles and 1,3-dipolar cycloaddition of azides to alkynes [19–21]. Recently, Sharpless and coworkers have reported a high yielding synthesis of triazoles using a Cu(I) catalyst with an excellent 1,4-regioselectivity. The metal-catalyzed reaction discovered simultaneously and independently in the Sharpless and Meldal laboratories [22] constitutes a substantial improvement of the classical Huisgen-type thermal 1,3-dipolar cycloaddition, which usually afford a mixture of 1,4- and 1,5-disubstituted triazoles. Fokin and coworkers have developed a multicomponent variant for the synthesis of trizoles both in conventional [23] and microwave irradiation [24] methods. Although *N*-propargyl isatins obtained from Friedel-Crafts alkylation of 2-napthol with isatin have been used for the 1,3-dipolar cycloaddition with alkyl azides [25], however, the reaction with *N*-alkyne and *N*-alkynyl ether derivatives of MBH adducts of isatin are unknown. Thus, herein, we report an efficient, safe, and one-pot synthesis of 1,4-disubstituted-1,2,3-triazole derivatives of oxindoles from the 1,3-dipolar cycloaddition reaction of *N*-propargyl MBH adduct of isatin with *in situ* generated alkyl azide and copper iodide as catalyst in 1:1 mixture of *t*-BuOH and water as a solvent. The reaction condition was fully compatible and environmentally benign. A detailed study

Scheme 1



on the 1,3-dipolar cycloaddition reaction of *N*-terminal alkynes **3** and **5** with alkyl azides to afford highly functionalized triazole derivatives is the subject matter of this article (Scheme 1).

RESULTS AND DISCUSSION

The starting material *N*-terminal alkynes of isatin were prepared from the alkylation reaction of isatin with propargyl bromide and CaH_2 as a base in DMF at 60°C for 1 hr. Further, the corresponding MBH adducts were prepared following reported procedure [26]. The other substrate namely, *N*-propargyl ether derivative of MBH adduct was prepared from the *N*-methylated MBH adduct of isatin with propargyl alcohol and cerium ammonium nitrate (CAN) in acetonitrile at room temperature [11].

Initially, we carried out a reaction of alkyne **3** with 1.2 equivalents of sodium azide, 2.6 equivalents of triethylamine, and 2.2 equivalents of benzyl bromide in the presence of 2.5 mol % CuI in PEG-400. The reaction did not proceed and attempts to carry out the reaction with other solvent such as H_2O also did not yield fruitful results. However, the use of a mixture of $^tBuOH:H_2O$ (1:1 v/v) as solvent drove the reaction to form the desired 1,4-disubstituted 1,2,3-bistriazole product in excellent yield (Scheme 1, Table 1, entry 1). The click chemistry reaction, under mild conditions, constituted the Cu(I) catalyzed alkyne–azide [3+2]-cycloaddition furnished pharmaceutically important 1,4-disubstituted 1,2,3-triazole indolones in excellent yields (Scheme 1, Table 1). This investigation offers a mild and efficient method for the preparation of 1,2,3-triazoles using CuI as catalyst for the 1,3-dipolar cycloaddition of terminal alkynes with alkyl azides. The copper(I) readily inserts into terminal alkynes in the presence of a base, which proceeds *via* the intriguing six-membered ring [22,27]. The triazole was formed in a regioselective manner, with no contamination of 1,5-regioisomer. To demonstrate the methodology applicable to a variety of substrates having bromo, fluorine, and alkyl substitutions, synthesis of several triazole derivatives of oxindoles have been achieved and the results are collected in Table 1. The structure of 1,4-disubstituted 1,2,3-triazoles obtained is in good agreement with those described in the previous reports on the synthesis of substituted triazoles *via* three component coupling reaction [28]. The results revealed that the reaction was dependent on the nature of substituents on the isatin as evident from the comparison of the yields of products (**4a–k** and **6a–c**) due to electronic effects. The yields of the products decreased when electron donating groups were present on the isatin (entries 3 and 4). The yield of the products increased when electron-withdrawing groups were present on the isatin (entries 5, 6, 9, and 10). The substitution in ester group from Me → Et → Bu (entries 6, 7, 8, 10, and 11) afforded decreased yields.

14	F	 6c	80

[a] Isolated yield.

All the new compounds were characterized thoroughly by spectroscopic methods (IR, ^{1}H, ^{13}C NMR, and ESI-mass spectra).

It is noteworthy that these reactions were efficiently performed in a neutral aqueous solution (water:^{t}BuOH) at an ambient temperature (RT). Molar equivalents of the halide, sodium azide, and alkyne were used in the mild 1,3-dipolar cycloaddition reaction. The method avoid the problems associated during the isolation of organic azides, and complements the reported method for the preparation of 1,2,3-triazoles. The operational simplicity of this method makes it attractive for preparative applications as well as a library compounds for drug discovery.

In conclusion, we have demonstrated an efficient synthetic procedure for the synthesis of highly functionalized 1,2,3-triazole derivatives of 2-indolones *via* a copper(I) catalyzed 1,3-dipolar cycloaddition of *N*-terminal alkyne derivative of MBH adduct of isatin with *in situ* generated alkyl azides. Further studies on this reagent system are in progress.

EXPERIMENTAL

General. IR measurements were done as KBr pellets for solids using PerkinElmer Spectrum RXI FTIR. The ^{1}H and ^{13}C NMR spectra were recorded in CDCl$_3$ with, Bruker 500 MHz and Bruker 300.1 MHz high resolution NMR spectrometer. CDCl$_3$ was used as the solvent for the NMR spectral measurements and spectra were recorded in ppm with TMS as internal standard. Multiplicities are abbreviated as follows: singlet (s), doublet (d), triplet (t), multiplet (m), and broad (br). The mass were analyzed by using a Electrospray Ionization method with Thermo Finnigan Mass spectrometer. Melting points were determined in capillary tubes and are uncorrected. Analytical TLC was performed on precoated plastic sheets of silica gel G/UV-254 of 0.2-mm thickness (Macherey-Nagel, Germany).

Typical experimental procedure (4b). A mixture of *N*-propargyl derivative of MBH adduct (100 mg, 0.35 mmol), sodium azide (27 mg, 0.42 mmol), benzyl bromide (66 mg, 0.38 mmol), triethylamine (92 mg, 0.91 mmol), and CuI (2.5 mol %) in 3 mL of *t*-butanol:water (1:1) was stirred at room temperature for 6 h. After completion of the reaction (monitored by TLC), the catalyst was filtered off through a pad of celite® and the product was extracted with ether (2 × 20 mL). The combined organic layer was dried (anhyd. Na$_2$SO$_4$), filtered, and removed under vacuum. The crude product was purified by silica gel column chromatography using hexane–ethyl acetate (7:3) solvent mixture to afford pure triazole derivatives.

2-(1-((1-benzyl-1H-1,2,3-triazol-4-yl)methyl)-3-hydroxy-2-oxoindolin-3-yl)acrylonitrile (4a). White solid: R_f (60% EA/hexane) 0.25; IR (KBr): 3378, 1612, 1487, 1332, 1177 cm^{-1}; ^{1}H NMR (CDCl$_3$/TMS, 300.1 MHz): δ 2.39 (brs, 1H), 4.86 (d, J = 15.8 Hz, 1H), 5.10 (d, J = 15.9 Hz, 1H), 5.38 (AB quartet, J = 14.2 Hz, 2H), 6.13 (s, 1H), 6.39 (s, 1H), 6.74–7.13 (m, 4H), 7.26–7.31 (m, 5H), 7.54 (s, 1H). ^{13}C NMR (CDCl$_3$/TMS, 75.3 MHz): 34.9, 52.5, 54.2, 76.2, 108.9, 112.1, 114.3, 122.7, 122.3, 122.6, 124.4, 128.0, 128.2, 128.9, 129.0, 131.0, 141.2, 164.3, 176.1. Synthesis of a series of near-infrared dimeric dyes is presented. The intramolecular dimers contain two chromophores linked with a conformationally flexible ether or oligoether bridge. Optical properties of the dyes are discussed.

J. Heterocyclic Chem., **46**, 925 (2009).

INTRODUCTION

Currently, there is substantial interest in dimeric dyes in which two chromophoric subunits are linked by a conformationally flexible chain. Under low concentration conditions in aqueous solution, these bichromophoric molecules tend to exist in an intramolecular clam-shell conformation with the two chromophores in close proximity to each other. The intermolecular aggregation of such intramolecular foldamers becomes important with the increase in concentration. Normally, these are H-type stacking interactions characterized by hypsochromic absorption and low fluorescence quantum yield as compared to the characteristics of non-interacting dye molecules. In general, the stacking interactions are less important in solvents of low polarity. Several dimeric dyes have been designed as non-covalent labels for the detection of nucleic acids [2,3] and proteins [4–7]. More specifically, upon binding with a biopolymer, the intramolecular complex of a dimeric cyanine undergoes dissociation and the clam-shell of the inner complex opens up. Binding of the open form of the dimeric dye usually results in a batochromic shift in absorption and a greatly increased quantum yield of fluorescence. Several bichromophoric squaraines have been developed as cation-specific chemosensors [8–11]. These dimeric dyes bind metal cations and the resulting complexes show different spectral properties in comparison to non-complexed dyes. Finally, several bichromophoric cyanine dyes have been used as agents for latent fingerprint detection [5,12]. These dimeric dyes exhibit strongly enhanced fluorescence upon interaction with the hydrophobic fats of fingerprints that results in a clear fluorescence image of the fingerprint.

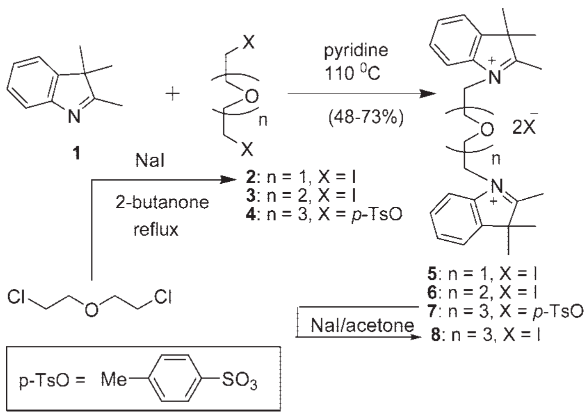
Synthesis of dimeric dyes **14–16** and **21–26** with an ether or oligoether linker in the molecule is described in this report. The molecules were designed as improved non-covalent labels for nucleic acids and proteins. The presence of oxygen atom(s) in the bridge linking the two dye moieties results in an increased solubility of the bifunctional molecules in water and aqueous buffers in comparison to the more hydrophobic analogs containing a polymethylene linker. The dimeric dyes **21–26** are additionally substituted with hydrophilic sulfonatobutyl groups. These dyes are bifunctional heptamethine cyanines that absorb and fluoresce in the near-infrared region (>700 nm). Few biomolecules absorb and fluoresce within the near-infrared region, and as a result Raman and Rayleigh light scattering are greatly reduced in this region. Consequently, improved signal-to-noise ratios are typically observed in the near-infrared region. In addition, typical impurities need not be considered because such species are not detected at wavelengths longer than 700 nm. All bis-dyes contain indolium moieties as end-heterocyclic subunits because such derivatives are relatively stable in solution [13].

RESULTS AND DISCUSSION

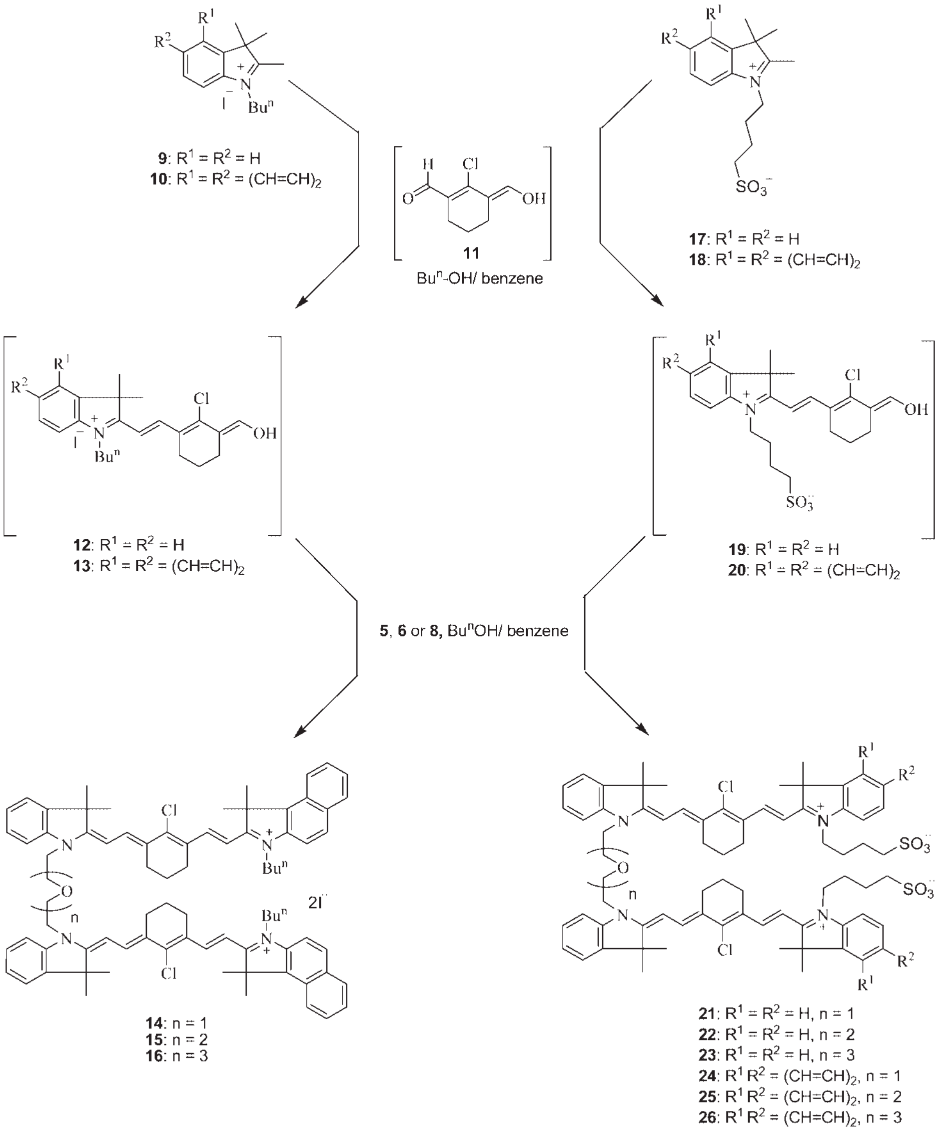
The key intermediate products are bis-indolium salts **5**–**7** (Scheme 1).

These compounds were obtained by quaternization of indolenine **1** with α,ω-diiodo-substituted ethers **2**, **3** or α,ω-bis-tosylate derivative **4**. In the latter case, the resultant bis-tosylate salt **7** was transformed into a more reactive diodide salt **8** by treatment with sodium iodide in acetone. The application of the intermediate dimeric salts **5**, **6**, and **8** in the synthesis of dimeric near-infrared cyanines **14**–**16** and **21**–**26** is shown in Scheme 2. The successful strategy for the synthesis of *N*-butyl derivatives **14**–**16** involved quaternization of 2,3,3-trimethylindole-nine and 2,3,3-trimethylbenzo[*e*]indolenine with *n*-butyl iodide followed by condensation of the

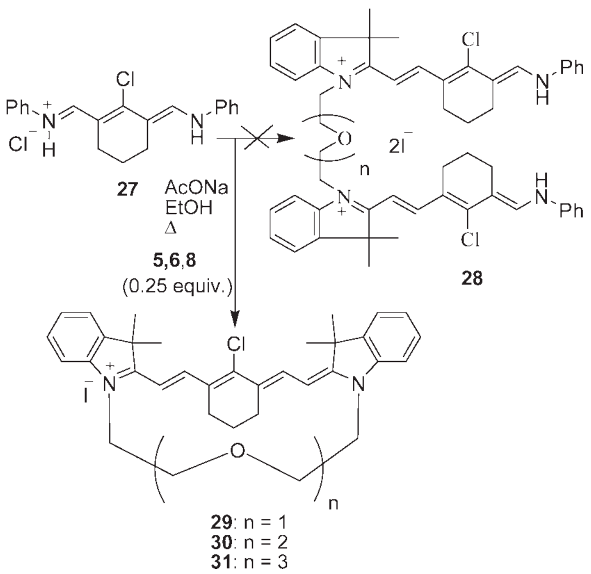
Scheme 1



Scheme 2



Scheme 3



resultant indolium salts **9** and **10** with a dialdehyde **11**. The condensation reaction was conducted in a mixture of *n*-butanol and benzene with azeotropic removal of water.

Under these conditions, the formation of mono-condensation products **12** or **13** is strongly favored [14]. Crude products **12** and **13**, without purification, were then allowed to react with dimeric salts **5**, **6,** and **8** to furnish the corresponding final dyes **14–16**. In a similar way, quaternization of 2,3,3-indolenine or its benzo counterpart with 1,4-butanesultone yielded the respective 4-sulfonatobutyl inner salts **17** and **18** that were subsequently used for mono-condensation with dialdehyde **11**. The resultant products **19** and **20** were subjected to condensation with dimeric indolium salts **5**, **6,** and **8** to furnish the desired corresponding dimeric cyanines **21–26**.

A bis-anilinium derivative of the bis-aldehyde **11** [15] (**27**, structure in Scheme 3) is normally used in the synthesis of cyanine dyes by the reaction with methyl-substituted cationic heterocycles. The anilinium derivative **27** is more stable than the parent compound **11** and is easily purified by crystallization. The initial synthesis plan called for condensation of excess **27** with a dimeric salt **5**, **6,** or **8** followed by condensation of the expected product **28** with the indolium salt **9** or analogs. This approach failed because compound **28** ($n = 1–3$) was not formed. A detailed separation analysis showed the presence of the corresponding cyanine dye **29–31** in which the terminal indolium subunits are bridged by an ether moiety. By contrast, the half-dyes **12**, **13** and **19**, **20** were the major products of the reactions conducted with bis-aldehyde **11**. The procedure is simple in that crude bis-aldehyde **11** and crude half-dyes **12**, **13**, **19,** and **20** can be used for the condensation reaction. The final dimeric dyes, however, must be purified by chromatography. The final yields of these highly polar products are quite low, even for the optimized procedures described in the experimental section. Nevertheless, the described preparations are inexpensive and highly reproducible, and the final dyes are analytically pure, as judged by the results of the elemental, thin-layer-chromatographic, and spectral analyses.

The near-infrared spectra of dyes **14–16** and **21–26** are listed in Table 1. As can be seen, for the spectra of **14–16** taken in methanol, the maximum absorption wavelengths decrease in the order **14** > **15** > **16**, and these decreases parallel the increases in the length of the linker joining two terminal dye subunits in these dimeric compounds. A similar pattern is observed in the spectra of the individual series of NIR dyes **21–23**, and **24–26**. The differences between the shortest and the longest absorption wavelengths are remarkably similar (about 20 ± 1 nm) for each individual series of dyes. These large differences cannot be due to an electronic effect of the linker on the absorption because the corresponding monomeric dyes that are N-substituted with ethyl, butyl, or 2-hydroxyethyl groups all show similar absorption within 1 nm in methanol [7,16]. It can be suggested that the spectral differences reflect different foldamers in which two dye subunits are in close proximity to each other. More specifically, it appears that the length of the linker dictates the stereochemistry of the foldamer.

It was of interest to compare spectral properties of the ether-linked NIR dyes with those of their oligomethylene-linked analogs, a limited number of which have been published by us previously [5–7]. A striking difference is the lack of correlation between the maximum absorption wavelength and the length of the polymethylene chain. Thus, the analogs of **21–23** containing 4, 6, 8, and 10 methylene (CH_2) units show absorption in methanol at 783 nm, 787 nm, 780 nm, and 787 nm, respectively. Yagi *et al.* [9] and Liang *et al.* [17] have synthesized a series of bichromophoric squarains containing intramolecular polymethylene chains of various length and reported their spectra. It escaped their attention, however, that, as in our analysis, there is no correlation between the length of a polymethylene linker and absorption wavelengths of the bichromophoric squaraines. The spectral differences between bichromophoric molecules containing polymethylene and ether chains can be explained in terms of their different conformational flexibility with the latter linkers showing more conformational freedom. This conclusion is strongly supported by conformational analysis of polyethylene $(CH_2CH_2)_n$, polyoxyethylene $(OCH_2CH_2)_n$, and related low molecular-weight molecules [18].

Table 1

Vis-NIR spectra of dyes **14–16**, and **21–26** taken in methanol.

Linker, No (C + O)	Dye	λ_{max}	Dye	λ_{max}	Dye	λ_{max}
5	**14**	817	**21**	794	**24**	818
8	**15**	799	**22**	776	**25**	802
11	**16**	797	**23**	775	**26**	797

We conducted conformational studies of dimeric dyes **14–16**. The conformations were computer-simulated in an aqueous environment and *in vacuo*, resembling conditions in solvents of high and low polarity, respectively. The technical aspects of the calculations are given in the experimental section. A general result is that there are a number of computed low-energy structures in an aqueous environment that contain the two cyanine subunits in close proximity to each other, strongly suggesting attractive hydrophobic interactions between these two subunits (not shown). By contrast, low-energy conformations of **14–16** in the absence of water contain an unfolded ether bridge and the two cyanine subunits away from each other. When the closed-shell conformations, as obtained from computing the structures in an aqueous environment, were taken as the starting structures for computation in the absence of water, all conformations opened-up, losing the presumed intramolecular interactions. The computed energy differences between the more stable solvated structures and the conformations in the absence of water are in the range of 70–100 kcal/mol. Compound **16** was selected for a detailed analysis. The molecular modeling work generated a number of water-induced conformations of **16** in which the two cyanine subunits are in close proximity to each other. Some of these structures are consistent with partial stacking of the planar portions of the dyes, suggesting a π–π interaction. Other computer-generated low-energy conformations of **16** in aqueous environment are consistent with hydrophobic interactions, but not stacking, between the cyanine chromophores. We have also conducted similar calculations for the analog of **16** in which the ether linkage is replaced by an eleven-methylene bridge. Despite the similar lengths of the two linkages, the number of low-energy conformations is larger for **16** than for its polymethylene analog. These computational results are consistent with the greater conformational flexibility of **16** in comparison to its analog containing an all-carbon bridge, as discussed earlier.

We have conducted preliminary binding studies of **14–16** and **21–26** with human serum albumin (HSA) and calf thymus DNA. All compounds bind with the protein, albeit the absorption and fluorescence differences between the compounds in the absence and presence of HSA are highly structure dependent. On the other hand, only the cationic molecules **14–16** bind with DNA as evidenced by the observed spectral changes. Molecules **21–26** that contain a zero net charge do not interact with anionic DNA. Complete biophysical studies will be reported in due course.

EXPERIMENTAL

General. Where applicable, products were purified on a chromatotron with silica gel-coated rotors. Melting points are greater than 300°C in all cases. All ^{1}H NMR spectra were taken at 400 MHz. Near-infrared (NIR) spectra were taken in methanol or dichloromethane for solutions with absorptivities <1.0. The intermolecular aggregation of cyanine dyes is negligible under such conditions.

Dimeric indolium salts 5, 6, 8. Bis(2-iodoethyl) ether (**2**) was prepared by refluxing bis(2-chloroethyl) ether with sodium iodide in 2-butanone for 24 h as reported previously [19]. A mixture of 2,3,3-trimethylindolenine (**1**, 0.48 g, 3 mmol), a diiodo derivative **2** or **3** (1.5 mmol), and pyridine (one drop) was heated to 110°C for 4 days to give the respective bis-salt **5** or **6**. In a similar way, product **7** was obtained by treatment of **1** with a bis-tosylate derivative **4**. Crude bis-tosylate salt **7** in acetone (10 mL) was treated with a saturated solution of sodium iodide (0.30 g, 2 mmol) in methanol, and the mixture was heated under reflux for 2 h. Cooling of the mixture to 0°C for several hours caused precipitation of sodium *p*-tosylate, leaving bis-indolium diiodide **8** in solution. The diiodides **5**, **6**, and **8** were purified by silica gel chromatography eluting with methanol/ethyl acetate (1:3).

***N,N′*-(3-Oxopentane-1,5-diyl)-bis(2,3,3-trimethyl-3*H*-indolium) diiodide 5.** This compound was obtained in a 63% yield; ^{1}H NMR (DMSO-d_6): $\delta = 1.26$ (s, 12H), 3.18 (s, 6H), 4.35 (t, $J = 5$Hz, 4H), 5.02 (t, $J = 5$Hz, 4H), 7.41 (m, 8H). Anal. Calcd for $C_{26}H_{34}I_2N_2O_2$: C, 48.46; H, 5.32; N, 4.35. Found: C, 48.28; H, 4.98; N, 4.29.

***N,N′*-(3,6-Dioxaoctane-1,8-diyl)-bis(2,3,3-trimethyl-3*H*-indolium) diiodide 6.** This compound was obtained in a 58% yield; ^{1}H NMR (DMSO-d_6): $\delta = 1.49$ (s, 12H), 2.76 (s, 6H), 3.66 (t, $J = 5$Hz, 4H), 3.79 (t, $J = 5$Hz, 4H), 4.67 (t, $J = 5$Hz, 4H), 7.61 (m, 4H), 7.85 (d, $J = 8$Hz, 2H), 7.92 (d, $J = 8$Hz, 2H). HR-MS (ESI). Calcd for $(C_{28}H_{38}N_2O_2)^{2+}$: $m/z = 217.1464$. Found: $m/z = 217.1456$. Anal Calcd for $C_{28}H_{38}I_2N_2O_2$: C, 48.84; H, 5.56; N, 4.07. Found: C, 48.95; H, 5.62; N, 4.03.

***N,N′*-(3,6,9-Trioxaundecane-1,11-diyl)-bis(2,3,3-trimethyl-3*H*-indolium) diiodide 8.** This compound was obtained in a 73% yield; ^{1}H NMR (DMSO-d_6): $\delta = 1.50$ (s, 12H), 2.35 (s, 6H), 3.25 (t, $J = 5$Hz, 4H), 3.34 (t, $J = 5$Hz, 4H), 3.83 (t, J

= 5Hz, 4H), 4.71 (t, J = 5Hz, 4H), 7.59 (m, 4H), 7.84 (d, J = 8Hz, 2H), 7.98 (d, J = 8Hz, 2H); ^{13}C NMR (DMSO-d_6): δ = 14.8, 21.9, 47.9, 54.2, 66.6, 69.4, 69.6, 115.6, 123.5, 128.8, 129.3, 140.8, 141.6, 189.1. HR-MS (ESI). Calcd for $(C_{30}H_{42}N_2O_3)^{2+}$: m/z = 239.1592. Found: m/z = 239.1592.

Near-infrared dyes 14–16 and 21–26. A mixture of bisaldehyde **11** [14] (173 mg, 1 mmol), a quaternary salt [5,19] **9**, **10**, **17**, or **18** (1 mmol), *n*-butanol (50 mL), and benzene (15 mL) was stirred at 23°C for 2 h. The resultant crude product **12**, **13**, **19**, or **20**, without isolation, was treated in the same flask with a dimeric salt **5**, **6**, or **8** (0.5 mmol) and the mixture was heated under reflux for an additional 12 h. The product was isolated by concentration of the mixture on a rotary evaporator followed by chromatography eluting with dichloromethane/methanol (10:1 for **14–16** and 9:1 for **21–26**).

3‴-Oxapentane-1‴,5‴-diyl[bis[2-[7′-(3″-butyl-1″,1″-dimethylbenzo[*e*]indolin-2″-ylidene)-4′-chloro-3′,5′-trimethylene-1′,3′,5′-heptatrien-1′-yl]-3,3-dimethyl-3*H*-indol-1-ium]] diiodide 14. This compound was obtained in a 17% yield; ^{1}H NMR (CDCl$_3$): δ = 1.02 (t, J = 6Hz, 6H), 1.54 (m, 4H), 1.68 (s, 12H), 1.90 (m, 4H), 1.94 (m, 4H), 2.02 (s, 12H), 2.74 (m, 8H), 4.05 (m, 4H), 4.36 (m, 8H), 6.20 (d, J = 11Hz, 2H), 6.32 (d, J = 11Hz, 2H), 7.09 (d, J = 6Hz, 2H), 7.18 (t, J = 6Hz, 2H), 7.26 (t, J = 6Hz, 2H), 7.34 (d, J = 6Hz, 2H), 7.44 (d, J = 6Hz, 2H), 7.48 (t, J = 6Hz, 2H), 7.63 (t, J = 6Hz, 2H), 7.96 (m, 4H), 8.13 (d, J = 6Hz, 2H), 8.28 (d, J = 11Hz, 2H), 8.48 (d, J = 11Hz, 2H); NIR: λ_{max} = 817 nm. Molecular modeling. Energy minimizations were performed using SYBYL (running on SGI O$_2$ station) using MMFF94 force field and the minimum energy change of 0.01 kcal/mol per Å as a convergence criterion. Charges were calculated using the MMFF94 method as implemented in SYBYL. The molecules in aqueous environment were minimized using the Molecular Silverware option in SYBYL, which resulted in change of energy (E_{min}) and in the conformation of dyes. The values of E_{min} decreased of about 70–100 kcal/mol when the environment was changed from vacuum to aqueous solution. In vacuum, the structures are opened, and in water, the individual cyanine moieties of the dimeric molecules are close to each other in all cases studied.

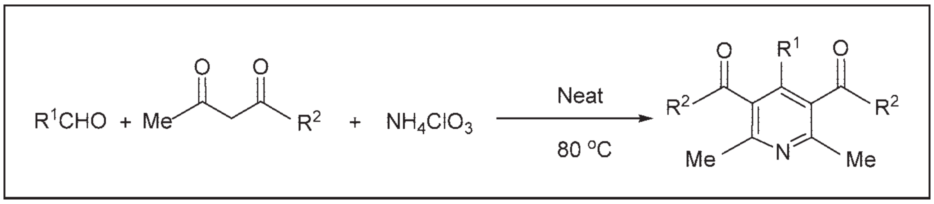
Received January 23, 2009
DOI 10.1002/jhet.175



In this article, efficient and simple preparation of Hantzsch pyridine derivatives by reaction of various aldehydes and β-dicarbonyls in the presence of ammonium chlorate under solvent-free condition at 80°C is reported. The advantages of this system are the one-step procedure, high yields of the products, and the ability to carry out large-scale reactions.

J. Heterocyclic Chem., **46**, 931 (2009).

INTRODUCTION

Pyridine bases, as representative heteroaromatic ring compounds, are produced for applications in herbicides, insecticides, vitamins, nicotinic acid and nicotinic amide, pharmaceuticals, and adhesives [1]. For example, there are many bioactive pyridine compounds, such as the prosthetic pyridine nucleotide (NADP) [2], pyridoxine (vitamin B_6), and nicotine [3], and also many pharmaceuticals [4] and agrochemicals [5] possessing a pyridine nucleus. Pyridine is used as a basic solvent as well as a catalyst in industrially important organic reactions [6]. Thus, new construction methods for multisubstituted pyridines are still intriguing studies [7,8].

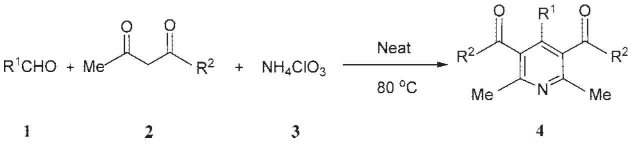
On the other hand, the synthesis of heteroaromatics by oxidative dehydrogenation is of fundamental importance in organic chemistry. These ubiquitous features always encourage synthetic chemist to explore improved protocols for the synthesis as well as the oxidation of 1,4-dihydropyridines. Oxidation of 1,4-dihydropyridines is one of the possible ways for the synthesis of the corresponding pyridines. Aromatization of 1,4-dihydropyridines has received considerable attention because of the fact that 1,4-dihydropyridine-based calcium channel blockers are oxidatively converted to pyridine derivatives by the action of cytochrome P-450 in the liver [9,10]. In addition, the corresponding pyridine derivatives show antihypoxic and anti-ischemic activities and are used in the treatment of atherosclerosis [11]. Additionally, dihydropyridines are often produced in a synthetic sequence and have to be oxidized to pyridines [12]. Numerous reagents and procedures have been recommended for this purpose, such as pyridinium chlorochromate (PCC) [13], N_2O_4 complex of 18-crown-6 [14], *tert*-butylhydroperoxide [15], photochemical oxidation [16], vanadium(V) salts [17], and biomimetic catalyzed oxidation [18].

Despite these intensive efforts, most of the reported oxidation procedures require long reaction time, use of the strong oxidants in large excess, and afford products with only modest yields. In particular, the aromatization reactions with these reagents lead to dealkylation of the 4-position or formation of side products.

It is well known in the protocol of green chemistry that its main objective is to perform reactions under solventless conditions using heterogeneous catalysts to generate environmentally friendly chemical transformations [19]. In addition, it is important to note that an ideal synthesis is considered as one in which a target molecule is produced quantitatively in one step, from available and inexpensive raw materials [20].

Ammonium acetate has been used for the synthesis of dihydropyridine [21] and pyridine derivatives. 4-Substituted Hantzsch 1,4-dihydropyridines were synthesized by replacing ammonium acetate with ammonia in a classical method, in which the products can be subsequently oxidized to corresponding pyridines. To the best of our knowledge, only two articles reported the continuous synthesis of Hantzsch pyridines by a mixture of bentonite clay, β-ketoester, aldehyde, and ammonium nitrate as the source of ammonia and oxidizing species [22,23]. These results are intriguing as they are somehow contradictory. In one of these reports [22], in the absence of solvent, the alkylated pyridine was isolated from the oxidation of 4-isopropyl dihydropyridine as the major product. On the other hand, dealkylated pyridine was isolated from the oxidation of 4-propyl or 4-phenyl dihydropyridines in substantial yield that this

Scheme 1



observation contrasts with the presented results in the second report [23], such as they do not mention the presence of this case of pyridine in the final mixtures.

In the Vilsmeier–Haack reaction progress, Jutz et al. [24] have demonstrated that the cyclization of the intermediate iminium salts formed by the multiple iminoalkylations of certain alkenes, in the presence of ammonium acetate, leads to the formation of substituted pyridines and naphthyridines. Thomas and Asokan [25] envisaged that a similar ammonium acetate-induced cyclization of the intermediates formed by the treatment of α-hydroxyketenedithioacetals would afford a useful method for the synthesis of substituted pyridines with moderate yields.

In this research, we report that the ammonium chlorate can be used as both ammonia and oxidizing agent source for the direct synthesis and oxidation of Hantzsch 1,4-dihydropyridines to pyridines.

RESULTS AND DISCUSSION

As a part of our current studies on multicomponent reaction (MCR) involving synthesis of dihydropyrimidinones [26] and our interest in the chemistry of dihydropyridines [18], we have investigated the one-pot synthesis of pyridine derivatives (Scheme 1).

The synthetic method for the preparation of substituted pyridine derivatives (**4**) was relatively easy and simple, and the compounds could be obtained in one step. The optimized reaction conditions were subsequently applied to the reaction between various aliphatic or aromatic aldehydes and β-dicarbonyls in the presence of ammonium chlorate in solvent-free conditions at 80°C. In all cases, the desired pyridine derivatives were obtained in high to excellent yields. Both electron-rich and electron-deficient aromatic aldehydes as well as heterocyclic ones worked well. Aliphatic aldehydes afforded equally good results. Many of the pharmacologically significant substitution patterns can be introduced with good efficiency (Table 1).

In a typical procedure, 2 mmol of aldehyde, 4 mmol of β-dicarbonyl, and 3 mmol of ammonium chlorate were mixed in solvent-free conditions at 80°C for 40–300 min. After work-up, the corresponding pyridines were isolated with excellent yields (**4a**–**4s**). One advantage of this method is its large-scale applicability. Pyridines were prepared on a 50-mmol scale, and the results were comparable with the small-scale experiments.

According to the literature, the thermal decomposition of NH_4ClO_3 begins at 50°C, which possibly includes equilibrium formation of ammonia and chloric acid according to Scheme 2 [28]. This process is probably accelerated by water formed in reaction. Thus, formed ammonia acts as a nitrogen nucleophile in Hantzsch dihydropyridine synthesis while chloric acid as an actual oxidant. However, it cannot be excluded that the product, substituted pyridine, is formed by the oxidation of intermediates different than 1,4-dihydropyridines.

Based on the evidences from the reaction and previous suggestions on such a system as shown in Scheme 1, our rationalization about the proposed mechanism includes thermal decomposition of ammonium chlorate to NH_3 and $HClO_3$ that these lead to Hantzsch dihydropyridine synthesis and its oxidation of the products with chloric acid to corresponding pyridines.

CONCLUSIONS

In conclusion, we have developed a simple and efficient synthetic protocol for the synthesis of a wide variety of Hantzsch pyridine derivatives under solvent-free conditions. Mild reaction conditions, cost efficiency, simplicity in operation, and large-scale applicability are some significant features of this protocol.

EXPERIMENTAL

All chemicals were purchased from Merck, Fluka, and Sigma-Aldrich chemical companies. The reactions were monitored by TLC. The products were isolated and identified by comparison of their physical and spectral data with authentic samples. IR spectra were recorded on FTIR JASCO-680. The ^{1}H NMR spectra were obtained on a Brüker-instrument DPX-300 MHz and melting points determined on a Barnstead Electrothermal (BI 9300) apparatus.

General procedure for the preparation of the Hantzsch pyridines. All reactions were carried out in a 25-mL round bottomed flask equipped with a magnetic stirring bar. A mixture of aldehyde (2 mmol), β-dicarbonyl (4 mmol), and ammonium chlorate (3 mmol) was heated at 80°C. After completion of the reaction, as monitored by TLC, the mixture was extracted with CH_2Cl_2 (3 × 5 mL). The solvent was evaporated off, and the crude product was purified by silica gel plate or silica gel column (eluent: *n*-hexane–EtOAc). The products were characterized by IR, ^{1}H NMR, and *via* comparison of their melting points with the reported ones.

Spectral and physical data for selected compounds ***Diethyl 4-(2,4-dichlorophenyl)-2,6-dimethyl-3,5-pyridinedicarboxylate (4i).*** mp: 58–60°C, R_f (*n*-hehaxe/EtOAc, 5:1) = 0.55. Received January 30, 2009
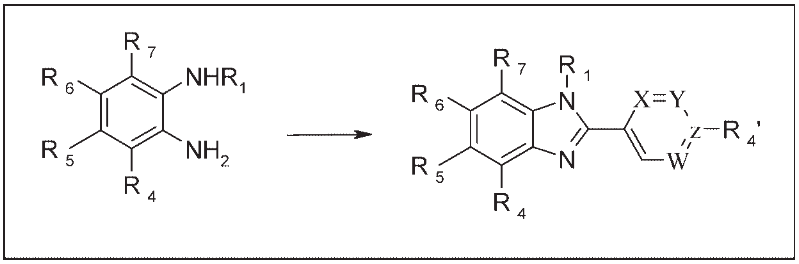
DOI 10.1002/jhet.179

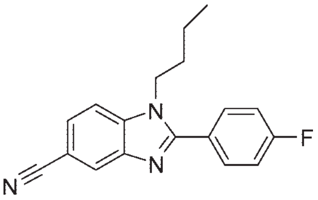


A series of 47 novel N^1-alkylated-2-aryl-5(6)-substituted-1*H*-benzimidazoles and their three novel indole analogues were synthesized and evaluated for *in vitro* antifungal activities against *Candida* species by the tube dilution method. The results showed that compounds **79** and **80**, having pyridine at the position C-2, of benzimidazoles exhibited the greatest activity with MIC values of 6.25–3.12 μg/mL. Indole analogues **108–110** have no inhibitory activity.

J. Heterocyclic Chem., **46**, 936 (2009).

INTRODUCTION

We have already reported the synthesis and potent antifungal evaluation of a series of 2-substituted-phenyl-1*H*-benzimidazole-5-carbonitriles [1]. The study revealed that among the synthesized benzimidazoles compound **I** exhibited greatest antifungal activity with the MIC of 3.12 μg/mL against *Candida albicans*, *Candida krusei*, *Candida glabrata*, and *Candida parapsilosis* (Fig. 1).



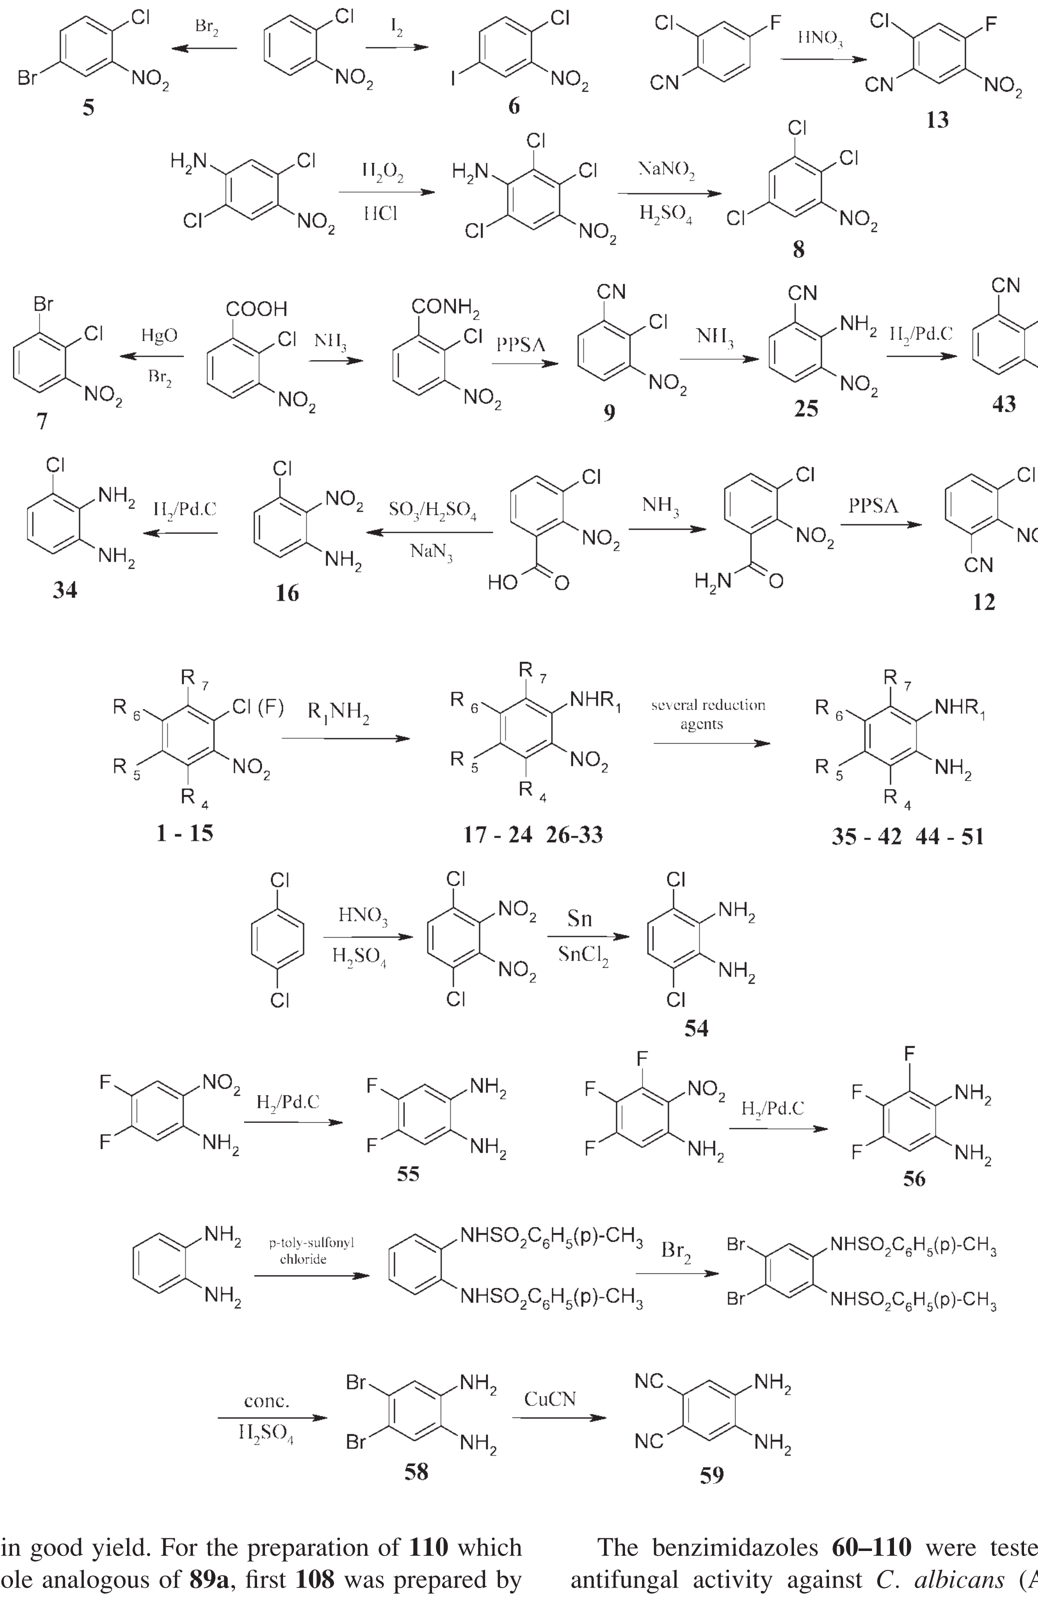
I

We planned to modify the structure of compound **I** in order to find more potent new antifungal agents.

RESULTS AND DISCUSSION

Noncommercial starting material *o*-phenylenediamines were prepared according to the literature methods, which are given in Scheme 1. The synthetic pathways for preparation of the targeted benzimidazoles listed in Table 1 are shown in Schemes 2 and 3. Nucleophilic displacement of the chloro group of **1–15** (Table 2), by the reaction with several amines in *N,N*-dimethylformamide gave **16–33** (Table 3). Their reduction with hydrogen gas by using palladium carbon or tin/hydrochloric acid produced **34–59** (Table 4). Condensation of these derivatives with the sodium metabisulfite adduct of appropriate benzaldehydes gave the targeted benzimidazoles **60–73**, **75**, **78–80**, **83**, **84**, **90–97**, **99–102**, **104** [1]. Heck and Nolley [23] reaction of **73** with (trimethylsilyl)acetylene led to **74a**, whose silyl group was cleaved to yield 5-ethynylbenzimidazole **74**. **77** was prepared by diazotation of **76**, followed by treatment with sodium azide. Acylation of 3-amino-4-(butylamino)benzonitrile with 4-pyridazine and pyrazine carbonyl chlorides gave the corresponding monoamide derivatives **81a** and **82a**, following this cyclization of these compounds with glacial acetic acid and anhydrous sodium acetate afforded **81** and **82**. The nitrile group of **I** was converted to carboxyaldehyde **85**, by using diisobutylaluminum hydride (DIBAL), in a moderato yield, and aldehyde group was transformed to the oxime ether **86**. The 1,2,4-oxadiazol-3-yl-1*H*-benzimidazole **88** was obtained by reaction of **I** first with hydroxylamine to amidoxime **87** and subsequently with acetic anhydride. In addition, another 1*H*-benzimidazole-5-carbonitrile **89a** reacted with sodium azide at high temperature to yield 5-substituted 1*H*-tetrazole **89**. Benzylic cleavage of **97** afforded **98** by reduction with hydrogen gas. Alkylation of tautomeric imidazole NH of **99–102** with butyl bromide in *N,N*-dimethylformamide gave **103**,

Scheme 1. Synthesis of noncommercial *o*-phenylenediamines.



105–107 in good yield. For the preparation of **110** which is the indole analogous of **89a**, first **108** was prepared by the well-known Fischer indole synthesis method (Scheme 3) [24]. Alkylation of this compound gave **109**, then bromine was converted to the nitrile with copper(I) cyanide.

The benzimidazoles **60–110** were tested *in vitro* for antifungal activity against *C. albicans* (ATCC 10231), *C. krusei* (ATCC 6258), *C. parapsilosis* (ATCC 22019), and *C. glabrata* (Clinical isolate) by the tube dilution method [25] and the MIC values are listed in Table 1.

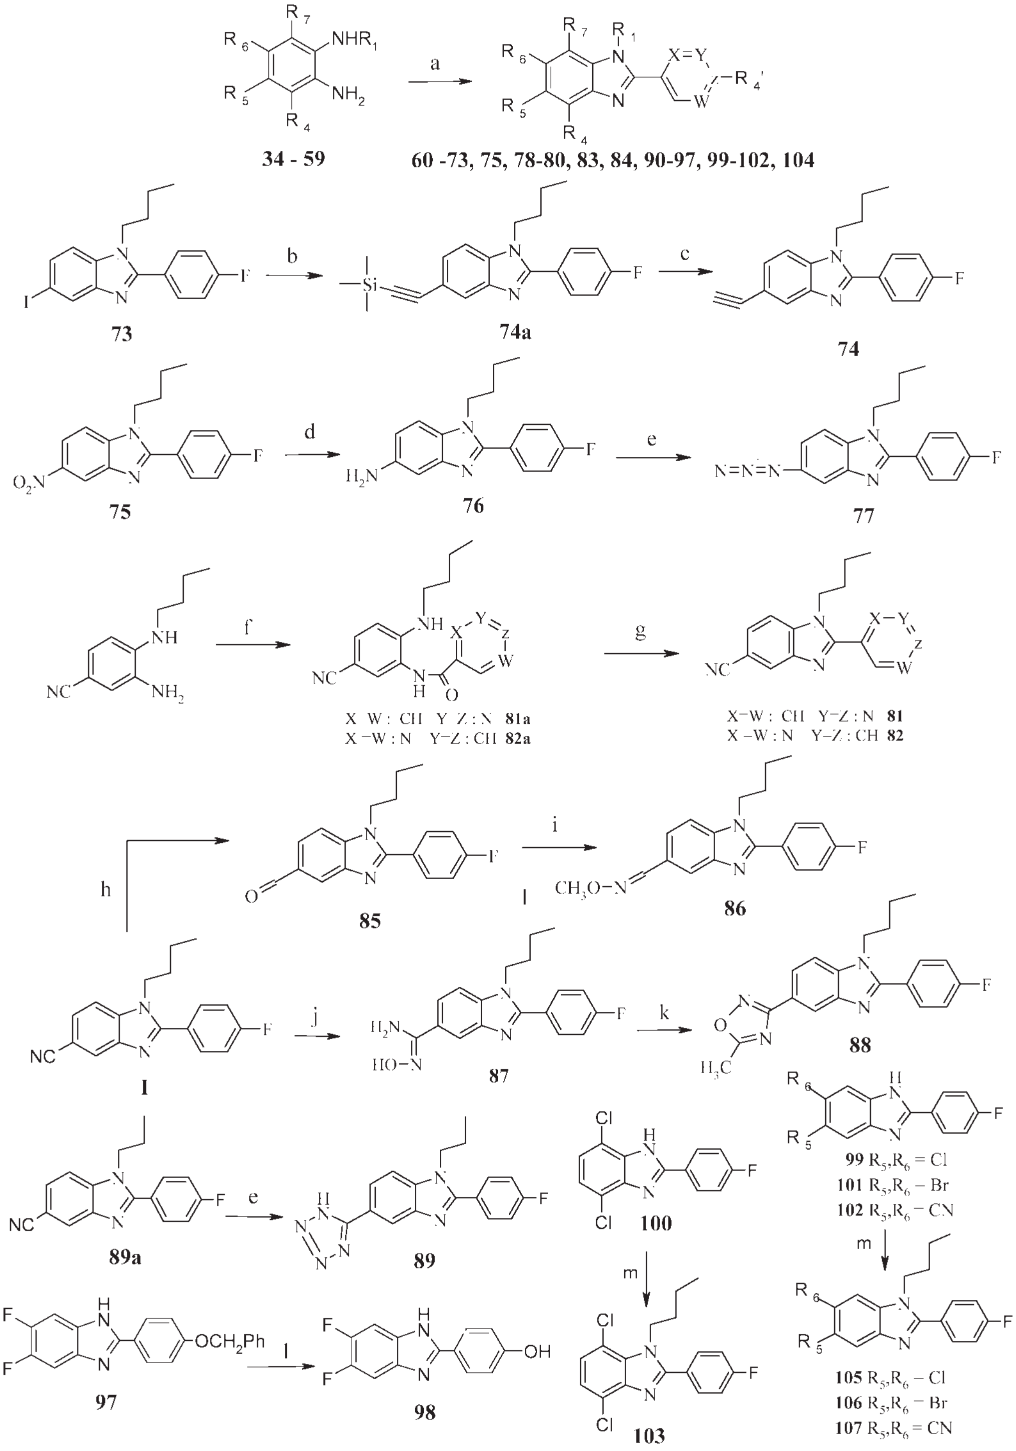
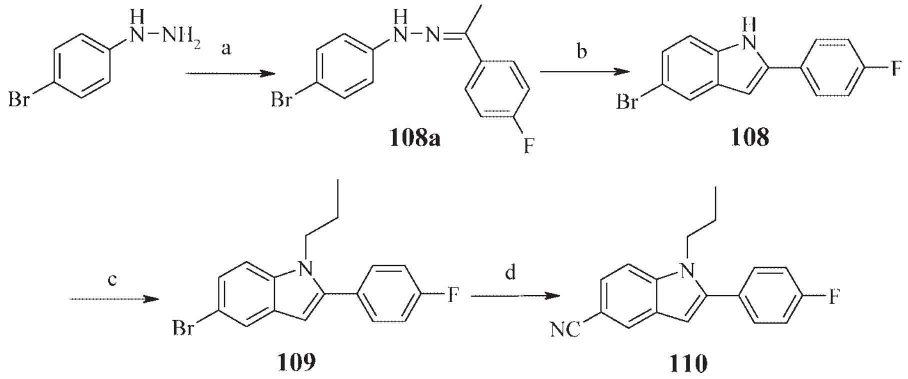
MIC$_{100}$ = Minimum inhibitory concentrations, *C a*, *Candida albicans*; *C k*, *Candida krusei*; *C p*, *Candida parapsilosis*; *C g*, *Candida glabrata*; I, formula in Figure 1; Flu, Fluconazole.

Scheme 2. Synthesis of benzimidazoles **60–107**. Reagents (a) $Na_2S_2O_5$ adduct of the corresponding benzaldehydes; (b) (Trimethylsilyl)-acetylen; (c) KOH/MeOH; (d) $SnCl_2$/HCl; (e) $NaNO_2$-HCl/NaN_3; (f) For **81a**: 4-Pyridazinecarboxylic acid and HBTU; For **82a**: Pyrazinecarbonyl chloride; (g) Glacial acetic acid/anhydrous Na-acetate; (h) DIBAL; (i) Methoxyl-amine HCl; (j) $NH_2OH{\cdot}HCl$, *i*-Pr_2NEt; (k) $(CH_3CO)_2O$; (l) Pd.C/H_2; and (m) Butyl bromide/NaH.



The synthesized compounds and reference drugs were dissolved in dimethyl sulfoxide-water (50%) at a concentration of 400 µg/mL. The concentration was adjusted to 100 µg/mL by fourfold dilution with media culture and fungi solution at the first tube. Data was not taken for the initial solution because of the high concentration (12.5%).

Scheme 3. Synthesis of indole analogues **108–110**. Reagents (a) 4′-fluoroacetophenone, trimethylamine; (b) PPA; (c) Propyl bromide, NaH; and (d) CuCN, *N*-methyl-2-pyrrolidone.



The result demonstrates that some of the benzimidazoles in this series showed the good activity profiles versus some *Candida* species. Among of them, compounds **79** and **80** exhibited the greatest activity with MIC values of 6.25–3.12 μg/mL. These compounds are having pyridine moiety at the position of C-2 instead of phenyl in compound **I** (Fig. 1). Replacement of phenyl moiety to 4-pyridazine (**81**) or pyrazine (**82**) caused to reduce inhibitory activity. Most of the other electron withdrawing group which could be the bioequivalence of cyano at the position of C-5 were tested, however, as no better result were found with them, cyano group was accepted

as a best pharmacophore at this position. Moreover, changing the position of cyano group from C-5, to C-4 (**91**), C-6 (**68**), and C-7 (**66**), did not give better result. In addition, this cyano group was converted to the aldehyde (**85**), oxime (**86**), oxadiazole (**88**), and tetrazole (**89**), unfortunately activity was reduced again. Because we have already reported that, the best group was butyl at position N-1, no more modifications have been done in this study, only compound **83** with *n*-pentyl group was prepared, which also caused to reduce activity. Among the halogenated compounds, the best results were obtained with **93** against *C. parapsilosis* with the MIC

values of 3.12 μg/mL. Dramatically reduced antifungal activity was also seen by changing the benzimidazole ring to indoles with similar substitutions (**108–110**). Further studies are needed to confirm these preliminary results and *in vivo* and mode of action studies are required to optimize the effectiveness of this series of compounds.

EXPERIMENTAL

Mp were measured with a capillary melting point apparatus Electrothermal 9100 and are uncorrected. The ^{1}H and ^{13}C NMR spectra were recorded with VARIAN Mercury 400 FT-NMR spectrophotometer, δ scale (ppm) in deuteriochloroform, if not stated otherwise. LC/MS analyses were performed with Waters Alliance (equipped with a diode array UV detection monitoring at 254 nm) and Micromass ZQ by using ESI(+) method, if not stated otherwise. Elemental analyses were taken on a Leco 932 CHNS analyser; cc, column chromatography. Compound **89a** was synthesized as described in our previous study [1].

3-Chloro-2-nitrobenzonitrile (12). The mixture of 0.5 g (2.48 mmol) of 3-chloro-2-nitrobenzoic acid toluene (3 mL) and thionyl chloride (2 mL) were heated at 80°C for 4 h. Excess of thionyl chloride and solvent were evaporated, then the residue was stirred in ammonium hydroxide (5 mL) at room temperature for 1 h. The formed precipitate 3-chloro-2-nitrobenzamide was collected. The solid (0.46 g, 2.3 mmol) was added to a solution of PPSA (20 mL), and the mixture was refluxed for 48 h. The reaction mixture was directly carried out to a long silica gel column and eluted with hexanes (200 mL), then dichloromethane. Concentration of the dichloromethane gave the desired nitrile, as a white solid, 0.14 g (33.4%). Then eluting with 5% methanol in dichloromethane recovered 0.16 g of starting material. See Table 2 for spectral data.

2-Amino-3-nitrobenzonitrile (25). The mixture of **9** (0.3 g, 1.65 mmol) and saturated ethanolic ammonia solution (30 mL) were heated in a sealed tube at 120°C for 5 h, ethanol was removed, and washing with water of the residue gave pure compound, 0.2 g (74 %). See Table 3 for spectral data.

General procedure for synthesis of (17–24, 26–33). To a solution of **1–15** (5 mmol) in ethanol (5 mL), butyl or pentyl amine (15 mmol) was added and heated under reflux until the starting material was consumed (determined by TLC, 8–48 h). The mixture was cooled, water was added. The resultant yellow residue was crystallized from ethanol or purified by cc by using the mixture of ethyl acetate-hexane (30–40:70–60) as eluent (Table 3).

General procedure for synthesis of (34, 37, 38, 43–51, 55, 56). Appropriate nitro derivatives (3 mmol) in ethanol (30 mL) were reduced by hydrogenation using 40 psi of H_2 and 10% Pd-C until cessation of H_2 uptake. The catalyst was filtered off on a bed of Celite, washed with ethanol, and the filtrate was concentrated. This procedure was carried out at the atmospheric pressure for compound **33** (Table 4).

General procedure for synthesis of (35, 36, 39–42, 54). Compound **17**, **20–23** (1 mmol), tin(II) chloride dihydrate (0.75 g, 3.33 mmol), a granule tin in the mixture of ethanol (3 mL), hydrochloric acid (3 mL), (for 20 HBr and for 21 sulfuric acid were used without tin(II) chloride), and 1.5 mL water were stirred at room temperature for 6–7 h. For compound 40, the reaction mixture was heated under reflux for 3 h. Then, water and ethyl acetate were added. The pH was rendered basic by addition of an ammonium solution. The slurry was filtered on a Buchner, the resulting solid was washed with ethyl acetate. The combined organic phases were concentrated (Table 4).

General procedure for synthesis of 60–73, 75, 78–80, 83, 84, 90–97, 99–102, 104. The corresponding benzaldehydes (7.5 mmol) were dissolved in 25 mL ethanol and sodium metabisulfite (0.8 g) in 5 mL H_2O was added in portions. The reaction mixture was stirred vigorously and more ethanol was added. The mixture was kept in a refrigerator for a several hours. The precipitate was filtered and dried (yield over 93%). The mixture of these salts (0.5 mmol) and **34–59** (0.5 mmol) in *N*,*N*-dimethylformamide (1 mL) were heated at 120°C for 4 h. The reaction mixture was cooled, poured into water, and the solid was filtered.

7-Chloro-2-(4-fluorophenyl)-1H-benzimidazole (60). Purification, cc, ethyl acetate-hexane (1:3), mp 208°C, yield 56%. ^{1}H NMR δ (DMSO-d_6): 7.18 (t, 1H), 7.26 (dd, 1H, J = 0.8, 6.4 Hz), 7.4 (t, 2H), 7.52 (d, 1H, J = 6 Hz), 8.25 (br.s, 2H); ms: *m/z* 247 (M +1, 100), 249 (M +3, 34). *Anal.* Calcd for $C_{13}H_8ClFN_2$ HOH: C, 59.00; H, 3.81; N, 10.58. Found C, 58.96; H, 3.80; N, 10.54.

2-(4-Fluorophenyl)-1H-benzimidazole-7-carbonitrile (61). Purification, cc, ethyl acetate-hexane (1:1), mp 224–225°C, yield 47.4%. ^{1}H NMR δ (DMSO-d_6): 7.35 (t, 1H), 7.43 (t, 2H), 7.67 (d, 1H, J = 7.2 Hz), 7.86 (d, 1H, J = 7.2 Hz), 8.26 (br.s, 2H), 13.5 (br.s, 1H); ms: *m/z* 238 (M +1, 100). *Anal.* Calcd for $C_{14}H_8FN_3$ 0.1 HOH: C, 70.35; H, 3.46; N, 17.57. Found C, 70.44; H, 3.48; N, 17.15.

2-(4-Fluorophenyl)-5-(trifluoromethyl)-1H-benzimidazole (62). Purification, cc, ethyl acetate-hexane (1:1), mp 178–180°C, yield 46.4%. ^{1}H NMR δ (DMSO-d_6): 7.45 (m, 2H), 7.54 (dd, 1H, J = 1.2, 8.8 Hz), 7.79 (d, 1H, J = 8 Hz), 7.96 (s, 1H), 8.26 (m, 2H), 13.35 (br.s, 1H); ms: *m/z* 281 (M +1, 100). *Anal.* Calcd for $C_{14}H_8F_4N_2$: C, 60.00; H, 2.88; N, 10.00. Found C, 59.63; H, 2.89; N 9.93.

1-Butyl-7-chloro-2-phenyl-1H-benzimidazole (63). Purification, cc, ethyl acetate-hexane (1:4), oily, yield 51.5%. ^{1}H NMR δ: 0.8 (t, 3H), 1.18 (m, 2H), 1.76 (m, 2H), 4.49 (t, 2H), 7.2 (t, 1H), 7.26 (dd, 1H, J = 1.2, 7.4 Hz), 7.53 (m, 3H), 7.67 (m, 2H), 7.71 (dd, 1H, J = 1.2, 8 Hz); ms: *m/z* 285(M +1, 100), 287 (M +3, 36). *Anal.* Calcd for $C_{17}H_{17}ClN_2$: C, 71.69; H, 6.02; N, 9.84. Found C, 71.24; H, 6.15; N, 9.77.

1-Butyl-7-chloro-2-(4-fluorophenyl)-1H-benzimidazole (64). Purification, cc, ethyl acetate-hexane (1:3), mp 60°C, yield 32%. ^{1}H NMR δ: 0.8 (t, 3H), 1.18 (m, 2H), 1.75 (m, 2H), 4.46 (t, 2H), 7.25 (m, 4H), 7.66 (m, 3H); ms: *m/z* 303 (M +1, 100), 305 (M +3, 35). *Anal.* Calcd for $C_{17}H_{16}ClFN_2$: C, 67.44; H, 5.33; N, 9.25. Found C, 67.29; H, 5.27; N, 9.23.

7-Bromo-1-butyl-2-(4-fluorophenyl)-1H-benzimidazole (65). Purification, cc, ethyl acetate-hexane (1:1), mp 62°C, yield 53%. ^{1}H NMR δ: 0.79 (t, 3H), 1,18 (m, 2H), 1.73 (m, 2H), 4.48 (t, 2H), 7.15 (t, 1H), 7.24 (m, 2H), 7.46 (d, 1H, J = 8 Hz), 7.66 (m, 2H), 7.74 (d, 1H, J = 8.4 Hz); ms: *m/z* 347 (M +1, 100), 349 (M +3, 100). *Anal.* Calcd for $C_{17}H_{16}BrFN_2$ 0.2 HOH: C, 58.20 H; 4.71; N, 7.98. Found C, 58.11; H, 4.47; N, 8.08.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazole-7-carbonitrile (66). Purification, cc, ethyl acetate-hexane (2:8), mp 53–54°C, yield 40.5%. ^{1}H NMR δ: 0.86 (t, 3H), 1.3 (m, 2H), 1.85 (m, 2H), 4.54 (t, 2H), 7.29 (m, 2H), 7.44 (t, 1H), 7.71 (d, 1H, J = 7.2 Hz), 7.77 (m, 2H), 8.15 (d, 1H, J = 8.4 Hz); ^{13}C NMR δ: 164.2 (d, J = 250 Hz), 155.1, 143.8, 134.6, 131.75 (d, J = 8.3 Hz), 129.4, 125.7 (d, J = 2.5 Hz), 125.5, 123.0, 117.1, 116.4 (d, J = 22.1 Hz), 95.1, 45.4, 33.3, 19.5, 13.67; ms: *m/z* 294 (M +1, 100). *Anal.* Calcd for $C_{18}H_{16}FN_3$: C, 73.70; H, 5.50; N, 14.32. Found C, 73.84; H, 5.61; N, 14.09.

1-Butyl-6-chloro-2-(4-fluorophenyl)-1H-benzimidazole (67). Purification, cc, ethyl acetate-hexane (1:2), mp 100–

101°C, yield 39.7%. ^{1}H NMR δ: 0.88 (t, 3H), 1.27 (m, 2H), 1.75 (m, 2H), 4.16 (t, 2H), 7.19–7.28 (m, 3H), 7.39 (d, 1H, J = 1.6 Hz), 7.65–7.73 (m, 3H); ^{13}C NMR δ: 165.2 (d, J = 249 Hz), 153.8, 141.9, 136.5, 131.5 (d, J = 8.4 Hz), 128.7, 126.6, 123.3, 121, 116.2 (d, J = 22 Hz), 110.4, 44.9, 31.9, 20.1, 13.7; ms: *m/z* 303 (M +1, 100) 305 (M +3, 40). *Anal.* Calcd for $C_{17}H_{16}ClFN_2$: C, 67.44; H, 5.33; N, 9.25. Found C, 67.47; H, 5.31; N, 9.17.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazole-6-carbonitrile (68). Purification, cc, ethyl acetate-hexane (1:3), mp 128°C, yield 72% [26]. ^{1}H NMR δ: 0.88 (t, 3H), 1.28 (m, 2H), 1.79 (m, 2H), 4.23 (t, 2H), 7.25 (m, 2H), 7.55 (d, 1H, J = 8.4 Hz), 7.71 (m, 2H), 7.74 (s, 1H), 7.84 (d, 1H, J = 8 Hz); ^{13}C NMR δ: 164.2 (d, J = 250 Hz), 156.2, 146.2, 135.5, 131.5 (d, J = 8.4 Hz), 126.2, 125.9, 121.1, 120.1, 116.4 (d, J = 18 Hz), 115.3, 105.8, 45.2, 32.1, 20.2, 13.7; ms: *m/z* 294(M +1,100). *Anal.* Calcd for $C_{18}H_{16}FN_3$: C, 73.70; H, 5.50; N, 14.32. Found C, 73.48; H, 5.56; N, 14.15.

1-Butyl-5-fluoro-2-(4-fluorophenyl)-1H-benzimidazole (69). Purification, cc, ethyl acetate-hexane (1:3), mp 82–83°C, yield 29%. ^{1}H NMR δ: 0.86 (t, 3H), 1.26 (m, 2H), 1.77 (m, 2H), 4.19 (t, 2H), 7.06 (m, 1H), 7.25 (m, 2H), 7.32 (m, 1H), 7.46 (dd, 1H, J = 2, 9.4 Hz), 7.67 (m, 2H); ms: *m/z* 287(M +1, 100). *Anal.* Calcd for $C_{17}H_{16}F_2N_2$: C, 71.31; H, 5.63; N, 9.78. Found C, 71.26; H, 5.49; N, 9.84.

1-Butyl-5-chloro-2-(4-fluorophenyl)-1H-benzimidazole (70). Purification, cryst., ethyl acetate-hexane, mp 81–82°C, yield 31.5%. ^{1}H NMR δ: 0.87 (t, 3H), 1.25 (m, 2H), 1.76 (m, 2H), 4.18 (t, 2H), 7.18–7.37 (m, 4H), 7.68 (m, 2H), 7.77 (d, 1H, J = 2 Hz); ^{13}C NMR δ: 163.9 (d, J = 250 Hz), 154.1, 144.1, 134.4, 131 (d, J = 8.3 Hz), 128.2, 126.6, 123.4, 119.9, 116.2 (d, J = 21 Hz), 111.1, 44.9, 32, 20.1, 13.7; ms: *m/z* 303 (M +1, 100) 305 (M +3, 40). *Anal.* Calcd for $C_{17}H_{16}ClFN_2$: C, 67.44; H, 5.33; N, 9.25. Found C, 67.33; H, 5.25; N, 9.24.

1-Butyl-5-chloro-2-(pyridin-4-yl)-1H-benzimidazole (71). Purification, cryst., ethyl acetate-hexane, mp 96–98°C, yield 34%. ^{1}H NMR δ: 0.82 (t, 3H), 1.22 (m, 2H), 1.74 (m, 2H), 4.18 (t, 2H), 7.25 (dd, 1H, J = 2, 8.6 Hz), 7.29 (dd, 1H, J = 0.8, 8.8 Hz), 7.6 (dd, 2H, J = 1.6, 4.6 Hz), 7.75 (t, 1H), 8.75 (dd, 2H, J = 1.6, 4.4 Hz); ms: *m/z* 286 (M +1, 100), 288 (M +3, 35). *Anal.* Calcd for $C_{16}H_{16}ClN_3$ 0.25 HOH: C, 66.2; H, 5.73; N, 14.48. Found C, 66.4; H, 5.56; N, 14.29.

1-Butyl-5-bromo-2-(4-fluorophenyl)-1H-benzimidazole (72). Purification, ethyl acetate-hexane (2:8), mp 77–79°C, yield 84% [27]. ^{1}H NMR δ: 0.86 (t, 3H), 1.25 (m, 2H), 1.75 (m, 2H), 4.18 (t, 2H), 7.19–7.31 (m, 3H), 7.4 (dd, 1H, J = 1.6, 8.8 Hz), 7.68 (m, 2H), 7.92 (d, 1H, J = 1.2 Hz); ^{13}C NMR δ: 164.2 (d, J = 249 Hz), 153.9, 144.6, 134.8, 131.5 (d, J = 8.4 Hz), 126.6, 126, 123, 116.4 (d, J = 22 Hz), 115.6, 111.55, 44.9, 32, 20.1, 13.7; ms: *m/z* 347 (M +1, 100) 349 (M +3, 100). *Anal.* Calcd for $C_{17}H_{16}BrFN_2$: C, 58.80; H, 4.64; N, 8.07. Found C, 58.51; H, 4.68; N, 8.13.

1-Butyl-5-iodo-2-(4-fluorophenyl)-1H-benzimidazole (73). Purification, ethyl acetate-hexane (2:8), mp 125–126°C, yield 88%. ^{1}H NMR δ: 0.86 (t, 3H), 1.25 (m, 2H), 1.75 (m, 2H), 4.18 (t, 2H), 7.15–7.29 (m, 3H), 7.58 (d, 1H, J = 8.8 Hz), 7.69 (m, 2H), 8.14 (s, 1H); ms: *m/z* 395 (M +1, 100). *Anal.* Calcd for $C_{17}H_{16}FIN_2$: C, 51.79; H, 4.09; N, 7.11. Found C, 51.72; H, 4.24; N,7.20.

1-Butyl-5-nitro-2-(4-fluorophenyl)-1H-benzimidazole (75). Purification, cc, ethyl acetate-hexane (3:7), mp 160–162°C, yield 62%. ^{1}H NMR δ: 0.86 (t, 3H), 1.27 (m, 2H), 1.77 (m, 2H), 4.26 (t, 2H), 7.25 (m, 2H), 7.45 (d, 1H, J = 9.2 Hz), 7.71 (m, 2H), 8.21 (dd, 1H, J = 2.4, 9 Hz), 8.64 (d, 1H, J = 2.4 Hz); ms: *m/z* 314 (M +1, 100). *Anal.* Calcd for $C_{17}H_{16}FN_3O_2$: C, 65.17; H, 5.15; N, 13.41. Found C, 65.37; H, 5.20; N, 13.35.

1-Butyl-2-(pyridin-2-yl)-1H-benzimidazole-5-carbonitrile (78). Purification, cc, ethyl acetate-hexane (1:1), mp 117–119°C, yield 38%. ^{1}H NMR δ: 0.93 (t, 3H), 1.37 (m, 2H), 1.85 (m, 2H), 4.85 (t, 2H), 7.41 (m, 1H), 7.51 (d, 1H, J = 8.8 Hz), 7.57 (dd, 1H, J = 1.6, 8.2 Hz), 7.88 (td, 1H, J = 1.6, 8 Hz), 8.14 (d, 1H, J = 0.8 Hz), 8.39 (d, 1H, J = 7.6 Hz), 8.72 (dd, 1H, J = 1, 4 Hz); ^{13}C NMR δ: 152.5, 150.0, 149.0, 142.3, 139.5, 137.2,126.5, 125.3, 125.2, 124.6, 120.1, 111.4, 105.8, 45.9, 32.3, 20.2, 13.8; ms: *m/z* 277 (M +1, 100). *Anal.* Calcd for $C_{17}H_{16}N_4$ 0.15 $C_4H_8O_2$: C, 73.01; H, 5.98; N, 19.35. Found C, 73.42; H, 5.88; N, 19.12.

1-Butyl-2-(pyridin-3-yl)-1H-benzimidazole-5-carbonitrile (79). Purification, cc, ethyl acetate-hexane (2:1), mp 130–131°C, yield 52%. ^{1}H NMR δ: 0.85 (t, 3H), 1.26 (m, 2H), 1.77 (m, 2H), 4.25 (t, 2H), 7.44–7.59 (m, 3H), 8.06 (d, 1H, J = 7.6 Hz), 8.10 (s, 1H), 8.77 (d, 1H, J = 4.8 Hz), 8.94 (d, 1H, J = 1.2 Hz); ^{13}C NMR δ: 153.4, 151.5, 149.8, 142.9, 138.6, 137.1, 126.6, 126.3, 125.4, 123.9, 119.9, 111.6, 106.2, 45.2, 32.2, 20.1, 13.7; ms: *m/z* 277(M +1, 100). *Anal.* Calcd for $C_{17}H_{16}N_4$: C, 73.87; H, 5.84; N, 20.27. Found C, 73.76; H, 5.82; N, 20.01.

1-Butyl-2-(pyridin-4-yl)-1H-benzimidazole-5-carbonitrile (80). Purification, cc, chloroform-isopropanol (10:2), mp 135–137°C, yield 47%. ^{1}H NMR δ (DMSO-d_6): 0.74 (t, 3H), 1.12 (m, 2H), 1.62 (m, 2H), 4.41 (t, 2H), 7.74 (dd, 1H, J = 1,6, 8.4 Hz), 7.83 (dd, 2H, J = 1.6, 4.4 Hz), 7.95 (d, 1H, J = 8.8 Hz), 8.3 (d, 1H, J = 1.4 Hz), 8.82 (dd, 2H, J = 1.6, 4.4 Hz); ^{13}C NMR δ (DMSO-d_6): 153.5, 151.1, 142.6, 139.4, 137.8, 127, 125.4, 124.1, 120.4, 113.6, 105.4, 44.9, 31.9, 19.8, 13.9; ms: *m/z* 277(M +1, 100). *Anal.* Calcd for $C_{17}H_{16}N_4$. 0.5 HOH: C, 71.55; H, 6.00; N, 19.63. Found C, 71.28; H, 5.73; N, 19.33.

1-Pentyl-2-phenyl-1H-benzimidazole-5-carbonitrile (83). Purification, cc, ethyl acetate-hexane (1:3), mp 124–125°C, yield 17.5%. ^{1}H NMR δ: 0.83 (t, 3H), 1.24 (m, 4H), 1.8 (m, 2H), 4.25 (t, 2H), 7.47 (d, 1H, J = 7.6 Hz), 7.56 (m, 4H), 7.7 (m, 2H), 8.13 (d, 1H, J = 0.8 Hz); ^{13}C NMR δ: 156.4, 142.9, 138.5, 130.6, 129.8, 129.4, 129.1, 126.2, 125.2, 120.1, 111.3, 105.7, 45.2, 29.6, 28.9, 22.2, 14.0; ms: *m/z* 290 (M +1, 100). *Anal.* Calcd for $C_{19}H_{19}N_3$: C, 78.86; H, 6.62; N, 14.52. Found C, 78.66; H, 6.72; N, 14.39.

1-Butyl-6-chloro-2-(4-fluorophenyl)-1H-benzimidazole-5-carbonitrile (84). Purification, cc, ethyl acetate-hexane (1:4), mp 138°C, yield 34%. ^{1}H NMR δ: 0.89 (t, 3H), 1.28 (m, 2H), 1.77 (m, 2H), 4.21 (t, 2H), 7.27 (t, 2H), 7.53 (s, 1H), 7.7 (m, 2H), 8.1 (s, 1H); ^{13}C NMR δ: 164.1 (d, J = 251 Hz), 156.0, 141.3, 138.9, 131.3 (d, J = 8.4 Hz), 130.2, 126.1, 125.4 (d, J = 3.1 Hz), 116.9, 116.3 (d, J = 22 Hz), 111.7, 107.0, 45.0, 31.7, 19.8, 13.4; ms: *m/z* 328 (M +1, 100) 330 (M +3, 35). *Anal.* Calcd for $C_{18}H_{15}ClFN_3$: C, 65.96; H, 4.61; N, 12.82. Found C, 65.75; H, 4.59; N, 12.87.

1-[1-Butyl-2-(4-fluorophenyl)-1H-benzimidazol-5-yl]ethanone (90). Purification, cc, ethyl acetate-hexane (1:3), mp 75–77°C, yield 21.5%. ^{1}H NMR δ: 0.88 (t, 3H), 1.27 (m, 2H), 1.83 (m, 2H), 2.68 (s, 3H), 4.35 (t, 2H), 7.28 (m, 2H), 7.56 (d, 1H, J = 8.4 Hz), 7.85 (m, 2H), 8.11 (d, 1H, J = 8.8 Hz), 8.46

(s, 1H); ^{13}C NMR δ: 198.1, 163.9 (d, $J = 250$ Hz), 154.8, 142.8, 139.1, 132.5, 131.4 (d, $J = 8.5$ Hz), 126.4 8 (d, $J = 3.4$ Hz), 123.2, 121.8, 116.3 (d, $J = 22$ Hz), 110.3, 44.9, 32.1, 26.9, 20.1, 13.7; ms: *m/z* 311 (M +1,100). *Anal.* Calcd for $C_{19}H_{19}FN_2O$: C, 73.53; H, 6.17; N, 9.03. Found C, 73.82; H, 6.53; N, 8.58.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazole-4-carbonitrile (91). Purification, cc, ethyl acetate-hexane (2:8), mp 83–84°C, yield 44.5%. ^{1}H NMR δ: 0.87 (t, 3H), 1.26 (m, 2H), 1.76 (m, 2H), 4.24 (t, 2H), 7.25 (m, 2H), 7.35 (t, 1H), 7.63 (dd, 2H, J = 1.6, 7.6 Hz), 7.74 (m, 2H); ^{13}C NMR δ: 164.1 (d, $J = 250$ Hz), 155.2, 144.1, 136.1, 131.8 (d, $J = 8.4$ Hz), 127.5, 126 (d, $J = 3.1$ Hz), 122.6, 117.0, 116.4 (d, $J = 21.3$ Hz), 115.0, 103.3, 45.1, 32.0, 20.0, 13.6; ms: *m/z* 294 (M +1,100). *Anal.* Calcd for $C_{18}H_{16}FN_3$: C, 73.70; H, 5.50; N, 14.33. Found C, 74.19; H, 5.74; N, 13.94.

7-Bromo-5-(trifluoromethyl)-2-phenyl-1H-benzimidazole (92). Purification, cc, ethyl acetate-hexane (1:1), mp 179–181°C, yield 59%. ^{1}H NMR δ (DMSO-d_6): 7.57 (m, 3H), 7.72 (s, 1H), 7.88 (s, 1H), 8.2 (d, 2H, $J = 5.2$ Hz), 13.98 (br.s, 1H); ms: *m/z* 341 (M +1,100) 343 (M +3,100). *Anal.* Calcd for $C_{14}H_8BrF_3N_2$: C, 49.29; H, 2.36; N, 8.21. Found C, 49.1; H, 2.41; N, 8.17.

5,6-Difluoro-2-phenyl-1H-benzimidazole (93). Purification, cc, ethyl acetate-hexane (1:1), mp 213–215°C, yield 77%. ^{1}H NMR δ (DMSO-d_6): 7.43 (m, 5H), 7.99 (d, 2H, $J = 6.8$ Hz), 13.03 (br.s, 1H); ms: *m/z* 231 (M +1,100). *Anal.* Calcd for $C_{13}H_8F_2N_2$: C, 67.82; H, 3.50; N, 12.17. Found C, 68.00; H, 3.57; N, 11.98.

5,6-Difluoro-2-(4-fluorophenyl)-1H-benzimidazole (94). Purification, cc, ethyl acetate-hexane (1:2), mp 207–209°C, yield 81%. ^{1}H NMR δ (DMSO-d_6): 7.4 (m, 2H), 7.64 (t, 2H), 8.17 (m, 2H); ms: *m/z* 249 (M +1,100). *Anal.* Calcd for $C_{13}H_7F_3N_2$: C, 62.91; H, 2.84; N, 11.29. Found C, 63.04; H, 2.84; N, 11.28.

5,6,7-Trifluoro-2-phenyl-1H-benzimidazole (95). Purification, cryst., ethyl acetate-hexane, mp 215–216°C, yield 77%. ^{1}H NMR δ (DMSO-d_6): 7.4–7.66 (m, 4H), 8.17 (dd, 2H, J = 1.2, 8 Hz); ms: *m/z* 249 (M +1,100). *Anal.* Calcd for $C_{13}H_7F_3N_2$. 0.5 HOH: C, 60.70; H, 3.13; N, 10.89. Found C, 60.75; H, 3.06; N, 10.96.

5,6-Difluoro-2-(pyridin-4-yl)-1H-benzimidazole (96). Purification, cc, ethyl acetate-ethanol (95:5) mp > 300°C, yield 61.5%. ^{1}H NMR δ (DMSO-d_6): 7.71 (br.s, 2H), 8.04 (m, 2H), 8.74 (m, 2H), 13.5 (br.s, 1H); ms: *m/z* 232 (M +1,100). *Anal.* Calcd for $C_{12}H_7F_2N_3$: C, 62.34; H, 3.05; N, 18.17. Found C, 62.77; H, 3.29; N, 17.65.

2-[4-(Benzyloxy)phenyl]-5,6-difluoro-1H-benzimidazole (97). Purification, cc, ethyl acetate-hexane (1:2), mp 215–217°C, yield 33.7%. ^{1}H NMR δ (DMSO-d_6): 5.17 (s, 2H), 7.16 (d, 2H, $J = 9.2$ Hz), 7.32–7.52 (m, 6H), 7.64 (m, 1H), 8.05 (d, 2H, $J = 8.8$ Hz), 12.98 (s, 1H); ms: *m/z* 337 (M +1,100). *Anal.* Calcd for $C_{20}H_{14}F_2N_2O$. 0.1 $C_4H_8O_2$. 0.25 HOH: C, 70.07; H, 4.41; N, 8.01. Found C, 70.04; H, 4.13; N, 8.14.

5,6-Dichloro-2-(4-fluorophenyl)-1H-benzimidazole (99). Purification, cryst., ethyl acetate-hexane, mp 278–280°C, yield 69.5%. ^{1}H NMR δ: 7.19 (m, 2H), 7.58 (s, 1H), 7.82 (s, 1H), 8.17 (m, 2H); ms: *m/z* 281 (M +1,100) 283 (M +3, 63) 285 (M +5, 13). *Anal.* Calcd for $C_{13}H_7Cl_2FN_2$: C, 55.54; H, 2.51; N, 9.97. Found C, 55.52; H, 2.46; N, 9.92.

4,7-Dichloro-2-(4-fluorophenyl)-1H-benzimidazole (100). Purification, cc, ethyl acetate-hexane (2:8), mp 242°C, yield 71.4%. ^{1}H NMR δ (DMSO-d_6): 7.31 (s, 2H), 7.43 (t, 2H), 8.38 (m, 2H), 13.48 (br.s, 1H); ms: *m/z* 281 (M +1, 100) 283 (M +3, 72) 285 (M +5, 15). *Anal.* Calcd for $C_{13}H_7Cl_2FN_2$. 0.25 $C_4H_8O_2$. 0.4 HOH: C, 54.18; H, 3.18; N, 9.03. Found C, 54.03; H, 3.07; N, 9.07.

5,6-Dibromo-2-(4-fluorophenyl)-1H-benzimidazole (101). Purification, cryst., ethanol, mp 273–275°C, yield 68.4%. ^{1}H NMR δ (DMSO-d_6): 7.4 (m, 2H), 7.96 (s, 2H), 8.2 (m, 2H); ms: *m/z* 369 (M +1, 50), 371 (M +3, 100), 373 (M +5, 48). *Anal.* Calcd for $C_{13}H_7Br_2FN_2$ 0.25 HOH: C, 41.69; H, 2.02; N, 7.48. Found C, 41.50; H, 1.99; N, 7.61.

2-(4-Fluorophenyl)-1H-benzimidazole-5,6-dicarbonitrile (102). Purification, cc, (1) ethyl acetate-hexane (1:1), (2) ethyl acetate, (3) ethyl acetate-ethanol (95:5), mp > 300°C, yield 59.8%. ^{1}H NMR δ (DMSO-d_6): 7.48 (t, 2H), 8.31 (m, 2H), 8.44 (s, 2H); ms: *m/z* 263 (M +1,100). *Anal.* Calcd for $C_{15}H_7FN_4$. 0.75 HOH: C, 65.33; H, 3.11; N, 20.32. Found C, 64.94; H, 3.76; N, 20.53.

1-Butyl-5,7-dichloro-2-(4-fluorophenyl)-1H-benzimidazole (104). Purification, cc, (1) dichloro-methane-hexane (2:8) (2) ethyl acetate-ethanol (1:9), mp 58°C, yield 27.3%. ^{1}H NMR δ: 0.81 (t, 3H), 1.17 (m, 2H), 1.74 (m, 2H), 4.44 (t, 2H), 7.25 (m, 3H), 7.65 (m, 3H); ^{13}C NMR δ: 163.8 (d, $J = 250$ Hz), 155.8, 145.6, 131.6 (d, $J = 8.4$ Hz), 130.1, 128.0, 126.0 (d, $J = 3.8$ Hz), 124.5, 118.6, 116,8, 116.1 (d, $J = 22$ Hz), 45.7, 34.0, 19.4, 13.4; ms: *m/z* 337 (M +1, 100) 339 (M +3, 60) 341 (M +5, 11). *Anal.* Calcd for $C_{17}H_{15}Cl_2FN_2$: C, 60.55; H, 4.48; N, 8.31. Found C, 60.14; H, 4.44; N, 8.32.

1-Butyl-5-trimethylsilanylethylnyl-2-(4-fluorophenyl)-1H-benzimidazole (74a). To the mixture of **73** (0.69 mmol, 0.272 g) and (trimethylsilyl)acetylene (0.081g) in *N,N*-dimethyl formamide (1 mL) and triethylamine (1 mL) 10 mg of bis(triphenyl-phosphine)palladium (II) chloride and 2 mg of copper(I) iodide were added, and the mixture was stirred for 4.5 h at 45°C. The solvent was then removed *in vacuo* and the resulting residue was dissolved in acetonitrile and ether and washed with water. The solvent was removed *in vacuo*. The crude product was used without purification, yield 0.100 g. ms: *m/z* 365 (M +1, 100).

1-Butyl-5-ethynyl-2-(4-fluorophenyl)-1H-benzimidazole (74). 0.1 g (0.27 mmol) of **74a** and 1*N* potassium hydroxide (0.5 mL) was added 2.5 mL methanol. The mixture was stirred for 1.5 h at 25°C. The solvent was then removed *in vacuo*. The residue was purified by cc chloroform-ethyl acetate (20:0.5), mp 114–115°C, yield 31%. ^{1}H NMR δ: 0.86 (t, 3H), 1.26 (m, 2H), 1.76 (m, 2H), 3.06 (s, 1H), 4.19 (t, 2H), 7.24 (m, 2H), 7.34 (d, 1H, $J = 8.8$ Hz), 7.45 (dd, 1H, J = 1.6, 8.2 Hz), 7.69 (m, 2H), 7.96 (s, 1H); ^{13}C NMR δ: 163.7 (d, $J = 249$ Hz), 153.9, 142.8, 135.9, 131.24 (d, $J = 8.4$Hz), 126.9, 126.5 (d, $J = 2.8$ Hz), 124.1, 116.0, 116.02 (d, $J = 22.1$ Hz), 110.2, 84.4, 75.7, 44.6, 31.9, 19.9, 13.5; ms: *m/z* 293 (M +1, 100). *Anal.* Calcd for $C_{19}H_{17}FN_2$: C, 78.05; H, 5.86; N, 9.58. Found C, 77.69; H, 5.88; N, 9.46.

5-Amino-1-butyl-2-(4-fluorophenyl)-1H-benzimidazole HCl (76). Compound **75** (0.24 g, 0.767 mmol), tin(II) chloride dihydrate (0.375 g, 1.66 mmol), a granule tin in the mixture of ethanol (2 mL), hydrochloric acid (2 mL), and 1 mL water were stirred at 50°C for 2 h. Then water was added, pH was rendered basic by addition of dilute sodium hydroxide solution, extracted with ethyl acetate. The slurry was filtered on a Buchner, the resulting solid was washed with ethyl acetate.

The combined organic phases was concentrated, crystallization of crude product from ethanolic hydrogen chloride gave **76**, mp 265–267°C, yield 57.1%. ^{1}H NMR δ (DMSO-d_6): 0.75 (t, 3H), 1.16 (m, 2H), 1.68 (m, 2H), 4.36 (t, 2H), 7.29 (d, 1H, J = 8.4 Hz), 7.55 (m, 3H), 7.95 (m, 3H); ms: m/z 284 (M +1, 100). *Anal.* Calcd for $C_{17}H_{18}FN_3$. HCl: C, 63.85; H, 5.99; N, 13.14. Found C, 63.59; H, 5.96; N, 12.98.

5-Azido-1-butyl-2-(4-fluorophenyl)-1H-benzimidazole (77). A cooled solution of **76** (0.16 g, 0.5 mmol) was dissolved in 2 mL of aqueous 9*M* HCl and slowly a sodium nitrite aqueous solution (0.76 mL, 1.2 mmol) was added. The reaction temperature was not allowed to rise above 5°C. The mixture was stirred in an ice bath for 1 h. A solution of 0.6 mL of sodium azide (1.7 mmol) and sodium acetate (0.25g) was added at 0°C and stirred for 1 h. Then, the mixture was allowed to warm to room temperature and stirred for 1 h. Potassium carbonate is added to neutralize the mixture and extracted with ethyl acetate. The solvent was then removed *in vacuo*, the residue was chromatographed by using ethyl acetate-hexane (2:8), mp 85–87°C, yield 25.2%. ^{1}H NMR δ: 0.87 (t, 3H), 1.27 (m, 2H), 1.77 (m, 2H), 4.19 (t, 2H), 6.99 (dd, 1H, J = 2, 8.6 Hz), 7.23 (m, 2H), 7.36 (d, 1H, J = 8.8 Hz), 7.46 (d, 1H, J = 2 Hz), 7.69 (m, 2H); ^{13}C NMR δ: 163.9 (d, J = 249 Hz), 154.2, 144.2, 135.2, 133.6, 131 (d, J = 8.2 Hz), 126.8, 116.3 (d, J = 21.4 Hz), 115, 111.3, 109.9, 44.9, 32.1, 20.1, 13.7; ms: m/z 310 (M +1, 100). *Anal.* Calcd for $C_{17}H_{16}FN_5$: C, 66.00; H, 5.21; N, 22.64. Found C, 66.09; H, 5.28; N, 22.32.

N-[2-(butylamino)-5-cyanophenyl]pyridazine-4-carboxamide (81a). A mixture of 4-pyridazinecarboxylic acid (0.11 g, 0.89 mmol), triethylamine (0.41 mL), 3-amino-4-butylaminobenzonitrile (0.18 g, 0.95 mmol), and *O*-(Benzotriazol-1-yl)-*N*,*N*,*N′*,*N′*-tetramethyl-uronium hexafluorophosphate (HBTU) (0.366 g, 0.96 mmol) in *N*,*N*-dimethylformamide (1 mL) was stirred at room temperature for 20 h, water was added to the reaction mixture, then extracted with ethyl acetate and evaporated. The residue was purified by cc (4:1 toluene/methanol), to give **81a** as a white solid (6.75 g, 71%); mp 214–215°C; ^{1}H NMR (DMSO-d_6) δ: 0.89 (t, 3H), 1.35 (m, 2H), 1.51 (m, 2H), 3.15 (q, 2H), 6.38 (t, 1H, J = 6 Hz, deuterium oxide-exchangeable), 6.76 (d, 1H), 7.52 (m, 2H), 8.14 (m, 1H), 9.51 (d, 1H, J = 5.2 Hz), 9.68 (s, 1H), 10.1 (s, 1H, deuterium oxide-exchangeable), ms: m/z 296 (M +1, 100).

1-Butyl-2-(pyridazin-4-yl)-1H-benzimidazole-5-carbonitrile (81). 0.1 g (0.33 mmol) of **81a** and 0.1 g of sodium acetate was dissolved in 1 mL glacial acetic acid. The mixture was stirred for 4.5 h at 100°C. Then poured into ice-water and filtered. The precipitate was purified by silicagel cc (ethyl acetate-ethanol, 10:0.1), mp 148°C, yield 38%. ^{1}H NMR δ: 0.94 (t, 3H), 1.36 (m, 2H), 1.87 (m, 2H), 4.35 (t, 2H), 7.57 (d, 1H, J = 8 Hz), 7.66 (dd, 1H, J = 1.6, 8.6 Hz), 7.91 (dd, 1H, J = 2.4, 5.6 Hz), 8.20 (s, 1H), 9.47 (dd, 1H, J = 0.8, 5.8 Hz), 9.63 (m, 1H); ms: m/z 278 (M +1, 100). *Anal.* Calcd for $C_{16}H_{15}N_5$: C, 69.30; H, 5.45; N, 25.25. Found C, 69.81; H, 5.80; N, not available.

N-[2-(butylamino)-5-cyanophenyl]pyrazine-2-carboxamide (82a). 0.124 g (1 mmol) of pyrazinecarboxylic acid, thionyl chloride (2 mL), and toluene (5 mL) were heated at reflux for 4 h. After removal of the solvent, a mixture of 3-amino-4-butylaminobenzonitrile 0.189 g (1 mmol), dichloromethane (5 mL), and pyridine (0.5 mL) were added, the residue and the whole was stirred and reflux overnight. The reaction mixture was evaporated, washed with sodium carbonate solution (5%), extracted with ethyl acetate, and washed with water. The organic layer was dried over sodium sulfate, and evaporated. The residue was purified by silicagel cc (ethyl acetate-hexane, 50%), mp 130–133°C, yield 0.11 g, 37.28%. ^{1}H NMR (DMSO-d_6): δ 0.87 (t, 3H), 1.33 (m, 2H), 1.49 (m, 2H), 3.12 (q, 2H), 6.16 (t, 1H, J = 5.6 Hz, deuterium oxide-exchangeable), 6.74 (m, 1H), 7.48 (m, 2H), 8.84 (m, 1H), 8.91 (d, 1H, J = 2.8 Hz), 9.23 (d, 1H, J = 1.6 Hz), 10.16 (s, 1H, deuterium oxide-exchangeable); ^{13}C NMR (DMSO-d_6): δ 163.4, 148.5, 148.2, 145.7, 144.6, 143.9, 132.7, 131.6, 122.86, 120.7, 111.25, 95.8, 42.69, 31.1, 20.3, 14.4; ms: m/z 296 (M +1, 100).

1-Butyl-2-(pyrazin-2-yl)-1H-benzimidazole-5-carbonitrile (82). 0.1 g (0.33 mmol) of **82a** and 0.1 g of sodium acetate was dissolved in 1 mL glacial acetic acid. The mixture was stirred for 4.5 h at 100°C. Then poured into ice-water and filtered. The precipitate was purified by silicagel cc (ethyl acetate-hexane 1:1), mp 174–175°C, yield 33%. ^{1}H NMR δ (DMSO-d_6): 0.87 (t, 3H), 1.3 (m, 2H), 1.77 (m, 2H), 4.82 (t, 2H), 7.77 (d, 1H, J = 8 Hz), 7.98 (d, 1H, J = 8.4 Hz), 8.37 (s, 1H), 8.84 (dd, 2H, J = 2.4, 10.2 Hz), 9.51 (s, 1H); ^{13}C NMR δ (DMSO-d_6): 150.3, 146.1, 145.9, 145.5, 144.3, 142.1, 139.9, 127.3, 125.6, 120.3, 113.5, 105.6, 45.7, 32.4, 20.0, 14.1; ms: m/z 278 (M +1, 100). *Anal.* Calcd for $C_{16}H_{15}N_5$: C, 69.30; H, 5.45; N, 25.25. Found C, 69.00; H, 5.44; N, 24.84.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazol-5-carboxaldehyde (85). To a solution of **I** (0.293 g, 1 mmol) in dry dichloromethane (20 mL), 3 mL of DIBAL (1.0*M* solution in dichloromethane) was added and the mixture was heated at reflux for 3h under nitrogen atmosphere. Cool dilute sulfuric acid (15 mL) was added and stirred overnight, dichloromethane was removed and the residue was neutralized with dilute sodium carbonate solution, then extracted with ethyl acetate and evaporated. The residue was purified by silicagel cc (ethyl acetate-hexane 2:3), mp 85–86°C, yield 31.5%. ^{1}H NMR δ: 0.885 (t, 3H), 1.29 (m, 2H), 1.79 (m, 2H), 4.26 (t, 2H), 7.26 (m, 2H), 7.52 (d, 1H, J = 8.4 Hz), 7.72 (m, 2H), 7.9 (dd, 1H, J = 1.2, 8.8 Hz), 8.27 (s, 1H), 10.1 (s, 1H); ^{13}C NMR δ: 192.3, 164.05 (d, J = 250 Hz), 155.2, 143.1, 140.1, 132.2, 131.5 (d, J = 9.1 Hz), 126.3 (d, J = 1.1Hz), 124.3, 123.45, 116.3 (d, J = 22 Hz), 110.9, 45.1, 32.1, 20.1, 13.7; ms: m/z 297 (M +1, 100). *Anal.* Calcd for $C_{18}H_{17}FN_2O$: C, 72.96; H, 5.78; N, 9.45. Found C, 73.05; H, 6.01; N, 9.10.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazole-5-carbaldehyde O-methyloxime (86). A solution of **85** (0.1 g, 0.33 mmol) and of methoxylamine hydrochloride (0.028 g, 0.33 mmol) in 1 mL of pyridine and 3 mL of absolute ethanol was refluxed for 3 h. Solvent was removed *in vacuo*, water was added and extracted with ethyl acetate and evaporated. The residue was crystallized from ethanol, mp 104–105°C, yield 38.3%. ^{1}H NMR δ (DMSO-d_6): 0.78 (t, 3H), 1.17 (m, 2H), 1.67 (m, 2H), 3.93 (s, 3H), 4.32 (t, 2H), 7.45 (t, 2H), 7.65 (dd, 1H, J = 1.4, 8.5 Hz), 7.71 (d, 1H, J = 8.5 Hz), 7.86 (m, 2H), 7.91 (s, 1H), 8.36 (s, 1H); ms: m/z 326 (M +1, 100). *Anal.* Calcd for $C_{19}H_{20}FN_3O$: C, 70.12; H, 6.20; N, 12.92. Found C, 70.34; H, 6.30; N, 12.61.

1-Butyl-2-(4-fluorophenyl)-N′-hydroxy-1H-benzimidazole-5-carboximidamide (87). To a stirring solution of compound **I** (1 mmol, 0.293 g) in ethanol (50 mL) was added hydroxylamine hydrochloride (1.43 mmol, 0.1 g) followed by *N*,*N*,-diisopropylethylamine (1.43 mmol, 0.184 g). The solution was heated to reflux and after 6 h, it was concentrated. Residue was washed with water and crystallized from ethanol, mp 230–233°C, yield 66%. ^{1}H NMR δ (DMSO-d_6): 0.72 (t, 3H), 1.1 (m, 2H), 1.6 (m, 2H), 4.26 (t, 2H), 5.84 (s, 2H), 7.40 (t, 2H), 7.62 (m, 2H), 7.81 (m, 2H), 7.95 (s, 1H), 9.54 (s, 1H); ms: *m*/*z* 327 (M +1, 100). *Anal.* Calcd for $C_{18}H_{19}FN_4O\cdot0.4$ HOH.$\cdot$0.25 C_2H_6O: C, 64.38; H, 6.22; N, 16.23. Found C, 64.46; H, 5.79; N, 15.93.

1-Butyl-2-(4-fluorophenyl)-5-(5-methyl-1,2,4-oxadiazol-3-yl)-1H-benzimidazole (88). To a stirring solution of **87** (0.070 g, 0.214 mmol) in 1,2-dichloroethane was added acetic anhydride (1 g, 0.97 mL, 10.2 mmol) and then the mixture was heated to 75°C. After 10 h, the reaction was cooled to room temperature and concentrated under reduced pressure. Water was added and the mixture was made alkaline with dilute sodium carbonate solution, then extracted with ethyl acetate. The organic layer was washed with water and evaporated, the residue was purified by cc eluting with first ethyl acetate-hexane 50%, later ethyl acetate-ethanol (99:1) to give **88** (0.025 g, 33.3%), mp 120–122°C, ^{1}H NMR δ: 0.86 (t, 3H), 1.27 (m, 2H), 1.78 (m, 2H), 2.66 (s, 3H), 4.22 (t, 2H), 7.23 (t, 2H), 7.47 (d, 1H, $J = 8$ Hz), 7.71 (m, 2H), 8.03 (d, 1H, $J = 8.8$ Hz), 8.51 (s, 1H); ms: *m*/*z* 351 (M +1, 100). *Anal.* Calcd for $C_{20}H_{19}FN_4O\cdot0.1$ $C_4H_8O_2$: C, 68.21; H, 5.56; N, 15.59. Found C, 68.35; H, 5.54; N, 15.36.

2-(4-Fluorophenyl)-1-propyl-5-(1H-tetrazol-5-yl)-1H-benzimidazole (89). A mixture of **89a** (0.1 g, 0.358 mmol), sodium azide (0.11 g, 1.7 mmol), and ammonium chloride (0.11 g, 2.056 mmol) in *N*,*N*-dimethylformamide (1 mL) was stirred at 145°C for 24 h. After cooling, the mixture was diluted with water, acidified to pH 3 with dilute HCl and extracted with ethyl acetate. The organic layer was washed with water and evaporated. The residue was purified by c.c. eluting with first ethyl acetate, later ethyl acetate-ethanol (9:1) to give **89**, mp 126–128°C, yield 19.1%. ^{1}H NMR δ: 0.68 (t, 3H), 1.64 (m, 2H), 4.26 (t, 2H), 7.39 (t, 2H), 7.83 (m, 3H), 7.97 (d, 1H, $J =$ 7.6 Hz), 8.32 (s, 1H); ^{13}C NMR δ (DMSO-d_6): 163.7 (d, $J =$ 250 Hz), 163.15, 156.7, 154.5, 143.1, 138.0, 132.3 (d, $J = 9.2$ Hz), 127.1, 122.2, 119.2, 118.5, 116.7 (d, $J = 22$ Hz), 112.7, 46.4, 23.1, 11.4; ms: *m*/*z* 323 (M +1,100). *Anal.* Calcd for $C_{17}H_{15}FN_6$. HOH: C, 59.99; H, 5.03; N, 24.69. Found C, 60.03; H, 5.07; N, 24.41.

5,6-Difluoro-2-(4-hydroxyphenyl)-1H-benzimidazole (98). Compound **97** (0.12 g, 0.357 mmol) in ethanol (10 mL) were reduced by hydrogenation using 40 psi of H_2 and 10% Pd-C until cessation of hydrogen uptake. The catalyst was filtered off on a bed of Celite, washed with ethanol, and the filtrate was concentrated. The residue was crystallized from ethanol, mp 286–287°C, yield 43.2%. ^{1}H NMR δ (DMSO-d_6): 6.88 (d, 2H, $J = 8.4$ Hz), 7.47 and 7.6 (br.s, 2H), 7.94 (d, 2H, $J = 8.8$ Hz), 10.0 (s, 1H), 12.87 (s, 1H); ms: *m*/*z* 247 (M +1,100). *Anal.* Calcd for $C_{13}H_8F_2N_2O\cdot0.5C_4H_8O_2$: C, 62.07; H, 4.17; N, 9.65. Found C, 62.55; H, 4.29; N, 9.37.

General procedure for synthesis of 103, 105–107. A mixture of **99–102** (1 mmol), *n*-butylbromide (1 mmol), and sodium hydride (95%, 1.25 mmol) in *N*,*N*-dimethylformamide (1mL) was stirred at 60°C for 5 h. The reaction mixture was poured into water and extracted with ethyl acetate. The extract was washed with water, dried over sodium sulfate, and concentrated *in vacuo*.

1-Butyl-4,7-dichloro-2-(4-fluorophenyl)-1H-benzimidazole (103). Purification, cc, ethyl acetate-hexane (2:8), mp 93–94°C, yield 52.5%. ^{1}H NMR δ: 0.81 (t, 3H), 1.18 (m, 2H), 1.74 (m, 2H), 4.46 (t, 2H), 7.22 (m, 4H), 7.67 (m, 2H); ms: *m*/*z* 337 (M +1, 100) 339 (M +3, 63), 341 (M +5, 13). *Anal.* Calcd for $C_{17}H_{15}Cl_2FN_2$: C, 60.54; H, 4.48; N, 8.31. Found C, 60.73; H, 4.58; N, 8.29.

1-Butyl-5,6-dichloro-2-(4-fluorophenyl)-1H-benzimidazole (105). Purification, cc, ethyl acetate-hexane (1:3), mp 85–86°C, yield 70.5%. ^{1}H NMR δ: 0.88 (t, 3H), 1.26 (m, 2H), 1.76 (m, 2H), 4.17 (t, 2H), 7.24 (m, 2H), 7.51 (s, 1H), 7.68 (m, 2H), 7.87 (s, 1H); ms: *m*/*z* 337 (M +1, 100) 339 (M +3, 57). 341 (M +5, 13). *Anal.* Calcd for $C_{17}H_{15}Cl_2FN_2$: C, 60.55; H, 4.48; N, 8.31. Found C, 60.5; H, 4.39; N, 8.31.

1-Butyl-5,6-dibromo-2-(4-fluorophenyl)-1H-benzimidazole (106). Purification, cryst., ethanol, mp 100–101°C, yield 72.8%. ^{1}H NMR δ: 0.87 (t, 3H), 1.26 (m, 2H), 1.75 (m, 2H), 4.15 (t, 2H), 7.23 (m, 2H), 7.68 (m, 3H), 8.05 (s, 1H); ^{13}C NMR δ: 165.0, 162.6, 154.5, 143.4, 135.8, 131.3, 131.2, 126.0, 125.9, 124.3, 117.9, 117.6, 116.2, 116.0, 114.6, 44.8, 31.7, 19.8, 13.4. ms: *m*/*z* 425 (M +1, 51), 427 (M +3, 100), 429 (M +5, 50). *Anal.* Calcd for $C_{17}H_{15}Br_2FN_2$: C, 47.92; H, 3.55; N, 6.57. Found C, 47.52; H, 3.45; N, 6.73.

1-Butyl-2-(4-fluorophenyl)-1H-benzimidazole-5,6-dicarbonitrile (107). Purification, cc, ethyl acetate-hexane (3:7), mp 158–160°C, yield 36.6%. ^{1}H NMR δ (DMSO-d_6): 0.76 (t, 3H), 1.14 (m, 2H), 1.64 (m, 2H), 4.4 (t, 2H), 7.49 (t, 2H), 7.91 (m, 2H), 8.57 (s, 1H), 8.75 (s, 1H); ms: *m*/*z* 319 (M +1, 100). *Anal.* Calcd for $C_{19}H_{15}FN_4$. 0.15 $C_4H_8O_2$: C, 71.0; H, 4.92; N, 16.89. Found C, 71.16; H, 4.95; N, 16.78.

1-(4-Fluorophenyl)ethanone (4-bromophenyl) hydrazone (108a). A mixture of 4-bromo-phenylhidrazine HCl (1.12 g, 5 mmol), 4′-fluoroacetophenone (0.69 g, 5 mmol), and triethylamine (1 mL) in ethanol (10 mL) was heated to 80°C for 3 h. The mixture was allowed to cool and water was added. The resultant precipitate was filtered and dried under vacuum, yield 1.34 g, 87.3%.

5-Bromo-2-(4-fluorophenyl)-1H-indole (108). Compound **108a** (0.92 g, 3 mmol) in polyphosphoric acid (25 g) was heated to 120°C for 4 h. After cooling to room temperature, the resultant reaction solution was poured into a mixture of ice and water, and the solution was basified with 10% sodium hydroxide solution. The resultant precipitate was filtered, washed with water, crystallized from ethanol, mp 178–179°C, ref. 28; 180°C, yield 85%. ^{1}H NMR δ (DMSO-d_6): 6.87 (s, 1H), 7.21 (dd, 1H, $J = 2$, 8.8 Hz), 7.33 (m, 3H), 7.71 (s, 1H), 7.91 (m, 2H), 11.77 (s, 1H); ^{13}C NMR δ (DMSO-d_6): 162.9, 160.4, 138.1, 135.6, 130.4, 128.2, 127.2, 127.1, 123.8, 121.9, 115.9, 115.7, 113.1, 111.7, 98.1; ms [ESI(−)]: *m*/*z* 288 (M −1, 100) 290 (M +2, −1, 100). *Anal.* Calcd for $C_{14}H_9BrFN$: C, 57.95; H, 3.13; N, 4.83. Found C, 57.73; H, 3.04s; N, 4.98.

5-Bromo-2-(4-fluorophenyl)-1-propyl-1H-indole (109). A solution of **108** (0.58 g, 2 mmol) and sodium hydride (0.072 g, 3 mmol) was stirred in dry *N*,*N*-dimethylformamide (3 mL) at 0°C for 30 min, and then propyl bromide (0.30 g, 2.5 mmol) was added dropwise and the resulting mixture was stirred at room temperature for 16 h and then poured into ice-water and extracted with ethyl acetate (3 × 10). The organic phase was washed with brine, dried over sodium sulfate, and concentrated under reduced pressure. The residue was crystallized from ethyl acetate-hexane, yield 63.3%, mp 55–56°C; ^{1}H NMR δ (DMSO-

d_6): 0.63 (t, 3H), 1.53 (m, 2H), 4.14 (t, 2H), 6.51 (s, 1H), 7.28 (dd, 1H, $J = 2$, 8.4 Hz), 7.36 (m, 2H), 7.55 (d, 1H, $J = 8.8$ Hz), 7.59 (m, 2H), 7.75 (d, 1H, $J = 2$ Hz); ms: m/z 332 (M +1, 100) 334 (M +3, 100). *Anal.* Calcd for $C_{17}H_{15}BrFN$: C, 61.46; H, 4.55; N, 4.22. Found C, 61.43; H, 4.56; N, 4.38.

5-Cyano-2-(4-fluorophenyl)-1-propyl-1H-indole (110). A mixture of **109** (0.332 g, 1 mmol) and cuprous cyanide (0.270 g, 3 mmol) in 5 mL of 1-methyl-2-pyrrolidinone was heated at 120°C for 6 h in a Parr Digestion Bomb. The mixture was cooled to room temperature and washed with 10 mL water, by stirring with water for 15 min and decanting the water layer. The washed reaction mixture was mixture with 8 mL of ethylenediamine and 5 mL of water. The resultant precipitate was filtered, washed with 15 mL of 10% sodium cyanide solution then water and dried. Crude product was purified by using cc (ethyl acetate-hexane 1:3), mp 141-143°C, yield 23.7%. ^1H NMR δ (DMSO-d_6): 0.63 (t, 3H), 1.52 (m, 2H), 4.20 (t, 2H), 6.67 (s, 1H), 7.37 (t, 2H), 7.52 (dd, 1H, $J = 1.4$, 8.6 Hz), 7.61 (m, 2H), 7.77 (d, 1H, $J = 8.6$ Hz), 8.09 (d, 1H, $J = 1$ Hz); ms: m/z 279 (M +1,100). *Anal.* Calcd for $C_{18}H_{15}FN_2$. 0.15 HOH: C, 76.93; H, 5.49; N, 9.96. Found C, 77.04; H, 5.76; N, 9.47.

Acknowledgments. This work was supported by TUBITAK Project no: 106S202 (SBAG-3450). Central Laboratory of Pharmacy, Faculty of Ankara University provided support for acquisition of the NMR, mass spectrometer, and elemental analyzer used in this work.

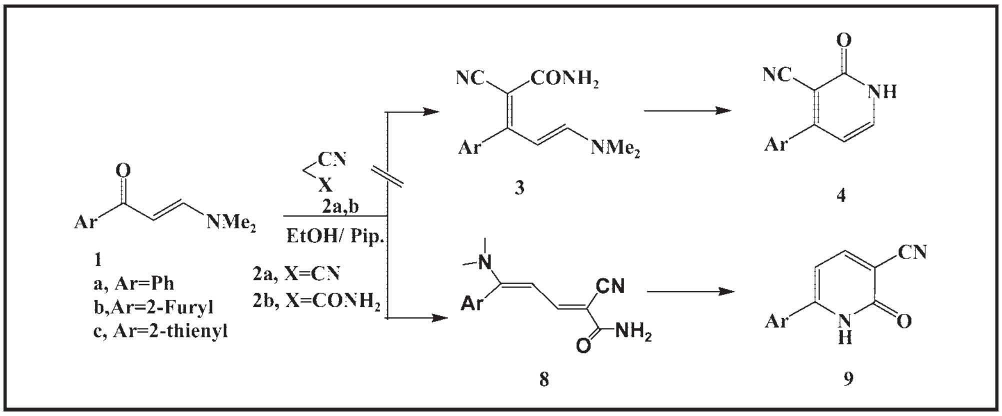
DOI 10.1002/jhet.181



The reaction of 3-dimethylamino-1-arylpropenone derivatives with active methylene nitriles was reinvestigated and a plausible mechanism to account for the results is suggested. X-ray crystallographic study supported the suggested mechanism. Based on these findings, the reaction of 3-acetylamino-4-dimethylaminobut-3-en-2-one with malononitrile was also reinvestigated and the correct structures verified.

J. Heterocyclic Chem., **46**, 949 (2009).

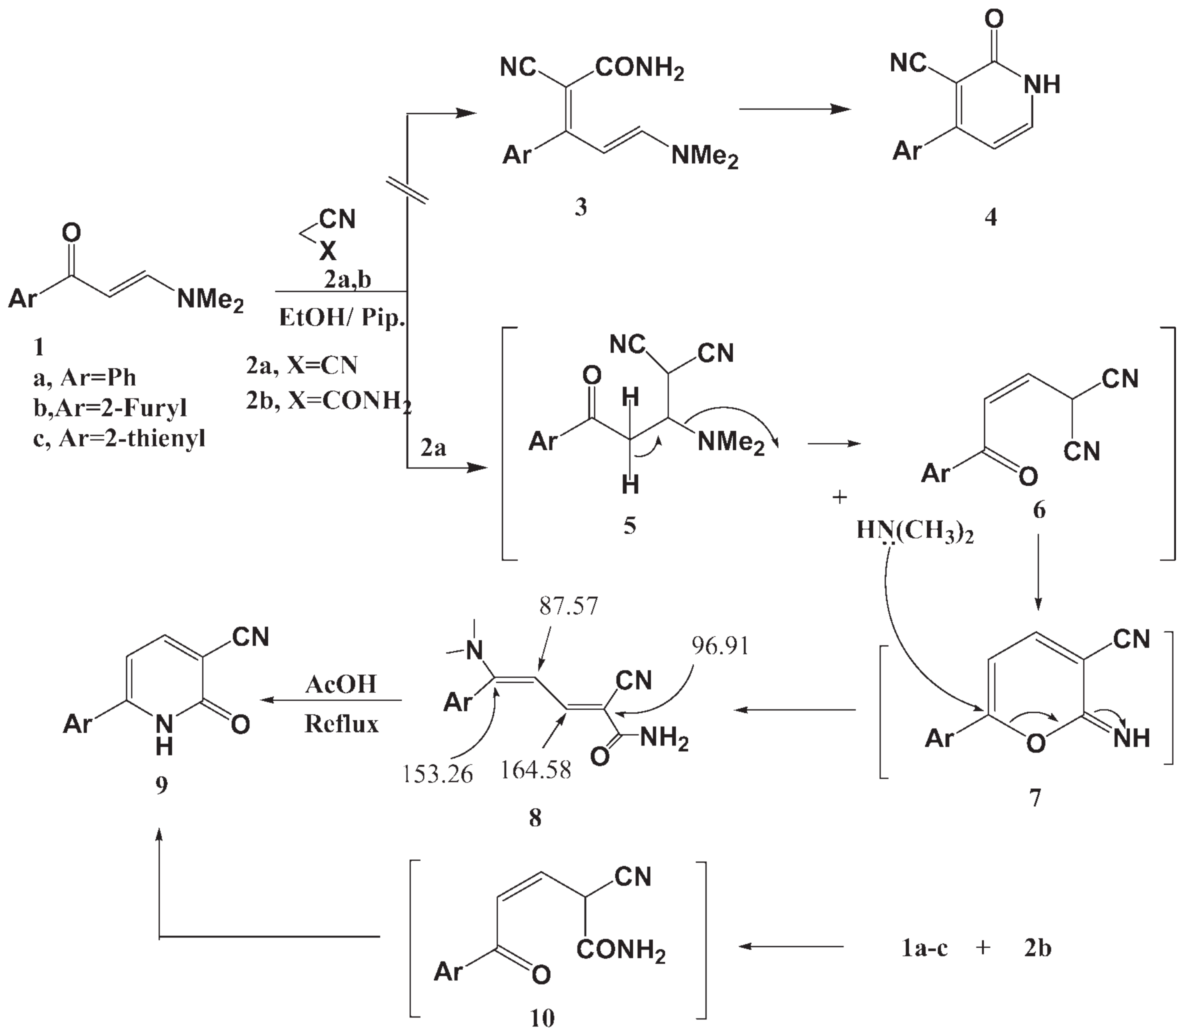
INTRODUCTION

In the past 2 decades, we have been involved in a program aiming to develop new simple routes for the synthesis of heterocyclic compounds of biological interest to be evaluated as biodegradable agrochemicals [1–5]. Pyridines and pyridones represent an important class of these compounds because of their pharmaceutical applications [6–8]. The reaction of enaminones with active methylene nitriles represents one of the strategies for the preparation of 2-1*H*-pyridone [9–11]. 3-Dimethylamino-1-arylpropenones **1a–c** have been extensively used in the last years by Elnagdi and coworkers for the synthesis of pyridones [12–14]. The reaction of **1a–c** with active methylene nitriles (namely malononitrile **2a** and cyanoacetamide **2b**; Scheme 1) in all these and other publications was based on the idea of a Knoevenagel condensation of the active methylene in **2a** or **2b** with the carbonyl groups of **1a–c**. In one article, it was assumed that malononitrile **2a** is first hydrolyzed to cyanoacetamide by the water present in the solvent [12], which then condenses with the carbonyl group of **1a–c** to afford **3a–c**. In the other article, it was assumed that the condensation takes place first and then the water resulting from the condensation hydrolyzes one of the cyano groups in the products of **2a** but do nothing with the products of **2b** to afford the amides **3a–c** [13]. Then, compounds **3a–c** were cyclized to afford the 2-1*H*-pyridones **4a–c**. These assumptions attracted our attention and raised our doubt in the structures of these products. The NMe$_2$ group is a very good leaving group and the active methylene reagent must substitute it easier and faster than to condense with the carbonyl group. Furthermore, the hydrolysis of a cyano group by the traces of water present in the solvent (ethanol and few drops of piperidine as catalyst), or that resulting from the condensation seemed far unlikely to occur. On the basis of these reservations, we decided to reinvestigate this reaction.

RESULTS AND DISCUSSION

Thus, the enaminone compounds **1a–c** were prepared and allowed to react with the active methylene compounds **2a**,**b** according to the method and under the same reaction conditions reported by Elnagdi and coworkers [12]. In our hands, we could isolate the 2-cyano-5-dimethylamino-5-arylpenta-2,4-dienoic amide derivatives **8a–c** from the reaction of **1a–c** with malononitrile **2a**. The mass spectra of these compounds showed

Scheme 1



5-9 : a, Ar=Ph ; b, Ar=2-Furyl ; c, Ar=2-thienyl

m/*z* = 241, 231, and 247, respectively. These masses reveal that 1:1 adducts were obtained and correspond to molecular formulae $C_{14}H_{15}N_3O$, $C_{12}H_{13}N_3O_2$, and $C_{12}H_{13}N_3OS$, respectively, as reported previously [12]. However, the cyclization of these compounds upon reflux in acetic acid led to the 2-1*H*-pyridone derivatives **9a–c**. The ^{1}H NMR spectrum of **9a** revealed two doublets; each integrated for 1H at $\delta = 6.72$ and 8.20 with equal *j* value of 8 Hz, which could be attributed to the pyridone **9a** H-5 and H-4, respectively. A pyridone structure like the claimed **4a** should have revealed these proton signals for H-5 and H-6 at slightly up field values $\delta \approx 5.8$ and 7.3 ppm. Thus, structures **9a–c** were assigned to these reaction products rather than **4a–c** (*cf.* Experimental).

The formation of the enaminones **8a–c** from the reaction of **1a–c** with **2a** is assumed to take place *via* the sequence depicted in Scheme 1. The active methylene group of malononitrile undergoes addition to the double bond of **1** to give the intermediate **5**, followed by elimination of dimethyl amine to afford 2-(3-oxo-3-aryl-propenyl)-malononitrile **6**, which directly undergoes ring closure *via* its enolized form to afford the iminopyran **7**. This newly born iminopyran is attacked by the dimethyl amine (which is still present in the reaction medium) and undergoes ring opening to afford the isolated 2-cyano-5-dimethylamino-5-arylpenta-2,4-dienoic amides **8a–c**. The ring opening of iminopyran under the effective ammonia and amines is well established in the literature [10]. Elemental analyses and spectral data are

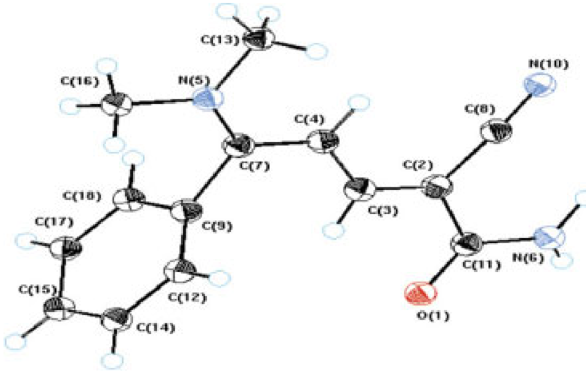


Figure 1. Crystal structure of compound **8a**. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

in complete agreement with structures **8a–c** (*cf*. Experimental).

The X-ray crystallographic picture [15] afforded an unambiguous evidence of structure **8a** (Fig. 1; *cf*. experimental). It shows that the N(Me)$_2$ attached to the same carbon atom (C7) carrying the phenyl group and the other terminus carrying the cyano and the amide group on (C2) as shown in Figure 1 and Scheme 1, which affords a conclusive evidence to the pyridone structures **9**.

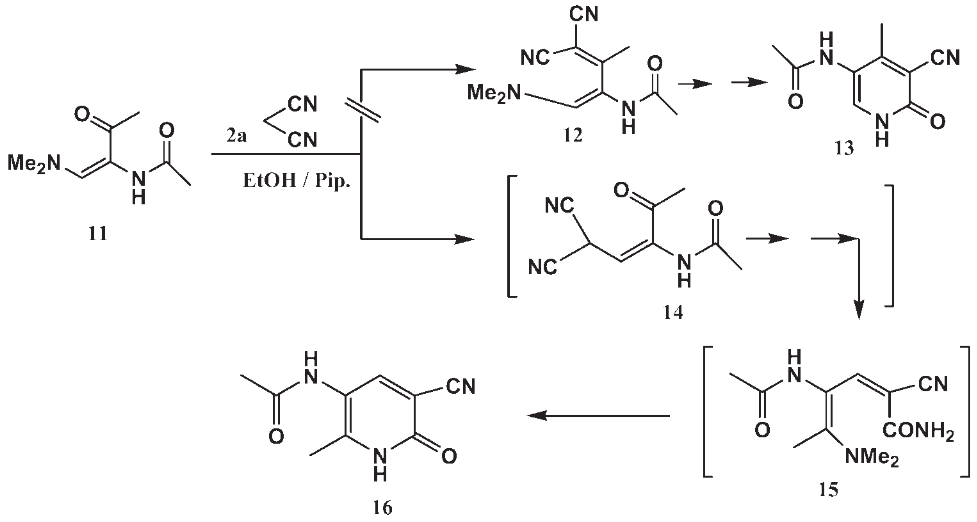
These compounds could be readily cyclized upon reflux in acetic acid to afford the 2-1*H*-pyridinone derivatives **9a–c**, respectively, *via* elimination of dimethyl amine.

The reaction of **1a–c** with cyanoacetamide **2b** afforded the same 2-1*H*-pyridinones **9a–c**, respectively, which represents further evidence to this suggested mechanism. It is apparent that **2b** followed the same addition elimination sequence to afford the intermediate 2-cyano-5-oxo-5-arylpent-3-enoic acid amide **10** (analogous to **6** in the above sequence), which undergoes directly the cyclization *via* elimination of water without passing through the step of the iminopyran, since the amide group is initially present. The identity of the products obtained from the reactions of **1a–c** with either **2a** or **2b** was deduced from the typical melting points and spectral data. It should be also clear that Elnagdi and coworkers [12] have reported that they obtained the same products from the reaction of **2b** with **1a–c**.

Furthermore, Elnagdi and coworkers [13] have reported the reaction of 3-acetylamino-4-dimethylamino-but-3-en-2-one **11** (obtained from the reaction of acetylaminoacetone with DMFDMA) with malononitrile **2a** and assumed the same scenario of condensation to give **12**, which is cyclized to **13** (Scheme 2).

Reinvestigation of this reaction showed that it follows the same mechanistic way shown in Scheme 1. Malononitrile substitutes the dimethylamnino group to give the intermediate **14** followed by cyclization and ring opening of the formed iminopyran to afford **15**, which readily eliminates dimethylamine to afford the final isolable 2-1*H*-pyridinone derivative **16** (in a Dimroth-type rearrangement). Although the claimed structure **13** and our structure **16** have almost the same elemental and spectral data, however, the δ value given by Elnagdi and coworkers [13] to the pyridinone H is 7.95 ppm, which better fits to the H-4 rather than the H-6. A structure like **13** would have revealed this H-6 signal much up field at ≈6–7 ppm. The ^{13}C NMR data given in [13] are wrongly interpreted. They assigned the value 116.64 ppm to the C-4, which points out that no methyl group is attached to this carbon, because attached methyl group at the fourth position would have shifted this

Scheme 2



value dramatically low field (>150 ppm); and the same words can be said on the value given to C-6 δ = 148.54, which is too much down field value to a simple CH ($\approx$90–100 ppm) and this means that the methyl group is attached to this carbon (C-6).

Finally, this confusion of the structures can be excused based on the similarity of analyses and the tiny differences in the spectral interpretation. However, the claim that the pyridinone obtained from this reaction underwent a Michael addition with ylidenemalononitriles to afford diaminoisoquinolines [13] requires revision.

CONCLUSION

Thus, we could suggest a conceivable mechanism that explains the behavior of active methylene nitriles with enaminones and could correct some literature wrong structures.

EXPERIMENTAL

Melting points were measured on an Electrothermal (9100) apparatus and are uncorrected. IR spectra were recorded as KBr pellets on a Perkin Elmer 1430 spectrophotometer. The ^{1}H NMR and ^{13}C NMR spectra were taken on a Varian Gemini 300 MHz spectrometer in DMSO-d_6 using TMS as an internal standard and chemical shifts are expressed in δ ppm values. Mass spectra were taken on a Shimadzu GCMS-GB 1000 PX (70 eV). Elemental analyses were carried out at the Microanalytical Center at Cairo University. X-ray data [15] were collected using KappaCCD on a Bruker Nonius apparatus. The structure was solved by direct methods and expanded using Fourier technique *SIR*92 [16]. The structure was refined using maXus [17]. Nonhydrogen atoms are refined anisotropically and the hydrogen atoms were refined according to the theoretical models.

Reaction of the enaminones 1a–c with malononitrile 2a: Preparation of compounds 8a–c. To a mixture of each of enaminone **1a–c** (10 mmol) and malononitrile (0.66 g; 10 mmol) in ethanol (15 mL) was added few drops of piperidine, which acts as catalyst. The reaction mixture was refluxed for 2 h and then left to cool to room temperature. The solid products thus precipitated were collected by filtration and crystallized from the proper solvent.

2-Cyano-5-dimethylamino-5-phenylpenta-2,4-dienoic acid amide 8a. Canary yellow crystals, yield (1.8 g, 75%); mp 260–262°C (Dioxan) (Lit. 254–256 [12]); $\upsilon_{\max}$ = 3435 and 3284 (NH$_2$), 2193 (CN) and 1665 cm^{-1} (CO); MS: *m*/*z* = 241 [M$^+$]; δ_H = 2.92 (s, 6H, 2 CH$_3$), 5.65 (d, *j* = 12.75 Hz, 1H, CH), 6.77 (s, 2H, NH$_2$), 7.13 (d, *j* = 12.75 Hz, 1H, CH), 7.24–7.55 (m, 5H, Ph). δ_C = 165.08 (s)(amide CO), 164.58 (d)(C-3), 153.26 (s)(C-5), [133.98(s), 129.56(d), 128.76(d), 128.72(d); Phenyl C's], 118.90(s)(CN), 96.91 (s)(C-2), 87.57(d)(C-4), 41.92 (q).

A fast, mild, and quantitative procedure for the preparation of tetrahydrobenzo[*b*]pyran derivatives in the presence of an easily accessible basic ionic liquid—[bmIm]OH(3-butyl-1-methylimidazoliumhydroxide) as the catalyst has been developed. The ionic liquid was stable during the reaction process and could also be reused at least nine times with consistent activity. This procedure may be a practical alternative to the existing procedures to meet the need of academe as well as industries.

J. Heterocyclic Chem., **46**, 954 (2009).

INTRODUCTION

The exploration of privileged structures in drug discovery is a rapidly emerging theme in medicinal chemistry [1]. 4*H*-Benzopyran derivatives constitute a structural unit of a number of natural products [2] and are versatile synthons because of the inherent reactivity of the pyran ring [3]. In addition, 4*H*-benzo[*b*]pyran derivatives are biologically interesting compounds that possess various pharmacological activities [4], such as, anticoagulant, spasmolytic, diuretic, anticancer, and anti-anaphylactin characteristics [5]. These ubiquitous applications of 4*H*-benzo[*b*]pyrans stimulated several groups [6–8] to develop new and efficient synthetic protocols for these two bioactive units.

Besides, because of the great pharmacological significance of benzothiazole, which is of particular interest especially within the realm of medicinal chemistry, many useful therapeutic agents also contain the benzothiazole moiety, and these substitution patterns were introduced with efficiency [9].

Because of the vast utility of these kinds of compounds, a number of synthetic routes have been developed for the expedition of these structure frameworks. Some of these reactions were catalyzed by a plethora of reagents including solid or molten state [6], sodium bromide under microwave irradiation [7], [bmIm][BF_4] [8]. However, despite the potential utility of these catalysts, many of these methodologies for the synthesis of 4*H*-benzo[*b*]pyrans are associated with several shortcomings, such as, long reaction time, high temperature, harsh reaction conditions, and using of expensive reagents. Gaps remain in terms of the search for economical and environmentally benign methods.

Multicomponent reactions (MCRs), an important subclass of tandem reaction [10], are one-pot processes in which several easily accessible components react to form a single product. They offer significant advantages over conventional linear step synthesis, by reducing time, saving money, energy, and raw materials, thus resulting in both economical and environmental benefits. At the same time, diversity can be achieved from building up libraries by simply varying each component [11].

Recently, ionic liquids have attracted increasing interest in the context of green synthesis [12]. Choline hydroxide has been used as a basic catalyst for aldol condensation reactions between several ketones and aldehydes [13], whereas the basic ionic liquid

R=3-$NO_2C_6H_4$, 2,5-$Cl_2C_6H_3$, 2-ClC_6H_4, 4-ClC_6H_4, 2,4-$Cl_2C_6H_3$, 2-BrC_6H_4, 4-BrC_6H_4, 2-FC_6H_4, 3-FC_6H_4, 4-FC_6H_4, C_6H_5, 4-$CH_3C_6H_4$, 4-$OMeC_6H_4$, 4-OHC_6H_4, 3,4($CH_3O)_2C_6H_3$, furan, 4-$N(CH_3)_2C_6H_4$

[bmIm]OH has been successfully applied to catalyze Michael additions of active methylene compounds to conjugated ketones, carboxylic esters, and nitriles [14]. The synthesis of new and important types of heterocyclic compounds using the basic ionic liquid [bmIm]OH continues to attract wide attention among synthetic chemists.

Thus, in view of the advantages of MCRs and Tandem reactions, and promoted by our earlier researches on MCRs [15], herein, we wish to disclose a green protocol for the synthesis of a variety of biologically important 4*H*-Benzo[*b*]pyrans using the catalyst [bmIm]OH under reflux condition (Scheme 1).

RESULTS AND DISCUSSION

We first studied the effects of a variety of catalysts on the reaction using *m*-nitrobenzaldehyde as the substrate in ethanol to develop the optimal reaction conditions. The results are summarized in Table 1. Although the reaction could take place without any catalyst, the yield of **4a** was relatively low 39.6%, and the reaction time was long (Table 1, entry 1). The yields of **4a** were also unsatisfactory when using Et_3N or piperidine as catalysts (45.2–52.5%; Table 1, entries 2 and 3). To obtain the higher yield, inorganic catalysts were studied; however, the result was disappointing. It turned out that using KF or KF/Al_2O_3 (1:1) as the catalyst, only moderate yields of **4a** were obtained (52.5–55.0%; Table 1, entries 4 and 5). Thus, ionic liquids were tried. Utilizing $[bmIm]BF_4$ and $[bmIm]BF_4$/KOH (1:1), the yields of the products were not obviously improved (50.2–68.0%; Table 1, entries 6 and 7), but when the [bmIm]OH was used as the catalyst, the yield of **4a** was dramatically improved to 83% in 0.5 h. Then, it was observed that when the quantity of [bmIm]OH increased from 20 to 60 mol %, the yield of **4a** improved accordingly to 95% (Table 1, entries 8–10). However, with increasing the amount of the catalyst, the yields of **4a** were not further improved but reduced (Table 1, entries 11 and 12). Therefore, we selected 60 mol % of [bmIm]OH as the catalyst. It was showed that the basic ionic liquid [bmIm]OH plays a significant catalytic role, as well as the acceleration of the reaction rate and improvement of selectivity.

To extend the scope of this new procedure for the synthesis of 4*H*-benzo[*b*]pyrans, a series of reactions were carried out under optimized conditions. We were pleased to find that the reactions proceeded smoothly, and desired products were afforded in excellent yields (77–95%) and in short time (30–50 min) (Table 2). When aromatic aldehydes **2** with more electron-

[a] Isolated.

withdrawing substituents or higher electronegativity were used, the yields of **4** were higher (Table 2, entries 1–10). The heterocyclic aldehyde (furan formaldehyde) was also used to support this reaction (Table 2, entry 16). In a further study, 4-$N(CH_3)_2C_6H_4$ was used in this case, however, though the reactions proceeded smoothly, the 2-(benzo[*d*]thiazol-2-yl)-3-(4-*N*,*N*-dimethyl-phenzyl)-acrylonitrile instead of the desired product **4r** was observed (Table 2, entry17). Presumably, it was arrested at the Knoevenagel condensation product stage, as further aromatization did not occur due to electronic effect.

We also investigated the reusability and the recycling of the basic ionic liquid [bmIm]OH, and found that the catalyst could be easily recovered after completion of the reaction and reused in subsequent reactions. Using the reaction of 2-(benzo[*d*]thiazol-2-yl)acetonitrile **1**, 4-chlorobenzaldehyde **2d** and 5,5-dimethyl-1,3-cyclohexanedione **3** as a model reaction, after completion of the reaction, the mixture was filtrated and the filtrate was evaporated under reduced pressure, then extracted with ethyl acetate:ether (1:1). The ionic liquid left in the reaction vessel was rinsed with ether and dried under vacuum at 90°C for 8 h to remove water leaving behind the ionic liquid. The recovered [bmIm]OH was recycled and reused nine times to carry out the same experiment. The activity of the catalyst did not show any significant decrease after nine runs (Fig. 1).

A plausible mechanism for the reaction is outlined in Scheme 2. The initial event can be considered as a Knoevenagel condensation of aldehydes **2** with benzothiazole **1** to form the intermediate [**A**], followed by the elimination to afford the 2-(benzo[*d*]thiazol-2-yl)-3-(aryl)acrylonitrile under the basic ionic liquid [bmIm]OH. The latter then undergoes Michael addition with 5,5-dimethyl-1,3-cyclohexanedione **3** tautomer to give the intermediate [**B**], followed by a intramolecular O-cyclization to give the products 4*H*-Benzo[*b*]pyrans **4** (Scheme 2).

It may be speculated that the difference in basicity of [bmIm]OH used in this reaction compared with Et_3N and piperidine may play a crucial role in accelerating the reaction and improving the yield.

In conclusion, this procedure using the task-specific basic ionic liquid [bmIm]OH as the catalyst provides a very efficient and convenient methodology for synthesis of 4*H*-benzo[*b*]pyrans through three-component reaction. This method offers remarkable improvements with

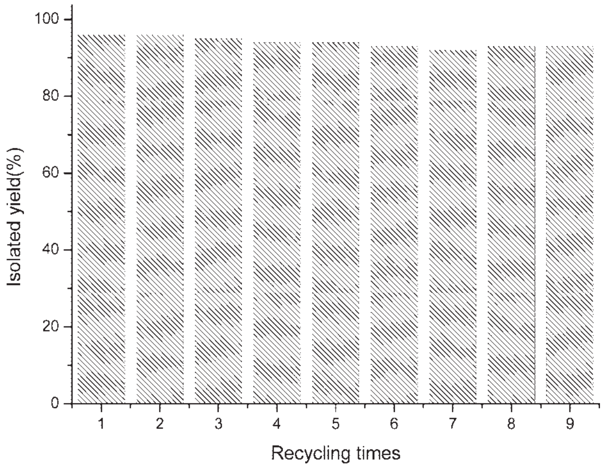

Figure 1. Recycling times of [bmIm]OH and the isolated yields of product **4d**.

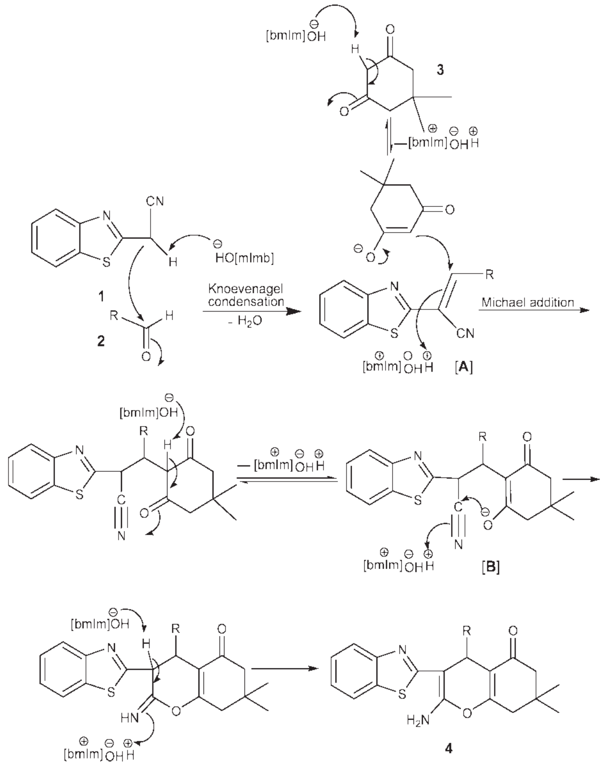
Scheme 2



regard to operational simplicity, reaction time, reaction conditions, general applicability, and greenness of procedure, especially high isolated yields of products and the selectivity. Thus, we believe that this simple and green procedure will be a practical alternative to the existing procedures to cater the need of academe as well as industries.

EXPERIMENTAL

General remarks. Melting points were measured by using a RY-1 apparatus and were uncorrected. IR spectra were recorded on a Nicolet 510P FTIR spectrophotometer as KBr pellets. ^{1}H and ^{13}C NMR were recorded in DMSO-d_6 and CDCl$_3$ on a Bruker AC-500 instrument and TMS as internal standard. Mass spectra were performed on a Bruker Esquire Hct spectrometer with an ESI source. Elemental analyses were carried out on a Vario EL III analyzer. All chemicals were purchased and used without further purification.

The synthesis of 2-cyanomethy-1,3-benzothiazloe [16]. mp 101–102°C; IR (KBr) υ: 2250 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6) δ: 7.80–8.27 (m, 2H), 7.00–7.80 (m, 2H), 4.72 (s, 2H, CH$_2$). Anal. calcd. for $C_9H_2N_2S$: C, 62.07; H, 3.47; N, 16.09; found: C, 62.16; H, 3.44; N, 16.11.

General procedure for the synthesis of basic ionic liquid. The basic ionic liquid [bmIm]OH was prepared by anion change of [bmIm]Br using 1 mol equivalent KOH. The ionic liquid was dried under vacuum for 24 h and stored in desiccators. The ionic liquid was characterized by IR, ^{1}H NMR, and ^{13}C NMR spectroscopy. ^{1}H NMR (500 MHz, CDCl$_3$): δ = 10.24 (s, 1 H), 7.62 (t, *J* = 1.7 Hz, 1 H), 7.50 (t, *J* = 1.7, 1 H), 4.34 (t, *J* = 7.4 Hz, 2 H), 4.12 (s, 3 H), 3.32–3.25 (br s, 1H), 1.93–1.87 (m, 2 H), 1.40–1.36 (m, 2 H), 0.96 ppm (t, *J* = 7.4 Hz, 3 H); ^{13}C NMR (125 MHz, CDCl$_3$): δ = 137.2, 123.8, 122.1, 49.7, 36.7, 32.1, 19.4, 13.4 ppm; IR (neat) υ: 3422, 3079, 1571, 1169 cm^{-1}.

General procedure for the synthesis of 2-amino-3-(benzo[*d*]thiazol-2-yl)-4-aryl-7,7-dimethyl–5–carbonyl-5,6,7,8-4*H*-benzo[*b*]pyrans (4). To a mixture of 2-(benzo[*d*]thiazol-2-yl)acetonitrile **1** (1 mmol), aromatic aldehydes **2** (1 mmol), 5,5-dimethyl-1,3-cyclohexanedione **3** (1 mmol) dissolved in a minimum amount (3.0 mL) of ethanol, the basic ionic liquid, [bmIm]OH (60 mol %) was added, and the mixture was refluxed for appropriate time. The progress of reaction was monitored by TLC. After completion of reaction aqueous, the mixture was allowed to cool to room temperature, and filtered to give the crude products, which was further purified by recrystallization (THF/ethanol) to give pure products **4**.

2-Amino-3-(benzo[d]thiazol-2-yl)-4-(3-nitrophenyl)-7,7-dimethyl-5-carbonyl-5,6,7,8-4H-benzo[b]pyran (4a). mp 218–219°C. IR (KBr) υ: 3429, 1679, 1624, 1525, 1473, 822, 696 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6) δ: 0.67 (s, 3H, CH$_3$), 0.92 (s, 3H, CH$_3$), 2.07 (d, *J* = 16.5 Hz, 1H), 2.29 (d, *J* = 16.0 Hz, 1H), 2.50 (d, *J* = 17.5 Hz, 1H), 2.59 (d, *J* = 17.5 Hz, 1H), 4.70 (s, 1H) 7.14–8.09 (m, 8H, ArH), 8.52 ppm (s, 2H, NH$_2$); ^{13}C NMR (125 MHz, DMSO-d_6) δ: 25.5, 25.6, 26.6, 29.0, 32.4, 37.4, 50.2, 67.4, 80.5, 114.4, 120.6, 121.9, 122.2, 123.4, 126.6, 130.1, 131.7, 135.3, 147.0, 147.9, 154.6, 162.8, 168.3, 196.3 ppm; ms (ESI) *m/z*: 448.4 [M +H]$^+$. Anal. calcd. for $C_{24}H_{21}N_3O_4S$: C, 64.42; H, 4.73; N, 9.40. Found: C, 64.49; H, 4.75; N, 9.42.

2-Amino-3-(benzo[d]thiazol-2-yl)-4-(2,5-dichlorophenyl)-7,7-dimethyl-5-carbonyl-5,6,7,8-4H-benzo[b]pyran (4b). mp 217–218°C. IR (KBr) υ: 3446, 1679, 1661, 1626, 1477, 820, 669 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$) δ: 1.007 (s, 3H, CH$_3$), 1.09 (s, 3H, CH$_3$), 2.23 (d, *J* = 16.0 Hz, 1H), 2.29 (d, *J* = 16.0 Hz, 1H), 2.50 (d, *J* = 17.5 Hz, 1H), 2.59 (d, *J* = 17.5 Hz, 1H), 5.07 (s, 1H) 7.04–7.30 (m, 7H, ArH), 7.35 ppm (s, 2H, NH$_2$); ^{13}C NMR (125 MHz, CDCl$_3$) δ: 26.6, 29.2, 32.2, 36.8, 50.5, 79.7, 112.7, 120.5, 121.9, 123.4, 126.6, 128.8, 131.3, 132.2, 142.5, 153.0, 154.8, 163.1, 168.4, 196.1 ppm; ms (47 eV) *m/z*: 493.40 (100%, M +Na). Anal. calcd. for $C_{24}H_{21}N_2O_2SCl_2$: C, 61.02; H, 4.48; N, 5.93. Found: C, 60.89; H, 4.47; N, 5.95.

2-Amino-3-(benzo[d]thiazol-2-yl)-4-(2-chlorophenyl)-7,7-dimethyl-5-carbonyl-5,6,7,8-4H-benzo[b]pyran (4c). mp 204–205°C. IR (KBr) υ: 3445, 1678, 1658, 1624, 1475, 748, 666 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6) δ: 0.83 (s, 3H, CH$_3$), 0.99 (s, 3H, CH$_3$), 2.01 (d, *J* = 16.0 Hz, 1H), 2.23 (d, *J* = 16.0 Hz, 1H), 2.40 (d, *J* = 17.5 Hz, 1H), 2.57(d, *J* =17.5 Hz, 1H), 4.82 (s, 1H), 7.06–7.83 (m, 8H, ArH), 8.48 ppm (s, 2H, NH$_2$); ^{13}C NMR (125 MHz, DMSO-d_6) δ: 26.6, 29.3, 32.1, 36.4, 39.4, 50.5, 80.4, 113.4, 120.4, 121.7, 123.2, 126.4, 127.0, 128.7, 126.6, 131.9, 133.1, 133.3, 140.5, 153.0, 154.7, 162.6, 168.6, 195.9 ppm; ms (ESI) *m/z*: 437.8 [M +H]$^+$. Anal. calcd. for $C_{24}H_{21}N_2O_2SCl$: C, 65.97; H, 4.84; N, 6.41. Found: C, 66.11; H, 4.85; N, 6.43.

2-Amino-3-(benzo[d]thiazol-2-yl)-4-(4-chlorophenyl)-7,7-dimethyl-5-carbonyl-5,6,7,8-4H-benzo[b]pyran (4d). mp 173–174°. IR (KBr) υ: 3451, 1667, 1618, 1531, 1469, 835, 672 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6) δ: 0.85 (s, 3H,

CH_3), 1.12 (s, 3H, CH_3), 2.18 (d, J = 16.5 Hz, 1H), 2.25 (d, J = 16.0 Hz, 1H), 2.41 (d, J = 17.5 Hz, 1H), 2.46 (d, J = 17.5 Hz, 1H), 4.76 (s, 1H), 7.24–7.77 (m, 8H, ArH), 7.79 ppm (s, 2H, NH_2); ^{13}C NMR (125 MHz, DMSO-d_6) δ: 26.7, 29.2, 32.4, 36.9, 50.4, 81.2, 115.1, 120.6, 121.9, 123.4, 126.6, 128.5, 130.5, 131.5, 131.9, 143.8, 153.3, 154.5, 162.4, 168.7, 196.3 ppm; ms (ESI) m/z: 437.5 $[M+H]^+$. Anal. calcd. for $C_{24}H_{21}N_2O_2SCl$: C, 65.97; H, 4.84; N, 6.41. Found: C, 65.89; H, 4.83; N, 6.39.

2-Amino-3-(benzo[d]thiazol-2-yl)-4-(2,4-dichlorophenyl)-7,7-dimethyl-5-carbonyl-5,6,7,8-4H-benzo[b]pyran (4e). mp 209–210°C. IR (KBr) υ: 3454, 1681, 1618, 1468, 1454, 855, 672 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d_6) δ: 0.85 (s, 3H, CH_3), 1.02 (s, 3H, CH_3), 2.05 (d, J = 16.5 Hz, 1H), 2.29 (d, J = 16.5 Hz, 1H), 2.46 (d, J = 17.5 Hz, 1H), 2.60 (d, J = 17.5 Hz,1H), 4.832 (s, 1H), 7.14–7.85 (m, 7H, ArH), 8.53 ppm (s, 2H, NH_2); ^{13}C NMR (125 MHz, DMSO-d_6) δ: 26.6, 29.2, 32.2, 36.7, 50.4, 79.9, 113.0, 120.4, 121.7, 123.3, 126.5, 127.3, 129.6, 130.3, 132.3, 134.0, 139.8, 152.9, 154.7, 162.9, 168.4, 196.0 ppm; ms (ESI) m/z: 472.2 $[M+H]^+$. The Suzuki-Miyaura reaction of some 4,6-dichloropyrimidines bearing methylthio-, methyl-, amino-, cyano-, formyl-, and nitro groups in positions 2 and/or 5 of the pyrimidine ring with arylboronic acids has been investigated. Influence of palladium catalyst, ligand, base, and solvent on the reaction outcome was studied. The reaction was found to give the corresponding 4,6-diarylpyrimidines in reasonable yields using Pd(OAc)$_2$/PPh$_3$/K$_3$PO$_4$ or Pd(PPh$_3$)$_2$Cl$_2$/K$_3$PO$_4$ as catalyst systems.

J. Heterocyclic Chem., **46**, 960 (2009).

INTRODUCTION

In the past two decades, the Suzuki-Miyaura cross-coupling reaction has evolved into one of the most widely used carbon-carbon bond forming processes [1,2]. Its impact on organic synthesis is largely attributed to the fact that it provides an applicable method for the preparation of biaryls. Aryl- and heteroarylpyrimidine derivatives have found applications in many contemporary areas of chemistry, such as, ligands for coordination to metal ions [3], components for molecular recognition studies involving hydrogen bonding and π–π interactions [4], compounds with therapeutic and agrochemical properties [5], fluorophores and electron-transporting compounds in organic light-emitting devices [6]. Although the direct arylation of simple chloropyrimidines is well documented [7], arylation of chloropyrimidines containing various reactive groups and application of the Suzuki-Miyaura reaction for the synthesis of densely substituted arylpyrimidines is explored insufficiently. Continuing our studies on the synthesis of pyrimidine derivatives and related heterocycles [8] in this communication, we present the results of investigation of the palladium-catalyzed cross-coupling reaction of some 4,6-dichloropyrimidines (**1a–f**) bearing methylthio-, methyl-, amino-, cyano-, formyl-, and nitro groups in positions 2 and/or 5 of the pyrimidine ring with selected arylboronic acids.

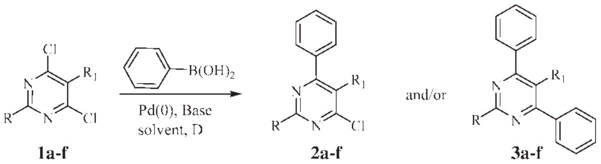
RESULTS AND DISCUSSION

Our investigation started with the cross-coupling of 4,6-dichloropyrimidines **1a–f** with phenylboronic acid (Scheme 1).

Initially, compound **1a** [9] was coupled with a slight excess of phenylboronic acid using Pd(OAc)$_2$/PPh$_3$/Na$_2$CO$_3$ (aqueous 1*M* solution) as a catalyst system in tetrahydrofurane. However, conversion of **1a** was very slow and led to a complex mixture of products from which any product was isolated (Table 1, entry 1). Almost the same result was obtained when Cs$_2$CO$_3$ was used as a base instead Na$_2$CO$_3$. Change of Pd(OAc)$_2$ to Pd$_2$(dba)$_3$ did not give the desirable result again—a mixture of **2a** and **3a** with the latter compound as major product was isolated in negligible amount.

It should be mentioned that in spite of the fact that equivalent amount of phenylboronic acid was used both chlorine groups of compound **1a** took part in the coupling reaction (entries 2 and 3). When 2.16 equiv. of phenylboronic acid was used in the reaction the corresponding 4,6-diphenylpyrimidine **3a** was isolated in 29% low yield (entry 4). We decided that a reason of such poor reaction course can be due to the presence of water in the reaction mixture. Chlorine groups in positions 4 and 6 of the pyrimidine ring are very reactive toward various nucleophiles [11]. Thus, in addition to other possible side reactions, such as, dehalogenation, homocoupling, etc., hydrolysis of chlorine groups under the alkaline reaction conditions could also occur to give several side products. Therefore, for further study, K$_3$PO$_4$/anhydrous dioxane was chosen as a base/solvent system. Using Pd(OAc)$_2$/PPh$_3$/K$_3$PO$_4$ as a catalyst system, the reaction of **1a** with 1.08 equiv. of phenylboronic acid gave a complex mixture of products from which compound **2a** was isolated in 26% yield (entry 5). When the coupling was carried out with 2.16 equiv. of phenylboronic acid in an

Scheme 1



1a-f **2a-f** **3a-f**

a: R = SMe, R_1 = CN; **b**: R = SMe, R_1 = CHO; **c**: R = NH_2, R_1 = CHO;
d: R NH_2, R_1 H; **e**: R Me; R_1 H; **f**: R H, R_1 NO_2

anhydrous dioxane with K_3PO_4 as a base twofold coupling occurred to give compound **3a** in 51% yield (entry 6).

The cross-coupling reaction of 4,6-dichloro-2-methylthiopyrimidine-5-carbaldehyde (**1b**) [9] with 1.08 equiv. phenylboronic acid using $Pd(OAc)_2/PPh_3/K_3PO_4$ in dioxane at 70°C furnished 4-chloro-2-methylthio-6-phenylpyrimidine-5-carbaldehyde (**2b**) in 34% yield (entry 7). A slightly better yield of **2b** (42%) was obtained when $Pd_2(dba)_3$ was used as a catalyst and when the reaction was carried out at room temperature (entry 8). In the reaction of **1b** with 2.16 equiv. of phenylboronic acid at the reflux temperature of dioxane, the corresponding 4,6-diphenylpyrimidine **3b** was obtained in 62% yield (entry 9). Compounds **1c,d** [12,13] bearing strong electron-donating and capable to form complexes with palladium species amino group [14] in the position 2 of the pyrimidine ring reacted with phenylboronic acid only at elevated temperatures. Moreover, possibly due to decreased reactivity of chlorine groups, the cross-coupling reaction with 1.08 equiv. phenylboronic acid did not give monophenyl derivatives **2c,d**. With both substrates **1c,d**, the side reactions competed with the cross-coupling reaction and, at best, formation of both monophenyl and diphenyl derivatives were observed. However, performing the reaction of **1c,d** with double amount of phenylboronic acids using $Pd(OAc)_2/PPh_3/K_3PO_4$ gave **3c,d** in 68% and 59% yields, respectively (entries 10 and 15). To increase the yield of the cross-coupling product **3c** bidentate ligand—1,4-di(triphenylphosphino)butane (dppb) and more electron rich and sterically hindered ligands—tri(*o*-tolyl)phosphane and (2-biphenyl)dicyclohexylphosphine were used in the reaction. However, the side reactions competed again and complex mixtures of products were formed (entries 11 and 12) or no reaction was observed (entry 13). It was found that using $Pd(PPh_3)_2Cl_2$ instead $Pd(OAc)_2$ sometimes gives better results (entries 14 and 16) and there is no necessity to add an additional amount of ligand when $Pd(PPh_3)_2Cl_2$ is used as a catalyst. Under these conditions, 4,6-diphenyl-2-methylpyrimidine (**3e**) was obtained in 73% yield (Table 1, entry 17). The cross-coupling of 4,6-dichloro-5-nitropyrimidine (**1f**) [15] with phenylboronic acid proceeded ambiguously. Nitro group due to its electron-withdrawing nature activates chlorine groups in the positions 4 and 6 of the pyrimidine ring, but this, perhaps, increases chances of side reactions to take place. Thus, after 2 h substrate **1f**

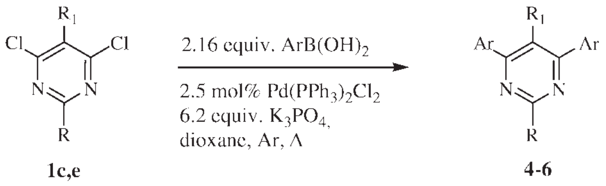
[a] The yields reported are after isolation and purification by the column chromatography.

[b] Determined by ^1H NMR spectra.

[c] Physical properties of compounds **3d,e** corresponded the reported data [10] where they were synthesized from acyclic precursors by cyclocondensation reactions.

Scheme 2



disappeared from the reaction mixture (TLC data), but the desirable 4,6-diphenyl-5-nitropyrimidine (**3f**) was isolated only in 21% yield (Table 1, entry 18).

Taking into account, the results of the cross-coupling reactions of **1a–e** with phenylboronic acid some 4,6-diarylpyrimidines **4–6** using Pd(PPh$_3$)$_2$Cl$_2$/K$_3$PO$_4$ as a catalyst system were synthesized (Scheme 2, Table 2).

In conclusion, the performed investigation showed that the synthesis of 6-aryl-4-chloropyrimidines bearing various substituents in the second and fifth positions of the pyrimidine ring by the Suzuki-Miyaura cross-coupling reaction is problematic. The reaction proceeds with the formation of mixtures of mono- and di-arylpyrimidines. Otherwise, the Suzuki-Miyaura cross-coupling reaction of the corresponding 4,6-dichloropyrimidines with double amount of arylboronic acids using Pd(OAc)$_2$/PPh$_3$/K$_3$PO$_4$ or Pd(PPh$_3$)$_2$Cl$_2$/K$_3$PO$_4$ as catalyst systems in dioxane furnishes the corresponding 2- and/or 5-substituted 4,6-diarylpyrimidines in reasonable yields.

EXPERIMENTAL

Melting points were determined in open capillaries and are uncorrected. UV spectra were obtained on a PerkinElmer UV-vis spectrophotometer Lambda 20 in ethanol solutions. IR spectra were run on a PerkinElmer FTIR spectrophotometer Spectrum BX II in nujol. ^{1}H and ^{13}C NMR spectra were recorded on a Varian INOVA spectrometer (300 MHz and 75 MHz, respectively). Chemical shifts are reported in ppm relative to tetramethylsilane. Mass spectrum was obtained on a mass spectrometer Kratos 115-30 (70 eV) by direct insertion probe. Elemental analysis (C and H) were found to be in good agreement (±0.4%) with the calculated values. Column chromatography was performed using Silica gel 60 (0.040–0.063 mm) (Merck). All reactions and purity of the synthesized compounds were monitored by TLC using Silica gel 60 F$_{254}$ aluminum plates (Merck). Visualization was accomplished by UV light.

Typical procedure for the synthesis of compounds 2a,b and 3a–d,f using Pd(OAc)$_2$/PPh$_3$/K$_3$PO$_4$. A solution of compound **1a–d,f** (0.45 mmol) in anhydrous dioxane (20 mL) was flushed with argon and K$_3$PO$_4$ (0.61 g, 2.9 mmol), phenylboronic acid (0.118 g, 0.97 mmol) (in case of synthesis **2a,b** 0.3 g, 1.47 mmol K$_3$PO$_4$, and 0.06 g, 0.49 mmol phenylboronic acid was used), 2.5 mol % Pd(OAc)$_2$ and 5 mol % PPh$_3$ were added under stirring and argon flow. The reaction mixture was stirred under argon at a temperature indicated in Table 1. Then dioxane was evaporated under reduced pressure to dryness. To dissolve inorganic salts the residue was treated with water (5 mL) and stirred for 0.5 h. The obtained solution was extracted with chloroform (3 × 25 mL), organic layer was dried with Na$_2$SO$_4$, chloroform removed by distillation under reduced pressure, and the solid was purified by column chromatography to give compounds **2a,b**, and **3a–d,f**.

Typical procedure for the synthesis of compounds 3c–e, 4–6 using Pd(PPh$_3$)$_2$Cl$_2$/K$_3$PO$_4$. A suspension of compounds **1c–e** (0.51 mmol) in dioxane (25 mL) was flushed with argon. Then, K$_3$PO$_4$ (3.16 mmol), arylboronic acid (1.1 mmol), 2.5 mol % Pd(PPh$_3$)$_2$Cl$_2$ were added under stirring and argon flow. The reaction mixture was refluxed under stirring and argon until compounds **1c–e** consumed (TLC control). Then

Table 2

Coupling of compounds **1c,e** with arylboronic acids.

Compound	Arylboronic acid	Duration (h)	Product	Yield (%)
 **1c**		2	 **4**	50
 **1e**		4	 **5**	65
 **1e**		7	 **6**	50

dioxane was evaporated under reduced pressure. To dissolve inorganic salts, the residue was treated with water (5 mL) and stirred for 0.5 h. The solid obtained was filtered off and purified by crystallization or column chromatography.

4-Chloro-2-methylthio-6-phenylpyrimidine-5-carbonitrile (2a). Compound **2a** was purified by column chromatography using benzene, yield 26%, mp 95–96°C. ^{1}H NMR (deuteriochloroform): δ 2.69 (s, 3H, SCH_3), 7.59–7.63 (m, 3H, 3′,4′,5′-H), 8.08–8.11 (m, 2H, 2′, 6′-H). ^{13}C NMR (deuteriochloroform): δ 14.99, 101.0, 114.9, 129.0, 129.6, 131.9, 134.5, 163.8, 168.8, 176.7. Anal. Calcd. for $C_{12}H_8ClN_3S$: C, 55.07; H, 3.08. Found: C, 55.42; H, 3.01.

4-Chloro-2-methylthio-6-phenylpyrimidine-5-carbaldehyde (2b). Compound **2b** was synthesized by the typical procedure using $Pd(OAc)_2$ (yield 34%) or by analogous procedure using 2.5 mol % $Pd_2(dba)_3$ under conditions presented in Table 1 (yield 42%). Compound **2b** was purified by column chromatography using benzene. mp 140–141°C. UV: λ_{max} 266 (ε 17,000), 287 (ε 15,000). IR: 1694 cm^{-1} (CHO). ^{1}H NMR (deuteriochloroform): δ 2.69 (s, 3H, SCH_3), 7.57–7.62 (m, 5H, C_6H_5), 10.09 (s, 1H, CHO). ^{13}C NMR (deuteriochloroform): δ 14.85, 120.7, 129.0, 130.5, 131.6, 135.2, 160.9, 170.1, 176.2, 188.2. Anal. Calcd. for $C_{12}H_9ClN_2OS$: C, 54.44; H, 3.43. Found: C, 54.78; H, 3.64.

2-Methylthio-4,6-diphenylpyrimidine-5-carbonitrile (3a). Compound **3a** was purified by column chromatography using benzene. Yield 29%, mp 220–221°C. UV: λ_{max} 277 (ε 30,000), 339 (ε 2500). IR: 2220 cm^{-1} (CN). ^{1}H NMR (deuteriochloroform): δ, 2.73 (s, 3H, SCH_3), 7.59–7.62 (m, 6H, 2 × 3′,4′,5′-H), 8.07–8.10 (m, 4H, 2 × 2′,6′-H). ^{13}C NMR (deuteriochloroform), δ, ppm: 14.8, 98.4, 117.7, 129.0, 129.6, 131.96, 135.8, 169.4, 175.9. Anal. Calcd. for $C_{18}H_{13}N_3S$: C, 71.26; H, 4.32. Found: C, 71.17; H, 4.55.

2-Methylthio-4,6-diphenylpyrimidine-5-carbaldehyde (3b). Compound **3b** was purified by column chromatography using benzene. Yield 62%, mp 112–113°C. UV: λ_{max} 275 (ε 20,000). IR: 1697 cm^{-1} (CHO). ^{1}H NMR (deuteriochloroform): δ 2.73 (s, 3H, SCH_3), 7.54–7.57 (m, 6H, 3′,4′,5′-H), 7.68–7.71 (m, 4H, 2′,6′-H), 10.05 (s, 1H, CHO). ^{13}C NMR (deuteriochloroform): δ 14.73, 121.8, 128.7, 130.4, 130.9, 136.8, 168.8, 175.1, 190.6. Anal. Calcd. for $C_{18}H_{14}N_2OS$: C, 70.56; H, 4.61. Found: C, 70.79; H, 4.49.

2-Amino-4,6-diphenylpyrimidine-5-carbaldehyde (3c). Yield 85% using $Pd(PPh_3)_2Cl_2$ and 68% using $Pd(OAc)_2/PPh_3$, mp 149–150°C (dec.) (from 2-propanol). UV: λ_{max} 259 (ε 22,000), 276 sh. (ε 21,000), 314 sh. (ε 11,000). IR: 3468, 3380 sh, 3277 (NH_2), 1687 cm^{-1} (C=O). ^{1}H NMR (deuteriochloroform): δ 5.96 (s, 2H, NH_2), 7.50–7.63 (m, 10H, 2× C_6H_5), 9.89 (s, 1H, CHO). ^{13}C NMR (deuteriochloroform): δ 117.9, 128.6, 129.5, 130.4, 137.5, 162.4, 172.5, 189.2. Anal. Calcd. for $C_{17}H_{13}N_3O$: C, 74.17; H, 5.11. Found: C, 74.00; H, 4.95.

5-Nitro-4,6-diphenylpyrimidine (3f). Compound **3f** was purified by column chromatography using benzene. Yield 21%, mp 117°C. UV: λ_{max} 257 sh. (ε 17,000); 271 (ε 18,000). ^{1}H NMR (deuteriochloroform): δ 7.52–7.60 (m, 6H, 2×[3′,4′,5′-H]), 7.73–7.76 (m, 4H, 2×[2′,6′-H]), 9.41 (s, 1H, 2-H). ^{13}C NMR (deuteriochloroform): δ 128.1, 129.3, 131.5, 133.6, 143.99, 158.3, 158.4. ms (ESI): *m/z* (%) 278 (100) (M +1). Anal. Calcd. for $C_{16}H_{11}N_3O_2$: C, 69.31; H, 4.00. Found: C, 69.22; H, 4.08.

2-Amino-4,6-di(4-biphenyl)pyrimidine-5-carbaldehyde (4). Compound **4** was purified by column chromatography using chloroform. Yield 50%, mp 248–251°C (from chloroform). UV: λ_{max} 204 (ε 67,000), 287 (ε 42,000). IR: 3492, 3400 sh., 3290 (NH_2), 1688 cm^{-1} (C=O). ^{1}H NMR (deuteriochloroform): δ 6.10 (s, 2H, NH_2), 7.44–7.46 (m, 2H, 2 × 4″-H), 7.50–7.55 (m, 4H, 2 × 3″,5″-H), 7.68–7.71 (m, 4H, 2 × 2″,6″-H), 7.77 (s, 8H, 2 × 2′,3′,5′,6′-H), 10.01 (s, 1H, CHO). ^{13}C NMR (dimethyl sulfoxide-d_6): δ 116.99, 126.8, 127.6, 128.6, 129.8, 131.1, 137.5, 140.1, 142.0, 163.4, 171.6, 188.9. ms (ESI): *m/z* (%) 428 (100) (M +1). Anal. Calcd. for $C_{29}H_{21}N_3O$: C, 81.48; H, 4.95. Found: C, 81.64; H, 5.04.

4,6-Di(4-tert-butylphenyl)-2-methylpyrimidine (5). Compound **6** was purified by column chromatography using chloroform. Yield 65%, mp 110–111°C. UV: λ_{max} 206 (ε 34,000), 255 (ε 25,000), 283 sh. (ε 21,000), 297 sh. (ε 24,000), 306 (ε 27,000). ^{1}H NMR (deuteriochloroform): δ 1.41 [s, 18H, 2× $C(CH_3)_3$], 2.88 (s, 3H, 2-CH_3), 7.58 (d, *J* = 8.7 Hz, 4H, 2 × 3′,5′-H), 7.88 (s, 1H, 5-H), 8.08 (d, *J* = 8.7 Hz, 4H, 2 × 2′,6′-H). ^{13}C NMR (deuteriochloroform): δ 26.72, 31.50, 35.13, 109.91, 126.17, 127.29, 135.00, 154.33, 164.97, 168.63. Anal. Calcd. for $C_{25}H_{30}N_2$: C, 83.75; H, 8.43. Found: C, 84.06; H, 8.62.

4,6-Bis(3,5-dichlorophenyl)-2-methylpyrimidine (6). Yield 50%, mp 230–231°C (from toluene). UV: λ_{max} 219 (ε 29,000), 247 (ε 12,000), 260 sh. (ε 8100), 295 (ε 12,000), 318 (ε 4600). ^{1}H NMR (deuteriochloroform): δ 2.91 (s, 3H, 2-CH_3), 7.56 (t, ^4J = 1.8 Hz, 2H, 2 × 4′-H), 7.82 (s, 1H, 5-H), 8.07 (d, ^4J = 1.8 Hz, 4H, 2 × 2′,6′-H). ^{13}C NMR (deuteriochloroform): δ 26.6, 110.2, 126.0, 131.0, 136.1, 140.2, 162.9, 169.50. ms (ESI): *m/z* (%) 384 (100) (M^+). Anal. Calcd. for $C_{17}H_{10}Cl_4N_2$: C, 53.16; H. 2,62. Found: C, 53.23; H, 2.57.

The efficient and facile synthesis of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin was achieved *via* microwave-assisted multicomponent reactions of aldehyde, 2*H*-indene-1,3-dione and 4-(arylamino)furan-2(5*H*)-one in glycol without catalyst. This method has the obvious advantages over traditional heating ones on short reaction time, high yield, operational simplicity as well as being environmental friendly.

INTRODUCTION

Tetronic acid derivatives and their metabolites are interesting and intriguing compounds because of their antibiotic [1], anticoagulant [2], antiepileptic [3], antifungal [4], anti-inflammatory [5], and anti-HIV [6] activities. Among them, azapodophyllotoxin (Fig. 1) derivatives are also well-known anticancer agents [7] besides their cardiotonic [8], inotropic [9], pesticidal [10], potassium channel opening [11], and calcium channel agonistic [12] activities. Moreover, more potent and less toxic azapodophyllotoxin derivatives with antitumor activities have also been obtained by extensive structural modifications [13]. However, most modifications were performed on ring B and C (Fig. 1), and the modifications both on ring A and on nitrogen atom were not well documented.

Indenopyridine skeletons, existed in many natural products, such as, onychine and oracin (Fig. 2) as well as lots of synthesized heterocyclic compounds, possess numerous significant bioactivities, namely, anticancer [14], anti-infective [15], anti-inflammatory [16], calcium antagonistic [17], DNA-damaging [18], antimicrobial [19] and anticandidal activities [20]. In addition, not only they are inhibitors against phosphodiesterase [21], cyclic nucleotide synthesis [22], bovine liver glutathione S-transferase (GT) [23], and proliferation of vascular smooth muscle cells [24] but also antagonists of adenosine A2a receptor [25] and human fatty acid synthase thioesterase [26]. It is promising that the modifications on ring A of azapodophyllotoxin, changed into indenole ring, may bring about novel or improved significant bioactivities.

However, survey of the literature reveals only two typical methods on synthesizing *N*-unsubstituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin. One method is a multistep reaction composed by cyclocondensation of arylideneindandione with 3-aminocrotonic acid ester, both of which should be prepared beforehand, and subsequently intramolecular cyclization treated with NBS to give the target compounds (Scheme 1) [27]. Evidently, this method suffers from the drawbacks of long route, low yields, as well as complicated operation.

Another method is Hantzsch condensation of 1,3-indandione, ammonium acetate, and 3-benzylidenefuran-2,4(3*H*,5*H*)-dione (Scheme 2), which was prepared in advance by condensation of tetronic acid with aromatic aldehyde [21]. However, this method still has some disadvantages such as long reaction time and moderate yields.

In addition, these two methods did not offer the synthesis of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine

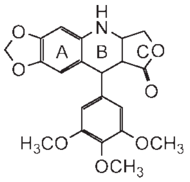

Figure 1. Structure of azapodophyllotoxin.

analogues of azapodophyllotoxin, which may bring about great changes in the bioactivities by the modifications both on nitrogen atom and on ring A of azapodophyllotoxin.

As a result, developing a facile and efficient method on the synthesis of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin is of great significance.

Multicomponent reactions (MCRs) are of increasing importance in organic and medicinal chemistry, because the strategies of MCR offer significant advantages over conventional linear-type syntheses [28]. On the other hand, microwave-assisted organic synthesis has been a topic of continued studies as it could lead to higher yields of pure products, easier operation, and shorter reaction time as compared with the traditional heating method [29]. Thus, it goes without saying that the use of atom-economical MCRs, together with the employment of energy-efficient microwave irradiation (MW), must be considered to be facile and efficient synthetic strategy of heterocyclic compounds with important bioactivities in the sense that the combination in itself offers greater potential than the two parts in isolation.

As a continuation of our efforts on structural modifications of azapodophyllotoxin with facile and efficient method [30], herein, we wish to report the synthesis of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin through three-component reactions of aldehyde **1**, 2*H*-indene-1,3-dione **2** and 4-(arylamino)furan-2(5*H*)-one **3** in glycol under microwave irradiation without catalyst (Scheme 3).

RESULTS AND DISCUSSION

Initially, the three-component reaction of 4-bromobenaldehyde **1c**, 2*H*-indene-1,3-dione **2** and 4-(phenylamino) furan-2(5*H*)-one **3c** was used to optimize the reaction conditions. To find the best suitable solvent, we compared the synthesis of **4c** in different solvents, such as, water, glycol, DMF, glacial acetic acid, and ethanol. The mixture of 4-bromobenaldehyde **1c** (1 mmol), 2*H*-indene-1,3-dione **2** (1 mmol), 4-(phenylamino)furan-2(5*H*)-one **3c** (1 mmol), and corresponding solvent (2 mL) was irradiated under MW at 90°C and 200 W for a given time, then the crude product was purified by recrystallization from EtOH.

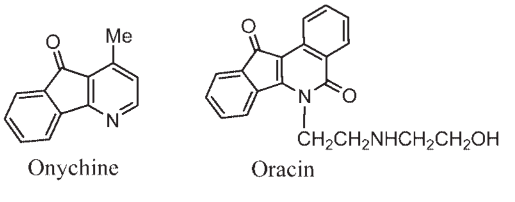

Figure 2. Structures of onychine and oracin.

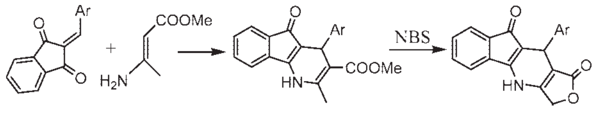
Scheme 1



The results (Table 1) reveal that glycol as solvent not only improve the yield but also shorten the time of this reaction. Therefore, glycol was preferred as solvent for all further microwave-assisted reactions.

To optimize the reaction temperature, the reaction of **1c** (1 mmol), **2** (1 mmol), and **3c** (1 mmol) was carried out using glycol (2 mL) as solvent under MW (200 W) at temperatures ranging from 70 to 110°C, with an increment of 10°C each time. Similarly, the crude product was purified by recrystallization from EtOH. The results are shown in Table 2. The yield of product **4c** was increased and the reaction time was shortened when the temperature was increased from 70 to 100°C (Entries 1–4, Table 2), whereas the yield leveled off when the temperature was further increased to 110°C (Entry 5, Table 2). Thus, 100°C is assigned as the most suitable reaction temperature. Furthermore, we found that the yield of this reaction was affected by the volume of glycol. The synthesis of **4c** was tested in different volumes of glycol at 100°C. The outcomes show that 2.0 mL of glycol is optimal as solvent because it generates the highest yield of **4c**.

Under these optimized reaction conditions (2.0 mL of glycol, 100°C), a series of novel *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin **4** were synthesized under MW, and the results were summarized in Table 3. As shown in Table 3, this method can be applied to various aromatic aldehydes and enamines of tetronic acid with high yields under the same conditions. Therefore, this synthetic approach has wide scope of applicability.

Moreover, we also performed the synthesis of **4** in glycol at 100°C under standard heating conditions (SC).

1	70	15	77
2	80	12	83
3	90	10	88
4	100	8	92
5	110	8	92

The results (Table 3) reveal that microwave irradiation efficiently promoted the reactions, resulting in dramatic reduction of reaction time, from hours to minutes, and remarkable increase in yields as well.

Although the detailed mechanism of the earlier reaction remains to be fully clarified, the formation of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin **4** could be explained by a reaction sequence of condensation, addition, cyclization, and dehydration (Scheme 4). First, the condensation of aldehyde **1** and 2*H*-indene-1,3-dione **2** gave the intermediate product **5**. The addition of **3–5** then furnished the intermediate product **6**, which upon intramolecular cyclization and dehydration gave rise to **4**.

All the products were characterized by IR, ^{1}H NMR, and HRMS (ESI). Moreover, the structure of **4g** was also established by X-ray crystallography (Fig. 3) [31].

In conclusion, we have developed an efficient and facile approach to the synthesis of *N*-substituted furo[3,4-*b*]indeno[2,1-*e*]pyridine analogues of azapodophyllotoxin via microwave-assisted MCRs without catalyst. This method has the obvious advantages over traditional heating ones on short reaction time, high yield, operational simplicity as well as being environmental friendly. Besides, this method may provide a shortcut for further investigations on the pharmacological activities of this type of compounds as important and novel azapodophyllotoxin analogues.

EXPERIMENTAL

Microwave irradiation was carried out in a monomodal Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden.

Table 1

Solvent optimization for the synthesis of **4c**.

Entry	Solvent	Time (min)	Yield (%)
1	DMF	10	80
2	EtOH	12	69
3	HOAc	12	76
4	Water	12	45
5	Glycol	10	88

Melting points were determined in XT5 apparatus and are uncorrected. IR spectra were recorded on a FTIR-Tensor 27 spectrometer. ^{1}H NMR spectra were measured on a DPX 400 spectrometer operating at 400 MHz, using DMSO-d_6 as solvent and TMS as internal standard. HRMS (ESI) was determined by using micrOTOF-QII HRMS/MS instrument (BRUKER). X-ray crystallographic analysis was performed with a Siemens SMART CCD and a Siemens P4 diffractometer.

General procedure for the synthesis of compounds 4 with microwave irradiation. Typically, a mixture of aromatic aldehyde **1** (1.0 mmol), 2*H*-indene-1,3-dione **2** (1.0 mmol), 4-(arylamino)furan-2(5*H*)-one **3** (1.0 mmol), and glycol (2.0 mL) was added to the reaction vessel of the monomodal Emrys^{TM} Creator microwave synthesizer and allowed to react under MW at 200 W power (initial power 100 W) and 100°C for several minutes. Upon completion, monitored by TLC, the reaction vessel was cooled to room temperature. The solid compound was collected by filtration and recrystallized from EtOH (95%) to give pure azapodophyllotoxin derivatives **4**.

General procedure for the synthesis of compounds 4 with conventional heating. A mixture containing aromatic aldehyde **1** (1.0 mmol), 2*H*-indene-1,3-dione **2** (1.0 mmol), 4-(arylamino)furan-2(5*H*)-one **3** (1.0 mmol), and glycol (2.0 mL) was introduced into a 10 mL Emrys^{TM} reaction vial, capped, and then stirred at 100°C (oil bath temperature) for a given time. The subsequent work-up procedure was the same as in the microwave irradiation reactions.

10-(4-Fluorophenyl)-4-phenyl-4,10-dihydro-3H-2-oxa-4-aza-cyclopenta[b]fluorene-1,9-dione (4a). ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 7.86–7.85 (m, 1H, ArH), 7.76–7.67 (m, 4H, ArH), 7.52–7.48 (m, 2H, ArH), 7.31–7.25 (m, 2H, ArH), 7.17–7.09 (m, 3H, ArH), 5.53 (d, 1H, J = 7.2 Hz, ArH) 4.79 (s, 1H, CH), 4.76–4.75 (m, 2H, CH_2). An efficient, convenient, one-pot synthesis of imidazo[1,2-*c*]quinazolines was accomplished in good yields via the novel reductive cyclization of 2-(2-nitrophenyl)-1*H*-imidazole with isothiocyanates mediated by zinc dust.

J. Heterocyclic Chem., **46**, 971 (2009).

INTRODUCTION

The quinazolinone skeleton is a building block for the preparation of natural purine base, alkaloids [1], many biologically active compounds, and intermediates in organic synthesis [2]. The quinazoline moiety present in imidazoquinazolines is responsible for a wide range of biological activities ranging form anticonvulsants and antibacterial to antidiabetic agents [3–9].

As a consequence, much attention has been paid to the development of efficient methods for the preparation of 5-amino derivatives of imidazo[1,2-*c*]quinazoline. The first method involved treatment of 6-mercaptobenzimidazoquinazoline with amines [10] and the second method involved an aza-wittig reaction of iminophosphoranes derived from 2-(*o*-azido)phenylbenzimidazole with isocyanates [11]. Recently, several methods have been developed for synthesizing this heterocyclic system. Sharma et al. [12] developed an efficient strategy for the preparation of imidazoquinazolines, but the use of DBU and multiple steps limited the method. We developed an efficient and one-pot synthesis of imidazoquinazolines from 2-(2-nitrophenyl)-1*H*-imidazole induced by low-valent titanium reagent [13], but this method required anhydrous system. As mentioned in our earlier works, herein, we reported a convenient protocol for the synthesis of imidazo[1,2-*c*]quinazolines in one-pot via the reductive cyclization of 2-(2-nitrophenyl)-1*H*-imidazole and isothiocyanates mediated by zinc dust.

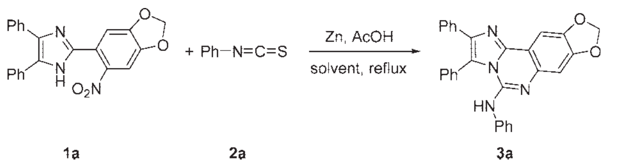
RESULTS AND DISCUSSION

On the basic of our previous experience, we selected 2-(2-nitro-4,5-methylenedioxyphenyl)-4,5-diphenyl-1*H*-imidazole (**1a**) and phenyl isothiocyanate (**2a**) as model substrates to optimize the experimental conditions for the proposed reductive cyclization reaction (Scheme 1). The results are summarized in Table 1.

The results obtained from these experiments indicated that the reaction solvents had a significant influence on the success of this reaction. No product was obtained when the solvent was H_2O or MeOH. When the solvent was AcOH, DMF, CH_3CN or $CHCl_3$, the yield of the product was 40–80%. When THF was used as solvent at refluxing temperature, the products **3a** was obtained in highest yield. To further evaluate the influence of the ratio of **1a**: Zn, this reaction was carried out with different ratio. When the ratio of substrate:Zn was 1:1, 45% yield of the product was obtained in 20 h, it can be seen that increasing the catalyst loading increase the yield. When the ratio of substrate:Zn was 1:5, the yield of the product decrease. From the results, it is obvious that the best ratio is 1:4.

Having established an optimal condition for the protocol, we performed a more detailed examination of the substrates. Thus, the behavior of a variety of substrates, which include different 2-(2-nitrophenyl)-1*H*-imidazole as well as different isothiocyanates was examined (Scheme 2). The results are summarized in Table 2. As

Scheme 1



shown in Table 2, for series of **3**, either the aromatic ring containing electron-withdrawing groups (such as halides) or electron-donating groups (such as alkyl group), reacted well to give the corresponding products **3** in good yields under the same reaction conditions. So, we concluded that no obvious effects from the electronic or nature of the aromatic ring substrates were observed in the above reactions.

We propose the possible following mechanism to account for the reaction. At first step 2-(2-nitrophenyl)-1*H*-imidazole **1** was reduced by Zn/H^+ to 2-(2-aminophenyl)-1*H*-imidazole **4**, the addition reaction of reductive product **4** with isothiocyanates **2** to afford intermediate **5**, intermediate **5** was cyclized by the nucleophilic attack of nitrogen atoms on C=S group and gave the intermediate **6**. Finally the expected products **3** were afforded by losing of H_2S (Scheme 3).

The structures of product **3** were identified by IR, ^{1}H NMR, and HRMS. The structure of product **3a** was further confirmed by X-ray diffraction analysis (Fig. 1).

In conclusion, a series of imidazo[1,2-*c*]quinazolines were synthesized by the reaction of 2-(2-nitrophenyl)-1*H*-imidazoles and isothiocyanates induced by zinc dust. This protocol has advantages of accessible materials, handy manipulation (only one-pot), and isolation of products via simple recrystallization.

Table 1

Optimization for the reductive cyclization reaction.

Entry	Solvent	Ratio[a]	Reaction time (h)	Yield (%)
1	THF	1:2	20	45
2	THF	1:3	12	60
3	THF	1:4	1.5	86
4	THF	1:5	1.5	85
5	MeOH	1:4	12	0
6	H_2O	1:4	12	0
7	AcOH	1:4	2	50
8	CH_3CN	1:4	1.5	80
9	$CHCl_3$	1:4	2	42
10	DMF	1:4	1.5	73

[a] Ratio of **1a** and zinc dust.

EXPERIMENTAL

THF was untreated. Melting points were determined in open capillaries and are uncorrected. IR spectra were recorded on a Varian FT-1000 spectrometer in KBr with absorptions in cm^{-1}. ^{1}H NMR was determined on a Varian Inova-400 MHz or a Varian NMR System 300 MHz spectrometer in DMSO-d_6 solution. *J* values are in Hz. Chemical shifts are expressed in ppm downfield from internal standard TMS. HRMS data were obtained using TOF–MS microma GCT-TOF instrument. X-ray diffraction was recorded on a Mercury Bruker Smart-1000 CCD diffractometer.

General procedure for the synthesis of 2-(2-nitrophenyl)-1*H*-imidazole 1. A solution of benzil (5 mmol) in AcOH was treated with 2-nitrobenzaldehyde (5 mmol) and NH_4OAc (40 mmol) [12]. The reaction mixture was refluxed for 4 h, then AcOH was evaporated, and the residue was treated with a 10% aqueous solution of $NaHCO_3$ (pH 8). The mixture was extracted with EtOAc (2 × 25 mL), washed with brine (25 mL), and dried over Na_2SO_4. The solvent was evaporated under reduced pressure to give a yellow solid.

General procedure for the synthesis of imidazol[1,2-*c*]quinazolines 3. To a solution of 2-(2-nitrophenyl)-1*H*-imidazole (1 mmol) and isothiocyanates (1 mmol) in THF (15 mL), zinc dust (4 mmol) and AcOH (0.5 mL) was added. The reaction mixture was refluxed for 2 h. After this period, TLC analysis of the mixture showed the reaction to be completed. The reaction mixture was quenched with 5% HCl (15 mL) and extracted with $CHCl_3$ (3 × 20 mL). The combined extracts were washed with water (3 × 20 mL) and dried over anhydrous Na_2SO_4. After evaporation of the solvent under reduced pressure, the crude product was purified by recrystallization from acetone.

(8,9-Methylenedioxy-2,3-diphenylimidazo[1,2-c]quinazolin-5-yl)phenylamine (3a). This compound was obtained as solid with mp 215–217°C; IR (KBr) ν: 3393, 3059, 2902, 1623, 1598, 1557, 1533, 1466, 1377, 1340, 1271, 1217, 1148, 1036, 941, 864, 824, 750, 706 cm^{-1}. ^{1}H NMR (400 MHz, DMSO-d_6): 6.19 (s, 2H, OCH_2O), 6.78 (s, 1H, NH), 7.00 (t, *J* = 8.0 Hz, 1H, ArH), 7.15 (s, 1H, ArH), 7.18 (s, 2H, ArH), 7.25–7.31 (m, 5H, ArH), 7.54 (d, *J* = 7.6 Hz, 2H, ArH), 7.68–7.72 (m, 2H, ArH), 7.76–7.82 (m, 4H, ArH).

A series of novel 7-alkyl/aryl sulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d] pyrimidine **6** were synthesized for evaluation of their antibacterial and antifungal activity. The structures were determined by IR, NMR, mass spectroscopy, and elemental analysis. They were screened for activities against bacterial and fungal strains.

J. Heterocyclic Chem., **46**, 975 (2009).

INTRODUCTION

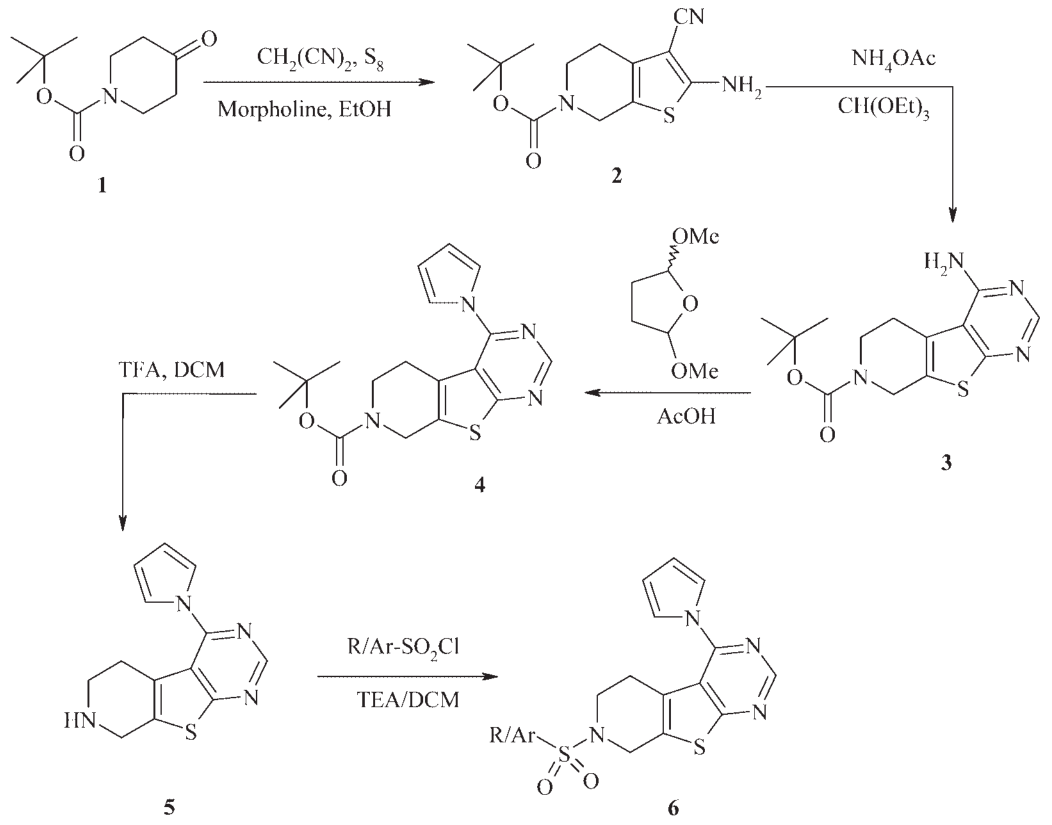
Fused pyrimidines continue to attract considerable attention because of their great practical usefulness, primarily, due to a very wide spectrum of biological activities. This is evident, in particular, from publications of regular reviews on the chemistry of systems where the pyrimidine ring is fused to various heterocycles, such as, purines [1], pteridines [2], quinazolines [3], pyridopyrimidines [4,5], triazolopyrimidines [6], pyrazolopyrimidines [7], pyrimidoazepines [8], furopyrimidines, and pyrrolopyrimidines. Thienopyrimidines occupy a special position among these compounds. Along with some other pyrimidine systems containing an annulated five-membered heteroaromatic ring, thienopyrimidines are structural analogs of biogenic purines and can be considered as potential nucleic acid antimetabolites. Earlier, various aspects of the chemistry and biology of isomeric thienopyrimidines have been reviewed [9,10]. The chemistry of pyrimidines and its derivatives has been studied over a century due to their diverse biological activities [11–14]. Thienopyrimidine possess various physiological and biological properties, and thus, find important use in medicine. According to recent literature survey, thienopyrimidine have been found to have antibacterial [15], antiviral [16], anticancer [17–19], analgesic [20], and antimalarial [21] activities. Though many synthetic strategies have been reported for the preparation of thienopyrimidine derivatives, most of them include use of expensive, commercially nonavailable or hazardous reagents, drastic reaction conditions, longer reaction time and difficult work-up [22–27]. In the view of biological importance of thienopyrimidine, we aimed the synthesis of a series of novel 7-alkyl/aryl sulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno [2,3-d]pyrimidine **6**.

RESULTS AND DISCUSSION

Chemistry. As shown in synthetic Scheme 1, the synthetic route involves the Gewald reaction [28] of boc-piperidone **1** with malononitrile and sulfur in presence of morpholine in refluxing ethanol to obtain 2-amino thiophene derivative **2**. The formation of 2-amino thiophene **2** was evident from the ^{1}H NMR spectra and mass spectrometry.

The cyclization of 2-amino thiophene **2** with triethyl orthoformate and ammonium acetate at 120°C led to formation of thienopyrimidine derivative **3.** In

Scheme 1



the ^{1}H NMR spectra of **3**, one aromatic proton resonance of pyrimidine ring was observed at 8.85 δδas a singlet, in addition molecular ion peak (M+, 90%) in mass spectrum was also observed. The compound **3** was further reacted with 2,5-dimethoxy-tetrahydrofuran in refluxing acetic acid furnished pyrrole derivative **4**. The identity of pyrrole **4** was established by mass spectrometry and ^{1}H NMR spectra, the aromatic protons resonance of pyrrole ring were observed at 6.32 δ, J = 2.1 and 7.34 δ, J = 2.0 as two doublet. The hydrolysis of carbamate group by TFA furnished secondary amine derivative **5**, which was supported by molecular ion peak in mass spectrum and ^{1}H NMR spectra, where a singlet at 1.38 δ for nine protons of boc group was not present. The target compounds 7-alkyl/aryl sulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine **6a–j** were obtained with excellent yield, by reacting secondary amine **5** with various aryl or alkyl sulfonyl chloride in presence of TEA as base.

The structure of all newly synthesized compounds **6a–j** were established on the basis of elemental analysis and spectral (IR, ^{1}H NMR, and mass) data. The physical characterization data are listed in Table 1.

The ^{1}H NMR spectral data of compound **6a** revealed a singlet of CH_3SO_2 group at 2.97 δ, a singlet of pyrimidine ring at 8.95 δ and two doublet of pyrrole ring at 6.36 δ, J = 2.0 Hz and 7.35 δ,J = 2.0 Hz. The IR spectra of **6a** revealed $-SO_2$ absorptions at 1334 cm^{-1} and 1159 cm^{-1}. In addition, the EI-MS spectra of **6a** showed a molecular ion peak (M+, 90%).

In conclusion, we have developed a facile and efficient synthetic method for the preparation of novel 7-alkyl/aryl sulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine **6**.

Biological activities.

Antibacterial and antifungal activities. The newly synthesized derivatives were evaluated for their *in vitro* antibacterial activity against Gram-positive *Staphylococcus aureus* and *Streptococcus pyogenes*, Gram-negative *Escherichia coli* and *Pseudomonas aeruginosa*, and antifungal activity against *Candida albicans* and *Aspergillus niger* by micro broth dilution methods [29–31]. The standard strains used for screening antibacterial and antifungal activities were procured from Institute of Microbial Technology (IMTECH), Chandigarh, India. The MIC values are given in Table 2. The standard drugs used for antibacterial activity were ampicillin and ciprofloxacin,

and nystatin for antifungal activity. Mueller Hinton Broth was used as nutrient medium for bacteria and Sabouraud Dextrose Broth for fungal to grow. Inoculums size for test strain was adjusted to 10^8 CFU/mL by comparing the turbidity. The serial dilutions were prepared in primary and secondary screening. The target compounds and standard drugs were dissolved in DMSO-water at a concentration of 2.0 mg/mL. In primary screening, 500 μg/mL, 250 μg/mL, and 125 μg/mL concentrations of the synthesized drugs were taken. Data were not taken for the initial solution because of the high DMSO concentration (10%). The actively synthesized drugs found in this primary screening were further tested in a second set of dilution against all microorganisms. In secondary screening, the drugs found active in primary screening were similarly diluted to obtain 100 μg/mL, 50 μg/mL, 25 μg/mL, 12.5 μg/mL, and 6.250 μg/mL concentrations. The inoculated wells were incubated overnight at 37°C in a humid atmosphere overnight. The highest dilution showing at least 99% inhibition zone is taken as MIC.

The MIC values revealed that some of the newly synthesized compounds showed moderate to good

inhibition. Compounds **6a**, **6d**, and **6j** exhibited good activity against all the four bacterial strains. Compounds **6d**, **6e**, **6h**, and **6f** showed good activity against *E .coli* and *S. aureus* bacterial strains. The MIC values of antifungal activity revealed that compound **6a** exhibited good activity against *C. albicans* fungal strain. Rest of all compounds did not exhibit comparable activity against both the fungal strains.

EXPERIMENTAL

Melting points were determined with Buchi B-545 melting point apparatus and are uncorrected. IR spectra were recorded on a PerkinElmer PE-1600 FTIR spectrometer in KBr disk. ^{1}H NMR spectra were recorded on a Varian 400 spectrometer in DMSO-d_6 as a solvent and TMS as an internal standard. Peak values are shown in δ ppm. EI-MS spectra were measured on a Waters Mass Spectrometer. All of the solvents and materials were reagent grade and purified as required.

2-Amino-3-cyano-4,7-dihydro-5H-thieno[2,3-c]pyridine-6-carboxylic acid tert-butyl ester (2). To a stirred solution of (10.0 g, 0.050 mol) of 1-Boc-4-piperidone (**1**), malononitrile (3.97 g, 0.060 mol) and sulfur (1.92 g, 0.060 mol) in ethanol (70 mL), morpholine (5.71 mL, 0.065 mol) was added over period of 15 min at room temperature. The reaction mixture was heated at 82°C with stirring for 1 h and cooled at room temperature. Water (200 mL) was charged to a reaction mixture and stirred at room temperature for 30 min. Product was separated by filtration and washed with water (50 mL), hexane (50 mL), and dried. Recrystallization from ethanol gave compound **2** as pale yellow solid, 11.2 g (80%), mp 193–195°C; ^{1}H NMR (DMSO-d_6) δ 1.39 (s, 9H), 2.62 (t, 2H, J = 5.6 Hz), 3.02 (t, 2H, J = 5.7 Hz), 4.21 (s, 2H), 5.84 (bs, 2H); ms: m/z 280 (M + 1). Anal. Calcd. for $C_{13}H_{17}N_3O_2S$: C, 55.89; H, 6.13; N, 15.04. Found: C, 55.92; H, 6.10; N, 15.06.

4-Amino-5,8-dihydro-6H-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine-7-carboxylic acid tert-butyl ester (3). A solution of compound **2** (11.0 g, 0.039 mol), ammonium acetate (9.1 g, 0.118 mol) in triethyl orthoformate (50 mL) was heated at 120°C with stirring for 6 h and cooled at room temperature. Water (150 mL) was added to reaction mixture and stirred at room temperature for 15 min. Solid product was filtered, washed with water (50 mL), hexane (50 mL), and dried. Solid was recrystallized from ethanol gave compound **3** as off white solid, 7.6 g (63%), ^{1}H NMR (DMSO-d_6): δ 1.40 (s, 9H), 2.64 (t, 2H, J = 5.7 Hz), 2.99 (t, 2H, J = 5.8 Hz), 4.24 (s, 2H), 5.75 (bs, 2H), 8.85 (s, 1H); ms: m/z 307 (M + 1). Anal. Calcd. for $C_{14}H_{18}N_4O_2S$: C, 54.88; H, 5.92; N, 18.29. Found: C, 54.91; H, 5.89; N, 18.32.

4-Pyrrol-1-yl-5,8-dihydro-6H-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine-7-carboxylic acid tert-butyl ester (4). A solution of compound **3** (7.5 g, 0.025 mol), 2,5-dimethoxy-tetrahydrofuran (3.5 mL, 0.027 mol) in acetic acid (50 mL) was heated at 100°C with stirring for 3 h and cooled at room temperature. Reaction mixture was charged in ice water (100 mL) and stirred for 15 min. Product was extracted with ethyl acetate (2 × 100 mL), combined ethyl acetate layer was washed with water (2 × 50 mL), dried on anhydrous sodium sulfate and evaporated to dryness. The residue was purified on a silica gel column, packed in hexane. Elution of the column with hexane: ethyl acetate (80:20 v/v) gave the pure compound **4** as off white solid, 4.88 g (56%), ^{1}H NMR (DMSO-d_6): δ 1.38 (s, 9H), 2.61 (t, 2H, J = 5.6 Hz), 2.98 (t, 2H, 5.6 Hz), 4.19 (s, 2H), 6.32 (d, 2H, J = 2.1 Hz), 7.34 (d, 2H, J = 2.0 Hz), 8.86 (s, 2H); ms: m/z 357 (M + 1). Anal. Calcd. for $C_{18}H_{20}N_4O_2S$: C, 60.65; H, 5.66; N, 15.72. Found: C, 60.68; H, 5.63; N, 15.69.

4-Pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (5). A solution of compound **4** (4.8 g, 0.013 mol) and TFA (3.2 mL, 0.040 mol) in DCM (20 mL) was stirred at 10°C for 1.5 h. Reaction mixture was charged into saturated $NaHCO_3$ (50 mL) and DCM layer was separated, aqueous layer was washed with DCM (100 mL). Combined DCM layer was washed with water (2 × 50 mL), dried on anhydrous sodium sulfate and evaporated to dryness gave compound **5** as off white solid, 2.05 g (59%), ^{1}H NMR (DMSO-d_6): δ 2.65 (t, 2H, J = 5.7 Hz), 3.01 (t, 2H, J = 5.8 Hz), 4.19 (s, 2H), 5.56–5.58 (m, 1H), 6.33 (d, 2H, J = 2.0 Hz), 7.36 (d, 2H, J = 2.1 Hz), 8.89 (s, 2H); ms: m/z 257 (M + 1). Anal. Calcd. for $C_{13}H_{12}N_4S$: C, 60.92; H, 4.72; N, 21.86. Found: C, 60.90; H, 4.75; N, 21.83.

General procedure for preparation of 7-alkyl/aryl sulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6). All of these reactions were carried out under a nitrogen atmosphere. To a stirred and cooled (5°C) solution of Compound **5** (0.781 mmol), dimethyl amino pyridine (0.0781 mmol) and triethylamine (1.56 mmol) in dry THF (15 mL), alkyl/aryl sulfonyl chloride (0.859 mmol) was added and the reaction mixture was allowed to warm at room temperature and stirred at room temperature for 3–5 h. Reaction mixture was evaporated under vacuum gave an oily residue. The residue was dissolved in ethyl acetate (50 mL) and washed with 5% aqueous HCl (50 mL), saturated aqueous $NaHCO_3$ (50 mL), and water (50 mL). Ethyl acetate layer was dried and evaporated under vacuum gave solid residue which was washed with hexane (10 mL) and dried, gave **6a–j**. The yield, reaction time, and physical properties are reported in Table 1.

7-Methanesulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6a). IR: —SO_2 1334, 1159 cm^{-1}; ^{1}H NMR: δ 2.64 (t, 2H, J = 5.4 Hz), 2.97 (s, 3H), 2.98 (t, 2H, J = 6.0 Hz), 4.66 (s, 2H), 6.36 (d, 2H, J = 2.0 Hz), 7.35 (d, 2H, J = 2.0 Hz), 8.95 (s, 1H); ms: m/z 335 (M$^+$).

7-Ethanesulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6b). IR: —SO_2 1336, 1163 cm^{-1}; ^{1}H NMR: δ 1.31 (t, 3H, J = 6.5), 2.61 (t, 2H, J = 6.0 Hz), 3.01 (t, 2H, J = 6.2 Hz), 3.01 (q, 2H, J = 6.0 Hz), 4.63 (s, 2H), 6.32 (d, 2H, J = 1.9 Hz), 7.32 (d, 2H, J = 2.0 Hz), 8.89 (s, 1H); ms: m/z 349 (M$^+$).

7-(Propane-2-sulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6c). IR: —SO_2 1332, 1160 cm^{-1}; ^{1}H NMR: δ 1.13 (d, 6H, J = 6.4 Hz), 2.63 (t, 2H, J = 6.1 Hz), 2.99 (t, 2H, J = 5.9 Hz), 3.32 (m, 1H, J = 6.1 Hz), 4.67 (s, 2H), 6.32 (d, 2H, J = 2.0 Hz), 7.34 (d, 2H, J = 2.0 Hz), 8.91 (s, H); ms: m/z 363 (M$^+$).

7-(Propane-1-sulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6d). IR: —SO_2 1330, 1152 cm^{-1}; ^{1}H NMR: δ 1.01 (t, 3H, J = 6.3 Hz), 1.93 (m, 2H, J

$= 5.7$ Hz), 2.67 (t, 2H, $J = 6.1$ Hz), 2.92 (t, 2H, $J = 6.1$ Hz), 3.10 (t, 2H, $J = 6.1$ Hz), 4.68 (s, 2H), 6.38 (d, 2H, $J = 2.1$ Hz), 7.37 (d, 2H, $J = 2.1$ Hz), 8.90 (s, 1H); ms: m/z 363 (M$^+$).

7-(Butane-1-sulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6e). IR: —SO$_2$ 1334, 1159 cm^{-1}; ^{1}H NMR: δ 0.97 (t, 3H, $J = 6.2$ Hz), 1.45 (m, 2H, $J = 5.7$ Hz), 2.13 (q, 2H, $J = 6.0$ Hz), 2.64 (t, 2H, $J = 5.8$ Hz), 2.98 (t, 2H, $J = 6.0$ Hz), 3.55 (t, 2H, $J = 6.1$ Hz), 4.66 (s, 2H), 6.35 (d, 2H, $J = 2.1$ Hz), 7.36 (d, 2H, $J = 2.0$ Hz), 8.95 (s, 1H); ms: m/z 377 (M$^+$).

7-Benzenesulfonyl-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6f). IR: —SO$_2$ 1342, 1168 cm^{-1}; ^{1}H NMR: δ 2.50 (t, 2H, $J = 5.6$ Hz), 3.29 (t, 2H, $J = 5.1$ Hz), 4.55 (s, 2H), 6.33 (d, 2H, $J = 2.1$ Hz), 7.20 (d, 2H, $J = 2.1$ Hz), 7.60–7.71 (m, 3H), 7.83–7.85 (m, 2H), 8.92 (s, 1H); ms: m/z 397 (M$^+$).

4-Pyrrol-1-yl-7-(toluene-4-sulfonyl)-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6g). IR: —SO$_2$ 1345, 1171 cm^{-1}; ^{1}H NMR: δ 2.35 (s, 3H), 2.60 (t, 2H, $J = 5.4$ Hz), 3.33 (t, 2H, $J = 5.3$ Hz), 4.61 (s, 2H), 6.36 (d, 2H, $J = 2.0$ Hz), 7.25 (d, 2H, $J = 2.0$ Hz), 7.35 (d, 2H, $J = 7.5$ Hz), 7.87 (d, 2H, $J = 7.6$ Hz), 8.89 (s, 1H); ms: m/z 411 (M$^+$).

7-(4-Fluoro-benzenesulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6h). IR: —SO$_2$ 1341, 1161 cm^{-1}; ^{1}H NMR: δ 2.62 (t, 2H, $J = 5.4$ Hz), 3.37 (t, 2H, $J = 5.3$ Hz), 4.64 (s, 2H), 6.33 (d, 2H, $J = 2.0$ Hz), 7.31 (d, 2H, $J = 2.0$ Hz), 7.25 (d, 2H, $J = 7.7$ Hz), 7.82 (d, 2H, $J = 7.8$ Hz), 8.91 (s, 1H); ms: m/z 415 (M$^+$).

7-(4-Methoxy-benzenesulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6i). IR: —SO$_2$ 1352, 1167 cm^{-1}; ^{1}H NMR: δ 2.63 (t, 2H, $J = 5.2$ Hz), 3.40 (t, 2H, $J = 5.6$ Hz), 3.78 (s, 3H), 4.61 (s, 2H), 6.34 (d, 2H, $J = 2.0$ Hz), 7.23 (d, 2H, $J = 2.1$ Hz), 7.05 (d, 2H, $J = 7.7$ Hz), 7.81 (d, 2H, $J = 7.6$ Hz), 8.90 (s, 1H); ms: m/z 427 (M$^+$).

7-(4-Nitro-benzenesulfonyl)-4-pyrrol-1-yl-5,6,7,8-tetrahydro-pyrido[4′,3′:4,5]thieno[2,3-d]pyrimidine (6j). IR: —SO$_2$ 1345, 1171 cm^{-1}, NO$_2$ 1540, 1361 cm^{-1}; ^{1}H NMR: δ 2.63 (t, 2H, $J = 5.8$ Hz), 3.38 (t, 2H, $J = 5.6$ Hz), 4.64 (s, 2H), 6.38 (d, 2H, $J = 2.0$ Hz), 7.26 (d, 2H, $J = 2.0$ Hz), 8.20 (d, 2H, $J = 7.8$ Hz), 8.46 (d, 2H, $J = 7.7$ Hz), 8.93 (s, 1H); ms: m/z 442 (M$^+$).

Acknowledgments. We gratefully acknowledge the most willing help and co-operation shown by CDRI, Lucknow, India for Spectroscopic Analysis and, Microcare Laboratory and Tuberculosis Research Centre, Surat, Gujarat, India for biological activity acquisition coordinating facility.

In this study, a novel series of substituted 4,6-difluoro-2-{2-[3-(substituted-phenyl)-[1,2,4]-oxadiazol-5-yl]-ethyl}-1*H*-benzo[d]imidazole derivatives were synthesized by condensation of 2,4-difluoro-6-nitrophenyl amine with 3-(substitutedphenyl-[1,2,4]-oxadiazol-5yl) propionic acid by using 2,4,6-trichlorobenzoyl chloride in the presence of triethyl amine base. The compounds were evaluated for their preliminary *in vitro* antibacterial activity against *Pseudomonas aeruginosa*, *Escherichia coli*, *Staphylococcus aureus*, and *Salmonella typhosa*. The antibacterial data of the tested compounds indicated that most of the synthesized compounds showed moderate activity with reference standard Gentamycin.

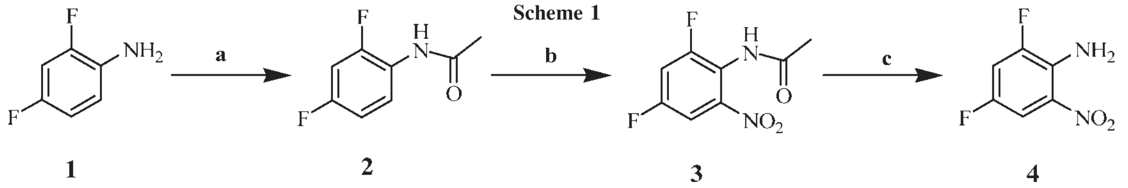
INTRODUCTION

After nitrogen, fluorine occupies the position of second favorite heteroelement in life science-oriented research. Over 10% of newly registered pharmaceutical drugs and some 40% of newly registered agrochemicals contain one or more fluorine atoms [1]. Fluorine containing benzimidazoles, which show promising biological activities, are well documented in the literature. Some of these are like Astemizole (antiallergic, anti-histaminic), Lansoprazole (antiulcerative), Flubendazole (Anthelmintic), and Droperidol (antipsychotic) [2]. So by this idea in view, synthesis of fluorobenzimidazole is the interesting area of research. Interest in benzimidazole containing structure stems not only because of exhibiting broad spectrum of pharmacological activity [3] but also displaying significant activities against several viruses such as casein kinase 2 [4], factor Xa [5], hepatitis C virus [6].

In continuation, heterocyclic species like [1,2,4]-oxadiazole and fluorobenzimidazole derivatives represent a novel emerging major chemical entity as antimicrobial agent. As we know that [1,2,4]-oxadiazoles are an important class of heterocyclic compounds with broad spectrum of pharmacological activity, due to its hydrolytic and metabolic stability of the oxadiazole ring along with improved pharmacokinetics and *in vivo* performance [7]. The biological activities of the compounds containing [1,2,4]-oxadiazoles have been well documented in the literature [8–11]. The oxadiazole moiety is an important structure unit in drugs and chemical materials [12]. Among these oxadiazoles, [1,2,4]-oxadiazoles are gaining interest in the medicinal chemistry [13] and shows numerous biological activities including muscarinic agonists [14], dopamine transporters [15], benzodiazepine receptor partial agonists [16], nematocidal, fungicidal, and microbicides [17], immunosuppressants [18], Fab I inhibitors as antibacterial agents [19], antiplatelet and antithrombotic agents [20], etc. Also, oxadiazoles plays an important role as bioisosteres for amides and esters [21]. Several methods have been reported for the synthesis of [1,2,4]-oxadiazoles in the literature [22–30].

In continuation of our research work [31] and after extensive search, it was observed that enough efforts have not been made till date, to combine these two moieties as a single molecule scaffold. So, we wish to disclose the derivatives of difluorobenzimidazoles clubbed

Scheme 1



a: Acetic anhydride, reflux; **b**: HNO_3, H_2SO_4, RT; **c**: 2N HCl, reflux.

with different substituted [1,2,4]-oxadiazoles and studied their antibacterial activity against different organisms.

RESULTS AND DISCUSSION

Synthesis of 2,4-difluoro-6-nitrophenyl amine [32]. In neat reaction condition, acetic anhydride was added slowly in 2,4-difluorophenyl amine **1** at 0°C, a solid material precipitates. The reaction mixture was quenched in ice water and stirred continuously for 30 min. An off violet colored solid compound separated out, which was filtered and suck dried to obtain 2, 4 difluoro acetanilide **2** as a free solid (Scheme 1).

In the second stage, 2,4-difluoro acetanilide **2** was dissolved in nitric acid and conc. sulfuric acid was added slowly at 5–10°C. The reaction mixture was stirred continuously for 3 h at room temperature. Reaction progress was monitored by TLC system (EA: Hexane 2:8). After completion of reaction, the reaction mixture was quenched in ice water, a pale yellow color solid separated, which was filtered through Büchner funnel and suck dried to obtain 2,4-difluoro-6-nitro acetanilide **3** as a free solid.

In the final stage, to a reaction mixture of **3** in 2*N* HCl, a catalytic amount of sulfuric acid was added slowly. Reaction mixture was heated to reflux for 3–4 h. After completion of reaction, the reaction mixture was cooled slowly at 0–5°C, a yellow color needle type crystal separated, which was filtered and suck dried to obtain as 2,4-difluoro-6-nitro aniline **4.**

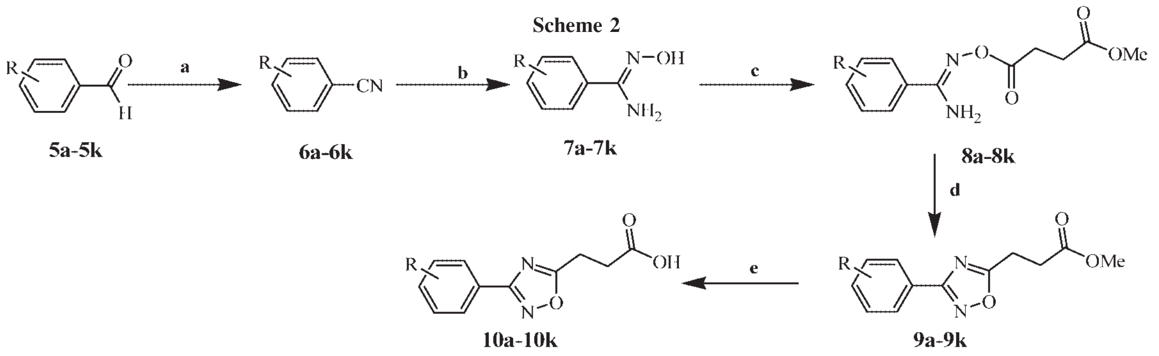
Synthesis of 3-(substitutedphenyl-[1,2,4]-oxadiazol-5-yl)-propionic acid. By using different substituted aromatic aldehydes **5a-5k** in the presence of iodine and aqueous NH_3 in tetrahydrofuran at room temperature, gave substituted benzonitrile **6a-6k.** The compounds were characterized by IR showing cyano functional group at 2210–2245 cm^{-1}. Then followed by amidoxime formation by using hydroxylamine hydrochloride and sodium bicarbonate in methanol at reflux temperature for 8–10 h gives substituted N-hydroxy benzamidine **7a-7k** (Scheme 2).

In the next reaction, condensation of **7a-7k** with monomethyl succinate was carried out by using coupling reagent dicyclohexylcarbodiimide (DCC) and N-hydroxy benzotriazole, and dimethylaminopyridine (DMAP) as a base in dichloromethane at room temperature to obtain **8a-8k**.

In the penultimate step, dehydration followed by cyclization of **8a-8k** was carried out in toluene at reflux temperature in the presence of molecular sieves as a dehydrating agent. It gives 3-(substituted phenyl-[1,2,4]-oxadiazol-5-yl)-propionic acid ethyl ester **9a-9k** as a free solid. In the final step, hydrolysis of **9a-9k** by lithium hydroxide in THF: EtOH: H_2O (7:2:1) at room temperature gives 3-(substituted phenyl-[1,2,4] oxadiazol-5-yl)-propionic acid **10a-10k**.

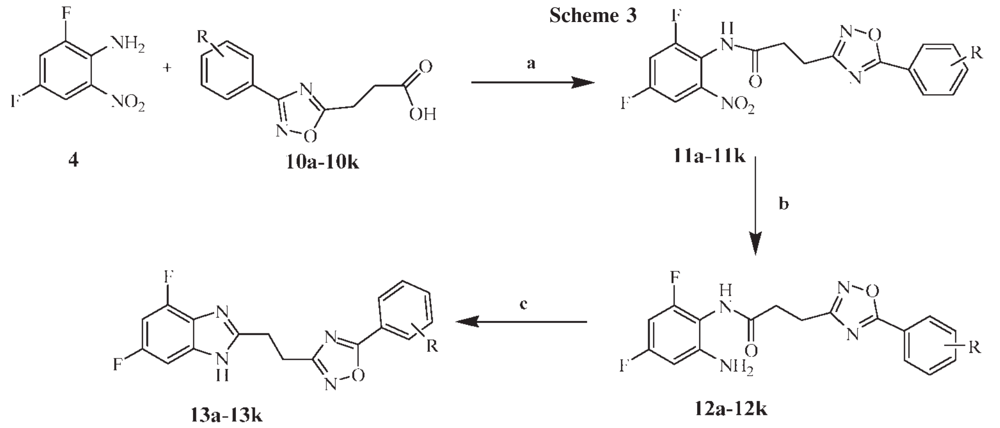
Synthesis of 4,6-difluoro-2-[2-(5-substituted-phenyl-[1,2,4]-oxadiazol-3-yl)-ethyl]-1*H*-benzo[*d*]imidazole. Condensation of 2, 4 difluoro 6-nitro phenyl amine **4** and 3-(substituted phenyl-[1,2,4]oxadiazol-5yl)-propionic acid **10a-10k** in 2,4,6 trichlorobenzoyl chloride [33] as a coupling reagent, in the presence of triethylamine and DMAP in THF: DMF (7:3) solvent at room temperature **11a-11k**. After workup, catalytic reduction of **11a-11k** by using 10% Pd/C in tetrahydrofuran was carried out

Scheme 2



a: I_2, NH_3, THF, RT; **b**: $NH_2OH.HCl$, $NaHCO_3$, methanol, reflux; **c**: monomethyl succinate, dicyclohexylcarbodiimide, dimethylaminopyridine, N-hydroxy benzotriazole, DCM; **d**: toluene, reflux; **e**: LiOH, THF-ETOH-H_2O, RT

Scheme 3



a: 2, 4,6 trichlorobenzoyl chloride, triethylamine, dimethylaminopyridine,THF:DMF, RT; **b**: 10% Pd/C, THF, 25-30 °C; **c**: 2 N HCl , reflux

to obtain **12a-12k**. Then **12a-12k** undergoes cyclization reaction in 2*N* HCl at 100°C to furnish with 4, 6 difluoro-2-{2-[3-(substituted-phenyl)-[1,2,4]-oxadiazol-5-yl]-ethyl}-*1H*-benzo[*d*] imidazole derivatives **13a-13k.** The details of the reaction condition were explained in experimental section (Scheme 3).

ANTIMICROBIAL ACTIVITY

The *in vitro* antibacterial screening of **13a-13k** was assessed against two gram positive and two gram negative bacteria *viz. Staphylococcus aureus* (ATCC 25923), *Pseudomonas aeruginosa* (ATCC 27853), *E. coli* (ATCC 25922), and *Salmonella typhosa* (ATCC 14028). From the antibacterial screening, it was observed that all the compounds exhibited activity against different organisms employed. In this, we studied different electron withdrawing or electron donating moieties. Some of the compounds showed better activity against gram positive organisms compared to gram negative organisms. Looking at the structure-activity relationship, marked inhibition in bacteria was observed in the number of compounds **13a**, **13f**, **13g**, and **13i** have shown moderate activity and others **13b**, **13c**, **13d**, **13e**, **13h**, **13j**, and **13k** showed least activity.

EXPERIMENTAL

The melting points were estimated by Veggo programmable (microprocessor based) melting point apparatus and are uncorrected. ^{1}H NMR spectra were recorded on a Varian 400 MHz spectrometer MHz instrument using CDCl$_3$ as solvent using TMS as internal standard; the chemical shifts (δ) are reported in ppm Signal multiplicities are represented by s (singlet), d (doublet), t (triplet), ds (double singlet), dd (double doublet), m (multiplet), and br s (broad singlet). IR spectra were recorded on (KBr disc) using a FTIR bruker Vector 22 Spectrophotometer. Elemental analyses were determined on Elementor Vario instrument. EIMS spectra recorded on micromass-quatro –II. The purity of the compounds was checked on Merck precoated silica gel 60 F-254.

General experimental procedure for the preparation of 2,4-difluoro-6-nitro phenyl amine (4). In the first stage, under neat reaction condition, acetic anhydride (7.9 g, 77.5 mmol) was added slowly in 2,4-difluoro phenyl amine **1** (10 g, 77.5 mmol) at 0°C, a solid compound precipitates out after 30–45 min. After completion of reaction, the reaction mixture was quenched in ice water with continues stirring for 30 min. The solid was filtered through Büchner funnel and suck dried to obtain 2,4-difluoro acetanilide **2** as a off violet color solid (12.0 g, 92% yield). *m*/*z:* 172 (M$^+$).

In the second stage, to a solution of 2,4-difluoro acetanilide **2** (12 g) in nitric acid (25 mL), Conc. sulfuric acid (25 mL) was added slowly at 5–10°C. The reaction mixture was stirred continuously for 3 h at room temperature. The progress of the reaction was monitored on TLC system (Ethyl acetate: Hexane, 2:8). After completion of reaction, the reaction mass was quenched slowly in ice water and a pale yellow color solid was observed, which was filtered through Büchner funnel and suck dried to obtain 2,4-difluoro-6-nitro acetanilide **3** as a free solid (12.0 g, 80% yield). The compound was characterized by mass and NMR. ^{1}H NMR (CDCl$_3$) δ (ppm): 2.23 (3H, —CH$_3$, s), 7.26 (1H, ArH, m), 7.62 (1H, ArH, m), 8.01 (1H, —NH, s). *m*/*z:* 215 (M$^-$).

In the final stage, to a suspension of 2, 4 difluoro 6-nitro acetanilide **3** (12 g, 69.0 mmol) in 2*N* HCl (25 mL), a catalytic amount of sulfuric acid (1.2 mL) was added slowly and the reaction mixture was heated to reflux for 3–4 h. After completion of reaction, the reaction mixture was cooled gradually at 10°C, a yellow color needle type crystal separated out. The solid compound was filtered and suck dried to obtain 2,4-difluoro-6-nitro aniline **4** as a free solid (7.0 g, 72.9% yield). The compound was characterized by mass and NMR. ^{1}H NMR (CDCl$_3$) δ (ppm): 6.05 (2H, —NH$_2$, s), 7.12 (1H, ArH, m), 7.73 (1H, ArH, s). *m*/*z:* 173 (M$^-$).

General experimental procedure for the preparation of 3-{3-substituted-phenyl-[1,2,4]-oxadiazole-5-yl)-propionic acid (10a). To a solution of 4-nitrobenzaldehyde **5a** (6.0 g, 39.73 mmol) in tetrahydrofuran (30 mL), aqueous NH$_3$ (120 mL) was added and then followed by iodine (10.59 g, 41.69 mmol). The reaction mixture was stirred further for 2 h. After completion of reaction, color of the reaction mixture changed from brownish to colorless. The reaction mixture was extracted with ethyl acetate (50 mL × 2) twice, and the organic layer was dried over sodium sulfate and evaporated under vaccum till dryness. The crude compound was triturated with diethyl ether to obtain a free solid of 4-nitro benzonitrile **6a** (5.1 g, 84% yield). The compound was characterized by IR showing cyano functional group at around 2238 cm^{-1} in this example.

To a solution of **6a** (5.0 g, 33.78 mmol) in methanol (50 mL), hydroxylamine hydrochloride (2.56 g, 37.16 mmol), sodium bicarbonate (4.35 g, 50.67 mmol) were added and the reaction mixture was heated to reflux for 8–10 h. Progress of reaction was monitored on TLC. After completion of reaction, methanol was distilled completely under vaccum. A pale yellow solid compound precipitates after charging water (100 mL), which was filtered through funnel and suck dried to obtain N-hydroxy-4-nitrobenzamidine (4.9 g, 80% yield) **7a** as a free solid.

In the second stage, monomethyl succinate (5.14 g, 38.94 mmol) was dissolved in THF: DMF (7:3 ratio) (25 mL) at 25–30°C. Then DCC (11.15 g, 54.14mmol) a coupling reagent, N-hydroxybenzo triazole (1.09 g, 8.12 mmol) was added at 25–30°C and stirred continuously for 30 min. Mixed anhydride formation, charged 4- nitrobenzamidine, **7a** (4.8 g, 27.07 mmol), and DMAP (0.99 g, 8.12 mmol) with continuous stirring for 60 min. Progress of the reaction was monitored on TLC (ethyl acetate: hexane 3:7). After completion of reaction, the reaction mixture was filtered through Büchner funnel with bed wash of ethyl acetate (25 mL) twice. Water wash given to the organic layer (100 mL × 2) twice separated the organic solution, which was dried over sodium sulphate and distilled out as organic layer under vaccum. The crude compound was triturated with diethyl ether to obtain **8a** (6.2 g, 74% yield) as a free off white solid.

In the penultimate stage, **8a** compound (6.2 g, 20.06 mmol) was dissolved in toluene (60 mL) and molecular sieves were added as dehydrating agent. The reaction mass was stirred at reflux temperature for 2–3 h. After completion of reaction, the reaction mixture was filtered through Büchner funnel with bed wash of toluene (10 mL). The filtrate was concentrated under vaccum and recrystallized with diethyl ether to obtain 3-(3-4-nitrophenyl-[1,2,4]-oxadiazol-5-yl)-propionic acid ethyl ester **9a** (4.5 g, 77% yield) as a pure compound.

In the final stage, 3-(3-4 nitrophenyl-[1,2,4] oxadiazol-5-yl)-propionic acid ethyl ester **9a** (4.5 g, 15.46 mmol) was dissolved in THF: EtOH: H_2O (7:2:1) with 25 mL volume. $LiOH.H_2O$ was added (0.630 g, 18.55 mmol) at room temperature and the reaction mixture was stirred for 2 h at 25–30°C. After completion of reaction, the mixture was acidified by 2*N* HCl, a solid material separated, which was filtered through Büchner funnel and suck dried to obtain 3-(3-4-nitrophenyl-[1,2,4]-oxadiazol-5-yl) propionic acid **10a** (2.9 g) as a pale yellow solid.

All the intermediates **10b-10k** were synthesized by the aforementioned procedure using different substituted aldehydes **5b-5k**, respectively, and were characterized by ^1H NMR and ms. The details of the intermediates were given in Table 1.

General procedure for the preparation of 4,6-difluoro-2-[2-(5-substituted-phenyl-[1,2,4]-oxadiazol-3-yl)-ethyl]-1H-benzimidazole: (13a-13k). In the reaction, 3-(3-4-nitrophenyl-[1,2,4] oxadiazol-5-yl)-propionic acid **10a** (1.5 g, 5.74 mmol) was dissolved in THF: DMF (7:3) 25 mL volume. Then 2,4,6-trichlorobenzoyl chloride (1.47 g, 6.03 mmol) followed by triethyl amine (0.696 g, 6.89 mmol) was added for the mixed anhydride formation. The reaction mass was stirred for 60 min at 25–30°C. DMAP (0.701 g, 5.74mmol) and **4** (1.0 g, 5.74 mmol) were added and stirred continuously for 2 h. Progress of the reaction was monitored on TLC system (ethyl acetate: hexane 3:7). After completion of reaction, the reaction mixture was filtered through Büchner funnel and bed wash of ethyl acetate. Water wash given to the organic solution, dried over sodium sulphate and concentrated under vacuum completely. Finally, the crude compound was triturated with diethyl ether to obtain as a off white color solid **11a** (1.6 g, 66% yield).

Similarly, by using the respective 3-{3-substituted-phenyl-[1,2,4]-oxadiazol-5-yl)-propionic acid **10b-10k,** we have synthesized **11b-11k** for the next stage.

In the second stage. **11a** (1.5 g, 3.58 mmol) was dissolved in THF (50 mL), and 10% Pd/C was added (0.3 g, 20% w/w) at room temperature under nitrogen. Reaction mass was stirred for 2 h at 25–30°C. Progress of the reaction was monitored on TLC system (ethyl acetate: hexane 3:7). After completion of the reaction the mixture was filtered through celite with bed wash of tetrahydrofuran (25 mL). The filtrate was concentrated under vacuum to obtain **12a-12k.** Without isolation of **12a-12k**, next cyclization reaction in 2*N* HCl (15 mL) at reflux temperature for 4–5 h was proceeded. After completion of reaction, aqueous $NaHCO_3$ solution (50 mL) was added to the reaction mixture slowly at 5–10°C. A solid product was separated out, which was filtered through Büchner funnel and suck dried to obtain 4-6-difluoro-2-{2-[3-(4-nitrophenyl)-[1,2,4]-oxadizol-5-yl]-ethyl}-4-6-difluoro-*1H*-benzo[*d*]imidazole **13a** as pale yellow colored solid.

Similarly, by using respective substituted [1,2,4]-oxadiazoles **10a-10k**, we synthesized the respective **13b-13k** by using aforementioned procedure. ^1H NMR, ms, IR, and elemental analysis characterized all the synthesized compounds. The details of the intermediates were given in Table 2.

Synthesis of 4,6-difluoro-2-{2-[3-(4-nitrophenyl)-[1,2,4]-oxadizol-5-yl]-ethyl}-4,6-difluoro-1*H*-benzo[*d*]-imidazole (13a). The compound was obtained using 3-(3-(4-nitrophenyl)-[1,2,4]-oxadiazol-5-yl) propanoic acid as a pale yellow solid (diethyl ether); IR (KBr): 3242, 2768, 2547, 2362, 1719, 1578, 1516, 1438, 1340, 1219, 914, 869, 719 cm^{-1}; ^1H NMR (400 MHz, DMSO d_6): δ 2.87 (2H, t), 3.19 (2H, t), 7.12 (1H, m), 7.29 (1H, d), 8.22 (2H, d), 8.39 (2H, d), 12.4 (1H, s —NH).

Synthesis of 2-(2-(3-(3-bromophenyl)-[1,2,4]-oxadizol-5-yl)-4,6-difluoro-1*H*-benzo[*d*]imidazole (13b). The compound was obtained using 3-[3-(3-bromo-phenyl)-[1,2,4]-oxadiazol-5-yl) propionic acid as a pale yellow solid (diethyl ether); IR (KBr): 3433, 2714, 2608, 2361, 1701, 1566, 1535, 1443, 1358, 846, 744, cm^{-1}; ^1H NMR (400 MHz, DMSO d_6): δ 2.84 (2H, t), 3.19 (2H, t), 7.18(1H, m), 7.52 (2H, m), 7.78–7.81 (1H, m), 7.98 (1H, m), 8.08 (1H, m), 12.14 (1H, s, —NH).

Synthesis of 4,6-difluoro-2-[2-(3-phenyl-[1,2,4]-oxadizol-5-yl)-ethyl]-1*H*-benzo[*d*]imidazole (13c). The compound was obtained using 3-(3-phenyl-[1,2,4]-oxadiazol-5-yl) propionic acid as a off white solid (diethyl ether); IR (KBr): 3133, 2933 2714, 2608, 2361, 1701, 1632, 1590, 1443, 1358, 1231, 912, 846, 718 cm^{-1} ;^1H NMR (400 MHz, DMSO d_6): δ 2.8 (2H, t), 3.15 (2H, t), 7.08(1H, m), 7.12 (1H, d), 7.55 (3H, m), 7.95 (2H, m), 12.21 (1H, s, —NH).

Table 1

Synthesis of 4,6-difluoro-2-{2-[3-(3,5-dimethoxy phenyl)-[1,2,4]-oxadizol-5-yl]-ethyl}-1*H*-benzo[d] imidazole (13h). The compound was obtained using 3-(3-(3,5-dimethoxyphenyl)-[1,2,4]-oxadiazol-5-yl) propanoic acid as a buff colored solid (diethyl ether); IR (KBr): 3101, 2714, 2612, 2361, 1701, 1559, 1535, 1443, 1358, 900, 740 cm^{-1}; ^{1}H NMR (400 MHz, DMSO d_6): δ 2.75–3.1(4H, s), 3.99 (6H, s), 7.11 (2H, m), 7.22 (2H, m), 7.46 (1H, m), 12.14 (1H, s —NH).

Synthesis of 4,6-difluoro-2-{2-[3-(4-methoxy phenyl)–[1,2,4]-oxadizol-5-yl]-ethyl}-1*H*-benzo[*d*]-imidazole (13i). The compound was obtained using 3-(3-(4-methoxyphenyl)-[1,2,4]-oxadiazol-5-yl) propanoic acid as a brownish colored solid (diethyl ether); IR (KBr): 2940, 2608, 2362, 1710, 1596, 1482, 1362, 1255, 1029, 843, 749 cm^{-1}; ^{1}H NMR (400 MHz, DMSO d_6): δ 2.75–3.1(4H, s), 4.02 (3H, s), 7.11 (1H, d), 7.24 (3H, m), 7.46 (2H, m), 12.04 (1H, s —NH).

Synthesis of 4,6-difluoro-2-{2-[3-(3-fluorophenyl)-[1,2,4]-oxadizol-5-yl]-ethyl}-1*H*-benzo[*d*]imidazole (13j). The compound was obtained using 3-(3-(3-fluorophenyl)-[1,2,4]-oxadiazol-5-yl) propanoic acid as a brownish solid (diethyl ether); IR (KBr): 3233, 2878, 2731, 2624, 2548, 2362, 1696, 1591, 1432, 1337, 1239, 1168, 898,752 cm^{-1}; ^{1}H NMR (400 MHz, DMSO d_6): δ 2.8–3.08 (4Hs), 7.04 (1H,m), 7.21 (1H,d), 7.62 (2H,m), 7.74 (1H,m), 7.92 (1H,m), 12.1 (1H,s —NH).

Synthesis of 4,6-difluoro-2-{2-[3-(4-methoxy phenyl)-[1,2,4]-oxadizol-5-yl]-ethyl}-1*H*-benzo[*d*]-imidazole (13k). The compound was obtained using 3-(3-(4-methoxyphenyl)-[1,2,4]-oxadiazol-5-yl) propanoic acid as a brownish colored solid (diethyl ether); IR (KBr): 2940, 2608, 2362, 1710, 1596, 1482, 1362, 1255, 1029, 843, 749 cm^{-1}; ^{1}H NMR (400 MHz, DMSO d_6): δ 2.75–3.1(4H, s), 4.02 (3H, s), 7.11 (1H, d), 7.24 (3H, m), 7.46 (2H, m), 12.04 (1H, s —NH).

PHARMACOLOGICAL ACTIVITY

Antimicrobial activity. The title compounds were screened for the antimicrobial activity against two different gram positive and two gram negative microorganisms *Staphylococcus aureus* (ATCC 25923), *Pseudomonas aeruginosa* (ATCC 27853), *E. coli* (ATCC 25922), and *Salmonella typhosa* (ATCC 14028) under the following conditions. (Table 3).

Method: Well diffusion method [34], Medium: The nutrient agar medium,

Solvent: Chloroform: Concentrations: 50 and 100 μ*M*.

Condition: 24 h at 24–28°C, Standard: The antibiotic Gentamycin.

The nutrient agar medium, 20 mL was poured into the sterile petri dishes. To the solidified plates, wells were made using a sterile cork borer 10 mm in diameter. The 24 h sub cultured bacteria was inoculated in the petri plates, with a sterile cotton swab dipped in the nutrient broth medium. After inoculating, the compounds were dissolved separately with the chloroform solvent and poured into the wells with varying concentrations ranging from 50 and 100 μ*M* using a micropipette. The plates were left over for 24 h at 24–28°C. The antibiotic Gentamycin was used as a standard for comparative study.

The percentage of inhibition was calculated by the formula% Inhibition = Diameter of the inhibition zone × 100.

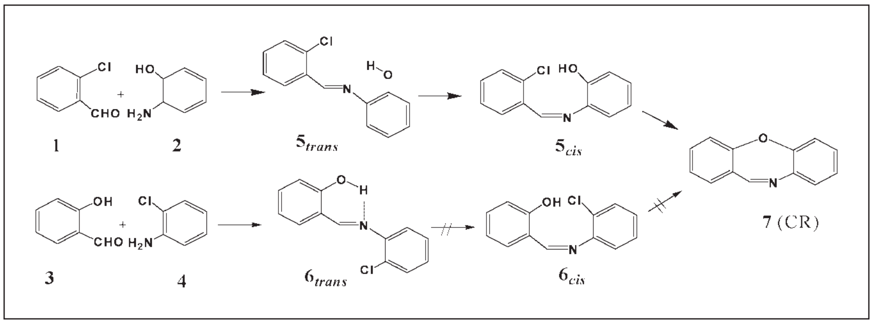
DOI 10.1002/jhet.59



Two distinct alternative methods using different starting materials for the preparation of dibenz[*b*,*f*][1,4]oxazepine (**7**, CR) were reinvestigated. The possibility of *trans-cis* conversion of the Schiff base **5** (produced from **1** and **2**) is considered the favorable orientation that leads to cyclization (production of **7**). Fluoro derivative of **1** afforded excellent and more convenient conditions for the one pot preparation of high yield pure **7**. The presence of only *trans* configuration for the imine **6** (produced from **3** with **4**) and the impossibility of its conversion to *cis*, makes it inadequate for the preparation of **7**.

J. Heterocyclic Chem., **46**, 988 (2009).

INTRODUCTION

Dibenz[*b*,*f*][1,4]oxazepine (**7**, CR) is an incapacitating lachrymatory agent [1–6] and is an intermediate in the synthesis of *loxapine* (antipsychotic), *amoxapine* (antidepressant) [7], and others substituted dibenzoxazepine compounds that are analgesic or useful for the treatment of different diseases [8–11].

Moreover, reduction of the imine group of dibenz[*b*,*f*][1,4]oxazepine and/or the oxidation of the same group to the imid afforded intermediates in the synthesis of several other compounds effective in the prevention and treatment of circulatory disease and osteoporosis [9,11].

There are different methods for the preparation of **7** [12–24]. Two pathways starting from different raw materials can be considered for the preparation of this compound (Schemes 1 and 2).

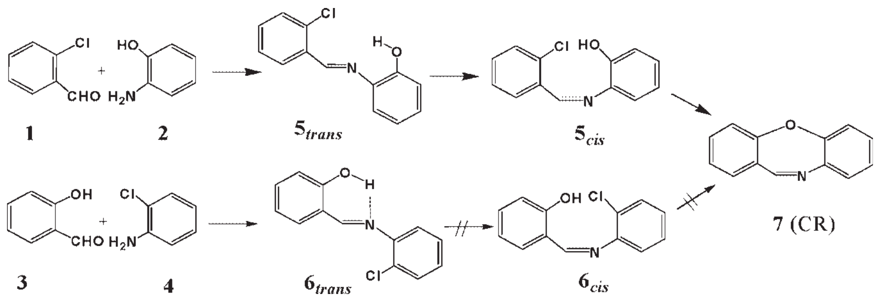
These methods are differentiated in the occurrence of either the imine reaction or etherification in the first step. Thus, in Scheme 1, dibenz[*b*,*f*][1,4]oxazepine is formed by the imine reaction followed by the etherification (cyclization), whereas in Scheme 2, etherification is followed by the imine reaction (cyclization). The two etherification and imine reactions each have limitations that influence the yield of the final product.

Firstly, the method proposed by Tambute [12,13] for the preparation of **7** involves the condensation of salicyl-aldehyde with 2-nitrochlorobenzene (Scheme 2). We have recently reported the effect of temperature and catalyst on the yields and rate of the etherification reaction between sodium salt of salicylaldehyde and 2-nitrochlorobenzene and have emphasized the harsh conditions necessary for the preparation of **7** by this method [22]. We have observed that the etherification reaction of 2-nitrophenol and 2-chlorobenzaldehyde does not occur under the same conditions and requires more difficult circumstances to be performed. This can be rationalized by the electrophilic effect of NO_2 group, which reduces the nucleophilic character of the hydroxy oxygen atom in 2-nitrophenol.

The formation of **7** *via* **1** and **2** (Scheme 1) has been reported recently [19,20], and the kinetic data have been investigated [17,18]. Other attempts to prepare **7** *via* cyclization of 2-[(2-fluorobenzylidene)amino] phenol (fluoro derivative of **5**) in ethanol with excess triethylamine were unsuccessful even after prolonged reflux. In contrast, the preparation of 1,2,3,4-tetrafluorobenzo[*b*,*f*][1,4]oxazepine (**10**) by cyclization of 2-[(2,3,4,5,6-pentaflurobenzylidene)amino] phenol (**8**) (Scheme 3) using the same conditions was successful, whereas the attempts to cyclize **9** into **11** failed [23].

The difference in reactivity between **8** and **9** has been justified by the necessity for the electrophilic arene to be a benzylidene and not a phenyl imine, that is, the

Scheme 1



electron-withdrawing —CH=N substituent enhances the susceptibility of C_6F_5 to nucleophilic attack, whereas the electron-donating —N=CH substituent has the opposite effect [23].

The last report on the synthesis of **7** was consisted in the reaction of 2-fluorobenzaldehyde (fluoro derivative of **1**) with 2-aminophenol using K_2CO_3 in polyethylene glycol (PEG-400) at 100°C, affording 89% of **7** after 8 h [24].

This contribution discussed the feasibility of two distinct pathway methods (Scheme 1) using different starting materials and passing by different intermediates for the preparation of dibenz[*b*,*f*][1,4]oxazepine (**7**, CR).

RESULTS AND DISCUSSION

The preparation of **7** *via* 2-chlorobenzaldehyde (**1**) and 2-aminophenol (**2**) or salicylaldehyde (**3**) and 2-chloro-aniline (**4**) was reinvestigated (Scheme 1). Imine formation following both methods was nearly quantitative, and the water released in the course of the reaction did interfere with imine formation.

We have reported the results of GC, GC-MS, and ^{1}H NMR analysis of the imine products [25], according to which we have presumed the formation of $\mathbf{5}_{cis}$ and $\mathbf{5}_{trans}$ and only $\mathbf{6}_{trans}$ in solution.

The ^{13}C NMR spectrum $\mathbf{5}_{cis}$ and $\mathbf{5}_{trans}$ were similar and their mixture presented 13 resonances for carbon, but the chemical shift of imine proton (in ^{1}H NMR spectrum) was different. However, their MS fragmentation patterns were completely different (see Experimental Section). It is noteworthy that the X-ray crystallography of **5** indicates a unique *trans* configuration [25].

The retention time in GC and GC-MS, and fragmentation pattern of $\mathbf{5}_{trans}$ and $\mathbf{6}_{trans}$ were nearly similar else the more abundant peak (*m*/*z* (100%); 120 for $\mathbf{5}_{trans}$ and 196 for $\mathbf{6}_{trans}$). The occurrence of $\mathbf{5}_{cis}$ increases at high temperature (> 100°C) and with a catalytic amount of acid (H_2SO_4 98%).

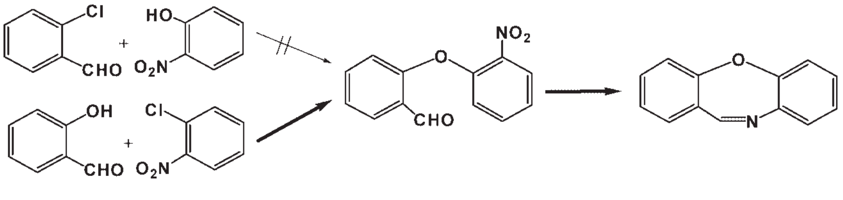
The effect of solvent and UV irradiation in the *trans*-*cis* transformation were also investigated, but complete conversion of $\mathbf{5}_{trans}$ to $\mathbf{5}_{cis}$ was never observed. In contrast, $\mathbf{6}_{trans}$ was not converted to $\mathbf{6}_{cis}$ under any conditions. The target product (**7**) was never obtained by cyclization of imine **6**. Thus, we presumed that apart from electronic parameters, the prevention of *trans-cis* conversion in **6** is another reason that the target product (**7**) was not obtained by cyclization of imine **6**. In fact, *trans-cis* isomerization can occur through the hemiaminal resulting from attack of the phenolic oxygen to the imine carbon, which is much easier in **5** (five-membered ring) than in **6** (four-membered ring).

The preparation of **7** *via* **1** and **2**, performed following several procedures, afforded different yields (Scheme 4).

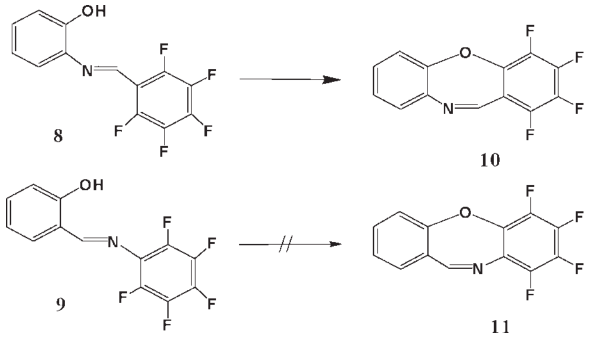
Reaction of **1** with **2** in DMSO at 150°C (the procedure B_1) afforded **7** in 25% yield. Following procedure B_3, the mixture of **1**, **2**, and KOH in CCl_4 are refluxed for 5 h and then after evaporation of solvent, DMSO was added, and the mixture was refluxed for 6 h to afford 50% of **7**.

According to the procedure B_2, when we used xylene as solvent, $\mathbf{5}_{cis}$ and $\mathbf{5}_{trans}$ were formed with proportional amounts of 12 and 88%, respectively. Heating the

Scheme 2



Scheme 3



solution at 120°C for 24 h changed the proportional amount of the two isomers in favor of *cis*, which afforded 75% of **7** after addition of Na and refluxing the reaction mixture. Without heating the solution, the attend product (**7**) was not formed. While when we used DMSO as solvent, prior conversion of *trans* to *cis* was not indispensable and the salt of **5** rearrange for the production of **7**.

Preparation of sodium salt of **2** and its subsequent reaction with **1** in DMSO at 150°C for 6 h (the procedure C) has yielded 47% of **7**.

The reaction conditions following the procedure A are more convenient (the time of reaction and the temperature), and pure products were formed after the first and second steps. In addition to good yield (70%), the formation of **7** following this method can be performed *via* a one-pot procedure (procedure B).

Our last tentative in the preparation of **7** was based on the usage of 2-fluorobenzaldehyde (a fluoro derivative of **1**) in conjunction with polyethylene glycol as was outlined recently [24]. 2-fluorobenzaldehyde is more expensive that **1** (7 fold) but the procedure offered soft conditions to obtain high-yield pure product. Simultaneous mixing of 2-fluorobenzaldehyde, 2-aminophenol (**2**), K_2CO_3 and PEG(300) (as was reported [24]) has not conducted us to the considered results. It seems that simultaneous addition of K_2CO_3 with other reactants causes formation of potassium salt of **2** which alter imine formation and its subsequent cyclization to **7**. In another attempt, 2-amino phenol was first dissolved in PEG(300) at 50°C and after addition of 2-fluorobenzaldehyde, the solution was stirred for 10 h at 50°C to complete imine (schiff base) formation. The production of **7** was accomplished after addition of K_2CO_3 and continuing the reaction for 10 h at 100°C (Scheme 5).

Thus, this procedure is slightly different from which previously proposed [24]. In this manner, the preparation of **7** was performed in one-pot two-step procedure following which preparation of imine in the first step was followed by the potassium salt formation of imine and its cyclization to produce **7** in the second step.

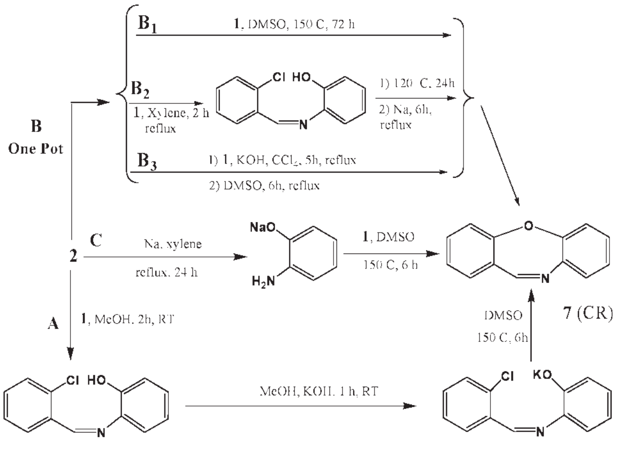
The time of reaction in the second step determined the yield of the final product. In fact, we have found that compound **7** is very temperature sensitive and at temperature higher than 100°C, the target compound decomposed and the yield decreased. Thus the time of reaction and the temperature in the second step should be controlled carefully.

The workup of the reaction mixture to obtain pure **7** was very simplified following this procedure. Effectively, the extraction with ether and several washing of organic phase with water, drying over $CaCl_2$ and stripping of solvent afforded very pure product without need of further purification procedure.

The reaction of **1** with **2** conducted under same conditions with PEG(300) has not afforded **7**. However, the usage of catalytic amount of KF (10 mol%) in the second step (after formation of imine in the first step) favors the formation of **7** (50%) but other experiments should be performed to optimize this method.

In summary, two distinct alternative methods (Scheme 1) using different starting materials for the preparation of dibenz[*b*,*f*][1,4]oxazepine (**7**) were reinvestigated. The imine reaction, according to these methods, occurs readily and yields of Schiff bases (**5**, its fluoro derivative, and **6**) are nearly quantitative. The possibility of *trans*-*cis* conversion of the Schiff base **5** were considered as favorable conditions that caused its cyclization (production of **7**). This reaction was performed following different procedures and various yields are obtained. The pathway A afforded more convenient and soft conditions for the production of pure **7** and its intermediates. Fluoro derivative of **1** afforded excellent, more convenient and soft conditions for the one-pot preparation of target compound (**7**). The presence of only *trans* configuration for the imine **6** (produced from **3** with **4**)

Scheme 4



Pathway	A	B_1	B_2	B_3	C

7 (CR), 89%

and the impossibility of its conversion to *cis*, makes it inadequate for the preparation of **7**.

EXPERIMENTAL

NMR spectra were obtained on a Bruker DPX-250 instrument (250 MHz for ^{1}H and 62.5 MHz for ^{13}C), and $CDCl_3$ was used as solvent; chemical shifts are reported in δ (ppm) from TMS. Electronic ionization GC-MS spectra were recorded on a Varian (SATURN 4D) spectrometer with capillary column (DB-5MS, 0.1 micron, 30 m × 0.250 mm). Only *m*/*z* values having intensities of more than 10% are given and retention times are reported using temperature programming (100–250°C, 10°C/min) with He flow rate of 10 mL/min. Melting points were obtained on a Mettler FP61 apparatus.

Preparation of 5. 2-Aminophenol (22 g, 0.2 mol) and MeOH (200 mL) were placed in a 300-mL, one-necked flask equipped with a mechanical stirrer. The solution was stirred at 50°C for 30 min. After complete dissolution of 2-aminophenol in MeOH, 2-chlorobenzaldehyde (28 g, 22.5 mL, 0.2 mol) was added, and the mixture was stirred for 2 h at RT. The precipitates formed were filtrated at 0°C and dried to offered 39 g of **5** (84% yield) as an orange solid, mp. 97–99°C.^{1}H NMR ($CDCl_3$): δ 6.89–7.42 (m, 8H, CH), 8.20 (d, $^4J_{H\text{—}H}$ = 2.5 Hz, 1H, CHN_{trans}), 8.23 (m, 1H, CHN_{cis}), 9.15 (s, 1H, OH). ^{13}C NMR ($CDCl_3$): δ 115.2, 116.2, 120.2, 127.2, 128.3, 129.5, 130.2, 132.4, 132.9, 135.4, 136.2, 152.6, 153.4. *Anal.* Calcd for $C_{13}H_{10}NOCl$: C, 67.39; H, 4.32; N, 6.05. Found: C, 68.38; H, 4.19; N, 6.18. GC: retention time: 28 min ($\mathbf{5}_{cis}$) and 38 min ($\mathbf{5}_{trans}$). GC-MS of $\mathbf{5}_{cis}$: retention time: 12.3 min; *m*/*z* (intensity (%)): 50 (11), 63 (51), 64 (25), 75 (11), 92 (13), 166 (19), 201 (25), 229 (100), 230 (20), 231 (38). GC-MS of $\mathbf{5}_{trans}$: retention time: 13.6 min; *m*/*z* (intensity (%)):50 (13), 51 (16), 63 (19), 65 (29), 75 (11), 89 (11), 93 (16), 102 (10), 120 (100), 196 (24), 230 (18), 231 (33), 232 (25), 233 (18), 234 (12).

Preparation of 6. 2-Chloroaniline (12.8 g, 10.6 mL, 0.1 mol) salicylaldehyde (12.2 g, 10.4 mL, 0.1 mol) and xylene (10 mL) were placed in a 100-mL, one-necked flask equipped with a magnetic stir bar. The mixture was stirred at RT for 12 h. Evaporation of solvent and water afforded 21.9 g of $\mathbf{6}_{trans}$ (95% yield) as a yellow-orange solid, mp. 86.5–87°C. ^{1}H NMR ($CDCl_3$): δ 6.9–7.5 (m, 8H, CH), 8.61 (s, 1H, CHN), 13.2 (s, 1H, OH). ^{13}C NMR ($CDCl_3$): δ 117.5, 119.1, 119.2, 127.7, 127.8, 129.6, 130.2, 132.6, 133.7, 144.8, 161.4, 163.2. GC: retention time: 38 min. GC-MS: retention time: 13.5 min; *m*/*z* (intensity (%)): 50 (13), 51 (21), 63 (12), 75 (22), 77 (12), 111 (14), 167 (16), 168 (14), 196 (100), 197 (15), 230 (11), 231 (57), 232 (40), 233 (25), 234 (13).

Preparation of 7 *via* 5. The sodium salt of **5** (25 g, 0.1 mol)—prepared by addition of **5** (23.2 g, 0.1 mol) to a methanolic solution of KOH (5.6 g, 0.1 mol in 70 mL of MeOH) followed by evaporation of solvent and drying the precipitate formed—and DMSO (100 mL) were placed in a 250-mL, glass pressure autoclave equipped with a magnetic stir bar. The mixture was stirred at 150°C for 6 h. Then the mixture was washed with water (2 × 10 mL) and extracted by toluene (3 × 10 mL). Vacuum stripping of solvent and recrystalization from benzene afforded **7** as an orange solid mp. 67–70°C, lit. [14–16] mp. 71–72°C, lit. [12] mp. 68–74°C. ^{1}H NMR ($CDCl_3$): δ 7–7.5 (m, 8H, CH), 8.52 (s, 1H, CHN). ^{13}C NMR ($CDCl_3$): δ 119.6, 120.3, 124, 124.6, 126.3, 127.7, 128.2, 129, 132.3, 139.5, 151.6, 159.4, 159.5, in agreement with literature [26]. *Anal.* Calcd for $C_{13}H_9NO$: C, 80.00; H, 4.61; N, 7.18. Found: C, 79.23; H, 4.42; N, 7.04. GC-MS: retention time: 10.2 min; *m*/*z* (intensity (%)): 50 (11), 51 (16), 63 (16), 139 (27), 140 (13), 166 (29), 167 (55), 195 (100), 196 (24) (lit.[27] 139 (25), 167 (52), 195 (100)).

One-pot preparation of 7 *via* fluoro derivative of 1. 2-aminophenol (5.5 g, 0.05 mol) and PEG(300) (100 mL) were placed in a 200-mL, one-necked flask equipped with a mechanical stirrer. The solution was stirred at 50°C for 30 min. After complete dissolution of 2-aminophenol in PEG(300), 2-fluorobenzaldehyde (6.82 g, 5.77 mL, 0.055 mol) was added and the mixture was stirred for 10 h at 50°C. Finally, K_2CO_3 (6.9 g, 0.05 mol) was added and the mixture was stirred again for 10 h at 100°C. Extraction with ether (4 × 50 mL), several washing of organic phase with water (5 × 200 mL), drying the organic phase over $CaCl_2$ and evaporation of solvent afforded very pure product **7** (7.8 g, 80% yield) as an orange solid.

Two methodologies have been investigated for the preparation of heterocyclic methylphosphonate using diethyleneglycole and either MPDC or DMMP as the bifunctional group starting materials needed for cyclization reactions. In addition to the eight-membered ring methylphosphonate **I** the five-membered ring methylphosphonate **II** was unexpectedly found to be formed during the cyclization reactions. This small-size cyclic methylphosphonate may have been generated from an intramolecular cyclization reaction by the nucleophilic attack of the ether oxygen atom of the intermediate Me—P(O)(X)OCH_2CH_2—O—CH_2CH_2OH (X = Cl or OMe). The resulting cyclic phosphonates were purified and characterized by NMR and mass spectroscopy.

J. Heterocyclic Chem., **46**, 993 (2009).

INTRODUCTION

Among the macrocyclic compounds reported to date, little attention has been paid to the phosphorus-containing macrocycles including cyclic phosphonates, hydrogen phosphonates, and alkyl or aryl phosphonates. These compounds are used as flame proofing agents [1,2] and for the recognition and separation of alkali and lanthanide metals [3,4]. Macrocycles containing phosphorus–oxygen bonds may also have special applications both in biological systems and for the recognition of molecules such as alanine [5].

There are two synthetic methods that have been used for the preparation of the few reported macrocyclic methylphosphonates; (i) nucleophilic substitution reaction between $MeP(O)Cl_2$ (MPDC) and diols [3,4,6], (ii) cyclotransesterification methodologies starting with $MeP(O)(OMe)_2$ (DMMP) and diols [7,8].

A search in the literature indicates that although compound **I** was reported in 1957 [9] from ethylene glycol and methylphosphonic dichloride, there also have been some reports, mostly theoretical, for compound **II** [10–13]. Neither of these cyclic phosphonates has been completely spectroscopically identified. Also, to the best of our knowledge, there have been no reports of the formation of the five-membered ring compound **II** by the methodology presented herein. We herein wish to report the concurrent formation of both cyclic phosphonates **I** and **II** during the cyclization reactions between DEG and MPDC and dimethylmethylphosphonate (DMMP).

RESULTS AND DISCUSSION

The cyclization reaction between MPDC and DEG was performed in $CHCl_3$ at room temperature using Et_3N to absorb the HCl. The progress of reaction was followed by measuring the concentration of starting material MPDC in the reaction mixture by $^{31}P\{^1H\}$ NMR. After 5h, no detectable MPDC was found. Therefore, the reaction mixture was filtered off and the filtrate was

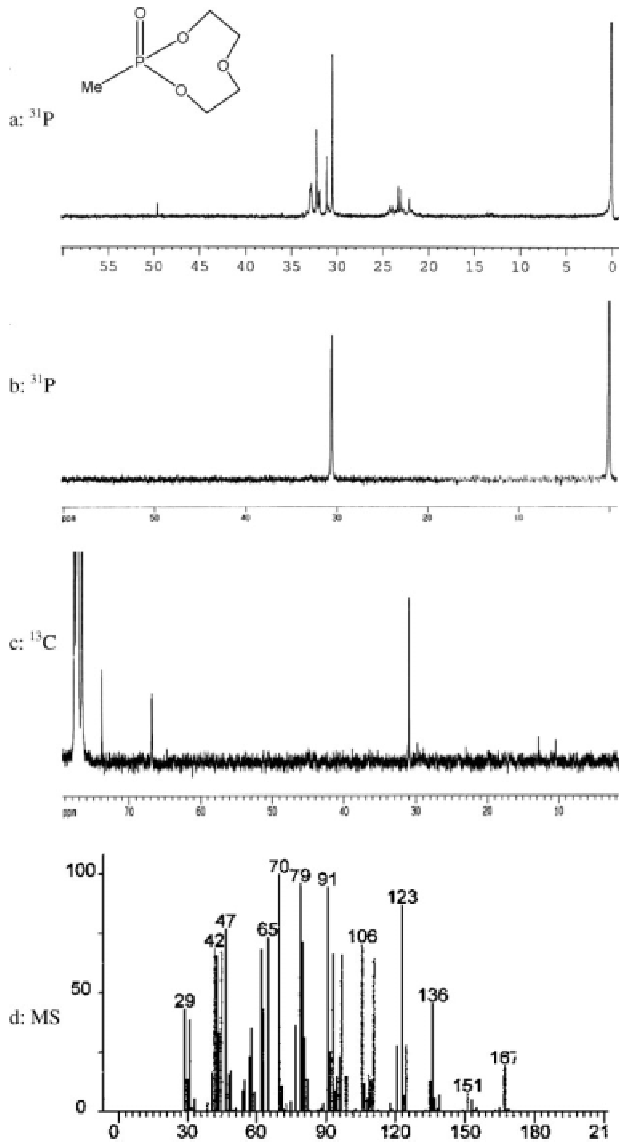

Figure 1. $^{31}P\{^{1}H\}$ NMR spectrum of reaction mixture (a), $^{31}P\{^{1}H\}$ (b) and $^{13}C\{^{1}H\}$ (c) NMR and mass (d) spectra of macrocycle **I** isolated from the reaction mixture obtained by the first cyclization method.

concentrated. The analysis of ^{1}H decoupled ^{31}P NMR spectra of the reaction mixture, shown in Figure 1, indicated the presence of methylphosphonate derivatives and the complete consumption of starting MPDC. The four peaks in the region 30–34 ppm correspond to acyclic methylphos-phonates and cyclic phosphonates with more than eight atoms including **I**. A distinct small ^{31}P peak at 49.36 ppm in Figure 1(a) corresponds to the five membered ring phosphonate **II**. The structure elucidation of **II** will be discussed in more detail.

To identify some of the resulting phosphonates obtained by methodology one, preparative TLC was applied to the concentrated reaction mixture and the macrocyclic phosphonate **I** was isolated. Characterization of the isolated component was performed using ^{31}P and ^{3}C NMR and mass spectroscopy as shown in Figure 1(b–d), respectively. The ^{1}H NMR data of **I** has been given in experimental section. The single peak in the $^{31}P\{^{1}H\}$ NMR spectrum at 30.45 ppm confirmed the presence of a single phosphonate in the isolated component. The chemical structure of **I** was then reconfirmed by $^{13}C\{^{1}H\}$ NMR spectrum [Fig. 1(c)]. Two doublets at 11.75 and 66.78 ppm with $^{1}J_{cp} = 135.5$ and $^{2}J_{cp} = 7.6$ Hz for CH_3P and P—O—CH_2 carbons respectively, and a singlet at 73.80 ppm were in support to the proposed structure for **I**. In the ^{1}H NMR spectrum a doublet at 1.52 ppm for CH_3P and four multipletes at 3.6, 3.8, 4.0, and 4.5 ppm for OCH_2 protons further confirmed the structure.

In mass spectrum of macrocycle **I**, the expected peaks at m/z 167 and 151 for M^+ and M—CH_3 were clearly observed. The possible acyclic structure shown in Figure 3, Me—P(O)$(OCH_2CH_2OCH_2CH_2OH)_2$, as one of the proposed structure for the isolated compound was ruled out not only because of the M^+ peak in the mass spectrum but also because of the four ^{13}C peaks needed for the OCH_2 carbon atoms of this phosphonate. The $^{13}C\{^{1}H\}$ NMR and mass spectral data of this phosphonate was quite different from the data obtained for the isolated phosphonate.

The second methodology applied was based on the high dilution cyclization reaction of DEG and DMMP, in the presence of $MgCl_2$ as catalyst at high temperature. The $^{13}C\{^{1}H\}$ NMR spectrum of the reaction mixture was similar to the products observed from method one. The three doublet peaks in ^{13}C NMR spectrum of the reaction mixture, in the region 10–15 ppm, corresponding to $CH_3P(O)$ carbon atoms, are indicative of the presence of three methylphosphonates as products.

Vacuum fractional distillation was applied to the reaction mixture and one of the resulting fractions with an acceptable purity for further spectral analysis was elected. The NMR and mass spectroscopic data for this fraction were found to be in agreement with the five-membered ring methylphosphonate **II**. A doublet and a singlet at 11.63 and 66.68 ppm in the $^{13}C\{^{1}H\}$ NMR spectrum, a singlet at 49.36 ppm in the $^{31}P\{^{1}H\}$ NMR spectrum, and finally a doublet and two multipletes at 1.5, 4.1, and 4.3 ppm, respectively, in the ^{1}H NMR spectrum clearly support the chemical structure proposed for phosphonate **II**.

The ^{31}P signal observed at 49.36 ppm when using method one is also observed from method two [see Figs. 1(a) and 2(a)]. Therefore, phosphonates **I** and **II** are produced during the cyclization reactions in both methods 1 and 2.

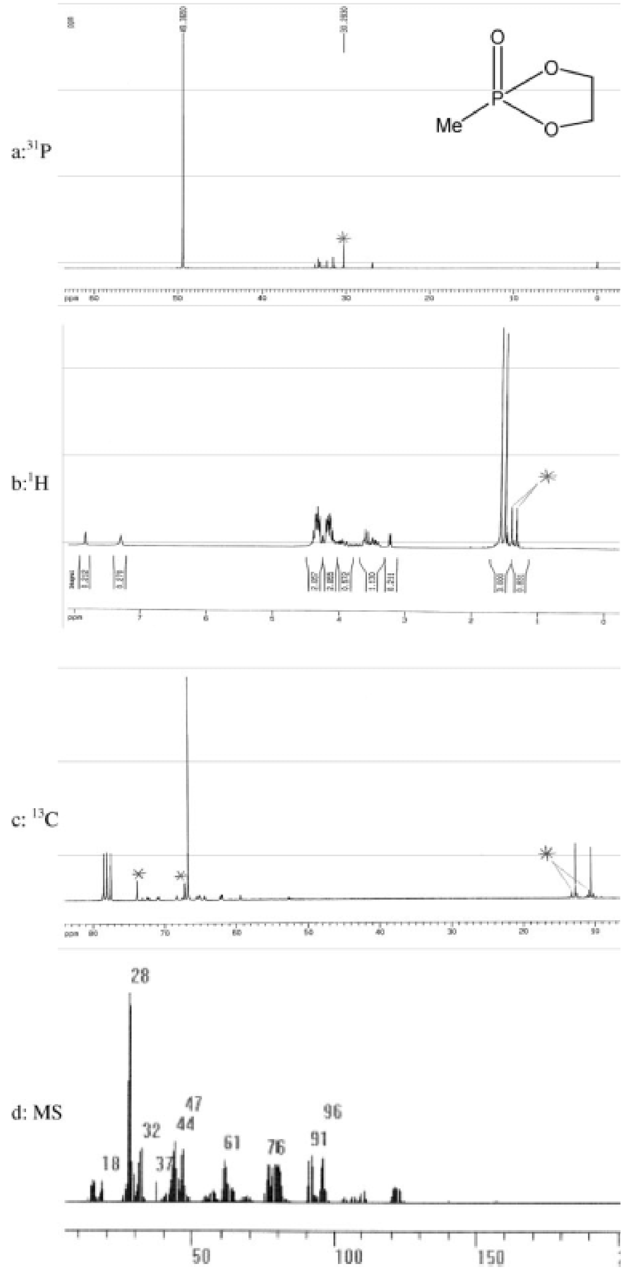

Figure 2. $^{31}P\{^1H\}$ (a), ^1H (b), $^{13}C\{^1H\}$ (c) NMR and mass (d) spectra of heterocycle **II** isolated from the reaction mixture obtained by the second cyclization method. * indicates trace phosphonate **I**.

The mass spectrum of **II** is presented in Figure 2(d). The molecular ion peak at m/z 122, a peak at m/z 28 corresponding to the $CH_2{-}CH_2$ fragment and a peak at m/z 96 for $MeP(O)(OH)_2$ are all supporting data for the proposed structure **II**.

To further confirm the chemical structure II, another cyclization reaction was performed using MPDC and ethylene glycol (EG) instead of DEG under the same conditions. The $^{31}P\{^1H\}$ NMR spectrum of the reaction mixture showed a distinct similar peak at 49 ppm indicating the formation of II. As it is clear from the NMR data presented for I and II, the ^{31}P chemical shift of cyclic methyl phosphonates is strongly dependent on ring size.

The final point to be noticed is the mechanism of the formation of phosphonate II. Though this has not been investigated in detail, an intermolecular nucleophilic attack by the ether oxygen, either from intermediate $Me{-}P(O)(X)OCH_2CH_2OCH_2CH_2OH$ ($X{=}Cl$ or OMe) may result in the formation of five-membered phosphonate ring as an unexpected product.

To estimate the approximate percentages of compounds I and II obtained by each method, the ^{13}P signal intensities were considered. It was determined that I and II have been formed in 15:1 and 10:1 mole ratios by using method one and two, respectively.

It is noted that the reaction mixtures obtained from both cyclization methods contain other products that have not been isolated yet. The possible structures for the other phosphonates produced in the cyclization reaction are given in Figure 3.

EXPERIMENTAL

All chemicals and solvents were purchased from Merck Co. except MPDC that was prepared as procedure reported in literature [14]. The reactions were monitored by TLC (aluminum sheets coated with silica gel no. 5553, Merck) with UV and iodine detection. Some purifications were taken using PLC (glass sheets coated with silica gel no. 5717, Merck). NMR spectra were recorded on a Bruker 250 MHz spectrometer (^1H: 250 MHz, ^{13}C: 62.5 MHz, ^{31}P: 101 MHz) and referenced to 80% phosphoric acid (for $^{31}P\{^1H\}$ spectra) and TMS (for ^1H and $^{13}C\{^1H\}$ spectra) as reference standards. Mass spectra were obtained on a FINNIGAN MAT 8430 instrument using electron impact ionization at 70 eV.

Synthesis of macrocyclic compound I. A total of 0.67 g (5 mmol) of Methylphosphonic acid dichloride dissolved in 50 mL of chloroform in 150 mL flask equipped with a magnetic stirrer. A mixture of 0.48 mL (5 mmol) DEG and 1.52 mL (12 mmol) TEA was then added to the MPDC

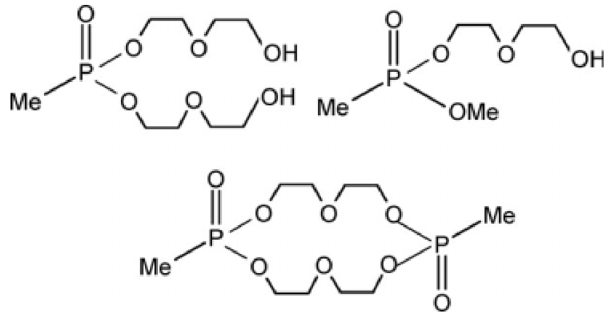

Figure 3. The other possible phosphonates produced during cyclization reaction.

solution over 20 min using a dropping funnel. The reaction mixture was stirred at room temperature for 5 h. The reaction mixture was then filtered with suction and the residue washed with chloroform. The solvent was evaporated and a semi-viscous yellow liquid was obtained. The preparative TLC was applied to the reaction crude product using *n*-heptane/chloroform (1:1) as eluent to obtain 0.15 g liquid pure macrocycle **I** in 25% yield. $^{31}P\ \{^{1}H\}$ NMR ($CDCl_3$): δ 30.54 ppm (P=O); ^{1}H NMR ($CDCl_3$): δ 1.52 (3H, d, $J = 18$ Hz, CH_3P), 3.6 (2H, m, CH_2), 3.8 (2H, m, CH_2), 4.0 (2H, m, CH_2); 4.5 (2H, m, CH_2) ppm; $^{13}C\{^{1}H\}$ NMR ($CDCl_3$): δ 11.75 (d, $^{1}J_{cp} = 135.5$ Hz, CH_3P), 66.78 (d, $^{2}J_{cp} = 7.6$ Hz, CH_2), 73.80 (s, CH_2) ppm; ms: m/z 167 (M^+, 25%), 151 (12), 123 (80), 106 (75), 91 (90), 79 (95), 70 (100), 65 (78), 47 (80), 42 (72), 29 (48).

Synthesis of macrocyclic compound II. A total of 2.75 mL (25 mmol) of DMMP and 0.12 g (1.25 mmol) of magnesium chloride were placed in a 10 mL flask. The mixture was heated at 140–150°C in an oil bath for 9 h, 2.4 mL (25 mmol) of DEG was then added at once and the oil bath temperature increased to 170–180°C. Heating was continued for 19 h and the reaction mixture was then cooled to room temperature to obtain a viscous brown liquid. Three fractions were collected by vacuum fractional distillation of reaction mixture. Fraction 2, 0.2 g, as a pale yellow semi-viscous liquid was compound **II**. $^{31}P\{^{1}H\}$ NMR ($CDCl_3$): δ 49.36; ^{1}H NMR ($CDCl_3$): δ 1.52 (3H, d, $^{1}J_{cp} = 18$ Hz, CH_3P), 4.1 (2H, m, CH_2), 4.3 (2H, m, CH_2) ppm; $^{13}C\{^{1}H\}$ NMR ($CDCl_3$): δ 11.62 (d, $^{1}J_{cp} = 132.9$ Hz CH_3P), 66.68 (s, CH_2) ppm; ms: m/z 122 (M^+, 10%), 91 (25), 76 (20), 47 (25), 28 (100).

Silica supported sodium hydrogen sulfate ($NaHSO_4{\cdot}SiO_2$) or amberlyst-15 acts as an efficient heterogeneous catalyst for the preparation of 14-alkyl and aryl-14-H-dibenzo[*a,j*]xanthenes with various aldehydes and β-naphthol in dichloroethane solvent in excellent yields. Synthesis of three new compounds are reported using this methodology. Recyclable nature of the amberlyst-15 catalyst was also studied and the catalyst can be reused.

J. Heterocyclic Chem., **46**, 997 (2009).

INTRODUCTION

Xanthenes and Benzoxanthenes are important class of heterocyclic compounds and they possess diverse range of biological properties such as antiviral [1], antibacterial [2], anti-inflammatory [3] activities, as well as in photodynamic therapy [4]. Benzoxanthenes have also been investigated for agricultural bactericide activity for antagonism of the paralyzing action of zoxazolamine [5]. In addition, these compounds have wide applications in dyes [6] and in laser technologies [7] because of their useful spectroscopic properties. These compounds can also be employed as pH sensitive fluorescent materials for visualization of biomolecules [8].

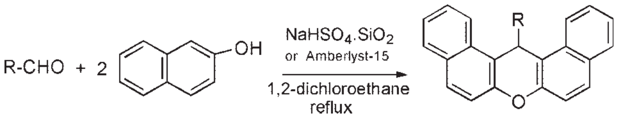
Many synthetic routes have been developed for the synthesis of xanthenes and benzoxanthenes, such as γ-alkylations to the heteroatom [9], trapping of benzynes by phenols [10], cyclocondensation between 2-hydroxy aromatic aldehydes, 2-tetralone [11], intramolecular phenyl carbonyl coupling reactions of benzaldehydes and acetophenones [12], reaction of β-naphthol with formamide [13], carbon monoxide [14], and 2-naphthol-1-methanol [15].

The reaction procedure has been improved by reacting β-naphthol with aldehydes under microwave irradiation [16] and using various acid catalysts [17]. Recently, our group reported using polyaniline based solid acid catalyst for the preparation of dodecahydroxanthenes [18]. In continuation of our research work, in this article we have used silica supported sodium hydrogen sulfate ($NaHSO_4{\cdot}SiO_2$) or amberlyst-15, an efficient heterogeneous acid catalyst for the preparation of 14-Alkyl and Aryl-14-H-dibenzo[*a,j*]xanthenes with various aldehydes and β-naphthol in dichloroethane solvent (Scheme 1). Recyclable nature of the amberlyst-15 catalyst was also studied.

RESULTS AND DISCUSSION

Product was not obtained when benzaldehyde (1 mmol) was reacted with β-naphthol (2 mmol) in 1,2-dichloroethane (5 mL) under reflux conditions for 24 h. However, with the use of Amberlyst-15 (20 wt % with respect to aldehyde) as catalyst yielded dibenzoxanthene in 93% yield in 2 h. Almost same yield (92%) was obtained with the use of silica supported sodium hydrogen sulfate as catalyst. Both catalysts are not soluble in organic solvents and act as heterogeneous catalysts. We have also examined this condensation reaction using different catalysts such as Amberlite IR-120 (H^+ form), Montmorillonite K-10, and Indion-236. However, very low yield (<15%) was obtained even for longer reaction time. This may be because of the acidic nature of these catalysts, *i.e.* these catalysts show less acidic character for this reaction. To evaluate the efficiency of this methodology, the catalytic activity of Amberlyst-15 and silica supported sodium hydrogen sulfate was studied

Scheme 1



for various aldehydes with β-naphthol and the yields are reported in Table 1.The products were obtained within 2 to 4 h in excellent yields and generally, both catalysts provided almost the same yield (Table 1).

We observed that the reactivity of aromatic aldehydes with β-naphthol is higher when compared with the aliphatic aldehydes in terms of yields and reaction time (Table 1). Furfural undergoes condensation smoothly with β-naphthol in 2.5 h with good yield (entry no. 15, Table 1). 4-Dimethylaminobenzaldehyde and pyridine-4-carbaldehyde did not react to give dibenzoxanthenes and it may be due to the presence of basic nitrogen in the system (Table 1). Amberlyst-15 can be recovered by simple filtration and can be reused after activation by treatment with HCl.

In conclusion, we have described a simple, clean, efficient, and environmental friendly method for the synthesis of biologically active heterocyclic compound, dibenzoxanthenes using two different inexpensive and nonhazardous catalysts $NaHSO_4 \cdot SiO_2$ and Amberlyst-15. We feel that this method is a valid contribution to the existing methodologies.

EXPERIMENTAL

All chemicals were of research grade and were used as obtained from Aldrich and Fluka. The reactions were carried out in a round-bottomed flask of 25 mL capacity at reflux temperature in an efficient fume hood. Analytical thin layer chromatography was performed with E. Merck silica gel 60F glass plates and flash chromatography using E. Merck silica gel (60–120 mesh). Melting points were determined on a MEL-TEMP II melting point apparatus and were uncorrected. NMR spectra were recorded of Gemini 200 MHz Varian instrument and Avance 300 MHz Bruker UX 300 FT NMR. All NMR data were obtained in $CDCl_3$ solution and chemical shifts (δ) were given in ppm relative to TMS and are compared with the reported literature values. Mass spectra were recorded on VG Micromass 7070 H (EI), VG Autospec (FAB) using Cs^+ ion gun, MNBA as a matrix, Applied Biosystems QSTAR XL High resolution mass spectrometer, Thermofinnigan ESI ion trap mass spectrometer and GC-MS instruments. Elemental analyses were performed using a Vario-EL elemental analyzer.

Typical procedure for the preparation of dibenzoxanthenes. In a typical procedure, a mixture of aldehyde (1 mmol), β-naphthol (2 mmol), 1,2-dichloroethane (5 mL), and $NaHSO_4.SiO_2$ (100 mg) (Method A) or amberlyst-15 (20 wt % with respect to aldehyde) (method B) was stirred at reflux for the appropriate time according to Table 1. The progress of the reaction was monitored by TLC. After completion of the reaction, the catalyst was filtered off and the organic solvent was evaporated by reduced pressure. The crude products were subjected to column chromatography (silica gel 5% EtOAc in hexane) to afford the pure products. All products were characterized by ^1H NMR, mass spectral data and compared with the reported spectral and physical data for known compounds (entry numbers 1–9, 11–13).

The recovered catalyst (Amberlyst-15) was reused (after treatment with HCl) four more times for the condensation reaction between benzaldehyde and β-naphthol following the above procedure for 2 h in each case the corresponding product furnishes with an yield of 93, 92, 92, and 91%.

Selected analytical data of three new representative dibenzoxanthenes are given below.

14-(3,4-dimethoxyphenyl)-14*H*-ibenzo[*a,j*]xanthene (entry 10). Wheatish solid; mp 186–188°C. An efficient synthesis of thiocoumestan derivatives, starting from catechols and 4-mercaptocoumarin in the presence of potassium ferricyanide as an oxidizing agent (Decker oxidation) was developed. The results indicate that the 4-mercaptocoumarin participates in Michael addition reactions with *in situ* generated *o*-benzoquinones. The present work has led to the development of a one-pot oxidative method for the synthesis of the 6*H*-benzothieno[3,2-*c*][1]benzopyron-6-one derivatives.

J. Heterocyclic Chem., **46**, 1000 (2009).

INTRODUCTION

Coumestans, [1] which are derivatives of 6*H*-benzofuro[3,2-*c*][1]benzopyran-6-one (Fig. 1) have the basic structure of many natural products such as wedelolactone, medicagol, psoralidin, isopsoralidin, erosnin, and estrogenic cumestrol, with interesting physiological activities [2,3]. The importance of these compounds has led us and many workers to synthesize a number of these compounds by chemical [4–10] and electrochemical [11–14] routes. Following our experiences in oxidation of catechols in the presence of nucleophiles [15–23], we envisaged that synthesis of thiocoumestans (6*H*-benzothieno[3,2-*c*][l]benzopyran-6-one) (Fig. 1) might cause an enhancement of physiological activities.

In this direction, some workers synthesize a number of thiocoumestan derivatives [10,24,25]. But, to the best of our knowledge, no reaction of *in situ* generated *o*-benzoquinones (**2**) with 4-mercaptocoumarin (**3**) has been previously reported. Therefore, we now discover a facile and one-pot synthetic route to thiocoumestans involving oxidation of catechols (**1**) in the presence of 4-mercapto-coumarin (**3**), using potassium ferricyanide as an oxidizing agent (Decker oxidation), in high yield and purity.

RESULTS AND DISCUSSION

In our earlier work, comparison of the values of half wave potential ($E_{1/2}$), evaluated from the midpoint potential between anodic and cathodic peaks for catechol (0.165 V *vs.* SCE) and potassium ferricyanide (0.195 V *vs.* SCE), using cyclic voltammetry, revealed that potassium ferricyanide was a suitable agent (Decker agent) for mild oxidation of catechols to their corresponding *o*-benzoquinones without any effect on the nucleophile [8]. Therefore, in this work we used potassium ferricyanide as a stable, easily handled, and commercially available oxidizing agent. This agent has also been used in Decker oxidation. During Decker oxidation, 1,3-disubstituted pyridinium salts converts to isomeric pyridones [26].

The reaction for oxidation of (**1a-c**) in the presence of **3** is presented in Scheme 1. As can be seen, when catechols (**1a-c**) (1 mmol) was treated with potassium ferricyanide (4 mmol) in water/acetonitrile mixture (70/30 v/v) containing 4-mercaptocoumarin (**3**) (1 mmol) and sodium acetate (0.2 *M*), thiocoumestans (**4a-c**) were obtained in good yields (Scheme I). In more basic solutions, the formation of anionic forms of catechols formed by an acid dissociation reaction was enhanced and the coupling of anionic

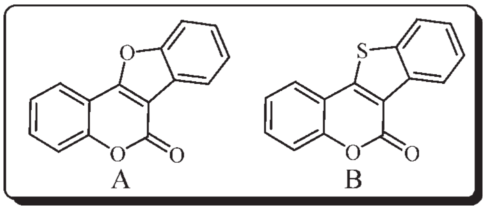

Figure 1. Structures of 6*H*-benzofuro[3,2-*c*][1]benzopyran-6-one (A) and 6*H*-benzothieno[3,2-*c*][l]benzo pyran-6-one (B).

forms with *o*-benzoquinones interfered in the Michael reaction of 4-mercaptocoumarin (**3**) with *o*-benzoquinones (Scheme 2) [23,27,28]. In other words, in an aqueous solution containing 0.2 *M* sodium acetate, any dimerization [27,28] or hydroxylation [29–31] reactions are too slow to interfere in the synthesis of **4a-c**.

Following our experiences in oxidation of catechols in the presence of nucleophiles [15–23], it seems that in water/acetonitrile mixture (70/30 v/v), the inter and intra Michael addition reactions of anion of 4-mercapto coumarin (**3**) to *o*-benzoquinone (**2a-c**) is faster than other secondary reactions [27–31], leading to the thiocoumestan derivatives (**4a-c**) as final products.

The oxidation of **1b** and **1c** in the presence of **3** proceeded in a similar fashion to that of **1a** (Scheme 2). The existence of a methyl or methoxy group at the C-3 position of these compounds probably causes relevant Michael acceptors (**2b** and **2c**) to be attacked by **3** at the C-4 or C-5 positions to yield two types of product in each case. As in the *o*-benzoquinones **2b** and **2c** C-5 more electropositive, we suggest that *o*-benzoquinones **2b** and **2c** are selectively attacked at C-5 position by **3** leading to the formation of the products **4b** and **4c**, respectively [15–18].

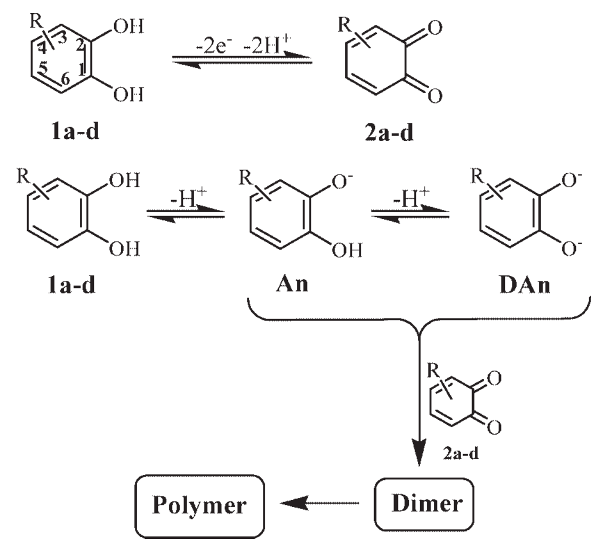
Interestingly, oxidation of 4-methylcatechol (**1d**) in the presence of **3** in aqueous sodium acetate/acetonitrile (70/30) solution, because of the existence of methyl group at C-4 position of it that is a reactive site of cyclization, proceeds in a different manner to that of **1a-c** (Scheme 3).

According to Scheme 3, generation of *o*-benzoquinone **2d** is followed by an intermolecular Michael addition of **3** to the *o*-benzoquinone **2d**, producing the catechol derivative (4-(4,5-dihydroxy-2-methylphenylthio)-2*H*-chromen-2-one) **4d** as final product.

Scheme 1

	R	Isolated Yield (%)
4a	H	82
4b	CH_3	75
4c	OCH_3	70

Scheme 2



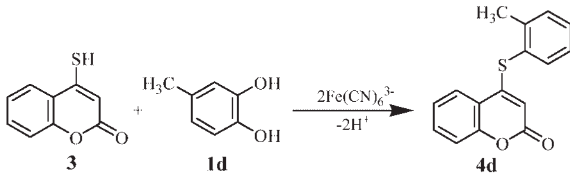
The synthesis of 4-phenylthio-2*H*-chromen-2-ones has been reported previously by us and several groups using different approaches [32–36]. However, to the best of our knowledge, no reaction of *o*-benzoquinone **2d** with 4-mercaptocoumarin (**3**) has been reported and this method described an efficient and one-pot method for the synthesis of 4-(4,5-dihydroxy-2-methylphenylthio)-2*H*-chromen-2-one (**4d**).

EXPERIMENTAL

Reagents. All chemicals were reagent grade materials. Sodium acetate, solvents, and reagents were of proanalysis. These chemicals were used without further purification. 4-mercaptocoumarin was prepared by the procedure reported previously [37].

General procedure for the synthesis of 4a-d. To a stirred solution of aqueous sodium acetate 0.2 *M*/acetonitrile (70/30), 4-mercaptocoumarin (**3**) (1 mmol) was added potassium ferricyanide (4 mmol in the cases of **1a-c** and 2 mmol in the case of **1d**). A solution of catechols (**1a-d**) (1 mmol) in relevant solution was prepared and added dropwise to the stirred solution over a period of 20–30 min. The reaction mixture was kept at r.t., with occasional stirring (1 h for **1a** and 2.5 h for **1b-d**). The solution become dark and formed precipitates. At

Scheme 3



Isolated Yield = 68 %

the end of the reaction, a few drops of acetic acid were added and the mixture was placed in a refrigerator overnight. The solid formed were collected by filtration and washed several times with water. The final products were characterized by IR, ^{1}H NMR, ^{13}C NMR, and MS spectroscopy.

A simple, green and efficient method has been developed for the synthesis of biologically and materially important dihydrobenzo/naphtho[*e*]-1,3-oxazines in good to excellent yields through a Mannich-type condensation cyclization reaction of aromatic alcohols with HCHO and primary amines in aqueous media at ambient temperature.

J. Heterocyclic Chem., **46**, 1003 (2009).

INTRODUCTION

Recently, great attention has been focused to develop nonhazardous and environment friendly synthetic strategies for organic reactions by replacing volatile organic solvents with nontoxic and noninflammable media such as water, ionic liquids, supercritical fluids, and even under neat conditions [1]. Among these, water has emerged as a versatile solvent for several organic transformations [2]. Water is not only a desirable solvent for chemical processes because of cost, safety, and environmental concerns but also provides completely new reactivity. The wide range of organic reactions is known in water including Diels-Alder cycloadditions, Knoevenagal condensations, Aldol-condensations, epoxidation, and oxidation–reduction reactions [3–7]. In addition to these, water has also been used as a solvent in reactions involving carbanions, carbocations, radicals, carbenes, and most recently transition metal catalyzed reactions [8]. In many organic reactions, the use of water as a solvent not only accelerates the rate and the yield but also enhances enantioselectivity in chiral synthesis [9].

Dihydrobenzo/naphtho[*e*]-1,3-oxazines are known to exhibit a wide range of valuable pharmacological properties as antitumor [10], antibacterial [11], anti-HIV [12], and antimicrobial agents [13]. In addition, 6-arylbenzoxazines have also been examined as progesterone receptor modulators and reported as potent nonsteroidal progesterone receptor agonists [14]. On the other hand, these molecules are materially very useful for making phenol type polymers such as polybenzoxazines, offers lucrative mechanical, and electrical properties [15]. The diverse applications of this class of heterocyclic systems inspired chemists to develop new and efficient synthetic strategies for the preparation of these bioactive and materially important molecules.

The syntheses of dihydro-1,3-oxazines have been previously reported by several investigators *via* Mannich-type condensation of a phenol or naphthol with formaldehyde and primary amine using highly inflammable organic solvents [16] and alkaline media [17]. Further, researchers have also been successful in developing mild and solvent free protocol for the construction of these molecules [18]. However, many of these processes are associated with several shortcomings such as long duration of reaction, high temperature, use of volatile and hazardous organic solvents, and occurrence of side products. As a part of our research program to develop a simple methodology for the preparation of target compounds of pharmaceutical interests, we wish to report herein a simple one-pot three-component synthesis of 3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazines (Scheme 1) and dihydronaphtho[*e*]-1,3-oxazines (Scheme 2) in neat water at ambient temperature.

RESULTS AND DISCUSSION

Our initial efforts are focused on the search of a green solvent to carry out the synthesis of dihydrobenzo/naphtho[*e*]-1,3-oxazines at ambient temperature. In this connection, water was chosen for the condensation reaction of phenol, HCHO, and butylamine at room temperature. The completion of the reaction was monitored by TLC

Scheme 1

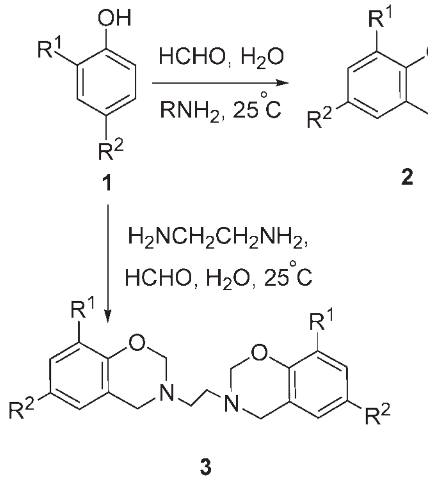

Table 1

Synthesis of 3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazines and 1,2-bis(2*H*-benzo[*e*]-1,3-oxazin-3(4*H*)-yl)ethanes in water.

Entry	Compound	R^1	R^2	R	Yield (%)
1	**2a**	H	H	C_4H_9	64
2	**2b**	H	H	C_6H_5	77
3	**2c**	H	H	C_6H_{11}	80
4	**2d**	Cl	H	4–$CH_3C_6H_4$	90
5	**2e**	H	CH_3	2–ClC_6H_4	82
6	**2f**	H	Cl	2–ClC_6H_4	84
7	**2g**	Cl	H	2–ClC_6H_4	74
8	**3a**	H	H	–	87
9	**3b**	H	Cl	–	75
10	**3c**	Cl	H	–	77
11	**3d**	Cl	Cl	–	70

and the product was extracted with ethyl acetate, and purified by column chromatography on silica gel using ethyl acetate/heptane as eluent to afford 3-butyl-6-chloro-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazine (**2a**) in 64% yield. To demonstrate the versatility of this methodology, synthesis of a variety of 3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazines (**2b-g**) and 1,2-bis(3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazin-3-yl)ethanes (**3a-d**) has been carried out in good to excellent yields (Table 1).

Under these optimized reaction conditions, the scope of the reaction was then further explored by reacting 1-naphthol (**4a**) and 2-naphthol (**4b**) with aqueous HCHO and primary amines in water at ambient temperature separately to obtain 3,4-dihydro-2*H*-naphtho[*e*]-1,3-oxazines (**5a-d**) and 2,3-dihydro-1*H*-naphtho[*e*]-1,3-oxazines (**6a-g**), respectively in good yields (Table 2).

Our synthetic strategy does not require hazardous and toxic organic solvents, and the products were isolated by extraction with ethyl acetate, a preferred and safer solvent [19]. In fact, the dihydrobenzo/naphtho[*e*]-1,3-oxazines were prepared in a short time (30 min to 1 h) at 25°C in water, whereas in other organic solvents the reaction takes several hours to days for complete consumption of starting materials. All the synthesized dihydro-1,3-oxazine derivatives have been characterized by ^{1}H, ^{13}C NMR, IR, mass, and elemental analyses. The physical data of all the known compounds (**2a-c, 3a, b, d, 5a-c, 6a-e**) are in agreement with those of reported data [11,16,20,21]. The spectral and analytical data of new compounds (**2d-g, 3c, 5d, 6f-g**) are presented in the experimental section.

Furthermore, the polymerization behavior of novel benzoxazine analogues (**2f**; 4.79 mg & **3c**; 6.30 mg) was examined by Differential Scanning Calorimetry (DSC) with a heating rate of 10°C per min. The endothermic peaks at 67.5°C and 167°C are attributed to the melting of both **2f** and **3c**. For 6-chloro-3-(2-chlorophenyl)-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazine (**2f**), an exotherm was observed due to the ring opening polymerization [16j] with onset at 267°C and maximum at 270°C. The amount of heat of polymerization is 218 J/g. The DSC trace of 1,2-bis(8-chloro-2*H*-benzo[*e*]-1,3-oxazin-3(4*H*)-yl)ethane (**3c**) showed an exotherm with onset

Scheme 2

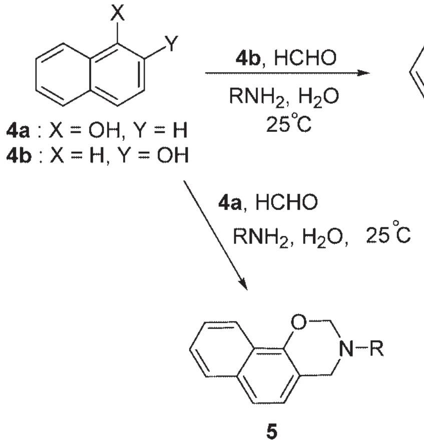

Table 2

Synthesis of 3,4-dihydro-2*H*-naphtho[*e*]-1,3-oxazines and 2,3-dihydro-1H-naphtho[*e*]-1,3-oxazines in water.

Entry	Compound	R	Yield (%)
1	**5a**	C_6H_5	90
2	**5b**	$CH_2C_6H_5$	60
3	**5c**	C_6H_{11}	62
4	**5d**	C_4H_9	85
5	**6a**	C_6H_5	79
6	**6b**	$CH_2C_6H_5$	75
7	**6c**	C_6H_{11}	87
8	**6d**	C_4H_9	80
9	**6e**	4-BrC_6H_4	73
10	**6f**	2,5-$Cl_2C_6H_3$	65
11	**6g**	2,4,6-$Cl_3C_6H_2$	63

at 195°C and maximum at 200°C. The amount of heat of polymerization for **3c** is 289 J/g. The shift of the cure exotherm to a lower temperature in case of **3c** than that of **2f** is possibly due to the flexibilizing effect of the ethylene bridge, which accelerated the ring opening polymerization.

In conclusion, we have developed a rapid, energy efficient, and environmentally conducive one-pot process for the preparation of dihydrobenzo- and naphtho[*e*]-1,3-oxazines in good yields at ambient temperature. In comparison with reported methods for making these molecules, the procedure presented herein avoids the use of hazardous organic media and the reactions are run in pure water, which is the cheapest and most harmless solvent available. Finally, these green advantages make the process more attractive for the synthesis of various biologically important dihydro-1,3-oxazine molecules.

EXPERIMENTAL

All the chemicals were used as received without any further purification. The products were purified by column chromatography using silica gel (60–120 mesh size). ^{1}H and ^{13}C NMR were recorded on Brucker 300 MHz spectrometer in $CDCl_3$ and referenced to the proton or carbon resonances resulting from incomplete deuteration of deuterated solvent. IR spectra were recorded on Perkin Elmer IR spectrometer and mass spectra were recorded on ESI-MS (micromass LCT, Water) mass spectrometer. DSC traces were recorded by using 4–6 mg samples in aluminium pan on Perkin Elmer DSC with a heating rate of 10°C min^{-1} in nitrogen atmosphere. Elemental Analyses were obtained from CHNSO Lab, University Science Instrumentation Centre, University of Delhi, Delhi.

General procedure for the one-pot synthesis of dihydrobenzo/naphtho[*e*]-1,3-oxazines (2a-g, 5a-d, 6a-g). To a mixture of aromatic alcohol (10 mmol) and primary amine (10 mmol) in water (20 ml), formalin (37%, w/v, 20 mmol) was added. The reaction mixture was stirred at 25°C for 30 min to 1 h. After completion of the reaction, the product was extracted with ethyl acetate (20 ml, two times). The organic layers were combined and washed with 10% aqueous NaOH solution (30 ml, two times) followed by water (50 ml). The organic layer was dried over sodium sulfate and evaporated under reduced pressure. The crude product was purified by column chromatography on silica gel using ethyl acetate/heptane as eluent to afford the desired product.

8-Chloro-3-(4-methylphenyl)-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazine (2d). Brown colored viscous liquid; ν_{max} (film, cm^{-1}): 2922, 2851, 1615, 1574, 1515, 1461, 1378, 1240, 927, 818; ^{1}H nmr ($CDCl_3$): δ 2.26 (s, 3H, CH_3), 4.59 (s, 2H, NCH_2), 5.44 (s, 2H, OCH_2N), 6.79 (dd, *J* = 7.8, 7.6 Hz, 1H, ArH), 6.91 (d, *J* = 7.6 Hz, 1H, ArH), 7.02 (d, *J* = 8.3 Hz, 2H, ArH), 7.07 (d, *J* = 8.3 Hz, 2H, ArH), 7.19 (d, *J* = 7.5 Hz, 1H, ArH), HRMS: exact mass calculated for $C_{15}H_{13}ClNO$ (M^+−H): 258.0686; found: 258.0246.

3-(2-Chlorophenyl)-6-methyl-3,4-dihydro-2*H*-benzo-[*e*]-1,3-oxazine (2e). Viscous liquid; ν_{max} (film, cm^{-1}): 2924, 2856, 1618, 1589, 1502, 1483, 1441, 1226, 1041, 971, 949, 916, 814; ^{1}H nmr ($CDCl_3$): δ 2.24 (s, 3H, CH_3), 4.52 (s, 2H, NCH_2), 5.25 (s, 2H, OCH_2N), 6.72–7.38 (m, 7H, ArH); ^{13}C nmr ($CDCl_3$): δ 152.2, 146.9, 130.9, 130.7, 128.9, 128.1, 127.4, 125.3, 123.3, 120.8, 117.1, 80.8, 51.3, 21.0. HRMS: exact mass calculated for $C_{15}H_{14}ClNO$ (M^+): 259.0764; found: 259.0696.

6-Chloro-3-(2-chlorophenyl)-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazine (2f). Pale yellow solid; mp 67.5 °C; ν_{max} (film, cm^{-1}): 2921, 2851, 1588, 1481, 1439, 1413, 1248, 1228, 1160, 1040, 942, 878, 815; ^{1}H nmr ($CDCl_3$): δ 4.52 (s, 2H, NCH_2), 5.26 (s, 2H, OCH_2N), 6.77–7.39 (m, 7H, ArH); ^{13}C nmr ($CDCl_3$): δ 153.0, 146.4, 131.0, 128.9, 128.4, 128.1, 126.8, 126.1, 125.6, 123.2, 122.5, 118.7, 81.0, 51.0; HRMS: exact mass calculated for $C_{14}H_{12}Cl_2NO$ (MH^+): 280.0296; found: 280.0770; *Anal*. Calcd. for $C_{14}H_{11}Cl_2NO$: C, 60.02; H, 3.96; N, 5.00. Found: C, 60.07; H, 4.03; N, 5.04.

8-Chloro-3-(2-chlorophenyl)-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazine (2g). Viscous liquid; ^{1}H nmr ($CDCl_3$): δ 4.58 (s, 2H, NCH_2), 5.41 (s, 2H, OCH_2N), 6.81–6.92 (m, 2H, ArH), 7.03 (t, *J* = 7.6 Hz, 1H, ArH), 7.15 (t, *J* = 8 Hz, 1H, ArH), 7.24 (d, *J* = 8.1 Hz, 1H, ArH), 7.33–7.40 (m, 2H, ArH); HRMS: exact mass calculated for $C_{14}H_{12}Cl_2NO$ (MH^+): 280.0296; found: 280.0972.

3-Butyl-3,4-dihydro-2*H*-naphtho[2,1-*e*]-1,3-oxazine (5d). Dark viscous liquid; ν_{max} (film, cm^{-1}): 2924, 2853, 1578, 1465, 1404, 1070, 913, 801; ^{1}H nmr ($CDCl_3$): δ 0.90 (t, *J* = 7.3 Hz, 3H, CH_3), 1.32–1.39 (m, 2H, CH_2), 1.56–1.61 (m, 2H, CH_2), 2.79 (t, *J* = 7.4 Hz, 2H, CH_2), 4.09 (s, 2H, NCH_2), 5.04 (s, 2H, OCH_2N), 7.05 (d, *J* = 8.3 Hz, 1H, ArH), 7.35 (d, *J* = 8.4 Hz, 1H, ArH), 7.41–7.47 (m, 2H, ArH), 7.73–7.76 (m, 1H, ArH), 8.11–8.14 (m, 1H, ArH); HRMS: exact mass calculated for $C_{16}H_{19}NO$ (M^+): 241.1467; found: 241.5292.

2-(2,5-Dichloro-phenyl)-2,3-dihydro-1*H*-naphtho[1,2-*e*]-1,3-oxazine (6f). Pale yellow solid; mp 139°C; ν_{max} (film, cm^{-1}): 2890, 1625, 1600, 1582, 1559, 1516, 1474, 1435, 1403, 1383, 1267, 1230, 1191, 1159, 1131, 1102, 1059, 1047, 1008, 981, 950, 917, 857, 810; ^{1}H nmr ($CDCl_3$): 4.88 (s, 2H, NCH_2), 5.32 (s, 2H, OCH_2N), 6.97 (dd, *J* = 2.4 Hz, 1H, ArH), 7.10 (d, *J* = 8.9 Hz, 1H, ArH), 7.29 (d, *J* = 8.5 Hz, 1H, ArH), 7.35–7.40 (m, 2H, ArH), 7.47–7.52 (m, 1H, ArH), 7.61–7.69 (m, 2H, ArH), 7.78 (d, *J* = 8.0 Hz, 1H, ArH); *Anal*. Calcd. for $C_{18}H_{13}Cl_2NO$: C, 65.47; H, 3.97, N, 4.24. Found: C, 65.19, H, 4.27, N, 4.16.

2-(2,4,6-Trichloro-phenyl)-2,3-dihydro-1*H*-naphtho[1,2-*e*]-1,3-oxazine (6g). Pale yellow solid; mp 122°C; ν_{max} (film, cm^{-1}): 2891, 1626, 1599, 1516, 1469, 1382, 1334, 1229, 1157, 1138, 1068, 1009, 953, 921, 880, 811; ^{1}H nmr ($CDCl_3$): δ 4.85 (s, 2H, NCH_2), 5.24 (s, 2H, OCH_2N), 7.09 (d, *J* = 8.9 Hz, 1H, ArH), 7.38 (t, *J* = 7.1 Hz, 1H, ArH), 7.46–7.52 (m, 3H, ArH), 7.61 (d, *J* = 8.3 Hz, 1H, ArH), 7.68 (d, *J* = 8.9 Hz, 1H, ArH), 7.78 (d, *J* = 8.0 Hz, 1H, ArH); *Anal*. Calcd. for $C_{18}H_{12}Cl_3NO$: C, 59.29, H, 3.32, N, 3.84. Found: C, 59.22, H, 3.57, N, 3.79.

General procedure for the one-pot synthesis of 1,2-bis(2*H*-benzo[*e*]-1,3-oxazin-3(4*H*)-yl)ethanes (3a-d). To a mixture of aromatic alcohol (20 mmol) and ethylene diamine (10 mmol) in water (20 ml), formalin (37%, w/v, 40 mmol) was added. The reaction mixture was stirred at 25°C for 30 min. After completion of the reaction, the product was extracted with ethyl acetate (20 ml, two times). The organic layers were combined and washed with 10% aqueous NaOH solution (30 ml, two times) followed by water (50 ml). The organic layer was dried over sodium sulfate and evaporated under reduced pressure. The crude solid was washed with ethanol to obtained sufficiently pure product.

1,2-Bis(8-chloro-3,4-dihydro-2*H*-benzo[*e*]-1,3-oxazin-3(4*H*)-yl)ethane (3c). White solid; mp 167°C; ν_{max} (film, cm^{-1}) 2918, 2854, 1572, 1456, 1353, 1321, 1231, 1120, 1071, 1031, 981, 894, 762; ^1H nmr ($CDCl_3$): δ 2.98 (s, 4H, NCH_2CH_2N), 4.04 (s, 4H, $2NCH_2$), 5.02 (s, 4H, $2OCH_2N$), 6.77–6.87 (m, 4H, ArH), 7.21 (d, $J = 6.8$ Hz, 2H, ArH). *Anal.* Calcd. for $C_{18}H_{18}Cl_2N_2O_2$: C, 59.19, H, 4.97, N, 7.67. Found: C, 59.39, H, 5.22, N, 7.91.

Synthesis of 5,5-diaryl and 5-alkyl-3-phenyl-4-imidazolidones has been reported by reductive desulfurization of 5,5-diaryl and 5-alkyl-3-phenyl-2-thiohydantoins with nickel boride.

J. Heterocyclic Chem., **46**, 1007 (2009).

INTRODUCTION

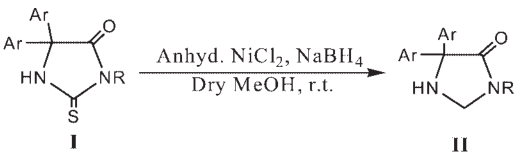
Compounds containing an imidazole ring are well-known in living systems. A number of 4-imidazolidone derivatives display a wide range of biological properties including anti-convulsant [1], anti-depressant [2], anti-inflammatory [3], anti-viral [4], anti-tumor [5], etc. 4-imidazolidones can be prepared by multistep synthesis involving reagents which are difficult to handle [6]. Although sodium and amyl alcohol [7], sodium amalgam [8], H_2 pressure on Pd-charcoal catalyst [9], and Raney nickel [10] have been reported as dethiating agents for 2-thiohydantoins, the yields range from low to moderate. However, the synthesis of 4-imidazolidones by reductive desulfurization of 2-thiohydantoins has not received attention. Reductive desulfurization of 2-thiohydantoins would obviously provide an alternate and convenient method of synthesis of 4-imidazolidones.

Nickel boride [11] has been reported as a convenient and efficient reagent for reductive desulfurization of benzimidazoline-2-thiones, 2-thiobarbituric acids [12], 2-thioxo-4-3*H*-quinazolinones [13], and 2-thioxo-5*H*-pyrano[23-*d*]pyrimidines [14]. In view of its versatility and ease of handling, we decided to explore its application for the desulfurization of 5,5-diaryl, 5-alkyl-3-phenyl and 5-alkyl-2-thiohydantoins.

RESULTS AND DISCUSSION

In this article, we report a convenient synthesis of 5,5-diaryl and 5-alkyl-3-phenyl-4-imidazolidones by reductive desulfurization of 5,5-diaryl-2-thiohydantoins (**Ia–i**) and 5-alkyl-3-phenyl-2-thiohydantoins (**IIIa–e**) with nickel boride in dry methanol at ambient temperature. The nickel boride was prepared *in situ* from anhydrous nickel chloride and sodium borohydride. Reactions were carried out under varying conditions by changing solvents and molar ratio of substrate to nickel boride to optimize conditions for quantitative desulfurization.

The 5,5-diaryl-2-thiohydantoins underwent complete reductive desulfurization to give the corresponding 5,5-diaryl-4-imidazolidones in high yields [Eq. (1)] and were identified by their spectral data. The sulfur by-product of these reactions is hydrogen sulfide gas. A number of new 4-imidazolidones have been synthesized in this manner. All the 4-imidazolidones showed a distinct peak at δ 4.4–4.5 for two protons due to —NH—CH$_2$—NR— group. IR showed a peak at ~1680–1750 cm^{-1} due to —CO—NR group. No 4-imidazolidinones (double bond between 1-2 positions or 2-3 positions) were formed under these conditions. These results are listed in Table 1.



(1)

2.	**Ib**	1:8:8	15	5,5-di(*p*-anisyl)-4-imidazolidone (**IIb**)	89 [10a]
3.	**Ic**	1:10:10	30	5,5-di(*p*-tolyl)-4-imidazolidone (**IIc**)	89
4.	**Id**	1:5:5	45	5,5-di(*o*-tolyl)-4-imidazolidone (**IId**)	88
5.	**Ie**	1:6:6	120	5,5-di(*p*-chlorophenyl)-4-imidaolidone (**IIe**)	89
6.	**If**	1:6:6	150	5,5-di(*o*-chlorophenyl)-4-imidazolidone (**IIf**)	86
7.	**Ig**	1:10:10	5	5,5-di(*p*-bromophenyl)-4-imidazolidone (**IIg**)	87
8.	**Ih**	1:8:8	10	5,5-di(*m*-bromophenyl)-4-imidazolidone (**IIh**)	84
9.	**Ih**	1:10:10	5	5,5-di(*m*-bromophenyl)-4-imidazolidone (**IIh**)	86
10.	**Ih**	1:15:15	5	5,5-di(*m*-bromophenyl)-4-imidazolidone (**IIh**)	82
11.	**Ii**	1:20:20[b]	6 h	–	–[c]

[a] 5 mL of dry methanol was used for 0.1 g of substrate.

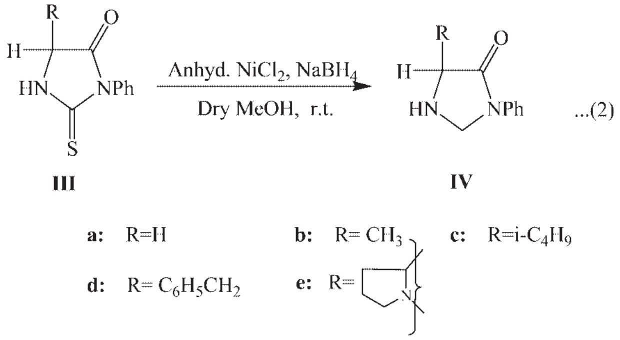
[b] Reaction started with 1:10:10 molar ratio of $S:NiCl_2:NaBH_4$ and another lot of 10:10 $NiCl_2:NaBH_4$ was added after 2 h.

[c] Incomplete reaction.

complex mixture of products, unlike the reactions in dry methanol. Therefore, dry methanol was the solvent of choice in these reactions. Reaction of 5,5-diphenyl-2-thiohydantoin (**Ia**) with sodium borohydride alone in 1:8 molar ratio yielded a mixture of products, whereas starting material was recovered on reaction with nickel chloride alone (molar ratio 1:8) under these conditions. This confirms that the reductive desulfurizations are proceeding due to nickel boride generated *in situ*.

Nickel boride showed high selectivity toward desulfurization because it did not affect the carbonyl group and also no dehalogenated products were obtained in the reactions of **Ie–h**. Reaction of 5,5-di(*m*-bromophenyl)-2-thiohydantoin (**Ih**) in high-molar ratios also did not show any debromination (Table 1) as only 82 and 86% of 5,5-di(*m*-bromophenyl)-4-imidazolidone (IIh) was isolated in runs 9 and 10, respectively. 3,5,5-Triphenyl-2-thiohydantoin (**Ii**) did not undergo any reaction and starting material was recovered unchanged even after using high-molar ratios (run 11). This could be due to steric hindrance of the 3-phenyl groups, which prevents reaction on the surface of catalyst.

Reactions of 5-alkyl-3-phenyl-2-thiohydantoins (**IIIa–d**) also yielded corresponding 5-alkyl-3-phenyl-4-imidazolidones (**IVa–d**) in high yields with nickel boride [Eq. (2)]. Desulfurization of 2-phenyl-1*H*-pyrrolo[1,2-*c*]imidazol-3-thio-1-one (**IIIe**) with nickel boride yielded 2-phenyl-1*H*-pyrrolo[1,2-*c*]imidazol-1-one (**IVe**) with 89% yield. Synthesis of **IVe** has been reported by multistep synthesis [16]. Reactions of 2-thiohydantoin (**Va**), 5-methyl-2-thiohydantoin (**Vb**), and 5-isopropyl-2-thiohydantoin (**Vc**) were not clear and mixtures of products were obtained. All the results are listed in Table 2.



Therefore, we conclude that nickel boride is an efficient reagent for the reductive desulfurization of 5,5-diaryl-2-thiohydantoins (**I**) and 5-alkyl-3-phenyl-2-thiohydantoins (**III**) and provides a convenient route for synthesis of 4-imidazolidones (**II** and **IV**) in high yields.

EXPERIMENTAL

Starting materials. Methanol (S.D. Fine) was used after drying by the reported procedure [17]. Nickel (II) chloride hexahydrate (Thomas Baker Chemicals) was dried by heating in a crucible till golden yellow, it was then allowed to cool at room temperature and stored over calcium chloride in a dessiccator. Sodium borohydride (E. Merck) was used in all the reactions. Thiourea (S.D. Fine) was used as such for the preparation of starting materials. Benzils were prepared from the corresponding hydrobenzoins by oxidation with NBS [18]. Glycine, alanine, isoleucine, phenylalanine, and proline were obtained from commercial sources. 5,5-Diaryl-2-thiohydantoins were prepared by the condensation of thiourea and benzils in the presence of potassium hydroxide [19]. 5-Alkyl-3-phenyl-2-thiohydantoins were prepared by the reaction of corresponding amino acids with aniline, triethyl amine, carbon disulphide, and methyl iodide [20] and 5-alkyl-2-thiohydantoins were

[a] Reaction started with 1:3:3 molar ratio of $S:NiCl_2:NaBH_4$ and second lot of $NiCl_2:NaBH_4$ was added after 60 min.
[b] Starting material disappeared but number of spots were observed on TLC.

prepared by reaction of amino acids with potassium thiocyanate in acetic anhydride [21].

Reactions of 2-thiohydantoins. In a typical procedure, 5,5-diphenyl-2-thiohydantoin (**Ia**) (0.1 g, 0.37315 mmol), anhydrous nickel chloride (0.3851 g, 2.9851 mmol), and dry methanol (5 mL) were placed in a 50 mL round-bottomed flask fitted with a condenser and a $CaCl_2$ guard tube. The flask was mounted over a magnetic stirrer. Sodium borohydride (0.1135 g, 2.9851 mmol) was added very cautiously while stirring the solution vigorously. The progress of the reaction was monitored by TLC using petroleum ether-ethyl acetate as eluent. After disappearance of the starting material, the reaction mixture was filtered through a celite pad (~1 inch) and washed with methanol (1 × 15 mL). The combined filtrate was diluted with water (~50 mL) and extracted with ethyl acetate (3 × 10 mL). The combined extract was dried over anhydrous $MgSO_4$, filtered, and concentrated on a rotary evaporator to give a new product, which was purified by recrystallization from ethanol and analyzed by mp, IR, NMR, and mass spectra as 5,5-diphenyl-4-imidazolidone (**IIa**) (0.0825 g, 94%) mp 182–183°C (lit. mp 183°C) [15]. All other products were synthesized similarly from the corresponding 2-thiohydantoins. The spectroscopic data of newly synthesized 4-imidazolidones is listed as follows.

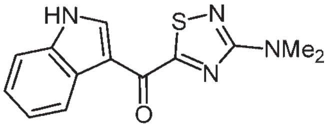
[2,4-Bis(arylamino)thiazol-5-yl]-(1-methyl-1*H*-benzimidazol-2-yl)methanones, as the analogs of the cytotoxic marine alkaloid dendrodoine, are synthesized and characterized by elemental analysis, IR, NMR, and Mass spectral data. The thiourea derivatives provide four ring atoms for the thiazole ring construction and thus act as [C—N—C—S] synthons. The remaining carbon of the thiazole is sourced from 2-(2-bromoacetyl)-1-methyl-1*H*-benzimidazole. This [4+1] heterocyclization reaction is adopted for the synthesis of novel 1-methyl-1*H*-benzimidazole derivatives.

J. Heterocyclic Chem., **46**, 1011 (2009).

INTRODUCTION

For a natural product, either from terrestrial or from marine sources, dendrodoine **1**, [3-(*N,N*-dimethylamino-1,2,4-thiadiazol-5-yl]-indol-3-yl-methanone, isolated [1] from the ''baked bean ascidian'' or *Dendrodoa grossularia*, is unusual in that it incorporates a 1,2,4-thiadiazole ring. It has been shown to be cytotoxic *in vitro* [1,2] and has been synthesized [3] by a 1,3-dipolar cycloaddition of indoloyl cyanide to a nitrile sulfide obtained by the thermolysis of a 1,3,4-oxathiazol-2-one prepared from *N,N*-dimethylurea and chlorocarbonylsulphenyl chloride. This route is rather inflexible as it is confined solely to the preparation of 3-*N,N*-dialkylamino derivatives. In addition, the hetaroyl cyanides are difficult to access, thereby making the preparation of dendrodoine analogs with a variety of substituents not easy. Moreover, the scope of the substituent manipulation in **1** is restricted due to the availability of only two carbons for substitution or functionalization in the 1,2,4-thiadiazole ring. Therefore, the exchange of a 2-aminothiazole unit for the 3-amino-1,2,4-thiadiazole unit in dendrodoine seemed attractive. Thus, the synthesis of several (2-*N,N*-dimethylaminothiazol-5-yl)-(hetaryl)-methanones as thiazole analogs of dendrodoine and the cancer cell cytotoxicity of the indolyl derivative **2** at submicromolar concentration were reported by us recently [4].



1
Dendrodoine

In this context, the 2-amino-5-ketothiazole synthesis developed by us [5–7] appeared promising. A variety of amino substituents could be placed on C-2 and C-4 carbons of the thiazole ring by choosing the appropriate thiourea synthon and the 5-keto substituent could be accessed through a variety of α-haloketones. As typical examples, [4-amino-2-(4-methoxyphenylamino)-thiazol-5-yl)]-phenylmethanone **3** [8], [4-(4-chlorophenylamino)-2-(4-methoxyphenylamino)thiazol-5-yl)]-*1H*-indol-3-yl-methanone **4**, and 5-[4-amino-2-(4-methoxyphenylamino)-thiazol-5-yl)]-(1-methyl-1*H*-benzimidazol-2-yl)-methan-one **5** [9] were found to be cancer cell cytotoxic at submicromolar levels. To broaden the scope of this study further, we now report the synthesis of [2,4-bis(arylamino)thiazol-5-yl](1-methyl-1*H*-benzoimidazol-2-yl)methanones as further analogs of dendrodoine. Literature survey shows several examples of compounds having a 1*H*-benzimidazole ring which exhibit remarkable bioactivity including anticancer activity [10–14].

RESULTS AND DISCUSSION

The route adopted for the synthesis of these novel analogs of dendrodoine was based on a retro synthetic analysis as outlined in Scheme 1. The thiourea derivatives [5–7] (**6a–k**) provide four ring atoms for the thiazole ring construction and thus act as [C—N—C—S] synthons. The remaining carbon of the thiazole is sourced from 2-(2-bromoacetyl)-1-methyl-1*H*-benzimidazole. This [4+1] heterocyclization reaction is now selected for the synthesis of novel 1-methyl-1*H*-benzimidazole derivatives (Scheme 2). Thus, the reaction of 1-(*N*,*N*'-diphenylamidino)-3-phenylthiourea (**6a**) in *N*,*N*-dimethylformamide (DMF) with 2-(2-bromoacetyl)-1-methyl-1*H*-benzimidazole (**7**) which was prepared from 2-(1-hydroxyethyl)-1*H*-benzimidazole [15,16], in DMF in the presence of triethylamine afforded an orange, crystalline compound which showed up in the thin layer chromatogram (TLC) as a single fluorescent yellow spot, indicating the formation of only one major product.

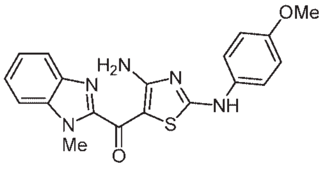
4



5

The molecular composition of the compound (**8a**) was found to be $C_{24}H_{19}N_5OS$. The IR (KBr) spectrum shows peaks at 3387, 3267, 3200, and 3117 cm^{-1}, which are attributed to the ν_{N-H} vibration. The aromatic ν_{C-H} band appears at 3050 cm^{-1}. The aliphatic ν_{C-H} band is observed at 2928 cm^{-1}and 2861 cm^{-1}. The highly conjugated carbonyl group shows $\nu_{C=O}$ vibration at 1607 cm^{-1}.

The ^{1}HNMR (300 MHz, DMSO-d_6) spectrum shows a three-hydrogen singlet at δ 4.22, which has been ascribed to the methyl group of 1-methyl-1*H*-benzimidazole ring. The spectrum consists of three multiplets in the aromatic region. The first multiplet at δ 7.06–7.18 is due to two aromatic hydrogens. The H-5 and H-6 of the 1-methyl-1*H*-benzimidazole ring and the four other aromatic hydrogens give rise to the second multiplet at δ 7.25–7.46. The third multiplet at δ 7.64–7.78 arises from H-4 and H-7 of the 1-methyl-1*H*-benzimidazole ring and the remaining four aromatic hydrogens. The two one-hydrogen singlets in the downfield region at δ 11.19 and 11.85 are assignable to NH hydrogen of the two NHAr groups.

The FAB MS confirms the molecular mass of the compound as 425 in accordance with the elemental analysis data. The presence of 24 carbons in the compound is confirmed from the 20 peaks observed in the ^{13}CNMR spectrum. Based on these data, the structure of the compound now obtained was assigned as [2,4-bis(phenylamino)thiazol-5-yl](1-methyl-1*H*-benzim-idazol-2-yl)methanone (**8a**). By following the similar procedure 10 additional [2,4-bis(arylamino)thia-zol-5-yl](1-methyl-1*H*-benzimidazol-2-yl)methanones (**8b–k**) were prepared and characterized.

EXPERIMENTAL

Melting points are uncorrected and were determined by open capillary method using an immersion bath of silicon oil. TLC was performed using silica gel-G (E. Merck, India) coated on glass plates. The spots were visualized in iodine vapor or under UV light. The spectra were recorded on: JEOL

[a] Crude product [b] Recrystallised product

DRX 300 or DPX 300 NMR spectrometer (300 MHz for ^{1}H and 75 MHz for ^{13}CNMR spectra), JEOL SX 102/DA-6000 mass spectrometer (using Argon/Xenon, 6 KV, 10 mA as the FAB gas, and *m*-nitrobenzyl alcohol as the matrix) for FAB mass spectra and Nicolet 400D FTIR spectrometer. All new compounds gave satisfactory C, H, and N analysis (CDRI, Lucknow).

General procedure for the synthesis of [2,4-bis(arylamino)thiazol-5-yl](1-methyl-1*H*-benzoimidazol-2-yl)methanones (8a–k). A solution of 2-(2-bromoacetyl)-1-methyl-1*H*-benzimidazole (**7**) (0.254 g, 1 mmol) which was prepared from 2-(1-hydroxyethyl)-1*H*-benzimidazole [15,16], in DMF (2 mL) was added to a solution of 1-aryl-3-(*N*,*N*'-diarylamidino)thiourea (1 mmol) (**6a–k**) [5] in DMF (2 mL). Triethylamine (0.15 mL, 1 mmol) was added under stirring and the mixture was heated at 80–85°C for 5 min. It was then cooled and poured into ice-cold water with constant stirring. The yellow precipitate thus obtained was filtered, washed with water, and dried. The crude product was purified by crystallization.

[2,4-Bis(phenylamino)thiazol-5-oyl](1-methyl-1H-benzoimidazol-2-yl)methanone (8a). Starting from 1-(*N*,*N*'-diphenylamidino)-3-phenylthiourea (**6a**), 2-(2-bromoacetyl)-1-methyl-1*H*-benzimidazole (**7**), and following the general procedure above, **8a** was obtained as a deep orange solid. It was crystallized from ethanol-water (3:1), m.p. 180–181°C; IR (KBr) ν: 3387, 3267, 3200, 3117, 3050, 2928, 2861, 1607, 1573, 1517, 1483, 1445, 1350, 1217, 950, 900, 733, 690 cm^{-1}; ^{1}HNMR (300 MHz, DMSO-d_6): δ 4.22(s, 3H, *N*—CH_3), 7.06–7.18(m, 2H, 2ArH), 7.25–7.46(m, 6H, H-5, H-6, 4ArH), 7.64–7.78(m, 6H, H-4, H-7, 4ArH), 11.19(s, 1H, NH), 11.85(s, 1H, NH); ^{13}CNMR (75 MHz, DMSO-d_6): δ 32.4, 96.4, 111.2, 119.4, 120.0, 120.2, 123.2, 123.4, 124.0, 124.6, 129.2, 129.3, 136.8, 139.1, 139.3, 140.8, 147.2, 162.7, 171.7, 171.8; FABMS: *m*/*z* 426 (MH$^+$), 425 (M$^+$). *Anal.* Calcd for $C_{24}H_{19}N_5OS$: C, 67.74; H, 4.50; N, 16.46%. Found: C, 67.61; H, 4.58; 16.61%.

[2,4-Bis(4-chlorophenylamino)thiazol-5-oyl](1-methyl-1H-benzoimidazol-2-yl)methanone (8b). The reaction of 1-(*N*,*N*'-di(4-chlorophenyl)amidino)-3-(4-chlorophenyl)thiourea (**6b**) with **7** afforded **8b** as a deep orange solid. It was crystallized from ethanol-water (3:1), m.p. 238–239°C; IR (KBr) ν: 3449, 3238, 3189, 3111, 3032, 2933, 2867, 1627, 1576, 1493, 1455, 1411, 1356, 1210, 1093, 1023, 960, 822, 740, 674 cm^{-1}; ^{1}HNMR (300 MHz, DMSO-d_6): δ 4.20(s, 3H, *N*—CH_3), 7.27–7.53(m, 6H, H-5, H-6, 4ArH), 7.60–7.78(m, 6H, H-4, H-7, 4ArH), 11.26(s, 1H, NH), 11.79(s, 1H, NH); FABMS: *m*/*z* 494 (MH$^+$), 493 (M$^+$). *Anal.* Calcd for $C_{24}H_{17}Cl_2N_5OS$: C, 58.30; H, 3.47; N, 14.17%. Found: C, 58.53; H, 3.58; N, 14.02%.

[2,4-Bis(4-methylphenylamino)thiazol-5-oyl](1-methyl-1H-benzoimidazol-2-yl)methanone (8c). 1-(*N*,*N*'-di(4-methylphenyl)amidino)-3-(4-methylphenyl)thiourea (**6c**) and **7** on reaction as above gave **8c** a as a deep orange solid. It was crystallized from ethanol-water (3:1), m.p. 208–209°C; IR (KBr) ν: 3312, 3200, 3117, 3050, 2928, 2850, 1607, 1597, 1550, 1519, 1450, 1350, 1216, 1167, 1117, 1017, 879, 825, 733, 683 cm^{-1}; ^{1}HNMR (300 MHz, DMSO-d_6): δ 2.29(s, 6H, 2CH_3), 4.23(s, 3H, *N*—CH_3), 7.16–7.26(m, 4H, 4ArH), 7.28–7.43(m, 2H, H-5, H-6), 7.54(d, J = 8.1 Hz, 2H, 2ArH), 7.63(d, J = 8.4 Hz, 2H, 2ArH), 7.69(d, J = 8.1 Hz, 1H, H-7), 7.74(d, J = 7.8 Hz, 1H, H-4), 11.08(s, 1H, NH), 11.87(s, 1H, NH); ^{13}CNMR (75 MHz, DMSO-d_6): δ 20.86, 20.94, 32.27, 95.46, 97.76, 102.35, 110.09, 120.78, 120.92, 121.03, 123.00, 124.47, 129.47, 130.14, 133.20, 135.22, 135.62, 136.82, 141.48, 148.38, 163.25, 172.28; FABMS: *m*/*z* 454 (MH$^+$), 453 (M$^+$). *Anal.* Calcd for $C_{26}H_{23}N_5OS$: C, 68.85; H, 5.11; N, 15.44%. Found: C, 68.58; H, 5.01; N, 15.58%.

[2-(4-Chlorophenylamino)-4-phenylaminothiazol-5-oyl](1-methyl-1H-benzoimidazol-2-yl)methanone (8d). Using 1-(*N*,*N*'-diphenylamidino)-3-(4-chlorophenyl)thiourea (**6d**), and **7**, **8d** was obtained as a deep orange solid. It was crystallized from ethanol-water (3:1), m.p. 171–173°C; IR (KBr) ν: 3367, 3282, 3184, 3117, 2929, 2864, 1621, 1582, 1522, 1494, 1456, 1406, 1355, 1222, 1097, 963, 830, 752, 686 cm^{-1}; ^{1}HNMR (300 MHz, DMSO-d_6): δ 4.22(s, 3H, *N*—CH_3), 7.11(t, J = 9 Hz, 1H, 1ArH), 7.26–7.51(m, 6H, H-5, H-6, 4ArH), 7.59–7.79(m, 6H, H-4, H-7, 4ArH), 11.27(s, 1H, NH), 11.80(s, 1H, NH). FABMS: *m*/*z* 460 (MH$^+$). *Anal.* Calcd for $C_{24}H_{18}ClN_5OS$: C, 62.67; H, 3.94; N, 15.23%. Found: C, 62.57; H, 3.81; N, 15.48%.

[2-(4-Methylphenylamino)-4-phenylaminothiazol-5-oyl](1-methyl-1H-benzoimidazol-2-yl)methanone (8e). The reaction of 1-(*N*,*N*'-diphenylamidino)-3-(4-methylphenyl)thiourea (**6e**) with **7** afforded **8e** as a deep orange solid. It was crystallized from ethanol-water (3:1), m.p. 161–164°C; IR (KBr) ν: 3384, 3272, 3200, 3117, 3059, 2931, 2850, 1619, 1580, 1506, 1448, 1418, 1357, 1205, 966, 825, 751 cm^{-1}; ^{1}HNMR (300 MHz, DMSO-d_6): δ 2.31(s, 3H, CH_3), 4.25(s, 3H, *N*—CH_3), 7.12(t, *J* = 6.9 Hz, 1H, 1ArH), 7.24(d, *J* = 7.8 Hz, 2H, 2ArH), 7.28–7.49(m, 4H, H-5, H-6, 2ArH), 7.56(d, *J* = 7.5 Hz, 2H, 2ArH), 7.64–7.86(m, 4H, H-4, H-7, 2ArH), 11.10(s, 1H, NH), 11.91(s, 1H, NH); FABMS: *m*/*z* 440 (MH^+), 439 (M^+). *Anal.* Calcd for $C_{25}H_{21}N_5OS$: C, 68.31; H, 4.82; N, 15.94%. The synthesis of halogenoindirubins was attempted. The reaction of 3-acetoxy-6-bromoindole (**5**) with 6-bromoisation (**10**) in methanol with Na_2CO_3 produced 6-bromo-6′-fluoroindirubin (**11**) in 80% yield. Its structure determination was mainly undertaken using ^1H NMR spectroscopy. A similar reaction gave 6′-bromoindirubin (**12**) and 6-bromoindirubin (**3**) in moderate yields.

J. Heterocyclic Chem., **46**, 1016 (2009).

INTRODUCTION

Tyrian purple, royal purple, and ancient purple are all synonyms for a dye of molluscan origin and were used as valuable purple dyes of garments for ancient exalted persons such as princes and nobles in the districts along the Mediterranean [1,2]. The precursors of Tyrian purple are contained in the hypobranchial glands of various species of gastropods from the families Muricidae and Thaidinae, and converted into Tyrian purple by the action of sunlight and purpurase [3,4]. In 1909, Friedländer isolated 1.4 g of the dye from 12,000 specimens of the gastropod *Murex brandaris* and identified it as 6,6′-dibromoindigo (**1**) [5].

We have already reported that **1** is easily obtained in three steps by the reactions of the commercially available 6-bromoindole [6]. The hypobranchial glands aforementioned contain 6,6′-dibromoindirubin (**2**) and 6-bromo-indiubin (**3**) as minor components [7–10]. Their compounds have become of interest from the standpoint of glycogen synthase kinase (GSK)-3-selective inhibitors [10]. In addition, indirubin (**4**) exhibits strong antitumor [11] and potent aryl hydrocarbon ligand activities [12]. Synthesis of the bromoindirubins has been already reported [13].

The reaction of 3-acetoxy-6-fluoroindole (**5**) with isatin (**6**) produced 6′-fluoroindirubin (**7**). On the basis of this result, we have already revised the synthetic scheme of **2** reported by Cooksey [14]. The revised synthetic scheme is applicable for the syntheses of halogenoindirubins.

The present article describes the syntheses of the halogenoindirubins (Fig. 1).

RESULTS AND DISCUSSION

We have already reported that the 3-acetoxy-halogenoindoles are obtained in two steps by the reactions of the commercially available haloindoles. Iodination of the haloindoles, followed by acetoxylation with silver acetate in acetic acid, afforded 3-acetoxy-6-halogenoindole [15]. The reaction of 3-acetoxy-6-fluoroindole (**5**) with 6-bromoisatin (**10**) was carried out in methanol with Na_2CO_3 at room temperature. The structure of the product (**11**) was based on the ^1H NMR spectral data and MS spectral data. The H-4 signal ($\delta = 8.67$) showed a remarkable downfield shifts relative to the H-4′ signal ($\delta = 7.74$). The absorption of H-4′ is split by H-5′ ($J_{4'\text{-}5'} = 8.5$ Hz) and F-6′ ($J_{4'\text{-F}} = 5.5$ Hz). Unfortunately, the ^{13}C NMR spectra could not be measured, because **11** was

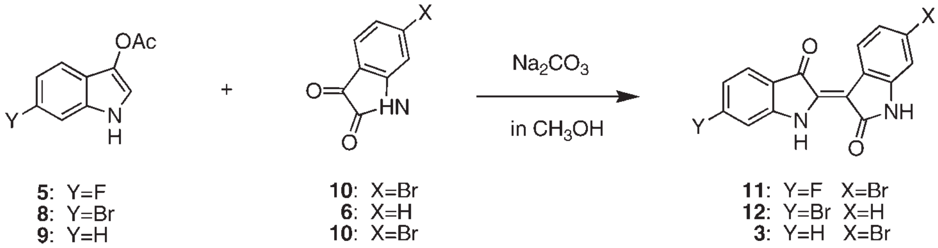
Scheme 1. Synthesis of the halogenoindirubins.



only slightly soluble in dimethyl sulfoxide. The mass spectrum of **11** clearly exhibited a molecular ion peak at *m*/*z* 358 (Scheme 1).

The treatment of 3-acetoxy-6-bromoindole (**8**) with **6** gave 6′-bromoindirubin (**12**) in 81% yield. On the other hand, the reaction of 3-acetoxyindole (**9**) [16] with 6-bromoisatin (**10**) afforded 6-bromoindirubin (**3**) in 85% yield.

The ^{1}H NMR spectra of **12** and **3** are shown in Figures 2 and 3 for direct comparison. In general, the signal of the ortho positional proton of Br is observed more downfield than that of the benzene ring proton. The H-5′ (δ = 7.15) and H-7′ (δ = 7.66) signals of **12** showed a downfield shift relative to those of H-5′ (δ = 7.03) and H-7′ (δ = 7.42) of **3**. Similarly, the H-5 (δ = 7.21) and H-7 (δ = 7.04) signals of **3** appeared as a downfield shift compared to those of H-5 (δ = 7.00) and H-7 (δ = 6.89) of **12**.

EXPERIMENTAL

The ^{1}H NMR and ^{13}C NMR spectra were obtained using a JEOL JNM-A500 (500 MHz) spectrometer in dimethyl sulfoxide-d$_6$ at room temperature. The chemical shifts are given in ppm relative to tetramethylsilane as the internal reference standard. The EI mass spectra were performed using a JEOL JMS-SX 102A mass spectrometer. The infrared spectra were recorded using a Shimadzu IR 470 spectrometer in potassium bromide pellets. The melting points were obtained using a Yanaco MS-S3 micro melting point apparatus (hot-plate type). For the preparative column chromatography, Wakogel C-200 silica gel was used. Indole, 6-fluoroindole, 6-bromoisatin, and isatin were purchased from Tokyo Kasei Kogyo (Tokyo, Japan).

General procedure for the synthesis of halogenoindirubins. The reaction of 3-acetoxy-6-fluoroindole (**5**) with 6-bromoisatin (**10**) is described as a typical example. A solution of **5** (65 mg, 0.339 mmol) and **10** (77 mg, 0.339 mmol) in methanol (15 mL) was stirred under a nitrogen atmosphere at room temperature for 10 min. To the mixture was added

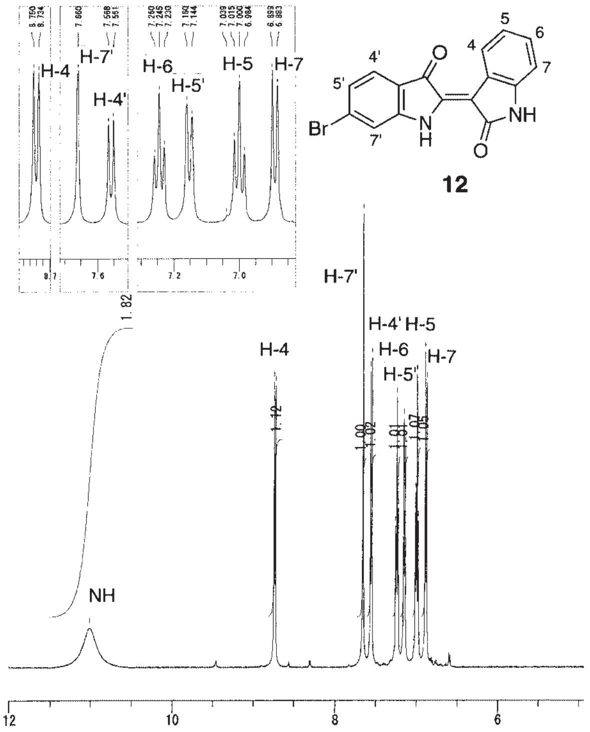


Figure 2. The spectrum of 6′-bromoindirubin (**12**).

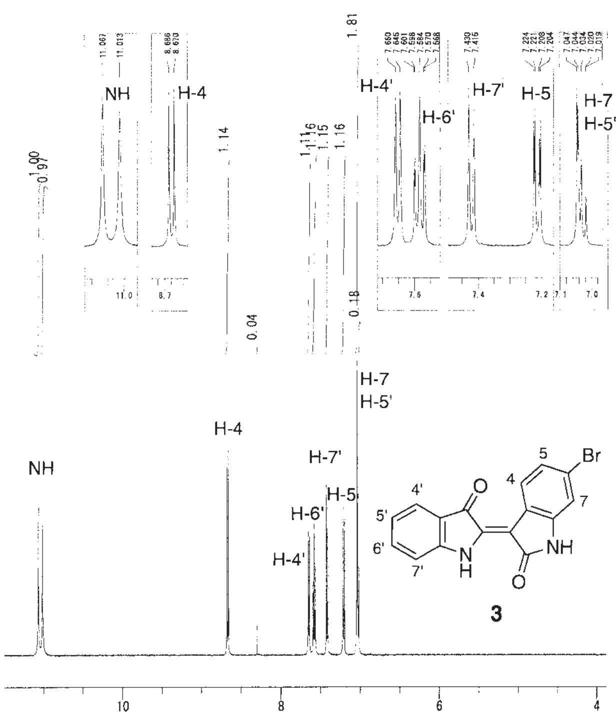

Figure 3. The spectrum of 6-bromoindirubin (**3**).

anhydrous sodium carbonate (86 mg, 0.814 mmol). After the mixture was stirred for 3 h, water was added. The resulting precipitate was collected by filtration, washed with water and aqueous methanol (1:1). The crude product (106 mg) was recrystallized from ethyl acetate to give 6-bromo-6′-fluoroindirubin (**11**) (97 mg, 80% yield) as a red–purple powder, mp $>$ 300°C; ir (potassium bromide): 3300 (NH), 3175 (NH), 1668 (C=O), 1625 (C=O), 1605, 1591, 1451, 1289, 1208, 1129, 1009, 968 cm^{-1}; ^1H NMR (dimethyl sulfoxid-d_6): δ = 6.86 (1H, m, H-5′), 7.11 (1H, d, $J_{7\text{-}5}$ = 2.3 Hz, H-7), 7.20 (1H, dd, $J_{7'\text{-}F}$ = 10, $J_{7'\text{-}5'}$ = 2.5 Hz, H-7′), 7.23 (1H, dd, $J_{5\text{-}4}$ = 8.5, $J_{5\text{-}7}$ = 2.3 Hz, H-5), 7.74 (1H, dd, $J_{4'\text{-}5'}$ = 8.5, $J_{4'\text{-}F}$ = 5.5 Hz, H-4′), 8.67 (1H, d, $J_{4\text{-}5}$ = 8.5 Hz, H-4), 11.05 (1H, s, NH), 11.14 (1H, s, NH); ms (EI): *m*/*z* (relative intensity) 360 (M+2, 99%), 358 (M^+, 100), 332 (21), 330 (21), 223 (62); HRMS(EI) calcd for $C_{16}H_8O_2N_2BrF$, M^+ 357.9753, found 357.9755.

A simple and efficient method has been developed for the synthesis of 4-aryl-3,4-dihydronaphtho[2,1-*e*][1,3]oxazin-2-one and 1-aryl-1,2-dihydronaphtho[1,2-*e*][1,3]oxazin-3-one derivatives through a one-pot three-component coupling of α or β-naphthol, aromatic aldehydes and urea using a catalytic amount of zinc triflate in refluxing acetonitrile.

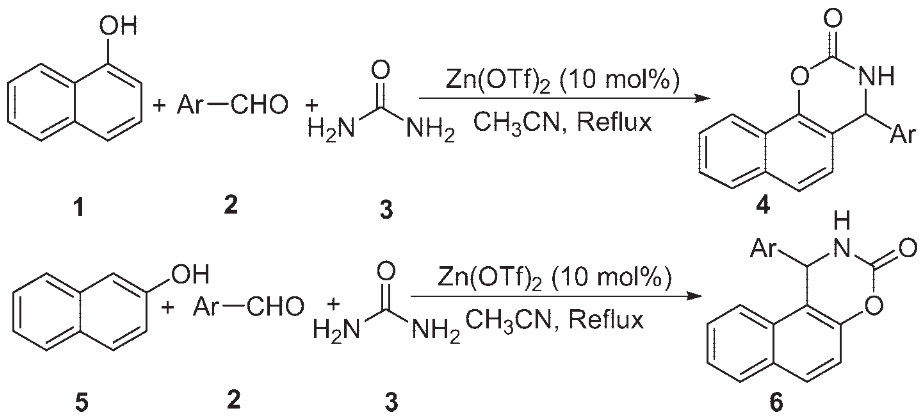
J. Heterocyclic Chem., **46**, 1019 (2009).

INTRODUCTION

Aromatic-condensed oxazinone derivatives are of significant importance because of their promising biological activities [1]. In addition, these heterocyclic compounds represent an important class of functionalized building blocks. For example, they have been used as valuable precursors in the preparation of phosphinic ligands for asymmetric catalysis and in the synthesis of biologically active heterocyclic derivatives [2]. The general method for the preparation of 2-aminomethyl phenol derivatives is *via* the Mannich-type reaction [3]. To the best of our knowledge, there is only one report for the synthesis of 4-aryl-3,4-dihydronaphtho[2,1-*e*][1,3]oxazin-2-one derivatives in the literature [4]. However, only few methods are available for the preparation of 1-aryl-1,2-dihydronaphtho[1,2-*e*][1,3]oxazin-3-one derivatives [1,4,5]. All of these methods suffer from the same drawbacks, specially in the use of toxic solvents (benzene) or expensive and hazardous reagents (carbamyl chlorides, isocyanates, and phosgene). In addition, they involve multistep synthetic operations which lower the overall yields. Recently, Bazgir *et al.* reported a one-pot synthesis of 1-aryl-1,2-dihydronaphtho[1,2-*e*][1,3]oxaxine-3-one derivatives by three component coupling of β-naphthol, aromatic aldehydes, and urea in moderate to high yields [6]. However, this approach is satisfactory for the condensation with β-naphthol, but α-naphthol produced no product under the reaction conditions. Therefore, it is desirable to develop a more efficient and general method for the synthesis of naphthoxazinone derivatives from both naphthol isomers.

Multicomponent reactions are finding increasing interest in the synthesis of biologically important compounds, as they possess one of the aforementioned qualities namely the possibility of building up complex molecules with simplicity and brevity. The modern synthesis is the one in which the target components are produced in one step, in quantitative yield from readily available and inexpensive starting materials in a resource-effective and environmentally benign process [7]. As a part of our program to synthesize biologically active heterocyclic derivatives using multicomponent coupling reactions [8,9], we wish to report here an efficient zinc triflate catalyzed one-pot synthesis of

Scheme 1



naphthoxazinone derivatives by coupling of α or β-naphthol, an aromatic aldehyde, and urea (Scheme 1).

RESULTS AND DISCUSSION

In our initial investigation, the coupling reaction of β-naphthol (1 mmol), benzaldehyde (1 mmol), and urea (1.5 mmol) was carried out in different solvents in the presence of $Zn(OTf)_2$ (10 mol%) under reflux. Comparing with other organic solvents, CH_3CN was the most effective reaction media (Table 1, entry 1). The coupling reaction was also performed in the presence of different catalysts (10 mol%), such as $La(OTf)_3$, $In(OTf)_3$, $ZnCl_2$, and $Zn(ClO_4)_2$. But, we observed $Zn(OTf)_2$ was the most effective catalyst in the terms of yields (82%).

On the basis of the earlier results, this process was then extended to other aromatic aldehydes to investigate its scope and generality. The results are summarized in Table 2. Aromatic aldehydes with both activating and weekly deactivating groups, such as F, Br, Cl, Me, OMe, and OH, reacted to afford the corresponding products in high yields. Piperonal also afforded high yields without any difficulty.

Table 1

Reaction of β-Naphthol with benzaldehyde and urea under reflux in different reaction conditions.

Entry	Catalyst (10 mol %)	Solvent	Time (h)	Yield (%)[a]
1	$Zn(OTf)_2$	CH_3CN	5	82
2	$Zn(OTf)_2$	$ClCH_2CH_2Cl$	5	70
3	$Zn(OTf)_2$	$HOCH_2CH_2OMe$	5	65
4	$ZnCl_2$	CH_3CN	5	36
5	$Zn(ClO_4)_2$	CH_3CN	5	68
6	$In(OTf)_3$	CH_3CN	5	60
7	$La(OTf)_3$	CH_3CN	5	55

[a] Isolated yields.

Our attention was then turned to the possibility of reaction with α-naphthol. It was found that the replacement of β-naphthol with α-naphthol produced the naphthoxazine-2-one derivatives in good yields under the similar conditions. On the basis of the earlier results, this process was then extended to other substituted aromatic aldehydes. The results are listed in Table 3. It is cleared that under these similar conditions, benzaldehydes containing methyl or methoxy groups easily undergo condensation with α-naphthol and urea to produce 4-aryl-3,4-dihydronaphtho[2,1-*e*][1,3]oxazin-2-ones in good yields. However, under the present reaction conditions aliphatic aldehydes and thiourea did not afford the corresponding naphthoxazinone derivatives, instead leaded to multiple products whose identities are yet to be established.

Based on the experimental results, a plausible mechanism was proposed in Scheme 2. In this hypothesis, $Zn(OTf)_2$ serves as the Lewis-acid catalyst for several stages. The intermediates **7** were isolated in a couple of reactions and properly characterized. These intermediates were subsequently cyclized to naphthoxazinone

derivatives by further heating. It should be pointed out that 4-nitrobenzaldehyde and 3-nitrobenzaldehyde reacted with urea and β-naphthol but the reaction stopped at intermediate stage **7** [10]. The reaction did not proceed further on long time heating.

CONCLUSIONS

In conclusion, the work presented here demonstrates a straightforward and general procedure for the efficient one-pot synthesis of naphthoxazinones by a three-component coupling of naphthols, aromatic aldehydes, and urea. The reaction possesses the following synthetic features: (a) mild conditions, (b) simple operation, (c) good yields, (d) nontoxic and cheap metal catalyst, (e) the compatibility with various functional groups, and (f) applicability for an easy synthesis of 1-aryl-1,2-dihydronaphtho[1,2-*e*][1,3]oxazin-3-ones and 4-aryl-3,4-dihydronaphtho[2,1-*e*][1,3]oxazin-2-ones.We believe that this procedure will provide a better and more practical alternative to the existing methodologies for the synthesis of naphthoxazinone derivatives. Further investigations to broaden the scope of this methodology toward pharmaceuticals and chiral products are in progress.

EXPERIMENTAL

Melting points were determined on a glass disk with an electrical bath and are uncorrected. ^1H NMR (300 MHz) and ^{13}C NMR (75 MHz) spectra were run in DMSO-d_6 solutions. IR spectra were taken as KBr plates. Elemental analyses were done by Perkin-Elmer autoanalyzer. $Zn(OTf)_2$ was purchased from Aldrich. All liquid reagents were distilled before use.

Typical procedure for the synthesis of 1-phenyl-1,2-dihydronaphtho[1,2-*e*][1,3]oxazin-3 one (Table 2, 4a). A solution of benzaldehyde (212 mg, 2 mmol, 203 μL), β-naphthol (288 mg, 2 mmol), and urea (180 mg, 3 mmol) in CH_3CN (4 mL) was heated under reflux (90–95°C) in the presence of zinc triflate (73 mg, 10 mol%) for 5 h (TLC). At completion, the reaction mixture was distilled under vacuum to remove the solvent and then diluted with cold water (10 mL). After extraction with ethyl acetate (20 mL × 3), the combined organic layers were washed with brine and dried over anhydrous Na_2SO_4. The residue was concentrated and recrystallized from EtOAc-hexane to afford the pure product as a white powder (451 mg, 82%), mp 216–218°C (reported 218–220°C) [6a].

Typical procedure for the synthesis of 4-phenyl-3,4-dihydronaphtho[1,2-*e*][1,3]oxazin-2-one (Table 3, 6a). The procedure reported in the previous experiment was followed using α-naphthol in place of β-naphthol. The corresponding pure product was obtained as a white powder (352 mg, 64%), mp 195–197°C (reported 196–198°C) [4].

The spectral (IR, ^1H, and ^{13}C NMR) data and elemental analyses of the compounds which are not readily found are provided later.

1-Benzo[1,3]dioxol-5-yl-1,2-dihydronaphtho[1,2-e][1,3]oxazin-3-one (Table 2, 4d). This compound was obtained according to the above procedure as white powder, mp 164–166°C; IR (KBr): 3321, 1701, 1447 cm^{-1}; ^1H NMR (DMSO-d_6): δ = 8.42 (br s, 1H), 7.89–7.84 (m, 2H), 7.64–7.60 (m, 2H), 7.46–7.41 (m, 2H), 7.32–7.27 (m, 1H), 6.83–6.71 (m, 3H), 6.01 (d, J = 4.0 Hz, 1H), 5.91 (d, J = 4.0 Hz, 1H); ^{13}C NMR (DMSO-d_6): δ = 149.5, 147.8, 147.6, 147.1, 137.0, 130.6, 130.4, 129.1, 128.8, 127.6, 125.3, 123.4, 120.6, 117.1, 114.2, 108.6, 107.5, 101.4, 53.6; *Anal.* Calcd for $C_{19}H_{13}NO_4$: C 71.47, H 4.10, N 4.39. A facile synthesis of 2*H*-thiochromenes through $TiCl_4$-promoted reaction of 2-*tert*-butylthiobenzaldehydes with activated alkenes is described.

J. Heterocyclic Chem., **46**, 1023 (2009).

INTRODUCTION

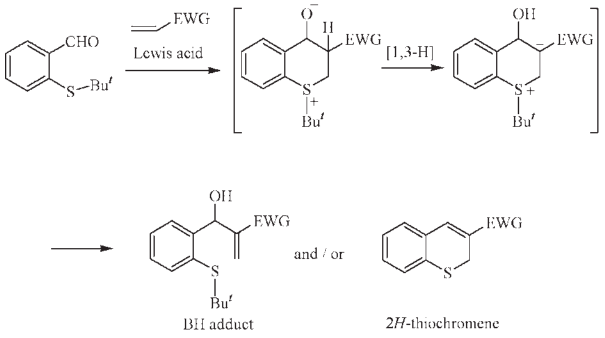
Thiochromenes are of considerable pharmacological and material interest because they display a wide range of biological activities [1] and are occasionally used as scaffolds [2] or synthetic intermediates of functional dyes [3]. In recognition of their importance, several efforts have been made to synthesize this class of molecules so far, but the development of more efficient and general method still remains a continuing challenge. The main synthetic routes involve an initial condensation of thiophenols with acrylic acid derivatives, followed by reduction and dehydration [4], and a magnesium amide-induced sequential conjugate addition-aldol type condensation reaction between 2-mercaptoacetophenone and α,β-unsaturated carboxylic acid derivatives and subsequent dehydration [5]. A similar method to produce chiral 2*H*-thiochromenes through tandem Michael-aldol reactions between 2-mercaptobenzaldehyde and α,β-unsaturated aldehydes has been reported [6]. In addition, several other synthetic methods are available such as the cyclization of 3-(2-*tert*-butylthiophenyl)-prop-2-en-1-ols [7] and the Baylis-Hillman (BH) reaction of 2,2′-dithiodibenzaldehyde with activated alkenes [8]. However, most of these routes suffer from main drawbacks such as multistep processes, the poor availability of starting material, and the limited scope of substrates. Recently, we also reported a tandem S_N2' and S_NAr reaction of BH acetates having an *ortho*-leaving group with sodium sulfide, leading to the formation of 2*H*-thiochromenes, which gave unsatisfactory product yields [9]. In continuation of our ongoing studies on the synthesis of heterocycles, including thiochromenes, using BH methodology [10], we herein describe $TiCl_4$-promoted reaction of 2-*tert*-butylthiobenzaldehydes with activated alkenes, which serves as a facile method for the synthesis of 2*H*-thiochromenes.

RESULTS AND DISCUSSION

The chalcogeno-Baylis-Hillman reaction [11] is well known as a coupling reaction of activated alkenes with electrophiles such as aldehydes [12], activated ketones [13], and acetals [14] catalyzed by a mixture of Lewis acid and base, typically using titanium (IV) chloride ($TiCl_4$)/methyl sulfide [12,13] to give highly functionalized olefins. We envisioned that the reactions of 2-*tert*-butylthiobenzaldehydes with activated alkenes in the presence of $TiCl_4$ could produce the thiochromenes alone or together with the BH adducts, after loss of the *tert*-butyl group under acidic conditions without addition of extra Lewis base such as sulfide, because aldehydes have a chalcogenyl group which might serve as a Lewis base (Scheme 1).

Accordingly, we first synthesized 2-*tert*-butylthiobenzaldehydes **2a–e** as starting materials, following a slightly modified literature procedure [15,16]. The reaction of benzaldehydes **1a–e** with 1.2 equiv of *tert*-butylthiol in the presence of 1 equiv of potassium carbonate in *N*,*N*-dimethylformamide at reflux temperature gave 2-*tert*-butylthiobenzaldehydes **2a–e** in 64–97% yields. Treatment of **2a–e** with 2 equiv of methyl vinyl ketone (MVK) in the presence of 1 equiv of $TiCl_4$ in 1,2-dichloroethane at reflux temperature gave the expected 3-acetyl-2*H*-thiochromenes **4a–e** in low to acceptable yields (8–51%) without the production of BH adducts. The spectral data of **4a** were identical to the reported infrared, ^1H, ^{13}C NMR spectral values [8]. As

Scheme 1



shown in Table 1, the presence of electron-withdrawing chloro- or nitro-substituents in benzene ring of aldehyde **2** demanded a prolonged reaction time to afford the corresponding thiochromenes. For instance, the synthesis of **4b** and **4c** (Entries 7 and 8) having chloro-substituent required longer reaction time than that of **4a** (Entry 6) (2–4 h *vs.* 0.5 h). Nitro-substituted aldehyde **2d** with MVK also gave desired thiochromene **4d** in low yield (8%) after relatively long reaction time (4 h). We consider that the reduced nucleophilicity of the sulfur atom in aldehyde **2** by electron-withdrawing chloro- or nitro-substituent decelerated the reaction. Next, we examined the reaction of **2a–e** with methyl acrylate or acrylonitrile. Using 2 equiv of methyl acrylate, the corresponding thiochromenes **4f–h** and **4j** were produced in 35–70% yields. However, the reaction of **2d** having nitro-substituent with methyl acrylate was unsuccessful, and very complex mixture of unidentified products was observed by thin layer chromatography. The spectral data of **4f–h** and **4j** were identical to the reported infrared, ^{1}H, ^{13}C NMR spectral values [9]. In the cases of acrylonitrile, thiochromenes **4k** and **4l** were produced in relatively low yields (25 and 18%, respectively) and were taken long reaction times (Entries 16 and 17). Because of low yields, additional reactions of **2c–e** with acrylonitrile were not undertaken. A plausible mechanism based on Kataoka's work [12] is shown in Scheme 2. A β-sulfonium-$TiCl_4$-stabilized enolate **3a** is produced by conjugate addition of sulfur atom in aldehyde **2** to $TiCl_4$-activated Michael acceptor, followed by carbon–carbon bond formation through transition state **3b** to give the $TiCl_4$-stabilized alkoxide **3c** and subsequent proton migration to afford **3d**, which gives *2H*-thiochromene **4** by dehydration and loss of the *tert*-butyl group. A similar Michael-aldol process catalyzed by Lewis acid/chalcogenide [11(b)], amine [17], and bifunctional thiourea [18] is well known. It is also known that the *tert*-butyl thioethers are easily cleaved under Lewis [19] or Brønsted [20] acidic conditions.

CONCLUSIONS

In conclusion, a new method for the synthesis of 2*H*-thiochromenes has been developed through $TiCl_4$-promoted reaction of 2-*tert*-butylthiobenzaldehyde derivatives with activated alkenes. Although some products were obtained in low yields, compared with other routes, this synthetic method apparently allows a facile approach to 2*H*-thiochromenes.

EXPERIMENTAL

Silica gel 60 (70–230 mesh ASTM) used for column chromatography was supplied by E. Merck. Analytical thin layer chromatography (TLC) was performed on Merck silica gel 60 F_{254} TLC plates. Melting points were measured by an electrothermal melting point apparatus and were uncorrected. Microanalyses were obtained using a Thermo Electron Corporation Flash EA 1112 element analyzer. Mass spectra were obtained using a ThermoQuest Polaris Q mass spectrometer operating at 70 eV. Infrared spectra were recorded on a Nicolet Magna 550 FTIR spectrometer. The ^{1}H and ^{13}C NMR spectra were measured on a Gemini 300 spectrometer using deuteriochloroform. All chemical shifts are reported in parts per million relative to tetramethylsilane. The coupling constants (*J*) are expressed in Hertz.

Preparation of 2-*tert*-butylthiobenzaldehyde derivatives 2: General procedure. To a stirred solution of aldehyde **1** (40 mmol) and *tert*-butyl thiol (5.40 mL, 48 mmol) in dimethylformamide (40 mL) was added potassium carbonate (5.53 g, 40 mmol) and the mixture was heated to reflux temperature for 1–7 days. After cooling to room temperature, the reaction mixture was diluted with water (300 mL) and extracted with diethyl ether (3 × 100 mL). The combined organic layer was dried over anhydrous magnesium sulfate, and the solvent was evaporated *in vacuo*. The resulting mixture was

chromatographed on silica gel eluting with hexane/ethyl acetate (20:1) to produce **2** as an oil or a solid.

The physical and spectral data of **2** prepared by this general method are as follows.

2-tert-Butylthiobenzaldehyde (2a). [15] Yellow oil; yield: 84%; IR (neat): 1692, 1583, 1455, 1363 cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.30 (s, 9H), 7.50–7.65 (m, 3H), 7.98–8.01 (m, 1H), 10.80 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 30.8, 47.5, 128.0, 129.5, 133.5, 136.5, 139.4, 139.9, 193.6; ms: *m/z* (%) 194 (M^+, 100), 138 (14), 137 (6), 109 (12), 104 (8).

2-tert-Butylthio-3-chlorobenzaldehyde (2b). [16] White solid; yield: 97%; mp: 52–54°C; IR (potassium bromide): 1680, 1571, 1458, 1366 cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.32 (s, 9H), 7.46 (t, *J* = 7.9 Hz, 1H), 7.78 (dd, *J* = 7.9 and 1.5 Hz, 1H), 7.91 (dd, *J* = 7.9 and 1.5 Hz, 1H), 10.77 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 31.1, 50.7, 126.7, 130.3, 135.0, 135.5, 142.0, 143.4, 193.5; ms: *m/z* (%) 230 (M^+, 41), 228 (M^+, 100), 173 (5), 172 (7), 171 (6).

2-tert-Butylthio-5-chlorobenzaldehyde (2c). Yellow oil; yield: 94%; IR (neat): 1695, 1570, 1454, 1363 cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.29 (s, 9H), 7.52–7.59 (m, 2H), 7.96 (d, *J* = 2.1 Hz, 1H), 10.71 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 30.8, 47.9, 128.1, 133.5, 134.8, 136.3, 140.4, 141.2, 192.4; ms: *m/z* (%) 230 (M^+, 39), 228 (M^+, 100), 227 (6), 226 (7), 225 (8). Anal. Calcd. for $C_{11}H_{13}ClOS$: C, 57.76; H, 5.73; S, 14.02. Found: C, 57.59; H, 5.55; S, 13.87.

2-tert-Butylthio-5-nitrobenzaldehyde (2d). Yellow oil; yield: 64%; IR (neat): 1696, 1598, 1525, 1458, 1345 cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.38 (s, 9H), 7.85 (d, *J* = 8.5 Hz, 1H), 8.39 (dd, *J* = 8.5 Hz and 2.7 Hz, 1H), 8.78 (d, *J* = 2.7 Hz, 1H), 10.75 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 31.0, 49.5, 123.2, 126.9, 139.9, 140.1, 144.6, 148.2, 191.0; ms: *m/z* (%) 239 (M^+, 8), 210 (9), 183 (100), 182 (14), 136 (43). Anal. Calcd. for $C_{11}H_{13}NO_3S$: C, 55.21; H, 5.48; N, 5.85; S, 13.40. Found: C, 55.32; H, 5.60; N, 5.84; S, 13.26.

2-tert-Butylthio-5-methoxybenzaldehyde (2e). Yellow oil; yield: 73%; IR (neat): 1683, 1589, 1473, 1375 cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.27 (s, 9H), 3.88 (s, 3H), 7.13 (dd, *J* = 8.5 and 3.1 Hz, 1H), 7.49 (d, *J* = 3.1 Hz, 1H), 7.54 (d, *J* = 8.5 Hz, 1H), 10.73 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 30.7, 47.1, 55.5, 110.9, 121.1, 128.0, 140.3, 141.3, 160.5, 193.7; ms: *m/z* (%) 224 (M^+, 100), 222 (3), 221 (2), 220 (2) 168 (2), 167 (1). Anal. Calcd. for $C_{12}H_{16}O_2S$: C, 64.25; H, 7.19; S, 14.29. Found: C, 64.41; H, 7.22; S, 14.03.

Preparation of 3-substituted 2*H*-thiochromenes 4: General procedure. To a stirred solution of aldehyde **2** (3 mmol) and alkene (6 mmol) in 1,2-dichloroethane (10 mL) was added $TiCl_4$ (0.33 mL, 3 mmol) at room temperature, and then the mixture was heated to reflux temperature for 0.5–96 h. After cooling to room temperature, the reaction mixture was quenched by aqueous saturated $NaHCO_3$ solution (50 mL), diluted with water (150 mL), and extracted with dichloromethane (2 × 150 mL). The combined organic layer was dried over anhydrous magnesium sulfate, and the solvent was evaporated *in vacuo*. The resulting mixture was chromatographed on silica gel eluting with hexane/ethyl acetate (10:1) to produce **4** as an oil or a solid.

The physical and spectral data of **4** prepared by this general method are as follows.

3-Acetyl-2*H*-thiochromene (4a). [8] Yellow oil; yield: 51%; IR (neat): 1641, 1616, 1439, 1378, 1305, 1281, 1235, 1217 cm^{-1}; ^1H NMR (deuteriochloroform): δ 2.47 (s, 3H), 3.72 (d, *J* = 0.9 Hz, 2H), 7.12–7.31 (m, 4H), 7.40 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 22.8, 25.3, 125.7, 127.3, 130.5, 130.8, 131.4, 131.7, 135.0, 137.8, 196.7; ms: *m/z* (%) 190 (M^{+}, 63), 189 (62), 149 (8), 148 (23), 147 (100).

3-Acetyl-8-chloro-2*H*-thiochromene (4b). Yellow oil; yield: 22%; IR (neat): 1656, 1625, 1412, 1372, 1238, 1214 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.49 (s, 3H), 3.76 (d, $J = 0.9$ Hz, 2H), 7.09 (t, $J = 7.6$ Hz, 1H), 7.20 (dd, $J = 7.6$ and 1.2 Hz, 1H), 7.33 (dd, $J = 7.6$ and 1.2 Hz, 1H), 7.39 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 22.9, 25.4, 125.7, 129.0, 131.2, 131.6, 131.9, 132.9, 134.8, 137.5, 196.5; ms: *m/z* (%) 226 (M^{+}, 23), 225 (20), 224 (M^{+}, 59), 223 (25), 183 (37), 181 (100), 146 (11), 145 (25). Anal. Calcd. for $C_{11}H_9ClOS$: C, 58.80; H, 4.04; S, 14.27. Found: C, 58.71; H, 3.87; S, 14.04.

3-Acetyl-6-chloro-2*H*-thiochromene (4c). Yellow solid; yield: 24%; mp: 85–86°C; IR (potassium bromide): 1662, 1632, 1461, 1369, 1235, 1208 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.48 (s, 3H), 3.71 (d, $J = 0.9$ Hz, 2H), 7.18–7.27 (m, 3H), 7.33 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 22.8, 25.4, 128.3, 130.1, 130.2, 131.2, 132.7, 132.8, 133.3, 136.6, 196.5; ms: *m/z* (%) 226 (M^{+}, 28), 225 (27), 224 (M^{+}, 78), 223 (27), 183 (38), 181 (100), 146 (12), 145 (18). Anal. Calcd. for $C_{11}H_9ClOS$: C, 58.80; H, 4.04; S, 14.27. Found: C, 58.67; H, 3.87; S, 14.03.

3-Acetyl-6-nitro-2*H*-thiochromene (4d). [3(a)] Yellow solid; yield: 8%; mp: 143–144°C; IR (potassium bromide): 1662, 1598, 1558, 1510, 1336, 1226 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.52 (s, 3H), 3.81 (d, $J = 0.9$ Hz, 2H), 7.42 (d, $J = 8.5$ Hz, 1H), 7.45 (s, 1H), 8.06 (dd, $J = 8.5$ Hz and 2.4 Hz, 1H), 8.15 (d, $J = 2.4$ Hz, 1H); ^{13}C NMR (deuteriochloroform): δ 22.8, 25.4, 124.6, 125.0, 127.5, 131.6, 132.6, 135.9, 144.4, 145.5, 196.2; ms: *m/z* (%) 235 (M^{+}, 68), 234 (8), 192 (90), 176 (19), 146 (100).

3-Acetyl-6-methoxy-2*H*-thiochromene (4e). Yellow solid; yield: 32%; mp: 100–102°C; IR (potassium bromide): 1653, 1620, 1485, 1459, 1316, 1247, 1223 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.48 (s, 3H), 3.69 (d, $J = 0.9$ Hz, 2H), 3.81 (s, 3H), 6.82–6.85 (m, 2H), 7.21–7.24 (m, 1H), 7.37 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 23.1, 25.4, 55.5, 115.7, 116.7, 125.5, 128.2, 132.4, 132.7, 137.9, 157.8, 196.8; ms: *m/z* (%) 220 (M^{+}, 87), 219 (33), 177 (100), 162 (8), 134 (33). Anal. Calcd. for $C_{12}H_{12}O_2S$: C, 65.43; H, 5.49; S, 14.56. Found: C, 65.62; H, 5.47; S, 14.31.

3-Carbomethoxy-2*H*-thiochromene (4f). [8,9] Yellow solid; yield: 69%; mp: 34–35°C; IR (potassium bromide): 1704, 1628, 1586, 1552, 1438, 1239 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.73 (d, $J = 0.9$ Hz, 2H), 3.84 (s, 3H), 7.09–7.28 (m, 4H), 7.54 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 24.0, 52.2, 123.0, 125.8, 127.1, 130.2, 130.6, 131.3, 134.0, 137.4, 166.4; ms: *m/z* (%) 206 (M^{+}, 73), 205 (62), 191 (100), 175 (8), 147 (35).

3-Carbomethoxy-8-chloro-2*H*-thiochromene (4g). [9] Yellow solid; yield: 70%; mp: 94–95°C; IR (potassium bromide): 1699, 1641, 1436, 1415, 1247, 1220 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.78 (d, $J = 1.2$ Hz, 2H), 3.86 (s, 3H), 7.06 (t, $J = 7.6$ Hz, 1H), 7.15 (dd, $J = 7.6$ and 1.5 Hz, 1H), 7.29 (dd, $J = 7.6$ and 1.5 Hz, 1H), 7.53 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 24.2, 52.3, 123.2, 125.7, 128.8, 130.9, 131.7, 132.8, 133.9, 137.0, 166.0; ms: *m/z* (%) 242 (M^{+}, 21), 241 (23), 240 (M^{+}, 56), 239 (31), 227 (39), 225 (100), 183 (12), 181 (34).

3-Carbomethoxy-6-chloro-2*H*-thiochromene (4h). [9] Yellow solid; yield: 42%; mp: 75–76°C; IR (potassium bromide): 1705, 1628, 1464, 1433, 1235 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.73 (d, $J = 0.9$ Hz, 2H), 3.85 (s, 3H), 7.16–7.23 (m, 3H), 7.48 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 23.9, 52.3, 124.3, 128.1, 129.8, 129.9, 131.2, 132.3, 132.7, 136.1, 166.0; ms: *m/z* (%) 242 (M^{+}, 25), 241 (20), 240 (M^{+}, 67), 239 (22), 227 (38), 225 (100), 183 (15), 181 (42).

3-Carbomethoxy-6-methoxy-2*H*-thiochromene (4j). [9] Yellow solid; yield: 35%; mp: 38–39°C; IR (potassium bromide): 1704, 1628, 1599, 1561, 1236 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.70 (d, $J = 1.2$ Hz, 2H), 3.80 (s, 3H), 3.85 (s, 3H), 6.75–6.82 (m, 2H), 7.18–7.21 (m, 1H), 7.53 (s, 1H); ^{13}C NMR (deuteriochloroform): δ 24.2, 52.2, 55.4, 115.6, 116.3, 124.0, 124.5, 128.0, 132.3, 137.4, 157.8, 166.3; ms: *m/z* (%) 236 (M^{+}, 86), 235 (25), 221 (100), 205 (4), 177 (20), 134 (12).

3-Cyano-2*H*-thiochromene (4k). [8] Yellow solid; yield: 25%; mp: 87–88°C; IR (potassium bromide): 2208, 1616, 1461, 1436, 1415, 1254 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.58 (d, $J = 0.9$ Hz, 2H), 7.15–7.26 (m, 5H); ^{13}C NMR (deuteriochloroform): δ 25.8, 103.7, 118.3, 126.3, 127.5, 130.06, 130.11, 130.9, 132.7, 142.2; ms: *m/z* (%) 173 (M^{+}, 64), 172 (100), 147 (7), 146 (4), 145 (10).

3-Cyano-8-chloro-2*H*-thiochromene (4l). Yellow solid; yield: 18%; mp: 116–117°C; IR (potassium bromide): 2202, 1620, 1442, 1413, 1282 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.64 (d, $J = 1.2$ Hz, 2H), 7.10–7.18 (m, 3H), 7.32–7.35 (m, 1H); ^{13}C NMR (deuteriochloroform): δ 26.0, 104.1, 117.9, 126.2, 128.4, 131.5, 131.7, 132.1, 132.8, 141.9; ms: *m/z* (%) 209 (M^{+}, 22), 208 (38), 207 (M^{+}, 59), 206 (51), 181 (5), 172 (100). Anal. Calcd. for $C_{10}H_6ClNS$: C, 57.83; H, 2.91; N, 6.74; S, 15.44. Found: C, 57.91; H, 2.70; N, 6.56; S, 15.28.

Acknowledgments. This study was supported in part by Brain Korea 21 program, Republic of Korea.

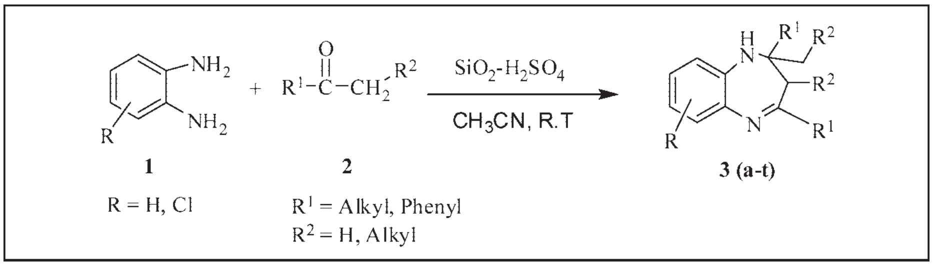
DOI 10.1002/jhet.174



Silica gel-supported sulfuric acid has been found to be an efficient catalyst for the synthesis of 1,5-benzodiazepines from *o*-phenylenediamine and ketones in acetonitrile solvent. This method is simple, effective, and environmentally friendly and gives better yields. Compared to the classical reaction conditions, this new method consistently has the advantage of excellent yields (80–97%) and short reaction time (30–150 min) at room temperature.

J. Heterocyclic Chem., **46**, 1028 (2009).

INTRODUCTION

Benzodiazepines are pharmacologically active compounds having anti-inflammatory [1], antianxiety, anticonvulsant, and hypnotic activity [2,3]. Because of the broad biological significance, the syntheses of these compounds have received a great deal of attention. Benzodiazepines have been synthesized by the condensation of *o*-phenylenediamines with β-unsaturated carbonyl compounds, β-haloketones, or ketones. This condensation has been carried out using different reagents, such as BF_3-etherate [4], polyphosphoric acid [5], $NaBH_4$ [6], SiO_2 [5], $MgO/POCl_3$ [7], $Yb(OTf)_3$ [8], $Ga(OTf)_3$ [9], lead nitrate [10], L-proline [11], acetic acid under microwave conditions [12], molecular iodine [13], and in ionic liquids [14]. Recently, this condensation is reported using different acid catalysts [15–22]. Many of these processes suffer from one or more limitations, such as long reaction times, occurrence of several side reactions, drastic reaction conditions, low yields, and tedious workup procedure. Therefore, the search continues for a better catalyst for the synthesis of 1,5-benzodiazepines in terms of mild reaction conditions.

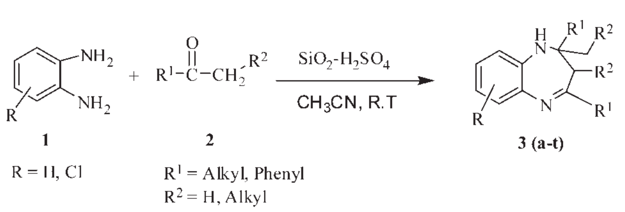
Recently, the use of heterogeneous catalysts [23–26] has received considerable importance in organic synthesis because of their ease of handling, enhanced reaction rates, greater selectivity, simple workup, and recoverability of catalysts. Among the various heterogeneous catalysts, particularly, silica gel-supported sulfuric acid [27] has advantages of low cost, ease of preparation, and catalyst recycling. As the reaction is heterogeneous in nature, the catalyst can conveniently be separated by simple filtration. In view of recent surge in the use of heterogeneous catalysts, we wish to report a simple, convenient, and efficient method for the preparation of 1,5-benzodiazepines under acetonitrile solvent using silica gel-supported sulfuric acid (10 mol %) as a catalyst. This catalyst is easy to handle, thermally robust, nonvolatile, nonexplosive, eco-friendly, and recyclable for a variety of organic transformations.

RESULTS AND DISCUSSION

Initially, we studied the catalytic properties of silica gel-supported sulfuric acid for the synthesis of 1,5-benzodiazepines at room temperature using *o*-phenylenediamine (**1**) and the ketone (**2**) (Scheme 1) and varying the mol % of silica gel-supported sulfuric acid (Table 1). Among the results obtained, use of 10 mol % silica gel-supported sulfuric acid gave better yield (97%) in 30 min for the synthesis of **3a**.We achieved good yield when compared with our earlier report (90% in 30 min) [16].

We investigated the reaction of a series of symmetrical and unsymmetrical ketones with *o*-phenylenediamine to get the corresponding 1,5-benzodiazepinederivatives in 80–97% yield under acetonitrile conditions. All

Scheme 1



synthesized derivatives were characterized using IR, ^{1}H NMR, and mass spectral analysis and also by comparison with authentic samples. The reactions of various ketones with *o*-phenylenediamine in the presence of silica gel-supported sulfuric acid are superior in terms of yields and reaction times (Table 2) than the previously reported methods. Especially, with *p*-chloroacetophenone (Table 2, entry 9), we have obtained 95% yield in 50 min, whereas previously reported was less than 95% in 50 min [17,18].

Chloro-substituted *o*-phenylenediamine and substituted ketones have been used with similar success to provide the corresponding benzodiazepines in high yields, which are also of much interest with regard to biological activity. The efficiency of the recovered catalyst was verified with the reaction of *o*-phenylenediamine and ketone (entry 1). Using the fresh catalyst, the yield of product (**3a**) was 97%, whereas using the recovered catalyst in the three subsequent recyclization, the yields were 94, 92, and 90, respectively.

In summary, we have developed a new methodology for the synthesis of various 1,5-benzodiazepines by using substituted *o*-phenylenediamine and substituted ketones in the presence of catalytic amount of silica gel-supported sulfuric acid catalyst at room temperature. Thus, this method is a simple, high yielding, time saving, and eco-friendly process. The catalyst can be prepared from available inexpensive reagents and can be easily recycled, which is heterogeneous and nonhazardous. Hence, the utility of silica gel-supported sulfuric acid catalyst for the synthesis of 1,5-benzodiazepines would be a valuable addition to available methods.

EXPERIMENTAL

All chemicals were AR grade obtained from Qualigens, India. All the solvents were purified by standard techniques. Column chromatographic separations were carried out on silica gel 100–200 mesh size. IR spectra were scanned on FT/IR-4200 Type A, spectrophotometer with potassium bromide optics. NMR spectra were recorded on a 300 MHz and mass spectra were recorded on a LC-MS.

Preparation of the catalyst. The catalyst was prepared by mixing silica gel (10 g, 200–400 mesh) in dry diethyl ether (50 mL), with sulfuric acid (3 mL). The resulting mixture was stirred for 30 min to absorb sulfuric acid on the surface of silica gel. After the removal of solvent in a rotary evaporator, the solid powder was dried at 120°C for 2–3 h under reduced pressure.

General procedure for the synthesis of 1,5-benzodiazepines. A mixture of *o*-phenylenediamine (**1**) (1 mmol), ketone (**2**) (2.5 mmol), and silica gel-supported sulfuric acid (0.1 mmol) was stirred in acetonitrile at room temperature until thin layer chromatography indicated that the reaction was complete. After the completion of reaction, 20 mL of ethyl acetate was added to the reaction mixture, and the catalyst was recovered by filtration. The organic layer was concentrated, and the crude product was purified by silica gel column chromatography using ethyl acetate–*n*-hexane (1:9) as eluent to afford the desired product (**3**). Entry **1–5** and **11** spectral data [20], entry **7**, **8** spectral data [21], and entry **9**, **10**, and **13** spectral data [22] are in full agreement with the reported literature, and the new compounds spectral data are given later.

1. INTRODUCTION

In 1967, Charles Pedersen, who was a chemist working at Du Pont, discovered a simple method for synthesizing a crown ether when he was trying to prepare a complexing agent for divalent cations [1]. Crown ethers are heterocyclic compounds that consist of a ring containing several ether groups. Pedersen realized that the cyclic polyethers presented a new class of complexing agents that were capable of binding alkali metal cations. The fields of organic synthesis, phase transfer catalysis, and other emerging disciplines benefited from the discovery of crown ethers. Pedersen shared the 1987 Nobel Prize in Chemistry for the discovery of the synthetic routes to and binding properties of crown ethers. Since Pedersen's discovery, there has been great interest in the synthesis of crown compounds in an attempt to find molecules with superior properties and proper applications in various areas [2–12].

Lariat ethers are a class of macrocyclic polyether compounds having one or more donor-group-bearing sidearms [13]. Functionalization of macrocyclic polyether compounds with such additional donating centers is a good way to increase their complexing ability and selectivity [14]. Lariat ethers should achieve a somewhat higher level of cation binding than generally observed with simple macrocyclic crown ethers by presenting a cation with a three-dimensional intramolecular array of binding sites as do the cryptands. Moreover, a higher degree of flexibility and dynamics characteristic of ionophores could be achieved. Thus, they combine characteristics of podands, corands, and cryptands [10,15].

The concept of lariat ethers has been extended to include molecules having sidearms that contain ionizable, lipophilic, or chromogenic groups. Functionalization of crown ethers with ionizable sidearms opened access to switchable lariat ethers [16]. Furthermore, lariat ethers with chromogenic sidearms offer distinct advantages in detection of cations when compared with the other available analytical methods. The color changes associated with complexation of different cations could make such sensors more versatile. Changes in potential or other properties could also be useful in sensing, but they would be less apparent. It is noteworthy that Takagi *et al.* pioneered chromogenic lariat ether complexation [17].

Moreover, macrocyclic ligands with one or more fluorine-containing sidearms have potential applications in metal ion separations involving a fluorous phase or supercritical carbon dioxide. Also, macrocycles with a fluoride label on the macrocyclic framework have potential applications as ^{19}F NMR probes [18]. Macrocycles with longer spacers between the macro ring and the perfluoroalkyl group were found to exhibit greater extraction efficiencies than analogues with shorter spacers.

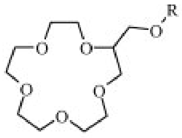
This review casts light on the main strategies for the synthesis of *C*-pivot lariat ethers as well as their specific syntheses. A number of other reviews [10,15,19] that have appeared concerning lariat ethers did not cover the synthesis of these compounds in an organized manner. We have concentrated on the crown compounds containing at least 12-membered rings.

2. NOMENCLATURE

The physical resemblance of CPK molecular models of these compounds to rope lassoes coupled with the concept of ''roping and tying'' a cation suggested the name lariat ethers [13].

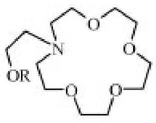
Lariat ethers are divided according to the point at which the sidearm and the macro ring meet (pivot atom), into two main classes:

(i) *C*-pivot lariat ethers **1** [20]: Systems in which sidearms are attached to a carbon of the macro ring.
(ii) *N*-pivot lariat ethers **2** [21]: Systems in which sidearms are attached to a nitrogen of the macro ring.



1

A carbon-pirvot lariat ether



2

A nitrogen-pivot lariat ether

When more than one sidearm is attached, the number of them is designated using standard prefix and the Latin word brachium which means arm.

Two-armed compounds **3** and **4** are thus bibracchial lariat ether and the name is abbreviated BiBLEs [22,23]. A three-armed compound **5** is tribracchial lariat ether and the name is abbreviated TriBLEs, *etc*.

Tribracchial lariat ether

3. LARIAT ETHER COMPLEXATION PROCESS

The lariat ether idea is represented schematically in Figure 1. The sidearm which contains one or more donor groups placed in appropriate position would provide a third dimension of solvation to a ring-bound cation (binding of Type A) [15].

Two armed crown ethers have various kinds of cation binding modes (Fig. 2) [22]

(a) Only one sidearm interacts with guest metal cation (Type B).
(b) Two side arms provide coordination from the same or opposite sides (Type C or Type D).

It is noteworthy to mention that carbon pivot lariat ethers proved to be more chemically stable but less dynamic than the *N*-pivot counterparts. The greater flexibility of the latter is due to the facile inversion of the nitrogen atom, a property not shared by carbon.

In comparison with ordinary crown ethers extractants, a crown ether with a proton-ionizable group has the advantage that metal ion transport into the organic phase does not require concomitant transport of an ion (or ions) from the aqueous phase (Fig. 3). This feature is of immense importance to potential practical applications of crown ether-type extractants in which the hard aqueous phase anions of chloride, nitrate, and sulfate would be involved [24].

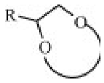
An additional advantage of proton-ionizable crown ethers is that a mechanism for cation release has been incorporated (Fig. 4). Following the extraction step, shaking of the separated organic phase with aqueous hydrochloric acid strips the extracted metal ions into an aqueous phase and regenerates the neutral form of the extractant [24].

The attachment of sufficient lipophilic groups to the proton-ionizable ionophores allows it to remain completely in the organic phase during extraction of alkali-metal cations from alkaline aqueous phases.

4. MAIN CLASSES OF *C*-PIVOT LARIAT ETHERS

C-Pivot lariat ethers are classified into two main classes A and B according to the point of attachment of the sidearm to the macro ring.

4.1. Attachment of the sidearm to an ethylenoxy unit of the macro ring.



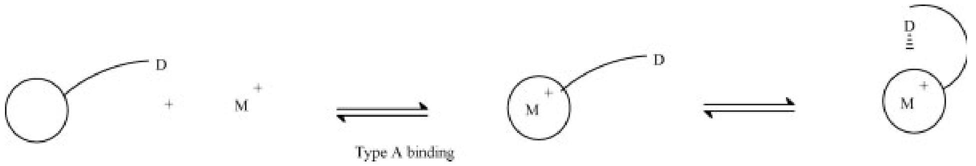


Figure 1. Cation binding by a single sidearmed crown ether.

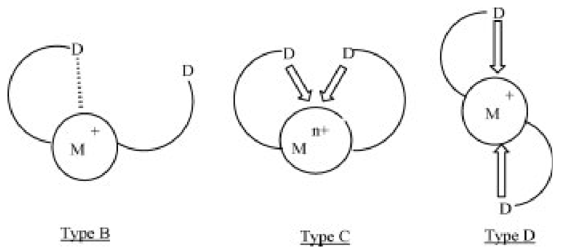

Figure 2. Various modes of cation binding by two armed crown ethers.

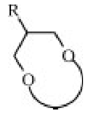
4.2. Attachment of the sidearm to the middle carbon of a trimethylene unit of the macro ring.



5. GENERAL AND SPECIFIC SYNTHESIS OF *C*-PIVOT LARIAT ETHERS

5.1. Synthesis of lariat ethers in which the sidearm is attached to an ethylenoxy unit of the macro ring.

5.1.1. Synthesis of C-pivot lariat ethers. There are different methods by which the pivot carbon could be incorporated into the macrocycle.

5.1.1.1. Incorporation of the pivot carbon via a glycerol unit. When the pivot carbon is incorporated *via* a glycerol unit the primary and secondary hydroxyl groups could be used as nucleophiles for formation of the ring. The remaining primary hydroxyl group must be protected by a group which could be removed after cyclization leaving a free hydroxy-methyl group for attachment of the sidearm. In other cases, the sidearm is incorporated into the glycerol unit before cyclization.

Glycerol units needed for the synthesis of *C*-pivot lariat ethers are prepared using one of the following routes:

Route 1: Reactions of alcohols or phenols **6** with epichlorohydrin (**7**). In the case of alcohol precursors, the chlorohydrin was isolated and then treated with 50% NaOH to give the glycidyl ether **8**. In the case of phenolic precursors, the conversion to the glycidyl ether could be accomplished in a single step. Hydrolysis with dilute perchloric acid afforded the corresponding diol **9**, as illustrated in Scheme 1 [25].

Route 2: Reactions of alcohols or phenols **6** with allyl chloride (**10**) to give the corresponding allyl ether **11** followed by bishydroxylation of the ethylene unit to furnish the corresponding diol **9** upon reaction with alkaline OsO_4 and *N*-methylmorpholine *N*-oxide (Scheme 2) [26].

Route 3: Bis(hydroxylation) of acrolein diethyl acetal **12** on treatment with $KMnO_4$ to give 1,2-dihydroxy-3,3-diethoxypropane (**13**) (Scheme 3) [27].

In the above three routes, cyclization of the diol is accomplished in the standard fashion by using NaOH or NaH as the base in concert with the appropriate oligoethylene glycol ditosylate, dimesylate, or dihalide in THF. In some cases, *t*-BuOLi/*t*-BuOH or NaOH/dioxane are used as bases. The reactions were typically heated overnight, although longer reaction times were required in some cases. Purification was usually accomplished by chromatography followed by crystallization in case when the *C*-pivot crown was a solid rather than an oil.

When the protecting group (R) is benzyl or allyl, they can be easily removed after cyclization with the appropriate ditosylates to give the corresponding hydroxymethyl derivative upon treatment with 10% Pd/C and a catalytic amount of *p*-toluenesulfonic acid [28,29] (PTSA) in ethanol under 3.4 atmosphere of H_2 at room temperature.

Yields were not appreciably altered by the presence of an aliphatic rather than an aromatic sidearm [20] (alcohols *vs*. phenol precursors), but the presence of donor group at a distance from the crown's cavity suitable for secondary interaction was important.

It was postulated by Greene [30] that a template effect was responsible for the high yields observed in these ring-formation reactions. Evidence for the template effect has accumulated [31], although there have also been skeptics of this theory [32]. In any event in molecules designed with sidearm capable of secondary binding through donor groups in them, one might anticipate that yields would be high (more organization in the transition state leading to a cycle) when such donor groups are present in contrast to the situation prevailing in their absence.

An example of this is shown in Scheme 4 in which the cyclization of 2-methoxyphenyloxypropanediol (**14**) with

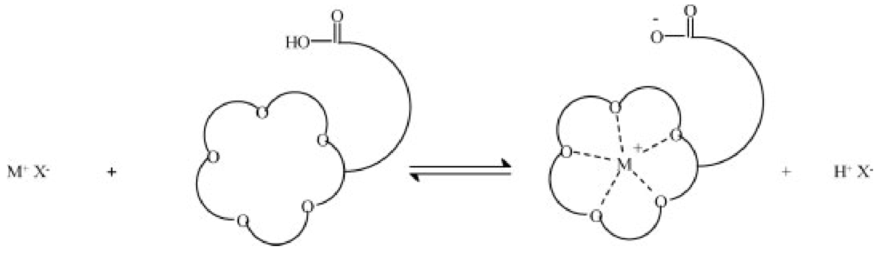


Figure 3. Metal ion extractant by a proton-ionizable crown ether.

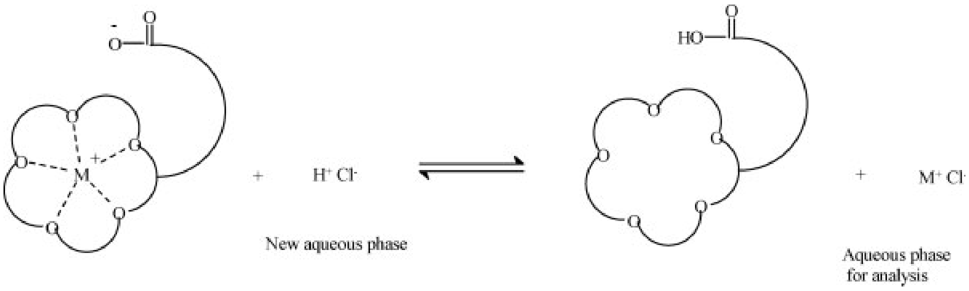

Figure 4. Metal ion stripping from an ionized crown ether-metal ion complex.

tetraethylene glycol ditosylate (**15**) to yield the corresponding 15-crown-5 **16** is illustrated. When the 2-methoxy group is present, the cycle is formed in about 70%, where in its absence the yield of the cyclization decreases to 34%. The yield of cyclization also decreases to 57% and 29%, respectively, when the methoxy group is present in the 3-(*meta*) or 4-(*para*) positions [13,20].

Using route 1 Gokel *et al*. [13] reported the synthesis of a series of 15-crown-5 ether derivatives **18–24** by treatment of the appropriate diols **17** with tetraethylene glycol ditosylates **15a** or dimesylates **15b** in the presence of NaH in THF (Scheme 5).

Scheme 1

28: a 15-Crown-5 (n = 1, ref. 34 (23%), ref. 15 (32%), ref. 35, (67%))

29: a 18-Crown-6 (n = 2, ref. 34, 27 (25%))

The latter compounds can be converted to the corresponding hydroxymethyl derivatives on treatment with H_2 over Pd/C.

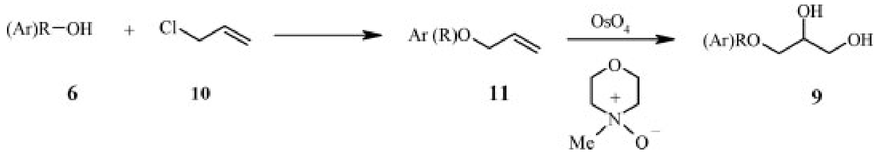
Gokel *et al*. [36] used the same approach for the synthesis of olefinic crown ethers **30**. The latter compounds were used as starting materials for the synthesis of epoxy lariat crown ethers **34** and **35** as outlined in Scheme 6.

Olefinic crown ethers **30** were converted to the corresponding diols **32** by treatment of the olefins with *N*-methylmorpholine *N*-oxide (**31**) in the presence of catalytic osmium tetraoxide. The diols thus obtained were converted to the monotosylates **33** on treatment with *p*-toluenesulfonyl chloride in pyridine. The latter compound underwent ring closure under basic condition to the desired epoxy crown ethers **34** and **35**.

Bradshaw *et al*. [37] reported the synthesis of bis-allyloxymethyl-18-crown-6 **37** by the 2 + 2 cycloaddition reaction of the commercially available allyloxymethyl ethylene glycol **9** and diethylene glycol ditosylate **36** (Scheme 7).

Gokel *et al*. [26] used route 2 for the synthesis of the cholestanyl lariat ether **41** as shown in Scheme 8. Commercially available 3β-cholestanol (**38**) was *O*-allylated under phase transfer catalytic conditions to give the

Scheme 2



6 **10** **11** **9**

Scheme 3

12 13

crystalline allyl cholestanyl ether **39**. Catalytic bis-hydroxylation of **39** using OsO$_4$ and *N*-methylmorpholine *N*-oxide afforded the diol **40**. Reaction of dialkoxide derived from diol **40** and NaH in THF with tetraethylene glycol ditosylate **15** gave after chromatography, cholestanyl lariat ether **41**.

Fukunishi *et al*. [27] used route 3 for the synthesis of hydroxylmethyl-18-crown-6 **45**. Thus, cyclization of **13** with pentaethylene glycol ditosylate **42** gave **43**. Hydrolysis of the latter to the aldehde derivative **44** and subsequent reduction produced **45** in 32% yield (Scheme 9).

5.1.1.2. Incorporation of the pivot carbon via a thioglycerol unit. Nabeshima *et al*. [38] used this approach to synthesize thiolariat ethers **50–55** as outlined in Scheme 10. Alkyl halides or benzyl chloride **47** was treated with thioglycerol **46** to give *S*-alkylated diols **48**. Cyclization of diols **48** with the appropriate oligoethylene glycol ditosylates **15**, **36,** and **49** in a THF suspension of NaH afforded thiolariat ethers **50–55**. Subsequent cleavage of the benzyl moiety of **50, 51, 54** gave the corresponding mercaptomethyl crown ethers **56a–c** in moderate yields.

Crown ethers containing a sulfur atom outside the ring have fascinating features for ion and molecular

recognition. Crown ethers bearing a mercapto group as a side chain are considered to be key compounds in host–guest chemistry. These mercapto crowns can be used as precursors for various thiolariat ethers whose side chain contain a substituent unstable under basic cyclization reaction conditions. The mercapto crown may also be useful for polymer-support thiolariat ethers and for functionalization of surfaces of electrode and other solid materials [38,39].

5.1.1.3. Incorporation of the pivot carbon via a 3-(N-substituted amino)-1,2-propanediol. Okahara *et al.* [40] reported the synthesis of various *N*-substituted or unsubstituted aminomethyl crown ethers **60–67** from the reaction between 3-amino-1,2-propanediols **59** and the oligoethylene glycol ditosylates **15** and **42** as outlined in Scheme 11.

The starting material, 3-(*N*-substituted amino)-1,2-propanediols (**59**) were prepared from 3-chloro-1,2-propanediol (**57**) and the appropriate primary amine **58**.

5.1.1.4. Incorporation of the pivot carbon via benzyloxy(alkoxy)methyl oligoethylene glycols or their ditosylates derivatives. Reaction of benzyloxyoligoethylene glycol **68** with the appropriate oligoethylene glycol ditosylate **15**, **48**, and **59** in THF in presence of CsOH, KOH, or *t*-BuOK gave the corresponding benzyloxymethyl 18-crown-6 **29** [35], 21-crown-7 **69** and **71** [41], 24-crown-8 [41] **70** and **72**, 27-crown-9 [41] **74**, and 30-

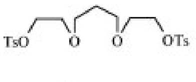
crown-10 **73** and **75** [41]. Debenzylation of **69, 70, 74,** and **75** afforded the hydroxymethyl derivatives **76–79** (Scheme 12) (Table 1) [41,42].

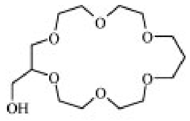
Montanari and Tundo [44] used a similar approach for the synthesis of *t*-butoxymethyl-18-crown-6 in an 38% yield from *t*-butoxymethyldiethylene glycol and triethylene glycol ditosylate followed by conversion into the corresponding hydroxymethyl-18-crown-6 on reaction with HBF_4 in CH_2Cl_2.

The diol **68** ($m = 1$) was obtained by the reaction of (benzyloxymethyl)ethylene glycol with chloroacetic acid followed by reduction. The diols **68** ($m = 2, 3$) were obtained by the reaction of 3-*O*-benzylglycerol with THP-blocked oligoethylene glycol monochloride in the presence of lithium *t*-butoxide in *t*-butyl alcohol followed by deprotection upon treatment with HCl in CH_2Cl_2—MeOH [29,43].

Hydroxymethyl 19-crown-6 **81** was obtained by cyclization of diol **68** ($m = 1$) and ditosylate **80** with potassium *t*-butoxide in THF, followed by debenzylation [45].



80



81

(quantitative yield)

Gandour *et al.* [28] reported the synthesis of alkoxymethyl 18-crown-6 **84–87** by cyclization of 1-(alkoxymethyl)-3,6,9-trioxaundecane-1,11-diol **83** with diethylene glycol ditosylate in the presence of KH. The hydroxymethyl derivative **44** can be easily liberated by removal of the allyl group on treatment of **87** with Pd/C and *p*-toluenesulfonic acid (Scheme 13).

Table 1

78	2	3	5	42 (97)
79	2	4	6	42 (86)

The diol **83** can be obtained by the reaction of (alkoxymethyl) oxirane **8** with excess 3,7-dioxaoctane-1,8-diol **82** in the presence of catalytic amount of NaH.

5.1.1.5. Incorporation of the pivot carbon via bis(aminomethyl) oligoethylene glycols. Okahara *et al.* [46] reported the synthesis of bis(aminomethyl)oligoethylene glycols **89** by treatment oligoethylene glycol diglycidyl ethers **88** with excess amine. Reaction of bis diols **89** with the oligoethylene glycol ditosylates **36** and **48** gave the corresponding bis(aminomethyl) crown ethers **90–98** (Scheme 14).

5.1.1.6. Incorporation of the pivot carbon via 2-methylallyl ether derivatives by a one-step or two-step bromination-cyclization sequence. Okahara *et al.* [25,47,48] reported the synthesis of 2-methyl-2-bromomethyl 12-, 13-, 14-, 15-, 16-crown ethers using two methods, A and B.

In method A, the appropriate 2-methylallyl ether **99** (obtained upon treatment of methallyl chloride with excess of the appropriate oligoethylene glycol) undergo intramolecular bromoalkoxylation with *N*-bromosuccinimide (NBS) using $LiBF_4$ as the template in 1,2-dichloroethane. In this instance, NBS acts as a brominating agent toward the double bond rather toward the allylic position. Bromination occurs, as expected from the less substituted side of the alkene with formation of the more stable carbocation [49]. The tertiary carbocation is intercepted intramolecularly by the hydroxyl group. This reaction is probably favored by the templating effect of sodium cation which is also present in this solution as the tetrafluoroborate salt [15,50].

Using this method Okahara *et al.* [25,47] prepared bromomethyl-substituted lariat ethers having a 12-, 14-crown-4 **100** and **101** as well as 15-crown-5 **102** rings (Scheme 15).

In method B, 2-methylallyl ethers **99** undergo intermolecular bromoalkoxylation with NBS and the appropriate oligoethylene glycol **82** and **103** followed by intramolecular cyclization with benzenesulfonyl chloride using lithium *tert*-butoxide as the base in *tert*-butyl

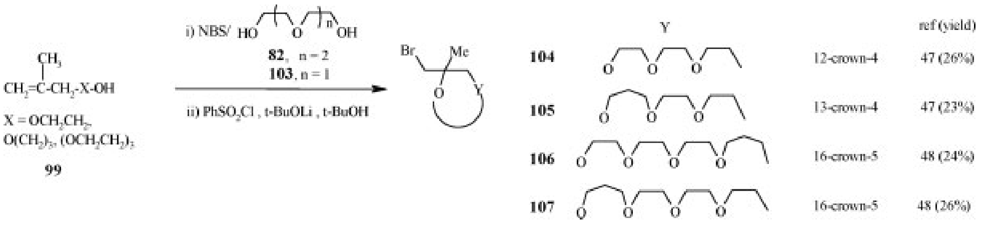
alcohol [47,48]. Using this approach, methyl lariat ether based on 12-crown-4 **104**, 13-crown-4 **105**, and 16-crown-5 **106** and **107** have been prepared as depicted in Scheme 16.

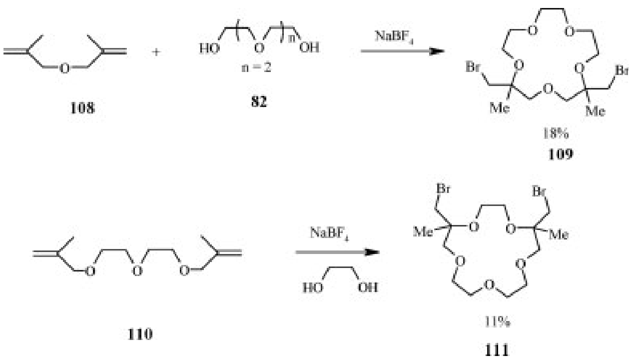
Nakatsuji *et al*. [51] and Okahara *et al*. [52] reported the synthesis of two kinds of positional isomers of the *C*-pivot type of double-armed 15-crown-5 ethers **109** and **111** by bromoalkoxylation reaction of the appropriate bis(2-methylallyl)ethers **108** and **110** with triethylene glycol and ethylene glycol, respectively, in the presence of $NaBF_4$ as the template ion (method A) (Scheme 17).

The same authors [51,52] used (method B) to prepare another positional isomer of double-armed 15-crown-5

Scheme 16



Scheme 17



ether **114** as well as some positional isomers of bis(bromomethyl)dimethyl 18-crown-6 **115** and **116** and 21-crown-7 **117** and **118** by intramolecular cyclization reaction of the diols **113**, which were obtained by bromoalkoxylation reaction of bis(2-methylallyl)ether **112** with the appropriate oligoethylene glycol, by using benzenesulfonyl chloride under basic conditions as depicted in Scheme 18.

5.1.2. Synthesis of C-pivot lariat benzocrown ethers. Bartsch *et al.* [45,53] used route 1 (Incorporation of the pivot carbon *via* a glycerol unit, Section 5.1.1.1) for the synthesis of hydroxymethylbenzo-12-crown-4, 14-crown-4 [45] and hydroxymethylbenzo-18-crown-6 [53] by reaction of the appropriate benzyloxymethy diol with the corresponding ditosylates and subsequent debenzylation.

Bartsch *et al.* [53] used the strategy reported in Section 5.1.1.4 (Incorporation of the pivot carbon *via* benzyloxy(alkoxy)methyl oligoethylene glycols or their ditosylate derivatives) for the synthesis of hydroxymethyl benzo-18-crown-6 **120**. Thus, cyclization of the diol **68** ($m = 1$) and ditosylate **119** with KOH in THF/H_2O and subsequent debenzylation gave an 96% yield of **120** (Scheme 19).

The ditosylate **119** was obtained from catechol by initial treatment with 2-chloroethanol to give 1,2-bis(2-hydroxyethoxy)benzene and subsequent reaction with *p*-toluenesulfonyl chloride in pyridine.

The hydroxymethyl benzo-18-crown-6 **120** ($n = 1$) was alternatively obtained in 70% yield by the reaction of catechol **122** with the ditosylate **121** and cesium fluoride in acetonitrile followed by debenzylation (Scheme 20) [43].

Using a similar approach, Reinhoudt *et al.* [29] reacted benzyloxymethylnonaethylene glycol ditosylate **121** ($n = 3$) with the cesium salt of catechol in acetonitrile followed by debenzylation to furnish 94% of the corresponding hydroxymethylbenzo-30-crown-10 **123**.

Scheme 18

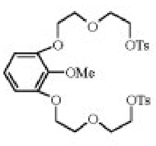
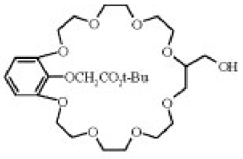
Similarly, Bartsch *et al*. [54] reported the synthesis of resorcinol-25-crown-8 **125** with an intraanular oxyacetic acid ester group and a pendant hydroxymethyl function in 99% yield starting from diol **68** ($n = 1$) and ditosylate **124**.



124



125

5.1.3. Synthesis of C-pivot lariat azacrown ethers. Preparation of such systems are classified depending on the starting materials as follows.

5.1.3.1. Action of diacid dichloride on diamines. Bartsch *et al*. [55,56] reported the synthesis of hydroxymethyl-substituted diazacrowns in which the cavity sizes are systematically varied as depicted in Scheme 21.

Thus, reaction of 3,6-dioxa-4-(allyloxymethyl)-1,8-octanedioic acid dichloride **126** with the appropriate diamines **127** under high dilution conditions in the presence of TEA afforded the allyloxymethyl-substituted cyclic diamides **128**. The latter compound underwent deprotection by isomerizatrion of the allyl group with palladium on carbon followed by acid-catalyzed cleavage and subsequent reduction with $LiAlH_4$ to give the hydroxymethyl-substituted diazacrowns **129–133** in good yields (50–78%).

5.1.3.2. Reaction of diamines with diiodide or dimesylate. Bradshaw *et al*. [56] reported the synthesis of [(allyloxy)methyl]-diaza-18-crown-6 **136** and **137** by the reaction of the appropriate diamine **127** with diiodide **135** in CH_3CN containing Na_2CO_3 or dimesylate **134** in hexane containing *n*-butyl lithium (Scheme 22).

The diacid dichloride **126** as well as the diiodide **135** were prepared as outlined in Scheme 23. Thus, reaction of diol **9** with chloroacetic acid afforded the diacid **138**. The latter underwent chlorination on treatment with oxalyl chloride to give the corresponding diacid dichloride **115**. Reduction of **126** with $LiAlH_4$ afforded the diol **139**. The dimesylate **134** could be obtained from **139** upon treatment with MesCl in pyridine. The diiodide **135** was obtained from **134** by the reaction with NaI in acetone [55].

5.1.3.3. Ring closure of the appropriate diazadiols. The most convenient method to prepare **136** as well as **142** is shown in Scheme 24 [56]. Thus, reaction of diamines **140** with epoxide **8** gave the diazadiol **141**. The Okahara ring closure of **141** using tosyl chloride gave good yields of diaza-18-crown-6 lariat ethers **136** and **142**.

Bradshaw *et al*. [57] prepared *N*,*N*-diethyl- and *N*,*N*-dibenzyldiazapentaethylene glycol **140** in high overall yield from the reaction of *N*-ethyl- or *N*-benzyl-substituted-ethanaolamine **143** with the dihalide **144** (Scheme 25).

Bradshaw [57] reported the synthesis of allyloxymethyl-substituted triaza- and tetraazacrown compounds **146** and **148** by the reaction of the appropriate diamines **145** and **147** with 4-(allyloxymethyl)-1,8-diiodo-3,6-

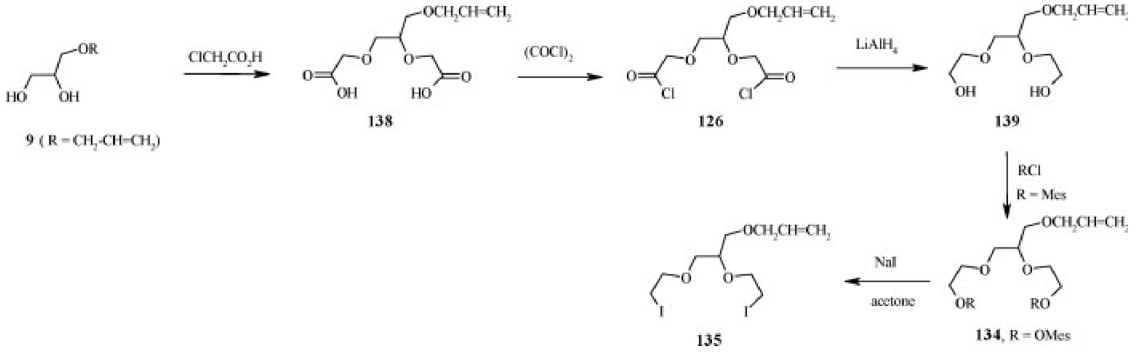
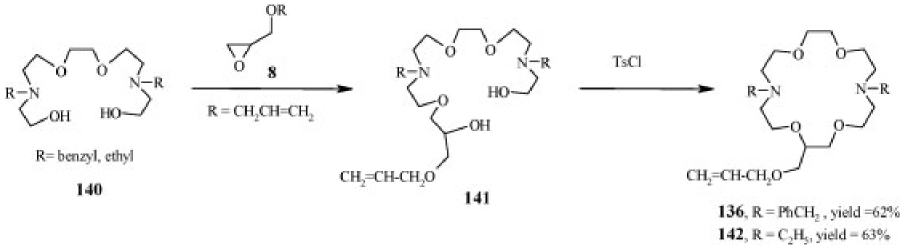


Scheme 24



dioxaoctane **135** in refluxing CH_3CN in the presence of anhydrous Na_2CO_3 (Scheme 26).

The starting diamines **145** and **147** were obtained from *N*-[2-(2-chloroethoxy)ethyl]acetamide **149** by initial reaction with each of benzylamine and the appropriate diamines **150** in refluxing toluene in the presence of anhydrous Na_2CO_3 followed by $LiAlH_4$ reduction (Scheme 27).

5.2. Synthesis of lariat ethers in which the sidearm is attached to the middle carbon of a trimethylene unit of the macro ring.

5.2.1. Synthesis of C-pivot lariat ethers. There are different methods by which the sidearm can be incorporated into the middle carbon of trimethylene unit of the crown ethers ring.

5.2.1.1. Synthesis of methylenecrown ether followed by hydroboration-oxidation. Tomoi [58] reported the synthesis of 15-crown-5 **155**, 19-crown-6 **156**, and 22-crown-7 **157** with vinylidene group by the reaction of 3-chloro-2-chloromethyl-1-propene **151** with the appropriate oligoethylene glycol **152–154**.

The methylene crown ether **155** was transformed into the corresponding hydroxymethyl crown **158** on treatment with borane-dimethyl sulfide complex followed by oxidation with H_2O_2 (Scheme 28).

Yoshihisa *et al*. [59] and Bartsch *et al*. [33] used a similar approach for the synthesis of hydroxymethyl-substituted crown ethers **159–162** with four ring oxygens and 13-, 14-, 15-, and 16-membered polyether rings.

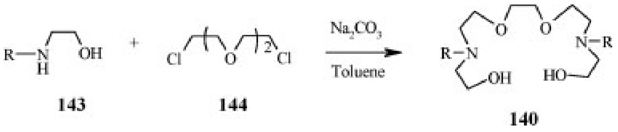
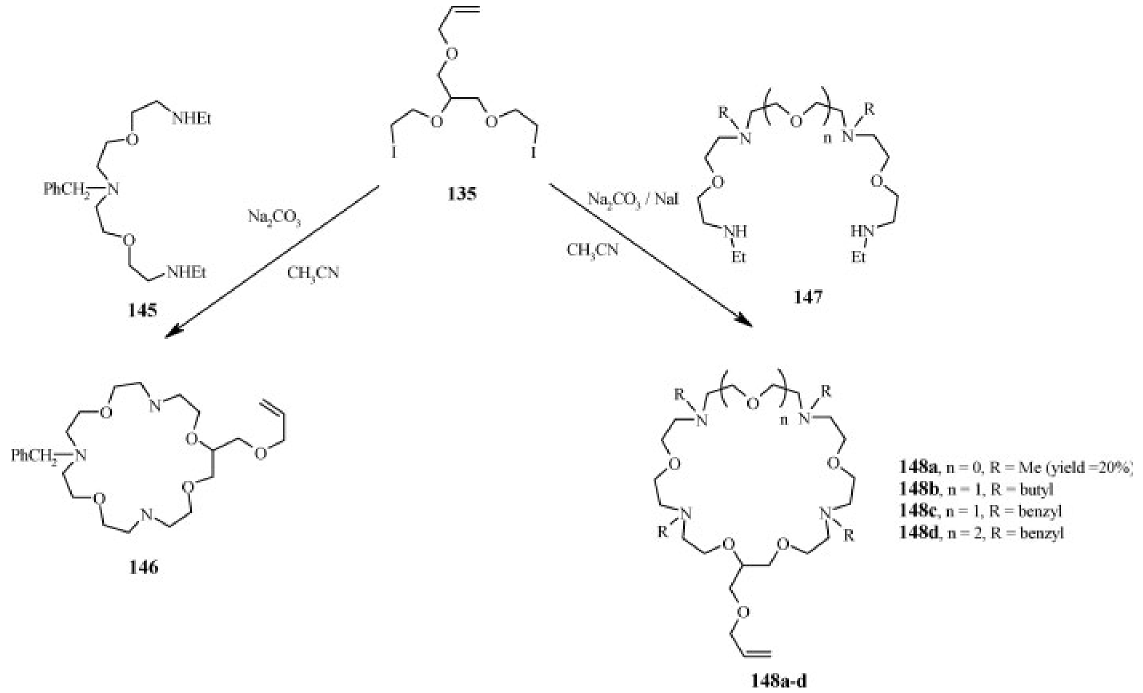
5.2.1.2. Photochemical addition of thioacetic acid to a methylene crown ether followed by reduction. Rasteller *et al*. [39] synthesized mercaptomethyl crown ether **164** by photochemical addition of thioacetic acid to **156** to give thioester **163** followed by cleavage of the thioester with $LiAlH_4$ (Scheme 29).

Scheme 25

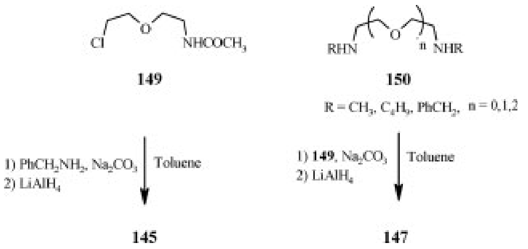


Scheme 26



5.2.1.3. Reaction of diols containing sidearm with the corresponding ditosylate compounds. Yoshihisa *et al.* [59] reported the synthesis of lariat ethers **166–169** having a sidearm attached to the 2-position of propane subunit to which was also attached a methyl group by reaction of the appropriate 1,3-propanediol **165** with the corresponding oligoethylene glycol ditosylates **36** and **48** in the presence of NaH as a base in THF (Scheme 30). The introduction of methyl group to the *C*-pivot remarkable improves the complexation ability toward alkali metal cations. As the methyl group is considered to work in restricting the movement of another substituent, this strategy should be also useful for chiral recognition of ammonium salts [25,60,61].

Scheme 27



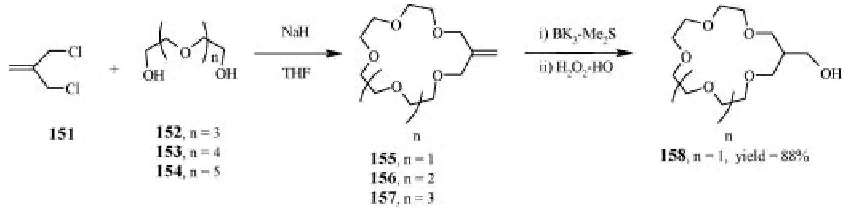
Lariat ethers **166** and **169** (R $= -CH_2-O-CH_2Ph$) underwent debenzylation upon treatment with Pd/C in EtOH to give the corresponding hydroxymethyl derivatives **170** and **171** [59].

Rasteller *et al.* [39] reported the synthesis of mercaptomethyl crown ether **174** by coupling of the diol **172** with triethylene glycol ditosylate followed by reduction and subsequent reaction with methylsulfonyl chloride to give **173**. Reaction of the latter with potassium thioacetate and subsequent reductive cleavage gave **174** (Scheme 31).

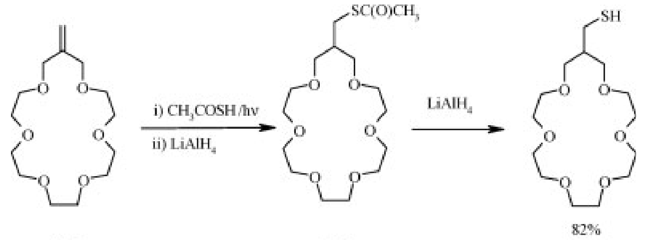
The diol **172** was obtained from multistep reactions starting from diethyl malonate [39].

Weber [62] and Hakushi *et al.* [63] reported the synthesis of lariat ethers with symmetrical double side arms attached through a carbon pivot. They prepared bis(hydroxymethyl) crown ethers **179–183** by reaction of monobenzalpentaerythritol [64] (**175**) with the appropriate oligoethylene glycol ditosylates **15**, **49**, **59**, **176**, and

Scheme 28



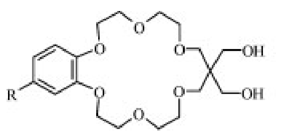
Scheme 29



156 **163** **164**

177 in the presence of NaH, NaOH, or KOH as a base in dioxane or THF, to give the corresponding spirocrown ethers **178** followed by acid hydrolysis (HCl/EtOH) or hydrogenolysis on treatment with H_2, Pd/C (Scheme 32).

Similarly were prepared the bis(hydroxymethyl)benzocrown ethers **184** and **185** from **175** and the appropriate ditosylate followed by acid hydrolysis [62].



184, R = H, yield = 96%
185, R = CH$_3$, yield = 92%

Reaction of crown ether diols **180** and **181** with the corresponding oligoethylene glycol monoethyl ether tosylate or oligoethylene glycol tetrahydropyranyl ether in the presence of NaH in THF afforded the corresponding crown ether derivatives with double symmetrical oxyethylene side arms of various chain length (cf. Table 16) [59,62,63,65].

Lariat ethers **190–192** with nonsymmetrical double side arms were prepared from the spiro crown ethers **178** by initial reduction with $LiAlH_4/AlCl_3$ in diethyl ether to afford the hydroxymethyl derivatives **186** in 90 and 92% yields. The latter compounds were then reacted with the appropriate chloride **187** in the presence of NaH in THF to give the crown ether derivatives **188**

with an oxyethylene chain and a benzyloxymethyl group in 39–47% yields. Hydrogenolysis yielded the corresponding hydroxymethyl crown ethers **189** in 89–95% yields. The latter compounds were then reacted with 1-bromodecane to give **190–192** in 51–55% yield (Scheme 33) [59].

5.2.1.4. Bromoalkoxylation of oligoethylene glycol mono-2-methylallyl ether with NBS and the appropriate alcohol followed by cyclization. Okahara and coworkers [48] prepared lariat crown ethers **195** and **196** having a sidearm in the 2-position to which was also attached a methyl group. Tetraethylene glycol is monosubstituted as its 2-methylpropenyl ether to give **193** and allowed to react with *N*-bromosuccinimide and Me(CH_2CH_2O)$_n$H to give the crown precursor **194** in which Me(CH_2CH_2O)$_n$H was incorporated as the incipient sidearm. The cyclization of **194** to **195** and **196** was accomplished on treatment with sodium *t*-butoxide in *t*-butanol (Scheme 34).

A 13-crown-4 version of these compounds was obtained by using triethylene glycol and lithium *t*-butoxide in *t*-butanol [66]. Other variants in ring size and pivot group were also reported by this group [47].

Considerable work has also been done by Inoue and coworkers with (3*n* + 1)-crown systems that incorporate the propene residue [67].

5.2.1.5. Bromoalkoxylation of methylenecrown ethers with NBS and the appropriate alcohol or glycol followed by nucleophilic displacement of the bromide. Ikeda *et al.* [68,69] reported the synthesis of two types of lariat ethers **202–210** and **215** derived from 3*n*-methylene-(3*n* + 1)-crown (*n* = 5, 6, 7) with different lengths of oxyethylene sidearm. These two types of *C*-pivot lariat ethers are different in basic skeleton around the pivot carbon, one type such as **202–210** directly connect the oxygen atom to the pivot carbon. The other type such as **215** contains one carbon atom between the pivot carbon and the oxygen atom.

Ligands **202–210** and **215** are structurally regarded to be derived from glycerol and trimethanol-methane, respectively. The difference in skeletal structure of the pivot position of these lariat ethers was found to remarkably affect their complexation properties. The lariat having a 2-methylglycerol structure around the pivot carbon showed much higher complexing ability than did the trimethylolmethane structure.

A series of lariat ethers containing a glycerol unit (compounds **202–210**) were designed to afford systematic structural variations of the crown ring size and the length of the oxyethylene sidearm. The 8-oxyquinoline moiety was introduced at the end of the sidearm of these lariat ethers because of its excellent coordination ability toward alkali metal cations [48]. The presence of the methyl group at the pivot position is expected to play an important role in increasing the complexation ability toward alkali metal cations [48,60,70]. The general synthetic procedures for compounds **202–210** are summarized in Scheme 35. Compounds **197** were obtained from the bromoalkoxylation of 3*n*-methylene-(3*n* + 1)-crown-

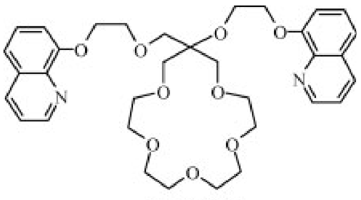
n (*n* = 5, 6, 7) **155–157** [58] using *N*-bromosuccinimide (NBS) and oligoethylene glycols. The hydroxyl group of compounds **197** was protected by treatment with 3,4-dihydro-2*H*-pyran, according to the conventional method, to give the corresponding tetrahydropyranyl ethers **198**, which were then treated with sodium hydride and *n*-butyl alcohol to give the butoxymethyl derivatives **199**, followed by deprotection under acidic conditions to give butoxymethyl alcohols **200**. The chlorides **201** obtained from the chlorination of alcohols **200** by use of thionyl chloride were further treated with 8-hydroxyquinoline in ethanol in the presence of KOH at reflux temperature for 2 days [71] to give the corresponding lariat ethers **202–210** (Scheme 35).

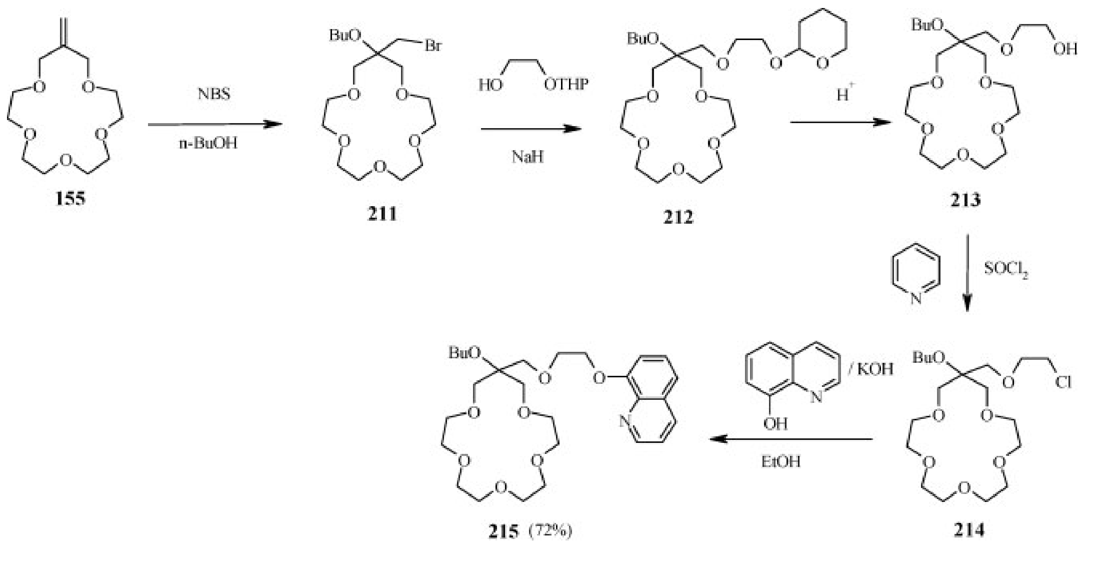
On the other hand, ligand **215** was prepared by changing the reaction sequence used in the case of lariat ethers **202–210**; that is, the bromoalkoxylation of 15-methylene-16-crown-5 (**155**) with NBS and *n*-butyl alcohol was performed as the first step as shown in Scheme 36.

The lariat ether **216**, with two oxyquinoline moieties, was also obtained from substrate **155** in a similar way.

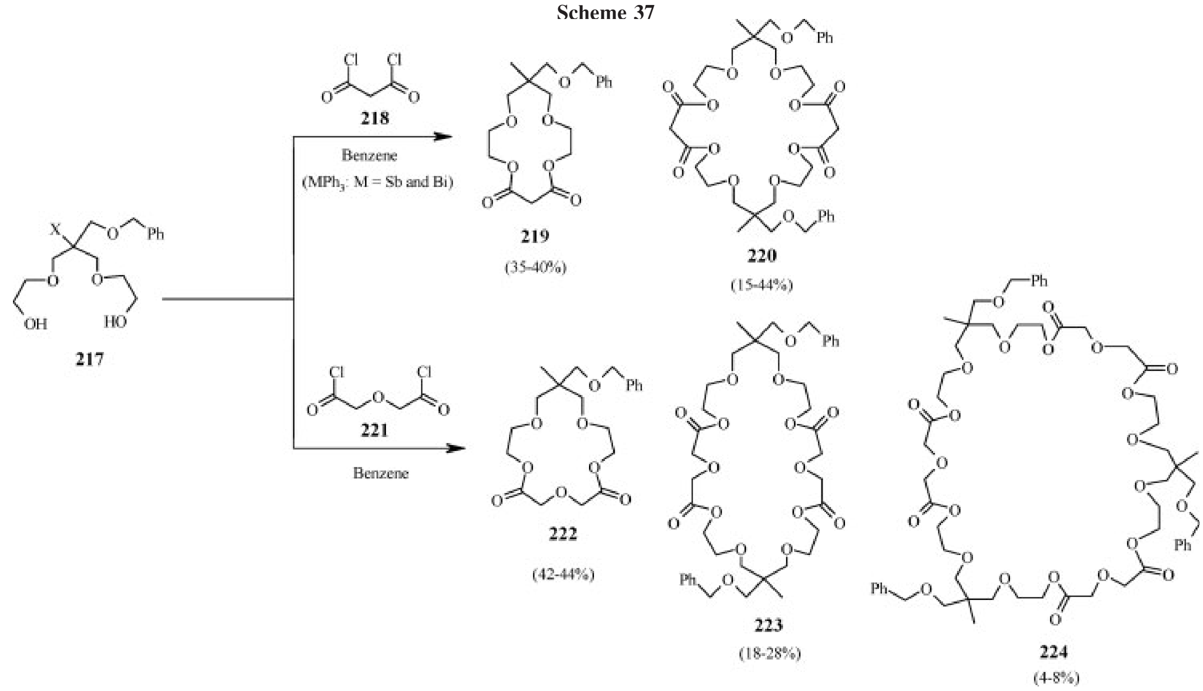


216 (74%)

Scheme 36



Scheme 37



5.2.1.6. Reaction of the appropriate diols with the corresponding diacid dichlorides. Habata *et al.* [72] reported the synthesis of benzyloxymethyl-substituted 14- and 16-membered crown ether ester **219** and **222** by treatment of diols **217** with the corresponding acid chlorides **218** and **221**, respectively, under high dilution condition using $SbPh_3$ and $BiPh_3$ as templates (Scheme 37). It was found that $SbPh_3$ and $BiPh_3$ are effective templates for the synthesis of 14-crown-4 ether ester. When **217** was treated with malonyl chloride, the dimer **220** was obtained together with the monomer **219**.

On the other hand, when diglycolyl chloride **221** was used the dimer **223** and the trimer **224** were obtained as cyclization products together with **222**.

5.2.1.7. Intramolecular cyclization of oligotrimethylene glycol monotosylates. Fredriksen *et al.* [73] reported the synthesis of 12-crown-3 ligands carrying methoxymethyl substituents in either one, two or all three of ring positions 3, 7, and 11.

They prepared 12-crown-3 ether **228** carrying methoxymethyl substituents in position 3 from diol **225** by initial reaction with one equivalent of tosyl chloride in pyridine to give the corresponding monotosylate **226**. Subsequent intramolecular cyclization of **226** in the presence of butyllithium and diisopropylamine **227** in DMF afforded **228** in 48% yield (Scheme 38).

Diol **225** was prepared from the appropriate substituted 1,3-propanediol by double chain extension with acrylonitrile followed by ester formation and $LiAlH_4$ reduction.

The same authors reported the synthesis of **228** from diol **229** by initial reaction with tosyl chloride in pyridine to give the monotosylate **230** followed by intramolecular cyclization using *n*-BuLi in dry DMSO to give the spiro macrocycle **231**. Reduction of **231** with $LiAlH_4$ in dry monoglyme afforded 3-hydroxymethyl derivative **232** which then underwent alkylation with MeI/BuLi to give **228** (Scheme 39).

The diol **229** was obtained by the reaction of 3,3-bis(iodomethyl)oxetane with a monobenzyl derivative of 1,3-propanediol followed by removal of the protected-benzyl group using Pd/C in EtOH.

Using the same approach 12-crown-3 ethers carrying methoxymethyl substituent at positions 3, 7 **234a,b** and at positions 3, 7, 11 **234c** were prepared starting from diol **233**.

5.2.1.8. Alkylation of hydroxymethylcrown ethers with the appropriate electrophiles. Crown ethers with hydroxymethyl sidearms are versatile intermediates in the synthesis of *C*-pivot lariat ethers. They may be used as nucleophiles and alkylated to form alkoxymethyl or phenoxymethylcrown compounds. The alkylation reactions were carried out using suitable basic solutions. The most common bases used are NaH in THF or K_2CO_3 in DMF [74–76].

Alkoxymethyl-substituted crown ethers have attracted considerable attention as synthons for more complex macrocycles and polymer-supported crown ethers. The more tedious problems in syntheses of these lariat ethers

334, 339, 342, 350, 352, 354, 358, 366, 375, 377, 379, 381, 383, 386, 388, 390, and **393** in the following tables were obtained from their ester precursors by basic hydrolysis followed by acidification. Some other lariat derivatives **298**, **311**, **316**, **321**, **330**, **340**, **355**, **384,** and **391** were obtained from their ester precursors on treatment with Me_3SiBr at 100°C. Various lariat ethers in the following tables were obtained from their precursors by some other reactions as mentioned under the tables.

5.2.1.10. Nucleophilic displacement of bromide from bromomethylcrown ethers. Lariat ethers with bromomethyl sidearms can also be converted into various lariats by nucleophilic displacement of the bromide. The following *C*-pivot lariat ethers are classified into nine tables (Tables 33–41) according to the ring size of the macro ring as well as the attachment point of the sidearm.

5.2.2. Synthesis of lariat dibenzocrown ethers. Bartsch *et al.* [89] developed an approach to dibenzo lariat ethers in which the sidearm is attached to the C2 position of a propane subunit. They studied some structure variations within these series of lariat ethers with the goal of enhancing their selectivity for alkali metal cations as well as their extraction efficiency. These structure variations include crown ether cavity size, basicity of the oxygen atoms, substituents on the benzene rings, nature of the alkyl group (linear or branched) attached to the central carbon or to the sidearm, and the linkage, which joins the functional group

of the sidearm to a common polyether ring. These series of lariat crown ethers are designed to provide systematic variations of some structural features while keeping the others unvaried. For example, in some cases, the crown ether cavity size is varied while holding the pendant arm constant. In others cases, the attachment site of the lipophilic group is varied while keeping the polyether ring and the linkage which join functional group on the sidearm and polyether portions invariant.

5.2.2.1. Synthesis of dibenzocrown ether alcohols. Bartsch *et al.* [89] reported the synthesis of dibenzocrown ether alcohols and studied their synthetic

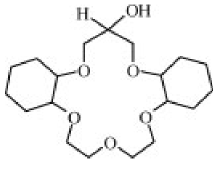
afford 1,3-disubstituted glycerol derivative **457** in which the 2-hydroxy group is free. An example of this cyclization is shown in Scheme 40.

In this reaction, the alkali hydroxide metal cation was varied to take advantage of the template effect [30,75]. Using this approach, lariat ether alcohols with different cavity sizes and different ring substituents **458–467** (Table 42) have been prepared [75,90–92]. Lariat ether alcohol (R = $C(CH_3)_3$) with *t*-butyl groups attached to the aromatic rings of dibenzocrown ethers was synthesized by reaction of lariat ether alcohol **457** with *tert*-butyl alcohol and 85% phosphoric acid at 100–110°C [92]. Lariat ether alcohol with nitro groups on its benzene rings **466** was obtained by reaction of **457** with nitric acid in acetic acid-chloroform-water. Reduction of **466** to the corresponding diamino derivative **467** was achieved by treatment with hydrazine hydrate over Pd/C as the hydrogen source in ethanol [92].

High-pressure catalytic hydrogenation of *sym*-hydroxydibenzo-16-crown-5 **457** produced the corresponding saturated crown ether alcohol **468** in good yield [75].



468 (50%)

Fuji *et al*. [93] reported the synthesis of binaphthyl crown receptors **470** with pendant hydroxyl group in 30% yield by the reaction of (S)-binaphthol **469** with 2-(2-chloroethoxy)ethanol in the presence of K_2CO_3 and KI, followed by cyclization with epichlorohydrin in the presence of tetrafluoroborate as a template (Scheme 41).

Bartsch *et al*. [92] reported the synthesis of lariat ether **472** with geminal methyl group on the central carbon of the propane subunit by reaction of the

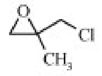
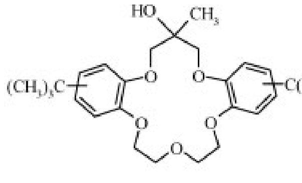
appropriate bisphenol with 2-methyl-2-chloromethyloxirane **471** in THF in the presence of NaH.



471



472 (64%)

The preparation of lariat ether tertiary alcohols **474–522** (Table 43) with (R = alkyl, alkenyl, alkynyl, aryl, aralkyl) was alternatively obtained using another strategy as depicted in Scheme 42 [75,91,92,94]. Thus, Jones oxidation or Swern oxidation of the appropriate lariat ether alcohol **457, 460,** and **465** gave the corresponding ketone **473**. Subsequent reaction of **473** with the appropriate Grignard reagent produced the corresponding lariat ether tertiary alcohols.

Kim *et al.* [95] reported the synthesis of lariat ether alcohol **526** with a second methyl group attached to a terminal carbon of the three-carbon bridge by initial cyclization of the bisphenol **456** with epoxide **523** and NaOH in THF-water to give the asymmetric crown ether alcohol **524** in an 31% yield. Oxidation of the latter compound with Jones reagent provided crown ether ketone **525** in 74% yield. Grignard reaction of **525** with methylmagnesium iodide gave the target **526** in an 87% yield (Scheme 43).

5.2.2.1.2. Dibenzocrown ethers with $O(CH_2)_nOH$ groups on the central carbon of the three carbon bridge. Lariat ether alcohol **527** with a —$O(CH_2)_2$—OH sidearm and a *tert*-butyl group on each benzene ring was prepared by addition of tetrahydropyranyl-protected ethylene chlorohydrin to the sodium alkoxide of lariat ether alcohol **465** followed by removal of the THP group with 10% HCl-methanol (Scheme 44) [92,96].

The synthesis of lariat ether alcohols **529–532** which have a —$O(CH_2)_3$—OH sidearm was accomplished by the addition of allyl bromide to the alkoxide of the appropriate lariat ether alcohol to give the corresponding allyloxycrown ethers **528** followed by hydroboration-oxidation (Scheme 45).

5.2.2.1.3. Dibenzocrown ethers in which one carbon atom mediates between the pivot carbon and the hydroxy group. Hydroxymethyl lariat ethers **535a,b** were synthesized as outlined in Scheme 46 [58,97]. Vinylidene dibenzo-crown ethers **534a,b** were prepared in 72–74% yield by cyclization of bisphenols **456** and **533** with methallyl dichloride and cesium carbonate in acetonitrile. Subsequent hydroboration with borane-THF complex, followed by oxidation with H_2O_2 and basic hydrolysis gave **535a,b** in 60 and 45% yields, respectively.

5.2.2.2. Synthesis of dibenzocrown ethers with a pendant ether groups from the corresponding lariat ethers alcohols. Reaction of lariat ethers alcohols with NaH

[a] Compound **552** was prepared from **551** by hydrolysis using NaOH/EtOH.

[b] Compound **555** was prepared from **554** by oxidation.

and the appropriate haloalkane in THF gave the corresponding dibenzocrown ethers with pendant ether groups **536–555** (Table 44) [89,98–100].

Lariat ethers **557** was prepared in 18% yield from compound **470** on treatment with the mesylate **556** in the presence of NaH followed by deprotection of the methoxymethyl group under acidic conditions (Scheme 47) [93].

5.2.2.3. Synthesis of dibenzocrown ethers with a pendant carboxylic acid group from the corresponding ethers alcohols. 5.2.2.3.1. Synthesis of dibenzocrown ether oxyacetic acid. Two approaches have been reported for the synthesis of this class of compounds (cf. compounds **558–620**, Table 45). The first approach involves initial formation of methyl ester from the corresponding lariat ether alcohol upon treatment with NaH and methyl bromoacetate in THF followed by basic hydrolysis and subsequent acidification [75,89,101].

In the second approach, the crown ether carboxylic acid were prepared in one step by reaction of the corresponding alcohol with NaH and bromoacetic acid in THF [89].

Using both approaches, Bartsch *et al.* [75,89,94,97,101–104] reported the synthesis of

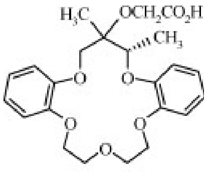
lipophilic lariat ether carboxylic acids in which the lipophilic group is incorporated either into the sidearm or on the geminal carbon.

Similarly, were prepared lariat carboxylic acids with lipophilic groups at both the geminal position and on the sidearm [97].

Dibenzo lariat ether carboxylic acids with substituents on both benzene rings were prepared by two methods. In the first method, the appropriate lariat ether alcohol containing the ring substituents were reacted with NaH and then bromoacetic acid to give the target lariat ethers [91,97]. In the second method, nitro- and sulfonic acid groups were introduced into the benzene rings of the preformed lariat ether carboxylic acid by nitration and sulfonation, respectively. Reduction of dinitro-derivatives to the corresponding diamines was accomplished with 85% hydrazine hydrate in ethanol in the presence of Pd/C [91,97].

Kim *et al.* [95] used a similar approach for the synthesis of lariat ether carboxylic acid **621** with a second methyl group attached to a terminal carbon of the propane subunit from the corresponding crown ether alcohol.



621 (87%)

5.2.2.3.2. Synthesis of dibenzocrown ether oxypropanoic aicd, oxybutanoic acid and oxypentanoic acid. The length of the spacer that connects the acidic function to the polyether ring is an important structural parameter for proton-ionizable lariat ethers.

Scheme 48

622, 623

624, 625

555, R = H, yield = 65%
626, R = *t*-Bu, yield = 90%

Three synthetic routes were employed for the synthesis of this class of compounds. In the first route, potassium *tert*-butoxide catalyzed cyanoethylation of the corresponding lariat ether alcohol in neat acrylonitrile or acrylonitrile in THF to give the corresponding lariat ether nitriles **622** and **623**. Hydrolysis of the latter compounds with methanolic solution containing HCl gas afforded the corresponding methyl esters **624** and **625**. Saponification with ethanolic KOH gave **555** and **626**, respectively (Scheme 48) [97].

In the second synthetic route, lariat ether oxypropanoic acid **555** was obtained in 6% yield by Jones oxidation of the corresponding alcohol [89].

In the third synthetic route [97], lariat ether alcohols **529, 531,** and **627** (*n* = 2, 3) were reacted with methanesulfonyl chloride in dichloromethane in the presence of TEA to give lariat ether mesylate **628–630**. Subsequent reaction with NaCN in DMSO gave lariat ether nitriles **631–633**. The latter compounds underwent reaction with anhydrous HCl gas in anhydrous methanol to give the corresponding lariat ether methyl esters **634–636**. Hydrolysis with KOH in 95% ethanol afforded the target molecules **637–639** in 88–97% yields (Scheme 49).

Lariat ether alcohol **627** (*n* = 2, R = Me) was obtained from the corresponding lariat ether acetic acid on estrification with ethanol and *p*-toluenesulfonic acid and subsequent reduction with $LiAlH_4$ [92].

Lariat ether oxypentanoic acid **641** was obtained from lariat ether alcohol **457** by initial reaction with ethyl 5-bromopentanoate in the presence of NaH in THF to give the corresponding ester **640** followed by basic hydrolysis with ethanolic NaOH (Scheme 50) [89].

5.2.2.3.3. Synthesis of dibenzocrown ether acetic acid.

This type of lariat ether contain one or more carbon atom between the pivot carbon and the carboxylic group on the sidearm.

(*sym*-Dibenzo-16-crown-5)acetic acid **645** was synthesized as shown in Scheme 51. Thus, reaction of lariat ether alcohol **535a** with methanesulfonyl chloride in dichloromethane in the presence of triethylamine gave lariat ether mesylate **642** which was treated with sodium

cyanide in dimethyl sulfoxide at 60°C to provide an 98% yield of lariat ether nitrile **643**. Passing hydrogen chloride gas through a refluxing methanolic solution of the latter compound gave a quantitative yield of lariat ether methyl ester **644**. Hydrolysis with potassium hydroxide in 95% ethanol at room temperature gave a quantitative yield of the target **645** [97].

5.2.2.3.4. Synthesis of dibenzocrown ether propanoic acid. The synthetic route to 3-(sym-dibenzo-16-crown-5)propanoic acid **648** is shown in Scheme 52. Lariat

ether alcohol **457** was converted into tosylate **646** in 97% yield. This tosylate was reacted with 10 equivalents of lithium bromide in hexamethylphosphoramide to give an 85% yield of lariat ether bromide **647,** which was photolyzed in the presence of acrylic acid and tributyltin hydride to produce an 30% yield of the desired lariat ether carboxylic acid **648** [97].

5.2.2.3.5. Synthesis of dibenzocrown ether 4-(2-oxabutanoic acid). The preparation of dibenzo-16-crown-5 compounds with 4-(2-oxabutanoic acid) side arms **651** and **652** is summarized in Scheme 53. Reaction of hydroxymethyl lariat ethers **535a,b** with ethyl bromoacetate and sodium hydride in tetrahydrofuran at room temperature gave lariat ether esters **649** and **650** in 36 and 40% yields, respectively. Hydrolysis with potassium hydroxide in 95% ethanol provided lariat ether carboxylic acids **651** and **652** in 94% yields [97].

5.2.2.4. Synthesis of dibenzocrown ethers with a pendant ester group. Bartsch *et al.* [105] reported the synthesis of dibenzo-16-crown-5 with pendant ester groups **653–671** (Table 46) from the corresponding lariat ether alcohols using the following synthetic routes:

(a) Reaction of the corresponding lariat ether alcohol with NaH and the appropriate alkyl bromoacetate in THF.
(b) Reaction of a lariatether alcohol with ethyl diazoacetate and boron trifluoride in benzene.
(c) Reaction of *sym*-(hydroxy)dibenzo-16-crown-5 and carboxylic acid nitroxide in the presence of *N*,*N*′-dicyclohexylcarbodiimide in THF.
(d) Treatment of a lariat ether alcohol with KH followed by addition of the appropriate acid chloride.
(e) Heating the appropriate lariat ether nitrile under reflux in ethanol-benzene (1:2) through which gaseous HCl was passed.

5.2.2.5. Synthesis of dibenzocrown ethers with a pendant acetamide group. Bartsch *et al.* [106,107] reported the synthesis of *sym*-dibenzo-16-crown-5 oxyacetamides **672–704** (Table 47) by the reaction of *sym*-hydroxydibenzo-16-crown-5 with KH in THF followed by addition of the appropriate 2-chloroacetamide.

5.2.2.6. Synthesis of dibenzocrown ethers with a pendant amine group. Bartsch *et al.* [109] reported a synthetic method for attachment of an amino group to the central carbon atom of a variety of dibenzocrown ethers with subsequent conversion of these lariat ether primary amines into proton-ionizable lariat ether containing picrylamino type side arms.

The synthetic route to *sym*-(amino)dibenzocrown ethers **707** starting from the appropriate lariat ether

alcohols is shown in Scheme 54. The latter compounds were converted to lariat ether mesylate **705** in 91–93% yields upon treatment with methylsulfonyl chloride in THF. Reaction of the mesylates **705** with NaN_3 and Na_2CO_3 in DMF produced lariat ether azides **706** which were reduced to the desired lariat ether amines **707** in 75–81% yields. Reaction of the latter with the appropriate chlorobenzenes in methanol containing $NaHCO_3$ afforded the corresponding lariat ethers with picrylamino sidearms **708–719** (Table 48).

Similarly, binaphthyl crown receptor with a pendant amine **722** was prepared from the corresponding alcohol **470** by reaction with tosyl chloride in pyridine to give tosylate **720**. The latter was subjected to azidation of tosyl group to give **721** in 94% yield and then reduced to form the amine **722** in 98% yield. Amine **722** was reacted with a large excess of activated carbamate (which was generated in situ by the reaction of 2,4-dinitroaniline and phenyl chloroforamte) to yield host **723** in 75% yield and an overall yield of 53% (Scheme 55) [110].

Bartsch *et al.* [111] reported also the synthesis of lariat ethers with a pendant amines **724** starting from ketone **473** by initial treatment with the appropriate primary amines and 5*N* HCl-methanol in methanol in the presence of 4 A° molecular sieves as the drying agent followed by reduction with sodium cyanoborohydride. Subsequent reaction of lariat ether amines with *N*,*N*-dipentylchloroacetamide in acetonitrile in the presence of sodium bicarbonate and a catalytic amount of NaI afforded amides **725** and **726**, respectively (Scheme 56).

Lariat ether amines **727–729** in which the nitrogen atom is not directly attached to the pivot carbon can be obtained by reduction of the corresponding lariat ether amide [97] or lariat ether nitriles [108] with borane-dimethylsulfide in THF in 68%, 54%, and 40% yields, respectively.

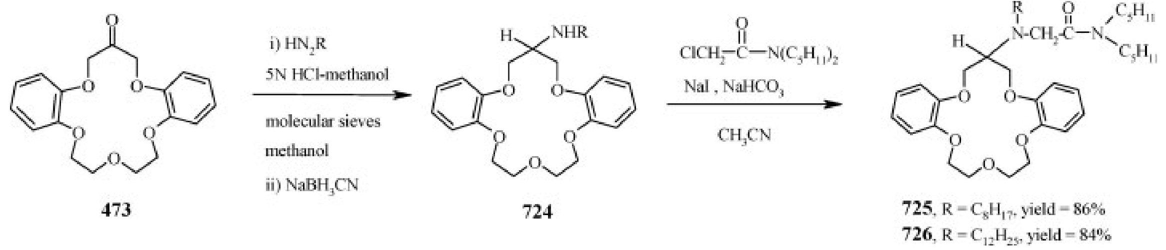
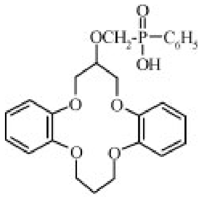
(a) 2-Bromobenzyl bromide, NaH, 90%; (b) (i) n-BuLi, (ii) $B(OME)_3$, (iii) H^+, 60% (three steps); (c) TsCl, pyridine 76%, (d) NaN3, 94%; (e) Pd/C, HCO_2NH_4, 98%; (f) 2,4-dinitroaniline, phenylchloroformate, 75%.

Scheme 56

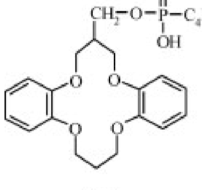


(chloromethyl)phenyl-phosphinic acid in presence of NaH in THF.



730

Habata *et al*. [113–116] reported the synthesis of alkylphosphoric acid armed dibenzo-14-crown-4 **731** by the reaction of hydroxymethyldibenzo-14-crown-4 with dichloroalkylphosphate in benzene or THF followed by hydrolysis.



731

Bartsch *et al*. [96] reported the synthesis of crown ether phosphonic acid monoethyl ester **735** ($n = 1$) by the reaction of the alkoxide from the appropriate lariat ether alcohol with monoethyl iodomethylphosphonic acid. Lariat ether phosphonic acid monoethyl esters **736–738** ($n = 2, 3, 4$) were obtained by the reaction of appropriate lariat ether substituted alkyl bromides **732–734** with triethyl phosphite followed by basic hydrolysis (Scheme 57).

Bromo derivatives **732** and **733** ($n = 2, 3$) were obtained from the corresponding alcohols on treatment with PBr_3 in DMF. Compound **734** ($n = 4$) was obtained from the corresponding alcohol upon treatment with 1,4-dibromobutane in aqueous NaOH in the presence of tetrabutylammonium hydrogen sulfate (Scheme 57).

5.2.2.8. Synthesis of various lariat ethers from dibenzocrown ethers carboxylic acids. Lariat ether carboxylic acids are important starting materials for the synthesis of lariat ethers with pendant ester, amide, hydroxamate, and *N*-(X)-sulfonylcarboxamide groups [97]. The functional groups may provide additional ligating atoms for cation complexation and serve as sites for further structure elaboration or function as attachment points for binding crown ethers to polymers [90].

Compounds no. **665–669** mentioned in Table 46 were prepared in 72—80% yield [117,105] using the above methods.

5.2.2.8.1. Synthesis of dibenzocrown ethers with a pendant ester group. Bartsch *et al*. [105] used two synthetic approaches for the preparation of dibenzo-16-crown-5 with pendant ester group **739–816** (Tables 49 and 50) from the corresponding crown ether carboxylic acid. These synthetic approaches include:

(a) Esterification of a carboxylic acid function in a lariat ether carboxylic acid with ethanol or methanol in the presence of H_2SO_4 or *p*-toluenesulfonic acid as catalyst [92,97,105,117].
(b) Conversion of a lariat ether carboxylic acid into the corresponding lariat ether acid chloride by treatment with oxalyl chloride in benzene and subsequent reaction with the appropriate alcohol in pyridine [95,117].

5.2.2.8.2. Synthesis of dibenzocrown ethers with pendant amide, hydroxamate, hydroxamic acid, and N-(X)sulfonyl carboxamide groups. Lariat ethers with oxyacetamide group were prepared from the corresponding lariat ether carboxylic acids by initial reaction with oxalyl chloride in benzene to give the corresponding acid chloride followed by reaction with ammonia gas or the appropriate alkyl amine [20,106,107,111,118].

Lariat ethers hydroxamates were obtained from the corresponding lariat ether acid chloride upon treatment with *o*-benzylhydroxylamine hydrochloride and pyridine in acetonitrile. Subsequent catalytic hydrogenation of the *o*-benzyl group afforded the lariat ether hydroxamic acid [91,94,111,119]. *N*-(X)sulfonyl carboxamide lariat ethers were prepared by coupling of the corresponding lariat ether acid chloride with the K-salt of the commercially available sulfonamides [18,120]. The following lariat ethers **739–816** (Tables 51 and 52) are prepared using the above strategies.

5.2.3. Synthesis of di-/tetrabenzo lariat azacrown ethers. *5.2.3.1. Synthesis of lariat ether formazan.* Katritzky [122] reported the synthesis of crown formazan **881** with a pendant hydroxyl group by coupling of tetrazotized 1,3-bis(2-aminophenoxy)propan-2-ol **879** with the sodium salt of β-phenylpyruvic acid **880** under phase transfer conditions. Acylation of the hydroxyl group of **881** with 2-chloroacetyl chloride

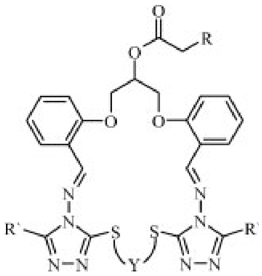
Table 56



Macrocyclic Schiff bases with a pendant $OC(O)CH_2NR$ group

Comp. no.	X	R′	R	Ref. (yield)
915	$(CH_2)_3$	Ph—		123 (70)
916	$(CH_2)_4$	$PhCH_2$—		123 (65)
917	$(CH_2)_4$	$PhCH_2$—	$(CH_3CH_2)_2N$—	123 (60)

dipotassium salts **883** with epichlorohydrin (**7**) for **884**, 1,3-bis(2-chloromethylphenoxy)propan-2-ol (**885**) for **886–888**, 1,3-bis(2-chloroacetyloxy-aminophenoxy)propan-2-ol (**889a**) and 1,3-bis(2-chloroacetyloxy-aminothiophenoxy)propan-2-ol (**889b**) for **890–894**, respectively [124,125] (Scheme 59).

The hydroxyazacrown ethers **897** were obtained by cyclocondensation of the aldehyde **895** with the corresponding bis(amine)s [123] **896** in refluxing acetic acid under high dilution conditions (Scheme 60).

Acknowledgments. Prof. Dr. Ahmed H. M. Elwahy thanks the Alexander von Humboldt Foundation for a research fellowship. He is also greatly indebted to Prof. K. Hafner, University of Darmstadt, for his continuous help and generous support.

This review intends to explore synthetic methodologies for the preparation of 2*H*-chromenes and their analog chromanes through *ortho*-quinone methide (*o*-QM) intermediates associated with inter and intramolecular hetero-Diels-Alder and electrocyclization reactions.

J. Heterocyclic Chem., **46**, 1080 (2009).

INTRODUCTION

Chromane and chromene substructures (Fig. 1) are frequently found in naturally occurring compounds, many of which exhibit useful biological activity [1–3]. Most of the time, the heterocyclic moiety is associated with an aromatic ring, forming 2,3- or 3,4-dihydrobenzopyran systems. From the position of the double bond, the chromene ring can be divided into two classes: 2*H*-chromene and 4*H*-chromene. Chromane is the saturated analog of chromene (Fig. 1).

In general, a number of biologically active chromenes and chromanes have been isolated from several natural sources. These substances have been identified as apoptosis-inducing agents [4], anti-HIV agents [5,6], modulators of the estrogen receptors [7], antibacterials [8], and antifungals [9].

For example, chromenes **1** and **2** (Fig. 2) were isolated from the leaves of *Peperomia serpens* (Sw.) Loudon [10] of genus *Peperomia* (Piperaceae) and presented antifungal activities against *Cladosporium cladosporioides* and *C. sphaerospermum.* Kawahara *et al.* in 1988 [11] isolated 2,2-dialkyl-substituted chromenes **3** and **4**, which exhibited antibacterial activity, from species of the fungi *Crucibulum, Lactarius, Aspergillus silvaticus*, and *Cylindrocarpon* (Fig. 2).

Some other important examples isolated from such diverse natural sources such as fungi, marine organisms, and plants are depicted in Figure 3. Compound **5**, which was isolated from the fungus *Daedalea quercina*, proved to have antioxidant and anti-inflammatory activities [12]. Chromenes with isoprenoid side chains are frequently found in nature [13], being structural analogs of prenylated coumarins, chalcones, and cannabinoids [14,15]. Cordiachromene (**6**) is a chromene with an isoprenoid chain that was isolated from *Cordia alliodora* Ruiz and Pav [16] and marine organisms *Aplidium antillense* [17] and *Aplidium constellatum* [18]. It exhibits antibacterial activity against *Staphylococcus aureus* and anti-inflammatory activity [19].

The most well-known class of naturally occurring 2*H*-chromenes are the precocenes, which are divided in two

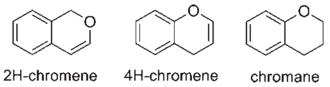

Figure 1. Chemical structures of the systems 2*H*-chromene, 4*H*-chromene, and chromane.

subclasses: precocene I (**7a**) and II (**7b**), also called ageratochromenes. These latter compounds were initially isolated from *Ageratum houstonianum* [2] but later found in several Ageratinae species. They are well known for their insecticidal activity and for inducing precocious metamorphosis [20], meaning they have properties as an antijuvenile hormone by reducing the length of larval life in sensitive species and preventing ovarian development in some adult insects [21].

The chromane moiety is present in other natural products [22–24], such as tocopherols and cannabinoids. α-Tocopherol (**8—**vitamin E) is found in the oil of wheat germ and it is reported that the chromane moiety is responsible for the antiandrogenic properties of vitamin E [25]. 4′-Methoxy-bavachromanol (**9**) was isolated from propolis and was found to be a more powerful antioxidant than lipoxygenases found in soybeans [26]. Among the constituents present in *Cannabis sativa*, tetrahydrocannabinol (**10**) is responsible for the plant's strong hallucinogenic activity (Fig. 4).

Substances that have the chromene or chromane ring fused with *ortho-* or *para*-quinones represent a special class of naturally occurring compounds that are present in many plants, fungi, and insects [27]. Xiloidone, 3,4-dihydro-α-lapachone (**11**) and its isomer, 3,4-dihydro-β-lapachone (**12**), are the most representative substances of the chromene-fused quinone class. These naphthoquinones are minor components in the extract of lapachol (**13**) [28–42]. Rodrigues and coworkers obtained **11** and **12** along with lapachol from *Tabebuia avellanedae* by using supercritical fluid extraction [43]. Gonçalves *et al.* [44,45] reported that xiloidone (**11**) has antibiotic activity against Gram-negative bacteria of the genus *Brucella*. Recently, Kuster *et al.* demonstrated that xiloidone (**11**) has potent antibacterial activity against multiresistant *Staphylococcus aureus* strains [46]. Cho *et al.* isolated xiloidone (**11**) from *Catalpa ovata* stems and demonstrated it had activity against some plant pathogenic fungi [47].

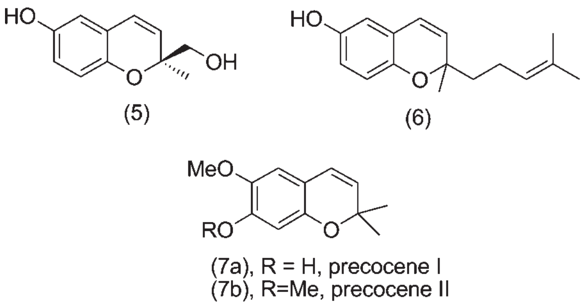

Figure 3. Precocens isolated from different natural sources.

The biogenetic route to naphthoquinone chromenes seems to have originated from lapachol (**13**) which is very abundant in many plants. D'Albuquerque *et al.* in 1972 and later in 2004 Jassbi *et al.* demonstrated that xiloidone can be obtained by $FeCl_3$ oxidation of lapachol in the presence of pyridine and acetic anhydride [48,49]. Indeed, several pathways for the formation of dihydro-α-lapachone from lapachol involving oxidative dehydrogenation [50] and photoirradiation [51] have been suggested. There are other natural and synthetic, biologically active naphthoquinones derived from lapachol (**13**).

The most important substances of the chromane-fused quinone class are α- (**14**) and β- (**15**) lapachones (Fig. 5). These compounds are the 2H hydrogenated analogs of compounds **11** and **12**. Thus, the development of valuable methods for the preparation of naphthoquinone-2*H*-chromene would also provide access to many analogs and derivatives of these substances.

Briefly, quinones have been the subject of much interest for a number of years due to their various biological activities [52–54]. For example, quinones have been studied for antitumor [55,56], molluscicidal [57–59], leischmanicidal [60], anti-inflammatory [61], antifungal [62], and trypanocidal [63,64] activities. It is described in the literature that the biological profiles of these molecules are centered on its *ortho-* or *para*-quinonoid moiety [65]. This group generally accepts one and/or two

electrons (redox cycling) [66] to form the corresponding radical anion or dianion species *in situ*. In such way, the semi-quinone radicals accelerate the intracellular hypoxic condition by producing a superoxide anion [67–69]. Because of this mechanism, quinones show cytotoxic activity against cancer cells (and also to normal cells) by interfering with enzymes such as topoisomerases, which are critical for DNA replication [70].

Lapachol (**13**) is a natural naphthoquinone that occurs in the grain of several wooden trees of the Bignoniaceae family and is widely used in American folk medicine for the treatment of several diseases. It was first isolated in 1882 from *Tabebuia Avellanedae* [71], but it occurs in several other species of the genus *Tabebuia* (Tecoma). These trees are commonly known in South America as ''ipês,'' but also as Lapacho, Pau d'Arco, Lapacho roxo, and Taheebo [72,73]. It also occurs in many other families such as Verbenaceae, Proteaceae, Leguminosae, Sapotaceae, Scrophulariaceae, and Malvaceae [68,73]. Since the discovery that lapachol (**13**) [74], a natural naphthoquinone, proved to have antitumor activity against Walker-256 carcinoma, several structural modifications were performed [75,76] in order to find new compounds with other activities [73,77–81].

β-Lapachone (**15**), also known as ARQ501 [82] (Fig. 5), is a natural pyran-*ortho*-naphthoquinone originally obtained from the heartwood of the Lapacho tree, which belongs to the genus *Tabebuia* (Bigoniaceae) and which grows throughout the South America. This compound has been demonstrated to have many different pharmacological effects including promising anticancer activity [70]. Currently, it is undergoing multiple Phase II clinical trials. Several possible mechanisms to explain the cytotoxic effect against cancer cells have been proposed. The most recent proposal suggests that a redox cycle between NAD(P)H and quinone oxireductase 1 (NQO1) enzyme causes the depletion of NAD(P)H and NADH in the cells. This consequently decreases ATP and increases cytochrome C and cytosolic Ca^{+2}, which then affect other pathways in the cell cycle checkpoint resulting in the selective apoptotic cell death of cancer cells. It has also been suggested that the generation of ROS affects the kinases that are involved in cell cycle progression, leading to cell death. β-Lapachone has also been considered as a coadjuvant in killing human cancer cells during radiotherapy treatment. It seems that it inhibits sublethal radiation damage repair. Regarding anticancer activity, it presents significant antineoplasic [83] activity against human cancer cell lines from leukemia [84], prostate [85], malignant glioma [75], hepatoma [86], colon [87], breast [88], ovarian [89], lung [90], and pancreatic [91] tumors, at concentrations in the range of 1–10 μ*M* (IC_{50}). It has also been intensely investigated as a possible drug against the flagellate protozoan *Trypanosoma cruzi*, which is the etiological agent of Chagas disease, in both acute and chronic infections [92–96]. This compound inspired a search for new derivatives with a better therapeutical index. Several heterocyclic derivatives (oxyranes [92(a,b)], oxazoles [64], imidazoles [92(c)], and phenazine [97]) of β-Lapachone (**15**) have been synthesized. Some of them have lower side effects and improved trypanocidal activity.

Because of the multiple uses and variety of biological activities of chromenes, the synthesis of this heterocyclic substructure has been the subject of intense investigations. Several new synthetic methods and improvements in existing and classical methods have been reported recently. In general, phenols and salicylaldehydes have been used in the preparation of chromenes. Table 1 summarizes some methods. The preparation of chromanes can be achieved by simple hydrogenation of the double bond of the chromenes. Nevertheless, there are several procedures that target the chromane ring directly, such as: (a) sequential [3+3] cyclization and Williamson's reaction [98] from salicylaldehydes [99,100], phenols [101], propargylic phenols [102], and 1,2-benzoxazines [103]; (b) iodine-catalyzed cyclocondensation [104]; (c) ring-closing olefin metathesis [105]; (d) *via* Wittig intermediates [106]; and (e) electrochemistry [107].

o-QUINONE METHIDES: GENERALITY

In general, *ortho*-quinone methides (*o*-QMs) possess a hexadiene ring with a carbonyl group and a methylene unit in the ring. With these two different functional groups, the molecule becomes highly polarized and is very reactive. With both cationic and anionic centers, the molecule can act either as a nucleophile or electrophile. In addition to quinone methides being excellent partners in Diels-Alder reactions, the structures are also present in many molecules with biological activity. A great variety of plants, animals, and fungus use these substances for defense.

o-QMs have been extensively used for the preparation of 2*H*-chromene and chromane substructures. Chromenes are obtained through electrocyclization reactions [eq. (1), Scheme 1] and chromanes by inter or intramolecular hetero-Diels-Alder reactions [eqs. (2) and (3), Scheme 1]. In both cases, quinone methides are the key intermediates (Fig. 6).

o-QMs are involved in a large number of chemical reactions and biological processes such as enzyme inhibition, reactions with phosphodiesters, DNA alkylation [112], and crosslinking [113,114]. Their electrophilicities towards amines, thiols, water, amino acids, and peptides have also been used for interactions with nucleobases of DNA [115]. Several important clinical anticancer drugs (*e.g.*, cisplatin, psoralens, and mitomycin C) are known to induce DNA ISC formation, which can disrupt cell maintenance and replication by a mechanism that involves *o*-QM intermediates. Similarly, *o*-QMs have been detected in daunomycin and have been shown to function as alkylating agents [116]. The formation of *o*-QMs as reactive intermediates in biologically active natural products has been reviewed [117,118]. Apart from their involvement in biological processes, *o*-QMs are also very versatile intermediates in organic synthesis [119–124], but until now they have been less utilized in total syntheses [125]. Since they are ephemeral species [126], they must be generated *in situ* by processes that involve photolysis of *o*-, *m*-, or *p*-hydroxybenzyl alcohols [127], thermal reactions [128,129], thermal extrusion of sulfur dioxide [128] and anionic triggered reactions [130,131]. In this regard, Amouri *et al.* synthesized the first metal-stabilized *o*-QM and found that it is reactive toward alkenes [132,133]. Nevertheless, there are some nonmetal stabilized *o*-QMs that can also be isolated. For example, in 1969, Sullivan *et al.* [134] showed that 9,10-phenanthrenequinone (**16**) reacts with several Wittig reagent (Carbethoxyethylidene) triphenylphosphorane (**17**) reagents to produce *o*-QM derivatives of phenanthrene which were quite stable toward isolation. The authors found that their stabilities were dependent on the electronegativity and bulkiness of the substituents on the *o*-QM moiety. Later on, Nicolaides *et al.* [135] revisited the reaction and prepared other *o*-QMs (*e.g.*, **18**) (Scheme 2).

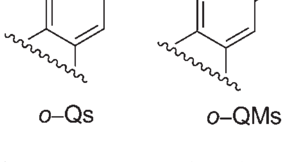

Figure 6. General structure of *o*-quinone methide.

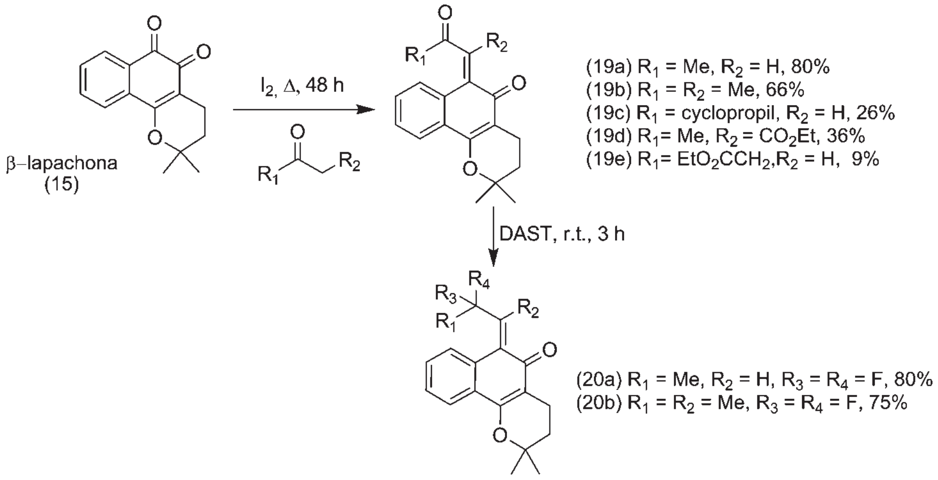
Very recently, Da Silva *et al.* prepared several stable *o*-QMs (**19a–e, 20a–b**) from β-lapachone (**15**) [136] under conditions that allowed for Aldol condensation with one of the carbonyls (Scheme 3).

The *o*-benzoquinone methide moiety (**21**) is a reactive intermediate that has potential synthetic utility as reported in many articles [137]. In 1976, Heldeweg and Hogeveen showed that *o*-benzoquinone methides prepared by pyrolysis of *o*-hydroxybenzyl alcohols (**22**) at 180°C in the presence of 2 equiv of $[Rh(CO)_2Cl]_2$ afforded 2[3H]-benzofuranone (**23**) in 12% yield [138]. Therefore, it is common that *o*-benzoquinone methides cannot be isolated, even though they can be observed *via* low temperature infrared [139], UV [140] or photoelectron spectroscopy [141] (Scheme 4).

Scheme 3



SYNTHETIC METHODOLOGY FOR PREPARING 2*H*-CHROMENES AND CHROMANES

This review will focus specifically on current strategies involving the construction of chromene and chromane rings *via* *o*-QMs that are mainly coupled with a quinone nucleus (Scheme 1).

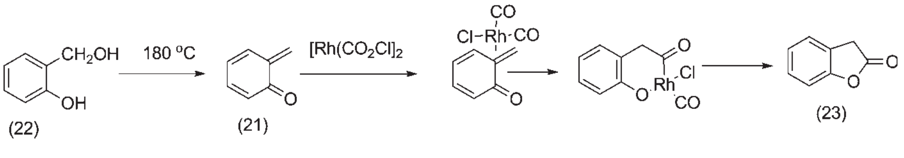
SYNTHESIS OF 2*H*-CHROMENES AND CHROMANES BY TRAPPING OF *o*-QMS *VIA* ELECTROCYCLIZATION

In 1969, Dudley and Chiang [50] reported a one-step synthesis of 2,2-dimethyl-2*H*-chromenes by exposing isolapachol (**24**) to an equimolar quantity of DDQ in benzene, resulting in oxidative cyclization to a mixture of the dehydro-α and -β-lapachones (**11** and **12**, Fig. 5). Consideration of the possible mechanisms by which chromenes **11** and **12** might arise led to the postulate that the isomeric *o*-quinone methide intermediates **25** and **26** might undergo a 6π-electrocyclic reaction. This simple procedure proved to be a facile entry into the lapachone series and was further simplified by the observation that **12** can be converted to **11** by treatment with acid. The authors proposed that the two isomeric *o*-QMs are involved as the key intermediates in the reaction mechanism and that their electrocyclization leads to the formation of the chromene moiety (Scheme 5).

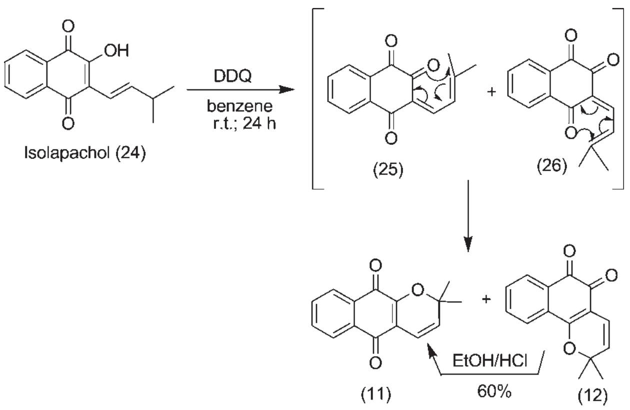
A new route for introducing the chromene moiety, based on the formation of an *o*-QM intermediate (**27**) through a tandem Knoevenagel-electrocyclic reaction, was reported by Ferreira *et al.* in 1980 [142]. The reaction of lawsone (**28**) with α,β-unsaturated aldehydes exclusively produced α-dehydrolapachones (**29–31**) in an average yield of 33%. The same synthetic route and conditions were used by De Oliveira *et al.* [143] for the preparation of the naturally occurring dihydro-α-caryopterone (**32**) and its isomer, 6-hydroxy-dehydro-α-lapachone (**33**) (Scheme 6).

Recently, the reaction of lawsone (**28**) with 3-methyl-2-butenal (**34**) utilizing several bases and Lewis acid catalysts was reinvestigated in order to improve the yield of dehydro-α-lapachone (**11**) [144]. This study found that indium (III) chloride (10 mmol %) and ytterbium (III) triflate (10 mol %) catalysts in acetonitrile produced the desired compound in very low yields. However, by using $Yb(OTf)_3$ in DMF at 100°C, the desired compound was produced in higher yield (55%). By using pyridine as a catalyst and solvent, the product was formed in 54% yield. The best condition found was with ethylenediamine diacetate (10 mol %) as the catalyst in MeOH (75%) or benzene (80%) (Scheme 7) [145]. As previously observed by Ferreira *et al.* in 1980, only the dehydro-α-lapachones were formed under these reaction conditions (Scheme 6).

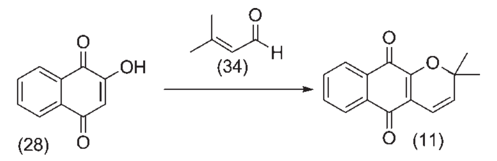
Scheme 4



Scheme 5



Scheme 7



Catalyst	Conditions	Yields (%)
$InCl_3$ (10 mol%)	MeCN, Δ, 5 h	5
$Yb(OTf)_3$ (10 mol%)	MeCN, Δ 5 h	10
$Yb(OTf)_3$ (10 mol%)	DMF, 100 °C, 5 h	55
Pyridine (excess)	$MgSO_4$, Δ, 5 h	54
Ethylenediamine diacetate (10 mol%)	$InCl_3$,(10 mol%)	47
Ethylenediamine diacetate (10 mol%)	MeOH, r.t., 5 h	75
Ethylenediamine diacetate (10 mol%)	Benzeno, Δ, 5 h	80

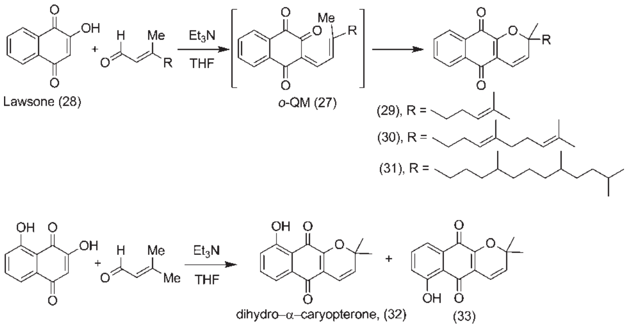
Although the aforementioned tandem-Knoevenagel-electrocyclic reaction with α,β-unsaturated aldehydes exclusively produced dehydro-α-lapachones quite successfully, Hayashi *et al.* found that in sharp contrast, the reaction of lawsone (**28**) with acrolein (**35**) does not even undergo cycloaddition [146]. Instead, two products were formed. The major isolated compound was *o*-QM (**36**), which is very stable. These products arose from two different possible condensations between acrolein and lawsone, a Claisen-Schmidt reaction and a Michael reaction, leading to **36** or **37**, respectively, after acetalization. Tournaire *et al.* [147] revisited this condensation under several acidic conditions and isolated **36** and **37**, as previously reported, along with some other products. When the reaction was performed in the presence of an excess of hydrochloric acid, **39** was isolated in less than 10% yield. Compound **39** is presumably produced *via* the formation of *o*-QM (**38**), followed by chlorination of a double bond (Scheme 8).

Other research groups soon became attracted to the opportunities presented by these tandem Knoevenagel-electrocyclic reactions. For instance, Hua *et al.* reported the condensation of various 6-substituted 4-hydroxypyrones with 1-cyclohexenecarboxaldehydes in the presence of L-proline in ethyl acetate gave high yields of substituted 1*H*,7*H*-5a,6,8,9-tetrahydro-1-oxopyrano[4,3-*b*][1]benzopyrans [148]. And the next advance was disclosed by Snieckus and coworkers. They reported a facile procedure for preparing 2*H*-chromenes (*e.g.*, **40**, Scheme 9) by coupling commercially available phenols (**41**) and naphthols (*e.g.*, **42**) with α,β-unsaturated aldehydes (**43**) under the influence of phenylboronic acid [149]. This reaction protocol was extended to a synthesis of β-lapachone (**15**) [150,151], which illustrates the rapid access to these types of molecules by this method.

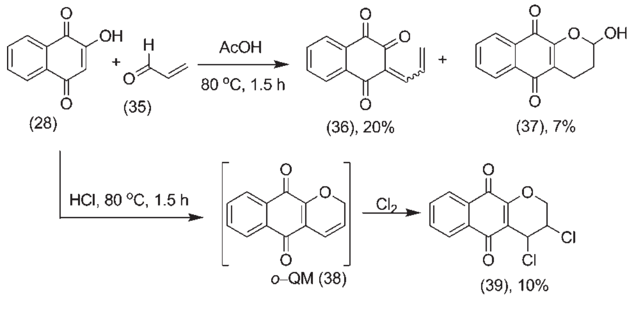
An interesting strategy for the synthesis of epoxynaphthopyranoquinone (**45**), a xiloidone derivative, was reported by Tapia and coworkers [152]. The authors synthesized benzopyran quinone (**46**) using the tandem Knoevenagel-electrocyclic protocol *via* an *o*-QM intermediate (**47**). Their synthetic route started from 2,5-dimethoxyphenol (**48**) that had its phenolic group protected as a tetrahydropyranyl (THP). This intermediate was transformed to *o*-hydroxy-γ,γ-dimethyl allyl alcohol (**49**) by reaction of **50** with 3-methyl-2-butenal (**34**) under basic conditions. The mild hydrolysis of the THP protecting group and dehydration of **50** led to formation of the *o*-QM intermediate, which upon intramolecular electrocyclization, formed benzopyrane (**46**). The latter compound was transformed in three steps to epoxynaphthopyanoquinone (**45**) (Scheme 10).

More recently, Dintzner and coworkers [153] reported for the first time a direct condensation of phenols with α,β-unsaturated aldehydes catalyzed by clays. The reaction between 3-methyl-2-butenal (**34**) and sesamol (**51**)

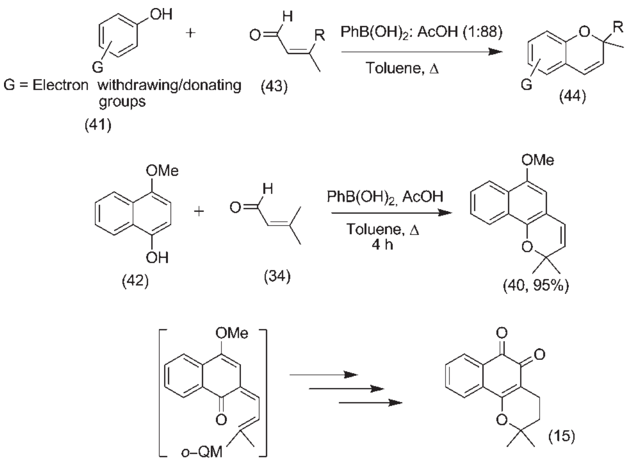
Scheme 6



Scheme 8



Scheme 9

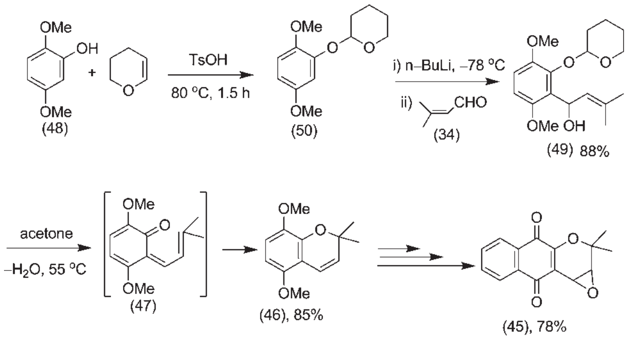


was used as the model reaction in order to prepare methylenedioxyprecocene (**52**), which as mentioned previously, exhibited antijuvenile hormone activity in some insects. Acidic montmorillonite K10 clay promoted the electrophilic aromatic addition yielding the desired 2*H*-chromene (**52**) through an *o*-QM intermediate (**53**). The optimal conditions for this process involved the reaction of the substrate on basic clay (K10–K$^+$) at 110°C, without solvent, under microwave irradiation (Scheme 11).

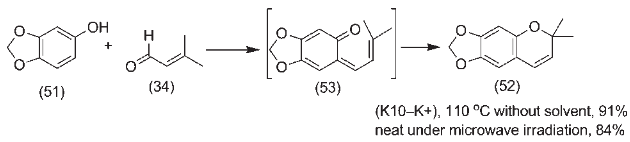
Parker and Mindt developed a very useful one-step procedure for synthesizing chromenes (**54a–c**) by a thermally induced 6π-electrocyclization of the enolizable vinyl quinone (**55**) *via* an intermediate quinone methide (**56**). The enolizable vinyl quinones are the products of Stille coupling. Application of this method led to the total synthesis of an *Ageratum* juvenile hormone (Scheme 12) [110].

Very recently, Da Silva and coworkers [154] developed a new general methodology that involves the reaction of *ortho*-naphthoquinones with allyltriphenylphosphonium salts **58a** and **58b** in the presence of an aqueous solution of NaOH and chloroform. The reaction proceeded *via in situ* formation of an ylide, and subsequent reaction with an *ortho*-naphthoquinone to produce *o*-QM intermediate **59**, which cyclizes to a 2*H*-chromene, as outlined in Scheme 13. With this selective and general one-pot synthesis, several 2*H*-chromene derivatives (**60**, **61,** and **62**) were obtained from the appropriate *ortho*-naphthoquinones and allyltriphenylphosphonium in yields ranging from 47 to 85%. It should be noted that the attack of the phosphorus ylide occurred exclusively at the more reactive 1- or α-position of the carbonyl carbon of the *ortho*-naphthoquinone. No products were detected from attack at the 2- or β-carbonyl.

Scheme 10



Scheme 11



SYNTHESIS OF 2*H*-CHROMENES AND CHROMANES *VIA o*-QMS HETERO-DIELS-ALDER REACTIONS

The unique feature of the Diels-Alder reaction of constructing up to four new stereogenic centers in one step has made this reaction one of the most important tools in the field of organic synthesis. It is not surprising, considering its scope, that Diels-Alder reaction continues to be important for constructing polycyclic ring systems of complex natural product targets [155]. Its broad reaction possibilities have led to an enormous number of variations, both intermolecular and intramolecular [156,157], with high levels of stereocontrol, as summarized in several review articles [158].

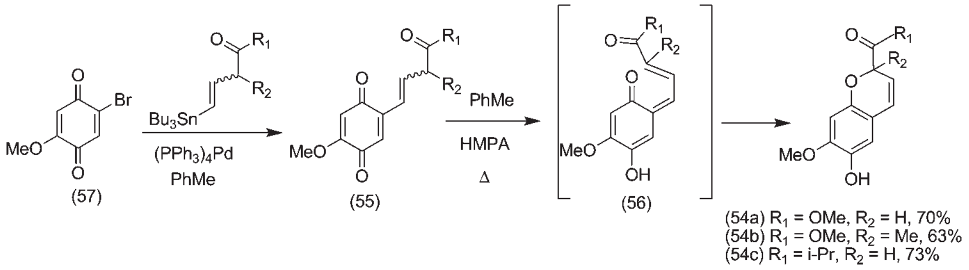
A very important variation of the typical Diels-Alder reaction is the hetero-Diels-Alder reaction. In this variation, heteroatoms, such as a carbonyl group, replace a carbon–carbon double bond in either the diene or dienophile [159–162].

o-QMs are hetero-dienes suitable for [4 + 2] cycloadditions with a wide range of dienophiles in either inter or intramolecular processes (Fig. 7). This reaction would lead directly to the chromane substructures. However, the intermolecular process has two major problems that must be overcome (among others): the fast dimerization of the *o*-QMs to spiro compounds [163,164] and that *o*-QMs generation and trapping must be done *in situ*.

SYNTHESIS OF 2*H*-CHROMENES AND CHROMANES *VIA o*-QMS AND INTERMOLECULAR HETERO-DIELS-ALDER REACTIONS

The first example that generated and made use of an *o*-QM in an intermolecular hetero-Diels-Alder reaction

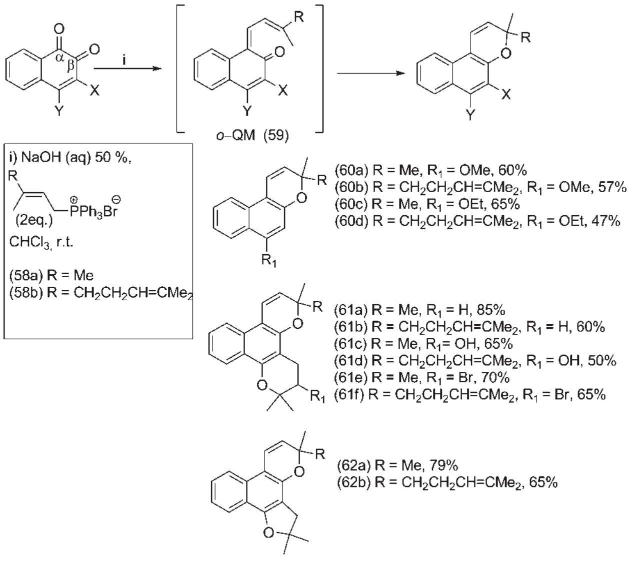
Scheme 12



was reported by Brougidou and Christol [165,166], who reacted *o*-QMs with butadiene (**63**) to obtain 2-vinylchromans (**64**) as the only reaction product. Chapman and Mcintosh in 1971 (Scheme 14) [167] demonstrated that the dimerization of *o*-QMs could be a useful methodology to prepare natural products. In this regard, they produced an *o*-QM by photodecarbonylation of the unsaturated lactone (**65**), which was then efficiently trapped with 1,l-dimethoxyethylene (**66**) producing an *ortho*-lactone (**67**) with high yield (>90%). Very recently, this reaction was reinvestigated, but the generation of *o*-QM (**68**) and subsequent hetero-Diels-Alder reactions was under mild, anionic conditions to prepare benzopyrans (**69a–d**) [168].

Baldwin and coworkers developed a biomimetic synthesis of Lucidene (**71**) based upon the fact that both this compound and humulene (**72**) were isolated from the root bark of *Uvaria lucida ssp. lucida* and **71** could be formed as the products of a double Diels-Alder reaction with two molecules of *o*-benzoquinone methide [169]. In a subsequent work, the same group synthesized pycnidione and epolone B using an *o*-QM derived from benzotropolone (**73**) *via* a hetero-Diels-Alder reaction with humulene [170]. More recently, they reported a biomimetic hetero-Diels-Alder reaction between humulene and a novel tropolone *o*-QM (**74**) to give a deoxy analog of epolone B (**75**) (Scheme 15) [171].

Scheme 13



The search for new *in situ* methods to generate *o*-QM intermediates without side reactions or with long reaction times and at low temperatures continues to be desired. In this regard, Baldwin and coworkers explored reductive transesterification with an aldehyde (**76**) to produce *o*-methyleneacetoxy-phenol (**77**), which under thermal conditions generated an *o*-quinone methide that cyclized (**78**). They applied this methodology to the synthesis of (±)-alboatrin (**79**) [172] and (±)-lucidene (**71**) (Scheme 16) [173].

SYNTHESIS OF 2*H*-CHROMENES AND CHROMANES *VIA* *o*-QMS AND INTRAMOLECULAR HETERO-DIELS-ALDER REACTIONS

Chapman and coworkers demonstrated that palladium chloride induced dimerization of *o*-vinylphenol (**80**) to generate an *o*-QM (**81**), which undergoes intramolecular hetero-Diels-Alder cyclization. They applied this useful methodology to prepare the natural product carpanone (**82**) in one step following a biomimetic pathway (Scheme 17) [174].

Much research has been focused on developing new and better methods for generating *o*-QM intermediates that can be trapped by an intramolecular Diels-Alder reaction. Hug and coworkers [175] reported that thermal dehydration of *o*-hydroxybenzyl alcohol (**83**) led to three products that could only be produced through an intermediate *o*-QM (**84**) generated *in situ*, followed by an intramolecular Diels-Alder cycloaddition. The authors proposed that the formation of the *o*-QM (**84**) occurs by an initial dehydration and concerted [1,5]-hydrogen shift, which is followed by a [4 + 2] cycloaddition to produce the product (**85**, **86**, and **61**) in 69% yield. Later, Boekelheide and Mao [176] performed flash

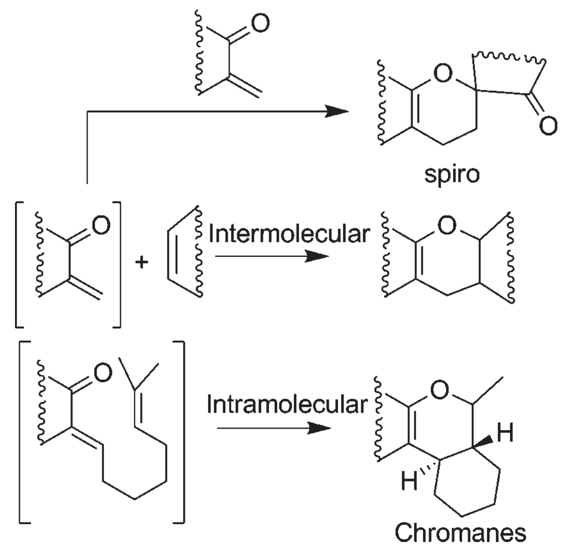


Figure 7. *o*-QMs as hetero-dienes for the construction of chromanes.

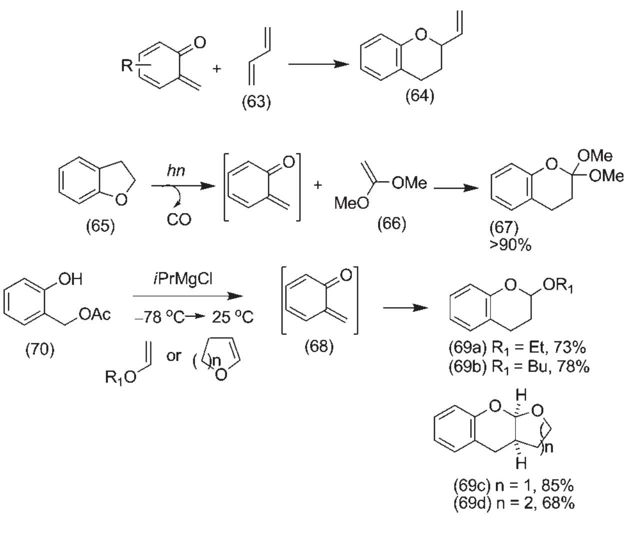
pyrolysis experiments of **84** at 700°C and found only product **85**, but in only 12% yield (Scheme 18).

Tietze and coworkers described the intramolecular Diels-Alder reaction between 1,3-cyclohexadione (**88**) and citronellal (**89**). They obtained tricyclic dihydropyran (**90**) with trans stereochemistry *via* an *exo-E-anti* transition state [177–179]. It is worthy to note that this structure was proved by X-ray structure analysis. The investigation into the conformation of the transition state was extended to benzylidenepyrazolones and benzylideneisoxazolones. The same *exo-E-anti* stereochemistry was also observed for these products (Scheme 19) [180,181].

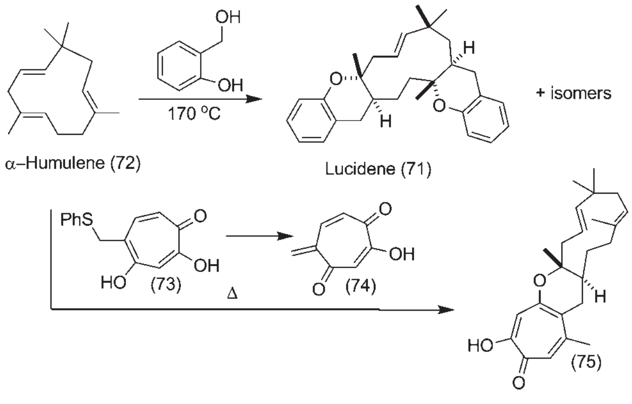
Ferreira and Pinto [182] in 1980 reported a novel preparation of tetracyclic α- and β-pyranaphthoquinones using an *o*-QM intermediate, generated *in situ*, followed by a tandem Knoevenagel/hetero-Diels-Alder reaction. The authors, instead of reacting natural α,β-unsaturated aldehydes with lawsone (**28**) (*e.g.*, citral) [142], reacted lawsone with an aldehyde bearing a remote double bond (*e.g.*, citronellal—**89**). In the later case, the *o*-QMs (**91** and **92**) underwent an intramolecular hetero-Diels-Alder reaction with the double bond to form tetracyclic α- and β-pyranaphthoquinones (**93** and **94**) in 70% yield. In order to obtain β-pyranaphthoquinone (**94**), a tetracyclic derivative of β-lapachone, the mixture was treated with H_2SO_4 (Scheme 20). Recently, Jiménez-Alonso and coworkers performed the asymmetric version of this reaction with (*s*)-(-)-citronellal, producing compounds **93** and **94** in a 1:1 ratio with 94% overall yield [183]. By using Yadav's methodology [184], they extended this reaction to other prenylated aromatic aldehydes with the double bond at an appropriate distance to generate new naphthoquinones. It should be noted that aromatic aldehydes furnished only *cis* adducts due to an *endo-E-syn* transition state. For instance, compounds **95** and **96** were obtained in 72% at a 1:1 ratio (Scheme 20).

Other research groups soon became attracted to the opportunities presented by these aforementioned thermal dehydrations of *o*-hydroxybenzyl alcohols that gave products that could only be produced through an *o*-QM intermediate followed by an intramolecular Diels-Alder cycloaddition. In 1985, Talley [185] studied this reaction both thermally and photochemically, starting with (*R*)-

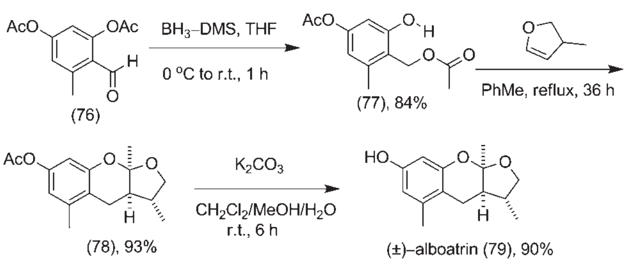
Scheme 14



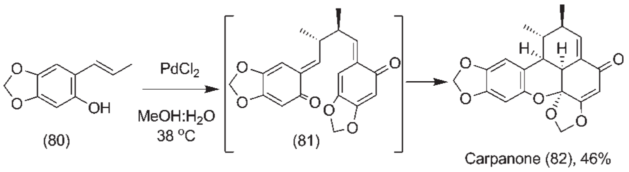
Scheme 15



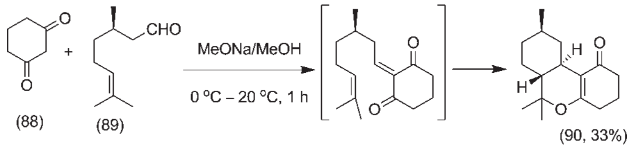
Scheme 16



Scheme 17



Scheme 19

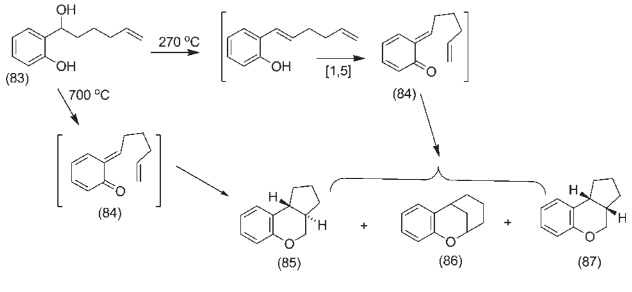


citronellal (**89**), in order to obtain informations about the transition state of the cycloaddition. The reactions were very successful in the generation of substituted *o*-QMs by the thermal dehydration of *o*-hydroxybenzyl alcohol derivatives (**97**) and subsequent intramolecular Diels-Alder reaction. The dehydration of *o*-hydroxybenzyl alcohol followed by intramolecular Diels-Alder reaction proceeded with excellent regio and stereospecificity. The presence of a chiral center on the alkyl side chain resulted in a high degree of stereocontrol during the cycloaddition reaction. The *trans* stereochemistry was the same as observed by Pinto and Ferreira and is thought to proceed *via* a pseudoequatorial conformation adopted by the chair-like exo transition state during the intramolecular Diels-Alder cycloaddition (Scheme 21).

Given the success of the preliminary results [152,186], Tapia's group [187] showed an interesting approach to obtain 2*H*-benzopyrans by using a Tandem Knoevenagel hetero-Diels-Alder reaction with citral (α,β-unsaturated aldehyde) instead of a Tandem Knoevenagel electrocyclization. Their protocol involved the addition of a suitably protected aryl lithium derivative of citral, followed by deprotection and cyclization *via* an *o*-QM to produce the chromane (**100**) [188]. In two more steps, the latter compound was transformed to an α-lapachone derivative (**101**). It is also clear from their results that the cis stereochemistry of **101** is opposite of that found by Hug [175], Ferreira [182] and Talley [185]. This is likely because of the endo transition state is favored due to conjugated double bond with *o*-QM moiety (Scheme 22).

o-Quinone methides (**106**) can also be efficiently produced by photoirradiation of phenolic Mannich bases (**107**) in aqueous solvents at neutral pH, by irradiation with >300 nm light and rapid trapping by ethyl vinyl ether (**108**) *via* an intermolecular hetero-Diels-Alder reaction [189]. This strategy has been used to prepare a series of chromane derivatives such as compounds **109** and **110** in Scheme 23. This procedure was also applied to the formation and trapping of bisquinone methide (**111**), although in low yield (Scheme 23).

Scheme 18



Ye and coworkers conveniently developed an interesting protocol for the synthesis of 5-one heterocyclic systems *via* heterocyclic quinone methides. A wide variety of pyrano[3,2-c]quinolines (**114a–d**) possessing different functional groups have been prepared successfully by the tandem Knoevenagel condensation of 4-Hydroxyquinolin-2(1H)-ones (**115**) with aldehydes (**116**). The formation of the products was rationalized by an initial Aldol condensation, to form the methide intermediate (**117**). This then undergoes a Michael-type-1,4-addition of the enolate anion followed by an intramolecular cyclization (Scheme 24) [190].

Similarly, Nair and coworkers reported a series of articles exploring the reactivity profile of *o*-QMs [191] generated *in situ* from lawsone (**28**), 4-hydroxycoumarin (**118**) and 4-hydroxyquinoline (**119**) and their subsequent intermolecular Diels-Alder reaction. This protocol overcomes the limitation regarding the use of appropriately substituted aldehydes in the tandem Knoevenagel/intramolecular hetero-Diels-Alder cycloaddition methodology.

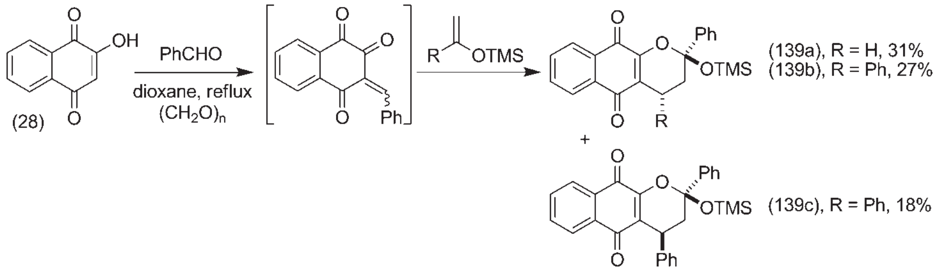
Scheme 27



In the first approach, Nair and Treesa [192] described a new, general three-component reaction for the synthesis of a wide variety of derivatives of α- and β-lapachone and other heterocyclic compounds. The reaction involved the Knoevenagel condensation between lawsone reagent (**28**) and paraformaldehyde (**120**) leading to the *o*-QM (**121**), which reacts *in situ* with several possible olefins to generate products in moderate to good yields. The latter methodology offers several alternative approaches for the syntheses of α- (**122, 123, 124,** and **125**) and β-lapachone (**126, 127,** and **128**) derivatives as illustrated in the selected examples shown in the Scheme 25.

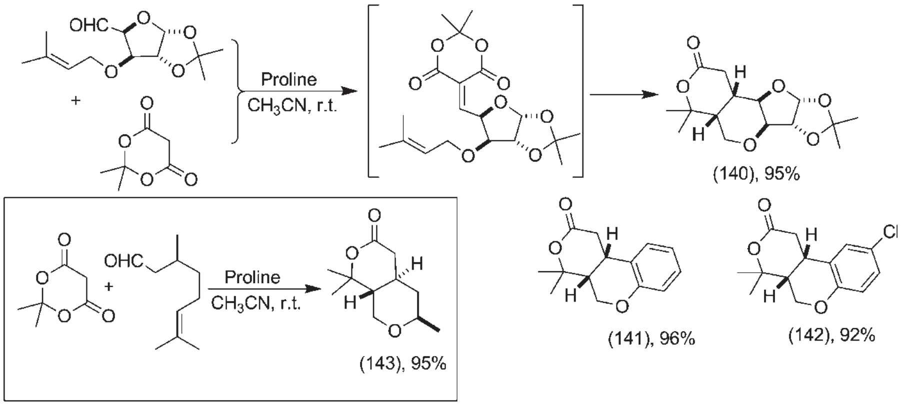
In related studies, the same group extended this three component methodology for the preparation of pyranopyrone derivatives (**129**) [Scheme 26, eq. (1)] [193]. They also demonstrated the potential of this protocol by applying it to the synthesis of pyranquinolines (*e.g.*, **130**) *via* quinoline quinone methide (**131**) as the key intermediate [Scheme 26, eq. (2)] [191].

Despite the good yields achieved in previous reactions with formaldehyde, aromatic aldehydes did not work even at reflux for periods exceeding 48 h. Aiming to improve the scope of this reaction and thus, to obtain various derivatives of lapachones, Ferreira and coworkers investigated the effect of solvents and found that reaction was accelerated in ethanol/water (1:1) at reflux [194]. With this improved methodology, it was possible to obtain β-pyranaphthoquinones more selectively, in better yields and with lower reaction times. Additionally, this methodology allowed the use of other aldehydes, not just formaldehyde (Table 2).

This reaction protocol was extended to the synthesis of silyl enol ethers to give a series of siloxy-containing naphtho[2,3-b]pyran-5,10-dione derivatives (**139a–c**) in moderate to high yields (Scheme 27) [195]. As expected, the reaction regioselectively produced α-lapachone derivatives. The authors rationalized these results by calculating the parameters of the frontier molecular orbital. This indicated that interaction of the *o*-QM with the silyl enol ether is a more energetically favorable pathway.

A very interesting variation of the protocol for *in situ* formation of *o*-QMs followed by Diels-Alder cycloaddition was reported by Sabitha *et al.* [196,197]. In this work, it was shown that the reaction of *O*-prenyl and *N*-prenyl aldehydes with Meldrum's acid led to cis-fused lactones (**140–142**) in excellent yields. Aliphatic aldehydes, such as citral, could also be used in this reaction, but as expected, the product **143** is trans (Scheme 28).

Scheme 28



CONCLUSIONS AND OUTLOOK

This review has given ample evidence that *o*-QM intermediates have developed into a useful synthetic tool for preparing chromene and chromane rings over recent years. Major progress has been made in terms of substrate scope and the development of efficient procedures for their preparation. All these developments have led to extensive use of *o*-QM intermediates in inter and intramolecular hetero-Diels-Alder and electrocyclization reactions in the field of total synthesis. The reaction even turned out to be a key tool for the preparation of pyran naphthoquinones. However, these reactions still have some drawbacks. For example, intermolecular reactions with *o*-QMs are, by far, more difficult to achieve, which is often due to reaction reversibility. Despite the improved methods for generation of *o*-QMs, their use with aldehydes has been difficult. Only very recently has this problem been partly addressed by modifying the conditions in the tandem processes. There is still a need for even more general reaction protocols, especially in the areas of intermolecular reactions and enantioselectivity.

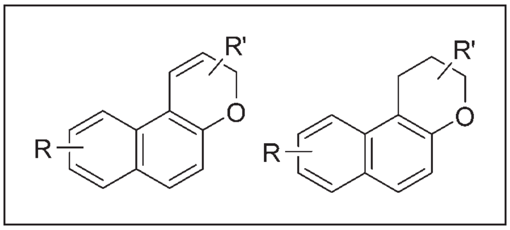
Synthetic Approaches to 3*H*-Naphtho[2,1-*b*]pyrans and 2,3-Dihydro-1*H*-naphtho[2,1-*b*]pyrans

Amitabh Jha* and Po-Jung Jimmy Huang

Department of Chemistry, Acadia University, Wolfville, Nova Scotia, Canada B4P 2R6
*E-mail: ajha@acadiau.ca

Received May 19, 2009
DOI 10.1002/jhet.270



Naphtho[2,1-*b*]pyran nuclei are prevalent in natural products with significant biological and medicinal properties. 3,3-Disubstituted 3*H*-naphtho[2,1-*b*]pyrans are photochromic and find use in electronic display systems, ophthalmic lenses, optical switches, and temporary or permanent memories. Of the various possible structural isomers of naphthopyran framework, this review is an account of reported synthetic procedures to produce 3*H*-naphtho[2,1-*b*]pyrans and their dihydro analogs, 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans. The advantages and disadvantages of each procedure in terms of yields, complexity, formation of side-products, use of uncommon/expensive reagents, *etc*., are also described.

J. Heterocyclic Chem., **46**, 1098 (2009).

INTRODUCTION

The pyran ring in the dihydronaphthopyran skeletons can be linearly or angularly fused to a naphthalene nucleus sharing one bond in several orientations. This leads to six different dihydronaphthopyran skeletons as shown in Figure 1. These compounds can also be viewed as dihydrobenzochromenes or dihydrobenzoisochromenes. This review deals with 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans (a.k.a. 2,3-dihydro-1*H*-benzo[*f*]chromenes or 1*H*-benzo[*f*]chromans) and their dehydro analogs 3*H*-naphtho[2,1-*b*]pyrans (a.k.a. 3*H*-benzo[*f*]chromenes).

KNOWN PROPERTIES OF NAPHTHOPYRAN DERIVATIVES

3*H*-Naphtho[2,1-*b*]pyrans, also known as 3*H*-benzo[*f*]chromenes (**1**), are well documented for their photochromic properties [1,2]. Photochromism can be seen as a reversible transformation of a chemical species induced in one or both directions by absorption of electromagnetic radiation. The mechanism involves facile electrocyclic reaction of pyran ring opening to yield a mixture of yellow or purple colored isomers (**2**). These colored species gradually cyclize, returning to the colorless pyran (**1**) ring upon thermal reaction (Scheme 1) [1,2].

This characteristic led to their application in transition lenses, which tinted upon exposure to the sunlight [3]. Photochromic properties of 3*H*-naphtho[2,1-*b*]pyrans also make them valuable to be used for a variety of other applications such as electronic display systems, optical switches, and temporary or permanent memories [4–6]. Furthermore, 3*H*-naphtho[2,1-*b*]pyrans and their oxygenated and/or partially reduced congeners have also been isolated from natural sources [7–9]; several analogs are reported to posses interesting biological activities [8–12]. Molecular structures of several representative examples are shown in Figure 2. A homoprenylated 3*H*-naphtho[2,1-*b*]pyran **3** was isolated from the roots of *Pentas bussei* [7]. In another case, several naphthopyrans including Adenaflorins C (**4**) were isolated from young leaves of *Adenaria floribunda* and bioassays show these compounds have cytotoxic effect against human cancer cells [8]. Bioassay-guided fractionation of extract of *Musa paradisiaca* cultivar using the quinone reductase induction assay led to the isolation of tetrahydro naphtho[2,1-*b*]pyran **5** (stereochemistry relative) [9]. Braccio *et al.* reported potent antiproliferative and cytotoxic properties of 1-*N*,*N*-dialkylamino-3*H*-naphtho[2,1-*b*]pyran-3-ones **6** [10]. Unsubstituted 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran-3-one (**7**), a.k.a. splitomicin, its oxygenated analogs (**8**) and the dehydro-analog **9** were identified as a small molecule inhibitors of Sir2p, an NAD$^+$-dependent histone deacetylase required for chromatin-dependent silencing in yeast [11,12].

METHODS OF SYNTHESIS OF 3*H*-NAPHTHO[2,1-*b*]PYRANS

Synthesis and properties of 3*H*-naphtho[2,1-*b*]pyrans have been studied and reported extensively, providing a wide knowledge-base for these molecules. A review on the synthesis and photochromic properties of 3*H*-naphtho[2,1-*b*]pyrans was published in 2005 [13]. Although this review focuses mainly on the synthetic routes to 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans, a brief review of synthetic approaches to its dehydro analogs 3*H*-naphtho[2,1-*b*]pyrans will be presented here providing the update since last review [13] and highlighting the variety in chemical synthesis.

Some methodologies for preparing 3*H*-naphtho[2,1-*b*]pyrans involve multi-step strategies. Hepworth and his colleagues reported a synthesis of 1-bromo-3*H*-naphtho[2,1-*b*]pyrans (**11**) from the corresponding ketones (**10**) and PBr_3. 1-Substituted-3*H*-naphtho[2,1-*b*]pyrans (**12**) can then be further synthesized by reacting **11** with a wide range of electrophiles (Scheme 2) [14].

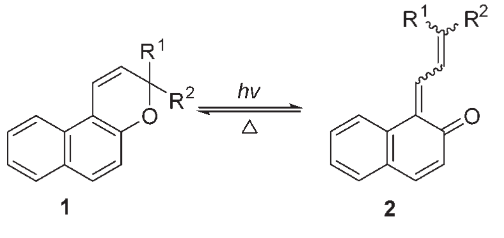
Jacobson and Vander Valde reported the synthesis of enantioenriched 3-methyl-3-(4-methylpent-3-enyl)-3*H*-naphtho[2,1-*b*]pyran-9-yl acetate (**16**) by kinetic resolution of the racemic mixture while attempting to synthesize (+)-teretifolione B (**14**), the monomer component of the potent anti-HIV agent concurvone (**15**, Scheme 3) [15]. Reaction of *E*-citral with 2,7-dihydroxynaphthalene produced racemic compound **16** in good yield [16]. Subsequent acylation followed by kinetic resolution using a manganese complex ((*R,R*)-**17**)-catalyzed asymmetric epoxidation at −78°C resulted in isolation of optically active (+)−**13** in 15% yield and 91% ee (Scheme 3).

While attempting removal of prenyl groups from protein by nucleophilic cleavage, Epstein and coworkers discovered that the 2-naphthoxide nucleophile produces prenylated 3*H*-naptho[2,1-*b*]pyrans [17]. They synthesized the prenylated 3*H*-naptho[2,1-*b*]pyrans **18** and **19** by carrying out an independent synthesis as depicted in Scheme 4. Reaction of sodium 2-naphthoxide with farnesyl bromide and geranylgeranyl chloride yielded 1-alkylated products **20** and **21**, respectively. DDQ-promoted oxidation of **20** and **21** resulted in formation of prenylated 3*H*-naptho[2,1-*b*]pyrans **18** and **19,** respectively [17].

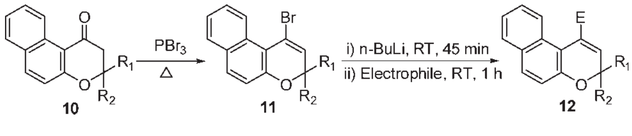
Epstein group then went on to provide more convincing evidence to the observation made during the reaction of prenylated proteins with 2-naphthoxide. They treated 2-naphthoxide with *S*-prenylated cysteine methyl ester with 2-naphthoxide in refluxing dioxane and obtained ~18% of prenylated 3*H*-naphtho[2,1-*b*]pyran **19** (Scheme 5) [17]. The reaction presumably involved C-1 alkylation, aerial oxidation, and [4+2] cycloaddition to yield the product.

Sosnovskikh and coworkers reported an interesting synthesis of a fused oxygen polycycle bearing 3*H*-

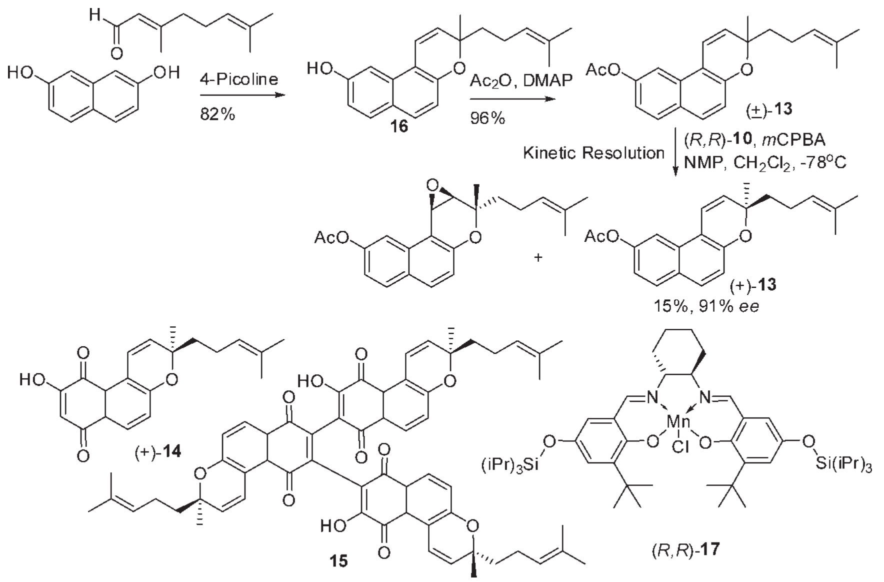
Scheme 1. Pericyclic ring opening/closure in 3*H*-naphtho[2,1-*b*]pyrans.



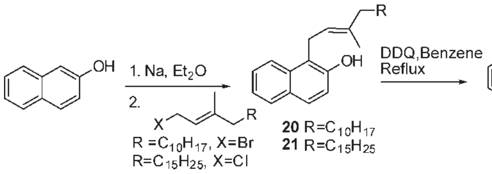
Scheme 2. Synthesis of 1-substituted-3*H*-naphtho[2,1-*b*]pyrans (**12**) from pyranones **10**.



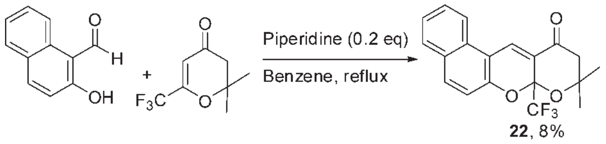
Scheme 3. Synthesis of racemic and enantioenriched 3-methyl-3-(4-methylpent-3-enyl)-3*H*-naphtho[2,1-*b*]pyran-9-yl acetate (**13**).



Scheme 4. Synthesis of prenylated 3*H*-naphtho[2,1-*b*]pyrans (**18** and **19**).



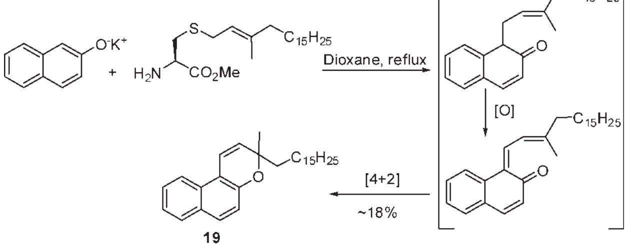
Scheme 6. Synthesis of an oxygen polycycle bearing 3*H*-naphtho[2,1-*b*]pyran nucleus (**22**).



naphtho[2,1-*b*]pyran nucleus (**22**) in 8% yield by reacting polyhaloalkyl-substituted pyrones with 2-hydroxy-1-naphthaldehyde in presence of catalytic piperidine in refluxing benzene (Scheme 6) [18]. Similar reactions with other substituted salicyaldehydes gave higher product yields (12–94%). The authors proposed that a three-component adduct is initially formed either by Michael addition/Schiff's base formation or through Baylis-Hillman protocol, which cyclizes with concomitant elimination of the secondary amine [18].

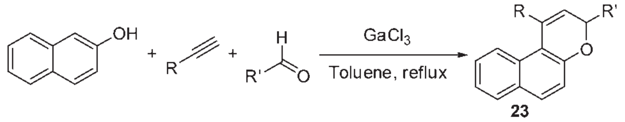
Yadav and coworkers [19] have reported an elegant procedure to produce 1,3-disubstituted 3*H*-naphtho[2,1-*b*]pyrans (**23**) from 2-naphthol, a terminal acetylene and an aldehyde in presence of 10 mol % $GaCl_3$ in refluxing toluene (Scheme 7). The terminal acetylene and the aldehyde can have an aryl or an alkyl substituent. The authors proposed that the reaction proceeds *via* arylation of alkyne to afford vinyl naphthalen-2-ol. This intermediate subsequently undergoes cyclization with an aldehyde to give the desired naphthopyran.

Scheme 5. Synthesis of prenylated 3*H*-naphtho[2,1-*b*]pyran **19** from *S*-prenylated cysteine methyl ester as the prenyl donor.

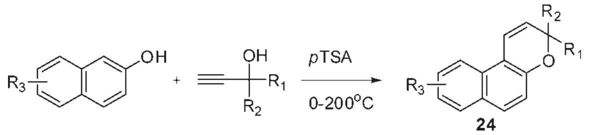


One of the most studied procedures for the preparation of 3*H*-naptho[2.1-*b*]pyrans uses the Claisen rearrangement of propargyl ethers obtained *in situ* from reaction of α,α-disubstituted propargyl alcohols with 2-naphthol under acidic conditions. For instance, 2-naphthol derivatives reacted with disubstituted propargyl alcohol in 1:1 molar ratio with *p*-toluenesulfonic acid (*p*TSA) as a catalyst (Scheme 8) to give naphthopyrans **24** [20]. The starting materials were dissolved in an aprotic organic solvent and reacted at temperatures

Scheme 7. Synthesis of 1,3-disubstituted 3*H*-naphtho[2,1-*b*]pyrans (**23**).



Scheme 8. 3,3-Disubstituted 3*H*-naphtho[2,1-*b*]pyrans (**24**) from 2-naphthols and α,α-disubstituted propargyl alcohols.



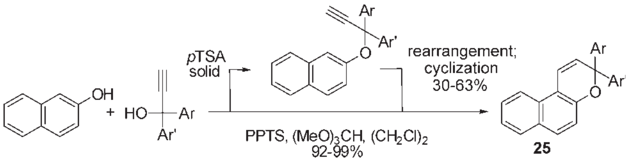
within the range of 0–200°C. However, this procedure did not provide satisfactory yield of the products (4–39%) [20].

In an improvement of this procedure, Tanaka reported a one-pot synthesis of naphthopyrans in the solid state. This reaction involved *p*TSA-catalyzed condensation of disubstituted propargyl alcohol with 2-naphthol in the first step. In the second step, naphthopyran derivatives (**25**) were obtained in moderate yield (30–63%) *via* cyclization of propargyl ether (Scheme 9) [21]. Hence, this solid-state reaction provided a green solvent-free efficient method for the synthesis of naphthopyran derivatives. Catalysts such as pyridinium *p*-toluenesulfonate (PPTS) have been used to improve yields in reactions of this nature. Zhao and Carreira used $(MeO)_3CH$ as a dehydrating agent to improve the synthesis of benzo/naphthapyrans derivatives (92–99%) [22]. In their report, disubstituted propargyl alcohols reacted with naphthol derivatives in the presence of 5 mol % PPTS and 2 equivalents of $(MeO)_3CH$ to yield various types of photochromic pyran systems (**25**, Scheme 9).

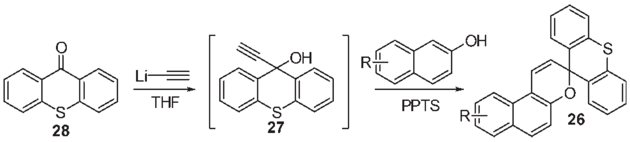
As shown in Scheme 10, Coelho *et al.* prepared spiro[thioxantene-naphthopyrans] **26** through a sequence of reactions. The alcohol intermediate (**27**) was obtained through the reaction of thioxanthone **28** with lithium acetylide in dry THF at 25°C, and reacted with 2-naphthol analogs without isolation to avoid degradation. After work-up, the desired 3*H*-naphtho[2,1-*b*]pyran products were obtained in low to moderate yield (9–61%) [23].

In another variation of this protocol, zeolite was used to condense 2-naphthols with α-alkynols to prepare 3*H*-naphtho[2,1-*b*]pyrans in reasonable yields (65–75%) [24]. Uemura's group used a thiolate-bridged diruthenium complex [Cp*RuCl(μ_2-SMe)$_2$RuCp*Cl] to effect the same transformation with decent yields (64–97%) [25]. While the use of catalysts facilitate the formation of transition state intermediates, *in situ* ether formation, followed by Claisen rearrangement and cycloaddition is generally accepted mechanism for this transformation (Scheme 11) [24].

Scheme 9. Condensation of 2-naphthols and diaryl propargyl alcohols.



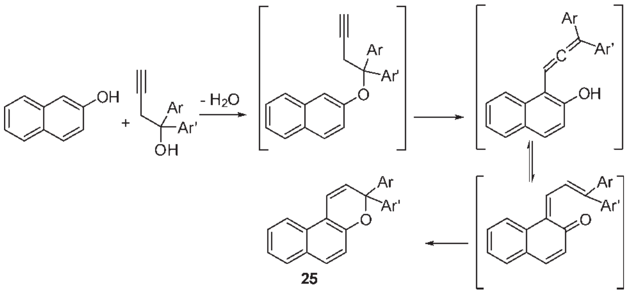
Scheme 10. PPTS-catalyzed synthesis of spiro[thioxantene-naphthopyrans] (**26**).



A large number of decorated 3*H*-naphtho[2,1-*b*]pyrans have been prepared using this protocol or a slightly modified version in the pursuit of photochromic naphthopyrans with interesting/desired properties. A sample of molecular diversity bearing photochromic 3*H*-naphtho[2,1-*b*]pyran core reported in recent literatures in presented in Figure 3. Chamontin *et al.* reported the synthesis of formyl-substituted naphthopyrans (*e.g.*, **29**) either by starting the reaction from formylated 2-naphthol or by conducting formylation on the naphthopyran products [26]. These formylated naphthopyrans can be used to produce an array of derivatives. Navarro and coworkers derivatized compound **29** with 1,4-dithiafulvenes to produce (1,4-dithiafulven-6-yl)substituted 3*H*-naphtho[2,1-*b*]pyrans (*e.g.*, **30**), which dimerized after electrochemical treatment; compound **31** was isolated to confirm this observation [27]. Zhao and Carreira reported the synthesis and photochromic properties of symmetrical phyenylene-linked bisnaphthopyrans (**32, 33**) initiating the synthesis from isoterephthaloyl and terephthaloyl chlorides to make the bisketones, which were converted to bispropargyl alcohols required for the synthesis of the desired naphtho[2,1-*b*]pyrans [28].

Coelho *et al.* also produced a number of symmetrical photochromic di/trinaphtho[2,1-*b*]pyrans (*e.g.*, **34, 35**) by preparing appropriate bis/tris-ketones, followed by propargylation and annulation (with 2-naphthol) sequence [29]. The same research group prepared unsymmetrical photochromic *bis*-naphthopyrans (*e.g.*, **36**) using the same general chemistry where the annulation with naphthol analogs were conducted sequentially

Scheme 11. Generally accepted mechanism of formation of 3*H*-naphtho[2,1-*b*]pyrans (**25**) from 2-naphthols and α-alkynols.



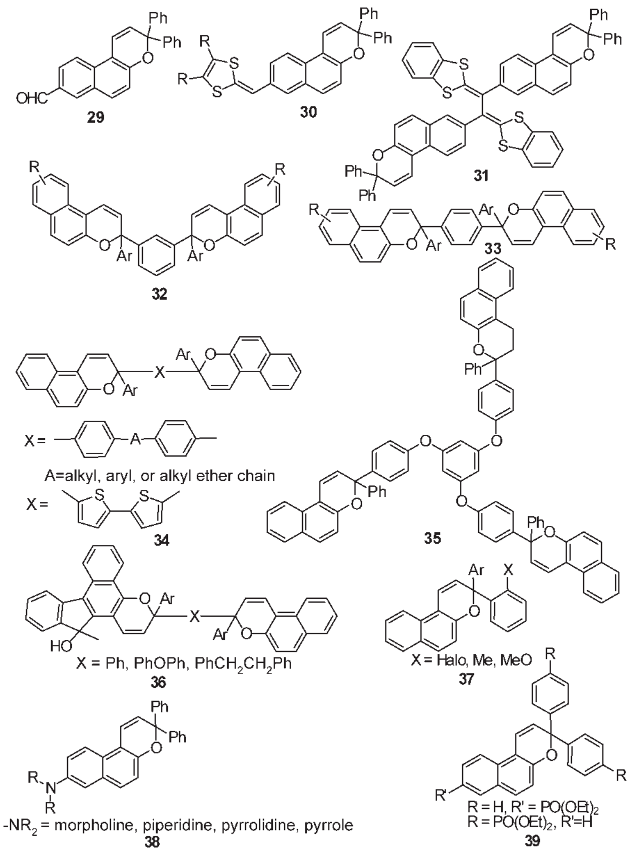


Figure 3. A sample of molecular diversity bearing photochromic 3*H*-naphtho[2,1-*b*]pyran core.

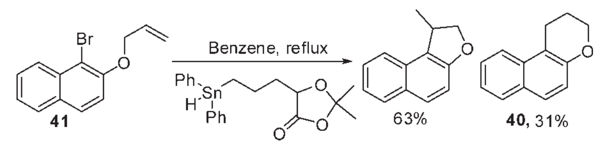
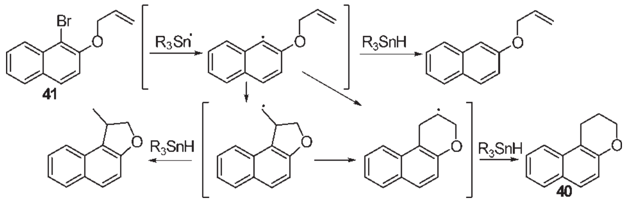
on the bispropargyl alcohol [30]. Effect of *ortho*-substituents on the 3-aryl group of 3,3-diaryl-3*H*-naphtho[2,1-*b*]pyran on photochromism was studied by Gabutt, Heron, and Instone where they synthesized a number of 3,3-diaryl-3*H*-naphtho[2,1-*b*]pyrans bearing substituents on the *ortho*-position of one of the 3-aryl groups (*e.g.*, **37**) [31]. Shilova *et al.* prepared a series of cyclic amine-substituted 3,3-diphenyl-3*H*-naphtho[2,1-*b*]pyrans (**38**) by using the Buchwald C—N coupling protocol on the corresponding bromo-substituted naphthopyrans in an effort to study their effect on photochromism [32]. In a similar endeavor, Campredon and coworkers prepared diethyl phosphonate-substituted 3*H*-naphtho[2,1-*b*]pyrans (**39**) for corresponding bromo-substituted naphthopyrans using Pd-catalyzed diethyl phosphate [33].

Scheme 12. C—C bond formation in 2-allyloxy-1-bromonaphthalene using a modified stannane.



Scheme 13. Proposed mechanism of Sn-mediated C—C bond formation in 2-allyloxy-1-bromonaphthalene (**41**).



METHODS OF SYNTHESIS OF 2,3-DIHYDRO-1*H*-NAPHTHO[2,1-*b*]PYRANS

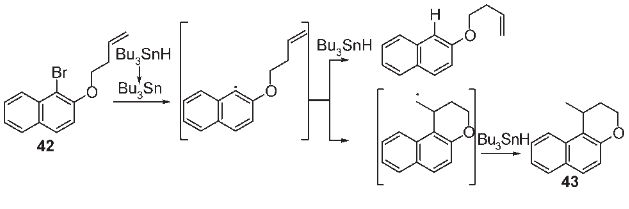
There are numerous procedures related to one another that are known for the synthesis of the 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran analogs with a saturated pyran ring, *i.e.*, 1*H*-benzo[*f*]chromans, which are devoid of photochromic characteristics. In a publication by Clive and Wang, 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran (**40**) was prepared in 31% yield by heating 2-allyloxy-1-bromonaphthalene (**41**) and azobisisobutyronitrile (AIBN) in benzene using a modified stannane reagent (Scheme 12) [34]; the conventional reagent, Bu_3SnH, gave very poor (~17%) yield [35]. Stannanes such as Bu_3SnH and Ph_3SnH are used in standard free radical reactions [35]. In case of modified stannane reagent, the tin-containing byproducts can be easily removed by mild hydrolysis.

The mechanism of stannane-mediated cyclization involves formation of a free radical at the carbon atom bearing the bromine. This intermediate then cyclizes with the alkenyl substituent leading to a 5- or 6-membered ring structure (Scheme 13) [35].

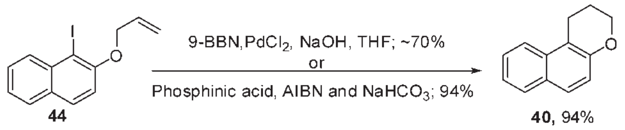
When 1-bromo-2-but-3-enyloxy-naphthalene (**42**) was used as starting material, dihydronaphthopyran **43** was obtained as one of the products (Scheme 14) [36]. The cyclization resulted in formation of a more stable 6-membered ring rather than a 7-membered ring.

According to numerous reports, the cross-coupling reaction of organic electrophiles with organometallic reagents in the presence of transition metals is generally a mild and straightforward method to form a C—C bond. Suzuki and coworkers published a related experiment where they initiated from 2-allyloxy-1-iodonaphthalene (**44**) using 9-borabicyclo[*3.3.1*]nonane (9-BBN) and palladium-catalyzed intramolecular cross-coupling

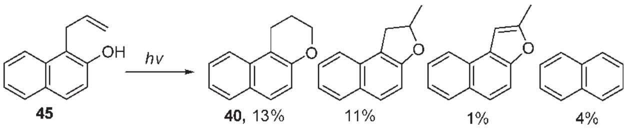
Scheme 14. Synthesis of dihydronaphthopyran **43** from 1-bromo-2-but-3-enyloxynaphthalene (**42**).



Scheme 15. Formation of dihydronaphthopyran **40** *via* intramolecular cross-coupling.



Scheme 16. Dihydronaphthopyran **40** *via* singlet excited-state H-transfer from **45**.



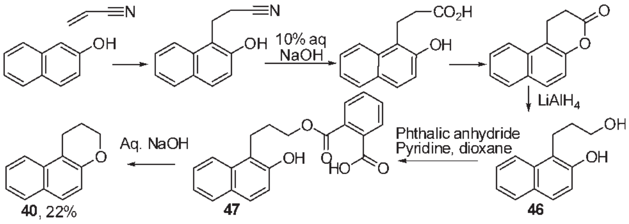
reaction. The desired dihydronaphthopyran **40** was obtained in ~70% yield *via* this reaction (Scheme 15) [37]. Another reaction on 2-allyloxy-1-iodonaphthalene leading to same product in nearly quantitative yield, using phosphinic acid, AIBN, and NaHCO$_3$, is also known (Scheme 15) [38,39].

Chow *et al.* discovered that singlet excited-state proton transfer of 1-allyl-2-naphthol (**45**) causes cyclization and results in formation of **40** in 13% yield. It was noted that secondary photodehydrogenation of the dihydronaphthofuran and formation of naphthalene are competing side reactions (Scheme 16) [40].

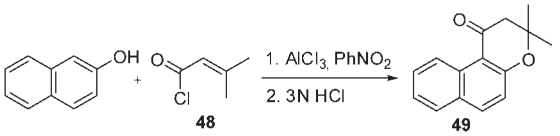
Dihydronaphthopyran **40** was also obtained from 2-naphthol and acrylonitrile by a 6-step reaction sequence in low yield (~22%; Scheme 17) [41]. 1-(3-Hydroxypropyl)naphthalen-2-ol (**46**) was obtained through 2-naphthol and acrylonitrile mixture by Michael addition, hydrolysis, and reduction sequence. It reacted with phthalic anhydride and pyridine to give acid phthalate (**47**), which yielded dihydronaphthopyran **40** upon addition of weak aqueous NaOH solution.

Livingstone has published a one-pot annulation reaction to prepare naphthopyrans [42]. As depicted in Scheme 18, 2-naphthol was mixed with 3-methylbut-2-enoyl chloride (**48**) in nitrobenzene and small amount of anhydrous aluminum chloride was added. The reaction was set aside for 12 days when the desired naphthopyran (**49**) was formed (yield not reported).

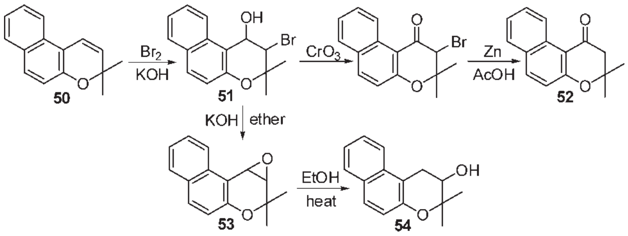
Scheme 17. Dihydronaphthopyran **40** *via* multistep intramolecular cyclization.



Scheme 18. Preparation dihydronaphthopyranone **49** from 2-naphthol *via* Friedel Craft acylation.



Scheme 19. Multiple step synthesis of dihydronaphthopyran derivatives.



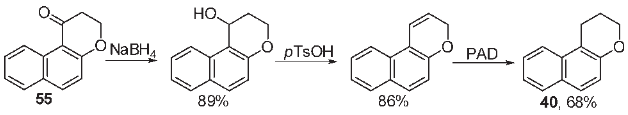
Livingstone subsequently reported a multi-step synthesis of dihydronaphtho[2,1-*b*]pyran derivatives (Scheme 19). 3,3-Dimethyl-3*H*-naphtho[2,1-*b*]pyran (**50**) was first converted to its bromohydrin **51** followed by CrO$_3$ oxidation and subsequent reduction *via* Zn/AcOH to afford 3,3-dimethyl-2,3-dihydronaphtho[2,1-*b*]pyran-1-one (**52**). Application of potassium hydroxide on the bromohydrin **51** resulted in an epoxide intermediate (**53**), which was later converted to 3,3-dimethyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran-2-ol (**54**) [43]. Product yields were not reported.

Another multi-step synthesis of dihydronaphthopyran **40** from 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran-1-one (**55**) involves sodium borohydride reduction followed by a dehydration and hydrogenation sequence. Selective reduction of the double bond was achieved by potassium azodicarboxylate (PAD) reduction (Scheme 20) [44].

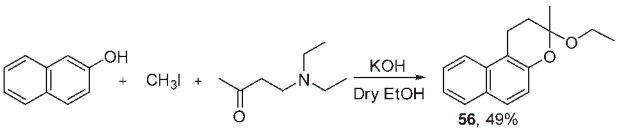
The same research article also reported the synthesis of 3-ethoxy-2,3-dihydro-3-methyl-1*H*-naphtho[2,1-*b*]pyran (**56**) [44]. In this reaction, methyl iodide was added to 1-(*N*,*N*-diethylamino)butan-3-one in dry ethanol. The mixture was then added to a solution of 2-naphthol and potassium hydroxide. The final product **56** was obtained in 49% yield after refluxing for 30 min (Scheme 21).

Scheme 22 depicts an electron transfer reaction where methylene blue-catalyzed photodecarboxylation of 1-allyl-2-naphthoxy acetic acid (**57**) led to formation of 2-

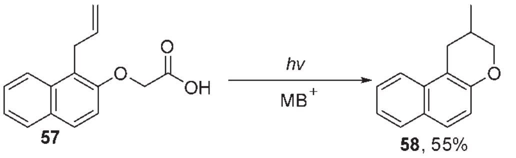
Scheme 20. Dihydronaphthopyran **40** from corresponding 4-pyranone **55**.



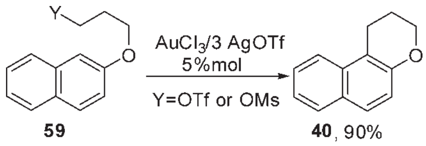
Scheme 21. Formation of 3-ethoxy-2,3-dihydro-3-methyl-1*H*-naphtho[2,1-*b*]pyran (**56**).



Scheme 22. Methylene blue-catalyzed photodecarboxylation and cyclization.



Scheme 23. Au-catalyzed intramolecular cycloalkylation of 2-naphthyloxy-propyl sulfonate **59**.



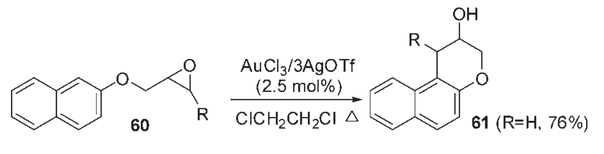
methyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran (**58**) in 55% yield [45,46].

Gold-catalyzed organic transformations have been studied quite extensively in recent years. Remarkable results were published by Sih and He who used relatively expensive Au(III) to catalyze carbon—carbon bond formation of 2-naphthyloxy-propyl triflate or methane sulfonate ester (**59**) and obtained 90% yield of 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran (**40**, Scheme 23) [47].

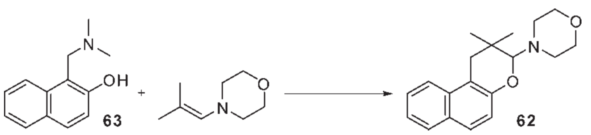
In a related endeavor, the same group reported Au(III)-catalyzed intramolecular cycloalkylation of substituted 2-(2-naphthyloxymethyl)oxiranes (**60**) to substituted 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran-1-ols (**61**) in good yields (Scheme 24) [48].

Strandtmann and his research group reported a new strategy to produce 3-morpholino-2,2-dimethyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyran (**62**) from 2-naphthol Mannich bases (**63**) and an enamine (Scheme 25; yield not reported) [49,50]. The proposed mechanism involved elimination of the dimethylamine from the Mannich base followed by a Michael-type addition to the enamine. The resulting intermediate then cyclized to give an amine substituted naphthopyran derivative.

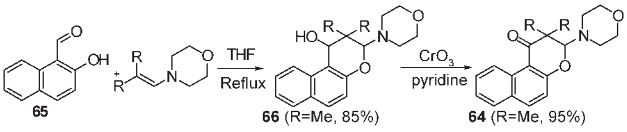
Scheme 24. Au(III)-catalyzed cycloalkylation of 2-(2-naphthyloxymethyl)oxiranes (**60**).



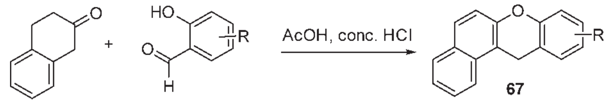
Scheme 25. Morpholino-dihydronaphthopyran **62** from 2-naphthol Mannich base **63**.



Scheme 26. Synthesis of morpholino-dihydronaphthopyranone **64** from 2-hydroxy-1-naphthaldehyde and appropriate enamine.



Scheme 27. 12*H*-benzo[*a*]xanthenes (**67**) from 2-tetralone and substituted salicylaldehydes.

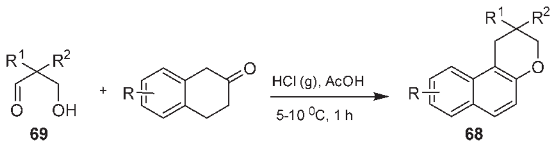


In a similar perspective, Dean *et al.* published a simple method of preparing 3-dialkylamino-2,2-dialkylnaphtho[2,1-*b*]pyran-1-ones (**64**) [51]. The reaction between 2-hydroxy-1-naphthaldehyde (**65**) and enamines gave 3-dialkylamino-2,2-dialkylnaphtho[2,1-*b*]pyran-1-ols (**59**) in high yield. Subsequently, the resulting compounds were oxidized by Sarett's reagent to produce 3-dialkylamino-naphthopyranones **64** in nearly quantitative yeilds (Scheme 26).

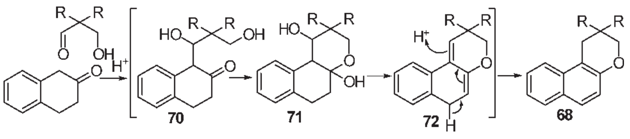
Our research group is also actively engaged in exploitation of 2-naphthol and 2-tetralone analogs to produce novel molecular frameworks [52–58]. Our efforts have also led to synthesis of three kinds of 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans [56–58]. Reaction between 2-tetralone and substituted *ortho*-hydroxy aromatic aldehydes under acidic conditions resulted in formation of benzene-fused 2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans or 12*H*-benzo[*a*]xanthenes (**67**, Scheme 27) in moderate to excellent yields (55–94%) [56].

This study was later expanded to expeditiously and conviniently prepare 2,2,-dialkyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans (**68**, Scheme 28) in 51–96% yeild range from 2-tetralone analogs and 2,2-dialkyl-3-

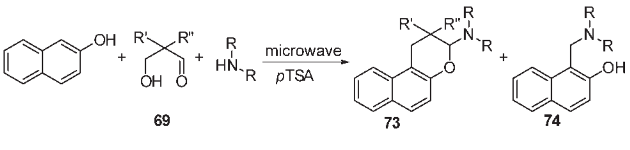
Scheme 28. Synthetic scheme for preparing 2,2,-dialkyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans (**68**) for 2-tetralone analogs.



Scheme 29. Most plausible mechanism of formation of 2,2-dialkyl-2,3-dihydro-1*H*-naphtho[2,1-*b*]pyrans (**68**) from 2-tetralone.



Scheme 30. Formation of dialklamino-dihydronaphthopyrans (**66**) from 2-naphthol.

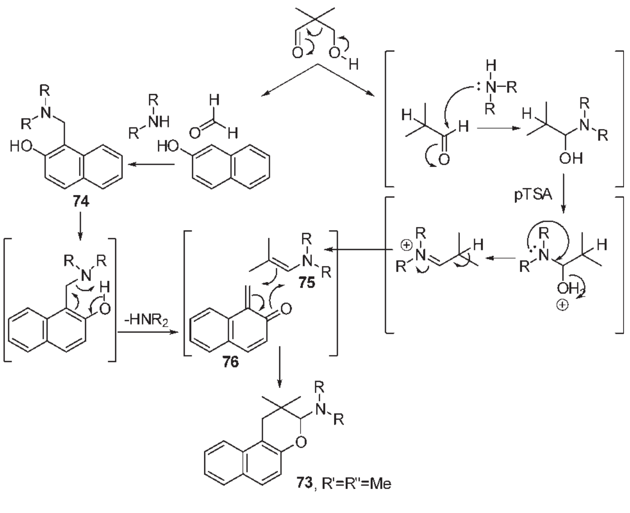


hydroxy propanaldehydes (**69**) under anhydrous acidic conditions [57].

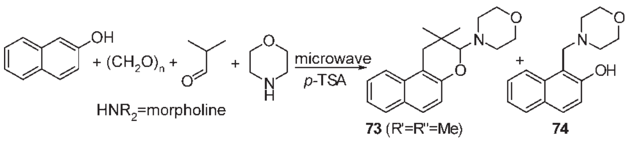
The overall reaction is tendam aldol condensation and hemiacetal formation followed by double dehydration. The most plausible mechanism involves the formation of aldol product (**70**) between the active methylene of 2-tetralone and the corresponding aldehyde. Subsequently, cyclization *via* nucleophilic attack leading to formation of the hemiacetal intermediate (**71**) followed by double dehydration (**72**) and aromatization by proton rearrangement produces stable products (**68**, Scheme 29) [57].

In another endeavor, we developed a microwave-assisted synthesis of 3-(dialklamino)-2,2-dialkyl-1,2-dihydro-naphtho[2,1-*b*]pyrans (**73**) [58]. These series of compounds were formed in moderate to good yields (45–72%) from 2-naphthol, a secondary amine, and 3-hydroxy-2,2-dialkylpropanaldehydes (**69**) in presence of catalytic amount of *p*-toluenesulfonic acid using focused microwave radiation as energy source (Scheme 30).

Scheme 31. Most plausible mechanism of formation of dialkylamino-dihydronaphthopyrans **73** from 2-naphthol, hydroxyl aldehydes **69**, and 2° amines.



Scheme 32. *p*-TSA-catalyzed four-component reaction for the synthesis of 2,2-dimethyl-3-morpholino-1,2-dihydro-naphtho[2,1-*b*]pyran.



The formation of 1-dialkylaminomethyl-2-naphthol byproducts (**74**) gave us a vital clue in discerning the mechanism of this reaction. We elucidated that under applied reaction conditions, 2,2-dialkyl-3-hydroxy-propanaldehydes undergoes retro-aldol condensation to produce formaldehyde and 2,2-dialkylacetaldehydes. These aldehydes meet different fates resulting in facile formation of 1-dialkylaminomethyl-2-naphthols (**74**) and 2,2-dialkylacetaldehyde/secondary amine enamines (**75**). Again, under the used reaction conditions, 1-dialkylaminomethyl-2-naphthols deaminate to naphthoquinone methide (**76**). Pericyclic cycloaddtion between electron deficient **76** and electron rich enamine **75** results in dialkylamino-dihydronaphthopyrans **73** with aromatization being the driving force (Scheme 31) [40].

Subsequently, we substantiated this mechanistic pathway by developing a *p*TSA catalyzed four-component reaction involving 2-naphthol, paraformaldehyde, isobutyraldehyde, and morpholine (1 molar equivalent each) under microwave conditions identical to the original three component reaction [58]. This indeed led to formation of **73** ($R'=R''=Me$, $-NR_2$=morpholine) and **74** ($-NR_2$=morpholine) in 52% and 43% yields, respectively (Scheme 32).

It is abundantly clear from the preceding discussions that 3*H*-naphtho[2,1-*b*]pyran and dihydro-1*H*-naphtho[2,1-*b*]pyran nuclei can be derived from a variety of synthetic routes. Evidently, the majority of these procedures lack simplicity and satisfactory yields; many are accompanied by one or more side-products. Since naphthopyran nuclei are biologically relevant and commercially important, it is paramount to develop expeditious, facile, and convenient synthetic routes to these types of molecular frameworks.

In this study, a facile and general method synthesizing flavone-like 2-aryl-4,9-dihydrocyclohepta[*b*]-pyran-4,9-diones (**2a–y**) from 3-cinnamoyltropolones (**1a–y**) *via* oxidative cyclization reaction by using I_2/DMSO/H_2SO_4 system is described. The method was found to be successfully applicable to a wide range of 3-cinnamoyltropolone derivatives and characterized by generality, compatibility, and easy work-up procedures.

J. Heterocyclic Chem., **46**, 1107 (2009).

INTRODUCTION

Heterocycle-fused troponoids are a type of compounds with physiological activities such as anticancer [1], germicide, antiphlogistic [2], antihypertension [3], and antidiabetic [4]. They are included in many natural products such as alkaloids and antibiotics. For example, a new antimalarial tropolone, named cordytropolone, was discovered in a culture broth of *Cordyceps* [5]. Heterocycle-fused troponoids can be synthesized in many ways, among which one was to oxidize the side chain of tropolone for cyclization. For instance, it was reported that flavone-like heterocycle-fused troponoid compounds, 2-aryl-4,9-dihydrocyclohepta[*b*]pyran-4,9-diones, were obtained by oxidative cyclization of 3-cinnamoyltropolones using selenium dioxide [6] or 2,3-dichloro-5,6-dicyanobenzoquinone (DDQ) [7] as oxidative reagents. We have ever reported that reactions of unsubstituted 3-cinnamoyltropolone or 3-cinnamoyl-5-phenylazo-substituted tropolone with excess bromine can also give heterocycle-fused flavone-like compounds [8]. Although these practical syntheses have been described so far, these methods, however, are limited to unsubstituted or specifically substituted 3-cinnamoyltropolones and lack generality, compatibility, easy work-up procedures, regiochemical control, and high yields. Another approach reported by Wang *et al.* [9] to 2-aryl-4,9-dihydrocyclohepta[*b*]pyran-4,9-diones was based on the reactions of 3-acetyltropolone with methoxyl- and/or hydroxy-substituted benzaldehydes in the presence of triethyl orthoformate and with perchloric acid as the oxidant. However, Wang's procedure is also limited to methoxy- and/or hydroxy-substituted benzaldehyde derivatives and is not applicable to a large number of starting materials. In view of the aforementioned drawbacks, we deemed it desirable to develop a simpler, more efficient, and broadly applicable synthetic approach with a wide range of substrates to overcome the previously mentioned disadvantages. Recently, a method has been reported for the synthesis of flavone compounds from 2′-hydroxychalcone via oxidative cyclization reaction using I_2/DMSO/H_2SO_4 system [10,11]. The reactions were completed in a few hours at 100°C in DMSO, and a catalytic amount of I_2 and concentrated H_2SO_4 to give flavone compounds in good yields. In connection with our studies, we envisioned that the system could also be applied to 3-cinnamoyltropolones, from which flavone-like compounds 2-aryl-4,9-dihydrocyclohepta[*b*]pyran-4,9-diones may be synthesized through oxidative cyclization reaction. Indeed, this was found to be the case and, to the best of our knowledge, it is the first example of the application of the I_2/DMSO/H_2SO_4 system in the oxidative cyclization reaction of 3-cinnamoyltropolones.

RESULTS AND DISCUSSION

Scheme 1 outlines the synthetic sequence used in our laboratories for the preparation of heterocycle-fused flavone-like compounds **2a–y**. The starting materials of our study were readily prepared from 3-acetyltropolone and various benzaldehyde derivatives by aldol condensation [6].

To check the feasibility of this approach using I_2/DMSO/H_2SO_4 system and show a comparable result, we initially chose the representative unsubstituted 3-cinnamoyltropolone (**1a**) and methoxy-substituted 3-cinnamoyltropolones **1d–f** and **1q–t** to perform the initial experiments because their oxidative cyclization reactions have been previously reported by using different oxidative reagents [6–9,12]. As reported earlier, using hydrogen peroxide in the presence of alkali substrates, **1a**, **1d–f**, and **1q–t**, could not be converted into flavone-like compounds [12]. In [6], only **1a** and **1d–f** could be converted to corresponding flavone-like products **2a** and **2d–f** while using SeO_2 as oxidative cyclization reagent. Moreover, this method has some drawbacks, such as the use of toxic reagent, tedious work-up procedures, and narrow scope of the substrates. When under the action of elemental bromine [8], only substrate **1a** could react to give flavone-like products, but the bromination reaction of the aromatic ring of **1a** also occurred at the same time under this condition. In the oxidation cyclization of 3-cinnamoyltropolones with DDQ [7], only unsubstituted and 3-methoxy-substituted 3-cinnamoyltropolones (**1a**, **1e**) gave the flavone-like compounds **2a** and **2e**, while the other methoxy-substituted ones, such as **1d**, **1f**, and **1q–t**, are often limited and gave aurone-like products. However, in our experiment, upon treatment with I_2/DMSO/H_2SO_4 system at 100°C for 10 h, these substrates were all smoothly converted to their corresponding flavone-like compounds (**2a**, **2d–f**, and **2q–t**), which are acceptable to good yields. Thus, I_2/DMSO/H_2SO_4 system offered a general method for the oxidative cyclization reaction of a wide variety of 3-cinnamoyltropolone substrates. The compounds **2a**, **2d–f**, **2q**, and **2t** are known compounds and their structures were unambiguously confirmed by the physical and spectroscopic data, which were in good agreement with the reported values. Through an effort to optimize the reaction conditions, such as the reaction temperature and the amount of the I_2/DMSO/H_2SO_4 system, we found that the best results were achieved when the reactions were conducted at a temperature of 100°C with a ratio of 1 mmol 3-cinnamoyltropolone to 8 mL DMSO, 10 mg I_2, and 3–4 drops of concentrated H_2SO_4. We also found that the addition of increased amounts of I_2 or H_2SO_4 lowered the purity and yield of products.

To establish the generality and applicability of this method, a wide variety of 3-cinnamoyltropolones containing electron-donating (such as alkyl or alkoxyl group) and electron-withdrawing (such as cyano, nitro, or halide groups) substituents were subjected to the same set of experiments to furnish the corresponding flavone-like compounds. The results summarized in Table 1 indicated the scope and generality of the oxidation cyclization reaction with respect to various 3-cinnamoyltropolones.

From Table 1, we could see that this method was found to be effective for both electron-donating and electron-withdrawing substituents to afford flavone-like products in moderate to good yields. For example, 3-cinnamoyltropolones, **1c**, **1f**, and **1q**, bearing electron-donating groups on the benzene ring were reacted to give the corresponding products: 2-(4-ethylphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (**2c**), 2-(4-methoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (**2f**), and 2-(1,3-benzodioxol-5-yl)-4,9-dihydrocyclohepta[*b*]-pyran-4,9-dione (**2q**) in 60%, 70%, and 92% yields, respectively. On the other hand, 3-cinnamoyltropolones, **1m**, **1o,** and **1x**, bearing electron-withdrawing groups gave the following products: 2-(3-cyanophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (**2m**), 2-(3-nitrophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (**2o**), and 2-(3,4-dichlorophenyl)-4,9-dihydrocyclohepta[*b*]-pyran-4,9-dione (**2x**) in 80%, 75%, and 59% yields, respectively. Thus, we concluded that the electronic nature of the substituents on 3-cinnamoyltropolones has no significant effect on this reaction. Among them, the compounds **2b–c**, **2g–p**, **2r–s,** and **2u–y** have never been reported, and their structures were confirmed by IR, ^{1}H NMR, ^{13}C NMR, and MS. These results showed that our protocol could tolerate a variety of functional groups on the benzene ring. However, we found that when the benzene ring of 3-cinnamoyltropolones was replaced with the pyridine ring, the reaction became complex under the same conditions and a prolonged reaction time of more than 48 h provided only a trace amount of oxidation cyclization products.

The ease of isolation of compounds **2a–y** was notable; after aqueous work-up, flavone-like compounds **2a–y** were isolated as the main products and their structures were analyzed. When the compounds were developed on thin-layer chromatography (TLC; silica gel: GF254, developing agent: ethyl acetate), there was only one main spot with no tailing. The compounds had the negative coloring test with iron (III) chloride in methanol solution. The IR spectrum exhibited an absence of hydroxyl group, which appeared in 3-cinnamoyltropolones, and the presence of two typical carbonyl absorptions for the tropone and pyran moiety at about 1640 and 1600 cm^{-1}, respectively. The ^{1}H NMR spectrum showed the absence of a hydroxy OH signal and the presence of one signal attributable to the proton of the pyran ring in addition to the signals of other groups. In ^{13}C NMR spectra, all the synthesized compounds showed peaks in the 180–183 and 169–172 ppm range for two carbonyl carbons of tropone and pyran (detailed spectral data are given in the ''Experimental'' section). In addition, the structure assigned for this reaction product was fully supported by their mass spectrum as well as their elemental analysis. All these facts show that the hydroxyl group in the tropolone ring had taken part in the reaction.

We believe that this method is the simplest route for the preparation of a wide range of flavone-like compounds, requiring only simple, cheap reagent, and mild conditions.

EXPERIMENTAL

Melting points (uncorrected) were determined using WRS-1B melting points apparatus. The ^{1}H NMR (400 MHz) and ^{13}C NMR (100 MHz) spectra were recorded with a Varian Inova 400 NMR spectrometer at 400 MHz. The reported chemical shifts were against TMS. The mass spectra were determined using an MSD VL ESI1 spectrometer. Elemental analysis was performed using an Elementar Vario EL-III element analyzer. The progress of reactions was monitored by TLC on silica gel GF254 using ethyl acetate as eluent.

General procedure for the reaction of 3-cinnamoyltropolones 1a–y with I_2/DMSO/H_2SO_4 system. To a solution of 3-cinnamoyltropolones (1 mmol) in 8 mL DMSO, 3–4 drops of concentrated H_2SO_4 were added. The mixture obtained was stirred for 10 min at 100°C, and then I_2 (10 mg) was added to the mixture and continued to stir at the same temperature. After 10–24 h, the completion of reaction was monitored by TLC, the mixture was cooled to room temperature, and the precipitate formed was filtered, washed with water, and dried to yield crude 2-aryl-4,9-dihydrocyclohepta[*b*]pyran-4,9-diones, which was purified by recrystallization to give pure 2-aryl-4,9-dihydrocyclohepta[*b*]pyran-4,9-diones **2a–y** in 33–92% yield.

2-Phenyl-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2a). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3058 (CH), 1660 (tropone CO), 1600 (pyran CO), 1520, 1510, 1390, 1190, 1120, 900, 820, 770, 690 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 8.13−9.06 ppm (m, 10H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.78, 182.65, 171.54, 163.09, 144.53, 138.70, 135.84, 131.83, 130.72, 129.78, 128.69, 119.91, 117.10, 114.28, 111.47, 109.29; ms: *m*/*z* 251 (M+1)$^+$. Anal. Calcd for $C_{16}H_{10}O_3$: C, 76.79; H, 4.03. Found: C, 76.82; H, 3.99.

2-(4-Methylphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2b). This compound was obtained as yellowish gray needles (1,4-dioxane); IR (potassium bromide): ν 3066 (CH), 2970 (CH), 1640 (tropone CO), 1590 (pyran CO), 1510, 1470, 1420, 1380, 1350, 1300, 1185, 1120, 1040, 890, 820, 710 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.93−8.92 (m, 9H, ArH, PhH, C=CH), 2.97 ppm (s, 3H, CH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.43, 182.00, 172.43, 162.58, 161.13, 144.39, 144.4, 138.80, 135.28, 131.65, 129.07, 126.71, 119.95, 117.14, 114.32, 111.50, 108.25, 21.39 ppm; ms: *m*/*z* 265 (M+1)$^+$. Anal. Calcd for $C_{17}H_{12}O_3$: C, 77.26; H, 4.58. Found: C, 77.37; H, 4.53.

2-(4-Ethylphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2c). This compound was obtained as yellow needles (ethanol); IR (potassium bromide): ν 3070 (CH), 2985 (CH), 1640 (tropone CO), 1590 (pyran CO), 1520, 1505, 1420, 1375, 1220, 1110, 960, 840, 820, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.29–8.33 (m, 9H, ArH, PhH, C=CH), 2.60–2.67 (q, 2H, CH_2, J = 7.6 Hz, 14.8 Hz), 1.38 ppm (t, 3H, CH_3, J = 6.2 Hz); ^{13}C NMR (CF_3COOD, 100 MHz): δ

182.66, 182.22, 172.31, 162.82, 156.63, 146.73, 144.54, 138.94, 135.35, 133.74, 132.21, 131.59, 129.29, 127.08, 120.09, 117.27, 114.45, 111.64, 108.55, 30.08, 14.72, and 14.54 ppm; ms: *m/z* 279 $(M+1)^+$. Anal. Calcd for $C_{18}H_{14}O_3$: C, 77.68; H, 5.07. Found: C, 77.74; H, 4.99.

2-(2-Methoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2d). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 2920 (CH), 1630 (tropone CO), 1610 (pyran CO), 1590, 1515, 1490, 1450, 1380, 1295, 1250, 1190, 1015, 750 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.51–8.73 (m, 9H, ArH, PhH, C=CH), 4.40 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.20, 181.97, 171.10, 162.21, 144.50, 138.89, 135.55, 132.04, 130.65, 127.79, 123.16, 120.07, 117.25, 114.44, 113.69, 113.07, 111.62, 56.53 ppm; ms: *m/z* 281 $(M+1)^+$. Anal. Calcd for $C_{17}H_{12}O_4$: C, 72.85; H, 4.32. Found: C, 72.91; H, 4.28.

2-(3-Methoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2e). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 2960 (CH), 1650 (tropone CO), 1590 (pyran CO), 1520, 1495, 1475, 1440, 1385, 1350, 1290, 1180, 1115, 870, 790, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.86–9.03 (m, 9H, ArH, PhH, C=CH), 4.57 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.98, 182.92, 170.35, 162.72, 144.66, 138.81, 135.24, 132.27, 129.76, 122.38, 121.44, 120.03, 117.22, 114.50, 111.58, 109.99, 56.72 ppm; ms: *m/z* 281 $(M+1)^+$. Anal. Calcd for $C_{17}H_{12}O_4$: C, 72.85; H, 4.32. Found: C, 72.81; H, 4.35.

2-(4-Methoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2f). This compound was obtained as golden needles (1,4-dioxane); IR (potassium bromide): ν 3040 (CH), 2920 (CH), 1640 (tropone CO), 1600 (pyran CO), 1510, 1250, 1380, 1270, 1190, 1110, 1020, 830, 810, 690 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.60–8.82 (m, 9H, ArH, PhH, C=CH), 4.47 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 180.44, 178.99, 171.42, 165.85, 161.52, 142.64, 137.39, 133.93, 130.63, 128.84, 126.43, 120.35, 118.34, 116.02, 115.52, 112.70, 109.89, 105.33, 54.84 ppm; ms: *m/z* 281 $(M+1)^+$. Anal. Calcd for $C_{17}H_{12}O_4$: C, 72.85; H, 4.32. Found: C, 72.87; H, 4.29.

2-(3-Phenoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2g). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3050 (CH), 1640 (tropone CO), 1605 (pyran CO), 1585, 1520, 1480, 1440, 1380, 1350, 1270, 1230, 1210, 1175, 1110, 870, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.00–8.44 ppm (m, 14H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.23, 170.17, 163.54, 156.92, 144.79, 138.85, 135.25, 132.37, 131.90, 131.40, 130.04, 126.34, 125.04, 123.37, 121.14, 120.13, 117.77, 114.50, 111.68, 110.15 ppm; ms: *m/z* 343 $(M+1)^+$. Anal. Calcd for $C_{22}H_{14}O_4$: C, 77.18; H, 4.12. Found: C, 77.04; H, 4.32.

2-(2-Chlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2h). This compound was obtained as pale yellow needles (1,4-dioxane); IR (potassium bromide): ν 3058 (CH), 1655 (tropone CO), 1600 (pyran CO), 1511, 1472, 1430, 1370, 1339, 1170, 1010, 1028, 815, 760, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.78–9.02 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.12, 182.94, 169.31, 163.66, 145.06, 138.72, 135.22, 132.19, 130.10, 128.58, 119.89, 117.57, 115.75, 114.26, 111.44 ppm; ms: *m/z* 285 $(M+1)^+$. Anal. Calcd for $C_{16}H_9ClO_3$: C, 67.50; H, 3.19. Found: C, 67.64; H, 3.10.

2-(3-Chlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2i). This compound was obtained as yellow solids (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 1650 (tropone CO), 1600 (pyran CO), 1520, 1470, 1410, 1365, 1305, 1180, 1110, 880, 700; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.46–8.54 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.46, 168.34, 162.45, 143.91, 138.14, 136.90, 134.55, 131.57, 129.33, 127.73, 125.90, 119.31, 116.49, 113.68, 110.86, 109.63 ppm; ms: *m/z* 285 $(M+1)^+$. Anal. Calcd for $C_{16}H_9ClO_3$: C, 67.50; H, 3.19. Found: C, 67.47; H, 3.16.

2-(4-Chlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2j). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 1650 (tropone CO), 1614 (pyran CO), 1512, 1490, 1410, 1370, 1340, 1286, 1175, 1091, 890, 832, 810, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.83–8.84 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 400 MHz): δ 182.80, 169.48, 162.63, 144.42, 142.77, 138.70, 135.05, 131.93, 131.07, 129.72, 128.36, 119.91, 117.09, 114.28, 111.46, 109.46 ppm; ms: *m/z* 285 $(M+1)^+$. Anal. Calcd for $C_{16}H_9ClO_3$: C, 67.50; H, 3.19. Found: C, 67.57; H, 3.12.

2-(2-Bromophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2k). This compound was obtained as pale yellow needles (1,4-dioxane); IR (potassium bromide): ν 3040 (CH), 1660 (tropone CO), 1600 (pyran CO), 1520, 1470, 1375, 1350, 1170, 1110, 1020, 820, 770, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.81–9.13 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.07, 182.92, 170.49, 163.51, 145.10, 138.71, 135.33, 134.67, 132.64, 131.91, 130.16, 129.04, 122.52, 119.87, 117.05, 115.74, 114.24, 114.42 ppm; ms: *m/z* 331 $(M+2)^+$. Anal. Calcd for $C_{16}H_9BrO_3$: C, 58.38; H, 2.76. Found: C, 58.45; H, 2.82.

2-(4-Bromophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2l). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3050 (CH), 1650 (tropone CO), 1590 (pyran CO), 1510, 1485, 1410, 1370, 1180, 1110, 1075, 1010, 890, 830, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.77–8.77 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.78, 169.47, 163.48, 144.38, 138.67, 135.01, 134.11, 131.91, 130.96, 129.65, 128.78, 119.87, 117.06, 114.24, 111.42, 109.46 ppm; ms: *m/z* 331 $(M+2)^+$. Anal. Calcd for $C_{16}H_9BrO_3$: C, 58.38; H, 2.76. Found: C, 58.28; H, 2.78.

2-(3-Cyanophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2m). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3055 (CH), 2220 (CN), 1640 (tropone CO), 1600 (pyran CO), 1511, 1425, 1370, 1300, 1185, 1110, 850, 820, 700 cm^{-1}; ^{1}H NMR (CF_3COOD, 400 MHz): δ 7.00–8.37 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.94, 171.96, 162.83, 155.82, 151.00, 144.74, 138.25, 136.39, 131.65, 129.52, 119.41, 116.59, 113.77, 110.96 ppm; ms: *m/z* 276 $(M+1)^+$. Anal. Calcd for $C_{17}H_9NO_3$: C, 74.18; H, 3.30. Found: C, 74.25; H, 3.28.

2-(4-Cyanophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2n). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 2220 (CN), 1651 (tropone CO), 1590 (pyran CO), 1510, 1420, 1380, 1295, 1160, 1110, 870, 810, 705 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 8.13–9.09 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.18, 167.07, 163.59, 144.49, 138.82, 135.58, 135.13, 134.55, 132.03, 130.14, 129.07, 119.95, 117.13, 116.25, 114.31, 111.50 ppm; ms: *m/z* 276 $(M+1)^+$. Anal. Calcd for $C_{17}H_9NO_3$: C, 74.18; H, 3.30. Found: C, 74.04; H, 3.39.

2-(3-Nitrophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2o). This compound was obtained as yellow needles (*N,N*-dimethylformamide); IR (potassium bromide): ν 3090 (CH), 1645 (tropone CO), 1600 (pyran CO), 1540, 1530, 1500, 1390, 1355, 1180, 1110, 915, 820, 750, 710 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 8.10–9.50 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.15, 166.86, 163.53, 149.87, 144.64, 138.91, 135.28, 134.62, 132.60, 132.19, 130.20, 128.94, 123.54, 120.03, 117.21, 114.40, 111.58, 111.37 ppm; ms: *m/z* 296 $(M+1)^+$. Anal. Calcd for $C_{16}H_9NO_5$: C, 65.09; H, 3.07. Found: C, 65.12; H, 3.11.

2-(4-Nitrophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2p). This compound was obtained as deep yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 1650 (tropone CO), 1605 (pyran CO), 1515, 1425, 1370, 1350, 1175, 1110, 1040, 850, 810, 755, 695 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.84–8.73 ppm (m, 9H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.94, 166.49, 162.90, 151.34, 144.32, 138.67, 136.62, 135.01, 131.81, 129.92, 125.48, 119.83, 117.01. 114.19, 111.81, 111.37 ppm; ms: *m/z* 296 $(M+1)^+$. Anal. Calcd for $C_{16}H_9NO_5$: C, 65.09; H, 3.07. Found: C, 65.16; H, 3.13.

2-(1,3-Benzodioxol-5-yl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2q). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3055 (CH), 2990 (CH), 1640 (tropone CO), 1595 (pyran CO), 1510, 1460, 1394, 1340, 1260, 1190, 1120, 1030, 920, 860, 850, 816, 700 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.45–8.85 (m, 8H, ArH, PhH, C=CH), 6.56 ppm (s, 2H, OCH_2O); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.09, 180.95, 172.2, 163.15, 156.18, 150.74, 144.28, 138.91, 135.46, 130.70, 128.31, 127.17, 123.34, 119.93, 117.11, 114.29, 111.48, 110.82, 108.38, 107.40, 104.13 ppm; ms: *m/z* 295 $(M+1)^+$. Anal. Calcd for $C_{17}H_{10}O_5$: C, 69.39; H, 3.43. Found: C, 69.33; H, 3.36.

2-(2,3-Dimethoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2r). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 2965 (CH), 1644 (tropone CO), 1609 (pyran CO), 1511, 1470, 1428, 1379, 1310, 1010, 910, 850, 760, 710 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.45–8.65 (m, 8H, ArH, PhH, C=CH), 4.18 (s, 3H, OCH_3), 4.11 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.57, 167.99, 162.45, 153.73, 148.37, 144.21, 138.10, 134.61, 131.61, 126.79, 124.29, 122.54, 119.34, 118.75, 116.53, 114.02, 113.71, 110.90, 62.07, 56.06 ppm; ms: *m/z* 311 $(M+1)^+$. Anal. Calcd for $C_{18}H_{14}O_5$: C, 69.67; H, 4.55. Found: C, 69.63; H, 4.57.

2-(2,5-Dimethoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2s). This compound was obtained as orange needles (1,4-dioxane); IR (potassium bromide): ν 3055 (CH), 2930 (CH), 1620 (tropone CO), 1590 (pyran CO), 1510, 1468, 1429, 1370, 1330, 1170, 1140, 1070, 910, 820, 700 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.26–8.56 (m, 8H, ArH, PhH, C=CH), 4.15 (s, 3H, OCH_3), 4.09 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.46, 168.87, 162.93, 157.4, 153.80, 144.43, 138.60, 135.16, 131.12, 128.29, 125.04, 119.82, 118.64, 117.00, 116.32, 114.99, 114.19, 113.69, 111.38, 57.48, 56.66 ppm; ms: *m/z* 311 $(M+1)^+$. Anal. Calcd for $C_{18}H_{14}O_5$: C, 69.67; H, 4.55. Found: C, 69.78; H, 4.61.

2-(3,4-Dimethoxyphenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2t). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3070 (CH), 2940 (CH), 1635 (tropone CO), 1600 (pyran CO), 1510, 1465, 1430, 1380, 1330, 1265, 1150, 1020, 850, 805, 770, 700 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.05–8.29 (m, 8H, ArH, PhH, C=CH), 3.95 (s, 3H, OCH_3), 3.92 ppm (s, 3H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.55, 181.56, 171.44, 163.26, 156.21, 151.73, 150.24, 144.45, 138.98, 135.37, 131.29, 129.26, 125.48, 122.75, 120.09, 117.27, 116.02, 114.45, 113.13, 112.22, 111.64, 110.37, 107.92, 67.78, 56.78, and 56.71 ppm; ms: *m/z* 311 $(M+1)^+$. Anal. Calcd for $C_{18}H_{14}O_5$: C, 69.67; H, 4.55. Found: C, 69.65; H, 4.57.

2-(2,3-Dichlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2u). This compound was obtained as pale yellow solids (1,4-dioxane); IR (potassium bromide): ν 3065 (CH), 1660 (tropone CO), 1600 (pyran CO), 1515, 1410, 1370, 1340, 1170, 1110, 900, 870, 795 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.67–8.98 ppm (m, 8H, ArH, PhH, C—CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.75, 183.65, 169.13, 163.91, 145.77, 139.56, 137.12, 136.06, 133.23, 130.93, 129.88, 120.69, 117.87, 116.70, 115.06, 112.24 ppm; ms: *m/z* 319 $(M)^+$. Anal. Calcd for $C_{16}H_8Cl_2O_3$: C, 60.22; H, 2.53. Found: C, 60.16; H, 2.63.

2-(2,4-Dichlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2v). This compound was obtained as colorless needles (1,4-dioxane); IR (potassium bromide): ν 3050 (CH), 1670 (tropone CO), 1604 (pyran CO), 1550, 1520, 1480, 1380, 1340, 1170, 1110, 890, 870, 820, 700 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.84–9.06 ppm (m, 8H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.81, 183.60, 168.72, 145.75, 142.19, 139.52, 136.01, 133.45, 130.82, 129.29, 120.66, 117.84, 116.59, 115.03, 112.22 ppm; ms: *m/z* 319 $(M)^+$. Anal. Calcd for $C_{16}H_8Cl_2O_3$: C, 60.22; H, 2.53. Found: C, 60.19; H, 2.66.

2-(3,5-Dichlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2w). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3040 (CH), 1650 (tropone CO), 1600 (pyran CO), 1560, 1520, 1425, 1375, 1345, 1250, 1115, 860, 800, 700 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.30–8.37 ppm (m, 8H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.07, 166.99, 163.04, 161.30, 151.73, 144.40, 138.84, 138.20, 135.02, 134.56, 133.17, 132.06, 130.03, 126.53, 119.94, 118.82, 117.12, 115.99, 114.82, 113.17, 111.49, 110.89 ppm; ms: *m/z* 319 $(M)^+$. Anal. Calcd for $C_{16}H_8Cl_2O_3$: C, 60.22; H, 2.53. Found: C, 60.28; H, 2.51.

2-(3,4-Dichlorophenyl)-4,9-dihydrocyclohepta[*b*]pyran-4,9-dione (2x). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3065 (CH), 1650 (tropone CO), 1600 (pyran CO), 1520, 1468, 1410, 1370, 1340, 1180, 1140, 1110, 1030, 900, 820, 710 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.27–8.32 ppm (m, 8H, ArH, PhH, C=CH); ^{13}C NMR (CF_3COOD, 100 MHz): δ 183.00, 167.52, 163.40, 161.28, 144.41, 140.39, 138.86, 135.91, 135.06, 132.79, 132.08, 130.06, 127.30, 119.99, 117.17, 114.36, 111.54, 110.25 ppm; ms: *m/z* 319 $(M)^+$. Anal. Calcd for $C_{16}H_8Cl_2O_3$: C, 60.22; H, 2.53. Found: C, 60.19; H, 2.65.

2-(3,4,5-Trimethoxyphenyl)-4,9-dihydrocyclohepta[*b*]-pyran-4,9-dione (2y). This compound was obtained as yellow needles (1,4-dioxane); IR (potassium bromide): ν 3060 (CH), 2935 (CH), 1650 (tropone CO), 1610 (pyran CO), 1520, 1470, 1410, 1370 cm^{-1}; ^1H NMR (CF_3COOD, 400 MHz): δ 7.87–8.91 (m, 7H, ArH, PhH, C=CH), 4.48–4.50 ppm (m, 9H, OCH_3); ^{13}C NMR (CF_3COOD, 100 MHz): δ 182.90, 182.58, 169.80, 162.64, 154.64, 144.59, 142.97, 138.79, 135.19, 131.89, 129.56, 126.77, 119.94, 117.12, 114.31, 111.49, 109.61, 106.75, 62.25, 56.98 ppm; ms: *m/z* 341 $(M+1)^+$. Anal. Calcd for $C_{19}H_{16}O_6$: C, 67.05; H, 4.74. Found: C, 66.98; H, 4.87.

An easy synthesis of four steps to afforded 12 new derivatives of 3,3-dimethyl-2,3,4,5,10,11-hexahydro-8-[(*o*-; and *p*-methyl)phenoxy]-11-[(o-; and *p*-substituted)phenyl]-1H-dibezo-[b,e][1,4]diazep-in-1-ones **IV**, **1-12** with potential biological and pharmacological activity as sedative, hypnotic-muscular relaxing, anticonvulsant, and schizophrenia treatment of the central nervous system (CNS). The final products have been obtained with good yields, by condensation and cyclization between 3-{4-[(*o*-; and *p*-methyl)phenoxy]-1,2-phenylendiamine}-5,5-dimethyl-2-cyclohexanone **III**, with the corresponding (*o*-; and *p*-R)benzaldehyde. The structure of all derivatives was corroborated by spectroscopy of ir, ^{1}H, and ^{13}C NMR, with bi-dimensional experiments and EI-MS in low and high resolution with collision-induced dissociation experiments (CID).

J. Heterocyclic Chem., **46**, 1113 (2009).

INTRODUCTION

The first 1,4- and 1,5-benzodiazepines appeared in the pharmaceutical industry as tranquilizers in the 1970's, their use and interest in recent years has been broader in areas such as tranquilizer, sedative, hypnotic, muscular relaxant, anticonvulsant, and schizophrenia treatment in the central nervous system. The development of new research projects using benzodiazepines and their application has great importance because these types of compounds have been used as antipsycotic drugs [1,2] and also for their antianaphylactic activity [3].

RESULTS AND DISCUSSION

To continue with our research program on the synthesis and determination of biological activity in different 1,4 and 1,5-benzodiazepines [4–7], we described in this report the synthesis of 12 new derivatives of 3,3-dimethyl-2,3,4,5,10,11-hexahydro-8-[(*o*-; and *p*-methyl)-phenoxy]-11-[(*o*-; and *p*-substituted)phenyl]-1*H*-dibezo-[*b*,*e*][1,4]di-azepin-1-ones **IV**, **1-12** (Fig. 1). The synthesis of the dibenzo[*b*,*e*][1,4]diazepin-1-ones **IV**, **1-12** derivatives was carried out in four steps as shown in the Scheme 1.

The reaction mixture of 5-chloro-2-nitroaniline with the (*o*- and *p*-methyl)phenol in presence of anhydrous potassium carbonate at reflux in anhydrous dimethylformamide was heated for 5 h. After cooling, the reaction mixture was diluted with cold water, the 3-amine-4-nitrophenyl-[(*o*-; and *p*-methyl)phenyl]ether **I** that was precipitated and collected by filtration with suction was obtained in a 90–93% yield [8].

Hydrogenation of the corresponding ether **I** in ethanol in presence of Pd/C 10% under a pressure of 60 pounds/inch^2 at room temperature with magnetic stirring for 22 h, we reduced the nitro group to amine. When the reaction was finished, the catalyst Pd/C 10% was removed

Figure 1. Compounds **IV**, **1–12**.

by filtration through celite and ethanol solution was evaporated under reduced pressure. The 3,4-diaminophenyl-[(*o*-; and *p*-methyl)phenyl]ether **II** [9] was obtained in very good yield of 95–98%.

Condensation of the derivatives **II** with 5,5-dimethyl-1,3-cyclohexanedione at reflux in anhydrous benzene with a Dean-Stark trap to eliminate the water produced; afforded after evaporated the ethanol under reduced pressure, the 3-{4-[(*o*-; and *p*-methyl)phenoxy]-1,2-phenylendiamine}-5,5-dimethyl-2-cyclohexenone **III** [10,11], almost pure in 70–75% yield.

Treatment of 1 equiv. of the corresponding 5,5-dimethyl-2-cyclohexenone **III**, with 1 equiv. of the corresponding (*o*-; and *p*-R_2)benzaldehyde in the presence of 0.5 mL of glacial acetic acid at reflux in 10 mL of ethanol with magnetic stirring for 2–4 h afforded the 3,3-dimethyl-2,3,4,5,10,11-hexahydro-8-[(*o*-; and *p*-methyl)phenoxy]-11-[(*o*-; and *p*-substituted)phenyl]-1H-dibezo-[*b*,*e*][1,4]diazepin-1-ones **IV**, **1-12** in 54–75% yields.

The infrared spectra of compounds **IV**, **1-12** displayed absorptions at 3415–3299 cm^{-1} for N—H stretching; at 1700–1600 cm^{-1} for C=O stretching; at 1377–1369 and 1266–1263 cm^{-1} for C—N stretching; at 1187–1171 and 1114–1012 cm^{-1} for C—O stretching and the corresponding absorptions for aromatic and R-substituents.

In the ^1H NMR spectra the presence of two singlet signals (2X3H) at δ 1.01–1.12 and 1.11–1.15 were assigned to the methyl protons joined at C-3. The presence of a doublet at δ 2.18–2.31 and 2.28–2.34 was consistent with the methylene protons at C-2; other doublet signals at δ 2.40–2.57 and 2.54–2.64 was assigned to the methylene protons on C-4. The singlet signal at δ 5.84–6.21 was consistent with methine proton on C-11.

The presence of a broad signal deuterium oxide exchangeable proton a δ 6.45–7.76 was consistent with the N—H. The other signals corresponding at the aromatic protons of the aromatic ring of dibenzodiazepin-1-one appears as a doublet at δ 5.60–6.12 and was consistent with the proton at C-9; the presence of a signal doublet of doublet at δ 6.26–6.40 correspond at the proton on C-7 and the signal doublet at δ 6.66–6.90 was assigned at the proton on C-6.

The other aromatic protons of the rings phenoxy and phenyl substituent on the framework of the dibenzodiazepin-1-one appears as multiplet and as AA′BB′ systems at δ 6.00–7.47. The signals for the methyl substituent in the aromatic rings were also observed as a singlet signal at δ 2.03–2.51.

The ^{13}C NMR spectra data for compounds **IV**, **1-12** are given in Table 1. The signals were confirmed by

The numbering of the phenyl ring is only for the assignment of the chemical shifts of the carbon in ^{13}C NMR spectra.

using HETCOR, FLOCK, COSY, NOESY, and DEPT NMR experiments operating at 300 and 500 MHz. The mass spectra of compounds **IV**, **1-12** exhibit a stable molecular ion with a relative abundance of 24–55%. The base peak is the ion at m/z $[M-(76 + R_2)]^+$. The main fragmentation pathway was consistent with the assigned structures and the mass spectra of the compounds **IV**, **1-12** includes ions of m/z corresponding to molecular ion $[M]^+$; $[M-CH_3]^+$; $[M-CH_4]^+$; $[M-R_2]^+$; $[M-(R_2+ CH_4)]^+$; $[M-28]^+$; $[M-57]^+$; $[M-84]^+$; $[M-85]^+$; $[M-(76 + R_2)]^+$ (the base peak); m/z 363 and 83. The proposed fragmentation pathways leading to the formation of a number of important daughter ions have been confirmed by the corresponding parent ion spectra, using collision-induced dissociation experiments (CID). The elemental composition of the molecular ion and the principal fragment ion were determined by exact mass measurements.

EXPERIMENTAL

The ir spectra were recorded on a Nicolet Magna TR-750 spectrophotometer in chloroform. The ^{1}H NMR spectra were recorded on a Varian Unity 300 spectrometer operating at 300 MHz and the ^{13}C NMR spectra were recorded on a Varian Unity 500 spectrometer operating at 125 MHz in deuterochloroform solution containing tetramethylsilane as the internal standard with chemical shifts δ (ppm) expressed downfield from tetramethylsilane. The mass spectra were measured on a JEOL JMS-AC505 and JEOL MS-SX 102A high-resolution mass spectrometer with accurate mass determination of the molecular ion and the principal fragment ions, using the direct inlet system. The spectra were recorded by electron impact at an ionization chamber temperature of 190°C and ionizing electron energy of 70 eV, using electronic ionization. The compounds **I**, **II**, and **III** were prepared following methods developed by us with modifications [8,9,12].

General procedure for the synthesis of the 3,3-dimethyl-2,3,4,5,10,11-hexahydro-8-[(*o*-; and *p*-methyl)phenoxy]-11-[(*o*-; and *p*-substituted)phenyl]-1*H*-dibenzo[*b*,*e*][1,4]diazepin-1-ones IV, 1-12. A mixture of 1 equiv. of the corresponding 3-{4-[(*o*-; and *p*-methyl)phenoxy]-1,2-phenylendiamine}-5,5-dimethyl-2-cyclo-hexenone III; 1 equiv. of the corresponding (*o*-; and *p*-substituted)benzaldehyde, 0.5 mL of acetic acid glacial in 10 mL ethanol was heated at reflux for 2–4 h. The reaction mixture was cooled to room temperature and evaporated *in vacuo* to yield a semisolid. The residual semisolid was purified on a silica gel by choromatography in column and elution with hexane-ethyl acetate (95:5) to yield the compounds **IV**, **1–12**, in 54–75%.

3,3-Dimethyl-8-[(*o*-methyl)phenoxy]-11-[(*o*-methyl)phenyl]-2,3,4,5,10,11-hexahydro-1*H*-dibenzo[*b*,*e*][1,4]diazepin-1-one (IV, 1). This compound was obtained as an orange solid in 70% yield; mp 135–136°; ir (chloroform): ν N—H 3415, C=O 1619, C—N 1369 and 1264, C—O 1287 and 1113 cm^{-1}; ^{1}H NMR (deuterochloroform): δ 1.05 and 1.11 (s, 6H, C_3—$(CH_3)_2$); 2.05 (s, 3H, $C_{2'}$—CH_3); 2.18 (d, 1H, J = 16.4 Hz, 2-Ha); and 2.28 (d, 1H, J = 16.4 Hz, 2-Hb); 2.43 (d, 1H, J = 15.8 Hz, 4-Ha); and 2.56 (d, 1H, J = 15.8 Hz, 4-Hb); 2.50 (s, 3H, $C_{2''}$—CH_3); 5.88 (d, 1H, J = 2.6 Hz, 9-H); 6.11 (s, 1H, 11-H); 6.27 (dd, 1H, J = 2.6, 8.6 Hz, 7-H); 6.43 (dd, 1H, J = 1.5, 7.8 Hz, 6′-H); 6.64 (dd, 1H, J = 1.1, 7.7 Hz, 6″-H); 6.72 (d, 1H, J = 8.6 Hz, 6-H); 6.81 (dt, 1H, J = 1.0, 7.2 Hz, 5″-H); 6.96 (dt, 1H, J = 1.4, 6.2 Hz, 4′-H); 6.98 (dt, 1H, J = 1.5, 6.2 Hz, 4″-H); 7.0 (bs, 2H, N—H, deuterium oxide exchangeable); 7.05 (dt, 1H, J = 2.1; 6.3 Hz, 5′-H); 7.06 (dd, 1H, J = 1.2, 8.0 Hz, 3′-H); 7.14 (dd, 1H, J = 1.7, 6.6 Hz, 3″-H); ms (IE = 70 eV): m/z (%) 438 (55) $[M^+]$; 423 (24) $[M\text{-}R_1]^+$ $[M\text{-}(CH_3)]^+$; 422 (14); 381 (4); 354 (6); 347 (100) $[M\text{-}(76 + R_1)]^+$; 83 (5). Anal. Calcd. for $C_{29}H_{30}N_2O_2$: (438.55): C, 79.42; H, 6.90; N, 6.40; Found: C, 79.50; H, 6.80; N, 6.49.

3,3-Dimethyl-8-[(*o*-methyl)phenoxy]-11-[(*p*-methyl)phenyl]-2,3,4,5,10,11-hexahydro-1*H*-dibenzo[*b*,*e*][1,4]diazepin-1-one (IV, 2). This compound was obtained as an orange solid in 70% yield; mp 240°; ir (chloroform): ν N—H 3301, C=O 1600, C—N 1376 and 1263, C—O 1185 and 1114 cm^{-1}; ^{1}H NMR (deuterochloroform): δ 1.08 and 1.13 (s, 6H, C_3—$(CH_3)_2$); 2.08 (s, 3H, $C_{2'}$—CH_3); 2.22 (s, 3H, $C_{4''}$—CH_3); 2.22 (d, 1H, J = 16.5 Hz, 2-Ha); and 2.31 (d, 1H, J = 16.5 Hz, 2-Hb); 2.40 (d, 1H, J = 15.6 Hz, 4-Ha); and 2.57 (d, 1H, J = 15.6 Hz, 4-Hb); 5.86 (s, 1H, 11-H); 5.96 (d, 1H, J = 2.4 Hz, 9-H); 6.32 (dd, 1H, J = 2.7, 8.7 Hz, 7-H); 6.53 (bs, 2H, N—H, deuterium oxide exchangeable); 6.57 (dd, 1H, J = 1.2, 8.1 Hz, 6′-H); 6.66 (d, 1H, J = 8.7 Hz, 6-H); 6.92 (s, 4H, phenyl protons of "E" ring); 6.99 (dt, 1H, J = 1.5, 7.3 Hz, 4′-H); 7.06 (dt, 1H, J = 1.5, 7.4 Hz, 5′-H); 7.16 (dd, 1H, J = 1.2, 6.3 Hz, 3′-H); ms (IE = 70 eV): m/z (%) 438 (49) $[M^+]$; 423 (6) $[M\text{-}R_1]^+$ $[M\text{-}(CH_3)]^+$; 422 (9); 381 (6); 354 (7); 353 (6); 347 (100) $[M\text{-}(76 + R_1)]^+$; 83 (4). Anal. Calcd. for $C_{29}H_{30}N_2O_2$: (438.55): C, 79.42; H, 6.90; N, 6.40; Found: C, 79.55; H, 6.76; N, 6.31.

3,3-Dimethyl-8-[(o-methyl)phenoxy]-11-[(*o*-chloro)phenyl]-2,3,4,5,10,11-hexahydro-1H-dibenzo[b,e][1,4]diazepin-1-one (IV, 3). This compound was obtained as an orange solid in 75% yield; mp 105–107°; ir (chloroform): ν N—H 3299, C=O 1620, C—N 1376 and 1265, C—O 1186 and 1113 cm^{-1}; ^{1}H NMR (deuterochloroform): δ 1.12 and 1.15 (s, 6H, C_3—$(CH_3)_2$); 2.04 (s, 3H, $C_{2'}$—CH_3); 2.23 (d, 1H, J = 16.2 Hz, 2-Ha); and 2.32 (d, 1H, J = 16.2 Hz, 2-Hb); 2.50 (d, 1H, J = 15.9 Hz, 4-Ha); and 2.61 (d, 1H, J = 15.9 Hz, 4-Hb); 6.0 (dt, 1H, J = 1.2; 7.8 Hz, 5″-H); 6.01 (d, 1H, J = 2.4 Hz, 9-H); 6.21 (s, 1H, 11-H); 6.26 (dd, 1H, J = 2.3, 8.8 Hz, 7-H); 6.43 (dd, 1H, J = 1.0, 7.8 Hz, 6′-H); 6.67 (d, 1H, J = 8.7 Hz, 6-H); 6.78 (dd, 1H, J = 1.3, 7.6 Hz, 6″-H); 6.88 (bs, 2H, N—H, deuterium oxide exchangeable); 7.01 (dt, 1H, J = 1.2, 6.6 Hz, 4′-H); 7.02 (dt, 1H, J = 1.2, 7.8 Hz, 5′-H); 7.03 (dt, 1H, J = 1.5, 7.3 Hz, 4″-H); 7.16 (dd, 1H, J = 1.5, 6.5 Hz, 3′-H); 7.27 (dd, 1H, J = 1.2, 6.6 Hz, 3″-H); ms (IE = 70 eV): m/z (%) 460 (15) $[M + 2]^+$; 458 (38) $[M^+]$; 443 (5) $[M\text{-}(CH_3)]^+$; 442 (9); 423 (20) $[M\text{-}R_1]^+$; 401 (4); 374 (5); 373 (4); 347 (100) $[M\text{-}(76+ R_1)]^+$; 83 (3). Anal. Calcd. for $C_{28}H_{27}ClN_2O_2$: (458.97): C, 73.27; H, 5.93; N, 6.10; Found: C, 73.59; H, 5.81; N, 6.25.

3,3-Dimethyl-8-[(*o*-methyl)phenoxy]-11-[(*p*-chloro)phenyl]-2,3,4,5,10,11-hexahydro-1H-dibenzo[b,e][1,4]diazepin-1-one (IV, 4). This compound was obtained as a yellow solid in 70% yield; mp 220–222°; ir (chloroform): ν N—H 3301, C=O 1585, C—N 1377 and 1264, C—O 1185 and 1114 cm^{-1}; ^{1}H NMR (deuterochloroform): δ 1.08 and 1.14 (s, 6H, C_3—$(CH_3)_2$); 2.08 (s, 3H, $C_{2'}$—CH_3); 2.22 (d, 1H, J = 16.5 Hz, 2-Ha); and 2.31 (d, 1H, J = 16.5 Hz, 2-Hb); 2.42 (d, 1H, J = 16.2 Hz, 4-Ha); and 2.58 (d, 1H, J = 16.2 Hz, 4-Hb); 5.85 (s, 1H, 11-H); 5.94 (d, 1H, J = 2.7 Hz, 9-H); 6.36 (dd, 1H, J = 2.4, 8.8 Hz, 7-H); 6.45 (bs, 2H, N—H, deuterium oxide exchangeable); 6.58 (dd, 1H, J = 1.2, 7.8 Hz, 6′-H); 6.68 (d, 1H, J = 8.7 Hz, 6-H); 6.96 and 7.10 (AA′BB′, 4H, J = 8.7 Hz, phenyl protons of "E" ring); 7.0 (dt, 1H, J = 1.2, 6.6 Hz, 4′-H); 7.11 (dt, 1H, J = 1.2, 6.6 Hz, 5′-H); 7.17 (dd, 1H, J = 1.2, 7.5 Hz, 3′-H); ms (IE = 70 eV): m/z (%) 460 (16) $[M+2]^+$; 458 (40) $[M^+]$; 443 (4) $[M\text{-}(CH_3)]^+$; 442 (6); 401 (6); 374 (6); 373 (6); 347 (100) $[M\text{-}(76 + R_1)]^+$; 83 (3). Anal. Calcd. for $C_{28}H_{27}ClN_2O_2$: (458.97): C, 73.27; H, 5.93; N, 6.10; Found: C, 73.15; H, 5.80; N, 6.19.

3,3-Dimethyl-8-[(o-methyl)phenoxy]-11-[(*o*-bromo)phenyl]-2,3,4,5,10,11-hexahydro-1*H*-dibenzo[*b*,*e*][1,4]diazepin-1-one (IV, 5). This compound was obtained as an orange solid in 60% yield; mp 72–74°; ir (chloroform): ν N—H 3413, C=O 1700, C—N 1371 and 1266, C—O 1285 and 1113 cm^{-1}; ^{1}H NMR (deuterochloroform): δ 1.09 and 1.12 (s, 6H, C_3—$(CH_3)_2$); 2.03 (s, 3H, $C_{2'}$—CH_3); 2.21 (d, 1H, J = 16.5 Hz, 2-Ha); and 2.30 (d, 1H, J = 16.5 Hz, 2-Hb); 2.51 (d, 1H, J = 15.3 Hz, 4-Ha); and 2.62 (d, 1H, J = 15.3 Hz, 4-Hb); 6.01 (d, 1H, J = 2.4 Hz, 9-H); 6.14 (s, 1H, 11-H); 6.26 (dd, 1H, J = 2.3, 8.8 Hz, 7-H); 6.43 (dd, 1H, J = 1.8, 7.8 Hz, 6′-H); 6.72 (d, 1H, J = 8.1 Hz, 6-H); 6.77 (dd, 1H, J = 1.8, 6.8 Hz, 6″-H); 6.78 (bs, 2H, N—H, deuterium oxide exchangeable); 6.91 (dt, 1H, J = 1.8, 6.6 Hz, 4″-H); 6.94 (dt, 1H, J = 1.8; 6.3 Hz, 5″-H); 6.97 (dt, 1H, J = 1.8, 7.2 Hz, 4′-H); 7.03 (dt, 1H, J = 2.1, 7.5 Hz, 5′-H); 7.15 (dd, 1H, J = 1.5, 7.2 Hz, 3′-H); 7.44 (dd, 1H, J = 1.5, 6.6 Hz, 3″-H); ms (IE = 70 eV): m/z (%) 504 (24) $[M + 2]^+$; 502 (24) $[M^+]$; 487 (5) $[M\text{-}(CH_3)]^+$; 486 (8); 423 (36) $[M\text{-}R_1]^+$; 407 (7) $[M\text{-}(R_1 + CH_4)]^+$; 445 (3); 418 (3); 417 (3); 347 (100) $[M\text{-}(76 + R_1)]^+$; 83 (3). DOI 10.1002/jhet.170

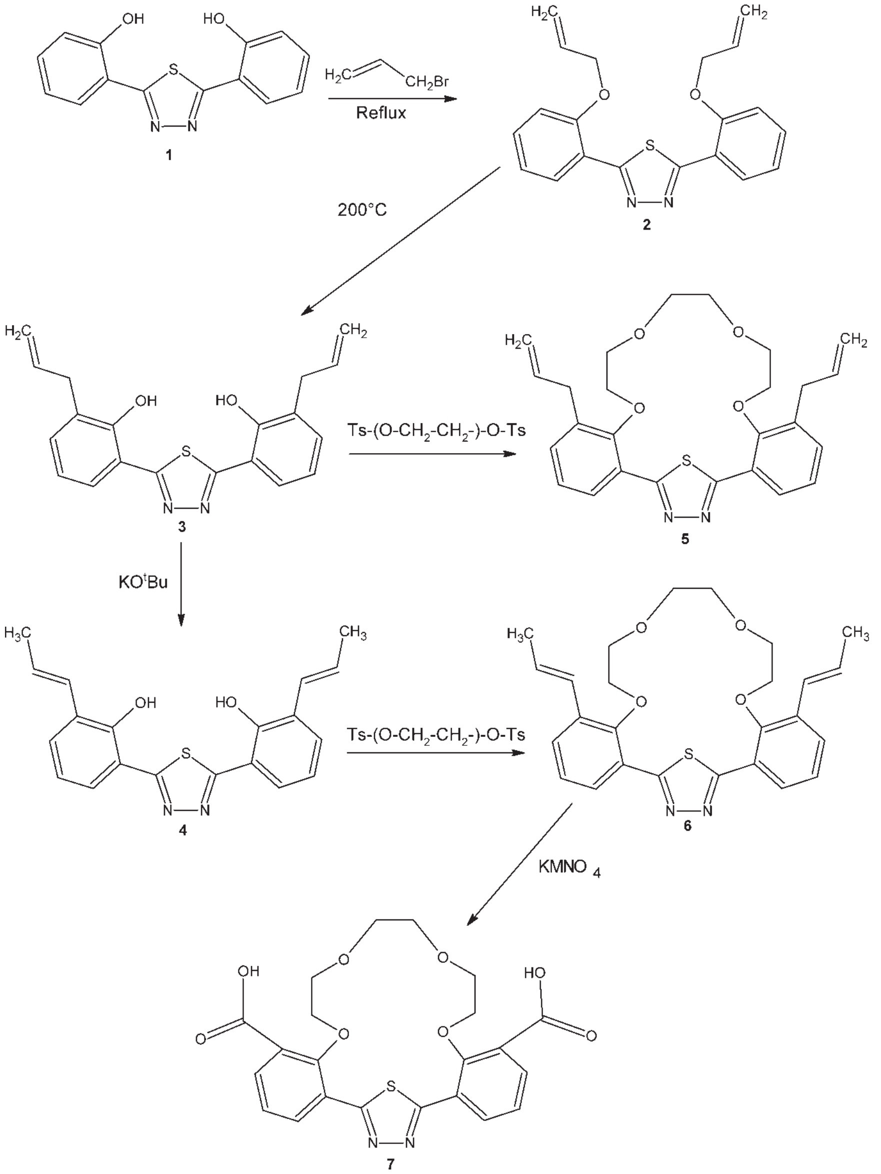
The syntheses of new macrocyclic compounds are described. The 2,5-bis(hydroxyphenyl)-1,3,4-thiadiazole reacts with allyl bromide to give the corresponding allyloxy derivative. The allyl is used to functionalize the ortho position by means of a Claisen rearrangement under microwave irradiation. New 2,5-dihydroxyphenyl-1,3,4-thiadiazoles are obtained, which are converted into macrocyclic polyethers. The structures of the new macrocyclic compounds were confirmed by ^{1}H, ^{13}C NMR, and mass spectroscopy. The crystal structure of 2,5-bis(2-allyloxyphenyl)-1,3,4-thiadiazole has been determined.

J. Heterocyclic Chem., **46**, 1119 (2009).

INTRODUCTION

In the field of supramolecular chemistry, crown ethers (CEs) belong to the most popular hosts, because their inclusion complexes have found a vast number of practical applications [1]. Growing interest has focused on the construction of synthetic macrocyclic polyether compounds containing heterocyclic subunits because these compounds have been shown to possess great ability to undergo selective complexation with charged as well as neutral species [2–4]. Cation complexing properties of synthetic macrocyclic polyether ligands containing a heterocyclic subcyclic unit, such as pyridine, have been previously studied by Bradshaw *et al.* using calorimetric technique for the reaction of Na^+, K^+, Ag^+, NH_4^+, and Ba^{2+} [5]. Series of such compounds containing diaryl-1,3,4-oxadiazoles and thiadiazoles have been reported recently [6–8]. In light of the general interest on the construction of synthetic macrocycles containing heterocyclic subunits as well as limited example of 1,3,4-thiadiazole inclusion in a macrocyclic framework, we report in this article the synthesis of new macrocyclic polyethers containing 2,5-diaryl-1,3,4-thiadiazole. These new macrocyclic compounds are expected to show coordinating behaviors toward cations, water, and organic molecules, such as amines or urea. Similar compounds such as crown-annelated oligothiophenes have been previously used as model compounds for molecular actuation [9]. In this work, the cation complexing properties were analyzed by ^{1}H NMR titration experiments with solution of Ba^{2+}, Sr^{2+}, or Pb^{2+}. More recently, the metal cation complexing properties of crown-annelated oligothiophenes containing 3,4-ethylenedioxythiophene have been studied showing that one of these compounds exhibit interesting complexing properties for Pb^{2+} [10]. The problem of recognition and selective binding of ions occupies a prominent place in separation process, especially in radiochemical technologies. For example, the extraction of uranium and of transuranium and rare-earth metals from nitric acid solutions with various functionally substituted CEs has been investigated by Yakshin *et al.* [11]. Recently, some macrocyclic polyether compounds containing a 1,3,4-thiadiazole moiety have been used as corrosion inhibitors for mild steel in acidic media [12]. The existing data show that most organic inhibitors act by adsorption on the metal surface [13], and it was discovered that the corrosion inhibition may be enhanced

Scheme 1



by various chemicals additives such as cation salts. Macrocyclic derivatives with potential complexing properties are expected to be useful for this purpose.

RESULTS AND DISCUSSION

The 2,5-bis (2-hydroxyphenyl)-1,3,4-thiadiazole **1** reacts with allyl bromide in the presence of solid potassium carbonate suspended in acetone. The mixture is heated under reflux during 12 h. The end of the reaction is controlled by TLC (thin layer chromatography) using a 50/50 mixture of ethylacetate and petroleum ether as eluent. Under these experimental conditions, the reaction takes place in basic media to allow the deprotonation of the two OH groups, which implies the rotation of the two oxygen atoms to the sulfur side as previously calculated [8]. After evaporation of the solvent *in vacuo*, the solid residue is treated with a solution of sodium hydroxide. The 2,5-bis-(2-allyloxyphenyl)-1,3,4-thiadiazole **2** was collected by filtration, washed with water, and recrystallized from ethanol. The structure proposed for this new thiadiazole derivative is consistent with the data obtained from their ^{1}H, ^{13}C, MS, and elemental analysis.

Single crystals suitable for X-ray diffraction study were obtained by slow evaporation of ethanol, and the crystal structure of compound **2** was investigated (Scheme 1).

The main features of the crystal structure of **2** are resulting from the quasi planarity of the whole entity:

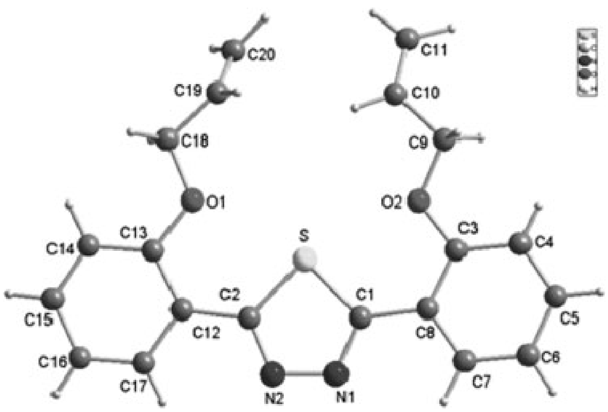


Figure 1. Projection view of compound **2**.

only O2, C10, C11, C18, and C20 are out of the mean plane containing most of the molecule; when using the central thiadiazole ring as planar reference, the phenyl ring on the right (C3 to C8, Fig. 1) is tilted 2° anticlockwise, whereas the other phenyl ring (C12 to C17) is tilted clockwise of 4°. The structure is described by stacking two different layers of such **2** entities along the [001] direction: a first set, located in the (001) basal plane of the unit cell, is seen with molecules of **2** with their central thiadiazole ring pointing upward and downward alternatively, stacked parallel to the [101] direction; a second set with a similar alternating organization of planar entities parallel to the [10-1] axis is seen at about *c*/2. This new ligand with sulfur and two π bonds is offering soft ligation sites and the two oxygen atoms provide hard ligation sites, all five of which are pointed toward a single space and are likely to discriminate between potential metals.

The allyl group was used to functionalize the ortho position to the phenol by means of a Claisen rearrangement. The compound **2** was exposed to microwave irradiation in ethylene glycol at an elevated temperature (200°C). This reaction was conducted under microwave heating to improve the yield and the purity of the product. The double bond of the allyl substituent was isomerized into conjugation with the aryl under basic conditions using potassium *tert*-butoxide [14].

EXPERIMENTAL

Melting points were determined on an IA 9000 series electrothermal apparatus and are uncorrected. Elemental analyses of C, H, N, and S were performed at the Elemental Analysis service of CNRS, Vernaison, France. ^{1}H and ^{13}C NMR spectra were recorded on a Bruker F.T. AC 300 spectrometer (300

MHz for ^1H NMR and 75 MHz for ^{13}C NMR) using chloroform ($CDCl_3$) solvent. Matrix-assisted laser desorption ionization (MALDI) and time-of-flight mass spectrometry (TOF-MS) are used to record the mass spectra of the correspondent compounds. All starting materials were of reagent grade and used as purchased.

A single crystal of compound **2** was mounted on a Brucker AXS SMART three-circle diffractometer using graphite monochromated MoKα radiation (λ = 0.71073 Å), equipped with a CCD two-dimensional detector [15]. Data (Table 1) were corrected for Lorentz, polarization, background, and decomposition effects. Atomic positions were determined using SHELXS [16] and refined using full-matrix least-squares [17]. Hydrogen positions were calculated and included in the final cycles of refinement in constrained positions and with fixed isotropic thermal parameters. Absorption corrections were not made because of the small value of the absorption coefficients (Table 1). Extinction was refined for all three structures but was minimal. Table 2 presents the bond angles and distances for compound **2**. The atomic coordinates and the equivalent displacement are given in Table 3. The anisotropic displacement parameters for compound **2** are presented in Table 4.

General procedure for the synthesis of compounds 1–7. The formula of the parent compounds with corresponding numbers to carbons scheme is given later (Scheme 2).

Synthesis of 2,5-Bis(2-hydroxyphenyl)-1,3,4-thiadiazole (1). Experimental method is reported in the literature [18].

Synthesis of 2,5-Bis(2-allyloxyphenyl)-1,3,4-thiadiazole (2). A mixture of 2,5-bis(2-hydroxyphenyl)-1,3,4-thiadiazole **1** (0.02 mol), anhydrous potassium carbonate (10 g), and allyl bromide (0.04 mol) in acetonitrile (100 mL) was heated under reflux for 12 h with vigorous stirring. The solvent was evaporated *in vacuo,* and the solid residue was heated under reflux with 200 mL of a molar potassium hydroxide solution for 1 h. After cooling, the crude product was filtered, washed with water, and recrystallized from ethanol. Pale yellow solids were obtained: mp 130°C; yield 89%; ^1H NMR ($CDCl_3$) δ (ppm) 8.39 (d, $J = 8.9$ Hz, 2H); 7.54 (t, $J = 8.9$ Hz, 2H), 7.30 (d, $J = 7.5$ Hz, 2H); 7.17 (t, $J = 7.5$ Hz, 2H), 6.20 (m, 2H); 5.53 (d, $J_{trans} = 18$ Hz, 2H), 5.36 (d, $J_{cis} = 9.5$ Hz, 2H); 4.84 (d, $J = 6.1$ Hz, 4H); ^{13}C NMR ($CDCl_3$) δ (ppm) C1 162.68; C2 119.17; C3 155.05; C4 119.30; C5 132.63; C6 121.80; C7 128.21; C8 70.21; C9 133.42; C10 113.89. MALDI-TOFMS: m/z 351 ($M + 1$). Anal. Calcd. for $C_{20}H_{18}N_2O_2S$: C, 68.55; H, 5.18; N, 7.99; S, 9.15. Found: C, 68.20; H, 5.20; N, 8.06; S, 9.09.

Synthesis of 2,5-Bis[3-allyl-2-hydroxy)phenyl]-1,3,4-thiadiazole (3). 2,5-Bis(2-allyloxyphenyl)-1,3,4-thiadiazole **2** (0.01 mol) was placed in multimode microwave and irradiated for 1 h (300 W) at 200°C in ethylene glycol (40 mL). Water (100 mL) was added to dilute the solvent. The reaction mixture was filtered. The resulting residue was recrystallized from ethanol: mp 150–152°C; yield 82%; ^1H NMR ($CDCl_3$) δ (ppm) 11.40 (s, 2H, OH); 7.41 (d, $J = 7.8$ Hz, 2H), 7.29 (d,

General procedure for the synthesis of macrocycles (5) and (6). A mixture of 2,5-bis[3-allyl-2-hydroxy)phenyl]-1,3,4-thiadiazole **3** or 3,5-bis[2-hydroxy-3-trans-1-propenyl)phenyl]-1,3,4-thiadiazole **4** (5 mmol), anhydrous potassium carbonate (24 mmol), and ethylene or polyethylene glycol ditosylate (5 mmol) in 150 mL of nonprotic polar solvent (acetone, acetonitrile, *etc.*) was irradiated in multimode microwave for 9 h. The solvent was evaporated *in vacuo* and the solid residue was heated under reflux with 200 mL of a potassium hydroxide solution for 1 h. After cooling, the crude product was filtered, washed with water, and recrystallized from ethanol.

Macrocycle 5. mp 85°C; yield 31%; 8.28 (d, J = 7.8 Hz, 2H), 7.42 (t, J = 7.8 Hz, 2H), 7.32 (d, J = 7.8 Hz, 2H), 6.04 (m, 2H), 5.14 (t, J = 17 Hz, 4H); 4.02 (m, 4H), 3.88 (m, 4H), 3.52 (s, 4H); 3.33 (d, J = 6.0 Hz, 4H). ^{13}C NMR ($CDCl_3$) δ (ppm) C1 163.72; C2 116.24; C3 154.43; C4 73.98; C5 69.77; C6 71.48; C12 130.74; C13 126.12; C14 131.18; C15 125.93; C16 34.23; C17 135.42.51; C18 117.79. MALDI-TOFMS: *m/z* 465 (M + 1). Anal. Calcd. for $C_{26}H_{28}N_2O_4S$: C, 67.24; H, 6.07; N, 6.03; S, 6.90. Found: C, 67.11; H, 6.08; N, 5.94; S, 6.88.

Macrocycle 6. mp 128°C; yield 27%; 8.44 (d, J = 7.8 Hz, 2H), 7.85 (t, J = 7.8 Hz, 2H), 7.28 (d, J = 7.8 Hz, 2H), 6.85 (d, J = 16 Hz, 2H), 6.04 (m, 2H); 4.10 (m, 4H), 3.93 (m, 4H), 3.56 (s, 4H); 1.78 (d, J = 6.8 Hz, 6H). ^{13}C NMR ($CDCl_3$) δ (ppm) C1 167.41; C2 117.27; C3 156.43; C4 74.84; C5 69.30; C6 71.33; C12 133.81; C13 125.35; C14 134.18; C15 126.63; C16 137.11; C17 124.51; C18 18.83. MALDI-TOFMS: *m/z* 465 (M + 1). Anal. Calcd. for $C_{26}H_{28}N_2O_4S$: C, 67.24; H, 6.07; N, 6.03; S, 6.90. Found: C, 67.09; H, 6.03; N, 5.98; S, 6.82.

Synthesis of macrocycle (7). A suspension of macrocyclic compound **6** (1 g, 2.15 mmol) in boiling water (100 mL) was prepared, to which sodium carbonate crystals (0.5 g) were added, and 4 g of finely powdered potassium permanganate (4 g) was slowly introduced. The mixture was heated under reflux until the purple color of the permanganate disappeared (1–4 h). After cooling, the mixture was filtered to remove any excess of manganese dioxide and carefully acidified with hydrochloride acid. The crude product was filtered, washed with water, and recrystallized from ethanol. mp 258°C; yield 47%; 11.31 (s, OH, 2H), 7.57 (d, $J = 7.8$ Hz, 2H), 7.11 (d, $J = 7.8$ Hz, 2H), 6.98 (t, $J = 16$ Hz, 2H); 4.15 (m, 4H), 3.58 (s, 4H). ^{13}C NMR ($CDCl_3$) δ (ppm) C1 167.77; C2 117.27; C3 157.11; C4 72.52; C5 69.43; C6 72.01; C12 134.6; C13 127.16; C14 135.75; C15 127.12; C16 163.67. MALDI-TOFMS: m/z 473 ($M + 1$). Anal. Calcd. for $C_{22}H_{20}N_2O_8S$: C, 55.93; H, 4.27; N, 5.93; S, 6.79. Found: C, 56.10; H, 4.30; N, 6.06; S, 6.74.

Acknowledgments. The authors acknowledge Frederic Capet (CNRS research staff) for handling the X-ray data collection and treatment for compound **2**.

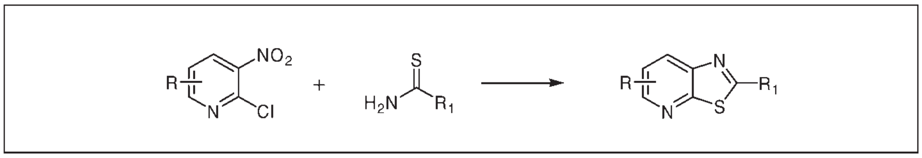
DOI 10.1002/jhet.185



A one-step synthesis of thiazolo[5,4-*b*]pyridines from an appropriately substituted chloronitropyridine and thioamide, or thiourea, is presented. In particular, the reaction was used to prepare a large number of 6-nitrothiazolo[5,4-*b*]pyridine derivatives, bearing hydrogen, alkyl, substituted alkyl, cycloalkyl, aryl, heteroaryl, and amine substituents at the 2-position. The reaction could also be extended to produce a thiazolo[4,5-*c*]pyridine derivative and thiazolo[5,4-*b*]pyridines with alternative substituents on the pyridinoid ring.

J. Heterocyclic Chem., **46**, 1125 (2009).

INTRODUCTION

The thiazolo[5,4-*b*]pyridine nucleus is of interest to those working in the agrochemical, pharmaceutical, and materials industries [1]. For instance, compounds containing a thiazolo[5,4-*b*]pyridine substructure have been described as ligands, or modulators, of leukotriene A_4 [2], VEGFR-2 [3], p38 MAP kinase [4], CCR3 [5], IAP [6], PPAR [7], D_4 [8], ubiquitin ligase [9], glucokinase [10], JAK3 [11], and sirtuin [12] amongst others [13]. A number of methods to prepare thiazolo[5,4-*b*]pyridines have been documented in the literature [1]. For example, methods that construct the bicycle by formation of a thiazole ring, include condensations of 3-amino-2-halopyridine, or 3-amino-2-pyridone derivatives, with thiocyanates, thioamides, or thioesters [14], the oxidative ring-closure of 3-aminopyridine thioamides or thioureas [15], condensations with 3-aminopyridin-2-thiones [16], and reactions of *N*-(2-pyridone-3-yl)acetamides with phosphorous pentasulfide [17]. Recently, a cross-coupling/cyclization sequence starting from *N*-(2-bromopyridin-3-yl)acetamide was also detailed [18]. In this article, we would like to disclose a new, single-step synthesis of the thiazolo[5,4-*b*]pyridine and thiazolo[4,5-*c*]pyridine nuclei. The approach is based upon the reaction of a thioamide, or thiourea, with an appropriately substituted chloronitropyridine to give a number of interesting thiazolopyridines in up to 60% yield (Fig. 1) [19]. In contrast to many literature methods of thiazolopyridine synthesis, our method does not use reagents such as tin(II) chloride, thiocyanate salts, thiophosgene, organometallics, or bromine [14–18].

RESULTS AND DISCUSSION

Our initial interest in compounds based around thiazolo[5,4-*b*]pyridines was stimulated by an examination of their potential use as modulators of ion-channel activity [20]. Toward this end, we required access to a number of 2-substituted-6-nitrothiazolo[5,4-*b*]pyridines. Our first attempts targeted the preparation of ethyl 6-nitrothiazolo[5,4-*b*]pyridine-2-carboxylate (**3a**). Fusing 2-chloro-3,5-dinitropyridine (**1**) with ethyl 2-amino-2-thioxoacetate (**2a**) in a 1:2 ratio at 70°C, then diluting with xylene and heating at 140°C gave the desired product (**3a**) in a moderate yield after column chromatography (Scheme 1). Subsequently, we found that the reaction could be performed using sulfolane as a solvent without any loss in efficiency (20% isolated yield). Sulfolane was chosen as similar reactions have used this solvent to give benzothiazole derivatives [21].

To investigate the scope of this ring-forming process, a diverse set of thioamides was reacted with 2-chloro-3,5-dinitropyridine to provide a range of thiazolo[5,4-*b*]pyridines that would be of interest to the medicinal chemist (Table 1). For example, it was found that this method could give compounds with substituted alkyl groups at the 2-position. The reaction was tolerant of a number of functional groups in the alkyl side chain,

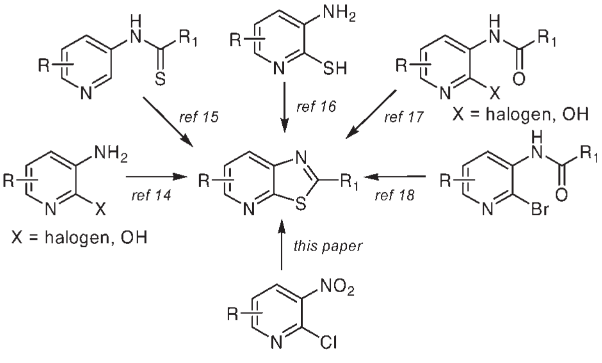


Figure 1. Some approaches to thiazolo[5,4-*b*]pyridines.

such as ester, ether, thioether, nitrile, and sulfone (entries 1–7). Branching on the alkyl chain was also tolerated as demonstrated by the successful reaction to produce compounds (**3i**)–(**3k**) (entries 8–10). 2-Aryl and heteroaryl derivatives were also accessible (entries 11–13), as was the 2-amino thiazolopyridine (entry 14). The parent hydrido compound (**3o**) was also produced (entry 15), although in this instance the final compound was synthesized by reacting 2-chloro-3,5-dinitropyridine with neat *N*,*N*-dimethylthioformamide at 60°C, then diluting with xylenes and refluxing overnight [22]. Yields for the synthesis of 2-substituted-6-nitrothiazolo[5,4-*b*]pyridines ranged from the moderate (*ca*. 40%) to the modest (10–20%). Although the reactions seemed to progress smoothly when followed by analytical techniques such as LC/MS, obtaining material with acceptable purity proved to be problematic in a number of cases. As such, at least part of the lower isolated yield may be attributable to difficulties with purification for many compounds, since preparative high-performance liquid chromatography, or repeated trituration, had to be used. Nevertheless, the above one-step process could be used to make compounds on a gram-scale, without any reduction in yield, for a number of final compounds (*e.g*., **3b** and **3c**).

Attempts to optimize a model transformation, (**2**–**3k**), by variation in solvent, or additives, did not result in any improvement in conversion as measured by high-performance liquid chromatography (Table 2). For example, changing from sulfolane to a similarly polar solvent such as DMF, DMSO, or NMP resulted in a marked retardation in the formation of desired product (entries 3–5) [23]. The use of diphenylether, ethanol, or 1,4-dioxane (entries 6–8) resulted in a moderate amount of thiazolo[5,4-*b*]pyridine formation, although efficiencies were lower than for sulfolane. We next investigated the influence of a small selection of additives on the amount of product formation (entries 9–14), finding that only the inclusion of scandium(III) triflate (entry 11) resulted in a comparable conversion compared with the reference transformation (entry 1). Significantly, other model transformations noticed that the use of heating under microwave irradiation resulted in a reduced reaction time, with no loss in isolated yield (Table 3, entry 1). Indeed, the use of 4 equivalents of thioamide starting material, together with microwave irradiation resulted in an enhanced conversion compared to the thermal conditions used previously (Table 3, entries 2–5 *cf*. Table 1 entries 3, 6, 7, and 15, respectively). This improvement in yield was most likely due to a combination of factors, including a rapid initial reaction under microwave conditions, resulting in a transient overshoot in temperature, particularly when reactions were run at high concentrations (*ca*. 1*M*; entry 5). In general, the microwave reactions also gave cleaner mixtures, with fewer by-products, which facilitated the purification process of final compounds.

Scheme 1. Synthesis of ethyl 6-nitrothiazolo[5,4-*b*]pyridine-2-carboxylate. *i*. Fuse 70°C, then dilute with xylene and heat to 140°C (20%).

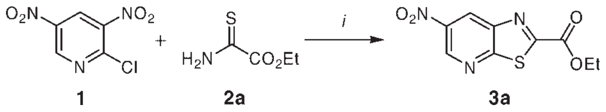

Table 1

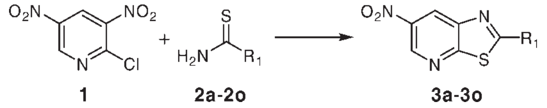
Synthesis of 6-nitrothiazolo[5,4-*b*]pyridines.



Entry	Product	R_1	% Yield[a]
1	**3a**	CO_2Et	20
2	**3b**	Me	43[b]
3	**3c**	$CH_2OC(O)C(Me)_3$	36
4	**3d**	$CH_2OC_6H_4OMe$ (4-methoxy isomer)	16
5	**3e**	CH_2SPh	14

11	Sulfolane	$Sc(OTf)_3$	39
12	Sulfolane	NaOAc	0
13	Sulfolane	K_2CO_3	0
14	Sulfolane	KI	21

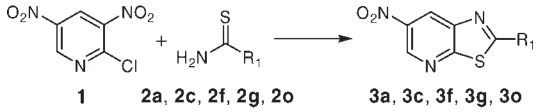
[a] Reaction performed using 2 equiv of (**2k**). Conversion to (**3k**) was based upon integration of peak area in LC/MS trace after 4 h at 100°C.

[b] Reaction performed using 1 equiv of (**2k**).

Reactions with 2-chloro-3-nitropyridine. To explore the potential of our method in providing thiazolo[5,4-*b*]pyridines with only hydrogen substituents on the pyridinoid ring, 2-chloro-3-nitropyridine (**4**) was reacted with a representative selection of thioamides (**2b**, **2k**, **2o**) and with thiourea (**2n**) to provide cyclized products (Table 4). Either thermal or microwave conditions could be used to give thiazolo[5,4-*b*]pyridines (**5a**)–(**5d**) in up to 49% yield. As can be seen when comparing the entries in Table 4 to their counterparts in Table 1, the absence of a nitro-group in the pyridinoid ring seemed to be slightly beneficial in terms of isolated yield.

Table 3

Microwave-assisted synthesis of 6-nitrothiazolo[5,4-*b*]pyridines.



Entry	Product	R_1	% Yield[a]
1	**3a**	CO_2Et	26

[a] Reaction of (**4**) using 4 equiv of appropriate thioamide at 135°C under microwave irradiation.

[b] Reaction performed using 2 equiv of thioamide (**2n**) at 130°C (no microwave irradiation).

Reactions with substituted 2-chloro-3-nitropyridines. As a further extension of the reaction, we sought to investigate the use of pyridine starting materials in which a substituent other than nitro, or hydrogen, was present. As can be seen from Table 5, a number of interesting derivatives were prepared. The mildness of the technique was illustrated in the preparation of thiazolo[5,4-*b*]pyridines incorporating a halogen (**7a**)–(**7c**) (entries 1–3). The synthesis of such compounds is somewhat sparse in the chemical literature, and our approach to the bromo- and iodo-analogues (entries 2 and 3) is significant, as some thiazolopyridine syntheses may not be able to provide such compounds (*e.g.*, methods involving metal-mediated approaches). Our methodology is therefore attractive, as halogenated thiazolopyridines are potentially useful building blocks for medicinal chemistry libraries. For instance, compounds (**7b**) and (**7c**) possess a halo- and amine handle for derivatization (*e.g.*, palladium-mediated reactions for halo-substituent;

Table 5

Synthesis of 2-aminothiazolo[5,4-*b*]pyridines.

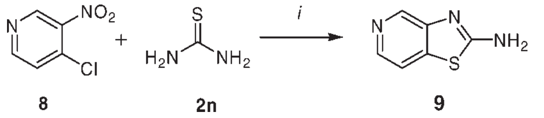
5	**6e**	**7e**	5-OMe	8

[a] Reaction of (**6a**)–(**6e**) using 4 equiv of appropriate thioamide at 135°C under microwave irradiation for 45 min.

Scheme 2. Preparation of 2-amainothiazolo[4,5-*c*]pyridine. *i*. Sulfolane, 135°C, microwave, 75 min (22%).



amide, urea, and reductive alkylation reactions for the amine group). Thus, chemical libraries with two points of diversity could be envisaged around these scaffolds. Compounds with alternative substituents on the pyridinoid ring, such as the 6-methyl and 5-methoxy derivatives (**7d**) and (**7e**) (entries 4–5), were also prepared. However, the reaction to give (**7e**) was particularly low yielding (8%), which may be as a result of the methoxy-group also being activated toward nucleophilic substitution by the thiourea starting material.

Reaction with 4-chloro-3-nitropyridine. As demonstrated, thiazolo[5,4-*b*]pyridines can be synthesized with diverse substituents on both the thiazole and pyridine rings. To probe the utility of the reaction in providing other isomeric thiazolopyridines, a synthesis of 2-aminothiazolo[4,5-*c*]pyridine (**9**) from 4-chloro-3-nitropyridine (**8**) and thiourea (**2n**) was devised (Scheme 2). Heating at 135°C under microwave irradiation gave the desired product (**9**) in 22% yield after column chromatography. Thus, we believe that the reaction may have the potential to access other thiazolo[4,5-*c*]pyridine derivatives, such as those with an alkyl- or aryl-group at the 2-position, or those with substituents other than hydrogen on the pyridinoid ring. However, investigations toward such molecules were beyond the scope of our studies and will await further experimentation. In addition, it would also be desirable to explore the potential of forming thiazolo[5,4-*c*]pyridines from 3-chloro-4-nitropyridine precursors.

The reaction pathway. Currently, we believe that the reaction proceeds by an initial displacement of the chloro-group followed by nitro-group reduction and concomitant cyclization. For example, with 2-chloro-3,5-dinitropyridine (**1**), displacement with an appropriate thioamide gives intermediates (**10a**)–(**10o**) (Fig. 2). Reductive cyclization of (**10a**)–(**10o**), on exposure to excess thioamide in the reaction mixture, provides the desired thiazolopyridines (**3a**)–(**3o**). Although nitro-group reductions with thioamides, or thiourea, have not been detailed extensively in the chemical literature, related reductions with sulfur reagents, such as sulfides (Zinin reduction), sodium dithionite, elemental sulfur, and thiourea *S*,*S*-dioxide, have been used frequently [24–27]. Of note in the reduction step is an apparent selectivity in nitro-reduction for the postulated intermediates (**10a**)–(**10o**). Although some low yields encountered in our synthesis meant that we cannot exclude the possibility that both nitro groups in (**10a**)–(**10o**) are reduced, the observed selectivity in reduction of (**10a**)–(**10o**) is consistent with that seen for other 2-substituted-3,5-dinitropyridines, such as the reduction of 2-amino-3,5-dinitropyridine with sodium sulfide [28,29]. Evidence for the type of reaction described earlier, as opposed to one involving displacement of the nitro group from intermediate (**10a**)–(**10o**), is provided in the preparation of parent hydrido derivative (**3o**) using *N*,*N*-dimethylthioformamide (Table 1, entry 15), and the formation of both (**12**) and (**3n**) when 2-chloro-3,5-dinitropyridine (**1**) is reacted with piperidine-1-carbothioamide (**11**) (Scheme 3).

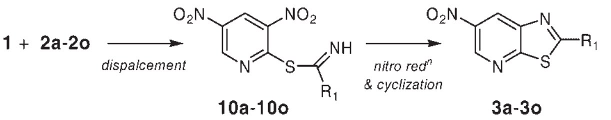


Figure 2. Proposed reaction pathway.

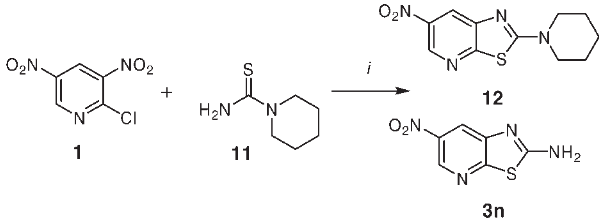
Scheme 3. Reaction with piperidine-1-carbothioamide. *i*. Sulfolane, 100°C (9% **12** and 6% **3n**).



CONCLUSIONS

In conclusion, we have developed an expeditious new single-step synthesis of the thiazolo[5,4-*b*]pyridine and thiazolo[4,5-*c*]pyridine nuclei by condensing an appropriately substituted chloronitropyridine with a thioamide or thiourea. The use of such conditions is complementary to existing techniques to thiazolopyridines and may offer advantages in terms of scope, speed of synthesis, and availability of starting materials. The single-step nature of the reaction is particularly noteworthy, as many established thiazolopyridine syntheses use multistep routes, and frequently resort to toxic reactants, or reagents requiring special handling conditions, to prepare suitable starting materials or final products. Additionally, our method tolerates sensitive functionality in the coupling partners, may be accelerated by the use of microwave irradiation and is operationally simple to perform, giving final products in moderate yield. The synthesis outlined in this article will be of particular interest to those in the medicinal, agrochemical, materials, and heterocyclic fields, where thiazolo[5,4-*b*]- and thiazolo[4,5-*c*]pyridines have found many uses.

EXPERIMENTAL

All reagents except 1-amino-1-thiooxopropan-2-yl pivalate and cyclopropanecarbothioamide were purchased from commercial sources and used without further purification. 1-Amino-1-thiooxopropan-2-yl pivalate (example **3h**) and cyclopropanecarbothioamide (example **3j**) were synthesized by GVK Biosciences Private (Hyderabad, India). All microwave-assisted reactions were performed with a CEM Discover S-Class microwave with 48-position autosampler. Temperature during microwave reactions was monitored by a vertically sensored infrared temperature sensor, which comes as a standard feature of the CEM Discover S-Class system. All NMR spectra are quoted in ppm relative to a tetramethylsilane internal standard, or by referencing on the chemical shift of the deuterated solvent.

General procedure for preparation of thiazolo[5,4-*b*]pyridines under thermal conditions.

Preparation of (6-nitrothiazolo[5,4-b]pyridin-2-yl)methyl pivalate (3c). A mixture of 2-chloro-3,5-dinitropyridine (1) (5.1 g, 25 mmol) and 2-amino-2-thioxoethylpivalate (2c) (8.8 g, 50 mmol) in sulfolane (50 mL) was heated to 100–110°C under a nitrogen atmosphere and stirred for 2 h. After allowing to cool to room temperature, the mixture was poured into EtOAc (150 mL), and the organic layer was washed with H_2O (3 × 200 mL) and brine (1 × 100 mL). The organic layer was dried ($MgSO_4$), filtered, and the solvent removed under vacuum to leave a crude oil. The oil was purified by filtration through a plug of silica eluting with EtOAc/hexanes (1:9–1:4) to give a solid (*ca.* 6–7g). The solid was then triturated with MeOH (*ca.* 20 mL) and filtered to give the desired product (2.17g). Further product was obtained by concentrating the filtrate under vacuum and purifying by column chromatography on silica gel using EtOAc/hexanes (0:1–1:4) as eluent to give a solid (1.1 g). The solid was triturated with MeOH to give further product (0.5g). Total yield 2.67 g (36%). ^{1}H NMR (400 MHz; $CDCl_3$) δ 9.46 (d, J = 2.4 Hz, 1H), 9.00 (d, J = 2.4 Hz, 1H), 5.54 (s, 2H), 1.32 (s, 9H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 177.4, 172.6, 163.6, 145.2, 143.1, 142.3, 125.1, 63.4, 38.9, 27.1; m/z = 296.5 (M + 1).

Ethyl 6-nitrothiazolo[5,4-b]pyridine-2-carboxylate (3a). ^{1}H NMR (400 MHz; $CDCl_3$) δ 9.59 (d, J = 2.4 Hz, 1H), 9.23 (d, J = 2.4 Hz, 1H), 4.62 (q, J = 7.0 Hz, 2H), 1.53 (t, J = 7.0 Hz, 3H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 164.0, 163.2, 159.4, 145.5, 144.6, 143.5, 127.7, 64.1, 14.2.

2-(tert-Butylsulfonylmethyl)-6-nitrothiazolo[5,4-b]pyridine (3g). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.41 (d, J = 2.4 Hz, 1H), 9.28 (d, J = 2.4 Hz, 1H), 5.35 (s, 2H), 1.42 (s, 9H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 163.5, 163.3, 144.1, 143.4, 142.8, 125.8, 60.8, 51.7, 22.8; m/z = 316.3 (M + 1).

1-(6-Nitrothiazolo[5,4-b]pyridin-2-yl)ethyl pivalate (3h). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.45 (d, J = 2.4 Hz, 1H), 9.21 (d, J = 2.4 Hz, 1H), 6.16–6.21 (q, J = 6.6 Hz, 1H), 1.70 (d, J = 6.6 Hz, 3H), 1.24 (s, 9H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 176.6, 176.3, 162.5, 144.6, 143.4, 142.5, 125.6, 70.0, 38.3, 26.7, 19.9; m/z = 310.4 (M + 1).

2-Benzhydryl-6-nitrothiazolo[5,4-b]pyridine (3i). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.40 (d, J = 2.0 Hz, 1H), 9.17 (d, J = 2.0 Hz, 1H), 7.37–7.43 (m, 11H), 7.31–7.33 (m, 2H), 6.29 (s, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 179.7, 164.0, 146.1, 144.2, 143.0, 141.6, 129.9, 129.8, 129.0, 128.5, 128.4, 126.2, 56.0; m/z = 348.2 (M + 1).

2-Cyclopropyl-6-nitrothiazolo[5,4-b]pyridine (3j). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.34 (d, J = 2.4 Hz, 1H), 8.97 (d, J = 2.4 Hz, 1H), 2.66–2.72 (m, 1H), 1.34–1.39 (m, 2H), 1.25–1.29 (m, 2H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 179.2, 162.6, 145.2, 143.2, 141.1, 123.6, 15.8, 12.9; m/z = 222.1 (M + 1).

6-Nitro-2-phenylthiazolo[5,4-b]pyridine (3k). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.44 (d, J = 2.0 Hz, 1H), 9.22 (d, J = 2.0 Hz, 1H), 8.18–8.21 (m, 2H), 7.65–7.68 (m, 3H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 158.3, 147.9, 142.0, 141.9, 141.5, 132.6, 129.4, 129.4, 127.5, 124.8; m/z = 259.0 (M + 1).

6-Nitro-2-(thiophen-2-yl)thiazolo[5,4-b]pyridine (3l). ^{1}H NMR (400 MHz; $CDCl_3$) δ 9.37 (d, J = 2.0 Hz, 1H), 8.95 (d, J = 2.0 Hz, 1H), 7.78–7.79 (m, 1H), 7.66–7.67 (m, 1H), 7.22–7.23 (m, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 146.4, 141.7, 136.1, 132.0, 131.0, 128.7, 124.0; m/z = 263.0 (M – 1).

6-Nitro-2-(pyridin-3-yl)thiazolo[5,4-b]pyridine (3m). ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.47 (d, J = 2.4 Hz, 1H), 9.36 (dd, J = 2.0 and 0.8 Hz, 1H), 9.27 (d, J = 2.4 Hz, 1H), 8.85 (dd, J = 4.8 and 1.5 Hz, 1H), 8.55 (ddd, J = 8.0, 2.0 and 1.5 Hz, 1H), 7.69 (ddd, J = 8.0, 4.8 and 0.8 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 154.1, 149.2, 143.6, 136.2, 129.1, 126.4, 125.6, 100.5; m/z = 259.2 (M + 1).

6-Nitrothiazolo[5,4-b]pyridine-2-amine (3n). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.93 (d, J = 2.5 Hz, 1H), 8.34 (br. s, 2H), 8.26 (d, J = 2.5 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 168.0, 161.8, 147.0, 143.3, 136.5, 116.7; m/z = 195.1 (M – 1).

6-Nitrothiazolo[5,4-b]pyridine (3o) [22]. A mixture of 2-chloro-3,5-dinitropyridine (**1**) (8.0 g, 39 mmol) and *N*,*N*-dimethylthioformamide (14.5 mL, 178 mmol) was heated at 60°C for 3 h (a yellow precipitate was formed). Xylene (20 mL) was added, and the mixture was heated to reflux for 4 h, then stirred at room temperature for 18 h. The mixture was diluted with EtOH (12 mL), filtered, and the solid recrystallized from EtOH to give the product (800 mg, 11%) as a solid. ^{1}H NMR (400 MHz; d_6-DMSO) δ 9.82 (s, 1H), 9.49 (d, J = 2.4 Hz, 1H), 9.27 (d, J = 2.4 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 162.4, 161.8, 144.7, 143.1, 142.6, 125.8; m/z = 182.2 (M + 1).

6-Nitro-2-piperidin-1-yl-thiazolo[5,4-b]pyridine (12). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.94 (d, J = 2.3 Hz, 1H), 8.34 (d, J = 2.3 Hz, 1H), 3.66–3.70 (m, 4H), 1.61–1.66 (m, 6H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 166.7, 159.5, 145.3, 141.9, 134.8, 115.7, 23.3, 21.9; m/z = 264.8 (M + 1). Separately, 6-nitrothiazolo[5,4-*b*]pyridin-2-amine (**3n**) (13 mg, 6%) was also isolated.

General procedure for reactions using microwave-assisted synthesis.

Preparation of 6-nitrothiazolo[5,4-b]pyridine (3o). A 5-mL microwave vial was charged with 2-chloro-3,5-dinitropyridine (**1**) (0.41 g, 2.0 mmol), *N*,*N*-dimethylthioformamide (0.69 mL, 8.0 mmol), and sulfolane (2 mL). The mixture was heated under microwave irradiation with a target temperature of 110°C (CARE: the reaction displayed a significant exotherm on heating and reached 130°C within 25 s). After 2 min the mixture had cooled to 110°C, and heating was continued at this temperature for 40 min. After cooling to room temperature, the mixture was diluted with MeOH (5 mL) and EtOAc (60 mL) and then washed with brine (50 mL, 3 × 20 mL) and saturated $NaHCO_3$ (20 mL). The organic layer was dried (Na_2SO_4), filtered, and the solvent removed under vacuum to leave a crude solid (1.08 g). Purification by column chromatography on silica gel (dry-loaded on 4.5 g of silica) using EtOAc/hexanes (1:9–3:2) as eluent gave the product (183 mg, 50%) as a solid.

2-Methylthiazolo[5,4-b]pyridine (5a). ^{1}H NMR (400 MHz; $CDCl_3$) δ 8.54 (d, J = 4.6 Hz, 1H), 8.19 (d, J = 8.2 Hz, 1H), 7.42 (dd, J = 8.2, 4.6 Hz, 1H), 2.87 (s, 3H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 162.3, 159.2, 146.7, 146.6, 129.4, 121.2, 21.1; m/z = 151.2 (M + 1).

2-Phenylthiazolo[5,4-b]pyridine (5b). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.64 (dd, J = 4.5, 1.5 Hz, 1H), 8.46 (dd, J = 8.2, 1.5 Hz, 1H), 8.15–8.12 (m, 2H), 7.64–7.61 (m, 4H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 167.5, 157.5, 147.6, 146.5, 135.5, 132.0, 130.2, 129.4, 127.3, 122.2; m/z = 213.4 (M + 1).

2-Aminothiazolo[5,4-b]pyridine (5c). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.09 (dd, J = 1.6, 4.6 Hz, 1H), 7.79 (br. s, 2H), 7.62 (dd, J = 1.6, 7.9 Hz, 1H), 7.24 (dd, J = 4.6, 7.9 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 165.5, 155.4, 146.8, 141.6, 123.4, 121.1; m/z = 152.2 (M + 1).

Thiazolo[5,4-b]pyridine (5d). ^{1}H NMR (400 MHz; $CDCl_3$) δ 9.18 (s, 1H), 8.66 (m, H), 8.37 (m, 1H), 7.48 (dd, J = 8.3, 4.6 Hz, 1H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 157.4, 155.4, 147.9, 145.8, 131.0, 121.3; m/z = 137.2 (M + 1).

6-Chlorothiazolo[5,4-b]pyridin-2-amine (7a). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.12 (d, J = 2.2 Hz, 1H), 8.06 (br. s, 2H), 7.74 (d, J = 2.2 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 167.4, 153.8, 147.9, 139.4, 128.6, 122.8; m/z = 186.2 (M + 1 for ^{35}Cl).

6-Bromothiazolo[5,4-b]pyridin-2-amine (7b). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.19 (d, J = 2.1 Hz, 1H), 8.06 (br. s, 2H), 7.86 (d, J = 2.1 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 167.1, 154.1, 148.3, 141.5, 125.4, 117.1; m/z = 230.1/232.1 (M + 1).

6-Iodothiazolo[5,4-b]pyridin-2-amine (7c). ^{1}H NMR (400 MHz; d_6-DMSO) δ 8.27 (d, J = 1.9 Hz, 1H), 8.01 (br. s, 2H), 7.97 (d, J = 1.9 Hz, 1H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 166.5, 154.5, 148.6, 146.4, 130.8, 90.1; m/z = 277.9 (M + 1).

6-Methylthiazolo[5,4-b]pyridin-2-amine (7d). ^{1}H NMR (400 MHz; d_6-DMSO) δ 7.94 (d, J = 1.2 Hz, 1H), 7.74 (br. s, 2H), 7.45 (d, J = 1.2 Hz, 1H), 2.30 (s, 3H); ^{13}C NMR (100 MHz; d_6-DMSO) δ 165.8, 152.4, 146.7, 142.0, 130.4, 124.0, 17.8; m/z = 166.3 (M + 1).

5-Methoxythiazolo[5,4-b]pyridin-2-amine (7e). ^{1}H NMR (400 MHz; $CDCl_3$) δ 7.69 (d, J = 8.6 Hz, 1H), 6.72 (d, J = 8.6 Hz, 1H), 5.52 (br. s, 1H), 5.39 (br. s, 1H), 3.94 (s, 3H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 163.3, 160.6, 151.4, 140.2, 128.7, 108.8, 54.0; m/z = 182.2 (M + 1).

2-Aminothiazolo[4,5-c]pyridine (9). ^{1}H NMR (400 MHz; $CDCl_3$) δ 8.55 (d, J = 0.9 Hz, 1H), 8.13 (d, J = 5.4 Hz, 1H), 7.79 (br. s, 2H), 7.75 (dd, J = 0.9, 5.4 Hz, 1H); ^{13}C NMR (100 MHz; $CDCl_3$) δ 167.0, 149.8, 140.4, 139.5, 138.4, 116.3; m/z = 152.0 (M + 1).

Acknowledgments. The authors thank Michael Kelly and John Kincaid for their support and encouragement throughout this study.

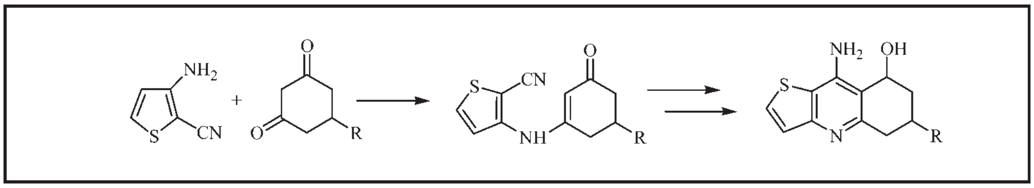
Received January 4, 2009
DOI 10.1002/jhet.186



The synthesis of 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinoline (**3**) and 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinolin-5-ol derivatives (**4a–g**) in good yield by three-step procedures starting from 3-aminothiophene-2-carbonitrile and 5-substituted cyclohexane-1,3-dione is described.

J. Heterocyclic Chem., **46**, 1132 (2009).

INTRODUCTION

Alzheimer's disease (AD) is characterized by the deficits in the cholinergic system [1,2] and presence of neurofibrillary tangles and amyloid plaques [3,4]. Since the deficiency in cholinergic neurotransmission is believed to be one of the major causes of the decline in cognitive and mental functions associated with AD, cholinergic system became a target for the design of anti-Alzheimer drugs.

Acetylcholinesterase (AChE) inhibitors such as tacrine (**1a**) and donepezil by "cholinergic hypothesis" have been a useful and practical treatment for AD [5,6]. Moreover, the interest for AChE inhibitors has been greatly renewed due to the recent evidences that AChE might function to accelerate β-amyloid peptide (Aβ) formation and could play a role during amyloid deposition in AD brain [7,8].

We have recently reported the synthesis of new 4-amino-5,6,7,8-tetrahydrothieno[2,3-*b*]quinoline (**2a**) and 4-amino-5,6,7,8-tetrahydrothieno[2,3-*b*]quinolin-5-ol derivatives (**2b**) as potential AChE inhibitors as shown in Figure 1 [9]. Similar analogues based on the substituted thieno[3,2-*b*]quinoline and the thieno[2,3-*b*]quinoline moiety were also reported [10]. As a continuation of our previous works on thienopyridine and thienopyrimidine [9,11,12], we now report the synthesis of 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinoline (**3**) and 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinolin-8-ol (**4a–g**) derivatives, which have hitherto not reported.

For the synthesis of **3** and **4**, 3-aminothiophene-2-carbonitrile (**9**) as starting material was needed. However, the only synthetic method for **9** is associated with several drawbacks, such as use of toxic H_2S, low yield, and poor selectivity [13]. The reaction, in addition, was capricious, and further scale-up led reaction that would occasionally fail. Gronowitz et al. has prepared 3-bromothiophene-2-carbaldeyde (**6**) in low yield from 2,3-dibromothiophene through its successive treatment butyllithium and DMF [14]. As shown in Scheme 1, the aldehyde **6** could be obtained in high yield more conveniently and on a large scale by selective deprotonation at position-2 of 3-bromothiophene (**5**) with LDA followed by *N*-formylpiperidine quench [15]. The nucleophilic substitution of Br in **6** by sodium azide in DMPU afforded 3-azidothiophene-2-carbaldehyde (**7**) in good yield [16].

The conversion of aldehyde in **7** into nitrile was obtained in high yield by heating **7** with hydroxylamine-*O*-sulfonic acid in water. The use of hydroxylamine-*O*-sulfonic acid in water instead of hydroxylamine in dry alumina [17] could lead to a more efficient and clear route to 3-azidothiophene-2-carbonitrile (**8**). Finally, the reduction of azide in **8** to amine without affecting nitrile group could be achieved by hydrogenation over 10% Pd-carbon, not using toxic H_2S gas, to give **5** in high yield. Compounds **10a–g**, 5-substituted cyclohexane-1,3-dione, were prepared by previously known procedures [18,19] or purchased.

The synthetic routes to **3** and **4a–g** are shown in Scheme 1. The condensation of **9** with **10** in the presence of catalytic amounts of *p*-toluenesulfonic acid gave the corresponding enamines **11a–g**, 3-(3-oxo-cyclohex-1-enylamino)thiophene-2-carbonitrile derivatives in good yield. These enamins were then cyclized in refluxing THF in the presence of cuprous chloride and potassium carbonate to give thienoquinolinones **12a–g**, 9-amino-6,7-dihydro-5*H*-thieno[3,2-*b*]quinolin-8-one derivatives. It was noteworthy that a stoichiometric cuprous chloride has to be used to run the reaction effectively and to

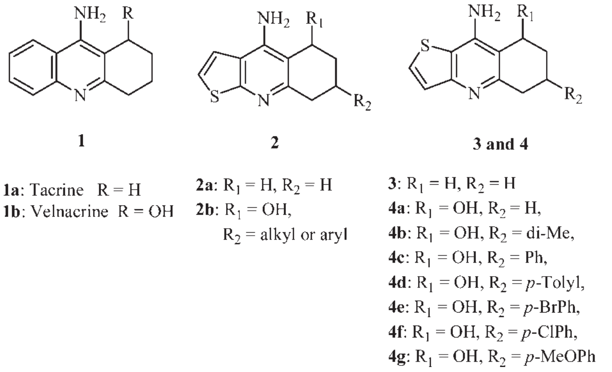


Figure 1. Tacrine and biosteric analogs.

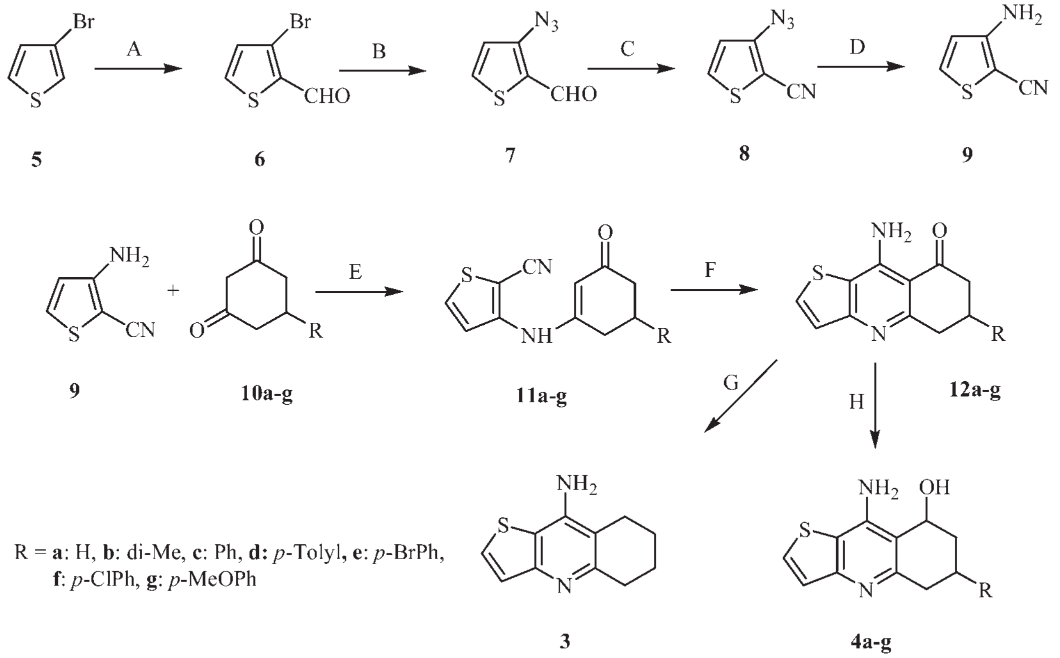
obtain a higher yield. The carbonyl of **12a** was transformed into methylene group by modified Wolff-Kishner reduction (hydrazine hydrate and KOH under hot ethylene glycol) [20] to give a new 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinoline (**3**) in 57% yield. In another way, the reduction reaction of compounds **12a–g** with lithium aluminum hydride in dry THF, followed by work up of aqueous acidification, and by washing with 30% NaOH solution in order to remove the aluminum salt from the product and to get free amine, provided the expected compounds **4a–g**, 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinolin-8-ol derivatives in quantitative yields. The compounds **4c–g** were formed with two diastereomers, and major products were *cis* compounds. Because the hydrogens on the alicyclic rings of **4c–g** were resolved at 300 MHz, it is possible to determine all the coupling constants by first-order analysis and to assign the relative stereochemistry of two diastereomers [21]. The product compounds **4a–g** were assayed on AChE inhibitory activity by the modified Ellman method [22]. None of these compounds showed an improved AChE inhibition ($IC_{50} \geq 100\ \mu M$) as compared with tacrine ($IC_{50} = 0.40\ \mu M$), with compound **4a** ($IC_{50} = 3.36\ \mu M$) being the most active. It showed that the introduction of alkyl or aryl group at the C-6 of cyclohexane ring resulted in marked decline in activity.

In conclusion, 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinoline and 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinolin-8-ol derivatives have been synthesized in good yield by three-step procedures.

EXPERIMENTAL

Melting points were determined in capillary tubes on Büchi apparatus and are uncorrected. Each compound of the reactions was checked on thin layer chromatography of Merck Kieselgel $60F_{254}$ and purified by column chromatography Merck silica gel (70–230 mesh). The ^1H NMR spectra were recorded on Bruker DRX-300 FT-NMR spectrometer (300 MHz) with Me_4Si as internal standard and chemical shifts are given in ppm (δ). Electron ionization mass spectra were recorded on a HP 59580 B spectrometer. Elemental analyses were performed on a Carlo Erba 1106 elemental analyzer.

Scheme 1. A: LDA/THF, *N*-formylpiperidne, 0°C; B: NaN_3/DMPU, 35°C; C: hydroxylamine-*O*-sulfonic acid/H_2O, 40–50°C; D: H_2, Pd-C/ EtOH, rt; E: *p*-TsOH/toluene, reflux; F: K_2CO_3, CuCl/THF, reflux; G: NH_2NH_2, KOH/ethylene glycol, reflux; H: $LiLH_4$/THF, H^+, 30% NaOH, rt.



Preparation of 3-aminothiophene-2-carbonitrile (9). 3-Bromothiophene (**5**) (0.3 mol) was added to a stirred solution of lithium diisopropylamide (0.3 mol) in dry THF (300 mL) at 0°C under nitrogen. After addition of *N*-formylpiperidine (0.3 mol), the reaction solution was stirred for 5 h. Then, it was poured into 30% aqueous ammonium chloride solution and extracted with ether. The combined extracts were dried over magnesium sulfate and evaporated to dryness to afford 3-bromothiophene-2-carbaldeyde (**6**) in 86% yield, bp 115–117°C at 10 mmHg (ref. 13, 113–115°C at 10 mmHg).

A suspension of **6** (0.2 mol) and sodium azide (0.8 mol) in DMPU (1,3-dimethyl-3,4,5,6-tetrahydro-2(*1H*)-pyrimidinone, 100 mL) was stirred at 50°C for 24 h. Then, it was poured into water and extracted with ether. The combined extracts were dried over magnesium sulfate and evaporated to dryness to give 3-azidothiophene-2-carbaldehyde **(7)** in 83% yield, mp 57–58°C (ref. 12, 56.6–57.2°C; ref. 15, 56–58°C).

A suspension of **7** (0.1 mol) and hydroxylamine-*O*-sulfonic acid (0.12 mol) in water (100 mL) was stirred at 50°C for 24 h. After cooling, the precipitate was filtered off and washed with water, giving 3-azidothiophene-2-carbonitrile (**8**) in 90% yield, mp 78–79°C (ref. 12, 77.5–79°C).

A suspension of **8** (0.05 mol) and 10% Pd-carbon (0.3 g) in ethanol (50 mL) was stirred under hydrogen at room temperature for 4 h. After completion of the reaction, the reaction mixture was filtered and evaporated to dryness to give 3-aminothiophene-2-carbonitrile (**9**) in 95% yield, mp 49–50°C (ref. 12, 47.5–50°C). ^{1}H NMR (deuteriochloroform): δ 7.28 (d, $J_{4,5}$ = 5.8 Hz, 1H, H-5), 6.54 (d, $J_{4,5}$ = 5.8 Hz, 1H, H-4), 4.48 (s, 2H, NH_2); ms: (*m/z*) 124 (M^+), 110. Anal. Calcd. for $C_5H_4N_2S$: C, 48.37; H, 3.25; N, 22.56. Found: C, 48.50; H, 3.40; N, 22.41.

General procedure for the preparation of 3-(3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile derivatives (11a–g). A suspension of 3-aminothiophene-2-carbonitrile (0.03 mol), the appropriate 1,3-cyclohexanedione (0.03 mol) and *p*-toluene sulfonic acid monohydrate (0.10 g) in dry toluene (20 mL) was refluxed for 7–8 h, and the water was collected in a Dean-Stark trap. After cooling, the reaction mixture was filtered off. The filtrate was evaporated to dryness, and the residue was chromatographed on a silica gel column by eluting with a 20:80 v/v ethyl acetate/chloroform mixture.

3-(3-Oxocyclohex-1-enylamino)thiophene-3-carbonitrile (11a). This compound was obtained from 1,3-cyclohexanedione in 70% yield, mp 142–143°C; ^{1}H NMR (deuteriochloroform): δ 7.54 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.21 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 6.88 (s, 2H, NH_2), 5.61 (s, 1H, vinyl proton, H-2), 2.56 (t, 2H, H-6), 2.40 (t, 2H, H-4), 2.07 (quintet, 2H, H-5); ms: (*m/z*) 218 (M^+), 190, 162, 123, 68. Anal. Calcd. for $C_{11}H_{10}N_2OS$: C, 60.53; H, 4.62; N, 12.83. Found: C, 60.72; H, 4.49; N, 12.70.

3-(5,5-Dimethyl-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile (11b). This compound was obtained from 5,5-dimethylcyclohexane-1,3-dione in 68% yield, mp 152–153°C; ^{1}H NMR (deuteriochloroform): δ 7.54 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.22 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 6.23 (s, 2H, NH_2), 5.64 (s, 1H, vinyl proton, H-2), 2.40 (s, 1H, H-6), 2.26 (s, 1H, H-4), 1.13 [s, 6H, $(CH_3)_2$]; ms: (*m/z*) 246 (M^+), 190, 123, 67. Anal. Calcd. for $C_{13}H_{14}N_2OS$: C, 63.39; H, 5.73; N, 11.37. Found: C, 63.50; H, 5.50; N, 11.44.

3-(3-Oxo-5-phenylcyclohex-1-enylamino)thiophene-2-carbonitrile (11c). This compound was obtained from 5-phenylcyclohexane-1,3-dione in 70% yield, mp 189–190°C; ^{1}H NMR (deuteriochloroform): δ 7.56 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.36–7.20 (m, 6H, thiophene and phenyl protons), 6.43 (s, 2H, NH_2), 5.70 (s, 1H, vinyl proton, H-2), 3.45 (m, 1H, H-5), 2.95(dd, 1H, H-6a), 2.68–2.58 (m, 3H, H-4 and H-6b); ms: (*m/z*) 294 (M^+), 265, 190, 159, 123. Anal. Calcd. for $C_{17}H_{14}N_2OS$: C, 69.36; H, 4.79; N, 9.52. Found: C, 69.47; H, 4.92; N, 9.38.

3-(3-Oxo-5-p-tolylcyclohex-1-enylamino)thiophene-2-carbonitrile (11d). This compound was obtained from 5-*p*-tolylcyclohexane-1,3-dione in 76% yield, mp 238–239°C; ^{1}H NMR (deuteriochloroform): δ 7.56 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.22 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.20 (s, 4H, phenyl protons), 6.60 (s, 2H, NH_2), 5.87 (s, 1H, vinyl proton, H-2), 3.42 (m, 1H, H-5), 2.89 (dd, 1H, H-6a), 2.66–2.59 (m, 3H, H-4 and H-6b), 2.35(s, 3H, CH_3); ms: (*m/z*) 308 (M^+), 279, 190, 162, 123, 67. Anal. Calcd. for $C_{18}H_{16}N_2OS$: C, 70.10; H, 5.23; N, 9.80. Found: C, 69.92; H, 5.10; N, 9.69.

3-(5-(4-Bromophenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile (11e). This compound was obtained from 5-(4-bromophenyl)-cyclohexane-1,3-dione in 70% yield, mp 238–239°C; ^{1}H NMR (deuteriochloroform): δ 7.60 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.36 (d, $J_{2',3'}$ = 7.5 Hz, 2H, phenyl protons), 7.22 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.18 (d, 2H, phenyl protons), 6.80 (s, 2H, NH_2), 5.71 (s, 1H, vinyl proton, H-2), 3.42 (m, 1H, H-5), 2.84 (dd, 1H, H-6a), 2.69–2.59 (m, 3H, H-4 and H-6b); ms: (*m/z*) 372 (M^+), 190, 123. Anal. Calcd. for $C_{17}H_{13}BrN_2OS$: C, 54.70; H, 3.51; N, 7.50. Found: C, 54.88; H, 3.70; N, 7.44.

3-(5-(4-Chlorophenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile (11f). This compound was obtained from 5-(4-chlorophenyl)cyclohexane-1,3-dione in 75% yield, mp 216–217°C; ^{1}H NMR (deuteriochloroform): δ 7.59 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.37–7.24 (dd, $J_{2',3'}$ = 7.5 Hz, 4H, phenyl protons), 7.22 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 6.32 (s, 2H, NH_2), 5.70 (s, 1H, vinyl proton, H-2), 3.43 (m, 1H, H-5), 2.83 (dd, 1H, H-6a), 2.70–2.60 (m, 3H, H-4 and H-6b); ms: (*m/z*) 328 (M^+), 190, 123. Anal. Calcd. for $C_{17}H_{13}ClN_2OS$: C, 62.10; H, 3.98; N, 8.52. Found: C, 61.92; H, 3.88; N, 8.63.

3-(5-(4-Methoxyphenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile (11g). This compound was obtained from 5-(4-methoxyphenyl) cyclohexane-1,3-dione in 75% yield, mp 147–148°C; ^{1}H NMR (deuteriochloroform): δ 7.56 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 7.36 (d, $J_{2',3'}$ = 7.5 Hz, 2H, phenyl protons), 7.21 (d, $J_{4,5}$ = 5.8 Hz, 1H, thiophene proton), 6.92 (d, 2H, phenyl protons), 6.40 (s, 2H, NH_2), 5.70 (s, 1H, vinyl proton, H-2), 3.46 (m, 1H, H-5), 2.84 (dd, 1H, H-6a), 2.70–2.63 (m, 3H, H-4 and H-6b); ms: (*m/z*) 324 (M^+), 190, 123, 67. Anal. Calcd. for $C_{18}H_{16}ClN_2OS$: C, 66.64; H, 4.97; N, 8.64. Found: C, 66.75; H, 5.13; N, 8.48.

General procedure for the preparation of 9-amino-6,7-dihydro-5*H*-thieno[3,2-*b*]quinolin-8-one derivatives (12a–g). A suspension of the appropriate 3-(3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile (0.01 mol), K_2CO_3 (0.01 mol) and CuCl (0.01 mol) in dry THF (10 mL) was refluxed for 10 h. After completion of reaction, the warm reaction solution was filtered off. The filtrate was evaporated to dryness, and the residue was chromatographed on a silica gel column by eluting with a 30:70 v/v ethyl acetate/chloroform mixture.

9-Amino-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12a). This compound was obtained from 3-(3-oxocyclohex-1-enyl-amino)-thiophene-2-carbonitrile in 55% yield, mp 199–200°C; ^{1}H NMR (deuteriochloroform): δ 7.70 and 7.40 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 3.13 (t, 2H, H-5), 2.72 (t, 2H, H-7), 2.16 (quintet, 2H, H-6); ms: (*m*/*z*) 218 (M$^+$), 190, 71, 57. Anal. Calcd. for $C_{11}H_{10}N_2OS$: C, 60.53; H, 4.62; N, 12.83. Found: C, 60.66; H, 4.50; N, 12.94.

9-Amino-6,6-dimethyl-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12b). This compound was obtained from 3-(5,5-dimethyl-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile in 67% yield, mp 255–256°C; ^{1}H NMR (deuteriochloroform): δ 7.72 and 7.40 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 3.01 (s, 2H, H-5), 2.57 (s, 2H, H-7), 1.01 [s, 6H, $(CH_3)_2$]; ms: (*m*/*z*) 246 (M$^+$), 230, 216. Anal. Calcd. for $C_{13}H_{14}N_2OS$: C, 63.39; H, 5.73; N, 11.37. Found: C, 63.23; H, 5.89; N, 11.48.

9-Amino-6-phenyl-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12c). This compound was obtained from 3-(3-oxo-5-phenylcyclohex-1-enylamino)thiophene-2-carbonitrile in 65% yield, mp 189–190°C; ^{1}H NMR (deuteriochloroform): δ 7.74 and 7.40 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 7.38–7.25 (m, 5H, phenyl), 3.53 (m, 1H, H-6), 3.34–3.28 (m, 2H, H-5), 2.95–2.91 (m, 2H, H-7); ms: (*m*/*z*) 294 (M$^+$), 265, 238, 203, 190. Anal. Calcd. for $C_{17}H_{14}N_2OS$: C, 69.36; H, 4.79; N, 9.52. Found: C, 69.48; H, 4.63; N, 9.65.

9-Amino-6-p-tolyl-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12d). This compound was obtained from 3-(3-oxo-5-*p*-tolylcyclohex-1-enylamino)thiophene-2-carbonitrile in 62% yield, mp 262–263°C; ^{1}H NMR (deuteriochloroform): δ 7.74 and 7.41 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 7.26–7.18 (m, 4H, phenyl), 3.55 (m, 1H, H-6), 3.33–3.29 (m, 2H, H-5), 2.95–2.92 (m, 2H, H-7), 2.35 (s, 3H, CH_3); ms: (*m*/*z*) 308 (M$^+$), 292, 201, 135. Anal. Calcd. for $C_{18}H_{16}N_2OS$: C, 70.10; H, 5.23; N, 9.08. Found: C, 70.28; H, 5.33; N, 9.19.

9-Amino-6-(4-bromophenyl)-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12e). This compound was obtained from 3-(5-(4-bromophenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile in 67% yield, mp 197–198°C; ^{1}H NMR (deuteriochloroform): δ 7.74 and 7.42 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 7.45 and 7.19 (d and d, $J_{2',\,3'}$ = 7.5 Hz, 4H, phenyl H-3′and H-2′), 3.55 (m, 1H, H-6), 3.40–3.29 (m, 2H, H-5), 2.96–2.89 (m, 2H, H-7); ms: (*m*/*z*) 308 (M$^+$), 292, 203, 161. Anal. Calcd. for $C_{18}H_{16}N_2OS$: C, 70.10; H, 5.23; N, 9.08. Found: C, 70.21; H, 5.40; N, 9.22.

9-Amino-6-(4-chlorophenyl)-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12f). This compound was obtained from 3-(5-(4-chlorophenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile in 68% yield, mp 204–205°C; ^{1}H NMR (deuteriochloroform): δ 7.77 and 7.52 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 7.35 and 7.24 (d and d, $J_{2',\,3'}$ = 7.5 Hz, 4H, phenyl), 3.57 (m, 1H, H-6), 3.38–3.30 (m, 2H, H-5), 2.97–2.90 (m, 2H, H-7); ms: (*m*/*z*) 328 (M$^+$), 312, 201. Anal. Calcd. for $C_{17}H_{13}ClN_2OS$: C, 62.10; H, 3.98; N, 8.52. Found: C, 62.27; H, 4.14; N, 8.40.

9-Amino-6-(4-methoxyphenyl)-6,7-dihydro-5H-thieno[3,2-b]quinolin-8-one (12g). This compound was obtained from 3-(5-(4-methoxyphenyl)-3-oxocyclohex-1-enylamino)thiophene-2-carbonitrile in 70% yield, mp 244–245°C; ^{1}H NMR (deuteriochloroform): δ 7.74 and 7.29 (d and d, $J_{2,\,3}$ = 5.7 Hz, 2H, thiophene protons), 7.24 and 6.90 (d and d, $J_{2',\,3'}$ = 7.5 Hz, 4H, phenyl), 3.78 (s, 3H, OCH_3), 3.55 (m, 1H, H-6), 3.39–3.31 (m, 2H, H-5), 2.98–2.89 (m, 2H, H-7); ms: (*m*/*z*) 324 (M$^+$), 308, 201, 190. Anal. Calcd. for $C_{18}H_{16}N_2O_2S$: C, 66.64; H, 4.97; N, 8.64. Found: C, 66.79; H, 5.08; N, 8.53.

Preparation of 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*] quinoline (3). A mixture of 0.65 g (3.0 mmol) of 9-amino-6,7-dihydro-5*H*-thieno[3,2-*b*]quinolin-8-one (12a), 0.60 g (12.0 mmol) of hydrazine hydrate, and 0.67 g (12.0 mmol) of potassium hydroxide in 30 mL of ethylene glycol was refluxed for 8 h. After the starting material was disappeared, the reaction mixture was concentrated by distillating off water and ethylene glycol. The concentrate was allowed to reach room temperature and extracted repeatedly with chloroform. The organic extract was dried with magnesium sulfate and evaporated. The residue was purified with silica gel column chromatography eluting with a 30:70 v/v ethyl acetate/chloroform mixture to give 0.35 g (57%) of **3**, mp 137–138°C; ^{1}H NMR (deuteriochloroform): δ 7.21 and 7.10 (d and d, 2H, thiophene protons), 4.47 (s, 2H, NH_2), 2.99 (m, 2H, H-5), 2.54 (m, 2H, H-8), 1.99–1.84 (m, 4H, H-6 and H-7); ms: (*m*/*z*) 204 (M$^+$), 190, 161, 135. Anal. Calcd. for $C_{11}H_{12}N_2S$: C, 64.67; H, 5.92; N, 13.71. Found: C, 64.88; H, 6.09; N, 13.60.

General procedure for the preparation of 9-amino-5,6,7,8-tetrahydrothieno[3,2-*b*]quinolin-8-ol derivatives (4a–g). A solution of $LiAlH_4$ in Et_2O (2.0 mL of 1.0*M*, 2.0 mmol) was added dropwise to a solution of the appropriate 9-amino-6,7-dihydro-5*H*-thieno[3,2-*b*]quinolin-8-one (2.0 mmol) in dry THF (10 mL) maintained at 0°C under nitrogen. After stirring at room temperature for 5 h, the reaction solution was quenched by adding 10% HCl, followed by washing with 30% NaOH to make free base and extracted with chloroform. The combined organic layers were evaporated to dryness, and the residue was purified by silica gel column chromatography eluting with a 50:50 v/v ethyl acetate/chloroform mixture.

9-Amino-5,6,7,8-tetrahydrothieno[3,2-b]quinolin-8-ol (4a). This compound was obtained from 9-amino-6,7-dihydro-5*H*-thieno[3,2-*b*]quinolin-8-one in 80% yield, mp 218–219°C; ^{1}H NMR (dimethyl sulfoxide-d_6): δ 7.78 and 7.22 (d and d, $J_{2,\,3}$ = 5.8 Hz, 2H, thiophene protons), 6.16 (s, 2H, NH_2), 5.06 (m, 1H, H-8), 2.78–2.66 (m, 2H, H-5), 1.93–1.70 (m, 4H, H-6 and H-7); ms: (*m*/*z*) 220 (M$^+$), 202, 201, 187, 175, 164. Anal. Calcd. for $C_{11}H_{12}N_2OS$: C, 59.97; H, 5.49; N, 12.72. Found: C, 60.18; H, 5.33; N, 12.88.

9-Amino-6,6-dimethyl-5,6,7,8-tetrahydrothieno[3,2-b]quinolin-8-ol (4b). This compound was obtained from 9-amino-6,6-dimethyl-6,7-dihydro-5*H*-thieno[3,2-b]quinolin-8-one in 84% yield, mp 176–177°C; ^{1}H NMR (dimethyl sulfoxide-d_6): δ 7.74 and 7.24 (d and d, $J_{2,\,3}$ = 5.8 Hz, 2H, thiophene protons), 5.06 (m, 1H, H-8), 2.80 and 2.58 (d and d, $J_{5a,\,5b}$ = 13 Hz, 2H, H-5), 2.10 (dd, *J* = 5.5 and 13 Hz, 1H, H-7a), 1.74 (dd, *J* = 6.0 and 13 Hz, 1H, H-7b), 1.13 (s, 3H, CH_3), 0.99 (s, 3H, CH_3); ms: (*m*/*z*) 248 (M$^+$), 230, 215, 203, 188. Anal. Calcd. for $C_{13}H_{16}N_2OS$: C, 62.87; H, 6.49; N, 11.28. Found: C, 62.94; H, 6.40; N, 11.39.

9-Amino-6-phenyl-5,6,7,8-tetrahydrothieno[3,2-b]quinolin 8-ol (4c). This compound was obtained from 9-amino-6-phenyl-6,7-dihydro-5*H*-thieno[3,2-b]quinolin-8-one in 89% yield, mp 193–194°C; ^{1}H NMR (dimethyl sulfoxide-d_6): δ 7.57 (d, $J_{2,\,3}$ = 5.8 Hz, 1H, thiophene proton), 7.41–7.29 (m, 6H, thiophene and phenyl protons), 5.20 (m, 1H, H-8), 3.19–3.09 (m, 3H, H-5 and H-6), 2.68–2.62 (m, 1H, H-7a), 2.06–2.02 (m, 1H, H-7b); ms: (*m*/*z*) 296 (M$^+$), 278, 263, 251, 201, 187.

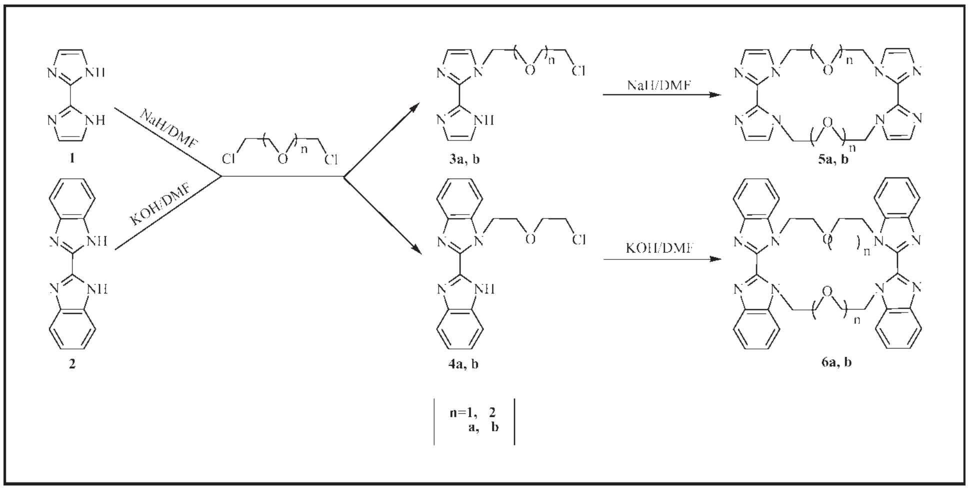
DOI 10.1002/jhet.188



Cyclophanes based on 2,2′-biimidazole and 2,2′-bibenzimidazole were synthesized as receptors. UV spectroscopic titration in chloroform at 25°C showed 1:1 complexes between the cyclophanes and the guests, and the binding constants (K) and Gibbs free energy changes ($-\Delta G_0$) were calculated according to the modified Benesi-Hildebrand equation.

J. Heterocyclic Chem., **46**, 1137 (2009).

INTRODUCTION

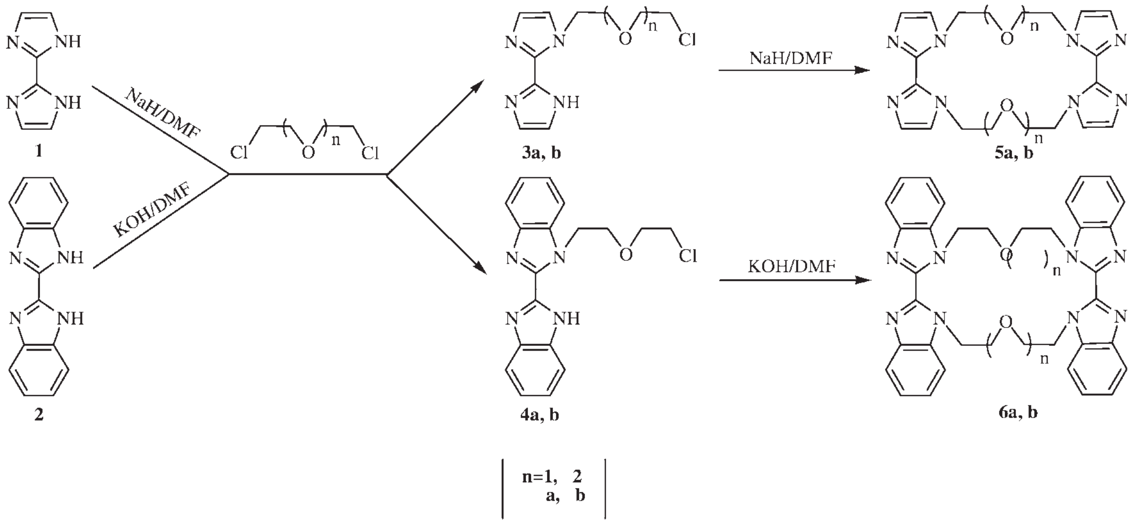
It is known that molecular recognition is a fundamental characteristic of biochemical system. The design and synthesis of receptors is of prime importance in supramolecular chemistry, due to its biological, medical, and environmental relevances [1,2]. During the last two decades, considerable attention have been addressed to develop systems capable of recognizing, self-assembling, catalyzing, and sensing, but the design of effective hosts for guests are still particularly challenging because of the characteristics of guests [3].

In biochemical host-guest processes, noncovalent interactions, such as, hydrogen bonding and coordination bonding play a central role in the creation of a variety of molecular architectures for molecular recognition, molecular self-assembly, and supramolecular catalysis. Imidazole can serve as proton donor-acceptor, general acid-base, nucleophile, and selective binding group [4]. Compounds with imidazole ring systems have many pharmaceutical activities and play important roles in biochemical processes [5]. Imidazole-based cyclophanes have received increasing attention in host-guest chemistry and biomimetic chemistry. Pioneering work has been carried out by Shi and Thummel [6]. Although much progress has been achieved [7], the construction of cyclophanes are of only one or two imidazole rings and has not yet overtaken the natural high efficiency and selectivity. We recently synthesized novel multiimidazole cyclophanes linked by alkyl groups [8]. However, these receptors only show poor recognition ability for amino acid esters. Noncovalent interactions, especially, hydrogen bonding and π-π stacking interaction may contribute to the attractive forces between hosts and guests. Because of the greater chemical stability and bidentate chelating sites [9], 2,2′-biimidazole (**Biim**) and 2,2′-bibenzimidazole (**BiBim**) are chosen as the component. We report, herein, the facile synthesis and characterization of novel multiimidazole cyclophanes which are comprised of four imidazole rings linked by ether chains (Scheme 1), and found that these artificial receptors exhibit excellent recognition ability toward amino acid esters.

RESULTS AND DISCUSSION

Design and synthesis of cyclophanes 5a,b and 6a,b. Cyclophanes **5a,b** and **6a,b** with different cavity and structure were designed and synthesized.

Scheme 1



Cyclophane **5a** contains four imidazole rings that could function as binding sites and two oxygen atoms on the macrocyclic skeleton that might serve as two hydrogen bonding recognition sites. Cyclophane **5b** also has four imidazole rings but with bigger cavity. For comparison, cyclophanes **6a**,**b** with more aromatic **BiBim** subunits linked to polyether dichlorides were also synthesized.

The multiimidazole compounds are generally considered to be difficult to prepare because of low solubility and several reactive sites. The reaction conditions have a significant influence on the selectivity. The *N*-alkylation of **Biim** and **BiBim** may have many possible substitutions at different sites, such as, quaternization or *N*,*N*′-bridged cyclization, 1,1′-disubstitution. By optimizing conditions, these competitive reactions can be minimized. Temperature and basicity are important in obtaining products. The temperature of the reaction affects on the yields of [1 + 1] and [2 + 2] cyclization. Excessive heating may lead [1 + 1] condensation. If excessive base are used, the mixture of quaternization, *N*,*N*′-bridged cyclization and 1,1′-disubstitution are formed. Under equivalent basicity to **Biim** and **BiBim**, 1-substitution of **Biim** and **BiBim** are produced. The bridged **Biim** and **BiBim** intermediates were synthesized by the *N*-alkylation of **Biim** and **BiBim**, respectively, with the corresponding polyether dichlorides in the presence of a slight excess of NaH or KOH in dry DMF at 70°C. The cyclization reactions of the bridged

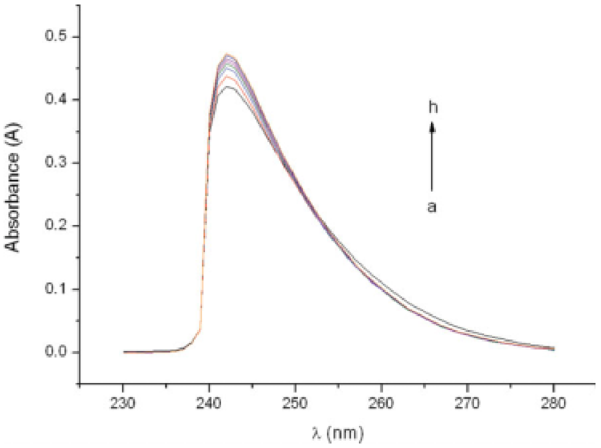


Figure 1. Spectrum of **5a** with varying Val-OMe concentration at 25°C ± 0.1°C. The concentration of **5a** is 6.8×10^{-5} mol dm^{-3}. The concentration of Val-OMe (mol dm^{-3}) are 0, 10×10^{-5}, 20×10^{-5}, 30×10^{-5}, 40×10^{-5}, 50×10^{-5}, 60×10^{-5}, and 70×10^{-5} reading from a to h. intermediates were carried out in DMF at 95°C. The slow addition of the intermediates made the cyclization facile and efficient. The structures proposed for these novel multiimidazole cyclophanes were confirmed by elemental analysis, MS, and ^1H NMR.

Molecular recognition of hosts in UV spectroscopic titration. Among the various methods to characterize host-guest interactions, the UV-vis titration method is widely used for its high sensitivity to host-guest binding [1,10]. In this article, the binding constants (*K*) of inclusion complexes of aforementioned receptors with amino acid esters were determined on the basis of the differential UV spectrometry in chloroform. In UV spectroscopic titration experiments, addition of varying concentration of amino acid derivatives resulted in a gradual increase of the characteristic absorptions of the host molecules. Typical UV spectral changes upon the addition of valine methyl ester (**Val-OMe**) to host **5a** are shown in Figure 1.

With the assumption of a 1:1 stoichiometry, the complexation of amino acid derivatives (*G*) with cyclophane (*H*) is expressed by eq. (1):

$$H + G \rightleftharpoons GH \tag{1}$$

Under the conditions used, the concentration of the receptors (6.8×10^{-5} mol dm^{-3}) is much lower than that of amino acid derivatives, that is, $[H]_0 << [G]_0$. Therefore, the stability constant of supramolecular system formed can be calculated according to the modified Hildebrand-Benesi equation [11], eq. (2).

$$[G]_0[H]_0/\Delta A = 1/K\Delta\varepsilon + [G]_0/\Delta\varepsilon \tag{2}$$

where $[H]_0$ represents the total concentration of host, $[G]_0$ denotes the total concentration of guest amino acid derivatives, $\Delta\varepsilon$ is the difference between the molar extinction coefficient for the free and complexing cyclophane, ΔA denotes the changes in the absorption of the host on adding amino acid derivatives. For all guest molecules examined, plots of calculated $[G]_0[H]_0/\Delta A$ values as a function of porting the 1:1 complex formation. Typical plots are shown for the complexation of compound **5a** with Val-OMe in Figure 2.

The association constants (*K*) and the free-energy change ($-\Delta G_0$) calculated from the slope and the intercept are shown in Table 1. Inspection of Table 1 shows that these receptors can recognize the differences between the cyclophane size and shape of amino acid derivatives. Our study clearly demonstrates that the different cavity size strongly influences the recognition ability of the cyclophane receptor. The multiimidazole cyclophane **5a** shows selective binding to amino acid derivatives in chloroform. For example, the association constants (*K*) of **5a** and **5b** for Val-OMe are 2656 and 960, respectively. The similar structure of **5a** and **6a** gives us the similar association constants (*K*) for Val-OMe, which are 2656 and 3295, respectively. Thus, the cavity size, steric effects, and structural rigidity of the receptors may play an important role in the selective recognition.

Figure 3 and Table 1 show the selective recognition ability of the receptor **6a** with α-animo acid esters, affording the *K* of 544–3295 and the ΔG_0 of 15.61–20.08 KJ mol^{-1}. The selectivity is highly sensitive to the chain length and shape of the substituted group in amino acids. Indeed, the receptor **6a** exhibits stronger binding for amino acid esters containing an acyclic group, inferring the hydrogen bonding interaction between the receptor and the amino acid is the principal attractive interaction involved. The acyclic Val-OMe is included most effectively by **6a**, giving the highest and the strongest binding. According to CPK model, when Val-OMe is embedded into the cavity, the supramolecular complex should be formed (Fig. 4). It has been proposed that the dimension of the cavity of cyclophane **6a** is more suitable for Val-OMe than other amino acid esters.

Different structure strongly influences the recognition ability of the receptor for amino acid esters. The similar structures **5b** and **6b** give us the association constants (*K*) for Gly-OMe, which are 687 and 1358, respectively. From this result, we think that the π-π stacking interaction between the receptor and the aromatic side chain of amino acid play an important role in recognition. Because **5b** and **6b** have bigger cavity, they cannot be propitious to the formation of stable supramolecular system. They give us low selective ability.

CONCLUSION

In conclusion, a facile synthesis led to cyclophanes based on biimidazole and bibenzimidazole units as molecular recognition motifs for amino acid esters. These receptors exhibit excellent recognition ability toward amino acid derivatives. The cavity size, steric effects, and structural rigidity, hydrogen bond, and π-π stacking interaction between the aromatic groups may be responsible for the recognition of amino acid derivatives.

EXPERIMENTAL

Physical measurements. Melting points were taken on a X-6 micro-melting point apparatus and were uncorrected. ^{1}H NMR spectra were recorded on a Bruker AVANCE/400 MHz instrument, and chemical shifts in ppm were reported with TMS as the internal standard. Mass spectra (ms) were measured on a VG Autospec 3000 mass spectrometer. Elemental analyses were performed on a Carlo Erba 1106 instrument. UV-vis spectra were obtained with TU-1810 spectrophotometer.

Reagents and general techniques. Anhydrous DMF was purified according to the standard method. **Biim** [12], **BiBim** [13], and polyether dichlorides [14] were prepared according to literature procedure. Amino acid methyl ester hydrochloride used was prepared by adding dropwise $SOCl_2$ into a suspension of the free amino acid in absolute methanol at 0°C. Free amino acid esters were obtained by neutralization with $NH_3 \cdot nH_2O$ before use. All other chemicals and reagents were obtained commercially and used without further purification.

General procedure for preparation of 3a, b and 4a, b. In a 25-mL flask, **Biim** or **BiBim** (5 mmol), DMF (10 mL) and NaH or KOH (6 mmol) were stirred at room temperature. Polyether dichlorides (5 mmol) was added quickly. The mixture was stirred for 12 h at 70°C. The solid was filtered and washed with a less absolute ethanol. The combined solvent was removed *in vacuo* and the residue was purified by column chromatography on silica gel (dichloromethane/ethanol 19:1 or petroleum ether/ethyl acetate 4:1) to give the pure products **3a,b** and **4a,b**.

1-(5-Chloro-3-oxa-pentyl)-2,2′-biimidazole, 3a. General procedure for the synthesis of cyclophanes 5a, b and 6a, b. To a stirred and warmed (95°C) solution of NaH or KOH (2.5 mmol) and DMF (5 mL), compounds **3a, b** and **4a, b** (2.1 mmol) in DMF was added dropwise over 5 h. The mixture was stirred at this temperature for 20 h. The solid was filtered and washed with a less absolute ethanol. The combined solvent was removed *in vacuo* and the residue was purified by column chromatography on silica gel (dichloromethane/ethanol 14:1 or petroleum ether/ethyl acetate 1:1) to give the pure products **5a, b** and **6a, b**.

Cyclophane 5a. Off-white solid, yield 45.6%, mp 186–188°C. ^{1}H NMR ($CDCl_3$) δ: 3.770–3.794 (t, 8H, OCH_2), 3.950–3.971 (t, 8H, NCH_2), 7.192 (s, 4H, BiIm 5,5′-H), 7.323 (s, 4H, BiIm 4,4′-H) ppm; ms (*m/z*): 409.5 ($M+H^+$). Anal. Calcd for $C_{20}H_{24}N_8O_2$: C 58.81, H 5.92, N 27.43; found: C 58.63, H 5.95, N 27.23.

Cyclophane 5b. Off-white solid, yield 24.1%, mp 172–174°C. ^{1}H NMR ($CDCl_3$) δ 3.610–3.632 (t, 8H, OCH_2—-CH_2O), 3.683 (s, 8H, NCH_2—CH_2O), 3.735–3.757 (t, 8H, NCH_2), 7.030 (s, 4H, BiIm 5,5′-H), 7.149 (s, 4H, BiIm 4,4′-H) ppm; ms (*m/z*): 497.2 ($M+H^+$). Anal. Calcd for $C_{24}H_{32}N_8O_4$: C 58.05, H 6.50, N 22.57; found: C 57.87, 6.46, 22.28.

Cyclophane 6a. Off-white solid, yield 42.3%, mp 161–163°C. ^{1}H NMR ($CDCl_3$) δ: 3.797–3.821 (t, 8H, OCH_2), 4.189–4.212 (t, 8H, NCH_2), 7.405–7.948 (m, 16H, Ar—H) ppm; ms (*m/z*): 609.1 ($M+H^+$). Anal. Calcd for $C_{36}H_{32}N_8O_2$: C 71.04, H 5.30, N 18.41; found: C 70.87, H 5.28, N 18.23.

Cyclophane 6b. Off-white solid, yield 22.3%, mp 124–126°C. ^{1}H NMR ($CDCl_3$) δ: 3.424–3.474 (m, 8H, OCH_2—-CH_2O), 3.559–3.644 (m, 8H, NCH_2—CH_2O), 4.053–4.080 (t, 8H, NCH_2), 7.259–7.717 (m, 16H, Ar—H) ppm; ms (*m/z*): 697.0 ($M+H^+$). Anal. Calcd for $C_{40}H_{40}N_8O_2$: C 68.95, H 5.79, N 16.08; found: C 70.13, H 5.77, N 15.96.

UV titration. UV spectra were recorded on a TU-1810 UV-vis spectrophotometer at 25°C ± 0.1°C with a 1-cm quartz cell. A 3.0 mL of chloroform solution of host was put into the cell. After the cell temperature had become constant at 25°C with a thermostatic cell compartment, the solution of amino acid esters in chloroform was added in portions via microsyringe to the cell. The concentration of guest increased along with each addition, as far as the concentration of guest reached about 15-fold of the concentration of host. Different absorption spectra were obtained directly using the instrument according to its normal procedure. The absorption of the guest was cancelled by using the guest solutions of $[G]_0$ concentration for each titration as the reference solution. The whole volume of guest solution added to the cell did not exceed 100 μL to dispel the effect of volume change. For example, when the concentration of host **5a** was 6.8×10^{-5} mol dm^{-3}, its maximum absorption wavelength was at 242 nm, and the absorbance A_0 was 0.422. When the guest Val-OMe was portion-wise added to the cell to make its concentration of 10×10^{-5}, 20×10^{-5}, 30×10^{-5}, 40×10^{-5}, 50×10^{-5}, 60×10^{-5}, 70×10^{-5} mol dm^{-3}, respectively, the maximal absorption increased orderly and gave the corresponding ΔA ($A-A_0$) values 0.016, 0.029, 0.036, 0.040, 0.044, 0.049, 0.052. According to eq. (2), plots of calculated $[G]_0[H]_0/\Delta A$ values as a function of $[G]_0$ values gave an excellent linear relationship (Fig. 2). From Figure 2, we can obtain the association constant $K = 2655$ dm^3 mol^{-1}.

The one-pot reaction of 2-tetralone with ammonium acetate and substituted benzaldehydes affords in a good yield of 5-aryl-7,8,13,14-tetrahydrodibenzo[*a*,*i*]phenanthridine or 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-one. The course of the reaction seems to be dictated by the position of the substituents present on the benzaldehyde ring.

J. Heterocyclic Chem., **46**, 1142 (2009).

INTRODUCTION

Phenanthridines, an important class of heterocyclic compounds in medicinal chemistry, are attractive synthetic targets due to their widespread occurrence in nature and broad range of biological activities, including anti-tumor and anti-viral activities [1–7]. Phenanthridine derivatives exhibit interesting pharmacological properties related to the planarity of the system. Benzophenanthridines are reported as compounds with topoisomerase I-targeting activity and cytotoxicity [8].

In addition, the high charge mobility of this heterocyclic system provides pronounced photoconducting, optoelectrical switching, and photovoltaic properties [9–11], which are key features in the field of dye lasers and electroluminescence [12,13]. Therefore, during the last few years, phenanthridines have gained much attention because of their promising applications in the development of optical materials, information recordings, such as, holography, lithographic plates for printing, and electric equipment [14].

The literature preparations of the phenanthridine ring system have disadvantages, such as, lengthy syntheses, low yields, and structurally complicated precursors [8,15–20]. Even a synthesis involving a few steps from simple precursors such as formaldehyde and 2-methylbenzonitrile affords benzo[c]phenanthridine in a 6% overall yield [15]. In this study, we found that one-step reaction of benzaldehyde or 4-substituted benzaldehydes, ammonium acetate, and 2-tetralone gave 5-aryl-7,8,13,14-tetrahydrodibenzo[*a*,*i*]phenanthridine (Scheme 1). On the other hand, the one-step reaction of 2-substituted benzaldehydes, ammonium acetate, and 2-tetralone gave 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-ones (Scheme 2).

In spite of their importance, only very few of them involve less than a few steps [16,20–22]. On the contrary, this study involves single step. Hence, the authors wish to explore a new and more versatile synthetic route for 5-aryl-7,8,13,14-tetrahydrodibenzo [*a*,*i*]phenanthridine.

The preparation of 5-phenyltetrahydrodibenzo[*a*,*i*]phenanthridine (4) and 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-one (5) was accomplished by the procedure reported by Noller and Baliah [23] through a simple three-compound reaction involving ammonium acetate (2), benzaldehyde (1), and 2-tetralone (3). We tried to carry out the Mannich reaction as reported in the article. However, we ended up with 5-aryl-7,8,13,14-tetrahydrodibenzo[*a*,*i*]phenanthridine in the case of parent benzaldehyde and para-substituted benzaldehydes. However, ortho-substituted benzaldehydes yielded 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-ones. The two reactions are not competing with each

Scheme 1

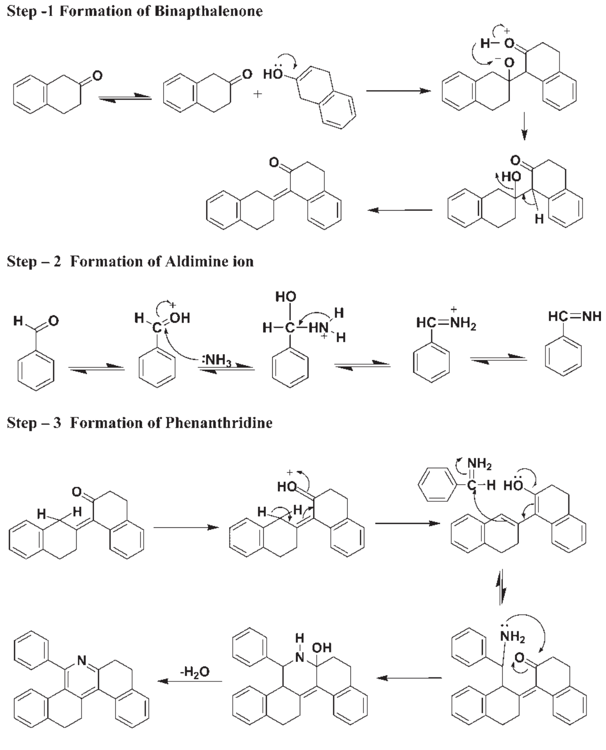
X = H, 4-Cl, 4-MeO

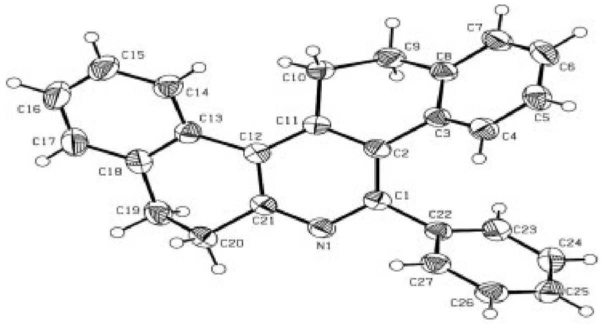
Compound - 4a, 4b, 4c
X = H, 4-Cl, 4-MeO

other. We are getting either phenanthridine or azabicyclo[3.3.1]nonan-9-one only. The product formation is exclusive. We are not getting the mixture of products. In Mannich reaction, the active methylene group in the 2-tetralone took part, whereas in the other reaction the enol form of 2-tetralone occurred. This reaction was found to be very easy and useful for synthesizing phenanthridine because other methods now being used are cumbersome and involve more steps (Table 1).

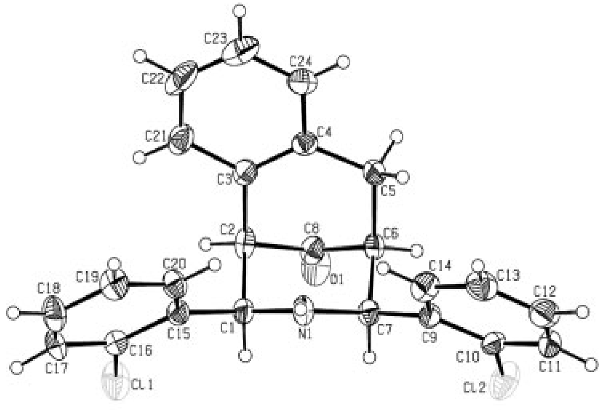
The mechanism for the formation of 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-one is already well documented [23]. We are proposing the following mechanism for the formation of phenanthridine derivative. The mechanism proposed is similar to the one reported for the reaction between tetralone and nitrile [20]. All the structures were confirmed by single crystal X-ray analysis.



The parent and para-substituted benzaldehydes give phenanthridine, and ortho-substituted benzaldehydes give azabicyclo[3.3.1]nonan-9-one. This is due to the steric hindrance in the ortho-substituted benzaldehydes and it is clearly shown in the mechanism. The aldimine formation in ortho-substituted benzaldehydes is impossible. Once it is able to form the aldimine then only the formation of phenanthridine is possible otherwise keto form will react with benzaldehyde and ammonium acetate to form azabicyclo[3.3.1]nonan-9-one.



Ortep diagram of compound 4a



Ortep diagram of compound 5d

Even the structures are also confirmed by single crystal X-ray analysis.

In conclusion, the authors developed two short, distinct, and complementary methods for the synthesis of various 5-aryl-7,8,13,14-tetrahydrodibenzo[*a*,*i*]phenanthridine and 2,4-diaryl-6,7-benzo-3-azabicyclo[3.3.1]-nonan-9-one with excellent yield. We believe that the

Table 1

Reaction of 2-tetralone with benzaldehydes.

Aldehyde	Product	Yield
Benzaldehyde (1a)	**4a**	86%
p-Chlorobenzaldehyde (1b)	**4b**	74%
p-Methoxybenzaldehyde (1c)	**4c**	76%
o-Chlorobenzaldehyde (1d)	**5d**	68%
o-Methoxybenzaldehyde (1e)	**5e**	65%

reported method provides a potential utility of chemistry in organic synthesis.

EXPERIMENTAL

General procedure. 0.2*M* of respective benzaldehyde was treated with 0.1*M* of 2-tetralone and 0.1*M* of ammonium acetate in 15 mL of ethanol. The mixture was gently warmed in a water bath until the color changed to orange and kept aside for overnight at room temperature. The completion of the reaction was identified with TLC. The solid obtained was separated and the crude compound was purified by silica gel column chromatography using hexane and ethyl acetate as elutant.

Spectral data

5-Phenyl-7,8,13,14-tetrahydrodibenzo[a,i]phenanthridine (4a). Crystal; mp 170°C; IR (KBr): 3057, 2833, 1606, 1549, 1425, 1396, 1245 cm^{-1}; ^{1}H NMR ($CDCl_3$, 400 MHz): δ 2.76–3.20 (m, 8H), 7.00–7.53 (m, 13H); ^{13}C NMR ($CDCl_3$, 100 MHz): δ 24.79, 27.41, 29.53, 31.38,124.68, 125.60, 126.30, 126.92, 127.25, 127.64, 127.75, 128.33, 128.68, 129.62, 129.80, 130.58, 132.77, 133.04, 136.99, 138.68, 139.43, 139.67, 140.29, 142.06, 145.65, 153.95, 158.08.

5-(p-Chlorophenyl)-7,8,13,14-tetrahydrodibenzo[a,i]phenanthridine (4b). Crystal; mp 178°C; IR (KBr): 3032, 2833, 1605, 1549, 1425, 1358, 1245, 763 cm^{-1}; ^{1}H NMR (DMSO-d_6, 300 MHz): δ 2.54 (m, 2H), 2.74–3.26 (m, 6H), 7.12–7.61 (m, 12H); MS (LC-MS): $m/z = 394$ (M^+).

5-(p-Methoxyphenyl)-7,8,13,14-tetrahydrodibenzo[a,i]phenanthridine (4c). Crystal; mp 174°C; IR (KBr) 3032, 2833, 1606, 1549, 1425, 1358, 1245 cm^{-1}; ^{1}H NMR (DMSO-d_6, 400 MHz): δ 2.50–3.08 (m, 8H), 3.78 (s, 3H), 6.86–6.91 (m, 4H), 7.29–7.32 (m, 8H); MS (LGC-MS): $m/z = 390$ (M^+).

2,4-Di(o-chlorophenyl)-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-one (5d). Crystal; mp 230°C; IR (KBr): 3309, 2846, 1711, 1423, 1243, 751 cm^{-1}; ^{1}H NMR (DMSO-d_6, 300 MHz): δ 2.92–3.15 (m, 4H), 3.56 (s, 1H, NH), 4.59–4.62 (d, 1H), 5.73–5.76 (d, 1H), 6.74–7.78 (m, 12H).

2,4-Di(o-methoxyphenyl)-6,7-benzo-3-azabicyclo[3.3.1]nonan-9-one (5e). Crystal; mp 220°C; IR (KBr) 3313, 2832, 1715, 1491, 1243 cm^{-1}; ^{1}H NMR (DMSO-d_6, 300 MHz): δ 2.48–2.97 (m, 4H), 3.48 (s, 1H, NH), 3.81–4.01 (s, 6H), 4.52–4.55 (d, 1H), 5.75 (d, 1H), 6.66–7.60 (m, 12H).

An efficient and convenient method for the synthesis of polyfunctionalized 4*H*-pyrans has been achieved through the one-pot condensation of aromatic aldehydes, malononitrile, and 4-hydroxycoumarin, phenols or active methylene carbonyl compounds such as 1, 3-cyclohexanedione and dimedone in the presence of 1-butyl-3-methyl imidazolium hydroxide ([bmim]OH) as catalyst in aqueous media. This method offers several advantages short reaction time, high yields, and simple procedure.

J. Heterocyclic Chem., **46**, 1145 (2009).

INTRODUCTION

The 4*H*-pyrans and their derivatives have attracted considerable attention from organic and medicinal chemists due to their useful biological and pharmacological properties [1], such as spasmolytic, diuretic, anticoagulant, anticancer, and antianaphylactic activity [2]. Furthermore, those compounds can be used as pigments [3], as photoactive materials [4], and as potential biodegradable agrochemicals [5]. Thus, the synthesis of 4*H*-pyran derivatives currently is of much importance. Various methods have been reported for the synthesis of 4*H*-pyrans, including the reaction of aromatic aldehydes, malononitrile with naphthol for the synthesis 2-amino-2-chromenes [6], the condensation of aromatic aldehydes, malononitrile with 4-hydroxycoumarin [7], and the condensation of aromatic aldehydes, malononitrile with active methylene carbonyl compounds [8]. Those reactions have been reported in the presence of a catalyst, such as piperidine [9], KF-Alumina [10], phase-transfer catalyst [11], and $(NH_4)HPO_4$ [12]. Pyrans have also been synthesized under microwave and ultrasound irradiations [13]. These methods also suffer from some disadvantages such as long reaction times, low yields, the use of organic solvent, special apparatus, and tedious workup procedures. Thus, the need for the development of an efficient and facile method for the synthesis of 4*H*-pyran derivatives is in high demand.

Our recent interest has been in the development of new synthetic methods on using ionic liquids as reaction media and catalyst [14]. Herein, we would like to report a highly efficient, convenient, and facile method for the synthesis of 4*H*-pyrans in the presence of basic ionic liquid [bmim]OH as catalyst in aqueous medium.

RESULTS AND DISCUSSION

Very recently, we reported a simple and convenient method for the synthesis of 2-amino-2-chromenes by condensation of aromatic aldehydes, malononitrile with α- or β-naphthol using [bmim]OH as catalyst in aqueous medium (Scheme 1) [15]. This versatility of this ionic liquid encourages us to study its use in other organic reactions. We have now extended the use of this functionalized ionic liquid to catalyze the reaction of aromatic aldehydes, malononitrile with 4-hydroxycoumarin (Scheme 2). The synthesis of 2-amino-4-aryl-5-oxo-4*H*,5*H*-pyrano-[3,2-*c*]chromence-3-carbonitrile was achieved by the three-component condensation of an aromatic aldehyde, malononitrile with 4-hydroxycoumarin in the presence of 10 mol% [bmim]OH at 100°C. The results are summarized in Table 1. In all cases, the corresponding dihydropyrano[*c*]chromenes were obtained in good to excellent yields. However, when aldehydes with electron-withdrawing groups (such as nitro group and halide) are reactants, the reaction time is shorter than that with electron-donating groups (such as methoxy group and hydroxyl group).

Encouraged by these results, we replaced the substituted phenols **5** instead of 4-hydroxycoumarin **3** in the same conditions (Scheme 3). The results are summarized in Table 2. No significant formation of product (**6a**) was observed, when the reaction of benzaldehyde, malononitrile, and phenol was preceded in the same conditions, even prolonged reaction time to 24 hours. However, resorcinol is an activated phenol, when used in the reaction instead of phenol, the yields were promoted greatly with shorter reaction time, which indicated that resorcinol can be successfully used in this reaction.

The versatility of this ionic liquid encourages us to study its utility for one-pot synthesis of other heterocyclic compounds. The reaction of aromatic aldehyde, malononitrile, and active methylene carbonyl compounds for synthesis of 4*H*-benzo[*b*]pyrans has been reported. We then investigated the three-component condesation of aromatic aldehydes, malononitrile, and active methylene carbonyl compounds using [bmim]OH as a catalyst (Scheme 4). When 5 mol% [bmim]OH was used, the corresponding 4*H*-benzo[*b*]pyrans were obtained in good to excellent yields at room temperature, and the results are summarized in Table 3.

As shown in Table 3, the substituents of aromatic aldehydes affect the reaction times, and the yields of 4*H*-benzo[*b*]pyrans to a large extent. When aromatic aldehydes with electron-withdrawing groups (such as nitro group and halide) are reactants, the reaction time is shorter than that with electron-donating groups (such as methoxy group and hydroxyl group).

CONCLUSION

In summary, we have developed an efficient and general method for the synthesis of polyfunctionalized 4*H*-

pyrans via [bmim]OH-catalyzed the one-pot, three-component reaction of aromatic aldehyde, malononitrile, and 4-hydroxycoumarin or active methylene carbonyl compounds. The attractive features of this protocol are simple procedure, short reaction time, excellent yields, mild conditions, and the easy workup procedure. In addition, water was chosen as a green solvent.

EXPERIMENTAL

General. Melting points were determined on an X6-data microscopic melting points apparatus and were uncorrected. Infrared (IR) spectra were recorded on a BRUKER VECTER 22. ^{1}H NMR spectra were obtained from solution $CDCl_3$ or DMSO-d_6 with TMS as internal standard using a BRUKER DRX-500 (500 MHz) spectrometer. Mass spectra were obtained with an automated Finnigan Trace Ultra-Trace DSQ GC/MS spectrometer.

The synthesis of this task-specific ionic liquid has been carried out from a similar method in the literature [16]. The ionic liquid was formed quantitatively and in high purity as assessed by ^{1}H NMR. All other chemicals (AR grade) were commercially available and used without further purification.

The synthesis of 2-amino-4-hydroxyl-6-hydroxymethyl-5,6,7,8-tetrahydropyrido[3,2-d]pyrimidine **3** is described from 2-amino-6-methyluracil **4** through the crucial step of 2-pivaloyl protecting and cyclization. The assignment of the structure of **3** was performed by its spectral data, the ^{1}H NMR, ^{13}C NMR, gHMQC, and HRMS spectra.

J. Heterocyclic Chem., **46**, 1151 (2009).

INTRODUCTION

The requirement for folic acid in the metabolism of one carbon units is well established [1]. The coenzyme forms are actually their reduced products, mostly 5,6,7,8-tetrahydro derivatives, whose nitrogen atom at position 5 is reactive site of those molecules in C_1-unit metabolism [2]. The inhibitors of these enzymes will cause a deficiency of tetrahydrofolate (Fig. 1) cofactors, which will result in blocks in the synthesis of pyrimidine, purines, and protein. Consequently, these blocks will affect both DNA synthesis and cell division. Thus, the enzymes in folate cycle have been recognized as an attractive target for cancer chemotherapy [3,4].

RESULTS AND DISCUSSION

As part of a program focused on the design and synthesis of inhibitors of methionine synthase [5], access to 2-amino-4-hydroxyl-6-hydroxymethyl-5,6,7,8-tetrahydropyrido[3,2-d]pyrimidine (**3**) was required as the intermediate of the preparation of 8-deaza 5,6,7,8-tetrahydrofolic acid (**2**) and their derivatives. Although the structure of **3** is not complicated, the direct synthesis of the 8-deaza-5,6,7,8-tetrahydropterdine and derivatives has not been reported. Limited reports describe the synthesis of N^5-substituted derivatives of **2** from a hydrogenation of 8-deazafolic acid (**1**) [6–8]; however, the yields are quite low. In this article, we report a successful synthesis of the 6-substituted 8-deazatetrahydropteridine starting from commercially available 2-amino-6-methyluracil.

Initial attempts to get access to the target compound **3** using 2-acetamide-5-nitro-6-methyluracil (**6**) were investigated. 2-Amino-5-nitro-6-methylpyrimidin-4-one (**5**) was prepared in 91% yield by reaction of 2-amino-6-methyluracil (**4**) with HNO_3-P_2O_5 under 0°C (Scheme 1) [9]. Compound **5** was reacted with Ac_2O to give the corresponding 2-acetamide (**6**). Attempted the transformation of 2-acetamide-5-nitro-6-methyluracil (**6**) into **7** expecting the successive cyclization of the resulting adduct by nucleophilic attack of the 5-amino group obtained from 5-nitro group. However, the reactions of **6** with 3-chloro-1,2-epoxypropane or 3-bromo-1,2-epoxypropane in different base conditions failed to yield any product **7**, a large percent of starting material (**5**) being recovered. The failure reason could be less stable acetyl group, and the pivaloyl group was selected to improve the stability of the protect group at 2-position.

The successful synthesis route of **3** using the more stable pivaloyl group was shown in Scheme 2. The 2-amino-5-nitro-6-methyluracil (**5**) was pivaloylated by pivaloyl chloride in acetonitrile or pyridine to give the corresponding 2-pivaloylamide (**8**) [10], which was then successfully epoxyalkylated in 6 position with 3-chloro-

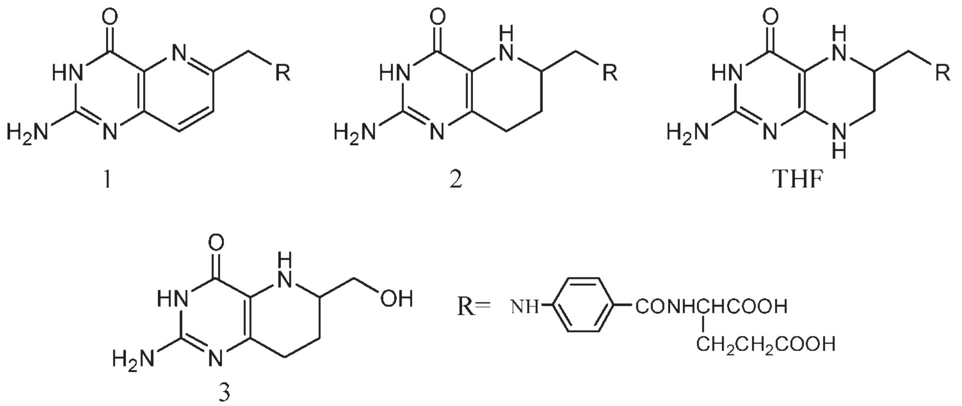

Figure 1. Structures of tetrahydrofolate (THF), compounds **1**, **2**, and **3**.

1,2-epoxypropane and KI in ethanolic sodium ethoxide to form the key intermediate **9** [11]. 2-Pivaloylamino-5-nitro-6-(3,4-epoxybutyl)uracil (**9**) was reduced by sodium dithionite under refluxing for 7 h to afford 2,5-diamino-6-(3,4-epoxybutyl)uracil (**10**). The next crucial step was the cyclization of **10** to give compound **3**. This was carried out by treatment of **10** with BF_3-etherate in dichloromethane to give ca. 1:1(high performance liquid chromatography) mixture R and S isomer of 2-amino-4-hydroxyl-6-hydroxymethyl-5,6,7,8-tetrahydropyrido[3,2-*d*] pyrimidine (**3**) in 37% yield. The structure of product was confirmed by its spectral data, the ^1H NMR, ^{13}C NMR, gHMQC, and HRMS spectra.

CONCLUSION

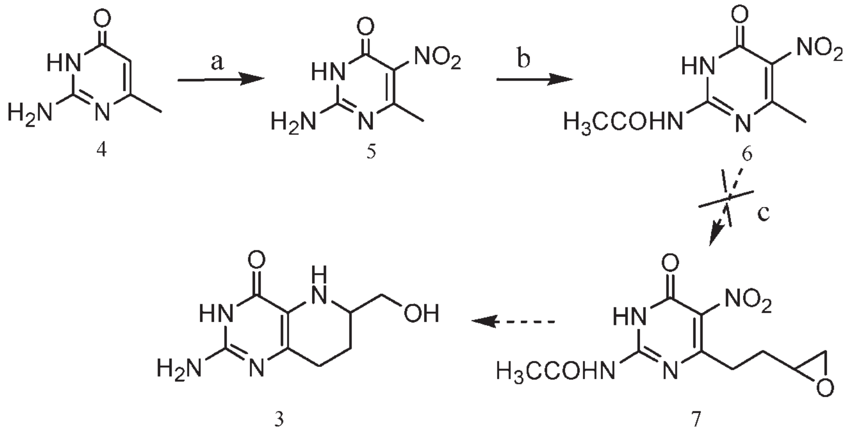
In conclusion, we have developed a new and general approach to the synthesis of 2-amino-4-hydroxyl-6-hydroxymethyl-5,6,7,8-tetrahydropyrido[3,2-*d*]pyrimidine, which is an interesting biological model and synthetic precursor used in synthesis of the modified tetrahydrofolic acid derivatives. The procedure described in this article should be a convenient means for the preparation of such analogues due to its simplicity.

EXPERIMENTAL

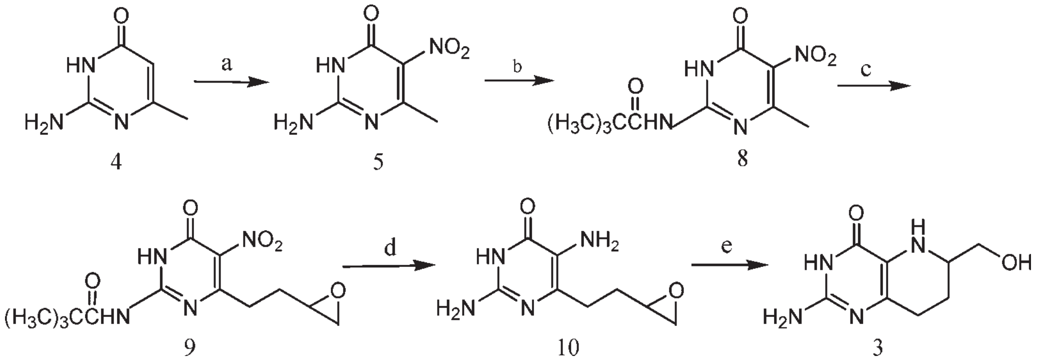
Melting points (uncorrected) were determined with an X_4-type apparatus. ^1H and ^{13}C NMR spectra were recorded on JNM-AL-300 or a varian INOVA-500 spectrometer using tetramethylsilane as an internal standard. Mass spectra were recorded on a VG-ZAB-HS spectrometry. Infrared spectra were recorded with Avatar 360 FT-IR and reported in cm^{-1}. Silica gel (0.40–0.64 mm) was used for column chromatography.

2-Amino-5-nitro-6-methylpyrimidin-4-one (5). To a suspension of fuming nitric acid (6.5 mL, 15.5 mmoles) and P_2O_5 (2.2 g, 15.5 mmoles) 2-amino-6-methylpyrimidin-4-one (1.25g, 10 mmoles) was added at −5 to 0°C. The reaction mixture was stirred for 4 h and poured into ice water (10 mL). The resulting solid was filtered and recrystallized from ethanol to give 2-amino-5-nitro-6-methylpyrimidin-4-one as light yellow crystal (1.55 g, 91%), mp 250°C (dec). ^1H nmr (300 MHz, DMSO-d_6): δ 2.29 (s, 3H), 11.78 (s, 2H), 11.81 (s, 1H); ^{13}C nmr (75 MHz, DMSO-d_6): $\delta = 16.7$, 127.2, 149.1, 154.2, 156.4; ms: m/z 170.

Scheme 1. Reagents and conditions: a, HNO_3, P_2O_5, −5 to 0°C, 4 h; b, Ac_2O, 80 to 90°C, 5 h; c: i, NaOEt, EtOH. ii, 3-bromo-1,2-epoxypropane.



Scheme 2. Reagents and conditions: a, HNO_3, P_2O_5, −5 to 0°C, 4 h; b, $(CH_3)_3COCl$, acetonitrile/pyridine, 80 to 90°C, 4 h; c: i, CH_3CH_2ONa, CH_3CH_2OH, 0.5 h. ii, , KI, DMF, 80 to 90°C, 3 h; d, $Na_2S_2O_4$, CH_3CH_2OH, 80°C, 7 h; e, BF_3-etherate, CH_2Cl_2, room temperature, 10 h.



2-Acetamide-5-nitro-6-methylpyrimidin-4-one (6). 2-Amino-5-nitro-6-methyl pyrimidin-4-one (2.0 g, 11.8 mmoles) was added to acetic anhydride (15 mL) and refluxed for 5 h. The reaction mixture was cooled to 0°C. The resulting solid was filtered and washed with ethyl acetate and petrol to give the product **6** as a light yellow (2.0 g, 80%), mp > 250°C (dec). ^{1}H nmr (500 MHz, DMSO-d_6): δ 2.19 (s, 3H), 2.33 (s, 3H), 12.10–12.30 (m, 2H); ^{13}C nmr (125 MHz, DMSO-d_6): δ 20.9, 23.9, 133.4, 150.5, 153.1, 161.5, 174.2; ms: m/z 213.0292.

2-Pivaloylamino-5-nitro-6-methyluracil (8). A mixture of 1.5 g (8.8 mmoles) of **5** and 3.8 mL (30.8 mmoles) of pivaloyl chloride in acetonitrile or pyrimidine (20 mL, v/v: 5/2) was stirred and refluxed for 4 h. The solution was evaporated to dryness, and the residue was recrystallized in 10% ammonia in water to give 1.4 g (63%) of **8**. mp 211–214°C. ^{1}H nmr (300 MHz, DMSO-d_6): δ 1.22 (s, 9H), 2.29 (s, 3H), 10.0 (br, 2H); ^{13}C NMR (75 MHz, DMSO-d_6): δ 20.7, 26.1, 27.0, 133.4, 151.9, 167.4, 181.5; esi-ms: $[M+H]^+$ *m/z* 254.9.

2-Pivaloylamino-5-nitro-6-(3,4-epoxybutyl)uracil (9). To a solution of 0.83 g (3.27 mmoles) of **8** in 7 mL of dry ethanol, 3.5 mL of ethanolic sodium ethoxide was added (1 N), and the mixture was reluxed for 0.5 h. The solvent was removed in vacuo, and the residue was added to 6 mL of dry *N*,*N*-dimethyformamide (DMF). To the solution, 0.35 ml (4.48 mmoles) of 3-chloro-1,2-epoxypropane and 0.22 g (1.33 mmoles) of KI was added. The resulting solution was refluxed for 3 h. Then the solvent was removed in vacuo, and the residue was suspended in water and extracted with ethyl acetate. The organic layers were pooled, dried over anhydrous sodium sulfate, and concentrated to a small volume. The residue was purified by preparative thin layer chromatograph (silica gel). Elution with $CHCl_3$—CH_3OH (9:1) gave pure **9** (0.25 g, 25%) as yellow oil. ^{1}H nmr (300 MHz, $CDCl_3$): δ 1.26 (s, 9H), 2.27–2.44 (m, 4H), 3.41–3.53, 3.66–3.81 (m, 1H), 4.10–4.26 (m, 1H), 4.49–4.56 (m, 1H); esi-tof-ms: $[M+H]^+$ *m/z* 311.0.

2,5-Diamino-6-(3,4-epoxybutyl)uracil (10). To the solution of 0.6 g (1.94 mmoles) of **9** in 30 ml of 95% ethanol, 3.36 g (19.3 mmoles) of sodium dithionite was added. The mixture was heated at 80°C for 7 h and filtered after cooling to room temperature. The filtrate was evaporated to dryness under reduced pressure, and the residue was purified by preparative thin layer chromatograph (silica gel). Elution with $CHCl_3$—CH_3OH (20:1) gave pure **10** (0.17 g, 45%) as oil. ^{1}H nmr (300 MHz, $CDCl_3$): δ 2.17–2.34 (m, 2H), 3.17, 3.21 (d, 2H), 3.37, 3.40 (d, 1H), 3.49, 3.53 (d,1 H), 4.09–4.17 (m, 1H), 4.25 (s, 2H), 5.45 (s, 2H), 8.88 (s, 1H); esi-tof-ms: $[M+H]^+$ *m/z* 197.1.

2-Amino-4-hydroxyl-6-hydroxymethyl-5,6,7,8-tetrahydropyrido[3,2-*d*]pyrimidine (3). To a solution of 0.24 g (0.86 mmoles) of **10** in 20 mL of dry dichloromethane in a dry and nitrogen flushed flask, the BF_3-etherate (0.11 mL, 0.86 mmoles) was added dropwise. The mixture was stirred for 10 h at room temperature in the dark, quenched by adding water, and extracted with dichloromethane. The extracts were pooled and dried over anhydrous $MgSO_4$. After the evaporation of solvent to a small volume, the residue was purified by column chromatography (silica gel) to give pure **3** (0.089 g, 37%) as yellow oil. ^{1}H nmr (300 MHz, DMSO): δ 1.09–1.13 (m, 2H), 3.07–3.29 (m, 2H), 3.52, 3.56 (d, 1H, J = 14 Hz), 4.00, 4.04 (d, 1H, J = 14 Hz), 4.12 (br, 1H); ^{13}C nmr (75 MHz, DMSO): δ 22.4, 44.7, 45.1, 57.2, 126.9, 152.1, 155.0, 162.2; esi-hrms: $[M+H]^+$ *m/z* 197.10251 (error (ppm): −4.02).

Variously substituted 2-vinylpyrroles underwent an *endo*-addition [4+2] cycloaddition reaction with maleimides followed by a spontaneous highly diastereoselective (93–98% *de*) isomerization to give tetrahydroindoles in moderate to excellent yield. Treatment with activated MnO_2 in refluxing toluene provided the corresponding indoles in moderate to good yield. This highly convergent methodology for formation of indoles is versatile and the starting materials are conveniently prepared.

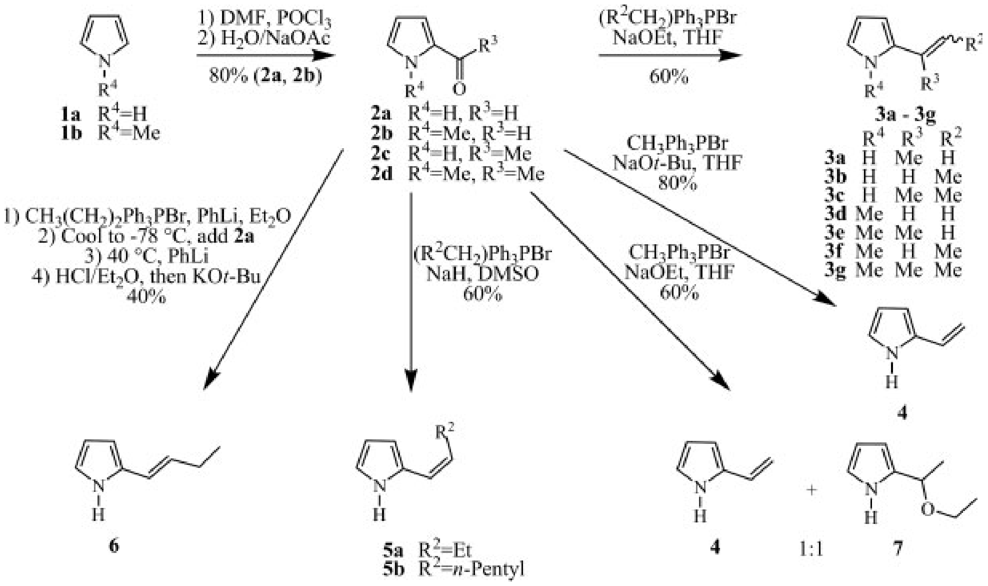
J. Heterocyclic Chem., **46**, 1154 (2009).

INTRODUCTION

The formation of indole continues to attract much study [1] because of its frequent occurrence in nature and its biological activity in both natural [2] and synthetic [3] products. We have reported that 3-vinylindoles are generated from condensation of indole and ketones, which then undergo an *in situ* Diels-Alder reaction with maleimides to form tetrahydrocarbazoles [4]. We recently reported the analogous work in which pyrroles are condensed with cyclic ketones to give 2-vinylpyrroles that also undergo *in situ* Diels-Alder reactions with maleimides to give the corresponding tetrahydroindoles, many of which exhibited high levels of *in vitro* activity against a variety of human cancer cell lines [5]. Although the *in situ* Diels-Alder approach toward indoles is advantageous with its one-pot method, it is somewhat limited in that acidic conditions are required to catalyze the condensation, and pyrroles are well known to form polymers under acidic conditions [6]. Indeed, we battled with the formation of polymeric material when using vinylpyrroles for *in situ* Diels-Alder reactions and found that to circumvent the problem, the use of 5-alkyl-substituted pyrroles was essential.

These results inspired us to explore the Diels-Alder chemistry of separately prepared 2-vinylpyrroles. Preparing the vinylpyrrole in a separate step *via* methods not using acidic conditions has the advantage of allowing the use of 5-unsubstituted 2-vinylpyrroles in Diels-Alder reactions. In addition, we were interested in effecting aromatization of the resulting tetrahydroindoles to give indoles. Some studies have been conducted on this route toward indoles using as the dienophiles carboxyl-substituted acetylenes [7,8], several acyclic electron-deficient alkenes [8,9], maleic anhydride and/or *N*-phenylmaleimide with *N*-benzenesulfonyl-2-vinylpyrrole [9,10] and methyl 3-nitroacrylate with *N*-*p*-toluenesulfonyl-2-vinylpyrroles [11] (neither of which was taken through to the aromatic indole), tetrachloro- or tetrabromocyclopropene with *N*-*p*-toluenesulfonyl-2-vinylpyrrole [12], *N*-phenylmaleimide with *N*-methyl- and *N*-propanoyloxy-2-vinylpyrrole [9], *N*-H-maleimide with 3-(*N*-alkyl-2-pyrrolyl) acrylates [13] and *N*-alkyl-2-styrylpyrroles [13,14], and one report using various maleimides with both *N*-H and *N*-alkyl-2-vinylpyrroles [15]. Several of these studies report biological activity from this class of compounds, particularly anticancer activity [13–15]. To our knowledge, no prior broad study of the efficacy of the synthesis of indoles *via* Diels-Alder reactions of 5-unsubstituted 2-vinylpyrroles with *N*-substituted maleimides has been reported. In most of the earlier studies, only *N*-alkyl-substituted pyrroles were studied, presumably due to both the higher reactivity of *N*-H pyrroles and the formation of Michael-addition products between the adduct

Scheme 1. Synthesis of 2-vinylpyrroles.



and dienophile when certain *N*-H-2-vinylpyrroles are used in Diels-Alder reactions, reported here for the first time. None of the earlier studies has characterized the diastereoselective isomerism of the adduct, potentially valuable for synthetic applications. We report here the first demonstration of the use of chiral maleimides in Diels-Alder reactions with 2-vinylpyrroles.

Herein, we report 38 examples where indoles are conveniently available from oxidation of the corresponding tetrahydroindoles, formed *via* Diels-Alder reactions of both *N*-H and *N*-alkyl-2-vinylpyrroles with a wide range of *N*-substituted maleimides. We also report a highly diastereoselective isomerism of the Diels-Alder adduct, and isolation of Michael-addition products between the adduct and the dienophile with the major product being the more sterically congested diastereomer. Additionally, we report an improved synthesis of *N*-H-2-vinylpyrrole.

RESULTS AND DISCUSSION

Synthesis of starting materials. A Vilsmeier-Haack formylation [16] was performed on the appropriate pyrrole (**1a** and **1b**, Scheme 1) to give pyrrole-2-carboxaldehydes **2a** and **2b**. Next, a Wittig reaction was conducted on **2a** and **2b** or on commercially available **2c** and **2d** to form the appropriate vinylpyrrole **3–6** [7a,8,17,18]. Various procedures for the Wittig reaction were used to synthesize the vinylpyrroles. The common procedure for the synthesis of 2-vinylpyrroles [18,19] using sodium ethoxide as the base for formation of the ylide was used to make methyl-substituted vinylpyrroles **3a–3g**. For vinylpyrroles **3b**, **3c**, **3f**, and **3g**, this procedure gave ~1:3.9, 2.8:1, 1:1.8, and 1:1.5 *E*:*Z* molar mixtures, respectively, as determined by ^{1}H NMR, which were used without further purification for formation of the Diels-Alder adducts. Vinylpyrrole **3a** decomposed or polymerized [20] rapidly at room temperature (rt) to a dark viscous liquid before it could be used in any Diels-Alder reaction.

Although the sodium ethoxide procedure produced the desired *N*-H-2-vinylpyrrole **4**, it also consistently gave a 1:1 molar ratio of the unwanted and not easily separated byproduct 2-(1-ethoxyethyl)-pyrrole **7**. X-ray crystallography proved the structure of **7** (Fig. 1). The isolation of **7** was surprising, considering the lack of mention of this compound in any literature procedure for synthesis of **4**. Although the mixture of **4** and **7** was used as is for

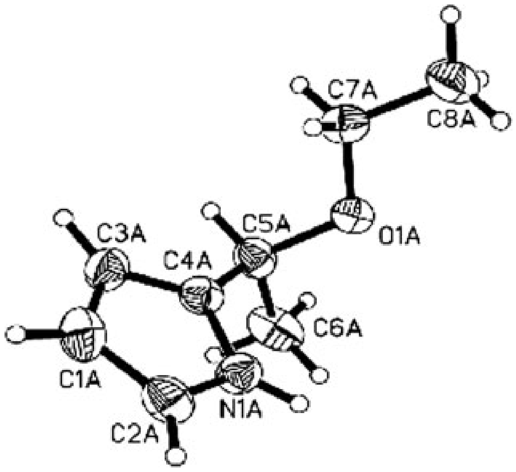


Figure 1. ORTEP representation of the X-ray structure of 2-(1-ethoxyethyl)pyrrole (**7**).

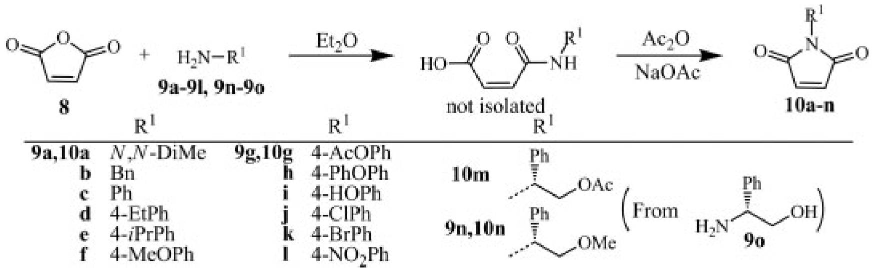
Scheme 2. Synthesis of maleimides.



formation of the Diels-Alder adducts, a search for a way to avoid contamination with this impurity was sought, which probably comes from an acid-catalyzed addition of ethoxide to the vinyl group in the expected Markovnikov orientation. Eliminating the acidic aqueous sodium bisulfite wash from the workup had no effect on the proportion of **7** formed. Heating the mixture of **4** and **7** in DMSO was attempted with the hope of effecting deethanolysis, which did occur, but with the destruction of a large amount of the desired **4**, probably from polymerization. It was found that using sodium *t*-butoxide in place of sodium ethoxide completely eliminated the byproduct and gave a higher efficiency than the sodium ethoxide procedure, with a consistent yield of ~80%, and less need for excess methyltriphenylphosphonium bromide and base (1.25 equiv) than was required for complete conversion using the sodium ethoxide procedure (2 equiv).

To determine whether the Diels-Alder reactions of 2-vinylpyroles with maleimides took place with the predicted *endo*-addition, vinylpyrroles with predominantly *E* or *Z* stereochemistry were desired. Ethyl- and pentyl-substituted vinylpyrroles **5a** and **5b** were made from aldehyde **2a** with the Corey procedure for the Wittig reaction [21], using methylsulfinyl carbanion as the base, formed from the reaction of DMSO with sodium hydride. ^{1}H NMR analysis showed that this procedure gave **5a** [18a] exclusively as the *Z* isomer and **5b** in a 1:9 *E*:*Z* mixture. For comparison of the stereochemistry in the resulting Diels-Alder adducts, (*E*)-2-(2-ethylvinyl)pyrrole **6** [18a] was synthesized using the Schlosser modification of the Wittig reaction [22], giving a 40% yield of an ~12:1 *E*:*Z* molar mixture.

Maleimides were synthesized by the typical procedure [23], by reaction of maleic anhydride **8** with the appropriate primary amine **9a–9l** and **9n–9o**, and then heating the resulting amide-acid in an excess of acetic anhydride (10 equiv) with sodium acetate (0.5 equiv), giving the corresponding *N*-substituted maleimide (**10a–10n**, Scheme 2). When the acid from reaction of **8** with (*R*)-(−)-phenylglycinol (**9o**) was cyclized, the primary alcohol group was acetylated, giving acetate **10m**. To make the chiral methyl ether **10n**, (*R*)-2-methoxy-1-phenylethanamine (**9n**) was synthesized by methylation of **9o** by reaction of sodium hydride followed by addition of methyl iodide [24].

Diels-Alder reactions. Diels-Alder reactions of 2-vinylpyrroles **3b–3g**, **4**, and **5a** with maleimides **10a–10f**, **10h**, **10m**, and **10n** in chloroform gave adducts **11–29**, **31**, and **39–51** (Scheme 3, Table 1). The chiral adducts **39–51** were not isolated but were taken directly through to the aromatic indoles **85–97** (Scheme 4). The reaction solution was refluxed, if necessary, and stopped when complete, as indicated by TLC. Alternatively, the Diels-Alder reactions of 2-vinylpyrroles **5** and **6** with maleimides **10c**, **10d**, **10g**, and **10i–10l** were run in refluxing toluene, giving adducts **30–38**. In both procedures, vinylpyrroles **3–6** were used in slight excess (1.1 equiv) to simplify the required chromatographic purification procedure, because, while the vinylpyrroles were always eluted first, unreacted maleimides generally were eluted very near to the adducts. The unrearranged adducts were not isolated in any case; instead, the rearomatized form of the adducts was obtained. Although an extensive case-by-case comparison of the efficiency of the two procedures was not undertaken, adduct **31** was produced in both chloroform (70% yield) and toluene (41%). Further, comparing the average yield of the toluene-procedure-derived products **30–38** (38%) to the average yield of the chloroform-procedure-derived products **12**, **14**, **15**, **17–29**, and **31** (73%), the chloroform procedure gave better yields.

To determine whether *endo*- or *exo*-addition was predominant, the orientation of a terminal substituent on the vinyl group of the pyrrole was studied in the resulting isomerized adducts using nuclear Overhauser effect (NOE) experiments (Fig. 2). For description of the orientation, the diastereomer with the *syn* 3a-H and 8b-H protons (Fig. 3) protruding from the α-face and the fused maleimide protruding from the β-face will always be used, corresponding to the structures at the top of Figure 2, this convention is also used throughout the Experimental.

2-(2-Methylvinyl)-pyrroles **3b** and **3f** gave the expected mixture of 4α-Me and 4β-Me in rearranged adducts **24–29**, expected for either *endo*- or *exo*-

addition. (*Z*)-2-Vinylpyrroles **5a** and **5b** gave adducts **30–37** with exclusively 4α-Et and 4α-*n*-pentyl substituents, as shown by ^{1}H NMR analysis. Correspondingly, adduct **38** from the *E*-vinylpyrrole **6** had mainly 4β-Me with ~12:1 ratio of 4β-Et to 4α-Et product. To the extent of ^{1}H NMR sensitivity, this is strong evidence of predominantly *endo*-addition Diels-Alder reactions.

The spontaneous rearrangement of Diels-Alder adducts to their aromatic counterparts was also observed in our previous work with *in situ* Diels-Alder reactions of 2-vinylpyrrole with maleimides [5]. As noted in that work, because orbital symmetry considerations forbid suprafacial 1,3-hydride shifts and antarafacial 1,3-hydride shifts are geometrically difficult [25], the isomerism probably takes place *via* acid catalysis, a "formal 1,3-hydride shift" [26]. A proton should approach from the least sterically hindered face of the adduct, the opposite face from which the maleimide protrudes and the same face from which the 8b-H and 3a-H protons protrude (the α-face); thus, the 5-H proton of the rearranged adduct would have the predominant orientation of α. The predominance of a particular diastereomer was observed in our earlier work [4,5], and to verify it occurred here as well, NOE experiments were performed on the rearranged adducts **22** and **23**, which had a methyl substituent at the 5-postion; compound **21** had overlapping ^{1}H NMR peaks which prevented accurate measurement of NOE interactions. The assignment of the two peaks corresponding to the 4α-H and 4β-H protons was confirmed by a weak NOE interaction between the 8bα-H and 4α-H protons, whereas no interaction between the 8bα-H and 4β-H protons was observed. Additionally, a much stronger interaction was observed between the 3aα-H and 4α-H protons than between the 3aα-H and 4β-H protons. A strong NOE interaction between the 4α-H and 5-H protons occurred, with no

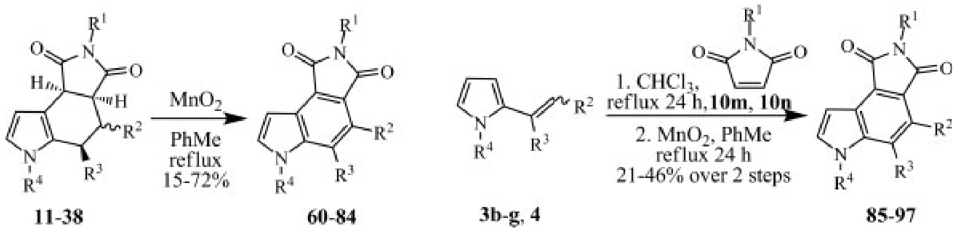
[a] Yields for chiral indoles are over two steps.

[b] Crude yields for adducts **11** (64%), **13** (92%), and **16** (90%) include double-addition type products detected by TLC but not isolated.

[c] Product was deacetylated to **81** during the reaction or workup.

[d] Only starting material **33** was recovered, but see note c above.

Scheme 4. Aromatization of Diels-Alder adducts.



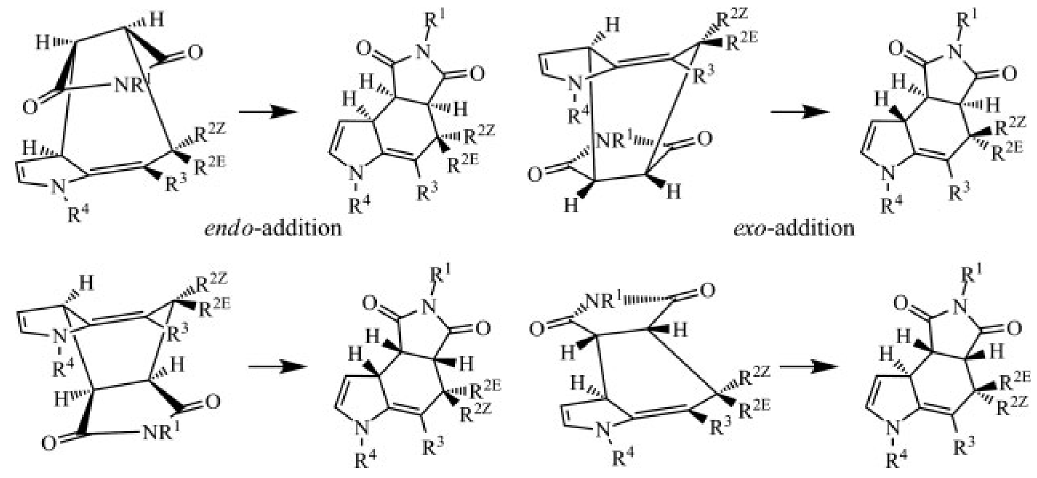


Figure 2. Effect of *endo*- or *exo*-addition on the stereochemistry of Diels-Alder adducts.

detectable interaction between the 4α-H proton and the 5-methyl group. Correspondingly, a strong NOE interaction was seen between the 4β-H proton and the 5-methyl group, whereas no detectable response was observed between the 4β-H and 5-H protons, showing the 5-methyl group to be in the β-orientation. The ^{1}H NMR integrations of **21–23** showed between a 13:1 and 54:1 molar ratio of major to minor product, a 93–98% diastereomeric excess. The predominant diastereomers had the sterically more congested configuration, with the 5-methyl group protruding from the same face as the maleimide.

The high diastereoselectivity of the formal 1,3-hydride shift is further evidenced from products **52–59**. These types of products were detected whenever unsubstituted vinylpyrrole **4** was used in Diels-Alder reactions with maleimides, where they were isolated and characterized in four reactions. Compound **56** was not completely separated from **52**, although sufficient purity was obtained to accurately report ^{1}H NMR data. In several cases, these products were detected by TLC but not isolated, although their masses were included in determining the percent yield; hence, yields for products **11**, **13**, and **16** do not reflect the actual isolated yield. NOE studies of **55** and **59** verified the structure of products **52–59**, giving evidence of the same kind of stereochemistry as described earlier for the 5β-Me adducts **22** and **23** (Fig. 4).

For minor product **59**, an NOE interaction was observed between the 8bα-H proton and a geminal proton of the succinimide substituent, an interaction absent in major product **55**. In **55**, an interaction between the 8bα-H and 4α-H protons showed a *syn*-relationship. Multiple strong interactions were observed in compound **55** between the 4β-H proton and the succinimide protons, whereas no such interactions were observed with the 4α-H proton, giving evidence that the succinimide is attached to the β-face in the major product. In compounds **52–59**, the stereochemistry of the succinimidyl proton at the point of attachment was not determined. However, coupling constants and NOE interactions between the geminal protons of the succinimide and the succinimidyl proton at the point of attachment did allow determination of a probable *syn*- or *anti*-relationship. In compound **55**, the ^{1}H NMR peaks of the 5α-H proton

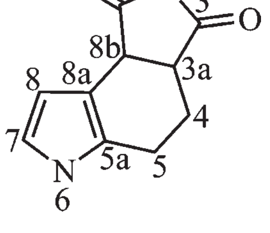

Figure 3. Numbering scheme.

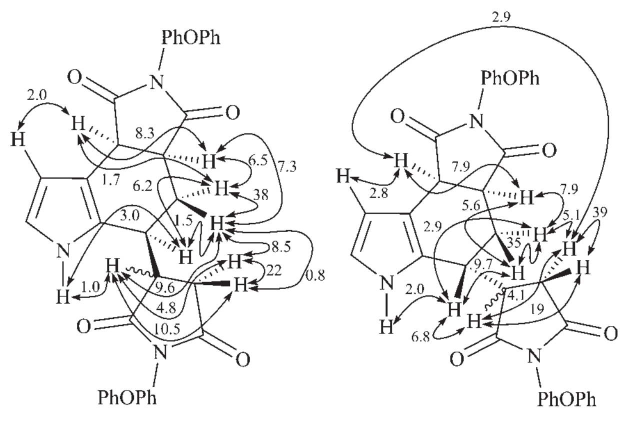

55

59

Figure 4. NOE experiments. *Numbers indicate % enhancement.

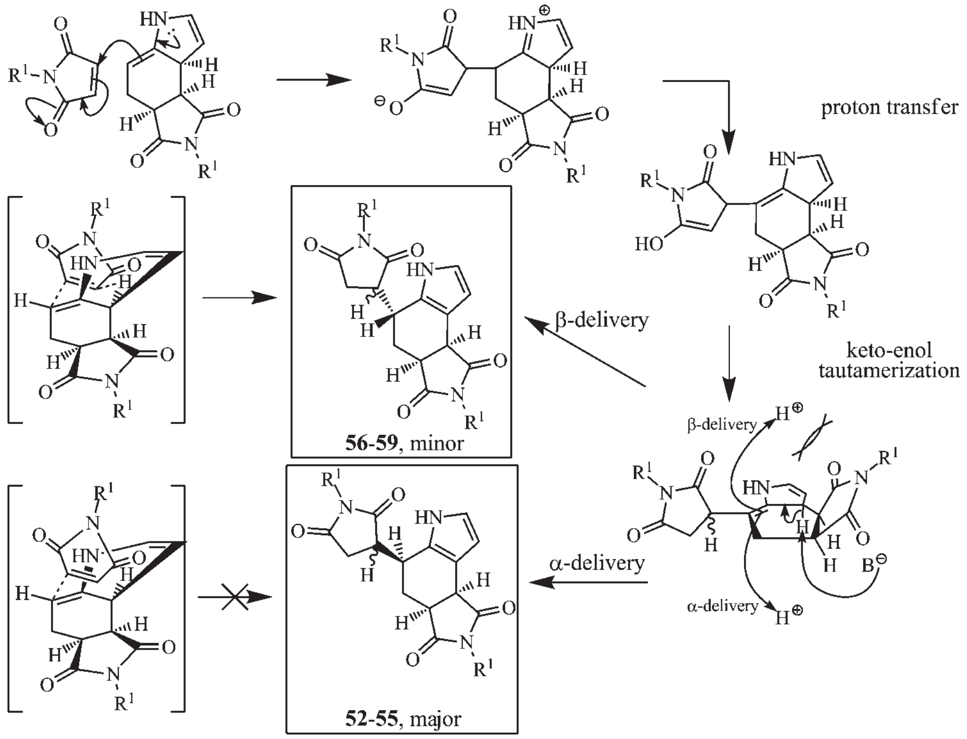

Figure 5. Proposed mechanism for the formation of **52–59**.

and the proton at the point of succinimide attachment overlapped too greatly to allow accurate measurement of NOE interactions.

When first detected, products **52–59** were assumed to be the result of ene-reactions between the Diels-Alder adduct and the maleimide, as there are several reports of ene-products formed between Diels-Alder adducts and their corresponding dienophiles [27]. However, after determining the stereochemistry at C5, it was realized that an ene reaction could not adequately explain the formation of both epimers. Although an ene reaction could justify the formation of minor products **56–59**, the tight transition state required [28] makes the ene reaction an impossible route toward major products **52–55** (Fig. 5). Because the more sterically congested epimers **52–55** were the predominant products, thermodynamic equilibration of the feasibly ene-reaction-formed **56–59** is also highly unlikely.

In light of the diastereoselective rearrangement at C5 noted in this work and in our earlier *in situ* Diels-Alder reaction work [4,5], it was realized that our mechanistic explanation for formation of the rearranged adducts could also explain the formation of **52–59**. A Michael-addition of the unrearranged adduct to the maleimide would result in 5-succinimide-substituted adducts. When a proton approaches the molecule to cause the formal 1,3-hydride shift, an addition from the least sterically congested face (the α-face in the Figures) would predominate and would result in products **52–55**, with a smaller amount of hydrogen delivery occurring from the more sterically occluded face to give minor products **56–59**. The presence of the succinimide substituent at C5 may cause the steric environment of the α-face to be more similar to the β-face than does a 5-methyl group; this would explain the 3:1–5:1 ratios of products **52–59** (75–83% *de*) as contrasted with the higher diastereomeric excess observed in 5-methyl products **21–23** (93–98% *de*).

Aromatization of Diels-Alder adducts. Diels-Alder adducts **11–32**, **34–36**, and **39–51** were dehydrogenated using activated MnO_2, giving the corresponding indoles **60–84** in 15–72% yield and giving chiral indoles **85–97** with 21–46% yield over two steps (Scheme 4, Table 1). Using manganese sulfate with potassium permanganate [29] to make the activated MnO_2 gave consistent and moderate-yielding aromatizations. Some restrictions to this technique apply, as when aromatization of hydroxyl-adduct **33** was attempted, only starting material was obtained. Competition for adsorption on the oxide surface of the activated MnO_2 from the phenol group of **33** may have partially deactivated the reagent. When MnO_2 treatment of acetoxy-adduct **32** was conducted, the hydroxy-indole **81** was the exclusive product isolated. When oxidation occurs, water can be produced, but deacetylation appears to be unprecedented under these oxidative conditions; therefore, the aromatized product was more likely deacetylated on silica gel during chromatography, giving **81**. Aromatization and purification of chiral adducts **39–44** gave indoles **85–90** with no deacetylation.

Biological activity. While participating in the Developmental Therapeutics Program at the National Cancer Institute (NCI), we submitted 11 compounds to the NCI for a one-dose 60 human tumor cell line prescreen: compounds **12**, **14**, **17**, **30**, **32**, **33**, **61**, **63**, **66**, and **79**. Of these, two compounds, **63** and **66**, were judged by the NCI to have sufficient activity to justify screening with 60 human tumor cell lines at five concentrations with 10-fold dilutions, from 1×10^{-4} to 1×10^{-8} M. Both of these compounds were found to have high levels of activity against many of the 60 different cell lines tested. Compound **63** was most active against non–small-cell lung cancer HOP-92 and melanoma cell lines SK-MEL-5 and LOX IMVI with an IC_{50} of 322, 412, and 462 ng/mL, respectively. Compound **66** was most active against breast cancer HS 578T, melanoma UACC-257, and leukemia RPMI-8226, with an IC_{50} of 3.5, 34, and 230 ng/mL, respectively.

CONCLUSIONS

Variously substituted 2-vinylpyrroles undergo *endo*-addition Diels-Alder additions with maleimides, followed by a highly diastereoselective (93–98% *de*) rearrangement to tetrahydroindoles in moderate to excellent yield. Treatment with activated MnO_2 in refluxing toluene gives the corresponding indole aromatized products in moderate to good yield. This highly convergent methodology for formation of indoles is flexible and the starting materials are conveniently prepared.

EXPERIMENTAL

General. Solvents and reagents were purchased and used as received. Flash chromatography was performed using 230–450 mesh silica gel. TLC analyses were performed on plastic-backed plates precoated with 0.2-mm silica with F_{254} indicator. Infrared spectra were recorded on a 4000 FTIR spectrometer; only the most intense and/or diagnostic peaks are reported. High-resolution mass spectra were recorded with a time-of-flight instrument using electrospray ionization with PEG as an internal calibrant. For NMR spectra, chemical shifts (δ) were referenced to the solvent. ^{13}C NMR spectra were proton decoupled. Melting points are uncalibrated. Elemental analyses were performed by M-H-W Laboratories, Phoenix, AZ. Petroleum ether refers to the fraction boiling at 35–60°C.

^{1}H NMR analysis. In the ^{1}H NMR spectra of adducts **11–38**, the 8bα-H proton often appears as a doublet of doublet of doublets in 5-unsubstituted adducts; COSY experiments indicate that the 8bα-H proton is coupled not only to the 3aα-H proton but also to the 5-bond-distant 5-H protons with a coupling constant of about 1.5 Hz [10,30]. In 5-methyl adducts, the 3aα-H proton was sometimes observed to couple to the 5α-H proton at 0.6–0.9 Hz. Additionally, in 4-alkyl adducts, the 3aα-H proton was coupled to the 5α-H proton at ~1.0 Hz. For indoles **60–97**, the 8-H proton and the 5-H proton were consistently coupled at about 1.0 Hz [31].

General methods for the preparation of vinylpyrroles. ***Method I.*** Sodium ethoxide (0.125 mol, 2.5 equiv, made freshly from sodium (2.87 g, 0.125 mol, 2.5 equiv) and EtOH followed by evaporation using a rotating evaporator) was suspended with the appropriate alkyltriphenylphosphonium bromide (0.1 mol, 2 equiv) in THF (50 mL) [18,19]. The mixture was stirred at rt under nitrogen for 3 h. Then, a solution of the appropriate pyrrole-2-carboxaldehyde **2a** or **2b** or 2-acetylpyrrole **2c** or **2d** (0.05 mol) in THF (20 mL) was added over 1 min, and the mixture was stirred under reflux for 15 h. The solvent was removed using a rotating evaporator, the residue was suspended in dichloromethane and filtered, and the filter cake was washed with dichloromethane (3 × 50 mL). The filtrate was washed with saturated $NaHSO_3$ (50 mL), saturated Na_2CO_3 (50 mL), and brine (50 mL), and dried over Na_2SO_4. The solvent was removed using a rotating evaporator and the crude product was vacuum-distilled, giving the appropriate pure 2-vinylpyrrole (with the exception of **4**, see later) at comparable 60% yield [18,19]. When method I was used to generate vinylpyrrole **4**, **7** was found to be an unwanted byproduct in an ~1:1 molar ratio to the desired product. This mixture was used without further purification in subsequent Diels-Alder reactions.

Method II. Potassium *t*-butoxide (14.76 g, 0.132 mol, 1.25 equiv) was added slowly to methyltriphenylphosphonium bromide (46.98 g, 0.132 mol, 1.25 equiv) in THF (100 mL) at 0°C. Formation of the bright yellow color characteristic of the ylide was observed immediately. The mixture was stirred at rt under nitrogen for 30 min and then cooled to 0°C. A solution of the pyrrole **2a** (10.00 g, 0.105 mmol) in THF (20 mL) was added over 5 min, with stirring, and refluxed for 30 min until TLC analysis indicated the reaction was complete. The mixture was allowed to cool to rt and filtered. The filter cake was washed with diethyl ether (4 × 25 mL). The filtrate was washed with saturated $NaHSO_3$ (50 mL), saturated Na_2CO_3 (50 mL), and brine (50 mL), and dried over anhydrous Na_2SO_4. The solvents were removed using a rotating evaporator and the residue was vacuum-distilled, giving **4** as a colorless liquid (7.66 g, 78%). The ^{1}H and ^{13}C NMR data matched the values in the literature [18,19].

For Diels-Alder reactions, vinylpyrroles **5a** and **5b** were synthesized using Corey's procedure for the Wittig reaction [21], and method I was used to synthesize vinylpyrroles **3a–g**. However, for purposes of characterization **3a–c**, **3e–f**, and **5b** were synthesized using method II.

2-(2-Propenyl)-1H-pyrrole (3a). Method II with **2c** (3.16 g, 0.029 mol) and distillation at 37°C/0.04 mm Hg gave **3a** (436 mg, 14%) as a white waxy solid [17a]: mp 71–73°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.32 (bs, 1H, 1-H), 6.82 (ddd, *J* = 2.8, 2.8, 1.4 Hz, 1H, 5-H), 6.37 (dddd, *J* = 3.1, 3.1, 1.7, 1.3 Hz, 1H, 3-H), 6.32 (dddd, *J* = 3.3, 2.6, 2.6, 0.9 Hz, 1H, 4-H), 5.09–5.11 (m, 1H, 1′-H *cis* to pyrrole), 4.91–4.93 (m, 1H, 1′-H *trans* to pyrrole), 2.17 (ddd, *J* = 1.6, 0.8, 0.8 Hz, 3H, 3′-H); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 135.1, 133.2, 118.8, 109.5, 107.0, 105.7, 20.8; IR (thin film, cm^{-1}) 3450(bs), 3400(s), 2969(s), 2925(m), 2840(w), 1634(m), 1597(m), 1557(w), 1499(w), 1470(m), 1403(m), 1235(m), 1110(w), 1035(m); HRMS *m*/*z* (M + H$^+$) calcd. for C_7H_9N: 108.0808, found 108.0815.

2-(1-Propenyl)-1H-pyrrole (3b). Method II with **2a** (2.66 g, 0.028 mol) and distillation at 35.5°C/0.05 mm Hg gave **3b** (2.32 g, 77%) as a white solid [17b,18a]: 1.0:3.9 *E*:*Z*; mp 27–28°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 8.10 (bs, 1H, 1-H), 6.82 (ddd, *J* = 2.6, 2.6, 1.4 Hz, 1H, 5maj-H), 6.74 (ddd, *J* = 2.7, 2.7, 1.4 Hz, 1H, 5min-H), 6.22–6.42 (m, 3H, 3-H, 4-H, 1′-H), 5.80–5.93 (m, 1H, 2′min-H), 5.61–5.74 (m, 1H, 2′maj-H), 2.03–2.07 (m, 3H, 3′maj-H), 1.93–1.97 (m, 3H, 3′min-H); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 130.4, 122.2, 121.8, 120.9, 120.4, 118.0, 117.8, 109.6, 109.4, 109.0, 106.6, 18.5, 15.2; IR (thin film, cm^{-1}) 3469(s), 3396(bs), 3107(w), 3024(m), 2963(m), 2950(m), 2935(m), 2857(w), 1642(m), 1603(w), 1546(w), 1459(m), 1409(w), 1366(m), 1294(w), 1278(w), 1216(w), 1118(m), 1098(m), 1032(m), 957(w), 800(s); HRMS *m*/*z* (M + H$^+$) calcd. 108.0808, found 108.0802. 2-(2-But-2-enyl)-N-methyl-1H-pyrrole (3g). Method II with **2d** (3.50 g, 0.032 mol) and distillation at 31.5°C/0.04 mm Hg gave **3g** (1.01 g, 23%) as a colorless liquid: 1.0:1.5 *E*:*Z*; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 6.70 (ddd, *J* = 2.7, 1.8, 1.8 Hz, 1H, 5maj-H), 6.64 (ddd, *J* = 2.7, 2.0, 2.0 Hz, 1H, 5min-H), 6.24 (ddd, *J* = 3.5, 2.4, 2.4 Hz, 1H, 3maj-H), 6.18 (ddd, *J* = 3.6, 2.4, 2.4 Hz, 1H, 3min-H), 6.10 (dddd, *J* = 3.9, 3.9, 2.0, 2.0 Hz, 1H, 4min-H), 6.02 (dddd, *J* = 3.8, 3.8, 2.0, 2.0 Hz, 1H, 4maj-H), 5.74–5.84 (m, 1H, 3′maj-H), 5.60–5.69 (m, 1H, 3′min-H), 3.68 (d, *J* = 2.1 Hz, 3H, 1min-CH$_3$), 3.57 (d, *J* = 1.8 Hz, 3H, 1maj-CH$_3$), 2.04–2.06 (m, 3H, 1′-H), 1.85–1.90 (m, 3H, 4′min-H), 1.59–1.64 (m, 3H, 4′maj-H); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 137.7, 133.6, 129.1, 128.1, 126.3, 124.1, 122.7, 121.4, 107.4, 107.1, 106.8, 33.3, 34.0, 25.5, 17.3, 15.5, 14.2; IR (thin film, cm^{-1}) 3106(m), 3026(m), 2943(m), 2918(m), 2884(m), 2857(w), 2810(w), 1703(w), 1638(m), 1484(s), 1451(m), 1367(w), 1305(s), 1261(w), 1228(w), 1091(m), 1058(w), 1009(w), 954(m), 789(m), 648(s), 605(m); HRMS *m*/*z* (M + H$^+$) calcd. for $C_9H_{13}N$: 136.1121, found 136.1124.

2-Ethenyl-1H-pyrrole (4). Method II with **2a** (10.00 g, 0.105 mol) and distillation at 30°C/0.04 mm Hg gave **4** (7.66 g, 78%) as a colorless liquid [18,19]; the ^{1}H and ^{13}C NMR data matched the literature values [18,19]. Anal. Calcd. for C_6H_7N: C, 77.38; H, 7.58; N, 15.04. Found: C, 77.17; H, 7.67; N, 14.83.

2-(1-Heptenyl)-1H-pyrrole (5b). Method II with **2a** (2.91 g, 0.031 mol) and distillation at 68°C/0.04 mm Hg gave **5b** (4.40 g, 81%) as a colorless liquid: 1.0:9.0 *E*:*Z*; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 8.10 (bs, 1H, 1-H), 6.81 (ddd, *J* = 2.3, 2.3, 1.7 Hz, 1H, 5maj-H), 6.74 (ddd, *J* = 2.6, 2.6, 1.4 Hz, 1H, 5min-H), 6.21–6.37 (m, 3H, 3-H, 4-H, 1′-H), 5.85 (ddd, *J* = 16.1, 7.0, 7.0 Hz, 1H, 2′min-H), 5.53 (ddd, *J* = 12.8, 6.8, 5.8 Hz, 1H, 2′maj-H), 2.45 (ddt, *J* = 7.3, 7.2, 1.8 Hz, 2H, 3′maj-H), 2.25 (dt, *J* = 7.2, 7.1, 1.5 Hz, 2H, 3′min-H), 1.34–1.65 (m, 6H, 4′-H, 5′-H, 6′-H), 1.01 (t, *J* = 7.2 Hz, 3H, 7′-H); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 134.0, 133.7, 130.3, 128.9, 128.8, 128.7, 128.6, 126.3, 120.5, 119.0, 117.8, 117.7, 109.6, 109.4, 108.9, 106.7, 32.9, 31.8, 31.5, 29.4, 29.4, 22.7, 14.2; IR (thin film, cm^{-1}) 3469(s), 3392(bs), 3105(m), 3014(m), 2957(s), 2926(s), 2857(s), 1712(w), 1639(m), 1545(w), 1460(m), 1434(m), 1412(m), 1379(m), 1293(w), 1280(w), 1212(w), 1182(w), 1118(m), 1095(m), 1033(m), 955(m), 799(m), 949(m); HRMS *m*/*z* (M + H$^+$) calcd. 164.1434, found 164.1434. Anal. Calcd. for $C_{11}H_{17}N$: C, 80.93; H, 10.50; N, 8.58. Found: C, 81.07; H, 10.32; N, 8.74.

2-(1-Ethoxyethyl)-N-methyl-1H-pyrrole (7). A 1:1 molar mixture of **4** and **7**, prepared using method I, was left in a refrigerator for 6 months, giving large colorless crystals of **7**. The crystals were removed and the liquid **4** was washed off using ice-cold petroleum ether, giving colorless crystals: mp 26.5–28.5°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.39 (bs, 1H, 1-H), 6.78 (ddd, J = 2.6, 2.6, 1.6 Hz, 1H, 5-H), 6.16 (ddd, J = 3.3, 2.7, 2.5 Hz, 1H, 4-H), 6.08 (ddd, J = 3.5, 2.6, 1.5 Hz, 1H, 3-H), 4.55 (q, J = 6.6 Hz, 1H, 1′-H), 3.44 (dq, J = 12.0, 7.0 Hz, 1H, OCH_2CH_3), 3.40 (dq, overlapped, J = 11.7, 7.0 Hz, 1H, OCH_2CH_3), 1.51 (d, J = 6.6 Hz, 3H, 2′-H), 1.19 (dd, J = 6.9, 7.2 Hz, 3H, OCH_2CH_3); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 133.7 (C2), 117.5 (C5), 107.9 (C4), 106.0 (C3), 71.1 (C1′), 63.4 (OCH_2CH_3), 21.7 (C2′), 15.5 (OCH_2CH_3); IR (film, cm^{-1}) 3464(m), 3322(w), 3054(m), 2980(m), 2933(w), 2873(w), 1446(w), 1422(w), 1373(w), 1325(w), 1266(s), 1151(w), 1086(m), 1028(w), 1006(w), 896(w), 796(w), 739(s), 707(s). X-ray data for **7** in CIF format are available in the Supporting Information.

General method for the synthesis of chiral maleimides. The primary amine (0.070 mol) dissolved in a large excess of diethyl ether (100 mL) was added over 20 min using a dropping funnel to a 2-L flask containing maleic anhydride (6.85 g, 0.070 mol, 1 equiv) dissolved in diethyl ether (500 mL) [23]. Throughout the addition, the mixture turned into a thick off-white suspension. The suspension was concentrated to half-volume, cooled in the freezer, and vacuum-filtered, giving the crude acid as a thick paste. Acetic anhydride (300 mL) and sodium acetate (2.87 g, 0.035 mol, 0.5 equiv) were added to the crude acid and the mixture was heated to 100°C in a boiling water bath for 2 h. The mixture was then cooled to rt, diluted with water (200 mL), and portions of $NaHCO_3$ were added slowly with vigorous stirring until the acetic acid was nearly neutralized. The solution was extracted with ether (3 × 200 mL), and the organic extracts were washed with saturated $NaHCO_3$ until neutral, then washed with water (100 mL) and brine (100 mL), and dried over anhydrous Na_2SO_4. The solvent was removed using a rotating evaporator and the product was purified using flash chromatography on silica gel using ethyl acetate/hexanes to give the pure chiral maleimide in moderate yield (~50%).

(+)-(R)-2-(2,5-Dioxo-1H-pyrrol-1-yl)-2-phenylethyl acetate (10m). The general method gave **10m** (8.167 g, 45%) as a light-red oil: $[\alpha]^{23}{}_D$ +1.7 (c 10.0, $CHCl_3$); ^{1}H NMR (300 MHz, $CDCl_3$, δ) 7.43–7.46 (m, 2H, Ph), 7.33–7.40 (m, 3H, Ph), 6.71 (s, 2H, vinyl-H), 5.43 (dd, J = 10.5, 5.4 Hz, 1H, 2′-H), 4.99 (dd, J = 11.1, 10.5 Hz, 1H, 1′-H), 4.71 (dd, J = 11.1, 5.4 Hz, 1H, 1′-H), 2.04 (s, 3H, OAc); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 170.7, 170.6, 135.9, 134.3, 128.9, 128.6, 128.0, 62.4, 53.6, 20.8; IR (film, cm^{-1}) 3465(m), 3101(m), 2950(w), 1743(s), 1713(s), 1399(s), 1370(s), 1232(s), 1163(m), 1043(m), 828(m), 696(s); HRMS m/z (M + Na^+) calcd. for $C_{14}H_{13}NO_4$: 282.0738, found 282.0740.

(+)-(R)-1-(2-Methoxy-1-phenylethyl)-1H-pyrrole-2,5-dione (10n). The general method gave **10n** (7.608 g, 47%) as white crystals: mp 55–56°C; $[\alpha]^{23}{}_D$ +22.5 (c 1.0, $CHCl_3$); ^{1}H NMR (300 MHz, $CDCl_3$, δ) 7.41–7.45 (m, 2H, Ph), 7.30–7.38 (m, 3H, Ph), 6.68 (s, 2H, vinyl-H), 5.38 (dd, J = 10.5, 5.4 Hz, 1H, 1′-H), 4.46 (dd, J = 11.2, 11.2 Hz, 1H, 2′-H), 3.82 (dd, J = 10.9, 5.4 Hz, 1H, 2′-H), 3.39 (s, 3H, OCH_3); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 171.0, 137.0, 134.2, 128.8, 128.3, 128.0, 70.8, 58.8, 54.3; IR (film, cm^{-1}) 3460(bm), 3095(m), 2915(m), 2810(w), 1706(s), 1400(m), 1368(m), 1154(w), 1110(m), 826(m), 696(s); HRMS m/z (M + Na^+) calcd. for $C_{13}H_{13}NO_3$: 254.0783, found 254.0783.

General method for Diels-Alder reactions. A mixture of the vinylpyrrole (0.0050 mol, 1.1 equiv) and the maleimide (0.0045 mol) (1) in chloroform (20 mL) was stirred at rt for 24 h and, if TLC analysis indicated maleimide remaining, the mixture was also refluxed for 24 h (method A) or (2) in toluene (20 mL) was refluxed for 24 h (method B). The solvent was removed using a rotating evaporator. The crude adduct was purified with flash chromatography or MPLC with ethyl acetate/hexanes as eluent, except in the case of chiral adducts, which were used without further purification in the next step.

General method for the dehydrogenation of Diels-Alder adducts. A mixture of the adduct (3.76 mmol) and activated MnO_2 [29] (18.8 mmol, 5 equiv) in toluene (30 mL) was refluxed for 2–3 h until the reaction was complete, as indicated by TLC (method C), or refluxed for 24 h (method D). For dehydrogenation of chiral adducts, the crude Diels-Alder reaction product was placed in toluene (30 mL) along with activated MnO_2 (5 equiv) and refluxed for 24 h (method E). The mixture was cooled to rt and filtered through a fine glass frit. The insoluble manganese salts were washed with several portions of dichloromethane until the washings ran clear (5 × 20 mL), and the combined organic filtrate and washings were evaporated to dryness using a rotating evaporator. Flash chromatography or MPLC with ethyl acetate/hexanes as eluent provided the desired product in good yields.

2-Dimethylamino-3aα,4,5,8bα-tetrahydro-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (11). Method A with vinylpyrrole **4** and maleimide **10a** gave **11** (597 mg, 64% crude yield, including contamination from double-addition type products, detected by TLC; the crude adduct was recrystallized from methylene chloride/petroleum ether, giving the pure compound, but the isolated yield is not available) as a light-brown powder: mp 56–57°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.02 (bs, 1H, 6-H), 6.68 (dd, J = 2.7, 2.7 Hz, 1H, 7-H), 6.37 (dd, J = 2.9, 2.9 Hz, 1H, 8-H), 3.89 (ddd, J = 8.1, 1.4, 1.4 Hz, 1H, 8bα-H), 3.18 (ddd, J = 7.8, 5.4, 5.4 Hz, 1H, 3aα-H), 2.84 (s, 6H, $N(CH_3)_2$), 2.57–2.65 (m, 2H, 5α-H and 5β-H), 2.34 (dddd, J = 13.6, 5.1, 5.1, 5.1 Hz, 1H, 4β-H), 2.00 (dddd, J = 13.7, 8.6, 6.3, 5.1 Hz, 1H, 4α-H); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 177.6, 176.7, 127.1, 117.2, 109.9, 107.7, 44.0, 38.8, 38.7, 22.2, 19.5; IR (film, cm^{-1}) 3361(bs), 2930(m), 1777(w), 1711(s), 1448(w), 1369(m), 1200(m), 1147(m), 719(w); HRMS m/z (M + Na^+) calcd. 256.1057, found 256.1057. Anal. Calcd. for $C_{12}H_{15}N_3O_2$: C, 61.79; H, 6.48; N, 18.01. Found: C, 61.59; H, 6.32; N, 17.90.

2-Benzyl-3aα,4,5,8bα-tetrahydro-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (12). Method A with vinylpyrrole **4** and maleimide **10b** gave **12** (258 mg, 23%) as a colorless oil; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 7.98 (bs, 1H, 6-H), 7.24–7.29 (m, 5H, Ph), 6.68 (dd, J = 2.7, 2.7 Hz, 1H, 7-H), 6.37 (dd, J = 2.7, 2.7 Hz, 1H, 8-H), 4.64 (AA′ d, J = 14.4 Hz, 1H, Bn), 4.58 (AA′ d, J = 14.1 Hz, 1H, Bn), 3.98 (ddd, J = 8.1, 1.2, 1.2 Hz, 1H, 8bα-H), 3.24 (ddd, J = 7.8, 5.1, 5.1 Hz, 1H, 3aα-H), 2.61 (dddd, J = 16.0, 5.3, 5.3, 0.9 Hz, 1H, 5β-H), 2.51 (dddd, J = 15.4, 9.9, 5.4, 0.9 Hz, 1H, 5α-H), 2.37 (dddd, J = 13.5, 4.8, 4.8, 4.8, 1H, 4β-H), 1.99 (dddd, J = 13.7, 9.8, 5.5, 5.3 Hz, 1H, 4α-H); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 179.0, 178.0, 136.0, 128.7, 128.4, 127.8, 127.2, 117.2, 110.4, 107.6, 42.3, 40.4, 40.1, 22.2, 19.6; IR (KBr, cm^{-1}) 3450s, 3100w, 2924m, 2980w, 1701s; HRMS *m/z* (M + Na$^+$) calcd. 303.1105, found 303.1093. Anal. Calcd. for $C_{17}H_{16}N_2O_2$: C, 72.84; H, 5.75; N, 9.99. Found: C, 72.92; H, 5.75; N, 9.43.

2-Phenyl-3aα,4,5,8bα-tetrahydro-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (13). Method A with vinylpyrrole **4** and maleimide **10c** gave **13** (980 mg, 92% crude yield, including contamination from double-addition type products, detected by TLC; the crude adduct was recrystallized from methylene chloride/petroleum ether, giving the pure compound, but the isolated yield is not available) as a light-brown powder: mp 155–156°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 7.95 (bs, 1H, 6-H), 7.41–7.47 (m, 2H, Ph), 7.33–7.39 (m, 1H, Ph), 7.23–7.28 (m, 2H, Ph), 6.70 (dd, *J* = 2.9, 2.9 Hz, 1H, 7-H), 6.41 (dd, *J* = 2.6, 2.6 Hz, 1H, 8-H), 4.15 (ddd, *J* = 8.1, 1.4, 1.4 Hz, 1H, 8bα-H), 3.45 (ddd, *J* = 8.1, 5.0, 5.0 Hz, 1H, 3aα-H), 2.63–2.67 (m, 2H, 5α-H and 5β-H), 2.53 (dddd, *J* = 13.6, 4.5, 4.5, 4.5 Hz, 1H, 4β-H), 2.06 (dddd, *J* = 13.4, 8.3, 7.6, 5.2 Hz, 1H, 4α-H); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 178.3, 177.3, 132.1, 129.1, 128.4, 127.3, 126.4, 117.3, 110.2, 107.7, 40.5, 40.4, 22.0, 19.4; IR (film, cm^{-1}) 3374(bs), 2857(m), 1775(w), 1707(s), 1596(w), 1498(m), 1383(m), 1177(m), 1064(m), 793(m), 723(m); HRMS *m/z* (M + Na$^+$) calcd. 289.0948, found 289.0947. Anal. Calcd. for $C_{16}H_{14}N_2O_2$: C, 72.16; H, 5.30; N, 10.52. Found: C, 71.96; H, 5.43; N, 10.57.

2-(4-Ethylphenyl)-3aα,4,5,8bα-tetrahydro-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (14). Method A with vinylpyrrole **4** and maleimide **10d** gave **14** (577 mg, 49%) as a white powder: mp 144–146°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 7.93 (bs, 1H, 6-H), 7.26 (d, *J* = 8.9, 2H, Ph), 7.15 (d, *J* = 8.4 Hz, 2H, Ph), 6.70 (dd, *J* = 2.6, 2.6 Hz, 1H, 7-H), 6.41 (dd, *J* = 2.7, 2.7 Hz, 1H, 8-H), 4.13 (ddd, *J* = 7.8, 1.4, 1.4 Hz, 1H, 8bα-H), 3.43 (ddd, *J* = 8.1, 5.0, 5.0 Hz, 1H, 3aα-H), 2.63–2.71 (m, 2H, 5α-H and 5β-H), 2.66 (q, overlapped, *J* = 7.6 Hz, 2H, CH_2CH$_3$), 2.52 (dddd, *J* = 13.7, 4.6, 4.6, 4.6 Hz, 1H, 4β-H), 2.06 (dddd, *J* = 13.4, 8.4, 7.3, 5.1 Hz, 1H, 4α-H), 1.23 (t, *J* = 7.7 Hz, 3H, CH$_2$CH_3); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 178.7, 177.7, 144.7, 129.6, 128.6, 127.3, 126.4, 117.3, 110.1, 107.4, 40.6, 40.4, 28.7, 22.1, 19.4, 15.6; IR (KBr, cm^{-1}) 3340(bs), 3030(w), 2970(m), 2940(m), 2860(w), 1780(m), 1700(s), 1600(w), 1510(m), 1445(w), 1395(s), 1360(w), 1310(w), 1295(w), 1205(m), 1195(m), 1170(m), 850(w), 815(w), 785(m), 720(m), 695(m); HRMS *m/z* (M + Na$^+$) calcd. 317.1261, found 317.1262. 2-(4-Ethylphenyl)-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (63). Method C with adduct **14** gave **63** (51 mg, 47%) as a yellow powder: mp 172–173°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 8.82 (bs, 1H, 6-H), 7.76 (d, J = 8.4 Hz, 1H, 4-H), 7.71 (dd, J = 8.1, 0.9 Hz, 1H, 5-H), 7.52 (dd, J = 3.3, 2.4 Hz, 1H, 7-H), 7.40 (d, J = 8.7 Hz, 2H, Ph), 7.34 (d, J = 8.7 Hz, 2H, Ph), 7.13 (ddd, J = 3.1, 2.0, 0.8 Hz, 1H, 8-H), 2.72 (q, J = 7.7 Hz, 2H, CH_2CH$_3$), 1.29 (t, J = 7.7 Hz, 3H, CH$_2$CH_3); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 169.1, 168.7, 143.9, 141.3, 132.6, 130.4, 128.7, 127.8, 124.2, 123.1, 123.0, 117.5, 115.8, 100.4, 28.4, 16.2; IR (KBr, cm^{-1}) 3417(bs), 3319(w), 2963(w), 2929(w), 1760(m), 1706(s), 1629(w), 1592(w), 1517(m), 1460(w), 1426(w), 1380(s), 1366(s), 1274(w), 1228(w), 1088(m), 1068(w), 823(w), 800(w), 759(m), 745(m); HRMS *m*/*z* (M + Na$^+$) calcd. 313.0948, found 313.0942. Anal. Calcd. for C$_{18}$H$_{14}$N$_2$O$_2$: C, 74.47; H, 4.86; N, 9.65. Found: C, 74.35; H, 4.94; N, 9.51.

2-(4-Isopropylphenyl)-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (64). Method C with adduct **15** gave **64** (70 mg, 61%) as yellow needle-like crystals: mp 178–179°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 8.68 (bs, 1H, 6-H), 7.78 (d, J = 8.4 Hz, 1H, 4-H), 7.73 (dd, J = 8.1, 0.9 Hz, 1H, 5-H), 7.55 (dd, J = 2.4, 0.9 Hz, 1H, 7-H), 7.41 (d, J = 8.4 Hz, 2H, Ph), 7.37 (d, J = 8.4 Hz, 2H, Ph), 7.15 (ddd, J = 3.1, 2.0, 1.0 Hz, 1H, 8-H), 2.98 (septet, J = 6.9 Hz, 1H, CH(CH$_3$)$_2$), 1.30 (d, J = 6.9 Hz, 6H, CH(CH_3)$_2$); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 169.1, 168.7, 148.4, 141.3, 132.6, 130.5, 127.8, 127.2, 124.2, 123.1, 123.0, 117.6, 115.8, 108.5, 100.5, 39.2, 24.4; IR (KBr, cm^{-1}) 3419(s), 2960(m), 2925(s), 2855(m), 1758(m), 1711(s), 1516(w), 1457(w), 1427(w), 1378(m), 1367(m), 1315(w), 1274(m), 1227(w), 1155(w), 1120(m), 1070(w), 714(w); HRMS *m*/*z* (M + Na$^+$) calcd. 327.1105, found 327.1113. Anal. Calcd. for C$_{19}$H$_{16}$N$_2$O$_2$: C, 74.98; H, 5.30; N, 9.20. Found: C, 74.71; H, 5.12; N, 9.07.

2-(4-Methoxyphenyl)-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (65). Method D with adduct **16** gave **65** (70 mg, 64%) as brown crystals: mp 220–221°C; ^{1}H NMR (300 MHz, acetone-d_6, δ) 11.12 (bs, 1H, 6-H), 7.93 (dd, J = 8.1, 0.9 Hz, 1H, 5-H), 7.81 (dd, J = 2.9, 2.9 Hz, 1H, 7-H), 7.66 (d, J = 8.1 Hz, 1H, 4-H), 7.44 (d, J = 9.0 Hz, 2H, Ph), 7.09 (d, J = 9.0 Hz, 2H, Ph), 6.98–7.02 (m, 1H, 8-H), 3.89 (s, 3H, OCH$_3$); ^{13}C NMR (75 MHz, acetone-d_6, δ) 168.7, 168.4, 159.0, 141.2, 131.2, 128.5, 125.6, 124.6, 123.4, 123.2, 116.8, 115.4, 114.0, 100.7, 55.0; IR (film, cm^{-1}) 3300(bs), 2920(m), 2810(m), 1758(w), 1706(s), 1517(m), 1441(w), 1369(m), 1250(m), 1155(w), 1117(w), 743(m); HRMS *m*/*z* (M + Na$^+$) calcd. 315.0741, found 315.0743. Anal. Calcd. for C$_{17}$H$_{12}$N$_2$O$_3$: C, 69.86; H, 4.14; N, 9.58. Found: C, 69.67; H, 4.10; N, 9.39.

2-(4-Phenoxyphenyl)-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (66). Method C with adduct **17** gave **66** (51 mg, 38%) as bright yellow crystals: mp 193–194°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.72 (bs, 1H, 6-H), 7.78 (d, J = 8.4 Hz, 1H, 4-H), 7.73 (dd, J = 8.4, 0.8 Hz, 1H, 5-H), 7.56 (dd, J = 3.2, 2.6 Hz, 1H, 7-H), 7.36–7.48 (m, 4H, Ph), 7.08–7.19 (m, 6H, 8-H, Ph); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 169.0, 168.7, 156.8, 156.6, 141.3, 132.6, 130.7, 129.6, 127.9, 124.4, 124.2, 123.1, 123.0, 119.6, 119.0, 117.6, 115.8, 100.5; IR (KBr, cm^{-1}) 3316(bm), 3065(w), 1764(m), 1703(s), 1629(w), 1588(w), 1506(m), 1487(m), 1460(w), 1433(w), 1383(m), 1370(m), 1241(s), 1151(m), 1105(m), 1089(m), 1070(m), 1005(w), 870(w), 822(w), 744(m), 691(m); HRMS m/z (M + Na$^+$) calcd. 377.0897, found 377.0883. Anal. Calcd. for $C_{22}H_{14}N_2O_3$: C, 74.57; H, 3.98; N, 7.91. Found: C, 74.44; H, 3.93; N, 7.54.

2-Dimethylamino-6-methyl-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (67). Method D with adduct **18** gave **67** (60 mg, 66%) as yellow crystals: mp 201–202°C; ^{1}H NMR (300 MHz, acetone-d_6, δ) 7.84 (d, J = 8.4 Hz, 1H, 4-H), 7.67 (d, J = 3.3 Hz, 1H, 7-H), 7.57 (dd, J = 8.1, 0.6 Hz, 1H, 5-H), 6.88 (dd, J = 3.0, 0.6 Hz, 1H, 8-H), 3.99 (s, 3H, 6-CH_3), 2.99 (s, 6H, $N(CH_3)_2$); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 168.8, 168.5, 141.2, 134.6, 123.5, 122.7, 122.0, 115.8, 114.2, 100.7, 45.2, 33.4; IR (film, cm^{-1}) 3102(m), 2969(m), 2877(m), 2854(w), 1763(m), 1706(s), 1509(w), 1498(w), 1375(w), 1357(m), 1296(w), 1168(w), 1092(w), 1023(w); HRMS m/z (M + Na$^+$) calcd. 266.0901, found 266.0892. Anal. Calcd. for $C_{13}H_{13}N_3O_2$: C, 64.19; H, 5.39; N, 17.27. Found: C, 64.46; H, 5.30; N, 17.27.

6-Methyl-2-phenyl-2H,6H-pyrrolo[3,4-e]indole-1,3-dione (68). Method D with adduct **19** gave **68** (74 mg, 71%) as bright orange-yellow crystals: mp 214–215°C; ^{1}H NMR (300 MHz, CD_2Cl_2, δ) 7.76 (d, J = 8.4 Hz, 1H, 4-H), 7.71 (dd, J = 8.4, 0.6 Hz, 1H, 5-H), 7.41–7.58 (m, 6H, 7-H and Ph), 7.03 (dd, J = 3.9, 0.7 Hz, 1H, 8-H), 3.93 (s, 3H, 6-CH_3); ^{13}C NMR (75 MHz, CD_2Cl_2, δ) 168.8, 168.3, 141.3, 134.9, 132.6, 129.0, 127.8, 127.6, 126.9, 124.3, 123.6, 115.7, 114.6, 100.4, 33.5; IR (film, cm^{-1}) 3125(m), 2900(w), 1759(m), 1710(s), 1595(m), 1512(m), 1490(m), 1453(w), 1377(s), 1361(s), 1294(m), 1223(w), 1171(w), 1094(w), 1063(w), 744(m); HRMS m/z (M + Na$^+$) calcd. 299.0792, found 299.0792. A convenient route for the synthesis of pyrazolo[3,4-*b*]pyridine-3-ones *via* condensation of 3-amino-1-phenylpyrazolin-5-one with 4-hydroxy-6-methylpyran-2-one is described. The pyrazolo[3,4-*b*]pyridine-3-one isomers obtained were functionalized at 1-, 4-, or 6- position by different pharmacophore entities allowing the synthesis of new compounds with promising biological activities.

J. Heterocyclic Chem., **46**, 1177 (2009).

INTRODUCTION

The pyrazolo[3,4-*b*]pyridines are important compounds, particularly in pharmaceutical research because of their significant and versatile biological activities such as antimicrobial, antimalarial, antiviral, antiproliferative, anticoagulative, hypotensive, and antiarrythmic [1–5].

Because of the potential of pyrazolo[3,4-*b*]pyridines, much work has been done over the years. The most important synthetic method used to reach these derivatives the condensation of aminopyrazole with α,β-unsaturated compounds reported by Quiroga et al. [6,7].

We were interested in the synthesis of pyridine analogues of these systems involving the condensation of the aminopyrazolone **1** with 2-pyrone **2** [8]. The latter skeleton was proven to be valuable scaffold to obtain new heterocyclic compounds [9,10]. The pyrazolo[3,4-*b*]pyridines prepared will be functionalized at 1-, 4-, and 6-positions.

RESULTS AND DISCUSSION

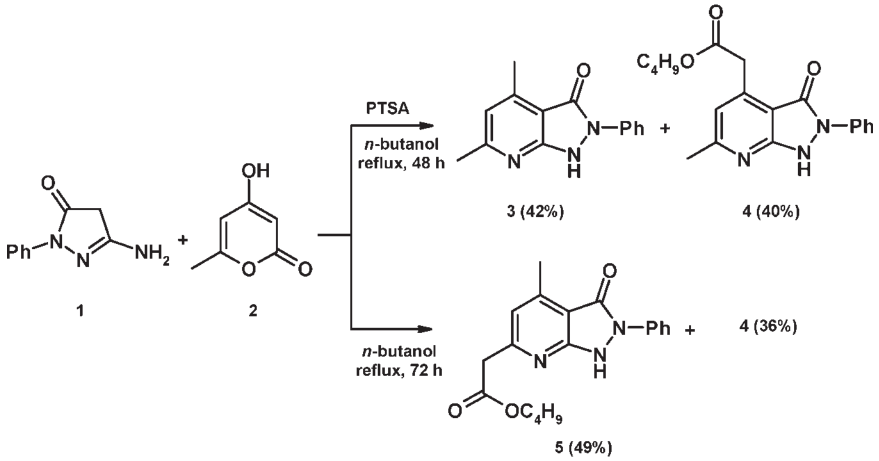
Synthesis of pyrazolo[3,4-*b*]pyridine-3-ones. The reaction of 3-amino-1-phenylpyrazolin-5-one **1** with 4-hydroxy-6-methylpyran-2-one **2** was carried out in butanol at reflux with or without PTSA as catalyst. Pyrazolo[3,4-*b*]pyridine-3-one **4** was isolated in both cases with moderate yields (36–40%). Depending on the reaction conditions used (presence or not of the catalyst), the product **4** was accompanied with pyrazolo[3,4-*b*]pyridine-3-ones **3** or **5** in comparable yields of 42 and 49%, respectively (Scheme 1) [8].

This sequence is of particular interest since it allows a rapid and easy functionalization of 1-, 4-, and 6-positions of the pyrazolo[3,4-*b*]pyridine-3-one scaffold. Thus, the development of synthesis of new molecules with potential biological and/or pharmacological properties appears attractive.

Synthesis of pyrazolo[3,4-*b*]pyridine-3-ones functionalized at 1- position. To widen the substitution of 1-position of pyrazolo[3,4-*b*]pyridine-3-ones, we decided to introduce a bromoethane linker in order to incorporate a bicyclic compound such as a saturated pyridodiazepine known to interact with 5-HT_7/5-HT_{1A} receptors [11].

For this purpose, Deprotonation of pyrazolo[3,4-b]pyridine-3-one 3 with sodium hydride and further nucleophilic substitution with dibromoethane allows the alkylation of position 1 and compound 7 was isolated in 60% yield (Scheme 2) [12].

Scheme 1



We then carried out the preparation of the decahydropyrido[1,2-*a*][1,4]diazepine **6**. This cyclic diamine was prepared in four steps from the piperidine-2-carboxylic acid ethyl ester according to the literature [13].

The final step of this synthetic route was the substitution of the bromine of derivative **7** with the saturated pyridodiazepine **6** in acetonitrile, in the presence of potassium carbonate and a catalytic amount of potassium iodide. The desired compound **8** was obtained in a good yield (78%) (Scheme 3).

Synthesis of pyrazolo[3,4-*b*]pyridine-3-ones functionalized at 4- or 6-position with an amine chain. In a second approach, we focused on the reactivity of the alkyl acetate group present at 4- or 6-position on pyrazolo[3,4-*b*]pyridine-3-ones. Functionalizations with amines and notably with aryl piperazines, often present in serotoninergic ligands, have been especially chosen.

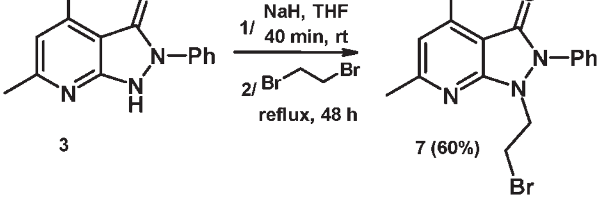
First, the protection of the amine present in compound **5** was necessary. To carry out this step, we choose the *para*-methoxybenzyl chloride (PMBCl) like protective agent. In a basic medium, reaction of pyrazolo[3,4-*b*]pyridine-3-one **5** with the PMBCl led to the amino protected derivative **9** in an excellent yield (97%). Reduction of the ester group with $LiAlH_4$ in THF at reflux led to the desired alcohol **10** in 40% yield. It is worth mentioning that a further reduction of the amide function occurred under these conditions to yield additional product **11** (29%).

To increase the chemioselectivity of the reduction reaction, we performed the reaction in diethyl ether at 0°C. These conditions lead only to the reduction of the function ester making it possible to obtain compound **10** with an average yield (53%). Activation of the alcohol function with methylsulfonyl chloride in the presence of pyridine led to the mesylate derivative **12** in good yield. Substitution of the leaving group with *N*,*N*-dibutylamine and phenylpiperazine provided compounds **13** and **14** in 92 and 93% yields, respectively. The deprotection of the pyrazolic amine group of **13** and **14** was carried out in TFA at reflux leading to compounds **15** and **16** in very good yields (Scheme 4).

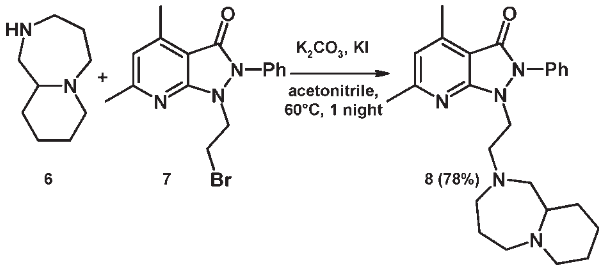
According to the procedure quoted earlier, we then prepared 4-aminoethylpyrazolo[3,4-*b*]pyridin-3-ones **22** and **23** from ester **4** with good yields (Scheme 5). The protection of the amine group of the pyrazoline ring with PMBCl was also realized in a quantitative yield.

The ester group of the resulting protected amine **17** was reduced by $LiAlH_4$ leading to alcohol **18** in 55% yield. The mesylation of the alcohol was carried out leading to the pyrazolo[3,4-*b*]pyridine-3-one **19** in 89% yield. Reaction of *N*,*N*-dibutylamine and phenylpiperazine provided

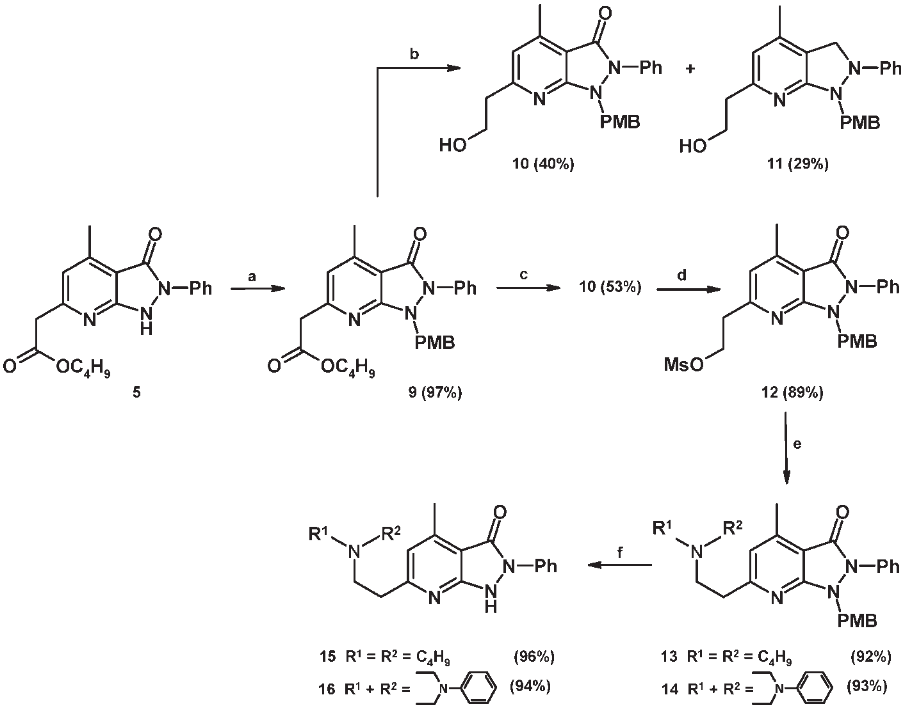
Scheme 2



Scheme 3



Scheme 4. (a) PMBCl, K_2CO_3, CH_2Cl_2, rt, 48 h; (b) $LiAlH_4$, THF, reflux, 3 h; (c) $LiAlH_4$, diethyl ether, 0°C, 24 h; (d) CH_3SO_2Cl, pyridine, 0°C to rt, 48 h; (e) *N*,*N*-dibutylamine or phenylpiperazine, DMF, 70°C, 1 night ; (f) TFA, reflux, 5 h.

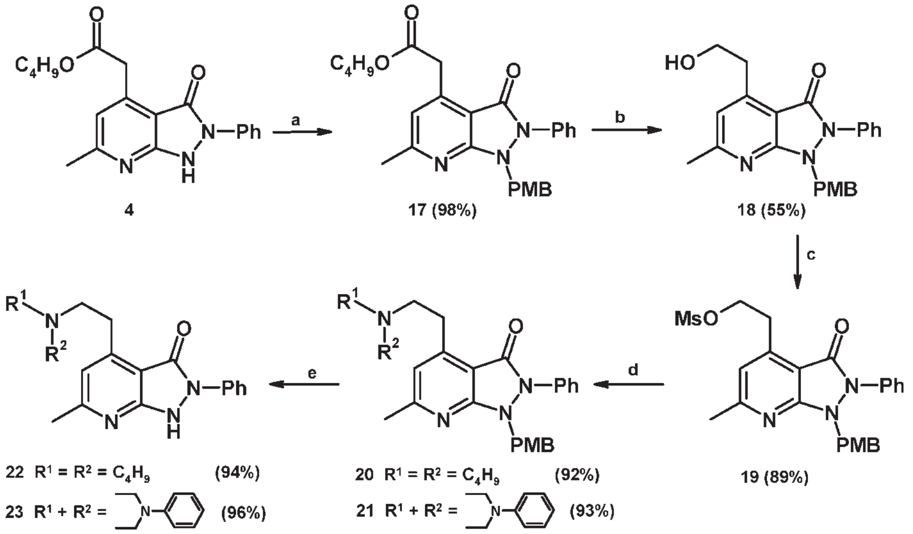


amino compounds **20** and **21** in 92 and 93% yields, respectively.

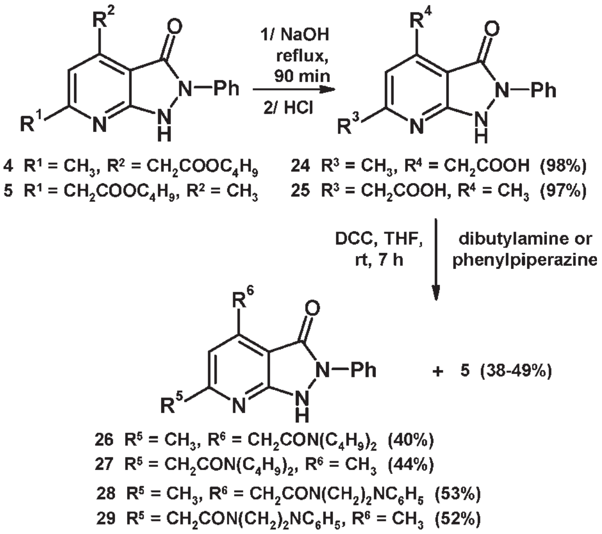
The final deprotection of the pyrazole amine systems was unrolled, like previously, in TFA at reflux affording 4-(2-(dibutylamino)ethyl)-6-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one **22** in a 94% yield and 6-methyl-2-phenyl-4-(2-(4-phenylpiperazin-1-yl)ethyl)-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one **23** in a 96% yield.

Synthesis of pyrazolo[3,4-*b*]pyridine-3-ones functionalized at 4- or 6-position with an amide chain. At last, we showed that the ester function at 4- or 6-position could be converted into amide. The preparation of

Scheme 5. (a) PMBCl, K_2CO_3, CH_2Cl_2, rt, 48 h; (b) $LiAlH_4$, diethyl ether, 0°C, 24 h; (c) CH_3SO_2Cl, pyridine, 0°C to rt, 48 h; (d) *N*,*N*-dibutylamine or phenylpiperazine, DMF, 70°C, 1 night ; (e) TFA, reflux, 5 h.



Scheme 6



amido-pyrazolopyridinones **26–29** was accomplished easily in two-step sequence by saponification of ester **4** and **5** followed by peptidic coupling with *N*,*N*-dibutylamine and phenylpiperazine using DCC as coupling agent (Scheme 6).

CONCLUSION

In summary, we have developed an efficient method for the synthesis of novel pyrazolo[3,4-*b*]pyridine-3-one derivatives. Thereafter, we have shown that 1-, 4-, and 6-positions of the pyrazolopyridine skeleton can be easily and rapidly functionalized in order to introduce new pharmacophore entities allowing the synthesis of potential biological molecules. One of the new molecules tested, is compound **26**, has shown pharmacological activities toward the serotoninergic receptors 5-HT_{1A} (Ki = 220 n*M*) and 5-HT_7 (Ki = 870 n*M*).

EXPERIMENTAL

All reagents were purchased either from Acros Organics or Aldrich. Thin layer chromatography was performed on 0.5 mm × 20 cm × 20 cm E. Merck silica gel plates (60 F-254). Infrared (IR) spectra were obtained on Perkin–Elmer Paragon 1000 PC FTIR. Infrared spectra were recorded using NaCl films or KBr pellets. ^{13}C and ^{1}H NMR spectra were recorded at room temperature using a Bruker Advance DXP250 at 62.9 and 250 MHz, respectively. Chemical shifts (δ) are given in parts per million downfield from tetramethylsilane as internal standard. Mass spectra were determined with a Perkin-Elmer SCIEX AOI 300 spectrometer. All chemicals were of reagent grade and used without further purification. THF was freshly distilled from Na/benzophenone, while CH_2Cl_2 was distilled over CaH_2. The biological characterization of the compounds was based on the screening protocol described by Zajdel et al. [14,15].

1-(2-Bromoethyl)-4,6-dimethyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one.(7). Sixty milligrams (1.51 mmol; 1.8 eq) of sodium hydride 60% were suspended in 8 mL of THF then 200 mg (0.84 mmol; 1 eq) of 4,6-dimethyl-2-phenyl-1,2-dihydro-pyrazolo[3,4-*b*]pyridin-3-one **3** were dissolved in 10 mL of THF and added slowly. The mixture was stirred for 40 min at room temperature. Then 0.216 mL (2.51 mmol; 5 eq) of dibromoethane in 3 mL of THF were added dropwise. The resulting mixture was heated at reflux for 30 h. The solution was hydrolyzed and extracted with CH_2Cl_2. The organic extracts were dried over $MgSO_4$ and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 6.5:3.5). Yield 60% (maroon solid); mp 84–86°C; IR (KBr) cm^{-1}: 1656 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.59 (s, 3H), 2.68 (s, 3H), 3.25 (t, 2H, $J = 7.3$ Hz), 4.25 (t, 2H, $J = 7.3$ Hz), 6.81 (s, 1H), 7.28–7.35 (m, 1H), 7.45–7.53 (m, 4H); ^{13}C NMR ($CDCl_3$): δ (ppm) 17.3 (CH_3), 25.1 (CH_3), 25.9 (CH_2), 49.2 (NCH_2), 107.7 (C), 120.6 (CH), 124.0 (2CH), 126.0 (CH), 129.4 (2CH), 135.0 (C), 149.6 (C), 160.7 (C), 162.3 (C), 163.8 (C); MS (m/z, %): 347 (M+1, 65), 348 (M+2, 82), 106 (100).

1-(2-(Hexanhydropyrido[1,2-*a*][1,4]diazepin-2(1*H*,3*H*,7*H*)-yl)ethyl)-4,6-dimethyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (8). Under inert atmosphere, 45 mg (0.29 mmol; 1 eq) of decahydropyrido[1,2-*a*][1,4]diazepine **6** were put in 8 mL of acetonitrile then 120 mg (0.87 mmol; 3 eq) of potassium carbonate, 7 mg (0.43 mmol; 0.15 eq) of potassium iodide and 100 mg (0.29 mmol;1 eq) of bromoethylpyrazolo[3,4-*b*]pyridin-3-one **7** were added. The resulting mixture was stirred overnight at 60°C. The solvent was evaporated and the residue was taken again with water and extracted with CH_2Cl_2. The organic phases were dried over $MgSO_4$ and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (eluent: CH_2Cl_2/MeOH/NH_4OH, 9:1:0.5). Yield 78% (maroon solid); mp 94–96°C; IR (KBr) cm^{-1}: 1683 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 1.02–1.32 (m, 4H), 1.48–1.68 (m, 5H), 1.81–1.94 (m, 2H), 2.04–2.10 (m, 1H), 2.23–2.32 (m, 1H), 2.35–2.40 (m, 4H), 2.57 (s, 3H), 2.60–2.71 (m, 5H), 4.02 (t, 2H, $J = 6.0$ Hz,), 6.75 (s, 1H), 7.24–7.30 (m, 1H), 7.44–7.58 (m, 4H); ^{13}C NMR (*$CDCl_3$*): δ (ppm) 17.3 (CH_3), 24.3 (CH_2), 25.1 (CH_3), 26.0 (CH_2), 27.4 (CH_2), 31.2 (CH_2), 46.0 (CH_2), 54.0 (CH_2), 55.6 (CH_2), 55.7 (CH_2), 57.3 (CH_2), 61.1 (CH_2), 65.6 (CH), 107.3 (C), 119.5 (CH), 123.4 (2CH), 126.2 (CH), 129.2 (2CH), 135.5 (C), 149.1 (C), 161.9 (C), 162.2 (C), 162.8 (C); MS (m/z, %): 420 (M+1, 100), 119 (25).

Butyl.2-(1-(4-methoxybenzyl)-4-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-6-yl)acetate (9). Ninety milligrams (0.65 mmol; 1.1 eq) of potassium carbonate were put in 8 mL of CH_2Cl_2 and 200 mg (0.59 mmol; 1 eq) of pyrazolo[3,4-*b*]pyridine-3-one **5** were added. After 20 min of stirring, 0.09 mL (0.65 mmol; 1.1 eq) of *para*-methoxybenzyl chloride in 4 mL of CH_2Cl_2 were added. The mixture was stirred for three days at room temperature. The solution was hydrolyzed and extracted with CH_2Cl_2. The organic extracts were dried over $MgSO_4$ then evaporated in vacuo. The residue was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 7.5:2.5). Yield 97% (maroon clearly oil); IR (NaCl) cm^{-1}: 1650, 1723 (CO); ^{1}H NMR (*$CDCl_3$*): δ (ppm) 0.86 (t, 3H, $J = 7.2$ Hz), 1.19–1.36 (m, 2H), 1.48–1.59 (m, 2H), 2.67 (s, 3H), 3.68 (s, 3H), 4.04–4.12 (m, 4H), 5.01 (s, 2H), 6.62

(AB, 4H, $J_{AB} = 8.8$ Hz, $\Delta\nu = 24.1$ Hz), 6.90 (s, 1H), 7.25–7.33 (m, 1H), 7.53 (d, 4H, $J = 3.1$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 13.6 (CH_3), 19.0 (CH_2), 25.1 (CH_3), 30.4 (CH_2), 35.4 (CH_2), 51.3 (NCH_2), 55.0 (OCH_3), 65.0 (OCH_2), 108.1 (C), 113.4 (2CH), 119.7 (CH), 123.9 (2CH), 125.5 (C), 126.3 (CH), 129.1 (2CH), 130.3 (2CH), 135.0 (C), 143.9 (C), 159.3 (C), 160.7 (C), 161.2 (C), 163.6 (C), 169.9 (C); MS (m/z, %): 460 (M+1, 90), 119 (100).

1-(4-Methoxybenzyl)-6-(2-hydroxyethyl)-4-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (10). Under inert atmosphere, 440 mg (0.96 mmol; 1 eq) of compound **9** weredissolved in 8 mL of Et_2O and this mixture was added at 0°C to suspension of 36 mg (0.96 mmol; 1 eq) of $LiAlH_4$ in 10 mL of Et_2O. The resulting mixture was maintained at 0°C for 24 h. The medium was hydrolyzed and the salt was filtered off. The solution was extracted with CH_2Cl_2 and the organic phases were dried over $MgSO_4$ and evaporated in vacuo. The residue was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 4.5:6.5). Yield 53% (white foam); IR (KBr) cm^{-1}: 1681 (CO), 3419 (OH); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.67 (s, 3H), 3.21 (t, 2H, $J = 6.0$ Hz), 3.70 (s, 3H), 3.91 (t, 2H, $J = 6.0$ Hz), 5.03 (s, 2H), 6.62 (AB, 4H, $J_{AB} = 8.8$ Hz, $\Delta\nu = 19.6$ Hz), 6.83 (s, 1H), 7.29–7.35 (m, 1H), 7.44–7.49 (m, 4H); ^{13}C NMR ($CDCl_3$): δ (ppm) 25.3 (CH_3), 35.2 (CH_2), 51.4 (NCH_2), 55.2 (OCH_3), 63.0 (CH_2), 108.6 (C), 113.6 (2CH), 120.1 (CH), 124.4 (2CH), 125.6 (C), 126.8 (CH), 129.3 (2CH), 130.4 (2CH), 134.9 (C), 150.2 (C), 159.5 (C), 160.6 (C), 162.3 (C), 163.8 (C); MS (m/z, %): 390 (M+1, 60), 119 (100).

2-(1-(4-Methoxybenzyl)-4-methyl-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-6yl)ethanol (11). This compound was obtained from **10** (eluent: petroleum ether/ethyl acetate, 6:4). Yield 29% (white foam); IR (KBr) cm^{-1}: 3416 (OH); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.46 (s, 3H), 2.56 (t, 2H, $J = 6.6$ Hz), 3.68–3.77 (m, 5H), 4.48 (s, 2H), 4.56 (s, 2H), 6.47 (s, 1H), 6.66 (d, 2H, $J = 8.7$ Hz), 6.90 (t, 1H, $J = 7.3$ Hz), 6.99 (d, 2H, $J = 8.7$ Hz), 7.07 (d, 2H, $J = 8.5$ Hz), 7.25–7.34 (m, 2H); ^{13}C NMR ($CDCl_3$): δ (ppm) 24.1 (CH_3), 36.3 (CH_2), 55.3 (OCH_3), 57.4 (CH_2), 57.5 (CH_2), 62.1 (CH_2), 115.2 (2CH), 118.9 (C), 120.1 (CH), 127.2 (CH), 127.8 (2CH), 129.2 (2CH), 129.3 (C), 130.1 (2CH), 136.7 (C), 143.1 (C), 152.2 (C), 157.2 (C), 162.2 (C); 376 (M+1, 100), 119 (23).

2-(1-(4-Methoxybenzyl)-4-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-6-yl)ethyl methanesulfonate (12). 0.63 mL (7.71 mmol; 5 eq) of pyridine were added to 600 mg (1.54 mmol; 1 eq) of alcohol **10** in 15 mL of CH_2Cl_2 at 0°C. The solution was stirred 45 min at 0°C then 0.30 mL (3.86 mmol; 2.5 eq) of mesyl chloride in 2 mL of CH_2Cl_2 are run. The mixture was stirred for 48 h at room temperature. The medium was hydrolyzed then the solution was extracted with CH_2Cl_2. The organic phases were dried over $MgSO_4$ and evaporated in vacuo. The residue was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 5:5). Yield 89% (yellow oil); IR (NaCl) cm^{-1}: (1678 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.67 (s, 3H), 2.80 (s, 3H), 3.36 (t, 2H, $J = 6.6$ Hz), 3.68 (s, 3H), 4.54 (t, 2H, $J = 6.6$ Hz), 5.01 (s, 2H), 6.62 (AB, 4H, $J_{AB} = 8.8$ Hz, $\Delta\nu = 23.1$ Hz), 6.85 (s, 1H), 7.30–7.36 (m, 1H), 7.46–7.54 (m, 4H); ^{13}C NMR ($CDCl_3$): δ (ppm) 25.1 (CH_3), 31.4 (CH_2), 36.8 (CH_3), 51.3 (CH_2), 55.0 (CH_3), 68.9 (CH_2), 107.7 (C), 113.4 (2CH), 120.1 (CH), 124.0 (2CH), 125.3 (C), 126.6 (CH), 129.2 (2CH), 130.3 (2CH), 134.7 (C), 146.5 (C), 159.3 (C), 160.8 (C), 161.0 (C), 163.9 (C); MS (m/z, %): 468 (M+1, 70), 119 (100).

1-(4-Methoxybenzyl)-6-(2-(dibutylamino)ethyl)-4-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (13). Two hundred milligrams (0.43 mmol; 1 eq) of sulphonate **12** were introduced into a sealed tube containing 2 mL of DMF then 1 mL (5.95 mmol; 13.9 eq) of *N*,*N*-dibutylamine. The mixture was heated with stirring at 70°C overnight. The solvent was evaporated under reduced pressure and the crude product was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 5:5). Yield 92% (yellow oil); IR (NaCl) cm^{-1}: 1672 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 0.86 (t, 6H, $J = 7.2$ Hz), 1.19–1.30 (m, 4H), 1.33–1.40 (m, 4H), 2.44 (t, 4H, $J = 7.5$ Hz), 2.65 (s, 3H), 2.75 (t, 2H, $J = 7.5$ Hz), 3.11 (t, 2H, $J = 7.5$ Hz), 3.68 (s, 3H), 4.99 (s, 2H), 6.62 (AB, 4H, $J_{AB} = 8.8$ Hz, $\Delta\nu = 23.7$ Hz), 6.81 (s, 1H), 7.28–7.34 (m, 1H), 7.50 (d, 4H, $J = 4.1$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 14.2 ($2CH_3$), 20.7 ($2CH_2$), 25.2 (CH_3), 28.5 (CH_2), 29.7 ($2CH_2$), 51.6 (CH_2), 53.7 ($2CH_2$), 54.3 (CH_2), 55.2 (CH_3), 108.3 (C), 113.5 (2CH), 119.7 (CH), 124.1 (2CH), 125.8 (C), 126.3 (CH), 129.3 (2CH), 130.5 (2CH), 135.4 (C), 152.3 (C), 159.4 (C); 161.1 (C); 161.6 (C), 163.1 (C); MS (m/z, %): 501 (M+1, 100), 102 (10).

1-(4-Methoxybenzyl)-4-methyl-2-phenyl-6-(2-(4-phenylpiperazin-1-yl)ethyl)-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (14). This product was obtained using same procedure as for **13** (eluent: petroleum ether/ethyl acetate, 6:4). Yield 93% (yellow oil); IR (NaCl) cm^{-1}: 1686 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.66–2.76 (m, 9H), 3.14–3.25 (m, 6H), 3.68 (s, 3H), 5.00 (s, 2H), 6.63 (AB, 4H, $J_{AB} = 8.8$ Hz, $\Delta\nu = 24.8$ Hz), 6.80–6.86 (m, 2H), 6.90 (d, 2H, $J = 7.8$ Hz), 7.21–7.33 (m, 3H), 7.51 (d, 4H, $J = 4.4$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 25.3 (CH_3), 28.5 (CH_2), 49.2 ($2CH_2$), 51.6 (CH_2), 52.9 ($2CH_2$), 55.2 (CH_3), 58.4 (CH_2), 108.3 (C), 113.5 (2CH), 116.1 (2CH), 119.6 (CH), 119.7 (CH), 124.2 (2CH), 125.7 (C), 126.5 (CH), 129.2 (2CH), 129.3 (2CH), 130.5 (2CH), 135.3 (C), 151.5 (2C), 159.5 (C), 161.1 (C), 161.5 (C), 163.4 (C); MS (m/z, %): 534 (M+1, 80), 102 (100).

6-(2-(Dibutylamino)ethyl)-4-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (15). One hundred and sixty milligrams (0.32 mmol; 1 eq) of compound **13** were dissolved in 5 mL of TFA then the solution was heated at reflux during 5 h. The solvent was evaporated under reduced pressure and the crude product was purified by column chromatography on silica gel (eluent: methanol/ethyl acetate, 1:9). Yield 96% (red solid); mp 114–116°C; IR (KBr) cm^{-1}: 1667 (CO), 3445 (NH); ^{1}H NMR ($CDCl_3$): δ (ppm) 0.85 (t, 6H, $J = 7.2$ Hz), 1.24–1.34 (m, 4H), 1.38–1.46 (m, 4H), 2.47 (s, 3H), 2.91–3.00 (m, 6H), 3.19 (t, 2H, $J = 6.8$ Hz), 6.61 (s, 1H), 7.16–7.23 (m, 1H), 7.41 (t, 2H, $J = 7.8$ Hz), 7.88 (d, 2H, $J = 7.8$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 14.2 ($2CH_3$), 20.5 ($2CH_2$), 25.2 (CH_3), 29.2 (CH_2), 29.9 ($2CH_2$), 53.6 ($2CH_2$), 54.2 (CH_2), 108.9 (C), 118.5 (CH), 119.7 (2CH), 125.3 (CH), 129.2 (2CH), 137.3 (C), 151.8 (C), 156.4 (C), 159.6 (C), 159.9 (C); MS (m/z, %): 381 (M+1, 100), 102 (40).

4-Methyl-2-phenyl-6-(2-(4-phenylpiperazin-1-yl)ethyl)-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (16). This product was obtained in 94% yield from the pyrazolopyridine **14** (130 mg, 0.24 mmol) following the procedure described earlier for compound **15** as a red solid; mp 116–118°C; IR (KBr) cm^{-1}: 1674 (CO), 3419 (NH); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.35 (s, 3H), 3.03–3.18 (m, 6H), 3.32–3.45 (m, 6H), 6.70 (s, 1H), 6.92 (d, 3H, J = 8.2 Hz), 7.20–7.30 (m, 3H), 7.45 (t, 2H, J = 7.8 Hz), 7.87 (d, 2H, J = 7.8 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 23.0 (CH_3), 27.9 (CH_2), 48.5 ($2CH_2$), 52.6 ($2CH_2$), 57.5 (CH_2), 108.7 (C), 116.4 (C), 116.5 (2CH), 120.5 (CH), 120.6 (2CH), 125.8 (CH), 129.3 (4CH), 137.8 (C), 150.8 (C), 154.9 (C), 159.2 (C), 159.3 (C); MS (m/z, %): 414 (M+1, 100), 102 (30).

Butyl.2-(1-(4-methoybenzyl)-6-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-4-yl)acetate (17). This product was obtained in 98% yield from the pyrazolopyridine **4** (300 mg, 0.89 mmol) following the procedure described earlier for compound **9** as a maroon clearly oil; IR (NaCl) cm^{-1}: 1683, 1724 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 0.93 (t, 3H, J = 7.2 Hz), 1.35–1.45 (m, 2H), 1.65–1.70 (m, 2H), 2.63 (s, 3H), 3.69 (s, 3H), 3.91 (s, 2H), 4.20 (t, 2H, J = 6.6 Hz), 4.99 (s, 2H), 6.63 (AB, 4H, J_{AB} = 8.8 Hz, $\Delta\nu$ = 26.9 Hz), 6.68 (s, 1H), 7.32 (t, 1H, J = 4.4 Hz), 7.50 (d, 4H, J = 4.4 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 13.8 (CH_3), 17.3 (CH_3), 19.2 (CH_2), 30.8 (CH_2), 44.4 (CH_2), 51.6 (CH_2), 55.2 (CH_3), 65.2 (CH_2), 109.8 (C), 113.5 (2CH), 120.5 (CH), 124.1 (2CH), 125.5 (C), 126.5 (CH), 129.3 (2CH), 130.6 (2CH), 135.2 (C), 150.0 (C), 158.5 (C), 159.5 (C), 160.8 (C), 161.7 (C), 170.3 (C); MS (m/z, %): 460 (M+1, 100), 106 (26).

1-(4-Methoxybenzyl)-4-(2-hydroxyethyl)-6-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (18). This product was obtained in 55% yield from the pyrazolopyridine **17** (440 mg, 0.87 mmol) following the procedure described earlier for compound **10** as a white foam; IR (KBr) cm^{-1}: 1660 (CO), 3412 (OH); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.61 (s, 3H), 3.10 (t, 2H, J = 5.7 Hz), 3.69 (s, 3H), 4.12 (dd, 2H, J = 11.3 Hz, J' = 5.3 Hz), 4.96 (s, 2H), 6.66 (AB, 4H, J_{AB} = 8.8 Hz, $\Delta\nu$ = 31.4 Hz), 6.76 (s, 1H), 7.29–7.35 (m, 1H), 7.52 (d, 4H, J = 4.1 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 17.3 (CH_3), 39.8 (CH_2), 51.6 (CH_2), 55.2 (CH_3), 61.7 (CH_2), 109.3 (C), 113.6 (2CH), 120.2 (CH), 124.1 (2CH), 125.5 (C), 126.6 (CH), 129.3 (2CH), 130.4 (2CH), 135.1 (C), 149.7 (C), 159.5 (C), 160.4 (C), 161.8 (C), 164.7 (C); MS (m/z, %): 390 (M+1, 17), 102 (100).

2-(1-(4-Methoxybenzyl)-6-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-4-yl)ethyl methanesulfonate (19). This product was obtained in 89% yield from the pyrazolopyridine **18** (500 mg, 1.29 mmol) and mesyl chloride (0.25 mL, 3.21mmol) following the procedure described earlier for compound **12** as a yellow oil; IR (NaCl) cm^{-1}: 1692 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.61 (s, 3H), 2.94 (s, 3H), 3.29 (t, 2H, J = 6.6 Hz), 3.68 (s, 3H), 4.77 (t, 2H, J = 6.6 Hz), 4.99 (s, 2H), 6.64 (AB, 4H, J_{AB} = 8.8 Hz, $\Delta\nu$ = 23.9), 6.79 (s, 1H), 7.29–7.35 (m, 1H), 7.50 (d, 4H, J = 4.1 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 17.2 (CH_3), 37.5 (CH_3), 37.7 (CH_2), 51.5 (CH_2), 55.2 (CH_3), 68.3 (CH_2), 109.7 (C), 113.6 (2CH), 120.4 (CH), 124.1 (2CH), 125.5 (C), 126.6 (CH), 129.3 (2CH), 130.4 (2CH), 135.1 (C), 149.9 (C), 159.5 (C), 160.7 (C), 160.8 (C), 161.6 (C); MS (m/z, %): 468 (M+1, 15), 97 (100).

1-(4-Methoxybenzyl)-4-(2-(dibutylamino)ethyl)-6-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (20). This product was obtained in 92% yield from the pyrazolopyridine **19** (200 mg, 0.43 mmol) and *N*,*N*-dibutylamine 1 mL (0.53 mL, 5.95 mmol) following the procedure described earlier for compound **13** as a yellow oil; IR (NaCl) cm^{-1}: 1697 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 0.92 (t, 6H, J = 7.2 Hz), 1.24–1.42 (m, 4H), 1.44–1.54 (m, 4H), 2.53 (t, 4H, J = 7.5 Hz), 2.59 (s, 3H), 2.97 (s, 4H), 3.67 (s, 3H), 4.99 (s, 2H), 6.63 (AB, 4H, J_{AB} = 8.8 Hz, $\Delta\nu$ = 32.9 Hz), 6.76 (s, 1H), 7.28–7.32 (m, 1H), 7.47–7.53 (m, 4H); ^{13}C NMR ($CDCl_3$): δ (ppm) 14.2 ($2CH_3$), 17.2 (CH_3), 20.8 ($2CH_2$), 29.5 ($2CH_2$), 35.9 (CH_2), 51.5 (CH_2), 53.8 ($2CH_2$), 53.9 (CH_2), 55.1 (CH_3), 108.8 (C), 113.4 (2CH), 120.2 (CH), 123.9 (2CH), 125.7 (C), 126.2 (CH), 129.2 (2CH), 130.5 (2CH), 135.3 (C), 149.0 (C), 159.4 (C), 161.1 (C), 162.0 (C), 165.7 (C); MS (m/z, %): 501 (M+1, 41), 119 (100).

1-(4-Methoxybenzyl)-6-methyl-2-phenyl-4-(2-(4-phenylpiperazin-1-yl)ethyl)-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (21). This product was obtained in 93% yield from the pyrazolopyridine **19** (150 mg, 0.24 mmol) and phenylpiperazine (0.53 mL, 4.50 mmol) following the procedure described earlier for compound **14** as a yellow oil; IR (NaCl) cm^{-1}: 1683 (CO); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.62 (s, 3H), 2.77 (t, 4H, J = 5.0 Hz), 2.97 (dd, 2H, J = 8.1 Hz, J' = 6.3 Hz), 3.12 (dd, 2H, J = 8.1 Hz, J' = 6.3 Hz), 3.27 (t, 4H, J = 5.0 Hz), 3.68 (s, 3H), 5.02 (s, 2H), 6.65 (AB, 4H, J_{AB} = 8.8 Hz, $\Delta\nu$ = 32.0 Hz), 6.80 (s, 1H), 6.87 (t, 1H, J = 7.8 Hz), 6.96 (d, 2H, J = 7.8 Hz), 7.25–7.32 (m, 3H), 7.50–7.54 (m, 4H); ^{13}C NMR ($CDCl_3$): δ (ppm) 17.2 (CH_3), 36.1 (CH_2), 49.3 ($2CH_2$), 51.6 (CH_2), 53.3 ($2CH_2$), 55.2 (CH_3), 60.5 (CH_2), 109.1 (C), 113.5 (2CH), 116.2 (2CH), 119.8 (CH), 120.1 (CH), 124.0 (2CH), 125.7 (C), 126.3 (CH), 129.2 (4CH), 130.5 (2CH), 135.3 (C), 149.3 (C), 151.4 (C), 159.4 (C), 161.0 (C), 162.0 (C), 164.9 (C); MS (m/z, %): 534 (M+1, 42), 102 (100).

4-(2-(Dibutylamino)ethyl)-6-methyl-2-phenyl-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (22). This product was obtained in 94% yield from the pyrazolopyridine **20** (150 mg, 0.30 mmol) following the procedure described earlier for compound **15** as a red solid; mp 118–120°C; IR (KBr) cm^{-1}: 1697 (CO), 3440 (NH); ^{1}H NMR ($CDCl_3$): δ (ppm) 0.94 (t, 6H, J = 7.2 Hz), 1.30–1.40 (m, 4H), 1.61–1.68 (m, 4H), 2.66 (s, 3H), 3.03–3.08 (m, 6H), 3.40 (t, 2H, J = 6.6 Hz), 6.60 (s, 1H), 7.14–7.21 (m, 1H), 7.40 (t, 2H, J = 7.8 Hz), 7.91 (d, 2H, J = 7.8 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 13.7 ($2CH_3$), 17.3 (CH_3), 20.1 ($2CH_2$), 25.1 ($2CH_2$), 30.6 (CH_2), 50.5 (CH_2), 52.7 ($2CH_2$), 109.1 (C), 118.3 (CH), 119.7 (2CH), 125.4 (CH), 129.1 (2CH), 137.4 (C), 150.8 (C), 156.8 (C), 159.5 (C), 159.8 (C); MS (m/z, %): 381 (M+1, 100), 102 (44).

6-Methyl-2-phenyl-4-(2-(4-phenylpiperazin-1-yl)ethyl)-1,2-dihydropyrazolo[3,4-*b*]pyridin-3-one (23). This product was obtained in 96% yield from the pyrazolopyridine **21** (120 mg, 0.23 mmol) following the procedure described earlier for compound **15** as a red solid; mp 122–124°C; IR (KBr) cm^{-1}: 1669 (CO), 3422 (NH); ^{1}H NMR ($CDCl_3$): δ (ppm) 2.63 (s, 3H), 3.10–3.42 (m, 12H), 6.59 (s, 1H), 6.86–6.98 (m, 3H), 7.17 (t, 1H, J = 7.6 Hz), 7.25–7.32 (m, 2H), 7.39 (t, 2H, J = 7.8 Hz), 7.90 (d, 2H, J = 7.8 Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 17.1 (CH_3), 31.1 (CH_2), 47.0 ($2CH_2$), 52.0 ($2CH_2$), 55.3 (CH_2), 109.7 (C), 117.0 (2CH), 119.5 (2CH), 121.6 (CH), 125.4 (CH), 129.1 (2CH), 129.4 (2CH), 137.4 (C), 149.4 (C), 151.0 (C), 159.2 (C), 159.8 (C); MS (m/z, %): 414 (M+1, 100), 102 (32).

2-(6-Methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-4-yl) acetic acid (24). Three hundred milligrams (0.88 mmol; 1 eq) of pyrazolo[3,4-*b*]pyridine **4** were introduced under magnetic agitation into 15 mL of NaOH solution 10%. The solution was heated at reflux during 90 min. After cooling, the solution was neutralized until pH = 2 with concentrated HCl. The precipitate thus formed was filtered and washed with water and then with diethyl ether (no purification was necessary). Yield 98% (yellow solid); mp 122–124°C; IR (KBr) cm^{-1}: 1706 (CO), 3070 (OH); ^1H NMR (CD_3OD): δ (ppm) 2.73 (s, 3H), 3.85 (s, 2H), 6.83 (s, 1H), 7.29 (m, 1H), 7.49 (t, 2H, $J = 7.9$ Hz), 7.91 (d, 2H, $J = 7.9$ Hz); ^{13}C NMR (CD_3OD): δ (ppm) 17.2 (CH_3), 42.3 (CH_2), 111.9 (C), 119.8 (2CH), 122.6 (CH), 125.2 (CH), 129.9 (2CH), 140.5 (C), 151.9 (C), 155.5 (C), 157.2 (C), 160.5 (C), 178.0 (C); MS (m/z, %): 284 (M+1, 100), 181 (65).

2-(4-Methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-6-yl)-acetic acid (25). Three hundred milligrams (0.88 mmol; 1 eq) of pyrazolo[3,4-*b*]pyridine **5** were introduced under magnetic agitation into 15 mL of NaOH solution 10%. The solution was heated at reflux during 90 min. After cooling, the solution was neutralized until pH = 2 with concentrated HCl. The precipitate thus formed was filtered and washed with water and then with diethyl ether (no purification was necessary). Yield 97% (yellow solid); mp 172–174°C; IR (KBr) cm^{-1}: 1700 (CO), 3061 (OH); ^1H NMR (CD_3OD): δ (ppm) 2.50 (s, 3H), 4.04 (s, 2H), 6.93 (s, 1H), 7.26 (m, 1H), 7.46 (t, 2H, $J = 7.9$ Hz), 7.85 (d, 2H, $J = 7.9$ Hz); ^{13}C NMR (CD_3OD): δ (ppm) 15.7 (CH_3), 48.4 (CH_2), 111.3 (C), 120.1 (2CH), 122.5 (CH), 126.2 (CH), 130.8 (2CH), 141.2 (C), 151.5 (C), 155.3 (C), 157.1 (C), 160.9 (C), 178.3 (C); MS (m/z, %): 284 (M+1, 53), 181 (100).

***N*,*N*-Dibutyl-2-(6-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-4-yl)acetamide (26).** One hundred and nine milligrams (0.53 mmol; 1.5 eq) of DCC were put in 10 mL of THF then 100 mg (0.35 mmol; 1 eq) of acid **24** were added. After stirring at room temperature for 20 min, 65 µL (0.39 mmol; 1.1 eq) of *N*,*N*-dibutylamine in 2 ml of THF were cast. The mixture was stirred for 7 h at room temperature. The solution was hydrolyzed with a saturated solution of NH_4Cl and extracted with AcOEt. The organic phases were dried over $MgSO_4$ and evaporated in vacuo. The crude reaction was purified by column chromatography on silica gel (eluent: petroleum ether/ethyl acetate, 5:5). Yield 40% (yellow clearly solid); mp 134–136°C; IR (KBr) cm^{-1}: 1591, 1637 (CO), 3414 (NH); ^1H NMR ($CDCl_3$): δ (ppm) 0.87–0.94 (m, 6H), 1.25–1.32 (m, 4H), 1.43–1.49 (m, 4H), 2.69 (s, 3H), 3.16 (t, 2H, $J = 7.6$ Hz), 3.29 (t, 2H, $J = 7.6$ Hz), 3.70 (s, 2H), 6.67 (s, 1H), 7.18 (t, 1H, $J = 7.9$ Hz), 7.41 (t, 2H, $J = 7.9$ Hz), 7.93 (d, 2H, $J = 7.9$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 13.6 ($2CH_3$), 17.2 (CH_3), 19.9 (CH_2), 20.0 (CH_2), 29.5 (CH_2), 29.6 (CH_2), 41.9 (CH_2), 45.9 (CH_2), 47.9 (CH_2), 109.6 (C), 118.6 (CH), 118.7 (2CH), 125.1 (CH), 129.0 (2CH), 137.6 (C), 150.8 (C), 156.2 (C), 157.7 (C), 159.9 (C), 168.6 (C); MS (m/z, %): 395 (M+1, 26), 119 (100).

***N*,*N*-Dibutyl-2-(4-methyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazolo[3,4-*b*]pyridin-6-yl)acetamide (27).** This product was obtained in 44% yield from acid **25** (100 mg, 0.35 mmol) and *N*,*N*-dibutylamine (65 µL, 0.39 mmol) following the procedure described earlier for compound **29** as a orange solid; mp 128–130°C; IR (KBr) cm^{-1}: 1612, 1683 (CO), 3424 (NH); ^1H NMR ($CDCl_3$): δ (ppm) 0.82–0.91 (m, 6H), 1.21–1.29 (m, 4H), 1.40–1.48 (m, 4H), 2.36 (s, 3H), 3.04 (t, 2H, $J = 7.6$ Hz), 3.23 (t, 2H, $J = 7.6$ Hz), 3.77 (s, 2H), 6.69 (s, 1H), 7.21 (t, 1H, $J = 7.7$ Hz), 7.41 (t, 2H, $J = 7.7$ Hz), 7.89 (d, 2H, $J = 7.7$ Hz); ^{13}C NMR ($CDCl_3$): δ (ppm) 13.9 ($2CH_3$), 20.0 (CH_2), 20.1 (CH_2), 23.2 (CH_3), 29.7 (CH_2), 29.8 (CH_2), 42.1 (CH_2), 46.2 (CH_2), 48.0 (CH_2), 109.1 (C), 118.1 (CH), 119.0 (2CH), 125.4 (CH), 129.1 (2CH), 137.5 (C), 148.8 (C), 155.6 (C), 158.7 (C), 159.8 (C), 168.7 (C); MS (m/z, %): 395 (M+1, 44), 119 (100).

1

2-Methyl-2,5,6,11,12,13-hexahydro 4H indazolo[5,4-a]pyrrolo[3,4-c]carbazole-4-one was synthesized utilizing a regioselective Diels-Alder reaction with 5-(1H-indol-2-yl)-2-methyl-6,7-dihydro-2H-indazole and ethyl *cis*-β-cyanoacrylate. Acetic acid and $YtBr_3$ were the best solvent and catalyst for the regioselective Diels-Alder reaction. The chemistry was used to synthesize novel 8-pyrimidinyloxy-2,5,6,11,12,13-hexahydro 4H indazolo[5,4-a]pyrrolo[3,4-c]carbazole-4-ones that were screened and found to be potent inhibitors of DLK.

J. Heterocyclic Chem., **46**, 1185 (2009).

INTRODUCTION

Indolocarbazole alkaloids have emerged as an attractive scaffold in the search for kinase inhibitors. Minor structural variations can dramatically change their biological profiles [1]. CEP-1347 is a semi-synthetic derivative of the indolocarbazole K-252a [1], and a potent MLK/DLK inhibitor with a broad neuroprotective profile (Figure 1) [1]. Recently, we reported a series dihydronaphthyl[2,1-a]pyrrolo[3,4-c]carbazoles (DHN) as selective MLK inhibitors [2]. As part of the continued chemistry effort to design inhibitors with potent DLK activity, we required an approach to synthesize hexahydroindazolo[5,4-a]pyrrolo[3,4-c]carbazoles (DHI) and the corresponding 8-pyrimidinyloxy analogs. Our approach to the synthesis was envisioned via a Diels-Alder reaction using 5-(1H-indol-2-yl)-2-methyl-6,7-dihydro-2H-indazole and ethyl *cis*-β-cyanoacrylate. Previously, we reported the synthesis of indeno[2,1-a]pyrrolo[3,4-c]carbazole-5-one and-7-one via a Diels-Alder reaction with 2-indenylindole and ethyl *cis*-β-cyanoacrylate as the dienophile [3a]. There are few references concerning the synthesis of heterocyclic vinyl indoles as dienes due to their accessibility and stability [4]. Reported here is the synthesis of hexahydroindazolo[5,4-a]pyrrolo[3,4-c]carbazole-4-one core **1**. The synthesis and characterization of the 8-hydroxy, 8-pyrimidin-2-yloxy analogs, and their DLK activity are also described.

RESULTS AND DISCUSSION

2-Methyl-2,4,6,7-tetrahydroindazol-5-one **2** was prepared in three steps from commercially available 1,4-cyclohexanedione monoethylene acetal using our recently described regioselective procedure (Scheme 1) [5]. The assignment of the *N*-methyl regiochemistry was confirmed with X-ray crystallography. The 1-carboxy dilithio indole species was generated *in situ* by treatment of indole with *n*-butyllithium followed by carbon dioxide and subsequent 2-metalation with *tert*-butyllithium [6]. Addition of the ketone **2** to the *in situ* generated dilithio species provided the 2-substituted indole-alcohol **3** [5]. Elimination of the alcohol **3** using D,L-camphorsulfonic acid as catalyst in chloroform containing anhydrous magnesium sulfate produced 5-(1H-indol-2-yl)-2-methyl-6,7-dihydro-2H-indazole **3a** in low to moderate yield. The Diels-Alder reaction using dihydro-1H-indazole diene and ethyl *cis*-β-cyanoacrylate was surveyed with different catalysts and solvents. The use of benzene, toluene, xylene, and dichlorobenzene gave either low yields of the cycloadduct or no reaction at room

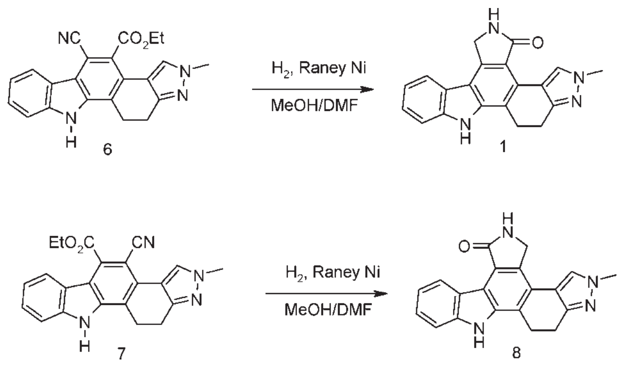
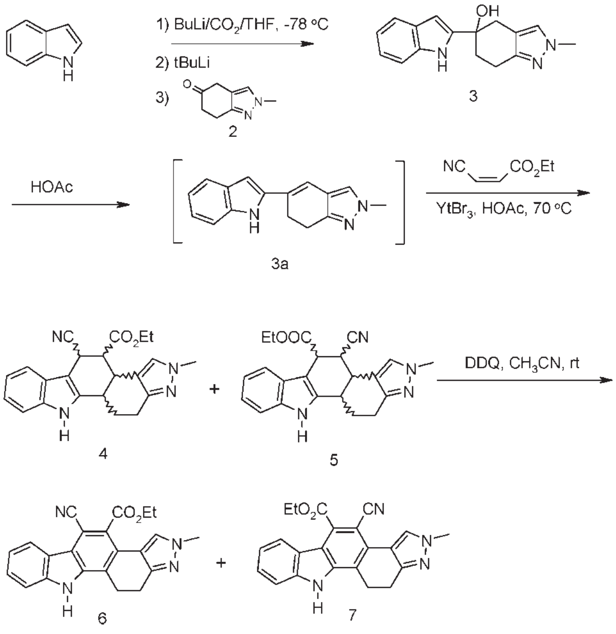
Scheme 2



temperature or under refluxing conditions. After screening a number of solvents, we found that the favored solvent was acetic acid. We also found that the problematic diene **3a** from dihydro-1H-indazo-5-ol **3** elimination could be generated *in situ* with HOAc as solvent. Lewis acid catalysts ($MgBr_2$, $YtBr_3$, and $ZnCl_2$) all improved the regioselectivity favoring the 4-CN isomer. The best conditions were using 0.1 mol % $YtBr_3$ in acetic acid at 70°C to give about 55% yield as 3:1 mixtures of the 4-CN-tetrahydrocarbazole isomer (**4**) and 5-CN-tetrahydrocarbazole isomer (**5**). The mixtures of isomers **4** and **5** were dehydrogenated using 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) in acetonitrile at room temperature or in methanol at 50°C to give a mixture of carbazoles **6** and **7**. Fractional crystallization isolated **6** in 39% yield for the two steps in >95% purity. Lactam **1** was produced by reductive cyclization of the cyano-ester **6** (RaNi, H_2, DMF/MeOH) in good yield (85%). The minor isomer the 6-lactam isomer **8** was formed by reductive cyclization of cyano-ester **7** (Scheme 2).

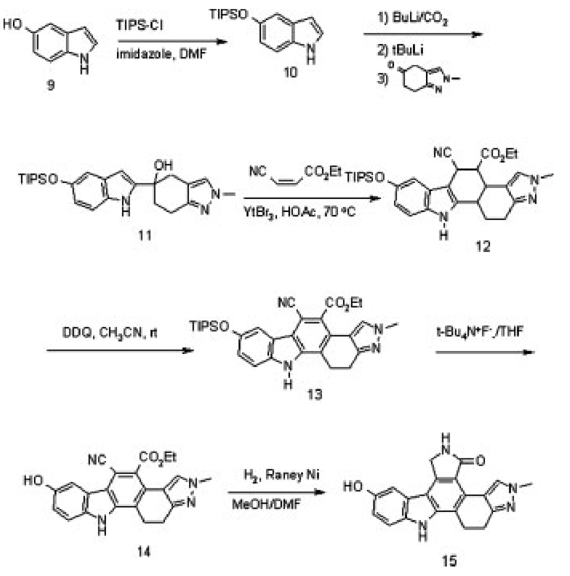
Scheme 1



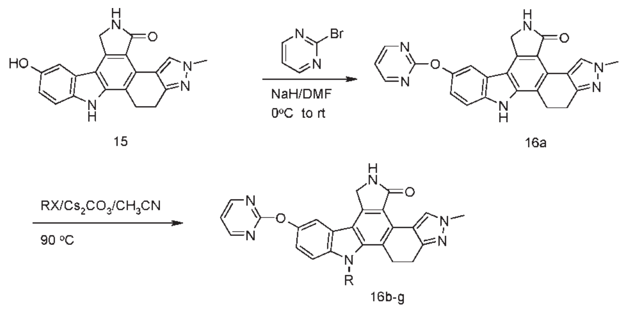
Several differences were observed in the proton ^1H NMR spectral data of lactams **1** and **8**. The regioisomers could be distinguished from ^1H NMR chemical shifts of the C-3 and C-7 protons. The C-7 aryl proton lactam **1** appeared at δ 7.90 and for lactam **8** appeared at δ 9.00 due to the deshielding effect of the lactam carbonyl. The chemical shifts of H-3 on **1** and **8** are found at δ 8.90 ppm and δ 8.00 ppm, respectively. The regioselectivity of the Diels-Alder reaction based on Frontier Molecular Orbital theory should favor of the formation of lactam **1** [3a]. The NMR assignment is in accord with our previously described structure assignment of indeno[2,1-a]pyrrolo[3,4-c]carbazoles, which was confirmed with X-ray crystallography [3a].

The synthesis of the 8-hydroxy analog is shown in Scheme 3. The dihydro-1H-indazo-5-ol **11** was prepared from TIPS-protected hydroxyindole **10** using the same

Scheme 3



Scheme 4



procedure to synthesize **3**. Diels-Alder reaction of **11** and ethyl *cis*-β-cyanoacrylate with 0.1 mol % of $YtBr_3$ in acetic acid at 70°C gave predominately the 4-CN-tetrahydrocarbazole isomer **12** as the major product. The high regioselectivity may be controlled by the steric effect of the triisopropylsilyloxy. Tetrahydrocarbazole **12** was dehydrogenated using 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) in acetonitrile at 60°C to give the aromatized product **13**. Deprotection of the TIPS group with tetrabutylammonium fluoride, followed by reductive cyclization of **14** afforded the 8-hydroxy lactam **15**. Lactam **15** could be easily assigned from the ^1H NMR chemical shifts of the C-3 (8.90 ppm), C-6 (4.75 ppm), and C-7 (7.20 ppm) protons, consistent with the structure of indeno[2,1-a]pyrrolo[3,4-c]carbazoles [3a].

8-Hydroxy-2,5,6,11,12,13-hexahydroindazolo[5,4-a] pyrrolo[3,4-c]carbazoles **15** was used as an intermediate to produce 8-pyrimidyloxydihydroindazoles **16a**. The reaction of **15** with 2-bromopyrimidine in the presence of sodium hydride in DMF gave **16a**. N11 alkylation of **16a** with various alkyl halides and Cs_2CO_3 as the base in CH_3CN resulted in N-substituted analogs **16b–g** (Scheme 4).

The analogs **1**, **15**, and **16a–g** were screened for DLK inhibitory activity [7]. The 4-oxo-lactam **1** displayed an IC_{50} value of 156 n*M*, whereas the 8-OH **15** was two-fold more potent. The 8-pyrimidin-2-oxy analog **16a** improved DLK potency greater than 30-fold compared with **15**. The N-11 ethyl **16c** and iPr **16d** were optimum with potent IC_{50} values of 1 and 2 n*M*. DLK activities decreased further with increasing alkyl size (Table 1).

In summary, we have developed the regioselective synthesis of 2,5,6,11,12,13-hexahydroindazolo[5,4-a] pyrrolo[3,4-c]carbazole-4-one utilizing a Diels-Alder reaction with dihydroindazoles and ethyl *cis*-β-cyanoacrylate. The acetic acid/$YtBr_3$ system was found to be superior in the Diels-Alder reaction to all other conditions evaluated. The 8-hydroxydihydroindazole provided a versatile intermediate to further functionalize and explore new kinase inhibitors. Further SAR evaluation and lead optimization on the scaffold leading to the progression of a clinical candidate compound will be disclosed in due course.

EXPERIMENTAL

All reagents were purchased from commercial sources and used as received. The NMR spectra were recorded at 400 MHz instrument in the solvent indicated with tetramethylsilane as an internal standard. Column chromatography was performed on silica gel 60 (230–400 mesh).

5-(1H-Indol-2-yl)-2-methyl-6,7-dihydro-1H-indazo-5-ol (3). A solution of indole (77 g, 0.66 mol) was dissolved in 3 L of anhydrous THF at −78°C under argon as *n*-butyllithium (330 mL, 0.83 mol, 2.5*M* solution in hexane) was added dropwise over 20 min. After 30 min stirring at −78°C, carbon dioxide was bubbled into the solution for 15 min. The solvent was removed under vacuum at 10–15°C to about 500 mL in volume. The reaction was diluted with 3 L of dry THF and recooled to −78°C and *tert*-butyllithium (570 mL, 0.86 mol, 1.5*M* solution in pentane) was slowly added. After 1 h at −78°C, the α-ketone **2** (100 g, 0.67 mol) in 1 L of anhydrous THF was added to the reaction dropwise over 40 min and stirred for 2 h. The reaction was quenched with brine and extracted with ethyl acetate. The combined organic layers were dried over $MgSO_4$, filtered, and concentrated. The brown solid was then triturated with cold methanol to form a white solid. The white solid was dissolved in 1 L of hot THF and the insoluble material was removed by filtration. The filtrate was concentrated and dried to give 102 g (58%) of **3**, mp 200–201°C; ^1H NMR (DMSO-d_6): δ 2.13 (m, 2H), 2.40 (m, 1H), 2.75 (m, 1H), 2.83 (d, 1H), 3.04 (d, 1H), 3.73 (s, 3H), 5.25 (s, 1H), 6.18 (s, 1H), 6.91 (t, 1H), 7.00 (t, 1H), 7.32 (d, 1H), 7.36 (s,1H), 7.41 (d, 1H), 10.96 (s,1H); ms: *m*/*z* = 268 (M +1).

5-Cyano-4-ethoxycarbonyl-2,10,11,12-tetrahydro-2-methyl-indazolo[5,4-a]carbazole (6). A mixture of **3** (16.0 g, 60.0 mmol), ethyl *cis*-β-cyanoacrylate (50.0 mL, 600 mmol), and $YbBr_3$ (1.66 g, 4.0 mmol) in 70 mL of acetic acid was stirred at 70°C for 40 h. HPLC indicated the completion of the reaction. The mixture was allowed to cool at room temperature and the solvent was evaporated. The thick oil (~100 mL) was triturated with 400 mL of ether overnight and the resulting solid was filtered, washed with water, ether, and dried to give 10.0 g of product. The trituration with ether was repeated to afford mixture of **4** and **5** (8.77 g) with HPLC ratios, 69%:25%.

The mixture of **4** and **5** (8.65 g, 23.1 mmol) and 2, 3-dichloro-5, 6-dicyano-1, 4-benzoquinone (10.5 g, 46.2 mmol) in 450 mL of acetonitrile was stirred at room temperature for 16 h. The resulting solid was filtered, and washed with cold MeOH to give tan solid (11.2 g) with HPLC ratio of two isomers, 77%:22% and with other impurities. Fractional crystallization with hot MeOH twice gave pure isomer **6** (6.6 g, 95.5% HPLC purity), mp: >250°C (dec.); ^{1}H NMR (DMSO-d_6): δ 1.41 (t,3H), 2.85 (t, 2H), 3.25 (t, 2H), 3.92 (s, 3H), 4.52 (q, 2H), 7.25 (t, 1H), 7.50 (t, 1H), 7.60 (m, 2H), 8.35 (d, 1H), 11.90 (s, 1H); ms: m/z = 343 (M +1).

4-Cyano-5-ethoxycarbonyl-2,10,11,12-tetrahydro-2-methyl-indazolo[5,4-a]carbazole (7). The mother liquid of **6** from fractional crystallization was combined and some solid appeared after a week at room temperature to give isomer **7**, mp: >250°C (dec.);^{1}H NMR (DMSO-d_6): δ 1.43 (t, 3H), 2.95 (t, 2H), 3.35 (t, 2H), 3.96 (s, 3H), 4.60 (q, 2H), 7.20 (t, 1H), 7.51 (t, 1H), 7.65 (m, 2H), 7.90 (d, 1H), 8.40 (s, 1H), 12.01 (s, 1H); ms: m/z = 343 (M +1).

2-Methyl-2,5,6,11,12,13-hexahydroindazolo-[5,4-a]pyrrolo [3,4-c]carbazole-4-one (1). A mixture of **6** (6.6 g, 17.83 mmol) and Raney Nickel catalyst (ca. 20 g) in DMF-methanol (150 mL:15 mL) was hydrogenated on a Parr Apparatus, until HPLC analysis indicated completion of the reaction. The solution was filtered through celite under N_2, washed with hot DMF, and the solvent was concentrated. The solid was recrystallized and triturated with methanol to give 3.72 g (65%) of **1** as colorless crystals with >97% purity by HPLC, mp: 250°C (dec.); ^{1}H NMR (DMSO-d_6): δ 2.80 (t, 2H), 3.20 (t, 2H), 3.80 (s, 3H), 4.75 (s, 2H), 7.20 (t, 1H), 7.90 (t, 1H), 7.51 (d, 1H), 7.91 (d,1H), 8.30 (s, 1H), 8.90 (s, 1H), 11.50 (s, 1H); ms: m/z = 329 (M +1). Anal. Calcd. For $C_{20}H_{16}N_4O\cdot1.0H_2O$: C, 69.35; H, 5.23; N, 16.17. Found: C, 69.85; H, 4.88; N, 16.28.

2-Methyl-2,5,6,11,12,13-dihydroindazolo-[5,4-a]pyrrolo [3,4-c]carbazole-6-one (8). A mixture of **7** (500 mg, 1.34 mmol, contains ~5% of **6**) and Raney Nickel catalyst (ca. 1 g) in DMF-methanol (30 mL:3 mL) was hydrogenated on a Parr Apparatus, until HPLC analysis indicated completion of the reaction. The solution was filtered through celite under N_2, washed with hot DMF, and the solvent was concentrated. The solid was recrystallized and triturated with methanol to give 110 mg (25%) of **8** as colorless crystals with ~9% of isomer **1**, mp 310–312°C; ^{1}H NMR (DMSO-d_6): δ 2.90 (t, 2H), 3.25 (t, 2H), 3.85 (s, 3H), 4.50 (s, 2H), 7.10 (t, 1H), 7.40 (t, 1H), 8.00 (s, 1H), 8.65 (s, 1H), 9.05 (d, 1H), 11.35 (s, 1H); ms: m/z = 329 (M +1).

5-[[Tris(1-methylethyl)silyl]oxy]-1H-indole (10). A solution of 5-hydroxyindole (5.0 g, 40.3 mmol) in 40 mL of DMF under N_2 was stirred as triisopropyl silyl chloride (12.0 mL, 60.45 mmol) was added dropwise, followed by imidazole (10.3 g, 161.2 mmol). After stirring overnight at room temperature, the reaction mixture was poured into water:hexane (1:1) and stirred for 1 h. The organic layer was separated, washed with brine, and dried over $MgSO_4$. Compound **10** (4.51 g) was used directly in the next step without purification. ^{1}H NMR (DMSO-d_6): δ 1.01 (d, 18H), 1.25 (m, 3H), 6.27 (s, 1H), 6.60 (d, 1H), 6.90 (s, 1H), 7.25 (m, 2H), 10.89 (s, 1H).

2-Methyl-5-(5-tris(1-methylethyl)silyloxy-1H-indol-2-yl)-4, 5,6,7-tetrahydro-2H-indazol-5-ol (11). A solution of indole **10** (3.47 g, 12 mmol) in 25 mL of anhydrous THF at −78°C under argon as *n*-butyllithium (7.1 mL, 12.1 mmol, 2.5*M* solution in hexane) was added dropwise over 20 min. After 30 min stirring at −78°C, carbon dioxide was bubbled into the solution for 15 min. The solvent was removed under vacuum at 10–15°C to about 10 mL in volume. The reaction was diluted with 15 mL of dry THF and recooled to −78°C and *tert*-butyllithium (8 mL, 12 mmol, 1.5*M* solution in pentane) was slowly added. After 1 h at −78°C, the α-ketone **2** (1.8 g, 12 mmol) in 15 mL of anhydrous THF was added to the reaction dropwise over 10 min and stirred for 2 h. The reaction was quenched with brine and the solvent was evaporated. The residue was stirred in 8.0 mL of water and 12.0 mL of ether for 30 min. The resulting solid was filtered and dried to give 2.5 g (47%) of **11**: ^{1}H NMR (DMSO-d_6): δ 1.01 (d, 18H), 1.25 (m, 3H), 2.10 (m, 2H), 2.45 (m, 1H), 2. 65 (m, 1H), 2.90 (dd, 2H), 3.65 (s, 3H), 5.20 (s, 1H), 6.08 (s, 1H), 6.60 (d, 1H), 6.80 (s, 1H), 7.20 (d, 1H), 7.39 (s, 1H), 10.85 (s, 1H); ms: m/z = 440 (M +1).

5-Cyano-4-ethoxycarbonyl-2,10,11,12-tetrahydro-2-methyl-(7-tris(1-methylethyl)silyloxy)indazolo[5,4-a]carbazole (12). A mixture of **11** (3.11 g, 7.05 mmol) and *cis*-β-cyanoacrylate (8.85 g, 70 mmol) and $YbBr_3$ (0.61 g, 1.41 mmol) in 50 mL of acetic acid was stirred at 70°C for 48 h. HPLC indicated the completion of the reaction (one major peak and with small peaks). The mixture was allowed to cool at room temperature and the solvent was evaporated. The thick oil (~50 mL) was triturated with 50 mL of ether for overnight and the resulting solid was filtered, washed with water (3 × 20 mL), ether (20 mL), and dried to give 0.91 g of the product of two isomers **12** with HPLC ratios: 84%:14%. The crude product was triturated with ether to give the pure **12** as a single isomer. ^{1}H NMR (DMSO-d_6): δ 1.01 (d, 18H), 1.25 (m, 3H), 1.28 (q, 3H), 1.95 (m, 1H), 2.15 (m, 1H), 2.58 (m, 1H), 3.50 (m, 2H), 3.55 (S, 3H), 3.85 (m, 1H), 4.15 (m, 1H), 4.45 (t, 2H), 4.48 (d, 1H), 6.68 (d, 1H), 6.80 (s, 1H), 7.39 (m, 2H), 10.85 (s, 1H); ms: m/z = 543 (M +1).

5-Cyano-4-ethoxycarbonyl-2,10,11,12-tetrahydro-2-methyl-(7-tris(1-methylethyl)silyloxy) indazolo[5,4-a]carbazole (13). A mixture of **12** (1.86 g, 3.40 mmol) and 2, 3-dichloro-5,6-dicyano-1,4-benzoquinone (1.55 g, 6.80 mmol) in 60 mL of methanol was stirred at 50°C for 1 h. HPLC indicated the completion of the reaction. The reaction mixture was then cooled to 0°C, stirred for 30 min, and the resulting solid was filtered and washed with cold MeOH to give colorless crystals **13** (1.09 g, 59%) with >95% purity by HPLC. ^{1}H NMR (DMSO-d_6): δ 1.01 (d, 18H), 1.25 (q, 3H), 1.28 (m, 3H), 2.88 (m, 2H), 3.50 (m, 2H), 3.80 (S, 3H), 4.50 (t, 2H), 7.15 (d, 1H), 7.50 (d, 1H), 7.62 (s, 1H), 7.90 (s, 1H), 11.75 (s, 1H); ms: m/z = 539 (M +1).

5-Cyano-2-methyl-4-ethoxycarbonyl-7-hydroxy-2,10,11,12-tetrahydro-4H-indazol[5,4-a]carbazole (14). A solution of **13** (1.08 g, 2.0 mmol) in 10.0 mL of THF was stirred at 0°C as 1*M* of $n\mathrm{Bu}_4N^+F^-$ in THF (2.0 mL, 2.0 mmol) was added dropwise. After addition, the ice-bath was removed and the reaction was stirred at room temperature for 2 h. HPLC indicated the completion of the reaction. The solvent was evaporated, and the residue was stirred in 1 mL of EtOAc and 5 mL of hot water. The resulting solid was filtered, washed with more hot water, and dried under vacuum to give 0.55 g (71%) of colorless crystals **14**. ^{1}H NMR (DMSO-d_6): δ 1.40 (q, 3H), 2.88 (m, 2H), 3.50 (m, 2H), 3.90 (S, 3H), 4.50 (t, 2H), 7.05 (d, 1H), 7.90 (d, 1H), 7.62(s,1H), 7.75 (s, 1H), 9.30 (s,1H), 11.65 (s, 1H); ms: *m/z* = 387 (M +1).

2-Methyl-8-hydroxy-2,5,6,11,12,13-hexahydo-4H-indazolo[5,4-a]pyrrolo[3,4-c]carbazol-4-one (15). A mixture of **14** (0.52 g, 1.36 mmol) and excess Raney Nickel catalyst (ca. 1 g) in DMF-methanol (20 mL:2 mL) was hydrogenated on a Parr Apparatus, until HPLC analysis indicated completion of the reaction. The solution was filtered through celite under N_2, washed with hot DMF, and the solvent was concentrated. The solid was washed and triturated with ether to give 0.4 g (85%) of **15** as colorless crystals with >97% purity by HPLC. ^{1}H NMR (DMSO-d_6): δ 2.75 (m, 2H), 3.15 (m, 2H), 3.80 (S, 3H), 4.65 (s, 2H), 6.90 (d, 1H), 7.20 (s, 1H), 7.35 (d, 1H), 8.30 (s, 1H), 8.90 (s,1H), 9.00 (s, 1H), 11.20 (s, 1H); ms: *m/z* = 345 (M +1). Anal. Calcd. For $C_{20}H_{16}N_4O_2 \cdot 1.5\ H_2O$: C, 64.67; H, 5.15; N, 15.08. Found: C, 64.86; H, 4.80; N, 14.52.

2-Methyl-8-(pyrimidin-2-yloxy)-2,5,6,11,12,13-hexahydro-4H-indazolo[5,4-a]pyrrolo[3,4-c]carbazol-4-one (16a). A mixture of sodium hydride (48 mg, 1.2 mmol, 60% in mineral oil) in 8.0 mL of DMF was stirred at 0°C under N_2 as 15 (137.6 mg, 0.4 mmol) in 4.0 mL of DMF was added dropwise. After stirred at 0°C for 15 min, 2-bromopyrimidine (127.2 mg, 0.8 mmol) in 2.0 mL of DMF was added dropwise. The reaction was stirred at 60°C for 20 h and HPLC indicated the completion of the reaction. After the reaction was cooled to room temperature, the solvent was evaporated and the residue was purified by preparation TLC with 10% MeOH in CH_2Cl_2 to give **16a** (90 mg, 53%): ^{1}H NMR (DMSO-d_6): δ 2.75 (m, 2H), 3.15 (m, 2H), 3.80 (S, 3H), 4.75 (s, 2H), 7.20 (d, 1H), 7.60 (d, 1H), 7.75 (s, 1H), 8.15 (s, 1H), 8.30 (s, 2H), 8.51 (s, 1H), 8.88 (s, 1H), 11.55 (s, 1H); ms: *m/z* = 423 (M +1).

2,11-Dimethyl-8-(-pyrimidin-2-yloxy)-2,5,6,11,12,13-hexahydro-4H-indazolo[5,4-a]pyrrolo[3,4-c]carbazol-4-one (16b). A mixture of **16a** (22.2 mg, 9.05 mmol) and Cs_2CO_3 (81.0 mg, 0.5 mmol) in 5.0 mL of CH_3CN was stirred as CH_3I (32 μL, 0.5 mmol) was added dropwise. After 14 h stirring at 80°C, the reaction mixture was cooled to room temperature, filtered through celite, washed with dichloromethane, and concentrated. The crude was purified by preparative TLC with 10% MeOH in CH_2Cl_2 to give **16b** (6.0 mg, 26%): ^{1}H NMR (DMSO-d_6): δ 2.75 (m, 2H), 3.65 (m, 2H), 3.80 (S, 3H), 4.15 (s, 3H), 4.65 (s, 2H), 7.20 (m, 1H), 7.30 (m, 2H), 7.65 (m, 2H), 8.35 (s, 1H), 8.55 (d, 1H), 8.88 (d, 1H); ms: *m/z* = 459 (M +23).

16 c–g were synthesized were carried out with different alkyl halides. The representative procedure given above for **16b** was used. Compounds **16 c–g** are all colorless crystals with melting point >250°C.

2-Methyl-8-(-pyrimidin-2-yloxy)-11-ethyl-2,5,6,11,12,13-hexahydro-4H-indazolo[5,4-a]pyrrolo[3,4-c]carbazol-4-one (16c). ^{1}H NMR (DMSO-d_6): δ 1.47 (t, 3H), 2.88 (m, 2H), 3.50 (m, 2H), 3.87 (S, 3H), 4.65 (q, 2H), 4.74 (s, 2H), 7.27 (m, 1H), 7.33 (m, 1H), 7.72 (d, 1H), 7.75 (s, 1H), 8.40 (s, 1H), 8.64 (d, 2H), 8.85 (s, 1H); ms: *m/z* = 451(M +1).

2-Methyl-11-(1-methylethyl)-8-(pyrimidin-2-yloxy)-2,5,6,11,12,13-hexahydro-4H-indazolo[5,4-a]pyrrolo[3,4-c]carbazol-4-one (16d). ^{1}H NMR (DMSO-d_6): δ 1.64 (d, 6H), 2.88 (m, 2H), 3.43 (m, 2H), 3.87 (S, 3H), 4.72 (s, 2H), 5.29 (m, 1H), 7.23 (m, 2H), 7.72 (d, 1H), 7.84 (d, 1H), 8.41 (s, 1H), 8.65 (d, 2H), 8.78 (s, 1H); ms: *m/z* = 465 (M +1).

In this study a facile synthesis of novel 10-*tert*-butyl[1]benzoxepino[3,4-*b*][1,3]dioxolo[4, 5-*g*]quinolin-12(6*H*)-ones is described, featuring the one-pot synthesis of 6-[(*tert*-butylphenoxy)methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylic acids from ethyl 6-(bromomethyl)[1,3]dioxolo[4,5-*g*]quinoline-7-carboxylate and their intramolecular Friedel-Crafts acylation reaction by the use of Eaton's reagent (P_2O_5–CH_3 SO_3H) under mild conditions.

J. Heterocyclic Chem., **46**, 1190 (2009).

INTRODUCTION

Quinoline-fused ring systems are a backbone of many natural products and pharmacologically significant compounds and display a broad range of biological activities [1–3]. Particularly, five-, six- and seven-membered heterocyclic compounds containing one or two heteroatoms fused to a quinoline ring are found in many natural products as well as in synthetic compounds, which are known to exhibit anticancer [4,5], antiallergenic [6], antibacterial [7], and antiviral properties [8]. The quinoline-fused compounds have been popular targets of synthesis, and a wide variety of protocols have been used. For instance, syntheses have included Friedländer condensation reactions [9], radical cyclization reactions [10], and intramolecular Friedel-Crafts acylation reactions [11,12]. The intramolecular Friedel-Crafts acylation of arylcarboxylic acids is an important route to construct fused ring compounds. Conventionally, intramolecular Friedel-Crafts acylation reaction can be achieved by treating aryl acids with a variety of condensing agents including liquid HF, H_2SO_4, $TiCl_4$, $AlCl_3$, and $AlCl_3$/NaCl [13]. However, using these reagents, not only does the harsh reaction conditions make synthesis and product isolation difficult but also a quantity of acidic waste is inevitably produced, which leads to pollution problems after the reaction. Hence, the development of new synthetic methods would be of considerable importance to the chemistry community.

On the other hand, the introduction of *tert*-butyl group to some compounds can enhance greatly their biological activity. Recently Huy et al. [14] reported that the placement of a metabolically stable *tert*-butyl group at C-2 position of a quinoline ring in primaquine results in a tremendous improvement in blood schizontocidal antimalarial activity (Fig. 1).

In light of these foundings and in view of structural diversity playing a prominent role in medicinal and combinatorial chemistry for a faster and efficient lead generation toward the new drug discovery [15], the synthesis of novel *tert*-butyl substituted quinoline-fused compounds would be much more attractive if a facile and mild broadly applicable synthetic approach could be used. Therefore, we reported herein the simple and effective synthesis of 10-*tert*-butyl[1]benzoxepino[3,4-*b*][1,3]dioxolo[4,5-*g*] quinolin-12(6*H*)-one derivatives by the intramolecular Friedel-Crafts acylation of the arylcarboxylic acids 6-[(*tert*-butyphenoxy)methyl][1,3]dioxolo-[4,5-*g*]quinoline-7-carboxylic acids using Eaton's reagent (P_2O_5–CH_3 SO_3H) as catalyst and solvent as shown in Scheme 1.

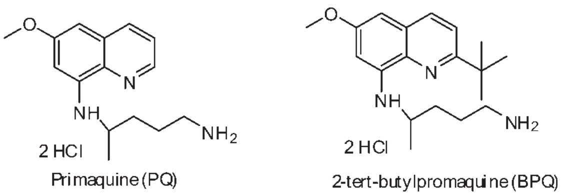

Figure 1. Structures of PQ and BPQ.

RESULT AND DISCUSSION

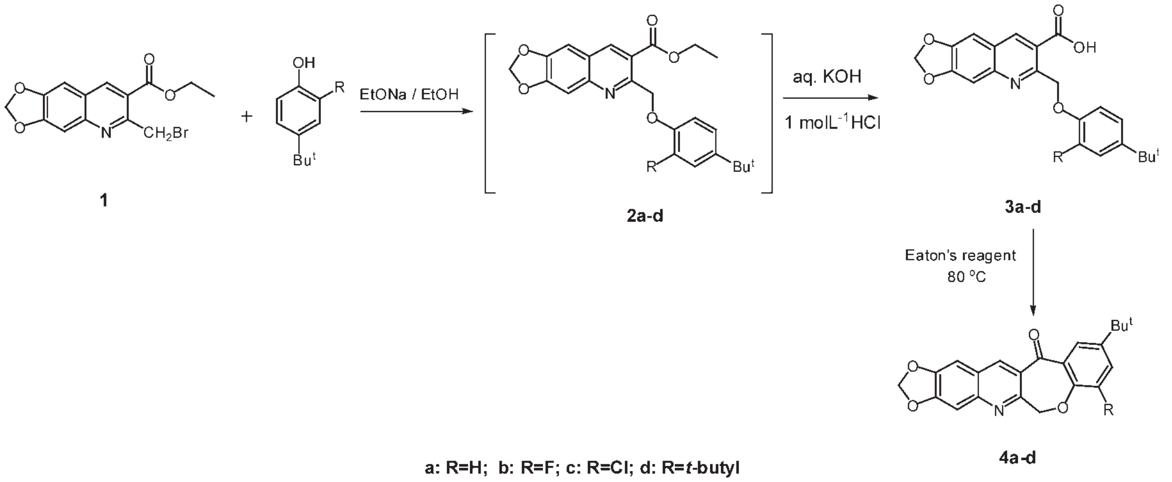
One-pot synthesis 6-[(*tert*-Butyphenoxy)methyl][1,3] dioxolo-[4,5-g]quinoline-7-carboxylic acids. The synthesis starts from readily available ethyl 6-(bromomethyl)[1,3]dioxolo[4,5-*g*]quinoline-7-carboxylate (**1**), which was prepared according to the literature method [11]. The ester ethers ethyl 6-[(*tert*-butylphenoxy)methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylates (**2a–d**) were formed by the Willamson reaction of starting compound **1** and *tert*-butyl substituted phenols. However, the resulting products were difficult to purify from the reaction mixture. Addition some water to the reaction mixture did not have the compounds **2a–d** precipitated out, but instead produced oils. We also tried to chromatograph the reaction mixture on a column to isolate the intermediates but in low yields. Therefore, we developed an efficient one-pot synthesis of the key intermediates 6-[(*tert*-butyphenoxy)methyl][1,3]dioxolo-[4,5-*g*]quinoline-7-carboxylic acids (**3a–d**), which involved the *in situ* formation of compounds **2a–d** followed by hydrolysis with aqueous ethanolic potassium hydroxide solution. Thus, the two reactions, Williamson reaction and hydrolysis reaction proceeded in one pot, avoiding the tedious isolation of **2a–d**. The value of the one-pot procedure is very obvious: high yields, simple manipulation, and easy purification.

The facile synthesis of the title compounds. Our initial efforts at cyclizing **3a** used polyphosphoric acid as catalyst and solvent. The cyclization reaction could be achieved at 150°C; however, only 37% yield of the cyclized product was isolated. The cyclized product in the obtained mixture was purified by recrystallization from ethanol and was identified as [1]benzoxepino[3,4-*b*][1,3]dioxolo[4,5-*g*]quinolin-12(6*H*)-one (**5**) by spectroscopic methods (Scheme 2). The IR spectrum of **5** exhibited an absence of carboxyl group, which appeared in the substrate **3a** at 3393 cm^{-1}, and the presence of one typical carbonyl absorption for cyclic ketone moiety at 1641 cm^{-1}. Its structure was unequivocal proven by the ^1H NMR spectrum. Particularly, characteristic was the absence of *tert*-butyl protons' resonance at the range of 1.3 to 1.4 ppm, and the presence of seven-proton multiplet in the aromatic region at 7.13 to 8.60 ppm, besides the signals for two methylene protons at 5.41 and 6.16 ppm, respectively. Moreover, the obtained elemental analysis values are also in agreement with theoretical data.

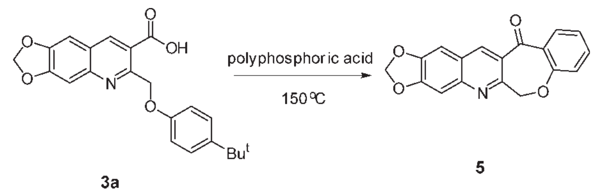
This process involves problem discussed below, which is accompanied by debutylation subsequent to the intramolecular Friedel-Crafts acylation reaction, and it is known that the debutylation reaction is usually carried out in a high-boiling solvent at a high temperature, and the *tert*-butyl substituent is easily removed from aromatic nuclei by Friedel-Crafts reaction using an acid catalyst [16–19]. Hence, we presumed that the high-reaction temperature might lead to the occurrence of debutylation reaction during the cyclization course.

A plausible intramolecular Friedel-Crafts acylation and debutylation mechanism is proposed as shown in Scheme 3. The substrate **3a** was treated with polyphosphoric acid to form the mixed phosphoric-carboxylic anhydride A [20], which further underwent the

Scheme 1



Scheme 2



intramolecular Friedel-Crafts acylation to afford cyclic ketone **4a.** Subsequently, nucleophilic attack of the resulting **4a** to H_3PO_4 under high temperature, followed by loss of isobutene, led to the formation of **5**. The mechanism is analogous to the de-*tert*-butylation of *p-tert*-butylcalix[n]arene in literature [21].

To verify the proposed mechanism, HPLC/MS analysis was selected as a simple and powerful tool, and the reaction was tested as a typical process. Thus, the reaction was monitored with HPLC/MS analysis as follows: portions of the reaction mixture were sampled and were worked up; the qualitative analysis was performed by HPLC/MS. The results revealed that compound **5** existed during the reaction process, and there were no compound **4a** observed during the course of the reaction according to mass spectroscopic detection.

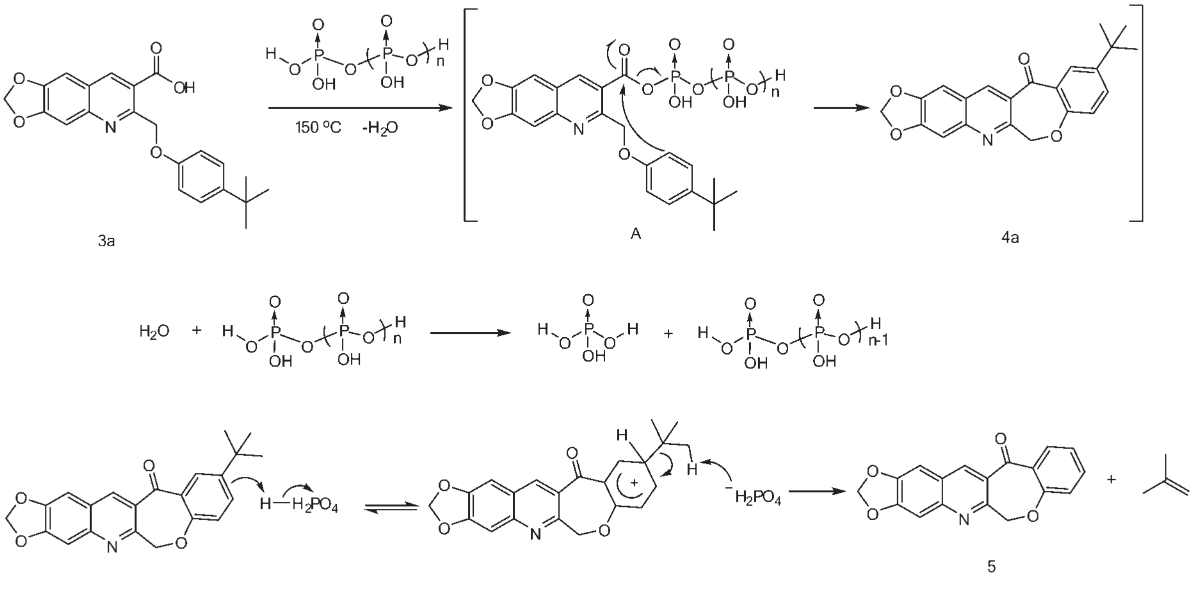
Recently, the inexpensive and commercially available Eaton's reagent, a mixture of P_2O_5 and $MeSO_3H$ [22], has been widely used for effecting intramolecular cyclizations under mild conditions. A number of interesting examples of intramolecular Friedel-Crafts acylation using Eaton's reagent have been published, including the syntheses of quinolone heterocycles [23], 4-hydroxycoumarins [24], and aromatic poly(ether ketone)s [25]. In connection with our studies, we envisioned that the reagent could also be applied to 6-[(*tert*-butylphenoxy)-methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylic acids, from which the desired quinoline-fused ring systems may be synthesized through intramolecular Friedel-Crafts acylation reaction. We were pleased to discover that simply dissolving **3a** in Eaton's reagent and heating to only 80°C resulted in conversion into **4a** in 65% yield within 3 hours. The ease of isolation of **4a** was notable: a simple quench into a basic solution precipitated the product in acceptable purity (94%). The role of P_2O_5 in the reagent mixture $P_2O_5/MeSO_3H$ is as a drying agent. Addition of P_2O_5 decreases the strength of the sulfonic acid. A small amount of water resulting from the cyclization reaction produced a decrease in acidity of $MeSO_3H$ but had little effect on the acid strength of $MeSO_3H$-P_2O_5 acid mixture. Phosphorus pentoxide is, thus, able to delay the deactivation by the water from the cyclization. In neat $MeSO_3H$ substrate **3a** does not give cyclized product after heating at 80°C over 10 hours.

Encouraged by the successful synthesis of compound **4a,** we tested this protocol for the intramolecular cyclization of other substrates **3b–d**. It was found that the method was effective, and all the *tert*-butyl substituted substrates were smoothly converted to the corresponding cyclized products without any evidence for the formation of de-*tert*-butyl products. Thus, the corresponding *tert*-butyl substituted cyclized products **4b–d** were afforded in 49%, 52%, and 58% yield, respectively.

EXPERIMENTAL

General. The melting points were determined by using WRS-1B melting points apparatus. The ^1H NMR was

Scheme 3



measured with a Varian Inova 400 NMR spectrometer at 400 MHz. The reported chemical shifts were against TMS. Elemental analysis was performed using an Elementar Vario EL-III element analyzer. HPLC/MS analysis was performed on a HP 1100 system HPLC/MS spectrometer.

General Procedure for the Preparation of 6-[(*tert*-Butyl phenoxy)methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylic acids (3a–d). To 0.046 g metal sodium (2 mmol) dissolved in 8 mL CH_3CH_2OH *tert*-butyl phenol (2 mmol) and 0.676 g ethyl 6-(bromomethyl)[1,3]dioxolo[4,5-*g*]quinoline-7-carboxylate (**1**) (2 mmol) were added. The mixture was refluxed for 2 hours. Then 60% (v/v) ethanolic potassium hydroxide solution 15 mL was added to the reaction mixture and continued to reflux for 2 hours, cooled, and acidified with 1 M HCl solution. The resulting crude product was recrystalized from 95% ethanol to afford compounds **3a–d**.

6-[(4-*tert*-Butylphenoxy)methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylic acid (3a). Yield 86%; mp 204 to 205°C. IR (KBr): 3393 (COOH), 3058, 2937, 2786, 1712 (C=O), 1610, 1502, 1426, 1245, 1047 (COC), 947 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.30$ (s, 9H, *t*-butyl), 5.51 (s, 2H, O-CH_2-Ar), 6.10 (s, 2H, OCH_2O), 6.76 to 6.82 (m, 2H, ArH), 6.91 (m, 2H, ArH), 7.38 to 7.41 (m, 2H, ArH), 8.44 (s, 1H, ArH). Anal. Calcd. For $C_{22}H_{21}NO_5$: C, 69.64; H, 5.58; N, 3.69 Found: C, 69.72; H, 5.63; N, 3.65%.

6-[(4-*tert*-Butyl-2-fluorophenoxy)methyl][1,3]dioxolo[4,5-*g*] quinoline-7-carboxylic acid (3b). Yield 79%, mp 185 to 187°C. IR (KBr): 3410 (COOH), 3064, 2930, 2853, 1698 (C=O), 1599, 1497, 1410, 1237, 1041 (COC), 948 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.36$ (s, 9H, *t*-butyl), 5.59 (s, 2H, O-CH_2-Ar), 6.21 (s, 2H, OCH_2O), 6.89 to 7.17 (m, 3H, ArH), 7.31 (s, 1H, ArH), 7.48 (s, 1H, ArH), 8.65 (s, 1H, ArH). Anal. Calcd. For $C_{22}H_{20}FNO_5$: C, 66.49; H 5.07; N 3.52 Found: C 66.53; H 5.12; N 3.59%.

6-[(4-*tert*-Butyl-2-chlorophenoxy)methyl][1,3]dioxolo[4,5-*g*] quinoline-7-carboxylic acid (3c). Yield 77%, mp 216 to 217°C. IR (KBr): 3421 (COOH), 3048, 2936, 2855, 1701 (C=O), 1579, 1514, 1428, 1240, 1035 (COC), 947 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.33$ s (9H, *t*-butyl), 5.58 s (2H, O-CH_2-Ar), 6.20 s (2H, OCH_2O), 7.12 to 7.18 m (2H, ArH), 7.32 to 7.35 m (1H, ArH), 7.41 to 7.55 m (2H, ArH), 8.54 s (1H, ArH). Anal. Calcd. For $C_{22}H_{20}ClNO_5$: C, 63.85; H, 4.87; N, 3.38 Found: C, 63.92; H, 4.85; N, 3.48%.

6-[(2,4-Di-*tert*-Butylphenoxy)methyl][1,3]dioxolo[4,5-*g*]quinoline-7-carboxylic acid (3d). Yield 68%, mp 178 to 180°C. IR spectrum (KBr), v, cm^{-1}: 3432 (COOH), 3044, 2939, 2851, 1707 (C=O), 1580, 1507, 1449, 1422, 1243, 1046 (COC), 950 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.31$ (s, 9H, *t*-butyl), 1.37 (s, 9H, *t*-butyl), 5.55 (s, 2H, O-CH_2-Ar), 6.19 (s, 2H, OCH_2O), 7.08 to 7.21 (m, 3H, ArH), 7.35 to 7.41 (m, 2H, ArH), 8.61 (s, 1H, ArH). Anal. Calcd. For $C_{26}H_{29}NO_5$: C, 71.70; H, 6.71; N, 3.22 Found: C, 71.82; H, 6.69; N, 3.28%.

Synthesis of [1]benzoxepino[3,4-b][1,3]dioxolo[4,5-*g*]quinolin-12(6*H*)-one (5). The 6-[(4-*tert*-butylphenoxy)methyl][1,3]-dioxolo[4,5-*g*]quinoline-7-carboxylic acid (**3a**) (0.38 g, 1 mmol) and polyphosphoric acid (12 g) were added to round flask (25 mL) and stirred at 150°C for 2.5 hours. Then, the reaction mixture was poured into icy water and neutralized with an icy saturated sodium carbonate solution. The crude products were obtained after filtration and washed with water. The pure product **5** was obtained by recrystalization from THF-H_2O. Yield 37%, mp 196 to 197°C. IR (KBr): 3019, 1641 (C=O), 1598, 1559, 1505, 1457, 1400, 1365, 1297,1222, 1168, 1109, 929. ^{1}H NMR (400 MHz, $CDCl_3$): 5.41 (s, 2H, Oxepan-H), 6.16 (s, 2H, OCH_2O), 7.13 to 7.20 (m, 2H, ArH), 7.26 (s, 1H, ArH), 7.40 (s, 1H, ArH), 7.51 to 7.54 (m, 2H, ArH), 8.29 to 8.31 (m, 1H, ArH), 8.60 (s, 1H, ArH). Anal. Calcd. For $C_{18}H_{11}$NO4: C, 70.82; H, 3.63; N, 4.59 Found: C, 70.63; H, 3.78; N, 4.57%.

General Procedure for the Preparation of Title Compounds (4a–d). 6-[(*tert*-Butylphenoxy)methyl][1,3]dioxolo[4,5-*g*]quinolin-7-carboxylic acids **(3a–d)** (1 mmol) and Eaton's reagent (8 mL) were added to round flask (25 mL) and stirred at 80°C for 3 hours. Then, the reaction mixture was poured slowly with stirring into an icy saturated sodium carbonate solution. The crude products were obtained after filtration and washed with water. The pure product **4a–d** was obtained by recrystalization from ethanol.

10-*tert*-Butyl[1]benzoxepino[3,4-b][1,3]dioxolo[4,5-*g*]quinolin-12(6*H*)-one (4a). Yield 65%, mp 201 to 203°C. IR (KBr): 3033, 2925, 2779, 1647 (C=O), 1604, 1586, 1457, 1400, 1249, 1029, 949 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.34$ (s, 9H, 3-*t*-butyl), 5.43 (s, 2H, Oxepan-H), 6.25 (s, 2H, OCH_2O), 7.24 to 7.27 (m, 1H, ArH), 7.47 (s, 1H, ArH), 7.61 (s, 1H, ArH), 7.83 (s, 1H, ArH), 8.12 to 8.14 (m, 1H, ArH), 8.74 (s, 1H, ArH). Anal. Calcd. For $C_{22}H_{19}NO_4$: C, 73.12; H, 5.30; N, 3.88 Found: C, 73.37; H, 5.18; N, 3.92%.

10-*tert*-Butyl-8-fluoro[1]benzoxepino[3,4-b][1,3]dioxolo[4,5-*g*]quinolin-12(6*H*)-one (4b). Yield 49%, mp 215 to 217°C. IR (KBr): 3031, 2927, 2791, 1637 (C=O), 1616, 1471, 1242, 1073, 1028 (COC), 951 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.39$ (s, 9H, *t*-butyl), 5.58 (s, 2H, Oxepan-H), 6.27 (s, 2H, OCH_2O), 7.29 to 7.31 (m, 1H, ArH), 7.52 (s, 1H, ArH), 7.85 (s, 1H, ArH), 8.13 to 8.16 (m, 1H, ArH), 8.78 (s, 1H, ArH). Anal. Calcd. For $C_{22}H_{18}FNO_4$: C, 69.65; H, 4.78; N, 3.69 Found: C, 69.89; H, 4.61; N, 3.70%.

10-*tert*-Butyl-8-chloro[1]benzoxepino[3,4-b][1,3]dioxolo[4,5-*g*]quinolin-12(6*H*)-one (4c). Yield 52%, mp 226 to 227°C. IR (KBr): 3011, 2920, 2815, 1647 (C=O), 1591, 1461, 1400, 1245, 1038 (COC), 948 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.32$ (s, 9H, *t*-butyl), 5.57 (s, 2H, Oxepan-H), 6.26 (s, 2H, OCH_2O), 7.19 to 7.23 (m, 1H, ArH), 7.47 (s, 1H, ArH), 7.81 to 7.84 (m, 1H, ArH), 8.11 to 8.13 (m, 1H, ArH), 8.66 (s, 1H, ArH). Anal. Calcd. For $C_{22}H_{18}ClNO_4$: C, 66.75; H, 4.85; N, 3.54 Found: C, 66.46; H, 4.91; N, 3.60%.

8,10-Di-*tert*-Butyl[1]benzoxepino[3,4-b][1,3]dioxolo[4,5-*g*] quinolin-12(6*H*)-one (4d). Yield 58%, mp 241 to 243°C. IR (KBr): 3015, 2923, 2810, 1636 (C=O), 1596, 1462, 1400, 1237, 1036 (COC), 949 (OCH_2O). ^{1}H NMR (400 MHz, $CDCl_3$): $\delta = 1.35$ (s, 9H, *t*-butyl), 1.34 (s, 9H, *t*-butyl), 5.40 (s, 2H, Oxepan-H), 6.23 (s, 2H, OCH_2O), 7.07 to 7.10 (m, 1H, ArH), 7.43 (s, 1H, ArH), 8.01 to 8.03 (m, 1H, ArH), 8.12 (s, 1H, ArH), 8.67 (s, 1H, ArH). Anal. Calcd. For $C_{26}H_{27}NO_4$: C, 74.80; H, 6.52; N, 3.35 Found: C, 74.68; H, 6.59; N, 3.29%.

New reaction of diaziridine ring expansion resulting in diethyl 1,2,3,6-tetrahydropyrimidine-4,5-dicarboxylate derivatives was discovered under the action of diethyl acetylenedicarboxylate on 1,2-di- and 1,2,3-trialkyldiaziridines in ionic liquids.

J. Heterocyclic Chem., **46**, 1195 (2009).

INTRODUCTION

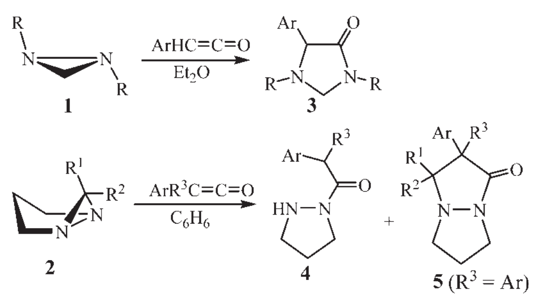
Over a few last years, new simple approaches to the construction of different nitrogen-containing heterocyclic systems have been developed in our laboratory. These are based on the strained diaziridine ring transformation in readily available [1,2] 1,2-dialkyldiaziridines **1** and 1,5-diazabicyclo[3.1.0]hexanes **2** under the action of electrophilic reagents, in particular, dipolarophiles. Herein, the diaziridine ring is capable of opening on the C—N or N—N bonds to generate dipolar intermediates prone to cycloaddition reactions (so-called ring expansion reactions) resulting in other heterocyclic structures [3–10].

Arylketenes [3–6], aroyliso- and aroylisothiocyanates [7,8], carbon disulfide [9,10], and activated nitriles [10,11] were investigated as dipolarophiles. Thus, the reaction of arylketenes with 1,2-dialkyldiaziridines **1** resulted in 5-aryl-1,3-dialkylimidazolidin-4-ones **3** and with 1,5-diazabicyclo[3.1.0]hexanes **2**—in heterocyclic compounds of two kinds—1-(arylacetyl)pyrazolidines **4** and 1,5-diazabicyclo[3.3.0]octan-2-ones **5** (Scheme 1).

However, these researches showed that new heterocyclic systems in common organic solvents could only be achieved in reactions with highly reactive reagents—arylketenes [3–6] and aroylisocyanates [7]. A reaction between diaziridines **1** and **2** and the other foresaid reagents was also performed successfully though only with ionic liquids (ILs) used as a reaction medium [8–11]. Moreover, absolutely unexpected heterocyclic structures were built in those solvents in some cases. For example, derivatives of earlier unknown infused 1,2,4,6-tetrazepan-5-thione were obtained in one preparative step by an interaction of 1,2-dialkyldiaziridines **1** with benzoylisothiocyanate in 1-butyl-3-methylimidazilium tetrafluoroborate ([bmim][BF$_4$]) or hexafluorophosphate ([bmim][PF$_6$]) [8].

We continued examining ring expansion reactions of monocyclic 1,2-dialkyldiaziridines **1** with dipolarophiles in ionic liquids within this research effort. As a dipolarophile dialkyl esters of acetylenedicarboxylic acid were selected. The reaction between 1,2-dialkyldiaziridine derivatives and dimethyl acetylenedicarboxylate in benzene had been described in literature [12]. The authors of this study have found out that the interaction of these compounds resulted in only linear products **7** and **8** and the diaziridine ring opening occurred on the N—N bond. The research on this reaction mechanism was assisted by labeled atoms (D). On the basis of the obtained compounds structure authors of the work [12] assumed that the first reaction step was the formation of dipolar intermediates **9**. Where one of the substituents at nitrogen atoms of initial diaziridine **1a** was benzyl, intermediate **9a** was stabilized by a proton split-off from the CH$_2$ group of the benzyl fragment followed by the generation of enamine **7**. If one of the substituents at nitrogen atoms was Ph (**1b**), intermediate **9b** was stabilized by proton breaking from the C(3)-carbon atom of the

Scheme 1



diaziridine ring with further generation of product **8** (Scheme 2) [12].

Originating from the data obtained in [8–11] we hoped that ILs as a reaction medium would change the stabilization pathways of intermediates **9** and result in heterocyclic structures **10** or **11** depending on C—N- or N—N-positioned opening of the diaziridine ring in the interaction of 1,2-dialkyldiaziridines **1** with dialkyl esters of acetylenedicarboxylic acid (Scheme 3).

Ionic liquids have been widely used over the past years as a potential replacement of conventional solvents for a variety of chemical processes [13,14]. ILs have considerable advantages over available organic solvents—they are fire-resistant and have limited vapor pressure thus allowing efficient recovery of organic products. In addition, they are recyclable and can be used several times in the same reactions. Moreover, many reactions gain acceleration in ILs due to stabilization of charged intermediates or ions [15–17]. The realization of different reactions in ILs pertains to a new prospective field of organic chemistry—''green chemistry.''

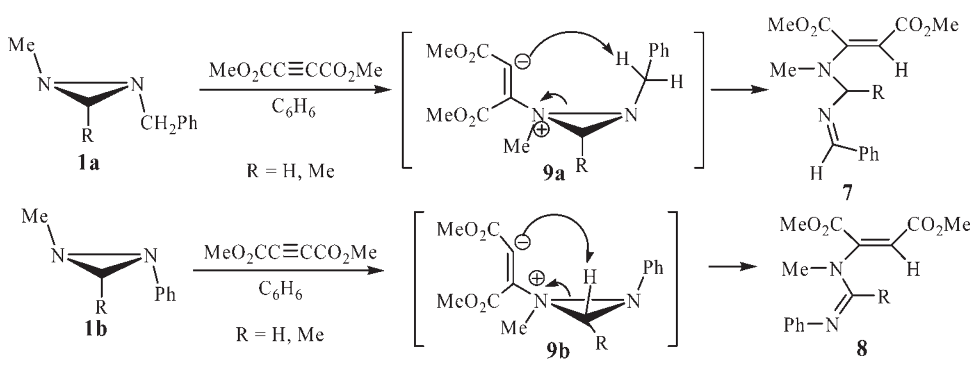
RESULTS AND DISCUSSION

1,2-Dibutyl-(**1c**), 1,2-dipropyl-(**1d**), 1,2-diethyl-(**1e**), 1,2-dimethyl-(**1f**), 1,2,3-triethyl-(**1g**), 1,2-diethyl-3-methyl-(**1h**), 1,2-dipropyl-3-ethyl-(**1i**), and 3-benzyl-1,2-di(2-phenylethyl)- (**1j**) diaziridines were examined as initial dialkyldiaziridines **1** and diethyl acetylenedicarboxylate **12** as a dipolarophyle. From a large number of ILs we picked 1-butyl-3-methylimidazolium tetrafluoroborate or hexafluorophosphate ([bmim][BF$_4$] or [bmim][PF$_6$]). These ionic liquids relate to room temperature ionic liquids group (RTIL) and are one of the most accessible ones. Note that during the reaction the reaction mixture is colored orange at first and then red at reaction end.

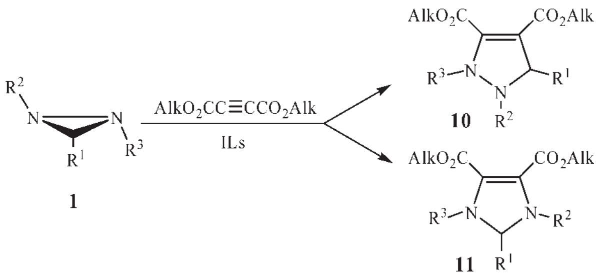
The investigations were started with 1,2-dibutyldiaziridine **1c** in [bmim][BF$_4$]. At first, the equimolar quantity of the reagents was added to the reaction. In about 30 min at 20°C, the reaction was completed (as shown by TLC) and a new compound, diethyl 1-[3-ethoxy-1-(ethoxycarbonyl)-3-oxoprop-1-enyl]-3-buthyl-6-propyl-1,2,3,6-tetrahydropyrimidine-4,5-dicarboxylate **13c,** was obtained in 37% yield. According to mass spectra this contained one molecule of diaziridine **1c** and two molecules of diethyl acetylenedicarboxylate **12**. After adding one mole of diaziridine **1c** and two moles of dipolarophile **12** to the reaction, the yield of **13c** became higher −69%. This reaction was found to have a general character—compounds **13d–f** were synthesized from diaziridines **1d–f** and dipolarophile **12** in close yields. The reaction ran in ionic liquid [bmim][PF$_6$] as well as in [bmim][BF$_4$]. Reaction rate depended on solubility of initial diaziridines **1c–f** in Ils—the shorter alkyl substituents at nitrogen atoms the higher their solubility and rate of reaction.

Further on, it was found that, apart from 1,2-dialkyldiaziridines **1c–f**, 1,2,3-trialkyldiaziridines **1g–i** were also capable of entering the reaction with diethyl acetylenedicarboxylate **12** to produce corresponding tetrahydropyrimidine derivatives **13g–i**. However, the latter are formed only at the replacement of ionic liquids [bmim][BF$_4$] or [bmim][PF$_6$] with [emim][HSO$_4$] being herein both a reaction medium and an acidic catalyst. Yields of compounds **13g–i** were also increased as affected by lengthening of the alkyl substituents both at N and at C(3) atoms of initial diaziridines **1g–i**.

Scheme 2



Scheme 3



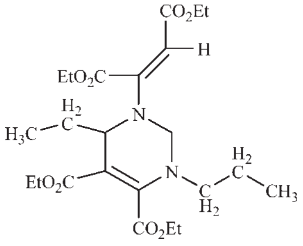


Figure 1. The molecule **13d** structure.

The structures of compounds **13c–i** were established by aggregating elemental analysis data and spectral characteristics (mass-spectra, IR-, NMR ^{1}H, ^{13}C, ^{15}N-spectra with use of COSY, NOESY, ^{1}H-^{13}C HSQC, ^{1}H-^{13}C HMBC, and ^{1}H-^{15}N HMBC methods). The proof of compounds **13** structure was demonstrated on example of compound **13d**. ^{13}C APT spectrum revealed 6 CH_3 groups, 8 CH_2 groups, 2 CH groups, and 7 quaternary carbon atoms, four of them were in the region of carboxylic carbon resonance. ^{1}H spectrum was assigned with COSY, NOESY, and HSQC 2D spectra. The investigation of these spectra showed that molecule contained four carboethoxy, one *N*-propyl-, one 1-substituted *N*-propyl group, one CH_2 group which had no interactions with other protons, and one sp^{2}-CH group. ^{1}H-^{13}C HMBC 2D spectral correlations allowed us to approve the structure of these fragments and interconnections between them, as well as positions of quaternary carbon atoms. The proposed molecular structure was tetrahydropyrimidine ring with substituents (Fig. 1)

The ^{1}H-^{13}C HMBC correlations of the compound **13d** are shown in Figure 2.

The ^{1}H-^{15}N HMBC spectrum revealed two sp^{3} N-atoms with chemical shifts of −295.1 and −291.9 ppm (with an external reference CH_3NO_2, $\delta = 0.0$ ppm) and connectivity between both N-atoms and protons, which is shown in Figure 3.

The most important NOE interactions in the molecule **13d** revealed in NOESY experiment (Fig. 4)

Cis-configuration of two carboethoxy groups near double bond at N-1 was proved by NOE interactions H-8/H-2 and H-6/H-12 in NOESY spectrum. Another important NOE correlation was between H-2 and H-9 also proved the structure of this molecule.

Initial 1,2-dialkyldiaziridines **1c–i** are chiral compounds but they were introduced to the reaction with diethyl acetylenedicarboxylate **12** in a racemic form.

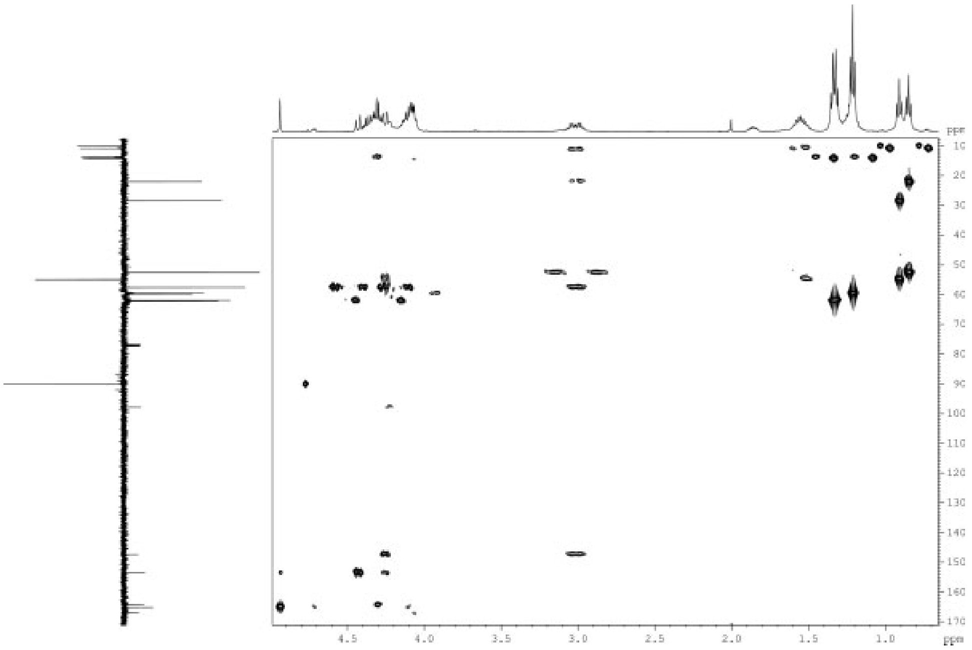

Figure 2. ^{1}H-^{13}C HMBC correlations of the compound **13d**.

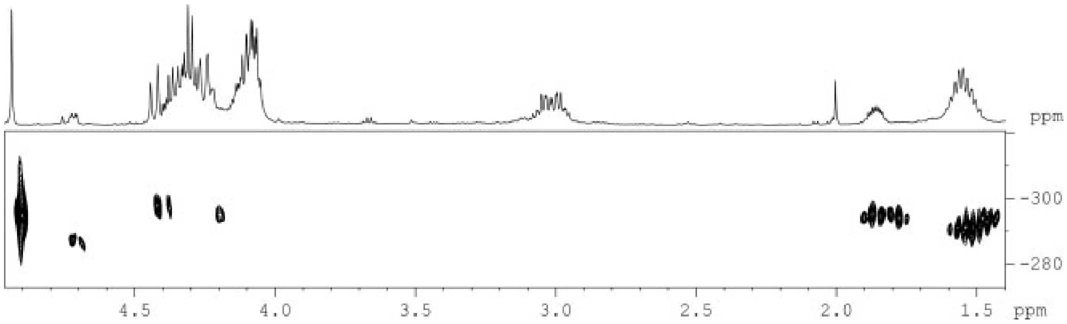

Figure 3. ^{1}H-^{15}N HMBC correlations of the compound **13d**.

And the reaction evidently proceeds not stereoselectively. The synthesized compounds (**13c–i**) contain chiral carbon atoms (C(6) in **13c–f** and C(2) and C(6) in **13g–i**), however, **13c–f** are racemates and, as seen from the spectral characteristics, no diastereomers were fixed in **13g–i** prepared from 1,2,3-trialkyldiaziridines **1g–i**.

The chemical shifts of signals NMR ^{1}H, ^{13}C, ^{15}N spectra by the example of compounds **13c**, **13d**, **13h** are presented in Table 1. The atom numeration is shown on Figure 5.

This result is in agreement with the assumed mechanism of the reaction. The first step (as in ref. [12]) is the formation of dipolar intermediate **9**, however, its life time evidently increases in ionic liquids able to solvate both positively and negatively charged particles or molecule moieties [15–17]. Therefore, the second molecule of diethyl acetylenedicarboxylate **12** has time to enter a reaction with intermediate **9,** generating the second intermediate **14,** which is transformed to final compound **13**. Generally, the formation of compounds **13** can be presented as two-step condensation of one molecule of initial diaziridine **1** and two molecules of compound **12** according to Scheme 4. Unlike the transformation of intermediate **9** in benzene (Scheme 2), the anion of intermediate **9** in ILs evidently attacks the proton of the CH_2 group bound to same nitrogen atom to generate a new anion, which in turn attacks the second molecule of diethyl acetylenedicarboxylate **12** (Scheme 4).

The expected five-member heterocyclic compound, *i.e.*, diethyl 5-benzyl-1,2-bis(2-phenylethyl)-2,5-dihydro-1*H*-pyrazole-3,4-dicarboxylate **15**, was obtained only in one case by the interaction of 1,2-di(2-phenylethyl)-3-phenylmethyldiaziridine **1j** with diethyl acetylenedicarboxylate **12** in ionic liquid [emim][HSO_4] (Scheme 5). Evidently, here, the attack of the second molecule of dipolarophile **12** on intermediate **9j** was sterically hindered.

Thus a new unexpected transformation of 1,2-dialkyldiaziridines **1** under the action of diethyl acetylenedicarboxylate **12** in ionic liquids resulting in tetrahydropyrimidine derivatives **13** was discovered. The reaction is a new method for preparing tetrahydropyrimidine derivatives and is a valuable supplement to the known synthetic methods for such kind of compounds. Pyrimidines and their analogs represent an important class of nitrogen heterocycles, which are components both of various biologically active natural compounds and of diverse drugs [18(a)]. They display antiviral [18(b)], antibacterial [18(b,c)], anti-inflammatory [18(a,b)], and anti-HIV (HIV Integrase inhibitors) activities [18(d)] and are useful as inflammatory mediators in Parkinson's disease therapy [18(e)].

EXPERIMENTAL

Elemental analysis was performed by the CHN Analyzer Perkin–Elmer 2400. The IR spectra (ν, cm^{-1}) were measured using a SPECORD-M82 spectrometer. Mass spectra were measured using a Finnigan MAT INCOS-50 instrument. The NMR spectra of compound **15** were recorded using a Bruker AM-300 spectrometer at 300 MHz for ^{1}H and 75.47 MHz for ^{13}C Spectra in $CDCl_3$. The NMR spectra of all compounds **13c–i** were measured on Bruker AV-600 instrument with the frequencies 600.13, 150.90, and 60.81 MHz for ^{1}H, ^{13}C, and ^{15}N, correspondingly. The chemical shifts of the signals of $CDCl_3$ residual proton (7.27 ppm) and carbon (77.0 ppm) were used as the internal standard. The ^{15}N spectra were measured with CH_3NO_2 ($\delta_{^{15}N} = 0.0$ ppm) as the external standard. All 2D-spectra were recorded using standard Bruker methods with Z-gradient. The spectra were measured at 30°C. Analytical thin-layer chromatography (TLC) was conducted on silica gel plates (Silufol UV-254). New compounds were purified by flash-chromatography (column chromatography for **15**) on

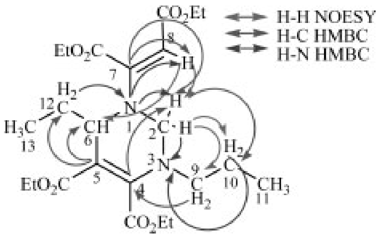

Figure 4. The most important NOE interactions in the molecule revealed in NOESY experiment.

Silicagel, 0.060–0.200 mm, 60 A (ACROS). R_f of all compounds **13** and **15** was measured with the usage of eluent [*n*-hexane-ethyl acetate, 2:1 (v/v)].

General procedure for the synthesis of substituted 1,2,3,6-tetrahydropyrimidines by the reaction of 1,2-di- and 1,2,3-trialkyldiaziridines 1c-i with diethyl acetylenedicarboxylate 12 in ionic liquid. To a stirred mixture (20°C) of diaziridine **1c–i** (1.0 mmol) and ionic liquid ([bmim][BF$_4$] or [bmim][PF$_6$] for 1,2-dialkyldiaziridines **1c–f** and [emim][HSO$_4$] for 1,2,3-trialkyldiaziridines **1g–i**) (0.4 g), diethyl acetylenedicarboxylate **12** (2.0 mmol) was added dropwise for about 1 min and the reaction mixture was stirred for an additional 30 min to the full conversion of initial compounds (TLC-control), the reaction mixture color was changed through the time from orange to red. After that the resulting substituted 1,2,3,6-tetrahydropyrimidine **13** was extracted from ionic liquid by mixture of solvents hexane and ethyl acetate (5:1, 4–5 times by 7 mL), then the solvent was evaporated. Final substituted 1,2,3,6-tetrahydropyrimidine **13** was purified by the method of flash-chromatography on Silicagel with the solvent of *n*-hexane and ethyl acetate (2:1).

Synthesis of diethyl 5-benzyl-1,2-bis(2-phenylethyl)-2,5-dihydro-1*H*-pyrazole-3,4-dicarboxylate (15). To a stirred mixture (20°C) of diaziridine **1j** (1.0 mmol) and ionic liquid ([bmim][BF$_4$] or [bmim][PF$_6$]) (0.4 g), diethyl acetylenedicarboxylate **12** (1.0 mmol) was added dropwise for about 1 min

ILs = [bmim][BF$_4$], [bmim][PF$_6$] (R^2 = H); [emim][HSO$_4$] (R^2 = Alk)

and the reaction mixture was stirred for an additional 48 h to the full conversion of initial compounds (TLC-control), the reaction mixture color was changed through the time from orange to red. After that the resulting compound **15** was extracted from ionic liquid by mixture of solvents hexane and ethyl acetate (5:1, 6 times by 7 mL), then the solvent was evaporated. Final compound **15** was purified by the method of column chromatography on Silicagel with the solvent of *n*-hexane and ethyl acetate (3:1).

The physical and spectral data of compounds **13c–i** and **15** are as follows.

Diethyl 1-[3-ethoxy-1-(ethoxycarbonyl)-3-oxoprop-1-enyl]-3-buthyl-6-propyl-1,2,3,6-tetrahydropyrimidine-4,5-dicarboxylate (13c). This compound was obtained as yellow nondistilled oil, 69% yield, R_f 0.37; IR: 668, 772, 864, 924, 1024, 1044, 1096, 1152, 1172, 1220, 1248, 1372, 1444, 1456, 1580, 1652, 1700, 1740, 2876, 2936, 2960, 2970 cm^{-1}; ^{1}H NMR: δ 0.89 (t, 6H, $\mathrm{C}H_3\mathrm{(CH_2)_3N}$ + $\mathrm{C}H_3\mathrm{(CH_2)_2N}$, ^3J = 7.1 Hz), 1.22 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC_{chain}N}$, ^3J = 7.2 Hz), 1.23 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC^4_{ring}}$, ^3J = 7.2 Hz), 1.26 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{(CH_2)_2N}$, ^3J = 7.2), 1.33 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC_{chain}H}$, ^3J = 7.2 Hz), 1.34, 1.41 (2m, 2H, $\mathrm{CH_3C}H_2\mathrm{CH_2C^6_{ring}}$), 1.35 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC^5_{ring}}$, ^3J = 7.2 Hz), 1.51, 1.76 (2m, 2H, $\mathrm{CH_3CH_2C}H_2\mathrm{C^6_{ring}}$), 1.52 (m, 2H, $\mathrm{CH_3CH_2C}H_2\mathrm{CH_2N}$), 3.03, 3.07 (2m, 2H, $\mathrm{CH_3(CH_2)_2C}H_2\mathrm{N}$), 4.06 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC^4_{ring}}$, ^3J = 7.2 Hz), 4.14 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC_{chain}N}$, ^3J = 7.2 Hz), 4.24, 4.45 (dd, 2H, $\mathrm{C^2_{ring}}H_2$), 4.31 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC^5_{ring}}$, ^3J = 7.2 Hz), 4.33 (m, 2H, $\mathrm{C^6_{ring}}H$), 4.36 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC_{chain}H}$, ^3J = 7.2 Hz), 4.94 ppm (s, 1H, $\mathrm{EtOOCC_{chain}}H$); ^{13}C NMR: 15.25 ($C\mathrm{H_3(CH_2)_3N}$ and $C\mathrm{H_3(CH_2)_2C^6_{ring}}$), 15.26 ($C\mathrm{H_3CH_2OOCC^4_{ring}}$), 15.29 ($C\mathrm{H_3CH_2OOCC^5_{ring}}$), 15.68 ($C\mathrm{H_3CH_2OOCC_{chain}N}$), 15.74 ($C\mathrm{H_3CH_2OOCC_{chain}H}$), 20.24 ($\mathrm{CH_3}C\mathrm{H_2CH_2C^6_{ring}}$), 21.27 ($\mathrm{CH_3}C\mathrm{H_2CH_2CH_2N}$), 32.39 ($\mathrm{CH_3CH_2}C\mathrm{H_2CH_2N}$), 39.32 ($\mathrm{C^6_{ring}}C\mathrm{H_2}$), 52.27 ($\mathrm{CH_3CH_2CH_2}C\mathrm{H_2N}$), 53.36 ($C^6_{\mathrm{ring}}\mathrm{H}$), 59.11 ($C^2_{\mathrm{ring}}\mathrm{H_2}$), 61.08 ($\mathrm{CH_3}C\mathrm{H_2OOCC^4_{ring}}$), 61.28 ($\mathrm{CH_3}C\mathrm{H_2OOCC_{chain}N}$), 63.44 ($\mathrm{CH_3}C\mathrm{H_2OOCC^5_{ring}}$), 63.73 ($\mathrm{CH_3}C\mathrm{H_2OOCC_{chain}H}$), 91.79 ($\mathrm{EtOOC}C_{\mathrm{chain}}\mathrm{H}$), 99.26 ($\mathrm{EtOOC}C^5_{\mathrm{ring}}$), 148.85 ($\mathrm{EtOOC}C^4_{\mathrm{ring}}$), 154.90 ($\mathrm{EtOOC}C_{\mathrm{chain}}\mathrm{N}$), 165.72 ($\mathrm{EtOO}C\mathrm{C^5_{ring}}$), 166.58 ($\mathrm{EtOO}C\mathrm{C_{chain}H}$), 166.61 ($\mathrm{EtOO}C\mathrm{C_{chain}N}$), 168.51 ppm ($\mathrm{EtOO}C\mathrm{C^4_{ring}}$); ^{15}N NMR: δ −292.2 ppm (N^1), −293.8 (N^3); ms: *m*/*z* (I, %) 496 (3, M), 467 (23, M – $\mathrm{C_2H_5}$), 451 (5, M – $\mathrm{C_3H_7}$ – 2H), 438 (4, M – $\mathrm{2C_2H_5}$), 323 (13, M – $\mathrm{CO_2C_2H_5}$), 350 (6, M – $\mathrm{2CO_2C_2H_5}$), 168 (15, diethyl acetilenedicarboxylate – 2H), 155 (71, 1,2-dibutyl diaziridine – H), 43 (100, $\mathrm{C_3H_7}$). Anal. Calcd for $\mathrm{C_{25}H_{40}N_2O_8}$ (496.59): C, 60.47; H, 8.12; N, 5.64. Found: C, 60.44; H, 8.15; N, 5.63.

Diethyl 1-[3-ethoxy-1-(ethoxycarbonyl)-3-oxoprop-1-enyl]-3-propyl-6-ethyl-1,2,3,6-tetrahydropyrimidine-4,5-dicarboxylate (13d). This compound was obtained as yellow nondistilled oil, 77% yield, R_f 0.37; IR: 666, 748, 774, 864, 1024, 1046, 1098, 1154, 1222, 1246, 1372, 1446, 1462, 1580, 1700, 1738, 2876, 2922, 2950, 2984 cm^{-1}; ^{1}H NMR: δ 0.85 (t, 3H, $\mathrm{C}H_3\mathrm{(CH_2)_2N}$, ^3J = 7.2 Hz), 0.91 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2C^6_{ring}H}$, ^3J = 7.3 Hz), 1.22 (t, 6H, $\mathrm{C}H_3\mathrm{CH_2OOCC^4_{ring}}$ + $\mathrm{C}H_3\mathrm{CH_2OOCC_{chain}N}$, ^3J = 7.2 Hz), 1.32 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC^5_{ring}}$, ^3J = 7.2 Hz), 1.35 (t, 3H, $\mathrm{C}H_3\mathrm{CH_2OOCC_{chain}H}$, ^3J = 7.2 Hz), 1.51, 1.85 (2m, 2H, $\mathrm{CH_3C}H_2\mathrm{C^6_{ring}}$), 1.55 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{CH_2N}$), 2.98, 3.04 (2m, 2H, $\mathrm{CH_3CH_2C}H_2\mathrm{N}$), 4.07 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC^4_{ring}}$, ^3J = 7.2 Hz), 4.12 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC_{chain}N}$, ^3J = 7.2 Hz), 4.22 (m, 2H, $\mathrm{C^6_{ring}}H$), 4.25, 4.43 (dd, 2H, $\mathrm{C^2_{ring}}H_2$), 4.30 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC^6_{ring}}$, ^3J = 7.2 Hz), 4.36 (m, 2H, $\mathrm{CH_3C}H_2\mathrm{OOCC_{chain}H}$, ^3J = 7.2 Hz), 4.94 ppm (s, 1H, $\mathrm{EtOOCC_{chain}}H$); ^{13}C NMR: δ 10.12 ($C\mathrm{H_3CH_2C^6_{ring}}$), 10.86 ($C\mathrm{H_3CH_2CH_2N}$), 13.72 ($C\mathrm{H_3CH_2OOCC^4_{ring}}$), 13.76 ($C\mathrm{H_3CH_2OOCC^5_{ring}}$), 14.18 ($C\mathrm{H_3CH_2OOCC_{chain}N}$), 14.23 ($C\mathrm{H_3CH_2OOCC_{chain}H}$), 22.09 ($\mathrm{CH_3}C\mathrm{H_2CH_2N}$), 28.56 ($\mathrm{C^6_{ring}}C\mathrm{H_2CH_3}$), 52.67 ($\mathrm{CH_3CH_2}C\mathrm{H_2N}$), 55.02 ($C^6_{\mathrm{ring}}\mathrm{H}$), 57.55 ($C^2_{\mathrm{ring}}\mathrm{H_2}$), 59.51 ($\mathrm{CH_3}C\mathrm{H_2OOCC^4_{ring}}$), 59.77 ($\mathrm{CH_3}C\mathrm{H_2OOCC_{chain}N}$), 61.93 ($\mathrm{CH_3}C\mathrm{H_2OOCC^5_{ring}}$),

A one-pot procedure for the synthesis of pyrrolo[2,1-*a*]isoquinolines and pyrrolo[1,2-*a*]quinolines in good to excellent yields has been reported, using quinoline or isoquinoline, phenacylbromide derivatives and activated alkynes in aqueous medium.

J. Heterocyclic Chem., **46**, 1203 (2009).

INTRODUCTION

The synthesis of indolizines, and their derivatives with additional rings fused like pyrrolo[2,1-*a*]isoquinolines and pyrrolo[1,2-*a*]quinolines, has puzzled scientists for decades. The interest in these compounds is largely owing to their properties. Synthetic indolizines are used as potential central nervous system depressants [1], calcium entry blockers [2], testosterone 5α-reductase inhibitors [3], cardiovascular agents [4], spectral sensitizers [5], and novel dyes [6]. Pyrrolo[2,1-*a*]isoquinoline derivatives [7] have attracted considerable interest, because they possess antidepressant [8], muscarinic agonist [9], antiplatelet [10], and anticancer activity [11]. Moreover, they can be used as Positron emission tomography (PET) radiotracers for imaging serotinine uptake sites [12]. The importance of these nitrogen heterocycles is further enhanced by their utility as advanced intermediates for the synthesis of alkaloids [13]. Acetoxy substituted 5,6-dihydro[2,1-*a*]isoquinolines (**1** in Fig. 1) exhibit strong binding affinities for the estrogen receptor of MDA-MB 231 and MCF-7 mammary tumor cell lines [14].

The parent framework of **1** (**2** in Fig. 1) is an α_2-adrenoreceptor antagonist[15] and its 5-phenyl derivatives exhibit antidepressant-like activity.[16] 1-benzoyl-3-cyano-pyrrolo[1,2-a]quinolines (**3** in Fig. 1) have been shown to be activators of caspases and inducers of apoptosis and also are used as therapeutically effective anticancer agents [17]. As a result, development of new methods to synthesize these classes of compounds is of considerable importance, and a number of general synthetic methods for their preparation have been reported [7,18].

The increasing environmental consciousness of the chemical community has led to the search for more efficient and environmentally friendly methods for chemical syntheses [19]. Because of the environmental acceptability, abundance, and low cost of water, organic reactions in water have received increased attention [20]. Many reactions that are traditionally carried out in organic solvent can be carried out in water with additional interesting features [21]. Thus, the development of efficient procedures for useful chemical transformations in water is highly appreciated.

RESULTS AND DISCUSSION

As part of our current studies on the development of ylide reactions in aqueous media [22], we report herein an efficient synthesis of pyrrolo[2,1-*a*]isoquinolines and pyrrolo[1,2-*a*]quinolines via a one-pot three component reaction of isoquinoline or quinoline with phenacylbromide derivatives and activated alkynes.

We began our study by investigating the reactivity of preformed salts, such as **4** or **5** as nitrogen ylide precursors (Scheme 1).

Treatment of salt **4** or **5** with activated acetylenes in water, in the presence of a base, formed compounds **6**, **7**, respectively, in good to excellent yields. The temperature was of crucial importance. No reaction was observed at room temperature with quinoline ylides and

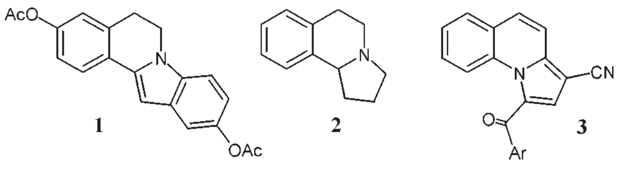

Figure 1. Chemical structures of **1**, **2**, and **3**.

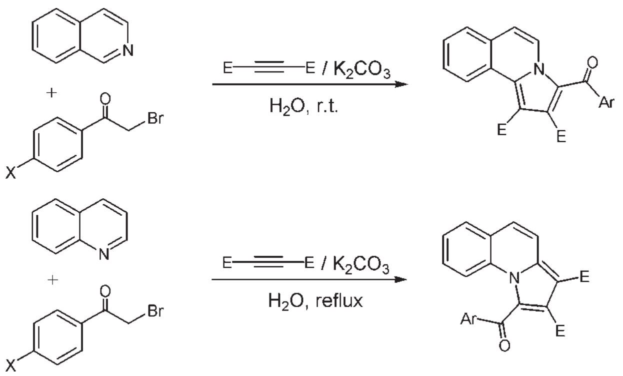
all of the reactions were carried out at reflux. However, isoquinoline ylides produced the corresponding products in good to excellent yields at room temperature. To increase the efficiency of this process, we investigated the development of a one-pot reaction in which the salt and the ylide could be generated *in situ*, in water, from readily available starting materials. Accordingly, phenacylbromide derivative was added to isoquioline or quinoline in water, and after a while, activated alkyne and base were added to the reaction mixture, and the reaction continued at room temperature or at reflux (Scheme 2).

The use of optimal conditions to the reaction of quinoline and isoquinoline with different phenacylbromide derivatives and activated acetylenes afforded good to excellent yields of pyrrolo[2,1-*a*]isoquinolines and pyrrolo[1,2-*a*]quinolines. The results of this study are summarized in Tables 1 and 2.

The structures of all the synthesized compounds were established on the basis of their spectroscopic data. The ^{1}H NMR spectrum of **6d** exhibited two coupled pairs of triplet and quarted signals for ethoxy groups, centered at δ = 1.02, 1.43 ppm and δ = 3.83, 4.48 ppm, respectively. Methoxy group resonated at δ = 3.91 ppm as a single sharp line. The peaks corresponding to aromatic protons of methoxyphenyl moiety and protons of nitrogen containing ring of isoquinoline were seen as two coupled pairs of doublet signals at δ = 6.98, 7.86 ppm (J = 8.7 Hz) and δ = 7.12, 8.66 ppm (J = 7.5 Hz), respectively. Other aromatic protons gave rise to characteristic signals in the aromatic region of the spectrum. The proton decoupled ^{13}C NMR spectrum of **6d** showed 24 distinct resonances in agreement with the proposed structure. ^{1}H NMR spectrum of **7c** exhibited three sharp singlet signals readily recognized as arising from methoxy protons. (δ = 3.55, 3.90 and 3.93 ppm) Signals due to aromatic protons of methoxyphenyl moiety and protons of nitrogen containing ring of quinoline were discernible as two coupled pairs of doublet signals at δ = 6.98, 7.98 ppm (J = 8.7 Hz) and δ = 7.55, 8.22 ppm (J = 9.4 Hz). Other aromatic protons gave rise to characteristic signals in the aromatic region of the spectrum. The proton decoupled ^{13}C NMR spectrum of **7c** showed 22 distinct resonances in agreement with the proposed structure.

Scheme 2



Mechanistically, it is conceivable that the reaction involves the initial formation of ylide A by the reaction of isoquinoline (or quinoline) and phenacylbromide derivative followed by deprotonation in the presence of K_2CO_3 as the base. This ylide intermediate then undergoes reaction with activated alkynes to produce B, which leads to C by oxidation (Scheme 3).

In summary, a one-pot procedure for the synthesis of pyrrolo[2,1-*a*]isoquinolines and pyrrolo[1,2-*a*]quinolines via *in situ* formation of quinoline or isoquinoline ylides and reaction of with activated alkynes in aqueous media has been reported. The notable advantages offered by this method are simple operation, mild and environment friendly reaction conditions, high yields of products, and costeffectiveness. Most significantly, this demonstrates

the potential of water as an efficient promoter and provides much promise for the use of water in other chemical transformations.

EXPERIMENTAL

^{1}H NMR (500 MHz) and ^{13}C NMR (125 MHz) spectra were recorded on a Bruker DRX-500 NMR spectrometer using TMS as an internal standard. Mass spectrometry (MS) spectra were carried out on HP 5973 GC-MS instrument. Infrared (IR) spectra were measured using a Shimadzu FTIR-4300. Chemicals were purchased from Merck and were used as received. Column chromatography was performed on silica gel (0.063-0.200 mm; Merck).

General procedure for the preparation of compound 6a. Isoquinoline (0.19 g, 1.5 mmol) and phenacylbromide (0.3 g, 1.5 mmol) were taken in water (10 mL), and the mixture was stirred at room temperature for 2 h. To this mixture, dimethyl acetylenedicarboxylate (0.14 g, 1.0 mmol) and K$_2$CO$_3$ (0.28 g, 2.0 mmol) were added, and it was allowed to stir at room temperature for 4 h. The reaction mixture was filtered and purified by column chromatography on silica gel with eluent 10%EtOAc in hexane to afford **6a** as yellow solid.

Compound (6a). Yellow solid; mp 154–155°C. Three-component coupling of aldehydes, malononitrile, and thiophenols has efficiently been carried out at room temperature using potassium fluoride on alumina (KF·Al_2O_3) as a catalyst to furnish highly substituted pyridines in high yields.

J. Heterocyclic Chem., **46**, 1208 (2009).

INTRODUCTION

Pyridine moiety in highly substituted form is frequently observed in various bioactive compounds [1–3]. This ring exists in both naturally occurring and synthetic drugs. The substituted pyridines of the common structure **1** possess significant antibacterial and anti-infective properties [4] and are useful for the development of other bioactive agents [5]. Thus, a number of methods for the synthesis of substituted pyridines have been reported [6–14]. One of the convenient methods involving three-component coupling of aldehydes, malononitrile, and thiols using bases, such as 1,4-diaza bicyclo [2,2,2,] octane and Et_3N, in ethanol under reflux led to the direct formation of **1** [8]. However, the yields of the products are unsatisfactory (20–48%), and the reactions are conducted at high temperature. The yields were improved by performing the reaction in the presence of an oxidizing agent [9]. Very recently, the similar method using ionic liquid has also been reported [12].

RESULTS AND DISCUSSION

In continuation of our work [15–17] on the development of useful synthetic methodologies, we have observed that the condensation of aldehydes, malononitrile, and thiols can efficiently be accomplished using potassium fluoride on alumina (KF·Al_2O_3) to produce the substituted pyridines at room temperature. (Scheme 1).

A series of 2-amino-4-aryl-3,5-dicyano-6-sulfanyl pyridines have been prepared from various aromatic aldehydes following the aforementioned procedure (Table 1). The aldehydes containing both electron-donating and electron-withdrawing groups underwent the conversion smoothly. Different functionalities, such as hydroxyl, ether, halogen, and nitro, remained unchanged. The conversion was complete within 0.5–1 h and the substituted pyridines were formed in high yields (84–95%). However, with aliphatic aldehydes and thiols, the reaction was not successful. The structures of the products were established from their spectral (^{1}H NMR, IR, and MS) data.

KF·Al_2O_3 has recently emerged as a valuable solid-phase catalyst for various organic transformations [18,19]. It possesses interesting catalytic activity. It can easily be handled and removed from the reaction mixture. It has been used here for the first time for the

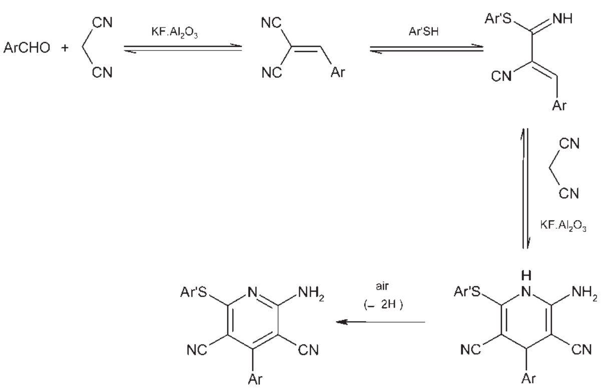
preparation of substituted pyridines. In the absence of this catalyst, the reaction did not proceed.

The formation of substituted pyridines in impressive yields in the present reaction can be explained by a mechanism (Scheme 2) related to that described by Ranu *et al.* [12] for their high-yielding synthesis of pyridines through a similar reaction in the presence of a basic ionic liquid. In both the cases, air played the role of an oxidant under the reaction conditions, and no additional oxidant was required [9,11,12].

Scheme 2



In conclusion, we have improved the process of synthesis of the substituted pyridines from aldehydes, malononitrile, and thiols using KF·Al_2O_3 at room temperature. The use of (i) inexpensive solid-phase catalyst, (ii) mild reaction conditions, (iii) impressive yields, and (iv) operational simplicity are the notable advantages of the present procedure.

General Procedure for the Synthesis of Substituted Pyridines. To a mixture of an aldehyde (0.5 mmol), malononitrile (1 mmol) and thiophenol (0.5 mmol) dissolved in EtOH (5 mL) KF·Al_2O_3 (prepared by reported method [15]) (10 mol%) was added, and the mixture was stirred at room temperature. The reaction was monitored by thin layer chromatography. After completion, the mixture was filtered, and the filtrate was concentrated. The residue was purified by column chromatography (silica gel, hexane-EtOAc) to obtain pure pyridine derivative.

The spectral (IR, ^1H NMR, and MS) data of the unknown products are given.

A serious of imidacloprid analogues have been synthesized from novel chloronicotinaldehydes. The chloronicotinaldehydes are the important synthons obtained from Vilsmeier reaction of various enamides. Thus synthesized imidacloprid analogues are new heterocyclic compounds obtained in very good yields.

J. Heterocyclic Chem., **46**, 1213 (2009).

INTRODUCTION

Neonicotinoids [1] are used worldwide for controlling insects because of their low mammalian toxicity, potency, and broad insecticidal and systemic properties. Imidacloprid (Fig. 1) is a new systemic insecticide for crop protection [2], and it is the first chloronicotinyl nonnatural insecticide, which consists of 2-(*N*-nitroimino)imidazolidine coupled with (6-chloropyridin-3-yl)methyl (CPM) residue [3]. It belongs to chloronicotinyl subclass of nicotinoids, which are a novel and distinct chemical class of insecticides with remarkable chemical and biological properties. It has a novel mode of action—binding to the nicotinergic acetylcholine receptor in the postsynaptic region of the insect nerve. Because of the importance of neonicotinoids, several imidacloprid analogues has been synthesized and reported in the literature [4].

Synthesis of large number of new heterocyclic molecules and their bioevaluation in agrochemical and pharmaceutical areas is the worldwide current interest. Discovery of new insecticides is an ongoing process and challenging area for organic chemists. Because of our continuous interest on synthesis of bioactive heterocyclic molecules [5a–g], we report the synthesis of novel imidacloprid derivatives from the substituted chloronicotinaldehydes in very good yields.

RESULTS AND DISCUSSION

The imidacloprid analogues reported in this article are synthesized from substituted chloronicotinaldehydes by Vilsmeier reaction of various enamide substrates according to our earlier reported method [5a]. Thus, prepared chloronicotinaldehydes were an important synthons used for various organic transformations such as synthesis of 2-chloro-5-methylpyridine-3-carbaldehydeimines (Schiff bases) [5b], Baylis-Hillman adducts [5e], reactions with cyclic enones [5c], and conversion of Baylis-Hillman adducts to synthesis of biologically important quinolines [5d]. As mentioned in the Scheme 1, the carboxaldehydes (**1a–k**) were subjected for reduction using sodium borohydride in methanol to give corresponding alcohols (**2a–k**). Under these reaction conditions, all the aldehydes (**1a–k**) were smoothly converted to alcohols (**2a–k**) without disturbing other functional groups present in the compounds. These alcohols (**2a–k**) were then converted to corresponding chlorides (**3a–k**) by using thionyl chloride, with catalytic amounts of dimethylformamide (DMF) as chlorinating agent in heptane solvent. The DMF used in catalytic amounts enhances the rate of reaction, subsequently, the reaction proceeds efficiently because of the formation of a complex between thionyl chloride and DMF, which actually acts as chlorinating agent.

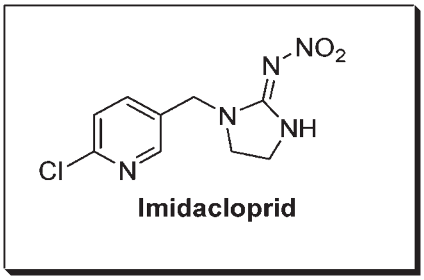

Figure 1. Imidacloprid.

The formed chlorides (**3a–k**) were allowed to react with nitroimino imidazole moiety (**4**) in acetonitrile using potassium carbonate and CsCl (5 mol%) under reflux conditions to give corresponding imidacloprid analogues (**5a–k**, Scheme 2) in very good yields. Thus prepared imidacloprid analogues (**5a–k**) are new compounds and are characterized by spectral data.

The 2-nitroiminoimidazole (**4**) is synthesized from ethylenediamine and nitroguanidine in the presence of hydrochloric acid as per our reported procedure [6]. In conclusion, the imidacloprid analogues have been synthesized from chloronicotinaldehydes in very good yields. Thus prepared new heterocyclic compounds are well characterized by spectral data. To achieve these target molecules, the important synthons such as chloronicotinaldehydes and nitraminoimidazolidine were used to complete the imidacloprid analogues.

EXPERIMENTAL

^{1}H-NMR and ^{13}C-NMR spectra were recorded on a Varian, Gemini 200 and Avance 300 MHz spectrometer in $CDCl_3$ with TMS as internal standard. Infrared (IR) spectra were recorded on Nicollet 740 FT spectrometer. EI-MS obtained on 7070H spectrometer operating at 70 eV using a direct inlet system. Melting points were determined in open glass capillary tubes on a Metler FP 51 melting point apparatus and are uncorrected. The CHN analyses were recorded on Vario EL analyzer. All reactions were monitored by thin layer chromatography (TLC) on precoated silica gel 60 F_{254} (mesh); spots were visualized under UV light. Merck silica gel (60–120; 100–200 mesh) was used for chromatography.

General procedure for the synthesis of 2-chloro-5/6-substituted pyridyl methanol (2a–k). Methyl 6-chloro-5-formyl-2-pyridinecarboxylate (**1j**; 200 mg, 0.0012 mol) was dissolved in methanol solvent, and sodium borohydride (15 mg, 0.00039 moles) was added slowly at 0°C over a period of 15 min. The reaction was monitored by TLC, and after completion of the reaction, the reaction mixture was quenched with saturated ammonium chloride solution, solvent was removed under reduced pressure, and the residue was extracted with dichloromethane and obtained methyl-6-chloro-5-(hydroxymethyl)-2-pyridinecarboxylate (**2j**) on column chromatography. All the alcohols were synthesized by using the similar procedure.

(2-Chloro-5-methyl-3-pyridyl)methanol (2a). Yield: 92%, solid; mp: 59–61°C. ^{1}H NMR ($CDCl_3$): δ 2.35 (s, 3H, CH_3), 4.73 (s, 2H, -CH_2OH), 7.66 (s, 1H, heteroaromatic), 8.07 (s, 1H, heteroaromatic). EI-MS (*m/z*): 157 (90) (M^+), 142 (23), 130 (9), 122 (100), 106 (20), 99 (4), 92 (57), 78 (10), 65 (25), 51 (8), 39 (14), 31 (3). UV: $\lambda_{max} = 268$ nm in acetonitrile. IR (KBr): ν = 3325, 2969, 2932, 2874, 1568, 1432, 1399, 1355, 1164, 1083, 1044, 904, 731 cm^{-1}. Anal. Calcd for C_7H_8ClNO: C, 53.35; H, 5.12; N, 8.89. Found: C, 53.39; H, 5.19; N, 8.72.

(2-Chloro-5-ethyl-3-pyridyl)methanol (2b). Yield: 91%, solid; mp: 62–64°C. ^{1}H NMR ($CDCl_3$): δ 1.31 (t, 3H, CH_3), 2.65 (q, 2H, CH_2), 4.75 (s, 2H, CH_2OH), 7.73 (s, 1H, heteroaromatic), 8.09 (s, 1H, heteroaromatic). EI-MS (*m/z*): 171 (50) (M^+), 174 (40), 154 (100), 140 (5), 91 (20), 77 (15). UV: $\lambda_{max} = 272$ nm in acetonitrile. IR (KBr): ν = 3330, 2960, 2935, 2870, 1575, 1340, 1160, 1090, 1040, 906, 735 cm^{-1}. Anal. Calcd for $C_8H_{10}ClNO$: C, 55.99; H, 5.87; N, 8.18. Found: C, 56.02; H, 5.84; N, 8.21.

(2-Chloro-5-propyl-3-pyridyl)methanol (2c). Yield: 90%, solid; mp: 64–65°C. ^{1}H NMR ($CDCl_3$): δ 0.9 (t, 3H, CH_3), 1.7 (m, 2H, CH_2), 2.64 (t, 2H, CH_2), 4.75 (s, 2H, CH_2OH), 7.73 (s, 1H, heteroaromatic), 8.09 (s, 1H, heteroaromatic). EI-MS (*m/z*): 185.

(2-Chloro-5-isopropyl-3-pyridyl)methanol (2d). Yield: 90%, solid; mp: 70–72°C. ^{1}H NMR ($CDCl_3$): δ 1.2–1.4 (m, 6H, 2CH_3), 3.20 (m, 1H, CH), 4.75 (s, 2H, CH_2OH), 7.73 (s, 1H, heteroaromatic), 8.09 (s, 1H, heteroaromatic). EI-MS (*m/z*): 185.

(2-Chloro-5-pentyl-3-pyridyl)methanol (2e). Yield: 87%, solid; mp: 58–60°C. ^{1}H NMR ($CDCl_3$): δ 0.9 (t, 3H, CH_3),

Methyl-6-chloro-5-(hydroxymethyl)-3-methyl-2-pyridinecarboxylate (2k). Yield: 91%, Solid; mp: 86–88°C. ^1H NMR ($CDCl_3$): δ 2.57 (s, 3H, CH_3), 3.93 (s, 3H, OCH_3), 4.78 (s, 2H, CH_2OH), 7.78 (s, 2H, heteroaromatic). EI-MS (*m*/*z*): 215 (M^+) (55), 200 (5), 183 (100), 157 (70), 137 (11), 126 (20), 92 (17), 65 (11), 51 (3), 39 (6). UV: λ_{max} = 282 nm. IR (KBr): ν = 3468, 1705, 1440, 1406, 1327, 1243, 1120, 1063, 722 cm^{-1}. Anal. Calcd for $C_9H_{10}ClNO_3$: C, 50.23; H, 4.67; N, 6.50. Found: C, 50.14; H, 4.68; N, 6.46.

General procedure for the synthesis of 2-chloro-3-chloromethyl-5/6-substituted pyridines (3a–k). Methyl-6-chloro-5-(hydroxymethyl)-2-pyridinecarboxylate (**2j**) (200 mg, 0.0009 moles) was dissolved in heptane (50 mL) and added one drop of DMF. The reaction mixture was heated to 60–65°C. Thionyl chloride (150 mg; 0.00135 mol) was added dropwise to the hot reaction mixture. After completion of the addition, the temperature was raised to 80°C and maintained for 2 h. Progress of the reaction was monitored by TLC. The organic solvent was removed under reduced pressure, and obtained crude methyl-6-chloro-5-(chloromethyl)-2-pyridinecarboxylate (**3j**) was recrystallized in hexane.

2-Chloro-3-(chloromethyl)-5-methylpyridine (3a). Yield: 88%, solid; mp: 55–58°C. ^1H NMR ($CDCl_3$): δ 2.37 (s, 3H, CH_3), 4.62 (s, 2H, -CH_2Cl), 7.65 (s, 1H, heteroaromatic), 8.17 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 175 (40) (M^+), 140 (100), 104 (12), 77 (23), 51 (9), 39 (5). UV: λ_{max} = 258 nm in acetonitrile. IR (KBr): ν = 2971, 2934, 2874, 1563, 1429, 1407, 1076, 908, 758 cm^{-1}. Anal. Calcd for C_7H_7 Cl_2N: C, 48.02; H, 4.01; N, 8.00. Found: C, 48.09; H, 4.08; N, 7.99.

2-Chloro-3-(chloromethyl)-5-ethylpyridine (3b). Yield: 94%, solid; mp: 63–64°C. ^1H NMR ($CDCl_3$): δ 1.32 (t, 3H, CH_3), 2.70 (q, 2H, CH_2), 4.75 (s, 2H, CH_2Cl), 7.65 (s, 1H, heteroaromatic), 8.18 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 189 (23) (M^+), 174 (13), 154 (100), 91 (5), 77 (4), 51 (3). UV: λ_{max} = 266 nm in acetonitrile. IR (KBr): ν = 2990, 2960, 1560, 1420, 1417, 1070, 900, 750 cm^{-1}. Anal. Calcd for C_8H_9 Cl_2 N: C, 50.79; H, 4.77; N, 7.40. Found: C, 50.71; H, 4.82; N, 7.38.

2-Chloro-3-(chloromethyl)-5-propylpyridine (3c). Yield: 88%, solid; mp: 65–66°C. ^1H NMR ($CDCl_3$): δ 0.9 (t, 3H, CH_3), 1.7 (m, 2H, CH_2), 2.64 (t, 2H, CH_2), 4.75 (s, 2H, CH_2-Cl), 7.65 (s, 1H, heteroaromatic), 8.18 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 217.

2-Chloro-3-(chloromethyl)-5-isopropylpyridine (3d). Yield: 89%, solid; mp: 66–68°C. ^{1}H NMR ($CDCl_3$): δ 1.2–1.4 (m, 6H, $2CH_3$), 3.20 (m, 1H, CH), 4.75 (s, 2H, CH_2-Cl), 7.65 (s, 1H, heteroaromatic), 8.18 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 217.

2-Chloro-3-(chloromethyl)-5-pentylpyridine (3e). Yield: 88%, solid; mp: 70–72°C. ^{1}H NMR ($CDCl_3$): δ 0.9 (t, 3H, CH_3), 1.38 (m, 4H, $2CH_2$), 1.70 (q, 2H, CH_2), 2.7 (t, 2H, CH_2), 4.75 (s, 2H, CH_2-Cl), 7.65 (s, 1H, heteroaromatic), 8.18 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 231.

2-Chloro-3-(chloromethyl)-5-phenylpyridine (3f). Yield: 91%, solid; mp: 78–80°C. ^{1}H NMR ($CDCl_3$): δ 4.77 (s, 2H, CH_2), 7.44–7.58 (m, 5H), 8.06 (s, 1H, heteroaromatic), 8.58 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 237 (82) (M^+), 202 (100), 166 (18), 139 (17), 115 (11), 101 (6), 69 (5). UV: λ_{max} = 256 nm in acetonitrile. IR (KBr): ν = 2970, 2910, 2880, 1420, 1240, 1170, 1060, 1020 cm^{-1}. Anal. Calcd for $C_{12}H_9$ Cl_2 N: C, 60.75; H, 3.79; N, 5.90. Found: C, 60.77; H, 3.72; N, 5.88.

2-Chloro-3-(chloromethyl)-5-(4-methoxyphenyl)pyridine (3g). Yield: 91%, solid; mp: 79–80°C. ^{1}H NMR ($CDCl_3$): δ 3.84 (s, 3H, OCH_3), 4.77 (s, 2H, -CH_2Cl), 6.97 (d, 2H, aromatic), 7.49 (d, 2H, aromatic), 7.98 (s, 1H, heteroaromatic), 8.50 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 267 (100) (M^+), 252 (15), 232 (45), 189 (6), 154 (6), 127 (12), UV: λ_{max} = 276 nm in acetonitrile. IR (KBr): ν = 2957, 2925, 2854, 1735, 1606, 1426, 1249, 1182, 1082, 1027, 832, 753 cm^{-1}. Anal. Calcd for $C_{13}H_{11}$ Cl_2 NO: C, 58.43; H, 4.13; N, 5.24. Found: C, 58.33; H, 4.22; N, 5.21.

2-Chloro-3-(chloromethyl)-5-methyl-6-phenylpyridine (3h). Yield: 88%, solid; mp: 78–82°C. ^{1}H NMR ($CDCl_3$): δ 2.43 (s, 3H, CH_3), 4.70 (s, 2H, -CH_2Cl), 7.28–7.38 (m, 5H), 7.73 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 251 (44) (M^+), 250 (100), 216 (39), 180 (11), 153 (13), 140 (4), 128 (5), 115 (5), 89 (5), 76 (10), 63 (4), 51 (5). UV: λ_{max} = 288 nm in acetonitrile. IR (KBr): ν = 2967, 2927, 1588, 1543, 1443, 1412, 1383, 1185, 1067, 984, 735, 702 cm^{-1}. Anal. Calcd for $C_{13}H_{11}$ Cl_2N: C, 62.16; H, 4.40; N, 5.57. Found: C, 60.81; H, 4.42; N, 5.61.

Ethyl-6-chloro-5-(chloromethyl)-2-phenylnicotinate (3i). Yield: 91%, light yellow liquid. ^{1}H NMR ($CDCl_3$): δ 1.13 (t, 3H, CH_3), 4.24 (q, 2H, CH_2), 4.74 (s, 2H, -CH_2Cl), 7.46 (m, 3H, aromatic), 8.76 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 309 (18) (M^+), 280 (100), 264(34), 245 (11), 229 (7), 202 (6), 166 (14), 139 (17), 105 (7). UV: λ_{max} = 256 nm in acetonitrile. IR (KBr): ν = 2925, 2853, 1724, 1573, 1531, 1440, 1237, 1129, 757 cm^{-1}. Anal. Calcd for $C_{15}H_{13}Cl_2NO_2$: C, 58.28; H, 4.22; N, 4.52. Found: C, 58.21; H, 4.28; N, 4.61.

Methyl-6-chloro-5-(chloromethyl)-2-pyridinecarboxylate (3j). Yield: 93% solid; mp: 78–80°C. ^{1}H NMR ($CDCl_3$): δ 4.04 (s, 3H, OCH_3), 4.76 (s, 2H, -CH_2Cl), 8.08 (q, 2H). EI-MS (*m*/*z*): 219 (4) (M^+), 189 (20), 161 (100), 124 (15), 90 (11), 63 (10). UV: λ_{max} = 258 nm in acetonitrile. IR (KBr): ν = 2925, 2854, 1728, 1562, 1450, 1369, 1137, 744 cm^{-1}. Anal. Methyl-6-chloro-5-(chloromethyl)-3-methyl-2-pyridinecar-boxylate (3k). Yield: 90%, solid; mp: 75–77°C. ^{1}H NMR ($CDCl_3$): δ 2.60 (s, 3H, CH_3), 3.99 (s, 3H, OCH_3), 4.69 (s, 2H, CH_2Cl), 7.80 (s, 1H, heteroaromatic). EI-MS (*m*/*z*): 234 (43) (M^+), 218 (5), 201(100), 175 (64), 138 (46), 102 (20), 77 (15), 51 (9). UV: λ_{max} = 286 nm in acetonitrile. IR (KBr): ν = 2915, 2850, 1729, 1560, 1455, 1360, 1130, 740 cm^{-1}. Anal. Calcd for $C_9H_9Cl_2NO_2$: C, 46.18; H, 3.84; N, 5.98. Found: C, 46.18; H, 3.92; N, 5.92.

General procedure for the synthesis of (substituted pyridyl)-methyl]tetrahydro-1*H*-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5a–k). A mixture of pyridine substituted methyl chloride (**3**; 0.5 g, 0.002 moles), 2-nitraimino imidazole (0.67 g, 0.005 mol), K_2CO_3 (0.33 g, 0.002 mol), and CsCl (5 mol %) in CH_3CN (10 mL) was refluxed for 2.5 h. After completion of the reaction, acetonitrile was removed. The solid crude was washed with water. The solid when recrystallized by methanol gave the title compounds in good yield.

2-{1-[(2-Chloro-5-methyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5a). Yield: 82%, solid; mp: 193–195°C. ^{1}H NMR (DMSO-d_6): δ 2.36 (s, 3H, CH_3), 3.5–3.8 (m, 4H, -CH_2-CH_2-), 4.62 (s, 2H, -CH_2N-), 7.62 (s, 1H, heteroaromatic), 8.20 (s, 1H, heteroaromatic), 9.05 (s, NH, 1H). UV: λ_{max} = 272 nm in acetonitrile. EI-MS (*m*/*z*): 269; IR (KBr): ν = 3792, 3307, 2922, 2861, 1584, 1546, 1439, 1286, 1240, 1148, 1053, 724, 679, 642 cm^{-1}. Anal. Calcd for $C_{10}H_{12}$Cl N_5O_2: C, 44.61; H, 4.48; N, 26.06. Found: C, 44.64; H, 4.51; N, 26.12.

2-{1-[(2-Chloro-5-ethyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5b). Yield: 81%, solid; mp: 197–199°C. ^{1}H NMR (DMSO-d_6): δ 1.32 (t, 3H, CH_3), 2.70 (q, 2H, CH_2), 3.5–3.8 (m, 4H, -CH_2-CH_2-), 4.60 (s, 2H, -CH_2N-), 7.62 (s, 1H, heteroaromatic), 8.20 (s, 1H, heteroaromatic), 9.05 (s, NH, 1H). EI-MS (*m*/*z*): 283; IR (KBr): ν = 3790, 3300, 2855, 1580, 1540, 1280, 1240, 1050, 724, cm^{-1}. Anal. Calcd for $C_{11}H_{14}ClN_5O_2$: C, 46.56; H, 4.97; N, 24.68. Found: C, 46.59; H, 4.99; N, 24.70.

2-{1-[(2-Chloro-5-propyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5c). Yield: 82%, solid; mp: 196–198°C. ^{1}H NMR (DMSO-d_6): δ 0.9 (t, 3H, CH_3), 1.7 (m, 2H, CH_2), 2.64 (t, 2H, CH_2), 3.5–3.8 (m, 4H, -CH_2-CH_2-), 4.60 (s, 2H, -CH_2N-), 7.64 (s, 1H, heteroaromatic), 8.22 (s, 1H, heteroaromatic), 9.05 (s, 1H, NH). EI-MS (*m*/*z*): 297.

2-{1-[(2-Chloro-5-isopropyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5d). Yield: 84%, solid; mp: 190–192°C. ^{1}H NMR (DMSO-d_6): δ 1.2–1.4 (m, 6H, $2CH_3$), 3.20 (m, 1H, CH), 3.5–3.8 (m, 4H, -CH_2-CH_2-), 4.64 (s, 2H, -CH_2N-), 7.60 (s, 1H, heteroaromatic), 8.21 (s, 1H, heteroaromatic), 9.05 (s, 1H, NH). EI-MS (*m*/*z*): 297.

2-{1-[(2-Chloro-5-pentyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5e). Yield: 86%, solid; mp: 198–201°C. ^{1}H NMR (DMSO-d_6): δ 0.9 (t, 3H, CH_3), 1.38 (m, 4H, $2CH_2$), 1.70 (q, 2H, CH_2), 2.7 (t, 2H, CH_2), 3.5–3.8 (m, 4H, -CH_2-CH_2-), 4.60 (s, 2H, -CH_2N-), 7.62 (s, 1H, heteroaromatic), 8.20 (s, 1H, heteroaromatic), 9.05 (s, 1H, NH). EI-MS (*m*/*z*): 325.

2-{1-[(2-Chloro-5-phenyl-3-pyridyl)methyl]-tetrahydro-1H-2-imidazolyliden}-1-oxo-1-hydraziniumolate (5f). Yield: 80%, solid; mp: 248–250°C. ^{1}H NMR (DMSO-d_6): δ 3.60–3.80 (m, 4H, -CH_2-CH_2-), 4.62 (s, 2H, -CH_2N-), 7.50 (m, 3H, aromatic), 7.75 (d, 2H, aromatic), 8.05 (s, 1H, heteroaromatic), 8.68 (s, 1H, heteroaromatic), 9.05 (s, 1H, NH). EI-MS (*m*/*z*): 331; UV: λ_{max} = 262 nm in acetonitrile. IR (KBr): ν = 3253, 3065, 2879, 1580, 1542, 1438, 1284, 1240, 1145, 1050, 953, 759, 687 cm$-^1$. Anal. A series of novel *O*-(*E*)-(arylmethyl) 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oxime ethers were synthesized by the *O*-alkylation of 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oximes with various arylmethyl chlorides in the basic condition. Their structures were confirmed by IR, ^{1}H NMR, mass spectroscopy, and elemental analyses. The preliminary bioassay indicated that some of the target compounds (**4a–f**) displayed good insecticidal and moderate fungicidal activity. For example, compounds **4c** and **4g** showed 100% and 90.6% death rates against aphides at the concentration of 250 mg/L, respectively, and compounds **4f** and **4g** displayed 67% and 78.4% inhibitory rates against *Rhizoctonia solani* at the dosage of 100 mg/L, respectively.

J. Heterocyclic Chem., **46**, 1218 (2009).

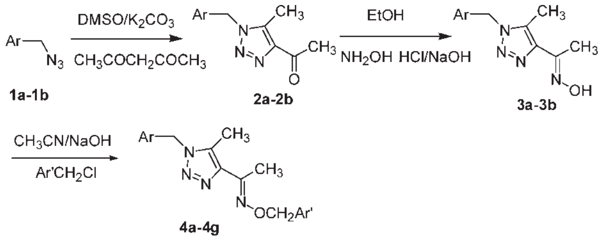
INTRODUCTION

Oxime ether derivatives are very important agrochemicals and are receiving more and more attention because of their widespread biological activities—some of them can be used as insecticides, acaricides [1,2], fungicides [3,4], and herbicides and its safener [5,6]—which are widely used in the worldwide plant protection. The 1,2,3-triazole ring has been known for more than 100 years. However, it was only in recent decades that the 1,2,3-triazole chemistry developed very fast due to the discovery of the diverse biologically active triazole derivatives. Many of them have been used as insecticides, nematocides, acaricides, and plant growth regulators [7–13]. Recently, heterocyclic compounds containing nitrogen play more and more important role in pesticide science and industry; moreover, the introduction of a pyridyl or a thiazole ring into a parent compound may improve its properties and biological activities in the looking for novel pharmaceutical and agrochemical lead compounds, and many pyridyl and thiazole containing compounds are also known to possess a wide range of biological and pharmacological activities, as well as low toxicity toward mammals, and the widely development of neonicotinic insecticides in the world are very successful examples [14–17]. As a continuation of our ongoing project aimed at investigating novel biologically nitrogen-containing heterocyclic compounds [18,19], we designed and synthesized a series of novel *O-(E)*-(arylmethyl) 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oxime ethers. We would like to report the synthesis and biological activities of the title compounds **4a–g** in this article (Scheme 1).

RESULTS AND DISCUSSION

2-Chloro-5-(chloromethyl)-pyridine (or thiazole) was treated with sodium azide in dry ethanol under refluxing condition to obtain 5-(azidomethyl)-2-chloro-pyridine (or thiazole) (**1**) in high yields, which was annulated with acetylacetone in DMSO in the presence of anhydrous potassium carbonate to generate compound **2**. Treatment of **2** with hydroxylamine hydrochloride

Scheme 1



4a: Ar = 6-chloropyridin-3-yl, Ar' = 6-chloropyridin-3-yl; **4b**: Ar = 6-chloropyridin-3-yl, Ar' = 2-chlorothiazol-5-yl; **4c**: Ar = 6-chloropyridin-3-yl, Ar' = phenyl; **4d**: Ar = 6-chloropyridin-3-yl, Ar' = pyridin-3-yl; **4e**: Ar = 2-chlorothiazol-5-yl, Ar' = 6-chloropyridin-3-yl; **4f**: Ar = 2-chlorothiazol-5-yl, Ar' = 2-chlorothiazol-5-yl; **4g**: Ar = 2-chlorothiazol-5-yl, Ar' = phenyl

afforded oxime **3**, which reacted with various arylmethyl chlorides in the basic condition to get the title compounds **4** in moderate yields.

To optimize the reaction condition of *O*-alkylation, we attempted to react 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl]ethanone oxime **3** with various alkyl chlorides in different base-solvent systems (e.g., Et_3N-CH_2Cl_2, Et_3N-CH_3CN, Et_3N-toluene, NaOH-CH_3CN, NaOH-DMF, and NaOH-toluene). Finally, we found that the *O*-alkylation can take place smoothly in sodium hydroxide and acetonitrile system to give the target products **4** in moderate yield (58–85%), and no other by-product was detected by TLC. In the *O*-alkylation, 2-chloro-5-(chloromethyl)-pyridine and 2-chloro-(5-chloromethyl)-thiazole are more active than 3-(chloromethyl)-pyridine and benzyl chloride. For example, when 2-chloro-5-(chloromethyl)-pyridine and 2-chloro-(5-chloromethyl)-thiazole are used as the alkylation reagents, the reaction can complete at room temperature for 4 to 5 h, however, for 3-(chloromethyl)-pyridine and benzyl chloride, the reactions underwent very slow and needed more high temperature and prolonged reation time.

Their structures of compounds **4** were confirmed by IR, ^{1}H NMR, EI-MS, and elemental analyses, which were listed in the experimental part. Because of C=N bond, it probably existed as Z and E-isomers in compounds **3** and **4a–g**. In ^{1}H NMR spectra, the CH_3 protons of the E isomer is shifted downfield relative to that of Z isomer, owing to its shorter distance between the oxygen atom in C=N—O— moiety and stronger unshielded effect [1]. In this article, both of compounds **3** and **4** are in E configurations, which were deduced by NMR analysis and further by compared with one of its phosphorothioate analog determined by X-ray diffraction analysis [20].

Biological activity

Insecticidal activity. Compounds **4** were tested for insecticidal activities against aphides at the concentration of 250 mg/L according to a previously reported method [21]. The results of preliminary bioassays indicated that some of the target compounds displayed good insecticidal activity against aphides (Table 1). For example, compounds **4c** and **4g** exhibited 100% and 90.6% inhibitory rates against aphides at the concentration of 250 mg/L, respectively.

Fungicidal activity. The preliminary fungicidal activity of the target compounds **4** was evaluated by the classic plate method at a dosage of 100 mg/L, which was described in the experimental part. The six fungi used—*Fusarium oxysporium, Rhizoctonia solani, Botrytis cinereapers, Gibberella zeae, Dothiorella gregaria,* and *Colletotrichum gossypi*—belong to the group of field fungi and were isolated from corresponding crops. The activities data were also listed in Table 1. The results indicated that most of compounds **4** exhibit moderate to weak inhibitory activities against the above six fungi. For example, compounds **4f** and **4g** displayed 67% and 78.4% inhibitory rates against *Rhizoctonia solani* at the dosage of 100 mg/L, respectively. Further structure-activity relationships are under investigation.

In conclusion, a series of novel *O*-(*E*)-(arylmethyl) 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oxime ethers were synthesized by the *O*-alkylation reactions of 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oximes with various arylmethyl chlorides in the basic condition. The preliminary bioassay indicated that some of the target compounds (**4a–f**) displayed good insecticidal and moderate fungicidal activity. For example, compounds **4c** and **4g** showed 100% and 90.6% death rates against aphides at the concentration of 250 mg/L, compounds **4f** and **4g** displayed 67% and 78.4% inhibitory rates against *Rhizoctonia solani* at the dosage of 100 mg/L, respectively.

EXPERIMENTAL

Melting points were determined with a WRS-1B digital melting point apparatus and are uncorrected. ^{1}H NMR spectra was recorded with a Varian Mercury PLUS400 spectrometer with TMS as the internal reference and $CDCl_3$ as the solvent, while mass spectra were obtained with a Finnigan TRACEMS2000 spectrometer using the EI method. Infrared (IR) spectra were measured by a Nicolet NEXUS470 spectrometer. Elemental analyses were performed with an Elementar Vario ELIII CHNSO elemental analyzer. All the solvents and materials were reagent grade and purified as required. 5-(Azidomethyl)-2-chloro-pyridine (or thiazole) (**1a–b**) was prepared according to the literature procedure [22].

General procedure for the synthesis of 1-[1-(arylmethyl)-5-methyl-1H-1,2,3-triazol-4-yl] ethanone 2 [23]. 5-(Azidomethyl)-2-chloro-pyridine (or thiazole) **1** (0.05 mol) and acetylacetone (5.0 g, 0.05 mol) were added to a suspension of milled potassium carbonate (20.7 g, 0.15 mol) in DMSO (50 mL). The mixture was stirred at room temperature for 6–8 h

Table 1

The insecticidal and fungicidal activities of **4a–4g** (inhibitory rate (%).

(monitored by TLC); the mixture was poured to water (500 mL). The solid was collected by filtration, washed with water and diethyl ether, and dried to give **2** as a white solid.

1-{1-[(6-Chloropyridin-3-yl) methyl]-5-methyl-1H-1,2,3-triazol-4-yl} ethanone (2a) [19]. White solid, yield: 81%, mp 121–122°C; ^{1}H NMR ($CDCl_3$): δ 2.55 (s, 3H, CH_3), 2.69 (s, 3H, CH_3), 5.52 (s, 2H, CH_2), 7.36 (d, J = 8.4 Hz, 1H, PyH), 7.52 (d, J = 11.2 Hz, 1H, PyH), 8.36 (s, 1H, PyH).

1-{1-[(2-Chlorothiazol-5-yl) methyl]-5-methyl-1H-1,2,3-triazol-4-yl} ethanone (2b). White solid, yield: 78%, mp 97–98°C; ^{1}H NMR ($CDCl_3$): δ 2.42 (s, 3H, CH_3), 2.48 (s, 3H, CH_3), 5.60 (s, 2H, CH_2), 7.51 (s, 1H, thiazole-H).

General procedure for the synthesis of 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oxime (3a–b). To the stirred mixture of hydroxylamine hydrochloride (2.2 g, 32 mmol), **2** (20.0 mmol), ethanol (40 mL), and H_2O (4 mL), sodium hydroxide (2 g, 50 mmol) was added slowly. After the addition completed, the solution was stirred at room temperature (for **3b**) or under reflux (for **3a**) for 5–6 h, the mixture was poured to water (200 mL). The solid was collected by filtration and recrystallized from toluene to get **3** as a white solid.

1-{1-[(6-Chloropyridin-3-yl) methyl]-5-methyl-1H-1,2,3-triazol-4-yl} ethanone oxime (3a). White solid, yield: 51%, mp 172–174°C; IR: OH 3421, CH_3 1419, 1385 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.54 (s, 1H, OH), 2.42 (s, 3H, CH_3), 2.43 (s, 3H, CH_3), 5.49 (s, 2H, CH_2), 7.34 (d, J = 8.0 Hz, 1H, PyH), 7.50 (d, J = 10.8 Hz, 1H, PyH), 8.35 (s, 1H, PyH); ms: *m*/*z* 265 (M^+, 10.5), 236 (37.1), 126 (100), 90 (22.3), 77 (8.3), 73 (32.9), 63 (15.8). Anal. Calcd. for $C_{11}H_{12}ClN_5O$: C, 49.72; H, 4.55; N, 26.36. Found: C, 49.57; H, 4.75; N, 26.18.

1-{1-[(2-Chlorothiazol-5-yl) methyl]-5-methyl-1H-1,2,3-triazol-4-yl} ethanone oxime (3b). White solid, yield: 43%, mp 139–141°C; ^{1}H NMR ($CDCl_3$): δ 1.62 (s, 1H, OH), 2.60 (s, 3H, CH_3), 2.69 (s, 3H, CH_3), 5.62 (s, 2H, CH_2), 7.53 (s, 1H, thiazole-H). Anal. Calcd. for $C_9H_{10}ClN_5OS$: C, 39.78; H, 3.71; N, 25.77. Found: C, 39.94; H, 3.53; N, 25.89.

General procedure for the synthesis of *O-(E)*-(arylmethyl) 1-[1-(arylmethyl)-5-methyl-1*H*-1,2,3-triazol-4-yl] ethanone oxime ethers 4a–g. A solution of **3** (2 mmol) in anhydrous CH_3CN (10 mL) and NaOH powder (2 mmol) was added to a three-necked flask. After vigorously stirring for 5–10 min, a solution of arylmethyl chloride (2 mmol) in anhydrous CH_3CN (5 mL) was added dropwise. After the addition completed, the mixture was stirred at room temperature or under reflux till the reaction was complete (monitored by TLC). The solid was filtered off, and the filtrate was concentrated under vacuum. The residue was purified by column chromatography on silica gel using petroleum ether and ethyl acetate (1:1 v/v) as the eluent, giving the corresponding **4a–g** in 58–85% yields.

O-(E)-[(6-chloropyridin-3-yl)methy] 1-{1-[(6-chloropyridin-3-yl)methyl]-5-methyl-1H-1,2,3-triazol-4-yl} ethanone oxime ether (4a). White crystal, yield: 85%, mp 125–127°C; IR: C=N 1589, 1566, Ar 1460, 1436, 1388, 1349, N-O-C 1019; ^{1}H NMR ($CDCl_3$): δ 2.31 (s, 3H, CH_3), 2.40 (s, 3H, CH_3), 5.13 (s, 2H, CH_2), 5.47 (s, 2H, CH_2), 7.27–8.40 (m, 6H, PyH); ms: *m*/*z* 388 (M^+, 94.1), 264 (9.2), 248(4.50), 126 (100). Fungicidal activity testing. The fungicidal activity measurement method was adapted from the one described by Molina-Torres et al. [24]. The synthesized target compounds were dissolved in 0.5–1.0 mL of DMF to the concentration of 1000 mg/L. The solutions (1 mL) were mixed rapidly with thawed potato glucose agar culture medium (9 mL) under 50°C. The mixtures were poured into petridishes. After the dished were cooled, the solidified plates were incubated with 4-mm mycelium disk, inverted, and incubated at 28°C for 48 h. Distilled water was used as the blank control. Three replicates of each test were carried out. The mycelial elongation radius (mm) of fungi settlements was measured after 48 h of culture. The growth inhibitory rates were calculated with the following equation: $I = [(C-T)/C] \times 100\%$. Here, I is the growth inhibitory rate (%), T is the treatment group fungi settlement radius (mm), and C is the radius of the blank control. The results are listed in Table 1.

The three-component reaction of aromatic aldehyde, naphthalen-2-amine and 2-halogenated acetophenone in THF catalyzed by 5 mol % iodine at reflux unexpectedly gave 1,3-diarylbenzo[*f*]quinolines, with halogen losing in the formation of the products. The formation of unexpected 1,3-diarylbenzo[*f*]-quinolines was tentatively explained by Cram's rule to one of the steps in the mechanism.

J. Heterocyclic Chem., **46**, 1222 (2009).

INTRODUCTION

There has been tremendous interest in developing highly efficient transformations for the preparation of organic compounds, as well as, biologically active materials. There is also a need for synthetic chemists to find new, efficient, and strategically important processes, which are environmentally benign and lead to greater structural variation in short period of times with high yields and simple work-up procedures. Multicomponent reactions are useful and efficient methods in organic synthesis. The major advantages of these reactions are a single purification step, higher yields than stepwise assembly, the use of simple and diverse precursors to construct complex molecules, and the use of only a single promoter or catalyst. Thus, the development of new multicomponent reactions is a popular area of research in current organic chemistry and is also acceptable from a ''Green Chemistry" point of view [1]. They provide a powerful tool toward the one-pot synthesis of diverse and complex compounds as well as small and drug-like heterocycles [2]. Such as benzo[*f*]quinoline and its derivatives, are very useful compounds in the various fields of chemistry including biological and pharmacological viewpoints. Some of which exhibit antibacterial activity [3], UDP (Uridine diphosphate)-glucuronosyl transferase activity [4], antimicrobial activity [5], antimalarial activity [6], agonistic activity [7], and antipsychotic activity [8].

In view of the importance of the benzoquinoline and its derivatives, several methods for the synthesis of benzo[*f*]quinoline and its derivatives were developed by Kozlov [9] and other groups [10]. However, many of these reported methods suffer from drawbacks such as harsh reaction conditions, unsatisfactory yields, prolonged reaction time or cumbersome product isolation procedure. In our previous paper, we have reported the 1,3-substituented benzoquinolines *via* three component reaction of aromatic aldehyde, naphthalen-2-amine and ketones [11]. Our interest in synthesis of heterocyclic compounds [12] by multicomponent reaction stimulates us to find some new and more substituented benzoquinolines, such as 1,3-diaryl-2-halogenated benzoquinoline derivatives, so we perform the 2-halogenated acetophenone in the aforementioned reaction instead of acetophenone. To our surprised, the desired products 1,3-diaryl-2-halogenated benzoquinolines were not observed, with 1,3-diarylbenzoquinoline derivatives being obtained. It should be noted that the halogen lose in these I_2-catalyzed three-component reactions.

RESULTS AND DISCUSSION

Initially, the reaction of 4-chlorobenzaldehyde **1a**, naphthalen-2-amine **2** and 2-bromo-1-(4-nitrophenyl) ethanone **3a** was used as a model reaction to optimize the

Table 1

Synthesis of **4a** under different reaction conditions.[a]

[b] Isolated yields.

conditions. The reaction was first carried out in THF in the absence of I_2. No reaction occurred at room temperature and reflux condition (Table 1, entries 1 and 2). We also evaluated the amount of catalyst required for this transformation. It was found that 5 mol % of I_2 at reflux in THF was sufficient to push the reaction forward. More amounts of the catalyst did not improve yields. To find the optimum reaction temperature, the reaction was carried out with 5 mol % of I_2 at room temperature, 50 and refluxing temperature, resulting in the isolation of **4a** in trace amount, 76% and 90% yields (Table 1, entries 3, 4, and 5), respectively. Thus, 5 mol % of I_2 and a reaction temperature at reflux were optimal conditions. In addition, we also looked into the solvent effect at reflux condition for this reaction. As showed in Table 1, THF gave the most satisfactory result in comparison with other solvents. (Table 1, entries 8–11).

In our initial study, we think it was an unexpected product. Subsequently, we repeated the reactions under the same reaction conditions with various kinds of benzaldehydes bearing either electron-withdrawing groups (such as halide, nitro) or electron-donating groups (such as alkyl group, or alkoxyl group) or α-halogenated acetophenones (Scheme 1). However, the designed reactions all gave the products of 1,3-diarylbenzoquinoline derivatives rather than 1,3-diaryl-2-halogenated benzoquinolines in good to high yields (Table 2). Furthermore, in order to confirm the structure of product, the X-ray diffraction of **4a** was carried out [13]. The crystal structure of **4a** was shown in Figure 1, which made further confirmation of structure **4**. This raises an interesting question: why do the halogens lose in the formation of the benzoquinolines?

According to the literatures [14], in these I_2-catalyzed reactions, the subsequent reactions including condensation, addition, Friedel–Crafts, dehydration and aromatization were proposed to form the quinoline or benzoquinoline derivatives (Scheme 2). However, no stereoselectivity was put forward in the Friedel–Crafts cyclization of the addition product. It is a Friedel–Crafts cyclization as well as an intra-molecular nucleophilic addition reaction with benzene as nucleophilic reagent attacking carboxyl group, with a chiral centre being connected with this carboxyl group. The stereochemistry of the Friedel–Crafts cyclization should be in agreement with Cram's rule, so the hydroxyl group and the hydrogen atom lie on syn periplanar geometry with halogen on the anti periplanar geometry. Subsequent elimination reaction of HX for their anti periplanar rather than H_2O results in oxirenoquinoline. The oxirane ring is opened to give 2-hydroxybenzoquinoline induced by iodine, which is further dehydrated to afford final 1,3-diaryl benzoquinoline (Scheme 2). The reason why the halogens lose is perhaps best explained by Cram's rule in the formation of the benzoquinolines.

In conclusion, we found an efficient method for the synthesis of benzo[*f*]quinoline derivatives via three-component reaction of aromatic aldehyde, naphthalen-2-amine and 2-halogenated acetophenone using 5 mol % of iodine as catalyst, with halogen losing in the formation of the products. A Cram's rule in the I_2-catalyzed Friedel–Crafts reaction was proposed to occur in the formation of the products.

EXPERIMENTAL

Melting points were determined in open capillaries and are uncorrected. IR spectra were recorded on a TENSOR 27 spectrometer in KBr pellet. ^1H NMR spectra were obtained from solution in DMSO-d_6 with Me_4Si as internal standard using a Bruker-400 spectrometer. HRMS analyses were carried out using a Bruker-micro-TOF-Q-MS analyzer.

Typical procedure for 1,3-diarylbenzo[f]quinoline derivatives 4. A dry 50 mL flask was charged with aromatic aldehyde (2.0 mmol), naphthalen-2-amine (2.0 mmol, 0.286 g), 2-halogenated acetophenone (2.0 mmol), I_2 (0.1 mmol, 0.026 g) and THF (10 mL). The reaction mixture was stirred at reflux for 11–15 h. After completion of the reaction as indicated by TLC, a little DMF was added to the mixture until the all yellow solid was dissolved. The generated crystals were collected by filtration to give 4 when the mixture was cooled to room temperature.

[a] Reagents and conditions: **1** (2 mmol), **2** (2 mmol, 0.286g), **3** (2 mmol), I_2 (0.1 mmol, 0.026 g), and THF (10 mL).
[b] Isolated yields.

3-(4-Chlorophenyl)-1-(4-nitrophenyl)benzo[*f*] quinoline (4a). This compound was obtained as pale yellow crystals, mp 286–288°C; ir (KBr): ν_{max} 3101, 3074, 3048, 1596, 1580, 1544, 1514, 1493, 1476, 1449, 1408, 1388, 1344, 1305, 1282, 1177, 1152, 1107, 1091, 1010, 851, 832, 797, 758, 744, 717, 704, 692; ^{1}H NMR (DMSO-d_6): δ 7.28–7.32 (m, 1H, ArH), 7.48–7.50 (m, 1H, ArH), 7.57–7.64 (m, 3H, ArH), 7.85 (d, J = 8.4 Hz, 2H, ArH), 8.08 (d, J = 8.4 Hz, 2H, ArH), 8.09 (s, 1H, ArH), 8.21–8.23 (m, 1H, ArH), 8.41–8.47 (m, 4H, ArH). HRMS (ESI, *m*/*z*): calcd. for $C_{25}H_{16}N_2O_2$ (M+H$^+$) 411.0900, found 411.0915.

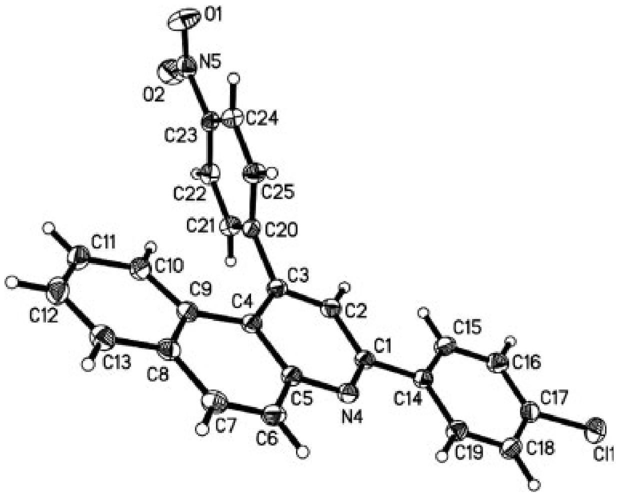

Figure 1. The crystal structure of product **4a.**

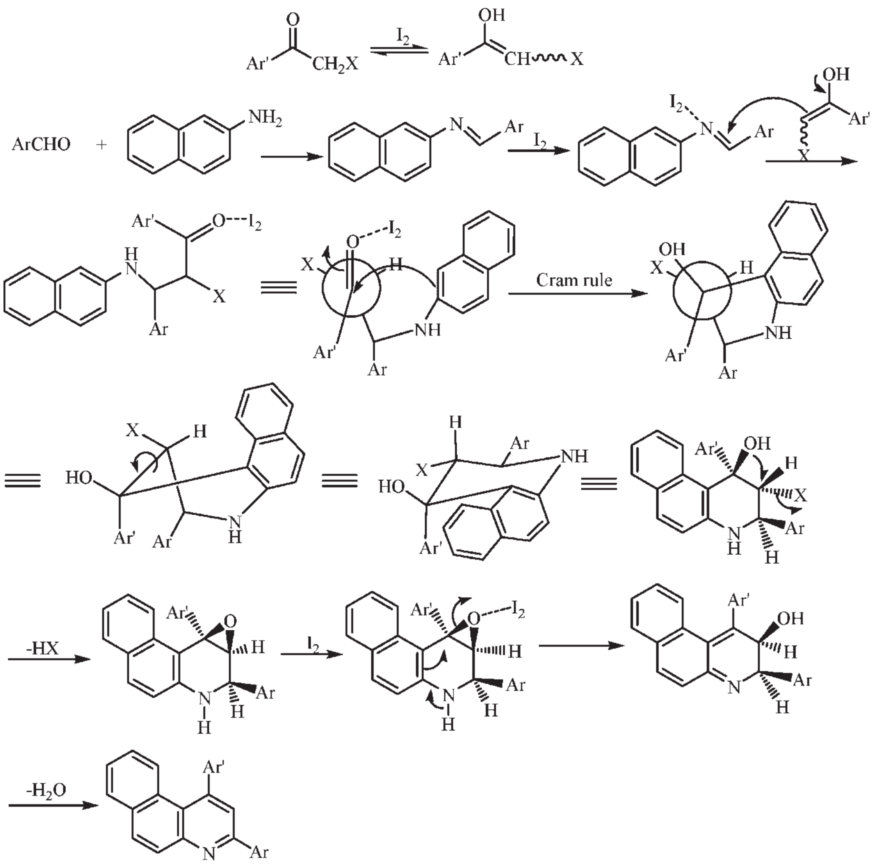
3-(2,3-Dimethoxyphenyl)-1-(4-nitrophenyl)benzo[*f*] quinoline (4b). This compound was obtained as pale yellow crystals, mp 140–141°C; ir (KBr): ν_{max} 3073, 3006, 2970, 2937, 2838, 1598, 1578, 1519, 1465, 1430, 1302, 1263, 1227, 1167, 1179, 1167, 1107, 1085, 1040, 1001, 856, 837, 805, 781, 746, 703; ^{1}H NMR (DMSO-d_6): δ 3.75 (s, 3H, CH_3), 3.84 (s, 3H, CH_3), 7.05 (dd, J = 8.0 Hz, J' = 1.2 Hz, 1H, ArH), 7.19–7.26 (m, 2H, ArH), 7.51–7.61 (m, 3H, ArH), 7.68 (d, J = 8.8 Hz, 2H, ArH), 7.91–7.93 (m, 2H, ArH), 8.03 (d, J = 8.8 Hz, 1H, ArH), 8.14 (d, J = 8.8 Hz, 1H, ArH), 8.39 (d, J = 8.8 Hz, 2H, ArH). HRMS (ESI, *m*/*z*): calcd. for $C_{27}H_{21}N_2O_4$ (M+H$^+$) 437.1501, found 437.1498.

3-(4-Nitrophenyl)-1-(4-nitrophenyl)benzo[*f*]quinoline (4c). This compound was obtained as pale yellow crystals, mp 235–237°C, Lit.[15] 231–232 °C; ir (KBr): ν_{max} 3083, 1598, 1578, 1545, 1514, 1450, 1343, 1257, 1163, 1106, 1084, 1041, 1015, 993, 850, 816, 750, 694; ^{1}H NMR (DMSO-d_6): δ 7.22–7.24 (m, 1H, ArH), 7.54–7.59 (m, 2H, ArH), 7.70 (d, J = 8.4 Hz, 2H, ArH), 7.82 (s, 1H, ArH), 7.95 (d, J = 7.6 Hz, 1H, ArH), 8.09 (d, J = 9.2 Hz, 1H, ArH), 8.15 (d, J = 8.8 Hz, 1H, ArH), 8.38–8.46 (m, 6H, ArH). HRMS (ESI, *m*/*z*): calcd. for $C_{25}H_{16}N_3O_4$ (M+H$^+$) 422.1141, found 422.1145.

3-(2,3-Dichlorophenyl)-1-(4-nitrophenyl)benzo[*f*]quinoline (4d). This compound was obtained as pale yellow crystals, mp 196–197°C; ir (KBr): ν_{max} 3099, 3056, 1597, 1575, 1545,

Scheme 2



1515, 1478, 1446, 1412, 1341, 1286, 1251, 1192, 1156, 1124, 1104, 1049, 875, 859, 844, 789, 767, 723, 705; ^{1}H NMR (DMSO-d_6): δ 7.21–7.25 (m, 1H, ArH), 7.36–7.40 (m, 1H, ArH), 7.53–7.59 (m, 3H, ArH), 7.65–7.71 (m, 4H, ArH), 7.94 (d, J = 7.6 Hz, 1H, ArH), 8.06 (d, J = 9.2 Hz, 1H, ArH), 8.11 (d, J = 9.2 Hz, 1H, ArH), 8.40 (d, J = 8.8 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{15}N_2Cl_2O_2$ (M+H$^+$) 445.0511, found 445.0508.

3-(2,4-Dichlorophenyl)-1-(4-nitrophenyl)benzo[*f*]quinoline (4e). This compound was obtained as pale yellow crystals, mp 202–203°C. ir (KBr): ν_{max} 3104, 3077, 1589, 1579, 1556, 1545, 1516, 1473, 1448, 1381, 1348, 1249, 1162, 1142, 1102, 1048, 1038, 991, 860, 838, 824, 803, 789, 758, 707; ^{1}H NMR (DMSO-d_6): δ 7.30–7.34 (m, 1H, ArH), 7.54 (d, J = 8.4 Hz, 1H, ArH), 7.60–7.66 (m, 2H, ArH), 7.78 (s, 1H, ArH), 7.82–7.89 (m, 4H, ArH), 8.06 (d, J = 8.8 Hz, 1H, ArH), 8.11 (d, J = 8.0 Hz, 1H, ArH), 8.25 (d, J = 9.2 Hz, 1H, ArH), 8.44 (d, J = 8.8 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{15}N_2Cl_2O_2$ (M+H$^+$) 445.0511, found 445.0493.

3-(3,4-Dimethylphenyl)-1-(4-nitrophenyl)benzo[*f*]quinoline (4f). This compound was obtained as pale yellow crystals, mp 234–236°C; ir (KBr): ν_{max} 3068, 2974, 2917, 2858, 1595, 1579, 1544, 1452, 1477, 1451, 1339, 1283, 1260, 1126, 1103, 1015, 1005, 885, 860, 851, 831, 802, 759, 742, 714, 705; ^{1}H NMR (DMSO-d_6): δ 2.31 (s, 3H, CH_3), 2.36 (s, 3H, CH_3), 7.29–7.34 (m, 2H, ArH), 7.48 (d, J = 8.8 Hz, 1H, ArH), 7.55–7.59 (m, 1H, ArH), 7.85 (d, J = 8.4 Hz, 2H, ArH), 8.02 (s, 1H, ArH), 8.06–8.12 (m, 3H, ArH), 8.17–8.21 (m, 2H, ArH), 8.45 (d, J = 8.4 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{27}H_{21}N_2O_2$ (M+H$^+$) 405.1603, found 405.1593.

3-(2,4-Dichlorophenyl)-1-(4-fluorophenyl)benzo[*f*]quinoline (4g). This compound was obtained as pale yellow crystals, mp 172–174°C; ir (KBr): ν_{max} 3069, 1601, 1586, 1555, 1507, 1475, 1448, 1378, 1347, 1332, 1246, 1217, 1158, 1139, 1100, 1048, 1038, 1016, 952, 896, 873, 859, 849, 825, 805, 775, 752; ^{1}H NMR (DMSO-d_6): δ 7.28–7.30 (m, 1H, ArH), 7.32–7.45 (m, 2H, ArH), 7.53–7.63 (m, 5H, ArH), 7.71 (s, 1H, ArH), 7.81 (d, J = 2.0 Hz, 1H, ArH), 7.85 (d, J = 8.4 Hz, 1H, ArH), 8.02 (d, J = 8.8 Hz, 1H, ArH), 8.07 (d, J = 7.6 Hz, 1H, ArH), 8.20 (d, J = 8.8 Hz, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{15}Cl_2NF$ (M+H$^+$) 418.0566, found 418.0550.

3-(3-Bromophenyl)-1-(4-fluorophenyl)benzo[*f*]quinoline (4h). This compound was obtained as pale yellow crystals, mp 221–222°C; ir (KBr): ν_{max} 3058, 1601, 157 2, 1542, 1506, 1477, 1446, 1386, 1344, 1328, 1252, 1230, 1154, 1088, 1069, 994, 873, 834, 796, 782, 756, 709, 689; ^{1}H NMR (DMSO-d_6): δ 7.26–7.30 (m, 1H, ArH), 7.42–7.46 (m, 2H, ArH), 7.50–7.59 (m, 5H, ArH), 7.69–7.72 (m, 1H, ArH), 8.03–8.07 (m, 3H, ArH, 8.17 (d, J = 9.2 Hz, 1H, ArH), 8.36 (d, J = 8.0 Hz, 1H, ArH), 8.56–8.57 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}BrFN$ (M+H$^+$) 428.0450, found 428.0468.

3-(4-Chlorophenyl)-1-(4-fluorophenyl)benzo[*f*]quinoline (4i). This compound was obtained as pale yellow crystals, mp 173–174°C; ir (KBr): ν_{max} 3054, 1602, 1579, 1544, 1505, 1 478, 1449, 1406, 1385, 1356, 1330, 1215, 1155, 1090, 1010, 866, 830, 799, 745, 714; ^{1}H NMR (DMSO-d_6): δ 7.25–7.30

(m, 1H, ArH), 7.42–7.46 (m, 2H, ArH), 7.54–7.63 (m, 6H, ArH), 8.01 (s, 1H, ArH), 8.04 (d, J = 8.8 Hz, 2H, ArH), 8.16 (d, J = 9.2 Hz, 1H, ArH), 8.36 (d, J = 8.4 Hz, 1H, ArH), 8.39 (d, J = 8.8 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}ClFN$ (M+H$^+$) 384.0955, found 384.0966.

3-(3,5-Dimethoxyphenyl)-1-(4-fluorophenyl)benzo[*f*]quinoline (4j). This compound was obtained as pale yellow crystals, mp 119–120°C; ir (KBr): ν_{max} 3051, 2984, 2952, 2935, 2830, 1592, 1549, 1528, 1508, 1488, 1451, 1357, 1301, 1216, 1201, 1157, 1061, 1047, 941, 862, 833, 807, 752, 698; ^{1}H NMR (DMSO-d_6): δ 3.87 (s, 6H, 2CH$_3$O), 6.64–6.66 (m, 1H, ArH), 7.27–7.29 (m, 1H, ArH), 7.42–7.46 (m, 2H, ArH), 7.50 (d, J = 2.4 Hz, 2H, ArH), 7.54–7.59 (m, 4H, ArH), 8.01–8.05 (m, 3H, ArH), 8.16 (d, J = 9.2 Hz, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{27}H_{21}FNO_2$ (M+H$^+$) 410.1556, found 410.1558.

3-(4-Bromophenyl)-1-(4-fluorophenyl)benzo[*f*]quinoline (4k). This compound was obtained as white powder, mp 167–169°C, ir (KBr): ν_{max} 3050, 1603, 1579, 1544, 1505, 1475, 1448, 1354, 1227, 1153, 1089, 1073, 1007, 865, 830, 756; ^{1}H NMR (DMSO-d_6): δ 7.26–7.30 (m, 1H, ArH), 7.42–7.47 (m, 2H, ArH), 7.55–7.59 (m, 4H, ArH), 7.25 (d, J = 8.8 Hz, 2H, ArH), 8.02 (s, 1H, ArH), 8.04 (d, J = 8.8 Hz, 2H, ArH), 8.17 (d, J = 8.8 Hz, 1H, ArH), 8.33 (d, J = 8.4 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}FBrN$ (M+H$^+$) 428.0450, found 428.0435.

1-(4-Fluorophenyl)-3-(3-nitrophenyl)benzo[*f*]quinoline (4l). This compound was obtained as pale yellow crystals, mp 222–224°C; ir (KBr): ν_{max} 3055, 1605, 1580, 1527, 1481, 1450, 1434, 1345, 1256, 1225, 1163, 1109, 1072, 896, 873, 849, 834, 801, 791, 746, 712; ^{1}H NMR (DMSO-d_6): δ 7.21–7.29 (m, 3H, ArH), 7.45–7.55 (m, 3H, ArH), 7.67–7.73 (m, 2H, ArH), 7.82 (s, 1H, ArH), 7.91 (d, J = 7.6 Hz, 1H, ArH), 8.04 (d, J = 8.8 Hz, 2H, ArH), 8.13 (d, J = 8.8 Hz, 1H, ArH), 8.30–8.33 (m, 1H, ArH), 8.61–8.63 (m, 1H, ArH), 9.08–9.09 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}FN_2O_2$ (M+H$^+$) 395.1196, found 395.1196.

3-(3-Bromophenyl)-1-(4-chlorophenyl)benzo[*f*]quinoline (4m). This compound was obtained as white powder, mp 218–220°C; ir (KBr): ν_{max} 3049, 1595, 1577, 1564, 1547, 1524, 1491, 1477, 1449, 1394, 1350, 1330, 1255, 1236, 1084, 1067, 1015, 993, 890, 870, 837, 804, 755, 710, 699; ^{1}H NMR (DMSO-d_6): δ 7.29–7.32 (m, 1H, ArH), 7.50–7.72 (m, 8H, ArH), 8.04–8.08 (m, 3H, ArH), 8.18 (d, J = 9.2 Hz, 1H, ArH), 8.37 (d, J = 8.0 Hz, 1H, ArH), 8.51–8.58 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}BrClN$ (M+H$^+$) 444.0155, found 444.0155.

3-(2,4-Dichlorophenyl)-1-(4-chlorophenyl)benzo[*f*]quinoline (4n). This compound was obtained as pale yellow crystals, mp 172–174°C; ir (KBr): ν_{max} 3086, 3049, 1585, 1552, 1524, 1490, 1474, 1448, 1392, 1378, 1347, 1332, 1247, 1138, 1100, 1090, 1047, 1037, 1013, 952, 871, 861, 834, 822, 802, 791, 751, 716; ^{1}H NMR (DMSO-d_6): δ 7.30–7.35 (m, 1H, ArH), 7.54 (d, J = 8.4 Hz, 1H, ArH), 7.59–7.66 (m, 5H, ArH), 7.71 (m, 1H, ArH), 7.82 (d, J = 2.4 Hz, 1H, ArH), 7.86 (d, J = 8.4 Hz, 1H, ArH), 8.03 (d, J = 9.2 Hz, 1H, ArH), 8.08 (d, J = 7.6 Hz, 1H, ArH), 8.21 (d, J = 9.2 Hz, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{15}Cl_3N$ (M+H$^+$) 434.0270, found 434.0264.

1-(3-Chlorophenyl)-3-(2-thiophenyl)benzo[*f*]quinoline (4o). This compound was obtained as pale yellow crystals, mp 211–213°C; ir (KBr): ν_{max} 3097, 3067, 1580, 1562, 1469, 1453, 1421, 1352, 1321, 1255, 1242, 1166, 1154, 1098, 1068, 1027, 860, 851, 829, 794, 779, 744, 716; ^{1}H NMR (DMSO-d_6): δ 7.21–7.23 (m, 1H, ArH), 7.24–7.28 (m, 1H, ArH), 7.43–7.67 (m, 6H, ArH), 7.76 (dd, J = 8.0 Hz, J' = 1.2 Hz, 1H, ArH), 7.95 (d, J = 8.8 Hz, 1H, ArH), 8.02 (s, 1H, ArH), 8.03 (d, J = 8.8 Hz, 1H, ArH), 8.09 (dd, J = 8.0 Hz, J' = 1.2 Hz, 1H, ArH), 8.15 (d, J = 8.8 Hz, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{23}H_{15}ClNS$ (M+H$^+$) 372.0614, found 372.0625.

3-(3-Bromophenyl)-1-(3-chlorophenyl)benzo[*f*]quinoline (4p). This compound was obtained as pale yellow crystals, mp 195–196°C; ir (KBr): ν_{max} 3052, 1592, 1578, 1544, 1529, 1467, 1451, 1407, 1382, 1358, 1327, 1262, 1239, 1161, 1098, 1078, 1066, 951, 881, 872, 834, 793, 770, 745, 718, 702, 692; ^{1}H NMR (DMSO-d_6): δ 7.27–7.32 (m, 1H, ArH), 7.46 (dd, J = 7.6 Hz, J' = 1.2 Hz, 1H, ArH), 7.51–7.73 (m, 7H, ArH), 8.05–8.11 (m, 3H, ArH), 8.20 (d, J = 8.8 Hz, 1H, ArH), 8.39 (d, J = 8.0 Hz, 1H, ArH), 8.59–8.60 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}BrClN$(M+H$^+$) 444.0155, found 444.0163.

3-(4-Bromophenyl)-1-(3-chlorophenyl)benzo[*f*]quinoline (4q). This compound was obtained as pale yellow crystals, mp 216–218°C; ir (KBr): ν_{max} 3047, 1578, 1562, 1543, 1527, 1472, 1451, 1417, 1384, 1355, 1329, 1101, 1074, 1008, 871, 862, 834, 825, 806, 784, 745, 718, 706; ^{1}H NMR (DMSO-d_6): δ 7.28–7.32 (m, 1H, ArH), 7.47 (d, J = 7.2 Hz, 1H, ArH), 7.56–7.69 (m, 5H, ArH), 7.76 (d, J = 8.4 Hz, 2H, ArH), 8.05–8.08 (m, 3H, ArH), 8.19 (d, J = 9.2 Hz, 1H, ArH), 8.35 (d, J = 8.4 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}BrClN$ (M+H$^+$) 444.0155, found 444.0157.

1-(3-Chlorophenyl)-3-(3-nitrophenyl)benzo[*f*]quinoline (4r). This compound was obtained as pale yellow crystals, mp 221–222°C; ir (KBr): ν_{max} 3052, 1580, 1563, 1531, 1484, 1472, 1450, 1408, 1347, 1297, 1278, 1256, 1237, 1164, 1113, 1098, 1074, 909, 871, 833, 801, 745, 717, 704; ^{1}H NMR (DMSO-d_6): δ 7.28–7.32 (m, 1H, ArH), 7.47 (d, J = 7.2 Hz, 1H, ArH), 7.56–7.70 (m, 5H, ArH), 7.82–7.86 (m, 1H, ArH), 8.06–8.11 (m, 2H, ArH), 8.20– 8.22 (m, 2H, ArH), 8.35 (d, J = 7.6 Hz, 1H, ArH), 8.81 (d, J = 7.6 Hz, 1H, ArH), 9.17 (s, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}N_2O_2$ (M+H$^+$) 411.0900, found 411.0899.

1-(3-Chlorophenyl)-3-(3,4-dimethylphenyl)benzo[*f*]quinoline (4s). This compound was obtained as yellow crystals, mp 182–184°C; ir (KBr): ν_{max} 3053, 2963, 2939, 2916, 1580, 1561, 1544, 1505, 1471, 1451, 1416, 1390, 1345, 1327, 1258, 1246, 1163, 1133, 1097, 1073, 998, 890, 873, 832, 812, 790, 745, 716, 705; ^{1}H NMR (DMSO-d_6): δ 2.31 (s, 3H, CH$_3$), 2.35 (s, 3H, CH$_3$), 7.25–7.32 (m, 2H, ArH), 7.44–7.47 (m, 1H, ArH), 7.53–7.67 (m, 5H, ArH), 7.98 (s, 1H, ArH), 8.03–8.10 (m, 3H, ArH), 8.15– 8.17 (m, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{27}H_{21}NCl$ (M+H$^+$) 394.1363, found 394.1366.

3-(4-Nitrophenyl)-1-phenylbenzo[*f*]quinoline (4t). This compound was obtained as yellow crystals, mp 200-201 °C, Lit.[15] 192 °C; ir (KBr): ν_{max} 3053, 1599, 1578, 1547, 1509, 1475, 1397, 1340, 1259, 1153, 1106, 1078, 1008, 860, 849, 832, 774, 755, 699; ^{1}H NMR (DMSO-d_6): δ 7.22–7.25 (m, 1H, ArH), 7.55–7.63 (m, 7H, ArH), 8.07 (d, J = 7.0 Hz, 1H, ArH), 8.11 (d, J = 9.2 Hz, 1H, ArH), 8.17 (s, 1H, ArH), 8.22 (d, J = 8.8 Hz, 1H, ArH), 8.40 (d, J = 8.8 Hz, 2H, ArH), 8.67 (d, J = 8.8 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{17}N_2O_2$ (M+H$^+$) 377.1290, found 377.1274.

3-(4-Chlorophenyl)-1-phenylbenzo[*f*]quinoline (4u). This compound was obtained as yellow crystals, mp 164–165°C; ir (KBr): ν_{max} 3051, 1576, 1545, 1527, 1491, 1474, 1449, 1354, 1279, 1255.1167, 1088, 1009, 834, 722, 753, 700; ^{1}H NMR (DMSO-d_6): δ 7.19–7.23 (m, 1H, ArH), 7.51–7.62 (m, 9H, ArH), 8.01–8.07 (m, 3H, ArH), 8.17 (d, *J* = 8.8 Hz, 1H, ArH), 8.41 (d, *J* = 8.4 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{17}ClN$ (M+H$^{+)}$ 366.1050, found 366.1057.

3-(4-Bromophenyl)-1-phenylbenzo[*f*]quinoline (4v). This compound was obtained as yellow crystals, mp 171–172°C; ir (KBr): ν_{max} 3051, 3028, 1575, 1544, 1527, 1474, 1448, 1353, 1329, 1278, 1256, 1073, 1006, 833, 814, 771, 753, 700; ^{1}H NMR (DMSO-d_6): δ 7.19–7.23 (m, 1H, ArH), 7.51–7.61 (m, 7H, ArH), 7.75 (d, *J* = 8.4 Hz, 2H, ArH). 8.01–8.07 (m, 3H, ArH), 8.17 (d, *J* = 8.8 Hz, 1H, ArH), 8.33 (d, *J* = 8.4 Hz, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{17}BrN$ (M+H^{+}) 410.0544, found 410.0544.

3-(3-Bromophenyl)-1-phenylbenzo[*f*]quinoline (4w). This compound was obtained as yellow crystals, mp 207–209°C; ir (KBr): ν_{max} 3054, 1576, 1542, 1522, 1476, 1447, 1388, 1345, 1328, 1252, 1231, 1083, 1069, 995, 943, 869, 838, 781, 756, 702, 689; ^{1}H NMR (DMSO-d_6): δ 7.15–7.19 (m, 1H, ArH), 7.37–7.41 (m, 1H, ArH), 7.47–7.59 (m, 7H, ArH), 7.67 (d, *J* = 8.4 Hz, 1H, ArH), 7.77 (s, 1H, ArH), 7.89 (d, *J* = 8.0 Hz, 1H, ArH), 8.02 (d, *J* = 9.2 Hz, 1H, ArH), 8.10–8.16 (m, 2H, ArH), 8.41 (s, 1H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{17}BrN$ (M+H^{+}) 410.0544, found 410.0556.

1-(3-Nitrophenyl)-3-(2-thiophenyl) benzo[*f*]quinoline (4x). This compound was obtained as yellow crystals, mp 278–280°C; ir (KBr): ν_{max} 3050, 1584, 1845, 1525, 1484, 1454, 1420, 1347, 1259, 1042, 1092, 1083, 883, 870, 835, 799, 753, 743, 696; ^{1}H NMR (DMSO-d_6): δ 7.23–7.27 (m, 2H, ArH), 7.46 (d, *J* = 8.4 Hz, 1H, ArH), 7.54–7.58(m, 1H, ArH), 7.78 (dd, *J* = 5.2 Hz;*J*′ = 1.2 Hz, 1H, ArH), 7.85–7.90 (m, 1H, ArH), 7.94–7.97 (m, 2H, ArH), 8.05 (d, *J* = 8.8 Hz, 1H, ArH), 8.09–8.10 (m, 2H, ArH), 8.18 (d, *J* = 8. 8 Hz, 1H, ArH), 8.45–8.47 (m, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{23}H_{15}N_2O_2S$ (M+H^{+}) 383.0854, found 383.0841.

3-(4-Chlorophenyl)-1-(3-nitrophenyl)benzo[*f*] quinoline (4y). This compound was obtained as yellow crystals, mp 258–259°C; ir (KBr): ν_{max} 3083, 3058, 1582, 1527, 1489, 1451, 1407, 1351, 1303, 1258, 1209, 1164, 1092, 1047, 1009, 892, 862, 832, 813, 745, 715; ^{1}H NMR (DMSO-d_6): δ 7.24–7.28 (m, 1H, ArH), 7.51 (d, *J* = 8.4 Hz, 1H, ArH), 7.56–7.60 (m, 1H, ArH), 7.62 (d, *J* = 8.4 Hz, 2H, ArH), 7.85–7.88 (m, 1H, ArH), 7.95 (d, *J* = 7.6 Hz, 1H, ArH), 8.06–8.08 (m, 2H, ArH), 8.13 (s, 1H, ArH), 8.20 (d, *J* = 9.2 Hz, 1H, ArH), 8.42 (d, *J* = 8.4 Hz, 2H, ArH), 8.45–8.47 (m, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}ClN_2O_2$ (M+H^{+}) 411.0900, found 411.0894.

3-(4-Bromophenyl)-1-(3-nitrophenyl)benzo[*f*] quinoline (4z). This compound was obtained as yellow crystals, mp 263–264°C; ir (KBr): ν_{max} 3056, 1581, 1527, 1486, 1451, 1384, 1351, 1304, 1258, 1210, 1179, 1163, 1075, 1006, 891, 861, 831, 814, 744, 705; ^{1}H NMR (DMSO-d_6): δ 7.25–7.29 (m, 1H, ArH), 7.52 (d, *J* = 8.4 Hz, 1H, ArH), 7.57–7.61(m, 1H, ArH), 7.77 (d, *J* = 8.4 Hz, 2H, ArH), 7.88 (d, *J* = 8.0 Hz, 1H, ArH), 7.95–7.97 (m, 1H, ArH), 8.04–8.10 (m, 2H, ArH), 8.15 (m, 1H, ArH), 8.27 (d, *J* = 9.2 Hz, 1H, ArH), 8.37 (d, *J* = 8.4 Hz, 2H, ArH), 8.45–8.48 (m, 2H, ArH). HRMS (ESI, *m/z*): calcd. for $C_{25}H_{16}BrN_2O_2$ (M+H^{+}) 455.0395, found 455.0399.

A novel method for the synthesis of 1,2-dihydro-5-arylnaphtho[2,1-*c*][2,7]naphthyridine derivatives via a three-component reaction of aromatic aldehyde, naphthalen-2-amine, and *N*-substituted piperidin-4-one derivatives is described using 5 mol % iodine as catalyst. The features of this new procedure are mild reaction condition, high yield, operational simplicity, and uses available reactants.

J. Heterocyclic Chem., **46**, 1229 (2009).

INTRODUCTION

Multicomponent reactions (MCRs) can be distinguished from classical, sequential two-component chemistry synthesis processes in that they use three or more chemical starting materials as the input for product formation. Up to seven starting components have been used, and MCRs have often been shown to produce higher product yields than classical chemistry [1]. They provide a powerful tool toward the one-pot synthesis of diverse and complex compounds, as well as small and drug-like heterocycles [2].

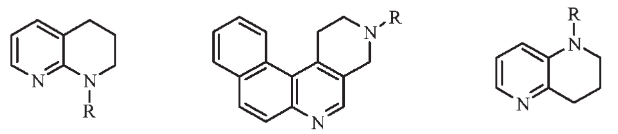
The naphtho[2,1-*c*][2,7]naphthyridine **1** ring system (Fig. 1) is a rare heterocycle compared with [1,8]naphthyridine **2** and [1,5]naphthyridine **3** substructures. Naphthyridines, which encompass two pyridine rings, are known to display a wide range of biological activities, including antibacterial activity [3], antimalarial activity [4], antimicrobial activity [5], anticancer activity [6], and antiinflammatory activity [7]. Moreover, it is envisioned that naphtho[2,1-*c*][2,7]naphthyridines **1**, which contained both naphthalene ring and naphthyridine moieties, may afford unique biological activities, such as Barta-Szalai et al. [8] revealed in 2003 that spiro[naphto[2,1-*c*][2,7]naphtiridine-5,4'-piperidine] derivatives were potent inhibitors of lipid peroxidation.

Previously, it has been demonstrated that naphthonaphthyridines can be obtained from 2-aminobenzo[*f*]-quinoline with glycerol in the presence of H_2SO_4 [9], or by the Skraup reaction of 3-aminobenzo[*h*]quinoline with ketone [10], or by any other methods [11]. However, despite their potential utility, many of these reported methods suffer from drawbacks such as harsh reaction conditions, unsatisfactory yields, prolonged reaction time, multistep reactions, and cumbersome product isolation procedure. This work is in connection with our previous research on the MCRs to the intriguing heterocycles [12] and successfully realized a three-component reaction of aromatic aldehyde, naphthalen-2-amine, and *N*-substituted piperidin-4-one catalyzed by iodine in THF without isolating and purifying the intermediates to afford naphtho[2,1-*c*][2,7]naphthyridine moiety.

RESULTS AND DISCUSSION

The treatment of aromatic aldehyde **4**, naphthalen-2-amine **5**, and ethyl 4-piperidinone-1-carboxylate **6** in THF in the presence of 5 mol % iodine at reflux afforded the corresponding ethyl 1,2-dihydro-5-arylnaphtho[2,1-*c*][2,7]naphthyridine-3(4*H*)-carboxylate derivatives **1** in high yields (Scheme 1).

In an initial endeavor, 3,4-dichlorobenzaldehyde **4a**, naphthalen-2-amine **5**, and ethyl 4-piperidinone-1-carboxylate **6** were stirred in THF in the absence of I_2. No reaction occurred at room temperature and reflux condition (Table 1, entries 1 and 2). Similar reactions were then attempted in the presence of 5, 10, and 20 mol % of I_2. The results from Table 1 (entries 5–7) showed



2 1 3

[1,8]naphthyridine naphtho[2,1-c][2,7]naphthyridine [1,5]naphthyridine

Figure 1.

that 5 mol % I_2 at reflux in THF was sufficient to push the reaction forward. Based on these observations, we have also conducted the reaction with 5 mol % of I_2 at room temperature, and 50 mol % at reflux temperature, resulting in the isolation of **1a** in trace amount, 62 and 91% yields (Table 1, entries 3–5), respectively. In addition, CH_3CN, benzene, DMF, and $CHCl_3$ (Table 1, entries 8–11) were also tested as the solvents. In these cases, product **1a** was formed in slightly lower yield (Table 1, entries 8–11).

To evaluate the efficiency of iodine as a catalyst, a range of benzaldehydes **4b–p** were subjected to react with **5** and **6** in the presence of 5 mol % I_2 to generate **1**, and the results are summarized in Table 2. It can be observed that the process tolerates both electron-donating and electron-withdrawing substituents in the benzaldehydes. In all cases, the reactions proceeded efficiently at reflux under mild conditions to afford the corresponding naphtho[2,1-*c*][2,7]naphthyridines in high yields (Table 2).

The structure of **1** was characterized by ^{1}H NMR, IR, and HRMS. The analyses were in agreement with their structures. For example, in the ^{1}H NMR of **1a**, the protons on the ethyl group appear at 1.31 (triplet, $J = 6.8$ Hz) and 4.22 ppm (quartet, $J = 6.8$ Hz), respectively. The adjacent methylene groups exhibit two triplets at 3.66 ($J = 5.6$ Hz) and 3.76 ($J = 5.6$ Hz), respectively. The singlet at 4.73 ppm is assigned as another methylene group in the pyridine moiety. Totally, nine corresponding protons detected make further confirmation of structure **1a**. The IR spectra for **1a** exhibit strong bands at 1715 cm^{-1} for the carboxyl group in the structure. The HRMS of **1a** is in good agreement with its structure (Calcd for $C_{25}H_{20}Cl_2N_2NaO_2$ (M+Na$^+$) 473.0800, found 473.0791) with a deviation of 1.9 ppm.

As expected, the substrate of ethyl 4-piperidinone-1-carboxylate could be extended to other 4-piperidinones.

[a] Reagents and conditions: **4** (0.350 g, 2 mmol), **5** (0.286 g, 2 mmol), **6** (0.343 g, 2 mmol), solvent (10 mL).

[b] Isolated yields.

The 1-(3-chlorobenzoyl)-4-piperidinone was also chosen as reactant to react with benzaldehyde, naphthalen-2-amine (Scheme 2), and were found to generate the corresponding naphtho[2,1-*c*][2,7]naphthyridines (**8a-8d**, Table 3). However, to our surprise, we failed to get the expected products when 4-piperidinone, *N*-methyl-4-piperidinone, and *N*-benzyl-4-piperidinone were used as reactants. Perhaps the stabilities of these above-mentioned 4-piperidinones restrained their reactions.

It was interesting that the 1,4-di(1,2,3,4-tetrahydro-3-ethoxycarbonyl-naphtho[2,1-*c*][2,7]naphthyridine-5-yl) benzene **9** was obtained in 87% yield when

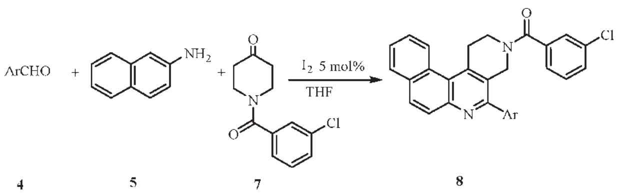
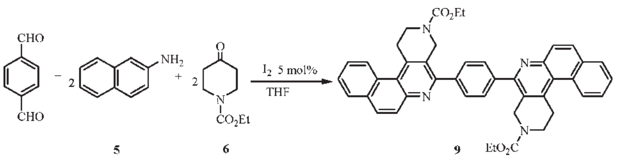
Scheme 2



Scheme 3



terephthalaldehyde was chosen as aromatic aldehyde to react with two equivalent of naphthalen-2-amine and ethyl 4-piperidinone-1-carboxylate (Scheme 3).

According to the literatures [13], we think that iodine catalyzes the reaction as a mild Lewis acid. The mechanism was proposed as shown in Scheme 4. In the presence of iodine, cyclophentone is in equilibrium with the enol form **I**. The enol immediately attack iodine-activated Schiff base to form intermediate **II**, followed by an intramolecular Friedel–Crafts cyclization to give **III**. The subsequent dehydration of **III** results in tetrahydronaphtho[2,1-*c*][2,7]naphthyridine **IV**, which is further oxidized by air to afford an aromatized naphtho[2,1-*c*][2,7]naphthyridine **1**.

To verify the mechanism, we individually performed each separate step. The Schiff base, *N*-(3,4-dichlorophenylidene) naphthalen-2-amine, was obtained in 92% yield, when the 3,4-dichlorobenzaldehyde (**1**, Ar = 3,4-$Cl_2C_6H_3$) was treated with naphthalen-2-amine in THF at ambient temperature (Scheme 5). As expected, Schiff base smoothly reacted with **6** to give the corresponding ethyl 1,2-dihydro-5-(3,4-dichlorophenyl) naphtha [2,1-*c*][2,7]naphthyridine-3(4*H*)-carboxylate **1a**. This result suggests that a formation of Schiff base took place during the reaction. It should be noted that the overall yield was low (76%) in the above separate reaction.

In conclusion, we found an efficient method for the synthesis of naphtho[2,1-*c*][2,7]naphthyridine derivatives by three-component reaction of aromatic aldehyde, naphthalen-2-amine, and ethyl 4-piperidinone-1-carboxylate or (3-chlorobenzoyl)-4-piperidinone using 5 mol % I_2 as catalyst. The features of this procedure are mild reaction conditions, high yields, operational simplicity, and environmentally friendly procedure.

[a] Reagents and conditions: **4** (2 mmol), **5** (2 mmol, 0.286 g), **7** (2 mmol, 0.474 g), I_2 (0.1 mmol, 0.026 g), THF (10 mL).

[b] Isolated yields.

EXPERIMENTAL

Melting points were determined in open capillaries and are uncorrected. Infrared (IR) spectra were recorded on a TENSOR 27 spectrometer in KBr pellet. ^1H NMR spectra were obtained from solution in DMSO-d_6 with Me_4Si as internal standard using a Bruker-400 spectrometer. HRMS analyses were carried out using a Bruker-micro-TOF-Q-MS analyzer.

General procedure for the syntheses of 1,2-dihydro-5-arylnaphtho [2,1-*c*] [2,7]naphthyridine derivatives 1 and 8. A dry 50-mL flask was charged with aromatic aldehyde (2.0 mmol), naphthalen-2-amine (2.0 mmol, 0.286 g), ethyl 4-piperidinone-1-carboxylate or (3-chlorobenzoyl)-4-piperidinone (2.0 mmol), I_2 (0.1 mmol, 0.026 g), and THF (10 mL). The reaction mixture was stirred at reflux for 10–18 h. After completion of the reaction, as indicated by TLC, a little DMF was added to the mixture until the all yellow solid was dissolved. The generated crystals were collected by filtration to give 1 or 8 when the mixture was cooled to room temperature.

Ethyl 1,2-dihydro-5-(3,4-dichlorophenyl)naphtho[2,1-c][2,7] naphthyridine-3(4H)-carboxylate (1a). This compound was obtained as pale yellow crystals (0.819 g, 91%), mp 192–194°C. IR (KBr): ν_{max} 3057, 2983, 2957, 2869, 1715, 1564, 1549, 1473, 1451, 1381, 1338, 1282, 1255, 1203, 1169, 1138, 1110, 1087, 1059, 1029, 966, 954, 894, 838, 808, 788, 779, 755 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.31 (t, J = 6.8 Hz, 3H,

Scheme 4

CH$_3$), 3.66 (t, J = 5.6 Hz, 2H, CH$_2$), 3.76 (t, J = 5.6 Hz, 2H, CH$_2$), 4.22 (q, J = 6.8 Hz, 2H, CH$_2$O), 4.73 (s, 2H, CH$_2$), 7.42 (dd, J = 8.0 Hz, J' = 2.0 Hz, 1H, ArH), 7.60 (d, J = 8.0 Hz, 1H, ArH), 7.66–7.70 (m, 2H, ArH), 7.74 (d, J = 2.0 Hz, 1H, ArH), 7.96–8.00 (m, 3H, ArH), 8.00–8.63 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{20}Cl_2N_2NaO_2$ (M+Na$^+$) 473.0800, found 473.0791.

Ethyl 1,2-dihydro-5-(3-nitrophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1b). This compound was obtained as pale yellow crystals (0.785 g, 92%), mp 156−157°C. IR (KBr): ν_{max} 3090, 2960, 1694, 1534, 1466, 1447, 1382, 1348, 1303, 1260, 1204, 1095, 1081, 1001, 832, 807, 771, 759, 738, 708 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH$_3$), 3.58–3.60 (m, 2H, CH$_2$), 3.74–3.76 (m, 2H, CH$_2$), 4.08 (q, J = 6.4 Hz, 2H, CH$_2$), 4.69 (s, 2H, CH$_2$), 7.75 (dd, J = 6.0 Hz, J' = 3.2 Hz, 2H, ArH), 7.86–7.91 (m, 2H, ArH), 8.11–8.13 (m, 3H, ArH), 8.40 (dd, J = 8.0 Hz, J' = 1.6 Hz, 1H, ArH), 8.49 (s, 1H, ArH), 8.74–8.76 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}N_3O_4$ (M+H$^+$) 428.1610, found 428.1611.

Ethyl 1,2-dihydro-5-(2-thiophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1c). This compound was obtained as pale yellow crystals (0.629 g, 81%), mp 111−112°C. IR (KBr): ν_{max} 3057, 2981, 1697, 1606, 1551, 1478, 1436, 1379, 1359, 1332, 1304, 1258, 1227, 1199, 1169, 1134, 1117, 1074, 1028, 969, 827, 817, 767, 749, 712 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.26 (t, J = 7.2 Hz, 3H, CH$_3$), 3.62–3.63 (m, 2H, CH$_2$), 3.73–3.74 (m, 2H, CH$_2$), 4.16 (q, J = 7.2 Hz, 2H, CH$_2$), 5.01 (s, 2H, CH$_2$), 7.29–7.31 (m, 1H, ArH), 7.62 (d, J = 3.6 Hz, 1H, ArH), 7.72–7.74 (m, 2H, ArH), 7.81–7.85 (m, 2H, ArH), 8.08–8.11 (m, 2H, ArH), 8.71–8.73 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{23}H_{20}N_2NaO_2S$ (M+Na$^+$) 411.1143, found 411.1130.

Ethyl 1,2-dihydro-5-(2,4-dichlorophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1d). This compound was obtained as pale yellow crystals (0.729 g, 83%), mp 168−169°C. IR (KBr): ν_{max} 3083, 2975, 1708, 1587, 1557, 1474, 1426, 1379, 1360, 1341, 1303, 1281, 1247, 1201, 1170, 1139, 1116, 1098, 1064, 1051, 947, 863, 837, 800, 767, 746 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.22 (b, 3H, CH$_3$), 3.42–3.45 (m, 1H, CH), 3.68–3.70 (m, 1H, CH), 3.78–3.84 (m, 2H, CH$_2$), 4.08–4.13 (m, 2H, CH$_2$), 4.34–4.38 (m, 1H, CH), 4.48–4.51 (m, 1H, CH), 7.59 (d, J = 8.4 Hz, 1H, ArH), 7.66 (dd, J = 8.4 Hz, J' = 2.0 Hz, 1H, ArH), 7.74–7.77 (m, 2H, ArH), 7.86–7.88 (m, 2H, ArH), 8.11–8.14 (m, 2H, ArH), 8.77–8.80 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{21}Cl_2N_2O_2$ (M+H$^+$) 451.0980, found 451.0983.

Ethyl 1,2-dihydro-5-(4-bromophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1e). This compound was obtained as pale yellow crystals (0.790 g, 86%), mp 188−190°C. IR (KBr): ν_{max} 3050, 2980, 1687, 1590, 1564, 1516, 1429, 1380, 1321, 1300, 1248, 1204, 1169, 1136, 1115, 1084, 1010, 953, 911, 886, 832, 765 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH$_3$), 3.54–3.57 (m, 2H, CH$_2$), 3.70–3.73 (m, 2H, CH$_2$), 4.09 (q, J = 7.2 Hz, 2H, CH$_2$), 4.65 (s, 2H, CH$_2$), 7.59 (d, J = 8.4 Hz, 2H, ArH), 7.72–7.75 (m, 4H, ArH), 7.86 (d, J = 8.8 Hz, 1H, ArH), 8.07–8.11 (m, 2H, ArH), 8.70–8.72 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}BrN_2O_2$ (M+H$^+$) 461.0865, found 461.0831.

Ethyl 1,2-dihydro-5-(4-chlorophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1f). This compound was obtained as pale yellow crystals (0.730 g, 88%), mp 210−212°C. IR (KBr): ν_{max} 3055, 2979, 1695, 1595, 1559, 1481, 1460, 1432, 1382, 1362, 1337, 1321, 1302, 1284, 1246, 1203, 1169, 1138, 1114, 1087, 1046, 1014, 979, 945, 870, 837, 757 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH$_3$), 3.58 (t, J = 5.6 Hz, 2H, CH$_2$), 3.75 (t, J = 5.6 Hz, 2H, CH$_2$), 4.09 (q, J = 6.8 Hz, 2H, CH$_2$O), 4.66 (s, 2H, CH$_2$), 7.63–7.74 (m, 4H, ArH), 7.75–7.76 (m, 2H, ArH), 7.87 (d, J = 8.8 Hz, 1H, ArH), 8.09–8.13 (m, 2H, ArH), 8.73–8.75 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}ClN_2O_2$ (M+H$^+$) 417.1370, found 417.1387.

Ethyl 1,2-dihydro-5-(2,3-dichlorophenyl)naphtho[2,1-c][2,7]naphthyri-dine-3(4H)-carboxylate (1g). This compound was obtained as pale yellow crystals (0.810 g, 90%), mp 165−167°C. IR (KBr): ν_{max} 3057, 2979, 2905, 1694, 1604, 1561, 1482, 1430, 1379, 1362, 1343, 1253, 1207, 1170, 1142, 1117, 1048, 1028, 870, 833, 788, 770, 753, 717, 701 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.29 (b, 3H, CH$_3$), 3.67–3.76 (m, 4H, 2CH$_2$), 4.16–4.23 (m, 2H, CH$_2$O), 4.57 (s, 2H, CH$_2$), 7.33–7.40 (m, 2H, ArH), 7.60 (d, J = 8.8 Hz, 1H, ArH), 7.67–7.70 (m, 2H, ArH), 7.97–8.00 (m, 3H, ArH), 8.67–8.69 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{21}Cl_2N_2O_2$ (M+H$^+$) 451.0980, found 451.0956.

Ethyl 1,2-dihydro-5-(4-nitrophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1h). This compound was obtained as pale yellow crystals (0.743 g, 87%), mp 209−211°C. IR (KBr): ν_{max} 3063, 2999, 2982, 2960, 2941, 2902, 1684, 1600, 1581, 1515, 1468, 1451, 1385, 1347, 1261, 1228, 1170, 1140, 1098, 1083, 1017, 968, 952, 886, 858, 837, 770, 751, 700 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH$_3$), 3.58–3.59 (m, 2H, CH$_2$), 3.74–3.75 (m, 2H, CH$_2$), 4.07 (q, J = 7.2 Hz, 2H, CH$_2$), 4.65 (m, 2H, CH$_2$), 7.76 (dd, J = 6.0 Hz, J' = 3.2 Hz, 2H, ArH), 7.87–7.92 (m, 3H, ArH), 8.11–8.13 (m, 2H, ArH), 8.41 (d, J = 8.8 Hz, 2H, ArH), 8.73–8.76 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}N_3O_4$ (M+H$^+$) 428.1610, found 428.1605.

Ethyl 1,2-dihydro-5-(4-fluorophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1i). This compound was obtained as pale yellow crystals (0.695 g, 87%), mp 207−209°C. IR (KBr): ν_{max} 3060, 2982, 2943, 2906, 1697, 1602, 1561, 1509, 1482, 1461, 1433, 1384, 1361, 1337, 1321, 1285, 1248, 1159, 1113, 1046, 1030, 979, 944, 869, 837, 808, 758 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH$_3$), 3.54–3.57 (m, 2H, CH$_2$), 3.71–3.74 (m, 2H, CH$_2$), 4.07 (q, J = 6.8 Hz, 2H, CH$_2$O), 4.64 (s, 2H, CH$_2$), 7.37–7.42 (m, 2H, ArH), 7.66–7.76 (m, 4H, ArH), 7.86 (d, J = 9.2 Hz, 1H, ArH), 8.07–8.11 (m, 2H, ArH), 8.70–8.73 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}FN_2O_2$ (M+H$^+$) 401.1665, found 401.1661.

Ethyl 1,2-dihydro-5-(2-nitrophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1j). This compound was obtained as pale yellow crystals (0.769 g, 90%), mp 218−220°C. IR (KBr): ν_{max} 3057, 2978, 2924, 2905, 2851, 2684, 1608, 1560, 1529, 1468, 1442, 1383, 1350, 1302, 1266, 1224, 1140, 1118, 1092, 1028, 979, 954, 895, 860, 840, 790, 758, 740, 705, 693 cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.13–1.22 (m, 3H, CH$_3$), 3.64 (b, 2H, CH$_2$), 3.75 (b, 2H, CH$_2$), 4.08 (b, 2H, CH$_2$), 4.51 (s, 2H, CH_2), 7.74–7.85 (m, 5H, ArH), 7.92–7.96 (m, 1H, ArH), 8.08–8.12 (m, 2H, ArH), 8.27 (d, *J* = 8.0 Hz, 1H, ArH), 8.78–8.80 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}N_3O_4$ ($M+H^+$) 428.1610, found 428.1610.

Ethyl 1,2-dihydro-5-(3-chlorophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1k). This compound was obtained as pale yellow crystals (0.691 g, 83%), mp 131−132°C. IR (KBr): ν_{max} 3053, 2969, 2869, 1700, 1568, 1479, 1466, 1417, 1363, 1346, 1280, 1255, 1202, 1170, 1137, 1111, 1060, 1027, 997, 957, 875, 837, 794, 768, 752, 722, 696 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.22 (b, 3H, CH_3), 3.57–3.58 (m, 2H, CH_2), 3.71–3.72 (m, 2H, CH_2), 4.09 (q, *J* = 6.4 Hz, 2H, CH_2), 4.66 (s, 2H, CH_2), 7.59–7.60 (m, 3H, ArH), 7.73–7.76 (m, 3H, ArH), 7.87 (d, *J* = 8.8 Hz, 1H, ArH), 8.09–8.13 (m, 2H, ArH), 8.71–8.74 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}ClN_2O_2$ ($M+H^+$) 417.1370, found 417.1350.

Ethyl 1,2-dihydro-5-(4-methoxyphenyl)naphtho[2,1-c][2,7] naphthyridine-3(4H)-carboxylate (1l). This compound was obtained as pale yellow crystals (0.674 g, 82%), mp 193−194°C. IR (KBr): ν_{max} 3018, 2978, 2958, 2934, 2903, 2871, 2841, 1702, 1610, 1556, 1518, 1418, 1367, 1292, 1204, 1135, 1109, 1087, 1060, 964, 952, 858, 836, 795, 759 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.20 (b, 3H, CH_3), 3.55 (t, *J* = 5.2 Hz, 2H, CH_2), 3.72 (s, 2H, CH_2), 3.86 (s, 3H, CH_3O), 4.08 (q, *J* = 7.2 Hz, 2H, CH_2), 4.69 (s, 2H, CH_2), 7.11 (d, *J* = 8.4 Hz, 2H, ArH), 7.59 (d, *J* = 8.4 Hz, 2H, ArH), 7.73 (t, *J* = 4.4 Hz, 2H, ArH), 7.86 (d, *J* = 8.8 Hz, 1H, ArH), 8.06–8.11 (m, 2H, ArH), 8.69–8.71 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{26}H_{25}N_2O_2$ ($M+H^+$) 413.1865, found 413.1865.

Ethyl 1,2-dihydro-5-(4-chloro-2-nitrophenyl)naphtha [2,1-c][2,7] naphthyridine-3(4H)-carboxylate (1m). This compound was obtained as pale yellow crystals (0.774 g, 84%), mp 185−186°C. IR (KBr): ν_{max} 3061, 2986, 2906, 1698, 1683, 1605, 1567, 1537, 1484, 1470, 1435, 1383, 1339, 1297, 1246, 1224, 1204, 1144, 1117, 1026, 980, 960, 894, 868, 834, 756 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.31 (b, 3H, CH_3), 3.75 (b, 4H, $2CH_2$), 4.20 (b, 2H, CH_2), 4.54 (b, 2H, CH_2), 7.51 (s, 1H, ArH), 7.62–7.69 (m, 3H, ArH), 7.86 (d, *J* = 9.2 Hz, 1H, ArH), 7.94–8.01 (m, 2H, ArH), 8.22 (d, *J* = 8.8 Hz, 1H, ArH), 8.65–8.67 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{21}ClN_3O_4$ ($M+H^+$) 462.1221, found 462.1201.

Ethyl 1,2-dihydro-5-phenylnaphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1n). This compound was obtained as pale yellow crystals (0.634 g, 83%), mp 175−177°C. IR (KBr): ν_{max} 3056, 2975, 2931, 2869, 1703, 1565, 1478, 1446, 1419, 1376, 1364, 1344, 1278, 1261, 1231, 1200, 1169, 1135, 1110, 1088, 1060, 1029, 954, 880, 853, 838, 782, 757, 737, 700 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.29 (b, 3H, CH_3), 3.65–3.66 (m, 2H, CH_2), 3.73–3.75 (m, 2H, CH_2), 4.20 (q, *J* = 6.8 Hz, 2H, CH_2), 4.74 (s, 2H, CH_2), 7.47–7.60 (m, 5H, ArH), 7.64–7.68 (m, 2H, ArH), 7.93–8.00 (m, 3H, ArH), 8.60–8.63 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{22}N_2NaO_2$ ($M+Na^+$) 405.1579, found 405.1579.

Ethyl 1,2-dihydro-5-(2-fluorophenyl)naphtho[2,1-c][2,7]naphthyridine-3(4H)-carboxylate (1o). This compound was obtained as pale yellow crystals (0.704 g, 88%), mp 95−97°C. IR (KBr): ν_{max} 3059, 2990, 2964, 2902, 2851, 1701, 1616, 1579, 1561, 1528, 1489, 1438, 1385, 1365, 1247, 1216, 1141, 1046, 1024, 978, 951, 896, 858, 842, 814, 755 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.22 (b, 3H, CH_3), 3.60–3.74 (m, 4H, $2CH_2$), 4.08 (b, 2H, CH_2O), 4.52 (b, 2H, CH_2), 7.41–7.45 (m, 2H, ArH), 7.57–7.65 (m, 2H, ArH), 7.74–7.76 (m, 2H, ArH), 7.88 (d, *J* = 8.8 Hz, 1H, ArH), 8.10–8.13 (m, 2H, ArH), 8.75–8.77 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{25}H_{21}FN_2NaO_2$ ($M+Na^+$) 423.1485, found 423.1467.

Ethyl 1,2-dihydro-5-(3,5-dimethoxyphenyl)naphtha [2,1-c][2,7] naphthyridine-3(4H)-carboxylate (1p). This compound was obtained as pale yellow crystals (0.760 g, 86%), mp 157−159°C. IR (KBr): ν_{max} 3052, 2985, 2936, 2843, 1694, 1599, 1454, 1423, 1372, 1321, 1301, 1247, 1204, 1193, 1112, 1088, 1058, 969, 897, 852, 836, 802, 770, 752, 729 cm^{-1}. ^1H NMR (DMSO-d_6): δ 1.30 (b, 3H, CH_3), 3.66–3.69 (m, 2H, CH_2), 3.74–3.76 (m, 2H, CH_2), 3.85 (s, 6H, $2CH_3O$), 4.21 (q, *J* = 6.8Hz, 2H, CH_2O), 4.77 (s, 2H, CH_2), 6.57 (s, 1H, ArH), 6.70 (d, *J* = 2.0 Hz, 2H, ArH), 7.65–7.68 (m, 2H, ArH), 7.94–8.01 (m, 3H, ArH), 8.61–8.64 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{27}H_{27}N_2O_4$ ($M+H^+$) 443.1971, found 443.1948.

1,2,3,4-Tetrahydro-3-(3-chlorobenzoyl)-5-(4-chlorophenyl)-naphtho[2,1-c][2,7]naphthyridine (8a). This compound was obtained as pale yellow crystals (0.789 g, 82%), mp 184−185°C. IR (KBr): ν_{max} 3062, 3014, 2977, 2899, 2853, 1623, 1560, 1479, 1430, 1361, 1322, 1259, 1211, 1165, 1126, 1085, 1055, 1045, 1012, 965, 946, 900, 838, 805, 744, 699 cm^{-1}. ^1H NMR (DMSO-d_6): δ 3.54–3.80 (m, 4H, $2CH_2$), 4.67–4.85 (m, 2H, CH_2), 7.43–7.75 (m, 10H, ArH), 7.89 (d, *J* = 8.8 Hz, 1H, ArH), 8.10–8.13 (m, 2H, ArH), 8.14 (s, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{29}H_{20}Cl_2N_2NaO$ ($M+Na^+$) 505.0850, found 505.0857.

1,2,3,4-Tetrahydro-3-(3-chlorobenzoyl)-5-(4-bromophenyl)-naphtho[2,1-c][2,7]naphthyridine (8b). This compound was obtained as pale yellow crystals (0.902 g, 86%), mp 171−172°C. IR (KBr): ν_{max} 3060, 3016, 2980, 2946, 2898, 2852, 1634, 1563, 1518, 1479, 1430, 1362, 1321, 1259, 1227, 1211, 1165, 1125, 1083, 1068, 1009, 966, 900, 833, 805, 745, 703, 683 cm^{-1}. ^1H NMR (DMSO-d_6): δ 3.79–3.85 (m, 4H, $2CH_2$), 4.67–4.85 (m, 2H, CH_2), 7.32–7.80 (m, 10H, ArH), 7.89 (d, *J* = 8.8 Hz, 1H, ArH), 8.09–8.12 (m, 2H, ArH), 8.74 (s, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{29}H_{21}BrClN_2O$ ($M+H^+$) 527.0526, found 527.0525.

1,2,3,4-Tetrahydro-3-(3-chlorobenzoyl)-5-(2,4-dichlorophenyl)naphtho[2,1-c][2,7]naphthyridine (8c). This compound was obtained as pale yellow crystals (0.805 g, 78%), mp 217−218°C. IR (KBr): ν_{max} 3058, 3022, 2944, 1641, 1588, 1562, 1518, 1477, 1460, 1439, 1380, 1360, 1343, 1321, 1263, 1228, 1170, 1131, 1099, 1049, 971, 906, 870, 834, 798, 781, 759, 745, 698 cm^{-1}. ^1H NMR (DMSO-d_6): δ 3.49–3.95 (m, 4H, $2CH_2$), 4.44–4.74 (m, 2H, CH_2), 7.43–7.78 (m, 9H, ArH), 7.89 (d, *J* = 8.8 Hz, 1H, ArH), 8.12–8.14 (m, 2H, ArH), 8.80 (s, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{29}H_{19}Cl_3N_2NaO$ ($M+Na^+$) 539.0461, found 539.0456.

1,2,3,4-Tetrahydro-3-(3-chlorobenzoyl)-5-(4-nitrophenyl)-naphtho[2,1-c][2,7]naphthyridine (8d). This compound was obtained as pale yellow crystals (0.818 g, 83%), mp 133−134°C. IR (KBr): ν_{max} 3055, 2944, 2887, 2855, 1658, 1629, 1564, 1515, 1478, 1430, 1349, 1322, 1258, 1211, 1098, 1045, 859, 837, 807, 757, 737, 701 cm^{-1}. ^1H NMR (DMSO-d_6): δ 3.57–3.87 (m, 4H, $2CH_2$), 4.67–4.86 (m, 2H, CH_2), 7.36–7.58 (m, 4H, ArH), 7.76–7.78(m, 2H, ArH), 7.91 (d, *J* = 8.8 Hz, 1H, ArH), 7.96–7.99 (m, 2H, ArH), 8.13 (d, *J* = 9.2 Hz, 2H, ArH), 8.26–8.45 (m, 2H, ArH), 8.76–8.78 (m, 1H, ArH). HRMS (ESI, *m/z*): calcd for $C_{29}H_{20}ClN_3NaO_3$ ($M+Na^+$) 516.1091, found 516.1099.

General procedure for the syntheses of binaphtho[2,1-*c*][2,7]naphthyridine 9. A dry 50-mL flask was charged with terephthalaldehyde (1.0 mmol, 0.134 g), naphthalen-2-amine (2.0 mmol, 0.286 g), ethyl 4-piperidinone-1-carboxylate (2.0 mmol, 0.342 g), I_2 (0.05 mmol, 0.013 g), and THF (10 mL). The reaction mixture was stirred at reflux for 10 h. After completion of the reaction, as indicated by TLC, a little DMF was added to the mixture until the all yellow solid was dissolved. The generated crystals were collected by filtration to give **9** when the mixture was cooled to room temperature.

1,4-di(1,2,3,4-tetrahydro-3-ethoxycarbonyl-naphtho[2,1-c][2,7]naphthyri-dine-5-yl)benzene (9). This compound was obtained as pale yellow crystals (0.597 g, 87%), mp 249−250°C. IR (KBr): ν_{max} 3054, 2987, 2872, 1708, 1564, 1479, 1449, 1419, 1379, 1362, 1259, 1205, 1137, 1112, 1086, 853, 837, 752cm^{-1}. ^{1}H NMR (DMSO-d_6): δ 1.21–1.23 (b, 6H, 2CH_3), 3.61–3.64 (m, 4H, 2CH_2), 3.78–3.80 (m, 4H, 2CH_2), 4.12 (q, $J = 6.8$ Hz, 4H, 2CH_2O), 4.80 (s, 4H, 2CH_2), 7.75–7.77 (m, 4H, ArH), 7.83 (s, 4H, ArH), 7.95 (d, $J = 9.2$ Hz, 2H, ArH), 8.12–8.15 (m, 4H, ArH), 8.76–8.78 (m, 2H, ArH). HRMS (ESI, *m/z*): calcd for $C_{44}H_{39}N_4O_4$ (M+H$^+$) 687.2971, found 687.2936.

Acknowledgments. We thank the National Natural Science foundation of China (20802061), the Natural Science foundation (08KJD150019), and Qing Lan Project (08QLT001) of Jiangsu Education Committee for financial support.

A one-pot synthesis of imidazoles has been established from the addition of azides to 2-amidoacrylates, and this synthetic method demonstrates an efficient synthesis of imidazole-4-carboxylates.

J. Heterocyclic Chem., **46**, 1235 (2009).

INTRODUCTION

Over the century, the chemical and biochemical properties of imidazoles in the biological system have been attracting much interest. Even today, research in imidazole chemistry continues unabated. Compounds with imidazole ring systems have many pharmacological properties and play important roles in biochemical processes [1]. Many substituted imidazoles are known as key pharmacophore in modern drugs [2]. Therefore, the preparation of imidazoles has gained considerable attention in recent years [3].

In 1998, Hadjiantou-Maroulis et al. [4] found the pyrolysis of 1-aroylamino-4,5-diphenyl-1,2,3-triazoles (**I**) yields 2,3-diphenyl-2H-azirine (**II**) and 2-aryl-4,5-diphenylimidazoles (**III**) as the major products (Scheme 1).

More recently, great attention has been given to dipolar cycloaddition chemistry using azides, especially azide cycloadditions to alkynes to generate triazoles [5] (Scheme 2). Addition of azides to α,β-unsaturated carbonyl compounds **IV** has been reported in the literature [6–10] (Scheme 3). Particularly interesting were the transformations of 2-amido-3-arylaminoacrylates **V** and **VII** to imidazoles **VI** and **VIII,** respectively [11] (Scheme 4).

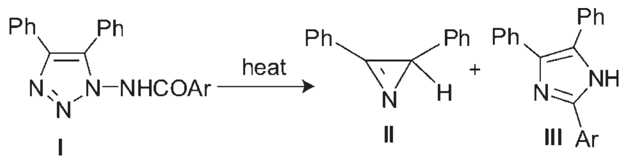
According to Hadjiantou-Maroulis et al. [4], we found a novel synthesis of imidazoles **XI** from 2-aminoacrylates **IX** and azides **X**. To our knowledge, no report has described such a one-pot procedure to synthesize imidazoles **XI** from 2-amidoacrylates **IX** (Scheme 5). In this article, we have systematically investigated each possible reaction of various 2-aminoacrylates and presented the results as follows.

RESULTS AND DISCUSSION

When 2-amidoacrylates **9** were heated with benzyl azide at reflux in toluene, imidazoles **11** were obtained as the main product in the reaction mixture. The effects of temperature, azide equivalents, and reaction time on the yield of imidazoles and byproducts **12** were investigated (Table 1). It is clear that temperature has a pivotal role in the reaction, since only trace amounts of imidazoles were observed under 100°C, and the yield of imidazoles increased with regard to reaction temperature. Likewise, we found that required reaction time could be shortened from 2–4 d to 15 h if reaction temperature increased from reflexing toluene to 190°C in a sealed tube (Table 1, entries 4, 6, and 7). Increased equivalents of benzyl azide appeared to be slightly detrimental to the yield of imidazoles, and more byproducts were yielded (Table 1, entries 6 and 7). Optimal yield of imidazoles was achieved when the reactants were heated in toluene in a sealed tube at 190°C for 15 h (Table 1, entries 4 and 6).

Based on similar imidazole synthesis previously reported [12] and the chemical properties of organic azides, we proposed a mechanism (Scheme 6) that can possibly explain the formation of 2-amido-

Scheme 1



3aminoacrylate byproduct **12** as an intermediate in the synthesis of imidazole **11**. Dipolar cycloaddition of benzyl azide to 2-amidoacrylate **9** should offer the regioisomeric triazolines A and B, even previous studies reported [13] that the formation of triazoline A would be greatly favored over the regioisomeric triazoline B. Thermal decomposition of triazolines A and B would provide compounds C and D, on extrusion of nitrogen, which would yield either aziridine E or imine F. Tautomerization of imine F would provide E-enamine G or the observed Z-enamine **12**, which on intramolecular cyclization would provide imidazole **11** after dehydration of tetrahedral intermediate H.

On the basis of proposed mechanism, we suggest that byproduct **12** appeared to be an intermediate contributing to the production of imidazole **11**. We found that enamine **12** was accumulated exclusively only in the sealed reaction conditions where water was confined in reaction system, otherwise imidazole **11** was observed (Table 2) [14].

A one-pot synthesis of imidazoles **11** has been developed from adding azides to 2-amidoacrylates **9**, and this synthetic method represents an efficient synthesis for imidazole-4-carboxylates **11**.

EXPERIMENTAL

All reactions were performed under an atmosphere of dry nitrogen unless noted otherwise. ^{1}H and ^{13}C NMR spectra were recorded on a Varian 300 MHz or 500 MHz spectrometer using $CDCl_3$ as solvent under ambient temperatures unless otherwise noted. Infrared spectra were recorded using an FT-IR spectrometer and are reported in cm^{-1}. Mass spectra were obtained as specified. Low-resolution mass and high-resolution mass spectra were measured with a Hitachi M-52-Instrument or Bruker APEX II mass spectrometer. Melting points were uncorrected and were determined either using recrystallized samples or samples, which crystallized during concentration of the chromatography eluents.

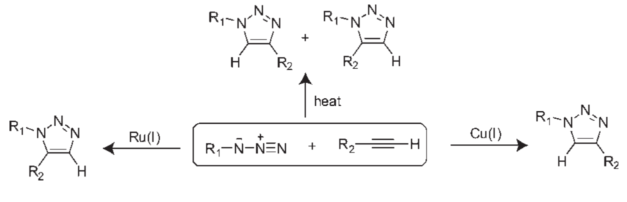
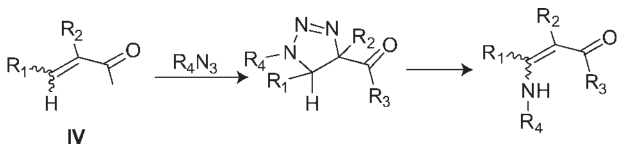


Scheme 3



Methyl 2-benzamidoacrylate (9a). The (*S*)-Methyl 2-benzamido-3-hydroxypropanoate compound (1.21 g, 5.40 mmol) was dissolved in 50 mL of dry CH_2Cl_2 in a flame-dried 100-mL round-bottomed flask under Ar. EDC HCl (1.24 g, 6.46 mmol) was added to the solution in one portion followed by CuCl (160.7 mg, 1.62 mmol). The reaction was wrapped in foil and stirred under Ar at room temperature. After 2 h, TLC of the reaction (1:1 hexanes/EtOAc) indicated starting material had been completely consumed, and a new, less polar compound was observed. After 3 h, H_2O (100 mL) was added to the reaction, and the layers were separated. The aqueous layer was extracted with CH_2Cl_2 (2 × 20 mL), and the combined CH_2Cl_2 layers were washed with H_2O (100 mL), dried over $MgSO_4$, filtered, and concentrated to yield a yellow oil. The oil was purified through a plug (30 g) of silica gel using CH_2Cl_2 and yielded **9a** as a colorless, cloudy liquid (1.06 g, 96% yield). IR: 3300, 3150, 3075, 1740, 1640, 1210, 830, 750 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 8.49 (br-s, 1H), 7.75 (dd, *J* = 7.1, 1.9 Hz, 2H), 7.43 (m, 1H), 7.37 (m, 2H), 6.71 (d, *J* = 1.6 Hz, 1H), 5.90 (d, *J* = 1.6 Hz, 1H), 3.76 (s, 3H). ^{13}C NMR: δ 165.3, 164.3, 133.9, 131.7, 130.8, 128.4, 126.6, 108.5, 52.7. HRMS (FAB): m/z $[M+H]^+$ calcd for $C_{11}H_{12}NO_3^+$, 206.0817; found, 206.0818.

Benzyl 2-benzamidoacrylate (9b). Compound **9b** was prepared following a similar procedure for **9a**. The (*S*)-Benzyl 2-benzamido-3-hydroxypropanoate compound (1.51 g, 5.03 mmol), EDC HCl (1.17 g, 6.12 mmol), and CuCl (0.15 g, 1.51 mmol) provided an oil. Chromatography through silica gel using CH_2Cl_2 yielded **9b** as a white solid (1.45 g, 99% yield); mp 51–52°C. IR (KBr): 3310, 3140, 3010, 1735, 1630, 1210, 840, 730 cm^{-1}; ^{1}H NMR: δ 8.56 (br-s, 1H), 7.84 (dd, *J* = 7.0, 1.5 Hz, 2H), 7.55 (m, 1H), 7.47 (m, 2H), 7.41–7.36 (m, 5H),

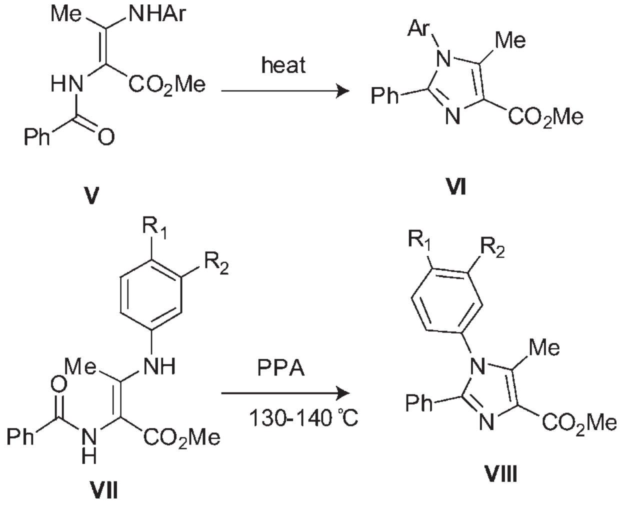
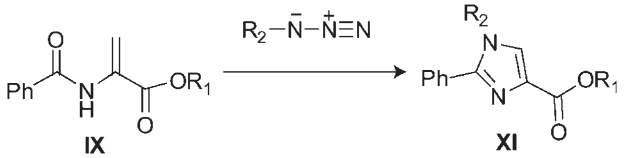


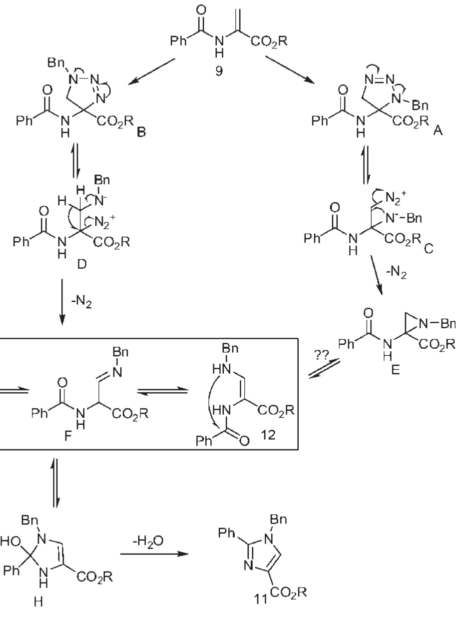
Scheme 5



6.82 (d, $J = 2.0$ Hz, 1H), 6.06 (d, $J = 2.0$ Hz, 1H), 5.32 (s, 2H). ^{13}C NMR: δ 165.7, 164.2, 135.0, 134.2, 132.0, 131.0, 128.8, 128.7, 128.6, 128.2, 126.9, 109.1, 67.9. HRMS (FAB): m/z $[M+H]^+$ calcd for $C_{17}H_{16}NO_3^+$, 282.1130; found, 282.1140.

General procedure for the preparation of imidazoles from 2-amidoacrylates and azides. Methyl 1-benzyl-2-phenyl-1H-imidazole-4-carboxylate (11a). Compound **9a** (116.2 mg, 0.57 mmol) and benzyl azide (0.11 mL, 0.87 mmol) were dissolved in 5 mL of toluene in a sealed pyrex tube fitted with a stir bar. The tube was heated in an oil bath maintained at 190°C. After 1 h, the colorless solution turned yellow in color, and gradually, the color became brown. After 15 h, the reaction was cooled to RT and concentrated. The crude brown oil was purified through 25 g of silica gel using a solvent gradient from CH_2Cl_2 to 80% CH_2Cl_2/EtOAc and yielded pure **12a** (26.5 mg, 15.1% yield), pure **11a** as an amber oil (84.1 mg, 50.8% yield), and a mixture of **12a** and **11a** (26.1 mg). Total yield of **11a** isolated as amber oil was 90.1 mg (54%). **11a** was recrystallized from EtOAc/hexanes to produce light yellow crystals. Rf = 0.14 (1:1 hexanes/EtOAc). IR (KBr): 3010, 1735, 1590, 1320, 1210, 840, 730 cm^{-1}; ^{1}H NMR: δ 7.69 (s, 1H), 7.60 (m, 2H), 7.44–7.40 (m, 3H), 7.37–7.32 (m, 3H), 7.09 (m, 2H), 5.23 (s, 2H), 3.90 (s, 3H). ^{13}C NMR: δ 163.0, 148.8, 135.4, 132.5, 129.2, 129.0, 128.8, 128.7, 128.2, 127.9, 126.9, 126.5, 51.3, 50.5. HRMS (FAB): m/z $[M+H]^+$ calcd for $C_{18}H_{17}N_2O_2^+$, 293.1290; found, 293.1293.

Scheme 6. Proposed formation mechanism of imidazole.



(Z)-Methyl 2-benzamido-3-(benzylamino)acrylate (12a). Compound **12a** was isolated as amber oil. Total yield isolated was 46.6 mg (27%). Compound **12a** was recrystallized from 70% EtOH/H_2O to yield colorless crystals. Rf = 0.26 (1:1 hexanes/EtOAc). IR (KBr): 3270, 3140, 3010, 2400, 1750, 1630, 840, 730 cm^{-1}; ^{1}H NMR: δ 8.00 (br, 1H), 7.84 (m, 2H), 7.51 (m, 1H), 7.44 (m, 2H), 7.37–7.26 (m, 6H), 6.50 (br, 1H), 4.42 (d, $J = 6.0$ Hz, 2H), 3.73 (s, 3H). ^{13}C NMR: δ 166.5, 164.8, 140.1, 138.5, 134.0, 131.6, 131.3, 128.73, 128.69, 128.6, 128.51, 128.46, 127.2, 127.1, 127.0, 126.9, 52.5, 51.6. Benzyl 1-benzyl-2-phenyl-1H-imidazole-4-carboxylate (11b). Compound **11b** was prepared following the general procedure for the synthesis of imidazoles from acrylates and azides. Acrylate **9b** (0.14 g, 0.51 mmol) and benzyl azide (0.10 mL, 0.79 mmol) were heated in toluene (5 mL) in a sealed pyrex tube for 15 h in a 190°C oil bath. Chromatography through 25 g of silica gel using a solvent gradient from CH_2Cl_2 to 90% CH_2Cl_2/EtOAc yielded pure **12b**, **11b**, and a mixture of **11b** and **12b** as amber oils. Total yield of **11b** was 120 mg (63%). IR (KBr): 3010, 1735, 1667, 1590, 1310, 1160, 820, 730 cm^{-1}; ^1H NMR: δ 7.65 (s, 1H), 7.56 (m, 2H), 7.44 (m, 2H), 7.42–7.29 (m, 9H), 7.05 (d, $J = 7.0$ Hz, 2H), 5.36 (s, 2H), 5.18 (s, 2H). ^{13}C NMR: δ 162.6, 149.2, 136.1, 135.6, 132.8, 129.4, 129.3, 129.1, 129.0, 128.44, 128.36, 128.3, 128.2, 128.0, 127.2, 126.7, 66.0, 50.7. HRMS (FAB): m/z $[M+H]^+$ calcd for $C_{24}H_{21}N_2O_2^+$, 369.1603; found, 369.1602.

(Z)-Benzyl 2-benzamido-3-(benzylamino)acrylate (12b). Compound **12b** was isolated as amber oil (35 mg, 18%). IR : 3270, 3140, 3010, 2400, 1735, 1630, 1210, 840, 730 cm^{-1}; ^1H NMR: δ 9.04 (br, 1H), 7.84 (d, $J = 7.5$ Hz, 2H), 7.79 (d, $J = 7.5$ Hz, 2H, isomer), 7.51 (m, 1H), 7.45–7.26 (m, 13H), 6.59 (br, 1H), 5.21 (s, 2H), 4.44 (d, $J = 6.0$ Hz, 2H). ^{13}C NMR: δ 164.9, 138.4, 136.5, 134.0, 131.6, 128.8, 128.7, 128.6, 128.53, 128.47, 128.02, 127.98, 127.5, 127.2, 127.1, 126.9, 66.1, 52.6. HRMS (FAB): m/z $[M]^+$ calcd for $C_{24}H_{22}N_2O_3^+$, 386.1630; found, 386.1628.

General procedure for thermal cyclization of methyl 2-benzamido-3-(benzylamino)acrylate (12a). A mixture of **12a** (0.01 mol) and toluene (6 mL) were heated under reflux for 1.5–15 h, volatile components were evaporated *in vacuo*, the residue was triturated with toluene–hexane or with Et_2O, and the precipitate was collected by filtration to give **11a**.

Acknowledgment. The authors thank the financial support from Chung Chou Institute of Technology.

A new class of aminopyrazolones, aminoisoxazolones, aminopyrimidinones, and thioxopyrimidinones were synthesized from Michael adduct, ethyl-3,4-diaroyl-2-cyanobutyrate, on reaction with different nucleophiles, hydrazine hydrate, hydroxylamine hydrochloride, and urea derivatives.

J. Heterocyclic Chem., **46**, 1239 (2009).

INTRODUCTION

A large number of heterocyclic compounds play a vital role as drugs and pharmaceutical agents. A number of barbiturate and thiobarbiturate derivatives exhibit anticonvulsant, anaesthetic, sedative, and hypnotic properties [1–5]. In fact, phenobarbital and mephobarbital are used for clinical treatment of epilepsy [6]. Besides, methohexital is still used worldwide in hospitals as injection narcotics [7]. Increasing evidence suggests that pyrazole and isoxazole derivatives possess a broad spectrum of biological activity such as bacteriostatic, antidiabetic, analgesic, antiarrhythmic, anti-inflammatory, antifungal, and antiviral properties [8–13]. Celecoxib, a pyrazole derivative, valdecoxib, an isoxazole derivative are now being used as anti-inflammatory drugs [14]. Thus, the development of practical and convenient method for the construction of nitrogen containing heterocycles is an important goal. Michael adducts afford a rich and diverse array of options for the synthesis of variety of five and six membered heterocycles. In fact, we have exploited a variety of Michael adducts to develop different heterocycles [15–19]. In a continuing quest for further ways of utilizing Michael adducts, the present work has been taken up.

RESULTS AND DISCUSSION

The synthetic scheme involves the Michael addition of ethyl cyanoacetate to (*E*)-1,4-diaroylbut-2-ene-1,4-dione (**1**) in the presence of K_2CO_3 in MEK to get ethyl-3,4-diaroyl-2-cyanobutyrate (**2**) (Scheme 1 and Table 1). The IR spectra of **2** displayed absorption bands at 2241–2250 (CN), 1698–1715 (ArCO), 1731–1748 cm^{-1} (CO_2Et) (Table 2). The ^{1}H NMR spectrum of **2a** showed a doublet at 4.53 (C_2—H), a multiplet at 4.02–4.07 (C_3—H), and two double doublets at 3.27 and 3.35 ppm (C_4—H). Apart from these, a quartet and a triplet are observed at 3.54, 1.25 ppm due to carboethoxy group (Table 3). The *gem*-cyanoester functionality in **2** is exploited to get the desired heterocycles. The cyclocondensation of **2** with hydrazine hydrate in the presence of piperidine in ethanol produced 3-amino-4(1′,2′-diaroylethyl)-1*H*-pyrazol-5(4*H*)-one (**3**). Likewise, the reaction of **2** with hydroxylamine hydrochloride gave 3-amino-4-(1′,2′-diaroylethyl)isoxazolo-5(4*H*)-one (**4**) (Scheme 1 and Table 1). The IR spectra of **3** and **4** displayed absorption bands at 3342–3375, 3438–3479 (NH_2), 1604–1624 (C=N), 1624–1636 (*C*ONH), 1692–1711 (Ar-CO), and at 1738–1749 cm^{-1} (*C*O—O) (Table 2). The ^{1}H NMR spectra of **3a** and **4a** exhibited a doublet at 4.37, 4.34 for C_4—H, a multiplet at 4.17–4.22, 4.15–4.24 for C_1'—H and two double doublets at 3.14 and 3.82 and 3.11 and 3.72 ppm for C_2'—H. Further, a broad singlet is observed at 5.87, 5.90 ppm due to NH_2 which disappeared on deuteration (Table 3). Similar reaction of **2** with urea, *N*,*N*′-dimethylurea, and thiourea produced 6-amino-5-(1′,2′-diaroylethyl)-2-hydroxypyrimidine-4(5*H*)-one (**5**), 6-imino-5-(1′,2′-diaroylethyl)-1,3-

dimethyl-pyrimidine-2,4(5*H*)-dione (**6**), and 6-amino-5-(1′,2′-diaroylethyl)-2-mercapto-pyrimidine-4(5*H*)-one (**7**), respectively (Scheme 1 and Table 1). The IR spectra of **5**–**7** showed absorption bands in the regions 3345–3460 (NH_2), 1625–1645 (*CO*—N), and 1695–1715 cm^{-1} (Ar-CO). In addition to these, the compound **5** displayed a band at 3315–3321 (OH), **6** at 1629–1642 (C=O of pyrimidine ring), and 3311–3238 cm^{-1} (NH), while **7** at 2543–2564 cm^{-1} (SH). The compounds **5** and **7** also showed an absorption band at 1603–1617 cm^{-1} (C=N) (Table 2). The ^1H NMR spectra of **5a, 6a,** and **7a** displayed a doublet at 4.37, 4.39, 4.33 for C_5—H, a multiplet at 4.18–4.24, 4.15–4.21, 4.13–4.25 for C'_1—H and two doublet of doublets at 3.08 and 3.82, 307 and 3.76, 3.04 and 3.77 ppm for C'_2—H. Besides these, **6a** showed two singlets at 2.73 and 2.75 for *N*-methyl protons and a broad singlet at 9.24 ppm for =NH. The compounds **5a** and **7a** also displayed a broad singlet at 5.87 and 5.73 ppm for NH_2. Another singlet is observed at 6.90 in **5a** due to OH and at 1.33 ppm in **7a** due to SH. The signals of NH, NH_2, OH, and SH are disappeared on deuteration. The structures of all the new compounds are further confirmed by ^{13}C NMR spectra (Table 3).

EXPERIMENTAL

General. Melting points were determined in open capillaries on a Mel-Temp apparatus and are uncorrected. The purity of the compounds was checked by TLC (silica gel H, BDH, ethyl acetate/hexane, 1:3). The IR spectra were recorded on a Thermo Nicolet IR 200 FT-IR spectrometer as KBr pellets and the wave numbers were given in cm^{-1}. The ^{1}H NMR spectra were recorded in CDCl$_3$/DMSO-d_6 on a Varian EM-360 spectrometer (300 MHz). The ^{13}C NMR spectra were recorded in CDCl$_3$/DMSO-d_6 on a Varian VXR spectrometer operating at 75.5 MHz. All chemical shifts are reported in δ (ppm) using TMS as an internal standard. The microanalyses were performed on a Perkin-Elmer 240C elemental analyzer. The starting compounds (*E*)-1,4-diaroylbut-2-ene-1,4-dione (**1**) was prepared by the literature procedure [20].

Ethyl-3,4-diaroyl-2-cyanobutyrate (2): General procedure. A mixture of ethyl cyanoacetate (15 mmol), methyl ethyl ketone (5 mL), and potassium carbonate (10 mmol) was cooled to 5–10°C. To this, compound **1** (10 mmol) was added and stirred for 3–5 h maintaining the same temperature. The contents of the flask were diluted with water and extracted with dichloromethane. The organic layer was washed with water, brine and dried (anhyd. Na$_2$SO$_4$). The solvent was removed *in vacuo*. The resultant solid was recrystallized from 2-propanol.

3-Amino-4(1′,2′-diaroylethyl)-1H-pyrazol-5(4H)-one (3): General procedure. The compound **2** (10 mmol), hydrazine hydrate (15 mmol), ethanol (20 mL), and piperidine (5 mL) was refluxed for 6–8 h. It was cooled and poured onto crushed ice containing conc. HCl. The reaction mixture was extracted with ethyl acetate. The organic layer was washed with brine, dried over anhydrous Na$_2$SO$_4$, and the solvent was removed under reduced pressure. The resultant solid was recrystallized from methanol.

3-Amino-4-(1′,2′-diaroylethyl)isoxazolo-5(4H)-one (4): General procedure. To a solution of **2** (10 mmol) in ethanol (20 mL), hydroxylamine hydrochloride (10 mmol) and piperidine (5 mL) were added and refluxed for 4–6 h. It was cooled and poured onto crushed ice containing conc. HCl. The reaction mixture was extracted with ethyl acetate. The organic layer was washed with brine and dried over anhydrous Na_2SO_4. Removal of the solvent under vacuum gave crude product which was purified by recrystallization from methanol.

6-Amino-5-(1′,2′-diaroylethyl)-2-hydroxy-pyrimidine-4(5H)-one (5): General procedure. The compound **2** (10 mmol) was dissolved in ethanol (10 mL). To this, urea (10 mmol) in ethanol (10 mL) and piperidine (5 mL) were added and refluxed for 6–10 h. The contents were cooled, poured onto crushed ice containing conc. HCl, and extracted with ethyl acetate. The organic layer was washed with brine and dried over anhydrous Na_2SO_4. Removal of the solvent *in vacuo* gave crude product which was recrystallized from methanol.

6-Imino-5-(1′,2′-diaroylethyl)-1,3-dimethyl-pyrimidine-2,4(5H)-dione (6): General procedure. A mixture of **2** (10 mmol), 1,3-dimethylurea (10 mmol), ethanol (15 mL), and piperidine (5 mL) was refluxed for 8–12 h. The contents were diluted with ice-cold water, acidified with conc. HCl, and extracted with ethyl acetate. The organic layer was washed with brine and dried over anhydrous Na_2SO_4. Removal of the solvent with rotary evaporator afforded crude product which was purified by recrystallization from methanol.

6-Amino-5-(1′,2′-diaroylethyl)-2-mercapto-pyrimidine-4(5H)-one (7): General procedure. To an equimolar mixture (10 mmol) of **2** and thiourea, ethanol (20 mL) and piperidine (5 mL) were added and refluxed for 10–15 h. The reaction mixture was cooled, poured onto crushed ice containing conc. HCl, and extracted with ethyl acetate. The organic layer was washed with brine and dried over anhydrous Na_2SO_4. The solvent was removed under reduced pressure. The resultant solid was recrystallized from methanol.

CONCLUSION

The *gem*-cyanoester functionality in ethyl-3,4-diaroyl-2-cyanobutyrate is conveniently exploited to get a new class of aminopyrazolones, isoxazolones, pyrimidinediones, and thioxopyrimidinones adopting facile, simple, and well-versed synthetic methodologies.

An efficient procedure to prepare a series of five 4-amino-1,1-dichloro-3-penten-2-ones [$CHCl_2C(O)CH{=}C(Me)NR^1R^2$, where R^1/R^2 = H/Ph, H/Bn, H/CH_2CH_2OH, —$(CH_2)_4$—, —$(CH_2)_2O(CH_2)_2$] from the solvent-free reaction of 1,1-dichloro-4-methoxy-3-penten-2-one with primary and secondary amines is reported. 1,1-Dichloro-4-methoxy-3-penten-2-one was reacted with hydrazine hydrochloride, phenylhydrazine hydrochloride and semicarbazide hydrochloride to obtain 5-dichloromethyl-3-methylpyrazoles. Aminoguanidine hydrochloride and 1,2-dimethylhydrazine dihydrochloride were also reacted with 1,1-dichloro-4-methoxy-3-penten-2-one to obtain 5-dichloromethyl-3-methylpyrazoline and 5-dichloromethyl-1,2,3-trimethyl pyrazolium chloride, respectively. All cyclocondensation reactions were performed in one-pot procedures.

J. Heterocyclic Chem., **46**, 1247 (2009).

INTRODUCTION

Substituted pyrazoles are important synthetic targets in the pharmaceutical industry because the pyrazole motif makes up the core structure of numerous biologically active compounds, including blockbuster drugs such as Celecoxib [1] and Sildenafil [2]. Specifically, 5-hydroxy-4,5-dihydro-1*H*-pyrazoles are known to possess anti-inflammatory and analgesic activity [3,4]. Although numerous methods have been developed, regioselective synthesis of the pyrazole ring remains a significant challenge for organic chemists. For example, the prevalent method of reacting hydrazines with 1,3-dicarbonyl compounds often results in a mixture of regioisomers when the reactivity of the two carbonyl groups is not drastically different. A modification of this method, replacing 1,3-dicarbonyl compounds with α,β-unsaturated ketones

[a]Yields of isolated products

or esters affords products with higher regioselectivity [5]. Over the last twenty years, our research group has developed a general procedure for preparing β-alkoxyvinyl halomethyl ketones from the β-haloacetylation of enol ethers using functionalized acyl groups RCO (with R = CF_3, CCl_3 and $CHCl_2$) [6,7], and demonstrated their importance in the construction of halomethyl-heterocyclic rings [6–11]. Our results have shown that the reaction of β-alkoxyvinyl trihalomethyl ketones and hydrazines generally produces highly regioselective 5-hydroxy-4,5-dihydro-1*H*-pyrazoles. Although trihalomethyl pyrazolium chlorides have been synthesized by the cyclocondensation reaction of 4-alkoxy-1,1,1-trichloro-3-alken-2-ones with 1,2-dimethylhydrazine [12], they remain rare in the literature. The reactivity of β-alkoxyvinyl dichloromethyl ketones with amines to obtain enaminones and reactions with different hydrazines in an attempt to obtain the respective 5-dichloromethylpyrazoles and 5-dichloromethylpyrazolium has not yet been studied. There is only one report in the literature concerning the reactivity of these compounds with hydroxylamine, and scarce reports on their reaction with amines [13].

In the last few years, our research group has been interested in developing environmental alternatives to obtain heterocyclic building blocks and heterocycles. More recently, we have employed ionic liquids for this objective [13–17]. We have also developed synthetic methods under solvent-free conditions to obtain enaminones [13,18] and 5-hydroxy-4,5-dihydro-1*H*-pyrazoles [19]. Considering our interest in new and green routes in organic synthesis, we have investigated the synthesis of β-enamino dichloromethyl ketones by the solvent-free reaction of 1,1,1-trihalo-4-alkoxy-3-alken-2-ones with primary and secondary amines. In addition, we have studied the cyclocondensation reaction of dichloromethyl substituted α,β-unsaturated ketone with hydrazines in environmentally favorable conditions.

RESULTS AND DISCUSSION

The starting material, 1,1-dichloro-4-methoxy-3-penten-2-one **1**, was synthesized from the reaction of 2-methoxypropene with dichloroacetyl chloride, by methodologies developed in our laboratories [6,20,21]. The synthetic method used to obtain β-enamino dichloromethyl ketones presented in this article was based on the solvent-free reaction of 1,1-dihalo-4-methoxy-3-penten-2-one with amines. The typical experiment was carried out through the addition of the appropriate amine to 1,1-dichloro-4-methoxy-3-penten-2-one **1** at 0°C, followed by stirring the reaction mixture at room temperature for 5 min (Scheme 1). The structures of the synthesized compounds were analyzed by ^1H, and ^{13}C NMR spectroscopy and GC-MS spectrometry. Data are reported in the Experimental Section. In every case, the stereochemistry of the 1,1-dichloro-4-methyl-aminopent-3-en-2-ones **2a–e** (Scheme 1) was determined based on ^1H NMR spectroscopy. The chemical shift of the enamino hydrogen (NH) was observed at 10–12 ppm, which further confirms the *Z*-configuration for the enaminones **2a–c**. This configuration is stabilized by the intramolecular hydrogen bond between the NH and the carbonyl oxygen [13,18]. The *E*-configuration of enaminones **2d–e** was determined by X-ray diffraction. The proposed structure of enaminone **2e** is illustrated in Figure 1.

When the results were compared with those obtained from the same reaction carried out in ionic liquid, the yields (81–88%) and reaction times were similar [13]. For compounds with a trichloromethyl substituent synthesized by this method, the yields were slightly better [18]. Consequently, it was demonstrated that 1,1-dichloro-4-methoxy-3-penten-2-one reacted in good yields with primary and secondary amines in solvent-free conditions.

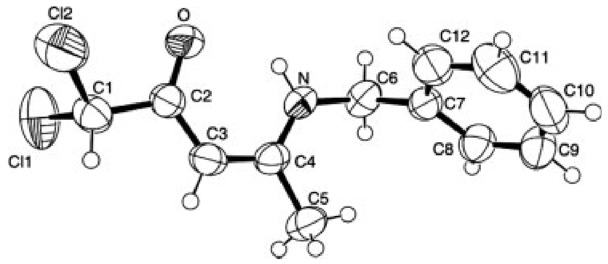

Figure 1. ORTEP of (*E*)-1,1-dichloro-4-morpholin-4-yl-3-penten-2-one (**2e**).

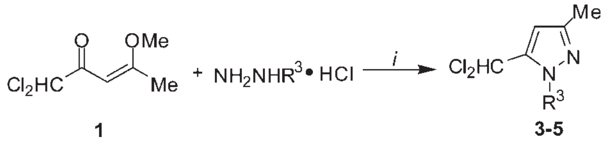
Scheme 2. R = H (83%), Ph (68%), C(O)NH_2 (56%), *i*: EtOH, 75°C, 24 h.

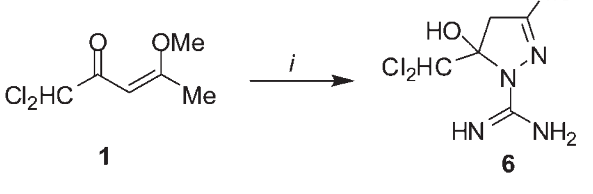


The second part of this study involved the reactivity of 1,1-dichloro-4-methoxy-3-penten-2-one with hydrazines. When 1,1-dichloro-4-methoxy-3-penten-2-one reacted with hydrazine hydrochoride, phenylhydrazine hydrochloride and semicarbazide hydrochloride, the 5-dichloromethyl-3-methylpyrazoles **3–5** (Scheme 2) were obtained. In accordance with previous results published by us, the formation of compound **5** was expected under the conditions used in the present study (refluxing ethanol for 24 h) [22]. On the other hand, the formation of compound **4** with high regioselectivity was unexpected, considering that the reaction of 1,1,1-trihalo-4-methoxy-3-penten-2-ones with phenyl hydrazine resulted in a mixture of isomers when the reaction was carried out in a microwave oven [23]. More surprising was the dehydrated product obtained from the reaction of 1,1-dichloro-4-methoxy-3-penten-2-one with semicarbazide hydrochloride. This result is especially surprising considering the reaction conditions employed in this study because, for the reaction of trihalomethyl precursors the dehydrated product is only obtained after heating 5-trihalomethyl-5-hydroxy-4,5-dihydro-1*H*-pyrazole with concentrated sulphuric acid [24]. The yields and reaction conditions are summarized in Scheme 2.

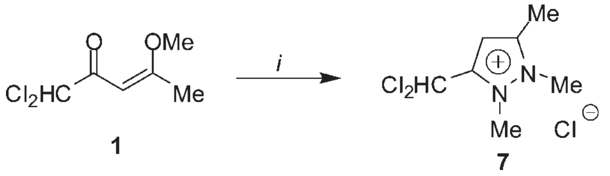
Another dinucleophile evaluated was aminoguanidine hydrochloride, which led to 5-dicloromethyl-5-hydroxy-4,5-dihydropyrazoles **6** (Scheme 3), the expected product under the reaction conditions used [25]. The pair of doublets (H4) for geminal protons observed in ^1H NMR spectra appeared at 3.4 and 3.6 ppm, with $J = 19.5$ Hz, which is typical spectroscopic data for 4,5-dihydropyrazoles [17,19,25]. Compound **6** is stable and was not converted to the corresponding pyrazole derivative.

In the same context, 5-dichloromethyl-1,2,3-trimethyl pyrazolium chloride **7** (Scheme 4) was formed from the reaction of 1,1-dichloro-4-methoxy-3-penten-2-one **1** with 1,2-dimethylhydrazine dihydrochloride in the presence of hydrochloric acid as a catalyst and ethanol as solvent. The reaction mixture was stirred at reflux temperature for 24 h. There is little information on the synthesis of these compounds using cyclocondensation methods such as the reaction of a β-diketone derivative with 1,2-dialkylhydrazines [26]. In addition, the most important route to synthesis of 1,2-dialkylpyrazolium salts is the *N*-alkylation of pyrazoles [27].

Scheme 3. *i*: $NH_2C(NH)NH_2$ • 2HCl, EtOH, 75°C, 24h, 58%.



Scheme 4. *i*: MeNHNHMe • 2HCl, EtOH/HCl 1:1, 75°C, 24h, 60%.



In conclusion, this article has demonstrated that 1,1-dichloro-4-methoxy-3-penten-2-one reacted with amines in solvent-free conditions to result in enaminones in good yields. In addition, they were reacted with hydrazines under mild reaction conditions furnishing products with high regioselectivity and in some cases led to unexpected products. Thus, we have demonstrated that the presence of the dichloromethyl group is a determining factor in the regiochemistry of the reaction because it provides a good deal of stability for the intermediate 5-dicloromethyl-5-hydroxy-4,5-dihydropyrazole, which contributes for high regioselectivity.

EXPERIMENTAL

General procedures. Unless otherwise indicated, all common reagents and solvents were used as obtained from commercial suppliers without further purification. ^1H and ^{13}C NMR spectra were recorded on a Bruker DPX 400 spectrometer (^1H at 400.13 MHz and ^{13}C at 100.61 MHz) 298 K, digital resolution of ±0.01 ppm, with 0.1 mol L^{-1} solution in $CDCl_3$, DMSO-$d_6$or H_2D/C_6D_6 as solvent. All spectra were registered in a 5 mm tube, at a natural abundance. Mass spectra were registered in a HP 5973 MSD connected to a HP 6890 GC and interfaced by a Pentium PC. The CG was equipped with a split–splitless, injector, auto sampler, cross-linked HP-5 capillary column (30 m, 0.32 mm of internal diameter), and helium was used as the carrier gas.

Synthesis of 4-amino-1,1-dichloro-3-penten-2-ones (2a–e). The appropriate amine (2 mmol) was added to 1,1-dichloro-4-methoxy-3-penten-2-one **1** (2 mmol) at 0°C. The reaction mixture was stirred at room temperature for 5 min. The residue was extracted with dichloromethane, dried over anhydrous ($MgSO_4$), filtered, and the solvent was removed under reduced pressure. The crude product **2e** was obtained with good purity, and the solids' products **2a–d** were recrystallized from hexane/ethyl acetate 9:1 as solvent.

Synthesis of 5-dichloromethyl-3-methylpyrazoles (3–5) and 5-dichloromethyl-3-methylpyrazoline (6). The appropriate hydrazine (2 mmol) was added to a solution of 1,1-

dichloro-4-methoxy-3-penten-2-one **1** (2 mmol) in ethanol (2 mL) at room temperature. The reaction mixture was stirred at reflux temperature for 24 h. The residue was extracted with dichloromethane, dried ($MgSO_4$), filtered, and the solvent was removed under reduced pressure. The crude product **4** was obtained with good purity, and the solids products **3** and **5–6** were recrystallized from ethanol as solvent.

Synthesis of 5-dichloromethyl-1,2,3-trimethyl pyrazolium chloride (7). 1,2-dimethylhydrazine dihydrochloride (2 mmol) and 36% hydrochloric acid (2 mL) were added to a solution of 1,1-dichloro-4-methoxypent-3-en-2-one **1** (2 mmol) in ethanol (2 mL) at room temperature. The reaction mixture was stirred at reflux temperature for 24 and the byproducts were extracted with dichloromethane. The product **7** was obtained in good purity from the aqueous phase after evaporation of water under vacuum.

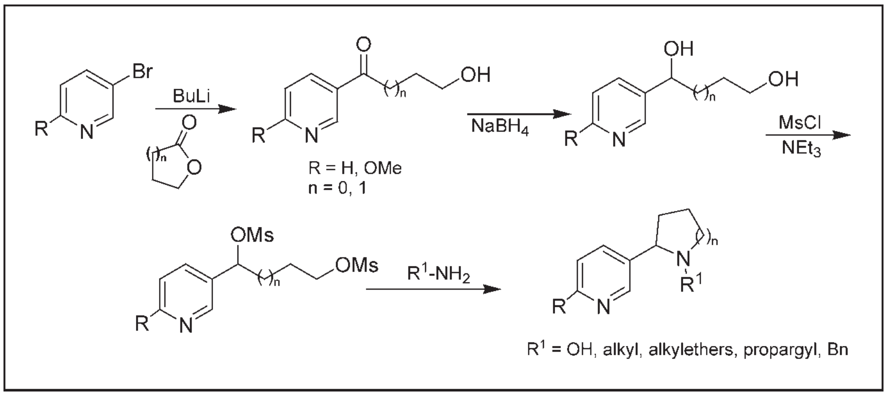
Received May 7, 2009
DOI 10.1002/jhet.233



A straightforward and practical approach was established for the synthesis of nicotine and anabasine analogues by the cyclization of mesylated 1-(3-pyridinyl)-1,4, and 1,5-diol derivatives to form the pyrrolidino or piperidino fragments. Nicotine analogue (*S*)-**15** was prepared with good enantioselectivity using the developed azacyclization procedure of nonracemic (*R*)-1-pyridin-3-yl-butane-1,4-diol, which was obtained by the borane-mediated reduction of ketone **12** in the presence of the spiroborate ester derived from diphenyl prolinol and ethylene glycol.

J. Heterocyclic Chem., **46**, 1252 (2009).

INTRODUCTION

As a group of ligand-gated ion channels, neuronal nicotinic acetylcholine receptors (nAChRs) hold significant promise as therapeutic targets for the treatment of the central nervous system (CNS) and peripheral nervous disorders [1]. Recent studies have shown that nicotine **1** (Fig. 1) displays beneficial effects on patients suffering from Parkinson's disease, anxiety, schizophrenia, Alzheimer's disease, ulcerative colitis, and other CNS disorders [2]. Furthermore, nicotine has been used on a large scale as an insecticide [3].

In the past decade, much attention has been concentrated on the discovery of novel nicotine analogues (Fig. 1) that would display higher selectivity to particular AChRs subtypes, targeting the beneficial actions of nicotine whereas reducing the toxicity effects [2–8]. SIB-1508Y (**2**) was designed as a memory enhancer and anti-Parkinson's agent [4]. The nAChR agonist ABT-418 (**3**), containing an isoxazole bioisostere of pyridine, was promising for the treatment of Alzheimer's patients because this analogue not only have binding potencies comparable with nicotine but also produce enhanced cognitive activity with less adverse effects [5]. The four-member ring analogue, *N*-methyl-(3-pyridyl)azetidine (**4**), produced a 10-fold increase in binding affinity compared with nicotine [6]. Wang et al. demonstrated that 6-methylnicotine (**5**) possess higher affinity in competition studies for [3H]nicotine in rat brain membranes [7]. Anabasine **6** has been established to be a selective α7-nAChR agonist in an animal model and with low toxicity for the potential treatment of schizophrenia [1e]. Recently, Bhatti et al. [8] evaluated the activity of bicyclic analogue **7**, which displayed high affinity for the α4β2 receptor.

Consequently, considerable efforts had been focused on the development of new syntheses of nicotine and anabasine analogues, which have been recently reviewed [9a]. Although various methods have been reported, including asymmetric induction using chiral auxiliaries [9b,c] and enantioselective stoichiometric allylboration of the 3-pyridyl carboxaldehyde [9d], surprisingly, there is a lack of a suitable direct synthetic routes for the pyrrolidine and piperidine ring construction of nicotine and anabasine analogues, respectively. Furthermore, our research program for the synthesis of potential biological active amino derivatives as nicotinic receptor

agonists, a practical synthesis of racemic and nonracemic nicotine and anabasine analogues was required. Herein, we report a new and efficient approach to prepare these compounds in racemic form from inexpensive commercial sources in good to excellent yields. In addition, an asymmetric synthesis of a representative nicotine derivative using our recently developed chiral spiroborate ester, as an environmentally friendly catalyst, is also described.

RESULTS AND DISCUSSION

As shown in Scheme 1, lithiation of 3-bromopyridine with *n*-butyl lithium at −78°C, followed by treatment with γ-butyrolactone at the same temperature, furnished ketone [8] in good yield (81%) [10]. Diol **9** was readily available from **8** by reduction with NaBH$_4$ in excellent yield (96%). Treatment of **9** with methanesulfonyl chloride in the presence of Et$_3$N afforded dimesylate **10**. Attempts to purify this product by column chromatography on silica gel failed because it decomposed during the process. Accordingly, after a simple work-up and solvents removal under reduced pressure, compound **10** was used directly for the next step. After stirring overnight the crude dimesylated diol with neat benzylamine, the benzyl substituted nornicotine (**11**) was obtained. Purification of this compound by flash column chromatography provided the desired pure product in 83% overall yield from **9**. This facile and effective azacyclization reaction opens a new way for the direct access to *N*-substituted nornicotine derivatives.

With an interest in developing compounds with potential biological activity and to demonstrate the synthetic potential of our new methodology, we prepared nicotine and a variety of analogues with N-substitution on the pyrrolidine ring (Table 1). The corresponding primary amines were allowed to react with dimesylate **10** under the previous established reaction conditions. By TLC and GC-MS analysis of the reaction mixture, only the azacyclization product was observed. As a result, the desired nicotine and its derivatives were easily purified and obtained in high yield (entries 1–7).

To further develop our methodology, the aza-annulation of the 1,5- and 1,6-dimesylated 1-(6-methoxypyridyl)diol to form six and seven member rings were investigated (Scheme 2). In general, the 1,5-dimesylated diol was readily annulated to yield the desired anabasine derivatives in moderate to good yield (Table 1, entries 8–11). On the other hand, as observed by GC-MS analysis, the 1,6-dimesylate was found to be unsuitable for the formation of azepanes under the previous conditions due to the less favored seven membered ring closure.

Enantiomers of a given racemate often display difference on the basis of potency, selectivity, or efficacy at biologic targets. (*S*)-Nicotine is more bioactive than the (*R*)-enantiomer, as it is also observed for related analogues [11]. The high yield and excellent enantionselectivity achieved in the borane reduction of heterocyclic ketones catalyzed by our spiroborate ester **13** derived from diphenyl prolinol (Scheme 3) [12a], prompted us to investigate the asymmetric synthesis of the nicotine derivative (*S*)-**15**.

Considering that borane can react with the hydroxyl group of ketone **8**, and that an intramolecular uncatalyzed reaction can take place, the hydroxyl group was initially protected with an acetyl group. The acetylated ketone was then reduced with borane employing 10% and 30% mol of catalyst **13** obtaining 81% ee and 85.5% ee of the diacetylated product, respectively. When the temperature was decreased at −10°C using 30% of catalyst, the enantioselectivity decreased to 78% ee. Therefore, the hydroxyl group was protected with TIPSCl affording **12** in 95% yield. High yield and excellent enantioselectivity (94% ee) was then achieved by the borane-mediated reduction of **12** employing 50% of catalyst **13**. The absolute *R* configuration of the product was assigned according to the catalyst **13** predicted stereoselectivity. After deprotection of silylated ether (***R***)-**14** with Bu$_4$F to yield the diol (***R***)-**9**, followed by dimesylation according to our previous procedure, the

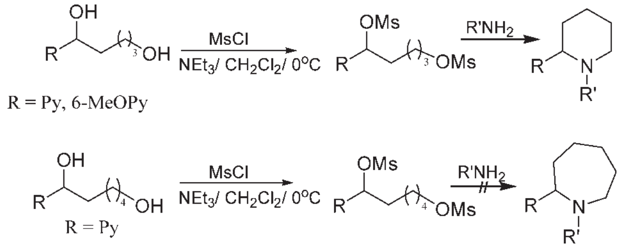
[a] The mixture of the corresponding dimesylate diol and the neat primary amine was stirred at 0°C overnight.

[b] Purified by flash column chromatography.

[c] Methylamine solution (33 wt %) in absolute ethanol was employed and the reaction was conducted at room temperature.

[d] $NH_2OH.HCl$ and Et_3N was used in ethanol and dichloromethane at room temperature.

Scheme 2. Pyperidine and azepane rings formation of pyridyl analogues.



azacyclization of (***R***)-**10** was successfully achieved, providing the desired nicotine derivative (***S***)-**15**.

Although some racemization took place at the benzylic position during the cyclization step, even at −10°C, the desired nicotine derivative (*S*)-15 was obtained in good enantiomeric excess (82% ee) and in good overall yield (76%).

CONCLUSION

In summary, a direct, mild, and efficient methodology for the synthesis of a variety of nicotine and anabasine analogues from commercially available sources has been described. Moreover, a catalytic asymmetric synthesis of the nicotine derivative (***S***)-**15** in good enantiomeric purity was established by the enantioselective reduction of the TIPS protected ketone **12**. Considering the readily available starting materials, facile synthetic procedures, easy purification and high yields, the present work constitutes an excellent methodology for the rapid access to important nicotinic receptor agonists, and will find applications in academic research and in the pharmaceutical industry.

EXPERIMENTAL

Air- and moisture-sensitive reactions were performed under N_2 atmosphere in flame-dried glassware. Common solvents were dried and distilled by standard procedures. All reagents were obtained commercially unless otherwise noted. Chromatographic purification of products was accomplished using flash chromatography on a Merck silica gel® Si 60 Å (70–230 mesh). ^1H and ^{13}C spectra were recorded on a Bruker Avance 400 MHz spectrometer with standard pulse sequences operating at 400.152 MHz and 100.627 MHz for ^1H and ^{13}C, respectively. Chiral GC analysis was processed with a Crompack Chirasil-Dex-CB column (30 m × 0.25 mm × 0.25 μm). High-resolution mass spectral analyses (HRMS) were performed at the University of Florida.

General procedure for the synthesis of hydroxy ketones [10]. To a stirred solution of 3-bromopyridine (10 g, 63.3 mmol) in anhydrous ether (100 mL) was added *n*-BuLi (40 mL, 1.6 *M* in hexane, 64 mmol) dropwise at −78°C. The mixture was stirred for 15 min and a solution of γ-butyrolactone, δ-valerolactone, or ε-caprolactone (63.6 mmol) in ether (20 mL) was added dropwise. The solution was stirred 1 h and then it was left overnight at room temperature. The mixture was diluted with brine (100 mL). The product was extracted with *n*-BuOH (3 × 150 mL) and the combined extracts were washed with brine (100 mL) and dried over anhydrous $MgSO_4$. The solvents were evaporated under reduced pressure and the residue was purified by column chromatography, eluted by CH_2Cl_2/MeOH (10/1).

4-Hydroxy-1-(pyridin-3-yl)butan-1-one. Yellow oil, Lit [10] mp 36–37°C; yield 81% (6.45 g); ^1H NMR (400 MHz, $CDCl_3$): δ 2.06 (m, 2H, CH_2), 2.22 (br s, 1H, OH), 3.19 (m, 2H, CH_2), 3.80 (m, 2H, CH_2), 7.46 (m, 1H, Py), 8.28 (m, 1H,

Py), 8.81 (m, 1H, Py), 9.22 (m, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 26.6, 35.5, 61.9, 123.7, 132.2, 135.4, 149.6, 153.5, 199.2.

5-Hydroxy-1-(6-methoxypyridin-3-yl)pentan-1-one. Colorless oil, yield 85% (5.68 g); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.66 (m, 2H, CH_2), 1.87 (m, 2H, CH_2), 2.05 (br s, 1H, OH), 2.99 (t, J = 7.0 Hz, 2H, CH_2), 3.70 (t, J = 6.2 Hz 2H, CH_2), 4.03 (s, 3H, OCH_3), 6.80, d, J = 9 Hz, 1H, Py), 8.18 (dd, J_1 = 2,4 Hz, J_2 = 8.7 Hz, 1H, Py), 8.83 (d, J = 2.0 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 203, 32.2, 38.0, 54.1, 62.3, 111.2, 126.7, 138.2, 149.0, 166.8, 198.1. EIS TOF HRMS calcd. for $[M + H]^+$ $C_{11}H_{16}NO_3$: 210.1125; found 210.1124.

6-Hydroxy-1-(pyridin-3-yl)hexan-1-one [10]. Light yellow crystals, mp 27–29°C; yield 68% (8.26 g); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.47 (m, 2H, CH_2), 1.67 (m, 2H, CH_2), 1.85 (m, 2H, CH_2), 2.18 (br s, 1H, OH), 3.03 (m, 2H, CH_2), 3.70 (m, 2H, CH_2), 7.44 (m, 1H, Py), 8.26 (m, 1H, Py), 8.78 (m, 1H, Py), 9.22 (m, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 23.6, 25.5, 32.5, 38.8, 62.5, 123.7, 132.2, 135.4, 149.6, 153.3, 199.1.

General procedure for the synthesis of diols. To a flask was added the ketone (20 mmol) and MeOH (40 mL) at room temperature. Then, neat $NaBH_4$ (1.52 g, 40 mmol) was added portion-wise to the solution at 0°C. The resulting mixture was stirred for 1 h and the solvent was evaporated under reduced pressure. Distilled water was added (50 mL) and the mixture was extracted with CH_2Cl_2 (3 × 100 mL) and the combined organic phases were removed under reduced pressure. The residue was directly submitted to the next step or recrystallized.

1-(Pyridin-3-yl)butane-1,4-diol (9) [13]. Light yellow oil; yield 96% (4.38 g); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.88 (m, 2H, CH_2), 1.93 (m, 2H, CH_2), 3.51 (br s, 1H, OH), 3.72 (m, 2H, CH_2), 4.63 (br s, 1H, OH), 4.80 (m, 1H, OCH), 7.30 (m, 1H, Py), 7.76 (m, 1H, Py), 8.46 (m, 1H, Py), 8.54 (m, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 29.0, 36.6, 62.5, 123.5, 133.9, 140.5, 147.5, 148.3.

1-(6-Methoxypyridin-3-yl)pentane-1,5-diol. Light yellow oil; yield 93% (1.88 g); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.38 (m, 1H, CH_2), 1.45 (m, 1H, CH_2), 1.62 (m, 2H, CH_2), 1.75 (m, 1H, CH_2), 1.85 (m, 1H, CH_2), 1.95 (br s, 1H, OH), 2.63 (br s, 1H, OH), 3.66 (t, J = 6.3 Hz, 2H, CH_2), 3.96 (s, 3H, CH_3), 4.68 (t, J = 6.6 Hz, 1H, OCH), 6.78 (d, J = 8.6 Hz, 1H, Py), 7.63 (dd, J_1 = 2.4 Hz, J_2 = 8.6 Hz, 1H, Py), 8.01 (d, J = 2.2 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.0, 32.3, 38.4, 53.5, 62.5, 71.8, 110.9, 132.8, 136.7, 144.6, 163.8. EIS TOF HRMS calcd. for $[M + H]^+$ $C_{11}H_{18}NO_3$: 212.1281; found 212.1288.

1-(Pyridin-3-yl)hexane-1,6-diol. Colorless oil; yield 96% (1.88 g); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.34–1.59 (m, 4H, CH_2), 1.55–1.62 (m, 2H, CH_2), 1.71–1.87 (m, 2H, CH_2), 2.39 (br s, 1H, OH), 3.66 (t J = 6.4 Hz, over s, 3H, CH_2 and OH), 4.76 (m, 1H, OCH), 7.30 (t, J = 3.8 Hz,, 1H, Py), 7.75 (dt, J_1 = 1.8 Hz, J_2 = 7.8 Hz, 1H, Py), 8.47 (dd, J_1 = 1.6 Hz, J_2 = 4.8 Hz, 1H, Py), 8.52 (d, J_1 = 2.0 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 25.4, 25.6, 32.5, 39.0, 62.5, 71.9, 123.6, 133.8, 140.5, 147.6, 148.5. EIS TOF HRMS calcd. for $[M + H]^+$ $C_{11}H_{18}NO_2$: 196.1332; found 196.1344.

Typical procedure: Synthesis of *rac*-nicotine derivative 11 from diol 9. To a two-neck round bottom flask was added a solution of diol **9** (1.67 mg, 10 mmol) in anhydrous CH_2Cl_2 (100 mL) and Et_3N (7 mL, 50 mmol) under nitrogen. The mixture was cooled to 0°C and MsCl (2.3 mL, 30 mmol) was added dropwise for 1 h by a syringe pump. The resulting solution was stirred until TLC indicated that the starting material was consumed. Water (100 mL) was added to quench the reaction and the aqueous phase was extracted with CH_2Cl_2 (3 × 50 mL). The combined organic phases were washed with brine, dried over $MgSO_{4,}$ and concentrated under reduced pressure at 25°C to obtain the crude dimesylate **10:** ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.90 (m, 2H), 2.10 (m, 1H), 2.19 (m, 1H), 2.96 (s, 3H, CH_3SO_2), 3.09 (s, 3H, CH_3SO_2), 4.35 (t, J = 6.3 Hz 2H, OCH_2), 5.80 (m, 1H, OCH), 7.59 (m, 1H, Py), 8.01 (dt, J_1 = 1.8 Hz, J_2 = 7.9 Hz, 1H, Py), 8.74 (m, 1H, Py), 8.82 (m, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 25.1, 33.1, 37.5, 39.0, 52.6, 68.7, 124.9, 135.7, 136.9, 145.8, 148.0.

3-(1-Benzylpyrrolidin-2-yl)pyridine (11) [9c]. To the crude dimesylate **10** (323 mg, 1 mmol), neat benzylamine (3 mL, 27 mmol) at 0°C was added. The resulting mixture was stirred overnight at the same temperature. The remaining benzylamine was removed in a Kugelrohr at 80°C under high vacuum and the residue was mixed with 10 mL water. The aqueous phase was extracted with CH_2Cl_2 (3 × 5 mL), and the combined organic phases were washed with brine (2 × 5 mL) solution and dried over Na_2SO_4. The pure product was obtained after flash column chromatography on silica gel eluted with hexane/EtOAc (1:1): Colorless oil, yield 83% (197 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.76–1.95 (m, 3H), 2.29 (m, 2H), 3.17 (m, 2H), 3.48 (m, 1H), 3.85 (m, 1H), 7.25–7.35 (m, 6H, Ar), 7.85 (m, 1H, Py), 8.54 (m, 1H, Py), 8.70 (m, 1H, Py; ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.6, 35.3, 53.5, 58.1, 67.0, 123.6, 126.9, 128.2, 128.6, 135.0, 139.3, 139.5, 148.6, 149.7; GC-MS m/z 238.1 (M^+).

3-(1-Methylpyrrolidin-2-yl)pyridine (or 1-methyl-2-(3-pyridyl)pyrrolidine) (*rac*-nicotine) [9c]. Colorless oil, yield 86% (139 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.74–1.84 (m, 2H, CH_2), 1.96 (m, 1H, CH_2), 2.18 (m, 4H, CH_2), 2.34 (m, 1H, CH_2), 3.12 (t, J = 8.5 Hz, 1H, CH), 3.28 (t, J = 8.5 Hz, 1H, CH), 7.26 (m, 1H, Py), 7.70 (m, 1H, Py), 8.51 (s, 1H, Py), 8.55 (m, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.6, 35.2, 40.4, 57.0, 68.9, 123.6, 134.8, 138.8, 148.6, 149.6; GC-MS m/z 162.0 (M^+).

3-(1-Propylpyrrolidin-2-yl)pyridine [14]. Colorless oil, yield 88% (167 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 0.84 (t, 3H, J = 7.2 Hz, CH_3), 1.43–1.51 (m, 2H, CH_2), 1.72 (m, 1H, CH), 1.86 (m, 1H, CH), 1.98 (m, 1H, CH), 2.07 (m, 1H, CH), 2.21 (m, 2H, CH), 2.46 (m, 1H, CH), 3.36 (t, J = 8.2 Hz, 1H, CH), 3.40 (td, J_1 = 2.4 Hz, J_2 = 8.5 Hz, 1H, CH), 7.26 (dd, J_1 = 4.8 Hz, J_2 = 7.8 Hz, 1H, Py), 7.75 (d, J = 7.8 Hz, 1H, Py), 8.52 (dd, J_1 = 0.8 Hz, J_2 = 4.7 Hz, 1H, Py), 8.59 (d, J = 1.9 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 11.9, 22.0, 22.7, 35.2, 53.6, 56.4, 67.6, 123.5, 134.9, 139.8, 148.4, 149.6; GC-MS m/z 190.1 (M^+).

3-[1-(2-Methoxyethyl)pyrrolidin-2-yl]pyridine [9c]. Colorless oil, yield 81% (167 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.73 (m, 1H, CH), 1.86 (m, 1H, CH), 2.01 (m, 1H, CH), 2.20 (m, 1H, CH), 2.36 (m, 2H, CH), 2.79 (m, 1H, CH), 3.29 (s, 3H, OCH_3), 3.34–3.47 (m, 4H, CH), 7.26 (dd, J_1 = 4.8 Hz, J_2 = 7.8 Hz, 1H, Py), 7.75 (d, J = 7.8 Hz, 1H, Py), 8.52 (dd, J_1 = 1.5 Hz, J_2 = 4.7 Hz, 1H, Py), 8.59 (d, J = 2.0 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.8, 35.0, 53.7, 54.5, 58.7, 67.8, 71.5, 123.5, 134.9, 139.4, 148.5, 149.6; GC-MS m/z 206.0 (M^+).

3-[1-(3-Methoxypropyl)pyrrolidin-2-yl]pyridine. Colorless oil, yield 83% (183 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.68–1.74 (m, 3H, CH), 1.81–2.01 (m, 2H, CH), 2.17–2.27 (m, 3H, CH), 2.59 (m, 1H, CH), 3.28 (s, 3H, OCH_3), 3.29–3.43 (m, 4H, CH), 7.26 (dd, J_1 = 4.8 Hz, J_2 = 7.8 Hz, 1H, Py), 7.77 (dt, J_1 = 1.9 Hz, J_2 = 7.8 Hz, 1H, Py), 8.51 (dd, J_1 = 1.7 Hz, J_2 = 4.8 Hz, 1H, Py), 8.57 (d, J = 2.0 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.7, 28.9, 35.3, 51.2, 53.6, 58.5, 67.6, 70.9, 123.4, 134.9, 139.7, 148.5, 149.5; GC-MS *m*/*z* 220.1 (M^+). EIS TOF HRMS calcd. for $[M + H]^+$ $C_{14}H_{21}N_2O$: 221.1654; found 221.1626.

3-[1-(Prop-2-ynyl)pyrrolidin-2-yl]pyridine [14]. Colorless oil, yield 82% (152 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ δ1.77 (m, 1H, CH), 1.85 (m, 1H, CH), 2.03 (m, 1H, CH), 2.24 (m, 2H, CH), 2.78 (q, J = 8.8 Hz, 1H, CH), 3.22 (m, 2H, CH), 3.47 (m, 1H, CH), 3.61 (t, J = 8.2 Hz, 1H, CH), 7.26 (dd, J_1 = 4.8 Hz, J_2 = 7.7 Hz, 1H, Py), 7.71 (d, J = 7.8 Hz, 1H, Py), 8.52 (d, J = 3.5 Hz, 1H, Py), 8.59 (d, J = 1.4 Hz, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 22.6, 34.9, 40.1, 52.2, 63.7, 72.9, 78.5, 123.6, 135.0, 138.2, 148.8, 149.7; GC-MS *m*/*z* 186.1 (M^+).

2-(Pyridin-3-yl)pyrrolidin-1-ol [15]. Colorless oil, yield 82% (134 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.76 (m, 1H, CH), 1.92 (m, 2H, CH), 2.26 (m, 1H, CH), 2.87 (q, J = 9.5 Hz, 1H, CH), 3.38 (m, 1H, CH), 3.76 (m, 1H, CH), 7.18 (dd, J_1 = 4.8 Hz, J_2 = 7.8 Hz, 1H, Py), 7.65 (dt, J_1 = 1.6 Hz, J_2 = 7.8 Hz 1H, Py), 8.35 (dd, J_1 = 1.4 Hz, J_2 = 4.8 Hz, 1H, Py), 8.54 (d, J = 1.8 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 19.9, 30.3, 57.5, 70.2, 123.2, 135.6, 137.5, 148.1, 149.3.

6-Methoxy-3-(1-methylpiperidin-2-yl)pyridine. Colorless oil, yield 78% (161 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.29 (m, 1H, CH), 1.48 (m, 1H, CH), 1.61 (m, 3H, OH), 1.73 (m, 1H, CH), 1.90 (s, 3H, CH_3), 2.02 (m, 1H, CH), 2.65 (dd, J_1 = 2.9 Hz, J_2 = 11 Hz, 1H, CH), 2.95 (m, 1H, CH), 3.85 (s, 3H, OCH_3), 6.63 (d, J = 8.6 Hz, 1H, Py), 7.50 (dd, J_1 = 2.4 Hz, J_2 = 8.5 Hz, 1H, Py), 7.93 (d, J = 2.3 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 24.9, 26.1, 35.8, 44.5, 53.4, 57.5, 67.5, 110.9, 132.9, 137.7, 145.7, 163.6; GC-MS *m*/*z* 206.1 (M^+). EIS TOF HRMS calcd. for $[M + H]^+$ $C_{12}H_{19}N_2O$: 207.1492; found 207.1500.

6-Methoxy-3-(1-benzylpiperidin-2-yl)pyridine. Colorless oil, yield 76% (214 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.41 (m, 1H, CH), 1.63 (m, 3H, CH), 1.82 (m, 2H, CH), 1.99 (td, J_1 = 3.5 Hz, J_2 = 11.5 Hz, 1H, CH), 2.86 (d, J = 13.6 Hz, 1H, CH), 3.00 (m, 1H, CH), 3.17 (dd, J_1 = 2.8 Hz, J_2 = 11 Hz 1H, CH), 3.80 (d, J = 13.5 Hz, 1H, CH), 3.98 (s, 3H, OCH_3), 6.78 (d, J = 8.5 Hz, 1H, Py), 7.24–7.33 (m, 5H, Ph), 7.78 (dd, J_1 = 2.3 Hz, J_2 = 8.5 Hz, 1H, Py), 8.19 (d, J = 2.2 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 25.1, 26.0, 36.9, 53.37, 53.4, 59.6, 65.7, 111.1, 126.6, 128.1, 128.6, 133.7, 137.8, 139.6, 145.8, 163.5; GC-MS *m*/*z* 282.1 (M^+). EIS TOF HRMS calcd. for $[M + H]^+$ $C_{18}H_{23}N_2O$: 283.1805; found 283.1817.

6-Methoxy-3-[1-(2-methoxyethyl)piperidin-2-yl]pyridine. Colorless oil, yield 78% (195 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.29 (m, 1H, CH), 1.48 (m, 1H, CH), 1.58 (m, 3H, CH), 1.70 (m, 1H, CH), 2.01 (m, 2H, CH), 2.60 (m, 1H, CH), 2.97 (dd, J_1 = 2.7 Hz, J_2 = 11 Hz, 1H, CH), 3.11 (s, 3H, OCH_3), 3.30 (m, 2H, CH), 3.85 (s, 3H, CH_3), 6.62 (d, J = 8.5 Hz, 1H, Py), 7.52 (dd, J_1 = 2.2 Hz, J_2 = 8.5 Hz, 1H, Py), 7.94 (d, J = 2.3 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 24.9, 26.0, 36.6, 53.4, 54.3, 54.4, 58.7, 65.7, 70.6, 110.9, 133.2, 137.9, 145.8, 163.5. EIS TOF HRMS calcd. for $[M + H]^+$ $C_{14}H_{23}N_2O_2$: 251.1754; found 251.1762.

6′-Methoxy-1-(3-methoxypropyl)-1,2,3,4,5,6-hexahydro-[2,3′]bipyridinyl. Colorless oil, yield 81% (206 mg); ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.27 (m, 1H, CH), 1.43 (m, 1H, CH), 1.52–1.71 (m, 6H, CH), 1.86 (m, 1H, CH), 1.94 (m, 1H, CH), 2.39 (m, 1H, CH), 2.91 (dd, J_1 = 2.7 Hz, J_2 = 11 Hz, 1H, CH), 3.05–3.21 (m, 6H, CH), 3.85 (s, 3H, OCH_3), 3.34–3.47 (m, 4H, CH), 6.62 (d, J = 8.5 Hz, 1H, Py), 7.50 (dd, J_1 = 2.0 Hz, J_2 = 8.4 Hz, 1H, Py), 7.93 (d, J = 2.3 Hz, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 25.0, 26.1, 26.4, 36.7, 51.8, 53.2, 53.3, 58.4, 65.6, 71.1, 110.8, 133.4, 137.9, 145.7, 163.4. EIS TOF HRMS calcd. for $[M + H]^+$ $C_{15}H_{25}N_2O_2$: 265.1911; found 265.1929.

Asymmetric synthesis of (*S*)-3-[1-(2-methoxyethyl)pyrrolidin-2-yl]pyridine (*S*)-15 [9c]

Borane reduction of ketone 12. To a 25 mL round flask, equipped with a septa and nitrogen flow, was added catalyst **13** (244 mg, 0.75 mmol). Then, dry THF (4 mL) and BH_3.THF (2.6 mL, 1 *M*, 2.6 mmol) were added to the flask and the resulting mixture was stirred about 1 h at room temperature. A solution of ketone **12** (482 mg, 1.5 mmol) in dry THF (3 mL) was added dropwise by a syringe pump for 1 h. After addition, the mixture was stirred for 1 h and then cooled by an ice bath. MeOH (5 mL) was added slowly to quench the excess of borane and the mixture was refluxed overnight. The solvents were removed under reduced pressure and the residue was purified by column chromatography on silica gel, eluted with CH_2Cl_2/MeOH (20/1).

(*R*)-1-(Pyridin-3-yl)-4-triisopropylsilyloxybutan-1-ol (*R*)-14. This was obtained as a colorless oil; yield 85% (411 mg); 94% ee. ^{1}H NMR (400 MHz, $CDCl_3$): δ 1.08–1.19 (m, 21H, TIPS), 1.60–1.70 (m, 2H, CH_2), 1.77 (m, 2H, CH_2), 3.84 (m, 2H, CH_2), 3.98 (br s, 1H, OH), 4.84 (m, 1H, CH), 7.32 (m, 1H, Py), 7.79 (m, 1H, Py), 8.53 (m, 1H, Py), 8.63 (s, 1H, Py); ^{13}C NMR (100 MHz, $CDCl_3$): δ 11.9, 18.0, 29.4, 37.3, 63.7, 71.9, 123.4, 133.5, 140.4, 147.9, 148.6. Chiral-GC analysis of acetyl derivate gave t_R = 121.479 min for major enantiomer, t_R = 124.10 min for minor enantiomer under the following gradient conditions: 80°C, 1°C/min up to 120°C, maintained for 40 min; then, 2°C/min up to 150°C, maintained for 30 min; 2°C/min up to 160°C and maintained for 15 min.

Azacyclization of (*R*)-14. To a solution of (*R*)-**14** (323 mg, 1 mmol) in 15 mL THF was added Bu_4NF (1.5 mL, 1.0 *M* in THF) dropwise at 0°C. The mixture was stirred until TLC indicated that the starting material was consumed (about 1 h). The solvents were removed under reduced pressure and the residue was directly submitted to the cyclization at −10°C following the general procedure given above. Compound (***S***)-**15** was obtained as a colorless oil after purification by column chromatography on silica gel, eluted with CH_2Cl_2/MeOH (30:1); yield 76% (156 mg, three steps); 82% ee; $[\alpha]_D^{20} = -82$ (*c* 1.7, $CHCl_3$); Chiral-GC analysis gave t_R = 110.67 min for major enantiomer, t_R = 118.38 min for minor enantiomer under the following gradient condition: 80°C, 1°C/min up to 110°C, and maintained for 20 min; then 1°C/min up to 120°C, then, maintained for 50 min; then, 1°C/min up to 130°C, and maintained for 30 min.

Acknowledgments. Financial support by the National Institute of Health through their MBRS (GM 08216) and NIH-AABRE (NC P20 RR-016470) grants is greatly appreciated. We express our special gratitude to the NSF-MRI (01–07) and NIH-MBRS programs to have made possible the acquisition of a 400 MHz NMR spectrometer. The NSF-PREM (DMR-03537730), NIH-INBRE and NIH-RISE, NIH-MARC, NSF-AMP undergraduate student's support are also gratefully acknowledged.

The addition reaction of lithium reagents to the 4 position of 2-chloropyrimidine or 2-chloroquinazoline followed by oxidation of the resultant dihydro intermediate product is a powerful tool for the synthesis of 4-substituted 2-chloropyrimidines or 2-chloroquinazolines. 4-Vinyl derivatives undergo a conjugate nucleophilic addition across the vinyl group. A nucleophilic displacement of chloride in 4-substituted 2-chloropyrimidines or 2-chloroquinazolines by treatment with 4-methylpiperazine provides compounds that are antagonists of the serotonin 5-HT_{2A} receptor.

J. Heterocyclic Chem., **46**, 1259 (2009).

INTRODUCTION

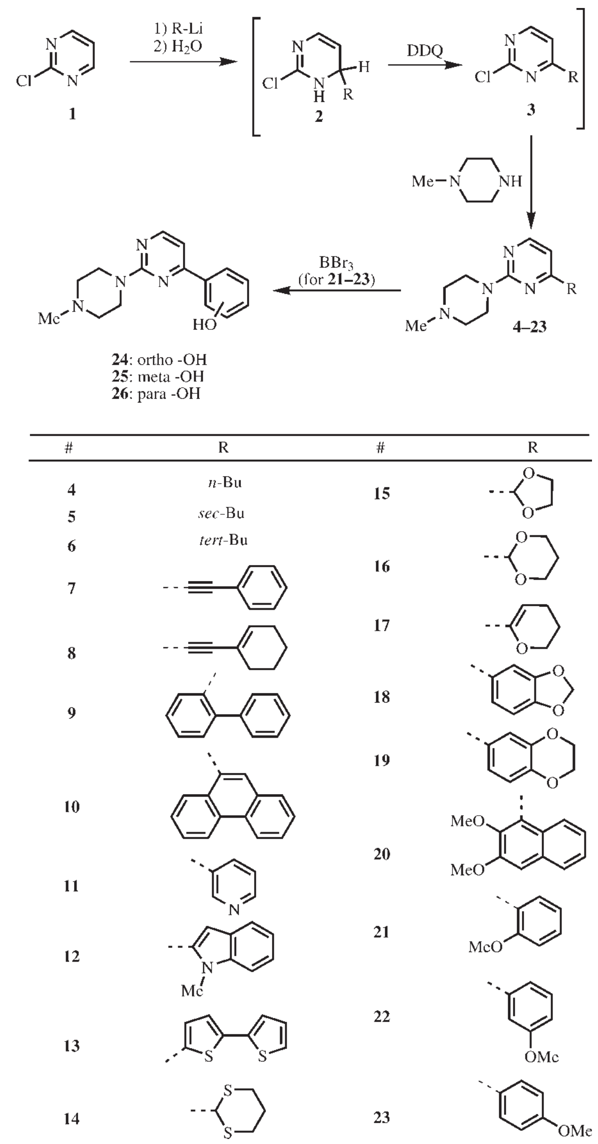
The addition reaction of organolithium reagents to the formal C=N bond in electron-deficient heteroaromatic compounds is known as the Ziegler reaction [3]. In particular, the addition reaction of organolithium reagents across the formal N3=C4 double bond in 2-chloropyrimidine followed by oxidation (aromatization) of the resultant adduct 2 (Scheme 1) is a powerful tool for the synthesis of 4-substituted 2-chloropyrimidines 3 [4,5]. The synthetic utility of this methodology is further enhanced by the facile nucleophilic displacement of chloride in 3 with common nucleophiles. In particular, 2-(4-methylpiperazino)pyrimidines obtained by this approach have been shown to interact with the central nervous system (CNS) (Chart 1) [6–9].

Related compounds bind with nucleic acids [10–15], enhance activity of the antitumor antibiotic bleomycin [16,17], and are anti-HIV-1 agents [18,19]. Surprisingly, relatively few potential CNS agents have been obtained, that is, only a limited number of simple 4-substituted pyrimidines have been synthesized by using this methodology. Herewith, we report that the synthetic sequence of Scheme 1 provides an easy access to pyrimidines containing structurally diverse groups at position 4. Because some of the previously reported 4-substituted 2-(4-methylpiperazino)pyrimidines are potent 5-HT_{2A} ligands (Chart 1, Table 1), the majority of new derivatives, obtained as part of this work, were tested for binding to the 5-HT_{2A} sites. This serotonin receptor is of immense interest because of its role in normal brain function. In particular, the powerful hallucinogens, such as LSD, presumably have the 5-HT_{2A} receptor as their primary target [20,21].

RESULTS AND DISCUSSION

The original synthetic route to 4-substituted 2-chloropyrimidines 3 (Scheme 1) was developed in our laboratories using a limited number of organolithium reagents R-Li [4,5]. The current study of the scope of this chemistry revealed that a large number of diverse compounds 3 can easily be synthesized. The 2-chloropyrimidines 3 are precursors to biologically active 2-aminopyrimidine derivatives [7–10]. As part of this work, it was found that the 2-aminopyrimidine derivatives, such as 4-23 in Scheme 1, can be prepared by using crude intermediate products 2 and 3. Thus, the methodology was greatly simplified. The yields of selected products 4–23 obtained using analytically pure and crude intermediate products 3 were similar. Purification of products 4–23 involved chromatography. Because most of these compounds are oils, they were transformed into hydrobromides, and the

Scheme 1



salts were additionally purified by crystallization. Conversely, demethylation of methoxyphenyl derivatives 21–23 by treatment with boron tribromide gave the corresponding hydrobromide salts 24–26 directly.

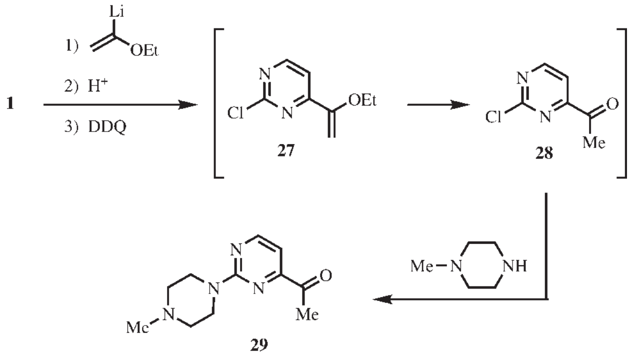
[d] Ref. 9.

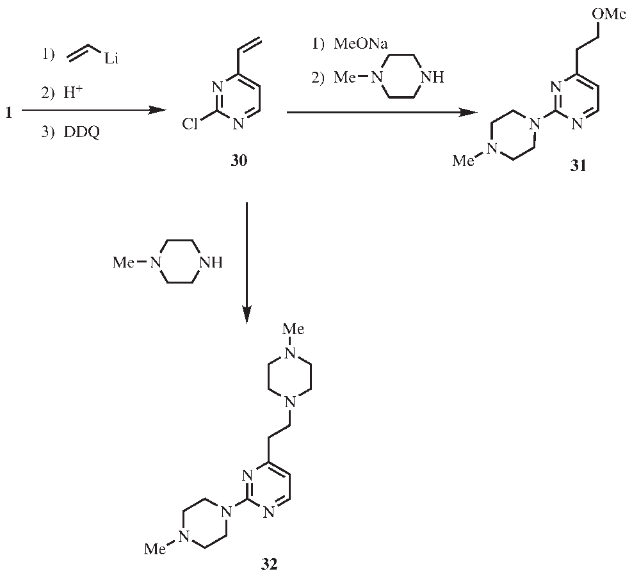
The introduction of the acetyl group at position 4 of the pyrimidine was achieved by using the umpolung approach [22]. Thus, a nucleophilic reagent derived from ethyl vinyl ether was allowed to react with 2-chloropyrimidine (1) followed by aromatization of the resultant adduct by treatment with 2,3-dichloro-5,6-dicyanoquinone (DDQ) to give the intermediate product 27 (Scheme 2). Then the ethoxyvinyl function in 27 was hydrolyzed under acidic conditions to give the acetyl-substituted pyrimidine 28. Nucleophilic displacement of chloride in 28 by treatment with *N*-methylpiperazine furnished the desired compound 29 in an overall yield of 70%. It should be noted that this preparation was achieved using crude intermediate products 27 and 28.

A vinyl function is easily introduced at position 4 of 2-chloropyrimidine (1, Scheme 3) or 2-chloroquinazoline (33, Scheme 4) by using the discussed chemistry.

Scheme 2



Scheme 3



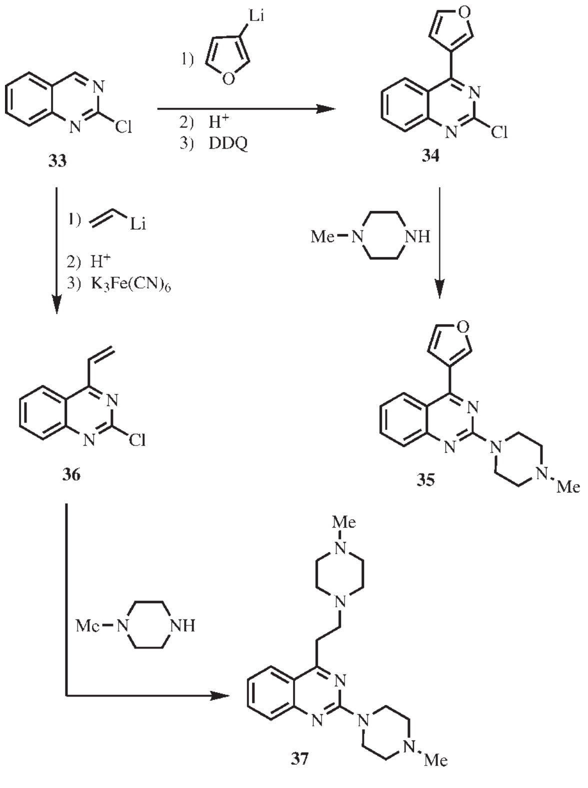
While 2-chloro-4-vinylpyrimidine (30) has been obtained previously using cumbersome chemistry [23], its quinazoline analog 36 is a new compound. In the synthesis of 36, the general protocol was modified in that the intermediate 2-chloro-4-vinyl-3,4-dihydroquinazoline (data not shown) was aromatized by the reaction with potassium ferricyanide, which has previously been used for the oxidation of 4-vinyl-3,4-dihydroquinazoline [24]. The standard treatment of the adduct with DDQ resulted in opening of the pyrimidine subunit, which was previously demonstrated [4]. The vinyl derivatives 30 and 36 are unusual substrates for the reaction with nucleophiles in that they undergo conjugate addition across the vinyl group. Thus, treatment of 30 with 1 equivalent of sodium methoxide and then with *N*-methylpiperazine furnished product 31 in an overall yield of 58%. This result shows that the methoxy anion undergoes selective conjugate addition reaction with the involvement of the vinyl group, and then chloride in the intermediate product (not shown) is displaced by the reaction with the amine. Conversely, the reaction of 30 with 1 equivalent of *N*-methylpiperazine gave a mixture of products that was difficult to separate, suggesting no selectivity between the conjugate addition and chloride displacement reactions. The treatment of 30 with excess amine gave the expected compound 32 as the sole product. In a similar way, the reaction of 2-chloro-4-vinylquinazoline (36, Scheme 4) with *N*-methylpiperazine furnished the displacement/addition product 37. It should be noted that the conjugate addition reactions with vinyl-substituted heterocyclic compounds are extremely rare, and we are aware of only single report on the conjugate addition to a vinylpyrimidine substrate [25].

In addition to the introduction of the vinyl group at position 4 of 2-chloroquinazoline as discussed earlier, a number of other 4-substituted quinazolines was synthesized using the discussed approach. This is illustrated in Scheme 4 by the preparation of 4-(3-furyl)-2-(4-methylpiperazino)quinazoline through the intermediary of 2-chloro analog 34. Again, the simplified methodology was used in that the intermediate product 34 was not purified before the treatment with the amine.

New compounds were evaluated for their affinity to serotonin 5-HT$_{2A}$ receptors according to the previously validated and published procedure [26]. The results of binding experiments are summarized in Table 1. The majority of new 4-substituted 2-(4-methylpiperazino)-pyrimidines show greater 5-HT$_{2A}$ affinity than the unsubstituted compound I. The highest affinity was found for biphenyl derivative 9, which is somewhat surprising, because the phenyl analog II displays only moderate activity (K_i = 2095 nM).

Because the 3-furyl derivative VI was earlier characterized as a potent 5-HT$_{2A}$ ligand [10], compounds 15–26, 29 and 31 were designed to have an oxygen atom in the substituent of the pyrimidine. Unfortunately, all these compounds are less active than the previously reported ligand VI. Quinazoline ligand 35 is also less active than its pyrimidine analog VI.

Scheme 4



In conclusion it seems that the ligand binding pocket in 5-HT_{2A} receptor has very discriminating structural requirements. The finding of the highly active biphenyl derivative 9 suggests possible direction of further structural modifications of 2-(4-methylpiperazino)-pyrimidines.

EXPERIMENTAL

General. All organometallic reactions were conducted under a nitrogen atmosphere in tetrahydrofuran distilled from sodium benzophenone ketyl immediately before use. Final products were purified on a chromatotron using silica gel-coated rotors (2 mm). Hydrobromide or hydrochloride salts of the piperazine products were obtained by using a general procedure [7], and the salts were crystallized from 95% ethanol. In several cases, it was necessary to dilute the ethanolic solution with ether to induce crystallization. Melting points (Pyrex capillary) are not corrected. ^{1}H NMR spectra were recorded at 400 MHz. Unless stated otherwise, the spectra were obtained for free bases in deuteriochloroform.

Lithium reagents. *n*-Butyllithium (2.0*M* in cyclohexane), *sec*-butyllithium (1.4*M* in cyclohexane), and *tert*-butyllithium (1.7*M* in pentane) were commercial reagents. The following lithium reagents (required for the preparation of compounds given in parentheses) were generated by bromine-lithium exchange reaction: 2-lithiobiphenyl (**9**), 9-lithiophenanthrene (**10**), 3-lithiopyridine (**11**), 5-lithio-2,2′-bithiophene (**13**), 4-lithio-1,2-(methylenedioxy)benzene (**18**), 6-lithio-1,4-benzodioxane (**19**), 1-lithio-2,3-dimethoxynaphthalene (**20**), 2-lithioanisole (**21**), 3-lithioanisole (**22**), 4-lithioanisole (**23**), and 3-lithiofuran (**35**). Briefly, a solution of the corresponding bromo derivative (12.5 mmol) in anhydrous tetrahydrofuran (15 mL) was cooled to −70°C and treated dropwise with *n*-butyllithium (6.3 mL, 12.6 mmol) for 5 min. Then the mixture was kept at −70°C for 2 h before treatment with 2-chloropyrimidine. The following lithium reagents (required for the preparation of compounds given in parentheses) were generated by lithiation (hydrogen-lithium exchange): 1-lithio-2-phenylacetylene (**7**), 1-lithio-2-(cyclohexen-1-yl)acetylene (**8**), 6-lithio-3,4-dihydro-2*H*-pyran (**17**), and 1-lithio-1-ethoxyethylene (**29**). Briefly, a solution of the corresponding substrate (12.5 mmol) in anhydrous tetrahydrofuran (15 mL) was treated at −10°C with *tert*-butyllithium (7.4 mL, 12.6 mmol), and the mixture was allowed to stand at this temperature for 10 min before cooling to −70°C. To generate 2-lithio-1,3-dithiane (for the preparation of **14**), a mixture of 1,3-dithiane (12.5 mmol) and *n*-butyllithium (6.3 mL, 12.6 mmol) in anhydrous tetrahydrofuran (10 mL) was allowed to react at −25°C for 3 h before cooling to −70°C. 2-Lithio-1,3-dioxolane (for **15**) and 2-lithio-1,3-dioxane (for **16**) were generated from the corresponding stannyl derivatives, as reported in the literature [27,28]. This is a multistep synthesis, and the final step was adjusted to generate 12.5 mmol of the lithium reagent in 15 mL of tetrahydrofuran. Vinyllithium (for **31**, **32**, and **37**) was generated by the reaction of tetravinyltin with *tert*-butyllithium as previously described [28,29]. Briefly, a solution of tetravinyltin (0.7 mL, 3.2 mmol) in tetrahydrofuran (15 mL) was treated dropwise at −70°C for 5 min with *tert*-butyllithium (7.4 mL, 12.6 mmol), and the mixture was stirred for an additional 15 min at −70°C before use.

General procedure for the synthesis of 4-substituted 2-(4-methylpiperazino)pyrimidines 4–23. A solution of the corresponding lithium reagent (12.5 mmol) was treated dropwise at −70°C with a solution of 2-chloropyrimidine (1.35 g, 12 mmol) in tetrahydrofuran (15 mL). The mixture was stirred and allowed to reach gradually 0°C within 2 h, then quenched with a solution of water (1 mL) in tetrahydrofuran (5 mL). After treatment with a solution of DDQ (2.8 g, 12.5 mmol) in tetrahydrofuran (15 mL), the mixture was stirred at 23°C for 5 min, then cooled to 0°C, treated with a cold solution of sodium hydroxide (4*M*, 5 mL, 20 mmol), and extracted at 0°C with cold hexanes (20 mL). The residue was additionally extracted with a mixture of ether or hexanes (1:1, 2 × 15 mL), and the organic extracts were combined, dried over sodium sulfate, and passed through silica gel (5 g) to remove tar. Concentration on a rotary evaporator gave crude 4-substituted 2-chloropyrimidine **3** that, without further purification, was used for the reaction with *N*-methylpiperazine. Thus, a solution of crude compound **3** and *N*-methylpiperazine (5.5 mL, 50 mmol) in toluene (20 mL) was heated to 70°C until a thin layer chromatography analysis on silica gel eluting with ethyl acetate or triethylamine (95:5) showed the absence of **1** (several hours). Filtration of the mixture was followed by concentration on a rotary evaporator and chromatography of the residue eluting with ethyl acetate or triethylamine/hexanes (90:5:5). All products **4–23** were transformed into salts as mentioned earlier (see General Section). Selected intermediate products **3** (R = *n*-Bu, 9-phenanthryl, 2,2′-bithiophen-5-yl) were purified by chromatography as described earlier before the treatment with *N*-methylpiperazine. The yields of the corresponding products **4**, **10**, and **13** and the yields of the same respective products obtained using crude compounds **3** were similar (±1%).

4-Butyl-2-(4-methylpiperazino)pyrimidine (4). This compound was obtained as an oil in 68% yield; ^{1}H NMR: δ 0.94 (t, *J* = 7 Hz, 3H), 1.38 (m, 2H), 1.67 (m, 2H), 2.34 (s, 3H), 2.47 (m, 4H), 2.56 (t, *J* = 7 Hz, 2H), 3.85 (m, 4H), 6.37 (d, *J* = 5 Hz, 1H), 8.18 ppm (d, *J* = 5 Hz, 1H). The hydrobromide salt had mp 100–101°C. Anal. Calcd. for $2C_{13}H_{22}N_4\cdot 4HBr\cdot H_2O$: C, 38.53; H, 6.22; N, 13.83. Found: C, 38.34; H, 6.23; N, 13.77.

4-(sec-Butyl)-2-(4-methylpiperazino)pyrimidine (5). This compound was obtained as an oil in 42% yield; ^{1}H NMR: δ 0.84–0.88 (m, 3H), 1.20–1.22 (m, 3H), 1.63 (m, 2H), 2.34 (s, 3H), 2.47 (m, 4H), 2.53 (m, 1H), 3.85 (m, 4H), 6.35 (d, *J* = 5 Hz, 1H), 8.19 ppm (d, *J* = 5 Hz, 1H). The hydrobromide salt had mp 177–178°C. Anal. Calcd. for $C_{13}H_{22}N_4\cdot HBr$: C, 49.53; H, 7.35; N, 17.77. Found: C, 49.41; H, 7.47; N, 17.47.

4-(tert-Butyl)-2-(4-methylpiperazino)pyrimidine (6). This compound was obtained as an oil in 53% yield; ^{1}H NMR: δ 1.27 (s, 9H), 2.47 (m, 4H), 3.85 (m, 4H), 6.51 (d, *J* = 5 Hz, 1H), 8.21 ppm (d, *J* = 5 Hz, 1H). The hydrobromide salt had mp 224–226°C. Anal. Calcd. for $4C_{13}H_{22}N_4\cdot 4HBr\cdot H_2O$: C, 48.15; H, 7.46; N, 17.28. Found: C, 47.82; H, 7.16; N, 16.93.

2-(4-Methylpiperazino)-4-(phenylethynyl)pyrimidine (7). This compound was obtained as an oil in 60% yield; ^{1}H NMR: δ 2.24 (s, 3H), 2.48 (t, *J* = 5 Hz, 4H), 3.89 (t, *J* = 5 Hz, 4H), 6.68 (d, *J* = 5 Hz, 1H), 7.39 (m, 3H), 7.61 (m, 2H), 8.30 ppm (d, *J* = 5 Hz, 1H). The hydrobromide salt had mp 193–195°C. Anal. Calcd. for $C_{17}H_{18}N_4\cdot 2HBr\cdot H_2O$: C, 44.56; H, 4.84; N, 12.23. Found: C, 44.18; H, 4.82; N, 11.94.

4-[(Cyclohexen-1-yl)ethynyl)]-2-(4-methylpiperazino)- pyrimidine (8). This compound was obtained as an oil in 59% yield; ^{1}H NMR: δ 1.66 (???m, 4H), 2.20 (m, 4H), 2.34 (s, 3H), 2.46 (m,4H), 3.85 (m, 4H), 6.37 (m, 1H), 6.55 (d, J = 5 Hz, 1H), 8.24 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 242°C (decomp). Anal. Calcd. for $C_{17}H_{22}N_4{\cdot}HBr$: C, 56.20; H, 6.38; N, 15.42. Found: C, 56.08; H, 6.47; N, 15.34.

2-(4-Methylpiperazino)-4-(2-biphenyl)pyrimidine (9). This compound had mp 8587°C and was obtained in 86% yield; ^{1}H NMR: δ 2.04 (s, 3H), 2.37 (m, 4H), 3.67–3.69 (m, 4H), 6.29 (d, J = 5 Hz, 1H), 7.25 (m, 3H), 7.44 (m, 3H), 7.70 (m, 3H), 8.09 ppm (d, J = 5 Hz, 1H). Anal. Calcd. for $C_{21}H_{22}N_4{\cdot}2HBr{\cdot}H_2O$: C, 49.43; H, 5.14; N, 10.98. Found: C, 49.32; H, 5.00; N, 10.57.

2-(4-Methylpiperazino)-4-(9-phenanthryl)pyrimidine (10). This compound was obtained as an oil in 78% yield; ^{1}H NMR: δ 2.32 (s, 3H), 2.48 (m, 4H), 3.93–3.97 (m, 4H), 6.81 (d, J = 5 Hz, 1H), 7.58 (m, 2H), 7.63–7.67 (m, 2H), 7.89 (m, 2H), 8.28 (d, J = 8 Hz, 1H), 8.44 (d, J = 5 Hz, 1H), 8.70 ppm (m, 2H). The hydrobromide salt had mp 195–198°C. Anal. Calcd. for $2C_{23}H_{22}N_4{\cdot}3HBr{\cdot}4H_2O$: C, 53.97; H, 5.42; N, 10.95. Found: C, 54.35; H, 5.04; N, 10.96.

2-(4-Methylpiperazino)-4-(3-pyridyl)pyrimidine (11). This compound was obtained as an oil in 84% yield. The hydrobromide salt had mp 163–165°C; ^{1}H NMR (salt, deuterated dimethyl sulfoxide): δ 2.87(s, 3H), 3.13 (m, 2H), 3.37 (m, 2H), 3.55 (m, 2H), 4.91 (m, 2H), 7.55 (d, J = 5 Hz, 1H), 7.91 (m, 1H), 8.66 (d, J = 5 Hz, 1H), 8.92 (m, 2H), 9.53 (s, 1H), 9.93 ppm (br s, 2H).Anal. Calcd. for $22C_{14}H_{17}N_5{\cdot}4HBr{\cdot}3H_2O$: C, 37.86; H, 4.99; N, 15.77. Found: C, 38.02; H, 4.66; N, 15.58.

4-(1-Methylindol-2-yl)-2-(4-methylpiperazino)pyrimidine (12). This compound was obtained as an oil in 78%; ^{1}H NMR: δ 240 (s, 3H), 2.55 (m, 4H), 3.94 (m, 4H), 4.18 (s, 3H), 6.97 (d, J = 5 Hz, 1H), 7.06 (s, 3H), 7.19 (t, J = 8 Hz, 1H), 7.36 (t, J = 8 Hz, 1H), 7.45 (d, J = 8 Hz, 1H), 7.70 (d, J = 8 Hz, 1H), 8.38 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 302–303°C. Anal. Calcd. for $2C_{18}H_{23}N_5{\cdot}4HBr{\cdot}H_2O$: C, 45.02; H, 5.46; N, 14.58. Found: C, 45.10; H, 5.26; N, 14.47.

4-(2,2′-Bithiophen-5-yl)-2-(4-methylpiperazino)-pyrimidine (13). This compound was obtained as an oil in 76% yield; ^{1}H NMR: δ 2.36 (s, 3H), 2.50 (m, 4H), 3.92 (m, 4H), 6.79 (d, J = 5 Hz, 1H), 7.05 (t, J = 4 Hz, 1H), 7.18 (d, J = 4 Hz, 1H), 7.27 (m, 2H), 7.55 (d, J = 4 Hz, 1H), 8.29 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 187–190°C. Anal. Calcd. for $2C_{17}H_{18}N_4S_2{\cdot}3HBr{\cdot}4H_2O$: C, 40.85; H, 4.74; N, 11.21. Found: C, 40.54; H, 4.41; N, 11.04.

4-(1,3-Dithiane-2-yl)-2-(4-methylpiperazino)pyrimidine (14). This compound was obtained as an oil in 69% yield; ^{1}H NMR: δ 204 (m, 2H), 2.17 (m, 1H), 2.35 (s, 3H), 2.47 (m, 4H), 3.03 (m, 4H), 3.88 (m, 4H), 8.30 (d, J = 5 Hz, 1H), 8.65 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 175–176°C. Anal. Calcd. for $C_{13}H_{20}N_4S_2{\cdot}2HBr$: C, 34.07; H, 4.84; N, 12.23. Found: C, 34.30; H, 5.13; N, 12.02.

4-(1,3-Dioxolane-2-yl)-2-(4-methylpiperazino)pyrimidine (15). This compound was obtained as an oil in 69% yield; ^{1}H NMR: δ 233 (s, 3H), 2.46 (t, J = 5 Hz, 4H), 3.87 (t, J = 5 Hz, 4H), 4.10 (m, 4H), 5.60 (s, 1H), 6.66 (d, J = 5 Hz, 1H), 8.34 ppm (d, J = 5 Hz, 1H). The hydrobromide had mp 166–170°C. Anal. Calcd. for $C_{12}H_{18}N_4O_2{\cdot}HBr$: C, 43.53; H, 5.78; N, 16.92. Found: C, 43.87; H, 5.87; N, 17.00.

4-(1,3-Dioxane-2-yl)-2-(4-methylpiperazino)pyrimidine (16). This compound was obtained as an oil in 71% yield The hydrobromide salt had mp 179–180°C; ^{1}H NMR (salt, deuteriochloroform): δ 1.49 (m, 1H),2.26(m, 1H), 2.82 (s, 3H), 2.85 (m, 2H), 3.59 (m, 2H), 3.94 (m, 4H), 4.28 (m, 2H), 4.98 (m, 2H), 5.32 (s, 1H), 6.97 (d, J = 5 Hz, 1H), 8.42 ppm (d, J = 5 Hz, 1H). Anal. Calcd. for $2C_{13}H_{20}N_4O_2{\cdot}2HBr{\cdot}H_2O$: C, 44.08; H, 6.26; N, 15.82. Found: C, 43.93; H, 6.01; N, 15.64.

4-(3,4-Dihydro-2H-pyran-6-yl)-2-(4-methylpiperazino)-pyrimidine (17). This compound was obtained as an oil in 80% yield; ^{1}H NMR: δ 1.91 (m, 2H), 2.25 (m, 2H), 2.33 (s, 3H), 2.47 (m, 4H), 3.86 (m, 4H), 4.15 (m, 2H), 6.21 (m, 1H), 6.74 (d, J = 5 Hz, 1H), 8.32 ppm (d, J = 5 Hz, 1H). The hydrobromide had mp 192–194°C. Anal. Calcd. for $4C_{14}H_{20}N_4O{\cdot}5HBr{\cdot}2H_2O$: C, 45.39; H, 6.05; N, 15.12. Found: C, 45.71; H, 6.08; N, 15.27.

4-(3,4-Methylenedioxyphenyl)-2-(4-methylpiperazino)-pyrimidine (18). This compound was obtained in 77% yield; mp (free base) 115–116°C; mp (hydrobromide salt) 287–288°C; ^{1}H NMR: δ 2.39 (s, 3H), 2.57 (m, 4H), 3.96 (m, 4H), 6.06 (s, 2H), 6.88 (d, J = 5 Hz, 1H), 6.92 (d, J = 8 Hz, 1H), 7.61 (m, 2H), 8.36 ppm (d, J = 5 Hz, 1H). Anal. Calcd. for $C_{16}H_{18}N_4O_2{\cdot}2HBr$: C, 41.76; H, 4.38; N, 12.18. Found: C, 41.58; H, 4.43; N, 12.12.

4-(1,4-Benzodioxane-4-yl)-2-(4-methylpiperazino)-pyrimidine (19). This compound was obtained as an oil in 81% yield; ^{1}H NMR: δ 2.38 (s, 3H), 2.57 (m, 4H), 3.96 (m, 4H), 4.33 (s, 4H), 6.89 (d, J = 5 Hz, 1H), 6.97 (d, J = 8 Hz, 1H), 7.57 (m, 1H), 7.68 (m, 1H), 8.35 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 297–298°C. Anal. Calcd. for $2C_{17}H_{20}N_4O_2{\cdot}4HBr{\cdot}H_2O$: C, 42.26; H, 4.80; N, 11.60. Found: C, 42.29; H, 4.65; N, 11.55.

4-(2,3-Dimethoxy-1-naphthyl)-2-(4-methylpiperazino)-pyrimidine (20). This compound was obtained as an oil in 70% yield; ^{1}H NMR: δ 2.37 (s, 3H), 2.51 (m, 4H), 3.85 (s, 3H), 3.93 (m, 4H), 4.05 (s, 3H), 6.69 (d, J = 5 Hz, 1H), 7.27 (s, 1H), 7.32 (m, 1H), 7.42 (m, 1H), 7.59 (d, J = 8 Hz, 1H), 7.78 (d, J = 8 Hz, 1H), 8.47 ppm (d, J = 5 Hz, 1H). The hydrobromide salt had mp 240–241°C. Anal. Calcd. for $4C_{21}H_{23}N_4O_2{\cdot}4HBr{\cdot}H_2O$: C, 56.19; H, 5.50; N, 12.48. Found: C, 56.01; H, 5.68; N, 12.48.

4-(2-Methoxyphenyl)-2-(4-methylpiperazino)pyrimidine (21). This compound was obtained in 88% yield; mp (free base) 79–80°C; mp (hydrobromide salt) 191–192°C; ^{1}H NMR: δ 238 (s, 3H), 3.51 (m, 4H), 3.91 (s, 3H), 3.93 (m, 4H), 7.03 (d, J = 8Hz, 1H), 7.18 (t, J = 8 Hz, 1H), 7.21 (d, J = 5 Hz, 1H), 7.43 (m, 1H), 8.01 (d, J = 8 Hz, 1H), 8.36 ppm (d, J = 5 Hz, 1H). Anal. Calcd. for $2C_{16}H_{20}N_4O{\cdot}4HBr{\cdot}H_2O$: C, 42.22; H, 5.09; N, 12.31. Found: C, 42.25; H, 5.06; N, 12.33.

4-(3-Methoxyphenyl)-2-(4-methylpiperazino)pyrimidine (22). This compound was obtained as an oil in 80% yield; ^{1}H NMR: δ 237 (s, 3H), 2.57 (m, 4H), 3.90 (s, 3H), 3.97 (m, 4H), 6.95 (d, J = 5 Hz, 1H), 7.42 (t, J = 8 Hz, 1H), 7.63 (m, 3H), 8.39 ppm (d, J = 5 Hz, 1H). The hydrobromide had mp 244–245°C. Anal. Calcd. for $2C_{16}H_{20}N_4O{\cdot}4HBr{\cdot}H_2O$: C, 42.20; H, 5.09; N, 12.31. Found: C, 42.18; H, 5.08; N, 12.35.

4-(4-Methoxyphenyl)-2-(4-methylpiperazino)pyrimidine (23). This compound was obtained in 89% yield; mp (free base) 66–67°C; mp (hydrobromide salt) 278–279°C; ^{1}H NMR: δ 237 (s, 3H), 2.52 (m, 4H), 3.89 (s, 3H), 3.96 (m, 4H), 6.90 (d, J = 5 Hz, 1H), 6.98 (m, 2H), 8.04 (m, 2H), 8.34 ppm (d, J = 5

Hz, 1H). Anal. Calcd. for $C_{16}H_{20}N_4O{\cdot}2HBr{\cdot}H_2O$: C, 41.40; H, 5.21; N, 12.07. Found: C, 41.74; H, 5.15; N, 12.03.

General procedure for demethylation of 21–23 to 24–26. A solution of **21–23** (free bases, 0.29 g, 1 mmol) in dichloromethane (10 mL) was treated at 23°C with boron tribromide in dichloromethane (1*M*, 4 mL, 4 mmol). The mixture was stirred at 23°C for 12 h and then quenched with a saturated solution of sodium bisulfate (5 mL). The resultant precipitate of the hydrobromide salt of **24–26** was filtered and crystallized from ethyl acetate or ether.

4-(2-Hydroxyphenyl)-2-(4-methylpiperazino)pyrimidine dihydrobromide (24·2HBr). This salt was obtained in 56% yield; mp 284–285°C; ^1H NMR (deuteriochloroform): δ 2.39(s, 3H), 2.55 (m, 4H), 3.86 (m, 4H), 6.97 (t, *J* = 8 Hz, 1H), 7.03 (d, *J* = 8 Hz, 1H), 7.06 (d, *J* = 5 Hz, 1H), 7.41 (t, *J* = 8 Hz, 1H), 7.79 (d, *J* = 8 Hz, 1H), 8.46 ppm (d, *J* = 5 Hz, 1H). Anal. Calcd. for $4C_{15}H_{18}N_4O{\cdot}8HBr{\cdot}H_2O$: C, 41.26; H, 4.73; N, 12.83. Found: C, 41.07; H, 4.61; N, 12.61.

4-(3-Hydroxyphenyl)-2(4-methylpiperazino)pyrimidine dihydrobromide (25·2HBr). This salt was obtained in 60% yield; mp >300°C; ^1H NMR (deuterated dimethyl sulfoxide): δ 3.21 (s, 3H), 3.56 (m, 4H), 4.76 (m, 4H), 6.96 (d, *J* = 5 Hz, 1H), 7.32 (t, *J* = 8 Hz, 1H), 7.63 (m, 3H), 8.51 ppm (d, *J* = 5 Hz, 1H). Anal. Calcd. for $4C_{15}H_{18}N_4O{\cdot}8HBr{\cdot}H_2O$: C, 41.26; H, 4.73; N, 12.83. Found: C, 41.11; H, 4.67; N, 12.70.

4-(4-Hydroxyphenyl)-2(4-methylpiperazino)pyrimidine dihydrobromide (26·2HBr). This salt was obtained in 60% yield; mp >300°C; ^1H NMR (deuterated dimethyl sulfoxide): δ 3.21 (s, 3H), 3.58 (m, 4H), 4.76 (m, 4H), 6.92 (d, *J* = 8 Hz, 2H), 7.32 (d, *J* = 5 Hz, 1H), 8.11 (d, *J* = 8 Hz, 2H), 8.45 ppm (d, *J* = 5 Hz, 1H). Anal. Calcd. for $2C_{15}H_{18}N_4O{\cdot}4HBr{\cdot}H_2O$: C, 40.84; H, 4.78; N, 12.70. Found: C, 40.84; H, 4.63; N, 12.58.

4-Acetyl-2-(4-methylpiperazino)pyrimidine (29). The reaction of 1-ethoxyvinyllithium (12.5 mmol) with 2-chloro-pyrimidine (1.35 g, 12 mmol) followed by aromatization of the resultant dihydropyrimidine intermediate by treatment with DDQ to give **27** was conducted as described earlier for other addition reactions. Crude product **27** was hydrolyzed to 4-acetyl-2-chloropyrimidine (**28**) by stirring the mixture of **27**, ethanol (25 mL), and hydrochloric acid (35%, 5 mL) at 23°C for 12 h. The acidic mixture was neutralized by addition of a saturated solution of sodium carbonate and then extracted with ether or hexanes (2:1, 3 × 50 mL). The extract was decolorized on a short column packed with silica gel (5 g), dried over magnesium sulfate and concentrated on a rotary evaporator. Crude product **28** gave the following ^1H NMR spectrum (deuteriochloroform): δ 2.27 (s, 3H), 7.84 (d, *J* = 5 Hz, 1H), 8.86 ppm (d, *J* = 5 Hz, 1H). Crude compound **28** was subjected to the reaction with *N*-methylpiperazine, and product **29** was purified by using the general procedure described earlier. Compound **29** (yield 70%) is an oil; ^1H NMR: δ 2.36 (s, 3H), 2.49 (m, 4H), 2.62 (s, 3H), 3.90 (m, 4H), 7.03 (d, *J* = 5 Hz, 1H), 8.50 ppm (d, *J* = 5 Hz, 1H). On heating, the hydrobromide salt **29**·1.5HBr undergoes melting with decomposition at 234°C. Anal. Calcd. for $2C_{11}H_{16}N_4O{\cdot}3HBr$: C, 38.67; H, 5.16; N, 16.40. Found: C, 38.82; H, 5.05; N, 16.41.

2-Chloro-4-vinylpyrimidine (30). The addition reaction of vinyllithium (25 mmol) with 2-chloropyrimidine (**1**, 24 mmol) followed by oxidation of the intermediate dihydropyrimidine was conducted by using a general procedure described earlier. After purification on a chromatotron eluting with hexanes or dichloromethane (2:1), compound **30** was obtained as an oil in 46% yield (1.5 g). The ^1H NMR spectrum of **30** [deuteriochloroform, δ 5.80 (m, 1H), 6.52 (m, 1H), 6.70 (m, 1H), 7.22 (d, *J* = 5 Hz, 1H), 8.57 ppm (d, *J* = 5 Hz, 1H)] was virtually identical with that reported in the literature for the compound obtained by an independent route [23].

4-(2-Methoxyethyl)-2-(4-methylpiperazino)pyrimidine (31). A solution of compound **30** (91 mg, 0.64 mmol) in anhydrous methanol (2 mL) was treated with a solution of sodium methoxide (0.5*M* in methanol, 0.65 mL, 0.65 mmol). The mixture was stirred at 23°C for 12 h, quenched with a saturated solution of sodium chloride (1 mL), and extracted with toluene (3 × 3 mL). The extract containing 2-chloro-4-(2-methoxyethyl)-pyrimidine was concentrated on a rotary evaporator to 3 mL and treated with *N*-methylpiperazine (0.25 mL, 2.0 mmol). The mixture was heated under reflux for 3 h, cooled, treated with a saturated solution of sodium carbonate (1 mL), and extracted with ether (2 × 5 mL), and the extract was concentrated on a rotary evaporator. Chromatography of the residue eluting with hexanes or triethylamine or methanol (4:1:1) gave 88 mg (58%) of **31** as an oil; ^1H NMR: δ 2.36 (s, 3H), 2.48 (m, 4H), 2.85 (t, *J* = 7 Hz, 2H), 3.37 (s, 3H), 3.77 (t, *J* = 7 Hz, 2H), 3.87 (m, 4H), 6.44 (d, *J* = 5 Hz, 1H), 8.22 ppm (d, *J* = 5 Hz, 1H). Anal. Calcd. for $C_{12}H_{21}N_4O{\cdot}HBr$: C, 30.09; H, 4.84; N, 11.70. Found: C, 29.86; H, 4.64; N, 12.02.

2-(4-Methylpiperazino)-4-[2-(4-methylpiperazino)ethyl]-pyrimidine (32). A mixture of 30 (0.33 g, 2.3 mmol) and *N*-methylpiperazine (0.55 mL, 5 mmol), and toluene (6 mL) was heated under reflux for 3 h. Workup and chromatography, as described for **31**, furnished 0.16 g (22%) of product **32** as an oil; ^1H NMR: δ 1.92 (m, 2H), 2.89 (s, 3H), 2.33 (s, 3H), 2.47 (m, 10H), 2.75 (m, 4H), 3.84 (m, 4H), 6.39 (d, *J* = 5 Hz, 1H), 8.17 ppm (d, *J* = 5 Hz, 1H). The hydrochloride has mp 202–206°C. Anal. Calcd. for $2C_{16}H_{28}N_4O{\cdot}8HCl{\cdot}H_2O$: C, 41.84; H, 7.24; N, 18.30. Found: C, 41.76; H, 7.10; N, 18.06.

4-(3-Furyl)-2-(4-methylpiperazino)quinazoline (35). The reaction of 2-chloroquinazoline [30] (**33**, 2.0 g, 12 mmol) with 3-furyllithium (12.5 mmol) and aromatization of the intermediate dihydroquinazoline by treatment with DDQ was conducted by using the general procedure described earlier. A mixture of the resultant crude product **34**, *N*-methylpiperazine 3 mL, 3 mmol, and toluene 15 mL was heated under reflux for 3 h, and the final product **35** was isolated and purified as described earlier. Product **35** was obtained in 18% yield (0.6 g); mp 67–69°C; ^1H NMR: δ 2.38 (s, 3H), 2.55(m, 4H), 4.05 (m, 4H), 7.02 (s, 1H), 7.22 (m, 1H), 7.60 (m, 1H), 7.66 (m, 2H), 8.08 ppm (m, 2H). Anal. Calcd. for $C_{17}H_{18}N_4O$: C, 69.37; H, 6.16; N, 19.03. Found: C, 69.21; H, 6.16; N, 18.83.

2-Chloro-4-vinylquinazoline (36). 2-Chloroquinazoline [30] (2.75 g, 12 mmol) in tetrahydrofuran (30 mL) was allowed to react with vinyllithium (12.5 mmol), and then the mixture was quenched by using the general procedure described earlier. A mixture of crude 2-chloro-4-vinyl-3,4-dihydroquinazoline thus obtained, potassium hydroxide (40 mg, 0.7 mmol), potassium ferricyanide (0.18 g, 0.55 mmol), water (0.3 mL), and benzene (1.5 mL) were stirred at 23°C for 5 h, and then treated with benzene (15 ml) and water (15 ml). The benzene layer was dried over magnesium sulfate, concentrated on a rotary evaporator, and the solid residue was crystallized from hexanes to give 29 mg (68%) of compound **36**; mp 65–67°C; ^1H NMR: δ 6.02 (m, 1H), 6.97 (m, 1H), 7.55 (m, 1H), 7.68 (m, 1H), 7.94

(m, 1H), 8.01 (m, 1H), 8.21 ppm (m, 1H). High resolution ms (esi, positive ion mode): Calcd. for $C_{10}H_7ClN_2$, *m/z* 190.0379 ($M^+ + 1$), found *m/z* 190.0376.

4-[2-(4-Methylpiperazino)ethyl]-2-(4-methylpiperazino)-quinazoline (37). A mixture of 36 (25 mg, 0.15 mmol), *N*-methylpiperazine (0.05 mL, 0.45 mmol), and toluene (2 mL) was heated to 70°C for 3 h. After cooling, the mixture was treated with a saturated solution of sodium carbonate (0.5 mL), extracted with ether (3 × 10 mL), and the extract was dried over magnesium sulfate and concentrated to give a solid residue. Chromatography eluting with hexanes or triethylamine or methanol (4:1:1, 100 mL; then 1:1:1, 400 mL) followed by crystallization from hexanes gave compound 37 in 40% yield (21 mg); mp 72–74°C; ^{1}H NMR: δ 2.33 (s, 3H), 2.37 (s, 3H), 2.52 (m, 8H), 2.66 (m, 4H), 2.96 (m, 2H), 3.35 (m, 2H), 4.00 (m, 4H), 7.20 (m, 1H), 7.60 (m, 2H), 7.88 ppm (d, $J = 8$ Hz, 1H). Anal. Calcd. for $C_{20}H_{30}N_6$: C, 67.76; H, 8.53; N, 23.71. Found: C, 67.93; H, 8.84; N, 23.96.

Radioligand Binding Studies. The *in vitro* affinity for native serotonin 5-HT_{2A} receptors was determined by inhibiting [^{3}H]-ketanserin (88 Ci/mmol; NEN Chemicals) binding to rat cortical membranes. Membrane preparation and a general assay procedure were carried out according to the previously published protocols [31]. Two compound concentrations were tested: 0.1 and 1 μM, each run in triplicate. The Cheng and Prusoff equation was used for calculations of estimated K_i values [32].

Acknowledgment. This study was supported by the Brain and Behavior Program at Georgia State University and Grant 2 P05F 019 30 from the Ministry of Science and Higher Education (Poland).

Spiro[benzo[g]chromene-4,3′-indoline]-3-carbonitriles and spiro[indoline-3,5′-pyrano[2,3-d]pyrimidine]-6′-carbonitriles were synthesized *via* a three-component reaction of isatins, 2-hydroxynaphthalene-1,4-dione or 2-methylpyrimidine-4,6-diol, and malononitrile in aqueous media.

J. Heterocyclic Chem., **46**, 1266 (2009).

INTRODUCTION

With the emphasis on the search for atom-efficient transformations of easily available starting materials into complex organic molecules [1], reactions that provide maximum diversity are especially desirable. Here, expeditious domino [2] and multicomponent reactions [3] (MCRs) have emerged as powerful strategies. MCRs are economically and environmentally very advantageous, because multistep syntheses produce considerable amounts of waste mainly due to complex isolation procedures often involving expensive, toxic, and hazardous solvents after each step.

The indole moiety is probably the most well-known heterocycle, a common and important feature of a variety of natural products and medicinal agents [4]. Furthermore, it has been reported that sharing of the indole 3-carbon atom in the formation of spiroindoline derivatives highly enhance biological activity [5–7]. The spirooxindole system is the core structure of many pharmacological agents and natural alkaloids [8–11].

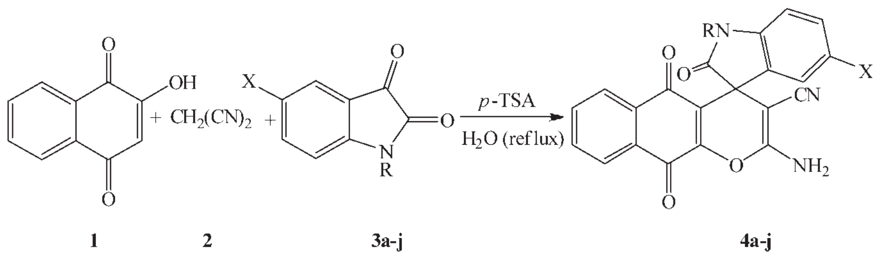
The quinone moiety is involved in a wide variety of biochemical processes including electron transport and oxidative phosphorylation [12]. Various biological properties, including enzyme inhibition, antibacterial, antifungal, and anticancer activities, have been reported for quinones and quinone derivatives [13–15]. Quinone-annulated heterocycles are found in nature, and most of them exhibit interesting biological activities. The chemistry of quinone annulated heterocycles is dependent largely on the substituent being either on the quinone or on adjacent rings [16,17]. These activities, combined with the diverse chemical behavior make quinones attractive targets in organic synthesis.

MCRs of isatins, malononitrile, and enol-neuclophilic compounds have recently attracted the interest of the synthetic community, because the formation of different condensation products can be expected depending on the specific conditions and structure of the building blocks [18–20]. 2-Hydroxynaphthalene-1,4-dione by containing enol group is a very interesting compound. As part of our program aimed at developing new selective and environmentally friendly methodologies for the preparation of heterocyclic compounds [21–28], we took advantage of enol group in 2-hydroxynaphthalene-1,4-dione for the preparation of spirooxindoles with fused chromene moiety. Fused chromenes have been found to have a wide spectrum of activities such as antimicrobial [29], antiviral [30], antiproliferative [31], sex pheromone [32], antitumor [33], and central nervous system activities [34].

RESULTS AND DISCUSSION

To achieve suitable conditions for the synthesis of spiro [benzo[*g*]chromene-4,3′-indoline]-3-carbonitriles, we first

Scheme 1



tested the reaction of 2-hydroxynaphthalene-1,4-dione 1, malononitrile 2 and isatin 3a, and as a simple model substrate in different solvents in the presence of *p*-toluenesulfonic acid (*p*-TSA) as an inexpensive and available catalyst at different conditions (Scheme 1). The results are shown in Table 1. It was found that water was a solvent of choice for the reaction, and the desired product was obtained in excellent yield in water (Entry 2).

Encouraged by this success, we extended the reaction of 2-hydroxynaphthalene-1,4-dione **1** and malononitrile **2** with a range of other isatin derivatives **3b-j** under similar conditions (Water/*p*-TSA) for 3–10 h, furnishing the respective 2-amino-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile derivatives **4b-j** in high yields. The optimized results are summarized in Table 2. The results were excellent in terms of yields and product purity using isatin derivatives in the presence of *p*-TSA, whereas without it for long period of time (24 h), the yields of products were low (< 30%). However, when this reaction was carried out with ethyl cyanoacetate, the thin layer chromatography (TLC) and ^{1}H NMR spectra of the reaction mixture showed a combination of starting materials and numerous products; the expected product was obtained in only trace amount.

A possible mechanism for the formation of **4** is proposed in Scheme 2. It is reasonable to assume that **4** results from initial formation of a intermediate **5** by standard Knoevenagel condensation of the malonitrile **2** and isatin **3**. Subsequently, Michael-type addition of the 2-hydroxynaphthalene-1,4-dione **1** to the intermediate **5**, followed by cyclization and tautomerization leads to the final products **4** (Scheme 2).

The nature of these compounds as 1:1:1 adducts was apparent from their mass spectra, which displayed, in each case, the molecular ion peak at appropriate *m*/*z* values. Compounds **4a–j** are stable solids whose structures are fully supported by IR, ^{1}H and ^{13}C NMR spectroscopy, mass spectrometry, and elemental analysis.

As expected, when the 2-hydroxynaphthalene-1,4-dione **1** was replaced by 2-methylpyrimidine-4,6-diol **6**, another series of spiro[indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitriles **7a–d** were obtained under the same reaction conditions (Scheme 3).

In conclusion, we have developed an efficient, clean, and three-component synthesis of new spiro[benzo[*g*]-chromene-4,3′-indoline] and spiro[indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitrile derivatives *via* cyclocondensation reaction of isatins, 2-malononitrile, and hydroxynaphthalene-1,4-dione or 2-methylpyrimidine-4,6-diol in aqueous media.

EXPERIMENTAL

Melting points were measured on an Elecrtothermal 9100 apparatus and are uncorrected. Mass spectra were recorded on a FINNIGAN-MAT 8430 mass spectrometer operating at an ionization potential of 70 eV. ^{1}H and ^{13}C NMR spectra were recorded on a BRUKER DRX-300 AVANCE spectrometer at 300.13 and 75.47 MHz, respectively. IR spectra were recorded

Table 1

Conditions effect on the reaction.[a]

Entry	Conditions	Cat.	Yield (%)
1	Water/80°C	*p*-TSA	65
2	Water (reflux)	*p*-TSA	90

2-Amino-1′-ethyl-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4c). Light brown powder (85%); mp 211°C (dec.); ir (KBr) (ν_{max} /cm^{-1}): 3349 (NH_2), 2196 (CN), 1717, 1668 and 1626 (CO). MS (EI, 70 eV) *m*/*z* (%): 397 (M^+, 100), 353 (100), 312 (58), 105 (40), 76 (45). ^{1}H NMR (300 MHz, DMSO-d_6): δ_H 1.25 (3H, t, *J* = 3.5 Hz, CH_3), 3.72–3.88 (2H, m, CH_2), 6.97 (t, *J* = 6.1 Hz, 1H, H—Ar), 7.12 (d, *J* = 6.0 Hz, 1H, H—Ar), 7.28–7.32 (m, 2H, H—Ar), 7.62 (s, 2H, NH_2), 7.78–7.88 (m, 3H, H—Ar), 8.06 (d, *J* = 6.2 Hz, 1H, H—Ar). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 12.6, 47.9, 57.15, 109.1, 117.1, 119.7, 122.9, 124.6, 126.5, 126.7, 129.5, 130.7, 130.9, 134.2, 134.9, 135.2, 142.5, 150.9, 159.1, 175.9, 176.7, 182.2. Anal. Calcd for $C_{23}H_{15}N_3O_4$: C, 69.52; H, 3.80; N, 10.57%. Found: C, 69.47; H, 3.86; N, 10.51%.

2-Amino-5′-nitro-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4d). Light brown powder (85%); mp 290°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3354 (NH_2), 3203 (NH), 2216 (CN), 1749, 1673, and 1629 (CO). MS (EI, 70 eV) *m*/*z* (%): 414 (M^+, 28), 371 (87), 324 (58), 297 (37), 174 (28), 105 (65), 43 (100). ^{1}H NMR (300 MHz, DMSO-d_6): δ_H 7.12 (d, *J* = 6.1 Hz, 1H, H—Ar), 7.80–7.89 (m, 5H, NH_2, 3H—Ar), 8.08 (d, *J* = 6.4 Hz, 1H, H—Ar), 8.19–8.22 (m, 1H, H—Ar), 8.33 (brs, 1H, H—Ar), 11.45 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 48.5, 56.0, 110.2, 117.1, 118.4, 120.8, 126.5, 126.7, 130.8, 135.0, 135.2, 135.6, 143.0, 148.6, 151.4, 159.3, 176.7, 178.5, 182.5. Anal. Calcd for $C_{21}H_{10}N_4O_6$: C, 60.88; H, 2.43; N, 13.52%. Found: C, 60.93; H, 2.47; N, 13.58%.

2-Amino-1′-methyl-5′-nitro-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4e). Light brown powder (94%); mp 320°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3335 (NH_2), 2197 (CN), 1728, 1668, and 1632 (CO). MS (EI, 70 eV) *m*/*z* (%): 428 (M^+, 83), 384 (55), 364 (35), 254 (55), 224 (55), 174 (53), 76 (100). ^{1}H NMR (300 MH$_Z$, DMSO-d_6): δ_H 3.34 (s, 3H, CH_3), 7.38 (d, *J* = 8.8 Hz, 1H, H—Ar), 7.08–7.89 (m, 5H, NH_2, 3H—Ar), 8.07 (d, *J* = 8.9 Hz, 1H, H—Ar), 8.29–8.33 (m, 1H, H—Ar), 8.38–8.39 (m, 1H, H—Ar). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 29.7, 111.6, 119.2, 122.7, 128.7, 128.9, 129.0, 133.0, 133.1, 136.9, 137.2, 137.4, 145.8, 151.7, 161.6, 178.8, 179.3, 184.7. Anal. Calcd for $C_{22}H_{12}N_4O_6$: C, 61.69; H, 2.82; N, 13.08%. Found: C, 61.75; H, 2.77; N, 13.00%.

2-Amino-1′-ethyl-5′-nitro-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4f). Light brown powder (97%); mp 287°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3350 (NH_2), 2200 (CN), 1727, 1669, and 1630 (CO). MS (EI, 70 eV) *m*/*z* (%): 442 (M^+, 100), 398 (73), 367 (30), 297 (25), 105 (73), 76 (87). ^{1}H NMR (300 MHz, DMSO-d_6): δ_H 1.26 (t, 3H, *J* = 6.78 Hz, CH_3), 3.86–3.96 (m, 2H, CH_2), 7.43 (d, *J* =

8.7 Hz, 1H, H—Ar), 7.80–7.89 (m, 5H, NH_2, 3H—Ar), 8.08 (d, *J* = 8.8 Hz, 1H, H—Ar), 8.27–8.30 (m, 1H, H—Ar), 8.38 (brs, 1H, H—Ar). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 12.6, 35.6, 47.8, 55.8, 109.3, 116.9, 118.2, 120.7, 126.5, 127.7, 130.8, 130.9, 135.1, 135.2, 143.4, 148.6, 151.6, 159.3, 176.6, 176.7, 182.5. Anal. Calcd for $C_{23}H_{14}N_4O_6$: C, 62.45; H, 3.19; N, 12.66%. Found: C, 62.39; H, 3.15; N, 12.61%.

2-Amino-5′-bromo-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4g). Light brown powder (86%); mp 275°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3378 (NH_2), 3305 (NH), 2200 (CN), 1741, 1672, and 1651 (CO). MS (EI, 70 eV) *m*/*z* (%): 449 (M^++2, 40), 447 (M^+, 40), 405 (70), 76 (100). ^1H NMR (300 MHz, DMSO-d_6): δ_H 6.85 (d, *J* = 8.9 Hz, 1H, H—Ar), 7.37–8.05 (m, 6H, H—Ar), 7.83 (brs, 2H, NH_2), 10.83 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 48.6, 56.7, 111.9, 114.1, 117.3, 119.1, 126.5, 127.6, 130.8, 130.9, 132.0, 134.9, 135.2, 137.2, 141.5, 151.1, 159.1, 176.7, 177.6, 182.4. Anal. Calcd for $C_{21}H_{10}BrN_3O_4$: C, 56.27; H, 2.25; N, 9.37%. Found: C, 56.33; H, 2.20; N, 9.44%.

2-Amino-5′-bromo-1′-methyl-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4h). Light brown powder (93%); mp 282°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3357 (NH_2), 2196 (CN), 1712, 1664, 1629 (CO). MS (EI, 70 eV) *m*/*z* (%): 464 (M^+ +2, 18), 462 (22), 419 (50), 391 (38), 105 (67), 76 (100). ^1H NMR (300 MHz, DMSO-d_6): δ_H 3.23 (s, 3H, CH_3), 7.09 (d, *J* = 6.3 Hz, 1H, H—Ar), 7.49–7.59 (m, 2H, H—Ar), 7.73 (s, 2H, NH_2), 7.82–7.87 (m, 3H, H—Ar), 8.06–8.09 (m, 1H, H—Ar).^{13}C NMR (75 MHz, DMSO-d_6): δ_C 27.1, 48.1, 56.4, 111.0, 114.9, 117.1, 118.9, 126.5, 126.7, 127.5, 130.8, 130.9, 132.1, 134.9, 135.2, 136.1, 142.9, 151.2, 159.2, 176.1, 176.7, 182.3. Anal. Calcd for $C_{22}H_{12}BrN_3O_4$: C, 57.16; H, 2.62; N, 9.09%. Found: C, 57.10; H, 2.67; N, 9.16%.

2-Amino-5′-bromo-1′-ethyl-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4i). Brown powder (80%); mp 288°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3336 (NH_2), 2205 (CN), 1721, 1677, and 1632 (CO). MS (EI, 70 eV) *m*/*z* (%): 477 (M^++2, 55), 475 (M^+, 55), 433 (85), 105 (38), 76 (100). ^1H NMR (300 MHz, DMSO-d_6): δ_H 1.21 (t, 3H, *J* = 6.79 Hz, CH_3), 3.71–3.87 (m, 2H, CH_2), 7.12 (d, *J* = 9.1 Hz, 1H, H—Ar), 7.49 (d, *J* = 7.9 Hz, 1H, H—Ar), 7.59 (brs, 1H, H—Ar), 7.71 (s, 2H, NH_2), 7.81–8.08 (m, 4H, H—Ar). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 12.5, 35.1, 47.9, 56.5, 111.1, 114.7, 117.0, 118.9, 126.5, 126.7, 127.6, 130.8, 130.9, 132.1, 134.9, 135.2, 136.4, 141.9, 151.2, 159.2, 175.6, 176.7, 182.3. Anal. Calcd for $C_{23}H_{14}BrN_3O_4$: C, 58.00; H, 2.96; N, 8.82%. Found: C, 57.93; H, 2.90; N, 8.89%.

2-Amino-5′-methyl-2′,5,10-trioxo-5,10-dihydrospiro[benzo[*g*]chromene-4,3′-indoline]-3-carbonitrile (4j). Light brown powder (98%); mp 310°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3349 (NH_2), 3224 (NH), 2186 (CN), 1724, 1663, and 1631 (CO). MS (EI, 70 eV) *m*/*z* (%): 383 (M^+, 100), 339 (100), 311 (33), 282 (50), 104 (30), 76 (80). ^1H NMR (300 MHz, DMSO-d_6): δ_H 3.03 (3H, s, CH_3), 6.75–6.79 (m, 1H, H—Ar), 6.99–7.01 (m, 1H, H—Ar), 7.06 (brs, 1H, H—Ar), 7.57 (s, 2H, NH_2), 7.81–7.89 (m, 3H, H—Ar), 8.05–8.077 (m, 1H, H—Ar) 10.59 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 21.0, 48.5, 57.5, 109.7, 117.4, 120.0, 122.2, 126.4, 126.6, 129.5, 130.7, 131.0, 131.2, 134.8, 135.0, 135.2, 139.6, 150.8, 159.0, 176.8, 177.9, 182.2. Anal. Calcd for $C_{22}H_{13}N_3O_4$: C, 68.93; H, 3.42; N, 10.96%. Found: C, 68.99; H, 3.37; N, 11.04%.

Typical procedure for the preparation of 7′-amino-2′-methyl-2,4′-dioxo-3′,4′-dihydrospiro[indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitrile (7a). A mixture of malononitrile **2** (0.07 g, 1mmol), isatin **3** (0.15 g, 1mmol), 2-methylpyrimidine-4,6-diol **6** (0.13 g, 1 mmol), *p*-TSA (0.1 g) was refluxed in water (5 mL) for 24 h (TLC). After cooling to room temperature, the resulting solid product was filtered, and the precipitate was washed with ethanol to afford the pure product **7a.** Cream powder (80%); mp 287°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3378 (NH_2), 3306 (NH), 3142 (NH), 2207 (CN), 1716 and 1676 (CO). MS (EI, 70 eV) *m*/*z* (%): 321 (M^+). ^1H NMR (300 MHz, DMSO-d_6): δ_H 2.27 (s, 3H, CH_3), 6.78–7.18 (m, 4H, ArH), 7.31 (s, 2H, NH_2), 10.49 (s, 1H, NH), 12.61 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 21.4, 47.9, 57.1, 98.3, 109.7, 117.9, 122.2, 124.0, 128.8, 134.0, 142.6, 160.0, 160.3, 160.8, 161.0, 177.9. Anal. Calcd for $C_{16}H_{11}N_5O_3$: C, 59.81; H, 3.45; N, 21.80. Found: C, 59.76; H, 3.41; N, 21.86.

7′-Amino-2′-methyl-5-nitro2,4′-dioxo-3′,4′-dihydrospiro [indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitrile (7b). Cream powder (82%); mp 270°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3471 (NH_2), 3363 (NH), 2202 (CN), 1704, and 1658 (CO). MS (EI, 70 eV) *m*/*z* (%): 366 (M^+). ^1H NMR (300 MHz, DMSO-d_6): δ_H 2.28 (s, 3H, CH_3), 7.02 (d, *J* = 8.8 Hz, 1H, ArH), 7.50 (s, 2H, NH_2), 8.04 (s, 1H, ArH), 8.16 (d, *J* = 8.6 Hz, 1H, ArH), 11.24 (s, 1H, NH), 12.68 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 21.5, 48.1, 55.4, 97.2, 109.9, 117.7, 120.0, 126.4, 134.9, 142.9, 149.1, 160.4, 160.8, 161.1, 161.2, 178.7. Anal. Calcd for $C_{16}H_{10}N_6O_5$: C, 52.46; H, 2.75; N, 22.94. Found: C, 52.50; H, 2.80; N, 22.88.

7′-Amino-1,2′-dimethyl-5-nitro2,4′-dioxo-3′,4′-dihydrospiro [indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitrile (7c). Cream powder (65%); mp 180°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3429 (NH_2), 3322 (NH), 2202 (CN), 1730, and 1667 (CO). MS (EI, 70 eV) *m*/*z*(%): 380 (M^+). ^1H NMR (300 MHz, DMSO-d_6): δ_H 2.29 (s, 3H, CH_3), 3.25 (s, 3H, CH_3), 7.30 (d, *J* = 9.0 Hz, 1H, ArH), 7.57 (s, 2H, NH_2), 8.11 (s, 1H, ArH), 8.27 (d, *J* = 8.9 Hz, 1H, ArH), 12.66 (s, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C. 21.5, 27.3, 47.7, 55.1, 97.1, 108.9, 117.6, 119.6, 126.4, 134.2, 143.4, 150.1, 160.6, 160.9, 161.0, 161.1, 177.3. Anal. Calcd for $C_{17}H_{12}N_6O_5$: C, 53.69; H, 3.18; N, 22.10. Found: C, 53.64; H, 3.22; N, 22.18.

7′-Amino-1-ethyl-2′-methyl-5-nitro2,4′-dioxo-3′,4′-dihydrospiro[indoline-3,5′-pyrano[2,3-*d*]pyrimidine]-6′-carbonitrile (7d). Cream powder (63%); mp 233°C (dec.); ir (KBr) (ν_{max}/cm^{-1}): 3481 (NH_2), 3325 (NH), 2197 (CN), 1755, 1668, and 1647 (CO). MS (EI, 70 eV) *m*/*z* (%): 394 (M^+). ^1H NMR (300 MHz, DMSO-d_6): δ_H 1.17 (t, *J* = 8.4 Hz, 3H, CH_3), 2.22 (s, 3H, CH_3), 3.74 (m, 2H, CH_2), 7.10 (d, *J* = 8.9 Hz, 1H, ArH), 7.59 (s, 2H, NH_2), 8.14 (d, *J* = 8.9 Hz, 1H, ArH), 8.14 (s, 1H, ArH), 12.16 (brs, 1H, NH). ^{13}C NMR (75 MHz, DMSO-d_6): δ_C 11.9, 18.0, 34.9, 39.07, 48.5, 95.3, 107.5, 118.4, 125.3, 135.3, 141.8, 150.6, 158.2, 161.4, 171.8, 178.6. Anal. Calcd for $C_{18}H_{14}N_6O_5$: C, 54.82; H, 3.58; N, 21.31. Found: C, 54.86; H, 3.63; N, 21.36.

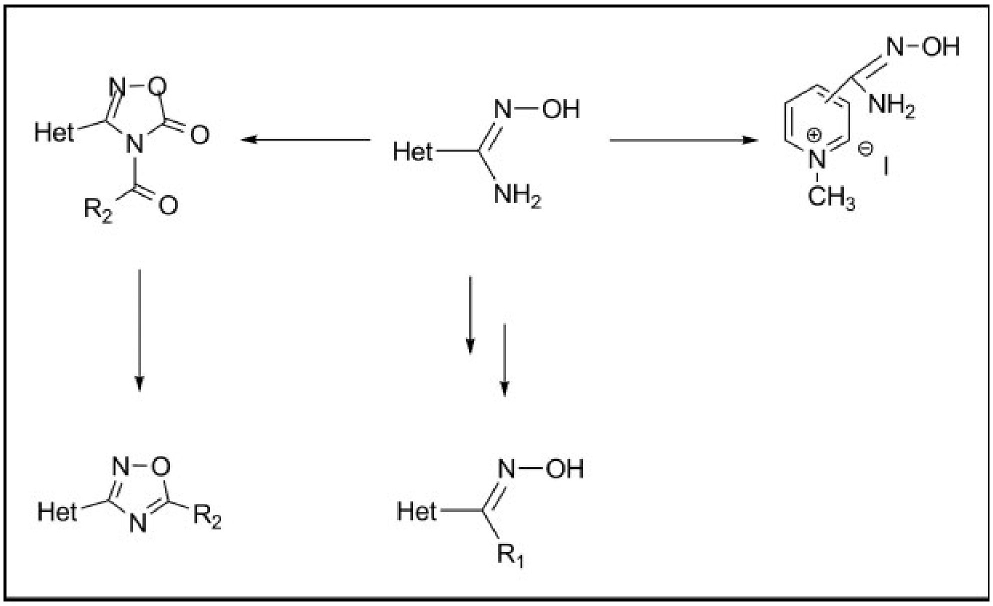
DOI 10.1002/jhet.251



The new pyridine, 4-pyridine *N*-oxide and pyrazine derivatives exhibiting an antibacterial activity have been synthesized. Amidoximes were transformed into *N*-hydroxyimidoyl chlorides and then into appropriate oximes. Upon treatment of pyridinecaboxamidoximes with methyl iodide 1-methylpyridynium iodides were formed. Reaction of amidoximes with various carbamoyl chlorides led to corresponding 5-aminocarbonyl-1,2,4-oxadiazoles. Some of carboxamides have undergone thermal decarboxylation to tertiary amines. The newly synthesized compounds were tested *in vitro* for their tuberculostatic activity. MIC of the most active compound **9** was 12.5 μg/mL for $H_{37}Rv$ strain. Their activity towards 25 strains of anaerobic and 25 strains of aerobic bacteria was also studied. Derivative **18** was active against both aerobic and anaerobic types of the bacteria.

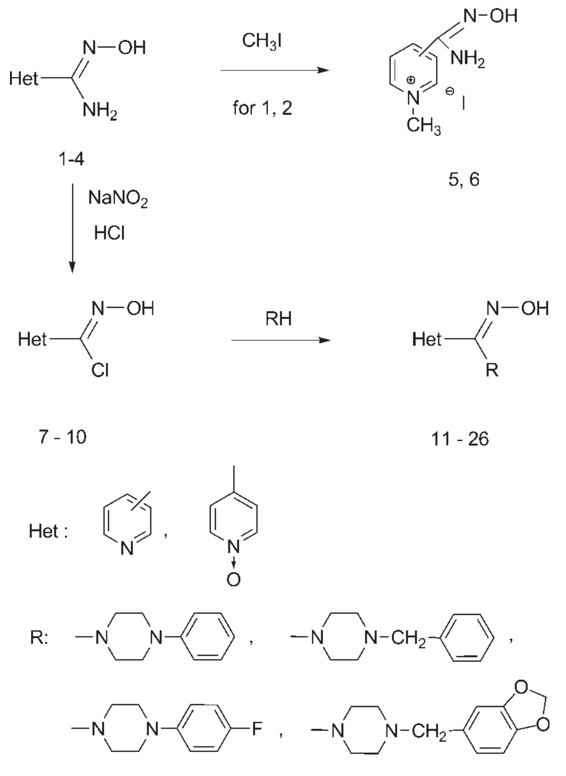
J. Heterocyclic Chem., **46**, 1271 (2009).

INTRODUCTION

Infections caused by *Mycobacteria* (*M. tuberculosis*, *M. avium*, *M. kansasaii*, *M. bovis*) are known to express multidrug-resistance toward most chemicals, disinfectants and number of antibiotics and chemotherapeutics as a consequence of single point mutations [1]. This phenomenon is very dangerous especially for HIV-infected individuals because of significantly increased risk of the infection progress to active disease. Other pathogenic strains, e.g. *Streptococcus pneumonia*, *Staphylococcus aureus*, *Enterococcus faecium*, also exhibit multidrug-resistance but mediated by other gene changes [2]. Thus antimicrobial therapy with a combination of different drugs is required and new active compounds for first-line therapy are needed.

In the last few years, many isoniazide and pyrazinamide derivatives have been synthesized. Few groups demonstrate high activity against *M. tuberculosis*: 2′-monosubstituted isonicotinohydrazides [3], isonicotinoylhydrazones [4], pyridine-2-carboxamidrazones [5,6] and 2-pyrazine or 3-pyridine-1,2,4-oxadiazole-5-ones [7]. Various pyridinium halides also exhibit antibacterial activity [8–10]. In our previous papers, we reported tuberculostatic activity of 4-mono- and 4-disubstituted pyridoyl thiosemicarbazides [11] and some derivatives

Scheme 1



of 5-substituted 3-pyrazine-1,2,4-oxadiazoles [12]. Further studies on antituberculosis agents active against multidrug- resistant strains prompted us to synthesize a series of new pyridine, pyridine-4-*N*-oxide and pyrazine derivatives possessing substituted amidoxime group or 1,2,4-oxadiazole ring substituted with amide in 4-position or amine group in 5-position. Both types of compounds could be synthesized from the same substrates, derivatives possessing carboxamidoxime functional group [13]. We now report on the synthesis and *in vitro* evaluation of their antibacterial and antituberculostatic activities *in vitro*.

RESULTS AND DISCUSSION

Carboxamidoximes **1–4** and **27** were obtained in reaction of appropriate carbonitriles with hydroxylamine. Methylation of 3- and 4-pyridinecarboxamidoximes **2**, **3** on pyridine nitrogen atom was performed with methyl iodide in anhydrous dioxane and resulted in 1-methylpyridynium iodides **5**, **6** formation (Scheme 1).

Compounds **2** and **3** also reacted with methyl iodide in alkaline solution but both pyridine nitrogen and amidoxime oxygen underwent methylation. *N*-hydroxycarboximidoylchlorides **7–10** were prepared from corresponding carboxamidoximes on treatment with sodium nitrite in hydrochloric acid solution at 0°C. Syntheses performed for pyridine derivatives required an use of sodium hydrogen carbonate to isolate products from reaction mixtures at pH 3. The obtained chlorides were used for the synthesis of appropriate oximes **11–26**. The reactions with secondary amines were performed in mole ratio 1:2 to neutralize hydrochloride generated during the reactions. Anhydrous dioxane was used as the solvent and reactions took about 15 min. In the case of oximes synthesized as pyridine *N*-oxide derivatives **23–26** refluxing time was prolonged to 1.5 h.

Amidoximes **1–4** and **27** were also treated with triple excess of appropriate carbamoyl chlorides in pyridine environment giving expected 3,4-disubstituted 5-oxo-[1,2,4]oxadiazoles **32–45** (Scheme 2) as a result of intramolecular nucleophilic attack of NH nitrogen electron pair for carbonyl carbon of carbamoyl moiety bound to OH oxygen instead proton. That attack followed substitution of OH proton and one of NH_2 protons by two carbamoyl moieties agreeably to mechanism proposed earlier by Marquez and DiPersia [14]. In two cases, the rate of that reaction was different resulting in formation of 3-monosubstituted 1,2,4-oxadiazole-5(4*H*)-ones **30** and **31** (method A). Those products forms probably as result of fast attack of NH_2 nitrogen electron pair for carbonyl carbon before NH_2 proton was substituted by carbamoyl (Scheme 3). Similar result was reached in control reactions between corresponding amidoximes and ethyl chloroformate (method B). Obtained compounds **28** and **29** were next transformed to 3,4-disubstituted derivatives by substitution in N4 position. Two amides **34** and **37** were undergone thermal decarboxylation at 215°C to tertiary amines **46** and **47**.

Characteristics of newly synthesized compounds have been presented in Table 1.

The investigations of aerobic and anaerobic bacteria susceptibility to the synthesized pyridine derivatives are summarized in Table 2. The results have been compared with that obtained while testing the susceptibility of the same bacteria to metronidazole (for anaerobes) and amikacin (for aerobes).

Low metronidazole concentrations in range ≤0.1–3.1 µg/mL inhibited the growth of Gram-negative bacteria except single strains of *Bacteroides fragilis*, *B. forsythus* and *Fusobacerium necrophorum*. These results were coincided with those obtained by other authors [15,16]. The lowest susceptibility to metronidazole exhibited Gram-positive rods from *Propionibacterium acnes* species (MIC > 12.5 µg/mL). Among 26 tested derivatives 24 (92%) exhibited differential activity against anaerobic bacteria (8–52% of the tested strains). The anaerobes were the most susceptible at concentrations in ranges from ≤6.2 to 100 µg/mL to derivatives **24** and **26** (52% were susceptible) and to compound **9** (40% of susceptible strains). The aerobic bacteria were generally not susceptible to compounds **13** and **15** in mentioned range of concentrations. Among 24 derivatives active towards anaerobic bacteria, 21 were more effective to Gram-positive strains. Compounds **30** (MIC 25–100 µg/mL, 100% of susceptible strains), **9** and **24** (MIC ≤6.2–100 µg/mL, 89%) exhibited the highest activity. Derivatives **26**, **27**, and **29** were more active against Gram-negative anaerobic rods. Compound **27** was the most active one (MIC ≤6.2–100 µg/mL, 38%).

Only one from 30 (3%) tested compounds was active towards aerobic bacteria. Derivative **18** was active in concentration 50–100 µg/mL and inhibited the growth of 16% of the tested aerobic bacteria. Other compounds did not inhibit the growth of aerobic bacteria in the range of tested concentration (≤6.2–200 µg/mL). Derivative **18** was active against both aerobic and anaerobic types of bacteria.

The standard strains of both types of bacteria exhibited rather high resistance towards tested compounds (MIC ≥ 200 µg/mL). In the case of anaerobic *Fusobacterium nucleatum*, ATCC 25586 compounds **21** (MIC 100 µg/mL), **23** (MIC 100 µg/mL) and **15** (MIC 100 µg/mL) were active. Derivative **18** induced the growth inhibition of *Bacteroides vulgatus* ATCC 8482 in concentration of 100 µg/mL. That compound also inhibited the growth of two aerobic standard strains: *Klebsiella pneumoniae* ATCC 13883 and *Staphylococcus aureus* ATCC 25923 and MIC value for that derivative was 100 µg/mL in both casas.

The determined minimum concentrations inhibiting the growth of tuberculous strains (MIC) for most of the tested compounds were within the limits 12–100 µg/mL. MIC of the most active compound **9** was 12.5 µg/mL for $H_{37}Rv$ strain and 25 µg/mL for other strains.

In conclusion, the present research showed that reaction between carboxamidoximes and carbamoyl chlorides can occur according to two different rates. One derivative (**18**) exhibited wide spectrum of antibacterial activity but it did not performe better that metronidazole against anaerobes and amikacin against aerobes. Other compound (**9**) exhibited interesting tuberculostatic activity and it can be good lead structure for further modifications.

EXPERIMENTAL

All materials and solvents were of analytical reagent grade. Thin-layer chromatography was performed on Merck silica gel $60F_{254}$ plates and visualized with UV. The results of elemental analyses (%C, H, N) for all of obtained compounds were in agreement with calculated values within ± 0.3 % range. ^1H NMR spectra in $CDCl_3$ or DMSO-d_6 were recorded on Varian Unity Plus (500 MHz) and Varian Gemini (200 MHz) instruments. IR Spectra (KBr) were determined as KBr pellets of the solids on a Satellite FT-IR spectrophotometer. Mass spectra for compounds **28**, **29**, and **46** were taken on Finingan MAT 95 by a chemical ionization method with isobutane. Melting points were determined on BOETIUS apparatus and were uncorrected.

Pyridinecarboxamidoximes (1–3). To a stirred solution of hydroxylamine hydrochloride (7 g, 0.1 mol) in methanol (50 mL) a solution of potassium hydroxide (6 g, 0.1 mol) in methanol was added. The precipitated potassium chloride was filtered off and appropriate pyridinecabonitrile (7 g, 60 mmol) was added to the clear filtrate. Reaction mixture was refluxed for 1 h and after cooling the final solid of **3** was filtered off, washed with water and dried at room temperature. The crude product was recrystallized to afford of bright leaflets (7.5 g). To isolate two other isomers final reaction mixtures were evaporated and 20 mL of water was added to the residue. The crude products were filtered off after cooling and purified by crystallization yielding 8 g of **1** and 6.7 g of **2**.

2-Pyridinecarboxamidoxime (1). This compound was obtained as colorless short needles. Yield 87%; m.p. 117–118°C. (ref. [17], m.p. 117°C).

3-Pyridinecarboxamidoxime (2). This compound was obtained as colorless small needles. Yield 73%; m.p. 131–133°C. (ref. [17], m.p. 131°C).

4-Pyridinecarboxamidoxime (3). This compound was obtained as colorless small needles. Yield 82%; m.p. 197–199°C. (ref. [17], m.p. 207°C).

[a] Metronidazole (Sigma).

[b] Amikacin sulfate salt (Sigma).

1-Oxy-isonicotincarboxamidoxime (4). A 7.2 g (60 mmol) quantity of 4-cyanopyridine N-oxide was dissolved in 50 mL of hot water and then water solution of hydroxylamine was added in small portions with stirring. Hot reaction mixture was left at room temperature for 1 h then cooled and precipitate was filtered and recrystallized giving 6.85 g of small colorless needles. Hydroxylamine solution was prepared by mixing 7 g (0.1 mol) of hydroxylamine hydrochloride in 10 mL of water with 6 g (0.1 mol) of potassium hydroxide in 10 mL of water. IR: 3416, 3296, 3180, 2834, 1644, 1608, 1500, 1439, 1379, 1226, 1189, 1099, 1036, 946, 863 cm^{-1}; ^1H NMR (200 MHz, $CDCl_3$): δ 6.03 (s; 2H, NH_2), 7.65 (m; 2H, 4-pyridyl), 8.20 (m; 2H, 4-pyridyl), 10.07 (s; 1H, OH) ppm.

***N*-hydroxycarbamimidoyl-1-methyl-pyridynium iodides (5, 6).** 1.3 g (10 mmol) of **2** or **3** was dissolved in hot anhydrous dioxane. After cooling to room temperature 2.5 mL (40 mmol) of methyl iodide was added. Reaction mixture was refluxed for 1 h then left at room temperature for next 1 h. After cooling precipitate was filtered and recrystallized to afford 2.6 g (**5**) and 2.7 g (**6**) of the product.

N-hydroxycarbamimidoyl-1-methyl-3-pyridynium iodide (5). This compound was obtained as light yellow prisms. IR: 3389, 3286, 1639, 1592, 1506, 1462, 1416, 1361, 1299, 1206, 953, 898, 876, 669 cm^{-1}; ^1H NMR (200 MHz, DMSO-d_6): δ 4.37 (s; 3H, N^+CH_3), 6.33 (s; 2H, NH_2), 8.14 (q; 1H, 3-pyridyl, J_1 8.3 Hz, J_2 6 Hz), 8.70 (d; 1H, 3-pyridyl, J 8.3 Hz), 8.96 (d; 1H, 3-pyridyl, J 6 Hz), 9.19 (s; 1H, 3-pyridyl), 10.39 (s; 1H,OH) ppm.

N-hydroxycarbamimidoyl-1-methyl-3-pyridynium iodide (6). This compound was obtained as light yellow prisms. IR: 3462, 3342, 1649, 1624, 1557, 1525, 1410, 1360, 1289, 1225, 1196, 1081, 952, 839, 824 cm^{-1}; ^1H NMR (200 MHz, DMSO-d_6): δ 4.31 (s; 3H, N^+CH_3), 6.42 (s; 2H, NH_2), 8.26 (d; 2H, 4-pyridyl, J 6.4 Hz), 8.94 (d; 2H, 4-pyridyl, J 6.4 Hz), 10.92 (s; 1H, OH) ppm.

***N*-Hydroxy-pyridinecarboximidoyl chlorides (7–9).** Appropriate pyridinecarboxamidoxime **1–3** (2.8 g, 20 mmol) was dissolved in a mixture of concentrated hydrochloric acid (20 mL) and water (100 mL) at 0°C. Sodium nitrite (1.6 g, 23 mmol) in 10 mL of water was added dropwise and reaction mixture was stirred for 1 h at 0°C. Next saturated solution of sodium hydrogen carbonate was slowly added to the reaction mixture until pH 3 was reached. The precipitate was filtered, washed with ice-cold water and purified by crystallization giving 2.8 g (**7**), 1.6 g (**8**), and 2.5 g (**9**) of the product.

N-Hydroxy-2-pyridinecarboximidoyl chloride (7). This compound was obtained as white small crystals. Yield: 80%; m.p. 120–122°C (ref. [18], m.p. 126–128°C.

N-Hydroxy-2-pyridinecarboximidoyl chloride (8). This compound was obtained as white small crystals. Yield: 80%; m.p. 129–131°C (ref. [18], m.p. 142–145°C).

N-Hydroxy-2-pyridinecarboximidoyl chloride (9). This compound was obtained as white small crystals 138–139°C (ref. [18], m.p. 148–150°C).

1-Oxide-*N*-hydoxy-4-pyridinecarboximidoyl chloride (10). 5.6 g of **4** (10 mmol) was dissolved in 40 mL of concentrated hydrochloric acid. The reaction mixture was cooled to temperature 0°C. Next sodium nitrite (5.5 g, 80 mmol) in water (10 mL) was added dropwise and mixture was stirred for 0.5 h. The precipitate was filtered and washed with ice-cold water. The crude product was recrystallized yielding bright needles (4.2 g). IR: 3098, 2520, 1603, 1550, 1476, 1444, 1232, 1213, 1183,1029, 959, 838, 623 cm^{-1}; ^1H NMR (500 MHz, DMSO-d_6): δ 7.73 (d; 2H, 4-pyridyl, J 7.5 Hz) 8.26 (d;2H, 4-pyridyl, J 20 Hz), 12.85 (s;1H, OH) ppm.

General procedure for the synthesis of pyridylmethanone oximes (11–26). A 0.78 g (5mmol) quantity of carboximidoyl chlorides **7–10** was dissolved in 10 mL of anhydrous dioxane. Next 10 mmol of appropriate secondary amine was added dropwise. Solid amines, 1-(4-flourophenyl)piperazine and 1-piperonylpiperazine, were dissolved in a small volume of the solvent (5 mL). The reaction mixture was heated under reflux for 15 min. In the case of 1-oxy-isonicitin derivatives, **23–26** refluxing time was prolonged for 1.5 h. The solvent was evaporated and 40 mL of ice-cold water was added to the residue. The precipitate was filtered, washed with water and recrystallized from suitable solvent yielding the solid.

4-Phenylpiperazin-1-yl-pyridin-2-yl-methanone oxime (11). This compound was obtained as white powder. IR: 3457, 2844, 1615, 1595, 1502, 1448, 1382, 1340, 1276, 1236, 1167, 1153, 951, 789, 754, 685 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): δ 3.27 (s; 8H, NCH_2), 6.89–7.00 (m; 3H, ArH), 7.28 (m; 3H, 2H ArH and 1H 2-pyridyl), 7.38 (M; 1H, 2-pyridyl), 7.61 (m; 1H, 2-pyridyl), 7.85 (m; 1H, 2-pyridyl), 8.72 (s; 1H, OH) ppm.

4-Benzylpiperazin-1-yl-pyridin-2-yl-methanone oxime (12). This compound was obtained as white powder. IR: 3168, 3053, 2826, 1621, 1588, 1566, 1447, 1432, 1385, 1275, 1172, 1140, 966, 943, 791, 754, 704 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): δ 2.53 (s; 4H, NCH_2), 3.09 (s; 4H, NCH_2), 3.57 (s; 2H, NCH_2Ar), 7.31 (s; 6H, 5H ArH and 1H 2-pyridyl), 7.53 (s; 1H, 2-pyridyl), 7.79 (s; 1H, 2-pyridyl), 8.69 (s; 1H, 2-pyridyl), 9.18 (s;1H,OH) ppm.

4-(4-Fluorophenyl)piperazin-1-yl-pyridin-2-yl-methanone oxime (13). This compound was obtained as white powder. IR: 3207, 2828, 1631, 1512, 1455, 1434, 1390, 1236, 1170, 988, 953, 818, 789 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): 3.15–3.23 (dd; 8H, NCH_2, J_1 38 Hz, J_2 5 Hz), 6.90 (m; 4H, ArH), 7.50 (d; 3H, 2-pyridyl, J 7.8 Hz), 7.84 (m; 1H, 2-pyridyl), 8.72 (s; 1H, OH) ppm.

4-Piperonylpiperazin-1-yl-pyridin-2-yl-methanone oxime (14). This compound was obtained as white powder. IR: 3179, 2831, 1608, 1590, 1487, 1439, 1370, 1244, 1169, 1141, 1039, 975, 799 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): δ 2.49 (s; 4H, NCH_2), 3.08 (s; 4H, NCH_2), 3.47 (s;2H, NCH_2Ar), 5.93 (s; 2H, OCH_2O), 6.73 (s; 2H, ArH), 6.87 (s; 1H, ArH), 7.33–7.53 (m; 2H, 2-pyridyl), 7.80 (s;1H, 2-pyridyl), 8,69 (s;1H, 2-pyridyl), 9.07 (s; 1H, OH) ppm.

4-Phenylpiperazin-1-yl-pyridin-3-yl-methanone oxime (15). This compound was obtained as white powder. IR: 3151, 3037, 2843, 1599, 1497, 1446, 1337, 1242, 1153, 1014, 923, 899, 765, 695 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): δ 3.21, (s; 4H, NCH_2), 3.57 (s; 4H, NCH_2), 6.89–6.95 (m; 3H, ArH), 7.28–7.41 (m;4H, 2H ArH and 2H 3-pyridyl), 7.86 (s; 1H, OH), 8.75 (m; 2H, 3-pyridyl) ppm.

4-Benzylpiperazin-1-yl-pyridin-3-yl-methanone oxime (16). This compound was obtained as white powder. IR: 3173, 2820, 1615, 1593, 1454, 1416, 1380, 1266, 1157, 1142, 1031, 1010, 965, 742, 714, 699 cm^{-1}; ^1H NMR (500 MHz, $CDCl_3$): δ 2.47 (s; 4H, NCH_2), 3.05 (s; 4H, NCH_2), 3.54 (s; 2H, NCH_2ArH), 7.25–7.37 (m; 6H, 5H ArH and 1H 3-pyridyl), 7.80 (m; 1H, 3-pyridyl), 8.37 (s; 1H, OH), 8.65 (m; 2H, 3-pyridyl) ppm.

4-(4-Fluorophenyl)piperazin-1-yl-pyridin-3-yl-methanone oxime (17). This compound was obtained as white powder. IR: 3176, 3056, 2839, 1624, 1592, 1510, 1417, 1382, 1267, 1235, 1152, 1025, 982, 957, 815, 713 cm^{-1}; ^{1}H NMR 500 MHz, CDCl$_3$: 3.15 (d; 8H, NCH$_2$, *J* 48 Hz), 6.87–6.90 (m; 4H, ArH), 7.42 (m; 1H, 3-pyridyl), 7.88 (d; 1H, 3-pyridyl, *J* 7 Hz), 8.22 (brs;1H,OH) 8.70 (d; 2H, 3-pyridyl, *J* 45 Hz).

4-Piperonylpiperazin-1-yl-pyridin-3-yl-methanone oxime (18). This compound was obtained as white powder. IR: 3162, 2827, 1600, 1592, 1487, 1440, 1368, 1265, 1246, 1159, 1142, 1033, 969, 921, 869, 809, 714 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 2.45 (s; 4H, NCH$_2$), 3.04 (s; 4H, NCH$_2$), 3.42 (s; 2H, NCH$_2$Ar), 5.92 (s; 2H, OCH$_2$O), 6.72 (s; 2H, ArH), 6.84 (s; 1H, ArH), 7.37 (s; 1H, 3-pyridyl), 7.81 (s; 1H, 3-pyridyl), 8.18 (brs; 1H, OH), 8.62–8.69 (d; 2H, 3-pyridyl, *J* 33 Hz) ppm.

4-Phenylpiperazin-1-yl-pyridin-4-yl-methanone oxime (19). This compound was obtained as light beige powder. IR: 3063, 2889, 2851, 1633, 1600, 1496, 1410, 1383, 1243, 1150, 1023, 962, 927, 830, 760, 692 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 3.18 (s; 8H, NCH$_2$), 6.89 (m; 3H, ArH), 7.25 (t; 2H, ArH, *J* 7.5 Hz), 7.42 (d; 2H, 4-pyridyl, *J* 4.5 Hz), 8.03 (s; 1H, OH), 8.74 (d; 2H, 4-pyridyl, *J* 4.5 Hz) ppm.

4-Benzylpiperazin-1-yl-pyridin-4-yl-methanone oxime (20). This compound was obtained as small white crystals. IR: 3054, 2920, 2820, 1623, 1597, 1457, 1402, 1300, 1154, 1002, 967, 833, 743 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 2.50 (s; 2H, NCH$_2$), 2.60 (s; 2H, NCH$_2$), 3.06 (s; 2H, NCH$_2$), 3.45 (s; 2H, NCH$_2$), 3.57 (s; 1H, NCH$_2$Ar), 3.64 (s; 1H, NCH$_2$Ar), 7.26–7.39 (m; 7H, 5H ArH and 2H 4-pyridyl), 8.10 (brs; 1H, OH), 8.59 (d; 1H, 4-pyridyl, *J* 6 Hz), 8,68 (d; 1H, 4-pyridyl, *J* 5.5 Hz) ppm.

4-(4-Fluorophenyl)piperazin-1-yl-pyridin-4-yl-methanone oxime (21). This compound was obtained as white powder. IR: 3193, 3070, 2837, 1640, 1598, 1508, 1449, 1386, 1285, 1267, 1231, 1147, 1023, 959, 927, 825 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 3.15 (d; 8H, NCH$_2$, *J* 43 Hz), 6.83–7.14 (m; 4H, ArH), 7.26–7.51 (m; 3H, 2H 4-pyridyl and 1H OH), 8.15 (brs; 1H, OH) 8.75 (m; 2H, 4-pyridyl) ppm.

4-Piperonylpiperazin-1-yl-pyridin-4-yl-methanone oxime (22). This compound was obtained as white powder. IR: 3180, 3024, 2815, 1599, 1488, 1441, 1369, 1248, 1159, 1142, 1037, 973, 826 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 2.43 (s; 4H, NCH$_2$), 3.01 (s; 4H, NCH$_2$), 3.43 (s; 2H, NCH$_2$Ar), 5.92 (s; 2H, OCH$_2$O), 6.72 (s; 2H, ArH), 6.83 (s; 1H, ArH), 7.35 (s; 2H,4-pyridyl), 8.25 (s; 1H, OH), 8,69 (s; 2H, 4-pyridyl) ppm.

4-Phenylpiperazin-1-yl-1-oxide-pyridin-4-yl-methanone oxime (23). This compound was obtained as white powder. IR: 3141, 3027, 2832, 1597, 1481, 1453, 1383, 1235, 1173, 1157, 1012, 971, 860, 735 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 2.49 (s; 4H, NCH$_2$), 3.16 (s; 4H, NCH$_2$), 6.78 (t; 1H, ArH, *J* 7 Hz), 6.94 (d; 2H, ArH, *J* 8.5 Hz), 7.21 (t; 2H, ArH, J_1 8.5 Hz, J_2 7 Hz), 7.50 (d; 2H, 4-pyridine-N-oxide, *J* 6.5 Hz), 8.17 (d; 2H, 4-pyridine-N-oxide, *J* 6.5 Hz), 10.49 (s; 1H, OH) ppm.

4-Benzylpiperazin-1-yl-1-oxide-pyridin-4-yl-methanone oxime (24). This compound was obtained as white powder. IR: 3139, 3078, 2845, 1623, 1596, 1481, 1453, 1408, 1336, 1226, 1177, 1156, 1012, 928, 763, 632 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 3.05 (s; 4H, NCH$_2$), 3.17 (s; 4H, NCH$_2$), 3.33 (s; 2H, NCH$_2$Ar), 6.94–7.23 (m; 5H, ArH), 7.47 (d; 2H, 4-pyridine-N-oxide, *J* 6.5 Hz), 8.26 (d; 2H, 4-pyridine-N-oxide, *J* 6 Hz), 9.99 (s; 1H, OH) ppm.

4-(4-Fluorophenyl)piperazin-1-yl-1-oxide-pyridin-4-yl-methanone oxime (25). This compound was obtained as white powder. IR: 3174, 3059, 2848, 1637, 1614, 1442, 1375, 1361, 1221, 1186, 1147, 1037, 989, 965, 854, 834, 819 cm^{-1}; ^{1}H NMR (500 MHz, DMSO-d$_6$): δ 3.07 (dd; 8H, NCH$_2$, J_1 28 Hz, J_2 8 Hz), 6.94–7.06 (m; 4H, ArH), 7.45 (m; 2H, 4-pyridine-N-oxide), 8.25 (m; 2H, 4-pyridine-N-oxide), 9.98 (s;1H,OH) ppm.

4-Piperonylpiperazin-1-yl-1-oxide-pyridin-4-yl-methanone oxime (26). This compound was obtained as white powder. IR: 3055, 2901, 2839, 1612, 1488, 1439, 1369, 1230, 1179, 1156, 1035, 970, 854 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 2.44 (m; 4H, NCH$_2$), 2.89 (s; 2H, NCH$_2$Ar), 3.42 (m; 4H, NCH$_2$), 5.97 (s; 2H, OCH$_2$O), 6.73–6.87 (m;3H, ArH), 7.42 (dd; 2H, 4-pyridine-N-oxide, J_1 25 Hz, J_2 7 Hz), 8.20 (dd; 2H, 4-pyridine-N-oxide, J_1 27 Hz, J_2 7 Hz), 9.89 (s; 1H,OH) ppm.

Pyrazinecarboxamidoxime (27). This compound was obtained as light beige needles according to method described earlier [19]. Yield: 96%; m.p. 186–187°C (lit. ref. [19], m.p. 186–187°C).

1,2,4-Oxadiazol-5-ones (28, 29). *Method A*. In 10 mL of dry pyridine 0.01 mol of appropriate carboxamidoxime was dissolved and 0.03 mol of carbamoyl chloride was added. The mixture was refluxed for 3 h. Then pyridine was evaporated and residue was cooled. Precipitate was filtered, washed with cold water and recrystallized. *Method B*. In 10 mL of dry pyridine 5 mmol of appropriate carboxamidoxime was dissolved and 0.956 mL (10 mmol) of ethyl chloroformate was added. The mixture was refluxed for 6 h. Then pyridine was evaporated and residue was cooled. Precipitate was filtered, washed with cold water and recrystallized with addition of active carbon.

3-Pyridin-3-yl-4H-[1,2,4]oxadiazol-5-one (28). This compound was obtained as small beige needles. IR: 3060, 2936, 1772, 1604, 1558, 1511, 1477, 1416, 1359, 1223, 1141, 1124, 1051, 1029, 915, 892, 761 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 7.63 (t; 1H, 3-pyridyl, J_1 3.0 Hz, J_2 5.0 Hz), 8.17 (q; 1H, 3-pyridyl, J_1 4.7 Hz, J_2 1.8 Hz), 8.79 (d; 1H, 3-pyridyl, *J* 4.9 Hz), 8.97 (s; 1H, 3-pyridyl), 12.8–13.4 (brs; 1H, NH) ppm. MS: m/z 164 (100 MH$^+$), 120 (32.4).

3-Pyridin-4-yl-4H-[1,2,4]oxadiazol-5-one (29). This compound was obtained as small white needles. IR: 3104, 3057, 1636, 1547, 1471, 1409, 1308, 1259, 1223, 1151, 1099, 1000, 933, 884, 846, 778 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 7.75 (q; 2H, 4-pyridyl, J_1 1.8 Hz, J_2 2.7 Hz), 8.82 (q; 2H, 4-pyridyl, J_1 1.7 Hz, J_2 2.8 Hz), 12.40–13.40 (brs; 1H, NH) ppm. MS: m/z 164 (62.6 MH$^+$), 120 (100).

1,2,4-Oxadiazole-5-ones (30, 31). Synthesis was performed according to procedure described above for compounds **28**, **29** *method B*.

3-Pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (30). This compound was obtained as small beige crystals. Yield: 63%; m.p. 259–261°C (ref. [12], m.p. 260–262°C).

3-Pyridin-2-yl-4H-[1,2,4]oxadiazol-5-one (31). This compound was obtained as small beige needles. IR: 3061, 1788, 1585, 1567, 1496, 1460, 1419, 1301, 1114, 1096, 990, 953, 893, 798 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 7.62–7.86 (m; 1H, 2-pyridyl), 7.95–8.09 (m; 2H, 2-pyridyl), 8.75 (m; 1H, 2-pyridyl), 12.85–13.40 (brs; 1H, NH) ppm.

4-Aminocarbonyl-[1,2,4]oxadiazol-5-ones (32–41). Synthesis was performed according to procedure described for compounds **28**, **29** *method A*.

4-Diethylaminocarbonyl-3-pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (32). This compound was obtained as small colorless crystals. IR: 2981, 1790, 1733, 1584, 1568, 1474, 1453, 1425, 1378, 1268, 1181, 1166, 1147, 1018, 905, 857, 759 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.31–1.39 (m; 6H, $2CH_2C\underline{H}_3$), 3.47–3.63 (m; 4H, $2NC\underline{H}_2CH_3$), 8.63 (t; 1H, pyrazinyl, J 1.8 Hz) 8,79 (d, 1H, pyrazinyl, J 2.5 Hz), 9.28 (d; 1H, pirazyna, J 1.5 Hz) ppm.

4-Diethylaminocarbonyl-3-pyridin-2-yl-4H-[1,2,4]oxadiazol-5-one (33). This compound was obtained as small colorless crystals. IR 2977; 1780; 1724; 1565, 1476; 1454; 1426; 1400; 1272; 1212; 1177; 1059; 903; 859; 756 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): 1.31–1.39 (m; 6H, $2CH_2C\underline{H}_3$), 3.44–3.55 (m; 4H, $2NC\underline{H}_2CH_3$), 7.46–7.53 (m; 1H, 2-pirydyl), 7.86–7.94 (m; 1H, 2-pyridyl), 8.62 (m; 1H, 2-pyridyl) ppm.

4-Diethylaminocarbonyl-3-pyridin-3-yl-4H-[1,2,4]oxadiazol-5-one (34). This compound was obtained as small beige crystals. IR: 2976, 1786, 1722, 1589, 1550, 1426, 1383, 1273, 1255, 1211, 1140, 1056, 1023, 901, 857, 814, 796, 758 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.23–1.34 (m, 6H, $2CH_2C\underline{H}_3$), 3.46–3.52 (m; 4H, $2NC\underline{H}_2CH_3$), 7,46–7,53 (q; 1H, 3-pyridyl, J_1 5.1 Hz, J_2 3.0 Hz), 8.01–8.07 (m; 1H, 3-pyridyl), 8.81 (q; 2H, 3-pyridyl, J_1 1.8 Hz, J_2 3.3 Hz) ppm.

4-Diethylaminocarbonyl-3-pyridin-3-yl-4H-[1,2,4]oxadiazol-5-one (35). This compound was obtained as small beige crystals. IR: 2978, 1792, 1725, 1659, 1637, 1600, 1583, 1408, 1270, 1251, 1212, 1064, 991, 909, 859, 827, 780, 759 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.25–1.35 (q; 6H, $2CH_2C\underline{H}_3$, J_1 7.1 Hz, J_2 6.3 Hz), 3.45 (m; 4H, $2NC\underline{H}_2CH_3$), 7.57 (d; 2H, 4-pyridyl, J 5.0 Hz), 8.83 (d; 2H, 4-pyridyl, J 6.2 Hz) ppm.

4-Diisopropylaminocarbonyl-3-pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (36). This compound was obtained as beige powder. IR: 2995, 1801, 1721, 1581, 1434, 1375, 1312, 1245, 1206, 1176, 1029, 1016, 900, 866, 825, 763 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.27–1.49 (m; 12H, $2CH(C\underline{H}_3)_2$), 3,57–3,71 (m; 1H, $NC\underline{H}(CH_3)_2$), 4,05–4,19 (m; 1H, $NC\underline{H}(CH)_3$), 8,57 (q; 1H, pyrazinyl, J_1 1.5 Hz, J_2 1.0 Hz), 8.76 (d; 1H, pyrazinyl, J 2.5 Hz); 9,23 (d; 1H, pyrazinyl, J 1.5 Hz) ppm.

4-Diisopropylaminocarbonyl-3-pyridin-2-yl-4H-[1,2,4]oxadiazol-5-one (37). This compound was obtained as beige powder. IR: 3004, 2986, 2969, 1792, 1717, 1565, 1480, 1436, 1400, 1375, 1317, 1251, 1209, 1171, 1137, 1034, 897, 827, 789, 755 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.28–1.38 (q; 6H, $CH(C\underline{H}_3)_2$ J_1 6.6 Hz, J_2 7.2 Hz), 1,5 (t; 6H, $CH(C\underline{H}_3)_2$ J 5.6 Hz), 3.49–3.71 (m; 1H; $NC\underline{H}(CH_3)_2$), 4.06–4.19 (m; 1H; $NC\underline{H}(CH_3)_2$); 7.45 (m; 1H, 2-pyridyl), 7.82–7.91 (m; 1H, 2-pyridyl); 7.99 (d; 1H, 2-pyridyl, J 7.9 Hz), 8.60 (q; 1H, 2-pyridyl, J_1 1.1 Hz, J_2 3.7 Hz) ppm.

4-Diisopropylaminocarbonyl-3-pyridin-3-yl-4H-[1,2,4]oxadiazol-5-one (38). This compound was obtained as beige powder. IR: 2994, 2973, 2938, 1797, 1716, 1588, 1433, 1378, 1309, 1247, 1152, 1029, 898, 852, 793, 755 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 1.38 (d; 12H, $2CH(C\underline{H}_3)_2$, J 6.7 Hz), 4.11–4.25 (m; 2H, $2NC\underline{H}(CH_3)_2$), 7.43–7.50 (q; 1H, 3-pyridyl, J_1 5.1 Hz, J_2 2.6 Hz), 8.38 (d; 1H, 3-pyridyl, J 8.0 Hz), 8.71 (d; 1H, 3-pyridyl, J 4.0 Hz), 9.26 (s; 1H, 3-pirydyl).

4-Diisopropylaminocarbonyl-3-pyridin-4-yl-4H-[1,2,4]oxadiazol-5-one (39). This compound was obtained as beige powder. IR: 2983, 1798, 1716, 1534, 1419, 1375, 1308, 1246, 1200, 1027, 995, 901, 827, 794, 755 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 1.26(d; 3H, $C\underline{H}_3CH$, J 6.8 Hz), 1.40 (d; 3H, $C\underline{H}_3CH$, J 6.8 Hz), 1.47 (d; 6H, $CH(C\underline{H}_3)_2$, J 6.8 Hz), 3.63–3.82 (m; 1H, $NC\underline{H}(CH_3)_2$), 4.07–4.12 (m; 1H, $NC\underline{H}(CH_3)_2$), 7.56 (d; 2H, 4-pyridyl, J 5.4 Hz), 8.82 (d; 2H, 4-pyridyl, J 5.4 Hz) ppm.

4-Dimethylaminocarbonyl-3-pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (40). This compound was obtained as small white needles. IR: 2931, 1784, 1725, 1587, 1484, 1450, 1384, 1274, 1193, 1144, 1059, 1019, 910, 868, 794, 765 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 3.17 (s; 3H, NCH_3), 3.21 (s; 3H, NCH_3), 8.64 (m; 1H, pyrazinyl), 8.77 (d; 1H, pyrazinyl, J 2.5 Hz), 9.22 (d; 1H, pyrazinyl, J 1.5 Hz) ppm.

4-Dimethylaminocarbonyl-3-pyridin-2-yl-4H-[1,2,4]oxadiazol-5-one (41). Yield: 35%; m.p. 139–141°C (ref. [13], m.p. 142–143°C).

4-Aminocarbonyl-[1,2,4]oxadiazol-5-ones (42–45). In 5 mL of dry pyridine 2.5 mmole of appropriate 1,2,4-oxadiazole-5-one **28–31** was dissolved and 7.5 mmol of carbamoyl chloride was added. The mixture was refluxed for 12–30 h. Reaction progress was monitored by TLC analysis. Pyridine was evaporated. Residue was cooled, filtered, washed, dried and recrystallized.

4-Dimethylaminocarbonyl-3-pyridin-3-yl-4H-[1,2,4]oxadiazol-5-one (42). This compound was obtained as beige powder. IR: 3060, 1772, 1728, 1604 1559, 1512, 1477, 1359, 1260, 1223, 1140, 1124, 1053, 1028, 910, 893, 829, 761 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 3.01 (s; 3H, NCH_3), 3.20 (s; 3H, NCH_3), 7.59–7.66 (q; 1H, 3-pyridyl, J_1 4.9 Hz, J_2 3.1 Hz), 8.04 (d; 1H, 3-pyridyl, J 8.0 Hz), 8.81 (m; 2H, 3-pyridyl) ppm.

4-Dimethylaminocarbonyl-3-pyridin-4-yl-4H-[1,2,4]oxadiazol-5-one (43). This compound was obtained as beige powder. IR: 2943, 1785, 1718, 1586, 1548, 1492, 1417, 1382, 1269, 1140, 1060, 1000, 903, 835, 759 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 3.18 (s; 3H, CH_3), 3.25 (s; 3H, CH_3), 7.56 (d, 2H, 4-pyridyl, J 6.2 Hz), 8.83 (d; 2H, 4-pyridyl, J 6.1 Hz) ppm.

4-(Morpholine-4-carbonyl)-3-pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (44). This compound was obtained as white powder. IR: 2922, 2867, 1808, 1735, 1584, 1421, 1377, 1263, 1233, 1178, 1114, 1017, 905, 840, 760 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 3.64–3.74 (m; 8H, morpholine), 8.88–8.95 (m; 2H, pyrazinyl), 9.26 (d; 1H, pyrazinyl, J 1.4 Hz) ppm.

4-(Morpholine-4-carbonyl)-3-pyrazin-2-yl-4H-[1,2,4]oxadiazol-5-one (45). This compound was obtained as white powder. IR: 2965, 2928, 1799, 1774, 1711, 1591, 1564, 1432, 1406, 1392, 1292, 1262, 1109, 1020, 1000, 900, 797, 755 cm^{-1}; ^{1}H NMR (200 MHz, CDCl$_3$): δ 3.61 (t, 2H, NCH_2, J 4.4 Hz), 3.76 (d; 2H, NCH_2, J 4.9 Hz), 3.85 (d; 4H, 2 OCH_2, J 3.3 Hz), 7.50 (t; 1H, 2-pyridyl, J 4.9 Hz); 7.85–8.02 (m; 2H, 2-pyridyl), 8.65 (d; 1H, 2-pyridyl, J 4.7 Hz) ppm.

5-Alkylamino-[1,2,4]oxadiazoles (46, 47). 3 mmole of compound **34** or **37** was heated in pressure vessel in silicon bath gradually to 215°C. Then vessel was cooled slowly. Decarboxylation product was separated from substrate and purified by column chromatography on silica gel using chloroform–ethyl acetate as liquid phase.

5-Diethylamino-3-pyridin-3-yl-[1,2,4]oxadiazole (46). This compound was obtained as beige powder. IR: 2972, 1636, 1594, 1579, 1519, 1439, 1355, 1261, 1214, 1137, 1083, 1022, 963, 883, 821, 759 cm^{-1}; ^{1}H NMR (200 MHz, DMSO-d$_6$): δ 1.20 (t; 6H, $2CH_2C\underline{H}_3$, *J* 7.0 Hz), 3.48–3.59 (q; 4H, $2NC\underline{H}_2CH_3$, J_1 7.3 Hz, J_2 7.0 Hz), 7.51–7.58 (q; 1H, 3-pyridyl, J_1 4,84 Hz, J_2 3,14 Hz,), 8.23 (d; 1H, 3-pyridyl, *J* 7.9 Hz); 8.72 (d; 1H, 3-pyridyl, *J* 4.8 Hz), 9.05 (s; 1H, 3-pyridyl) ppm. MS: m/z 219 (100MH$^+$).

5-Diisopropylamino-3-pyridin-2-yl-[1,2,4]oxadiazole (47). This compound was obtained as beige powder. IR: 2976, 1610, 1523, 1410, 1391, 1368, 1298, 1197, 1160, 1123, 1024, 990, 925, 807, 757 cm^{-1}; ^{1}H NMR (500 MHz, CDCl$_3$): δ 1.37 (d; 12H, $2CH(C\underline{H}_3)_2$, *J* 6.8 Hz), 4.26 (t; 2H, $2NC\underline{H}(CH_3)_2$, *J* 6.5 Hz); 7.39 (q; 1H, 2-pyridyl, J_1 5.4 Hz, J_2 1.5 Hz), 7.82 (t; 1H, 2-pyridyl, *J* 7.1 Hz), 8.07 (d; 1H, 2-pyridyl, *J* 7.8 Hz), 8.80 (d; 1H, 2-pyridyl, *J* 4.4 Hz) ppm.

Antibacterial activity. The investigations included 25 strains of anaerobic bacteria and 25 strains of aerobic bacteria isolated from the oral cavity, respiratory system and abdominal cavity as well as 12 standard strains. The anaerobes belonged to the following genera: *Peptostreptococcus* (5 strains), *Actinomyces* (2), *Propionibacterium* (2), *Prevotella* (6), *Porphyromonas* (2), *Fusobacterium* (3), *Bacteroides* (5), and standard strains: *Bacteroides fragilis* ATCC 25285, *Bacteroides vulgatus* ATCC 8482, *Bacteroides ovatus* ATCC 8483, *Fusobacterium nucleatum* ATCC 25586, *Peptostreptococcus anaerobius* ATCC 27337 and *Propionibacterium acnes* ATCC 11827. There were also the following aerobes: Staphylococcus aureus (4 strains), *Corynebacterium spp*. (2), *Klebsiella pneumoniae* (3), *Acinetobacter baumannii* (2), *Escherichia coli* (6), *Pseudomonas aeruginosa* (6), *Pseudomonas stutzeri* (2) and 6 standard strains: *Staphylococcus aureus* ATCC 25923, *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae* ATCC 13883, *Acinetobacter baumannii* ATCC 19606, *Escherichia coli* ATCC 25922 and *Pseudomonas aeruginosa* ATCC 27853.

The susceptibility of the anaerobic bacteria was determined by means of the plate dilution technique in Brucella agar, supplemented with 5% sheep's blood [20,21]. For aerobic bacteria experiments agar dilution technique with Miller-Hinton agar was used. The derivatives were dissolved in 1mL of DMSO immediately before the experiment. Sterile distilled water was used for further dilutions. The following concentrations of derivatives were used: 200, 100, 50, 25, 12.5, and 6.2 μg/mL. The inoculum containing 10^6 CFU/spot applied to the agar plates with Steers replicator. For aerobes the inoculated agar plates and agar plates without derivatives were incubated for 24 h at 37°C. For anaerobes agar plates were incubated in anaerobic jars for 48 h at 37°C in 10% CO$_2$, 10% H$_2$ and 80% N$_2$ with palladium catalyst and indicator for anaerobiosis. The minimal inhibitory concentration (MIC) was defined as the lowest concentration of the derivative that inhibited growth of the anaerobes.

Mycobacterium tuberculosis. The compounds were examined for their tuberculostatic activity towards *Mycobacterium tuberculosis* H$_{37}$Rv strain and two ''wild'' strains isolated from tuberculotic patients: one (Spec. 210) resistant to p-aminosalicic acid (PAS), isonicotinic acid hydrazide (INH), etambutol (ETB) and rifampicine (RFP), another (Spec. 192) fully sensitive to the administrated drugs. *In vitro* investigations were performed by a classical test tube method of successive dilution with Youman's liquid medium containing 10% of bovine serum [22].

A number of aldimines have been obtained in very good yield in reaction of 5-formyl-1,3-dimethyluracil with various substituted anilines in boiling methanol. Selected aldimines were treated with nitrile oxides generated from 4-chlorobenzaldoxime or 4-methylbenzaldoxime forming the appropriate 1,3-cycloadducts in moderate yields.

J. Heterocyclic Chem., **46**, 1280 (2009).

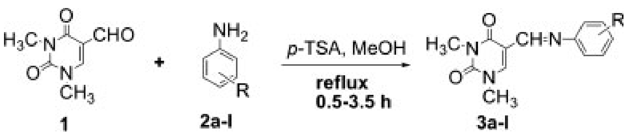
INTRODUCTION

The uracil derivatives are broadly known due to their application in bioorganic and medicinal chemistry. The 5-substituted uracils, mostly in the form of N1-glycosyl derivatives, possess biological activity, especially against viruses and neoplastic cells. 5-Fluorouracil and (*E*)-5-(2-bromovinyl)-2′-deoxyuridine belong to the best described uracil derivatives [1–3]. Similar to 5-halouridines, their analogues substituted with another heterocyclic system at C5 carbon of uracil ring, exhibit interesting biological activities. They form stable complexes with RNA [4] and inhibit thymidine kinase of HIV-1 virus [5,6]. The introduction of heteroaryl group into uracil ring can be performed using various methods. The UV irradiation of persilylated 5-iodo-2′-deoxycytidine in the presence of thiophene leads to appropriate 5-(2-thienyl)-2′-deoxycytidine in moderate yield [7]. The opposite variant of this reaction, when a mixture of 2-iodothiophene and 2-deoxycytidine was irradiated is also known [7]. Several 5-heteroaryl-2′-deoxyuridines have been obtained in palladium complexes catalyzed reaction of 5-iodo-2′-deoxyuridine with heteroaryltrialkyltin derivatives [8,9]. Other approaches based on traditional synthesis of heterocyclic rings involving 5-aminouracil as a building block in the construction of heterocyclic system have also been reported [10,11].

As a part of our research interest in the reactivity of uracil derivatives containing electron-withdrawing substituents, we have considered the molecule of 5-formyluracil (2,4-dioxo-1,2,3,4-tetrahydropyrimidine-5-carbaldehyde) as a suitable reagent for the preparation of Schiff bases, which could be used further as dipolarophiles in 1,3-cycloaddition reaction. The chemical properties of 5-formyluracil are reported in the literature mainly in the context of its cytotoxic effect. The 5-formyl-2′-deoxyuridine formed by the oxidation of thymidine induces the damage of DNA [12–16]. Surprisingly, the syntheses involving 5-formyluracil as a reagent are rarely reported. 5-Formyl-1,3-dimethyluracil reacts with enamines giving 5-(acylvinyl)uracil derivatives. When enamines derived from 1,3-cyclohexanedione or ethyl acetate were applied, 5-(9-xanthenyl)uracil and 5-(6-cyclohexadienyl)uracil were obtained [17]. Recently, 5-formyluracil was used for the formation of nitrones, which treated with allyl alcohol as dipolarophile under harsh conditions to form isoxazolines in moderate yields [18]. Similarly, several isoxazoles, isoxazolines, and isoxazolidines have been synthesized by 1,3-dipolar cycloaddition reactions of nitrile oxides and nitrones derived from mono- and di-substituted uracil-5-carbaldehydes and 2,4-dimethoxypyrimidine-5-carbaldehyde [19].

The nickel, cobalt, and copper complexes of 5-formyluracil thiosemicarbazones were synthesized and their activity against model leukemia cells was examined [20]. Schiff bases of 5-formyluracil and chiral amino

Scheme 1. Synthesis of aldimines.



alcohols undergo highly diastereoselective 1,2- and 1,3-allylations to form homoallylic amino alcohol appended uracils [21].

RESULTS AND DISCUSSION

In our trials, which we report herein, 5-formyl-1,3-dimethyluracil (**1**) has been used as a carbonyl component in the synthesis of imines. For the preparation of **1** uracil was methylated by dimethyl sulfate followed by the Vilsmeier-Haack formylation using DMF and phosphorous trichloride [22]. Overall yield exceeded 60%. The condensation of **1** with substituted anilines **2a–l** occurs smoothly under mild condition (Scheme 1, Table 1). The desired aldimines **3a–l** were obtained by refluxing the equimolar amounts of reagents in methanol. The reaction time did not exceed 4 h in the case of less active anilines. The products **3a–l** are well soluble in hot methanol and, after cooling down to room temperature, they precipitate from the post-reaction solution in the form of crystalline solids in satisfactory yields (Table 1). The purity of the obtained imines **3a–d** was sufficient for the further synthesis as it was concluded from the NMR spectra. Other imines **3e–l** were recrystallized from methanol.

The structure of the products was assigned on the bases of NMR data and elemental analysis. The configuration of the double bond in the obtained imines was assumed as (*E*), which was confirmed by X-ray analysis of **3j** (Fig. 1) [23]. Because the synthesis of **3a–l** was performed under similar conditions (excluding time of reaction), we anticipated the same *E* configuration for all the obtained products.

For the primary trials of 1,3-dipolar cycloaddition reaction four imines **3a–d** possessing the substituent on C4 carbon of benzene ring were selected. The 1,3-dipole **4a** was generated *in situ* from 4-chlobenzaldehyde oxime using *N*-chlorosuccinimide and triethylamine as a base in chloroform solution according to the modified procedure [24]. The cycloaddition reaction of appropriate aldimine **3a–d** with 4-chlorobenzonitrile oxide **4** proceeded in refluxed $CHCl_3$ (Scheme 2). The products of reactions: 5-[3-(4-chlorophenyl)-4-(4-aryl)-4,5-dihydro-1,2,4-oxadiazole-5-yl]-1,3-dimethyl-1H-pyrimidine-2,4-dione **5a–d** were separated by column chromatography in satisfactory yields (Table 2). A same procedure was applied when 4-methylbenzonitrile oxide **4b** was used as the 1,3-dipole and cycloaddition reactions were occurred in 49–51% yields. The structure for all new compounds **5a–h** was confirmed by NMR spectroscopy and elemental analysis. As it was mentioned, the obtained aldimines have *E* configuration. The presence of single bond between C(5) of uracil ring and imine carbon atom allows for free rotation around this bond. The 1,3-cycloaddition reaction of nitrile oxide with double bond is the suprafacially concerted reaction [25]. However, when the free rotation is possible, the attack of dipole can occurs from both sides of imines and results in the formation of racemic mixture.

CONCLUSION

In summary, we have successfully carried out the condensation reaction of 1,3-dimethyl-5-formyluracil with substituted anilines. Reactions proceed under mild conditions and purity of aldimines in most of the cases was sufficient for the next step. It should be noticed that

Table 1

Synthesis of imines **3a–l** derived from 1,3-dimethyl-5-formyluracil and substituted anilines.

Product 3	R	Yield[a] (%)	Reaction time (h)	Mp (°C)

the presence of neighboring carbonyl group has not influence on reactivity of 5-formyl group in uracil ring rather toward weak nucleophiles like aromatic amines. The obtained Schiff bases were applied as dipolarophiles in the 1,3-dipolar cycloaddition reactions of 4-chlorobenzonitrile oxide or 4-methylbenzonitrile oxide to produce the racemic 5-(4,5-dihydro-1,2,4-oxadiazole-5-yl)uracil derivatives in satisfactory yields. The attack of 1,3-dipole on C(5)—C(6)—double bond of uracil ring was not observed [26].

EXPERIMENTAL

NMR spectra were recorded at 300 MHz for ^{1}H NMR and 75.5 MHz for ^{13}C NMR on a Varian Inova 300 MHz in $CDCl_3$ solution; δ values are in parts per million relative to tetramethylsilane as an internal standard. Elemental analyses were obtained using a PerkinElmer 240C apparatus. 4-Chlorobenzaldoxime (mp 107–108°C, lit. mp 107–109°C) and 4-methylbenzaldoxime (mp 71–73°C, lit. mp 76–78°C) were prepared according to known procedures [27]. The other used reagents were purchased from Lancaster. TLC $60F_{254}$ plates and silica gel 60 (0.040–0.063 mm) were purchased from Merck.

General procedure for synthesis of imines (3a–l). To the solution of 1,3-dimethyl-5-formyluracil **1** (0.34 g, 2 mmol) in MeOH (4 mL) containing 10 mg of *p*-TSA, appropriate aniline **2a–l** (2 mmol) was added and the reaction mixture was refluxed until the decay of substrates (0.5–3.5 h, Table 1), then cooled down to 0°C. The precipitate was filtered off, rinsed with cold methanol (2 mL), and dried in vacuum dessicator over P_2O_5. The products were sufficiently pure for the next step. If necessary the crystallization from methanol was applied and the pure compounds were obtained as light yellow crystals.

5-[(3-Iodo-phenylimino)-methyl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (3i). ^{1}H NMR ($CDCl_3$): δ 3.41 (s, 3H, CH_3), 3.54 (s, 3H, CH_3), 7.03–7.15 (m, 2H, arom.), 7.51–7.56 (m, 2H, arom.), 8.30 (s, 1H, H-6), 8.55 (s, 1H, imine). ^{13}C NMR ($CDCl_3$): δ 28.2, 37.9, 94.6, 109.2, 120.6, 129.9, 130.7, 135.7, 143.7, 151.2, 154.2, 162.3. Anal. Calcd. for $C_{13}H_{12}IN_3O_2$: C, 42.30; H, 3.28; N, 11.38. Found: C, 42.05; H, 2.96; N, 11.03.

1,3-Dimethyl-5-[(2-methylphenylmino)-methyl]-1H,3H-pyrimidine-2,4-dione (3j). ^{1}H NMR ($CDCl_3$): δ 2.31 (s, 3H, CH_3, *o*-tol), 3.41 (s, 3H, CH_3), 3.53 (s, 3H, CH_3), 6.89 (d, 1H, J = 6.9 Hz, arom.), 7.09–7.21 (m, 3H, arom.), 8.23 (s, 1H, H-6), 8.46 (s, 1H, imine). ^{13}C NMR ($CDCl_3$): δ 18.0, 28.1, 37.8, 110.0, 118.1, 126.0, 126.9, 130.4, 131.8, 142.8, 150.6, 151.4, 152.4, 162.6. Anal. Calcd. for $C_{14}H_{15}N_3O_2$: C, 65.36; H, 5.88; N, 16.33. Found: C, 64.97; H, 5.52; N, 15.98.

5-[(2-chloro-phenylimino)-methyl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (3k). ^{1}H NMR ($CDCl_3$): δ 3.41 (s, 3H, CH_3), 3.54 (s, 3H, CH_3), 7.00 (dd, 1H, J = 7.7 Hz, 1.6 Hz, arom.), 7.13 (dt, 1H, J = 7.7 Hz, 1.6 Hz, arom.), 7.24 (dq, 1H, J = 7.7 Hz, 1.6 Hz, arom.), 7.41 (dd, 1H, J = 7.7 Hz, 1.6 Hz, arom.), 8.32 (s, 1H, H-6), 8.50 (s, 1H, imine). ^{13}C NMR ($CDCl_3$): δ 28.2, 37.8, 109.6, 120.2, 126.8, 127.8, 128.2, 130.0, 143.7, 149.0, 151.4, 155.0, 162.4. Anal. Calcd. for $C_{13}H_{12}ClN_3O_2$: C, 56.23; H, 4.36; N, 15.13. Found: C, 56.56; H, 4.32; N, 14.91.

5-[(2-Bromo-phenylimino)-methyl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (3l). ^{1}H NMR ($CDCl_3$): δ 3.13 (s, 3H, CH_3), 3.26 (s, 3H, CH_3), 6.61 (dd, 1H, J = 7.9 Hz, 1.2 Hz, arom.), 6.77 (dt, 1H, J = 7.9 Hz, 1.2 Hz, arom.), 7.02 (dt, 1H, J = 7.9 Hz, 1.2 Hz, arom.), 7.31 (dd, 1H, J = 7.9 Hz, 1.2 Hz, arom.), 8.03 (s, 1H, H-6), 8.18 (s, 1H, imine). ^{13}C NMR ($CDCl_3$): δ 28.2, 37.9, 109.5, 118.5, 120.0, 127.0, 128.6, 133.1, 143.7, 150.2, 151.4, 154.7, 162.4. Anal. Calcd. for $C_{13}H_{12}BrN_3O_2$: C, 48.47; H, 3.75; N, 13.04. Found: C, 48.23; H, 3.54; N, 12.85.

General procedure for synthesis of 5-[3-(4-chlorophenyl)-(4-substituted-phenyl)-4,5-dihydro-1,2,4-oxadiazol-5-yl]-1,3-dimethyl-1*H*,3*H*-pyrimidine-2,4-dione (5a–d). To a solution of 4-chlorobenzaldoxime (0.12 g, 0.77 mmol) in $CHCl_3$ (4 mL) NCS (0.11 g, 0.85 mmol) was added at room temperature while stirring. The reaction mixture changed the color from light yellow, through blue to green. Completion of the reaction was indicated by the turn the color of reaction mixture to yellow (40 min). The solution of 4-chlorobenzohydroximinoyl chloride was washed with small amounts of cold water (2 mL), dried over anhydrous $MgSO_4$, and immediately used for the next step. To the solution of 4-chlorobenzohydroximinoyl chloride the imine **3a–d** (0.7 mmol) was added followed by addition of triethylamine (0.11 mL, 0.77 mmol). The reaction mixture was refluxed for the time indicated in Table 2, concentrated under diminished pressure, and purified on silica gel packed column using AcOEt:*n*-hexane (1:1) as an eluent. The products **5a–d** were obtained as solid colorless materials, crystallized if necessarily from methanol.

The same procedure starting from the same molar amounts of substrates was applied for preparation of 4-methylbenzonitrile oxide **4b**. The 1,3-dipolar cycloaddition of **4b** to aldimines **3a–d** was carried out under conditions described earlier. The products **5e–h** were purified by silica gel packed column using a (1:1) mixture of *n*-hexane-ethyl acetate as eluent, in the form of colorless solids.

5-[3-(4-chlorophenyl)-4-phenyl-4,5-dihydro-1,2,4-oxadiazol-5-yl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (5a). ^{1}H NMR ($CDCl_3$): δ 3.39 (s, 3H, CH_3), 3.42 (s, 3H, CH_3), 6.64 (s, 1H, oxadiaz.), 7.09 (d, 2H, J = 7.7 Hz, arom.), 7.15 (t, 1H, J = 7.7 Hz, arom.), 7.25 (d, 2H, J = 7.7 Hz, arom.), 7.30 (dt, 2H, J = 8.6 Hz, 1.9 Hz, arom.), 7.52 (s, 1H, H-6), 7.57 (dt, 2H, J = 8.6, 1.9 Hz, arom.). ^{13}C NMR ($CDCl_3$): δ 27.9, 37.4, 94.6, 110.5, 123.8, 124.3 (2C), 126.0, 129.1 (2C), 129.3 (2C), 129.3 (2C), 137.0, 142.0, 142.1, 151.4, 154.8, 161.9. Anal. Calcd. for $C_{20}H_{17}ClN_4O_3$: C, 60.53; H, 4.32; N, 14.12. Found: C, 60.14; H, 3.98; N, 13.88.

5-[3-(4-chlorophenyl)-4-(4-methylphenyl)-4,5-dihydro-1,2,4-oxadiazol-5-yl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (5b). ^{1}H NMR ($CDCl_3$): δ 2.28 (s, 3H, CH_3, *p*-tol), 3.38 (s, 3H, CH_3), 3.42 (s, 3H, CH_3), 6.59 (s, 1H, oxadiaz.), 6.97 (d, 2H, J = 8.4 Hz, arom.), 7.05 (d, 2H, J = 8.4 Hz, arom.), 7.29 (d, 2H, J = 8.6 Hz, arom.), 7.51 (s, 1H, H-6), 7.56 (d, 2H, J = 8.6 Hz, arom.). ^{13}C NMR ($CDCl_3$) δ: 21.0, 28.0, 37.6, 94.8, 110.8, 124.0, 124.9 (2C), 129.1 (2C), 129.5 (2C), 130.1 (2C), 136.3, 137.0, 139.4, 142.3, 151.6, 155.1, 162.0. Anal. Calcd. for $C_{21}H_{19}ClN_4O_3$: C, 61.39; H, 4.66; N, 13.64. Found: C, 61.62; H, 4.65; N, 13.29.

5-[3-(3,4-bis-(4-chlorophenyl)-4,5-dihydro-1,2,4-oxadiazol-5-yl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (5c). ^{1}H NMR ($CDCl_3$): δ 3.39 (s, 3H, CH_3), 3.42 (s, 3H, CH_3), 6.59

(s, 1H, oxadiaz.), 7.10 (dt, 2H, J = 8.9 Hz, 2.4 Hz, arom.), 7.22 (dt, 2H, J = 8.9 Hz, 2.4 Hz, arom.), 7.32 (dt, 2H, J = 8.6 Hz, 2.2 Hz, arom.), 7.51 (s, 1H, H-6), 7.55 (dt, 2H, J = 8.6 Hz, 2.2 Hz, arom.). ^{13}C NMR ($CDCl_3$): δ 28.1, 37.6, 94.8, 110.3, 123.6, 126.0 (2C), 129.4 (2C), 129.5 (2C), 129.6 (2C), 131.9, 137.4, 140.9, 142.3, 151.5, 154.9, 162.1. Anal. Calcd. for $C_{20}H_{16}Cl_2N_4O_3$: C, 55.70; H, 3.74; N, 12.99. Found: C, 55.31; H, 3.39; N, 12.67.

5-[3-(4-chlorophenyl)-4-(4-bromo-phenyl)-4,5-dihydro-1,2,4-oxadiazol-5-yl]-1,3-dimethyl-1H,3H-pyrimidine-2,4-dione (5d). ^{1}H NMR ($CDCl_3$): δ 3.39 (s, 3H, CH_3), 3.42 (s, 3H, CH_3), 6.59 (s, 1H, oxadiaz.), 7.04 (d, 2H, J = 8.6 Hz, arom.), 7.32 (d, 2H, J = 8.7 Hz, arom.), 7.37 (d, 2H, J = 8.6 Hz, arom.), 7.50 (s, 1H, H-6), 7.55 (d, 2H, J = 8.7 Hz, arom.). ^{13}C NMR ($CDCl_3$): δ 28.1, 37.6, 94.7, 110.3, 119.6, 123.6, 126.2 (2C), 129.4 (2C), 129.5 (2C), 132.6 (2C), 137.4, 141.4, 142.4, 151.5, 154.8, 162.1. N-*p*-Toluenesulfonyl-3-vinylpyrrole underwent *endo*-addition [4 + 2] cycloaddition reactions with maleimides and benzoquinones, followed by isomerization to give tetrahydroindoles in good yields. Dehydrogenation with activated MnO$_2$ in refluxing toluene gave the corresponding indoles in fair to good yields. Detosylation *via* saponification or with magnesium in refluxing methanol gave the *N*-H indoles in moderate to good yields. This method for formation of indoles is both convergent and versatile and uses starting materials that are conveniently prepared.

J. Heterocyclic Chem., **46**, 1285 (2009).

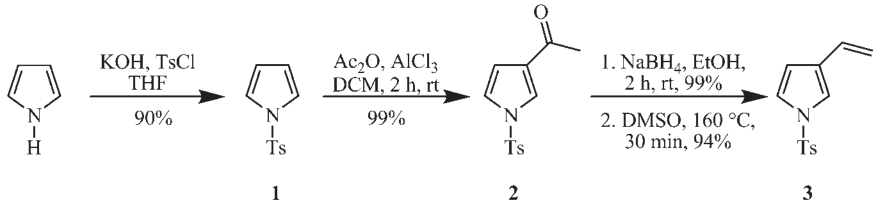
INTRODUCTION

Synthesis of the indole nucleus continues to receive much attention [1] due to its common occurrence in the molecules of living systems and also the biological activity exhibited in both natural [2] and synthetic [3] indole-containing products. We have reported that tetrahydroindoles are available *via* 2-vinylpyrroles derived from an acid-catalyzed condensation of pyrrole with cyclic ketones, followed by *in situ* trapping by various maleimides in a Diels-Alder reaction [4,5]. We recently reported that indoles are available from oxidation of tetrahydroindoles synthesized by Diels-Alder reactions of both *N*-H and *N*-alkyl-2-vinylpyrroles with a wide range of *N*-substituted maleimides [6]. To expand upon this general methodology, in a desire to find improved synthetic methods towards indole and to generate novel indoles for biological testing, we chose to study the use of 3-vinylpyrroles as the diene in Diels-Alder reactions.

Pyrrole preferentially undergoes electrophilic attack at its 2-position as the most stable resonance structure of the reactive species has its greatest electron density α to the iminium nitrogen. Therefore, 2-vinylpyrroles are the most obviously accessible vinylated pyrroles, and there are numerous examples of 2-vinylpyrroles being used as dienes in Diels-Alder reactions [4,7–10]. Several of these studies report biological activity from the resulting class of compounds and the corresponding aromatized indoles, particularly anti-cancer activity [4,10].

To the best of our knowledge, only four reports of 3-vinylpyrroles being used in Diels-Alder reactions exist [8,9,11,12]. Jones *et al*. reported the Diels-Alder reaction of *N*-*t*-butyl-3-vinylpyrrole with DMAD and oxidation with DDQ to give the corresponding indoles [8]. Murase *et al*. reported Diels-Alder reactions of sulfur-substituted *N*-methyl-3-vinylpyrrole generated *in situ* from the corresponding 3-thioacetylpyrrole, using as the dienophile DMAD, maleic anhydride, *N*-methylmaleimide, 1,4-naphthoquinone, and several unsymmetrical alkenes, followed by DDQ aromatization of the indoles [11]. The Diels-Alder adducts were not isolated, but were oxidized directly to the indoles in a maximum of 31% yield over three steps. Xiao and Ketcha reported Diels-Alder reactions of *N*-benzenesulfonyl-3-vinylpyrrole and ethyl 3-(1-(benzenesulfonyl)-1*H*-2-pyrrolyl)acrylate with *N*-phenylmaleimide and maleic anhydride, without taking the adducts through to the indoles [9]. Most recently, Hodges *et al*. reported Diels-Alder reactions of osmium-complexed *N*-methyl-3-vinylpyrroles with *N*-phenylmaleimide to give tetrahydroindoles, which were then oxidized with DDQ to give the corresponding indoles, but difficulties with oxidation and pyrrole polymerization were experienced [12]. In most of the prior examples of Diels-Alder reactions of 3-vinylpyrroles, the isolated tetrahydroindole had isomerized from the originally formed adducts, with a double bond having moved into the five-membered ring to form the aromatic pyrrole. In the one exception, the work by Hodges *et al*. [12], the

Scheme 1. Synthesis of *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3**.



unrearranged adduct was complexed with osmium when isolated.

The synthesis of 3-vinylpyrrole was first reported, to the best of our knowledge, in 1979 by Jones *et al*., by the photoaddition of acetaldehyde and *N*-methylpyrrole followed by dehydration of the resulting alcohol to *N*-methyl-3-vinylpyrrole in 32% overall yield [13]. A more efficient method uses 3-(*N*-*t*-butylpyrrole)carboxaldehyde in a Wittig methylenation in 55% overall yield [14]. The *t*-butyl group, due to its steric bulk, directs selective Vilsmeier-Haack formylation to the 3-position. The most efficient method to 3-vinylate pyrrole is likely *via* *N*-benzenesulfonylation followed by 3-acetylation under Friedel-Crafts acylation conditions using AlCl$_3$ as the Lewis acid, which selectively acetylates the 3-position [15–17]. The resulting acetylpyrrole is then reduced and dehydrated to the 3-vinylpyrrole [9,17]. An extensive study by Huffman *et al*. indicates that subjecting *N*-*p*-toluenesulfonylpyrrole to Friedel-Crafts acylation conditions using AlCl$_3$ does not result in a Friedel-Crafts-type acylation, but instead causes reversible formation of 2- and 3-dichloroaluminum intermediates, the latter being sterically favored, and the former possibly experiencing a stabilizing electronic interaction between the electrophilic aluminum and an oxygen of the *N*-sulfonyl group [18]. The predominant and more reactive 3-substituted organoaluminum intermediate then reacts with the acylating agent to give mainly 3-acylpyrroles.

While altering the side to which the dienophile-component is fused in the resulting tetrahydroindole, using 3-vinylpyrroles in Diels-Alder reactions is significantly advantageous over the use of 2-vinylpyrroles. 2-Vinylpyrroles are generally volatile liquids which polymerize or decompose on exposure to air and light, but *N*-*p*-toluenesulfonyl-3-vinylpyrroles are robust crystalline solids which are easy to store and handle. 2-Vinylpyrroles are most efficiently made from pyrrole-2-carboxaldehyde or from the 2-acylpyrrole *via* a Wittig reaction in ~50% yield over two steps from *N*-H-pyrrole [6,19]. In comparison, *N*-*p*-toluenesulfonyl-3-vinylpyrrole is generated using the Lewis Acid-catalyzed process outlined above in 83% yield from *N*-H-pyrrole over four steps, a sizable increase in efficiency. In most of the prior examples, the 2-vinylpyrroles are *N*-alkylated due to the high reactivity and tendency towards polymerization and decomposition of *N*-H-2-vinylpyrroles, whereas an *N*-*p*-toluenesulfonyl group decreases reactivity, increases stability, and may be removed later to give the *N*-H-indole derivative, or the H can then be replaced with another group of choice.

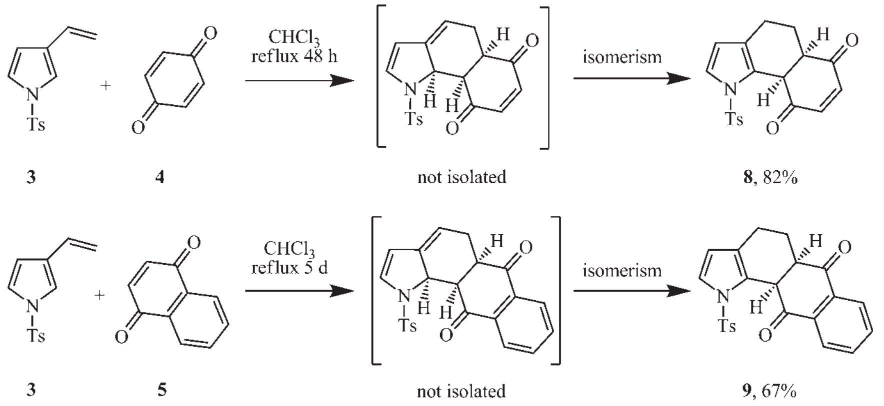
RESULTS AND DISCUSSION

Synthesis of starting materials. Vinylpyrrole **3** was prepared in 83% overall yield in four steps from pyrrole by literature methods (Scheme 1) [9,15,17,20].

Commercial *p*-benzoquinone **4** and 1,4-naphthoquinone **5** were used. *N*-(4-Isopropylphenyl)maleimide **6** and *N*-(4-phenoxyphenyl)maleimide **7** were synthesized by reported procedures [6,21]. Flash chromatography on silica gel, followed by recrystallization, was used to purify the maleimides.

Diels-Alder reactions. Diels-Alder reactions of *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3** with *p*-benzoquinone **4**, 1,4-naphthoquinone **5**, *N*-(4-isopropylphenyl)maleimide **6**, and *N*-(4-phenoxyphenyl)maleimide **7** in chloroform gave compounds **8**, **9**, **10**, and **11**, respectively (Schemes 2 and 3). The reactions were monitored by TLC. While the maleimide-containing reactions which gave adducts **10** and **11** went to completion at rt over 5 days, the Diels-Alder reactions giving **8** and **9** required, for completion, refluxing for 48 h and 5 days, respectively. In each reaction, the vinylpyrrole was used in slight excess (1.1 equiv.) to simplify the required chromatographic purification procedure, because the vinylpyrroles were always eluted first, unreacted maleimides or quinones were eluted very close to the adducts. Chromatography on silica gel, followed by recrystallization, was used to purify the adducts. Conditions for the Diels-Alder reactions were not optimized, except that chloroform was used as the solvent, which is based on the considerably higher yields obtained in our earlier work in Diels-Alder reactions with 2-vinylpyrroles in chloroform *versus* toluene [6].

In Diels-Alder reactions with *p*-benzoquinone and 1,4-naphthoquinone, unisomerized adducts were not isolated or detected; instead compounds **8** and **9** were isolated, in which a double-bond had moved into the five-membered ring, giving the more stable aromatic

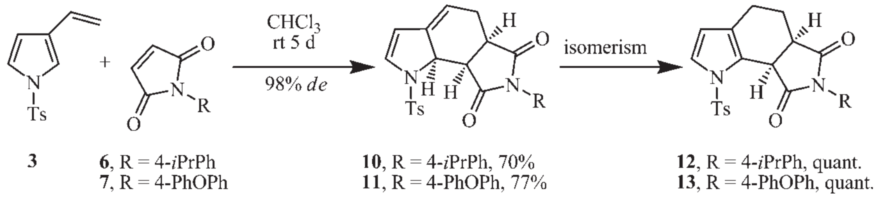


Scheme 2. Diels-Alder reactions of *N-p*-toluenesulfonyl-2-vinylpyrrole **3** with quinones **4** and **5**.

pyrrole. In Diels-Alder reactions with maleimides, however, the unisomerized adducts **10** and **11** were isolated first, and quantitative isomerization of these compounds into the aromatic **12** and **13** occured in chloroform at rt over a month, or over several days at reflux (Scheme 3). Although unisomerized adducts were not isolated in our 2-vinylpyrrole work, evidence of them as intermediates was provided by the isolation of products likely resulting from a Michael addition of an unisomerized adduct with a maleimide [6]. NOE experiments were used to confirm the stereochemistry of **10** and **11**. This seems to be the first report of the isolation of unisomerized Diels-Alder adducts being formed from vinylpyrroles. The average yield of the Diels-Alder products **8**, **9**, **10**, and **11** was 74%, nearly identical with the 73% average for Diels-Alder products from 2-vinylpyrrole obtained in chloroform in our prior work [6], although a greater number of Diels-Alder reactions of 3-vinylpyrroles would be needed for an accurate comparison of the relative efficiency of the two procedures.

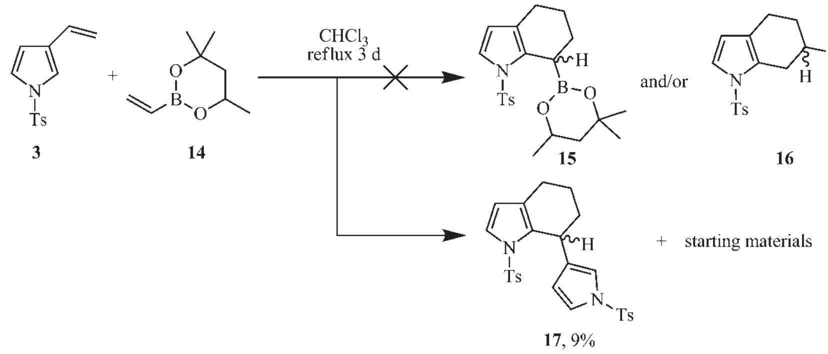
For descriptions of orientation, the diastereomer with the *cis*-protons at the points of diene fusion protruding from the α-face and the fused-dienophile protruding from the β-face will always be used; this convention is also used throughout the Experimental. In the ^{1}H NMR spectra of unisomerized adducts **10** and **11**, the 5α-H proton appears as a doublet of doublet of doublet of doublets; COSY experiments indicate that the 5α-H proton is coupled not only to the 5β-H, 4-H, and 5aα-H protons, but also to the 8bα-H proton, with a coupling constant of about 3.0 Hz [9,22]. For isomerized adduct **8**, the 7-H proton is coupled not only to the 8-H proton but also to the 5aα-H proton, with a coupling constant of about 1.2 Hz [23].

Diels-Alder dimerization. In an effort to extend our method to allow for a highly convergent synthetic step after indole formation *via* a potential Suzuki coupling [24], a Diels-Alder reaction between *N-p*-toluenesulfonyl-3-vinylpyrrole **3** and commercially available vinylboronic acid 2-methyl-2,4-pentanediol ester **14** was attempted (Scheme 4) [25]. Although Diels-Alder reactions of vinylboranes [26], vinylboronates [27], and of **14** [28] are known, to the best of our knowledge they are not reported to have occurred with vinylpyrroles. No reaction was observed to occur in chloroform at room temperature over 5 days, so the solution was refluxed. After 3 days, a new TLC spot had appeared, and no further consumption of the vinylpyrrole **3** seemed to be occurring. Isolation of the single new product from the remaining starting materials and purification revealed *via* ^{1}H NMR that the new product was in fact not the expected Diels-Alder adduct **15** and/or **16**, as it lacked any of the characteristic aliphatic methyl groups from vinyl boronate **14**. Characterization of this product using HRMS, COSY, and NOE studies showed it to be the result of a formal Diels-Alder reaction between two molecules of *N-p*-toluenesulfonyl-3-vinylpyrrole **3**, giving the dimer **17** (Fig. 1). In the ^{1}H NMR, the 4α-H and 4β-H protons were overlapped, which prevented distinguishing between them in the NOE study.



Scheme 3. Diels-Alder reactions of *N-p*-toluenesulfonyl-2-vinylpyrrole **3** with maleimides **6** and **7**.

Scheme 4. Attempted Diels-Alder reaction of *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3** with vinylboronate **14**.



Formation of dimer **17** would occur when two vinylpyrroles approach each other with the terminal ends of their vinyl groups nearest to one another, but would seem to maximize proximity of repulsive like partial-charges and to violate the *ortho*/*para* rule [29] of adduct substitution in Diels-Alder reactions. Refluxing *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3** in toluene or chloroform without vinylboronate **14** for 2 weeks produced no sign of dimer **17** by ^{1}H NMR and HRMS analysis; only starting materials were shown to be present by ^{1}H NMR. Refluxing 100 mg of *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3** in 10 mL of chloroform with one drop of concentrated hydrochloric acid for several days produced no sign of dimer **17** by TLC analysis; only starting materials were present. It is likely that the vinylboronate acted as a Lewis acid and activated a vinylpyrrole to form the dimer **17**.

Considering the electron-rich nature of vinylpyrrole systems, the reaction reported above seems unexpected. Examples of compounds undergoing Diels-Alder-dimerization include butadiene [30], natural products [31], 2-styrylindolizine [32], 2-vinylindoles [33,34], 3-vinylindoles [35,36], and 2-vinylpyrroles [37]. Several of these dimeric products violate the '*ortho*/*para*' rule [34,36,37], and in each case the diene and the dienophile is connected to an electron-donating substituent, the nitrogen atom of the pyrrole ring, as in the present case, but no Lewis acid was present. This type of '*meta*' regioselectivity in Diels-Alder reactions having electron-donating substituents on the diene and dienophile was predicted by Houk in 1972 using frontier molecular orbital theory [38,39], and it has been experimentally observed in nondimerization Diels-Alder reactions not involving pyrrole as well (between the diene generated from benzocyclobutenes with the dienophiles propyne and ethoxyethene) [40]. As in some of the examples of *ortho*/*para* rule violation [34,36,37,40], a steric argument may also be made to help explain the formation of the dimer **17**, especially considering that in the present case dimer formation did not occur without the Lewis acid. This can be rationalized if one molecule of **3** complexes with the boronate **14** acting as a Lewis acid present at the more basic, terminal end of **3**. This may cause the terminal end of the vinylpyrrole to be so sterically bulky as to prohibit approach by either a free vinylpyrrole in the normal *ortho*/*para* regiochemistry or another Lewis acid-complexed vinylpyrrole (statistically unlikely), allowing only the approach of a free vinylpyrrole with the pyrrole ring farthest from the complexing-Lewis acid. The electrons of the nitrogen of the noncomplexed vinylpyrrole may then drive an attack from the α-carbon of that pyrrole to the α-carbon of the vinyl group of the complexed pyrrole, the positive charge of which is induced by complexation with the Lewis acid (Fig. 2). This is followed by dissociation of the catalyst and concomitant formation of a bond between the terminal carbons of each

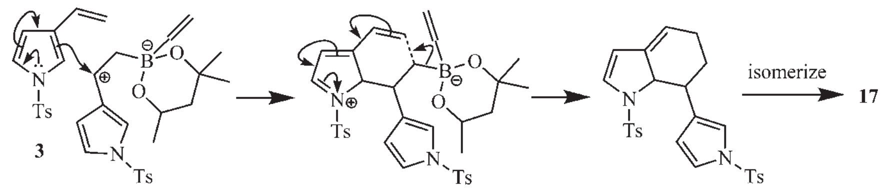

Figure 2. Formation of the 3-vinylpyrrole dimer **17**.

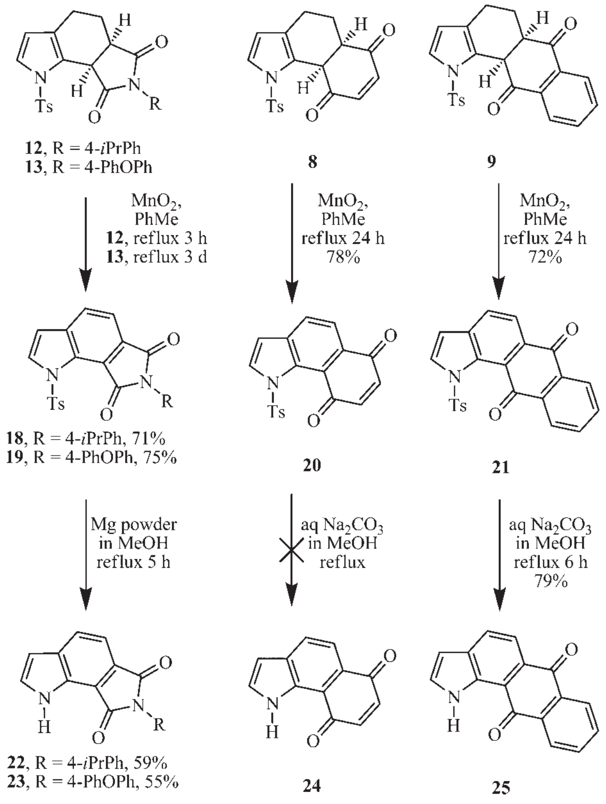
vinylpyrrole. Then, isomerization of the double bond in the adduct gives the observed 7-pyrrolyl-substituted tetrahydroindole **17**. In this proposed mechanism, nucleophilic attack by the free pyrrole in the first step effectively allows reversal of the normal polarity of the terminus of its vinyl group, allowing the second carbon-carbon bond formation, an example of umpolung [41]. Further studies are currently underway in our labs to determine the scope of such a dimerization approach towards indoles.

Aromatization of Diels-Alder adducts. Tetrahydroindoles **12**, **13**, **8**, and **9** were aromatized using MnO_2 in refluxing toluene for 3–72 h, giving **18**, **19**, **20**, and **21** in 71, 75, 78, and 72% yields, respectively (Scheme 5). The most consistent and high-yielding results were achieved using MnO_2 generated from manganese(II) sulfate and potassium permanganate [42], which was also used in our 2-vinylpyrrole work [6]. The average yield from dehydrogenations was 74%, higher than the 54% average achieved in aromatizing the adducts resulting from 2-vinylpyrrole, indicating that the tosyl group may help to facilitate the reaction or provide some degree of stability to the tetrahydroindoles during the aromatization process [6].

Detosylation of *N*-*p*-toluenesulfonylindoles. Detosylation of maleimide-derived indoles **18** and **19** was accomplished by magnesium in refluxing methanol for 5 h, giving **22** and **23** in 59 and 55% yield, respectively (Scheme 5) [43]. Detosylation of 1,4-naphthoquinone-derived indole **21** [44] was effected by saponification with aqueous sodium carbonate in methanol under reflux for 6 h. With saponification of **18** and **19**, competition between removal of the *p*-toluenesulfonyl group and hydrolysis of the imide was observed. When these two methods were applied to the *p*-benzoquinone-derived indole **20**, decomposition occurred with no recovery of starting materials. Various other methods were attempted, such as TBAF in refluxing THF/MeOH [45], 5% sodium-mercury amalgam in THF/MeOH [46], the dilithium salt of thioglycolate in DMF [47], and concentrated sulfuric acid [48], but none of these methods gave the desired *N*-H indole **24**. The failure to achieve compound **24** is likely due to the α,β-unsaturated dione portion of indole **20**, which is acting as a strong Michael acceptor. An example exists of saponification failing to detosylate an *N*-tosyl compound containing such a dione portion [49], an *N*-*p*-toluenesulfonyl-1*H*-indole-4,7-dione, but some precedent exists for detosylation of such compounds using TBAF in THF [50]. However, 1*H*-indole-4,7-diones may be distinguished from **20** because the carbonyls of these compounds are in more direct conjugation with the electron-releasing nitrogen, causing deactivation. If the conjugated dione of compound **20** indeed prevented its detosylation by the means attempted, then a masking technique could be used, such as reduction of **20** and formation of the *bis*-silyl ether [51], detosylation *via* conventional means, then desilylation followed by tautomerization to the quinone [52] to give *N*-H indole **24**. Such a route toward **24** is currently under investigation in our labs.

Scheme 5. Aromatization and detosylation of tetrahydroindoles **8**, **9**, **12**, and **13**.



Biological activity. While participating in the Developmental Therapeutics Program at the National Cancer Institute (NCI), we submitted eight compounds to the NCI for a one-dose 60-human tumor cell line prescreen: compounds **8**, **9**, **12**, **13**, **18**, **19**, **20**, and **21**. Of these, four compounds, **8**, **9**, **20**, and **21**, were judged by the NCI to have sufficient activity to justify screening with 60 human-tumor cell lines at five concentrations with 10-fold dilutions, from 1×10^{-4} M to 1×10^{-8} M. All four of these compounds were found to have high levels of activity against many of the 60 different cell lines tested. Compound **8** was most active against colon cancer HCT-116, melanoma M14, and nonsmall cell lung cancer, with IC_{50}'s of 67, 63, and 37 ng/mL, respectively. Compound **9** was most active against melanoma M14, and leukemia cell lines CCRF-CEM and HL-60(TB), with IC_{50}'s of 11, 13, and 11 ng/mL, respectively. Compound **20** was most active against melanoma UACC-257, and leukemia cell lines MOLT-4 and SR, with IC_{50}'s of 21, 56, and 50 ng/mL, respectively. Compound **21** was most active against CNS cancer SF-295, ovarian cancer OVCAR-3, and melanoma MDA-MB-435, with IC_{50}'s of 10, 9.6, and 9.1 ng/mL, respectively. Compounds **8** and **20** were selected by the NCI for toxicity testing and subsequent hollow fiber testing. Compound **8** had a maximum tolerated dose of 100 mg/Kg body wt in athymic nude mice, with death resulting in 3 days at 200 mg/Kg body wt and 2 days at 400 mg/Kg body wt. Hollow fiber testing of compound **8** against breast cancer MDA-MB-231, nonsmall cell lung cancer NCI-H23 and NCI-H522, colon cancer SW-620 and COLO 205, melanoma LOX IMVI, UACC-62, and MDA-MB-435, ovarian cancer OVCAR-3, CNS cancer U251 and SF-295 gave a score of 4/96 with no cell kill, below the 20/96 minimum score required for selection for xenograft testing. Toxicity and hollow fiber testing data for compound **20** were pending at the time of submission of this article.

CONCLUSION

N-*p*-Toluenesulfonyl-3-vinylpyrrole underwent *endo*-addition [4 + 2] cycloaddition reactions with *p*-benzoquinone, 1,4-naphthoquinone, and maleimides giving isomerized aromatic tetrahydroindoles with *p*-benzoquinone and 1,4-naphthoquinone, and unisomerized tetrahydroindoles with maleimides. In the presence of vinylboronic acid 2-methyl-2,4-pentanediol ester, *N*-tosyl-3-vinylpyrrole underwent a Diels-Alder dimerization. Dehydrogenation of the tetrahydroindoles with activated MnO_2 in refluxing toluene gave the corresponding indoles. The maleimide-fused indoles were detosylated *via* saponification, and the 1,4-naphthoquinone-fused indole was detosylated with magnesium in refluxing methanol, giving the *N*-H indoles in moderate to good yields. This efficient method for formation of indoles offers high convergency and easily accessible starting materials.

EXPERIMENTAL

General. Solvents and reagents were purchased and used as received. Flash chromatography was performed using 230–450 mesh silica gel. MPLC refers to medium pressure liquid chromatography was performed using 325–635 mesh silica gel. Ethyl acetate/hexanes were used as eluent unless otherwise specified. TLC analyses were performed on plastic-backed plates pre-coated with 0.2 mm silica with F_{254} indicator. Infrared spectra were recorded on a 4000 FT IR spectrometer; only the most intense and/or diagnostic peaks are reported. High-resolution mass spectra were recorded with a time-of-flight instrument using electrospray ionization with PEG as an internal calibrant. For NMR spectra, chemical shifts (δ) were compared to the solvent. ^{13}C NMR spectra were proton-decoupled. Melting points are uncalibrated. Elemental analyses were performed by M-H-W Laboratories, Phoenix, AZ. Petroleum ether refers to the 35–60°C boiling point fraction.

General method for Diels-Alder reactions. A mixture of *N*-*p*-toluenesulfonyl-3-vinylpyrrole **3** (1.237 g, 0.005 mol) and the dienophile (0.0045 mol, 1.1 equiv.) in chloroform (20 mL) was stirred at rt for 24 h and, if TLC analysis indicated insignificant consumption of the dienophile, was refluxed until the reaction was complete. The solvent was removed using a rotating evaporator. The crude adduct was purified by MPLC using ethyl acetate/hexanes as eluent, followed by recrystallization from dichloromethane/petroleum ether, giving the desired product in good yields.

General method for dehydrogenation of Diels-Alder adducts. A mixture of the adduct (0.003 mol) and activated MnO_2 [42] (0.015 mol, 5 equiv.) in toluene (30 mL) was stirred under reflux until the reaction was complete, as indicated by TLC analysis. The mixture was cooled to rt and vacuum-filtered through a fine glass fritted funnel. The insoluble manganese salts were washed using several portions of dichloromethane until the washings ran clear (5 × 20 mL). The combined organic filtrate and washings were evaporated to dryness using a rotating evaporator. MPLC with ethyl acetate/hexanes as eluant, followed by recrystallization from dichloromethane/petroleum ether, gave the desired product in fair to good yields.

1-p-Toluenesulfonyl-4,5,5aα,9aα-tetrahydro-1H-benzo[g]indole-6,9-dione (8). The general method with quinone **4** and reflux for 48 h gave **8** (1.325 g, 82%) as light-yellow crystals: mp 172–174°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 7.74 (d, J = 8.4 Hz, 2H, Ts), 7.33 (d, J = 8.1 Hz, 2H, Ts), 7.20 (d, J = 3.5 Hz, 1H, 2-H), 6.88 (d, J = 10.2 Hz, 1H, 8-H), 6.70 (dd, J = 10.4, 1.4 Hz, 1H, 7-H), 6.17 (d, J = 3.6 Hz, 1H, 3-H), 4.84 (d, J = 5.7 Hz, 1H, 9aα-H), 3.06 (ddddd, J = 13.2, 5.5, 2.7, 1.4, 0.9 Hz, 1H, 5aα-H), 2.54–2.70 (m, 2H, 4α-H, 4β-H), 2.43 (s, 3H, Ts-CH_3), 2.07 (dddd, J = 13.6, 5.0, 2.5, 2.5 Hz, 1H, 5β-H), 1.68 (dddd, J = 13.2, 13.2, 10.4, 7.4 Hz, 1H, 5aα-H); ^{13}C NMR (75 MHz, $CDCl_3$, δ) 200.6, 196.5, 145.0, 141.5, 138.9, 136.5, 129.9, 127.2, 124.2, 123.9, 123.3, 112.6, 49.8, 47.3, 26.3, 22.8, 21.8; IR (KBr, cm^{-1}) 3382(w), 3137(w), 3101(w), 3051(m), 2946(m), 2853(m), 1702(s), 1673(s), 1595(m), 1486(w), 1433(w), 1379(s), 1276(m), 1260(m), 1228(m), 1209(w), 1173(s), 1137(m), 1121(s), 1089(s), 1061(m), 1033(m), 986(m), 923(w), 902(w), 850(m), 813(m), 775(w), 734(w), 704(m), 673(s); HRMS m/z (M + Na$^+$) calcd 378.0771, found 378.0782. 7-(4-Phenoxyphenyl)-1-p-toluenesulfonyl-1H,7H-benzo[g]indole-6,8-dione (19). The general method with tetrahydroindole **13** and reflux for 3 d gave **19** (1.144 g, 75%) as yellow crystals: mp 216–217°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.12 (d, J = 3.6 Hz, 1H, 2-H), 8.00 (d, J = 7.8 Hz, 1H, 4-H), 7.94 (d, J = 8.1 Hz, 2H, Ts), 7.88 (d, J = 7.8 Hz, 1H, 5-H), 7.31–7.45 (m, 6H, Ts, PhOPh), 7.06–7.20 (m, 5H, PhOPh), 6.91 (d, J = 3.9 Hz, 1H, 3-H), 2.43 (s, 3H, Ts-CH_3); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 167.4, 164.7, 157.1, 156.6, 145.3, 138.6, 136.5, 134.7, 130.8, 130.3, 130.0, 129.9, 128.8, 128.1, 127.6, 127.4, 124.6, 119.8, 118.9, 118.8, 117.4, 109.4, 21.6; IR (KBr, cm^{-1}) 3159(m), 3114(m), 1773(w), 1716(s), 1587(w), 1536(w), 1506(s), 1487(m), 1454(w), 1428(m), 1398(m), 1365(s), 1320(w), 1266(m), 1233(s), 1178(m), 1147(m), 1121(m), 1093(m), 1017(m), 990(m), 938(w), 909(w), 864(w), 830(m), 806(m), 777(w), 740(m), 665(m); HRMS m/z (M + Na^{+}) calcd 531.0986, found 531.1006. Anal. Calcd for $C_{29}H_{20}N_2O_5S$: C, 68.49; H, 3.96; N, 5.51. Found: C, 68.57; H, 4.03; N, 5.33.

1-p-Toluenesulfonyl-1H-benzo[g]indole-6,9-dione (20). The general method with tetrahydroindole **8** and reflux for 24 h gave **20** (822 mg, 78%) as light-orange crystals: mp 186–187°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 8.08 (d, J = 8.08 Hz, 1H, 4-H), 7.91 (d, J = 3.9 Hz, 1H, 2-H), 7.89 (d, J = 8.4 Hz, 1H, 5-H), 7.89 (J = 8.7 Hz, 2H, Ts), 7.41 (d, J = 8.4 Hz, 2H, Ts), 6.97 (d, J = 10.2 Hz, 1H, 8-H), 6.90 (d, J = 10.2 Hz, 1H, 7-H), 6.83 (d, J = 3.9 Hz, 1H, 3-H), 2.49 (s, 3H, Ts-CH_3); ^{1}H NMR (300 MHz, acetone-d_6, δ) 8.11 (d, J = 3.9 Hz, 1H, 2-H), 8.08 (d, J = 8.4 Hz, 1H, 4-H), 8.04 (d, J = 8.1 Hz, 1H, 5-H), 7.94 (d, J = 8.4 Hz, 2H, Ts), 7.50 (d, J = 8.1 Hz, 2H, Ts), 7.09 (d, J = 10.2 Hz, 1H, 8-H), 7.04 (d, J = 3.6 Hz, 1H, 3-H), 7.01 (d, J = 10.5 Hz, 1H, 7-H), 2.45 (s, 3H, Ts-CH_3); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 185.3, 184.8, 145.3, 139.4, 138.0, 137.8, 136.9, 136.7, 131.6, 130.1, 129.5, 127.4, 127.3, 123.2, 122.5, 110.8, 21.6; IR (KBr, cm^{-1}) 3311(m), 3153(m), 3116(w), 3065(m), 1718(w), 1660(s), 1609(m), 1594(m), 1533(m), 1494(w), 1459(w), 1415(w), 1380(m), 1354(s), 1301(s), 1282(m), 1252(m), 1241(w), 1189(m), 1163(s), 1119(m), 1088(m), 1070(s), 997(m), 967(w), 956(w), 882(w), 860(w), 831(m), 810(m), 756(w), 720(m), 666(s), 622(w); HRMS m/z (M + Na^{+}) calcd 374.0458, found 374.0464. Anal. Calcd for $C_{19}H_{13}NO_4S$: C, 64.95; H, 3.73; N, 3.99. Found: C, 64.82; H, 4.10; N, 4.10.

1-p-Toluenesulfonyl-1H-naphtho[2,3-g]indole-6,11-dione (21). The general method with tetrahydroindole **9** and reflux for 24 h gave **21** (867 mg, 72%) as light-orange crystals: mp 139–140°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 831 (d, J = 8.1 Hz, 1H, 4-H), 8.26–8.28 (m, 1H, 8-H), 8.14–8.17 (m, 1H, 9-H), 7.91–7.95 (m, 4H, Ts, 2-H, 5-H), 7.77–7.81 (m, 2H, 7-H, 10-H), 7.43 (d, J = 7.8 Hz, 2H, Ts), 6.84 (d, J = 3.6 Hz, 1H, 3-H), 2.51 (s, 3H, Ts-CH_3); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 184.1, 182.6, 145.4, 137.8, 136.8, 135.1, 134.8, 134.7, 133.0, 132.1, 130.7, 130.1, 127.7, 127.6, 127.4, 127.0, 126.9, 125.2, 123.1, 110.8, 21.7; IR (KBr, cm^{-1}) 3180(m), 3066(m), 2915(w), 1668(s), 1593(m), 1529(w), 1458(w), 1412(w), 1379(w), 1352(m), 1324(m), 1286(s), 1258(m), 1195(w), 1172(m), 1130(w), 1095(m), 1044(w), 1014(m), 955(w), 884(w), 851(w), 811(w), 737(w), 715(m), 705(w), 669(m), 636(w); HRMS m/z (M + Na$^+$) calcd 424.0615, found 424.0622. Anal. Calcd for $C_{23}H_{15}NO_4S$: C, 68.81; H, 3.77; N, 3.49. Found: C, 68.70; H, 3.79; N, 3.51.

7-(4-Isopropylphenyl)-1H,7H-benzo[g]indole-6,8-dione (22). Forty mesh magnesium metal powder (245 mg, 101 mmol, 20 equiv.) was ground with a mortar and pestle by hand for 1 min, and then placed immediately in anhydrous methanol (20 mL, ≤0.100% water). The indole **18** (231 mg, 0.504 mmol) was added, and the mixture was stirred under reflux for 5 h, at which time TLC analysis indicated that the starting materials were completely converted. The mixture was cooled to rt, vacuum-filtered on a fritted-glass funnel, and the remaining solids were washed several times with dichloromethane (3 × 20 mL). The filtrate and washings were diluted with water (100 mL), and extracted with dichloromethane (3 × 20 mL). The dichloromethane was washed with saturated aqueous sodium bicarbonate (20 mL), water (20 mL), and brine (20 mL), and dried over anhydrous sodium sulfate. The solvent was removed using a rotating evaporator. The crude product was purified using MPLC with ethyl acetate/hexanes as eluent, and recrystallized from dichloromethane/petroleum ether, giving **22** (90 mg, 59%) as bright-yellow crystals: mp 185–186°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 9.48 (s, 1H, 1-H), 7.99 (d, *J* = 8.1 Hz, 1H, 4-H), 7.69 (d, *J* = 8.1 Hz, 1H, 5-H), 7.49 (dd, *J* = 3.0, 2.4 Hz, 1H, 2-H), 7.41 (d, *J* = 8.1 Hz, 2H, *i*PrPh), 7.38 (d, *J* = 8.1 Hz, 2H, *i*PrPh), 6.74 (dd, *J* = 3.3, 1.8 Hz, 1H, 3-H), 2.99 (septet, *J* = 7.1 Hz, 1H, —C*H*(CH$_3$)$_2$), 1.31 (d, *J* = 7.2 Hz, 6H, —CH(C*H*$_3$)$_2$); ^{1}H NMR (300 MHz, DMSO-d_6, δ) 2.19 (s, 1H, 1-H), 8.04 (d, *J* = 7.8 Hz, 1H, 4-H), 7.69 (dd, *J* = 2.9, 2.9 Hz, 1H, 2-H), 7.54 (d, *J* = 7.8 Hz, 1H, 5-H), 7.40 (d, *J* = 9.0 Hz, 2H, *i*PrPh), 7.37 (d, *J* = 9.0 Hz, 2H, *i*PrPh), 6.75 (dd *J* = 3.2, 1.7 Hz, 1H, 3-H), 2.96 (septet, *J* = 6.9 Hz, 1H, —C*H*(CH$_3$)$_2$), 1.25 (d, *J* = 6.9 Hz, 6H, —CH(C*H*$_3$)$_2$); ^{1}H NMR (300 MHz, acetone-d_6, δ) 11.22 (s, 1H, 1-H), 8.10 (d, *J* = 7.8 Hz, 1H, 4-H), 7.77 (d, *J* = 2.7, 2.7 Hz, 1H, 2-H), 7.60 (d, *J* = 7.8 Hz, 1H, 5-H), 7.46 (d, *J* = 9.0 Hz, 2H, *i*PrPh), 7.42 (d, *J* = 8.7 Hz, 2H, *i*PrPh), 6.82 (dd, *J* = 3.2, 2.0 Hz, 1H, 3-H), 3.02 (septet, *J* = 7.1 Hz, 1H, —C*H*(CH$_3$)$_2$), 1.31 (d, *J* = 6.9 Hz, 6H, —CH(C*H*$_3$)$_2$); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 169.0, 168.0, 148.5, 135.5, 132.3, 130.4, 129.3, 127.9, 127.3, 126.8, 125.6, 115.0, 114.0, 103.7, 33.8, 24.4; IR (KBr, cm^{-1}) 3392(bs), 3115(w), 3041(w), 2965(m), 2873(m), 1764(m), 1702(s), 1603(w), 1579(w), 1511(s), 1481(m), 1447(m), 1414(m), 1390(s), 1366(s), 1330(m), 1294(m), 1241(m), 1229(m), 1160(w), 1128(w), 1098(s), 1082(m), 971(w), 944(w), 888(w), 851(m), 825(m), 796(w), 762(m), 730(m), 670(m); HRMS m/z (M + Na$^+$) calcd 327.1105, found 327.1102. Anal. Calcd for $C_{19}H_{16}N_2O_2$: C, 74.98; H, 5.30; N, 9.20. Found: C, 74.78; H, 5.16; N, 9.21.

7-(4-Phenoxyphenyl)-1H,7H-benzo[g]indole-6,8-dione (23). Forty mesh magnesium metal powder (96 mg, 93 mmol, 20 equiv.) was ground with a mortar and pestle by hand for 1 min, and then placed immediately in anhydrous methanol (10 mL, ≤0.100% water). The indole **19** (100 mg, 0.196 mmol) was added, and the mixture was stirred under reflux for 5 h, at which time TLC analysis indicated complete conversion of the starting materials. The mixture was cooled to rt, vacuum-filtered on a fritted-glass funnel, and the remaining solids were washed with dichloromethane (3 × 10 mL). The filtrate and washings were diluted with water (50 mL), and extracted with dichloromethane (3 × 10 mL). The dichloromethane was washed with saturated aqueous sodium bicarbonate (10 mL), water (10 mL), and brine (10 mL), and dried over anhydrous sodium sulfate. The solvent was removed using a rotating evaporator. The crude product was purified by MPLC with ethyl acetate/hexanes as eluent, and recrystallized from dichloromethane/petroleum ether, giving **23** (38 mg, 55%) as yellow crystals: mp 206–207°C; ^{1}H NMR (300 MHz, DMSO-d_6, δ) 12.19 (s, 1H, 1-H), 8.05 (d, *J* = 7.8 Hz, 1H, 4-H), 7.70 (dd, *J* = 2.9, 2.9 Hz, 1H, 2-H), 7.56 (d, *J* = 8.1 Hz, 1H, 5-H), 7.42–7.51 (m, 4H, PhOPh), 7.09–7.23 (m, 5H, PhOPh), 6.76 (dd, *J* = 3.0, 1.8 Hz, 1H, 3-H); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 169.0, 167.9, 156.7, 135.5, 132.3, 130.8, 129.7, 129.4, 127.8, 126.8, 125.6, 124.5, 119.7, 119.0, 114.0, 105.0, 104.3, 103.7; IR (KBr, cm^{-1}) 3346(bs), 2960(m), 2922(s), 2853(m), 1761(m), 1698(s), 1590(w), 1509(m), 1486(m), 1447(m), 1392(m), 1368(m), 1332(w), 1291(w), 1245(m), 1159(w), 1109(m), 1074(m), 1009(w), 871(w), 828(w), 803(w), 756(w), 722(w); HRMS m/z (M + Na$^+$) calcd for $C_{22}H_{14}N_2O_3$: 377.0897, found 377.0891.

1H-Naphtho[2,3-g]indole-6,11-dione (25) [44]. A mixture of indole **21** (105 mg, 0.262 mmol), saturated aqueous sodium carbonate (10 mL), and methanol (10 mL) were stirred under reflux for 6 h, at which time TLC analysis indicated complete conversion of the starting materials. The mixture was cooled to rt, diluted with water (100 mL), and extracted with dichloromethane (3 × 20 mL). The dichloromethane was washed with saturated aqueous ammonium chloride (20 mL), and brine (20 mL), and dried over anhydrous sodium sulfate. The solvent was removed using a rotating evaporator, and the product was recrystallized from dichloromethane/petroleum ether, giving **25** (51 mg, 79%) as light-orange crystals: mp 205–206°C; ^{1}H NMR (300 MHz, $CDCl_3$, δ) 10.66 (s, 1H, 1-H), 8.07 (d, *J* = 8.4 Hz, 1H, 4-H), 8.00 (d, *J* = 8.1 Hz, 1H, 5-H), 8.23–8.34 (m, 2H, 8-H, 9-H), 7.75–7.81 (m, 2H, 7-H, 10-H), 7.57 (dd, *J* = 3.0, 2.4 Hz, 1H, 2-H), 6.68 (dd, *J* = 3.3, 1.8 Hz, 1H, 3-H); ^{13}C NMR (75 MHz, DMSO-d_6, δ) 185.0, 183.5, 135.0, 134.8, 134.70, 134.65, 133.8, 133.3, 132.8, 128.0, 127.6, 127.2, 126.7, 118.0, 117.8, 103.2; IR (KBr, cm^{-1}) 3095(w), 2960(m), 2923(m), 2852(w), 1719(w), 1668(s), 1660(m), 1590(m), 1572(w), 1545(w), 1487(m), 1445(w), 1405(w), 1329(m), 1289(s), 1235(w), 1199(w), 1158(m), 1090(s), 1048(m), 1008(m), 898(w), 844(w), 816(m), 724(s), 716(s), 638(w); HRMS m/z (M + Na$^+$) calcd 270.0526, found 270.0538. Anal. Calcd for $C_{16}H_9NO_2$: C, 77.72; H, 3.67; N, 5.67. Found: C, 77.74; H, 3.80; N, 5.49.

^{1}H and ^{13}C NMR spectra for **8**, **9**, **10**, **11**, **12**, **13**, **17**, **18**, **19**, **20**, **21**, **22**, **23**, and **25**. This material is available online free of charge (see Supporting Information).

Treatment of 2,4,6-trichloropyrimidines (**1a,b**) with the sodium salt of benzyl cyanide derivatives (**2a,b**) afforded 5-substituted 4-aryl(cyanomethyl)-2,6-dichloropyrimidines (**3a–f**). Compounds **3a,b** were alkylated with methyl iodide to furnish 4-(1-aryl-1-cyanoethyl)-2,6-dichloropyrimidines (**4a,b**). Compounds **3a–f** and **4a,b** were hydrolyzed with concentrated hydrochloric acid to afford 5-substituted 6-arylalkyluracils **5a–h**. 5-Bromo-6-arymethylluracils (**6a–d**) were synthesized by bromination of 6-arylmethylluracils (**5a–d**) with *N*-bromosuccinimide (NBS). Refluxing 2-(2,6-dichloro-5-ethylpyrimidin-4-yl)-2-(3,5-dimethylphenyl)acetonitrile (**3f**) with sodium methoxide followed by oxidation afforded (3,5-dimethylphenyl)(5-ethyl-2,6-dimethoxypyrimidin-4-yl)methanone (**7**). Addition of methylmagnesium bromide to compound **7** gave the tertiary alcohol derivative **8** which was fluorinated by diethylaminosulfurtrifluoride and deprotected by trimethylsilyl iodide to furnish 6-(1-(3,5-dimethylphenyl)-1-fluoroethyl)-5-ethylpyrimidine-2,4(1*H*,3*H*)-dione (**12**).

J. Heterocyclic Chem., **46**, 1246 (2009).

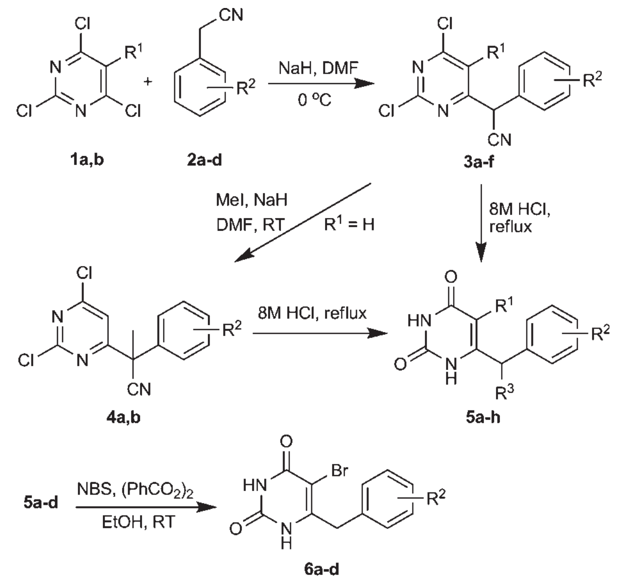
INTRODUCTION

5-Substituted 6-arylmethyluracils are important intermediates for the synthesis of many biologically active compounds. 5-Alkyl-6-arylmethyluracils are used for the synthesis of 6-benzyl-1-ethoxymethyl-5-isopropyluracil (MKC-442) [1–3] analogs as human immunodeficiency virus type 1 (HIV-1) nonnucleoside reverse transcriptase inhibitors (NNRTIs) [4–10]. 5-Bromo-6-arylmethyluracils were used as inhibitors of thymidine phosphorylase [11–13]. Uracil derivatives are known to be synthesized by refluxing the corresponding thiouracils with 10% aqueous chloroacetic acid [14–21]. Thiouracils are synthesized by the condensation of the appropriate β-ketoester with thiourea in strong basic medium [14–21]. Lee and Kim [22] have reported the synthesis of 5-alkyl-6-benzyluracil derivatives by the reaction of 5-alkyl-2,4,6-trichloropyrimidines with various arylmethyl magnesium halides to afford the regioselectively 6-arylmethyl-2,4-dichloropyrimidines as the major products. The dichloropyrimidine derivatives were refluxed with sodium methoxide to afford the dimethoxy derivatives which were refluxed with 37% hydrochloric acid to give 5-alkyl-6-benzyluracil derivatives [22]. El-Brollosy *et al*. [23] have synthesized some of 6-arylmethyluracils by the treatment of Grignard reagents of the corresponding benzyl halides with 4-chloro-5-ethyl-2,6-dimethoxypyrimidine. Hydrolysis of the Grignard products with 4 *M* hydrochloric acid afforded 6-benzyluracil derivatives [23]. In the present work, a novel synthetic route for 5-substituted 6-arylmethyluracils is reported.

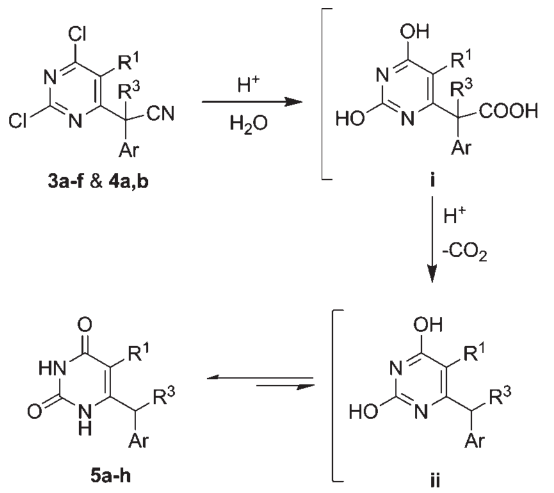
RESULTS AND DISCUSSION

Treatment of the sodium salt of arylacetonitriles (**2a–d**) with 2,4,6-trichloropyrimidine (**1a**) and/or 2,4,6-trichloro-5-ethylpyrimidine (**1b**) afforded 2-aryl-2-(2,6-dichloropyrimidin-4-yl)acetonitrile (**3a–d**) and 2-aryl-2-(2,6-dichloro-5-ethylpyrimidin-4-yl)acetonitriles (**3a,f**), respectively as sole products. No coupling at the 2-position of the pyrimidine ring was observed. As reported,

Scheme 1



Scheme 2



the 4- or 6-position (4-position is equivalent to 6-position in **1a,b**) in chloropyrimidines is more reactive than the 2-position in the nucleophilic substitution reaction [22,24,25]. Coupling at the 4-position of the pyrimidine ring was confirmed by nuclear Overhauser effect (NOE). On irradiation of CH—CN of compound **3c**, 1.29 NOE was detected with H5 which showed 2.0 NOE with CH—CN when irradiated. Compounds **3a,b** were methylated by stirring their sodium salts with methyl iodide in dry dimethylformamide to furnish 2-(2,6-dichloropyrimidin-4-yl)-2-arylacetonitriles **4a,b**. 6-Arylalkyluracils **5a–h** were obtained by refluxing of each compound of **3a–f** and **4a,b** with concentrated hydrochloric acid (Scheme 1). The mechanism for the synthesis of **5a–h** from **3a–f** and **4ab** is postulated as described by Smith and March [26]. The mechanism proceeds through acid hydrolysis of compounds **3a–f** and **4a,b** to their corresponding 2-(2,4-dihydroxypyrimidin-6-yl)-ethanoic acid derivatives **i** as intermediates. The intermediates **i** were decarboxylated in strong acidic medium to afford 6-arylpyrimidine-2,4-diols **ii** which are the enol forms of compounds **5a–h** (Scheme 2). Compounds **5a,b,f** have previously been prepared through desulfurization of the corresponding 2-thiouracil derivatives [14–16]. Compounds **5a–d** were brominated with *N*-bromosuccinimide in absolute ethanol in the presence of benzoyl peroxide at room temperature to give the 5-bromouracil derivatives **6a–d** (Scheme 1). Previously, Johnson and Ambelang [14] has synthesized compound **6a** through attacking compound **5a** with bromine in glacial acetic acid at 40–50°C.

2-(2,6-Dichloro-5-ethylpyrimidin-4-yl)-2-(3,5-dimethylphenyl)acetonitrile (**3f**) was refluxed with sodium methoxide in methanol followed by oxidation with a stream of oxygen at room temperature to furnish (3,5-dimethylphenyl)(5-ethyl-2,6-dimethoxypyrimidin-4-yl)methanone (**7**). Grignard reaction was applied on compound **7** by the treatment with methylmagnesium bromide to give 1-(3,5-dimethylphenyl)-1-(5-ethyl-2,6-dimethoxypyrimidin-4-yl)ethanol (**8**). Treatment of compound **8** with diethylaminosulfurtrifluoride (DAST) furnished two different compounds. One of them is dehydrated compound **9** in 28% yield and the other one is the fluoro derivative **10** in 37% yield. Compound **10** was deprotected by refluxing with trimethylsilyl iodide (TMSI) in dry chloroform to afford 6-[1-(3,5-dimethylphenyl)-1-fluoroethyl]-5-ethylpyrimidine-2,4(1*H*,3*H*)-dione (**11**) (Scheme 3; Table 1).

Novel and facile synthetic route for uracil derivatives starting with the commercially available 2,4,6-trichloropyrimidines and arylmethyl cyanides was achieved. One pot reaction was carried out by the hydrolysis of compounds **3a–f** and **4a,b** followed by decarboxylation of the resultant intermediates in strong acidic medium. The novel synthesized uracil derivatives can be used for the synthesis of NNRTIs and also N1-nucleosides.

EXPERIMENTAL

NMR spectra were recorded on Varian Gemini 2000 spectrometer (300 MHz for ^1H and 75 MHz for ^{13}C) and a Bruker AVANCE III 400 spectrometer (400 MHz for ^1H and 100 MHz for ^{13}C) with TMS as an internal standard. Electron impact mass spectra were recorded on a Finnigan MAT SSQ 710. MALDI spectra were recorded on a 4.7 T Ultima Fourier transform Mass spectrometer (IonSpec, Irvine, CA). Melting points were determined in a Büchi melting point apparatus. The silica gel (0.040–0.063 mm) used for column chromatography was purchased from Merck. Microanalyses were carried out at Chemical Laboratory II, University of Copenhagen, Denmark.

General procedure for the synthesis of 2-aryl-2-(2,6-dichloropyrimidin-4-yl)acetonitriles (3a–f). Sodium hydride (1.1 g, 25 mmol, and 55% suspension in paraffin oil) was added portionwise to a stirred solution of **1a,b** (10 mmol) and the appropriate benzyl cyanide (**2a–d**) (11 mmol) in dry dimethylformamide (20 mL) at 0°C. The mixture was allowed to reach room temperature gradually and left to be stirred for 3 h. The mixture was poured on the ice-cold water and stirred for 1 h. The solid product formed was filtered off and washed with cold water. The solid was purified by stirring with methanol (15 mL), filtered off, washed with methanol, and dried to afford the pure compounds **3b–f**. Only compound **3a** was extracted with ether (3 × 20 mL) from the aqueous mixture. The ether phase was dried and evaporated under reduced pressure. The residual material was purified by silica gel column chromatography using petroleum ether:ether (1:1, v/v) as eluent.

2-(2,6-Dichloropyrimidin-4-yl)-2-phenylacetonitrile (3a). This compound was obtained as white crystals; ^1H nmr ($CDCl_3$, 400 MHz): δ 5.22 (s, 1H, CH—CN), 7.41 (s, 1H, H5), 7.42–7.47 ppm (m, 5H, H_{arom}); ^{13}C nmr ($CDCl_3$, 100 MHz): δ 44.36 (*C*H—CN), 116.67 (CN), 117.81 (C5), 127.81, 129.47, 129.74, 131.65 (C_{arom}), 161.10 (C6), 163.91 (C2), 167.61 ppm (C4); ms: (70 eV, electron impact) *m/z* 51 (100%), 263, (39%, $C_{12}H_7{}^{35}Cl_2N_3$, M^+), 265 (20%, $C_{12}H_7{}^{35}Cl^{37}ClN_3$, M^++2), 267 (4%, $C_{12}H_7{}^{37}Cl^{37}ClN_3$, M^++4). Anal. Calcd. for $C_{12}H_7Cl_2N_3$ (264.11): C,54.57; H, 2.67; N, 15.91. Found: C, 55.02; H, 2.59; N, 15.74.

2-(2,6-Dichloropyrimidin-4-yl)-2-(2,6-difluorophenyl)acetonitrile (3b). This compound was obtained as white crystals; ^1H nmr ($CDCl_3$, 400 MHz): δ 5.60 (s, 1H, CH—CN), 7.03 (t, 2H, J = 8.4 Hz, H_{arom}), 7.43–7.47 (m, 1H, H_{arom}), 7.66 ppm (s, 1H, H5); ^{13}C nmr ($CDCl_3$, 100 MHz): δ 32.70 (t, J = 3.3 Hz, *C*H—CN), 108.95 (t, J = 17.2 Hz, C_{arom}), 112.34 (dd, J = 2.8, 22 Hz, C_{arom}), 114.60 (CN), 117.73 (C5), 132.11 (t, J = 10.1 Hz, C_{arom}), 160.38 (dd, J = 6.0, 252.4 Hz, C_{arom}), 161.17 (C6), 164.08 (C2), 165.50 ppm (C4); ms: (70 eV, electron impact) *m/z* 125 (100%), 299 (56%, $C_{12}H_5{}^{35}Cl_2F_2N_3$, M^+), 301 (27%, $C_{12}H_5{}^{35}Cl^{37}ClF_2N_3$, M^++2), 303 (6%, $C_{12}H_5{}^{37}$

$Cl_2F_2N_3$, M^++4). Anal. Calcd. for $C_{12}H_5Cl_2F_2N_3$ (300.09): C, 48.03; H, 1.68; N, 14.00. Found: C, 48.15; H, 1.58; N, 13.93.

2-(2,6-Dichloropyrimidin-4-yl)-2-(3,5-dimethylphenyl)acetonitrile (3c). This compound was obtained as white crystals; ^{1}H nmr ($CDCl_3$, 400 MHz) δ: 2.33 (s, 6H, $(CH_3)_2$N), 5.12 (s, 1H, CH—CN), 7.03 (s, 3H, H_{arom}), 7.39 ppm (s, 1H, H5); ^{13}C nmr ($CDCl_3$, 100 MHz) δ: 21.21 [$(CH_3)_2$N], 44.31 (*C*H—CN), 116.87 (C5), 117.87 (CN), 125.46, 131.10, 131.41, 139.64 (C_{arom}), 161.02 (C4), 163.78 (C2), 167.91 (C4) ppm; ms: (70 eV, electron impact) *m/z* 144 (100%), 291 (86%, $C_{14}H_{11}{}^{35}Cl_2N_3$, M^+), 293 (51%, $C_{14}H_{11}{}^{35}Cl^{37}ClN_3$, M^++2), 295 (6%, $C_{14}H_{11}{}^{37}Cl_2N_3$, M^++4). *Anal.* Calcd. for $C_{14}H_{11}Cl_2N_3$ (292.16): C, 57.55; H, 3.79; N, 14.38. Found: C, 58.11; H, 3.85; N, 14.14.

(2,6-Dichloropyrimidin-4-yl)(mesityl)acetonitrile (3d). This compound was obtained as yellow crystals ^{1}H nmr ($CDCl_3$, 300 MHz): δ 2.30 (s, 6H, $3CH_3$), 5.62 (CH—CN), 6.95 (s, 2H, H_{arom}), 7.14 ppm (s, 1H, H5); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 20.67 [$(CH_3)_2$Ar], 20.90 (*C*H_3Ar), 38.52 (*C*H—CN), 115.96 (CN), 117.20 (C5), 125.74, 130.57, 136.92, 139.53 (C_{arom}), 161.19 (C4), 163.60 (C2), 167.86 ppm (C6); ms: (70 eV, electron impact) *m/z* 32 (100%), 305 (78%, $C_{15}H_{13}{}^{35}Cl_2N_3$, M^+), 307 (55%, $C_{15}H_{13}{}^{35}Cl^{37}ClN_3$, M^++2), 309 (9%, $C_{15}H_{13}{}^{37}Cl_2N_3$, M^++4). Anal. Calcd. for $C_{15}H_{13}Cl_2N_3$ (306.19): C, 58.84; H, 4.28; N, 13.72. Found: C, 58.96; H, 4.05; N, 13.75.

2-(2,6-Dichloro-5-ethylpyrimidin-4-yl)-2-(2,6-difluorophenyl) acetonitrile (3e). This compound was obtained as yellow crystals; ^{1}H nmr ($CDCl_3$, 300 MHz): δ 1.09 (t, 3H, *J* = 7.2 Hz, *CH₃*CH_2), 2.81 (q, 2H, *J* = 7.2 Hz, CH_3*CH₂*), 5.72 (s, 1H, CH—CN), 7.03 (t, 2H, *J* = 8.4 Hz, H_{arom}), 7.26–7.44 ppm (m, 1H, H_{arom}); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 11.76 (*C*H_3CH_2), 21.54 (CH_3*C*H_2), 31.66 (t, *J* = 2.6 Hz, CH—CN), 105.87 (C5), 108.81 (t, *J* = 16.9 Hz, C_{arom}), 112.27 (dd, *J* = 3.2, 22.3 Hz, C_{arom}), 114.69 (CN), 131.96 (t, *J* = 10.4 Hz, C_{arom}), 157.54 (C2), 158.84 (d, *J* = 6.1 Hz, C_{arom}), 161.95 (C4), 162.19 (d, *J* = 6.2 Hz, C_{arom}), 163.72 ppm (C6); ms: (70 eV, electron impact) *m/z* 308 (100%), 327 (69%, $C_{14}H_9{}^{35}Cl_2F_2N_3$, M^+), 329 (36%, $C_{14}H_9{}^{35}Cl^{37}ClF_2N_3$, M^++2), 331 (7%, $C_{14}H_9{}^{37}Cl_2F_2N_3$, M^++4). Anal. Calcd. for $C_{14}H_9Cl_2F_2N_3$ (328.14): C, 51.24; H, 2.76; N, 12.81. Found: C, 51.31; H, 2.26; N, 12.71.

2-(2,6-Dichloro-5-ethylpyrimidin-4-yl)-2-(3,5-dimethylphenyl) acetonitrile (3f). This compound was obtained as white crystals; ^{1}H nmr ($CDCl_3$, 300 MHz): δ 1.01 (t, 3H, *J* = 7.6 Hz, *CH₃*CH_2), 2.31 [s, 6H, (*CH₃*)$_2$Ar], 2.75 (q, 2H, *J* = 7.6 Hz, CH_3*CH₂*), 5.35 (s, 1H, CH—CN), 6.98 ppm (s, 3H, H_{arom}); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 11.91 (*C*H_3CH_2), 21.21 (CH_3*C*H_2), 21.67 [(*C*H_3)$_2$Ar], 116.94 (CN), 125.43, 130.87, 131.67, 139.45 (C_{arom}), 132.04 (C5), 157.57 (C2), 163.98 (C4), 164.58 ppm (C6); hrms: (maldi) *m/z* calcd. for $C_{16}H_{16}Cl_2N_3$ (MH^+) 320.0716, found 320.0719.

Synthesis of 2-aryl-2-(2,6-dichloropyrimidin-4-yl)propanenitriles (4a,b). To a solution of **3a,b** (2 mmol) in dry dimethylformamide (10 mL) sodium hydride (131 mg, 3 mmol, 55% suspension in paraffin oil) was added portionwise at 0°C. The mixture was stirred for 1 h and then methyl iodide (0.19 mL, 3 mmol) was added at 0°C. The reaction mixture was stirred for 6 h at room temperature then poured on ice-cold water (100 mL). The mixture was extracted with ether (2 × 20 mL) and the combined ether phases were dried ($MgSO_4$) and evaporated under reduced pressure. The residual material was purified by a silica gel column chromatography using petroleum ether:ether (1:1, v/v) as eluent to afford compounds **4a,b**.

2-(2,6-Dichloropyrimidin-4-yl)-2-phenylpropanenitrile (4a). This compound was obtained as colorless prisms; ^{1}H nmr ($CDCl_3$, 400 MHz): δ 2.18 (s, 3H, CH_3), 7.36–7.45 (m, 3H, H_{arom}), 7.47 (s, 1H, H5), 7.49–7.51 ppm (m, 2H, H_{arom}); ^{13}C nmr ($CDCl_3$, 100 MHz): δ 25.80 (CH_3), 48.30 (*C*—CN), 117.63 (CN), 120.61 (C5), 126.19, 129.01, 129.41, 137.11 (C_{arom}), 160.93 (C4), 163.68 (C2), 171.49 ppm (C6); ms: (70 eV, electron impact) *m/z* 77 (100%), 277 (52%, $C_{13}H_9{}^{35}Cl_2N_3$, M^+), 279 (30%, $C_{13}H_9{}^{35}Cl^{37}ClN_3$, M^++2), 281 (6%, $C_{13}H_9{}^{37}Cl_2N_3$, M^++4). Anal. Calcd. for $C_{13}H_9Cl_2N_3$ (278.14): C, 56.14; H, 3.26; N, 15.11. Found: C, 56.70; H, 3.22; N, 15.11.

2-(2,6-Dichloropyrimidin-4-yl)-2-(3,5-dimethylphenyl)propanenitrile (4b). This compound was obtained as colorless prisms; ^{1}H nmr ($CDCl_3$, 400 MHz): δ 2.14 (s, 3H, CH_3), 2.33 [s, 6H, (C*H₃*)$_2$Ar], 6.99 (s, 1H, H_{arom}), 7.06 (s, 2H, H_{arom}), 7.43 ppm (s, 1H, H5); ^{13}C nmr ($CDCl_3$, 100 MHz): δ 21.36 [(*C*H_3)$_2$Ar], 25.65 (CH_3), 48.16 (*C*—CN), 117.77 (CN), 120.85 (C5), 123.87, 130.64, 136.99, 139.21 (C_{arom}), 160.85 (C4), 163.53 (C2), 171.80 ppm (C6); ms: (70 eV, electron impact) *m/z* 158 (100%), 305 (47%, $C_{15}H_{13}{}^{35}Cl_2N_3$, M^+), 307 (47%, $C_{15}H_{13}{}^{35}Cl^{37}ClN_3$, M^++2), 309 (9%, $C_{15}H_{13}{}^{37}Cl_2N_3$, M^++4). Anal. Calcd. for $C_{15}H_{13}Cl_2N_3$ (306.19): C, 58.84; H, 4.28; N, 13.72. Found: C, 58.71; H, 4.23; N, 13.57.

General procedure for synthesis of 6-arylalkylpyrimidine-2,4(*1H*,*3H*)-dione derivatives 5a–h. Each compound of **3a–f** and **4a,b** (5 mmol) was refluxed in a mixture of concentrated hydrochloric acid (30 mL) and acetic acid (5 mL) for 50 h. The reaction mixture was cooled to room temperature and the solid product formed was filtered off, washed with water, and dried to furnish compounds **5a–h**.

6-(2,6-Difluorobenzyl)pyrimidine-2,4(1*H*,3*H*)-dione (5b). This compound was obtained as a white solid; ^{1}H nmr (DMSO-*d₆*, 400 MHz): δ 3.75 (s, 2H, CH_2), 4.78 (s, 1H, H5), 7.18 (t, *J* = 8.0 Hz, 2H, H_{arom}), 7.44–7.51 (m, 1H, H_{arom}), 11.09 ppm (bs, 2H, 2NH) ; ^{13}C nmr (DMSO-*d₆*, 100 MHz): δ 24.42 (CH_2), 97.41 (C5), 110.80 (t, *J* = 20.2 Hz, C_{arom}), 111.69 (dd, *J* = 18.7, 6.2 Hz, C_{arom}), 130.21 (t, *J* = 10.3Hz, C_{arom}), 151.31 (C6), 153.54 (C2), 160.76 (dd, *J* = 246.8, 7.7 Hz, C_{arom}), 163.79 ppm (C4); ms: (70 eV, electron impact) *m/z* 68 (100%), 238 (79%, M^+). Anal. Calcd. for $C_{11}H_8F_2N_2O_2.0.4H_2O$ (245): C, 53.93; H, 3.46; N, 11.43. Found: C, 53.82; H, 3.15; N, 11.33.

6-(3,5-Dimethylbenzyl)pyrimidine-2,4(1*H*,3*H*)-dione (5c). This compound was obtained as a white solid; ^{1}H nmr (DMSO-*d₆*, 400 MHz): δ 2.25 (s, 6H, (C*H₃*)$_2$Ar)), 3.54 (s, 2H, CH_2), 5.23 (s, 1H, H5), 6.90 (s, 1H, H_{arom}), 6.93 (s, 2H, H_{arom}), 10.93 ppm (s, 2H, 2NH); ^{13}C nmr (DMSO-*d₆*, 100 MHz): δ 20.75 [$(CH_3)_2$Ar], 37.30 (CH_2), 98.70 (C5), 126.65, 128.29, 135.82, 137.44 (C_{arom}), 151.53 (C6), 155.61 (C2), 164.02 ppm (C4); ms: (70 eV, electron impact) *m/z* 187 (100%), 230 (49%, M^+). Anal. Calcd. for $C_{13}H_{14}N_2O_2{\cdot}0.25\ H_2O$ (232.07): C, 67.28; H, 6.17; N, 12.07. Found: C, 67.15; H, 6.13; N, 12.08

6-(Mesitylmethyl)pyrimidine-2,4(1*H*,3*H*)-dione (5d). This compound was obtained as a white solid; ^{1}H nmr (DMSO-*d₆*, 300 MHz): δ 2.15 (s, 6H, $2CH_3$), 2.23 (s, 3H, CH_3), 3.62 (s, 2H, CH_2), 4.40 (s, 1H, H5), 6.89 (s, 2H, H_{arom}), 10.98 ppm (bs, 2H, 2NH); ^{13}C nmr (DMSO-*d₆*, 75 MHz): δ 19.32 ($2CH_3$), 20.47 (CH_3), 30.94 (CH_2), 96.55 (C5), 128.68, 128.76, 136.00, 136.61 (C_{arom}), 151.47 (C4), 155.18 (C2), 163.97 ppm

(C6); hrms: (maldi) *m/z* Calcd. for $C_{14}H_{17}N_2O_2$ (MH^+) 245.1285, found 245.1294.

6-(2,6-Difluorobenzyl)-5-ethylpyrimidine-2,4(1H,3H)-dione (5e). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 300 MHz): δ 0.60 (t, 3H, J = 7.4 Hz, CH_3CH_2), 2.12 (q, 2H, J = 7.4 Hz, CH_3CH_2), 3.82 (s, 2H, CH_2Ar), 7.11 (t, 2H, J = 8.3 Hz, H_{arom}), 7.37–7.43 (m, 1H, H_{arom}), 10.78 (s, 1H, NH), 11.04 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 75 MHz): δ 12.54 (CH_3CH_2), 17.30 (CH_3CH_2), 23.72 (CH_2Ar), 111.23 (C5), 111.67 (dd, J = 7.5, 17.7 Hz, C_{arom}), 129.54 (t, J = 10.5 Hz, C_{arom}), 147.50 (C2), 150.73 (C6), 159.09 (d, J = 8.5 Hz, C_{arom}), 162.36 (d, J = 8.1 Hz, C_{arom}), 164.27 ppm (C4); ms: (70 eV, electron impact) *m/z* 266 (100%, M^+). Anal. Calcd. for $C_{13}H_{12}F_2N_2O_2$ (266.24): C, 58.65; H, 4.54; N, 10.52. Found: C, 58.68; H, 4.23; N, 10.38.

6-(1-Phenylethyl)pyrimidine-2,4(1H,3H)-dione (5g). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 1.48 (d, 3H, J = 7.3 Hz, CH_3CH), 3.80 (q, 1H, J = 7.3 Hz, CH_3CH), 5.41 (s, 1H, H5), 7.25–7.50 (m, 5H, H_{arom}), 10.83 (s, 1H, NH), 10.96 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 100 MHz): δ 180.60 (CH_3), 41.27 (CH), 97.18 (C5), 126.98, 127.42, 128.44, 141.54 (C_{arom}), 151.55 (C6), 159.45 (C2), 164.15 ppm (C4); ms: (70 eV, electron impact) *m/z* 216 (100%, M^+). Anal. Calcd. for $C_{12}H_{12}N_2O_2.0.6H_2O$ (227.05): C, 63.48; H, 5.86; N, 12.34. Found: C, 63.46; H, 5.24; N, 12.57.

6-[1-(3,5-Dimethylphenyl)ethyl]pyrimidine-2,4(1H,3H)-dione (5h). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 1.44 (d, 3H, J = 7.3 Hz, CH_3CH), 2.25 [s, 6H, $(CH_3)_2Ar$], 3.70 (q, 1H, J = 7.3 Hz, CH_3CH), 5.39 (s, 1H, H5), 6.89 (s, 1H, H_{arom}), 6.95 (s, 2H, H_{arom}), 10.77 (s, 1H, NH), 10.94 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 100 MHz): δ 18.59 (CH_3CH), 20.85 [$(CH_3)_2Ar$], 41.18 (CH_3CH), 97.06 (C5), 125.13, 128.38, 137.36, 141.35 (C_{arom}), 151.53 (C6), 159.59 (C2), 164.17 ppm (C4); ms: (70 eV, electron impact) *m/z* 158 (100%), 244 (86%, M^+). Anal. Calcd. for $C_{14}H_{16}N_2O_2$ (244.3): C, 68.83; H, 6.60; N, 11.47. Found: C, 68.35; H, 6.54; N, 11.62.

Synthesis of 6-arylmethyl-5-bromopyrimidine-2,4(1*H*, 3*H*)-diones (6a–d). A suspension of **5a–d** (2 mmol), *N*-bromosuccinimide (0.4 g, 2.25 mmol) and benzoyl peroxide (10 mg) in absolute ethanol (15 mL) was stirred for 5 h at room temperature. The solid product was filtered off, washed with ethanol (5 mL) and dried to afford compounds **6a–d**.

6-Benzyl-5-bromopyrimidine-2,4(1H,3H)-dione (6a). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 3.90 (s, 2H, CH_2), 7.25–7.37 (m, 5H, H_{arom}), 11.50 (s, 1H, NH), 11.53 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 400 MHz): δ 37.96 (CH_2), 96.01 (C5), 126.95, 128.30, 128.58, 135.13 (C_{arom}), 150.31 (C6), 152.41 (C2), 160.15 ppm (C4); ms: (70 eV, electron impact) *m/z* 201 (100%), 280 (13%, $C_{11}H_9{}^{79}BrN_2O_2$, M^+), 282 (19%, $C_{11}H_9{}^{81}BrN_2O_2$, M^++2). Anal. Calcd. for $C_{11}H_9BrN_2O_2$ (281): C, 47.00; H, 3.23; N, 9.97. Found: C, 46.99; H, 3.12; N, 9.86.

5-Bromo-6-(2,6-difluorobenzyl)pyrimidine-2,4(1H,3H)-dione (6b). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 3.93 (s, 2H, CH_2); 7.11 (t, 2H, J = 8.3 Hz, H_{arom}), 7.37–7.44 (m, 1H, H_{arom}), 11.58 ppm (s, 1H, NH); ^{13}C NMR (DMSO-d_6, 400 MHz): δ 26.98 (CH_2), 95.72 (C5), 110.96 (t, J = 19.1 Hz, C_{arom}), 111.55 (dd, J = 18.8, 6.2 Hz, C_{arom}), 129.67 (t, J =10.6 Hz, C_{arom}), 150.20 (C6), 151.28 (C2), 159.97 (C4), 160.41 ppm (dd, J =247.2, 8.1 Hz, C_{arom}); ms: (70 eV, electron impact) *m/z* 127 (100%), 316 (28%, $C_{11}H_7{}^{79}BrF_2N_2O_2$, M^+), 318 (23%, $C_{11}H_7{}^{81}BrF_2N_2O_2$, M^++2). Anal. Calcd. for $C_{11}H_7BrF_2N_2O_2$ (318.09): C, 41.67; H, 2.23; N, 8.83. Found: C, 41.46; H, 2.03; N, 8.64.

5-Bromo-6-(3,5-dimethylbenzyl)pyrimidine-2,4(1H,3H)-dione (6c). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 2.24 (s, 6H, $2CH_3$), 3.82 (s, 2H, CH_2), 6.89 (s, 1H, H_{arom}), 6.93 (s, 2H, H_{arom}), 11.42 (s, 1H, NH), 11.51 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 100 MHz): δ 20.82 ($2CH_3$), 37.81 (CH_2), 95.95 (C5), 125.96, 128.33, 134.90, 137.51 (C_{arom}), 150.28 (C6), 152.45 (C2), 160.13 ppm (C4); ms: (70 eV, electron impact) *m/z* 158 (100%) 308 (22%, $C_{13}H_{13}{}^{79}BrN_2O_2$, M^+), 310 (20%, $C_{13}H_{13}{}^{81}BrN_2O_2$, M^++2). Anal. Calcd. for $C_{13}H_{13}BrN_2O_2$ (309.2): C, 50.50; H, 4.24; N, 9.06. Found: C, 50.78; H, 4.12; N, 8.97.

5-Bromo-6-(2,4,6-trimethylbenzyl)pyrimidine-2,4(1H,3H)-dione (6d). This compound was obtained as a white solid; ^1H nmr (DMSO-d_6, 400 MHz): δ 2.19 (s, 6H, $2CH_3$), 2.21 (s, 3H, CH_3), 3.90 (s, 2H, CH_2), 6.83 (s, 2H, H_{arom}), 10.60 (s, 1H, NH), 11.51 ppm (s, 1H, NH); ^{13}C nmr (DMSO-d_6, 100 MHz): δ 20.26 ($2CH_3$), 20.38 (CH_3), 95.65 (C5), 128.46, 128.88, 135.77, 137.20 (C_{arom}), 150.14 (C6), 152.61 (C2), 159.87 ppm (C4); ms: (70 eV, electron impact) *m/z* 243 (100%), 322 (21%, $C_{14}H_{15}{}^{79}BrN_2O_2$, M^+), 324 (19%, $C_{14}H_{15}{}^{81}BrN_2O_2$, M^++2). Anal. Calcd. for $C_{14}H_{15}BrN_2O_2$ (323.19): C, 52.03; H, 4.68; N, 8.67. Found: C, 51.93; H, 4.63; N, 8.49.

(3,5-Dimethylphenyl)(5-ethyl-2,6-dimethoxypyrimidin-4-yl) methanone (7). Sodium (0.3 g, 13 mmol) was dissolved in anhydrous methanol (15 mL) at 0°C. Compound **3f** (1 g, 3.1 mmol) was added and the mixture was refluxed for 20 h. Stream of oxygen was pumped through the solution at room temperature for 2 h, the solvent was concentrated to 5 mL under reduced pressure. Water (30 mL) was added to the mixture and the solid product formed was filtered off and dried to give 0.85 g (91%) of **7** as a white solid; mp 99–100°C, 97–99°C [27].

Synthesis of 1-(3,5-dimethylphenyl)-1-(5-ethyl-2,6-dimethoxypyrimidin-4-yl)ethanol (8). Under stream of nitrogen, a solution of MeMgBr (4 mL, 12 mmol, and 3 *M* in Et_2O) was added dropwise to a stirred solution of compound **7** (3.0 g, 10 mmol) in diethyl ether (20 mL) at –20°C, the reaction was left to reach room temperature with stirring for 2 h. The reaction was quenched by a saturated solution of ammonium chloride (10 mL). Water (10 mL) was added to the mixture and was extracted with ether (2 × 15 mL). The combined ether phases were dried ($MgSO_4$) and evaporated under reduced pressure. The residue was chromatographed on a silica gel column using ether:petroleum ether (1:10, v/v) as eluent to afford 2.9 g of **8** as a colorless prisms; yield 92%; mp 73–75°C; ^1H nmr ($CDCl_3$, 300 MHz): δ 0.59 (t, 3H, J = 7.0 Hz, CH_3CH_2), 1.89 (s, 3H, CH_3—C—OH), 2.24 (q, 2H, J = 7.0 Hz, CH_3CH_2), 2.27 (s, 6H, $(CH_3)_2Ar$) 3.99 (s, 3H, OCH_3), 4.08 (s, 3H, OCH_3), 6.29 (s, 1H, OH), 6.88 (s, 1H, H_{arom}), 6.94 ppm (s, 2H, H_{arom}); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 11.87 (CH_3CH_2), 18.56 (CH_3CH_2), 21.32 [$(CH_3)_2Ar$], 27.29 (CH_3—C—OH), 54.27, 54.67 (2 OCH_3), 74.41 (C—OH), 113.21 (C5), 124.17, 128.93, 137.58, 145.17 (C_{arom}), 161.08 (C6), 169.89 (C2), 171.33 ppm (C4); ms: (70 eV, electron impact) *m/z* 316 (100%, M^+).

Fluorination of 8: Synthesis of compounds 9 and 10. A solution of DAST (0.5 mL, 3.8 mmol) in 1 mL dichloromethane was added dropwise at –5°C to a solution of compound

8 (0.7 g, 2.5 mmol) in dichloromethane (10 mL) under argon at –5°C. The solution was stirred and left to reach room temperature for 4 h. The reaction was quenched by addition of 1 mL saturated solution of sodium carbonate with stirring. Water (10 mL) was added to the mixture and extracted with dichloromethane (2 × 10 mL). The combined dichloromethane phases were dried ($MgSO_4$) and evaporated under reduced pressure. The residue was chromatographed by a silica gel column using petroleum ether:ether (2:1, v/v) as eluent to give compounds **9** and **10**.

4-[1-(3,5-Dimethylphenyl)vinyl]-5-ethyl-2,6-dimethoxypyrimidine (9). This compound was obtained as a white solid; yield 37%; mp 112–114°C; ^{1}H nmr ($CDCl_3$, 300 MHz): δ 0.93 (t, 3H, J = 7.4 Hz, CH_3CH_2), 2.27 [s, 6H, $(CH_3)_2Ar$], 2.38 (q, 2H, J = 7.4 Hz, CH_3CH_2), 3.96 (s, 3H, OCH_3), 4.03 (s, 3H, OCH_3), 5.27, 5.81 (2s, 2H, $CH_2{=}C$), 6.92 ppm (s, 3H, H_{arom}); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 13.59 (CH_3CH_2), 18.88 (CH_3CH_2), 21.26 [$(CH_3)_2Ar$], 53.90, 54.53 (2 OCH_3), 114.78 (C5), 115.54 ($CH_2{=}C$), 124.16, 129.65, 137.72, 146.43 (C_{arom}), 138.46 ($CH_2{=}C$), 162.83 (C2), 166.92 (C6), 171.12 ppm (C4); ms: (70 eV, electron impact) m/z 298 (100%, M^+). Anal Calcd. for $C_{18}H_{22}N_2O_2$ (298.38): Calcd: C, 72.46; H, 7.43; N, 9.39. Found: C, 72.42; H, 7.53; N, 9.38.

4-[1-(3,5-Dimethylphenyl)-1-fluoroethyl]-5-ethyl-2,6-dimethoxypyrimidine (10). This compound was obtained as an oil; yield 28%; ^{1}H nmr ($CDCl_3$, 300 MHz): δ 0.86 (t, 3H, J = 7.3 Hz, CH_3CH_2), 2.00 (d, 3H, $J_{H,F}$ = 24.0 Hz, CH_3—C—F), 2.27 [s, 6H, $(CH_3)_2Ar$], 2-39–2.47 (m, 2H, CH_3CH_2), 3.97 (s, 1H, OCH_3), 4.02 (s, 3H, OCH_3), 6.88 (s, 1H, H_{arom}), 6.93 ppm (s, 2H, H_{arom}); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 13.31 (d, J = 1.9 Hz, CH_3CH_2), 18.24 (d, J = 6.7 Hz, CH_3CH_2), 21.36 [$(CH_3)_2Ar$], 29.22 (d, J = 25.4 Hz, CH_3—C—F), 54.08 (OCH_3), 54.48 (OCH_3), 99.52 (d, J = 174.8 Hz, C—F), 115.68 (C5), 121.79 (d, J = 7.2 Hz, C_{arom}), 129.05 (C_{arom}), 137.66 (d, J = 1.3 Hz, C_{arom}), 143.99 (d, J = 23.7 Hz, C_{arom}), 161.88 (C2), 166.28 (d, J = 23.7 Hz, C4), 171.26 ppm (C6); hrms: (MALDI) m/z Calcd. for $C_{18}H_{24}FN_2O_2$ (MH^+) 319.1816, found 319.1808.

6-[1-(3,5-Dimethylphenyl)-1-fluoroethyl]-5-ethylpyrimidine-2,4(1*H*,3*H*)-dione (11). Under stream of nitrogen, a mixture of TMSI (0.16 mL, 1.1 mmol) and compound **10** (160 mg, 0.5 mmol) in dry chloroform (15 mL) was refluxed for 2 h and the mixture was left to reach room temperature. The reaction was quenched with 5% aqueous sodium bicarbonate solution (2 mL), water (10 mL) was added and the two layers were separated. The aqueous layer was extracted with chloroform (2 × 10 mL). The chloroform phases were dried using sodium sulfate and evaporated under reduced pressure. The residual material was chromatographed on a silica gel column using ether as eluent to give 60 mg of **11** as a white solid; yield 63%; mp 200–202°C; ^{1}H nmr ($CDCl_3$, 300 MHz): δ 0.69 (t, 3H, J = 7.2 Hz, CH_3CH_2), 2.07 (q, 2H, J = 7.2 Hz, CH_3CH_2), 2.08 (d, 3H, $J_{H,F}$ = 24 Hz, CH_3—C—F), 2.34 [s, 6H, $(CH_3)_2Ar$], 7.04 (s, 3H, H_{arom}), 8.61 (s, 1H, NH), 9.72 ppm (s, 1H, NH); ^{13}C nmr ($CDCl_3$, 75 MHz): δ 12.29 (CH_3CH_2), 18.62 (CH_3CH_2), 21.30 [$(CH_3)_2Ar$], 24.30 (d, J = 26.5 Hz, CH_3—C—F), 95.29 (d, J = 174.5 Hz, C—F), 111.63 (C5), 123.97 (d, J = 5.1 Hz, C_{arom}), 131.50 (d, J = 3.3 Hz, C_{arom}), 138.59 (d, J = 2.1 Hz, C_{arom}), 138.18 (d, J = 20.8 Hz, C_{arom}), 149.93 (d, J = 43.5 Hz, C6), 150.29 (C2), 164.79 ppm (C4); hrms: (maldi) m/z Calcd. for $C_{16}H_{19}FNaN_2O_2$ (MNa^+) 313.1323, found 313.1323. Anal. Calcd. for $C_{16}H_{19}FN_2O_2 \cdot 0.7H_2O$ (302.95): C, 63.44; H, 6.79; N, 9.25. Found: C, 63.26; H, 6.51; N, 8.82.

The starting substrate 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) was achieved by the aldol condensation reaction of 3-acetyltropolone with 2-naphthaldehyde. Compound (**1**) reacted with bromine to give 7-bromo-(**2**) and 5,7-dibromo-3-(3-(2-naphthyl)acryloyl)tropolone (**3**) according to the amount of the brominated reagent. Iodination of **1** gave 7-iodo-3-(3-(2-naphthyl)acryloyl)tropolone (**4**). Azo-coupling reactions of **1**, **2**, and **4** gave 5-arylazo-3-(3-(2-naphthyl)acryloyl) tropolones (**5–8**). Compounds **1–4** reacted with hydroxyamine to give 3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-ones (**9–12**). The reactions of **1–4** with phenylhydrazine and substituted phenylhydrazines gave 3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[*c*]pyrazol-8(1*H*)-ones (**13–21**).

J. Heterocyclic Chem., **46**, 1302 (2009).

INTRODUCTION

Tropolone is an aromatic compound with a seven-membered ring, a metabolite of *Pseudomonas* sp.; the tropolone ring system represents the key structural element in a wide range of natural products, many of which are isolated from fungi [1] and higher plants [2]. Troponoids display various biological activities, such as pesticides [3], metals protease inhibition [4], and antifungal plant genetic disease genes [5]. Therefore, natural and synthetic tropolone derivatives have attracted considerable interest to organic chemists. The synthesis of substituted troponoids continues to be a considerable synthetic challenge. We have reported the electrophilic reactions of 3-acetyltropolone [6], 3-acetamidotropolone

Scheme 1

[7], 3-cinnamoyltropolone [8], 3-isopropenyltropolone [9], and 3-(2-quinolyl)tropolone [10], meanwhile various fused-heterocyclic troponoids have been prepared. In continuation of our interests in these compounds, we report the synthesis of 3-(3-(2-naphthyl)acryloyl)tropolone by the condensation of 3-acetyltropolone with 2-naphthaldehyde. 3-(3-(2-Naphthyl)acryloyl)tropolone possesses similar structure to 3-cinnamonytropolone and has three reactive parts for electrophilic reagents, two of which are seven-membered tropolone ring and a naphthalene ring and the third is a propenyl part between the two rings. Therefore, the reactions of 3-(3-(2-naphthyl)acryloyl)tropolone with electrophilic reagents are also expected to be interesting. On the other hand, the reactions with nucleophilic reagents are also of interest for participation of the tropolone ring, because chalcones reacted with hydroxylamine [11–14] and hydrazine [15–19] at the propenyl moiety to give diaryl-substituted isoxazolines and pyrazolines, respectively.

This article deals with the preparation of 3-(3-(2-naphthyl)acryloyl)tropolone as well as its electrophilic substitution reactions with halo and diazonium salts and the condensation reactions with hydroxylamine, phenylhydrazine, and substituted phenylhydrazines.

RESULTS AND DISCUSSION

The aldol condensation reactions of 3-acetyltropolone with substituted benzaldehydes [20] and heterocyclic aldehydes [21–23] have been reported. However, to our knowledge, the research of 3-acetyltropolone with 2-naphthaldehyde has never been performed, despite their important potential biological activities. Thus, we tried for the first time to study the preparation of 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) from 3-acetyltropolone and 2-naphthaldehyde.

Scheme 1 outlines the aldol condensation reaction of 3-acetyltropolone with 2-naphthaldehyde using aqueous KOH (5%) as a catalyst and 50% methanol as solvent to furnish 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) in 85.3% yield, mp 166–167°C. Its structure was established from the elemental analysis ($C_{20}H_{14}O_3$) and spectral data.

In its IR spectrum, an absorption band for the hydroxyl group was observed at 3190 cm^{-1}, and the two typical carbonyl absorption bands were observed at 1658 and 1613 cm^{-1}, respectively. The ^{1}H NMR spectrum showed a proton singlet at 7.98 (s, 1H) assignable to naphthalene H-1 and unresolved complex peaks at δ 7.14–7.86 for the protons of the aromatic ring and the exocyclic double bond. Moreover, the structure assigned for this reaction product was fully supported by its mass spectrum, which showed a molecular ion peak at 302 (M$^+$).

By theoretical calculation, the 5- and 7-position of the tropolone ring and the propenyl part have higher reactive activities than the naphthalene ring for electrophilic reagents, and their electronegativities are −0.150, −0.204, and −0.219, respectively, as shown in Figure 1.

To verify the calculated results, compound **1** was treated with some electrophilic reagents such as bromine, iodine, and diazonium salts. Thus, compound **1** was first subjected to react with bromine. When 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) was reacted with bromine in acetic acid in a mole ratio of 1:1 or 1:2, the corresponding monosubstituted 7-bromo-3-(3-(2-naphthyl)acryloyl)tropolone (**2**) and disubstituted 5,7-dibromo-3-(3-(2-naphthyl)acryloyl)tropolone (**3**) were obtained in 67.7% and 73.2% yield, respectively (Scheme 2).

The structure of **2** was determined by the elemental analysis and spectral data. In the IR spectrum, an absorption band for the hydroxyl group was at 3180 cm^{-1}, and the two typical carbonyl absorption bands were observed at 1641 and 1601 cm^{-1}, respectively. The ^{1}H NMR spectrum showed a doublet at δ 8.50 (d, 1H, J = 8.5 Hz) assignable to tropolone H-4, a quartet at 7.76 (q, 1H, J = 10.0 Hz) attributable to tropolone H-5, a doublet at 8.18 (d, 1H, J = 10.0 Hz) for naphthalene H-6, a doublet at 7.99 (d, 1H, J = 6.3 Hz) for naphthalene H-1, and a triplet at 7.16 (t, 1H, J = 11.0 Hz) and a doublet at 7.26 (d, 1H, J = 15.6 Hz) for the proton of the carbon–carbon double bond, besides multiplet peaks at δ 7.50–7.56 and 7.83–7.87 for the

Scheme 2

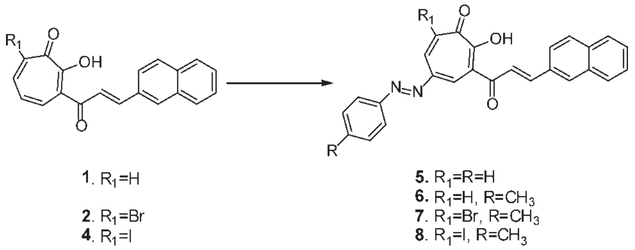
3. R_1=R_2= Br
4. R_1=I, R_2=H

aromatic ring protons. It is worth mentioning that when compound **1** was treated with three equivalents of bromine, neither oxidative cyclization nor electrophilic addition reaction on carbon–carbon double bond occurred. Therefore, we concluded that the electrophilic reactivity of the 5- and 7-position of the tropolone ring were indeed higher than that of the naphthalene ring and of the propenyl part. The reaction of 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) with excess iodine in the presence of potassium carbonate afforded only the monosubstituted compound 7-iodo-3-(3-(2-naphthyl)acryloyl)tropolone (**6**) in 51.9% yield. The reaction indicated that the 7-position of tropolone ring had the highest electrophilic activity, which is in agreement with the theoretically calculated results. In a similar method to compound **2**, the structures of **3** and **4** were also established from elemental analysis and spectral data. In addition, although the nitration of 3-acetyl, 3-acetamido, 3-cinnamoyl [6–8], and 3-(2-quinolyl)tropolone [10] gave 5-nitro- and/or 5,7-dinitro-substituted products, when 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) was treated with concentrated or fuming nitric acid, any expected product was not observed. The reaction may proceed with an unknown mechanism that needs further investigation.

The azo-coupling reaction of tropolone took place exclusively at the 5-position to give crystalline dyes. The reactions of 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) with diazonium salts gave 5-arylazo-substituted 3-(3-(2-naphthyl)acryloyl)tropolones (**5** and **6**) in 47.8% and 76.2% yield, respectively. The compounds (**2**) and (**4**) were also reacted with *p*-toluidine diazonium salt to afford 7-bromo-3-(3-(2-naphthyl)acryloyl)-5-(*p*-tolyldiazenyl)tropolone (**7**) and 7-iodo-3-(3-(2-naphthyl)acryloyl)-5-(*p*-tolyldiazenyl)tropolone (**8**) in 28.5% and 20.9% yield, respectively. These structures were confirmed from the elemental analysis and spectral data (see Experimental section). For example, in the IR spectrum of compound **5**, an absorption band for the hydroxyl group was at 3185 cm^{-1}, for the tropolone carbonyl group was at 1648 cm^{-1}, and for the propenyl carbonyl group was at 1608 cm^{-1}. Its ^1H NMR spectrum showed peaks at δ 8.53 (d, 1H, $J = 2.1$ Hz) for tropolone H-4, at 8.31 (q, 1H, $J = 2.2$ Hz) for tropolone H-6, at 7.99 (s, 1H) for naphthalene H-1, at 7.74 (dd, 1H, $J = 16.0$, 2.2 Hz) for tropolone H-7, and an unresolved complex peaks at δ 7.73–7.93 and 7.34–7.59 for the protons of the aromatic ring and carbon–carbon double bond (Scheme 3).

As attacking site of nucleophilic reagents, chalcones have an enone moiety that connects two benzene rings. Thus, it has been reported that the chalcones reacted with hydroxylamine [11–14] and hydrazine [15–19] to afford diphenyl-substituted isoxazolines and pyrazolines, respectively. On the other hand, we found that 3-acetyl [6] and 3-cinnamoyltropolone [8] reacted with various nucleophilic reagents bearing two reactive sides to give a wide variety of heterocycle-fused troponoid compounds [24].

Scheme 3



The reactions of 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) with hydroxylamine in refluxing ethanol gave 3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one (**9**) in 47.7% yield. In the IR spectrum of **9**, the disappearance of characteristic hydroxyl and carbonyl absorption for tropolone and the carbonyl group in the side chain and the appearance of tropone carbonyl absorption at 1629 cm^{-1} were clear evidence for the formation of a new compound. Its ^1H NMR spectrum showed the absence of the hydroxy OH signal in addition to 7.12 (q, 1H, $J = 8.5$ Hz), 7.23 (d, 1H, $J = 16.0$ Hz) for carbon–carbon double bond protons, 7.29 (d, 1H, $J = 12.6$ Hz) for tropolone H-7, 7.44 (dd, 1H, $J = 4.0$, 8.2 Hz) for tropolone H-5, 7.77 (q, 1H, $J = 16.5$ Hz) for tropolone H-6, 7.98 (s, 1H) for naphthalene H-1, 8.21 (d, 1H, $J = 4.5$ Hz) for tropolone H-4, besides an unresolved complex peaks in the aromatic region at δ 7.51–7.54 and 7.85–7.90. The mass spectrum exhibited a molecular ion 299 (M^+), which matched the expected molecular weight for the corresponding compound **9**. The elemental analysis further supported the assigned structure. The vital characteristic structure of compound **9** could be authenticated by a simple method: when the compound was developed on thin layer chromatography (TLC) (silica gel: GF254, developing agent: ethyl acetate), there was only one main spot with no tailing, as well as giving a negative coloring test with iron (β) chloride in ethanol solution. In a similar way, the reactions of compounds **2**, **3**, and **4** with hydroxylamine also afforded the corresponding 5-substituted or 5,7-substituted 3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-ones (**10–12**), and their structures were determined on the basis of a negative coloring test with iron (III) chloride and the elemental analysis as well as on spectral data (Scheme 4).

When a solution of 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) and phenylhydrazine in ethanol was refluxed for 18 h, the 3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[*c*]pyrazol-8(1*H*)-one (**13**) was isolated in 19.3% yield.

Its structure was confirmed from the elemental analysis ($C_{26}H_{18}N_2O$) and spectral data. The IR spectrum showed the absorption for tropone carbonyl group at 1630 cm^{-1}. Its ^1H NMR spectrum showed the absence of the hydroxy OH signal, and all the protons were observed at δ 6.86 (q, 1H, $J = 8.4$ Hz) for tropolone H-5, 7.94 (s, 1H) for naphthalene H-1, 6.99 (d, 1H, $J = 12.5$ Hz) for one proton of carbon–carbon double bond, 7.25–7.30 (m, 1H) for tropolone H-7, 7.44–7.52 (m, 8H), 7.77–7.87 (m, 6H) for the aromatic region and the other protons of carbon–carbon double bond. The compound (**1**) reacted with 4-nitro, 4-bromo, 4-chloro, 4-methoxy, and 3-chlorophenylhydrazines to give 3-(2-(2-naphthyl)vinyl)-1-(4-nitrophenyl)cyclohepta[*c*]pyrazol-8 (1*H*)-one (**14**), 1-(4-bromophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[*c*]pyrazol-8(1*H*)-one (**15**), 1-(4-chlorophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[*c*]pyrazol-8(1*H*) -one (**16**), 1-(4-methoxyphenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[*c*]pyrazol-8(1*H*)-one (**17**), and 1-(3-chlorophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[*c*]-pyrazol-8(1*H*) -one (**18**) in 57.6%, 53.8%, 43.3%, 26.2%, and 41.2% yield, respectively. The electrophilic substitution products (**2–4**) reacted with phenylhydrazine and also gave the corresponding 1,8-dihydrocycloheptapyrazol-8-one derivatives (**19–21**). In conclusion, this investigation has demonstrated the synthesis of naphthalene-substituted tropolones and troponoids compounds (Scheme 5).

EXPERIMENTAL

The melting points were determined by using WRS-1B melting points apparatus. ^1H NMR was measured with a Varian Inova 500 NMR spectrometer at 500 MHz or a Varian Inova 400 NMR spectrometer at 400 MHz. The reported chemical shifts were against TMS. Mass spectra were determined using a MSD VL ESII spectrometer. Elemental analysis was performed using an Elementar Vario EL-III element analyzer.

3-(3-(2-Naphthyl)acryloyl)tropolone (1). To a stirred solution of 3-acetyltropolone and 2-naphthaldehyde in 50% methanol, a solution of 5% KOH aqueous was added dropwise at room temperature. Having monitored by TLC, and after the reaction was completed, the mixture was acidified with 6*M* hydrochloric acid to precipitate yellow crystals. The crystals were collected and recrystallized from ethanol to give 3-(3-(2-naphthyl)acryloyl)tropolone (**1**) as yellow crystals, yield 85.3%; mp 166–167°C; IR (KBr): 3190 (OH), 1658 (C=O), 1613 (C=O) cm^{-1}; ^1H NMR ($CDCl_3$): δ 7.14–7.86 (m, 12H, Ar-H and HC=CH), 7.98 (s, 1H, 2-NaphthH-1); ms: *m*/*z* 303 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{14}O_3$: C, 79.46; H, 4.67. Found: C, 79.30; H, 4.52.

7-Bromo-3-(3-(2-naphthyl)acryloyl)tropolone (2). To a stirred solution of 3-(3-(2-naphthyl) acryloyl)tropolone (0.302 g, 1 mmol) and sodium acetate (0.125 g) in acetic acid (50 mL), a solution of bromine (0.160 g, 1 mmol) in acetic acid (2 mL) was added dropwise at room temperature. After the reaction was completed, water (100 mL) was added. The precipitate was collected and recrystallized from ethyl acetate to give 7-bromo-3-(3-(2-naphthyl)acryloyl)tropolone as yellow crystals, yield 70.6%; mp 182–184°C; IR (KBr): 3180 (OH), 1641 (C=O), 1601 (C=O) cm^{-1}; ^1H NMR ($CDCl_3$): δ 7.16 (t, 1H, —C=CH, $J = 11.0$ Hz), 7.26 (d, 1H, CH=C—, $J = 15.6$ Hz), 7.50–7.56 (m, 2H, Ar-H), 7.76 (q, 1H, tropolone H-5, $J = 10.0$ Hz), 7.83–7.87 (m, 4H, Ar-H), 7.99 (d, 1H, 2-NaphthH-1, $J = 6.3$ Hz), 8.18 (d, 1H, tropolone H-6, $J = 10.0$ Hz), 8.50 (d, 1H, tropolone H-4, $J = 8.5$ Hz); ms: *m*/*z* 381 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{13}BrO_3$: C, 63.01; H, 3.44. Found: C, 62.97; H, 3.20.

5,7-Dibromo-3-(3-(2-naphthyl)acryloyl)tropolone (3). To a stirred solution of sodium acetate and 3-(3-(2-naphthyl)acryloyl)tropolone (0.302 g,1 mmol) in acetic acid, a solution of bromine (0.320 g, 2 mmol) in acetic acid (2 mL) was added dropwise at room temperature. After completion, the mixture was poured into water (150 mL), and then the precipitate was collected and recrystallized from ethyl acetate to give 5,7-dibromo-3-(3-(2-naphthyl)acryloyl)tropolone as yellowish blue powder, yield 72.3%; mp 212–213°C; IR (KBr): 3185 (OH), 1647 (C=O), 1592 (C=O) cm^{-1}; ^1H NMR ($CDCl_3$): δ 7.25 (d, 1H, —C=CH, $J = 15.9$ Hz), 7.50–7.56 (m, 2H, Ar-H), 7.71 (q, 1H, —C=CH, $J = 1.6$ Hz), 7.83–7.87 (m, 4H, Ar-H), 7.78 (d, 1H, tropolone H-6, $J = 15.9$ Hz), 7.99 (s, 1H, 2-NaphthH-1), 8.50 (d, 1H, tropolone H-4, $J = 2.0$ Hz); ms: *m*/*z* 461 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{12}Br_2O_3$: C, 52.21; H, 2.63. Found: C, 52.01; H, 2.45.

7-Iodo-3-(3-(2-naphthyl)acryloyl)tropolone (4). To a stirred mixture of 3-(3-(2-naphthyl)acryloyl)tropolone (0.302 g,1 mmol) and potassium carbonate (0.305 g) in water (0.85 mL), a solution of iodine (0.325 g) and potassium iodide (0.325 g) in water (1.85 mL) was added in an ice water bath. After being stirred for 11.5 h, excess iodine was reduced with

3-(3-(2-Naphthyl)acryloyl)-5-(phenyldiazenyl)tropolone (5). To an ice-cooled stirred solution of compound **1** (0.302 g, 1 mmol) in pyridine (4 mL), arenediazonium chloride solution (2 mmol, 2 mL), prepared from aniline or *p*-toluidine, was added dropwise. After additional stirring for 2–3 h, the precipitate was collected and recrystallized from benzene or ethyl acetate to give product (**5**) as pale yellow crystals, yield 47.8%; mp 190–191°C; IR (KBr): 3185 (OH), 1648 (C=O), 1608 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 7.34–7.59 (m, 6H, Ar-H and CH=CH), 7.74 (dd, 1H, tropolone H-7, *J* = 16.0, 2.2 Hz), 7.73–7.93 (m, 7H, Ar-H), 7.99 (s, 1H, 2-NaphthH-1), 8.31 (q, 1H, tropolone H-6, *J* = 2.2 Hz), 8.53 (d, 1H, tropolone H-4, *J* = 2.1 Hz); ms: *m*/*z* 407 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{18}N_2O_3$: C, 76.83; H, 4.46; N, 6.89. Found: C, 76.79; H, 4.29; N, 6.87.

3-(3-(2-Naphthyl)acryloyl)-5-(*p*-tolyldiazenyl)tropolone (6). The same experimental method as compound (**5**) was followed. This compound was obtained as deep red powder, yield 76.2%; mp 173–174°C; IR (KBr): 3203 (OH), 1673 (C=O), 1610 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.44 (s, 3H, CH_3), 7.30–7.58 (m, 6H, Ar-H and CH=CH), 7.73 (q, 1H, tropolone H-7, *J* = 1.5 Hz), 7.82–7.86 (m, 6H, Ar-H), 7.99 (s, 1H, 2-NaphthH-1), 8.28 (q, 1H, tropolone H-6, *J* = 2.1 Hz), 8.50 (d, 1H, tropolone H-4, *J* = 2.0 Hz); ms: *m*/*z* 421 $(M+1)^+$. Anal. Calcd. for $C_{27}H_{20}N_2O_3$: C, 77.13; H, 4.79; N, 6.66. Found: C, 77.11; H, 4.58; N, 6.53.

7-Bromo-3-(3-(2-naphthyl)acryloyl)-5-(*p*-tolyldiazenyl)tropolone (7). The same experimental method as compound (**5**) was followed. The compound was obtained as orange crystals, yield 38.5%; mp > 290°C; IR (KBr): 3210 (OH), 1673 (C=O), 1608 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.45 (s, 3H, —CH_3), 7.31–7.80 (m, 6H, Ar-H and CH=CH), 7.84–7.87 (m, 6H, Ar-H), 8.00 (s, 1H, 2-NaphthH-1), 8.38 (d, 1H, tropolone H-6, *J* = 2.0 Hz), 9.02 (d, 1H, tropolone H-4, *J* = 1.6 Hz); ms: *m*/*z* 499 $(M+1)^+$. Anal. Calcd. for $C_{27}H_{19}BrN_2O_3$: C, 64.94; H, 3.84; N, 5.61. Found: C, 64.89; H, 3.50; N, 5.65.

7-Iodo-3-(3-(2-naphthyl)acryloyl)-5-(*p*-tolyldiazenyl)tropolone (8). The same experimental method of compound (**7**) was followed. This compound was obtained as deep red crystals, yield 20.9%; mp > 290°C; IR (KBr): 3304 (OH), 1682 (C=O), 1617 (C=O) cm^{-1}; δ 2.45 (s, 3H, —CH_3), 7.30–7.55 (m, 3H, Ar-H and CH=C—), 7.75–7.87 (m, 9H, Ar-H and —C=CH), 8.00 (s, 1H, 2-NaphthH-1), 8.36 (d, 1H, tropolone H-6, *J* = 2.0 Hz), 9.26 (d, 1H, tropolone H-4, *J* = 1.6 Hz); ms: *m*/*z* 547 $(M+1)^+$. Anal. Calcd. for $C_{27}H_{19}IN_2O_3$: C, 59.35; H, 3.51; N, 5.13. Found: C, 59.38; H, 3.1 6; N, 5.10.

3-[2-(2-Naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one (9). A solution of 3-(3-(2-naphthyl)acryloyl)tropolone (0.151 g, 0.5 mmol) and hydroxylamine hydrochloride (0.071 g, 1 mmol) in ethanol (5 mL) was refluxed for 12 h. The precipitate was collected and recrystallized from acetic acid to give 3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one as pale brown powder, yield 47.7%; mp 252–253°C; IR (KBr): 1629 (C=O), 1573 (C=N) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 7.12 (q, 1H, CH=C—, *J* = 8.5 Hz), 7.23 (d, 1H, —C=CH, *J* = 16.0 Hz), 7.51–7.54 (m, 2H, Ar-H), 7.29 (d, 1H, tropolone H-7, *J* = 12.6 Hz), 7.44 (dd, 1H, tropolone H-5, *J* = 4.0, 8.2 Hz), 7.77 (q, 1H, tropolone H-6, *J* = 16.5 Hz), 7.85–7.90 (m, 4H, Ar-H), 7.98 (s, 1H, 2-NaphthH-1), 8.21 (d, 1H, tropolone H-4, *J* = 4.5 Hz); ms: *m*/*z* 300 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{13}NO_2$: C, 80.25; H, 4.38; N, 4.68. Found: C, 80.17; H, 4.01; N, 4.82.

7-Bromo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one (10). A solution of 7-bromo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and hydroxylamine hydrochloride (0.036 g) in ethanol (5 mL) was refluxed for 20 h. The precipitate was collected and recrystallized from acetic acid to give 7-bromo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one as golden powder, yield 41.4%; mp 243–244°C; IR (KBr): 1670 (C=O), 1549 (C=N) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 7.30–7.79 (m, 8H, Ar-H and CH=CH), 7.53 (q, 1H, tropolone H-5, *J* = 3.2 Hz), 7.88 (d, 1H, tropolone H-6, *J* = 6.8 Hz), 7.94 (s, 1H, 2-NaphthH-1), 8.41(d, 1H, tropolone H-4, *J* = 10.0 Hz); ms: *m*/*z* 378 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{12}BrNO_2$: C, 63.51; H, 3.20; N, 3.70. Found: C, 63.33; H, 3.50; N, 3.59.

5,7-Dibromo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one (11). A solution of 5,7-dibromo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and hydroxylamine hydrochloride (0.030 g) in ethanol (5 mL) was refluxed for 28 h. The precipitate was collected and recrystallized from ethyl acetate to give 5,7-dibromo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one as brown crystals, yield 60.7%; mp 196–197°C; IR (KBr): 1679 (C=O), 1560 (C=N) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 7.89–7.24 (m, 8H, Ar-H and CH=CH), 7.78 (d, 1H, tropolone H-6, *J* = 12.7 Hz), 7.99 (s, 1H, 2-NaphthH-1), 8.51 (d, 1H, tropolone H-4, *J* = 1.5 Hz); ms: *m*/*z* 458 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{11}Br_2NO_2$: C, 52.55; H, 2.43; N, 3.06. Found: C, 52.41; H, 3.39; N, 3.18.

7-Iodo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one (12). A solution of 7-iodo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and hydroxylamine hydrochloride (0.032 g) in ethanol (5 mL) was refluxed for 24 h. The precipitate was collected and recrystallized from tetrahydrofuran to give 7-iodo-3-[2-(2-naphthyl)vinyl]-8*H*-cyclohepta[*d*]isoxazol-8-one as pale brown powder, yield 41.0%; mp 275°C decomposition; IR (KBr): 1692 (C=O), 1602 (C=N) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 6.81–7.24 (m, 2H, CH=CH), 7.85–7.90 (m, 6H, Ar-H), 7.53 (q, 1H, tropolone H-5, *J* = 3.6 Hz), 7.78 (d, 1H, tropolone H-6, *J* = 8.4 Hz), 7.99 (s, 1H, 2-NaphthH-1), 8.76 (d, 1H, tropolone H-4, *J* = 9.2 Hz); ms: *m*/*z* 426 $(M+1)^+$. Anal. Calcd. for $C_{20}H_{12}INO_2$: C, 56.49; H, 2.84; N, 3.29. Found: C, 56.42; H, 2.61; N, 3.34.

Synthesis of 2-vinyl naphthalene heterocycle-fused troponoid compounds (13–18). A mixture of 3-(3-(2-naphthyl)acryloyl)tropolone (0.151 g, 0.5 mmol) and substituted phenylhydrazines (1 mmol) in ethanol (10 mL) was refluxed for 18–28 h. The precipitates were collected and recrystallized to give the products.

3-[2-(2-Naphthyl)vinyl]-1-phenylcyclohepta[c]pyrazol-8(1H)-one (13). This compound was obtained as golden needles, yield 19.3%; mp 193–194°C; IR (KBr): 1630 (C=O), 1600 (C=N)

cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.86 (q, 1H, tropolone H-5, J = 8.4 Hz), 6.99 (d, 1H, CH=C—, J = 12.5 Hz), 7.25–7.30 (m, 1H, tropolone H-7), 7.44–7.52 (m, 8H, Ar-H and CH=C—), 7.77–7.87 (m, 6H, Ar-H), 7.94 (s, 1H, 2-NaphthH-1); ms: m/z 375 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{18}N_2O$: C, 83.40; H, 4.85; N, 7.48. Found: C, 83.17; H, 5.30; N, 7.45.

3-(2-(2-Naphthyl)vinyl)-1-(4-nitrophenyl)cyclohepta[c]pyrazol-8(1H)-one (14). This compound was obtained as brown powder, yield 57.6%; mp 280°C decomposition; IR (KBr): 1630 (C=O), 1604 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.95–7.10 (m, 2H, Ar-H and CH=C—), 7.43–7.51 (m, 4H, Ar-H and —C=CH), 7.66 (d, 2H, Ar-H, J = 9.2 Hz), 7.80–7.89 (m, 6H, Ar-H), 7.96 (s, 1H, 2-NaphthH-1), 8.37 (d, 2H, Ar-H, J = 9.2 Hz); ms: m/z 420 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{17}N_3O_3$: C, 74.45; H, 4.09; N, 10.02. Found: C, 74.51; H, 4.38; N, 9.99.

1-(4-Bromophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[c]-pyrazol-8(1H)-one (15). This compound was obtained as yellow crystals, yield 53.8%; mp 284–285°C; IR (KBr): 1625 (C=O), 1576 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.91 (t, 1H, tropolone H-5, J = 5.6 Hz), 7.01 (d, 1H, CH=C—, J = 8.0 Hz), 7.26–7.64 (m, 8H, Ar-H and CH=C—), 7.77–7.86 (m, 6H, Ar-H), 7.95 (s, 1H, 2-NaphthH-1); ms: m/z 453 $(M+1)^+$. 1-(4-Chlorophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[c]-pyrazol-8(1H)-one (16). This compound was obtained as pale yellow crystals, yield 26.2%; mp 212–213°C; IR (KBr): 1652 (C=O), 1590 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.90–7.02 (m, 2H, Ar-H and —C=CH), 7.27 (d, 1H, tropolone H-7, J = 11.2 Hz), 7.39–7.50 (m, 7H, Ar-H and CH=C—), 7.77–7.88 (m, 6H, Ar-H), 7.94 (s, 1H, 2-NaphthH-1); ms: m/z 409 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{17}ClN_2O$: C, 76.37; H, 4.19; N, 6.85. Found: C, 76.30; H, 3.95; N, 6.80.

1-(4-Methoxyphenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[c]-pyrazol-8(1H)-one (17). This compound was obtained as golden powder, yield 43.3%; mp 277–278°C; IR (KBr): 1660 (C=O), 1587 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 3.89 (s, 3H, —OCH_3), 6.86 (q, 1H, tropolone H-5, J = 10.0 Hz), 7.01 (d, 1H, tropolone H-7, J = 4.8 Hz), 7.37–7.50 (m, 7H, Ar-H and CH=CH), 7.77–7.85 (m, 7H, Ar-H), 7.94 (s, 1H, 2-NaphthH-1); ms: m/z 405 $(M+1)^+$. Anal. Calcd. for $C_{27}H_{20}N_2O_2$: C, 80.18; H, 4.98; N, 6.93. Found: C, 80.11; H, 4.73; N, 6.94.

1-(3-Chlorophenyl)-3-(2-(2-naphthyl)vinyl)cyclohepta[c]-pyrazol-8(1H)-one (18). This compound was obtained as golden crystals, yield 41.2%; mp 247°C decomposition; IR (KBr): 1639 (C=O), 1574 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.91 (q, 1H, tropolone H-5, J = 10.0 Hz), 7.02 (d, 1H, —C=CH, J = 12.8 Hz), 7.35–7.52 (m, 8H, Ar-H and CH=C—), 7.77–7.84 (m, 6H, Ar-H), 7.95 (s, 1H, 2-NaphthH-1); ms: m/z 409 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{17}ClN_2O$: C, 76.37; H, 4.19; N, 6.85. Found: C, 76.25; H, 4.50; N, 6.90.

7-Bromo-3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[c]pyrazol-8(1H)-one (19). A mixture of 7-bromo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and phenylhydrazine hydrochloride (0.056 g) in absolute ethanol (5 mL) was refluxed for 19 h. The precipitate was collected and recrystallized from ethyl acetate to give 7-bromo-3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[*c*]pyrazol-8(1*H*)-one as yellow crystals, yield 29.0%; mp 288–289°C; IR (KBr): 1644 (C=O), 1589 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.75 (q, 1H, tropolone H-5, J = 9.6 Hz), 7.47–7.52 (m, 6H, Ar-H and CH=CH), 7.81–7.90 (m, 7H, Ar-H), 7.94 (s, 1H, 2-NaphthH-1), 8.28 (d, 1H, tropolone H-6, J = 6.8 Hz), 8.51 (d, 1H, tropolone H-4, J = 8.0 Hz); ms: m/z 453 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{17}BrN_2O$: C, 68.89; H, 3.78; N, 6.18. Found: C, 68.70; H, 3.47; N, 6.07.

5,7-Dibromo-3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[c]-pyrazol-8(1H)-one (20). A mixture of 5,7-dibromo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and phenylhydrazine hydrochloride (0.048 g) in absolute ethanol (5 mL) was refluxed for 22 h. The precipitate was collected and recrystallized from ethyl acetate to give 5,7-dibromo-3-[2-(2-naphthyl)-vinyl]-1-phenylcyclohepta[*c*] pyrazol-8(1*H*)-one as orange crystals, yield 35.0%; mp > 290°C; IR (KBr): 1656 (C=O), 1591 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 7.26–7.53 (m, 5H, Ar-H and CH=CH), 7.80–7.87 (m, 8H, Ar-H), 7.95 (s, 1H, 2-NaphthH-1), 8.16 (d, 1H, tropolone H-6, J = 1.6 Hz), 8.52 (d, 1H, tropolone H-4, J = 1.6 Hz); ms: m/z 533 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{16}Br_2N_2O$: C, 58.67; H, 3.03; N, 5.26. Found: C, 58.63; H, 3.29; N, 5.33.

7-Iodo-3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[c]pyrazol-8(1H)-one (21). A mixture of 7-iodo-3-(3-(2-naphthyl)acryloyl)tropolone (0.100 g) and phenylhydrazine hydrochloride (0.051 g) in absolute ethanol (5 mL) was refluxed for 47 h. The precipitate was collected and recrystallized from ethyl acetate to give 7-iodo-3-[2-(2-naphthyl)vinyl]-1-phenylcyclohepta[*c*]pyrazol-8(1*H*)-one as yellowish blue powder, yield 24.0%; mp >290°C; IR (KBr): 1635 (C=O), 1581 (C=N) cm^{-1}; ^1H NMR ($CDCl_3$): δ 6.60 (t, 1H, tropolone-5, J = 10.0 Hz), 7.41–7.43 (m, 2H, CH=CH), 7.43–7.52 (m, 5H, Ar-H), 7.79–7.88 (m, 6H, Ar-H), 7.87 (d, 1H, tropolone H-6, J = 2.4 Hz), 7.94 (s, 1H, 2-NaphthH-1), 8.63 (d, 1H, tropolone-4, J = 9.6 Hz); ms: m/z 501 $(M+1)^+$. Anal. Calcd. for $C_{26}H_{17}IN_2O$: C, 62.41; H, 3.42; N, 5.60. Found: C, 62.32; H, 3.64; N, 5.71.

The Cadogan reaction, a widely accepted route for the synthesis of nitrogen containing heterocycles, is modified by using microwave radiation as the source of heat instead of the conventional heating by reflux in a nitrogen atmosphere for several hours. Appropriate starting materials were mixed with triethyl phosphite or triphenylphosphine and irradiated with microwaves for several minutes at a specific power to give the desired products. The indazoles were prepared by irradiating *N*-(2-nitrobenzylidene) anilines with triethyl phosphite at 200 W for 12–14 min to give 85–92% product yields. Irradiation of the mixture of *N*-benzylidene-2-nitroanilines and triphenylphosphine at 200 W for 3–5 min yielded 93–96% of the benzimidazoles. The carbonylindoles were obtained in 61–68% yields by irradiating 2-nitrochalcone or alkyl 2-nitrocinnamates and triphenylphosphine with microwaves at 80–200 W for 8–11 min. The mixture of 2-nitrobiphenyl and triphenylphosphine yielded 96% of carbazole when irradiated with microwaves at 200 W for 2 min while 75% of phenazine was obtained by irradiating the mixture of 2-nitrodiphenylamine and triphenylphosphine with microwaves at 200 W for 3.5 min. These results show that microwave-assisted Cadogan reactions gave better product yields at shorter reaction times.

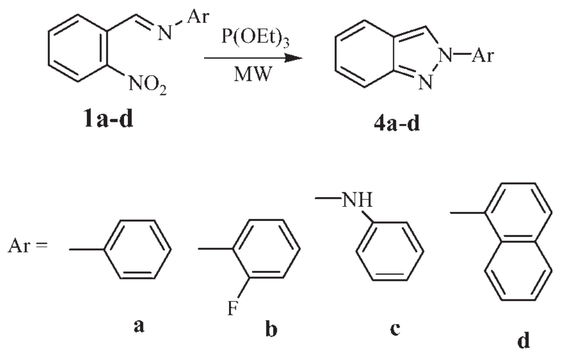
J. Heterocyclic Chem., **46**, 1309 (2009).

INTRODUCTION

The search for better methods for the syntheses of *N*-containing heterocyclic compounds has never ended as evidenced by the increasing number of articles devoted to this topic. This has led some researchers to look into the possibility of improving the reaction by heating the reaction mixture with microwave radiation instead of the usual conventional heating procedure. The microwave ovens have been with us for some time now but it was not until 1986 when researchers started to utilize the microwave oven for chemical syntheses [1]. Since then, many researchers have been using the technique for organic syntheses, thus contributing to the enormous volume of literatures we now see in print. Microwave-assisted heating under controlled conditions is a valuable technology for chemical syntheses as it can increase the rate of reaction, improve the product yield, and reduce the formation of side products [2].

Several methods for the syntheses of indazoles, indoles and benzimidazoles have been modified by carrying out the reactions under microwave irradiation [3].

Scheme 1



Dubey and Moorthy did a comparative study on conventional and microwave assisted synthesis of benzimidazoles and their derivatives and concluded that the microwave assisted reactions have reduced the reaction times by 96–98% and increased the yields by about 10 to 50% [3(d)]. Yu *et al.* and Navarrete-Vazquez *et al.* have developed a simple and rapid synthesis of substituted benzimidazoles under solvent-free condition using readily available reagents and the microwave oven [3(l,m)]. Sridar as well as Abramovitch and Bulman have reported that rate enhancement in the Fischer indole synthesis was observed when assisted by microwave radiations, that the reaction goes to completion in a short time furnishing good yields [3(n,o)]. Furthermore, Varma described the microwave-enhanced solvent-free synthetic approach to a variety of heterocyclic compounds and observed that the method was simple, easy to manipulate, uses minimal amounts of solvents, and give good product yields [3(p)]. Thus, the prospect of using microwave radiation for organic synthesis seems to be limitless, offering routes of shorter reaction times, minimal side products, and better product yields. It is this idea that led our laboratory to venture into microwave-assisted organic synthesis.

The reduction or deoxygenation of aromatic nitrocompounds by triethyl phosphite and related reagents is referred to as the Cadogan reaction [4]. The reaction is carried out at high temperature under nitrogen atmosphere for several hours. This reaction has been widely investigated as a synthetic route for *N*-containing heterocycles [5] and since the discovery of the reaction in 1962 [4], the reduction of aromatic nitro-compounds by triethyl phosphite and related reagents has been exploited as a route to a wide variety of nitrogen

containing heterocyclic compounds, including carbazoles [4,6], indoles [4,7], indazoles [6], and other related compounds [5(b),6,8].

Because of the versatility of Cadogan reaction, a number of researchers have tried to modify the method to shorten the reaction time and improve the yield by using microwave radiations as the source of heat and were successful [9].

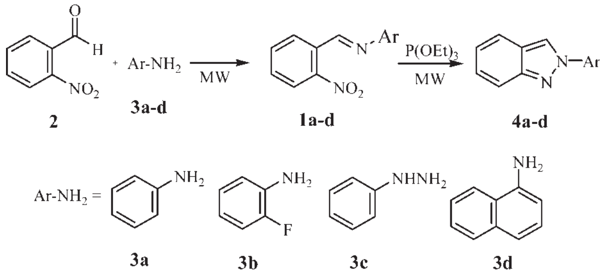
In this article, we report the microwave-assisted Cadogan reaction for the synthesis of indazoles, benzimidazoles, indoles, carbazole and phenazine.

RESULTS AND DISCUSSION

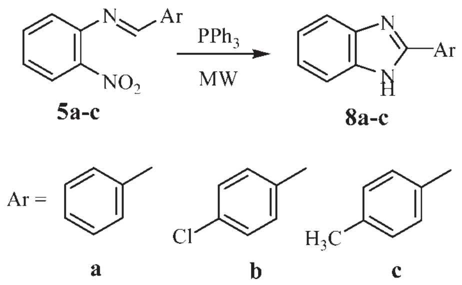
The starting materials used were either synthesized according to literature or purchased from the manufacturer and used as received. The Cadogan reaction was done by irradiating the starting materials with microwaves from a domestic microwave oven. For the synthesis of indazoles, the imines **1a–d** were mixed with triethyl phosphite and irradiated with microwaves to give the corresponding indazoles **4a–d** (Scheme 1). The results are tabulated in Table 1. Initially, 1.0 mmol of *N*-(2-nitrobenzylidene)aniline **1a** was added with 4.0 mmol triethyl phosphite in a Pyrex test tube and irradiated for 4 min at 600 W. The reaction afforded 2-phenyl-2*H*-indazole **4a** in 33% yield (Table 1, Entry 1). The procedure was repeated but this time after 4 min of irradiation, another 4.0 mmol of triethyl phosphite was added and the mixture irradiated for 4 min more. This resulted to an increase in the yield (67%) of 2-phenyl-2*H*-indazole **4a** (Table 1, Entry 2). However, the reaction mixture showed signs of decomposition, so the reaction was further investigated by using lower power rating. A mixture of 1.0 mmol of *N*-(2-nitrobenzylidene)aniline **1a** and 4.0 mmol of triethyl phosphite was irradiated for 14 min at 200 W. The reaction afforded 2-phenyl-2*H*-indazole **4a** in 77% yield (Table 1, Entry 3). Increasing the amount of triethyl phosphite to 8.0 mmol and irradiating the mixture for 14 minutes at 200 W did not give any significant change in the yield (76%, Table 1, Entry 4). The procedure was repeated using 4.0 mmol of triethyl phosphite. After irradiation for 14 min, the mixture was added with another 4.0 mmol of triethyl phosphite and irradiated for another 14 min at 200 W. The reaction afforded 2-phenyl-2*H*-indazole **4a** in 86% yield (Table 1, Entry 5). A third addition of 4.0 mmol of triethyl phosphite and 14 min more of irradiation gave only a slight increase in the yield of 2-phenyl-2*H*-indazole **4a** (89%, Table 1, Entry 6). These results show that irradiation of the mixture of *N*-(2-nitrobenzylidene)aniline **1a** and triethyl phosphite at 200 W gave better results than irradiation of the mixture at 600 W, and a second addition of the triethyl phosphite can increase the yield further. This method gave a better yield of 2-phenyl-2*H*-indazole **4a** (89%) compared to that reported by Song and Yee in the palladium-catalyzed intramolecular amination of *N*-phenyl-*N*-(*o*-bromobenzyl)hydrazine which yielded only 58% of 2-phenyl-2*H*-indazole **4a** after 15 h [10]. On the other hand, Varughese *et al.* reported a 60–65% yields of 2-phenyl-2*H*-indazole **4a** by the microwave-assisted Cadogan reaction of 2-nitrobenzaldehyde and aniline [9(b)] while the classical Cadogan method yielded 60% of 2-phenyl-2*H*-indazole **4a** after 6 h [6,11].

For the other three imines, **1b-d**, the reaction was carried out at 200W and various reaction times. When 1.0 mmol of *N*-(2-nitrobenzylidene)-2-fluoroaniline **1b** and 4.0 mmol triethyl phosphite were mixed and irradiated for 13 min at 200 W, 92% of 2-(2-fluorophenyl)-2*H*-indazole **4b** was obtained (Table 1, Entry 7). Irradiation of 1-(2-nitrobenzylidene)-2-phenylhydrazine **1c** at 200 W for 12 min gave 85% of 2-phenylamino-2*H*-indazole **4c** (Table 1, Entry 8). Dyablo *et al.* obtained 16% of 2-phenylamino-2*H*-indazole **4c** by mixing the corresponding amine with cupric acetate, phenylboric acid and triethylamine and stirring the mixture at 20°C for 17 h [12]. Irradiation of *N*-(2-nitrobenzylidene)-1-naphthylamine **1d** at 200 W for 14 min gave 89% of 2-(1-naphthyl)-2*H*-indazole **4d** (Table 1, Entry 9). The classical Cadogan reaction produced 51% of 2-α-naphthylamine after 6 h [6]. Sequential addition of triethyl phosphite

Scheme 3



Scheme 4

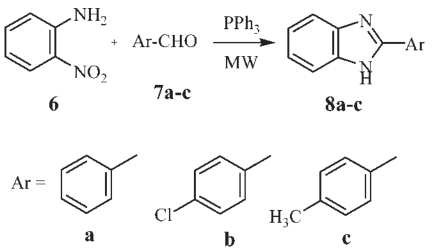


was no longer done because yields of the products were already good.

In the interest of saving time, a one-pot-one-step and one-pot-two-steps reaction procedures for the synthesis of indazoles were developed. For the one-pot-one-step procedure, 2-nitrobenzaldehyde **2** and aryl amines **3a-d** were mixed together in a test tube and added with triethyl phosphite. This mixture was then irradiated at 200 W for several minutes (Scheme 2). The results in Table 1 show that the procedure gave a fair yield of 2-phenylamino-2*H*-indazole **4c** when the mixture was irradiated for 12 min at 200 W (47%, Table 1, Entry 12). For the one-pot-two-steps procedure, 2-nitrobenzaldehyde **2** and aryl amines **3a–d** were mixed in a test tube and irradiated at 80 W for 1–2 min. After this, triethyl phosphite was added and the mixture irradiated again at 200 W for several minutes (Scheme 3). The results show that this method gave higher yields compared to the one-pot-one-step procedure (Table 1, Entries 14–17). However, the synthesis of indazoles from the starting imines is a better method as it gave better yield. These imply that the formation of the imine is an important step in the synthesis of indazoles.

For the synthesis of benzimidazoles, the imines **5a–c** were added with triethyl phosphite and irradiated with microwaves for several minutes at a specific power. However, the reactions gave poor product yields.

Scheme 5



Triethyl phosphite was replaced with triphenylphosphine as this reagent can also deoxygenate aromatic nitro-compounds and is easily handled, inexpensive and a stable solid (Scheme 4) [6,13]. One millimole of *N*-benzylidene-2-nitroaniline **5a** was mixed with 4.0 mmol of triphenylphosphine and irradiated with microwaves for 5 min at 200 W. The reaction gave 96% of 2-phenyl-1*H*-benzimidazole **8a** (Table 2, Entry 1). 2-(4-Chlorophenyl)-1*H*-benzimidazole **8b** and 2-(4-methylphenyl)-1*H*-benzimidazole **8c** were also synthesized from the corresponding imines, *N*-(4-chlorobenzylidene)-2-nitroaniline **5b** and *N*-(4-methylbenzylidene)-2-nitroaniline **5c**, respectively, by irradiating the mixture with microwaves for 3 min at 200 W. The reactions gave 94% of 2-(4-chlorophenyl)-1*H*-benzimidazole **8b** and 93% of 2-(4-methylphenyl)-1*H*-benzimidazole **8c** (Table 2, Entries 2, 3). The group of Sharghi reported the synthesis of benzimidazoles by the reaction of phenylenediamine and benzaldehyde in the presence of phorphyrinatoiron(III) complex as catalyst. They were able to synthesize 2-phenyl-1*H*-benzimidazole **8a** at 97% by carrying out the reaction for 30 min, 2-(4-chlorophenyl)-1*H*-benzimidazole **8b** at 94% by carrying out the reaction for 55 min and 2-(4-methylphenyl)-1*H*-benzimidazole **8c** at 95% by carrying out the reaction for 55 min [14]. The results of the two methods are comparable but the microwave-assisted Cadogan reaction does not require a metal-complex catalyst and was complete in 3 to 5 min only. Other researchers also reported the synthesis of 2-

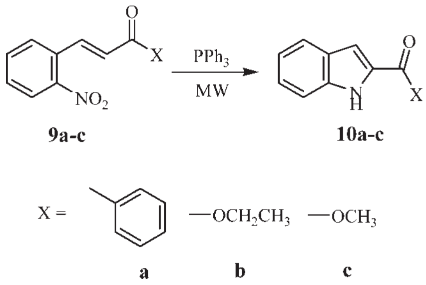
[c] Isolated yield.
[d] One-pot-one-step reaction.

Scheme 6

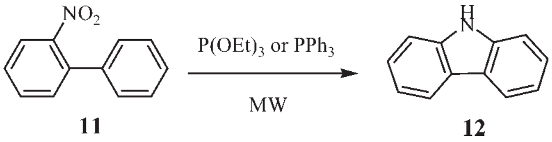


phenylbenzimidazole by other methods but the yields were relatively low and reaction times longer [15].

The one-pot-one-step synthesis of the benzimidazoles (Scheme 5) gave relatively lower yields compared to the synthesis from the corresponding imines (Table 2, Entries 4, 5, 6). However, the one-pot-one-step synthesis is a simple and convenient procedure.

The carbonylindoles were synthesized using 2-nitrochalcone **9a** and alkyl 2-nitrocinnamates **9b-c**. The reaction with triethyl phosphite gave low product yields so triphenylphosphine was used instead (Scheme 6). The reaction of 2-nitrochalcone **9a** with triphenylphosphine at 200 W and 8 min gave 68% of 2-benzoylindole **10a** (Table 3, Entry 1). Mahboobi *et al.* obtained 73% 2-benzoylindole **10a** from a reaction which required heating the reagents under reflux for 12 h [16]. On the other hand, the reaction with ethyl 2-nitrocinnamate **9b** yielded 64% of 2-ethoxycarbonylindole **10b** while reaction with methyl 2-nitrocinnamate **9c** yielded 61% of 2-methoxycarbonylindole **10c**, with the reactions being carried out at 80 W for 10 min and 11 min, respectively (Table 3, Entries 2, 3). At higher power, decomposition products are formed. Csomos *et al.* obtained 83% of 2-ethoxycarbonylindole **10b** by reacting indole-2-carboxylic acid, thionyl chloride and dry ethanol, and carrying out the reaction at different temperatures, requiring a total of 4.5 h for the reaction to complete [17]. Cadogan *et al.* reacted *o*-nitrocinnamic acid with triethyl phosphite for 24 h to give 7.5% of 2-ethoxycarbonylindole **10b** [6]. Sechi *et al.*, on the other hand, heated azidocinnamates in xylene under reflux for 15 min to yield 67% of 2-methoxycarbonylindole **10c** [18].

Scheme 7



Deoxygenation of 2-nitrobiphenyl **11** to give carbazole **12** was done with triethyl phosphite and triphenylphosphine (Scheme 7). The results show that 64% of carbazole **12** was obtained when 2-nitrobiphenyl **11** and triethyl phosphite were irradiated with microwaves for 7.5 min at 600 W while 96% of carbazole **12** was obtained when triphenylphosphine was used instead and irradiating the mixture for 2 min at 200 W (Table 4, Entries 2, 3). With the classical Cadogan reaction, 82.5% of carbazole **12** was obtained by refluxing 2-nitrobiphenyl **11** and triethyl phosphite, under nitrogen atmosphere, for 9 hours, and 43% of carbazole **12** was obtained when triphenylphosphine was used and the mixture placed in a sealed tube and heated at 130°C for 9 h [6]. On the other hand, Freeman *et al.* obtained 91% of carbazole **12** by refluxing 2-nitrobiphenyl **11** in triphenylphosphine for 21 h [13(a)]. When 2-nitrodiphenylamine **13** was mixed with triethyl phosphite and irradiated with microwaves for 5 min at 600 W, 43% of phenazine **14** was obtained (Table 4, Entry 4) (Scheme 8). When triphenylphosphine was used and the mixture irradiated at 200 W for 3.5 min, 75% of phenazine **14** was obtained (Table 4, Entry 5).

The results in this article indicate that the use of microwave radiation greatly enhances the yield of the products and reduces the reaction time from hours to minutes. When decomposition is observed, triphenylphosphine is a better alternative because the reaction can be carried out at lower power and still gives good yields. The procedure can be used to synthesize a variety of *N*-containing heterocyclic compounds once the appropriate starting materials have been prepared.

EXPERIMENTAL

The microwave oven used for the reactions was Model YD-17 (W), Yoshii Electric Co., Ltd. The reaction vessel was either a Pyrex test tube (15 mm i.d. × 19 mm o.d. × 129 mm h.) placed in a 50-mL Erlenmeyer flask for support, a 50-mL round bottom flask placed in a beaker for support, or a 50-mL Erlenmeyer flask. The melting points are uncorrected. Column chromatography was performed on silica gel (Wakogel C-200). Unless otherwise stated, anhydrous sodium sulfate was used as the drying agent. The IR spectra were measured on a Hitachi Model 270-30 IR spectrometer. The ^{1}H NMR and ^{13}C NMR spectra were measured at 500 MHz and 125 MHz, respectively, on a Varian Unity plus-500W NMR spectrometer, using tetramethylsilane as the internal standard. The starting materials were synthesized according to literature while those which were available commercially were used as received.

***N*-(2-nitrobenzylidene)aniline (1a).** Compounds **1a–d** were prepared according to the procedure in literature [9(b)]. *o*-Nitrobenzaldehyde (3.022 g, 20 mmol) and aniline (2.235 g, 24 mmol) were placed into a 100 mL round bottom flask. The mixture was heated in a water bath at 70°C for 15 min with continuous stirring. The resulting product was separated from the mixture and recrystallized from ethanol to give yellow plates of *N*-(2-nitrobenzylidene)aniline **1a** (4.203 g, 93%), mp 63–64°C (ref. [9(b)] mp 64–65°C); IR (KBr): 1518 cm^{-1} and 1346 cm^{-1} (NO$_2$); ^{1}H NMR (CDCl$_3$): δ 7.26–7.31 (m, 3H, 3 Ar-H), 7.43 (dd, *J* = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.63 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.75 (dd, *J* = 7.5Hz and 7.5Hz, 1H, Ar-H), 8.08 (d, *J* = 7.5Hz, 1H, Ar-H), 8.32 (d, *J* = 7.5Hz, 1H, Ar-H), 8.95 (s, 1H, N=CH); ^{13}C NMR (CDCl$_3$): δ 121.2 (d), 124.5 (d), 126.9 (d), 129.2 (d), 129.7 (s), 131.1 (d), 131.2 (d), 133.5 (d), 149.3 (s), 151.0 (s), 155.8 (d).

***N*-(2-nitrobenzylidene)-2-fluoroaniline (1b).** *o*-Nitrobenzaldehyde (3.022 g, 20 mmol) and 2-fluoroaniline (2.667 g, 24 mmol) were placed into a 100-mL round bottom flask. The mixture was heated in a water bath at 70°C for 15 min with continuous stirring. The resulting product was separated from the mixture and recystallized from ethanol to give yellow needles of *N*-(2-nitrobenzylidene)-2-fluoroaniline **1b** (4.099 g, 84%), mp 76–78°C (ref. [19] mp 72–73°C); IR (KBr): 1520 cm^{-1} and 1348 cm^{-1} (NO$_2$); ^{1}H NMR (CDCl$_3$): δ 7.15–7.26 (m, 4H, 4 Ar-H), 7.65 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.76 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 8.10 (d, *J* = 8.0 Hz, 1H, Ar-H), 8.35 (d, *J* = 8.0 Hz, 1H, Ar-H), 9.02 (s, 1H, N=CH); ^{13}C NMR (CDCl$_3$): δ 116.3 (d), 121.8 (s), 124.5 (d), 124.6 (d), 127.7 (d), 129.9 (d), 130.9 (s), 131.5 (d), 133.7(d), 139.4 (d), 149.2 (s), 155.4 (s), 158.2 (d).

1-(2-nitrobenzylidene)-2-phenylhydrazine (1c) [20]. *o*-Nitrobenzaldehyde (3.022 g, 20 mmol) and phenylhydrazine (2.595 g, 24 mmol) were placed into a 100-mL round bottom flask. The mixture was heated in a water bath at 70°C for 5 min with continuous stirring. The product was separated from the mixture and recrystallized from ethanol to give red crystals of 1-(2-nitrobenzylidene)-2-phenylhydrazine **1c** (4.627 g, 96%), mp 118–119°C (ref. [20] mp 117°C); IR (KBr): 3292 cm^{-1} (NH), 1532 cm^{-1}, and 1334 cm^{-1} (NO$_2$); ^{1}H NMR (CDCl$_3$): δ 6.93 (t, *J* = 8.0 Hz, 1H, Ar-H), 7.14 (d, *J* = 8.0 Hz, 2H, 2 Ar-H), 7.31 (dd, *J* = 8.0 Hz and 8.0 Hz, 2H, 2 Ar-H), 7.40 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.61 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.99 (d, *J* = 8.0 Hz, 1H, Ar-H), 8.06 (br s, 1H, Ph-NH), 8.27 (d, *J* = 8.0 Hz, 1H, Ar-H), 8.32 (s, 1H, N=CH); ^{13}C NMR (CDCl$_3$): δ 113.1 (d), 121.0 (d), 124.8 (d), 127.7 (s), 128.1 (d), 129.4 (d), 130.4 (d), 131.6 (d), 133.1 (d), 143.8 (s), 146.9 (s).

***N*-(2-nitrobenzylidene)-1-naphthylamine (1d) [21].** *o*-Nitrobenzaldehyde (3.022 g, 20 mmol) and 1-naphthylamine (3.437 g, 24 mmol) were placed into a 100-mL round bottom flask. The mixture was heated in a water bath at 70°C for 15 min with continuous stirring. The product was separated from the mixture and recrystallized from ethanol to give yellow plates of *N*-(2-nitrobenzylidene)-1-naphthylamine **1d** (6.536 g, 95%), mp 110–111°C; IR (KBr): 1514 cm^{-1} and 1336 cm^{-1} (NO$_2$); ^{1}H NMR (CDCl$_3$): δ 7.17 (d, *J* = 8.0 Hz, 1H, Ar-H), 7.50 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.52–7.55 (m, 2H, 2 Ar-H), 7.66 (dd, *J* = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.81 (d, *J* = 8.0 Hz, 2H, 2 Ar-H), 7.87–7.88 (m, 1H, Ar-H), 8.10 (d, *J* = 8.0 Hz, 1H, Ar-H), 8.34-8.36 (m, 1H, Ar-H), 8.50 (d, *J* = 8.0 Hz, 1H, Ar-H), 9.04 (s, 1H, N=CH); ^{13}C NMR (CDCl$_3$): δ 113.2 (d), 123.6 (s), 124.5 (s), 126.0 (d), 126.0 (d), 126.5 (d), 126.8 (d), 127.7 (d), 128.8 (d), 130.0 (s), 131.1 (d), 131.2 (d), 133.5 (d), 133.9 (d), 148.2 (s), 155.7 (s), 155.8 (d).

***N*-benzylidene-2-nitroaniline (5a).** Imine compounds **5a-c** were prepared according to literature [22]. *o*-Nitroaniline (2.486g, 18 mmol), benzaldehyde (1.592 g, 15 mmol), sulfuric acid (5 drops), and molecular sieves (15 g) were added to benzene (30 mL) in a 100-mL round bottom flask. The mixture was heated under reflux for 8.5 h using Soxhlet extractor packed with molecular sieves. The resulting mixture was extracted with benzene, filtered to remove the molecular sieves, and the solvent evaporated under reduced pressure. The extract was then chromatographed on a silica gel column and eluted with hexane:EtOAc (85:15, 2% triethylamine) to give *N*-benzylidene-2-nitroaniline **5a** (2.787g, 82%). The structure of *N*-benzylidene-2-nitroaniline **5a** was determined by comparison of mp and ^{1}H NMR spectrum with those of literature [22]. Recrystallization from hexane gave yellow crystals, mp 70–71°C (ref. [22] mp 71–72°C); IR (KBr): 1594 cm^{-1} and 1334 cm^{-1} (NO_2); ^{1}H NMR ($CDCl_3$): δ 7.06 (d, *J* = 7.5 Hz, 1H, Ar-H), 7.30 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.47–7.55 (m, 3H, 3 Ar-H), 7.59 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.91 (d, *J* = 7.5 Hz, 2H, 2 Ar-H), 7.96 (d, *J* = 7.5 Hz, 1H, Ar-H), 8.41 (s, 1H, CH=N); ^{13}C NMR ($CDCl_3$): δ 121.0 (d), 124.6 (d), 125.3 (d), 128.8 (d), 129.2 (d), 132.1 (d), 133.8 (d), 135.4 (s), 142.9 (s), 146.8 (s), 161.8 (d).

***N*-(4-chlorobenzylidene)-2-nitroaniline (5b).** *o*-Nitroaniline (2.486 g, 18 mmol), *p*-chlorobenzaldehyde (2.109 g, 15 mmol), sulfuric acid (5 drops), and molecular sieves (10 g) were added to benzene (30 mL) in a 100-mL round bottom flask. The mixture was heated under reflux for 10 h using Soxhlet extractor packed with molecular sieves. The resulting mixture was extracted with benzene, filtered to remove the molecular sieves, and the solvent was evaporated under reduced pressure. The extract was then chromatographed on a silica gel column and eluted with hexane:EtOAc (85:15, 2% triethylamine) to give *N*-(4-chlorobenzylidene)-2-nitroaniline **5b** (2.226 g, 57%). Recrystallization from hexane gave yellow crystals, mp 78–79°C (ref. [23] mp 79–80°C); IR (KBr): 1586 cm^{-1} and 1348 cm^{-1} (NO_2); ^{1}H NMR ($CDCl_3$): δ 7.05 (d, *J* = 7.5 Hz, 1H, Ar-H), 7.32 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.47 (d, *J* = 7.5 Hz, 2H, 2 Ar-H), 7.60 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.85 (d, *J* = 7.5 Hz, 2H, 2 Ar-H), 7.97 (d, *J* = 7.5 Hz, 1H, Ar-H), 8.37 (s, 1H, CH=N); ^{13}C NMR ($CDCl_3$): δ 120.9 (d), 124.6 (d), 125.5 (d), 129.2 (d), 130.4 (d), 133.9 (d), 133.9 (s), 138.3 (s), 142.9 (s), 146.5 (s), 160.4 (d).

***N*-(4-methylbenzylidene)-2-nitroaniline (5c).** *o*-Nitroaniline (2.486 g, 18 mmol), *p*-methylbenzaldehyde (1.802 g, 15 mmol), sulfuric acid (5 drops), and molecular sieves (7.5 g) were added to benzene (30 mL) in a 100-mL round bottom flask. The mixture was heated under reflux for 9 h using Soxhlet extractor packed with molecular sieves. The resulting mixture was extracted with benzene, filtered to remove the molecular sieves, and the solvent evaporated under reduced pressure. The extract was then chromatographed on a silica gel column and eluted with hexane:EtOAc (85:15, 2% triethylamine) to give *N*-(4-methylbenzylidene)-2-nitroaniline **5c** (1.783 g, 49%). Recrystallization from hexane gave yellow crystals, mp 71–72°C (ref. [23] mp 72–74°C); IR (KBr): 1592 cm^{-1} and 1348 cm^{-1} (NO_2); ^{1}H NMR ($CDCl_3$): δ 2.43 (s, 3H, CH_3), 7.05 (d, *J* = 7.5 Hz, 1H, Ar-H), 7.27–7.30 (m, 3H, 3 Ar-H), 7.58 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.80 (d, *J* = 7.5 Hz, 2H, 2 Ar-H), 7.95 (d, *J* = 7.5 Hz, 1H, Ar-H), 8.36 (s, 1H, CH=N); ^{13}C NMR ($CDCl_3$): δ 21.6 (q), 121.1 (d), 124.5 (d), 125.0 (d), 129.2 (d), 132.1 (d), 133.8 (s), 135.4 (d), 142.9 (s), 142.9 (s), 146.8 (s), 161.8 (d).

Ethyl 2-nitrocinnamate (9b). 2-Nitrobenzaldehyde (1.09 g, 7 mmol), triphenylphosphine (2.56 g, 9.8 mmol), ethyl bromoacetate (1.87 g, 11.2 mmol) and saturated aqueous solution of $NaHCO_3$ (15 mL) were placed in an Erlenmeyer flask and stirred for 1.5 hours at 20°C. The resulting mixture was extracted with benzene, dried over anhydrous sodium sulfate, and the solvent evaporated under reduced pressure. The extract was chromatographed on a silica gel column and eluted with hexane:EtOAc (3:1) to give ethyl 2-nitrocinnamate **9b** (1.09 g, 68%) as colorless liquid. The structure of ethyl2-nitrocinnamate **9b** was determined by comparison of IR, ^{1}H NMR and ^{13}C NMR spectra with those of literature [24]. IR (neat): 1700 cm^{-1} (CO_2), 1510 cm^{-1}, and 1272 cm^{-1} (NO_2); ^{1}H NMR ($CDCl_3$): δ 1.36 (t, *J* = 7.5 Hz, 3H, CH_3); 4.30 (q, *J* = 7.5 Hz, 2H, CH_2), 6.37 (d, *J* = 17 Hz, 1H, C=CH), 7.55 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.64–7.65 (m, 2H, 2 Ar-H), 8.04 (d, *J* = 7.5 Hz, 1H, Ar-H), 8.11 (d, *J* = 17 Hz, 1H, Ph-CH=C); ^{13}C NMR ($CDCl_3$): δ 14.7 (q), 60.9 (t), 123.9 (d), 125.5 (d), 129.8 (d), 130.9 (s), 132.8 (d), 134.1 (d), 139.1 (d), 140.4 (s), 165.7 (s).

Methyl 2-nitrocinnamate (9c). 2-Nitrobenzaldehyde (1.09 g, 7 mmol), triphenylphosphine (2.56 g, 9.8 mmol), methyl bromoacetate (1.71 g, 11.2 mmol) and saturated aqueous solution of $NaHCO_3$ (15 mL) were placed in an Erlenmeyer and stirred for 1.5 h at 20°C. The resulting mixture was extracted with benzene, dried over anhydrous sodium sulfate, and the solvent evaporated under reduced pressure. The extract was chromatographed on a silica gel column and eluted with hexane:EtOAc (3:1) to give methyl 2-nitrocinnamate **9c** (0.98 g, 66%). The structure of methyl 2-nitrocinnamate **9c** was determined by comparison of mp, ^{1}H NMR and ^{13}C NMR spectra with those of literature [25]. Recrystallization from hexane gave colorless plates, mp 70–73°C (ref. [25(a)] mp 71–73°C); IR (KBr): 1712 cm^{-1} (CO_2), 1504 cm^{-1}, and 1332 cm^{-1} (NO_2); ^{1}H NMR ($CDCl_3$): δ 3.84 (s, 3H, CH_3), 6.37 (d, *J* = 17 Hz, 1H, C=CH), 7.56 (dd, *J* = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.64–7.66 (m, 2H, 2 Ar-H), 8.05 (d, *J* = 7.5 Hz, 1H, Ar-H), 8.12 (d, *J* = 17 Hz, 1H, Ph-CH=C); ^{13}C NMR ($CDCl_3$): δ 52.5 (q), 123.5 (d), 125.5 (d), 129.7 (d), 131.0 (s), 132.9 (d), 134.2 (d), 139.4 (d), 140.7 (s), 166.2 (s).

General procedure of the microwave-assisted Cadogan reaction for the synthesis of indazoles, benzimidazoles, indoles, carbazole, and phenazine. Microwave-assisted Cadogan reaction for the synthesis of the various *N*-containing heterocyclic compounds was performed using the appropriate starting materials. Thus, for indazoles, the following starting materials were used: *N*-(2-nitrobenzylidene)aniline, *N*-(2-nitrobenzylidene)-2-fluoroaniline, 1-(2-nitrobenzylidene)-2-phenylhydrazine and *N*-(2-nitrobenzylidene)-1-naphthylamine; for benzimidazoles: *N*-benzylidene-2-nitroaniline, *N*-(4-chlorobenzylidene)-2-nitroaniline and *N*-(4-methylbenzylidene)-2-nitroaniline; for indoles: chalcone, ethyl 2-nitrocinnamate and methyl 2-nitrocinnamate; for carbazole: 2-nitrobiphenyl; and for phenazine: 2-nitrodiphenylamine. One millimole of the starting material was placed in the reaction vessel and added with 4 mmol of triethyl phosphite or triphenylphosphine. The reaction vessel containing the mixture was plugged with quartz wool and then placed inside the cavity of the microwave oven (Model YD-17 (W), Yoshii Electric Co., Ltd.). The mixture was irradiated at various power ratings and different reaction times to get the best result. The resulting mixture was then extracted with acetone, filtered, and the solvent evaporated under reduced pressure. The extract was chromatographed on a silica gel column and eluted with benzene, benzene:EtOAc, hexane:EtOAc, or hexane:acetone to yield the different products.

In the one-pot-one-step procedure, 2-nitrobenzaldehyde and aryl amine or 2-nitroaniline and aryl aldehyde were mixed with triethyl phosphite or triphenylphosphine in the reaction vessel and irradiated with microwaves at different power ratings and reaction times to get the best results. In the one-pot-two-steps procedure, 2-nitrobenzaldehyde and aryl amine were placed in the reaction vessel and irradiated with microwaves at certain power rating and reaction time, after which, triethyl phosphite was added and the mixture irradiated again. The products were isolated in the same manner as described above.

2-Phenyl-2H-indazole (4a) [6]. Compound **4a** was obtained as white plates from hexane, mp 80–82°C (ref. [26] mp 80–82°C); ^{1}H NMR ($CDCl_3$): δ 7.12 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.32 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.40 (t, J = 7.5 Hz, 1H, Ar-H), 7.53, (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.71 (d, J = 7.5 Hz, 1H, Ar-H), 7.80 (d, J = 7.5 Hz, 1H, Ar-H), 7.91 (d, J = 7.5 Hz, 2H, 2 Ar-H), 8.41 (s, 1H, N—CH=C); ^{13}C NMR ($CDCl_3$): δ 117.9 (d), 120.4 (d), 120.4 (d), 121.0 (d), 122.1 (d), 122.7 (s), 126.8 (d), 127.9 (d), 129.5 (d), 140.5 (s), 149.8 (s).

2-(2-Fluorophenyl)-2H-indazole (4b) [27]. Compound **4b** was obtained as yellow liquid, IR (neat): 1222 cm^{-1} (Ar-F); ^{1}H NMR ($CDCl_3$): δ 7.12 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.28–7.40 (m, 4H, 4 Ar-H), 7.73 (d, J = 8.0 Hz, 1H, Ar-H), 7.79 (d, J = 8.0 Hz, 1H, Ar-H), 8.09 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 8.51 (s, 1H, N—CH=C); ^{13}C NMR ($CDCl_3$): δ 116.9 (d), 117.7 (d), 120.5 (d), 122.4 (d), 122.5 (s), 124.5 (d), 124.6 (d), 125.0 (d), 125.8 (d), 127.1 (d), 129.0 (s), 149.1 (s), 154.1 (s).

2-Phenylamino-2H-indazole (4c). Compound **4c** was obtained as white needles from benzene-hexane, mp 138–139°C (ref. [12] mp 140–142°C); IR (KBr): 3168 cm^{-1} (NH); ^{1}H NMR ($CDCl_3$): δ 6.54 (d, J = 7.5 Hz, 2H, 2 Ar-H), 6.97 (t, J = 7.5 Hz, 1H, Ar-H), 7.15 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.21 (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.34 (dd. J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.65 (br s, 1H, NH), 7.70 (d, J = 7.5 Hz, 2H, 2 Ar-H), 8.14 (s, 1H, N—CH=); ^{13}C NMR ($CDCl_3$): δ 114.1 (d), 117.6 (d), 120.4 (d), 122.3 (d), 122.5 (d), 124.1 (s), 126.7 (d), 128.3 (d), 129.2 (d), 146.8 (s), 147.3 (s).

2-(1-Naphthyl)-2H-indazole (4d) [6]. Compound **4d** was obtained as yellow liquid, ^{1}H NMR ($CDCl_3$):δ 7.18 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.38 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.48 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.54 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.56 (dd, J = 8.0 Hz and 8.0 Hz, 1H, Ar-H), 7.64 (d, J = 8.0 Hz, 1H, Ar-H), 7.74 (d, J = 8.0 Hz, 1H, Ar-H), 7.77 (d, J = 8.0 Hz, 1H, Ar-H), 7.86 (d, J = 8.0 Hz, 1H, Ar-H), 7.94 (d, J = 8.0 Hz, 1H, Ar-H), 7.98 (d, J = 8.0 Hz, 1H, Ar-H), 8.28 (s, 1H, N—CH=); ^{13}C NMR ($CDCl_3$): δ 117.8 (d), 120.2 (d), 121.9 (d), 122.2 (d), 122.9 (d), 123.7 (d), 124.8 (d), 125.3 (s), 126.5 (d), 126.6 (d), 127.4 (d), 127.9 (d), 128.8 (s), 129.5 (d), 134.0 (s), 137.5 (s), 149.5 (s).

2-Phenyl-1H-benzimidazole (8a). The structure of 2-phenyl-1*H*-benzimidazole **8a** was determined by comparison of mp, IR, ^{1}H NMR and ^{13}C NMR spectra with those of literature [14]. Colorless crystals from hexane-EtOAc, mp (hexane: EtOAc) 289–290°C (ref. [14] mp 290–292°C); IR (KBr): 3436 cm^{-1} (NH); ^{1}H NMR ($(CD_3)_2CO$): δ 7.21 (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.47–7.68 (m, 5H, 5 Ar-H), 8.24 (d, J = 7.5 Hz, 2H, 2 Ar-H), 11.97 (br s, 1H, NH); ^{13}C NMR (CD_3OD): δ 123.9 (d), 123.9 (d), 127.7 (d), 130.1 (d), 130.9 (d), 131.3 (s), 153.3 (s).

2-(4-Chlorophenyl)-1H-benzimidazole (8b). The structure of 2-(4-chlorophenyl)-1*H*-benzimidazole **8b** was determined by comparison of mp, IR and ^{1}H NMR spectra with those of literature [14]. Colorless crystals from acetone, mp 291–292°C (ref. [14] mp 292–293°C); IR (KBr): 3405 cm^{-1} (NH); ^{1}H NMR ($(CD_3)_2CO$): δ 7.22–7.24 (m, 2H, 2 Ar-H), 7.51–7.70 (m, 4H, 4 Ar-H), 8.23 (d, J = 7.5 Hz, 2H, 2 Ar-H), 11.98 (br s, 1H, NH). No data for ^{13}C NMR, not determined due to low solubility.

2-(4-Methylphenyl)-1H-benzimidazole (8c). The structure of 2-(4-methylphenyl)-1*H*-benzimidazole **8c** was determined by comparison of mp, IR and ^{1}H NMR spectra with those of literature [14]. Colorless crystals from acetone, mp (acetone) 270–271°C (ref. [14] mp 270–272°C); IR (KBr): 3476 cm^{-1} (NH); ^{1}H NMR ($(CD_3)_2CO$): δ 2.40 (s, 3H, CH_3), 7.17–7.21 (m, 2H, 2 Ar-H), 7.35 (d, J = 7.5 Hz, 2H, 2 Ar-H), 7.49–7.66 (m, 2H, 2 Ar-H), 8.11 (d, J = 7.5 Hz, 2H. 2 Ar-H), 11.82 (br s, 1H, NH). No data for ^{13}C NMR, not determined due to low solubility.

2-Benzoylindole (10a). The structure of 2-benzoylindole **10a** was determined by comparison of mp, IR and ^{1}H NMR spectra with those of literature [16]. Pale yellow needles from hexane, mp 147–148°C (ref. [16] mp 145–147°C); IR (KBr): 3300 cm^{-1} (NH), 1610 cm^{-1} (CO); ^{1}H NMR ($CDCl_3$): δ 7.17 (s, 1H, indole CH), 7.17 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.38 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.48 (d, J = 7.5 Hz, 1H, Ar-H), 7.54 (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.62 (t, J = 7.5 Hz, 1H, Ar-H), 7.72 (d, J = 7.5 Hz, 1H, ArH), 8.00 (d, J = 7.5 Hz, 2H, 2 Ar-H), 9.31 (br s, 1H, NH); ^{13}C NMR ($CDCl_3$): δ 112.3 (d), 113.0 (d), 120.9 (d), 123.1 (d), 126.5 (d), 127.6 (s), 128.4 (d), 129.3 (d), 132.3 (d), 134.3 (s), 137.7 (s), 138.0 (s), 187.3 (s).

2-Ethoxycarbonylindole (10b). The structure of 2-ethoxycarbonylindole **10b** was determined by comparison of mp, IR, ^{1}H NMR and ^{13}C NMR spectra with those of literature [17]. Colorless needles from hexane, mp 121–123°C (ref. [17] mp 124–125°C); IR (KBr): 3300 cm^{-1} (NH), 1680 cm^{-1} (CO_2); ^{1}H NMR ($CDCl_3$): δ 1.42 (t, J = 7.5 Hz, 3H, CH_3), 4.41 (q, J = 7.5 Hz, 2H, CH_2), 7.15 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.23 (s, 1H, indole CH), 7.32 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.42 (d, J = 7.5 Hz, 1 H, Ar-H), 7.69 (d, J = 7.5 Hz, 1H, Ar-H), 8.91 (br s, 1H, NH); ^{13}C NMR ($CDCl_3$): δ 14.4 (q), 61.0 (t), 108.6 (d), 111.9 (d), 120.7 (d), 122.5 (d), 125.3 (d), 127.4 (s), 127.4 (s), 136.9 (s), 162.2 (s).

2-Methoxycarbonylindole (10c). The structure of 2-methoxycarbonylindole **10c** was determined by comparison of mp, IR and ^{1}H NMR spectra with those of literature [18]. Colorless crystal from hexane, mp 144–147°C (ref. [18] mp 145–147°C); IR (KBr): 3308 cm^{-1} (NH), 1680 cm^{-1} (CO_2); ^{1}H

NMR ($CDCl_3$): δ 3.95 (s, 3H, CH_3), 7.16 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.23 (s, 1H, indole CH), 7.33 (dd, J = 7.5 Hz and 7.5 Hz, 1H, Ar-H), 7.42 (d, J = 7.5 Hz, 1H, Ar-H), 7.69 (d, J = 7.5 Hz, 1H, Ar-H), 8.90 (br s, 1H, NH); ^{13}C NMR ($CDCl_3$): δ 51.0 (q), 108.8 (d), 111.9 (d), 120.8 (d), 122.6 (d), 125.4 (d), 127.0 (s), 127.4 (s), 137.0 (s), 162.6 (s).

Carbazole (12). The mp, IR, ^{1}H NMR and ^{13}C NMR spectra of the compound were identical with those of commercially available sample. Colorless plates from ethanol, mp 245-250°C (ref. [6] mp 246–248°C); IR (KBr): 3420 cm^{-1} (NH); ^{1}H NMR ($CDCl_3$): δ 7.24 (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.42 (dd, J = 7.5 Hz and 7.5 Hz, 2H, 2 Ar-H), 7.42 (d, J = 7.5 Hz, 2H, 2 Ar-H), 8.04 (br s, 1H, NH), 8.09 (d, J = 7.5 Hz, 2H, 2 Ar-H); ^{13}C NMR ($CDCl_3$): δ 110.5 (d), 119.4 (d), 120.3 (d), 123.3 (s), 125.8 (d), 139.4 (s).

Phenazine (14). The mp, IR, ^{1}H NMR and ^{13}C NMR spectra of the compound were identical with those of commercially available sample. Pale yellow needles from ethanol, mp 169–171°C; ^{1}H NMR ($CDCl_3$): δ 7.80 (ddd, J = 7.5 Hz, 7.5 Hz and 1.5 Hz, 4H, 4 Ar-H), 8.26 (dd, J = 7.5 Hz and 1.5 Hz, 4H, 4 Ar-H); ^{13}C NMR ($CDCl_3$): δ 129.6 (d), 130.3 (d), 143.3 (s).

Acknowledgments. ECC would like to thank the Japan Society for the Promotion of Science (JSPS) for the research grant at Niigata University, Japan.

The regioselectivity of the 1,3-dipolar cycloaddition of benzonitrile *N*-oxide to phenyl vinyl sulfoxide is established by isotopic labeling and ^{13}C NMR analysis, and by DFT calculations.

J. Heterocyclic Chem., **46**, 1318 (2009).

INTRODUCTION

The synthesis of 3-phenylisoxazoles is an active area because that structural unit is the core of many compounds with biological or agricultural activity [1]. One of the prominent routes to these molecules is the reaction of a benzonitrile *N*-oxide **1** with a substituted alkyne or alkene, a pathway first recognized as a 1,3-dipolar cycloaddition by Huisgen [2]. Several hundred examples of this process have been documented [3].

The parent compound **2** can be prepared by this procedure with acetylene as the dipolarophile [4], but more often a two-step sequence is used whereby a monosubstituted alkene serves as the dipolarophile, followed by an elimination process on the intermediate isoxazoline **3** (Scheme 1). In the latter case, two distinct isomeric intermediates are possible depending on whether the oxygen terminal of **1** adds to the substituted or the unsubstituted carbon of the alkene (paths **a** and **b**, respectively in Scheme 1). This reaction is known to be generally regioselective for the 5-substituted cycloadduct **3a** [5]. However, yields for the process are not quantitative, and rigorous analyses for the isomeric 4-substituted cycloadduct are seldom reported [6].

Phenyl vinyl sulfoxide **4** and its 2-substituted analogs (R—CH═CH—S(O)—Ph) are among the useful dipolarophiles in the synthesis of isoxazoles *via* 1,3-dipolar cycloaddition, particularly, because subsequent elimination of phenylsulfenous acid occurs spontaneously [7]. Maiorana and coworkers investigated the regioselectivity of the addition step in the 2-substituted systems based on the distribution of the final isomeric oxazole products using ^{1}H NMR spectroscopy and found that the regioselectivity ratio is dramatically altered (90:10 to 10:90) depending on R [7b]. Clearly, direct analysis of the product ratio cannot be used to determine the regioselectivity when R = H, as the two intermediates (**3a/3b**) yield the same product (**2a/2b**), although this case may easily be the most relevant to understanding the influence of the S(O)Ph group. Herein, we report the results for a simple isotope labeling experiment that solve this problem.

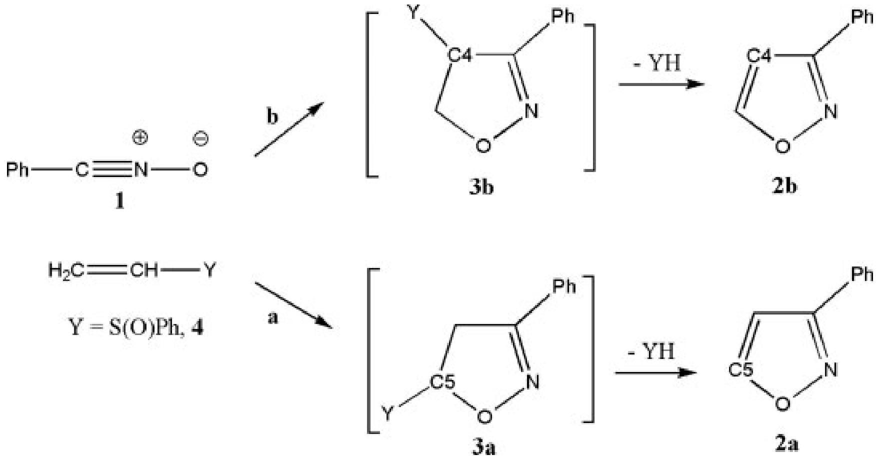
Our approach, summarized in Scheme 2, was to analyze product **2** by ^{13}C NMR spectroscopy following reaction of **1** with a sample of **4** selectively enriched with ^{13}C in the 1-position (C1). The results show that the ^{13}C label is incorporated largely at the 5-position of the isoxazole ring. We estimate a regioselectivity of 110:1 based on the integrated ^{13}C peak areas in the final product. These conclusions were then supported with DFT calculations.

RESULTS AND DISCUSSION

Synthesis. Standard procedures were used to convert 1-^{13}C-ethyl iodide to phenyl 1-^{13}C-vinyl sulfoxide **4*** (see Experimental Section). A mixture consisting of ~80% unlabeled **4** and 20 % labeled **4** (*i.e.* **4***) was then reacted with benzonitrile *N*-oxide **1** under conditions [7] that directly produced 3-phenyl-5-isoxazole **2** (Scheme 2). The crude product of this reaction was contaminated only with by-products resulting from the phenylsulfenous acid elimination (*i.e.* Ph_2S_2); purification by flash column chromatography produced pure **2**.

^{13}C NMR analysis. Initial chemical shift assignment of the isoxazole carbons in the ^{13}C NMR spectrum of **2** was straightforward (see Experimental Section). In

Scheme 1



earlier work, we definitively assigned the signal at δ 161.48 to C3 by preparing **2** selectively ^{13}C-lableled at this position [8]. This was accomplished by using the synthetic approach summarized in Scheme 2 beginning with benzaldehyde oxime ^{13}C-labeled at the oxime carbon. C4 and C5 (δ 102.42 and 158.85, respectively) were assigned by comparison with data from the NMR literature [9].

The first row in Table 1 gives the integrated peak areas observed in a natural abundance sample of **2**. In this case, the areas of C4 and C5 are roughly equal (C5/C4 = 1.12), and each is about three times the C3 peak area. The second row gives ^{13}C data observed when **2** is prepared from a mixture that was ~20% ^{13}C1-enriched phenyl 1-vinyl sulfoxide (**4***) and 80% natural abundance **4**. As expected, the enrichment causes significant

Scheme 2

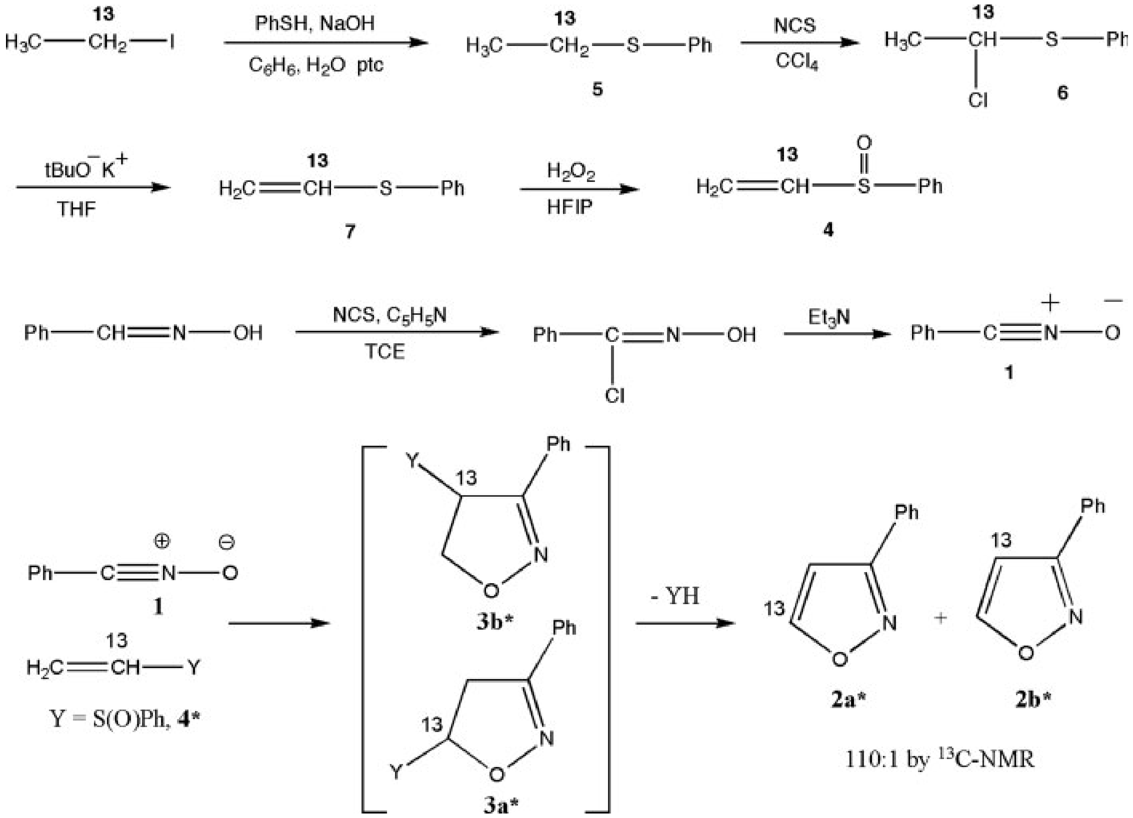


Table 1

Data from ^{13}C NMR analysis of **2**.

	Integrated peak area ratio		
	C5/C3	C4/C3	C5/C4
Natural abundance	3.53	3.15	1.12
^{13}C-Enriched[a]	53.59	3.56	15.05
^{13}C 1st adjustment[b]	50.66	0.95	
^{13}C 2nd adjustment[c]	50.66	0.41	
^{13}C Final adjustment[d]	50.66	0.46	

[a] Observed areas when 2 is prepared from 4* with 17% ^{13}C label at the 1-position.

[b] Adjusted peak areas in the ^{13}C-enriched experiment; obtained by subtracting the contribution from natural abundance component (83% of the area in row 1) from the observed area (row 2).

[c] Estimated distribution of the ^{13}C label originating from 4* onto C5 and C4 before scaling (see Discussion).

[d] Scaled for C5/C4 relative sensitivity (1.12).

increase in the C5 and C4 peak areas relative to C3. From the total amount of this increase, we can, in fact, determine that a total of 17% of the product obtained in the enriched experiment comes from labeled **4***. The distribution of ^{13}C from C1 of this component onto the C5 and C4 positions in **2** (**2a***/**2b*** in Scheme 2) provides the measure of regioselectivity in our reaction. When the natural abundance ^{13}C contributions from the C1 and C2 carbons of the **4**(83%)/**4***(17%) mixture are subtracted from the areas in row 2, the resulting data (third row in Table 1) clearly show that in the reaction of **4*** with **1**, the ^{13}C label at C1 has been deposited largely at the 5-position of the isoxazole ring. This implies that C4 in **2** originates mostly from the C2 carbon of **4***, which is not labeled. If the reaction were 100% regioselective, the natural ^{13}C abundance at C2 in **4*** (1.108%) should produce a net peak area of 0.54 for C4 in row 3 (*i.e.* 17% of the respective C4 value in row 1). As the observed area, 0.95, is larger by 0.41, this excess area must have come from a small fraction of the ^{13}C label at C1 in **4***, and this can now be used to make a quantitative estimate of the regioselectivity. To do this, we first scale the excess area by 1.12 to account for the inherently greater sensitivity of C5 toward integration (*i.e.* C5/C4 = 1.12 in row 1). Thus, our analysis, based on the final, adjusted integrated ^{13}C data (row 5), affords an overall regioselectivity of 50.66:0.46, or 110:1, for the reaction between **1** and **4** (in dichloroethane at 50°C).

It should be noted that, because of differences in relaxation times (T1) and NOE effects between protonated (*i.e.* C4, C5) and non-protonated carbons (*i.e.* C3), integrated peak areas from Fourier-Transform ^{13}C NMR spectra acquired with standard pulse sequences cannot be used to obtain accurate values for relative numbers of carbons in the same molecule (in contrast to the common integration practice in ^{1}H NMR spectroscopy). In this study, however, as we are comparing relative peak areas for the same carbon atoms in isotopically-distinct isomers, this limitation does not apply.

DFT calculations and analysis. 1,3-Dipolar addition reactions have been the subject of numerous electronic structure investigations [10]. Among the earlier studies in this area is work by Houk [11], which analyzed the frontier MO interactions in cycloaddition reactions. Subsequent studies used increasingly more sophisticated theoretical tools to obtain more accurate activation and reactions energies. However, elucidation and interpretation of the factors that control reactivity and regioselectivity in 1,3-dipolar addition reactions remains debatable and an active topic of research. For instance, Although Schleyer searched for a role for the in plane aromaticity in the cyclic transition states of 1,3-dipolar addition reactions [12], Ponti and Molteni advocated a possible role for the reactivity indices of the separate reactants in driving the reactions in the context of hard-soft acid-base theory [13]. More recently, Ess and Houk showed that the reactivities of different 1,3-dipoles correlate with the energy needed to distort the dipole and the dipolarophile to the transition state geometries ($E_{\mathrm{d}}^{\ddagger}$) [14]. Because none of the prior theoretical studies had considered any dipolar reactions of a vinyl sulfoxide, we became interested in investigating the reaction we studied experimentally (**1** + **4**) using density functional theory. For this purpose, we used the B3LYP and B3P86/6-31+G(d,p) levels of theory to study the transition states (TS), and products of the actual molecules used in the experiments. To present the results in perspective, we also calculated the reactions between **1** and each of ethylene and propene. Relevant geometrical parameters and energies of the reaction of **4** are presented in Figure 1, and Table 2 compares the results for the three alkenes considered.

Figure 1 shows that the TS in which the oxygen atom adds to the substituted carbon of **4** (**TS3a**) is 2.8 kcal/mol lower in energy than the alternative TS where oxygen adds to the terminal carbon (**TS3b**) ($\Delta\Delta G^{\circ\ddagger}$, at 298 K and 1 atm). A nearly identical $\Delta\Delta G^{\circ\ddagger}$ is obtained at the B3P86 level, and this value remains largely unchanged when the energies are calculated in a dichloroethane solvent continuum. The computed regioselectivity agrees well with the estimated experimental regioselectivity of 110:1, which affords and experimental $\Delta\Delta G^{\ddagger} = 2.6$ kcal/mol at 323 K. The calculations reveal that the kinetic product (**3a**) is also the thermodynamic product in the given reaction, with $\Delta\Delta G^{\circ} = 5.5$ kcal/mol in favor of the isomer in which the S(O)Ph substituent is attached at the 5-position before loss of phenylsulfenous acid to give the isoxazole ring (Fig. 1).

In light of the recent studies by Ess and Houk [14], we analyzed the calculated regioselectivity in reactions

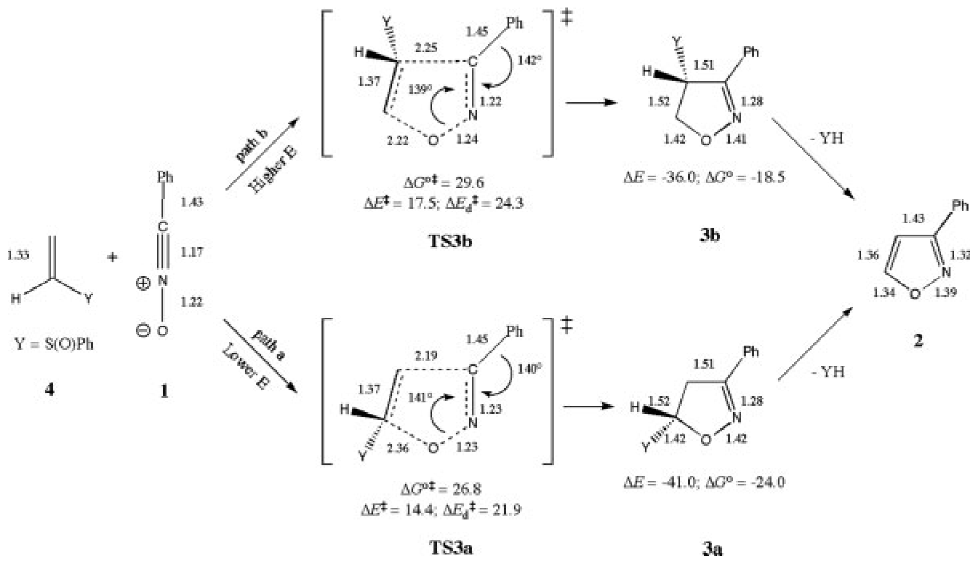

Figure 1. Selected B3LYP geometric parameters and energies of the transition states and products in the reaction between 4 and 1 (in Å and kcal/mol).

of **4** using the activation strain model. This model is built on a thermodynamic cycle that gives the activation energy ($\Delta E^{\ddagger}$) as the sum of a distortion energy ($\Delta E^{\ddagger}_{\mathrm{d}}$; defined as the energy needed to distort the equilibrium geometry of the reactants to the respective geometries in the TS) and an electronic interaction term ($\Delta E^{\ddagger}_{\mathrm{int}}$, for the energy change that takes place when the distorted reactants are brought to the TS). In our system, $\Delta E^{\ddagger}_{\mathrm{d}}$ has a term from the dipole ($\Delta E^{\ddagger}_{\mathrm{d1}}$) and another from the alkene ($\Delta E^{\ddagger}_{\mathrm{d2}}$, Table 2). Each of these terms is larger for the higher energy TS (**TS3b**). The net difference between the total $\Delta E^{\ddagger}_{\mathrm{d}}$ in the two TSs ($\Delta\Delta E^{\ddagger}_{\mathrm{d}} = 2.9$ kcal/mol) is very close to the difference between the actual activation energies ($\Delta\Delta E^{\ddagger} = 2.4$ kcal/mol). This behavior is in line with the general conclusions reached by Ess and Houk [14] on the reactivities of 1,3-dipole addition reactions.

Finally, to examine if S(O)Ph imparts any special substituent effects on the dipolarophilicity of ethylene, we calculated the reactions of ethylene and propene with **1**. The results are included in Table 2. In spite of the large electronic difference among the given three alkenes when the lower energy **TS3a** is considered, the activation energy appears to be rather invariant: $\Delta G^{\circ\ddagger} =$ 26.8, 27.2, and 25.8 kcal/mol, for Y = H, CH_3 or S(O)Ph, respectively. The same holds for the reaction energies: $\Delta G^{\circ}_{\mathrm{rxn}} = -23.3$ (H), -22.7 (CH_3), and -24.0 (S(O)Ph). Similarly, the calculated regioselectivity is comparable for Y = CH_3 ($\Delta\Delta G^{\circ\ddagger} = 3.3$ kcal/mol) and S(O)Ph ($\Delta\Delta G^{\circ\ddagger} = 2.8$ kcal/mol). Noticeably, the small variations in the activation energies among the three substituents correlate with the variation in the respective distortion energies.

Table 2

B3LYP activation and reaction energies of addition of PhCNO (**1**) to substituted ethylene (CH_2=CHY).[a]

Y	O adds to	$\Delta E^{\ddagger}$	$\Delta G^{\circ\ddagger}$	$\Delta E^{\ddagger}_{\mathrm{d1}}$	$\Delta E^{\ddagger}_{\mathrm{d2}}$	$\Delta G^{\circ}_{\mathrm{rxn}}$
S(O)Ph	C1	14.4	26.8	17.6	4.3	−24.0
S(O)Ph	C2	17.5	29.6	18.7	5.6	−18.9
CH_3	C1	14.9	27.2	17.6	3.7	−22.7
CH_3	C2	17.9	30.5	19.3	4.9	−18.3
H	C1 = C2	14.1	25.8	17.1	3.0	−23.3

$\Delta E^{\ddagger}$ is the raw electronic activation energy without ZPE correction. $\Delta G^{\circ\ddagger}$ and $\Delta G^{\circ}_{\mathrm{rxn}}$ are the standard state activation and reaction free energies, respectively, obtained at 298 K and 1 atm using unscaled harmonic vibrational frequencies. $\Delta E^{\ddagger}_{\mathrm{d1}}$ and $\Delta E^{\ddagger}_{\mathrm{d2}}$ are the energies needed to distort the geometries of **1** and the alkene, respectively, to their corresponding parameters in the transition state. When Y = S(O)Ph, the results are for the lowest energy conformer.

[a] Units are in kcal/mol, relative to the separated reactants.

Overall, the DFT calculations support the experimental quantification of the regioselectivity in the reaction between **1** and **4** made from the integrated ^{13}C areas of the final product (**2**). The calculations confirm that the observed regioselectivity is not the result of any special effects provided by the S(O)Ph group.

EXPERIMENTAL

Melting points were determined on a MelTemp apparatus. Extracts were dried over Na_2SO_4, and solvents were removed by rotary evaporation at reduced pressure. Product purities were determined by gas chromatography-mass spectrometry analysis on a Hewlett Packard HP 6890 system equipped with a HP-5MS crosslinked diphenyl (5%) dimethyl (95%) polysiloxane capillary column (30 m × 0.25 mm × 0.25 μm film), a 5973 mass selective detector, and a HP Kayak XA computer. NMR spectra were measured at 298 K with a Brüker Avance DRX 500 MHz NMR spectrometer operating at frequencies of 500.630 (^{1}H) and 125.884 (^{13}C) using a standard 5 mm broadband multinuclear (PABBO) probehead (90° pulse widths: ^{1}H, 11.5 μs; ^{13}C, 6.0 μs). Chemical shifts (ppm) were measured relative to internal Me_4Si (^{1}H) or internal $CDCl_3$ (^{13}C). ^{13}C chemical shifts were measured using a standard power gated decoupling pulse sequence (zgpg30) from the Brüker pulse sequence library. Spectral windows for ^{13}C acquisitions were set at 240 ppm, and a total of *ca*. 300 scans of 32 k data points were collected and then zero-filled to 64 k points before Fourier transformation. The recycle delay (D1) was set at 2 s.

Phenyl 1-^{13}C-vinyl sulfoxide (4). The synthesis of phenyl vinyl sulfoxide selectively ^{13}C-labeled in the 1-position began with a sample of *ca*. 20% ^{13}C-enriched 1-^{13}C-ethyl iodide that was prepared by mixing 4 volumes of unlabeled ethyl iodide (Sigma–Aldrich, 17780) with 1 volume of 99% atom purity 1-^{13}C-ethyl iodide (Cambridge Isotope Laboratories, CLM-1025). As shown in Scheme 2, preparation of phenyl 1-^{13}C-vinyl sulfoxide **4** proceeded from labeled ethyl iodide *via* the sequence: 1-^{13}C-ethyl phenyl sulfide **5** [15] to 1-^{13}C-chloroethyl phenyl sulfide **6** [16] to phenyl 1-^{13}C-vinyl sulfide **7** [17] to **4** [18], following methods that have been reported previously. The crude product was used for the subsequent synthesis of **2**; GC-MS analysis of crude **4** showed that it was at least 94% pure.

3-Phenyl-5-^{13}C isoxazole (2). We have reported a general synthesis of unlabeled 3-phenyl-5-isoxazole beginning from benzaldehyde oxime previously [7a]. Adaptation of this method using phenyl 1-^{13}C-vinyl sulfoxide **4** afforded 3-phenyl-5-^{13}C isoxazole **2**, as follows. To a solution of *N*-chlorosuccinimide (0.119 g, 0.8913 mmol) and pyridine (4 μL, 0.124 mmol) in 1,1,2-trichloroethane (TCE) (1.0 mL) was added benzaldehyde oxime (0.098 g, 0.809 mmol; Aldrich 245674) and the solution was stirred at 50°C for 30 min. A solution of phenyl 1-^{13}C-vinyl sulfoxide **4** (0.138 g, 0.905 mmol) and triethylamine (0.12 mL, 0.86 mmol) in TCE (98 μL) was added dropwise *via* Pasteur pipet over 3 min. The solution was stirred at 50°C for 20 min and then heated to reflux for an additional 60 min. The reaction mixture was cooled to room temperature and evaporated to dryness, and the residue was treated with 2*M* NaOH (5 mL). The mixture was heated at reflux for 35 min, cooled to room temperature, neutralized with saturated NH_4Cl solution (3 mL), and extracted with CH_2Cl_2. The extract was washed with water (2 × 10 mL), dried (anhydrous Na_2SO_4), and evaporated to give 0.092 g of crude product **2**. Purification by flash liquid chromatography (4:1 hexane:ethyl acetate on flash silica gel) removed the Ph_2S_2 by-product and afforded **2** as a pale yellow oil in *ca*. 94% purity by GC-MS analysis. ^{13}C NMR (deuteriochloroform) δ 102.42 (C4), 126.86 (C2′/3′; assignments may be interchanged), 128.76 (C1′), 128.91 (C2′/3′; assignments may be interchanged), 130.00 (C4′), 158.85 (C5), 161.48 (C3).

Computational methods. All computations were carried out using Gaussian 03. [19]. The B3LYP [20] and B3P89 [21] levels of theory and the standard 6-31+G(d,p) basis set [22] were used to optimize the reactants, transition states, and products for normal mode vibrational analysis. Several conformers defined by rotation of the S(O)Ph group were considered for the transition state and products, but we report only the results for the lowest energy conformer. Solvent effects were calculated *via* single point calculations on the gas phase optimized geometries using the polarizable continuum model (PCM) [23].

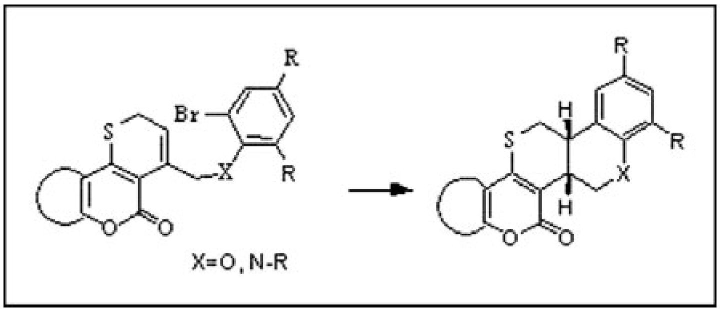
DOI 10.1002/jhet.220



4-Chloromethylthiopyrano[3,2-*c*][1]benzopyran-5-(2*H*)-ones were refluxed with *o*-bromophenols in acetone in the presence of anhydrous potassium carbonate and sodium iodide to afford a number of 4-aryloxymethylthiopyrano[3,2-*c*][1]benzopyran-5-(2*H*)-ones in 72–79% yields. These compounds were refluxed with tri-*n*-butyltin hydride and azobisisobutyronitrile in dry benzene for 7–8 h to give [6,6]pyranothiopyrans in 76–84% yields with good diastereoselectivity. Similarly, [6,6]pyridothiopyrans were also synthesized in 70–75% yields with excellent diastereoselectivity.

J. Heterocyclic Chem., **46**, 1324 (2009).

INTRODUCTION

In recent years, radical cyclization has emerged as a valuable tool for the construction of carbo- and heterocyclic compounds, including natural products [1]. An understanding of the kinetic and the structural information of these reactive intermediates paved the way for the development of modern synthetic radical chemistry [2]. There has been continuing enhanced interest in recent years in the synthesis of coumarin derivatives largely on account of their occurrence in nature [3,4] and biological activity [5] *viz*., anthelmintic, hypnotic, insecticidal, antifungal activities, anticoagulant effect on blood, and diuretic properties. During our work on the synthesis of heterocycles by the application of sigmatropic rearrangements [6], we recently observed the unusual formation of [6,6]pyranopyrans in case of substrates containing 5-hydroxypyrimidines [7] and 3-hydroxycoumarin [8], in the second Claisen rearrangement step. The generation and subsequent reactions of radicals formed from aryl halides using tri-*n*-butyltin hydride and azobisisobutyronitrile (AIBN) are now well established [9]. However, literature reveals only a few examples of heteroaryl radicals [10–13]. Aryl radical cyclization normally has a high 5-*exo*:6-*endo* ratio indicating stronger preference for *exo* cyclization compared to the alkyl radicals. However, this preference is found to be reversed in cyclizations involving stabilized radicals [14]. Recently, we have reported [15] the synthesis of [6,6]pyranothiopyrans by the application of sequential Claisen rearrangement followed by pyridine hydrotribromide-mediated regioselective 6-endo cyclization. We have also reported some successful 6-*endo* aryl radical cyclizations by tri-*n*-butyltin hydride-mediated radical reaction [16]. In continuation of our studies, we became interested to examine the viability of synthesizing the [6,6]pyranothiopyran ring system by tri-*n*-butyltin hydride-induced radical cyclization of appropriate substrates (**3a–f**).

RESULTS AND DISCUSSION

4-Chloromethylthiopyrano[3,2-*c*][1]benzopyran-5-(2*H*)-ones (**1a–b**) were refluxed with *o*-bromophenol in acetone in the presence of anhydrous potassium carbonate and sodium iodide to afford a number of 4-aryloxymethylthiopyrano[3,2-*c*][1]benzopyran-5-(2*H*)-ones (**3a–f**) (Scheme 1).

Compounds (**3a–f**) were characterized from their elemental analyses and spectral data. IR spectrum of compound **3a** showed carbonyl absorption at 1690 cm^{-1}. The high-field (300 MHz) ^1H NMR spectrum of compound **3a** exhibited two proton doublet at δ 3.48 for —SCH_2, two proton doublet at δ 5.18 for —OCH_2, one proton triplet at δ 6.35 for the vinylic proton among other signals for aromatic protons.

The substrate **3a** was refluxed in dry benzene under nitrogen atmosphere with tri-*n*-butyl tin hydride and

AIBN for 7 h to afford cyclic product **4a** in 80% yield as an inseparable diastereoisomeric mixture (3:1), which was determined by ^{1}H, ^{13}C, COSY, and NOESY experiments. ^{1}H NMR spectrum of the product **4a** displayed peaks for two —SC**H**$_2$ protons at δ 3.23 and 3.33, two —OC**H**$_2$ protons at δ 3.88 and 4.70, and two ring juncture protons at δ 3.25 and 3.75 along with eight aromatic protons (δ 6.91–7.76) for the major diastereoisomer, whereas minor diastereoisomer displayed peaks at δ 3.05 and 3.74 for two —SC**H**$_2$ protons, δ 3.93 and 5.67 for two —OC**H**$_2$ protons, and δ 3.17 and 3.42 for two ring juncture protons. IR spectrum of compound **4a** also showed carbonyl absorption at 1700 cm^{-1}. The generality of the reaction was tested by subjecting five other substrates **3b–f** under the same reaction condition to give products **4b–f** in 76–84% yields (Scheme 2).

In the course of our studies on the application of sigmatropic rearrangements for the synthesis of heterocyclic compounds, we have already noted the formation of several [6,6]pyranopyran and [6,6]pyranothiopyran ring systems [17] using sequential Claisen rearrangements. However, we failed to synthesize [6,6]pyridothiopyran ring system using the Claisen rearrangement. The aforesaid results motivated us to investigate the synthesis of [6,6]pyridothiopyran ring system by tributyl tin hydride-mediated aryl radical cyclization.

The starting materials for our study 4-arylaminomethyl-7-methyl thioyrano[3,2-*c*]pyran-5-ones **7a–e** were synthesized from 4-chloromethyl-7-methyl-thiopyrano[3,2-*c*]pyran-5-ones **5** and various substituted *o*-bromoanilines **6a–e** in refluxing acetone in the presence of anhydrous K_2CO_3 and catalytic amount of NaI (Scheme 3).

Substrate **7a** was refluxed in benzene with tributyl tin (IV) hydride in the presence of azoisobutyronitrile (AIBN) for 5 h to give compound **8a** (70%), which was characterized from its elemental analysis and spectroscopic data. The IR spectrum of the compound **8a** showed peaks at 3387 and 1682 cm^{-1} for secondary N—H group and carbonyl group, respectively. The high-field ^{1}H NMR (500 MHz) spectrum of the product **8a** displayed peaks for two —SC**H**$_2$ protons at δ 2.90 and δ 3.02, two ring juncture protons at δ 3.09 and δ 3.65, and two —NC**H**$_2$ protons at δ 3.19 and 3.33. The mass spectrum of the compound **8a** also displayed a molecular ion peak at *m*/*z* 286 (M^+ + 1). Encouraged by this result, other substrates **7b–e** were also similarly treated to give tetracyclic heterocycles **8b–e** in 70–75% yields (Scheme 4).

Substrates **3b** and **3c** also gave diastereomeric mixtures [18] (2.5:1 and 2:1, respectively) under similar reaction conditions, whereas substrates **3d–f** and **7a–e** with Bu_3SnH and AIBN in refluxing benzene gave the

cyclized products **4d–f** and **8a–e**, respectively, with 100% diastereoselectivity. The high-field ^1H NMR (500 MHz) of the compound **8a** showed the two ring juncture protons at δ 3.09–3.12 (dt, 1H, $J = 12.1$, 3.5 Hz) and δ 3.65–3.69 (dt, 1H, $J = 11.5$, 3.6 Hz). The low coupling constants ($J = 3.5$ and 3.6 Hz) for the ring juncture protons indicate *cis*-stereochemistry of the ring juncture. The *cis*-stereochemistry of the ring juncture is also supported by the comparison of the ^1H NMR data of similar compounds published earlier [17]. The stereochemistry at the ring juncture can also be surmised from the molecular models (Dreiding model), which shows a strain free *cis*-arrangement.

It was already established [19] that very high level of diastereoselectivity (>50:1) could be obtained when the concentration of the reactants is reduced from 0.1 to 0.01 M. This observation has been attributed to the reversibility of the cyclization and decreased availability of the Bu_3SnH. However, no significant change in diastereoselectivity was observed when the substrates **3a–c** were treated with $^nBu_3SnH$ and AIBN in refluxing benzene under a very dilute condition. Therefore, the reason behind the reduced diastereoselectivity in case of **3a–c** over the other is not clear.

The formation of products **4a–f** and **8a–e** from the substrates **3a–f** and **7a–e**, respectively, may easily be explained by the generation of an aryl radical **9** in the tri-*n*-butyltin hydride and azobisisobutyronitrile-mediated reaction. The aryl radical **9** may undergo cyclization by two different modes, a 6-*endo* trig cyclization to afford the heterocyclic radical **11** (pathway a) or a 5-*exo* trig cyclization to give the spiroheterocyclic radical [20] **10** (not isolated, pathway b). The possibility of the formation of heterocyclic radical **11** *via* spirocyclic radical **10** by a neophyl rearrangement [21] cannot be ruled out (Scheme 5).

It is known that radical cyclizations leading to six-membered rings are usually less general than cyclization leading to five-membered rings. The six-membered ring forming reactions are also slower than five-membered ring forming reactions and are subject to competitive formation of reduced uncyclized by-products. However, appropriately substituted 5-hexenyl radicals are known to undergo 6-*endo* cyclization to give six-membered rings. Our noteworthy observation is that the usual oxidation [13] does not occur at the present instance, and the dihydro compounds are isolated in excellent yield with good diastereoselectivity. It is also interesting to note that six-membered heterocyclic rings are regioselectively formed in all the cases. This is an attractive and simple methodology for the synthesis of [6,6]pyranothiopyran and [6,6]pyridothiopyran ring systems.

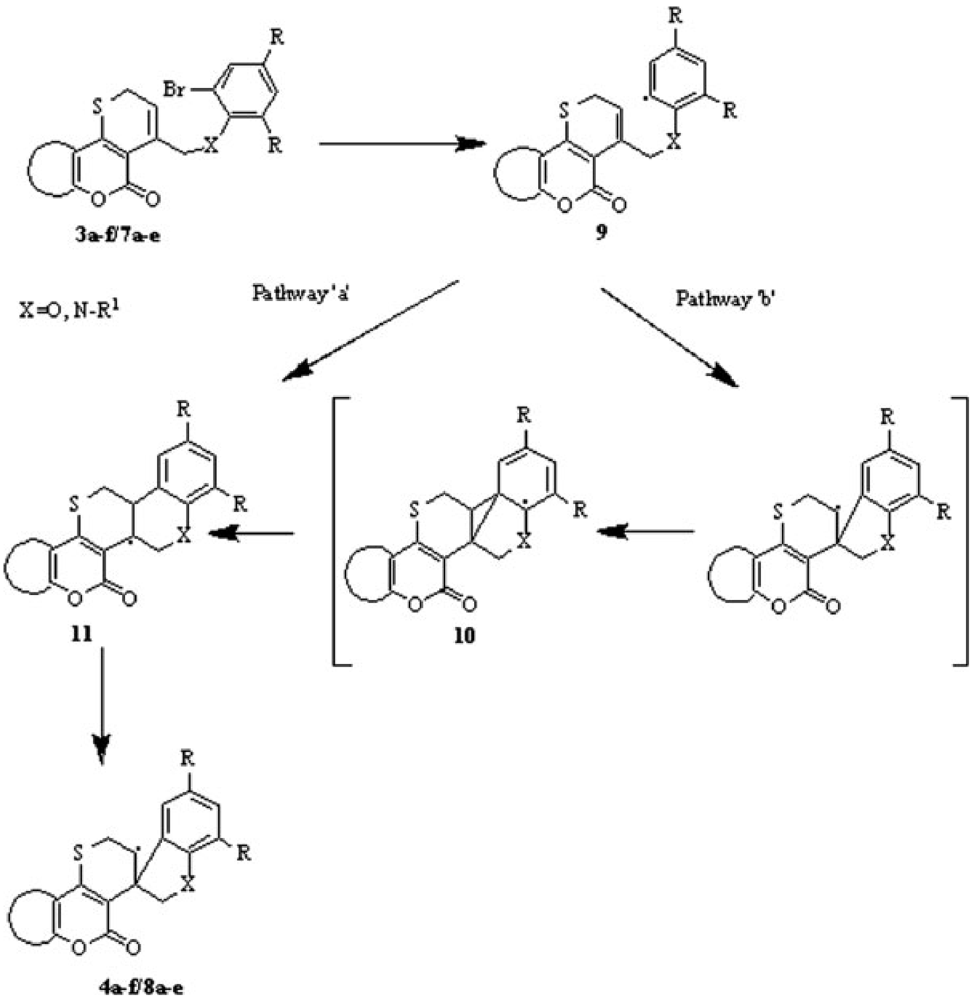
EXPERIMENTAL

Melting points were determined in an open capillary and are uncorrected. IR spectra were recorded on a Perkin-Elmer L120-000A spectrometer (ν_{max} in cm^{-1}) on KBr disks. UV absorption spectra were recorded in EtOH on a Shimadzu UV-2401PC spectrophotometer (λ_{max} in nm). ^1H NMR (300 MHz, 500 MHz) and ^{13}C NMR (125 MHz) spectra were recorded on a Bruker DPX-300 and Bruker DPX-500 spectrometer in $CDCl_3$ (chemical shift in δ) with TMS as an internal standard. ^1H NMR and ^{13}C NMR spectra were recorded at the Indian Institute of Chemical Biology, Kolkata and Bose Institute,

Scheme 5



Kolkata. Silica gel [(60–120 mesh), Spectrochem, India] was used for chromatographic separation. Silica gel G [E-Merck (India)] was used for TLC. Petroleum ether refers to the fraction boiling between 60 and 80°C.

The starting materials (**1a**,**b**) and **5** for this study were prepared according to our earlier published procedure [22,23].

General procedure for the preparation of compound 3a–f. Compound (**1a, b**) (1 mmol) was refluxed with several *o*-bromophenols (**2a–c**) (1 mmol) in acetone (100 mL) in the presence of anhydrous potassium carbonate (1g) and catalytic amount of NaI for 3–5 h. The reaction mixture was then cooled, filtered, and the solvent was removed. The residual mass was subjected to column chromatography over silica gel using petroleum ether–ethylacetate (19:1) as eluant to give compounds **3a**–**f**, which were then recrystallized from chloroform.

Compound 3a. Yield 75%; yellow solid; m.p. 90°C; UV(EtOH)λ_{max}: 214, 243, 371 nm; IR(KBr) ν_{max}: 1690, 1600, 1260 cm^{-1}; ^{1}H NMR (500 MHz): δ 3.48 (d, 2H, J = 6 Hz, —SCH$_2$), 4.99 (d, 2H, J = 1 Hz, —OCH$_2$), 6.38–6.42 (tt, 1H, J = 1, 6 Hz, =CH), 7.17–7.23 (m, 3H, ArH), 7.29–7.37 (m, 4H, ArH), 7.50–7.61 (m, 1H, ArH); Anal. Calcd. for $C_{19}H_{13}BrO_3S$: C, 56.85%; H, 3.24%; Found C, 56.91%; H, 3.57%.

Compound 3b. Compound 3c. Yield 74%; yellow solid; m.p. 136°C; UV(EtOH)λ_{max}: 218, 240, 336 nm; IR(KBr) ν_{max}: 1700, 1600, 1240 cm^{-1}; ^{1}H NMR (500 MH$_Z$): δ 2.43 (s, 3H, —CH$_3$), 3.46 (d, 2H, J = 6 Hz, —SCH$_2$), 5.20 (d, 2H, J = 1 Hz, —OCH$_2$), 6.34–6.35 (tt, 1H, J = 1,6 Hz, =CH), 6.83–7.61 (m, 7H, ArH); Anal. Calcd. for $C_{20}H_{15}BrO_3S$: C, 57.83%; H, 3.61%; Found C, 58.04%; H, 3.73%.

Compound 3d. Yield 72%; yellow solid; m.p. 94°C; UV(EtOH)λ_{max}: 221, 243, 375 nm; IR(KBr) ν_{max}: 1700, 1590, 1290 cm^{-1}; ^{1}H NMR (300 MHz): δ 2.26 (s, 3H, —CH$_3$), 3.46 (d, 2H, J = 6 Hz, —SCH$_2$), 5.16 (d, 2H, J = 1 Hz, —OCH$_2$), 6.31–6.35 (tt, 1H, J = 1, 6 Hz, =CH), 6.84–6.87 (m, 1H, ArH), 7.02–7.05 (m, 1H, ArH), 7.29–7.35 (m, 3H, ArH), 7.51–7.57 (m, 1H, ArH), 7.82–7.85 (m, 1H, ArH); Anal. Calcd. for $C_{20}H_{15}BrO_3S$: C, 57.83%; H, 3.61%; Found C, 57.98%; H, 3.47%.

Compound 3e. Yield 75%; yellow solid; m.p. 122°C; UV(EtOH)λ_{max}: 216, 245, 359 nm; IR(KBr) ν_{max}: 3300, 1680, 1590, 1250 cm^{-1}; ^{1}H NMR (500 MHz): δ 2.26 (s, 3H, —C**H**$_3$), 2.43 (s, 3H, —C**H**$_3$), 3.45 (d, 2H, J = 6 Hz, —SC**H**$_2$), 5.16 (d, 2H, J = 1 Hz, —OC**H**$_2$), 6.30–6.33 (tt, 1H, J = 1, 6 Hz, =C**H**), 6.84–6.86 (d, J = 9 Hz, 1H, Ar**H**), 7.01–7.03 (dd, 1H, J = 2.5, 9 Hz, Ar**H**), 7.21–7.26 (m, 1H, Ar**H**), 7.32–7.34 (m, 2H, Ar**H**), 7.60 (s, 1H, Ar**H**); Anal. Calcd. for $C_{21}H_{17}BrO_3S$: C, 58.74%; H, 3.96%; Found C, 58.60%; H, 4.19%.

Compound 3f. Yield 73%; yellow solid; m.p. 168°C; UV(EtOH)λ_{max}: 212, 240, 326 nm; IR(KBr) ν_{max}: 1720, 1700, 1230 cm^{-1}; ^{1}H NMR (500 MHz): δ 2.24 (s, 3H, —C**H**$_3$), 2.26 (s, 3H, —C**H**$_3$), 2.43 (s, 3H, —C**H**$_3$), 3.48 (d, 2H, J = 6 Hz, —SC**H**$_2$), 5.00 (d, 2H, J = 1 Hz, —OC**H**$_2$), 6.38–6.42 (t, 1H, J = 6 Hz, =C**H**), 7.19–7.61 (m, 5H, Ar**H**); Anal. Calcd. for $C_{22}H_{19}BrO_3S$: C, 59.59%; H, 4.29%; Found C, 59.70%; H, 4.06%.

General procedure for the synthesis of compounds 7a–e. Compound 5 (1 mmol) was refluxed with several *o*-bromoanilines (**6a**–**e**) (1 mmol) in dry acetone (100 mL) in the presence of anhydrous potassium carbonate (1 g) and catalytic amount of NaI for 4–5 h. The reaction mixture was cooled, filtered, and the solvent was removed. The residual mass was subjected to column chromatography over silica gel using petroleum ether–ethylacetate (19:1) as eluant to give compounds **7a**–**e**.

Compound 7a. Yield: 80%; Solid, m.p. 170°C; IR (KBr)ν_{max}: 3410, 1698, 1596, 1497 cm^{-11} H NMR (CDCl$_3$, 400 MHz) δ_H 2.21 (s, 3H), 3.27–3.28 (d, 2H, J = 5.8 Hz), 4.38 (s, 2H), 5.76–5.79 (t, 1H, J = 5.8 Hz), 5.99 (s, 1H), 6.49–6.53 (t, 1H, J = 7.42 Hz), 6.59–6.61 (d, 1H, J = 8 Hz), 7.09–7.12 (t, 1H, J = 7.5 Hz), 7.35–7.37 (d, 1H, J = 8.04 Hz). UV (EtOH) λ_{max}= 361, 302, 245, 209 nm. Anal. Calcd. for $C_{16}H_{14}NO_2SBr$: C, 52.75%; H, 3.85%; N, 3.85%; Found C, 52.45%; H, 3.55%; N, 3.65%.

Compound 7b. Yield: 80%; Gummy mass. IR (KBr)ν_{max}: 3399, 1698, 1492 cm^{-1} ^{1}H NMR (CDCl$_3$, 400 MHz) δ_H 2.18 (s, 3H), 2.21 (s, 1H), 3.26–3.28 (d, 2H, J = 5.8 Hz), 4.36 (s, 2H), 5.75–5.78 (t, 1H, J = 5.86 Hz), 5.99 (s, 1H), 6.50–6.52 (d, 1H, J = 8.2 Hz), 6.90–6.92 (dd, 1H, J = 8.24, 1.32 Hz), 7.20–7.21 (d, 1H, J = 1.16 Hz). UV (EtOH) λ_{max}= 302, 243, 208 nm. Anal. Calcd. for $C_{17}H_{16}NO_2SBr$: C, 53.96%; H, 4.23%; N, 3.70%; Found C, 53.66%; H, 4.53%; N, 3.40%.

Compound 7c. Yield: 75%; Solid, m.p. 125–130°C; IR (KBr)ν_{max}: 3391, 1699, 1594 cm^{-1} ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 1.15–1.18 (t, 3H, J = 7.58 Hz), 2.22 (s, 3H), 2.47–2.52 (q, 2H, J = 7.58 Hz), 3.28–3.29 (d, 2H, J = 5.88 Hz), 4.36–4.37 (d, 2H, J = 1.09 Hz), 5.77–5.79 (t, 1H, J = 5.87 Hz), 5.99 (s, 1H), 6.56–6.58 (d, 1H, J = 8.26 Hz), 6.94–6.96 (dd, 1H, J = 8.26, 1.98 Hz), 7.23–7.24 (d, 1H, J = 1.99 Hz). UV (EtOH) λ_{max}= 303, 246, 209 nm. Anal. Calcd. for $C_{18}H_{18}NO_2SBr$: C, 55.10%; H, 4.59%; N, 3.57%; Found C, 55.40%; H, 4.49%; N, 3.27%.

Compound 7d. Yield: 80%; Solid, m.p. 120°C; IR (KBr)ν_{max}: 1711, 1493 cm^{-1}; ^{1}H NMR (CDCl$_3$, 400 MHz) δ_H 2.17 (s, 3H), 2.24 (s, 3H), 2.61 (s, 3H, —NMe), 3.23–3.25 (d, 2H, J = 6.04 Hz), 4.15 (s, 2H), 5.92–5.95 (m, 2H), 6.89–6.91 (d, 1H, J = 8.12 Hz), 6.96–6.98 (dd, 1H, J = 8, 1.68 Hz), 7.33 (d, 1H, J = 1.68 Hz). UV (EtOH) λ_{max} = 356, 248, 205 nm. Anal. Calcd. for $C_{18}H_{18}NO_2SBr$: C, 55.10%; H, 4.59%; N, 3.57%; Found C, 54.80%; H, 4.89%; N, 3.28%.

Compound 7e. Yield: 75%; Solid, m.p. 110°C; IR (KBr)ν_{max}: 1711, 1495 cm^{-1}; ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 1.17–1.20 (t, 3H, J = 7.59 Hz), 2.18 (s, 3H), 2.52–2.57 (q, 2H, J = 7.57 Hz), 2.62 (s, 3H, —NMe), 3.25–3.26 (d, 2H, J = 5.99 Hz), 4.16 (s, 2H), 5.96–5.99 (m, 2H), 6.94–6.96 (d, 1H, J = 8.12 Hz), 7.0–7.02 (dd, 1H, J = 8.15, 1.9 Hz), 7.35 (d, 1H, J = 1.9 Hz). General procedure for the preparation of compounds 4a–f and 8a–e by radical cyclization. A suspension of the compound 3a (0.5 mmol), ^{n}Bu$_3$SnH (0.075 mL), and AIBN (0.5–0.6 mol equiv) in dry benzene (7–10 mL) were refluxed for 7–8 h under N$_2$ atmosphere. The solvent was evaporated under reduced pressure. The residue was dissolved in 10 mL of ether and stirred with 10 mL of 10% aqueous potassium fluoride for 45 min. The white precipitate separated by filtration and the aqueous phase was extracted with CHCl$_3$ (3 × 10 mL). The combined organic extract was washed with brine and dried (Na$_2$SO$_4$). The residual mass after removal of the solvent was subjected to column chromatography over silica gel using pet-ether–ethyl acetate (19:1) as eluant to give cyclized products **4a**, which were then recrystallized from chloroform–petroleum ether. Similarly, other compounds **4b**–**f** and **8a**–**e** were also synthesized.

Compound 4a. Yield 80%; white solid; m.p. 140°C; UV (EtOH) λ_{max}: 219, 279 nm; IR (KBr) ν_{max}: 2900, 1700, 1195 cm^{-1}, ^{1}H NMR (CDCl$_3$, 500 MHz): Major diastereomer: δ 3.23 (t, 1H, J = 11.4 Hz, —SC**H**$_2$), 3.25 (dt, 1H, J = 3.6, 10.5 Hz, ring juncture), 3.33 (dd, 1H, J = 2.4 Hz, 12.6 Hz, SC**H**$_2$), 3.75 (dt, 1H, J = 3.1, 11.4 Hz, ring juncture), 3.88 (t, 1H, J = 10.5 Hz, OC**H**$_2$), 4.70 (dd, 1H, J = 3.08, 10.8 Hz, OC**H**$_2$), 6.88–6.97 (m, 2H, Ar**H**), 7.28–7.35 (m, 2H, Ar**H**), 7.51–7.57 (m, 3H, Ar**H**), 7.74–7.76 (m, 1H, Ar**H**); ^{13}C NMR (125 MHz, CDCl$_3$): at 29.6, 31.7, 32.4, 64.5, 114.9, 117.7, 120.7, 121.2, 124.0, 124.5, 129.3, 130.1, 130.2, 130.6, 132.2, 149.9, 151.3, 154.7, and 159.5; MS m/z 322 (M$^+$); Anal. Calcd. for $C_{19}H_{14}O_3S$: C, 70.81%; H, 4.35%; Found C, 71.02%; H, 4.43%. Minor diastereomer: ^{1}H NMR (CDCl$_3$, 500 MHz): δ 3.05–3.07 (m, 1H), 3.17–3.20 (m, 1H), 3.42–3.45 (m, 1H), 3.74–3.76 (m, 1H), 3.93–3.96 (m, 1H), 5.66 (dd, 1H, J = 3.4 Hz, 10.46 Hz); ^{13}C NMR (125 MHz, CDCl$_3$): δ 28.7, 37.5, 38.8, and 69.

Compound 4b. Yield 76%; white solid; m.p. 198°C; UV (EtOH) λ_{max}: 215, 279 nm; IR (KBr) ν_{max}: 2910, 1700, 1190 cm^{-1}, ^{1}H NMR (CDCl$_3$, 500 MHz): Major diastereomer: δ 2.19 (s, 3H, —C**H**$_3$), 2.28 (s, 3H, —C**H**$_3$), 3.20 (t, 1H, J = 11.2 Hz, —SC**H**$_2$), 3.24 (dt, 1H, J = 3.4, 10.8 Hz, ring juncture proton), 3.34 (dd, 1H, J = 2.6, 12.4 Hz, —SC**H**$_2$), 3.72 (dt, 1H, J = 3.2, 11.2 Hz, ring juncture proton), 3.90 (t, 1H, J = 10.8 Hz, —OC**H**$_2$), 4.68 (dd, 1H, J = 2.6, 11.8 Hz, —OC**H**$_2$), 6.84–6.89(s, 2H, Ar**H**), 7.32–7.61 (m, 2H, Ar**H**), 7.73–7.76 (m, 2H, Ar**H**); MS m/z 350 (M$^+$); Anal. Calcd. for $C_{21}H_{18}O_3S$: C, 72.0%; H, 5.14%; Found C, 72.25%; H, 5.43%. *Minor diastereomer:* ^{1}H NMR (CDCl$_3$, 500 MHz): δ 2.99–3.22 (m, 3H), 3.73–3.87 (m, 2H), 5.64 (dd, 1H, J = 3.5, 10.7 Hz).

Compound 4c. Yield 82%; white solid; m.p. 182°C; UV (EtOH) λ_{max}: 219, 280 nm; IR (KBr) ν_{max} : 2915, 1710, 1190 cm^{-1}, ^{1}H NMR (CDCl$_3$, 300 MHz): Major diastereomer: δ 2.43

(s, 3H, —C**H**$_3$), 3.26 (t, 1H, $J = 11.4$ Hz, —SC**H**$_2$), 3.27 (dt, 1H, $J = 3.4$, 10.7 Hz, ring juncture proton), 3.35 (dd, 1H, $J = 2.5$, 12.2 Hz, —SC**H**$_2$), 3.74 (dt, 1H, $J = 3.5$, 11.4 Hz, ring juncture proton), 3.87 (t, 1H, $J = 10.7$ Hz, —OC**H**$_2$), 4.64 (dd, 1H, $J =$ 2.6, 10.2 Hz, —OC**H**$_2$), 6.88–6.97 (m, 3H, Ar**H**), 7.14–7.35 (m, 3H, Ar**H**), 7.51(s, 1H, Ar**H**); MS *m*/*z* 336 (M$^+$); Anal. Calcd. for $C_{20}H_{16}O_3S$: C, 71.43%; H, 4.76%; Found C, 71.62%; H, 4.83%. Minor diastereomer: ^{1}H NMR (CDCl$_3$, 300 MHz): δ 3.00–3.22 (m, 3H), 3.88–3.93 (m, 2H), 5.62 (dd, 1H, $J = 3.4$, 10.4 Hz).

Compound 4d. Yield 82%; white solid; m.p. 182°C; UV (EtOH) λ_{max}: 220, 279 nm; IR (KBr) ν_{max} : 2900, 1700, 1196 cm^{-1}, ^{1}H NMR (CDCl$_3$, 300 MHz): δ 2.29 (s, 3H, —C**H**$_3$), 3.19 (dd, 1H, $J = 2.4$, 11.2 Hz, —SC**H**$_2$), 3.26–3.34 (m, 2H), 3.69 (dt, 1H, $J = 3.5$, 11.0 Hz, ring juncture proton), 3.78 (t, 1H, $J = 10.5$ Hz, —OC**H**$_2$), 4.61 (dd, 1H, $J = 2.1$, 10.0 Hz, —OC**H**$_2$), 6.78–7.00 (m, 3H, Ar**H**), 7.27–7.34 (m, 2H, Ar**H**), 7.51–7.56 (m, 1H, Ar**H**), 7.73 (d, $J = 7.8$ Hz, 1H, Ar**H**); MS *m*/*z* 336 (M$^+$); Anal. Calcd. for $C_{20}H_{16}O_3S$: C, 71.43%; H, 4.76%; Found C, 71.59%; H, 4.62%.

Compound 4e. Yield 84%; white solid; m.p. 208°C; UV (EtOH) λ_{max}: 219, 280 nm; IR (KBr) ν_{max}: 2900, 1690, 1220 cm^{-1}, ^{1}H NMR (CDCl$_3$, 300 MHz): δ 2.29 (s, 3H, —C**H**$_3$), 2.43 (s, 3H, —C**H**$_3$), 3.18–3.29 (m, 3H), 3.72 (dt, 1H, $J = 3.4$, 10.7 Hz, ring juncture proton), 3.77 (t, 1H, $J = 10.5$ Hz, —OC**H**$_2$), 4.60 (dd, 1H, $J = 3.2$, 10.4 Hz, —OC**H**$_2$), 6.77–7.01 (m, 3H, Ar**H**), 7.20–7.24 (m, 1H, Ar**H**), 7.32 (dd, 1H, $J = 1.6$, 8.3 Hz, Ar**H**), 7.51 (s, 1H, Ar**H**); MS *m*/*z* 350 (M$^+$); Anal. Calcd. for $C_{21}H_{18}O_3S$: C, 72.0%; H, 5.14%; Found C, 72.17%; H, 5.25%.

Compound 4f. Yield 77%; white solid; m.p. 214°C; UV (EtOH) λ_{max}: 219, 278 nm; IR (KBr) ν_{max} : 2910, 1690, 1210 cm^{-1}, ^{1}H NMR (CDCl$_3$, 300 MHz): δ 2.18 (s, 3H, —CH$_3$), 2.26 (s, 3H, —CH$_3$), 2.43 (s, 3H, —CH$_3$), 3.13–3.30 (m, 3H), 3.66–3.71 (dt, 2H, $J = 3.6$, 10.7 Hz, ring juncture proton), 3.76 (t, 1H, $J = 10.6$ Hz, —OCH$_2$), 4.66 (dd, 1H, $J = 2.1$, 10.3 Hz, —OCH$_2$), 6.84–6.87 (d, 2H, $J = 9$ Hz, ArH), 7.20–7.23 (m, 1H, ArH), 7.32–7.34 (m, 1H, ArH), 7.52 (s, 1H, ArH); MS *m*/*z* 364 (M$^+$); Anal. Calcd. for $C_{22}H_{20}O_3S$: C, 72.53%; H, 5.49%; Found C, 72.71%; H, 5.25%.

Compound 8a. Yield: 70%; Solid, m.p. 218°C; IR (KBr)ν_{max}: 3387, 1682, 1539 cm^{-1}; ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 2.18 (s, 3H), 2.90–2.94 (ddd, 1H, $J = 12.9$, 3.2, 2.1 Hz), 3.02–3.06 (t, 1H, $J = 11.4$ Hz), 3.09–3.12 (dt, 1H, $J =$ 12.1, 3.5 Hz), 3.19–3.24 (t, 1H, $J = 12.6$ Hz), 3.33–3.37 (dt, 1H, $J = 11.02$, 4.1 Hz), 3.65–3.69 (dt, 1H, $J = 11.5$, 3.6 Hz), 4.02 (brs, 1H, N—H), 5.81 (s, 1H), 6.51–6.53 (dd, 1H, $J = 8.04$, 0.76 Hz), 6.64–6.67 (dt, 1H, $J = 7.32$, 1.12 Hz), 7.02–7.06 (m, 2H). MS: *m*/*z* = 286 (M + 1); UV (EtOH) λ_{max}= 306, 255, 232, 209 nm. Anal. Calcd. for $C_{16}H_{15}NO_2S$: C, 67.37%; H, 5.26%; N, 4.91%; Found C, 67.67%; H, 4.96%; N, 5.21%.

Compound 8b. Yield: 75%; Solid, m.p. 210°C; IR (KBr)ν_{max}: 3392, 1684, 1539 cm^{-1}; ^{1}H NMR (CDCl$_3$, 300 MHz) δ_H 2.18 (s, 3H), 2.23 (s, 3H), 2.90–2.97 (m, 1H), 3.00–3.08 (m, 2H), 3.17–3.25 (t, 1H, $J = 12.35$ Hz), 3.30–3.34 (m, 1H), 3.62–3.66 (d, 1H, $J = 11.17$ Hz), 3.90 (brs, 1H, N—H), 5.81 (s, 1H), 6.45–6.47 (d, 1H, $J = 7.77$ Hz), 6.85–6.87 (d, 1H, $J = 7.63$ Hz), 6.87 (s, 1H). ^{13}C NMR (125 MHz, CDCl$_3$): 19.8, 20.7, 30.8, 31.0, 35.2, 42.0, 104.3, 112.9, 115.0, 121.9, 126.8, 129.3, 130.5, 141.7, 151.7, 158.0, 161.7. MS: *m*/*z* = 300 (M + 1); UV (EtOH) λ_{max} = 308, 257, 232, 208 nm. Anal. Calcd. for $C_{17}H_{17}NO_2S$: C, 68.23%; H, 5.69%; N, 4.68%; Found C, 68.53%; H, 5.39%; N, 4.98%.

Compound 8c. Yield: 75%; Solid, m.p. 200°C; IR (KBr)ν_{max}: 3386, 1693, 1545 cm^{-1}; ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 1.17–1.20 (t, 3H, $J = 7.58$ Hz), 2.19 (s, 3H), 2.50–2.55 (q, 2H, $J = 7.57$ Hz), 2.92–2.95 (dd, 1H, $J = 13.11$, 2.49 Hz), 2.99–3.03 (t, 1H, $J = 11.4$ Hz), 3.06–3.09 (dt, 1H, $J =$ 12.14, 3.5 Hz), 3.19–3.24 (t, 1H, $J = 12.63$ Hz), 3.31–3.34 (dt, 1H, $J = 10.98$, 4.0 Hz), 3.64–3.66 (dt, 1H, $J = 11.44$, 3.68 Hz), 3.91 (brs, 1H, N—H), 5.80 (s, 1H), 6.47–6.49 (d, 1H, $J = 8.63$ Hz), 6.88–6.89 (m, 2H). MS: *m*/*z* = 314 (M + 1); UV (EtOH) λ_{max}= 309, 257, 232, 210 nm. Anal. Calcd. For $C_{18}H_{19}NO_2S$: C, 69.01%; H, 6.07%; N, 4.47%; Found C, 69.31%; H, 5.87%; N, 4.19%.

Compound 8d. Yield: 70%; Solid, m.p. 162°C; IR (KBr)ν_{max}: 1694, 1463 cm^{-1}; ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 2.19 (s, 3H), 2.23 (s, 3H), 2.97–3.01 (t, 1H, $J = 11.09$ Hz), 3.03–3.07 (m, 1H), 3.14–3.19 (t, 1H, $J = 12.54$ Hz), 3.43–3.47 (dt, 1H, $J = 10.83$, 4.19 Hz), 3.48–3.51 (ddd, 1H, $J = 11.25$, 3.9, 1.3 Hz), 5.80 (s, 1H), 6.53–6.55 (d, 1H, $J = 8.37$ Hz), 6.88–6.89 (d, 1H, $J = 1.78$ Hz), 6.95–6.97 (dd, 1H, $J = 8.31$, 1.84 Hz). ^{13}C NMR (125 MHz, CDCl$_3$): 19.8, 20.6, 30.9, 31.0, 35.8, 39.3, 50.7, 104.3, 111.8, 112.9, 123.2, 125.9, 129.5, 130.4, 143.8, 151.9, 158.0, 161.7. MS: *m*/*z* = 314 (M + 1); UV (EtOH) λ_{max} = 309, 260, 208 nm. Anal, Calcd. for $C_{18}H_{19}NO_2S$: C, 69.01%; H, 6.07%; N, 4.47%; Found C, 69.29%; H, 6.28%; N, 4.25%.

Compound 8e. Yield: 70%; Solid, m.p. 140°C; IR (KBr)ν_{max}: 1700, 1463 cm^{-1}; ^{1}H NMR (CDCl$_3$, 500 MHz) δ_H 1.18–1.21 (t, 3H, $J = 7.59$ Hz), 2.19 (s, 3H), 2.51–2.56 (q, 2H, $J = 7.59$ Hz), 2.88–2.90 (ddd, 1H, $J = 12.8$, 3.16, 2.0 Hz), 2.91 (s, 3H), 2.98–3.02 (t, 1H, $J = 11.08$ Hz), 3.05–3.08 (dt, 1H, $J = 12.08$, 3.4 Hz), 3.15–3.20 (t, 1H, $J = 12.53$ Hz), 3.43–3.47 (dt, 1H, $J = 10.87$, 4.2 Hz), 3.49–3.52 (ddd, 1H, J = 11.2, 2.76, 1.2 Hz), 5.81 (s, 1H), 6.56–6.58 (d, 1H, $J =$ 8.34 Hz), 6.90–6.91 (d, 1H, $J = 1.87$ Hz), 6.98–7.00 (dd, 1H, $J = 8.4$, 1.99 Hz). MS: *m*/*z* = 328 (M + 1); UV (EtOH) λ_{max} = 308, 262, 231, 208 nm. Anal. Calcd. For $C_{19}H_{21}NO_2S$: C, 69.72%; H, 6.42%; N, 4.28%; Found C, 69.45%; H, 6.22%; N, 4.50%.

Acknowledgment. The authors thank the CSIR (New Delhi) for financial assistance. They are thankful to Dr. A. Dutta of the Medicinal Chemistry Department, University of Kansas for spectral analyses of compound **4a**. Three of them S.M., S.S., and P.P. are grateful to the CSIR for their Research Fellowships.

A series of 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione derivatives were synthesized via the three-component reaction of aromatic aldehyde, 2,6-diaminopyrimidine- 4(3*H*)-one, and Meldrum's acid in water in the presence of triethylbenzylammonium chloride (TEBAC). This protocol has the advantages of easier work-up, milder reaction conditions, and environmentally benign procedure.

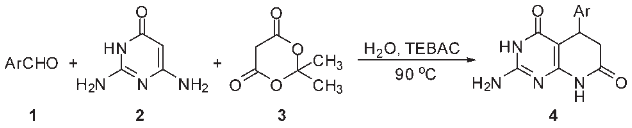
J. Heterocyclic Chem., **46**, 1331 (2009).

INTRODUCTION

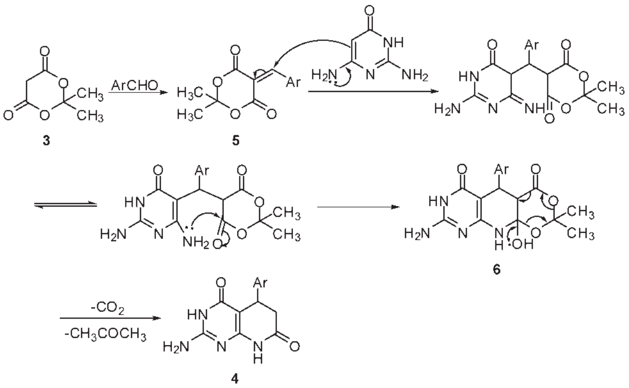
Multicomponent reactions (MCRs), in which multiple reactions are combined into one synthetic operation, have been extensively used in synthetic chemistry for the formation of carbon-carbon and carbon–heteroatom bonds [1]. Such reactions offer a wide range of possibilities for the efficient construction of highly complex molecules in a single procedural step, thus avoiding complication operations and allowing saving both of solvent and of reagents. In the past decade there have been tremendous developments in three- and four-component reactions and great efforts continue to be made to develop new MCRs [2]. The need to reduce the amount of toxic waste and by-product arising from chemical processes requires increasing emphasis on the use of less toxic and environmentally compatible materials in the design of new synthetic methods. One of the most promising approaches is using water as the reaction medium. Breslow rediscovered the use of water as a solvent in organic synthesis in the 1980s [3]. There has been growing recognition that water is an attractive medium for many organic reactions [4] and many MCRs in aqueous media have been reported [5].

The importance of uracil and its annulated derivatives is well recognized by synthetic [6] as well as biological [7] chemists. With the development of clinically useful anticancer and antiviral drugs [8], there has recently been remarkable interest in the synthetic manipulations of uracils [9]. Pyrido[2,3-*d*]pyrimidines have received considerable attention over the past years because of their wide range of biological activities, which include antitumor [10], antibacterial [11], anti-inflammatory [12], antifungal [13], and antileishmaniasis [14] properties, and also act as cyclin-dependent kinase 4 inhibitors [15]. Therefore, for the preparation of these complex molecules large efforts have been directed toward the synthetic manipulation of uracils. Broom *et al.* [16] synthesized pyrido[2,3-*d*]pyrimidines from the reaction of DMAD and 6-aminouracile in protic solvent but obtained uncyclized condensed acetylenic adduct when the reaction was carried in DMF [17]. Bhuyan *et al.* [18] reported the synthesis of pyrido[2,3-*d*]pyrimidines from the reaction of arylidenemalononitrile with 6-aminouracil in refluxing 1-propanol, but in this reaction, benzylmalononitrile was obtained as by-product and the amount of arylidenemalononitrile needed was in excess. Rodríguez *et al.* [19] reported the synthesis of 9-aryl substituted 2-amino-4,7-dioxopyrido[2,3-*d*]pyrimidines by refluxing equimolar amounts of 5-arylidene substituted Meldrum's acid and 2,6-diamino-4-oxopyrimidine in acetic acid. Recently, Devi *et al.* [20] reported a novel three-component one-pot synthesis of pyrido[2,3-*d*]pyrimidines using microwave heating. These methods usually require forcing conditions, using organic solvents, long reaction times and complex synthetic pathways. As part of our current studies on the development of new routes to heterocyclic systems [21], recently we have reported the synthesis of pyrido[2,3-*d*]pyrimidine derivatives by the three-component reaction of aldehyde,

Scheme 1



Scheme 2



alkyl nitriles, and aminopyrimidines in water [22]. In this article, we would report an efficient and clean synthetic route to 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*] pyrimidine-4,7(3*H*,8*H*)-dione derivatives in aqueous media catalyzed by TEBAC.

RESULTS AND DISCUSSION

When the three-components of aromatic aldehyde **1**, 2,6-diaminopyrimidine-4(3*H*)-one **2**, and Meldrum's acid **3** were treated in water in the presence of TEBAC at 90°C for a few hours (Scheme 1), the desired 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*, 8*H*)-dione **4** were obtained in high yields (Table 1).

As shown in Table 1, this protocol could be applied not only to the aromatic aldehydes with electron-withdrawing groups (such as halide and nitro groups), but also to aromatic aldehydes with electron-donating groups (such as alkyl and alkoxyl groups). Therefore, we concluded that the electronic nature of the substituents of aldehydes has no significant effect on this reaction. However, because some aldehydes were remaining in the mixture, so some aldehydes gave low yields.

The structures of the compounds **4** were identified by their spectroscopy analysis. Thus, the IR spectra of compounds **4** measured in potassium bromide pellets show two bands of the elongation vibrations of the C=O group at 1703–1646 cm^{-1}, NH$_2$, and NH groups at 3467–3157 cm^{-1}. In the ^{1}H NMR spectra of compounds **4** measured in dimethyl-d_6 sulfoxide were observed the CH$_2$ proton signals at 2.41–2.57 and 2.91–3.17 ppm, the CH proton signals at 4.05–4.46 ppm, the NH$_2$ proton signals at 6.53–6.66 ppm, the aromatic proton signals at 6.82–8.16 ppm, and the NH proton signals at 10.10–10.33 and 10.60–10.90 ppm, respectively.

Table 1

Synthesis of 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione **4** in aqueous media.

Entry	Ar	Time (h)	Yield (%)
4a	4-FC$_6$H$_4$	5	76
4b	4-CH$_3$OC$_6$H$_4$	3	74
4c	4-BrC$_6$H$_4$	9	69
4d	4-ClC$_6$H$_4$	4	67
4e	2-NO$_2$C$_6$H$_4$	6	75
4f	4-CH$_3$C$_6$H$_4$	9	65
4g	3-NO$_2$C$_6$H$_4$	5	95
4h	3-ClC$_6$H$_4$	4	72
4i	2-ClC$_6$H$_4$	4	69
4j	3,4-OCH$_2$OC$_6$H$_3$	8	80
4k	4-NO$_2$C$_6$H$_4$	6	82

Although the detailed mechanism of earlier reaction remains not to be fully clarified, the formation of compounds **4** could be explained by a reaction sequence presented in Scheme 2. According to the literature [23], we proposed that the reaction proceeded via a reaction sequence of condensation, addition, cyclization, and elimination. First, the condensation of aldehyde **1** and Meldrum's acid **3** gave the intermediate product **5**. The addition of **5** to 2,6-diaminopyrimidine-4(3*H*)-one **2**, then cyclized to give intermediate product **6**. The carbon dioxide and acetone were losing from the intermediate product **6** to give the products **4**.

In conclusion, we have developed a simple three-component reaction consisting of an aldehyde, 2,6-diaminopyrimidine-4(3*H*)-one, and Meldrum's acid for the synthesis of 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*] pyrimidine-4,7(3*H*,8*H*)-dione derivatives in aqueous media. This method has the advantages of easier work-up, milder reaction conditions, and environmentally benign procedure.

EXPERIMENTAL

Melting points are uncorrected. Infrared spectra were recorded on a Tensor 27 spectrometer in KBr with absorption in cm^{-1}. ^{1}H NMR spectra were recorded on a Bruker DPX 400-MHz spectrometer as DMSO-d_6 solution. *J* values are in Hz. Chemical shifts are expressed in δ downfield from internal tetramethylsilane.

General procedure for the synthesis of 2-amino-5-aryl-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione derivatives 4 in aqueous media. A suspension of a mixture of aromatic aldehyde **1** (2 mmol), 2,6-diaminopyrimidine-4(3*H*)-one 2 (2 mmol), Meldrum's acid 3 (2 mmol) and TEBAC (0.15 g) was stirred in water (10 mL) at 90°C for several hours. After completion monitored by TLC, the reaction mixture was allowed to cool to room temperature. The crystalline powder formed recrystallized from DMF and water to give pure **4**.

2-Amino-5-(4-fluorophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*, 8*H*)-dione (4a). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3325, 3167, 1691, 1652, 1591, 1537, 1508, 1485, 1361, 1305, 1264, 1211, 1158, 1099, 1015, 973, 906, 838, 794 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.48 (d, J = 16 Hz, 1H, CH), 2.96 (dd, J_1 = 7.6 Hz, J_2 = 16 Hz, 1H, CH), 4.13 (d, J = 7.6 Hz, 1H, CH), 6.59 (br., s, 2H, NH$_2$), 7.07–7.12 (m, 2H, ArH), 7.16–7.20 (m, 2H, ArH), 10.16 (s, 1H, NH), 10.64 (s, 1H, NH).

2-Amino-5-(4-methoxylphenyl)-5,6-dihydropyrido[2,3-*d*] pyrimidine-4,7(3*H*,8*H*)-dione (4b). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3464, 3315, 3159, 1691, 1652, 1596, 1559, 1539, 1511, 1488, 1457, 1396, 1361, 1310, 1251, 1220, 1178, 1033, 907, 831, 793, 699 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.45 (d, J = 16 Hz, 1H, CH), 2.91 (dd, J_1 = 7.6 Hz, J_2 = 16 Hz, 1H, CH), 3.70 (s, 3H, CH$_3$O), 4.06 (d, J = 7.6 Hz, 1H, CH), 6.53 (br., s, 2H, NH$_2$), 6.82 (d, J = 8.4 Hz, 2H, ArH), 7.06 (d, J = 8.4 Hz, 2H, ArH), 10.08 (s, 1H, NH), 10.80 (s, 1H, NH).

2-Amino-5-(4-bromophenyl)-5,6-dihydro[2,3-*d*] pyrimidine-4,7(3*H*,8*H*)-dione (4c). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3325, 3159, 1688, 1646, 1588, 1539, 1486, 1398, 1362, 1307, 1262, 1212, 1158, 1074, 1010, 972, 907, 817, 793 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.47 (d, J = 16.4 Hz, 1H, CH), 2.97 (dd, J_1 = 8.0 Hz, J_2 = 16.4 Hz, 1H, CH), 4.11 (d, J = 8.0 Hz, 1H, CH), 6.60 (br., s, 2H, NH$_2$), 7.11 (d, J = 8.4 Hz, 2H, ArH), 7.47 (d, J = 8.4 Hz, 2H, ArH), 10.18 (s, 1H, NH), 10.66 (s, 1H, NH).

2-Amino-5-(4-chlorophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4d). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300 °C); IR (potassium bromide): 3460, 3319, 3158, 1698, 1650, 1591, 1539, 1487, 1398, 1361, 1307, 1261, 1211, 1159, 1091, 1014, 973, 907, 819, 793 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.47 (d, J = 16 Hz, 1H, CH), 2.97 (dd, J_1 = 8.0 Hz, J_2 = 16 Hz, 1H, CH), 4.12 (d, J = 8.0 Hz, 1H, CH), 6.59 (br., s, 2H, NH$_2$), 7.17 (d, J = 8.4 Hz, 2H, ArH), 7.34 (d, J = 8.4 Hz, 2H, ArH), 10.16 (s, 1H, NH), 10.65 (s, 1H, NH).

2-Amino-5-(2-nitrophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4e). This compound was obtained as solid with mp > 300°C (Lit. [19] > 300°C); IR (potassium bromide): 3433, 3319, 3167, 1698, 1652, 1588, 1536, 1519, 1477, 1408, 1340, 1281, 1259, 1233, 1213, 1165, 1018, 967, 930, 904, 862, 824, 794, 744, 700 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.41 (d, J = 16.4 Hz, 1H, CH), 3.17 (dd, J_1 = 8.8 Hz, J_2 = 16.4 Hz, 1H, CH), 4.49 (d, J = 8.8 Hz, 1H, CH), 6.65 (br., s, 2H, NH$_2$), 7.16 (d, J = 7.6 Hz, 1H, ArH), 7.49 (t, J = 7.6 Hz, 1H, ArH), 7.63 (t, J = 7.6 Hz, 1H, ArH), 7.93 (d, J = 8.0 Hz, 1H, ArH), 10.33 (s, 1H, NH), 10.67 (s, 1H, NH).

2-Amino-5-(4-methylphenyl)-5,6-dihydro-pyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4f). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3315, 3157, 1698, 1653, 1636, 1600, 1559, 1540, 1487, 1457, 1395, 1362, 1309, 1264, 948, 904, 835, 809 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.23 (s, 3H, CH$_3$), 2.45 (d, J = 16 Hz, 1H, CH), 2.93 (dd, J_1 = 7.6 Hz, J_2 = 16 Hz, 1H, CH), 4.07 (d, J = 7.6 Hz, 1H, CH), 6.55 (br., s, 2H, NH$_2$), 7.02 (d, J = 8.0 Hz, 2H, ArH), 7.15 (d, J = 8.0 Hz, 2H, ArH), 10.10 (s, 1H, NH), 10.60 (s, 1H, NH).

2-Amino-5-(3-nitrophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4g). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3450, 3317, 3163, 1691, 1652, 1588, 1530, 1470, 1405, 1353, 1301, 1266, 1020, 977, 929, 894, 826, 807, 790, 737 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.57 (d, J = 16.4 Hz, 1H, CH), 3.05 (dd, J_1 =8.0 Hz, J_2 = 16.4 Hz, 1H, CH), 4.30 (d, J = 8.0 Hz, 1H, CH), 6.66 (br, s, 2H, NH$_2$), 7.58∼7.67 (m, 2H, ArH), 8.01 (s, 1H, ArH), 8.06–8.11 (m,1H, ArH), 10.28 (s, 1H, NH), 10.71 (s, 1H, NH).

2-Amino-5-(3-chlorophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4h). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300 °C); IR (potassium bromide): 3325, 3169, 1683, 1652, 1585, 1539, 1477, 1391, 1264, 1212, 953, 907, 840, 786, 781 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.49 (d, J = 16 Hz, 1H, CH), 2.97(dd, J_1 = 7.6 Hz, J_2 = 16 Hz, 1H, CH), 4.14(d, J = 7.6 Hz, 1H, CH), 6.62 (br., s, 2H, NH$_2$), 7.12 (d, J = 7.6 Hz, 1H, ArH), 7.17 (s, 1H, ArH), 7.25–7.34 (m, 2H, ArH), 10.17 (s, 1H, NH), 10.67 (s, 1H, NH).

2-Amino-5-(2-chlorophenyl)-5,6-dihydropyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4i). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3327, 3174, 1703, 1670, 1621, 1540, 1487, 1440, 1395, 1359, 1325, 1098, 1048, 1035, 1005, 975, 909, 813, 753 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.37 (d, J = 16.4 Hz, 1H, CH), 3.04 (dd, J_1 = 8.4 Hz, J_2 = 16.4 Hz, 1H, CH), 4.46 (d, J = 8.4 Hz, 1H, CH), 6.61 (br, s, 2H, NH$_2$), 6.89–6.93 (m, 1H, ArH), 7.21–7.28 (m, 2H, ArH), 7.45–7.49 (m, 1H, ArH), 10.20 (s, 1H, NH), 10.68 (s, 1H, NH).

2-Amino-5-(benzo[d][1,3]dioxol-6-yl)-5,6-dihydropyrido [2,3-*d*]pyrimidine-4,7-(3*H*,8*H*)-dione (4j). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3467, 3320, 3164, 1694, 1639, 1591, 1540, 1502, 1486, 1438, 1405, 1356, 1311, 1242, 1212, 1121, 967, 934, 811, 807, 790 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.45 (d, J = 16 Hz, 1H, CH), 2.91 (dd, J_1 = 7.6 Hz, J_2 = 16 Hz, 1H, CH), 4.05 (d, J = 7.6 Hz, 1H, CH), 5.95 (s, 2H, OCH$_2$O), 6.50–6.62 (m, 3H, NH$_2$+ArH), 6.73 (s, 1H, ArH), 6.79 (d, J = 8.0 Hz, 1H, ArH), 10.12 (s, 1H, NH), 10.62 (s, 1H, NH).

2-Amino-5,6-dihydro-5-(4-nitrophenyl)pyrido[2,3-*d*]pyrimidine-4,7(3*H*,8*H*)-dione (4k). This compound was obtained as solid with mp > 300°C (Lit. [24] > 300°C); IR (potassium bromide): 3360, 3308, 3186, 1693, 1675, 1588, 1513, 1482, 1412, 1347, 1305, 1262, 1180, 1058, 1022, 966, 905, 826, 791, 701 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.53 (d, J = 16.4 Hz, 1H, CH), 3.06 (dd, J_1 = 8.0 Hz, J_2 = 16.4 Hz, 1H, CH), 4.27 (d, J = 8.0 Hz, 1H, CH), 6.64 (br., s, 2H, NH$_2$), 7.44 (d, J = 8.4 Hz, 2H, ArH), 8.16 (d, J = 8.4 Hz, 2H, ArH), 10.27 (s, 1H, NH), 10.70 (s, 1H, NH).

A series of 4-aryl-3-methyl-1-phenyl-7*H*-furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-ones were synthesized *via* the three-component reaction of an aldehyde, 5-amino-3-methyl-1-phenyl-1*H*-pyrazole and tetronic acid in aqueous media in the presence of triethylbenzylammonium chloride (TEBAC). This method has the advantages of easier work-up, mild reaction conditions, high yields, and an environmentally benign procedure.

J. Heterocyclic Chem., **46**, 1335 (2009).

INTRODUCTION

The need to reduce the amount of toxic waste and byproducts arising from chemical processes requires increasing emphasis on the use of less toxic and environmentally compatible materials in the design of new synthetic methods [1]. One of the most promising approaches uses water as the reaction medium [2]. Breslow [3], who showed that hydrophobic effects could strongly enhance the rate of several organic reactions, rediscovered the use of water as a solvent in organic reactions in 1980s. In recent years, there has been increasing recognition that water is an attractive medium for many organic reactions [4]. The aqueous medium with respect to organic solvent is less expensive, less dangerous, and environment-friendly. Many important types of heterocyclic compounds, such as triazines, acridines, quinolines, pyridines, indoles, pyrazines, furans, and pyrimidines [5], have been synthesized in aqueous media. The synthesis of new and important type of heterocyclic compounds in water continues to attract wide attention among synthetic chemists.

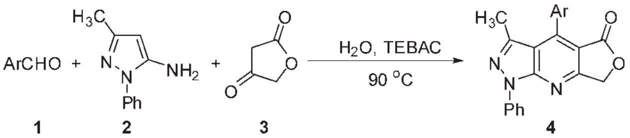
Pyrazole derivatives have been reported in the literature to be versatile building blocks for the synthesis of a wide range of the heterocyclic motifs, such as pyrazolopyridines [6], pyrazolequinolines [7], and pyrazolopyrazoles [8]. The pyrazolo[3,4-*b*]pyridine system has interesting biological and pharmacological properties [9]. Furopyridines is one of the ''privileged medical scaffolds,'' which are used for the development of pharmaceutical agents of various applications. Compounds with this motif show a wide range of pharmacological activities [10] and used as calcium influx promoters, HIV-1 non-nucleoside reverse transcriptase inhibitors and acetylcholinesterase inhibitors [11]. As part of our current studies on the development of new routes to heterocyclic systems in aqueous media [12], we now report an efficient and clean synthetic route to furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-one derivatives (**4**) via the three-component reaction of arylaldehyde **1**, 5-amino-3-methyl-1-phenyl-1*H*-pyrazole **2** and tetronic acid **3** in aqueous media (Scheme 1).

RESULTS AND DISCUSSION

Choosing an appropriate solvent is of crucial importance for the successful organic synthesis. To search for the optimal solvent, the three-component reaction of 3,4-dimethoxybenzaldehyde **1a**, 5-amino-3-methyl-1-phenyl-1*H*-pyrazole **2** and tetronic acid **3** was examined using water, acetonitrile, acetone, ethanol, DMF and 1,2-dichloroethane as solvent, respectively, at different temperature for the synthesis of **4a**. The results are summarized in Table 1.

It can be seen from the Table 1 that the reactions using water as the solvent resulted in higher yields and shorter reaction times than those using organic solvents. On the basis of the obtained results, H_2O/TEBAC was found to be superior in terms of yield. Under these optimized reaction conditions, a series of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-one derivatives **4** were synthesized. The products

Scheme 1



were different from those in ethanol in the presences of *L*-proline [13]. The results are summarized in Table 2.

Apart from the mild conditions of the process and its excellent results, the simplicity of product isolation and the possibility to recycle the reaction solution offer a significant advantage. Because TEBAC is soluble in water and the desired product is less soluble in water, the products can be directly separated by cooling to room temperature and filtering after the reaction is completed. The remaining reaction solution can be recycled. Studies using **1a**, **2**, and **3** as model substrates showed that the recovered reaction solution could be successively recycled in subsequent reaction without any decrease of yield (Table 3).

All the products **4** were characterized by mp, IR, and ^{1}H NMR spectra as well as HRMS.

Although the detailed mechanism of the aforementioned reaction remains to be fully clarified the formation of furo[3,4-*4*]pyrazolo[3,4-*b*]pyridine-5-ones **4** could be explained by a reaction sequence presented in Scheme 2. We proposed that the reaction proceeded via a reaction sequence of condensation, addition, cyclization, dehydration, and aromatization. First, the condensation of aldehyde **1** and tetronic acid **3** gave the intermediate product **5**. The addition of **2** to **5** then furnished the intermediate product **7**, which upon intramolecular cyclization and dehydration gave rise to **9**. In the last step, the intermediate product **9** aromatized to product **4**.

In conclusion, we have developed a simple and clean three-component reaction of an aldehyde, 5-amino-3-methyl-1-phenyl-1*H*-pyrazole and tetronic acid for the synthesis of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-one derivatives in the presence of TEBAC in aqueous media. This method has the advantages of good yields, convenient procedure and environmentally friendly reaction conditions.

[a] In all entries 90°C temperature was used.

EXPERIMENTAL

Melting points are uncorrected. Infrared spectra were recorded on a Tensor 27 spectrometer in KBr with absorption in cm^{-1}. ^{1}H NMR spectra were recorded on a Bruker DPX 400-MHz spectrometer as DMSO-d_6 solution, *J* values are in Hz. Chemical shifts are expressed in δ downfield from internal tetramethylsilane. HRMS were obtained using TOF-MS or Bruker-micro TOF-Q-MS instrument.

General procedure for the synthesis of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-one derivatives 4 in aqueous media. Aldehyde **1** (2 mmol), 5-amino-3-methyl-1-phenyl-1*H*-pyrazole **2** (2 mmol), tetronic acid **3** (2 mmol) and TEBAC (0.1 g) were added to a 50-mL round-bottom flask containing 10 mL water. The mixture was then stirred at 90°C for given times. After completion of the reaction, the reaction mixture was cooled to room temperature. The precipitate was collected by suction and purified by recrystallization from EtOH to give products **4**.

3-Methyl-1-phenyl-4-(3,4-dimethoxyphenyl)-7*H*-furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5-one (4a). This compound was obtained as solid with mp 200–202°C (lit. [14] 203–205°C); IR (potassium bromide): 3059, 3018, 1768, 1590, 1570, 1512, 1460, 1438, 1412, 1355, 1325, 1309, 1259, 1234, 1203, 1174, 1130, 1070, 1045, 1027, 843, 795, 761, 701 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.18 (s, 3H, CH_3), 3.79 (s, 3H, CH_3O), 3.88 (s, 3H, CH_3O), 5.46 (s, 2H, CH_2), 7.13 (d, $J = 7.6$ Hz, 2H, ArH), 7.19 (s, 1H, ArH), 7.40 (t, $J = 7.6$ Hz, 1H, ArH), 7.60 (t, $J = 7.6$ Hz, 2H, ArH), 8.19 (d, $J = 8.0$ Hz, 2H, ArH). A number of substituted tetracyclic 4*H*-[1,4]diazepino[3,2,1-*hi*]pyrido[4,3,2-*cd*]indole and tricyclic 1*H*-[1,4]diazepino[2,3-*g*] or [2,3-*h*]quinoline derivatives were prepared from 7- (or 8, or 9)amino-1,5-benzodiazepin-2-ones by the Doebner–von Miller quinoline synthesis. The structure of the cyclized products depends on the position of the primary amino group and on the substituents of the diazepine ring of the starting compounds. The regiochemical outcome of the reaction was estimated by calculating average local ionization energies on the molecular surface at the Density Functional Theory (DFT) level of theory.

J. Heterocyclic Chem., **46**, 1339 (2009).

INTRODUCTION

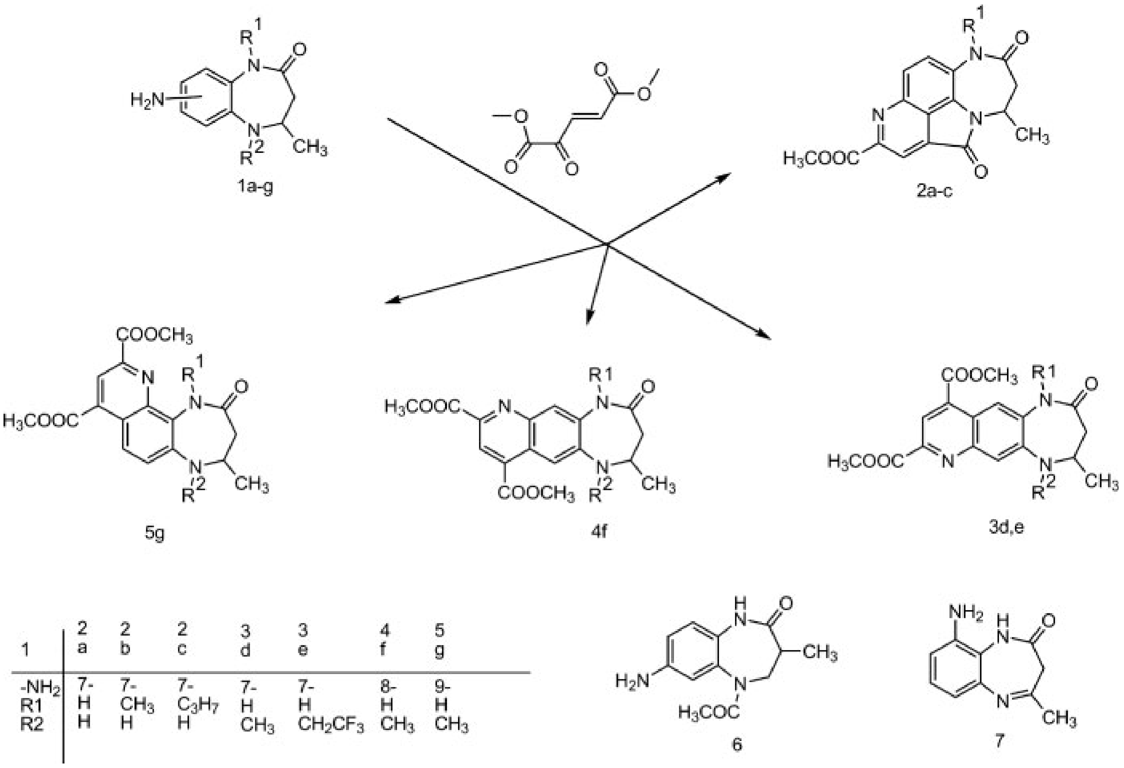
Benzodiazepines and their polycyclic derivatives are known as medically active synthetic substances [1]. Quinoline ring system derivatives are important as antimalarial agents. In addition, quinolines are present as structural subunits of naturally occurring products, such as quinonoid alcohol dehydrogenase coenzyme [2,3]. Numerous papers have described the synthesis of polycyclic 1,5-benzodiazepine derivatives with a pyridine ring annelated to the heptatomic diazepine nucleus [4]. It is known that some of such derivatives exhibit widespread biological activities. As a continuation of our interest in polycyclic 1,5-benzodiazepines we investigated the combination of the diazepine and quinoline heterocycles in the common polyheterocyclic system where the pyridine ring is annelated to the aromatic ring of bicyclic benzodiazepine.

The classical Skraup-Doebner-von Miller synthesis is among the most general approaches to the quinoline ring system [2,3]. The key substrates for this condensation reaction are aromatic amines and α,β-unsaturated ketones [2]. In this article, we report our results on the preparation of tetracyclic diazepinopyridoindoles and tricyclic diazepinoquinolines.

RESULTS AND DISCUSSION

In this study, 7-(or 8, or 9)amino-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-ones **1a–g** were used as starting amine components to prepare annelated derivatives

Scheme 1



1	2 a	2 b	2 c	3 d	3 e	4 f	5 g
-NH$_2$	7-	7-	7-	7-	7-	8-	9-
R1	H	CH$_3$	C$_3$H$_7$	H	H	H	H
R2	H	H	H	CH$_3$	CH$_2$CF$_3$	CH$_3$	CH$_3$

(Scheme 1). Cyclocondensation was accomplished by the reaction of amines with dimethyl-2-oxoglutaconate [5] (modified Doebner-von Miller sequence) in a single step. Thus, the treatment of amines **1a–g** with 1.5 equiv of dimethyl-2-oxoglutaconate in dichloromethane at room temperature for 24 h and then for additional 24 h after the addition of 3*M* hydrogen chloride solution in glacial acetic acid gave cyclic derivatives **2a–c, 3d,e, 4f,** and **5g**. The yields of compounds ranged from poor to moderate (16–51%).

For the application of this cyclization methodology, first we employed amines **1a–c,** which did not possess an alkyl group on the N_5 atom of the heterocyclic diazepine ring. The reaction of **1a–c** with dimethyl-2-oxoglutaconate afforded tetracyclic tetrahydro-4*H*-[1,4]diazepino[3,2,1-*hi*]pyrido[4,3,2-*cd*]indole derivatives **2a–c**. During the first stage of this reaction, the amino group added to the carbon atom of unsaturated ketone at β-position with respect to the ketonic function and cyclization occurred to give the cyclized piperidinol [3]. The addition of the acid catalyst effected the dehydration and aromatization of the latter together with intramolecular acylation of the diazepine ring N_5 atom by the cyclic ester group and an indole ring was formed [6]. The pyridine ring closure in 7-aminoderivatives **1a–c** took place at the 6-position of the benzodiazepine moiety.

When 7-amino-5-alkylsubstituted benzodiazepinones **1d,e** were treated with oxoglutaconate, the cyclocondensation proceeded at the 8-position of the bicyclic heterocycle and linear tricyclic diazepinoquinolines **3d,e** were obtained. The TLC analysis did not indicate the formation of isomeric products. On the other hand, the reaction of amine **6** with oxoglutaconate under parallel reaction conditions did not take place, and about 30% of the starting N_5-acetylsubstituted amine **6** was recovered.

Analogically, the cyclocondensation of 8-amino **1f** and 9-aminoderivative **1g** with oxoglutaconate under the same conditions gave linear [1,4]diazepino[2,3-*g*]quinoline **4f** and angular [1,4]diazepino[2,3-*h*]quinoline **5g**, respectively (in low yields). The isolation of the reaction products was rather complicated because the formation of polymeric products of unknown structure was observed. The attempts to prepare a new tricyclic derivative from 9-amino-2,3-dihydro-1,5-benzodiazepin-2-one **7** were not straightforward. In the reaction of **7** with oxoglutaconate, the isolated product was not identified. In the ^{1}H NMR spectrum, the observed signals at 8.79 (pyridine ring), doublets at 8.73 and 7.91 (benzene ring), and singlets at 4.09 and 4.10 ppm (COOCH$_3$ groups) confirmed the presence of the 2,4-substituted quinoline structure fragment (compare with **5g**), but there were no signals dependant on diazepine unit protons. Our early studies showed that in acidic medium the split of the N_5—C_4 bond of dihydro-1,5-benzodiazepinones or their transformation to a five-membered cycle could occur [7].

The synthesis of the starting materials **1a** [8] and **1d,f** [9] was described in our previous studies. Derivatives **1b,c,e,g, 6** and **7** were then easily obtained from the corresponding nitroderivatives **8b,c,e,g,** 5-acetyl-3-methyl-7-nitro-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (**9**) and 2,3-dihydro-4-methyl-9-nitro-1*H*-1,5-benzodiazepin-2-one (**10**) [10] by catalytic hydrogenation. 1,4-Dimethyl-7-nitro-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (**8b**) and 4-methyl-7-nitro-5-(2,2,2-trifluorethyl)-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (**8e**) were prepared according to the procedure described in our previous work [11]. Compound **8c** was synthesized by alkylation of 4-methyl-7-nitro-1,3,4,5,-tetrahydro-2*H*-1,5-benzodiazepin-2-one [12] with 1-bromopropane under phase-transfer catalysis conditions. 4,5-Dimethyl-9-nitroderivative **8g** was prepared by reductive alkylation of dihydronitroderivative **10** with sodium borohydride and formic acid. Compound **9** was synthesized by nitration of 5-acetyl-3-methyl-1,3,4,5-tetrahydro-2H-1,5-benzodiazepin-2-one [13]. The starting aminobenzodiazepinones carrying various alkyl groups at the N_1 and N_5 atoms of the diazepine heterocycle ring were chosen for their acute solubility in organic solvents.

The structures attributed to the compounds described in this article are consistent with the results of elemental analysis, IR, ^{1}H and ^{13}C NMR spectral data. In this connection, the ^{1}H NMR spectra of linear and angular condensed regioisomeric systems are particularly significant. The signals of two benzene ring protons form two doublets or two singlets for compounds **2a–c, 5g** and **3d,e, 4f**, respectively. These assignments are unambiguously confirmed when NOE is observed between amide group (N—H) or methyl group (N—CH_3) protons and the nearest benzene ring proton (16–25% and 11–24%, respectively). Furthermore, we can point out that the ^{1}H NMR spectra of **2a–c** confirm the structure attributed to these tetracyclic systems because no signals for heterocyclic amine (N—H) group and for one of OCH_3 group protons were detected. Moreover, the diazepine CH proton signals were shifted downfield by about 0.9 ppm with respect to those of the starting compounds **1a–c**. It is interesting to note that the vicinal spin-spin coupling constants of seven-membered ring protons for **2a–c** were very low (2.1–2.4 and 5.3–5.4 Hz) in comparison with those of precursors **1b,c** (7.5–7.7 and 5.2 Hz) or 5-acetyl-4-methyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (13.0 Hz) [14]. This observation suggests that the conformation of the seven-membered ring in tetracyclic derivatives **2a–c** is exchanged. ^{13}C NMR spectral data agree with the proposed structures.

The quinoline derivatives are highly colored compounds and ethanolic solutions of **3d,e** and **4f** exhibit deep colors accompanied with fluorescence.

Generally, we have described the synthesis of novel heterocyclic systems from various N_1- and N_5-substituted amino-1,5-benzodiazepinones employing the Doebner-von Miller quinoline synthesis. It is confirmed that the formation of a new pyridine ring takes place at the adjacent position with respect to the primary amine group of the starting compound. However, the regiochemical outcome of cyclization reaction for asymmetrically substituted aromatic amines is unpredictable [3,15]. To get more insight into the nature of the studied cyclization process, the theoretical investigation of the electronic structure of the starting compounds was carried out.

Considering the reaction mechanism of the Doebner-von Miller quinoline synthesis, it was shown [2,3,15] that cyclization reaction involves a stepwise mechanism. The cyclocondensation step is based on the electrophilic addition to the carbon atom of the aromatic ring [2,15]. This step determinates the regiochemical features of the reaction. Hence, our goal was to estimate the most reactive aromatic sites for electrophilic attack. One of the best indicators of electrophilic attraction is provided by local ionization energy map calculations based on molecular electron density surfaces [16–22].

In this study, we computed local ionization energy maps for a series of N_1- and N_5-substituted amino-1,5-benzodiazepinones **1a,b,d,f,g** and **6**. First, a conformational search was performed using Molecular Mechanics Force Field to identify the lowest energy conformer for each structure [23]. The lowest energy conformer structures were further optimized using quantum mechanics at the DFT level of theory with B3LYP functional and 6-31G* basis set [24]. This basis set then was used to calculate the local ionization energy map on three dimension surfaces corresponding to the contour of constant electronic density equal to 0.025 electron/bohr^3 [17,23–25]. The surface of value 0.025 electron/bohr^3 displays the surface that indicates electron density on the π-electron surface of aromatic compounds. The literature [17,25] suggests that this contour gives physically reasonable molecular dimensions and reflects molecular features such as bond formation, electron lone pairs, *etc*.

We present two distinct and typical local ionization energy maps, which are most important for the interpretation of the observed regiochemistry. Figure 1 demonstrates the optimized geometry structures of **1a** and **6** heterocycles and shows the computed local ionization energy maps onto the molecular surfaces of these heterocycles. The dark gray regions on the surface area around the aromatic ring represent localizations on the

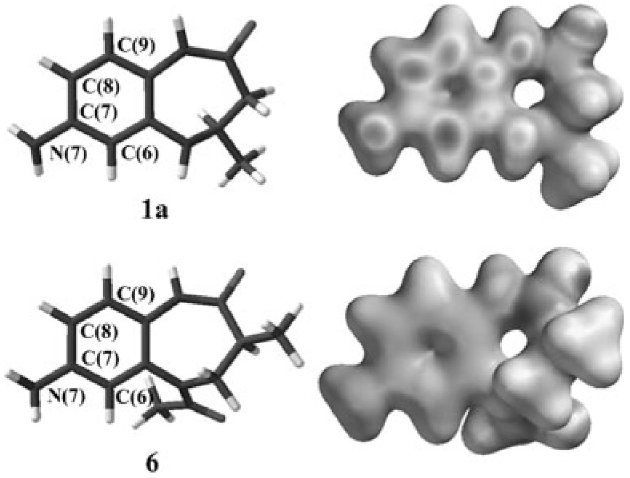


Figure 1. Optimized geometry structures and local ionization energy surface maps on the molecular surfaces defined by the contour of constant electron density equal 0.025 electron/bohr^3 for compounds **1a** and **6**. Color ranges in kcal/mol: from dark gray 259.43 to bright gray 593.62.

molecular surface where electron removal occurs easily (with minimal energy). For **1a** the lowest average localization of local ionization energies are found at adjacent positions with respect to the aromatic primary amino group. The results indicate the affinity to electrophiles at the adjacent positions of the aromatic carbon atoms. Analogical tendencies in localization of the lowest average local ionization energies are observed for heterocycles **1b,d,f,g** (not shown in Fig. 1). Otherwise, the pictured evenly gray molecular surface above the aromatic ring area for **6** shows that the aromatic ring is deactivated toward the electrophilic attack. Experimentally, the reaction of amine **6** with oxoglutaconate does not lead to the cyclized product. These findings reveal the deactivating tendency of the acetyl group in **6** for the pending reaction. In Table 1, the smallest local ionization energy values (I_{min}) and total energy values for optimized geometry structures **1a,b,d,f,g** and **6** are presented. I_{min} values are the points at which the smallest amount of energy is required to remove the electron from the surface and show the most reactive sites toward electrophiles. The lowest average local ionization energy localizations (Fig. 1) for 7-amino substituted **1a** are found on the molecular surface over the aromatic C_6 and C_8 atoms. Furthermore, as shown in Table 1, the I_{min} values for **1a,b** are lower for C_6 position than for C_8. This suggests a higher electrophilic affinity and propensity of ring cyclization at C_6 position. In the experiments with 7-aminoderivatives **1a–c**, the pyridine ring closure is observed at C_6 position. The lowest I_{min} values for 7-amino-5-methylsubstituted **1d** located above the C_8 atom show the C_8-directing ring closure tendency. Accordingly, the experimental cyclocondensation of compound **1d** proceeds at C_8 position. In the case of 7-amino-5-acetylsubstituted derivative **6**, I_{min} values are higher than those for compounds **1a,b,d,f,g**. The calculated I_{min} values for 8-aminosubstituted **1f** show that the lowest value is located above the C_7 carbon atom and is consistent with the tendency of the ring closure at the C_7 position. The same consequence of calculated and experimental results is in accordance with 9-aminoderivative **1g** where I_{min} values are located at C_8 position of the aromatic ring. Thus, in general, the obtained results are in agreement with experimental data.

In conclusion, quantum-chemical calculations show that cyclization reaction behavior is governed by the easiness of electron removal (ionization) from definite π-electron density surface regions of molecules. Local ionization energy maps and I_{min} values are indicative tools for the calculation of the relative activating and deactivating tendencies of the aromatic ring in the studied compounds.

EXPERIMENTAL

Melting points were determined in open capillaries method on a MEL-TEMP 1202D apparatus and are uncorrected. The IR spectra (potassium bromide) were taken on a Perkin Elmer Spectrum GX FTIR spectrometer. The electronic absorption spectra were obtained on Nicolet evoliution 300

Table 1

Calculated total energies (a.u.) of optimized geometries and smallest local ionization energy values I_{min} (kcal/mol) on the molecular surfaces defined by the contour of constant electron density equal 0.025 electron/bohr^3 on carbon atoms of the aromatic ring and the nitrogen atom of the primary amino group for compounds **1a,b,d,f,g** and **6**.

spectrophotometer, and the fluorescence emission spectra were recorded on Hitachi MPF-4 Fluorescence spectrophotometer in ethanol. Except where noted otherwise, ^{1}H (300 MHz) and ^{13}C (75 MHz) NMR spectra were recorded in deuteriochloroform on a Varian Unity Inova 300 spectrometer at 302 K. The chemical shifts are referenced to tetramethylsilane (δ (^{1}H) = 0) and the solvent signal deuteriochloroform (δ (^{13}C) = 77.0 ppm), deuteriodimethylsulfoxide (δ (^{13}C) = 49.5 ppm). The values of chemical shifts are expressed in ppm and coupling constants (*J*) in Hz. The CH$_3$, CH$_2$, CH and C$_{\text{quart}}$ groups in ^{13}C NMR were differentiated by means of the APT method. The reactions were controlled by the TLC method and performed on a Merck precoated silica gel aluminum roll (60F$_{254}$) with chloroform-ethyl acetate-methanol (v/v, 14:7:1) as the eluent and was visualized with UV light. Dry column vacuum chromatography [26] was performed with silica gel Chemapol L 5/40 mesh.

General Procedure for the Synthesis of 2a–c, 3d,e, 4f and 5g. To a stirred solution of the appropriate aminobenzodiazepinone **1a–g** (5.0 mmol) in 100–300 mL of dry dichloromethane, 1.28 g (7.5 mmol) of dimethyl-2-oxoglutaconate was added. The mixture was stirred at room temperature for 24 h. Then 4 mL (12.0 mmol) of 3*M* hydrogen chloride solution in glacial acetic acid was added and the intensively colored mixture was stirred at room temperature for additional 24 h. In some occasions, the precipitate was formed. The mixture was treated with a saturated aqueous sodium hydrogencarbonate solution until the aqueous phase became alkaline (pH 7–8), then the organic phase was washed with water. After drying over magnesium sulfate and the removal of the solvent in vacuum, the dark semisolid residue was subjected to purification. Recrystallization from a proper solvent gave pure compounds **3d** and **3e**. Dark oily residues were subjected to dry column vacuum chromatography (silicagel) using the dichloroethane-ethyl acetate system for gradient elution. Organic fractions with R$_f$ ~ 0.35 were collected and after removal of the solvent gave compounds **2a–c** and fractions collected with R$_f$ ~ 0.50 gave compounds **4f** and **5g**. Pure compounds were obtained by recrystallization from a proper solvent.

Methyl 6-methyl-4,8-dioxo-6,7,8,9-tetrahydro-4*H*-[1,4]diazepino[3,2,1-*hi*]pyrido[4,3,2-*cd*]indole-2-carboxylate (2a). Brightly yellow crystals (chloroform, 30% yield), mp 299–302°C [6]; ^{1}H NMR: δ 1.52 (d, *J* = 6.6 Hz, 3H, CH$_3$), 3.07 (dd, *J* = 2.3, 14.8 Hz, 1H, CH$_2$), 3.18 (ddd, *J* = 1.3, 5.3, 14.8 Hz, 1H, CH$_2$), 4.13 (s, 3H, OCH$_3$), 4.99 (m, 1H, CH), 7.33 (d, *J* = 9.1 Hz, 1H, 10-H), 7.97 (d, *J* = 9.1 Hz, 1H, 11-H), 8.47 (br s, 1H, NH), 8.74 (s, 1H, 3-H); ^{13}C NMR (dimethylsulfoxide-*d$_6$*): δ 19.12 (6-CH$_3$), 42.53 (7-C), 44.06 (6-C), 52.81 (OCH$_3$), 117.82 (3-C), 120.72, 120.98, 123.17, 123.81 (11-C), 127.79 (10-C), 133.31, 141.47, 148.49, 163.08 (CO), 164.92 (CO), 171.04 ppm (8-CO).

Methyl 6,9-dimethyl-4,8-dioxo-6,7,8,9-tetrahydro-4*H*-[1,4]-diazepino[3,2,1-*hi*]pyrido[4,3,2-*cd*]indole-2-carboxylate (2b). Orange crystals (chloroform, 29% yield), mp 231–233°C [6]; ^{1}H NMR: δ 1.49 (d, *J* = 6.7 Hz, 3H, CH$_3$), 3.00 (dd, *J* = 2.1, 14.2 Hz, 1H, CH$_2$), 3.18 (dd, *J* = 5.4, 14.3 Hz, 1H, CH$_2$), 3.59 (s, 3H, 9-OCH$_3$), 4.13 (s, 3H, OCH$_3$), 4.90 (m, 1H, CH), 7.65 (d, *J* = 9.3 Hz, 1H, 10-H), 8.01 (d, *J* = 9.3 Hz, 1H, 11-H), 8.72 (s, 1H, 3-H); ^{13}C NMR: δ 19.29 (6-CH$_3$), 34.31 (9-CH$_3$), 42.60 (C-7), 46.30 (C-6), 53.52 (OCH$_3$), 119.29 (d, *J* = 173.0 Hz, 3-C), 121.57, 124.44, 124.87 (d, *J* = 166.7 Hz, 11-C), 126.83, 127.17 (d, *J* = 160.6 Hz, 10-C), 134.31, 142.31, 150.19, 164.48 (CO), 165.19 (CO), 169.92 ppm (8-CO).

Methyl 6-methyl-4,8-dioxo-9-propyl-6,7,8,9-tetrahydro-4*H*-[1,4]diazepino[3,2,1-*hi*]pyrido[4,3,2-*cd*]indole-2-carboxylate (2c). Orange crystals (mixture of diethyl ether and ethyl acetate, yield 25%), mp 163–165°C; IR: 1725, 1702, 1660 cm^{-1}; ^{1}H NMR: δ 1.00 (t, *J* = 7.4 Hz, 3H, CH$_3$), 1.49 (d, *J* = 6.7 Hz, 3H, CH$_3$), 1.65–1.89 (m, 2H, CH$_2$), 2.99 (dd, *J* = 2.4, 14.0 Hz, 1H, CH$_2$), 3.13 (dd, *J* = 5.4, 13.9 Hz, 1H, CH$_2$), 3.96–4.12 (m, 2H, CH$_2$), 4.13 (s, 3H, OCH$_3$), 4.89 (m, 1H, CH), 7.64 (d, *J* = 9.4 Hz, 1H, 10-H), 8.00 (d, *J* = 9.4 Hz, 1H, 11-H), 8.72 (s, 1H, 3-H); ^{13}C NMR: δ 11.29 (9-CH$_3$), 19.26 (6-CH$_3$), 21.72 (9$''$-CH$_2$), 42.60 (7-C), 46.56 (6-C), 48.34 (9$'$-CH$_2$), 53.56 (OCH$_3$), 119.22 (3-C), 121.90, 123.75, 124.91 (11-C), 127.28 (10-C), 127.38, 134.21, 142.37, 150.04, 164.67 (CO), 165.23 (CO), 169.65 ppm (8-CO). *Anal.* Calcd. for $C_{19}H_{19}N_3O_4$: C, 64.58; H, 5.42; N, 11.89. General procedure for the synthesis of 1b,c,e,g, 6 and 7. In a hydrogenation apparatus, equipped with a magnetic stirrer, the catalyst 10% palladium on carbon (10% of the weight of the starting nitroderivative) was added to a solution of suitable nitrobenzodiazepinone **8b,c,e,g, 9** and **10** (20.0 mmol) in 150–200 mL of methanol and the mixture was hydrogenated at room temperature and atmospheric pressure. After the consumption of 1.34 L (60 mmol) of hydrogen the catalyst was filtered off. The filtrate was concentrated to dryness in vacuum and the resultant solid residue was crystallized from a proper solvent.

7-Amino-1,4-dimethyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (1b). Synthesized from **8b** [11]. Yellowish crystals (ethyl acetate, 77% yield), mp 149–151°C; ^{1}H NMR: δ 1.24 (d, *J* = 6.2 Hz, 3H, CH_3), 2.28 (dd, *J* = 7.7, 12.7 Hz, 1H, 3-CH_2), 2.51 (dd, *J* = 5.2, 12.6 Hz, 1H, 3-CH_2), 3.13 (br s, 1H, NH), 3.28 (s, 3H, 1-CH_3), 3.66 (br s, 2H, NH_2), 4.00 (m, 1H, CH), 6.18 (d, *J* = 2.5 Hz, 1H, 6-H), 6.36 (dd, *J* = 2.5, 8.4 Hz, 1H, 8-H), 6.91 (d, *J* = 8.4 Hz, 1H, 9-H); ^{13}C NMR: δ 23.19 (4-CH_3), 35.45 (1-CH_3), 40.24 (3-C), 56.80 (4-C), 108.31, 109.43, 123.62, 127.90, 140.15, 144.72, 171.37 ppm (CO). *Anal.* Calcd. for $C_{11}H_{15}N_3O$: C, 64.34; H, 7.37; N, 20.47. Found: C, 64.38; H, 7.30; N, 20.66.

7-Amino-4-methyl-1-propyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (1c). Synthesized from **8c**. Beige colored crystals (mixture of methanol and diethyl ether, 71% yield), mp 143-145°C; IR: 3407, 3345, 3330, 3233, 1666–1609 cm^{-1}; ^{1}H NMR: δ 0.84 (t, *J* = 7.4 Hz, 3H, CH_3), 1.23 (d, *J* = 6.2 Hz, 3H, CH_3), 1.50 (m, 2H, CH_2), 2.23 (dd, *J* = 7.5, 12.6 Hz, 1H, 3-CH_2), 2.48 (dd, *J* = 5.2, 12.6 Hz, 1H, 3-CH_2), 3.05 (br s, 1H, NH), 3.64 (br s, 2H, NH_2), 3.73 (m, 2H, CH_2), 3.98 (m, 1H, CH), 6.18 (d, *J* = 2.5 Hz, 1H, 6-H), 6.35 (dd, *J* = 2.5, 8.4 Hz, 1H, 8-H), 6.93 (d, *J* = 8.4 Hz, 1H, 9-H); ^{13}C NMR: δ 11.22 (CH_3), 21.13 (CH_2), 23.11 (4-CH_3), 40.38 (3-C), 49.26 (CH_2), 56.89 (4-C), 108.52, 109.51, 124.08, 126.60, 141.20, 144.74, 171.20 ppm (CO). *Anal.* Calcd. for $C_{13}H_{19}N_3O$: C, 66.92; H, 8.21; N, 18.01. Found: C, 67.23; H, 8.32; N, 17.89.

7-Amino-4-methyl-5(2,2,2-trifluoroethyl)-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (1e). Synthesized from **8e** [11]. Yellowish crystals (mixture of diethyl ether and hexane, 95% yield), mp 156–158°C; IR: 3454, 3371, 3174, 1677 cm^{-1}; ^{1}H NMR: δ 1.08 (d, *J* = 6.1 Hz, 3H, CH_3), 2.22–2.40 (m, 2H, CH_2), 3.3–3.7 (br s, 2H, NH_2), 3.53 (dq, *J* = 8.9, 15.4 Hz, 1H, 5-CH_2), 3.83 (dq, *J* = 8.6, 15.4 Hz, 1H, 5-CH_2), 4.02 (m, 1H, CH), 6.42–6.46 (m, 2H, 6-H, 8-H), 6.81 (m, 1H, 9-H), 7.83 (br s, 1H, NH); ^{13}C NMR: δ 17.05 (4-CH_3), 41.07 (3-C), 52.80 (q, *J* = 32.4 Hz, 5-CH_2), 61.37 (4-C), 111.82, 112.00, 123.68, 124.49, 126.69, 140.05, 144.93, 173.44 ppm (CO). *Anal.* Calcd. for $C_{12}H_{14}F_3N_3O$: C, 52.75; H, 5.16; N, 15.38. 9-Amino-4,5-dimethyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (1g). Synthesized from **8g**. Cream crystals (methanol, 70% yield), mp 213–215°C; IR: 3453, 3367, 3198, 1678 cm^{-1}; ^{1}H NMR: δ 1.09 (d, *J* = 6.1 Hz, 3H, CH_3), 2.24 (dd, *J* = 10.0, 12.6 Hz, 1H, CH_2), 2.42 (ddd, *J* = 1.2, 5.4, 12.6 Hz, 1H, CH_2), 2.77 (s, 3H, CH_3), 3.86 (m, 1H, CH), 3.95 (br s, 2H, NH_2), 6.45–6.51 (m, 2H, 6-H, 8-H), 6.98 (dd, *J* = 8.0, 8.0 Hz, 1H, 7-H), 8.34 (br s, 1H, NH); ^{13}C NMR: δ 15.78 (4-CH_3), 38.65 (5-CH_3), 41.52 (3-C), 62.83 (4-C), 110.53, 111.84, 119.72, 126.29, 139.59, 142.66, 174.76 ppm (CO). *Anal.* Calcd. for $C_{11}H_{15}N_3O$: C, 64.34; H, 7.37; N, 20.47. Found: C, 64.47; H, 7.29; N, 20.59.

5-Acetyl-7-amino-3-methyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (6). Synthesized from **9**. Yellow crystals (acetonitrile, 89% yield), mp 191–193°C; IR: 3438, 3348, 3233, 1673, 1653 cm^{-1}; ^{1}H NMR: δ 1.11 (d, *J* = 6.7 Hz, 3H, CH_3), 1.86 (br s, 3H, CH_3), 2.75 (m, 1H, CH), 3.46 (dd, *J* = 6.9, 13.5 Hz, 1H, CH_2), 3.83 (br s, 2H, NH_2), 4.56 (dd, *J* = 12.3, 13.1 Hz, 1H, CH_2), 6.51 (d, *J* = 2.5 Hz, 1H, 6-H), 6.67 (dd, *J* = 2.5, 8.4 Hz, 1H, 8-H), 6.94 (d, *J* = 8.5 Hz, 1H, 9-H), 7.90 (br s, 1H, NH); ^{13}C NMR: δ 12.51 (4-CH_3), 22.66 (5-CH_3), 34.88(3-C), 54.74 (4-C), 115.06, 115.39, 124.35, 126.05, 135.66, 145.29, 170.38, 175.20 ppm. *Anal.* Calcd. for $C_{12}H_{15}N_3O_2$: C, 61.79; H, 6.48; N, 18.01. Found: C, 61.62; H, 6.41; N, 18.13.

9-Amino-2,3-dihydro-1*H*-1,5-benzodiazepin-2-one (7). Synthesized from 10 [10] Yellowish crystals (methanol, 90% yield), mp 170–172°C; ^{1}H NMR: δ 2.39 (s, 3H, CH_3), 3.16 (s, 2H, CH_2), 3.81 (br s, 2H, NH_2), 6.66 (dd, *J* = 1.4, 7.8 Hz, 1H, 8-H or 6-H), 6.83 (dd, *J* = 1.3, 8.1 Hz, 1H, 6-H or 8-H), 7.05 (t, *J* = 7.9 Hz, 1H, 7-H), 8.00 (m, 1H, NH); ^{13}C NMR: δ 28.00, 43.80, 113.38, 117.81, 125.54, 138.41, 141.09, 163.09, 166.45 ppm. *Anal.* Calcd. for $C_{10}H_{11}N_3O$: C, 63.48; H, 5.86; N, 22.21. Found: C, 63.57; H, 5.79; N, 22.37.

4-Methyl-7-nitro-1-propyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (8c). To a solution of 2.2 g (10.0 mmol) of 4-methyl-7-nitro-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one [12] in 150 mL of benzene, 0.5 g (1.50 mmol) of tetrabutylammonium bromide, 15 mL 50% aqueous sodium hydroxide and 1.8 mL (20.0 mmol) of 1-bromopropane were added. The reaction was performed according to the procedure method A previously described by us [11]. The working-up of the reaction mixture gave 1.6 g (61%) of **8c**. Yellowish crystals (ethyl acetate), mp 116–118°C; IR: 3296, 1651, 1517, 1344 cm^{-1}; ^{1}H NMR: δ 0.85 (t, *J* = 7.4 Hz, 3H, CH_3), 1.32 (d, *J* = 6.3 Hz, 3H, CH_3), 1.54 (m, 2H, CH_2), 2.28 (dd, *J* = 7.4, 12.9 Hz, 1H, 3-CH_2), 2.57 (dd, *J* = 5.2, 12.9 Hz, 1H, 3-CH_2), 3.55 (br s, 1H, NH), 3.86 (m, 2H, CH_2), 4.12 (m, 1H, CH), 7.29 (d, *J* = 8.8 Hz, 1H, 9-H), 7.76 (d, *J* = 2.6 Hz, 1H, 6-H), 7.89 (dd, *J* = 2.5, 8.8 Hz, 1H, 8-H); ^{13}C NMR: δ 11.08 (CH_3), 21.13(CH_2), 23.01(4-CH_3), 40.29 (3-C), 49.67 (CH_2), 57.32 (4-C), 117.23, 117.84, 123.27, 140.29, 140.78, 145.10, 170.57 ppm (CO). *Anal.* Calcd. for $C_{13}H_{17}N_3O_3$: C, 59.30; H, 6.51; N, 15.96. Found: C, 59.61; H, 6.63; N, 16.12.

4,5-Dimethyl-9-nitro-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (8g). To a solution of 2.2 g (10.0 mmol) of dihydro-9-nitroderivative **10** [10] in 50 mL of formic acid, 3.25 g

(70.0 mmol) of sodium borohydride was added. The reaction was performed following the procedure previously described by us [11]. The working-up of the reaction mixture gave 1.3 g (57%) of **8g**. Yellow crystals (ethyl acetate), mp 184–186°C; IR: 3192, 3122, 1686, 1636, 1529, 1345 cm^{-1}; ^1H NMR: δ 1.19 (d, J = 6.1 Hz, 3H, CH_3), 2.25 (dd, J = 9.8, 13.0 Hz, 1H, CH_2), 2.55 (ddd, J = 1.4, 5.7, 13.0 Hz, 1H, CH_2), 2.88 (s, 3H, 5-CH_3), 3.95 (m, 1H, CH), 7.24 (dd, J = 8.1, 8.1 Hz, 1H, 7-H), 7.37 (dd, J = 1.4, 8.1 Hz, 1H, 6-H), 7.77 (dd, J = 1.5, 8.2 Hz, 1H, 8-H), 8.80 (br s, 1H, NH); ^{13}C NMR: δ 15.93 (4-CH_3), 39.41 (5-CH_3), 41.37 (3-C), 62.77 (4-C), 119.42, 124.36, 127.95, 130.04, 140.28, 143.11, 171.89 ppm (CO). *Anal.* Calcd. for $C_{11}H_{13}N_3O_3$: C, 56.16; H, 5.57; N, 17.86. Found: C, 56.35; H, 5.65; N, 17.71.

5-Acetyl-3-methyl-7-nitro-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one (9). A solution of 2.2 g (10.0 mmol) of 5-acetyl-3-methyl-1,3,4,5-tetrahydro-2*H*-1,5-benzodiazepin-2-one [13] in 30 mL of conc. sulfuric acid, and a solution of 2.2 g (20.0 mmol) of potassium nitrate in 25 mL of conc. sulfuric acid were precooled to −18°C and were combined. The reaction mixture was kept at −18°C for 1 h, then at 4°C for 5 h and at room temperature for 24 h. After that the reaction mixture was poured on ice and extracted with ethyl acetate (3 × 70 mL). The organic phase was washed successively with water and a saturated aqueous sodium hydrogencarbonate solution (3 × 40 mL), dried over magnesium sulfate and concentrated in vacuum to dryness. Recrystallization of the solid residue from ethyl acetate gave 1.3 g (50%) of yellowish crystals of **9**, mp 212–214°C; IR: 3208, 3156, 1697, 1650, 1523, 1347 cm^{-1}; ^1H NMR: δ 1.22 (br d, 3H, CH_3), 1.88 (br s, 3H, CH_3), 2.82 (br m, 1H, CH), 3.63 (br m, 1H, CH_2), 4.67 (br m, 1H, CH_2), 7.34 (d, J = 8.7 Hz, 1H, 9-H), 8.17 (br d, 1H, 6-H), 8.29 (br dd, 1H, 9-H), 9.05 ppm (br s, 1H, NH). *Anal.* Calcd. for $C_{12}H_{13}N_3O_4$: C, 54.75; H, 4.98; N, 15.96. Found: C, 54.93; H, 4.79; N, 16.17.

Acknowledgments. The calculations of this study was supported by the European Commission, project BalticGrid-II (GA No. 223807), and the Lithuanian Ministry of Education and Science, LitGrid programme (SUT-325/LNS-1100000-795).

We report an efficient and new method of synthesis of 2-amino-5,6-dihydro-5,7-diarylquinazolin-4-ols by the reaction of substituted cyclohexenones with guanidine hydrochloride in presence of NaOEt. The reactions are with 50–72% yield. All the synthesized compounds are characterized using IR, NMR and CHN analysis.

J. Heterocyclic Chem., **46**, 1346 (2009).

INTRODUCTION

Quinazoline skeleton is an important pharmacophore that occurs frequently in medicinal chemistry literature [1]. Quinazolines are recently been the subject of deep investigation due to their diverse pharmacological properties such as analgesic, narcotic, antimalarial, sedative, hypoglycemic [2], anti-cancer [3] and anti-tubercular activities[4]. It has been reported that quinazolines act as potent [5] and highly selective inhibitors of epidermal growth factor receptor tyrosine kinase and have been employed as DNA binder [6]. Alkaloids with quinazoline ring system are known for natural compounds having a wide spectrum of biological effects. The biological activity of quinazolines strongly depends on the nature and the position of the substituents in the quinazoline ring. The 2-amino substituted quinazolines are reported as potential histamine antagonists [7]. This large interest in medicinal chemistry stimulated the development of new and more efficient synthesis of amino substituted heterocycles recently we have reported the synthesis and antibacterial activity of naphthyl and thienyl substituted 2-aminopyrimidines [8]. In continuation of synthesis of the biologically active heterocyclic compounds here we report a simple synthesis for 2-amino-5,6-dihydro-5,7-diarylquinazolin-4-ols.

RESULTS AND DISCUSSION

Quinazolin-4-ols are synthesized in three steps (Scheme 1) starting from easily available acetophenone and benzaldehyde. Initialy, chalcones **1** were synthesized by Claisen-Schmidt condensation between benzaldehyde and acetophenone.

The chalcones on treatment with ethyl acetoacetate in the presence of sodium ethoxide gave carbethoxycyclohex-2-en-one derivatives **2.** The structure of the carbethoxycyclohex-2-en-one derivatives were conformed by comparing with their reported IR and melting points.

Carbethoxycyclohex-2-en-one derivatives **2** on treatment with guanidine hydrochloride in the presence of sodium ethoxide under go condensation reaction and gave 2-amino-5,6-dihydro-5,7-diarylquinazolin-4-ols (**3a–h**).

The structures of **3a–h** were elucidated by ^{1}H and ^{13}C NMR, mass spectral analysis and elemental analysis. In the ^{1}H NMR spectra, the characteristic chemical shift of the hydroxy protons of **3a–h** were found at $\delta = 10.76$–10.81 ppm as a broad singlet. The two amino protons were observed as a singlet at $\delta = 6.20$–6.42 ppm. The alkenic proton signal was observed at around 6.40 ppm.

To conclude, we have proposed an efficient method for the preparation of 2-amino-5,6-dihydro-5,7-diarylquinazoline-4-ols by reaction of guanidine hydrochloride

with carbethoxycyclohex-2-enone derivatives. These compounds are known pharmacophores in several structure based drug design approaches.

EXPERIMENTAL

Melting points are determined in open capillaries and are uncorrected. The NMR spectra were recorded on 300 MHz spectrometer in DMSO-d_6. Chemical shifts are expressed in parts per million using residual solvent proton and carbon as internal standards. The FT-IR spectra were recorded on NICOLET AVATAR 360-FTIR instrument by using KBr pellets. Elemental analyses were done on Vario EL. CHN elemental analyzer.

Preparation of chalcone (1a–h). About 0.5 g of sodium hydroxide was dissolved in 50 mL of water. A mixture of acetophenone (0.01 mole) and aromatic aldehyde (0.01 mole) in 50 mL of absolute ethanol was added. The mixture was stirred at room temperature for 3 h and allow to stand for overnight. The preceipitated solid was separated, washed with distilled water and recrystallized from hot ethanol. The products were confirmed from their reported IR spectra and melting points.

Ethyl-2-oxo-4,6-diarylcyclohex-2-en-carboxylate (2a-h). A mixture of chalcone (0.01 mole) (**1a-h**) and ethyl acetoacetate (0.01 mole) was dissolved in absolute ethanol (30 mL). Sodium ethoxide (2 g sodium in 60 mL ethanol) was added to the mixture and refluxed for the 5 h. The reaction mixture was kept aside for more than 1 h and the solid mass obtained was collected and recrystallized from ethanol. The products were confirmed from their reported IR spectra and melting points.

2-Amino-5,6-dihydro-5,7-diarylquinazolin-4-ols (3a–h). Appropriate diarylcyclohexenone (**2a–h**, 0.01 mole), guanidine hydrochloride (0.01 mole) and sodium ethoxide (2 g in 30 mL ethanol) were refluxed for 28–32 h. The reaction mixture was cooled to room temperature, poured into crushed ice and stirred. The separated product was purified using column chromatography (silica gel, 100–200 mesh, $CHCl_3$-EtOAc, 6:4). All the compounds were characterized using IR, ^1H and ^{13}C NMR and elemental analysis.

2-Amino-5,6-dihydro-5,7-diphenylquinazolin-4-ol (3a). This compound was obtained as a yellow solid. mp 134–136°C; yield 72.5%; IR (KBr) ν cm^{-1} 3415 (N—H stretching), 2836 (C—H stretching), 1649 (C=C stretching) ^1H NMR (DMSO-d_6, 300 MHz), δ ppm 2.94 (d, 1H, $J = 17.1$ Hz), 3.12–3.22 (m, 1H), 4.21 (d, 1H, $J = 7.5$ Hz), 6.42 (s, NH_2), 6.46 (s, H-8), 7.09–7.49 (Ar-H), 10.76 (s, —OH). ^{13}C NMR (DMSO-d_6, 75 MHz) δ ppm 34.3, 41.7, 110.1, 125.4, 125.9, 126.3, 126.9, 127.3, 127.8, 128.3, 128.5, 128.9, 129.1, 140.1, 145.2, 155.4, 161.5. Calc. for $C_{20}H_{17}N_3O$: C 76.17; H, 5.43; N, 13.32%. Observed were C, 76.12; H, 5.48; N, 13.48%.

2-Amino-5,6-dihydro-5-(4-flurophenyl)-7-phenylquinazolin-4-ol (3b). This compound was obtained as white solid. mp 217–219°C; yield 60.4%; IR (KBr) ν cm^{-1} 3336 (N—H stretching), 2852 (C—H stretching), 1648 (C=C stretching) ^{1}H NMR (DMSO-d_6, 300 MHz) δ ppm 2.92 (d, 1H, J = 17.4 Hz), 3.21–3.11 (m, 1H), 4.21 (d, 1H, J = 8.1 Hz), 6.38 (s, NH$_2$), 6.44 (s, 1H), 7.00–7.50 (Ar-H), 10.76 (s, —OH). ^{13}C NMR (DMSO-d_6, 75 MHz) δ ppm 34.2, C-6 (merged with DMSO), 115.3, 125.3, 125.5,125.9, 127.8, 128.9, 129.0, 129.1, 129.2, 129.3, 130.0, 130.2, 132.0, 132.1, 132.5, 139.5, 143.9, 155.3, 169.7. Calc. for $C_{20}H_{16}N_3O$ C, 72.06; H, 4.84; N, 12.61%; Observed were C, 72.02; H, 4.86; N, 12.59%.

2-Amino-5-(4-chlorophenyl)-5,6-dihydro-7-phenylquinazolin-4-ol (3c). This compound was obtained as white amorphous solid. mp 196–198°C; yield 70.1%; IR (KBr) ν cm^{-1} 3437 (N—H stretching), 2858 (C—H stretching), 1647 (C=C stretching) ^{1}H NMR (DMSO-d_6, 300 MHz) δ ppm 2.93 (d, 1H, J = 17.6 Hz), 3.75–3.14 (m, 1H), 4.29 (d, 1H, J = 8.4 Hz), 6.47 (s, NH$_2$), 6.54 (s. H-8), 7.13–7.51 (Ar-H), 10.78 (s, —OH). ^{13}C NMR (DMSO-d_6, 300 MHz) δ ppm 34.9, 43.1, 113.8, 120.1, 122.8, 125.2, 125.6, 126.4, 128.8, 129.9, 130.4, 130.5, 131.2, 137.2, 140.9, 159.1, 169.1. Dedicated to the memory of Dr. Chaitanya G. Dave.

2-Chloro-4,6-diarylnicotinonitrile **1** was reacted with ethyl 2-mercaptoacetate **2** to furnish ethyl 2-(3-cyano-4,6-diarylpyridin-2-ylthio)acetate **3** as intermediates. These intermediates were cyclized by Thorpe–Zeigler cyclization using solid–liquid phase-transfer catalysis conditions to give ethyl 3-amino-4,6-diarylthieno[2,3-*b*]pyridine-2-carboxylate **4**. One-pot heterocyclization without isolating the intermediates was also achieved using solid–liquid phase transfer conditions.

J. Heterocyclic Chem., **46**, 1349 (2009).

INTRODUCTION

Many thienopyridines have been evaluated pharmacologically and in particular thieno[2,3-*b*]pyridines are of special importance due to the reported biological activities, including antibacterial [1], anti-inflammatory [2], antiparasitic [3], and antidiabetic [4] agents. Moreover, thieno[2,3-*b*]pyridine-5-carbonitrile were synthesizes as kinase inhibitors [5–7], were as thieno[2,3-*b*]pyridin-4-one derivatives were prepared as orally active, nonpeptide luteinizing hormone-releasing hormone (LHRH) receptor antagonists [8].

Despite the recent emergence of the thieno[2,3-*b*]pyridines moiety as a useful pharmacophore, methodology for preparation of this interesting heterocyclic ring system remains severely limited. Traditionally, the alkylation of substituted 3-cyano-2(1*H*)-pyridinethiones [9a–c] or 2-chloro-4,6-diarylnicotinonitrile [10] and Thorpe–Ziegler cyclization of the latter in alkali medium to give 3-aminothieno[2,3-*b*]pyridines have been extensively studied. Hard base like sodium or potassium alkoxide, which are relatively difficult to handle are used in such multistep synthesis.

The Thorpe–Zeigler cyclizations [11] are one of the most promising lines in the chemistry of amino heterocycles. They are base catalyzed and sodium or potassium alkoxide [12a–f], sodium hydride [12g,h], potassium hydroxide [12i], and lithium hydroxide [12j] were used frequently. Radical alternatives [13a], solvent free [13b] strategies as well as iridium hydride complexes [13c] also have been applied to Thorpe–Ziegler cyclizations. However, a little to our surprise, no attempt has been made to use comprehensive strategies for Thorpe–Zeigler cyclization involving phase-transfer conditions. In light of these considerations, we decided to set an improved protocol by introducing phase-transfer catalysis conditions for the Thorpe–Ziegler cyclization.

RESULTS AND DISCUSSION

2-Chloro-4,6-diarylnicotinonitrile **1** was reacted with ethyl 2-mercaptoacetate **2** in powdered KOH at 40–45°C using triethylbenzylammonium chloride (TEBA) as phase transfer catalyst and toluene as solvent to furnish ethyl 2-(3-cyano-4,6-diarylpyridin-2-ylthio)acetate **3** as

[a] Isolated yields.

intermediates (Table 1). The reaction was optimized using different reaction conditions and catalysts, for liquid–liquid phase-transfer conditions CH_2Cl_2/KOH (aq. 40% w/v), the most lipophilic *quats*, the Aliquat, and the tetrabutylammonium cation (TBA) were ineffective phase transfer catalyst were as more hydrophilic cation, TEBA gave poor yields. However in solid–liquid phase-transfer conditions Toluene/powdered KOH TEBA was the preferred choice. These intermediates were cyclized by Thorpe–Zeigler cyclization using 18-crown-6 and potassium hydroxide complex dissolved in acetonitrile, the heterocyclization allowed efficient access to various ethyl 3-amino-4,6-diarylthieno[2,3-*b*]pyridine-2-carboxylate **4** in excellent yields. One-pot heterocyclization without isolating the intermediates **3** was also achieved using solid–liquid phase-transfer catalysis (SL-PTC) conditions (Table 2; Scheme 1).

Given the frequent appearance of thieno[2,3-*b*]pyridine fragments in pharmaceutical compounds, we sought to expand the scope of this potentially useful phase-transfer method and optimize its efficiency. To optimize the synthesis of **4**, different catalysts and reaction conditions were examined. For liquid–liquid phase-transfer conditions CH_2Cl_2/KOH (aq. 40% w/v), lack of reactivity was observed in the presence of catalysts such as tetrabutylammonium iodide (TBAI) and tricaprylmethylammonium chloride (Aliquat® 336) even after prolonged heating (24 h, 40°C). Thus, the most lipophilic *quats*, the Aliquat, and the TBA are ineffective as phase-transfer catalysts. Changing the counter ion in the TBA *quat* [iodide (TBAI) or chloride (TBACl)] was also unsuccessful thus discarding the possibility that the lack of reactivity in the presence of the catalyst could be due to the effect of the iodide counter ion (‘‘catalyst poisoning’’ by association with the quat in the organic phase [14a–d]) the results also showed that swapping anions such as BF_4^-, ClO_4^-, and HSO_4^- have no catalytic activity. On the other hand, smaller and more

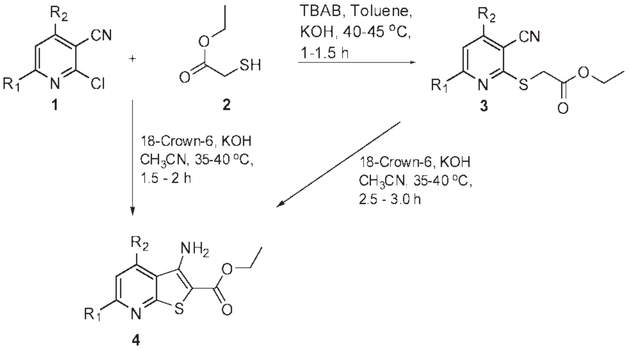
Scheme 1. Synthesis of ethyl 3-amino-4,6-diarylthieno[2,3-*b*]pyridine-2-carboxylate **4**.



hydrophilic cations such as tributylmethylammonium and TEBA were unsuccessful to facilitate the reaction. These results indicate that the structure of the quaternary ammonium cation (*quat*) does not seem to be crucial for the success of the reaction. Catalyst loading, changing the solvent, or change in temperature resulted the same. The heterocyclization in SL-PTC conditions using 18-crown-6, KOH along with acetonitrile as solvent furnished products **4** in excellent yields. One-pot synthesis of thieno[2,3-*b*]pyridine-2-carboxylate **4** without isolation of intermediates **3** from 2-chloro-4,6-diarylnicotinonitrile **1** using same conditions was successful. Solvents like toluene, benzene, chlorobenzene, diethyl ether, methanol, and hexane were used, however, acetonitrile was the best choice for such heterocyclization.

The structure of compound ethyl 3-amino-4-tolyl-6-phenylthieno[2,3-*b*]pyridine-2-carboxylate **4e** was confirmed using X-ray crystallography [15] (Fig. 1).

A plausible mechanism for the Thorpe–Zeigler cyclization is proposed in Figure 2. The initial complex formation between crown ether and potassium hydroxide extracts proton from ethyl 2-(3-cyano-4,6-diarylpyridin-2-ylthio)acetate **3**, resulting into the intermediate, followed by intramolecular nucleophilic addition of —CH— onto an imine that could yield an enamine and also aromatic system for the formation of ethyl 3-amino-4,6-diarylthieno[2,3-*b*]pyridine-2-carboxylate **4**.

CONCLUSIONS

In conclusion, we have described a simple, cleaner, and convenient synthesis of ethyl 3-amino-4,6-diarylthieno[2,3-b]pyridine-2-carboxylate **3**, which are important building blocks for the construction of various fused heterocycles. SL-PTC conditions using 18-crown-6 is the method of choice with excellent yields even for one-pot heterocyclization. The ease with which phase-transfer catalyst reacts, presents new opportunities for expanding Thorpe–Zeigler cyclization for the synthesis of numerous heterocycles.

EXPERIMENTAL

Melting points were determined by electro thermal method in open capillary tube and are uncorrected. The IR spectra were recorded in cm^{-1} for KBr pellets on a Buck-500 spectrophotometer. The ^{1}H NMR spectra were recorded on a Varian 300 MHz spectrophotometer in DMSO-d_6 using TMS as internal standard and the chemical shifts are expressed in δ ppm. MS spectra were recorded on a JEOL/ SX-102 mass spectrophotometer under electron-impact (EI) ionization. Elemental analyses were performed on a Carlo Erba 1108 microanalyzer or Elementar's Vario EL III microanalyzer. The completion of the reaction was checked by TLC using silica gel G and spots were exposed to iodine vapor. 2-Chloro-4,6-diarylnicotinonitrile **1** were synthesized by refluxing 2-oxo-4,6-diaryl-1,2-dihydropyridine-3-carbonitrile [16] in phosphoryl trichloride.

General procedure for the synthesis of ethyl 2-(3-cyano-4,6-diarylpyridin-2-ylthio)acetate (3a-k). To a well stirred mixture of powdered potassium hydroxide (0.7 g, 12.5 mmol), triethylbenzylammoniumchloride (0.113 g, 0.5 mmol) and 2-chloro-4,6-diarylnicotinonitrile **1** (5 mmol) in toluene (25 mL), was added drop wise ethyl 2-mercaptoacetate **2** (6 mmol). The reaction mixture was heated up to 40–45°C. After the completion of reaction 1–1.5 h (TLC), water (25 mL) was added to the reaction mixture and stirring was continued for 5 min. Organic layer was separated and aqueous layer was washed with toluene (15 mL). The combined organic layer was dried over anhydrous magnesium sulfate, the solvent was removed *in vacuo*, and the solid **3a–k** thus obtained was crystallized from EtOH-DMF mixture.

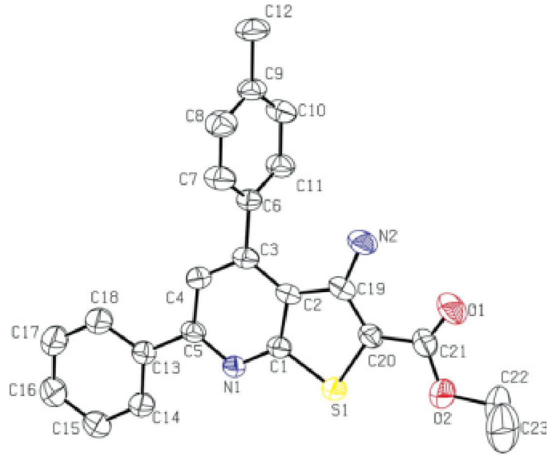

Figure 1. Ethyl 2-amino-6-phenyl-4-p-tolylthieno[2,3-*b*]pyridine-3-carboxylate [15] (**4e**). [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

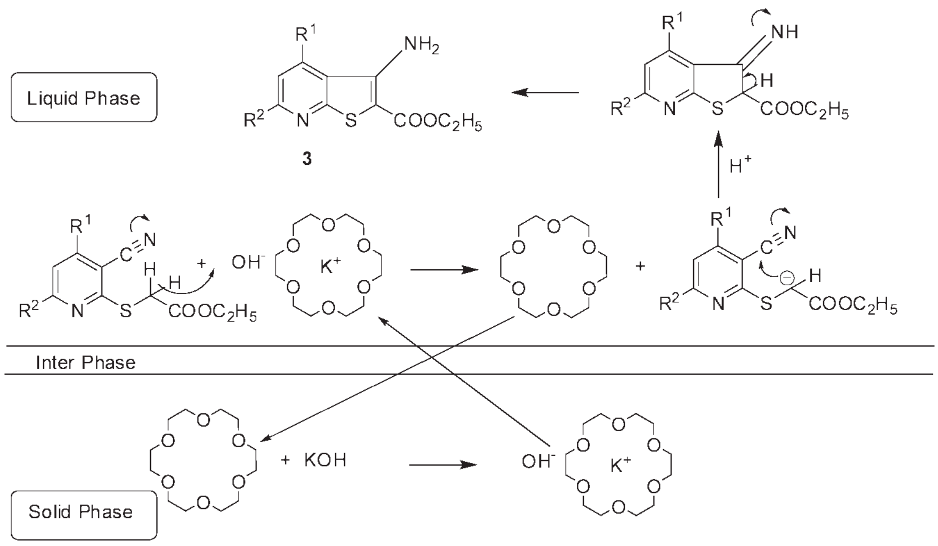

Figure 2. A plausible mechanism for the Thorpe–Zeigler cyclization in solid–liquid phase-transfer catalysis conditions.

7.2 Hz, 3H, —CH_2CH_3), 3.98 (s, 3H, OCH_3), 4.25 (s, 2H, —CH_2) 4.52 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.12–8.15 (m, 10H, Ar—H); MS: m/z = 404 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_3S$ (404.48): C, 68.30; H, 4.98; N, 6.93; Found: C, 68.35; H, 5.12; N, 7.06%.

Ethyl 2-(3-cyano-4-(4-fluorophenyl)-6-phenylpyridin-2-ylthio)acetate (3c). IR (KBr): ν = 3004, 2980, 2216, 1758, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.32 (t, 3H, J = 7.2 Hz, —CH_2CH_3), 4.35 (s, 2H, —CH_2), 4.60 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.50–8.31 (m, 10H, Ar—H); MS: m/z = 392 (M^+). *Anal.* Calcd for $C_{22}H_{17}FN_2O_2S$ (392.45): C, 67.33; H, 4.37; N, 7.14; Found: C, 67.44; H, 4.26; N, 7.26%.

Ethyl 2-(4-(3-chloro-4-fluorophenyl)-3-cyano-6-phenylpyridin-2-ylthio)acetate (3d). IR (KBr): ν = 3020, 2940, 2224, 17408, 1580 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.38 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.32 (s, 2H, —CH_2), 4.59 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.45–8.60 (m, 9H, Ar—H); MS: m/z = 426 (M^+). *Anal.* Calcd for $C_{22}H_{16}ClFN_2O_2S$ (426.89): C, 61.90; H, 3.78; N, 6.56; Found: C, 61.83; H, 3.66; N, 6.60%.

Ethyl 2-(3-cyano-6-phenyl-4-p-tolylpyridin-2-ylthio)acetate (3e). IR (KBr): ν = 3020, 2980, 2208, 1736, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.43 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.40 (s, 3H, CH_3), 4.44 (s, 2H, —CH_2), 4.70 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.12–8.55 (m, 10H, Ar—H); MS: m/z = 388 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_2S$ (388.48): C, 71.11; H, 5.19; N, 7.21; Found: C, 71.14; H, 5.02; N, 7.14%.

Ethyl 2-(3-cyano-4,6-dip-tolylpyridin-2-ylthio)acetate (3f). IR (KBr): ν = 3010, 2940, 2236, 1748, 1612 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.35 (t, J =7.2 Hz, 3H, —CH_2CH_3), 2.53 (s, 6H, CH_3), 4.33 (s, 2H, —CH_2), 4.62 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.58–8.56 (m, 9H, Ar—H); MS: m/z = 402 (M^+). *Anal.* Calcd for $C_{24}H_{22}N_2O_2S$ (402.51): C, 71.62; H, 5.51; N, 6.96; Found: C, 71.70; H, 5.46; N, 6.86%.

Ethyl 2-(4-(4-chlorophenyl)-3-cyano-6-p-tolylpyridin-2-ylthio)acetate (3g). IR (KBr): ν = 3020, 2970, 2228, 1742, 1584 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.34 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.49 (s, 3H, CH_3), 4.38 (s, 2H, —CH_2), 4.66 (q, J =7.0 Hz, 2H, —CH_2CH_3), 7.30–8.25 (m, 9H, Ar—H); MS: m/z = 422 (M^+). *Anal.* Calcd for $C_{23}H_{19}ClN_2O_2S$ (422.93): C, 65.32; H, 4.53; N, 6.62; Found: C, 65.43; H, 4.56; N, 6.76%.

Ethyl 2-(3-cyano-4-(4-fluorophenyl)-6-p-tolylpyridin-2-ylthio)acetate (3h). IR (KBr): ν = 3010, 2992, 2232, 1744, 1596 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.39 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.47 (s, 3H, CH_3), 4.37 (s, 2H, —CH_2), 4.67 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.23–8.55 (m, 9H, Ar—H); MS: m/z = 406 (M^+). *Anal.* Calcd for $C_{23}H_{19}FN_2O_2S$ (406.47): C, 67.96; H, 4.71 N, 6.89; Found: C, 67.83; H, 4.86; N, 6.96%.

Ethyl 2-(3-cyano-6-(4-methoxyphenyl)-4-phenylpyridin-2-ylthio)acetate (3i). IR (KBr): ν = 3000, 2988, 2212, 1756, 1584 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.43 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.05 (s, 3H, OCH_3), 4.30 (s, 2H, —CH_2), 4.66 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.20–8.37 (m, 10H, Ar—H); MS: m/z = 404 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_3S$ (404.48): C, 68.30; H, 4.98; N, 6.93; Found: C, 68.33; H, 5.06; N, 7.12%.

Ethyl 2-(3-cyano-4,6-bis(4-methoxyphenyl)pyridin-2-ylthio)acetate (3j). IR (KBr): ν = 3010, 2960, 2236, 1756, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.33 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 3.64 (s, 2H, —CH_2), 4.12 (s, 6H, OCH_3), 4.50 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 6.99–8.19 (m, 9H, Ar—H); MS: m/z = 434 (M^+). *Anal.* Calcd for $C_{24}H_{22}N_2O_4S$ (434.51): C, 66.34; H, 5.10; N, 6.45; Found: C, 66.37; H, 5.16; N, 6.55%.

Ethyl 2-(3-cyano-6-(4-fluorophenyl)-4-phenylpyridin-2-ylthio)acetate (3k). IR (KBr): ν = 3000, 2980, 2224, 1752, 1604 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.38 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.35 (s, 2H, —CH_2), 4.62 (q, J = 7.0 Hz, 2H, —CH_2CH_3), 7.55–8.48 (m, 10H, Ar—H); MS: m/z = 392 (M^+). *Anal.* Calcd for $C_{22}H_{17}FN_2O_2S$ (392.45): C, 67.33; H, 4.37; N, 7.14; Found: C, 67.46; H, 4.26; N, 7.20%.

General procedure for the synthesis of ethyl 3-amino-4,6-diarylthieno[2,3-b]pyridine-2-carboxylate 4a–k. ***Method I.*** To the well stirred solution of MeCN (20 mL), powdered KOH (0.700 g, 12.5 mmol), and 18-crown-6 (0.132 g, 0.5 mmol) was added ethyl 2-(3-cyano-4,6-diarylpyridin-2-ylthio)acetate **3** (5 mmol). The reaction mixture was further stirred at 35–40°C for 1.5–2 h (TLC). The solvent was distilled under reduced pressure and the reaction mixture was poured onto crushed ice (20 g) and neutralized with acetic acid (50% v/v). The products thus obtained were filtered, washed with water, dried, and crystallized from glacial acetic acid.

Method II. Ethyl 2-mercaptoacetate **2** (6 mmol) was added drop wise to a stirred mixture of powdered potassium hydroxide (15 mmol, 0.84 g) and 18-crown-6 (1 mmol, 0.264 g) in acetonitrile (20 mL). 2-Chloro-4,6-diarylnicotinonitrile **1** (5 mmol) was added portion wise to the reaction mixture with stirring. The reaction was further stirred at 35–40°C for 2.5–3.0 h (TLC). The solvent was distilled under reduced pressure and the reaction mixture was poured onto crushed ice (20 g) and neutralized with acetic acid (50% v/v). The products thus obtained were filtered, washed with water, dried, and crystallized from glacial acetic acid.

Ethyl 3-amino-4,6-diphenylthieno[2,3-b]pyridine-2-carboxylate (4a). IR (KBr): ν = 3510, 3380, 3020, 2900, 1686, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.42 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.42 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.70 (s, 2H, —NH_2), 7.23–8.16 (m, 11H, Ar—H); MS: m/z = 374 (M^+). *Anal.* Calcd for $C_{22}H_{18}N_2O_2S$ (374.46): C, 70.57; H, 4.85; N, 7.48; Found: C, 70.51; H, 4.89; N, 7.42%.

Ethyl 3-amino-4-(4-methoxyphenyl)-6-phenylthieno[2,3-b]pyridine-2-carboxylate (4b). IR (KBr): ν = 3480, 3380, 3030, 2990, 1664, 1604 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.41 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 3.95 (s, 3H, —OCH_3), 4.49 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.85 (s, 2H, —NH_2), 7.18–8.10 (m, 10H, Ar—H); MS: m/z = 404 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_3S$ (404.48): C, 68.30; H, 4.98; N, 6.93; Found: C, 68.35; H, 4.88; N, 6.88%.

Ethyl 3-amino-4-(4-fluorophenyl)-6-phenylthieno[2,3-b]pyridine-2-carboxylate (4c). IR (KBr): ν = 3480, 3380, 3030, 2990, 1664, 1604 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.43 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.40 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.65 (s, 2H, —NH_2), 7.45–8.15 (m, 10H, Ar—H); MS: m/z = 392 (M^+). *Anal.* Calcd for $C_{22}H_{17}FN_2O_2S$ (392.45): C, 67.33; H, 4.37; N, 7.14; Found: C, 67.41; H, 4.45; N, 7.10%.

Ethyl 3-amino-4-(3-chloro-4-fluorophenyl)-6-phenylthieno-[2,3-b]pyridine-2-carboxylate (4d). IR (KBr): ν = 3455, 3300, 3010, 2980, 2204, 1624, 1596 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.35 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.24 (q, J = 6.9 Hz, 2H, —CH_2CH_3), δ = 5.34 (s, 2H, NH_2), 7.67–8.14 (m, 9H, Ar—H); MS: m/z = 426 (M^+). *Anal.* Calcd for $C_{22}H_{16}ClFN_2O_2S$ (426.89): C, 61.90; H, 3.78; N, 6.56; Found: C, 61.81; H, 3.88; N, 6.60%.

Ethyl 2-amino-6-phenyl-4-p-tolylthieno[2,3-b]pyridine-2-carboxylate (4e). IR (KBr): ν = 3520, 3400, 3000, 2980, 1674, 1608 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.30 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.45 (s, 3H, CH_3), 4.42 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.75 (s, 2H, —NH_2), 7.04–8.25 (m, 10H, Ar—H); MS: m/z = 388 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_2S$ (388.48): C, 71.11; H, 5.19; N, 7.21; Found: C, 71.22; H, 5.05; N, 7.15%.

Ethyl 3-amino-4,6-dip-tolylthieno[2,3-b]pyridine-2-carboxylate (4f). IR (KBr): ν = 3480, 3380, 3030, 2990, 1664, 1604 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.39 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.47 (s, 6H, CH_3), 4.43 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.63 (s, 2H, —NH_2), 7.38–8.11 (m, 9H, Ar—H); MS: m/z = 402 (M^+). *Anal.* Calcd for $C_{24}H_{22}N_2O_2S$ (402.51): C, 71.62; H, 5.51; N, 6.96; Found: C, 71.68; H, 5.45; N, 6.89%.

Ethyl 3-amino-4-(4-chlorophenyl)-6-p-tolylthieno[2,3-b]pyridine-2-carboxylate (4g). IR (KBr): ν = 3510, 3380, 3000, 2940, 1676, 1616 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.35 (t, J =7.2 Hz, 3H, —CH_2CH_3), 2.40 (s, 3H, CH_3), 4.36 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.60 (s, 2H, —NH_2), 7.18–8.21 (m, 9H, Ar—H); MS: m/z = 422 (M^+). *Anal.* Calcd for $C_{23}H_{19}ClN_2O_2S$ (422.93): C, 65.32; H, 4.53; N, 6.62; Found: C, 65.23; H, 4.44; N, 6.55%.

Ethyl 3-amino-4-(4-fluorophenyl)-6-p-tolylthieno[2,3-b]pyridine-2-carboxylate (4h). IR (KBr): ν = 3500, 3390, 3010, 2940, 1682, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.33 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 2.39 (s, 3H, CH_3), 4.35 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.62 (s, 2H, —NH_2), 7.13–8.19 (m, 9H, Ar—H); MS: m/z = 406 (M^+). *Anal.* Calcd for $C_{23}H_{19}FN_2O_2S$ (406.47): C, 67.96; H, 4.71; N, 6.89; Found: C, 67.99; H, 4.80; N, 6.86%.

Ethyl 3-amino-6-(4-methoxyphenyl)-4-phenylthieno[2,3-b]-pyridine-2-carboxylate (4i). IR (KBr): ν = 3520, 3400, 3000, 2980, 1676, 1608 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.39 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 3.98 (s, 3H, OCH_3), 4.36 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.96 (s, 2H, —NH_2), 7.27–8.24 (m, 10H, Ar—H); MS: m/z = 404 (M^+). *Anal.* Calcd for $C_{23}H_{20}N_2O_3S$ (404.48): C, 68.30; H, 4.98; N, 6.93; Found: C, 68.38; H, 4.88; N, 6.87%.

Ethyl 3-amino-4,6-bis(4-methoxyphenyl)thieno[2,3-b]pyridine-2-carboxylate (4j). IR (KBr): ν = 3510, 3300, 3020, 2970, 1672, 1596 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.42 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.02 (s, 6H, OCH_3), 4.39 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.99 (s, 2H, —NH_2), 7.26–8.20 (m, 9H, Ar—H); MS: m/z = 434 (M^+). *Anal.* Calcd for $C_{24}H_{22}N_2O_4S$ (434.51): C, 66.34; H, 5.10; N, 6.45; Found: C, 66.30; H, 5.12; N, 6.39.

Ethyl 3-amino-6-(4-fluorophenyl)-4-phenylthieno[2,3-b]pyridine-2-carboxylate (4k). IR (KBr): ν = 3500, 3390, 3010, 2980, 1668, 1600 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ = 1.45 (t, J = 7.2 Hz, 3H, —CH_2CH_3), 4.46 (q, J = 6.9 Hz, 2H, —CH_2CH_3), 5.55 (s, 2H, —NH_2), 7.21–8.24 (m, 10H, Ar—H); MS: m/z = 392 (M^+). *Anal.* Calcd for $C_{22}H_{17}FN_2O_2S$ (392.45): C, 67.33; H, 4.37; N, 7.14; Found: C, 67.22; H, 4.25; N, 7.26.

Acknowledgment. The authors thank the Regional Sophisticated Instrumentation Center, Central Drug Research Institute, Lucknow and Chandigarh, India for ^1H NMR and mass spectral analysis, and Dishman Pharmaceuticals and Chemicals Ltd. for their support.

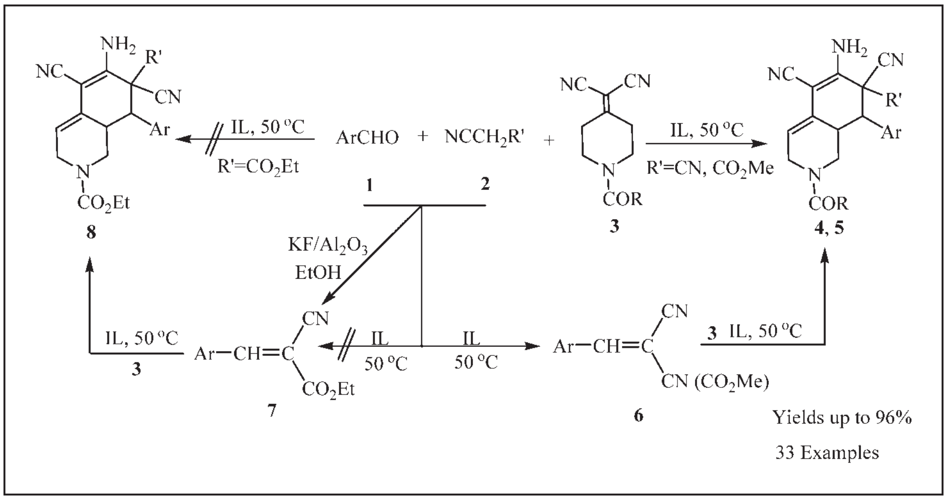
Received April 15, 2009
DOI 10.1002/jhet.244



A series of new highly substituted isoquinoline derivatives was obtained from the reaction of 2-(1-substituted piperidin-4-ylidene)malononitrile, benzaldehyde and malononitrile or cyanoacetate in ionic liquid at 50°C. This novel procedure was different from the previous method in the synthesis of isoquinoline using pyridine fragment as reactant to construct benzene ring, and as well as had the advantages of one-pot, mild and environmentally benign. A possible mechanism was proposed based on the further experimental results.

J. Heterocyclic Chem., **46**, 1355 (2009).

INTRODUCTION

Multi-component reactions (MCRs) are economically and environmentally very advantageous because multi-step syntheses produce considerable amounts of waste mainly due to complex isolation procedures often involving expensive, toxic, and hazardous solvents after each step. MCRs are perfectly suited for combinatorial library synthesis, and thus find increasing use in the discovery process for new drugs and agrochemicals [1]. In addition, ionic liquids have attracted increasing interest in the context of green synthesis in recent years. They were initially introduced as alternative green reaction media because of their unique chemical and physical properties of nonvolatility, nonflammability, thermal stability, and controlled miscibility. The possibility of recycling them and the low vapor pressure also ensure their utility in environmentally friendly technologies. They have been used as solvents for a large number of organic transformations [2].

Molecules with heterocyclic substructures are attractive targets for synthesis as they often exhibit diverse and important biological properties, such as isoquinoline derivatives. They have been reported to possess antifungal activity [3], antitumor activity [4], anticoagulant activity [5], anti-inflammatory, and analgesic activity [6]. 3-Cyanoisoquinoline **I** (Fig. 1), was reported as a Kv1.5 antagonist, and evaluated *in vitro* and *in vivo* assays for inhibition of the Kv1.5 potassium channel and its associated cardiac potassium current. Its derivatives afforded with excellent potency, selectivity, and oral bioavailability [7].

Accordingly, novel strategies for the synthesis of isoquinolines continue to receive considerable attention in the field of synthetic organic chemistry [8], except for the known classical isquinoline synthetic methods [9(a)–(f)], *e.g.* Bischler-Napieralski reaction, Pictet-Gams isoquinoline synthesis, Pomeranz-Fritsch reaction, Gabriel-Colman rearrangement, and Pictet-Spengler isoquinoline synthesis. Commonly, amines containing benzene ring

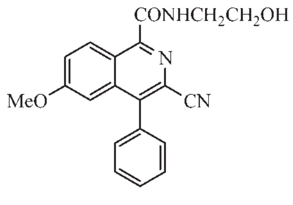


Figure 1. 3-Cyanoisoquinoline.

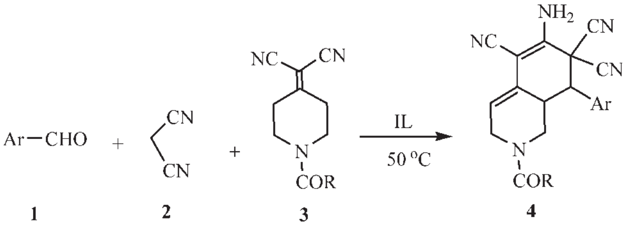
were used as reactants to construct the pyridine nucleus to gain the isoquinolines. On the contrary, our interest was focused on the synthesis of isoquinoline derivatives using a fragment containing pyridine ring as starting material to form benzene moiety. Inspired this novel idea and as part of a continuing effort in our laboratory toward the new methods for the e biologically relevant heterocyclic compounds in ionic liquids [10], herein, we would like to report a novel reaction of 2-(1-substituted-piperidin-4-ylidene)malononitrile, benzaldehyde, and malononitrile or cyanoacetate in the synthesis of highly substituted isoquinoline derivatives.

RESULTS AND DISCUSSION

The three-component reaction of benzaldehyde **1**, malononitrile **2**, and ethyl 4-(dicyanomethylene) piperidine-1-carboxylate **3** (*R*=OEt) was treated in ionic liquid at 50°C, with ethyl 6-amino-5,7,7-tricyano-3,4,7,8-tetrahydro-8-arylisoquinoline-2(1*H*)-carboxylate derivatives **4** being obtained in high yields (Scheme 1).

Firstly, optimizations of the reaction conditions, including reaction temperature and solvents, were investigated using 2-chlorobenzaldehyde, malononitrile and ethyl 4-(dicyanomethylene)piperidine-1-carboxylate as model reactants. As summarized in Table 1, the results showed that at room temperature, only trace products were observed by TLC. (Table 1, entry 1). To our delight, the reaction proceeded smoothly in high yield at 50°C, higher temperature 90°C gave a complicated system, only 52% yield of **4a** was isolated by silica gel column chromatography. Moreover, different ionic liquids were further tested as reaction medium and it was observed that [bmim$^+$] [BF$_4^-$] was the best ionic liquid for the reaction (Table 1, entries 4–8). In addition, we also looked into the water and other organic solvent effect at 50°C for this reaction. As showed in Table 1, ionic liquid of [bmim$^+$] [BF$_4^-$] gave the most satisfactory result in comparison with other solvents (Table 1, entries 9–12).

Scheme 1



After the reaction was completed, the reaction mixtures were cooled to room temperature. Water (5 mL) was then added to the mixture and the solid was isolated by filtration. The water in the filtrate was removed by evaporation at reduced pressure, and the ionic liquid in the filtrate could be recycled easily at 80°C *in vacuum* for 4 h. The recovered ionic liquid could be directly used for the same reactions. Alternatively, if the ionic liquid was used for other reactions with different substrates, it was washed with ethyl acetate, followed by evaporation at 80°C *in vacuum* for 3 h. Investigations by using 2-chlorobenzaldehyde, ethyl 4-(dicyanomethylene) piperidine-1-carboxylate, and malononitrile as model substrates proved the successive reuse of ionic liquid. Even in the fourth cycle the yield (87%) of product **4a** is fairly high.

According to the optimized conditions, we next examined the utility of this process (Scheme 1) to synthesize a range of isoquinoline **4**. Various arylaldehydes **1**, bearing either electron-withdrawing groups (such as halide, nitro) or electron-donating groups (such as alkyl group or alkoxyl group), were subjected to react with **3** to give the corresponding isoquinoline derivatives **4** in high yields (Table 2, entries 1–16). Replacing the ethyl 4-(dicyanomethylene)piperidine-1-carboxylate to 2-(1-(3-chlorobenzoyl)piperidin-4-ylidene)malononitrile

[a] Reaction conditions: ionic liquid (2 mL), benzaldehyde (2 mmol), ethyl 4-(dicyanomethylene)piperidine-1-carboxylate (0.438 g, 2 mmol), malononitrile (0.132 g, 2 mmol).

[b] Isolated yields.

also gave the satisfactory results (Table 2, entries 17–20). As expected, the substrate of malononitrile could be extended to other active methylene compound. Methyl cyanoacetate was also chosen as reactant to treat with benzaldehyde, 4-(dicyanomethylene) piperidine-1-carboxylate (Scheme 2), and was found to generate the corresponding 2-ethyl 7-methyl 6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-arylisoquinoline-2,7(1*H*)-dicarboxylate derivatives (**5a–5f**) (Scheme 2) in high yields (Table 3).

However, to our surprise, we failed to get the expected products when ethyl cyanoacetate was used (Scheme 2). This raised an interesting question: why could the methyl cyanoacetate give good results, while ethyl cyanoacetate could not? This also stimulated us to carry out new experiments to find the reason as well as explore the reaction mechanism.

In our continued study, we find the reaction of benzaldehyde and methyl cyanoacetate could be proceeded smoothly to give corresponding methyl 2-cyano-3-(2-chlorophenyl)acrylate **6** in ionic liquid, while other cyanoacetates, such as ethyl or propyl cyanoacetate could not react with benzaldehyde. Perhaps, the reaction activity of ethyl cyanoacetate is less than that of methyl cyanoacetate or malononitrile. The results were agreed to those of the same reactions in water [11] or ethanol [12] without catalyst. Subsequently, we also tested the reaction of **6** and ethyl 4-(dicyanomethylene)piperidine-1-

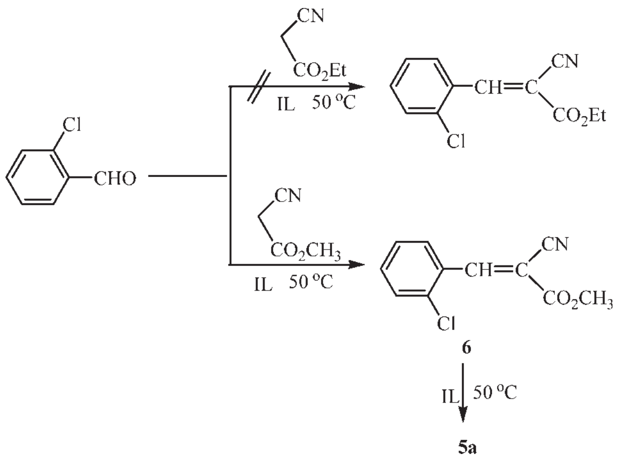
Scheme 3

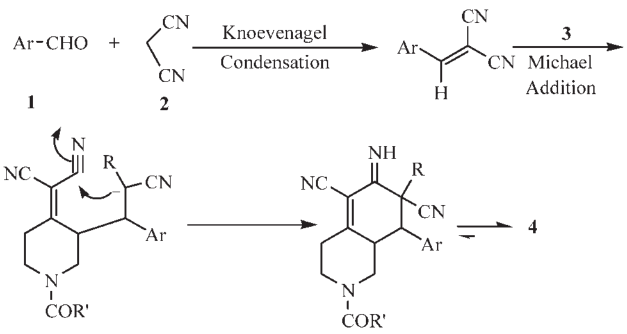


carboxylate **3** in ionic liquid at the same temperature, the desired 2-ethyl 7-methyl 6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-(2-chlorophenyl)isoquinoline-2,7(1*H*)-dicarboxylate **5a** was obtained successfully in high yield of (total yield 78%) (Scheme 3).

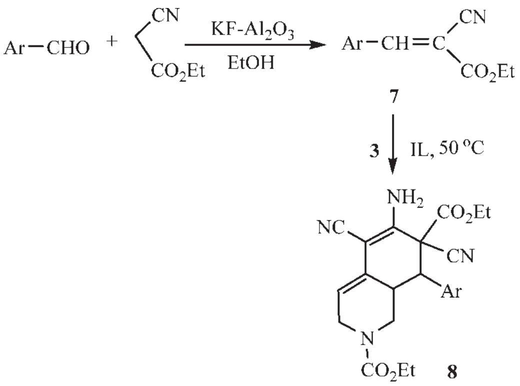
According to the above results, a sequential reaction of the Knoevenagel condensation, Michael addition reaction cyclization and isomerization may take place to give the final products **4**. A tentative mechanism was outlined in Scheme 4.

Encouraged by this result and to obtain the desired diethyl isoquinoline-2,7-dicarboxylate derivatives, a number of ethyl 2-cyano-3-arylacrylate **7** were synthesized by the known Knoevenagel condensation [13] of benzaldehydes and ethyl cyanoacetate in EtOH firstly, and then applied to react with **3** in ionic liquid (Scheme 5). Similarly, **7** smoothly reacted in ionic liquid at 50 °C to give the corresponding diethyl-6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-arylisoquinoline-2,7(1*H*)-dicarboxy late derivatives **8** in high yields (Table 4) as expected. The results were listed in Table 4.

Scheme 4



Scheme 5



CONCLUSION

In conclusion, we have disclosed a green and novel method to synthesize of new highly substituted isoquinoline derivatives was obtained from the reaction of 2-(1-substituted piperidin-4-ylidene)malononitrile, benzaldehyde and malononitrile or cyanoacetate in ionic liquid at 50°C. The note-worthy features of this procedure are different from the previous method in the synthesis of isoquinoline using pyridine fragment as reactant to construct benzene ring, mild reaction conditions, one-pot, high yield, operational simplicity and the environmentally friendly procedure. Meanwhile, [bmim$^+$] [BF$_4^-$] could be reused for several rounds without significant loss of activity.

EXPERIMENTAL

Melting points were determined in open capillaries and are uncorrected. IR spectra were recorded on a TENSOR 27 spectrometer in KBr pellet. ^{1}H NMR spectra were obtained from solution in DMSO-*d*$_6$ or CDCl$_3$ with Me$_4$Si as internal standard using a Bruker-400 spectrometer. HRMS analyses were carried out using Bruker-micro TOF-Q-MS analyzer.

[b] Isolated yields.

General procedure for the syntheses of 6-amino-8-arylisoquinoline derivatives 4. A dry 50 mL flask was charged with arylaldehyde (2.0 mmol), malononitrile (0.132 g, 2.0 mmol), 2-(1-substitutedpiperidin-4-ylidene)malononitrile (2.0 mmol), and ionic liquid of [bmim$^+$][BF$_4^-$] (2 mL). The reaction mixture was stirred at 50°C for 7–11 h, and then cooled to room temperature. The generated yellow solid was filtered off, and the ionic liquid in filtrate was then recovered for reuse by evaporating at 80°C several h at *vacuum*. The crude yellow products were washed with water and purified by recrystallization from DMF and water, followed by being dried at 50°C several h at *vacuum* to give **4**.

Ethyl 6-amino-2-(3-chlorobenzoyl)-8-(2-chlorophenyl)-1,2,3,4-tetrahydroisoquinoline-5,7,7(8H)-tricarbonitrile 4t. Mp. 235–237°C. IR (KBr)/ cm^{-1} 3326, 3192, 3069 2941, 2881, 2842, 2212, 1641, 1605, 1568, 1478, 1440, 1398, 1374, 1341, 1301, 1288, 1255, 1120, 1080, 1058, 1039, 813, 799, 774, 748, 707. ^{1}H NMR (DMSO-d_6, 400 MHz) δ_H 2.67–2.70 (m, 1H, CH), 3.01–3.16 (m, 1H, CH), 3.77 (d, J = 19.6 Hz, 1H, CH), 3.96–4.14 (m, 2H, 2CH), 4.67 (d, J = 19.6 Hz, 1H, CH), 5.79 (s, 1H, CH), 7.32–7.52 (m, 7H, ArH), 7.65–7.70 (m, 3H, ArH + NH_2). HRMS-ESI. calcd for $C_{25}H_{18}Cl_2N_5O$, M + H$^+$: 474.0888, found: 474.0881.

General procedure for the syntheses of 2-ethyl 7-methyl 6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-arylisoquinoline-2,7(1*H*)-dicarboxylate derivatives 5. A dry 50 mL flask was charged with arylaldehyde (2.0 mmol), methyl cyanoacetate (0.198 g, 2.0 mmol), ethyl 4-(dicyanomethylene)piperidine-1-carboxylate (0.438 g, 2.0 mmol), and ionic liquid of [bmim$^+$][BF$_4^-$] (2 mL). The reaction mixture was stirred at 50°C for 11–15 h, and then cooled to room temperature. The generated yellow solid was filtered off, and the ionic liquid in filtrate was then recovered for reuse by evaporating at 80°C several hours at *vacuum*. The crude yellow products were washed with water and purified by recrystallization from DMF and water, followed by being dried at 50°C several hours at *vacuum* to give **5**.

2-Ethyl 7-methyl 6-amino-8-(2-chlorophenyl)-5,7-dicyano-3,4,7,8-tetrahydroisoquinoline-2,7(1H)-dicarboxylate 5a. Mp. 249–251°C. General procedure for the syntheses of diethyl-6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-arylisoquinoline-2,7(1*H*)-dicarboxylate derivatives 8. A dry 50 mL flask was charged with ethyl 2-cyano-3-arylacrylate (2.0 mmol), ethyl 4-(dicyanomethylene)piperidine-1-carboxylate (0.438 g, 2.0 mmol), and ionic liquid of [bmim$^+$][BF$_4^-$] (2 mL). The reaction mixture was stirred at 50°C for 6–10 h, and then cooled to room temperature. The generated yellow solid was filtered off, and the ionic liquid in filtrate was then recovered for reuse by evaporating at 80°C several h at *vacuum*. The crude yellow products were washed with water and purified by recrystallization from DMF and water, followed by being dried at 50°C several h at *vacuum* to give **8**.

Diethyl 6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-(2-nitrophenyl) isoquinoline-2,7(1H)-dicarboxylate 8a. Mp. 235–236°C. IR (KBr)/ cm^{-1} 3404, 3348, 3303, 3237, 2993, 2880, 2844, 2205, 1752, 1662, 1590, 1536, 1479, 1428, 1391, 1352, 1299, 1247, 1194, 1126, 1022, 973, 881, 863, 845, 821, 788, 773, 765, 718. ^{1}H NMR (CDCl$_3$, 400 MHz) δ_H 1.14–1.26 (m, 6H, 2CH$_3$), 2.75–2.79 (m, 1H, CH), 3.08–3.15 (m, 1H, CH), 3.72–4.06 (m, 7H, 2CH$_2$O+3CH), 4.46–4.51 (m, 1H, CH), 4.73 (s, 2H, ArH), 5.92 (s, 1H, CH), 7.54–7.57 (m, 1H, ArH), 7.74–7.81 (m, 2H, ArH), 8.06–8.08 (m, 1H, ArH). ^{13}C NMR (DMSO-d_6, 100 MHz) δ_C 12.8, 14.4, 34.3, 40.2, 41.4, 43.4, 54.1, 60.9, 64.0, 79.4, 114.8, 115.2, 116.2, 125.1, 127.4, 128.2, 128.7, 130.4, 133.5, 148.8, 150.8, 163.8, 198.3. HRMS-ESI. calcd for $C_{23}H_{23}N_5NaO_6$, M + Na$^+$: 488.1546, found: 488.1536.

Diethyl 6-amino-5,7-dicyano-3,4,7,8-tetrahydro-8-p-tolylisoquinoline-2,7(1H)-dicarboxylate 8b. Mp. 223–224°C. An efficient, convenient, one-pot synthesis of imidazo[1,2-*c*]quinazoline-5(6*H*)-thione and imidazo[1,2-*c*]quinazolin-5(6*H*)-one was accomplished in good yields via the novel reductive cyclization of 2-(2-nitrophenyl)-1*H*-imidazoles with isothiocyanates or isocyanates mediated by $SnCl_2{\cdot}2H_2O$ system.

J. Heterocyclic Chem., **46**, 1364 (2009).

INTRODUCTION

A literature survey revealed that quinazolinones show antihypertonic, antirheumatic, antianaphylactic, antiasthmatic, tranquilizing, neurostimulating, and benzodiazepine binding activity [1,2]. For example, 3-substituted quinazolinones, such as SGB-1534 (**1**) [3] and ketanserin (**2**) have been found to have antihypertensive activities mediated via α-adrenoceptor and serotonic receptor anatgonism, respectively. Addition of a (2-methoxyphenyl)piperazine side chain at the 2- or 3-position of the angular tricyclic 2,3-dihydroimidazo[1,2-*c*]quinazoline ring system of SGB-1534 resulted in the formation of potent antihypertensive agents, such as 2-[[4-(2-methoxyphenyl)- piperazin-1-yl]methyl]-2,3-dihydroimidazo[1,2-*c*]-quinazolin-5(6*H*)-one (**3**) and 3-[[4-(2-methoxy phenyl)piperazin-1-yl]methyl]-2,3-dihydroimidazo[1,2-*c*]-quinazolin-5(6*H*)-one (**4**) that selectively antagonized the α_1-adrenoceptor [4]. (Fig. 1)

Imidazo[1,2-*c*]quinazolinone derivatives also are of considerable interest because of their biological and pharmacological activities, including antimicrobial, antihypertension, diuresis, and muscle relaxation [5,6].

The imidazo[1,2-*c*]quinazolinone ring system can generally be prepared by the reaction of α-aminoketones with 2-isocyanatobenzonitrile [7], α-aminocarboxylic esters with 2-isocyanatobenzonitrile [8], and 2-(2-nitrophenyl)-1*H*-imidazoles with triphosgene [9]. Chern et al. also have reported the synthesis of imidazo[1,2-*c*]quinazolinone derivatives based on cyclocondensations of NBS [10]. However, these methods suffer from some disadvantages, such as drastic conditions, unsatisfactory yields, long reaction time, high temperature, complex manipulation, and inaccessible starting materials. Therefore, we became interested in developing a convenient synthetic methods for the preparation of imidazo[1,2-*c*]quinazolinone derivatives.

In recent years, our interest has been focused on the usage of $SnCl_2$ reagent. We have previously reported the synthesis of 2-aryl-2*H*-indazoles [11], 1-hydroxy quinazolinones [12], respectively mediated by $SnCl_2$ reagent. As our earlier works goes, herein, we will describe a new approach to synthesize imidazo[1,2-*c*]quinazolinone derivatives by treating 2-(2-nitrophenyl)-1*H*-imidazoles with isothiocyanates or isocyanates mediated by $SnCl_2$ reagent.

RESULTS AND DISCUSSION

On the basis of our previous experience, we selected 2-(2-nitrophenyl)-4,5-diphenyl-1*H*-imidazole **1a** and the 4-methylphenyl isothiocyanate **2a** as model substrates to optimize the experimental conditions for the proposed reductive cyclization reaction (Scheme 1). The results are summarized in Table 1.

As shown in Table 1, we briefly examined the effect of different temperatures, different solvents and ratio of **1a**:$SnCl_2{\cdot}2H_2O$. The results showed that at reflux the reaction proceeded smoothly in high yield. To further

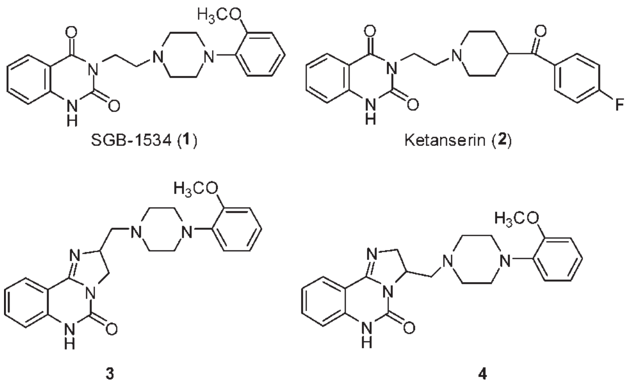

Figure 1. Some biologically active quinazolinones.

evaluate the influence of the ratio of **1a**:$SnCl_2 \cdot 2H_2O$, the reaction was carried out in acetonitrile using a 1:3–1:8 ratio of **1a**:$SnCl_2 \cdot 2H_2O$ (Table 1, entries 5, 6, 7, 8, 4, 9), leading to **3a** in 37%, 67%, 70%, 75%, 81%, and 82% yields, respectively. We concluded the best ratio of **1a**:$SnCl_2 \cdot 2H_2O$ was 1:7. Moreover, different organic solvents were further investigated as shown in Table 1; we concluded that acetonitrile was the best solvent for this reaction.

Having established an optimal condition for the protocol, we performed a more detailed examination of the substrates. Thus, the behavior of a variety of substrates, which include different 2-(2-nitrophenyl)-1*H*-imidazoles as well as different isothiocyanates or isocyanates was examined.

First of all, we performed the reaction of a variety of 2-(2-nitrophenyl)-1*H*-imidazoles **1** and isothiocyanates **2** via $SnCl_2 \cdot 2H_2O$ system (Scheme 2, Table 2).

As shown in Table 2, it can be seen that this protocol can be applied to isothiocyanates with either electron-withdrawing groups (such as halide groups) or electron-donating groups (such as alkyl groups) under the same conditions. Furthermore, it was particularly noteworthy that the effects of substituted 2-(2-nitrophenyl)-1*H*-imidazoles were also investigated. 4-fluorophenyl and 4-methoxyphenyl substitution can also give moderate to good yields.

A second part of the research was designed to synthesize imidazo[1,2-*c*]quinazolin-5(6*H*)-ones *via* the novel reductive cyclization of 2-(2-nitrophenyl)-1*H*-imidazoles with isocyanates under the same reaction conditions (Scheme 3, Table 3).

Table 1

Optimization for the reductive cyclization reaction.

Entry	Temperature (°C)	Solvent	Ratio[a]	Isolated yield (%)
1	rt	CH_3CN	1:7	0
2	40	CH_3CN	1:7	0
3	60	CH_3CN	1:7	60
4	Reflux	CH_3CN	1:7	81
5	Reflux	CH_3CN	1:3	37
6	Reflux	CH_3CN	1:4	67
7	Reflux	CH_3CN	1:5	70
8	Reflux	CH_3CN	1:6	75
9	Reflux	CH_3CN	1:8	82
10	Reflux	THF	1:7	42
11	Reflux	$CHCl_3$	1:7	0

[a] Ratio of **1** and $SnCl_2 \cdot 2H_2O$ system.

Similarly, aryl isocyanates containing electron-donating and electron-withdrawing substituents were reacted well with 2-(2-nitrophenyl)-1*H*-imidazoles, therefore, we can conclude that the electronic nature of the substituents has no significant effect on this reaction. Meanwhile, it was found that isocyanates showed better reactivity trends than isothiocyanates.

A plausible mechanistic pathway to products **3** and **5** is illustrated in Scheme 4, although the details are still unclear. In the initial step, 2-(2-nitrophenyl)-1*H*-imidazoles **1** are reduced by tin(II) chloride to **A**. The amine compounds **A** then reacted with isothiocyanates or isocyanates to give intermediate **B**. Intermediate **C** was formed by attack of the amino group onto the the central carbon atom of the urea or thiourea. Finally, products **3** and **5** were obtained by eliminating a amine molecule.

The structures of products **3** and **5** were confirmed by IR, ^{1}H NMR, and HRMS.

In summary, a series of imidazo[1,2-*c*]quinazoline-5(6*H*)-thiones and imidazo[1,2-*c*]quinazolin-5(6*H*)-ones were synthesized *via* $SnCl_2 \cdot 2H_2O$ induced reductive cyclization of isothiocyanates and isocyanates with 2-(2-nitrophenyl)-1*H*-imidazoles, respectively. The new method has advantages, such as easily accessible starting materials, convenient manipulation, and moderate to high yields.

EXPERIMENTAL

Commercial solvents and reagents were used as received. Melting points were uncorrected. IR spectra were recorded on Varian F-1000 spectrometer in KBr with absorptions in cm^{-1}. ^{1}H NMR was determined on Varian-400 MHz spectrometer in DMSO-d_6 solution. *J* values are in Hz. Chemical shifts are expressed in ppm downfield from internal standard TMS. HRMS data were obtained using microma GCT-TOF instrument.

General procedure for synthesis of imidazo[1,2-*c*]quinazoline-5(6*H*)-thione 3. A solution of 2-(2-nitrophenyl)-1H-imidazoles (0.5 mmol), isothiocyanates (0.5 mmol), and $SnCl_2{\cdot}2H_2O$ (3.5 mmol) in CH_3CN (5 mL) was stirred at reflux for 3 h. After this period, the TLC analysis of the mixture showed the reaction to be completed. The mixture was quenched with 3% HCl (10 mL) and filtered to yield a crude product, which was purified *via* silica gel column chromatography using acetone/petroleum ether (1:9, v/v) as eluent to furnish pure products in 78–90% yield.

9-Chloro-2,3-bis(4-methoxyphenyl)imidazo[1,2-c] quinazoline-5(6H)-thione (3a). This compound was obtained as solid with mp 284–286°C; IR(KBr):ν: 3172, 3109, 3006, 2960, 1616, 1533, 1520, 1490, 1472, 1389, 1369, 1312, 1291, 1245, 1171, 1134, 1083, 1034, 984, 875, 840, 816, 743, 696 cm^{-1}. ^{1}H NMR (DMSO-d_6): 3.73(s, 3H, OCH_3), 3.84 (s, 3H, OCH_3), 6.85 (d, J = 8.4 Hz, 2H, ArH),6.97 (d, J = 7.6 Hz, 2H, ArH), 7.30 (d, J = 8.0 Hz, 2H, ArH), 7.46 (d, J = 8.4 Hz, 2H, ArH), 7.56 (d, J = 8.4 Hz, 1H, ArH), 7.67 (d, J = 8.8 Hz, 1H, ArH), 8.26 (s, 1H, ArH), 13.38 (s, 1H, NH).

31.0 % Anti-inflammatory activity at 50 mg/kg p.o.

Condensation of various mono amines with various diacids gave heterocyclic imide derivatives and condensation of amines with various aldehydes gave azomethine derivatives in good yields under solvent free condition. Structures assigned to imide and azomethine derivatives are fully supported by spectral data. All these compounds were screened for anti-inflammatory activity at a dose of 50 mg/kg p.o. Compound **8a** (6-((tetrahydrofuran-2-yl)methyl)-6H-pyrrolo[3,4]pyrazine-5,7-dione) exhibited anti-inflammatory activity comparable to standard drug phenyl butazone which showed 37% activity at 50 mg/kg p.o.

J. Heterocyclic Chem., **46**, 1369 (2009).

INTRODUCTION

Increasing interest to synthesize small molecules as the structural building block is driving the development of new technologies under green chemistry research that can produce highly pure compounds at very high rate in very less time. Imides and azomethine derivatives are well known compounds as the productive component in various reactions [1]. Imides form structural part of various important natural and synthetic molecules such as fumaramidmycin [2], coniothyromycin [3], and SB-253514 [4], thalidomide [5], granulatimide [6], and isogranulatimide [7]. Wide range of biological activities, *i.e.*, anti-inflammatory [8], anticancer [9], and insecticidal [10] are shown by imide derivatives. Azomethine derivatives also possess anti-inflammatory [11], anticancer [12], antibacterial [13], and antimicrobial [14] activities.

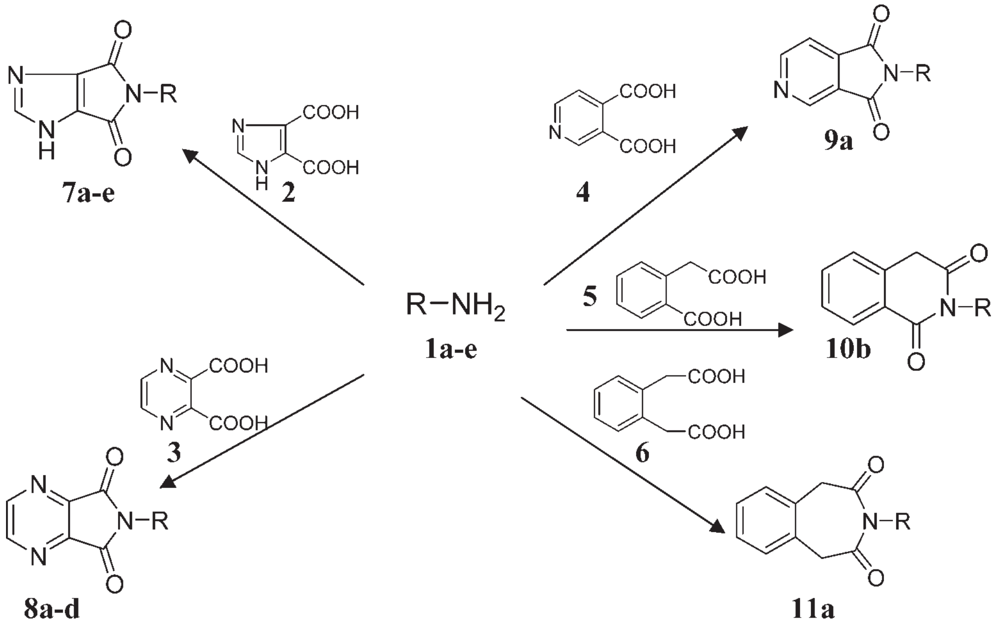
Microwave chemistry is relatively new technology that has been reported to significantly improve productivity in generation of complex target molecules. Some important features of microwave irradiation, *i.e.*, solvent free reactions, low waste, energy efficiency, high yield, and short reaction time make this technique an important tool for organic synthetic chemistry. Use of microwave chemistry and solvent free reaction conditions allow us to synthesize a large number of compounds in a very short period of time. With this hypothesis and in continuation of our work [15] in search of potent molecules exhibiting the anti-inflammatory activity, we have synthesized a number of heterocyclic imide and azomethine derivatives and screened them for anti-inflammatory activity, which we wish to report in this article.

RESULTS AND DISCUSSION

Chemistry. A number of heterocyclic imide derivatives **7a–e**, **8a–d**, **9a, 10b** and **11a** (Scheme 1) have been synthesized *via* the condensation of various amines (**1a–e**; Scheme 1) with various diacids (**2–6;** Scheme 1) under microwave irradiation conditions (power 600 Watt). Microwave irradiation of a mixture of tetrahydrofurfuryl amine (**1a**) and 4,5-imidazoledicarboxlic acid (1:1 molar ratio) at 600W for 4 min gave product **7a**. For compound **7a**, IR absorption band at 1728 cm^{-1} indicates the presence of —CO—N—CO— group. Spectral data of **7a** reported in experimental section fully support the structure assigned to it. Irradiation time and percentage yield of **7b–e**, **8a–d**, **9a**, **10b**, and **11a** synthesized by following above method is reported in Table 1.

A number of heterocyclic azomethine derivatives **15a–c** and **16a–c** have been synthesized *via* the condensation of **12**, **1c** and **1d** amines with aromatic aldehydes **13** and **14** by following reaction Scheme 2.

Scheme 1. Synthesis of heterocyclic imide derivatives.



Condensation of thiophen-2-ylmethanamine (**12**) with 2-hydroxy-1-naphthaldehyde (**13**) by irradiating at 600W for 1 min gave product **15a** in 99% yield.

Spectral data of **15a** reported in experimental section of this article fully support the structure assigned to it. By following above method other azomethine derivatives, *i.e.*, **15b–c** and **16a–c** have been synthesized. Power level, Irradiation time and percentage yield of all the azomethine derivatives synthesized is reported in Table 2.

Conventional methods for the synthesis of imide derivatives involve refluxing of reactants in pyridine [16a], or toluene [16b], or use of PCl_3/CH_3CN [16c] etc. whereas synthesis of schiffs bases involve use of P_2O_5/Al_2O_3 [17a] as a catalyst, refluxing of reactants in toluene [17b] or ethanol [17c] or chloroform [17d] for long hours and still yields are not very good. Microwave irradiation technique [18] is reported to be an efficient way of energy transfer as compared to conventional heating and thus reduces reaction time which leads to a few side products and hence high yield of required products. In the synthesis of imide and azomethine, we used microwave irradiation technique and got desired products in high yields but in a very short period of reaction time.

Crystal structure of compound 15a. To get the structure of compound **15a**, single crystal of compound **15a** was grown by slow evaporation of methanol solution. The quality of data for the crystal of **15a** was not very good but it was enough to predict the structure of

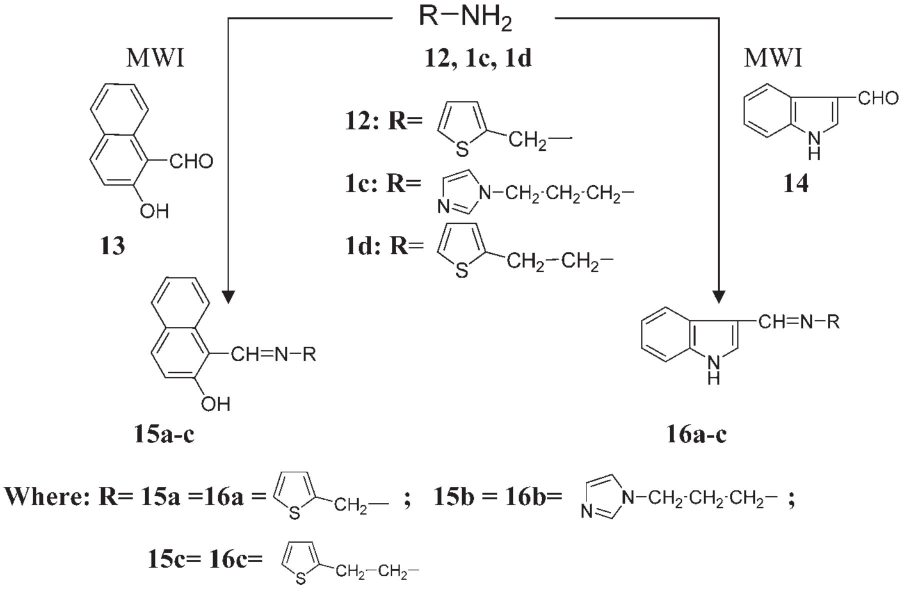
Scheme 2. Synthesis of heterocyclic azomethine derivatives.



compound **15a** (Fig. 1). The crystal data of **15a** is summarized in Table 3. The crystal structure give rise to C=N bond distance of 1.301 A° which is comparable to reported value 1.282(3) A° [19].

Biological activity. Anti-inflammatory [20] activity evaluation of **7a–e**, **8a–d**, **9a, 10b**, **11a, 15a–c** and **16a–c** was carried out using carrageenan-induced paw oedema model and results are summarized in Table 4. Compound **8a** exhibited 31% (50 mg/kg p.o.) where as standard drug phenyl butazone exhibited 37% (50 mg/kg p.o.) anti-inflammatory activity. Anti inflammatory activity of **8a** is comparable to phenyl butazone.

CONCLUSION

A number of heterocyclic- imide and azomethine derivatives have been synthesized in high yields in a very short time period using microwave irradiation technique. These imide and azomethine derivatives were screened for anti-inflammatory activity and compound **8a** exhibited good anti-inflammatory activity. Microwave technique is an important tool for synthetic organic chemistry.

EXPERIMENTAL

General. Microwave oven model M197DL (Samsung) was used for microwave irradiation. Compounds **7a**, **8d**, and **11a** were purified by crystallization from methanol/ ethyl acetate (8:2) whereas all other compounds reported in this article were purified by crystallization from methanol. Melting points (mp) were determined on a JSGW apparatus and are uncorrected. IR spectra were recorded using a Perkin Elmer 1600 FT spectrometer ^{1}H NMR spectra were recorded on a Bruker WH-500 spectrometer at a ca 5–15% (w/v) solution in DMSO-d_6 (TMS

as internal standard) FAB-MS was recorded on JEOL SX-120 (FAB) spectrometer. GC-MS was recorded on Perkin Elmer Clarus 500 gas chromatograph where built in MS detector was used. Elemental analysis was carried out on a Vario EL III elementor. Thin layer chromatography (TLC) was performed on silica gel G for TLC (Merck) and spots were visualized by iodine vapour or by irradiation with ultraviolet light (254 nm). The X-ray data collection and processing were performed on Bruker Kappa Apex-II CCD diffractometer by using graphite monochromated Mo-Kα radiation (λ = 0.71070 Å) at 100 K. Crystal structures were solved by direct methods. Structure solution, refinement and data output were carried out with the SHELXTL program [21,22]. All nonhydrogen atoms were refined anisotropically. Hydrogen atoms were placed in geometrically calculated positions and refined using a riding model. Images were created with the DIAMOND program [23].

Reaction procedure for synthesis of 7a. 4,5-Imidazoledicarboxlic acid (0.200 g, 1.28 mmol) and tetrahydrofurfuryl amine (0.20 mL, 1.98 mmol) were mixed together thoroughly in a petri dish to form a paste. This paste was subjected to microwave irradiation for 4 min at a power level of 600 Watt. Completion of reaction was checked by TLC. Crude reaction product was washed with ether. The product so obtained was further purified by crystallization from ethylacetate:methanol (8:2). Yield 210mg (95%) m.p. 212°C.

Similarly were prepared compounds **7a–e**, **8a–d**, **9a, 10b** and **11a**.

2-((-Tetrahydrofuran-2-yl) methyl)-2H-pyrrolo[3,4-c]pyridine-1,3dione (9a). Mp 107–108°C; IR (KBr) ν_{max}: 1715 (—CO—N—CO—), 1593, 1489, and1400 (Ar) cm^{-1} ^{1}H NMR δ 1.51–1.55 (q, 1H, aliphatic), 1.80–1.87 (m, 2H, aliphatic), 1.94–1.99 (m, 1H, aliphatic), 2.72–2.76 (m, 1H, aliphatic), 2.90–2.93 (m, 1H, aliphatic), 3.66–3.70 (m, 1H, aliphatic), 3.95–4.00 (m, 2H, CH_2), 7.97–7.98 (d, 1H, py), 8.73–8.74 (d, 1H, py), 9.24 (s, 1H, py). **GC-MS** m/z 232 (M$^+$, 21%). Anal. Calcd. For $C_{12}H_{12}N_2O_3$ C, 62.06; H, 5.17; N, 12.06. Found C, 62.05; H, 5.17; N, 12.03.

2-Cyclopropylisoquinoline-1,3-(2H,4H)-dione (10b). Mp 40–41°C; IR (KBr) ν_{max}: 1715 (—CO—N—CO—), 1629 and 1590 (Ar) cm^{-1}. ^{1}H NMR δ 0.63–0.68 (m, 4H, CH_2—CH_2—), one H of cyclopropyl ring merged with DMSO-d_6 signal, 3.58 (s, 2H, CH_2), 7.17–7.19 (d, 1H, Ar), 7.23–7.26 (t, 1H, Ar), 7.30–7.33 (m, 1H, Ar), 7.63–7.65 (d, 1H, Ar). **GC-MS** m/z 201 (M$^+$, 35%). Anal. Calcd. For $C_{12}H_{11}NO_2$ C, 71.64; H, 5.47; N, 6.96. Found C, 71.62; H, 5.44; N, 6.96.

3-(Tetrahydrofran-2-yl)methyl)-1H-benzo[d]azepine-2,4(3H,5H)-dione (11a). Mp150–151°C; IR (KBr) ν_{max}: 1711 (—CO—N—CO—), 1634, 1582, and 1491 (Ar) cm^{-1}. ^{1}H NMR δ 1.51–1.56 (m, 1H, aliphatic), 1.81–1.86(m, 2H, aliphatic), 1.93–1.96 (q, 1H, aliphatic), 2.68–2.73 (q, 1H, aliphatic), 2.84–2.87 (dd, 1H, aliphatic), 2.30 (s, 4H, 2 × CH_2,) 3.76–3.80 (m, 2H, aliphatic), 3.94–3.97 (q, 1H, aliphatic), 7.14–7.19 (m, 4H, Ar). **GC-MS** m/z 259 (M$^+$, 2%), Anal. Calcd. For $C_{15}H_{17}NO_3$ C, 69.49; H, 6.56; N, 5.40. Found C, 69.47; H, 5.56; N, 5.38.

Reaction procedure for synthesis of 15a. 2-Hydroxy-1-naphthaldehyde (0.200 g, 1.16 mmol) and thiophen-2-ylmethanamine (0.20 mL, 1.76 mmol) were mixed together thoroughly in a petri dish to form a paste. This paste was subjected to microwave irradiation for 1.5 min at power level of 600 Watt.. Completion of reaction was checked by TLC. Crude reaction product was washed with chilled ethyl acetate. The product so obtained was further purified by crystallization from Methanol. Yield 265mg (99%) m.p. 135°C.

Similarly compounds **15a–c, 16a,b** and **16c** were prepared. Physical constants and spectral data is reported as below.

1-((Thiophen-2-ylmethylimino)methyl)naphthalen-2-ol (15a). Mp 135–137°C; IR (KBr) ν_{max}: 3439 (OH), 1628 (C=N), 1544 and 1493 (Ar) cm^{-1}. ^{1}H NMR δ 5.08 (s, 2H, CH_2), 6.78–6.79 (d, 1H, Ar), 7.05–7.07 (q, 1H, Ar), 7.17–7.18 (q, 1H, Ar), 7.23–7.26 (m, 1H, Ar), 7.46–7.49 (m, 1H, Ar), 7.52–7.53 (q, 1H, Ar), 7.68–7.69 (q, 1H, Ar), 7.773–7.792 (d, 1H, Ar), 8.12–8.13 (d, 1H, Ar), 9.33–9.35 (d, 1H, Ar), 14.34 (s, 1H, OH exch.). **GC-MS** m/z 267 (M$^+$, 58%), Anal. N-((1H-indol-3-yl)methylene)-3-(1H-imidazol-1-yl)propan-1-amine (16b). Semisolid; IR (KBr) ν_{max}: 3434 (NH), 1635 (C=N), 1601, 1512, and 1499 (Ar) cm^{-1}. ^{1}H NMR δ 2.04–2.09 (m, 2H, CH_2), 3.44–3.47 (t, 2H, CH_2), 4.08–4.11 (t, 2H, CH_2), 6.911–6.912 (d, 1H, CH), 7.05–7.13 (m, 1H, Ar), 7.17–7.19 (m, 1H, Ar), 7.23–7.24 (m, 1H, Ar), 7.42–7.43 (d, 1H, Ar), 7.65 (s, 1H, Ar), 7.77–7.79 (d, 1H, Ar), 8.21–8.29 (t, 1H, Ar), 8.44 (s, 1H, Ar), 11.54 (s, 1H, NH exch.). **GC-MS** m/z 252 (M$^+$, 39%). Anal. Calcd. For $C_{15}H_{16}N_4$ C, 71.43; H, 6.35; N, 22.22. Found C, 71.42; H, 6.34; N, 22.22.

N-(1H-Indol-3-yl)methylene)(thiophen-2-yl)ethanamine (16c). Mp 98–100°C; IR (KBr) ν_{max}: 3431(NH), 1627 (C=N), 1543 and 1443 (Ar) cm^{-1}. ^{1}H NMR δ 3.15–3.18 (t, 2H, CH_2), 3.75–3.77 (t, 2H, CH_2), 6.92–6.95 (m, 2H, Ar), 7.10–7.13 (m, 1H, Ar), 7.17–7.20 (m, 1H, Ar), 7.29–7.30 (m, 1H, Ar), 7.426–7.432 (d, 1H, Ar), 7.74–7.77 (d, 1H, Ar), 8.27–8.28 (d, 1H, Ar), 8.42–8.44 (d, 1H, Ar), 11.52 (s, 1H, NHexch.). **GC-MS** m/z 254 (M$^+$, 12%). Anal. Calcd. For $C_{15}H_{14}N_2S$ C, 70.86; H, 5.51; N, 11.02; S, 12.59. Found C, 70.85; H, 5.52; N, 11.00; S, 12.58.

Preparation of single crystal for X-ray analysis. All the crystallographic parameters are tabulated in Table 3 and selected bond distance is reported in Text. Crystals of compound **15a** were obtained from slow evaporation of methanol solution of compound **15a**. Compound **15a** crystallized in monoclinic space group *P21/c*.

Anti-inflammatory activity [20]. Paw oedema inhibition test was used on albino rats of Charles Foster by adopting the method of Winter et al [20]. Groups of five animals of both sexes (body weight 120–160 g), excluding pregnant females, were given a dose of test compound. Thirty minute later, 0.20 mL of 1% freshly prepared carrageenan suspension in 0.9% NaCl solution was injected subcutaneously into the planter aponeurosis of the hind paw and the volume was measured by a water plethysmometer apparatus and then measured again 1–3 h later. The mean increase of paw volume at each interval was compared with that of control group (five rats treated with carrageenan but not with test compound) at the same intervals and percent inhibition value calculated by the formula given below.

$$\%\ \text{anti-inflammatory activity} = [1 - D_t/D_c] \times 100$$

D_t and D_c are paw volumes of oedema in tested and control groups, respectively. Compounds **7a–e**, **8a–d**, **9a**, **10**b, **1 1a**, **15a–**c, and **16a–c** were screened for anti-inflammatory activity and results are summarized in Table 4.

Acknowledgments. The authors are thankful to technical staff and Prof. U. P. Singh of Chemistry Department, I. I. T. Roorkee, for spectroscopic studies, elemental analysis and single crystal analysis. Ms. Reshma Rani is thankful to CSIR, New Delhi, for financial assistance.

As part of an ongoing program aimed at recognizing novel antioxidant, antimicrobial, and anticancer molecules, herein we report the synthesis and biological evaluation of imidazolidin-4-one and thiazolidine-2,4-dione derivatives as antimicrobial agents. These compounds were prepared from 5,5,8,8-tetramethyl-5,6,7,8-tetrahydro-naphthalen-2-carboxaldehyde and 3-substituted phenacyl-2,4-thiazolidinediones using Knoevenagel reaction. The structures of compounds were confirmed by ^{1}H NMR, mass spectral data, and elemental analyses. The molecules were evaluated for *in vitro* antimicrobial activity against methicillin-resistant *Staphylococcus aureus* (MRSA) (standard), methicillin-resistant *Staphylococcus aureus* (isolated), *Staphylococcus aureus* (SA), *Escherichia coli* (EC), *Bacillus subtilis* (BS), and *Candida albicans* (CA). Compounds **3(a–g)** and compound **4** showed equal and/or greater antimicrobial activity against MRSA and EC than ampicillin and sultamicillin.

J. Heterocyclic Chem., **46**, 1375 (2009)

INTRODUCTION

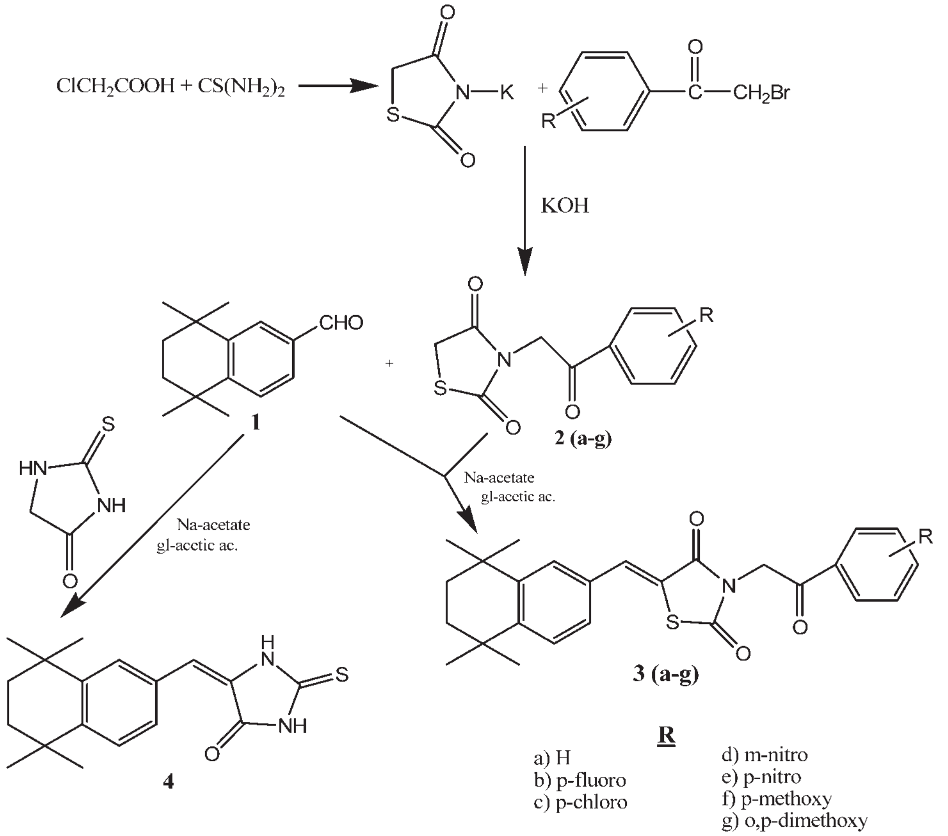
Previously, we reported that the synthesis and antimicrobial evaluation of tetrahydro-tetramethyl-naphthalene benzimidazoles, and tetrahydro-tetramethyl-naphthalene benzimidazole-amidines showed an activity comparable with that of fluconazole and sultamicillin against methicillin-resistant *Staphylococcus aureus*, *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Enterococcus faecalis*, *Candida krusei*, and *Candida albicans* [1,2].

Recent investigations have used retinoids both in chemotherapeutic and chemopreventive modes either as single agents or in combination with other agents such as growth factors and biological response modifiers [3]. The presence of a thiazolidine ring in penicillins and related derivatives was the first recognition of its occurence in nature [4]. The thiazolidinone nucleus is present in many compounds that have antibacterial and antifungal activity [5–9] This started the detailed structure-activity studies on thiazoline-2,4-diones and analogues related to them [10].

To provide more effective therapeutic agents with the benefical effects of all *trans*-retinoic acid (ATRA) but with reduced side effects, we developed conformationally constrained retinoids consisting of tetrahydro-tetramethyl-naphthalene moiety, which is integrated with thiazolidinedion and hydantoin ring systems and studied on their biological activity in terms of antimicrobial prospect.

In this article, synthesis and antimicrobial activity of a new series of 3-[2-(2,3,4-substitue-phenyl)-2-oxo-ethyl]-5-[1-(5,5,8,8-tetramethyl-5,6,7,8-tetrahydro-naphthalen-2-yl)-meth-(*Z*)-ylidene]-thiazolidine-2,4-dione and 1-substitue-5-[1-(5,5,8,8-tetramethyl-5,6,7,8-tetrahydro-

Scheme 1. General synthesis of **3**(**a-g**) and **4**.



naphthalen-2-yl)-meth-(*E*)-ylidene]-2-thioxo-imidazolidine-4-one are described.

RESULTS AND DISCUSSION

The synthetic procedure of the retinoidal thiazolidinedione derivatives is shown in Scheme 1. Because of the labile hydrogen atom at the 3-position, the thiazolidine-2,4-dione was *N*-alkylated with appropriate phenacyl halides in alkaline medium. The condensation of *N*-phenacylintermediates **2**(**a–g**) with retinoidal carboxaldehyde in glacial acetic acid and in the presence of sodium acetate by Knoevenagel reaction, led to 3-[2-(2,3,4-substitue-phenyl)-2-oxo-ethyl]-5-[1-(5,5,8,8-tetramethyl-5,6,7,8-tetrahydro-naphthalen-2-yl)-meth-(*Z*)-ylidene]-thiazolidine-2,4-dione derivatives **3**(**a–g**).

The appearance of pathogens resistant to known antibiotic therapy is becoming an important healthcare problem including the increase in the isolation and treatment of methicillin-resistant *Staphylococcus aureus* (MRSA) strains [11]. Besides resistance to beta-lactam antibiotics, MRSA strains are also found to possess resistance to several antibiotics (macrolides, tetracyclines, and aminoglycosides) other than beta-lactams. Although MRSA are resistant to many drugs, most remain susceptible to the antibiotics vancomycin, teicoplanin (belongs to a group of antibiotics called glycopeptides), and linezolid [12,13]. Linezolid is a new antibiotic that is found active against MRSA and has good safety, tolerability even for newborns and children [14]. The chemical structure of linezolid is related to oxazolidine moiety, which is quite similar to those we have synthesized thiazolidinedione retinoids. The oxazolidinones, including linezolid and eperezolid, denote a unique class of synthetic antimicrobial agents with good activity against MRSA and vancomycin-resistant enterococci. Because of their unique mode of action, they do not display cross-resistance with other classes of antimicrobial agents [15].

In our study, the prepared compounds [novel compounds **3**(**a–g**) and **4**] were screened *in vitro* against *Staphylococcus aureus* (ATCC 25923), methicillin-resistant *Staphylococcus aureus* (standard) (ATCC 43300), methicillin-resistant *Staphylococcus aureus* (isolated), *Escherichia coli* (ATCC 23556), *Bacillus subtilis* (ATCC 6633), and *Candida albicans* (ATCC10145) by dilution method and ciprofloxacin, ampicilline, sultamicillin, and fluconazole were used as standard drugs whose minimum inhibitory concentration (MIC) values

MIC, minimum inhibitory concentration μg/mL.

are provided (Table 1). The results of the antimicrobial screening showed that the thiazolidinedione derivatives integrated to partial retinoic acid moiety exhibited varying degrees of moderate activity against bacteria comparable with ampicilline and sultamiclline on MRSA. Moreover, compounds **3c**, **3e**, **3g**, and **4** were active toward *C. albicans*. The MICs ranging between 3.125 and 25 μg/mL were reported for these compounds.

EXPERIMENTAL

Chemistry. Melting points were determined with a Buchi SMP-20 and Buchi 9100 melting point apparatus and are uncorrected. ^{1}H and ^{13}C NMR spectra were recorded on a Varian Mercury 400 MHz spectrometer in DMSO-d_6, chemical shifts are expressed as δ (ppm) values with tetramethylsilane (TMS) as an internal standard and coupling constants (J) are reported in Hertz (in NMR description, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, and br = broad peak). The mass spectra were recorded with a Waters ZQ micromass LC-MS spectrometer by the method of ES$^+$ and elemental analyses were performed on LECO 932 CHNS instrument and were within ±0.5% of the theoretical values (analyses performed at Scientific and Technical Research Council of Turkey, Instrumental Analysis Center, Ankara, Turkey). Analytical thin-layer chromatography (TLC) was run on Merck silica gel plates (Kieselgel 60F-254). Column chromatographies were accomplished on silica gel 60 (40-63 μm particle size) (Merck). All starting materials and reagents were high-grade commercial products purchased from Aldrich, Merck or Fluka. Compound **2a**, **2c**, **2e** [16], **2b** [17], **2d** [18], **2f–g** [19], and retinoidal-carboxaldehyde **1** [20] were prepared according to the literature.

General synthesis of compounds 3a-g and 4. 3-(Substituted phenacyl)-2,4-thiazolidinedione 2a–g or thiohydantoine (1 mmol) and CH_3COONa (0.25 g) were added to a solution of retinoidal carboxaldehyde 1 (1.2 mmol) in glacial CH_3COOH (3 mL). The reaction mixture was heated to 140–150°C for a period of 4-6 h. The resulting precipitate was filtered, washed with H_2O, and then with acetone. The residue was purified by column chromatography silica gel 60 (230–400 mesh ASTM) using *n*-hexane: $CHCl_3$ (2:1) mL or *n*-hexane: EtOAc (3:1) mL as eluant [18].

3-[2-(Phenyl)-2-oxo-ethyl]-5-[1-(5,5,8,8-tetramethyl-5,6,7,8-tetrahydro-naphthalen-2-yl)-meth-(Z)-ylidene]-thiazolidine-2,4-dione (3a). According to the literatures, the thiazolidinedione compounds usually possess the *Z* configuration [21–23]. On the other hand, 5-arylidene-4-thio-imidazolidine-2-ones are theoretically able to exist both in the *Z* and *E* configurations. To explain configurations of our thio-imidazolidine compound. The NOESY and ROESY spectra of the compound 4 showed the compound is a mixture of *E* (more in amount) and *Z* configurations.

Microbiology. Determination of the minimal inhibitory concentrations (MIC) of the compounds by dilution method.

Sample preparation. Each of the test compounds and standards (ampicillin, floconazole, cipro, and sultamicilin) were dissolved in 12.5% DMSO, at concentrations of 200 μg/mL. Further dilutions of the compounds and standards in the test medium were prepared at the required quantities of 100, 50, 25, 12.5, 6.25, 3.125, 1.56, and 0.78 μg/mL.

Culture of microorganims. All the compounds were tested for their *in vitro* growth inhibitory activity against different bacteria and the yeasts *Candida albicans*. The bacterial strains and *Candida albicans* used in this study were obtained from the culture collection of Refik Saydam Health Institution of Health Ministry, Ankara, and maintained at the Microbiology Department of Faculty of Pharmacy of Ankara University. The bacterial strains were maintained on MHA (Mueller-Hinton Agar) medium for 24 h at 37°C and fungi were maintained on SDA (Sabouraud Dextrose Agar) for 2–5 days at 25°C ± 1°C. The bacteria and fungi inocula were prepared by suspension in 9 mL of sterile water for colonies from culture on MHA and SDA medium.

Assay for in vitro antimicrobial activity. The *in vitro* antimicrobial activity of compounds was tested by the tube dilution technique [24,25]. The tube dilution technique was followed to determine the MIC of all the synthesized compounds. MHB (Mueller-Hinton Broth) was used for bacteria, and SDB (Sabouraud Dextrose Broth) was used for *Candida spp*. The cell density of each inoculum was adjusted in sterile water of a 0.5 Mc Farland standard. A final concentration of $\sim 10^5$ CFU/mL and 10^4 CFU/ mL for the bacteria and fungi, respectively. Microbial inocula were added to the twofold diluted samples. After incubation for bacteria 18–24 h at 37°C ± 1°C and for fungi 2–5 days 25°C ± 1°C, the last tube with no growth of microorganism was recorded to represent MIC expressed in μg/mL.

Acknowledgment. This work is supported by Ankara University Research Fund (2001-08-03-029).

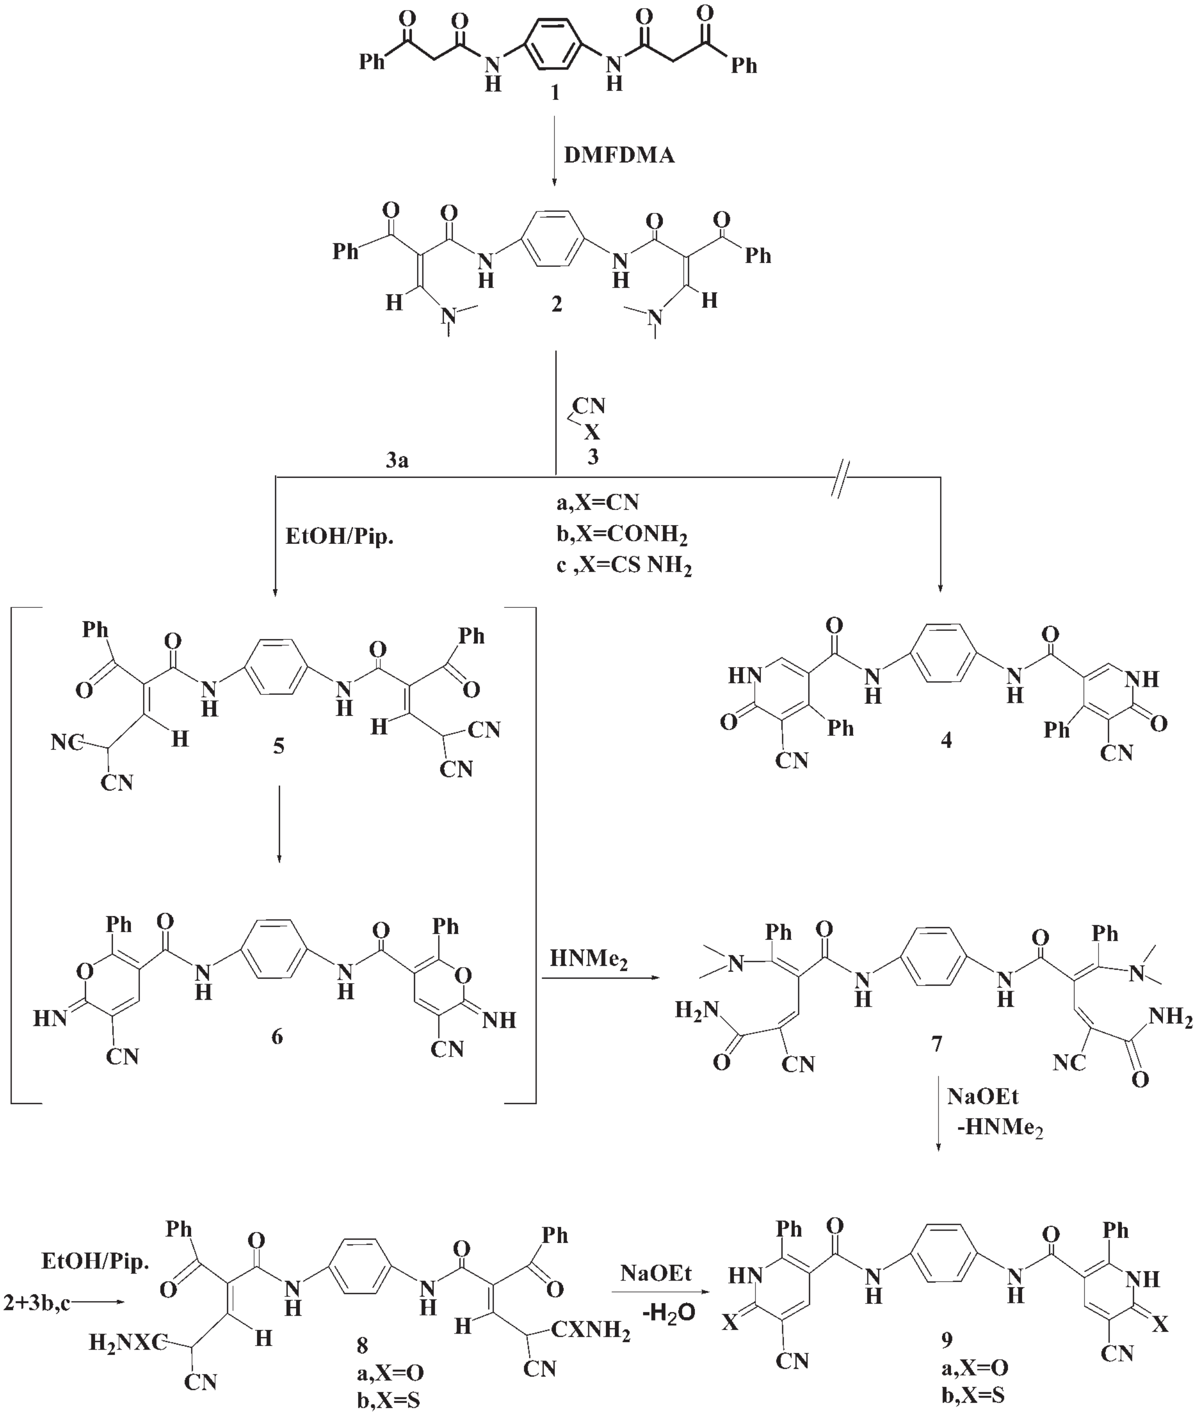
N,N′-(1,4-phenylene)bis(3-oxo-3-phenylpropanamide) **1** reacts with DMFDMA in refluxing toluene to afford *N,N′*-(1,4-phenylene)bis(2-benzoyl-3-(dimethylamino)acrylamide) **2**. Compound **2** reacts with a twofold excess of the active methylene reagents **3a-c** to afford the pent-2-enediamide derivatives **7** and **8a,b**, respectively. Compounds **7** and **8a** could be cyclized to afford the same compound *N,N′*-(1,4-phenylene)bis(5-cyano-6-oxo-2-phenyl-1,6-dihydropyridine-3-carboxamide) **9a** while **8b** was cyclized to afford the 6-thioxo analogue **9b**. Compound **2** reacts with hydrazine derivatives **10a,b** in refluxing ethanol/piperidine to afford the hydrazinylacrylamide derivatives **11a,b**, which have been cyclized to the corresponding *N,N′*-(1,4-phenylene)bis(1*H*-pyrazole-4-carboxamide) derivatives **12a,b**, respectively. Compound **2** reacts also with urea derivatives **13a-c** in refluxing ethanol/piperidine to afford the *N,N′*-(1,4-phenylene)bis(2-benzoyl-3-substituted-acrylamide) derivatives **14a-c**, which could be cyclized into *N,N′*-(1,4-phenylene)bis(6-phenyl-1,2-dihydropyrimidine-5-carboxamide)-2-oxo; 2-thioxo or 2-imino derivatives **15a-c**, respectively.

J. Heterocyclic Chem., **46**, 1380 (2009).

INTRODUCTION

Pyridines and pyridones represent an important class of organic compounds due to their pharmaceutical applications [2–4]. Furthermore functionalized pyrazoles have received much attention due to their diverse biological activities as immunosuppressant agents, selective COX-2 inhibitors, and antitumor agents [5]. Pyrimidine derivatives also exhibit HMG-CoA reductase inhibitory effect and antitumor activity [6]. The majority of attention has been so far paid to the development of syntheses of only one functionally substituted unit of these nuclei [7,8]. To our knowledge there is only one report describing the synthesis of compounds containing two 4*H*-benzopyran units [9], but those containing two pyridone units, two pyrazole units or two pyrimidine units, are hitherto not investigated. The reaction of enaminones with active methylene reagents [10], amines [11], or hydrazines [12] represents one of the strategies for the preparation of 2-1*H*-pyridones, pyrroles, and pyridazines, respectively. In the last two decades, we have been involved in a program aiming at the synthesis of functionally substituted heterocyclic compounds from

Scheme 1. Preparation of compounds **2**, **7**, **8**, and **9**.

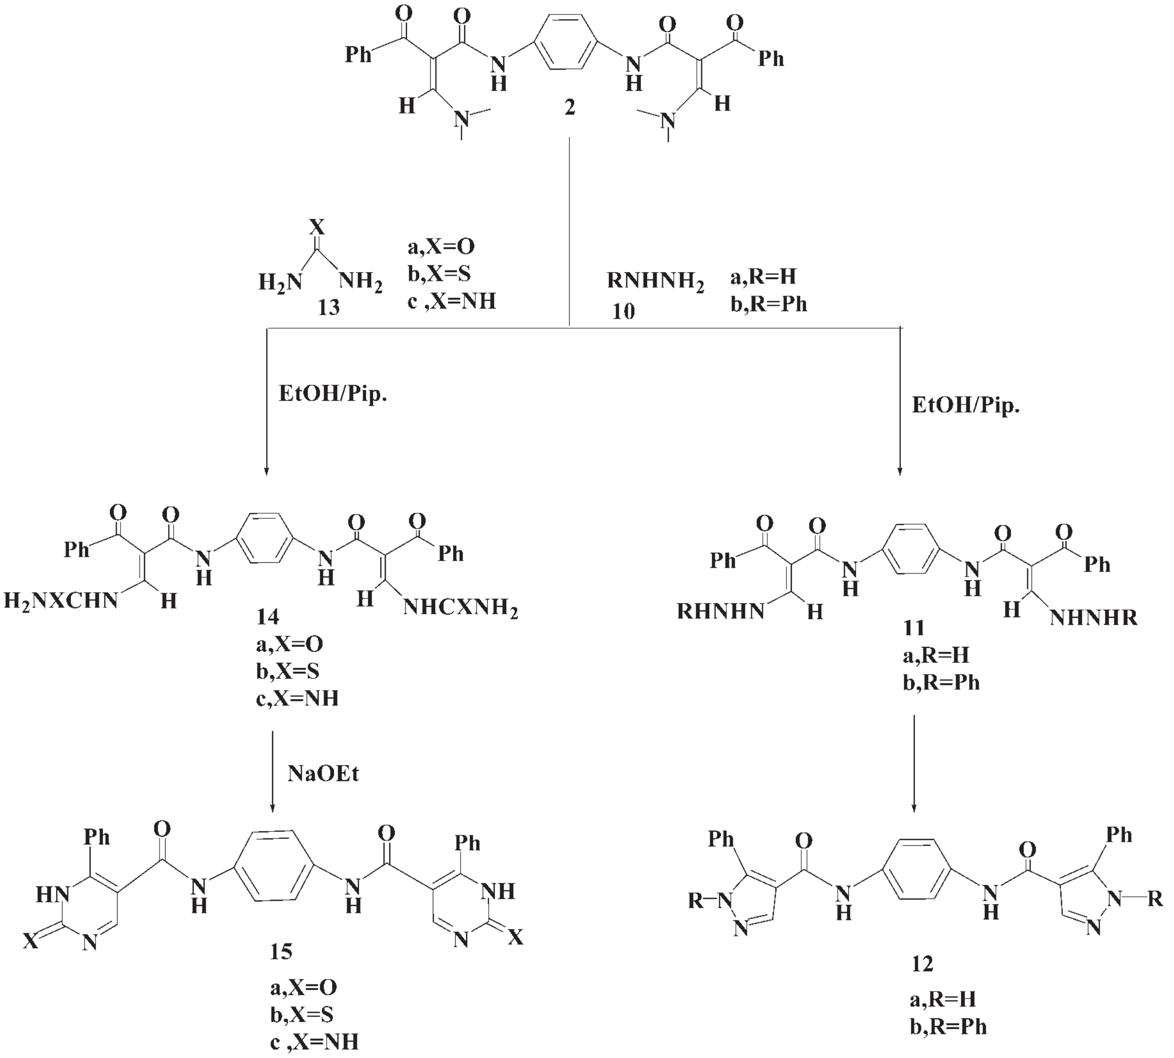


cheap laboratory available starting materials to be tested as biodegradable agrochemicals [13–15]. Some functional compounds bearing two or more of the aforementioned units are required for biological activity studies. 1,4-Phenylenediamine seemed a suitable candidate to fulfill this objective.

RESULTS AND DISCUSSION

1,4-Phenylenediamine smoothly undergoes the condensation reaction with twofold excess of ethyl benzoylacetate in refluxing dimethylformamide (DMF) to afford quantitatively *N*,*N*′-(1,4-phenylene)bis(3-oxo-3-phenylpropanamide) **1**.

Scheme 2. Preparation of compounds **11**, **12**, **14**, **15**.



Compound **1** reacts with dimethylformamide dimethylacetal (DMFDMA) in refluxing toluene to afford *N,N′*-(1,4-phenylene)bis(2-benzoyl-3-(dimethylamino)acrylamide) **2** in quantitative yield (*cf.* Scheme 1).

Compound **2** reacts with a twofold excess of malononitrile **3a** to afford a product of molecular mass m/z = 642. This molecular mass is applicable to the molecular formula $C_{36}H_{34}N_8O_4$. *N,N′*-(1,4-phenylene)bis(2-cyano-4-((dimethylamino)(phenyl)methylene)pent-2-enediamide) **7** (Scheme 1) was assigned to this product based on analytical and spectral data (*cf.* Experimental part). In this reaction it is apparent that malononitrile moieties readily substitute the dimethylamino groups in **2** with elimination of dimethylamine to give the intermediate **5** rather than the initial condensation of **3a** with the carbonyl groups of **2** and cyclization after the claimed hydrolysis of two cyano groups (one on each side) to amide groups to give **4** [16,17]. The intermediate **5** undergoes cyclization to the bis-iminopyran derivative **6**, which is re attacked by dimethylamine to afford the isolable product **7**. Recently, we could prove via an X-ray crystallographic study that **3a** substitutes NMe_2 followed by cyclization into iminopyran and ring opening by the attack of dimethylamine [10].

Refluxing compound **7** in ethanol/sodium ethoxide furnished its cyclization to the desired *N,N′*-(1,4-phenylene)bis(5-cyano-6-oxo-2-phenyl-1,6-dihydropyridine-3-carboxamide) **9a** via re-elimination of dimethylamine. The IR spectrum of this product showed absorption bands at υ_{max} at 3451–3141 cm^{-1} for the NH protons, 2213 cm^{-1} for the CN groups, 1687 and 1659 cm^{-1} for the carbonyl groups. The mass spectrum showed the molecular ion peak at m/z = 552 [M^+]. ^1H NMR spectrum showed signals at δ_H = 7.15–7.68 (m, 14H, Ar-Hs), 7.70 (s, 2H, 2NH), 7.99 (s, 2H, Pyridone 4-Hs), 10.07 (s, 2H, 2NH). Thus structure **9a** was established for this product on the basis of the spectral and element analysis data, which are in complete agreement with this structure.

Compound **2** also reacts with cyanoacetamide **3b** in refluxing ethanol with few drops of piperidine as catalyst to afford the product **8a** via substitution of NMe_2 in **2** by cyanoacetamide. Refluxing compound **8a** in ethanol/sodium ethoxide furnished its cyclization to afford the same product **9a** via loss of water. This finding is in complete agreement with our reported behavior of **3b** with enaminones that had been rationalized in our previous article [10].

Following the same mechanistic pathway during its reaction with **3b**, compound **2** reacts with cyanothioacetamide **3c** in refluxing ethanol/piperidine to afford a yellow crystalline product, which showed the presence of sulfur in the element test. The IR spectrum showed carbonyl absorption bands at $\upsilon_{max} = 1658$ & $1680\ cm^{-1}$ and the mass spectrum showed the molecular ion peak at $m/z = 620$ [M^+]. Based on these data as well as the ^1H NMR and elemental analytical data structure **8b** was assigned to this product. Refluxing compound **8b** in ethanol/sodium ethoxide led to its cyclization via loss of water to afford the *N*,*N*′-(1,4-phenylene)bis(5-cyano-2-phenyl-6-thioxo-1,6-dihydropyridine-3-carboxamide) compound **9b** (*cf.* Scheme 1 and Experimental part).

Compound **2** reacts also with hydrazine hydrate **10a** and with phenyl hydrazine **10b** in refluxing ethanol/piperidine to afford the hydrazinylacrylamide derivatives **11a** and **11b**, respectively (Scheme 2), in which the hydrazino moiety (—NHNHR) of **10a** or **10b** substitutes the -NMe_2 of **2** on both sides. These could be readily cyclized in refluxing ethanol/sodium ethoxide to give *N*,*N*′-(1,4-phenylene)bis(5-phenyl-1*H*-pyrazole-4-carboxamide) **12a** and *N*,*N*′-(1,4-phenylene)bis(1,5-diphenyl-1*H*-pyrazole-4-carboxamide) **12b**. Analytical and spectral data are in complete agreement with structures **11a,b** and **12a,b** (*cf.* experimental).

Similarly, compound **2** reacts with urea **13a**, thiourea **13b**, and guanidine **13c** in refluxing ethanol/piperidine to afford yellow products with molecular masses 540, 672, and 538, respectively. It is apparent also in this case that the dimethylamino groups of **2** were substituted by the —$NHCXNH_2$ of the respective urea derivative with elimination of dimethylamine to afford compounds **14a**, **14b**, and **14c**, respectively.

Compounds **14a-c** could also be cyclized upon their reflux in ethanol/sodium ethoxide solution to afford the desired *N*,*N*′-(1,4-phenylene)bis(2-oxo-6-phenyl-1,2-dihydropyrimidine-5-carboxamide) **15a** *N*,*N*′-(1,4-phenylene)bis(6-phenyl-2-thioxo-1,2-dihydropyrimidine-5-carboxamide) **15b** and *N*,*N*′-(1,4-phenylene)bis (2-imino-6-phenyl-1,2-dihydropyrimidine-5-carboxamide) **15c**, respectively.

CONCLUSION

We could obtain some novel *p*-phenylene-bis-heterocyclic carboxamides from readily available cheap starting materials that could be useful for biological evaluation studies.

EXPERIMENTAL

Melting points were measured on an Electrothermal (9100) apparatus and are uncorrected. IR spectra were recorded as KBr pellets on a Perkin Elmer 1430 spectrophotometer. The ^1H NMR and ^{13}C NMR spectra were taken on a Varian Gemini 300 MHz spectrometer in DMSO-d_6 using TMS as internal standard and chemical shifts are expressed in δ ppm values. Mass spectra were taken on a Shimadzu GCMS-GB 1000 PX (70 ev). Elemental analyses were carried out at the Micro-analytical Center at Cairo University.

***N*,*N*′-(1,4-phenylene)bis(3-oxo-3-phenylpropanamide) 1.** A mixture of *p*-phenylenediamine (10 mmol) and ethyl benzoylacetate (20 mmol) in DMF (15 mL) was refluxed for 3 h and then left to cool to room temperature. The reaction mixture was then poured onto ice-cold water and the precipitated solid was filtered off and recrystallized from ethanol to afford **1** as yellow crystalline solid; yield (3.84 g; 96%); mp 237–238°C (EtOH/DMF). $\upsilon_{max} = 3470, 3377, 3271$ (NH), 1687(CO), 1641 (amide CO); δ_H. MS: $m/z = 400$ (M^+). $\delta_H = 3.54$ (s, 4H, $2CH_2$), 7.29–7.85 (m, 14H, arom. H), 9.95 (s, 2H, 2NH).

Anal. Calcd for $C_{24}H_{20}N_2O_4$ (400.43): C, 71.99; H, 5.03; N, 7.00. Found: C, 72.08; H, 5.13; N, 7.28.

***N*,*N*′-(1,4-phenylene)bis(2-benzoyl-3-(dimethylamino)acrylamide) 2.** To compound **1** (4 g; 10 mmol) in 20 mL of dry toluene was added (2.4 g; 20 mmol) of DMFDMA and the reaction mixture was refluxed for 4 h, whereby the reactants dissolve completely to a clear solution and then a precipitate reappeared. The flask was left to cool to room temperature and the solid product was collected by filtration and recrystallized from ethanol to give compound **2** as yellow crystalline solid; yield (4.85 g; 95%); mp 209–210°C (EtOH/DMF). $\upsilon_{max} = 3400, 3265, 3131$ (NH), 1655(CO), 1642 (amide CO); $\delta_H = 3.33$ (s, 12H, $4CH_3$), 7.14–8.00 (m, 14H, arom.), 7.44 (s, 2H, olefinic protons), 10.07 (s, 2H D_2O exch., 2NH). MS: $m/z = 510$ (M^+).

Anal. Calcd for $C_{30}H_{30}N_4O_4$ (510.58): C, 70.57; H, 5.92; N, 10.97. Found: C, 70.62; H, 5.98; N, 11.17.

***N*,*N*′-(1,4-phenylene)bis(2-cyano-4-((dimethylamino)(phenyl)methylene)pent-2-enediamide)7.** To a mixture of the enaminone **2** (5.1 g; 10 mmol) and malononitrile **3a** (1.32 g; 20 mmol) in ethanol (25 mL) was added few drops of piperidine as catalyst. The reaction mixture was refluxed for 2 h and then left to cool to room temperature. The solid product thus precipitated that was collected by filtration and crystallized from acetic acid to afford compound **7** as yellow crystalline product: yield (5 g, 78%); mp 246–247°C (AcOH); $\upsilon_{max} = 3451, 3333, 3141$ (NH & NH_2), 2213 (CN), 1687 (CO), and 1659 (CO) cm^{-1}; MS: $m/z = 642$ [M^+]; $\delta_H = 2.85$ (s, 12H, $4 \times CH_3$), 7.15–7.68 (m, 14H, Ar-Hs), , 6.78 (s, 4H, $2NH_2$), 7.70 (s, 2H, 2NH), 7.98 (s, 2H, 3-Hs).

Anal. Calcd *for* $C_{36}H_{34}N_8O_4$: (642.71): C, 67.28; H, 5.33; N, 17.43. Found: C, 67.35; H, 5.38; N, 17.35.

The reaction of the enaminone 2 with the acetamides 3b,c. To a mixture of the enaminone **2** (5.1 g; 10 mmol) and cyanoacetamide **3b** (1.64 g; 20 mmol) or cyanothioacetamide **3c** (2.0 g, 20 mmol) in ethanol (25 mL) was added few drops of piperidine as catalyst. The reaction mixture was refluxed in each case for 2 h and then left to cool at room temperature. The solid products thus precipitated were collected by filtration and crystallized from acetic acid to afford compound **8a** and **8b**.

***N,N*′-(1,4-phenylene)bis(2-benzoyl-4-cyanopent-2-enediamide) 8a.** Yellow crystalline product: yield (4.47 g, 76%); mp 234–235°C (AcOH); υ_{max} = 3452, 3330, 3142 (NH & NH_2), 2215 (CN), 1686 (CO), and 1656 (CO), 1640 (CO) cm^{-1}; MS: *m/z* = 588 [M^+]; δ_H = 3.34 (d, 2H, 2Hs; *j* = 12.62 Hz), 7.15–7.68 (m, 14H, Ar-Hs), 7.72 (s, 2H, 2NH), 7.98 (d, 2H, 3-Hs; *j* = 12.62 Hz), 10.05 (s, 4H, $2NH_2$).

Anal. Calcd *for* $C_{32}H_{24}N_6O_6$: (588.57): C, 65.30; H, 4.11; N, 14.28. Found: C, 65.32; H, 4.15; N, 14.38.

***N,N*′-(1,4-phenylene)bis(5-amino-2-benzoyl-4-cyano-5-thioxopent-2-enamide) 8b.** Yellow crystalline product: yield (4.28 g, 69%); mp 213–215°C (AcOH); υ_{max} = 3454, 3332, 3140 (NH & NH_2), 2219 (CN), 1679 (CO), and 1656 (CO) cm^{-1}; MS: *m/z* = 621 [$M^+ + 1$]; δ_H = 3.32 (d, 2H, 2Hs; *j* = 12.6 Hz), 7.14–7.67 (m, 14H, Ar-Hs), 7.73 (s, 2H, 2NH), 7.92 (d, 2H, 3-Hs; *j* = 12.6 Hz), 10.04 (s, 4H, $2NH_2$).

Anal. Calcd for $C_{32}H_{24}N_6O_4S_2$: (620.70): C, 61.92; H, 3.90; N, 13.54; S, 10.33. Found: C, 61.98; H, 3.85; N, 13.74; S, 10.50.

Cyclization of 7 and 8a,b. To the solution of each compounds **7**, **8a**, and **8b** (10 mmol) in 20 mL of ethanol was added few drops of sodium ethoxide (freshly prepared by dissolving 0.1 g of sodium metal in 10 mL of absolute ethanol). The reaction mixture was refluxed for 1 h in each case then left to cool overnight. The contents of the flask was poured on ice cold water and acidified with few drops of HCl till just neutral. The precipitated solids were collected by filtration and recrystallized to give.

***N,N*′-(1,4-phenylene)bis(5-cyano-6-oxo-2-phenyl-1,6-dihydropyridine-3-carboxamide) 9a.** Pale yellow crystals, yield (3.7 g, 67 % from **7**; mp 282–283°C (AcOH) and 3.86 g; 70% from **8a**; mp 284–285°C (AcOH); υ_{max} = 3451, 3333, 3141 (NH), 2213 (CN), 1687 (CO), and 1659 (CO) cm^{-1}; MS: *m/z* = 552 [M^+]; δ_H = 7.15–7.68 (m, 14H, Ar-Hs), 7.70 (s, 2H, 2NH), 7.99 (s, 2H, Pyridone 4-Hs), 10.07 (s, 2H, 2NH).

A reaction of 3,5-dimethylborondipyrromethene **3** with the DMF dimethylacetal gives rise to monoenamine **4**. The latter is converted to the corresponding aldehyde **5**. A considerable contribution of the enolic form of the aldehyde allows preparing numerous 3-vinyl substituted borondipyrromethenes and some heterocyclic derivatives. A reaction of the aldehyde **5** with tertiary aliphatic amines and the consecutive Hofmann-type decomposition of the intermediary quaternary salt give rise to the corresponding dialkylaminovinyl derivatives.

J. Heterocyclic Chem., **46**, 1386 (2009).

INTRODUCTION

The 4,4-difluoro-4-boron-3a,4a-diazo-s-indacene (so-called borondipyrromethene (BODIPY))-derived dyes have both very intensive absorption bands in their ultraviolet-visible (UV-Vis) spectra and intensive fluorescence [1,2]. A low sensitivity of these properties of the BODIPY dyes toward both solvent polarity and the pH led to their numerous applications, such as labeling of proteins [3–5] and DNA [6]. To widen the range of the biochemical applications requiring deeply colored dyes, the extension of the chromophoric system of the BODIPY dyes by means of their peripheral functionalization is usually carried out. For example, the Knoevenagel reaction of the BODIPY involving methyl groups in 3- and 5-positions with aromatic aldehydes led to the corresponding monostyryl or distyryl derivatives [7–9]. The latter compounds exhibit absorption maxima at considerably longer wavelengths compared with the parent BODIPY. In this contribution, we report an efficient synthetic approach to the 3-vinyl substituted BODIPY dyes using the reactivity of the α-methyl groups. The obtained compounds are useful scaffolds that could be used in further structural and functional modifications of the dipyrromethene dyes.

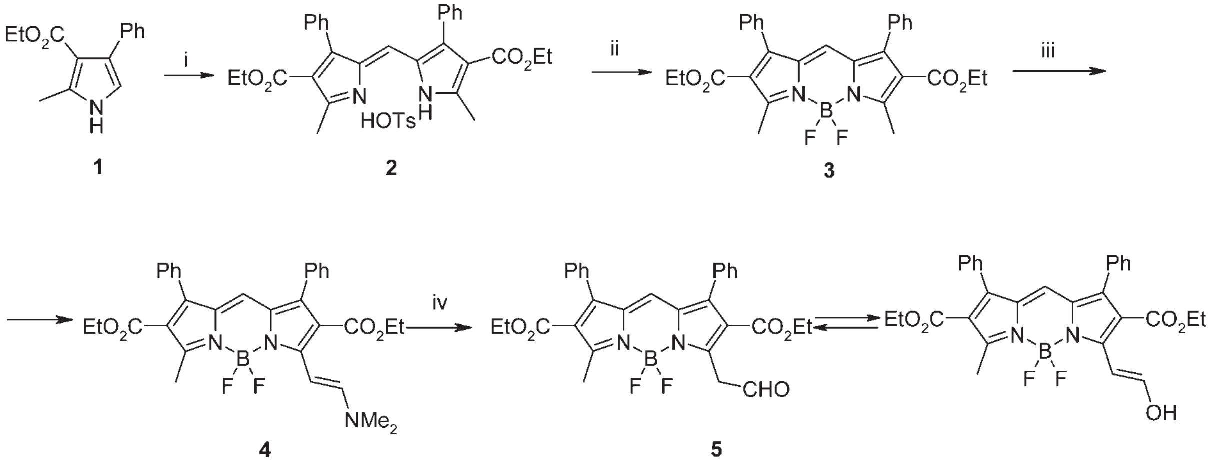
RESULTS AND DISCUSSION

As shown in Scheme 1, the condensation of the pyrrole **1** with trimethylorthoformate in the presence of *p*-toluenesulfonic acid leads to the dipyrromethene tosylate **2** in a 95% yield. Noteworthy, the preparation of hydrobromide of the dipyrromethene **2** from the pyrrole and triethyl orthoformate dissolved in the 50% HBr in acetic acid was reported in the literature [10], but no yield was given. Finally, the treatment of the tosylate **2** with $BF_3{\cdot}Et_2O$ and the Hünig's base gives rise to 84% of the BODIPY **3** that is used as the starting compound in our study.

A reaction of **3** with the DMF dimethylacetal in the presence of acetic anhydride in hot xylene results in 89% enamine **4** (Scheme 1). The fact that only one methyl group of **3** reacts even if a large excess of the DMF dimethylacetal is used reflects a decreased reactivity of the remaining methyl group of **4** on introduction of the electron donor enamine fragment.

Treatment of the enamine **4** with TFA in water gives rise to the corresponding aldehyde **5**. The latter compound exists in a medium dependent equilibrium of two tautomeric forms. Thus, ^{1}H NMR spectrum of **5** recorded in $CDCl_3$ reveals characteristic peaks of CH_2 and aldehyde protons at 4.52 ppm and 9.82 ppm, respectively. The presence of the enolic form of **5** in $CDCl_3$ is, therefore, negligible and cannot be detected by means ^{1}H NMR. On the contrary, the DMSO-d$_6$ ^{1}H NMR spectrum of **5** shows both tautomeric forms in a 1:1 ratio. The latter manifests itself in two peaks of the CH_3 group at 2.76 and 2.81 ppm, one peak of the CH_2 group

Scheme 1. Reagents and conditions. i, $CH(OCH_3)_3$, HOTs, room temperature; ii, $BF_3{*}Et_2O$, $EtN(i\text{-}Pr)_2$, room temperature; iii, $(CH_3O)_2CHN(CH_3)_2$, Ac_2O, o-xylene, reflux 1 min; iv, 30% TFA in water, reflux 1 min.



at 4.45 ppm, broad peaks of CH=CH at 6.46 and 8.09 ppm, two peaks of meso-protons at 6.7 and 6.98 ppm, and the aldehyde proton peak at 9.76 ppm.

Scheme 2 shows reactions of aldehyde **5** leading to a variety of vinyl derivatives. For example, heating of **5** in $POCl_3$ in the presence of *N,N*-diethylaniline results in the chlorovinyl compound **6**, whereas heating of **5** in acetic anhydride in the presence of catalytic amount of DMF gives rise to the enole acetate **7**. Interestingly, treatment of **5** with $BF_3{\cdot}Et_2O$ in toluene at room temperature leads to the intramolecular displacement of the fluorine with the enolic unit producing the cyclic structure **8**. ^1H NMR data show that the coupling constant of the ethylene protons in **8** is equal to 5.1 Hz, which is typical for the *cis*-configuration of the bond. This observation is in stark contrast with those for the noncyclic vynil

Scheme 2. Scheme 3

derivatives shown in Scheme 2 in which the corresponding coupling constants are in the range of 12–16 Hz and characteristic of the *trans*-configuration of the double bond. ^{19}F NMR spectrum of **8** shows that the peak corresponding to its fluorine atom is shifted to the low field (−137.2 ppm) compared with that of **5** (−141.6 ppm). Mass spectrum of **8** (mw 524) recorded in the positive mode reveals cationic peak with *m*/*z* of 505 that corresponds to the loss of the remaining fluorine anion. The intermolecular displacement of the fluorine in BODIPYs with alkoxy and phenoxy groups in the presence of $AlCl_3$ has already been reported in the literature [11]. There are also reports on an intramolecular *O*-chelation of the boron atom in BODIPYs [12]. The described here compound **8** is the representative of unsymmetrically chelated BODIPYs recently reported in [13].

A mixture of cyclic structures **8** (28%) and **9** (22%) is obtained from the aldehyde **5** in hot acetic acid in the presence of sulfuric acid. The formation of the both cycles is also observed (TLC) while heating aldehyde **5** over 200°C.

The chlorine atom of the compound **6** is considerably reactive. Addition of bases, such as pyridine, triethylamine, carbonates etc., to **6** leads to the formation of tars. This observation can possibly be explained by the formation of the corresponding acetylene derivative and its polymerization. Similar tar formation is observed when a phenolate anion reacts with **6**. However, a reaction of **6** with a thiophenolate anion that is less basic but more nucleophilic gives rise to the sulfide **10**.

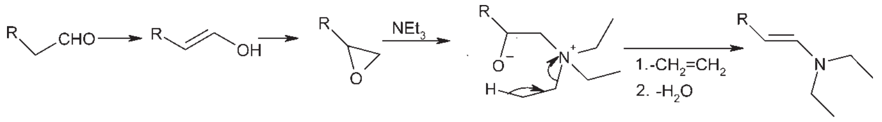
The aldehyde **5** reacts easily with aromatic amines. For example, a reaction of **5** with aniline gives rise to the anilinovinyl derivative **11** in a yield of 80%. The acylation of the latter compound leads to the corresponding acetanilide **12**. The derivatives of type **11** can also be obtained by the reaction of aniline with the enamine **4** and enole acetate **7**. However, reactions of **5** with primary aliphatic amines cannot be used for the preparation of the corresponding aminovinyl derivatives because of their follow-up cyclization to pyridones of type **13**. The pyridone **13** is easily obtained by the reaction of **5** with a methanol solution of methylamine in hot toluene in the presence of acetic acid (Scheme 2).

Attempting to carry out the reaction of **5** with different CH-acids in the presence of triethylamine led to a dye product. The structure of this dye does not depend on the structure of the CH-acid used as TLC and UV-Vis absorption spectra reveal. Further, analytical characterization of this new product confirms the structure of a diethylaminovinyl derivative **14** that is the result of a direct coupling of **5** and the triethylamine (Scheme 3). This reaction takes place after either 10–15 min of heating or 24 h of standing at room temperature of the reaction mixture in pyridine or dioxane. The enamine **14** can also be obtained by a reaction of **5** with diethylamine (Scheme 3).

A reaction of **5** with tributylamine proceeds in a similar way, giving rise to the dibutylamino-derivative **15**. The reaction results a chromatographically nonseparable mixture of two products if ethyldiisopropylamine is used. According to the ^{1}H NMR data, the mixture consists of equal amounts of diisopropylamino and ethylisopropylamino derivatives.

A possible mechanism of the reaction of **5** with trialkylamines is depicted in Scheme 4. The enolic form of the aldehyde **5** undergoes cyclization to an oxirane intermediate, which reacts with the amine producing betaine. The following Hoffman-type decomposition of the quaternary salt leads to the consecutive elimination of the alkene and the water. To our knowledge, the reactions of acetaldehyde derivatives with trialkylamines leading

Scheme 4



to enamines or similar transformations have not been reported in the literature.

Optical properties. The cyclization of dipyrromethene **2** to boron dipyrromethene **3** leads to a bathochromic shift of the UV-Vis absorption maximum of **3** compared with **2** by 35 nm. Compound **3** has also a more intense UV-Vis absorption band when compared with **2** (Table 1). All vinyl derivatives prepared from **3** have their UV-Vis absorption maxima at longer wavelengths compared with the precursor. However, their absorption bands become broader than that of **3**. The smallest bathochromic shifts of the UV-Vis absorption maxima are observed for the chlorovinyl derivative **6** (29 nm) and enole acetates **7** (33 nm) and **9** (34 nm). Aminovinyl derivatives **4**, **11**, **14**, and **15** show significantly larger bathochromic shifts of their UV-Vis absorption maxima when compared with that of **3** ranging from 102 to 107 nm. However, the absorption intensities of the UV-Vis spectra of the aminovinyl derivatives show a twofold decrease while their absorption bands broaden.

The synthesized vinyl-substituted BODIPYs with the exception of the amino-derivatives exhibit high fluorescence quantum yields (φ = 0.73-1). The fluorescence quenching in enamines **4**, **14**, and **15** takes place seemingly *via* photoinduced electron transfer (PET) as it is described for some other amino-substituted BODIPYs [14,15]. In the case of aniline derivative **11**, the PET is much less pronounced (φ = 0.17). The PET quenching can be avoided by, e.g., acylation or cyclization into pyridone **13**. These structural modifications lead to the fluorescence increase. The largest Stokes shifts are observed for sulfide **10** and enamine **11** (1150 and 1400 cm^{-1}, respectively). The remaining vinyl derivatives show the Stokes shifts comparable with that of the starting BODIPY (500–700 cm^{-1}).

Table 1

14	622 (6.0)	2481	668 (<0.001)	1107

To sum up, the reported here BODIPY-3-acetaldehyde is a useful scaffold for the synthesis of 3-vinyl-substituted BODIPYs and some heterocycles having the BODIPYs core as the cycle component. The synthesized 3-vinyl-substituted BODIPYs can, in turn, be used for the further modification of BODIPYs.

EXPERIMENTAL

Electronic absorption spectra were recorded on Shimadzu UV-3100 spectrophotometer. ^{1}H (300 MHz, 25°C, $Si(CH_3)_4$ as an internal standard) and ^{19}F NMR (188 MHz, $CFCl_3$ as internal standard) spectra were obtained with Varian VXR-300 instrument. LC/MS spectra were recorded using chromatography/mass spectrometric system that consists of high-performance liquid chromatograph ''Agilent 1100 Series'' equipped with diode-matrix and mass-selective detector ''Agilent LC\MSD SL.'' Purification by column chromatography was carried out with neutral silica gel 100 (70–230). Fluorescence spectra were recorded on a Solar CM 2203 fluorescence spectrophotometer. The relative fluorescent quantum yields (φ) were determined using Rhodamine 6G (φ = 0.95, EtOH) and indodicarbocyanine iodide (φ = 0.25, EtOH) as the references.

2-[3-Phenyl-4-carbethoxy-5-methylpyrrol-2-yl]methyliden-3-phenyl-4-carbethoxy-5-methylpyrrolium tosylate (2). Toluene-4-sulfonic acid (3.6 g, 21 mmol) was added to a stirred solution of pyrrole **1** (9.16 g, 40 mmol) in 20 mL trimethyl orthoformate at room temperature, and stirring was continued for 15 min. Then the mixture was diluted with benzene (50 mL), and the solid product was filtered. Yield 12.1 g (95%). mp 138–140°C. ^{1}H NMR ($CDCl_3$): δ 1.07(t, $^3J_{H,H}$ = 7.2 Hz, 6H, CH_2CH_3), 2.40 (s, 3H, CH_3), 2.85 (s, 6H, CH_3), 4.12 (q, $^3J_{H,H}$ = 7.2 Hz, 4H, CH_2CH_3), 6.82 (s, 1H, meso-CH), 7.09 (m, 4H, ArH), 7.27 (m, 8H, ArH), 7.91 (d, $^3J_{H,H}$ = 8.1 Hz, 2H, ArH), 13.82 (s, 2H, NH). 1,7-Diphenyl-2,6-dicarbethoxy-3,5-dimethyl-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (3). Diisopropylethylamine (14 mL, 80 mmol) was added dropwise to a stirred solution of compound **2** (12.8 g, 20 mmol) in $BF_3 \cdot Et_2O$ (50 mL) at room temperature The mixture was stirred for additional 20 min, followed by pouring into ice water (250 mL), and then was left for 2 h. The precipitate was filtered, air-dried, and recrystallized from hexane-toluene. Yield 8.7 g (84%). M.p. 217–218°C. ^{1}H NMR (DMSO-d_6): δ 1.03 (t, $^3J_{H,H}$ = 7.2 Hz, 6H, CH_2CH_3), 2.81 (s, 6H, CH_3), 4.08 (q, $^3J_{H,H}$ = 7.2 Hz, 4H, CH_2CH_3), 6.91 (s, 1H, meso-CH), 7.42 (s, 10H, ArH). Anal.

calcd. for $C_{29}H_{27}BF_2N_2O_4$: C, 67.4; H, 5.23; N, 5.43. Found: C, 67.5; H, 5.5; N, 5.5.

3-(2-Dimethylaminoethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (4). DMF dimethylacetal (3 g, 25 mmol) was added to a solution of compound **3** (2.58 g, 5 mmol), Ac_2O (6 mL) in o-xylene (15 mL), and the mixture was refluxed for 1 min. After cooling to room temperature, hexane (20 mL) was added, and the mixture was left overnight. The precipitate was filtered and washed with hexane. Yield 2.46 g (89%). M.p. 204–205°C. ^{1}H NMR (DMSO-d_6): δ 0.94 (t, 3H, CH_2CH_3), 1.01 (t, 3H, CH_2CH_3), 2.71 (s, 3H, CH_3), 3.08 (s, 3H, NCH_3), 3.29 (s, 3H, NCH_3), 4.06 (m, 4H, CH_2CH_3), 6.02 (d, $^3J_{H,H}$ = 12.9 Hz, 1H, CH), 6.30 (s, 1H, meso-CH), 7.25–7.44 (m, 10H, ArH), 8.19 (d, $^3J_{H,H}$ = 12.9 Hz, 1H, CH). Anal. calcd. for $C_{32}H_{32}BF_2N_3O_4$: C, 67.2; H, 5.6; N, 7.35. Found: C, 67.4; H, 5.4; N, 7.5.

(5-Methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacen-3-yl)acetaldehyde (5). A mixture of enamine **4** (2.28 g, 4 mmol), water (12 mL), and trifluoroacetic acid (5 mL) was refluxed for 1 min. After cooling to room temperature, the product was filtered and recrystallized from acetonitrile. Yield 1.4 g (73%). M.p. 194–196°C. ^{1}H NMR ($CDCl_3$): δ 1.09 (m, 6H, CH_2CH_3), 2.92 (s, 3H, CH_3), 4.13 (m, 4H, CH_2CH_3), 4.52 (s, 2H, CH_2CHO), 6.98 (s, 1H, meso-CH), 7.28–7.39 (m, 10H, ArH), 9.82 (s, 1H, CHO). ^{19}F NMR ($CDCl_3$): δ −141.6 (m).

^{1}H NMR (DMSO-d_6) a mixture of tautomers: δ 1.01 (m, CH_2CH_3), 2.76 (s, CH_3), 2.81 (s, CH_3), 4.08 (m, CH_2CH_3), 4.45 (s, CH_2CHO), 6.46 (br.s, CH), 6.70 (s, meso-CH), 6.98 (s, meso-CH), 7.75 (m, ArH), 8.09 (br.s, CH), 9.76 (s, CHO). Anal. calcd. for $C_{30}H_{27}BF_2N_2O_5$: C, 66.2; H, 4.96 N, 5.15. Found: C, 66.4; H, 4.8; N, 5.1.

3-(2-Chloroethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (6). A mixture of aldehyde **5** (270 mg, 0.5 mmol), $POCl_3$ (1 mL, 11 mmol), and *N,N*-diethylaniline (150 mg, 1 mmol) was heated at 90–95°C for 45 min. After cooling to room temperature, the mixture was poured into ice water, the precipitate was filtered and washed with hot ethanol. Yield 200 mg (71%). M.p. 186–187°C. ^{1}H NMR ($CDCl_3$): δ 0.99 (t, 3H, CH_2CH_3), 1.01 (t, 3H, CH_2CH_3), 2.93 (s, 3H, CH_3), 4.14 (m, 4H, CH_2CH_3), 6.93 (s, 1H, meso-CH), 7.25–7.40 (m, 10H, ArH), 7.53 (d, $^3J_{H,H}$ = 13.5 Hz,1H, CH), 7.68 (d, $^3J_{H,H}$ = 13.5 Hz, 1H, CH). ^{19}F NMR ($CDCl_3$): δ −141.4 (m). Anal. calcd. for $C_{30}H_{26}BClF_2N_2O_4$: C, 64.0; H, 4.62; N, 4.98. Found: C, 63.7; H, 4.4; N, 5.1.

3-(2-Acetoxyethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (7). A mixture of aldehyde **5** (270 mg, 0.5 mmol), Ac_2O (1.3 mL), and DMF (35 mg, 0.5 mmol) was heated at reflux for 4 min. After cooling to room temperature, the mixture was diluted with i-PrOH (3 mL), and the precipitate was filtered. Yield 240 mg (82%). M.p. 209–210°C. ^{1}H NMR ($CDCl_3$): δ 1.04 (m, 6H, CH_2CH_3), 2.25 (s, 3H, $COCH_3$), 2.93 (s, 3H, CH_3), 4.13 (m, 4H, CH_2CH_3), 6.90 (s, 1H, meso-CH), 7.11 (d, $^3J_{H,H}$ = 13.5 Hz,1H, CH), 7.26–7.39 (m, 10H, ArH), 8.68 (d, $^3J_{H,H}$ = 13.5 Hz, 1H, CH). ^{19}F NMR ($CDCl_3$): δ −142.5 (m). Anal. calcd. for $C_{32}H_{29}BF_2N_2O_6$: C, 65.5; H, 4.95; N, 4.78. Found: C, 65.7; H, 4.8; N, 5.0.

9b-Fluoro-9-methyl-5,7-diphenyl-4,8-dicarbethoxy-1-oxa-9a,9c-diaza-9b-bora-cyclopenta[e]acenaphtylene (8). $BF_3{\cdot}Et_2O$ (500 mg, 3.5 mmol) was added to a solution of aldehyde **5** (270 mg, 0.5 mmol) in toluene (5 mL) at room temperature. The mixture was allowed for stand for 45 min, followed by addition of water (5 mL). The organic layer was separated, washed with water, dried over Na_2SO_4, and then evaporated to dryness. The residue was purified by column chromatography on silica gel (eluent hexane:EtOAc, 4:1). Yield 150 mg (58%). M.p. 167–168°C. ^{1}H NMR(DMSO-d_6): δ 1.01 (t, 3H, CH_2CH_3), 1.15 (t, 3H, CH_2CH_3), 2.87 (s, 3H, CH_3), 4.06 (q, 2H, CH_2CH_3), 4.17 (q, 2H, CH_2CH_3), 6.69 (d, $^3J_{H,H}$ = 5.1 Hz, 1H, CH), 6.88 (s, 1H, meso-CH), 7.40–7.52 (m, 10H, ArH), 7.72 (d, $^3J_{H,H}$ = 5.1 Hz, 1H, CH). ^{19}F NMR ($CDCl_3$): δ −137.2 (m). LS-MS: *m/z* 505 $[M-19(F)]^+$. Anal. calcd. for $C_{30}H_{26}BFN_2O_5$: C, 68.7; H, 4.94; N, 5.34. Found: C, 68.5; H, 4.9; N, 5.1.

2-Carbethoxy-3,7-dimetyl-1,9-diphenyl-4,4-difluoro-7-oxa-3a,4a-diaza-4-bora-cyclopenta[b]fluoren-8-on (9). A solution of aldehyde **5** (300 mg, 0.55 mmol), H_2SO_4 (98 mg, 1 mmol) in AcOH (3 mL) was heated at 100°C for 30 min. After cooling to room temperature, the mixture was poured into water. The precipitate was filtered and air dried. The crude product was purified by column chromatography on silica gel (eluent hexane-EtOAc, 4:1) to give **8** (80 mg), and **9** (60 mg) in 28% and 22% yield, respectively. mp 234–235°C. ^{1}H NMR ($CDCl_3$): δ 1.11 (t, 3H, CH_2CH_3), 2.99 (s, 3H, CH_3), 4.18 (q, 2H, CH_2CH_3), 6.96 (d, $^3J_{H,H}$ = 5.7 Hz, 1H, CH), 7.23 (s, 1H, meso-CH), 7.33–7.55 (m, 11H, ArH, CH), ^{19}F NMR ($CDCl_3$): δ −143.6 (m). Anal. calcd. for $C_{28}H_{21}BF_2N_2O_4$: C, 67.5; H, 4.21; N, 5.62. Found: C, 67.4; H, 4.4; N, 5.76.

3-[2-(4-Chlorophenylsulfanyl)ethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (10). An ethanol solution of sodium *p*-chlorotiophenolate (consisted of *p*-chlorotiophenole (54 mg, 0.37 mmol), NaOH (15 mg, 0.37 mmol) and EtOH (1 mL)) was added to a solution of compound **6** (160 mg, 0.28 mmol) in DMF (2 mL). The mixture was left for 30 min at room temperature followed by pouring into 10% aqueous NH_4Cl, and then the precipitate was filtered. The wet product was dissolved in EtOAc, dried over Na_2SO_4, and evaporated to dryness. The residue was recrystallized from cyclohexane. Yield 140 mg (74%). M.p.125–126°C. ^{1}H NMR (DMSO-d_6): δ 0.90 (t, 3H, CH_2CH_3), 1.03 (t, 3H, CH_2CH_3), 2.79 (s, 3H, CH_3), 4.08 (m, 4H, CH_2CH_3), 6.89 (s, 1H, meso-CH), 7.05 (d, $^3J_{H,H}$ = 15.9 Hz, 1H, CH), 7.42 (m, 10H, ArH), 7.59 (s, 4H, ArH), 8.08 (d, $^3J_{H,H}$ = 15.9 Hz, 1H, CH). Anal. calcd. for $C_{36}H_{30}BClF_2N_2O_4S$: C, 64.5; H, 4.48; N, 4.18. Found: C, 64.7; H, 4.6; N, 4.1.

3-(2-Phenylaminoethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (11). a. A mixture of aldehyde **5** (130 mg, 0.24 mmol), aniline (35 mg, 0.38 mmol), and acetic acid (2 mL) was heated to 80°C. After cooling to room temperature, the precipitate was filtered. Yield 120 mg (81%).

b. A mixture of enamine **4** (570 mg, 1 mmol), aniline (130 mg, 1.4 mmol), and acetic acid (3 mL) was refluxed for 20 min. After cooling to room temperature, the precipitate was filtered. Yield 360 mg (58%).

M.p.217–218°C. ^{1}H NMR (DMSO-d_6): δ 0.88 (t, 3H, CH_2CH_3), 1.01 (t, 3H, CH_2CH_3), 2.76 (s, 3H, CH_3), 4.06 (m, 4H, CH_2CH_3), 6.46 (s, 1H, meso-CH), 6.68 (d, $^3J_{H,H}$ = 13.2 Hz, 1H, CH), 7.15 (m, 3H, ArH), 7.34–7.44 (m, 12H, ArH), 8.81 (dd, $^3J_{H,H}$ = 13.5 Hz, $^3J_{H,H}$=13.2 Hz,1H, CH), 10.96 (d, $^3J_{H,H}$ = 13.5 Hz, 1H, NH). ^{19}F NMR (DMSO-d_6): δ −140.8

(m). Anal. calcd. for $C_{36}H_{32}BF_2N_3O_4$: C, 69.8; H, 5.16; N, 6.78. Found: C, 69.7; H, 5.4; N, 7.1.

3-(2-Acetanilidoethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (12). A solution of compound **10** (200 mg, 0.32 mmol), Ac_2O (0.5 g, 4.9 mmol), and triethylamine (15 mg, 0.15 mmol) in acetonitrile (2 mL) was refluxed for 1 min. After cooling to room temperature, the mixture was poured into water and allowed to stand for 30 min. The product was filtered and recrystallized from EtOH. Yield 120 mg (56%). M.p. 145–146°C. ^{1}H NMR (DMSO-d_6): δ 1.01 (m, 6H, CH_2CH_3), 1.99 (s, 3H, $COCH_3$), 2.69 (s, 3H, CH_3), 4.08 (m, 4H, CH_2CH_3), 5.93 (d, $^{3}J_{H,H}$ = 14.7 Hz, 1H, CH), 6.78 (s, 1H, meso-CH), 7.38–7.48 (m, 12H, ArH), 7.64 (m, 3H, ArH), 8.93 (d, $^{3}J_{H,H}$ = 14.7 Hz, 1H, CH). Anal. calcd. for $C_{38}H_{34}BF_2N_3O_5$: C, 70.0; H, 5.14; N, 6.35. Found: C, 69.9; H, 5.1; N, 6.1.

2-Carbethoxy-3,7-dimetyl-1,9-diphenyl-4,4-difluoro-3a,4a,7-triaza-4-bora-cyclopenta[b]fluoren-8-on (13). A mixture of aldehyde **5** (200 mg, 0.37 mmol), acetic acid (22 mg, 0.37 mmol), 27% methanol solution of methylamine (100 mg), and toluene (3 mL) was refluxed for 2 min. After cooling to room temperature, the precipitate was filtered. Yield 80 mg (42%). M.p. 273–274°C. ^{1}H NMR (DMSO-d_6): δ 1.04 (t, 3H, CH_2CH_3), 2.85 (s, 3H, CH_3), 3.43 (s, 3H, NCH_3), 4.10 (q, 2H, CH_2CH_3), 6.58 (d, $^{3}J_{H,H}$ = 6.9 Hz, 1H, CH), 7.11 (s, 1H,meso-CH), 7.47 (m, 8H, ArH), 7.64 (m, 2H, ArH), 7.84 (d, $^{3}J_{H,H}$ = 6.9 Hz, 1H, CH).^{19}F NMR (DMSO-d_6): δ −141.6 (m). LS-MS: m/z 511 $[M]^+$. Anal. calcd. for $C_{29}H_{24}BF_2N_3O_3$: C, 68.1; H, 4.69; N, 8.22. Found: C, 68.4; H, 4.6; N, 7.96.

3-(2-Diethylaminoethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (14). a. A solution of aldehyde **5** (270 mg, 0.5 mmol) and triethylamine (150 mg, 1.5 mmol) in dioxane (3 mL) was allowed to stand for 24 h at room temperature. The reaction mixture was purified by column chromatography on silica gel (eluent CH_2Cl_2) to give the pure product. Yield 100 mg (33%).

b. A solution of aldehyde **5** (136 mg, 0.25 mmol), diethylamine (91 mg, 1.25 mmol), and acetic acid (60 mg, 1 mmol) in methanol (2 mL) was heated at reflux for 5 min. After cooling to room temperature, the product was filtered and purified by column chromatography (eluent hexane-EtOAc, 3:2). Yield 50 mg (33%).

M.p. 188–189°C. ^{1}H NMR (DMSO-d_6): δ 0.92 (t, 3H, CH_2CH_3), 0.99 (t, 3H, CH_2CH_3), 1.25 (t, 6H, NCH_2CH_3), 2.71 (s, 3H, CH_3), 3.49 (q, 4H, NCH_2CH_3), 4.03 (m, 4H, CH_2CH_3), 6.10 (d, $^{3}J_{H,H}$ = 12.9 Hz, 1H, CH), 6.28 (s, 1H, meso-CH), 7.30–7.44 (m, 10H, ArH), 8.25 (d, $^{3}J_{H,H}$ = 12.9 Hz, 1H, CH). ^{19}F NMR (DMSO-d_6): δ −141.1 (m). Anal. calcd. for $C_{34}H_{36}BF_2N_3O_4$: C, 68.1; H, 6.0; N, 7.01. Found: C, 67.9; H, 5.9; N, 7.1.

3-(2-Dibuthylaminoethen-1-yl)-5-methyl-1,7-diphenyl-2,6-dicarbethoxy-4,4-difluoro-4-bora-3a,4a,-diaza-s-indacene (15). The product was prepared using tributylamine analogously to **14**. Yield 180 mg (54 %). M.p. 179–180°C. ^{1}H NMR (DMSO-d_6): δ 0.97 (m, 12H, $CH_2CH_3+N(CH_2)_3CH_3$), 1.39 (m, 4H, CH_2), 1.65 (m, 4H, CH_2), 2.7 (s, 3H, CH_3), 3.44 (q, 4H, NCH_2), 4.04 (m, 4H, CH_2CH_3), 6.11 (d, $^{3}J_{H,H}$ = 13.2 Hz, 1H, CH), 6.27 (s, 1H, meso-CH), 7.30–7.42 (m, 10H, ArH), 8.23 (d, $^{3}J_{H,H}$ = 13.2 Hz, 1H, CH). Anal. calcd. for $C_{38}H_{45}BF_2N_3O_4$: C, 69.6; H, 6.87; N, 6.41. Found: C, 69.9; H, 6.9; N, 6.2.

Reaction of aldehyde 5 with ethyldiisopropylamine. A solution of aldehyde **5** (270 mg, 0.5 mmol), ethyldiisopropylamine (130 mg, 1 mmol) in dioxane (3 mL) was allowed to stand for 24 h at room temperature. The reaction mixture was purified by column chromatography on silica gel (eluent CH_2Cl_2) to give 110 mg of the mixture of two dyes. ^{1}H NMR ($CDCl_3$): δ 0.88 (t, 6H, CH_2CH_3), 1.07 (t, 6H, CH_2CH_3), 1.36 (m, 21H, $CH(CH_3)_2$ + NCH_2CH_3), 2.86 (s, 6H, CH_3), 3.47 (q, 2H, NCH_2CH_3), 3.75 (m, 2H, $CH(CH_3)_2$), 4.01–4.11 (m, 8H, CH_2CH_3), 4.28 (m, 1H, $CH(CH_3)_2$), 6.31 (d, $^{3}J_{H,H}$ = 13.5 Hz, 1H, CH), 6.43 (m, 3H, meso-CH + CH), 7.25–7.44 (m, 20H, ArH), 8.57 (d, $^{3}J_{H,H}$ = 13.5 Hz, 1H, CH), 8.69 (d, $^{3}J_{H,H}$ = 13.5 Hz, 1H, CH).

Room temperature synthesis of benzo[b]pyran-2-imine derivatives *via* the Knoevenagel condensation of malononitrile and cyanoacetates with salicylaldehyde derivatives over MgO and their transformation to the known coumarins is described. The satisfactory results were obtained with good yields, short reaction time, and simplicity in the experimental procedure.

J. Heterocyclic Chem., **46**, 1392 (2009).

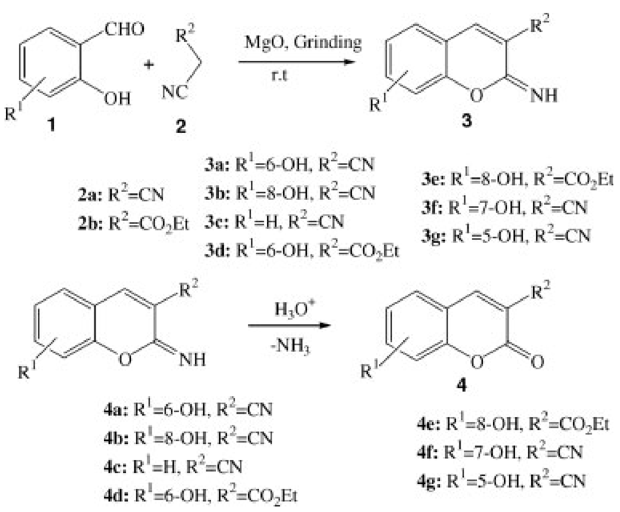
INTRODUCTION

Organic reactions under solvent-free [1] and aqueous [2] conditions have increasingly attracted chemists' interests, particularly from the viewpoint of green chemistry [3]. As an important carbon-carbon bond forming reaction, Knoevenagel condensation has been extensively studied. Generally, this type of reaction is catalyzed by base or Lewis acid in the liquid-phase system. In recent years, chemists paid more and more attention to the clean synthesis of alkenes by Knoevenagel condensations. Alkali metal hydroxides (e.g., NaOH and KOH), pyridine, and piperidine are the traditional catalysts used in these reactions. However, basic zeolites, such as Cs-exchanged NaX (CsNaX) and GeX, as well as cesium and cesium-lanthanum impregnated mesoporous MCM-41 are also able to catalyze the Knoevenagel condensation under mild reaction conditions [4]. The Knoevenagel condensations between aldehydes and malononitrile in dry media catalyzed by silica gel [5], ammonium acetate (NH_4OAc)-basic alumina [6], and zinc dichloride [7] have been reported. We described the same reactions, which could proceed efficiently in NH_4Cl aqueous solution [8]. Recently, we reported a convenient method for the preparation of coumarins *via* the Knoevenagel reaction in ionic liquids [ILs] [9].

Magnesium oxide has been used for benzylation of aromatic compounds [10], transesterification [11], Michael addition of sulfonamides to α,β-unsaturated esters [12], synthesis of chiral epoxy ketones, chiral nitro alcohols, and Michael adducts [13], etc. More recently, we reported the efficient synthesis of nitrones over MgO under solvent-free conditions [14]. In continuation of our recent interest to use solid supports, ILs, water, or solventless systems as a green reaction medium and microwave (MW)-mediated reactions [15], we wish to report here the synthesis of several benzopyran-2-imines over MgO in solventless system followed by their transformation to the coumarin derivatives without using MW and conventional heating technique in solventless system over MgO solid support (Scheme 1).

The use of ILs has received more attention as eco-friendly, reusable, and alternative reaction media in organic synthesis because of their unique properties [16–21]. A number of organic reactions, including hydrogenation, oxidation, and C—C bond forming reactions, have already been demonstrated in ILs [22–25]. We first examined the reaction of 2,5-dihydroxysalicylaldehyde with active methylene compounds **2a–b** over a variety of solid supports at room temperature (Table 1). As shown in Table 1, we found that the

Scheme 1



reaction using MgO as a solid support was accelerated to produce the related 3-cyano-2H-1-benzopyran-2-imines **3a** and **3d** in 93% and 91% yields, respectively, at room temperature for 25 min by grinding.

In another experiment, for the same reaction, several butylmethylimidazolium-based ILs, [bmim]X, with varying anions, such as Cl^-, BF_4^-, and PF_6^-, were examined in the presence of $KHCO_3$ at room temperature. The observation shows that the reaction in ILs was carried out slower with lower yields in comparison with the reaction by hand grinding of reactants over MgO and all ILs examined gave similar results (entries 5–7). The reactions in ILs were conducted at higher temperatures for optimizing the conditions and no significant improvements were observed in yields or reaction times. There is no significance difference in the results using different bases such as Na_2CO_3, K_2CO_3, $NaHCO_3$, NH_4OAc, NaOH, NH_4Cl, and piperidine as the catalyst in this procedure. It should be noted that in the absence of any catalyst, the condensation reaction failed to give the desired 2H-1-benzopyran-2-imines.

From the results obtained as shown in Table 1, it is clear that the reaction over MgO should be the method of choice for synthesizing 2H-1-benzopyran-2-imines, because a comparatively higher yield was achieved in a shorter reaction time. Under identical conditions, a variety of salicylaldehydes were reacted with active methylene compounds to afford the related benzo[b]pyran-2-imine derivatives in good to high yield, which hydrolyzed in acidic conditions to afford the related coumarins (Table 2). A plausible mechanism for the Knoevenagel condensation reaction catalyzed by MgO is outlined in Scheme 2.

In summary, we have successfully applied MgO as efficient support and catalyst for the synthesis of benzo[b]pyran-2-imine derivatives in solventless system. This methodology is highly profitable in terms of convenient, fast, and safe synthesis of benzo[b]pyran-2-imines in pure form and good yields. The products were purified by column chromatography using hexane/ethylacetate mixtures as eluent and were characterized by ^1H NMR, ^{13}C NMR, IR, and elemental analysis.

EXPERIMENTAL

General information. All reagents were purchased from Merck Company (Germany) and used without further purification. ^1H NMR spectra were obtained in $CDCl_3$ solution from Bruker Avance AC-400MHz or 300MHz and ^{13}C NMR spectra at 100MHz or 75MHz on the aforementioned instrument using TMS as internal standard. Elemental analyses were carried out on a Perkin–Elmer 240C elemental analyzer and are reported in percent atomic abundance.

Preparation of benzo[b]pyran-2-imine in ILs, general procedure. The selected arylaldehyde (10 mmol), the active methylene compound (11 mmol), $KHCO_3$ (10 mmol), and IL

(2 ml) were stirred at room temperature for appropriate time (Table 1). The completion of reaction was monitored by thin layer chromatography (TLC) using (ethylacetate/n-hexane:1/5) as eluent. After completion of the reaction, the mixture was extracted with ethylacetate. The extracts were concentrated on a rotary evaporator, and the crude mixture was purified by silica gel (Merck 230–240 mesh) column chromatography using (ethylacetate/n-hexane:1/5) mixtures as eluent.

Preparation of benzo[b]pyran-2-imine over solid supports, general procedure. The selected aldehyde (10 mmol), the active methylene compound (11 mmol), $KHCO_3$ (10 mmol), and solid support (1 g) were co-grinded in a mortar at room temperature for appropriate time (Table 2). The completion of reaction was monitored by TLC using (ethylacetate/petroleum:1/5) as eluent. After completion of the reaction, the mixture was extracted with ethylacetate. The extracts were concentrated on a rotary evaporator, and the crude mixture was purified by silica gel (Merck 230–240 mesh) column chromatography using (ethylacetate/n-hexane:1/5) mixtures as eluent.

3-Cyano-6-hydroxy-benzo[b]pyran-2-imine (3a). Two series of 4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine derivatives **3–5** and **7–12** were synthesized by the reactions of 3-methylthiopyrido[4,3-*e*]-1,4,2-dithiazine 1,1-dioxide **1** with 2-or 6-hydrazinoazines and 2-aminophenols or 2-aminothiophenol, respectively. Aminolysis of **8** (R = Me, Y = O) afforded the corresponding 3-(R-amino)-4-(2-hydroxy-5-methylphenyl)-4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxides **13–18**. The structures of these compounds were confirmed on the basis of elemental analysis, spectral data, and X-ray crystallography. Compounds **3–5**, **7–10**, **12–15**, and **17–18** were screened *in vitro* for antibacterial activity. Moreover, preliminary *in vitro* anticancer assay was performed for compounds **3**, **7**, **10**, **11–13**, and **17–18** at the National Cancer Institute (Bethesda, MD) at a single dose (10 μ*M*) in the full NCI 60 cell panel.

J. Heterocyclic Chem., **46**, 1396 (2009).

INTRODUCTION

The aryl/heteroaryl sulfonamides constitute an important class of compounds with several types of biological activities and well-established safety profile [1]. Previously, as part of an extensive research program on the synthesis of compound containing 2-thiobenzenesulfonamide scaffold, several series of novel sulfonamides with remarkable antitumor activity [2–22], anti-HIV activity [2–6,16,22–28], or carbonic anhydrase inhibitors [29–31] were discovered in our laboratories. In the course of study on the synthesis of heterocyclic compounds bearing sulfonamide moiety, we developed a new synthetic method for preparation of 4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxide (**I–III**, Fig. 1) which involves reaction of the previously described [32] 3-methylthiopyrido[4,3-*e*]-1,4,2-thiadiazine 1,1-dioxide (**1**) with 2- or 6-hydrazinoazines, 2-aminophenols or 2-aminothiophenols as a key step. The previously described 4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxides (**IV** and **V**, Fig. 1) as the potassium channel openers, were obtained starting from 4-(hydroxy-, amino-, or alkylamino) pyridine-3-sulfonamide [33,34].

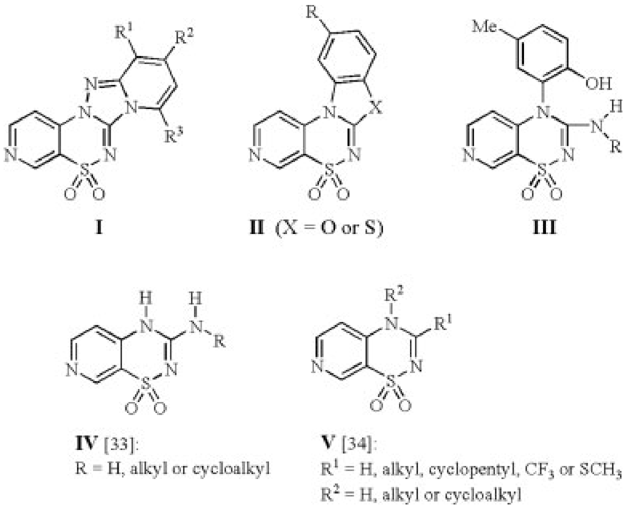

Figure 1. General structures of novel 4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxides **I–III** and structures of known potassium channel openers **IV** and **V**.

RESULTS AND DISCUSSION

Synthesis of the target compounds **3–5** and **7–12** was achieved by a convenient one-pot procedure starting from methylthiopyridodithiazine **1** as shown in Schemes 1 and 2. Thus, the reaction of **1** with appropriate 2-hydrazinopyridine **2a–b** or 2,4-dimethyl-6-hydrazinopyrimidine **2c** carried out in boiling toluene led to the pyridothiadiazine derivatives **3–5**. An analogous reaction of 2-aminophenols **6a–e** or 2-aminothiophenol **6f** with **1** furnished 5-thia-3,6,11b-triaza-benzo[*c*]fluorene 5,5-dioxides **7–12**. We propose a reaction sequence for the transformations as shown in Scheme 2. The initial step is believed to be formation of 3-arylaminopyridodithiazine intermediate **A**, which may arise by nucleophilic displacement of the thiomethyl group, and subsequent transformation resulting in the formation of 4-mercaptopyridine intermediate **B**. In the final stage of the reaction, the nonisolable intermediate **B** undergoes an intramolecular ring closure *via* two-step addition–elimination (S_NAr) process leading to the formation of benzo[*c*]fluorene derivatives **7–12** in 46–58% yields. The structures of the newly obtained compounds **3–5** and **7–12** were confirmed by elemental analyses (C, H, N) and spectroscopic data presented in the experimental section.

Further reactions of **8** with methylhydrazine or amines in boiling THF led to the formation of desired 3-(R-amino)-4-(2-hydroxy-5-methylphenyl)-4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxides **13–18** in good yields (78–92%). The proposed mechanism leading to the compounds **13–18** is outlined in Scheme 3. Nucleophilic attack of amine at the carbon C-6b atom of benzo[*c*]fluorene ring results in C—O bond cleavage, and formation of the 4-substituted-4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine products **13–18** (structure **C**). It is worth noticing, however, that the spectroscopic data for the latter

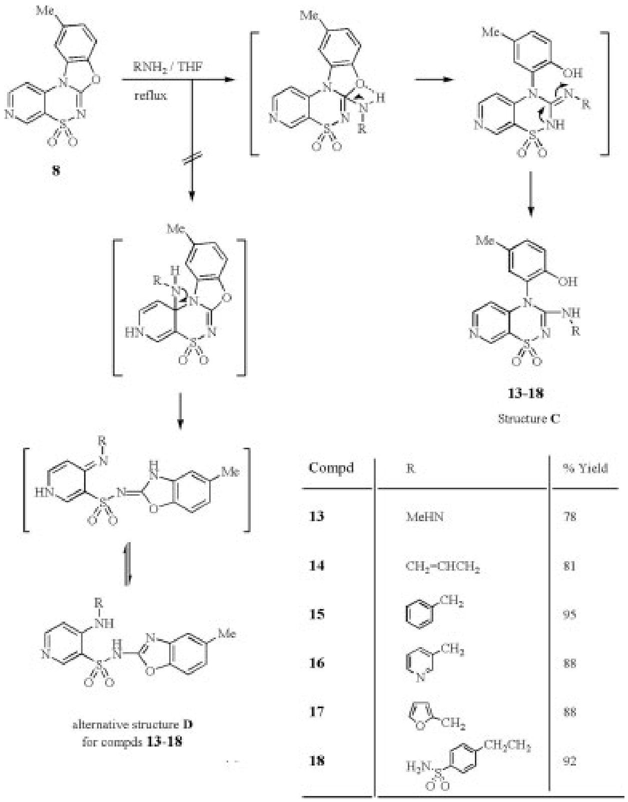
compounds (Experimental section) did not allow straightforward discrimination between the actual pyrido[4,3-*e*]-1,2,4-thiadiazines **13–18** (structure **C**) and the alternative 4-aminopyridine-3-sulfonamides (structure **D**, Scheme 3). Therefore, X-ray crystallography was undertaken to confirm the proposed structure **C** on representative compounds **14** and **17**. Molecular structures of compounds **14** and **17** are shown in Figures 2 and 3, respectively. These compounds crystallize as pyridothiadiazine derivatives, *i.e.*, the 2-hydroxy-5-methylphenyl moiety is bound to the N-4 nitrogen atom of 1,2,4-thiadiazine ring.

Biological assay. Compounds **3–5**, **7–10**, **12–15**, and **17–18** were tested *in vitro* for antibacterial activity. The investigation was carried out on 26 strains of anaerobic bacteria isolated from the oral cavity, respiratory tract, and intestinal tract, as well as 11 standard strains. The anaerobes belonged to the following genera: *Finegoldia* (2 strains), *Micromonas* (3), *Actinomyces* (2), *Propionibacterium* (2), *Prevotella* (6), *Porphyromonas* (2), *Fusobacterium* (3), *Bacterioides* (6), and standard strains: *Bacteroides fragilis* ATCC 25285, *Fusobacterium nucleatum* ATCC 25586, *Peptostreptococcus anaerobius* ATCC 27337, *Peptostreptococcus magnus* ATCC 29328, and *Propionibacterium acnes* ATCC 11827. The susceptibility of the anaerobic bacteria was determined by means of the plate dilution technique in Brucella agar supplemented with 5% sheep blood [35–37]. The derivatives were dissolved in 1 mL of DMSO immediately before the experiment. Further dilutions were performed in sterile distilled water. The following concentrations of the compounds were used: 200, 100, 50, 25, 12.5, and 6.2 μg/mL. Metronidazole was used as a reference compound. The inoculum containing 10^6 CFU/spot was applied to the agar plates with Steers replicator. The inoculated agar plates and compound-free ones were incubated in anaerobic jars for 48 h at 37°C in 10% CO_2, 10% H_2 and 80% N_2 atmosphere with palladium catalyst and indicator of anaerobiosis.

Furthermore, 25 strains of aerobic bacteria isolated from the oral cavity, respiratory tract, and intestinal tract as well as six standard strains were tested. The aerobes were as follows: *Staphylococcus* (four strains), *Corynebacterium* (2), *Klebsiella* (3), *Acinetobacter* (2), *Escherichia* (6), *Pseudomonas* (8), as well as standard strains: *Staphylococcus aureus* ATCC 25923, *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae* ATCC 13883, *Acinetobacter baumannii* ATCC 19606, *Escherichia coli* ATCC 25922, *and Pseudomonas aeruginosa* ATCC 27853. Amikacin was used as a reference compound. The susceptibility of the aerobic bacteria was determined by means of agar dilution technique with Mueller-Hinton agar [35–37]. Further dilutions were performed in sterile distilled water. The following concentrations of the compounds were used: 200, 100, 50, 25, 12.5, and 6.2 μg/mL. The inoculum containing 10^6

Scheme 3. Syntheses and proposed mechanism of the formation of 3-(R-amino)-4-(2-hydroxy-5-methylphenyl)-4H-pyrido[4,3-e]-1,2,4-thiadiazine 1,1-dioxides **13–18**.



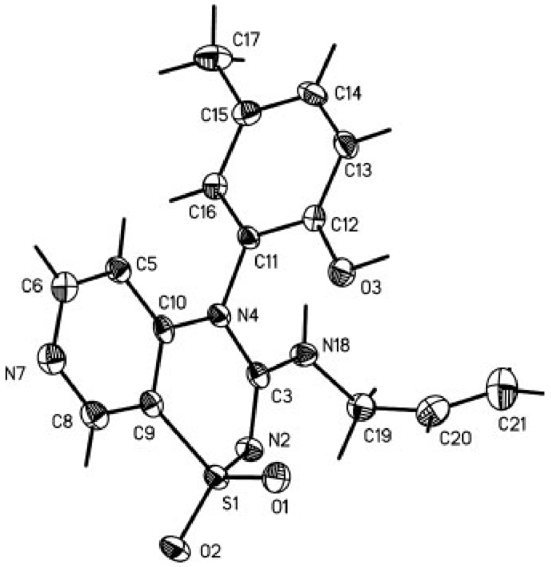


Figure 2. ORTEP drawing of compound **14** with the atom labeling scheme. Displacement ellipsoids are drawn at the 50% probability level.

CFU/spot was applied to the agar plates with Steers replicator. The inoculated agar plates and the compound-free ones were incubated for 24 h at 37°C in aerobic conditions. The minimal inhibitory concentration (MIC) was defined as the lowest compound concentration, which inhibited growth of bacteria.

The susceptibility of anaerobic and aerobic bacteria toward compounds **3–5**, **7–10**, **12–15**, and **17–18** was shown in Table 1. The results have been compared with those obtained either for metronidazole (anaerobes) or amikacin (aerobes). Activity toward anaerobic bacteria exhibited 3 of 13 tested compounds (**3**, **4**, and **18**). The anaerobes were the most susceptible for compounds **4** and **18** which inhibited 7–8 (27–31%) strains at concentrations in the range from 25 to 100 μg/mL, whereas compound **3** inhibited growth of 2 (8%) strains in lower concentrations within limits 6.2–25 μg/mL) and other 3 (12%) strains at concentration of 100 μg/mL (Table 1). The compounds active toward anaerobic bacteria (**3**, **4**, and **18**) were effective to both Gram-positive and Gram-negative strains.

In general, aerobic bacteria were less susceptible to the tested compounds **3–5**, **7–10**, **12–15**, and **17–18**. Activity toward aerobes was shown only for compound **13** which acted against 6 (24%) strains at concentrations ranged from 50 to 100 μg/mL and was more effective to Gram-negative strains. It is worthy of notice, however, that **13** was able to inhibit growth of four among six standard strains tested, such as *Staphylococcus aureus* ATCC 25923, *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae* ATCC 13883, and *Escherichia*

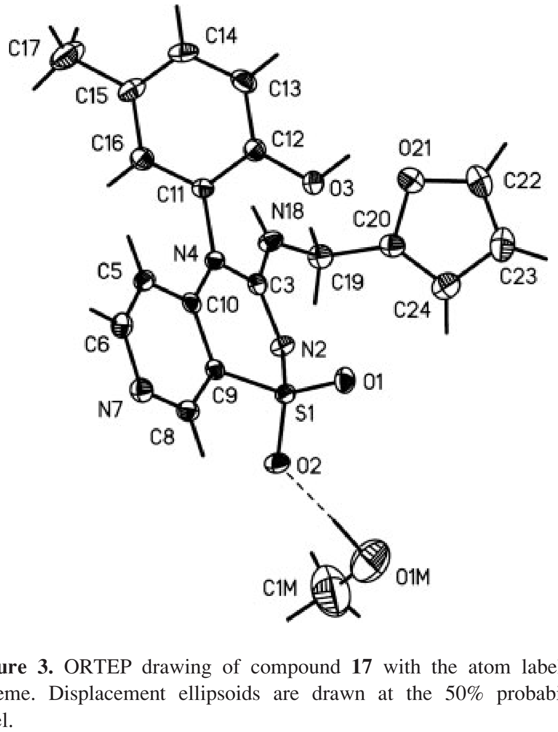

Figure 3. ORTEP drawing of compound **17** with the atom labeling scheme. Displacement ellipsoids are drawn at the 50% probability level.

[a] Metronidazole (Sigma).

[b] Amikacin sulfate salt (Sigma).

coli ATCC 25922 (MIC 100 μg/mL). The remaining compounds were active toward aerobic bacteria at the concentration equal or higher then 200 μg/mL.

The compounds **3**, **7**, **10**, **11–13**, and **17–18** were tested *in vitro* at the National Cancer Institute (Bethesda, MD) at a single dose (10 μ*M*) in the full NCI 60 cell panel. All tested compounds acted selectively and exhibited structure depended reasonable or high activity against one to two cell lines of leukemia, lung and CNS cancers, or renal cancer cells as shown in Table 2. Compounds **7** and **17** were the most potent of all derivatives tested. Relatively highest sensitivity to the compounds described here was found for cell lines of CNS cancer (SF-295), leukemia (SR, MOLT-4), and lung cancer (HOP-92) (Table 2). It is pertinent to note that further evaluations concerning biological activity of pyridosulfonamides of type **II** and **III** (Fig. 1) are still in progress.

EXPERIMENTAL

The following instruments and parameters were used: melting points Büchi 535 apparatus; ir spectra: KBr pellets, 400–4000 cm^{-1} Perkin Elmer 1600 FTIR spectrometer; ^{1}H and ^{13}C NMR: Varian Gemini 200 apparatus at 200 and 50 MHz, respectively; chemical shifts are expressed as δ values relative to Me_4Si as standard. The starting 3-methylthiopyrido[4,3-*e*]-1,4,2-dithiazine 1,1-dioxide **1** was prepared according to method described previously [32].

General procedure for the preparation of pyridothiadiazine derivatives (3–5). A mixture of 3-methylthiopyrido[4,3-*e*]-1,4,2-dithiazine 1,1-dioxide **1** (1.48 g, 6 mmol) and the corresponding 2-hydrazinopyridine **2a–b** or 2,4-dimethyl-6-hydrazinopyrimidine **2c** (6 mmol) in dry toluene (20 mL) was refluxed with stirring until the evolution of MeSH and H_2S had ceased (75–90 h). (CAUTION: because of high toxicity, MeSH and H_2S should be trapped in an aqueous NaOH solution). After cooling to room temperature, the precipitate was collected by filtration, washed successively with toluene (4 × 3 mL) and methanol (3 × 1 mL), dried and purified by crystallization from DMF. In this manner, the following compounds were obtained.

10-Chloro-8-trifluoromethyl-5-thia-3,6,6b,11,11a-pentaazabenzo[a]fluorene 5,5-dioxide (3). Starting from 3-chloro-5-trifluoromethyl-2-hydrazinopyridine **2a** (1.27 g) the title compound **3** was obtained (1.55 g, 68%): mp 347–348°C dec.; ir (KBr): 1645, 1580 (C=N, C=C) 1310, 1185, 1160 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 8.05 (d, J = 5.6 Hz, 1H, H-1), 8.30 (s, 1H, H-9), 8.99 (s, 1H, H-7), 9.03 (d, J = 5.6 Hz, 1H, H-2), 9.26 (s, 1H, H-4) ppm; ^{13}C NMR (dimethyl sulfoxide-d$_6$): δ 109.95 (CF_3), 115.95, 116.65, 119.17,

[a] Data obtained from the National Cancer Institute (Bethesda MD). Compounds were tested at a single dose (10 μ*M*) in the full NCI 60 cell panel.

121.15, 124.80, 128.56, 138.05, 143.33, 143.55, 146.56, 154.15 ppm. *Anal*. Calcd. for $C_{12}H_5ClF_3N_5O_2S$ (375.71): C, 38.36; H, 1.34; N, 18.64. Found: C, 38.38, H, 1.42, N, 18.76.

8-Chloro-10-trifluoromethyl-5-thia-3,6,6b,11,11a-pentaaza-benzo[a]fluorene 5,5-dioxide (4). Starting from 5-chloro-3-trifluoromethyl-2-hydrazinopyridine **2b** (1.27 g) the title **4** was obtained (1.43 g, 63%): mp 392–394°C dec.; ir (KBr): 1635, 1585, (C=N, C=C), 1335, 1310, 1170, 1145 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 7.97 (d, *J* = 5.5 Hz, 1H, H-1), 8.31 (s, 1H, H-9), 8.96 (d, *J* = 5.5 Hz, 1H, H-2), 9.05 (s, 1H, H-7), 9.20 (s, 1H, H-4), ppm. *Anal*. Calcd. for $C_{12}H_5ClF_3N_5O_2S$ (375.71): C, 38.36; H, 1.34; N, 18.64. Found: C, 38.42, H, 1.39, N, 18.68.

7,9-Dimethyl-5-thia-3,6,6b,11,11a-heksaaza-benzo[a]fluorene 5,5-dioxide (5). Starting from 2,4-dimethyl-6-hydrazinopyrimidine **2c** (0.83 g) the title **5** was obtained (0.93 g, 51%): mp 406–408°C dec.; ir (KBr): 1640, 1595, 1570 (C=N, C=C), 1300, 1295, 1150 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 2.72 (s, 3H, CH_3-9), 2.90 (s, 3H, CH_3-7), 8.26 (d, *J* = 5.8 Hz, 1H, H-1), 8.60 (s, 1H, H-10), 8.98 (d, *J* = 5.8 Hz, 1H, H-2), 9.14 (s, 1H, H-4) ppm. *Anal*. Calcd. for $C_{12}H_{10}N_6O_2S$ (302.21): C, 47.67; H, 3.33; N, 27.79. Found: C, 47.61, H, 3.50, N, 27.78.

General procedure for the preparation of 5-thia-3,6,11b-triaza-benzo[*c*]fluorene 5,5-dioxide derivatives (7–12). A solution of 3-methylthiopyrido[4,3-*e*]-1,4,2-dithiazine 1,1-dioxide **1** (1.73 g, 7 mmol) and appropriate 2-aminophenol **6a–e** or 2-aminothiophenol **6f** (7.2 mmol) in dry 1,4-dioxane (7 mL) was refluxed with stirring until the evolution of MeSH and H_2S had ceased (26–30 h). (CAUTION: because of high toxicity, MeSH and H_2S should be trapped in an aqueous NaOH solution). After cooling to room temperature, the reaction mixture was left overnight. The precipitate was collected by filtration, washed with 1,4-dioxane (2 × 0.5 mL), dried, and purified by crystallization from DMF. In this manner, the following products were obtained.

7-Oxa-5-thia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (7). Starting from 2-aminophenol **6a** (0.78 g) the title compound **7** was obtained (0.97 g, 50%): mp 352–353°C dec.; ir (KBr): 1635, 1580, 1560 (C=N, C=C), 1360, 1305, 1175, 1135 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 7.47–7.58 (m, 2H, H-9, and H-10), 7.35–7.80 (m, 1H, H-11), 8.30–8.33 (m, 1H, H-8), 8.35 (d, *J* = 5.9 Hz, 1H, H-1), 8.96 (d, *J* = 5.9 Hz, 1H, H-2), 9.22 (s, 1H, H-4) ppm. *Anal*. Calcd. for $C_{12}H_7N_3O_3S$ (273.27): C, 52.74; H, 2.58; N, 15.37. Found: C, 52.72, H, 2.69, N, 15.49.

10-Methyl-7-oxa-5-thia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (8). Starting from 2-amino-4-methylphenol **6b** (0.89 g) the title compound **8** was obtained (1.15 g, 57%): mp 346–347°C; ir (KBr): 1660, 1625, 1575 (C=N, C=C), 1335, 1305, 1170 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 3.30 (s, 3H, CH_3), 7.31 (d, *J* = 8.4 Hz, 1H, H-9), 7.63 (d, *J* = 8.4 Hz, 1H, H-8), 8.17 (s, 1H, H-11), 8.37 (d, *J* = 5.9 Hz, 1H, H-1), 8.96 (d, *J* = 5.9 Hz, 1H, H-2), 9.21 (s, 1H, H-4) ppm; ^{13}C NMR (dimethyl sulfoxide-d$_6$): δ 21.28, 110.91, 111.31, 118.91, 126.64, 126.89, 127.27, 135.91, 138.44, 141.94, 146.59, 154.00 ppm. *Anal*. Calcd. for $C_{13}H_9N_3O_3S$ (287.29): C, 54.35; H, 3.15; N, 14.62. Found: C, 54.39, H, 3.27, N, 14.64.

10-Chloro-7-oxa-5-thia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (9). Starting from 2-amino-4-chlorophenol **6c** (1.03 g) the title compound **9** was obtained (1.06 g, 49%): mp 357–358°C; ir (KBr): 1670, 1620, 1575 (C=N, C=C), 1385, 1315, 1170 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 7.57 (d, *J* = 8.8 Hz, 1H, H-9), 7.97 (d, *J* = 8.8 Hz, 1H, H-8), 8.38 (d, *J* = 5.8 Hz, 1H, H-1), 8.46 (s, 1H, H-11), 8.94 (d, *J* = 5.8 Hz, 1H, H-2), 9.21 (s, 1H, H-4) ppm; ^{13}C NMR (dimethyl sulfoxide-d$_6$): δ 111.12, 113.04, 114.69, 118.81, 126.45, 128.44, 130.19, 137.97, 142.76, 146.63, 153.09, 154.15 ppm. *Anal*. Calcd. for $C_{12}H_6ClN_3O_3S$ (307.71): C, 46.84; H, 1.96; N, 13.65. Found: C, 46.81, H, 2.02, N, 13.67.

10-Nitro-7-oxa-5-thia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (10). Starting from 2-amino-4-nitrophenol **6d** (1.11 g) the title compound **10** was obtained (1.04 g, 46%): mp 393–396°C dec.; ir (KBr): 1680, 1630, 1570 (C=N, C=C), 1385, 1340, 1170, 1155 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 8.03 (d, *J* = 8.7 Hz, 1H, H-8), 8.45 (d, *J* = 6.0 Hz, 2H, H-1, and H-2), 8.99 (s, 2H, H-10, and H-11), 9.27 (s, 1H, H-4) ppm. *Anal*. Calcd. for $C_{12}H_6N_4O_5S$ (318.27): C, 45.28; H, 1.90; N, 17.60. Found: C, 45.34, H, 2.00, N, 17.59.

10-(Ethylsulfonyl)-7-oxa-5-thia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (11). Starting from 2-amino-4-(ethylsulfonyl)phenol **6e** (1.45 g) the title compound **11** was obtained (1.49 g, 58%): mp 283–284°C; ir (KBr): 1665, 1620, 1580 (C=N, C=C), 1350, 1325, 1165, 1135 (SO_2) cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 1.15 (t, *J* = 5.2 Hz, 3H, CH_3), 3.52 (q, 2H, CH2), 8.03 (s, 2H, H-8, and H-9), 8.40 (d, *J* = 5.5 Hz, 1H, H-1), 8.62 (s, 1H, H-11), 9.04 (d, *J* = 5.5 Hz, 1H, H-2), 9.26 (s, 1H, H-4) ppm. *Anal*. Calcd. for $C_{14}H_{11}N_3O_5S_2$ (365.40): C, 46.02; H, 3.03; N, 11.49. Found: C, 46.11, H, 3.19, N, 11.52.

5,7-Dithia-3,6,11b-triaza-benzo[c]fluorene 5,5-dioxide (12). Starting from 2-aminothiophenol **6f** (0.9 g) the title compound **12** was obtained (1.0 g, 49%): mp 318–319°C; ir (KBr): 1685, 1580, 1565 (C=N, C=C), 1345, 1320, 1160 (SO_2) cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6): δ 7.56 (t, J = 7.6 Hz, 1H, H-9), 7.63 (t, J = 7.6 Hz, 1H, H-10), 8.09 (d, J = 7.6 Hz, 1H, H-8), 8.25 (d, J = 7.6 Hz, 1H, H-11), 8.27 (d, J = 5.9 Hz, 1H, H-1), 8.97 (d, J = 5.9 Hz, 1H, H-2), 9.21 (s, 1H, H-4) ppm; ^{13}C NMR (dimethyl sulfoxide-d_6): δ 112.52, 117.76, 119.69, 123.50, 124.94, 127.56, 128.26, 135.51, 141.32, 146.83, 154.25, 167.59 ppm. *Anal.* Calcd. for $C_{12}H_7N_3O_2S_2$ (289.34): C, 49.81; H, 2.44; N, 14.52. Found: C, 49.85, H, 2.52, N, 14.61.

General procedure for the preparation of 3-(R-amino)-4-(2-hydroxy-5-methylphenyl)-4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxides (13–17). A solution of dioxide **8** (0.58 g, 2 mmol) and the appropriate amine RNH_2 (2.2 mmol) in tetrahydrofuran (8 mL) was stirred at reflux for 3 h. The solvent was evaporated under lowered pressure, and then dry residue was dissolved in hot methanol (5–10 mL). After cooling to room temperature and standing overnight, the precipitate of the adequate product was filtered off, washed with methanol, and dried at temperatures gradually increasing to 105°C.

4-(2-Hydroxy-5-methylphenyl)-3-(2-methylhydrazino)-4H-pyrido[4,3-e]-1,2,4-thiadiazine 1,1-dioxide (13). Starting from methylhydrazine (0.1 g), the title compound **13** was obtained (0.52 g, 78%): mp 187–189°C dec.; ir (KBr): 3425, 3315, 3195 (OH, NH), 1595, 1545 (C=N, C=C), 1345, 1175 (SO_2) cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.22 (s, 3H, CH_3 Ph), 3.38 (s, 3H, CH_3N), 6.19 (d, J = 5.6 Hz, 1H, H-5, pyridothiadiazine), 6.90–6.94 (m, 2H, arom.), 7.09–7.14 (m, 1H, arom.) 8.83 (d, J = 5.6 Hz, 1H, H-6, pyridothiadiazine), 8.69 (s, 1H, H-8, pyridothiadiazine), 9.30–9.80 (br.s, 3H, OH and 2 × NH) ppm. *Anal.* Calcd. for $C_{14}H_{15}N_5O_3S$ (333.37): C, 50.44; H, 4.53; N, 21.00. Found: C, 50.47; H, 4.62; N, 21.02.

3-Allylamino-4-(2-hydroxy-5-methylphenyl)-4H-pyrido [4,3-e]-1,2,4-thiadiazine 1,1-dioxide (14). Starting from allylamine (0.13 g), the title compound **14** was obtained (0.56 g, 81%): mp 247–248°C; ir (KBr): 3500, 3380 (OH), 3335 (NH), 1600, 1555 (C=N, C=C), 1345, 1175, 1160 (SO_2) cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.27 (s, 3H, CH_3), 3.81 (d, J = 4.2 Hz, 2H, CH_2), 5.04 (dd, J_{cis} = 10.3 Hz, J_{gem} = 1 Hz, 1H, NCH_2 $CH_C{=}CH_A$), 5.09 (dd, J_{trans} = 17.2 Hz, I_{gem} = 1.0 Hz, 1H, NCH_2 $CH_C{=}CH_B$), 5.75–5.86 (m, 1H, $NCH_2CH_C{=}CH_2$), 6.23 (d, J = 5.9 Hz, 1H, H-5, pyridothiadiazine), 7.03–7.08 (m, 1H, arom.), 7.13 (br.s, 1H, OH), 7.21–7.32 (m, 2H, arom.), 8.47 (d, J = 5.9 Hz, 1H, H-6, pyridothiadiazine), 8.84 (s, 1H, H-8, pyridothiadiazine), 10.20 (s, 1H, NH) ppm; ^{13}C NMR (dimethyl sulfoxide-d_6) δ 20.22, 43.71, 110.61, 115.44, 118.17, 119.92, 120.20, 130.45, 130.56, 133,22, 134.42, 144.48, 145.11, 150.40, 152.02, 152.67 ppm. *Anal.* Calcd for $C_{16}H_{16}N_4O_3$ S (344.40): C, 55.80; H, 4.68; N, 16.27, Found: C, 55.84; H, 4.77; N, 16.39.

3-Benzylamino-4-(2-hydroxy-5-methylphenyl)-4H-pyrido[4,3-e]-1, 2,4-thiadiazine 1,1-dioxide (15). Starting from benzylamine (0.24 g), the title compound **15** was obtained (0.75 g, 95%): mp 256–257°C; ir (KBr): 3660, 3485, 3410 (OH), 3290 (NH), 1600, 1560 (C=N, C=C), 1340, 1180, 1150 (SO_2)cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.27 (s, 3H, CH_3), 4.43 (d, J = 4.1 Hz, 2H, CH_2), 6.28 (d, J = 5.9 Hz, 1H, pyridothiadiazine), 7.06–7.3 (m, 8H, arom.), 7.64 (br.s, 1H, OH), 8.49 (d, J = 5.9 Hz, 1H, H-6, pyridothiadiazine), 8.58 (s, 1H, H-8, pyridothiadiazine), 10.30 (br.s, 1H, NH) ppm; ^{13}C NMR (dimethyl sulfoxide-d_6) δ 20.23, 44.76, 110.67, 118.19, 119.93, 120.24, 126.96, 128.44, 130.43, 130.59, 133.26, 138.81, 144.52, 145.12, 150.73, 152.12, 152.74 ppm. *Anal.* Calcd. for $C_{20}H_{18}N_4O_3S$ (394.45): C, 60.89; H, 4.59; N, 14.20. Found: C, 60.92; H, 4.67; N, 14.19.

4-(2-Hydroxy-5-methylphenyl)-3-(2-pyridylmethylamino)-4H-pyrido[4,3-e]-1,2,4-thiadiazine 1,1-dioxide (16). Starting from 2-pyridylmethylamine (0.24 g) the title compound **16** was obtained (0.7 g, 88%): mp 168–169°C dec.; ir (KBr): 3470 (OH), 3275 (NH), 1600, 1590, 1575 (C=N, C=C), 1345, 1150 (SO_2)cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.27 (s, 3H, CH_3), 3.14 (d, J = 5.1 Hz, 2H, CH_2), 6.27 (d, J = 5.9 Hz, 1H, H-5, pyridothiadiazine), 7.07 (d, J = 8.3 Hz, 1H, arom.), 7.20 (s, 1H, OH), 7.29–7.36 (m, 2H, arom.), 7.66–7.70 (m, 2H, arom.), 8.42–8.47 (m, 2H, arom.), 8.50 (d, J = 5.9 Hz, 1H, H-6, pyridothiadiazine), 8.85 (s, 1H, H-8, pyridothiadiazine), 10.27 (s, 1H, NH) ppm. *Anal.* Calcd. for $C_{19}H_{17}N_5O_3S$ (395.43): C, 57.71; H, 4.33; N, 17.71. Found: C, 57.78; H, 4.41; N, 17.89.

3-(Furfurylamino)-4-(2-hydroxy-5-methylphenyl)-4H-pyrido[4,3-e]-1,2,4-thiadiazine 1,1-dioxide (17). Starting from furfurylamine (0.22 g), the title compound **17** was obtained (0.68 g, 88%): mp 240–241°C dec.; ir (KBr): 3505 (OH), 3375 (NH), 1605, 1590, 1555 (C=N, C=C), 1340, 1175, 1150 (SO_2) cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.27 (s, 3H, CH_3), 4.37 (s, 2H, CH_2), 6.26 (d, J = 5.6 Hz, 2H, arom.), 6.38 (s, 1H, arom.), 7.05 (d, J = 8.3 Hz, 1H, arom.), 7.14 (s, 1H, OH), 7.30 (d, J = 8.3 Hz, 1H arom.), 7.45–7.60 (m, 2H, arom.), 8.48 (d, J = 5.9 Hz, 1H, H-6, pyridothiadiazine), 8.86 (s, 1H, H-8, pyridothiadiazine), 10.22 (s, 1H, NH) ppm. *Anal.* Calcd. for $C_{18}H_{16}N_4O_4S$ (384.42): C, 56.24; H, 4.19; N, 14.57. Found: C, 56.30; H, 4.27; N, 14.58.

Synthesis of 4-(2-hydroxy-5-methylphenyl)-3-[2-(4-sulfamoylphenyl)ethylamino]-4*H*-pyrido[4,3-*e*]-1,2,4-thiadiazine 1,1-dioxide (18). A solution of dioxide **8** (0.58 g, 2 mmol) and 4-(2-aminoethyl)benzenesulfonamide (0.44 g, 2.2 mmol) in tetrahydrofuran (25 mL) was refluxed with stirring for 5 h. After cooling to room temperature, the suspension was left overnight. The precipitate was collected by filtration, washed successively with tetrahydrofuran (2 × 1.5 mL) and methanol (5 × 2 mL), and dried initially at room temperature and then at 105°C. Yield 0.9 g (92%): mp 276–277°C; ir (KBr): 3500 (OH), 3360, 3305, 3280 (NH and SO_2NH_2), 1600, 1555 (C=N, C=C), 1335, 1160, 1150 (SO_2)cm^{-1}; ^1H NMR (dimethyl sulfoxide-d_6) δ 2.24 (s, 3H, CH_3), 2.86 (t, J = 5.0 Hz, 2H, $NCH_2\mathit{CH_2}PhSO_2$), 3.39 (t, J = 5.0 Hz, 2H, $N\mathit{CH_2}CH_2PhSO_2$), 6.25 (d, J = 5.2 Hz, 1H, H-5, pyridothiadiazine), 6.95–7.19 (m, 3H, arom.), 7.27 (br.s, 3H, SO_2NH_2, and OH), 7.35 (d, J = 7.4 Hz, 2H, H-3 and H-5, Ph SO_2), 7.74 (d, J = 7.4 Hz, 2H, H-2 and H-6, Ph SO_2), 8.47 (d, J = 5.2 Hz, 1H, H-6, pyridothiadiazine), 8.88 (s, 1H, H-8, pyridothiadiazine), 10.08 (s, 1H, NH) ppm. *Anal.* Calcd. for $C_{21}H_{21}N_5O_5S_2$ (487.56): C, 51.73; H, 4.34; N, 14.36. Found: C, 51.70; H, 4.41; N, 14.45.

X-ray structure analysis. The diffraction data were collected with a KumaCCD diffractometer using graphite monochromated Mo K_α radiation. The intensity data were collected and processed using Oxford Diffraction CrysAlis Software [38]. The crystal structures were solved by direct methods with the program SHELXS-97 [39] and refined by full-matrix least-squares method on F^2 with SHELXL-97 [40].

Crystal data for **14**: $C_{16}H_{16}N_4O_3S$, monoclinic, space group $P2_1/c$, $a = 9.2385(9)$, $b = 11.6851(10)$, $c = 15.0960(14)$ Å, $\beta = 95.274(8)°$, $V = 1622.8(3)$ Å^3, $Z = 4$, $d_x = 1.410$ g cm^{-3}, $T = 130$ K. Data were collected for a crystal with dimensions $0.4 \times 0.4 \times 0.1$ mm. Final R indices for 2570 reflections with $I > 2\sigma(I)$ and 227 refined parameters are: $R_1 = 0.0367$, $wR_2 = 0.0942$ ($R_1 = 0.0502$, $wR_2 = 0.1009$ for all 3309 data).

Crystal data for **17**: $C_{18}H_{16}N_4O_4S{\cdot}CH_3OH$, monoclinic, space group $P2_1/c$, $a = 10.9766(10)$, $b = 11.4912(11)$, $c = 15.6294(15)$ Å, $\beta = 102.592(8)°$, $V = 1924.0(3)$ Å^3, $Z = 4$, $d_x = 1.438$ g cm^{-3}, $T = 130$ K. Data were collected for a crystal with dimensions $0.4 \times 0.4 \times 0.1$ mm. Final R indices for 2798 reflections with $I > 2\sigma(I)$ and 271 refined parameters are as follows: $R_1 = 0.0435$, $wR_2 = 0.1131$ ($R_1 = 0.0640$, $wR_2 = 0.1235$ for all 3903 data).

Crystallographic data for compounds **14** and **17** have been deposited with Cambridge Crystallographic Data Centre (CCDC deposition numbers CCDC 684581 and 684582, respectively). Copies of the data can be obtained upon request from CCDC, 12 Union Road, Cambridge CB2 1EZ, UK, quoting the deposition numbers.

Acknowledgments. The authors are very grateful to Dr. V.L. Narayanan, Chief Drug Synthesis, Chemistry Branch, National Cancer Institute (Bethesda, MD) for the *in vitro* anticancer screening.

2,6-Dimethyl-7,8-dihydro-4*H*-cyclohepta[*b*]furan and 2,6-dimethyl-7,8-dihydro-4*H*-cyclohepta[*b*]thiophene were prepared by direct cyclization of 3-methyl-5-(5-methylfuran-2-yl)-pent-1-en-3-ol and 3-methyl-5-(5-methyltiophen-2-yl)-pent-1-en-3-ol, respectively.

J. Heterocyclic Chem., **46**, 1404 (2009).

INTRODUCTION

Cyclic furan and thiophene derivatives have attracted increased attention due to their potential use as basic synthetic building blocks. Especially, in pharmaceutical drug design, a variety of heterocycles are used as pharmacophores [1,2].

Although many methods have been devised for the synthesis of furan (thiophene) core and cycloheptane ring, the formation of both condensed rings has rarely been reported. 5,6,7,8-Tetrahydro-4*H*-cyclohepta[*b*]furan has been prepared by Herz and Juo [3] through the conversion of 3,6-dihydro-1,2-dioxin derivative obtained in a 1,3-diene photo-oxygenation process. The same fused furan has been synthesized from 2-(2-phenylsulfanyl-allyl)-cycloheptanon via its cyclization under acidic conditions [4] and its 2-methyl derivative by mercuric triftalete-catalyzed cyclization of 2-prop-2-ynyl-cycloheptanone [5]. The corresponding thiophene analogues are reported to be available in a multistep transformation of 5-thiophene pentanoyl chloride [6]. We have found only one report on the preparation of 7,8-dihydro-4*H*-cyclohepta[*b*]furan (thiophene) in the 1-furyl (thienyl)-2-vinylcyclopropane Cope rearrangement [7].

RESULTS AND DISCUSSION

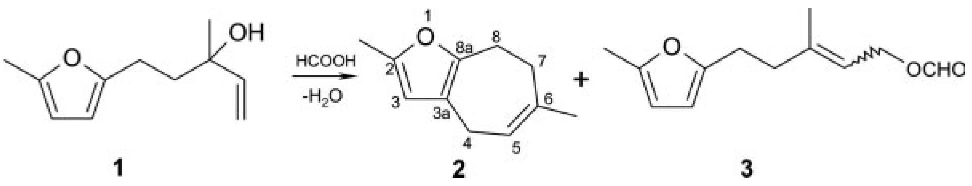
Working on the synthesis of furyl analogues of acyclic monoterpenes [8], we could observe that the formic acid catalyzed allylic rearrangement of furyl-derived tertiary allylic alcohol **1** did not yield primary alcohols and/or their formates as main components of the product mixture. The main compound composed 60% of the reaction mixture (gc) was isolated by flash chromatography in a yield of 45%. Its ^{1}H and ^{13}C NMR analyses revealed the presence of six *sp*^{2} carbon atoms in the molecule indicating thereby a bicyclic structure of **2** (Scheme 1).

The double bond position in the seven-membered ring was unambiguously confirmed by heteronuclear multiple bond correlation (HMBC) experiment. Heteronuclear long–range correlations ($^2J_{C\text{—}H}$ and $^3J_{C\text{—}H}$) between ^{13}C-3a (117.37 ppm) and protons 3, 4, 5, 8, and between ^{13}C-8a (149.19 ppm) and protons 3, 4, 7, 8 were used to distinguish correctly between structure **2** and presumable structure of its 5,8-dihydro-isomer that would have very similar one-dimensional ^{1}H and ^{13}C NMR spectra. Table 1 includes complete ^{1}H and ^{13}C assignments of compound **2**.

The second major product (ca. 35% of a crude material) was an E/Z-mixture (5:1) of formate **3**, the structure of which was proved by MS and NMR. No substrate alcohol was detectable in the gc trace of the crude reaction product. This reflects the ease of tertiary allylic carbocation formation from the alcohol. So, the reaction in the presence of formic acid likely proceeds through a cation and the formation of the bicyclic compound can be clarify by the participation of the allylic carbocation in a two-pathway mechanism (Scheme 2).

Although, in general the 2-positions at furan ring are more reactive than the 3-ones, the first intramolecular electrophilic attack on C-3 carbon atom seems to come into consideration (Path A) assuming the charge distribution as the kinetic criterion. Similarly, an intramolecular carbocationic attack on C-3 position in a 2,5-disubstituted furan moiety of 2-furyl benzo[b]furan derivatives leading

Scheme 1. Transformation of furyl-derived tertiary allylic alcohol **1** to 2,6-dimethyl-7,8-dihydro-4*H*-cyclohepta[*b*]furan (**2**) and formate **3**.



to benzofuro-oxaazulene derivatives had been reported by Russian team [9]. Worth mentioning is that the gas-phase alkylation of 2-methylfuran occurs preferentially at β-position with high charge densities [10]. In our work, the charge distribution has been determined by theory calculations at B3LYP/6-31G(d) (Gaussian 03W ver. 6.1) for allylic carbocation. The charge densities are −0.18 and −0.19 for C3 and C4, respectively, and −0.46 for the oxygen. However, the rearrangement of 5/6 spiro-intermediate to 7,8-dihydro-4*H*-cyclohepta[*b*]furan skeleton is also a considerable reaction path (Path B).

Based on these observations, an attempt to apply the method for the preparation of some other 7,8-dihydro-4*H*-cyclohepta[*b*]furan and 7,8-dihydro-4*H*-cyclohepta[*b*]thiophene derivatives was made (Scheme 3).

However, under similar reaction conditions, the yield of the isolated compounds not containing methyl substituent in the aromatic ring (**5a**, **5b**) was much poorer (13%). Presumably, it is a consequence of competitive intermolecular reactions which resulted in formation of much polymeric material. Alcohols **4a** and **4b** reacted rapidly and the process was difficult to control under changing conditions studied (e.g., dilution, temperature 0°C).

It should be pointed out that the substrate alcohols are easily obtainable from the corresponding furyl and thienyl butanones and their acid catalyzed cyclization can also be of some value for the access to furan and thiophene derivatives with seven-membered ring. To the best of our knowledge, there are no reports on the direct use of tertiary allylic alcohol derivatives for annulation of any hetero- or carbo-cycles.

EXPERIMENTAL

The courses of all reactions, composition products and their purity were checked by means of thin layer chromatography (TLC) and capillary gas chromatography (gc). A THF 1*M* solution of vinyl magnesium bromide was purchased from Aldrich®. The final products were isolated by flash chromatography (silica gel:hexane/ethyl acetate in ratio 100:2.5). gc-ms (mass spectra) were obtained with a Carlo Erba gc coupled to MD 800 Fisons Instruments at 70 eV. ^{1}H NMR (250 MHz) and ^{13}C NMR (62.90 MHz) were recorded in $CDCl_3$ on a Bruker instrument.

2,6-Dimethyl-7,8-dihydro-4*H*-cyclohepta[*b*]furan (2). 1 g (5.5 mmol) of allylic alcohol **1** [6] in hexane (5 mL) was added dropwise to a stirred mixture of hexane (20 mL) and concentrated formic acid (20 mL) at room temperature. The stirring was continued for another 3 h and then 10 cm^3 of water was added. The crude product was extracted with hexane (2 × 20 mL), washed neutral with water and dried over anhydrous sodium sulphate. Furan derivative **2** was isolated by flash chromatography in a yield of 405 mg (45%). Anal. Calcd for $C_{11}H_{14}O$: C, 81.44; H, 8.70. Found: C, 81.19; H, 8.68.

Four 1*H*-indazoles, two of them doubly substituted by fluorine atoms and the other two obtained by nitration of the foregoing derivatives, were prepared and fully characterized by multinuclear NMR in solution and in solid state in view of their potential nitric oxide synthase inhibition properties.

J. Heterocyclic Chem., **46**, 1408 (2009).

INTRODUCTION

We have been interested in 1*H*-indazoles for many years [1–4], some of them being potent inhibitors of the nitric oxide synthase (NOS) family of isozymes [5–8]. Amongst indazoles, 3-bromo-7-nitro-1*H*-indazole **1** (NIBr) is one of those that show highest affinity for type I NOS [9]. This work is concerned with four new 1*H*-indazole derivatives bearing two fluorine substituents **2–5** (Scheme 1). We have already reported studies on fluorinated indazoles [10] as well as indazoles with NOS inhibitory properties [11,12].

RESULTS AND DISCUSSION

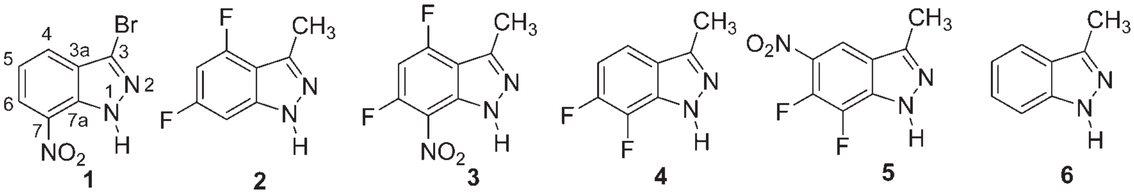
Synthesis. Compounds **2–5** were prepared using one of the classical methods of synthesis of this family of heterocycles [13,14]: the reaction of hydrazine with *ortho*-fluoro carbonyl derivatives (Scheme 2). Thus, starting from appropriately fluorinated acetophenones **7** and **8**, 4,6-difluoro-3-methyl-1*H*-indazole **2** and 6,7-difluoro-3-methyl-1*H*-indazole **4** were obtained with yields in pure compound of 98% and 50%, respectively. In the latter case, formation of hydrazine and azine compete, lowering the yield [15,16].

Reactivity. The nitration of 1*H*-indazole itself **9** in strongly acidic conditions affords 5-nitro-1*H*-indazole **10** as the main product together with 5,7-dinitro-1*H*-indazole **11** in minor proportion [2,17–20]. Further nitration of **10** leads to **11** [21]. Thus, formation of 6,7-difluoro-3-methyl-5-nitro-1*H*-indazole **5** from **4** is the expected reaction. However, nitration of **2** occurs at position 7 yielding 4,6-difluoro-3-methyl-7-nitro-1*H*-indazole **3**, due to the deactivating effect of both fluorine atoms at positions 4 and 6 [13,14].

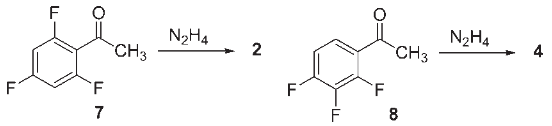
NMR results. We have gathered the solution NMR data for indazoles **2–5** in Tables 1 (^{1}H), 2 (^{19}F), 3 (^{13}C), and 4 (^{15}N). We have already reported the data relating to 3-methyl-1*H*-indazole **6** in $CDCl_3$ [10], but now we have recorded ^{13}C NMR and ^{15}N NMR in DMSO-d_6 for comparative purposes. Moreover, Table 5 contains the ^{13}C and ^{15}N CPMAS NMR chemical shifts for all of them. The spin-spin systems of 1,2- and 1,3-difluorobenzenes have been analyzed and the signs of the SSCC were determined [22]: we have given a negative sign to those couplings in Tables 2 and 3 that have a negative sign in difluorobenzenes.

Couplings with ^{19}F (Tables 1–3) are very sensitive to the positions of both nuclei and, consequently, they are useful for structure determination. Chemical shifts in Table 3 can be analyzed to determine the contribution of the different substituents or pairs of substituents (the F atoms are always associated two by two). The methyl group is almost insensitive (largest shift: -1.6 ppm for

Scheme 1. Indazoles.



Scheme 2. Synthesis of indazoles **2** and **4**.



the 6,7-difluoro) and C3 is only a little more sensitive (between 3.3 ppm for the 5-nitro and −1.7 ppm for the 4,6-difluoro). The substituent chemical shifts (SCS) on the six-membered ring have been averaged and are shown in Scheme 3 together with literature data on benzenes [23].

We have analyzed the ^{15}N chemical shifts in Table 4 using a presence–absence matrix (also called a Free-Wilson matrix) [24]. The effects are: on N1 −0.4 (5-NO_2), −5.4 (7-NO_2), 4.5 (4,6-diF), −3.2 (6.7-diF), and on N2 4.3 (5-NO_2), −0.4 (7-NO_2), 1.9 (4,6-diF), 4.4 (6.7-diF).

In Scheme 4, some representative coupling constants are reported, to show the analogies and differences between difluorobenzenes and difluoroindazoles.

The data in the solid state and in solution are very similar as can be seen in Figure 1. When signals (C4 and C5 of **4**) are split in the solid state, their averaged value has been used. This consistency reflects the fact that all these compounds are 1*H*-tautomers, just like most indazoles [10,18,25].

EXPERIMENTAL

Melting points were determined by DSC (Seiko 220C with a scanning rate of 5.0°C min^{-1}. Column chromatography: Merck silica (70–230 mesh). Microanalyses were determined at the Centro de Análisis Elemental-UCM, Madrid [Perkin Elmer 240 (CHN)].

Solution NMR spectra were recorded on a Bruker DRX 400 (9.4 Tesla, 400.13 MHz for ^{1}H, 100.62 MHz for ^{13}C, 376.50 MHz for ^{19}F, and 40.56 MHz for ^{15}N) spectrometer with a 5-mm inverse-detection H-X probe equipped with a z-gradient coil, at 300 K. Chemical shifts (δ in ppm) are given from internal solvent, DMSO-d_6 2.49 for ^{1}H and 39.5 for ^{13}C, external reference $CFCl_3$ for ^{19}F and for ^{15}N NMR nitromethane (0.00) was used as external standard. Digital resolution: 1.25 Hz for ^{13}C and 0.80 Hz for ^{19}F. 2D (^{1}H-^{13}C) gs-HMQC, gs-HMBC and (^{1}H-^{15}N) gs-HMQC, gs-HMBC, were acquired and processed using standard Bruker NMR software and in nonphase-sensitive mode [26]. Variable temperature experiments were recorded on the same spectrometer. A Bruker BVT3000 temperature unit was used to control the temperature of the cooling gas stream and an exchanger to achieve low temperatures.

Solid state ^{13}C (100.73 MHz) and ^{15}N (40.60 MHz) CPMAS NMR spectra have been obtained on a Bruker WB 400 spectrometer at 300 K using a 4 mm DVT probehead. Samples were carefully packed in a 4-mm diameter cylindrical zirconia rotor with Kel-F end-caps. Operating conditions involved 3.2 μs 90° ^{1}H pulses and decoupling field strength of 78.1 kHz by TPPM sequence. ^{13}C spectra were originally referenced to a

The 7-aryl-4,7-dihydro[1,2,4]triazolo[1,5-*a*]pyrimidines **1a-c** can undergo addition of hydrazine to the enamine double bond leading to hydrazine derivatives of tetrahydrotriazolopyrimidines **2a-c**; the process is usually accompanied by partial opening of pyrimidine ring leading to **3a,b**.

J. Heterocyclic Chem., **46**, 1413 (2009).

INTRODUCTION

1,4-Dihydroazines are compounds which are very important in biological processes. According to the available data about the structure–activity relationship for 1,4-dihydropyridines [1], the phenyl substituent at position 4 of dihydropyrimidine ring is the most suitable for showing physiological activity. However, the stereochemistry of addition processes for 4-aryl-1,4-dihydroazines was not widely investigated, in spite of their simplicity and their similarity to chemical processes in nature [2]. It is also known that dihydroazines fused with azole ring possess a relatively stable dihydro structure (in comparison with nonfused 1,4-dihydroazines, such as 1,4-dihydropyridine and 1,6-dihydropyrimidine). This makes them convenient models for studying many theoretical problems of organic chemistry, e.g. tautomerization, stereochemistry, and chemical reactivity [3]. In addition, there are many compounds with various types of physiological activity exactly among dihydroazolopyrimidines [4].

Only several adducts of dihydroazolopyrimidines (namely hydrates) are described; they were formed either by attempt of preparation of corresponding dihydroazolopyrimidine [5], or directly from previously prepared dihydroazolopyrimidine in attempts of its salt formation with HCl (as side product without isolation) [6].

The aim of this work was to investigate the ability of the enamine fragment of the 7-aryl-5-methyl-4,7-dihydro[1,2,4]triazolo[1,5-*a*]pyrimidine to react with nucleophile and to study the stereochemistry of nucleophilic addition to dihydroazine ring which should be influenced by aryl ring. The investigated dihydroazolopyrimidine contains supposedly only one reaction center for nucleophile attack, namely the C-5 carbon. The most appropriate nucleophilic reagent for this case, in our opinion, could be hydrazine. The earlier described reactions of analogous acetyl derivatives with hydrazine or hydroxylamine [2] (Scheme 1) were accompanied by heterocyclizations leading to only one stereoisomer (a pair of enantiomers) in both cases; the stereochemistry of heterocyclization products was consistent with nucleophilic attack of the enamine double bond from the sterically less hindered side of the dihydroazolopyrimidine system.

RESULTS AND DISCUSSION

We studied the reaction of dihydroazolopyrimidines **1a-c** with hydrazine by heating in dioxane. The products obtained from **1a,b** were showed in the NMR ^{1}H spectrum in the presence of two groups of signals (compounds **2a,b** and **3a,b**, respectively). In case of 3-nitrophenyl derivative (**1c**), the presence of only one compound was observed (**2c**). Pure compound **3b** was isolated by fractional crystallisation of the obtained mixture **2b** and **3b**; the attempts to isolate either **2a** or **3a** in analogous way were fully unsuccessful.

The elemental analysis for pure **3b** and **2c** and for obtained mixtures showed that compounds **2** and **3** are isomers, and their composition corresponded to addition of one molecule of hydrazine to azolopyrimidine **1**.

The ^{1}H NMR spectra of **2a–c**, **3a,b** in DMSO-d_6 (Table 1) were similar and showed signals of ABX systems

Table 1

3a (in mixture with **2a**)	Ph	6.10, 5.53	7.14–7.57	5.55	3.11	2.84	1.50	8.8	5.8	15.0
3b	4-$CH_3OC_6H_4$	6.10, 5.51	7.29–7.31 (2H, m), 7.29 (1H, s), 6.81–6.85 (2H, m)	5.51	3.03	2.79	1.55	8.6	6.1	14.7

(the signals of **3** were shifted downfield in comparison with **2**), singlets of CH_3 groups, and multiplets of aromatic rings. Compound **3b** also showed broad signals of two NH_2 groups, but in the spectrum of **2c** only one signal of NH protons was observed in the aromatic region.

The ^{13}C NMR spectra of **2c** and **3b** were allowed to make the structure assignment. Both compounds showed signals of aliphatic CH and CH_2 carbons, but compound **2c** showed signal of quaternary carbon in the aliphatic region, at 69.2 ppm, which was consistent with the proposed structure of cyclic adduct. In contrast, the spectrum of **3b** contained an additional signal downfields, at ~159.0 ppm, which was assigned to imine carbon. Thus, compound **3b** has the opened, noncyclic structure, as shown in Scheme 2. Two series of signals were observed in the spectrum of **3b**. The minor signals had low intensity and probably represented the stereoisomers of **3b** which had different configuration of the $C{=}N{-}NH_2$ fragment. The assignment of signals in ^{13}C NMR spectrum of **3b** was based on HSQC experiment.

The reaction can be described by Scheme 2:

Two stereoisomers are possible for compounds **2**, but in their NMR spectra the signals of only one stereoisomer were observed. The stereochemistry of **2** was investigated by NOE measurements. The irradiation of CH_3 showed enhancement for *ortho* protons of aromatic ring which proved proximity of the protons and showed that methyl group and aryl substituent are both oriented in the same direction from the plane of the azolopyrimidine system. Thus, compounds **2** have the stereochemistry as shown in Scheme 2.

The ^3J values between H_X and H_A in **2a–c** were 11.3–11.6 Hz (Table 1) indicating that H_X and H_A are both axial. Such contradiction between coupling data and NOE results could be explained by equilibrium between conformers of **2a–c** (Scheme 3).

Thus, 7-aryl derivatives of 4,7-dihydro[1,2,4]triazolo[1,5-*a*]pyrimidines can add nucleophiles directly, and their nucleophilic attack occurs from the side opposite to the orientation of aryl substituent. Compounds **2a–c**, **3a, b** were quite unstable in DMSO-d_6 solutions undergoing partial elimination of hydrazine (for **2**), partially full decomposition in about 0.5–1.0 h at room temperature.

EXPERIMENTAL

The melting points, determined on a Kofler apparatus, are uncorrected. The ^1H and ^{13}C NMR spectra were obtained on a Varian Mercury VX-200 or Bruker DMX 600 in DMSO-d_6 with TMS as a internal standard. The EI mass spectra were measured on a Varian 1200L at 70 eV.

4,7-Dihydro-5-methyl-7-aryl[1,2,4]triazolo[1,5-*a*]pyrimidines (1b,c). General procedure. Compounds 1b,c were prepared by the procedure described in ref. 7 for 1a. A mixture of commercially available 3-amino-1,2,4-triazole (0.84 g, 10 mmol) and the corresponding substituted benzylideneacetone (10.0 mmol)

in DMF (1 mL) was refluxed for 30 min. The reaction mixture was cooled to 20°C, mixed with benzene (20 mL) and the precipitate formed was collected by filtration and crystallized from DMF-methanol mixture.

4,7-Dihydro-5-methyl-7-(4-methoxyphenyl)[1,2,4]triazolo [1,5-*a*]pyrimidine (1b). 4,7-Dihydro-5-methyl-7-(4-methoxyphenyl)[1,2,4]triazolo[1,5-*a*]pyrimidine (1b) was isolated with yield 58% and melted at 215–216°C (from mixture of DMF and methanol). The ^{1}H NMR signals were found in DMSO-d$_6$ at 1.85 s, 3H (4-CH$_3$), 3.70 s, 3H (OCH$_3$), 4.50 d, 1H (6-H), 5.09 d, 1H, $^{3}J = 2.0$ (7-H), 6.86 m, 2H (*m*-ArH), 7.11 m, 2H (*o*-ArH), 7.51 s, 1H (2-H), 9.52 br.s, 1H (NH). The ^{13}C NMR signals were measured in DMSO-d$_6$ at δ, ppm: 18.9 (5-CH$_3$), 55.8 (OCH$_3$), 59.6 (C-7), 96.1 (C-6), 114.5 (*m*-C$_{Ar}$), 128.8 (o-C$_{Ar}$), 132.4 (*i*- C$_{Ar}$), 135.3 (C-5), 149.6 (C-3*a*), 149.8 (C-2), 159.5 (*p*-C$_{Ar}$). The ei ms spectrum showed peaks at *m*/*z* (%)242 (87) [M^{+}], 227 (57) [M^{+}-15], 214 (34) [M^{+}-28], 200 (40) [M^{+}-42], 135 (100) [M^{+}-107]. Anal. Calcd. for $C_{13}H_{14}N_4O$ (242.3): 64.45% C, 5.82% H, 23.13% N. Found: 64.39% C, 5.71% H, 23.05% N.

4,7-Dihydro-5-methyl-7-(3-nitrophenyl)[1,2,4]triazolo[1,5-*a*] pyrimidine (1c). Yield 52%; m.p. 249–250°C (ethanol). ^{1}H NMR (DMSO-d$_6$): 1.88 s, 3H (CH$_3$), 4.61 m, 1H (6-H), 6.23 m, 1H (7-H), 7.60 s, 1H (2-H), 7.62–7.67 m, 2H (5,6-ArH), 8.03 m, 1H (2-ArH), 8.12–8.18 m, 1H (4-ArH), 9.73 br.s, 1H (NH). ^{13}C NMR (DMSO-d$_6$): 19.0 (5-CH$_3$), 59.3 (C-7), 94.9 (C-6), 121.9 (2-C$_{Ar}$), 123.5 (4-C$_{Ar}$), 131.0 (5-C$_{Ar}$), 133.5 (6-C$_{Ar}$), 134.1 (C-5), 145.2 (1-C$_{Ar}$), 148.6 (3-C$_{Ar}$), 149.9 (C-3*a*), 150.4 (C-2). MS [EI, *m*/*z* (rel. %)]: 257 (78) [M^{+}], 242 (25) [M^{+}-15], 210 (14) [M^{+}-47], 135 (100) [M^{+}-122], 128 (13) [M^{+}-129]. Anal. Calcd. for $C_{12}H_{11}N_5O_2$ (257.3): 56.03% C, 4.31% H, 27.22% N. Found: 55.92% C, 4.24% H, 27.18% N.

5-Methyl-7-phenyl-4,5,6,7-tetrahydro[1,2,4]triazolo[1,5-*a*] pyrimidin-5-yl)hydrazine (2a) and 2-(3-hydrazono-1-phenyl-butyl)[1,2,4]triazol-3-amine (3a). A solution of 1a [7] (1.40 g, 6.6 mmol) and 85% hydrazine hydrate (1.66 g, 30 mmol) in dioxane (7 mL) was heated for 60 min and the solvent was evaporated under reduced pressure. The residue was triturated with diethyl ether (10 mL) and allowed to stand for 2 days. The formed precipitate (1.51 g) was filtered off. It contained, according to the ^{1}H NMR data (Table 1) about 60% of 2a and 40% of 3a. Anal. Calcd. for $C_{12}H_{16}N_6$ (244.3): 59.00% C, 6.60% H, 34.40% N. Found: 58.87% C, 6.54% H, 34.35% N.

Compounds **2b,c** and **3b** were prepared in analogous way from **1b** and **1c**, respectively. In case of **1c**, the precipitate formed contained only pure **2c**.

A mixture of **2b** and **3b** was isolated in 96% yield and contained, according to the ^{1}H NMR data, 65% of **2b** and 35% of **3b**.

Pure compound **3b** was isolated by careful crystallization of the obtained mixture from dioxane-diethyl ether; m.p. 175–177°C. ^{13}C NMR (DMSO-d$_6$), for major stereoisomer: 14.5 (CH$_3$), 44.1 (CH$_2$), 55.6 (OCH$_3$), 56.4 (CH), 114.1, 129.0 (*m*- and *o*-C$_{Ar}$), 133.2 (*i*-C$_{Ar}$), 144.2 (C-5 of triazole), 148.6 (CH of triazole), 155.1 (—C=N—), 159.0 (*p*-C$_{Ar}$); for minor stereoisomer: 22.8 (CH$_3$), 34.8 (CH$_2$), 54.8 (OCH$_3$), 55.6 (CH), 114.2, 128.6 (*m*- and *o*-C$_{Ar}$), 133.1 (*i*-C$_{Ar}$), 145.3 (C-5 of triazole), 148.9 (CH of triazole), 155.4 (—C=N—), 159.2 (*p*-C$_{Ar}$). Anal. Calcd. for $C_{13}H_{18}N_6O$ (274.3): 56.92% C, 6.61% H, 30.64% N. Found: 56.83% C, 6.55% H, 30.71% N.

Compound **2c**, m.p. 153–154°C, was isolated in yield 73%. ^{13}C NMR (DMSO-d$_6$) δ, ppm: 24.2 (CH$_3$), 41.2 (C-6), 55.7 (C-7), 69.2 (C-5), 122.6 (*p*-C$_{Ar}$), 123.1 (*o*-C$_{Ar}$), 130.5 (*m*′-C$_{Ar}$), 134.6 (o′-C$_{Ar}$), 143.3 (*i*-C$_{Ar}$), 148.3 (*m*-C$_{Ar}$), 149.3 (C-2), 154.7 (C-3*a*). Anal. Calcd. for $C_{12}H_{15}N_7O_2$ (289.3): 49.82% C, 5.23% H, 33.89% N. Found: 49.69% C, 5.14% H, 33.97% N.

In this study, a new synthetic route for the synthesis of 1-hydroxy-4-oxo-1,2,3,4-tetrahydrocarbazole derivatives **12** and **13** from lactone **11** is described. Unfortunately, cyclization of compounds **12** and **13** to their respective azocino[4,3-*b*]indole derivatives **14** and **15** was unsuccessful.

J. Heterocyclic Chem., **46**, 1416 (2009).

INTRODUCTION

Recently we reported the total synthesis of (±)-epidasycarpidone [1] based on the acid catalyzed D-ring cyclization of the appropriate 4-oxo-1,2,3,4-tetrahydrocarbazol derivative. 4-Oxotetrahydrocarbazole with a functionalized ethyl side chain plays an important role in the synthesis of the hexahydroazocino[4,3-*b*]indole frame work [2–5]. In the present work, the synthesis of 2-ethyl-substituted 4-oxo-tetrahydrocarbazole derivatives is described. These intermediates, such as **12** and **13**, could be useful starting materials for the synthesis of uleine alkaloids.

RESULTS AND DISCUSSION

For the synthesis of 4-oxotetrahyrocarbazole derivatives, we started from the diastereomers **1**, which were reported previously [1]. Diastereomers like 1-oxo-2-substituted-2,3,4,9-tetrahydrocarbazole were converted into the racemic trans form by treatment with sodium methoxide [6,7]. However, the diastereomer of **1** was transformed into the racemic trans keto acid **2** by using 15% potassium hydroxide in methanol-water (3:1) at room temperature (Scheme 1). Synthesis of racemic trans ester **3** was achieved under mild conditions by stirring compound **2** for 4 h in DMSO using K_2CO_3 and ethyl iodide. The GC-MS analysis of the isolated ester shows only a single isomer, whose spectral data were identical to those of the trans ester **3** reported in the literature [8]. Treatment of trans ketoester **3** or ketoacid **2** with $NaBH_4$ in THF-CH_3OH (1:1) at room temperature yielded the corresponding alcohols **4** and **5**, which underwent acid-catalyzed ring closure to produce lactone **10** (Scheme 2).

Compound **10** was oxidized to the corresponding 4-oxo-lactone **11** by treatment with 2,3-dichloro-5,6-dicyano-*p*-benzoquinone at 0°C [9].

Subsequent opening of lactone **11** with ammonia and methylamine at room temperature in THF-MeOH afforded amides **12** and **13**.

Unfortunately, cyclization of compounds **12** and **13** under a variety of conditions failed. Compounds **14** and **15** were never detected [2–5] (Scheme 3).

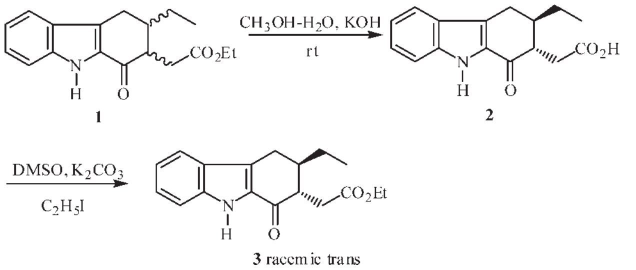
At this point, we decided to reduce alcohol **12** to compound **16**. Treatment of **12** with Et_3SiH and $TiCl_4$ in CH_2Cl_2, however, afforded compound **17** [10] (Scheme 4).

In conclusion, starting from compound **1** and using common intermediates **11**, we obtained the racemic trans amides **12** and **13**. Unfortunately, all attempts to convert amides **12** and **13** to the corresponding tetracyclic lactams **14** and **15** were unsuccessful and reduction of alcohol **12** into compound **16** also failed.

EXPERIMENTAL

^1H NMR (400 MHz) and ^{13}C NMR (100 MHz) spectra were recorded with a Bruker instrument DPX-400, 400-MHz High-Performance Digital FT-NMR Spectrometer using $CDCl_3$

Scheme 1



and DMSO as solvents and tetramethylsilane (TMS) as an internal standard at 25°C. Chemical shifts are expressed in terms of parts per million (δ) and the coupling constants are given in Hz. IR spectra were recorded using a Mattson 1000 FTIR spectrometer. Melting points were determined in a capillary tube on a Gallenkamp apparatus and are uncorrected. Reactions were monitored by thin layer chromatography (silica gel 60 F254). Purification of solvents was performed according to standard methods.

2-(3-Ethyl-1-oxo-1,2,3,4,9-tetrahydrocarbazole-2-yl)-2-acetic acid (2). A solution of 5.00 g (16.72 mmol) of compound 1 in 20 mL tetrahydrofurane and 100 mL 15% potassium hydroxide solution (methanol-water (1:1) was stirred for 4 h. The organic solvent was evaporated under vacuum. The residue was acidified slowly with 100 mL of 10% hydrochloric acid. The mixture was cooled to 0°C and the precipitate was filtered. The product was washed with water and ether and recrystallized from ethyl acetate to yield 4.38 g (96%) of compound 2; m.p. 229–231°C. R_f = 0.69 (EtOAc/methanol, 20:1); IR (potassium bromide): ν 3283, 2959, 2912, 1706, 1639 cm^{-1}; ^{1}H NMR (dimethyl sulfoxide-d$_6$): δ 0.96–0.99 (t, 3H, CH_2CH_3, J = 7.37 Hz), 1.40–1.49 (m, 1H), 1.60–1.66 (m, 1H), 2.22–2.35 (m, 1H), 2.65–2.71 (m, 3H), 2.73–2.80 (m, 1H), 3.18 (dd, 1H, J = 4.46 and 16.48 Hz), 7.07–7.10 (m, 1H, aromatic proton), 7.25–7.32 (m, 1H, arom. We herein report conventional and microwave-assisted methods for the synthesis of a series of compounds containing some bivalent ion chelating requirements useful to exert potential HIV-1 integrase (IN) enzyme inhibition activity. The biological screening highlighted that only derivative **5** proved to be a strand-transfer step inhibitor of the virus integration process at micromolar concentration.

J. Heterocyclic Chem., **46**, 1420 (2009).

INTRODUCTION

Human immunodeficiency virus (HIV), the etiological agent of acquired immunodeficiency syndrome (AIDS) continues to be a major health threat worldwide. The main steps in the viral life cycle include viral entry, replication of the viral genome, and proteolytic processing of viral polyproteins. In addition, HIV replication depends on the integration of the proviral DNA into the genome of infected cells, which is catalyzed by HIV integrase (IN). All these steps are potential targets for antiviral drugs.

The IN-catalyzed insertion of viral DNA into the host cell chromosome is a multistep process that includes two catalytic reactions: 3′-Processing (3′P) and strand-transfer (ST) [1]. Moreover, it has been suggested that the integration mechanism involves bivalent metal ions (Mg^{2+} or Mn^{2+}) in the enzyme catalytic site [2,3].

After many years of research, several molecules were identified as IN inhibitors and among them β-diketo acids (DKAs) [4] and their analogs [5] represent one of the major leads in the identification of new antiviral agents. In particular, it has been reported that the DKA pharmacophoric motif could be able to sequester one or both metal ions necessary for IN-enzymatic activity [2].

In fact, the only one integrase strand-transfer inhibitor (INSTI) (Raltegravir) (Fig. 1) [6] so far approved by Food and Drug Administration (FDA), belongs to the DKAs analogs class, in which the diketo acid moiety, as ‘‘ketoenole,’’ has been included in a rigid system.

Taking into account these findings and considering the results of our previously reported studies [7–10], we planned the synthesis of new derivatives containing a pyridazine core as well as the chemical features able to inhibit IN activity as chelating agents for bivalent metal ions. The obtained compounds were characterized and tested to evaluate their antiviral activity and enzymatic inhibition.

RESULTS AND DISCUSSION

The synthesis of the first designed compound **4** was carried out, as reported in Scheme 1, starting from the commercially available nitrophenylhydrazine **1**.

At first it was converted into 3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanoic acid ethyl ester (**2**) by reaction with 3-amino-3-ethoxy-acrylic acid ethyl ester. This is a novel synthetic approach with respect to a previously reported procedure [11] thus improving the yields and reducing reaction time. The obtained mixture of Z- and E-isomers (**2**), without further separation, was successively used for the cyclocondensation with oxalyl chloride to give the ethyl 5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxylate (**3**). The pyridazine

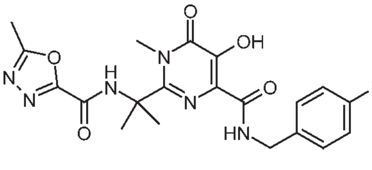

Figure 1. Chemical structure of Raltegravir.

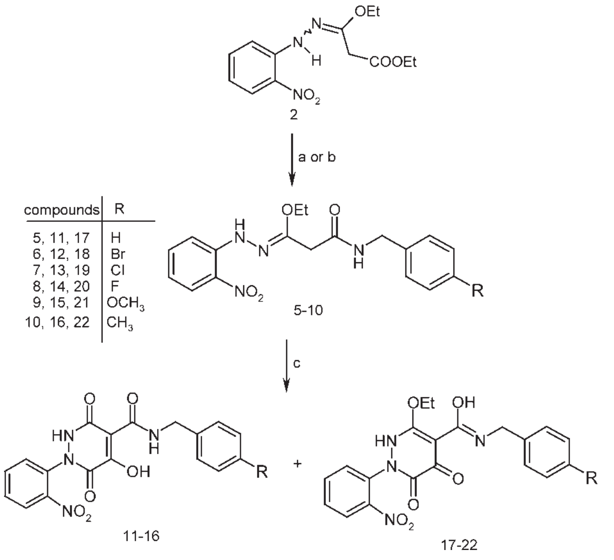
derivative **3** was finally treated with platinum dioxide under hydrogen atmosphere to give the ethyl 4-hydroxy-2-oxo-1,2-dihydropyridazino[1,6-a]benzimidazole-3-carboxylate (**4**) resulting from the nitro-group reduction and the consequent ring closure.

With the aim to prepare the amide derivatives **5–22**, we used the synthetic route described in Scheme 2. The (Z) isomer of intermediate **2**, obtained as red crystals from ethanol, was used as starting material, and was converted into the corresponding (*Z*)*N*-benzyl-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamides **5–10**, by reaction with appropriate benzylamine. With the aim to optimize the synthetic procedure, we performed this step both at room temperature and under reflux (50°C). We found that even elevating the reaction temperature no significant reduction in reaction time occurred. Alternatively, when we used the microwave-assisted organic synthesis (MAOS) approach we observed a remarkable reduction of reaction time (1 h rather than 15 h). Moreover, this approach was used in free-solvent conditions (see experimental section). Then, the condensation with oxalyl chloride gave a mixture of two different series (**11–16** and **17–22** in a ratio of 2:1) of pyridazine derivatives depending on the tautomeric form of the amide precursors **5–10** as well as the hydrolytic processes occurred on their ethoxy functionality.

The *N*-benzyl-5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxamides **11–16** were directly recovered as crude precipitate from reaction mixture, while the evaporation of the resulting solution furnished the *N*-benzyl-3-ethoxy-1-(2-nitrophenyl)-5,6-dioxo-1,2,5,6-tetrahydropyridazine-4-carboximidic acids **17–22**.

All the synthesized compounds were tested for their IN enzymatic inhibitory effect both against the overall integration reaction and more specifically against the strand-transfer step. The biological results showed that compound **5** was able to inhibit the enzymatic activity at micromolar concentration (Table 1).

Scheme 2. Reagents and conditions: a) $ArCH_2NH_2$, CH_2Cl_2, r.t. 15 h; b) $ArCH_2NH_2$, two steps in the same conditions: 280 W, 50°C, 30 min; and c) oxalyl chloride, toluene, 0°C, 2 h.



compounds	R

10, 16, 22	CH_3

Moreover, the HIV-induced cytopathic effect (CPE) in human lymphocyte MT-4 cell culture was determined by the MT-4/MTT-assay. The screening data put in evidence that only the *N*-benzyl-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamides (**5–10**) showed antiviral activity in cells test, but also toxicity at same concentration.

EXPERIMENTAL

Chemistry. All microwave-assisted reactions were carried out in a CEM Focused Microwave Synthesis System, Model Discover working at the potency necessary for refluxing under atmospheric conditions. Melting points were determined on a BUCHI Melting Point B-545 apparatus and are uncorrected. Elemental analyses (C, H, N) were carried out on a Carlo Erba Model 1106 Elemental Analyzer and the results are within ±0.4% of the theoretical values. Merck silica gel 60 F_{254} plates were used for analytical tlc. ^1H NMR spectra were recorded in DMSO-d_6 on a Varian Gemini-300 spectrometer. Chemical shifts were expressed in δ (ppm).

Scheme 1. Reagents and conditions: a) 3-amino-3-ethoxy-acrylic acid ethyl ester, dry EtOH, N_2, rt, 2h; b) oxalyl chloride, toluene, 0°C, 5 h; and c) PtO_2, H_2, EtOH, rt, 5 h.

Synthesis of (*Z-E*)3-ethoxy-3-[(2-nitrophenyl)hydrazono]-propanoic acid ethyl ester (2). 2-Nitrophenylhydrazine (0.001 mol, 137.14 mg) (**1**) and 3-amino-3-ethoxy-acrylic acid ethyl ester hydrochloride (0.001 mol, 195.65 mg) were suspended in ethanol (3 mL), under N_2 atmosphere, and stirred at room temperature for 2 h. The precipitate was filtered off and the solution concentrated *in vacuo*. Yield 69%. Spectral measurements (^1H NMR) and experimental data were in accordance with reported data in the literature [11].

Synthesis of ethyl 5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxylate (3). Oxalyl chloride (0.001 mol, 126.93 mg) was added dropwise at 0°C to a solution of (*Z-E*)3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanoic acid ethyl ester (**2**) (0.001 mol, 295.30 mg) in toluene (6 mL). The mixture was stirred for 5 h and allowed to reach room temperature. Yellow crystals were formed, the precipitate was filtered off, and crystallized from diethyl ether. Mp 260–262°C yield 81%; ^1H NMR: δ 1.15 (t, 3H, J = 7.1, CH_3), 3.40 (q, 2H, J = 7.1, CH_2), 6.78–8.12 (m, 4H, ArH), 9.40 (bs, 1H, NH). Anal. Calcd. for $C_{13}H_{11}N_3O_7$: C, 48.61; H, 3.45; N, 13.08. Found: C, 48.54; H, 3.38; N, 13.24.

Synthesis of ethyl 4-hydroxy-2-oxo-1,2-dihydropyridazino[1,6-a]benzimidazole-3-carboxylate (4). Compound **3** (0.001 mol, 321.25 mg) was dissolved in dry ethanol (50 mL) in a flask suitable for a normal pressure hydrogenation. Platinum dioxide (0.002 mol, 32 mg) was added and the compound **3** was hydrogenated under ambient pressure. The mixture was stirred for 5 h. The catalyst was filtered off on diatomaceous earth and the solvent removed under reduced pressure. The residue was powdered by treatment with diethyl ether and crystallized from ethanol. Mp 230–232°C, yield 26%; ^1H NMR: δ 1.22 (t, 3H, J = 7.1, CH_3), 4.16 (q, 2H, J = 7.1, CH_2), 6.55–7.97 (m, 4H, ArH), 10.43 (bs, 1H, NH). Anal. Calcd. for $C_{13}H_{11}N_3O_4$: C, 57.14; H, 4.06; N, 15.38. Found: C, 57.20; H, 4.12; N, 15.30.

General procedure for the synthesis of (*Z*)*N*-benzyl-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamides (5–10)

Conventional method. (*Z*)3-Ethoxy-3-[(2-nitrophenyl)hydrazono]propanoic acid ethyl ester (**2**) (0.001 mol, 295.30 mg) was dissolved in methylene chloride (2 mL), under N_2 atmosphere, and the solution stirred at room temperature for 10 min. The appropriate benzylamine (0.010 mol) was added and the resulting solution was stirred for 15 h. Precipitate was filtered and crystallized from ethanol.

Microwave-assisted synthesis. The appropriate benzylamine (0.010 mol) was added to the (*Z*)3-ethoxy-3-[(2-nitrophenyl)-hydrazono]propanoic acid ethyl ester (**2**) (0.001 mol, 295.30 mg), under N_2 atmosphere, and the resulting mixture was placed in a cylindrical quartz tube (Ø 2 cm). The reaction mixture was then stirred and irradiated in a microwave oven for two subsequent periods in the same conditions: 280 W, 30 min, and 50°C. After cooling the work-up was carried out as described for the conventional method.

(Z)N-Benzyl-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (5). Mp 172–174°C, yield 100%; ^1H NMR: δ 1.30 (t, 3H, J = 7.1, CH_3), 3.55 (s, 2H, CH_2), 4.23 (q, 2H, J = 7.1, CH_2), 4.31 (d, 2H, J = 5.99, CH_2), 6.76–8.08 (m, 9H, ArH), 8.68 (t, 1H, J = 5.99, NH), 10.93 (bs, 1H, NH). Anal. Calcd. for $C_{18}H_{20}N_4O_4$: C, 60.67; H, 5.66; N, 15.72. Found: C, 60.60; H, 5.59; N, 15.78.

(Z)N-(4-Bromobenzyl)-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (6). Mp 175–177° C, yield 99%; ^1H NMR: δ 1.30 (t, 3H, J = 6.9, CH_3), 3.54 (s, 2H, CH_2), 4.22 (q, 2H, J = 6.9, CH_2), 4.27 (d, 2H, J = 5.8, CH_2), 6.76–8.08 (m, 8H, ArH), 8.71 (t, 1H, J = 5.8, NH), 10.92 (bs, 1H, NH). Anal. Calcd. for $C_{18}H_{19}BrN_4O_4$: C, 49.67; H, 4.40; N, 12.87. Found: C, 49.62; H, 4.43; N, 12.83.

(Z)N-(4-Chlorobenzyl)-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (7). Mp 171–173°C, yield 100%; ^1H NMR: δ 1.30 (t, 3H, J = 6.9, CH_3), 3.69 (s, 2H, CH_2), 4.22 (q, 2H, J = 6.9, CH_2), 4.29 (d, 2H, J = 5.8, CH_2), 6.76–8.08 (m, 8H, ArH), 8.72 (t, 1H, J = 5.8, NH), 10.93 (bs, 1H, NH). $C_{12}H_{12}O_4$: C, 65.45; H, 5.49; C, 65.31; H, 5.63. Anal. Calcd. for $C_{18}H_{19}ClN_4O_4$: C, 55.32; H, 4.90; N, 14.34. Found: C, 55.28; H, 4.95; N, 14.31.

(Z)N-(4-Fluorobenzyl)-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (8). Mp 180–182°C, yield 93%; ^1H NMR: δ 1.30 (t, 3H, J = 7.1, CH_3), 3.69 (s, 2H, CH_2), 4.22 (q, 2H, J = 7.1, CH_2), 4.29 (d, 2H, J = 5.8, CH_2), 6.78–8.08 (m, 8H, ArH), 8.68 (t, 1H, J = 5.8, NH), 10.93 (bs, 1H, NH). Anal. Calcd. for $C_{18}H_{19}FN_4O_4$: C, 57.75; H, 5.12; N, 14.97. Found: C, 57.71; H, 5.08; N, 14.93.

(Z)N-(4-Methoxybenzyl)-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (9). Mp 171–173°C, yield 84%; ^1H NMR:

δ 1.30 (t, 3H, $J = 7.3$, CH_3), 3.52 (s, 2H, CH_2), 3.72 (s, 3H, CH_3O), 4.21 (q, 2H, $J = 7.3$, CH_2), 4.23 (d, 2H, $J = 5.7$, CH_2), 6.75–8.07 (m, 8H, ArH), 8.58 (t, 1H, $J = 5.7$, NH), 10.92 (bs, 1H, NH). Anal. Calcd. for $C_{19}H_{22}N_4O_5$: C, 59.06; H, 5.74; N, 14.50. Found: C, 59.02; H, 5.69; N, 14.55.

(Z)N-(4-Methylbenzyl)-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (10). Mp 179–181°C, yield 90%; ^{1}H NMR: δ 1.30 (t, 3H, $J = 7.1$, CH_3), 2.27 (s, 3H, CH_3), 3.53 (s, 2H, CH_2), 4.22 (q, 2H, $J = 7.1$, CH_2), 4.26 (d, 2H, $J = 5.7$, CH_2), 6.76–8.08 (m, 8H, ArH), 8.63 (t, 1H, $J = 5.7$, NH), 10.93 (bs, 1H, NH). General procedures for the synthesis of N-benzyl-5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxamides (11–16) and N-benzyl-3-ethoxy-1-(2-nitrophenyl)-5,6-dioxo-1,2,5,6-tetrahydropyridazine-4-carboximidic acids (17–22). The appropriate (*Z*)*N*-benzyl-3-ethoxy-3-[(2-nitrophenyl)hydrazono]propanamide (**5–10**) (0.001 mol) was dissolved in dry toluene (6.5 mL). Oxalyl chloride (0.001 mol, 126.93 mg) was added dropwise at 0°C and the reaction mixture stirred for 2 h. The obtained precipitate was filtered and crystallized from ethanol/methanol (1:1, v/v) to give derivatives **11–16**. The solution was concentrated under reduced pressure and the residue treated with diethyl ether to afford derivatives **17–22**.

N-Benzyl-5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxamide (11). Mp 164–166°C, yield 56%; ^{1}H NMR: δ 4.41 (s, 2H, CH_2), 6.87–8.12 (m, 9H, ArH), 9.44 (bs, 1H, NH). Anal. Calcd. for $C_{18}H_{14}N_4O_6$: C, 56.55; H, 3.69; N, 14.65. Found: C, 56.49; H, 3.65; N, 14.68.

N-(4-Bromobenzyl)-5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxamide (12). Mp 171–173°C, yield 64%; ^{1}H NMR: δ 4.36 (s, 2H, CH_2), 6.84–8.11 (m, 8H, ArH), 9.41 (bs, 1H, NH). Anal. Calcd. for $C_{18}H_{13}BrN_4O_6$: C, 46.87; H, 2.84; N, 12.15. Found: C, 46.61; H, 2.55; N, 12.82.

N-(4-Chlorobenzyl)-5-hydroxy-1-(2-nitrophenyl)-3,6-dioxo-1,2,3,6-tetrahydropyridazine-4-carboxamide (13). Bioassays ***Overall integrase assay using an enzyme-linked immunosorbent assay and strand-transfer inhibition.*** We used enzyme-linked immunosorbent assays to determine the susceptibility of the HIV-1 integrase enzyme towards different compounds. These assays use an oligonucleotide substrate of which one oligonucleotide (5′-ACTGCTAGAGATTTTCCA-CACT GACTAAAAGGGTC-3′) is labeled with biotin at the 3′ end and the other oligonucleotide is labeled with digoxigenin at the 5′ end. For the overall integration assay the second 5′-digoxigenin labeled oligonucleotide is (5′-GACCCTTT-TAGT CAGTGTGGAAAATCTCTAGCAGT-3′). For the strand transfer assay the second oligonucleotide lacks GT at the 3′ end. The integrase enzyme was diluted in 750 m*M* NaCl, 10 m*M* Tris pH 7.6, 10% glycerol, and 1 m*M* β-mercapto ethanol. To perform the reaction 4 μL diluted integrase (corresponding to a concentration of 1.6 μ*M*) and 4 μL of annealed oligonucleotides (7 n*M*) were added in a final reaction volume of 40 μL containing 10 m*M* $MgCl_2$, 5 m*M* DTT, 20 m*M* HEPES pH 7.5, 5% PEG and 15% DMSO. The reaction was carried out at 37°C for 1 h. Reaction products were denatured with 30 m*M* NaOH and detected by an immunosorbent assay on avidin-coated plates [12].

In vitro anti-HIV and drug susceptibility assays. The inhibitory effect of antiviral drugs on the HIV-induced cytopathic effect (CPE) in human lymphocyte MT-4 cell culture was determined by the MT-4/MTT-assay [13]. This assay is based on the reduction of the yellow colored 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) by mitochondrial dehydrogenase of metabolically active cells to a blue formazan derivative, which can be measured spectrophotometrically. The 50% cell culture infective dose (CCID50) of the HIV(IIIB) strain was determined by titration of the virus stock using MT-4 cells. For the drug-susceptibility assays MT-4 cells were infected with 100–300 CCID50 of the virus stock in the presence of fivefold serial dilutions of the antiviral drugs. The concentration of various compounds achieving 50% protection against the CPE of the different HIV strains, which is defined as the EC_{50}, was determined. In parallel the 50% cytotoxic concentration (CC_{50}) was determined.

Acknowledgments. This work was supported by the European Commission (HEALTH-F3-2008-201032) (THINC project).

To enhance the iron-chelating ability of P-3A, 4-aminoquinazolines were designed as conformation-restricted bleomycin analogs. An efficient method was developed to prepare the 4-aminoquinazoline heterocyclic nucleus, which entails a two-step one-pot procedure leading to 4-aminoquinazolines in good yields. The application of this method to synthesis 4-aminoquinazoline bleomycin analogs is envisioned.

J. Heterocyclic Chem., **46**, 1425 (2009).

INTRODUCTION

Bleomycins are a family of glycopeptide natural products and have been used clinically to treat various cancers for decades. However, dose-dependent undesired side effects, such as pulmonary toxicity are limiting the therapeutic efficacy of bleomycins. Thus, it has been suggested that improved bleomycin analogs may have enhanced therapeutic index between anticancer activity and undesired toxicity [1]. The seminal studies by Hecht [2–4], and Boger [5] groups not only established synthetic methodologies to access bleomycin analogs but also contributed to the understanding of mechanism of action for this important class of compounds.

Bleomycins exert their antitumor activities through sequence-specific cleavages of DNA, which requires the activation of oxygen *via* the formation of a complex consisting of the metal-binding domain of bleomycins, a transition metal such as Fe(II) or Cu(I) and molecular oxygen [6]. In medicinal chemistry, conformational restriction is commonly used to improve potency [7]. We envision that the application of such a strategy to the metal-binding domain of bleomycin could lead to analogs that promote more efficient formation of the oxygen-Fe(II)-bleomycin complex. To test this concept, P-3A, the smallest member of the bleomycin family but still retaining DNA cleavage properties was selected (Figure 1). The four atoms of **P-3A** responsible for metal-coordination are highlighted in bold (Figure 1), and it is evident that the —NH— of the amide group participates in the metal binding, but the carbonyl group does not. Therefore, the cyclization of the carbonyl group onto the 6-position of the pyrimidine nucleus *via* a benzene ring, leading to compounds **1**. The quinazoline ring system in compounds **1** should fix the —NH— group in a position that has higher propensity for metal binding compared with the relatively flexible amide group in **P-3A** and other bleomycins.

Syntheses of quinazolines are widely reported as a result of efforts towards natural product total synthesis and medicinal chemistry programs [8]. For example, the quinazoline scaffold is common to numerous kinase inhibitors including Iressa [9]. 4-Aminoquinazolines were prepared from 2-aminobenzonitrile with either a nitrile [10] or an orthoester [11] under microwave conditions. Recently, 2-aminonitrile was cyclized with formic acid at the elevated temperature of 200°C leading to 5,6-dihydro-quinazolines [12]; 2-aminobenzamide was cyclized with anilines and orthoesters to give 4-arylaminoquinazolines [13]. We envisioned that 2-aminobenzonitrile (**2**) also could react with a carboxylic acid in an one-pot two-step procedure to produce the key intermediate (**4**) required for our conformation-restricted P-3A analogs (Scheme 1).

RESULTS AND DISCUSSION

Imidoyl chlorides were readily prepared from carboxylic acids and amines under the mild conditions of PPh_3-CCl_4 [14], and this method has been applied to the synthesis of various heterocycles [15]. Our strategy is to generate the imidoyl chloride **3** *in situ* and then

[a] Reaction conditions: 3.3 equiv Ph_3P, 3.3 equiv pyridine, 24 equiv CCl_4/CH_3CN, reflux, then NH_3-MeOH, 100°C.

[b] T_1 and T_2, reaction times for step 1 and 2, respectively.

substitute it with ammonia; the resulting amidine should readily be cyclized onto the neighboring nitrile group leading to the desired 4-aminoquinazolines (**4**). To test this one-pot procedure, 2-aminobenzonitrile **2a** was reacted with various aromatic carboxylic acids, and the results are summarized in Table 1.

Most benzoic acid studies gave the desired quinazolines in good-to-high yields (entries 1–5, Table 1). However, para-methoxybenzoic gave lower yield compared to other benzoic acids (entry 6, Table 1), and it is possible that the strong electron-donating property of the MeO group reduces the reactivity of the benzoic acid. Heterocyclic aromatic acids were also suitable substrates for this reaction leading to desired quinazolines in moderate yields (entries 7–9). Encouraged by the success with aromatic acids, aliphatic acids including *N*-Cbz-L-asparagine (*N*-Cbz-Asn) required for the synthesis of bleomycin analogs were studied and the results are summarized in Table 2.

As evident from Table 2, aliphatic carboxylic acids are also suitable for this one-pot two-step reaction leading to 4-aminoquinazolines in good yields (entries 1–4, Table 2). To compare this new one-pot procedure against the conventional stepwise approach, phenylacetic acid was coupled with 2-aminobenzonitrile *via* its acyl chloride to give 2-*N*-(phenylacetyl) aminobenzonitrile in 72% yield; the resulting amide was subjected to the new one-pot two-step procedure and give compound **6d** in 54% yield (entry 5, Table 2). This indicates that preformation of the amide bond did not lead to higher yield of the desired 4-aminoquinazoline. More importantly, *N*-Cbz-Asn reacted with 2-aminobenzonitrile to give 4-aminoquinazoline **6f** in good yield (entry 7, Table 2), suggesting that our planned syntheses of conformation-restricted bleomycin analogs **1** are likely feasible. To gain confidence of our planned synthesis of bleomycin analog **1**, substituted 2-aminobenzonitriles were studied to expand the scope of this new one-pot procedure (Table 3).

4, Table 3). The electron-withdrawing effects of the halo groups likely decreased the nucleophilicity of the aniline group, which may account for the observed lower yields compared to reactions with compound **2a**.

In summary, a series of 4-aminoquinazolines were designed as conformationally restricted bleomycin analogs, which may have improved metal-binding efficiency. A new one-pot two-step procedure was developed to prepare 4-aminoquinazolines from carboxylic acids and 2-aminobenzonitriles. Various carboxylic acids, including aromatic, aliphatic, and amino acids, are suitable substrates for this new method. Given there are numerous carboxylic acids available, this method should complement existing methods to access broad range of quinazolines. The application of this new method to 4-aminoquinazoline bleomycin analogs are in progress and will be reported in due course.

EXPERIMENTAL

Melting points are uncorrected. Mass spectra and HPLC (ELSD) data were recorded on an 1100 LC/MS system (Agilent Technology) with Alltech ELSD 2000, using a 4.6 × 50 mm Column (CenturySIL C-18 AQ$^+$, 5 μm) with a linear gradient 30–90% (v/v) acetonitrile–water with 0.035% trifluoroacetic acid over 5 min with a flow rate of 3.5 mL/min. Analytical TLC was performed using 2 × 5 cm plates coated with a 0.25-mm thickness of silica gel 60 F_{254}. Column chromatography was performed using silica gel G (200–300 mesh). All ^1H NMR spectra (300 MHz) and ^{13}C NMR spectra (75 MHz) were measured on a Varian 300 MHz spectrometer using TMS as an internal standard and $CDCl_3$ or DMSO-d_6 as solvent. The ammonia methanol solution was prepared by the saturation of anhydrous methanol with ammonia gas at 0°C.

General procedure for the one-pot two-step synthesis of compounds 5a. A solution of benzoic acid (1.0 mmol, 122 mg), 2-aminobenzonitrile **2a** (1.1 mmol, 130 mg), and pyridine (3.3 mmol, 260 mg, and 0.26 mL) in 4 mL CCl_4 and 6 mL acetonitrile was stirred at room temperature for 10 min, and triphenylphosphine (3.3 mmol, 866 mg) was added. The mixture was refluxed at 80°C for 8 h and then the mixture and a 10 mL ammonia methanol solution (2 *M*) were added into a sealed steel reactor. The reactor was heated at 100°C for 6 h and then concentrated. The residue was purified by column chromatography (hexanes/EtOAc, 6/1) affording 2-phenyl-4-aminoquinazoline **5a** (166 mg, 75%) as a white solid. white solid, mp 144–145°C; 1H NMR (300 MHz, DMSO-d6) δ = 8.48–8.44 (m, 2H), 8.25 (d, J = 7.8 Hz, 1H), 7.84 (br., 2H), 7.81–7.76 (m, 2H), 7.51–7.44 (m, 4H). 13C NMR (75 MHz, DMSO-d_6): δ = 161.7, 159.3, 149.9, 138.1, 132.5, 129.4, 127.7, 127.4, 127.2, 124.6, 123.1, and 112.8. ES-MS: *m*/*z* 222 [M+H$^+$].

4-Amino-2-phenylquinazoline (5a). White solid, mp 144–145°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.48–8.44 (m, 2H), 8.25 (d, *J* = 7.8 Hz, 1H), 7.84 (br., 2H), 7.81–7.76 (m, 2H), 7.51–7.44 (m, 4H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 161.7, 159.3, 149.9, 138.1, 132.5, 129.4, 127.7, 127.4, 127.2, 124.6, 123.1, and 112.8. ES-MS: *m*/*z* 222 [M + H$^+$].

4-Amino-2-(*p*-tolyl)quinazoline (5b). White solid, mp 139–140°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.36 (d, *J* = 6.6 Hz, 2H), 8.23 (d, *J* = 8.1 Hz, 1H), 7.79–7.74 (m, 4H), 7.47–7.43 (m, 1H), 7.29 (d, *J* = 7.2 Hz, 2H), 2.38 (s, 3H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 161.6, 159.3, 150.0, 139.0, 135.4, 132.4, 128.3, 127.4, 127.1, 124.4, 123.1, 112.8, and 20.5. ES-MS: *m*/*z* 236 [M + H$^+$].

4-Amino-2-(4-fluorophenyl)quinazoline (5c). White solid, mp 156–158°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.52–8.47 (m, 2H), 8.24 (d, *J* = 8.1 Hz, 1H), 7.86 (br., 2H), 7.81–7.73 (m, 2H), 7.47 (t, *J* = 6.9 Hz, 1H), 7.31 (t, *J* = 8.7 Hz, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 163.5 (d, *J* = 245.2 Hz), 162.2, 158.9, 150.3, 135.1, 133.0, and 130.1 (d, *J* = 8.6 Hz), 127.6, 125.1, 123.6, and 115.0 (d, *J* = 21.1 Hz), 113.2. ES-MS: *m*/*z* 240 [M + H$^+$].

4-Amino-2-(4-nitrophenyl)quinazoline (5d). Yellow solid, mp 218–220°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.68 (d, *J* = 9.3 Hz, 2H), 8.38 (d, *J* = 8.7 Hz, 2H), 8.29 (d, *J* = 7.8 Hz, 1H), 8.03 (br, 2H), 7.83–7.82 (m, 2H), 7.57–7.52 (m, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 162.3, 157.8, 150.1, 148.3, 144.7, 133.3, 128.8, 127.9, 126.1, 123.7, 123.5, and 113.4. ES-MS: *m*/*z* 267 [M + H$^+$].

4-Amino-2-(4-bromophenyl)quinazoline (5e). White solid, mp 167–168°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.38 (d, *J* = 7.5 Hz, 2H), 8.24 (d, *J*=8.1 Hz, 1H), 7.89 (br., 2H), 7.81–7.68 (m, 4H), 7.51–7.46 (m, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 162.2, 158.8, 150.3, 137.8, 133.0, 131.2, 129.8, 127.7, 125.3, 123.7, 123.6, and 113.3. ES-MS: *m*/*z* 300, 302 [M + H$^+$].

4-Amino-2-(4-methoxyphenyl)quinazoline (5f). White solid, mp 177–179°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 8.41 (d, *J* = 8.7 Hz, 2H), 8.21 (d, *J* = 8.1 Hz, 1H), 7.77–7.70 (m, 4H), 7.45–7.40 (m, 1H), 7.04 (d, *J* = 9.0 Hz, 2H), 3.84 (s, 3H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 162.0, 161.0, 159.7, 150.6, 132.9, 131.2, 129.5, 127.5, 124.7, 123.6, 113.5, 113.1, and 55.2. ES-MS: *m*/*z* 252 [M + H$^+$].

4-Amino-2-(pyridin-3-yl)quinazoline (5g). White solid, mp 226–227°C; ^1H NMR (300 MHz, DMSO-d_6): δ = 9.56 (s, 1H), 8.71–8.66 (m, 2H), 8.27 (d, *J* = 8.1 Hz, 1H), 7.96 (br., 2H), 7.84–7.77 (m, 2H), 7.55–7.48 (m, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 162.2, 158.2, 150.6, 150.2, 149.2, 135.0, 133.8, 133.1, 127.7, 125.6, 123.7, 123.4, and 113.4. ES-MS: *m*/*z* 223 [M + H$^+$].

4-Amino-2-(quinolin-2-yl)quinazoline (5h). White solid, mp 261–262°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.59 (d, *J* = 9.0 Hz, 1H), 8.49 (d, *J* = 8.1 Hz, 1H), 8.31 (d, *J* = 8.1 Hz, 1H), 8.16 (d, *J* = 9.0 Hz, 1H), 8.07 (br. 2H), 8.04 (s, 1H), 7.90–7.80 (m, 3H), 7.66 (t, *J* = 7.5 Hz, 1H), 7.56 (t, *J* = 7.2 Hz, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 162.6, 160.0, 156.2, 150.2, 147.4, 136.3, 133.1, 129.7, 129.5, 128.0, 127.9, 127.8, 127.1, 126.0, 123.6, 121.1, and 113.6. ES-MS: *m*/*z* 273 [M + H$^+$].

4-Amino-2-(furan-2-yl)quinazoline (5i). White solid, mp 221°C (decomp.); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.21 (d, *J* = 8.1 Hz, 1H), 7.86–7.68 (m, 5H), 7.47–7.42 (m, 1H), 7.18 (d, *J* = 2.7 Hz, 1H), 6.65 (t, *J* = 1.5 Hz, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ= 162.1, 153.7, 153.1, 150.2, 144.7, 133.2, 127.4, 125.1, 123.7, 113.4, 112.2, and 112.1. ES-MS: *m*/*z* 212 [M + H$^+$].

4-Amino-2-methylquinazoline (6a). White solid, mp 226°C (decomp.); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.47 (br., 2H), 8.27 (d, *J* = 8.7 Hz, 1H), 7.83 (t, *J* = 7.5 Hz, 1H), 7.67 (d, *J* = 8.1 Hz, 1H), 7.53 (t, *J* = 7.5 Hz, 1H), 1.76 (s, 3H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 171.7, 162.8, 162.4, 134.1, 125.8, 124.2, 123.4, 111.9, and 24.2. ES-MS: *m*/*z* 160 [M + H$^+$].

4-Amino-2-isopropylquinazoline (6b). White solid, mp 117–119°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.17 (d, *J* = 8.1 Hz, 1H), 7.74–7.68 (m, 3H), 7.61 (d, *J* = 8.1 Hz, 1H), 7.43–7.38 (m ,1H), 2.95–2.90 (m, 1H), 1.26 (d, *J* = 8.7 Hz, 6H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 170.8, 162.0, 150.1, 132.6, 127.0, 124.5, 123.4, 113.0, 37.1, and 21.7. ES-MS: *m*/*z* 188 [M + H$^+$].

4-Amino-2-cyclohexylquinazoline (6c). White solid, mp 210–213°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.16 (d, *J* = 8.7 Hz, 1H), 7.72–7.55 (m, 4H), 3.39 (t, *J* = 7.8 Hz, 1H), 2.64–2.56 (m, 1H), 1.92–1.55 (m, 7H), 1.41–1.21 (m, 3H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 170.0, 162.0, 150.3, 132.4, 127.1, 124.4, 123.4, 113.0, 47.1, 31.4, and 25.9. ES-MS: *m*/*z* 228 [M + H$^+$].

4-Amino-2-benzylquinazoline (6d). White solid, mp 240–242°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.16 (d, *J* = 8.7 Hz, 1H), 7.75–7.69 (m, 3H), 7.65–7.62 (m, 1H), 7.44–7.39 (m, 1H), 7.34–7.24 (m, 4H), 7.20–7.15 (m, 1H), 3.99 (s, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 165.4, 162.1, 150.1, 139.3, 132.7, 128.9, 128.1, 127.0, 125.9, 124.7, 123.4, 112.7, and 45.6. ES-MS: *m*/*z* 236 [M + H$^+$].

4-Amino-2-(hydroxy(phenyl)methyl)quinazoline (6e). Yellow oil; ^{1}H NMR (300 MHz, CDCl$_3$): δ = 7.89 (d, *J* = 8.1 Hz, 1H), 7.79 (td, *J* = 1.5, 6.6 Hz, 1H), 7.66 (d, *J* = 8.1 Hz, 1H), 7.54–7.44 (m, 4H), 7.36–7.28 (m, 2H), 5.68 (br., 2H), 5.42 (br., 1H). ^{13}C NMR (75 MHz, CDCl$_3$): δ = 165.3, 161.8, 148.9, 142.7, 133.4, 128.4, 127.9, 127.8, 127.7, 126.0, 121.8, 113.3, and 75.1. ES-MS: *m*/*z* 252 [M + H$^+$].

Benzyl 3-amino-1-(4-aminoquinazolin-2-yl)-3-oxopropylcarbamate (6f). White solid, mp 244–246°C; $[\alpha]_D^{15}$= −77.2 (*c* = 1, MeOH:TFA = 10:1); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.18 (d, *J* = 8.1 Hz, 1H), 7.73 (t, *J* = 6.9 Hz, 3H), 7.59 (d, *J* = 8.1 Hz, 1H), 7.45–7.43 (m, 2H), 7.26 (s, 5H), 7.05 (s, 1H), 5.04–4.93 (m, 2H), 4.63–4.62 (m, 1H), 3.16–3.09 (m, 1H), 2.98–2.90 (m, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 170.0, 161.9, 150.2, 132.4, 131.5, 128.8, 128.6, 127.1, 124.3, 123.4, 113.0, 47.0, 31.4, and 25.9. ES-MS: *m*/*z* 366 [M + H$^+$].

Benzyl (4-aminoquinazolin-2-yl)methylcarbamate (6g). White solid, mp 209°C (decomp.); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.19 (d, *J* = 8.4 Hz, 1H), 7.77–7.72 (m, 3H), 7.63 (d, *J* = 8.1 Hz, 1H), 7.50–7.35 (m, 6H), 5.07 (s, 2H), 4.22 (d, *J* = 6.0 Hz, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 163.1, 162.0, 156.3, 149.8, 137.3, 132.8, 128.3, 127.7, 127.6, 127.0, 124.9, 123.6, 113.3, 65.2, and 46.5. ES-MS: *m*/*z* 309 [M + H$^+$].

Benzyl 3-amino-1-(4-amino-6-chloroquinazolin-2-yl)-3-oxopropylcarbamate (7a). Yellow solid, mp 252–254°C; $[\alpha]_D^{15}$= −92.2 (*c* = 1, MeOH:TFA = 10:1); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.34 (d, *J* = 2.4 Hz, 1H), 7.82 (br., 2H), 7.74 (dd, *J* = 2.1 Hz, 8.7 Hz, 1H), 7.60 (d, *J* = 9.0 Hz, 1H), 7.40 (d, *J* = 8.4 Hz, 1H), 7.27 (s, 5H), 7.24 (s, 1H), 7.03 (br, 1H), 5.03–4.96 (t, 2H), 4.62–4.60 (t, 1H), 3.32–3.09 (t, 1H), 3.97–3.92 (t, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 173.4, 164.2, 161.0, 155.7, 148.6, 137.0, 133.0, 129.2, 128.7, 128.2, 127.6, 127.4, 122.7, 113.7, 65.2, 53.4, and 40.9; ES-MS: *m*/*z* 400 [M + H$^+$].

4-amino-6-chloro-2-benzylquinazoline (7b). White solid, mp 239–242°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.36 (d, *J* = 2.1 Hz, 1H), 8.19 (d, *J* = 2.4 Hz, 1H), 8.03 (br., 2H), 7.35–7.25 (m, 5H), 7.21–7.18 (m, 1H), 4.02 (s, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 166.9, 161.7, 146.6, 138.7, 135.7, 128.9, 128.6, 128.2, 126.1, 123.6, 122.6, 114.2, and 45.6. ES-MS: *m*/*z* 270 [M + H$^+$].

Benzyl 3-amino-1-(4-amino-7-chloroquinazolin-2-yl)-3-oxopropylcarbamate (7c). Yellow solid, mp 259–261°C; $[\alpha]_D^{15}$= −57.6 (*c* = 1, MeOH:TFA = 10:1); ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.22 (d, *J* = 8.7 Hz, 1H), 7.88 (br., 2H), 7.62 (d, *J* = 1.8 Hz, 1H), 7.48 (dd, *J* = 1.8 Hz, 8.7 Hz, 1H), 7.41 (d, *J* = 8.4 Hz, 1H), 7.27 (s, 6H), 7.05 (s, 1H), 5.05–4.93 (m, 2H), 4.65–4.60 (m, 1H), 3.16–3.09 (m, 1H), 2.97–2.90 (m, 1H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 173.5, 165.7, 165.0, 161.6, 155.7, 150.9, 137.3, 128.2, 127.6, 127.4, 125.7, 125.1, 111.5, 65.2, 53.6, and 40.9.; ES-MS: *m*/*z* 400 [M + H$^+$].

4-Amino-7-chloro-2-benzylquinazoline (7d). White solid, mp 210–212°C; ^{1}H NMR (300 MHz, DMSO-d_6): δ = 8.20 (d, *J* = 8.7 Hz, 1H), 7.90 (br., 2H), 7.68 (d, *J* = 2.1 Hz, 1H), 7.49–7.46 (m, 1H), 7.36–7.16 (m, 5H), 3.98 (s, 2H). ^{13}C NMR (75 MHz, DMSO-d_6): δ = 166.9, 162.0, 151.3, 139.0, 137.4, 128.9, 128.2, 127.7, 126.1, 125.7, 125.2, 111.4, and 45.5. ES-MS: *m*/*z* 270 [M + H$^+$].

The condensation of aromatic aldehyde, cyclopentanone, and urea or thiourea in the presence of Ytterbium bis(perfluorooctanesulfonyl)imide complex in perfluorodecalin was used to synthesize a variety of benzylidene heterobicyclic pyrimidinones in excellent yields.

J. Heterocyclic Chem., **46**, 1430 (2009).

INTRODUCTION

Multicomponent reactions (MCRs) are powerful tools in modern medicinal chemistry, enabling straightforward access to large libraries of structurally related, drug-like compounds and thereby facilitating the generation of precursor candidates compounds. Hence, combined with the use of combinatorial chemistry and high throughput parallel synthesis, such reactions have constituted an increasingly valuable approach to drug discovery efforts in recent years [1,2].

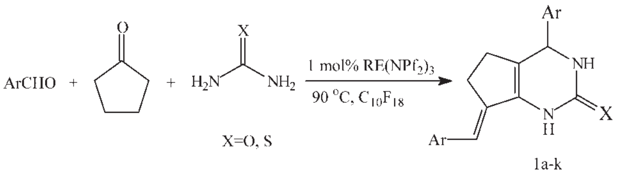
Over the past decade, pyrimidinone derivatives have attracted strong interest because of their useful biological activities, pharmaceutical, and therapeutic properties, such as antiviral, antitumor, antibacterial, and anti-inflammatory activities [3–6]. Classical Biginelli reactions involve one-pot condensations of an aldehyde, α,β-ketoester, and urea under strongly acidic conditions. In recent decades, the Biginelli reaction was extended the scope [7]. Especially, some fused pyrimidinones carrying an arylidene moiety exit not only the broad-spectrum antitumor activity but also a distinctive pattern of selectivity toward individual cell line such as that of leukemia. Thus, synthesis of these heterocycles is of much current importance for both organic synthesis and medicinal chemistry. Conventional methods for synthesis of this type of pyrimidinones involve condensation of α, α′-bis(substituted benzylidene)cycloalkanones with urea or thiourea using strong Bronsted acid [8] or base [9] as catalysts. Recently Pan and coworkers [7b] and Xu and coworkers [10] described efficiently alternative synthesis of these fused pyrimidinones by a three-component condensation with aromatic aldehyde, cyclopentanone, and urea or thiourea as starting materials. Each of the aforementioned methods has its own merits, while some of these methods are plagued with the limitation of poor yields, difficult workup, effluent pollution, and unrecyclability of catalysts.

Metal complexes with bis(perfluorooctanesulfonyl)-imide ligands are active and recyclable catalysts in the fluorous immobilized phase for Baeyer-Villiger oxidation [11], Diels-Alder reaction [12], esterification [13], and Friedel-Crafts acylation [14]. A key factor to accomplish the catalytic processes was ascribed to the use of long-enough perfluorinated—N(SO$_2$C$_8$F$_{17}$)$_2$, whose structural characteristic can coordinate with a variety of metal cations to obtain the desired Lewis acid catalysts with appropriate catalytic activity, and the selective immobilization in the fluorous. Herein, this letter attempts to describe the catalytic activity of rare earth (III) bis-(perfluorooctanesulfonyl)imide complexes RE[N(SO$_2$—C$_8$F$_{17}$)$_2$]$_3$, (RE(NPf$_2$)$_3$) in the one-pot synthesis of pyri-midinone from aromatic aldehyde, cyclopentanone, and urea or thiourea (Scheme 1), the so-called Biginelli-type three-component reaction.

RESULTS AND DISCUSSION

At first, we began to study the catalytic activities of a series of rare earth bis(perfluorooctanesulfonyl)imide complexes to optimize the reaction condition of benzaldehyde, cyclopentanone, and urea (Scheme 2), which was chosen as a model reaction. The results are

Scheme 1



summarized in Table 1. It was obviously that rare earth bis(perfluorooctanesulfonyl)imide complexes catalyzed the Bigineli-type reaction efficiently and $Yb(NPf_2)_3$ showed the best catalytic activity among these complexes.

By using $Yb(NPf_2)_3$ as catalyst, we examined the effect of the amount of the catalyst on the model reaction mentioned earlier. When the amount of $Yb(NPf_2)_3$ was increased from 0.4 to 1.2 mol%, the yield was increased until to a maximum and then gradually decreased, and the highest yield was obtained at 1 mol% catalyst loading (Table 2, Entries 1–5).

Based on the earlier optimized results, with 1 mol% $Yb(NPf_2)_3$ as catalyst, we also investigated the effect of the reaction temperature ranging from 80 to 100°C, and the best results were obtained at 90°C (Table 2, Entries 4, 6 and 7). Meanwhile, further studies showed that the molar ratio of benzaldehyde, cyclopentanone, and urea at 1:1:1.2 was preferred.

Under the optimized conditions, the reactions of different aldehydes with cyclopentanone and urea or thiourea were examined. As listed in Table 3, aromatic aldehydes carrying different functional groups, such as methyl, methoxy, chloro, bromo, and nitro, were subjected to the reactions, and in all cases, the desired products were obtained in high yields (81–93%). All reactions were clean and free from any by-products. It is important to note that aldehydes with electron-withdrawing group were more reactive, and the reactions with cyclopentanone and urea were faster. The reason may be that the carbonyl carbon in aldehydes containing electron-withdrawing group are more electrophilic. Thiourea exhibited behavior similar to that urea.

The possibility of recycling $Yb(NPf_2)_3$ catalyst for the synthesis of 1a was also investigated. When the reaction was finished, the reaction mixture was cooled to room temperature. The fluorous phase containing catalysts was separated from reaction mixture by decantation and reused for the next cycle. The condensations of benzaldehyde, cyclopentanone, and urea under the conditions as mentioned earlier were run for five consecutive cycles, respectively, furnishing the corresponding pyrimidinones with 91%, 89%, 88%, 87%, and 87% isolated yields.

The mechanism for formation of benzylidene heterobicyclic pyrimidinones products is assumed to take place *via* coordination of $Yb(NPf_2)_3$ with an aldehyde, which then activates the attack of keto compound in its enol form and subsequent removal of OH group gives enone. Similar reaction further proceeds on this enone to give bis-benzylidene derivatives. The next are the Michael addition of urea, elimination of water, and cyclization to form pyrimidione.

In conclusion, we report a one-pot synthesis of fused pyrimidinone by $Yb(NPf_2)_3$-catalyzed Biginelli-type reaction of aromatic aldehyde, cyclopentanone, and urea or thiourea in fluorous media. The easy workup procedure, recyclable catalyst, short reaction times, and very good yields are the main advantages of this method.

Scheme 2

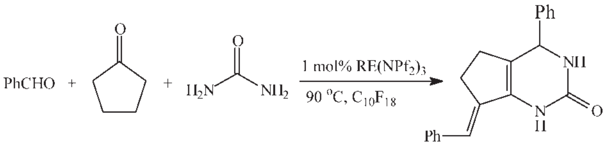


Table 1

$RE(NPf_2)_3$-catalyzed one-pot synthesis of benzylidene heterobicyclic pyrimidinones.[a]

Entry	Catalyst	Yield[b] (%)
1	$Y(NPf_2)_3$	73
2	$La(NPf_2)_3$	64
3	$Ce(NPf_2)_3$	83
4	$Nd(NPf_2)_3$	68
5	$Sm(NPf_2)_3$	71
6	$Eu(NPf_2)_3$	72
7	$Tb(NPf_2)_3$	77
8	$Dy(NPf_2)_3$	79
9	$Er(NPf_2)_3$	85
10	$Yb(NPf_2)_3$	91

[a] Reaction conditions: benzaldehyde (0.212 g, 2 mmol), cyclopentanone (0.168 g, 2 mmol), urea (0.146 g, 2.4 mmol), $C_{10}F_{18}$ (2 mL), $RE(NPf_2)_3$ (0.02 mmol), 90°C, 2.5 h.

[b] Isolated yield.

Table 2

Reaction of benzaldehyde, cyclopentanone, and urea in the presence of $Yb(Npf_2)_3$ under different reaction conditions.[a]

Entry	Amount of $Yb(NPf_2)_3$ (mol%)	Temperature (°C)	Yield[b] (%)
1	0.4	90	42
2	0.6	90	67
3	0.8	90	83
4	1.0	90	91
5	1.2	90	89
6	1.0	80	68
7	1.0	100	85

[a] Reaction conditions: benzaldehyde (0.212 g, 2 mmol), cyclopentanone (0.168 g, 2 mmol), urea (0.146 g, 2.4 mmol), $C_{10}F_{18}$ (2 mL), 2.5 h.

[b] Isolated yield.

Table 3

Synthesis of benzylidene heterobicyclic pyrimidinones in the presence of $Yb(Npf_2)_3$ in $C_{10}F_{18}$.[a]

Entry	Ar	X	Time (h)	Product	Yield[b] (%)
1	Ph	O	2	1a	91
2	4-$CH_3C_6H_4$	O	3	1b	93
3	2-$CH_3C_6H_4$	O	3	1c	81
4	4-$OCH_3C_6H_4$	O	3	1d	85
5	4-ClC_6H_4	O	2	1e	89
6	2-ClC_6H_4	O	2	1f	84
7	4-BrC_6H_4	O	2	1g	83
8	4-$NO_2C_6H_4$	O	2	1h	92
9	Ph	S	6	1i	94
10	4-$CH_3C_6H_4$	S	6	1j	86
11	4-ClC_6H_4	S	5	1k	92

[a] Reaction conditions: aldehyde (2 mmol), cyclopentanone (2 mmol), thiourea or urea (2.4 mmol), $C_{10}F_{18}$(2 mL), 90°C.

[b] Isolated yield.

EXPERIMENTAL

Chemicals used were obtained from commercial suppliers and used without further purifications. ^1H NMR, ^{13}C, and ^{19}F NMR spectra were recorded with a Bruker Advance RX500 spectrometer. Mass spectra were recorded on a Saturn 2000GC/MS instrument. Inductively coupled plasma (ICP) spectra were measured on an Ultima2C apparatus. Elemental analyses were performed on a Yanagimoto MT3CHN recorder.

Typical procedure for preparation of $(C_8F_{17}SO_2)_2NH$. $(C_8F_{17}SO_2)_2NH$ was prepared according to the literature [15,16]. Ammonia (300 mmol) was transferred with stirring perfluorooctanesulfonyl fluoride (50 g, 99.6 mmol) at −20°C for about 1 h, it was then continued at room temperature for 1 h. The solid product was acidified with HCl followed by addition of Et_2O. The organic layer was dried over anhydrous Na_2SO_4 and concentrated under reduced pressure, dried in vacuum at 80°C for 16 h to give $C_8F_{17}SO_2NH_2$ (87% yield). Then the mixture of perfluorooctanesulfonyl fluoride (45.4 g, 91 mmol), perfluorooctanesulfonamide (43.4 g, 87 mmol), and Et_3N (76 mL) was heated at reflux for 23 h. The lower brown fluorous layer was washed with 10% HCl and dried in vacuum at 70°C for 6 h to afford $(C_8F_{17}SO_2)_2N\ HNEt_3$. Finally, through acidic ion exchange resin column, $(C_8F_{17}SO_2)_2N\ HNEt_3$ changed to afford $(C_8F_{17}SO_2)_2NH$ in 50% yield. Anal. Calcd. for $(C_8F_{17}SO_2)_2NH$: C,19.57; N: 1.43 H: 0.10. Found: C, 19.61; N: 1.45, H, 0.16. ^{19}F NMR: δ-126.2, -121.8, -114.0, -81.2.

Typical procedure for preparation of $Yb(NPf_2)_3$. Ytterbium bis(perfluorooctanesulfonyl)imide complex, $Yb(NPf_2)_3$ was prepared according to the reported procedure [17]. The mixture of Yb_2O_3 (0.118 g, 0.3 mmol) and bis (perfluorooctanesulfonyl)imide (0.883 g, 0.9 mmol) in H_2O (10 mL) at 110°C for 1 h. The resulting mixture was filtered through a membrane filter. The remaining water was removed under reduced pressure at 80°C for 16 h. The Ytterbium bis (perfluorooctanesulfonyl)imide complex was obtained in 98% yield. ICP: Calcd for $C_{48}O_{12}N_3F_{102}S_6Yb$: Yb, 5.56. Found: 5.60 Anal. Calcd. For $Yb[N(SO_2C_8F_{17})_2]_3$: C, 18.50; N, 1.35. Found: C: 18.45; N, 1.41. ^{19}F NMR: δ −126.1, −121.2, −114.2, −81.4.

Typical procedure for the preparation of 7-benzylidene-4-phenyl-3,4,6,7-tetrahydro-1*H*- cyclopenta[d] pyrimidin-2(5H)-one. A mixture of benzaldehyde (0.212 g, 2 mmol), cyclopentanone (0.168 g, 2 mmol), urea (0.146 g, 2.4 mmol), and $Yb(NPf_2)_3$ (0.062 g, 0.02mmol) in perfluo-rodecalin ($C_{10}F_{18}$, cis and trans-mixture, 2mL) was well stirred at 90°C for appropriate time. After the reaction was completed, the system was cooled to room temperature. Then, the perfluorodecalin on the bottom was separated for the next cycle. Water was added to the reaction mixture, and the pure product was obtained by filtration followed by washing with acetone, ethyl acetate, and alcohol. Selected data: 7-benzylidene-4-phenyl-3,4,6,7-tetrahydro-1*H*-cyclopenta[d]pyrimidin-2(5*H*)-one, pale yellow solid; mp 236–239°C; ^1H NMR (500 MHz, DMSO): δ = 1.97–2.01 (m, 1H), 2.49 (m, 1H), 2.71–2.82 (m, 2H), 5.15 (s, 1H), 6.63 (s, 1H), 7.21–7.38 (m, 11H), 8.78 (s, 1H). ^{13}C NMR: δ = 29.5, 29.8, 58.7, 117.8, 119.6, 127.2, 127.4, 128.6, 129.0, 129.5, 129.6, 137.1, 138.8, 140.3, 144.3, 154.4 ppm. MS (EI) *m/z* 303 $[M+H]^+$.
