The synthesis of 3,4-diaryl-3-pyrrolin-2-ones and 4-aryl-3-pyrrolin-2-ones using Suzuki–Miyaura cross-coupling reactions of tetramic acid sulfonates with arylboronic acids has been studied. The effect that sulfonate ester, sterics, and lactam protection has on the cross-coupling reaction was evaluated. As expected, triflates were better cross-coupling partners than the corresponding tosylates. The yields were only partially affected by the incorporation of aryl groups at the 3-position. Importantly, tetramic acid triflates (and to a lesser extent tosylates) lacking a lactam protecting group were still competent substrates.

J. Heterocyclic Chem., **46**, 447 (2009).

INTRODUCTION

3,4-Diaryl-3-pyrrolin-2-ones **1a** and 4-aryl-3-pyrrolin-2-ones **1b** are important synthetic targets given their range of biological activity and utility as precursors to other compounds. 3,4-Diaryl-3-pyrrolin-2-ones have been investigated as inhibitors of cyclooxygenase-II (COX-II) [1], vascular endothelial growth factor receptor (VEGF-R) [2], and protein kinase C (PKC) [3]. 3,4-Diaryl-3-pyrrolin-2-ones have been used as building blocks for the preparation of the PKC inhibitor staurosporinone [4] and *N*-protected staurosporinones [5], whereas 4-aryl-3-pyrrolin-2-ones have been used as intermediates in the synthesis of 4-arylpyrrolidinones [6] (*e.g.*, antidepressant rolipram) [7], γ-aminobutyric acids [8] (*e.g.*, antispastic agent baclofen) [9], and β-arylpyrroles [10]. Before our involvement in this field [11,12], nearly all of the known methods to aryl-substituted 3-pyrrolin-2-ones **1** involved linear sequences that culminated in aldol-like cyclocondensations of α-amidoketones **2** [1,2,4,5,10a,13] (Fig. 1). An alternate method that has been explored to prepare 3,4-diaryl-3-pyrrolin-2-ones **1a** involves reducing the corresponding maleimides with borane [3a], but these reactions have proven to be nonselective [14]. Alternate methods used to synthesize 4-aryl-3-pyrrolin-2-ones **1b** include treatment of 4-bromo-2-butenoates with amines [6,8,15] and ring expansion of cyclobutanones [10b]. These literature methods all incorporate the C-4 aryl groups early in the sequence making them less applicable to the synthesis of C-4 aryl analogs [16]. A four component Ugi reaction provided access to 3,4-diaryl-3-pyrrolin-2-ones and 4-aryl-3-pyrrolin-2-ones, but this route was not amenable to the preparation of 5-unsubstituted derivatives [17,18].

Given their importance as drug candidates and building blocks, we initiated a program aimed at developing novel synthetic approaches to aryl-substituted 3-pyrrolin-2-ones that were amenable to the synthesis of new substitution patterns that allowed for the preparation of analogs. We recently reported our progress toward developing methodologies to **1** using Suzuki–Miyaura cross-coupling reactions of tetramic sulfonates **3a** [11a] and **4b** [11b] (Fig. 1). These methods have the potential to be useful in the synthesis of analogs given the late-stage introduction of C-4 aryl groups. The utility of our synthetic methodology was demonstrated by preparing the *N*-unsubstituted lactam analog of Vioxx® from **3a** and the 4-arylpyrrolidinone precursor to baclofen from **4b**.

We were initially inspired to investigate Suzuki–Miyaura cross-coupling reactions for the installation of C-4 aryl groups onto tetramic acid sulfonates by the analogous cross-coupling reactions of tetronic acid sulfonates **5** [19,20] and **6** [21] (Fig. 2). Interestingly, the cross-coupling of **6a** was reported to proceed in very low yield; this was attributed to a steric effect caused by the neighboring phenyl group [21a]. On the other hand, we observed excellent yields in the cross-coupling reactions of triflate **3a** which also contains a vicinal phenyl

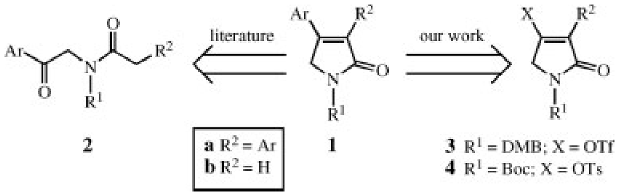

Figure 1. Synthetic approaches to 3,4-diaryl-3-pyrrolin-2-ones and 4-aryl-3-pyrrolin-2-ones.

group [11a]. To better understand the limitations of our methodology, we decided to systematically study the effect that sterics (R^3 = Ph *vs.* R^3 = H), sulfonate ester [trifluoromethanesulfonyl (OTf) *vs.* tosylsulfonyl (OTs)], and lactam protecting group [*tert*-butoxycarbonyl (Boc) *vs.* 3,4-dimethoxybenzyl (DMB)] have on the yield of the cross-coupling reaction. We thus set out to prepare new tetramic acid sulfonates **7** and **8** and compare their competence as cross-coupling substrates to our known tetramic acid sulfonates **3** and **4**. Our progress to date is reported herein.

RESULTS AND DISCUSSION

Tetramic acid sulfonate ester substrates (*e.g.*, **3a**) [11a] were prepared from the corresponding 3-phenyltetramic acids. The latter can be obtained *via* Dieckmann-like cyclocondensations of the corresponding *N*-phenylacetylglycinates [22]. Toward this end, treatment of glycine ethyl ester (**9**) with phenacetyl chloride gave known amide **10** [23] (Scheme 1). Conversion of **10** to **11** was achieved with Boc_2O and 4-(*N*,*N*′-dimethylamino)pyridine (DMAP) [24]. 3-Phenyltetramic acid **12** was then prepared by a Dieckmann cyclocondensation of **11** mediated by sodium *tert*-butoxide. Treatment of **12** with either triflic anhydride or tosyl chloride in the presence of triethylamine gave **7a** and **4a**, respectively.

In some cases, the synthesis of **7a** was accompanied by the formation of small amounts of lactam **13a** *via* a seemingly facile Boc deprotection (this was not observed with **4a**). We therefore decided to investigate cross-coupling reactions of substrates that did not contain protecting groups. Thus, we treated **7a** and **4a** with trifluoroacetic acid (TFA), and obtained lactams **13a** and **14a**, respectively.

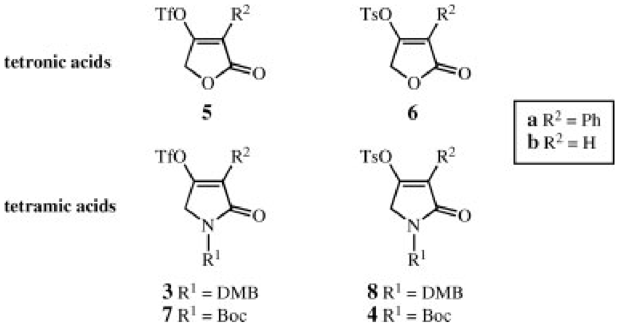

Figure 2. Tetramic acid sulfonates and tetronic acid sulfonates.

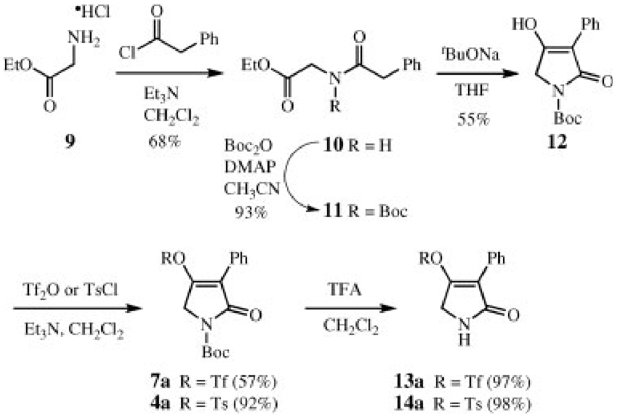
Scheme 1

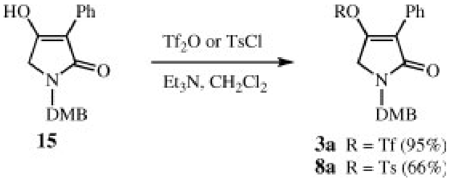


We reported a similar procedure for the synthesis of DMB-protected tetramic acid **15** [11a]. Treatment of **15** with either triflic anhydride or tosyl chloride in the presence of triethylamine gave **3a** [11a] and new compound **8a**, respectively (Scheme 2).

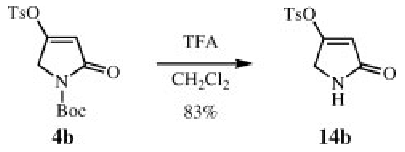
The next substrate that was prepared was *N*-unsubstituted tetramic acid tosylate **14b**. Known compound **4b** was available from our previous studies by the cyclocondensation of Boc-glycine with Meldrum's acid [11b,25]. Treatment of **4b** with TFA led to lactam **14b** (Scheme 3). We were not able to access 4-trifloxy-3-pyrrolin-2-one *via* this route as the requisite starting material, compound **7b**, turned out to be unstable and underwent a facile dimerization [11b].

With the tetramic acid sulfonate substrates in hand, we evaluated the effect that lactam protecting group, sulfonate leaving group, and sterics have on the yield of Suzuki–Miyaura cross-coupling reactions. We used our previously optimized conditions for cross-coupling reactions with tetramic acid triflates [Method A: $Pd(PPh_3)_4$ and Na_2CO_3] [11a] and tetramic acid tosylates [Method B: $Pd(1,1\text{-bis(diphenylphosphino)ferrocen})Cl_2(Pd(dppf)Cl_2)$, Cs_2CO_3] [11b]. To simplify our study and the analysis of the products, we used 4-methoxyphenylboronic acid. Our results are detailed later in Tables 1–3.

Scheme 2



Scheme 3



We first examined the cross-coupling reactions of 3-phenyltetramic acid sulfonates (Table 1). The results shown in Table 1 describe the effect that lactam protecting group (R^1 = Boc *vs.* R^1 = DMB *vs.* R^1 = H) have on the cross-coupling reaction. These results also show the relative capabilities of the sulfonate leaving groups (X = OTf *vs.* X = OTs). In the triflate series, the Boc and DMB protecting groups were equivalent (97% *vs.* 95%); on the other hand in the tosylate series, the Boc protecting group proved to be superior (40% *vs.* Trace). We were pleasantly surprised to see that *N*-unsubstituted triflate **13a** proved to be a viable substrate providing known 3,4-diaryl-3-pyrrolin-2-one **18a** in 62% yield. This result indicates a potential for step savings that could be realized with this methodology during the preparation of analogs. Unlike triflate **13a**, cross-coupling with the corresponding *N*-unsubstituted tosylate **14a** failed to give product **18a**. As expected, triflate leaving groups proved to be superior to tosylate leaving groups; in some cases, triflate leaving groups appear to be required in the cross-coupling of unprotected lactams.

Next, we examined the cross-coupling reactions of tetramic acid tosylates **4** and **14** with 4-methoxyphenylboronic acid using Method B (Table 2). We used tosylates in this study as 3-unsubstituted triflates (R^2 = H) were not available. The results shown in Table 2 describe the effects of sterics (R^2 = Ph *vs.* R^2 = H) on the cross-coupling reactions. With Boc-protected tetramic acid tosylates **4**, the addition of a vicinal phenyl group lowered the yield (74% *vs.* 40%) although it did not shut down the reaction as was observed with the 3-phenyltetronic acid tosylate [21a]. Somewhat unexpectedly with *N*-unsubstituted tetramic acid tosylates **14**, the neighboring phenyl group precluded the reaction (55% *vs.* 0%). When further analyzing the importance of lactam protection, the yield was only partially diminished going from *N*-Boc tosylate **4b** to *N*-unsubstituted tosylate **14b** (74% *vs.* 55%).

4a	Boc	Ph	**16a**	40
14b	H	H	**18b**	55
14a	H	Ph	**18a**	0

[a] Yields reported are for isolated, chromatographed materials.

Finally, we investigated the reactions of tetramic acid sulfonates with 4-methoxyphenylboronic acid and 2-methoxyphenylboronic acid (Table 3). The results shown in Table 3 describe the effects of sterics of the arylboronic acids on the cross-coupling reactions. With 3-phenyltetramic acid sulfonates **4a** and **7a**, the

[b] Method A.
[c] Method B.

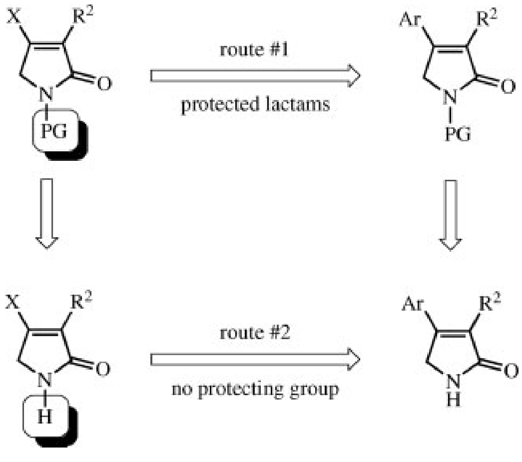
reactions with 4-methoxyphenylboronic acid were higher yielding than the reactions with 2-methoxyphenylboronic acid, although the effect was muted with tosylate **4a**. With the 3-unsubstituted tetramic acid tosylate **4b**, no difference in yield was observed; consequently, the steric effect appears to arise from the vicinal phenyl group (R^2 = Ph) and not from the steric differences of the arylboronic acids.

In conclusion, the Suzuki–Miyaura cross-coupling of tetramic acid sulfonates has proven to be a versatile methodology for the preparation of 3,4-diaryl-3-pyrrolin-2-ones and 4-aryl-3-pyrrolin-2-ones. This synthetic methodology provides facile access to C-4 analogs. The effect that sulfonate ester, sterics, and lactam protection has on the cross-coupling reaction was studied systematically. In all cases, triflates were better cross-coupling partners than the corresponding tosylates. The reactions still proceeded with vicinal phenyl groups, although the yield was partially diminished. We were pleased to find that tetramic acid triflates (and to a lesser extent tetramic acid tosylates) lacking a lactam protecting group proved to be competent substrates [26]. The latter result has the potential to improve the step economy [27] associated with preparing analogs *via* Suzuki–Miyaura cross-coupling reactions of lactams. Each analog can be prepared in one step using *N*-unsubstituted lactam (route #2), while two steps per analog are required with the corresponding *N*-substituted lactam (route #1) (Scheme 4).

EXPERIMENTAL

General remarks. All reactions were performed under a positive argon atmosphere with magnetic stirring unless otherwise noted. Tetrahydrofuran (THF) and CH_2Cl_2 were purified by passage through a column of alumina using a PureSolv 400 solvent purification system. Et_3N was distilled fresh from calcium hydride immediately before use. Unless otherwise indicated, all other reagents and solvents were purchased from commercial sources and were used without further purification. Petroleum ether (PE) refers to the fraction with boiling point 35–60°C. 4-Methoxyphenylboronic acid and 2-methoxyphenylboronic acid were purchased from Aldrich® and used as provided. ^1H NMR and ^{13}C NMR chemical shifts are reported in parts per million (δ) using the solvents residual proton or carbon signal ($CDCl_3$: δH 7.24 ppm, δC 77.3 ppm; d_6-DMSO: δH 2.50 ppm, δC 39.5 ppm) as an internal reference. Flash chromatography was performed with silica gel (230–400 mesh), and thin-layer chromatography (TLC) was performed with glass-backed silica gel plates and visualized with UV (254 nm). IR spectra were measured using a Perkin–Elmer Spectrum 100 with ATR sampler (attenuated total reflectance). Known tetramic acid derivatives **3a** [11a], **4b** [11b], and **15**

Scheme 4



[11a] were prepared using our previously published procedures.

Ethyl 2-(2′-phenylacetamido)acetate (10) [23]. A modification of a known procedure to the corresponding methyl ester was followed [28]. To a 0°C stirred solution of glycine ethyl ester hydrochloride (**9**) (10.0 g, 104 mmol) in CH_2Cl_2 (155 mL) was added ice-cooled, neat Et_3N (21.0 g, 28.9 mL, 208 mmol) followed by a solution of phenylacetyl chloride (16.1 g, 13.8 mL, 104 mmol) in CH_2Cl_2 (45 mL) dropwise *via* addition funnel. The cloudy yellow reaction mixture was stirred at 0°C for 2 h and then at rt for 2 h. The organic layer was then washed with H_2O (250 mL), brine (250 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave a crude yellow oil that solidified on standing. Trituration (ether) gave the known titled compound **10** as a yellow amorphous solid (15.6 g, 70.5 mmol, 68% yield): mp 77–79°C (lit. [23b] mp 79–82°C); ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.24–7.38 (m, 5H), 5.91 (br s, 1H), 4.15 (q, 3H, $J = 7.1$ Hz), 3.97 (d, 2H, $J = 5.1$ Hz), 3.61 (s, 2H), 1.22 (t, 4H, $J = 3.6$ Hz) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 171.4, 170.0, 134.7, 129.7, 129.3, 127.7, 61.8, 43.7, 41.7, 14.4 ppm.

Ethyl 2-(*N*-(*tert*-butoxycarbonyl)-2′-phenylacetamido)-acetate (11). To a rt stirred solution of **10** (15.6 g, 70.6 mmol) in CH_3CN (170 mL) was added DMAP (0.862 g, 7.06 mmol) followed by a solution of Boc_2O (16.9 g, 79.0 mmol) in CH_3CN (80 mL). The brown reaction mixture was stirred at rt for 3 h. The solvent was then concentrated *in vacuo* to give a brown oil that was taken up in ether (50 mL) and washed with an aqueous solution of HCl (1*M*, 40 mL), brine (40 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave the title compound **11** as a brown oil, which was used directly without further purification (21.0 g, 65.3 mmol, 93% yield): ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.19–7.29 (m, 5H), 4.43 (s, 2H), 4.28 (s, 2H), 4.16 (q, 2H, $J = 7.2$ Hz), 1.46 (s, 9H), 1.24 (t, 3H, $J = 7.2$ Hz) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 174.1, 169.2, 152.4, 135.1, 129.9, 128.6, 127.1, 84.3, 61.5, 45.9, 44.4, 28.1, 14.5 ppm.

***tert*-Butyl 2,5-dihydro-4-hydroxy-2-oxo-3-phenyl-1*H*-pyrrole-1-carboxylate (12).** To a 0°C stirred solution of **11** (15.1 g, 47.1 mmol) in THF (200 mL) was added sodium *tert*-butoxide (5.43 g, 47.1 mmol). The cloudy rust-colored reaction mixture was stirred at 0°C for 2 h and then at rt overnight. An aqueous solution of $KHSO_4$ (12.8 g, 94.0 mmol in 200 mL H_2O) was added to the reaction mixture and allowed to stir for 20 min. The THF was then removed *in vacuo*, and the remaining aqueous layer was extracted with ethyl acetate (EtOAc) (3 × 80 mL). The combined organic layers were then washed with brine (200 mL) and dried over sodium sulfate. Removal of the solvent *in vacuo* gave a crude yellow solid. Trituration (EtOAc) gave the titled compound **12** as white crystals (7.04 g, 25.6 mmol, 55% yield): mp 134–135°C; IR (ATR, neat) 3141, 1745, 1718, 1663, 1639, 1408, 1350, 1313, 1257, 1155, 1103, 1073, 980, 898, 851, 780, 754, 742, 721, 694, 665 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 12.39 (br s, 1H), 7.84 (d, 2H, $J = 7.2$ Hz), 7.35 (t, 2H, $J = 7.5$ Hz), 7.20 (t, 1H, $J =$ 7.5), 4.27 (s, 2H), 1.48 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 169.4, 168.0, 149.0, 131.1, 127.9, 127.0, 126.2, 103.5, 81.1, 47.9, 27.8 ppm; *Anal.* calcd for $C_{15}H_{17}NO_4$: C, 65.44; H, 6.22; N, 5.09. Found: C, 65.23; H, 6.22; N, 5.00.

***tert*-Butyl 2,5-dihydro-2-oxo-3-phenyl-4-(trifluoromethylsulfonoxy)-1*H*-pyrrole-1-carboxylate (7a).** To a −15°C stirred solution of **12** (1.21 g, 4.65 mmol) in CH_2Cl_2 (30 mL) was added neat Et_3N (0.626 g, 0.860 mL, 6.18 mmol) followed by neat trifluoromethanesulfonic anhydride (Tf_2O; 1.44 g, 0.860 mL, 5.11 mmol) dropwise *via* syringe. The reaction mixture was stirred at −15°C for 2.5 h at which point TLC showed complete conversion of the starting material **12**. The reaction mixture first turned green on the addition of Tf_2O, and then turned into a clear yellow solution after 5 min. The reaction mixture was poured onto an aqueous solution of $KHSO_4$ (1.27 g, 9.33 mmol in 75 mL H_2O) and the aqueous layer was extracted with CH_2Cl_2 (3 × 30 mL). The combined organic layers were washed with an aqueous solution of sodium bicarbonate (1% *w*/*v*, 100 mL), brine (100 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave a crude yellow solid (1.36 g). Purification by flash column chromatography (gradient: 1:15 to 1:11 EtOAc/PE) gave the titled compound **7a** as an analytically pure yellow solid (1.07 g, 2.63 mmol, 57% yield): mp 94–96°C; $R_f = 0.34$ (1:8 EtOAc/PE); IR (ATR, neat) 2980, 1772, 1693, 1449, 1424, 1371, 1328, 1311, 1293, 1247, 1223, 1211, 1151, 1133, 1096, 969, 922, 902, 847, 820, 783, 764, 735, 696, 670 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.62–7.65 (m, 2H), 7.41–7.44 (m, 3H), 4.59 (s, 2H), 1.57 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 164.6, 154.9, 149.2, 130.2, 129.1, 129.0, 126.2, 124.6, 118.5 (q, $J = 320$ Hz), 84.6, 47.8, 28.3 ppm; *Anal.* calcd for $C_{16}H_{16}F_3NO_6S$: C, 47.17; H, 3.96; N, 3.44. Found: C, 47.13; H, 3.89; N, 3.39.

***tert*-Butyl 2,5-dihydro-2-oxo-3-phenyl-4-(tosyloxy)-1*H*-pyrrole-1-carboxylate (4a).** To a rt stirred solution of **12** (1.00 g, 3.65 mmol) in CH_2Cl_2 (40 mL) was added TsCl (0.730 g, 3.83 mmol) followed by neat Et_3N (0.443 g, 0.608 mL, 4.38 mmol) dropwise *via* syringe. The reaction mixture was stirred at rt for 1 h at which point TLC showed complete conversion of the starting material **12**. The reaction mixture was poured onto an aqueous solution of $KHSO_4$ (0.992 g, 7.30 mmol in 50 mL H_2O) and the aqueous layer was extracted with CH_2Cl_2 (3 × 40 mL). The combined organic layers were washed with an aqueous solution of sodium bicarbonate (1% *w*/*v*, 150 mL), brine (150 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave the titled compound **4a** as a yellow amorphous solid (1.44 g, 3.35 mmol, 92% yield). Recrystallization (CH_2Cl_2) gave the analytical sample as yellow crystals: mp 137–140°C; $R_f = 0.76$ (1:2 EtOAc/PE); IR (ATR, neat) 1770, 1450, 1377, 1335, 1314, 1287, 1192, 1159, 1091, 977, 898, 781, 761, 697, 664 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.60 (d, 2H, $J = 8.4$ Hz), 7.35–7.39 (m, 2H), 7.21–7.25 (m, 3H), 7.11 (d, 2H, $J = 9.0$ Hz), 4.58 (s, 1H), 2.35 (s, 3H), 1.57 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 165.7, 156.6, 149.0, 147.5, 131.1, 129.9, 128.7, 128.6, 128.2, 128.0, 127.0, 122.5, 83.7, 48.2, 28.1, 21.7 ppm; *Anal.* calcd for $C_{22}H_{23}NO_6S$: C, 61.52; H, 5.40; N, 3.26. Found: C, 61.13; H, 5.46; N, 3.31.

2,5-Dihydro-2-oxo-3-phenyl-4-(trifluoromethylsulfonoxy)-1*H*-pyrrole (13a). To a rt stirred solution of **7a** (1.50 g, 3.68 mmol) in CH_2Cl_2 (10 mL) was added TFA (10 mL). The reaction mixture was stirred at rt for 5 min at which point TLC showed complete conversion of the starting material **7a**. Removal of the solvent *in vacuo* gave a crude brown oil that was taken up in $CHCl_3$ (20 mL) and washed with a saturated aqueous solution of sodium bicarbonate (20 mL). The aqueous layer was extracted with $CHCl_3$ (3 × 20 mL) and the combined organic layers were then washed with brine (50 mL) and dried over sodium sulfate. Removal of the solvent *in vacuo* gave the titled compound **13a** as a yellow amorphous solid (1.10 g, 3.58 mmol, 97% yield). Recrystallization (EtOH) gave the analytical sample as yellow crystals: mp 117–119°C; R_f = 0.33 (1:2 EtOAc/PE); IR (ATR, neat) 3072, 1699, 1420, 1333, 1211, 1170, 1134, 1025, 958, 919, 825, 781, 766, 735, 694, 681 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 8.78 (s, 1H), 7.61–7.64 (m, 2H), 7.46–7.49 (m, 3H), 4.36 (d, 2H, J = 1.2 Hz) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 168.1, 155.6, 129.3, 128.5, 128.4, 127.2, 123.3, 117.7 (q, J = 320 Hz), 44.5 ppm; *Anal.* calcd for $C_{11}H_8F_3NO_4S$: C, 43.00; H, 2.62; N, 4.56. Found: C, 42.91; H, 2.59; N, 4.58.

2,5-Dihydro-2-oxo-3-phenyl-4-(tosyloxy)-1*H*-pyrrole (14a). To a rt stirred solution of **4a** (1.00 g, 2.33 mmol) in CH_2Cl_2 (20 mL) was added TFA (20 mL). The reaction mixture was stirred at rt for 5 min at which point TLC showed complete conversion of the starting material **4a**. Removal of the solvent *in vacuo* gave a crude brown oil that was taken up in $CHCl_3$ (20 mL) and washed with a saturated aqueous solution of sodium bicarbonate (20 mL). The aqueous layer was extracted with $CHCl_3$ (3 × 25 mL) and the combined organic layers were then washed with a saturated aqueous solution of sodium bicarbonate (200 mL), brine (200 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave titled compound **14a** as a yellow amorphous solid (0.750 g, 2.28 mmol, 98% yield). Recrystallization (CH_2Cl_2) gave the analytical sample as light yellow crystals: mp 159–161°C; R_f = 0.21 (1:1 EtOAc/PE); IR (ATR, neat) 3071, 1686, 1593, 1497, 1451, 1360, 1306, 1236, 1204, 1182, 1172, 1088, 1039, 960, 813, 786, 735, 703, 689 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 8.47 (s, 1H), 7.73–7.76 (m, 2H), 7.28–7.37 (m, 7H), 4.20 (d, 2H, J = 0.9 Hz), 2.35 (s, 3H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 169.3, 156.6, 146.6, 130.5, 130.2, 128.2, 128.1, 128.0, 127.9, 121.5, 44.9, 21.2 ppm; *Anal.* calcd for $C_{17}H_{15}NO_4S$: C, 61.99; H, 4.59; N, 4.25. Found: C, 62.00; H, 4.64; N, 4.29.

2,5-Dihydro-1-(3′,4′-dimethoxybenzyl)-2-oxo-3-phenyl-4-(tosyloxy)-1*H*-pyrrole (8a). To a rt stirred solution of known tetramic acid **15** [2] (2.00 g, 6.18 mmol) in CH_2Cl_2 (60 mL) was added TsCl (1.23 g, 6.46 mmol) followed by neat Et_3N (0.748 g, 1.028 mL, 7.39 mmol) dropwise *via* syringe. The reaction mixture was stirred at rt for 2 h at which point TLC showed complete conversion of the starting material **15**. The reaction mixture was poured onto an aqueous solution of $KHSO_4$ (1.99 g, 14.6 mmol in 75 mL H_2O) and the aqueous layer was extracted with CH_2Cl_2 (3 × 50 mL). The combined organic layers were washed with an aqueous solution of sodium bicarbonate (1% *w*/*v*, 150 mL), brine (150 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave a crude clear oil (2.79 g) that was purified by flash column chromatography (gradient: 1:5 to 1:1 EtOAc/PE). Removal of the solvent *in vacuo* gave the titled compound **8a** as a clear oil. Trituration (MeOH) gave the analytical sample as a white solid (1.94 g, 4.05 mmol, 66% yield): mp 110–112°C; R_f = 0.17 (1:2 EtOAc/PE); IR (ATR, neat) 1688, 1593, 1517, 1447, 1405, 1356, 1338, 1296, 1280, 1263, 1356, 1338, 1296, 1280, 1263, 1236, 1205, 1160, 1136, 1090, 1022, 973, 956, 900, 814, 787, 766, 741, 706, 697 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.52 (d, 2H, J = 8.1 Hz), 7.43–7.46 (m, 2H), 7.20–7.22 (m, 3H), 7.05 (d, 2H, J = 8.7 Hz), 6.79 (d, 3H, J = 12 Hz), 4.59 (s, 2H), 4.12 (s, 2H), 3.86 (s, 3H), 3.85 (s, 3H), 2.31 (s, 3H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 168.3, 154.8, 149.6, 149.0, 146.5, 131.4, 130.0, 129.4, 128.8, 128.6, 128.4, 128.2, 122.5, 120.9, 111.5, 111.4, 56.2, 49.4, 46.1, 21.9 ppm; *Anal.* calcd for $C_{26}H_{25}NO_6S$: C, 65.12; H, 5.25; N, 2.92. Found: C, 65.05; H, 5.37; N, 2.92.

2,5-Dihydro-2-oxo-4-(tosyloxy)-1*H*-pyrrole (14b). To a 0°C stirred solution of known tosylate **4b** [11b] (0.600 g, 1.70 mmol) in CH_2Cl_2 (8.6 mL) was added TFA (8.6 mL) dropwise *via* syringe. The reaction mixture was stirred for 0.5 h. Removal of the solvent *in vacuo* gave a crude product that was taken up in $CHCl_3$ (25 mL) and washed with an aqueous solution of sodium bicarbonate (5% *w*/*v*, 2 × 25 mL), brine (25 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave the titled compound **14b** as a white amorphous solid (0.355 g, 1.40 mmol, 83% yield): mp 151–153°C; IR (ATR, neat) 3102, 1693, 1631, 1596, 1386, 1360, 1325, 1216, 1196, 1184, 1161, 1092, 980, 921, 877, 818, 803, 782, 704, 667 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 8.03 (s, 1H), 7.96 (d, 2H, J = 8.4 Hz), 7.54 (d, 2H, J = 8.1 Hz), 5.62 (d, 1H, J = 1.5 Hz), 3.93 (t, 2H, J = 1.2 Hz), 2.45 (s, 3H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 170.8, 163.3, 146.9, 130.6, 130.4, 128.5, 107.4, 46.2, 21.2 ppm; *Anal.* calcd for $C_{11}H_{11}NO_4S$: C, 52.16; H, 4.38; N, 5.53; S, 12.66. Found: C, 52.10; H, 4.30; N, 5.47; S, 12.71.

General procedures for Suzuki–Miyaura reactions

Method A (tetramic acid triflates). To a rt stirred solution of tetramic acid triflate (1.00 mmol) in THF (10 mL) was added an arylboronic acid (1.50 mmol) and was allowed to dissolve completely. To this solution was added $Pd(PPh_3)_4$ (0.050 mmol) followed by an aqueous solution of sodium carbonate (2.2 mmol in 1 mL H_2O). The reaction mixture was stirred at rt for 40 min and then heated to reflux until TLC showed complete conversion of the starting triflate (typically 1–3 h). The reaction mixture was then filtered through a short plug of celite with the aid of EtOAc. Removal of the solvent *in vacuo* gave a crude solid that was purified by flash column chromatography (gradient: 1:4 to 1:1 EtOAc/PE).

Method B (tetramic acid tosylates). To a rt stirred solution of tetramic acid tosylate (1.00 mmol) in THF (10 mL) was added an arylboronic acid (1.50 mmol) and was allowed to dissolve completely. To this solution was added $Pd(dppf)Cl_2$ (0.050 mmol) followed by a solution of an aqueous solution of cesium carbonate (3.00 mmol, 1 mL H_2O). The reaction mixture was stirred at rt for 40 min and heated to reflux until TLC showed complete conversion of the starting material (typically 12–20 h). The reaction mixture was then filtered through a short plug of celite with the aid of EtOAc. The organic layer was washed with a saturated aqueous solution of sodium bicarbonate (50 mL), brine (50 mL), and dried over sodium sulfate. Removal of the solvent *in vacuo* gave a crude oil that was purified by flash column chromatography (gradient: CH_2Cl_2 to 8:92 EtOAc/CH_2Cl_2).

***tert*-Butyl 2,5-dihydro-4-(4′-methoxyphenyl)-2-oxo-3-phenyl-1*H*-pyrrole-1-carboxylate (16a).** Using triflate **7a**, Method **A** was followed and gave the titled compound **16a** as a light yellow amorphous solid (97% yield). Recrystallization (EtOAc) gave the analytical sample as white crystals: mp 177–179°C; R_f = 0.60 (1:2 EtOAc/PE); IR (ATR, neat) 1763, 1686, 1604, 1516, 1450, 1366, 1348, 1313, 1298, 1257, 1160, 1123, 1097, 1027, 926, 912, 851, 835, 787, 743, 700 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.33–7.34 (m, 5H), 7.26 (d, 2H,

J = 7.5 Hz), 6.79 (d, 2H, J = 9.0 Hz), 4.64 (s, 2H), 3.79 (s, 3H), 1.58 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 168.9, 161.2, 150.5, 149.3, 131.8, 130.7, 129.9, 129.7, 128.8, 128.6, 124.7, 114.4, 83.3, 55.6, 50.9, 28.4 ppm; *Anal.* calcd for $C_{22}H_{23}NO_4$: C, 72.31; H, 6.34; N, 3.83. Found: C, 72.10; H, 6.38; N, 3.87.

Using tosylate **4a**, Method **B** was followed and gave the titled compound **16a** as a light yellow amorphous solid (40% yield) which gave spectral data consistent with the material prepared from triflate **7a**.

2,5-Dihydro-1-(3′,4′-dimethoxybenzyl)-4-(4″-methoxyphenyl)-2-oxo-3-phenyl-1*H*-pyrrole (17a). Using triflate **3a** [11a], Method **A** was followed and gave the titled compound **17a** as a yellow amorphous solid as reported previously [11a] (95% yield).

Using tosylate **8a**, Method **B** was followed in an attempt to obtain the titled compound **17a**; however, only a trace amount of product was formed as seen by TLC. Flash column chromatography gave only starting material **3a**.

2,5-Dihydro-4-(4′-methoxyphenyl)-2-oxo-3-phenyl-1*H*-pyrrole (18a). Using triflate **13a**, Method **A** was followed and gave the titled compound **18a** as a white amorphous solid (62% yield): mp 169–174°C (lit. [11a] mp 193–196°C); R_f = 0.28 (1:1 EtOAc/PE); ^{1}H NMR ($CDCl_3$, 300 MHz) δ 8.42 (s, 1H), 7.29–7.37 (m, 3H) 7.24–7.28 (m, 4H) 6.87 (d, 2H, J = 8.7 Hz), 4.33 (s, 2H), 3.74 (s, 3H) ppm. The physical properties and spectral data for 18a were consistent to that reported previously [11a].

Using tosylate **14a**, Method **B** was followed in an attempt to obtain **18a**; however, spectroscopic and TLC assessment of the crude material obtained on work-up failed to reveal even reveal a trace of **18a**.

***tert*-Butyl 2,5-dihydro-4-(4′-methoxyphenyl)-2-oxo-1*H*-pyrrole-1-carboxylate (16b).** Using tosylate **4b** [11b], Method **B** was followed and gave the titled compound **16b** as a tan amorphous solid (74% yield): mp 151–154°C (lit. [11b] mp 158–160°C); R_f = 0.31 (1:2 EtOAc/PE); ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.59 (d, 2H, J = 9 Hz), 6.92 (d, 2H, J = 8.7 Hz), 6.24 (t, 1H, J = 1.2 Hz), 4.62 (d, 2H, J = 1.5 Hz), 3.82 (s, 3H), 1.55 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 169.8, 162.2, 156.0, 150.0, 128.1, 123.7, 117.6, 114.8, 83.1, 55.7, 51.2, 28.4 ppm. The physical properties and spectral data for **16b** were consistent to that reported previously [11b].

2,5-Dihydro-4-(4′-methoxyphenyl)-2-oxo-1H-pyrrole (18b). Using tosylate **14b**, Method **B** was followed and gave the titled compound **18b** as a tan amorphous solid (55% yield): mp 185–188°C (lit. [11b] mp 198–199°C); ^{1}H NMR ($CDCl_3$, 300 MHz) δ 8.05 (s, 1H), 7.61 (q, 2H, J = 4.5 Hz), 6.99 (d, 2H, J = 8.7 Hz), 6.38 (d, 1H, J = 1.2 Hz), 6.33 (d, 2H, J = 0.9 Hz), 3.80 (s, 3H) ppm. The physical properties and spectral data for **18b** were consistent to that reported previously [11b].

***tert*-Butyl 2,5-dihydro-4-(2′-methoxyphenyl)-2-oxo-3-phenyl-1*H*-pyrrole-1-carboxylate (19a).** Using triflate **7a**, Method **A** was followed and gave the titled compound **19a** as a yellow oil which partially solidified (61% yield). Crystallization (EtOH) gave the analytical sample as yellow crystals: mp 122–126°C; R_f = 0.44 (1:4 EtOAc/PE); IR (ATR, neat) 2967, 1759, 1680, 1596, 1470, 1350, 1292, 1257, 1152, 1100, 1014, 912, 786, 756, 702 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.28–7.31 (m, 3H), 7.21–7.23 (m, 2H), 7.00–7.03 (m, 1H), 6.82–6.90 (m, 2H), 4.65 (s, 2H), 3.65 (s, 3H), 1.57 (s 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 168.5, 157.2, 150.4, 149.8, 133.2, 131.6, 131.1, 130.5, 129.4, 128.3, 128.2, 122.1, 122.0, 111.6, 83.1, 55.5, 52.1, 28.5 ppm; *Anal.* calcd for $C_{22}H_{23}NO_4$: C, 72.31; H, 6.34; N, 3.83. Found: C, 72.03; H, 6.46; N, 3.81.

Using tosylate **4a**, Method **B** was followed and gave the titled compound **19a** as a yellow oil (33% yield) that gave spectral data consistent with the material prepared from **7a**.

2,5-Dihydro-4-(2′-methoxyphenyl)-2-oxo-1*H*-pyrrole-1-carboxylate (19b). Using tosylate **4b** [11b], Method **B** was followed and gave the titled compound **19b** as a brown amorphous solid (74% yield). Trituration (EtOH) gave the analytical sample as white crystals: mp 127–128°C; R_f = 0.33 (5:95 EtOAc/CH_2Cl_2); IR (ATR, neat) 1756, 1678, 1606, 1577, 1501, 1455, 1362, 1333, 1293, 1251, 1156, 1077, 1015, 876, 852, 789, 759, 730 cm^{-1}; ^{1}H NMR ($CDCl_3$, 300 MHz) δ 7.38–7.41 (m, 2H), 6.95–6.99 (m, 2H), 6.65 (s, 1H), 4.71 (d, 2H, J = 1.5 Hz), 3.89 (s, 3H), 1.56 (s, 9H) ppm; ^{13}C NMR ($CDCl_3$, 75 MHz) δ 170.3, 158.9, 153.1, 150.0, 132.5, 128.4, 123.0, 121.0, 120.1, 111.8, 83.0, 55.7, 52.8 ppm; *Anal.* calcd for $C_{16}H_{19}NO_4$: C, 66.42; H, 6.62; N, 4.84. Found: C, 66.33; H, 6.67; N, 4.92.

Acknowledgments. The authors thank Camille and Henry Dreyfus start-up grant (E.T.P.), Research Corporation, Patchett Foundation (S.J.P.Y.-M.), Dr. Edwards P. Franks (K.P.W.), and Hobart and William Smith Colleges for the support of this research

The synthesis of novel bis(diamino)thiazoles has been achieved by reacting bis(bromoacetyl)benzene and 1-alkyl(or aryl)-3-(*N*-nitroamidino)thioureas in presence of triethylamine. These new compounds were characterized by spectral analysis and screened for antimicrobial activities.

J. Heterocyclic Chem., **46**, 455 (2009).

INTRODUCTION

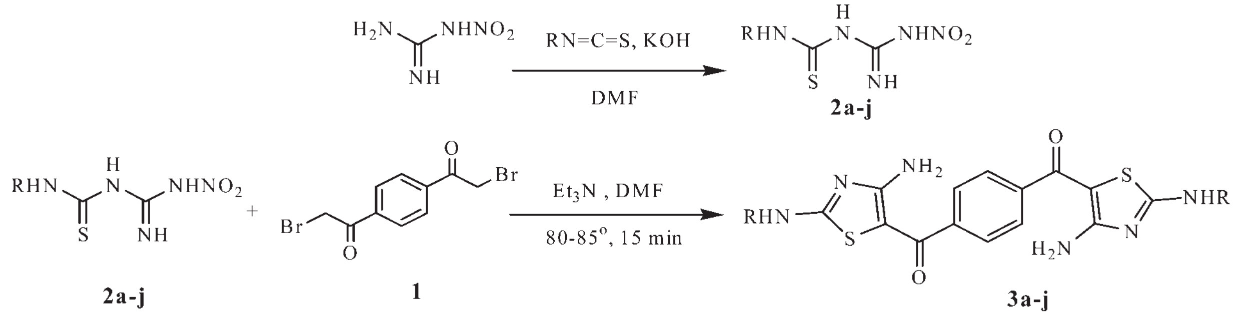
Compounds that incorporate two thiazole rings either directly connected as in bithiazoles or through a linker unit as in bisthiazolyl compounds, show significant biological activity. Bleomycin, isolated from *Streptomyces verticilus* containing a bithiazole moiety, which has been shown to bind to DNA thereby inhibiting DNA synthesis of the tumor cells, is the prime example for such compounds [1]. A number of other bi- or bisthiazoles [2–4] exhibit antibacterial, antiviral and cytotoxic activities. In addition to these compounds, quite a few of the highly active secondary metabolites from marine tunicates also contain bisthiazole units [5]. It also appears that the thiazole units need not always be directly linked for the manifestation of bioactivity; for example, ritonavir, a bisthiazole in which the two thiazole units are separated by a small peptidomimetic chain, is a potent bisthiazole HIV-protease inhibitor [6].

As far back as in 1997, we have observed that 2,4-diamino-5-ketothiazoles show excellent cytotoxic activity [7] based on screening programs at National Cancer Institute, an observation later substantiated further by us [8]. As part of our work in the synthesis of 2,4-diamino-5-ketothiazoles, we have developed a variety of thiourea based synthons, such as amidinothioureas, nitroamidinothioureas, and thiocarbamoylamidinopyrazoles that [9] serve as precursors for 2,4-diaminothiazoles by providing the [C^4—N^3—C^2—S^1] ring atoms for the thiazole ring construction, the remaining C^5 carbon of the thiazole being sourced from a reactive halomethyl compound of the type X—CH_2—EWG where the electron withdrawing group EWG can be O_2N—C_6H_4—, NC—, R—CO—, RO—CO—, Ar—CH=CH—CO— or similar ones, including α-haloketones. This [4 + 1] ring assembly, in a tandem bromination-cyclization strategy has been now applied for the synthesis of novel [4-(4-amino-2-(*N*-substituted amino)thiazole-5-carbonyl)-phenyl]-(4-amino-2-(*N*-substituted amino)thiazol-5-yl)-methanones. The above [(C^4—N^3—C^2—S^1) + C^5] ring assembly of 2,4-diaminothiazole using functionalized thiourea derivatives is distinctly different from the classic Hantzsch synthesis, which is the synthesis of 2-aminothiazoles from halo carbonyl compounds and thioureas is well reviewed [10,11] in literature. The latter is a [3 + 2] ring construction strategy starting from simple thioureas, that give the [N^3—C^2—S^1] ring atoms, and α-haloketones, which provide the remaining [C^4—C^5] atoms, giving 2-aminothiazoles as products.

RESULTS AND DISCUSSION

In a typical case, the reaction of 1-(*N*-nitroamidino)-3-*n*-propylthiourea with 1,4-bis(bromoacetyl)benzene

Scheme 1



R = *n*-Propyl, *n*-butyl, *t*-butyl, allyl, benzyl, phenyl, *p*-chlorophenyl, *m*-methylphenyl, *p*-ethoxyphenyl, *p*-methylphenyl

was done in DMF in the presence of triethylamine at 80–85°C for 15 min to obtain a compound which had a molecular composition $C_{20}H_{24}N_6O_2S_2$ gave a product the FAB mass spectrum of the which showed a MH^+ peak at *m/z* 445 indicating that the molecular mass of the compound is 444. It's ^{1}H NMR spectrum showed the presence of an *n*-propylamino group, a phenylene group and NH hydrogen. The ^{13}C NMR spectrum showed three peaks in the alkyl region at 13.51, 20.12, and 31.50 ppm indicating the presence of the *n*-propyl group. The signals at 143.8, 156.7, and 167 ppm were assignable to thiazole ring carbons, that at 181 ppm to carbonyl carbon and those at 126.4, 127.6, 128, and 129 ppm, to a *p*-phenylene group carbons. Accordingly, the compound was formulated as [4-(4-amino-2-*n*-propylaminothiazole-5-carbonyl)phenyl]-(4-amino-2-*n*-propylaminothiazol-5-yl)methanone **3a**. The reaction was next extended to 1-aryl-3-(*N*-nitroamidino)thioureas. As a typical example, 1-(4-methylphenyl-3-(*N*-nitroamidino)thiourea reacted with 1,4-bis(bromoacetyl)benzene to give a compound with molecular composition $C_{28}H_{24}N_6O_2S_2$. The ^{1}H NMR spectrum of the compound showed a doublet due to four hydrogens at δ 7.02–7.25, assignable to aryl hydrogen *ortho*- to a NH group. Another doublet of four hydrogens at δ 7.35–7.55 was ascribed to the aryl hydrogen *meta*- to a NH group. A singlet of four hydrogens at δ 7.74 was attributable to the aryl hydrogen of a *p*-phenylene group. A broad peak at δ 8.0–8.52 was due to NH hydrogen. A singlet due to two hydrogens at δ 10.72 was also assignable to two NH groups. The ^{13}C NMR spectrum showed fourteen peaks among which the peak at δ 26.98 showed the presence of a methyl group. Based on these data and the fragmentations observed in its EI mass spectrum, the compound was assigned the structure [4-(4-amino-4-phenylaminothiazole-5-carbonyl)phenyl]-(4-amino-4-phenylaminothiazol-5-yl)methanone **3j** (Scheme 1).

The general reaction scheme is depicted above. These new [4-(4-amino-2-(*N*-substituted amino)thiazole-5-carbonyl)phenyl]-(4-amino-2-(*N*-substituted amino)thiazol-5-yl)methanones (**3a–j**) were screened for their antibacterial and antifungal activities. The data from these studies are compiled in Table 1.

In conclusion, we have described an efficient synthetic route to obtain bis(diamino)thiazoles (**3a–j**), several of which show good antibacterial and antifungal activities.

EXPERIMENTAL

Melting points were determined by open capillary method and were uncorrected. The IR spectra were recorded in potassium bromide pellets with an AVATAR 330 FTIR spectrometer and the ^{1}H, ^{13}C NMR experiments were done on AMX-400/DRX-500 NMR spectrometers. The molecular masses of compounds were confirmed by taking EI and the fast atom bombardment mass spectra (FAB-MS). The compounds were purified by column chromatography using silica gel (60–120 mesh, E. Merck). The required alkyl and aryl isothiocyanates and nitroamidinothioureas were synthesized by reported methods [9(c),12] The bromination of 2,4-diacetylbenzene was done in DMF at 80–85°C and the 1,4-bis(bromoacetyl)benzene **1** was isolated and characterized. The antibacterial and antifungal activities were studied by the disc diffusion method against *Staphylococcus aureus*, *Klebsiella pneumonia*, *Candida albicans*, and *Aspergillus niger*. In the case of *C. albicans* and *A. niger* the standard used is ketoconazole and in the case of *S. aureus* and *K. pneumonia* the data has been compared with ciplofloxacin.

Bis(bromoacetyl)benzene (1). To a solution of 1,4-diacetylbenzene (0.21 g, 1.3 mmol) in glacial acetic acid, bromine (2.6 mmol, 90 mL) in glacial acetic acid (2 mL) was added slowly and warmed. The reaction mixture was then heated at 95°C for 1 h, and then poured into ice water and the product was filtered, dried and recrystallized from glacial acetic, to obtain colorless shinning crystals of 1,4-bis(bromoacetyl)benzene (**1**) in 65% yield, mp 165–167°C; IR (KBr): 2998, 2945, 1699, 1402, 1263, 1202, 1121, 987, 811, 683, 565, 499 cm^{-1}; ^{1}H NMR (400 MHz, $CDCl_3$): δ: 4.45 (s, 4H, CH_2), 8.04–8.10 (m, 4H, Ar—H); FAB ms: *m/z* (MH^+) 320.

1-*t*-Butyl-3-(*N*-nitroamidino)thiourea (2c). Finely powdered potassium hydroxide (1.08 g, 1.92 mmol) was added to

General procedure for the synthesis of bis(diamino)thiazoles (3a–j). To a solution of 1,4-bis(bromoacetyl)benzene in DMF (2 mL) kept at 50–60°C containing triethylamine (2 mmol), 1-alkyl/aryl-3-(*N*-nitroamidino)thioureas (1 mmol), in *N,N*-dimethylformamide (2 mL) was added dropwise. After warming for 15 min, the reaction mixture was poured into water. The product obtained, after adjusting the pH to 7, was collected and purified using column chromatography using silica gel by elution using chloroform-ethyl acetate (1:5) to obtain the bisthiazoles in 65–80% yield.

[4-(4-Amino-2-n-propylaminothiazole-5-carbonyl)phenyl]-(4-amino-2-n-propylaminothiazol-5-yl)-methanone (3a). This compound was obtained as yellow-colored microcrystals (65%), mp > 250°C; IR (KBr): 3416, 2963, 2928, 1603, 1567, 1444, 1384, 1279, 1225, 1091, 747 cm^{-1}; ^1H NMR (300 MHz, DMSO-d_6): δ 0.85 (t, 6H, CH_3, $J = 7$ Hz), 1.53 (sextet, 4H, CH_2, $J = 7$ Hz), 3.68 (t, 4H, CH_2, $J = 5.1$ Hz), 7.60–8.10 (m, 4H, Ar—H), 8.69 (s, NH); ^{13}C NMR (100 MHz, DMSO-d_6)δ: 13.51, 20.12, 31.50, 126.4, 127.6, 128, 129, 143.8, 156.7, 167, 181 ppm; FAB ms: *m*/*z* (MH^+) 445. *Anal*. Palladium-catalyzed Suzuki reactions were performed on 4-chlorothieno[2,3-*d*]pyrimidines under classical heating conditions and under microwave irradiation. Some unexpected results were obtained during this study as two kinds of compounds were isolated depending on the conditions used. A careful investigation of experimental details has shown that the expected C—C bond formation occurred when degassed solvents were used (both in classical and microwave heating) whereas an unexpected C—O bond formation happened when solvents were not degassed with argon-bubbling before use.

J. Heterocyclic Chem., **46**, 459 (2009).

INTRODUCTION

Kinase insert domain (KDR)-containing receptor is one of the human tyrosine kinases that has a high affinity for vascular endothelial growth factor (VEGF) and is believed to be a primary mediator of tumor-induced angiogenesis [1]. Compounds which influence the KDR kinase have attracted much attention and are of great interest as potential therapeutic agents. Several compounds with a quinazoline moiety have shown effective antitumor activity and have found clinical applications such as gefitinib (Iressa® from AstraZeneca) or erlotinib (Tarceva® from Genentech) [2].

For many years, thieno[3,2-*d*]pyrimidines and thieno[2,3-*d*]pyrimidines are known to be pharmacophoric elements in numerous active compounds such as analgesic [3], anticancer [4], mGluR1 antagonists [5], or molecules having antimicrobial and anti-inflammatory activities [6] (Fig. 1). Munchhof et al. [7] reported the design and structure activity relationship (SAR) of thieno[3,2-*d*]-pyrimidines and -pyridines as selective VEGFR-2 kinase inhibitors. Since then, many patents were filed and consequently, thienopyrimidines have become a well-sought privileged class of compounds in drug discovery programs and practical strategies for the construction of libraries have been developed [8].

RESULTS AND DISCUSSION

The interest in this heterocyclic core prompted us to set up a short and efficient route toward this nucleus. In 2007, we have reinvestigated the synthesis of thieno[2,3-*d*]pyrimidinone **1a** and 4-chlorothieno[2,3-*d*]pyrimidine **2a** using microwave-assisted procedure [9]. We now extended this procedure to compound **2b** (Scheme 1).

Aiming to extend thienopyrimidine libraries, we then wanted to functionalize those compounds on position 4. Usually, functionalities are introduced at C-4 via nucleophilic substitution reaction of the chlorothienopyrimidine with amines [10]. In this study, we have decided to focus our attention on the introduction of aromatics and heterocycles at this position. Indeed, we thought that easy modulation at C-4 could be done by palladium-catalyzed cross-coupling of 4-chlorothieno[2,3-*d*]pyrimidines **2a**,**b** with different arylboronic acids.

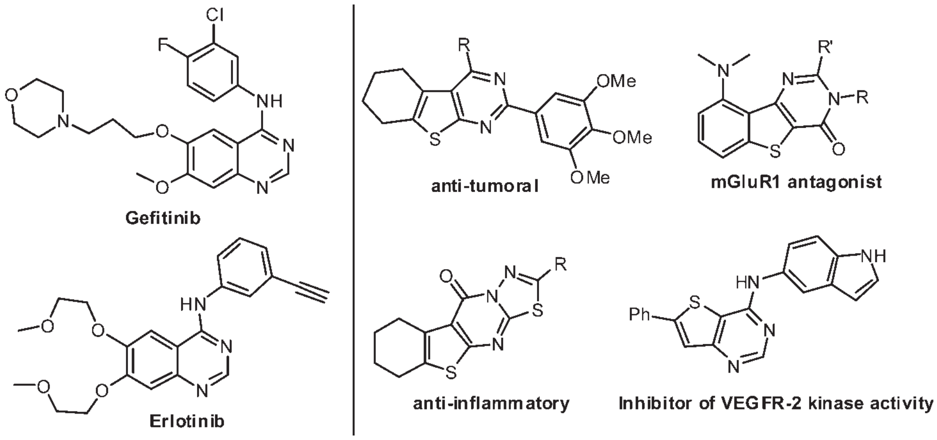

Figure 1. Structures of quinazolines and thienopyrimidines with biological activities.

The electron-deficient nature of the pyrimidine ring makes this system far more reactive in Suzuki coupling compared with the analogous benzenoid halides. 2,4,6-Trichloropyrimidines, 2,4- and 4,6-dihalo pyrimidines have been successfully arylated under classical Suzuki conditions ($Pd(OAc)_2$, PPh_3, Na_2CO_3, benzene/ethanol/water or $Pd(PPh_3)_4$, toluene, Na_2CO_3 2*M*) [11,12]. A sequential Suzuki coupling/amination reaction was recently described on 4,6-dichloropyrimidines under microwave irradiation [13]. Some studies were also done on condensed halopyrimidines as for example on 2,4-dichloropyridopyrimidines [14] or on 4-chloro-2-trichloromethylquinazoline [15]. To the best of our knowledge, there is only one publication with one example on Suzuki coupling on 4-chlorothieno[2,3-*d*]pyrimidine [4a].

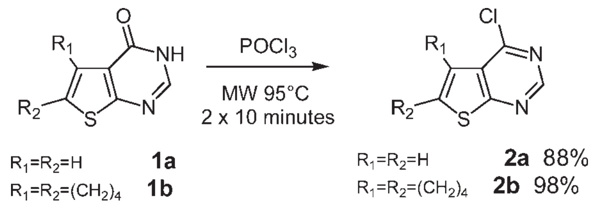
First, we investigated the reactivity of 4-chlorothieno[2,3-*d*]pyrimidine **2a** with 4-methoxyphenylboronic acid under classical Suzuki conditions. The reaction was performed in DME with $Pd(OAc)_2/PPh_3$ catalysis in the presence of Na_2CO_3 2*M* as base at 75–85°C. The reaction was stopped when the starting material had completely disappeared (TLC control) and the product was isolated by column chromatography (Scheme 2).

We then carried out the same Suzuki coupling under microwave irradiation hoping to enhance the yields and decrease reaction times. $Pd(OAc)_2/PPh_3$ was used as catalytic system, with Cs_2CO_3 as base and DME/EtOH/H_2O as solvent. We worked under temperature/time control with 150°C/30 min as parameters. At the end of the time, the TLC control indicated that all starting material was consumed. However, after purification, the ^1H NMR spectrum was not consistent with the one obtained under classical conditions (Fig. 2). Two different products were obtained. First of all, to control these results, we applied under microwave irradiation exactly the same conditions as for classical heating (DME/H_2O was used as solvent and Na_2CO_3 as base). The same product as before was obtained, different from the one resulting from classical heating.

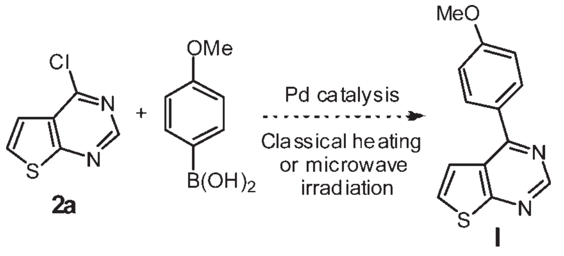
As shown in Figure 2, in both ^1H NMR spectra, the same signals were present although their δ values were slightly different. The thiophene ring seemed to remain unchanged in both compounds (two doublets at 7.63 and 7.94 ppm in compound **A**; two doublets at 7.75 and 8.01 ppm in compound **B**). The presence of an AB signal let us suppose that the *p*-disubstituted phenyl ring was still present in both structures too (two doublets at 7.01 and 7.22 ppm in compound **A**, two doublets at 7.15 and 8.01 ppm in compound **B**). Moreover, NOESY experiment and HMBC sequence showed that the pyrimidine proton was isolated and placed between the two nitrogen atoms in both structures.

The same coupling with 4-methoxyphenylboronic acid was realized on chlorothienopyrimidine **2b** in classical

Scheme 1



Scheme 2



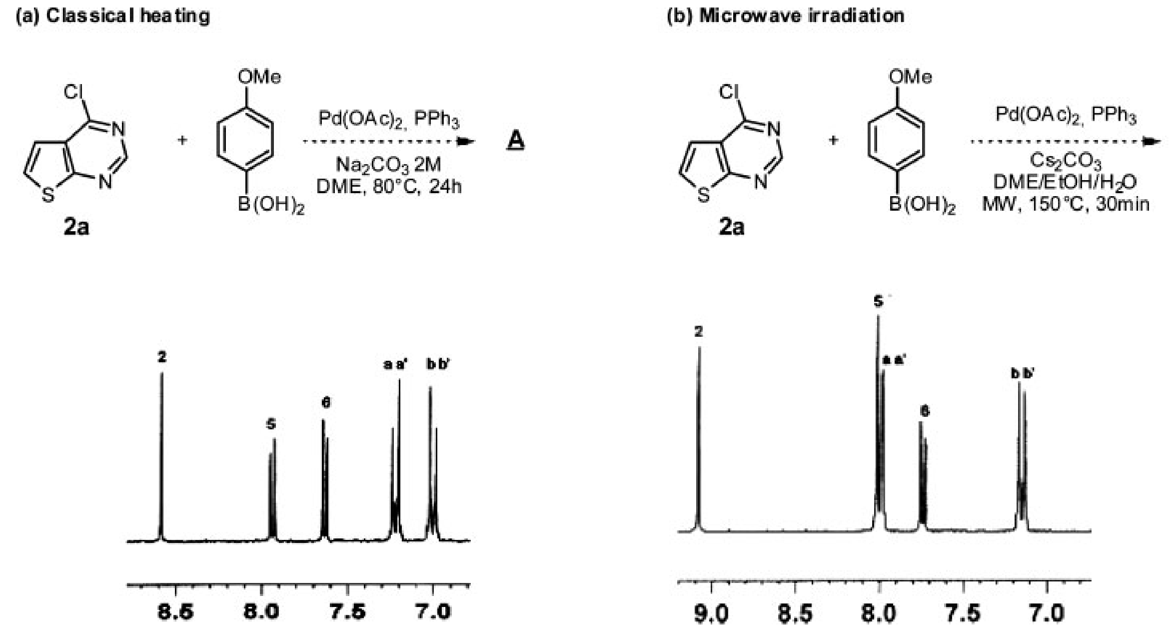


Figure 2. ^{1}H NMR spectra (aromatic part) of compound obtained by classical heating and under microwave irradiation: (a) classical heating and (b) microwave irradiation.

conditions and under microwave irradiation. Two different compounds were obtained and after several attempts, we succeeded in isolating crystals. Those crystallographic data showed that the expected product was obtained under microwave irradiation (with formation of the C—C bond between chlorothienopyrimidine and boronic acid), whereas the classical heating led to the formation of a C—O bond. The compounds obtained are shown in Scheme 3.

Once the structures were elucidated, we tried to explain the formation of compounds **3**. During those first experiments, we have noticed that *p*-methoxyphenol was detected as trace in the crude material. So, we postulated that the boronic acid must have been transformed into *p*-methoxyphenol and after, the phenol would have reacted with the chloropyrimidine under SNAr process giving compounds **3**. As a verification, compound **3b** was synthesized directly by the action of *p*-methoxyphenate on 4-chloropyrimidine **2b** in 55% yield (Scheme 4).

Regarding the yield obtained for compound **3a** (70%), it would mean that the boronic acid was converted into phenol near completely. It is well known that oxygen should be avoided when working with boronic acids since they could be oxidized to the corresponding phenols [16,17]. That is why our reactions were performed under an argon atmosphere both under classical heating and under microwave irradiation. However, there was a very small difference of manipulation when doing those reactions. Under classical heating, the reactions were performed in a Schlenk tube flushed with argon whereas in microwave irradiation, a one-necked round-bottom

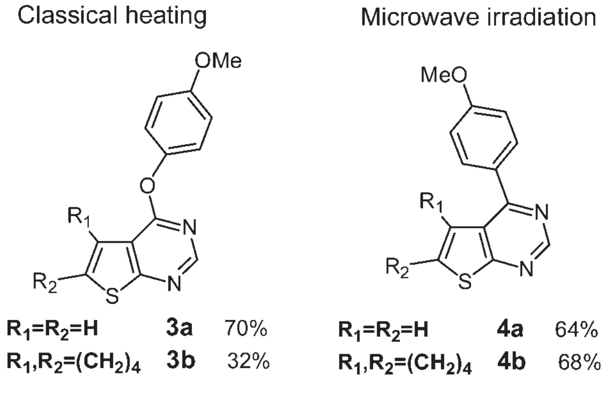

Scheme 4

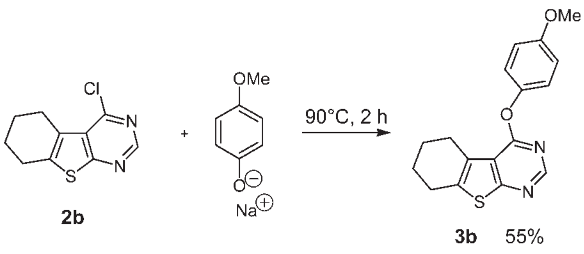

Table 1

Suzuki coupling of 4-chlorothienopyrimidines under classical heating and microwave irradiation.

Entry	Method	Product	Yield		
1	A		$R_1 = R_2 = H$ $R_1,R_2 = (CH_2)_4$	**5a** **5b**	77% 25%[a]
2	B for **6a** C for **6b**		$R_1 = R_2 = H$ $R_1,R_2 = (CH_2)_4$	**6a** **6b**	44% 75%
3	A			**7**	67%
4	C			**8**	61%
5	C		$R_1 = R_2 = H$ $R_1,R_2 = (CH_2)_4$	**9a** **9b**	36% 51%

Method A: Classical heating, nondegassed solvents (75°C, 24 h); Method B: Microwave irradiation (150°C, 30 min); Method C: Classical heating, DME, and H_2O degassed (75°C, 24 h).

[a] Reaction was performed at room temperature.

flask was used and argon was bubbled directly in the solution while loading the reagents. So, we performed the Suzuki cross-coupling under classical heating conditions but this time, solvents (DME and water) were degassed with argon bubbling before being introduced in the reaction mixture. In this case, we only observed C—C bond formation. Compounds **6**, **8–9** were synthesized in good yields under classical heating with degassed solvents whereas the formation of C—O bond occurred when nondegassed solvents were used for compounds **5** and **7** (Table 1).

CONCLUSIONS

In summary, we have demonstrated that 4-chlorothieno[2,3-*d*]pyrimidines undergo Suzuki coupling under both classical heating and microwave irradiation in moderate to good yields. Moreover, because of unexpected results obtained under classical heating, we have shown the importance to use degassed solvents in those reactions and not working only under an argon stream. Further investigation of the mechanism of C—O bond formation in cross-coupling with boronic acid as well as its application to other substrates are ongoing in our laboratory.

EXPERIMENTAL

General methods. Melting points were determined on a Stuart SMP3 apparatus and are uncorrected. ^1H NMR spectra were measured at 250 MHz, and ^{13}C NMR spectra were measured at 62.9 MHz on a Bruker AC 250 spectrometer at 25°C in DMSO-d_6. IR spectra were recorded for neat samples on KBr plates on a Perkin Elmer Spectrum Bx FTIR spectrophotometer. Standard mass spectrometry data were acquired by using GC-MS system in EI mode with a maximum *m*/*z* range of 400 on a GC Varian CP 3800 spectrometer and triple quadrupole 1200 Varian detector. HMRS were collected on a Bruker MICROTOF-Q ESI/QqTOF spectrometer. Elemental analyses were determined with a Thermofinnigan FlashEA 1112 elemental analyzer. Microwave monomode synthesizer, (CEM Corporation) Discover model was used in open-vessel mode for the microwave-assisted synthesis; the temperature was monitored by an infrared sensor located in the microwave cavity floor. When required, all solvents and reagents were purified by standard techniques. All Suzuki cross-coupling reactions were conducted under a positive pressure of argon. Chromatographic separations were carried out with silica gel 60 Å (70–200 μm) or alumina. Yields reported are for chromatographically pure isolated product.

Details of synthesis, purification, and characterization of starting materials **1a**,**b** and **2a**,**b** can be found in literature [9].

CCDC 716544 and CCDC 716545 contain the supplementary crystallographic data for this article (compounds **4b** and **3b**, respectively). These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

General procedure for Suzuki cross-coupling. ***Method A.*** To a solution of 4-chlorothienopyrimidine (**2a**: 171 mg, **2b**: 225 mg, 1 mmol), boronic acid (1.2 mmol) and PPh_3 (39 mg, 0.15 mmol) in DME (12 mL) were added 2*M* Na_2CO_3 (10 mL) and $Pd(OAc)_2$ (10 mg, 0.04 mmol).The reaction mixture was stirred at 75–80°C for 24 h under argon. After filtration, the aqueous layer was extracted with AcOEt (3 × 30 mL). The combined organic layers were washed with 10% NaOHaq and brine, and dried over $MgSO_4$. The solvent was removed under reduced pressure. The residue was purified by silica gel column chromatography to give products **3a**, **3b**, **5a**, **5b**, and **7**.

Method B. A 50-mL round-bottomed flask was charged with 4-chlorothienopyrimidine (**2a**: 171 mg, **2b**: 225 mg, 1 mmol), boronic acid (1.5 mmol), Cs_2CO_3 (1.01 g, 3.1 mmol), PPh_3 (66 mg, 0.25 mmol), $Pd(OAc)_2$ (11 mg, 0.05 mmol), and DME/EtOH/H_20 (30 mL, ratio: 1/1/1) flushed with argon. The reaction mixture was placed in a microwave synthesizer. The microwave vial was purged three times with argon and then heated under microwave irradiation (150°C) for 30 min. After this time, the reaction mixture was allowed to cool to room temperature and was quenched with AcOEt/H_20 (20 mL, ratio: 1/1). The water layer was extracted with AcOEt (3 × 30 mL). The combined organic layers were washed with brine and dried over $MgSO_4$. The solvent was removed under reduced pressure. The residue was purified by silica gel column chromatography to give products **4a**, **4b**, and **6a**.

Method C. Same procedure as Method A but with DME and water degassed with argon bubbling.

4-(4-Methoxyphenoxy)thieno[2,3-d]pyrimidine (3a). Compound **3a** was obtained according to Method A from **2a** (171 mg, 1 mmol) and 4-methoxyphenylboronic acid (182 mg, 1.2 mmol) and isolated by column chromatography (Silica, CH_2Cl_2 as eluent); the yield was 155 mg (64%), beige solid, mp 111–112°C; IR: 1572, 1534, 1503 cm^{-1}; ^{1}H NMR: δ 3.78 (s, 3H), 7.01 (d, *J* = 9.1 Hz, 2H), 7.22 (d, *J* = 9.1 Hz, 2H), 7.63 (d, *J* = 6 Hz, 1H), 7.94 (d, *J* = 6 Hz, 1H), 8.59 (s, 1H); ^{13}C NMR: δ 55.3, 114.2, 118.4, 118.5, 122.8, 127.1, 145.3, 152.9, 156.9, 163.4, 168.8; GC MS (t_R 9.19 min) *m*/*z* (%) = 257 (100, M^+), 244 (19), 134 (94); HRMS calcd for $[M + H^+]$ $C_{13}H_{11}N_2O_2S$ 259.0536, found 259.0534. *Anal.* Calcd. for $C_{13}H_{10}N_2O_2S$: C, 60.45; H, 3.90; N, 10.85. Found: C, 60.59; H, 3.88; N, 10.89.

4-(4-Methoxyphenoxy)-5,6,7,8-tetrahydrobenzothieno[2,3-d]pyrimidine (3b). Compound **3b** was obtained according to Method A from **2b** (225 mg, 1 mmol) and 4-methoxyphenylboronic acid (182 mg, 1.2 mmol) and isolated by column chromatography (Silica, CH_2Cl_2 as eluent); the yield was 101 mg (34%), brown solid, mp 83–84°C, IR: 1570, 1560, 1498 cm^{-1}; ^{1}H NMR: δ 1.85 (m, 4H), 2.85 (m, 2H), 3.00 (m, 2H), 6.99 (d, *J* = 7.5 Hz, 2H), 7.19 (d, *J* = 7.5 Hz, 2H), 8.45 (s, 1H); ^{13}C NMR: δ 21.8, 22.3, 24.9, 25.4, 55.4, 114.5, 118.3, 122.8, 126.9, 135.5, 145.4, 152.0, 156.7, 163.1, 167.4; GC MS (t_R 11.62 min) *m*/*z* (%) = 313 (100, M^+), 298 (40), 205 (44). *Anal.* Calcd. for $C_{17}H_{16}N_2O_2S$: C, 65.36; H, 5.16; N, 8.97. Found: C, 65.60; H, 5.21; N, 9.06.

4-(4-Methoxyphenyl)thieno[2,3-d]pyrimidine (4a). Compound **4a** was obtained according to the general procedure B from **2a** (171 mg, 1 mmol) and 4-methoxyphenylboronic acid (228 mg, 1.5 mmol) and isolated after purification by chromatography on silica gel (CH_2Cl_2 as eluent), the yield was 155 mg (64%), beige solid, mp 136–137°C, IR: 1609, 1540, 1514 cm^{-1}; ^{1}H NMR: δ 3.85 (s, 3H), 7.15 (d, *J* = 8.6 Hz, 2H), 7.75 (d, *J* = 6 Hz, 1H), 7.98–8.02 (m, 3H), 9.08 (s, 1H); ^{13}C NMR: δ 55.4, 114.4, 121.1, 126.7, 128.3, 129.3, 130.8, 152.9, 159.3, 161.2, 169.1; GC MS (t_R 9.34 min) *m*/*z* (%) = 242 (100, M^+), 211 (66), 134 (5); HRMS calcd for $[M + H^+]$ $C_{13}H_{11}N_2OS$ 243.0587, found 243.0601. *Anal.* Calcd. for $C_{13}H_{10}N_2OS$: C, 64.44; H, 4.16; N, 11.56. Found: C, 64.62; H, 4.17; N, 11.49.

4-(4-Methoxyphenyl)-5,6,7,8-tetrahydrobenzothieno[2,3-d]pyrimidine (4b). Compound **4b** was obtained according to the general procedure B from **2b** (225 mg, 1 mmol) and 4-methoxyphenylboronic acid (228 mg, 1.5 mmol) and isolated after purification by column chromatography on silica gel (CH_2Cl_2 as eluent), the yield was 201 mg (68%), white solid, mp 101–102°C, IR: 1608, 1508 cm^{-1}; ^{1}H NMR: δ 1.56–1.60 (m, 2H), 1.79–1.83 (m, 2H), 2.13–2.18 (m, 2H), 2.85–2.90 (m, 2H), 3.83 (s, 3H), 7.06 (d, *J* = 8.6 Hz, 2H), 7.49 (d, *J* = 8.6 Hz, 2H), 8.95 (s, 1H); ^{13}C NMR: δ 21.9, 22.1, 25.4, 26.8, 55.2, 113.2, 127.2, 128.0, 130.5, 130.6, 130.7, 137.6, 151.5, 160.1, 168.0; GC MS (t_R 11.32 min) *m*/*z* (%) = 296 (100, M^+), 265 (12), 211 (9). *Anal.* Calcd. for $C_{17}H_{16}N_2OS$: C, 68.89; H, 5.44; N, 9.45. Found: C, 69.10; H, 5.36; N, 9.53.

1-[3-(Thieno[2,3-d]pyrimidin-4-yloxy)phenyl]ethanone (5a). Compound **5a** was prepared according to Method A from **2a** (171 mg, 1 mmol) and 3-acetylphenylboronic acid (197 mg, 1.2 mmol) and purified by column chromatography (Silica, CH_2Cl_2 as eluent), the yield was 208 mg (77%), white solid, mp 140–141°C; IR: 1694, 1571, 1526 cm^{-1}; ^{1}H NMR: δ 2.59 (s, 3H), 7.64 (m, 2H), 7.69 (d, *J* = 6 Hz, 1H), 7.90 (m, 2H), 7.99 (d, *J* = 6 Hz, 1H), 8.61 (s, 1H); ^{13}C NMR: δ 26.8, 118.4, 118.6, 121.6, 125.7, 127.0, 127.5, 130.2, 138.5, 152.2, 152.8, 163.0, 169.1, 197.2; GC MS (t_R 9.82 min) *m*/*z* (%) = 270 (100, M^+), 255 (99), 242 (29), 227 (98), 135 (97); HRMS calcd for $[M + H^+]$ $C_{14}H_{11}N_2O_2S$ 271.0536, found 271.0516. *Anal.* Calcd. for $C_{14}H_{10}N_2O_2S$: C, 62.21; H, 3.73; N, 10.36. Found: C, 62.48; H, 3.75; N, 10.55.

1-[3-(5,6,7,8-Tetrahydrobenzothieno[2,3-d]pyrimidin-4-yl-oxy)-phenyl]ethanone (5b). Compound **5b** was prepared from **2b** (225 mg, 1 mmol) and 3-acetylphenylboronic acid (197 mg, 1.2 mmol) according to Method A working at room temperature and purified by column chromatography (Silica, Cyclohexane/AcOEt 98:2 as eluent), the yield was 80 mg (25%), white solid, mp 148–149°C, IR: 1683, 1571, 1558 cm^{-1}; ^{1}H NMR: δ 1.85 (m, 4H), 2.58 (s, 3H), 2.86 (m, 2H), 3.02 (m, 2H), 7.55–7.65 (m, 2H), 7.83–7.90 (m, 2H), 8.47 (s, 1H); ^{13}C NMR: δ 21.7, 22.3, 25.0, 25.4, 26.8, 118.4, 121.5, 125.5, 126.9, 127.0, 130.0, 135.9, 138.4, 151.9, 152.3, 162.6, 167.7, 197.2; HRMS calcd for $[M + H^+]$ $C_{18}H_{17}N_2O_2S$ 325.1005, found 325.0985. *Anal.* Calcd. for $C_{18}H_{16}N_2O_2S$: C, 66.64; H, 4.97; N, 8.64. Found: C, 66.87; H, 4.90; N, 8.64.

1-(3-Thieno[2,3-d]pyrimidin-4-ylphenyl)ethanone (6a). Compound **6a** was prepared from **2a** (171 mg, 1 mmol) and 3-acetylphenylboronic acid (246 mg, 1.5 mmol) according to Method B. The pure product was obtained by column chromatography (Silica, CH_2Cl_2 as eluent), the yield was 111 mg (44%), white solid, mp 129–130°C, IR: 1683, 1603, 1545 cm^{-1}; ^{1}H NMR: δ 2.74 (s, 3H), 7.83 (m, 2H), 8.13–8.32 (m, 3H), 8.56 (s, 1H), 9.25 (s, 1H); ^{13}C NMR: δ 26.9, 120.7, 127.3, 128.7, 129.3, 129.4, 130.0, 133.5, 137.3, 137.4, 153.0, 158.9, 169.4, 197.5; GC MS (t_R 9.76 min) *m*/*z* (%) = 254 (100, M^+), 239 (64), 211 (68); HRMS calcd for $[M + H^+]$ $C_{14}H_{11}N_2OS$ 255.0587, found 255.0572. *Anal.* Calcd. for $C_{14}H_{10}N_2OS$: C, 66.12; H, 3.96; N, 11.02. Found: C, 66.26; H, 3.88; N, 10.99.

1-[3-(5,6,7,8-Tetrahydrobenzothieno[2,3-d]pyrimidin-4-yl)phenyl]ethanone (6b). Compound **6b** was prepared from **2b** (225 mg, 1 mmol) and 3-acetylphenylboronic acid (197 mg, 1.2 mmol) according to Method C. The pure product was obtained by column chromatography (Silica, CH_2Cl_2 as eluent), the yield was 231 mg (75%), pale brown solid, mp 121–122°C, IR: 1684, 1579, 1560, 1523 cm^{-1}; ^{1}H NMR: δ 1.53–1.58 (m, 2H), 1.77–1.82 (m, 2H), 2.02–2.07 (m, 2H), 2.63 (s, 3H), 2.86–2.91 (m, 2H), 7.68 (m, 1H), 7.80 (m, 1H), 8.10 (m, 1H), 8.30 (s, 1H), 9.02 (s, 1H); ^{13}C NMR: δ 21.2, 22.0, 25.4, 26.6, 26.8, 126.8, 128.1, 128.4, 128.6, 128.9, 133.6, 136.3, 138.4, 138.5, 151.6, 159.3, 168.1, 197.6; GC MS (t_R 11.78 min) *m*/*z* (%) = 307 (100, M^+), 293 (56), 280 (93), 266 (16); HRMS calcd for $[M + H^+]$ $C_{18}H_{17}N_2OS$ 309.1056, found 309.1030. *Anal.* Calcd. for $C_{18}H_{16}N_2OS$: C, 70.10; H, 5.23; N, 9.08. Found: C, 70.17; H, 5.35; N, 9.12.

tert-Butyl 4-(thieno[2,3-d]pyrimidin-4-yloxy)phenylcarbamate (7). Compound **7** was prepared from **2a** (171 mg, 1 mmol) and 4-[(*tert*-butoxycarbonyl)amino]phenylboronic acid (285 mg, 1.2 mmol) according to Method A. The pure product was obtained by column chromatography (Silica, CH_2Cl_2 as eluent), the yield was 230 mg (67%), pale yellow solid, mp 141–142°C, IR: 1702, 1573, 1535 cm^{-1}; ^1H NMR: δ 1.46 (s, 9H), 7.17 (d, J = 9 Hz, 2H), 7.49 (d, $J = 9$ Hz, 2H), 7.61 (d, $J = 6$ Hz, 1H), 7.91 (d, $J = 6$ Hz, 1H), 8.56 (s, 1H), 9.41 (s, 1H); ^{13}C NMR: δ 28.0, 79.2, 115.0, 118.4, 118.5, 119.2, 122.0, 127.2, 137.1, 146.5, 152.9, 163.3, 168.8; GC MS (t_R 9.74 min) m/z (%) = 243 (100, M^+); HRMS calcd for $[M + H^+]$ $C_{17}H_{18}N_3O_3S$ 344.1063, found 344.1042. *Anal*. Calcd. for $C_{17}H_{17}N_3O_3S$: C, 59.46; H, 4.99; N, 12.24. Found: C, 59.62; H, 4.88; N, 12.29.

tert-Butyl 4-(5,6,7,8-tetrahydrobenzothieno[2,3-d]pyrimidin-4-yl)phenylcarbamate (8). Compound **8** was prepared from **2b** (225 mg, 1 mmol) and 4-[(*tert*-butoxycarbonyl)amino]phenylboronic acid (285 mg, 1.2 mmol) according to Method C. The pure product was obtained by column chromatography (Alumina, cyclohexane/AcOEt 98:2 as eluent), the yield was 231 mg (61%), white solid, mp 173–174°C, IR: 1702, 1612, 1513 cm^{-1}, ^1H NMR: δ 1.46 (s, 9H), 1.61 (m, 2H), 1.79 (m, 2H), 2.15 (m, 2H), 2.87 (m, 2H), 7.44 (m, 2H), 7.60 (m, 2H), 8.95 (s, 1H), 9.62 (s, 1H); ^{13}C NMR: δ 22.0, 25.4, 26.2, 26.8, 28.1, 79.3, 116.9, 127.2, 128.3, 129.9, 131.7, 137.6, 140.7, 151.5, 152.7, 160.1, 168.0; GC MS (t_R 12.23 min) m/z (%) = 280 (100, M^+); HRMS calcd for $[M + H^+]$ $C_{21}H_{24}N_3O_2S$ 382.1584, found 382.1545. *Anal*. An efficient and convenient multicomponent reaction for the preparation of 4-aryl-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*]pyridine-3-carbonitrile and 4-aryl-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile derivatives by the 2,3-dihydroinden-1-one or 3,4-dihydronaphthalen-1(2*H*)-one, aromatic aldehydes, and malononitrile in the presence of sodium hydroxide under solvent-free condition is reported. The short reaction time coupled with the simplicity of the reaction procedure makes this method one of the most efficient methods for the synthesis of these classes of compounds.

J. Heterocyclic Chem., **46**, 465 (2009).

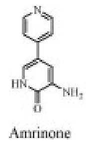
INTRODUCTION

At the new century begins, organic synthetic chemists are placing a greater importance on protecting the environment. A shift in emphasis in chemistry is apparent with the desire to develop more environmentally friendly routes to a myriad of materials. This shift is most apparent in the growth of green chemistry [1–3]. Green chemistry approaches not only hold out significant potential for reduction of by-products, a reduction in the waste produced and lowering of energy costs, but also in the development of new methodologies toward previously unobtainable materials, using existing technologies [4]. Solvent-free organic synthesis [5], as one of efficient synthesis strategies of green chemistry, has caused great interest by chemists in recent years. For they have the many advantages, such as high efficiency and selectivity, easy separation and purification, and mild reaction conditions. Furthermore, the organic solvent could be avoided in this process, and it was very important of protecting the environment.

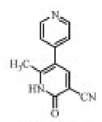
Substituted six-membered lactams have attracted the attention of synthetic organic chemists for many years because these structural features are found in a wide variety of naturally occurring alkaloids [6]. For the compounds with these scaffolds have been shown significant pharmacological properties, medicinal chemists often incorporate these motifs in the design of novel biologically active drugs. For example, arnrinone and milrinone are these type drugs [7] and that have been found to display effective activities on therapy of myocardial infarction. Because of importance of these kinds of compounds, development of a general and efficient synthetic strategy to synthesize those compounds is still desired. Although several synthetic methodologies directed toward the preparation of six-membered lactams have been reported [8], they had many disadvantages, such as long reaction times, low yields, and forces reaction conditions. Especially, in reported reactions, the organic solvents were necessary. In continuation of our research to prepare organic compounds under solvent-free conditions [9], herein, we reported a simple and efficient process to synthesize six-membered lactams, indeno[1,2-*b*]pyridine and benzo[*h*]quinoline derivatives under solvent-free conditions.

RESULTS AND DISCUSSION

The operation of preparation these derivatives could be carried out as follows: 2,3-dihydroinden-1-one, aromatic aldehydes, and malononitrile were put into a round flask, in the presence of a small amount NaOH under solvent-free conditions at 70°C, and corresponding products, 4-aryl-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*]pyridine-3-arbo-nitrile could be gained with high yields (Scheme 1 and Table 1). In our investigation, we found that the reaction could be finished within 10–15 min, Furthermore, the aromatic aldehydes, either bearing electron-withdrawing groups (such as halide) or electron-donating groups (such alkoxyl group), could be reacted smoothly in these process.



Amrinone



Milrinone

To examine the efficiency and the applicability of this process, then 3,4-dihydronaphthalen-1(2*H*)-one was chosen to react with aromatic aldehydes and malononitrile under same conditions. To our delight, the six-membered lactams, 4-aryl-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile was easily obtained with excellent yields, and these reactions could also be completed in a few minutes (about 10 min). Similarly, the aromatic aldehydes, bearing different groups, did not affect the reaction.

The structures of the products were confirmed on the basis of IR, ^{1}H NMR spectroscopic data, elemental analysis, and that of **4c** [10] and **4j** [11] was additionally confirmed by X-ray diffraction analysis (Figs. 1 and 2).

In conclusion, we have developed a rapid and highly efficient method for the synthesis of a variety of 4-aryl-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*]pyridine-3-carbonitrile and 4-aryl-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile derivatives *via* the reaction of different aromatic aldehydes, 2,3-dihydroinden-1-one or 3,4-dihydronaphthalen-1(2*H*)-one, and malononitrile under solvent-free conditions. The advantages of the present method in terms of avoiding to using toxic organic solvent, ease of manipulation, fast reaction rates, and lower cost should make this protocol as a valuable alternative to the existing methods.

EXPERIMENTAL

Melting points were determined on XT-5 microscopic melting-point apparatus and were uncorrected. IR spectra were recorded on a FT Bruker Tensor 27 spectrometer. ^{1}H NMR spectra were obtained from solution in DMSO-d_6 with Me_4Si as internal standard using a Bruker-400 spectrometer. Microanalyses were carried out using a Perkin–Elmer 2400 II analyzer. X-ray diffraction was measured on a Siemens P4 diffractometer.

The mixture of 2,3-dihydroinden-1-one or 3,4-dihydronaphthalen-1(2*H*)-one **1** (2 mmol), aromatic aldehydes **2** (2 mmol), malononitrile **3** (3 mmol), and NaOH (2 mmol) was put in a reaction flask and let them under 70°C about 10–15 min. After completing the reaction, the reaction mixture was poured into water, and then washed with water thoroughly. The product was filtered, dried, and recrystallized from 95% ethanol.

4-(4-Fluorophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*]pyridine-3-carbonitrile (4a). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3287, 3045, 2739, 2219, 1635, 1595, 1559, 1486, 1459, 1396, 1356, 1316, 1298, 1264, 1233, 1203, 1159, 1134, 1086, 1014, 955, 899, 835, 772, 734, 684, 634; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.67 (2H, s, CH_2), 7.52 (2H, t, J = 3.6 Hz, ArH), 7.62 (1H, d, J = 6.0 Hz, ArH), 7.68 (4H, q, J = 8.4 Hz, ArH), 7.16 (1H, d, J = 6.0 Hz, ArH), 13.65 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{11}FN_2O$: C 75.49, H 3.67, N 9.27. Found C 75.60, H 3.65, N 9.31.

4-(4-Bromophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*]pyridine-3-carbonitrile (4b). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3241, 3016, 2790, 2222, 1636, 1592, 1564, 1486, 1460, 1387, 1354, 1316, 1297, 1271, 1227, 1202, 1161, 1130, 1067, 1010, 945, 898, 824, 768, 733, 674, 628; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.66 (2H, s, CH_2), 7.50–7.53 (2H, m, ArH), 7.63 (3H, t, J = 7.8 Hz, ArH), 7.70 (2H, d, J = 7.8 Hz, 8.4 Hz, ArH), 8.17 (1H, d, J = 2.0 Hz, ArH), 13.65 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{11}BrN_2O$: C 62.83, H 3.05, N 7.71. Found C 62.61, H 3.07, N 7.74.

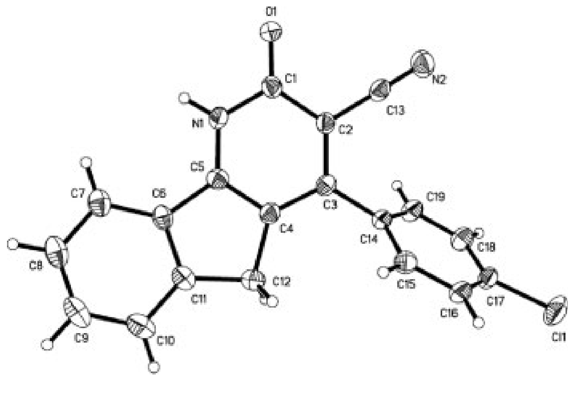

Figure 1. The structure of compound 4c.

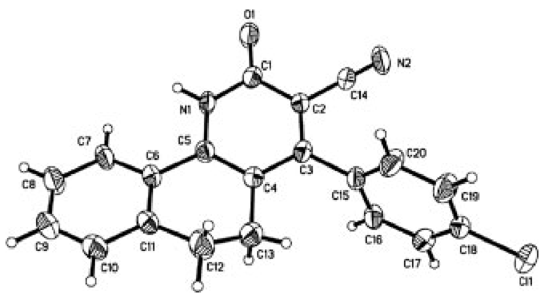

Figure 2. The structure of compound 4j.

4-(4-Chlorophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*] pyridine-3-carbonitrile (4c). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3296, 3045, 2696, 2219, 1637, 1596, 1560, 1487, 1459, 1396, 1356, 1298, 1265, 1233, 1203, 1159, 1134, 1086, 1014, 955, 899, 835, 772, 734, 684, 634; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.68 (2H, s, CH_2), 7.53 (2H, t, J = 5.6 Hz, ArH), 7.64 (1H, d, J = 5.6 Hz, ArH), 7.70 (4H, dd, J = 8.4 Hz, 8.4 Hz, ArH), 8.19 (1H, d, J = 5.6 Hz, ArH), 13.68 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{11}ClN_2O$: C 71.59, H 3.48, N 8.79. Found C 71.41, H 3.50, N 8.84.

4-(2-Chlorophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*] pyridine-3-carbonitrile (4d). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3337, 3066, 2222, 1698,1612, 1474, 1465, 1442, 1396, 1316, 1281, 1244, 1210, 1179, 1156, 1099, 1034, 1011, 918, 780, 758, 702, 667, 628; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.50 (2H, dd, J = 22.4 Hz, J = 22.4 Hz, CH_2), 7.54 (2H, t, J = 3.6 Hz, ArH), 7.58 (2H, br, ArH), 7.62 (2H, t, J = 4.0 Hz, ArH), 7.72 (1H, d, J = 7.2 Hz, ArH), 8.20 (1H, d, J = 4.0 Hz, ArH), 13.68 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{11}ClN_2O$: C 71.59, H 3.48, N 8.79. Found C 71.40, H 3.45, N 8.82.

4-(2,4-Dichlorophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*] pyridine-3-carbonitrile (4e). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3291, 3067, 2781, 2223, 1635, 1594, 1561, 1482, 1458, 1419, 1399, 1375, 1351, 1315, 1298, 1272, 1255, 1202, 1190, 1155, 1135, 1010, 1056, 940, 900, 859, 838, 771, 735, 678, 652, 637; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 4.13 (2H, s, CH_2), 7.50–7.54 (1H, m, ArH), 7.52 (2H, t, J = 6.4 Hz, ArH), 7.84 (2H, t, J = 6.4 Hz, ArH), 7.89 (1H, d J = 6.8 Hz, ArH), 8.00 (1H, s, ArH), 13.85 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{10}Cl_2N_2O$: C 64.61, H 2.85, N 7.93. Found C 64.88, H 2.84, N 7.89.

4-(3,4-Dichlorophenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*] pyridine-3-carbonitrile (4f). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3339, 3072, 2744, 2219, 1658, 1616, 1558, 1507, 1488, 1481, 1458, 1419, 1398, 1375, 1355, 1299, 1268, 1229, 1203, 1191, 1139, 1122, 1032, 865, 824, 767, 728, 680, 669; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.71 (2H, s, CH_2), 7.54 (2H, q, J = 60 Hz, J = 7.2 Hz, ArH), 7.66 (1H, d, J = 7.2 Hz, ArH), 7.69 (1H, d, J = 8.4 Hz, ArH), 7.89 (1H, d J = 8.0 Hz, ArH), 8.04 (1H, d, J = 7.6 Hz, ArH), 8.19–8.21 (1H, br, ArH), 13.76 (1H, s, NH). *Anal.* Calcd. For $C_{19}H_{10}Cl_2N_2O$: C 64.61, H 2.85, N 7.93. Found C 64.50, H 2.87, N 7.90.

4-(4-Methoxyphenyl)-2-oxo-2,5-dihydro-1*H*-indeno[1,2-*b*] pyridine-3-carbonitrile (4g). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3292, 3059, 2836, 2219, 1637, 1616, 1560, 1517, 1485, 1458, 1418, 1356, 1294, 1258, 1234, 1179, 1159, 1031, 835, 767, 731, 648; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 3.72 (2H, s, CH_2), 3.87 (3H, s, OCH_3), 7.14 (2H, t, J = 8.8 Hz, ArH), 7.52 (2H, t, J = 3.6 Hz, ArH), 7.66 (1H, m, ArH), 7.89 (2H, d, J = 8.8 Hz, ArH), 8.17 (1H, br, ArH), 13.59 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{14}N_2O_2$: C 76.42, H 4.49, N 8.91. Found C 76.60, H 4.47, N 8.87.

4-(4-Fluorophenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile (4h). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3131, 3069, 2931, 2220, 1634, 1606, 1555, 1533, 1510, 1499, 1458, 1403, 1345, 1298, 1250, 1218, 1160, 1141, 1098, 894, 843, 824, 794, 772, 736; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.33 (2H, br, CH_2), 2.74 (2H, t, J = 7.2 Hz, CH_2), 7.35 (1H, d, J = 6.4 Hz, ArH), 7.39–7.46 (4H, m, ArH), 7.52 (2H, dd, J = 5.2 Hz, J = 5.6 Hz, ArH), 8.07 (1H, br, ArH), 12.77 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{13}FN_2O$: C 75.94, H 4.14, N 6.01. Found C 75.81, H 4.12, N 6.04.

4-(4-Bromophenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile (4i). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3124, 3032, 2939, 2221, 1638, 1606, 1552, 1497, 1458, 1389, 1344, 1298, 1250, 1215, 1160, 1103, 1071, 1010, 908, 833, 811, 773, 738, 666; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.36 (2H, t, J = 6.0 Hz, CH_2), 2.76 (2H, t, J = 6.8 Hz, CH_2), 7.35 (1H, d, J = 6.8 Hz, ArH), 7.43 (4H, dd, J = 8.4 Hz, J = 8.4 Hz, ArH), 7.78 (2H, d, J = 8.8 Hz, ArH), 8.07 (1H, d, J = 7.6 Hz, ArH), 12.62 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{13}BrN_2O$: C 63.68, H 3.47, N 7.43. Found C 63.50, H 3.49, N 7.46.

4-(4-Chlorophenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile (4j). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3130, 3031, 2931, 2223, 1637, 1553, 1535, 1498, 1460, 1425, 1340, 1346, 1297, 1251, 1217, 1198, 1176, 1142, 1086, 1014, 909, 836, 813, 774, 739, 707, 658; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.37 (2H, br, CH_2), 2.76 (2H, t, J = 6.8 Hz, CH_2), 7.35 (1H, d, J = 7.2 Hz, ArH), 7.43 (2H, dd, J = 7.2 Hz, J = 7.2 Hz, ArH), 7.49 (2H, d, J = 8.0 Hz, ArH), 7.64 (2H, d, J = 8.4 Hz, ArH), 8.07 (1H, d, J = 7.6 Hz, ArH), 12.62 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{13}ClN_2O$: C 72.18, H 3.94, N 8.42. Found C 72.38, H 3.91, N 8.46.

4-(2-Chlorophenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile (4k). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3130, 3031, 2931, 2223, 1637, 1553, 1535, 1498, 1460, 1425, 1340, 1346, 1297, 1251, 1217, 1198, 1176, 1142, 1086, 1014, 909, 836, 813, 774, 739, 707, 658; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.37 (2H, br, CH_2), 2.76 (2H, t, J = 6.8 Hz, CH_2), 7.35 (1H, d, J = 7.2 Hz, ArH), 7.44 (4H, dd, J = 8.0 Hz, J = 8.0 Hz, ArH), 7.78 (2H, d, J = 8.4 Hz, ArH), 8.07 (1H, d, J = 7.6 Hz, ArH), 12.66 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{13}ClN_2O$: C 72.18, H 3.94, N 8.42. Found C 72.32, H 3.91, N 8.46.

4-(3,4-Dichlorophenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]-quinoline-3-carbonitrile (4l). This compound was obtained as yellow crystals, mp 287–289°C; IR (KBr, ν, cm^{-1}): 3123, 3023, 2940, 2218, 1635, 1557, 1497, 1474, 1455, 1397, 1374, 1341, 1297, 1247, 1212, 1194, 1129, 1031, 952, 896, 821, 773, 737, 664; ^{1}H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.28 (1H, t, J = 7.2 Hz, CH_2), 2.38 (1H, t, J = 6.8 Hz, CH_2), 2.75 (2H, q, J = 6.8 Hz, J = 8.0 Hz, CH_2), 7.23–7.30 (1H, m, ArH), 7.35–7.48 (3H, m, ArH), 7.69–7.85 (2H, m, ArH), 8.03–

8.09 (1H, m, ArH), 12.54 (1H, s, NH). *Anal.* Calcd. For $C_{20}H_{12}Cl_2N_2O$: C 65.41, H 3.29, N 7.63. Found C 65.60, H 3.28, N 7.59.

2-Oxo-4-p-tolyl-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile e (4m). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3128, 3030, 2930, 2221, 1634, 1555, 1536, 1497, 1457, 1402, 1344, 1322, 1296, 1282, 1250, 1210, 1184, 1171, 1141, 1115, 1041, 1020, 975, 954, 905, 808, 774, 759, 737, 666; ^1H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.37 (2H, br, CH_2), 2.40 (3H, s, CH_3), 2.76 (2H, t, $J = 7.2$ Hz, CH_2), 7.31 (2H, d, $J = 8.4$ Hz, ArH), 7.36 (3H, d $J = 8.4$ Hz, ArH), 7.43 (2H, q, $J = 6.4$ Hz, $J = 7.2$ Hz, ArH), 8.07 (1H, d, $J = 8.4$ Hz, ArH), 12.65 (1H, s, NH). *Anal.* Calcd. For $C_{21}H_{16}N_2O$: C 80.75, H 5.16, N 8.97. Found C 80.55, H 5.19, N 8.92.

4-(4-Methoxyphenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile e (4n). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3120, 3032, 2936, 2219, 1636, 1556, 1515, 1497, 1457, 1398, 1341, 1295, 1255, 1212, 1180, 1142, 1025, 1020, 975, 838, 819, 772, 761, 736, 667; ^1H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.41 (2H, t, $J = 6.0$ Hz, CH_2), 2.75 (2H, t, $J = 7.2$ Hz, CH_2), 3.84 (3H, s, CH_3O), 7.11 (2H, d, $J = 8.8$ Hz, ArH), 7.34 (1H, d, $J = 6.8$ Hz, ArH), 7.38 (3H, d, $J = 8.8$ Hz, ArH), 7.43 (1H, t, $J = 7.2$ Hz, ArH), 8.06 (1H, d, $J = 7.2$ Hz, ArH), 12.58 (1H, s, NH). *Anal.* Calcd. For $C_{21}H_{16}N_2O_2$: C 76.81, H 4.91, N 8.53. Found C 76.62, H 4.88, N 8.56.

4-(3,4-Dimethylphenyl)-2-oxo-1,2,5,6-tetrahydrobenzo[*h*]quinoline-3-carbonitrile (4o). This compound was obtained as yellow crystals, mp >300°C; IR (KBr, ν, cm^{-1}): 3123, 3023, 2940, 2218, 1635, 1557, 1497, 1474, 1455, 1397, 1374, 1341, 1297, 1247, 1212, 1194, 1129, 1031, 952, 896, 821, 773, 737, 664; ^1H NMR (400 MHz, DMSO-d_6) (δ, ppm): 2.29 (3H, s, CH_3), 2.30 (3H, s, CH_3), 2.37 (2H, t, $J = 7.2$ Hz, CH_2), 2.73 (2H, t, $J = 7.2$ Hz, CH_2), 7.13 (1H, d, $J = 7.6$ Hz, ArH), 7.08 (1H, s, ArH), 7.32 (2H, t $J = 7.6$ Hz, ArH), 7.39 (1H, t, $J = 7.6$ Hz, ArH), 7.45 (1H, t, $J = 7.6$ Hz, ArH), 8.06 (1H, d, $J = 7.6$ Hz, ArH), 12.72 (1H, s, NH). *Anal.* Calcd. For $C_{22}H_{18}N_2O$: C 80.96, H 5.56, N 8.58. Found C 80.72, H 5.52, N 8.61.

A series of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one and indeno[2,1-*e*]pyrazolo[3,4-*b*]pyridine-5(1*H*)-one derivatives were synthesized via the three-component reaction of an aldehyde, 5-aminopyrazole and either tetronic acid or 1,3-indanedione in ionic liquid without any catalyst. The structures of the products have been established by spectroscopic data and further confirmed by X-ray diffraction analysis. This method has the advantages of easier work-up, mild reaction conditions, high yields and an environmentally benign procedure.

J. Heterocyclic Chem., **46**, 469 (2009).

INTRODUCTION

Multicomponent reactions (MCRs) are of increasing importance in organic and medical chemistry. The first MCR was described by Strecker in 1850 for the synthesis of amino acids [1]. However, in the past decade there have tremendous developments in three- and four-component reactions and great efforts continue to be made to develop new MCRs [2]. Recently, there has been considerable interest in the use of ionic liquids as an environmentally benign reaction media because of its unique properties such as a wide liquid range, good solvating ability, tunable polarity, high-thermal stability, negligible vapor pressure, and ease of recyclablity [3]. Numerous chemical reactions, such as polymerization [4], hydrogenation [5], regioselective alkylation [6], Friedel–Crafts reactions [7], dimerization of alkenes [8], Diels–Alder reactions [9], Michael reactions [10], cross-coupling reactions [11], and some enzymic reactions [12] can be carried out in ionic liquids. Recently, some MCRs in ionic liquids have been reported [13].

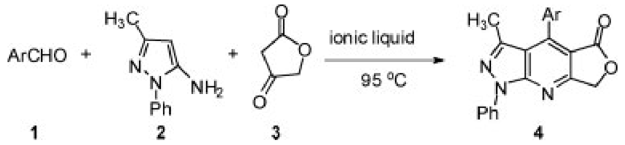
Furopyridines is one of the ''privileged medicinal scaffolds'' which are used for the development of pharmaceutical agents of various applications. Compounds with this motif show a wide range of pharmacological activities such as antipsychotic [14], antiproliferative [15], anticonvulsant [16], antianaphylactic [17], and anthelmintic [18] activities and can be used as calcium influx promoters [19], HIV-1 non-nucleoside reverse transcriptase inhibitors [20], and acetylcholinesterase inhibitors [21]. Pyrazole derivatives have been reported in the literature to be versatile building blocks for the synthesis of a wide range of the heterocyclic motifs, such as pyrazolopyridines [22], pyrazoloquinolines [23], and pyrzolopyrazoles [24]. The pyrazolo[3,4-*b*]pyridine system has interesting biological and pharmacological properties [25], such as adrenocorticotropic hormone (ACTH)-releasing factor antagonist activity [26].

Furopyridines and pyrazolo[3,4-*b*]pyridines have been reported widely in the literature. However, the synthesis of the compounds with both pyrazolo[3,4-*b*]pyridine and furo[3,4-*b*]pyridine motifs was neglected. We herein described a facile three-component reaction consisting of aldehyde **1**, 5-amino-3-methyl-1-phenylpyrazole **2**, and tetronic acid **3** in ionic liquid to synthesize the furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one derivatives **4** (Scheme 1).

RESULTS AND DISCUSSION

Choosing an appropriate solvent is of crucial importance for the successful organic synthesis. To search for

Scheme 1



the optimal solvent, the three-component reaction of 4-bromobenzaldehyde **1a**, 5-amino-3-methyl-1-phenylpyrazole **2**, and tetronic acid **3** was examined using ionic liquid such as [bmim]Br, [bmim]BF_4, [pmim]Br, water, glacial acetic acid, acetone, and ethanol as solvent, respectively, at different temperature for the synthesis of **4a**.

It can be seen from Table 1 that the reactions using ionic liquids as the solvent resulted in higher yields and shorter reaction times than those using organic solvents. Using water can also give the higher yields, but the reaction time is very long. On the basis of the obtained results, [bmim]Br was found to be superior in terms of cheap and yield. Under these optimized reaction conditions, a series of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one derivatives **4** were synthesized. The results are summarized in Table 2. The products were different from those in ethanol in the presences of L-proline [27]. The structures of the products may be affected by catalyst and solvents.

To expand the scope of the present method, the replacement of tetronic acid **3** with 1,3-indanedione **5** was examined. This is particularly attractive because compounds with indenopyridine motifs show a wide range of biological activities such as calcium antagonistic [28], antioxidant [29], antihistamine and antidepressant [30], and also act as phosphodiesterase inhibitors [31], NK-1, and dopamine receptor ligands [32]. To our delight, under the earlier-optimized conditions, the reactions proceeded smoothly. A series of indeno[2,1-*e*]pyrazolo[3,4-*b*] pyridine-5(1*H*)-one derivatives **6** were obtained (Scheme 2) in excellent yields. The products were agreed with those in ethanol [27] or DMF [33]. The results are summarized in Table 3.

Table 1

4n	Thiophen-2-yl	5	80
4o	Pyridin-3-yl	5	62
4p	Pyridin-4-yl	5	72

As shown in Tables 2 and 3, this method can be applied not only to the aromatic aldehydes with either electron-withdrawing groups (such as nitro and halide groups) or electron-donating groups (such as hydroxyl and alkoxyl groups), but also to heterocyclic aldehydes with excellent yields under same conditions. Therefore, we concluded that the electronic nature of the substituents has no significant effect on this reaction.

Apart from the mild conditions of the process and its excellent results, the simplicity of product isolation and the possibility to recycle the [bmim]Br offer a significant advantage. Because [bmim]Br is miscible with water and the desired products are insoluble in water, the products can be directly separated by adding water into the synthetic system after the reaction is complete. The remaining [bmim]Br can then be recycled after removal of water under vacuum. Studies using **1a**, **2**, and **3** as model substrates showed that the recovered ionic liquid could be successively recycled in subsequent reactions without almost any decrease in its efficiency (Table 4). An overall process for the one-pot synthesis

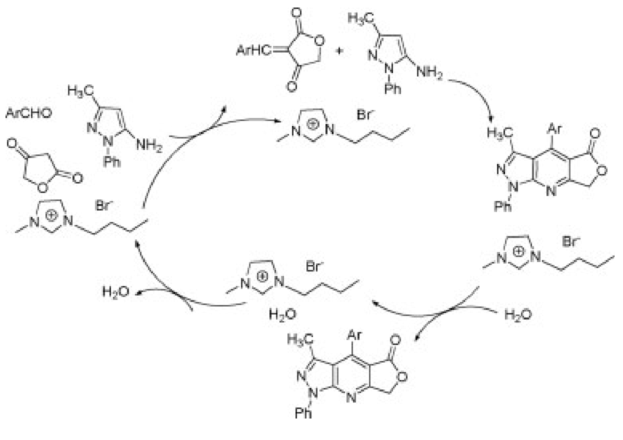

Figure 1. Reaction-isolation-recycle process for the one-pot synthesis of 4 in [bmim]Br.

of furo[3,4-*e*]pyrazolo [3,4-*b*]pyridine-5(7*H*)-one derivatives can be envisaged as shown in Figure 1.

All the products **4** and **6** were characterized by mp, IR, and ^{1}H NMR spectra as well as HRMS. The structure of **4l** was further confirmed by X-ray diffraction analysis [34]. The molecular structure **4l** is shown in Figure 2.

Although the detailed mechanism of the above reaction remains to be fully clarified the formation of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one derivatives **4** could be explained by a reaction sequence presented in Scheme 3. We proposed that the reaction proceeded via a reaction sequence of condensation, addition, cyclization, dehydration, and aromatization. First, the condensation of aldehyde **1** and tetronic acid **3** gave the intermediate product **7**. The addition of **7** to 5-amino-3-methyl-1-phenylpyrazole **2** then furnished the intermediate product **9**, which on intermolecular cyclization and dehydration gave rise to **11**. In the last step, the intermediate product **11** aromatized to product **4**.

Evidence supporting this proposed mechanism came from the observation that when **7a** and **2** were treated under same conditions, the expected product **4a** was obtained in a yield similar to that obtained in the one-pot reaction (Scheme 4).

In conclusion, we have developed a simple three-component reaction of an aldehyde, 5-amino-3-methyl-1-phenylpyrazole and either tetronic acid or 1,3-indanedione for the synthesis of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one and indeno[2,1-*e*]pyrazolo[3,4-*b*]pyridine-5(1*H*)-one derivatives in ionic liquid without any catalyst. This method has the advantages of good yields, convenient procedure, and environmentally friendly reaction conditions.

Bruker DPX 400-MHz or Inova 300-MHz spectrometer as DMSO-d_6 solution. *J* values are in hertz (Hz). Chemical shifts are expressed in δ downfield from internal tetramethylsilane. HRMS were obtained using TOF-MS instrument. X-ray crystallographic analysis was performed with a Smart-1000 CCD diffractometer.

General procedure for the synthesis of furo[3,4-*e*]pyrazolo[3,4-*b*]pyridine-5(7*H*)-one derivatives 4 and indeno[2,1-*e*]pyrazolo[3,4-*b*]pyridine-5(1*H*)-one derivatives 6 in ionic liquid. Aldehyde 1 (2 mmol), 5-amino-3-methyl-1-phenylpyrazole 2 (2 mmol), tetronic acid 3 or 1,3-indanedione 5 (2 mmol) were added to a 10 mL round bottom flask containing 2 mL [bmim]Br. The mixture was then stirred at 95°C for given times. After completion of the reaction, the reaction mixture was added with 5 mL water. The precipitate was collected by suction and purified by recrystallization from EtOH to give products 4 or 6. The filtrate was concentrated under reduced pressure and dried at 100°C to recover the ionic liquid for subsequent use.

4-(4-Bromophenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]-pyrazolo[3,4-b]pyridine-5(7H)-one (4a). This compound was obtained as solid with mp 226–227°C; IR (potassium bromide): 3058, 2965, 2929, 1764, 1578, 1557, 1505, 1439, 1386, 1356, 1313, 1210, 1140, 1070, 1048, 1027, 1011, 847, 821, 798, 759, 720 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.13 (s, 3H, CH_3), 5.51 (s, 2H, CH_2), 7.42 (t, *J* = 7.2 Hz, 1H, ArH), 7.55 (d, *J* = 8.4 Hz, 2H, ArH), 7.62 (t, *J* = 7.6 Hz, 2H, ArH), 7.79 (d, *J* = 8.0 Hz, 2H, ArH), 8.19 (d, *J* = 8.8 Hz, 2H, ArH). HRMS [Found: *m/z* 421.0236 (M$^+$); Calcd for $C_{21}H_{14}{}^{79}BrN_3O_2$: M 421.0249].

3-Methyl-4-(4-methoxyphenyl)-1-phenyl-1H-furo[3,4-e] pyrazolo[3,4-b]pyridine-5(7H)-one (4b). This compound was obtained as solid with mp 190–192°C; IR (potassium bromide): 3046, 2971, 2924, 1765, 1608, 1579, 1561, 1509, 1458, 1445, 1426, 1384, 1358, 1309, 1294, 1259, 1208, 1176, 1140, 1071, 1048, 1036, 1019, 824, 797, 758, 692 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.16 (s, 3H, CH_3), 3.88 (s, 3H, CH_3O), 5.47 (s, 2H, CH_2), 7.13 (d, *J* = 8.4 Hz, 2H, ArH), 7.40 (t, *J* = 7.2 Hz, 1H, ArH), 7.53 (d, *J* = 8.4 Hz, 2H, ArH), 7.61 (t, *J* = 8.0 Hz, 2H, ArH), 8.20 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 371.1255 (M$^+$); Calcd for $C_{22}H_{17}N_3O_3$: M 371.1270].

4-(4-Fluorophenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4c). This compound was obtained as solid with mp 235–237°C; IR (potassium bromide): 3070, 2929, 1756, 1597, 1578, 1513, 1490, 1449, 1437, 1422, 1392, 1360, 1315, 1221, 1167, 1137, 1068, 1042, 1028, 830, 798, 757 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.12 (s, 3H, CH_3), 5.49 (s, 2H, CH_2), 7.39–7.45 (m, 3H, ArH), 7.59–7.67 (m, 4H, ArH), 8.19 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 359.1055 (M$^+$); Calcd for $C_{21}H_{14}FN_3O_2$: M 359.1070].

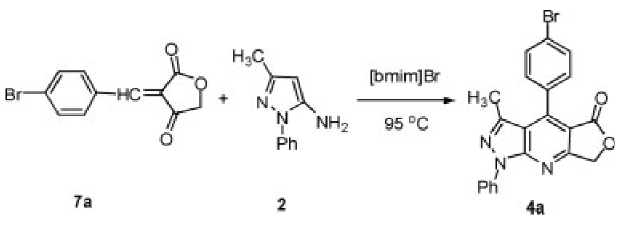
4-(4-Chlorophenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4d). This compound was obtained as solid with mp 223–225°C; IR (potassium bromide): 3062, 2934, 1763, 1598, 1580, 1562, 1505, 1488, 1459, 1442, 1421, 1386, 1358, 1313, 1269, 1211, 1144, 1124, 1089, 1071, 1048, 1027, 1015, 915, 848, 825, 799, 760, 723 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.12 (s, 3H, CH_3), 5.50 (s, 2H, CH_2), 7.39–7.43 (m, 1H, ArH), 7.59–7.67 (m, 6H, ArH), 8.19 (d, *J* = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 15.62, 69.66, 111.48, 116.50, 121.74, 127.26, 128.64, 129.98, 130.74, 131.92, 135.14, 138.84, 145.41, 146.51, 153.11, 168.02, 168.33. HRMS [Found: *m/z* 375.0768 (M$^+$); Calcd for $C_{21}H_{14}{}^{35}Cl\ N_3O_2$: M 375.0775].

3-Methyl-4-(4-nitrophenyl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4e). This compound was obtained as solid with mp 288–289°C; IR (potassium bromide): 3068, 2929, 1763, 1580, 1517, 1439, 1388, 1350, 1314, 1293, 1213, 1142, 1108, 1073, 1050, 1022, 838, 802, 754, 709, 692 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.11 (s, 3H, CH_3), 5.54 (s, 2H, CH_2), 7.43 (t, *J* = 7.6 Hz, 1H, ArH), 7.63 (t, *J* = 7.6 Hz, 2H, ArH), 7.90 (d, *J* = 8.4 Hz, 2H, ArH), 8.20 (d, *J* = 8.0 Hz, 2H, ArH), 8.44 (d, *J* = 8.4 Hz, 2H, ArH). HRMS [Found: *m/z* 386.1012 (M$^+$); Calcd for $C_{21}H_{14}N_4O_4$: M 386.1015].

4-(4-Hydroxyphenyl)-3-methyl-1-phenyl-1H-furo[3,4-e] pyrazolo[3,4-b]pyridine-5(7H)-one (4f). This compound was obtained as solid with mp >300°C; IR (potassium bromide): 3312, 1744, 1614, 1591, 1573, 1511, 1490, 1438, 1388, 1360, 1317, 1276, 1214, 1173, 1146, 1082, 1051, 1026, 854, 826, 802, 758 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.17 (s, 3H, CH_3), 5.45 (s, 2H, CH_2), 6.93 (d, *J* = 8.0 Hz, 2H, ArH), 7.40 (d, *J* = 8.0 Hz, 3H, ArH), 7.60 (t, *J* = 7.6 Hz, 2H, ArH), 8.19 (d, *J* = 7.6 Hz, 2H, ArH), 9.97 (s, 1H, OH); ^{13}C NMR (DMSO-d_6): δ 15.88, 69.34, 111.13, 115.27, 116.72, 121.66, 121.96, 127.08, 129.90, 132.04, 138.96, 145.61, 148.82, 153.18, 159.48, 168.14, 168.45. HRMS [Found: *m/z* 357.1092 (M$^+$); Calcd for $C_{21}H_{15}N_3O_3$: M 357.1113].

4-(4-Dimethylaminophenyl)-3-methyl-1-phenyl-1H-furo [3,4-e] pyrazolo[3,4-b]pyridine-5(7H)-one(4g). This compound was obtained as solid with mp 246–248°C; IR (potassium bromide): 2926, 1760, 1615, 1593, 1571, 1531, 1515, 1457, 1441, 1390, 1362, 1311, 1294, 1272, 1213, 1191, 1139, 1070, 1044, 1029,

Scheme 4



943, 850, 813, 796, 759 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.23 (s, 3H, CH$_3$), 3.04 (s, 6H, (CH$_3$)$_2$N), 5.43 (s, 2H, CH$_2$), 6.86 (d, J = 8.4 Hz, 2H, ArH), 7.37–7.45 (m, 3H, ArH), 7.60 (t, J = 7.6 Hz, 2H, ArH), 8.20 (d, J = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 16.31, 69.25, 110.81, 111.29, 116.57, 118.08, 121.78, 121.82, 127.12, 129.94, 132.13, 132.18, 139.05, 145.72, 149.45, 151.78, 153.34, 168.39, 168.65. HRMS [Found: *m/z* 384.1585 (M$^+$); Calcd for $C_{23}H_{20}N_4O_2$: M 384.15 86].

3-Methyl-4-(3-nitrophenyl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4h). This compound was obtained as solid with mp 259–261°C; IR (potassium bromide): 3069, 2934, 1773, 1589, 1535, 1516, 1491, 1460, 1439, 1387, 1345, 1315, 1212, 1156, 1125, 1073, 1048, 1029, 875, 800, 755, 738, 713, 702, 692 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.12 (s, 3H, CH$_3$), 5.53 (s, 2H, CH$_2$), 7.42 (t, J = 7.6 Hz, 1H, ArH), 7.62 (t, J = 7.6 Hz, 2H, ArH), 7.90 (t, J = 8.0 Hz, 1H, ArH), 8.10 (d, J = 7.6 Hz, 1H, ArH), 8.20 (d, J = 8.0 Hz, 2H, ArH), 8.47 (d, J = 8.8 Hz, 1H, ArH), 8.51 (s, 1H, ArH); ^{13}C NMR (DMSO-d_6): δ 14.34, 68.57, 108.77, 110.48, 115.22, 120.58, 123.76, 126.07, 128.73, 132.23, 135.37, 135.39, 137.58, 143.49, 143.99, 146.68, 151.99, 166.68, 167.10. HRMS [Found: *m/z* 386.1031 (M$^+$); Calcd for $C_{21}H_{14}N_4O_4$: M 386.1015].

4-(2,4-Dichlorophenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]pyrazolo [3,4-b]pyridine-5(7H)-one (4i). This compound was obtained as solid with mp 206–208°C; IR (potassium bromide): 3064, 2930, 1762, 1585, 1506, 1490, 1475, 1441, 1470, 1389, 1376, 1361, 1316, 1274, 1210, 1180, 1150, 1127, 1100, 1078, 1050, 1024, 893, 853, 821, 801, 757, 689 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.10 (s, 3H, CH$_3$), 5.54 (d, J = 16.0 Hz, 1H, CH), 5.61 (d, J = 16.0 Hz, 1H, CH), 7.43 (t, J = 7.6 Hz, 1H, ArH), 7.60–7.65 (m, 3H, ArH), 7.68 (d, J = 8.4 Hz, 1H, ArH), 7.95 (s, 1H, ArH), 8.19 (d, J = 8.4 Hz, 2H, ArH). HRMS [Found: *m/z* 409.0385 (M$^+$); Calcd for $C_{21}H_{13}{}^{35}Cl_2N_3O_2$: M 409.0385].

4-(3,4-Dimethylphenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4j). This compound was obtained as solid with mp 231–233°C; IR (potassium bromide): 2926, 2861, 1768, 1577, 1513, 1458, 1434, 1386, 1355, 1268, 1228, 1210, 1182, 1128, 1070, 1042, 1027, 852, 818, 808, 798, 758, 719 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.11 (s, 3H, CH$_3$), 2.33 (s, 3H, CH$_3$), 2.36 (s, 3H, CH$_3$), 5.48 (s, 2H, CH$_2$), 7.28 (d, J = 8.0 Hz, 1H, ArH), 7.32–7.35 (m, 2H, ArH), 7.41 (t, J = 7.6 Hz, 1H, ArH), 7.61 (t, J = 7.6 Hz, 2H, ArH), 8.20 (d, J = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 15.62, 19.98, 69.47, 111.34, 116.68, 121.82, 127.18, 127.47, 129.31, 129.56, 129.95, 130.93, 136.33, 138.43, 138.97, 145.61, 148.48, 153.17, 168.11, 168.31. HRMS [Found: *m/z* 369.1480 (M$^+$); Calcd for $C_{23}H_{19}N_3\ O_2$: M 369.1477].

3-Methyl-4-(3,4-dimethoxyphenyl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4k). This compound was obtained as solid with mp 203–205°C; IR (potassium bromide): 3059, 3018, 2930, 1768, 1589, 1570, 1512, 1460, 1438, 1412, 1355, 1325, 1309, 1259, 1234, 1203, 1174, 1130, 1070, 1045, 1027, 843, 795, 761, 701 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.19 (s, 3H, CH$_3$), 3.79 (s, 3H, CH$_3$O), 3.88 (s, 3H, CH$_3$O), 5.47 (s, 2H, CH$_2$), 7.10–7.17 (m, 2H, ArH), 7.20 (s, 1H, ArH), 7.41 (t, J = 7.6 Hz, 1H, ArH), 7.61 (t, J = 7.6 Hz, 2H, ArH), 8.19 (d, J = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 20.44, 60.97, 74.11, 116.36, 119.99, 121.51, 126.54, 127.86, 128.63, 131.88, 134.65, 134.73, 143.71, 150.39, 153.01, 153.34, 155.29, 157.96, 172.81, 173.03. HRMS [Found: *m/z* 401.1386 (M$^+$); Calcd for $C_{23}H_{19}N_3O_4$: M 401.1376].

4-(2-Chloro-5-nitrophenyl)-3-methyl-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4l). This compound was obtained as solid with mp 253–255°C; IR (potassium bromide): 3081, 1771, 1587, 1568, 1527, 1507, 1459, 1437, 1422, 1370, 1338, 1325, 1214, 1152, 1124, 1108, 1082, 1054, 1025, 947, 867, 853, 820, 757, 709 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.13 (s, 3H, CH$_3$), 5.54 (d, J = 16.0 Hz, 1H, CH), 5.64 (d, J = 16.0 Hz, 1H, CH), 7.44 (t, J = 7.6 Hz, 1H, ArH), 7.64 (t, J = 7.6 Hz, 2H, ArH), 7.96 (s, 1H, ArH), 8.01 (d, J = 8.8 Hz, 1H, ArH), 8.21 (d, J = 8.0 Hz, 2H, ArH), 8.45 (d, J = 8.8 Hz, 1H, ArH). HRMS [Found: *m/z* 420.0621 (M$^+$); Calcd for $C_{21}H_{13}{}^{35}ClN_4O_4$: M 420.0625].

3-Methyl-4-(3,4-methylinenedioxophenyl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4m). This compound was obtained as solid with mp 248–249°C; IR (potassium bromide): 3070, 2903, 1764, 1577, 1508, 1490, 1445, 1387, 1364, 1341, 1313, 1240, 1207, 1166, 1119, 1071, 1051, 1031, 924, 796, 758 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.19 (s, 3H, CH$_3$), 5.47 (s, 2H, CH$_2$), 6.18 (s, 2H, OCH$_2$O), 7.04 (d, J = 8.0 Hz, 1H, ArH), 7.12 (d, J = 8.0 Hz, 1H, ArH), 7.18 (s, 1H, ArH), 7.40 (t, J = 7.6 Hz, 1H, ArH), 7.61 (t, J = 7.6 Hz, 2H, ArH), 8.19 (d, J = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 15.67, 69.45, 102.22, 108.51, 110.70, 111.51, 116.80, 121.71, 124.38, 125.22, 127.15, 129.92, 138.93, 145.56, 147.48, 147.82, 149.03, 153.19, 168.02, 168.27. HRMS [Found: *m/z* 385.1065 (M$^+$); Calcd for $C_{22}H_{15}N_3O_4$: M 385.1063].

3-Methyl-4-(thiophen-2-yl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4n). This compound was obtained as solid with mp 248–250°C; IR (potassium bromide): 3098, 1761, 1579, 1541, 1515, 1490, 1438, 1384, 1360, 1340, 1311, 1266, 1225, 1201, 1181, 1131, 1116, 1076, 1050, 1028, 852, 817, 794, 762, 732, 716, 720 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.25 (s, 3H, CH$_3$), 5.48 (s, 2H, CH$_2$), 7.32 (t, J = 8.0 Hz, 1H, ArH), 7.40–7.46 (m, 2H, ArH), 7.61 (t, J = 8.0 Hz, 2H, ArH), 7.97 (d, J = 5.2 Hz, 1H, ArH), 8.18 (d, J = 8.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 19.95, 74.20, 117.01, 122.03, 126.62, 132.01, 132.56, 134.64, 135.02, 135.44, 136.22, 143.56, 145.58, 150.10, 157.81, 172.63, 172.70. HRMS [Found: *m/z* 347.0745 (M$^+$); Calcd for $C_{19}H_{13}N_3O_2S$: M 347.0728].

3-Methyl-4-(pyridin-3-yl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4o). This compound was obtained as solid with mp 223–225°C; IR (potassium bromide): 3032, 2971, 2947, 1753, 1593, 1579, 1510, 1487, 1440, 1421, 1389, 1357, 1336, 1312, 1293, 1269, 1213, 1194, 1146, 1125, 1071, 1050, 1026, 908, 848, 813, 795, 760, 717, 701 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.14 (s, 3H, CH$_3$), 5.53 (s, 2H, CH$_2$), 7.42 (t, J = 7.6 Hz, 1H, ArH), 7.60–7.65 (m, 3H, ArH), 8.08 (dd, J_1 = 1.5 Hz, J_2 = 7.6 Hz, 1H, ArH), 8.20 (d, J = 8.0 Hz, 2H, ArH), 8.79 (d, J = 2.0 Hz, 2H, ArH); ^{13}C NMR (DMSO-d_6): δ 20.39, 74.46, 116.48, 121.39, 126.52, 128.22, 132.00, 132.72, 134.66, 142.47, 155.85, 157.87, 172.67, 173.11. HRMS [Found: *m/z* 342.1136 (M$^+$); Calcd for $C_{20}H_{14}N_4O_2$: M 342.1117].

3-Methyl-4-(pyridin-4-yl)-1-phenyl-1H-furo[3,4-e]pyrazolo[3,4-b]pyridine-5(7H)-one (4p). This compound was obtained as solid with mp 223–225°C; IR (potassium bromide): 3032, 2976, 2939, 1769, 1583, 1543, 1510, 1491, 1438, 1419, 1388, 1361, 1340, 1314, 1273, 1212, 1178, 1148, 1126, 1072, 1051, 1029, 989, 812, 797, 759 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.11 (s, 3H, CH_3), 5.53 (s, 2H, CH_2), 7.42 (t, J = 7.6 Hz, 1H, ArH), 7.60–7.70 (m, 4H, ArH), 8.18 (d, J = 8.0 Hz, 2H, ArH), 8.80 (d, J = 5.2 Hz, 2H, ArH). HRMS [Found: m/z 342.1099 (M$^+$); Calcd for $C_{20}H_{14}N_4O_2$: M 342.1117].

3-Methyl-1-phenyl-4-p-tolylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6a). This compound was obtained as solid with mp 219–221°C (Lit. [32] 217–218°C); IR (potassium bromide): 3028, 2916, 1712, 1592, 1572, 1555, 1498, 1461, 1437, 1383, 1326, 1310, 1278, 1246, 1198, 1178, 1159, 1119, 1083, 1022, 995, 869, 767, 726, 698 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.02 (s, 3H, CH_3), 2.46 (s, 3H, CH_3), 7.36 (d, J = 7.2 Hz, 2H, ArH), 7.41–7.47 (m, 3H, ArH), 7.60–7.67 (m, 4H, ArH), 7.77 (t, J = 7.2 Hz, 1H, ArH), 8.01 (d, J = 7.6 Hz, 1H, ArH), 8.29 (d, J = 7.6 Hz, 2H, ArH). HRMS [Found: m/z 401.1533 (M$^+$); Calcd for $C_{27}H_{19}N_3O$: M 401.1528].

4-(4-Methoxyphenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6b). This compound was obtained as solid with mp 222–224°C (Lit. [32] 224–225°C); IR (potassium bromide): 2995, 2932, 2834, 1710, 1608, 1560, 1511, 1463, 1439, 1384, 1327, 1311, 1292, 1246, 1201, 1178, 1152, 1122, 1035, 996, 952, 834, 787, 770, 757, 727, 690 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.01 (s, 3H, CH_3), 3.88 (s, 3H, CH_3O), 7.12 (d, J = 7.6 Hz, 2H, ArH), 7.42 (t, J = 7.6 Hz, 1H, ArH), 7.51 (d, J = 7.6 Hz, 2H, ArH), 7.57–7.65 (m, 4H, ArH), 7.74 (t, J = 7.6 Hz, 1H, ArH), 7.96 (d, J = 7.2 Hz, 1H, ArH), 8.30 (d, J = 8.4 Hz, 2H, ArH). HRMS [Found: m/z 417.1474 (M$^+$); Calcd for $C_{27}H_{19}N_3O_2$: M 417.1477].

4-(4-Fluorophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6c). This compound was obtained as solid with mp 256–258°C (Lit. [32] 255–257°C); IR (potassium bromide): 3068, 3019, 1715, 1605, 1596, 1561, 1509, 1462, 1437, 1383, 1324, 1209, 1248, 1226, 1201, 1160, 1121, 1096, 1085, 1015, 995, 911, 872, 839, 803, 763, 730, 697 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 1.99 (s, 3H, CH_3), 7.37–7.44 (m, 3H, ArH), 7.57–7.64 (m, 6H, ArH), 7.74 (t, J = 7.6 Hz, 1H, ArH), 7.98 (d, J = 7.6 Hz, 1H, ArH), 8.28 (d, J = 8.0 Hz, 2H, ArH). HRMS [Found: m/z 405.1276 (M$^+$); Calcd for $C_{26}H_{16}FN_3O$: M 405.1277].

4-(4-Chlorophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6d). This compound was obtained as solid with mp 265–267°C (Lit. [32] 269–270°C); IR (potassium bromide): 3054, 2924, 1710, 1597, 1572, 1558, 1503, 1461, 1438, 1383, 1325, 1311, 1294, 1270, 1246, 1179, 1153, 1120, 1084, 1015, 996, 953, 867, 835, 767, 728 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.01 (s, 3H, CH_3), 7.42 (t, J = 7.2 Hz, 1H, ArH), 7.56–7.65 (m, 8H, ArH), 7.75 (t, J = 7.2 Hz, 1H, ArH), 7.98 (d, J = 7.2 Hz, 1H, ArH), 8.28 (d, J = 8.0 Hz, 2H, ArH). HRMS [Found: m/z 421.0976 (M$^+$); Calcd for $C_{26}H_{16}{}^{35}ClN_3O$: M 421.0982].

4-(4-Bromophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6e). This compound was obtained as solid with mp 272–274°C (Lit. [32] 274–276°C); IR (potassium bromide): 1712, 1595, 1570, 1503, 1460, 1438, 1383, 1326, 1311, 1293, 1270, 1246, 1201, 1180, 1153, 1120, 1083, 1012, 767, 728 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 1.99 (s, 3H, CH_3), 7.42 (t, J = 7.6 Hz, 1H, ArH), 7.53 (d, J = 8.0 Hz, 2H, ArH), 7.56–7.64 (m, 4H, ArH), 7.73–7.77 (m, 3H, ArH), 7.98 (d, J = 7.6 Hz, 1H, ArH), 8.27 (d, J = 8.0 Hz, 2H, ArH). HRMS [Found: m/z 465.0479 (M$^+$); Calcd for $C_{26}H_{16}{}^{79}BrN_3O$: M 465.0477].

3-Methyl-4-(4-nitrophenyl)-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6f). This compound was obtained as solid with mp >300°C (Lit. [26] 318–319°C); IR (potassium bromide): 3065, 1709, 1592, 1566, 1510, 1503, 1462, 1439, 1384, 1347, 1325, 1311, 1290, 1246, 1201, 1180, 1154, 1121, 1084, 1016, 997, 949, 865, 838, 768, 752, 729, 719, 703, 691 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 1.99 (s, 3H, CH_3), 7.44 (t, J = 7.2 Hz, 1H, ArH), 7.61–7.66 (m, 4H, ArH), 7.78 (t, J = 7.6 Hz, 1H, ArH), 7.90 (d, J = 8.4 Hz, 2H, ArH), 8.03 (d, J = 7.2 Hz, 1H, ArH), 8.28 (d, J = 8.0 Hz, 2H, ArH), 8.42 (d, J = 8.4 Hz, 2H, ArH). HRMS [Found: m/z 432.1220 (M$^+$); Calcd for $C_{26}H_{16}N_4O_3$: M 432.1222].

4-(4-Hydroxyphenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6g). This compound was obtained as solid with mp >300°C (Lit. [26] 316–318°C); IR (potassium bromide): 3233, 3067, 3031, 1695, 1614, 1593, 1557, 1510, 1489, 1456, 1436, 1418, 1383, 1332, 1323, 1309, 1293, 1275, 1247, 1232, 1201, 1176, 1157, 1121, 1083, 768, 756, 730 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.04 (s, 3H, CH_3), 6.91 (d, J = 8.4 Hz, 2H, ArH), 7.35–7.41 (m, 3H, ArH), 7.53–7.62 (m, 4H, ArH), 7.72 (t, J = 7.6 Hz, 1H, ArH), 7.94 (d, J = 8.0 Hz, 1H, ArH), 8.27 (d, J = 8.0 Hz, 2H, ArH), 9.90 (s, 1H, OH). HRMS [Found: m/z 403.1317 (M$^+$); Calcd for $C_{26}H_{17}N_3O_2$: M 403.1321].

3-Methyl-4-(3-nitrophenyl)-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6h). This compound was obtained as solid with mp 269–271°C; IR (potassium bromide): 3086, 1710, 1605, 1593, 1564, 1525, 1503, 1437, 1417, 1384, 1349, 1326, 1311, 1285, 1247, 1204, 1188, 1156, 1123, 1083, 909, 770, 760, 741, 728, 706, 690 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 1.99 (s, 3H, CH_3), 7.43 (t, J = 7.2 Hz, 1H, ArH), 7.60–7.65 (m, 4H, ArH), 7.77 (t, J = 7.2 Hz, 1H, ArH), 7.88 (t, J = 8.0 Hz, 1H, ArH), 8.02 (d, J = 7.2 Hz, 1H, ArH), 8.08 (d, J = 7.6 Hz, 1H, ArH), 8.29 (d, J = 8.0 Hz, 2H, ArH), 8.46 (d, J = 8.4 Hz, 1H, ArH), 8.51 (s, 1H, ArH). HRMS [Found: m/z 432.1237 (M$^+$); Calcd for $C_{26}H_{16}N_4O_3$: M 432.1222].

4-(3-Chlorophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6i). This compound was obtained as solid with mp 243–245°C; IR (potassium bromide): 3065, 1715, 1593, 1561, 1503, 1474, 1461, 1436, 1382, 1325, 1309, 1293, 1276, 1245, 1203, 1180, 1153, 1119, 1024, 998, 955, 907, 889, 766, 754, 726, 702 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.01 (s, 3H, CH_3), 7.43 (t, J = 7.6 Hz, 1H, ArH), 7.52–7.67 (m, 7H, ArH), 7.70 (s, 1H, ArH), 7.77 (t, J = 7.6 Hz, 1H, ArH), 8.01 (d, J = 7.6 Hz, 1H, ArH), 8.28 (d, J = 7.6 Hz, 2H, ArH). HRMS [Found: m/z 421.0963 (M$^+$); Calcd for $C_{26}H_{16}{}^{35}ClN_3O$: M 421.0982].

4-(4-Dimethylaminophenyl)2-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6j). This compound was obtained as solid with mp 242–244°C (Lit. [26] 241–242°C); IR (potassium bromide): 2892, 1706, 1617, 1561, 1531, 1504, 1481, 1462, 1441, 1384, 1370, 1325, 1310, 1292, 1244, 1233, 1206, 1194, 1182, 1168, 1156, 1125, 1085, 1059, 1020, 992, 945, 815, 768, 729, 690 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.14 (s, 3H, CH_3), 3.05 (s, 6H, $(CH_3)_2N$), 6.80 (d, J = 8.4 Hz, 2H, ArH), 7.40–7.43 (m, 3H, ArH), 7.56–7.64 (m, 4H, ArH), 7.74 (t, J = 7.2 Hz, 1H, ArH), 7.97 (d, J = 7.6 Hz, 1H, ArH), 8.29 (d, J = 8.0 Hz, 2H, ArH). HRMS [Found: m/z 430.1783 (M$^+$); Calcd for $C_{28}H_{22}N_4O$: M 430.1794].

4-(2,4-Dichlorophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6k). This compound was obtained as solid with mp 179–181°C (Lit. [26] 182–184°C); IR (potassium bromide): 3076, 2990, 1716, 1593, 1561, 1504, 1473, 1464, 1435, 1383, 1321, 1306, 1261, 1246, 1197, 1158, 1124, 1102, 1084, 1055, 995, 946, 872, 829, 791, 772, 760, 728 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 1.99 (s, 3H, CH_3), 7.43 (t, *J* = 7.6 Hz, 1H, ArH), 7.60–7.68 (m, 6H, ArH), 7.78 (t, *J* = 7.6 Hz, 1H, ArH), 7.93 (s, 1H, ArH), 8.03 (d, *J* = 7.6 Hz, 1H, ArH), 8.27 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 455.0585 (M^+); Calcd for $C_{26}H_{15}{}^{35}Cl_2N_3O$: M 455.0592].

4-(3,4-Dimethylphenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6l). This compound was obtained as solid with mp 200–202°C; IR (potassium bromide): 3046, 2969, 2921, 1709, 1591, 1558, 1506, 1456, 1437, 1378, 1326, 1311, 1291, 1280, 1245, 1207, 1187, 1154, 1123, 1084, 1023, 807, 769, 758, 726, 691 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.00 (s, 3H, CH_3), 2.33 (s, 3H, CH_3), 2.37 (s, 3H, CH_3), 7.26 (d, *J* = 7.6 Hz, 1H, ArH), 7.30–7.32 (m, 2H, ArH), 7.42 (t, *J* = 7.6 Hz, 1H, ArH), 7.56–7.64 (m, 4H, ArH), 7.74 (t, *J* = 7.2 Hz, 1H, ArH), 7.98 (d, *J* = 7.6 Hz, 1H, ArH), 8.28 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 415.1686 (M^+); Calcd for $C_{28}H_{21}N_3O$: M 415.1685].

4-(3,4-Dimethoxyphenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6m). This compound was obtained as solid with mp 224–226°C (Lit. [26] 230–231°C); IR (potassium bromide): 3054, 2959, 2938, 1703, 1606, 1550, 1510, 1488, 1463, 1444, 1381, 1355, 1328, 1309, 1287, 1275, 1262, 1247, 1232, 1195, 1168, 1158, 1138, 1123, 1086, 1022, 801, 763, 729 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.09 (s, 3H, CH_3), 3.79 (s, 3H, CH_3O), 3.88 (s, 3H, CH_3O), 7.12 (s, 1H, ArH), 7.21 (s, 1H, ArH), 7.42 (t, *J* = 7.2 Hz, 1H, ArH), 7.58–7.65 (m, 4H, ArH), 7.76 (t, *J* = 7.6 Hz, 1H, ArH), 8.00 (d, *J* = 7.2 Hz, 1H, ArH), 8.29 (d, *J* = 8.4 Hz, 2H, ArH). HRMS [Found: *m/z* 447.1599 (M^+); Calcd for $C_{28}H_{21}N_3O_3$: M 447.1583].

4-(3,4-Methylienedioxyphenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6n). This compound was obtained as solid with mp 220–222°C (Lit. [32] 223–224°C); IR (potassium bromide): 3075, 3016, 2880, 1714, 1594, 1561, 1503, 1483, 1462, 1440, 1383, 1354, 1324, 1308, 1282, 1239, 1196, 1160, 1138, 1118, 1106, 1081, 1044, 1029, 996, 942, 918, 805, 768, 730, 701 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.04 (s, 3H, CH_3), 6.17 (s, 2H, OCH_2O), 7.01 (d, *J* = 8.0 Hz, 1H, ArH), 7.08 (d, *J* = 8.0 Hz, 1H, ArH), 7.15 (s, 1H, ArH), 7.41 (t, *J* = 7.2 Hz, 1H, ArH), 7.55–7.62 (m, 4H, ArH), 7.72 (t, *J* = 7.2 Hz, 1H, ArH), 7.93 (d, *J* = 7.6 Hz, 1H, ArH), 8.26 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 431.1264 (M^+); Calcd for $C_{27}H_{17}N_3O_3$: M 431.1270].

4-(3,4-Dichlorophenyl)-3-methyl-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6o). This compound was obtained as solid with mp 194–196°C (Lit. [26] 192–194°C); IR (potassium bromide): 3065, 2985, 2927, 1713, 1596, 1566, 1546, 1503, 1471, 1436, 1416, 1376, 1323, 1307, 1244, 1202, 1180, 1154, 1135, 1118, 1034, 998, 953, 895, 831, 775, 766, 751, 726 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.06 (s, 3H, CH_3), 7.43 (t, *J* = 7.2 Hz, 1H, ArH), 7.60–7.66 (m, 5H, ArH), 7.77 (t, *J* = 7.2 Hz, 1H, ArH), 7.85 (d, *J* = 8.4 Hz, 1H, ArH), 7.95 (s, 1H, ArH), 8.01 (d, *J* = 7.2 Hz, 1H, ArH), 8.28 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 455.0586 (M^+); Calcd for $C_{26}H_{15}{}^{35}Cl_2N_3O$: M 455.0592].

3-Methyl-4-(thiophen-2-yl)-1-phenylindeno[2,1-e]pyrazolo[3,4-b]pyridine-5(1H)-one (6p). This compound was obtained as solid with mp 231–233°C (Lit. [26] 232–233°C); IR (potassium bromide): 3076, 2993, 1705, 1593, 1562, 1510, 1499, 1460, 1434, 1381, 1336, 1320, 1306, 1291, 1247, 1220, 1192, 1170, 1155, 1117, 1082, 1030, 991, 860, 806, 770, 752, 720 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.12 (s, 3H, CH_3), 7.30 (t, *J* = 8.0 Hz, 1H, ArH), 7.41–7.45 (m, 2H, ArH), 7.60–7.67 (m, 4H, ArH), 7.76 (t, *J* = 7.6 Hz, 1H, ArH), 7.92 (d, *J* = 5.2 Hz, 1H, ArH), 8.00 (d, *J* = 7.2 Hz, 1H, ArH), 8.27 (d, *J* = 8.0 Hz, 2H, ArH). HRMS [Found: *m/z* 393.0917 (M^+); Calcd for $C_{24}H_{15}N_3OS$: M 393.09 36].

3-Methyl-4-(pyridin-4-yl)-1-phenylindeno[2,1-e]pyrazolo-[3,4-b]pyridine-5(1H)-one (6q). This compound was obtained as solid with mp >300°C; IR (potassium bromide): 3021, 2986, 1707, 1590, 1568, 1541, 1504, 1462, 1437, 1412, 1385, 1327, 1312, 1249, 1203, 1181, 1157, 1123, 1085, 1068, 996, 950, 831, 772, 763, 732, 691 cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.02 (s, 3H, CH_3), 7.44 (t, *J* = 7.2 Hz, 1H, ArH), 7.61–7.67 (m, 6H, ArH), 7.79 (t, *J* = 7.2 Hz, 1H, ArH), 8.04 (d, *J* = 8.0 Hz, 1H, ArH), 8.28 (d, *J* = 8.0 Hz, 2H, ArH), 8.79 (d, *J* = 8.8 Hz, 2H, ArH). HRMS [Found: *m/z* 388.1326 (M^+); Calcd for $C_{25}H_{16}N_4O$: M 388.1324].

The preparation of 4a from 7a. 3-(4-Bromobenzylidene)-furan-2,4(3*H*,5*H*)-dione **7a** (2 mmol) and 5-amino-3-methyl-1-phenylpyrazole **2** (2 mmol) were added to a 10 mL round flask containing 2 mL [bmim]Br. The mixture was then stirred at 95°C for 2 h. After completion of the reaction, the reaction mixture was added with 5 mL water. The precipitate was collected by suction and purified by recrystallization from ethanol to give **4a** in 96% yield.

Acknowledgments. This work was supported by Foundation of Key Laboratory of Organic Synthesis of Jiangsu Province and Key Laboratory of Biotechnology on Medical Plants of Jiangsu Province.

The reactions of 1-amino-2,3-diferrocenylcyclopropenylium tetrafluoroborate (**5a–c**) or 2,3-diferrocenyl-1-methylthiocyclopropenylium iodide with sodium azide afford 5-amino-4,6-diferrocenyl-1,2,3-triazines (**7a–c**) or 5-methylthio-4,6-diferrocenyl- and 4-methylthio-5,6-diferrocenyl-1,2,3-triazines (**8a** and **8b**), respectively. Their structures were established using spectroscopic methods and that of compound **8a** was confirmed using X-ray diffraction analysis. Triazines **5a–c** react with alkyl iodides to yield N(2)- and N-alkyl-C(5)-derivatives. Their alkaline hydrolysis results in 2-methyl-4,6-diferrocenyl-2,5-dihydro-1,2,3-triazin-5-one (**16**) and 4,6-diferrocenyl-5-hydroxy-1,2,3-triazine (**17**). J.

Heterocyclic Chem., **46**, 477 (2009).

INTRODUCTION

The study of 1,2,3-triazines has been on-going at least since the early 1970s [1–6]. It is significant that the chemistry of this heterocyclic system is relatively underdeveloped. 1,2,3-Triazines are of particular interest as potential azete precursors [3,7–10]. The first thermodynamically stable trisubstituted azetes **1a** and **1b** with electron-withdrawing groups have been prepared by pyrolysis and photolysis of the corresponding 4,5,6-trisubstituted 1,2,3-triazines [3,9–11] (Scheme 1).

The ability of electron-density-deficient 1,2,3-triazine systems to interact with nucleophilic reagents, such as the Grignard reagents, electron-rich alkenes, and dienes, is also of interest [12–15]. Thus, 4,6-disubstituted 1,2,3-triazine **2a** undergoes nucleophilic attack at the $N_{(2)}$ and $C_{(5)}$ atoms of the heterocycle to yield 2,5-dihydro-1,2,3-triazines **3a** and **4a**, whereas 4,5,6-trisubstituted 1,2,3-triazine **2b** affords adducts **3b,c** exclusively upon nucleophilic attack at $N_{(2)}$ (Scheme 2).

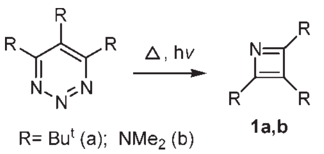
In addition to these reactions of 1,2,3-triazines, pyrolysis and photolysis resulting in substituted alkynes and carbonitriles of mononitrogenous heterocycles are documented [2,4,9]. As bases, they form quaternary salts upon alkylation with alkyl halides at $N_{(2)}$ [16].

On the whole, compounds of the 1,2,3-triazine series are little studied in both the synthetic and practical aspects.

Ferrocenyl-substituted 1,2,3-triazines have not hitherto been described. The interest in these compounds may stem from the peculiarities of their chemical behavior due to the mutual effects of the ferrocene system and the heterocyclic fragment [17]. These effects may result in the emergence of diverse valuable properties, such as biological activity, dyeing ability, possible use as propellant additives or light-sensitive materials, and redox switching receptors in supramolecular chemistry, which has previously been observed for a number of heterylferrocenes [17].

In continuation of our studies in the field of diferrocenyl-substituted cyclopropenylium cations, we describe here the use of the latter for the synthesis of 5-amino- and 5-methylthio-4,6-diferrocenyl-1,2,3-

Scheme 1



triazines **7a–c, 8a,b**, and present first data on their reactivity.

RESULTS AND DISCUSSION

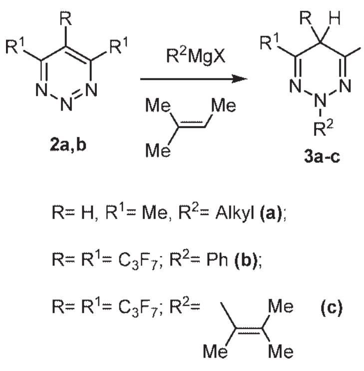
1-Dialkylamino-2,3-diferrocenylcyclopropenylium tetrafluoroborates **5a–c** and 2,3-diferrocenyl-1-methylthiocyclopropenylium iodide **6** obtained as depicted in Scheme 3 [18–20] served as the starting compounds.

Tetrafluoroborates **5a–c** react with sodium azide in dichloromethane, chloroform, acetone, or acetonitrile at ambient temperature (~30 h) or on heating under reflux to give 5-dialkylamino-4,6-diferrocenyl-1,2,3-triazines **7a–c** in ~70–85% yields (Scheme 4). They were obtained as yellow crystalline substances stable on storage in a dry state under ordinary conditions. The structures of compounds **7a–c** were established based on the data from IR spectroscopy, ^{1}H and ^{13}C NMR spectroscopy (which suggest symmetrical structures), and mass spectrometry.

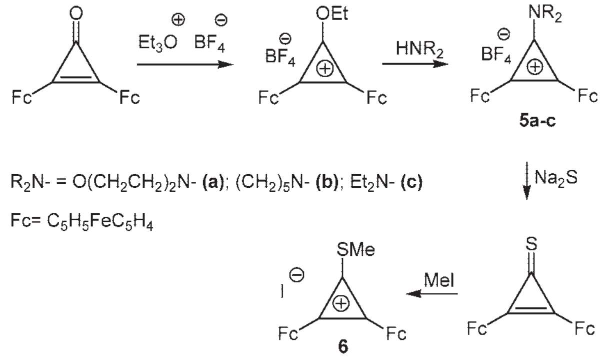
In contrast to tetrafluoroborates **5a–c**, 2,3-diferrocenyl-1-methylthiocyclopropenylium iodide **6** reacted with sodium azide under similar conditions to afford a mixture of isomeric diferrocenyl(methylthio)-1,2,3-triazines **8a** and **8b**. The ratio of the isomers was determined by ^{1}H NMR spectroscopy, this varied depending on the reaction solvent and temperature (Scheme 5, Table 1).

Separation of the isomers was carried out by chromatography on alumina and characterized by ^{1}H and ^{13}C NMR spectroscopy and mass spectrometry. The data from ^{1}H and ^{13}C NMR spectroscopy suggest symmetrical structure for compound **8a** and nonsymmetrical structure for **8b**.

Scheme 2



Scheme 3



The structure of one of the reaction products, *viz.*, 4,6-diferrocenyl-5-methylthio-1,2,3-triazine **8a** was confirmed by X-ray diffraction analysis of a single crystal prepared by crystallization from chloroform. The general view of the molecule **8a** and its principal characteristics are given in Figures 1 and 2; the main geometrical parameters are given in Table 2.

In the molecule of compound **8a**, the substituted cyclopentadienyl rings of the ferrocene fragments are coplanar with, and the ferrocene sandwiches are oriented in opposite directions with respect to, the central planar six-membered ring. The C=N, N=N, Fe—C, and carbon–carbon bonds of the cyclopentadienyl rings as well as the geometrical parameters of the ferrocene sandwiches are close to the standard values [21].

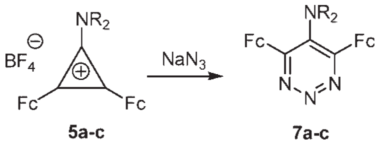
The formation of diferrocenyl-1,2,3-triazines **7a–c** and **8a,b** proceeds apparently with intermediacy of diferrocenylcyclopropenylium azides **9** as ion pairs [1,2,5,9], which undergo reversible transformation to 3-azido(diferrocenyl)cyclopropenes **10a, 10b,**or **11a,b,** representing allyl azides (Scheme 6).

It is known that allyl azides can undergo [3,3]-sigmatropic rearrangements [22] (Scheme 7).

To all appearance, cyclopropenyl azides **10a**, **10b,** and **11b** transform into 1,2,3-triazine systems according to the mechanism of the [3,3]-sigmatropic rearrangement of allyl azides *via* intermediates **12a**, **12b,** and **13b** (Scheme 8).

None of the presumable intermediates **9**, **10a**, **10b** could be detected even when the reactions were conducted at low temperatures (up to −20°C) in methanol or aqueous methanol. Triazines **7a–c** and **8a,b** were the only reaction products in all cases.

Scheme 4



Scheme 5

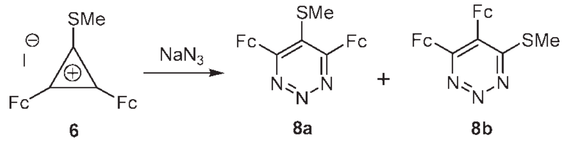


Table 1

Yields of compounds **8a** and **8b**.

			Yield (%)	
Solvent	Temp. (°C)	Time (h)	**8a**	**8b**
CH_2Cl_2	20	36	22	56
CH_2Cl_2	35	20	16	68
$CHCl_3$	20	30	18	59
$CHCl_3$	60	18	15	70
CH_3COCH_3	20	24	19	56
CH_3COCH_3	50	14	17	61
CH_3CN	20	25	18	58
CH_3CN	60	15	17	58

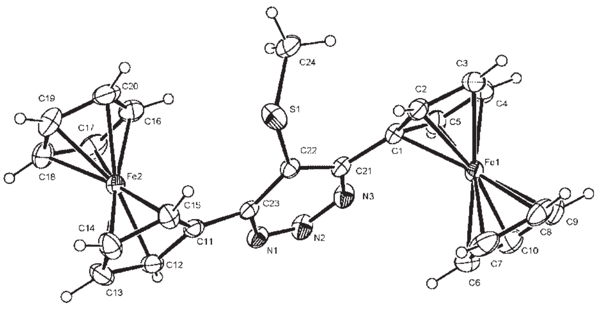

Figure 1. Crystal structure of **8a**.

Different regioselectivity of reactions of 1-amino- and 1-methylthiocyclopro-penylium salts with sodium azide is noteworthy. Compounds **5a–c** afforded symmetrical 1,2,3-triazines stereospecifically, whereas compound **6** gave a mixture of 5-methylthio- and 4-methylthio-substituted 1,2,3-triazines **8a** and **8b** in a ratio of ~1:3 or 1:4 with the nonsymmetrical isomer predominating.

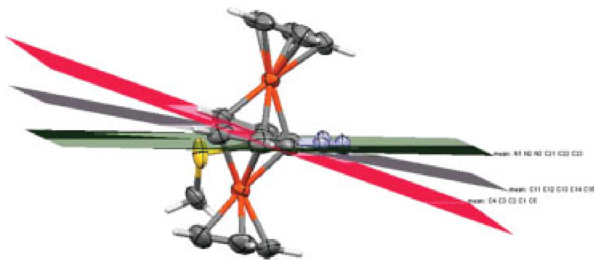

Figure 2. Relative positions of three rings. For plane: C21 C22 C23 N1 N2 N3, maximum deviation from meanplane = −0.136 Å, with respect plane: C11 C12 C13 C14 C15 and maximum deviation from meanplane = 0.218 Å, with respect plane: C1 C2 C3 C4 C5. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

Reactions of triazines **7a–c** with methyl iodide resulted in mixtures of salts **14a–c** and **15a–c** in a ~5:1 ratio (^{1}H NMR data) (Scheme 9).

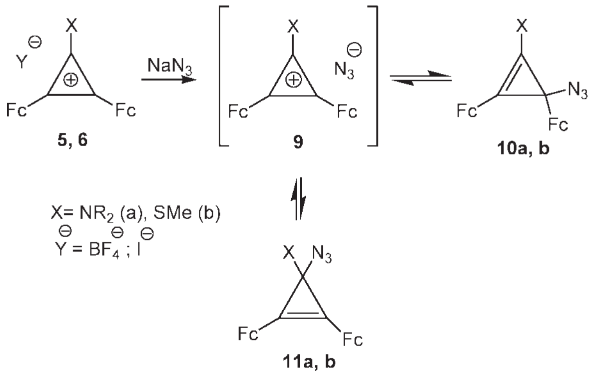
Their structures followed from the spectroscopic data (^{1}H and ^{13}C NMR) and confirmed by chemical transformations. Thus, hydrolysis of salts **14a–c** + **15a–c** with an aqueous-ethanolic alkali afforded 4,6-diferrocenyl-2-methyl-2,5-dihydro-1,2,3-triazin-5-one **16** and 4,6-diferrocenyl-5-hydroxy-1,2,3-triazine **17** separated by column chromatography on alumina (Scheme 10).

Analogously, triazine **7a** reacts with 1,3-diiodopropane to give salts **18** and **19** (Scheme 11) in a ratio of ~5:1.

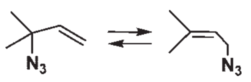
Alkaline hydrolysis converted the compound **18** to N(2)-alkylated ketones as about 2:1 mixture of two isomers (*trans*-**20a**and *cis*-**20b**), which could not be separated by chromatography (Scheme 12). However, their identification based on spectroscopic data of ^{1}H NMR spectra did not present any problems (Table 3). Hydrolysis of the compound **19** affords diketone **21** (Scheme 13).

The structures of compounds **18**, **19**, and **21** were confirmed by the data from ^{1}H and ^{13}C NMR

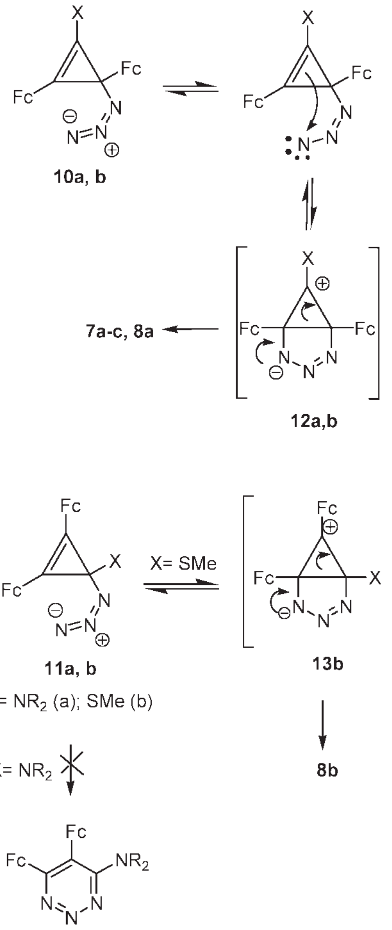
Scheme 6



Scheme 7



Scheme 8

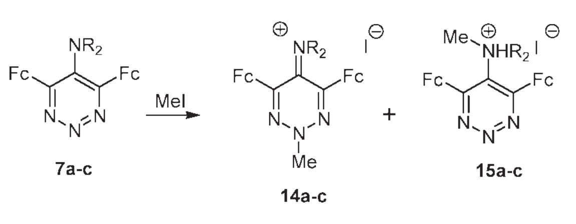


spectroscopy, mass spectrometry, and elemental analysis (Tables 3–5).

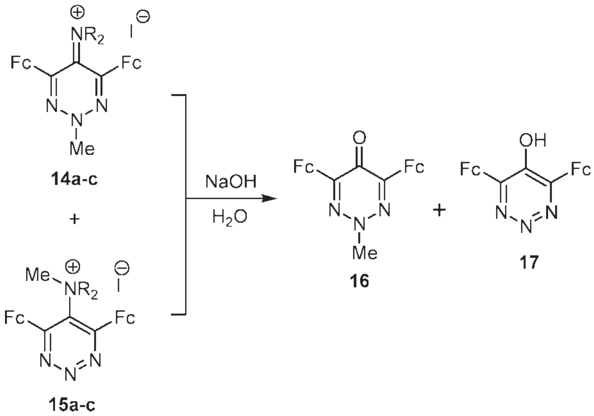
EXPERIMENTAL

The ^1H and ^{13}C NMR spectra were recorded on a Unity Inova Varian spectrometer (300 and 75 MHz) for solutions in $CDCl_3$ with Me_4Si as the internal standard. Chemical shifts are given in ppm and *J* values in Hz. The NMR spectroscopic data are listed in Tables 3 and 4.

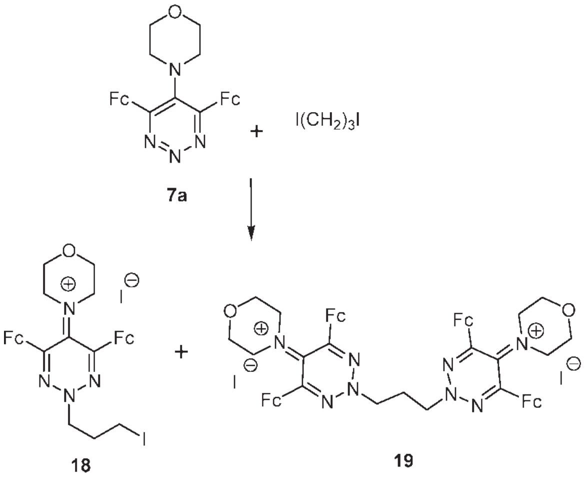
Scheme 9



Scheme 10



Scheme 11



The mass spectra were obtained on a Varian MAT CH-6 instrument (EI MS, 70 eV). An Elemental Analysis system LECO 1 CHNS-900 was used for determination of elemental analyses (Table 5).

IR spectra of compounds **7a, 8a, 8b, 14a, 16,** and **20a,b** were obtained for samples as KBr pellets on a Specord IR-75 instrument; UV spectra of compounds **8a, 8b,** and **16** were recorded on a Specord UV–vis spectrophotometer (Table 6).

Column chromatography was carried out on alumina (Brockmann activity III).

The following reagents were purchased from Aldrich: ferrocene, 98%; aluminum chloride, 99.99%; tetrachlorocyclopropene, 98%; triethyloxonium tetrafluoroborate, 1.0*M* solution in

Scheme 12

dichloromethane; morpholine, 99+%; sodium hydrosulfide hydrate NaHS·xH_2O; diethylamine, 99.5%; piperidine, 99%; 1,3-diiodopropane, 99%; and sodium azide, 99%.

2,3-Diferrocenylcyclopropenone was obtained from the ferrocene and tetrachlorocyclopropene in the presence of $AlCl_3$ according to the standard procedure [18]. Ethoxy(diferrocenyl)-cyclopropenylium tetrafluoroborate was obtained from the 2,3-diferrocenylcyclopropenone in the presence of triethyloxonium tetrafluoroborate (1.0*M* solution in dichloromethane) [19]. Amino(differocenyl)cyclopropenylium tetrafluoroborates **5a–c** were obtained from ethoxy(diferrocenyl)cyclopropenylium tetrafluoroborate and morpholine, piperidine, or diethylamine in dichloromethane [19,20]. 2,3-Diferrocenylcyclopropenethione was obtained by treating ethanolic differocenyl(morpholino)cyclopropenylium tetrafluoroborate with an aqueous solution of NaSH [20], yield 91%, m.p. 208–209°C. 2,3-Diferrocenyl(methylthio)-cyclopropenylium iodide **6** was obtained from the 2,3-diferrocenylcyclopropenethione and iodomethane [20]. Freshly prepared and thoroughly dried tetrafluoroborates **5a–c** and iodide **6** were used in the synthesis of 1,2,3-triazines **7a–c** and **8a,b**. Reactions were carried out in freshly distilled dry solvents.

5-Amino-4,6-diferrocenyl-1,2,3-triazines (7a–c). Sodium azide (1.3 g, 20 mmol) was added to a solution of 1-amino-2,3-diferrocenylpropenylium tetrafluoroborate (**5a–c**) (10 mmol) in dichloromethane (chloroform, acetone, or acetonitrile) (100 mL), and the mixture was stirred in a dry inert atmosphere at ∼20°C (∼24–36 h) or under reflux (14–20 h). The solvents were removed *in vacuo*, and the residues were chromatographed on alumina (hexane–dichloromethane, 4:1) to give 65–78% of triazines **7a–c**.

Reaction of 1-methylthio-2,3-diferrocenylcyclopropenylium iodide 6 with sodium azide. A solution of compound **6** (2.9 g, 5.0 mmol) in a solvent mentioned in Table 1 (100 mL) was stirred with sodium azide (0.65 g, 10 mmol) at ∼20°C or with heating for 14–36 h. Subsequent work-up of the reaction mixtures as described earlier gave compounds **8a** and **8b** (see Table 1).

Reactions of triazines 7a–c with methyl iodide. A solution of 5-amino-4,6-diferrocenyl-1,2,3-triazine (**7a–c**) (1.5 mmol) and methyl iodide (3 mL) in dichloromethane (50 mL) was kept at ∼20°C for 3 days. The solvent was removed *in vacuo*, and dry benzene (40 mL) was added to the residue. The solids were filtered off and dried to obtain ∼75–85% of mixtures of quaternary salts **14a–c** and **15a–c** (∼5:1).

Reaction of triazine 7a with 1,3-diiodopropane. The title reaction was carried analogously from 4,6-diferrocenyl-5-morpholino-1,2,3-triazine **7a** (1.6 g, 3 mmol) and 1,3-diiodopropane (0.6 g, 2 mmol) in dichloromethane (50 mL). The violet precipitate that formed was filtered off, washed with dry ether, and dried *in vacuo*. The yield of the diiodide **19** was 0.51 g (25%). The solvent from filtrate was removed *in vacuo*, and

dry ether (100 mL) was added to the residue. The solid was filtered off, dried to obtain 1.46 g (60%) of iodide **18**.

Alkaline hydrolysis of salts (14a–c + 15a–c), 18, and 19. A mixture of quaternary salts (**14a** + **15a**), (**14b** + **15b**), (**14c** + **15c**), (**18**), or (**19**) (1 mmol) in 10% aqueous NaOH (5 mL) and ethanol (50 mL) was stirred under reflux for 4 h. On cooling, water (100 mL) and chloroform (50 mL) were added, the reaction mixtures were stirred for additional 10 min, the organic layer was separated and concentrated *in vacuo*. The residues were chromatographed on alumina (hexane–dichloromethane, 5:1) to yield 2,5-dihydro-1,2,3-triazine-5-on and 5-ol **16** and **17**, compounds **20** and **21**.

Determination of the crystal structure. The unit cell parameters and the X-ray diffraction intensities were recorded on a Siemens P4 diffractometer. The structure of compound **8a** was solved by the direct method (SHELXS -97 [23]) and refined using full-matrix least-squares on F^2.

Crystal data for $C_{24}H_{21}Fe_2N_3S$ (**8a**): $M = 495.20$ g mol^{-1}, monoclinic P2$_1$/c, $a = 7.8403(12)$, $b = 16.025(3)$, $c = 16.655(3)$ Å, $\alpha = 90$, $\beta = 99.300(11)$, $\gamma = 90°$, $V = 2065.1(6)$ Å^3, $T = 293(2)$ K, $Z = 4$, $\rho = 1.593$ Mg/m^3, λ (Mo–Kα) = 0.71073 Å, $F(000) = 1016$, absorption coefficient 1.522 mm^{-1}, index ranges $-1 \leq h \leq 9$, $-1 \leq k \leq 19$, $-20 \leq l \leq 20$, scan range $2.48 \leq \theta \leq 25.98°$, 4046 independent reflections, $R_{int} = 0.0395$, 5339 total reflections, 272 refinable parameters, final R indices $[I > 2\sigma(I)]$ $R_1 = 0.0346$, $wR_2 = 0.0759$, R indices (all data) $R_1 = 0.0513$, $wR_2 = 0.0837$, largest difference peak and hole 0.330/−0.359 e·Å^{-3}.

CCDC-676457 (for **8a**) contains the supplementary crystallographic data for this paper. These data can be obtained free of charge at www.ccdc.cam.ac.uk/const/retrieving.html.

Reactions of 2-ferrocenylmethylidene-1,3-diketones (**1a–c**) with methylhydrazine afford mainly insertion products (~40–58%), *viz*., 1-(*N*′-acyl-*N*′-methylhydrazino)-1-ferrocenyl-2-acylethanes (**7a–d**), together with lesser amounts of pyrazoles (**8a,b**) and dihydropyrazoles (**9a,b**).

J. Heterocyclic Chem., **46**, 484 (2009).

INTRODUCTION

Syntheses of pyrazoles are mainly based on reactions of 1,3-diketones or 2,3-ynones with hydrazines or on the oxidation of 2-pyrazolines [1–3]. Both these methods are virtually inapplicable as approaches to ferrocenylpyrazoles, because 1,3-diketones with ferrocenyl substituents are usually accessible with difficulty, while oxidative methods may result in destruction of the metallocene substituent. Earlier [4,5], we have proposed a method for the preparation of ferrocenylpyrazole derivatives by condensation of 3- and 5-ferrocenyl-4,5-dihydropyrazoles with aromatic aldehydes (Scheme 1).

Biological assays of the thus obtained compounds have shown that the majority of them possessed high antiviral and anti-inflammatory activities [6–11]. The low solubility of the ferrocenylpyrazoles in water, alcohols, and in acidic solutions is their substantial drawback precluding their manifestation in full pharmacological potential.

In view of the aforesaid, the quest for the approaches to introduce new functional groups to increase the solubility of ferrocenyl-containing pyrazoles is topical. One of such approaches might be based on the use of easily accessible ferrocenylmethylidene-1,3-diketones as precursors of ferrocenylpyrazoles with retention of one of the functional groups in the reaction products.

Data on the features of reactions of these compounds with hydrazines are absent in the chemical literature. Here, we describe the results of investigations of the reactions of methylhydrazine with 2-ferrocenylmethylidene-1,3-dicarbonyl compounds.

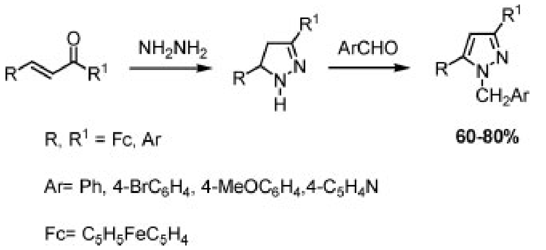
RESULTS AND DISCUSSION

The starting 2-ferrocenylmethylidene-1,3-diketones **1a–c** were obtained by the Knoevenagel condensation of β-dicarbonyl compounds **2a–c** with ferrocenecarbaldehyde in the presence of piperidinium y pyridinium acetates [12–14] (Scheme 2).

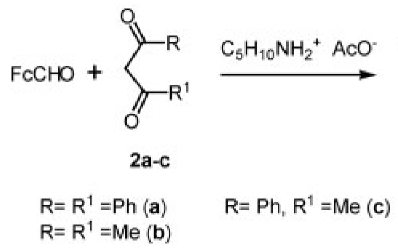
The structure of **1c** was elucidated based on the data from mass spectrometry, elemental analysis, and ^{1}H NMR spectroscopy (see Experimental section). According to the NMR data, compound **1c** is formed as single geometric isomers. The ^{1}H NMR spectrum of compound **1c** contains characteristic signals for one ferrocenyl, one phenyl, and one methyl entities, as well as one signal for the olefinic proton.

The spatial structure of compound **1c** as (*Z*)-2-ferrocenylmethylidene-1-phenylbutane-1,3-dione was determined by X-ray analysis of a single crystal obtained by crystallization from chloroform. The general view of the molecule of **1c** and its principal characteristics are given

Scheme 1



Scheme 2



in Figure 1(a), and the crystal packing is shown in Figure 1(b).

It was anticipated that compounds **1a–c** would react with methylhydrazine to form 4-acyl-5-ferrocenyl-4,5-dihydropyrazoles **3a**,**b** and **4a,b** or 4-acyl-3-ferrocenyl-2,3-dihydropyrazoles **5a**,**b** and **6a,b** [15], respectively (Scheme 3).

However, the results of these reactions turned out to be unexpected. In neither case did the coupling of *N*-methylhydrazine with compounds **1a–c** yield 4-acyl-4,5-dihydropyrazoles **3a,b**, **4a,b**, **5a,b**, and **6a,b**.

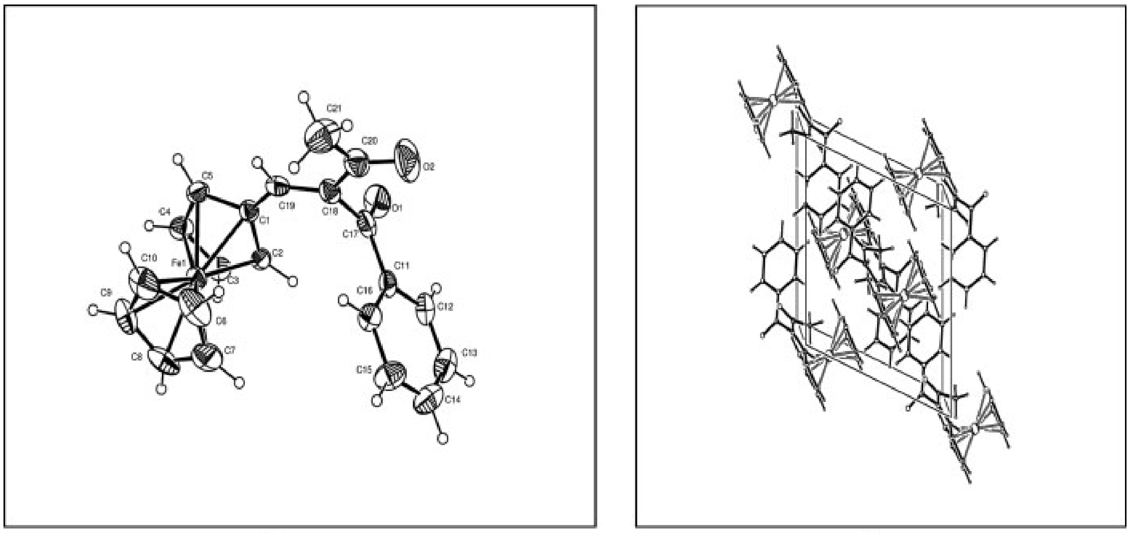
We have found that 1,3-diketones **1a** and **1b** react with *N*-methylhydrazine at 20°C to give mainly (~50%) the insertion products, *viz*., 1-benzoyl-2-(*N*′-benzoyl-*N*′-methylhydrazino)-2-ferrocenylethane **7a** and 4-(*N*′-acetyl-*N*′-methylhydrazino)-4-ferrocenylbutan-2-one **7b** (Scheme 4).

In addition, the fragmentation products, *viz*., 5-ferrocenyl-1-methylpyrazoles **8a,b**, 4,5-dihydropyrazoles **9a,b**, hydrazones **10a**,**b**, and hydrazides **11a**,**b** were isolated in lesser amounts.

Compounds **7a** and **7b** are yellow crystalline substances that precipitated from the reaction mixtures. They are storage-stable in the crystalline state, whereas in solution they gradually decompose. Pyrazole derivatives **8a,b** and **9a,b** were isolated by chromatography from the mother liquors following separation of the insertion products **7a** and **7b**.

The structures of compounds **7a** and **7b** were established based on data from ^{1}H and ^{13}C NMR spectroscopy. Their ^{1}H NMR spectra contain characteristic signals for the protons of the ABM system of the —CH$_2$—CH— fragments, singlets for protons of the CH$_3$— and NH groups, and the signals for the protons of the ferrocenyl and phenyl (for **7a**) substituents (Table 1).

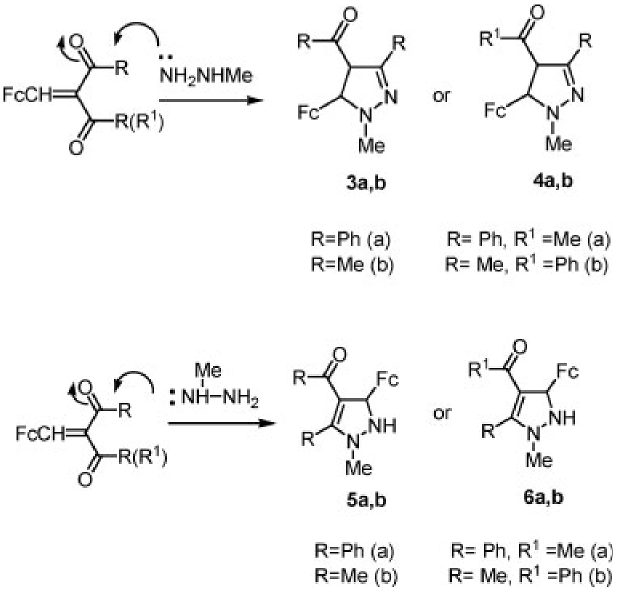
The ^{13}C NMR spectra of compounds **7a** and **7b** contain signals for the carbon atoms of two carbonyl



(a) (b)

Figure 1. (a) Crystal structure of **1c**. Selected bond lengths (Å): C(11)-C(17) = 1.478(7); C(17)-O(1) = 1.223(7); C(17)-C(18) = 1.510(7); C(18)-C(19) = 1.338(7); C(19)-C(1) = 1.439(7); C(18)-C(20) = 1.459(8); C(20)-C(21) = 1.503(9); C(20)-O(2) = 1.215(7). Selected bond angles (°): O(1)-C(17)-C(11) = 121.5(5); C(18)-C(17)-O(1) = 119.8(5); C(17)-C(18)-C(19) = 122.6(5); C(19)-C(18)-C(20) = 122.7(5); C17)-C(18)-C(20) = 114.6(5). (b) Crystal packing of **1c**.

Scheme 3



groups, of one ferrocenyl fragment with one signal for C_{ipso}Fc, and the appropriate number of signals for Me, Ph with two signals for C_{ipso} (**7a**), CH_2, and CH groups (Table 2).

X-ray diffraction analysis of a single crystal of the insertion product **7a** obtained upon crystallization from a 10:1 ethanol–methylhydrazine mixture proves unambiguously its structure. The general view of the molecule **7a** and its main geometric parameters are presented in Figure 2; these require no special comments.

The structures of pyrazole derivatives **8a**,**b** and **9a**,**b**, compounds **10a**,**b** and **11a**,b were unambiguously established based on the data from elemental analysis (Table 3), ^{1}H and ^{13}C NMR spectroscopy (Tables 1 and 2), and mass spectrometry (Table 3). Data from ^{1}H and ^{13}C NMR spectra of compounds **8a**,**b** and **9a**,**b** corroborate their structures. The number of signals for the CH=, C_5H_5, C_5H_4, Ph, Me **8a**,**b** and CH_2, CH, Fc, Ph, and Me **9a**,**b** groups and their chemical shifts correspond completely to the structures **8** and **9**.

The reaction of benzoyl(ferrocenylmethylidene)acetone **1c** with *N*-methylhydrazine affords mainly the insertion products, *viz*., 4-(N'-benzoyl-N'-methylhydrazino)-4-ferrocenylbutan-2-one **7c** and 3-(N'-acetyl-N'-methylhydrazino)-3-ferrocenyl-1-phenylpropan-1-one **7d** ($\sim$1:1) and lesser amounts of pyrazole derivatives **8a**,**b**, **9a**,**b**, hydrazones **10a**,**b,** and hydrazides **11a**,**b** (Scheme 5).

Data from elemental analysis, mass spectrometry, and ^{1}H and ^{13}C NMR spectroscopy including 1D NOE experiments, which have demonstrated the CH_3CO fragment either to be, or not to be, adjacent to the CH_2 group, prove the structure of compounds **7c** and **7d**.

Thus, the results obtained in this study demonstrate that the following processes take place in the reactions of *N*-methylhydrazine with 2-ferrocenylmethylidene-1,3-dicarbonyl compounds: (i) insertion of *N*-methylhydrazine into the molecules of the starting compounds **1a–c**; (ii) fragmentation of 1,3-diones **1a–c** under the action of *N*-methylhydrazine with, apparently, intramolecular redox process with formation of pyrazoles **8a,b**; and (iii) fragmentation of the same 1,3-diones **1a–c** under the action of *N*-methylhydrazine with formation of 4,5-dihydropyrazoles **9a,b** from α,β-unsaturated ketones.

The following putative reaction schemes seem to rationalize the formation of compounds **7a–d**, **8a**,**b**, **9a**,**b**, **10a**,**b,** and **11a**,**b**:

1. The addition of the NH_2 group of *N*-methylhydrazine to the activated double bond of the fragment FcCH=C of β-dicarbonyl compounds **1a–c** (the Michael addition) results in intermediates **12a–d** [Scheme 6(a)]. Subsequent nucleophilic attack by the CH_3NH fragment on the carbon atom of the carbonyl group with higher positive charge ($\delta+$) is accompanied by migration of the carbon–carbon σ bond to the adjacent position with formation of the enol forms of the insertion products (**13a–d**), which are transformed into final compounds **7a–d**.
2. The initial nucleophilic addition of the $-NHCH_3$ group of *N*-methylhydrazine to the carbon atom of a carbonyl group of the starting compounds **1a–c** [Scheme 6(b)] resulting in intermediates **12e–h**, **13e–h**, which are transformed into final compounds **7a–d**.
3. 5-Ferrocenylpyrazoles **8a,b** are formed apparently upon initial nucleophilic attack by the NH_2 group of *N*-methylhydrazine on the carbon atom of a carbonyl

group (preferably, of the C=O group linked with the Ph substituent) of the starting compounds **1a–c** (Scheme 7) resulting in hydrazones **14a–c**.

The subsequent nucleophilic attack by the CH_3NH fragment of hydrazones **14a–c** on the carbon atom of the second carbonyl group is accompanied, in our opinion, by an intramolecular redox process (see Scheme 7) resulting in intermediates **15a–c**, which are transformed into pyrazoles **8a,b** and hydrazones **10a**,**b**.

4. The formation of 4,5-dihydropyrazoles **9a,b** and hydrazides **11a**,**b** from 2-ferrocenylmethylidene-1,3-diones **1a–c** and *N*-methylhydrazine can be explained by the fragmentation of the starting dicarbonyl compounds to yield hydrazones **17a**,**b** according to a tentative Scheme 8.

The insertion products of *N*-methylhydrazine to 2-ferrocenylmethylidene-1,3-diketones have been isolated for the first time. This novel reaction may be regarded as a version of the Michael reaction, which allows preparation of (i) β-ferrocenyl-β-hydrazinoketones and (ii) 1-hydrazinoalkyl-substituted ferrocene derivatives. The synthetic potential of this type of reactions deserves undoubtedly more detailed studies.

EXPERIMENTAL

The ^{1}H and ^{13}C NMR spectra were recorded on a Unity Inova Varian spectrometer (300 and 75 MHz) for solutions in $CDCl_3$with Me_4Si as the internal standard. The NMR spectroscopic data are listed in Tables 1 and 2. The mass spectra were obtained on a Varian MAT CH-6 instrument (EI MS, 70 eV).

Elemental analyses were performed by Galbraith Laboratories, Knoxville. The mass spectrometric data, data from

elemental analyses, yields, and melting points of the compounds obtained are given in Table 3. Column chromatography was carried out on alumina (Brockmann activity III).

The following reagents were purchased from Aldrich: ferrocenecarbaldehyde, 99%; dibenzoylmethane, 98%; 2,4-pentanedione, 99+%; 1-benzoylacetone, 99%; methylhydrazine, 98%.

3-Ferrocenylmethylidene-1,3-diphenylpropane-1,3-dione 1a, 3-ferrocenylmethylidenepentane-2,4-dione 1b. These compounds were prepared by condensation of ferrocenecarbaldehyde with dibenzoylmethane, pentane-2,4-dione, respectively, in benzene in the presence of piperidinium acetate [16,17]. The physical and ^{1}H NMR spectroscopic characteristics of compounds 1a,b were in accord with the literature data [18,19].

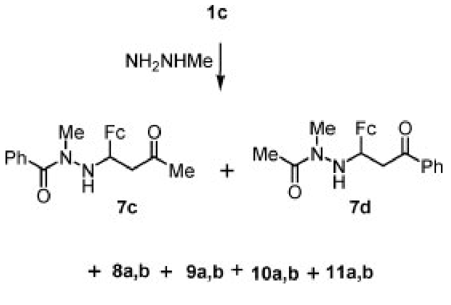
Condensation of ferrocenecarboxaldehyde with 1-benzoylacetone. A mixture of FcCHO (4.3 g, 20 mmol), 1-benzoylacetone (4.86 g, 30 mmol), piperidine (1 mL), pyridine (1 mL), and AcOH (2 mL) in dry benzene (100 mL) was refluxed for 12 h. The reaction mixture was washed with 5% HCl to remove the amines, and the organic layer was concentrated to dryness. Diethyl ether (100 mL) was added to the residue, the precipitate was filtered off, and dried on a filter to give (*Z*)-2-ferrocenylmethylidene-1-phenylbutane-1,3-dione **1c**, yield 5.8 g (81%), violet powder, mp 162–164°C. Subsequent chromatography on Al_2O_3 (hexane/dichloromethane, 4:1) gave 5.44 g (76%) compound **1c**, red crystals, mp 168–169 (lit. [19] 173)°C.

Reactions of 3-ferrocenylmethylidene-1,3-diphenylpropane-1,3-dione 1a or 3-ferrocenylme-thylidenepentane-2,4-dione 1b with *N*-methylhydrazine. A mixture of 1,3-diketone **1a** (2.10 g, 5 mmol) or **1b** (1.48 g, 5 mmol) and *N*-methylhydrazine (1.0 mL) in ethanol (15 mL) was stirred for 18 h at ambient temperature in an inert atmosphere. Yellow crystals of compounds **7a** or **7b** that sedimented were filtered off, washed with ethanol (2 × 5 mL), and dried in air. The yield of compound **7a** was 1.19 g (51%) and **7b** (0.86 g, 50.3%). The filtrates were concentrated *in vacuo* and the residues were chromatographed on alumina (hexane–ether, 3:1) to yield: (1) from **1a—**benzaldehyde *N*-methylhydrazone (**10a**) (0.07 g, 14%, colorless oil [20,21]), *N*′-methylbenzohydrazide **11a** (0.05 g, 12%, yellow oil [22,23]), and pyrazoles **8a** (yellow powder, 0.26 g, 15%) and **9a** (yellow powder, 0.27 g, 16%); (2) from **1b—**compounds **10b** (0.02 g, 10%, colorless oil [20,21]), **11b** (0.022 g, 9%, colorless oil [22,23]), **8b** (0.22 g, 16%), **9b** (0.20 g, 14%).

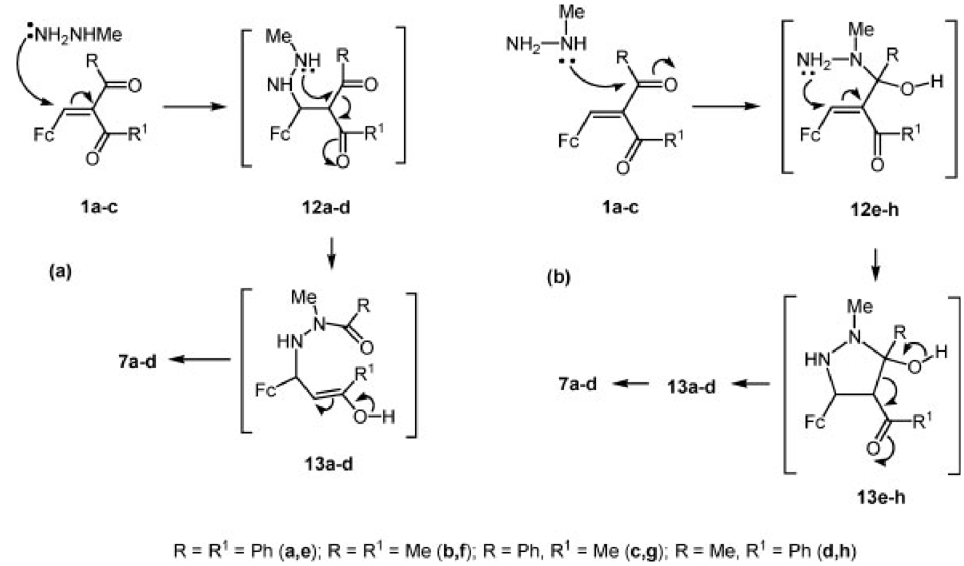
Reaction of *(Z)*-2-ferrocenylmethylidene-1-phenylbutane-1,3-dione 1c with *N*-methylhydrazine. The reaction of compound **1c** (1.79 g, 5 mmol) with *N*-methylhydrazine (1.0 mL) was carried out similarly. Work-up of the reaction mixture as described earlier and column chromatography afforded compounds **10a** + **10b** (0.06 g, 10%, ~1:1), **11a** + **11b** (0.078 g, 13%, ~1:1), **8a** (0.24 g, 14%), **9a** (0.28 g, 16%), and **7c**,**d** (1.17 g, 58%, ~1:1). Compounds **7c,d** were separated by preparative TLC on silica gel (hexane–diethyl ether, 5:1). The yield of compound **7c** was 0.50 g (25%) and that of **7d**, 0.54 g (27%).

Determining the crystal structure. The unit cell parameters and the X-ray diffraction intensities were recorded on a

Scheme 5



Scheme 6



Siemens P4 diffractometer. The structures of compounds **1c** and **7a** were solved by direct methods (SHELXS-97 [24]) and refined using full-matrix least squares on F^2.

The tin hydride-mediated aryl radical cyclization of a number of 4-(2′-bromo-*N*-methylanilino)-methyl-1-alkylquinolin-2(1*H*)-ones under mild neutral condition afforded 1-alkyl-3,4-dihydroquinolin-2(1*H*)-one-4-spiro-3′-(1-methylindolines) in excellent yield. The starting materials, amines were derived from 4-bromomethyl-*N*-methyl quinolin-2(1*H*)-ones and 2-bromo-*N*-methyl anilines by refluxing in acetone in the presence of anhydrous potassium carbonate and sodium iodide (Finkelstein condition).

J. Heterocyclic Chem., **46**, 492 (2009).

INTRODUCTION

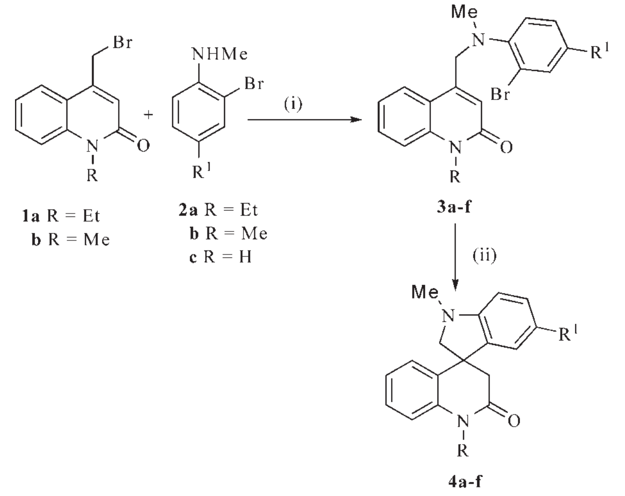
Nitrogen-containing heterocycles as recognized pharmacophores have received great attention in drug discovery and lead optimization [1–3]. In addition to traditional cycloadditions, cyclizations of nitrogen radicals or nitrogen-containing carbon radicals are the new approaches to *N*-heterocyclics [4–11]. Between these two radical reactions, the latter one is more general because carbon radicals are easy to generate and carbon–carbon bond formation by radical cyclization is a well-established process [12–16]. In our continuous effort on the development of free-radical reactions, we recently reported the 5-exo cyclization [17–20] and 6-endo cyclization [21,22] of oxygen heterocycles. We also recently reported the cyclization of 4-(2′-bromo-thioarylmethyl)-1-methylquinolin-2(1*H*)-one by $^{n}Bu_3SnH$ and AIBN, where a 6-endo ring closure took place to generate a six-membered sulfur heterocycle [23]. Several methodologies based on free-radical cyclization for the construction of five- [24–26] and six-membered [27–31] nitrogen heterocycles are available. In contrast, formation of spiro nitrogen heterocycles is almost rarely reported in literature [32–34].

Zhang and Pugh [35] demonstrated that intramolecular free-radical Michael-type addition facilitates the spiro cyclization process when an aryl radical is attached at the β-carbon of an α,β-unsaturated lactone system. Stabilization of the intermediate radical by the carbonyl group controls this regioselectivity [35]. It is also well documented that a 5-hexenyl radical cyclizes preferentially to the cyclopentylmethyl radical *via* 5-exo cyclization and not to the more stable cyclohexyl radical *via* 6-endo cyclization [36,37]. In this context, we undertook a study on the radical cyclizations of 4-(2′-bromo-*N*-methylanilinomethyl)-1-alkylquinolin-2(1*H*)-ones where these very criteria are present. Also quinolones fused with other heterocycles are known to have interesting biological activities and medicinal properties. Quinolone derivatives are biologically significant [38–42] because of their antibacterial activity, DNA-gyrase inhibition and marked cytotoxicity against animal and plant tumors. Keeping these biological activities in mind a number of attempts have been made over the last few decades to synthesize various biologically active quinolone derivatives many of which are abundant in nature [43]. Herein, we report the regioselective formation of spiro quinolone heterocycles by $^{n}Bu_3SnH$ mediated radical cyclization.

RESULTS AND DISCUSSION

The amines **3a–f** required for the present study were readily prepared in 89–95% yield from *o*-bromoanilines

Scheme 1. Reagents and conditions: (i) Acetone, K_2CO_3, NaI, reflux, 8h; (ii) ^{n}Bu$_3$SnH, toluene, 80°C N_2 atm, 1h.



3, 4	R	R^1	Yield (%) (Compound 3)	Yield (%) (Compound 4)
a	Et	H	95	90
b	Et	Mc	90	95
c	Et	Et	89	92
d	Me	H	95	95
e	Me	Me	92	92
f	Me	Et	92	90

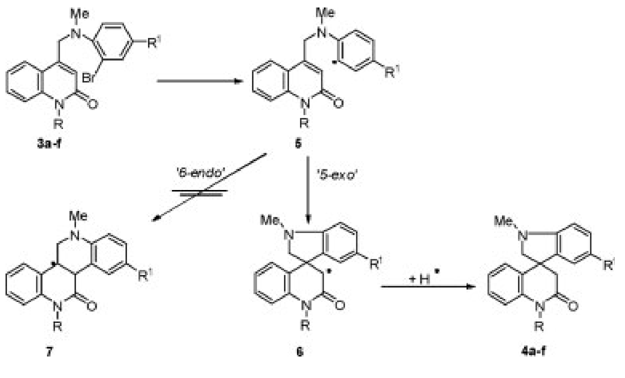
2a–c and 4-bromomethyl-1-alkylquinolin-2(1*H*)-ones **1a,b** in refluxing acetone for 8 h in the presence of anhydrous potassium carbonate and sodium iodide. The amines were subjected to ^{n}Bu$_3$SnH-AIBN induced radical cyclization. Compound **3a** when heated at 80°C in dry degassed toluene under nitrogen with ^{n}Bu$_3$SnH in the presence of catalytic amount of AIBN for 1 h afforded the cyclic product **4a** in 90% yield (Scheme 1). The structure of the compound **4a** was readily confirmed by ^{1}H NMR spectroscopy which exhibited one proton doublet at δ 2.83 (J = 16 Hz), another one proton doublet at δ 2.90 (J = 16 Hz) due to $\text{—COC}H_2$, $\text{—N(CH}_3\text{)C}H_2$ protons appear as two one proton doublet each at δ 3.21 and 3.39 (J = 8.8 Hz). Further confirmation of the structure **4a** came from its COSY, HETCOR and ^{13}C NMR spectrum. COSY spectrum of compound **4a** showed that $\text{—COC}H_2$ protons at δ 2.83 and 2.90 correlate with each other and $\text{—N(CH}_3\text{)C}H_2$ protons at δ 3.21 and 3.39 correlate with each other. The ^{13}C NMR spectrum of **4a** also strongly supported its structure. The ^{13}C chemical shifts of the compound **4a** are assigned by DEPT experiment. DEPT showed thirteen protonated carbons, two —CH_3, three $>\text{CH}_2$ and eight $>\text{CH—}$ moieties. Protonated carbon resonances are established by direct correlation with proton resonance by HETCOR experiment (normal one bond C—H coupling). Methylene protons resonance at δ 2.83 and 2.90 ($\text{C}H_2\text{CO}$) are related with carbon resonance at δ 42.34 and the methylene protons at δ 3.21 and 3.39 ($\text{—N(CH}_3\text{)C}H_2$) are related with carbon resonance at δ 67.42 respectively. Mass spectrum of the compound **4a** showed a molecular ion peak at m/z = 293 ($M^+ + 1$). These clearly indicated the formation of a spiro heterocyclic compound.

The other substrates **3b–f** were also treated similarly to afford exclusively compounds **4b–f** in 90–95% yield.

FMO theory can rationalize the regioselective formation of the spiro heterocyclic ring. Aryl radicals are high energy species and hence are nucleophilic in character. The highly electron withdrawing carbonyl group confers considerable electrophilic character to the C-4 position of the quinolone moiety. Thus in the case of nucleophilic radical **5**, FMO theory suggests that the mode of ring closure is largely determined by the interaction between the radical SOMO (≡HOMO) and the alkene LUMO of the acceptor (electron deficient centre) and accordingly more favorable bond formation occurs between the radical centre (nucleophilic) and C-4 of the quinolone ring for 5-exo product **4a–f** (Scheme 2) containing both the quinolone and indoline moieties which are known to be present in biologically active compounds.

In conclusion, we can say that the exclusive formation of 5-membered spiro heterocyclic pyrrole ring in excellent yield occurs because of two driving forces: first, the stabilization of the radical intermediate and second, stereoelectronically favored 5-exo pathway. This gives a simple and straightforward synthesis for spiro heterocyclic compounds. The methodology described here is mild and attractive because of its simplicity.

Scheme 2



EXPERIMENTAL

Melting points were determined in an open capillary and are uncorrected. IR spectra were recorded on a Perkin–Elmer L

120-000A spectrometer (ν_{max} in cm^{-1}) using samples as neat liquids and solid samples were recorded on KBr disks. UV absorption spectra were recorded in EtOH on a Shimadzu UV-2401PC spectrophotometer (λ_{max} in nm). ^{1}H NMR (400 MHz, 500 MHz) and ^{13}C NMR (125 MHz) spectra were recorded on a Bruker DPX-400 and Bruker DPX-500 spectrometer in $CDCl_3$ (chemical shift in δ) with TMS as internal standard. Elemental analyses and mass spectra were recorded on a Leco 932 CHNS analyzer and on a JEOL JMS-600 instrument respectively. Silica gel [60–120 mesh, Spectrochem, India] was used for chromatographic separation. Silica gel G [E-Merck, India] was used for TLC. Petroleum ether refers to the fraction boiling between 60 and 80°C.

General procedure for the preparation of 4-(2′-bromo-*N*-methylanilino)methyl-1-alkylquinolin-2(1*H*)-ones 3a–f. A mixture of 4-bromomethyl-*N*-alkylquinolone (**1a,b,**5 mmol), 2-bromoaniline (**2a–f**, 5 mmol), anhydrous potassium carbonate (5 g) and sodium iodide (20 mg) was heated under reflux in dry acetone (125 mL) for 8 h. The reaction mixture was cooled, filtered and concentrated. The residual mass was extracted with CH_2Cl_2(3 × 50 mL), washed with 10% Na_2CO_3 solution (2 × 25 mL), brine (3 × 50 mL) and dried (Na_2SO_4). The residual mass after the removal of solvent was subjected to column chromatography on silica gel using petroleum ether EtOAc (4:1) as eluant to give compounds **3a–f** which were recrystallized from $CHCl_3$-petroleum ether.

General procedure for the preparation of 1-alkyl-3,4-dihydroquinolin-2(1*H*)-one-4-spiro-3′-(1-methylindoline) 4a–f. Tributyltin hydride (1.1 mmol) was added to a stirred solution of (**3a–f**, 1 mmol) and azobisisobutyronitrile (0.5 mmol) in dry degassed toluene (5 mL) under nitrogen. The mixture was heated at 80°C for 1 h and concentrated. The residue was dissolved in ether (10 mL) and stirred with a 10% aq. potassium fluoride solution (10 mL) for 45 min. The white precipitate was filtered and the aqueous phase was extracted with ether (10 mL). The combined ether extract was washed with brine and dried (Na_2SO_4). The residual mass after the removal of solvent was subjected to column chromatography using petroleum ether-ethyl acetate (4:1) as eluant to give cyclized product **4a–f**.

Compound (4a). Yield 90%, Viscous liquid; IR (Neat) υ_{max}: 2974 (Aromatic CH stretching), 1673 (CO δ lactum) cm^{-1}; UV (EtOH) λ_{max} (log ε): 212 (4.47), 253 (4.19), 305 (3.42) nm; ^{1}H NMR (500 MHz, $CDCl_3$): δ_H 1.28 (t, *J* = 7.1 Hz, 3H, NCH_2CH_3), 2.75 (s, 3H, NCH_3), 2.83 (d, *J* = 16 Hz, 1H, COC*H*), 2.90 (d, *J* = 16 Hz, 1H, COC*H*), 3.21 (d, *J* = 8.8 Hz, 1H, NC*H*), 3.39 (d, *J* = 8.8 Hz, 1H, NC*H*), 4.03 (q, *J* = 7.1 Hz, 2H, NCH_2CH_3), 6.59–7.25 (m, 8H, Ar*H*); ^{13}C NMR (125 MHz, $CDCl_3$): δ_C 12.70 (NCH_2CH_3), 35.52 (NCH_3), 37.16 (NCH_2CH_3), 42.34 ($COCH_2$), 46.55 (CH_2C), 67.42 (CH_2NCH_3), 107.85 (ArCH), 115.02 (ArCH), 118.41 (ArCH), 123.09 (ArCH), 123.52 (ArCH), 127.00 (ArCH), 128.02 (ArCH), 128.82 (ArCH), 131.93 (ArC), 132.55 (ArC), 138.65 (ArC), 153.04 (ArC), 168.05 (CO); MS (*m/z*): 315 (M^+ + 23, 25%), 293 (M^+ + 1, 100%), 289 (20%), 251 (50%). *Anal.* Calcd for $C_{19}H_{20}N_2O$: C, 78.05; H, 6.89; N, 9.54%. DOI 10.1002/jhet.100

A new class of methylene-bis-4,6-diarylbenzo[*d*]isoxazoles **8a–i** was synthesized by the reaction of methylene-bis-aryl-6-hydroxymethylene-2-cyclohexenone **6** with hydroxylamine hydrochloride, followed by aromatization with DDQ. Chemical structures of the newly synthesized compounds were elucidated by their IR, ^{1}H NMR, ^{13}C NMR, MS, and elemental analyses. Furthermore, all the compounds were screened for their antifungal activity against various fungi and compared with their monomeric compounds. Among the synthesized compounds, **8b**, **8g**, and **8i** were found to be the most active against *Candida albicans* (ATCC 10231), *Aspergillus fumigatus* (HIC 6094), *Trichophyton rubrum* (IFO 9185), and *Trichophyton mentagrophytes* (IFO 40996). It is interesting to note that the compounds **8a**, **8g**, and **8i** showed fungicidal activity toward *C. albicans* at the concentration of 3.12 μg/mL, which is less than the concentration of standard Amphotericin B.

J. Heterocyclic Chem., **46**, 497 (2009).

INTRODUCTION

The treatment of infectious diseases still remains an important and challenging problem because of a combination of factors including emerging infectious diseases and the increasing number of multidrug resistant microbial pathogens. In spite of a large number of antibiotics and chemotherapeutics available for medical use, the emergence of old and new antibiotic resistance created in the last decades revealed a substantial medical need for new classes of antimicrobial agents. There is a real perceived need for the discovery of new compounds endowed with antimicrobial activity, which are distinct from those of well known classes of antibacterial agents to which many clinically relevant pathogens are now resistant. Similarly in recent decades, an increased incidence of fungal infections has been observed as a consequence of the growing number of immunocompromised patients and the frequent use of antibacterial and cytotoxic drugs. For many fungal infections, polyenes, such as Amphotericin B, represent the standard therapy. Polyenes bind to membrane sterols, leading to membrane permeability, leakage, and cell death. However, the clinical use of Amphotericin B is limited by a high frequency of renal toxicity and several adverse effects [1]. Although the various molecules designed and synthesized for the above aim and to reduce the adverse effects, it was demonstrated that isoxazole derivatives could be considered as possible antifungal agents [2]. The other activities include, inhibition of Aβ precursor protein (APP) [3], inhibition of protein tyrosine phosphatase 1B [4], antiviral [5], anthelmintics [6], anti-inflammatory [7], anticonvulsant [8], insecticidal [9], antitubercular [10], immunomodulatory [11], and hypolipemics [12]. Valdecoxib, an isoxazole derivative, is now widely used in the market as an anti-inflammatory drug [13]. The most general and widely employed synthetic route to isoxazoles involves reaction of chalcones with hydroxylamine hydrochloride [14] or 1,3-dipolar cycloaddition of nitrile oxides to alkynes [15] or condensation of open chain α-hydroxymethylene ketones with hydroxylamine [16] or from 3,5-diarylcyclohexenone and hydroxylamine [17].

Following the successful introduction of antimicrobial agents, inspired by the biological profile of isoxazoles and their increasing importance in pharmaceutical and biological fields, and in continuation of our research on biologically active heterocycles [18], and to enhance the biological activity of isoxazole derivatives, it was considered worth while to synthesize certain new chemical entities incorporating two active pharmacophores in a single molecular framework. In this article, we wish to report the synthesis of a new class of methylene-bis-4,6-diarylbenzo[*d*]isoxazoles **8** in good yields from methylene-bis-aryl-6-hydroxy-methylene-2-cyclohexenone **6** (Scheme 1) and *in vitro* antifungal activity.

RESULTS AND DISCUSSION

The key intermediate, **6** required for the synthesis of the title compounds was prepared according to the procedure outlined in the Scheme 1. Condensation of the salicylaldehyde **1** and trioxane in the presence of a mixture of conc. sulfuric acid and acetic acid gave methylene-bis-salicylaldehyde **2** in good yield [19]. Compound **2** on reaction with the aromatic/heteroaromatic methyl ketones in the presence of alc. KOH at room temperature gave methylene-bis-chalcones **3** (yield over 90%) [18(g)], the reaction time as well as the product yield varies depending on the corresponding reagents. The crude product, contaminated by some starting materials, was purified by extracting with ether. Knoevenagel condensation of compound **3** with ethyl acetoacetate gave methylene-bis-aryl-6-carbethoxycyclohexenones **4** (yield over 80%). Decarboxylation of compound **4**, in the presence of HCl/AcOH at reflux temperature, resulted in methylene-bis-arylcyclohexenone **5** (yield over 80%), which on Claisen-like condensation with ethylformate in the presence of sodium methoxide at room temperature afforded methylene-bis-aryl-6-hydroxymethylene-2-cyclo-hexenone **6** in good yields. Compound **6** on

Scheme 1. Reagents and conditions: (i) trioxane, H_2SO_4/AcOH, reflux, 81%; (ii) $ArCOCH_3$, KOH/EtOH, rt, 82–95%; (iii) EAA, NaOEt/EtOH, reflux, 78–86%; (iv) HCl/AcOH, reflux, 74–82%; (v) HCOOEt, NaOMe/C_6H_6, rt, 79–88%; (vi) $H_2NOH{\cdot}HCl$, AcOH, reflux, 77–86%; and (vii) DDQ/dry C_6H_6, N_2–atm, 76–83%.

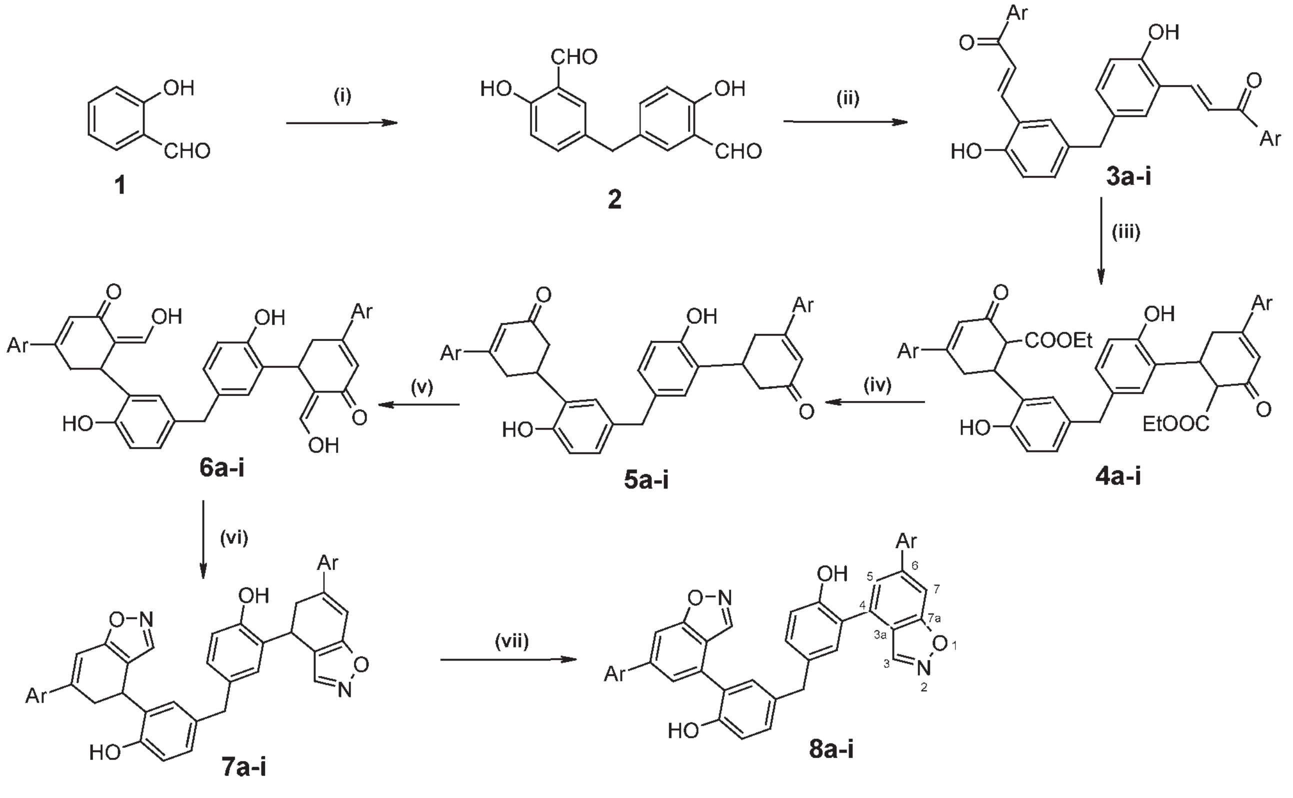

Table 1

Synthesis of compounds **8a–i**.

Product[a]	Ar	Mol. formula	Yield (%)[b]	M.p.°C
8a		$C_{39}H_{26}N_2O_4$	78	158–60
8b		$C_{39}H_{24}Br_2N_2O_4$	84	171–72
8c		$C_{39}H_{28}N_4O_4$	79	158–60
8d		$C_{39}H_{24}Cl_2N_2O_4$	86	144–46
8e		$C_{41}H_{30}N_2O_6$	77	135–37
8f		$C_{35}H_{22}N_2O_6$	80	162–63
8g		$C_{33}H_{20}N_4O_4S_2$	82	149–50
8h		$C_{37}H_{24}N_4O_4$	77	151–53
8i		$C_{35}H_{22}N_6O_4$	81	162–64

[a] All the products were characterized by IR, NMR, MS, and elemental analyses.

[b] Isolated yields after purification.

cyclocondensation with hydroxylamine hydrochloride in refluxing acetic acid gave dihydroisoxazole derivative **7**, in good to excellent yields (yields over 80%). Subsequent aromatization of **7** with dichlorodicyanoparabenzoquinone (DDQ), under N_2-atomsphere at reflux temperature, gave methylene-bis-4,6-diarylbenzo[*d*]isoxazoles **8** in good yields (Table 1). In the ^{1}H NMR spectra of **8**, the absence of signals corresponding to methine and methylene protons of cyclohexadiene ring indicates that aromatization has indeed taken place. The structure of all the synthesized compounds was confirmed by their IR, ^{1}H NMR, ^{13}C NMR, MS, and elemental analyses. Furthermore, the compounds was subjected to antifungal testing and compared with their monomeric compounds prepared from the literature method [17].

In this work, a series of nine new benzo-[*d*]isoxazole derivatives were synthesized and the Scheme 1 illustrates the strategy used for the synthesis of target compounds. Salicylaldehyde and trioxane was used as starting materials to prepare isoxazole derivatives. In the IR spectra of compounds **8a–i**, the C=N and N—O bands of the isoxazole moiety was observed at about 1600 and 1470 cm^{-1}, respectively. In the ^{1}H NMR spectra of compounds **8a–i** recorded in DMSO-d_6, the signal due to methylene bridge protons appeared at 3.98–4.06 ppm as a singlet and the N=CH proton appeared at 8.20–8.28 ppm as a singlet, proved that these compounds have isoxazole nucleus. All the other aromatic and aliphatic protons of **8a–i** were observed at the expected regions. In the ^{13}C NMR spectra of compounds **8a–i** that are taken in DMSO-d_6, the prominent signal corresponding to C-3, C-3a, and C-7a observed at 150.3, 128.0–120.5, 173.0–170.0 ppm, respectively, have proved for further evidence for their structures. Mass spectra of all the synthesized compounds showed M$^+$/M$^+$+1 peaks are in agreement with their molecular formulae.

Antifungal activity. The newly prepared compounds were screened for their antifungal activity against four fungal organisms viz. *Candida albicans* (ATCC 10231), *Aspergillus fumigatus* (HIC 6094), *Trichophyton rubrum* (IFO 9185), and *Trichophyton mentagrophytes* (IFO 40996) by the broth dilution method, recommended by National Committee for Clinical Laboratory Standards (NCCLs) [20]. The *C. albicans* was grown for 48 h at 28°C in YPD broth (1% yeast extract, 2% peptone, and 2% dextrose), harvested by centrifugation, and then washed twice with sterile distilled water. *A. fumigatus*, *T. rubrum*, and *T. mentagrophytes* were plated in potato dextrose agar (PDA) (Difco) and incubated at 28°C for 2 weeks. Spores were washed three times with sterile distilled water and resuspended in distilled water to obtain an initial inoculum size of 10^5 spores/mL. Each test compound was dissolved in DMSO and diluted with potato dextrose broth (Difco) to prepare serial twofold dilutions in the range 100 to 0.8 μg/mL. Ten microliters of the broth containing about 10^3 (for yeast) and 10^4 (for filamentous fungi) cells/mL of test fungi was added to each well of a 96-well microtiter plate. Culture plates were incubated for ~48–72 h at 28°C. The antifungal activity of each compound was compared with the standard drug Amphotericin B. Minimum inhibitory concentration (MIC, μg/mL) was measured and compared with controls; the MIC values of the compounds screened are presented in Table 2.

The antifungal screening data showed only moderate activity of the tested compounds. Among the screened compounds, **8b**, **8g**, and **8i** in which isoxazole moiety bearing 4-bromophenyl, 5-thiazole, and 2-pyrazine nucleus, respectively, were showed high activity against all the microorganisms employed. The activities of these three compounds are almost equal to the standard. It is

Table 2

— Indicates fungi are resistant to the compound >50 μg/mL conc.

[a] Activity of dimeric compounds.

[b] Activity of their monomeric compounds.

also interesting to note that the compounds **8b**, **8g**, and **8i** showed activity toward *C. albicans* at the concentration of 3.12 μg/mL, which is less than the concentration of the standard Amphotericin B. Similarly, compound **8h** in which isoxazole ring bearing 2-pyridine nucleus, also showed good antifungal activity equal to the activity of the standard but only toward *A. fumigatus* and *T. rubrum*. The remaining compounds showed moderate to good antifungal activity. Furthermore, the activity of dimeric compounds was compared with that of their monomeric compounds prepared from the reported method [17]. The results reveal that almost all the dimeric compounds showed enhanced activity than their monomeric compounds (Table 2).

In conclusion, a new class of methylene-bis-4,6-diarylbenzo[*d*]isoxazoles **8a–i** has been designed and synthesized. The antifungal activity of these compounds was evaluated against various fungi. Among the synthesized compounds, **8b**, **8g**, and **8i** showed good activity against test fungi and emerged as potential molecules for further development. With this set of analogues, we are now in a position to investigate the multiple biological activities for these compounds.

EXPERIMENTAL

All the chemicals and solvents were of analytical grade and used as purchased. A proper safety measure was taken while carring out the reactions. Evaporations were performed at reduced pressure below 40°C. The reactions and purifications were monitored by TLC on aluminium sheets coated with silica gel 60 F_{254} (Merck), column chromatography on silica gel 60 (Merck). Melting points were taken using a Fisher-Johns melting point instrument and are uncorrected. IR spectra were obtained on a Perkin-Elmer FTIR 5000 spectrometer, using KBr pellets. ^{1}H NMR and ^{13}C NMR spectra were obtained with Varian Gemini (^{1}H: 300 MHz, ^{13}C: 75 MHz) spectrometer, and the chemical shifts were reported as parts per million (δ ppm) down field from internal tetramethylsilane and coupling constants (*J*) in Hz. Mass spectra were obtained on a VG Micromass 7070H spectrometer. Elemental analyses were performed on a Perkin-Elmer 240 CHN elemental analyzer.

Ethyl-6-(5-{3-[6-(ethoxycarbonyl)-5-oxo-3-phenyl-3-cyclohexenyl]-4-hydroxybenzyl}-2-hydroxyphenyl)-2-oxo-4-phenyl-3-cyclohexene-1-carboxylate (4a). To a solution of sodium metal (2 g) in ethanol (30 mL), a mixture of freshly distilled ethylacetoacetate (3.9 mL, 0.03 mol) and compound **3a** (4.6 g, 0.01 mol) dissolved in ethanol (20 mL) was added. The resulting solution was refluxed on a water bath for 4 h. Allowing the reaction mixture to cool and crystallization of the formed precipitate from ethanol gave **4a** (82% yield) as brown solid; mp 150–152°C; ^{1}H NMR (DMSO-d_6): δ 1.10 (6H, t, CH_3), 2.87 (4H, d, CH_2), 3.72 (2H, s, CH_2), 3.81 (2H, d, CH), 3.87 (2H, q, CH), 4.06 (4H, q, CH_2), 5.20 (2H, s, OH), 6.10 (2H, s, CH), 6.62 (2H, d, $J = 9.2$ Hz, ArH), 6.79 (2H, d, $J = 9.2$ Hz, ArH), 6.80 (2H, s, ArH), 7.10–7.14 (10H, m, ArH); ^{13}C NMR (DMSO-d_6): δ 17.0, 30.7, 37.0, 42.1, 60.6, 61.2, 117.4, 121.9, 123.8, 125.5, 127.9, 128.2, 128.7, 130.0, 133.4, 142.3, 149.5, 154.6, 176.7, 190.1; IR (KBr): υ 3452, 3065, 1702, 1695, 1597, 1245 cm^{-1}; MS: *m/z* 685 (M^+ +1). The other compounds **4b–i** were also prepared by the similar procedure.

5-{2-Hydroxy-5-[4-hydroxy-3-(5-oxo-3-phenyl-3-cyclohexenyl)benzyl]phenyl-3-phenyl}-2-cyclohexen-1-one (5a). To a mixture of glacial AcOH (100 mL) and conc. HCl (50 mL) was added compound **4a** (6.5 g, 0.01 mol) in portions. The mixture was heated to reflux for 10 h. After cooling to room temperature, the reaction mixture was concentrated *in vacuo*. The residue was taken up with ethyl acetate and washed with water and brine, dried over $MgSO_4$, filtered, and evaporated *in vacuo* to give oil, which soon solidified. It was purified by recrystallization from ethanol to give compound **5a** (79% yield) as brown solid; mp 132–134°C; ^{1}H NMR (DMSO-d_6): δ 2.67 (4H, d, CH_2), 2.70 (4H, d, CH_2), 3.72 (2H, s, CH_2), 3.83 (2H, m, CH), 5.20 (2H, s, OH), 6.10 (2H, s, CH), 6.62 (2H, d, $J = 9.2$ Hz, ArH), 6.82 (2H, s, ArH), 7.00 (2H, d, *J* = 9.2 Hz, ArH), 7.10–7.14 (10H, m, ArH); ^{13}C NMR (DMSO-d_6): δ 31.0, 38.9, 42.0, 47.5, 116.1, 122.6, 124.5, 126.2, 127.4, 127.8, 128.5, 131.2, 132.3, 140.5, 150.1, 155.2, 198.0; IR (KBr): υ 3357, 3025, 2932, 1687, 1596 cm^{-1}; MS: *m*/*z* 541 (M$^+$ +1). The other compounds **5b–i** were also prepared by the similar procedure.

5-[2-Hydroxy-5-(4-hydroxy-3-{6-[(*Z*)-1-hydroxymethylidene]-5-oxo-3-phenyl-3-cyclohexenyl}benzyl)phenyl]-6-[(*Z*)-1-hydroxymethylidene]-3-phenyl-2-cyclohexen-1-one (6a). In a solution of 10% sodium methoxide (10 mL) in benzene (25 mL), ethylformate (2.24 mL, 0.03 mol) was added and then compound **5a** (5.4 g, 0.01 mol), dissolved in benzene (10 mL), was added over 30 min. The resulting solution was stirred for 10 h at room temperature and allowed to stand overnight, then evaporated to dryness. The suspension obtained was mixed with cold water, acidified with dil HCl (20 mL), and extracted three times with ether (40 mL). The organic layer was dried over $MgSO_4$, evaporated *in vacuo* to give solid, and purified by crystallization in ethanol to afford pure 6a (81% yield) as yellow solid; mp 143–145°C; ^{1}H NMR (DMSO-d_6): δ 3.22 (4H, d, CH_2), 3.72 (2H, s, CH_2), 4.12 (2H, t, CH), 5.67 (2H, s, CH), 6.40–6.49 (4H, m, ArH), 6.80 (2H, s, ArH), 7.10–7.14 (10H, m, ArH), 7.92 (2H, s, CH), 8.97 (2H, s, OH); ^{13}C NMR (DMSO-d_6):δ 37.8, 42.0, 44.1, 115.5, 116.7, 126.2, 127.6, 127.9, 128.0, 128.9, 130.2, 130.6, 131.1, 142.0, 149.7, 156.1, 167.6, 191.3; IR (KBr): υ 3320, 3028, 2952, 1662, 1620, 1597 cm^{-1}; MS: *m*/*z* 596 (M$^+$). The other compounds **6b–i** were also prepared by the similar procedure.

4-[4-Hydroxy-3-(6-phenyl-4,5-dihydrobenzo[*d*]isoxazol-4-yl)benzyl]-2-(6-phenyl-4,5-dihydrobenzo[*d*]isoxazol-4-yl)phenol (7a). To a solution of 6a (5.9 g, 0.01 mol) in glacial acetic acid (50 mL), hydroxylamine hydrochloride (2.0 g, 0.03 mol) was added. After stirring at 80°C for 10 h, the mixture was concentrated *in vacuo*. To the residue was added water and twice extracted with ether. The organic layer was washed with saturated $NaHCO_3$ solution, subsequently with water and birne, dried over $MgSO_4$ and evaporated to dryness. The residue was recrystallized from ethanol to afford 7a (79% yield) as brown solid; mp 123–125°C; ^{1}H NMR (DMSO-d_6): δ 2.82 (4H, d, CH_2), 3.72 (2H, s, CH_2), 4.22 (2H, t, CH), 4.62 (2H, s, OH), 6.70 (2H, s, ArH), 6.73 (2H, d, *J* = 9.0 Hz, ArH), 6.84 (2H, d, *J* = 9.1 Hz, ArH), 6.99 (4H, m, ArH), 7.00 (2H, s, ArH), 7.21 (2H, s, ArH), 7.32 (4H, d, *J* = 9.2 Hz, ArH); ^{13}C NMR (DMSO-d_6): δ 38.1, 39.3, 42.1, 110.5, 117.2, 118.7, 125.4, 126.5, 127.8, 128.0, 128.9, 130.0, 132.0, 132.8, 140.3, 143.4, 156.2, 161.7; IR (KBr): 3390, 3037, 2972, 1609, 1470, 1030 cm^{-1}; MS: *m*/*z* 590 (M$^+$). The other compounds **7b–i** were also prepared by the similar procedure.

4-[4-Hydroxy-3-(6-phenylbenzo[*d*]isoxazol-4-yl)benzyl]-2-(6-phenylbenzo[*d*]isoxazol-4-yl)phenol (8a). To a solution of **7a** (5.9 g, 0.01 mol) in dry benzene (20 mL), DDQ (6.81 g, 0.03 mol), dissolved in dry benzene (20 mL), was added in portions. The mixture was heated to reflux and stirred for 5 h under nitrogen atmosphere. The precipitated DDQ-H_2 was filtered off and the filtrate was subjected to column chromatography on silica gel (60–120 mesh) to afford pure **8a** (78% yield) as orange solid; mp 158–160°C; ^{1}H NMR (DMSO-d_6): δ 3.99 (2H, s, CH_2), 4.65 (2H, s, OH), 6.90 (2H, s, ArH), 6.99 (2H, d, *J* = 8.9 Hz, ArH), 7.29 (2H, d, *J* = 8.9 Hz, ArH), 7.44–7.50 (10H, m, ArH), 7.90 (2H, s, ArH), 8.20 (2H, s, ArH), 8.60 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.7, 115.1, 117.0, 125.4, 127.0, 127.9, 128.3, 130.0, 133.2, 134.7, 137.4, 144.9, 145.2, 150.4, 151.2, 153.6, 159.3, 171.4; IR (KBr): υ 3344, 3062, 2972, 1609, 1470, 1030 cm^{-1}; MS: *m*/*z* 586 (M$^+$). Anal. calcd. for $C_{39}H_{26}N_2O_4$: C, 79.85; H, 4.47; N, 4.78. Found: C, 79.90; H, 4.39; N, 4.71. The other compounds **8b–i** were also prepared by the similar procedure.

2-[6-(4-Bromophenyl)benzo[*d*]isoxazol-4-yl]-4-3-[6-(4-bromophenyl)benzo[*d*]isoxazol-4-yl]-4-hydroxybenzylphenol (8b). This compound was obtained as brown solid; yield 84%; mp 171–172°C; ^{1}H NMR (DMSO-d_6): δ 4.00 (2H, s, CH_2), 4.65 (2H, s, OH), 6.90 (2H, s, ArH), 7.00 (2H, d, *J* = 8.9 Hz, ArH), 7.29 (2H, d, *J* = 8.9 Hz, ArH), 7.40–7.45 (8H, m, ArH), 7.90 (2H, s, ArH), 8.20 (2H, s, ArH), 8.60 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.7, 115.0, 117.1, 122.1, 125.4, 130.0, 130.6, 132.3, 133.1, 134.6, 137.3, 141.3, 144.9, 147.1, 151.3, 153.6, 159.4, 171.4; IR (KBr): υ 3390, 3065, 2995, 1609, 1470, 1030, 586 cm^{-1}; MS: *m*/*z* 742/744/746 (M$^+$). Anal. calcd. for $C_{39}H_{24}Br_2N_2O_4$: C, 62.92; H, 3.25; N, 3.76. Found: C, 62.85; H, 3.30; N, 3.70.

2-[6-(4-Aminophenyl)benzo[*d*]isoxazol-4-yl]-4-3-[6-(4-aminophenyl)benzo[*d*]isoxazol-4-yl]-4-hydroxybenzylphenol (8c). This compound was obtained as brown solid; yield 79%; mp 158–160°C; ^{1}H NMR (DMSO-d_6): δ 4.06 (2H, s, CH_2), 4.65 (2H, s, OH), 6.68 (4H, d, *J* = 8.5 Hz, ArH), 6.90 (2H, s, ArH), 7.00 (2H, d, *J* = 8.9 Hz, ArH), 7.31 (2H, d, *J* = 8.9 Hz, ArH), 7.52 (4H, d, *J* = 8.5 Hz, ArH), 7.90 (2H, s, ArH), 8.20 (2H, s, ArH), 8.60 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.7, 115.9, 116.7, 125.3, 127.3, 128.5, 130.1, 133.0, 134.1, 134.7, 137.5, 139.6, 144.5, 146.3, 151.2, 153.4, 159.2, 171.3; IR (KBr): υ 3390, 3065, 2972, 1612, 1469, 1028 cm^{-1}; MS: *m*/*z* 616 (M$^+$). Anal. calcd. for $C_{39}H_{28}N_4O_4$: C, 75.96; H, 4.58; N, 9.09. Found: C, 75.85; H, 4.60; N, 9.03.

2-[6-(4-Chlorophenyl)benzo[*d*]isoxazol-4-yl]-4-3-[6-(4-chlorophenyl)benzo[*d*]isoxazol-4-yl]-4-hydroxybenzylphenol (8d). This compound was obtained as yellow solid; yield 86%; mp 144–146°C; ^{1}H NMR (DMSO-d_6): δ 4.02 (2H, s, CH_2), 4.68 (2H, s, OH), 6.90 (2H, s, ArH), 7.00 (2H, d, *J* = 8.9 Hz, ArH), 7.31 (2H, d, *J* = 8.9 Hz, ArH), 7.39 (4H, d, *J* = 8.1 Hz, ArH), 7.83 (4H, d, *J* = 8.1 Hz, ArH), 7.90 (2H, s, ArH), 8.22 (2H, s, ArH), 8.51 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.7, 115.7, 117.2, 125.4, 127.3, 128.5, 130.1, 133.0, 134.1, 134.7, 137.5, 139.6, 144.5, 146.3, 151.2, 153.4, 159.2, 171.3; IR (KBr): υ 3384, 3062, 2968, 1605, 1470, 1028, 782 cm^{-1}; MS: *m*/*z* 654/656/658 (M$^+$). Anal. calcd. for $C_{39}H_{24}Cl_2N_2O_4$: C, 71.46; H, 3.69; N, 4.27. Found: C, 71.42; H, 3.61; N, 4.31.

4-4-Hydroxy-3-[6-(4-methoxyphenyl)benzo[*d*]isoxazol-4-yl]benzyl-2-[6-(4-methoxyphenyl)benzo[*d*]isoxazol-4-yl]phenol (8e). This compound was obtained as yellow solid; yield 77%; mp 135–137°C; ^{1}H NMR (DMSO-d_6): δ 3.81 (6H, s, OMe), 4.02 (2H, s, CH_2), 4.70 (2H, s, OH), 6.90 (2H, s, ArH), 6.96 (4H, d, *J* = 8.4 Hz, ArH), 7.00 (2H, d, *J* = 8.9 Hz, ArH), 7.32 (2H, d, *J* = 8.9 Hz, ArH), 7.34 (4H, d, *J* = 8.4 Hz, ArH), 7.90 (2H, s, ArH), 8.22 (2H, s, ArH), 8.51 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.5, 54.7, 115.0, 112.1, 117.0, 125.0, 129.5, 130.1, 133.1, 134.1, 137.3, 139.5, 144.3, 147.2, 151.1, 153.5, 159.1, 160.7, 172.1; IR (KBr): υ 3384, 3062, 2968, 1605, 1470, 1240 cm^{-1}; MS: *m*/*z* 646 (M$^+$). Anal. calcd. for $C_{41}H_{30}N_2O_6$: C, 76.15; H, 4.68; N, 4.33. Found: C, 76.21; H, 4.61; N, 4.35.

2-[6-(2-Furyl)benzo[*d*]isoxazol-4-yl]-4-3-[6-(2-furyl)benzo-[*d*]isoxazol-4-yl]-4-hydroxybenzylphenol (8f). This compound was obtained as black solid; yield 80%; mp 162–163°C; ^{1}H

NMR (DMSO-d_6): δ 4.02 (2H, s, CH_2), 4.70 (2H, s, OH), 6.34 (2H, m, ArH), 6.82 (2H, s, ArH), 6.70 (2H, m, ArH), 6.96 (2H, d, J = 8.9 Hz, ArH), 7.32 (2H, d, J = 8.9 Hz, ArH), 7.39 (2H, m, ArH), 7.90 (4H, m, ArH), 8.00 (2H, s, ArH), 8.22 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.8, 106.2, 106.5, 114.4, 115.1, 121.7, 126.9, 134.1, 138.7, 139.6, 141.9, 143.1, 151.1, 159.1, 159.8, 176.4; IR (KBr): υ 3390, 3071, 2965, 1609, 1470, 1030 cm^{-1}; MS: m/z 566 (M^+). Anal. calcd. for $C_{35}H_{22}N_2O_6$: C, 74.20; H, 3.91; N, 4.94. Found: C, 74.12; H, 3.90; N, 4.83.

4-4-Hydroxy-3-[6-(1,3-thiazol-5-yl)benzo[*d*]isoxazol-4-yl]-benzyl-2-[6-(1,3-thiazol-5-yl)benzo[*d*]isoxazol-4-yl]phenol (8g). This compound was obtained as brown solid; yield 82%; mp 149–150°C; ^{1}H NMR (DMSO-d_6): δ 4.02 (2H, s, CH_2), 4.70 (2H, s, OH), 6.74 (2H, s, ArH), 6.96 (2H, d, J = 8.9 Hz, ArH), 7.32 (2H, d, J = 8.9 Hz, ArH), 7.90–7.95 (4H, m, ArH), 8.10 (2H, s, ArH), 8.22 (2H, s, ArH), 8.62 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.6, 105.9, 115.1, 120.1, 120.9, 126.3, 134.0, 137.4, 138.3, 138.9, 140.5, 142.7, 150.9, 151.7, 158.4, 160.3, 173.1; IR (KBr): υ 3390, 3071, 2965, 1609, 1580, 1470, 638 cm^{-1}; MS: m/z 600 (M^+). Anal. calcd. for $C_{33}H_{20}N_4O_4S_2$: C, 65.99; H, 3.36; N, 9.33. Found: C, 65.89; H, 3.40; N, 9.24.

4-4-Hydroxy-3-[6-(2-pyridyl)benzo[*d*]isoxazol-4-yl]benzyl-2-[6-(2-pyridyl)benzo[*d*]isoxazol-4-yl]phenol (8h). This compound was obtained as brown solid; yield 77%; mp 151–153°C; ^{1}H NMR (DMSO-d_6): δ 4.02 (2H, s, CH_2), 4.68 (2H, s, OH), 6.51 (2H, s, ArH), 7.00 (4H, m, ArH), 7.31 (2H, d, J = 8.9 Hz, ArH), 7.59 (2H, m, ArH), 7.72 (2H, m, ArH), 7.92 (2H, s, ArH), 8.22 (2H, s, ArH), 8.62 (2H, d, J = 4.7 Hz, ArH), 8.92 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.8, 115.0, 117.0, 121.7, 124.7, 125.3, 130.1, 133.0, 134.0, 135.3, 137.1, 144.1, 144.8, 146.3, 151.1, 153.4, 157.9, 160.3, 169.4; IR (KBr): υ 3390, 3072, 2969, 1605, 1470 cm^{-1}; MS: m/z 588 (M^+). Anal. calcd. for $C_{37}H_{24}N_4O_4$: C, 75.50; H, 4.11; N, 9.52. Found: C, 75.41; H, 4.15; N, 9.47.

4-4-Hydroxy-3-[6-(2-pyrazinyl)benzo[*d*]isoxazol-4-yl]benzyl-2-[6-(2-pyrazinyl)benzo[*d*]isoxazol-4-yl]phenol (8i). This compound was obtained as black solid; yield 81%; mp 162–164°C; ^{1}H NMR (DMSO-d_6): δ 4.02 (2H, s, CH_2), 4.68 (2H, s, OH), 6.72 (2H, s, ArH), 7.00 (2H, d, J = 8.9 Hz, ArH), 7.31 (2H, d, J = 8.9 Hz, ArH), 7.90 (2H, s, ArH), 8.22 (2H, s, ArH), 8.41 (2H, d, J = 2.7 Hz, ArH), 8.64 (2H, d, J = 2.7 Hz, ArH), 8.80 (2H, s, ArH), 8.92 (2H, s, ArH); ^{13}C NMR (DMSO-d_6): δ 40.7, 110.7, 115.1, 127.1, 130.4, 134.0, 137.1, 138.0, 142.1, 143.4, 143.9, 144.1, 144.9, 146.3, 151.2, 156.7, 158.4, 169.4; IR (KBr): υ 3384, 3062, 2968, 1609, 1470, 1028, cm^{-1}; MS: m/z 590 (M^+). Anal. calcd. for $C_{35}H_{22}N_6O_4$: C, 71.18; H, 3.75; N, 14.23. Found: C, 71.11; H, 3.74; N, 14.17.

Acknowledgment. The authors are grateful to the Director, Indian Institute of Chemical Technology, Hyderabad, India, for NMR and MS spectral analysis and to the Head, Department of Biotechnology, S.R. PG. Center, Warangal, India for providing facilities for biological screening.

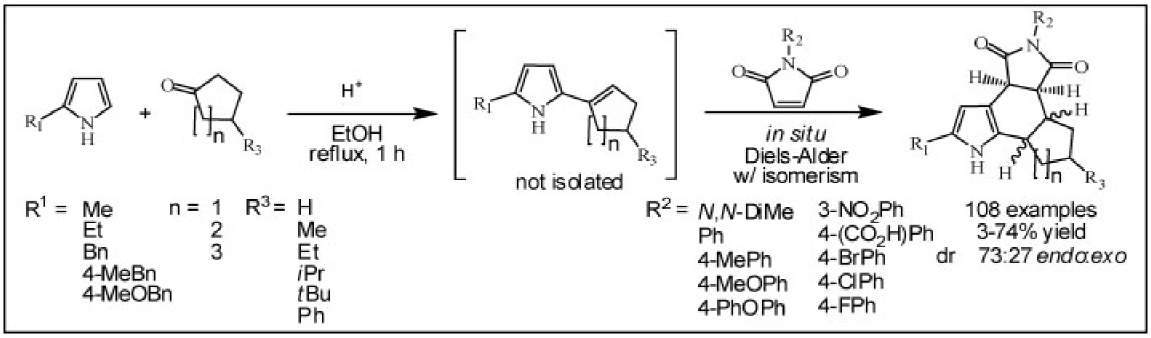
DOI 10.1002/jhet.95



A series of 108 tetrahydroindoles has been prepared by a one-pot synthesis from 2-alkylpyrroles, cyclic ketones, maleimides, and an acid catalyst. A 5-vinylpyrrole is formed by an acid-catalyzed condensation of a 2-alkyl-substituted pyrrole with a ketone, which is subsequently trapped *in situ* by a maleimide in a predominantly *endo*-addition Diels-Alder reaction. Isomerization of the double bond into the pyrrole ring gives a tetrahydroindole with predominant *cis*-fusion of the cycloalkane ring.

J. Heterocyclic Chem., **46**, 503 (2009).

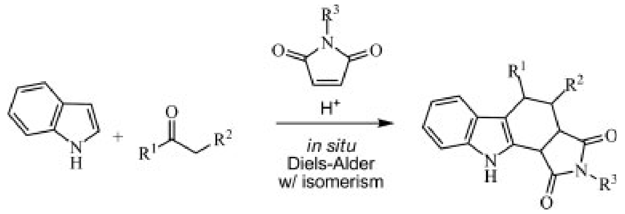
INTRODUCTION

The common occurrence of indole in biologically active compounds [1] highlights the importance of studies on the synthesis of indoles as well as the value of biological testing of indole-containing molecules. Previously, our group has reported the synthesis of 3-vinylindoles, which are trapped *in situ* by a Diels-Alder reaction with various maleimides, a technique which was used to prepare a large variety of tetrahydrocarbazoles [2]. We now wish to report analogous work with cycloadditions of 2-alkyl-substituted vinylpyrroles.

Pyrrole preferentially undergoes electrophilic attack at its 2-position since the most stable resonance structure of the reactive species has its greatest electron density α to the iminium nitrogen. For indole, dearomatization of the fused benzene ring inhibits a similar adjacent placement of charge. Instead, the highest electron-density occurs at the 3-position; thus, indole has favored electrophilic substitution at the 3-position in spite of greater charge separation. Correspondingly, our previous work involved the trapping of 3-vinylindoles produced from condensation of indole with ketones (Scheme 1), whereas in this work, the trapped intermediates are 2-vinylpyrroles. This has bearing on the topology; the products of this work are *e*-side maleimide-fused tetrahydroindoles, whereas the tetrahydroindole component of the products of the vinylindole work is maleimide-fused at the *g*-side.

There are several known examples of 2-vinylpyrroles participating in Diels-Alder reactions [3], including employing as the dienophiles carboxyl-substituted acetylenes [4,5], several acyclic electron-deficient alkenes [5,6], maleic anhydride and/or *N*-phenylmaleimide with *N*-benzenesulfonyl-2-vinylpyrrole [6,7] and methyl 3-nitroacrylate with *N*-*p*-toluenesulfonyl-2-vinylpyrroles [8], tetrachloro- or tetrabromocyclopropene with *N*-*p*-toluenesulfonyl-2-vinylpyrrole [9], *N*-phenylmaleimide with *N*-methyl- and *N*-propanoyloxy-2-vinylpyrrole [6], *N*-H-maleimide with 3-(*N*-alkyl-2-pyrrolyl)acrylates [10] and *N*-alkyl-2-styrylpyrroles [10,11], and one example using various maleimides with both *N*-H and *N*-alkyl-2-vinylpyrroles [12]. Several of these studies report biological activity from this class of compounds, particularly anticancer activity [10–12]. To our knowledge, no prior demonstration of 2-vinylpyrrole formation accompanied by *in situ* trapping with a dienophile exists, a route which avoids the multiple steps involved in synthesizing the vinylpyrrole before the Diels-Alder reaction, affording considerable efficiency over the alternative procedures available for tetrahydroindole formation.

Scheme 1. *In situ* synthesis of tetrahydrocarbazoles from ketones.



RESULTS AND DISCUSSION

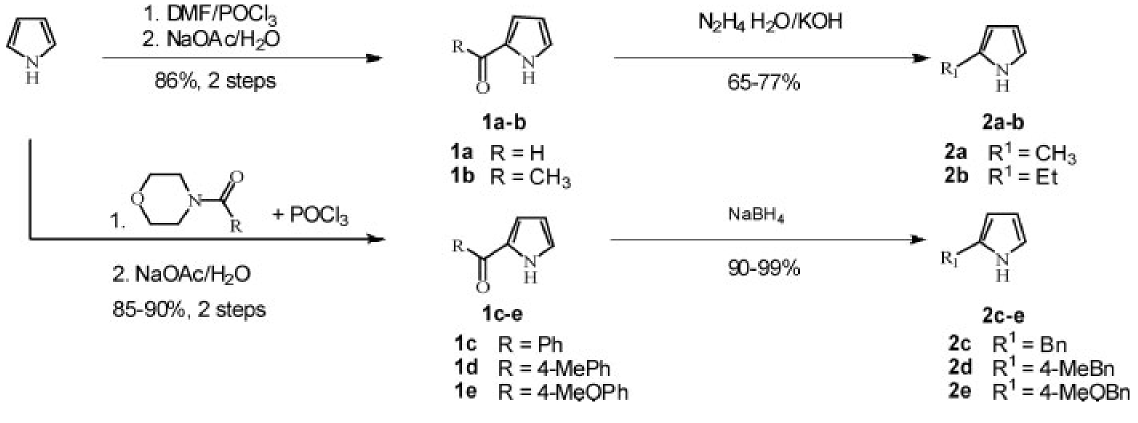
General. Pyrrole is a reactive electron-rich heterocycle which, upon condensation with cyclic ketones, followed by proton-transfer, is believed to form a tertiary alcohol. In the presence of an acid catalyst, the alcohol should readily dehydrate, forming a resonance-stabilized 2-vinylpyrrole. The highly reactive 2-vinylpyrrole is then captured *in situ* by the dienophile. Under acidic conditions, pyrroles are known to form polymers [13]. Tetrameric calix [4] pyrroles are known to form when pyrroles and ketones react in the presence of an acid catalyst [14,15]. When producing vinylpyrroles for *in situ* trapping, we have found that blocking the other 2-position by use of 2-alkyl-substituted pyrroles is useful in preventing formation of complex polymeric mixtures, which generally appeared as dark sticky tars or black powders. Studies using removable blocking groups at the 2-position of pyrroles in the formation of vinylpyrroles for *in situ* trapping and other uses are currently ongoing in our laboratory.

2-Substituted-5-vinylpyrroles were synthesized as outlined in Scheme 2. Pyrrole-2-carboxaldehyde (**1a**) was synthesized *via* Vilsmeier-Haack formylation [16], followed by Wolff-Kishner reduction [17], to give 2-methylpyrrole (**2a**). Wolff-Kishner reduction of commercially available 2-acetylpyrrole (**1b**) produced 2-ethylpyrrole (**2b**) [17]. Vilsmeier-Haack aroylation [18] of pyrrole gave the 2-phenyl (**1c**), 2-(4-methylphenyl) (**1d**), and 2-(4-methoxyphenyl) (**1e**) ketones, which, after sodium borohydride reduction [19], gave the corresponding 2-benzylpyrroles (**2c**–**e**).

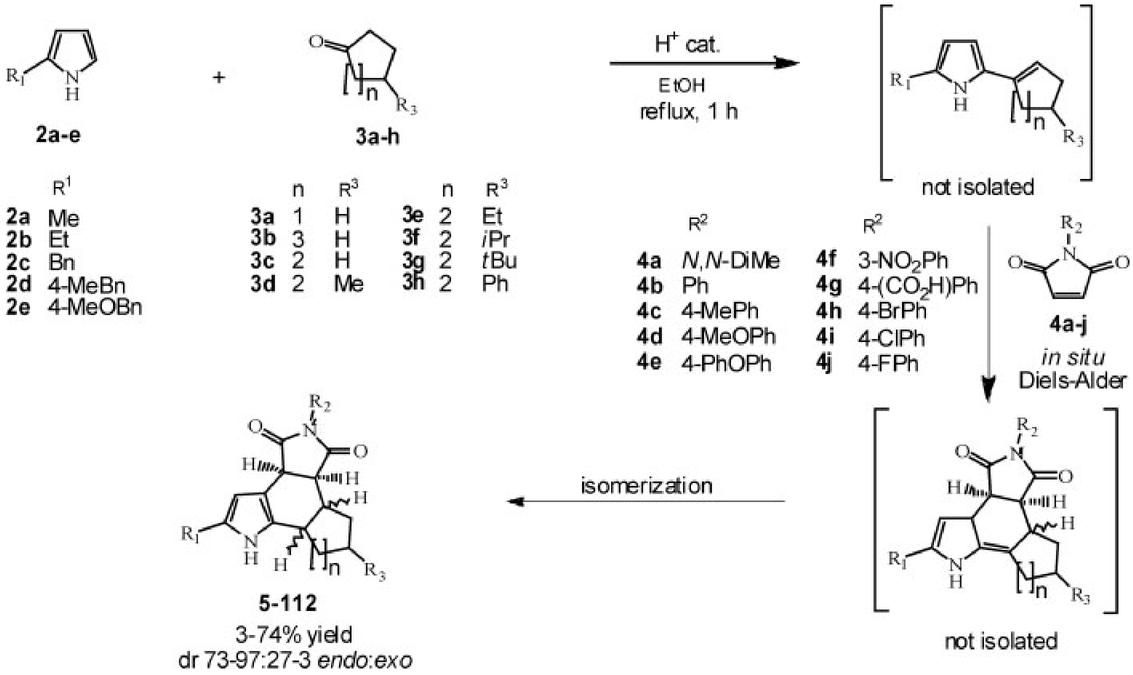
Condensation of **2a**–**e** with cyclopentanone (**3a**), variously 4-substituted-cyclohexanones (**3c**–**h**), or cycloheptanone (**3b**), gave the corresponding vinylpyrroles. These acted as electron-rich dienes for normal electron-demand Diels-Alder reactions, which occurred *in situ* with various substituted maleimides (**4a**–**j**, Scheme 3). The unrearranged form of the Diels-Alder adduct was not isolated. Instead, spontaneous isomerization of the double bond into the five-membered ring gave aromatized tetrahydroindoles (**5-112**, Table 1). *cis*-Fusion of the cycloalkyl ring involves less strain, but, since isomerism to the pyrrole is likely irreversible, thermodynamic equilibration may not determine the type of ring-fusion. Orbital symmetry considerations forbid suprafacial 1,3-hydride shifts and antarafacial 1,3-hydride shifts are geometrically difficult [20]; therefore, the isomerism probably takes place through acid catalysis. A proton should approach preferentially from the less sterically hindered face, the face opposite to the maleimide fusion and the same face from which protons 3b-H and 6a-H protrude (in the Experimental, this face is always designated "α"). This face of hydrogen delivery gives *cis*-fusion of the cycloalkyl ring with a *syn* relationship between all four of the protons on the cyclohexene ring.

The ^{1}H NMR data of **5-112** show mixtures of isomers, which were usually isolated by precipitation from the crude ethanolic reaction mixture, possibly influencing the reported distribution of isomers because of solubility differences. Both *endo*- and *exo*-Diels-Alder additions are possible, and *cis*- or *trans*-fusion gives the possibility of four isomers, *endo*-addition with *cis*-fusion (**En-c**), *endo*-addition with *trans*-fusion (**En-t**), *exo*-addition with *cis*-fusion (**Ex-c**), and *exo*-addition with *trans*-fusion (**Ex-t**, Fig. 1). Between one and four isomers are recognizable in each spectrum, corresponding to these stereoisomeric products. Smaller minor isomer peaks are

Scheme 2. Synthesis of 2-substituted pyrroles.



Scheme 3. *In situ* synthesis of tetrahydrocarbazoles fromcyclic ketones.



visible next to or overlapping the peaks belonging to the major isomer, particularly for protons 1-H, 3b-H, 6a-H, 6b-H, and the proton α to the point of cycloalkane ring-fusion to the pyrrole ring, labeled 9a-H, 10a-H, or 11a-H, the numbers depending on which sized cyclic ketone, **3a**, **3b**, or **3c–h**, was used.

In some products derived from the 4-substituted-cyclohexanones **3d–h**, additional isomerism is observed due to the stereogenic center at position 8 (see Fig. 1 for numbering). This is supported by the observation that the ratio of the integrated areas of proton peaks belonging to the alkyl substituents at position 8 is generally not equal to the ratio of *endo*/*exo*-addition *cis*/*trans*-fusion isomers present in the mixture determined from the integrated areas of protons 1-H, 3b-H, and 6a-H. Since our major concern in analyzing the ^{1}H NMR data is the diastereoselectivity of the Diels-Alder reaction and subsequent isomerization, it is the distribution of the four isomers **En-c**, **En-t**, **Ex-c**, and **Ex-t** that is reported in Table 1 and in the Experimental section, and it is these four isomers to which the text refers in subsequent discussion.

^{1}H NMR, nuclear Overhauser effect (NOE), and computational analyses. For all products, two isomers are present in greater quantity than the other two, corresponding to the expected *endo*-addition Diels-Alder products. At a minimum, in the isolated products, *endo*-addition is preferred over *exo*-addition in a 73:27 diastereomeric ratio, and at a maximum in a 97:3 diastereomeric ratio (in which no **Ex-c** and **Ex-t** isomers are visible by ^{1}H NMR). The *endo*-addition preference in Diels-Alder reactions is commonly explained by a favorable secondary orbital interaction that occurs in the transition state when the molecular orbitals of the carbonyls of the imide dienophile overlap with the developing molecular orbital from the diene, an interaction not present with an *exo*-approach. Although both stepwise and concerted mechanisms are theoretically possible to give tetrahydroindoles **5-112** [21], the stereochemical relationships found below in the major isomers are consistent with that expected for an *endo*-addition; therefore, a concerted reaction pathway is likely. To verify the *endo*-addition preference, and to confirm that *cis*-fusion is predominant, NOE experiments were performed on nine representative tetrahydroindoles, compounds **13**, **20**, **26**, **47**, **55**, **61**, **89**, **84**, and **103**.

Consistent NOE interactions were observed between the 3b-H and 6b-H protons of the two major isomers of each of these products, giving evidence that they arise from *endo*-addition. To determine whether *cis*- or *trans*-fusion occurred in a particular *endo*-addition isomer, NOE experiments must compare interactions of the protons at the points of the cycloalkane ring-fusion. In *trans*-fused products, the distance between the protons should be greater, giving a weaker NOE interaction. For careful comparison of the relative strength of these interactions, a reference NOE interaction of consistent strength should be present in each experiment. Because the distance between the proton α to the point of cycloalkane ring-fusion to the pyrrole ring and the 6a-H

[a] Ex-c is assumed to be the major *exo*-addition product.

proton should be relatively constant for the *cis*- and *trans*-fused products, NOE interactions between these two protons were used as the reference.

In the cyclohexanone-derived products, the ratio of the strength of the NOE interaction for the **En-c** isomer between the 10a-H and 6b-H protons (**a** in Fig. 2) to the 10a-H and 6a-H protons (**b**) should appear as markedly less than the ratio for the **En-t** isomer between the 10a-H and 6b-H protons (**a′**) to the 10a-H and 6a-H protons (**b′**). Restating using the labels of Figure 2, **a** is less than **a′**, and **b** is approximately equal to **b′**; therefore, **a**:**b** is less than **a′**:**b′**. For the two predominant isomers

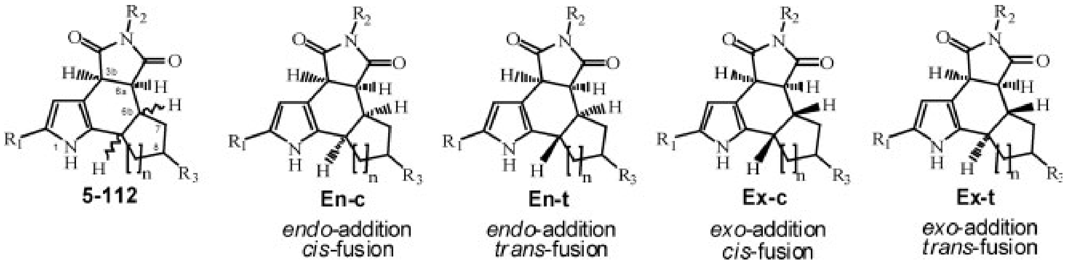

Figure 1. Stereochemistry of the tetrahydroindoles.

in the cyclohexanone-derived products, it was always observed that for one isomer the interaction between the 10a-H and 6b-H protons relative to that between the 10a-H and 6a-H protons was roughly one-third stronger (**En-c**) than for the other (**En-t**). This relationship was also observed for the cyclopentanone-derived product **13**. Thus, NOE evidence supports the assertion that the two most prevalent isomers are **En-c** and **En-t**. Unfortunately, in no ^{1}H NMR spectrum of the cycloheptanone-derived products were protons at position 11a sufficiently free from overlap to allow accurate observation and comparison of the NOE interactions.

To support the bond-length relationships used to analyze the results of the NOE experiments, a general simplified structure was used to perform computational analysis at the RHF/STO-6G level for the *endo*-addition cyclopentane, cyclohexane, and cycloheptane *cis*- and *trans*-fused products. In these simplified structures, the tetrahydroindole had a phenyl group at the 5-position and was unsubstituted at the 2-position. Calculations indicate that in the **En-c** isomer, the ratio of the distance between the proton at the point of the cycloalkane ring fusion α to the pyrrole and the 6b-H proton should differ significantly from the ratio of the distance between these protons in the **En-t** isomer. The computational models indicate that this ratio in the **En-t** isomer is 72.4, 69.2, and 69.5% of the ratio for the **En-c** isomer for the cyclopentane-, cyclohexane-, and cycloheptane-fused products, respectively.

In all nine of the representative NOE experiments performed, the ^{1}H NMR peak of the 1-H proton of the **En-c** isomer always appeared upfield from the peak corresponding to the 1-H proton of the **En-t** isomer. This consistent relationship made identifying the number of products having **En-t** as the major isomer a relatively simple process of inspecting the two predominant 1-H peaks in each spectrum; products with **En-t** as the major isomer display the unique signature of having their major 1-H peak farthest downfield. As expected, **En-c** is usually the major isomer. Out of 108 products, only 23 (21%) had **En-t** as the major isomer.

Based on the observation that there are a maximum of four isomers present, and the common general observations of minor *exo*-addition Diels-Alder products in the literature [22], it seems reasonable to assume that the minor peaks appearing in the ^{1}H NMR spectra indicate *exo*-addition products. Sufficient steric bulk of substituents on the ketone or maleimide may cancel out favorable secondary orbital interactions and allow some *exo*-approach Diels-Alder products. The two minor isomers were not present in sufficient concentration in any sample, nor were the 6b-H protons sufficiently resolved to perform NOE studies to confirm these assertions, or to check whether *cis*- or *trans*-fusion is predominant among the *exo*-addition isomers. Separation of *endo*- and *exo*-addition isomers was not achieved by chromatography nor by crystallization, which prevented analysis of individual isomers.

Diastereotopism of the protons on the methylene unit of a benzyl group is sometimes observed as second-order doublets. The 3bα-H proton appears as a doublet of doublets; COSY experiments indicate that the 3bα-H proton is coupled not only to the 6a-H proton but also to the proton at the point of cycloalkane ring-fusion α to the pyrrole ring (which would be the 10a-H proton in the cyclohexanone case), with a coupling constant of ~2.0 Hz [8,23]. In the 2-methyl compounds **5-71**, the 2-methyl group often appears as a doublet of doublets; COSY experiments indicate that this is due in part to ~0.9 Hz coupling with the 3-H proton [24]. COSY experiments suggest that the 2-methyl group is also sometimes coupled with the 1-H proton at ~0.9 Hz, though to the best of our knowledge, this type of coupling has no literature precedent.

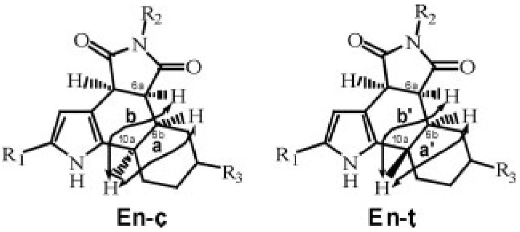

Figure 2. NOE interactions.

Biological activity. By participating in the Developmental Therapeutics Program at the National Cancer Institute (NCI), we submitted 32 representative compounds to the NCI for a one-dose three-human tumor cell line prescreen: compounds **20**, **22**, **24**, **32**, **34**, **72**, **73**, **74**, **75**, **76**, **77**, **78**, **79**, **80**, **81**, **82**, **83**, **84**, **85**, **87**, **89**, **90**, **92**, **100**, **101**, **102**, **103**, **104**, **106**, **108**, **109**, and **111**. Of these, seven compounds, **79**, **101**, **103**, **104**, **106**, **108**, and **109**, were judged by the NCI to have activity sufficient to justify screening with 60 human-tumor cell lines at five concentrations with 10-fold dilutions, from 1×10^{-4}M to 1×10^{-8}M. Of these seven compounds, compounds **103**, **106**, **108**, and **109**, were found to have high levels of activity against many of the 60 different cell lines tested. Compound **103** was most active against non-small cell lung cancer EKVX, with an IC_{50} of 113.2 μg/mL. Compound **109** was most active against colon cancer KM12, with an IC_{50} of 80.9 μg/mL. Compounds **106** and **108** were found to be active against several different cell-lines and were the best performing of the 32 compounds. Compound **106** had its highest activities against melanoma SK-MEL-5, colon cancer KM12, and breast cancer MDA-MB-435, with IC_{50} values of 62.5, 73.5, and 113.8 μg/mL, respectively. Compound **108** was most active against colon cancer HCT-15, with an IC_{50} value of 18.3 μg/mL.

CONCLUSIONS

In summary, a series of 108 novel tetrahydroindoles has been prepared *via* a Diels-Alder reaction of maleimides with 5-alkyl-2-vinylpyrroles formed *in situ* from an acid-catalyzed condensation between 2-alkylpyrroles and cyclic ketones. This one-pot method of tetrahydroindole synthesis is convenient and offers a fair-yielding and highly convergent synthetic route toward substituted indoles with good diastereoselectivity for the **En-c** isomer. Further extensions of this general methodology are currently underway in our laboratory.

EXPERIMENTAL

General. Solvents and reagents were purchased and used as received. Flash chromatography was performed using 230–450 mesh silica gel. TLC analyses were performed on plastic-backed plates precoated with 0.2 mm silica with F_{254} indicator. Infrared spectra were recorded on a 4000 FT-IR spectrometer; only the most intense and/or diagnostic peaks are reported. High-resolution mass spectra were recorded with a time-of-flight instrument using electrospray ionization with PEG as an internal calibrant. For NMR spectra, chemical shifts (δ) were referenced to the solvent. The abbreviations for splitting include: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad. ^{13}C NMR spectra were proton decoupled. Melting points are uncallibrated. Elemental analyses were performed by M-H-W Laboratories, Phoenix, AZ.

^{1}H NMR analyses. All the Diels-Alder products are identified such that both *endo*- and *exo*-addition products have their protons 3b-H and 6a-H in the α-orientation, as shown in Figure 1. Major and minor isomers are identified when possible with the abbreviations maj and min. The ratio of products is given such that the most prevalent minor isomer is 1.0 for easy readability of the *cis*:*trans* or *trans*:*cis* ratio of the *endo*-addition isomers. When the orientation of a proton is unclear, the orientation is omitted from the identification. Insufficient resolution or peak overlap sometimes leads to the labeling of a splitting pattern as ‘‘apparent’’ (app.), which is used when there are discrepancies between the splitting of the same proton of several isomers in a single ^{1}H NMR spectrum, or when it is certain that coupling from a particular proton occurs but is not visible.

Most of the protons of the fused cycloalkane rings appear upfield as multiplets. For compounds with more than one isomer present, it would be confusing and nonintuitive to label the integration of these multiplets with multiplicity that varies depending on the number of isomers present in the mixture. Therefore, when the peaks of all the isomers overlap into a single peak, the integration is designated as 1H. When it is clear that the protons of several but not all isomers overlap in a particular peak, this multiplicity is indicated with an integration larger than 1H. When it is not clear whether multiple peaks overlap, the integration reflects the number of protons which are thought to be definitely in the peak. Thus, sometimes, fewer isomers are identified for a particular proton than there are isomers present in the mixture, because it is not clear where the peak(s) from one isomer occurs.

With some protons, the peaks belonging to the various isomers overlap. In these cases, sometimes the peak is identified as it would be if there was a single isomer present, omitting the designation maj and min, and also omitting the designation α or β if the orientation is unknown or mixed. These designations are only omitted when it is clear, which isomers overlap into a single identified peak, and when it is clear, the protons are of mixed or unknown orientation. Overlap of signals from a proton with multiple orientations occurs most frequently with protons at the 6b-position in compounds with more than one minor isomer present. In the case of a compound with three isomers present, with the peak from 6bαmaj-H distinct but the peaks from the 6bαmin-H and 6bβmin-H protons overlapping into one, the overlapped peak is labeled 6b-H and is assigned an integration of two. This situation also occurs with peaks belonging to protons α to the point of cycloalkane ring fusion to the pyrrole ring in compounds with more than one isomer present.

General reaction conditions. Method A: A solution of the pyrrole (3.00 mmol), the cyclohexanone (4.00 mmol), and the maleimide (4.00 mmol) was heated to reflux in ethanol (5.0 mL). Hydrochloric acid (0.20 mL, 37% aqueous solution) was added to the hot solution, causing it to turn red-brown in color. The solution was refluxed for 1 h. In most cases, slow precipitation of the *in situ* product was observed throughout this time. After the mixture had cooled to rt, the precipitate was vacuum-filtered, washed with ethanol (5.0 mL), and reprecipitated from ethanol (5.0 mL). In cases where no precipitate was observed during reflux, which occurred particularly when 4-*tert*-butylcyclohexanone and/or 4-methoxyphenylmaleimide were used, the desired product was isolated by flash chromatography on silica gel using ethyl acetate:hexane as the eluent.

Method B: Hydrochloric acid (0.10 mL, 37% aqueous solution) was added to a solution of the pyrrole (5.00 mmol), the cyclic ketone (6.50–9.82 mmol), and the maleimide (4.80 mmol) in ethanol (15.0 mL), and the resulting solution was refluxed with stirring for 1–6 h, as determined by TLC. As the solution was allowed to cool to rt, a precipitate developed, which was vacuum-filtered. Purification to give the desired product was accomplished in one of several ways: (1) washing with diethyl ether (5–20 mL) and/or ethanol (5–20 mL), (2) reprecipitation from ethanol (15–20 mL) and/or diethyl ether (15–20 mL) and then, if necessary, washing with diethyl ether (5–20 mL), (3) purified using flash chromatography on silica gel, or (4) a combination of the above techniques, as noted.

Compounds 5 through 112. *2-Methyl-5-phenyl-3b,6a,6b,7,8,9,9a-heptahydro-1H,5H-cyclopenta[g]pyrrolo[3,4-e]indole-4,6-dione (5).* Method B with **3a** (800 mg, 9.50 mmol), 2-h reflux, ethanol wash (10 mL), and then a diethyl ether wash (10 mL) gave **5** (950 mg, 62%) as a colorless solid, a mixture of three isomers (maj:min:min = 3.4:1.0:0.1): mp 260–262°C; ^{1}H NMR (300 MHz, CDCl$_3$, δ) 8.55 (bs, 1H, 1min-H), 8.22 (bs, 1H, 1min-H), 7.64 (bs, 1H, 1maj-H), 7.36–7.52 (m, 3H, Ph), 7.26–7.31 (m, 2H, Ph), 6.11 (dd, J = 2.6, 1.1 Hz, 1H, 3maj-H), 6.03–6.05 (m, 1H, 3min-H), 5.76 (app. d, J = 3.0 Hz, 1H, 3min-H), 4.02 (dd, J = 8.3, 1.7 Hz, 1H, 3bαmin-H), 4.01 (dd, J = 8.4, 1.8 Hz, 1H, 3bαmaj-H), 3.63 (dd, J = 8.9, 6.2 Hz, 1H, 6aαmin-H), 3.55 (dd, J = 8.4, 6.0 Hz, 1H, 6aαmaj-H), 3.20–3.27 (m, 1H, 9aαmaj-H), 3.10–3.16 (m, 1H, 9aβmin-H), 2.75–2.88 (m, 1H, 6b-H), 2.29 (s, 3H, 2-CH$_3$), 1.88–2.08 (m, 2H, cyclopent.), 1.57–1.75 (m, 3H, cyclopent.), 1.38–1.49 (m, 1H, cyclopent.); ^{1}H NMR (300 MHz, DMSO-d_6, δ) 10.48 (bs, 1H, 1min-H), 10.29 (bs, 1H, 1maj-H), 7.38–7.54 (m, 3H, Ph), 7.19–7.25 (m, 2H, Ph), 5.76 (dd, J = 2.3, 1.1 Hz, 1H, 3maj-H), 5.57 (dd, J = 2.3, 1.1 Hz, 1H, 3min-H), 4.18 (app. d, J = 8.7 Hz, 1H, 3bαmin-H), 4.05 (dd, J = 8.3, 2.0 Hz, 1H, 3bαmaj-H), 3.53 (dd, J = 8.3, 5.9 Hz, 1H, 6aαmin-H), 3.48 (dd, J = 8.3, 5.9 Hz, 1H, 6aαmaj-H), 3.07–3.14 (m, 1H, 9aαmaj-H), 2.99–3.04 (m, 1H, 9aβmin-H), 2.56–2.66 (m, 1H, 6b-H), 2.04–2.18 (m, 1H, cyclopent.), 2.15 (s, 3H, 2-CH$_3$), 1.77–1.94 (m, 1H, cyclopent.), 1.36–1.61 (m, 3H, cyclopent.), 1.15–1.30 (m, 1H, cyclopent.); ^{13}C NMR (75 MHz, CDCl$_3$, δ) 178.4, 177.0, 132.2, 131.0, 129.3, 129.2, 128.5, 128.1, 127.8, 126.6, 115.5, 109.3, 108.7, 105.6, 104.1, 41.9, 41.7, 38.5, 37.2, 36.5, 31.1, 30.5, 24.9, 22.4, 21.9, 13.3; IR (thin film, cm^{-1}) 3397(bs), 3059(m), 2934(m), 2857(m), 1775(s), 1695(s), 1498, 1391(m), 1189(m), 1170(m); HRMS m/z (M + Na^{+}) calcd 343.1418, found 343.1417. Zirconyldodecylsulfate (ZrO(DS)$_2$) as a versatile Lewis acid-surfactant-combined (LASC) catalyzed ecofriendly synthesis of bis- and tris(indolyl)methanes *via* electrophilic substitution of indoles with carbonyl compounds in high yields at mild conditions.

J. Heterocyclic Chem., **46**, 535 (2009).

INTRODUCTION

Replacing current chemical processes with more environmentally benign alternatives is an increasingly attractive subject [1]. The rapid and extensive growth of synthetic procedures using materials with detrimental effects to the environment has turned the attention of chemists to the development of environmentally benign methods in order to avoid or minimize these harmful effects.

Bis(indolyl)methanes (BIM) are the most active cruciferous substances for promoting beneficial estrogen metabolism in woman and men [2]. BIM increases the body's natural metabolism of hormones and promotes good estrogen (2-hydroxyestrogen). This indole antioxidant is patented for alleviating symptoms of fibromyalgia. BIM is effective in the prevention of cancer because of its ability to modulate certain cancer causing estrogen metabolites [3]. Scientists have demonstrated that BIM induces apoptosis in human cancer cells and may also normalize abnormal cell growth associated with cervical dysplasia.

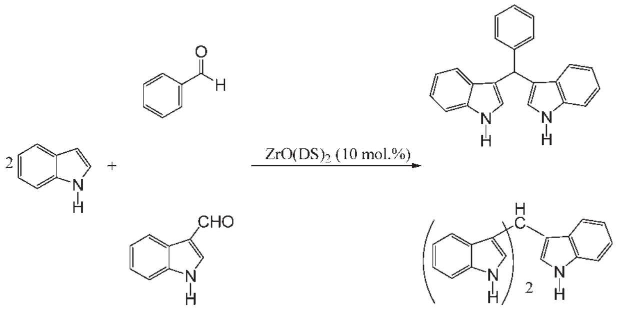
Also 1,1,1-tris(3,3′,3″-indolyl)ethane was found in bacterial metabolites [4], and the triarylmethanes (TIMs) could be converted into important cage molecules [5]. It is reported that the cationic form of TIMs could be used as acceptors of hydride ions.

Thus, indole and its derivatives have been a topic of research interest [6]. Because of their intriguing physiological activities, many synthetic procedures have been reported so far [7–12], where development of environmentally benign methods are currently of interest in process chemistry by using green catalysts.

Green catalysts require high catalytic activity and atom efficiency, as well as low toxicity, low cost, and ease of handling. Fortunately, Zr(IV) compounds generally have low toxicity and are not considered particularly poisonous. Reports on the safety of Zr(IV) salts show that their LD_{50} is high [LD_{50} [$ZrOCl_2.8H_2O$, oral rat] = 3500 mg/Kg] [13]. Although $ZrOCl_2.8H_2O$ has a rather high LD_{50}, it should not be very harmful to mammalians. Also, this material is commercially available and is an inexpensive compound.

In continuation of our ongoing interest on development of new applications of zirconium salts [8,14–18] in synthetic methods, we herein report the use of ZrO(DS)$_2$ as LASC in the electrophilic substitutions of

Scheme 1



indoles with a variety of aldehydes and ketones in H_2O and EtOH, both of which are green solvents, affording excellent yields of bis- and tris(indolyl)methanes under mild condition (Scheme 1).

RESULTS AND DISCUSSION

Optimized reaction conditions were investigated using a reaction of benzaldehyde and indole (1:2.2), with respect to temperature, time, and the molar ratio of $ZrO(DS)_2$ to the substrate in water. We found that 10 mol % of $ZrO(DS)_2$ was sufficient to obtain the desired bisindolylmethane in 96% yield within 20 min at 60°C.

Based on the optimized reaction conditions, the present protocol was applied to a variety of carbonyl compounds (Table 1). As shown in Table 1 aryl aldehydes with both electron-donating and electron-withdrawing characteristics afforded bis(indolyl)methane in excellent yields. Not only aryl aldehydes but also aliphatic aldehydes provided the desired bis(indolyl)methane (Table 1, entry 9).

We have found that the reaction of both activated and deactivated aromatic aldehydes with 2-methyl indole is faster than indole (Table 1, entries 10,11).

When 3-formylindole was used as a carbonyl compound, the corresponding trisindolylmethanes are formed. The reaction proceeded at room temperature in EtOH and the time required for the conversion was short (Table 1, entreis 12,13).

The reaction of acetophenone with indole is slower than with aldehydes, and unreacted ketone and indole remains (Table 1, entry 14).

To show the merit of $ZrO(DS)_2$ in comparison with other catalysts used for the similar reactions in green solvents, we have tabulated some of the results in Table 2.

CONCLUSION

We have developed a highly convenient, efficient, and green catalytic system for the preparation of biologically important bis- and trisindolylmethanes in high yields through the electrophilic substitution reaction of indoles with carbonyl compounds using $ZrO(DS)_2$ as new LASC. This protocol will contribute to reducing the use of harmful organic solvents.

EXPERIMENTAL

General. $ZrOCl_2.8H_2O$, SDS, carbonyl compounds, and indoles were purchased from Merck or Fluka Chemical Companies. Progress of the reactions was monitored by TLC using silica-gel SIL G/UV 254 plates. NMR spectra were recorded on a Brucker Avance DPX 300 MHz and 500 MHz instruments. Mass spectra were recorded on a Shimadzu GC-MS-QP 5050A.

Preparation of $ZrO(DS)_2$ from $ZrOCl_2.8H_2O$ and sodium dodecyl sulfate (SDS). A solution of $ZrOCl_2.8H_2O$ (5 mmol, 1.61 g in 50 mL of water) was added to a solution of sodium dodecyl sulfate (SDS) (10 mmol, 2.88 g in 50 mL of distilled water) while stirring at room temperature. A white precipitate was appeared immediately and the mixture was stirred for another 30 min. The white solid was collected by filtration and washed with water (2 × 100 mL). The isolated solid was dried under reduced pressure and $ZrO(DS)_2$ was obtained as a white powder in 90% yield (2.87 g). M.p: 125°C; ^1H NMR (DMSO, 500 MHz): δ 0.82 (t, 6H, J = 6.8 Hz), 1.1–1.35 (m, 36H), 1.45 (m, 4H), 3.69 (t, 4H, J = 6.6 Hz) ppm; ^{13}C NMR (DMSO, 125.77 MHz): 13.90, 22.14, 25.58, 28.78, 28.90, 29.04, 29.11, 29.13, 31.37, 32.63, 60.83, 65.99 ppm.

General procedure for condensation of indoles with carbonyl compounds catalyzed by $ZrO(DS)_2$. Indole (2.2 mmol) and carbonyl compound (1 mmol) was added to a suspension of $ZrO(DS)_2$ (10 mol %, 0.0638 g in 2 mL of water or EtOH) (see Table 1). The reaction mixture was stirred at 60°C for appropriate time which was monitored by TLC (Table 1). After completion of the reaction, EtOAc (5 mL) was added to the reaction mixture; organic phase was separated and dried over $CaCl_2$ followed by filtration and evaporation of the solvent. The desired product was secured in high purity (Table 1). Further purification was performed by plate chromatography eluted with *n*-hexan/EtOAc (3/1). Structural assignments of the products are based on their ^1H NMR, ^{13}C NMR, MS spectra and elemental analysis.

Selected spectral data. Table 1, entry 2: Solid; mp: 97–98°C; ^1H NMR ($CDCl_3$, TMS, 300 MHz): δ 2.37 (s, 3H), 5.83 (s, 1H), 6.70(d, 2H, J = 2.45 Hz), 7.02(t, 2H, J = 8.2 Hz), 7.12(d, 2H, J = 8.2 Hz), 7.21–7.3(m, 6H), 7.45(d, 2H, J = 8.2 Hz), 7.9(br, s, 2H) ppm; ^{13}C NMR ($CDCl_3$, TMS, 62.9 MHz): 21, 40.25, 110.9, 112, 119.5, 120.2, 121.6, 122.6, 129.5, 131.5, 134.3, 136.8 ppm; MS (70 ev), m/e: 336 [M^+]. Anal. Calcd for ($C_{24}H_{20}N_2$): C, 85.68; H, 5.99; N, 8.33. Found: C, 85.70; H, 5.96; N, 8.35.

Table 1, entry 12: Solid; mp: 161°C(dec.); ^1H NMR (DMSO, 300 MHz): δ 6.08 (s, 1H), 6.89 (s, 3H), 6.87(t, 3H, J = 7.45 Hz), 7.02 (t, 3H, J = 7.25 Hz), 7.44 (d, 3H, J = 7.83 Hz), 7.56 (d, 3H, J = 7.83 Hz), 10.72 (s, 3H) ppm; ^{13}C NMR (DMSO, 62.9 MHz): 30.8 ,111.4, 117.5, 118, 119,120.6, 124, 126.8, 136.5 ppm; MS (70 eV), m/e: 361 [M^+]. Anal. Calcd. for ($C_{25}H_{19}N_3$): C, 83.08; H, 5.30; N, 11.63. Found: C, 83.10; H, 5.32; N, 11.65.

A simple preparation of ethyl 2,5-dimethylfuran-3-carboxylate (**3**), 2,5-dimethylfuran-3,4-dicarboxylic acid (**4**), and diethyl 2,5-dimethylfuran-3,4-dicarboxylate (**5**) by treatment of diethyl 2,3-diacetylsuccinate (**2**) with aqueous HCl is reported. The reaction is performed under organic solvent free conditions from a readily available cheap starting material.

J. Heterocyclic Chem., **46**, 540 (2009).

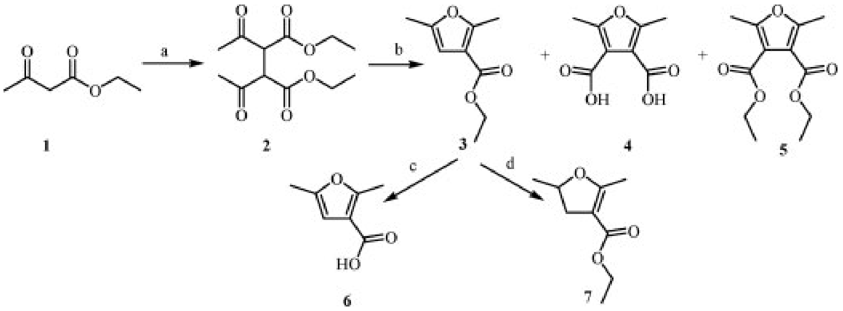
INTRODUCTION

Highly substituted furans play an important role as structural elements of many pharmaceutical and natural substances [1]. Moreover, they are useful building blocks in synthetic organic chemistry [2]. Especially, ethyl 2,5-dimethylfuran-3-carboxylate (**3**) (Scheme 1) is an important trisubstituted furan. Its derivatives have been used as wood preservatives [3], microbicides, insecticides [4], and fungicides [5]. 2,5-Dimethylfuran-3,4-dicarboxylic acid (**4**) and diethyl 2,5-dimethylfuran-3,4-dicarboxylate (**5**) are also useful intermediates in medicinal chemistry and organic synthesis [6–8]. Among the different approaches to multiply substituted furans [9–15], there are some methods for the preparation of **3**, such as gold(I) catalyzed cascade reaction of propargyl Claisen rearrangement and heterocyclization of propargyl vinyl ethers [1], polymer-supported selenium-induced electrophilic cyclization [16], I_2-induced cyclization of 2-alkenyl substituted 1,3-dicarbonyl compounds [17], treatment of α,β-unsaturated ketones with *N*-bromosuccinimide followed by cyclization [18], and treatment of ethyl 2-acetyl-4-oxopentanoate with montmorillonite clay in toluene at reflux with water removal [5]. Some methods require expensive reagents and some use unreadily accessed starting materials or hazardous organic solvents. Thus, the development of convenient strategies is still of considerable interest. We now wish to report a simple preparation of trisubstituted furan (**3**) starting from diethyl 2,3-diacetylsuccinate (**2**) by decarboxylation and subsequent Paal–Knorr cyclization [19–21] in aqueous HCl. Using this procedure, trisubstituted furan (**3**) and tetrasubstituted furan (**4**) or (**5**) can be easily prepared at will by adjusting the concentrations of aqueous HCl. The reaction is simple to perform, and the starting material is cheap and readily available.

RESULTS AND DISCUSSION

Diethyl 2,3-diacetylsuccinate (**2**) (Scheme 1) was prepared according to literature from ethyl acetoacetate (**1**) using sodium in diethyl ether followed by treatment with iodine at room temperature [22]. In our initial exploration, treatment of **2** with 0.4*N* aqueous HCl at reflux for 14–15 h in oil bath afforded trisubstituted furan monoester (**3**) and tetrasubstituted furan diacid (**4**), in 30–50% and 40–60% yields, respectively. Different aqueous HCl concentrations were further compared for the reaction under both oil bath heating and microwave irradiation (Table 1). When **2** was treated with 6*N* aqueous HCl or 3*N* aqueous HCl, tetrasubstituted furan diacid (**4**) was obtained as the only product in excellent to quantitative yields. Whereas using dilute aqueous HCl, trisubstituted furan monoester (**3**) was obtained. The highest yield of **3** was observed in 57% under oil bath heating in 0.3*N* aqueous HCl, and 50% under microwave irradiation in 0.2*N* aqueous HCl. Interestingly, tetrasubstituted furan ester (**5**) was obtained only under microwave irradiation possibly because of the shorter reaction time.

Scheme 1. Reaction conditions: (a) (i) Na, Et_2O, r.t., 12 h, (ii) I_2, Et_2O, r.t., 4 h, 66%; (b) HCl-H_2O, reflux under oil bath heating or under microwave irradiation; (c) 5% NaOH, reflux, 5 h, 96%; (d) H_2, 5% Pd/C, EtOH-H_2O, 4d, 90%.



A previous report by Fales *et al*. described the formation of diethyl 2,5-dimethylfuran-3,4-dicarboxylate (**5**) from diethyl 2,3-diacetylsuccinate (**2**) by using concentrated H_2SO_4 in CCl_4 [23]. In our procedure, tetra- or trisubstituted furans can be easily prepared by using different aqueous HCl concentrations. The product selectivity appears to be controlled by acid concentrations. More dilute aqueous HCl can provide trisubstituted furan monoester (**3**) probably through decarboxylation and subsequent Paal–Knorr dehydrative cyclization. Meanwhile, higher concentrations of aqueous HCl gave tetrasubstituted furan diacid (**4**) as main or even only product possibly through Paal–Knorr cyclization and subsequent hydrolysis. It is notable that no decarboxylation was observed under more acidic conditions. We think that it is possibly because the higher concentrations of aqueous HCl can accelerate dehydrative cyclization step to form furan ring before decarboxylation, and the resulting conjugated system between the furan ring and dicarbonyl groups is strong enough to prevent it from decarboxylation under employed reaction conditions. Actually, no decarboxylation of **4** was observed in our investigation. Therefore, compound **4** would be the major product if cyclization is faster than decarboxylation, otherwise **3** would be the major one.

To confirm the structure of **3**, the hydrolysis of **3** with 5% aqueous NaOH was performed to afford 2,5-dimethylfuran-3-carboxylic acid (**6**) as crystals (Scheme 1). The X-ray crystallographic analysis of **6** was shown in Figure 1 [24].

Moreover, we investigated the selective hydrogenation of **3**. Treatment of **3** with 5% Pd/C in EtOH-H_2O at H_2 atmosphere for 4 days yielded dihydrofuran **7** as the only product in excellent yield (Scheme 1). This selective hydrogenation is a useful approach for dihydrofurans which are also important structural elements of many pharmaceutical and natural products [16,25–27].

The procedure described earlier is a practical method for the preparation of trisubstituted furan **3**. Although **3** was obtained in medium yield, it is still a valuable approach because the starting material is a readily accessed symmetrically substituted 1,4-dicarbonyl compound. Moreover, using this procedure trisubstituted furan (**3**) and tetrasubstituted furan (**4** or **5**) can be easily prepared at will by adjusting the concentrations of

aqueous HCl under organic solvent free conditions. Both conventional and microwave heating were investigated for this method.

EXPERIMENTAL

General methods. ^{1}H NMR (300 MHz) and ^{13}C NMR (75 MHz) spectra were recorded on a Bruker AV-300 spectrometer with TMS as an internal standard. The chemical shifts (δ) are given in ppm, and the coupling constants (*J*) in hertz (Hz). X-ray diffraction analysis was performed on a Bruker P4 X-ray diffraction meter. Melting points were determined on an X-4 digital display micro melting point apparatus and were uncorrected. Unless otherwise noted, all reagents were obtained from commercial suppliers and were used without further purification. Organic solvents used were dried by standard methods when necessary. All reactions were monitored by TLC with Haiyang GF254 silica gel plates. Flash column chromatography was carried out using 200–300 mesh silica gel at increased pressure.

Ethyl 2,5-dimethylfuran-3-carboxylate (3) and 2,5-dimethylfuran-3,4-dicarboxylic acid (4). A solution of diethyl 2,3-diacetylsuccinate (**2**) (145 mg, 0.56 mmol) in aqueous HCl (0.4*N*, 1.8 mL) was refluxed for 15 h in oil bath. After cooling to r.t., the reaction mixture was extracted with diethyl ether thoroughly. The combined extracts were washed with water, brine, dried (Na_2SO_4), and filtered. The solvents were removed and the residue was purified by flash chromatography (petroleum ether/diethyl ether 5:1, then pure diethyl ether) to give compound **3** (47 mg, 50%) as colorless oil, and compound **4** (41 mg, 40%) as white crystals.

Compound 3. ^{1}H NMR ($CDCl_3$) δ 1.33 (t, 3H, *J* = 7.1 Hz), 2.36 (s, 3H), 2.52 (s, 3H), 4.26 (q, 2H, *J* = 7.1 Hz), 6.21 (s, 1H); ^{13}C NMR ($CDCl_3$) δ 13.2, 13.7, 14.5, 60.0, 106.3, 114.2, 150.0, 157.6, 164.4. Identical to that previously reported [28].

Compound 4. Mp 214–216°; ^{1}H NMR (CD_3COCD_3) δ 2.60 (s, 2 × 3H); ^{13}C NMR (CD_3COCD_3) δ 14.5, 112.4, 161.5, 166.6. Spectroscopic data were in accordance with commercially available material.

Diethyl 2,5-dimethylfuran-3,4-dicarboxylate (5). A solution of **2** (243 mg, 0.94 mmol) in aqueous HCl (0.4*N*, 3.3 mL) was refluxed under atmospheric pressure for 2 h within a synthetic microwave reactor (Sineo microwave MAS-II), which was equipped with a condenser and set at 100°. After cooling to r.t., the reaction mixture was extracted with diethyl ether thoroughly. The combined extracts were washed with water, brine, dried (Na_2SO_4), and filtered. The solvents were removed and the residue was purified by flash chromatography (petroleum ether/diethyl ether 5:1) to give compound **5** (138 mg, 61%) as colorless oil, and compound **3** (51 mg, 21%) as colorless oil.

Compound 5. ^{1}H NMR ($CDCl_3$) δ 1.30 (t, 2 × 3H, *J* = 7.1 Hz), 2.43 (s, 2 × 3H), 4.29 (q, 2 × 2H, *J* = 7.1 Hz); ^{13}C NMR ($CDCl_3$) δ 13.0, 13.8, 60.5, 113.6, 155.5, 163.5. Identical to that previously reported [14].

2,5-Dimethylfuran-3-carboxylic acid (6). A solution of **3** (76 mg, 0.41 mmol) in aqueous NaOH (5%, 3 mL) was refluxed for 5 h. After cooling to r.t., the solution was treated with aqueous HCl to make pH = 3. The reaction mixture was extracted with diethyl ether thoroughly. The combined extracts were washed with water, brine, dried (Na_2SO_4), and filtered. The solvents were removed to obtain compound **6** (61 mg, 96%) as white crystals, mp 131–132°; ^{1}H NMR ($CDCl_3$) δ 2.26 (s, 3H), 2.55 (s, 3H), 6.25 (s, 1H); ^{13}C NMR ($CDCl_3$) δ 13.3, 14.0, 106.4, 113.5, 150.4, 159.5, 169.9. Identical to that previously reported [29].

Ethyl 2,5-dimethyl-4,5-dihydrofuran-3-carboxylate (7). A mixture of **3** (230 mg, 1.25 mmol) and 5% Pd/C (146 mg) in EtOH-H_2O (6:1, 3 mL) was vigorously stirred at r.t. at H_2 atmosphere under ordinary pressure for 4 days. The reaction mixture was extracted with diethyl ether. The combined extracts were washed with water, brine, dried (Na_2SO_4), and filtered. The solvents were removed and the residue was purified by flash chromatography (petroleum ether/diethyl ether 20:1) to get compound **7** (206 mg, 90%) as colorless oil. ^{1}H NMR ($CDCl_3$) δ 1.26 (t, 3H, *J* = 7.1 Hz), 1.34 (d, 3H, *J* = 6.2 Hz), 2.16 (s, 3H), 2.47 (1H, dd, *J* = 7.6, 14.0 Hz), 2.98 (dd, 1H, *J* = 11.0, 14.0 Hz), 4.14 (q, 2H, *J* = 7.1 Hz), 4.76 (m, 1H); ^{13}C NMR ($CDCl_3$) δ 14.3, 14.6, 22.0, 37.0, 59.5, 78.8, 101.6, 166.5, 167.7. Identical to that previously reported [30].

A series of novel 3-aryl-1-[2-(aryloxy)propanoyl]imidazolidine-2,4-diones were synthesized by the condensation of 3-aryl-imidazolidine-2,4-diones with 2-(aryloxy)propanoyl chlorides under mild conditions. Their structures were confirmed by IR, ^{1}H NMR, mass spectroscopy, and elemental analyses. The preliminary bioassay indicated that the target compounds **II** displayed excellent herbicidal activity against monocotyledonous (barnyard grass) and dicotyledonous (oil rape) plants.

J. Heterocyclic Chem., **46**, 544 (2009).

INTRODUCTION

Recently, imidazolidine-2,4-dione derivatives have attracted the interest of chemists because some of them exhibit wide range of pharmaceutical activity such as anti-HIV [1], microbicidal activity [2], or nonpeptide inhibitors of human heart chymase [3] as well as agrochemical activity such as herbicidal [4] and fungicidal activity [5]. In the area of modern crop protection, amide derivatives are widely used as bactericides [6] and fungicides [7]. Especially, some of the amide derivatives are found to be an inhibitor of photosystem II electron transport and used as a very important class of herbicides in the world agrochemical market, there are about 57 amide herbicides; acetochlor, metolachlor, and butachlor are the best selling amide herbicides in the world [8,9]. As a continuation of our ongoing project aimed at investigating novel biologically nitrogen-containing heterocyclic compounds [10,11], we designed and synthesized a series of novel 3-aryl-1-[2-(aryloxy)propanoyl] imidazolidine-2,4-diones, which have both imidazoline-2,4-dione and 2-(aryloxy)propanoyl moieties. Herein, we would like to report the synthesis and biological activity of the title compounds **II** (Scheme 1).

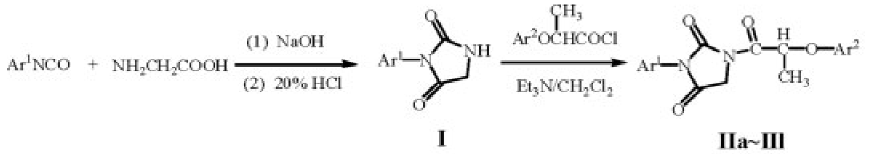
RESULTS AND DISCUSSION

3-Aryl-imidazolidine-2,4-diones (**I**) were prepared from the reaction of aromatic isocyanates with α-amino acids in a basic medium according to the reported method. Compound **I** reacted with various 2-(aryloxy)propanoyl chlorides under mild conditions to give the target compounds **II** in good yields (73–90%).

Their structures of the products were confirmed by IR, ^{1}H NMR, mass spectroscopy, and elemental analyses. The structures of compounds **II** were deduced from their spectroscopic data. In the ^{1}H NMR spectra of compounds **II**, the two methylene protons display two doublets because of their different magnetic environments with the coupling constant of 18 Hz, whereas the two methylene protons in compounds **I** appear as a singlet at δ 4.1. The IR spectra of compounds **II** showed normal stretching absorption bands indicating the existence of the C=O, Ar group, and C—O—C moiety. The EI mass spectra of compounds **II** revealed the existence of their molecular ion peaks and main fragmentation peaks, which were in accordance with the given structures of products **II**.

Herbicidal activity. The herbicidal activity values of the title compounds **II** against *Brassica campestris* (oil rape) and *Echinochloa crus-galli* (barnyard grass) has been investigated at the dosages of 100 mg/L and 10 mg/L compared with distilled water and the commercially available herbicide, 2,4-dichlorophenoxyacetic acid (2,4-D) according to the method described in the Experimental section. The preliminary results of bioassay showed that compounds **II** possessed excellent herbicidal activity. The activity data were listed in Table 1. For example, compounds **IIh** and **IIj** exhibited as good herbicidal activity as the commercially available herbicide 2,4-D. Further structure-activity relationships are under investigation.

Scheme 1. Synthetic route to compounds **II**.



$Ar^1 = C_6H_5$, 4-ClC_6H_4, 4-FC_6H_4; $Ar^2 = C_6H_5$, 4-ClC_6H_4, 4-FC_6H_4, 2,4-$Cl_2C_6H_3$

In conclusion, a series of novel 3-aryl-1-[2-(aryloxy)-propanoyl]imidazolidine-2,4-diones were synthesized by the condensation of 3-arylimidazolidine-2,4-diones with 2-[aryloxy]propanoyl chlorides under mild conditions. The preliminary bioassay indicated that the target compounds II displayed excellent herbicidal activity against monocotyledonous (barnyard grass) and dicotyledonous (oil rape) plants.

EXPERIMENTAL

Melting points were determined with a WRS-1B digital melting point apparatus and are uncorrected. ^{1}H NMR spectra were recorded with a Varian Mercury PLUS400 (400 MHz) spectrometer with TMS as the internal reference and $CDCl_3$ as the solvent, whereas mass spectra were obtained with a Finnigan TRACEMS2000 spectrometer using the EI method. IR spectra were measured by a Nicolet NEXUS470 spectrometer. Elemental analyses were performed with an Elementar Vario ELIII CHNSO elemental analyzer. All of the solvents and materials were reagent grade and purified as required. 2-(Aryloxy)propanoyl chlorides and 3-aryl-imidazolidine-2,4-diones were prepared according to the methods described in references [12] and [13–16], respectively.

General procedure for the preparation of 3-aryl-1-[2-(aryloxy)propanoyl]imidazolidine-2,4-diones II. To the solution of 3-aryl-imidazolidine-2,4-dione (3 mmol) and triethyl amine (6 mmol) in dry CH_2Cl_2 (15 mL) was added dropwise the solution of 2-(aryloxy)propanoyl chloride (3 mmol) in dry CH_2Cl_2 (10 mL) while cooling in an ice-bath, after the addition, the mixture was stirred at room temperature for 3–4 h (monitored by TLC). The workup involved stripping the solvent followed by an addition of water and extraction of the product mixture into CH_2Cl_2. After phase separation, washing by aqueous sodium hydrogen carbonate, drying over anhydrous sodium sulfate, filtration and evaporation, the crude product was purified by flash column chromatography on silica gel using petroleum ether and ethyl acetate (3:1---1:1, *v*/*v*) as the eluent to give white crystals (**IIa~IIl**).

1-(2-Phenoxypropanoyl)-3-phenylimidazolidine-2,4-dione (IIa). Yield: 75%, mp 56.2–57.8°C; ^{1}H NMR ($CDCl_3$): δ 1.70 (d, J = 6.8 Hz, 3H, CH_3), 4.57 (dd, J = 18.4 Hz, 2H, CH_2N), 5.95 (q, J = 6.4 Hz, 1H, CH), 6.90–7.00 (m, 3H, Ar—H), 7.28–7.30 (m, 2H, Ar—H), 7.40–7.55 (m, 5H, Ar—H); IR: C=O 1786, 1738, 1725, Ar 1592, 1484, 1445, Ar—O—C 1040, C—Cl 756 cm^{-1}; ms: *m*/*z* 324 (M$^+$, 16), 247 (23.9), 231 (100), 122 (35.2), 121 (90.2), 105 (15.9), 93 (35.5), 77 (85.6). *Anal.* Calcd. for $C_{18}H_{16}N_2O_4$: C, 66.66; H, 4.97; N, 8.64. 1-[2-(4-Fluorophenoxy)propanoyl]-3-phenylimidazolidine-2, 4-dione (IIj). Yield: 85%, mp 64.2–65.5°C; ^{1}H NMR ($CDCl_3$): δ 1.67 (d, J = 6.8 Hz, 3H, CH_3), 4.47 (dd, J = 18.8 Hz, 2H, CH_2N), 5.85 (q, J = 6.4 Hz, 1H, CH); 6.85–6.98 (m, 4H, Ar—H), 7.38–7.54 (m, 5H, Ar—H); IR: C=O 1738, 1716, Ar 1599, 1504, 1436, CH_3 1402, C—F 1262, 1201, Ar—O—C 1095; ms: m/z 358 (M^+, 3.1), 267 (21.8), 265 (100), 238 (10.5), 210 (45.0), 122 (30.2), 121 (56.9), 105 (9.0), 93 (41.0), 77 (25.2). *Anal.* Calcd. for $C_{18}H_{15}FN_2O_4$: C, 63.15; H, 4.42; N, 8.18. Found: C, 63.30; H, 4.67; N, 7.95.

1-[2-(4-Fluorophenoxy)propanoyl]-3-(4-fluorophenyl)imidazolidine-2,4-dione (IIk). Yield: 82%, mp 162.2–163.8°C; ^{1}H NMR ($CDCl_3$): δ 1.68 (d, J = 6.8 Hz, 3H, CH_3), 4.50 (dd, J = 18.8 Hz, 2H, CH_2N), 5.84 (q, J = 6.8 Hz, 1H, CH); 6.86–6.89 (m, 2H, Ar—H), 6.95–6.99 (m, 2H, Ar—H), 7.38 (d, 2H, J = 8.8 Hz, Ar—H), 7.50 (d, 2H, J = 8.8 Hz, Ar—H); IR: C=O 1787, 1739, 1720, Ar 1576, 1514, 1462, Ar—O—C 1060, C—Cl 765 cm^{-1}; ms: m/z 362 (2.0), 360 (M^+, 4.3), 267 (41.7), 265 (100), 223 (10.2, 211 (13.6), 153 (8.8), 139 (21.4), 125 (4.9), 111 (9.8), 95 (10.2). *Anal.* Calcd. for $C_{18}H_{14}F_2N_2O_4$: C, 60.00; H, 3.92; N, 7.77. Found: C, 59.81; H, 3.75; N, 7.64.

3-(4-chlorophenyl)-1-[2-(4-fluorophenoxy)propanoyl]imidazolidine-2,4-dione (IIl). Yield: 82%, mp 66.8–68.4°C; ^{1}H NMR ($CDCl_3$): δ 1.67 (d, J = 6.8 Hz, 3H, CH_3), 4.48 (dd, J = 18.4 Hz, 2H, CH_2N), 5.85 (q, J = 6.8 Hz, 1H, CH); 6.86–6.99 (m, 4H, Ar—H), 7.29–7.51 (m, 4H, Ar—H); IR: C=O 1785, 1740, 1722, Ar 1586, 1494, 1463, Ar—O—C 1074, C—Cl 758 cm^{-1}; ms: m/z 379 (5.9), 378 (5.8), 376 (M^+, 28.1), 269 (4.4), 267 (40.9), 266 (62.7), 265 (100), 237 (8.2), 223 (13.6), 211 (19.4), 153 (30.4), 140 (44.7), 139 (66.5), 125 (15.7), 111 (37.3), 95 (46.9), 83 (24.3), 56 (53.2). *Anal.* Calcd. for $C_{18}H_{14}ClFN_2O_4$: C, 57.38; H, 3.75; N, 7.44. Found: C, 57.14; H, 3.83; N, 7.60.

Bioassay method. ***Herbicidal activity testing.*** Herbicidal testing of the newly synthesized compounds II was carried out in a greenhouse, with temperature 23 ± 1°C, relative humidity (RH) 60 ± 5%, light intensity 10 Klux, photoperiod 8 h/day. Twenty seeds of each weed species including oil rape and barnyard grass were chosen for testing. Seedlings were grown in the test plate of 9-cm diameter containing two pieces of filter paper and 9 mL solution of the tested compound (100 mg/L and 10 mg/L, respectively). Distilled water and 2,4-D were used as the comparison compounds. The herbicidal activity was assessed as the inhibitory rate in comparison with the distilled water. The herbicidal rating score was based on visual observation. Range from 0 to 100%, 0% means no effect and 100% means complete killing. The test was run three times, and the results were averaged and given as activity in Table 1.

3-Acetyl-4-benzoyl-1,5-diphenylpyrazole reacts with DMF-DMA to give the novel enaminone **2**. The reaction of the latter with various hydrazonoyl halides afforded regioselectively the respective substituted (3-pyrazolyl)(4-pyrazolyl)ketones **4** in good over all yield. The preliminary screening for the antitumor activity of the synthesized compounds **2** and **4a-g** against human breast cancer cell line (MCF-7) revealed that both compounds **2** and **4b** have high-antitumor activity. SAR is discussed.

J. Heterocyclic Chem., **46**, 548 (2009).

INTRODUCTION

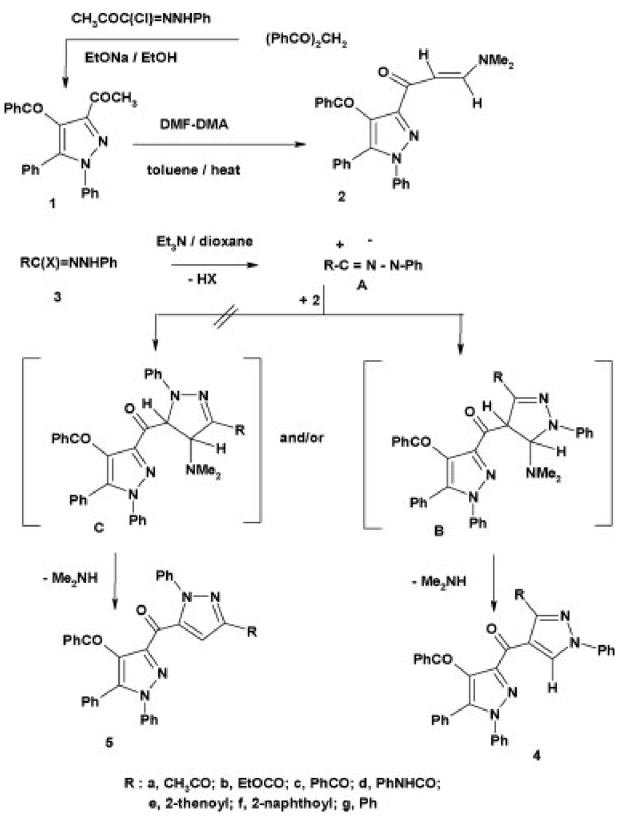
Within the past 10 years, we have been engaged on the utility of hydrazonoyl halides for synthesis of various heterocyclic systems [1–10]. Furthermore, literature cites many reports on valuable biological activity of various pyrazole derivatives [11–21]. On the basis of these facts, it was thought interesting to explore the utility of hydrazonoyl halides for synthesis of the hitherto unreported (3-pyrazolyl)(4-pyrazolyl) ketones and evaluate their antitumor activity against human breast cell line MCF-7. For this purpose, we investigated the reactions of a series of hydrazonoyl halides **3** with the hitherto unreported 3-pyrazolyl-enaminone **2** (Scheme 1). We carried out such reactions to explore also their regiochemistry as they can lead to (3-pyrazolyl)(4-pyrazolyl) ketones **4** and/or their isomers (3-pyrazolyl)(5-pyrazolyl) ketones **5** (Scheme 1).

RESULTS AND DISCUSSION

The hitherto unreported 3-acetyl-4-benzoyl-1,5-diphenylpyrazole 1 was prepared *via* reaction of *N*-phenyl 2-oxopropanehydrazonoyl chloride 3a with dibenzoylmethane in ethanol in the presence of sodium ethoxide. Its structure was confirmed by its spectra (IR, MS, ^{1}H NMR and ^{13}C NMR) and its elemental analysis (see Experimental section). For example, its IR spectrum showed two bands at υ 1692 and 1659 cm^{-1} assignable to two C=O groups. Its ^{1}H NMR (DMSO-d_6) displayed signals at δ 3.34 (s, 3H, CH_3), 7.15–7.80 (m, 15H, ArH). Reaction of compound 1 with dimethylformamide-dimethylacetal (DMF-DMA) in refluxing toluene furnished the required new enaminone 2. The IR spectrum of the latter showed two carbonyl absorption bands at 1678 and 1649 cm^{-1}. Its ^{1}H NMR spectrum revealed, in addition to the aromatic protons multiplet, two doublet signals at δ 5.84 and 7.62 with $J = 19$ Hz assignable to the two olefinic protons and two methyl protons singlet signals at δ 2.86 and 3.09. This finding indicates that this enaminone 2 exists in the indicated trans-configuration (Scheme 1).

Reaction of **2** with each of the hydrazonoyl halides **3a-g** in dioxane in the presence of triethylamine gave, in each case, one isolable product as evidenced by TLC analysis. Both mass spectra and elemental analysis data of the isolated products were consistent with either one of the two isomeric structures **4** or **5** (Scheme 1). On the basis of their ^{1}H NMR spectra, the isolated products were assigned structure **4** and the isomeric structure **5** was discarded. This is because their ^{1}H NMR spectra revealed, in each case, a singlet signal for the pyrazole ring proton in the region δ 9.20–9.33 assignable to pyrazole-5H. Literature reports [22,23] indicate that the ^{1}H NMR spectra of 5- and 4-unsubstituted pyrazoles exhibit the characteristic singlet signals of 5-CH and 4-CH

Scheme 1



protons at δ 8.35 and 7.30, respectively. Furthermore, spectral simulation by ACD/H NMR Predictor (v.6.12) for 5- and 4-unsubstituted pyrazoles showed the 5-H and 4-H signals at d 8.30 and 7.63, respectively. On the basis of such data, it is not unreasonable to conclude that the studied reactions are completely regioselective and the structure of the isolated products is **4** and not **5**. This conclusion is consistent with literature reports that indicate that reactions of hydrazonoyl halides with various enaminones are regioselective and lead to the formation of the respective 5-unsubtituted pyrazole derivatives [8].

To account for the formation of products **4**, it is suggested that the reaction starts with a regioselective 1,3-dipolar cycloaddition of the nitrilimine intermediate **A**, generated *in situ* by base-catalyzed dehydrohalogenation of the hydrazonoyl halide **3**, to the carbon–carbon double bond of the enaminone **2** to afford the nonisolable cycloadduct intrermediate **B**. The latter then undergoes *in situ* elimination of dimethylamine to yield the corresponding pyrazole derivative **4** as end product (Scheme 1).

Antitumor screening. The cytotoxic effects of the new enaminone **2** and bis(pyrazolyl) ketones **4a-g** against human breast cell line MCF-7 were evaluated at the National Institute of Cancer, Cairo, Egypt. Doxorubicin was used as a reference to evaluate the potency of the tested compounds. Five different concentrations of each compound and the reference were used in such screening tests and determination of IC_{50} values. The results are given in Table 1. As shown in Table 1, compound **2** has unpredictable antitumor activity against MCF-7 cell line as its IC_{50} value is 0.87 μg/mL which is close to that of the reference doxotrubicin (IC_{50} = 0.70). Compounds **4a-g** showed, however, less activity than that of compound **2**. This finding indicates that substitution of *N*,*N*-dimethylaminovinyl group in **2** by the 1,3-disubstituted pyrazol-4-yl moiety in **4** decreased the activity. Such a decrease might be due to the fact that the pyrazolyl group is more complex than *N*,*N*-dimethylaminovinyl group. This complexity limits penetration of compounds **4** into the cell or interferes with their metabolism or both and as a result, the antitumor activity decreases. Furthermore, a comparison of the IC_{50} values of compounds **4a-g** indicates further that their activity depends on the nature of the R group. The order of activity is: EtOCO > C_6H_5 > CH_3CO > C_6H_5NHCO > C_6H_5CO = 2-thenoyl > 2-naphthoyl.

In conclusion, a facile synthesis of each of both the novel enaminone **2** and bis(pyrazolyl)ketones **4a-g** is demonstrated. Evaluation of the antitumor activity of these new compounds revealed that compounds **2** (IC_{50} = 0.87 μg/mL) and **4b** (IC_{50} = 1.81 μg/mL) showed good inhibitory activity of human breast cancer cell (MCF-7).

Table I

In vitro cytotoxic activity of the new compounds **2** and **4a-g**.

[a] Doxotrobicin, an antitumor reference.

EXPERIMENTAL

All melting points are uncorrected. IR spectra were recorded in KBr using Pye Unicam SP-1000 Spectrophotometer. ^{1}H NMR spectra were recorded in $DCCl_3$ and DMSO-d_6 using a Varian Em-200 MHz Spectrometer, and TMS as internal reference. Mass spectra were recorded on AEI MS 30 mass spectrometer operating at 70 eV. Elemental analyses were carried out at the Microanalytical Centre of Cairo University. The hydrazonoyl halides **3** were prepared following literature procedures [24].

3-Acetyl-4-benzoyl-1,5-diphenyl-1*H*-pyrazole (1). To an ethanolic sodium ethoxide solution, prepared by dissolving sodium metal (0.12 g, 0.005 g-atom) and absolute ethanol (20 mL), was added dibenzoylmethane (1.12 g, 5 mmol). To the resulting solution *N*-phenyl 2-oxopropanehydrazonoyl chloride **3a** (5 mmol) was added to the solution portionwise while stirring the reaction mixture at room temperature. After complete addition, the reaction mixture was stirred for further 3 h during which the hydrazonoyl chloride dissolved and a new solid precipitated. The latter was filtered off, washed and crystallized from ethanol to give 3-acetyl-4-benzoyl-1,5-diphenyl-1*H*-pyrazole (**1**) as yellow crystals (yield 80%), mp 170–171°C. IR (KBr) ν 1692, 1659 (2C=O); ^{1}H NMR (DMSO-d_6): δ 3.34 (s, 3H, CH_3), 7.15–7.80 (m, 15H, ArH); ^{13}C NMR (DMSO-d_6): δ 26.3, 120.8, 125.8, 127.5, 128.4, 128.6, 128.9, 129.1, 129.3, 129.5, 133.3, 137.3, 138.5, 143.2, 148.5, 177.8, 190.9, 192.2; ms: *m*/*z* (%): 367 ($M^+ + 1$, 25), 366 (M^+, 54), 323 (20), 289 (100), 247 (20), 180 (13), 77 (64). *Anal.* Calcd. for $C_{24}H_{18}N_2O_2$ (366.42): C, 78.67; H, 4.95; N, 7.65%. Found: C, 78.37; H, 5.06; N, 7.66%.

3-[3-(*N*,*N*-Dimethylamino)acryloyl]-4-benzoyl-1,5-diphenyl-1*H*-pyrazole (2). A mixture of 3-acetyl-4-benzoyl-1,5-diphenyl-1*H*-pyrazole (**1**) (3.66 g, 10 mmol) and dimethylformamide-dimethylacetal (DMF-DMA) (2.4 g, 20 mmol) was refluxed for 5 h then left to cool. To the cold mixture was added ether. The resulting yellow solid was filtered, washed with ether, dried and finally crystallized from ethanol to afford the enaminone **2**. This compound was obtained as yellow crystals (yield 70 %), mp 190–192°C; IR (KBr) ν 1678, 1649 (2C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6): δ 2.86 (s, 3H, CH_3), 3.09 (s, 3H, CH_3), 5.84 (d, 1H, *J* = 19 Hz, —CO—CH=), 7.15–7.55 (m, 15H Ar—H), 7.62 (d, 1H, *J* = 19 Hz, =CH—N—); ms: *m*/*z* (%): 422 ($M^+ + 1$, 11), 421 (M^+, 12), 404 (50), 316 (80), 180 (23), 98 (78), 77 (100). *Anal.* Calcd. for $C_{27}H_{23}N_3O_2$ (421.49): C, 76.94; H, 5.50; N, 9.97%. Found: C, 76.70; H, 5.32; N, 10.14%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-substituted-pyrazol-4-yl)ketones (4a-g): General procedure. To a stirred solution of the appropriate hydrazonoyl halide **3** (1 mmol) and the enaminone **2** (0.42 g, 1 mmol) in dry dioxane (50 mL), was added triethylamine (0.5 mL) and the mixture was refluxed for 12 h. The precipitated triethylamine hydrochloride was filtered off, and the filtrate was evaporated under reduced pressure. The residue was triturated with ethanol. The solid product so formed was filtrated, washed with water, and dried. Crystallization from ethanol afforded the corresponding pyrazole derivatives **4**. The physical constants of the products 4a-g are listed in the subsequent sections.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-acetyl-pyrazol-4-yl)ketone (4a). This compound was obtained as pale yellow crystals (yield 75%), mp 150–152°C; IR (KBr) ν 1693, 1655, 1620 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 2.57 (s, 3H, CH_3), 7.24–7.93 (m, 20H, Ar—H), 9.15 (s, 1H, pyrazole); ms: *m*/*z* (%) 537 ($M^+ + 1$, 25), 536 (M^+, 38), 493 (23), 417 (29), 180 (17), 105 (100). *Anal.* Calcd. for $C_{34}H_{24}N_4O_3$ (536.58): C, 76.11; H, 4.51; N, 10.44%. Found: C, 76.41; H, 4.85; N, 10.77%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-ethoxycarbonyl-pyrazol-4-yl)ketone (4b). This compound was obtained as pale orange crystals (yield 68%), mp 105–107°C; IR (KBr) ν 1725, 1663, 1615 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 1.18 (t, 3H, *J* = 7.5 Hz, CH_3), 4.14 (q, 2H, *J* = 7.5 Hz, CH_2), 7.21–7.90 (m, 20H, Ar—H), 9.2 (s, 1H, pyrazole); ms: *m*/*z* (%) 567 ($M^+ + 1$, 32), 566 (M^+, 74), 493 (82), 417 (74), 316 (42), 260 (42), 215 (22), 180 (25), 77 (100). *Anal.* Calcd. for $C_{35}H_{26}N_4O_4$ (566.61): C, 74.19; H, 4.63; N, 9.89%. Found: C, 73.98; H, 4.78; N, 10.11%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-benzoyl-pyrazol-4-yl)ketone (4c). This compound was obtained as pale brown crystals (yield 70%), mp 110–112°C; IR (KBr) ν 1690, 1663, 1620 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 7.1–7.97 (m, 25H, Ar—H), 9.33 (s, 1H, pyrazole); ms: *m*/*z* (%) 599 ($M^+ + 1$, 21), 598 (M^+, 34), 493 (62), 404 (74), 351 (24), 316 (72), 105 (100). *Anal.* Calcd. for $C_{39}H_{26}N_4O_3$ (598.65): C, 78.25; H, 4.38; N, 9.36%. Found: C, 78.46; H, 4.20; N, 9.55%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-phenylaminocarbonyl-pyrazol-4-yl)ketone (4d). This compound was obtained as yellow crystals (yield 66%), mp 120–122°C; IR (KBr) ν 3236 (NH), 1699, 1664, 1618 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 7.19–8.00 (m, 25H, Ar—H), 9.25 (s, 1H, pyrazole), 10.8 (s, 1H, NH, D_2O-exchangeable); ms: *m*/*z* (%) 614 ($M^+ + 1$, 10), 613 (M^+, 37), 521 (46), 260 (8), 222 (9), 180 (10), 105 (100). *Anal.* Calcd. for $C_{39}H_{27}N_5O_3$ (613.66): C, 76.33; H, 4.43; N, 11.41%. Found: C, 76.16; H, 4.58; N, 11.27%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-thenoyl-pyrazol-4-yl)ketone (4e). This compound was obtained as white buff solid (yield 65%), mp 118–120°C; IR (KBr) ν 1694, 1658, 1615 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ, 7.15–8.14 (m, 23H, Ar—H, Het-H), 9.29 (s, 1H, pyrazole); ms: *m*/*z* (%) 605 ($M^+ + 1$, 15), 604 (M^+, 32), 499 (54), 281 (13), 111 (100), 77 (12.5). *Anal.* Calcd. for $C_{37}H_{24}N_4O_3S$ (604.68): C, 73.49; H, 4.00; N, 9.27; S, 5.30%. Found: C, 73.67; H, 3.86; N, 9.10; S, 5.18%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1-phenyl-3-(2-naphthoyl)-pyrazol-4-yl)ketone (4f). This compound was obtained as white buff crystals (yield 68%), mp 100–102°C; IR (KBr) ν 1688, 1662, 1616 (3C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 7.01–8.18 (m, 27H, Ar—H), 9.30 (s, 1H, pyrazole); ms: *m*/*z* (%) 649 ($M^+ + 1$, 71), 648 (M^+, 81), 544 (71), 494 (31), 127 (100). *Anal.* Calcd. for $C_{43}H_{28}N_4O_3$ (648.71): C, 79.61; H, 4.35; N, 8.64%. Found: C, 79.47; H, 4.50; N, 8.40%.

(4-Benzoyl-1,5-diphenyl-pyrazol-3-yl)-(1,3-diphenyl-py-razol-4-yl)ketone (4g). This compound was obtained as pale yellow crystals (yield 72%), mp 130–132°C; IR (KBr) ν 1668, 1647 (2C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 7.16–7.74 (m, 25H, Ar—H), 9.23 (s, 1H, pyrazole); ms: *m*/*z* (%) 571 ($M^+ + 1$, 49), 570 (M^+, 100), 405 (93), 317 (51), 247 (42), 84 (38). *Anal.* Calcd. for $C_{38}H_{26}N_4O_2$ (570.64): C, 79.98; H, 4.59; N, 9.82%. Found: C, 80.14; H, 4.79; N, 9.68%.

Pharmacology. ***Cytotoxic activity against human breast cancer (MCF-7) in vitro.*** The method applied is similar to that reported by Skehan and Storeng [25] using Sulfo-Rhodamine-B stain (SRB). Cells were plated in 96-multiwill plate (10^4 cells/well) for 24 h before treatment with the test compound to allow attachment of cell to the wall of the plate, different concentration of the compound under test (0, 1.0, 2.5, 5, and 10 μg/mL) were added to the cell monolayer in triplicate wells individual dose, monolayer cells were incubated with the compounds for 48 h at 37°C and in atmosphere of 5% CO_2. After 48 h, cells were fixed, washed and stained with SRB stain, excess stain was washed with acetic acid and attached stain was recovered with tris-EDTA buffer, color intensity was measured in an ELISA reader, the relation between surviving fraction and drug concentration is plotted to get the survival curve of tumor cell line and the IC_{50} was calculated. The results are summarized in Table 1.

The treatment of 5-methylene-thiazolidine-2-thione with hydrazine hydrate in boiling dioxane leads in a novel type of ring-expansion reaction to 6-methyl-1,2,4-triazine-3-thione.

J. Heterocyclic Chem., **46**, 552 (2009).

INTRODUCTION

Heterocycles represent the class of compounds that contains the majority of biologically or pharmacologically active substances. A vast number of 1,2,4-triazines [1,2] with antifungal, herbicidal, antibacterial, and tubercolo-static activities have been described. Even on 4,5-dihydro-2*H*-1,2,4-triazine-3-thiones, the Crossfire data bank registers presently more than 900 hits. We present here a new synthetic approach to this ring system.

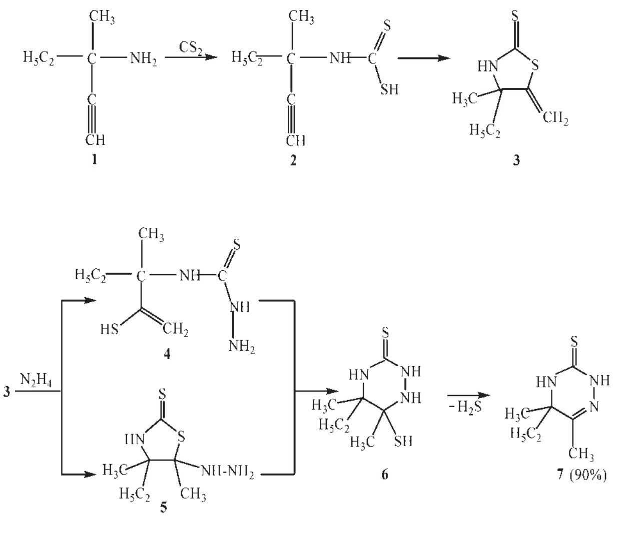
RESULTS AND DISCUSSION

Hennion and Teach [3] published an elegant synthesis of 5-methylene-thiazolidine-2-thiones **3** by the reaction of propargylamines and CS_2 (Scheme 1). The process can be applied to many amines **1** with different substituents [3–8]. We found now that **3** reacts with hydrazine hydrate in ethanol under elimination of H_2S.

Among the variety of conceivable products, we verified the 4,5-dihydro-2*H*-1,2,4-triazine-3-thione structure **7** by one- and two-dimensional NMR studies [HMQC, HMBC]. The (^{1}H,^{15}N) HMBC technique, shown in Figure 1, was the most important tool for the structure determination. Figure 1 depicts the crosspeaks of all expected $^nJ(^1H,^{15}N)$ couplings for $n = 1, 2, 3$. Direct, geminal, and vicinal couplings were observed for 2-H to N-2, N-1, and N-4, respectively. Both diastereotopic methylene protons of the ethyl group on C-5 and the protons of the methyl group on C-5 give vicinal couplings to N-4. The proton on N-4 shows the direct coupling (^1J) to N-4 and a vicinal coupling (^3J) to N-2. Finally, the methyl protons of 6-CH_3 give a ^3J coupling to the sp^2 nitrogen atom N-1. The correlation of the ^{1}H, ^{13}C, and ^{15}N chemical shifts to certain nuclei is presented in Figure 2.

Two possible mechanistic routes for the ring-expansion **3**→**7** are illustrated in Scheme 1. Compound **3** contains C-2 and C-5 as electrophilic centers for the attack of N_2H_4 as nucleophile. The concomitant ring opening to **4**, which represents the hydrazine adduct of an

Scheme 1



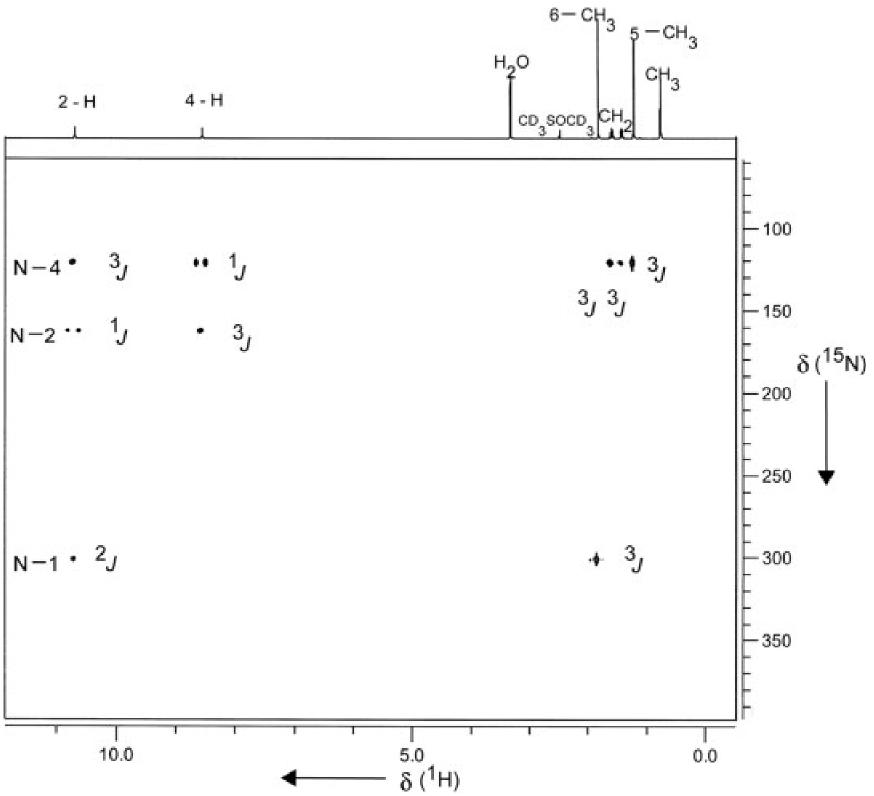


Figure 1. (^1H, ^{15}N) HMBC Spectrum of **7** in CD_3SOCD_3.

isothiocyanate, can be followed by a cyclization to the 1,2,4-triazine derivative **6**. The thiosemicarbazid moiety adds thereby to the polar CC double bond of the ene-thiol function. However, a comparably polar CC double bond is already present in **3**, so that **3**→**5** can be the initial step as well. Ring expansion to **6** and elimination of H_2S (**6**→**7**) can terminate the almost quantitative process **3**→**7**.

We are attempting to apply this ring enlargement reaction in order to generate novel mono- and bicyclic 1,2,4-triazine systems with biological or pharmacological activity [9].

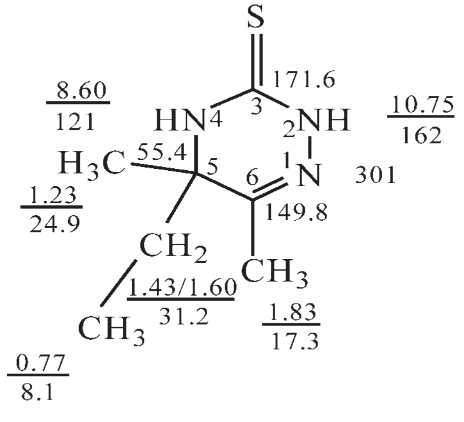

Figure 2. ^1H, ^{13}C, and ^{15}N chemical shifts of **7** in CD_3SOCD_3 [δ (^1H) and δ (^{13}C) values related to TMS as internal standard, δ (^{15}N) values related to NH_3, H_3CNO_2 as external standard]. Because of the chiral center C-5, the CH_2—CH_3 group gives rise to a ABM_3 spin pattern with multiplets at 1.43 and 1.60 ppm for the CH_2 protons and a triplet at 0.77 ppm for the CH_3 protons.

EXPERIMENTAL

Melting points were measured with a Büchi melting point apparatus. NMR spectra were obtained on Bruker AMX 400 and Avance 600 spectrometers. Mass spectra were recorded on a Finnigan MS 95 (field desorption technique) and a Micromass Q-TOF-ULTIMA API (electrospray technique) spectrometer.

5-Ethyl-5,6-dimethyl-4,5-dihydro-2*H*-[1,2,4]triazine-3-thione (7). To 1.73 g (10.0 mmol) 4-ethyl-4-methyl-5-methylene-thiazolidine-2-thione (**3**) [3] in 10 mL dioxane, 20 mL (2.0 g, 40.0 mmol) hydrazine hydrate (65%) were slowly added within 30 min. The vigorously stirred solution was refluxed for 6 h, cooled to 0°C and diluted with 20 mL crushed ice. The formed precipitate was collected by filtration, washed with water, dried, and recrystallized from ethanol. Yield: 1.54 g (90%), mp: 182°C. FD MS: m/z (%) = 171 (100) [M^+]; ESI HRMS m/z: 172.0910 [$M+H^+$], calcd. 172.0908. Anal. Calcd. for $C_7H_{13}N_3S$ (171.3): C, 49.09; H, 7.65; N, 24.54. Found: C, 48.88; H, 7.94; N, 24.39.

Diethyl {[5-amino-4-cyano-3-(methylthio)-1*H*-pyrazol-1-yl]substitutedphenylmethyl}phosphonates **3** were efficiently synthesized *via* the condensation of [(1-hydrazino)substitutedphenylmethyl]phosphonates **1** with 2-[bis(methylthio)methylene]malononitrile **2**. **3** reacted with triethyl orthoformate to afford diethyl (*E*)-{[4-cyano-5-[(ethoxymethylene)amino]-3-(methylthio)-1*H*-pyrazol-1-yl]substitutedphenylmethyl}phosphonates **4**, which reacted with various secondary amines at room temperature to provide the target compounds **5** in good yields. Their structures were confirmed by ir, ^{1}H and ^{31}P NMR, mass spectroscopy, and elemental analyses. The results of preliminary bioassay indicated that compounds **5** possess potent herbicidal activity against the roots of dicotyledonous (oil rape) plants at the dosage of 100 mg/L, and compounds **5c** and **5g** exhibit 80.8% and 76.7% inhibitory activity against *Colletotrichum gossypi* at the concentration of 50 mg/L, respectively. Abstract end data:

J. Heterocyclic Chem., **46**, 555 (2009).

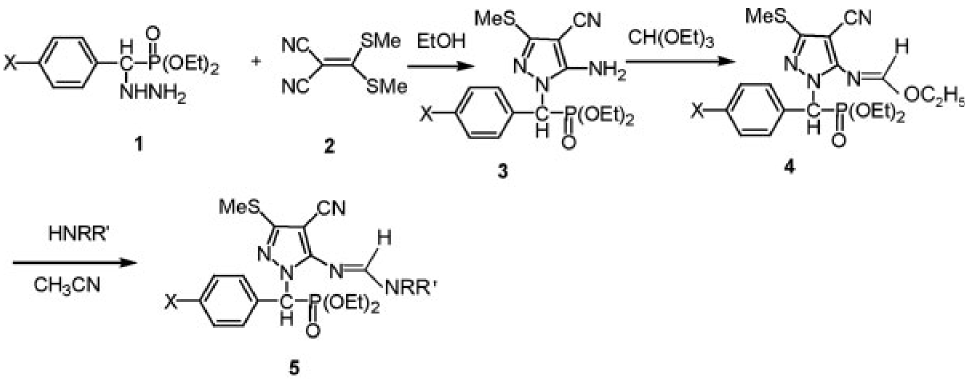
INTRODUCTION

In recent years, 1-aminoalkyl phosphonate analogs, as the phosphorus analogs of natural amino acids are of increasing interest in medicinal chemistry and pesticide science [1,2] because of their wide biological activities such as enzyme inhibitors [3], antibiotics [4], and haptens of catalytic antibodies [5], antifungal agents, herbicides, plant growth regulators, and plant virucides [6]. Recently, pyrazole compounds play an important role in pesticide science, and some pyrazole derivatives have been developed as herbicides [7,8], insecticides (such as Regent and MK-239) [9,10], and fungicides (Furametpyr, Pyraclostrobin) [11]; to the best of our knowledge, some pyrazole derivatives containing phosphorus have shown good biological activities, for example, pyraclofos and flupyrazofos have been developed as good insecticides [12,13]. As a continuation of our search for new biologically active organic phosphorus heterocyclic compounds, we designed and synthesized a series of novel title compounds.

RESULTS AND DISCUSSION

The versatile intermediates, [(1-hydrazino)substitutedphenylmethyl]phosphonates **1** have been reported by several methods [14]. We synthesized it by a modified procedure of Yuan's report [14a]. For converting substituted benzaldehydes to [(1-hydroxy)substitutedphenylmethyl]-phosphonates, an excess of solid catalyst (potassium fluoride, four times) caused difficulty in stirring and incomplete reactivity. Instead, we used one molecular catalyst triethylamine in methylene chloride to avoid these shortcomings and obtained [(1-hydroxy)substitutedphenylmethyl]phosphonates in better yields. Compounds **1** can be obtained in moderate yields by the reaction of diethyl [(1-hydroxy)substitutedphenylmethyl]phosphonates with mesyl

Scheme 1. Synthetic route to compounds **5**.



1a, **3a**, **4a**: X = H; **1b**, **3b**, **4b**: X = F; **5a**: X = H, NRR' = diethylamino; **5b**: X = H, NRR' = piperidin-1-yl; **5c**: X = F, NRR' = diethylamino; **5d**: X = F, NRR' = dipropylamino; **5e**: X = F, NRR' = dibutylamino; **5f**: X = F, NRR' = piperidin-1-yl; **5g**: X = F, NRR' = morpholin-3-yl

chloride, followed by the nucleophilic substitution with hydrazine in a one-pot reaction. Cyclization of compounds **1** with 2-[bis(methylthio)methylene]malononitrile **2** in a mild condition gave diethyl {[5-amino-4-cyano-3-(methylthio) -1*H*-pyrazol-1-yl]substitutedphenylmethyl}phosphonates **3**, which could easily convert to the corresponding imidates **4** in excess triethyl orthoformate. Compounds **4** reacted with various secondary amines such as diethylamine, piperidine, diisopropylamine, dibutylamine, and morpholine to yield the corresponding target compounds **5a**–**5g** conveniently at room temperature (Scheme 1).

The structures of compounds **5a**–**5g** were deduced from their spectral data (ir, ^{1}H and ^{31}P NMR), ms, and elemental analyses. In the ^{1}H NMR spectra of compounds **5**, the methylthio protons display as a singlet at δ 2.6; the CH proton linking with the phosphonyl group appears as a doublet due to coupling with P atom with the coupling constant of 23 Hz, whereas the N=CH proton in compounds **5** appears as a singlet at δ 8.3. The ir spectra of compounds **5** showed normal stretching absorption bands indicating the existence of the CN, Ar group, P=O, and P—O—C moieties. The EI mass spectra of compounds **5** revealed the existence of their molecular ion peaks and main fragmentation peaks. Because of the existence of a C=N bond, it probably existed in *E* and *Z* isomers in compound **4a**–**4b** and target molecules **5a**–**5g**. In ^{1}H NMR spectra, the N=CH proton in compounds **4** and **5** appears as a singlet at δ 8.4 and 8.3, respectively. Due to probably intramolecular hydrogen bonding between the hydrogen of N=CH— moiety with the nitrogen of the CN group and thermodynamic stable isomer, we deduced the stereoconfigurations in compounds **4** and **5** are all in E-configuration, which was also consisted with the configuration of substituted formamides [15] and that of its C=N analog, which was confirmed by single crystal X-ray diffraction [16].

Herbicidal activity. The herbicidal activity of title compounds **5** against *Brassica campestris* L (oil rape) and *Echinochloa crusgalli* (barnyard grass) has been investigated at the dosages of 100 mg/L and 10 mg/L compared with distilled water and the commercially available herbicide, 2,4-dichlorophenoxy acetic acid (**2,4-D**) according to the method described in the experimental section. The preliminary results of bioassay showed that some of compounds **5** possess potent and selective herbicidal activities against dicotyledonous weeds such as oil rape at the dosage of 100 mg/L. For example, compounds **5b**, **5f**, and **5g** exhibit 84.4%, 91.4%, and 96.0% inhibitory activity against the root of rape, respectively. It is also found that compounds **5** exhibit a stronger inhibitory effect against the root of rape than the stem (Table 1). Moreover, the herbicidal activity decreases with the decrease of the dosage of compounds **5**. The QSAR studies of **5** are under investigation.

Fungicidal activities. The preliminary fungicidal activity of the target compounds **5** were evaluated by the classic plate method at a concentration of 50 mg/L. The six fungi used as follows, *Fusarium oxysporium*, *Rhizoctonia solani*, *Botrytis cinereapers*, *Gibberella zeae*, *Dothiorella gregaria*, and *Colletotrichum gossypi*, belong to the group of field fungi and were isolated from corresponding crops. The activity data were also listed in Table 1. The results indicated that most of compounds **5** exhibit moderate to weak inhibitory activities against the above six fungi. For example, compounds **5c** and **5g** exhibit 80.8% and 76.7% inhibitory activity against *Colletotrichum gossypi*, respectively.

In conclusion, we developed an efficient synthesis of diethyl (*E*)-{[4-cyano-5-[[(disubstitutedamino)methylene]amino]-3-(methylthio)-1*H*-pyrazol-1-yl] substituitedphenylmethyl}phosphonates *via* a multistep reaction.

The preliminary bioassays showed that these compounds possess potent herbicidal activity against the roots of dicotyledonous (oil rape) plants at the dosage of 100 mg/L, and some of them displayed moderate fungicidal activity at the concentration of 50 mg/L.

EXPERIMENTAL

Melting points were determined with a WRS-1B digital melting point apparatus and were uncorrected. ^{1}H and ^{31}P NMR spectra were recorded on a Varian MERCURY-PLUS400 (400 MHz) spectrometer with deuteriochloroform as the solvent and TMS and 85% phosphoric acid as the internal and external references, respectively. Mass spectra were obtained with a Finnigan TRACEMS2000 spectrometer using the EI method; IR spectra were measured by a Nicolet NEXUS470 spectrometer; Elemental analyses were performed with an Elementar Vario ELIII CHNSO elementary analyzer. All of the solvents and materials were reagent grade and purified as required. [(1-Hydrazino)substitutedphenylmethyl]-phosphonates **1** [14a], 2-[bis(methylthio)methylene]malononitrile **2** [17] were prepared according to the literature procedures.

General procedure for the preparation of compounds 1. A mixture of substituted benzaldehyde (0.1 moles), diethyl phosphite (13.8 g, 0.1 moles), and triethylamine (5.1 g, 0.05 moles) was heated at 75°C for 0.5 h until the reaction completed (monitored by tlc). After cooling, mesyl chloride (12.5 g, 0.11 moles) in anhydrous methylene chloride (100 mL) was added dropwise at 0°C. After the addition completed, the mixture was stirred at room temperature for 2 h. The solid was removed by filtration, the filtrate was washed by distilled water (30 mL × 3), dried over anhydrous sodium sulphate, and then concentrated *in vacuo* to give [(1-mesyl oxy)-substitutedphenylmethyl]phosphonate as a light yellow liquid, yield: 87–91%, which can be used without further purification.

To the mixture of [(1-mesyl oxy)substitutedphenylmethyl]-phosphonate (0.1 moles) in ethanol (40 mL) was added drop wise 85% hydrazine (26.4 g, 0.4 moles) at 0°C, after the addition finished, the mixture was stirred for 6–8 h at 45–50°C. The workup involved stripping of the solvent followed by an addition of water (100 mL) and extraction of the product into anhydrous ethyl ether (50 mL × 3), after phase separation, drying over anhydrous sodium sulphate, filtration and evaporation, a crude product 1 was yielded as a yellow liquid, yield 40–45%, which can be used without further purification.

General procedure for the preparation of compounds 3. A mixture of 1 (24.3 mmoles), 2 (3.89 g, 22.9 mmoles), and anhydous ethanol (30 mL) was refluxed for 5 h [18]. After cooling, the reaction mixture was concentrated *in vacuo* and recrystallized from ethyl acetate and petroleum ether (1;1, *v*/*v*) to give white crystals.

3a: yield: 64%, mp 161–163°C; ^{1}H NMR: δ 1.19–1.27 (m, 6H, 2CH$_3$), 2.53 (s, 3H, SCH$_3$), 4.01–4.16 (m, 4H, 2CH$_2$), 5.54 (s, 2H, NH$_2$), 5.75 (d, *J* = 24 Hz, 1H, PCH), 7.27–7.52 ppm (m, 5H, Ar—H); ir: NH$_2$ 3358, Ar—H 2995, CN 2215, P=O 1265, P—O—C 1048, P—C 978 cm^{-1}; ms: *m*/*z* 380 (M$^+$, 65), 333 (16), 227 (48), 153 (100); Anal. Calcd for $C_{16}H_{21}N_4O_3PS$: C, 50.52; H, 5.56; N, 14.73. Found: C, 50.69; H, 5.48; N, 14.89.

3b: yield: 71%, mp158–159°C. ^{1}H NMR: δ 1.19–1.27 (m, 6H, 2CH$_3$), 2.53 (s, 3H, SCH$_3$), 4.01–4.16 (m, 4H, 2CH$_2$), 5.56 (s, 2H, NH$_2$), 5.72 (d, *J* = 24 Hz, 1H, PCH), 7.28–7.50 ppm (m, 4H, Ar—H); ir: NH$_2$ 3342, Ar—H 2992, CN 2210, P=O 1256, P—O—C 1045, P—C 975 cm^{-1}; ms: *m*/*z* 398 (M$^+$, 81), 261 (50), 109 (100); Anal. Calcd for $C_{16}H_{20}FN_4O_3PS$: C, 48.24; H, 5.06; N, 14.06. Found: C, 48.39; H, 4.81; N, 14.14.

General procedure for the preparation of compounds 4. 3 (6 mmoles) was dissolved in triethyl orthoformate (4 mL), and the mixture was refluxed for 2 h. After cooling, the solvent was removed under a reduced pressure, and the residue was purified on silica gel (ethyl acetate-light petroleum ether, 1:5, *v*/*v*) to afford 4 as a white solid.

4a. yield: 95%, mp 64–66°C. ^{1}H NMR: δ 1.18–1.27 (m, 6H, 2CH$_3$), 1.40 (t, *J* = 7 Hz, 3H, CH$_3$), 2.62 (s, 3H, SCH$_3$), 4.01–4.20 (m, 4H, 2CH$_2$), 4.39 (t, *J* = 6.6 Hz, 2H, CH$_2$), 5.90 (d, *J* = 22.8 Hz, 1H, PCH), 7.33–7.55 (m, 5H, Ar—H), 8.39 ppm (s, 1H, N=CH); ir: Ar—H 2976, CN 2222, C=N— 1608, P=O 1266, P—O—C 1058, P—C 969 cm^{-1}; ms: *m*/*z* 436 (M$^+$, 65), 391 (79), 389 (52), 109 (100); Anal. Calcd for $C_{19}H_{25}N_4O_4PS$: C, 52.28; H, 5.77; N, 12.84. Found: C, 52.41; H, 5.54; N, 12.72.

4b. yield: 89%, mp 77–78°C. ^{1}H NMR: δ 1.19–1.31 (m, 6H, 2CH$_3$), 1.42 (t, *J* = 7.2 Hz, 3H, CH$_3$), 2.61 (s, 3H, SCH$_3$), 4.02–4.05 (m, 2H, CH$_2$), 4.14–4.18 (m, 2H, CH$_2$), 4.38–4.41 (m, 2H, CH$_2$), 5.87 (d, *J* = 22.4 Hz, 1H, PCH), 7.04 (dd, *J* = 8.4 Hz, *J* = 8.4 Hz, 2H, Ar—H), 7.54 (dd, *J* = 5.2 Hz, *J* = 8.4 Hz, 2H, Ar—H), 8.41 ppm (s, 1H, N=CH); ir: Ar—H 2972, CN 2210, C=N— 1616, P=O 1248, P—O—C 1042, P—C 970 cm^{-1}; ms: *m*/*z* 456 (16), 454 (M$^+$, 45), 411 (36), 409 (57), 109 (100); Anal. Calcd for $C_{19}H_{24}FN_4O_4PS$: C 50.21, H 5.32, N 12.33; found C 50.03, H 5.15, N 12.18.

General procedure for the preparation of compounds 5. A solution of 4 (1 mmole) and secondary amine (1.5 mmoles) in anhydrous acetonitrile (15 mL) was stirred at room temperature for 0.5–1 h (monitorede by tlc). After the reaction was complete, the solvent was removed under reduced pressure, and the residue was purified on silica gel (petroleum ether and acetone, 4:1, *v*/*v*) to yield the corresponding target compounds 5a–5g.

5a. Colorless oil, yield: 75%; ^{1}H NMR: δ 1.18–1.29 (m, 12H, 4CH$_3$), 2.62 (s, 3H, SCH$_3$), 3.32 (q, *J* = 6.8 Hz, 2H, NCH$_2$), 3.34–3.48 (m, 1H, NCH$_2$), 3.56–3.61 (m, 1H, NCH$_2$), 3.99–4.06 (m, 2H, OCH$_2$), 4.16–4.21 (m, 2H, OCH$_2$), 6.06 (d, *J* = 23 Hz, 1H, PCH), 7.27–7.32 (m, 3H, Ar—H), 7.54 (d, 2H, *J* = 6.4 Hz, Ar—H), 8.26 ppm (s, 1H, N=CH); ^{31}P NMR (162 MHz): δ 16.79 ppm; ir: Ar—H 2974, CN 2214, C=N— 1617, P=O 1260, P—O—C 1026, P—C 976 cm^{-1}; ms: *m*/*z* 463 (M$^+$, 35), 326 (100), 279 (18); Anal. Calcd for $C_{21}H_{30}N_5O_3PS$: C, 54.41; H, 6.52; N, 15.11. Found: C, 55.14; H, 6.67; N, 14.98.

5b. Colorless crystals, yield: 95%; mp 87.9–89.6°C; ^{1}H NMR: δ 1.17–1.26 (m, 6H, 2CH$_3$), 1.62–1.71 (m, 6H, CH$_2$CH$_2$CH$_2$), 2.62 (s, 3H, SCH$_3$), 3.37 (t, *J* = 5.2 Hz, 2H, NCH$_2$), 3.64 (t, *J* = 5.2 Hz, 2H, NCH$_2$), 3.98–4.04 (m, 2H, OCH$_2$), 4.14–4.21 (m, 2H, OCH$_2$), 6.07 (d, *J* = 23.2 Hz, 1H, PCH), 7.29–7.35 (m, 3H, Ar—H), 7.56 (d, *J* = 7.6 Hz, 2H, Ar—H), 8.23 ppm (s, 1H, N=CH); ^{31}P NMR (162 MHz): δ 16.98 ppm; ir: Ar—H 2985, CN 2212, C=N— 1618, P=O

Bioassay method

Herbicidal activities testing. Herbicidal testing of the newly synthesized compounds **5** was carried out in a greenhouse, with temperature 23 ± 1°C, relative humidity (RH) 60 ± 5%, light intensity 10 Klux, photoperiod 8 h/day. Twenty seeds of each weed species including oil rape and barnyard grass were chosen for testing. Seedlings were grown in the test plate of 9 cm diameter containing two pieces of filter paper and 9 mL solution of the tested compound (100 mg/L and 10 mg/L, respectively). Distilled water and **2,4-D** were used as the comparison compounds. The herbicidal activity was assessed as the inhibitory rate in comparison with the distilled water. The herbicidal rating score based on visual observation. Range from 0 to 100%, 0% means no effect, 100% means complete killing. The test was run three times, and the results were averaged and given as activity in Table 1.

Fungicidal activity testing. The fungicidal activity measurement method was adapted from the one described by Molina-Torres *et al* [19]. The synthesized target compounds were dissolved in 0.5–1.0 mL of *N,N*-dimethylformamide to the concentration of 500 mg/L. The solutions (1 mL) were mixed rapidly with thawed potato glucose agar culture medium (9 mL) under 50°C. The mixtures were poured into petridishes. After the dished were cooled, the solidified plates were incubated with 4 mm mycelium disk, inverted, and incubated at 28°C for 48 h. Distilled water was used as the blank control. Three replicates of each test were carried out. The mycelial elongation radius (mm) of fungi settlements was measured after 48 h of culture. The growth inhibitory rates were calculated with the following equation: $I = [(C - T)/C] * 100\%$. Here, I is the growth inhibitory rate (%), C and T are the mycelial elongation radius (mm) of fungus settlements and that of treatment group, respectively. The results are also given in Table 1.

An improved preparation method of 3-(1,1-dimethylallyl)decursinol from inexpensive commercially available start material was described. In the cyclization of **13**, silica gel was used as catalyst to give **1** with high purity and satisfying yield.

J. Heterocyclic Chem., **46**, 560 (2009).

INTRODUCTION

3-(1,1-dimethylallyl)decursinol (**1**) was previously isolated from *Helietta longifoliata* Britt, a plant growing in South America, which has been used in Brazilian folk medicine for the treatment of various disease [1,2]. Compound **1** and it analogues (Fig. 1), such as (+)-decursinol (**2**), decursin (**3**), and decursinol angelate (**4**), constitute a class of dihydropyranocoumarin natural product, which has received considerable attention because of their diverse range of biological activities [2]. Both **3** and**4** have protein kinase C-related cytotoxic activity against various human cancer cells [3,4]. Compound **2** and **3** exhibited *in vitro* activities toward acetylcholinesterase, as well as the two compounds could excellently improve scopolamine-induced amnesia *in vivo*. Additionally, these dihydropyranocoumarin was found to exhibit anti-*Helicobacter pylori* activity and strong analgestic activity [5].

As the resource of **1** is restricted to the species of *Helietta longifoliata*, the detailed biological investigation has not been successful so far. To explore the potential biological activities of **1** and its derivatives, a reliable preparing procedure in large scale was needed. Rosario has semisynthesized the compound of **1** in milligram scale; nevertheless, the resource of start material was also limited [6].

Herein, an improved preparing procedure, staring with inexpensive, commercially available 7-hydroxy-2*H*-chromen-2-one (**5**), was reported (Scheme 1). In the process, compound **9**was deprotected in the presence of active Ni with almost quantitative yield. The cyclization of compound **13** could be promoted by silica gel to obtain compound **1**, and the later was purified by simple crystallization rather than chromatograph.

RESULTS AND DISCUSSION

The hydroxyl in compound **5** was protected by benzyl in the presence of potassium carbonate to give **6**. The latter was treated with sodium methoxide in refluxing methanol, and then reacted with 1-bromo-3-methylbut-2-ene to obtain compound **8**. On heating in refluxing diethylaniline, **8** smoothly rearranged, resulting in prenyl substitution at the free C-3 position with concomitant relactonisation to produce **9** [7].

In the ref. [7], the benzyl group was removed in the presence of trichloroborane; nevertheless, our attempt to scale up the reaction in several hundred grams was failed. The reason was trichloroborane, a strong Lewis-acid, could induce some side-reaction. Hydrogenation of **9** to remove the benzyl, using Raney Ni as catalyst afforded the compound **10**in quantitative yield, although trace of by-product was formed.

The free hydroxyl of **10** was prenylated to furnish the key intermediate **11**, sigmatropic rearrangement of which in refluxing diethylaniline gave the compound **12**. Epoxidation of **12** in dichloromethane gave the unstable intermediate**13**, which could be conversed to compound **1** in the presence of silica gel *in situ*, and the product can be purified conveniently by crystallization in ethyl acetate.

EXPERIMENTAL

All solvents and reagents were purchased from the suppliers and used without further purification. ^{1}H NMR spectra were recorded in deuteriochloroform or DMSO-d_6 at room temperature on a Bruker AMX-400/600 at 400 MHz using TMS as an internal standard. The mass spectrum was recorded on a

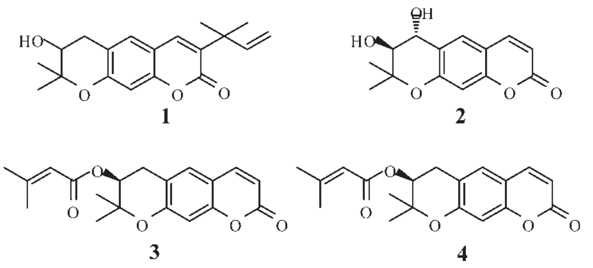

Figure 1. Structures of **1** and its analogues.

Finnigan MAT-95/711 spectrometer. Melting points were measured on a Buchi-510 melting point apparatus, which are uncorrected. TLC analyses were performed on Merck silica gel 60 F_{254} plate.

7-(Benzyloxy)-2*H*-chromen-2-one (6). 1.0 kg (6.18 mol) compound **5** was added to the mixture of 2.0 kg (14.47 mol) K_2CO_3, 0.1 kg KI (0.6 mol), and 12 L acetone and then, 0.86 kg (6.78 mol) benzyl chloride was added. The resulted mixture was heated to reflux for 4 h, cooled to room temperature, filtrated, and the filtration was concentrated under decreased pressure. The residue was dissolved in 20 L CH_2Cl_2, washed with saturated NH_4Cl solution and H_2O, dried over Na_2SO_4, concentrated, and filtrated to obtain 1.5 kg white solid **6**, yield 96.4%, mp 151–154°, ref. [8] 153–155°. The spectroscopic data correspond to those reported in the ref. [8].

Methyl 3-(4-(benzyloxy)-2-hydroxyphenyl)acrylate (7). 1.5 kg (6 mol) **6** was dissolved in the mixture of 16 L methanol and 2.0 kg (37 mol) sodium methylate. The resulted mixture was heated to reflux for 6 h, cooled to room temperature, added to 40 L of 2.6*M* hydrochloric acid with stirring at 0°, filtrated to obtain white solid. The solid was washed with H_2O, dried at 60° to obtain 1.27 kg **7** as white solid, yield 75%, mp 182–183°, ref. [7] 184.5–186°; ^{1}H NMR (400 MHz, DMSO-d_6): δ 3.66 (s, 3H), 5.06 (s, 2H), 6.45 (d, $J = 16$ Hz, 1H), 6.50 (s, 1H), 6.52 (d, $J = 7.2$ Hz, 1H), 7.32–7.43 (m, 5H), 7.52 (d, $J = 7.2$ Hz, 1H), 7.77 (d, $J = 16$ Hz, 1H).

Methyl 3-(4-(benzyloxy)-2-(3-methylbut-2-enyloxy) phenyl) acrylate (8). 1.27 kg (4.45 mol) compound **7** was added to the suspension of 1.24 kg (9.27 mol) K_2CO_3 and 120 g (0.73 mol) KI in 15 L acetone, then the 620 mL (5.34 mol) 1-bromo-3-methylbut-2-ene was added dropwise. The resulted mixture was stirred at room temperature for 3 h, filtrated, and the filtration was concentrated. The obtained residue was dissolved in 8 L CH_2Cl_2, and the organic layer was washed by H_2O and saturated brine, dried over Na_2SO_4, filtrated, and concentrated to oil. The oil was stirred in 3 L petroleum ether for 2 h, filtrated to obtain 1.2 kg **8** as white solid, yield 77%, mp 62–63°, ref. [7] 59–61°; ^{1}H NMR (300 MHz, deuteriochloroform): δ 1.76 (s, 3H), 1.82 (s, 3H), 3.79 (s, 3H), 4.55 (d, $J = 7.2$ Hz, 2H), 5.06 (s, 2H), 5.48 (m, 1H), 6.42 (d, $J = 16$ Hz, 1H), 6.55 (m, 2H), 7.37 (m, 6H), 7.63 (d, $J = 9$ Hz, 1H).

7-(Benzyloxy)-6-(3-methylbut-2-enyl)-2*H*-chromen-2-one (9). 400 g (1.1 mol) **8** was dissolved in 2 L *N*,*N*-diethyl-benzenamine in 5 L reactor equipped with water segregator. The solvent was heated to reflux under N_2. During the removing of methanol, the temperature of reaction mixture developed from 202° to 226°, reflux for another 3 h, cooled to room temperature. The mixture was added into 10 L of 2*M* hydrochloric acid, extracted with ethyl acetate three times. The combined organic layer was washed by saturated brine, dried over Na_2SO_4, concentrated to obtain slurry, filtrated to obtain 713 g **9** as white solid, yield 65%, mp 102–103°, ref. [7] 104–104.5°; ^{1}H NMR (300 MHz, deuteriochloroform): δ 1.66 (s, 3H), 1.76 (s, 3H), 3.37 (d, $J = 7.2$ Hz, 2H), 5.06 (s, 2H), 5.30 (m, 1H), 6.25 (d, $J = 9$ Hz, 1H), 6.83 (s, 1H), 7.21 (s, 1H), 7.42 (m, 5H,), 7.63 (d, $J = 9$ Hz, 1H).

7-Hydroxy-6-(3-methylbut-2-enyl)-2*H*-chromen-2-one (10). 355 g (1.1 mol) compound **9** was dissolved in the mixture of 3.5 L ethanol, 500 mL H_2O, and 10 g Raney Ni, the resulted suspension was stirred under H_2 at room temperature for 24 h, filtrated, the filtration was concentrated to obtain white solid 250 g **10**, yield 98%, mp 133–135°, ref. [7] 133–135°; ^{1}H NMR (300 MHz, deuteriochloroform): δ 1.75 (s, 3H), 1.79 (s, 3H), 3.38 (d, $J = 7.5$ Hz, 2H), 5.34 (m, 1H),

6-(3-Methylbut-2-enyl)-7-(3-methylbut-2-enyloxy)-2*H*-chromen-2-one (11). 77 g (4.45 mol) compound **10** was added to the suspension of 120 g (0.95 mol) K_2CO_3 and 5 g (30 mmol) KI in 1 L acetone, then the 60 mL (0.5 mol) 1-bromo-3-methylbut-2-ene was added dropwise. The resulted mixture was stirred at room temperature for 3 h, filtrated, and the filtration was concentrated. The obtained residue was dissolved in 0.5 L CH_2Cl_2, and the organic layer was washed by H_2O and saturated brine, dried over Na_2SO_4, filtrated, and concentrated to oil. The oil was stirred in 300 mL petroleum ether for 2 h, filtrated to obtain 70 g **11** as white solid, yield 70%, mp 76–78°, ref. [7] 78–79°; ^{1}H NMR (300 MHz, deuteriochloroform): δ 1.71 (s, 3H), 1.77 (s, 6H), 1.78 (s, 3H), 3.38 (d, $J = 7.5$ Hz, 2H), 4.63 (d, $J = 7.5$ Hz, 2H), 5.30 (m, 1H), 5.46 (m, 1H), 6.76 (s, 1H), 7.17 (s, 1H), 7.61 (d, $J = 9$ Hz, 1H).

7-Hydroxy-6-(3-methylbut-2-enyl)-3-(2-methylbut-3-en-2-yl)-2*H*-chromen-2-one (12). 82 g (1.1 mol) compound **11** was dissolved in 0.5 L *N*,*N*-diethylbenzenamine in 5 L reactor equipped with water segregator. The solvent was heated to reflux under N_2. During the removing of methanol, the temperature of reaction mixture developed from 202° to 226°, reflux for another 3 h, cooled to room temperature. The mixture was added into 500 mL of 2*M* hydrochloric acid, extracted with ethyl acetate three times. The combined organic layer was washed by saturated brine, dried over Na_2SO_4, concentrated to obtain residue, which was purified on silica gel column (petroleum ether:ethyl acetate = 20:1) filtrated to obtain 27.5 g **12** as white solid, yield 32%, mp 163–165°, ref. [7] 181–183°; ^{1}H NMR (300 MHz, deuteriochloroform): δ 1.47 (s, 6H), 1.77 (s, 3H), 1.79 (s, 3H), 3.38 (d, $J = 7.5$ Hz, 2H), 5.04 (dd, 1H), 5.30 (m, 1H), 6.08–6.21 (m, 2H), 6.84 (s, 1H), 7.17 (s, 1H), 7.50 (s, 1H).

(±)-3-(1,1-Dimethylallyl)decursinol (1). 5 g (16.7 mmol) compound **12** was dissolved in 80 mL ethyl ether, to which 4.3 g (21.2 mmol) m-CPBA was added in portions at 0°C, the mixture was stirred for 6 h at room temperature. The reaction was monitored by TLC. When compound **12** was consumed up, 10 g silica gel was added to the resulted mixture at 0°, stirred for another 1 h. The mixture was filtrated, and the filtration was washed by saturated $NaHCO_3$ and H_2O, dried over Na_2SO_4, concentrated to obtain crude product, which was crystallized in ethyl acetate to give 3.7 g **1** as white solid, yield 70%, mp 182–183°, ref. [6] 181–183°; ms: m/z 337 (M^++Na); ^{1}H NMR (300 MHz, $CDCl_3$): δ 1.35 (s, 3H), 1.38 (s, 3H), 1.47 (s, 6H), 2.82 (dd, $J = 14$, 6 Hz, 1H), 3.10 (dd, $J = 14$, 6 Hz, 1H), 3.85 (m, 1H), 1.79 (s, 3H), 3.38 (d, $J = 7.5$ Hz, 2H), 5.06 (m, 2H), 6.17 (dd, $J = 17$, 12 Hz, 1H), 6.74 (s, 1H), 7.15 (s, 1H), 7.47 (s, 1H).

A series of novel pyrimido[5,4-*b*][4,7]phenanthroline-9,11(7*H*,8*H*,10*H*,12*H*)-dione derivatives were synthesized *via* microwave-assisted three-component reactions of barbituric acid, aldehyde, and quinolin-6-amine in DMF without catalyst. This facile synthesis not only offers an economical and efficient synthetic strategy to this class of significant compounds but also enriches the investigations on microwave-assisted multicomponent reactions. Moreover, this protocol has the prominent advantages of short reaction time, good yields, low cost, easy operation, as well as environmental-friendliness.

J. Heterocyclic Chem., **46**, 563 (2009).

INTRODUCTION

Multicomponent reactions (MCRs) are of increasing importance in organic and medicinal chemistry, because the strategies of MCR offer significant advantages over conventional linear-type syntheses. MCRs leading to interesting heterocyclic scaffolds are particularly useful for the creation of diverse chemical libraries of ''drug-like'' molecules for biological screening, since the combination of three or more small-molecular weight building blocks in a single operation leads to a high-combinatorial efficacy [1]. On the other hand, microwave-assisted organic synthesis has been a topic of continued studies as it could lead to higher yields of pure products, easier operation, and shorter reaction time when compared with the traditional heating method [2].

Thus, it goes without saying that the use of atom-economical MCRs, together with the employment of energy-efficient microwave irradiation (MW), must be considered to be facile and effective synthetic strategy of heterocyclic compounds with important bioactivities in the sense that the combination in itself offers greater potential than the two parts in isolation.

Pyrimido[5,4-*b*][4,7]phenanthroline-9,11(7*H*,8*H*,10*H*,12*H*)-diones (**4**, Fig. 1), a novel class of fused heterocyclic compounds, are incorporated by pyrimido-[4,5-*b*]quinoline-2,4(1*H*,3*H*,5*H*,10*H*)-dione and [4,7]-phenantroline motifs, both of which possess various important bioactivities. For example, not only are pyrimido[4,5-*b*]quinoline-2,4(1*H*,3*H*,5*H*,10*H*)-dione derivatives antitumor [3], anticancer [4], antihypertensive [5], and antibacterial [6], they are also inhibitors of Kaposi's sarcoma-associated herpesvirus (KSHV) [7] and topoisomerase, useful for the treatment of topoisomerase-associated diseases and disorders [8]. At the same time, [4,7]phenantroline derivatives exhibit antitumor [9], anticancer [10], antiviral [11], antimalarial [12], antiinfective [13], cytotoxic [14] activities, as well as being triple-helix DNA stabilizing agents [15]. Hence, it is promising that the fused scaffolds of pyrimido[4,5-*b*]quinoline-2,4(1*H*,3*H*,5*H*,10*H*)-dione with [4,7]phenanthroline, *i.e.*, pyrimido[5,4-*b*][4,7]phenanthroline-9,11-(7*H*,8*H*,10*H*,12*H*)-diones, may display novel or enhanced significant bioactivities.

However, survey of the literature revealed that the synthesis of this important fused heterocyclic skeleton was neglected. Therefore, the investigation on the synthesis of pyrimido[5,4-*b*][4,7]phenanthroline-9,11-(7*H*,8*H*,10*H*,12*H*)-diones is of great necessity.

In view of the prominent merits of microwave-assisted multicomponent reactions and the potential

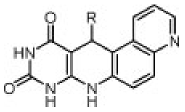

Figure 1. Structure of **4**.

bioactivities of fused heterocyclic compounds, lots of investigations on this topic have been carried out in our laboratory [16]. Herein, we would like to report a facile and efficient synthesis of pyrimido[5,4-*b*][4,7]phenanthroline-9,11-(7*H*,8*H*,10*H*,12*H*)-diones **4** *via* microwave-assisted three-component reactions of barbituric acid **1**, aldehyde **2**, and quinolin-6-amine **3** in DMF without catalyst (Scheme 1).

RESULTS AND DISCUSSION

Initially, the three-component reaction of barbituric acid **1**, 4-bromobenaldehyde **2c** and quinolin-6-amine **3** was employed to optimize the reaction conditions. As illustrated in Table 1, DMF was preferred as the optimal solvent and 110°C was chosen as the most suitable reaction temperature.Moreover, we found that the yield of this reaction was affected by the volume of solvent. The synthesis of **4c** was tested in different volumes of DMF at 110°C. The results show that 1.5 mL of DMF were optimal as solvent since it generated the highest yield of **4c**.

Under these optimized reaction conditions (1.5 mL of DMF, 110°C), a series of pyrimido[5,4-*b*][4,7]phenanthroline-9,11(7*H*,8*H*,10*H*,12*H*)-dione derivatives **4** were synthesized under MW, and the results were summarized in Table 2. It is obvious this protocol could be applied to various aromatic aldehydes with electron-withdrawing groups or electron-donating groups. Besides, the results suggest that the substrates bearing electron-withdrawing groups have higher reactivity (higher yields and shorter reaction time) than those bearing electron-donating groups. So, it is concluded that the electronic nature of the substituents on aldehydes has some effect on this reaction. It seems that the electron-withdrawing groups in aldehydes enhanced the electropositive property of β-C in the intermediates yielded from the Knoevenagel condensation of aldehydes **2** with barbituric acid **1**, which facilitated the nucleophilic attack thereafter.

Scheme 1

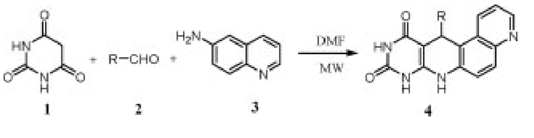

Table 1

Reaction conditions optimization for the synthesis of **4c**.

Entry	Solvent	*T* (°C)	Time (min)	Yield (%)
1	EtOH	90	15	52
2	HOAc	90	15	63
3	Water	90	15	37
4	Glycol	90	12	79
5	DMF	90	10	86
6	DMF	70	15	78
7	DMF	80	12	82
8	DMF	100	8	90
9	DMF	110	6	92
10	DMF	120	6	92

To demonstrate the superiority of MW over standard heating conditions (SC), we also performed the syntheses of **4c** under SC in DMF at 110°C. Under this condition, the reaction time was prolonged from 6 min (under MW) to 4 h and the yield was decreased from 92% (under MW) to 76%. Therefore, MW exhibited several distinct advantages over SC by not only significantly reducing the reaction time and dramatically improving the reaction yield, but also being environmental-friendly.

The structures of all the synthesized compounds were established on the basis of their spectroscopic data and elemental analyses.

In conclusion, we have developed a facile and efficient method on the synthesis of novel pyrimido [5,4-*b*][4,7]phenanthroline-9,11(7*H*,8*H*,10*H*,12*H*)-dione derivatives *via* microwave-assisted three-component reactions in DMF without catalyst. This protocol has the prominent advantages of short reaction time, good yields, low cost, easy operation, as well as environmental-friendliness. At the same time, this synthesis can not only offer an efficient strategy to highly fused heterocyclic compounds with biological significance but also enrich the investigations on microwave-assisted multicomponent reactions. Moreover, this series of novel pyrimido[5,4-*b*][4,7]phenanthroline-9,11(7*H*,8*H*,10*H*,-12*H*)-diones may provide new class of biologically active compounds for biomedical screening.

EXPERIMENTAL

Microwave irradiation was carried out in a monomodal Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden. Melting points were determined in XT5 apparatus and were uncorrected. IR spectra were recorded on a FT-IR-Tensor 27 spectrometer. ^{1}H NMR spectra were measured on a DPX 400 spectrometer operating at 400 MHz, using DMSO-d_6 as solvent and TMS as internal standard. Elemental analysis was determined by using a Perkin-Elmer 240c elemental analysis instrument.

Table 2

Synthesis of **4** under microwave irradiation.

Entry	4	R	Time (min)	Yield (%)	M.P. (°C)
1	**4a**	4-FC_6H_4	6	89	>300
2	**4b**	4-ClC_6H_4	8	90	>300
3	**4c**	4-BrC_6H_4	6	92	>300
4	**4d**	3,4-$(CH_3O)_2C_6H_3$	14	78	>300
5	**4e**	3-$NO_2C_6H_4$	6	86	>300
6	**4f**	4-$CH_3C_6H_4$	12	81	>300

8	**4h**	4-OH-3-$NO_2C_6H_3$	13	81	>300
9	**4i**	3,4-$OCH_2OC_6H_3$	15	72	>300

General procedure for the syntheses of compounds 4 with microwave irradiation. Typically, in a 10 mL Emrys^{TM} reaction vial, barbituric acid **1** (1 mmol), aldehyde **2** (1 mmol), quinolin-6-amine **3** (1 mmol), and and DMF (1.5 mL) were mixed and then capped. The mixture was irradiated at 150 W and at 110°C for a given time. The reaction mixture was cooled to room temperature and poured into water (50 mL), filtered to give the crude product, which was further purified by recrystallization from EtOH.

12-(4-Fluorophenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11 (7H,8H,10H,12H)-dione (4a). This compound was obtained according to above general procedure; ir (KBr): ν 3207, 3066, 1714, 1655, 1633, 1543, 1471, 1381, 1265, 1093, 976, 862 cm^{-1}; ^{1}H NMR: δ 10.73 (s, 1H, NH), 10.54(s, 1H, NH), 9.32(s, 1H, NH), 8.70 (d, 1H, J = 4.0 Hz, ArH), 8.35 (d, 1H, J = 8.4 Hz, ArH),7.91–7.96 (m, 1H, ArH), 7.65 (d, 1H, J = 8.8 Hz, ArH),7.42 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.29 (dd, 2H, J = 7.6, 6.0 Hz, ArH), 7.00 (t, 2H, J = 8.4 Hz, ArH),5.76 (s, 1H, CH). Anal. calcd for $C_{20}H_{13}FN_4O_2$: C, 66.66; H, 3.64; N, 15.55; Found C, 66.70; H, 3.68; N, 15.52.

12-(4-Chlorophenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11 (7H,8H,10H,12H)-dione (4b). This compound was obtained according to above general procedure; ir (KBr): ν 3203, 3065, 1714, 1683, 1634, 1543, 1487, 1381, 1266, 1089, 976, 830 cm^{-1}; ^{1}H NMR: δ 10.74 (s, 1H, NH), 10.55 (s, 1H, NH), 9.34 (s, 1H, NH), 8.70 (d, 1H, J = 4.0 Hz, ArH), 8.34 (d, 1H, J = 8.4 Hz, ArH), 7.94 (t, 1H, J = 8.4 Hz, ArH), 7.65 (d, 1H, J = 8.4 Hz, ArH), 7.42 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.29 (d, 2H, J = 8.4 Hz, ArH), 7.23 (d, 2H, J = 8.4 Hz, ArH), 5.76 (s, 1H, CH). Anal. calcd for $C_{20}H_{13}ClN_4O_2$: C, 63.75; H, 3.48; N, 14.87; Found C, 63.68; H, 3.50; N, 14.90.

12-(4-Bromophenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11 (7H,8H,10H,12H)-dione (4c). This compound was obtained according to above general procedure; ir (KBr): ν 3201, 3065, 1714, 1656, 1633, 1545, 1484, 1381, 1266, 1099, 976, 829 cm^{-1}; ^{1}H NMR: δ 10.74 (s, 1H, NH), 10.57 (s, 1H, NH), 9.39 (s, 1H, NH), 8.70–8.71 (m, 1H, J = 4.0 Hz, ArH), 8.34 (d, 1H, J = 8.8 Hz, ArH), 7.93 (d, 1H, J = 8.8 Hz, ArH), 7.64 (d, 1H, J = 8.8 Hz, ArH),7.42 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.36 (d, 2H, J = 8.4 Hz, ArH), 7.23 (d, 2H, J = 8.4 Hz, ArH), 5.74 (s, 1H, CH). Anal. calcd for $C_{20}H_{13}BrN_4O_2$: C, 57.02; H, 3.11; N, 13.30; Found C, 57.07; H, 3.10; N, 13.32.

12-(3,4-Dimethoxyphenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11(7H,8H,10H,12H)-dione (4d). This compound was obtained according to above general procedure; ir (KBr): ν 3262, 3068, 1706, 1653, 1554, 1513, 1418, 1382, 1263, 1138, 973, 820 cm^{-1}; ^{1}H NMR: δ 10.66 (s, 1H, NH), 10.45 (s, 1H, NH), 9.22 (s, 1H, NH), 8.69–8.70 (m, 1H, ArH), 8.38 (d, 1H, J = 8.4 Hz, ArH), 7.91 (d, 1H, J = 8.8 Hz, ArH), 7.63 (d, 1H, J = 8.8 Hz, ArH),7.41 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.07 (d, 1H, J = 2.0 Hz, ArH), 6.70 (d, 1H, J = 8.4 Hz, ArH), 6.55 (dd, 1H, J = 8.4, 2.0 Hz, ArH), 5.70 (s, 1H, CH), 3.66 (s, 3H, OCH_3), 3.61 (s, 3H, OCH_3). Anal. calcd for $C_{22}H_{18}N_4O_4$: C, 65.66; H, 4.51; N, 13.92; Found C, 65.60; H, 4.50; N, 13.95.

12-(3-Nitrophenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11 (7H,8H,10H,12H)-dione (4e). This compound was obtained according to above general procedure; ir (KBr): ν3252, 3067, 1714, 1660, 1580, 1551, 1451, 1383, 1263, 1098, 975, 829 cm^{-1}; ^{1}H NMR: δ 10.75 (s, 1H, NH), 10.63 (s, 1H, NH), 9.44 (s, 1H, NH), 8.70 (d, 1H, J = 4.0 Hz, ArH), 8.38 (d, 1H, J = 8.4 Hz, ArH), 8.16 (s, 1H, ArH), 7.40–7.98 (m, 2H, ArH), 7.71 (d, 2H, J = 8.8 Hz, ArH), 7.49 (t, 1H, J = 8.0 Hz, ArH), 7.42 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 5.96 (s, 1H, CH). Anal. calcd for $C_{22}H_{17}N_3O_4$: $C_{20}H_{13}N_5O_4$: C, 62.01; H, 3.38; N, 18.08; Found C, 62.05; H, 3.40; N, 18.05.

12-p-Tolylpyrimido[5,4-b][4,7]phenanthroline-9,11(7H,-8H, 10H,12H)-dione (4f). This compound was obtained according to above general procedure; ir (KBr): ν 3193, 3064, 1713, 1658, 1542, 1470, 1451, 1382, 1266, 1037, 976, 832 cm^{-1}; ^{1}H NMR: δ 10.65 (s, 1H, NH), 10.43 (s, 1H, NH), 9.22 (s, 1H, NH), 8.68 (d, 1H, J = 4.0 Hz, ArH), 8.34 (d, 1H, J = 8.4 Hz, ArH), 7.90 (d, 1H, J = 8.8 Hz, ArH), 7.63 (d, 1H, J = 8.8 Hz, ArH), 7.41 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.15 (d, 2H, J = 8.0 Hz, ArH), 6.96 (d, 2H, J = 8.0 Hz, ArH), 5.96 (s, 1H, CH), 2.15 (s, 3H, CH_3). Anal. calcd for $C_{21}H_{16}N_4O_2$: C, 70.77; H, 4.53; N, 15.72; Found C, 70.82; H, 4.52; N, 15.74.

12-Phenylpyrimido[5,4-b][4,7]phenanthroline-9,11(7H,-8H, 10H,12H)-dione (4g). This compound was obtained according to above general procedure; ir (KBr): ν 3196, 3067, 1713, 1647, 1599, 1518, 1452, 1382, 1264, 1078, 976, 829 cm^{-1}; ^{1}H NMR: δ 10.69 (s, 1H, NH), 10.49 (s, 1H, NH), 9.27 (s, 1H, NH), 8.69–8.70 (m, 1H, ArH), 8.36 (d, 1H, J = 8.4 Hz, ArH), 7.92 (d, 1H, J = 8.8 Hz, ArH), 7.65 (d, 1H, J = 8.8 Hz, ArH), 7.42 (dd, 1H, J = 8.4, 4.0 Hz, ArH), 7.28 (d, 2H, J = 8.8 Hz, ArH), 7.18 (t, 2H, J = 7.6 Hz, ArH), 7.06 (t, 1H, J = 7.6 Hz, ArH),5.74 (s, 1H, CH). Anal. calcd for $C_{20}H_{14}N_4O_2$: C, 70.17; H, 4.12; N, 16.37; Found C, 70.23; H, 4.10; N, 16.40.

12-(4-Hydroxy-3-nitrophenyl)pyrimido[5,4-b][4,7]phenanthroline-9,11(7H,8H,10H,12H)-dione (4h). This compound was obtained according to above general procedure; ir (KBr):

ν 3350, 3209, 3056, 1715, 1641, 1610, 1529, 1477, 1373, 1274, 1081, 941, 828 cm^{-1}; ^{1}H NMR: δ 11.50 (s, 1H, OH), 10.73 (s, 1H, NH), 10.53 (s, 1H, NH), 9.33 (s, 1H, NH), 8.70 (d, 1H, J = 3.6 Hz, ArH), 8.36 (d, 1H, J = 8.4 Hz, ArH), 7.94 (d, 1H, J = 9.2 Hz, ArH), 7.80 (d, 1H, J = 1.6 Hz, ArH),7.65 (d, 1H, J = 8.8 Hz, ArH),7.38–7.44 (m, 2H, ArH), 6.94 (d, 1H, J = 8.4 Hz, ArH), 5.77 (s, 1H, CH). Anal. calcd for $C_{20}H_{13}N_5O_5$: C, 59.56; H, 3.25; N, 17.36; Found C, 59.52; H, 3.26; N, 17.35.

12-(Benzo[d][1,3]dioxol-5-yl)pyrimido[5,4-b][4,7]phenanthroline-9,11(7H,8H,10H,12H)-dione (4i). This compound was obtained according to above general procedure; ir (KBr): ν 3445, 32119, 3094, 1728, 1687, 1669, 1546, 1453, 1405, 1275, 1254, 1030, 914, 894, 824 cm^{-1}; ^{1}H NMR: δ 10.68 (s, 1H, NH), 10.45 (s, 1H, NH), 9.24 (s, 1H, NH), 8.69–8.70 (m, 1H, ArH), 8.37 (d, 1H, J = 8.4 Hz, ArH), 7.91 (d, 1H, J = 8.8 Hz, ArH), 7.63 (d, 1H, J = 8.8 Hz, ArH), 7.74 (dd, 1H, J = 8.4, 1.2 Hz, ArH), 7.41 (dd, 1H, J = 8.4, 4.4 Hz, ArH), 7.08 (d, 1H, J = 8.4 Hz, ArH), 6.86 (d, 1H, J = 1.2 Hz, ArH), 5.88 (d, 2H, J = 9.6 Hz, CH_2), 5.68 (s, 1H, CH). Anal. calcd for $C_{21}H_{14}N_4O_4$: C, 65.28; H, 3.65; N, 14.50; Found C, 65.32; H, 3.66; N, 14.47.

Acknowledgments. A series of novel methylcinnamate derivatives of 15-crown-5 have been synthesized. The derivatives of methylcinnamate have been prepared by a synthesis from the corresponding chromenone-crown ether with MeONa/MeOH or KOH, CH_3I, and DMSO as solvent. Novel compounds were characterized by elemental analysis, IR, ^1H NMR, and MALDI-TOF.

INTRODUCTION

Cinnamic (3-phenylpropenoic) acid analogues are a fundamental part of plant chemistry. The hydroxylated cinnamic acids possess antifungal, antibacterial, and parasite fighting abilities [1]. In the cinnamic acid molecule, the carboxylic acid group is separated from the aromatic ring by a double bond. Conjugation between the —C=C— bond gives very interesting electronic structure to cinnamic acid derivatives.

The flavonoid class compound coumarin (2*H*-chromenone) derivatives exist in many plants as free or glucosides. Because of biological activities, which gain importance in recent years, many coumarin derivatives have been synthesized and took place in literature. Most important coumarins are the ones that have substituted in third position. Some coumarins show a perfect fluorescens characteristic in addition to their anticoagulant, anti-inflammatory, anti-oxidative, anti-aging, and anticancer effects [2,3]. Methyl and acetyl substituents destroy the activities of coumarins. The beneficial effects of phenolic antioxidants on health have been attributed to their antioxidant capacity, particularly their ability to protect low-density lipoproteins from oxidative attack [4]. As a result of this, hydroxy coumarin derivatives gain more importance. Particularly, *o*-dihydroxy-3-phenylcoumarin shows antioxidant property and the 18-crown-6, 15-crown-5, 12-crown-4 derivatives form complexes with alkali metal cations [5–8]. δ-Lacton ring of alkyloxy coumarin compounds can be opened using sodium alkoxide in dry respective alcohol yielding cinnamate derivatives. Then, the phenolic hydroxyl group can be alkylated [9,10].

Because the cinnamic acid analogues show biological activity, we might expect that the crown ether derivatives of methylcinnamate could also have biological activity.

This work introduces the preparation and characterization of some novel crown ether derivatives of methylcinnamate compounds obtained from respective chromenone-crown ethers.

RESULTS AND DISCUSSION

Recent work from our laboratory described general method for the synthesis of chromenone-crown ethers [5–8]. 7,8-Dihydroxy-2*H*-chromenone crown ether derivatives **4a–f** were synthesized from the polyethylene glycol ditosylate or dichloride with corresponding 7,8-dihydroxy-2*H*-chromenone derivatives **3a–f**, which were prepared from pyrogallol and D,L-malic acid **2a** in the presence of H_2SO_4 or 2,3,4-trihydroxybenzaldehyde and corresponding methoxyphenylacetic acid in NaOAc/Ac_2O mixture **3b–f** [5–8]. All these compounds were purified using column chromatography (silica gel) with chloroform. The structures of all synthesized compounds were identified by elemental analysis, IR, ^{1}H NMR, ^{13}C NMR, and mass spectrometry [6–8].

We report herein a general method for the synthesis of methylcinnamate derivatives of 15-crown-5 from the respective chromenone-crown ethers. The phenylacrylic acids have been prepared by a synthesis from the corresponding chromenone-crown ethers with MeONa solution in MeOH refluxed for 4 h to afford **5a** [11–13] or KOH and DMSO as solvent at 60°C for 3–6 h. The phenolic hydroxyl group was methylated with CH_3I to give desired compounds **5b–g** in quantitative yield [14,15]. The structures of all synthesized compounds were identified by elemental analysis, IR, ^{1}H NMR, and mass spectrometry. All spectral data confirm the proposed structures of all of the new compounds **5a–g**.

The IR spectra of novel methylcinnamate derivatives of 15-crown-5 **5a–g** showed C—H stretching bands at about 2940 and 2858 cm^{-1}, an α,β-unsaturated ester carbonyl and double bond in the region 1680–1700, 1600 cm^{-1}, respectively. The bending peaks around 1040–1260 cm^{-1} showed the structure of C—O—C ether chain for all new methylcinnamate derivatives.

The cinnamate skeleton was also elucidated by ^{1}H NMR spectra. The ^{1}H NMR spectrum of compound **5a–g**, which showed triplets for the methylene protons [—OCH_2CH_2O—] at δ 3.66–4.39, a pair of doublet with ortho-coupling constants at δ 6.54–7.40 ppm (d, J = 8.50 Hz, H-6) and δ 7.10–7.90 ppm (d, J = 8.50 Hz, H-5) implied the presence of methylcinnamate derivatives of 15-crown-5. When the ^{1}H NMR spectra of compounds 7,8-dihydroxy-2*H*-chromenone derivatives of 15-crown-5 **4a–f** and methylcinnamate derivatives of 15-crown-5 **5a–g** were compared, one marked difference lay in the aromatic proton region with a singlet (s, H-3) was observed in the spectrum of **5a–g** at lower field than **4a–f**. And, also peaks at 3.68–3.92 ppm indicated the presence of —OCH_3 groups.

The IR spectrum of compound **5a**, the absorption band at 3400 cm^{-1} corresponding to hydroxyl stretching vibration disappears after its conversion into compound **5b**. The rest of spectral data of compound **5a** are very similar to **5b**. The IR spectrum of compound **5a** and **5b** including the stretching bands around 2947–2858 cm^{-1} of the C—H stretching frequency, 1701–1681 cm^{-1}of the carbonyl group, 1623–1604 cm^{-1} of the benzene ring, and 1261–1041 cm^{-1} of the ether chain, respectively. The structural assignments are based on the ^{1}H NMR coupling constants of the olefinic protons, and stereochemistry of the **5a** and **5b** was assigned as *trans*-on the basis of the coupling constant value ($J_{H—H}$ = 15.99 Hz) with reference to previous data [11].

The structures of newly synthesized compounds **5a–g** were checked using MS spectrometry. Also MALDI-TOF mass spectra confirmed the formation of novel methylcinnamate derivatives of 15-crown-5 **5a–g** (Scheme 1).

EXPERIMENTAL

The starting chemicals used were of reagent grade. Melting points were obtained on a Gallenkamp apparatus. Elemental analysis was performed on a LECO CHNS 92 instrument. ^{1}H NMR spectra were determined with a Brucker DPX-400, 400 MHz High Performance Digital FT-NMR spectrometer. IR spectra were recorded as KBr disks in the range of 400–4000 cm^{-1} on a Schimadzu FTIR-8300 spectrometer. Mass spectra have been obtained with MALDI-TOF Instruments, model Bruker Autoflex III.

General procedure for the synthesis of methylcinnamate derivatives of 15-crown-5 5a–g. The crown ethers **4a–f** were prepared according to the known procedure [5–8]. The typical procedure for the reaction leading to a series of novel substituted methylcinnamate 15-crown-5 **5a–g** is as follows: A solution of sodium methoxide (28% in MeOH) (4 mmol) was added to a solution of the crown ether **4a** (2 mmol) in dry MeOH, and the mixture refluxed for 4 h and then the reaction mixture concentrated and extracted with AcOEt. The organic layer washed with brine and dried over $MgSO_4$ and evaporated to give product **5a** [11–13]. The crown ethers **4b–f** and methylcinnamate 15-crown-5 **5a** (1 mmol) were dissolved in DMSO, and then the KOH (2 mmol) was added to the reaction mixture and stirred at 60°C for 3–6 h. The reaction could also be monitored by thin-layer chromatography. CH_3I (2.5 mmol) was then added to the cooled reaction mixture. The reaction mixture was stirred at ambient room temperature for 2–6 h. The reaction was followed by thin-layer chromatography. The resulting mixture was poured into 30–50 mL icy water. The precipitate was collected by filtration, washed with water, and dried to give product **5b–g** [14,15].

(E)-Methyl-3-(14-hydroxy-2,3,5,6,8,9,11,12-octahydrobenzo[*b*][1,4,7,10,13] pentaoxacyclopentadecin-15-yl)acrylate (5a: $C_{18}H_{24}O_8$). A solution of sodium methoxide (28% MeOH) (0.77 mL, 4 mmol) was added to compound **4a** (0.672 g, 2 mmol) in MeOH (10 mL), which was reacted as described earlier to afford **5a**. Yield: 0.42 g (57%), mp 188–189°C; IR (KBr): 3402, 2939, 2873, 2858, 1681, 1604, 1504, 1458, 1261, 1041 cm^{-1}; ^{1}H NMR (400 MHz/$CDCl_3$): δ 3.66 (t, 4H, J = 4.29 Hz), 3.68 (s, 3H, OCH_3), 3.70 (t, 2H, J = 4.29 Hz), 3.79 (t, 2H, J = 4.29 Hz), 3.88 (t, 2H, J = 4.29 Hz), 4.00 (t, 2H, J = 5.46 Hz), 4.20 (t, 2H, J = 4.29 Hz), 4.30 (t, 2H, J = 5.46 Hz), 6.48 (d, 1H, J = 8.97 Hz), 6.55 (d, 1H, J = 15.99 Hz), 7.15 (d, 1H, J = 8.58 Hz), 7.90 (d, 1H, J = 15.99 Hz). *Anal.* Calcd. for $C_{18}H_{24}O_8$: C, 58.69; H, 6.57. DOI 10.1002/jhet.131

Microwave-assisted synthesis has been found to increase both reaction rates and yields *via* more efficient heating compared with standard thermal conduction. Dry reaction of isatins with thiosemicarbazide and their thiosemicarbazone with secondary amine on acid—washed K10 in microwave oven afforded isatin-3-thiosemicarbazones and N-Mannich bases in reasonably good yield. The chemical structures were confirmed by means of ^{1}H NMR, IR spectral data, and elemental analysis.

J. Heterocyclic Chem., **46**, 571 (2009).

INTRODUCTION

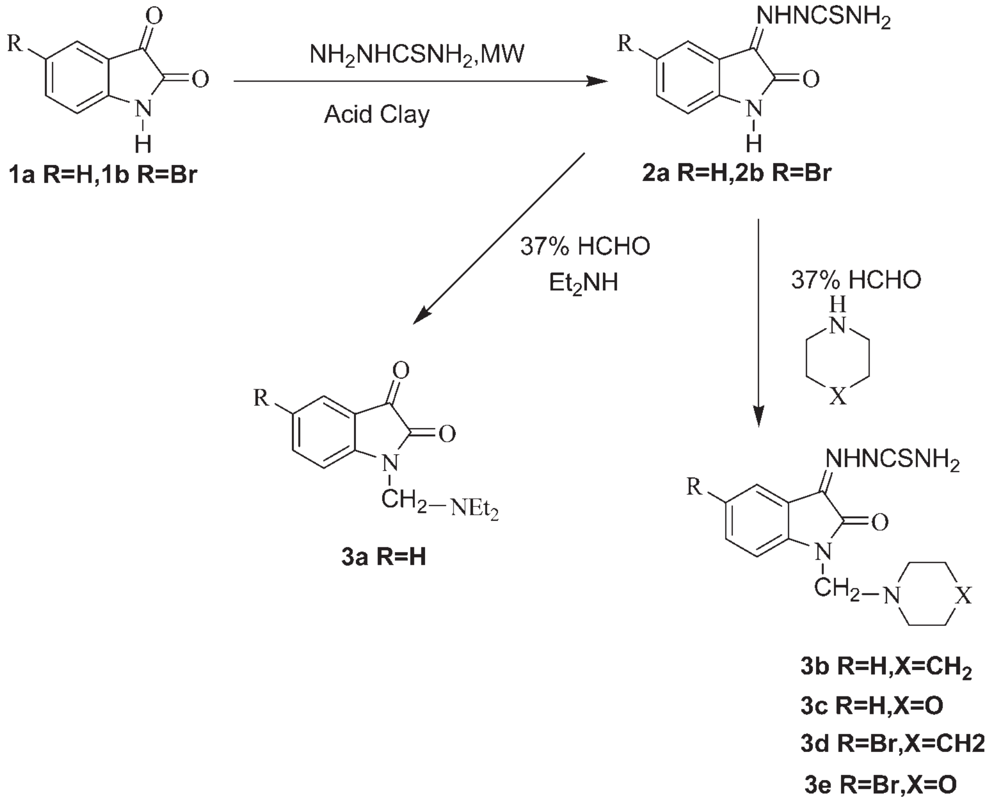
Microwave-assisted organic synthesis is a fascinating and quickly growing area in synthetic organic chemistry [1a–e]. This new synthetic technique is based on the observation that some reactions proceed much faster and with higher yields under microwave irradiation compared with conventional heating. In many cases reactions that normally require many hours at reflux temperature under classical conditions can be completed within a few minutes or even seconds in a microwave oven. The microwave-assisted chemical transformations have become important because of several advantages over the conventional thermal reactions.

Solvent-free chemical synthesis has received much attention recently [2a–e]. Solvent-free processes are not only environmentally benign but also economical [3]. Because a solvent is not required, toxic wastes can be minimized or eliminated, and so the cost of solvent and waste treatment is reduced. Furthermore, operational simplicity is an attractive feature. Recent advances in this area include, for example, aldol and related reactions [4a–f].

In view of the growing need for green chemistry for a cleaner environment and the ever increasing contribution of acidic solid surfaces, especially Montmorillonite clay, we have now developed a general, solvent-free synthesis of Schiff and Mannich bases of isatin.

Montmorillonite clay with its large surface area and high Bronsted and Lewis acidity has emerged as an environmentally benign solid acid catalyst, replacing many hazardous acid catalysts in organic synthesis and reactions, both in laboratory and industry.

Scheme 1



Isatin (1*H*-indole-2,3-dione) derivatives [5a–d] are reported to manifest a variety of biological activities like antibacterial, antifungal, antiplasmodial, and anti-HIV [6–8]. In recent years, Schiff and Mannich bases of 1*H*-indole-2,3-dione are found to exhibit broad-spectrum chemotherapeutic properties such as antiviral [9], anti-TB [10–12], antifungal, anticancer [13,14], antiprotozoal [15], muscle relaxant [16], and antibacterial [17–20]. An insight into the structure activity relationships of isatin reveals that N-Mannich bases and 3-thiosemicarbazones of 5-bromo-isatin are reported to have a profound increase in their biological activities [21–29]. In view of the above, it was thought worthwhile to exploit the use of MW irradiation for the synthesis of some potent bioactive Mannich and Schiff base of isatin.

RESUTS AND DISCUSSION

In the present study, 1*H*-indole-2,3-dione and its 5-bromo derivative (**1a**,**1b**) were allowed to react with thiosemicarbazide in the presence of a catalytic amount of acid clay under microwave irradiation at 160 W to give thiosemicarbazone derivatives (2a/2b) in reasonably good yield. The resulting products 2a/2b was subsequently made to undergo Mannich reaction using formaldehyde solution and morpholine/piperidine/secondary amine to furnish the desired product **3a–e** in excellent yields (Scheme 1). All the products displayed IR and ^{1}H NMR spectra consistent with their assigned structures. The physical data and yield of the products are given in Table 1. For the synthesis of thiosemicarbazone, we initially attempted the dry reaction of isatin with thiosemicarbazide on montmorrillonite K^{10} clay (Bronsted acidity: Hamett acidity function, $H_0 = -5.5$ to -5.9) at room temperature and also under microwave irradiation; however, the reaction was extremely sluggish. To overcome this difficulty, we utilized the fact that washing of this clay with mineral acids increases its acidity sharply ($H_0 = -6$ to -8) [30]. Indeed acid-treated clay has been previously used for a few reactions [31]. Therefore, we washed montmorrillonite K_{10} clay with concentrated HCl, which, after usual work-up, furnish what we designate ‘‘acid clay.’’ It was found to be devoid of any free acid and chloride ions. We next used this acid-clay in the targeted reactions and achieved success.

Table 1

Yield and physical data of the products.

Product	R	Formula	Time		Yield[a] (%)		Mp (°C)

[b] Irradiation at 160 W.

CONCLUSION

The use of MWI provides an efficient, clean, and quick methodology for the synthesis of various 1*H*-indole-2,3-dione derivatives with greater yields than the previously reported conventional methods.

EXPERIMENTAL

Melting points were measured in open capillaries and are uncorrected. IR spectra were recorded on a Jasco FT/IR-5300 spectrophotometer. ^{1}H NMR spectra were run on a Jeol AL 300 FTNMR spectrometer and the chemical shifts are expressed as δ ppm using TMS as internal reference. Elemental analyses were performed on Exeter Analytical Inc. ‘‘Model CE-440 CHN analyzer. All commercially available chemicals were purchased from E. Merck and Aldrich.

General procedure for the preparation for 2a/2b

Microwave-assisted Method. A mixture of isatin/5-bromoisatin (1a/1b, 0.01 mol), thiosemicarbazide (0.011 mol), and catalytic amount of acid clay contained in an Erlenmeyer flask was introduced in to a Le Chef domestic microwave oven and was irradiated for 4 min at 160 W. After completion of the reaction (as monitored by TLC), the mixture was extracted with dichloromethane (3 × 20 mL), the solvent was evaporated and the solid obtained was recrystallized with ethanol and dried to afford the product 2a/2b.

Conventional Method. A solution of thiosemicarbazide (0.011 mol) in ethanol (10 mL) was added to a solution of isatin/5-bromoisatin (1a/1b) (0.01 mol) in ethanol (20 mL). After addition of a drop of acetic acid, the mixture was refluxed on a water bath for 5 h. The product formed after cooling was collected by filtration and washed with ethanol or recrystallized from ethanol.

General procedure for the preparation of 3a–e

Microwave-assisted Method. The mixture of 2a/2b (2 mmol), formaldehyde solution (37%, 0.5 mL), and morpholine/piperidine/*N*,*N*-diethyl amine (2 mmol) was introduced into the microwave oven and was irradiated for 4–5 min at 160 W, while monitoring the course of reaction by TLC. The resulting mixture was extracted with dichloromethane (3 × 20 mL) and washed with petroleum ether. After evaporation of dichloromethane, pure solid 3a–e was obtained.

Conventional Method. To a suspension of 2a/2b (0.002 mol) in absolute ethanol (20 mL), 37% formaldehyde solution (0.5 mL) and morpholine/piperidine/*N*,*N*-diethyl amine (2 mmol) were added dropwise with vigorous stirring. After combining all reagents, the reaction mixture was stirred with gentle refluxing for 4 h. The solid product was collected by filtration and washed with petroleum ether to obtain pure product 3a–3e.

1H-Indole-2,3-dione-3-thiosemicarbazone(2a). (69%) Mp 240–241°C (lit. [23] 239–241°C); IR (KBr): 3425 (N-Hstr of indole), 3238 (N-Hstr of thiosemicarbazone moiety), 1682 (C=Ostr), 1130 (C=Sstr), ^{1}H NMR (DMSO-d_6):δ 12.45 (s, NH of thiosemicarbazone moiety), 11.18 (s,1H-NH proton of indole nucleus), 9.02 (s, 2H NH_2 of thiosemicarbazone moiety), 7.65 (d, 1H-C_7-H of indole nucleus), 7.35 (dd 1H C_6-H proton), 7.08 (dd, 1HC_5-H proton), 6.91 (d, 1HC_4-H proton). Anal Calcd. for $C_9H_8N_4OS$ (220.27) C, 49.03; H, 3.61; N, 25.42. Found: C, 48.97; H, 3.60; N, 25.28.

5-Bromo-1H-indole-2,3-dione-3-thiosemicarbazone (2b). Yield (73%); Mp 271–272°C; IR (KBr): 3430 (N-Hstr of indole nucleus), 3230 (N-Hstr of thiosemicarbazone moiety), 1690 (C=Ostr), 1133 (C=Sstr); ^{1}H NMR (DMSO-d_6): δ 12.47 (s, 1H-NH of thiosemicarbazone moiety), 11.17 (s, 1H NH proton of indole nucleus), 9.02 (s, 1H NH_2 of thiosemicarbazone moiety), 7.74 (d, 1HC_4-H proton), 7.41 (dd, 1H C_6-H proton), 7.12 (d, 1H C_7-H of indole nucleus). Anal Calcd. for $C_9H_7BrN_4OS$ (299.14) C, 36.10; H, 2.34; N,18.72. Found: C, 36.08; H, 2.30; N, 18.74.

N^1-Diethylaminomethyl-indole-2,3-dione-3-thiosemicarbazone (3a). Yield (75%); Mp 132–134°C (Lit. 135°C) [24]; IR (KBr): 3436 (N-Hstr of indole), 3240 (N-Hstr of thiosemicarbazone moiety), 1670 (C=Ostr), 1140 (C=Sstr); ^{1}H NMR (DMSO-d_6) δ 12.11 (s, 1H NH of thiosemicarbazone moiety), 9.06 (s, 2H NH_2 of thiosemicarbazone moiety), 7.73 (d, 1H C_7-H proton), 7.45 (dd, 1H C_6-H proton), 7.17 (dd, 1H C_5-H proton), 7.20 (d, 1H C_4-H proton), 4.52 (s, 2H N-CH_2-N proton), 2.65 (q, 4H), 1.08 (t, 6H). Anal Calcd. for $C_{14}H_{19}N_5OS$ (305.63) C, 55.08; H, 6.23; N, 22.95. Found: C, 54.76; H, 6.17; N, 22.88.

N^1-Piperidin-1-ylmethyl-indole-2,3-dione-3-thiosemicarbazone (3b). Yield (77%); Mp 178–179°C (lit. 177–178°C) [24];

IR (KBr): 3427 (N-Hstr of indole), 2925 (N-Hstr of thiosemicarbazone moiety), 1700 (C=Ostr), 1162 (C=Sstr); ^{1}H NMR (DMSO-d_6): δ 12.36 (s, 1H NH of thiosemicarbazone moiety), 9.06 (s, 1H NH_2 of thiosemicarbazone moiety), 7.71 (d 1H C_7-H proton), 7.41 (dd, 1H C_6-H proton), 7.26 (d, 1H C_4-H proton), 7.17 (dd, 1H C_5-H proton), 4.47 (s, 2H N-CH_2-N proton), 2.54 (t, 4H), 1.46 (m, 4H), 1.33 (m, 2H). Anal Calcd. for (319.14) $C_{14}H_{17}N_5OS$ C, 52.64; H, 5.33; N, 21.93. Found: C, 52.43; H, 5.37; N, 20.96.

N^1-Morpholin-4-ylmethyl-indole-2,3-dione-3-thiosemicarbazone (3c). Yield (68%); Mp 212–213°C: (lit. 215 216°C) [24] IR (KBr): 3447 (N-Hstr of indole), 3206 (N-Hstr of thiosemicarbazone moiety), 1692 (C=Ostr), 1149 (C=Sstr); ^{1}H NMR (DMSO-d_6): δ 12.38 (s, 1H NH of thiosemicarbazone moiety), 9.05 (s, 1H NH_2 of thiosemicarbazone moiety), 7.73 (d, 1H C_7-H proton), 7.42 (dd, 1H C_6-H proton), 7.27 (d, 1H C_4-H proton), 7.15 (dd, 1H C_5-H proton), 4.49 (s, 2H N-CH_2-N proton), 3.54 (br s, 4H), 2.58 (br s, 4H). Anal Calcd. for $C_{15}H_{19}N_5OS$ (317.26) C, 56.76; H, 5.99; N, 22.07. Found C, 56.74; H, 6.03; N, 22.11.

5-Bromo-N^1-piperidin-1-ylmethyl-indole-2,3-dione-3-thiosemicarbazone(3d). Yield (64%); Mp 216–217°C IR (KBr): 3447 (N-Hstr of indole), 2933 (N-Hstr of thiosemicarbazone moiety), 1695 (C=Ostr), 1112 (C=Sstr), ^{1}H NMR (DMSO-d_6): δ 12.37 (s, 1H NH of thiosemicarbazone moiety), 9.06 (s, 1H NH_2 of thiosemicarbazone moiety), 7.78 (dd, 1H C_4-H proton), 7.45 (dd, 1H C_6-H proton), 7.28 (d, 1H C_7-H proton), 4.48 (s, 2H N-CH_2-N proton), 2.52 (t, 4H), 1.46 (m, 4H), 1.34 (m, 2H). Anal Calcd. for $C_{14}H_{16}BrN_5O_2S$ (397.25) C, 42.30; H, 4.05; N, 17.63. Found C, 42.62; H, 4.05; N,17.60.

5-Bromo-N^1-morpholin-4-ylmethyl-indole-2,3-dione-3-thiosemicarbazone(3e). Yield (71%); Mp 230–231°C IR (KBr): 3440 (N-Hstr of indole), 2925 (N-Hstr of thiosemicarbazone moiety), 1691 (C=Ostr), 1145 (C=Sstr), ^{1}H NMR (DMSO-d_6): δ 12.39 (s, 1H NH of thiosemicarbazone moiety), 9.05 (s, 1H NH_2 of thiosemicarbazone moiety), 7.80 (dd, 1H C_4-H proton), 7.47 (dd, 1H C_6-H proton), 7.30 (d, 1H C_7-H proton), 4.50 (s, 2H N-CH_2-N proton), 3.54 (br s, 4H), 2.56 (br s, 4H). Seven new 2,4-disubstituted thiazoles have been synthesized by Hantzsch condensation and assayed for several biological activities for a preliminary screening. They have been fully characterized by elemental analysis, UV–Vis spectroscopy, TG-DTA, IR, and ^{1}H NMR as well. These structures display different pharmacological (antimicrobic activity, citotoxicity, and hMAO inhibition) and industrial properties (complete transparency in the region between 465–800 nm and high thermal stability) varying on their substituents and could be considered as good lead compounds for further developments.

J. Heterocyclic Chem., **46**, 575 (2009).

INTRODUCTION

In the last few years, researchers have renewed interest in 3-(thiazol-4-yl)coumarins [1–6] for their industrial applications as fluorescent probes and laser dyes [7], for their biological activity as pharmaceutical agents [8–10] and because they could be useful for the construction of the diazepinone ring [11]. In addition, π-conjugated systems are known to show interesting electronic, optical, and electric properties [12]. On the basis of our experience in the synthesis of thiazole and coumarin [13,14] derivatives, we were pursued, therefore, to synthesize a series of novel heterocyclic systems characterized by the association of a coumarin nucleus with a thiazole ring linked to a cycloaliphatic group, whose presence and influence on this kind of molecules have not been described so far (Table 1).

RESULTS AND DISCUSSION

The coumarin-thiazole derivatives (**1–7**) were prepared by Hantzsch condensation between the appropriate thiosemicarbazone and 3-α-bromo-acetyl coumarin in 2-propanol at room temperature according to a protocol used in our laboratory [15]. In these conditions, the isolation of pure products in 86–99% yield was made simply by filtration under vacuum. All the structures were fully supported by elemental analysis and spectral data as reported in the experimental section and in Table 2. In particular, we obtained compound **3** and **4** as racemates, because of the presence of a chiral center in the structure. Knowing that the stereochemistry could affect deeply different biological activities and being commercially available the pure (*R*)-(+) enantiomer of 3-methylcyclohexanone, we planned a stereocontrolled synthesis in order to obtain derivative **5** with correlated (*R*)-(+) absolute configuration. The stereochemistry has been preserved by the stereoconservative synthetic pattern which did not interest the methyl on the cycloaliphatic moiety. The enantiomeric excess has been determined by HPLC on the Chiralpak AS-H chiral stationary phase (CSP) using the mixture *n*-hexane-2-propanol 70:30 (v/v) as a mobile phase: ee > 99%; $[\alpha]_D^{20} = -20$ (0.1, EtOH).

The compounds, correctly analyzed for their molecular formula, showed in the IR spectrum strong bands at 1710 and 1600 cm^{-1} due to the presence of a δ-lactone C=O and C=N group, respectively.

The UV–visible spectral analysis was carried out in methanol as solvent and the data are collected in Table

Table 1

Structure and CLogP (ChemDraw Ultra 8.0) of compounds **1–7**.

Compound	*n*	R	CLogP
1	1	H	3.28
2	2	H	3.84
3	2	2-CH_3	4.36
4	2	3-CH_3	4.36
5	2	(*R*)-(+)-3-CH_3	4.36
6	2	4-CH_3	4.36
7	3	H	4.40

Table 3

MIC values (μg/mL) of some derivatives against eight strains of *Candida spp* and **C** = Clotrimazole.

Compound	*C. albicans* (2 strains)	*C. sakè* (strain)	*C. parapsilopis* (strains)	*C. krusei* (strains)
1	4	32	>128	>128
2	8	16	16	8–16
7	8–16	16	8	8–>128
C	8	8	8	8

2. The absorption spectra of all derivatives are generally characterized by sharp absorption bands in the region of 230–250 nm and 290–300 nm with the λ_{max} independent upon the substituent and size of the cycloaliphatic moiety. Accordingly, the coumarin local π-π excitation appears to be the main type of electronic transition and complete transparency was observed in the region between 465–800 nm.

Further we have also studied the thermal stability of **1–7** using TG-DTA method (heat rate: 10°C/min, Ar flow: 100 cc/min). All the compounds exhibited a decomposition temperature (T_d) in the range 290–315°C, a feature which could be significant for NLO applications because it is superior to that reported (T_d = 290°C) for the benchmark 4-dimethylamino-4′-nitrostilbene (DANS) [16].

From a biological point of view, evaluating the influence of the bioactive coumarin nucleus on the C4 position of the thiazole as a modulator of the biological activity and correlating the results with those obtained in our previous papers [15,17,18], some of the synthesized compounds (which all show calculated log P values < 5) have been widely assayed for a preliminary antimicrobic screening against eight strains of pathogenic fungi (Table 3), several types of routine clinical Gram-positive and negative isolates (MIC values > 128 μg/mL, data not shown), and 20 clinical strains of *Helycobacter pylori* (Table 4). Clotrimazole and Metronidazole were used as standard antifungal and antibacterial drug, respectively.

The results showed that all compounds possess an antibacterial activity targeting selectively towards Metronidazole resistant strains of *Helicobacter pylori* and some *Candida albicans* strain isolates.

In addition, we evaluated the low citotoxic effect of the most representative compound (**7**) against EAhy, a human cell line obtained from a hybridoma between HUVEC and epithelial cells from a lung carcinoma. The viability of cells exposed to test compounds was estimated by the Trypan Blue dye exclusion assay after 24 h of incubation at 37°C. Cells incubated with culture medium alone represented the control and the cell viability was always greater than 97%. Data represent the arithmetic mean ± SD of at least three independent experiments (Table 5).

In the end, all the newly synthesized compounds were investigated for their ability to inhibit both human MAO isoforms by measuring their effects on the production of H_2O_2 from *p*-tyramine, using the Amplex Red MAO assay kit. Microsomial MAO isoforms prepared from insect cells (BTI-TN-5B1-4) infected with recombinant baculovirus containing cDNA inserts for hMAO-A and hMAO–B. Data were calculated as pIC_{50} for both isoforms and pSI referred to log selectivity index = $pIC_{50\ (MAO\text{-}A)} - pIC_{50\ (MAO\text{-}B)}$. The data represent mean values of at least five separate experiments and Clorgyline and *R*-(−)-deprenyl were used as standard drugs (Table 6).

Despite their inhibitory activity in the micromolar range, in examining the influence of the structural variation, some of them (in particular those which did not present substituents on the cycloaliphatic moiety) possessed a moderate A-selectivity. From a qualitative point

Table 2

UV–visible absorption of derivatives **1–7** (MeOH).

Compound	λ_{ab} (nm)	$\varepsilon \times 10^4$
1	293.74	1.60
2	293.57	1.85
3	291.61	1.29
4	292.03	0.88
5	295.37	0.66
6	298.52	1.23
7	292.30	1.24

Table 4

MIC values (μg/mL) of some derivatives and **M** = Metronidazole against 20 *H. pylori* strains.

Compound	Metronidazole sensitive strains (15 strains)	Metronidazole resistant strains (strains)
1	16–32	16–32
2	8–32	8–32
7	8–32	8–32
M	0.5–2	64–>128

Table 5

Citotoxicity of derivative **7** expressed as cell survival fraction ± SD (%).

	Concentration (μg/mL)			
Compound	50	5	0.5	0.05
7	52.94 ± 3.8	81.82 ± 5.6	93.75 ± 4.7	97.50 ± 1.8

of view, it must be highlighted the different selective hMAO inhibition of compound **5** (pure (*R*)-(+) enantiomer) in relation to **4** (racemate) bearing the same substituent in the same position.

CONCLUSION

We reported the synthesis, the spectral characterization, and a preliminary biological evaluation of seven novel heterocyclic systems. According to the biological results, these compounds exhibited a promising antimicrobic activity expecially oriented towards Metronidazole resistant strains of *Helycobacter pylori* and an interesting anti-*Candida* spectrum comparable to that of Clotrimazole. It has been also found a low cytotoxic effect against EAhy, a human immortalized cell line, which could justify a safe and therapeutic use of these derivatives. They further displayed a moderate selective hMAO-A inhibition which is probably affected by the steric hindrance of bulky coumarin nucleus inside the active site. All these results could be useful to evaluate new substitutions on the coumarin nucleus in order to enhance biological activities.

EXPERIMENTAL

The chemicals, solvents for synthesis, and spectral grade solvents were purchased from Aldrich (Italy) without further purification. Melting points (uncorrected) were determined automatically on a FP62 apparatus (Mettler-Toledo). ^{1}H NMR spectra were recorded at 400 MHz on a Bruker spectrometer. Chemical shifts are expressed as δ units (parts per millions) relative to the solvent peak. Coupling constants *J* are valued in Hertz (Hz). IR spectra were registered on a Perkin-Elmer FTIR Spectrometer Spectrum 1000 in potassium bromide. Elemental analysis for C, H, and N were recorded on a Perkin-Elmer 240 B microanalyzer and the analytical results were within ±0.4% of the theoretical values for all compounds. All reactions were monitored by TLC on 0.2 mm thick silica gel plates (60 F254 Merck). UV–vis spectra were recorded on a Perkin-Elmer UV–vis Spectrometer Lambda 10. Thermal analysis was performed under an inert gas flux using TGA/DTA (Pyris Diamond Perkin-Elmer, Waltham, MA).

Typical procedure for the thiosemicarbazones synthesis. The appropriate cycloaliphatic ketone (50 mmol) was dissolved in 100 mL of 2-propanol and stirred at room temperature with an equimolar amounts of thiosemicarbazide for 24 h with acetic acid as catalyst. The desired thiosemicarbazone precipitated from reaction mixture was filtered and crystallized from suitable solvent and dried.

Typical procedure for the Hantzsch protocol for the preparation of derivatives 1–7. Equimolar amounts of the prepared thiosemicarbazones (50 mmol) and 3-α-bromo-acetyl coumarin [19] (50 mmol), both dissolved in 2-propanol, were reacted at room temperature under magnetic stirring for 2 h. The precipitate was filtered, washed with petroleum ether and diethyl ether, and dried to give compounds **1–7** in 86–99% yields. All the yields are on isolated basis. The characterization data are given in Tables 1 and 2.

3-(2-(2-Cyclopentylidenehydrazynyl)thiazol-4-yl)-2*H*-chromen-2-one (1). HPLC enantioseparation. HPLC enantioseparation was performed using stainless-steel Chiralpak AS-H (250 mm × 4.6 mm I.D.) columns (Chiral Technologies Europe, Illkirch, France). HPLC-grade solvents were supplied by Carlo Erba (Milan, Italy). The HPLC apparatus consisted of a Perkin-Elmer (Norwalk, CT) 200 LC pump equipped with a Rheodyne (Cotati, CA) injector, a 50-μL sample loop, a HPLC Dionex TCC-100 oven (Sunnyvale, CA), and a Perkin-Elmer UV detector model 290.

Specific rotations of enantiomers of compound **4**, dissolved in ethanol, were measured at 589 nm by a Perkin-Elmer polarimeter model 241 equipped with a Na lamp. The volume of the cell was 1 mL and the optical path 10 cm. The system was set at a temperature of 20°C using a Neslab RTE 740 cryostat.

Acknowledgments. This work was supported by grants from MURST (Italy). We also are very thankful to Prof. Francisco Orallo of the Department of Pharmacology, Faculty of Pharmacy, University of Santiago de Compostela for performing hMAO inhibition assays.

Fifteen novel 3-substituted-5-methyl-4-methylene-7-alkylsulfanyl-3,4-dihydro-pyrido[4,3-d]pyrimidine-8-carbonitriles **5a–o**, were synthesized *via* a facile annulation process in which formation of the pyrimidine ring proceeded smoothly by the regioselective attack of a formamidate group on a neighboring carbonyl group instead of a cyano group. Bioassay results indicated that these compounds showed significant herbicidal activity at a dose of 100 μg/mL on the roots of oil rape and barnyard grass. In addition, some of these compounds displayed fungicidal activity.

J. Heterocyclic Chem., **46**, 579 (2009).

INTRODUCTION

Reports in the literature on the biological activity of pyrido[4,3-d]pyrimidines relate mainly to their pharmaceutical activity as EGFR-TK and DHFR inhibitors [1]. Very little has been reported about their biological activities relating to agriculture [2].

Generally, pyrido[d]pyrimidines have been prepared by routes in which the pyrimidine ring is formed by cyclization of suitable substituents on a pyridine [3]. For example, it has been reported that formamidate reacts with a cyano group in the neighboring position to afford a pyrimidine ring [4]. However, there are no reports about formamidate regioselectively attacking a neighboring carbonyl group instead of a cyano group.

In our previous work, we have synthesized various pyrido[4,3–d]pyrimidine derivatives possessing fungicidal and herbicidal activity [5]. As a progression to this research, we herein describe a highly efficient regioselective cyclization reaction leading to the synthesis of pyrido[4,3–d]pyrimidines under mild conditions and in short reaction times. A preliminary *in vitro* bioassay indicated that these 4-methylene-pyrido[4,3–d]pyrimidines have strong herbicidal activity and that some have fungicidal activity as well.

RESULTS AND DISCUSSION

The conventional synthetic route to pyrido[4,3–d]pyrimidines involves formation of the pyrimidine ring by closure of suitable substituents on a pyridine. It was noted that the synthesis of the substituted pyridines, or the pyrimidine ring closure, always suffered from certain drawbacks, such as low yield, long reaction time, or difficulty in isolating or purifying the products [3,4]. In the protocol described here, formation of the pyrimidine ring proceeded regioselectively and with high efficiency (see Scheme 1).

The intermediates **1** and **2** can be prepared according to a published method [6]. It was reported that 4-amino nicotinonitrile 3 was prepared in moderate yield (48%) by using anhydrous stannic chloride as catalyst [7]. We improved the conditions by using zinc nitrate as catalyst to achieve much higher yield than the reported method (over 83%) [8]. By optimizing the reaction conditions, formamidate **4a** was obtained with the yield of 87% yield in the presence of *p*-toluene sulfonic acid. By comparison, only 32% yield was obtained when no catalyst was used, and formamidate **4b** was obtained with 82% yield in the presence of acetic anhydride as the catalyst.

The formamidate **4** reacted with primary amines smoothly and regioselectively in acetonitrile at 40~50°C to give the title compounds **5a–o** in moderate to excellent yields. The products were easily isolated by filtration. The structures of compounds **5a–o** were fully elucidated by a comprehensive analysis of their IR, MS, and ^{1}H NMR spectra and by elemental analysis.

The compounds **5a–o** were screened for activity against six fungi, namely *Fusarium oxysporium, Rhizoctonia solani, Botrytis cinerea, Gibberella zeae, Dothiorella gregaria*, and *Colletotrichum gossypii*, at a

Scheme 1

5o: R^1= 4-OCH$_3$-C$_6$H$_4$-CH$_2$$^-$

concentration of 50 μg/mL according to a reported method [5]. As the results in Table 1 show, most of the compounds have weak fungicidal activity. Among these compounds, only compound **5a,** in which R^1 is (2-chloropyridin-4-yl)methyl group, exhibited moderate inhibitory activity against each of the six fungi. This might imply that the introduction of pyridine ring to the position 3 of pyrimidines was important for its fungicidal activity. All the remaining compounds, in which the substituent R^1 is alkyl or substituted benzyl, showed only weak antifungal activity.

The herbicidal activity of compounds **5a–o** was also evaluated, against two representative targets, oil rape and barnyard grass, at concentrations of 100 and 10 μg/mL, according to a literature method [9]. The results are listed in Table 2 and show that these compounds have moderate to good herbicidal activity against the roots of these two species at the rate of 100 μg/mL, especially against the root of barnyard grass. Compound **5a** with (2-chloropyridin-4-yl)methyl moiety in position 3 of the pyrimidine ring showed much better activity than the rest of the series with over 85% inhibition even at the lower concentration of 10 μg/mL. Switching the substituent R from methyl to ethyl has no obvious effect on the inhibition rates. In terms of R^1, the substituents with electron-donating groups on the phenyl rings seem to have somewhat higher herbicidal activity. For example, compounds **5d** and **5e** showed better activity than compound **5c**, and compounds **5l–o** were better than compound **5k.**

EXPERIMENTAL

All chemicals were of reagent grade and were commercially available. Solvents were either used directly or were purified as required. *Fusarium oxysporium, Rhizoctonia solani, Botrytis cinerea, Gibberella zeae, Dothiorella gregaria, Colletotrichum gossypii*, and seeds of oil rape and barnyard grass were provided through the courtesy of the Bioassay Center, Central China Normal University.

Melting points were measured on a WRS-1B Digital melting point apparatus. ^{1}H NMR spectra were recorded at 400 MHz in CDCl$_3$ solution on a Varian VNMR-400 Spectrometer, whereas IR spectra were recorded on a Nicolet AVATAR-360 Infrared Spectrometer. The MS spectra were determined using a Finnigan Trace MS Spectrometer, and the signals were given in *m*/*z*. Elementary analysis was carried out on a Vario EL III CHNSO elemental analyzer.

Intermediates **1** and **2** were prepared according to the literature [6].

5-Acetyl-4-amino-6-methyl-2-alkylsulfanyl-nicotinonitrile (3). Acetylacetone (1.0 g, 10 mmol) and **2** (10 mmol) were added to a stirred solution of zinc nitrate in 30 mL alcohol. The mixture was stirred and refluxed for 12 h. The precipitate

was filtered off, washed with water (10 mL × 3), and recrystalized from alcohol to give **3**.

5-acetyl-4-amino-6-methyl-2-methylsulfanyl-nicotinonitrile (3a). White solid, m.p. 163.5–164.5°C, yield 83%. ^{1}H NMR ($CDCl_3$): δ 2.58 (s, 3H, CH_3), 2.61 (s, 3H, SCH_3), 2.68 (s, 3H, $COCH_3$), 6.60 ppm (br, 2H, NH_2).

5-acetyl-4-amino-6-methyl-2-ethylsulfanyl-nicotinonitrile (3b). Yellowish solid, m.p. 139.0–140.0°C, yield 89%. ^{1}H NMR ($CDCl_3$): δ 1.38 (t, 3H, SCH_2CH_3, J = 7.4 Hz), 2.59 (s, 3H, CH_3), 2.70 (s, 3H, $COCH_3$), 3.15 (q, 2H, SCH_2CH_3, J = 7.4 Hz), 6.68 ppm (br, 2H, NH_2).

***N*-(3-Acetyl-5-cyano-2-methyl-6-alkylsulfanyl-pyridin-4-yl)-formimidic acid ethyl ester (4).** To a solution of **4**-aminopyridine **3** (10 mmol) in triethyl orthoformate (5.92 g, 40 mmol) was added acetic anhydride or *p*-toluene sulfonic acid as catalyst. The mixture was heated and monitored by TLC. The triethyl orthoformate was removed at reduced pressure, and the residue was purified by silica gel chromatography (ether:petroleum ether=1:10) to afford formamidate **4**.

N-(3-acetyl-5-cyano-2-methyl-6-methylsulfanyl-pyridin-4-yl)-formimidic acid ethyl ester (4a). White solid, m.p. 78.5–79.9°C, yield 95%. ^{1}H NMR: δ 1.40 (t, 3H, CH_2CH_3, J = 8.0 Hz), 2.46 (s, 3 H, CH_3), 2.56 (s, 3H, SCH_3), 2.62 (s, 3H, $COCH_3$), 4.39 (q, 2H, CH_2CH_3, J = 8.0 Hz), 8.06 ppm (s, 1H, =CH). ms (70 Ev): *m/z* 277 (M^+, 63).

N-(3-acetyl-5-cyano-2-methyl-6-ethylsulfanyl-pyridin-4-yl)-formimidic acid ethyl ester (4b). Yellowish liquid, yield 82%. ^{1}H NMR: δ 1.38 (t, 3H, SCH_2CH_3, J = 3.8 Hz), 1.40 (t, 3H, CH_2CH_3, J = 3.8 Hz), 2.45 (s, 3H, CH_3), 2.46 (s, 3H, $COCH_3$), 3.27 (q, 2H, SCH_2CH_3, J = 3.6 Hz), 4.27 (q, 2H, CH_2CH_3, J = 3.6 Hz), 7.65 ppm (s, 1H, N=CH).

General procedure for the preparation of compounds (5a–m). To a solution of formamidate **4** (10 mmol) in anhydrous acetonitrile (10 mL) was added the appropriate amine (15 mmol), and the mixture was stirred and heated at 40–50°C for 30 min. The precipitate was isolated by filtration, then recrystalized from acetone/petroleum ether to give pure products **5**.

3-[(2-Chloropyridin-4-yl)methyl]-5-methyl-4-methylene-7-methylsulfanyl-3,4-dihydropyrido[4,3–d]pyrimidine-8-carbonitrile (5a). This compound was obtained as a pale yellow solid, m.p. 167.9–168.2°C, yield 59%. IR (KBr): ν 3036, 2931, 2218, 1610, 1550, 1523, 1390, 1278 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.61 (s, 3H, CH_3), 2.64 (s, 3H, SCH_3), 4.67 (d, 2H, =CH_2), 4.83 (s, 2H, CH_2), 7.20-7.64 (m, 3H, pyridine-H), 7.86 ppm (s, 1H, pyrimidine-H); ms: *m/z* 357 (M^++1 20). *Anal.* Calcd. for $C_{17}H_{14}ClN_5S$ (356): C, 57.38; H, 3.97; N, 19.68. Found C, 57.82; H, 3.44; N, 19.71.

3-(α-Phenylethyl)-5-methyl-4-methylene-7-methylsulfanyl-3,4-dihydropyrido[4,3–d]pyrimidine-8-carbonitrile (5b). This compound was obtained as a white solid, m.p. 147.4–148.5°C, yield 62%. IR (KBr): ν 3170, 2978, 2925, 2211, 1621, 1563, 1514, 1399, 1294 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.63 (d, 3H, Ph—CH_3, J = 4.0 Hz), 2.45 (s, 3H, CH_3), 2.60 (s, 3H, SCH_3), 4.65 (d, 2H, =CH_2), 6.41 (d, 1H, Ph—CH, J = 4.0 Hz), 6.27-7.43 (m, 5H, ArH), 7.75 ppm (s, 1H, pyrimidine-H); ms: *m/z* 334 (M^+ 8). *Anal.* Calcd. for $C_{19}H_{18}N_4S$ (334): C, 68.23; H, 5.42; N, 16.75. Found C, 68.29; H, 5.44;, N, 16.51.

3-(2-Chlorophenyl)-5-methyl-4-methylene-7-methyl sulfanyl-3,4-dihydropyrido[4,3–d]pyrimidine-8-carbonitrile (5c). This compound was obtained as a white solid, m.p. 143.2–144.5°C, yield 63%. IR (KBr): ν 3148, 2927, 2215, 1601, 1548, 1524, 1396, 1280 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.61 (s, 3H, CH_3), 2.66 (s, 3H, SCH_3), 4.46 (d, 1H, =CH^a, J = 2.0 Hz), 4.64 (d, 1H, =CH^b, J = 2.0 Hz), 4.86 (s, 2H, CH_2), 7.21-7.47 (m, 4H, ArH), 7.55 ppm (s, 1H, pyrimidine-H); ms: *m/z* 357 (M^++2 7), 355(M^+ 24). *Anal.* Calcd. for $C_{18}H_{15}ClN_4S$ (355): C, 60.92; H, 4.26; N, 15.79. Found C, 60.72; H, 4.44; N, 15.71.

3-(2-Methylphenyl)-5-methyl-4-methylene-7-methyl sulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5d). This compound was obtained as a white solid, m.p. 184.2–184.8°C, yield 75%. IR (KBr): ν 3001, 2926, 2218, 1604, 1553, 1521, 1399, 1278 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.32 (s, 3H, Ph—CH_3), 2.62 (s, 3H, CH_3), 2.69 (s, 3H, SCH_3), 4.50 (d, 1H, =CH^a, J = 2.0 Hz), 4.65 (d, 1H, =CH^b, J = 2.0 Hz), 4.69 (s, 2H, —CH_2—), 7.16-7.28 (m, 4H, ArH), 7.44 ppm (s, 1H, pyrimidine-H); ms: *m/z* 335(M$^+$+1 9), 334(M$^+$ 20). *Anal.* Calcd. for $C_{19}H_{18}N_4S$ (334): C, 68.23; H, 5.42; N, 16.75. Found C, 68.72; H, 5.44; N, 16.71.

3-(3-Methylphenyl)-5-methyl-4-methylene-7-methyl sulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5e). This compound was obtained as a white solid, m.p. 162.1–163.6°C, yield 90%. IR (KBr): ν 3074, 2926, 2219, 1607, 1555, 1522, 1401, 1262 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 2.34 (s, 3H, Ph—CH_3), 2.62 (s, 3H, CH_3), 2.64 (s, H, SCH_3), 4.54 (d, 1H, =CH^a, *J* = 2.0 Hz), 4.62 (d, 1H, =CH^b, *J* = 2.0 Hz), 4.74(s,2H, —CH_2—), 7.06–7.28 (m, 4H, ArH), 7.58 ppm (s, 1H, pyrimidine-H); ms: *m/z* 334(M$^+$ 43). *Anal.* Calcd. for $C_{19}H_{18}N_4S$ (334): C, 68.23; H, 5.42; N, 16.75. Found C, 68.39; H, 5.44; N, 16.73.

3-Ethyl-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5f). This compound was obtained as a white solid, m.p. 144.1–145.0°C, yield 63%. IR (KBr): ν 3170, 2975, 2931, 2221, 1615, 1547, 1523, 1399 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.36–1.41 (m, 6H, CH_3 in —CH_2CH_3 and —SCH_2CH_3), 2.69 (s, 3H, —CH_3), 3.24 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 3.69 (q, 2H, —CH_2CH_3, *J* = 7.2 Hz), 4.64 (d, 1H, =CH^a, *J* = 3.2 Hz), 4.65 (d, 1H, =CH^b, *J* = 3.2 Hz), 7.52 ppm (s, 1H, pyrimidine-H); ms: *m/z* 273(M$^+$+1 3), 272(M$^+$ 3). *Anal.* Calcd. for $C_{14}H_{16}N_4S$ (272) : C, 61.74; H, 5.92; N, 20.57. Found C, 61.72; H, 5.72; N, 20.30.

3-Propyl-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5g). This compound was obtained as a white solid, m.p. 148.8–150.4°C, yield 61%. IR (KBr): ν 3180, 2966, 2875, 2221, 1613, 1548, 1521, 1388 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.99 (t, 3H, —$CH_2CH_2CH_3$, *J* = 7.4 Hz), 1.38 (t, 3H, —SCH_2CH_3, *J* = 8.0 Hz), 1.75^{-1}.81 (m, 2H, —$CH_2CH_2CH_3$), 2.69 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 3.58 (t, 2H, —$CH_2CH_2CH_3$, *J* = 7.2 Hz), 4.63 (d, 1H, =CH^a, *J* = 3.2 Hz), 4.65 (d, 1H, =CH^b, *J* = 3.2 Hz), 7.47 ppm (s, 1H, pyrimidine-H); ms: *m/z* 286(M$^+$ 64). *Anal.* Calcd. for $C_{15}H_{18}N_4S$ (286) : C, 62.91; H, 6.33; N, 19.56. Found C, 62.88; H, 6.40; N, 19.61.

3-Butyl-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro pyrido[4,3–d]pyrimidine-8-carbonitrile (5h). This compound was obtained as a white solid, m.p. 144.6–145.1°C, yield 59%. IR (KBr): ν 3047, 2959, 2871, 2218, 1597, 1550, 1517, 1388 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.96^{-1}.00 (t, 3H, —$CH_2CH_2CH_2CH_3$, *J* = 7.2 Hz), 1.36–1.44 (m, 5H, —$CH_2CH_2CH_2CH_3$ and —SCH_2CH_3), 1.69–1.76 (m, 2H, —$CH_2CH_2CH_2CH_3$), 2.69 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 4.9 Hz), 3.62 (t, 2H, —$CH_2CH_2CH_2CH_3$, *J* = 7.0 Hz), 4.62 (d, 1H, =CH^a, *J* = 3.2 Hz), 4.64 (d, 1H, =CH^b, *J* = 3.2 Hz), 7.47 ppm (s, 1H, pyrimidine-H); ms: *m/z* 301(M$^+$+H 31), 300(M$^+$ 67). *Anal.* Calcd. for $C_{16}H_{20}N_4S$ (300): C, 63.97; H, 6.71; N, 18.65. Found C, 64.02; H, 6.84; N, 18.43.

3-Amyl-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro pyrido[4,3–d]pyrimidine-8-carbonitrile (5i). This compound was obtained as a white solid, m.p. 134.8–135.4°C, yield 56%. IR (KBr): ν 3163, 2957, 2868, 2211, 1613, 1548, 1522, 1395cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.93 (t, 3H, —$CH_2CH_2CH_2CH_2CH_3$, *J* = 6.8 Hz), 1.33–1.40 (m, 7H, —$CH_2CH_2CH_2CH_2CH_3$ and —SCH_2CH_3), 1.73–1.78 (m, 2H, —$CH_2CH_2CH_2CH_2CH_3$), 2.694 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.4 Hz), 3.61 (t, 2H, —$CH_2CH_2CH_2CH_2CH_3$, *J* = 7.0 Hz), 4.62 (d, 1H, =CH^a, *J* = 3.2 Hz), 4.65 (d, 1H, =CH^b, *J* = 3.2 Hz), 7.47 ppm (s, 1H, pyrimidine-H); ms: *m/z* 315(M$^+$+1 13), 314(M$^+$ 47), 313(M$^+$−H 14). *Anal.* Calcd. for $C_{17}H_{22}N_4S$ (314): C, 64.93; H, 7.05; N, 17.82. Found C, 64.59; H, 7.28; N, 17.66.

3-Hexyl-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro pyrido[4,3–d]pyrimidine-8-carbonitrile (5j). This compound was obtained as a white solid, m.p. 131.5–132.4°C, yield 79%. IR (KBr): ν 3174, 2950, 2865, 2222, 1615, 1547, 1523, 1397cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.88–0.91 (t, 3H, —$CH_2CH_2CH_2CH_2CH_2CH_3$, *J* = 6.8 Hz), 1.33–1.40 (m, 9H, —$CH_2CH_2CH_2CH_2CH_2CH_3$ and —SCH_2CH_3), 1.72−1.77 (m, 2H, —$CH_2CH_2CH_2CH_2CH_2CH_3$), 2.69 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 3.61 (t, 2H, —$CH_2CH_2CH_2CH_2CH_3$, *J* = 7.2 Hz), 4.63 (d, 1H, =CH^a, *J* = 3.2 Hz), 4.65 (d, 1H, =CH^b, *J* = 3.2 Hz), 7.47 ppm (s, 1H, pyrimidine-H); ms: *m/z* 328(M$^+$ 41). *Anal.* Calcd. for $C_{18}H_{24}N_4S$ (328): C, 65.82; H, 7.36; N, 17.06. Found C, 65.53; H, 7.41; N, 16.99.

3-(2-Chlorobenzyl)-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydropyrido[4,3–d]pyrimidine-8-carbonitrile (5k). This compound was obtained as a white solid, m.p. 148.5–149.5°C, yield 61%. IR (KBr): ν 3066, 2928, 2216, 1599, 1548, 1525, 1393 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.37–1.41 (t, 3H, —SCH_2CH_3, *J* = 7.4 Hz), 2.66 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 4.45 (d, 1H, =CH^a, *J* = 3.6 Hz), 4.63 (d, 1H, =CH^b, *J* = 3.2 Hz), 4.86 (s, 2H, —CH_2—), 7.21–7.47 (m, 4H, ArH), 7.55 ppm (s, 1H, pyrimidine-H); ms: *m/z* 370(M$^+$+2 7), 368(M$^+$ 23). *Anal.* Calcd. for $C_{19}H_{17}ClN_4S$ (368): C, 61.86; H, 4.65; N, 15.19. Found C, 61.62; H, 4.74; N, 14.93.

3-(2-Methylbenzyl)-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5l). This compound was obtained as a white solid, m.p. 153.9–154.9°C, yield 68%. IR (KBr): ν 3066, 2966, 2218, 1607, 1554, 1523, 1400 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.39 (t, 3H, —SCH_2CH_3, *J* = 7.6 Hz), 2.33 (s, 3H, Ph—CH_3), 2.68 (s, 3H, —CH_3), 3.24 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 4.49 (d, 1H, =CH^a, *J* = 3.6 Hz), 4.65 (d, 1H, =CH^b, *J* = 3.6 Hz), 4.69 (s, 2H, —CH_2—), 7.16–7.27 (m, 4H, ArH), 7.43 ppm (s, 1H, pyrimidine-H); ms: *m/z* 348(M$^+$ 32). *Anal.* Calcd. for $C_{20}H_{20}N_4S$ (348): C, 68.93; H, 5.79; N, 16.08. Found C, 69.06; H, 5.88; N, 15.94.

3-(3-Methylbenzyl)-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5m). This compound was obtained as a white solid, m.p. 145.2–146.0°C, yield 80%. IR (KBr): ν 3001, 2967, 2926, 2217, 1606, 1550, 1524, 1401 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.38 (t, 3H, —SCH_2CH_3, *J* = 7.4 Hz), 2.35 (s, 3H, Ph—CH_3), 2.64 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 4.52 (d, 1H, =CH^a, *J* = 3.6 Hz), 4.62 (d, 1H, =CH^b, *J* = 3.6 Hz), 4.74 (s, 2H, —CH_2Ph), 7.06–7.27 (m, 4H, ArH), 7.57 ppm (s, 1H, pyrimidine-H); ms: *m/z* 348(M$^+$ 16). *Anal.* Calcd. for $C_{20}H_{20}N_4S$ (348): C, 68.93; H, 5.79; N, 16.08. Found C, 68.81; H, 5.86; N, 15.91.

3-(4-Methylbenzyl)-5-methyl-4-methylene-7-ethylsulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5n). This compound was obtained as a white solid, m.p. 163.5–164.5°C, yield 63%. IR (KBr): ν 3030, 2974, 2927, 2218, 1606, 1554, 1521, 1399 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.36–1.40 (t, 3H, —SCH_2CH_3, *J* = 7.2 Hz), 2.36 (s, 3H, Ph—CH_3), 2.63 (s, 3H, —CH_3), 3.25 (q, 2H, —SCH_2CH_3, *J* = 7.3 Hz), 4.53 (d, 1H, =CH^a, *J* = 3.6 Hz), 4.60 (d, 1H, =CH^b, *J* = 3.2 Hz), 4.74 (s, 2H, —CH_2Ph), 7.14-7.20 (m, 4H, ArH), 7.57 ppm (s, 1H, pyrimidine-H); ms: *m/z* 348(M$^+$ 5). *Anal.* Calcd. for $C_{20}H_{20}N_4S$

(348): C, 68.93; H, 5.79; N, 16.08. Found C, 68.84; H, 5.63; N, 15.90.

3-(4-Methoxybenzyl)-5-methyl-4-methylene-7-ethyl sulfanyl-3,4-dihydro-pyrido[4,3–d]pyrimidine-8-carbonitrile (5o). This compound was obtained as a white solid, m.p. 156.1–156.9°C, yield 82%. IR (KBr): ν 2934, 2220, 1612, 1547, 1515, 1404 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 1.38 (t, 3H, $-SCH_2\mathit{CH_3}$, $J = 7.2$ Hz), 2.63 (s, 3H, $-CH_3$), 3.24 (q, 2H, $-SCH_2CH_3$, $J = 7.5$ Hz), 3.81 (s, 3H, $-OCH_3$), 4.57 (d, 1H, $=CH^a$, $J = 3.2$ Hz), 4.61 (d, 1H, $=CH^b$, $J = 3.2$ Hz), 4.71 (s, 2H, $-CH_2Ph$), 6.90–7.20 (m, 4H, ArH) 7.54 ppm (s, 1H, pyrimidine-H); ms: *m/z* 364(M^+ 12). *Anal.* Calcd. for $C_{20}H_{20}N_4OS$ (364): C, 65.91; H, 5.53; N, 15.37. Found C, 65.84; H, 5.63; N, 15.21.

Acknowledgments. This work was supported by the National Basic Research Program of China (No. 2003CB114400), National Natural Science Foundation of China (No.20372023, 20772042) and Syngenta Ltd. We thank Dr. John Clough of Syngfenta Jealott's Hill International Research Centre for proof reading.

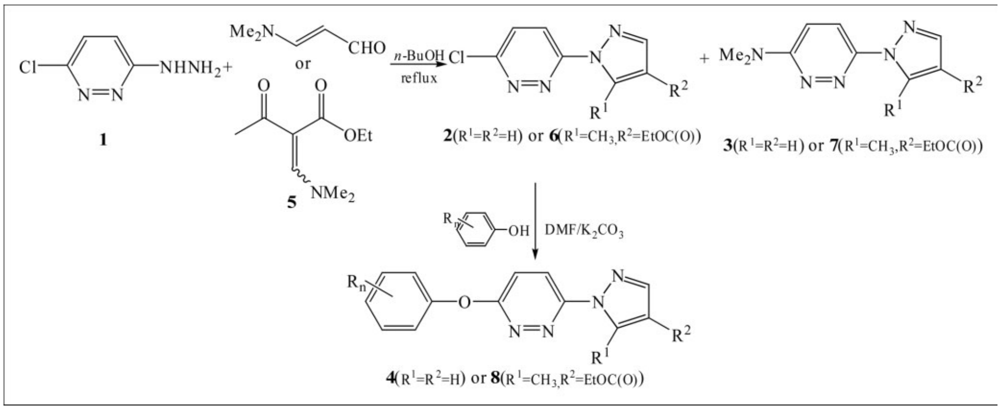
Received December 23, 2008
DOI 10.1002/jhet.120



A series of 3-substituted phenoxy-6-((substituted)*1H*-pyrazol-1-yl) pyridazines were synthesized from the condensation of various phenols and 3-chloro-6-(*1H*-pyrazol-1-yl) pyridazine **2** or 3-chloro-6-(5′-methyl-4-ethoxycarbonyl-*1H*-pyrazol-1-yl) pyridazine **6** in N,N-dimethylformamide (DMF) at 120°C with K_2CO_3 as an acid receptor. The intermediates **2** or **6** were obtained from the cyclization of 3-chloro-6-hydrazinyl pyridazine **1** with 3-dimethylamino-acrylaldehyde or ethyl 2-((dimethylamino) methylene)-3-oxobutanoate in *n*-butanol under reflux, respectively, and side products **3** or **7** were also generated. All of the title compounds were confirmed by ^{1}H NMR, infrared spectometry (IR) and elemental analyses. Preliminary bioassay indicated that some of the title compounds showed high inhibitory activity against *Brassica campestris L. (B. campestris)* and moderate inhibitory activity against *Echinochloa crusgalli*. For example, the inhibition percentages of compound **4b** and **4c** against *B. campestris* were both 94% at 10 μg/mL.

J. Heterocyclic Chem., **46**, 584 (2009).

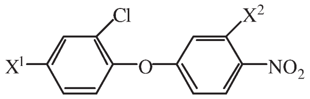
INTRODUCTION

Protoporphyrinogen IX oxidase (Protox, EC 1.3.3.4) is the key enzyme in chlorophyll biosynthesis pathways in plants, which catalyzes the oxidative O_2-dependent aromatization of the colorless protoporphyrinogen IX to the highly conjugated protoporphyrin IX. The phytotoxicity of Protox inhibitors is light dependent and involves intracellular peroxidation caused by protoporphyrin IX, chlorophyll precursor, leading to accumulation of protoporphyrin IX in plant mitochondria and plant chloroplasts. Abnormal accumulated protoporphyrin IX in plant tissue is assumed to cause light-induced formation of active oxygen, which induces disruption of membranes, chlorophyll degradation, and desiccation of plants in the light [1].

So far, several structurally distinct classes of compounds, cyclic imides, phenyltriazolinones, diphenyl ethers (DPEs), etc, targeted at Protox, have been used as herbicides for several decades [2]. DPEs are one of the important Protox inhibitors, and numerous diphenylether compounds have been developed as commercial herbicides (Fig. 1), for example, nitrofen, chlomethoxynil, bifenox, oxyfluorfen, acifluorfen, fluoroglycofen-ethyl, fomesafen, and lactofen.

According to the commercialized Protox inhibitors, DPEs, a pharmacophore of Protox, and its inhibitors were established in our group [3], which indicated that two phenyl rings in DPEs, connected by an oxygen atom as a hydrogen-bonding acceptor, play important roles in their herbicidal activity. In addition, it is deduced from the Protox pharmacophore that a molecule bearing three aromatic rings connected directly or by oxygen atoms or nitrogen atoms maybe also shows good inhibition against Protox.

Heterocyclic rings are the classic phenyl-ring equivalents according to the bioisosterism [4], especially nitrogen-containing heterocyclic rings. So, it is reasonable to



nitrofen(X^1=Cl, X^2=H),
chlomethanoxynil (X^1=Cl, X^2=OMe),
bifenox(X^1=Cl, X^2=CO_2Me),
oxyfluorfen(X^1=CF_3, X^2=OEt),
acifluorfen (X^1= CF_3, X^2=COONa),
fluoroglyfen-ethyl(X^1=CF_3, X^2=$CO_2CH_2CO_2Et$),
fomesafen (X^1= CF_3, X^2=$CONHSO_2Me$),
lactofen (X^1= CF_3, X^2=CH(Me)CO_2Et).

Figure 1. Commercialized herbicides of diphenyl ethers.

use a heterocyclic ring to replace one of the phenyl rings in DPEs. Pyridazine ring is an important moiety in some pharmaceuticals and agrochemicals [5–7]. In our previous work, we synthesized numerous 3-phenoxy-6-dimethylamino pyridazines, and some of them showed inhibitory activity against *Brassica campestris L. (B. campestris)* and *Echinochloacrus-galli (E. crus-galli)* (Fig. 2, X^3 = H, Cl, CF_3, etc) [8]. However, after treatment of above weeds using the synthesized phenoxy pyridazines, *B. campestris* and *E. crus-galli* were desiccated but not killed completely. Ten days later after ''desiccation,'' these two weeds can grow again, which may be attributed to the loss of dimethylamino moiety of phenoxy-pyridazines in above weeds in the light [9]. To get new phenoxy pyridazines, which can be tolerated in above two weeds, we synthesized 3-aryloxy-6-fluoro pyridaiznes and found that they can inhibit the growth of *B. campestris* and *E. crus-galli* to some extent (Fig. 3, X^4 = Cl, OMe, NO_2, etc.) [10]. It was excited that they can be well tolerated in these two weeds. Currently, pyrazole ring is an important moiety in the pesticide researches [11–13]. We introduced pyrazole ring into phenoxy pyridazines because pyrazol-yl moiety has electron-withdrawing characteristic in pyrazolyl pyridazines as nitro group in DPEs (Fig. 4). In addition, the structures in Figure 4 almost meet the requirement of the deducation from Protox pharmacophore. So, we synthesized 3-aryloxy-6-(3′,5′-dimethyl-*1H*-pyrazol-1-yl) pyridazines (Fig. 4, X^5 = Cl, Br, Me, etc.), which showed inhibitory activity against *B. campestris* and *E. crus-galli* to some extent [14].

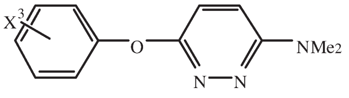


Figure 2. 3-Aryloxy-6-substituted pyridazines.

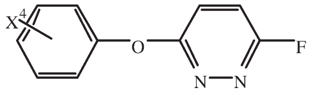

Figure 3. 3-Aryloxy-6-fluoro pyridazines.

In continuation on our research program for the synthesis of novel pyrazolyl-pyridazine derivatives and study on the relationship of structure and herbicidal activity, we design 3-substituted phenoxy-6-(*1H*-pyrazol-1-yl)pyridazines **4** and 3-substituted phenoxy-6-(5′-methyl-4′-ethoxycarbonyl-*1H*-pyrazol-1-yl) pyridazines **8**, which were synthesized from the condensation of various phenols and 3-chloro-6-(1*H*-pyrazol-1-yl) pyridazine or 3-chloro-6-(5′-methyl-4′-ethoxycarbonyl-1*H*-pyrazol-1-yl) pyridazine in DMF at 120°C using K_2CO_3 as an acid acceptor(Scheme 1). All novel compounds were characterized by ^1H NMR, IR, and elemental analyses. Preliminary bioassay indicated that some of the title compounds showed high inhibitory activity against *B. campestris* and moderate inhibitory activity against *E. crus-galli*. Moreover, the title compounds are well tolerated in above weeds during the bioassay procedure.

RESULTS AND DISCUSSION

Synthesis. The synthetic procedure of the title compounds is shown in Scheme 1. The intermediate **2** was achieved from the cyclization of starting materials **1** and 3-(dimethylamino)-acrylaldehyde. When this reaction was carried out in anhydrous ethanol under reflux, side product **3**, rather than the desired compound **2**, was obtained in high yield. However, compound **1** was treated with 3-(dimethylamino)acrylaldehyde in *iso*-propanol or *n*-butanol under reflux to afford compound **2** in 20% and 80% yield, respectively. Steiner *et al.*, [15] Steel and Constable, [16] and Blake *et al.* [17] have previously obtained **2** in 53–74% yield by treatment of pyrazole and 3,6-dichloropyridazine in DMF with NaH as a base. However, side product, 3,6-bis(*1H*-pyrazol-1-yl) pyridazine, was not avoidable.

As such, treatment of starting materials **1** and ethyl 2-((dimethylamino)methylene)-3-oxobutanoate **5** under reflux in *n*-butanol furnished the desired intermediate **6**

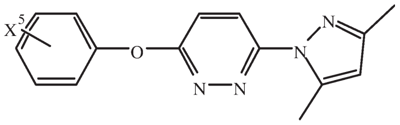

Figure 4. Structure of 3-aryloxy-6-(3′,5′-dimethyl-*1H*-pyrazol-1-yl) pyridazines.

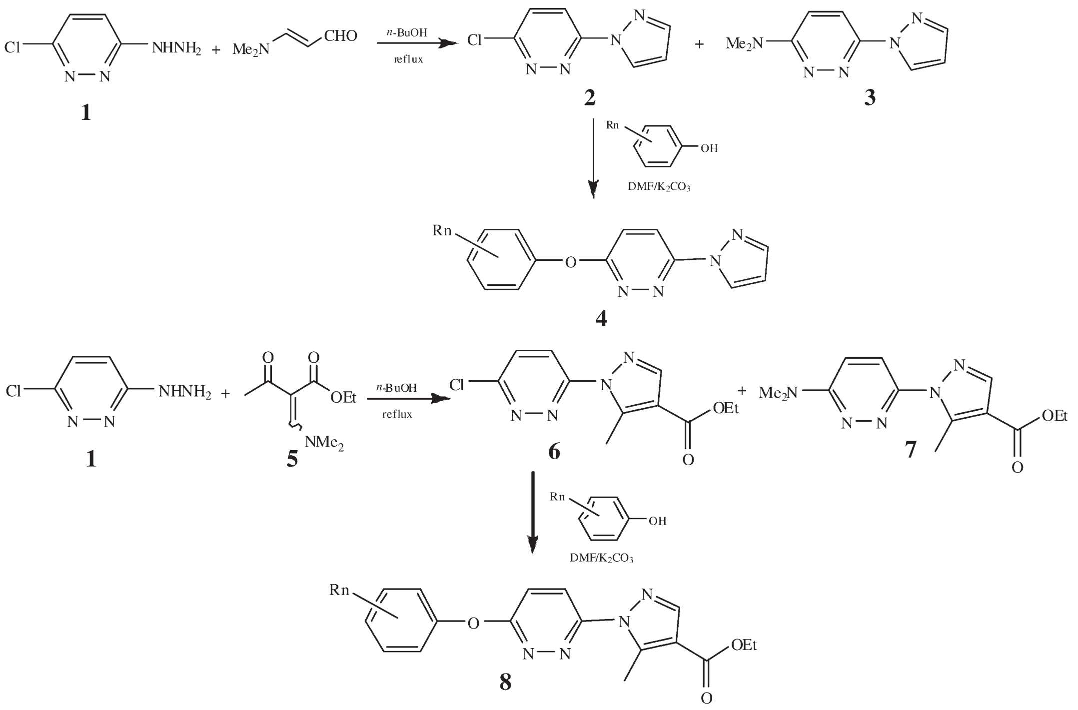
Scheme 1. General procedure for the synthesis of the title compounds.



4a(R_n=3-Cl), **4b**(R_n=4-Cl), **4c**(R_n=4-CH_3), **4d**(R_n=3,4-Cl_2), **4e**(R_n=3-CF_3), **4f**(R_n 4-$CH_3OC(O)$).

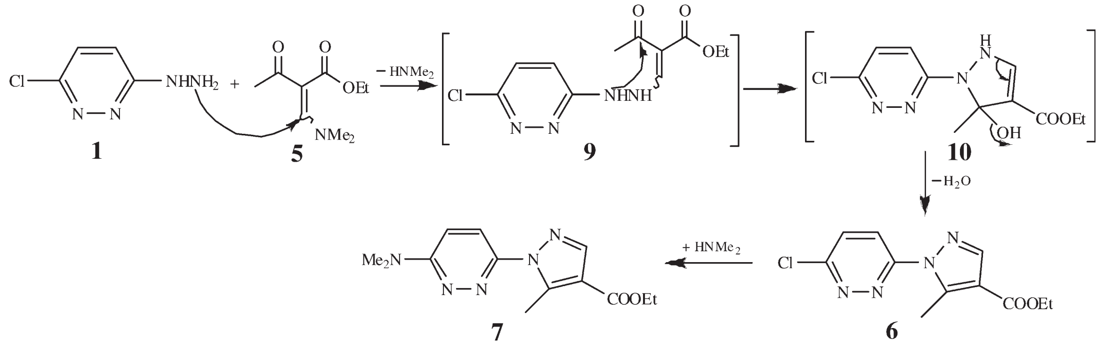
8a(R_n=4-CH_3), **8b**(R_n=3,5-$(CH_3)_2$), **8c**(R_n=2-$CH_3OC(O)$), **8d**(R_n=4-Cl), **8e**(R_n=3-Cl), **8f**(R_n=3,4-Cl_2), **8g**(R_n=4-$CH_3OC(O)$), **8h**(R_n=3-CF_3).

and side product **7** in the yields of 60% and 10%, respectively. Compound **6** was first synthesized by Bagrov [18] from the reaction of ethyl 2-(ethoxymethylene)-3-oxobutanoate with **1**.

A proposed mechanism of the generation of **6** and **7** is shown in Scheme 2. First, the hydrazinyl group in compound **1** attacks the carbon nucleus, which is linked to the dimethylamino moiety, to generate intermediate **9** with elimination of dimethylamine. **9** proceeds the intramolecular cyclization to furnish intermediate **10**, which is dehydrated to give **6**. **7** is obtained through the condensation of **6** and dimethylamine, which is produced from the cyclization of starting materials **1** and **5**. **7** is conformed by X-ray diffraction (Fig. 5) [19], indicating that methyl group is at 5th position and ethoxycarbonyl moiety is at 4th position in the pyrazole ring.

The title compounds **4** or **8** were obtained from the treatment of intermediates **2** or **6** and substituted phenols in DMF at 120°C for several hours until **2** or **6** was consumed completely as indicated by thin layer chromatography. After the reactions were over, the resulting mixtures were poured into cold water, and crude solids were filtrated, which were recrystallized with ethanol and cyclohexane to give pure products. All of the title

Scheme 2. Proposed mechanisms for the generation of **6** and **7**.



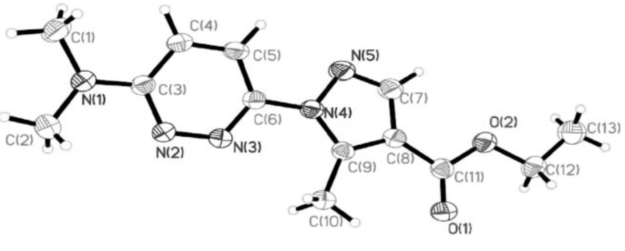


Figure 5. Crystal structure of compound **7**.

compounds were confirmed by ^{1}H NMR, IR, and elemental analyses.

Herbicidal activities. The title compounds were screened for herbicidal activity against *B. campestris* and *E. crus-galli* using a previously reported procedure [20,21], and the data of herbicidal activity were listed in Table 1. It was found that the title compounds are well tolerated in two weeds during the bioassay procedure. Most of compounds **8**, containing a methyl group at 5th position and an ethylcarbony moiety at 4th position in pyrazole ring, have no or slight herbicidal activity against *B. Campestris* and *E. crus-galli*. Compounds **4a–d**, which only have H-atoms at 4th and 5th positions in pyrazole ring, showed high inhibitory activity against *B. Campestris* and moderate inhibitory activity against *E. crus-galli*. at the concentration of 100 and 10 μg/mL, respectively. Compounds **4b** (R_n = 4-Cl) and **4c** (R_n = 4-Me) both showed high inhibitory activity against *B. Campestris*, which indicates that electron-donating groups or weak electron-withdrawing groups at 4th position in phenyl rings are favorable to the increase of herbicidal activity. However, compounds **4e** (R_n = 3-CF_3) and **4f** (R_n = 4-$CH_3OC(O)$) have no herbicidal activity against *B. Campestris*, indicating that strong electron-withdrawing groups at 3rd or 4th positions in phenyl rings are unfavorable to the enhancement of herbicidal activity. When R_n = 3,4-Cl_2, inhibitory activity of compound **4d** against *B. Campestris* decreased slightly compared with that of **4b**, suggesting that introduction of chlorine at 3rd position in phenyl ring be unfavorable to the increase of herbicidal activity. Compound **4a** with chlorine atom at 3rd position in phenyl ring has lower herbicidal activity against *B. Campestris* and *E. crus-galli* than compound **4b** with chlorine atom at 4th position in phenyl ring.

CONCLUSION

In conclusion, a series of 3-substituted phenoxy 6-(substituted pyrazol-yl)pyridazines were obtained from the condensation of various phenols and 3-chloro-6-(*1H*-pyrazol-1-yl) pyridazine or 3-chloro-6-(5′-methyl-4-ethoxycarbonyl-*1H*-pyrazol-1-yl) pyridazine in DMF at 120°C with K_2CO_3 as an acid receptor. The title compounds were screened for herbicidal activity against *B. Campestris* and *E. crus-galli*. Preliminary bioassay indicated that some of title compounds show high inhibitory activity against *B. Campestris* and moderate inhibitory activity against *E. crus-galli* at 10 and 100 μg/mL, respectively. Further study of structure-activity relationship of modified 3-phenoxy 6-substituted pyrazolyl pyridazines is now under investigation.

EXPERIMENTAL

General methods. ^{1}H NMR spectra were recorded on a Varian Mercury Plus 400 MHz spectrometer using $CDCl_3$ or DMSO-d_6 as a solvent and chemical shift values (δ) were given in parts per million downfield of internal tetramethylsilane. ^{13}C NMR spectra were recorded on a Varian Mercury Plus 400 MHz spectrometer (100 MHz) using $CDCl_3$ as a solvent, and chemical shift values (δ) were reported in parts per million relative to the residual chloroform (77.00 ppm) and was obtained with ^{1}H decoupling. IR spectra were recorded on a MAGNA-560 FTIR (Nicolet Company) spectrometer using KBr plates (thin film). The melting points were determined on an X-4 binocular microscope melting point apparatus (Beijing Tech Instruments Co., Beijing, China) and were not corrected. Elemental analyses were performed on a Yanaca CHN Corder MT-3 elemental analyzer. All anhydrous solvents were dried and purified by standard techniques just before use. 3-Chloro-6-hydrazinylpyridazine **1** was prepared according to the literature procedure [22], and 3-(dimethylamino)acrylaldehyde and 3-((dimethylamino) methylene)-1-ethoxy-pentane-2,4-dione **5** were both available commercially.

Synthesis of 3-chloro-6(1H-pyrazol-1-yl) pyridazine 2 and 3-dimethylamino-6(1H-pyrazol-1-yl) pyridazine 3. A mixture of 3-(dimethylamino)acrylaldehyde (1.09 g, 11.00 mmol) and 3-chloro-6-hydrazinyl pyridazine **1** (1.45 g, 10.00 mmol) in *n*-butanol(20mL) was refluxed for half an hour. When the

starting materials were consumed completely as indicated by thin layer chromatography, the reaction mixture was allowed to cool to room temperature. After removal of the solution under pressure, the resulting residue was subjected to flash column chromatography on silica gel to give compound **2** (1.50 g) as a white crystal (eluent: petroleum ether: ethyl acetate=4:1 (*V*/*V*) in 80% yield, mp.143–144°C (ref.: mp. 124–126°C[15]). ^{1}H NMR ($CDCl_3$, 400 MHz), δ: 6.54–6.56 (m, 1H, pyrazole-H), 7.63 (d, J = 9.2 Hz, 1H, pyridazine-H), 7.81 (d, J = 2.0 Hz, 1H, pyrazole-H), 8.22 (d, J = 9.2 Hz, 1H, pyridazine-H), 8.73 (d, J = 2.8 Hz, 1H, pyrazole-H); ^{13}C NMR ($CDCl_3$, 100 MHz), δ: 109.18, 119.92, 127.40, 130.43, 143.28, 153.62, 154.23; IR (KBr) ν (cm^{-1}): 3129, 1635, 1575, 1523, 1448, 1402, 1143, 1016, 860, 765.

Side product 3-dimethylamino-6(1*H*-pyrazol-1-yl) pyridazine **3** was also obtained in 15% yield, mp. 147–149°C. ^{1}H NMR ($CDCl_3$, 400 MHz), δ: 3.21 (s, 6H, NMe_2), 6.47 (m, 1H, pyrazole-H), 7.00 (d, J=9.6 Hz, 1H, pyridazine-H), 7.73 (d, J=2.0 Hz, 1H, pyrazole-H), 7.97 (d, J=9.6 Hz, 1H, pyridazine-H), 8.62 (d, J=2.4 Hz, 1H, pyrazole-H). GC-MS(EI, m/z(%)): 189.09 (M+, 40), 160.10(100). ^{13}C NMR($CDCl_3$, 100 MHz), δ: 38.38, 107.86, 119.40, 126.26, 141.48, 147.77, 159.08. Anal. calcd. for $C_9H_{11}N_5$: C, 57.13; H, 5.86; N, 37.01; found: C, 57.18; H, 5.72; N, 36.89.

General Procedure for the Synthesis of 3-aryloxy-6-(1H-pyrazol-1-yl) pyridazine 4. A 25-mL three-necked round bottom flask equipped with a thermometer, magnetic stir bar, and a dropping addition funnel was charged sequentially with new distilled DMF (7 mL), compounds **2** (2.00 mmol), substituted phenols (2.00 mmol), anhydrous potassium carbonate 0.29 g (2.10 mmol). The resulting mixture was heated at 120°C. After stirring for 12 h, the reaction mixture was allowed to cool to room temperature, poured into 30 mL of ice water, and filtrated to give the crude product. The resulting precipitate was washed with water (5 mL). The collected solid was dried overnight under vacuum to give a white powder, which was recrystallized from ethanol/cyclohexane (1/3: (*V*/*V*) to generate pure compounds **4**.

3-(3-chlorophenoxy)-6-(1H-pyrazol-1-yl)pyridazine(4a). White solid, yield 86%, mp.130–131°C. ^{1}H NMR (DMSO-d_6, 400 MHz) δ: 6.51–6.52 (m, 1H, pyrazole-H), 7.15 (dd, J_1=8.8Hz, J_2=2.0Hz, 1H, ArH), 7.22–7.29 (m, 2H, ArH), 7.35 (s, 1H, ArH), 7.37 (d, J = 9.2 Hz, 1H, pyridazine-H), 7.77 (d, J=2.0Hz, 1H, pyrazole-H), 8.30 (d, J = 9.2 Hz, 1H, pyridazine-H), 8.40 (d, J=2.4Hz, 1H, pyrazole-H). IR (KBr) ν (cm^{-1}): 3136, 3093, 3021, 1578, 1523, 1469, 1418, 1290, 1197, 1126, 1085, 1046, 1018, 909, 858, 768. White solid, yield 85%, m.p. 151–152°C.^{1}H NMR ($CDCl_3$, 400 MHz) δ: 6.51–6.52 (m, 1H, pyrazole-H), 7.19 (d, J = 8.8 Hz, 2H, ArH), 7.35 (d, J = 9.2 Hz, 1H, pyridazine-H), 7.40 (d, J = 8.8 Hz, 2H, ArH), 7.77 (d, J = 2.0Hz, 1H, pyrazole-H), 8.28 (d, J = 9.2 Hz, 1H, pyridazine-H), 8.63 (d, J = 2.4 Hz, 1H, pyrazole-H); IR (KBr) ν (cm^{-1}): 3150, 3006, 1571, 1530, 1498, 1459, 1408, 1299, 1254, 1200, 1171, 1136, 1043, 1008, 934, 838, 762; Anal. calcd for $C_{13}H_9ClN_4O$: C, 57.26; H, 3.33; N, 20.55; found: C, 57.01; H, 3.48; N, 20.58.

3-(4-methylphenoxy)-6-(1H-pyrazol-1-yl)pyridazine(4c). White solid, yield 70%, mp. 131–132°C.^{1}H NMR ($CDCl_3$, 400 MHz) δ:2.37 (s, 3H, $ArCH_3$), 6.50–6.51 (m, 1H, pyrazole-H), 7.11 (d, J = 8.4 Hz, 2H, ArH), 7.23 (d, J = 8.0 Hz, 2H, ArH), 7.31 (d, J = 9.6 Hz, 1H, pyridazine-H), 7.76 (d, J = 2.0Hz, 1H, pyrazole-H), 8.23 (d, J = 9.2 Hz, 1H, pyridazine-H) 8.63 (d, J = 2.0 Hz, 1H, pyrazole-H); IR (KBr) ν (cm^{-1}): 3136, 3093, 3042, 1581, 1514, 1459, 1411, 1296, 1258, 1203, 1133, 1104, 1032, 1014, 931, 861, 762; Anal. calcd for $C_{14}H_{12}N_4O$: C, 66.65; H, 4.79; N, 22.21; found: C, 66.78; H, 4.89; N, 22.45.

3-(3,4-dichlorophenoxy)-6-(1H-pyrazol-1-yl)pyridazine (4d). White solid, yield 87%, mp.158–159°C. ^{1}H NMR ($CDCl_3$, 400 MHz), δ: 6.52–6.56 (m, 1H, pyrazole-H), 7.14 (dd, J_1 = 2.4 Hz, J_2 = 8.8 Hz, 1H, ArH), 7.37 (d, J = 9.6 Hz, 1H, pyridazine-H), 7.40 (d, J = 2.8 Hz, 1H, ArH), 7.50 (d, J = 8.8 Hz, 1H, ArH), 7.77 (d, J=2.0Hz, 1H, pyrazole-H), 8.30 (d, J = 9.6 Hz, 1H, pyridazine-H), 8.63 (d, J = 2.4 Hz, 1H, pyrazole-H); IR (KBr) ν (cm^{-1}): 3143, 3084, 3056, 3028, 1568, 1530, 1469, 1418, 1398, 1299, 1261, 1206, 1120, 1043, 1018, 918, 864, 810, 755; Anal. calcd. for $C_{13}H_8Cl_2N_4O$: C, 50.84; H, 2.63; N, 18.24; found: C, 50.62; H, 2.83; N, 18.34.

3-(3-trifluorophenoxy)-6-(1H-pyrazol-1-yl)pyridazine (4e). White solid, yield 80%, mp. 160–161°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 6.51–6.53 (m, 1H, pyrazole-H), 7.40 (d, J = 9.6 Hz, 1H, pyridazine-H), 7.46 (d, J = 7.6 Hz, 1H, ArH), 7.51–7.59 (m, 3H, ArH), 7.77(d, J=2.0Hz, 1H, pyrazole-H), 7.82 (d, J = 9.6 Hz, 1H, pyridazine-H), 8.63 (d, J = 2.0 Hz, 1H, pyrazole-H); IR (KBr) ν (cm^{-1}): 3136, 3086, 3035, 1574, 1523, 1459, 1408, 1325, 1286, 1206, 1162, 1136, 1068, 1018, 909, 864 762; Anal. calcd. for $C_{14}H_9F_3N_4O$: C, 54.91; H, 2.96; N, 18.29; found: C, 54.98; H, 2.94; N, 18.29.

3-(4-methoxycarbonylphenoxy)-6-(1H-pyrazol-1-yl) pyridazine (4f). White solid, yield 80%; mp. 187–188°C. ^{1}H NMR ($CDCl_3$, 400 MHz), δ: 3.93 (s, 3H, $COOCH_3$), 6.51–6.52 (m, 1H, pyrazole-H), 7.31 (d, J = 8.0 Hz, 2H, ArH), 7.39 (d, J = 9.6 Hz, 1H, pyridazine-H), 7.77 (d, J = 2.0 Hz, 1H, pyrazole-H), 8.13 (d, J = 8.0 Hz, 2H, ArH), 8.31 (d, J = 9.6 Hz, 1H, pyridazine-H), 8.64 (d, J = 2.0 Hz, 1H, pyrazole-H); IR (KBr) ν (cm^{-1}): 3136, 3093, 3028, 2958, 1725, 1597, 1517, 1456, 1408, 1283, 1197, 1158, 1110, 1046, 1014, 931, 861, 774; Anal. calcd. for $C_{15}H_{12}N_4O_3$: C, 60.78; H, 4.08; N, 18.91; found: C, 60.78; H, 4.02; N, 18.92.

Synthesis of 3-chloro-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl)pyridazine 6 and 3-dimethylamin-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl)pyridazine 7. A mixture of ethyl 2-((dimethylamino)methylene)-3-oxobutanoate **5** (1.50 g, 8.10 mmol) and 3-chloro-6- hydrazinyl pyridazine **1**(1.16 g, 8.00 mmol) in *n*-butanol (20mL) was refluxed. When the starting materials were consumed completely as indicated by thin layer chromatography, the workup of reaction mixture was the same as that of compound **2** to give compound **6** (1.52 g) as a white crystal in 60% yield, mp. 140–141°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.39 (t, J = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 3.05 (s, 3H, pyrazole-CH_3), 4.35 (q, J = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.69 (d, J = 9.2 Hz, 1H, pyridazine-H), 8.10 (s, 1H, pyrazole-H), 8.14 (d, J = 9.2 Hz, 1H, pyridazine-H); ^{13}C NMR ($CDCl_3$, 100 MHz), δ: 13.73, 14.55, 60.53, 115.59, 124.14, 130.73, 143.91, 146.59, 155.38, 156.06, 163.31; LC-MS: 267 (M^+, 100), 269 (33); IR (KBr) ν (cm^{-1}): 3131, 1633, 1448, 1402, 1089, 1018, 860, 765. Anal. calcd. for $C_{11}H_{11}ClN_4O_2$: C, 49.54; H, 4.16; N, 21.01; found: C, 49.28; H, 4.26; N, 20.98.

Side product 3-dimethylamin-6-(4-ethoxycarbonyl-5-methyl-1*H*-pyrazol-1-yl) pyridazine **7** was also obtained in 10% yield.

mp. 102–104°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.92 (s, 3H, pyrazole-CH_3), 3.24(s, 6H, $N(CH_3)_2$), 4.33 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 6.98((d, *J* = 10.0 Hz, 1H, pyridazine-H), 7.34 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 8.04 (s, 1H, pyrazole-H). Anal. calcd. for $C_{13}H_{17}N_5O_2$: C, 56.71; H, 6.22; N, 25.44; found: C, 56.77; H, 6.27; N, 25.41. Compound **7** was further confimred by X-ray diffraction (Fig. 5).

3-(4-methylphenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl)pyridazine(8a). White solid, yield 41%, mp. 110–111°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.38 (s, 3H, Ar—CH_3), 2.95 (s, 3H, pyrazole-CH_3), 4.33 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.12 (d, *J* = 8.4 Hz, 2H, ArH), 7.25 (d, *J* = 8.4 Hz, 2H, ArH), 7.34 (d, *J* = 9.2 Hz, 1H, pyridazine-H), 8.06 (s, 1H, pyrazole-H), 8.11 (d, *J* = 9.2 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3114, 3035, 1710, 1545, 1446, 1402, 1302, 1251, 1184, 1085, 1018, 934, 880, 842, 771; Anal. calcd. for $C_{18}H_{18}N_4O_3$: C, 63.89; H, 5.36; N, 16.56; found: C, 63.92; H, 5.41; N 16.49.

3-(3,5-dimethylphenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8b). White solid, yield 80%, mp. 119–120°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.34 (s, 6H, Ar—$(CH_3)_2$), 2.95 (s, 3H, pyrazole-CH_3), 4.34 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 6.83 (s, 2H, ArH), 6.90 (s, 1H, ArH), 7.33 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 8.06 (s, 1H, pyrazole-H), 8.10 (d, *J* = 9.6 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}):3114, 3035, 2985, 2934,1718,1619, 1555, 1443, 1402, 1296, 1251, 1184, 1133, 1094, 1034, 934, 835, 784; Anal. calcd. for $C_{19}H_{20}N_4O_3$: C, 64.76; H, 5.72; N, 15.90; found: C, 64.56; H, 6.00; N, 15.97.

3-(2-methoxycarbonylphenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8c). White solid, yield 75%, mp. 130–131°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.93 (s, 3H, pyrazole-CH_3), 3.74 (s, 3H, $COOCH_3$), 4.33 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.32 (d, *J* = 8.0 Hz, 1H, ArH), 7.37 (t, *J* = 7.6 Hz, 1H, ArH), 7.45 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 7.65 (t, *J* = 7.6 Hz, 1H, ArH), 8.06 (s, 1H, pyrazole-H), 8.09 (d, *J* = 7.6 Hz, 1H, ArH), 8.17 (d, *J* = 9.6 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3122, 2992, 1710, 1602, 1552, 1478, 1446, 1402, 1299, 1258, 1184, 1133, 1091, 1034, 931, 880, 835, 774; Anal. calcd. for $C_{19}H_{18}N_4O_5$: C, 59.68; H, 4.74; N, 14.65; found: C, 59.70; H, 4.61; N, 14.69.

3-(4-chlorophenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8d). White solid, yield 80%, mp. 175–176°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.95 (s, 3H, pyrazole-CH_3), 4.33 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.19 (d, *J* = 8.8 Hz, 2H, ArH), 7.38 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 7.41 (d, *J* = 8.8Hz, 2H, ArH), 8.06(s, 1H, pyrazole-H), 8.16 (d, *J* = 9.6 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3134, 3012, 1716, 1578, 1552, 1443, 1402, 1285, 1254, 1168, 1041, 1087, 848, 772; Anal. calcd. for $C_{17}H_{15}ClN_4O_3$: C, 56.91; H, 4.21; N, 15.62; found: C, 56.73; H, 4.34; N, 15.90.

3-(3-chlorophenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8e). White solid, yield 72%, mp. 130–131°C. ^{1}H NMR (DMSO-d_6, 400 MHz) δ: 1.38 (t, *J* =7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.97 (s, 3H, pyrazole-CH_3), 4.34 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.16(dd, *J*=1.6Hz, 6.8Hz, 1H, ArH), 7.27–7.30(m, 2H, ArH), 7.38–7.42 (m, 2H, pyridazine-H + ArH), 8.07 (s, 1H, pyrazole-H), 8.18 (d, *J* = 9.2 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3136, 3035, 1718, 1584, 1562, 1442, 1402, 1290, 1248, 1187, 1040, 1094, 854, 778; Anal. calcd. for $C_{17}H_{15}ClN_4O_3$: C, 56.91; H, 4.21; N, 15.62; found: C, 57.32; H, 4.05; N, 15. 44.

3-(3,4-dichlorophenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8f). White solid, yield 58%, mp. 145–146°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.97 (s, 3H, pyrazole-CH_3), 4.34 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.14 (dd, J_1 = 8.8Hz, J_2 = 2.8Hz, 1H, ArH), 7.36–7.42 (m, 2H, ArH+ pyridazine-H), 7.52 (d, *J* = 8.8 Hz, 1H, ArH), 8.07 (s, 1H, pyrazole-H), 8.20 (d, *J* = 9.2 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3114, 3021, 1718, 1552, 1443, 1402, 1296, 1246, 1187, 1094, 1037, 922, 890, 838, 771; Anal. calcd. for $C_{17}H_{14}Cl_2N_4O_3$: C, 51.93; H, 3.59; N, 14.25; found: C, 52.11; H, 4.05; N, 14.03.

3-(4-methoxycarbonylphenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8g). White solid, yield 52%, mp. 129–130°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.96 (s, 3H, pyrazole-CH_3), 3.94(s, 3H, $COOCH_3$), 4.33 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.32(d, *J* = 8.8 Hz, 2H, ArH), 7.42 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 8.07 (s, 1H, pyrazole-H), 8.14 (d, *J* = 8.8 Hz, 2H, ArH), 8.19 (d, *J* = 9.6 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3136, 3013, 2025, 1723, 1606, 1590, 1554, 1506, 1481, 1456, 1435, 1412, 1400, 1298, 1245, 1206, 1184, 1168, 1098, 1042, 1016, 935, 877, 771; Anal. calcd. for $C_{19}H_{18}N_4O_5$: C, 59.68; H, 4.74; N, 14.65; found: C, 59.64; H, 4.55; N, 14.45.

3-(3-trifluorophenoxy)-6-(4-ethoxycarbonyl-5-methyl-1H-pyrazol-1-yl) pyridazine(8h). White solid, yield 80%, mp.: 133–134°C. ^{1}H NMR ($CDCl_3$, 400 MHz) δ: 1.38 (t, *J* = 7.2 Hz, 3H, $CH_2\mathbf{CH_3}$), 2.96 (s, 3H, pyrazole-CH_3), 4.34 (q, *J* = 7.2 Hz, 2H, $\mathbf{CH_2}CH_3$), 7.43 (d, *J* = 9.6 Hz, 1H, pyridazine-H), 7.47 (d, *J* = 8.0 Hz, 1H, ArH), 7.52 (s, 1H, ArH), 7.54 (d, *J* = 8.0 Hz, 1H, ArH), 7.58 (t, *J* = 7.6 Hz, 1H, ArH), 8.08 (s, 1H, pyrazole-H), 8.20 (d, *J* = 9.6 Hz, 1H, pyridazine-H); IR (KBr) ν (cm^{-1}): 3181, 3145, 3060, 2992, 2931,1718, 1648, 1581, 1554, 1474, 1444, 1380, 771, 691; Anal. calcd. for $C_{18}H_{15}F_3N_4O_3$: C, 55.10; H, 3.85; N, 14.28; found: C, 55.24; H, 4.05; N, 14.39.

Herbicidal activity tests [20,21]. ***Inhibition of the root-growth of rape (Brassica campestris L.).*** The compounds to be tested are made into emulsions to aid dissolution. Rape seeds are soaked in distilled water for 5 h before being placed on a filter paper in a 6-cm Petri plate, to which 2 ml of inhibitor solution had been added in advance. Usually, 15 seeds are used on each plate. The plate is placed in a dark room and allowed to germinate for 72 h at 28(±1)°C. The lengths of 10 rape roots selected from each plate are measured and the means are calculated. The inhibition percentage is calculated relative to controls using distilled water instead of the inhibitor solution. There were two replicates for each treatment. The data of herbicidal activity are listed in Table 1.

Inhibition of the seedling growth of barnyard grass (Echinochloa crusgalli (L.) Beauv.). The compounds to be evaluated are made into emulsions to aid dissolution. Ten baryard grass seeds are placed into a 50-mL cup covered with a layer of grass beads (diameter = 0.5cm) and a piece of filter paper at the bottom, to which 5 mL of inhibitor solution had been added in advance. The cup is placed in a bright room, and the seeds were allowed to germinate for 72 h at 28(±1)°C. The height of the above-ground parts of the seedlings in each cup is measured and the means calculated. The inhibition percentage is calculated relative to controls using distilled water instead of the inhibitor solution. There were two replicates for each treatment. The data of herbicidal activity are listed in Table 1.

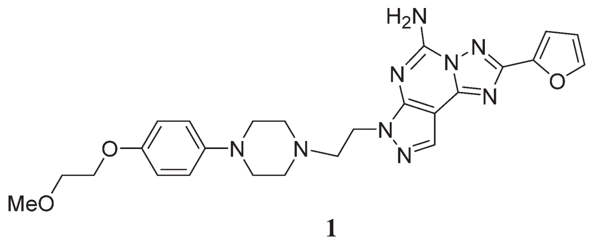
A systematic study was conducted to investigate the influence of differently ionized species on the fragmentation pathways and energetics of a piperazine-containing adenosine by using different cations or anions. Very different fragmentation mechanisms were observed in protonated- *versus* sodiated-molecules, which indicated that the proton is mobilized to promote the charge-direct fragmentation, whereas Na^+ cation was fixed at the heterotricyclic ring structure provoking charge-remote fragment ions. This finding was also supported by the results observed in the fragmentation behaviors in the deprotonated-molecule. The energetics of these fragment ions were also explored by using the breakdown curves obtained from the triple quadrupole and LTQ-Orbitrap™ instrument. The data indicated that the lowest energy pathways in the protonated-molecule $[M+H]^+$ involve breaking a C—N bond connecting an ethylene bridge and heterotricyclic ring structure. The lowest energy pathway is the cleavage of a C—O bond connecting the methoxy ethyl group and phenolic oxygen to form a distonic radical ion for a sodiated-molecule $[M+Na^+]$and a deprotonated-molecule $[M\text{-}H]^-$. The data suggest that by choosing the differently ionized species, one can probe different fragmentation channels that can provide additional structure information for an unknown impurity and possibly degradation product identification. In addition, by comparing the data obtained from triple quadrupole and LTQ-Orbitrap instruments, one can develop further understanding of the differences in the fragmentation behaviors due to the variations in the collision activation-dissociation process. From the side-by-side comparison with the breakdown curves obtained for both instruments, the difference in fragmentation behaviors caused by the difference in dissociation processes that occur in these two types of instruments can be probed.

J. Heterocyclic Chem., **46**, 591 (2009).

INTRODUCTION

LC/MS and LC/MS/MS techniques have become a widely used analytical tool for the identification of small molecule impurities in active pharmaceutical ingredients (API). With the increasing number of applications of LC/MS and MS/MS methods, a comprehensive understanding of small-molecule fragmentation pathways has become correspondingly more important. The newly designed LTQ-Orbitrap™ instrument has the capability of performing high-resolution (upto 100,000) and high-mass accuracy (<5 ppm, external calibration) with wide-dynamic range (>5000) mass measurements [1,2]. The instrument can also perform multistage MS/MS (MS^n) experiment that are essential for studying fragmentation pathways.

A potential adenosine receptor antagonist, **1**, was utilized as a model compound for this mass spectral fragmentation pathway study.



1

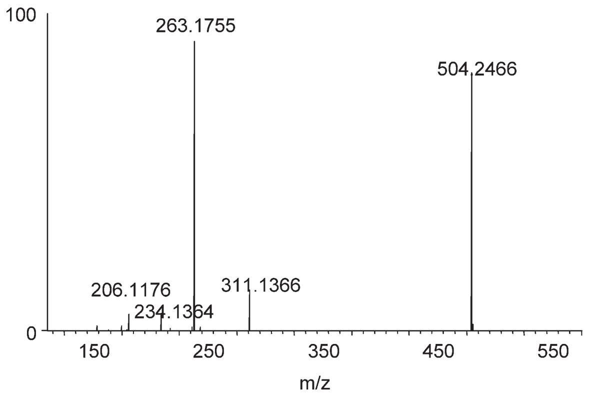


Figure 1. 30 eV MS/MS spectrum of the protonated-molecule at m/z 504 obtained from Orbitrap MS.

The fragmentation mechanisms and energetics of these types of compounds have not been explored previously. To identify potential impurities and degradation products in **1**, and related compounds, it is essential to understand the fragmentation pathways and energetics of this model compound. The LTQ-Orbitrap is a hybrid instrument that combines an LTQ ion trap instrument with an Orbitrap; the latter is used for high-mass accuracy analysis. All the ion activation processes occur in the LTQ ion trap portion of the instrument, and the resulting ions are then injected into the Orbitrap to achieve high-mass accuracy detection. In an ion trap, collisonal-activation of the precursor ion occurs *via* resonance excitation that couples with the tandem-in-time process of the ion trap, rather than tandem-in-space process of a beam instrument. This allows multistage tandem mass spectrometry for structural elucidation. Combining multistage MS/MS experiments with high-resolution detection obtained in the Orbitrap, one can obtain high-mass accuracy (<5 ppm) for every fragment ion. Consequently, we are able to determine the elemental composition of each fragment ion, allowing the derivation of plausible fragment structures. As a result, a detailed fragmentation pathway of a compound can be readily derived *via* these experiments. Themo Fisher Quantum triple quadrupole mass spectrometer is a beam instrument where collision activation of precursor ions occurs through tandem-in-space was used for comparison purposes [3,4]. The differences in fragmentation behavior of the model compound were illustrated clearly from the breakdown curves generated by both instruments.

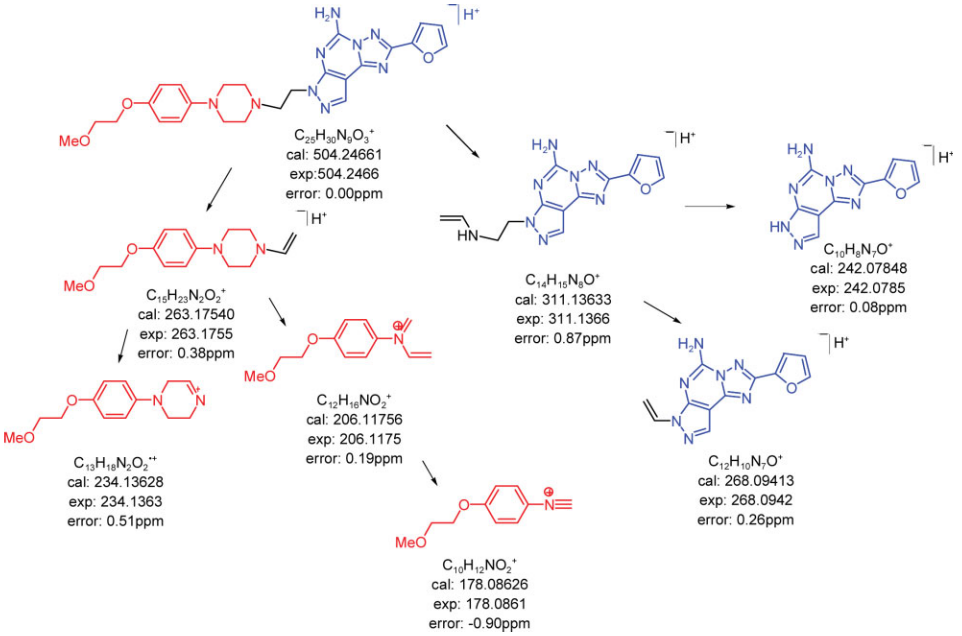
In this article, we discuss the influence of the different cations or anions on the fragmentation behavior of **1**, especially, the protonated, sodiated, and deprotonated adducts commonly observed in a routine LC/MS run. The different fragmentation behaviors observed from these varied approaches can assist the investigator in determining additional fragmentation channels that are structurally informative. By applying different approaches, the process can help an investigator to interpret the fragmentation patterns generated in unknown impurities and degradation products leading ultimately to the determination of the structure. Charge-remote fragmentation mechanism of the sodium adduct were also studied. The purpose was to provoke the charge-remote fragmentation by using the Na^+ cation instead of the protonated-molecule to gain access to different types of fragmentation channels. A similar approach has been successfully applied to other types of compounds previously [5,6].

RESULTS AND DISCUSSION1

Protonated-molecule. Figure 1 shows the 30 eV MS/MS spectrum of the protonated-molecule, 1, at m/z 504, obtained from the Orbitrap instrument. The most abundant fragment ion at m/z 263 was the result of the cleavage C—N bond with a neutral loss of 7*H*-pyrazolo[4,3-*e*]-[1,2,4]triazolo-[1,5-*c*]pyrimidin-5-yl amine moiety (a heterotricyclic moiety, see Scheme 1). The fragment ion at m/z 311 was the result of piperazine ring opening with a neutral loss of the methoxy-phenetole and a portion of the piperazine ring. MS^3 experiments were also conducted to further investigate the fragmentation pathway of this compound. Figure 2 shows the MS^3 spectra of the product ions at m/z 263 and m/z 311. As shown in Scheme 1, the fragment ion at m/z 263 yields two dominant fragment ions at m/z 206 generated by piperazine ring opening and 234 produced by the loss of the ethylene bridge. The fragment ion at m/z 206 undergoes further fragmentation to give an ion at m/z 178. The fragment ion at m/z 311 gave two major fragment ions at m/z 268 (the result of loss of a vinyl amine group) and 242 generated by cleavage at the C—N bond between the carbon of the ethylene linkage and the nitrogen on the tricyclic ring. The data show that all the fragment ions were the result of either the piperazine ring opening or the cleavage at either side of the ethylene linkage connecting the phenyl piperazine and hetero tricyclic moieties.

For comparison purposes, the 30 eV MS/MS spectrum of the protonated-molecule (m/z 504) generated by a

Scheme 1. Fragmentation pathways of the protonated-molecule at m/z 504 derived from MS^3 spectra obtained from the Orbitrap instrument at mass accuracy within 1 ppm. [Color scheme can be viewed in the online issue, which is available at www.interscience.wiley.com.]



triple quadrupole instrument is shown in Figure 3. The fragmentation patterns were similar to those obtained from the Orbitrap instrument except for the differences in the relative abundances of individual fragment ions. The MS/MS data suggested that preferential and selective cleavage was observed in the protonated-molecule obtained *via* the Orbitrap instrument, whereas extensive and nonselective cleavage was generated by the triple quadrupole instrument.

To illustrate energy effects on the fragmentation behavior more clearly, the breakdown curves obtained from both Orbitrap and triple quadrupole instruments are shown in Figure 4. It is clear that the breakdown curve obtained from the Orbitrap instrument changes dramatically with changing the collision energy from 20 to 35 eV. The intensity for the precursor ion decreases with increasing collision energy. At 35 eV collision energy, almost all the precursor ions underwent further fragmentation, the fragment ion at m/z 263 becoming the most dominant peak. The relative intensity of each fragment ion remained unchanged when the collision energy was increased from 35 to 60 eV. The major fragment ion at m/z 263 remained the dominant fragment ion, whereas all the other fragment ions were present at very low intensity. The data indicated that the m/z 263 ion was the low energy and preferred fragmentation channel. The collision activation dissociation process occurred in a linear ion trap, where the ion of interest collided multiple times with helium gas but could not accumulate enough internal energy to facilitate the higher energy fragmentation channels.

The breakdown curves obtained from the triple quadrupole instrument changed dramatically *via* changes of the collision energy as shown in Figure 4(b). The collision energy had a significant impact on the fragmentation channels. The precursor ion intensity decreases with the increase of the collision energy from 0 to 40 eV. Above 40 eV, the precursor ion intensity was less than 5%. Concurrently, the fragment ion intensity increased dramatically. At around 30 eV, the fragment ion at m/z 263 became the dominant fragmentation channel, which is consistent with the observation from Orbitrap instrument, where the m/z 263 is the lowest energy channel in the protonated-molecule. When the collision energy increased to around 40 eV, the fragment ions at m/z 84 and 206 became the dominant fragmentation channels. When the collision energy was increased to 50 eV, m/z 178 became the major fragment channel.

Based on the Scheme 1, it is clear that the fragment ions at m/z 84, 178, and 206 were the result of further dissociation of the fragment ion at m/z 263. The data suggest that in the triple quadrupole instrument, there is enough internal energy deposited into the molecule to promote higher energy fragmentation channels.

The breakdown curves obtained from both instruments also demonstrated that the dominant fragment ions, such as, m/z 263, 206, 178, and 84 contained the whole or partial piperazine ring. The fragment ions containing the 7*H*-pyrazolo[4,3-*e*][1,2,4]-triazolo[1,5-*c*]pyrimidin-5-yl amine, such as m/z 311, 268, and 242, were present in a very small amount. It is clear that in the

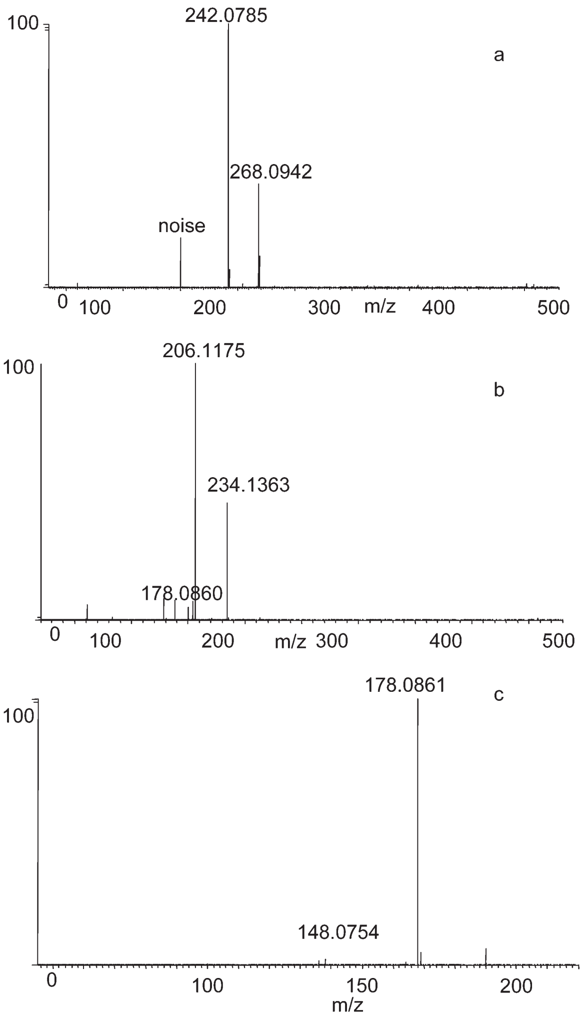


Figure 2. (a) 30 eV MS^3 spectrum of the protonated-molecule at m/z 504→m/z 311→ product, (b) 35 eV MS^3 spectrum of the protonated-molecule at m/z 504→m/z 263→ product, and (c) 30 eV MS^3 spectrum of the protonated-molecule at m/z 504→m/z 206→ product.

protonated-molecule, **1**, the preferred fragmentation channels involved the phenyl piperazine moiety.

Sodiated-molecule[M+Na$^+$]. Figure 5(a) shows the 20 eV MS/MS spectrum of the sodiated-molecule at m/z 526 in the Orbitrap MS instrument. Again, very selective and preferential cleavage was observed in the sodiated-molecule in the Orbitrap instrument. Only one fragment ion at m/z 467 was observed at collision energies ranging from 0 to 70 eV in the Orbitrap instrument. Based on the accurate mass data, the structure of this fragment ion can be determined as a nonconventional distonic radical cation (Scheme 2). This fragment ion was not observed for the protonated-molecule (Fig. 1 and Scheme 1). To explore the fragmentation behaviors of the sodiated-molecule, MS^3 experiments of the product ion at m/z 467 generated from the sodiated-molecule at m/z 526 were conducted [Fig. 5(b)]. The major fragment ions observed were m/z 333, 319, 290, and 264, in which, m/z 333, 290, and 264 correspond to fragment ions at m/z 311, 268, and 242 in the protonated-molecule. The fragment ion at m/z 319, the most dominant fragment in the 30 eV MS^3 spectrum using the Orbitrap MS, was not present for the protonated-molecule. This fragment ion was the result of piperazine ring opening in a different way from that of the m/z 333 ion. The fragmentation pathways derived from the MS/MS and

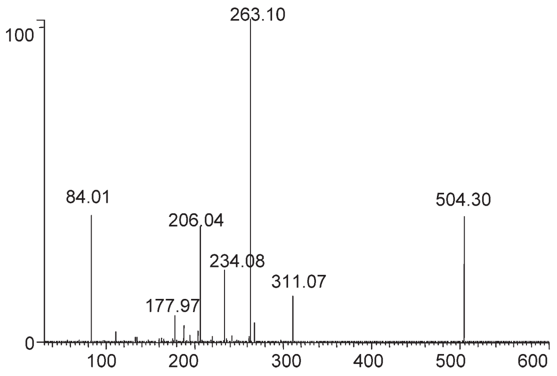

Figure 3. 30 eV MS/MS spectrum of the protonated-molecule at m/z 504 obtained from triple quadrupole instrument.

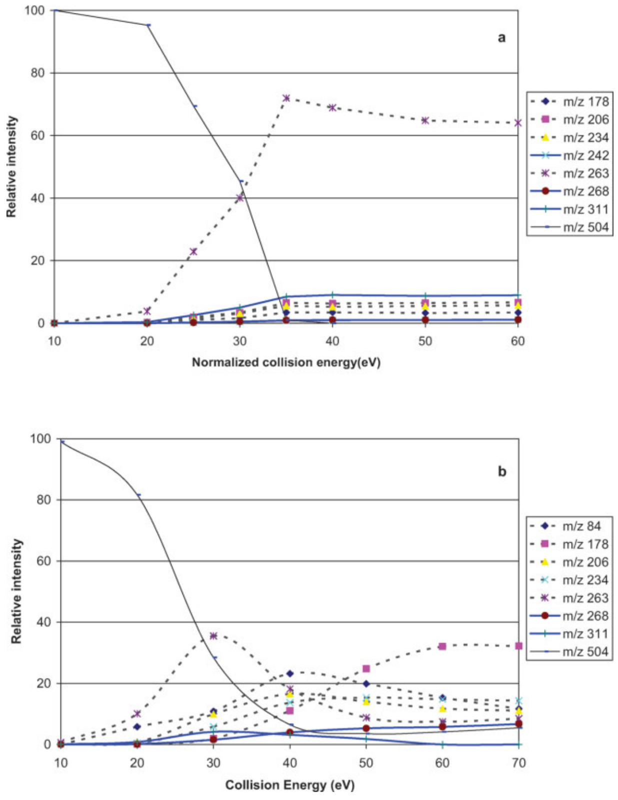

Figure 4. (a) Breakdown curve of $[M+H]^+$ from Orbitrap; (b) Breakdown curve of $[M+H]^+$ from triple quadrupole. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

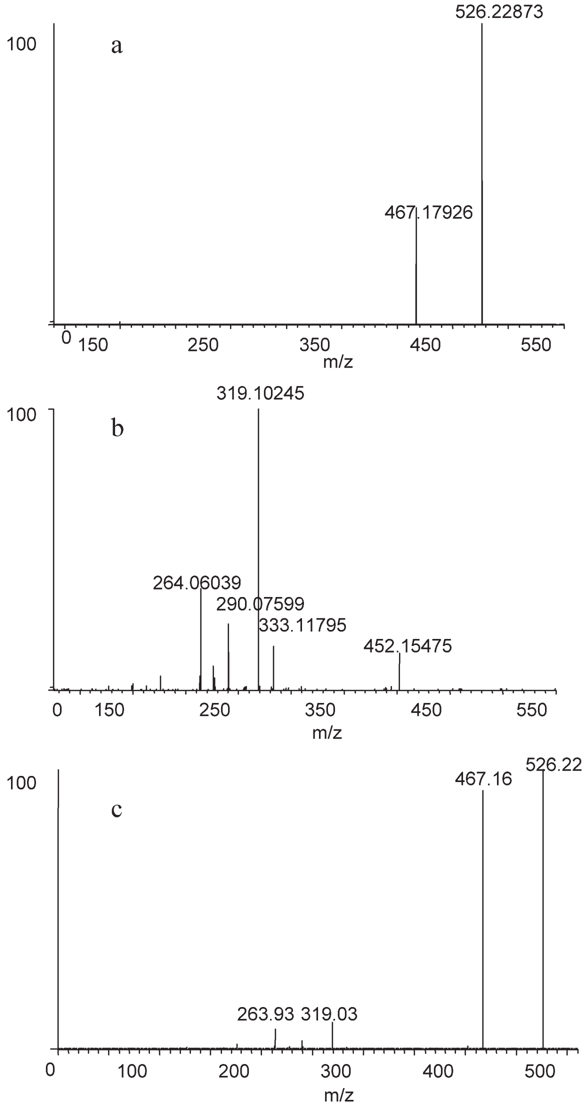

Figure 5. (a) 20 eV MS/MS spectra of [M+Na$^+$] at m/z 526 from the Orbitrap MS, (b) 35 eV MS^3 spectrum of [M+Na$^+$] at m/z 526→ m/z 467→products from the Orbitrap MS, (c) 30 eV MS/MS of [M+Na$^+$] at m/z 526 from the triple quadruple MS.

MS^3 experiments in the Orbitrap MS instrument are depicted in Scheme 2. It is worth noting that contrary to the fragmentation patterns observed for the protoned-molecule the major fragment ions in the MS^3 spectrum of the sodiated-molecule from the Orbitrap instrument all contain the intact 7*H*-pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidin-5-yl amine tricyclic ring moiety.

Figure 5(c) shows the 30 eV MS/MS spectrum of [M+Na$^+$] generated by a triple quadrupole instrument at 30 eV collision energy. The data showed the dominant fragment ion was observed at m/z 467, which is consistent with that obtained from Orbitrap instrument. However, in a triple quadrupole, we also observed several fragment ions at m/z 226, 264, 290, and 319, which were absent from the MS/MS spectrum generated in an Orbitrap instrument. Interestingly, all these ions were only observed in a MS^3 spectrum of the product ion at m/z 467 using the Orbitrap instrument.

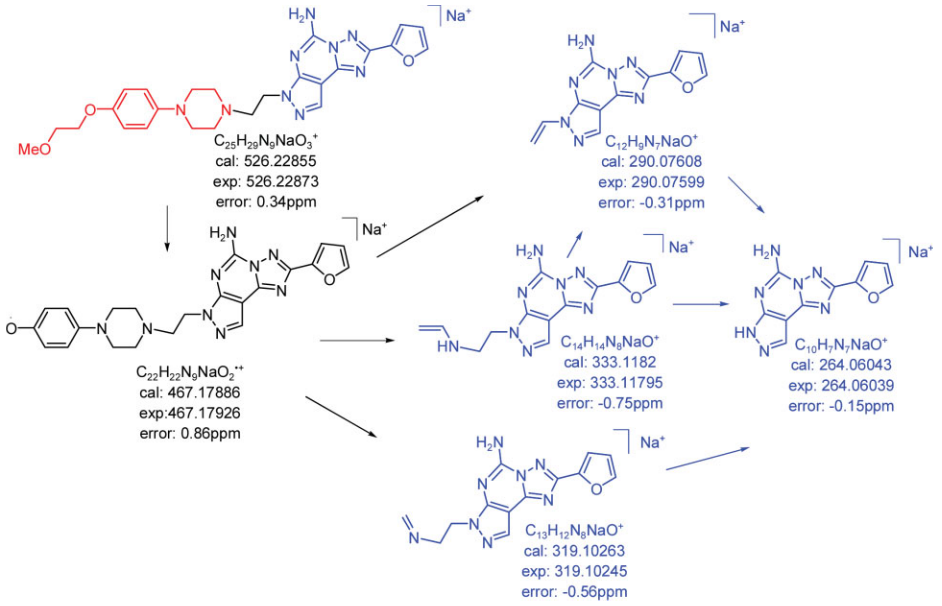
Figure 6(a,b) shows the breakdown curves generated by the Orbitrap and triple quadrupole instruments. The breakdown curves generated by the Orbitrap were very simple. Only one fragment ion at m/z 467 was generated at collision energy ranging from 0 to 80 eV with He as the collision gas. The data demonstrated that only one fragmentation channel opened during MS/MS experiment in Orbitrap and that forming the fragment ion at m/z 467 was the lowest energy process.

Figure 6(b) exhibits very interesting and different breakdown curves generated by the triple quadrupole instrument. Overall, the fragmentation behavior changed dramatically with increasing collision energy. At lower energy, the precursor ion intensity decreased with increasing collision energy. Only 50% of the precursor ion remained at collision energy of 30 eV; the dominant fragment ion observed at this collision energy was m/z 467, which indicated that this is the lowest energy channel. Many fragmentation channels were opened up when the fragment ion at m/z 319 became the major fragment ion at 40–50 eV collision energy. At a collision energy of 60 eV, the m/z 264 fragment ion was the most favored. The data clearly suggest that there were more internal energy deposited in the dissociation process in a triple quadrupole instrument, which opens up higher energy fragmentation channels.

The remarkable differences between breakdown curves obtained from the Orbitrap and triple quadrupole instruments for protonated- and sodiated-forms of **1** are the relative abundance of fragment ions at m/z 263 (protonated) and m/z 467 (sodiated). These differences are most likely caused by discrimination against certain fragment ions in competitive reaction channels in slow activation processes common in ion trap instruments [8,9]. Based on the study conducted by Futrell and coworkers [8], two different fragmentation pathways are competing with each other: the further dissociation of the lowest-energy fragmentation *via* high-energy fragmentation channel. The higher energy fragmentation pathway is strongly suppressed if it has a slower-activation process than that of the low-energy pathway(s). These observations were also consistent with the results of other ion-activation processes, such as surface-induced dissociation (SID) *vs.* collision induced dissociation (CID) reported by Laskin *et al.* [10]

We also wished to compare the fragmentation pathways obtained using the Orbitrap instrument (Schemes 1 and 2) and breakdown curves generated by triple quadrupole instrument [Figs. 4(b) and 6(b)] for both protonated- and sodiated-molecule, respectively. It is clear that all the dominant fragment ions in the protonated-

Scheme 2. Fragmentation pathways of [M+Na$^+$] from Orbitrap instrument with mass accuracy of 1 ppm. [Color scheme can be viewed in the online issue, which is available at www.interscience.wiley.com.]



molecules contain the piperazine moiety, whereas the major fragment ions in the sodiated-molecules contain a heterotricyclic moiety. The data may be explained by the proposed fragmentation mechanism shown in Scheme 3. In the protonated-molecule, the proton is freely mobilized in the molecule, which will promote charge-directed fragmentation. For example, when the proton is on a nitrogen atom of the tricyclic ring, it will weaken the C—N bond, which breaks to form the dominant fragment ion at m/z 263. The mobile proton model was also applied to explain the fragmentation behavior for protonated-peptides [11]. Conversely, for the sodiated-molecule, sodium cation is localized at the heterotricyclic moiety, which can provoke charge-remote fragment ions [12–14]. For example, the dominant fragment ion at m/z 467 was obtained through homolytic cleavage of a C—O bond to form the distonic radical cation, with 0.11 ppm mass accuracy. The data from deprotonated-negative ion [M-H]$^-$, as described in the next section, further supported this hypothesis.

Deprotonated-negative ion [M-H]$^-$. Figure 7(a,c) show the 30 eV MS/MS spectra of the deprotonated-molecule at m/z 502 obtained by Orbitrap and triple quadrupole instruments. Similar fragmentation patterns were observed in both instruments, with the major fragment ion at m/z 443, which is speculated to be a distonic radical ion formed *via* the breaking C—O bond, corresponding to m/z 467 ion in sodiated-molecule. Figure 7(b) shows the 35 eV MS^3 spectrum of the product ion at m/z 443, the major fragment ion from the precursor ion at m/z 502. The major fragment ions at m/z 295 and 252 were generated by the piperazine ring opening and C—C breaking in the ethylene moiety. The fragmentation pathways of the deprotonated-negative ion at m/z 502 are presented in Scheme 4. It is worth noting that

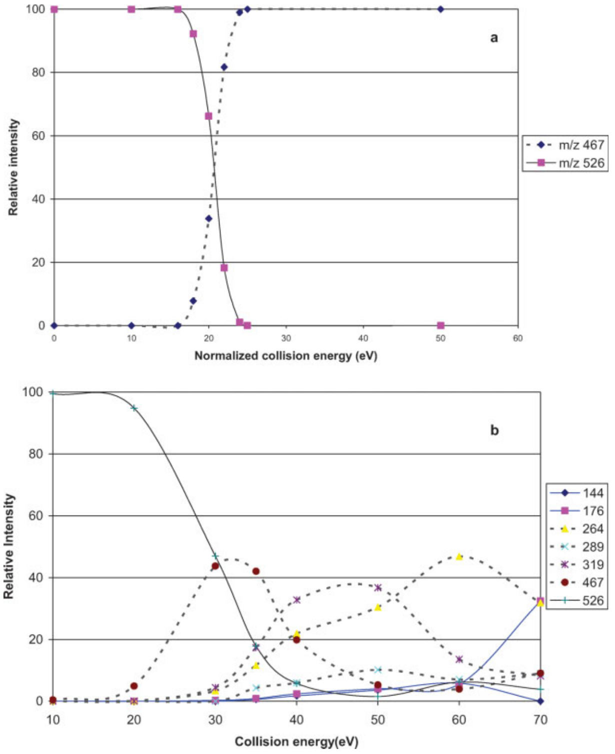


Figure 6. (a) Breakdown curve of [M+Na$^+$] from Orbitrap; (b) breakdown curve of [M+Na$^+$] from triple quadrupole. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

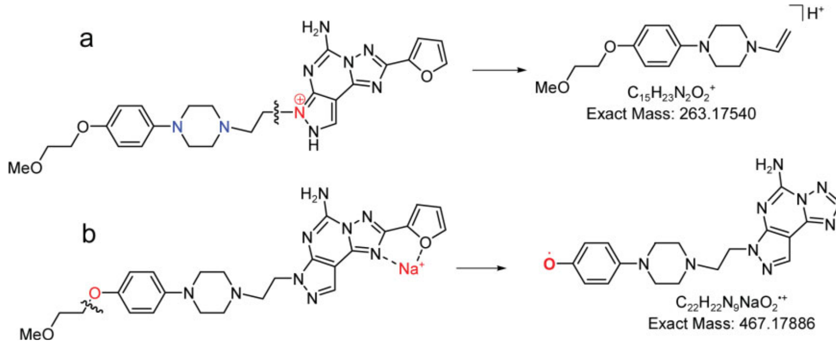
Scheme 3. The proposed fragmentation mechanism diagram: (a) $[M+H]^+$: mobile proton-charge direct fragmentation; (b) $[M+Na^+]$: fixed charge–charge remote fragmentation. [Color scheme can be viewed in the online issue, which is available at www.interscience.wiley.com.]



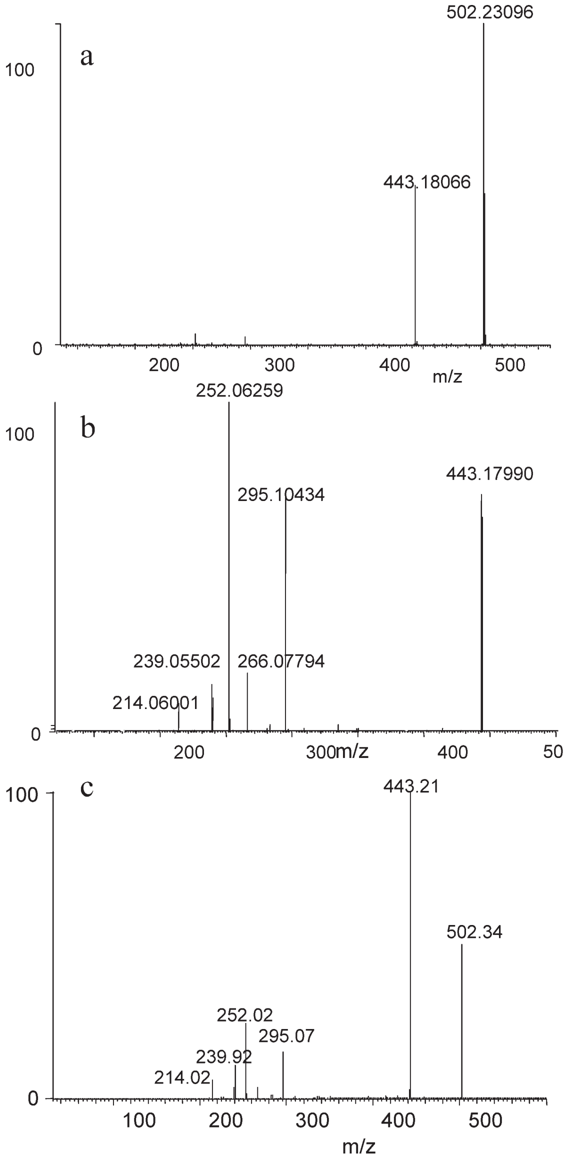


Figure 7. (a) 30 eV MS/MS spectra of $[M\text{-}H]^-$ from Orbitrap, (b) 35 eV MS^3 spectrum from Orbitrap, (c) 30 eV MS/MS spectra from triple quadrupole.

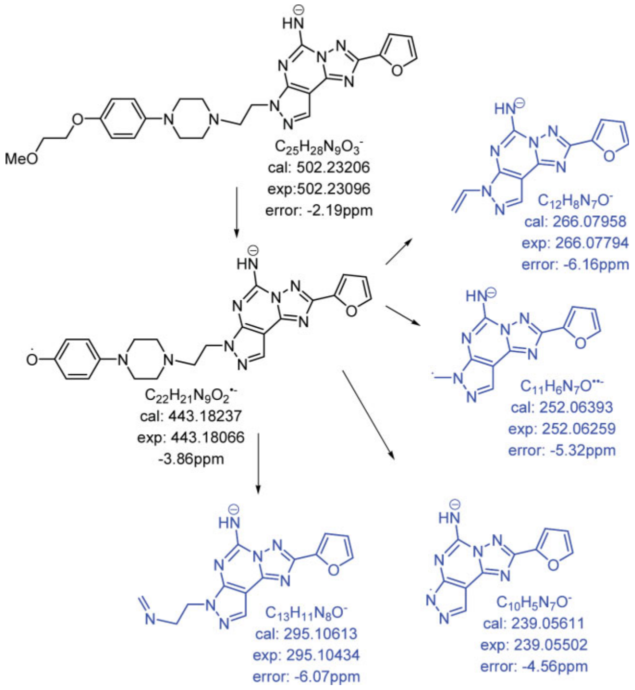
all the fragment ions from both MS/MS and MS^3 spectra contained a heterotricyclic moiety, which is similar to the behavior of the sodiated-molecule. The data suggest that the negative charge was located on the heterotricyclic moiety and all the fragment ions were again generated *via* charge-remote fragmentation mechanisms. This observation explains why the fragmentation patterns obtained from the deprotonated-molecule are similar to those obtained from the sodiated-molecule. A plausible hypothesis is that the only protons that can be removed in this molecule were those of the amino group connected to the tricyclic ring moiety, and the anion is localized/stabilized by the heterotricyclic ring moiety,

Scheme 4. Fragmentation pathways of $[M\text{-}H]^-$ from Orbitrap instrument. [Color scheme can be viewed in the online issue, which is available at www.interscience.wiley.com.]



which promotes the charge-remote fragment ions as seen in the sodiated-molecule. The data served to further confirm that the fragmentation mechanisms for protonated-molecule and sodiated-molecule are different. Fragment ions generated in protonated-molecules were through charge-direct fragmentation, whereas the fragment ions generated in sodiated-molecules were *via* charge-remote fragmentation.

CONCLUSIONS

Fragmentation patterns differed substantially for the protonated- and sodiated–molecules, whereas the fragmentation patterns between the sodiated- and deprotonated-molecules were similar, with all the dominant fragmentation ions containing the hetero tricyclic moiety. The data suggest that the proton is mobile in a protonated-molecule to produce the charge-direct fragment ions, whereas the sodiated- or deprotonated-ions were localized/stabilized in the heterotricyclic moiety, to promote the formation of charge-remote fragment ions.

Based on the differences in the breakdown curves generated for the triple quadrupole and Orbitrap instruments, it is clear that higher internal energy was deposited into the molecule in the triple quadrupole instrument, whereas less internal energy was deposited in the Orbitrap instrument. The lowest energy fragmentation channel for the protonated-molecule was the formation of the fragment ion at m/z 263 formed *via* the cleavage between C—N bond connecting an ethylene linkage and heterotricyclic moiety. The lowest energy fragmentation channel for the sodiated- and deprotonated-molecule was the formation of the fragment ion at m/z 467 or 443 due to the cleavage of the phenole ether linkage. The data suggest that the preferential and selective cleavages at C—N and C—O in the protonated, deprotonated, and sodiated are likely to be observed in other adenosine receptor antagonist related compounds. These characteristic fragmentation patterns observed in Orbitrap MS/MS spectra will provide additional evidence in solving the unknown impurities related to adenosine receptor antagonist compounds. By fragmenting differently ionized species adducts, one can get additional fragmentation information helpful in pinpointing the location of the oxidation or chemical modification sites in the unknown molecules. Combining the fragmentation information obtained in both ion trap and triple quadrupole instrument, one can derive a more comprehensive understanding of the molecular structure and its behavior.

EXPERIMENTAL

Ion trap experiments. Experiments were conducted using a Thermo LTQ-Orbitrap instrument equipped with a Surveyor HPLC system. The high resolution LC/MS and LC/MS^n spectra were acquired in the FTMS mode of the Orbitrap instrument at 30,000 mass resolution and 5 ppm mass accuracy to obtain the elemental composition of each fragment ion. The electrospray ionization needle was held at 4.5 kV, and a nitrogen sheath gas (10 units), and a nitrogen auxiliary gas (20 units) were used to stabilize the spray. The heated-capillary was set at 270°C. All MS/MS experiments were conducted in the linear ion trap. Helium was introduced into the ion trap to improve the trapping efficiency and also serves as the collision gas for CID. Consequently, only helium can be used as collision gas with the Orbitrap instrument. The operational pressure after introducing helium was $\sim 2 \times 10^{-5}$ Pa in the linear ion trap.

Triple quadrupole experiments. The experiments were conducted in a Thermo Quantum triple quadrupole mass spectrometer equipped with a Surveyor HPLC system. Argon was used as collision gas at 0.1 Torr in all MS/MS experiments. The electrospray ionization needle was held at 4 kV, and a nitrogen sheath gas (10 units) and a nitrogen auxiliary gas (20 units) were used to stabilize the spray. The heated-capillary was set at 270°C.

About 1 mg/mL of adenosine receptor antagonist (**1**), which was synthesized and well characterized previously [7], was dissolved in 50:50 acetonitrile: water. Sample solutions were introduced to the mass spectrometer through the LC system. The protonated, sodiated, and deprotonated-molecule were formed during the LC run without introducing additional Na cation.

Acknowledgments. The authors thank Dr. Birendra Pramanik (Schering-Plough) and Dr. Michael Gross (Washington University) for their valuable discussion and comments.

1a **2a-f** **3a-f** **4a-f**

1-(2-Chloro-5-nitrophenyl)ethanone) reacts with various amines in the presence of sulfur under microwave radiation to give the corresponding 2-aminobenzo[*b*]-thiophenes **3a–f** in good yields. The yields of **3a–f** are vastly superior to those obtained using conventional heating. Additionally, 1-(2-amino-5-nitrophenyl)ethanones **4a–f** were also obtained. A mechanism is proposed in which 2-amino thiophenes **3a–f** are formed by a S_NAr mechanism involving an intramolecular addition of sulfur of the intermediate thioamide to the 2-substituted carbon to give a Meisenheimer complex, which collapses to 2-aminothiophenes **3a–f**, and 2-amino ketones (**4a–f**) are formed by a parallel pathway involving nucleophilic addition amine to the 2-chloro position of **1** to form a Meisensheimer complex, which collapses to the amino ethanones.

J. Heterocyclic Chem., **46**, 599 (2009).

INTRODUCTION

In our continuing research on microwave-assisted synthesis of heterocycles [1], we directed our attention to preparing 2-aminobenzo[*b*]-thiophenes. Our interest in these heterocycles was piqued by their extensive use in the chemical and pharmaceutical industries. For example, 2-aminothiophenes are important precursors or intermediates in the preparation of coumarin dyes, biologically active chemicals, other fused heterocycles, *etc*. [2–4].

Before this study, 2-aminothiophenes were prepared primarily by the Gewald reaction [5], which involves treating an activated ketone, an activated nitrile and sulfur in the presence of morpholine as catalyst. Recently, the Gewald reaction was carried out using KF-alumina as catalyst [6] and microwave irradiation for heating. Cyclohexanone and cyclopentanone gave 2-amino products in very good yields (85–92%), whereas other cyclic ketones and various acyclic ketones gave modest yields (55–66%). All reactions were completed in 3.5–8.0 min. On the other hand, when the reactions were carried out using conventional heating (CH), the 2-aminothiphenes were obtained in comparable yields but a much longer time (3.5–7 h) was required [6].

Neckers and coworkers [7] reported a one-pot synthesis of 5-nitro-2-aminobenzo[*b*]thiophenes *via* a Willgerodt–Kindler (W-K) [8] using CH. Although the thiophenes were formed quickly (6–20 min), the yields were generally mediocre (4–47%). Furthermore, 2-chlorophenyl)ethanones that lacks a 5-nitro group failed to react. To see if these yields could be increased, we subjected the reactions to microwave irradiation and report the results herein.

RESULTS AND DISCUSSION

Equation (1) outlines the microwave-assisted reactions carried out in our laboratories for preparation of several 5-nitro-2-amino-benzo[*b*]thiophenes (**3a–f**). As shown, the reaction 5-nitro-1-(2-chlorophenyl)ethanone (**1**) with the appropriate amine (**2a–f**), elemental sulfur, NaOAc and DMF using microwave irradiation at 90–100°C for 10 min yielded thiophene analogs (**3a–f**) as major products along with minor amounts of 2-amino-5-nitroethanones (**4a–f**). The microwave yields as well as the yields of **3a–f** reported previously using CH [7] are listed in Table 1.

Considering first the relative yields of **3a–f** using microwave radiation (MV) *versus* CH, one sees that the yields from the former are significantly higher than those of the latter. For example, the ratio of the yields of **3b** and **3d** (entries 2 and 4) using MV *versus* CH was 60:14 and 52:19, respectively. Additionally, the ratio of the yields of the morpholino derivative **3f** was essentially the same (10 *vs.* 12%) (entry 6) in DMF. However, the MW reaction using NMM (entry 7) increased to 45%.

A possible mechanism for the formation of **3** and **4** is shown in Scheme 1. As shown, there are two parallel

[a] DMF used as solvent unless indicated otherwise. MW reactions were carried out at 90°C for 10 min.

[b] Respective time (minutes) and temperature (°C) for conventional reactions are given in parenthesis and ranged between 6 and 20 min and 35 and 100°C.

[c] NMM used as solvent.

pathways to the two products. One involves the reaction of 5-nitro-2-chloro ketone (**1**), amine (**2**), and sulfur proceeds *via* a W-K reaction to give the corresponding thioamide (**5**). Compound **5** then undergoes a substitution nucleophilic aromatic (S_NAr) intramolecular addition of sulfur to the 2-chloro-substituted carbon to give a Meisenheimer complex **6**, which then collapses to **3**. However, the starting ketone **1** can also proceed *via* a S_NAr pathway in which amine **2** adds intramolecularly to the 2-chloro carbon atom of **1** to form the resonance-stabilized Meisenheimer complex **7** and **8**. The complex then collapses to **4**. The stability of this complex probably allows this pathway to compete successfully with the addition of amine **2** to the C=O group in **1** giving an enamine, which is most likely the first step in the W-K mechanism [8,9].

In support of our proposed mechanism, the starting acetophenones **1b** and **Ic** (entries 8 and 9), which lack a 5-nitro group, failed to react by either pathway. Further, we were able to isolate the direct amination products **4a–f** by carrying out microwave-assisted reactions of **1a** with the amines **2a–f** in the absence of sulfur and solvent. As shown in Table 2, compounds **4a–f** were obtained in excellent yields (93–97%) using microwave irradiation at 90°C for only 5 min.

An added feature of this reaction is that various 2-aminoacetophenones are excellent precursors to various

biologically important compounds, such as azines [10], heterocyclic compounds [10], and repaglinide and related hypoglycemic benzoic acid derivatives [11].

EXPERIMENTAL

The ^{1}H and ^{13}C NMR were recorded on a 500 MHz Joel multinuclear NMR spectrometer; chemical shifts were referenced to TMS as internal standard. Microwave experiments were carried out in CEM-Driver microwave. All chemicals were purchased from Aldrich Chemicals and were used without further purification. Elemental analyses were performed by the SMU Analytical Services.

General procedure for the preparation of 5-nitro-2-amino[*b*]thiophenes (3a–f). In a typical experiment, 1-(2-chloro-5-nitrophenyl)-ethanone (**1**) (1 equiv) was mixed with amine 2 (2 equiv), sulfur (3 equiv), DMF or *N*-methylpyrrolidine as solvent, and base (sodium acetate or methylpyrrolidine) in a microwavable test tube. The tube was then capped and charged into a CEM microwave instrument, and the mixture was irradiated with 250 psi pressure and at a temperature for several minutes (see Table 1 for conditions). After cooling, the reaction mixture was dissolve in ethyl acetate and then washed with brine. The ethyl acetate layer was separated, dried over sodium sulfate, and evaporated under reduced pressure. The crude reaction mixture was purified by column chromatography using ethyl acetate–hexane (9:1, v/v) as eluent, and the compounds were identified by comparison of their ^{1}H and ^{13}C NMR spectral data with those previously reported [7].

General procedure for the preparation of 1-(2-amino-5-nitrophenyl)ethanones (4a–f). In a typical experiment, 1 equiv 1-(2-chloro-5-nitrophenyl)ethanone (**1**) and 2 equiv of the appropriate amine **2a–f** were placed in a microwavable test tube and then capped. The mixture was then placed in a CEM-driven microwave and heated at 90°C for 10 min. After cooling, the reaction mixture was worked up as described in the general procedure for the preparation of **3a–f**. The ^{1}H and ^{13}C NMR, IR spectral data, and elemental analyses for these novel compounds are shown later.

1-(2-(n-Butylamino)-5-nitrophenyl)ethanone (4a). This compound was obtained as light yellow solid, mp (46.8–48.3°C); IR: 637.1, 748.2, 904.3, 953.4, 1213.8, 1322.2, 1496.8, 1608.9, 1633.8, 2960.6, 3284.9 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 0.96 (t, J = 7.45 Hz, 3H, CH_3), 1.42–1.49 (m, 2H, CH_2), 1.64–1.71 (m, 2H, CH_2), 2.63 (s, 1H, CH_3), 3.26–3.30 (m, 2H, CH_2), 6.68 (d, J = 9.75 Hz, 1H, aromatic), 8.17 (dd, J = 2.3 Hz, 9.15 Hz, 1H, aromatic), 8.70 (d, J = 2.5 Hz, 1H, aromatic), 9.63 (br, 1H, NH). ^{13}C NMR (deuteriochloroform): δ 13.8 (CH_3), 20.2 (CH_2), 27.8 (CH_3), 30.8 (CH_2), 42.8 (CH_2), 111.5 (C), 115.7 (CH), 130.0 (CH), 130.1 (CH), 135.1 (C), 154.7 (C), 200.5 (CO). *Anal.* Calcd. for $C_{12}H_{16}N_2O_3$: C, 61.00; H, 6.83; N, 11.86. Found: C, 60.86; H, 7.01; N, 12.05.

1-(2-(Isopropylamino)-5-nitrophenyl)ethanone (4b). This compound was obtained as light orange solid, mp (68.3–71.4°C); IR: 676.1, 634.8, 831.2, 1172.3, 1114.5, 1236.4, 1338.0, 1440.3, 1486.9, 1527.8, 1580.9, 1604.4, 1642.7, 1690.2, 1708.9, 2973.5, 3249.2 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 1.29 (d, J = 6.30 Hz, 6H, —CH_3 X 2), 2.61 (S, 3H, CH_3), 3.78–3.82 (m, 1H, CH), 6.68 (d, J = 9.15 Hz, 1H, aromatic), 8.13 (dd, J = 2.3 Hz, 9.15 Hz, 1H, aromatic), 8.67 (d, J = 2.3 Hz, 1H, aromatic), 9.60 (br, 1H, NH). ^{13}C NMR (deuteriochloroform): δ 22.5 (CH_3), 27.9 (CH_3), 44.2 (CH), 111.8 (CH), 126.3 (C), 129.9 (CH), 130.3 (CH), 132.0 (CH), 153.8 (C), 200.4 (CO). *Anal.* Calcd. for $C_{15}H_{14}N_2O_3$: C, 59.45; H, 6.35; N, 10.36. Found: C, 60.86; H, 5.27; N, 10.45.

1-(2-(Benzyl)-5-nitrophenyl)ethanone (4c). This compound was obtained as light yellow solid, mp (89.1–91.5°C); IR: 696.7, 746.4, 819.7, 965.4, 1118.4, 1224.9, 1326.0, 1493.7, 1579.0, 1605.7, 1643.7, 3068.7, 3280.9 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.69 (s, 3H, CH_3), 4.54 (d, J = 5.65 Hz, 1H, CH_2), 6.68 (d, J = 9.20 Hz, 1H, aromatic), 7.28–7.37 (m, 5H, aromatic), 8.15 (d, J = 9.75 Hz, 1H, aromatic), 8.73 (d, J = 2.25 Hz, 1H, aromatic), 10.0 (br, 1H, NH). ^{13}H NMR (deuteriochloroform): δ 27.9 (CH_3), 47.1 (CH_2), 112.2 (CH), 116.3 (C), 127.0 (CH), 127.9 (CH), 129.1 (CH), 129.9 (CH), 130.0 (CH), 135.7 (C), 136.7 (C), 154.6 (C), 200.7 (CO). *Anal.* Calcd. for $C_{15}H_{14}N_2O_3$: C, 66.66; H, 5.22; N, 10.36. Found: C, 66.86; H, 5.27; N, 10.45.

1-(2-Cyclohexylamino-5-nitrophenyl)ethanone (4d). This compound was obtained as light yellow solid, mp (124.3–126.1°C); IR: 654.97, 757.7, 834.5, 907.4, 953.2, 1115.3, 1225.0, 1315.7, 1442.2, 1492.5, 1529.5, 1579.4, 1603.7, 1649.2, 1708.0, 2852.8, 2927.2, 3254.1 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 1.31–1.46 (m, 5H, CH_2), 1.63–1.65 (m, 1H, CH_2), 1.78–1.79 (m, 2H, CH_2), 1.99–2.03 (m, 2H, CH_2), 2.65 (s, 3H, CH_3), 3.51–3.52 (m, 1H, CH), 6.71 (d, J = 9.70 Hz, 1H, aromatic), 8.15 (dd. J = 2.90 Hz, 9.70 Hz, 1H, aromatic), 8.71 (d, J = 2.90 Hz, 1H, aromatic), 9.75 (br, 1H, NH). ^{13}C NMR (deuteriochloroform): δ 24.4 (CH_2), 25.5 (CH_2), 27.9 (CH_3), 32.4 (CH_2), 51.1 (CH_2), 111.8 (CH), 115.6 (C), 129.9 (CH), 130.4 (CH), 134.8 (C), 153.8 (C), 200.5 (CO). *Anal.* Calcd. for $C_{14}H_{18}N_2O_3$: C, 64.10; H, 6.92; N, 10.68. Found: C, 64.16; H, 6.77; N, 10.48.

1-(5-Nitro-2-(pyrrolidin-1-yl)phenyl)ethanone (4e). This compound was obtained as a colorless solid, mp (149.8–

151.8°C); IR: 747.9, 802.1, 867.4, 914.7, 955.2, 1113.4, 1229.2, 1266.8, 1300.6, 1369.1, 1447.1, 1481.8, 1501.9, 1563.2, 1556.1, 1682.4, 2851.6 cm^{-1}; ^{1}H NMR (deuteriochloroform): δ1.97−2.0 (m, 4H, NCH_2 X 2), 2.62 (s, 3H, CH_3) 3.17−3.19 (m, 4H, NCH_2 X 2), 6.70 (d, J = 9.75 Hz, 1H, aromatic), 8.08 (dd, J = 2.3 Hz, 9.2 Hz, 1H, aromatic), dd, J = 2.3 Hz, 1H, aromatic). ^{13}C NMR (deuteriochloroform): δ 25.8 (NCH_2), 29.0 (CH_3), 52.3 (OCH_2), 113.7 (CH), 124.2 (C), 126.8 (CH), 127.3 (CH), 135.6 (C), 150.8 (C), 198.4 (CO). *Anal*. Calcd. for $C_{14}H_{12}N_2O_3$: C, 61.53; H, 6.02; N, 11.96. Found: C, 61.63; H, 6.07; N, 11.89.

1-(2-Morpholino)-5-nitrophenyl)ethanone (4f). This compound was obtained as light yellow solid, mp (61.1–63.6°C); IR: 601.3, 653.7, 739.2, 905.3, 931.3, 1263.7, 1043.5, 1107.8, 1229.4, 1342.6, 1452.6, 1503.8, 1576.2, 1598.0, 1684.7 cm^{-1}; 2859.5 ^{1}H NMR (deuteriochloroform): δ 2.63 (s, 3H, CH_3)), 3.15−3.17 (m, 4H, NCH_2 X 2), 3.84−3.86 (m, 4H, OCH_2 X 2), 2.63 (s, 3H, CH_3), 7.03 (d, J = 9.2 Hz, 1H, aromatic), 8.22 (dd, J = 2.4 Hz, 9.2 Hz, 1H, aromatic), 8.31 (d, J = 2.4 Hz, 1H, aromatic). ^{13}C NMR (deuteriochloroform): δ 28.7 (CH_3), 52.4 (NCH_2), 66.4 (OCH_2), 117.6 (CH), 127.2 (CH), 127.5 (CH), 131.8 (C), 141.0 (C), 155.3 (C), 200.7 (CO). Anal. Calcd. for $C_{12}H_{14}N_2O_4$: C, 57.59; H, 5.64; N, 11.19. Found: C, 57.86; H, 5.67; N, 11.25.

Acknowledgments. The authors thank the Robert Welch Foundation for partial funding of this work and Mr. Alan Humason for running elemental analyses.

The synthesis of a novel series of analogous intermediates N^3-[1-alkyl(aryl/heteroaryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2,3-diaminopyridines and N^2-(methanesulfonyl) [$Cl_3CC(O)CH{=}CRNH(C_5H_3N)$—NHY], where R = H, Me, C_6H_5, 4-FC_6H_4, 4-ClC_6H_4, 4-BrC_6H_4, 4-$CH_3C_6H_4$, 4-$OCH_3C_6H_4$, 4,4′-biphenyl, 1-naphthyl, 2-thienyl, 2-furyl, and Y = H, SO_2Me, is reported. A new corresponding series of 2-aryl/heteroaryl-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones obtained from intramolecular cyclization reaction of the first series of trichloroacetyl enamines or from the direct cyclocondensation reaction of 4-methoxy-1,1,1-trichloalk-3-en-2-ones with 2,3-diaminopyridine, under mild conditions, is also demonstrated.

J. Heterocyclic Chem., **46**, 603 (2009).

INTRODUCTION

The reactions of 2,3-diaminopyridine with ethyl benzoylacetate and ethyl nicotinoylacetate were first reported in a communication in 1964 by Barchet and Merz [1]. However, no evidence was given in support of the first 2-phenyl-1,3-dihydro-4*H*-pyrido[2,3-*b*][1,4] diazepin-4-one structure assignment.

Three years later, Israel *et al.* [2] found that different reaction conditions resulted in the preferential formation of dihydropyrido[2,3-*b*][1,4]diazepin-2-one or the 4-one isomer from the reaction of 2,3-diaminopyridine with ethyl acetoacetate. This reaction when conducted in boiling xylene for 8 h with azeotropic removal of water, afforded 2-methylpyrido[2,3-*b*][1,4]diazepin-4-one as the major product. However, 1,3-dihydro-1-isopropenyl-2*H*-imidazo[4,5-b]pyridin-2-one was present in small yield. In the absence of solvent, the mixture of 2,3-diaminopyridine with an excess of ethyl acetoacetate at 185°C for 15 min furnished 4-methylpyrido[2,3-*b*][1,4]diazepin-2-one, which was obtained as an inseparable tautomeric mixture of 1,3- and 1,5-dihydro-4-methyl-2*H*-pyrido[2,3-*b*][1,4]diazepin-2-one.

Later, in 1969, Israel and Jones [3] studied the reaction of 2,3-diaminopyridine with ethyl benzoylacetate in boiling xylene, in an approximation of the incompletely defined conditions given by Barchet and Merz [1] and obtained and proved the isolation of the same pyridodiazepinone described firstly in 1964.

In the 1960s, the determination of the correct structure for a given pyridodiazepinone product from the reaction involving 2,3-diaminopyridine and β-ketoesters was difficult and laborious, and, in some instances, an impossible task. Contributing with the solution of this problem, Israel and Jones [3,4] developed the thermal conversion of pyridodiazepinones into imidazolones, which permitted the assignment of the correct structures to ambiguous products through the knowledge that the N1—C2 bond of the pyridodiazepinone was not cleaved during the course of the rearrangement reaction.

Recently, various diamine-ketoester condensations involving reactions of ethyl 2-oxocyclohexanecarboxylate [5] or ethyl 2-oxocyclopentanecarboxylate [6] (cyclic β-ketoesters) with nonsymmetrical diaminopyridines have been studied, and the results compared in a attempt to develop generalizations of predictive value regarding the direction of ring closure to form diazepinones, as well as, in search of novel tricyclic ring systems which may be of interest in obtaining clozapine and pirenzapine analogues with psychotropic properties.

Finally, in 2001 Savelli *et al.* [7] studied the reaction of 3-amino-2-(methylamino)pyridine with diethyl 1,3-acetonedicarboxylate to develop pyridodiazepinone derivatives. From the reaction mixture, Savelli separated dipyrido[1,2-*a*:2,3-*d*]imidazole derivatives as well as two isomeric pyrido[2,3-*b*]diazepinone derivatives in which the complex structural differentiation was achieved through NMR experiments and chemical evidence, but attempts to obtain the cited pyrido[2,3-*b*][1,4]diazepinone isomers as pure compounds have failed until now.

On the other hand, over the last few years, we have reported the synthesis of 2-trifluoro- and 2-trichloromethyl-3*H*-1,5-benzodiazepines from the reaction of 4-aryl-4-methoxy-1,1,1-haloalk-3-en-2-ones with *o*-phenylenediamine in good yields [8]. Next, we demonstrated that 4-phenyl-2-trichloromethyl-3*H*-1,5-benzodiazepine hydrogen sulfate possesses anxiolytic activity and produces motor in co-ordination similar to that observed in mice given diazepam [9]. In the same year, we also reported that some 4-substituted 2-trichloromethyl-3*H*-1,5-benzodiazepines presented an inhibitory effect on acetylcholinesterase and ATPDase activities from cerebral cortex of adult rats [10].

Recently, we have also reported an addition/elimination sequence leading to trichloroacetyl enamines from the reaction of *o*-phenylenediamine [8c] and *o*-aminophenol [11] with 4-alkyl(aryl)-1,1,1-trichloro-4-alkoxyalk-3-en-2-ones. Particularly, considering the importance of the development of new anticancer agents, in the last several years we have researched the possibility of using 4-alkoxy-1,1,1-trichloroalk-3-en-2-ones for the synthesis of new structures with promising chemotherapeutic potential. Thus, some acyclic trichloroacetyl enamines, derived from *o*-phenylenediamine and *o*-aminophenol, were submitted to *in vitro* antitumor screens and showed interesting results [11]. The best activity was obtained when the structure was derived from *o*-aminophenol and presented a *p*-bromophenyl substituent linked to the carbon-1 of the trichloromethylated enamino ketone.

In 2002, we showed the use of the trichloromethyl group as a convenient leaving group for the synthesis of 6-methyl- and 7-alkyl(aryl)-5H-thiazolo[3,2-*a*]pyrimidin-5-ones in 45–89% yields from the reaction of 4-alkyl(aryl)-1,1,1-trichloro-4-alkoxyalk-3-en-2-ones with 2-aminothiazole in refluxing ethanol [12]. In the mentioned work, it was only possible to isolate the non-substituted *N*-[3-oxo-4,4,4-trichlorobut-1-en-1-yl]-2-aminothiazole and all the other (1-substituted) enamino ketone intermediates *N*-[1-alkyl(aryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2-aminothiazoles could be not isolated.

Recently, we have reported attempts to obtain *N*-[1-alkyl(aryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2-aminopyridine intermediates by the reaction of 4-alkoxy-1,1,1-trichloroalk-3-en-2-ones with 2-aminopyridine [13]. However, when these reactions were carried out in dichloromethane as solvent, under mild conditions, the respective trichloroacetyl enamines were isolated only in very low yields (>10%). Surprisingly, when the same reactions were carried out in a molar ratio of 1:1 in anhydrous ethanol as solvent under reflux for 5 h, 4-oxo-4*H*-pyrido[1,2-*a*]pyrimidines were easily isolated in 45–81% yields instead of *N*-[1-alkyl(aryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2-aminopyridine intermediates.

Surprisingly, since the first pyridodiazepinone was reported in 1964 [1], no publications have been found with the objective of carrying out a regiospecific and simultaneous introduction of trichloromethyl and substituted aryl groups at the pyrido[2,3-*b*][1,4]-diazepine derivatives starting from trichloromethyl substituted 1,3-diketones or 4-methoxy-1,1,1-trihaloalk-3-en-2-ones. In addition, there is no data on reactions involving simple 1,3-diketones, such as acetylacetone or benzoylacetone, with 2,3-diaminopyridine.

Only recently, we have communicated the first synthesis of 2-aryl(heteroaryl)-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones from the direct cyclocondensation reaction of 4-methoxy-1,1,1-trichloroalk-3-en-2-ones (**1**) with 2,3-diaminopyridine [14].

Considering the biological importance of heterocyclic fused diazepinones and their derivatives and the fact that 2-aryl- and 2-heteroaryl-dihydropyridodiazepinone analogues and trichloroacetyl enamine intermediates have not yet been reported, it would be worthwhile to demonstrate a new synthetic application of β-aryl(heteroaryl)-β-methoxyvinyl trichloromethyl ketones. In addition, with the intention of carrying out future biological evaluations, it seemed desirable to develop a general method for the synthesis of pyridodiazepine derivatives (3*H*-1,5-benzodiazepine analogues), in which a trichloromethyl, carbonyl, aryl, or heteroaryl group could be introduced as substituent to this promising triaza fused heterocyclic family.

RESULTS AND DISCUSSION

Herein, the synthesis and isolation of a novel series of fifteen N^3-[1-aryl(heteroaryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2,3-diaminopyridines and some N^3-[1-(aryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-N^2-(methanesulfonyl)-2,3-diaminopyridines and the regiospecific preparation of a series of 10 2-aryl(heteroaryl)-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones from the intramolecular cyclization reaction of trichloroacetyl enamines, or direct cyclocondensation reaction of 4-substituted-4-methoxy-1,1,1-trichloroalk-3-en-2-ones with 2,3-diaminopyridine, is presented (Scheme 1).

A review of the literature has shown that 2-methyl- and 2-phenyl-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones, obtained under hard reaction conditions in boiling xylene, would result from the interaction of the more nucleophilic 3-amino group of the 2,3-diaminopyridine with the keto carbonyl function of the β-keto-ester [2]. This direction of cyclization was also seen in the cyclocondensation reaction of 2,3-diaminopyridine with ethyl benzoylacetate under similar conditions [3].

An extension of the reaction of ketones **1** with 2,3-diaminopyridine, a nonsymmetrical heteroaromatic diamine, necessarily introduces the additional problem of two possible isomeric diazepine products. The formation of the pyridodiazepine system presumably will depend on whether the initial reaction of the more nucleophilic 3-amino function occurs at the β-olefinic carbon of the vinyl ketones **1** or at the carbonyl carbon.

The ketones **1a** [15b], **1b-f** [12], **1g-j** [15a], **1m-n** [14], and **1o-p** [15g] are readily available *CCC* synthetic blocks and were prepared from trichloroacetylation reactions of enol ethers generated *in situ* from the respective aryl- or heteroaryl methyl ketone acetals [15] with trichloroacetyl chloride, respectively.

Subsequently, a novel series of 15 N^3-[1-alkyl(aryl/heteroaryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2,3-diaminopyridines **2a-m**, **2o-p** was obtained in 65–93% yields by the methoxy-amino exchange reaction of **1** with 2,3-diaminopyridine and its X-ray diffraction data is shown (Fig. 1). The best results were obtained when the reactions of compounds **1a-p** with 2,3-diaminopyridine were carried out in methanol at 0°C for 20 h.

Crystallographic data for compound **2g**, reported in this article, have been given to the Cambridge Crystallographic Data Center (CCDC 687399) [16].

Initially, to obtain other new protected pyridino-sulfonamides bearing the similarly interesting aryl substituents at the enamino function, four examples of these new aryl-enamino ketones **2** were employed to obtain the respective N^3-[1-aryl-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-N^2-(methanesulfonyl)-2,3-diaminopyridines (**3g-i**, **3l**). Thus, the reactions of **2g-i**, **2l** with methanesulfonyl chloride were carried out in dichlomethane as solvent at

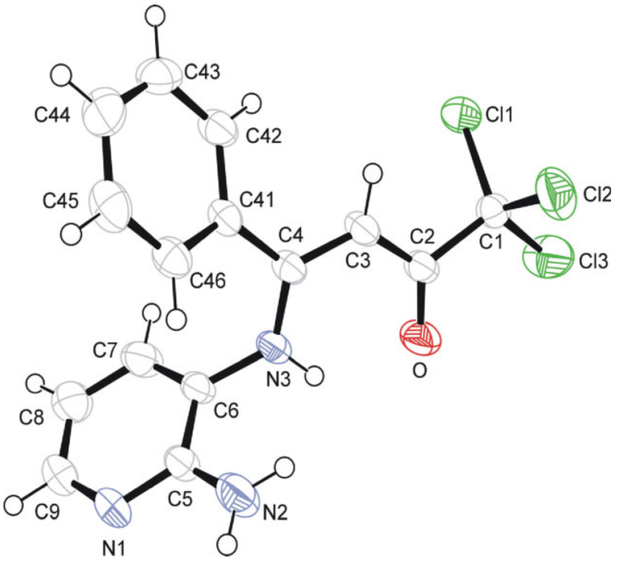

Figure 1. Perspective view of compound **2g**. Thermal ellipsoids correspond to 50% probability. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

35°C for 4 h. This procedure allowed for the easy attainment of sulfonamides **3g-i**, **3l** in 53–66% yields.

In this study, we also found that aryl- and heteroaryl-substituted trichloromethylated ketones **1g-p**, when treated directly with 2,3-diaminopyridine at a molar ratio of 1:1, respectively, in anhydrous methanol as solvent and in the presence of sodium methoxide under reflux for 24 h, regiospecifically produced 2-aryl(heteroaryl)-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones (**4g-p**), which were easily isolated in 52–70% yields, as pure isomers. The above described conditions allowed us to regiospecifically obtain the diazepinones (**4**) instead of the analogous 2-aryl(heteroaryl)-4-trichloromethyl-4,5-dihydro-3*H*-pyrido[2,3-*b*][1,4]diazepin-4-ol or the respective 2-keto-pyridodiazepine isomers.

Although similar reaction conditions have been employed previously to synthesize 5*H*-thiazolo[2,3-*a*]pyrimidin-5-ones and 4*H*-pyrido[1,2-*a*]pyrimidin-4-ones, we found in this case an unexpected reactivity of the 2-amino group of the π-deficient pyridine ring toward the carbonyl group of the 4-aryl(heteroaryl)-4-methoxy-1,1,1-trichloroalk-3-en-2-ones (**2**), promoting an efficient haloform reaction. Compound **4g** had only been synthesized previously by Israel et al. [3] and by Barchet and Merz [1] in 65% yield from the reaction of 2,3-diaminopyridine with ethyl benzoylacetate, but under difficult reaction conditions (boiling xylene for 4 h with azeotropic distillation of the formed water). Our procedure not only gave the same compound under milder conditions (refluxing methanol for 24 h) and in a similar yield (52%) but also increased the scope of the reaction with the possibility of introducing other aryl and heteroaryl substituents to this pyridodiazepinone system.

Complementarily, examples of enamino ketones (**2g-m, 2o-p**) were readily converted into **4g-m, 4g-p** by refluxing in methanol in the presence of sodium methoxide for 24 h with yields higher than 70% (Scheme 1).

We consider the one-pot reaction presented to be a useful and convenient alternative to obtain regiospecifically pyridodiazepinone system and, in summary, the use of this methodology allowed also the isolation of two new series of N^3-[1-alkyl(aryl/heteroaryl)-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2,3-diaminopyridines and N^3-[1-aryl-3-oxo-4,4,4-trichloroalk-1-en-1-yl]-N^2-(methanesulfonyl)-2,3-diaminopyridines, which have been prepared in an analytically pure form and in good yields, for future chemical and biological studies.

EXPERIMENTAL

Unless otherwise indicated all common reagents and solvents were used as obtained from commercial suppliers without further purification. All melting points were determined on a calibrated Electrothermal Melt-Temp 3.0 apparatus. ^{1}H and ^{13}C NMR spectra were acquired on a Bruker DPX 200 spectrometer (^{1}H at 200.13 MHz and ^{13}C at 50.32 MHz), 5mm sample tubes, 298 K, digital resolution ±0.01 ppm, in chloroform-d_1 (for **2, 3**) or DMSO-d_6 (for **4**) using TMS as internal reference. The CHN elemental analyses were performed on a Perkin Elmer 2400 CHN elemental analyzer (São Paulo University–USP/Brazil).

General procedure for the preparation of substituted N^3-[3-oxo-4,4,4-trichloroalk-1-en-1-yl]-2,3-aminopyridines (2a-m, 2o-p). To a stirred solutions of 2,3-diaminopyridine (0.327 g, 3 mmol) in 10 mL of dry methanol, 4-alkoxy-4-aryl(alkyl)-1,1,1-trichloroalk-3-en-2-ones (**1a-m, 1o-p**) (3 mmol) were added at 0°C. The mixtures were stirred for 20 h at 0°C. After the reaction time, yellow solids (**2a-m, 2o-p**) were filtered, washed with cold methanol and recrystallized from hexane (yields 65–93%).

N^3-[4-Oxo-5,5,5-trichloropent-2-en-2-yl]-2,3-diaminopyridine (2a). Yield 86%; mp 120–122°C; ^{1}H NMR, δ (ppm) = 11.5 (s, 1H, NH), 8.0 (d, 1H, J = 5, PyH6), 7.3 (d, 1H, J = 7.5, PyH4), 6.70 (dd, 1H, J = 5, J = 5, PyH5), 5.9 (s, 1H, H2), 4.8 (s, 2H, NH$_2$), 2.1 (s, 3H, Me); ^{13}C NMR, δ (ppm) = 181.7 (C=O), 161.6 (C1), 154.9 (PyC2), 147.6 (PyC6), 135.6 (PyC4), 118 (PyC3), 113.9 (PyC5), 96.7 (CCl$_3$), 88.9 (C2), 20.2 (Me). General procedure for the preparation of substituted 2-aryl(heteroaryl)-3*H*-pyrido[2,3-*b*][1,4]diazepin-4(5*H*)-ones (4g-p).

Method A: From N^3-[1-aryl(heteroaryl)-3-oxo-4,4,4-trichlorobut-1-en-1-yl]-2,3-diaminopyridines (2g-p). To a stirred solutions of N^3-[1-aryl(heteroaryl)-3-oxo-4,4,4-trichlorobut-1-en-1-yl]-2,3-diaminopyridines (**2g-p**) (3 mmol) in 5 mL of dry ethanol, were added CH_3ONa (3 mmol). The reactions were carried out under reflux during 24 h. After the reaction time the solvent was removed under reduced pressure and the crude solid products were washed with water and then with chloroform, obtaining dark solids (**4g-p**), as pure compounds (yields 70–85%).

Method B: From 4-aryl(heteroaryl)-4-methoxy-1,1,1-trichlorobut-3-en-2-ones (1g-p). To a stirred solutions of 2,3-diaminopyridine (2 mmol, 0.218 g), in 6 mL of dry methanol, was added CH_3ONa (2 mmol). After 10 min, the respective 4-aryl(heteroaryl)-4-methoxy-1,1,1-trichlorobut-3-en-2-ones (**1g-p**) were added (2 mmol) in one portion and the solutions were stirred at 60–65°C during 24 h. After the reaction time the solvent was removed under reduced pressure and the crude solid products were washed with water and then with chloroform, obtaining dark solids (**4g-p**), as pure compounds (yields 52–70%).

2-Phenyl-3H-pyrido[2,3-b][1,4]-diazepin-4(5H)-one (4g). Yield 52%; mp 250–252°C. See ref. DOI 10.1002/jhet.91

Mixing of *meso*-tetraarylporphyrins and *o*-chloranil leads to the formation of a $[H_2T(4\text{-}X)PP{:}(C_6Cl_4O_2)_2]$ molecular complex, that two nitrogen atoms of pyrrolenine in the porphyrin core act as electron donors to π^* orbital of a CO group in two acceptor molecules.

$$H_2T(4\text{-}X)PP + 2C_6Cl_4O_2 \rightarrow [H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$$

Interaction of *meso*-tetraarylporphyrins ($H_2T(4\text{-}X)PP$, X=H, CH_3, OCH_3, Br) and *o*-chloranil ($C_6Cl_4O_2$) in chloroform at room temperature, with any ratio of the reactants leads to formation of $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ compounds as a sole yield. The significant UV-vis, ^{1}H NMR, and ^{13}C NMR spectral results suggested distortion of porphyrin core structure in the molecular complexes. Spectral data of the complexes revealed that the lone pair electron of a pyrrolenine nitrogen of porphyrin (σ-electron donor) occupy π^* orbital of a CO group in one *o*-chloranil molecule (π-electron acceptor).

J. Heterocyclic Chem., **46**, 610 (2009).

INTRODUCTION

The molecular interaction of free base porphyrins (as σ-electron donors) with σ- or π-acceptors has been of interest to chemists because of deformation of porphyrin core in the produced adducts. It is reported that the reaction between porphyrins and σ- or π-acceptors produces the molecular complexes with 1:1 or 1:2 (donor:acceptor) molar ratios [1–15]. In most of the studies, the selected acceptor molecules are σ-acceptors [3–15], and there are two works for the molecular complexation between porphyrins and π-acceptors of DDQ (2,3-dichloro-5,6-dicyanobenzoquinone) and TCNE (tetracyanoethylene) [1,2]. The π-acceptors are weaker acids than σ-acceptors and formation of those molecular complexes with porphyrins is slow. Furthermore, the importance and complexity of electron transfer reactions in nature have lead many researchers to look always to study the fundamental chemistry of these processes in simplified model systems. Porphyrins are some of the most ubiquitous compounds found in nature, and they are important in a wide variety of biochemical processes from oxygen transport to the trapping and transduction of solar radiation into useful chemical energy [16–18]. The primary photochemical reaction of photosynthesis is involving electron transfer from a photo-excited chlorophyll molecule to a quinone [19]. This subject led us to investigate the formation of molecular complexes of quinones with free base *meso*-tetraarylporphyrins. In this article, spectroscopic evidences of molecular complexes of four derivatives of free base parasubstituted *meso*-tetraarylporphyrins (Figure 1) as σ-electron donors, with *o*-chloranil ($C_6Cl_4O_2$) as electron acceptor (Figure 2) has been studied. This work provides the first example of the molecular complexes of *meso*-tetraarylporphyrins containing N-to-O dative bond.

RESULTS AND DISCUSSION

The UV-vis spectra for titration of *o*-chloranil into H_2TPP with different molar ratios (*e.g.*, 1:0, 1:0.5, 1:1, 1:1.5, and 1:2) in $CHCl_3$ show a new absorption band at 444 nm and shrinking of 418 nm peak (Soret band), which are, respectively, belong to 1:2 molecular complex and H_2TPP with no evidence of formation of 1:1 adduct $[H_2TPP{:}(C_6Cl_4O_2)]$, Figure 3. The spectrum of the 1:1 $[H_2TPP{:}\ (C_6Cl_4O_2)]$ reaction mixture clearly demonstrates the superimposition of the H_2TPP and $[H_2TPP(C_6Cl_4O_2)_2]$ spectra, with no indication for the occurrence of a 1:1 adduct. While an excess amount of *o*-chloranil beyond the 1:2 molar ratios makes no measurable changes in the UV-vis spectra of $[H_2TPP(C_6Cl_4O_2)_2]$ molecular complex. For the interaction of other *meso*-tetraarylporphyrins were obtained similar UV-vis spectral results, Table 1. The spectral red shift for $[H_2T(4\text{-}OCH_3)PP(C_6Cl_4O_2)_2]$ when compared with that of $[H_2TPP(C_6Cl_4O_2)_2]$ is greater than the shifts in other $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ molecular complexes (Table 1). This could be attributed to a better π-resonance-type interaction produced by the lone pair of the methoxy groups.

Comparison of the ^{1}H NMR spectra of H_2TPP and $[H_2TPP(C_6Cl_4O_2)_2]$ reveals notable shifts, which are due

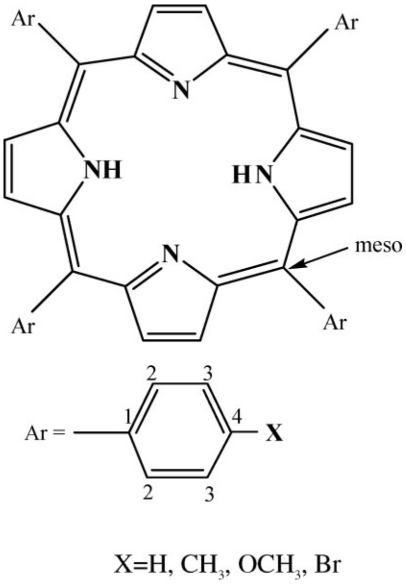

Figure 1. *meso*-Tetraarylporphyrins.

to the formation of $[H_2TPP(C_6Cl_4O_2)_2]$ complex (*o*-chloranil has no hydrogens), Figure 4. ^1H NMR spectra of different molar ratios of *o*-chloranil with the porphyrin (*e.g.*, 1:1 and 1:1.5), in $CDCl_3$ show a mixture of the free base porphyrin and the related 1:2 complex with no trace of 1:1 adduct. The protons of internal N—H in free base porphyrins are upfield (at −2.75 to −2.82 ppm) and the β-protons are downfield (at 8.85–8.89 ppm), Table 2. The aryl protons show a composition of two doublets, a doublet for the *ortho*-protons at about 8.08–8.24 ppm, and another for the *meta*-hydrogens at 7.27–7.77 ppm. The complexation of $H_2T(4\text{-}X)PP$ with *o*-chloranil was similar to molecular complexation of porphyrin with various acceptors [1–8] and showed a downfield shift of NH signals ($\Delta\delta$ = 3.08–3.20 ppm) and an upfield shift of β-hydrogens ($\Delta\delta$ = −0.23 to −0.40 ppm, Table 2. Also a downfield shift is observed for all the protons of the aryl ring, while β-hydrogens of pyrrole and *ortho*-aryl overlap to give a broad signal at 8.47 to 8.65 ppm, Table 2. All of these downfield or upfield changes were in the direction to decrease and increase of the ring current for the porphyrin macrocycle and the aryl rings, respectively [1–7]. The eight protons of meta-positions in aryl ring and four protons of the para in the molecular complex of $[H_2TPP(C_6Cl_4O_2)_2]$ is overlapped and showed a resonance at 7.99 to 8.07 ppm, Table 2.

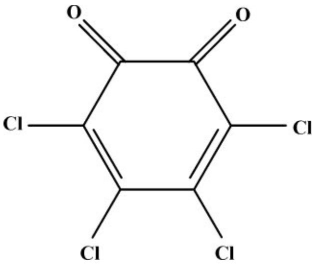

Figure 2. *o*-Chloranil.

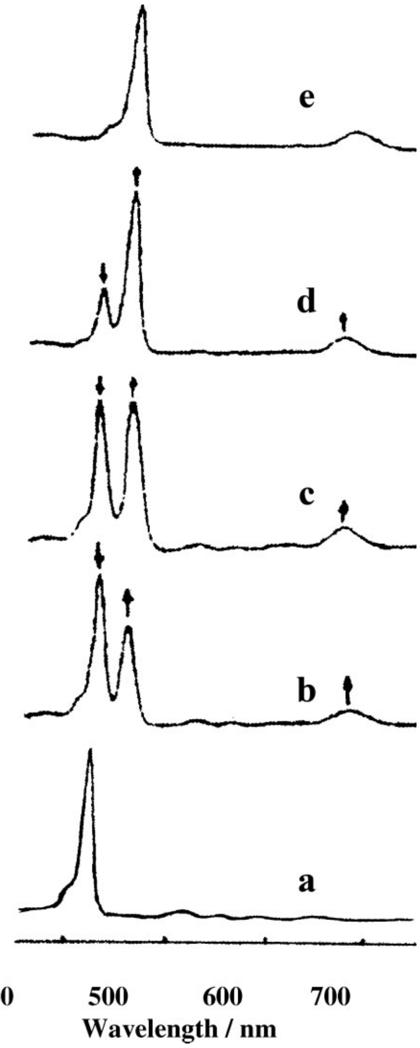

Figure 3. UV-vis spectra for the titration of H_2TPP with (a) 0.0; (b) 0.5; (c) 1.0; (d) 1.5; and (e) two equivalents of *o*-chloranil in chloroform solution. The concentration of H_2TPP for the spectra was $4.33 \times 10^{-6}M$.

The UV-vis and ^1H NMR spectra of the $H_4T(4\text{-}X)PP^{2+}$ were quite sensitive to the concentration of CF_3COOH, but an excess of *o*-chloranil had no effect on the UV-vis and ^1H NMR spectra of $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ molecular complexes [5,6,8]. In result, a diprotonated porphyrin species is not formed in our reaction system. The remarkable spectral correspondence between the $[H_2TPP(C_6Cl_4O_2)_2]$ and H_4TPP^{2+}

suggested analogous saddled porphyrin core structures in these species [1–8,20].

^1H NMR and UV-vis spectral shifts for the molecular complexation of various *meso*-tetraarylporphyrins with *o*-chloranil indicate that π-resonance more than σ-induction effects are predominantly transmitted from aryl substituents to the porphyrin core in the molecular complexes (Tables 1 and 2).

^{13}C NMR spectrum of $[H_2TPP(C_6Cl_4O_2)_2]$ molecular complex shows 11 signals in regions: 123.1, 124.0, 128.5, 128.8, 129.8, 130.4, 135.0, 139.4, 140.3, 146.4, 154.5 ppm. ^{13}C NMR spectrum of free base H_2TPP is consisting to six signals. One broad signal for β-carbons (131.5 ppm) and five sharp lines ($C_{meso} = 120.5$, $C'_3 = 127.1$, $C'_4 = 128.1$, $C'_2 = 135.0$, $C'_1 = 142.6$) [1,2,5,6]. The α-carbons about 145 ppm is too broad and weak to be seen. The complexation of the porphyrin with *o*-chloranil was leaded to changes in the ^{13}C NMR spectrum of the porphyrin (123.1 (C_{meso}), 128.5 (C_β), 128.8 (C'_3), 130.4 (C'_4), 139.4 (C'_2), 140.3 (C'_1), and 146.4 (Cα) ppm). Complexation of the porphyrin with *o*-chloranil sharpens α and β-carbon signals. On the other hand, the complexation causes a small downfield shift in the lines of C_{meso}, C'_2, C'_3, C'_4 and an upfield shift of C_β and C'_1 signals of H_2TPP. The molecular complexation of the porphyrins with π-acceptors (DDQ and TCNE) or σ-acceptors ($BiCl_3$ and $SbCl_3$) have been made same changes in those ^{13}C resonances [1,2,5,6].

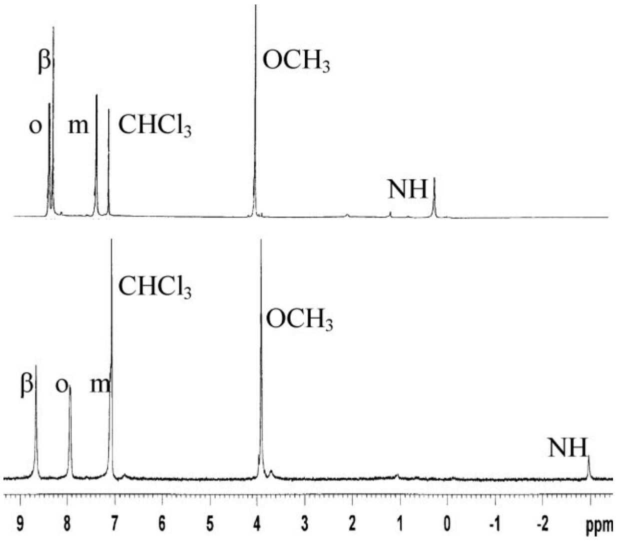

Figure 4. ^1H NMR spectra of (a) $H_2T(4\text{-}OCH_3)PP$ and (b) $[H_2T(4\text{-}OCH_3)PP(C_6Cl_4O_2)_2]$ in $CDCl_3$ at 20°C.

Considerable correspondences between UV-vis, ^1H NMR, and ^{13}C NMR spectral data (shifts and general features of spectra) in the adducts of the

Multiplicity in all signals of the *meso*-tetraarylporphyrins and those molecular complexes are as follows: N—H (singlet); H_β (singlet); H_o (doublet); H_m (doublet); in H_2TPP, H_m and H_p (multiplet).

[a] Δδ is difference between the proton chemical shift for the porphyrin and the related molecular complex.

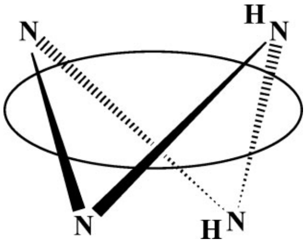

Figure 5. The deformation of the porphyrin core causes two pyrrolenine nitrogen atoms of pyrrole rings to be able act as the electron donors to two molecules of *o*-chloranil.

porphyrins with various acceptors [1–8] and [H_2T(4-X)PP($C_6Cl_4O_2$)$_2$] complexes strongly suggests a very similar porphyrin core structure in all of the mentioned species. This is logically corresponded to the proposed deformation of porphyrin pyrrole rings to provide suitable position for the N—Hs for formation of new bonds in above and below the plane of porphyrin, Figure 5.

In the FT-IR spectroscopy, the N—H stretching band of the free base *meso*-tetraarylporphyrins appears at 3320 cm^{-1} [21], and two stretching vibrations of the carbonyl groups in *o*-chloranil give one strong band at 1670 cm^{-1}, Figure 6(a,b). In the FT–IR spectra of the [H_2T(4-X)PP($C_6Cl_4O_2$)$_2$] complexes, the bands in 3320 and 1670 cm^{-1} regions are completely lost, Figure 6(c). The disappearance of the NH stretching band for the molecular complexes, [H_2T(4-X)PP($C_6Cl_4O_2$)$_2$], suggests the existence of an interamolecular hydrogen-bonding between N—H and *o*-chloranil [1,2]. Furthermore, the disappearance of the carbonyl band of *o*-chloranile upon the molecular complexation indicates that π*-orbital of CO group is as electron acceptor.

^{13}C NMR spectrum of *o*-chloranil has been showed that the resonances in the 131.9 ppm (C_α), 143.7 ppm (C_β), and 168.7 ppm (CO) regions [22] that upon the complexation with H_2TPP change to four signals (123.9, 129.8, 135.0, 154.5 ppm). These changes suggested a loss of symmetry upon the interaction of *o*-chloranil with H_2TPP.

The FT-IR and ^{13}C NMR results indicated that the *o*-chloranil has an electron acceptor role through only one of its carbonyl groups (π* orbital). The pyrrole rings of the H_2TPP tilt alternately up and downward and the two lone electron pairs of the pyrrolenine nitrogens in this noncoplanar configuration are much more accessible for being engaged with the empty π* orbital of CO groups in *o*-chloranil, from above and below the main plane of the porphyrin (Figure 7). The accepting of an electron pair of pyrrolenine nitrogen by a π* orbital of one carbonyl group is most consistent with ^{13}C NMR assignments of a complexed *o*-chloranil. The largest shift is relative to the carbon atom of CO group that acting as electron acceptor directly (C_1 = 129.8 ppm, shift = −38.9 ppm), Figure 7. In contrast, the C_α and C_β carbon atoms had the most distances from the interaction site and revealed as signals in the 123.9 and 135.0 ppm, respectively. These carbons showed a small shift −8.0 ppm (C_α) and −8.7 ppm(C_β), respectively. Furthermore, another CO group that had no interaction with the lone pair of the pyrrolenine nitrogen in the porphyrin had the most contribution in the accepting of electron and revealed at 154.5 ppm and showed −14.2 ppm shift relative to carbonyl group in free *o*-chloranil. The accepting of electron by a CO group causes the aromaticity property for the complexed *o*-chloranil molecule. In Figure 7, two adjacent nitrogen atoms acted as electron donors to two molecules of *o*-chloranil. This structure is

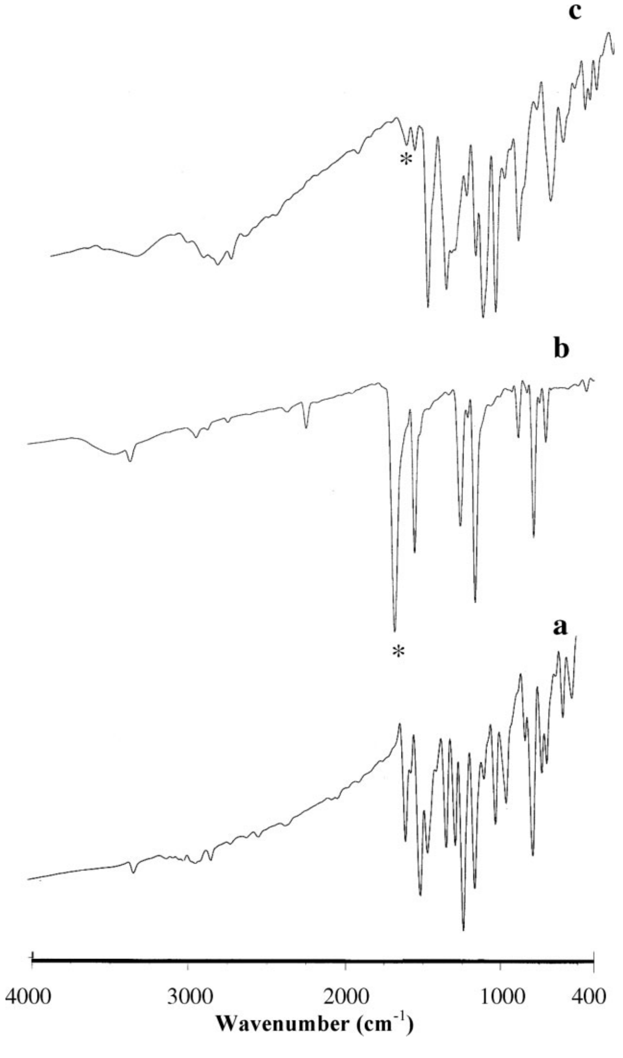

Figure 6. FT-IR spectra of (a) $H_2T(4\text{-}OCH_3)PP$ (b) o-Chloranil and (c) [$H_2T(4\text{-}OCH_3)PP(C_6Cl_4O_2)_2$]. *The band in1670 cm^{-1} region is completely lost.

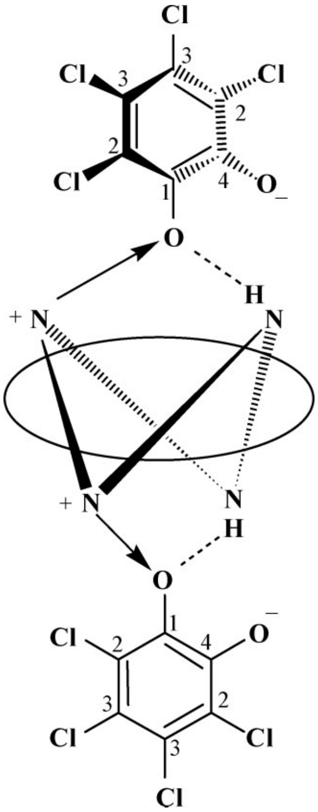

Figure 7. The proposed structure and bonding interactions for a $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ molecular complex.

similar to the proposed structure of diprotonated porphyrin, $[H_4TPP^{2+}].2Cl^-$, [23]. In diprotonated species, two molecules of HCl located above and below the porphyrin plane and two protons connected to two adjacent nitrogens. Furthermore, this structure is similar to the proposed structure for the 1:2 molecular complexation of porphyrins with various acceptors [1–4,7,8].

It was interest that there had no interaction between *p*-chloranil and the *meso*-tetraarylporphyrins under our experimental conditions. This may related to long distance between two carbonyl groups and the weakness of the electron accepting in *p*-chloranil or existence of four chloro atoms between two carbonyl groups in *p*-chloranil. If a carbonyl group of *p*-chloranil to acts as electron acceptor, the existence of four electronegative chloro atoms causes negative charge does not locate on oxygen of *p*-chloranil and in result does not produce an aromatic property in the *p*-chloranil ring.

Finally, a singlet for β-protons of *meso*-tetraarylporphyrins is in contrast to unsymmetrical pyrrole rings of the proposed structure in the molecular complex. This may related to a ring inversion of the tilted core conformation of the porphyrin that is probably fast on the NMR time scale [5,6,8].

CONCLUSIONS

Reaction of *meso*-tetraarylporphyrins ($H_2T(4\text{-}X)PP$) and *o*-chloranil ($C_6Cl_4O_2$), with any ratio of the reactants leads only to formation of $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ molecular complexes. The UV-vis, (^1H and ^{13}C) NMR spectral data suggest distortion of porphyrin core structure in the molecular complexes. In the produced molecular complexes, the lone electron of pyrrolenine nitrogen of the porphyrin occupies π^* orbital of a CO group in the *o*-chloranil molecule.

EXPERIMENTAL

All of the employed chemicals and solvents were obtained from Merck. The used pyrrole was purified by distillation before use. Chloroform solvent was distilled over K_2CO_3 before use. Syntheses of the *meso*-tetraarylporphyrins have carried out according to Adler and Gonsalves method [24].

The UV-vis spectra were recorded in $CHCl_3$ solution utilizing a GBC cintra 6 UV-Vis spectrophotometer, (1 cm optical path length was employed). A Bruker DPX 500 MHz spectrometer was used for ^1H NMR and ^{13}C NMR spectra of porphyrins and those molecular complexes in $CDCl_3$ solvent. The concentration of the molecular complexes in ^1H NMR spectra was 0.006*M*. The residual $CHCl_3$ in the conventional 99.8% atom $CDCl_3$ gives a signal at $\delta = 7.26$ ppm, which was used for calibration of the chemical shift scale. For FT-IR spectra, a Magna 550 Nicolet instrument was applied (using KBr pellets).

Mixing of *o*-chloranil (0.2 mmol) and *meso*-tetraarylporphyrin (0.1 mmol) in chloroform (20 mL) at room temperature after 7–8 days slowly produced green $[H_2T(4\text{-}X)PP(C_6Cl_4O_2)_2]$ complex. The needle crystals obtained after slow evaporation (3–4 days) of the solvent contained no excess of either *o*-chloranil or $H_2T(4\text{-}X)PP$. The results of elemental analyses for the molecular complexes formed from the porphyrins and *o*-chloranil, which were dried under vacuum oven for 12 h at 55–60°C, were consistent with $[H_2t(4\text{-}X)pp(C_6Cl_4O_2)_2]$.

(1,3-Dioxo-2,3-dihydro-1*H*-inden-2-ylidene)propanedinitrile (**2**, in dimethylformamide solution), 3-(dicyanomethylene)-2-indolone (**3**, in ethanol/piperidine solution) act on substituted carbohydrazides **1a–e** forming the derivatives of oxadiazolylideneindene-1,3-diones **4a–e**, spiro(indene-2,2′-oxadiazole)-1,3-dione **5a–e**, cyloxoindenopyrazolecarbonitriles **6a–e**, spiro(indoline-3,2′-oxadiazol)-2-ones **11a–e**, and acylpyrazoloindoles **13a–e**. Rational for these conversions involving the nucleophilic addition on the dicyanomethylene carbon atom are presented.

J. Heterocyclic Chem., **46**, 616 (2009).

INTRODUCTION

In organic π-acceptors containing dicyanomethylene groups such as ethenetetracarbonitrile and (1,3-dioxo-2,3-dihydro-1*H*-inden-2-ylidene)propanedinitrile (**2**), the nitrile groups can be substituted by the nucleophilic nitrogen atom of primary aromatic [1–3] and secondary aliphatic amines [4,5]. Tertiary aromatic amines (like *N,N*-dimethylaniline) are prone to attack to the C=C double bond of **2** with their *para*-position, followed by release of HCN [3,6–10]. By reaction of acceptor **2** with tertiary cyclic amines, one can generate the iminium ions and formation of the α-cyanated amines [11]. Additionally, the reaction of **2** with arylazoaminopyrazoles [12,13], 2-mercaptobenzazoles [14], thiocarbohydrazide, and thiocarbazones [15] as well as *N*-arylisoindolines [16] have been reported. Closely analogous 3-(dicyanomethylene)-2-indolone (**3**) [17] which is a ylidene malononitrile like **2** reacted with thiobarbituric acid [18], *S,S*- and *N,S*-acetals [19], cyclohexanedione [20], and another active methylene systems to give spiroheterocyclic compounds [21,22]. The reaction of *N,N*′-diarylacetamidines with **2** afforded indenoazepine-6-ones [23]. In contrast, spiro[2,3-dihydro-indol-3,4′-pyridino]-5′-carbonitriles were obtained from the reaction of *N,N*′-diarylacetamidines with **3** [23].

Recently, we have reported an efficient transformation of substituted acylhydrazinecarbothioamides with **2** and **3** into oxoindenopyrrolylidenehydrazide, thiazoloindolylidenehydrazide, and pyrroloindolylidenehyrazide derivatives [24].

These intriguing transformations led us to investigate the reaction of carbohydrazides **1a–e** bearing a selection of aromatic and heterocyclic substitutions with acceptor systems **2** and **3** (Fig. 1).

RESULTS AND DISCUSSION

Dimethylformamide solutions of **2** and substituted carbohydrazides **1a–e** in a molar ratio of 2:1 were stirred at room temperature for 48 h. Concentration of the reaction mixture yielded reddish brown crystals from 2-(5-substituted-1,3,4-oxadiazol-2(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-diones **4a–e** (51–57%). The remaining soluble materials were subjected to preparative layer chromatography to give 5′-substituted spiro(indene-2,2′-[1,3,4]-oxadiazole)-1,3-dione **5a–e** (13–17%) and 1-acyl-4-oxo-indeno[1,2-*c*]pyrazole-3-carbonitriles **6a–e** (11–15%).

The structures of **4a–e** were delineated from their spectroscopic properties and gross compositions. The products **4a–e** resulted from **1a–e** were found to be

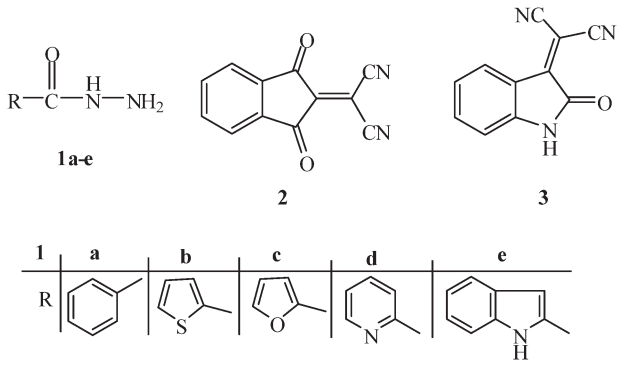

Figure 1. Substituted carbohydrazides and some electron acceptors.

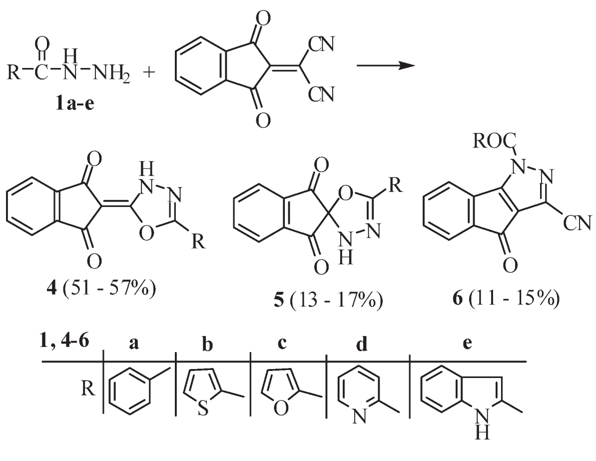
formed by reacting one molecule of **1a–e** and one molecule of **2** *via* loss two molecules of HCN. The molecular ions in their EI-mass spectra confirm the molecular masses and the gross compositions. Furthermore, the following common features of the fragmentation patterns lend support to the assigned structures: Loss of RCO giving rise to the ion $m/z = 185$ common in the spectra of all five compounds. The resulting fragment ions undergo loss of 28 a.m.u. (dinitrogen or CO group). The ir spectra show characteristic absorptions for NH group in range 3330 to 3355 and carbonyl absorption at 1705–1720 cm^{-1} as expected for indane-1,3-dione ring system. Strong bands around 1080–1095 have to be assigned to C—O—C group [25].

The ^{1}H NMR spectra show the presence of a broad signal for 1H at $\delta = 12.57$–12.64 ppm due to oxadiazole-NH, and additionally, the expected signals for R groups. In the ^{13}C NMR spectrum of **4b**, the carbonyl groups resonate at 187.34 ppm. Further peaks at 91.64 (indene-C-2) [16], 154.55 (oxadiazole-C-5), and 174.26 (oxadiazole-C-2) lend support to the structures assigned to **4a–e** (Scheme 1).

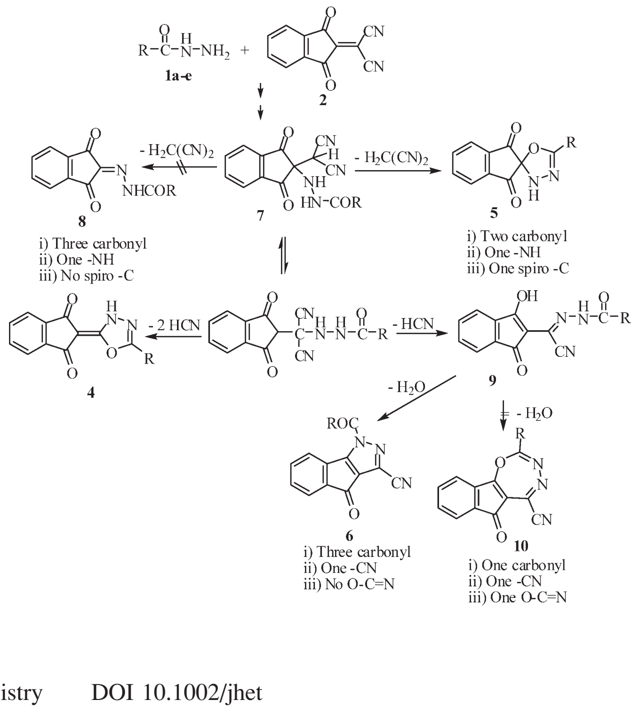
Scheme 1



Compounds **5a–e** show sharp absorptions characteristic of carbonyl group at 1725–1710, NH group at 3330–3315, C=N group at 1630–1620 cm^{-1}, as well as C—O—C group 1095–1080 cm^{-1}. The ^{1}H NMR spectrum (DMSO-d_6) of **5a** clearly shows the presence of oxadiazole-NH at ($\delta = 12.55$ ppm) and phenyl protons at ($\delta = 7.34$–8.12 ppm). The ^{13}C NMR of **5a** shows signals at $\delta = 103.67$ for (spiro-C-2,2′), 156.47 (C-5), and 187.42 (C-1,3), in addition to aryl carbons. The molecular formulae of compounds **5a–e** were supported by elemental analysis and mass spectra, which gave the expected molecular ion peaks. The alternative structure **8** (Scheme 2) based on the same elemental composition could be eliminated according to ir, ^{1}H NMR and ^{13}C NMR spectral data.

The results of combustion analysis and spectroscopic data suggested the presence of acyloxoindenopyrazole derivatives **6a–e** as one of the products from the reaction between **1a–e** and **2**. The gross formula, $C_{20}H_{10}N_4O_2$, **6e** was confirmed by the mass spectrum, which exhibited the molecular ion at *m*/*z* 338 (26%) and the fragmentation pattern at 312, 284, 144, 140, 104, 91, 77, and 65. The ir spectrum showed absorptions at 3365 (NH), 2220 (CN), and 1710, 1665 (CO). The ^{1}H NMR spectrum of **6e** displayed one broad singlet at 11.69 ppm for 1H (indole-NH) and another sharp singlet at 6.64 due to indole-CH in addition to the aromatic protons. In its ^{13}C NMR spectrum, C-3 and C-4 resonate at $\delta = 121.69$ and 189.31 ppm, respectively; further peaks are at $\delta = 99.91$ ppm (indole-CH), 105.06 (C-3a), 149.76 (C-8a), 167.72 acyl-CO, and cyano group at 118.11 ppm.

Scheme 2

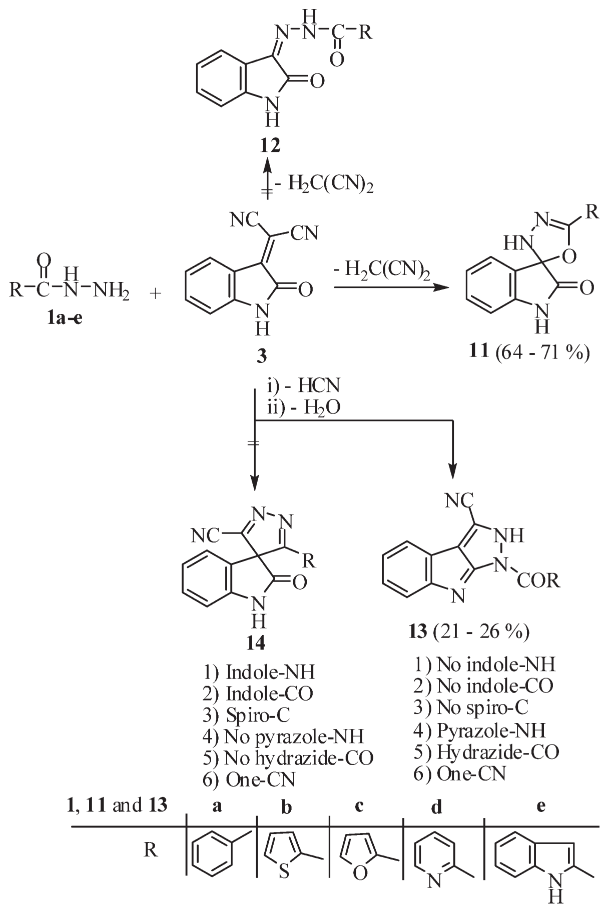


Compound **10** (Scheme 2) could be ruled out, owing to the presence of acyl-CO signals in the ^{13}C NMR spectra. A rational for the formation of the products **4–6** is presented in scheme 2. The carbohydrazides **1a–e** and **2** give the neutral adduct **7**. Elimination of a molecule of malononitrile afforded compounds **5**, whereas elimination two molecules of HCN gave compounds **4**. Elimination one molecule of HCN from the adduct **7** afforded the intermediate **9** followed by elimination a molecule of H_2O to give oxoindenopyrazole derivatives **6**.

Reflux of one mole of **1a–e** with two equivalents of 3-(dicyanomethylene)-2-indolone (**3**) in ethanol/piperidine resulted in pink coloration of the solution, which later became yellowish brown. The residue remaining after concentration was subjected to preparative layer chromatography to give 5′-substituted-spiro[indoline-3,2′-1,3,4-oxadiazol]-2-one **11a–e** (64–71%) and 1-(substituted-2-carbonyl)-1,2-dihydro-pyrazolo[3,4-*b*]-indole-3-carbonitrile **13a–e** (21–26%) (Scheme 3).

Compounds 11a–e. The EI-mass spectra of 11a–e are characterized by molecular ions of low intensity and loss of 28 a.m.u. (may be dinitrogen or carbonyl group) followed by loss of 144 a.m.u. from the molecular ion of 11e (probably indol-2-carbonyl). The ir spectrum showed absorption at 3325–3370 (NH's), 1720 (CO), 1090 (C-O-C). The ^{1}H NMR spectrum of 11e showed the presence of three broad signals with the ratio 1:1:1 centered at 9.81, 11.75, and 12.38 due to indolinone-NH, indole-NH, and oxadiazole -NH, respectively. Indole-CH resonate at 6.57 ppm in addition to the aromatic protons. Signals around 93.66 (spiro C-3 = C-2′), 101.96 (indole-CH), 154.84 (C-5′), and 177.90 (CO) in addition to the aromatic carbons.

Scheme 3



The alternative structure **12** was ruled out based on mp, ir, ^{1}H NMR and ^{13}C NMR spectral data. It has been reported that **1a** and isatine were ball-milled at room temperature for 3 h to give **12a** [26] after drying at 0.01 bar at 80°C. Also, **12a** was obtained during the reaction of **1a** with isatine under reflux in MeOH [27].

Recently, it has been reported that under acetylating condition, isatine-3-acylhydrazones were transformed into selectively acylated derivatives and into the corresponding 3-acetyl-1,3,4-oxadiazolines [28].

Compounds 13a–e. Substituted carbonyl-1,2-dihydropyrazolo[3,4-*b*]indole-3-carbonitrile **13a–e** (21–26%), the ir spectrum of **13b** shown absorption bands characteristic of NH group at 3395 cm^{-1}, strong cyano group at 2215, and one carbonyl absorption at 1660 cm^{-1}. ^{1}H NMR spectrum of **13b** clearly supports the presence of broad signals centered at 11.98 ppm due to pyrazole-NH, aromatic, and thiophene protons were also observed. The ^{13}C NMR spectrum of **13b** exhibited a signal at $\delta = 169.64$ for carbonyl group, 118.24 (CN), 102.36 (C-3a), and 148.66 (C-8a). Therefore, we will concentrate on the interplay between the formation of the products **13a–e** and alternative structure **14**. The a priori possible isomeric structures **14** were ruled out on the basis of ^{1}H NMR and ^{13}C NMR, which clearly support the presence of pyrazole-NH [29] and hydrazide-CO groups. Also, the spectral data showed the absence of indolone-CO, indolone-NH, and spiro-carbons [30].

EXPERIMENTAL

Mps were determined with a Gallenkamp melting point apparatus and were uncorected. The ir spectra were recorded with a Shimadzu 408 instrument using potassium bromide pellets. Five hundred Megahertz ^{1}H and 125 MHz ^{13}C NMR spectra were recorded on a Bruker AVANCE DRX 500 spectrometer. Chemical shifts are expressed as δ (ppm) with reference to tetramethylsilane as internal standard, br = broad, s =singlet, and m = multiplet. ^{13}C assignments (q = quaternary carbon atoms) were made with the aid DEPT 135/90 spectra. The mass spectra (70 eV, electron impact mode) were recorded on Varian MAT CH-7 instrument. Elemental analyses were carried out at the Microanalytical Center, Cairo University, Egypt. Preparative layer chromatography (PLC) was made using 48 cm × 20 cm glass plates covered with slurry applied and air dried 1.0 mm thick layers of Merck silica gel Pf_{254}. Zones were detected by indicator fluorescence quenching upon 254 nm exposure, removed from plates, and extracted with cold acetone

Starting materials. Substituted carbohydrazides 1a–e were prepared according to published procedures [31–36], as were 2-thiophene carbo-hydrazide (1b), mp 135–137°C (lit. [31] 134–136°C); furan-2-carbohydrazide (1c), mp 77–79 (lit. [32] 78°C); 2-pyridine carbohydrazide (1d), mp 136–138°C (lit. [33] 137°C); indole-2-carbohydrazide (1e), mp 243–245°C (lit. [34–36] 246°C) and phenyl carbohydrazide (1a) (Aldrich) was used as received. 2-(1,3-Dioxo-2,3-dihydro-1*H*-inden-2-ylidene)pro-panedinitrile(dicyanomethyleneindane-1,3-dione) (2) was prepared according chatterjee [37], yellow crystals, mp 282–284°C with decomposition, black preheated to 260°C (lit. [37] 280–285°C with decomp.). 3-(Dicyanomethylene)-2-indolone (3) was prepared according to Fatiadi [17], brick-red needles, mp 235–236°C (lit. [17] 235–237°C).

Reactions of carbohydrazides 1a–e with (2). To a solution of **2** (416 mg, 2.0 mmol) in dry dimethylformamide (DMF) (15 mL), a solution of **1a**–**e** (1.0 mmol each) in 5 mL of DMF was added drop wise over 5 min at room temperature with stirring and admission of air for 3 h and left standing for 48 h at room temperature. Reddish brown crystals were precipitated, filtered, and washed with small amount of cold ethanol, which contains 2-(5-substituted-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-diones (**4a**–**e**). The filtration was concentrated to dryness and dissolved in a few mL of acetone and subjected to PLC using toluene/ethyl acetate (2:1) to afford two zones. The fastest migrating fraction contained compounds **5a**–**e** and the slowest migrating zone contained **6a**–**e**.

2-(5-Phenyl-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-dione (4a). This compound was obtained as reddish brown crystals (acetonitrile), mp 247–249°C; ir: NH 3340, CO 1710, C=N 1630, Aryl and C=C 1605, C—O—C 1085 cm^{-1}. ^{1}H NMR: δ 7.38–8.18 (m, 9H, Ar—H), 12.64 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 91.57 (indene-C-2), 126.31, 128.41, 129.67, 135.86, 138.17 (Ar—CH), 141.27, 143.67 (Ar—C), 154.67 (C-5), 174.34 (C-2), 187.38 (CO); ms: *m*/*z* 290 (M^+, 31), 185 (52), 153 (13), 105 (100), 104 (76), 77 (68), 65 (55). Anal. Calcd. for $C_{17}H_{10}N_2O_3$: C, 70.34; H, 3.47; N, 9.65. Found: C, 70.57; H, 3.39; N, 9.73.

2-(5-(Thiophen-2-yl)-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-dione (4b). This compound was obtained as reddish brown crystals (acetonitrile), mp 270–272°C; ir: NH 3330, CO 1715, C=N 1625, Aryl and C=C 1600, C—O—C 1080; ^{1}H NMR: δ 7.19–8.16 (m, 7H, Ar—H and thiophene-H), 12.62 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 91.64 (indene-C-2), 126.14, 127.49, 129.57, 130.12, 135.66 (Ar—CH), 141.39, 144.15 (Ar—C), 154.55 (C-5), 174.26 (C-2), 187.34 (CO); ms *m*/*z*: 296 (M^+, 25), 185 (44), 111 (65), 104 (100), 76 (76), 65 (44). Anal. Calcd. for $C_{15}H_8N_2O_3S$: C, 60.80; H, 2.72; N, 9.45; S, 10.82. Found: C, 61.02; H, 2.86; N, 9.28; S, 11.03.

2-(5-(Furan-2-yl)-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-dione (4c). This compound was obtained as reddish brown crystals (methanol), mp 228–230°C; ir: NH 3345, CO 1720, C=N 1620, Aryl and C=C 1605, C—O—C 1090; ^{1}H NMR: δ 7.14–8.21 (m, 7H, Ar—H and furan-H), 12.59 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 91.65 (indene-C-2), 126.03, 126.33, 127.41, 134.88 (Ar—CH and furan-CH), 140.97, 142.85, 143.66, 145.54 (Ar—C and furan-C-2, C-5), 155.12 (C-5), 174.16 (C-2), 187.83 (CO); ms *m*/*z*: 280 (M^+, 41), 185 (37), 104 (77), 95 (100), 76 (56), 65 (66). Anal. Calcd. for $C_{15}H_8N_2O_4$: C, 64.29; H, 2.88; N, 10.00. Found: C, 64.11; H, 3.04; N, 9.83.

2-(5-(Pyridine-2-yl)-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-dione (4d). This compound was obtained as reddish brown crystals (methanol), mp 262–264°C; ir: NH 3355, CO 1705, C=N 1630, Aryl and C=C 1610, C—O—C 1095; ^{1}H NMR: δ 7.54–8.43 (m, 8H, Ar—H and pyridine-H), 12.57 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 91.48 (indene-C-2), 126.33, 126.84, 126.87, 136.33 (Ar—CH and pyridine-CH), 141.44, 143.59 (Ar—C), 147.14, 149.34 (pyridine-C-2, C-6), 155.12 (C-5), 174.32 (C-2), 187.66 (CO); ms *m*/*z*: 291 (M^+, 24), 185 (29), 106 (58), 104 (67), 76 (66), 65 (100). Anal. Calcd. for $C_{16}H_9N_3O_3$: C, 65.98; H, 3.11; N, 14.43. Found: C, 66.17; H, 2.98; N, 14.27.

2-(5-(1*H*-Indol-2-yl)-1,3,4-oxadiazol-2-(3*H*)-ylidene)-1*H*-indene-1,3-(2*H*)-dione (4e). This compound was obtained as reddish brown crystals (methanol), mp 291–293°C; ir: NH 3385–3340, CO 1720, C=N 1625, Aryl and C=C 1590, C—O—C 1095; ^{1}H NMR: δ 6.58 (s, 1H, indole-CH), 7.09–8.13 (m, 8H, Ar—H), 11.69 (br, 1H, indole-NH), 12.61 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 91.76 (indene-C-2), 102.12 (indole-CH), 125.23 (indole-C-2), 126.27, 127.96, 135.78, 138.26 (Ar—CH), 140.22, 141.38, 142.57, 143.81 (Ar—C), 155.06 (C-5), 174.47 (C-2), 187.71 (CO); ms *m*/*z*: 329 (M^+, 39), 225 (23), 185 (34), 144 (41), 104 (74), 91 (57), 76 (100), 65 (69). Anal. Calcd. for $C_{19}H_{11}N_3O_3$: C, 69.30; H, 3.37; N, 12.76. Found: C, 69.13; H, 3.25; N, 12.95.

5′-Phenyl-3′*H*-spiro(indene-2,2′-[1,3,4]oxadiazole)-1,3-dione (5a). This compound was obtained as yellow crystals (ethanol), mp 206–208°C; ir: NH 3325, CO 1715, C=N 1625, Ar—C=C 1595, C—O—C 1090; ^{1}H NMR: δ 7.34–8.12 (m, 9H, Ar—H), 12.55 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 103.67 (C-2,2′), 126.27, 126.56, 128.31, 129.26, 130.44 (Ar—CH), 132.84, 134.71 (Ar—C), 156.47 (C-5′), 187.42 (C-1,3); ms *m*/*z*: 278 (M^+, 34), 250 (49), 145 (67), 105 (89), 104 (59), 77 (100), 65 (71); Anal. Calcd. for $C_{16}H_{10}N_2O_3$: C, 69.06; H, 3.62; N, 10.07. Found: C, 68.84; H, 3.73; N, 9.88.

5′-(Thiophen-2-yl)-3′*H*-spiro(indene-2,2′-[1,3,4]oxadi-azole)-1,3-dione (5b). This compound was obtained as yellow crystals (ethanol), mp 227–228°C; ir: NH 3315, CO 1710, C=N 1620, Ar—C=C 1600, C—O—C 1080; ^{1}H NMR: δ 7.23–8.15 (m, 7H, Ar—H and thiophene-H), 12.51 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 103.69 (C-2,2′), 126.36, 126.72, 127.94, 128.66, 130.46 (Ar—CH and thiophene-CH), 132.82, 134.66 (Ar—C and thiophene-C), 156.39 (C-5′), 187.47 (C-1,3); ms *m*/*z*: 284 (M^+, 41), 256 (17), 145 (46), 111 (100), 104 (73), 77 (64), 65 (55); Anal. Calcd. for $C_{14}H_8N_2O_3S$: C, 59.15; H, 2.84; N, 9.85; S, 11.28. Found: C, 58.89; H, 2.92; N, 10.03; S, 11.05.

5′-(Furan-2-yl)-3′*H*-spiro(indene-2,2′-[1,3,4]oxadiazole)-1,3-dione (5c). This compound was obtained as yellow crystals (acetonitrile), mp 189–190°C; ir: NH 3320, CO 1710, C=N 1625, C—O—C 1100, 1080; ^{1}H NMR: δ 7.26–8.15 (m, 7H, Ar—H and furan-H), 12.54 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 103.71 (C-2,2′), 125.97, 126.43, 126.42, 130.34 (Ar—CH and furan-CH), 134.26 (Ar—C), 140.96, 141.88 (furan-C-2, C-5), 156.47 (C-5′), 187.55 (C-1,3); ms *m*/*z*: 268 (M^+, 33), 240 (21), 145 (28), 104 (67), 95 (81), 77 (100), 65 (49); Anal. Calcd. for $C_{14}H_8N_2O_4$: C, 62.69; H, 3.01; N, 10.44. Found: C, 62.46; H, 2.94; N, 10.67.

5′-(Pyridin-2-yl)-3′*H*-spiro(indene-2,2′-[1,3,4]oxadiazole)-1,3-dione (5d). This compound was obtained as orange crystals (acetonitrile), mp 214–216°C, ir: NH 3330, CO 1715, C=N 1630, C—O—C 1095; ^{1}H NMR: δ 7.28–8.46 (m, 8H, Ar—H and pyridine-H), 12.50 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 103.55 (C-2,2′), 126.11, 126.47, 126.96, 130.54, 132.16 (Ar—CH and pyridine-CH), 134.71 (Ar—C), 147.93, 148.67 (pyridine-C2, C6), 156.79 (C-5′), 187.56 (C-1,3); ms *m/z*: 279 (M$^+$, 51), 251 (26), 145 (55), 106 (67), 104 (89), 78 (100), 77 (92), 65 (41); Anal. Calcd. for $C_{15}H_9N_3O_3$: C, 64.52; H, 3.25; N, 15.05. Found: C, 64.71; H, 3.36; N, 14.87.

5′-(1*H*-Indol-2-yl)-3′*H*-spiro(indene-2,2′-[1,3,4]oxadi-azole)-1,3-dione (5e). This compound was obtained as orange crystals (methanol), mp 283–285°C; ir: 3380-NH 3325, CO 1710, C=N 1630, C—O—C 1095; ^{1}H NMR: δ 6.61 (s, 1H, indole-H), 7.19–8.22 (m, 8H, Ar—H), 11.71 (br, 1H, indole-NH), 12.53 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 99.76 (indole-CH), 103.42 (C-2,2′), 122.87 (indole-CH-2), 125.88, 126.29, 126.44, 127.63, 128.41, 130.55 (Ar—CH), 132.77, 133.52, 134.89 (Ar—C), 156.36 (C-5′), 187.64 (C-1,3); ms *m/z*: 317 (M$^+$, 18), 289 (26), 144 (57), 145 (37), 116 (29), 104 (76), 91 (89), 77 (100), 65 (71); Anal. Calcd. for $C_{18}H_{11}N_3O_3$: C, 68.14; H, 3.49; N, 13.24. Found: C, 67.88; H, 3.36; N, 13.45.

1-Benzoyl-4-oxo-1,4-dihydroindeno[1,2-*c*]pyrazole-3-carbonitrile (6a). This compound was obtained as pale yellow crystals (acetonitrile), mp 273–275°C; ir: Ar—CH 3090, CN 2215, CO (1720, 1660), C=N 1620, Ar—C=C 1590; ^{1}H NMR: δ 7.31–8.21 (m, 9H, Ar—H); ^{13}C NMR: δ 105.12 (C-3a), 118.12 (CN), 121.75 (C-3), 126.76, 126.94, 127.85, 129.22, 130.12, 130.41 (Ar—CH), 132.18, 134.71 (Ar—C), 149.53 (C-8b), 167.54 (CO), 189.27 (C-4); ms *m/z*: 299 (M$^+$, 26), 273 (16), 245 (41), 140 (61), 105 (100), 104 (74), 77 (56), 65 (64); Anal. Calcd. for $C_{18}H_9N_3O_2$: C, 72.24; H, 3.03; N, 14.04. Found: C, 72.39; H, 2.89; N, 13.83.

4-Oxo-1-(thiophene-2-carbonyl)-1,4-dihydroindeno[1,2-*c*] pyrazole-3-carbonitrile (6b). This compound was obtained as pale yellow crystals (ethanol), mp 296–298°C; ir: Ar—CH 3105, CN 2220, CO (1715, 1665), C=N 1620, Ar—C=C 1590; ^{1}H NMR: δ 7.22–8.16 (m, 7H, Ar—H and thiophene-H); ^{13}C NMR: δ 104.96 (C-3a), 118.19 (CN), 121.71 (C-3), 126.75, 128.45, 129.97, 130.26, 130.54 (Ar—CH and thiophene-CH), 132.28 (Ar—C), 139.26 (thiophene-C), 149.67 (C-8b), 167.49 (CO), 189.34 (C-4); ms *m/z*: 305 (M$^+$, 22), 279 (19), 251 (46), 140 (41), 111 (100), 104 (83), 77 (69), 65 (59); Anal. Calcd. for $C_{16}H_7N_3O_2S$: C, 62.94; H, 2.31; N, 13.76; S, 10.50. Found: C, 63.19; H, 2.43; N, 13.54; S, 10.68.

1-(Furan-2-carbonyl)-4-oxo-1,4-dihydroindeno[1,2-*c*]-pyrazole-3-carbonitrile (6c). This compound was obtained as pale yellow crystals (ethanol), mp 265–267°C; ir: Ar—CH 3085, CN 2210, CO (1715, 1660), C=N 1615, Ar—C=C 1585, C—O—C 1085; ^{1}H NMR: δ 7.31–8.15 (m, 7H, Ar—H and furan-H); ^{13}C NMR: δ 105.09 (C-3a), 118.22 (CN), 121.68 (C-3), 125.94, 126.35, 128.90, 130.56 (Ar—C and furan-C), 141.18, 142.26 (furan-C-2, C-5), 149.74 (C-8b), 167.61 (CO), 189.28 (C-4); ms: *m/z* 289 (M$^+$, 39), 253 (22), 225 (32), 130 (29), 104 (74), 95 (81), 77 (100), 65 (61); $C_{16}H_7N_3O_3$: C, 66.44; H, 2.44; N, 14.53. Found: C, 66.27; H, 2.57; N, 14.71.

4-Oxo-1-picolinoyl-1,4-dihydroindeno[1,2-*c*]pyrazole-3-carbonitrile (6d). This compound was obtained as yellow crystals (acetonitrile), mp 284–286°C; ir: Ar—CH 3115, CN 2215, CO (1715, 1665), C=N 1620, Ar—C=C 1590; ^{1}H NMR: δ 7.28–8.49 (m, 8H, Ar—H and pyridine-H); ^{13}C NMR: δ 104.92 (C-3a), 118.12 (CN), 121.74 (C-3), 126.32, 126.53, 127.19, 127.44, 130.47, 132.22 (Ar—CH and pyridine-CH), 134.65 (Ar—C), 148.11, 148.72 (pyridine-C-2, C6), 149.79 (C-8b), 167.70 (CO), 189.29 (C-4); ms: *m/z* 300 (M$^+$, 28), 274 (9), 246 (19), 140 (38), 106 (100), 104 (91), 77 (83), 65 (54). Anal. Calcd. for $C_{17}H_8N_4O_2$: C, 68.00; H, 2.69; N, 18.66. Found: C, 67.78; H, 2.78; N, 18.83.

1-(1*H*-Indole-2-carbonyl)-4-oxo-1,4-dihydroindeno[1,2-*c*] pyrazole-3-carbonitrile (6e). This compound was obtained as yellow crystals (methanol), mp 311–313°C; ir: NH 3365, CN 2220, CO (1710, 1665), C=N 1625, Ar—C=C 1595; ^{1}H NMR: δ 6.64 (s, 1H, indole-H), 7.28–8.19 (m, 8H, Ar—H), 11.69 (br, 1H, indole-NH); ^{13}C NMR: δ 99.91 (indole-CH), 105.06 (C-3a), 118.19 (CN), 121.69 (C-3), 126.12, 126.22, 126.45, 126.86, 127.61, 128.22, 130.51 (Ar—CH), 132.69, 134.18, 134.87, 135.29 (Ar—C), 149.76 (C-8b), 167.72 (CO), 189.31 (C-4); ms: *m/z* 338 (M$^+$, 27), 312 (21), 284 (46), 144 (87), 140 (51), 104 (79), 91 (100), 77 (82), 65 (43); Anal. Calcd. for $C_{20}H_{10}N_4O_2$: C, 71.00; H, 2.98; N, 16.56. Found: C, 70.83; H, 3.11; N, 16.77.

Reaction of carbohydrazides 1a–e with 3. Carbohydrazides **1a–e** (1.0 mmol) were dissolved in 20 mL absolute ethanol with two drops of pipridine and added to the indolone **3** (1 mmol) in 25 mL absolute ethanol, the mixture was heated under reflux for 5 h (for runs **1a–c** with **3**), and 7 h (for runs **1d**,**e** with **3**), cooled to room temperature. Concentrated and subjected to PLC using toluene/ethyl acetate (4:1) to give numerous colored zones, the two intense of which were removed and extracted. The fastest migrating one contained substituted spiro(indoline-3,2′-[1,3,4]oxadiazol)-2-one **11a–e**, the second zone contained substituted carbonylpyrazolo[3,4-*b*]indole-3-carbonitrile **13a–e**. Extraction of the zones with acetone and crystallized.

5′-Phenyl-3′*H*-spiro(indoline-3,2′-[1,2,4]oxadiazol)-2-one (11a). This compound was obtained as yellow crystals (ethanol), mp 231–233°C; ir: NH's 3310–3380, CO 1710, C=N 1620, Ar and C=C 1600, C—O—C 1085; ^{1}H NMR: δ 7.22–7.82 (m, 9H, Ar—H), 9.89 (br, 1H, indolone-NH), 12.56 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 93.74 (C-3 = C-2′), 126.54, 127.17, 127.94, 128.76, 131.24, 132.16 (Ar—CH), 135.33, 138.19, 142.55 (Ar—C), 154.85 (C-5′), 177.98 (CO); ms: *m/z* 265 (M$^+$, 36), 237 (17), 132 (56), 119 (68), 105 (74), 91 (82), 77 (100), 65 (42); Anal. Calcd. for $C_{15}H_{11}N_3O_2$: C, 67.92; H, 4.18; N, 15.84. Found: C, 68.16; H, 4.02; N, 16.05.

5′-(Thiophen-2-yl)-3′*H*-spiro(indoline-3,2′-[1,2,4]oxadi-azol)-2-one (11b). This compound was obtained as yellow crystals (acetonitril), mp 259–261°C; ir: NH's 3330–3375, CO 1720, C=N 1625, Ar and C=C 1590, C—O—C 1080; ^{1}H NMR: δ 7.11–7.74 (m, 7H, Ar—H and thiophene-H), 9.93 (br, 1H, indolone-NH), 12.46 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 93.65 (C-3 = C-2′), 126.17, 127.37, 127.88, 129.17, 130.17, 131.44 (Ar—CH and thiophene-CH), 132.16, 137.95, 142.35 (Ar—C and thiophene-C), 155.12 (C-5′), 178.09 (CO); ms: *m/z* 271 (M$^+$, 37), 139 (42), 119 (25), 111 (100), 91 (63), 77 (87), 65 (56); Anal. Calcd. for $C_{13}H_9N_3O_2S$: C, 57.55; H, 3.34; N, 15.49; S, 11.82. Found: C, 57.77; H, 3.21; N, 15.26; S, 12.06.

5′-(Furan-2-yl)-3′*H*-spiro(indoline-3,2′-[1,2,4]oxadiazol)-2-one (11c). This compound was obtained as pale yellow crystals (ethanol), mp 218–219°C; ir: NH's 3315–3380, CO 1715, C=N 1620, Ar and C=C 1595, C—O—C 1085; ^{1}H NMR: δ 7.08–7.69 (m, 7H, Ar—H and furan-H), 9.90 (br, 1H, indolone-NH), 12.48 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 93.68 (C-3 = C-2′), 125.87, 126.82, 128.76, 129.97, 130.18 (Ar—CH and furan-CH), 132.76, 141.55, 141.96, 144.12 (Ar—C and furan-C-2, C-5), 155.29 (C-5′), 177.84 (CO); ms *m*/*z* 255 (M^+, 27), 227 (23), 142 (19), 119 (26), 85 (69), 91 (82), 77 (100), 65 (44); Anal. Calcd. for $C_{13}H_9N_3O_3$: C, 61.18; H, 3.55; N, 16.46. Found: C, 60.94; H, 3.64; N, 16.65.

5′-(Pyridin-2-yl)-3′*H*-spiro(indoline-3,2′-[1,2,4]oxadiazol)-2-one (11d). This compound was obtained as yellow crystals (acetonitril), mp 236–235°C; ir: NH's 3325–3380, CO 1725, C=N 1630, Ar and C=C 1600, C—O—C 1080; ^{1}H NMR: δ 7.24–8.46 (m, 8H, Ar—H and pyridine-H), 9.86 (br, 1H, indolone-NH), 12.49 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 93.75 (C-3 = C-2′), 126.26, 126.53, 127.79, 128.88, 130.16, 130.35 (Ar—CH and pyridine-CH), 132.19, 141.76 (Ar—C), 147.23, 148.89 (pyridine-C-2, C-6), 155.28 (C-5′), 178.05 (CO); ms: *m*/*z* 266 (M^+, 22), 160 (36), 132 (28), 119 (41), 106 (100), 91 (57), 77 (83), 65 (61); Anal. Calcd. for $C_{14}H_{10}N_4O_2$: C, 63.15; H, 3.79; N, 21.04. Found: C, 62.92; H, 3.91; N, 20.88.

5′-(1H-Indol-2-yl)-3′*H*-spiro(indoline-3,2′-[1,2,4]oxadi-azol)-2-one (11e). This compound was obtained as orange crystals (methanol), mp 187–188°C; ir: NH's 3290–3370, CO 1720, C=N 1630, Ar and C=C 1605, C—O—C 1090; ^{1}H NMR: δ 6.57 (indole-CH), 7.02–7.74 (m, 8H, Ar—H), 9.81 (br, 1H, indolone-NH), 11.75 (br, 1H, indole-NH), 12.55 (br, 1H, oxadiazole-NH); ^{13}C NMR: δ 93.66 (C-3 = C-2′), 101.96 (indole-CH), 126.26, 127.53, 128.82, 129.96, 130.31, 130.45 (Ar—CH), 132.26, 135.26, 138.92, 141.22, 142.11 (Ar—C and indole-C-2), 154.89 (C-5′), 177.90 (CO); ms: *m*/*z* 304 (M^+, 33), 276 (31), 144 (28), 132 (26), 119 (54), 91 (100), 77 (67), 65 (41); Anal. Calcd. for $C_{17}H_{12}N_4O_2$: C, 67.10; H, 3.97; N, 18.41. Found: C, 66.87; H, 4.12; N, 18.18.

1-Benzoyl-1,2-dihydropyrazolo[3,4-*b*]indole-3-carbonitrile (13a). This compound was obtained as pale yellow crystals (methanol), mp 279–281°C; ir: NH 3410, CN 2210, CO 1665, C=N 1625, Ar and C=C 1590; ^{1}H NMR: δ 7.34–7.96 (m, 9H, Ar—H), 11.96 (br, 1H, pyrazole-NH); ^{13}C NMR: δ 101.86 (C-3a), 118.16 (CN), 126.37, 126.89, 128.85, 129.71, 130.16, 130.97, 132.12 (Ar—CH and C-3), 136.33, 138.91, 141.74, 142.23 (Ar—C), 150.33 (C-8a), 169.44 (CO); ms: *m*/*z* 286 (M^+, 54), 181 (37), 154 (42), 126 (18), 105 (62), 91 (75), 77 (100), 65 (64); Anal. DOI 10.1002/jhet.70

A tandem Michael-S_NAr annulation reaction has been developed for the synthesis of 1-alkyl-2,3-dihydro-4(1*H*)-quinolinones. Success in the reaction followed expected electronic effects for the final S_NAr ring closure. Treatment of doubly activated 1-(2-fluoro-5-nitrophenyl)-2-propen-1-one with primary amines in *N,N*-dimethylformamide at 50°C for 24 h provided 2,3-dihydro-4(1*H*)-quinolinones in 67–78% yields. Singly activated 1-(2-fluorophenyl)-2-propen-1-one reacted similarly, but failed to undergo the final ring closure with hindered or aromatic amines. Finally, 1-(2-fluoro-5-methoxyphenyl)-2-propen-1-one, with one activating and one deactivating group on the ring, gave only simple 1,4-addition products.

J. Heterocyclic Chem., **46**, 623 (2009).

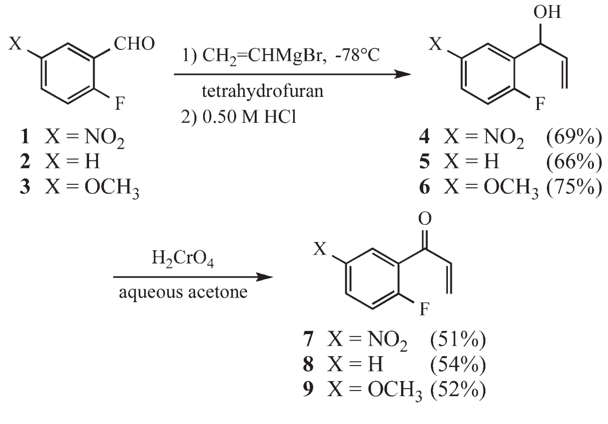
INTRODUCTION

Over the past several years, our work has led to a number of tandem cyclizations terminated by nucleophilic aromatic substitution reactions [2]. The current work extends these previous results to the preparation of 1-alkyl-2,3-dihydro-4(1*H*)-quinolinones by a sequential Michael-S_NAr process. Earlier approaches to these ring systems have involved Friedel-Crafts cyclizations of *N*-phenyl-β-alanine derivatives [3]; acid mediated ring opening-Friedel-Crafts reactions of 1-aryl-2-azetidinones [4]; acid or base promoted cyclizations of 2-aminochalcone derivatives [5]; or reaction of aromatic amines with iminium salts derived from reaction of *N,N*-dimethylacrylamide with trifluoromethanesulfonic anhydride [6]. These protocols gave modest to good yields, but generally subjected substrates to strongly acidic reagents. The current reaction provides a straightforward route to the title compounds in good yields under very mild reaction conditions. The target dihydroquinolinones are valuable building blocks for the synthesis of drugs used to treat pain [7], psychosis [8], and Alzheimer's disease [9] as well as several other medical afflictions [10].

RESULTS AND DISCUSSION

The synthesis of our cyclization substrates is shown in Scheme 1. The requisite aryl vinyl ketones were easily prepared in two steps from 2-fluoro-5-nitrobenzaldehyde (**1**) [11], 2-fluorobenzaldehyde (**2**), and 2-fluoro-5-methoxybenzaldehyde (**3**). Treatment of these aldehydes with vinylmagnesium bromide in tetrahydrofuran at −78°C gave alcohols **4**, **5**, and **6**, respectively. These alcohols were carried on directly to dihydroquinolinone precursors **7**, **8**, and **9** by Jones oxidation in 34–39% overall yields after chromatography [12].

Scheme 1



In the planning stages, we anticipated that 1,4-addition to the unhindered side chain enone would precede nucleophilic attack on the aromatic ring. Because of this, however, bulky amines could pose a problem in the final S_NAr ring closure. Thus, precursor **7** was selected as our initial test case because this compound possessed two electron-withdrawing substituents positioned to facilitate the final ring-closing step. If the annulation proceeded

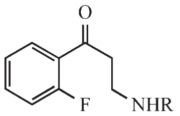
h	C_6H_5	0[b]

[a] This reaction gave 3-(*tert*-butylamino)-1-(2-fluorophenyl)-1-propanone (**12a**) as the only product in 52% yield.

[b] This reaction gave 1-(2-fluorophenyl)-3-(phenylamino)-1-propanone (**12b**) as the only product in 65% yield.



12a R = t-C_4H_9
12b R = C_6H_5

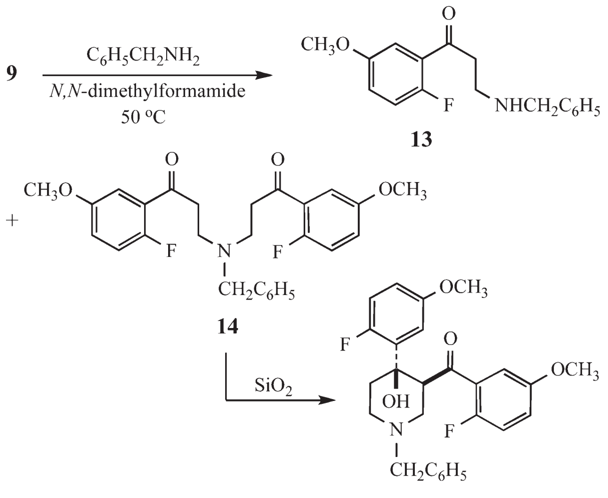
smoothly for **7**, we planned to further explore the scope of the reaction by studying compounds **8** and **9**, which vary the electronic nature of the aromatic moiety. Substrate **8** has a single activating group for the final S_NAr reaction; **9** has one activating and one deactivating group.

Experimentally, the Michael-S_NAr reaction was carried out by dissolving 1.00 equivalent of the aryl vinyl ketone in dry *N,N*-dimethylformamide, adding 1.25 equivalents of the amine and heating for 24 h at 50°C. Following workup, the products were easily isolated and purified by chromatography to give the target heterocycles in good yields. The use of *N,N*-dimethylformamide as the solvent was critical to the success of the reaction; methanol gave complex product mixtures and was not useful.

The results of our cyclization studies are summarized in Tables 1 and 2. Doubly activated substrate **7** reacted with α-branched as well as unbranched and aryl primary amines to give dihydroquinolinones in 67–78% yields. Singly activated precursor **8** was successful in most cases, but failed to cyclize with sterically hindered amines such as *tert*-butylamine and deactivated amines such as aniline. The methoxy-bearing substrate **9** afforded products derived only from 1,4-addition without the subsequent ring closure. Thus, under our standard conditions with benzylamine, **9** gave the expected 1:1 Michael adduct **13** in 12% yield (Scheme 2). More surprisingly, however, the reaction also produced piperidinol **15** in 42% yield. This product presumably arose from silica gel-promoted aldol ring closure of the 2:1 Michael adduct **14** during chromatography. Indeed, ^1H NMR analysis of the crude reaction mixture revealed that **14** was present before purification. The structure of **15** was deduced from spectral analysis and by comparison to calculated ^1H and ^{13}C NMR spectra [13], but the stereochemical assignment is tentative. The indicated relative stereochemistry places both aryl moieties in equatorial positions and allows hydrogen bonding between the C1 alcohol and the side chain carbonyl.

Thus, for success in the two-reaction sequence, the substrate must possess at least one electron-withdrawing group ortho or para to fluorine on the aromatic ring. Substrates incorporating an electron-donating group on the ring (even in the presence of a second withdrawing

Scheme 2



15

substituent) fail to undergo the final ring closure. Additionally, the reacting partner must be an alkyl or aryl primary amine. Secondary amines give only complex product mixtures containing low yields of the 1,4-adduct.

The mechanism of dihydroquinolinone formation involves sequential Michael addition to the side chain enone followed by $\mathrm{S_NAr}$ ring closure. The fact that hindered and deactivated amines react with **8** to afford only the simple 1,4-addition product confirms this reaction sequence. Uncyclized structures resulting from an initial $\mathrm{S_NAr}$ reaction with the aromatic ring are not observed, nor are products resulting from attack at the carbonyl.

CONCLUSION

We have developed a new approach to the synthesis of 1-alkyl-2,3-dihydro-4(1*H*)-quinolinones based on a novel tandem Michael addition-$\mathrm{S_NAr}$ reaction. The required substrates are easily prepared in two steps from readily available precursors. The sequence gives good yields of the target ring system from substrates having either one or two electron withdrawing groups ortho or para to fluorine on the aromatic ring. Systems having one activating group are slightly less reactive while those incorporating an electron donating group give only Michael adducts and fail to close the final ring. We are pursuing further studies of this annulation procedure in systems bearing alkyl groups at the β-carbon of the Michael acceptor.

EXPERIMENTAL

All reactions were run under dry nitrogen. Vinylmagnesium bromide (1*M* in tetrahydrofuran) was purchased from Aldrich Chemical Company. *N*,*N*-Dimethylformamide from a freshly opened bottle was stored over 4 Å molecular sieves and syringed into reactions where it was used. Reactions were monitored by thin layer chromatography on silica gel GF plates (Analtech 21521) with ultraviolet detection. The 0.5*M* hydrochloric acid, saturated sodium bisulfite, saturated sodium chloride, and 0.1*M* sodium hydroxide used in workup procedures were aqueous solutions. Preparative separations were performed by one of the following methods: (1) flash column chromatography [14] on silica gel (grade 62, 60–200 mesh) containing ultraviolet-active phosphor (Sorbent Technologies UV-5) packed into quartz columns or (2) preparative thin layer chromatography on 20-cm × 20-cm silica gel GF plates (Analtech 02015). Band elution for both methods was monitored using a hand-held ultraviolet lamp. Hexanes used in chromatography had a boiling range of 65–70°C. Melting points were uncorrected. Infrared spectra were run as thin films on sodium chloride disks and referenced to polystyrene. ^{1}H and ^{13}C Nuclear magnetic resonance spectra were measured in deuteriochloroform at 300 MHz and 75 MHz, respectively, using tetramethylsilane as the internal standard; coupling constants (*J*) are given in Hertz. Unless otherwise indicated, mass spectra (electron impact/direct probe) were obtained at 70 eV.

Representative procedure for the addition of vinylmagnesium bromide: (±)-1-(2-Fluoro-5-nitrophenyl)-2-propen-1-ol (4). The general procedure of Danishefsky and coworkers was used [11]. To a −78°C solution of 4.00 g (23.7 mmoles) of **1** [11] in 75 mL of anhydrous tetrahydrofuran was added 35.6 mL of 1*M* vinylmagnesium bromide in tetrahydrofuran (35.6 mmoles). The reaction mixture was stirred for 3.5 h at −78°C, then quenched by addition of 50 mL of 0.5*M* hydrochloric acid and ether extracted (three times). The combined ether extracts were washed with water (three times), saturated sodium chloride (one time), dried (magnesium sulfate), and concentrated under vacuum to give 3.09 g (66%) of **4** as a brown oil. This product was spectroscopically pure and was used without further purification. IR: 3382, 1530, 1353, 1254 cm^{-1}; ^{1}H NMR: δ 8.44 (dd, 1H, J = 6.1, 2.9), 8.18 (ddd, 1H, J = 9.0, 4.4, 2.9), 7.18 (t, 1H, J = 9.0), 6.02 (ddd, 1H, J = 17.2, 10.3, 6.0), 5.55 (d, 1H, J = 6.0), 5.43 (d, 1H, J = 17.2), 5.28 (d, 1H, J = 10.3), 2.53 (br s, 1H); ^{13}C NMR: δ 163.1 (d, J = 257.9), 144.7, 137.7, 131.8 (d, J = 16.0), 125.0 (d, J = 10.3), 123.8 (d, J = 6.6), 116.7, 116.4 (d, J = 24.6), 68.5 (d, J = 2.3); ms (30 eV): *m*/*z* 197 (M^{+}). (±)-1-Phenyl-2-propen-1-ol (5). This compound (3.10 g, 69%) was prepared as above from 3.66 g (29.6 mmoles) of **2** and 30 mL of 1*M* vinylmagnesium bromide (30.0 mmoles). It was used without further purification. IR: 3363, 1228 cm^{-1}; ^{1}H NMR: δ 7.43 (td, 1H, J = 7.4, 1.6), 7.25 (m, 1H), 7.14 (td, 1H, J = 7.6, 1.0), 7.02 (ddd, 1H, J = 10.3, 8.2, 1.0), 6.06 (ddd, 1H, J = 17.2, 10.3, 5.5), 5.50 (d, 1H, J = 5.5), 5.34 (d, 1H, J = 17.2), 5.19 (dd, 1H, J = 10.3, 1.2), 2.47 (br s, 1H); ^{13}C NMR: δ 159.9 (d, J = 246.6), 138.8, 129.6, (d, J = 13.3), 129.2, (d, J = 8.1), 127.6 (d, J = 3.7), 124.3 (d, J = 3.7), 115.3 (d, J = 22.1), 115.3, 69.1 (d, J = 2.9); ms (30 eV): *m*/*z* 152 (M^{+}). Anal. Calcd. for C_9H_9FO: C, 71.05; H, 5.92. Found: C, 71.08; H, 5.93.

(±)-1-(2-Fluoro-5-methoxyphenyl)-2-propen-1-ol (6). This compound (2.21 g, 75%) was prepared as above from 2.50 g (16.2 mmoles) of **3** and 24.5 mL of 1*M* vinylmagnesium bromide (24.5 mmoles). It was used without further purification. IR: 3402, 2839, 1272 cm^{-1}; ^{1}H NMR: δ 6.97 (m, 1H), 6.95 (t, 1H, J = 9.0), 6.76 (ddd, 1H, J = 9.0, 3.8, 3.3), 6.05 (ddd, 1H, J = 16.4, 10.0, 5.5), 5.48 (d, 1H, J = 5.5), 5.35 (dd, 1H, J = 17.3, 0.8), 5.20 (dt, 1H, J = 1.0, 1.1), 3.78 (s, 3H), 2.27 (br s, 1H); ^{13}C NMR: δ 155.8, 154.3 (d, J = 238.8), 138.7, 130.3 (d, J = 14.9), 115.9 (d, J = 23.5), 115.4, 114.2 (d, J = 8.3), 112.2 (d, J = 4.0), 69.2, 55.7; ms (30 eV): *m*/*z* 182 (M^{+}). Anal. Calcd. for $C_{10}H_{11}FO_2$: C, 65.93; H, 6.04. Found: C, 66.01; H, 6.10.

Representative procedure for oxidation to the enone: 1-(2-Fluoro-5-nitrophenyl)-2-propen-1-one (7). The general procedure of Danishefsky and coworkers was used [12]. To a solution of 3.09 g (15.7 mmoles) of **4** in 30 mL of acetone was added 8.10 mL of freshly prepared Jones reagent (*ca.*, 2.9*M*, 23.5 mmoles) [15]. After 15 min, 37.5 mL of ice water was added followed by 7.5 mL of saturated sodium bisulfite and the resulting mixture was extracted with ether (four times). The combined ether extracts were washed with water (three times), saturated sodium chloride (one time), dried (magnesium sulfate), and concentrated under vacuum. The resulting yellow oil was flash chromatographed on a 40 cm × 2.5 cm silica gel column eluted with 5–15% ether in hexanes to give 1.57 g (51%) of **7** as a light yellow oil that crystallized on standing, mp 50–52°C. IR: 1673, 1530, 1349, 1251 cm^{-1}; ^{1}H NMR: δ 8.65 (dd, 1H, J = 6.1, 2.9), 8.42 (ddd, 1H, J = 9.0, 4.1, 2.9), 7.35 (t, 1H, J = 9.0), 7.01 (ddd, 1H, J = 17.2, 10.3, 3.0), 6.45 (dt, 1H, $J = 17.2, 1.2$), 6.06 (dd, 1H, $J = 10.3, 1.2$); ^{13}C NMR: δ 187.1 (d, $J = 2.9$), 164.1 (d, $J = 264.3$), 144.4, 134.4 (d, $J = 5.9$), 132.2, 129.0 (d, $J = 11.0$), 127.0 (d, $J = 16.2$), 127.0 (d, $J = 5.2$), 118.0 (d, $J = 25.8$); ms (30 eV): *m/z* 195. Anal. Calcd. for $C_9H_6FNO_3$: C, 55.38; H, 3.08; N, 7.18. Found: C, 55.44; H, 3.11; N, 7.15.

1-Phenyl-2-propen-1-one (8). This compound was prepared as a colorless oil from 3.10 g (20.3 mmoles) of **5** and 10.5 mL of freshly prepared Jones reagent (*ca.*, 2.9*M*, 30.4 mmoles) [15]. The crude product was flash chromatographed on a 40 cm × 2.5 cm silica gel column eluted with 5% ether in hexanes to give 1.64 g (54%) of **8** as a colorless oil. IR: 1673, 1276 cm^{-1}; ^{1}H NMR: 7.75 (td, 1H, $J = 7.4, 1.8$), 7.51 (m, 1H), 7.24 (td, 1H, $J = 7.6, 1.0$), 7.14 (ddd, 1H, $J = 10.7, 8.4, 1.0$), 7.02 (ddd, 1H, $J = 17.2, 10.4, 3.1$), 6.39 (dt, 1H, $J = 17.2, 1.6$), 5.92 (dd, 1H, $J = 10.4, 1.6$); ^{13}C NMR: δ 189.6, 161.2 (d, $J = 254.0$), 135.5 (d, $J = 5.9$), 134.1 (d, $J = 8.8$), 130.9 (d, $J = 2.9$), 130.2, 128.3, 124.4 (d, $J = 2.9$), 116.5 (d, $J = 22.8$); ms (30 eV): *m/z* 150 (M$^+$). Anal. Calcd. for C_9H_7FO: C, 72.00; H, 4.67. Found: C, 72.04; H, 4.69.

1-(2-Fluoro-5-methoxyphenyl)-2-propen-1-one (9). This compound was prepared from 2.21 g (12.1 mmoles) of **6** and 6.86 mL of freshly prepared Jones reagent (*ca.*, 2.9*M*, 19.9 mmoles) [15]. The crude product was flash chromatographed on a 40 cm × 2.5 cm silica gel column eluted with 5% ether in hexanes to give 1.14 g (52%) of **9** as a colorless oil. IR: 2840, 1671, 1273 cm^{-1}; ^{1}H NMR: δ 7.24 (m, 1H), 7.10–6.99 (complex, 3H), 6.41 (dt, 1H, $J = 17.0, 1.6$), 5.91 (dd, 1H, $J = 10.4, 1.6$), 3.82 (s, 3H); ^{13}C NMR: δ 189.2, 155.9 (d, $J = 246.8$), 155.8, 135.4 (d, $J = 7.2$), 130.1, 126.3 (d, $J = 15.9$), 120.8 (d, $J = 8.6$), 117.4 (d, $J = 25.4$), 113.6 (d, $J = 2.9$), 55.9; ms (30 eV): *m/z* 180 (M$^+$). Anal. Calcd. for $C_{10}H_9FO_2$: C, 66.67; H, 5.00. Found: C, 66.71; H, 5.03.

Representative procedure for the tandem Michael-S$_N$Ar reaction using 7: 1-Benzyl-6-nitro-4(1*H*)-quinolinone (10a). To a solution of 78 mg (0.4 mmoles) of **5** in 3 mL of anhydrous *N,N*-dimethylformamide was added 53.5 mg (0.055 mL, 0.5 mmoles) of benzylamine and the solution was heated at 50°C for 22 h. The reaction mixture was cooled and added to 25 mL of saturated sodium chloride and extracted with ether (three times). The combined ether extracts were washed with water (one time), saturated sodium chloride (one time), dried (magnesium sulfate), and concentrated under vacuum to afford a dark yellow oil. The product was purified on a 20-cm × 20-cm preparative thin layer chromatography plate using 50–70% ether in hexanes to afford 78 mg (69%) of **7a** as a yellow solid, mp 118–121°C. IR: 1686, 1513, 1314 cm^{-1}; ^{1}H NMR: δ 8.77 (d, 1H, $J = 2.7$), 8.11 (dd, 1H, $J = 9.5, 2.7$), 7.43–7.28 (complex, 3H), 7.25 (d, 2H, $J = 7.0$), 6.74 (d, 1H, $J = 9.5$), 4.72 (s, 2H), 3.77 (t, 2H, $J = 7.1$), 2.83 (t, 2H, $J = 7.1$); ^{13}C NMR: δ 191.2, 154.5, 138.3, 135.2, 130.0, 129.2, 128.0, 126.5, 125.1, 118.1, 113.3, 55.4, 49.0, 37.1; ms: *m/z* 191 (M$^+$-C$_7$H$_7$). Anal. Calcd. for $C_{16}H_{14}N_2O_3$: C, 68.09; H, 4.96; N, 9.93. Found: C, 68.05; H, 4.95; N, 9.96.

6-Nitro-1-(2-phenylethyl)-4(1*H*)-quinolinone (10b). This compound (92 mg, 78%) was isolated as a yellow solid, mp 96–99°C. IR: 1687, 1517, 1317 cm^{-1}; ^{1}H NMR: δ 8.74 (s, 1H), 8.17 (d, 1H, $J = 9.2$), 7.38–7.18 (complex, 5H), 6.73 (d, 1H, $J = 9.2$), 3.76 (t, 2H, $J = 6.8$), 3.49 (t, 2H, $J = 7.0$), 2.98 (t, 2H, $J = 7.0$), 2.59 (t, 2H, $J = 7.0$); ^{13}C NMR: δ 191.3, 153.7, 137.9, 137.6, 129.9, 128.9, 128.7, 127.1, 125.4, 117.9, 112.5, 53.8, 49.2, 36.7, 33.2; ms: *m/z* 205 (M$^+$-C$_7$H$_7$). Anal. Calcd. for $C_{17}H_{16}N_2O_3$: C, 68.91; H, 5.41; N, 9.46. Found: C, 68.94; H, 5.40; N, 9.49.

1-Hexyl-6-nitro-4(1*H*)-quinolinone (10c). This compound (74 mg, 67%) was isolated as a yellow oil. IR: 1688, 1515, 1317 cm^{-1}; ^{1}H NMR: δ 8.73 (d, 1H, $J = 2.7$), 8.17 (dd, 1H, $J = 9.4, 2.7$), 6.71 (d, 1H, $J = 9.4$), 3.68 (t, 2H, $J = 7.0$), 3.48 (t, 2H, $J = 7.4$), 2.76 (t, 2H, $J = 7.0$), 1.68 (quintet, 2H, $J = 7.4$), 1.41–1.33 (complex, 6H), 0.91 (t, 3H, $J = 6.8$); ^{13}C NMR: δ 191.3, 154.1, 137.4, 129.9, 125.3, 117.8, 112.6, 52.1, 48.7, 36.9, 31.5, 26.6 (2C), 22.5, 13.9; ms: *m/z* 205 (M$^+$-C$_5$H$_{11}$). Anal. Calcd. for $C_{15}H_{20}N_2O_3$: C, 65.21; H, 7.25; N, 10.14. Found: 65.34; 7.29; N, 10.06.

1-(3-Isopropoxypropyl)-6-nitro-4(1*H*)-quinolinone (10d). This compound (88 mg, 75%) was isolated as a yellow oil. IR: 1687, 1516, 1317 cm^{-1}; ^{1}H NMR: δ 8.70 (d, 1H, $J = 2.7$), 8.14 (dd, 1H, $J = 9.4, 2.7$), 6.84 (d, 1H, $J = 9.4$), 3.71 (t, 2H, $J = 7.0$), 3.63 (t, 2H, $J = 7.1$), 3.57 (septet, 1H, $J = 6.1$), 3.50 (t, 2H, $J = 6.0$), 2.75 (t, 2H, $J = 7.0$), 1.92 (quintet, 2H, $J = 7.0$), 1.18 (d, 6H, $J = 6.1$); ^{13}C NMR: δ 191.4, 154.3, 137.4, 129.8, 125.2, 117.7, 112.9, 71.8, 64.4, 48.9, 48.5, 36.9, 27.4, 22.0 (2C); ms: *m/z* 205 (M$^+$-C$_5$H$_{11}$O). Anal. Calcd. for $C_{15}H_{20}N_2O_4$; C, 61.64; H, 6.85; N, 9.59. Found: C, 61.76; H, 6.89; N, 9.53.

1-Isobutyl-6-nitro-4(1*H*)-quinolinone (10e). This compound (72 mg, 72%) was isolated as a yellow solid, mp 102–104°C. IR: 1686, 1520, 1315 cm^{-1}; ^{1}H NMR: δ 8.73 (d, 1H, $J = 2.7$), 8.14 (dd, 1H, $J = 9.4, 2.7$), 6.71 (d, 1H, $J = 9.4$), 3.71 (t, 2H, $J = 7.0$), 3.28 (d, 2H, $J = 7.4$), 2.76 (t, 2H, $J = 7.0$), 2.13 (nonet, 1H, $J = 6.6$), 1.04 (d, 6H, $J = 6.6$); ^{13}C NMR: δ 191.3, 154.4, 137.3, 129.8, 125.3, 117.6, 112.7, 59.6, 49.5, 36.8, 27.4, 20.3, 20.2; ms: *m/z* 205 (M$^+$-C$_3$H$_7$). Anal. Calcd. for $C_{13}H_{16}N_2O_3$: C, 62.90; H, 6.45; N, 11.29. Found: C, 62.94; H, 6.45; N, 11.26.

1-Cyclohexyl-6-nitro-4(1*H*)-quinolinone (10f). This compound (84 mg, 77%) was isolated as a yellow solid, mp 174–177°C. IR: 1688, 1504, 1316 cm^{-1}; ^{1}H NMR: δ 8.77 (d, 1H $J = 2.5$), 8.16 (dd, 1H, $J = 9.5, 2.5$), 6.86 (d, 1H, $J = 9.5$), 3.81 (tt, 1H, $J = 11.5, 3.3$), 3.60 (d, 2H, $J = 7.0$), 2.70 (d, 2H, $J = 7.0$), 1.91 (m, 4H), 1.78 (m, 1H), 1.58 (m, 2H), 1.45 (m, 2H), 1.21 (m, 1H); ^{13}C NMR: δ 191.6, 154.3, 137.4, 129.9, 12.57, 118.5, 112.6, 57.4, 41.2, 37.3, 30.0 (2C), 25.8 (2C), 25.4; ms: *m/z* 274 (M$^+$). Anal. Calcd. for $C_{15}H_{18}N_2O_3$: C, 65.69; H, 6.57; N, 10.22. Found: C, 65.70; H, 6.56; N, 10.20.

1-*tert*-Butyl-6-nitro-4(1*H*)-quinolinone (10g). This compound (70 mg, 71%) was isolated as a yellow solid, mp 132–134°C. IR: 1688, 1499, 1317 cm^{-1}; ^{1}H NMR: δ 8.81 (d, 1H, $J = 2.9$), 8.13 (dd, 1H, $J = 9.6, 2.9$), 7.19 (d, 1H, 9.6), 3.73 (t, 2H, $J = 6.6$), 2.70 (t, 2H, $J = 6.6$), 1.61 (s, 9H); ^{13}C NMR: δ 192.5, 155.2, 137.9, 127.9, 125.5, 121.2, 117.5, 57.7, 44.2, 38.9, 29.6 (3C); ms: *m/z* 233 (M$^+$-CH$_3$). Anal. Calcd. for $C_{13}H_{16}N_2O_3$: C, 62.90; H, 6.45; N, 11.29. Found: C, 62.93; H, 6.44; N, 11.27.

6-Nitro-1-phenyl-4(1*H*)-quinolinone (10h). This compound (77 mg, 72%) was isolated as a yellow solid, mp 126–128°C. IR: 1688, 1498, 1314 cm^{-1}; ^{1}H NMR: δ 8.80 (d, 1H, $J = 2.7$), 8.00 (dd, 1H, $J = 9.4, 2.7$), 7.54 (t, 2H, $J = 7.5$), 7.41 (t, 1H, $J = 7.4$), 7.30 (d, 2H, $J = 7.4$), 6.59 (d, 1H, $J = 9.4$), 4.03 (t, 2H, $J = 6.9$), 2.93 (t, 2H, $J = 7.0$); ^{13}C NMR: δ 191.1, 154.5, 144.0, 138.9, 130.5, 129.3, 127.9, 126.1, 125.0, 118.4, 115.4, 50.6, 37.4; ms: *m*/*z* 268 (M^+). Anal. Calcd. for $C_{15}H_{12}N_2O_3$: C, 67.16; H, 4.48; N, 10.45. Found: C, 67.18; H, 4.47; N, 10.42.

Representative procedure for the tandem Michael-S_NAr reaction using 8: 1-Benzyl-4(1*H*)-quinolinone (11a). This reaction was run using 75 mg (0.50 mmoles) of **8** and the general procedure given above for the preparation of **10a**. This compound (72 mg, 61%) was isolated as a light yellow solid, mp 111–114°C [16]. IR: 1673 cm^{-1}; ^1H NMR δ 7.93 (dd, 1H, *J* = 7.8, 1.8), 7.39–7.24 (complex, 6H), 6.72 (t, 1H, *J* = 8.0), 6.70 (d, 1H, *J* = 8.4), 4.57 (s, 2H), 3.60 (t, 2H, *J* = 7.0), 2.75 (t, 2H, *J* = 7.0); ^{13}C NMR: δ 193.5, 151.7, 137.2, 135.5, 128.8, 128.2, 127.4, 126.7, 119.8, 117.0, 113.4, 55.2, 49.4, 38.0; ms: *m*/*z* 146 (M^+-C_7H_7). 1-Cyclohexyl-4(1*H*)-quinolinone (11f). This compound (62 mg, 54%) was isolated as a yellow oil. IR: 1674 cm^{-1}; ^1H NMR δ 7.92 (dd, 1H, *J* = 7.8, 1.8), 7.35 (ddd, 1H, *J* = 8.6, 7.0, 1.8), 6.83 (d, 1H, *J* = 8.8), 6.67 (t, 1H, *J* = 7.8), 3.68 (tt, 1H, *J* = 11.1, 3.1), 3.43 (t, 2H, *J* = 7.0), 2.62 (t, 2H, *J* = 7.0), 1.85 (m, 4H), 1.74 (m, 1H), 1.45 (m, 4H), 1.15 (m, 1H); ^{13}C NMR: δ 193.9, 151.6, 135.3, 128.6, 120.1, 116.1, 112.7, 56.0, 41.5, 38.3, 29.8 (2C), 26.1 (2C), 25.7; ms: *m*/*z* 229 (M^+). Anal. Calcd for $C_{15}H_{19}NO$: C, 78.60; H, 8.30; N, 6.11. Found: C, 78.54; H, 8.34; N, 6.04.

3-(*tert*-Butylamino)-1-(2-fluorophenyl)-1-propanone (12a). This compound (58 mg, 52%) from *tert*-butylamine and **8** was isolated as a yellow oil. To prevent extraction of the product into the aqueous layer during workup, the reaction was diluted with water and made slightly basic with 0.1*M* NaOH before extraction with ether. Attempts to purify this material by chromatography resulted in extensive decomposition, and thus, characterization was carried out on the crude product. IR: 3454, 1685, 1269 cm^{-1}; ^1H NMR: δ 7.87 (td, 1H, *J* = 7.6, 1.8), 7.50 (m, 1H), 7.22 (t, 1H, *J* = 7.8), 7.12 (dd, 1H, *J* = 11.2, 8.0), 3.20 (td, 2H, *J* = 6.2, 3.3), 2.96 (t, 2H, *J* = 6.2), 1.71 (br s, 1H), 1.13 (s, 9H); ^{13}C NMR: δ 198.1, 162.0 (d, *J* = 254.7), 134.5 (d, *J* = 8.8), 130.5 (d, *J* = 2.9), 130.4, 124.4 (d, *J* = 3.4), 116.7 (d, *J* = 24.2), 50.5, 44.7 (d, *J* = 7.4), 37.3 (d, *J* = 2.2), 28.9 (3C); ms: *m*/*z* 123 (M^+-$C_6H_{14}N$).

1-(2-Fluorophenyl)-3-(phenylamino)-1-propanone (12b). This compound (79 mg, 65%) from aniline and **8** was isolated as a yellow solid, mp 69–71°C. IR: 3405, 1683, 1264 cm^{-1}; ^1H NMR: δ 7.88 (td, 1H, *J* =7.8, 1.8), 7.50 (m, 1H), 7.25–7.08 (complex, 5H), 6.70 (t, 1H, *J* = 7.2), 6.64 (dd, 1H, *J* = 7.6, 1.0), 4.09 (br s, 1H), 3.58 (t, 2H, *J* = 6.1), 3.28 (m, 2H); ^{13}C NMR: δ 197.4, 162.1 (d, *J* = 254.7), 147.7, 134.8 (d, *J* = 8.8), 130.5 (d, *J* = 2.2), 129.3, 124.5 (d, *J* = 3.7), 117.5, 116.8, 116.6 (d, *J* = 11.8), 112.9, 42.8, 38.5; ms: *m*/*z* 123 (M^+-$C_8H_{10}N$). Anal. Calcd. for $C_{15}H_{14}FNO$: C, 74.07; H, 5.76; N, 5.76. Found: C, 73.98; H, 5.79; N, 5.70.

Representative procedure for the tandem Michael-S_NAr reaction using 9: 1-(2-Fluoro-5-methoxyphenyl)-3-(benzylamino)-1-propanone (13) and (±)-(3*S,4*R**)-1-benzyl-3-(2-fluoro-5-methoxybenzoyl)-4-(2-fluoro-5-methoxyphenyl)-4-piperidinol (15).** This reaction was run using 75 mg (0.42 mmoles) of **9** and the general procedure given above for the preparation of **10a**. The reaction did not yield the dihydroquinolinone but yielded only products resulting from the initial conjugate addition without subsequent S_NAr ring closure. The 1:1 Michael addition product **13** (14 mg, 12%) was isolated as a yellow oil. IR: 3333, 2815, 1685, 1271 cm^{-1}; ^1H NMR: δ 7.32 (m, 5H), 7.25 (m, 1H), 7.04 (m, 2H), 3.83 (s, 2H), 3.81 (s, 3H), 3.22 (td, 2H, *J* = 6.2, 3.3), 3.02 (t, 2H, *J* = 6.2), 1.77 (br s, 1H); ^{13}C NMR: δ 197.7 (d, *J* = 4.4), 156.6 (d, *J* = 247.4), 155.7, 140.2, 128.4, 128.1, 126.9, 125.5 (d, *J* = 14.7), 121.5 (d, *J* = 8.8), 117.7 (d, *J* = 26.5), 112.7 (d, *J* = 2.9), 55.9, 54.0, 43.9, 43.8 (d, *J* = 7.4); ms: *m*/*z* 153 (M^+-$C_9H_{12}N$). Anal. Calcd. for $C_{17}H_{18}FNO_2$: C, 71.08; H, 6.27; N, 4.88. Found: C, 71.12; H, 6.29; N, 4.82.

This reaction also yielded piperidinol **15**, which results from the silica gel-promoted aldol ring closure of the 2:1 Michael addition product **14**. Compound **15** (82 mg, 42%) was isolated as a viscous yellow oil. IR: 3462, 2830, 1663 cm^{-1}; ^1H NMR: δ 7.39 (d, 2H, *J* = 7.4), 7.32 (t, 2H, *J* = 7.4), 7.25 (m, 2H), 6.97 (m, 2H), 6.91 (m, 1H), 6.77 (dd, 1H, *J* = 11.5, 8.9), 6.63 (dt, 1H, *J* = 8.9, 3.5), 4.89 (d, 1H, *J* = 2.3), 4.71 (dd, 1H, *J* = 11.1, 3.5), 3.76 (s, 3H), 3.69 (s, 3H), 3.68 (s, 2H), 3.03 (dd, 1H, *J* = 11.1, 3.5), 2.75 (complex, 3H), 2.72 (m, 1H), 1.65 (d, 1H, *J* = 13.7); ^{13}C NMR: δ 203.2 (d, *J* = 3.7), 156.1 (d, *J* = 250.3), 155.6, 155.5, 153.2 (d, *J* = 237.8), 138.3, 134.1 (d, *J*

= 14.0), 128.8, 128.2, 127.0, 125.3 (d, J = 13.9), 121.9 (d, J = 8.8), 117.7 (d, J = 25.8), 116.6 (d, J = 26.5), 113.9 (d, J = 8.8), 112.9 (d, J = 4.4), 112.6 (d, J = 2.2), 72.3 (d, J = 5.9), 62.0, 55.7, 55.6, 53.1 (t, J = 7.4), 51.4, 48.5, 36.2 (d, J = 2.9); ms (30 eV): m/z 467 (M^{+}). Anal. Calcd for $C_{27}H_{27}F_{2}NO_{4}$: C, 69.38; H, 5.78; N, 3.00. Found: C, 69.44; H, 5.81; N, 2.93. The ^{1}H and ^{13}C NMR spectra compare well with calculated spectra [12], but the stereochemical assignment is tentative.

Acknowledgment. T. N. thanks Oklahoma State University for a Niblack Scholarship and the Department of Chemistry for a Moore Scholarship. Funding for the 400 MHz NMR spectrometer of the Oklahoma Statewide Shared NMR Facility was provided by NSF (BIR-9512269), the Oklahoma State Regents for Higher Education, the W. M. Keck Foundation, and Conoco, Inc. Finally, the authors wish to thank the OSU College of Arts and Sciences for funds to upgrade our departmental FTIR and GC-MS instruments.

A tandem reductive amination-S$_N$Ar reaction has been applied to the synthesis of (±)-1,2-dialkyl-5-nitro-2,3-dihydro-1*H*-indoles. Treatment of a series of 2-fluoro-5-nitrobenzyl ketones with primary amines and sodium cyanoborohydride in methanol at room temperature provided good yields of the target heterocycles. The reaction is sensitive to steric hindrance and proceeds best with less hindered ketone substrates using primary amines that are unbranched at the α carbon.

J. Heterocyclic Chem., **46**, 629 (2009).

INTRODUCTION

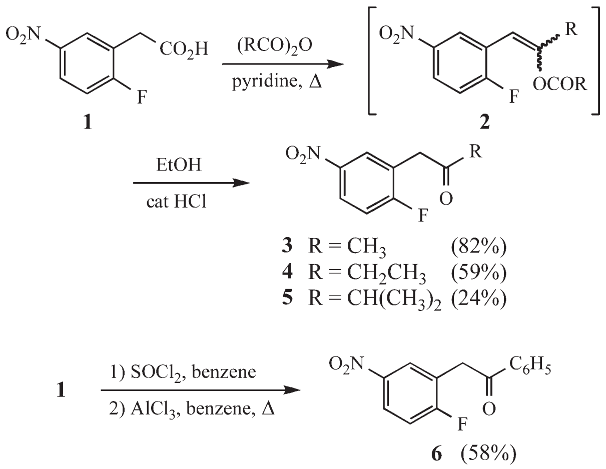
Over the past several years, our work has led to a number of reductive cyclizations that yield 1,2,3,4-tetrahydroquinolines [2]. Recently, we reported a tandem reductive amination-S$_N$Ar reaction for the preparation of substituted 6-nitro-1,2,3,4-tetrahydroquinolines [3]. In the current work, we have extended this sequence to the preparation of (±)-dialkyl-5-nitro-2,3-dihydro-1*H*-indoles. Earlier syntheses of dihydroindoles have involved photolysis of *N*-aryl enamines [4]; reduction of indoles with borane-trimethylamine [5]; base-catalyzed spirocyclization of aromatic imide imines [6]; base-catalyzed tandem hydroamination-aryne addition of chlorostyrenes [7]; and tandem S$_N$2-S$_N$Ar reaction of 2-(3-bromopropyl)-1-fluoro-4-nitrobenzene [2(b)]. Each of these mechanistically diverse routes provides access to a select group of dihydroindoles but none constitutes a general synthesis.

Dihydroindoles bearing a 1,1,1,3,3,3-hexafluoro-2-hydroxypropan-2-yl group in the C5 position have been shown to exhibit significant biological activity as nonsteroidal liver X receptor-α agonists [8]. Liver X receptors normally bind 24*S*,25-epoxycholesterol and have been found to play an important role in lipid metabolism [8]. These potent modulators of liver X receptor-α are currently being investigated for the treatment of dyslipidemia, atherosclerosis, and diabetes [9]. While the compounds prepared here possess a nitro group at C5, the nitro group could be readily transformed [10,11] to permit installation of the required substituent.

RESULTS AND DISCUSSION

The synthesis of our dihydroindole precursors is shown in Scheme 1. Dakin-West reaction of (2-fluoro-5-nitrophenyl)acetic acid (**1**) [2(b)] with a series of carboxylic acid anhydrides in pyridine followed by refluxing with acidic ethanol gave the 1-(2-fluoro-5-nitrophenyl)-2-propanone derivatives **3**, **4**, and **5** [12,13]. Yields of the ketone products correlated with the steric hindrance of the anhydride with acetic anhydride giving the highest yield (82%) and isobutyric anhydride the lowest (24%). Finally, the desoxybenzoin derivative **6** was prepared in 58% yield by a Friedel-Crafts reaction of (2-fluoro-5-nitrophenyl)acetyl chloride with benzene [14].

Scheme 1



3 R = CH$_3$ (82%)
4 R = CH$_2$CH$_3$ (59%)
5 R = CH(CH$_3$)$_2$ (24%)

6 (58%)

Our cyclization study sought to demonstrate the feasibility of preparing selected dihydroindoles from alkyl 2-fluoro-5-nitrobenzyl ketones and primary amines by a tandem reductive amination-S$_N$Ar sequence. Initially, we believed that the enolizability of the substrates might lead to competitive condensation reactions under the neutral to basic reaction conditions. Another potential problem was the strain associated with closing a benzo-fused five-membered ring [15]. Neither of these concerns, however, proved to be a significant deterrent to the success of the reaction.

The reaction is run by dissolving 1.00 equivalent of the ketone in methanol, then adding 1.20 equivalents of the amine and 1.25 equivalents of sodium cyanoborohydride, and stirring at room temperature for 48 h. Optimum yields were obtained when two extra portions (0.18 equivalents each) of the amine and the reducing agent were added at 12-h intervals during the first 24 h. The major limitation of the current process is its sensitivity to the steric environment surrounding the ketone and amine functions. For example, the reaction was successful for substrates **3** ($R = CH_3$) and **4** ($R = CH_2CH_3$), but proceeded poorly for **5** ($R = CH(CH_3)_2$). The phenyl ketone **6** proved to be inert to the reaction conditions at 22°C, but gave a low yield of the heterocycle, along with three other products, at 65°C. Bulky amines, branched at the α-carbon, also gave lower yields.

The best results were achieved by reacting methyl ketone **3** with unbranched primary amines (see Table 1). These gave the target dihydroindoles **7a–e** in 74–82% yields. In each case, the ketone reduction product, 1-(2-fluoro-5-nitrophenyl)-2-propanol (**8**), was also isolated in 10–15% yield. More hindered amines, such as cyclohexylamine, gave dihydroindole **7f** in much lower yield (22%), with the remainder being alcohol **8** (20%), simple reductive amination product **9** (32%) and recovered **3** (14%). Isolation of **9** in this case suggests that reductive amination initiates the two-step sequence. Finally, *tert*-butylamine gave only alcohol **8** (20%) along with unreacted **3** (75%).

For more sterically congested substrates **4** and **5**, the yield of the dihydroindole decreased and the proportion of ketone reduction product (**11** and **13**, respectively) and unreacted ketone increased (see Tables 2 and 3). Ethyl ketone **4** gave the dihydroindoles in 60–64% yield, which is still synthetically useful. Isopropyl ketone **5**, however, afforded less than 25% yields and the desired products were difficult to separate from unreacted ketone and other minor by-products. Finally,

Table 1

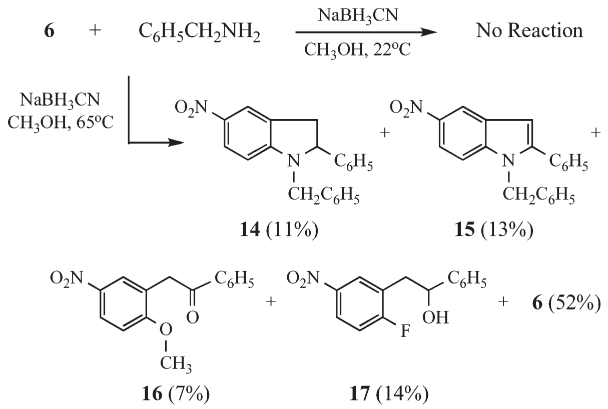
c	n-C_6H_{13}	22[b]

[a] This reaction also gave **13** in 15% yield and unreacted **5** in 58% yield.

[b] This reaction also gave **13** in 14% yield and unreacted **5** in 55% yield.

Scheme 2



phenyl ketone **6** and benzylamine in methanol reacted only under forcing conditions (65°C, 48 h) to give a low yield of the desired dihydroindole **14** (11%), along with indole **15** (13%) from α deprotonation of the intermediate imine and cyclization by the nitrogen of the delocalized anion, methoxyketone **16** (7%) from solvent addition to the activated ring, alcohol **17** (14%) and unreacted **6** (52%) (see Scheme 2).

CONCLUSION

We have developed an approach to the synthesis of (±)-1,2-dialkyl-5-nitro-2,3-dihydro-1*H*-indoles based on a tandem reductive amination-S_NAr reaction. The reaction gives good yields in many cases but is sensitive to steric hindrance in the ketone and amine reacting partners. Thus, while satisfactory conversions were achieved from substrates **3** and **4**, hindered ketone **5** gave low yields and aromatic ketone **6** was unreactive. Branching at the α-carbon of the amine also proved detrimental to the reaction. We are pursuing further studies of this transformation in systems bearing other electron withdrawing groups at C5 and C7 of the dihydroindole system.

EXPERIMENTAL

All reactions were run under dry nitrogen unless otherwise indicated. Methanol was used from a freshly opened bottle. Reactions were monitored by thin layer chromatography on silica gel GF plates (Analtech 21521) with ultraviolet detection. Preparative separations were performed by one of the following methods: (1) flash column chromatography [16] on silica gel (grade 62, 60–200 mesh) containing ultraviolet-active phosphor (Sorbent Technologies UV-5) packed into quartz columns or (2) preparative thin layer chromatography on 20 cm × 20 cm silica gel GF plates (Analtech 02015). Band elution for both methods was monitored using a hand-held ultraviolet lamp. Hexanes used in chromatography had a boiling range of 65–70°C. Melting points were uncorrected. Infrared spectra were run as thin films on sodium chloride disks and referenced to polystyrene. ^{1}H and ^{13}C Nuclear magnetic resonance spectra were measured in deuteriochloroform at 300 MHz and 75 MHz, respectively, using tetramethylsilane as the internal standard; coupling constants (J) are given in Hz. Mass spectra (electron impact/direct probe) were obtained at 70 eV.

1-(2-Fluoro-5-nitrophenyl)-2-propanone (3). This compound was prepared from **1** and acetic anhydride on a 13.2 mmol scale by adapting the method described by Schtacher and Dayagi [12] for the synthesis of 1-(3-nitrophenyl)-2-propanone. The crude product was recrystallized from methanol to give 2.13 g (82%) of **3**, mp 113–114°C. ir: 1725, 1522, 1352, 1246 cm^{-1}; ^{1}H NMR: δ 8.19 (ddd, 1H, *J* = 8.8, 4.4, 2.7), 8.12 (dd, 1H, *J* = 6.2, 2.7), 7.22 (t, 1H, *J* = 8.8), 3.88 (d, 2H, *J* = 0.9), 2.31 (s, 3H); ^{13}C NMR: δ 202.7, 164.5 (d, *J* = 257.4), 144.2, 127.4 (d, *J* = 6.6), 124.9 (d, *J* = 10.3), 123.4, (d, *J* = 18.6), 116.2 (d, *J* = 24.9), 43.3, 29.7; ms: *m*/*z* 197 (M^+). Anal. Calcd. for $C_9H_8FNO_3$: C, 54.82; H, 4.06; N, 7.11. Found: C, 54.84; H, 4.07; N, 7.07.

1-(2-Fluoro-5-nitrophenyl)-2-butanone (4). This compound was prepared from **1** and propionic anhydride on a 13.2 mmol scale by adapting the method described by Schtacher and Dayagi [12] for the synthesis of 1-(3-nitrophenyl)-2-propanone. The crude product was flash chromatographed on a 30 cm × 2.5 cm silica gel column eluted with 5% ether in hexanes to give 1.53 g (59%) of **4**, mp 59–61°C. ir: 1721, 1529, 1351, 1248 cm^{-1}; ^{1}H NMR: δ 8.18 (ddd, 1H, *J* = 8.8, 4.5, 2.9), 8.13 (dd, 1H, *J* = 6.2, 2.9), 7.21 (t, 1H, *J* = 8.8), 3.85 (d, 2H, *J* = 0.8), 2.60 (q, 2H, *J* = 7.2), 1.12 (t, 3H, *J* = 7.2); ^{13}C NMR: δ 205.5, 164.5 (d, *J* = 257.7), 144.1, 127.7 (d, *J* = 6.6), 124.9 (d, *J* = 9.6), 123.6 (d, *J* = 19.1), 116.2 (d, *J* = 24.3), 42.0 (d, *J* = 1.5), 35.9, 7.7; ms: *m*/*z* 211 (M^+). Anal. Calcd. For $C_{10}H_{10}FNO_3$: C, 56.87; H, 4.74; N, 6.63. Found: C, 56.85; H, 4.73; N, 6.63.

1-(2-Fluoro-5-nitrophenyl)-3-methyl-2-butanone (5). This compound was prepared from **1** and isobutyric anhydride on an 11.5 mmol scale by adapting the method described by Schtacher and Dayagi [11] for the synthesis of 1-(3-nitrophenyl)-2-propanone. The crude product was flash chromatographed on a 30 cm × 2.5 cm silica gel column using 5% ether in hexanes to give 0.62 g (24%) of **5**, mp 46–48°C. ir: 1720, 1530, 1349, 1249 cm^{-1}; ^{1}H NMR: δ 8.18 (ddd, 1H, *J* = 8.8, 4.5, 2.9), 8.12 (dd, 1H, *J* = 6.2, 2.9), 7.20 (t, 1H, *J* = 8.8), 3.90 (s, 2H), 2.79 (septet, 1H, *J* = 6.8), 1.20 (d, 6H, *J* = 6.8); ^{13}C NMR: δ 208.8, 164.5 (d, *J* = 256.9), 144.3, 127.8 (d, *J* = 6.6), 124.8 (d, *J* = 10.7), 123.8 (d, *J* = 18.4), 116.1 (d, *J* = 24.3), 41.0, 40.1 (d, *J* = 1.5), 18.2; ms: *m*/*z* 182 (M^+-C_3H_7). Anal. Calcd. For $C_{11}H_{12}FNO_3$: C, 58.67; H, 5.33; N, 6.22. Found: C, 58.71; H, 5.34; N, 6.17.

3-(2-Fluoro-5-nitrophenyl)-1-phenyl-1-ethanone (6). **[Caution!** Benzene is a carcinogen. Thionyl chloride is an inhalation hazard and is highly toxic. Both should be handled carefully in a well-ventilated area.] In a round-bottomed flask protected by a drying tube (Drierite®), 2.97 g (1.82 mL, 25.0 mmol) of thionyl chloride was added to a solution of 2.49 g (12.5 mmol) of **1** in 40 mL of benzene and the mixture was stirred and heated under reflux for 3 h. Solvent and excess thionyl chloride were removed by distillation and the resulting acid chloride in 10 mL of benzene was added dropwise to a suspension of 2.00 g (15.0 mmol) of aluminum chloride in 40 mL of benzene [14]. The mixture was heated under reflux for 1 h, then cooled and quenched by addition to 10 mL of concentrated hydrochloric acid and 25 g of crushed ice. The product was extracted with 1:1 benzene:ether (two times) and the combined organic extracts were washed with saturated sodium chloride (one time), dried (magnesium sulfate), and concentrated under vacuum. The crude product was recrystallized from methanol to give 1.88 g (58%) of **6**, mp 89–90°C. ir: 1691, 1527, 1352, 1249 cm^{-1}; ^{1}H NMR: δ 8.21 (superimposed ddd and dd, 2H), 8.05 (superimposed dd, 2H), 7.64 (tt, 1H, *J* = 7.4, 1.2), 7.52 (t, 2H, *J* = 7.4), 7.24 (t, 1H, *J* = 8.2), 4.44 (d, 2H, *J* = 0.8); ^{13}C NMR: δ 194.5, 164.7 (d, *J* = 256.9), 144.1, 135.9, 133.8, 128.9, 128.3, 127.9 (d, *J* = 6.6), 125.0 (d, *J* = 10.3), 123.8 (d, *J* = 18.4), 116.2 (d, *J* = 24.3), 38.6 (d, *J* = 1.5); ms (30 eV): *m/z* 259 (M^{+}). Anal. Calcd. For $C_{14}H_{10}FNO_3$: C, 64.86; H, 3.86; N, 5.41. Found: C, 64.87; H, 3.86; N, 5.42.

Representative procedure for the reductive amination-nucleophilic substitution reaction with 3: (±)-1-Benzyl-2-methyl-5-nitro-2,3-dihydro-1*H*-indole (7a). To a stirred solution of 100 mg (0.51 mmol) of **3** and 64 mg (0.65 mL, 0.60 mmol) of benzylamine at 22°C was added 40 mg (0.64 mmol) of sodium cyanoborohydride. The reaction was stirred at 22°C for 48 h; two additional portions of 10 mg (0.09 mmol) of benzylamine and 6 mg (0.09 mmol) of sodium cyanoborohydride were added at 12-h intervals during the first 24 h. The crude reaction mixture was poured into saturated sodium chloride and extracted with ether (three times). The combined ether extracts were dried (magnesium sulfate), concentrated under vacuum, and purified by preparative thin layer chromatography using 20% ether in hexanes. The bright yellow band contained 106 mg (78%) of **7a** as a yellow solid, mp 94–95°C. ir: 1506, 1315 cm^{-1}; ^{1}H NMR: δ 8.00 (dd, 1H, *J* = 8.8, 2.4), 7.88 (m, 1H), 7.38–7.22 (complex, 5H), 6.23 (d, 1H, *J* = 8.8), 4.55 (d, 1H, *J* = 16.3), 4.35 (d, 1H, *J* = 16.3), 4.02 (m, 1H), 3.29 (ddd, 1H, *J* = 16.1, 9.1, 1.1), 2.72 (ddd, 1H, *J* = 16.1, 7.7, 0.9), 1.32 (d, 3H, *J* = 6.2); ^{13}C NMR: δ 156.8, 138.1, 136.7, 128.8, 128.5, 127.6, 127.0, 126.6, 120.6, 103.7, 59.7, 48.5, 35.8, 19.8; ms: *m/z* 268 (M^{+}). Anal. Calcd. for $C_{16}H_{16}N_2O_2$: C, 71.64; H, 5.97; N, 10.45. Found: C, 71.64; H, 5.96; N, 10.42.

This reaction also produced 12 mg (12%) of 1-(2-fluoro-5-nitrophenyl)-2-propanol (**8**), mp 53–54.5°C. ir: 3385, 1527, 1350, 1245 cm^{-1}; ^{1}H NMR: δ 8.21 (dd, 1H, *J* = 6.2, 2.9), 8.13 (ddd, 1H, *J* = 8.8, 4.4, 2.9), 7.18 (t, 1H, *J* = 8.8), 4.13 (d of sextets, 1H, *J* = 6.2, 0.9), 2.91 (ddd, 1H, *J* = 13.8, 4.8, 1.3), 2.83 (ddd, 1H, *J* = 13.8, 7.5, 1.3), 1.61 (br s, 1H), 1.29 (d, 3H, *J* = 6.2); ^{13}C NMR: δ 164.8 (d, *J* = 256.2), 149.6, 128.3 (d, *J* = 18.3), 127.6 (d, *J* = 7.2), 124.1 (d, *J* = 10.3), 116.2 (d, *J* = 25.5), 67.4, 38.2, 23.3; ms: *m/z* 199 (M^{+}). Alcohol **8** (10%) was also isolated.

(±)-1-Cyclohexyl-2-methyl-5-nitro-2,3-dihydro-1*H*-indole (7f). This compound (29 mg, 22%) was isolated as a yellow oil. ir: 1506, 1313 cm^{-1}; ^{1}H NMR: δ 8.02 (dd, 1H, *J* = 8.8, 2.3), 7.83 (dt, 1H, *J* = 2.3, 1.4), 6.24 (d, 1H, *J* = 8.8), 4.14 (m, 1H), 3.30 (m, 2H), 2.61 (ddd, 1H, *J* = 16.2, 4.5, 0.8), 1.89 (m, 4H), 1.73 (m, 2H), 1.54 (m, 1H), 1.30 (m, 3H), 1.30 (d, 3H, *J* = 6.2); ^{13}C NMR: δ 155.3, 137.1, 128.5, 126.7, 120.8, 103.6, 57.2, 56.2, 36.0, 31.0, 30.1, 26.1, 26.0, 25.6, 23.2; ms: *m/z* 245 (M^{+}-CH$_3$). Anal. Calcd. for $C_{15}H_{20}N_2O_2$: C, 69.23; H, 7.69; N, 10.77. Found: C, 69.26; H, 7.71; N, 10.72.

This reaction also produced 45 mg (32%) of *N*-cyclohexyl-α-methyl-2-(2-fluoro-5-nitrophenyl)ethanamine (**9**) as a yellow oil. ir: 3323, 1528, 1350, 1244 cm^{-1}; ^{1}H NMR: δ 8.16 (dd, 1H, *J* = 6.2, 2.7), 8.11 (ddd, 1H, *J* = 9.0, 4.5, 2.7), 7.16 (t, 1H, *J* = 9.0), 3.11 (sextet, 1H, *J* = 6.3), 2.86 (dd, 1H, *J* = 13.5, 6.1), 2.64 (dd, 1H, *J* = 13.5, 7.2), 2.55 (tt, 1H, *J* = 10.3, 3.7), 1.85 (m, 2H), 1.70 (m, 2H), 1.60 (m, 1H), 1.32–1.15 (complex, 4H), 1.04 (d, 3H, *J* = 6.3), 1.01 (m, 2H); ^{13}C NMR: δ 164.8 (d, *J* = 256.2), 144.3, 128.7 (d, *J* = 17.7), 127.5 (d, *J* = 7.4), 123.8 (d, *J* = 10.3), 116.1 (d, *J* = 25.8), 53.5, 49.7, 36.7, 34.2, 33.9, 26.1, 25.1, 25.0, 20.9; ms: *m/z* 265 (M^{+}-CH$_3$). Anal. Calcd. for $C_{15}H_{21}FN_2O_2$: C, 64.29; H, 7.50; N, 10.00. Found: C, 64.38; H, 7.56; N, 9.95.

Alcohol **8** (20%) and unreacted **3** (14%) were also isolated.

Attempted preparation of (±)-1-*tert*-butyl-2-methyl-5-nitro-2,3-dihydro-1*H*-indole (7g). Treatment of **3** as above gave only alcohol **8** (20%) and unreacted **3** (75%).

Reductive amination-nucleophilic substitution reaction with 4: (±)-1-Benzyl-2-ethyl-5-nitro-2,3-dihydro-1*H*-indole (10a). This reaction was run on a 100 mg (0.47 mmol)-scale using the general procedure given above for the preparation of **7a**. This compound (80 mg, 60%) was obtained as a yellow solid, mp 47–48°C. ir: 1509, 1316 cm^{-1}; ^{1}H NMR: δ 8.00 (dd, 1H, *J* = 8.9, 2.3), 7.89 (m, 1H), 7.36–7.22 (complex, 5H), 6.23 (d, 1H, *J* = 8.9), 4.56 (d, 1H, *J* = 16.4), 4.36 (d, 1H, *J* = 16.4), 3.89 (m, 1H), 3.24 (dd, 1H, *J* = 16.5, 9.6), 2.81 (dd, 1H, *J* = 16.5, 3.1), 1.81 (sextet d, 1H, *J* = 7.4, 3.1), 1.58 (m, 1H), 0.90 (t, 3H, *J* = 7.4); ^{13}C NMR: δ 157.2, 138.0, 136.7, 128.8, 128.6, 127.5, 126.9, 126.7, 120.6, 103.5, 65.1, 48.7, 32.8, 26.2, 8.9; ms: *m/z* 191 (M^+-C_7H_7). Anal. Calcd. for $C_{17}H_{18}N_2O_2$: C, 72.34; H, 6.38; N, 9.93. Found: C, 72.38; H, 6.41; N, 9.87.

This reaction also produced 19 mg (19%) of 1-(2-fluoro-5-nitrophenyl)-2-butanol (**11**), mp 37–38°C. ir: 3390, 1527, 1350, 1244 cm^{-1}; ^{1}H NMR: δ 8.23 (dd, 1H, *J* = 6.2, 2.9), 8.13 (ddd, 1H, *J* = 8.9, 4.2, 2.9), 7.18 (t, 1H, *J* = 8.9), 3.84 (m, 1H), 2.95 (ddd, 1H, *J* = 14.0, 4.1, 1.0), 2.79 (dd, 1H, *J* = 14.0, 8.4), 1.60 (br s, 1H), 1.58 (m, 2H), 1.02 (t, 3H, *J* = 7.4); ^{13}C NMR: δ 164.8 (d, *J* = 256.9), 144.0, 127.8 (d, *J* = 17.6), 127.6 (d, *J* = 7.4), 124.0 (d, *J* = 10.3), 116.1 (d, *J* = 25.8), 72.6, 36.2, 30.1, 9.8; ms: *m/z* 184 (M^+-C_2H_5). Anal. Calcd. For $C_{10}H_{12}FNO_3$: C, 56.34; H, 5.63; N, 6.57. Found: C, 56.40; H, 5.66; N, 6.51.

Unreacted **4** (12%) was also recovered.

(±)-2-Ethyl-5-nitro-1-(2-phenylethyl)-2,3-dihydro-1*H*-indole (10b). This compound (87 mg, 62%) was isolated as a yellow oil. ir: 1513, 1322 cm^{-1}; ^{1}H NMR: δ 8.00 (dd, 1H, *J* = 8.8, 2.1), 7.83 (m, 1H), 7.32–7.15 (complex, 5H), 6.15 (d, 1H, *J* = 8.8), 3.76 (m, 1H), 3.51 (ddd, 1H, *J* = 14.8, 9.0, 6.1), 3.42 (ddd, 1H, *J* = 14.8, 8.8, 6.8), 3.12 (dd, 1H, *J* = 16.4, 9.6), 2.89 (ddd, 1H, *J* = 14.6, 9.0, 6.8), 2.80 (ddd, 1H, *J* = 14.6, 8.8, 6.1), 2.70 (dd, 1H, *J* = 16.4, 7.4), 1.78 (sextet d, 1H, *J* = 7.4, 3.1), 1.50 (m, 1H), 0.88 (t, 3H, *J* = 7.4); ^{13}C NMR: δ 156.6, 138.6, 137.5, 128.6 (2C), 128.5, 126.7, 126.6, 120.5, 102.8, 64.8, 46.3, 33.4, 32.6, 26.0, 8.8; ms: *m/z* 205 (M^+-C_7H_7). Anal. Calcd. for $C_{18}H_{20}N_2O_2$: C, 72.97; H, 6.76; N, 9.46. Found: C, 73.01; H, 6.74; N, 9.47.

Alcohol **11** (19%) and unreacted **4** (10%) were also isolated.

(±)-2-Ethyl-1-hexyl-5-nitro-2,3-dihydro-1*H*-indole (10c). This compound (80 mg, 61%) was isolated as a yellow oil. ir: 1511, 1313 cm^{-1}; ^{1}H NMR: δ 8.03 (dd, 1H, *J* = 8.9, 2.3), 7.83 (m, 1H), 6.19 (d, 1H, *J* = 8.9), 3.89 (m, 1H), 3.31–3.11 (complex, 3H), 2.73 (dd, 1H, *J* = 17.1, 8.0), 1.80 (m, 1H), 1.57 (m, 3H), 1.31 (m, 6H), 0.91 (t, 3H, *J* = 7.4), 0.90 (distorted t, 3H, *J* = 6.2); ^{13}C NMR: δ 157.0, 137.2, 128.4, 126.8, 120.4, 102.7, 64.6, 44.4, 32.6, 31.5, 27.0, 26.8, 26.0, 22.5, 14.0, 8.8; ms: *m/z* 205 (M^+-C_5H_{11}). Anal. Calcd. for $C_{16}H_{24}N_2O_2$: C, 69.57; H, 8.70; N, 10.14. Found: C, 69.63; H, 8.75; N, 10.06.

Alcohol **11** (20%) and unreacted **4** (10%) were also isolated.

(±)-2-Ethyl-1-(3-isopropoxypropyl)-5-nitro-2,3-dihydro-1*H*-indole (10d). This compound (84 mg, 61%) was isolated as a yellow oil. ir: 1515, 1315 cm^{-1}; ^{1}H NMR: δ 8.03 (dd, 1H, *J* = 8.8, 2.1), 7.84 (m, 1H), 6.28 (d, 1H, *J* = 8.8), 3.85 (m, 1H), 3.53 (septet, 1H, *J* = 6.2), 3.49–3.27 (complex, 4H), 3.18 (dd, 1H, *J* = 16.4, 9.4), 2.74 (dd, 1H, *J* = 16.4, 7.4), 1.82 (m, 3H), 1.55 (m, 1H), 1.15 (d, 6H, *J* = 6.2), 0.91 (t, 3H, *J* = 7.4); ^{13}C NMR: δ 157.2, 137.4, 128.3, 126.8, 120.4, 102.9, 71.6, 64.8, 64.7, 41.3, 32.6, 27.8, 26.0, 22.1, 22.0, 8.8; ms: *m/z* 205 (M^+-$C_5H_{11}O$). Anal. Calcd. for $C_{16}H_{24}N_2O_3$: C, 65.75; H, 8.22; N, 9.59. Found: C, 65.79; H, 8.24. N, 9.52.

Alcohol **11** (18%) and unreacted **4** (11%) were also isolated.

(±)-2-Ethyl-1-isobutyl-5-nitro-2,3-dihydro-1*H*-indole (10e). This compound (75 mg, 64%) was isolated as a yellow oil. ir: 1511, 1315 cm^{-1}; ^{1}H NMR: δ 8.02 (dd, 1H, *J* = 8.8, 2.3), 7.85 (m, 1H), 6.21 (d, 1H, *J* = 8.8), 3.88 (m, 1H), 3.20 (ddd, 1H, *J* = 16.4, 9.6, 1.0), 3.03 (m, 2H), 2.74 (ddd, 1H, *J* = 16.4, 6.6, 1.0), 2.02 (septet, 1H, *J* = 6.7), 1.78 (sextet d, 1H, *J* = 7.4, 3.1), 1.53 (m, 1H), 0.97 (d, 3H, *J* = 6.7), 0.91 (d, 3H, *J* = 6.7), 0.90 (t, 3H, *J* = 7.4); ^{13}C NMR: δ 157.4, 137.1, 128.2, 126.8, 120.5, 102.9, 65.1, 52.3, 32.5, 27.4, 25.9, 20.5, 20.3, 8.8; ms: *m/z* 205 (M^+-C_3H_7). Anal. Calcd. for $C_{14}H_{20}N_2O_2$: C, 67.74; H, 8.06; N, 11.29. Found: C, 67.69; H, 8.04; N, 11.30.

Alcohol **11** (18%) and unreacted **4** (11%) were also isolated.

Reductive amination-nucleophilic substitution reaction with 5: (±)-1-Benzyl-2-isopropyl-5-nitro-2,3-dihydro-1*H*-indole (12a). This reaction was run on a 100 mg (0.44 mmol)-scale using the general procedure given above for the preparation of **7a**. This compound (22 mg, 17%) was isolated as a yellow oil following preparative thin layer chromatography using 15% ether in hexanes. ir: 1510, 1317 cm^{-1}; ^{1}H NMR: δ 8.01 (dd, 1H, *J* = 9.0, 2.3), 7.89 (m, 1H), 7.38–7.20 (complex, 5H), 6.29 (d, 1H, *J* = 9.0), 4.62 (d, 1H, *J* = 16.4), 4.33 (d, 1H, *J* = 16.4), 3.92 (ddd, 1H, *J* = 10.3, 7.6, 3.9), 3.03 (dd, 1H, *J* = 16.6, 10.2), 2.89 (dd, 1H *J* = 16.6, 7.6), 2.17 (sextet d, 1H, *J* = 6.8, 3.9), 0.91 (d, 3H, *J* = 6.8), 0.81 (d, 3H, *J* = 6.8); ^{13}C NMR: δ 157.7, 138.0, 136.4, 128.8, 127.7, 127.6, 127.1, 126.7, 120.6, 103.7, 68.0, 48.4, 28.3, 27.5, 18.6, 14.6; ms: *m/z* 205 (M^+-C_7H_7). Anal. Calcd. for $C_{18}H_{20}N$ for $C_{18}H_{20}N_2O_2$: C, 72.97; H, 6.76; N, 9.46. Found: C, 72.93; H, 6.72; N, 9.48.

This reaction also produced 15 mg (15%) of 1-(2-fluoro-5-nitrophenyl)-3-methyl-2-butanol (**13**) as a dark yellow oil. ir: 3427, 1526, 1347, 1245 cm^{-1}; ^{1}H NMR: δ 8.24 (dd, 1H, *J* = 6.2, 2.9), 8.13 (ddd, 1H, *J* = 8.8, 4.3, 2.9), 7.17 (t, 1H, *J* = 8.8), 3.66 (m, 1H), 2.96 (dd, 1H, *J* = 14.1, 2.0), 2.73 (dd, 1H, *J* = 14.1, 9.8), 1.77 (septet, 1H, *J* = 6.8), 1.48 (br s, 1H), 1.03 (d, 3H, *J* = 6.8), 1.02 (d, 3H, *J* = 6.8); ^{13}C NMR: δ 164.8 (d, *J* = 256.2), 144.1, 128.5 (d, *J* = 18.5), 127.6 (d, *J* = 7.4), 124.0 (d, *J* = 10.3), 116.1 (d, *J* = 25.0), 76.1, 33.9, 33.5, 18.7, 17.1; ms: *m/z* 184 (M^+-C_3H_7). Anal. Calcd. for $C_{11}H_{14}FNO_3$: C, 58.15; H, 6.17; N, 6.17. Found: C, 58.23; H, 6.19; N, 6.12.

Unreacted **5** (58%) was also recovered.

(±)-1-Hexyl-2-isopropyl-5-nitro-2,3-dihydro-1*H*-indole (12c). This compound (28 mg, 22%) was isolated as a yellow oil. ir: 1516, 1327 cm^{-1}; ^{1}H NMR: δ 8.03 (dd, 1H, *J* = 8.8, 2.1), 7.83 (m, 1H), 6.19 (d, 1H, *J* = 8.8), 4.12 (t, 1H, *J* = 7.8), 3.93 (ddd, 1H, *J* = 10.5, 7.3, 3.7), 3.30 (ddd, 1H, *J* = 14.8, 9.4, 6.3), 3.16 (ddd, 1H, *J* = 14.8, 9.4, 5.8), 3.06 (septet, 1H, *J* = 6.8), 2.98 (dd, 1H, *J* = 16.6, 9.9), 2.82 (dd, 1H, *J* = 16.6, 7.2), 2.16 (m, 1H), 1.76 (m, 1H), 1.57 (m, 1H), 1.32 (m, 4H), 0.95 (d, 3H, *J* = 6.8), 0.89 (m, 3H), 0.78 (d, 3H, *J* = 6.8); ^{13}C NMR: δ 157.3, 139.5, 128.5, 126.9, 120.4, 102.5, 67.9, 44.4, 43.6, 31.5, 28.5, 27.2, 26.8, 26.7, 22.6, 18.6, 14.4; ms: *m/z* 219 (M^+-C_5H_{11}). Anal. Calcd. for $C_{17}H_{26}N_2O_2$: C, 70.34; H, 8.97; N, 9.66. Found: C, 70.40; H, 9.01; N, 9.60.

Alcohol **13** (14%) and unreacted **5** (55%) were also isolated.

Reductive amination-nucleophilic aromatic substitution reactions with 6. Treatment of 100 mg (0.39 mmol) of **6** with 51.8 mg (0.48 mmol) of benzylamine using the general procedure given above for the preparation of **7a** afforded 98% recovery of unreacted **6**.

Repeating this reaction in methanol at 65°C for 48 h yielded four products, in addition to recovered **6**. These products were separated by preparative thin layer chromatography using 10% ether in hexanes to give: band 1: 16 mg (13%) of **15**; band 2: 13 mg (11%) of **14**; band 3: 52 mg (52%) of recovered **6**; band 4: 14 mg (14%) of **17**; and band 5: 7 mg (7%) of **16**. The physical and spectral data for these products were as follows:

1-Benzyl-2-phenyl-5-nitroindole (15). Viscous yellow oil; ir: 1513, 1332 cm^{-1}; ^{1}H NMR: δ 8.62 (d, 1H, *J* = 2.2), 8.05 (dd, 1H, *J* = 9.3, 2.2), 7.43 (apparent s, 5H), 7.30 (m, 1H), 7.28 (apparent t, 2H, *J* = 6.6), 7.20 (d, 1H, *J* = 8.8), 6.97 (dd, 2H, *J* = 8.2, 2.2), 6.80 (s, 1H), 5.41 (s, 2H); ^{13}C NMR: δ 145.0, 142.1, 140.6, 136.9, 131.3, 129.2, 129.0, 128.9, 128.8, 127.7, 127.5, 125.8, 117.6, 117.5, 110.4, 104.3, 48.0; ms: *m*/*z* 237 (M$^+$-C$_7$H$_7$). Anal. Calcd. for $C_{21}H_{16}N_2O_2$: C, 76.82; H, 4.88; N, 8.54. Found: C, 76.88; H, 4.91; N, 8.50.

(±)-1-Benzyl-2-phenyl-5-nitro-2,3-dihydro-1*H*-indole (14). Yellow solid, mp 137–139°C; ir: 1510, 1313 cm^{-1}; ^{1}H NMR: δ 8.09 (dd, 1H, *J* = 8.8, 2.2), 7.93 (s, 1H), 7.41–7.24 (complex, 8H), 7.12 (dd, 2H, *J* = 7.7, 2.2), 6.39 (d, 1H, *J* = 8.8), 4.88 (dd, 1H, *J* = 9.9, 7.7), 4.56 (d, 1H, *J* = 15.9), 4.01 (d, 1H, *J* = 15.9), 3.55 (dd, 1H, *J* = 16.5, 9.9), 3.08 (dd, 1H, *J* = 16.5, 8.2); ^{13}C NMR: δ 156.8, 141.0, 138.6, 136.0, 129.0, 128.8, 128.4, 128.2, 127.7, 127.5, 127.1, 126.8, 120.8, 103.9, 67.6, 48.4, 37.7; ms: *m*/*z* 239 (M$^+$-C$_7$H$_7$). Anal. Calcd. for $C_{21}H_{18}N_2O_2$: C, 76.36; H, 5.45; N, 8.48. Found: C, 76.38; H, 5.46; N, 8.45.

(±)-1-Phenyl-2-(2-fluoro-5-nitrophenyl) ethanol (17). Viscous yellow oil; ir: 3546, 3416, 1526, 1346, 1244 cm^{-1}; ^{1}H NMR: δ 8.13 (m, 2H), 7.41–7.28 (complex, 5H), 7.16 (t, 1H, *J* = 8.8), 4.99 (t, 1H, *J* = 6.6), 3.12 (d, 2H, *J* = 6.6), 2.00 (br s, 1H); ^{13}C NMR: δ 164.8 (d, *J* = 256.5), 144.0, 143.1, 128.7, 128.2, 127.8 (d, *J* = 6.9), 127.2 (d, *J* = 18.0), 125.7, 124.2 (d, *J* = 10.0), 116.1 (d, *J* = 25.5), 73.7, 38.4; ms: *m*/*z* 243 (M$^+$-H$_2$O). Anal. Calcd. for $C_{14}H_{12}FNO_3$: C, 64.37; H, 4.60; N, 5.36. Found: C, 64.44; H, 4.64; N, 5.29.

3-(2-Methoxy-5-nitrophenyl)-1-phenyl-1-ethanone (16). Light yellow solid, mp 118–120°C; ir: 2848, 1689, 1514, 1330 cm^{-1}; ^{1}H NMR: δ 8.22 (dd, 1H, *J* = 9.3, 2.7), 8.11 (d, 1H, *J* = 2.7), 8.03 (d, 2H, *J* = 7.7), 7.62 (t, 1H, *J* = 7.7), 7.51 (t, 2H, *J* = 7.7), 6.96 (d, 1H, *J* = 9.3), 4.36 (s, 2H), 3.88 (s, 3H) ^{13}C NMR: δ 196.0, 162.5, 141.3, 136.5, 133.4, 128.7, 128.2, 127.0, 125.1, 124.9, 110.0, 56.2, 39.9; ms: *m*/*z* 166 (M$^+$-C$_7$H$_5$O). Anal. Calcd. for $C_{15}H_{13}NO_4$: C, 66.42; H, 4.80; N, 5.17. Found: C, 66.44; H, 4.80; N, 5.19.

Acknowledgment. T. N. thanks Oklahoma State University for a Niblack Scholarship and the Department of Chemistry for a Moore Scholarship. B. W. thanks the 2008 NSF-REU program at OSU (CHE-0649162) and the Department of Chemistry for a Skinner Scholarship. Funding for the 400 MHz NMR spectrometer of the Oklahoma Statewide Shared NMR Facility was provided by NSF (BIR-9512269), the Oklahoma State Regents for Higher Education, the W. M. Keck Foundation, and Conoco, Inc. Finally, the authors wish to thank the OSU College of Arts and Sciences for funds to upgrade our departmental FTIR and GC-MS instruments.

[15] Strain in closing a benzo-fused five-membered ring was cited as a contributing factor in the low yields obtained for 2,3-dihydro-1*H*-indoles prepared by a tandem S$_N$2-S$_N$Ar reaction. This now appears unlikely. The primary problem in the S$_N$2-S$_N$Ar approach to this ring system is the tendency for the substrates to undergo elimination to the styrene in the presence of the basic amine nucleophile, see ref. 1(b).

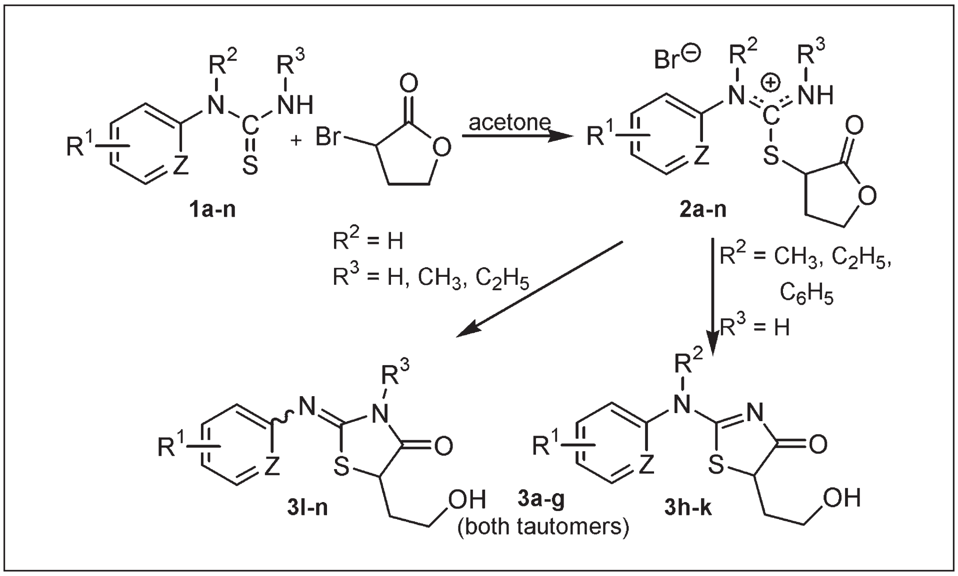
Received January 9, 2009
DOI 10.1002/jhet.118

Dedicated to Professor Vladimír Macháček on the occasion of his 65th birthday.



A new method for the synthesis of substituted 5-(2-hydroxyethyl)-2-phenylimino-1,3-thiazolidin-4-ones and 5-(2-hydroxyethyl)-2-phenylamino-4,5-dihydro-1,3-thiazol-4-ones is described, starting from phenylthioureas and 3-bromotetrahydrofuran-2-one. The reaction proceeds under mild conditions, is very simple to perform, and is applicable to a relatively wide range of substituents in benzene nucleus. Some 1,3-thiazolidin-4-ones show dynamic NMR behavior in solution because of prototropy tautomerism and *E*-/*Z*-stereoisomerism.

J. Heterocyclic Chem., **46**, 635 (2009).

INTRODUCTION

Natural [1] as well as synthetic heterocyclic compounds, containing a thiazole ring system often exhibit good antifungal [2], antibacterial [3], and anti-inflammatory [4] activity and are widely used in new pharmaceutical and agrochemical compounds. Also thiazolidine cycle belongs among pharmaceutically significant heterocycles representing an important group of per oral antidiabetics [5]. Thiazole skeleton is also present in many dyes and pigments [6].

There exist a lot of synthetic methods leading to thiazole or thiazolidine skeleton [7] from which those involving rearrangements of another heterocyclic rings represent new interesting alternative. Such rearrangements may provide fascinating routes to derivatives that can be obtained only with great difficulties—or not at all—by other procedures.

RESULTS AND DISCUSSION

Recently, we have found [8] that substituted *S*-(1-phenylpyrrolidin-2-on-3-yl) isothiuronium salts in weakly basic medium undergo an intramolecular transformation reaction. In this particular case, the γ-lactam ring is cleaved and a thiazolidine ring is formed, i.e. substituted 2-imino-5-[2-(phenylamino)ethyl]-1,3-thiazolidin-4-ones are obtained in very good yields. In this work, we extended the scope of this transformation replacing γ-lactam cycle by γ-lacton cycle. In the first step, we have prepared corresponding *S*-(2-oxotetrahydrofuran-3-yl)-*N*-(subst. phenyl) isothiuronium

bromides (**2a–n**) from substituted phenylthioureas (**1a–n**) and 3-bromotetrahydrofuran-2-one (α-bromo-γ-butyrolactone), which then underwent rearrangement in basic medium to give desired 5-(2-hydroxyethyl)-2-phenylimino-1,3-thiazolidin-4-ones (**3a–g**, **3l–n**) or 5-(2-hydroxyethyl)-2-phenylamino-4,5-dihydro-1,3-thiazol-4-ones (**3h–k**) (Scheme 1). In most cases, it was impossible to characterize pure isothiuronium salts by NMR because of their spontaneous cyclization giving **3a–n** in DMSO-d_6 solution.

The only exception was *S*-(2-oxotetrahydrofuran-3-yl)-*N*-(4-methoxyphenyl)isothiuronium bromide (**2b**) which was prepared in a pure form and characterized by ^{1}H, ^{13}C NMR, and microanalysis. The reason for enhanced reactivity of the other derivatives lies in the presence of electron-withdrawing group in the benzene nucleus or methyl group on nitrogen(s). All of these substituents facilitate rearrangement involving bicyclic tetrahedral intermediate.

Similar method [9] starting from substituted phenylthioureas and ethyl 3-bromo-5-methyl-2-oxo-tetrahydrofuran-3-carboxylate, ethyl 3-bromo-5,5-dimethyl-2-oxo-tetrahydrofuran-3-carboxylate, and ethyl 3-bromo-5-isobutoxymethyl-2-oxotetrahydrofuran-3-carboxylate giving spirocyclic 2-aza-3-amino or substituted amino-4-thia-7-oxa-8-methyl-8-substituted spiro[4.4]-2-nonene-1,6-diones was recently published. In this case, nitrogen atom of isothiuronium salt attacks ethoxycarbonyl group in position 3 instead of lactone carbonyl group.

Prepared 5-(2-hydroxyethyl)-2-phenylimino-1,3-thiazolidin-4-ones (**3a–g**, **3l–n**) 5-(2-hydroxyethyl)-2-phenylamino-4,5-dihydro-1,3-thiazol-4-ones (**3h–k**) were characterized by ^{1}H, ^{13}C NMR, and microanalyses and some of them also by X-ray diffraction (Figs. 1, 2) and mass spectroscopy.

Compounds **3a–f** carrying hydrogen atoms on both nitrogen atoms ($R^2 = R^3 = H$) exist in the form of two tautomers differing in the position of C=N double bond. Moreover, the tautomer with exocyclic double bond exists as a mixture of *E*- and *Z*-stereoisomers in the proportion depending on substitution of the benzene nucleus and temperature. This tautomerism and stereoisomerism, which can be seen in both ^{1}H and ^{13}C NMR spectra was previously studied for C-5 unsubstituted 2-phenyliminothiazolidin-4-ones by several authors [10].

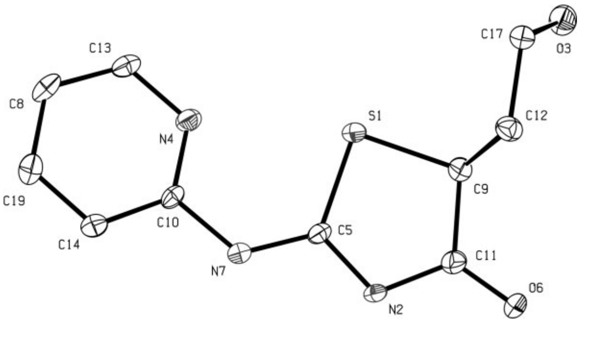

Figure 1. ORTEP view of compound **3g** (thermal ellipsoids at 40% probability).

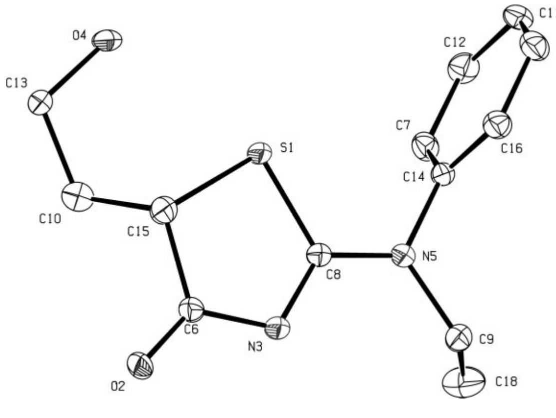

Figure 2. ORTEP view of compound **3i** (thermal ellipsoids at 40% probability).

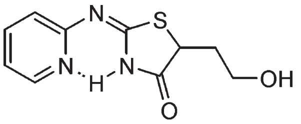

Figure 3. Intramolecular hydrogen bond in solution of **3g** in DMSO-d_6.

In the case of compounds **3h–k** ($R^2 = CH_3, C_2H_5, C_6H_5$; $R^3 = H$) and **3l–n** ($R^2 = H$; $R^3 = CH_3, C_2H_5$), prototropic tautomerism is absent due to C=N double bond fixation and stereoisomerism is possible only for **3l–n**. In both ^{1}H and ^{13}C NMR spectra of **3g**, there is only one set of signals. From this observation, it can be deduced that compound **3g** exists only as *E*-stereoisomer stabilized in solution by intramolecular hydrogen bond (Fig. 3). On the other hand, in crystal lattice two molecules of **3g** are connected by intermolecular hydrogen bonds ($N_{ring}—H\cdots N_{imino}$), which constrains *Z*-configuration of C=N double bond (Fig. 1).

EXPERIMENTAL

Starting arylthioureas **1a–n** were prepared and purified by known methods [11]. All other chemicals were purchased from commercial suppliers and used as received. Before use, solvents were dried and distilled. ^{1}H and ^{13}C NMR spectra were recorded on a Bruker Avance 500 MHz instrument in DMSO-d_6 solution. Chemical shifts δ are referenced to solvent residual peak δ(DMSO-d_6) = 2.50 (^{1}H) and 39.6 ppm (^{13}C). Coupling constants *J* are quoted in Hz. ^{13}C NMR spectra were measured in a standard way and by means of the APT (attached proton test) pulse sequence to distinguish CH, CH_3, and CH_2, C_{quart}. Proton–proton connectivities were found by gs-COSY. Protonated carbon atoms were assigned by gs-HSQC spectra. All NMR experiments were performed with the aid of the manufacturer's software. The microanalyses were performed on an apparatus of Fisons Instruments, EA 1108 CHN. The mass spectra (EI) were recorded on an Agilent Technologies Co. gas chromatograph 6890N with a mass detector 5973 Network for samples dissolved in either ether or acetone.

X-ray Crystallography of 3g and 3i. The colorless single crystals of **3g** and **3i** were grown from DMSO solution. The X-ray diffraction data were collected at 150(2)K on a Nonius KappaCCD diffractometer with graphite-monochromated Mo Kα radiation (λ = 0.71073 Å). The structures were solved by direct methods (SIR92) [12]. All reflections were used in the structure refinement based on F2 by full-matrix least-squares technique (SHELXL97) [13].

Compound 3g. $C_{10}H_{11}N_3O_2S$; triclinic, space group P-1, $a = 5.7500(3)$, $b = 8.7980(3)$, $c = 10.9290(6)$ (Å), $\alpha = 90.703(4)°$, $\beta = 95.787(4)°$, $\gamma = 107.550(4)°$, $Z = 2$, $V = 523.93(4)$ Å^3, Dc = 1.504 g·cm^{-3}. Intensity data collected with $3.0 \leq \theta \leq 27.5°$; 2404 independent reflections measured; 2000 observed [$I > 2\sigma(I)$]. Final *R* index = 0.0589 (observed reflections), Rw = 0.1329 (all reflections), *S* = 1.112. CCDC 704421.

Compound 3i. $C_{13}H_{16}N_2O_2S$; monoclinic, space group P-21/c, $a = 9.3440(7)$, $b = 18.8800(1)$, $c = 7.5690(5)$ (Å), $\alpha = 90.000(5)°$, $\beta = 105.913(6)°$, $\gamma = 90.000(5)°$, $Z = 4$, $V = 1284.11(15)$ Å^3, Dc = 1.367 g·cm^{-3}. Intensity data collected with $3.0 \leq \theta \leq 27.5°$; 2849 independent reflections measured; 2406 observed [$I > 2\sigma(I)$]. Final *R* index = 0.0608 (observed reflections), Rw = 0.1481 (all reflections), *S* = 1.062. CCDC 704422.

Isothiuronium salts 2; General Procedure. To a hot solution of *N*-arylthiourea **1a–n** (5 mmol) in dry acetone 5 mmol (0.83 g) of 3-bromotetrahydrofuran-2-one was injected. Reaction mixture was refluxed for 5 min and left to stand at room temperature for 2 days. Then precipitated crystals were collected by filtration and submitted to cyclization. In the case of compounds **2d–g**, **2j**, **2l**, and **2n**, no crystals precipitated so that the solution was evaporated and resulting oil was submitted to cyclization without any further purification (yields are given only for **3d–g**, **3j**, **3l**, and **3n**). Crystalline isothiuronium salts **1a–c**, **1h**, **1i**, **1k**, and **1m** were characterized by melting point and by microanalysis. Only in the case of salt **1b**, it was possible to measure ^{1}H and ^{13}C NMR spectra immediately after its dissolution in DMSO-d_6. For all the other salts quick transformation to **3a–n** was observed during the measurement.

S-(2-Oxotetrahydrofuran-3-yl)-N-phenyl isothiuronium bromide (2a). Yield: 1.24g (78%); m.p. 153–155°C. *Anal.* Calcd. for $C_{11}H_{13}BrN_2O_2S$: C, 41.65; H, 4.13; N, 8.83; S, 10.11; Br, 25.19. Found: C, 41.74; H, 4.13; N, 9.01; S, 10.16; Br, 25.05.

S-(2-Oxotetrahydrofuran-3-yl)-N-(4-methoxyphenyl) isothiuronium bromide (2b). Yield: 0.77g (44%); m.p. 154–156°C; ^{1}H NMR (500 MHz): δ = 2.29 (m, 2H, CH_2), 3.65 (m, 2H, OCH_2), 3.82 (s, 3H, OCH_3), 4.72 (dd, *J* = 7.5 and 4.5 Hz, 1H, SCH), 7.16 (AA′XX′, *J* = 9 Hz, 2H, ArH), 7.37 (AA′XX′, *J* = 9 Hz, 2H, ArH), 10.79 (vbs, 3H, NH and NH_2).

^{13}C NMR (125 MHz): δ = 33.6 (CH_2), 47.5 (S—CH), 55.7 (OCH_3), 57.8 (O—CH_2), 115.3 (Ar C-3), 123.6 (Ar C-1), 129.6 (Ar C-2), 160.7 (Ar C-4), 174.1 (C=N), 175.0 (C=O). *Anal.* Calcd. for $C_{12}H_{15}BrN_2O_3S$: C, 41.51; H, 4.35; N, 8.07; S, 9.23; Br, 23.01. Found: C, 41.56; H, 4.29; N, 8.07; S, 9.08; Br, 22.99.

S-(2-Oxotetrahydrofuran-3-yl)-N-(4-methylphenyl) isothiuronium bromide (2c). Yield: 0.83g (50%); m.p. 160–164°C. *Anal.* Calcd. for $C_{12}H_{15}BrN_2O_2S$: C, 43.51; H, 4.56; N, 8.46; S, 9.68; Br, 24.12. Found: C, 43.71; H, 4.60; N, 8.26; S, 9.45; Br, 24.32.

S-(2-Oxotetrahydrofuran-3-yl)-N-phenyl-N-methyl isothiuronium bromide (2h). Yield: 1.3g (78%); m.p. 155–159°C. *Anal.* Calcd. for $C_{12}H_{15}BrN_2O_2S$: C, 43.51; H, 4.56; N, 8.46; S, 9.68; Br, 24.12. Found: C, 43.51; H, 4.86; N, 8.35; S, 9.90; Br, 24.03.

S-(2-Oxotetrahydrofuran-3-yl)-N-phenyl-N-ethyl isothiuronium bromide (2i). Yield: 1.59g (92%); m.p. 155–157°C. *Anal.* Calcd. for $C_{13}H_{17}BrN_2O_2S$: C, 45.23; H, 4.96; N, 8.11; S, 9.29; Br, 23.14. Found: C, 45.14; H, 5.11; N, 8.08; S, 9.03; Br, 23.20.

S-(2-Oxotetrahydrofuran-3-yl)-N-(4-methoxyphenyl)-N-methyl isothiuronium bromide (2k). Yield: 0.96g (53%); m.p. 164–167°C. *Anal.* Calcd. for $C_{13}H_{17}BrN_2O_3S$: C, 43.22; H, 4.74; N, 7.75; S, 8.87; Br, 22.12. Found: C, 43.06; H, 4.80; N, 7.66; S, 8.68; Br, 22.03.

S-(2-Oxotetrahydrofuran-3-yl)-N-phenyl-N′-ethyl isothiuronium bromide (2m). Yield: 1.3g (75%); m.p. 144–146°C. *Anal.* Calcd. for $C_{13}H_{17}BrN_2O_2S$: C, 45.23; H, 4.96; N, 8.11; S, 9.29; Br, 23.14. Found: C, 45.43; H, 5.08; N, 7.96; S, 9.10; Br, 23.14.

5-(2-Hydroxyethyl)-2-phenyliminothiazolidin-4-ones (3a-n); General Procedure. Isothiuronium salts (2 mmol) were dissolved in a minimum amount of aqueous ammonia (25%) and solution was stirred until precipitation of products. Crude products (yields 80–90%) were filtered off and recrystallized from water. Isothiuronium salts **2k–m** were quite insoluble in aqueous ammonia and stirring of suspension gave an oil which was extracted by dichloromethane. Extract was dried and evaporated to give oil solid which was characterized.

5-(2-Hydroxyethyl)-2-(phenylimino)-1,3-thiazolidin-4-one (3a). Yield: 0.44g (94%); m.p. 123–124°C; ^{1}H NMR (500 MHz): δ = 1.79 and 2.26 (2 × m, 2H, CH_2), 3.45 (m, 2H, OCH_2), 4.29 (m, 1H, S—CH), 4.74 (m, 1H, OH), 7.00 and 7.72 (2 × m, 2H, Ar H-2,6), 7.12 (m, 1H, Ar H-4), 7.36 (m, 2H, Ar H-3,5), 11.14, and 11.71 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 36.0 and 36.6 (CH_2), 47.7 and 52.1 (S—CH), 58.8 and 59.6 (O—CH_2), 120.5 and 121.6 (Ar C-2,6), 124.7 and 124.8 (Ar C-4), 129.1 and 129.4 (Ar C-3,5), 138.9 and 146.8 (Ar C-1), 177.5 and 178.5 (C=N), 190.6 (C=O). *Anal.* Calcd. for $C_{11}H_{12}N_2O_2S$: C, 55.91; H, 5.12; N, 11.86; S, 13.57. Found: C, 56.13; H, 5.32; N, 11.62; S, 13.35. EI-MS: *m/z* 236 [M^+], 218 [M^+—H_2O], 205, 192, 160, 151, 145, 135, 118 (100 %), 109, 101, 91, 77, 71, 65, 59, 51.

5-(2-Hydroxyethyl)-2-[(4-methoxyphenyl)imino]-1,3-thiazolidin-4-one (3b). Yield: 0.48g (91%); m.p. 124–126°C; ^{1}H NMR (500 MHz): δ = 1.76 and 2.27 (2 × m, 2H, CH_2), 3.52 (m, 2H, OCH_2), 3.74 (s, 3H, OCH_3), 4.26 (dt, *J* = 11.8 and 3.5 Hz, 1H, S—CH), 4.73 (m, 1H, OH), 6.94 (m, 2H, Ar H-3,5), 6.99 and 7.60 (2 × m, 2H, Ar H-2,6), 11.02 and 11.56 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 36.0 and 36.5 (CH_2), 48.4 and 52.0 (S—CH), 55.2 (OCH_3), 58.8 and 59.5 (O—CH_2), 114.0 and 114.4 (Ar C-3,5), 121.9 and 123.3 (Ar C-2,6), 131.9 (Ar C-1), 156.2 and 156.7 (Ar C-4), 176.6 (C=N), 190.3 (C=O). *Anal.* Calcd. for $C_{12}H_{14}N_2O_3S$: C, 55.12; H, 5.30; N, 10.52; S, 12.04. Found: C, 55.24; H, 5.26; N, 10.64; S, 12.01. EI-MS: *m/z* 266 [M^+], 248 [M—H_2O], 235, 222, 207, 191, 175, 165, 148, 133 (100%), 118, 105, 90, 78, 63, 55, 41.

5-(2-Hydroxyethyl)-2-[(4-methylphenyl)imino]-1,3-thiazolidin-4-one (3c). Yield: 0.43g (87%); m.p. 124–126°C; ^{1}H NMR (500 MHz): δ = 1.79 and 2.30 (2 × m, 2H, CH_2), 2.27 (s, 3H, CH_3), 3.52 (m, 2H, OCH_2), 4.27 (m, 1H, S—CH), 4.75 (m, 1H, OH), 6.91 and 7.14 (2 × AA′XX′, 2H, Ar H-2,6), 7.15 and 7.59 (2 × AA′XX′, 2H, Ar H-3,5), 11.08 and 11.64 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 20.3 (CH_3), 36.1 and 36.7 (CH_2), 48.1 and 52.1 (S—CH), 58.9 and 59.7 (O—CH_2), 120.4 and 121.7 (Ar C-2,6), 129.5 and 129.8 (Ar C-3,5), 134.0 (Ar C-4), 136.5 and 143.3 (Ar C-1), 177.1 and 179.4 (C=N), 190.6 (C=O). *Anal.* Calcd. for $C_{12}H_{14}N_2O_2S$: C, 57.58; H, 5.64; N, 11.19; S, 12.81. Found: C, 57.59; H, 5.69; N, 10.93; S, 12.74.

5-(2-Hydroxyethyl)-2-[(4-chlorophenyl)imino]-1,3-thiazolidin-4-one (3d). Overall yield: 1.7g (97%); m.p. 136–137°C; ^{1}H NMR (500 MHz): δ = 1.79 and 2.25 (2 × m, 2H, CH_2), 3.52 (m, 2H, OCH_2), 4.31 (m, 1H, S—CH), 4.75 (bs, 1H, OH), 6.96 and 7.37 (2 × AA′XX′, 2H, Ar H-2,6), 7.42 and 7.77 (2 × AA′XX′, 2H, Ar H-3,5), 11.26 and 11.80 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 35.8 and 36.5 (CH_2), 47.5 and 52.2 (S—CH), 58.7 and 59.6 (O—CH_2), 122.0 and 123.3 (Ar C-2,6), 128.6 (Ar C-4), 129.1 and 129.3 (Ar C-3,5), 137.1 and 146.7 (Ar C-1), 177.4 and 177.7 (C=N), 190.5 (C=O). *Anal.* Calcd. for $C_{11}H_{11}ClN_2O_2S$: C, 48.80; H, 4.10; N, 10.35; S, 11.84; Cl, 13.10. Found: C, 49.01; H, 4.27; N, 10.08; S, 11.60; Cl, 12.94.

5-(2-Hydroxyethyl)-2-[(4-bromophenyl)imino]-1,3-thiazolidin-4-one (3e). Overall yield: 1.21g; (61%) m.p. 140–141°C; ^{1}H NMR (500 MHz): δ = 1.81 and 2.26 (2 × m, 2H, CH_2), 3.50 (m, 2H, OCH_2), 4.31 (m, 1H, S—CH), 4.77 (bs, 1H, OH), 6.91 and 7.51 (2 × AA′XX′, 2H, Ar H-2,6), 7.56 and 7.67 (2 × AA′XX′, 2H, Ar H-3,5), 11.37 and 11.70 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 35.8 and 36.5 (CH_2), 47.5 and 52.1 (S—CH), 58.7 and 59.6 (O—CH_2), 116.7 (Ar C-4), 122.4 and 123.7 (Ar C-2,6), 132.0 and 132.3 (Ar C-3,5), 138.3 and 147.1 (Ar C-1), 176.6 (C=N), 190.6 (C=O). *Anal.* Calcd. for $C_{11}H_{11}BrN_2O_2S$: C, 41.92; H, 3.52; N, 8.89; S, 10.17; Br, 25.35. Found: C, 41.93; H, 3.71; N, 8.78; S, 10.40; Br, 24.98.

5-(2-Hydroxyethyl)-2-[(3-trifluoromethylphenyl)-imino]-1,3-thiazolidin-4-one (3f). Overall yield: 1.02g (53%); m.p. 130–131°C; ^{1}H NMR (500 MHz): δ = 1.83 and 2.26 (2 × m, 2H, CH_2), 3.52 (m, 2H, OCH_2), 4.34 (d, *J* = 6.0 Hz, 1H, S—CH), 4.78 (m, 1H, OH), 7.24 (m, 1H, Ar H-6), 7.48 (m, 1H, Ar H-4), 7.60 (m, 1H, Ar H-5), 7.89 and 8.22 (2 × m, 1H, Ar H-2), 11.02 and 11.56 (2 × bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 35.6 and 36.4 (CH_2), 47.4 and 52.2 (S—CH), 58.6 and 59.6 (O—CH_2), 124.1 (q, *J* = 272 Hz, CF_3), 130.1 (q, *J* = 31.6 Hz, Ar C-3), 116.6 and 121.1 (Ar C-2), 117.8 and 120.8 (Ar C-5), 124.0 and 130.5 (Ar C-4), 125.2 and 130.6 (Ar C-6), 139.6 and 149.1 (Ar C-1), 176.9 and 178.3 (C=N), 190.6 (C=O). *Anal.* Calcd. for $C_{12}H_{11}F_3N_2O_2S$: C, 47.37; H, 3.64; N, 9.21; S, 10.54. Found: C, 47.56; H, 3.67; N, 9.42; S, 10.31.

5-(2-Hydroxyethyl)-2-[(2-pyridyl)imino]-1,3-thiazolidin-4-one (3g). Overall yield: 1.34g (84%); m.p. 187–188°C; ^{1}H NMR (500 MHz): δ = 1.82 and 2.22 (2 × m, 2H, CH_2), 3.58 (m, 2H, OCH_2), 4.10 (d, *J* = 7.0 Hz, 1H, S—CH), 4.78 (bs, 1H, OH), 7.11 (m, 2H, Ar H-4,6), 7.82 (m, 1H, Ar H-5), 8.42 (m, 1H, Ar H-3), 11.93 (bs, 1H, NH); ^{13}C NMR (125 MHz): δ = 35.9 (CH_2), 47.2 (S—CH), 58.9 (O—CH_2), 118.2 (Ar C-6), 119.8 (Ar C-4), 138.7 (Ar C-5), 146.9 (Ar C-3), 156.2 (Ar C-1), 165.3 (C=N), 180.7 (C=O). *Anal.* Calcd. for $C_{10}H_{11}N_3O_2S$: C, 50.62; H, 4.67; N, 17.71; S, 13.41. Highly efficient, practical and convenient synthesis of twelve compounds by the [3+2] 1, 3-dipolar cycloaddition reaction of norcantharidin derivatives of substituted aromatic amines with two hydrazines in the presence of chloramine-T.

J. Heterocyclic Chem., **46**, 640 (2009).

INTRODUCTION

Cantharidin (Figure 1), the principle active ingredient of Mylabris, a compound that has been used in China as a medicinal agent for 2000 years and for the treatment of cancer, particularly hepatoma [1]. Cantharidin is potentially attractive for the treatment of leukemia because it does not cause myelosuppression [2,3] and is effective against cells exerting the multidrug resistance phenotype [4]. Despite such qualities, the nephrotoxicity of cantharidin has prevented it from entering mainstream oncology. Norcantharidin (NCTD, Figure 1), the demethylated analogue of cantharidin, also possesses anticancer activity and stimulates the bone marrow, but without the urinary toxicity. Both agents are known protein phosphatase 1 (PP1) and protein phosphatase 2A (PP2A) inhibitors [5]. Pyrazoles [6,7] have been the subject of chemical and biological studies due to their interesting pharmacology including antipyretic, analgesic, anti-inflammatory potential herbicidal, fungicidal and leishmanicidal [8–11] properties. Stimulated by these findings, we combine pyrazoles with norcantharidin derivatives in one single molecule through 1,3-dipolar cycloaddition and we have successfully synthesized some compounds before [12]. With our sustained interest in the synthesis of norcantharidin derivatives we have achieved a facile 1,3-dipolar cycloaddition method by the use of chloramines-T. Chloramine-T, a versatile reagent in organic synthesis [13], was used in this article to generate nitrilimines *in situ* from hydrazines. Such type of compounds (Table 1) with versatile activities

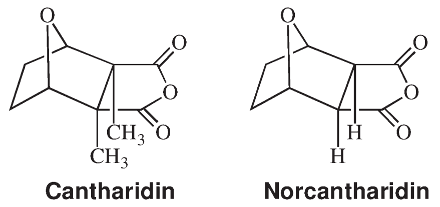

Figure 1. Chemical structures of cantharidin and noncantharidin.

may be of interest in chemistry, biochemistry and pharmacology [14].

RESULTS AND DISCUSSION

The precursor 5,6-dehydronorcantharidian derivatives **3a-3f** were synthesized by ‘‘one pot’’ method in good yield (Scheme 1) [12].

In this article, we have carried out the [4+2] cycloaddition of furan to maleic anhydride to obtain 5,6-dehydronorcantharidin **1**, then by "one pot" method, 5,6-dehydronorcantharidin reacted with substituted phenylamine **2a-2f** to give compounds **3a-3f**, after that, we carried out the [3+2] cycloaddition of **3a-3f** with **4**, **5** in the presence of chloramine-T respectively to obtain the target compounds **6a-6f**, **7a-7f** efficiently.

To identify the configuration of the pyrazoline with norcantharidin adducts (**6a-6f**, **7a-7f**), we have studied selective ^{1}H-^{1}HCOSY spectra, NOESY spectra of the compounds (take the example of **6a**). The exo-adduct (**6a-6f**, **7a-7f**) showed characteristic coupling for the bridge-head proton in the 400 MHz NMR spectrum which indicate that the protons involved are attached to the vicinal proton,[1] H-^{1}HCOSY spectrum showed cross peaks between C_2—H and C_3—H; between C_5—H and C_6—H; NOESY spectrum showed cross peaks between C_1—H and C_2—H; C_1—H and C_4—H; C_2—H and C_3—H; C_3—H and C_4—H; C_2—H and C_6—H; between C_3—H and C_5—H. This proves that the six protons are near in space and on the same side. The Diels-Alder adduct of furan with maleic anhydride has been shown to have the exo configuration exclusively; the endo isomer has never been reported [11]. This information combined with ^{1}H-^{1}HCOSY spectra and NOESY spectra data give us a definite configuration as we have proved before [12].

EXPERIMENTAL

Melting points were obtained on a B-540 Bűchi melting point apparatus and were uncorrected. ^{1}H NMR spectra were recorded on a Brucker AM-400 M Hz spectrometer with

“One-pot” method for the preparation of 3-acetyl-7-oxa-bicyclo[2.2.1]hept-5-ene-2-carboxylic acid phenylamide 3a-3f. All this work we have done before [12].

General procedure for the preparation of the pyrazole-linked norcantharidin derivatives of substituted aromatic amines (6a-6f, 7a-7f). To a solution of 3-acetyl-7-oxa-bicyclo [2.2.1] hept-5-ene-2-carboxylic acid phenylamide **3a** (1 mmole) and 2-phenyl-4-((2-phenylhydrazono) methyl)-2H-1, 2, 3-triazole **4** (1 mmole) in ethanol (20 mL), add chloramine T (1.2 mmole) and the reaction mixture was refluxed in ethanol for 3–8 h which were monitored by thin-layer chromatography. Then washed with water (30 mL) and extracted with dichloromethane (30 mL). The extracts were dried over anhydrous sodium sulfate, concentrated *in vacuum* and the residue was recrystallized from menthol to give the compound **6a**. The synthesis of compounds **6b-6f, 7a-7f** was performed using the same method.

An efficient, convenient, one-pot synthesis of 2,4(1*H*,3*H*)-quinazolinediones and 2-thioxoquinazolinones was accomplished in good yields *via* the novel reductive cyclization of ethyl 2-nitrobenzoates with isocyanates or isothiocyanates mediated by $TiCl_4$/Zn system.

J. Heterocyclic Chem., **46**, 645 (2009).

INTRODUCTION

It has been reported that quinazolinones show antihypertonic, antirheumatic, antianaphylactic, antiasthmatic, tranquilizing, neuro-stimulating, and benzodiazepine binding activity [1,2]. The quinazolindione moiety, in particular, is widely found in natural purine based, alkaloids and many biologically active compounds [3]. For example, 3-substituted quinazolinones, such as SGB-1534 (**1**) and ketanserin (**2**) have been found to have antihypertensive activities mediated *via* α-adrenoceptor and serotonic receptor anatgonism [4], respectively. 6,7-Dimethoxy-1*H*-quinazoline-2,4-dione is a key intermediate for the production of the following medicines (Prazosin (Minipress) [5], Bunazosin (Detantol) [5], and Doxazosin (Cardenalin) [5]. 7-Chloro-1*H*-quinazoline-2,4-diones is also a key intermediate for the production of the medicines such as FK366 [6] and KF31327 [7].

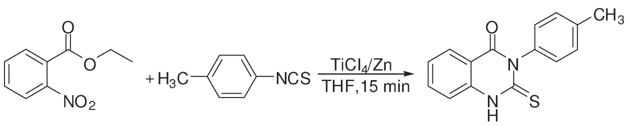
The quinazolinedione ring system can generally be prepared by the reaction of anthranilic acid with urea [8], anthranilamide with phosgene [9], and anthranilic acid with potassium cyanate [10] or chlorosulfonyl isocyanate [11]. However, these synthetic methods are considerably limited because of the usage of drastic conditions and uneasily starting materials. Different solid-phase combinatorial synthesis of quinazolinediones was reported in recent years, but these methods need long reaction times, multiple steps, or both [12]. Carbon dioxide reacted with 2-aminobenzonitriles assisted by excess amount of DBU or DBN to give corresponding 1*H*-quinazoline-2,4-diones has been reported [13]. However, the reaction time is too long (24 h). A recent report details the preparation of 2,4(1*H*,3*H*)-quinazolinediones and 2-thioxoquinazolines assisted by microwave [14], but the yields of this protocol were a little lower. It is found that all the methods mentioned earlier used amino-compounds other than nitro-compounds as starting materials. Therefore, we became interested in developing a novel and convenient synthetic method for the preparation of quinazolinedione derivatives start with nitro-compounds. Our initial studies showed that successful synthesis of various quinazolinediones from 2-nitrobenzamides and triphosgene [15]. As part of our ongoing research for novel synthesis of quinazolinediones derivatives, herein, we describe a new one-pot synthesis of quinazolinedione derivatives by treating ethyl *o*-nitrobenzoates with isothiocyanates or isocyanates under low-valent titanium reagent ($TiCl_4$/Zn).

RESULTS AND DISCUSSION

On the basis of our previous experience, we selected ethyl 2-nitrobenzoate **1a** and the 4-methylphenyl isothiocyanate **2a** as model substrates to optimize the experimental conditions for the proposed reductive cyclization reaction (Scheme 1). The results are summarized in Table 1.

As shown in Table 1, we briefly examined the effect of different temperatures and ratio of **1a**:$TiCl_4$/Zn. The

Scheme 1



1a **2a** **3a**

results obtained from these experiments indicated that the reaction temperatures had a significant influence on the success of this reaction. At room temperature or 40°C, no expected compound was detected (Table 1, entries 1 and 2). To our delight at refluxed the reaction proceeded smoothly in high yield (entry 4). To further evaluate the influence of the ratio of **1a**:$TiCl_4$/Zn, this reaction was carried out with different ratio. From the results it is obvious that the best ratio is 1:3.

Having established an optimal condition for the protocol, we performed a more detailed examination of the substrates. Thus, the behavior of a variety of substrates, which include different ethyl 2-nitrobenzoates as well as different isothiocyanates or isocyanates, was examined.

First of all, we performed the reaction of a variety of ethyl 2-nitrobenzoates **1** and isothiocyanates **2** *via* $TiCl_4$/Zn system (Scheme 2, Table 2).

As shown in Table 2, it can be seen that this protocol can be applied not only to aliphatic isothiocyanates but also to aromatic isothiocyanates with either electron-withdrawing groups (such as halide groups) or electron-donating groups (such as alkyl groups) under the same conditions. Furthermore, it was particularly noteworthy that the effects of substituted ethyl 2-nitrobenzoates were also investigated. 4-Chloro and 3-methyl substitution can also give moderate to good yields. However, the reductive cyclization was hindered by severe steric hindrance. For instance, no expected product was obtained when ethyl 2-nitrobenzoate was reacted with 2,6-di-*i*-pr-substituted aryl isothiocyanate.

A second part of the research was designed to synthesize quinazoline-2,4(1*H*,3*H*)-diones *via* the novel reductive cyclization of ethyl 2-nitrobenzoates with isocyanates under the same reaction conditions (Scheme 3, Table 3).

Table 1

Optimization for the reductive cyclization reaction.

Entry	Temperature (°C)	Ratio[a]	Isolated yield (%)
1	r.t.	1:3	0
2	40	1:3	0
3	60	1:3	10
4	Reflux	1:3	93
5	Reflux	1:1	0
6	Reflux	1:2	57
7	Reflux	1:4	83
8	Reflux	1:5	80

[a] Ratio of **1** and $TiCl_4$/Zn system.

Similarly, aryl isocyanates containing electron-donating and electron-withdrawing substituents were reacted well with ethyl 2-nitrobenzoate, therefore, we can conclude that the electronic nature of the substituents has no significant effect on this reaction, but severe steric hindrance still play an important part in this reaction. Good yields were also obtained when 3-methyl or 4-Cl-substituted ethyl 2-nitrobenzoates were used. Meanwhile, it was found that isocyanates showed similar reactivity trends with isothiocyanates.

The structures of products **3** and **5** were confirmed by IR, ^{1}H NMR, ^{13}C NMR, and HRMS.

In conclusion, a series of quinazoline-2,4(1*H*,3*H*)-diones and 2-thioxoquinazolinones were synthesized induced by low-valent titanium reagent ($TiCl_4$/Zn). The protocol has been used for nitro-compounds other than amino-compounds as starting materials, which is very economic. Meanwhile, a variety of substrates can participate in the procedure with good yields. Furthermore, this method still has the advantages of short reaction time and convenient manipulation.

EXPERIMENTAL

THF was distilled from sodium-benzophenone immediately before use. All reactions were conducted under N_2 atmosphere. Melting points are uncorrected. IR spectra were recorded on Varian F-1000 spectrometer in KBr with absorptions in cm^{-1}. ^{1}H and ^{13}C NMR were determined on Varian-400 MHz spectrometer in DMSO-d_6 solution. *J* values are in Hz. Chemical shifts are expressed in ppm downfield from internal standard TMS.

General procedure for synthesis of thioxoquinazolineones 3. $TiCl_4$ (0.3 mL, 3 mmol) was added dropwise using a syringe to a stirred suspension of zinc powder (0.384 g, 6 mmol) in freshly distilled anhydrous THF (10 mL) at RT under a dry N_2 atmosphere. After completion of the addition, the mixture was refluxed for 2 h. The suspension of the low-valent titanium reagent formed was cooled to RT and a solution of ethyl 2-nitrobenzoates (1 mmol) and isothiocycanates (1 mmol) in THF (5 mL) was added dropwise. The reaction mixture was then refluxed for 15 min under N_2. After this period, the TLC analysis of the mixture showed the reaction to be completed. The reaction mixture was quenched with 5% HCl (15 mL) and extracted with $ClCH_2CH_2Cl$ (3 × 20 mL). The combined extracts were washed with water (3 × 20 mL) and dried over anhydrous Na_2SO_4. After evaporation of the solvent under reduced pressure, the crude product was purified by recrystallization from 95% ethanol.

[a] Isolated yield.

2-Thioxo-3-*p*-tolyl-2,3-dihydroquinazolin-4(1*H*)-one (3a). This compound was obtained as solid with mp >300°C (ref. 16; 304°C); IR (KBr) ν: 3244, 1661, 1621, 1532, 1488, 1408, 1269, 1232, 1200, 1023, 990, 807, 759, 709, 692 cm^{-1}. ^1H NMR (DMSO-d_6): 2.37 (s, 3H, CH_3), 7.13–7.15 (m, 2H, ArH), 7.26–7.28 (m, 2H, ArH), 7.35 (t, $J = 7.6$ Hz, 1H, ArH), 7.43–7.45 (m, 1H, ArH), 7.76–7.80 (m, 1H, ArH), 7.94–7.96 (m, 1H, ArH), 13.03 (s, 1H, NH).

3-Phenyl-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3b). This compound was obtained as solid with mp >300°C (ref. 17; 307°C); IR (KBr) ν: 3245, 1661, 1622, 1532, 1487, 1406, 1266, 1105, 988, 759, 691 cm^{-1}. ^1H NMR (DMSO-d_6): 7.26–7.28 (m, 2H, ArH), 7.33–7.37 (m, 1H, ArH), 7.38–7.42 (m, 1H, ArH), 7.45–7.50 (m, 3H, ArH), 7.76–7.80 (m, 1H, ArH), 7.96 (t, $J = 7.6$ Hz, 1H, ArH), 12.99 (s, 1H, NH).

2-Thioxo-3-*m*-tolyl-2,3-dihydroquinazolin-4(1*H*)-one (3c). This compound was obtained as solid with mp 282–284°C (ref. 18; 286–289°C); IR (KBr) ν: 3246, 1665, 1622, 1530, 1488, 1403, 1270, 1238, 1203, 913, 798, 772, 691 cm^{-1}.

3-Benzyl-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3d). This compound was obtained as solid with mp 233–234°C (ref. 19; 230–231°C); IR (KBr) ν: 3198, 3130, 1650, 1622, 1533, 1487, 1426, 1403, 1340, 1170, 1147, 1074, 958, 754, 707, 691 cm^{-1}.

7-Chloro-3-phenyl-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3e). This compound was obtained as solid with mp 286–288°C (ref. 20; 289 °C); IR (KBr) ν: 3185, 1661, 1616, 1528, 1479, 1385, 1337, 1276, 1260, 1217, 1191, 1123, 1075, 925, 861, 845, 751, 692 cm^{-1}. ^1H NMR (DMSO-d_6): 7.27–7.29 (m, 2H, ArH), 7.38–7.51 (m, 5H, ArH), 7.94–7.96 (m, 1H, ArH), 13.09 (s, 1H, NH).

7-Chloro-3-(4-chlorophenyl)-2-thioxo-2,3-dihydroqui-nazolin-4(1*H*)-one (3f). This compound was obtained as solid with mp 274–276°C (ref. 20; 273°C); IR (KBr) ν: 3195, 1657, 1617, 1530, 1491, 1386, 1279, 1257, 1219, 1193, 1090, 1022, 992, 924, 856, 815, 756, 680 cm^{-1}.

7-Chloro-2-thioxo-3-*m*-tolyl-2,3-dihydroquinazolin-4(1*H*)-one (3g). This compound was obtained as solid with mp 230–231°C (ref. 21; 230–232°C); IR (KBr) ν: 3193, 1659, 1617, 1525, 1479, 1385, 1258, 1192, 926, 880, 781, 757, 696 cm^{-1}. ^1H NMR (DMSO-d_6): 2.34 (s, 3H, CH_3), 7.06–7.08 (m, 2H, ArH), 7.21–7.23 (m, 1H, ArH), 7.34–7.38 (m, 2H, ArH), 7.44–7.45 (m, 1H, ArH), 7.93 (t, $J = 8.4$ Hz, 1H, ArH), 13.06 (s, 1H, NH). ^{13}C NMR (DMSO-d_6): 20.84, 114.99, 115.14, 124.39, 125.92, 128.77, 128.90, 129.16, 129.56, 133.31, 138.95, 139.92, 140.43, 159.13, 176.49.

HRMS [Found: m/z 302.0281 (M^+), calcd for $C_{15}H_{11}N_2OS^{35}Cl$: M, 302.0281].

3-Benzyl-7-chloro-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3h). This compound was obtained as solid with mp 258–260°C (ref. 21; 255–257°C); IR (KBr) ν: 3204, 1652, 1616, 1528, 1481, 1431, 1385, 1334, 1307, 1289, 1254, 1163, 1150, 1075, 948, 917, 862, 761, 726, 698 cm^{-1}. ^1H NMR (DMSO-d_6): 5.65 (s, 2H, CH_2), 7.22–7.26 (m, 1H, ArH), 7.28–7.33 (m, 4H, ArH), 7.37–7.40 (m, 1H, ArH), 7.44 (s, 1H, ArH), 7.96 (t, $J = 8.4$ Hz, 1H, ArH), 13.08 (s, 1H, NH).

HRMS [Found: m/z 302.0293 (M^+), calcd for $C_{15}H_{11}N_2OS^{35}Cl$: M, 302.0281].

8-Methyl-3-phenyl-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3i). This compound was obtained as solid with mp 152–153°C; IR (KBr) ν: 3263, 1692, 1617, 1524, 1492, 1469, 1409, 1240, 1213, 1090, 1016, 987, 795, 757, 735, 691 cm^{-1}. ^1H NMR (DMSO-d_6): 2.12 (s, 3H, CH_3), 6.15 (s, 2H, ArH), 6.57 (t, $J = 7.6$ Hz, 1H, ArH), 7.15 (d, $J = 7.2$ Hz, 1H, ArH), 7.38 (t, $J = 8.8$ Hz, 1H, ArH), 7.51 (d, $J = 7.6$ Hz, 1H, ArH), 7.65–7.69 (m, 1H, ArH), 8.04 (dd, $J_1 = 2.4$ Hz, $J_2 = 6.8$ Hz, 1H, ArH), 10.19 (s, 1H, NH). ^{13}C NMR (DMSO-d_6): 17.67, 114.57, 116.52, 116.74, 120.67, 120.73, 121.82, 123.18, 126.55, 133.19, 136.57, 147.77, 168.38.

HRMS [Found: m/z 268.0670 (M^+), calcd for $C_{15}H_{12}N_2OS$: M, 268.0670].

3-(4-Chlorophenyl)-8-methyl-2-thioxo-2,3-dihydroquinazolin-4(1*H*)-one (3j). This compound was obtained as solid with mp 182–184°C; IR (KBr) ν: 3060, 1705, 1617, 1514, 1404, 1247, 1213, 1165, 1075, 808, 762, 701 cm^{-1}. ^1H NMR (DMSO-d_6): 2.57 (s, 3H, CH_3), 7.24–7.28 (m, 1H, ArH), 7.33–7.35 (m, 2H, ArH), 7.54–7.56 (m, 2H, ArH), 7.62 (d, J = 8.0 Hz, 1H, ArH), 7.83 (d, J = 7.6 Hz, 1H, ArH), 11.90 (s, 1H, NH). ^{13}C NMR (DMSO-d_6): 17.44, 116.56, 124.26, 124.58, 125.32, 129.04, 131.01, 132.69, 136.88, 138.03, 138.45, 159.79, 176.29.

HRMS [Found: m/z 302.0281 (M^+), calcd for $C_{15}H_{11}N_2OS^{35}Cl$: M, 302.0281].

General procedure for synthesis of quinazolinedione 5. $TiCl_4$ (0.3 mL, 3 mmol) was added dropwise using a syringe to a stirred suspension of zinc powder (0.384 g, 6 mmol) in freshly distilled anhydrous THF (10 mL) at RT under a dry N_2 atmosphere. After completion of the addition, the mixture was refluxed for 2 h. The suspension of the low-valent titanium reagent formed was cooled to RT and a solution of ethyl 2-nitrobenzoates (1 mmol) and isocyanates (1 mmol) in THF (5 mL) was added dropwise. The reaction mixture was then refluxed for 15 min under N_2. After this period, the TLC analysis of the mixture showed the reaction to be completed. The reaction mixture was quenched with 5% HCl (15 mL) and extracted with $ClCH_2CH_2Cl$ (3 × 20 mL). The combined extracts were washed with water (3 × 20 mL) and dried over anhydrous Na_2SO_4. After evaporation of the solvent under reduced pressure, the crude product was purified by recrystallization from 95% ethanol.

3-(4-Chlorophenyl)quinazoline-2,4(1*H*,3*H*)-dione (5a). This compound was obtained as solid with mp 298–299°C (ref. 22; 301–302°C); IR (KBr) ν: 3201, 3070, 2938, 1732, 1674, 1493, 1448, 1406, 1282, 1156, 1090, 1016, 872, 825, 757, 741, 688 cm^{-1}. ^1H NMR (DMSO-d_6): 7.23 (d, J = 7.2 Hz, 2H, ArH), 7.38–7.39 (m, 2H, ArH), 7.54–7.55 (m, 2H, ArH), 7.71 (t, J = 8.0 Hz, 1H, ArH), 7.95 (d, J = 8.0 Hz, 1H, ArH), 11.59 (s, 1H, NH).

3-(3-Chlorophenyl)quinazoline-2,4(1*H*,3*H*)-dione (5b). This compound was obtained as solid with mp 265–266°C (ref. 23; 260.5–261.5°C); IR (KBr) ν: 3248, 3204, 3065, 2938, 1734, 1652, 1594, 1493, 1437, 1400, 1340, 1275, 1168, 731, 688 cm^{-1}. ^1H NMR (DMSO-d_6): 7.22–7.25 (m, 2H, ArH), 7.33–7.35 (m, 1H, ArH), 7.51–7.52 (m, 3H, ArH), 7.71 (t, J = 8.0 Hz, 1H, ArH), 7.94 (d, J = 8.0 Hz, 1H, ArH), 11.61 (s, 1H, NH).

3-*p*-Tolylquinazoline-2,4(1*H*,3*H*)-dione (5c). This compound was obtained as solid with mp 260–262°C (ref. 24; 265–266°C); IR (KBr) ν: 3199, 3129, 3069, 3005, 1721, 1665, 1608, 1512, 1490, 1448, 1288, 1153, 1023, 869, 815, 791, 754 cm^{-1}. ^1H NMR (DMSO-d_6): 2.37 (s, 3H, CH_3), 7.10–7.19 (m, 2H, ArH), 7.21–7.24 (m, 2H, ArH), 7.27–7.29 (m, 2H, ArH), 7.68–7.72 (m, 1H, ArH), 7.93 (d, J = 7.2 Hz, 1H, ArH), 11.54 (s, 1H, NH).

3-*m*-Tolylquinazoline-2,4(1*H*,3*H*)-dione (5d). This compound was obtained as solid with mp 256–258°C (ref. 23; 252–252.6°C); IR (KBr) ν: 3255, 1721, 1668, 1620, 1607, 1490, 1433, 1398, 1272, 1157, 922, 812, 785, 758, 697 cm^{-1}. ^1H NMR (DMSO-d_6): 2.36 (s, 3H, CH_3), 7.10–7.13 (m, 2H, ArH), 7.22–7.25 (m, 3H, ArH), 7.37 (t, J = 7.6 Hz, 1H, ArH), 7.71 (t, J = 8.0 Hz, 1H, ArH), 7.94 (d, J = 8.0 Hz, 1H, ArH), 11.56 (s, 1H, NH).

7-Chloro-3-(3-chlorophenyl)quinazolinee-2,4(1*H*,3*H*)-dione (5e). This compound was obtained as solid with mp >300°C (ref. 23; 312°C); IR (KBr) ν: 3232, 3188, 1736, 1656, 1616, 1594, 1480, 1432, 1370, 1169, 1089, 945, 867, 837, 759, 718 cm^{-1}. ^1H NMR (DMSO-d_6): 7.25–7.35 (m, 3H, ArH), 7.52–7.53 (m, 3H, ArH), 7.95 (d, J = 8.4 Hz, 1H, ArH), 11.74 (s, 1H, NH).

7-Chloro-3-*m*-tolylquinazoline-2,4(1*H*,3*H*)-dione (5f). This compound was obtained as solid with mp >300°C (ref.17; >300°C); IR (KBr) ν: 3230, 3185, 1736, 1652, 1593, 1429, 1370, 1262, 1159, 1089, 944, 871, 815, 726, 702 cm^{-1}. ^1H NMR (DMSO-d_6): 2.35 (s, 3H, CH_3), 7.10–7.13 (m, 2H, ArH), 7.24–7.29 (m, 3H, ArH), 7.37 (d, J = 7.6 Hz, 1H, ArH), 7.93–7.95 (m, 1H, ArH), 11.68 (s, 1H, NH).

3-(4-Chlorophenyl)-8-methylquinazoline-2,4(1*H*,3*H*)-dione (5g). This compound was obtained as solid with mp 282–284°C; IR (KBr) ν: 3327, 3233, 1721, 1655, 1534, 1493, 1405, 1225, 1092, 1059, 1019, 819, 760 cm^{-1}. ^1H NMR (DMSO-d_6): 2.39 (s, 3H, CH_3), 7.14 (t, J = 7.6 Hz, 1H, ArH), 7.33 (d, J = 8.8 Hz, 1H, ArH), 7.38–7.40 (m, 2H, ArH), 7.55–7.56 (m, 3H, ArH), 10.84 (s, 1H, NH).

HRMS [Found: m/z 286.0510 (M^+), calcd for $C_{15}H_{11}N_2O_2{}^{35}Cl$: M, 286.0509].

3-(3-Chlorophenyl)-8-methylquinazoline-2,4(1*H*,3*H*)-dione (5h). This compound was obtained as solid with mp 280–282°C; IR (KBr) ν: 3233, 3089, 1726, 1665, 1605, 1506, 1476, 1405, 1330, 1266, 1147, 1088, 898, 785, 753, 691 cm^{-1}. ^1H NMR (DMSO-d_6): 2.40 (s, 3H, CH_3), 7.15 (t, $J = 7.6$ Hz, 1H, ArH), 7.35–7.36 (m, 1H, ArH), 7.52–7.57 (m, 4H, ArH), 7.82 (d, $J = 8.0$ Hz, 1H, ArH), 10.86 (s, 1H, NH). ^{13}C NMR (DMSO-d_6): 17.87, 115.18, 123.01, 124.77, 126.06, 128.80, 128.96, 129.96, 131.08, 133.56, 136.94, 137.92, 138.85, 150.94, 150.97.

A series of 3-acyl-4-amino-1-aryl-1*H*-pyrazoles has been prepared by reaction of β-enaminones with benzenediazonium tetrafluoroborates substituted especially by fluorine-containing groups (F, CF_3, and OCF_3). The compounds prepared have been characterized by means of ^1H and ^{13}C NMR spectroscopy. In the case of reaction of 5-phenylaminohept-4-en-3-one with 2,6-dichloro-4-trifluoromethylbenzenediazonium tetrafluoroborate the product of azo coupling on phenylamino group of the corresponding pyrazole has been isolated and identified. The intermediate (4-(4-methoxyphenyldiazenyl)-5-methylaminohept-4-en-3-one) on the route from enaminone to pyrazole has been isolated.

J. Heterocyclic Chem., **46**, 650 (2009).

INTRODUCTION

Fluorinated heterocycles represent an important class of compounds. These compounds are widely used as agrochemicals, pharmaceuticals, fluorinated polymers, and catalysts [1]. It has been proved that the introduction of a CF_3 group into heterocycle often leads to enhancement of biological effect compared with a parent compound, probably due to high lipophilicity of perfluoralkyl groups [2].

Compounds containing pyrazole moiety rank among the compounds having broad spectrum of biological activity [3]. A number of fluorine-containing pyrazoles found application as insecticides [4] (e.g., fiproles), herbicides [4] (e.g., pyrasulfotole, fluazolate, azimsulfurone), and fungicides [4] (e.g., penthiopyrad). Pyrazole ring is also an important pharmacophore. Celecoxib [5] (Celebrex) is an example of fluorinated pyrazole used in human medicine for treatment of osteoarthritis, rheumatoid arthritis, acute pain, painful menstruation and menstrual symptoms, and to reduce numbers of colon and rectum polyps in patients with familial adenomatous polyposis. Pyrazole derivatives so-called scorpionates work as metal ligands with promising perspective in homogeneous catalysis [6,7].

Great practical usability of pyrazole derivatives is reflected in interest in their syntheses. Stanovnik and Svete [8] published a review of the synthetic methods leading to pyrazoles. Probably, the most used method for synthesis of pyrazole skeleton is reaction of hydrazines with 1,3-difunctional compounds [8]. A drawback of the methods is the possibility of formation of regioisomers in the case of using of unsymmetrical 1,3-difunctional compounds. Kumar et al. [9] published a review dealing with a synthesis of trifluoromethylpyrazoles by reaction of corresponding trifluoromethyl-β-diketones with hydrazines. Pyrazoles are also obtainable from enaminones [10].

Combination of enaminones and diazonium salts is useful for preparation of some heterocyclic systems: pyridazinones [11], pyridazinium salts [12,13], and some boron-containing heterocycles [14,15]. We also developed a method for synthesis of substituted 3-acyl-4-amino-1-aryl-1*H*-pyrazoles using reaction of β-enaminones with substituted benzenediazonium tetrafluoroborates [16]. Advantages of the method are mild reaction conditions and easy performance. The method is applicable for diazonium salts substituted by both electron-donating and electron-withdrawing groups. The aim of this study was to prepare and characterize some

potentially biologically active pyrazoles with one or more fluorine atoms at various places of molecule and to explore extension of its applicability for other substituents at the amino group of the starting β-enaminones.

RESULTS AND DISCUSSION

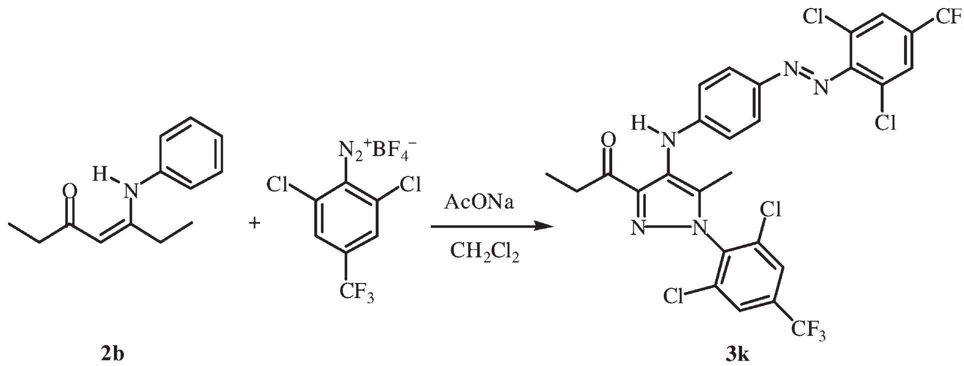
The pyrazoles have been synthesized according to the general Scheme 1. The starting components have been selected so that a series of the pyrazoles containing fluorine at various places of the molecule is prepared (fluorinated diazonium salts, diketones, and amines). For consideration of the applicability of the method some new amines for preparation of the β-enaminones have been used (aminoantipyrine, ethyl glycinate, 2-aminoethanol) and polysubstituted diazonium salt (from 2,6-dichloro-4-trifluoromethylaniline). For a review of the prepared pyrazoles see Scheme 1. Pyrazoles **3b,c,h** were prepared in relative good yields 65–79%. In the most cases, however, yields about 35% were obtained.

In the case of the reaction of 2,6-dichloro-4-trifluoromethylbenzenediazonium tetrafluoroborate with enaminone **2b**, a product of azo coupling on benzene ring of the group =C—NHC_6H_5 of pyrazole **3** has been isolated (Scheme 2). We have never observed formation of a product of this type for any previously used diazonium ions, including very reactive 4-nitrobenzenediazonium. Indeed 2,6-Dichloro-4-trifluoromethylbenzenediazonium is considerably more reactive than 4-nitrobenzenediazonium. For 2,6-dichloro-4-trifluoromethylbenzenediazonium was, from the kinetics of azo coupling with anion of pentane-2,4-dione, found the value [17] $\Sigma\sigma = 1.73$. Difference in the values of σ_p constants [18] between groups 4-NO_2 and 4-CF_3 is $\Delta\sigma = 0.24$, and the value of the reaction constant of azo coupling at position 4- of *N*,*N*-dimethylaniline is $\rho = 4.15$ [19] and at position 4- of *N*-methylaniline is $\rho = 3.98$ [20]. It results that, for azo coupling at position 4- of phenylamino group, 2,6-dichloro-4-trifluoromethylbenzenediazonium is about 10 times more reactive than 4-nitrobenzenediazonium.

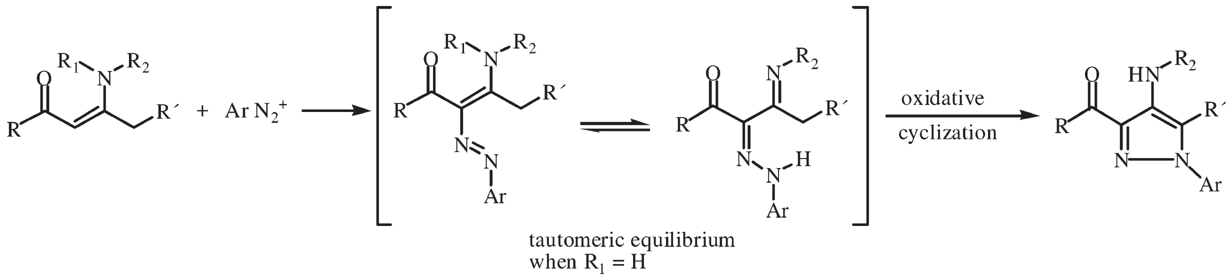
Because of no intermediate of the reaction has been detected, the sequence of the reaction stages of formation of the compound **3k** is unclear.

From the reaction mixture of enaminone **2g** and 4-methylbenzenediazonium tetrafluoroborate, only the

Scheme 2



Scheme 3



starting enaminone has been isolated after 24 h and no pyrazole was formed.

The mechanisms of the pyrazole formation by reaction of diazonium salts with β-enaminones is so far not clear. A hypothesis assumes the primary attack of diazonium ion at α-carbon of enaminone to form a product of azo coupling undergoing subsequently oxidative cyclization to pyrazole (Scheme 3). The hypothesis is supported by the fact that by the reaction of 5-methylaminohept-4-en-3-one (**2j**) with 4-methoxybenzenediazonium tetrafluoroborate at a molar ratio 1:1 of 4-methoxyphenyldiazenyl-5-methylaminohept-4-en-3-one (**4**) (tautomeric form assigned based on results of the structural study [21] performed for similar compounds) was isolated as the main product. Compound **4** exists in $CDCl_3$ solution as *Z* isomer (in analogy with similar compounds [21]) with traces of *E* isomer. Corresponding pyrazole **3i** was isolated as a by-product. Oxidative cyclization of hydrazones to pyrazoles by number of oxidative agents ($Pb(OAc)_4$, hypervalent iodine compounds, MnO_2...) is described in the literature [22–24]. An oxidative agent in the case of formation of pyrazoles **3** is unclear; it could be the second molecule of diazonium salt.

To eliminate possibility of oxidation of primarily formed azo compound (Scheme 3) by air oxygen, the reaction of enaminone **2b** with 4-fluorobenzenediazonium tetrafluoroborate has been performed in an inert atmosphere. After finishing the reaction, a test for diazonium salt was negative and pyrazole was isolated in 69% yield (without inert atmosphere 42.5%). Presence of fluorobenzene as a possible reduction product of diazonium salt in the reaction mixture has been proved by means of gas chromatography-mass spectrometry. Previously, anisol has been detected in the reaction of 4-methoxybenzenediazonium tetrafluoroborate with 3-phenylaminocyclopent-2-en-1-one [25].

The reaction of β-enaminones with benzenediazonium salts in a molar ratio of 1:2 is accompanied by a color change, i.e., after approximately 20–30 min the color of the reaction mixture changes from dark red to orange. When the reaction of 4-methoxybenzenediazonium tetrafluoroborate with 5-methylaminohept-4-en-3-one (**2j**) was stopped after the color change, the yield of pyrazole **3i** was 58%. Compound **4** was isolated in 18% yield. Gas chromatography-mass spectrometry analysis of the reaction mixture detected anisole. Extension of a reaction time to 2 h and subsequent ^{1}H NMR analysis of the reaction mixture proved pyrazole as practically a sole product.

CONCLUSIONS

The method developed and described by us [16] has been used for synthesis of pyrazole derivatives containing fluorine atoms. At the same time its usability in the case of presence of new nitrogen substitutions of the starting enaminone (2-hydroxyethyl, antipyrine-4-yl, pyrrolidine-1-yl, and ethoxycarbonylmethyl) was tested. While using 2,6-dichloro-4-trifluoromethylbenzenediazonium tetrafluoroborate, the product of attack of *N*-phenyl group of the starting enaminone has been isolated for the first time.

Attack of diazonium ion at α-carbon of β-enaminone has been proved to be the first step of our synthesis of pyrazoles. An oxidation agent is probably the second molecule of diazonium ion, being reduced to substituted benzene (4-fluorobenzenediazonium to fluorobenzene, 4-methoxybenzenediazonium to anisole). The mechanism of the pyrazole formation is currently under examination.

EXPERIMENTAL

Tetrahydrofuran (THF) was dried by refluxing with sodium benzophenone ketyl under inert atmosphere until blue–violet coloration took place. THF was freshly distilled under inert atmosphere before use. Dichloromethane was used commercially (Fluka), dried over molecular sieves, and stored in the bottle with Sure/Seal.

Diazonium tetrafluoroborates were freshly prepared before using standard procedures (diazotization of corresponding aniline and subsequent treatment of diazonium chloride by sodium tetrafluoroborate) and dried *in vacuo*. Anhydrous sodium acetate was purchased commercially and used without change.

NMR spectra were measured in $CDCl_3$ using the Bruker AVANCE 500 spectrometer operating at 500.13 MHz (^{1}H), 125.77 MHz (^{13}C).

Hexamethyldisiloxane was used as internal standard for ^{1}H ($\delta = 0.05$). The ^{13}C NMR spectra were standardized by means of the middle signal of the solvent multiplet ($\delta = 76.9$). The carbon spectra were measured by standard way with the broad-band decoupling of protons or by means of the APT pulse sequence.

Diketones **1a,b,d** and enaminones **2a,h,j** were prepared according to the procedure described in the literature [10]. Diketone **1c** was purchased commercially (Aldrich).

1,1,1-Trifluoro-6-methylheptane-2,4-dione (1e). The reaction has been performed in an inert atmosphere. Sodium hydride (9.6 g, 0.4 mol) and THF (240 mL) were added to a 500-mL four-necked flask equipped with reflux condenser, thermometer, magnetic stirrer, and dropping funnel. Methyl trifluoroacetate (25.61 g, 0.2 mol) was added dropwise for 30 min. Then, 4-methylpentane-2-one (20.03 g, 0.2 mol) was added under cooling for 30 min. The mixture was stirred under inert atmosphere at laboratory temperature overnight. Reaction was quenched by ethanol (10 mL) and the mixture was poured into a flask containing 10% HCl (120 mL). Aqueous layer was extracted by ethyl acetate (2 × 50 mL). Combined organic layers were washed by saturated aqueous sodium bicarbonate (1 × 150 mL), water (1 × 150 mL), and brine (1 × 150 mL), dried with sodium sulfate, and evaporated. Diketone has been purified through copper diketonate [16]. After complex decomposition by dilute sulfuric acid, the product was distilled, bp 153–154°C ([26] 136°C). Yield: 7.66 g (19.5%). ^{1}H NMR: δ 0.94 (d, 6H, J = 7.0 Hz, 2 × CH_3), 2.09 (sp, 1H, J = 6.5 Hz, CH), 2.26 (d, 2H, J = 7.5 Hz, CH_2), 5.87 (s, 1H, =C—H), 14.28 (brs, 1H, NH). ^{13}C NMR: δ 22.1 (CH_3), 26.3 (CH), 47.0 (CH_2), 96.0 (q, J = 1.8 Hz, =CH), 116.9 (q, J = 283.3, CF_3), 176.3 (q, J = 36.2 Hz, =C—OH), 196.3 (C=O).

5-Phenylaminohept-4-en-3-one (2b). A mixture of **1c** (6.61 g, 0.05 mol), aniline (4.65 g, 0.05 mol), and catalytic amount of TsOH in toluene (30 mL) has been boiled on an oil bath for 2.5 h. Reaction water was removed azeotropically. After completion of the reaction, volatile components were distilled off *in vacuo* and the rest was subjected to a vacuum distillation. Yield: 7.54 g (74%), bp 142–144°C/0.5 kPa. ^{1}H NMR: δ 1.04 (t, 3H, J = 7.5 Hz, CH_3), 1.13 (t, 3H, J = 7.5 Hz, CH_3), 2.31 (q, 2H, J = 7.5 Hz, CH_2), 2.36 (q, 2H, J = 7.5 Hz, CH_2), 5.20 (s, 1H, =C—H), 7.09–7.10 (m, 2H, Ph), 7.16–7.19 (m, 1H, Ph), 7.30–7.33 (m, 2H, Ph), 12.48 (brs, 1H, NH). ^{13}C NMR: δ 9.7 (CH_3), 12.3 (CH_3), 25.0 (CH_2), 35.1 (CH_2), 94.2 (=CH), 125.0, 125.5, 128.9 (3 × CH_{Ar}), 138.5, 165.8, 200.0 (3 × C_q). *Anal.* Calcd for $C_{13}H_{17}NO$: C, 76.81; H, 8.43; N, 6.89. Found: C, 76.65; H, 8.49; N, 6.96.

5-(1,5-Dimethyl-3-oxo-2-phenyl-1,2-dihydropyrazol-4-yl)-aminohept-4-en-3-one (2c). A mixture of **1c** (3.84 g, 0.03 mol) and 4-aminoantipyrine (4.06 g, 0.02 mol) has been stirred at laboratory temperature overnight. The mixture was then diluted by petroleum ether (70 mL). Separated oil solidified on standing. The solidified product was thoroughly washed with petroleum ether. Yield: 5.72 g (91.3%), mp 94–96.5°C. ^{1}H NMR: δ 1.04 (t, 3H, J = 7.5 Hz, CH_3), 1.10 (t, 3H, J = 7.5 Hz, CH_3), 2.21 (s, 3H, =C—CH_3), 2.30 (q, 2H, J = 7.5 Hz, CH_2), 2.34 (q, 2H, J = 7.5 Hz, CH_2), 3.05 (s, 3H, N—CH_3), 5.21 (s, 1H, =C—H), 7.25–7.29 (m, 1H, Ph), 7.36–7.38 (m, 2H, Ph), 7.42–7.45 (m, 2H, Ph), 11.54 (brs, 1H, NH). ^{13}C NMR: δ 9.6, 10.4, 11.5 (3 × CH_3), 25.0, 35.1 (2 × CH_2), 36.0 (CH_3), 94.0 (=C—H), 110.4 (C_q), 123.8, 126.6, 129.0 (3 × CH_{Ar}), 134.7, 150.9, 161.9, 168.0, 200.2 (5 × C_q). *Anal.* Calcd for $C_{18}H_{23}N_3O_2$: C, 68.98; H, 7.40; N, 13.41. Found: C, 69.23; H, 7.32; N, 13.48.

3-(3,4-Difluorophenylamino)-1-phenylpent-2-en-1-one (2d). A mixture of diketone **1a** (1.39 g, 7.9 mmol), 3,4-difluoroaniline (1.02 g, 7.9 mmol), and catalytic amount of TsOH in toluene (15 mL) has been boiled and water formed was removed azeotropically. After 3 h, solvent was distilled off and the rest was suspended in *n*-hexane. Solid product was isolated by suction and recrystallized from *n*-hexane. Yield: 1.12 g (49.3%), mp 54–57°C. ^{1}H NMR: δ 1.14 (t, 3H, J = 7.5 Hz, CH_3), 2.40 (q, 2H, J = 7.5 Hz, CH_2), 5.94 (s, 1H, =C—H), 6.89–6.92 (m, 1H, NPh), 7.02 (ddd, 1H, J = 10.9, 7.0, 2.7 Hz, NPh), 7.13 (dt, 1H, J = 8.8, 9.5 Hz, NPh), 7.40–7.47 (m, 3H, Ph), 7.89–7.91 (m, 2H, Ph), 12.98 (brs, 1H, NH). ^{13}C NMR: δ 12.4 (CH_3), 25.4 (CH_2), 92.5 (=CH), 114.7 (d, J = 18.5 Hz, NPh), 117.5 (d, J = 18.1 Hz, NPh), 121.5 (dd, J = 6.0, 3.4 Hz, NPh), 127.0, 128.2, 131.0 (3 × CH, Ph), 134.9 (dd, J = 7.7, 3.5 Hz, NPh), 139.7 (Ph), 148.3 (dd, J = 198.7, 13.5 Hz, NPh), 150.3 (dd, J = 200.7, 13.5 Hz, NPh), 167.2 (C_q), 189.42 (C=O). *Anal.* Calcd for $C_{17}H_{15}F_2NO$: C, 71.07; H, 5.26; N, 4.88. Found: C, 71.27; H, 5.01; N, 5.10.

3-(Ethoxycarbonylmethylamino)-1-phenylpent-2-en-1-one (2e). A mixture of ethyl glycinate hydrochloride (2.38 g, 17 mmol), **1a** (3 g, 17 mmol) and $NaHCO_3$ (1.43 g, 17 mmol) in ethanol (30 mL) has been refluxed for 5.5 h. The mixture was then cooled, filtered, and the solvent was distilled off. The residue was extracted with dichloromethane (20 mL), filtered, and the filtrate was evaporated. The residue was recrystallized from hexane–cyclohexane mixture. Yield: 3.90 g (87%), mp 69–71.5°C. ^{1}H NMR: δ 1.18 (t, 3H, J = 7.5 Hz, CH_3), 1.26 (t, 3H, J = 7.0 Hz, CH_3), 2.28 (q, 2H, J = 7.5 Hz, CH_2), 4.06 (d, 2H, J = 6.0 Hz, N—CH_2), 4.21 (q, 2H, J = 7.0 Hz, O—CH_2), 5.75 (s, 1H, =C—H), 7.34–7.40 (m, 3H, Ph), 7.83–7.85 (m, 2H, Ph), 11.55 (brs, 1H, NH). ^{13}C NMR δ: 11.9, 14.0 (2 × CH_3), 25.2, 44.3, 61.6 (3 × CH_2), 91.0 (=CH), 126.9, 128.0, 130.5 (3 × CH_{Ar}), 140.2, 168.6, 168.9 (3 × C_q), 188.8 (C=O). *Anal.* Calcd for $C_{15}H_{19}NO_3$: C, 68.94; H, 7.33; N, 5.36. Found: C, 69.12; H, 7.28; N, 5.26.

1-Phenyl-3-(pyrrolidine-1-yl)pent-2-en-1-one (2f). The procedure from Ref. [27] has been adopted. A mixture of diketone **1a** (2.05 g, 11.6 mmol), pyrrolidine (1.03 g, 14.4 mmol), and $CoCl_2 \cdot 6H_2O$ (0.14 g, 0.58 mmol) has been stirred at laboratory temperature for 72 h, then mixed with CH_2Cl_2 and filtered. Filtrate was evaporated and the residue was recrystallized from cyclohexane. Yield: 1.50 g (56.4%) mp 105–108°C. ^{1}H NMR: δ 1.24 (t, 3H, J = 7.5 Hz, CH_3), 1.96 (brs, 4H, 2 × CH_2), 3.12 (q, 2H, J = 7.5 Hz, CH_2), 3.33 (brs, 2H, CH_2), 3.56 (brs, 2H, CH_2), 5.55 (s, 1H, =C—H), 7.34–7.38 (m, 3H, Ph), 7.85–7.86 (m, 2H, Ph). ^{13}C NMR: δ 12.2 (CH_3), 24.4, 24.8, 25.4, 47.3, 48.7 (5 × CH_2), 91.5 (=CH), 127.2, 128.0, 130.1 (3 × CH_{Ar}), 143.1, 167.0 (2 × C_q), 187.0 (C=O). *Anal.* Calcd for $C_{15}H_{19}NO$: C, 78.56; H, 8.35; N, 6.11. Found: C, 78.60; H, 8.29; N, 6.14.

1,1,1-Trifluoro-5-methyl-4-(3,4-difluorophenylamino)hept-3-en-2-one (2g). A mixture of **1e** (2.94 g, 15 mmol), 3,4-difluoroaniline (1.94 g, 15 mmol), and catalytic amount of TsOH in toluene (10 mL) has been heated to 110°C for 3 h. The mixture solidified on cooling. The solidified mixture was subjected to column chromatography (silicagel/$CHCl_3$-EtOAc 6:1). Yield: 2.66 g (57.7%). Recrystallization from aqueous ethanol, mp 50–56°C. ^{1}H NMR: δ 0.86 (d, 6H, $J = 6.6$ Hz, 2 × CH_3), 1.80 (sp, 1H, $J = 6.8$ Hz, CH), 2.24 (d, 2H, $J = 7.4$ Hz, CH_2), 5.56 (s, 1H, =C—H), 6.90–6.94 (m, 1H, NPh), 7.02 (ddd, 1H, $J = 2.6, 6.9, 10.0$ Hz, NPh), 7.22 (dt, 1H, $J = 8.7, 9.8$ Hz, NPh), 12.54 (brs, 1H, NH). ^{13}C NMR: δ 22.1 (CH_3), 27.8 (CH), 40.8 (CH_2), 90.5 (=CH), 115.6 (d, $J = 18.8$ Hz, NPh), 117.2 (q, $J = 288.3$ Hz, CF_3), 117.9 (d, $J = 18.4$ Hz, NPh), 122.4 (dd, $J = 6.3, 3.6$ Hz, NPh), 133.2 (dd, $J = 7.5, 3.6$ Hz, NPh), 149.5 (dd, $J = 250.6, 12.4$ Hz, C—F), 150.1 (dd, $J = 251.9, 13.6$ Hz, C—F), 171.4, 177.1 (q, $J = 33.3$, C=O). *Anal.* Calcd for $C_{14}H_{14}F_5NO$: C, 54.73; H, 4.59; N, 4.56. Found: C, 55.11; H, 4.41; N, 4.77.

1-Cyclopropyl-3-(2-hydroxyethyl)hex-2-en-1-one (2i). A mixture of diketone **1d** (3.08 g, 0.02 mol) and ethanolamine (1.22 g, 0.02 mol) in toluene (10 mL) has been refluxed in the presence of catalytic amount of TsOH for 5.5 h. The mixture was then cooled and washed by water (10 mL). Organic phase was separated, dried by sodium sulfate, and solvent was evaporated. The residue was recrystallized from *n*-hexane. Yield: 2.5 g (63.4%), mp 68–71°C. ^{1}H NMR: δ 0.67–0.71 (m, 2H, cPr CH_2), 0.88–0.91 (m, 2H, cPr CH_2), 0.98 (t, 3H, $J = 7.0$ Hz, CH_3), 1.54–1.64 (m, 3H, cPr CH + CH_2), 2.17–2.20 (m, 2H, CH_2), 3.37 (q, 2H, $J = 5.7$ Hz, CH_2N), 3.71 (brt, 2H, $J = 5.6$ Hz, CH_2O), 3.85 (brs, 1H, OH), 5.13 (s, 1H, =C—H), 10.81 (brs, 1H, NH). ^{13}C NMR: δ 8.5 (CH_2), 13.8 (CH_3), 19.7 (CH), 21.1, 33.9, 44.7, 61.2 (4 × CH_2), 94.0 (=CH), 166.3 (=C—N), 196.6 (C=O). *Anal.* Calcd for $C_{11}H_{19}NO_2$: C, 66.97; H, 9.71; N, 7.10. Found: C, 67.31; H, 9.39; N, 7.23.

Pyrazoles synthesis. The following pyrazoles have been prepared according to the published procedure [16].

1-(4-Fluorophenyl)-5-methyl-4-phenylamino-3-propanoyl-1H-pyrazole (3a). This is prepared from enaminone **2b** and 4-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 42.5%, recrystallization from ethanol, mp 100–102°C. ^{1}H NMR: δ 1.16 (t, 3H, $J = 7.5$ Hz, CH_3), 2.10 (s, 3H, CH_3), 3.04 (q, 2H, $J = 7.5$ Hz, CH_2), 6.76–6.78 (m, 2H, Ph), 6.81–6.84 (m, 1H, Ph), 6.91 (brs, 1H, NH), 7.17–7.23 (m, 4H, Ph), 7.48–7.51 (m, 2H, Ph). ^{13}C NMR: δ 7.7, 12.0 (2 × CH_3), 32.0 (CH_2), 115.6 (CH_{Ar}), 116.2 (d, $J_{CF} = 23.0$ Hz, CH_{Ar}), 119.7 (CH_{Ar}), 126.6 (d, $J_{CF} = 8.7$ Hz, CH_{Ar}), 126.6 (C_q), 129.0 (CH_{Ar}), 131.6, 135.4 (d, $J_{CF} = 2.9$ Hz, C_q), 141.6, 144.5, 162.1 (d, $J_{CF} = 249.0$ Hz, C—F), 199.3 (C=O). *Anal.* Calcd for $C_{19}H_{18}FN_3O$: C, 70.57; H, 5.61; N, 12.99. Found: C, 70.77; H, 5.37; N, 12.99.

3-Benzoyl-1-(4-fluorophenyl)-4-(3,4-difluorophenylamino)-5-methyl-1H-pyrazole (3b). This compound is prepared from enaminone **2d** and 4-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 70%, recrystallization from ethanol, mp 190–193°C. ^{1}H NMR: δ 2.14 (s, 3H, CH_3), 6.50–6.51 (m, 1H, Ph), 6.56 (ddd, 1H, $J = 12.3, 6.7, 2.7$ Hz, Ph), 6.99 (dt, 1H, $J = 8.9, 9.9$ Hz, Ph), 7.09 (brs, 1H, NH), 7.18–7.22 (m, 2H, Ph), 7.42–7.45 (m, 2H, Ph), 7.50–7.55 (m, 3H, Ph), 8.30–8.31 (m, 2H, Ph). ^{13}C NMR: δ 11.8 (CH_3), 104.2 (d, $J_{CF} = 20.8$ Hz), 111.1 (dd, $J_{CF} = 5.4, 2.9$ Hz), 116.2 (d, $J_{CF} = 23.0$ Hz), 117.3 (d, $J_{CF} = 17.9$ Hz), 126.6 (d, $J_{CF} = 8.7$ Hz), 128.0, 128.1, 130.5, 131.9, 132.8, 135.3 (d, $J_{CF} = 3.1$ Hz), 136.8, 141.6 (dd, $J_{CF} = 8.2, 2.0$ Hz), 142.0, 144.3 (dd, $J_{CF} = 239.1, 12.8$ Hz), 150.6 (dd, $J_{CF} = 246.2, 13.8$ Hz), 162.2 (d, $J_{CF} = 249.2$ Hz), 189.2 (C=O). *Anal.* Calcd for $C_{23}H_{16}F_3N_3O$: C, 67.81; H, 3.96; N, 10.31. Found: C, 67.94; H, 4.04; N, 10.32.

3-Benzoyl-1-(4-fluorophenyl)-5-phenyl-4-phenylamino-1H-pyrazole (3c). This is prepared from enaminone **2a** and 4-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 79%, recrystallization from ethanol, mp 148–150°C. ^{1}H NMR: δ 6.56–6.61 (m, 3H, Ph), 6.86–6.89 (m, 2H, Ph), 6.97–7.00 (m, 2H, Ph), 7.10–7.13 (m, 5H), 7.26–7.28 (m, 2H, Ph), 7.42–7.46 (m, 2H), 7.50–7.53 (m, 2H), 8.31–8.33 (m, 2H). ^{13}C NMR: δ 115.8 (d, $J_{CF} = 23.0$ Hz, CH), 116.4, 119.7 (2 × CH), 127.3 (d, $J_{CF} = 8.7$ Hz, CH), 128.1, 128.2, 128.3 (3 × CH), 128.9, 128.9 (2 × C_q), 129.0, 130.4, 132.6 (3 × CH), 133.0 (C_q), 135.9 (d, $J_{CF} = 3.2$ Hz, C_q), 137.1, 141.9, 142.9 (3 ×C_q), 161.8 (d, $J_{CF} = 248.9$ Hz, C—F), 189.3 (C=O). *Anal.* Calcd for $C_{28}H_{20}FN_3O$: C, 77.58; H, 4.65; N, 9.69. Found: C, 77.55; H, 4.90; N, 9.71.

1-(4-Fluorophenyl)-5-methyl-4-(1,5-dimethyl-2-phenyl-1,2-dihydropyrazol-3-one-4-ylamino)-3-propanoyl-1H-pyrazole (3d). This compound is prepared from enaminone **2c** and 4-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/$CHCl_3$-EtOAc 3:2, yield 37.2%, recrystallization from ethanol, mp 184–189.5°C. ^{1}H NMR: δ 1.08 (t, 3H, $J = 7.0$ Hz, CH_3), 1.91 (s, 3H, CH_3), 2.13 (s, 3H, CH_3), 2.89–2.95 (m, 5H, CH_2 + CH_3), 6.99–7.03 (m, 2H, Ph), 7.13–7.16 (m, 1H, Ph), 7.26–7.32 (m, 6H, Ph). ^{13}C NMR: δ 7.7, 9.9, 10.0 (3 × CH_3), 31.2 (CH_2), 35.7 (NCH_3), 112.9 (C_q), 115.5 (d, $J_{CF} = 23.0$ Hz, CH), 123.5 (CH), 124.5 (C_q), 126.3 (CH), 126.7 (d, $J_{CF} = 8.7$ Hz, CH), 128.7, 131.2, 134.4 (2 × C_q), 135.0 (d, $J_{CF} = 2.9$ Hz, C_q), 138.0, 150.9 (2 × C_q), 161.6 (d, $J_{CF} = 248.5$ Hz, C—F), 163.2 (C_q), 199.2 (C=O). *Anal.* Calcd for $C_{24}H_{24}FN_5O_2$: C, 66.50; H, 5.58; N, 16.16. Found: C, 66.67; H, 5.32; N, 15.92.

3-Benzoyl-1-(2-fluorophenyl)-4-methylamino-5-phenyl-1H-pyrazole (3e). This is prepared from enaminone **2h** and 2-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 39.5%, recrystallization from ethanol, mp 140–145°C. ^{1}H NMR: δ 2.54 (s, 3H, CH_3), 5.94 (brs, 1H. NH), 7.00–7.04 (m, 1H, Ph), 7.07–7.10 (m, 1H, Ph), 7.24–7.31 (m, 7H), 7.42–7.45 (m, 2H), 7.49–7.53 (m, 1H), 8.29–8.31 (m, 2H). ^{13}C NMR: δ 33.3 (CH_3), 116.4 (d, $J_{CF} = 19.7$ Hz, CH), 124.1 (d, $J_{CF} = 3.9$ Hz, CH), 127.7, 127.9, 128.2, 129.2 (3 × CH), 129.7 (C_q), 130.3 (CH), 130.4 (d, $J_{CF} = 7.7$ Hz, CH), 130.5, 132.1 (2 × CH), 137.9 (d, $J_{CF} = 9.9$ Hz, C_q), 138.7 (C_q), 157.0 (d, $J_{CF} = 253.4$ Hz, C—F), 190.0 (C=O). *Anal.* Calcd for $C_{23}H_{18}FN_3O$: C, 74.38; H, 4.88; N, 11.31. Found: C, 74.16; H, 5.17; N, 11.06.

3-Benzoyl-4-ethoxycarbonylmethylamino-1-(4-fluorophenyl)-5-methyl-1H-pyrazole (3f). The compound **3f** is prepared from enaminone **2e** and 4-fluorobenzenediazonium tetrafluoroborate. Chromatography silicagel/$CHCl_3$-EtOAc 6:1, yield 56%, oil. ^{1}H NMR: δ 1.21 (t, 3H, $J = 7.0$ Hz, CH_3), 2.31 (s, 3H, CH_3), 3.96 (s, 2H, CH_2), 4.17 (q, 2H, $J = 7.0$ Hz, CH_2), 6.02 (brs, 1H, NH), 7.15–7.18 (m, 2H), 7.41–7.44 (m, 4H), 7.50–7.53 (m, 1H), 8.28–8.29 (m, 2H). It was not possible to purify the compound sufficiently for elemental analysis.

3-Benzoyl-1-(3-trifluoromethylphenyl)-5-methyl-4-(pyrrolidine-1-yl)-1H-pyrazole (3g). This is prepared from enaminone **2f** and 3-trifluoromethylbenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 38.3%, oil. ^{1}H NMR: δ 1.94–1.97 (m, 4H, CH_2 pyrr.), 2.37 (s, 3H, CH_3), 3.18–3.20 (m, 4H, CH_2, pyrr.), 7.44–7.47 (m, 2H), 7.53–7.56 (m, 1H), 7.60–7.62 (m, 1H), 7.64–7.66 (m, 1H), 7.69–7.71 (m, 1H), 7.77 (brs, 1H), 8.11–8.13 (m, 2H). ^{13}C NMR: δ 11.0 (CH_3), 25.9, 52.4 (2 × CH_2), 121.5 (q, J_{CF} = 3.9 Hz, CH), 123.3 (q, J_{CF} = 273.0 Hz, CF_3), 124.5 (q, J_{CF} = 3.7 Hz, CH), 127.8, 128.0, 129.7, 130.5 (4 × CH), 131.6 (q, J_{CF} = 33.2 Hz, C_q), 132.6 (CH), 134.5, 134.6, 137.9, 140.1, 145.1 (5 × C_q), 189.8 (C=O). *Anal*. Calcd for $C_{22}H_{20}F_3N_3O$: C, 66.16; H, 5.05; N, 10.52. Found: C, 66.08; H, 5.34; N, 10.34.

3-Cyclopropylcarbonyl-5-ethyl-4-(2-hydroxyethylamino)-1-(4-methylphenyl)-1H-pyrazole (3h). This is prepared from enaminone **2i** and 4-methylbenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2-EtOAc 4:1, yield 65.7%, recrystallization from *n*-hexane, mp 112–114°C. ^{1}H NMR: δ 0.90–0.94 (m, 2H, cPr CH_2), 0.98 (t, 3H, *J* = 7.5 Hz, CH_3), 1.13–1.16 (m, 2H), 2.38 (s, 3H, CH_3Ph), 2.63 (q, 2H, *J* = 7.5 Hz, CH_2), 3.02 (tt, 1H, *J* = 4.6, 8.0 Hz, cPr CH), 3.16–3.18 (m, 2H, NCH_2), 3.60–3.62 (m, 2H, CH_2O), 4.63 (brs, 1H, OH), 7.24–7.29 (m, 4H, Ph). ^{13}C NMR: δ 11.4 (cPr CH_2), 12.9, 17.0 (2 × CH_3), 17.7 (CH_2), 21.0 (cPr CH), 50.4, 61.0 (2 × CH_2), 125.4, 129.6 (2 × CH_{Ar}), 131.8, 134.5, 137.0, 138.8, 140.9 (5 × C_q), 199.2 (C=O). *Anal*. Calcd for $C_{18}H_{23}N_3O_2$: C, 68.98; H, 7.40; N, 13.41. Found: C, 69.27; H, 7.45; N, 13.58.

1-(4-Methoxyphenyl)-4-methylamino-5-methyl-3-propanoyl-1H-pyrazole (3i). This is prepared from enaminone **2j** and 4-methoxybenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2-EtOAc 4:1. Yield 62.9% mp 79–82°C ([16] 79–82°C).

1-(2-Trifluoromethoxyphenyl)-5-methyl-4-phenylamino-3-propanoyl-1H-pyrazole (3j). Prepared from enaminone **2b** and 2-trifluoromethoxybenzendiazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 23% (in an inert atmosphere 34%). ^{1}H NMR: δ 1.16 (t, 3H, *J* = 7.4 Hz CH_3), 1.98 (s, 3H, CH_3), 3.04 (q, 2H, *J* = 7.4 Hz CH_2), 6.76–6.77 (m, 2H), 6.83–6.86 (m, 1H), 6.87 (brs, 1H, NH), 7.20–7.23 (m, 2H), 7.45–7.50 (m, 2H), 7.54–7.59 (m, 2H).

1-(2,6-Dichloro-4-trifluoromethyl)-4-[4-(2,6-dichloro-4-trifluoromethylphenyldiazenyl)phenylamino]-5-methyl-3-propanoyl-1H-pyrazole (3k). Prepared from enaminone **2b** and 2,6-dichloro-4-trifluoromethylbenzenediazonium tetrafluoroborate. Chromatography silicagel/CH_2Cl_2, yield 27.3%, recrystallization from ethanol, mp 192–194°C. ^{1}H NMR: δ 1.18 (t, 3H, *J* = 7.3 Hz, CH_3), 2.02 (s, 3H, CH_3), 3.05 (q, 2H, *J* = 7.3 Hz, CH_2), 6.81–6.83 (AA′, 2H), 7.03 (s, 1H, NH), 7.64 (s, 2H, CH_{Ar}), 7.81 (s, 2H, CH_{Ar}), 7.90–7.92 (XX′, 2H). ^{13}C NMR: δ 7.6, 10.3 (2 × CH_3), 32.4 (CH_2), 114.5 (C_q), 121.9 (q, J_{CF} = 273.5 Hz, CF_3), 122.5 (q, J_{CF} = 273.1 Hz, CF_3), 123.3 (C_q), 125.7 (CH), 125.9 (q, J_{CF} = 3.7 Hz, CH), 126.0 (q, J_{CF} = 3.5 Hz, CH), 127.6 (CH), 134.0 (q, J_{CF} = 34.6 Hz, 2 × C_q), 135.2 (C_q), 136.0 (C_q), 137.5 (C_q), 144.0 (C_q), 145.8 (C_q), 149.3 (C_q), 151.4 (C_q), 198.8 (C=O). *Anal*. Calcd for $C_{27}H_{17}Cl_4F_6N_5O$: C, 47.46; H, 2.51; N, 10.25. Found: C, 47.71; H, 2.21; N, 10.29.

4-Methoxyphenyldiazenyl-5-methylaminohept-4-en-3-one (4). The compound has been prepared by the same procedure as pyrazoles **3a–j** but the molar ratio of diazo:enaminone was 1:1. The reaction was performed for 24 h under inert atmosphere. Chromatography silicagel/CH_2Cl_2-EtOAc 4:1. Yield 45.2%, oil. ^{1}H NMR (major isomer only) δ: 1.14 (t, 3H, *J* = 7.5 Hz, CH_3), 1.25 (t, 3H, *J* = 7.5 Hz, CH_3), 2.99–3.03 (m, 4H, 2 × CH_2), 3.13 (s, 3H, N—CH_3), 3.83 (s, 3H, OCH_3), 6.92–6.94 (m, 2H, AA′), 7.53–7.55 (brm, 2H, XX′), 14.53 (brs, 1H, NH). ^{13}C NMR: (major isomer only) δ 9.4, 11.5, 21.8, 28.8, 32.7, 55.3, 114.1, 121.1, 127.0, 145.8, 158.6, 165.1, 200.4. *Anal*. Calcd for $C_{15}H_{21}N_3O_2$: C, 65.43; H, 7.69; N, 15.26. Found: C, 65.28; H, 7.40; N, 15.46.

Acknowledgments. The authors are indebted to the Ministry of Education, Youth and Sports of the Czech Republic (Project No. MSM 002 162 7501) and Czech Science Foundation (Project No. 203/07/0469) for financial support. The authors also thank Mr. Radim Horák for his help with some experiments and Ms. Gabriela Adamová for preliminary results in this field.

The novel macrocyclic diamides **11–13, 16–18** are obtained in 45–66% yields by the reaction of dipotassium salts **10a–c** and **15** with each of 1,4-di(bromomethyl)benzene **4**, 2,6-di(bromomethyl)naphthalene **6** and 9,10-di(bromomethyl)anthracene **8**, repectively, in boiling DMF. On the other hand, the new macrocyclic Schiff bases **28** and **29** are obtained in 44% and 42% yields by heating the appropriate bis-amines **25b**, **26b** with the corresponding bis-aldehydes **21**, **22**, respectively, in refluxing acetic acid under high-dilution conditions.

J. Heterocyclic Chem., **46**, 656 (2009).

INTRODUCTION

Over the past few decades, macrocyclic compounds have become important synthetic targets due to their wide applications in host-guest supramolecular chemistry. They have been shown to exhibit important applications, including selective ion separation and detection, molecular recognition, catalysis, biological applications as well as many other interesting applications in diverse fields of supramolecular chemistry [1–8]. In particular, macrocyclic polyethers with amide groups in the macrocyclic ring have attracted much attention. Insertion of these groups into the macrocyclic ring structure has been reported to affect the binding properties and selectivity of macrocyclic compounds with metal cation [9,10] as well as organic molecules [11–13]. Recently Kumar *et al.* [14–16] have reported that diamide-ester macrocyclic compounds showed extraordinary Ag^+ binding strength with a remarkable selectivity for Ag over other metal ions. Macrocyclic amides are also precursors in the preparation of azacrown ethers and cryptands [4,6,9,11]. Furthermore, some diamide-containing macrocycles have been utilized as new catalysts [17]. Moreover, a progressive interest was directed in the last few years to the synthesis of novel macrocyclic Schiff bases because they can be obtained by simple self-condensation of suitable formyl- or keto- and primary amine-precursors [18] and they can be functionalized by inserting appropriate groups in the aliphatic and/or aromatic chains of the precursors. They generally can contain additional donor groups (O, S, P, etc.) and this makes them good candidates for metal ion complexation and for mimicking biological systems.

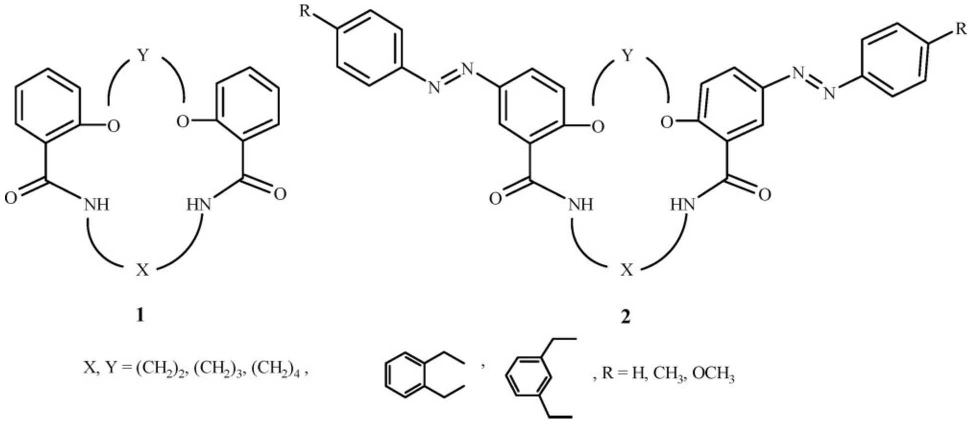
Furthermore, considerable attention has been focused on crown ethers bearing chromophores such as naphthalene and/or anthracene. They are promising analytical reagents for colorimetry and can be used for spectrophotometric determination of metal ions [19]. Anthracene is one of the most employed chromophores due to its ability to induce PET (photoinduced electron transfer) processes [20]. The naphthalene moiety is also a well-known fluorophore and its ability to block intersystem crossing in the first excited state is remarkable [21]. The detection of metal ions with a high specificity under physiologically relevant conditions is an important issue in the design of fluorescent chemosensors in biological and environmental applications [22].

We have investigated several synthetic approaches towards macrocyclic azacrown compounds where some of them showed useful application in ion selective electrodes and as spectrophotometric reagents [23].

Although up to now, many kinds of azacrownophanes were prepared, development of a mild and effective synthetic route to this type of macrocycles still remains an attractive and challenging subject for synthetic chemists. Here, we report on the synthesis of a new family of amide-crownophanes and Schiff base-crownophanes that use *p*-phenylene, 2,6-naphthalene or 9,10-anthracene as assembling units.

RESULTS AND DISCUSSION

Previously, we reported the synthesis of tribenzo- and tetra-benzosubstituted macrocyclic diamides **1** and their corresponding azo derivatives **2**, in which the arylazo groups act as chromophoric side arms, by the reaction of the potassium salts of the appropriate bis(phenols) with the corresponding dihalo compounds in refluxing DMF [23a,b,f,h].



1

2

In this study, we intended to insert the chromophoric units 2,6-naphthalene and 9,10-anthracene into the macrocyclic rings **1**. The insertion of *p*-phenylene unit into the macrocycles **1** was also investigated for a comparison study. For this purpose, the bis(bromomethyl) compounds **4**, **6**, and **8** were chosen as a key intermediate and could be readily obtained from the corresponding dimethyl derivatives **3**, **5**, and **7**, respectively, by bromination with Br_2 or *N*-bromosuccinimide (NBS) in CCl_4 according to reported methods [24] (Scheme 1).

Thus, the treatment of the bis(phenol)s **9** with ethanolic KOH afforded the corresponding dipotassium salt **10**. Alkylation of **10** with **4**, **6**, and **8** in boiling DMF led to the formation of the novel macrocyclic diamides **11–13** in 45–66% yield (Scheme 2). It is noteworthy that we were not able to isolate pure sample of **13a** by the reaction of **10a** with **8** under similar conditions.

We also studied the insertion of an additional 1,3-xyly unit into the macrocyclic ring **11–13** instead of the alkylene moieties, aiming at studying the effect of rigidity provided by these groups on the ability of the ligands to form stable complexes compared with other macrocyclic analogues. Thus, reacting the dipotassium salts **15** (obtained from the corresponding bis(phenol) **14** upon treatment with ethanolic KOH) with the corresponding bis(bromomethyl)arenes **4**, **6**, and **8** under similar conditions give the corresponding macrocyclic diamides **16–18** in 49–62% yields, respectively (Scheme 3).

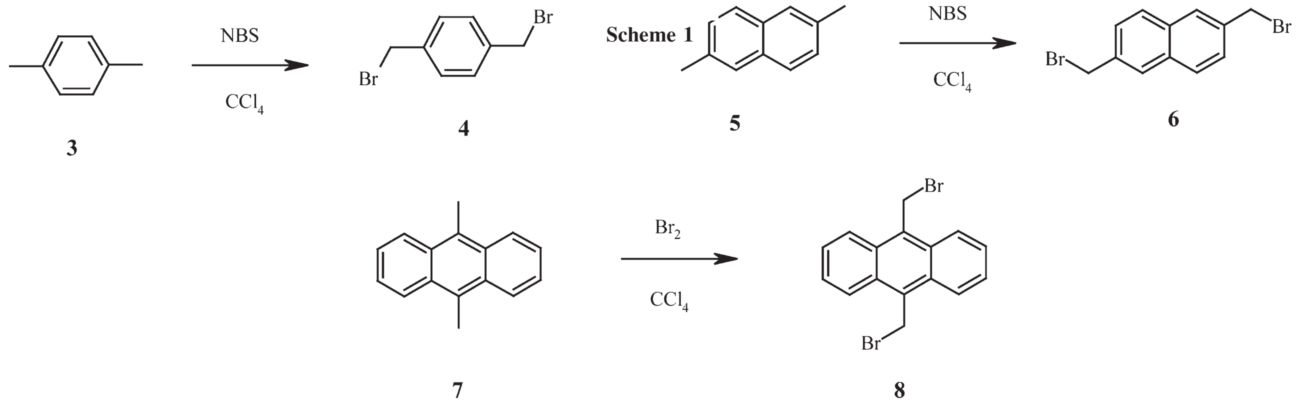
Our study was extended to include the insertion of chromophoric units into the macrocyclic Schiff base **19**. The latter compounds were recently obtained by cyclocondensation of the appropriate bis(carbonyl) ethers with the corresponding bis(amines) in glacial acetic acid under high-dilution conditions [23(f,l)].

To achieve this goal, the novel bis(aldehyde)s **21–23** as well as the novel bis(amine)s **25–27** were prepared as outlined in Schemes 4 and 5. Compounds **4**, **6**, and **8** serve as starting materials for the synthesis of **21–23**, **25–27**. Thus, reaction of **4**, **6**, and **8** with the potassium salt **20** (obtained upon treatment of salicylaldehyde with ethanolic potassium hydroxide) in refluxing DMF afforded the corresponding bis(aldehydes) **21–23** in 65–80% yield (Scheme 4).

On the other hand, reaction of **4**, **6** and **8** with 4-amino-1,2,4-triazol-3-thiones **24a,b** in ethanol/water mixture containing potassium hydroxide afforded the corresponding bis(4-amino-1,2,4-triazol-3-ylsulfanylmethyl)arenes **25–27** in 67–81% yield (Scheme 5).

The synthetic utility of the novel bis(aldehyde)s **21–23** and the bis(amine)s **25–27** as building blocks for novel macrocyclic Schiff bases containing *p*-phenylene, 2,6-naphthalene, or 9,10-anthracene groups incorporated into the ring system was then investigated. Thus, cyclocondensation of **21** with 1,4-bis(4-amino-5-phenyl-3-

Scheme 1



ylsulfanylmethyl)benzene (**25b**) in glacial acetic acid under high-dilution conditions gave the corresponding macrocyclic Schiff base **28** in 44% yield. Under similar conditions **22** reacted with **26b** to give the corresponding macrocyclic Schiff base **29** in 42% yield (Scheme 6).

Unfortunately repeated attempts to react 9,10-bis(2-formylphenoxymethyl)anthracene **23** with with 9,10-bis(4-amino-5-phenyl-3-ylsulfanylmethyl)anthracene **27b** in refluxing acetic acid under high dilution conditions did not lead to the formation of the expected macrocyclic Schiff base **30**. Instead, the reaction gave 55% of another product which was characterized by ^{1}H NMR (DMSO), IR, and mass spectra as 9,10-bis(acetyloxymethyl)-anthracene **31**. The latter was obtained in 50% yield by heating only **23** in refluxing acetic acid (Scheme 7).

In conclusion, we prepared a new series of bis(4-amino-1,2,4-triazol-3-ylsulfanylmethyl)arenes as well as bis(2-formylphenoxymethyl)arenes and utilized them successfully as key intermediates for the synthesis of novel macrocyclic Schiff bases upon which fused triazole units and contain N, O, and S inside the macrocyclic ring as donor atoms. We also prepared a new series of amide-crownophanes by the reaction of the appropriate bis(phenol)s with the corresponding dihalo compounds. The novel macrocycles use *p*-phenylene, 2,6-naphthalene or 9,10-anthracene as assembling units. Some derivatives of the new dilactams as well as the new Schiff bases showed promising cation binding properties in a preliminary spectrophotometric study. This data will be published separately due to the large quantity of analytical data accumulated.

EXPERIMENTAL

Melting points are uncorrected. IR spectra (KBr) were recorded on a Perkin-Elmer 1430 spectrophotometer. NMR

spectra were measured with a Varian Mercury 300 (300 MHz ^{1}H NMR, 75 MHz ^{13}C NMR) spectrophotometer and chemical shifts are given in ppm from TMS. Mass spectra were recorded on GC MS-QP1000 EX (70 eV) or MS 5988 (15 eV) spectrometers. Elemental analyses were carried out at the Microanalytical Centre, Cairo University. 4-Aminotriazol-3-thione derivatives **24a**,**b** were prepared as reported [25].

Preparation of dipotassium salts 10, 15, general procedure [28a,28s,28y]. To a solution of KOH (1.14 g, 10 mmol) in methanol (10 mL) was added the appropriate bis(phenol) **9a–c**, **14** (5 mmol). The mixture was stirred at room temperature for 10 min. The solvent was then removed *in vacuo*. The remaining solid was triturated with dry ether, collected, dried, and used in the next step without further purification.

Synthesis of macrocycles 11a–c, 12a–c, 13b,c, 16–18, general procedure. A solution of the appropriate potassium salt **10a–c**, **15** (10 mmol) and the appropriate dihalo compound **4**, **6**, **8** (10 mmol) in DMF (20 mL) was heated under reflux for 10 min. during which time KCl precipitated. The solvent was then removed *in vacuo* and the remaining material was washed with water (50 mL) and purified by crystallization from acetic acid unless otherwise noted.

Macrocycle 11a. Reaction of **10a** with **4** produced **11a** as colorless crystals (64%), mp 253–254°C; IR: 3376 (NH), 1651 (C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 3.26 (s, 4H, CH_2NH), 5.20 (s, 4H, OCH$_2$), 7.02–7.57 (m, 14H, ArH's, NH); ^{13}C NMR (DMSO) δ 38.66 (CH$_2$N), 72.48 (OCH$_2$), 116.51, 121.49, 125.72, 129.35, 129.86, 131.90, 136.60, 155.77 (ArC's), 165.28 (C=O); MS (EI): *m/z* 402 (M$^+$, 2%), 282 (42.6%), 239 (15.1%), 162 (24.5%), 104 (100%). 178 (16.3%), 104 (100%). Anal. Calcd. for $C_{25}H_{24}O_4N_2$ (416.48): C, 72.10; H, 5.81; N, 6.73. Found: C, 72.30; H, 5.70; N, 6.70.

Macrocycle 11c. Reaction of **10c** with **4** produced **11c** as colorless crystals (61%), mp 291–292°C; IR: 3413, 3380 (NH), 1647 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 1.21 (s, 4H, *CH*$_2$CH$_2$NH), 3.19 (m, 4H, *CH*$_2$NH), 5.21 (s, 4H, OCH$_2$), 7.07–7.91 (m, 14H, ArH's, NH); ^{13}C NMR (DMSO) δ 26.87 (*C*H$_2$CH$_2$NH), 38.82 (CH$_2$N), 70.87 (OCH$_2$), 113.22, 120.93, 122.35, 130.88, 132.43, 136.39, 156.54 (ArC's), 164.21 (C=O); MS (EI): *m/z* 430 (M$^+$, 1.6%), 310 (49.4%), 173 (25.3%), 104 (100%). Anal. Calcd. for $C_{26}H_{26}O_4N_2$ (430.51): C, 72.54; H, 6.09; N, 6.51. Found: C, 72.70; H, 5.90; N, 6.20.

Macrocycle 12a. Reaction of **10a** with **6** produced **12a** as colorless crystals (54%), mp 197–199°C; IR: 3390 (NH), 1636 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 3.47 (m, 4H, *CH*$_2$NH), 5.32 (m, 4H, OCH$_2$), 7.33–7.84 (m, 14H, ArH's), 8.40 (brs, 2H, NH); MS (EI): *m/z* 453 (M$^+$+1, 2.5%), 369 (2.6%), 300 (17.5%), 247 (13.6%), 155 (4.2%). Anal. Calcd. for $C_{28}H_{24}O_4N_2$ (452.51): C, 74.32; H, 5.35; N, 6.19. Found: C, 74.50; H, 5.30; N, 6.20.

Macrocycle 12b. Reaction of **10b** with **6** produced **12b** as colorless crystals (66%), mp 287–289°C; IR: 3384 (NH), 1641 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 0.13 (m, 2H, *CH*$_2$CH$_2$NH), 2.79 (brs, 4H, *CH*$_2$NH), 5.38 (s, 4H, OCH$_2$), 7.03–8.16 (m, 16H, ArH's, NH); ^{13}C NMR (DMSO) δ 26.40 (*C*H$_2$CH$_2$NH), 37.28 (CH$_2$N), 73.26 (OCH$_2$), 114.93, 121.30, 122.32, 127.71, 128.66, 128.96, 130.82, 132.75, 133.20, 134.35, 156.96 (ArC's), 163.84 (C=O); MS (EI): *m/z* 466 (M$^+$, 15.6%), 346 (93.9%), 154 (100%), 121 (36.9%). Anal. Calcd. for $C_{29}H_{26}O_4N_2$ (466.54): C, 74.66; H, 5.62; N, 6.01. Found: C, 74.80; H, 5.30; N, 5.80.

Macrocycle 12c. Reaction of **10c** with **6** produced **12c** as colorless crystals (61%), mp 254–255°C; IR: 3426, 3385 (NH), 1642 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 0.68 (brs, 4H, *CH*$_2$CH$_2$NH), 2.85 (m, 4H, *CH*$_2$NH), 5.38 (s, 4H, OCH$_2$), 7.05–8.12 (m, 16H, ArH's, NH); ^{13}C NMR (DMSO) δ 26.76 (*C*H$_2$CH$_2$NH), 38.80 (CH$_2$N), 72.73 (OCH$_2$), 115.19, 121.10, 121.34, 123.76, 127.54, 128.56, 130.40, 132.27, 132.94, 134.42, 156.49 (ArC's), 164.35 (C=O); MS (EI): *m/z* 480 (M$^+$, 11.1%), 360 (100%), 223 (19.2%), 154 (55.7%), 121 (24.4%). Anal. Calcd. for $C_{30}H_{28}O_4N_2$ (480.57): C, 74.98; H, 5.87; N, 5.83. Found: C, 74.80; H, 5.50; N, 5.70.

Macrocycle 13b. Reaction of **10b** with **8** produced **13b** as yellow crystals (45%), mp 291–292°C; IR: 3388, 3421 (NH), 1640 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ −0.34 (brs, 2H, *CH*$_2$CH$_2$NH), 2.64 (m, 4H, *CH*$_2$NH), 6.37 (s, 4H, OCH$_2$), 7.14–8.52 (m, 18H, ArH's, NH); ^{13}C NMR (DMSO) δ 26.24 (*C*H$_2$CH$_2$NH), 36.41 (CH$_2$N), 64.23 (OCH$_2$), 113.74, 120.71, 121.20, 124.77, 126.65, 129.14, 130.04, 130.54, 132.54, 156.74 (ArC's), 163.56 (C=O); MS (EI): *m/z* 516 (M$^+$, 45.5%), 396 (100%), 314 (13.8%), 204 (81.1%), 178 (86.8%), 121 (73.5). Anal. Calcd. for $C_{33}H_{28}O_4N_2$ (516.60): C, 76.73; H, 5.46; N, 5.42. Found: C, 76.80; H, 5.30; N, 5.20.

Macrocycle 13c. Reaction of **10c** with **8** produced **13c** as yellow crystals (51%), mp 259–260°C; IR: 3402 (NH), 1650 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 0.28 (s, 4H, *CH*$_2$CH$_2$NH), 2.73 (m, 4H, *CH*$_2$NH), 6.30 (s, 4H, OCH$_2$), 7.14–8.50 (m, 18H, ArH's, NH). ^{13}C NMR (DMSO) δ 25.92 (*C*H$_2$CH$_2$NH), 37.10 (CH$_2$N), 63.19 (OCH$_2$), 113.88, 121.28, 124.68, 126.69, 128.95, 130.03, 131.13, 132.76, 156.78 (ArC's), 163.66 (C=O); MS (EI): *m/z* 530 (M$^+$, 14.9%), 410 (56.8%), 204 (75.6%), 121(100%). Anal. Calcd. for $C_{34}H_{30}O_4N_2$ (530.63): C, 76.96; H, 5.70; N, 5.28. Found: C, 76.80; H, 5.40; N, 5.20.

Macrocycle 16. Reaction of **15** with **4** produced **16** as colorless crystals [acetic acid-ethanol (1:1)] (62%), mp 281–282°C; IR: 3392 (NH), 1648 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 4.46 (m, 4H, *CH*$_2$NH), 5.15 (s, 4H, OCH$_2$), 7.09–7.93 (m, 16H, ArH's), 8.48 (br, 2H, NH); MS (EI): *m/z* 478 (M$^+$, 5.9%), 358 (25.7%), 254 (10.6%), 121 (55.9%), 104 (100%). Anal. Calcd. for $C_{30}H_{26}N_2O_4$ (478.55): C, 75.30; H, 5.48; N, 5.85. Found: C, 75.40; H, 5.70; N, 5.90.

Macrocycle 17. Reaction of **15** with **6** produced **17** as colorless crystals (ethanol) (49%), mp 258–259°C; IR: 3391 (NH), 1649 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 4.32 (m, 4H, CH$_2$NH), 5.31 (s, 4H, OCH$_2$), 6.50–7.97 (m, 18H, ArH's), 8.17 (br, 2H, NH); ^{13}C NMR (DMSO) δ 42.59 (CH$_2$N), 71.27 (OCH$_2$), 113.10, 120.96, 121.99, 123.36, 125.66, 126.87, 127.67, 128.19, 130.83, 132.55, 132.68, 133.33, 136.85, 156.74 (ArC's), 164.51 (C=O); MS (EI): *m/z* 528 (M$^+$, 9.4%), 408 (49.1%), 339 (25.7%), 288 (22%), 154 (100). Anal. Calcd. for $C_{34}H_{28}N_2O_4$ (528.61): C, 77.26; H, 5.34; N, 5.30. Found: C, 77.30; H, 5.30; N, 4.90.

Macrocycle 18. Reaction **15** with **8** produced **18** as yellow crystals [acetic acid-ethanol (1:1)] (51%), mp 245–246°C; IR: 3485, 3389 (NH), 1641 (C=O) cm^{-1}; ^1H NMR (DMSO-d_6) δ 3.91 (m, 4H, *CH*$_2$NH), 6.18 (s, 4H, OCH$_2$), 6.50–8.39 (m, 20H, ArH's, NH); MS (EI): *m/z* 578 (M$^+$, 9.4%), 458 (13.7%), 338 (11.5%), 240 (17.6%), 205 (100%), 121 (51.5%). Anal. Calcd. for $C_{38}H_{30}N_2O_4$ (578.67): C, 78.87; H, 5.23; N, 4.84. Found: C, 78.80; H, 4.90; N, 4.90.

Synthesis of bis(aldehyde)s 21–23, general procedure. A solution of the potassium salt of salicylaldehyde 20 (20 mmol) and the dibromo compound **4**, **6**, **8** (10 mmol) in DMF (20 mL) was heated under reflux for 5 min. during which the potassium chloride precipitated. The solution was concentrated to small volume (ca. 2 mL) and then cold water (ca. 10 mL) was added. The solid obtained was collected and crystallized from acetic acid.

1,4-Bis(2-formylphenoxymethyl)benzene (21). Reaction of **20** with **4** produced **21** as colorless crystals (80%), mp 189–

190°C; IR: 2762, 2850 (CHO), 1686 (C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 5.30 (s, 4H, OCH_2), 7.06–7.73 (m, 12H, ArH's), 10.44 (s, 2H, CHO); ^{13}C NMR (DMSO) δ 69.77 (OCH_2), 114.15, 120.93, 124.73, 127.64, 127.86, 136.15, 136.22, 160.51 (ArC's), 189.05 (C=O); MS (EI): *m/z* 346 (M$^+$, 0.1%), 224 (38%), 179 (4.6%), 121.05 (11.7%), 104 (92.2%), 91 (100%). Anal. Calcd. for $C_{22}H_{18}O_4$ (346.38): C, 76.29; H, 5.24. Found: C, 76.30; H, 4.90.

2,6-Bis(2-formylphenoxymethyl)naphthalene (22). Reaction of **20** with **6** produced **22** as colorless crystals (65%), mp 191–192°C; IR: 2761, 2868 (CHO), 1674 (C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 5.45 (s, 4H, OCH_2), 7.07–8.05 (m, 14H, ArH's), 10.49 (s, 2H, CHO); ^{13}C NMR (DMSO) δ 69.98 (OCH_2), 114.13, 120.59, 120.63, 120.95, 125.84, 126.07, 127.83, 128.27, 134.33, 136.27, 160.53 (ArC's), 189.25 (C=O); MS (EI): *m/z* 396 (M$^+$, 0.9%), 275 (55.9%), 215 (0.9%), 169 (2.2%), 154 (100%). Anal. Calcd. for $C_{26}H_{20}O_4$ (396.45): C, 78.77; H, 5.09. Found: C, 78.70; H, 4.90.

9,10-Bis(2-formylphenoxymethyl)anthracene (23). Reaction of **20** with **8** produced **23** as yellow crystals (DMF) (70%), mp 248–249°C; IR: 2753, 2850 (CHO), 1682 (C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 6.28 (s, 4H, OCH_2), 7.14–8.51 (m, 16H, ArH's), 10.04 (s, 2H, CHO); MS (EI): *m/z* 446 (M$^+$, 2.5%), 325 (26%), 204 (100%), 121 (35.6%). Anal. Calcd for $C_{30}H_{22}O_4$ (446.51): C, 80.70; H, 4.97. Found: C, 80.60; H, 5.10.

Synthesis of bis(amine)s 25a,b–27a,b, general procedure. To a solution of **24a**, **b** (50 mmol) in aqueous ethanol (50 mL, 50%) containing KOH (50 mmol) was added the appropriate dibromo compound **4**, **6**, **8** (25 mmol). The reaction mixture was heated under reflux for 1 h. The solvent was then removed *in vacuo* and the remaining solid was collected and crystallized from the proper solvent.

1,4-Bis(4-amino-1,2,4-triazol-3-ylsulfanylmethyl)benzene (25a). Reaction of **24a** with **4** produced **25a** as colorless crystals (DMF/H_2O) (71%), mp 207–209°C; IR: 3333, 3092 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 4.35 (s, 4H, SCH_2), 6.02 (s, 4H, NH_2), 7.33 (s, 4H, ArH's), 8.44 (s, 2H, triazole H's); ^{13}C NMR (DMSO-*d6*) δ 34.73 (SCH_2), 128.95, 136.60, 146.19, 150.47 (ArC's, Triazole C's); MS (EI): *m/z* 334 (M$^+$, 0.4%), 218 (3.9%), 203 (8%), 183 (4%), 128 (4.9%), 116 (100%). Anal. Calcd. for $C_{12}H_{14}N_8S_2$ (334.43): C, 43.10; H, 4.22; N, 33.51. Found: C, 43.40; H, 4.30; N, 33.50.

1,4-Bis(4-amino-5-phenyl-1,2,4-triazol-3-ylsulfanylmethyl)benzene (25b). Reaction of **24b** with **4** produced **25b** as colorless crystals (dilute acetic acid) (81%), mp 214–215°C; IR: 3309, 3181 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 4.42 (s, 4H, SCH_2), 6.09 (s, 4H, NH_2), 7.42–7.99 (m, 14H, ArH's); ^{13}C NMR (DMSO-d_6) δ 34.93 (SCH_2), 126.85, 127.72, 128.37, 129.03, 129.54, 136.63, 152.85, 154.02 (ArC's, Triazole C's); MS (EI): *m/z* 486 (M$^+$, 2.6%), 294 (11.8%), 192 (100%), 121 (20.1%). Anal. Calcd. for $C_{24}H_{22}N_8S_2$ (486.63): C, 59.24; H, 4.56; N, 23.03. Found: C, 59.30; H, 4.30; N, 22.90.

2,6-Bis(4-amino-1,2,4-triazol-3-ylsulfanylmethyl)naphthalene (26a). Reaction of **24a** with **6** produced **26a** as colorless crystals (DMF/H_2O) (69%), mp 216–217°C; IR: 3325, 3109 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 4.53 (s, 4H, SCH_2), 6.04 (s, 4H, NH_2), 7.53–7.86 (m, 6H, ArH's), 8.44 (s, 2H, triazole H's); ^{13}C NMR (DMSO-*d6*) δ 35.68 (SCH_2), 120.81, 127.15, 127.44, 127.80, 131.94, 135.14, 146.10 (ArC's, Triazole C's); MS (EI): *m/z* 385 (M$^+$+1, 3.2%), 327 (2.6%), 268 (21.7%), 155 (29.2%), 116 (100%). Anal. Calcd. for $C_{16}H_{16}N_8S_2$ (384.49): C, 49.98; H, 4.19; N, 29.14. Found: C, 50.10; H, 4.30; N, 28.90.

2,6-Bis(4-amino-5-phenyl-1,2,4-triazol-3-ylsulfanylmethyl)-naphthalene (26b). Reaction of **24b** with **6** gave **26b** as colorless crystals (acetic acid) (74%), mp 240–241°C; IR: 3315, 3183 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 4.60 (s, 4H, SCH_2), 6.10 (s, 4H, NH_2), 7.48–7.98 (m, 16H, ArH's); ^{13}C NMR (DMSO-d_6) δ 35.33 (SCH_2), 120.71, 126.81, 127.29, 127.57, 127.86, 128.41, 129.57, 131.91, 135.17, 152.91, 154.03 (ArC's, Triazole C's). Anal. Calcd. for $C_{28}H_{24}N_8S_2$ (536.69): C, 62.66; H, 4.51; N, 20.88. Found: C, 62.40; H, 4.30; N, 21.00.

9,10-Bis(4-amino-1,2,4-triazol-3-ylsulfanylmethyl)anthracene (27a). Reaction of **24a** with **8** produced **27a** as yellow crystals (DMF/H_2O) (67%), mp 243–244°C; IR: 3332, 3281 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 5.46 (s, 4H, SCH_2), 6.14 (s, 4H, NH_2), 7.64–8.47 (m, 8H, ArH's), 8.55 (s, 2H, triazole H's); ^{13}C NMR (DMSO-*d6*) δ 29.40 (SCH_2), 124.79, 126.39, 128.90, 129.35, 146.39, 150.45 (ArC's, Triazole C's); MS (EI): *m/z* 434 (M$^+$, 2.2%), 318 (5.7%), 204 (18.2%), 116 (100%). Anal. Calcd. for $C_{20}H_{18}N_8S_2$ (434.55): C, 55.28; H, 4.18; N, 25.79. Found: C, 55.30; H, 4.30; N, 25.90.

9,10-Bis(4-amino-5-phenyl-1,2,4-triazol-3-ylsulfanylmethyl)-anthracene (27b). Reaction of **24b** with **8** produced **27b** as yellow crystals (DMF/H_2O) (75%), mp 233–235°C; IR: 3281, 3353 (NH_2) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 5.52 (s, 4H, SCH_2), 6.17 (s, 4H, NH_2), 7.53–8.52 (m, 18H, ArH's); MS (EI): *m/z* 586 (M$^+$, 9%), 394 (46.1%), 228 (25.8%), 192 (82%), 104 (100%). Anal. Calcd. for $C_{32}H_{26}N_8S_2$ (586.75): C, 65.51; H, 4.47; N, 19.10. Found: C, 65.30; H, 4.30; N, 18.90.

Synthesis of macrocyclic bis-Schiff bases 28, 29, and 9,10-bis(acetyloxymethyl)-anthracene 31, general procedure. To a solution of the appropriate bis aldehyde **21–23** (10 mmol) in glacial acetic acid (50 mL) was added a solution of the appropriate bis amine **25b**, **26b**, **27b** (10 mmol) in glacial acetic acid (50 mL). The reaction mixture was then heated under reflux for 2 h. The solution was concentrated to small volume (ca. 2 mL) and then cold water (ca. 15 mL) was added. The precipitate obtained was collected and recrystallized from acetic acid.

Macrocycle 28. Reaction of **21** with **25b** produced **28** as colorless crystals (44%), mp 248–249°C; ^{1}H NMR (DMSO-d_6) δ 4.43 (s, 4H, SCH_2), 5.24 (s, 4H, OCH_2), 7.14–7.99 (m, 26H, ArH's), 9.18 (s, 2H, CH=N). MS (EI): *m/z* 796 (M$^+$, 0.4%), 626 (0.3%), 561 (0.8%), 558 (0.8%), 486 (1.6%), 280 (22.4%), 222 (76.5%), 177 (24.9%), 104 (100%). Anal. Calcd. for $C_{46}H_{36}N_8O_2S_2$ (796.98): C, 69.33; H, 4.55; N, 14.06. Found: C, 69.40; H, 4.30; N, 14.30.

Macrocycle 29. Reaction of **22** with **26b** gave **29** as colorless crystals (42%), mp 254–255°C; ^{1}H NMR (DMSO-d_6) δ 4.60 (s, 4H, SCH_2), 5.38 (s, 4H, OCH_2), 7.17–8.03 (m, 30H, ArH's), 9.21 (s, 2H, CH=N). MS (EI): *m/z* 896 (M$^+$, 0.5%), 522 (0.9%), 448 (1.6%), 390 (2.1%), 330 (4%), 272 (65.5%), 154 (100%). Anal. Calcd. for $C_{54}H_{40}N_8O_2S_2$ (897.10): C, 72.30; H, 4.49; N, 12.49. Found: C, 72.40; H, 4.30; N, 12.20.

9,10-Bis(acetyloxymethyl)anthracene (31). Reaction of **23** with **27b** produced **31** as yellow crystals (55%), mp 214–215°C; 178 (35.29%); IR: 1729 (C=O) cm^{-1}; ^{1}H NMR (DMSO-d_6) δ 2.02 (s, 6H, $OCOCH_3$), 6.15 (s, 4H, OCH_2), 7.65–8.45 (m, 8H, ArH's); MS (EI): *m/z* 322 (M$^+$, 30.71%), 263 (10.8%), 220 (100%), 204 (18.96%), 191 (53.41%). Anal. Calcd. for $C_{20}H_{18}O_4$ (322.36): C, 74.52; H, 5.63. Found: C, 74.80; H, 5.50.

Action of acetic acid on 27b. A solution of **27b** (10 mmol) in acetic acid (20 mL) was heated under reflux for 1 h. The solid obtained upon cooling was collected and crystallized from acetic acid to give **31** as yellow crystals (50%).

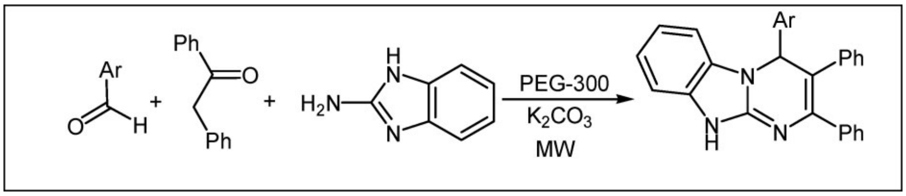
Received March 10, 2009
DOI 10.1002/jhet.132



Polyethylene glycol is found to be a nontoxic and recyclable reaction medium for the microwave-assisted, one-pot, multicomponent reactions of aromatic aldehydes with 2-aminobenzimidazole and 1,2-diphenylethanone in the presence of potassium carbonate. This environmentally friendly microwave protocol offers ease of operation and enables recyclability of reaction media and synthesis of a variety of substituted benzo[4,5]imidazo[1,2-*a*]pyrimidine derivatives. It is an efficient, promising, and green synthetic strategy to construct benzo[4,5]imidazo[1,2-*a*]pyrimidine skeleton.

J. Heterocyclic Chem., **46**, 664 (2009).

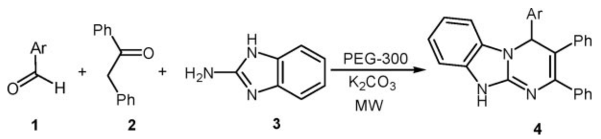
INTRODUCTION

The search for alternative reaction media to replace volatile and often toxic solvents commonly used in organic synthetic procedures is an important objective of significant environmental consequence [1]. Media considered include (a) the use of supercritical fluids [2] that have the advantage of facile solvent removal and easy recyclability but require high pressure; (b) fluorous-based systems [3] that have the advantage of being highly hydrophobic but expensive and for which the solvents are probably innocuous but have the disadvantage of being volatile; (c) more recently, environmentally benign solvents such as ionic liquids [4] and water [5]. Ionic liquids have a particularly useful set of properties, being nonvolatile and readily dissolving many transition metal catalysts but their preparation was not convenient, and volatile organic solvents were also used for the preparation. The use of water as solvent is probably the most desirable approach, but this is often not possible due to the hydrophobic nature of the reactants. It is customary to measure the efficiency of a catalyst by the number of cycles for which it can be reused. Similarly, the value of a new solvent medium primarily depends on its environmental impact, the ease with which it can be recycled, low vapor pressure, nonflammability, and high polarity for solubilization. In performing the majority of organic transformations, solvents play an important role in mixing the ingredients to make the system homogeneous and allow molecular interactions to be more efficient [6].

Recently, using polyethylene glycol (PEG) as a green reaction medium has become an important research area [7]. In addition to be a safe, readily available, and environmentally friendly solvent [8], PEG has also been recognized as an effective and recyclable reaction medium with unique properties and potentials for many organic reactions such as substitution, oxidation, and reduction. Under microwave irradiation (MW), PEG is rapidly heated to high temperature, enhancing molecular interactions more efficiently. Thus, it is clear that the combined approach of microwave superheating and PEG as a reaction medium could be considered a promising and green synthetic strategy for the construction of important heterocyclic skeleton.

Imidazo[1,2-*a*]pyrimidines are well-known compounds because of their pharmacological profiles as anti-cytomegalo-zoster and antivaricella-zoster virus [9]. The chemical modification of the imidazopyrimidine ring such as the introduction of different substituents or heteroatoms have allowed expansion of the research to structure–activity relationship to afford new insight into the molecular interaction at the receptor level. With an imidazo[1,2-*a*]pyrimidine parent nucleus, benzo[4,5]imidazo[1,2-*a*]pyrimidine derivatives showed a diverse range of biological properties such as antineoplastic activity [10], and acted as C3a receptor antagonists [11]

Scheme 1

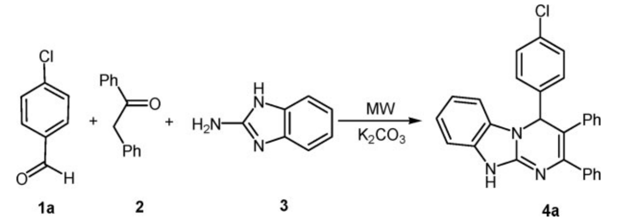


and new calcium antagonists [12]. Because of a range of biological activity they exhibited, these compounds have distinguished themselves as heterocycles of profound chemical and biological significance. Thus, the synthesis of these molecules has attracted considerable attention [13]. Recently, the synthesis of benzo[4,5] imidazo[1,2-*a*]pyrimidine derivatives were reported by Alvarez-Builla and coworkers *via* the reaction of an requisite arylmethyleneacetoacetate with 2-aminobenzimidazole [14]. The improved procedure for benzo[4,5]-imidazo[1,2-*a*]pyrimidines in ionic liquid through the condensation of aldehydes with β-ketoester and 2-aminobenzimidazole was described by Shaabani *et al*. [15]. However, the synthesis of new heterocyclic compounds containing benzoimidazopyrimidine scaffold and development of more rapid and efficient entry to this heterocycles are strongly desired. In connection with our previous studies [16], to modify benzoimidazopyrimidine scaffold, in this article we report a practical, inexpensive, rapid, and green microwave-promoted method for the synthesis of new heterocyclic compounds containing benzoimidazopyrimidine unit in PEG-300 using 1,2-diphenylethanone as potent precursor (Scheme 1).

RESULTS AND DISCUSSION

2-Aminobenzimidazole is a versatile and readily obtainable reagent, and its chemistry has received considerable attention in recent years due to the high nucleophilic reactivity of two nitrogen atoms [17]. Our strategy synthesizing the poly-substituted benzo[4,5]imidazo[1,2-*a*]pyrimidines was that 2-aminobenzimidazole was examined as starting material to react with aromatic aldehydes and 1,2-diphenylethanone under microwave heating. Initially, we screened various conditions for the one-pot, three-component reaction of equimolar amount of 2-aminobenzimidazole with 4-chlorobenzaldehyde and 1,2-diphenylethanone at 100°C in the presence of potassium carbonate under microwave irradiation (Scheme 2 and Table 1). Among various polar solvents tested, glacial acetic acid (HOAc), acetonitrile, ethanol, and water gave poor to moderate yields of the expected product (Table 1, entries 1−4). The best solvent was found to be PEG-300. In this solvent, benzo[4,5]imidazo[1,2-*a*]pyrimidines (**4a**) was obtained with the best yield (Table 1, entry 5). To further optimize the reaction conditions, the reaction was carried out at temperatures ranging from 90 to 130°C, with an increment of 10°C each time. The yield of product **4a** was increased and the reaction time was shortened as the temperature was increased from 90 to 120°C (Table 1, entries 5−8). However, further increase of the temperature to 130°C failed to improve the yield of product **4a** (Table 1, entry 9). Therefore, 120°C was chosen as the reaction temperature for all further microwave-assisted reactions.

Scheme 2



The use of these optimal microwave experimental conditions [PEG-300, 120°C] to the reactions of different aromatic aldehydes afforded good yields of benzo[4,5]imidazo[1,2-*a*]pyrimidines, with two phenyl groups presenting in positions 4 and 5 of the new forming pyrimidine nucleus, respectively. To test the scope of aromatic aldehydes, 2-aminobenzimidazole and 1,2-diphenylethanone were used as model substrates, and the results (Table 2, entries 1–11) indicated that aromatic aldehydes bearing functional groups such as chloro, bromo, or methoxy are suitable for the reaction. We have also observed electronic effects, that is, aromatic aldehydes with electron-withdrawing groups (Table 2, entries 1−4) reacted rapidly, while electron-rich groups (Table 2, entries 6−11) decreased the reactivity, requiring longer reaction times.

The use of PEG as a recyclable reaction medium in these reactions avoids the use of volatile and toxic organic solvents. In addition to the often referred advantages of using PEG-300 as solvent, this procedure has following remarkable features when compared to conventional method: (1) short reaction time, (2) clean reaction protocol, (3) high yielding.

Table 1

Optimization for the synthesis of **4a** under MW.

Entry	Solvent	*T* (°C)	Time (min)	Yield (%)
1	HOAc	100	10	46
2	CH_3CN	100	10	34
3	Ethanol	100	10	57
4	Water	100	10	41
5	PEG-300	100	10	68
6	PEG-300	90	14	60
7	PEG-300	110	12	76
8	PEG-300	120	12	87
9	PEG-300	130	12	83

Table 2

Synthesis of compounds **4** under microwave irradiation.

Entry	Product	Ar	Time (min)	Yield (%)	mp (°C)
1	 **4a-4k**	**4a**, 4-Chlorophenyl (**1a**)	12	87	284–286
2		**4b**, 4-Bromophenyl (**1b**)	12	85	>300
3		**4c**, 2-Chlorophenyl (**1c**)	10	86	>300
4		**4d**, 2,4-Dichlorophenyl (**1d**)	10	84	>300
5		**4e**, Phenyl (**1e**)	14	82	274–276
6		**4f**, 4-Tolyl (**1f**)	14	80	295–297
7		**4g**, 4-Dimethylaminophenyl (**1g**)	16	78	>300
8		**4h**, Benzo[*d*][1,3]dioxol-5-yl (**1h**)	14	80	>300
9		**4i**, 4-Methoxyphenyl (**1i**)	14	79	250–252
10		**4j**, 3,4-Dimethoxyphenyl (**1j**)	16	75	267–268
11		**4k**, 3,4,5-Trimethoxyphenyl (**1k**)	18	76	296–298

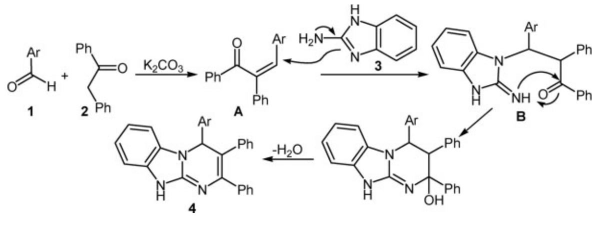
To prove that the use of PEG as solvent is practical, it has to be conveniently recyclable with minimal loss and decomposition. Because PEG is immiscible with aliphatic hydrocarbons, the desired product may be extracted with compounds such as cyclohexane [18], and the retained PEG phase may be reused. In the recycling study, the reaction between 4-chlorobenzaldehyde, 1,2-diphenylethanone, and 2-aminobenzimidazole in the presence of potassium carbonate could be repeated three times without reduction of the yield (84% ± 3%), although a weight loss of ~10% PEG was observed from cycle to cycle.

The formation of **4** is likely to proceed *via* initial condensation of aromatic aldehydes **1** with 1,2-diphenylethanone **2** to afford 3-aryl-1,2-diphenylprop-2-en-1-one **A,** which further undergoes *in situ* Michael addition reaction with 2-aminobenzimidazole **3** to yield intermediate **B**. The intermediate **B** is upon intramolecular cyclization and dehydration to generate final products 4 (Scheme 3).

In this study, all the products were characterized by melting point, IR, and ^{1}H NMR spectral data, as well as elemental analysis.

In conclusion, we have demonstrated that PEG is a convenient, inexpensive, nonionic liquid, nontoxic, and recyclable reaction medium for the efficient synthesis of 4,5-bis-aryl substituted benzo[4,5]imidazo[1,2-*a*]pyrimidines. Interestingly, we found a new multicomponent reaction of aromatic aldehydes with 1,2-diphenylethanone and 2-aminobenzimidazole in PEG-300, which provides a rapid and efficient route for the construction of benzo[4,5]imidazo[1,2-*a*]pyrimidine skeleton. This protocol offers a rapid and clean alternative and reduces reaction time. The recyclability of the reaction media makes reaction economically and potentially viable for commercial applications.

Scheme 3



EXPERIMENTAL

Microwave irradiation was carried out with a microwave oven Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden. Melting points were determined in the open capillaries and were uncorrected. IR spectra were taken on a FT-IR-Tensor 27 spectrometer in KBr pellets and reported in cm^{-1}. ^{1}H NMR spectra were measured on a Bruker DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. Elemental analysis was determined by using a Perkin-Elmer 240c elemental analysis instrument.

General procedure for the one-pot synthesis of benzo[4,5]imidazo[1,2-*a*]pyrimidine derivatives under microwave irradiation conditions. Typically, in a 10-mL Emrys^{TM} reaction vial, aromatic aldehyde 1 (1 mmol), 1,2-diphenylethanone 2 (1 mmol), 2-aminobenzimidazole 3 (1 mmol), potassium carbonate (0.4 mmol), and PEG-300 (2 mL) were mixed and then capped. The mixture was irradiated for a given time at 120°C under microwave irradiation (initial power 100 W and maximum power 250 W). Upon completion, monitored by TLC, the reaction mixture was cooled to room temperature. The precipitated product was filtered off and the filter liquor was extracted by diethyl ether. The residue left after evaporation of the solvent was added to the solid product isolated by filtration, and purified by flash chromatography (silica gel, petroleum ether: acetone = 10:1) to give rise to the pure product 4. The recovered PEG can be reused for a number of cycles without significant loss of activity.

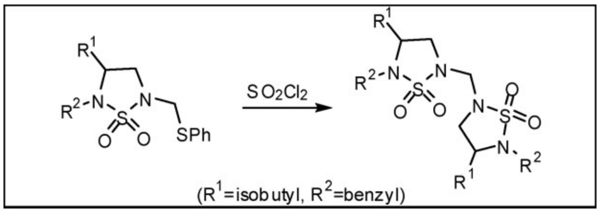
DOI 10.1002/jhet.136



The treatment of a 1,2,5-thiadiazolidine 1,1-dioxide-derived phenylthiomethyl ether with sulfuryl chloride yielded an unexpected dimeric product whose structure was determined using X-ray crystallography. A plausible mechanism for the formation of this product is proposed.

J. Heterocyclic Chem., **46**, 669 (2009).

INTRODUCTION

Chronic obstructive pulmonary disease (COPD) is a multifactorial inflammatory disorder characterized by alveolar wall destruction, enlargement of the air spaces, and airflow obstruction due to chronic bronchitis and emphysema [1–3]. The treatment of COPD is symptomatic [4,5], and there are no drugs capable of halting the relentless progression of the disorder. Although the pathogenesis of COPD is poorly understood, recent ground-breaking studies indicate that the disorder involves the close interplay of oxidative stress [6], alveolar septal cell apoptosis [7–9], extracellular matrix destruction arising from a protease/antiprotease imbalance [10,11], and chronic inflammation [12]. Proteases implicated in COPD include serine (neutrophil elastase), cysteine (cathepsin S), and metallo-(MMP-2, MMP-9, and MMP-12) proteases [13]. Agents capable of modulating the aberrant activity of these enzymes may be of potential therapeutic value [14–16].

We have previously described the design, synthesis, and *in vitro* biochemical evaluation of a new and general class of mechanism-based inhibitors of serine proteases (structure (I), Figure 1) [17,18], and have recently demonstrated that the time-dependent inactivation of these enzymes by (I) proceeds through the initial formation of a Michael acceptor (a sulfonyl imine), ultimately leading to the formation of an inactive enzyme-inhibitor complex (or complexes) [19]. A key step in the multistep synthesis of (I) was the synthesis of a substituted *N*-chloromethyl sulfohydantoin via a sulfuryl chloride-mediated cleavage of a phenylthiomethyl ether (Scheme 1).

Based on the successful development of (I), we reasoned that the replacement of the C=O group by a CH_2 group would generate a 1,2,5-thiadiazolidine 1,1-dioxide (cyclosulfamide) and transform (I) into a new class of noncovalent inhibitors (II) (Figure 1) [20]. Accordingly, the appropriate substituted 1,2,5-thiadiazolidine 1,1-dioxide-derived phenylthiomethyl ether intermediate was synthesized and then treated with sulfuryl chloride to obtain the *N*-chloromethyl derivative (Scheme 2). Surprisingly, work up of the reaction mixture and subsequent purification of the product by flash chromatography afforded a solid which did not exhibit the spectral characteristics of the expected *N*-chloromethyl compound. Instead, an interesting dimeric product (7) was obtained, the structure of which and the mechanism leading to it constitutes the subject of the present article.

RESULTS AND DISCUSSION

The structure of product (7) was established on the basis of the following data: the molecular weight of the compound was determined by ESI-MS to be 549, corresponding to the molecular formula $C_{27}H_{40}N_4O_4S_2$, which was in agreement with the elementary analysis of the product. The structure of (7) was established unambiguously via single crystal X-ray crystallography. An ORTEP [21] view (Figure 2) and X-ray crystal structure data (Table 1) are shown below [22].

A plausible mechanism depicting the formation of (7) is outlined in Figure 3, line (a), whereby the initial formation of a chlorosulfonium salt proceeds further along

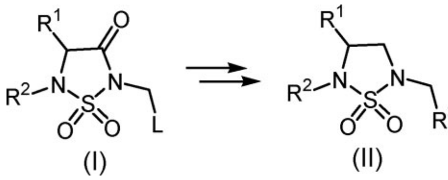


Figure 1. Design of noncovalent inhibitor (II).

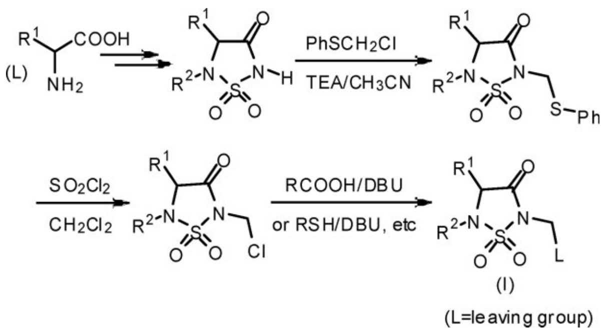
two pathways: one leading to an iminium ion (A) [23], and the other leading to a sulfur ylide (B), probably favored by the high acidity of the methylene hydrogens in the moiety -N(SO_2N-)CH_2SClPh. This ylide subsequently undergoes rearrangement to α-chlorosulfide (C) in a process that is reminiscent of the Pummerer rearrangement [24,25]. When (C) dissociates into an ion pair (both ions are stabilized by resonance), anion (D) undergoes a Michael-type reaction with iminium ion (A) to afford the unusual dimeric product (7). The equilibrium leading to (A) will likely be more favorable for formation of (A) than (B), and hence more favorable for (A) than for (C) and (D). However, capture of (D) by (A) to produce (7) would shift the series of equilibria from (B) to (C) and (D), ultimately leading to (7).

It now becomes clear why such a dimeric product is not observed when the initial phenyl thiomethyl ether bears a carbonyl group at position 3 of the 1,2,5-thiadiazolidine 1,1-dioxide ring, but merely affords the chloromethyl derivative upon treatment with sulfuryl chloride (Figure 3, line (b)). The presence of a C=O group adjacent to nitrogen located at position 2 diminishes its nucleophilicity considerably (by virtue of being adjacent to a C=O group, as well as an SO_2 group), rendering path (a) in Figure 3 inoperative and blocking the formation of a dimer.

In summary, the structure of an unexpected dimeric product formed in the reaction of a 1,2,5-thiadiazolidine 1,1-dioxide-derived phenylthiomethyl ether with sulfuryl chloride was determined using X-ray crystallography. A plausible mechanism leading to the formation of this product is proposed.

Scheme 1



EXPERIMENTAL

General. The ^{1}H NMR spectra were recorded on a Varian XL-300 or XL-400 NMR spectrometer. Melting points were determined on a Mel-Temp apparatus and are uncorrected. IR spectra were taken with a Nicolet FT-IR-Avatar 360 spectrometer. MS spectra were recorded with VARIAN 1200L mass spectrometer. Elemental analysis data were obtained from Columbia Analytical Services (Tucson, AZ). Reagents and solvents were purchased from various chemical suppliers (Aldrich, Acros rganics, TCI America, and Bachem). Silica gel (230–450 mesh) used for flash chromatography was purchased from Sorbent Technologies, Atlanta, GA. Thin layer chromatography was performed using Analtech silica gel plates. The TLC plates were visualized using iodine and/or UV light.

Methyl 2-(Benzylamino)-4-methylpentanoate (1). DL-Leucine methyl ester hydrochloride (43.6 g; 240 mmol) was suspended in 250 mL 1,2-dichloroethane, and then benzaldehyde (30.8 g; 270 mmol) and acetic acid (19.2 g; 320 mmol) were added, followed by sodium triacetoxyborohydride (71.2 g; 335 mmol). The reaction was stirred at RT overnight. The reaction mixture was adjusted to pH 10 using 20% sodium hydroxide, and then two layers were separated. The aqueous layer was extracted with 2 × 100 mL diethyl ether and the organic layers were combined and dried over anhydrous sodium

sulfate. Removal of solvent yielded a crude product, which was purified by flash chromatography (silica gel/ethyl acetate/hexanes) to give compound **1** as a colorless oil (27.0 g, 48.6% yield). ir (neat): 3333 (NH), 1735 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.88 (dd, 6H, $2CH_3$, J = 6.6, 19.8 Hz), 1.48 (t, 2H, CH_2, J = 7.5 Hz), 3.31 (t, 1H, alpha-H, J = 7.5 Hz), 3.71 (dd, 2H, CH_2, J = 12.9, 60 Hz), 3.72 (s, 3H, OCH_3), 7.20–7.26 (m, 5H, phenyl protons); ms: m/z 258 (M^++Na, 27%), 236 (M^++1, 53%), 176 (M^+-C(O)OCH$_3$, 21%), 91 (phCH$_2^+$, 100%). Anal. Calcd. for $C_{14}H_{21}NO_2$: C, 71.46; H, 8.99; N, 5.95. Found: C, 71.19; H, 9.28; N, 5.94.

Methyl 2-(Benzyl(*N*-(*tert*-butoxycarbonyl)sulfamoyl)-amino)-4-methylpentanoate (2). A solution of *N*-chlorosulfonyl isocyanate (14.9 g; 103 mmol) in 130 mL dry methylene chloride cooled in an ice bath was added dropwise to a solution of *t*-butyl alcohol (7.72 g; 103 mmol) in 130 mL dry methylene chloride with stirring. After 15 min stirring, the resulting solution was added dropwise to a solution of compound **1** (24.24 g; 103 mmol) and triethylamine (10.6 g; 103 mmol) in 130 mL dry methylene chloride under an ice bath. The ice bath was removed after the addition and the reaction stirred at RT for 6 h. The reaction mixture was washed with150 mL brine and the organic layer was dried over anhydrous sodium sulfate. Removal of the solvent yielded a crude product, which was purified by flash chromatography (silica gel/ethyl acetate/hexanes) to give compound **2** as a white solid (31.0 g, 72.6% yield), mp 95–96°C. ir (KBr pellet): 3355 (NH), 1740 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.68 (dd, 6H, $2CH_3$, J = 6.0, 94.5 Hz), 1.40–1.60 (m, 3H, CH & CH_2), 1.50 (s, 9H, t-Butyl protons), 3.70 (s, 3H, OCH_3), 4.65 (t, 1H, alpha-H, J = 7.5 Hz), 4.71 (dd, 2H, CH_2, J = 16.5, 122.1 Hz, CH_2), 7.25–7.45 (m, 5H, phenyl protons); ms: m/z 437 (M^++Na, 100%), 381 (M^+-OCH$_3$, 19%), 258 (M^+-SO$_2$NH-Boc+Na, 29%), 236 (M^+-SO$_2$NHBoc+1, 46%), 91 (PhCH$_2^+$, 19%). Anal. Calcd. for $C_{19}H_{30}N_2O_6S$: C, 55.05; H, 7.29; N, 6.76. Found: C, 55.13; H, 7.03; N, 6.62.

***tert*-Butyl *N*-Benzyl-*N*-(1-hydroxy-4-methylpentan-2-yl) sulfamoylcarbamate (3).** To a solution of compound **2** (27.21 g; 65.5 mmol) in 100 mL dry THF, a solution of 2*M* lithium borohydride in THF (32.8 mL; 65.6 mmol) was added dropwise, followed by the dropwise addition of 197 mL absolute ethanol. The reaction mixture was stirred at RT overnight. The reaction mixture was cooled in an ice bath and neutralized to pH 4 using 5% aqueous HCl solution, and then the solvent was completely removed. Two hundred and fifty millilitres of water was added and extracted with 3 × 300 mL ethyl acetate. The combined organic extracts were dried over anhydrous sodium sulfate. Removal of the solvent yielded a crude product, which was purified by flash chromatography (silica gel/ethyl acetate/hexanes) to give compound **3** as a white solid (22.0 g, 86.7% yield), mp 107–109°C. ir (KBr pellet): 3217 (OH), 1733 (C=O) cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 0.82 (dd, 6H, $2CH_3$, J = 6.3, 38.4 Hz), 1.05–1.35 (m, 2H, CH_2), 1.48 (s, 9H, t-Butyl protons), 1.56–1.65 (m, 1H, CH), 2.82 (t, 1H, OH, J = 5.4 Hz), 3.55–3.70 (m, 2H, CH_2), 4.03–4.17 (m, 1H, CH), 4.50 (dd, 2H, CH_2, J = 15.9, 29.7 Hz), 7.18–7.45(m, 5H, phenyl protons); ms: m/z 409 (M^++Na, 100%), 353 (M^+-*t*-Butene+Na, 12%), 230 (M^+-SO$_2$NHBoc+Na, 35%), 91 (PhCH$_2^+$, 9%). The synthesis of new 2-(4-substituted thiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, 2-(4-oxo-4,5-dihydro-thiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, and 2-(5-arylidene-4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihy-drophthalazine-1,4-diones is reported. The introduction of different substituents on the phthalazine, the thiazole and the thiazolinone has been studied. The new compounds have been characterized and evaluated for their antiproliferative activity against hepatocellular carcinoma, one of the most lethal tumors. The activity shown by some of these compounds towards liver tumor cells is encouraging.

J. Heterocyclic Chem., **46**, 674 (2009).

INTRODUCTION

Thiazoles play a prominent role in nature and have broad applications in agricultural and medicinal chemistry. As a matter of fact, thiazole derivatives show antitumor [1,2], anti-hypertensive [3], anti-inflammatory [4,5], anti-hyperlipidemic [6] and other biological properties [7,8].

Phthalazine derivatives, similarly to other members of the isomeric diazine series, have found wide application as therapeutic agents [9–21]. The synthesis and biological evaluation of semicarbazide derivatives that exhibit anticancer activity has been reported [22–24].

Moreover, a number of molecules bearing a tridentate ligand system, structurally related to thiazolophthalazines and thiazolinonephthalazines [25–32], show an inhibitory activity towards tumors; it has been shown that complexation of these compounds results in derivatives that are potent cytotoxic agents [33].

Following our interest in the synthesis and biological activity of heterocyclic compounds [34–39], we have synthesized several new 2-(4-substituted thiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, 2-(4-oxo-4,5-dihydro-thiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, and 2-(5-arylidene-4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, in order to assess their capability of inhibiting tumor cell growth, and in particular their activity against hepatocellular carcinoma.

Hepatocellular carcinoma is one of the five most common cancers worldwide; it is one of the most common cancers in males in the world; it has an annual incidence worldwide of more than 500,000 cases and is very poorly treated with survival rates of only 23% at one year and less than 5% at five years [40].

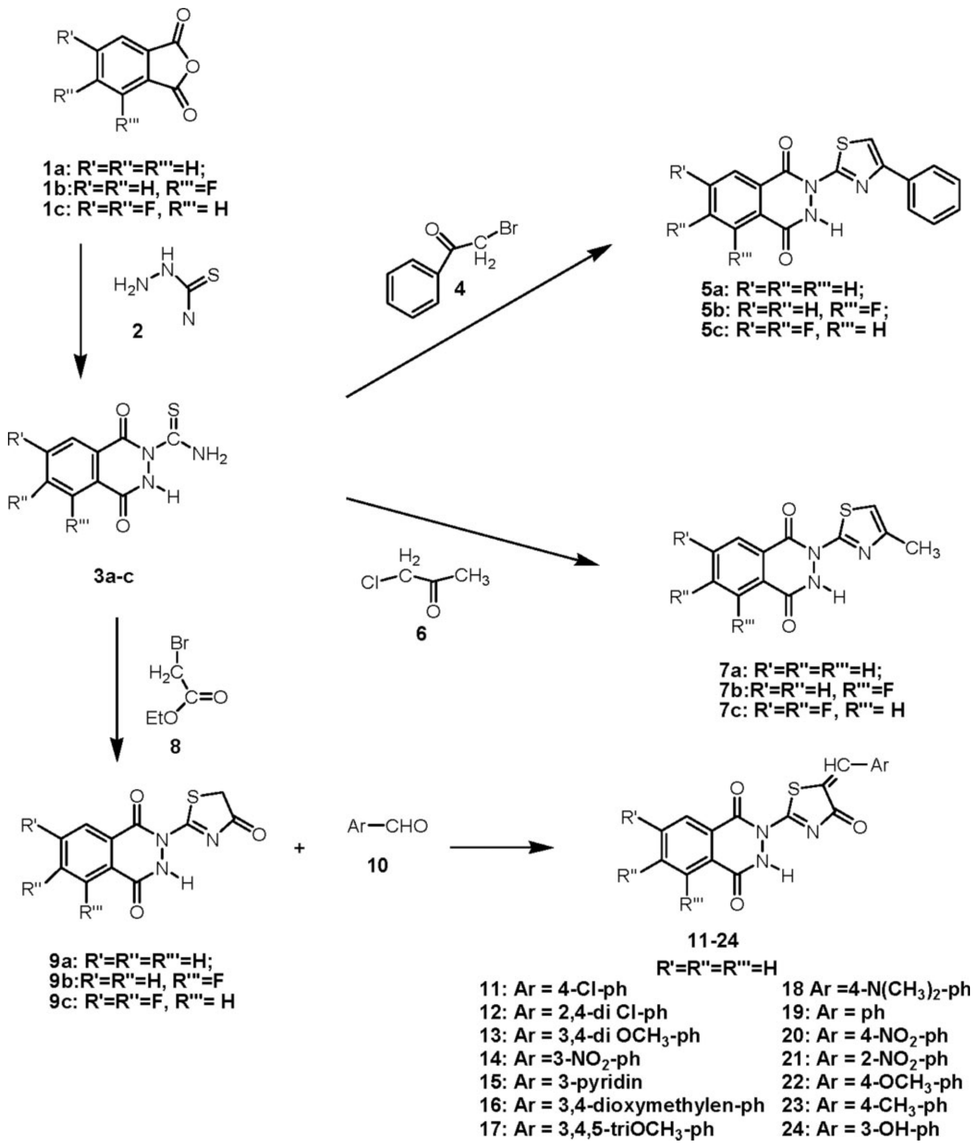
According to literature data, the highest diffusion is observed in China and eastern Asia, middle Africa and some countries of western Africa, while lower incidence is evident in Japan, Europe, and America. Nevertheless a rising trend is observed, due to the increasing of HCV infection [41]. The prognosis is generally poor, especially in the African and Chinese population, where survival time may be as short as eleven weeks from the onset of symptoms.

In this article, we investigate a straightforward and efficient synthesis of compounds containing thiazole and phthalazine moieties in the same molecule, as we consider this aspect particularly interesting.

RESULTS AND DISCUSSION

Several 2-(4-substituted thiazol-2-yl)-2,3-dihydrophtha-lazine-1,4-diones, 2-(4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, and 2-(5-arylidene-4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-

Scheme 1



diones have been synthesized and their capability of inhibiting tumor cell growth investigated.

The first step in the synthetic pathway (Scheme 1) consists of the reaction of equimolecular amounts of phthalic anhydrides **1a–c** with thiosemicarbazide **2** in isopropanol, in the presence of catalytic amounts of acetic acid. By this method [39], 2-carbothioamidophthalazines **3a–c** can be prepared easily.

Compounds **3a–c** are then reacted either with α-halogen ketones or with α-halogen esters to form the substituted thiazole ring derivatives (**5a–c**, **7a–c**), and the thiazolinonic derivatives **9a–c,** respectively.

In the case of compound **3b** and its derivatives two possible regioisomers can be obtained. Apparently, according to chromatographic and spectral data, only one of the two possible isomers is formed, but the exact structure has not been investigated at this stage of the study.

Compounds **11–24** were obtained by reacting compound **9a** with different aryl aldehydes in acetic acid and acetic anhydride. All the obtained compounds were purified by crystallization from an appropriate solvent, and were fully characterized with the aid of ^{1}H NMR spectroscopy, mass spectrometry, and elemental analysis.

Compounds **5b–c**, **7a–c**, **9a–c**, **11–18** have been evaluated for their anti-proliferative activity towards the *FaO Reuber hepatoma* cell line, which maintains the characteristics of hepatocytes, both *in vivo* and *in vitro*, and retains the ability to undergo apoptosis [42].

To demonstrate the most promising structures and substitutions for biological activity, we investigated

three different scaffolds, namely 2-(4-phenylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, 2-(4-thiazolinone-2-yl)-2,3-dihydrophthalazine-1,4-diones, and 2-(4-arylidenthiazolinone-2-yl)-2,3-dihydrophthalazine-1,4-diones.

Some of the tested compounds (Table 1) show a fairly good cytotoxic activity against FaO cells in the NRU assay.

Compound **11**, 2-[5-(4-chlorobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione shows the best activity with a 44% cell survival at a concentration of 0.1m*M*.

A similar behavior was observed in compound **12**, 2- [5-(2,4-dichlorobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione, indicating that the presence of one or two chlorine atoms, in the 5-arylidene moiety, increases activity against hepatoma cells.

It should be observed on the other hand that introduction of different substituents in the same scaffold generally leads to a decrease in biological activity, as observed for compounds **14, 15,** and **18**, which have a 3-nitrobenzylidene-, a 3-pyridylene-, and a 4-dimethylaminobenzylidene in position 5 of the thiazolidinone moiety, respectively.

In the case of compounds **16** and **17**, good activity is observed only at relatively high concentrations.

Compound **9a**, which contains an unsubstituted thiazolinonic cycle, showed a moderate biological activity.

The substitution of the thiazolinonic ring with a 4-phenylthiazole or 4-methylthiazole leads to a moderate increase in biological activity. This is particularly evident for compounds **5b** and **7c**, where one or two fluorine atoms are introduced in the phthalazine moiety, respectively.

Moreover, the presence of an opportunely functionalized aromatic moiety both in the thiazole and in the thiazolinone rings seems important for biological properties.

Thus activity is strongly influenced by the nature of the substituents, and the presence of halogen atoms both on the phthalazine and on 5-arylidenthiazolinone leads to an increase in activity.

These results give an indication towards the design of new and potentially more active compounds, and suggest that 2-(4-phenylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-diones, 2-(4-thiazolinone-2-yl)-2,3-dihydrophthalazine-1,4-diones, and 2-(5-arylidenthiazolinone-2-yl)-2,3-dihydrophthalazine-1,4-diones could be considered promising scaffolds for cytotoxic compounds.

EXPERIMENTAL

Melting points were uncorrected and were determined on a Reichert Kofler thermopan apparatus. ^{1}H NMR spectra were recorded on a Bruker AMX (300 MHz) using tetramethylsilane (TMS) as internal standard (chemical shifts in δ values). Electron ionization (EI) mass spectra were obtained by a Fisons QMD 1000 mass spectrometer (70 eV, 200 μA, ion source temperature 200°C). The samples were introduced directly into the ion source. Elemental analyses were obtained on a Perkin-Elmer 240 B microanalyzer.

All synthesized compounds were purified by crystallization from an appropriate solvent (ethanol, ethanol/water or ethanol/acetic acid).

Compounds **3a–c** were prepared as reported in the literature [39].

General procedure for the synthesis of compounds 5a–c. The compounds **3a–c** (3 mmol) and 2-bromoacetophenone (3.5 mmol) in 100 mL of isopropanol suspension is refluxed, under vigorous stirring, until complete dissolution of reagents and for further 4 h. After cooling to room temperature, a solid is obtained, which is filtered off, washed with isopropyl ether several times, and dried.

The following listed compounds were synthesized using the same procedure.

2-(4-Phenylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (5a). Whitish solid, m.p. 300°C. MS m/z = 321, yield = 70%. ^{1}H NMR (DMSO-*d6*): δ 7.36 (t, 1H, phth., $J = 7.7$); 7.47 (t, 2H, phenyl, $J = 7.7$); 7.90 (s, 1H, C_5H-thiaz.); 7.96–8.05 (m, 4H, phth. + phenyl); 8.10 (d, 1H, phth., $J = 7.3$); 8.38 (d, 1H, phth., $J = 7.3$); 12.42 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{17}H_{11}N_3O_2S$: C, 63.54; H, 3.45; N, 13.08. Found: C, 63.71; H, 3.43; N, 13.13.

5- (or 8-) Fluoro-2-(4-phenylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (5b). Pale yellow solid, m.p. 210–211°C. MS m/z = 339, yield = 79%. ^{1}H NMR (DMSO-*d6*): δ 7.36 (t, 1H, phth., $J = 7.7$); 7.47 (t, 2H, phenyl, $J = 7.7$); 7.90 (s, 1H, C_5H-thiaz.); 7.96–8.05 (m, 3H, phenyl); 8.10 (d, 1H, phth. $J = 7.3$); 8.38 (d, 1H, phth. $J = 7.3$); 12.42 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{17}H_{10}FN_3O_2S$: C, 60.17; H, 2.97; N, 12.38. Found: C, 59.99; H, 2.96; N, 12.35.

6,7-Difluoro-2-(4-phenylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (5c). Beige solid, m.p. 229–231°C. MS m/z = 357, yield = 72%. ^{1}H NMR (DMSO-*d6*): δ· 7.42–7.44 (m, 1H, phth.); 7.51–7.55 (m, 2H, phenyl); 7.99 (s, 1H, C_5H-thiaz.); 8.04–8.07 (m, 2H, phenyl + phth.); 8.14 (t, 1H, phenyl, $J = 8.1$); 8.42 (t, 1H, phenyl, $J = 8.1$); 12.82 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{17}H_9F_2N_3O_2S$: C, 57.14; H, 2.54; N, 11.76. Found: C, 56.99; H, 2.55; N, 11.75.

General procedure for the synthesis of compounds 7a–c. A suspension of compounds **3a–c** (2.71 mmol) and chloroacetone (3.25 mmol) in 140 mL of isopropanol is refluxed, under vigorous stirring, until complete dissolution of reagents and then for further 5 h. The mixture is allowed to cool down to room temperature thus obtaining a solid, which is filtered off, washed with isopropyl ether several times, and dried. The following listed compounds were synthesized using the same procedure.

2-(4-Methylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (7a). Beige solid, m.p. 249–251°C. MS m/z = 259, yield = 52%. ^{1}H NMR (DMSO-*d6*): δ· 2.38 (s, 3H, CH_3); 7.08 (s, 1H, C_5H-thiaz.); 7.95–8.08 (m, 3H, phth.); 8.37 (d, 1H, phth. $J = 7.3$); 12.61 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{12}H_9N_3O_2S$: C, 55.59; H, 3.50; N, 16.21. Found: C, 55.80; H, 3.48; N, 16.15.

5- (or 8-) Fluoro-2-(4-methylthiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (7b). Beige solid, m.p. 243–245°C. MS m/z = 277, yield = 89%. ^{1}H NMR (DMSO-*d6*): δ· 2.13 (s, 3H, CH_3); 6.61 (s, 1H, C_5H-thiaz.); 7.76–7.96 (m, 2H, phth.); 7.98–8.03 (m, 1H, phth.); NH not detected. *Anal.* Calcd for $C_{12}H_8FN_3O_2S$: C, 51.98; H, 2.91; N, 15.15. Found: C, 52.19; H, 2.90; N, 15.11.

6,7-Difluoro-2-(4-methylthiazol-2-yl)-2,3-dihydrophtha-lazine-1,4-dione (7c). Beige solid, m.p. 254–258°C. MS m/z = 295, yield = 77%. ^{1}H NMR (DMSO-*d6*): δ· 2.27 (s, 3H, CH_3); 6.50 (s, 1H, C_5H-thiaz.); 7.65 (dd, 1H, phth., $J = 7.8, 2.4$); 8.00 (dd, 1H, phth., $J = 7.8, 2.7$); 10.72 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{12}H_7F_2N_3O_2S$: C, 48.81; H, 2.39; N, 14.23. Found: C, 48.55; H, 2.41; N, 14.17.

General procedure for the synthesis of compounds 9a-c. A mixture of compounds **3a–c** (0.013 mol) and ethyl bromoacetate (0.016 mol) were suspended in isopropanol (120 mL) and refluxed for 2 h. A white product was isolated by filtration and crystallized from acetic acid. The following listed compounds have been synthesized using the same procedure.

2-(4-Oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (9a). White solid, m.p. 311–312°C. MS m/z = 261, yield = 93%. ^{1}H NMR (DMSO-*d6*): δ· 4.10 (s, 2H, CH_2-thiaz.); 7.83–7.91 (m, 4H, phth.); 12.52 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{11}H_7N_3O_3S$: C, 50.57; H, 2.70; N, 16.08. Found: C, 50.78; H, 2.68; N, 16.11.

5- (or 8-) Fluoro-2-(4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (9b). White solid, m.p. 309°C d. MS m/z = 279, yield = 82%. ^{1}H NMR (DMSO-*d6*): δ· 3.85 (s, 2H, CH_2-thiaz.); 7.71–7.76 (m, 2H, phth.); 7.89–7.92 (m, 1H, phth.); 11.77 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{11}H_6FN_3O_3S$: C, 47.31; H, 2.17; N, 15.05. Found: C, 47.52; H, 2.18; N, 14.99.

6,7-Difluoro-2-(4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (9c). Whitish solid, m.p. 298°C d. MS m/z = 297, yield = 84%. ^{1}H NMR (DMSO-*d6*): δ· 3.97 (s, 2H, CH_2-thiaz.); 8.15–8.26 (m, 2H, phth.); 11.88 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{11}H_5F_2N_3O_3S$: C, 44.45; H, 1.70; N, 14.14. Found: C, 44.21; H, 1.69; N, 14.18.

General procedure for the synthesis of 2-(5-arylidene-4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione derivatives (11–24). These derivatives were prepared starting from 2-(4-oxo-4,5-dihydrothiazol-2-yl)-2,3-dihydrophthalazine-1,4-dione (4 mmol) and the appropriate aryl aldehyde (4 mmol) in acetic acid (20 mL) and acetic anhydride (2 mL). The reaction mixture was stirred and heated to reflux for 30 min. A colored precipitate was obtained, which was filtered off and crystallized from the appropriate solvent. Compounds **11–24** were synthesized using this procedure.

2-[5-(4-Chlorobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (11). Light yellow solid, m.p. 346–347°C d. MS m/z = 383–385, yield = 64%. ^{1}H NMR (DMSO-*d6*): δ· 7.52 (d, 2H, aryl, $J = 8.5$); 7.58 (d, 2H, phth., $J = 7.3$); 7.76 (s, 1H, aryl—CH=); 7.90–7.97 (m, 4H, aryl + phth.); 11.80 (1H, s, NH, D_2O-exch.). *Anal.* Calcd for $C_{18}H_{10}ClN_3O_3S$: C, 56.33; H, 2.62; N, 10.95. Found: C, 56.14; H, 2.64; N, 10.90.

2-[5-(2,4-Dichlorobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (12). Orange solid, m.p. 345–347°C d. MS m/z = 417–420, yield = 54%. ^{1}H NMR (DMSO-*d6*): δ· 7.52 (d, 2H, aryl, $J = 8.5$); 7.59 (d, 2H, phth., $J = 7.3$); 7.76 (s, 1H, aryl—CH=); 7.88–7.97 (m, 3H, aryl + phth.); 11.80 (1H, s, NH, D_2O-exch.). *Anal.* Calcd for $C_{18}H_9Cl_2N_3O_3S$: C, 51.69; H, 2.17; N, 10.05. Found: C, 51.92; H, 2.15; N, 10.10.

2-[5-(3,4-Dimethoxybenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (13). Yellow solid, m.p. 308–311°C d. MS m/z = 409, yield = 68%. ^{1}H NMR (DMSO-*d6*): δ· 3.76 (s, 3H, OCH_3); 3.78 (s, 3H, OCH_3); 6.84 (d, 1H, aryl, $J = 8.1$); 7.07 (d, 1H, aryl, $J = 8.1$); 7.24 (s, 1H, aryl); 7.73 (s, 1H, aryl—CH=); 7.76–7.94 (m, 4H, phth.); 11.78 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{20}H_{15}N_3O_5S$:

C, 58.67; H, 3.69; N, 10.26. Found: C, 58.55; H, 3.70; N, 10.30. *Anal.* Calcd for $C_{10}H_{10}OS$: C, 67.38; H, 5.65; S, 17.99. Found: C, 67.06; H, 5.75; S, 17.69.

2-[5-(3-Nitrobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (14). Mustard colored solid, m.p. 320–323°C d. MS m/z = 394, yield = 49%. ^1H NMR (DMSO-d_6): δ· 7.72 (t, 1H, aryl, J = 8.1); 7.88–7.96 (m, 6H, phth. +aryl—CH=); 8.24 (d, 1H, phth., J = 7.3); 8.45 (s, 1H, aryl); 11.78 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{18}H_{10}N_4O_5S$: C, 54.82; H, 2.56; N, 14.21. Found: C, 55.01; H, 2.54; N, 14.26.

2-[5-(3-Pyridinylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (15). Light yellow solid, m.p. 297–299°C d. MS m/z = 350, yield = 67%. ^1H NMR (DMSO-d_6): δ· 7.48 (t, 1H, pyr. J = 7.8); 7.80 (s, 1H, —CH=aryl); 7.83–7.94 (m, 5H, phth. + pyr.); 8.58 (dd, 1H, pyr, J = 4.6, 1.9); 8.82 (d, 1H, pyr., J = 1.9); 11.78 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{17}H_{10}N_4O_3S$: C, 58.28; H, 2.88; N, 15.99. Found: C, 57.98; H, 2.90; N, 16.04.

2-[5-(3,4-Dioxymethylenbenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (16). Orange solid, m.p. 333°C d. MS m/z = 393, yield = 75%. ^1H NMR (DMSO-d_6): δ 6.09 (s, 2H, CH_2); 7.04 (d, 1H, aryl, J = 8.1); 7.13 (d, 1H, aryl, J = 8.1); 7.20 (s, 1H, aryl); 7.68 (s, 1H, —CH=aryl); 7.85–7.93 (m, 4H, phth.); 12.25 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{19}H_{11}N_3O_5S$: C, 58.01; H, 2.82; N, 10.68. 2-[5-(2-Nitrobenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (21). Orange solid, m.p. 327°C d. MS m/z = 394, yield = 37%. ^1H NMR (DMSO-d_6): δ· 7.84–8.09 (m, 9H, phth. +aryl—CH=); 12.27 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{18}H_{10}N_4O_5S$: C, 54.82; H, 2.56; N, 14.21. Found: C, 54.88; H, 2.55; N, 14.18.

2-[5-(4-methoxybenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (22). Beige solid, m.p. 301–304°C d. MS m/z = 379, yield = 50%. ^1H NMR (DMSO-d_6): δ· 3.86 (s, 3H, OCH_3); 7.02 (d, 2H, aryl, J = 8.4); 7.51 (d, 2H, aryl, J = 8.8); 7.70 (s, 1H, aryl—CH=); 7.86–7.96 (m, 4H, phth.); 11.78 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{19}H_{13}N_3O_4S$: C, 60.15; H, 3.45; N, 11.08. Found: C, 59.88; H, 3.47; N, 11.06.

2-[5-(4-Methylbenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione (23). Yellow solid, m.p. 331–333°C d. MS m/z = 363, yield = 38%. ^1H NMR (DMSO-d_6): δ· 2.32 (s, 3H, CH_3); 7.28 (d, 2H, aryl, J = 8.1); 7.45 (d, 2H, aryl, J = 8.1); 7.72 (s, 1H, aryl—CH=); 7.76–7.97 (m, 4H, phth.); 11.79 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{19}H_{13}N_3O_3S$: C, 62.80; H, 3.60; N, 11.56. Found: C, 63.11; H, 3.59; N, 11.60.

2-[5-(3-Hydroxybenzylidene)-4-oxo-4,5-dihydrothiazol-2-yl]-2,3-dihydrophthalazine-1,4-dione. (24). Yellow solid, m.p. 354°C d. MS m/z = 365, yield = 42%. ^1H NMR (DMSO-d_6): δ· 7.22 (d, 1H, aryl, J = 7.7); 7.35 (s, 1H, aryl); 7.44–7.49 (d, 2H, aryl+aryl-OH, D_2O-exch.); 7.52 (t, 1H, aryl, J = 7.7); 7.75 (s, 1H, —CH=aryl); 7.88–7.94 (m, 4H, phth.); 11.78 (s, 1H, NH, D_2O-exch.). *Anal.* Calcd for $C_{18}H_{11}N_3O_4S$: C, 59.17; H, 3.03; N, 11.50. Found: C, 58.97; H, 3.05; N, 11.45.

Biological assay. The FaO rat hepatoma cell line H-35 Reuber (ICLC ATL99001) was purchased from Interlab Line Collection (Servizio Biotecnologie, IST, Genoa, Italy). FaO cells were cultured in flasks (capacity 75 cm^2) containing 15 mL Dulbecco's modified Eagle's medium (DMEM plus Glutamax I, Invitrogen S.r.l., Milan, Italy) and then supplemented with 100 UI/mL penicillin, 0.1 mg/mL streptomycin and 10% foetal bovine serum (Mascia Brunelli, Milan, Italy). Cells were incubated at 37°C in 5% CO_2 and 95% O_2 atmosphere. All experiments were carried out 24 h after seeding. Before the assay, the cells were treated with a phosphate buffer (PBS) and the culture medium was substituted with DMEM without serum.

Cell vitality. The vitality of adhesive cells was determinated with the *Neutral Red Uptake* assay (NRU) as reported by Borenfreund and Puerner [43]. As far as the NRU assay is concerned, the Neutral Red solution (0.4% NR in H_2O) was diluted 1:80 with phosphate buffer (PBS) and incubated at 37°C overnight. Then the solution was centrifuged (2600 rpm) to remove micro crystals that are insoluble in coloring. Once treated, the culture medium was vacuumed and substituted with a NR solution. The cells were incubated in the NR solution at 37°C for 30 min to allow coloring incorporation of the lisosomes in the vital cells of the flask. The RN solution was removed, the cells were rapidly washed with 1% formaldehyde and a calcium chloride solution was added. To remove incorporated NR from vital cells, a mixture (solution) of 1% acetic acid in ethanol 50% was added. A sample collected from every well was read using a Perkin-Elmer, 540 nm spectrophotometer. The values obtained for the treated cells were expressed as percentages of the value obtained for the control cells. All experiments were repeated at lease three times and were made in triplicate.

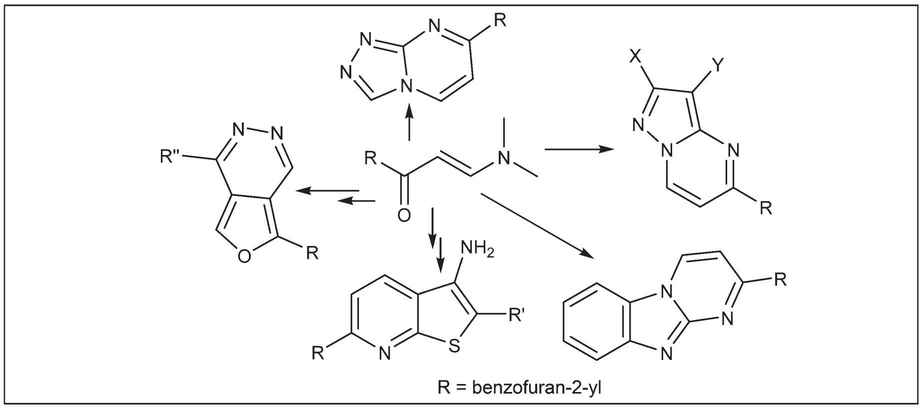
DOI 10.1002/jhet.141



Pyrazolo[1,5-*a*]pyrimidines, pyrazoles, and thieno[2,3-*b*]pyridine were synthesized from sodium salt of 5-benzofuran-2-yl-3-hydroxypropenone and the appropriate of heterocyclic amines, diazonium chloride, and 1,3-dicarbonoyl compounds. Pyrimidino[4′,5′:4,5]thieno[2,3-*b*]pyridine, 1,2,3,4-tetrazolo[1″,5″:6′,1′]-pyrimidino[4′,5′:4,5]thieno[2,3-*b*]pyridine and pyridino[2″,3″:2′,3′]thieno[4,5-*d*]1,2,4-triazolo[4,3-*e*]pyrimidine derivatives were synthesized from 6-benzo[*d*]furan-2-yl-2-thioxohydropyridine-3-carbonitrile and each of formic acid or formamide. Structures of the newly synthesized were established by elemental analysis and spectral data.

J. Heterocyclic Chem., **46**, 680 (2009).

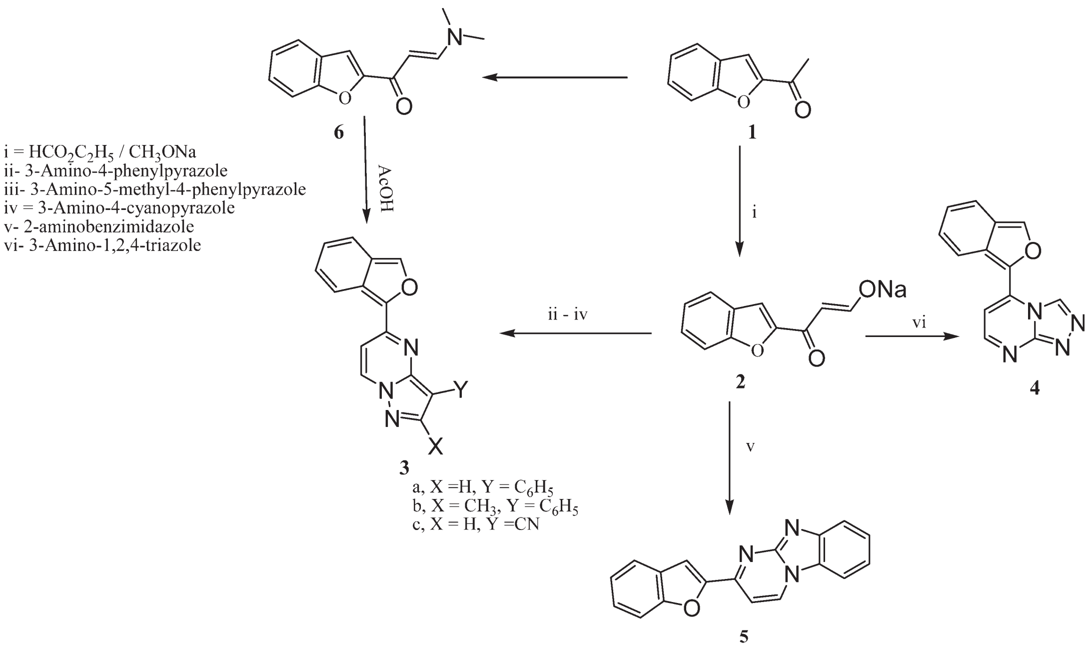
INTRODUCTION

Pyrazolo[1,5-*a*]pyrimidines are of considerable chemical and pharmacological importance as purine analogs [1]. The interesting biological activity has attracted the attention of many chemists to develop new efficient general procedures for the synthesis of pyrazolo[1,5-*a*]pyrimidines by using aminopyrazoles. The benzofuran moiety is incorporated in various natural products [2–5] and pharmaceuticals [6–9]. In addition, biological and medicinal activity of fused thienopyrimidines has stimulated much research in this field [10–21]. Our research has been devoted to the development of new classes of heterocyclic systems which incorporate the thienopyrimidine moiety in the hope that they may be biologically active. In continuation of our interest in the synthesis of heterocycles [22–26], we report herein, a convenient method for the synthesis of pyrazolo[1,5-*a*]pyrimidines, thieno[2,3-*b*]pyridines, pyrimidino[4′,5′:4,5]thieno[2,3-*b*]pyridine, isoxazolo[3,4-*d*]pyridazines, and pyridine containing benzofuran moiety as antimicrobial agents.

RESULTS AND DISCUSSION

Treatment of sodium salt of 5-benzofuran-2-yl-3-hydroxypropenone (**2**) with 3-amino-4-phenylpyrazole in piperidenium acetate yielded 5-benzofuran-2-yl-3-phenylpyrazolo[1,5-*a*]pyrimidine (**3a**). Structure of **3** was established on the basis of their elemental analysis, spectral data, and alternative synthetic route. Thus, treatment of 1-benzofuran-2-yl-3-dimethylamino-propenone [26] (**6**) with 3-amino-4-phenylpyrazole in boiling ethanol gave product identical in all respects (mp., mixed mp., and spectra) with **3a**. ^{1}H NMR spectrum of **3a** revealed multiple band at $\delta = 7.35–8.55$ (m, aromatic protons). Analogously, compound **2** was reacted with the appropriate 3-amino-4-methyl-5-phenylpyrazole, 3-amino-4-cyanopyrazole, 2-aminobenzimidazole or 3-aminotriazole gave 5-(1-benzofuran-2-yl)-3-methyl-2-phenylpyrazolo[1,5-*a*]pyrimidine (**3b**), 5-benzofuran-2-yl-3-cyanopyrazolo[1,5-*a*]pyrimidine (**3c**), 7-(benzofuran-2-yl)-[1,2,4]triazolo[4,3-*a*]pyrimidine (**4**), and 2-(1-benzofuran-2-yl)pyrimido[1,2-*a*]benzimidazole (**5**), respectively (Scheme 1).

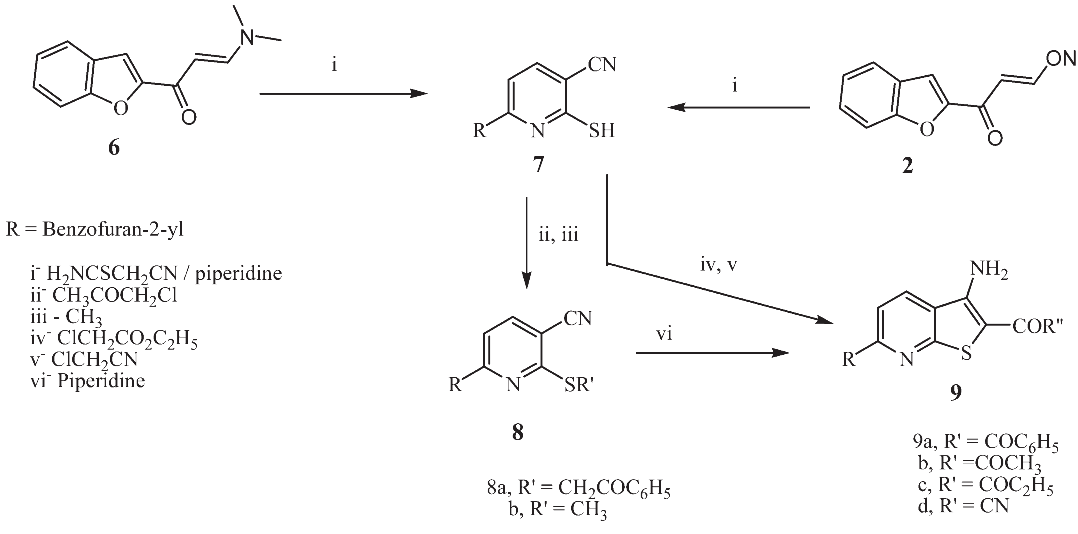
Scheme 1



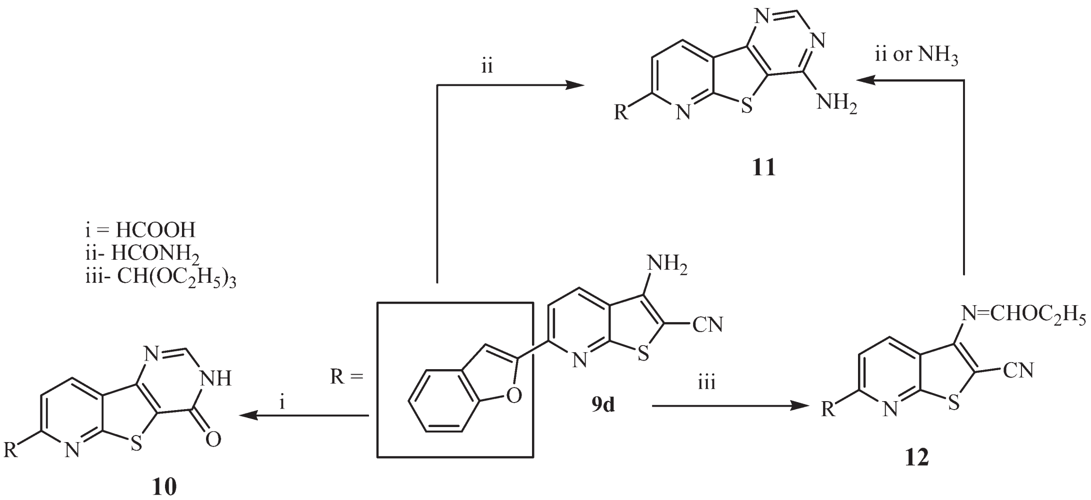
It has been found that 6-benzofuran-2-yl-2-sulfanylpyridine-3-carbonitrile (**7**), which prepared via reaction of **2** with cyanothioacetamide in presence of piperidenium acetate, reacted with ω-bromoacetophenone in *N,N*-dimethylformamide containing potassium hydroxide to afford the product corresponding to addition and dehydrobromination reactions. The IR spectrum of this product showed bands corresponding to CN and CO groups. Its ^{1}H NMR spectrum revealed the signals at δ = 4.09 (S, 2H, **SCH_2**) and 7.47–8.04 (m, 12H, ArH's). Based on the above-mentioned data, these reaction products could be formulated as 6-benzofyran-2-yl-2-(2-oxo-2-phenylethylthio)pyridine-3-carbonitrile (**8a**). Further confirmation of the structure of **8a** arose from their cyclization in boiling ethanol containing catalytic amount of piperidine to give the corresponding (3-amino-6-(benzofuran-2-yl)thieno[2,3-b]pyridin-2-yl)(phenyl)methanone (**9a**) (Scheme 2).

The IR spectrum of **9a** showed no band of the CN function while the band of the new NH_2 group was detected. On the other hand, the ^{1}H NMR spectrum of **9a** revealed absence of signals of the —SCH_2— group and the presence of the NH_2 protons. The earlier findings proved that the CN and the —SCH_2— groups were

Scheme 2



Scheme 3

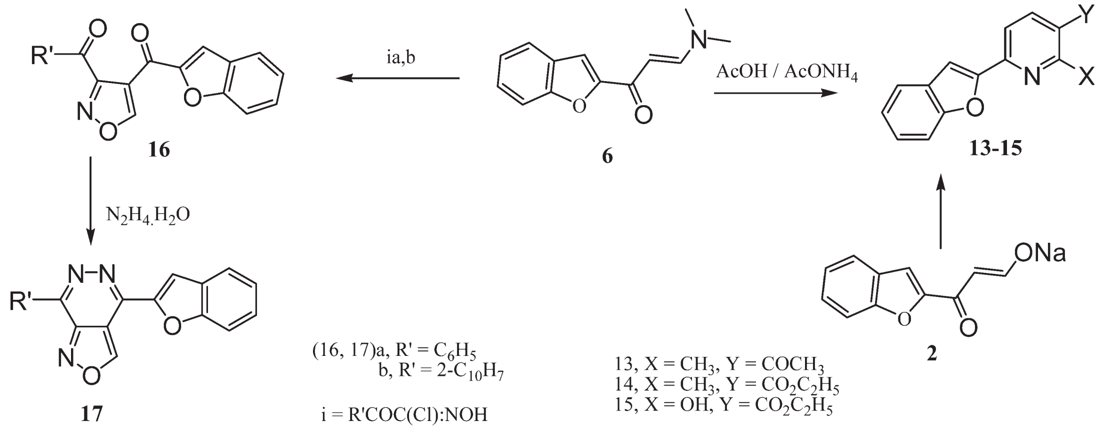


both involved in the cyclization step leading to **9a**. Compound **7** reacted also with each of iodomethane, chloroacetone, ethyl chloroacetate, and chloroacetonitrile in *N*,*N*-dimethylformamide containing potassium hydroxide to afford **8b** and **9b–d**, respectively. The reaction seemed to proceed through dehydrochlorination to give the intermediate **8c–d**, which underwent cyclization via addition of the $-SCH_2-$ hydrogen to the nitrile function to give **9b–d**, respectively. IR, ^1H NMR, and elemental analyses were the basis on which the structure of **9** was established. Thus, it has been found that **9d** reacted with each of formic acid, formamide, or triethyl orthoformate to give the corresponding 7-(1-benzofuran-2-yl)pyrido[2′,3′:4,5]-thieno[2,3-*b*]pyridin-4(3*H*)-one (**10**), 7-(1-benzofuran-2-yl)pyrido[2′,3′:4,5]thieno[2,3-*b*]pyridin-4-amine (**11**), and ethyl [6-(1-benzofuran-2-yl)-2-cyanothieno[2,3-*b*]pyridin-3-yl]imidoformate (**12**), respectively (Scheme 3). Structures of **10–12** were established on the basis of spectral data (IR, ^1H NMR) and elemental analysis. Thus, IR spectrum of **11** revealed bands at 3458 and 3216 (NH_2). IR spectrum of **12** revealed bands at 2248 (CN) and 1627 (C=N). Also, compound **17** reacted with ethanolic ammonia (or formamide) afforded a product identical in all aspects (mp., mixed mp., and spectra) with **11**.

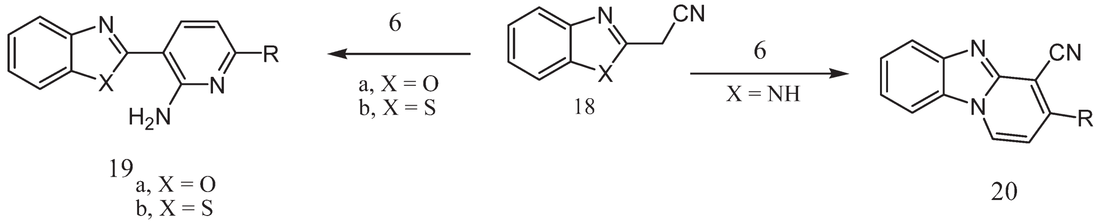
Treatment of 1-benzofuran-2-yl-3-dimethylamino-propenone (**6**) with the appropriate acetylacetone, ethyl acetoactate, or ethyl cyanoacetate, in boiling acetic acid containing ammonium acetate under reflux gave pyridine derivatives **13–15**, respectively (Scheme 4).

Compound **6** reacted with *N*-hydroxy-2-oxo-2-phenylethanimidoyl chloride in toluene containing triethylamine afforded 1-benzofuran-2-yl(3-benzoylisoxazol-4-yl)methanone (**16a**). Structure **16** was elucidated by elemental analysis, spectral data, and chemical transformation. ^1H NMR spectrum of **16a** showed signals at $\delta = 7.25–7.69$ (m, 8H, aromatic), 8.58–8.60 (d, 2H, $J = 4$ Hz, aromatic), and 8.74 (s, 1H, isoxazole H-5). Thus, treatment of **16a** with hydrazine hydrate gave 1-benzofuran-2-yl(3-benzoylisoxazol-4-yl)methanone (**17a**). Analogously, **6** reacted with *N*-hydroxy-2-oxo-2-(2-naphthyl)ethanimidoyl chloride

Scheme 4



Scheme 5



in toluene containing triethylamine afforded **16b**, which treated with hydrazine hydrate to give **17b**.

Also, treatment of 1-benzofuran-2-yl-3-dimethylamino-propenone (**6**) with each of benzoxazol-2-ylacetonitrile (**18a**) and benzthiazol-2-ylacetonitrile (**18b**) in boiling acetic acid containing ammonium acetate afforded 3-(benzo[d]oxazol-2-yl)-6-(benzofuran-2-yl)pyridin-2-amine (**19a**) and 3-(benzo[*d*]thiazol-2-yl)-6-(benzofuran-2-yl) pyridin-2-amine (**21b**) on the elemental analysis and spectral data. In contrast, benzimidazol-2-acetonitile reacted with **6** in ethanol gave 3-(1-benzofuran-2-yl)pyrido[1,2-*a*]benzimidazole-4-carbonitrile (**20**) in a good yield (Scheme 5).

Finally, treatment of sodium salt of 5-benzofuran-2-yl-3-hydroxypropenone **2** with the benzenediazonium chloride in ethanol containing sodium acetate as a buffer solution yielded 3-(1-benzofuran-2-yl)-3-oxo-2-(phenylhydrazono)propanal (**21**). Structure **21** was confirmed by elemental analysis, spectral data, and chemical transformation. ^{1}H NMR spectrum of **21** showed signal at δ = 7.26–7.93 (m, 10 H, ArH's), 9.98 (s, 1H, —CHO) and 14.39 (s, br., 1H, NH). Thus, **21** was reacted with hydrazine hydrate in boiling ethanol under reflux to give 3-(1-benzofuran-2-yl)-4*H*-pyrazol-4-one phenylhydrazone **22** (Scheme 6).

CONCLUSION

5-Benzofuran-2-yl-3-hydroxypropenone is used to synthesize different pyrazolo[1,5-*a*]pyrimidines, pyrazoles, and thieno[2,3-*b*]pyridine via its reaction with different heterocyclic amines, cyanothioacetamide, and diazonium chlorides, respectively. Pyrimidino[4′,5′:4,5]-thieno[2,3-*b*] pyridine, 7-(1-benzofuran-2-yl)pyrido-[2′,3′:4,5]thieno[2,3-*b*] pyridin-4(3*H*)-one, and 7-(1-benzofuran-2-yl)pyrido[2′,3′: 4,5]thieno[2,3-*b*]pyridin-4-amine were synthesized from 6-benzo[*d*]furan-2-yl-2-thioxohydropyridine-3-carbonitrile in good yields.

EXPERIMENTAL

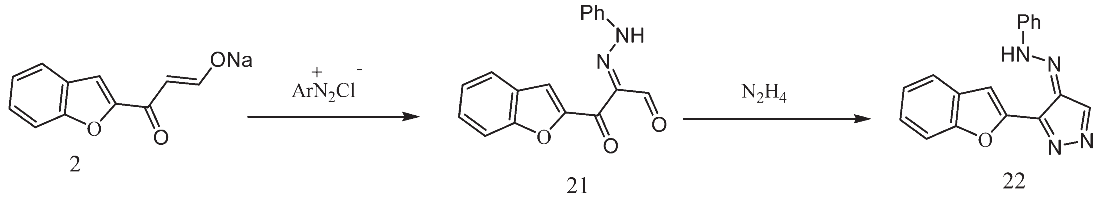
All melting points were determined on an electrothermal apparatus and are uncorrected. IR spectra were recorded (KBr discs) on a Shimadzu FTIR 8201 PC spectrophotometer. ^{1}H NMR and ^{13}C NMR spectra were recorded in $(CD_3)_2SO$ solutions on a Varian Gemini 300 MHz spectrometer and chemical shifts are expressed in δ units using TMS as an internal reference. Elemental analyses and microorganism tests were carried out at the Microanalytical Center of the Cairo University.

Sodium salt of 5-benzofuran-2-yl-3-hydroxypropenone (2). In three-necked flask sodium methoxide (10 mmol) and ether (20 mL) was taken and 2-acetylbenzofuran (**1**) (10 mmol) with (10 mmol) of ethyl format was poured over it through a separating funnel with efficient stirring. The solid product was collected and used directly in the reactions.

Synthesis of 3a–c, 4, 5, 7, 13, 14, and ethyl 15. ***Method A.*** A solution of (10 mmol) sodium salt of sodium salt of 5-benzofuran-2-yl-3-hydroxypropenone **2**, (10 mmol), the appropriate 3-amino-4-phenyle, 3-amino-4-methyl-5-phenylpyrazole, 3-amino-4-cyanopyrazole, 3-aminopyrazole, 2-aminobenzimidazole, cyanothioacetamide, acetylacetone, ethyl acetoacetate, or ethyl cyanoacetate (10 mmol) and piperidine acetate (1 mL) in water (3 mL) was refluxed for 10 min. Acetic acid (1.5 mL) was added to the hot solution. The solid product was filtered off and recrystallized from the proper solvent gave products **3a–c**, **4**, **5**, **7**, **13–15**.

Method B. An equimolar amount of 1-benzofuran-2-yl-3-dimethylaminopropenone (**6**), the appropriate 3-amino-4-phenylpyrazole, 3-amino-4-methyl-5-phenylpyrazole, 3-amino-4-cyanopyrazole, 3-amino-1,2,4-triazole, 2-aminobenzimidazole, cyanothioacetamide, acetylacetone, ethyl acetoacetate, or ethyl cyanoacetate and ammonium acetate (5 mmol) in acetic acid

Scheme 6



(10 mL) was heated under reflux for 4 h. The resulting solid was collected and recrystallized from the proper solvent gave products **3a–c**, **4**, **5**, **7**, **13–15**.

5-Benzofuran-2-yl-2-phenylpyrazolo[1,5-*a*]pyrimidine (3a). This compound was obtained as yellow crystals (AcOH), mp 204–206°C, yield (73%); IR (cm^{-1}): 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 7.35–8.55 (m, aromatic protons). ^{13}C NMR $(CD_3)_2SO$ δ = 102.23, 110.21, 122.6, 122.8, 123.52, 125.8, 125.9, 128.2, 128.6, 130, 131.2, 132, 133.1, 135.2, 140.1, 144.2, 146.2, 147.8. *Anal.* Calcd. for $C_{20}H_{13}N_3O$ (311.35): C, 77.16; H, 4.21; N, 13.50. Found: C, 76.92; H, 4.00; N, 13.65.

5-(1-Benzofuran-2-yl)-3-methyl-2-phenylpyrazolo[1,5-*a*] pyrimidine (3b). This compound was obtained as yellow crystals (AcOH), mp 215–217°C, yield (75%); IR (cm^{-1}): 3050 (CH, aromatic), 2920 (CH, aliphatic), 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 2.51 (s, 3H, CH_3), 7.35–8.55 (m, 12 H, aromatic protons). *Anal.* Calcd. for $C_{21}H_{15}N_3O$ (325.37): C, 77.52; H, 4.65; N, 12.91. Found: C, 77.45; H, 4.56; N, 13.12.

5-Benzofuran-2-yl-2-cyanopyrazolo[1,5-*a*]pyrimidine (3c). This compound was obtained as pale yellow crystals (AcOH), mp 238–240°C, yield (76 %); IR (cm^{-1}): 3050 (CH, aromatic), 2920 (CH, aliphatic), 2229 (CN), 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 7.32–8.91 (m, 11 H, aromatic protons), 8.97 (s, 1H, pyrazole H-5). ^{13}C NMR $(CD_3)_2SO$ δ = 84.1, 104.2, 112,3, 121.3, 122.6, 123.3, 128.5, 130.1, 130.7, 131.2, 136.2, 140.4, 148.8, 150, 152.2. *Anal.* Calcd. for $C_{15}H_8N_4O$ (260.26): C, 69.23; H, 3.10; N, 21.53. Found: C, 69.32; H, 3.00; N, 21.35.

2-(1-Benzofuran-2-yl)pyrimido[1,2-*a*]benzimidazole (4). This compound was obtained as pale yellow crystals (AcOH), mp 230–262°C, yield (64%); IR (cm^{-1}): 1616 (C=N), 1562 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 7.36–7.955 (m, 5H, aromatic protons), 8.59 (s, 1H, triazole H-5), 8.99–9.01(d, *J* = 6H), pyrimidine ring). *Anal.* Calcd. for $C_{13}H_8N_4O$ (236.23): C, 66.10; H, 3.41; N, 23.72. Found: C, 66.25; H, 3.51; N, 23.54.

7-(1-Benzofuran-2-yl)[1,2,4]triazolo[4,3-*a*]pyrimidine (5). This compound was obtained as yellow crystals (AcOH), mp 205–207°C, yield (37%); IR (cm^{-1}): 3050 (CH, aromatic), 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 7.34–8.53 (m, aromatic protons). *Anal.* Calcd. for $C_{18}H_{11}N_3O$ (285.31): C, 75.78; H, 3.89; N, 14.73. Found: C, 75.87; H, 3.98; N, 14.65.

6-Benzofuran-2-yl-2-sulfanylpyridine-3-carbonitrile (7). This compound was obtained as page crystals (EtOH), mp 200–202°C, yield (84%); IR (cm^{-1}): 3342 (NH), 2217 (CN). ^{1}H NMR $(CD_3)_2SO$ δ = 6.67–7.42 (m, 6H, aromatic proton), 8.21 (s, 1H, 5-H of the pyridinethione ring), 14.10 (b, 1H, SH). *Anal.* Calcd. for $C_{14}H_8N_2OS$ (252.30): C, 66.65; H, 3.20; N, 11.10.60; S, 12.71. Found: C, 66.72; H, 3.41; N, 11.28; S, 12.64.

1-[6-(1-Benzofuran-2-yl)-2-methylpyridin-3-yl]ethanone (13). This compound was obtained as colorless crystals (EtOH), mp 113–114°C, yield (37%); IR (cm^{-1}): 1685 (CO), 1639 (C=N), 1581 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 2.50 (s, 3H, CH_3), 2.70 (s, 3H, CH_3), 7.31–8.38 (m, 7H, aromatic protons). ^{13}C NMR $(CD_3)_2SO$ δ = 24.4, 25.3, 106.3, 111.5, 118.4, 121.2, 123.4, 125, 128.2131, 137.5, 148.2, 151.3, 145,5, 155.8, 199.8. *Anal.* Calcd. for $C_{16}H_{13}NO_2$ (251.25): C, 76.48; H, 5.21; N, 5.57. Found: C, 76.64, H, 5.10; N, 5.75.

Ethyl 6-(1-benzofuran-2-yl)-2-methylnicotinate (14). This compound was obtained as colorless crystals (EtOH), mp 129–130°C, yield (37%); IR (cm^{-1}): 1715 (CO), 1639 (C=N), 1581 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 1.29 (t, 3H, *J* = 7.5 Hz, CH_3), 2.77 (s, 3H, CH3), 4.26 (q, 2H, *J* = 7.5 Hz, CH_2), 7.27–839 (m, 7H, aromatic protons). ^{13}C NMR $(CD_3)_2SO$ δ = 14.2, 25.6, 60.8, 106.3, 111.5, 115.4, 121, 123.3, 125.2, 125.6, 128.3, 139.4, 148, 145.2, 156.2, 159.3, 164. ^{1}H NMR $(CD_3)_2SO$. *Anal.* Calcd. for $C_{17}H_{15}NO_3$ (281.31): C, 72.58; H, 5.37; N, 4.98. Found: C, 72.45; H, 5.45; N, 4.75.

Ethyl 6-(1-benzofuran-2-yl)-2-oxo-1,2-dihydro-pyridine-3-carboxylate (15). This compound was obtained as colorless crystals (AcOH), mp 182–184°C, yield (89%); IR (cm^{-1}): 3448 (NH), 1681 (CO), 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 1.32 (t, 3H, *J* = 6 Hz, CH_3), 4.28 (q, 2H, *J* = 6 Hz, CH_2), 7.22–8.50 (m, 7H, aromatic protons), 9.26 (s, br., 1H, NH). *Anal.* Calcd. for $C_{16}H_{13}NO_4$ (283.28): C, 67.84; H, 4.63; N, 4.94. Found: C, 67.58; H, 4.50; N, 5.24.

Synthesis of 8a,b, 9b-d. A mixture of **7**(1.3 g, 10 mmol) and potassium hydroxide (0.6 g, 10 mmol) in *N,N*-dimethylformamide (20 mL) was stirred for 2 h at room temperature. The appropriate of ω-bromoacetophenone, methyl iodide, chloroacetone, ethyl chloroacetate, or chloroacetonitrile (10 mmol each) was added and stirring was continued for 2 h. The resulting solid was collected and recrystallized from the proper solvent to give **8a**, **8b**, and **9b–d**, respectively.

6-(1-Benzofuran-2-yl)-2-[(2-oxopropyl)thio]nicotino-nitrile (8a). This compound was obtained as pale yellow crystals (EtOH), mp 240–242°C, yield (92%); IR (cm^{-1}): IR: 2190 (CN). ^{1}H NMR $(CD_3)_2SO$ δ = 4.09 (S, 2H, SCH_2) and 7.47–8.04 (m, 12H, ArH's). ^{1}H NMR $(CD_3)_2SO$ δ = 52.8, 95.1, 106.3, 111.4, 113.2, 116, 121.2, 123.3, 125.6, 126.4, 127.6, 127.9, 130.1, 136.7, 151, 155.4, 160.3, 163.2, 198.8. *Anal.* Calcd. for $C_{22}H_{14}N_2O_2S$ (370.42): C, 71.33; H, 3.81; N, 7.56; S, 8.66. Found: C, 71.23; H, 3.75; N, 7.64; S, 8.65.

6-(1-Benzofuran-2-yl)-2-(methylthio)nicotinonitrile (8b). This compound was obtained as pale brown crystals (EtOH), mp 120–121°C, yield (81%); IR (cm^{-1}): 2198 (CN). ^{1}H NMR $(CD_3)_2SO$ δ = 2.47 (s, 3H, CH_3), 6.67–8.02 (m, 11H, aromatic proton), 8.21 (s, 1H, 5-H of the pyridinethione ring). *Anal.* Calcd. for $C_{15}H_{10}N_2OS$ (266.32): C, 67.65; H, 3.78; N, 10.52; S, 12.04. Found: C, 67.52; H, 3.82; N, 10.67; S, 12.19.

1-[3-Amino-6-(1-benzofuran-2-yl)thieno[2,3-*b*]pyridin-2-yl] ethanone (9b). This compound was obtained as pale yellow crystals (EtOH), mp 260–262°C, yield (37%); IR (cm^{-1}): 3316, 3124 (NH_2), 1596 (CO). ^{1}H NMR $(CD_3)_2SO$ δ = 2.38 (s, 3H, CH_3CO), 6.45 (br, 2H, NH_2), 7.16–7.73 (m, 6H, aromatic protons), 7.82 (s, 1H, 5-H of the thienopyridine ring). ^{13}C NMR $(CD_3)_2SO$ δ = 30.1, 106.4, 111.6, 115.4, 121.3, 122.6, 123.2, 125.6, 127.4, 127.8, 134.6, 148.2, 149.4, 154.3, 155.8, 156.6, 191.2. *Anal.* Calcd. for $C_{17}H_{12}N_2O_2S$ (308.35): C, 66.22; H, 3.92; N, 9.08; S, 10.40. Found: C, 66.10; H, 3.85; N, 8.89; S, 10.30.

Ethyl 3-amino-6-(1-benzofuran-2-yl)thieno[2,3-*b*]pyridine-2-carboxylate (9c). This compound was obtained as pale yellow crystals (Dioxan), mp 240–242°C, yield (68%); IR (cm^{-1}): 3481, 3351 (NH_2), 1731 (CO). ^{1}H NMR $(CD_3)_2SO$ δ = 1.29 (t, 3H, *J* = 7 Hz, CH3), 4.24 (q, 2H, *J* = 7 Hz, CH2), 6.21 (br, 2H, NH_2), 7.12–7.87 (m, 6H, aromatic protons), 7.99 (s, 1H, 5-H of the thienopyridine ring). ^{13}C NMR $(CD_3)_2SO$ δ = 13.8, 59.1, 105.6, 106.2, 111.4, 115.5, 121.2, 123.5, 125.4, 127.2, 128.1, 133.3, 148.4, 149.6, 154.3, 155.2, 155.8, 166.4. ^{1}H NMR $(CD_3)_2SO$. *Anal.* Calcd. for $C_{18}H_{14}N_2O_3S$ (338.38): C, 63.89; H, 4.17; N, 8.28; S, 9.48. Found: C, 63.95; H, 4.00; N, 8.45; S, 9.65.

3-Amino-6-(1-benzofuran-2-yl)thieno[2,3-*b*]pyridine-2-carbonitrile (9d). This compound was obtained as pale yellow crystals (EtOH), mp 160–162°C, yield (72%); IR (cm^{-1}): 3496, 3300 (NH_2), 2198 (CN). ^{1}H NMR $(CD_3)_2SO$ $\delta = 6.57$ (br, 2H, NH_2), 7.12 (m, 6H, aromatic protons), 8.31(s, 1H, 5-H of the thienopyridine ring). *Anal.* Calcd. for $C_{16}H_9N_3OS$ (291.33): C, 65.96; H, 3.11; N, 14.42; S, 11.01. Found: C, 66.12; H, 3.18; N, 14.30; S, 10.85.

(3-Amino-6-(benzofuran-2-yl)thieno[2,3-b]pyridin-2-yl)(phenyl)-methanone (9a). A solution of **8a** (1.85 g, 5 mmol) in ethanol (20 mL) containing piperidine (0.3 mL) was heated under reflux for 2 h. After cooling, the resulting solid was collected by filtration and recrystallized from dioxin/ethanol to give as pale yellow crystals (EtOH), mp 290–292°C, yield (78%); IR (cm^{-1}): 3408, 3300 (NH_2), 1685 (CO). ^{1}H NMR $(CD_3)_2SO$ $\delta = 16.21$ (br, 2H, NH_2), 7.52–7.87 (m, 11H, aromatic protons), 7.99 (s, 1H, 5-H of the thienopyridine ring). *Anal.* Calcd. for $C_{22}H_{14}N_2O_2S$ (370.42): C, 71.33; H, 3.81; N, 6.56; S, 8.66. Found: C, 71.34; H, 3.79; N, 7.64; S, 8.75.

7-(1-Benzofuran-2-yl)pyrido[2′,3′:4,5]thieno[2,3-*b*]pyridin-4(3*H*)-one (10). A mixture of **9c** (1.7 g, 10 mmol) and formic acid (99%, 20 mL) was heated under reflux for 7 h. After cooling, the reaction mixture was poured over ice (100 g) and the resulting solid was collected and recrystallized form *N*,*N*-dimethylformamide to give as page crystals mp > 300°C, yield (88%); IR (cm^{-1}): 3423 (NH), 1660 (CO). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.02$–7.99 (m, 6H, aromatic protons), 8.25 (s, 1H, 5-H of the thienopyridine ring), 8.57 (s, 1H, Proton on C-2 of pyrimidine ring), 12.56 (s, 1H, NH of pyrimidine ring). *Anal.* Calcd. for $C_{17}H_9N_3O_2S$ (319.34): C, 63.94; H, 2.84; N, 13.16; S, 10.04. Found: C, 64.12; H, 2.98; N, 13.25; S, 10.15.

7-(1-Benzofuran-2-yl)pyrido[2′,3′:4,5]thieno[2,3-*b*]pyridin-4-amine (11). Compound **9c** (1.7 g, 10 mmol) was heated with formamide (20 mL) at 180°C for 2 h. After cooling, the reaction mixture was poured over ice and the formed solid was collected by filtration and recrystallized form *N*,*N*-dimethylformamide to obtain as page crystals, mp 220–222°C, yield (78%); IR (cm^{-1}): 3458, 3216 (NH_2). ^{1}H NMR $(CD_3)_2SO$ $\delta =$ 6.79 (br, 2H, NH_2), 7.14–7.93 (m, 6H, aromatic protons), 8.01 (s, 1H, 5-H of the thienopyridine ring). *Anal.* Calcd. for $C_{17}H_{10}N_4OS$ (318.35): C, 64.14; H, 3.17; N, 17.60; S, 10.07. Found: C, 64.00; H, 3.27; N, 17.51; S, 10.24.

Ethyl [6-(1-benzofuran-2-yl)-2-cyanothieno[2,3-*b*]pyridin-3-yl]imidoformate (12). A mixture of **9c** (1.7 g, 10 mmol) and triethylorthoformate (20 mL) with catalytic amount of acetic acid were heated under reflux at 140°C for 6 h. The resulting dark brown solution was allowed to cool to room temperature and evaporated under vacuum. *n*-Hexane was added to the residue and the separated solid was filtered, washed with *n*-hexane and recrystallized from ethanol to obtain as pale yellow crystals, mp 180–182°C, yield (69%); IR (cm^{-1}): 2248 (CN), 1627 (C=N). ^{1}H NMR $(CD_3)_2SO$ $\delta = 1.22$ (t, 3H, $J =$ 7.5 Hz, CH_3), 4.33 (q, 2H, $J = 7.5$ Hz, CH_2), 6.73–7.98 (m, 6H, aromatic protons), 8.11 (s, 1H, 5-H of the thienopyridine ring), 8.66 (s, 1H, CH=N). ^{13}C NMR $(CD_3)_2SO$ $\delta = 13.2$, 62.4, 85.4, 106.1, 111.5, 115.2, 121.2, 123.4, 125.2, 125.6, 126.4, 127.2, 135.2, 147.4, 150, 154.2, 155.5, 165.4. *Anal.* Calcd. for $C_{19}H_{13}N_3O_2S$ (347.39): C, 65.69; H, 3.77; N, 12.10; S, 9.23. Found: C, 65.82; H, 3.51; N, 11.95; S, 9.32.

Synthesis of 1-phenyl-4-(1-benzofuran-2-ylcarbonyl)-3-substituted oxazoles 16a,b. An equimolar amounts of the appropriate hydroxamoyl chlorides, 1-(benzofuran-2-yl)-3-(dimethylamino)prop-2-en-1-one (**6**) (5 mmol), and triethylamine (5 mmol) in toluene (20 mL) were heated under reflux for 2 h. The solvent was evaporated under reduce pressure and triturated with petroleum ether 40–60°C then the resulting solid was collected and recrystallized from ethanol to give the oxazoles **16a** and **16b**, respectively.

1,3-Diphenyl-4-(1-benzofuran-2-ylcarbonyl)oxazoles (16a). This compound was obtained as colorless crystals (EtOH), mp 148–150°C, yield (91%); IR (cm^{-1}): 3058 (CH), 1685, 1639 (CO), 1612 (C=N), 1596 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta =$ 7.38–8.02 (m, 10H, aromatic protons) and 10.26 (s, 1H, isoxazole H-5). ^{13}C NMR $(CD_3)_2SO$ $\delta = 111.3$, 117.4, 123.3, 123.8, 126.3, 128.6, 129.2, 130.5, 132.2, 138.2, 138.6, 157.3, 162.7, 173.6, 185.2, 187.9. *Anal.* Calcd. for $C_{19}H_{11}NO_4$ (317.29): C, 71.92; H, 3.49; N, 4.41. Found: C, 71.84; H, 3.75; N, 4.57.

1-Phenyl-4-(1-benzofuran-2-ylcarbonyl)-3-(2-naphthyl)oxazoles (16b). This compound was obtained as yellow crystals (AcOH), mp 214–216°C, yield (95%); IR (cm^{-1}): 3055 (CH), 1674, 1639 (CO), 1627 (C=N), 1554 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.25$–7.69 (m, 8H, aromatic), 8.58–8.60 (d, 2H, $J = 4$ Hz, aromatic) and 9.92 (s, 1H, isoxazole H-5). *Anal.* Calcd. for $C_{23}H_{13}NO_4$ (367.35): C, 75.20; H, 3.57; N, 3.81. Found: C, 75.10; H, 3.45; N, 3.75.

Synthesis of 17a,b and 22. An equimolar amount of the appropriate isoxazoles **16a**, **16b**, or **21** and hydrazine hydrate (5 mmol) in ethanol (20 mL) was boiled under refluxed for 15 min. The resulting solid was collected and recrystallized from the proper solvent to give the oxazolo[3,4-*d*]pyridazines **17a**, **17b**, and **25**, respectively.

7-(1-Benzofuran-2-yl)-2,4-diphenyl-2H-oxazolo[3,4-*d*]pyridazine (17a). This compound was obtained as colorless crystals (AcOH), mp 178–181°C, yield (94%); IR (cm^{-1}): 3058 (CH), 1685, 1639 (CO), 1612 (C=N), 1596 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.37$–8.53 (m, 12H, aromatic protons) and 10.32 (s, 1H, isoxazole H-5). ^{13}C NMR $(CD_3)_2SO$ $\delta = 105.2$, 113.2, 117.7, 122, 123.5, 124.8, 128.2, 128.7, 129.3, 131.3, 136.8, 141.2, 149.2, 149.6, 151.5, 154.8, 159.1. *Anal.* Calcd. for $C_{19}H_{11}N_3O_2$ (313.31): C, 72.84; H, 3.54; N, 13.41. Found: C, 72.65; H, 3.41; N, 13.50.

7-(1-Benzofuran-2-yl)-2-phenyl-2H-4-(2-naphthyl)oxazolo[3,4-*d*]pyridazines (17b). This compound was obtained as yellow crystals (AcOH), mp 240–242°C, yield (89%); IR (cm^{-1}): 3058 (CH), 1624 (C=N), 1569 (C=C). ^{1}H NMR $(CD_3)_2SO$ δ = 7.42–8.58 (m, 11, aromatic protons), 9.13 (s, 1H, aromatic proton) and 9.90 (s, 1H, isoxazole H-5). *Anal.* Calcd. for $C_{23}H_{13}N_3O_2$ (363.37): C, 76.02; H, 3.61; N, 11.56. Found: C, 76.15; H, 3.48; N, 11.68.

3-(1-Benzofuran-2-yl)-4H-pyrazol-4-one phenylhydrazone (22). This compound was obtained as yellow crystals (AcOH), mp 246–248°C, yield (88%); IR (cm^{-1}): 3309 (NH), 1624 (C=N), 1566 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.26$–7.93 (m, 11H, aromatic protons) and 9.35 (s, 1H, NH). ^{13}C NMR $(CD_3)_2SO$ $\delta = 104.2$, 114.2, 114.5, 119.1, 123.3, 125.7, 126.3, 128.6, 130.8, 132.8, 140.5, 143.2, 149.2, 154.2. *Anal.* Calcd. for $C_{17}H_{12}N_4O$ (288.3): C, 70.82; H, 4.20; N, 19.43. Found: C, 70.89; H, 4.10; N, 19.21.

Synthesis of 19a, 19b, and 20. An equimolar amount of 1-benzfuran-2-yl-3-dimethylaminopropenone (**6**), the appropriate benzoxazol-2-ylacetonitrile, benzthiazole-2-ylacetonitrile or benzimidazole-2-ylacetonitrile and ammonium acetate (5 mmol) in acetic acid (10 mL) was heated under reflux for 4 h. The resulting solid was collected and recrystallized from the proper solvent gave products **19a**, **19b**, and **20**, respectively.

3-(Benzo[*d*]oxazol-2-yl)-6-(benzofuran-2-yl)pyridin-2-amine (19a). This compound was obtained as yellow crystals (DMF), mp 278–279°C, yield (68%); IR (cm^{-1}): 3421, 3298 (NH_2), 3055 (CH), 1627 (C=N), 1581 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 6.21$ (s, br., 2H, NH_2), 6.07–7.98 (m, 11H, aromatic protons). MS: 329 [(5.2%), M^{+2}], 328 [(27%), M^{+1}], 327 [(100%), M^+)], 310 (41%), 208 (12.5%), 150 (12.4%). *Anal.* Calcd. for $C_{20}H_{13}N_3O_2$ (327.34): C, 73.38; H, 4.00; N, 12.84. Found: C, 73.24; H, 3.87; N, 12.74.

3-(Benzo[*d*]thiazol-2-yl)-6-(benzofuran-2-yl)pyridin-2-amine (19b). This compound was obtained as yellow crystals (DMF), mp 274–276°C, yield (74%); IR (cm^{-1}): 3398, 3286 (NH_2), 3055 (CH), 1620 (C=N), 1577 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 2.42$ (s, 3H, CH_3), 3.25 (s, 3H, CH_3), 3.49 (t, 1H, $J = 7.5$ Hz, pyrazoline H-4), 6.21 (s, br., 2H, NH_2), 6.07–7.98 (m, 11H, aromatic protons). *Anal.* Calcd. for $C_{20}H_{13}N_3OS$ (343.40): C, 69.95; H, 3.82; N, 12.24; S, 9.34. Found: C, 70.15; H, 3.74; N, 12.45; S, 9.43.

3-(1-Benzofuran-2-yl)pyrido[1,2-*a*]benzimidazole-4-carbonitrile (20). This compound was obtained as yellow crystals (AcOH), mp 256–258°C, yield (65%); IR (cm^{-1}): 3124, 3055 (CH), 2241 (CN), 1635 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.11$ (s, 1H, furan, vinyl CH), 7.24–7.58 (m, 7H, aromatic proton), 8.0–8.10 (d, 2H, $J = 4$ Hz, aromatic) and 9.54 (d, 1H, $J = 4$ Hz, 1H). *Anal.* Calcd. for $C_{20}H_{11}N_3O$ (309.32): C, 77.66; H, 3.58; N, 13.58. Found: C, 77.54; H, 3.45; N, 13.75.

3-(1-Benzofuran-2-yl)-3-oxo-2-(phenylhydrazono)-propanal (21). Benzenediazonium chloride was added to a cold solution of **6** (5 mmol) in ethanolic sodium acetate solution (ethanol, 50 mL) and sodium acetate (0.65 g, 5 mmol) while stirring. The crude solid was collected and recrystallized from ethanol to obtain as reddish yellow crystals, mp 145–145°C, yield (90%); IR (cm^{-1}): 3320 (NH), 1739, 1647 (CO), 1624 (C=N), 1589 (C=C). ^{1}H NMR $(CD_3)_2SO$ $\delta = 7.26$–7.93 (m, 11H, aromatic protons) and 9.98 (s, 1H, CHO), 14.39 (s, br., 1H, NH). ^{13}C NMR $(CD_3)_2SO$ $\delta = 112.1$, 115.8, 118.3, 123.1, 125.7, 126.4, 127.4, 128.6, 130.5, 149.3, 150.5, 155.2, 155.7, 178.2, 192.6. *Anal.* Calcd. for $C_{17}H_{12}N_2O_3$ (292.29): C, 69.86; H, 4.14; N, 9.58. Found: C, 70.12; H, 4.00; N, 9.72.

Diethyl maleate reacts with *N*-substituted-hydrazino-carbothioamides to form ethyl [1,2,4]triazolo[3,4-*b*][1,3]thiazine-5-carboxylates. Reaction proceeds *via* bicyclization and oxidation processes.

J. Heterocyclic Chem., **46**, 687 (2009).

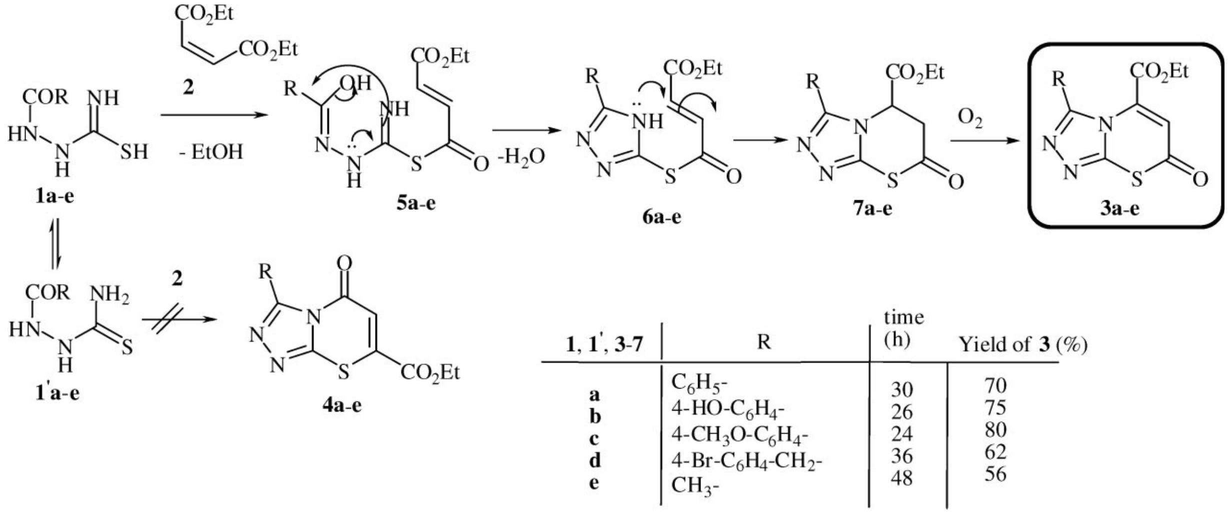
INTRODUCTION

Thioamides and their derivatives occupy a special place among *N*,*S*-containing compounds used in the synthesis of heterocyclic systems, due to their accessibility and the ability to act as difunctional nucleophiles. Reaction of acetylenecarboxylic acid derivatives with *N*,*S*-dinucleophiles provides the general approach for the construction of 1,3-thiazolidine and 1,3-thiazine systems, which are of great interest [1,2]. [1,2,4]Triazepine-3-thiones have been obtained during the reactions of *N*-substituted-hydrazino-carbothioamides with dimethyl acetylene-dicarboxylate and dibenzoyl acetylene under microwave irradiation [3]. The proton-coupled ^{15}N-NMR spectra of hydrazine-carbothioamides have been taken at the natural-abundance level in neutral, basic and acidic solutions at 25°C. The *N*-H proton-exchange reactions of the hydrazino-NH_2 groups in both compounds were found to be very rapid in the presence of acid, but quite slow in the presence of base [4]. Recent report has shown that various *N*-ethyl hydrazine-carbothioamides can undergo different cyclization reactions to give five member heterocycles, which showed a general stimulation effect on B-cells' response [5]. Recently Aly *et al.* [6] investigated the reaction between 2,3-diphenylcyclopropenone and ylidene-*N*-phenylhydrazine-carbothioamides. 1,3-Thiazines have shown wide biological activities. For example, they have shown potential CNS activity [7], potential analgesic, anti-inflammatory, activities [8], and activity as chemotherapeutic agents (i.e., leishmanicides) [9], in addition to their antifungal activity [10]. Our synthetic program has been concerned with the preparation of novel heterocycles efficiently [11–13]. On the basis of the aforementioned encouraging results, we have investigated the reaction of *N*-substituted-hydrazino-carbothioamides **1a**-**e** [14] with diethyl maleate (**2**) to synthesize heterocyclic systems, which might give prospective biological and/or pharmaceutical activities.

RESULTS AND DISCUSSION

Now we have reacted *N*-substituted-hydrazino-carbothioamides **1a**-**e** [14] with diethyl maleate (**2**); the reactions gave mainly the corresponding ethyl 7-oxo-3-substituted-7*H*-[1,2,4]triazolo[3,4-*b*][1,3]thiazine-5-carboxylates **3a-e** (Scheme 1). We chose compounds **1a-d** having aryl groups, whereas we used the methyl derivative **1e** to generalize the idea beyond benzenoid aromatics, to alkyl-substituted starting materials. The structural proof of **3a-e** was based upon the mass, ^{1}H-NMR, ^{13}C-NMR and IR spectra, and elemental analyses. The IR and ^{13}C-NMR spectra of **3a-e** supported the disappearance of any thione and/or NH group. Mass spectrometry and elemental analysis of **3a** proved its molecular formula to be $C_{14}H_{11}N_3O_3S$. The ^{1}H-NMR spectrum of **3a** showed three multiplets for the aromatic phenyl. Besides, the ester-ethyl protons appeared at δ_H 4.12 (q, 2 H, $J = 6.8$ Hz, CH_2) and 1.25 (t, 3 H, $J = 6.8$ Hz, CH_3). The H-6 proton in the ^{1}H-NMR spectrum of **3a** resonated at δ_H 6.82, whereas CH-6 appeared at δ_C 124.2. The ^{13}C-NMR spectrum supported the ^{1}H-NMR spectroscopic data by the distinctive appearance of the

Scheme 1. Reaction of *N*-substituted-hydrazino-carbothioamides **1a-e** with diethyl maleate (**2**). Condition: AcOH, reflux, 1-3d.



1, 1', 3-7	R	time (h)	Yield of 3 (%)

e	CH_3-	48	56

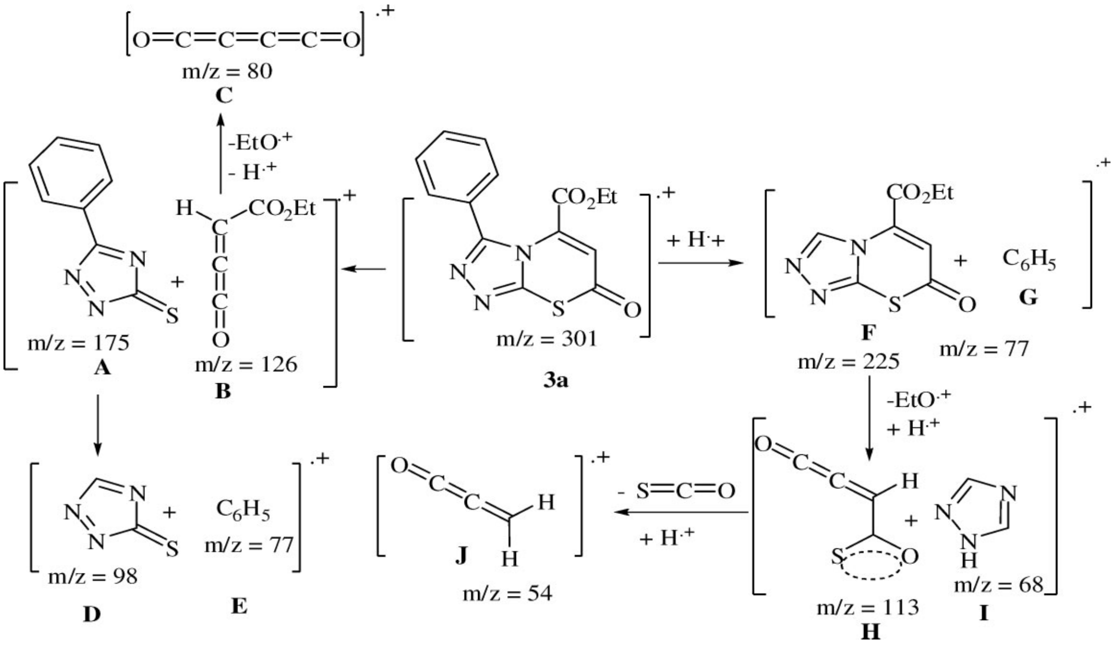
carbon signals representing the ethyl triazolo-thiazine-5-ester skeleton at δ_C 184.0 (C-7), 166.4 (CO-ester), 158.0 (C-3), 150.8 (C-8a), 131.0 (C-5) and 124.2 (CH-6). In **3b**, the mass spectrometry and elemental analysis proved the molecular formula to be $C_{14}H_{11}N_3O_4S$. The IR spectrum did not reveal any absorption due to C=S and/or NH groups, but an absorption band at ν_{max} 3490 cm^{-1} was assigned to the OH stretching. In the ^{1}H-NMR spectrum of **3b**, the OH proton absorbed at δ_H 9.20. Distinctive ^{13}C-NMR signals of **3b** appeared at δ_C 184.2 (C-7), 158.4 (C-3), 150.6 (C-8a), 149.0 (OH-Ar-C), 134.0 (Ar-C-1′), 131.6 (C-5), 128.6 (*ortho*-Ar CH), 120.6 (*meta*-Ar CH), 124.6 (CH-6). The ester carbon signals appeared at δ_C 166.1 (CO), 59.6 (CH_2), and 13.0 (CH_3). In the ^{13}C-NMR of **3d**, characteristic carbon signals appeared at δ_C 183.2, 166.2, 158.3, 150.6, 134.8, 132.0, 129.2, 126.8, 124.4, 122.2, 33.6, and 24.2, which were assigned to C-7, CO-ester, C-3, C-8a, Br-Ar-C, C-5, Ar-C-1′, *ortho*-Ar CH, CH-6, *meta*-Ar CH, 60.2 CH_2-ester, benzyl-CH_2 and CH_3-ester, respectively (Experimental part). The reaction of **1e** with **2** took the longest time of refluxing (2d) compared with other substituents. The ^{1}H-NMR spectrum of **3e** revealed the proton signals at δ_H 6.82 (s, 1 H, H-6), 4.17 (q, 2 H, $J = 6.7$ Hz, CH_2-ester), 2.20 (s, 3 H, C-3-CH_3), 1.21 (t, 3 H, $J = 6.7$, CH_3-ester), whereas the carbon signals appeared at δ_C 184.2 (C-7), 166.6 (CO-ester), 158.4 (C-3), 151.2 (C-8a), 132.0 (C-5), 124.2 (CH-6), 59.8 (CH_2-ester), 22.2 (CH_3), 24.4 (CH_3-ester).

The yield percentages of the obtained products increase in the presence of aromatic moiety. On the other hand, the methyl derivative **1e** gives a lower yield and the reaction requires more time than the other derivatives **1a-d**.

The reaction mechanism proceeds *via* the HN=C—SH tautomer **1** instead of the H_2N—C=S tautomer **1′**. Evidently attack by the SH group is faster than attack by the amine [6]. Accordingly, the reaction of **1a-e** with **2** can be described as due to nucleophilic attack of the thiol group to the ester carbon accompanied by elimination of one molecule of ethanol to form the intermediate **5** (Scheme 1). Thereafter, amidine-like nucleophilic attack on the amide is accompanied by water elimination to give **6** (Scheme 1). Nucleophilic attack of the terminal NH on the π-deficient double-bond produces the corresponding triazolo-dihydrothiazines **7** (Scheme 1). Ultimately, we propose that aerial oxidation of **7** gives the stable heterocyclic compounds **3** (Scheme 1). In HMBC studies of **3a-c**, the aromatic protons showed a correlation with the carbonyl ester, but not with the carbonyl in position-7. In methyl derivative **3e**, the methyl revealed a medium correlation with the carbonyl-ester, whereas no correlation was indicated with C-7. In an NOE experiment, irradiation of the methyl protons in **3e** (δ_H 2.20) showed enhancement the CH_2-ester protons. These data unambiguously exclude the formation of isomers **4a-e** (Scheme 1).

The 70-eV EI mass spectra of compounds **3a-e** are illustrated in the experimental section. All compounds **3a-e** exhibit the molecular peaks as intense base ion peaks. Most indicative is the appearance of the triazolethiones$^+$ and ethyl 4-oxobuta-2,3-dienoate$^+$ (Scheme 2). For example, the fragmentation pattern of **3a** showed ion peaks for **A**$^+$ and **B**$^+$ at m/z 175 (50) and 126 (28), respectively. An abundant peak resulting from loss of ethanol from **B**$^+$ leads to **C**$^+$, whereas loss of phenyl group gave species **D**$^+$ and **E**$^+$ (Scheme 2). The ion peak **H**$^+$ shows that it fragmented primarily *via* the loss of carbonoxysulfide from **H**$^+$ to give **J**$^+$ at m/z 54. Other species **F-J**$^+$ of **3a** appeared as shown in Scheme 2.

Scheme 2. Fragmentation patterns of compound **3a**.



CONCLUSION

In conclusion, *N*-substituted-hydrazino-carbothioamides react with diethyl maleate *via* initial *S*-acylation followed by cyclizative conjugate addition to the unsaturated ester. A second cyclization forms a triazole ring, and aerial oxidation occurs to afford the [1,2,4]triazolo-[3,4-*b*][1,3]thiazine-5-carboxylate products.

EXPERIMENTAL

Melting points are uncorrected values. ^{1}H-NMR and ^{13}C-NMR spectra (Bruker AM 400, ^{1}H: 400.13 MHz, ^{13}C: 100.6 MHz) were obtained from deuterio-chloroform and deuterio-DMSO solutions; the chemical shifts are given relative to internal standard TMS. For preparative thin layer chromatography (PLC), glass plates (20 × 48 cm) were covered with slurry of silica gel Merck PF$_{254}$ and air-dried using the solvents listed for development. Zones are detected by quenching of indicator fluorescence upon exposure to 254 nm UV light. Elemental analyses were carried in Assiut Microanalysis Center of Assiut University. Mass spectroscopy was performed at 70 eV with a Finnigan Mat 8430 spectrometer at the Institute of Organic Chemistry, TU-Braunschweig. Germany. The IR spectra were run on a Shimadzu 470 spectrometer using KBr pellets.

Starting materials. *N*-Substituted-hydrazino-carbothioamides **1a**-**e** were prepared according to literature [14].

General procedure. To a 250 cm^3 two-necked round bottom flask containing a solution of **1a**-**e** (2 mmol) in glacial acetic acid (50 mL), a solution of **2** (0.344 g, 2 mmol) in glacial acetic acid (10 mL) was added dropwise with stirring. The mixture was refluxed for 1-2 d (the reaction was monitored by TLC). The solvent was evaporated under vacuum, and the solid residue was dissolved in dry acetone (30 mL), and the solution was chromatographed on thin layer plates (silica gel) using toluene. All zones were extracted and the obtained products were recrystallized from the stated solvents.

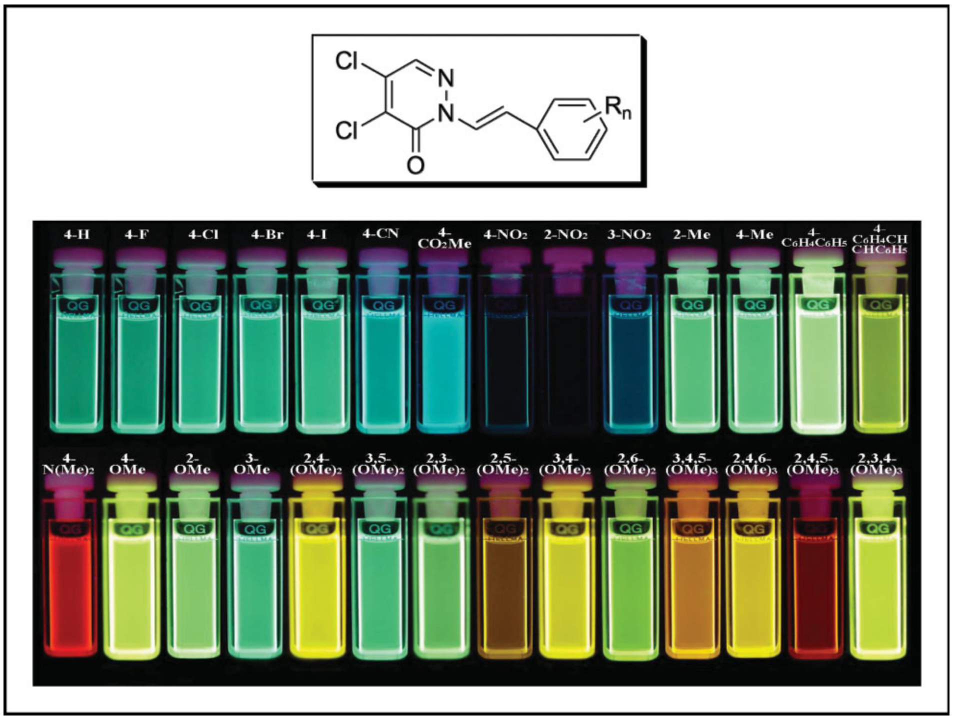
Received October 3, 2009
DOI 10.1002/jhet.137



The photophysical behavior of *trans*-2-styrylpyridazin-3(2*H*)-ones **3** strongly depend on the number and the position of substituents in the phenyl ring in THF, methylene chloride, acetonitrile and methanol. The absorption spectra of **3** containing the electron-donating substituents at the *para*-position show the red-shift, whereas the spectra of **3** containing the electron-withdrawing substituents show the blue-shift. For the *trans*-2-(*p*-substituted-styryl)pyridazin-3(2*H*)-ones **3b**–**3h** and **3k**–**3o**, the magnitude of the solvatochromic shifts and the shape of the fluorescence spectra depend on the number and/or the position of substituents in benzene ring. The emission maximum of *trans*-2-styrylpyridazin-3(2*H*)-ones involving the electron-donating group is larger than one of *trans*-2-styrylpyridazin-3(2*H*)-ones involving the electron-withdrawing group in the phenyl ring. The magnitude of the emission maximum is roughly parallel to the relative electron-withdrawing ability of the substituents of the phenyl ring.

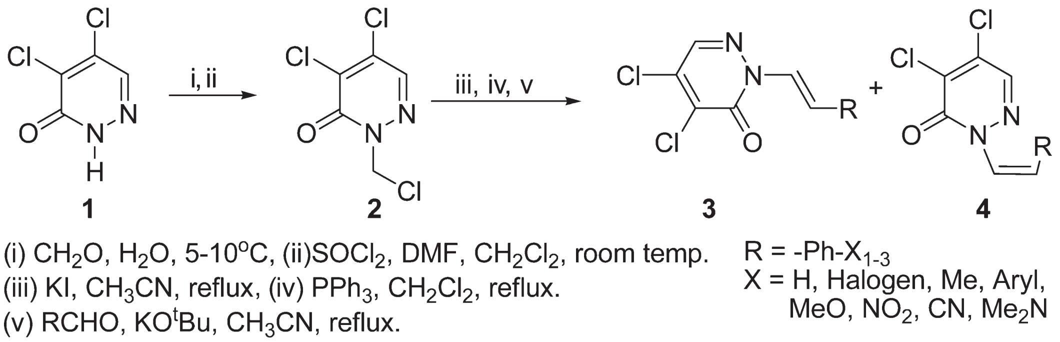
J. Heterocyclic Chem., **46**, 691 (2009).

INTRODUCTION

The creation of luminescent molecules is an active field of research in supramolecular chemistry [1–8]. The chemosensors also have the advantages of possessing high sensitivity and selectivity, as well as providing on-line and real time analysis [9–25]. However, the development of a useful fluorescent probes is difficult because of the lack of flexible design strategies. The design also is largely empirical at present. Thus, the tuning of the photophysical properties introducing the substituent is very useful in this field.

Organic molecules that contain styryl moiety are an important fluorescent class and show a number of attractive photophysical and electro-optical properties

Scheme 1



(i) CH_2O, H_2O, 5-10°C, (ii)$SOCl_2$, DMF, CH_2Cl_2, room temp.
(iii) KI, CH_3CN, reflux, (iv) PPh_3, CH_2Cl_2, reflux.
(v) RCHO, KO^tBu, CH_3CN, reflux.

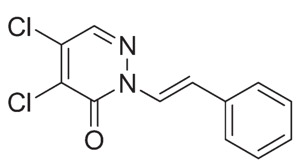
[20,26–36]. The substitution of phenyl ring in stilbene with a heterocyclic acceptor (pyridine) significantly affected the photophysical and photochemical behavior, because of the involvement of the (nπ*) state [28,37]. According to the literature [26,28,38–40], the photophysical behavior and the torsional barrier of *trans*-stilbene derivatives depend on the nature of substituents and/or solvent polarity. Therefore, the fluorescent property could be tunable by the introduction of a suitable substituent on the phenyl ring in stilbene.

Recently, we reported the synthesis the photophysical properties and the potentiality for the application as spectroscopic or fluorescent probes for some *N*-styrylazinones containing Het-N—CH=CH—Ar (Het = hetetocycle) moiety [41]. The heterocycle-dependent photophysical behavior of *trans*-2-(2-arylvinyl)-4,5-dichloropyridazin-3(2*H*)-ones was also reported [42]. Because of the utility of C—Cl bond in 4,5-dichloropyridazin-3(2*H*)-one ring for the derivatization, we selected *trans*-4,5-dichloro-2-styrylpyridazin-3(2*H*)-one as parent fluorescence molecules, and studied on the dependence on the substituents of the phenyl ring about the photophysical properties of **3**. Here we report on the synthesis and tuning of the photophysical properties of some *trans*-2-styrylpyridazin-3(2*H*)-ones **3**.



trans-4,5-Dichloro-2-styrylpyridazin-3(2*H*)-one

RESULTS AND DISCUSSION

Synthesis. Various *trans*-2-(substituted-styryl)pyridazin-3(2*H*)-ones **3** were prepared according to the literature [41] using the synthetic sequence outlined in Scheme 1. Compound **2** [43] was reacted with benzaldehyde after treating potassium iodide and then triphenylphosphine to give *trans*-isomers **3** as the major product. Although *cis*-isomers **4** were formed as the minor product, it was not isolated since the *cis*-isomer changed slowly to *trans*-isomer at room temperature during the workup. The structures of **3** were established by NMR, IR and elemental analyses.

Absorption spectra. All the *trans*-2-styrylpyridazin-3(2*H*)-ones **3a–3aa** displays a single intense long wavelength absorption band in methylene chloride, tetrahydrofuran, acetonitrile and methanol. The absorption maxima are reported in Table 2. In general, the absorption maximum of **3** depends on substituent of *para*-position in benzene ring; that is, the electron-donating group shows the red-shift (e.g., **3o** vs. **3a**), whereas the electron-withdrawing group shows the blue-shift (e.g., **3f** vs. **3a**).

The substituted position also affects about absorption maximum of nitrophenyl derivatives, that is, the 4-nitro: the red-shift (**3h** *vs.* **3a**); the 2-nitro or 3-nitro group: the blue-shift (**3i/3j** *vs.* **3a**). The **3b** show the blue-shift in the absorption maximum due to the 4-fluoro group.

On the other hand, we investigated the dependence of an absorption spectrum on the position and the number of methoxy group. All methoxy compounds showed the red-shift compared with **3a** in the absorption spectrum. The magnitude of the bathochromic effect of 2-methoxy and 4-methoxy compounds (**3o** and **3p**) is larger than that of 3-methoxy derivative (**3q**) (Table 2 entries 15–17). For the dimethoxy derivatives, the bathochromic effect of 2,4-, 2,5-, 2,6-, and 3,4-dimethoxy compounds (**3r**, **3u**, **3w**, **3v**) is also larger than one of 3,5-and 2,3-dimethoxy derivatives (**3s, 3t**) (Table 2 entries 18–23). All four trimethoxy derivatives (**3x–3aa**) show much larger the bathochromic effect than mono- and dimethoxy derivatives. Among four trimethoxy derivatives, the magnitude of the bathochromic shift for 2,4,5- and 2,4,6-trimethoxy compounds (**3y** and **3z**) is especially large (Table 2 entries 25 and 26).

[a] Fluorescence data were obtained from corrected spectra.

[b] The second vibronic band is given in parentheses.

[c] $\Delta\nu_{st} = \nu_{abs-}\ \nu_{f.}$

[d] The value of $\lambda_{0,0}$ was obtained from the intersection of normalized absorption and fluorescence spectra.

[e] Quantum yield of the emission is evaluated at 25°C, the quantum yield values is that relative to 9,10-diphenylanthracene (1.00×10^{-4} *M*) in acetonitrile (from 352 nm excitation wavelength, $\Phi = 0.95$).

3q, **3s**, **3u**, **3w**, and **3y-3aa**) in tetrahydrofuran comparing with the spectra in methylene chloride. However, the solvatochromic effect of these compounds is rather small, which indicate a small difference between the dipole moment of the Franck-Condon excited state and the ground state [44].

Emission spectra. The fluorescence maxima (λ_f), the half-bandwidth ($\Delta\nu_{1/2}$), the 0,0 transitions ($\lambda_{0,0}$), the

Stokes shift ($\Delta\nu_{st}$), and the fluorescence quantum yield (Φ) of all compounds **3** are reported in four solvents in Table 3. For the *trans*-2-(*p*-substituted-styryl)pyridazin-3(2*H*)-ones **3b–3h** and **3k–3o**, the magnitude of the solvatochromic shifts and the shape of the fluorescence spectra depend on the substituents in four solvents. In general, the emission maximum of **3** involving an electron-donating substituent is larger than one of **3** involving an electron-withdrawing. Among all *p*-substituted derivatives, compound **3n** shows the largest emission maximum and the lowest fluorescence efficiency in four solvents.

The magnitude of the emission maximum for *p*-substituted derivatives **3a–3h** and **3k–3o** is in the order **3n** (4-Me_2N) >**3m** (4-C_6H_5CHCH) >**3o** (4-MeO) >**3l** (4-C_6H) >**3k** (4-Me) >**3a** (4-H) >**3b** (4-F), **3c** (4-Cl), **3e** (4-I) >**3d** (4-Br) >**3g** (4-CO_2Me) >**3f** (4-CN) >**3h** (4-NO_2) in methylene chloride, **3n** (4-Me_2N) >**3m** (4-C_6H_5CHCH) >**3o** (4-MeO) >**3l** (4-C_6H_5) >**3k** (4-Me) >**3a** (4-H), **3e** (4-I) >**3d** (4-Br), **3c** (4-Cl) >**3b** (4-F) >**3g** (4-CO_2Me) >**3f** (4-CN) >**3h** (4-NO_2) in acetonitrile,**3n** (4-Me_2N) >**3m** (4-C_6H_5CHCH) >**3o** (4-MeO) >**3l** (4-C_6H_5) >**3k** (4-Me) >**3e** (4-I) >**3b** (4-F) >**3d** (4-Br) >**3a** (4-H) >**3c** (4-Cl) >**3g** (4-CO_2Me) >**3h** (4-NO_2) >**3f** (4-CN) in methanol and **3n** (4-Me_2N) >**3m** (4-C_6H_5CHCH) >**3o** (4-MeO) >**3l** (4-C_6H_5) >**3k** (4-Me) >**3c** (4-Cl) >**3d** (4-Br) >**3a** (4-H), **3b** (4-F) >**3e** (4-I) >**3g** (4-CO_2Me) >**3f** (4-CN) >**3h** (4-NO_2) in Tetrahydrofuran. The magnitude of the emission maximum for *p*-substituted derivatives is roughly parallel with the relative electron-withdrawing ability of the substitutents. According to the 0-0 transition energies (Table 3), the planar $^1t^*$ (ICT) state of **3a** (4-H) is stabilized by the electron-donating substituents (e.g., **3k**, **3n**, and **3o**) but destabilized by the electron-withdrawing substituents (e.g., **3b**, **3f**, **3g**, and **3h**) [26,38]. The number and the position of the substituents on the phenyl ring and/or the solvents affected about the magnitude of fluorescence band half-width ($\Delta\nu_{1/2}$) of all derivatives. Fluorescence band half-width increases due to the electron-withdrawing groups, whereas one of derivatives containing the electron-donating groups decreases. All derivatives are strongly fluorescent in methylene chloride, but the values of Φ_f decrease in more polar solvents. It depends on the substituents of the phenyl ring. The quantum yields of **3f–3j** decrease due to the strong electron-withdrawing substituents, whereas one of **3b–3e** and **3k–3aa** increases due to halogen at the para-position (for **3b–3e**) and the electron-donating substituents (for **3k–3aa**).

According to the literatures [26,45], the energies of the fluorescence maxima of benzene derivatives correlate better with the Hammett σ^+ than with the σ constants. The relationship of the energies of the fluorescence maxima for **3** and the Hammett σ^+ shows in the Figure 2. In four solvents, a nice linear relationship can be observed for *p*-substituted derivatives **3e–3h, 3k**, and **3o** except for **3l**.

For the **3h** (4-NO_2), **3i** (2-NO_2), and **3j** (3-NO_2), the magnitude of the solvatochromic shifts and the shape of the fluorescence spectra (Fig. 1) depend on the substituted position. The magnitude of the emission maximum for **3h–3j** is in the order **3i** (2-NO_2) >**3j** (3-NO_2) >**3h** (4-NO_2) in methylene chloride and acetonitrile, **3j** (3-NO_2) >**3h** (4-NO_2) >**3i** (2-NO_2) in methanol and **3h** (4-NO_2) >**3i** (2-NO_2) >**3j** (3-NO_2) in THF. The magnitude of the quantum yields for **3h**, **3i**, and **3j** is in the order **3h** (4-NO_2) >**3j** (3-NO_2) >**3i** (2-NO_2). According 0-0 transition energies (Table 3), the stability of the planar $^1t^*$ (ICT) state in the excited state for *trans*-2-(nitrostyryl)pyridazin-3(2*H*)-ones **3h-3j** depends on the substituted position of the nitro group and/or slightly the solvent. Among the *trans*-2-(*p*-substituted-styryl)pyridazin-3(2*H*)-ones, *p*-methoxy derivative **3o** shows the largest value of the emission maximum and the 0-0 transition energy in four solvents. Therefore, we have been investigated the dependence of the fluorescence spectra for mono-, di- and trimethoxystyryl derivatives on the position and the numbers of the methoxy group. Among the three monomethoxy derivatives, *p*-substituted derivative **3o** shows excellent emission maximum and the high fluorescence intensity in four solvents except for **3p** in methanol.

For the *trans*-2-(dimethoxystyryl)pyridazin-3(2*H*)-ones **3r-3w**, the emission maximum and the quantum yield depend very highly on the solvent and the substituted position (Table 3). Among six dimethoxy derivatives, compound **3v** [3,4-$(MeO)_2$] shows the highest quantum yield in tetrahydrofuran. For the *trans*-2-(trimethoxystyryl)pyridazin-3(2*H*)-ones **3x-3aa**, the number and the position of the methoxy group and/or the solvent affected about the magnitude of the solvatochromic shifts, the shape of the fluorescence spectra and the quantum yield.

In case of the *trans*-2-(methoxystyryl)pyridazin-3(2*H*)-ones **3o-3aa**, the magnitude of the solvatochromic shifts and the shape of the fluorescence spectra depend on the number and the substituted position of the methoxy group. These effects for the di- and trimethoxy derivatives **3r–3w, 3x–3aa** are larger than the monomethoxy derivatives **3p** and **3q** in polar solvents such as acetonitrile and methanol. Among the methoxy derivatives, the magnitude of the solvatochromic shifts and the shape of the fluorescence spectra for 2,5-dimethoxy derivative (**3u**) change dramatically in polar solvent such as methanol and acetonitrile. The magnitude of the fluorescence maxima for the trimethoxy derivatives **3x–3z** is larger than the magnitude of the mono- or dimethoxyphenyl derivatives **3p–3w** except for **3r**. In the case of

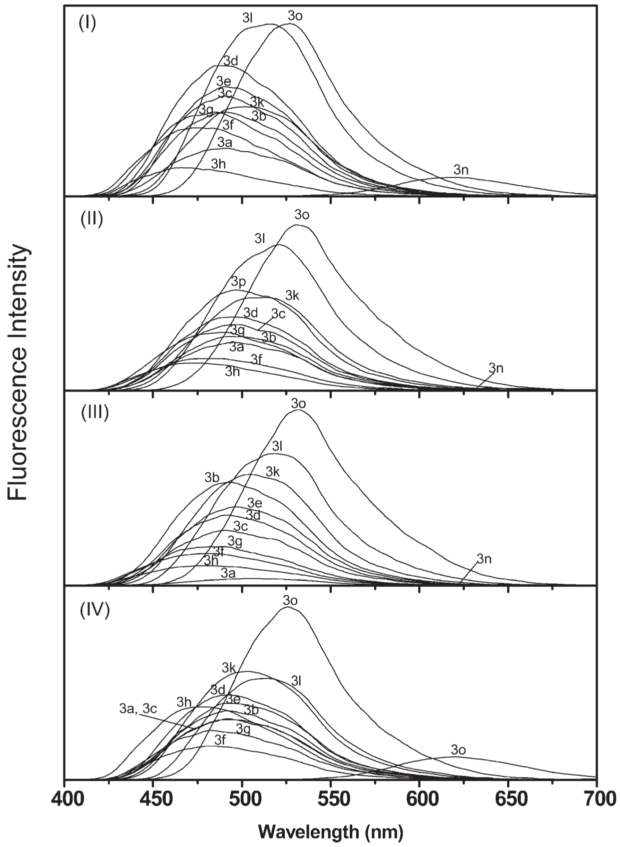

Figure 1. Normalized fluorescence spectra of *p*-substituted-2-styrylpyridazin-3(2*H*)-ones **3a-3h** and **3k-3o** in methylene chloride (I), acetonitrile (II), methanol (III), and tetrahydrofuran (IV).

dimethoxy derivatives **3r–3w**, the emission maximum strongly depends on the substitution position and the solvent. According to the 0-0 transition energies (Table 3), the stability of the planar $^1t^*$ (ICT) state for all methoxy compounds **3o–3aa** depends also on the substituted position and the number of the methoxy group and slightly the solvent. Especially, the methoxy group at the *para*-position should be more stabilized, whereas the methoxy group at the *meta*-position should be more destabilized.

CONCLUSIONS

The substituent-dependent photophysical behavior of the 28 *trans*-2-styryl-4,5-dichloropyridazin-3(2*H*)-ones **3** as novel fluorescent molecules has been elucidated. According to our observation, the absorption maximum of compounds **3** depends on the substituent, the substituted position of the benzene ring and the solvent polarity. In addition, the intensity of absorption spectra for compounds **3** depends on the solvent polarity.

The magnitude of the solvatochromic shifts and the shape of the fluorescence spectra for **3** depend on the substituents. In general, the emission maxima of *trans*-2-styrylpyridazin-3(2*H*)-ones involving the electron-donating group is larger than that of *trans*-2-styrylpyridazin-3(2*H*)-ones involving the electron-withdrawing group. The magnitude of the emission maximum is roughly parallel with the relative electron-withdrawing ability of the substitutents. According to the 0-0 transition energies (Table 3), the planar $^1t^*$ (ICT) state of the *trans*-2-(*p*-substituted-styryl)pyridazin-3(2*H*)-ones is stabilized by electron donating substituents but destabilized by electron withdrawing substituents. The number and the position of the substituents on the phenyl ring and/or the solvents also affected about the magnitude of fluorescence band half-width ($\Delta\nu_{1/2}$) of all derivatives. The quantum yield and fluorescent intensity of all compounds **3** depend on the number, the kind and the position of substituent in the phenyl ring and the solvent.

By introducing the suitable substituent in the phenyl ring of styryl moiety, *trans*-2-styrylpyridazin-3(2*H*)-ones **3** may use as a platform for fluorescence probes. These results may be a guide-line for the tuning of novel fluorescence molecules containing styryl moiety.

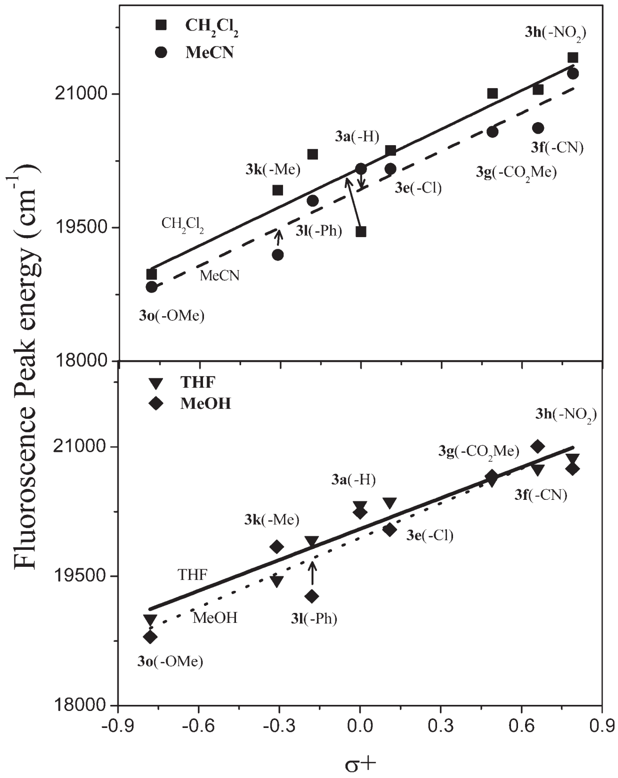

Figure 2. Correlation diagram of the energies of the fluorescence maxima against the Hammett σ^+ constants for *p*-substituted derivatives **3e-3h**, **3k**, **3l,** and **3o** in methylene chloride, tetrahydrofuran, methanol and acetonitrile.

Further dynamic, theoretical and application studies on these and the related systems would complement the current results and provide more insights into the photophysical behaviors of *trans*-*N*-styryl-nitrogen-heterocycles.

EXPERIMENTAL

General comments. Melting points were determined with a capillary apparatus and uncorrected. ^{1}H and ^{13} NMR spectra were recorded on a 300 MHz spectrometer with chemical shift values reported in δ units (ppm) relative to an internal standard TMS. IR spectra were obtained on an IR spectrophotometer. Elemental analyses were performed with a Perkin Elmer 240 C. Open-bed chromatography was carried out on silica gel (70–230 mesh, Merck) using gravity flow. The column was packed as slurries with the elution solvent.

Typical process of 4,5-dichloro-2-chloromethylpyridazin-3(2*H*)-one (2). A mixture of 4,5-dichloropyridazin-3(2*H*)-one (**1**, 60 g, 364 mmol) and distilled water (350 mL) was stirred for 10 min at room temperature. After adding formaldehyde solution (36%, 70 mL), the solution was refluxed for 1.5 h. After cooling to 5–10°C, the resulting precipitate was filtered, washed with cold water (0–5°C, 200 mL) and dried in air to give *N*-hydroxymethyl-4,5-dichloropyridazin-3(2*H*)-one. A solution of thionyl chloride (357 mmol) and dimethylformamide (360 mmol) in methylene chloride (50 mL) was added slowly to the mixture of *N*-hydroxymethyl-4,5-dichloropyridazin-3(2*H*)-one and methylene chloride (550 mL) for 30 min at room temperature with stirring. The resulting mixture was stirred for 2 h at room temperature. After cooling to 0°C, water (200 mL) was added slowly. The solution was neutralized to pH 6.7–7.4 by using saturated solution of $NaHCO_3$. The organic layer was separated and then dried over anhydrous magnesium sulfate. The resulting organic solution was evaporated under reduced pressure. The residue was washed with *n*-hexane (100 mL) to give 4,5-dichloro-2-chloromethylpyridazin-3(2*H*)-one (**2**, 71.2 g, 92%) as white color. White crystal (diethyl ether/*n*-hexane = 1:5, v/v). mp 69–70°C (lit. 43 mp 70–71°C). TLC (CH_2Cl_2) $R_f = 0.65$. IR (KBr) 3046, 2984, 1670, 1292, 1122, 964 cm^{-1}; ^{1}H NMR ($CDCl_3$): δ 5.83 (s, 2H), 7.88 ppm (s, 1H); ^{13}C NMR ($CDCl_3$) δ 58.40, 134.87, 137.23, 137.34, 155.58 ppm. Elemental analysis calcd. for $C_5H_3Cl_3N_2O$: C 28.13, H 1.42, N 13.12; found: C 28.10, H 1.41, N 13.09.

Typical process of synthesis for trans-4,5-dichloro-2-styrylpyridazin-3(2*H*)-one 3. A mixture of 2-chloromethyl-4,5-dichloropyridazin-3(2*H*)-one (**2**, 3 g, 14.055 mmol), sodium iodide (2.45 g, 14.76 mmol) and acetonitrile (50 mL) was refluxed for 10 h. After cooling to 30–40°C, triphenylphosphine (4.07 g, 15.51 mmol) was added to the reaction solution. The mixture was then refluxed for 6 h. After cooling to room temperature, the mixture was filtered by using Celite 545 and washed with methylene chloride (50 mL). The organic layer was concentrated under reduced pressure. After adding dichloromethane (100 mL) to the resulting mixture, the solution was stirred for 20 min. The solution was filtered and then concentrated under reduced pressure. After cooling to room temperature, the resulting precipitate was filtered, washed with excess diethyl ether and dried to give the product as thin yellow crystals. The product was used without further purification.

To a solution of crude ((4,5-dichloro-6-oxopyridazin-1(6*H*)-yl)methyl)triphenyl phosphonium iodide (8 g, 14.10 mmol) in acetonitrile (50 mL) was added benzaldehyde (1.5 g, 14.10 mmol) at 0–10°C. After stirring for 30 min, potassium *t*-butoxide (2.05 g, 95%, 17.21 mmol) was added. The resulting mixture was stirred for 2 h. The solution was concentrated under reduced pressure. After adding dichloromethane (100 mL) and then water (50 mL), the solution was stirred for 10 min, and neutralized to pH 6.7–7.4 by using saturated solution of $NaHCO_3$. The organic layer was separated and then dried over anhydrous magnesium sulfate. The resulting organic solution was evaporated under reduced pressure. The resulting residue was applied to the top of an open-bed silica gel. The column was eluted with methylene chloride/*n*-hexane (1:4, v/v). Fractions containing *trans*-isomer **3** were combined and evaporated to give pure *trans*-isomer **3**, respectively. The yields of all compounds **3** showed in Table 1.

(E)-4,5-Dichloro-2-styrylpyridazin-3(2H)-one (3a). Pale yellow crystal (diethyl ether:*n*-hexane = 1:2, v/v). mp 161–162°C. δ 7.32 (d, J = 14.38 Hz, 1H), 7.61 ~ 7.65 (m, 2H), 7.92 (s, 1H), 8.20 ~ 8.27 (m, 3H). ^{13}C NMR (CDCl$_3$); δ 119.47, 124.25, 127.19, 127.44, 134.86, 136.44, 136.69, 141.26, 147.32, 154.72. Anal. Calcd. for $C_{12}H_7Cl_2N_3O_3$: C, 46.18; H, 2.26; N, 13.46. Found: C, 46.16; H, 2.23; N, 13.47.

(E)-4,5-dichloro-2-(2-nitrostyryl)pyridazin-3(2H)-one (3i). Light yellow crystal (methylene chloride). mp 180–181°C. IR (KBr) 3108, 3068, 1668, 1596, 1520, 1340, 1300, 1280, 1146, 1122, 964, 950, 898, 738 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 7.45 ~ 7.50 (m, 1H), 7.61 ~ 7.66 (m, 1H), 7.70 ~ 7.73 (m, 1H), 7.80 (d, J = 14.15 Hz, 1H), 7.93 (s, 1H), 8.00 ~ 8.04 (m, 1H), 8.08 (d, J = 14.12 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 117.55, 125.07, 127.30, 128.59, 128.92, 130.38, 133.46, 134.72, 136.50, 136.64, 148.24, 154.79. Anal. Calcd. for $C_{12}H_7Cl_2N_3O_3$: C, 46.18; H, 2.26; N, 13.46. Found: C, 46.15; H, 2.24; N, 13.45.

δ 7.38 (d, J = 14.26 Hz, 1H), 7.59 ~ 7.64 (m, 1H), 7.88 ~ 7.91 (m, 1H), 8.08 ~ 8.15 (m, 2H), 8.23 (d, J = 14.38 Hz, 1H), 8.34 (s, 1H). ^{13}C NMR (CDCl$_3$); δ 119.34, 121.89, 123.06, 127.12, 130.78, 133.35, 134.01, 136.36, 136.92, 137.69, 148.83, 154.75. Anal. Calcd. for $C_{12}H_7Cl_2N_3O_3$: C, 46.18; H, 2.26; N, 13.46. Found: C, 46.13; H, 2.23; N, 13.42.

(E)-4,5-dichloro-2-(4-methylstyryl)pyridazin-3(2H)-one (3k). Light yellow crystal (methylene chloride). mp 179–180°C. IR (KBr) 3150, 2976, 1688, 1610, 1322, 1158, 980, 920, 832, 758 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 2.35 (s, CH$_3$), 7.15 (d, J = 7.97 Hz, 2H), 7.25 (d, J = 14.34 Hz, 1H), 7.38 (d, J = 8.08 Hz, 2H), 7.85 (s, 1H), 8.08 (d, J = 14.32 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 21.28, 122.22, 123.37, 126.94, 129.57, 131.69, 134.37, 135.80, 135.91, 138.59. Anal. Calcd. for $C_{13}H_{10}Cl_2N_2O$: C, 55.54; H, 3.59; N, 9.96. Found: C, 55.51; H, 3.58; N, 9.93.

(E)-2-(2-(biphenyl-4-yl)vinyl)-4,5-dichloropyridazin-3(2H)-one (3l). Light yellow crystal (methylene chloride). mp 212–213°C. IR (KBr) 3088, 1680, 1614, 1140, 972, 838, 760 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 7.31 ~ 7.38 (m, 2H), 7.42 ~ 7.47 (m, 2H), 7.55 ~ 7.63 (m, 6H), 7.92 (s, 1H), 8.16 (d, J = 14.31 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 121.99, 123.92, 126.84, 126.96, 127.43, 127.49, 128.77, 133.47, 134.34, 136.09, 136.26, 140.29, 141.25, 154.84. Anal. Calcd. for $C_{18}H_{12}Cl_2N_2O$: C, 62.99; H, 3.52; N, 8.16. Found: C, 62.98; H, 3.49; N, 8.15.

4,5-Dichloro-2-((E)-4-(E)-styrylstyryl)pyridazin-3(2H)-one (3m). Yellow crystal (methylene chloride). mp 224–225°C. IR (KBr) 3106, 1670, 1600, 1520, 1306, 1142, 968, 906, 820, 768, 698 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 7.12 (d, J = 4.01 Hz, 2H), 7.24 ~ 7.29 (m, 2H), 7.32 ~ 7.39 (m, 25H), 7.47 ~ 7.54 (m, 6H), 7.89 (s, 1H), 8.15 (d, J = 14.32 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 121.87, 123.93, 126.58, 126.98, 127.39, 127.81, 128.02, 128.71, 129.28, 133.86, 134.38, 136.07, 137.18, 137.67. Anal. Calcd. for $C_{20}H_{14}Cl_2N_2O$: C, 65.06; H, 3.82; N, 7.59. Found: C, 65.05; H, 3.81; N, 7.57.

(E)-4,5-dichloro-2-(4-(dimethylamino)styryl)pyridazin-3(2H)-one (3n). Deep red crystal (methylene chloride). mp 130–132°C. IR (KBr) 3134, 2962, 1678, 1620, 1540, 1522, 1380, 1200, 1248, 1236, 964, 914 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 2.99 (s, 6H), 6.68 (d, J = 8.86 Hz, 2H), 7.22 (d, J = 14.26 Hz, 1H), 7.39 (d, J = 8.84 Hz, 2H), 7.85 (s, 1H), 7.98 (d, J = 14.24 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 40.30, 112.25, 120.51, 122.36, 122.75, 128.27, 133.89, 135.33, 135.60, 150.59, 154.52. Anal. Calcd. for $C_{14}H_{13}Cl_2N_3O$: C, 54.21; H, 4.22; N, 13.55. Found: C, 54.19; H, 4.20; N, 13.52.

(E)-4,5-dichloro-2-(4-methoxystyryl)pyridazin-3(2H)-one (3o). Yellow crystal (methylene chloride). mp 177–178°C. IR (KBr) 3062, 2944, 1666, 1614, 1590, 1522, 1308, 1258, 1196, 1140, 1038, 960, 906, 812, 744 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 3.83 (s, OCH$_3$), 6.87 ~ 6.92 (m, 2H), 7.23 (d, J = 14.32 Hz, 1H), 7.41 ~ 7.4 5 (m, 2H), 7.86 (s, 1H), 8.01 (d, J = 14.29 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 55.34, 114.32, 121.95, 122.36, 127.09, 128.37, 134.25, 135.74, 135.88, 154.62, 159.95. Anal. Calcd. for $C_{13}H_{10}Cl_2N_2O_2$: C, 52.55; H, 3.39; N, 9.43. Found: C, 52.52; H, 3.38; N, 9.40.

(E)-4,5-dichloro-2-(2-methoxystyryl)pyridazin-3(2H)-one (3p). Light yellow crystal (methylene chloride). mp 133–135°C. IR (KBr) 3132, 2987, 1684, 1600, 1500, 1478, 1300, 1260, 1140, 1042, 966, 760 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 3.91 (s, OCH$_3$), 6.91 ~ 6.99 (m, 2H), 7.26 ~ 7.31 (m, 1H), 7.48 ~ 7.51 (m, 1H), 7.53 (d, J = 14.02 Hz, 1H), 7.89 (s, 1H), 8.87 (d, J = 14.32 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 55.50, 110.96, 118.06, 120.82, 123.42, 124.89, 128.31, 129.58, 134.33, 135.81, 135.90, 154.73, 157.45. Anal. Calcd. for $C_{13}H_{10}Cl_2N_2O_2$: C, 52.55; H, 3.39; N, 9.43. Found: C, 52.53; H, 3.37; N, 9.42.

(E)-4,5-dichloro-2-(3-methoxystyryl)pyridazin-3(2H)-one (3q). Pale yellow crystal (methylene chloride). mp 143–145°C. IR (KBr) 3126, 2988, 1676, 1602, 1504, 1478, 1264, 1134, 1046, 960, 900, 796, 740 cm^{-1}. ^{1}H NMR (CDCl$_3$); δ 3.84 (s, OCH$_3$), 6.84 ~ 6.88 (m, 1H), 7.01 ~ 7.02 (m, 1H), 7.08 ~ 7.11 (m, 1H), 7.24 ~ 7.31 (m, 2H), 7.89 (s, 1H), 8.12 (d, J = 14.32 Hz, 1H). ^{13}C NMR (CDCl$_3$); δ 55.33, 112.12, 114.34, 119.73, 122.15, 124.30, 129.88, 134.52, 135.92, 136.00, 136.12, 154.72, 159.95. Anal. Calcd. for $C_{13}H_{10}Cl_2N_2O_2$: C, 52.55; H, 3.39; N, 9.43. Found: C, 52.51; H, 3.38; N, 9.43.

(E)-4,5-dichloro-2-(2,4-dimethoxystyryl)pyridazin-3(2H)-one (3r). Yellow crystal (methylene chloride). mp 169–170°C. IR (KBr) 3066, 2982, 1660, 1620, 1592, 1516, 1460, 1298, 1280, 1216, 1156, 1134, 1040, 966, 898, 834 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.83 (s, OCH_3), 3.88 (s, OCH_3), 6.47 ~ 6.52 (m, 2H), 7.39 ~ 7.46 (m, 3H), 7.86 (s, 1H), 8.17 (d, J = 14.36 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.42, 55.51, 98.64, 105.08, 116.50, 118.10, 123.21, 129.30, 134.08, 135.52, 135.65, 154.62, 158.71, 161.23. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.38; H, 3.70; N, 8.55.

δ 3.81 (s, 2OCH_3), 6.40 ~ 6.42 (t, J = 2.19 Hz, 1H), 6.62 (d, J = 2.21 Hz, 2H), 7.20 (d, J = 14.30 Hz, 1H), 7.86 (s, 1H), 8.09 (d, J = 14.29 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.43, 100.85, 104.99, 122.16, 124.40, 134.47, 135.98, 136.12, 136.41, 154.66, 161.03. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.36; H, 3.69; N, 8.53.

(E)-4,5-dichloro-2-(2,3-dimethoxystyryl)pyridazin-3(2H)-one (3t). Yellow crystal (methylene chloride). mp 149–150°C. IR (KBr) 3066, 2962, 1674, 1592, 1482, 1276, 1076, 966 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.86 (s, OCH_3), 3.88 (s, OCH_3), 6.87 (dd, J = 1.28, 8.06 Hz, 1H), 7.05 (t, J = 7.96 Hz, 1H), 7.15 (dd, J = 1.27, 7.90 Hz, 1H), 7.54 (d, J = 14.46 Hz, 1H), 7.89 (s, 1H), 8.20 (d, J = 14.44 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.85, 60.96, 112.34, 117.20, 118.82, 124.27, 125.26, 128.72, 134.38, 135.95, 136.03, 147.46, 153.12, 154.75. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.39; H, 3.68; N, 8.55.

(E)-4,5-dichloro-2-(2,5-dimethoxystyryl)pyridazin-3(2H)-one (3u). Yellow crystal (methylene chloride). mp 158–159°C. IR (KBr) 3068, 2974, 1664, 1594, 1506, 1300, 1228, 1046, 972, 896, 814, 742 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.80 (s, OCH_3), 3.85 (s, OCH_3), 6.83 (s, 2H), 7.02 (d, J = 1.93 Hz, 1H), 7.47 (d, J = 14.40 Hz, 1H), 7.86 (s, 1H), 8.23 (d, J = 14.38 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.80, 56.10, 112.20, 113.06, 114.83, 117.78, 124.10, 125.05, 134.29, 135.79, 135.90, 151.92, 153.63, 154.66. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.38; H, 3.67; N, 8.53.

(E)-4,5-dichloro-2-(3,4-dimethoxystyryl)pyridazin-3(2H)-one (3v). Yellow crystal (methylene chloride). mp 163–164°C. IR (KBr) 3076, 2966, 1674, 1600, 1530, 1272, 1156, 1036, 958, 908, 814 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.90 (s, OCH_3), 3.93 (s, OCH_3), 6.84 (d, J = 7.97 Hz, 1H), 7.01 ~ 7.04 (m, 2H), 7.22 (d, J = 14.30 Hz, 1H), 7.85 (s, 1H), 8.01 (d, J = 14.28 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.94, 55.97, 109.01, 111.27, 120.81, 122.20, 122.48, 127.41, 134.25, 135.74, 135.90, 149.26, 149.67, 154.59. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.39; H, 3.68; N, 8.55.

(E)-4,5-dichloro-2-(2,6-dimethoxystyryl)pyridazin-3(2H)-one (3w). Light yellow crystal (methylene chloride). mp 190°C. IR (KBr) 3060, 2964, 1660, 1590, 1480, 1258, 1136, 1106, 962, 776, 720 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.90 (s, 2OCH_3), 6.56 (d, J = 8.39 Hz, 2H), 7.19 (t, J = 8.37 Hz, 1H), 7.66 (d, J = 14.42 Hz, 1H), 7.86 (s, 1H), 8.63 (d, J = 14.42 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.84, 103.75, 111.99, 113.20, 126.91, 12916, 134.06, 135.53, 135.62, 154.73, 158.81. Anal. Calcd. for $C_{14}H_{12}Cl_2N_2O_3$: C, 51.40; H, 3.70; N, 8.56. Found: C, 51.37; H, 3.66; N, 8.54.

(E)-4,5-dichloro-2-(3,4,5-trimethoxystyryl)pyridazin-3(2H)-one (3x). Yellow crystal (methylene chloride). mp 149–150°C. IR (KBr) 3120, 2962, 1678, 1590, 1516, 1460, 1428, 1360, 1300, 1246, 1136, 1014, 952, 900 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.87 (s, OCH_3), 3.90 (s, 2OCH_3), 6.71 (s, 2H), 7.22 (d, J = 14.28 Hz, 1H), 7.88 (s, 1H), 8.04 (d, J = 14.26 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 56.22, 60.97, 104.18, 122.32, 123.55, 130.12, 134.46, 135.95, 136.11, 138.69, 153.52, 154.68. Anal. Calcd. for $C_{15}H_{14}Cl_2N_2O_4$: C, 50.44; H, 3.95; N, 7.84. Found: C, 50.43; H, 3.93; N, 7.82.

(E)-4,5-dichloro-2-(2,4,6-trimethoxystyryl)pyridazin-3(2H)-one (3y). Orange crystal (methylene chloride). mp 209–210°C. IR (KBr) 3058, 2950, 1650, 1600, 1580, 1458, 1334, 1232, 1196, 1120, 956 cm^{-1}. ^{1}H NMR ($CDCl_3$); δ 3.84 (s, OCH_3), 3.90 (s, 2OCH_3), 6.16 (s, 2H), 7.62 (d, J = 14.37 Hz, 1H), 7.88 (s, 1H), 8.51 (d, J = 14.37 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 55.36, 55.80, 90.62, 105.36, 113.45, 124.96, 133.86, 135.30, 135.45, 154.70, 159.78, 161.20. Anal. Calcd. for $C_{15}H_{14}Cl_2N_2O_4$: C, 50.44; H, 3.95; N, 7.84. Found: C, 50.41; H, 3.93; N, 7.83.

δ 3.89 (s, 2 OCH_3), 3.92 (s, OCH_3), 6.53 (s, 1H), 6.99 (d, J = 2.66 Hz, 1H), 7.47 (d, J = 14.38 Hz, 1H), 7.87 (s, 1H), 8.14 (d, J = 14.37 Hz, 1H). ^{13}C NMR ($CDCl_3$); δ 56.10, 56.45, 56.61, 97.40, 110.86, 115.04, 117.73, 123.03, 134.09, 135.59, 135.75, 143.38, 150.41, 152.41, 152.52, 154.64. Anal. Calcd. for $C_{15}H_{14}Cl_2N_2O_4$: C, 50.44; H, 3.95; N, 7.84. Found: C, 50.40; H, 3.93; N, 7.84.

(E)-4,5-dichloro-2-(2,3,4-trimethoxystyryl)pyridazin-3(2H)-one (3aa). Yellow crystal (methylene chloride). mp 127–128°C. Anal. Calcd. for $C_{15}H_{14}Cl_2N_2O_4$: C, 50.44; H, 3.95; N, 7.84. Found: C, 50.43; H, 3.94; N, 7.85.

Absorption spectra, fluorescence spectra and quantum yield. UV spectra were measured on a Shimadzu PC-2401 double beam spectrophotometer. Absorption spectra were collected from sample solution prepared under atmosphere without degassing or inert gas bubbling. The concentration of the sample solution is 1.0×10^{-4} *M*. ^{b}(M^{-1} cm^{-1}).

Fluorescence spectra were recorded on a PerkinElmer LS50B spectrofluorometer at room temperature. Quantum yield of the emission is evaluated in acetonitrile at 25°C, the quantum yield values are that relative to 9,10-diphenylanthrancene (1.00×10^{-4} *M*) in acetonitrile (from 352 nm extraction, Φ = 0.95).

2,4,5-Triaryl-5*H*-chromeno[4,3-*b*]pyridines were synthesized from a three-component cascade reaction of 2′-hydroxyacetophenone, aromatic aldehyde, and ammonium acetate catalyzed by 2-1′-methylimidazolium-3-yl-1-ethyl sulfate under microwave irradiation. Nine new bonds and two new rings were formed in one-pot.

J. Heterocyclic Chem., **46**, 702 (2009).

INTRODUCTION

The synthesis of new heterocyclic compounds has been a subject of great interest due to their wide applicability. Among a large variety of heterocyclic compounds, heterocycles containing 5*H*-chromeno[4,3-*b*]pyridine are of interest because they show some important biological activities such as analgesic, anti-inflammation, and antibacterial [1,2]. Accordingly, the development of efficient synthetic strategies for the construction of this molecular architecture is of considerable importance from the standpoint of the material and organic chemistry.

By far, only two types of approach for obtaining 5*H*-chromeno[4,3-*b*]pyridines have been reported due to its complex structure. One was mainly based on the multistep intramolecular oxa- or diaza-Diels-Alder cycloadditions [1] with some shortcomings, such as low yields, high reaction temperature (180–200°C), long reaction time (48h) [3c], and requirement of toxic solvents. Moreover, unavailable starting material such as benzylidene-3-chromanone-4 (**1**, Fig. 1) [3a] or neutral 2-azadienes (**2**, Fig. 1) [3b] or 2-[2-(prop-2-ynyloxy)phenyl]-pyridine (**3**, Fig. 1) [3c] were required. In another method [4], it is the product of the primary 1,4-addition followed by the pyrone ring-opening, attacking of the NH_2 group to the carbonyl bound with the aromatic cycle and ring-closure involving the phenolic hydroxyl and CHO group (Fig. 2).

However, at least, two rings of product derived from starting materials in these methods. There were few of report about the synthesis of poly aryl-substituted 5*H*-chromeno[4,3-*b*]pyridines. To the best of our knowledge, aryl can improve the oil–water partition coefficient of drug, which serve as an important impact factor on the absorption and duration of drug *in vivo*, and it can also lengthen the conjugated system to improve the rigidity and luminescence potency of molecules. So, it is important to develop new efficient method to prepare poly aryl-substituted 5*H*-chromeno[4,3-*b*]pyridines.

The synthetic route used for the preparation of the title compound (**8**) *via* the one-pot, three-component reaction of aromatic aldehyde (**6**), 2′-hydroxyacetophenone (**7**), and ammonium acetate (1:1:5) under microwave-radiation is shown in Scheme 1. The new compound, 2-1′-methylimidazolium-3-yl-1-ethyl sulfate, was

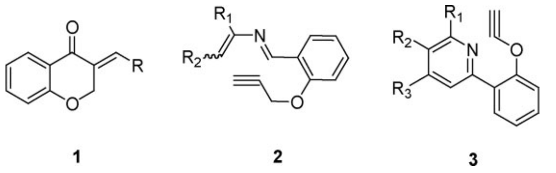

Figure 1. Three previous starting materials of 5*H*-chromeno[4,3-*b*] pyridines.

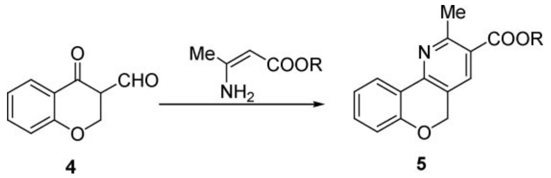

Figure 2. A previous method to construct 5*H*-chromeno[4,3-*b*] pyridines.

synthesized and used as catalyst to improve the selectivity of the reaction. Upto nine new bonds were formed with water as the only one by-product in this transformation. Only one benzene ring in the new 5*H*-chromeno[4,3-*b*]pyridine framework is derived from starting material.

RESULTS AND DISCUSSION

Initially, different reaction conditions were systematically tested based on the reaction of 4-cyanobenzaldehyde, 2′-hydroxyacetophenone, and ammonium acetate (1:1:5) (Table 1). It indicated that only the corresponding chalcone was detected when the amount of 2-1′-methylimidazolium-3-yl-1-ethyl sulfate was less than 3.2 mmol, which showed the importance of catalyst amount in controlling the selectivity of this multicomponent reaction. In addition, glycol is necessary to prevent the instantaneous partial charring of reactant caused by the catalyst. However, when the amount of glycol was up to 2 mL, the yield decreased due to the dilution of catalyst.

Under the optimal conditions, the reaction of a variety of aromatic aldehydes with 2′-hydroxyacetophenone and ammonium acetate was investigated. The product **8** was obtained with the yields ranging from 50 to 81% (Table 2). As can be seen from the results, the electronic nature and steric effect of substituted group in aromatic aldehyde influenced the yield. Substrates with electron-donated groups can enhance the yields.

The X-ray structure of **8h** [5] (Table 2, entry 8) was shown in Figure 3. The framework has a long conjugated system with many modifiable positions, which indicates its potential application in new drug discover or molecular electronics.

A reasonable mechanism for the formation of the products **8** was proposed (Scheme 2). The reaction proceeds *via* a simple and normal procedure: the tandem Aldol condensation-Michael addition-Aldol condensation-nucleophilic addition (Adn), and finally, the elimination (*E*)-cyclication.

In summary, we have developed a novel, simple, and efficient method to synthesize 2,4,5-triaryl-5*H*-chromeno[4,3-*b*]pyridines under microwave radiation. Besides the advantages that all the reactants were added at the beginning and the same reaction conditions were maintained throughout, the features of this process include as follows: (1) the starting materials are available; (2) the reaction has good atom-economy and environmental friendliness: nine new bonds (three C—N bonds, one C—O bond, three C—C single bonds, two C—C double bonds) and two new rings were formed in one-pot with water as the only one by-product during the whole process. Indeed, the present protocol provides a straightforward and effective pathway to afford triaryl-5*H*-chromeno[4,3-*b*]pyridines.

EXPERIMENTAL

Microwave radiation was carried out with a microwave oven Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden. Melting points were determined in the open capillaries and were uncorrected. IR spectra were obtained on a Bruker FT-IR spectrometer. ^{1}H NMR spectra were recorded at

Scheme 1. One-pot synthesis of 2,4,5-triaryl-5*H*-chromeno[4,3-*b*]pyridines.

400 MHz on a Bruker DPX 400 or AV400 spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. ^{13}C NMR spectra were recorded at 100.6 MHz. Mass was determined by using a TOF-MS high-resolution mass spectrometer. Elemental analyses were performed on a Perkin-Elmer-2400 elemental analyzer. Thin layer chromatography analysis was carried out on aluminium sheets of silica gel GF_{254}. All reagents were obtained from commercial suppliers and used without further purification unless otherwise stated. Organic solvents were dried and/or distilled prior to use. The X-ray structure determination for complex **8h** was given by Smartapex Bruke diffractometer.

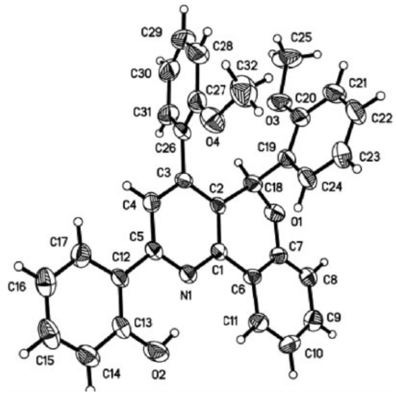

Figure 3. Single-crystal X-ray structure of compound **8h**.

General procedure for the preparation of 2-1′-methylimidazolium-3-yl-1-ethyl sulfate. 1-Methylimidazole (0.3 mol) and chloroethanol (0.3 mol) were added in a flask containing 10 mL of $CHCl_3$, the mixture was refluxed for 8 h, removed $CHCl_3$ under vacuum, extracted the unreacted 1-methylimidazole with ether to give 1-methyl-3-(2-hydroxylethyl)imidazolium chloride, then chlorosulfonic acid was added dropwise at 0–5°C, when the mixture became solid, suitable single crystal was obtained after 3 days by recrystallized with DMF. Its structure was further confirmed by X-ray crystallographic analysis (Fig. 4). This solid inner salt reacted with chlorosulfonic acid continuously until it just became a ropy liquid to afford acidic ionic liquid 2-1′-methylimidazolium-3-yl-1-ethyl sulfate.

Procedure for the preparation of triaryl-5*H*-chromeno [4,3-*b*]pyridines. 2 mmol of aromatic aldehyde **1**, 2′-hydroxyacetophenone (**2**, 2 mmol), and ammonium acetate (5 equiv.) were added into a one-necked 50 mL round bottom flask containing 1 mL of glycol and 2 mL of 1-methyl-3-2′-hydroxylethylimidazolium chloride, the mixture was then radiated under microwave in a Emrys^{TM} Creator (Sweden) for 50 min (5 × 10 min). When the reaction was finished (monitored by TLC), distilled water was poured into, the deposition was then filtered, and recrystallized with DMF to give **8**.

2-(4,5-Diphenyl-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8a). This compound was obtained as yellow crystal (DMF), mp 194.1–195.3°C; ir (potassium bromide): 3310, 3030, 1600, 1580, 1031; ^1H NMR: δ 13.80 (s, 1H, OH), 8.20 (d, 1H, J = 8.4 Hz, ArH), 8.14 (s, 1H, ArH), 8.01 (d, 1H, J = 8.0 Hz, ArH), 7.46 (m, 3H, ArH), 7.36 (m, 4H, ArH), 7.24 (m, 3H, ArH), 7.11 (t, 1H, ArH), 7.04 (t, 2H, ArH), 7.02 (d, 1H, J = 9.6 Hz, ArH), 6.97 (t, 2H, ArH), 6.50 (s, 1H, CH); ^{13}C NMR: δ 161.5, 159.2, 156.5, 153.2, 148.0, 141.2, 139.2, 135.0, 134.5, 131.5, 131.4, 131.3, 131.2, 131.0, 130.8, 130.3, 126.4, 125.5, 125.3, 124.5, 123.4, 122.9, 122.8, 120.9, 120.5; Anal. Calcd. for $C_{32}H_{25}NO_2$: C, 83.26; H, 6.77; N, 3.03. Found: C, 83.36; H, 6.76; N, 3.01; hrms: m/z calcd. for $C_{32}H_{25}NO_2$, 455.1885; found, 455.1871.

2-(4,5-Bis(4-methoxyphenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8c). This compound was obtained as brown crystal (DMF), mp 191.2–192.4°C; ir (potassium bromide): 3310, 3030, 2985, 1610, 1540, 1020; ^{1}H NMR: δ 13.91 (s, 1H, OH), 8.18 (dd, 1H, J_1 = 1.6 Hz, J_2 = 7.6 Hz, ArH), 8.09 (s, 1H, ArH), 8.00 (dd, 1H, J_1 = 1.6 Hz, J_2 = 7.6 Hz, ArH), 7.39–7.32 (m, 2H, ArH), 7.26 (d, 2H, J = 7.6 Hz, ArH), 7.12–7.17 (t, 1H, ArH), 6.90–7.07 (m, 7H, ArH), 6.79–6.81 (d, 2H, J = 7.6 Hz, ArH), 6.45 (s, 1H, CH), 3.78 (s, 3H, OCH_3), 3.65 (s, 3H, OCH_3); ^{13}C NMR: δ 160.0, 159.5, 156.9, 154.1, 149.4, 145.9, 132.0, 131.6, 131.3, 129.7, 129.4, 129.3, 126.3, 124.2, 123.5, 122.3, 122.1, 119.3, 118.9, 118.8, 118.5, 118.1, 114.0, 113.8, 55.3, 55.1; *Anal.* Calcd. for $C_{32}H_{25}NO_4$: C, 78.83; H, 5.17; N, 2.87. Found: C, 78.72; H, 5.18; N, 2.89; hrms: m/z calcd. for $C_{32}H_{25}NO_4$, 487.1784; found, 487.1771.

2-(4,5-Bis(4-bromophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8d). This compound was obtained as yellow crystal (DMF), mp 221.5–222.5°C; ir (potassium bromide): 3310, 3030, 2980, 1600, 1550, 1010; ^{1}H NMR: δ 13.65 (s, 1H, OH), 8.21 (d, 1H, J = 9.6 Hz, ArH), 8.15 (s, 1H, ArH), 8.06 (d, 1H, J = 9.6 Hz, ArH), 7.67 (d, 2H, J = 8.0 Hz, ArH), 7.44 (d, 2H, J = 9.6 Hz, ArH), 7.33–7.41 (m, 2H, ArH), 7.29 (d, 2H, J = 8.0 Hz, ArH), 7.14–7.21 (t, 1H, ArH), 6.94–7.09 (m, 5H, ArH), 6.47 (s, 1H, CH); ^{13}C NMR: δ 155.2, 152.8, 149.1, 143.8, 141.4, 138.0, 135.0, 133.1, 131.0, 127.7, 127.3, 127.2, 127.0, 125.1, 124.9, 121.7, 119.6, 118.7, 118.3, 118.0, 117.6, 117.0, 114.4, 114.2, 113.9, 113.8, 113.4; Anal. Calcd. for $C_{30}H_{19}Br_2NO_2$: C, 61.56; H, 3.27; N, 2.39. Found: C, 61.66; H, 3.26; N, 2.37; hrms: m/z calcd. for $C_{30}H_{19}Br_2NO_2$, 584.9762; found, 584.9760.

2-(4,5-Bis(2,3-dimethoxyphenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8e). This compound was obtained as yellow crystal (DMF), mp 223.7–225.2°C; ir (potassium bromide): 3310, 3030, 2986, 1600, 1560, 1030; ^{1}H NMR: δ 13.95 (s, 1H, OH), 8.23 (d, 1H, J = 8.0 Hz, ArH), 8.15 (s, 1H, ArH), 8.00 (d, 1H, J = 8.0 Hz, ArH), 7.33–7.41 (m, 2H, ArH), 7.13–7.18 (t, 1H, ArH), 6.10–7.08 (m, 6H, ArH), 6.84 (s, 1H, ArH), 6.77 (d, 1H, J = 8.0 Hz, ArH), 6.46 (d, 1H, J = 8.0 Hz, ArH), 6.44 (s, 1H, CH), 3.79 (s, 3H, OCH_3), 3.67 (s, 3H, OCH_3), 3.65 (s, 3H, OCH_3), 3.52 (s, 3H, OCH_3); ^{13}C NMR: δ 159.0, 155.3, 154.3, 153.0, 152.9, 147.0, 145.5, 145.0, 132.8, 132.3, 131.8, 131.0, 128.3, 124.8, 123.9, 122.9, 121.9, 121.6, 120.9, 119.9, 119.5, 118.5, 118.0, 61.0, 60.5, 56.5, 56.0; *Anal.* Calcd. for $C_{34}H_{29}NO_6$: C, 74.57; H, 5.34; N, 2.56. Found: C, 73.85; H, 6.36; N, 2.51; hrms: *m/z* calcd. for $C_{34}H_{29}NO_6$, 547.1995; found, 547.1975.

2-(4,5-Bis(4-cyanophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8f). This compound was obtained as yellow crystal (DMF), mp > 300°C; ir (potassium bromide): 3320, 3030, 2980, 2250, 1600, 1560, 1030; ^{1}H NMR: δ 13.50 (s, 1H, OH),

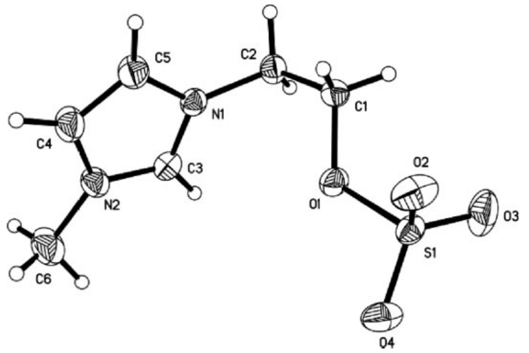

Figure 4. Single-crystal X-ray structure of 2-1′-methylimidazolium-3-yl-1-ethyl sulfate.

8.21 (d, 1H, $J = 8.0$ Hz, ArH), 8.19 (s, 1H, ArH), 8.03 (d, 1H, $J = 7.6$ Hz, ArH), 7.94 (d, 2H, $J = 8.0$ Hz, ArH), 7.71 (d, 2H, $J = 8.0$ Hz, ArH), 7.54 (d, 2H, $J = 8.0$ Hz, ArH), 7.37–7.41 (t, 2H, ArH), 7.30 (d, 2H, $J = 8.0$ Hz, ArH), 7.17–7.21 (t, 1H, ArH), 6.96–7.04 (t, 3H, ArH), 6.57 (s, 1H, CH); ^{13}C NMR: δ 159.2, 156.8, 154.0, 149.5, 148.3, 148.0, 147.9, 147.9, 145.7, 133.0, 132.9, 132.3, 130.3, 128.5, 124.0, 123.3, 123.0, 122.9, 122.2, 122.1, 121.9, 119.9, 119.8, 118.8, 118.2, 109.4, 109.0, 108.4, 101.9; *Anal.* Calcd. for $C_{32}H_{19}N_3O_2$: C, 80.49; H, 4.01; N, 8.80. Found: C, 80.59; H, 4.00; N, 8.78; hrms: *m*/*z* calcd. for $C_{32}H_{19}N_3O_2$, 477.1477; found, 477.1455.

2-(4,5-Bis(4-chlorophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8g). This compound was obtained as yellow crystal (DMF), mp 208.3–209.4°C; ir (potassium bromide): 3350, 3030, 2980, 1640, 1580, 1050; ^{1}H NMR: δ 13.62 (s, 1H, OH), 8.20 (d, 1H, $J = 8.0$ Hz, ArH), 8.13 (s, 1H, ArH), 8.01 (d, 1H, $J = 8.0$ Hz, ArH), 7.52 (d, 2H, $J = 8.0$ Hz, ArH), 7.29–7.35 (m, 6H, ArH), 7.11–7.20 (m, 3H, ArH), 6.94–7.04 (m, 3H, ArH), 6.48 (s, 1H, CH); ^{13}C NMR: δ 159.1, 157.0, 153.9, 148.9, 145.9, 137.9, 135.8, 134.2, 134.0, 133.0, 132.8, 130.9, 130.0, 129.5, 129.0, 128.6, 124.0, 123.2, 123.0, 121.9, 121.0, 119.0, 118.9, 118.3; *Anal.* Calcd. for $C_{30}H_{19}Cl_2NO_2$: C, 72.59; H, 3.86; N, 2.82. Found: C, 72.65; H, 3.85; N, 2.81; hrms: *m*/*z* calcd. for $C_{30}H_{19}Cl_2NO_2$, 495.0793; found, 495.0775.

2-(4,5-Bis(2-methoxyphenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8h). This compound was obtained as yellow crystal (DMF), mp 244.5–245.5°C; ir (potassium bromide): 3310, 3030, 2985, 1600, 1550, 1050; ^{1}H NMR: δ 14.70 (s, 1H, OH), 8.11 (dd, $J_1 = 1.2$ Hz, $J_2 = 1.6$ Hz, 1H, ArH), 7.81 (dd, $J_1 = 1.6$ Hz, $J_2 = 1.6$ Hz, 1H, ArH), 7.81 (s, 1H, ArH), 7.56 (t, 1H, ArH), 7.31–7.33 (t, 1H, ArH), 7.08–7.18 (m, 6H, ArH), 6.78–6.98 (m, 4H, ArH), 6.75–6.79 (m, 2H, ArH), 6.39 (s, 1H, CH), 3.88 (s, 3H, OCH$_3$), 3.74 (s, 3H, OCH$_3$); ^{13}C NMR: δ 160.1, 159.7, 159.3, 156.9, 154.1, 149.8, 145.9, 132.9, 132.1, 131.1, 130.3, 129.6, 129.1, 128.0, 124.1, 123.6, 123.0, 122.5, 121.0, 119.9, 119.9, 118.5, 118.8, 114.8, 114.7, 60.5, 56.0; Anal. Calcd. for $C_{32}H_{25}NO_4$: C, 78.83; H, 5.17; N, 2.87. Found: C, 78.91; H, 5.16; N, 2.85; hrms: m/z calcd. for $C_{32}H_{25}NO_4$, 487.1784; found, 487.1768.

2-(4,5-Bis(3,4,5-trimethoxyphenyl)-5*H*-chromeno[4,3-*b*] pyridin-2-yl)phenol (8i). This compound was obtained as brown crystal (DMF), mp 236.1–237.9°C; ir (potassium bromide): 3300, 3030, 2980, 1600, 1550, 1050; ^{1}H NMR: δ 13.95 (s, 1H, OH), 8.22 (d, 1H, $J = 8.0$ Hz, ArH), 8.17 (s, 1H, ArH), 8.02 (d, 1H, $J = 8.0$ Hz, ArH), 7.53–7.59 (t, 1H, ArH), 7.34–7.44 (m, 1H, ArH), 6.94–7.22 (m, 4H, ArH), 6.60 (s, 1H, CH), 6.46 (d, 3H, $J = 11.2$ Hz, ArH), 3.56–3.61 (m, 18H, OCH$_3$); ^{13}C NMR: δ 159.4, 156.9, 154.4, 153.9, 150.1, 147.6, 145.6, 138.2, 135.2, 132.8, 132.3, 131.6, 128.4, 127.7, 123.5, 123.6, 122.3, 121.0, 120.0, 119.6, 119.6, 118.6, 118.2, 106.6, 106.5, 106.1, 60.6, 60.5, 60.3, 56.9, 56.4, 56.0; *Anal.* Calcd. for $C_{36}H_{33}NO_4$: C, 71.16; H, 5.47; N, 2.31. Found: C, 71.26; H, 5.46; N, 2.29; hrms: *m*/*z* calcd. for $C_{36}H_{33}NO_4$, 607.2206; found, 607.2217.

2-(4,5-Bis(2-chlorophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8j). This compound was obtained as yellow crystal (DMF), mp 196.9–197.7°C; ir (potassium bromide): 3350, 3010, 2990, 1630, 1580, 1010; ^{1}H NMR: δ 13.62 (s, 1H, OH), 8.16–8.21 (t, 1H, ArH), 8.13 (s, 1H, ArH), 8.09 (d, 1H, $J = 8.0$ Hz, ArH), 7.67–7.75 (m, 1H, ArH), 6.81–7.49 (m, 12H, ArH), 6.60 (d, 1H, $J = 9.6$ Hz, ArH), 6.58 (s, 1H, CH); ^{13}C NMR: δ 159.21, 157.7, 153.8, 153.7, 147.2, 145.6, 135.2, 135.1, 133.4, 133.1, 132.4, 131.3, 131.2, 131.1, 131.1, 130.7, 130.3, 130.2, 130.0, 128.6, 127.9, 123.5, 119.7, 118.2; *Anal.* Calcd. for $C_{30}H_{19}Cl_2NO_2$: C, 72.59; H, 3.86; N, 2.82. Found: C, 72.66; H, 3.87; N, 2.80; hrms: *m*/*z* calcd. for $C_{30}H_{19}Cl_2NO_2$, 495.0793; found, 495.0769.

2-(4,5-Bis(3-bromophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8k). This compound was obtained as brown crystal (DMF), mp 187.1–188.6°C; ir (potassium bromide): 3320, 3020, 2980, 1620, 1580, 1020; ^{1}H NMR: δ 14.70 (s, 1H, OH), 8.10 (dd, 1H, $J_1 = 1.6$ Hz, $J_2 = 7.6$ Hz, ArH), 7.85 (dd, 1H, $J_1 = 1.6$ Hz, $J_2 = 7.6$ Hz, ArH), 7.79 (s, 1H, ArH), 7.33–7.37 (t, 1H, ArH), 7.23–7.27 (t, 1H, ArH), 7.18 (d, 2H, $J = 7.6$ Hz, ArH), 7.01–7.11 (m, 8H, ArH), 6.90–6.94 (t, 1H, ArH), 6.82 (dd, 1H, $J_1 = 1.6$ Hz, $J_2 = 7.6$ Hz, ArH), 6.38 (s, 1H, CH); ^{13}C NMR: δ 159.2, 157.0, 154.2, 149.9, 145.7, 139.0, 137.0, 132.2, 129.7, 129.3, 129.1, 129.0, 129.0, 128.8, 128.5, 128.1, 124.1, 123.2, 123.0, 122.1, 121.1, 121.1, 119.8, 119.7, 118.6, 118.2; *Anal.* Calcd. for $C_{30}H_{19}Br_2NO_2$: C, 61.56; H, 3.27; N, 2.39. Found: C, 61.62; H, 3.26; N, 2.38; hrms: *m*/*z* calcd. for $C_{30}H_{19}Br_2NO_2$, 584.9762; found, 584.9753.

2-(4,5-Bis(2,4-dichlorophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8l). This compound was obtained as yellow crystal (DMF), mp 196.4–197.1°C; ir (potassium bromide): 3310, 3030, 2998, 1600, 1540, 1020; ^{1}H NMR: δ 13.65 (s, 1H, OH), 8.21 (d, 1H, $J = 8.0$ Hz, ArH), 8.15 (s, 1H, ArH), 8.02 (d, 1H, $J = 8.0$ Hz, ArH), 7.54 (d, 2H, $J = 8.0$ Hz, ArH), 7.29–7.41 (m, 6H, ArH), 7.11–7.21 (m, 3H, ArH), 6.94–7.04 (m, 3H, ArH), 6.50 (s, 1H, CH); ^{13}C NMR: δ 160.0, 159.5, 156.9, 154.1, 149.4, 145.9, 131.9, 131.6, 131.3, 129.7, 129.4, 129.3, 126.3, 124.2, 123.5, 122.3, 122.1, 119.3, 118.9, 118.2, 118.5, 118.1, 114.0, 113.7; *Anal.* Calcd. for $C_{30}H_{17}Cl_4NO_2$: C, 63.74; H, 3.03; N, 2.48. Found: C, 63.66; H, 3.04; N, 2.50; hrms: *m*/*z* calcd. for $C_{30}H_{17}Cl_4NO_2$, 564.9989; found, 564.9927.

2-(4-(Benzo[*d*][1,3]dioxol-5-yl)-5-(benzo[*d*][1,3]dioxol-6-yl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl)phenol (8m). This compound was obtained as yellow crystal (DMF), mp 234.1–235.0°C; ir (potassium bromide): 3320, 3020, 2995, 1600, 1500, 1010; ^{1}H NMR: δ 13.85 (s, 1H, OH), 8.19 (d, 1H, $J = 8.0$ Hz, ArH), 8.09 (s, 1H, ArH), 7.81 (d, 1H, $J = 8.0$ Hz, ArH), 7.37 (t, 2H, ArH), 7.17 (t, 1H, ArH), 6.95–7.02 (m, 5H, ArH), 6.73–6.81 (m, 3H, ArH), 6.46 (d, 1H, $J = 8.0$ Hz, ArH), 6.43 (s, 1H, ArH), 6.09 (s, 2H, CH$_2$), 5.97 (s, 2H, CH$_2$); ^{13}C NMR: δ 159.2, 156.9, 154.0, 152.9, 149.3, 148.2, 148.0, 147.9, 133.9, 123.6, 122.1, 120.0, 118.9, 109.3, 109.0, 108.0; *Anal.* Calcd. for $C_{32}H_{21}NO_6$: C, 74.56; H, 4.11; N, 2.72. Found: C, 74.61; H, 4.10; N, 2.71; hrms: *m*/*z* calcd. for $C_{32}H_{21}NO_6$, 515.1369; found, 515.1360.

2-(4,5-Bis(3-nitrophenyl)-5*H*-chromeno[4,3-*b*]pyridin-2-yl) phenol (8n). This compound was obtained as yellow crystal (DMF), mp 186.2–197.7°C; ir (potassium bromide): 3350, 3010, 2995, 1600, 1530, 1040; ^{1}H NMR: δ 14.35 (s, 1H, OH), 8.50 (m, 1H, ArH), 8.25–8.35 (m, 3H, ArH), 8.17 (s, 1H, ArH), 8.00 (dd, 1H, $J_1 = 1.6$ Hz, $J_2 = 7.6$ Hz, ArH), 7.50–7.67 (m, 2H, ArH), 7.10–7.49 (m, 9H, ArH), 6.55 (s, 1H, CH); ^{13}C NMR: δ 155.3, 153.6, 148.8, 141.7, 135.8, 133.5, 129.3, 128.7, 128.1, 127.7, 125.5, 125.1, 121.8, 119.9, 119.3, 119.2, 118.5, 117.9, 116.7, 116.6, 114.5, 114.3, 114.0, 113.5; *Anal.* Calcd. for $C_{30}H_{19}N_3O_6$: C, 69.63; H, 3.70; N, 8.12. Found: C, 69.55; H, 3.71; N, 8.14; hrms: *m*/*z* calcd. for $C_{30}H_{19}N_3O_6$, 517.1274; found, 517.1360.

Acknowledgments. [5] The single crystal growth was carried out in DMF at room temperature. X-ray crystallographic analysis was performed with a Smartapex Bruke diffractometer (graphite monochromator, MoKα radiation $\lambda = 0.71073$ Å). Crystal data for 8 h: Empirical formula $C_{32}H_{25}NO_4$, yellow, crystal dimension 0.16 × 0.10 × 0.08 mm, monoclinic, space group P2(1)/*n*, $a = 10.382$ (6) Å, $b = 15.694$ (9) Å, $c = 14.987$ (8) Å, $\alpha = 90.00°$, $\beta = 99.233$ (8)°, $\gamma = 90.00°$, $V = 2410$ (2) Å^3, Mr = 487.53, $Z = 7$, Dc = 1.344 Mg/m^3, $\lambda = 0.71073$ Å, μ (MoKα) = 0.088 mm^{-1}, F(000) = 1024, $S = 0.898$, $R_1 = 0.0558$, wR$_2$ = 0.0592. Crystallographic data for the structures of 8 h reported in this letter have been deposited with the Cambridge Crystallographic Date Centre as supplementary publication No. CCDC-655835.

New One-Step Synthesis of Pyrazolo[1,5-*a*]pyrimidine and Pyrazolo[1,5-*a*]quinazoline Derivatives via Multicomponent Reactions

A series of pyrazolopyrimidine and pyrazoloquinozoline derivatives has been synthesized in one step by multicomponent reactions using, 5-aminopyrazole, *p*-substitutedbenzoylacetonitrile/dimedone and triethylorthoesters. pyrazolopyrimidine derivatives were also studied for their absorption and fluorescence maxima.

J. Heterocyclic Chem., **46**, 708 (2009).

INTRODUCTION

Heterocyclic ring systems that containing the pyrazole ring fused to pyrimidine or quinazoline rings are interesting classes of compounds both chemically and biologically. For example, pyrazolopyrimidines display significant chemical properties [1–7]. In particular, pyrazolo[1,5-*a*]pyrimidines structural motif may be found in a large number of pharmaceutical agents with a diverse range of physiological activities, such as, antiepileptic agents [8], anxiolytics [9], antidepressants [10], agents for treatment of sleep disorders [11], and oncolytics [12,13]. Whereas, several naturally occurring and synthetic compounds containing the quinazoline derivatives exhibit a wide range of biological properties [14,15]. In recent years an increasing interest has been focused on synthesis of fluorescent compounds owing to their significant biological applications in the medicinal chemistry [16,17]. In particular, these compounds have important applications in the field of dyes [18] and are used in the security papers [19]. In literature the synthesis of pyrazolo[1,5-*a*]pyrimidines has been reported [20,21] by using Michael addition reaction of 5-aminopyrazoles with enol ether of reactive methylene compounds and triethylorthoesters. The title compounds could be synthesized in one pot in which the synthesis of enol ether is not required.

On the other hand, multicomponent reactions (MCRs) are of increasing importance in organic and medicinal chemistry. MCR strategies offer significant advantages over conventional linear type synthesis [22–24]. As a part of our continued interest [25–27] in the synthesis of novel heterocyclic compounds, we have reported the synthesis of pyrazolo[3,4-*b*]pyridines, pyrazolo[3,4-*b*]quinolines, pyrazolonaphthyridines and pyrazolopyridopyrimidines by Friedlander condensation of 5-aminopyrazole-4-carbaldehyde with various reactive methylene compounds and the synthesis of fused pyrimidines [28] by using 2-aminoheterocycles and cyclic β-formylesters in ammonium acetate at 120°C. We have also reported the study of fluorescence properties of benzo[*h*]quinolines and dipyrazolopyridines [29,30]. In our recent communications [31,32], we have reported the synthesis of chromenes, quinolines, and pyrazolo[3,4-*b*]pyridines by multicomponent reaction strategy. These literature reports and increasing importance of multicomponent reactions in organic chemistry encourage us to synthesize, pyrazolo[1,5-*a*]pyrimidine and pyrazolo[1,5-*a*] quinazoline derivatives using multicomponent reactions and study the photophysical properties of pyrazolopyrimidine derivatives.

RESULTS AND DISCUSSION

The cyclocondensation of 5-amino-1*H*-pyrazole-4-carbonitrile **1**, *p*-substituted benzoylacetonitriles **2** and triethylorthoesters **3** by refluxing in toluene containing catalytic amount of triethylamine for 2 h, afforded compounds **4** in good yield. The structure of **4a** was confirmed by IR, ^{1}H-NMR, ^{13}C-NMR, mass spectroscopy and elemental analysis for example the IR spectrum of **4a** showed bands at 2237 cm^{-1} for CN stretching. The ^{1}H-NMR of compound **4a** showed a multiplets at δ 7.85–7.89 for four aromatic protons and the two singlets at δ 8.87 and δ 9.16 corresponding to C$_2$H and C$_5$H aromatic protons. The ^{13}C-NMR spectrum of this compound exhibits a peaks of tertiary carbons at δ 128, 129, 138, 161 and of quaternary carbons at δ 66, 106, 117, 167, 131, 133, 134. Mass Spectrum of **4a** showed characteristic peaks for M$^+$ and M+2 at 279 and 281 *m*/*z*, due to presence of chlorine. The elemental analysis obtained is in agreement with molecular formula. Analogously, the cyclocondensation of 5-amino-1*H*-pyrazole-4-carbonitrile **1**, *p*-substituted benzoylacetonitriles **2** and triethylorthoesters **3** by refluxing in ethanol in the presence of catalytic amount of hydrochloric acid for 2 h, afforded compounds **5** in good yield. The structure of **5a** was confirmed by IR, ^{1}H-NMR, ^{13}C-NMR, mass spectroscopy and elemental analysis for example the IR spectrum of **5a** showed the bands at 1621 and 2231 cm^{-1} for C=O and CN stretching respectively and two bands for NH$_2$ groups were appears at 3328–3425 cm^{-1}. The 1H-NMR of compound **5a** showed a multiplet

Table 1

The absorbance, emission λ_{max}, and quantum yield of pyrazolopyrimidines (**4a-f** and **5a-f**).

Compd.	Absorbance λ_{max} (nm)	Emission λ_{max} (nm)	Quantum yield (Φ_F)
(**4a**)	293	322	0.110
(**4b**)	280	316	0.109
(**4c**)	296	332	0.111
(**4d**)	279	306	0.108
(**4e**)	267	304	0.107
(**4f**)	284	312	0.112
(**5a**)	336	393	0.113
(**5b**)	342	398	0.114
(**5c**)	345	400	0.116
(**5d**)	360	414	0.117
(**5e**)	338	402	0.103
(**5f**)	350	407	0.104

between δ 7.71 and 7.97 for four aromatic protons and the two singlets at δ 6.84 and δ 8.63 for C2H and C5H aromatic protons. The two broad singlets appeared at δ 7.01 and δ 8.48 corresponding to NH_2 protons. The NH_2 protons are splits in to two broad singlets due to formation of hydrogen bonding between hydrogen atom of NH_2 group and oxygen atom of C=O group. The 13C-NMR spectrum of this compound exhibits a peaks of tertiary carbons at δ 129, 131, 138, 160, and of quaternary carbons at δ 68, 115, 133, 138, 168. The cyanide and carbonyl carbon appears at δ 126 and 196. The mass spectrum of a showed M+ and M+2 at 297 and 299 *m*/*z*. The elemental analysis obtained is in agreement with the molecular formula. Similarly, the structures of bromo-derivatives 4d and 5d were confirmed. It was observed that, the cyclocondensation of intermediate Y with $-COCH_2-$ fragment of substrate 2 should give product 4 but cyclocondensation of Y with $-CH_2CN-$ fragment of substrate 2 should give product 5 [21,33].

It was interesting to note that the cyclocondensaton reaction in presence of basic medium at pH 9–10 led 7-(4-aryl)pyrazolo[1,5-*a*] pyrimidine-3,6-dicarbonitriles **4**, where the cyclization on carbonyl carbon takes place, whereas the similar cyclocondensation reaction when carried out in presence of acidic medium at pH 3-4 gave 7-amino-6-(4-aroyl)pyrazolo[1,5-*a*]pyrimidine-3-carbonitriles **5** in which the cyclization on nitrile carbon takes place [21,33]. The synthesis of pyrazolo[1,5-*a*]quinazolines **7** were also achieved in one step, by the cyclocondensation of 5-aminopyrazole **1**, dimedone **6** and triethyorthoesters **3** by refluxing in toluene for 3 h furnished the compound **7** in 75–80% yield. The structure of **7a** was confirmed by IR, ^{1}H-NMR, ^{13}C-NMR and elemental analysis for example the IR spectrum of **7a** showed bands at 2215, 1687 cm^{-1} for CN and carbonyl groups. The ^{1}H-NMR of compound **7a** showed a singlet at δ 1.25 for six methyl protons, singlet at δ 2.65 and δ 3.40 for four methylene protons, a singlet at 8.49 and 9.18 corresponding to C_2H and C_5H protons respectively. Further this structure was confirmed by ^{13}C-NMR which is in agreement with the structure proposed. Similarly, the structures of compound **7b** and **7c** were confirmed.

After synthesis of all these compounds, it was noted that the pyrazolo[1,5-*a*]pyrimidine derivatives showed good fluorescence properties. So, we further studied the photophysical properties of pyrazolopyrimidine derivatives **4** and **5**. It was observed that compounds **4** showed UV absorption in the range 267–296 nm and fluorescence maxima in the range of 304–332 nm. While the compounds **5** showed slightly better absorption and emission values. From Table 1. It is evident that the incorporation of amino group at C_7 position in compounds **5** markedly increases the absorption and emission properties compared with aryl group at C_7 position in compounds **4**. The compound **5d** showed good absorption and emission spectra as shown in Figure 1.

The reactions reported here represent new synthetic methods toward synthesis of novel pyrazolopyrimidine and pyrazoloquinozoline derivatives with simple workup and clean products in single step.

EXPERIMENTAL

Melting points were determined on a Gallenkamp Melting Point Apparatus, Mod. MFB-595 in open capillary tubes and are uncorrected. The ^{1}H and ^{13}C-NMR spectra were recorded on a Varian XL-300 spectrometer (300 MHz). Chemical shifts are reported in ppm from internal tetramethylsilane standard and are given δ-units. The solvents for NMR spectra was duteriochloroform unless otherwise stated. Infrared spectra were taken on Shimadzu IR-408, a Shimadzu FTIR instrument in potassium bromide pellets unless otherwise stated. UV Spectra were recorded on a Shimadzu UV-1601 UV–visible

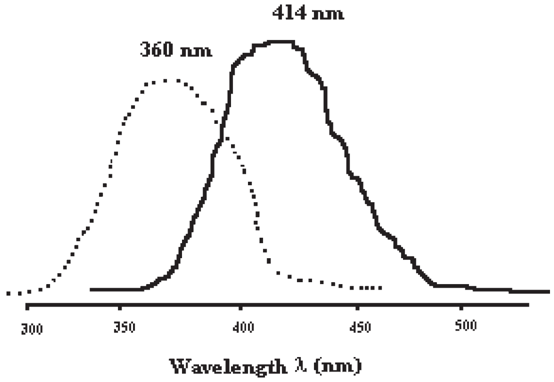

Figure 1. The absorption (dotted line) and emission spectra of compound **5d**.

Spectrophotometer. High-resolution mass spectra were obtained with a Mat 112 Varian Mat Bremen (70 eV) mass spectrometer. Compounds for UV scan were dissolved in methanol. Fluorescence spectra were recorded using RF-5301 PC Spectrofluorophotometer. Compounds for fluorescence measurements were dissolved in methanol. UV and fluorescence scans were recorded from 200 to 500 nm. Elemental analyses were performed on a Hosli CH-Analyzer and are within ±0.3 of the theoretical percentage. Solutions were concentrated in a rotary evaporator under reduced pressure. All reactions were monitored by thin layer chromatography, carried out on 0.2-mm silica gel 60 F_{254} (Merk) plates using UV light (254 and 366 nm) for detection. Common reagents-grade chemicals are either commercially available and were used without further purification or prepared by standard literature procedures.

General procedure for the synthesis of 7-(4-aryl) pyrazolo[1,5-*a*]pyrimidine-3,6-dicarbonitrile (4). A mixture of 5-aminopyrazole **1** (1.08 g, 10 mmole), aroylacetonitriles **2** (10 mmole), and triethylorthoesters **3** (10 mmole) in toluene (20 mL) containing catalytic amount of triethylamine (0.5 mL) was refluxed for 2–3 h. The completion of reaction was monitored by thin layer chromatography (TLC). Then the excess of solvent was removed under reduced pressure. The solid obtained was stirred in ethanol (10 mL), filtered, washed with ethanol, dried and recrystallized from suitable solvent furnished compounds **4** in good yield.

7-(4-Chlorophenyl)pyrazolo[1,5-a]pyrimidine-3,6-dicarbonitrile (4a). This compound was obtained as colorless prism (ethanol), 2.15 g (77%), mp 223–224°C; IR: (Potassium bromide): 2237, 1654, 1606, 1590, 1525, 1486, 1264, 1065, 1012, 827, 637 cm^{-1}; 1H-NMR: (CDCl3) δ 7.85–7.89 (m, 4H, Ar—H), 8.87 (s, 1H, Ar—H), 9.16 (s, 1H, Ar—H); 13C-NMR: (CDCl3) δ 66, 106, 117, 119, 128, 129, 131, 133, 134, 138, 161, 167. MS: (70 eV) *m*/*z* (%) 281 (90) (M+2), 279 (100) (M+), 271 (80), 258 (65), 244 (70), 233 (80), 207 (10), 181 (20), 153 (40), 122 (30), 93 (50), 78 (70), 63 (80), 44 (40). *Anal.* Calcd for $C_{14}H_6ClN_5$: C, 60.12; H, 2.16; N, 25.04. Found: C, 60.29; H, 2.45; N, 25.33.

7-(4-Chlorophenyl)-5-methylpyrazolo[1,5-a]pyrimidine-3,6-dicarbonitrile (4b). This compound was obtained as yellow prism (ethanol/DMF), 2.58 g (88 %), mp 228–230°C; IR: (Potassium bromide): 2246, 1615, 1596, 1489, 1464, 1381, 1098, 1018, 832, 643 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 2.81 (s, 3H, CH_3), 7.74 (d, 2H, *J* = 8.7 Hz, Ar—H), 7.84 (d, 2H, *J* = 8.7 Hz, Ar—H), 8.89 (s, 1H, Ar—H). *Anal.* Calcd for $C_{15}H_8ClN_5$: C, 61.34; H, 2.75; N, 23.84. Found: C, 61.13; H, 2.45; N, 23.61.

7-(4-Chlorophenyl)-5-ethylpyrazolo[1,5-a]pyrimidine-3,6-dicarbonitrile (4c). This compound was obtained as colorless prism (ethanol/DMF), 2.43 g (79%), mp 174–175°C; IR: (Potassium bromide): 2233, 1622, 1587, 1492, 1463, 1385, 1094, 1021, 838, 642 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 1.41 (t, 3H, *J* = 7.2 Hz, CH_3), 3.19 (q, 2H, *J* = 7.2 Hz, CH_2), 7.83 (d, 2H, *J* = 8.7 Hz, Ar—H), 7.95 (d, 2H, *J* = 8.4 Hz, Ar—H), 8.91 (s, 1H, Ar—H); MS: (70 eV) *m*/*z* (%) 309 (40) (M+2), 307 (100) (M+), 280 (40), 272 (80), 252 (20), 245 (30), 229 (10), 218 (10), 187 (30), 179 (20), 161 (50), 152 (30), 126 (30), 113 (10), 111 (40), 88 (10), 75 (60), 63 (50), 51 (55), 40 (40). *Anal.* Calcd for $C_{16}H_{10}ClN_5$: C, 62.45; H, 3.28; N, 22.76. Found: C, 62.67; H, 3.53; N, 22.55.

7-(4-Bromophenyl)pyrazolo[1,5-a]pyrimidine-3,6-dicarb onitrile (4d). This compound was obtained as colorless prism (ethanol), 2.78 g (86%), mp 246–248°C; IR: (Potassium bromide): 2239, 1656, 1610, 1587, 1521, 1482, 1262, 1068, 1018, 828, 639 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 7.85 (d, 2H, *J* = 8.5 Hz, Ar—H), 7.89 (d, 2H, *J* = 8.4 Hz, Ar—H), 8.85 (s, 1H, Ar—H), 9.12 (s, 1H, Ar—H); ^{13}C-NMR: ($CDCl_3$) δ 67, 108, 118, 121, 125, 127, 131, 134, 136, 140, 163, 168. MS: (70 eV) *m*/*z* (%) 326 (90) (M+2), 324 (100) (M+), 323 (80), 322 (60), 298 (10), 271 (10), 258 (10), 244 (20), 233 (10), 207 (10), 183 (20), 181 (10), 153 (40), 122 (60), 102 (70), 91 (60), 75 (80), 63 (70), 44 (60). *Anal.* Calcd for $C_{14}H_6BrN_5$: C, 51.88; H, 1.87; N, 21.61. Found: C, 51.54; H, 1.62; N, 21.41.

7-(4-Bromorophenyl)-5-methylpyrazolo[1,5-a]pyrimidine-3,6-dicarbonitrile (4e). This compound was obtained as yellow prism (ethanol/DMF), 2.77 g (82%), mp 142–143°C; IR: (Potassium bromide): 2243, 1611, 1592, 1485, 1460, 1383, 1097, 1016, 830, 641 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 2.83 (s, 3H, CH_3), 7.76 (d, 2H, *J* = 8.7 Hz, Ar—H), 7.86 (d, 2H, *J* = 8.7 Hz, Ar—H), 8.85 (s, 1H, Ar—H). *Anal.* Calcd for $C_{15}H_8BrN_5$: C, 53.28; H, 2.38; N, 20.71. Found: C, 53.51; H, 2.49; N, 20.39.

7-(4-Bromophenyl)-5-ethylpyrazolo[1,5-a]pyrimidine-3,6-dicarbonitrile (4f). This compound was obtained as yellow prism (ethanol/DMF), 2.67 g (76%), mp 194–196°C; IR: (Potassium bromide): 2234, 1622, 1587, 1491, 1461, 1382, 1093, 1016, 836, 646 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 1.40 (t, 3H, *J* = 7.2 Hz, CH_3), 3.18 (q, 2H, *J* = 7.2 Hz, CH_2), 7.83 (d, 2H, *J* = 8.7 Hz, Ar—H), 7.94 (d, 2H, *J* = 8.4 Hz, Ar—H), 8.91 (s, 1H, Ar—H). *Anal.* Calcd for $C_{16}H_{10}BrN_5$: C, 54.56; H, 2.86; N, 19.89. Found: C, 54.29; H, 2.66; N, 19.65.

General procedure for the synthesis of 7-Amino-6-(4-aroyl)pyrazolo[1,5-*a*]pyrimidine-3-carbonitrile (5). A mixture of 5-aminopyrazole **1** (1.08 g, 10 mmole), aroylacetonitriles **2** (10 mmole) and triethylorthoesters **3** (10 mmole) in absolute ethanol (20 mL) containing catalytic amount of hydrochloric acid (0.1*N*, 0.5 mL) was refluxed for 2–3 h. The completion of reaction was monitored by thin layer chromatography (TLC). The solid obtained on cooling was filtered, washed with ethanol, dried, and recrystallized from suitable solvent furnished compounds **5** in good yield.

7-Amino-6-(4-chlorobenzoyl)pyrazolo[1,5-a]pyrimidine-3-carbonitrile (5a). This compound was obtained as colorless prism (DMF), 2.64 g (89%), mp 273–274°C; IR: (Potassium bromide): 3425, 3328, 2887, 2874, 2554, 2231, 1660, 1621, 1499, 1368, 1313, 1200, 1076, 1011, 899, 821, 726, 627. cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 6.84 (s, 1H, Ar—H), 7.01 (bs, 1H, NH), 7.71 (d, 2H, *J* = 8.4 Hz, Ar—H), 7.97 (d, 2H, *J* = 8.4 Hz, Ar—H), 8.48 (bs, 1H, NH), 8.63 (s, 1H, Ar—H); ^{13}C-NMR: ($CDCl_3$) δ 68, 115, 126, 129, 131, 133, 138, 160, 164, 168, 169, 196. MS: (70 eV) *m*/*z* (%) 299 (70) (M+2), 297 (90) (M+), 275 (80), 243 (65), 236 (70), 233 (80), 205 (10), 173 (100), 151 (40), 119 (30), 91 (50), 74 (70), 61 (80), 42 (40). *Anal.* Calcd for $C_{14}H_8ClN_5O$: C, 56.48; H, 2.71; N, 23.52. Found: C, 56.29; H, 2.45; N, 23.33.

7-Amino-6-(4-chlorobenzoyl)-5-methylpyrazolo[1,5-a] pyrimidine-3-carbonitrile (5b). This compound was obtained as colorless prism (DMF), 2.43 g (78%), mp 275–277°C; IR: (Potassium bromide): 3427, 3330, 3086, 2888, 2524, 2235, 1660, 1623, 1400, 1367, 1310, 1200, 1069, 1011, 890, 820, 726, 626. cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 2.35 (s, 3H, CH_3), 5.29 (bs, 2H, NH_2), 7.60 (s 1H, Ar—H), 7.62 (d, 2H, *J* = 8.7 Hz, Ar—H), 7.70 (d, 2H, *J* = 8.7 Hz, Ar—H). *Anal.* Calcd for

$C_{15}H_{10}Cl\,N_5O$: C, 57.79; H, 3.23; N, 22.47. Found: C, 57.63; H, 3.41; N, 22.61.

7-Amino-6-(4-chlorobenzoyl)-5-ethylpyrazolo[1,5-a]pyrimidine-3-carbonitrile (5c). This compound was obtained as colorless prism (DMF), 2.47 g (76%), mp 271–272°C; IR: (Potassium bromide): 3430, 3320, 3086, 2920, 2877, 2530, 2231, 1620, 1622, 1401, 1369, 1310, 1200, 1069, 1011, 890, 830, 710, 636. cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 1.24 (t, 3H, J = 7.2 Hz, CH_3), 2.55 (q, 2H, J = 7.2 Hz, CH_2), 5.62 (bs, 2H, NH_2), 7.89 (d, 2H, J = 8.7 Hz, Ar—H), 7.98 (d, 2H, J = 8.4 Hz, Ar—H), 8.96 (s, 1H, Ar—H). *Anal.* Calcd for $C_{16}H_{12}ClN_5O$: C, 58.99; H, 3.71; N, 21.50. Found: C, 58.76; H, 3.53; N, 21.69.

7-Amino-6-(4-bromobenzoyl)pyrazolo[1,5-a]pyrimidine-3-carbonitrile (5d). This compound was obtained as colorless prism (DMF), 2.87 g (84%), mp 289–290°C; IR: (Potassium bromide): 3426, 3329, 2889, 2877, 2559, 2232, 1661, 1623, 1496, 1363, 1310, 1201, 1077, 1012, 890, 823, 722, 628. cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 6.86 (s, 1H, Ar—H), 7.12 (bs, 1H, NH), 7.77 (d, 2H, J = 8.2 Hz, Ar—H), 7.95 (d, 2H, J = 8.2 Hz, Ar—H), 8.52 (bs, 1H, NH), 8.65 (s, 1H, Ar—H); ^{13}C-NMR: ($CDCl_3$) δ 65, 120, 122, 123, 124, 128, 130, 133, 134, 165, 166, 192. MS: (70 eV) m/z (%) 344 (20) (M+2), 342 (90) (M+), 339 (30), 326 (10), 315 (60), 307 (10), 288 (10), 275 (10), 145 (25), 235 (20), 218 (60), 196 (65), 182 (45), 157 (10), 151 (05), 127 (20), 116 (15), 109 (100), 97 (60), 63 (40). *Anal.* Calcd for $C_{14}H_8BrN_5O$: C, 49.14; H, 2.36; N, 20.47. General procedure for the synthesis of 8,8-Dimethyl-6-oxo-6,7,8,9-tetrhydropyrazolo[1,5-*a*]quinazoline-3-carbo-nitrile (7). A mixture of 5-aminopyrazole **1** (1.08 g, 10 mmole), dimedone **2** (10 mmole) and triethylorthoesters **3** (10 mmole) was refluxed in toluene for about 3 h. Completion of reaction was monitored by thin layer chromatography (TLC). The excess of solvent was removed under reduced pressure. The solid obtained was stirred in ethanol (20 mL), filtered, washed with ethanol, dried, and recrystallized from suitable solvent furnished compounds **7** in good yield.

8,8-Dimethyl-6-oxo-6,7,8,9-tetrhydropyrazolo[1,5-a]quinazoline-3-carbonitrile (7a). This compound was obtained as colorless prism (ethanol), 1.96 g (82%), mp 162–163°C; IR: (Potassium bromide): 2215, 1687, 1609, 1537, 1367, 1310, 1261, 1175, 1096, 801, 683 cm^{-1}; ^{1}H-NMR: ($CDCl_3$) δ 1.25 (s, 6H, $2CH_3$), 2.65 (s, 2H, CH_2), 3.40 (s, 2H, CH_2), 8.49 (s, 1H, Ar—H), 9.18 (s, 1H, Ar—H); ^{13}C-NMR: 28, 32, 37, 50, 85, 111, 115, 149, 150, 151, 153, 193. *Anal.* Calcd for $C_{13}H_{12}N_4O$: C, 64.99; H, 5.03; N, 23.32. The ring opening polymerizations of *p*-substituted phenol-based benzoxazines are self-terminated as soon as dimers form. The polymerization of benzoxazine monomers does not proceed according to the theoretical mechanism even though the conditions, temperature, molar ratio, solvent polarity, and reactant ratio are varied. The speculated mechanism, involving the unique structure of a dimer with inter- and intramolecular hydrogen bonds, is applied to explain an obstructive effect on ring opening polymerization. In this article, we clarify an important case which the stereo structure of the compound controls the reaction and prevents the polymerization expected from the theoretical mechanism.

J. Heterocyclic Chem., **46**, 714 (2009).

INTRODUCTION

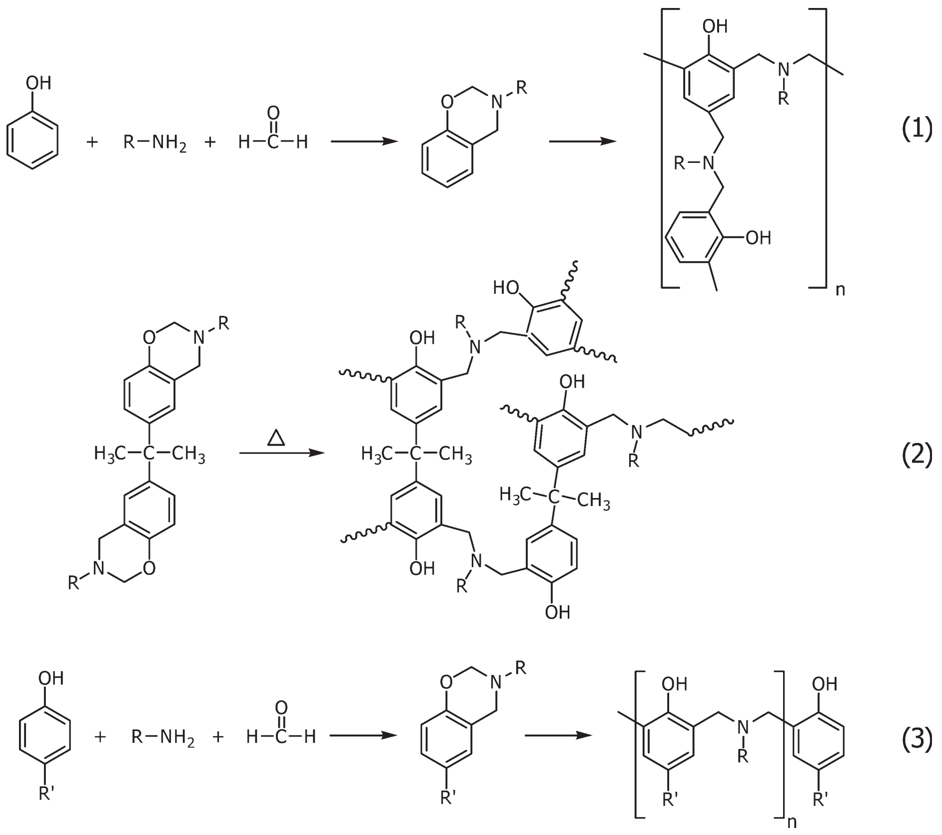
3,4-Dihydro-1,3-2*H*-benzoxazines are known as heterocyclic compounds obtained from *p*-substituted phenols, formaldehyde, and primary amines in a molar ratio of 1:2:1 *via* the Mannich reaction [1]. Theoretically, benzoxazines act as a monomer that undergoes the ring opening reaction to obtain a polymer chain with methylene-amine-Mannich bridges at both the ortho and para positions [2–6] [eq. (1), Scheme 1]. Kopf and Wagner [7] proposed the oxazine-derived phenolics as a potential precursor in synthesis of novolacs. Benzoxazines are reported as polybenzoxazines for the first time when Ning and Ishida [6] demonstrated novel phenolic resins obtained from a series of bisphenol A-based benzoxazine monomers. The success in polymeric material of bisphenol A-based polybenzoxazines might be related to the crosslink structure generated from the two hydroxyl groups belonging to a single bisphenol ring [eq. (2), Scheme 1] [6].

It is important to note that, although the reaction and mechanism of ring-opening benzoxazines [2] have been studied since 1952, *p*-substituted phenol-based benzoxazines and azamethylene phenols have rarely been reported. Based on the reverse Mannich reaction [8], *p*-substituted phenol should produce a high-molecular-weight linear polymer, since the aza-methylene linkage is occurred at only the ortho positions in the structure [eq. (3), Scheme 1].

Riess *et al.* [5] attempted the polymerization of phenol by using various conditions, which are the type of phenols, reaction temperatures, molar ratios, and phenol initiator concentrations. The reactions were done in bulk using NMR and vapor pressure methods to find that the degree of polymerization of the main products were about at the level of tetramer to hexamer. Although the reason why polymerization terminated was not clarified, the reaction was explained in terms of the kinetics and mechanisms [5].

Until now, there is no report about the linear polybenzoxazines even the mechanism insists the stepwise reaction to produce a chain of aza-methylene-phenol polymer. For the past few years, our group has paid attention onto the linear chain of polybenzoxazines, however, to our surprise the polymerization of *p*-substituted phenol-based benzoxazines does not proceed as expected. As will be describe here, the many reactions we have carried out allows us to conclude that the ring opening of *p*-substituted phenols provide neither linear oligomer nor polymer (Scheme 2), but only dimers.

Scheme 1



This article, thus, are to clarify (i) if indeed we never get the linear or cyclic compounds from the *p*-substituted based benzoxazine monomers as written in the formula, (ii) why the *p*-substituted based benzoxazine monomers give only dimer, and (iii) what obstructs the polymerization. By solving these questions, we are able not only to point out a rare example of a polymerization that could not proceed according to theory but also to design a synthesis pathway considering the factors involved at the monomer level.

RESULTS AND DISCUSSION

Ring opening polymerization. Carboxylic acids and phenol derivatives are known as acid catalysts for the ring opening reaction of benzoxazines [5,9]. Ning and Ishida [6] reported that the ring opening is preferable in high-dielectric constant solvents such as methanol.

After the mixture of **1a** and *p*-cresol (molar ratio of 20:1) was refluxed in MeOH for 8 h, a white precipitate appeared. The TLC of the MeOH solution shows two spots at R_f for 0.48 and 0.56, referring to *p*-cresol and **1a**, respectively. This confirmed that only starting materials were present. However, the white precipitate gives an R_f for 0.30, implying a new product. The HPLC chromatograms exhibit the results corresponding to TLC. As shown in Figure 1, a new single sharp peak at (t_R) 3.430 min is observed for the white product, whereas those for **1a** and *p*-cresol are found at t_R 3.344 and 3.418 min, respectively.

From FTIR spectra (Fig. 2), the white product gives rise not only to the band at 3226 cm^{-1} but also to a broad band at 3100–2600 cm^{-1}. Lin-Vien *et al.* [10] reported a broad band at 3200–2600 cm^{-1} corresponding to the strong OH···N bond. Thus, we speculate that the white product with a free hydroxyl group in an open ring benzoxazine forms an intermolecular hydrogen bond with another free hydroxyl group and an intramolecular hydrogen bond with an aza group. The band at

Scheme 2

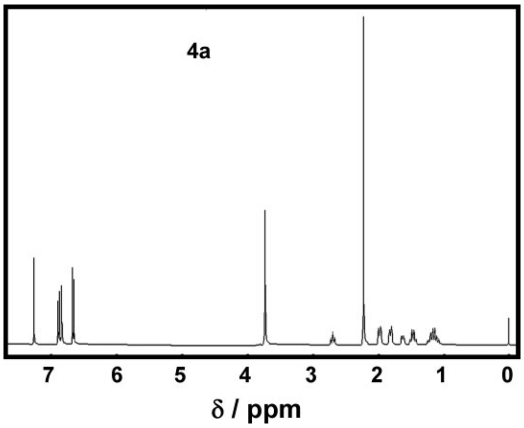

Figure 3. ^{1}H NMR spectrum of **4a**.

1502 cm^{-1} in both **1a** and the product corresponds to a vibrational mode of a trisubstituted benzene. It is important that no tetrasubstituted benzene band at 1485 cm^{-1} was observed. The ^{1}H NMR spectrum of **1a** shows two singlet peaks at $\delta_H = 4.07$ and 4.95 ppm, whereas that of the white precipitate (Fig. 3) shows a singlet resonance at $\delta_H = 3.75$ ppm belonging to methylene groups. This suggests the existence of the aza-methylene linkage in the product as a result of a ring opening reaction. If the product is a polymer, four species of aromatic protons could be observed; however, only three protons at δ_H 6.65 (d), 6.8 (s), and 6.90 (d) ppm resulted. Thus, we speculated that the product was not a polymer but rather a dimer as shown in **4a**.

Elemental analysis (EA) supports our conclusion. Elemental analysis is C 77.90, H 8.56, and N 4.16, which reflects exactly the dimer unit of **4a**.

Effect of solvent and temperature. Bruke *et al.* [4] reported the ring opening of benzoxazine monomer initiated by an intermolecular hydrogen bond with phenol derivatives. Riess *et al.* [5] proposed a mechanism catalyzed by dissociation of phenol. To overcome the termination at dimer, we concentrated on the optimal amount of *p*-cresol and solvent as well as reaction time and temperature.

Regardless of the variation of the molar ratio and solvents, the white precipitate was obtained. The characterization by TLC, HPLC, FTIR, ^{1}H NMR, and EA showed that the product was the dimer **4a**. In addition, it was found that the generation of **4a** is largely dependent on the amount of *p*-cresol (Fig. 4). When the molar ratio of the *p*-cresol increases, the yield of the dimer is increased. Unexpectedly, at 1:1, the yield is highest for all solvents. This implies that the reaction between **1a** and *p*-cresol might possibly be stoichiometric.

If *p*-cresol acts as an initiator in a reverse Mannich reaction, a generated open-ring intermediate should attack at the ortho position of either **1a** or *p*-cresol (see speculated mechanism). Thus, the product obtained should be a mixture of dimer and mono-oxazine compound as detailed in Scheme 3. However, the compound

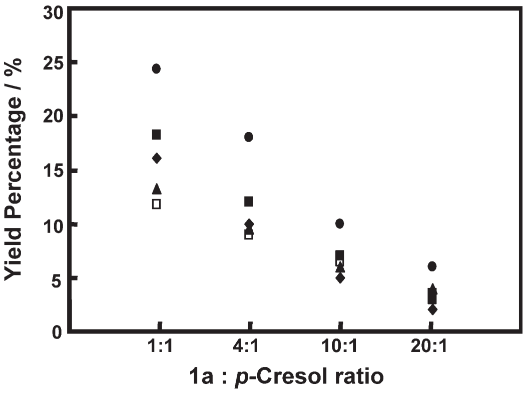

Figure 4. Yields of the product obtained from the reaction of **1a** and *p*-cresol carried out at the boiling point of each solvent; MeOH (◆), iso-PrOH (■), iso-BuOH (▲), cyclohexane (●), and xylene (□).

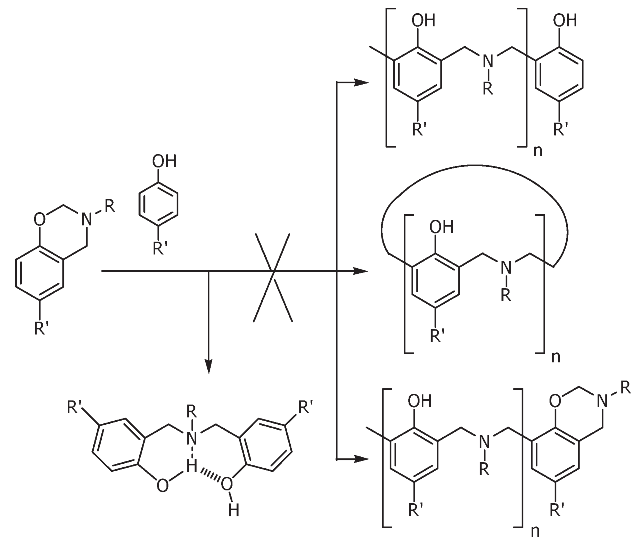
Scheme 3



obtained is a single component and its characterization does not correspond to the mono-oxazine product [11].

Figure 4 also implies that the yields of **4a** are increased for all molar ratios when the reactions have been carried out at low temperature. The yields from lower reaction temperatures, such as MeOH (bp 65°C) and cyclohexane (bp 80°C) are higher than those from higher reaction temperatures, such as iso-BuOH (bp 110°C) and mixed xylenes (bp 135°C).

Figure 5 implies two important results related to the optimum temperature and polarity effect. As expected, the highest yields are obtained at 65°C for every solvent. Considering the solvent polarity, the nonpolar ones (yield 40–60%) give higher yields than the polar ones (18–35%). This implies that the reaction is preferably carried out with nonpolar solvents (see speculated mechanism).

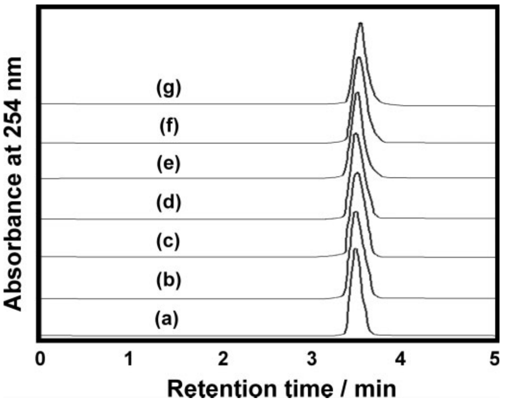


Figure 6. HPLC chromatograms of the product obtained from **1a** and *p*-cresol at 65°C in neat condition with various ratios; (a) 0.5:1, (b) 1:1, (c) 2:1, (d) 3:1, (e) 4:1, (f) 10:1, and (g) 20:1.

Neat liquid state reaction. It can be expected that the polymerization of *p*-substituted phenol-based benzoxazine might be favorable in neat condition. After heating the mixture of **1a** and *p*-cresol in various ratios to the molten state, the white powder precipitated soon after 30 min. Figure 6 shows that each product obtained exhibits only a single component with t_R 3.430 min. The NMR spectra of all products were same as shown in Figure 3, hence, we conclude that all products are **4a**.

Figure 7 shows the comparative studies between neat and solvent (xylene) conditions with a fixed molar ratio of **1a** and *p*-cresol of 1:1. Both reactions give the dimer in high yield (~90%) at 65°C. It is obvious that the neat condition also provides a stoichiometric reaction between **1a** and *p*-cresol. When the reactions are carried out at temperatures either lower or higher than 65°C, the yield is drastically decreased. This supports our speculation about the effect of temperature.

It is important to point out that when the reaction was carried out to satisfy the thermal initiation (above

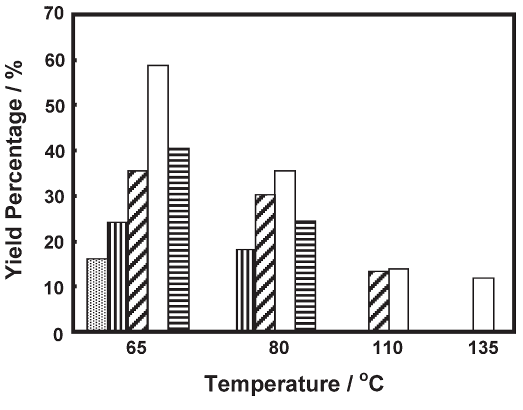

Figure 5. Yields of the product obtained from **1a** and *p*-cresol under various temperatures: 65, 80, 110, and 135°C in various solvents; MeOH ▒, iso-PrOH ▥, iso-BuOH ▨, xylene □, and cyclohexane ▤.

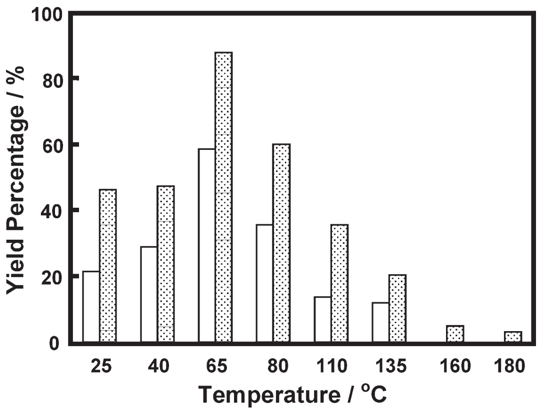

Figure 7. Yields of the product obtained from **1a** and *p*-cresol at various temperatures; 25, 40, 65, 80, 110, 135, 160, and 180°C in □ mixed xylenes and ▒ neat condition.

140°C) condition as reported by Riess *et al.* [5], the precipitation of dimer **4a** is decreased to 2–3% (Fig. 7). Figure 7 also suggests that the reaction either in solution (mixed xylenes) or neat give maximum yield at the reaction temperature 65°C. At the same time, the neat liquid becomes a dark-brownish highly viscous liquid. A further study by LC-MS indicates the various fragments belonging to the dimer, appearing at m/z = 340, as well as other incomplete structures associated with the starting materials (Fig. 8). The trace fragments (m/z = 570 and 678) of higher molecular weight than dimer is also observed. These fragments could result from dimer aggregation or from trimer and tetramer. This implies that high temperature does not favor the polymerization but brings into play the competition between thermal dissociation of benzoxazine and chain propagation as reported by Riess *et al.* [5]

Reactivity of 1a and *p*-cresol. Figure 9 gives important information about the reactivity of **1a** and *p*-cresol as related to the reaction temperature. Generally, stoichiometric balance gives the highest yield with an equivalent molar ratio between the two reactants.

At high-reaction temperatures such as 110 and 135°C, our results indicate that even a lesser amount (stoichimetric imbalance) of *p*-cresol in the system, such as a molar ratio of **1a** and *p*-cresol of 2:1, 3:1, and 4:1, provides a yield of **4a** higher than that of equivalent molar quantities (stoichiometric balance).

It should be noted that the stoichiometric ratio 1:1 and the effectiveness of this stoichiometric ratio are different due to the reactivity of the reactive species. In this case, the reactive species are deactivated by heat [5]. Thus, the high yield of **4a** might result in the case of stoichiometric imbalance because the reactive species, **1a**, were always present in high concentration in the system.

In the case of low temperatures (65°C and 80°C), the yield from the reactant ratios in stoichiometric balance gives the maximum yield when compared with other ratios. This shows that there is no deactivation of **1a** at the low temperature, and the high yield is obtained as expected.

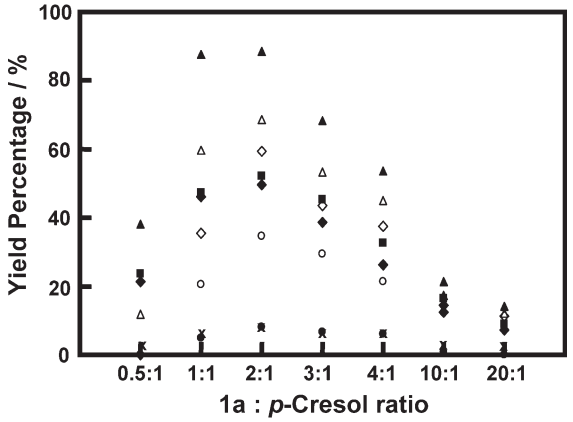

Figure 9. Yields of the product obtained from **1a** and *p*-cresol in various temperatures; 25 (◆), 40 (■), 65 (▲), 80 (△), 110 (◇), 135 (○), 160 (●), and 180°C (×) in neat condition.

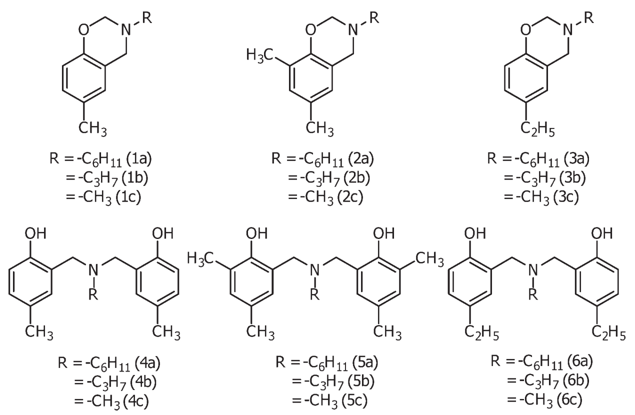
Taking the above discussion into consideration, we speculated that without thermal degradation, the reactivity of *p*-cresol is ~0.8–0.9. This is strongly supported by the results that **4b–4c**, **5a–5c**, and **6a–6c** (Scheme 4) give similar yields (80–90%).

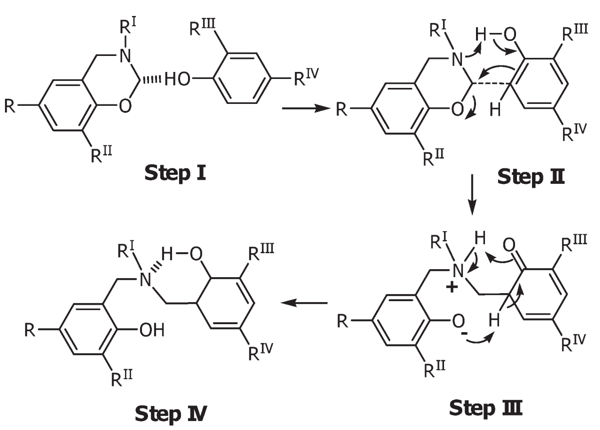
When we consider that there is no deactivation at 65°C, it is natural to expect that all molar ratios should give a yield of **4a** of 90%. However, Figure 9 shows that the yield of **4a** decreases significantly with an excess amount of **1a**. This implies that the reaction of **1a** and *p*-cresol could not proceed effectively. In other words, the ring opening reaction occurs only when the intermediate between **1a** and *p*-cresol is effectively formed.

Since only the dimer is obtained in every case, we conclude that the *p*-substituted phenol in the reaction does not provide a reactive site for another step in ring

Scheme 4



Scheme 5



opening polymerization. In fact, Riess *et al.* [5] reported that the *in situ* ring opening polymerization of *p*-substituted phenol initiated by disubstituted phenol (10%) gave a range of dimers to octamers as evaluated by NMR and vapor pressure methods. Although the structural characterization of the purified product in those cases was not reported in detail, the results support our speculation about some obstructive effects in polymerization.

It is known that the cyclization might be successful in dilute conditions [12]. Thus, an attempt was made to prepare cyclic compounds by using a mixture of **1a** and *p*-cresol (20:1) diluted in mixed xylenes to $5 \times 10^{-3} M$. These systems did not even give a white precipitate as in the previous reactions and the reactants remained in the solution.

Speculated mechanism. To explain why self termination occurs to prevent the polymerization, we combine our results with the mechanisms proposed by Burke *et al.* [4] and Riess *et al.* [5] We speculated that the reaction proceeded as follows. As shown in Scheme 5, intermolecular hydrogen bonding takes place between benzoxazine and the free ortho position in the phenol.

Here, the ring opening of benzoxazine requires some protonation from the phenol derivatives at the nitrogen atom of the oxazine ring to further react with the phenol derivative at ortho position. If the phenol derivative was an initiator, after generating the dimer, the hydroxyl group of one unit of the dimer would further attack another benzoxazine molecule. As a result, a linear polymer chain would be obtained. However, in our case, it is important to note that the reaction terminates as soon as the dimer is formed. This implies that phenol derivatives act as a reactant, not as an initiator, since the reaction does not give products other than dimer.

The effect of temperature and polarity might play an important role (Scheme 5). At this step, an effective ring opening requires thermal degradation, whereas the intermolecular hydrogen bonding between **1a** and *p*-cresol needs lesser thermal motion to maintain stability. Thus, the effect of temperature to drive the reaction provides a dilemma. This might be the reason why we found that the reaction can best proceed at a defined temperature (at 65°C) rather than at a higher or lower temperature (below or higher than 65°C).

In the case of solvent polarity, proton dissociation of phenol results when a polar solvent is used. However, at the same time, the hydrogen bond with the polar solvent will stabilize that proton. In contrast, nonpolar solvents promote the intermolecular hydrogen bonding between the benzoxazine and phenol derivatives. The significant yield of dimer in the nonpolar solvent might result from phenol dissociation rather than intermolecular hydrogen bonding. The effect of intermolecular hydrogen bonding is much enhanced as evidenced from experiments in the neat liquid state.

Stereo structure of dimer: A key factor for obstructive effect in polymerization. Previously, we detailed the unique stereo structure of benzoxazine dimer with strong inter- and intramolecular hydrogen bonds. The stabilization of a symmetrical compound through an intramolecular hydrogen bond inevitably gives us an asymmetric compound [11]. The X-ray structural analyses of dimers (**4a–4c**, **5a–5c**, and **6a–6c**) shows clearly that *p*-substituted based benzoxazines have inter- and intramolecular hydrogen bonds that stabilize the compounds [11,13,14]. Thus, after the single step of ring opening polymerization that produces the dimer, the stability of the network of inter- and intramolecular hydrogen bonding brings about the self termination. It can be concluded that stereo structure of dimer is the key factor to terminate the polymerization.

CONCLUSIONS

Although, in theory, a linear polymer can be obtained from the ring opening polymerization of *p*-substituted phenol-based benzoxazines, this work shows that in practice we will probably never achieve the polymer. Even when the reaction conditions were varied in terms of solvent, neat liquid state, reaction temperature, and concentration, the product was inevitably the dimer. Considering the factors involved in the ring opening reaction, our results show that, in the initial step, the hydrogen bonding between phenol derivatives and benzoxazine is primary when compare with phenol dissociation. Combining this with the previous X-ray structure analyses [11,13,14], we conclude that the obstructive effect of dimer in polymerization might result from the strong intramolecular hydrogen bond between the hydroxyl group of the phenol ring and the aza methylene group in the dimer.

Thus, the mechanism and the reaction assumed from the formula are not always practical. As shown here, the unique stereo structure of benzoxazine dimer leads to the self termination and obstructs the polymerization as clarified in Scheme 5.

EXPERIMENTAL

Chemicals. Paraformaldehyde was purchased from Sigma (St. Louis, MO). *p*-Cresol, 2,4-dimethylphenol, 4-ethylphenol, methylamine (40% w/v in water), cyclohexylamine, and propylamine, deuterated chloroform ($CDCl_3$), and anhydrous sodium sulfate were purchased from Fluka Chemicals (Buchs, Switzerland). HPLC grade tetrahydrofuran (THF), methanol, propan-2-ol, mixed xylenes, 2-methylpropan-1-ol, cyclohexane, sodium hydroxide, and diethyl ether were the products of Ajax chemicals (Australia). All chemicals were analytical grade and used as received.

Procedures. Benzoxazines, **1a**–**3c**, were prepared by using phenol, formaldehyde, and amine derivatives in the ratio of 1:2:1, respectively. *p*-Cresol was added into solution of cyclohexylamine and *p*-formaldehyde, then refluxed for 6 h. The crude product was washed and solvent was removed to obtain **1a**. Compounds **1b** and **1c** were prepared similarly but using propylamine and methylamine, respectively, instead of cyclohexylamine. In the preparation of **2a**–**2c** and **3a**–**3c**, 2,4-dimethylphenol and 4-ethylphenol were used as phenol derivatives, respectively. The ^{1}H nuclear magnetic resonance (NMR) spectrometers were a Bruker ACF with a proton frequency of 200 MHz. Fourier transform infrared spectra were measured at a resolution of 4 cm^{-1} by a Bruker Equinox55/S spectrophotometer equipped with deuterated triglycine (DTGS) detector under constant purge with dry air. High-performance liquid chromatography (HPLC) was done with a Hewlett Packard HP1100 HPLC and a diode array detector model G1315A #DE72002547 fixed at 254 nm. The samples were eluted through a Whatman Partisil 5, a silica gel column with an average pore diameter of 8.5 nm, and a surface area > 350 m^2/g by maintaining the flow rate at 1 mL/min throughout the experiment. Liquid chromatography mass spectrometer (LC-MS) was a Bruker Esquire-LC using methanol as a mobile phase. Elemental analysis (EA) was performed by a Perkin Elmer 2400 Series II CHNS/O analyzer with a combustion temperature of 975°C and a reduction temperature of 500°C.

Reaction of 1a and *p*-cresol in various solvents and temperatures. Benzoxazine **1a** (1.6 mmol) and *p*-cresol were reacted in molar ratios of 1:1, 4:1, 10:1, and 20:1 in various solvents (5 mL), methanol (MeOH), propan-2-ol (iso-PrOH), 2-methylpropan-1-ol (iso-BuOH), cyclohexane, and xylene. The mixtures of monomer **1a** and *p*-cresol in each solvent were reacted at room temperature (~25°C), 40, 65, 80, 110, 135, 160, and 180°C. The completion of the reaction was followed by thin layer chromatography (TLC) and the reaction was stopped after 8 h. The solvent was removed and the crude product was washed with diethyl ether several times before drying at 60°C for 6 h.

Reaction in neat liquid state under various temperatures. Mixtures of **1a** and *p*-cresol (0.5:1, 1:1, 2:1, 3:1, 4:1, 10:1, and 20:1) were prepared and stirred at room temperature (~25°C), 40, 65, 80, 110, 135, 160, and 180°C. The mixtures were allowed to react until viscous. The precipitates obtained from the reaction were collected, washed with diethyl ether before drying at 60°C for 6 h.

Similarly, **1b**–**1c**, **2a**–**2c**, and **3a**–**3c** were reacted with *p*-cresol, 2,4-dimethylphenol, and 4-ethylphenol, respectively. The compounds obtained were qualitatively analyzed by FTIR, ^{1}H NMR, HPLC, LC-MS, and EA. From structural analyses, the compounds obtained are proposed as shown in Scheme 3.

2,2′-[(Cyclohexylimino)di(methylene)]bis(4-methylphenol) (4a). 80% yield; $R_f = 0.30$ (5% MeOH in $CHCl_3$); clear and colorless solid; mp = 181°C; FTIR (KBr, cm^{-1}): 3226 (br, OH), 1500 (vs, C—C), 1449 (m, N—CH), 1249 (s, C—N), 1210 (m, C—N—C), 819 (s, C—N—C); ^{1}H NMR (200 MHz, $CDCl_3$, ppm): δ_H 1.1 (m, 2H, **CH$_2$**), 1.45 (m, 4H, **CH$_2$**), 1.82 (m, 4H, **CH$_2$**), 2.22 (s, 6H, **CH$_3$**—Ar), 2.70 (m, 1H, **CH**), 3.72 (s, 4H, Ar—**CH$_2$**—N), 6.68 (d, 2H, Ar—**H**), 6.85 (s, 2H, Ar—**H**), 6.90 (d, 2H, Ar—**H**). The reaction of 1,2,4-oxadiazole carbohydrazides **1a-h** with phenyl isothiocyanate led to an unexpected ring cyclisation of the thiosemicarbazide derivatives **2a-h**, giving compounds **3a-h** as side products. These two new series were preliminarily evaluated for their anti-inflammatory activity, using the carrageenin induced edema protocol.

J. Heterocyclic Chem., **46**, 722 (2009).

INTRODUCTION

Non-steroidal anti-inflammatory drugs (NSAIDs) have been used remarkably widely in the treatment of pain, fever, and inflammatory diseases, in particular rheumatoid arthritis [1–3]. However, severe side effects like gastrointestinal (GI) ulceration, bleeding, and nephrotoxicity are associated with the chronic use of NSAIDs [4,5]. Since most NSAIDs possess a carboxylic group or a 1,3-diketone moiety capable of forming an enol, they have the potential to have a topical effect on the stomach walls, leading to GI damage [6,7]. In addition, the inhibition of enzyme cyclooxygenases (COXs), which is the main NSAID action mechanism, also inhibits tissue prostraglandin production, undermining its physiological cytoprotective role in maintaining GI health [8–11].

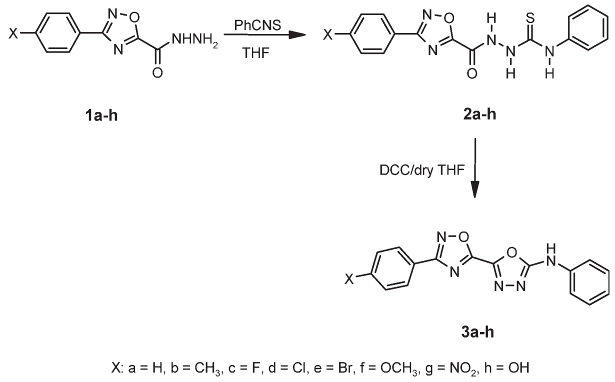
Substances containing heterocyclic and/or heteroaliphatic moieties have been found to exhibit a large spectrum of biological responses, including anti-inflammatory activity. It has been reported in the literature that certain compounds possessing 1,2,4-oxadiazole [12–14], 1,3,4-oxadiazole [15–19] or thiosemicarbazide [20–22] moieties exhibit significant anti-inflammatory properties. This led us to investigate the planning and synthesis of new series of substances whose structures fuse two of these groups with the consequent study of their biological responses. In our attempt to discover new and useful agents for the treatment of inflammation diseases, we selected the 1,2,4-oxadiazole ring as the main pharmacophoric group in our studies. Starting with 1,2,4-oxadiazole carbohydrazides **1a-h**, it was possible to introduce thiosemicarbazide and 1,3,4-oxadiazole residues at the C-5 position of the 1,2,4-oxadiazole ring, so as to obtain the designed substances. On the basis of the approach to the synthesis of 1,2,4-oxadiazole derivatives largely explored in our group, it was possible to synthesize compounds **1a-h**, which are the adequate starting materials for our purposes [23].

During the synthesis of the thiosemicarbazide derivatives **2a-h**, their spontaneous ring closure was observed, leading to 1,3,4-oxadiazole derivatives **3a-h**. To our best knowledge, this unusual outcome for this condensation reaction was never observed before and is possible due to the structural features of compounds **2a-h**. All isolated compounds were preliminary tested for their anti-inflammatory activity as part of our studies on new NSAIDs drugs.

RESULTS AND DISCUSSION

1,2,4-Oxadiazole hydrazides **1a-h** provided access to the designed heterogeneous chains and heterocyclic systems. Their synthesis was already described by our group and can be achieved in three easy and efficient steps [23]. Preparation of thiosemicarbazide derivatives has usually been carried out by condensation of hydrazides with appropriate isothiocyanates in a polar protic

Scheme 1



solvent under reflux. However, it was not possible to transform 1,2,4-oxadiazole hydrazides **1a-h** into their thiosemicarbazide derivatives **2a-h** under these conditions. First, educts were poorly soluble in ethanol or methanol even at their boiling points. Solubility was increased after addition of phenyl isothiocyanate and reflux. After reaction times, a complex mixture of products was observed when using TLC, but none of them could be isolated or identified. Access to the desired thiosemicarbazides **2a-h** was possible using dry THF as solvent and refluxing for only short periods of time (Scheme 1). Despite the satisfactory outcome, this methodology led to a result different from that usually reported in the literature. Thiosemicarbazide adducts **2a-h** have been formed in a mixture with their corresponding ring closed 1,3,4-oxadiazole derivatives **3a-h** as by-products in yields ranging from 2 to 10%, as determined after isolation (Tables 1 and 2).

Cyclisation of thiosemicarbazide moiety exclusively into the 1,3,4-oxadiazole nucleus has been reported under oxidative iodine-mediated conditions in the presence of base [24] or selective activation of the sulfur moiety by coupling reagents such as DCC [25] under reflux. No references to a spontaneous process have been found in the literature. This suggests that the ring closure process is possibly associated with the specific structural features of the thiosemicarbazides **2a-h**. In order to investigate the effect of the solvent on this cyclisation, the reaction of hydrazides **1a-h** with phenyl isothiocyanate was carried out in THF/MeOH 7:3. No difference in the results was observed, indicating that the reaction doesn't depend on using an aprotic or protic solvent. On the other hand, solutions of pure phenyl thiosemicarbazides **2a-h** in THF produce 1,3,4-oxadiazole derivatives **3a-h** very slowly at room temperature. By means of TLC control, traces of 1,3,4-oxadiazole were identified only after 10 days. Refluxing these solutions over several hours under argon, a mixture of decomposition products could be observed, confirming the thermal instability of the thiosemicarbazides. However, transformation into tetracyclic compounds **3a-h** was not increased, as observed by ^{1}H-NMR analysis. Hence, the cyclisation process should occur mainly during the formation of the thiosemicarbazides. Analysing the mechanism of this reaction, depicted in Scheme 2, it can be assumed that the formation of intermediate **A** is a critical step for understanding its outcome. After the breaking of the C=N bond, an electron pair of thiol group (pathway **a**) easily establishes the thiocarbonyl bond, leading to the thiosemicarbazide products **2a-h**, as normally described. Ring closure should otherwise occur as a consequence of a nucleophilic attack by the carbonyl oxygen on the carbon atom of the imine group, as shown in pathway **b**. However, this oxygen atom is usually not basic enough to undergo such a nucleophilic addition. It is reasonable to assume that the conjugated 3-aryl-1,2,4-oxadiazol-5-yl substituent attached to the

carbonyl group acts as a good electron-donating group, enhancing the nucleophilicity of the oxygen atom. Thus, the reaction described by pathway **b** can take place in addition to the pathway **a**. Protons migration, elimination of the thiol group, and aromatisation of the five-membered ring should be a specially favoured and rapid process, owing to the direct conjugation between 1,3,4-oxadiazole and the other two aromatic rings.

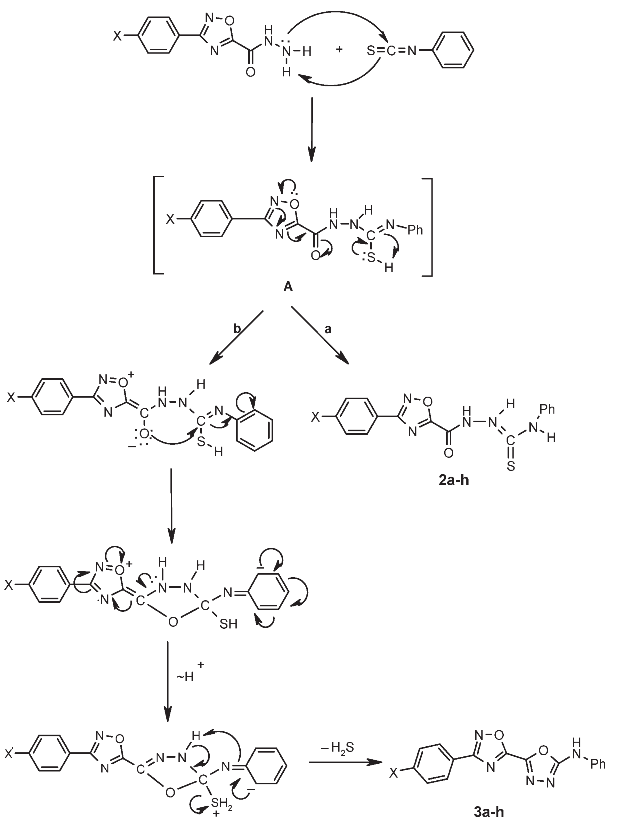
The nature of the para-substituents on the phenyl ring influences the quantity of products formed. The strong electron-withdrawing nitro-substituent doubtless affects the cyclisation reaction, since it decreases the stabilising effect of the aromatic rings on the carbonyl group, leading to only 2% of compound **3g** as a by-product. The other substituents seem to influence the ring closure process to almost the same extent, as suggested by the yields for isolated products (Table 2).

To obtain appropriate amounts of compounds **3a-h**, thiosemicarbazides **2a-h** were treated with DCC in dry THF, leading to the well known oxidative process of ring closure with good yields. The characterization and results of pharmacological tests for compounds **2a-h** and **3a-h** are given in Tables 1 and 2 as well as in the experimental protocols.

The anti-inflammatory activity of synthesized compounds **2a-h** and **3a-h** was evaluated using the carrageenin induced edema method [26]. The compounds were tested at a 25 mg/kg oral dose and compared with the standard drug diclofenac sodium in a dose of 2 mg/kg. Comparing the results in Tables 1 and 2 it can easily be concluded that compounds exhibiting the thiosemicarbazide moiety **2a-h** have a low level of activity. In contrast to these poor results, compounds **3a-h**, possessing the two oxadiazole rings directly linked to each other are more effective in edema inhibition. It was found that the presence of NO_2 and OH groups, in products **3g** and **3h** respectively, promotes better biological responses.

In the light of these results, we envisage introducing structural modifications in compounds **3a-h** to identify

Scheme 2



more potent substances, which can then be submitted to further biological studies.

In summary, a set of 16 new compounds were designed and synthesized to evaluate their anti-inflammatory profiles and to correlate them with molecular properties of these products. Although compounds bearing a thiosemicarbazide moiety **2a-h** are practically inactive, their derivatives **3a-h** showed better biological response to the carrageenin footpad edema (CFE) test, so that they can serve as models for designing a new series of derivatives, expected to be more effective as NSAIDs drugs. Compounds **3g** and **3h** were especially active, suggesting that groups capable of establishing hydrogen bonds should be crucial for the biological response. Studies of GI effects of these products were not carried out because of the limitation of their anti-inflammatory profiles.

The spontaneous ring closure of compounds bearing the thiosemicarbazide group **2a-h** leading to compounds **3a-h** was observed for the first time for this kind of transformation, constituting an interesting subject for further experimental and theoretical studies.

EXPERIMENTAL

Melting points were determined on a Gallenkamp capillary apparatus and are uncorrected. Infrared spectra were recorded using KBr discs on a Perkin-Elmer Paragon 500 FT-IR spectrometer. ^{1}H-NMR spectra were recorded on a Bruker DPX-200 spectrometer, with chemical shifts δ reported in ppm unities relative to the internal standard TMS. Mass spectra were obtained by using a Finnigam MAT 8200 or MAT 95 mass spectrometer. Values for High resolution mass spectrometry (HRMS) lie within the permitted limit intervals with resolution of 10,000. Reactions were generally run under an argon atmosphere. Elemental analysis was performed on a Carlo Erba EA 1110 elemental analyzer. Organic solutions were concentrated at vacuum on a rotary evaporator at room temperature or at 60°C. Column chromatography was performed with ICN Biomedicals silica gel 60, 32–63 μm.

Compounds **3**-(4-substitutedaryl)-1,2,4-oxadiazol-5-yl carbohydrazide (**1a-h**) were prepared by the procedure given in literature [23].

General procedure for the preparation of *N*^{1}-[3-(4-substitutedaryl)-1,2,4-oxadiazol-5-yl carbonyl]-*N*^{4}-phenyl thiosemicarbazides (2a-h). A solution of hydrazides **1a-h** (0.5 mmol) in 2.5 mL THF was gently heated at 50°C, then phenyl isothiocyanate (0.5 mmol, 0.068 g) was added and the reaction was allowed to proceed at reflux under inert atmosphere for 30 min before cooling to room temperature. Solvent was removed in vacuo and the crude products were recrystallized from THF/petroleum ether (30–60°C) to afford, after filtration, the thiosemicarbazides **2a-h** as main products, whose yields, melting points and results of biological evaluation are given in Table 1. The filtrate was concentrated and the residue was eluted on a silica gel column using CH_2Cl_2/MeOH 10:0.2 as eluent to give the secondary ring closed products **3a-h,** and their yields were reported in Table 2.

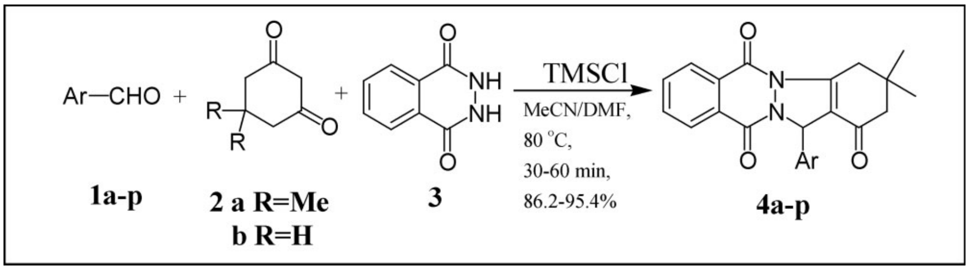
DOI 10.1002/jhet.135



A simple, efficient, and cost-effective method for the synthesis of 2*H*-indazolo[2,1-*b*]phthalazine-1,6,11(13*H*)-trione derivatives by a one-pot, three-component condensation reaction of phthalazide, dimedone, or 1,3-cyclohexanedione and aromatic aldehydes under CH_3CN/DMF (8:2) media at 80°C for 30–60 min in the presence of trimethylsilyl chloride (TMSCl) is described.

J. Heterocyclic Chem., **46**, 728 (2009).

INTRODUCTION

One-pot multicomponent reactions (MCRs) by virtue of their convergence, productivity, facile execution, and high yield have attracted considerable attention in recent years [1]. There have been tremendous developments in three- or four-component reaction specially the Biginelli [2], Passerini [3], Ugi [4], and Mannich [5] reactions, which have further led to renaissance of MCRs. Nevertheless, great efforts have been and still are being made to find and develop new MCRs.

The development of new synthetic methods for the efficient preparation of heterocycles containing phthalazine ring fragment (antihypoxic and antipyretic agent **I** and HAV 3C inhibitor **II**) is an interesting challenge because they show some pharmacological and biological activities [6–8]. Phthalazine derivatives were reported to possess anticonvulsant [8], cardiotonic [9], and vasorelaxant [10] activities. Therefore, a number of methods have been reported for the synthesis of phthalazine derivatives [11–19]. In recent years, the development of more economical and environmental friendly conversion processes is gaining interest in the chemical community (Figure 1).

In continuation of our work on the use of silica-supported reagents [20], TMSCl has attracted our interest. Among the various silicon-based acidic reagents, TMSCl has received considerable attention as an inexpensive and readily available reagent for various organic transformations [21]. Advantages such as its compatibility with many synthetically valuable nucleophiles (*e.g.*, organometalic reagents and cuprates) and its non-aggregation nature substantially simplify the analysis of the reaction mechanism. Because of this, it has been extensively used as a protecting group for various functional groups such as hydroxy and amino group [20(a),22] and as a promoter for cycloaddition and conjugate addition reactions [21(a)] under mild and convenient conditions to offer the products in excellent yield with high selectivity and one-pot cyclocondensation of dimedone, aldehydes, with/without urea or thiourea to form octahydroquinazolones and 1,8-dioxo-octahydro xanthenes in excellent yields [23]. However, to the best of our knowledge, there is no report on the synthesis of 2*H*-indazolo[2,1-*b*]phthalazine-1,6,11(13*H*)-triones using TMSCl as a reagent. In this communication, we report a TMSCl-mediated simple, efficient, and environmentally benign three-component condensation reaction of aromatic aldehydes **1a-p,** 5,5-dimethyl-1,3-cyclohexanedione **2a** or 1,3-cyclohexanedione **2b** and phthalhydrazide **3** in the preparation of 13-aryl-2,3,4,13-tetrahydroindazolo[1,2-*b*]phthalazine-1,6,11(13*H*)-trione or 3,4-dihydro-3,3-dimethyl-13-aryl-2*H*-indazolo[1,2-*b*]phthalazine-1,6,11(13*H*)-trione derivatives **4a-p** (Scheme 1).

RESULTS AND DISCUSSION

During the course of our studies directed towards the development of practical, and eco-friendly procedures [24], we developed the applicability of TMSCl for efficient, convenient, and facile synthesis of 13-aryl-

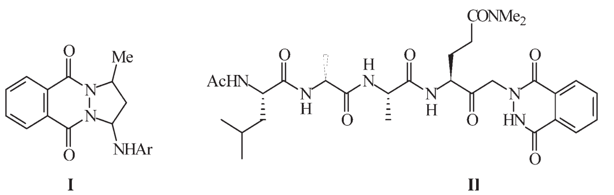


Figure 1. Antihypoxic and antipyretic agent **I** & HAV 3C inhibitor **II**.

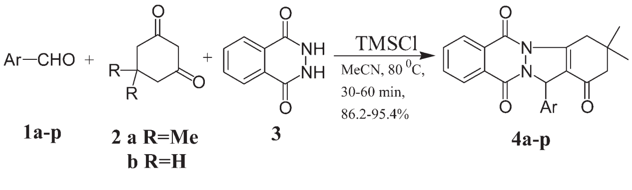
2,3,4,13-tetrahydroindazolo[1,2-*b*]phthalazine-1,6,11(13*H*)-trione or 3,4-dihydro-3,3-dimethyl-13-aryl-2*H*-indazolo-[1,2-*b*]phthalazine-1,6,11(13*H*)-trione derivatives by a one-pot three-component condensation reaction of aromatic aldehydes **1a-p**, 5,5-dimethyl-1,3-cyclohexanedione **2a** or 1,3-cyclohexanedione **2b** and phthalhydrazide **3** in CH_3CN/DMF (8:2) at 80°C (Scheme 1).

Initially, a pilot reaction was attempted using benzaldehyde **1**, 5,5-dimethyl-1,3-cyclohexanedione **2a** and phthalhydrazide **3** in the presence of TMSCl (0.5 equiv) without any solvent. After 3 h, only 27% of 3,3-dimethyl-13-phenyl-2,3,4,13-tetrahydroindazolo[2,1-*b*]phthalazine-1,6,11-trione product **4a** was isolated. Increasing the amount of TMSCl (1.0 equiv) did not improve the product yield to a considerable amount. Subsequently, we investigated the effect of different solvents on the reaction rate as well as yield of the products. In protic solvents such as MeOH or EtOH, the reaction was very slow and resulted in lower product yield. Similar results were obtained in coordinating solvents such as THF, diethyl ether, and dimethyl ether. On the other hand, conducting the reactions in chlorinated solvents such as dichloromethane and chloroform improved both the reaction rates as well as product yields. After screening for different solvents, acetonitrile/DMF (8:2) came out as the solvent of choice, which not only afforded the products in good yield, but also with higher reaction rates (95% yield in 0.5 h). The formation of compound **4a** was evident from the appearance of $[M+H]^+$ peak at *m*/*z* 373 in mass spectrum (ESI), —C=O stretching at 1667 cm^{-1} in IR and the appearance of methine proton as singlet at δ 6.34 in ^1H NMR

To extend the scope of this catalytic transformation, the general applicability of this method was verified by reacting a number of substituted benzaldehydes with 5,5-dimethyl-1,3-cyclohexanedione **2a** or 1,3-cyclohexanedione **2b**. No observable substituent effect was noted for the various aromatic aldehydes.

Scheme 1



Aromatic aldehydes **1a-p**, 1,3-cyclohexanedione **2a-b** with phthalhydrazide **3** in the presence of TMSCl undergo a fast 1:1:1 addition reaction at 80°C in CH_3CN/DMF for 30–60 min to produce 2*H*-indazolo[2,1-*b*]phthalazine-1,6,11(13*H*)-trione derivatives **4a-p** (Scheme 1). The results were excellent in terms of yields and product purity in the presence of TMSCl instead of *p*-TSA24, compounds **4a-p** are stable solids whose structures are fully supported by IR, ^1H, and ^{13}C NMR spectroscopy's, mass spectrometry and elemental analysis.

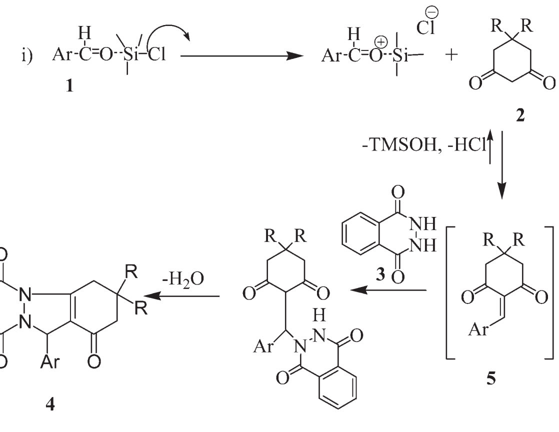
A feasible pathway (Scheme 2) might involve the role of TMSCl as a Lewis acid, which activated the aromatic aldehydes **1** by coordinating to the carbonyl group followed by the removal of TMSOH and HCl with enol form of 1,3-cyclohexanedione **2** to form a heterodienes **5**. Then, the subsequent Michael-type addition of the phthalhydrazide **3** followed by cyclization affords the corresponding products **4**.

In conclusion, we have successfully demonstrated a novel catalytic application of TMSCl for the efficient synthesis of 2*H*-indazolo[2,1-*b*]phthalazine-1,6,11(13*H*)-trione derivatives. This simple procedure is efficient and can be applied to a wide variety of aromatic aldehydes. Shorter reaction times and excellent product yields make this catalytic system an alternative method for the synthesis of 2*H*-indazolo[2,1-*b*]phthalazine-1,6,11(13*H*)-trione derivatives. Further application to explore this simple catalytic system is under progress.

EXPERIMENTAL

Melting points were measured with Fiescher-Johns melting point apparatus. ^1H NMR spectra were recorded with an AVANCE 300 Bruker (at 300 MHz) and Gemini 200 MHz spectrometers in $CDCl_3$. Chemical shifts relative to TMS as internal standard are given as δ values in ppm. ^{13}C NMR was

Scheme 2



recorded in $CDCl_3$ on a Varian (75 Hz) spectrometer. IR spectra were taken with a Perkin–Elmer 1725A FT-IR spectrophotometer. EI–MS mass spectra were measured at 70 eV (EI).

General procedure. A solution of benzaldehyde **1a** (10 m*M*), dimedone **2a** (10 m*M*) and phthalhydrazide **3** (12 m*M*), and CH_3CN/DMF (8 mL/2 mL) containing TMSCl (10 m*M*) was refluxed (80°C) till the reaction was completed (monitored by TLC). After completion, the reaction mass was poured into ice cold water, stirred, and filtered. The solid product **4a** obtained was filtered through a Buckner funnel, washed with hexane (2 × 5 mL) and dried. Spectral data for new compounds:

13-(2,4-Dichlorophenyl)-3,3-dimethyl-2,3,4,13-tetrahydro-indazolo[2,1-b]phthalazine-1,6,11-trione (4b). Pale yellow crystalline powder; Yield: 94.8%; mp 208–209°C. IR (KBr): $V_{\max}$ 2942, 1657, 1362, 1268, 711 cm^{-1}. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 1.24$ (s, 3H); 1.25 (s, 3H); 2.31 (s, 2H); 3.16–3.41 (dd, $J = 2.2$, 18.8 Hz, 2H); 6.57 (s, 1H); 7.28–7.36 (m, 2H, Ar); 7.46 (d, $J = 8.3$ Hz, 1H, Ar); 7.80–7.89 (m, 2H, Ar); 8.23–8.38 (m, 2H). 13-(3-Hydroxyphenyl)-3,3-dimethyl-2,3,4,13-tetrahydro-indazolo[2,1-b]phthalazine-1,6,11-trione (4f). Light yellow crystalline powder, mp 257–258°C. Yield: 89.2%. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 1.20$ (s, 6H); 2.27 (s, 2H); 3.11–3.41 (dd, $J = 1.4$, 18.8, 2H); 6.23 (s, 1H); 6.63–6.82 (m, 3H, Ar); 7.02–7.10 (t, $J = 8.0$, 1H, Ar); 7.84–7.89 (m, 2H, Ar); 8.16–8.32 (m, 2H, Ar); 9.02 (brs, 1H, OH). LC/MS: $m/z =$ 389 $[M+H]^+$. *Anal*. Calcd for $C_{23}H_{20}N_2O_4$: C, 71.12; H, 5.19; N, 7.21%. Found: C, 71.11; H, 5.17; N, 7.21%.

3,3-Dimethyl-13-naphthalen-1-yl-2,3,4,13-tetrahydroindazolo[2,1-b]phthalazine-1,6,11-trione (4g). Pale yellow crystalline powder, Yield: 88.4%. mp 264–265°C. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 1.19$ (s, 3H); 1.23 (s, 3H); 2.25 (s, 2H); 3.20–3.47 (dd, $J = 2.2$, 18.8 Hz, 2H); 7.12 (s, 1H); 7.36–7.59(m, 4H, Ar); 7.75–7.84 (m, 5H, Ar); 8.15–8.36 (m, 2H, Ar). LC/MS: $m/z = 423$ $[M+H]^+$. *Anal*. Calcd for $C_{27}H_{22}N_2O_3$; C, 76.76; H, 5.25; N, 6.63%. Found: C, 76.76; H, 5.24; N, 6.63%.

3,3-Dimethyl-13-(3,4,5-trimethoxyphenyl)-2,3,4,13-tetra-hydroindazolo[2,1-b]phthalazine-1,6,11-trione (4h). Pale yellow crystalline powder, mp 202–203°C; Yield: 86.2%. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 1.24$ (s, 3H); 1.25 (s, 3H); 2.32 (s, 2H); 3.12–3.44 (dd, $J = 2.2$, 18.8, 2H); 3.77 (s, 3H); 3.82 (s, 6H); 6.34 (s, 1H); 6.57 (s, 2H, Ar); 7.82–7.86 (m, 2H, Ar); 8.26–8.34 (m, 2H, Ar).LC/MS: $m/z = 463$ $[M+H]^+$. *Anal*. Calcd for $C_{26}H_{26}N_2O_6C$, 67.52; H, 5.67; N, 6.06%. Found: C, 67.49; H, 5.62; N, 6.00%.

13-Phenyl-2,3,4,13-tetrahydroindazolo[2,1-b]phthalazine-1,6,11-trione (4i). Pale yellow crystalline powder, Yield: 93.8%. mp 224–225°C. IR (KBr): $V_{\max}$ 3290, 1685, 1512, 1479, 1181, 1125 cm^{-1}. ^1H NMR (200 MHz, DMSO-d_6): $\delta =$ 2.18–2.45 (m, 4H); 3.19–3.61 (m, 2H); 6.34 (s, 1H); 7.23–7.41 (m, 5H, Ar); 7.83–7.88 (m, 2H, Ar); 8.09–8.32 (m, 2H, Ar). LC/MS: $m/z = 345$ $[M+H]^+$. *Anal*. Calcd for $C_{21}H_{16}N_2O_3$: C, 73.24; H, 4.68; N, 8.13%. Found: C, 73.20; H, 4.64; N, 8.13%.

13-(2,4-Dichlorophenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4j). Pale yellow crystalline powder, Yield: 94.0%; mp 274–275°C. IR (KBr): $V_{\max}$ 2943, 1659, 1362, 1265, 701 cm^{-1}. ^1H NMR (200 MHz, DMSO-d_6): $\delta =$ 2.15–2.42 (m, 4H); 3.23–3.46 (m, 2H); 6.60 (s, 1H); 7.25–7.48 (m, 2H, Ar); 7.72–7.93 (m, 3H, Ar); 8.03–8.37 (m, 2H, Ar). LC/MS: $m/z = 413$ $[M+H]^+$. *Anal*. Calcd for $C_{21}H_{14}C_{l2}N_2O_3$: C, 61.03; H, 3.41; N, 6.78%. Found: C, 61.01; H, 3.42; N, 6.77%.

13-(2-Chlorophenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4k). Pale yellow crystalline powder, Yield: 91.1%; mp 250–252°C. IR (KBr): $V_{\max}$ 2925, 1660, 1366, 1270, 703 cm^{-1}. ^1H NMR (200 MHz, DMSO-d$_6$): $\delta = 2.22$–2.58 (m, 4H); 3.31–3.47 (m, 2H); 6.63 (s, 1H); 7.26–7.50 (m, 4H, Ar); 7.90–7.95 (m, 2H, Ar); 8.10–8.19 (m, 1H, Ar), 8.31–8.36 (m, 1H, Ar); LC/MS: $m/z = 379$ $[M+H]^+$. *Anal*. Calcd for $C_{21}H_{15}ClN_2O_3$: C, 66.58; H, 3.99; N, 7.40%. Found: C, 66.58; H, 3.88; N, 7.42%.

13-(4-Chlorophenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4l). Pale yellow crystalline powder, Yield: 92.0%; mp 272–273°C. IR (KBr): $V_{\max}$ 3290, 1685, 1512, 1479, 1181, 1125 cm^{-1}. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 2.23$–2.43 (m, 4H); 3.21–3.52 (m, 2H); 6.33 (s, 1H); 7.23–7.43 (m, 4H, Ar); 7.92–7.77 (m, 2H, Ar); 8.17–8.35 (m, 2H, Ar). LC/MS: $m/z = 379$ $[M+H]^+$. $\delta =$ (75 MHz, $CDCl_3$ + DMSO-d_6) 21.6, 23.8, 30.4, 60.5, 63.7, 117.7, 126.6, 127.8, 129.0, 132.6, 133.4, 134.2, 135.9, 152.7, 153.5, 155.1, 161.8, 167.3, 191.8. *Anal*. Calcd for $C_{21}H_{15}ClN_2O_3$: C, 66.58; H, 3.99; N, 7.40%. Found: C, 66.55; H, 3.99; N, 7.38%.

13-(3-Hydroxyphenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4m). Pale yellow crystalline powder, Yield: 89.4%; mp 267–268°C. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 2.21$–2.43 (m, 4H); 3.20–3.61 (m, 2H); 6.24 (s, 1H); 6.66–6.82 (m, 3H, Ar); 7.10 (t, $J = 8.8$ Hz, 1H, Ar); 7.86–7.89 (m, 2H, Ar); 8.21–8.32 (m, 2H, Ar); 9.04 (brs, 1H). LC/MS: $m/z = 361$ $[M+H]^+$. *Anal*. Calcd for $C_{21}H_{16}N_2O_4$: C, 69.99; H, 4.48; N, 7.77%. Found: C, 69.98; H, 4.49; N, 7.77%.

13-Naphthalen-1-yl-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4n). Pale yellow crystalline powder, Yield: 88.9%; mp 260–262°C; ^1H NMR (200 MHz, DMSO-d_6): $\delta = 2.19$–2.38 (m, 4H); 3.22–3.62 (m, 2H); 7.10 (s, 1H); 7.34–7.64 (m, 4H, Ar); 7.75–7.89 (m, 4H, Ar); 8.09–8.11 (m, 1H, Ar); 8.29–8.34 (m, 1H, Ar); 8.47 (d, $J = 8.0$ Hz, 1H, Ar). LC/MS: $m/z = 395$ $[M+H]^+$. *Anal*. Calcd for $C_{25}H_{18}N_2O_3$: C, 76.13; H, 4.60; N, 7.10%. Found: C, 76.11; H, 4.61; N, 7.11%.

13-(4-Bromo-phenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4o). Pale yellow crystalline powder, Yield: 93.0%; mp 280–281°C. IR (KBr): $V_{\max}$ 2942, 1658, 1363, 1265, 703 cm^{-1}. ^1H NMR (200 MHz, DMSO-d_6): $\delta = 2.21$–2.26 (m, 2H); 2.38–2.42 (m, 2H); 3.25–3.31 (dt, $J =$ 5.7 Hz, 1H); 3.48–3.54 (dt, $J = 5.7$ Hz, 1H); 6.30 (s, 1H); 7.34 (d, $J = 8.5$ Hz, 2H), 7.43 (d, $J = 8.5$ Hz, 2H, Ar); 7.88 (t, $J = 4.7$ Hz, 2H, Ar); 8.19 (t, $J = 4.7$ Hz, 1H, Ar), 8.31 (t, $J = 4.7$ Hz, 1H, Ar). δ_C (75 MHz, DMSO-d_6) 21.7, 23.9, 36.2, 63.7, 69.2, 117.7, 121.0, 126.6, 127.4, 128.4, 129.0, 129.7, 130.9, 133.7, 134.4, 136.8, 153.1, 155.3, 160.7, 165.7, 192.2. LC/MS: $m/z = 423$ $[M+H]^+$. *Anal*. Calcd for $C_{21}H_{15}BrN_2O_3$: C, 59.59; H, 3.57; N, 6.62%. Found: C, 59.59; H, 3.54; N, 6.61%.

13-(3-Methoxyphenyl)-2,3,4,13-tetrahydroindazolo[2,1-b]-phthalazine-1,6,11-trione (4p). Pale yellow crystalline powder, Yield: 88.2%; mp 210–211°C. IR (KBr): $V_{\max}$ 2942, 1658, 1366, 1427, 701 cm^{-1}. ^{1}H NMR (200 MHz, DMSO-d_6): $\delta = 2.21$–2.46 (m, 4H); 3.19–3.65 (m, 2H); 3.79 (s, 3H, OMe); 6.30 (s, 1H); 6.81 (dd, $J = 8.0$ Hz, 1H, Ar); 6.94–6.96 (m, 2H, Ar); 7.24 (t, $J = 8.08$ Hz, 1H, Ar); 7.89–7.91 (m, 2H, Ar); 8.17–8.33 (m, 2H, Ar). LC/MS: $m/z = 375$ $[M+H]^+$. *Anal*. Calcd for $C_{22}H_{18}N_2O_4$: C, 70.58; H, 4.85; N, 7.48%. Found: C, 70.55; H, 4.83; N, 7.48%.

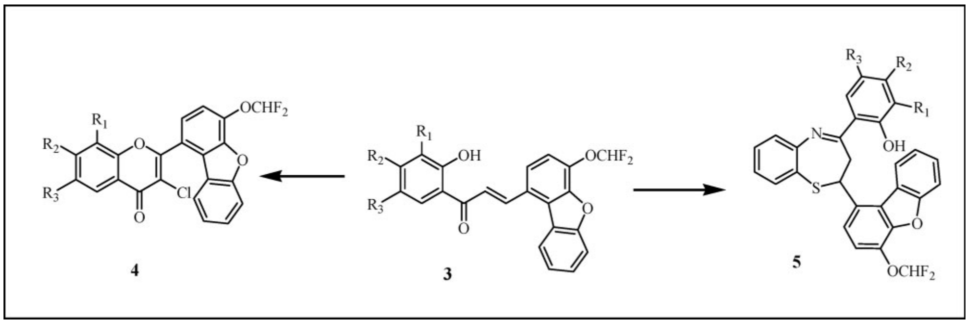
DOI 10.1002/jhet.139



Variously substituted chalcones were synthesized from 4-difluoromethoxy-dibenzofuran-1-carboxaldehyde. These chalcones were converted into corresponding 3-chlorochromones and dihydro-benzothiazepines. Synthesized compounds were tested for their antifungal, antibacterial, antiviral and antioxidant activities.

J. Heterocyclic Chem., **46**, 732 (2009).

INTRODUCTION

In recent days, active research has been initiated on halogen containing heterocycles, particularly fluorine containing heterocycles. Incorporation of fluorine can alter the course of reaction as well as biological activities. Introduction of fluorine atom into an organic molecule largely enhances the pharmacological properties as compared with nonfluorinated analogues [1]. Despite the fact that fluorine has greater size than hydrogen, several studies have demonstrated that fluorine is a reasonable hydrogen mimic and exerts only a minor steric demand at receptor sites [2].

Fluorine containing organic compounds are associated with antimicrobial [3], antibacterial [4], and anticancer [5] activities. They also act as selective inhibitors of biosynthesis of aminergic neurotransmitters [6].

Dibenzofurans are associated with biological activities like antifungal [7], antibacterial [8], anti-inflammatory, and antiallergic [9].

Chalcones are versatile synthones and can be cyclized to give chromones [10], chlorochromones, and benzothiazepines [11]. Chalcones can be converted into 3-chlorochromones by using DMSO+$CuCl_2$ system [11,12].

Chalcones possess a broad spectrum of biological activities including antibacterial, anthelmintic, amoebicidal, antiulcer, antiviral, insecticidal, antiprotozoal, anticancer, cytotoxic, immunosuppressive, etc. [13,14].

Halogeno substituted chromones with heterocyclic substituent at 2-position are reported to have bronchodilatory [15], coronary spasmolytic [16], and antimicrobial properties [17,18].

1,4-Benzothiazepine derivatives are of considerable interest because of their biological activities as inhibitors of HIV-1 integrase [10], anti-tumor, antibiotics, enzyme inhibitors, muscle relaxant, anticonvulsant, sedatives, and hypnotics [19]. Some dihydrobenzothiazepines have excellent fungicidal activities [20]. Benzothiazepines are also associated with chemotherapeutic application such as antihypertension [21] and antibacterial activities [11,22]. Benzothiazepines have been reported as potent neuroleptic agents [23].

Biological activities associated with these molecules and importance of fluorine, prompted us to synthesize some fluorine containing chalcones, 3-chlorochromones and 1,4-benzothiazepines, and screen them for biological activities.

RESULT AND DISCUSSION

In this work, 2-hydroxy acetophenones **2** were treated with 4-difluoro-methoxy-dibenzofuran-1-carboxaldehyde **1** in presence of 40% KOH to afford corresponding 3-(4-(difluoromethoxy)dibenzofuran-1-yl)-1-(2-hydroxyphenyl) prop-2-en-1-one **3**. Compound **3** on treatment with copper

Table 1

Antioxidant activity results with test concentration 125 μg/mL.

Compd.	R_1	R_2	R_3	% AO activity
3a	H	H	H	−2.96
3f	H	Cl	H	5.65
4a	H	H	H	−2.71
4e	Cl	H	Cl	−23.26
5a	H	H	H	4.58
5b	H	H	Br	1.62

chloride in DMSO gave 3-chlorochromone **4** and with 2-aminothiophenol in alcohol gave benzothiazepine **5**.

The structures of compounds **3**, **4**, and **5** are confirmed by spectral analysis (IR, ^{1}H-NMR, and MS). The IR spectrum of compound **3a** shows a strong absorption band (cm^{-1}) at 3305 for —OH and 1633 for α, β-unsaturated carbonyl groups. The IR spectrum of compound **4a** shows no absorption band for —OH, whereas the band at 1650 is for carbonyl group of chromone. The IR spectrum of compound **5a** shows the absorption band at 3397 for —OH, whereas the band for carbonyl group is absent.

The ^{1}H-NMR spectra of **3a** shows a doublet at 8.40 δ for one proton (J = 15 Hz) for transcoupled protons of α, β-unsaturated carbonyl group. In ^{1}H-NMR spectrum of **4a**, the presence of triplet for one proton at 6.80 δ (J = 72.94 Hz) indicates coupling of proton of —$OCHF_2$ group with two fluorine atoms. The ^{1}H-NMR spectrum of **5a** shows three doublet of doublets at 3.21, 3.47, and 5.97 δ, which are the characteristic peaks of dihydrobenzothiazepine moiety.

The structures of all compounds are also confirmed by mass spectral analysis. The mass spectra shows M^+ peaks at corresponding masses of respective molecules.

Antioxidant activity. The antioxidant activity of some of the synthesized compounds was determined by DPPH method using Trolox as a reference standard. Amongst, the compounds screened for antioxidant activity none of the compounds showed promising activity as shown in Table 1.

Antimicrobial activity. The antimicrobial activity of some compounds was assessed against 24 hr culture of some selected bacteria and fungi. The bacteria used were *Escherichia coli* and *Staphylococcus aureus*; the fungi used were *Candida albicans* and *Aspergillus fumigatus*.

The antimicrobial activity was performed by agar well diffusion method at 100 and 1000 μg/mL conc. in DMSO. Nutrient agar and potato dextrose agar were used to culture the bacteria and fungi, respectively.

Amphotericin B and Vancomycin were used as standards for comparison of antifungal and antibacterial activities respectively. The activity is reported by measuring the diameter of the zone of inhibition. All the screened compounds were found inactive as shown in Table 2.

Antiviral activity. The antiviral activity of some of the compounds was determined against *Herpes Simplex virus-2* by CPE inhibition assay. Vero cells (African green monkey kidney cell line-ATCC # CCL-81) were cultivated as monolayers in 5% carbon dioxide at 37°C, in Dulbecco's modified Eagle medium (MEM) with 5% fetal bovine serum (FBS).

The diluted extracts (100 μg/mL) were transferred to the aspirated Vero cell monolayers. Cultures were incubated at 37°C for 60 minutes. 100 μL of virus (100 $TCID_{50}$) was added to each well. The tray was transferred to an environmental chamber (37°C).

Cultures were inspected periodically for virus-induced cytopathic effect (viral CPE). Absence of CPE indicated

complete inactivation of the virus. Partial inhibition was considered to be a negative result. All the screened compounds were found inactive as shown in Table 3.

EXPERIMENTAL

All the recorded melting points were determined in open capillary tubes and are uncorrected. IR spectra were recorded on Perkin-Elmer FTIR spectrophotometer in KBr disc. ^{1}H-NMR spectra were recorded on Varian 300 MHz spectrometer and Bruker Avance II 400 MHz spectrometer in DMSO or $CDCl_3$ as a solvent and TMS as an internal standard. Peak values are shown in δ ppm. Mass spectra were recorded on a Q-T micromass 5630 mass spectrometer.

3-(4-(Difluoromethoxy)dibenzofuran-1-yl)-1-(2-hydroxyphenyl)prop-2-en-1-one (3a–f). Equimolar amount of compound **1** (0.02 mol) and **2** (0.02 mol) were dissolved in 25 mL of alcohol in conical flask. To this reaction mixture 40% KOH (10 mL) was added. The reaction mixture was stirred at room temperature for 48 hr. The contents were then poured into crushed ice and neutralized with acetic acid. The yellow solid thus obtained was filtered and crystallized from alcohol to afford compounds **3**. The compounds synthesized by above procedure are listed in Table 4.

3-(4-(Difluoromethoxy)dibenzofuran-1-yl)-1-(2-hydroxyphenyl)-prop-2-en-1-one (3a). IR (KBr): 3305, 1633, 1589 and 1501, 1115 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.75–8.22 (m, 12H, aromatic, olefinic, and —$OCHF_2$), 8.40 (d, 1H, $J = 15.00$ Hz, β to carbonyl), 12.61 (s, 1H, —OH); Mass: M$^+$ 380.

1-(5-Bromo-2-hydroxyphenyl)-3-(4-(difluoromethoxy)dibenzofuran-1-yl)prop-2-en-1-one (3b). IR (KBr): 3308, 1635, 1598 and 1515, 1125 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.81–8.31 (m, 11H, aromatic, olefinic, and —$OCHF_2$), 8.43 (d, 1H, $J = 15.10$ Hz, β to carbonyl), 12.72 (s, 1H, —OH); Mass: M$^+$ 459.

3-(4-(Difluoromethoxy)dibenzofuran-1-yl)-1-(5-fluoro-2-hydroxyphenyl)prop-2-en-1-one (3c). IR (KBr): 3313, 1638, 1610 and 1519, 1177, 1130 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.87–7.91 (m, 7H, aromatic, olefinic, and —$OCHF_2$), 8.13–8.20 (m, 3H, aromatic), 8.40–8.44 (m, 1H, aromatic) 8.55 (d, 1H, $J = 15.30$ Hz, β to carbonyl), 12.87 (s, 1H, —OH); Mass: M$^+$ 398.

1-(5-Chloro-2-hydroxyphenyl)-3-(4-(difluoromethoxy)dibenzofuran-1-yl)prop-2-en-1-one (3d). IR (KBr): 3311, 1636, 1601 and 1510, 1125, 1066 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.72–7.75 (m, 7H, aromatic, olefinic, and —$OCHF_2$), 7.98–8.42 (m, 4H, aromatic) 8.48 (d, 1H, $J = 15.17$ Hz, β to carbonyl), 12.77 (s, 1H, —OH); Mass: M$^+$ 414 with isotopic peaks.

1-(3,5-Dichloro-2-hydroxyphenyl)-3-(4-(difluoromethoxy)dibenzofuran-1-yl) prop-2-en-1-one (3e). IR (KBr): 3320, 1642, 1125, 1076 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.77–7.87 (m, 6H, aromatic, olefinic, and —$OCHF_2$), 7.98–8.42 (m, 3H, aromatic) 8.48–8.50 (m, 2H, aromatic, and β to carbonyl), 12.83 (s, 1H, —OH); Mass: M$^+$ 449 with isotopic peaks.

1-(4-Chloro-2-hydroxyphenyl)-3-(4-(difluoromethoxy)dibenzofuran-1-yl)prop-2-en-1-one (3f). IR (KBr): 3305, 1635, 1599 and 1496, 1125, 1063 cm^{-1}; ^{1}H-NMR (DMSO): δ 6.73–7.92 (m, 8H, aromatic, olefinic, and —$OCHF_2$), 8.21–8.42 (m, 4H, aromatic, and β to carbonyl), 12.97 (s, 1H, —OH); Mass: M$^+$ 414 with isotopic peaks.

3-Chloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4a–f). Compound **3** (0.001 mole) was dissolved in 15 mL DMSO. To this reaction mixture excess of $CuCl_2$ (2 gm) was added. The reaction mixture was heated under mild reflux for 3 hr and left overnight. Then 100 mL ice

cold water was added in it. The solid thus obtained was filtered and washed with dil. HCl and again with water. The product was crystallized from acetic acid to afford compounds **4.** The compounds synthesized by above procedure are listed in Table 4.

3-Chloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4a). IR (KBr): 1650, 1128, 1072 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.80 (t, 1H, J = 72.94 Hz, —OCHF$_2$), 7.15–8.13 (m, 10H, aromatic); Mass: M$^+$ 491 with isotopic peaks.

6-Bromo-3-chloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4b). IR (KBr): 1647, 1135, 1065 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.83 (t, 1H, J = 72.95 Hz, —OCHF$_2$) 7.25–7.77 (m, 8H, aromatic), 8.22 (d, 1H, aromatic); Mass: M$^+$ 491 with isotopic peaks.

3-Chloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-6-fluoro-4*H*-chromon-4-one (4c). IR (KBr): 1658, 1169, 1132, 1078 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.87 (t, 1H, J = 72.95 Hz, —OCHF$_2$) 7.35–7.92 (m, 8H, aromatic), 8.32 (m, 1H, aromatic); Mass: M$^+$ 430 with isotopic peaks.

3,6-Dichloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4d). IR (KBr): 1652, 1135, 1075 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.85 (t, 1H, J = 72.94 Hz, —OCHF$_2$), 7.25–7.74 (m, 8H, aromatic), 8.22(d, 1H, aromatic); Mass: M$^+$ 447 with isotopic peaks.

3,6,8-Trichloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4e). IR (KBr): 1662, 1134, 1107, 1072, 1052, 1015 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.97 (t, 1H, J = 72.96 Hz, —OCHF$_2$) 7.26–7.70 (m, 6H, aromatic), 7.81 (d, 1H, J = 2.48 Hz, aromatic), 8.26 (d, 1H, J = 2.48 Hz, aromatic); Mass: M$^+$ 481 with isotopic peaks.

3,7-Dichloro-2-(4-(difluoromethoxy)dibenzofuran-1-yl)-4*H*-chromon-4-one (4f). IR (KBr): 1655, 1125, 1080 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 6.88 (t, 1H, J = 72.93Hz, —OCHF$_2$), 7.23–7.80 (m, 9H, aromatic), Mass: M$^+$ 447 with isotopic peaks.

2-(2-(4-(Difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4]thiazepin-4-yl)phenol (5a–f). Compound **3** (0.001 mol) and 2-aminothiophenol (0.001 mol) were dissolved in 15 mL ethanol in 100 mL RBF. The reaction mixture was heated under reflux for 4 hr. Then 5 mL glacial acetic acid was added and heating was continued for further 4 hr. After completion of reaction, the contents were cooled to room temperature and poured into crushed ice. The solid thus obtained was separated by filtration and crystallized with alcohol to afford compounds **5.** The compounds synthesized by above procedure are listed in Table 4.

2-(2-(4-(Difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4]thiazepin-4-yl)phenol. (5a). IR (KBr): 3397, 1598 and 1499, 1123 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.21 (dd, 1H,) 3.47 (dd, 1H), 5.97 (dd, 1H), 6.81 (t, 1H, J = 72.97Hz, —OCHF$_2$), 6.99–7.90 (m, 14H, aromatic), 15.77 (s, 1H, —OH); Mass: M$^+$ 487.

4-Bromo-2-(2-(4-(difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4] thiazepin-4-yl)phenol (5b). IR (KBr): 3395, 1595 and 1518, 1116 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.23 (dd, 1H), 3.49 (dd, 1H), 5.95 (dd, 1H), 6.84 (t, 1H, J = 72.95Hz, —OCHF$_2$), 7.02–7.85 (m, 13H, aromatic), 15.79(s, 1H, —OH); Mass: M$^+$ 566.

2-(2-(4-(Difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4]thiazepin-4-yl)-4-fluorophenol (5c). IR (KBr): 3398, 1170, 1145 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.24 (dd, 1H), 3.50 (dd, 1H), 5.95 (dd, 1H), 6.85 (t, 1H, J = 72.96Hz, —OCHF$_2$), 7.32–8.20 (m, 13H, aromatic), 15.82 (s, 1H, —OH); Mass: M$^+$ 505.

4-Chloro-2-(2-(4-(difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4] thiazepin-4-yl)phenol. (5d). IR (KBr): 3390, 1590 and 1489, 1131, 1070 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.23 (dd, 1H), 3.58 (dd, 1H), 6.00 (dd, 1H), 6.82 (t, 1H, J = 72.95 Hz, —OCHF$_2$), 7.15–7.98 (m, 13H, aromatic), 15.77(s, 1H, —OH); Mass: M$^+$ 521 with isotopic peaks.

2,4-Dichloro-2-(2-(4-(difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b] [1,4]thiazepin-4-yl)phenol (5e). IR (KBr): 3409, 1125, 1072 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.29(dd, 1H), 3.47 (dd, 1H), 6.00 (dd, 1H), 6.85 (t, 1H, J = 72.96 Hz, —OCHF$_2$), 7.11–7.95 (m, 10H, aromatic),8.02 (d, 1H, aromatic), 8.23 (d, 1H, aromatic), 15.74 (s, 1H, —OH); Mass: M$^+$ 556 with isotopic peaks.

3-Chloro-2-(2-(4-(difluoromethoxy)dibenzofuran-1-yl)-2,3-dihydrobenzo[b][1,4] thiazepin-4-yl)phenol. (5f). IR (KBr): 3395, 1592 and 1501, 1131 cm^{-1}; ^{1}H-NMR (CDCl$_3$): δ 3.25 (dd, 1H), 3.49 (dd, 1H), 5.99 (dd, 1H), 6.82 (t, 1H, J = 72.95Hz, —OCHF$_2$), 7.21–8.06 (m, 13H, aromatic), 15.80 (s, 1H, —OH); Mass: M$^+$ 521 with isotopic peaks.

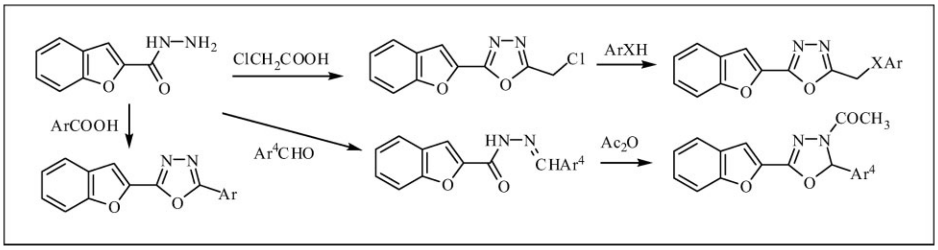
DOI 10.1002/jhet.142



In this study, the synthesis of series of 2-benzo[*b*]furan-substituted 1,3,4-oxadiazole derivatives using readily available 2-benzo[*b*]furan carboxylic acid hydrazide as starting material has been investigated.

J. Heterocyclic Chem., **46**, 737 (2009).

INTRODUCTION

1,3,4-Oxadiazoles are five-membered aromatic heterocycles with great utility in synthetic, medicinal, and material chemistry [1–4]. The widespread use of 1,3,4-oxadiazoles as a scaffold in medicinal chemistry establishes this moiety as an important bioactive class of heterocycles. These molecules are also utilized as pharmacophores because of their favorable metabolic profile and ability to engage in hydrogen bonding. In particular, marketed antihypertensive agents, such as tiodazosin [5] and nesapidil [6], and antibiotics, such as furamizole [7], contain the oxadiazole nucleus. They are also useful as HIV integrase inhibitors and angiogenesis inhibitors [7,8]. 2,5-Disubstituted 1,3,4-oxadiazoles have also attracted significant interest because of their applications in organic light-emitting diodes, photoluminescence, polymers, and material science [9,10].

Several methods have been reported in the literature for the synthesis of 1,3,4-oxadiazoles. Most of these protocols are multistep in nature and generally involve the cyclization of diacylhydrazides or acylthiosemicarbazides and the oxidation of acylhydrozones [11] with a variety of reagents such as thionyl chloride, phosphorus oxychloride, or sulfuric acid, usually under harsh reaction conditions. Recently, a few efficient examples have been reported for the synthesis of 1,3,4-oxadiazoles by treatment of readily available carboxylic acids with acid hydrazides under acid conditions [12]. 1,3,4-Oxadiazoles by condensation of acid hydrazide and triethyl orthoalkanates under microwave irradiations have also been reported. This green protocol was catalyzed efficiently by solid-supported Nafion_NR50 [13].

2-Substituted benzo[*b*]furans [14,15] are widely distributed in nature and have a range of biological activities [16], for example, as insulin-sensitivity enhancers [17], inhibitors of tubulin polymerase [18], antagonists of the A1 adenosine receptor [19], inhibitors of testosterone 5R-reductase [20], and inhibitors of 5-lipoxygenase [21]. Recently, of particular interest is BPAP, which enhances impulse propagation mediated by the release of catecholamines and serotonin in the brain and so may slow progression of Parkinson's and Alzheimer's disease [22].

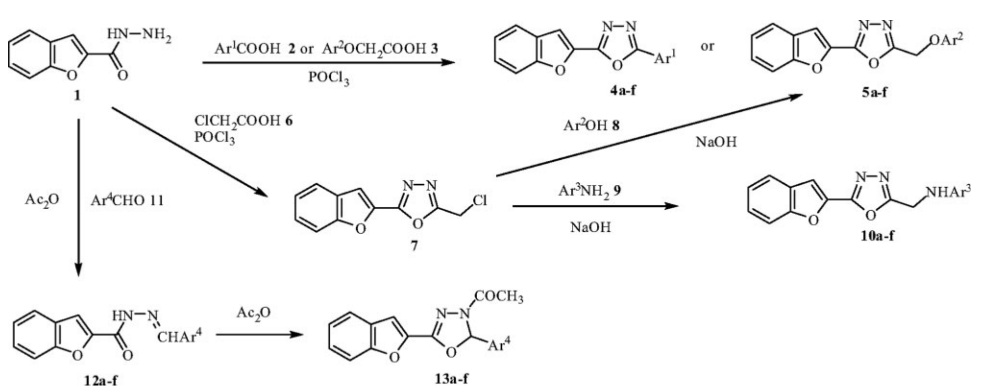
In previous reports, we demonstrated the use of 2-benzo[*b*]furan carboxylic acid and 2-benzo[*b*]furan carboxylic acid hydrazide as versatile building blocks for the synthesis of functionalized heterocycles [23]. We now report the investigations on the use of 2-benzo[*b*]furan carboxylic acid hydrazide (**1**) for the synthesis of 2,5-disubstituted 1,3,4-oxadiazole derivatives **4a–f**, **5a–f**, **10a–f**, and **13a–f** (Schemes 1).

RESULTS AND DISCUSSION

Scheme 1 outlines the synthetic sequences used in our laboratories for the preparation of the key intermediate **1** and its derivatives 1,3,4-oxadiazoles **4**, **5**, **10**, and **13**.

Synthesis of 2-aryl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles 4a–f and 2-aryloxymethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles 5a–f. Treatment of 2-benzofuroyl hydrazine (**1**) with 1 equiv of substituted benzoic acids (**2a–f**) in the presence of $POCl_3$ under reflux for 6 h produced 2,5-diaryl-substituted 1,3,4-oxadiazoles (**4a–f**) in high yields. However, the reaction of compound

Scheme 1



1 with aryloxyacetic acids (**3a–f**) need catalytic amounts of pyridine in reflux $POCl_3$ and longer time (8 h) to give the corresponding 1,3,4-oxadiazoles (**5a–f**) in higher yields (method A) (entries 7–12, Table 1).

Synthesis of 2-chloromethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazole (7) and its utilization for the synthesis of 2-aryloxymethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (5a–f) and 2-arylaminomethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (10a–f). The reaction of acylhydrazine (**1**) with 2-chloroacetic acid in xylene in the presence of $POCl_3$ under reflux for 8 h gave compound **7** in 89% yield. Treatment of **7** with 1.1 equiv of substituted phenylamines (**9a–f**) gave 2-arylamine-methyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (**10a–f**) (entries 13–18, Table 1), which cannot be synthesized by cyclization reaction of corresponding acids and acylhydrazines, and the reaction gave high yields. In examining the reactivity of 2-chloromethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazole (**7**), the reaction of **7** with aryl-substituted phenols (**8**) was carried out in the

The values in parenthesis indicate the yields of method B for compounds **5** and **13**.

[a] Isolated yield.

[b] Yields of method A for compounds **5** and **13**.

presence of NaOH powder under reflux ethanol condition. Compounds **5a–f** could also be obtained in good yields (method B) (entries 7–12, Table 1).

One-pot synthesis of 3-acetyl-2-aryl-5-(2-benzo[*b*]-furan)-1,3,4-oxadiazolines (13a–f). First, the synthesis of 1,3,4-oxadiazoles **13a–f** were investigated through a two-step pathway. Treatment of **1** with aromatic aldehydes (**11a–f**) in the presence of catalytic amounts of Ac$_2$O under refluxing ethanol for 6 h gave 2-benzo[*b*]-furoyl hydrazones **12a–f**, which upon treatment in refluxing Ac$_2$O afforded 1,3,4-oxadiazolines **13a–f** in moderate total yields (entries 19–24, Table 1).

The ability of Ac$_2$O to promote both steps led us to investigate the one-pot synthesis of oxadiazolines **13a–f** starting from the same substrates. When acylhydrazine (**1**) and aromatic aldehydes (**11a–f**) were stirred in Ac$_2$O under reflux, the corresponding oxadiazolines **13a–f** were obtained in good yields after 2 h (entries 19–24, Table 1). It could be seen from Table 1 that the one-pot method was a more efficient way than the two-step procedures for the preparation of compounds **13a–f**.

In conclusion, the synthesis of series of 2-benzo[*b*]-furan-substituted 1,3,4-oxadiazole derivatives using readily available 2-benzo[*b*]furan carboxylic acid hydrazide as starting material has been investigated. These processes are highly efficient with good yields and use cheap and easily available aldehydes and acids.

EXPERIMENTAL

All reagents were obtained commercially and used without further purification. Melting points were determined on an XT-4 electrothermal micromelting point apparatus and uncorrected. IR spectra were recorded using KBr pellets on Nicolet AVATAR 36 FTIR spectrophotometer. For compounds **4a–f** and **5a–f**, NMR spectra were recorded on an Avanci-D2X-200 instrument using CDCl$_3$ as solvent and TMS as internal standard. For compounds **7**, **10a–f**, and **13a–f**, NMR spectra were recorded at 400 (^{1}H) and 100 (^{13}C) MHz, respectively, on a Varian Mercury plus-400 instrument using CDCl$_3$ as solvent and TMS as internal standard.

General procedure for the synthesis of 2-aryl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (4a–f). The mixture of 2-benzo[*b*]furan carboxylic acid hydrazide (**1**) (1 mmol), substituted benzoic acids (**2a–f**) (1 mmol), and POCl$_3$ (5 mL) was stirred under reflux condition for 6 h. The excess of POCl$_3$ was evaporated under reduced pressure. The residue was poured into ice water (50 mL). Then the precipitate was filtered and washed with aqueous solution of NaOH (1%) and subsequently with water. The solid was recrystallized from EtOH to give the products 2-aryl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (**4a–f**).

4a: m.p. 170–172°C; IR (KBr): 1633, 1579, 1506, 1210, 1058 cm^{-1}; ^{1}H NMR (200 Hz, CDCl$_3$): $\delta = 7.00$–8.14 (m, 10H, Ar-H); ^{13}C NMR (75 Hz, CDCl$_3$): $\delta = 164.5$, 159.8, 158.4, 144.1, 129.8, 128.1, 127.7, 127.1, 124.8, 124.6, 122.9, 121.2, 116.9, 110.4.

General procedure for the synthesis of 2-aryl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (5a–f).

Method A. The mixture of 2-benzo[*b*]furan carboxylic acid hydrazide (**1**) (1 mmol), substituted aryloxyacetic acids (**3a–f**) (1 mmol), pyridine (0.1 mL), and POCl$_3$ (5 mL) were stirred under reflux condition for 8 h. The excess of POCl$_3$ was evaporated under reduced pressure. The residue was poured into ice water (50 mL). Then the precipitate was filtered and washed with aqueous solution of NaOH (1%) and subsequently with water. The solid was recrystallized from EtOH to give the products 2-aryloxymethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (**5a–f**).

Method B. The mixture of 2-chloromethyl-5-(2-benzo[*b*]-furan)-1,3,4-oxadiazole (**7**) (1 mmol), substituted phenols (**8**) (1.1 mmol), and NaOH (1.1 mmol) in 10 mL ethanol were stirred at 80°C for 12 h. The mixture was poured into ice water (50 mL). Then the precipitate was filtered and washed with water (3 × 10 mL). The solid was recrystallized from EtOH to give the product 2-aryloxymethyl-5-(2-benzo[*b*]-furan)-1,3,4-oxadiazoles (**5a–f**).

5a: m.p. 184–186°C, IR (KBr): 1640, 1577, 1511, 1202, 1056 cm^{-1}; ^{1}H NMR (200 Hz, CDCl$_3$): $\delta = 7.01$–7.76 (m, 10H, Ar-H), 5.37 (s, 2H, CH$_2$); ^{13}C NMR (75 Hz, CDCl$_3$): $\delta = 164.4$, 161.2, 158.3, 157.8, 154.6, 129.8, 128.0, 127.7, 124.3, 122.8, 120.3, 114.0, 112.3, 110.5, 72.6.

5b: m.p. 130–132°C, IR (KBr): 1638, 1580, 1489, 1214, 1048 cm^{-1}; ^{1}H NMR (200 Hz, CDCl$_3$): $\delta = 7.10$–7.91 (m, 9H, Ar-H), 5.37 (s, 2H, CH$_2$); ^{13}C NMR (75 Hz, CDCl$_3$): $\delta =$ 164.6, 161.3, 158.3, 156.6, 154.8, 131.4, 130.9, 127.5, 126.5, 124.8, 123.2, 122.5, 114.1, 112.6, 110.3, 72.6.

5c: m.p. 187–189°C; IR (KBr): 1651, 1564, 1512, 1214, 1056 cm^{-1}; ^{1}H NMR (200 Hz, CDCl$_3$): $\delta = 6.88$–7.92 (m, 9H, Ar-H), 5.37 (s, 2H, CH$_2$), 2.36 (s, 3H, CH$_3$); ^{13}C NMR (75 Hz, CDCl$_3$): $\delta = 164.3$, 161.5, 158.6, 156.3, 154.1, 131.3, 131.4, 130.1, 127.7, 124.7, 124.8, 123.0, 122.1, 121.7, 112.6, 110.2, 72.9, 22.1.

5d: m.p. 137–139°C; IR (KBr): 1650, 1569, 1520, 1214, 1059 cm^{-1}; ^{1}H NMR (200 Hz, CDCl$_3$): $\delta = 6.94$–7.92 (m, 9H, Ar-H), 5.36 (s, 2H, CH_2), 2.35 (s, 3H, CH_3); ^{13}C NMR (75 Hz, $CDCl_3$): δ = 164.8, 160.4, 158.9, 156.9, 157.4, 131.1, 130.8, 128.1, 127.5, 124.0, 122.3, 120.8, 111.9, 110.3, 72.5, 22.2.

5e: m.p. 141–142°C; IR (KBr) 1639, 1567, 1501, 1208, 1052 cm^{-1}; ^{1}H NMR (200 Hz, $CDCl_3$): δ = 6.84–7.73 (m, 9H, Ar-H), 5.37 (s, 2H, CH_2), 3.77 (s, 3H, CH_3O); ^{13}C NMR (75 Hz, $CDCl_3$): 161.9, 160.3, 157.8, 156.9, 155.0, 154.0, 130.7, 128.8, 127.1, 126.0, 118.5, 115.7, 112.2, 111.2, 58.9, 56.1.

5f: m.p. 192–194°C; IR (KBr): 1652, 1580, 1508, 1206, 1056 cm^{-1}; ^{1}H NMR (200 Hz, $CDCl_3$): δ = 7.02–8.21 (m, 9H, Ar-H), 5.37 (s, 2H,CH_2); ^{13}C NMR (75 Hz, $CDCl_3$): δ = 164.9, 160.9, 158.8, 156.0, 155.8, 145.8, 132.3, 130.2, 127.3, 124.2, 124.0, 122.8, 121.1, 114.4, 112.2, 110.5, 70.7.

Synthesis of 2-chloromethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazole (7). The mixture of 2-benzo[*b*]furan carboxylic acid hydrazide (**1**) (10 mmol), 2-chloroacetic acid (**6**) (11 mmol), xylene (10 mL), and $POCl_3$ (5 mL) were stirred under reflux for 8 h. The excess of $POCl_3$ and solvent were evaporated under reduced pressure. The residue was poured into ice water (50 mL). Then the precipitate was filtered and washed with aqueous solution of NaOH (1%) and subsequently with water. The solid was recrystallized from EtOH to give the product 2-chloromethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazole (**7**).

Yield 89%, m.p. 149–151°C; IR (KBr): 3024, 1638, 1574 cm^{-1}; ^{1}H NMR (400 MHz, $CDCl_3$): δ = 7.71 (d ,1H, *J* = 8.0 Hz, Ar-H), 7.63 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.58 (s, 1H, Ar-H),7.47 (t, *J* = 8.0 Hz, Ar-H), 7.34 (t, *J* = 8.0 Hz, Ar-H), 4.82 (s, 2H, CH_2).

General procedure for the synthesis of 2-arylamine-methyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (10a–f). The mixture of 2-chloromethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazole (**7**) (1 mmol), arylamines (**9**) (1.1 mmol), and NaOH (1.1 mmol) in 10 mL ethanol were stirred at 80°C for 12 h. The mixture was poured into ice water (50 mL). Then the precipitate was filtered and washed with water (3 × 10 mL). The solid was recrystallized from EtOH to give the product 2-aryloxymethyl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazoles (**10a–f**).

10a: m.p. 204–205°C; IR (KBr): 3334, 1579, 1642, 1203, 1060 cm^{-1}; ^{1}H NMR (400 Hz, $CDCl_3$): δ = 7.63 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.57 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.74–7.40 (m, 2H, Ar-H), 7.34–7.23 (m, 1H, Ar-H), 7.21–6.85 (m, 5H, Ar-H), 4.30 (s, 1H, NH); ^{13}C NMR (100 Hz, $CDCl_3$): δ = 163.9, 158.0, 154.9, 146.5, 140.8, 128.7, 128.2, 126.8, 126.9, 124.5, 123.0, 115.2, 111.8, 109.5, 38.8.

10b: m.p. 150–151°C; IR (KBr): 3384, 1558, 1644, 1206, 1171 cm^{-1}; ^{1}H NMR (400 Hz, $CDCl_3$): δ = 7.65 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.58 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.46–7.40 (m, 2H, Ar-H), 7.33–7.25 (m, 1H, Ar-H), 7.01 (d, 2H, *J* = 8.0 Hz, Ar-H), 6.68 (d, 2H, *J* = 8.0 Hz, Ar-H), 4.35 (s, 2H, NH); 4.31 (s, 1H, NH), 2.23 (s, 3H, CH_3); ^{13}C NMR (100 Hz, $CDCl_3$): δ = 164.6, 158.3, 155.6, 143.9, 140.3, 129.9, 128.3, 127.1, 127.1, 124.0, 122.3, 113.4, 110.3, 39.4, 20.3.

10f: m.p. 142–144°C; IR (KBr): 3351, 1571, 1652, 1210, 1200 cm^{-1}; ^{1}H NMR (400 Hz, $CDCl_3$): δ = 8.27–8.05 (m, 2H, Ar-H), 7.68 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.67 (d, 1H, *J* = 8.0 Hz, Ar-H), 7.63–7.52 (m, 2H, Ar-H), 7.51–7.35 (m, 1H, Ar-H), 7.05–6.95 (m, 2H, Ar-H), 4.67 (s, 2H, CH_2), 4.43 (s, 1H, NH); ^{13}C NMR (100 Hz, $CDCl_3$): δ = 165.0, 158.8, 156.2, 154.6, 142.1, 137.5, 128.0, 124.5, 124.4, 123.0, 122.2, 114.8, 112.9, 111.1, 44.8.

General procedure for one-pot synthesis of 3-acetyl-2-aryl-5-(2-benzo[*b*]furan)-1,3,4-oxadiazolines (13a–f). The mixture of 2-benzo[*b*]furan carboxylic acid hydrazide (**1**) (1 mmol), aromatic aldehydes (**11a–f**) (1 mmol), and Ac_2O (5 mL) were stirred under reflux condition for 2 h. The excess of Ac_2O was evaporated under reduced pressure. The residue was recrystallized from benzene to give the product 2-aryl-5-(2-benzo[*b*]furan)-3-acetyl-1,3,4-oxadiazoline (**13a–f**).

In this study, a series of new and significative bisfunctional compounds containing two furo[3,4-*b*]quinoline and acridinedione skeletons has been synthesized through a rapid one-pot three-component reaction of dialdehydes with *N*-aryl enaminones and cyclic-1,3-dicarbonyl compounds (tetronic acid and cyclohexane-1,3-dione) in mixed solvent of glacial acetic acid and *N*,*N*-dimethylformamide under microwave irradiation without catalyst. This method has the advantages of good yield and simple workup procedure.

J. Heterocyclic Chem., **46**, 742 (2009).

INTRODUCTION

Podophyllotoxin **1** (Figure 1) is an important lignan that inhibits microtubule assembly [1]. However, because attempts to use it for the treatment of human neoplasia were mostly unsuccessful and complicated by side effects, extensive structural modifications have been performed to obtain more potent and less toxic anticancer agents [2]. Among them, 4-aza podophyllotoxin derivative **2** (Fig. 1) has been reported to be a powerful DNA topoisomerase inhibitor, working through a mechanism of action entirely different from that of the parent, natural podophyllotoxin [3,4]. This suggests that substitution of the carbon atom at position 4 of podophyllotoxin by a nitrogen atom would bring about great changes in the biological profile. In view of the important biological properties of the azapodophyllotoxin, the modifications on the scaffold of aza-analogs may also bring significant changes in pharmacological activities.

The furoquinolines **A** as a kind of azapodophyllotoxin derivative have been synthesized by the reactions of single aldehydes with equivalent of appropriate cyclic-1,3-dicarbonyl compounds and *N*-aryl enaminones in our previous communications [5]. In addition, with a 1,4-dihydropyridine (1,4-DHP) parent nucleus, acridine-1,8-diones **B**, which showed interesting physical properties such as photoinitiators [6] have been prepared [7]. However, all these compounds contain only single furoquinoline skeleton or acridinedione unit. To the best of our knowledge, the compounds of type **C** and **D** including two furoquinoline skeletons or acridinedione units have been seldom reported (Fig. 1). With the aim to broaden the diversity of heterocyclic compound library and in continuation of our recent interest in the construction of heterocyclic scaffolds [8], we developed a facile, three-component reaction between dialdehydes, *N*-aryl enaminones, and cyclic-1,3-dicarbonyl compounds (tetronic acid and 1,3-cyclohexanedione) under microwave (MW) heating to afford a series of new polycyclic fused compounds **C** and **D**, including two furoquinoline skeletons or acridinedione units, respectively (Scheme 1).

RESULTS AND DISCUSSION

Enaminones and related compounds possessing the structural unit (N—C=C—Z, Z=COR, CO_2R, *etc.*) are versatile synthetic intermediates in organic chemistry that combine the ambient nucleophilicity of enamine and the electrophilicity of enones [9]. They are frequently applied in the preparation of heterocycles [10]. Our strategy of synthesizing the bisfunctional

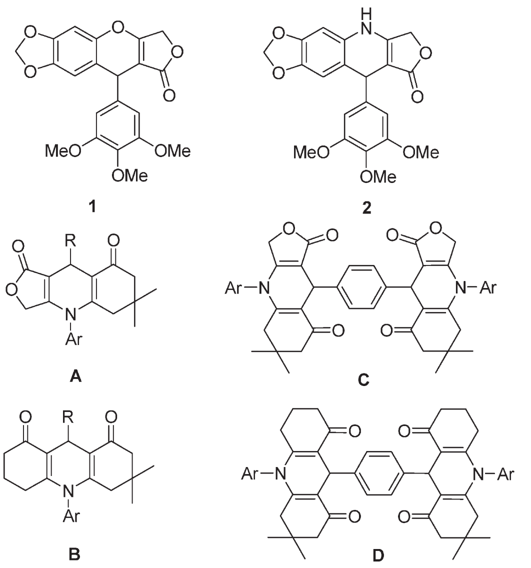

Figure 1. The podophyllotoxin derivatives and the unsymmetrical acridinediones.

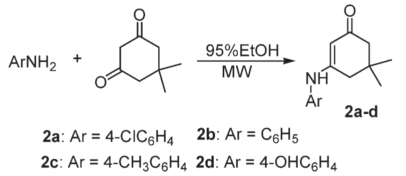
compounds, furoquinolines of type **C** and acridinediones of type **D**, was through the reaction of a dialdehyde with a appropriate cyclic-1,3-dicarbonyl derivative and a preformed *N*-aryl enaminones. Representing aromatic amines with electron-rich group, 4-methylphenylamine electron-withdrawing group, 4-chlorobenzenamine, and 4-aminophenol, and phenylamine were selected for our study. The preparation of enaminones **2a–d** was commonly achieved by refluxing the reaction mixture in an aromatic solvent, with the removal of the produced water by azeotropic distillation [11]. We found that enaminones (**2a–d**) could be obtained in good to excellent yields by MW heating the mixture of the corresponding amine and 5,5-dimethyl-1,3-cyclohexanedione in EtOH (95%) at 100°C for 4–6 min (Scheme 2, Table 1) [5].

Choosing an appropriate solvent is of crucial importance for the successful microwave-assisted synthesis. To search for the optimal solvent, the microwave-assisted reaction of equimolar amount of terephthalaldehyde (**1a**) with 3-(*p*-tolylamino)-5,5-dimethylcyclohex-2-enone (**2c**) and tetronic acid (**3a**) was examined using

Scheme 2



ethylene glycol, glacial acetic acid (HOAc), *N*,*N*-dimethylformamide (DMF), and mixed solvent of glacial acetic acid and DMF as solvent at 100°C, respectively. All the reactions were carried out under microwave irradiation (initial power 100 W and maximum power 250 W; Table 2).

As shown in Table 2, the reactions using the mixed solvent (V_{HOAc}/V_{DMF}: 2:1) as the solvent resulted in higher yields and shorter reaction time than those using ethylene glycol, HOAc, DMF, and other mixed solvent as solvents. Thus, the mixed solvent (V_{HOAc}/V_{DMF}: 2:1) was used as the solvent for further optimization of reaction conditions, the same reaction was carried out at temperatures ranging from 80 to 140°C, with an increment of 10°C each time. The yield of product **4c** was increased, and the reaction time was shortened when the temperature was increased from 80 to 120°C. The yield leveled off when the temperature was further increased to 130 and 140°C. Therefore, the temperature of 120°C was chosen for all further microwave-assisted reactions (Table 3).

Under these optimal conditions [the mixed solvent (V_{HOAc}/V_{DMF}: 2:1, 2.0 mL), 120°C], the reactions of different dialdehydes, various *N*-aryl enaminones, and tetronic acid were performed. Initially, to test the scope of *N*-aryl enaminones substrates, dialdehydes and tetronic acid were used as model substrates (Table 4, entries 1–6), and the results indicated that *N*-aryl enaminones bearing functional groups such as chloro or methyl are suitable for the reaction. At the same time, we have also observed delicate electronic effects, that is, *N*-aryl enaminones with electron-rich groups (Table 4, entries 3 and 6) reacted rapidly, while electron-withdrawing groups on the benzene ring (Table 4, entries 1 and 4) decreased the reactivity, requiring longer reaction times.

Scheme 1

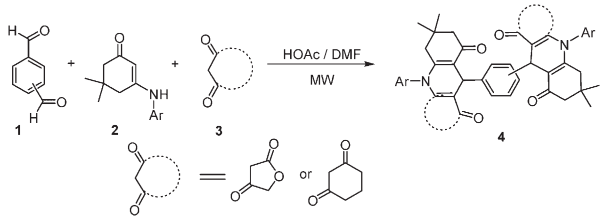


Table 1

Reaction times and yields for enaminones **2a**–**2d**.

Entry	Product	Time (min)	Yield (%)	m.p. (°C)
1	**2a**	4	89	207–209
2	**2b**	5	91	189–190
3	**2c**	5	93	206–208
4	**2d**	6	94	249–251

Table 2

Solvent optimization for the synthesis of **4c** under MW.

Entry	Solvent	Time (min)	Yield (%)
1	Ethylene glycol	14	80
2	HOAc	14	81
3	DMF	15	78
4	HOAc/DMF (3:1)	12	83
5	HOAc/DMF (2:1)	12	85
6	HOAc/DMF (1:1)	12	82

Table 3

Temperature optimization for the synthesis of **4c** under MW.

Entry	Temp (°C)	Time (min)	Yield (%)
1	80	18	70
2	90	16	81
3	100	12	85
4	110	10	89
5	120	8	92
6	130	8	90
7	140	6	86

To further expand the scope of this method, the replacement of tetronic acid (**3a**) with 1,3-cyclohexanedione (**3b**) was examined. To our delight, under the optimized conditions described earlier, the reactions proceeded smoothly as well (Table 4, entries 7–11). The new polycyclic-fused compounds including two acridinedione units were obtained without byproduct.

Additionally, to compare with microwave-assisted reactions, the same temperature and time were applied to synthesize the same product under classical heating (CH) conditions. The results listed in Table 4 show the specific activation of this reaction by MW heating. Simultaneously, the reaction yields were obviously increased. The difference in yields (MW > CH) may be a consequence of both thermal effects and specific effects induced by the microwave field [12,13]. The reactants in these multicomponent reactions (MCRs)

Table 4

The synthesis of compounds **4** at 120°C.

Entry	4	1	2	3	Time (min)	Yield[a] (%)	m.p. (°C)
1	**4a**		**2a**		14	85 (31)	>300

[a] Isolated yields under classical heating (CH) conditions.

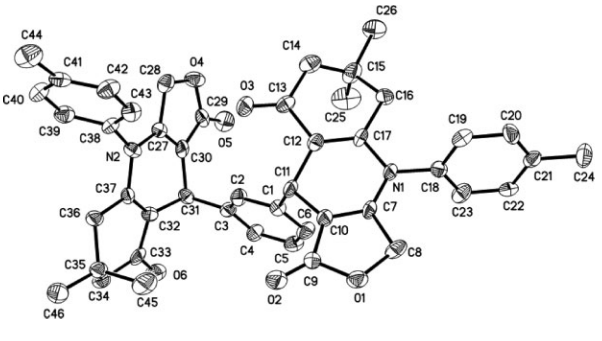

Figure 2. ORTEP diagram of **4f**.

contain dipoles and proceed via relatively polar intermediates, which enhance their interactions with MW and consequently benefit significantly from MW irradiation with respect to more efficient yield and product purity.

The mechanism of these reactions is similar to those we have previously reported [5,7], which includes sequential condensation, addition, cyclization, and elimination.

In this study, all the products were characterized by melting point, IR, ^{1}H NMR spectral data, and elemental analysis. Furthermore, the structure of **4f** was established by X-ray crystallographic analysis (Fig. 2) [14].

In summary, we have successfully combined the advantages of microwave technology with multicomponent reactions to facilitate the rapid construction of bisfuro[3,4-*b*]quinoline and bisacridinedione skeletons from readily obtainable and inexpensive materials. Particularly, valuable features of this method included the good to excellent yields and operational simplicity as well as increased safety for small-scale high-speed synthesis. In addition, this series of bisfunctional compounds containing two furo[3,4-*b*]quinoline and acridinedione skeletons may prove new classes of biologically active compounds for biomedical screening, which is in progress in our laboratory.

EXPERIMENTAL

Microwave irradiation was carried out with a microwave oven Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden. Melting points were determined in the open capillaries and were uncorrected. IR spectra were taken on a FTIR-Tensor 27 spectrometer in KBr pellets and reported in cm^{-1}. ^{1}H NMR spectra were measured on a Bruker DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. Elemental analysis was determined by using a Perkin-Elmer 240c elemental analysis instrument. HRMS (ESI) was determined by using micrOTOF-QII HRMS instrument (BRUKER). X-ray crystallographic analysis was performed with a Siemens SMART CCD and a Siemens P4 diffractometer.

General procedure for the one-pot synthesis of furo[3,4-*b*]quinoline and acridinedione derivative 4 under microwave irradiation conditions. Typically, in a 10-mL Emrys^{TM} reaction vial, dialdehyde 1 (1 mmol), *N*-aryl enaminones 2 (1 mmol), tetronic acid or 1,3-cyclohexanedione 3 (1 mmol), and HOAc/DMF (2:1, 2 mL) were mixed and then capped. The mixture was irradiated for a given time at 120°C under microwave irradiation (initial power 100 W and maximum power 250 W). Upon completion, monitored by TLC, the reaction mixture was filtered to give the crude product, which was further purified by recrystallization from EtOH (95%) to give pure furo[3,4-*b*]quinoline and acridinedione derivative **4**.

4-(4-Chlorophenyl)-9-(4-(4-(4-chlorophenyl)-1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxofuro[3,4-b]quinolin-9-yl)-phenyl)-6,7-dihydro-6,6-dimethylfuro[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4a). This compound was obtained as pale yellow solid (95% ethanol), m.p. > 300°C; IR (potassium bromide, cm^{-1}): 1755 (C=O), 1682 (C=O); ^{1}H NMR: δ 7.68–7.60 (m, 8H, Ar-H), 7.25 (s, 4H, Ar-H), 4.75 (s, 1H, CH), 4.74 (s, 1H, CH), 4.63–4.59 (m, 2H, CH$_2$), 4.56–4.49 (m, 2H, CH$_2$), 2.23–2.09 (m, 8H, 4CH$_2$), 0.94–0.86 (m, 12H, 4CH$_3$). Anal. Calcd. for $C_{44}H_{38}Cl_2N_2O_6$: C, 69.38; H, 5.03; N, 3.68. Found: C, 71.08; H, 5.07; N, 3.66.

4-Phenyl-6,7-dihydro-9-(4-(1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxo-furo[3,4-b]quinolin-9-yl)phenyl)-6,6-dimethylfuro[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4b). This compound was obtained as pale yellow solid (95% ethanol), m.p. > 300°C; IR (potassium bromide, cm^{-1}): 1756 (C=O), 1680 (C=O); ^{1}H NMR: δ 7.59–7.54 (m, 10H, Ar-H), 7.26 (s, 4H, Ar-H), 4.77 (s, 1H, CH), 4.75 (s, 1H, CH), 4.62–4.58 (m, 2H, CH$_2$), 4.51–4.45 (m, 2H, CH$_2$), 2.23–2.07 (m, 8H, 4CH$_2$), 0.93–0.85 (m, 12H, 4CH$_3$). Anal. Calcd. for $C_{44}H_{40}N_2O_6$: C, 76.28; H, 5.82; N, 4.04. Found: C, 76.41; H, 5.86; N, 4.15.

4-p-Tolyl-6,7-dihydro-9-(4-(1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxo-4-p-tolylfuro[3,4-b]quinolin-9-yl)phenyl)-6,6-dimethyl-furo[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4c). This compound was obtained as pale yellow solid (95% ethanol), m.p. > 300°C; IR (potassium bromide, cm^{-1}): 1755 (C=O), 1681 (C=O); ^{1}H NMR: δ 7.44–7.40 (m, 8H, Ar-H), 7.24 (s, 4H, Ar-H), 4.76 (s, 2H, 2CH), 4.58 (d, 2H, *J* = 16.0 Hz, CH$_2$), 4.49 (d, 2H, *J* = 16.0 Hz, CH$_2$), 2.40 (s, 6H, 2CH$_3$), 2.21–2.09 (m, 8H, 4CH$_2$), 0.93 (s, 6H, 2CH$_3$), 0.89 (s, 6H, 2CH$_3$). Anal. Calcd. for $C_{46}H_{44}N_2O_6$: C, 76.64; H, 6.15; N, 3.89. Found: C, 76.69; H, 6.14; N, 3.83. HRMS (ESI): *m/z* calcd for: 743.3092 [M+Na]$^+$, found: 743.3099.

4-(4-Chlorophenyl)-9-(3-(4-(4-chlorophenyl)-1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxofuro[3,4-b]quinolin-9-yl)phenyl)-6,7-dihydro-6,6-dimethylfuro[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4d). This compound was obtained as pale yellow solid (95% ethanol), m.p. > 300°C; IR (potassium bromide, cm^{-1}): 1756 (C=O), 1681 (C=O); ^{1}H NMR: δ 7.67 (s, 8H, Ar-H), 7.48 (s, 1H, Ar-H), 7.20–7.17 (m, 1H, Ar-H), 7.07 (d, 2H, *J* = 7.2 Hz, Ar-H), 4.82 (s, 2H, 2CH), 4.68 (d, 2H, *J* = 16.0 Hz, CH$_2$), 4.55 (d, 2H, *J* = 16.0 Hz, CH$_2$), 2.18–2.14 (m, 8H, Ar-H), 0.94 (s, 6H, 2CH$_3$), 0.85 (s, 6H, 2CH$_3$). Anal. Calcd. for $C_{44}H_{38}Cl_2N_2O_6$: C, 69.38; H, 5.03; N, 3.68. Found: C, 69.45; H, 5.00; N, 3.72.

4-Phenyl-6,7-dihydro-9-(3-(1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxo-4-phenylfuro[3,4-b]quinolin-9-yl)phenyl)-6,6-dimethyl-furo[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4e). This compound was obtained as pale yellow solid (95%

ethanol), m.p. > 300°C; IR (potassium bromide, cm^{-1}): 1756 (C=O), 1680 (C=O); ^1H NMR: δ 7.60 (s, 10H, Ar-H), 7.49 (s, 1H, Ar-H), 7.21–7.18 (m, 1H, Ar-H), 7.08 (d, 2H, J = 7.6 Hz, Ar-H), 4.83 (s, 2H, 2CH), 4.67 (d, 2H, J = 16.4 Hz, CH_2), 4.49 (d, 2H, J = 16.4 Hz, CH_2), 2.23–2.09 (m, 8H, $4CH_2$), 0.92 (s, 6H, $2CH_3$), 0.84 (s, 6H, $2CH_3$). Anal. Calcd. for $C_{44}H_{40}N_2O_6$: C, 76.28; H, 5.82; N, 4.04. Found: C, 76.34; H, 5.80; N, 4.08.

4-p-Tolyl-6,7-dihydro-9-(3-(1,3,4,5,6,7,8,9-octahydro-6,6-dimethyl-1,8-dioxo-4-p-tolylfuro[3,4-b]quinolin-9-yl)phenyl)-6,6-dimethyl-furo[3,4-b]quinoline-1,8(3H,4H,5H,9H)-dione (4f). Anhydrous $AlCl_3$-mediated heteroarylation of various arenes and heteroarenes with 2,4-dichloro-quinazoline (**1**) and 4-chloroquinoline (**4**) afforded exclusively 4-aryl/heteroarylquinazolines (**3**) and 4-aryl/heteroarylquinolines (**5**), respectively. Compared with the available synthetic protocols, aluminum chloride induced C—C bond formation is direct and convenient to access bis-(hetero)aryl quinazolines and quinolines. The products were obtained in good to excellent yields by this method.

J. Heterocyclic Chem., **46**, 748 (2009).

INTRODUCTION

Biaryls and biheteroaryls are significant building blocks in a large number of natural products [1] and are also an important structural motif in a variety of biologically active compounds [2]. Pyrazinopyridine biheteroaryls have been reported as potent VEGFR-2 inhibitors [3]. The meridianins and related psammopemmin marine alkaloids containing 3-(2-aminopyrimidine)-indole motifs are potent protein kinase inhibitors [4] and possess antitumor activity [5]. The biheteroaryls have drawn a great attention in advanced materials including conductive polymers [6], liquid crystals [7], supramolecules [8], and molecular electronics [9]. Quinazolines and quinolines are of considerable interest because of their synthetic and therapeutic utility [10]. Biheteroaryls containing these scaffolds may have interesting biological and physicochemical properties. Important class of atropisomeric biaryl ligands with axial chirality, quinazolinap [11], and related ligands [12] containing nitrogen in one of the aryl rings have been used in various asymmetric reactions. These important biheteroaryls were earlier synthesized by metal-catalyzed reactions, which include palladium-catalyzed Suzuki-Miyaura cross coupling [13] between organoboronic acid and halides, nickel- or palladium-catalyzed Negishi coupling [14] of organozinc compounds with various halides, or Stille coupling [15] between stannanes and halides. These synthetic protocols require multistep reactions involving either pyrophoric organolithium reagents or toxic and expensive catalysts. Alternately, anhydrous $AlCl_3$-mediated heteroarylation of arenes [16] and heteroarenes could be a cheap, convenient, and straightforward synthetic methodology to access the bis-heteroaryls 1-(2-chloroquinazolin-4-yl)-naphthalen-2-ol (**3b**) and 2-chloro-4-(1H-indol-3-yl)quinazoline (**3g**), which are structurally similar to quinazolinap and meridianins, respectively. As a part of our ongoing program devoted to the diversity-oriented synthesis (DOS), we had reported synthesis and biological activity of some azaheterocycles and coumarine derivatives. In the continuation of our studies [17], herein we report a facile and direct synthesis of 4-aryl/heteroaryl quinazolines and 4-aryl/heteroaryl quinolines by $AlCl_3$-mediated direct C—C bond forming reactions.

RESULTS AND DISCUSSION

The heteroarylation of arenes and heteroarenes with 2,4-dichloroquinazoline [18] was explored under Friedel-Crafts reaction conditions. When one equivalent of arene/heteroarene was reacted with one equivalent of 2,4-dichloroquinazoline in the presence of 1.2 equiv of anhydrous aluminum chloride using dichloroethane as solvent, 4-(hetero)aryl-substituted-2-chloroquinazolines were formed exclusively in good to excellent yields. The results are summarized in Table 1. Alternatively, on carrying out reactions at relatively lower temperature (40–45°C) for a longer duration of time (8–10 h), similar yield of the arylated and heteroarylated products could be obtained.

The heteroarylation proceeded well in the presence of various aryl and heteroaryl reactants. Arenes activated with electron donating groups were found to be effective for heteroarylation (entries 1–6). With 1,3,5-trimethoxybenzene as reactant, an excellent yield (85%) of the product **3e** was obtained in a short time (entry 5). Free phenolic hydroxyl groups were found to be well tolerated during the reaction and heteroarylation occurred at the ring carbon rather than oxygen (entries 1, 2, 3, and 6). With 2-hydroxynaphthalene (entry 2), a trace of 2,4-diarylquinazoline was formed along with the product **3b**. The structures of the products synthesized were established by analytical and spectroscopic data. The regioselectivity of the product **3a–d** were confirmed by NOESY experiment (Figure 1). In the ^{1}H NMR spectrum of compound **3a**, the signals at δ 3.49, 6.46, 7.01, and 7.68 were assigned for H-19, H-15, H-17, and H-4, which in ^{13}C NMR were appeared at δ 55.25, 104.00, 116.21, and 128.65, respectively.

The existence of correlations in the NOESY experiment of **3a** between the protons signals of H-19 and H-15, between the protons signals of H-19 and H-17 and the protons signals of H-15 and H-4 suggested that there is no substitution at C-15 and C-17, which is the confirmatory evidence of structure for the compound **3a**. Similarly, the connectivity in compound **3d** was confirmed from correlation between the proton signals at δ 6.61 (H-4) and δ 3.71 (H-7), between the protons signals of δ 6.67 (H-2) and δ 3.90 (H-8) and between the protons signals of δ 6.61 (H-4) and δ 3.90 (H-8) in the NOESY experiment of compound. A number of nitrogen-containing heteroarenes, e.g., pyrrole (entry 11), indoles (entries 7–10), and indolizines (entries 12–15) were used in the $AlCl_3$-induced reaction.

The reactivity toward indole and pyrrole derivatives (entries 7–15) were somewhat more than those of naphthyl derivatives which might be due to differences in their nucleophilicity. Similarly, with 1,3-dimethoxybenzene and *sym*-trimethoxybenzene, the arylation was completed within 2 h at 65–70°C, and the products were isolated in excellent yields (entries 4 and 5). The reaction of 2,4-dichloroquinazoline with various indolizines (fused pyrroles) (entries 12–15) were completed at 40–45°C within a few minutes. Imidazoles (entries 16 and 17), surprisingly, did not react under similar conditions. This is perhaps due to the formation of a metal-ionic complex with imidazole ($pK_a = 7.1$) resulting in a decrease of nucleophilicity. Thus, unlike pyrrole derivatives, the more basic imidazole system having an additional nitrogen atom deactivates the ring for arylation to occur.

The arylation of 4-chloroquinoline derivatives with arenes and heteroarenes under similar conditions furnished 4-(hetero)aryl-substituted quinolines. The results are shown in Table 2. In the case of 4-chloro-2,8-bis(trifluoromethyl)quinoline, the reaction occurred in 72–80% yield at 60–65°C in 45–50 min for 1,3-dimethoxy-benzene and 1,3,5-trimethoxybenzene as nucleophiles. However, unsubstituted 4-chloroquinoline and 8-hydroxy quinoline failed to undergo arylation with arenes and heteroarenes.

The proposed mechanism is shown in Figure 2. The two chlorine atoms in 2,4-dichloroquinazoline are in different electronic environments, the chlorine at C-4 becomes more labile due to a greater electron withdrawing effect involving both the N atoms through mesomeric effects and hence can be easily replaced by a suitable nucleophile to give the regioselective product. A similar mechanism in the case of 4-chloro-2,8-bis(trifluoromethyl)quinoline may be invoked. Trifluoromethyl groups in the quinoline derivative make the reaction more facile by participating in decreasing the electron density at C-4 and thereby making this position more electrophilic for the nucleophilic attack.

CONCLUSIONS

In conclusion, we have explored for the first time the scope and limitation of $AlCl_3$-mediated arylation and heteroarylation of mono and dichloroazarenes through a direct C—C bond forming reaction with arenes and heteroarenes. Suitably substituted chloroazarenes with single nitrogen atom such as 4-chloro-2,8-bis(trifluoromethyl)quinoline could be arylated regioselectively to furnish 4-arylquinolines. Similarly, arylation of 2,4-dichloroquinazoline leads to the formation 4-aryl and 4-heteroaryl quinazolines which are of biological importance. The biheteroaryls with ortho substituent are obtained in their racemic form, which after resolution could be separated into atropisomers, providing an easy route to access the P, N ligands. Surprisingly, demethylation and debromination of the product were not observed in any case in the presence of anhydrous aluminum chloride under the comparatively mild conditions.

EXPERIMENTAL

General methods. All the reactions were performed under nitrogen atmosphere in oven-dried glass wares. The nucleophilic substrates **2a–q** used were either commercially available or prepared in laboratory. Aluminum chloride used was of commercial grade. A commercial grade dichloroethane stored

over calcium chloride was used. Reaction progress was monitored by TLC aluminum sheets silica gel 60 F_{254}. ^{1}H NMR and ^{13}C NMR spectra were recorded on Bruker Supercon Magnet DPX-200 or DRX-300 spectrometers (operating at 200 and 300 MHz, respectively, for ^{1}H; 50 and 75 MHz, respectively, for ^{13}C) using $CDCl_3$ and DMSO-d_6 as solvent. Tetramethylsilane (δ 0.00 ppm) served as an internal standard in ^{1}H NMR and $CDCl_3$ (δ 77.23 ppm) in ^{13}C NMR. Splitting patterns are described as singlet (s), broad singlet (brs), doublet (d), triplet (t), and multiplet (m). Electrospray mass spectra (ES-MS) were recorded on a Micromass Quattro II triple quadruple mass spectrometer. High-resolution electron impact mass spectra (HREIMS) were obtained on JEOL MS route 600H instrument. Elemental analysis was performed on Vario EL-III C H N S analyzer. Column chromatography was performed over Merck silica gel (particle size: 60–120 mesh) obtained from Qualigens (India), or flash silica gel (particle size: 230–400 mesh).

General method for the preparation of 2,4-dichloroquinazoline 1

Step 1. A mixture of anthranilic acid (50 g, 0.36 mol) and urea (109 g, 1.82 mol) was heated [18a] in neat at 135–140°C using an air condenser for 3 h. The product mixture was poured into crushed ice (500 mL) with continuous stirring for 30 min. Quinazoline-2,4-dione thus obtained as solid was filtered, washed with water and used as such in the next step. Yield 74%; m.p. > 250°C.

Step 2. A mixture of quinazoline-2,4-dione (20 g, 0.12 mol) as obtained earlier and $POCl_3$ (98 g, 0.64 mol) was refluxed in the presence of *N*,*N*-dimethylaniline (8.5 g, 0.07 mol) for 5 h [18b]. The reaction mixture was allowed to cool to room temperature and poured cautiously into crushed ice (500 mL) with continuous stirring for 20 min. The precipitate obtained was filtered, washed with water, and finally purified column chromatography using 30% ethyl acetate/hexane as eluent. Yield 73%; m.p.: 115–116°C (116–117°C) [18b].

General method for the preparation of 4-(hetero)aryl quinazolines 3a–o. To the solution of 2,4-dichloroquinazoline **1** (1 mmol, 0.198 g) in 10 mL of dichloroethane under stirring, $AlCl_3$ (1.2 mmol, 0.158 g) was added and allowed to stir for 2–5 min. Nucleophilic substrate **2a–q** (1 mmol) (Table 1) were added and allowed to stir for completion of the reaction (see Table 1 for time and temperature). Reaction was monitored by TLC using 30% of ethyl acetate-hexane mixture. The reaction mixture was cooled to room temperature and poured into crushed ice (100 mL) with continuous stirring for 15–20 min. The products were obtained either by filtration through suction pump (**3b**, **3g**) or extracted with dichloromethane (3 × 30 mL). The organic layers were combined, washed with brine, and concentrated under reduced pressure after drying over Na_2SO_4. The crude products obtained were further purified by silica gel column chromatography using ethyl acetate-hexane as eluent.

4-[2-(4-Bromophenyl)indolizin-3-yl]-2-chloroquinazoline (3n). Yield 85%; m.p.: 190–192°C; IR (potassium bromide): 1597, 1348, 772cm^{-1}; ^{1}H NMR (300 MHz, CDCl$_3$): δ 6.70–6.75 (m, 2H), 6.97–7.02 (m, 3H), 7.09–7.15 (m, 1H), 7.22–7.25 (m, 2H), 7.50–7.55 (m, 2H), 7.67–7.73 (m, 1H), 7.88 (d, 1H, J = 8.3 Hz), 8.91 (dd, 1H, J = 7.1, 0.5 Hz); ^{13}C NMR (75 MHz, CDCl$_3$): δ 102.83, 112.94, 115.55, 119.22, 121.38, 121.45, 122.08, 124.90, 127.35, 127.64, 128.42, 130.66, 131.90, 134.05, 134.72, 134.94, 136.85, 157.15, 162.58; ES-MS (m/z): [M+H]$^+$ 434 (Br^{78}), 436(Br^{80}); HRMS-EI: found: 432.9950, calcuated: 432.9981. Anal. Calcd. for $C_{22}H_{13}BrClN_3$: C, 60.78; H, 3.01; N, 9.67. Found: C, 60.59; H, 3.29; N, 9.43.

4-(2-Benzofuran-2-yl-indolizin-3-yl)-2-chloroquinazoline (3o). Yield 80%; m.p.: 146–148°C; IR (potassium bromide): 1596, 1350 1172, 765 cm^{-1}; ^{1}H NMR (300 MHz, CDCl$_3$): δ 6.49 (s, 1H), 6.67–6.71 (m, 1H), 6.94–6.99 (m, 1H), 7.02–7.12 (m, 4H), 7.17–7.22 (m, 1H), 7.36–7.39 (m, 1H), 7.52 (d, 1H, J = 8.9 Hz), 7.72–7.79 (m, 2H), 7.99 (d, 1H, J = 8.3 Hz), 8.68 (d, 1H, J = 7.2 Hz); ^{13}C NMR (75 MHz, CDCl$_3$): δ 99.79, 103.04, 109.49, 111.60, 113.77, 117.96, 119.38, 120.36, 121.16, 121.49, 122.17, 122.87, 123.14, 126.27, 126.35, 127.39, 133.58, 135.01, 149.88, 151.95, 153.21, 155.61, 161.43; ES-MS (m/z): [M+H]$^+$ 396; HRMS-EI: found: 395.0831, calculated: 395.0825. Anal. Calcd. for $C_{24}H_{14}ClN_3O$: C, 72.82; H, 3.56; N, 10.62. Found: C, 72.53; H, 3.70; N, 10.45.

General method for the preparation of 4-(hetero)aryl quinolines 5a-c. 4-Chloro-2,8-bis(trifluoromethyl)quinoline **4** (1 mmol, 0.299 g) was added in 10 mL of dichloroethane. Under stirring, to it was added AlCl$_3$ (1.2 mmol, 0.158 g) and allowed to stirred for 2–5 min. Nucleophilic substrates **2d**, **2e**, and **2g** (1 mmol) (Table 2) were added and allowed to stirred at 60–65°C. The reaction mixture was cooled to room temperature and poured into ice-cold water (100 mL) with continuous stirring for 15–20 min. The products were obtained by extracting with dichloromethane (3 × 30 mL). The organic layers were combined, washed with brine and concentrated under reduced pressure after drying over Na_2SO_4. The crude products obtained further purified by silica gel column chromatography using ethyl acetate-hexane mixture.

4-(2,4-Dimethoxyphenyl)-2,8-bis-trifluoromethylquinoline (5a). Yield 80%; m.p.: 105–107°C; IR (potassium bromide): 1610, 1200, 1150 cm^{-1}; ^{1}H NMR (200 MHz, $CDCl_3$): δ 3.69 (s, 3H), 3.91 (s, 3H), 6.64–6.69 (m, 2H), 7.19 (d, 1H, $J = 8.5$ Hz), 7.54–7.62 (m, 1H), 7.72 (s, 1H), 7.92 (d, 1H, $J = 8.4$ Hz), 8.13 (d, 1H, $J = 7.1$ Hz). ^{13}C NMR (75 MHz, $CDCl_3$): δ 55.70, 55.81, 99.23, 105.28, 118.33, 119.23, 126.61, 128.90, 128.97, 129.12, 131.21, 132.05, 144.16, 147.99, 148.45, 148.86, 157.97, 162.40; ES-MS (*m/z*): $[M+H]^+$ 402; HRMS-EI: found: 401.0848, calcuated: 401.0850. Anal. Calcd. for $C_{19}H_{13}F_6NO_2$: C, 56.87; H, 3.27; N, 3.49. Found: C, 57.02; H, 3.56; N, 3.24.

4-(2,4,6-Trimethoxyphenyl)-2,8-bis-trifluoromethylquinoline (5b). Yield 72%; m.p.: 133–135°C; IR (potassium bromide): 1613, 1194, 1143 cm^{-1}; ^{1}H NMR (200 MHz, $CDCl_3$): δ 3.64 (s, 6H), 3.89 (s, 3H), 6.24 (s, 2H), 7.10 (d, 1H, $J = 8.2$ Hz), 7.23 (s, 1H), 7.53–7.62 (m, 1H), 7.89 (d, 1H, $J = 8.3$); ^{13}C NMR (75 MHz, $CDCl_3$): δ 55.67, 55.98, 91.10, 106.70, 118.36, 119.21, 126.58, 128.87, 128.89, 130.99, 132.01, 144.12, 147.95, 148.39, 148.84, 159.10, 168.90; ES-MS (*m/z*): $[M+H]^+$ 432; HRMS-EI: found: 431.0955, calcuated: 431.0955. Anal. Calcd. for $C_{20}H_{15}F_6NO_3$: C, 55.69; H, 3.51; N, 3.25. Found: C, 55.51; H, 3.58; N, 2.97.

4-(1H-Indol-3-yl)-2,8-bis-trifluoromethylquinoline (5c). Yield 66%; m.p.: 145–147°C; IR (potassium bromide): 1611, 1522, 1403, 778 cm^{-1}; ^{1}H NMR (300 MHz, $CDCl_3$): δ 7.21–7.27 (m, 2H), 7.52–7.58 (m, 2H), 8.01–8.13 (m, 1H), 8.26 (m, 1H), 8.27–8.29 (m, 1H), 8.39 (s, 1H), 11.53 (brs, 1H, NH); ^{13}C NMR (75 MHz, $CDCl_3$): δ 111.89, 112.30, 118.21, 119.03, 120.99, 121.19, 121.31, 123.01, 126.11, 127.25, 128.63, 128.96, 130.99, 131.93, 136.71, 145.62, 147.89, 148.36, 148.67; ES-MS (*m/z*): $[M+H]^+$ 381; HRMS-EI: found: 380.0739, calculated: 380.0746. Anal. Calcd. for $C_{19}H_{10}F_6N_2$: C, 60.01; H, 2.65; N, 7.37. Found: C, 59.73; H, 2.55; N, 7.26.

Acknowledgments. S.K is thankful to the University Grants Commission, New Delhi, for the financial support and the Sophisticated Analytical Instrument Facility, CDRI, Lucknow, for providing spectroscopic data.

In an attempt to carry out a straightforward synthesis of thiazolopyrazolodiazepines from the reaction of 4,5-diamino-3-methyl-1-phenylpyrazole **1** with arylidene derivatives of rhodanine **2**, the unplanned (Z)-2′-[(5-amino-3-methyl-1-phenylpyrazol-4-yl)imino]-5-arylidenethiazolidin-4-ones **4** were obtained as unique products. Nevertheless, the treatment of these compounds with aliphatic aldehydes in dimethylformamide provided the novel thiazolo[2,3-*b*]pyrazolo[3,4-*f*][1,3,5]triazepines **5** and **6** in good to excellent yields. All the structures of the obtained compounds were assigned on the basis of IR, 1D and 2D NMR measurements, mass spectrometry, and microanalysis.

J. Heterocyclic Chem., **46**, 756 (2009).

INTRODUCTION

In recent years, the synthesis and pharmacological properties of diverse systems containing heterocycles fused to a seven-membered diazepine ring have appeared in the literature [1]. Particularly, good CNS activity was reported for various pyrazolodiazepines [2], some of them acting as psychotropic agents [3].

It is known that the interaction of *ortho*-diamines with α,β-unsaturated carbonyl compounds constitutes one of the more expeditious procedures yielding diazepine systems fused to aromatic rings [4]. In this sense, we have successfully carried out several reactions between 4,5-diaminopyrazoles and diaminopyrimidines with chalcones and β-dimethylaminopropiophenone hydrochlorides as versatile approaches for the synthesis of new pyrazolo- and pyrimidodiazepine derivatives, respectively [5].

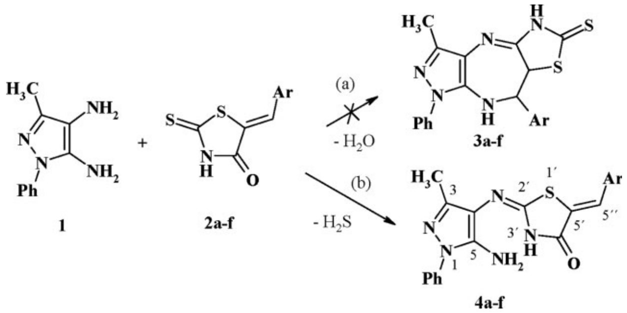
RESULTS AND DISCUSSION

Continuing with our studies directed toward the development of synthetic methodologies leading to fused pyrazole systems and in an attempt to obtain the new thiazolopyrazolodiazepines **3** for biological testing, we prepared a series of (Z)-arylidene derivatives of rhodanine **2a–f** (α,β-unsaturated carbonyl compounds) [6] to be reacted with 4,5-diamino-3-methyl-1-phenylpyrazole **1** as a direct procedure for the synthesis of our target compounds **3**, Scheme 1, approach (a).

To obtain the expected diazepines **3**, a mixture of diaminopyrazole **1** (1.5 mmol) and (Z)-5-(nitrobenzylidene)-2-thioxothiazolidin-4-one (**2a**) (Ar = 4-$NO_2C_6H_4$) (1.5 mmol) was heated at reflux for 15 h in the presence of ethanol (20 mL) as solvent and triethylamine (1 mL) as catalyst, according to previously reported procedures [7]. This reaction afforded a yellow solid, which after spectroscopic analysis (IR, ^{1}H and ^{13}C NMR and mass spectrum), corresponded unexpectedly to the imine compound **4a** (Ar = 4-$NO_2C_6H_4$) in 87% isolated yield, Scheme 1, approach (b), but not to the cyclo-condensed product **3a**.

The yellow solid exhibited all the signals expected for the proposed structure (**4a**). The IR spectrum showed mainly absorption bands at 3410, 3285, and 1700 cm^{-1} assigned to NH, NH_2, and C=O functionalities, respectively. The ^{1}H NMR of this compound features the following main signals: a broad singlet (2H) at 5.72 ppm assigned to the 5-NH_2 group, a singlet (1H) at 7.64 ppm assigned to 5″-H, and a broad singlet (1H) at 11.04 ppm assigned to 3′-NH. In fact, an H,H-NOESY effect was observed between both 5-NH_2 and 3′-NH groups in agreement with the proposed conformational structure. Without including the methyl carbon atoms, the relevant feature in

Scheme 1

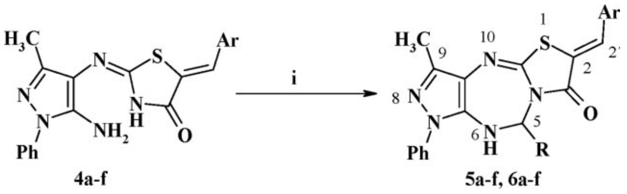


the ^{13}C NMR spectrum of this compound is that all signals appear at aromatic field (120.5–162.3 ppm), which is consistent with the proposed structure (**4a**). Finally, the molecular ion (*m*/*z* = 420), showed in mass spectrum confirmed that the formation process of this solid effectively involved the loss of a molecule of H_2S but not the loss of a molecule of H_2O, as expected for the synthesis of our compound **3**.

To evaluate the general character of this unplanned reaction, this approach was extended to the other 5-arylidene-2-thioxothiazolidin-4-ones (**2b–f**) with similar results, that is, yielding compounds **4b–f** as unique products involving in all the cases the loss of a molecule of H_2S, as shown in Scheme 1 and Table 1.

Trying to overcome the aforementioned failed attempt to obtain compounds **3**, we rationalized that according to NOESY experiments both 5-NH_2 and 3′-NH groups in **4** are certainly spatially nearby. Therefore, we considered the possibility of completing the cyclization process by treatment of compounds **4** with aldehydes, toward the formation of a novel, although slightly different from **3**, no less interesting triazepine system **5**. In this sense, the heating of compounds **4a–f** with an excess of formaldehyde in DMF at 70°C enabled us to obtain the novel pyrazolo[3,4-*f*]thiazolo[2,3-*b*][1,3,5]triazepines (**5a–f**) in 70 to 92% yield, as shown in Scheme 2 and Table 2.

Scheme 2. i = HCHO for **5a–f** (R = H). i = CH_3CHO for **6a–f** (R = CH_3).



In the ^{1}H NMR spectra of compounds **5**, the proton 2′-H appears as a singlet at δ = 7.65–7.77 ppm. The signals for the 9-CH_3 protons of the pyrazole ring result in a singlet at δ = 2.19–2.22 ppm. The two protons, 5-H and 6-NH, of the triazepine ring appear coupled between them, and the coupling constants are in the range of *J* = 6.2–6.4 Hz.

The analysis of ^{13}C, DEPT-135, and two-dimensional heteronuclear NMR spectra provided the final structural elucidation of compounds **5**. Thus, the signal for C-5 is in the range of δ = 56.4–63.9 ppm. The HMBC experiments for all derivatives indicate three-bond correlations between 5-H and quaternary carbons C-10a and C-6a. Mass spectra of compounds **5** show well-defined molecular ions with a characteristic fragmentation pattern involving the loss of phenyl group.

The extension of this procedure to acetaldehyde provided the analog triazepine systems **6a–f** also in good yields, as shown in Table 2. It is worth mentioning that when the compounds **4** were treated with aryl aldehydes (*i.e.* benzaldehyde, 4-methylbenzaldehyde and 4-chlorobenzadehyde), under the same reaction conditions, the reaction was not observed. Probably, steric effects could be related to such lack of reactivity, and therefore, this procedure is limited to aliphatic aldehydes. In short, we have not yet concluded an explanation why monoamines reacts with the arylidene derivatives **2** involving the C=O functionality through its α,β-unsaturated moiety as previously reported [8], while the analog diamine **1** reacted exclusively by the C=S functionality without participation of the α,β-unsaturated moiety. Currently, we are working in other cases to try to give a satisfactory explanation to this matter.

In summary, we have developed a new and versatile indirect two-step method for the synthesis of novel thiazolopyrazolotriazepines **5** and **6**, *via* the initially unplanned iminopyrazoles **4**, followed by treatment with

Table 1

Physical and analytical data of compounds **4a–f**.

Compound	Ar	m.p. (°C)	Yield
4a	4-$O_2NC_6H_4$	287–288	87

aliphatic aldehydes. The chemical and biological potential of the triazepines **5** and **6** described herein are currently under investigation.

EXPERIMENTAL

Melting points were measured using a Stuart SMP3 melting point apparatus and are uncorrected. IR spectra were recorded on a Shimadzu FTIR 8400 instrument. The ^{1}H and ^{13}C NMR spectra were run on a Bruker DPX 400 spectrometer operating at 400 and 100 MHz, respectively, using dimethyl sulfoxide-d_6 as solvent and tetramethylsilane as internal standard. The mass spectra were scanned on a Hewlett Packard HP Engine-5989 spectrometer (equipped with a direct inlet probe) operating at 70 eV. High-resolution mass spectra (HRMS) were recorded in a Waters Micromass AutoSpec NT spectrometer (STIUJA). The elemental analyses have been obtained using a LECO CHNS-900 and a Thermo Finnigan FlashEA1112 CHNS-O (STIUJA) elemental analyzers. Thin layer chromatography (TLC) was performed on a 0.2-mm precoated plates of silica gel 60GF$_{254}$ (Merck). The benzylidene derivatives of rhodanine were obtained according to methodology described in the work [6c].

General procedure for the synthesis of (Z)-2′-[(5-amino-3-methyl-1-phenylpyrazol-4-yl)imino]-5′-arylidenethiazolidin-4-ones (4a–f). To a mixture of 4,5-diamino-3-methyl-1-phenylpyrazole **1** (1.5 mmol), ethanol (20 mL) and triethylamine (1 mL) was added to the corresponding 5-arylidene-2-thioxothiazolidin-4-one (1.5 mmol). The mixture was refluxed for 15 h. The formed precipitate was filtered off and washed with ethanol and recrystallized from ethanol.

(Z)-2′-[(5-Amino-3-methyl-1-phenylpyrazol-4-yl)imino]-5′-(4-nitrobenzylidene)thiazolidin-4-one (4a). This compound was obtained as yellow solid (ethanol); IR (KBr): (NH, NH$_2$) 3410 and 3285, C=O 1700 cm^{-1}; ^{1}H NMR (400 MHz, DMSO-d_6): δ 2.07 (s, 3H, 3-CH$_3$), 5.72 (s, 2H, NH$_2$), 7.34 (t, 1H, H$_p$-Ph, J = 7.5 Hz), 7.48 (t, 2H, H$_m$-Ph, J = 8.2 Hz), 7.50 (d, 2H, H$_o$-Ar, J = 8.2 Hz), 7.62 (d, 2H, H$_o$-Ph, J = 8.6 Hz), 7.64 (s, 1H, H-5″), 7.67 (d, 2H, H$_m$-Ar, J = 8.2 Hz), 11.04 ppm (s, 1H, 3′-NH); ^{13}C NMR (100 MHz, DMSO-d_6): δ 11.3 (3-CH$_3$), 120.5 (C-4), 122.5 (C$_o$), 126.3 (C$_p$), 128.2 (C-5′), 128.5 (C-5″), 129.0 (C$_i$-Ar), 129.2 (C$_m$-Ph), 131.1 (C$_o$-Ar), 132.2 (C$_m$-Ar), 134.0 (C$_p$-Ar), 139.0 (C$_i$-Ph), 143.3 (C-5), 144.9 (C-2′), 147.0 (C-3), 162.3 ppm (C-4′); ms (EI, 70 eV) m/z (%): 420 (M$^+$, 100), 213 (39). *Anal.* Calcd for $C_{20}H_{16}N_6O_3S$: C, 57.13; H, 3.84; N, 19.99. Found: C, 57.01; H, 3.79; N, 19.91.

(Z)-2′-[(5-Amino-3-methyl-1-phenylpyrazol-4-yl)imino]-5′-(4-bromobenzylidene)thiazolidin-4-one (4b). This compound was obtained as yellow solid (ethanol); IR (KBr): (NH, NH$_2$) 3442 and 3288, C=O 1698 cm^{-1}; ^{1}H NMR (400 MHz, DMSO-d_6): δ 2.05 (s, 3H, 3-CH$_3$), 5.68 (s, 2H, NH$_2$), 7.34 (t, 1H, H$_p$-Ph, J = 7.6 Hz), 7.49 (d, 2H, H$_m$-Ph, J = 8.3 Hz), 7.50 (d, 2H, Ho-Ar, J = 8.0 Hz), 7.63 (d, 2H, H$_o$-Ph, J = 8.7 Hz), 7.64 (s, 1H, H-5″), 7.68 (d, 2H, H$_m$-Ar, J = 8.0 Hz), 10.88 ppm (s, 1H, 3′-NH); ^{13}C NMR (100 MHz, DMSO-d_6): δ 11.4 (3-CH$_3$), 120.3 (C-4), 122.4 (C$_o$-Ph), 122.9 (C$_i$-Ar), 126.2 (C$_p$-Ph), 128.0 (C-5″), 128.4 (C-5″), 129.1 (C$_m$-Ph), 131.3 (C$_o$-Ar), 132.2 (C$_m$-Ar), 133.1 (C$_p$-Ar), 139.0 (C$_i$-Ph), 143.2 (C-5), 143.5 (C-2′), 144.9 (C-3), 161.8 ppm (C-4′); ms (EI, 70 eV) m/z (%): 455 (M$^+$, 100), 213 (58). *Anal.* Calcd for $C_{20}H_{16}BrN_5OS$: C, 52.87; H, 3.55; N, 15.41. General procedure for the synthesis of (Z)-2-arylidene-9-methyl-7-phenyl-5-*R*-5,6-dihydropyrazolo[3,4-*f*][1,3]thiazolo [2,3-*b*][1,3,5]triazepin-3-ones (5a–f and 6a–f). A mixture of 2-(5-amino-3-methyl-1-phenylpyrazol-4-ylimino)-5-arylidenethiazolidin-4-one **4** (1 mmol), formaldehyde or acetaldehyde (2 mmol), and DMF (2.0 mL) was heated at 70°C for 2 h. The formed products were precipitated by adding water, filtered off under vacuum, washed with water and recrystallized from ethanol.

(Z)-9-Methyl-2-(4-nitrobenzylidene)-7-phenyl-5,6-dihydropyrazolo[3,4-f]thiazolo[2,3-b][1,3,5]triazepin-3-ona (5a). This compound was obtained as brown solid (ethanol); IR (KBr): NH 3371, C=O 1690 cm^{-1}; ^{1}H NMR (400 MHz, DMSO-d_6): δ 2.19 (s, 3H, 9-CH$_3$), 5.04 (d, 2H, H-5, J = 6.3 Hz), 7.18 (t, 1H, 6-NH, J = 6.2 Hz), 7.34 (t, 1H, H$_p$-Ph, J = 7.6 Hz), 7.48 (t, 2H, H$_m$-Ph, J = 8.4 Hz), 7.61 (d, 2H, H$_o$-Ph, J = 8.7 Hz), 7.77 (s, 1H, H-2′), 7.82 (d, 2H, H$_o$-Ar, J = 8.1 Hz), 8.30 ppm (d, 2H, H$_m$-Ar, J = 8.0 Hz); ^{13}C NMR (100 MHz, DMSO-d_6): δ 11.1 (9-CH$_3$), 56.5 (C-5), 118.2 (C-9a), 122.5 (C$_o$-Ph), 124.1 (C$_m$-Ar), 125.9 (C-2′), 126.5 (C$_p$-Ph), 128.6 (C-2), 129.0 (C$_m$-Ph), 130.5 (C$_o$-Ar), 138.4 (C-6a), 138.5 (C$_i$-Ph), 139.9 (C$_i$-Ar), 142.5 (C-10a), 145.5 (C-9), 146.7 (C$_p$-Ar), 164.8 ppm (C-3); ms (EI, 70 eV) *m*/*z* (%): 432 (M$^+$, 100), 225 (27), 131 (28). *Anal.* Calcd for $C_{21}H_{16}N_6O_3S$: C, 58.32; H, 3.73; N, 19.43. Dedicated to Professor Raymond C. F. Jones on the occasion of his 60th birthday.

The cleavage of the isoxazole ring during the Raney-Ni-promoted catalytic hydrogenation is prevented under the influence of 3-(substituted nitrophenyl)-2-isoxazoline in isoxazoline-substituted isoxazole systems produced *via* 1,3-dipolar cycloaddition either on the Baylis–Hillman derivatives or Grignard products. Unexpectedly, the hydrogenations in these diastereomeric compounds were observed to exclusively yield products, wherein the methoxycarbonyl and the hydroxyl or the acetyl groups exist *syn* to each other.

J. Heterocyclic Chem., **46**, 762 (2009).

INTRODUCTION

The catalytic hydrogenation of isoxazole and 2-isoxazoline heterocyclic systems in the presence of heterogeneous catalysts is relatively old and well-studied subject of synthetic organic chemistry [1]. Recently, we have discovered that the 2-isoxazoline system containing a 2-,3- or 4-nitrophenyl group at 3-position does not undergo ring cleavage under catalytic hydrogenation [2]. In our program to carry out Baylis–Hillman reaction-assisted synthesis of cyclic compounds [3], based on the aforementioned observation, we envisaged the synthesis of the spiroisoxazoline **III** from **I** (Figure 1). Substrate **I** was to be readily generated *via* 1,3-dipolar cycloaddition of appropriate benzonitrile oxide on the Baylis–Hillman adduct of substituted 3-isoxazolecarbaldehyde. In principle, a Raney-Ni-promoted hydrogenation would result in chemoselective ring cleavage of **I** to afford **II**, which may undergo intramolecular cyclization to produce the spiro-derivative. Spiroisoxazoline class of compounds has stimulated great interest in medicinal and biological chemistry [4]. Moreover, naturally occurring spiroisoxazolines have been found useful in different biomedical areas [5].

Therefore, we initiated the investigation by synthesizing **I** *via* 1,3-dipolar cycloaddition of the nitro-substituted benzonitrile oxide to the Baylis–Hillman adduct of 3-isoxazolecarbaldehyde and subjecting it to catalytic hydrogenation in the presence of Raney-Ni. Unexpectedly, analysis of the product isolated after work-up of the reaction revealed that instead of cleavage of the isoxazole ring, only the nitro group present on the phenyl group of the isoxazoline ring was reduced to amino group. A careful literature survey revealed that several reports described the Pd-on-carbon-promoted hydrogenation of the isoxazole derivatives without cleavage of the ring [6], but there exists no report exemplifying the retention of the isoxazole ring during Raney-Ni-promoted catalytic hydrogenation. This prompted us to systematically investigate the catalytic hydrogenation of derivatives wherein the isoxazole ring carry 3-(substituted nitrophenyl)-2-isoxazoline as substituent. It was observed that the cleavage of the isoxazole ring was invariably prevented during the catalytic hydrogenation because of the influence of 3-(substituted nitrophenyl)-2-isoxazoline in an isoxazoline-substituted isoxazole derivative. The details of this study are presented in this communication.

RESULTS AND DISCUSSION

The Baylis–Hillman adducts (**1a–c**) of substituted 3-isoxazolecarbaldehydes were prepared according to the

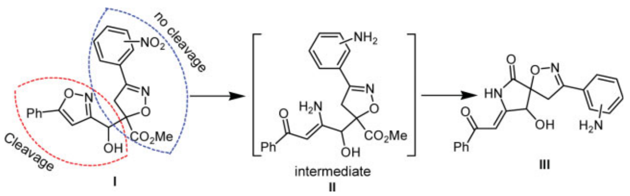

Figure 1. Possible route to spiroisoxazoline from isoxazoline-substituted isoxazole system. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

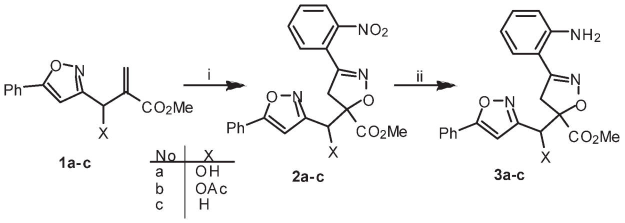
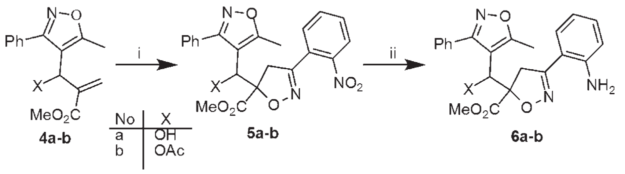
literature procedure [7] and subjected to 1,3-dipolar cycloaddition with 2-nitrobenzonitrile oxide. The required benzonitrile oxide was generated *in situ* from corresponding 2-nitrophenyl methylhydroximinoyl chloride by treating it with triethyl amine in dry ether. This reaction yielded **2a–c** as diastereomeric mixtures (1:1) in 78–83% yields. Hydrogenation of **2a** in the presence of Raney-Ni in methanol on a Parr assembly led to completion of reaction in 3 h. Unexpectedly, the spectral analysis of the isolated product (67% yield) led us to establish the structure as **3a** as a single diastereomer (Scheme 1). At this stage, the likelihood was that both the diastereomer were formed during the reaction, but we isolated only one of them. Consequently, ^{1}H NMR of the crude product was recorded. This spectrum also indicated the presence of a single diastereomer. Assuming that the period of reaction was insufficient to affect the cleavage of the isoxazole ring, the hydrogenation was repeated by continuing it for longer duration (*ca.* 24 h). The product isolated even after 24 h of the reaction time, however, was found to be **3a**. This led us to examine the hydrogenation using Pd-on-carbon as the catalyst. Interestingly, under this condition too, the compound **2a** was transformed to **3a** in 65% yield. To evaluate the outcome of these reactions with other substrates, compounds **2b** and **2c** were subjected to similar reactions. Both substrates behaved in an identical fashion to furnish corresponding products **3b** and **3c** as a single diastereomer in 63–66% yields.

This unusual observation generated interest to study hydrogenation in similar substrates afforded from the Baylis–Hillman adducts of substituted 4- and 5- isoxazole-carbaldehydes [8,9]. Accordingly, compounds **5a,b** were prepared in 83–92% yields from the Baylis–Hillman adduct **(4a)** of 3-phenyl-5-methyl-4-isoxazolecarbaldehyde and corresponding acetate **4b** through 1,3-dipolar cycloaddition. These compounds upon hydrogenation in the presence of Raney-Ni resulted in **6a,b** (Scheme 2) as single diastereomer in 66–92% yields. The relative stereochemistry delineated *via* X-ray crystallographic analysis of a single crystal of compound **6b** indicated that the acetyl group is placed *syn* to the ester group (Figure 2) [10].

Scheme 1. Reagents and conditions: (i) (2-NO$_2$C$_6$H$_4$)—C(=NOH)Cl, Et$_3$N, Et$_2$O, −78°C to rt, 12 h. (ii) Raney-Ni or Pd on carbon, H$_2$, MeOH, rt, 40 psi, 3 h.



Scheme 2. Reagents and conditions: (i) (2-NO$_2$C$_6$H$_4$)—C(=NOH)Cl, Et$_3$N, Et$_2$O, −78°C to rt, 12 h. (ii) Raney-Ni, H$_2$, MeOH, rt, 40 psi, 3 h.



In the next stage, the Baylis–Hillman derivatives **7a–c** and **8a** afforded from substituted 5-isoxazolecarbaldehydes were subjected to the cycloaddition with 2-nitrobenzonitrile oxide to furnish **9a–c** and **10a**, respectively, as diastereomeric mixtures (1:1) in 82–89% yields. Hydrogenation of **9a–c** and **10a** in the presence of Raney-Ni yielded **13a–c** and **14a**, respectively, in 63–71% yields (Scheme 3).

Next, to investigate whether the position of the nitro group in the phenyl ring has any effect on the outcome of the product, we prepared compounds **11a** and **12a** and carried out Raney-Ni-promoted hydrogenation.

Gratifyingly, these substrates were also transformed to products **15a** and **16a**. In the absence of evidence, it is difficult to comment on the observed stereoselectivity; it is assumed that during hydrogenation reaction, inversion of one of the diastereomer occurs to produce the product with syn-stereochemistry only.

Earlier, we have observed that replacing the nitro-substituted phenyl with phenyl group at 3-position of the 2-isoxazoline makes it prone to ring cleavage during the catalytic hydrogenation [2]. In view of this observation, we decided to evaluate the effect of catalytic hydrogenation in the system where the nitrophenyl group was replaced by phenyl group. Hence, in a model study, compound **17** was prepared from reaction between compound **8a** and benzonitrile oxide. The Raney-Ni-mediated hydrogenation of **17** yielded a product, which was analyzed to be the 2-pyrrolidone **18** (Scheme 4). The formation of compound **18** from **17** implied that during catalytic hydrogenation, cleavage of both the isoxazole and the 2-isoxazoline rings ensued. This result made it apparent that presence of a nitro-substituted phenyl moiety at the 3-position of the 2-isoxazoline protected the isoxazole from ring cleavage during the catalytic hydrogenation of an isoxazoline-substituted isoxazole system.

With the objective to find whether this phenomenon was restricted to the system wherein both the rings were separated by a methylene bridge or extend to a system wherein the two rings are separated by ethylene spacer compounds **23–24** were prepared. Grignard reaction of **19–20** with allylbromide resulted in the formation of **21–22** in good yields (Scheme 5). 1,3-Dipolar cycloaddition reaction of 2-nitrobenzonitrile oxide on the double bond of the allyl moiety furnished the required derivatives **23–24**. Hydrogenation of compounds **23–24** in the presence of Raney-Ni in methanol at room temperature in the Parr assembly yielded compounds **25–26**, respectively. Simultaneously, 1,3-dipolar cycloaddition of benzonitrile oxide on **21** was accomplished to afford the product **27**. As expected, hydrogenation of **27** in the presence of Raney-Ni at room temperature for 3 h led to the cleavage of isoxazole and isoxazoline ring leading to **28**. This study further substantiate that the presence of a 2-isoxazoline ring bearing a nitro-phenyl substitution at 3-position protect the isoxazole ring from hydrogenolysis.

On suggestion from one of the reviewers that the production of aniline derivatives during the hydrogenation would be poisoning the catalyst to prevent further reaction, hydrogenations of different substrates in the presence of aniline were investigated. Hydrogenating a simpler isoxazole derivative **29** in the presence of aniline

Scheme 6. Reagent and conditions: (i) Aniline, Raney-Ni, H_2, rt, 40 psi, 5 h. (ii) Aniline, Raney-Ni, H_2, rt, 40 psi, 1 h then added **29**, 5 h.

and Raney-Ni furnished **30** in 67% yield (Scheme 6). Alternatively, a mixture of aniline and Raney-Ni was maintained under hydrogen atmosphere for 1 h followed by addition of **29**. This reaction too resulted in the formation of **30** in 5 h. Similar study was also performed with compound **27**. Here too, the hydrogenolyzed product **28** was isolated in 62% yield. This study delineated that the presence of aniline in the hydrogenation mixture does not affect the activity of the catalyst.

CONCLUSIONS

In summary, we have disclosed an interesting observation wherein the cleavage of the isoxazole ring during the catalytic hydrogenation is influenced by the substitutions present on the 3-position of the 2-isoxazoline ring in isoxazoline-substituted isoxazole systems. Further work toward exploring applications of the intermediates resulting from the study for the synthesis of heterocyclic systems is underway.

EXPERIMENTAL

Melting points are uncorrected and were determined in capillary tubes on an apparatus containing silicon oil. IR spectra were recorded using Perkin Elmer's Spectrum RX I FTIR spectrophotometer. ^{1}H NMR and ^{13}C NMR spectra were recorded either on a Bruker DPX-200 FT or Bruker Avance DRX-300 spectrometers, using TMS as an internal standard (chemical shifts in δ values, *J* in Hz). The ESMS were recorded on MICROMASS LCMS system and FABMS were recorded on JEOL/ SX-102 spectrometer. Elemental analyses were performed on Carlo Erba's 108 or Elementar's Vario EL III microanalyzer. The HRMS spectra were recorded as EI-HRMS. Compounds **2, 5, 9–12** existed as 1:1 diastereomeric mixtures.

General procedure for the synthesis of compounds 2a–c, 5a–b, 9a–c, 10–12a, 17, 23–24, and 27: as exemplified for the compound 2a. To a stirred solution of compound **1a** (2.0 g, 7.7 mmol) and 2-nitrophenyl methylhydroximinoyl chloride (1.85 g, 9.3 mmol) in anhydrous diethylether (15 mL) was added dropwise a solution of Et_3N (1.5 mL, 11.1 mmol) in anhydrous diethylether (5 mL) at −78°C. The reaction was allowed to continue at room temperature for 24 h. Thereafter, the reaction mixture was quenched with water (30 mL) and the ether layer was separated. The aqueous layer was again extracted with diethylether. The combined organic layer was dried over anhydrous Na_2SO_4 and evaporated to obtain the crude oily residue. The crude product was then purified by column chromatography over silica gel (60–120 mesh) using hexane/ethyl acetate (70:30, v/v) as the eluent to afford 2.58 g (79%) of **2a** as a brown solid.

Methyl 5-[hydroxy-(5-phenylisoxazol-3-yl)-methyl]-3-(2-nitrophenyl)-4,5-dihydro-isoxazole-5-carboxylate (2a). Mp 120–122°C, IR (potassium bromide): 1741 (CO_2Me), 3449 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.69 (d, 1H, 1H of CH_2, *J* = 17.7 Hz), 3.81–3.93 (m, 9H, CH_2, 1H of CH_2 and 2 × CO_2CH_3), 5.49 (d, 1H, C*H*OH, *J* = 5.8 Hz), 5.56 (s, 1H, C*H*OH), 6.74 (s, 1H, =CH), 6.77 (s, 1H, =CH), 7.45–7.46 (m, 8H, 2 × 4ArH), 7.60–7.68 (m, 4H, 2 × 2ArH), 7.80–7.81 (m, 4H, 2 × 2ArH), 8.06–8.11 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 42.5, 43.3, 53.9, 69.2, 90.5, 91.8, 99.4, 124.6, 124.8, 125.3, 126.3, 127.4, 128.4, 128.8, 129.4, 130.8, 131.0, 131.5, 134.0, 134.9, 148.1, 156.6, 162.8, 170.0, 170.9; ms: (electron spray+) *m*/*z* 424.2 (M^{+} + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_7$: C, 59.57; H, 4.05; N, 9.93. Found: C, 59.48; H, 4.11; N, 9.98.

Methyl 5-[acetoxy-(5-phenylisoxazol-3-yl)-methyl]-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (2b). This compound was obtained in 83% yield as a white solid, mp 133–135°C; IR (potassium bromide): 1756 (CO_2Me and OAc) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.22 (s, 3H, $OCOCH_3$), 2.25 (s, 3H, $OCOCH_3$), 3.80–4.01 (m, 10H, 2 × CH_2 and 2 × CO_2CH_3), 6.67 (s, 1H, =CH), 6.68 (s, 1H, =CH), 7.40–7.49 (m, 8H, 2 × 3ArH and 2 × CHOAc), 7.60–7.68 (m, 6H, 2 × 3ArH), 7.79–7.86 (m, 4H, 2 × 2ArH), 8.07–8.13 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 21.1, 21.3, 42.6, 43.3, 54.0, 54.2, 67.8, 89.3, 90.0, 102.9, 103.7, 124.6, 124.7, 125.4, 127.1, 127.4, 128.7, 128.9, 129.4, 130.5, 130.7, 131.6, 134.0, 134.2, 148.1, 156.2, 156.3, 163.1, 166.1, 166.3, 168.2, 168.8, 169.5, 169.9, 171.2; ms: (electron spray+) *m*/*z* 466.1 (M^{+} + 1). *Anal.* Calcd for $C_{23}H_{19}N_3O_8$: C, 59.36; H, 4.11; N, 9.03. Found: C, 59.13; H, 4.21; N, 8.96.

Methyl 3-(2-nitrophenyl)-5-(5-phenylisoxazol-3-ylmethyl)-4,5-dihydroisoxazole-5-carboxylate (2c). This compound was obtained in 78% yield as yellow oil; IR (neat): 1744 (CO_2Me) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.47 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.66 (d, 2H, CH_2, *J* = 6.1 Hz), 3.86 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.93 (s, 3H, CO_2CH_3), 6.63 (s, 1H, =CH), 7.45–7.50 (m, 3H, ArH), 7.61–7.71 (m, 3H, ArH), 7.81–7.84 (m, 2H, ArH), 8.10 (d, 1H, ArH, *J* = 7.2 Hz); ^{13}C NMR (deuteriochloroform) δ= 33.5, 45.5, 53.7, 87.8, 102.6, 124.3, 124.5, 125.1, 127.0, 128.8, 129.0, 130.2, 131.2, 133.9, 147.7, 155.9, 162.9, 167.1, 167.2, 170.2; ms: (electron spray+) *m*/*z* 408.1 (M^{+} + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_6$: C, 61.91; H, 4.21; N, 10.31. Found: C, 61.78; H, 4.29; N, 10.26.

Methyl 5-[hydroxy-(5-methyl-3-phenylisoxazol-4-yl)-methyl]-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (5a). This compound was obtained in 92% yield as pale yellow oil; IR (neat): 1744 (CO_2Me), 3382 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.64 (s, 3H, CH_3), 2.65 (s, 3H, CH_3), 3.07 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.36 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.45 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.53 (d, 1H, 1H of CH_2, *J* = 17.4 Hz), 3.61 (s, 6H, 2 × CO_2CH_3), 5.26 (s, 1H, C*H*OH), 5.40 (s, 1H, C*H*OH), 7.21–7.42 (m, 2H, 2 × 1ArH), 7.43–7.57 (m, 10H, 2 × 5ArH), 7.60–7.69 (m, 4H, 2 × 2ArH), 8.02–8.07 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 13.0, 13.1, 41.7, 43.6, 53.2, 53.3, 67.3, 67.7, 92.7, 92.8, 110.0, 124.2, 124.9, 128.7, 128.9, 129.0, 129.2, 129.7, 130.9, 131.1, 133.7, 147.6, 155.9, 162.3, 169.5, 170.4; ms: (electron spray+) *m*/*z* 438.1 (M^{+} + 1). *Anal.* Calcd for $C_{22}H_{19}N_3O_7$: C, 60.41; H, 4.38; N, 9.61. Found: C, 60.63; H, 4.47; N, 9.49.

Methyl 5-[acetoxy-(5-methyl-3-phenylisoxazol-4-yl)-methyl]-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (5b). This compound was obtained in 83% as a pale yellow solid, mp. 74–76°C; IR (potassium bromide): 1752 (CO_2Me and OAc) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.19 (s, 3H, $OCOCH_3$), 2.26 (s, 3H, $OCOCH_3$), 2.72 (s, 3H, CH_3), 2.74 (s, 3H, CH_3), 3.26–3.50 (m, 4H, 2 × CH_2), 3.78 (s, 6H, 2 ×

CO_2CH_3), 6.37 (s, 1H, CHOAc), 6.42 (s, 1H, CHOAc), 7.12 (d, 1H, ArH, J = 7.6 Hz), 7.47–7.54 (m, 7H, 2 × 3ArH and ArH), 7.62–7.73 (m, 8H, 2 × 4ArH), 8.08 (d, 2H, 2 × 1ArH, J = 7.6 Hz); ^{13}C NMR (deuteriochloroform): δ 13.5, 13.7, 20.9, 21.0, 43.9, 44.1, 53.3, 53.8, 68.7, 69.3, 91.2, 91.5, 108.0, 108.7, 124.4, 125.4, 129.2, 129.6, 129.9, 130.3, 131.4, 131.7, 134.1, 134.3, 147.8, 148.2, 155.6, 162.2, 162.6, 169.7, 170.0, 171.7, 172.0; ms: (electron spray+) m/z 480.1 (M^+ + 1). *Anal.* Calcd for $C_{24}H_{21}N_3O_8$: C, 60.12; H, 4.41; N, 8.76. Found: C, 59.98; H, 4.53; N, 8.69.

Methyl 5-[hydroxy(3-phenylisoxazol-5-yl)methyl]-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (9a). This compound was obtained in 82% as yellow oil; IR (neat): 1744 (CO_2Me), 3336 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.64–3.85 (m, 4H, 2 × CH_2), 3.89 (s, 3H, CO_2CH_3), 3.93 (s, 3H, CO_2CH_3), 5.47 (s, 1H, C*H*OH), 5.56 (s, 1H, C*H*OH), 6.75 (s, 1H, =CH), 6.78 (s, 1H, =CH), 7.46–7.52 (m, 6H, 2 × 3ArH), 7.58–7.72 (m, 4H, 2 × 2ArH), 7.78–8.04 (m, 6H, 2 × 3ArH), 8.06–8.09 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 41.7, 43.9, 53.9, 54.0, 68.7, 69.0, 90.6, 91.5, 102.2, 124.4, 125.2, 127.3, 128.8, 129.4, 130.5, 130.6, 131.5, 131.6, 134.0, 134.2, 148.2, 156.6, 162.9, 169.6, 169.9; ms: (electron spray+) m/z 424.0 (M^+ + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_7$: C, 59.57; H, 4.05; N, 9.93. Found: C, 59.38; H, 4.17; N, 10.01.

Methyl 5-[(acetyloxy)(3-phenylisoxazol-5-yl)methyl]-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (9b). This compound was obtained in 86% as yellow oil; IR (neat): 1757 (CO_2Me and OAc) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.20 (s, 3H, $OCOCH_3$), 2.25 (s, 3H, $OCOCH_3$), 3.72–4.02 (m, 10H, 2 × CH_2 and 2 × CO_2CH_3), 6.62 (s, 1H, CHOAc), 6.70 (s, 1H, CHOAc), 6.72 (s, 1H, =CH), 6.83 (s, 1H, =CH), 7.46–7.48 (m, 6H, 2 × 3ArH), 7.64–7.70 (m, 4H, 2 × 2ArH), 7.77–8.05 (m, 6H, 2 × 3ArH), 8.10–8.13 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 21.0, 21.4, 42.4, 43.4, 54.1, 54.2, 67.8, 89.1, 90.0, 103.5, 103.9, 124.4, 124.5, 125.4, 127.2, 127.3, 128.6, 128.8, 129.4, 130.7, 130.8, 131.6, 134.1, 134.2, 148.2, 156.1, 156.2, 163.0, 166.1, 166.3, 168.3, 168.9, 169.5, 169.6, 171.5; ms: (electron spray+) m/z 466.0 (M^+ + 1). *Anal.* Calcd for $C_{23}H_{19}N_3O_8$: C, 59.36; H, 4.11; N, 9.03. Found: C, 59.21; H, 4.01; N, 9.12.

Methyl 3-(2-nitrophenyl)-5-[(3-phenylisoxazol-5-yl)methyl]-4,5-dihydroisoxazole-5-carboxylate (9c). This compound was obtained in 87% as brown oil; IR (neat): 1743 (CO_2Me) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.45 (d, 1H, 1H of CH_2, J = 17.4 Hz), 3.64 (s, 2H, CH_2), 3.85 (d, 1H, 1H of CH_2, J = 17.4 Hz), 3.91 (s, 3H, CO_2CH_3), 6.62 (s, 1H, =CH), 7.45–7.48 (m, 4H, ArH), 7.58–7.72 (m, 2H, ArH), 7.79–7.81 (m, 2H, ArH), 8.11 (d, 1H, ArH, J = 7.3 Hz); ^{13}C NMR (deuteriochloroform): δ 33.9, 45.6, 54.0, 88.1, 102.8, 124.6, 125.4, 127.3, 129.1, 129.4, 130.6, 131.5, 131.6, 134.2, 148.1, 156.2, 163.2, 167.4, 170.6; ms: (electron spray+) m/z 408.1 (M^+ + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_6$: C, 61.91; H, 4.21; N, 10.31. Found: C, 62.13; H, 4.12; N, 10.39.

Methyl 5-{hydroxy[3-(4-methylphenyl)isoxazol-5-yl]methyl}-3-(2-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (10a). This compound was obtained in 89% as pale yellow oil; IR (neat): 1742 (CO_2Me), 3371 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.40 (s, 6H, 2 × $ArCH_3$), 3.63–3.84 (m, 4H, 2 × CH_2), 3.88 (s, 3H, CO_2CH_3), 3.93 (s, 3H, CO_2CH_3), 5.46 (s, 1H, C*H*OH), 5.55 (s, 1H, C*H*OH), 6.72 (s, 1H, =CH), 6.74 (s, 1H, =CH), 7.24–7.28 (m, 4H, 2 × 2ArH), 7.48–7.51 (m, 2H, 2 × 1ArH), 7.61–7.71 (m, 8H, 2 × 4ArH), 8.05–8.09 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 21.8, 41.7, 43.9, 53.9, 54.0, 68.7, 69.0, 90.6, 91.5, 102.1, 102.2, 124.5, 125.3, 125.9, 126.1, 127.2, 130.0, 131.5, 131.6, 134.0, 134.2, 140.8, 148.1, 156.6, 162.8, 169.3, 169.6, 170.3; ms: (electron spray+) m/z 438.1 (M^+ + 1). *Anal.* Calcd for $C_{22}H_{19}N_3O_7$: C, 60.41; H, 4.38; N, 9.61. Found: C, 60.58; H, 4.29; N, 9.70.

Methyl 5-[hydroxy-(3-phenylisoxazol-5-yl)-methyl]-3-(3-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (11a). This compound was obtained in 79% as a pale yellow solid, mp 138–140°C; IR (potassium bromide): 1744 (CO_2Me), 3421 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.68–3.91 (m, 4H, 2 × CH_2), 3.92 (s, 3H, CO_2CH_3), 3.93 (s, 3H, CO_2CH_3), 5.51 (s, 1H, C*H*OH), 5.58 (s, 1H, C*H*OH), 7.08 (s, 1H, =CH), 7.14 (s, 1H, =CH), 7.38–7.42 (m, 4H, 2 × 2ArH), 7.48–7.54 (m, 6H, 2 × 3ArH), 7.61–7.66 (m, 4H, 2 × 2ArH), 7.93–7.99 (m, 2H, 2 × 1ArH), 8.03–8.05 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 42.3, 43.6, 53.9, 69.2, 91.2, 91.9, 104.3, 124.7, 125.3, 126.3, 127.6, 129.9, 131.5, 132.3, 134.0, 148.0, 148.2, 156.6, 162.6, 167.2, 169.9, 170.3; ms: (electron spray+) m/z 424.1 (M^+ + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_7$: C, 59.57; H, 4.05; N, 9.93. Found: C, 59.69; H, 4.19; N, 9.84.

Methyl 5-[hydroxy-(3-phenylisoxazol-5-yl)-methyl]-3-(4-nitrophenyl)-4,5-dihydroisoxazole-5-carboxylate (12a). This compound was obtained in 79% as pale yellow oil; IR (neat): 1742 (CO_2Me), 3464 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.71 (d, 1H, 1H of CH_2, J = 17.1 Hz), 3.83–3.95 (m, 9H, CH_2, 1H of CH_2 and 2 × CO_2CH_3), 5.49 (s, 1H, C*H*OH), 5.58 (s, 1H, C*H*OH), 6.76 (s, 1H, =CH), 6.79 (s, 1H, =CH), 7.46–7.53 (m, 8H, 2 × 4ArH), 7.61–7.72 (m, 4H, 2 × 2ArH), 7.79–7.82 (m, 4H, 2 × 2ArH), 8.08–8.13 (m, 2H, 2 × 1ArH); ^{13}C NMR (deuteriochloroform): δ 41.7, 43.6, 53.8, 54.1, 68.9, 69.1, 90.6, 91.3, 102.6, 103.1, 124.5, 124.7, 125.4, 127.0, 128.8, 129.2, 130.5, 130.7, 131.4, 131.7, 134.1, 134.3, 148.2, 156.9, 163.7, 169.9, 170.3; ms: (electron spray+) m/z 424.1 (M^+ + 1). *Anal.* Calcd for $C_{21}H_{17}N_3O_7$: C, 59.57; H, 4.05; N, 9.93. Found: C, 59.43; H, 3.89; N, 9.97.

Methyl 5-{hydroxy[3-(4-methylphenyl)isoxazol-5-yl]methyl}-3-phenyl-4,5-dihydroisoxazole-5-carboxylate (17). This compound was obtained in 85% as a white solid, mp. 118–120°C; IR (potassium bromide): 1744 (CO_2Me), 3438 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.40 (s, 6H, 2 × $ArCH_3$), 3.67–3.95 (m, 10H, 2 × CH_2 and 2 × CO_2CH_3), 5.55 (s, 1H, C*H*OH), 5.56 (s, 1H, C*H*OH), 6.68 (s, 1H, =CH), 6.69 (s, 1H, =CH), 7.24–7.28 (m, 6H, 2 × 3ArH), 7.37–7.43 (m, 4H, 2 × 2ArH), 7.15–7.19 (m, 2H, 2 × 1ArH), 7.63–7.70 (m, 6H, 2 × 3ArH); ^{13}C NMR (deuteriochloroform): δ 21.8, 21.9, 38.9, 41.9; 53.8, 68.9, 69.0, 90.0, 91.0, 102.0, 126.0, 127.2, 127.4, 128.6, 128.9, 129.2, 130.1, 131.2, 140.8, 141.3, 157.9, 162.8, 169.4, 169.7; ms: (electron spray+) m/z 393.1 (M^+ + 1). *Anal.* Calcd for $C_{22}H_{20}N_2O_5$: C, 67.34; H, 5.14; N, 7.14. Found: C, 67.47; H, 5.01; N, 7.21.

2-[3-(2-Nitrophenyl)-4,5-dihydroisoxazol-5-yl]-1-(3-phenylisoxazol-5-yl)ethan-1-ol (23). This compound was obtained in 69% as yellow oil; IR (neat): 3414 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.38–2.56 (m, 2H, CH_2), 3.00–3.14 (m, 1H, 1H of CH_2), 3.37–3.46 (m, 1H, 1H of CH_2), 5.01–5.28 (m, 1H, C*H*OH), 5.22–5.25 (m, 1H, C*H*CH_2), 6.62 (s, 1H, =CH), 7.44–7.46 (m, 3H, ArH), 7.57–7.70 (m, 3H, ArH), 7.79–7.82 (m, 2H, ArH), 8.06–8.09 (m, 1H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.7, 42.9, 65.3, 78.4, 99.5, 124.9, 125.4, 126.8, 128.8, 129.0, 130.1, 130.8, 131.0, 141.6, 156.0, 162.4, 174.6; ms: (electron spray+) *m*/*z* 380.0 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{20}H_{17}N_3O_5}$: C, 63.32; H, 4.52; N, 11.08. Found: C, 63.49; H, 4.47; N, 11.34.

1-[3-(4-Methylphenyl)isoxazol-5-yl]-2-[3-(2-nitrophenyl)-4,5-dihydroisoxazol-5-yl]ethan-1-ol (24). This compound was obtained in 74% as pale yellow oil; IR (neat): 3382 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.28–2.49 (m, 5H, CH$_2$ and ArCH$_3$), 2.97–3.18 (m, 1H, 1H of CH$_2$), 3.35–3.51 (m, 1H, 1H of CH$_2$), 5.01–5.16 (m, 1H, C*H*OH), 5.21–5.24 (m, 1H, C*H*CH$_2$), 6.60 (s, 1H, =CH), 7.24–7.28 (m, 1H, ArH), 7.55–7.61 (m, 2H, ArH), 7.62–7.72 (m, 3H, ArH), 8.08 (d, 2H, ArH, *J* = 7.7 Hz); ^{13}C NMR (deuteriochloroform): δ 21.7, 40.9, 41.3, 64.8, 79.5, 99.6, 125.0, 125.3, 126.5, 128.3, 129.2, 130.3, 130.6, 131.4, 141.2, 157.1, 162.1, 174.3; ms: (electron spray+) *m*/*z* 394.0 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{21}H_{19}N_3O_5}$: C, 64.12; H, 4.87; N, 10.68. Found: C, 63.91; H, 5.03; N, 10.47.

2-(3-Phenyl-4,5-dihydroisoxazol-5-yl)-1-(3-phenylisoxazol-5-yl)ethan-1-ol (27). This compound was obtained in 66% as a white solid, mp 135–137°C; IR (potassium bromide): 3380 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.31–2.38 (m, 2H, CH$_2$), 3.10–3.20 (m, 1H, 1H of CH$_2$), 3.52–3.61 (m, 1H, 1H of CH$_2$), 4.98–5.16 (m, 1H, C*H*OH), 5.25–5.28 (m, 1H, C*H*CH$_2$), 6.60 (d, 1H, =CH, *J* = 2.1 Hz), 7.41–7.48 (m, 5H, ArH), 7.67–7.70 (m, 3H, ArH); 7.80–7.83 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.8, 41.3, 64.8, 77.9, 99.7, 126.9, 127.0, 128.79, 129.0, 129.3, 129.4, 130.3, 130.5, 130.6, 157.3, 162.6, 174.8; ms: (electron spray+) *m*/*z* 335.0 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{20}H_{18}N_2O_3}$: C, 71.84; H, 5.43; N, 8.38. Found: C, 71.92; H, 5.21; N, 8.55.

General procedure for the synthesis of compounds 3a–c, 6a–b, 13a–c, 14–16a, 18, 25–26, and 28: as exemplified for the compound 3a. A mixture of compound **2a** (1.5 g, 3.56 mmol) and Raney-Ni (100 mg wet) in methanol (10 mL) was subjected to hydrogenation in the Parr assembly at 40 psi. The reaction was allowed to continue for 3 h. Thereafter, the catalyst was removed by filtration of the reaction mixture through a celite bed with methanol. The filtrate was evaporated to obtain an oily residue, which was taken in ethyl acetate (2 × 20 mL) and washed with water (30 mL). The organic layers were collected, dried over anhydrous $\mathrm{Na_2SO_4}$, and the solvent was evaporated *in vacuo* to obtain a crude oily product, which was purified by column chromatography over silica gel (60–120 mesh). Elution with hexane: ethyl acetate (70:30, v/v) gave 0.93 g (67%) of compound **3a** as a brown solid.

The Pd-on-carbon-promoted hydrogenations were performed in similar fashion on a Parr assembly.

Methyl 3-(2-aminophenyl)-5-[hydroxy(phenylisoxazol-3-yl)methyl]-4,5-dihydroisoxazole-5-carboxylate (3a). Mp 83–85°C; IR (potassium bromide): 1745 (CO$_2$Me), 3352 (NH), 3461 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.81 (d, 1H, 1H of CH$_2$, *J* = 17.1 Hz), 3.88 (s, 3H, CO$_2$CH$_3$), 3.98 (d, 1H, 1H of CH$_2$, *J* = 17.1 Hz), 5.54 (s, 1H, CHOH), 6.67–6.74 (m, 3H, =CH and ArH), 7.16–7.24 (m, 2H, ArH), 7.45–7.48 (m, 3H, ArH), 7.78–7.83 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 42.5, 53.9, 69.2, 91.8, 99.4, 125.3, 126.3, 127.4, 128.5, 129.4, 130.9, 131.5, 134.0, 148.1, 156.6, 162.8, 170.0, 170.9; ms: (electron spray+) *m*/*z* 394.2 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{21}H_{19}N_3O_5}$: C, 64.12; H, 4.87; N, 10.68. Found: C, 63.98; H, 4.95; N, 10.73.

Methyl 5-[acetoxy-(5-phenylisoxazol-3-yl)-methyl]-3-(2-amino-phenyl)-4,5-dihydromisoxazole-5-carboxylate (3b). This compound was obtained in 63% as yellow oil; IR (neat): 1743 (CO$_2$Me), 3358 (NH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.17 (s, 3H, OCOCH$_3$), 3.53–3.67 (m, 3H, CH$_2$ and 1H of CH$_2$), 3.86 (s, 3H, CO$_2$CH$_3$), 4.03 (d, 1H, 1H of CH$_2$, *J* = 17.0 Hz), 5.59 (s, 2H, NH$_2$), 6.56 (s, 1H, =CH), 6.69–6.75 (m, 2H, ArH), 7.12–7.23 (m, 2H, ArH), 7.45–7.47 (m, 3H, ArH), 7.78–7.79 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 34.0, 44.8, 53.8, 85.6, 102.4, 110.8, 116.4, 117.0, 127.2, 129.3, 130.1, 130.5, 131.7, 147.3, 158.5, 163.1, 167.6, 171.1; ms: (electron spray+) *m*/*z* 436.1 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{23}H_{21}N_3O_6}$: C, 63.44; H, 4.86; N, 9.65. Found: C, 63.68; H, 5.07; N, 9.56.

Methyl 3-(2-amino-phenyl)-5-[hydroxy-(5-methyl-3-phenylisoxazol-4-yl)-methyl]-4,5-dihydro-isoxazole-5-carboxylate (6a). This compound was obtained in 66% as yellow oil; IR (neat): 1731 (CO$_2$Me), 3466 (NH and OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.66 (s, 3H, CH$_3$), 3.21 (d, 1H, 1H of CH$_2$, *J* = 17.0 Hz), 3.44 (d, 1H, 1H of CH$_2$, *J* = 17.0 Hz), 3.60 (s, 3H, CO$_2$CH$_3$), 5.40 (s, 1H, C*H*OH), 6.64–6.74 (m, 3H, ArH), 7.15–7.21 (m, 1H, ArH), 7.50–7.54 (m, 3H, ArH), 7.55–7.59 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 13.2, 30.3, 43.1, 53.7, 69.4, 88.7, 107.9, 110.1, 117.4, 117.9, 129.1, 129.5, 130.6, 131.7, 133.0, 147.1, 157.4, 163.2, 169.9, 170.6; ms: (electron spray+) *m*/*z* 408.1 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{22}H_{21}N_3O_5}$: C, 64.86; H, 5.20; N, 10.31. Found: C, 64.98; H, 5.08; N, 10.43.

Methyl 5-[acetoxy-(5-methyl-3-phenylisoxazol-4-yl)-methyl]-3-(2-amino-phenyl)-4,5-dihydro-isoxazole-5-carboxylate (6b). This compound was obtained in 92% as a white solid, mp. 180–182°C; IR (potassium bromide) 1756 (CO$_2$Me and OAc), 3346 (NH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.16 (s, 3H, OCOCH$_3$), 2.70 (s, 3H, CH$_3$), 3.00 (d, 1H, 1H of CH$_2$, *J* = 17.0 Hz), 3.39 (d, 1H, 1H of CH$_2$, *J* = 17.0 Hz), 3.77 (s, 3H, CO$_2$CH$_3$), 5.49 (s, 2H, NH$_2$), 6.38 (s, 1H, CHOAc), 6.62–6.71 (m, 3H, ArH), 7.15–7.20 (m, 1H, ArH), 7.53–7.55 (m, 3H, ArH), 7.59–7.63 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 13.4, 20.9, 30.1, 43.4, 53.7, 69.6, 88.9, 107.9, 110.1, 116.4, 116.7, 129.4, 129.6, 130.4, 131.8, 132.9, 147.2, 157.4, 162.5, 169.7, 170.6, 171.8; ms: (electron spray+) *m*/*z* 449.9 (M$^+$ + 1). HR-EIMS Calcd for $\mathrm{C_{24}H_{23}N_3O_6}$: 449.1587. Found: 449.1566.

Methyl 3-(2-aminophenyl)-5-[hydroxy(3-phenylisoxazol-5-yl)methyl]-4,5-dihydroisoxazole-5-carboxylate (13a). This compound was obtained in 67% as brown oil; IR (neat): 1742 (CO$_2$Me), 3350 (NH), 3464 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 3.77–3.94 (m, 5H, CH$_2$ and CO$_2$CH$_3$), 5.54 (brs, 3H, C*H*OH and NH$_2$), 6.67–6.74 (m, 3H, =CH and ArH), 7.16–7.23 (m, 2H, ArH), 7.45–7.46 (m, 3H, ArH), 7.76–7.79 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.6, 53.9, 69.0, 89.0, 102.0, 110.9, 116.5, 117.2, 127.3, 128.9, 129.4, 130.3, 130.7, 131.8, 147.2, 159.1, 162.8, 169.6, 170.0; ms: (electron spray+) *m*/*z* 394.1 (M$^+$ + 1). *Anal.* Calcd for $\mathrm{C_{21}H_{19}N_3O_5}$: C, 64.12; H, 4.87; N, 10.68. Found: C, 64.31; H, 4.72; N, 10.79.

Methyl 3-(2-aminophenyl)-5-{hydroxy[3-(4-methylphenyl)isoxazol-5-yl]methyl}-4,5-dihydroisoxazole-5-carboxylate (14a). This compound was obtained in 63% as colorless oil; IR (neat): 1741 (CO$_2$Me), 3352 (NH), 3461(OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.40 (s, 3H, ArCH$_3$), 3.78 (d, 1H, 1H of CH_2, $J = 17.1$ Hz), 3.87 (s, 3H, CO_2CH_3), 3.97 (d, 1H, 1H of CH_2, $J = 17.1$ Hz), 5.53 (brs, 3H, C*H*OH and NH_2), 6.68–6.74 (m, 3H, =CH and ArH), 7.16–7.24 (m, 4H, ArH), 7.69 (d, 2H, ArH, $J = 7.8$ Hz); ^{13}C NMR (deuteriochloroform): δ 21.8, 40.5, 53.9, 69.0, 89.1, 101.9, 110.9, 116.5, 117.2, 126.0, 127.2, 130.1, 130.3, 131.7, 140.8, 147.2, 159.1, 162.8, 169.5, 170.0; ms: (electron spray+) *m*/*z* 408.1 ($M^+ + 1$); *Anal.* Calcd for $C_{22}H_{21}N_3O_5$: C, 64.86; H, 5.20; N, 10.31. Found: C, 64.67; H, 5.09; N, 10.43.

Methyl 3-(3-aminophenyl)-5-[hydroxy-(3-phenylisoxazol-5-yl)-methyl]-4,5-dihydro-isoxazole-5-carboxylate (15a). This compound was obtained in 73% as a brown solid, mp. 114–116°C; IR (potassium bromide): 1721 (CO_2Me), 3321 (NH), 3456 (OH) cm^{-1}; ^1H NMR (deuteriochloroform): δ 3.72–3.88 (m, 5H, CH_2 and CO_2CH_3), 5.31 (s, 1H, C*H*OH), 5.46 (s, 2H, NH_2), 6.62–6.67 (m, 2H, =CH and ArH), 6.87–6.93 (m, 2H, ArH), 7.06–7.12 (m, 1H, ArH), 7.31–7.38 (m, 3H, ArH), 7.69–7.70 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.5, 52.0, 67.6, 88.1, 100.2, 111.7, 116.2, 116.4, 125.6, 127.6, 127.7, 128.4, 128.8, 145.4, 155.9, 161.1, 168.3; ms: (electron spray+) *m*/*z* 394.1 ($M^+ + 1$); *Anal.* Calcd for $C_{21}H_{19}N_3O_5$: C, 64.12; H, 4.87; N, 10.68. Found: C, 64.37; H, 4.98; N, 10.49.

Methyl 3-(4-aminophenyl)-5-[hydroxy-(3-phenylisoxazol-5-yl)-methyl]-4,5-dihydro-isoxazole-5-carboxylate (16a). This compound was obtained in 69% as yellow oil; IR (neat): 1745 (CO_2Me), 3345 (NH), 3442 (OH) cm^{-1}; ^1H NMR (deuteriochloroform): δ 3.83 (d, 2H, 1H of CH_2, $J = 17.0$ Hz), 3.89 (s, 3H, CO_2CH_3), 4.00 (d, 2H, 1H of CH_2, $J = 17.0$ Hz), 5.55 (s, 1H, C*H*OH), 6.73–6.75 (m, 3H, =CH and ArH), 7.19 (d, 2H, ArH, $J = 7.5$ Hz), 7.47–7.49 (m, 3H, ArH), 7.80–7.85 (m, 3H, ArH); ^{13}C NMR (deuteriochloroform): δ 41.3, 53.2, 67.9, 88.7, 101.4, 111.3, 115.1, 114.9, 125.4, 126.4, 127.0, 128.1, 128.4, 129.6, 144.7, 156.7, 161.8, 168.5, 170.2; ms: (electron spray+) *m*/*z* 394.2 ($M^+ + 1$). *Anal.* Calcd for $C_{21}H_{19}N_3O_5$: C, 64.12; H, 4.87; N, 10.68. Found: C, 64.27; H, 4.73; N, 10.79.

3-[(Z)-4-Amino-1-hydroxy-4-(4-methylphenyl)-2-oxobut-3-enyl]-3-hydroxy-5-phenylpyrrolidin-2-one (18). This compound was obtained in 85% as a pale yellow solid, mp. 90–92°C; IR (potassium bromide): 1685 (CONH), 1721 (CO), 3426 (OH and NH) cm^{-1}; ^1H NMR (deuteriochloroform): δ 2.42 (s, 6H, 2 × $ArCH_3$), 3.48 (d, 1H, 1H of CH_2, $J = 17.1$ Hz), 3.72 (d, 1H, 1H of CH_2, $J = 17.1$ Hz), 3.83–3.96 (m, 2H, CH_2), 4.26 (s, 2H, 2 × ArCH), 4.36 (brs, 1H, 1H of NH_2), 4.75 (s, 1H, C*H*OH), 4.82 (s, 1H, C*H*OH), 5.34 (brs, 1H, 1H of NH_2), 5.64 (brs, 1H, 1H of NH_2), 5.67 (brs, 1H, 1H of NH_2), 5.74 (s, 1H, =CH), 5.81 (s, 1H, =CH), 7.37–7.51 (m, 14H, 2 × 7ArH), 7.60–7.72 (m, 4H, 2 × 2ArH), 9.89 (brs, 1H, NH), 8.96 (brs, 1H, NH); ^{13}C NMR (deuteriochloroform): δ 21.5, 21.8, 33.4, 33.5, 39.9, 41.3, 89.4, 89.5, 93.9, 94.1, 103.1, 103.4, 126.1, 126.3, 127.4, 127.8, 128.2, 128.8, 129.2, 130.3, 131.2, 140.4, 141.5, 157.6, 157.7, 162.4, 162.7, 179.3, 179.5, 190.4, 190.6; ms: (electron spray+) *m*/*z* 367.1 ($M^+ + 1$). *Anal.* Calcd for $C_{21}H_{22}N_2O_4$: C, 68.84; H, 6.05; N, 7.65. Found: C, 68.69; H, 6.19; N, 7.57.

2-[3-(2-Aminophenyl)-4,5-dihydroisoxazol-5-yl]-1-(3-phenylisoxazol-5-yl)ethan-1-ol (25). This compound was obtained in 63% as a yellow solid, mp 110–112°C; IR (potassium bromide): 3431 (OH and NH_2) cm^{-1}; ^1H NMR (deuteriochloroform): δ 2.27–2.36 (m, 2H, CH_2), 3.16–3.29 (m, 1H, 1H of CH_2), 3.60–3.69 (m, 1H, 1H of CH_2), 4.90–4.96 (m, 1H, C*H*OH), 5.24–5.26 (m, 1H, C*H*CH_2), 6.62 (d, 1H, =CH, $J = 3.5$ Hz), 6.70–6.77 (m, 2H, ArH), 7.15–7.23 (m, 2H, ArH); 7.46–7.48 (m, 3H, ArH), 7.80–7.82 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.8, 41.2, 64.9, 78.6, 99.6, 111.8, 116.2, 116.6, 117.0, 126.1, 126.9, 129.8, 131.0, 131.3, 140.6, 147.1, 162.5, 174.5; ms: (electron spray+) *m*/*z* 350.1 ($M^+ + 1$). *Anal.* Calcd for $C_{20}H_{19}N_3O_3$: C, 68.75; H, 5.48; N, 12.03. Found: C, 68.62; H, 5.19; N, 12.28.

2-[3-(2-Aminophenyl)-4,5-dihydroisoxazol-5-yl]-1-[3-(4-methylphenyl)isoxazol-5-yl]ethan-1-ol (26). This compound was obtained in 62% as a brown solid mp 158–160°C; IR (potassium bromide): 3374 (OH and NH_2) cm^{-1}; ^1H NMR (deuteriochloroform): δ 2.24–2.33 (m, 2H, CH_2), 2.40 (s, 3H, $ArCH_3$), 3.19–3.29 (m, 1H, 1H of CH_2), 3.56–3.69 (m, 1H, 1H of CH_2), 4.63–4.94 (m, 1H, C*H*OH), 5.21–5.24 (m, 1H, C*H*CH_2), 5.63 (brs, 2H, NH_2), 6.58 (d, 1H, =CH, $J = 1.2$ Hz), 6.66–6.76 (m, 2H, ArH), 7.13–7.19 (m, 2H, ArH); 7.22–7.28 (m, 2H, ArH), 7.69 (d, 2H, ArH, $J = 8.0$ Hz); ^{13}C NMR (75 MHz, deuteriochloroform): δ= 21.7, 40.6, 42.5, 65.2, 78.0, 99.7, 111.6, 116.1, 116.8, 116.9, 126.2, 127.0, 129.9, 131.1, 131.2, 140.5, 147.0, 158.9, 162.6, 173.9; ms: (electron spray+) *m*/*z* 364.1 ($M^+ + 1$). HR-EIMS Calcd for $C_{21}H_{21}N_3O_3$: 363.1583. Found: 363.1577.

1,8-Diamino-4,6-dihydroxy-1,8-diphenyloct-1-en-3-one (28). This compound was obtained in 63% as a brown solid, mp 118–120°C; IR (potassium bromide): 3410 (OH and NH_2) cm^{-1}; ^1H NMR (deuteriochloroform): δ 1.71 (brs, 1H, OH), 1.79–2.06 (m, 4H, 2 × CH_2), 3.71 (brs, 5H, OH and 2 × NH_2), 4.15–4.22 (m, 1H, C*H*OH), 4.37–4.39 (m, 1H, C*H*OH), 4.48–4.50 (m, 1H, C*H*NH_2), 5.53 (s, 1H, =CH), 7.33–7.57 (m, 10H, ArH); ^{13}C NMR (deuteriochloroform): δ 29.6, 30.7, 49.5, 52.9, 90.3, 126.4, 127.6, 128.6, 128.9, 129.3, 129.6, 129.9, 130.0, 134.2, 175.2; ms: (electron spray+) *m*/*z* 341.1 ($M^+ + 1$). *Anal.* Calcd for $C_{20}H_{24}N_2O_3$: C, 70.56; H, 7.11; N, 8.23. Found: C, 70.75; H, 7.03; N, 8.31.

(Z)-4-Amino-1-hydroxy-4-phenylbut-3-en-2-one (30). This compound was obtained in 67% as yellow oil; IR (neat): 1703 (CO), 3407 (OH and NH_2) cm^{-1}; ^1H NMR (deuteriochloroform): δ 3.61 (brs, 1H, OH), 4.26 (s, 2H, CH_2), 5.36 (s, 1H, =CH), 7.40–7.61 (m, 5H, ArH), 9.69 (brs, 2H, NH_2); ms: (electron spray+) *m*/*z* 178.1 ($M^+ + 1$). *Anal.* Calcd for $C_{10}H_{11}NO_2$: C, 67.78; H, 6.26; N, 7.90. Found: C, 67.83; H, 6.41; N, 7.62.

General procedure for the synthesis of compounds 21–22: as exemplified for the compound 21. To the stirred suspension of Mg (0.42 g, 17.34 mmol) in anhydrous diethyl ether (30 mL), allyl bromide (1.5 mL, 17.34 mmol) was added under nitrogen atmosphere at room temperature and the mixture was stirred for 1 h. Thereafter, the resulting Grignard reagent was added to the stirred solution of appropriate aldehydes from **19** (1.5 g, 8.67 mmol) in anhydrous diethyl ether (40 mL) dropwise *via* cannula under nitrogen atmosphere, and the reaction was continued for additional 5 h. After completion, the reaction mixture was decomposed with cold H_2O maintaining the pH at 5–6 with dil. HCl. The resulting mixture was extracted with diethyl ether (3 × 30 mL). The organic layers were combined, dried with anhydrous Na_2SO_4, and evaporated to yield crude product, which was purified *via* silica gel chromatography using hexane: EtOAc (80:20, v/v) to afford 1.4 g (75%) of compound **21** as yellow oil.

1-(3-Phenylisoxazol-5-yl)but-3-en-1-ol (21). IR (neat): 3411 (OH) cm^{-1}; ^1H NMR (deuteriochloroform): δ 2.65–2.76

(m, 2H, C*H*$_2$CH), 4.94, 4.99 (dd, 1H, C*H*OH, $J_1 = 6.7$ Hz, $J_2 = 16.7$ Hz), 5.21–5.30 (m, 2H, =CH$_2$), 5.73–5.93 (m, 1H, =C*H*CH$_2$), 6.54 (d, 1H, =CH, $J = 0.9$ Hz), 7.42–7.49 (m, 3H, ArH), 7.78–7.82 (m, 2H, ArH); ^{13}C NMR (deuteriochloroform): δ 40.7, 66.9, 98.8, 120.6, 126.2, 126.7, 127.2, 129.4, 133.0, 141.3, 162.1, 174.7; ms: (electron spray+) *m/z* 216.1 ($M^+ + 1$). *Anal.* Calcd for $C_{13}H_{13}NO_2$: C, 72.54; H, 6.09; N, 6.51. Found: C, 72.31; H, 5.97; N, 6.63.

1-[3-(4-Methylphenyl)isoxazol-5-yl]but-3-en-1-ol (22). This compound was obtained in 90% as pale yellow oil; IR (neat): 3384 (OH) cm^{-1}; ^{1}H NMR (deuteriochloroform): δ 2.40 (s, 3H, ArCH$_3$), 2.65–2.75 (m, 2H, C*H*$_2$CH), 4.91–5.00 (m, 1H, C*H*OH), 5.20–5.30 (m, 2H, =CH$_2$), 5.73–5.90 (m, 1H, =C*H*CH$_2$), 6.51 (d, 1H, =CH, $J = 1.0$ Hz), 7.26 (d, 2H, ArH, $J = 8.0$ Hz), 7.69 (d, 2H, ArH, $J = 8.0$ Hz); ^{13}C NMR (deuteriochloroform): δ 21.7, 40.5, 66.6, 99.3, 120.1, 126.3, 127.0, 129.9, 132.7, 140.4, 162.5, 174.3; ms: (electron spray+) *m/z* 230.1 ($M^+ + 1$). *Anal.* Calcd for $C_{14}H_{15}NO_2$: C, 73.34; H, 6.59; N, 6.11. Found: C, 73.19; H, 6.72; N, 6.01.

Acknowledgments. Three of the authors (VS, SH, and GPY) gratefully acknowledge the financial support from CSIR, N. Delhi in the form of fellowship. This work was carried out with a grant under the DST project. The authors thank the anonymous reviewers for their suggestions and comments.

Canthin-4-one, as well as 5- and 6-alkylcanthin-4-ones are readily available through reaction of 1-acyl-β-carbolines with Bredereck's reagent or dimethylacetamide acetals in anhydrous DMF. The intermediate enaminoketones readily undergo cyclization to the canthin-4-ones. The alkaloids tuboflavine and norisotuboflavine were prepared following this methodology.

J. Heterocyclic Chem., **46**, 770 (2009).

INTRODUCTION

Considerable time ago, we published [1] the first total synthesis of the alkaloid annomontine (**3**), a aminopyrimidyl β-carboline from *Annona montana* [2] and *Annona foetida*, showing antileishmanial activity [3]. Readily available 1-acetyl-β-carboline (**1**) [1,4] was reacted with Bredereck's reagent (*tert*-butoxy-bis(dimethylamino)methane) in DMF to give a postulated enaminoketone **2**, which was, without further purification and characterization, converted to the alkaloid **3** by heating with guanidinium carbonate. To our surprise, construction of the aminopyrimidine ring was only possible with guanidinium carbonate under drastic conditions. Free guanidine and other guanidinium salts (hydrochloride, thiocyanate) did not give the desired product. This was in contrast to reports in literature describing an easy conversion of enaminoketones to aminopyrimidines with guanidine or various guanidinium salts [5,6].

RESULTS AND DISCUSSION

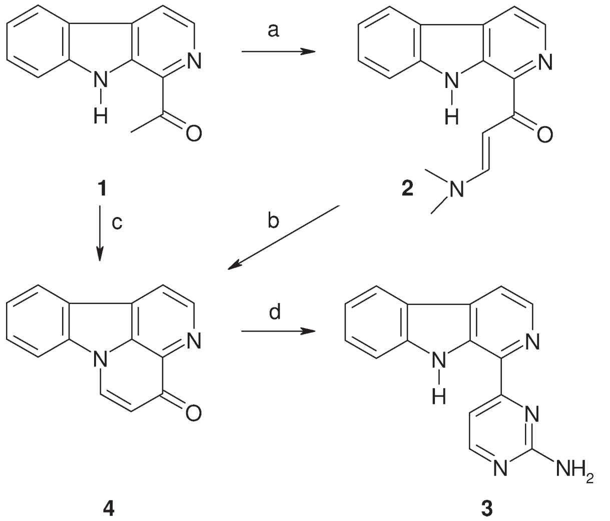
In a reinvestigation of the synthesis described above we intended to isolate the putative intermediate **2**. To our surprise we found that the progress of the reaction strongly depends on the water content of the solvent DMF. Reaction of **1** with Bredereck's reagent in commercially available DMF (water content about 1500 ppm) gave the expected enaminoketone **2**. In contrast, reaction in anhydrous DMF (water content about 50 ppm, as determined by Karl-Fischer titration) gave another product which was unambiguously identified as canthin-4-one (**4**) on the basis of spectroscopic and literature data [7]. Obviously, this product is formed by nucleophilic attack of the indole nitrogen at the enaminoketone moiety, followed by elimination of dimethylamine. In fact, heating of pure enaminoketone **2** in anhydrous DMF in the presence of a catalytic amount of potassium *tert*-butoxide resulted in a clean conversion to canthin-4-one (**4**), whereas heating of **2** in DMF without base for a prolonged time gave only traces of **4**. In the original reaction leading to **4**, the catalytic amount of alkoxide essential for the cyclization is obviously provided by heterolytic cleavage of Bredereck's reagent [8]. So the presence of alkoxide is essential for the cyclization of **2** to canthin-4-one (**4**), obviously by enhancing the nucleophilicity of the indole nitrogen by deprotonation. In wet DMF the alkoxide generated from Bredereck's reagent is likely to be hydrolyzed by water.

Canthin-4-one (**4**) could easily be converted to annomontine (**3**) by heating with guanidinium carbonate in DMF. This ring transformation is obviously initiated by nucleophilic attack of guanidine at the 6-position to affect ring opening, followed by cyclization to the aminopyrimidine ring system (Scheme 1).

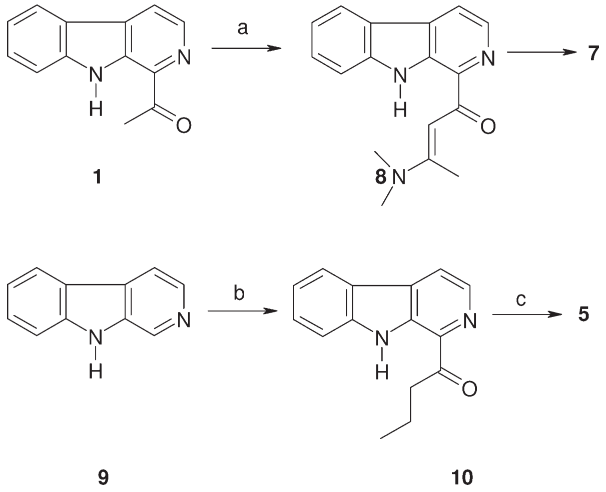
So we found, by chance, a new entry to the canthin-4-one ring system.

Canthin-4-ones represent a small class of three alkaloids isolated from *Pleiocarpa* species (Apocynaceae). Tuboflavine (**5**), isotuboflavine (**6**), and nor-

Scheme 1. Reagents: (a) Bredereck's reagent, wet DMF, reflux; (b) *tert.*-BuOK (cat.), anhydrous DMF, reflux; (c) Bredereck's reagent, anhydrous DMF, reflux; (d) guanidinium carbonate, DMF, reflux.



Scheme 2. Reagents: (a) *N,N*-dimethylacetamide dimethylacetal, anhydrous DMF, 130°C; (b) butyraldehyde, $H_2O/AcOH/H_2SO_4$, then $FeSO_4$, *tert.*-BuOOH/H_2O; (c) Bredereck's reagent, anhydrous DMF, reflux.



isotuboflavine (**7**) were isolated from *Pleiocarpa mutica* [9], **5** was also found in *Pleiocarpa tubicina* [10] (Fig. 1).

Up to now several multi-step syntheses of the alkaloids tuboflavine [11], isotuboflavine [7], norisotuboflavine [7,12], and of unsubstituted canthin-4-one [7] have been published, but none of these offer overall yields higher than 1%. So these total syntheses could only serve as proofs for the structures of the alkaloids, but do not represent efficient approaches to the canthin-4-one ring system.

In order to elucidate the scope of this new anellation protocol, we worked out total syntheses of the alkaloids norisotuboflavine (**7**) and tuboflavine (**5**) following the strategy described above.

Condensation of 1-acetyl-β-carboline (**1**) with *N,N*-dimethylacetamide dimethylacetal in refluxing anhydrous DMF gave, presumably via an intermediate enamine **8**, the alkaloid norisotuboflavine (**7**) in 52% yield.

For the synthesis of tuboflavine (**5**) we prepared the starting material 1-butanoyl-β-carboline (**10**) by *Minisci* –type acylation [13] of norharmane (**9**) with butyraldehyde and *tert*-butyl hydroperoxide/$FeSO_4$ in acidic medium. As we had demonstrated earlier [4], homolytic acylation occurs in a regioselective manner at C-1 with β-carbolines. Diacylated products could only be detected in traces by mass spectroscopy. Condensation of **10** with Bredereck's reagent in refluxing anhydrous DMF readily gave the expected alkaloid **5** in 74% yield (Scheme 2).

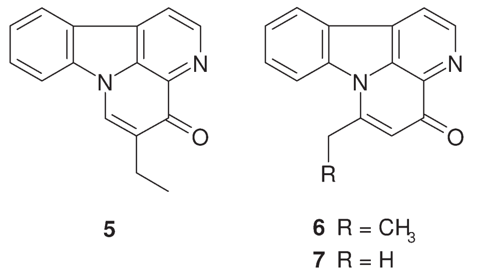


Figure 1. Canthin-4-one alkaloids from *Pleiocarpa* species: tuboflavine (**5**), isotuboflavine (**6**), norisotuboflavine (**7**).

In a preliminary screening for antimicrobial activities canthin-4-one (**4**) and norisotuboflavine (**7**) showed strong antibacterial and antifungal activities, whereas tuboflavine (**5**) was inactive.

In conclusion, we have worked out a simple and efficient approach to canthin-4-one as well as 5- and 6-alkylated derivatives thereof, starting from readily available 1-acyl-β-carbolines. Work on further modifications of the canthin-4-one ring system is in progress.

EXPERIMENTAL

General. Elemental analyses were performed on a Carlo Erba CHNO Elemental Analyser. FTIR spectra were recorded as KBr discs on a Pye-Unicam PU-9800 spectrometer, mass spectra on a Finnigan MAT-8430 spectrometer; nmr spectra were recorded with tetramethylsilane as internal standard on a Bruker AM-400 (400.1 MHz ^1H, 100.5 MHz ^{13}C) spectrometer, *J* values are given in Hz. Flash column chromatography was carried out on Merck Kieselgel 60 (230–400 mesh).

Commercially available reagent grade DMF (dimethylformamide) was purified by distillation; "anhydrous" DMF (water content about 50 ppm) was prepared by distillation followed by storage over activated molecular sieves 4 Å. The water content was determined by Karl-Fischer titration using a Mitsubishi MCI Moisturemeter, model CA-05.

1-(3-Dimethylamino)prop-2-enoyl-β-carboline (2). *tert*-Butoxy-bis(dimethylamino)methane [166 mg (0.95 mmole)] was added to a solution of 105 mg (0.50 mmole) 1-acetyl-β-carboline (**1**) in 8 mL DMF (water content 1580 ppm, equivalent to 0.7 mmole H_2O). The mixture was refluxed under nitrogen for 1 h. After evaporation the residue was purified by flash column chromatography (CH_2Cl_2:ethanol, 14:1, v/v) to give 89 mg (67%) **2** as a brown oil that crystallized overnight, mp 178°C; IR: 3422, 1638, 1625, 1537, 1412, 1243, 1101 cm^{-1}; ^1H NMR (deuteriochloroform) δ 10.82 (s, 1H, NH), 8.49 (d, 1H, *J* = 5.1 Hz, 3-H), 8.13 (d, 1H, *J* = 8.7 Hz, 5-H), 8.06 (d, 1H, *J* = 5.0 Hz, 4-H), 7.96 (d, 1H, *J* = 12.7 Hz, 3'-H), 7.55 (m, 2H, 7-H, 8-H), 7.27 (m, 1H, 6-H), 6.74 (d, 1H, *J* = 12.5 Hz, 2'-H), 3.19 (s, 3H, N-CH_3), 3.04 (s, 3H, N-CH_3); ^{13}C nmr (deuteriochloroform) δ 189.3 (C=O), 154.1 (C-3'), 140.9 (C-8a), 138.2 (C-4b), 137.5 (C-3), 135.9 (C-9a), 130.9 (C-4a), 128.6 (C-7), 121.6 (C-5), 120.7 (C-1), 119.9 (C-6), 117.3 (C-4), 111.8 (C-8), 91.5 (C-2'), 45.2 (CH_3), 37.5 (CH_3); ms (EI) m/z 265 (M^+, 17), 235 (15), 222 (48), 221 (100), 220 (19), 182 (19), 98 (26). Hr-ms: Calcd. for $C_{16}H_{15}N_3O$: 265.1215, found: 265.1210.

Canthin-4-one (4) from 1-acetyl-β-carboline (1). Under nitrogen 214 mg (1.23 mmol) *tert*-butoxy-bis-(dimethylamino) methane were added dropwise to a stirred solution of 200 mg (0.95 mmol) (**1**) [1,4] in 20 mL anhydrous DMF (water content about 55 ppm). The mixture was refluxed under nitrogen for 3 h. The solvent was evaporated under reduced pressure and the residue was dissolved in 60 mL ethyl acetate. The organic layer was washed with water (40 mL) and dried with Na_2SO_4. After evaporation the residue was purified by flash column chromatography (CH_2Cl_2:ethanol, 14:1, v/v) to give 156 mg (74%) **4** as a yellow solid. Recrystallization from CH_2Cl_2- heptane gave yellow needles, mp 264°C (lit. [7]: mp (diethyl ether) 270°C); IR: 1645, 1615, 1554, 1506, 1438, 1294, 1223, 1193 cm^{-1}; ^1H NMR (DMSO-d_6) δ 8.98 (d, 1H, *J* =4.6 Hz, 2-H), 8.97 (d, 1H, *J* = 7.7 Hz, 6-H), 8.47 (d, 1H, *J* = 4.8 Hz, 1-H), 8.38 (d, 1H, *J* = 7.7 Hz, 11-H), 8.18 (d, 1H, *J* = 8.2 Hz, 8-H), 7.79 (dd, 1H, *J* = 7.3, 8.4 Hz, 9-H), 7.53 (dd, 1H, *J* = 7.7, 7.3 Hz, 10-H), 6.52 (d, 1H, *J* = 7.7 Hz, 5-H); ^{13}C NMR (DMSO-d_6) δ 178.7 (C=O), 147.2 (C-2), 139.4 (C-7a), 138.9 (C-3a), 135.0 (C-11c), 134.3 (C-6), 133.7 (C-11b), 131.5 (C-9), 125.1 (C-10), 124.6 (C-11), 124.3 (C-11a), 119.9 (C-1), 117.1 (C-5), 112.7 (C-8); ms (EI) m/z 220 (M^+, 100), 192 (28), 165 (12), 139 (8); Anal. Calcd. for $C_{14}H_8N_2O$: C, 76.35; H, 3.66; N, 12.72. Found: C, 76.02; H, 3.27; N, 12.48.

Canthin-4-one (4) from enaminoketone 2. A catalytic amount (ca. 3 mg) of potassium *tert*-butoxide was added to a refluxing solution of 89 mg (0.34 mmol) **2** in 5 mL anhydrous DMF under nitrogen. Refluxing was continued for 4 h. After cooling to room temperature 20 mL 10% $NaHCO_3$-solution were added and the mixture was extracted with ethyl acetate (3 × 20 mL). The combined organic layers were washed 3 times with water and dried with $MgSO_4$. After evaporation 59 mg (80%) of pure canthin-4-one (**4**) was obtained.

Annomontine (3). Canthin-4-one (**4**) [100 mg (0.45 mmol)] was dissolved in 10 mL DMF, then 244 mg (1.35 mmol) guanidinium carbonate was added and the mixture was refluxed under nitrogen for 7 h. The solvent was evaporated under reduced pressure and the residue was dissolved in 40 mL ethyl acetate. The organic layer was washed with 30 mL water and dried with Na_2SO_4. After evaporation the residue was purified by flash column chromatography (CH_2Cl_2:ethanol, 14:1, v/v) to give 70 mg (59%) **3** as a yellow solid. The product was identified by comparison with an authentic sample. The spectroscopic data were in full accordance with those described in lit. [1].

Norisotuboflavine (7). Under nitrogen 231 mg (1.74 mmol) *N*,*N*-dimethylacetamide dimethylacetal were added dropwise to a stirred solution of 200 mg (0.95 mmol) 1-acetyl-β-carboline (**1**) in 20 mL anhydrous DMF. The mixture was heated under nitrogen at 130°C for 24 h. The solvent was evaporated under reduced pressure and the residue was dissolved in 60 mL ethyl acetate. The organic layer was washed with water (40 mL) and dried with Na_2SO_4. After evaporation the residue was purified by flash column chromatography (CH_2Cl_2:ethanol, 14:1, v/v) to give 115 mg (52%) **7** as a yellow solid. Recrystallization from CH_2Cl_2-heptane gave pale yellow needles, mp 294°C (lit. [7,9,11]: mp (diethyl ether) 298–300°C, (methanol) 282–284°C, (methanol) 294–296°C); IR: 1633, 1607, 1496, 1428, 1289, 1220 cm^{-1}; ^1H NMR (deuteriochloroform) δ 8.92 (d, 1H, *J* = 4.7 Hz, 2-H), 8.08 (d, 1H, *J* = 7.7 Hz, 11-H), 7.99 (d, 1H, *J* = 4.7 Hz, 1-H), 7.83 (d, 1H, *J* = 8.4 Hz, 8-H), 7.60 (m, 1H, 9-H), 7.42 (dd, 1H, *J* = 7.5, 7.6 Hz, 10-H), 6.35 (s, 1H, 5-H), 2.87 (s, 3H, CH_3); ^{13}C NMR (DMSO-d_6) δ 178.8 (C=O), 147.0 (C-6), 146.7 (C-2), 140.1 (C-7a), 138.5 (C-3a), 135.4 (C-11c), 133.4 (C-11b), 130.9 (C-9), 125.4 (C-11a), 124.6 (C-10), 123.7 (C-11), 118.2 (C-1), 117.6 (C-5), 114.4 (C-8), 21.3 (CH_3); ms (EI) m/z 234 (M^+, 100), 217 (15), 195 (25), 168 (62), 139 (22) and 113 (27); Anal. Calcd. for $C_{15}H_{10}N_2O$: C, 76.91; H, 4.30; N, 11.96. Found: C, 77.05; H, 4.00; N, 11.78.

1-Butanoyl-β-carboline (10). Norharmane (**9**) [200 mg (1.19 mmol)] was suspended in an ice-cooled mixture of water (3 mL), glacial acetic acid (3 mL) and conc. sulfuric acid (0.6 mL) by means of ultrasound irradiation. 0.50 g (6.9 mmol) butyraldehyde were added. Then a solution of 1.0 g (3.6 mmol) $FeSO_4 \times 7\ H_2O$ in 3.6 mL water and 0.5 mL (3.6 mmol) *tert*-BuOOH (70% solution in water) were added simultaneously under stirring. After 1 h at 0°C the mixture was poured into water (100 mL), neutralized with solid K_2CO_3 and extracted with ethyl acetate (3 × 100 mL). The combined organic layers were dried with Na_2SO_4 and evaporated. The residue was purified by flash column chromatography (ethyl acetate:hexane, 1:4, v/v) to give 180 mg (64%) **10** as pale yellow crystals, mp 152°C; IR: 3401, 1663, 1490, 1452, 1430, 1317, 1200, 1137 cm^{-1}; ^1H NMR (deuteriochloroform) δ 10.34 (s, 1H, N—H), 8.52 (d, 1H, *J* = 4.9 Hz, 3-H), 8.14 (d, 1H, *J* = 7.9 Hz, 5-H), 8.13 (d, 1H, *J* = 4.9 Hz, 4-H), 7.53 (m, 2H, 7-H, 8-H), 7.32 (m, 1H, 6-H), 3.39 (m, 2H, 2'-H), 1.88 (m, 2H, 3'-H), 1.08 (t, 3H, *J* = 7.4 Hz, CH_3); ^{13}C NMR (deuteriochloroform) δ 205.4 (C=O), 141.1 (C-8a), 138.1 (C-3), 135.9 (C-9a), 135.5 (C-1), 131.5 (C-4a), 129.2 (C-7), 121.8 (C-5), 120.6 (C-6, C-4b), 118.9 (C-4), 111.9 (C-8), 39.6 (C-2'), 17.8 (C-3'), 14.0 (C-4'); ms (EI) m/z 238 (M^+, 42), 223 (35), 210 (38), 195 (20), 182 (50), 168 (100), 140 (40), and 91 (32); Anal. Calcd. for $C_{15}H_{14}N_2O$: C, 75.61; H, 5.92; N, 11.76. Found: C, 75.97; H, 5.68; N, 11.49.

Tuboflavine (5). Under nitrogen 154 mg (0.89 mmol) *tert*-butoxy-bis(dimethylamino)methane was added dropwise to a stirred solution of 100 mg (0.42 mmol) 1-butanoyl-β-carboline (**10**) in 15 mL anhydrous DMF. The mixture was refluxed under nitrogen for 6 h. The solvent was evaporated under reduced pressure and the residue was purified by flash column chromatography (CH_2Cl_2:ethanol, 19:1, v/v) to give 77 mg

(74%) **5** as a yellow solid. Recrystallization from CH_2Cl_2-heptane gave yellow needles, mp 217°C (lit. [10,12]: mp 207–208°C, 216°C (acetone-hexane)); IR: 1610, 1573, 1510, 1470, 1438, 1345, 1292, 1166 cm^{-1}; ^{1}H NMR (CF_3COOD) δ 9.23 (d, 1H, $J = 5.9$ Hz, 2-H), 8.90 (d, 1H, $J = 5.9$ Hz, 1-H), 8.82 (s, 1H, 6-H), 8.51 (d, 1H, $J = 8.0$ Hz, 11-H), 8.11 (m, 2H, 8-H, 9-H), 7.81 (m, 1H, 10-H), 2.94 (q, 2H, $J = 7.5$ Hz, 1'-H), 1.45 (t, 3H, $J = 7.5$ Hz, 2'-H); ^{13}C NMR (CF_3COOD) δ 173.5 (C=O), 144.7 (C-7a), 143.3 (C-3a), 140.5 (C-2), 136.5 (C-6), 134.7 (C-11c), 133.6 (C-11b), 133.5 (C-9), 127.8 (C-10), 126.5 (C-11), 126.4 (C-11a), 122.4 (C-5), 119.9 (C-1), 112.3 (C-8), 20.9 (C-1'), 10.9 (C-2'); ms (EI) m/z 248 (M^+, 100), 247 (99), 192 (25), 151 (30), 91 (24); Anal. 2-(1-Benzyl-1*H*–1,2,3-triazole-4-yl)-3-methylsulfanyl-5-oxo-5-substituted-*pent*-2-enenitrile **3a-e** were obtained in good yields by condensation of (1-benzyl-1*H*-1,2,3-triazole-4-yl)acetonitrile **(1)** with various α-oxoketene dithioacetals **2a-e** in the presence of sodium hydride. The intermediates **3a-e** underwent facile acid-induced cyclization in the presence of PTSA to afford the corresponding benzotriazoles **4a-e** in moderate yields.

J. Heterocyclic Chem., **46**, 774 (2009).

INTRODUCTION

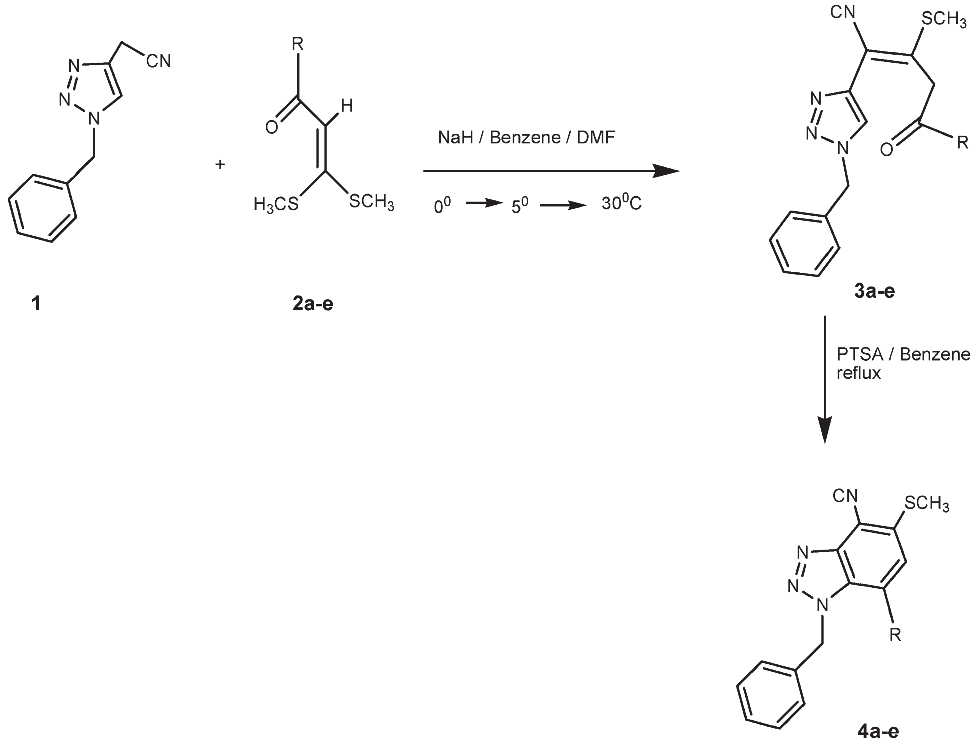
The α-oxoketene dithioacetals owe their potential synthetic application to their varied intrinsic chemical properties. The presence of carbonyl functionality and its position in conjugation with double bond carrying bis(alkylthio)group at the β-position place them among the versatile 1,3-dielectrophilic 3-carbon equivalents. The [3+3] benzoannulation methodologies involving the reaction of allyl anions with α-oxoketene dithioacetals, developed by Junjappa and coworkers [1–3], has emerged as a versatile method for the construction of a wide variety of aromatics, heteroaromatics, and benzoheterocycles. These benzoannulation methodologies have became the subject of intense investigation due to the easy availability of 1,3-dielectrophilic synthons, wide structural variants of allyl anions and a high degree of regiocontrol observed in these reactions.

In continuation of our studies on JI annulation and Heteroaromatic annulation reaction [4] on triazole chemistry [5] and in view of the pharmacological significance of benzotriazoles [6–9], we became interested in the corresponding benzotriazole group of compounds and found that the method developed by Junjappa and Ila to construct an aromatic ring over the preconstructed triazole ring would be an efficient route for the synthesis of benzotriazole. Interestingly, the literature survey revealed that entire benzotriazole chemistry has been confined to construct a triazole ring over the appropriately substituted benzene ring [10–13]. We therefore deemed it interesting to attempt the construction of benzotriazoles from the preconstructed triazole ring with required substitution. We have successfully achieved this goal and present our results in this communication.

DISCUSSION

The required α-oxoketene dithioacetals **2a-e** were prepared as described in the literature [14,15] and (1-benzyl-1*H*-1,2,3-triazol-4-yl]acetonitrile **1** was prepared from 1-benzyl-4-chloromethyl-1*H*-1,2,3-triazole [16]. The reaction of (1-benzyl-1*H*-1,2,3-triazol-4-yl)-acetonitrile **1** with various α-oxoketene dithioacetals **2a-e** in the presence of sodium hydride in dry dimethyl formamide and benzene mixture (50:50) afforded the corresponding 2-(1-benzyl-1*H*-1,2,3-triazol-4-yl]-3-methylsulfanyl-5-oxo-5-substituted-*pent*-2-enenitrile **3a-e** in good yields (60–75%) (Scheme 1). Evolution of methanethiol (MeSH) was observed during the course of the reaction. Formation of this conjugate adduct was ascertained by spectral and analytical data. The presence of a sharp band in the region 1675–1746 cm^{-1} due to the carbonyl group and a sharp band around 2200 cm^{-1}, due to cyano group supports the formation of the adduct. The ^1H NMR spectra exhibited two sets of characteristic methylene

Scheme 1. a, R = Ph; b, R = *p*BrPh; c, R = *p*ClPh; d, R = *p*CH_3Ph; and e, R = 1-Naphthyl.



protons as singlets in the region δ 4.9–5.1 and δ 5.4–5.6 for $COCH_2$ and N—CH_2 respectively depending upon the alkyl/aryl substituents. The C5—H of the triazole ring in all the synthesized intermediates resonated around δ 7.6. The ^{13}C NMR spectra of the compound **3** also confirmed the formation of the intermediates, where characteristic carbonyl carbon resonated in the region δ 180.2 and the adjacent methylene carbon at around δ 44.07. These intermediates **3a-e** underwent facile acid-induced cyclization in presence of PTSA to furnish corresponding 1-benzyl-5-methylsulfanyl-7-substituted-1*H*-1,2,3-benzotriazole-4-carbonitrile **4a-e** in moderate yields (40–60%). The absence of carbonyl band in IR spectra, C5—H of triazole and carbonyl-methylene protons in ^1H NMR spectra confirms the cyclization. Similarly the carbonyl carbon and one of methylene carbon also disappeared in ^{13}C NMR spectra, confirming the formation of cyclized product **4**. Its application for functionally substituted benzotriazoles and other heterocycles is in progress.

EXPERIMENTAL

Melting points were determined in open capillaries and are uncorrected. IR spectra were recorded on Nicolet Impact-410 FT-IR spectrophotometer, using KBr pellet technique. ^1H NMR and ^{13}C NMR experiments were performed at 300 MHz on Bruker AC-300F spectrometer (TMS as internal standard). Mass spectra were recorded on EI-70 EV instrument. Elemental analyses were carried out using Heraus CHN rapid analyzer.

(1-Benzyl-1*H*-1,2,3-triazole-4-yl)acetonitrile (1). A mixture of 1-benzyl-4-chloromethyl-1*H*-1,2,3-triazole (20.9 g, 0.1 mol) [16] and sodium cyanide (0.3 mol) in aq. ethanol (85%, 120 mL) was refluxed for 12 h (TLC). The reaction mixture was cooled, poured into water (200 mL), and extracted twice with benzene (100 mL). The benzene extract was washed thrice with water (200 mL), dried over anhydrous sodium sulfate and passed through silica bed. The filtrate was concentrated under reduced pressure to yield residual golden yellow oil in good yield (75%), which solidifies on cooling as needles. Pale brown solid, Yield 60%, mp 65–67°C; ir (KBr) ν cm^{-1}: 3066, 2922, 2229, 1412, 1129, 710; ^1H NMR (300 MHz, $CDCl_3$) δ: 3.86 (s, 2H, CH_2CN), 5.54(s, 2H, CH_2-N), 7.28–7.53(m, 5H, Ar-H), 7.30(s, 1H, C5—H of triazole); ^{13}C NMR (75 MHz, $CDCl_3$) δ: 17.5, 52.8, 112.6, 125.5, 128.4, 128.6, 129.2, 134.7. Anal. calcd for $C_{11}H_{10}N_4$: C, 66.65; H, 5.08; N, 28.26. Found: C, 66.61; H, 5.01; N, 28.29%

General procedure for the preparation of 2-(1-benzyl-1*H*-1,2,3-triazole-4-yl)-3-methylsulfanyl-5-oxo-5-substituted-*pent*-2-enenitrile (3a-e). To a suspension of NaH (60%, 0.88 g, 22 mmol) in dry benzene (20 mL) and dry DMF (20 mL) under stirring, a solution of (1-benzyl-1*H*-1,2,3-triazol-4-yl) acetonitrile **1** (2 g, 10 mmol) in dry benzene (10 mL) was added at 0°C over a period of 15 minutes and further stirred at 0–5°C for 15 min. Solution of α-oxoketene dithioacetal **2a-e** (10 mmol) in dry DMF (10 mL) was added slowly over 10 min to this mixture with stirring at 0–5°C. The reaction mixture was stirred at room temperature for 4–5 h. The solution was poured into aqueous ammonium chloride solution (8%, 200 mL), and extracted twice with benzene (50 mL). The collective benzene extract was washed thrice with water

(100 mL), dried over anhydrous sodium sulfate, passed through a silica bed and concentrated. After standing for 2 h, the crystallized material was separated by filtration and washed with a mixture of benzene and hexane (1:1) to afford **3a-e**.

2-(1-Benzyl-1H-1,2,3-triazole-4-yl)-3-methylsulfanyl-5-oxo-5-phenyl-*pent*-2-enenitrile (3a). Colorless solid, yield 70%, mp 114–116°C; ir (KBr) ν cm^{-1}: 3136, 2930, 2214, 1680, 1610, 1574, 1471; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.55 (s, 3H, SCH$_3$), 5.46 (s, 2H, NCH$_2$), 5.03 (s, 2H, COCH$_2$), 7.03–7.84 (m, 11H, C5—H of triazole, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 15.4, 44.07, 61.20, 96.3, 119.7, 127.8, 128.4, 128.6, 130.2, 132.4, 142.0, 165.4, 190.2. Anal. calcd for $C_{21}H_{18}N_4OS$: C, 67.36; H, 4.85; N, 14.96. Found: C, 67.24; H, 4.79; N, 14.99%.

2-(1-Benzyl-1H-1,2,3-triazole-4-yl)-5-(4-bromophenyl)-3-methylsulfanyl-5-oxo-*pent*-2-enenitrile (3b). Colorless solid, yield 75%, mp 140–142°C; ir (KBr) ν cm^{-1}: 3143, 2925, 2213, 1680, 1677, 1610, 1579, 1492; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.58 (s, 3H, SCH$_3$), 5.40 (s, 2H, NCH$_2$), 4.95 (s, 2H, COCH$_2$), 7.37–7.90 (m, 10H, C5—H of triazole, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 14.8, 46.6, 58.8, 107.0, 125.5, 125.7, 127.5, 128.4, 128.6, 129.2, 129.4, 130.8, 136.4, 144.3, 163.4, 184.5. Anal. calcd for $C_{21}H_{17}BrN_4OS$: C, 55.64; H, 3.78; N, 12.36. Found: C, 55.58; H, 3.65; N, 12.45%.

2-(1-Benzyl-1H-1,2,3-triazole-4-yl)-5-(4-chlorophenyl)-3-methylsulfanyl-5-oxo-*pent*-2-enenitrile (3c). Colorless solid, yield 65%, mp 152–154°C; ir (KBr) ν cm^{-1}: 3139, 2923, 2209, 1678, 1587, 1468; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.48 (s, 3H, SCH$_3$), 5.55 (s, 2H, NCH$_2$), 5.00 (s, 2H, COCH$_2$), 6.72–7.76 (m, 10H, C5—H of triazole, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 15.2, 47.1, 61.5, 99.7, 119.0, 125.5, 128.4, 128.6, 129.2, 129.4, 130.0, 135.5, 137.7, 142.0, 164.8, 190.0. Anal. calcd for $C_{21}H_{17}ClN_4OS$: C, 61.68; H, 4.19; N, 13.70. Found: C, 61.56; H, 4.10; N, 13.82%.

2-(1-Benzyl-1H-1,2,3-triazole-4-yl)-5-(4-methylphenyl)-3-methylsulfanyl-5-oxo-*pent*-2-enenitrile (3d). Colorless solid, yield 60%, mp 139–141°C; ir (KBr) ν cm^{-1}: 3129, 2914, 2210, 1673, 1570, 1260; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.53 (s, 3H, SCH$_3$), 5.46 (s, 2H, NCH$_2$), 4.99 (s, 2H, COCH$_2$), 7.07–7.72 (m, 10H, C5—H of triazole, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 15.3, 20.5, 46.9, 59.8, 109.1, 125.5, 128.4, 128.5, 128.7, 129.2, 129.4, 134.4 137.7, 165.4, 190.0. Anal. calcd for $C_{22}H_{20}N_4OS$: C, 68.02; H, 5.19; N, 14.42. Found: C, 67.93; H, 5.09; N, 14.54%.

2-(1-Benzyl-1H-1,2,3-triazole-4-yl)-3-methylsulfanyl-5-(1-naphthyl)-5-oxo-*pent*-2-enenitrile (3e). Colorless solid, yield 65%, mp 146–148°C; ir (KBr) ν cm^{-1}: 3142, 2932, 2219, 1668, 1574, 1460; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.42 (s, 3H, SCH$_3$), 5.35 (s, 2H, NCH$_2$), 4.90 (s, 2H, COCH$_2$), 7.06–8.74 (m, 13H, C5—H of triazole, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 15.7, 47.7, 62.0, 102.3, 123.7, 125.5, 126.6, 127.6, 128.2, 128.4, 128.6, 129.9, 134.4, 144.9, 164.0, 186.5. Anal. calcd for $C_{25}H_{20}N_4OS$: C, 70.73; H, 4.75; N, 13.20. Found: C, 70.61; H, 4.68; N, 13.31%.

General procedure for the preparation of 1-benzyl-5-methylsulfanyl-7-substituted-1*H*-1,2,3-benzotriazole-4-carbonitrile (4a-e). A solution of 2-(1-benzyl-1*H*-1,2,3-triazol-4-yl)-3-methylsulfanyl-5-oxo-5-substituted-*pent*-2-enenitrile 3a-e (2.5 mmol) and PTSA (1 g, 5.3 mmol) in benzene was refluxed for 4–6 h. The reaction mixture (monitored by TLC) was concentrated and dissolved in chloroform and poured into aqueous sodium bicarbonate solution (6%, 150 mL). The organic layer was separated, washed thrice with water (100 mL) and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure to yield the greenish yellow oil, which was purified by column chromatography using a benzene-hexane mixture (45:55–80: 20v/v) as eluent to furnish 4a-e.

1-Benzyl-5-methylsulfanyl-7-phenyl-1H-1,2,3-benzotriazole-4-carbonitrile (4a). Yellow solid, yield 50%, mp 180–182°C; ir (KBr) ν cm^{-1}: 3140, 2923, 2219, 1572, 1498; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.58 (s, 3H, SCH$_3$), 5.40 (s, 2H, NCH$_2$), 7.06–7.82 (m, 11H, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 17.4, 61.1, 123.7, 125.5, 125.7, 126.4, 127.1, 127.6, 128.4, 128.6, 129.2, 129.4, 130.5, 130.7, 133.4, 139.0, 144.3. Anal. calcd for $C_{21}H_{16}N_4S$: C, 70.76; H, 4.52; N, 15.72. Found: C, 70.67; H, 4.67; N, 15.80%.

1-Benzyl-7-(4-bromophenyl)-5-methylsulfanyl-1H-1,2,3-benzotriazole-4-carbonitrile (4b). Green solid, yield 58%, mp 191–193°C; ir (KBr) ν cm^{-1}: 3134, 2924, 2211, 1583, 1486; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.50 (s, 3H, SCH$_3$), 5.65 (s, 2H, NCH$_2$), 7.02–7.94 (m, 10H, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 17.9, 61.7, 124.2, 124.4, 124.6, 126.1, 126.5, 127.8, 128.3, 128.6, 129.5, 131.5, 132.9, 139.7, 142.9. Anal. calcd for $C_{21}H_{15}BrN_4S$: C, 57.94; H, 3.47; N, 12.87. Found: C, 57.89; H, 3.35; N, 12.95%.

1-Benzyl-7-(4-chlorophenyl)-5-methylsulfanyl-1H-1,2,3-benzotriazole-4-carbonitrile (4c). Pale yellow solid, yield 60%, mp 187–189°C; ir (KBr) ν cm^{-1}: 3135, 2926, 2219, 1584, 1468; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.54 (s, 3H, SCH$_3$), 5.60 (s, 2H, NCH$_2$), 7.03–8.02 (m, 10H, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 16.5, 60.0, 108.4, 125.4, 125.6, 127.1, 128.2, 129.8, 132.0, 135.5, 137.4, 139.4. Anal. calcd for $C_{21}H_{15}ClN_4S$: C, 64.53; H, 3.87; N, 14.33. Found: C, 64.42; H, 3.78; N, 14.44%.

1-Benzyl-7-(4-methylphenyll)-5-methylsulfanyl-1H-1,2,3-benzotriazole-4-carbonitrile (4d). Pale yellow solid, yield 50%, mp 156–158°C; ir (KBr) ν cm^{-1}: 3132, 2920, 2214, 1580, 1466; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.48 (s, 3H, SCH$_3$), 5.41 (s, 2H, NCH$_2$), 7.05–7.69 (m, 10H, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 17.9, 60.5, 111.2, 123.9, 125.2, 125.4, 126.9, 127.1, 128.6, 137.0, 141.9. Anal. calcd for $C_{22}H_{18}N_4S$: C, 71.32; H, 4.90; N, 15,12. Found: C, 71.21; H, 4.80; N, 15.20%.

1-Benzyl-5-methylsulfanyl-7-(1-naphthyl)-1H-1,2,3-benzotriazole-4-carbonitrile (4e). Pale green solid, yield 40%, mp 170–172°C; ir (KBr) ν cm^{-1}: 3133, 2922, 2211, 1590, 1458; ^{1}H NMR (300 MHz, CDCl$_3$) δ: 2.61 (s, 3H, SCH$_3$), 5.34 (s, 2H, NCH$_2$), 7.14–7.84 (m, 13H, ArH); ^{13}C NMR (75 MHz, CDCl$_3$) δ: 16.4, 59.7, 114.4, 125.7, 127.1, 128.6, 129.2, 132.6, 137.3, 140.8. Anal. calcd for $C_{25}H_{18}N_4S$: C, 73.87; H, 4.46; N, 13.78. Found: C, 73.79; H, 4.51; N, 13.80%.

Triarylpyrylium perchlorates are readily and selectively converted into corresponding 2-isoxazolines in good yield and short reaction time using solventless conditions.

J. Heterocyclic Chem., **46**, 778 (2009).

INTRODUCTION

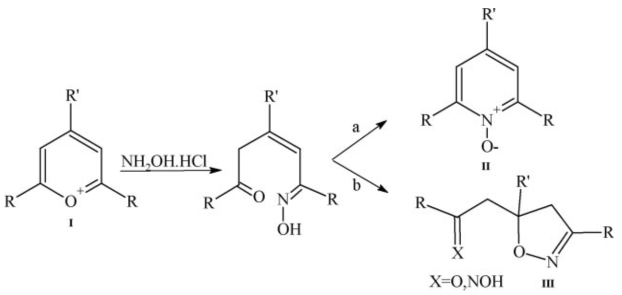
Isoxazoline heterocycles have been employed for a wide variety of uses in chemistry. These ring systems represent a class of unique pharmacophores, which are observed in many therapeutic agents and are versatile intermediates for the synthesis of complex natural products and are found in GPII/IIIa inhibitors and human leukocyte elastase inhibitors [1]. Besides being potential pharmaceutical agents, the isoxazolines have found numerous applications in synthesis through reductive cleavage of the N—O bond to give 1,3-amino alcohols [2]. Typically, 1,3-dipolar cycloaddition between nitrile oxide and alkene are used for synthesis of isoxazoline derivatives [3]. An alternative synthetic route could be offered for preparation of some 2-isoxazolines on treatment of a suspension of some 2,4,6-triarylpyrylium salts in aqueous ethanol with hydroxylamine in the presence of sodium hydroxide [4–6].

Mechanistic studies [5b,6] demonstrated that in the presence of bases the reaction proceeded, after initial attacked of the nucleophile and the ring opening to the δ-oxo-α,β-unsaturated ketoximes, not *via* path (a) but through Michael addition (path b) of two competing intramolecular cyclizations (Scheme 1). Even though this reaction is well studied in solution phase, however, solid supports procedures remain unexplored. The solvent-free use of supported reagents in combination with microwave irradiation provide ideal reaction conditions with special attributes such as reduced reaction time, easier work-up procedure, and enhanced selectivity and reactivity [7,8]. In connection with this trend and in continuation with our studies to develop selective, preparative, and synthetically useful methodology for preparation [9], application [10], and other transformation of pyrylium and thiopyrylium salts [11,12], herein, we report our results for a solvent-free microwave reaction protocol that leads to a facile preparation of 2-isoxazolines from the corresponding pyrylium salts.

RESULTS AND DISCUSSION

In efforts to improve the conversion of triarylpyryliums to corresponding 2-isoxazolines, these transformations were studied on solid materials such as silica gel, basic alumina, and nontraditional solid support material, such as K_2CO_3, which couple poorly with microwaves. Before introducing general protocol, preliminary tests were carried out to survey the requisite reaction conditions and establish the modifications required for this methodology. Triphenylpyrylium perchlorate was chosen as the model compound to identify and optimize the ideal solid support. In the cases of basic alumina and K_2CO_3 as solid support 2-isoxazolines obtained as sole product in comparable yields under microwave irradiation. More importantly, isolation of the product was more simplified and environmentally acceptable especially in the case of K_2CO_3, in which only washing the reaction mixture with water gave pure product. The same reaction in the presence of silica gel showed less selectivity toward 2-isoxazoline. Other attempts in the absence of solid phases were not successful and noticeable amount of starting materials remained intact. With these experiments, we have demonstrated that the traditional solid supports with soft acidic surface is less selective and effective, whereas solid supports with soft basic surface and nontraditional ones are moderately

Scheme 1



effective and perform the high selectivity toward desired product. Following these tests, the relative molar ratio of reactants and the amounts of solid support were also optimized under suitable microwave power. For elucidating the relative importance of this method and other effects in determining the selectivity course of these conversions, we proceeded to develop the solid support route to other triarylpyrylium perchlorates which contains electron donor and withdrawing group in para position of substituted phenyl rings and the results compared with those obtain from traditional method (in EtOH solvent). The data in Table 1 clearly showed that in the all cases (**Ia–g**) the reactions exhibit high regioselectivity toward corresponding 2-isoxazolines derivatives as favored products in very short reaction times. The long reaction time (*e.g.*, 18 h for model compound) which is one of the main drawbacks of traditional method overcomes in this method. The products undergo elimination of phenacyl in presence of sodium hydroxide as base in solvent so here; any attempt to increase the rate of the reaction at elevated temperature will decrease the yields [5a]. The formation of the oximes **IIId–f** may be described by considering the fact that the completion of these reactions in the presence of extra amount of hydroxylamine need more power of microwave irradiation and also more reaction times in comparison with the others. Interestingly, unlike to those obtained from trialkyl pyrylium [6a] these oximes were obtained as single E-isomer. This is also in accordance with the general trend in oximes, namely prevalence of the configuration in which the bulkier R group is opposite to hydroxyl group [13]. Pyryliums carrying *N*,*N*-dimethyl substituents in para position of 4-phenyl rings (**Ih**) do not react completely and selectively with hydroxylamine under these conditions and typical reaction times.

In conclusion, a new and general procedure for the construction of 2-isoxazoline derivatives (**IIIa–g**) from readily available starting material has been developed. We believe present solvent-free procedure under microwave irradiation; provide efficient, selective, and environmentally friendly methodology for conversion of triarylpyrylium perchlorates in which desired products can be obtained by simple filtration and washings without the need for a chromatographic workup.

EXPERIMENTAL

Chemicals were purchased from Fluka, Merck, and Aldrich chemical companies. All yields refer to isolated products. Monitoring of the reactions was accomplished by TLC. A domestic Butan microwave oven (1000 W) was used. Melting points were determined on a Gallenkamp melting point apparatus and are uncorrected. IR spectra were obtained on a Bomen.MB:102 FTIR spectrophotometer in KBr disks. ^{1}H NMR spectra were recorded on 400 MHz Brucker using $CDCl_3$ as the solvent and TMS as the internal standard.

Syntheses. All triarylpyrylium perchlorates were synthesized from the corresponding aldehydes and ketones by the

method previously described [14,15]. The isoxazolines IIIa and IIIf were identical with samples (IR, m.p.) prepared from the pervious method [5].

General procedure. ***In ethanol.*** 2,4,6-Triarylpyrylium perchlorate (0.5 mmol) was suspended in ethanol (10 ml). To the stirred suspension was added an aqueous of hydroxylamine hydrochloride (2.5 mmol) and excess sodium hydroxide. The suspension was stirred for 18 h at room temperature. The products was extracted and purified by chromatography (PLC) and then recrystalized from suitable solvents.

Solvent free. Triarylpyrylium perchlorate (1 mmol) was added to 1 g of basic alumina and/or K_2CO_3 in a mortar (this ratio was optimized under our experimental condition), after homogenizing 5 mmol of hydroxylamine gradually added in portion and the mixtures were grinded for further homogenization, then irradiated in different energy and required reaction times (Table 1). The reactions were monitored by TLC using a 30:70 mixture of ether:*n*-hexane as an eluent. After completion of the reaction, the mixtures were washed with water in the case of K_2CO_3 then the products were isolated by filtration. In the case of basic alumina, the reaction mixture diluted with CH_2Cl_2 then washed with water and dried (using $MgSO_4$). Evaporation of the solvent under vacuum provided a residue which was purified by PLC to afford the desired 2-isoxazolines or their oxime derivatives.

2-(3,5-Diphenyl-4,5-dihydro-isoxazol-5-yl)-1-phenyl-ethanone (IIIa). White crystals, m.p.: 123–124°C. IR (ν max/cm^{-1}): 1340, 1370, 1450, 1680. ^{1}H NMR: 7.3–7.88 (15H, m, Ar), 4.12 (1H, d, $^2J = 17$, CH_AH_B), 3.75 (1H, d, $^2J = 17$, CH_AH_B), 3.74 (2H, s, $COCH_2$). *Anal.* Calcd. for ($C_{23}H_{19}NO_2$): C, 80.91; H, 5.61; N, 4.10. An approach to pyrano[2,3-*c*]pyrazoles starting from spirocyclopropanepyrazoles *via* a ring-opening/cyanomethylation and intramolecular cyclization is described. Reactions of spirocyclopropanepyrazoles **1a**-**d** with chloroacetonitrile in the presence of sodium hydride gave the corresponding cyanomethoxypyrazoles **4a**-**d**. Treatment of **4a**-**d** with sodium hydride at room temperature caused intramolecular Michael addition reaction to afford the corresponding pyrano[2,3-*c*]pyrazoles **5a**-**d**.

J. Heterocyclic Chem., **46**, 782 (2009).

INTRODUCTION

In many biologically active compounds, the pyrazole core is a privileged substructure. Compounds containing this ring system are known to display diverse pharmacological activities such as analgesic, antidepressant, antibacterial, plant growth regulatory, anti-inflammatory and antihyperglycemic activities [1–10]. In this context, the synthesis of pyrazole derivatives continues to attract attention and provides an interesting challenge [11–16]. In connection with our current research interests in this area, we have reported the synthesis of 1-acyl-1,2-dihydro-3*H*-pyrazol-3-ones through Lewis acid-mediated rearrangement of 3-acyloxypyrazoles [17]. More recently, we have also discussed the efficient method for the preparation of spirocyclopropanepyrazoles [18].

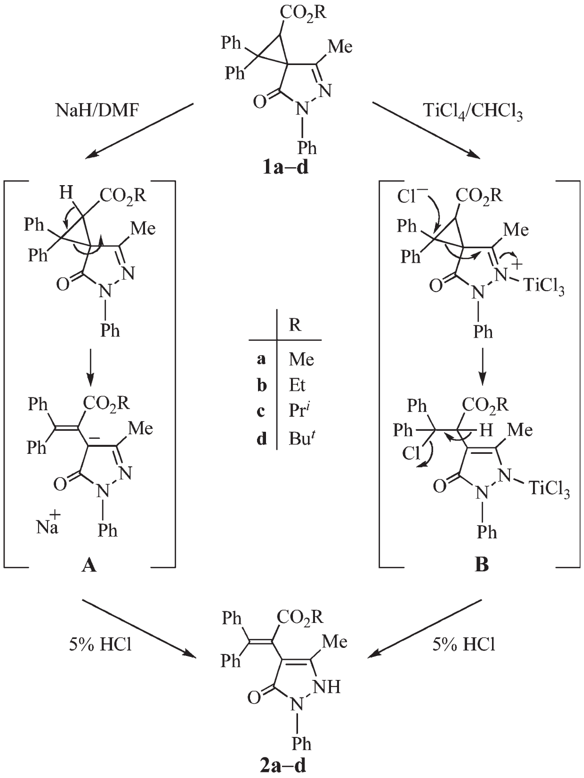
Some heterocyclic compounds containing condensed pyrazoles such as pyrano[2,3-*c*]pyrazoles possess a wide spectrum of pharmacological action, including analgesic, anti-inflammatory, vasodilating and antihypertensive activities [19–21]. Hence, the preparation and biological properties of new substituted pyrano[2,3-*c*]pyrazoles are of interest [22–36]. For these reasons, we focused our attention on the development of a new method for the preparation of pyrano[2,3-*c*]pyrazoles starting from spirocyclopropanepyrazoles and now report the results of our investigation, a ring-opening/cyanomethylation and intramolecular cyclization of them in the presence of a base such as sodium hydride.

RESULTS AND DISCUSSION

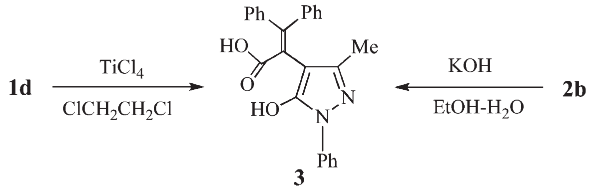
The starting materials, spiro compounds **1a-d**, were prepared by treatment of 2,4-dihydro-5-methyl-2-phenyl-4-(diphenylmethylene)-3*H*-pyrazol-3-one and α-chloro esters according to our previous investigation [18]. When a mixture of **1a-d** and sodium hydride in *N*,*N*-dimethylformamide was stirred at room temperature for 1 h, pyrazol-3-ones **2a-d** were obtained in excellent yields (Scheme 1 and Table 1). The IR spectra of **2a-d** display bands near 3100 cm^{-1} due to the secondary amino group and in the range of 1650–1690 cm^{-1} due to the two carbonyl groups. The ^{1}H NMR spectra of **2a-d** in deuteriochloroform exhibit a D_2O exchangeable signal near δ 10 attributable to the secondary amino proton. The ^{13}C NMR spectra of **2a-d** show two signals near δ 120 and 150 due to the olefin carbons, whereas those of **1a-d** show three signals near δ 50 due to the spirocyclopropane carbons. Elemental analyses and spectral data of **2a-d** are consistent with the proposed structures (see experimental section).

Fortunately, we found the reaction condition under which ring-opening products **2a-c** could be isolated in the presence of a Lewis acid. Titanium(IV) chloride-catalyzed ring-opening reactions have already been reported in the literature [37–39]. Subsequently, thermal treatment of **1a-c** with titanium(IV) chloride in chloroform caused ring opening of cyclopropane to give the corresponding pyrazol-3-ones **2a-c** in good yields. The

Scheme 1



Scheme 2



melting points and IR spectra of these compounds **2a**-**c** coincided with those of samples prepared from **1a**-**c** and sodium hydride as described above. Interestingly, in the case of the reaction of **1d** as the substrate, the expected product **2d** could not be produced but instead the carboxylic acid **3** was obtained in 93% yield (Scheme 2 and see "Experimental" section). To confirm the structure of **3**, we carried out the hydrolysis of compound **2b**. Thus, thermal treatment of **2b** with potassium hydroxide in aqueous ethanol afforded the carboxylic acid **3** (73%), which was confirmed by direct comparison with an authentic sample prepared from **1d** and titanium(IV) chloride. Although the detailed mechanism for the formation of **3** is not clear at present, this is probably because the metal complex containing chelate ring coordinated by both carboxyl and hydroxyl groups would be easily formed as an intermediate in this reaction.

Table 1

Synthesis of compounds **2a-d** according to Scheme 1.

Entry	Substrate	Product	Yield (%)
1	**1a**	**2a**	99[a] 99[b]
2	**1b**	**2b**	99[a] 99[b]
3	**1c**	**2c**	99[a] 99[b]
4	**1d**	**2d**	86[a] 0[b]

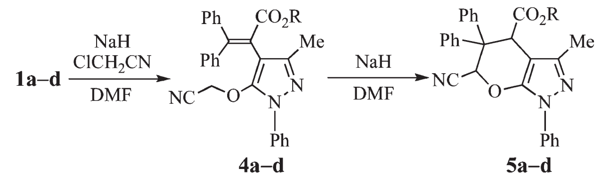
[a] NaH/DMF, r.t., 1 h.

[b] $TiCl_4/CHCl_3$, reflux, 1h.

The formation of the pyrazole-3-ones **2** could be explained by possible mechanism presented in Scheme 1. Thus, the reaction of spiro compounds **1** with sodium hydride probably causes the ring opening of cyclopropane *via* deprotonation to give the sodium salts **A** of pyrazole, which could then undergo protonation of **A** to afford the pyrazoles **2**. On the other hand, treatment of **1** with titanium(IV) chloride probably causes ring opening reaction *via* an attack of chloride ion to cyclopropane ring, giving the intermediate chlorine-containing compound **B**. The pyrazol-3-ones **2** would then be produced easily from **B** through an elimination of hydrogen chloride.

Based on these results, we hypothesized if a cyanomethylation of sodium salts **A** of pyrazole could undergo readily under an appropriate reaction condition, the synthesis of cyanomethylated pyrazoles would be possible. Thus, we carried out the cyanomethylation of spiro compounds **1** with chloroacetonitrile by use of a sodium hydride/*N*,*N*-dimethylformamide system. Contrary to our expectation, when a mixture of **1a-d** and sodium hydride in *N*,*N*-dimethylformamide was stirred at room temperature for 1 h and then the reaction mixture was treated with chloroacetonitrile at 60°C for 1 h, the *O*-cyanomethylated pyrazoles **4a-d** were obtained in moderate to good yields (Scheme 3 and entries 1–4 in Table 2). By comparison of the NMR, mass spectra and elemental analyses of **4a-d** it seems that the structural assignments given to these compounds are correct. In this reaction, *C*- and/or *N*-cyanomethylated pyrazoles were not detected.

Scheme 3



a: R = Me, **b**: R = Et, **c**: R = Pr^i, **d**: R = Bu^t

Table 2

Synthesis of compounds **4a-d** and **5a-d** according to Scheme 3.

Entry	Substrate	Product	Yield (%)
1	**1a**	**4a**	67
2	**1b**	**4b**	58
3	**1c**	**4c**	76
4	**1d**	**4d**	85
5	**4a**	**5a**	35
6	**4b**	**5b**	61
7	**4c**	**5c**	56
8	**4d**	**5d**	58

To confirm the *O*-cyanomethylated pyrazoles **4**, we next examined the conversion of **4** into the fused pyrazole derivatives in the presence of a base. After some optimization, the best result was obtained when **4a-d** were treated with sodium hydride in *N,N*-dimethylformamide at room temperature, the expected pyrano[2,3-*c*]pyrazoles **5a-d** was isolated in moderate yields (Scheme 3 and entries 5–8 in Table 2). Although, we tested the reactions under the other conditions such as a potassium *tert*-butoxide/*N,N*-dimethylformamide and potassium *tert*-butoxide/*tert*-butyl alcohol system, those attempts were unacceptable with respect to yield. It makes us believe that the intramolecular Michael addition reaction of **4** can only be promoted by using a sodium hydride/*N,N*-dimethylformamide system.

The IR spectra of **5a-d** display bands near 2250 cm^{-1} due to a nonconjugated cyano group and near 1730 cm^{-1} due to a carbonyl group. The ^{1}H NMR spectra of **5a-d** in deuteriochloroform exhibit a signal near δ 5.0 attributable to the 4-methine proton and a signal near δ 6.0 attributable to the 6-methine proton. The ^{13}C NMR spectra of **5a-d** show a signal near δ 50 due to the 4-methine carbon, a signal near δ 60 due to the 5-quaternary carbon and a signal near δ 70 due to the 6-methine carbon, whereas those of **4a-d** show a signal near δ 40 due to the methylene carbon and two signals near δ 120 and 150 due to the olefin carbons. Elemental analyses and spectral data of **4** and **5** are consistent with the assigned structures (see experimental section). In addition, for products **5a-d**, a clear nuclear Overhauser effect was not observed between 4-methine proton and 6-methine proton of trans configuration. These results indicate that *trans*-pyrano[2,3-*c*]pyrazoles are more stable than *cis*-pyrano[2,3-*c*]pyrazoles.

Finally, on the basis of these results, we have tried to directly construct pyrano[2,3-*c*]pyrazoles **5** starting from sipro compounds **1** in a one-pot process. To optimize the yield of **5**, we carried out several further experiments on **1**, testing different reaction conditions, e.g. time, solvent and substrate/base molar ratio. The results are summarized in Table 3. After a mixture of 1.0 equivalent of **1a-d** and 1.0 equivalent of sodium hydride in *N,N*-dimethylformamide was stirred at room temperature for 1 h, the reaction mixture was treated with 1.0 equivalent of chloroacetonitrile at 60°C for 1 h and then with 0.5 equivalent of sodium hydride at room temperature, the corresponding pyrano[2,3-*c*]pyrazoles **5a-d** were obtained in moderate yields (Table 3).

In conclusion, we have developed a novel method for the construction of pyrano[2,3-*c*]pyrazole derivatives **5a-d**, proceeding by a ring-opening/cyanomethylation and intramolecular cyclization when spirocyclopropane-pyrazoles **1a-d** are treated with chloroacetonitrile in the presence of sodium hydride. This methodology offers significant advantages with regard to the supply of pyrano[2,3-*c*]pyrazoles, which may exhibit biological activities such as analgesic, anti-inflammatory, vasodilating and antihypertensive activities. Functionalized pyrano[2,3-*c*]pyrazoles are important synthons in organic synthesis and for the preparation of biologically active compounds with interest in medicinal chemistry. Further studies on the synthesis of new substituted pyrano[2,3-*c*]pyrazoles are under way.

EXPERIMENTAL

All melting points are uncorrected. The IR spectra were recorded on a JASCO FT/IR-4100 spectrometer. The ^{1}H and ^{13}C NMR spectra were recorded on a JEOL JNM-A500 spectrometer at 500 and 125 MHz, respectively. The ^{1}H and ^{13}C chemical shifts (δ) are reported in parts per million (ppm) relative to tetramethylsilane as internal standard. The positive FAB mass spectra were obtained on a JEOL JMS-700T spectrometer. The elemental analyses were performed on a YANACO MT-6 CHN analyzer.

General Procedure for the Preparation of Ring-Opening Products 2a-d from 1a-d. Procedure A. To an ice-cooled and stirred solution of **1a-d** [18] (1 mmole) in *N,N*-dimethylformamide (5 mL) was added 60% sodium hydride (0.04 g, 1 mmole). After the mixture was stirred at room temperature for 1 h, the solvent was removed *in vacuo*. A 5% hydrochloric acid solution (20 mL) was added to the residue with stirring and ice-cooling. The resulting mixture was extracted with chloroform (60 mL). The extract was dried over anhydrous sodium sulfate and concentrated *in vacuo*. The residue was purified by column chromatography on silica gel with chloroform-acetone (4:1) as the eluent to afford **2a** (0.404 g, 99%),

Table 3

Synthesis of pyrano[2,3-*c*]pyrazoles **5a-d** starting from **1a-d**.

Entry	Substrate	Product	Yield (%)
1	**1a**	**5a**	28
2	**1b**	**5b**	47
3	**1c**	**5c**	44
4	**1d**	**5d**	59

2b (0.420 g, 99%), **2c** (0.436 g, 99%) and **2d** (0.388 g, 86%), respectively.

Procedure B. To an ice-cooled and stirred solution of **1a**-**c** (1 mmole) in chloroform (5 mL) was added titanium(IV) chloride (0.38 g, 2 mmoles). After the mixture was refluxed for 1 h, a 5% hydrochloric acid solution (20 mL) was added to the reaction mixture with stirring and ice-cooling. After work-up as described above, **2a** (0.406 g, 99%), **2b** (0.419 g, 99%) and **2c** (0.435 g, 99%) were obtained.

Methyl 2-(5-methyl-3-oxo-2-phenyl-2,3-dihydro-1H-pyrazol-4-yl)-3,3-diphenylacrylate (2a). This compound was obtained as pale yellow needles, mp 141–143°C (chloroform-petroleum ether); IR (potassium bromide): ν 3060 (NH), 1714, 1685, 1656 cm^{-1} (C=O); ^1H NMR (deuteriochloroform): δ 1.32 (s, 3H, 5-Me), 3.37 (s, 3H, CO_2Me), 6.72 (d, J = 7.3 Hz, 2H, Ph-H), 6.99 (d, J = 3.7 Hz, 2H, Ph—H), 7.15–7.44 (m, 9H, Ph—H), 7.79 (d, J = 7.9 Hz, 2H, Ph—H), 10.33 ppm (s, 1H, NH); ^{13}C NMR (deuteriochloroform): δ 12.0 (5-Me), 52.3 ($CO_2\mathit{Me}$), 107.9 (C-4), 118.0, 121.6 (Ph—C), 122.2 ($Ph_2C{=}\mathit{C}{-}CO_2Me$), 124.6, 125.0, 127.9, 128.0, 128.1, 128.5, 128.7, 128.9, 129.1, 130.4, 137.1, 141.2, 142.4 (Ph—C), 149.1 (C-5), 150.2 ($Ph_2\mathit{C}{=}C{-}CO_2Me$), 162.7, 172.9 ppm (C=O); ms: m/z 411 $[M+H]^+$. *Anal.* Calcd. for $C_{26}H_{22}N_2O_3{\cdot}0.2H_2O$: C, 75.42; H, 5.45; N, 6.77. The Preparation of Carboxylic Acid Derivative 3 from 1d and/or 2b. Procedure A. To an ice-cooled and stirred solution of **1d** [18] (0.45 g, 1 mmole) in 1,2-dichloroethane (5 mL) was added titanium(IV) chloride (0.38 g, 2 mmoles). After the mixture was refluxed for 4 h, a 5% hydrochloric acid solution (20 mL) was added to the reaction mixture with stirring and ice-cooling. The precipitate was collected by filtration, washed with water, dried and recrystallized from chloroform-methanol to yield **2-(5-hydroxy-3-methyl-1-phenyl-1*H*-pyrazol-4-yl)-3,3-diphenylacrylic acid** (**3**) (0.37 g, 93%) as colorless needles, mp 277–279°C; IR (potassium bromide): ν 3448 (OH), 1676 cm^{-1} (C=O); ^1H NMR (dimethyl sulfoxide-d_6): δ 1.67 (s, 3H, 3-Me), 7.05–7.07 (m, 2H, Ph—H), 7.17–7.24 (m, 6H, Ph—H), 7.39–7.42 (m, 5H, Ph—H), 7.63–7.65 (m, 2H, Ph—H), 11.04, 12.21 ppm (s, 2H, 2×OH); ^{13}C NMR (dimethyl sulfoxide-d_6): δ 12.2 (3-Me), 118.3 (C-4), 124.3 ($Ph_2C{=}\mathit{C}{-}CO_2H$), 124.6, 127.4, 127.6, 127.7, 127.8, 128.8, 129.0, 129.6, 137.4, 141.8 (Ph—C), 142.2 (C-3), 147.1 (C-5), 147.5 ($Ph_2\mathit{C}{=}C{-}CO_2H$), 169.9 ppm (C=O); ms: m/z 397 $[M+H]^+$. *Anal.* Calcd. for $C_{25}H_{20}N_2O_3$: C, 75.74; H, 5.09; N, 7.07. Found: C, 75.62; H, 5.13; N, 6.91.

Procedure B. After a mixture of **2b** (0.42 g, 1 mmole) and potassium hydroxide (0.56 g, 10 mmoles) in ethanol (5 mL) and water (2 mL) was refluxed for 8 h, the solvent was removed *in vacuo*. A 10% hydrochloric acid solution (20 mL) was added to the residue with stirring and ice-cooling. The precipitate was collected by filtration, washed with water, dried and recrystallized from chloroform-methanol to yield **3** (0.289 g, 73%).

General Procedure for the Preparation of Cyanomethoxypyrazoles 4a-d from 1a-d and chloroacetonitrile. To an ice-cooled and stirred solution of **1a**-**d** (5 mmoles) in *N*,*N*-dimethylformamide (15 mL) was added 60% sodium hydride (0.20 g, 5 mmoles). After the mixture was stirred at room temperature for 1 h, chloroacetonitrile (0.76 g, 10 mmoles) was added to the reaction mixture with stirring and then the resulting mixture was stirred at 60°C for 1 h. After the solvent was removed *in vacuo*, a 5% hydrochloric acid solution (20 mL) was added to the residue with stirring and ice-cooling. The resulting mixture was extracted with chloroform (60 mL). The extract was dried over anhydrous sodium sulfate and concentrated *in vacuo*. The residue was purified by column chromatography on silica gel with chloroform as the eluent to afford **4a**-**d**.

Methyl 2-[5-(cyanomethoxy)-3-methyl-1-phenyl-1H-pyrazol-4-yl]-3,3-diphenylacrylate (4a). This compound was obtained as colorless prisms (1.51 g, 67%), mp 120–122°C (acetone-petroleum ether); IR (potassium bromide): ν 2251 (CN), 1712 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 2.05 (s, 3H, 3-Me), 3.55 (s, 3H, CO_2Me), 4.62 (s, 2H, OCH_2CN), 7.08–7.10 (m, 2H, Ph—H), 7.20–7.30 (m, 6H, Ph—H), 7.34–7.43 ppm (m, 7H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 13.3 (3-Me), 52.1 (CO_2*Me*), 57.9 (O*C*H_2CN), 105.1 (C-4), 114.0 (CN), 121.5 (Ph_2C=*C*—CO_2Me), 122.7, 127.3, 128.1, 128.4, 128.6, 129.1, 129.2, 137.6, 140.5, 141.5 (Ph—C), 148.3 (C-3), 148.4 (C-5), 150.8 (Ph_2*C*=C—CO_2Me), 170.2 ppm (C=O); ms: m/z 450 $[M+H]^+$. *Anal.* Calcd. for $C_{28}H_{23}N_3O_3$: C, 74.82; H, 5.16; N, 9.35. Found: C, 74.98; H, 5.22; N, 9.29.

Ethyl 2-[5-(cyanomethoxy)-3-methyl-1-phenyl-1H-pyrazol-4-yl]-3,3-diphenylacrylate (4b). This compound was obtained as colorless prisms (1.35 g, 58%), mp 98–100°C (acetone-petroleum ether); IR (potassium bromide): ν 2244 (CN), 1713 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 0.95 (t, J = 7.1 Hz, 3H, CO_2CH_2*Me*), 2.06 (s, 3H, 3-Me), 4.02 (q, J = 7.1 Hz, 2H, CO_2*C*H_2Me), 4.64 (s, 2H, OCH_2CN), 7.09–7.10 (m, 2H, Ph—H), 7.20–7.44 ppm (m, 13H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 13.4 (3-Me), 13.6 (CO_2CH_2*Me*), 57.9 (O*C*H_2CN), 61.2 (CO_2*C*H_2Me), 105.1 (C-4), 114.0 (CN), 121.9 (Ph_2C=*C*—CO_2CH_2Me), 122.7, 127.3, 128.1, 128.2, 128.4, 128.5, 129.2, 129.9, 137.6, 140.5, 141.7 (Ph—C), 148.36 (C-3), 148.43 (C-5), 150.5 (Ph_2*C*=C—CO_2CH_2Me), 169.8 ppm (C=O); ms: m/z 464 $[M+H]^+$. *Anal.* Calcd. for $C_{29}H_{25}N_3O_3$: C, 75.14; H, 5.44; N, 9.07. Found: C, 75.14; H, 5.52; N, 9.04.

Isopropyl 2-[5-(cyanomethoxy)-3-methyl-1-phenyl-1H-pyrazol-4-yl]-3,3-diphenylacrylate (4c). This compound was obtained as colorless needles (1.54 g, 65%), mp 143–145°C (acetone-petroleum ether); IR (potassium bromide): ν 2244 (CN), 1716 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 0.97 (d, J = 6.4 Hz, 6H, CO_2CH*Me_2*), 2.09 (s, 3H, 3-Me), 4.68 (s, 2H, OCH_2CN), 4.88 (sep, J = 6.4 Hz, 1H, CO_2*CH*Me_2), 7.19–7.23 (m, 2H, Ph—H), 7.25–7.30 (m, 6H, Ph—H), 7.33–7.35 (m, 3H, Ph—H), 7.37–7.43 ppm (m, 4H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 13.4 (3-Me), 21.2 (CO_2CH*Me_2*), 58.0 (O*C*H_2CN), 69.0 (CO_2*C*HMe_2), 105.0 (C-4), 114.0 (CN), 122.2 (Ph_2C=*C*—CO_2CHMe_2), 122.7, 127.3, 128.1, 128.3, 128.4, 129.1, 129.3, 129.9, 137.5, 140.5, 141.6 (Ph—C), 148.3 (C-3), 148.4 (C-5), 149.9 (Ph_2*C*=C—CO_2CHMe_2), 169.3 ppm (C=O); ms: m/z 478 $[M+H]^+$. *Anal.* Calcd. for $C_{30}H_{27}N_3O_3$: C, 75.45; H, 5.70; N, 8.80. Found: C, 75.43; H, 5.77; N, 8.75.

tert-*Butyl 2-[5-(cyanomethoxy)-3-methyl-1-phenyl-1H-pyrazol-4-yl]-3,3-diphenylacrylate (4d).* This compound was obtained as colorless needles (2.09 g, 85%), mp 85–87°C (diethyl ether-petroleum ether); IR (potassium bromide): ν 2251 (CN), 1711 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 1.24 (s, 9H, CO_2CMe_3), 2.13 (s, 3H, 3-Me), 4.70 (s, 2H, OCH_2CN), 7.06–7.08 (m, 2H, Ph—H), 7.19–7.21 (m, 3H, Ph—H), 7.25–7.29 (m, 3H, Ph—H), 7.34–7.42 ppm (m, 7H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 13.5 (3-Me), 27.6 (CO_2C*Me_3*), 58.0 (O*C*H_2CN), 81.9 (CO_2*C*Me_3), 105.1 (C-4), 114.1 (CN), 122.8 (Ph—C), 123.4 (Ph_2C=*C*—CO_2CMe_3), 127.2, 128.0, 128.2, 129.1, 129.4, 129.8, 137.7, 140.6, 141.7 (Ph—C), 148.4 (C-3), 148.5 (C-5), 149.5 (Ph_2*C*=C—CO_2CMe_3), 168.6 ppm (C=O); ms: m/z 492 $[M+H]^+$. *Anal.* Calcd. for $C_{31}H_{29}N_3O_3 \cdot 0.3CH_3CH_2OCH_2CH_3$: C, 75.27; H, 6.28; N, 8.18. Found: C, 75.26; H, 6.47; N, 8.01.

General Procedure for the Preparation of Pyrano[2,3-*c*]pyrazoles 5a-d from 4a-d. To an ice-cooled and stirred solution of **4a**-**d** (1 mmole) in *N,N*-dimethylformamide (5 mL) was added 60% sodium hydride (0.02 g, 0.5 mmole). After the mixture was stirred at room temperature for 48 h, a 5% hydrochloric acid solution (20 mL) was added to the reaction mixture with stirring and ice-cooling. The resulting mixture was extracted with chloroform (60 mL). The extract was dried over anhydrous sodium sulfate and concentrated *in vacuo*. The residue was purified by column chromatography on silica gel with chloroform as the eluent to give **5a**-**d**.

Methyl 6-cyano-3-methyl-1,5,5-triphenyl-1,4,5,6-tetrahydropyrano[2,3-c]pyrazole-4-carboxylate (5a). This compound was obtained as colorless prisms (0.155 g, 35%), mp 218–220°C (chloroform-petroleum ether); IR (potassium bromide): ν 2255 (CN), 1740 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 2.28 (s, 3H, 3-Me), 3.26 (s, 3H, CO_2Me), 4.40 (s, 1H, 4-H), 6.54 (s, 1H, 6-H), 7.15–7.38 (m, 13H, Ph—H), 7.59–7.61 ppm (m, 2H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 12.6 (3-Me), 47.3 (C-4), 50.5 (C-5), 52.2 (CO_2*Me*), 71.2 (C-6), 96.3 (C-3a), 115.4 (CN), 120.4, 126.3, 128.0, 128.3, 129.1, 137.8, 139.4, 140.5, (Ph—C), 145.2 (C-3), 148.1 (C-7a), 171.8 ppm (C=O); ms: m/z 450 $[M+H]^+$. *Anal.* Calcd. for $C_{28}H_{23}N_3O_3$: C, 74.82; H, 5.16; N, 9.35. tert-*Butyl 6-cyano-3-methyl-1,5,5-triphenyl-1,4,5,6-tetrahydropyrano[2,3-c]pyrazole-4-carboxylate (5d).* This compound was obtained as pale yellow prisms (0.287 g, 58%), mp 225–227°C (chloroform-petroleum ether); IR (potassium bromide): ν 2251 (CN), 1723 cm^{-1} (C=O); ^{1}H NMR (deuteriochloroform): δ 1.07 (s, 9H, CO_2CMe_3), 2.33 (s, 3H, 3-Me), 4.32 (s, 1H, 4-H), 6.61 (s, 1H, 6-H), 7.20–7.38 (m, 13H, Ph—H), 7.60–7.62 ppm (m, 2H, Ph—H); ^{13}C NMR (deuteriochloroform): δ 12.8 (3-Me), 27.5 ($CO_2C\mathit{Me}_3$), 47.6 (C-4), 50.4 (C-5), 71.2 (C-6), 82.1 ($CO_2\mathit{C}Me_3$), 96.9 (C-3a), 115.6 (CN), 120.3, 126.2, 127.8, 128.1, 128.2, 128.7, 129.1, 137.9, 140.0, 140.9 (Ph—C), 145.1 (C-3), 148.1 (C-7a), 170.6 ppm (C=O); ms: m/z 492 $[M+H]^+$. *Anal*. Calcd. for $C_{31}H_{29}N_3O_3$: C, 75.74; H, 5.95; N, 8.55. Found: C, 75.74; H, 6.03; N, 8.51.

General Procedure for the Preparation of Pyrano[2,3-*c*]pyrazoles 5a-d from 1a-d and Chloroacetonitrile. To an ice-cooled and stirred solution of **1a-d** (1 mmole) in *N*,*N*-dimethylformamide (5 mL) was added 60% sodium hydride (0.04 g, 1 mmole). After the mixture was stirred at room temperature for 1 h, chloroacetonitrile (0.075 g, 1 mmole) was added to the reaction mixture with stirring and then the resulting mixture was stirred at 60°C for 1 h. To an ice-cooled and stirred solution of the reaction mixture was added 60% sodium hydride (0.04 g, 1 mmole). After the mixture was stirred at room temperature for 48 h, a 5% hydrochloric acid solution (20 mL) was added to the reaction mixture with stirring and ice-cooling. The resulting mixture was extracted with chloroform (60 mL). The extract was dried over anhydrous sodium sulfate and concentrated *in vacuo*. The residue was purified by column chromatography on silica gel with chloroform as the eluent to form **5a** (0.127 g, 28%), **5b** (0.219 g, 47%), **5c** (0.208 g, 44%), and **5d** (0.292 g, 59%), respectively.

Acknowledgments. The authors thank Mr. Hiroshi Hanazono and Ms. Yukiko Iwase for obtaining Mass and NMR spectra and to Ms. Junko Honda for her valuable help with elemental analyses.

5,6-Dinitro and 5,6-diaminobenzimidazolone-2 can be synthesized at a sufficiently high purity and yield to permit its large scale production in an economically feasible manner. The results of our studies derived optimum conditions for the nitration process necessary to obtain pure 5,6-dinitriobenzimidazolone-2.

J. Heterocyclic Chem., **46**, 788 (2009).

INTRODUCTION

Connected mostly with their ability to form strong hydrogen bonds, benzimidazolone-2 and its derivatives have invoked considerable interest, and they are useful chemicals mainly as the intermediates in production of pharmaceuticals, pesticides, and pigment. 5,6-Dinitrobenzimidazolone-2 possess a variety of biological activities [1] and is explored for corrosion inhibitor [2]. 5,6-diaminobenzimidazolone-2 is widely used in diverse applications such as organic pigments and pharmaceuticals [3].

According to the refs. 4 and 5,5,6-dinitriobenzimidazolone-2 can be obtained by nitration of benzimidazolone-2 or 5-nitrobenzimidazolone-2, and 5,6-diaminobenzimidazolone-2 can be synthesized by reduction of 5,6-dinitriobenzimidazolone (Scheme 1). If pure compounds can obtain by the first method, it has a remarkable advantage in terms of cost.

Although there are some references to the synthesis of two compounds in the literature, very few data were reported. Moreover, the results of our investigations show their purity should be important, since impurities in the substrates can cause a substantial deterioration of the properties of the pigments.

In this article, we provide a process for preparing 5,6-dinitro and 5,6-diaminobenzimidazolone-2 and study the optimum conditions for the nitration reaction. The results indicate two compounds can be synthesized with high purity and yield, which permit a large scale production in an economically feasible manner.

RESULTS AND DISCUSSION

The nitration of bezimidazolone-2 is a key process in the overall reaction, since impure 5,6-dinitrobenzimidazolone-2 can cause a substantial deterioration of the properties of following products. In this article, our special concern is the optimum conditions for the nitric process.

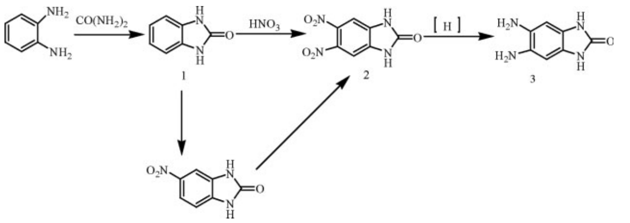
In the nitration reaction, the concentration and the dosage of nitric acid were two important factors. The by-product, 5-nitrobenzimidazolone-2, could be formed when the concentration of nitric acid was lower than 80%. It was found that the preferred concentration of nitric acid was 90% (fuming) [6], and pure 5,6-dinitriobenzimidazolone could be obtained by nitration of benzimidazolone-2 using a excess of fuming nitric acid (1.07:1–1.20:1).

Furthermore, bezimidazolone-2 is soluble in 98% sulfuric acid, and there is a disadvantage of being able to sulfonate starting material. The disadvantage is rarely serious, for nitration is generally a more rapid process than sulfonation, and pure 5,6-dinirtobezimidazolone-2 can be obtained by purified.

To obtain the optimal conditions of the nitration reaction, we designed the L_3^3 orthogonal test, and selected values of D.V.S (Dehydrating value of sulfuric acid), reaction temperature, and reaction time were chosen. The results are shown in Table 1.

The nitrating mixture employed can be characterized by the D.V.S. value. The D.V.S. value is defined as the actual sulfuric acid divided by the total water present

Scheme 1. Synthesis of 5,6-dinitro and 5,6-diaminobenzimidazolone-2.



when nitration is completed, both values being on a weight basis. Hence, water introduced with the reactants-mixed acid and formed in the reaction are both accounted for in the D.V.S. The relationship can be calculated from the equations:

$$\text{D.V.S.} = \frac{\text{Wt. of } H_2SO_4 \text{ used}}{\text{Wt. of } H_2O \text{ at end of reaction}} = \frac{m_{H_2SO_4}}{m_{H_2O}}$$

The results listed in Table 1 show that the higher D.V.S. is, the higher yield is obtained. A 73.75% yield is corresponding to D.V.S. 20. Intuitively, it would seem that the rate of reaction could be increased by increasing concentration sulfuric acid, since an increase in sulfuric acid concentration generates a corresponding increase in nitronium ion activity. Whereas using a significant excess of strong acid would raise the cost of the method, since the acid should be regenerated and purified. Otherwise, the presence of more water in the mixed acid can affect the reaction by (a) increasing the NO_x produced, which increases reaction instability and (b) decreasing the nitrating strength of the acid which, in turn, lowers product yield. Moreover, the results listed in Figure 1 has shown that if D.V.S. exceed 15, the product is low in other by-product impurities without 5-nitrobenzimidazolone-2 and can gain 97% or greater based on HPLC (Fig. 1) by purification. So, this value should be in the range 16–20, more preferably about 20.

Table 1

Parameters and results of the nitration reaction of benzimidazolone-2.[a]

D.V.S.	98% of H_2SO_4 (g)	90% of HNO_3 (g)	Reaction temperature (°C)	Reaction time (h)	Yield[b] (%)
20	44.82	4.02	0–5	2	73.75
20	44.82	4.02	5–10	5	67.35
20	44.82	4.02	10–15	8	66.30
18	37.74	4.02	0–5	5	71.38
18	37.74	4.02	5–10	8	65.13
18	37.74	4.02	10–15	2	69.22
16	31.51	4.02	0–5	8	65.19
16	31.51	4.02	5–10	2	74.05
16	31.51	4.02	10–15	5	60.94

[a] Reaction conditions: benzimidazolone-2, 3.35 g (dissolved in 22.5 g 98% sulfuric acid); the mole ratio of actual nitric acid to theoretical acid, 1.15.

[b] Isolated yield.

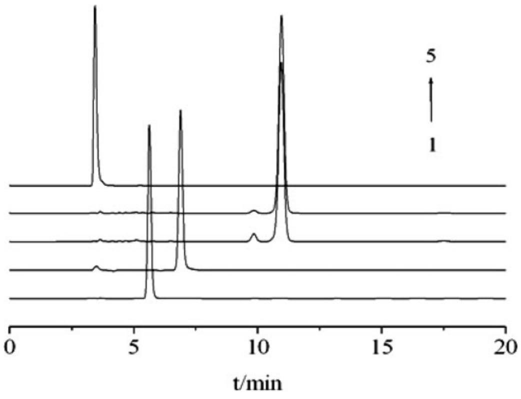


Figure 1. The chromatograms of (1) benzimidazolone-2 ($R_f = 5.62$, ≥99%); (2) 5-nitrobenzimidazolone-2 ($R_f = 6.88$, ≥99%, purchased from Aldrich); (3) 5,6-dinitrobenzimidazolone-2 (crude, $R_f = 10.95$, ≥93%); (4) 5,6-dinitrobenzimidazolone-2 (pure, $R_f = 10.95$, ≥97%); (5) 5,6-diaminobenzimidazolone-2 ($R_f = 3.42$, ≥98%).

As the nitration reaction is highly exothermic, it is necessary by using cooling techniques. As regards reaction temperature, pure product by further recrystallization can be obtained below 15°C, and the reaction temperature preferably being in the range of from about 0 to about 5°C. Eventually, it could be shown from Figure 1 that two by-product impurities ($R_f = 9.84$ and $R_f = 17.50$) were formed and have a certain relation. When the reaction time is extended, the product ($R_f = 9.84$) is slowly decreased, and another is increased. Both of them are inevitably formed, however, the total will be less below 5°C. Preferably, the reaction temperature is below 5°C by means of controlling the dropping rate. Immediately after the addition of the mixed acid was complete, the cold solution was poured into ice-water.

The results of our investigations indicated the purity of 5,6-dinitriobenzimidazolone-2 did not affect its reduction process. 5,6-Diaminobenzimidazolone-2 was easily oxidized by oxygen, so the reduction of 5,6-dinitriobenzimidazolone-2 should be under nitrogen, and the light yellow 5,6-diaminobenzimidazolone-2(HPLC 98%) could be obtained.

EXPERIMENTAL

All the reagents were reagent grade and were used without further purification unless otherwise noted. Melting points were determined on a SPSIC WRS-1B digital melting point apparatus which is uncorrected. Infrared spectra were recorded as KBr pellets for all the samples on a Perkin Elmer FT-IR instrument. Nuclear Magnetic Resonance spectra were recorded as indicated on a Varian INOVA600 spectrometer operating at 600 MHz for ^{1}H nuclei and 150 MHz for ^{13}C nuclei. Chemical shifts are reported downfield from TMS, and coupling constants are given in hertz. Mass spectra were obtained on Perkin Elmer Mass Spectrometer. The elemental analysis was carried out using Flashea 1112Series CHNS-O Analyzer and the METTLER TOLEDO MX5 (Max5.1 g d = 1 μg) weighting device. Quantitative analyses were carried out over a Shimadzu LC−20A HPLC (Column: Ultimate XB-C18 150 × 4.6 mm, 5 μm).

Benzimidazolone-2 (1). Following a literature procedure, a mixture of 54 g (0.5 mol) *o*-phenylenediamine, 34 g (0.57 mol) urea, and 95 mL glycol were stirring under nitrogen for 1 h at 130–140°C, and then heated in an oil bath at a maximum temperature of 170°C for 7 h [7]. The solution was cooled down to 40–50°C, and ~35 mL of 95% ethanol were added with stirring for 10 min, then ~100 mL of water were added. The precipitate was recovered by suction filtration and slurried with successive batches of water and 95% ethanol. The residue was dried at 100°C to give 60.2 g of white benzimidazolone-2 (1). Yield 89.9%. M.P.: 317.7–318.6°C; HPLC ≥ 99%, IR: 3128.74, 3021.52, 1741.41, 1484.26, 736.67 cm^{-1}; ^{1}H NMR (DMSO, 600 MHz): δ 6.87(s, 4H), 10.54 (s, 2H); ^{13}C NMR (DMSO, 150 MHz): δ 109.133, 121.060, 130.311, 155.934. Anal. calc. for $C_7H_6ON_2$: C 62.69, H 4.48, N 20.90; found: C 62.79, H 4.60, N 20.59.

5,6-Dinitrobenzimidazolone-2 (2). According to a variation of the method of literature, 5,6-dinitrobenzimidazolone-2 was prepared. Benzimidazolone-2 (67 g, 0.50 mol) was dissolved in 450 g 98% sulfuric acid. The colorless solution was cooled to 0–5°C in an ice bath and 80 g (1.14 mol) of 90% fuming nitric acid in 470 g 98% sulfuric acid was added dropwise to the cooled, stirred solution. The reaction temperature was not allowed to go above 5°C during the addition. After the addition of the nitric acid was complete, the cold solution was poured onto 3 kg of ice rapidly. The yellow precipitate was collected *via* filtration and washed thoroughly four times with 1-L portions of cold water. After drying at 100°C, 101.6 g yellow 5,6-dinitrobenzimidazolone-2 was obtained (HPLC 93%). Yield 90.7%. The crude 2 was recrystallized from 60% aqueous acetone to afford 80 g pure 2. M.P. > 300°C, HPLC ≥ 97%, IR: 3289.9, 3073.67, 1721.95, 1629.54, 1537.29, 1332.22, 883.59 cm^{-1}; ^{1}H NMR (DMSO, 600MHz): δ 7.65 (s, 2H), 11.78 (s, 2H); ^{13}C NMR (DMSO, 150 MHz): δ 105.560, 133.255, 137.810, 156.120; MS: 224. Anal. calc. for $C_7H_4O_5N_4$: C 37.50, H 1.79, N 35.71; found: C 37.65, H 2.00, N 35.62.

5,6-Diaminobenzimidazolone-2 (3). A mixture of 112 g (0.5 mol) of crude 2, 224 g (4 mol) of iron dust, and 1.2 L of 85% ethanol were heated to boiling on an oil bath, the stirrer was started, and a solution of 75 mL concentrated hydrochloric acid in 300 mL 85% ethanol was added dropwise. The mixture was refluxed for 5 h beyond the final addition of hydrochloric acid, and then the hot mixture was made just alkaline to pH paper by the addition of potassium hydroxide pellets. Without allowing the mixture to cool, the iron was removed by filtration and the hot ethanol was used to wash the iron residue. Hydrochloric acid (15%) was added until the filtrate was 4–5 to pH paper, and then the mixture was chilled to 0°C for 12 h. The resulting precipitate was filtered, washed with water, and dried for about 24 h under vacuum with slight nitrogen flow at 80°C to give 75 g (91.4%) of tan 5,6-diaminobenzimidazolone-2 (3). The crude 3 was purified to afford 72 g (87.8%) of light yellow pure 3. M.P.: > 300°C; HPLC ≥ 98%; IR: 3407.18, 3366.27, 3106.60, 1682.70, 850.39 cm^{-1}; ^{1}H NMR (DMSO, 600 MHz): δ 4.07 (s, 2H), 6.23 (s, 2H), 9.81(s, 2H); ^{13}C NMR (DMSO, 150 MHz): δ 96.910, 121.410, 129.550, 155.440; MS: 164. Anal. calc. for $C_7H_8ON_4$: C 51.22, H 4.88, N 34.15; found: C 50.40, H 5.67, N 33.44.

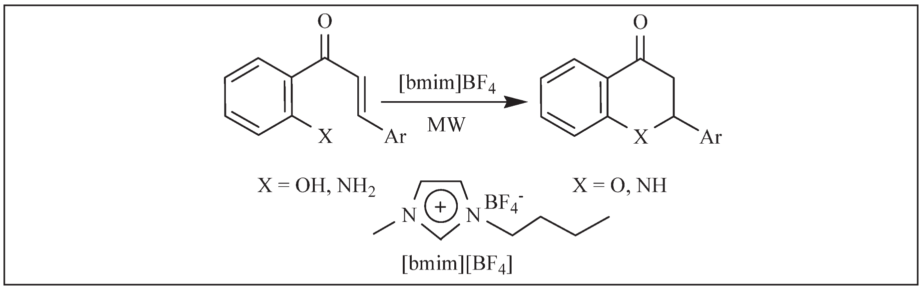
Received January 26, 2009
DOI 10.1002/jhet.123



A facile and convenient synthesis of 2-aryl-2,3-dihydroquinolin-4(1*H*)-one and 2-aryl-2,3-dihydro-4*H*-chromen-4-one has been described using ionic liquid catalyzed intramolecular cyclization of the corresponding 2′-aminochalcones and 2′-hydroxychalcones, respectively. The rapid and fairly general protocol affords product in good yield. Ionic liquid, 1-butyl-3-methylimidazolium tetrafluoroborate, was recovered and reused without loosing its efficiency.

J. Heterocyclic Chem., **46**, 791 (2009).

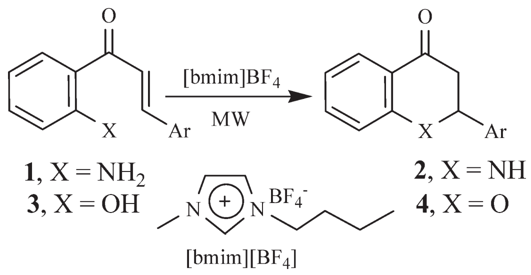
INTRODUCTION

Naturally occurring 2-aryl-2,3-dihydro-quinolin-4(1*H*)-ones and 2-aryl-2,3-dihydro-4*H*-chromen-4-ones are valuable precursors [1] for the synthesis of medicinally important compounds [2]. Because of their diverse biological activities such as hypertensive, antibacterial, antitumor, antifungal, antiinflammatory, etc., synthesis of these compounds has generated significant interest among chemists and biologists. Thus, the synthesis of these compounds has been fuelled due to diverse biological importance and presence of these moieties in various natural products [3]. The common method for the synthesis of 2-aryl-2,3-dihydroquinolin-4(1*H*)-ones and 2-aryl-2,3-dihydro-4*H*-chromen-4-ones is intramolecular cyclization of 2′-hydroxy and 2′-amino chalcones, respectively. Their synthesis following this strategy have been accomplished by using Lewis acid as catalyst, e.g. silica gel supported $TaBr_5$, K-10 Clay, orthophosphoric acid, sulphuric acid, acetic acid, 30% TFA over silica gel, silica gel [4]. Intramolecular cyclization by basic catalysts such as alumina supported-$CeCl_3{\cdot}7H_2O$-NaI, NaOH [5] is well documented in literature. Other methods like thermolysis [6], electrolysis [7], ZnO supported metal oxide [8], light [9], Ni/Zn/K halides [10] were also employed for the cyclization. Many of the reported methods for the synthesis of these biologically important heterocyclic compounds involve the use of toxic fine chemicals, requires stoichiometric amount of catalysts and afford products in low yields. Therefore, the search continues for an efficient method in terms of operational simplicity and economical viability.

In the last decade, ionic liquids have gained increasing attention of synthetic organic chemists in various organic transformations because of their tunable chemical and physical properties and catalytic behaviour [11–14]. Ionic liquids are salts that contain organic cations and inorganic or organic anions, and are liquid at or close to ambient temperature. In contrast to conventional polar organic solvents such as THF, DMF and DMSO, ionic liquids are nonflammable, nonvolatile and stable to atmospheric conditions. Among all, imidazolium-based ionic liquids with tetrafluoroborate and hexafluorophosphate anions are the most studied ionic liquids for organic synthesis.

Microwave-assisted organic synthesis offers many advantages including faster and cleaner reaction, high product yield, and operational simplicity [15]. Several methods have been developed for performing reactions with microwave irradiation in solution and under solvent free conditions [16], but a homogeneous mixture is preferred to obtain uniform heating. The excellent dielectric properties of ionic liquids offer added advantages when used as solvent in microwave-assisted organic reactions [17]. Ionic liquids couple very efficiently with

Scheme 1



microwave through an ionic conduction mechanism [18]. Nucleophilic aromatic substitution reactions have been reported with and without solvent under microwave irradiations [19]. In continuation of our study on the development of new cost effective methodologies utilizing this unconventional energy source, we herein report an ionic liquid catalyzed intramolecular cyclization of 2′-aminochalcones and 2′-hydroxychalcones with enhanced yields and efficiency under microwave irradiation to obtain 2-aryl-2,3-dihydro-quinolin-4(1*H*)-ones and 2-aryl-2,3-dihydro-4*H*-chromen-4-ones, respectively (Scheme 1).

RESULTS AND DISCUSSION

Our initial attempts under conventional conditions to cyclize 2′-aminochalcones and 2′-hydroxychalcones using 1-butyl-3-methylimidazolium tetrafluoroborate [bmim]BF_4 failed at room temperature. On heating the reaction mixture for 48 h at 135°C, very little product was produced. Further heating at this temperature generated more impurities. Encouraged by reported efficient coupling of ionic liquids with microwave [18], we next investigated this intramolecular cyclization under microwave irradiation. After several attempts, it was realized that intermittent microwave exposure for 20 s (total microwave exposer time 120 s) followed by cooling (20 s) is optimum in terms of efficient intramolecular cyclization and product yield. Among ionic liquids, [bmim]BF_4 is found to be best choice for the efficient intramolecular cyclization with shorter reaction time and good yield. After standardizing the reaction conditions for this reaction, cyclization of substituted 2′-aminochalcones **1a–g** to the corresponding 2-aryl-2,3-dihydroquinolin-4(1*H*)-ones **2a–g** were achieved satisfactorily (Table 1).

Encouraged by the successful cyclization of 2′-aminochalcones, we next explored the intramolecular cyclization of analogues 2′-hydroxychalcones **3a–g** to prepare 2-aryl-2,3-dihydro-4*H*-chromen-4-ones **4a–g**. Microwave exposure (1.0–1.5 min) of a thick paste of 2′-hydroxychalcones **3a–g** in [bmim]BF_4 led to the formation of 2-aryl-2,3-dihydro-4*H*-chromen-4-ones **4a–g** in moderate yields (Table 2). In all the cases, some unreacted 2′-hydroxychalcones was recovered along with the product. Further increasing the amount of [bmim]BF_4 and prolonging microwave irradiation does not improve the product yield.

To determine if the ionic liquid, [bmim]BF_4 was an essential factor to promote this intramolecular cyclization, the cyclization of **2a** as a model reaction was carried out in polar organic solvents such as DMF and DMSO under microwave irradiation. This resulted in poor yield of product along with unchanged starting material. Ionic liquids are known to couple efficiently with microwave energy to accelerate the reaction. Further, ionic liquids are reported to stabilize the charged species formed as intermediate in different reactions and enhance the nucleophilicity of various nucleophiles [20]. It is expected that enhanced stability of the polar activated complex formed during intramolecular cyclization (Figure 1) and enhanced nucleophilicity of amino or hydroxyl group by ionic liquid along with the effect of microwave radiations are probable reasons for the increased reaction rate. It is also worth to mention that in absence of ionic liquid reaction did not proceed under

Table 1

Synthesis of 2-aryl-2,3-dihydroquinolin-4(1*H*)-ones.

Substrate (**1**)	Ar	Product[a] (**2**)	Time (min)	Yield[b] (%)
1a	C_6H_5	**2a**	2.0	89[c]
1b	4-ClC_6H_4	**2b**	2.0	85
1c	4-MeC_6H_4	**2c**	2.0	87
1d	4-$(C_6H_5CH_2O)C_6H_4$	**2d**	2.0	84
1e	2,6-$Cl_2C_6H_3$	**2e**	2.0	82
1f	2-Furyl	**2f**	2.0	88

[a] All the products gave satisfactory NMR (^1H and ^{13}C) and Mass data.
[b] Isolated yield.
[c] **2a** was obtained in 81% when ionic liquid was recycled and reused.

Table 2

Synthesis of 2-aryl-2,3-dihydro-4*H*-chromen-4-one.

Substrate (**3**)	Ar	Product[a] (**4**)	Time (min)	Yield[b] (%)

[b] Isolated yield.

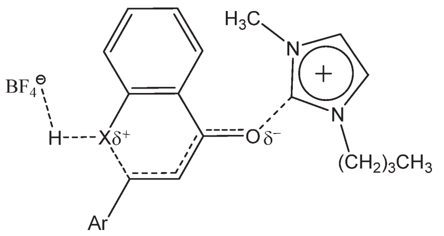

Figure 1. Proposed activated complex of [Bmim] BF_4 catalyzed intramolecular cyclization of 2′-amino/2′-hydroxychalcones.

microwave irradiation. Results of this intramolecular cyclization in other ionic liquids were also poor. Thus [bmim]BF_4 and microwave irradiation plays very important role in this rapid intramolecular cyclization.

The slow reactivity of 2′-hydroxychalcones relative to 2′-aminochalcones can be rationalized from the corresponding activation energy (E_{act}) values. For example, the transition states corresponding to the cyclization process of **1a** and **3a** are optimized using *ab initio* quantum chemical method (HF/6-31G**). The E_{act} value for the cyclization of **1a** is found to be 57 kcal/mol, whereas for cyclization of **3a** the value is 117.886 kcal/mol. To find out the exact reason of this difference in E_{act} between the two types of chalcone derivatives we used conceptual density functional theory (DFT) based local reactivity descriptors. As both types of chalcones have same number of electrons (if *R* remains same) local nucleophilicity of the N_{NH_2} (*N*-atom of the NH_2 group) and O_{OH} (*O*-atom of OH group) should be an ideal descriptor to reveal the relative electron donating ability of the two atoms during cyclization process [21]. One such descriptor is condensed local softness (S_{k}^-) [22]. The S_{k}^- values generated using the same HF/6-31G** method were 0.37 and 0.29 for N_{NH_2} and O_{OH}, respectively. These values clearly demonstrate that *N*-atom of the NH_2 group is more nucleophilic than *O*-atom of the OH group, favouring cyclization by lowering the activation energy values.

In conclusion, this article describes a practical and facile way to make 2-aryl-2,3-dihydroquinolin-4(1*H*)-ones and 2-aryl-2,3-dihydro-4*H*-chromen-4-ones in moderate to good yields. Relatively faster cyclization of 2′-aminochalcone in comparison with 2′-hydroxychalcone has been explained using theoretical calculations. A plausible explanation for the ionic liquid-mediated expeditious cyclizations of 2′-aminochalcones and 2′-hydroxychalcones under the influence of microwave irradiation has also been provided. When compared with literature procedures, this method has the advantages of simple reaction procedure, shorter reaction time, and reuse of [bmim]BF_4 as a catalyst.

EXPERIMENTAL

Melting points were determined in open capillary tubes on a MPA120-Automated Melting Point apparatus and are uncorrected. IR spectra were recorded with a JASCO IR-Report-100. ^{1}H (400 MHz) and ^{13}C NMR (100 MHz) spectra were recorded on Bruker-400 instrument in $CDCl_3$ solution with TMS as an internal standard. Column chromatography was performed on silica gel (100–200 mesh, S. D. Fine, Pilani, India). Amino- and hydroxychalcones were prepared using the appropriate aldehyde and the corresponding *o*-substituted acetophenones [23]. The 2-aminoacetophenone and 2-hydroxyacetophenone (Sigma-Aldrich) were used as purchased. Aromatic aldehydes were obtained from E-Merck (India) Ltd. [bmim]BF_4 was prepared according to literature procedure [24]. Theoretical calculations were performed using Gaussian 03 Rev E.0.1 software. Reactions were performed in a domestic LG microwave MG607APR model (900 W).

Preparation of 2-aryl-2,3-dihydro-4(1*H*)-quinolinones (2a-g). A neat mixture of 2′-aminochalcone (1 mmol) and [bmim]BF_4 (50 mg) was subjected to microwave irradiation at 50% power for 2 min with intermittent heating (20 s) and cooling (20 s). After completion of reaction, as indicated by TLC, the product was extracted into diethyl ether (3 × 5 mL). Combined diethyl ether layer was distilled off under reduced pressure. The residue so obtained was percolated through a bed of silica gel using hexane:ethyl acetate (8:2) as eluent to afford pure product.

2-Phenyl-2,3-dihydro-4(1*H*)-quinolinone (2a). mp 149–152°C, lit. Hafnium (IV) bis(perfluorooctanesulfonyl)amide (Hf(NPf)$_4$) catalyzed the one-pot synthesis of substituted quinolines in fluorous media. By simple phase separation, the fluorous phase containing the catalyst can be used several times.

J. Heterocyclic Chem., **46**, 796 (2009).

INTRODUCTION

Quinolines and their derivatives are very important synthons of many natural products and semisynthetic biologically active compounds. Many multisubstituted quinolines are important pharmaceutical compounds, and they exhibit a wide spectrum of biological activity [1]. Methods introduced by Skraup [2], Doebner and Miller [3], Conrad and Limbach [4], Combes [5], and Pfitzinger [6] are some of the classic ways to synthesize quinolines. A number of general synthetic methods have also been reported [7]. However, all of these methods have problems, including drastic reaction conditions, low yields, and severe side reactions. Therefore, development of a more practical and economical method for synthesis of quinolines is highly desirable. Recently, Shindoh *et al*. reported that triflic imide could catalyze the auto-tandem synthesis of quinolines by three-component reactions followed by oxidation reactions [8]. However, the catalyst triflic imide could not be recycled.

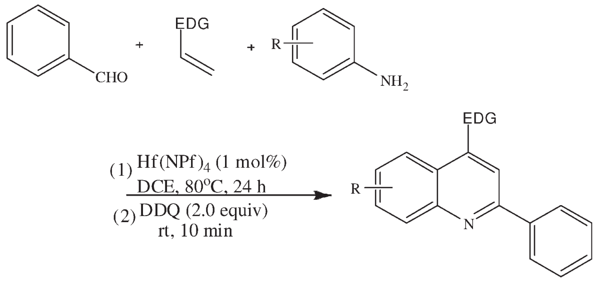
There has been rapidly increasing interest in the design and the synthesis of compounds that exhibit high affinities for ''fluorous'' phases since the technique of ''fluorous biphasic system'' (FBS) was described by Horváth and Rábai [9,10]. The technique of FBS, as a phase-separation and catalyst immobilization technique, has become one of the most important methods for facile catalyst separation from the reaction mixture and recycling of the catalyst [11]. In this catalytic system, the metalic catalyst coordinated by perfluoroalkylated ligands can be retained in the fluorous phase after the reaction. Recently, novel Lewis acids of lanthanide tris (perfluorooctanesulfonyl)methide {Ln[C(SO$_2$Rf$_8$)]$_3$, Rf$_8$ = (CF$_2$)$_7$CF$_3$, Ln(CPf$_3$)$_3$} [12], lanthanide bis(perfluorooctanesulfonyl)amide {Ln[N(SO$_2$Rf$_8$)$_2$]$_3$, Ln(NPf$_2$)$_3$} [13], and lanthanide perfluorooctanesulfonate [Ln(O-SO$_2$Rf$_8$)$_3$, Ln(OPf)$_3$] [14,15] received special interest because they have the characteristics of low hygroscopicity, ease of handling, robustness for the reuse, and high solubility in fluorous solvent.

During our studies to explore the utility of fluorinated Lewis acid catalysts in fluorous solvents [15], we found that the three component reaction of aldehydes, anilines, and electron-rich olefins followed by oxidation can proceed smoothly to afford quinolines in the presence of hafnium bis(perfluorooctanesulfonyl)amide [Hf(NPf)$_4$] in a FBS system (Scheme 1). Concurrently, we also found that the catalytic system could be reused by simple phase separation.

RESULTS AND DISCUSSION

Initially, the effect of catalyst loading and cosolvents using was examined. The results were summarized in Table 1. A mixture of benzaldehyde (1.2 equiv), aniline (1.2 equiv), and allyltriisopropylsilane (1 equiv) in the presence of Hf(NPf)$_4$ (1 mol%) in DCE (2 mL) and

Scheme 1



perfluorodecalin($C_{10}F_{18}$, *cis* and *trans*-mixture) (2 mL) was stirred at 80°C for 24 h, then the mixture was cooled to ambient temperature, followed by addition of 2,3-dichloro-5,6-dicyano-1,2-benzoquinone (DDQ, 2 equiv), and the reaction mixture was stirred in the same temperature for 10 min to afford the product in 76% yield (Table 1, entry 1). Although the catalyst loading was decreased from 1 to 0.5, and 0.25 mol %, lower product yields of 50, and 22% were obtained (Table 1, entries 2 and 3), and no reaction was observed in the absence of $Hf(NTf)_4$ (Table 1, entry 4). Several other cosolvents, such as MeCN, PhMe, H_2O, and THF, were tested, and less effective and lower product yields of 10–67% were obtained (Table 1, entries 5–8). DCE proved to be the most efficient one and was selected to be the reaction cosolvent for the subsequent exploration.

With the optimum reaction conditions in hands, we next investigated the scope of the reaction using different reactants. As shown in Table 2, several different substituted anilines and two kinds of electron-rich olefins were tested. The reactions of different reactants afforded the corresponding substituted quinolines in moderate to good yields. The substituents on the aniline had no obvious effect on the conversion. The reactivity of electron-rich olefin allyltriisopropylsilane (Table 2, entries 1–5) is higher than styrene (Table 2, entries 6–10). It may be caused by the different electron effect of the two electron-rich olefins. When the reaction was finished, the reaction mixture was cooled to room temperature, and the fluorous phase with $Hf(NPf)_4$ can be separated from the organic layer and return to the bottom layer. The recycle results (Table 2, entry 1) indicate that the catalyst does not lose its activity and can be reused without significant loss in activity up to four cycles. When the reaction was finished, the reaction mixture was cooled to room temperature, and the fluorous phase with $Hf(NPf)_4$ can be separated from the organic layer and return to the bottom layer. Based on GC-MS and ^{19}F NMR data, no distribution of $Hf(NPf)_4$ was found in organic layer and only a trace amount of perfluorodecalin leached to organic phase can be detected.

According to the literatures [8], $Hf(NPf)_4$ catalyzes the reaction as a mild Lewis acid. The reaction may proceed via 1,2,3,4-tetrahydroquinolines as intermediates formed by the reaction of the aldehyde, aniline, and electron-rich olefin. Subsequently, the intermediates were further oxidized by DDQ to give the product quinoline. These reactions take place as a one-pot reaction.

In conclusion, $Hf(NPf)_4$ is demonstrated to be new and highly effective catalyst for one-pot synthesis of substituted quinolines in FBS. By simple phase separation of the fluorous phase containing the catalyst, the reaction can be repeated many times. Further study on the application of FBS to other reactions, which can be promoted by such Lewis acids, is under way in this laboratory.

EXPERIMENTAL

Chemicals used were obtained from commercial suppliers and used without further purifications. ^1H NMR and ^{19}F NMR spectra were recorded with a Bruker Advance RX500 spectrometer. Mass spectra were recorded on a Saturn 2000GC/MS instrument. Inductively coupled plasma (ICP) spectra were measured on an Ultima2C apparatus. Elemental analyses were performed on a Yanagimoto MT3CHN recorder.

Typical procedure for preparation of $Hf(NPf)_4$. $Hf(NPf)_4$ was prepared according to the literatures [13]. Anhydrous methanol (10 mL) was added by $HN(SO_2C_8F_{17})_2$ (0.981 g, 1 mmol) and Hafnium (IV) chloride (0.080 g, 0.25 mmol), which was stirred continuously at 50°C for 16 h. After being cooled to room temperature, the mixture was evaporated and dried at 80°C /0.01 mmHg for 16 h to give white powders of Hafnium (IV) bis(perfluorooctanesulfonyl)amide complex in 96% yield (0.984 g). ICP: Calcd. for $C_{64}O_{16}N_4F_{136}S_8Hf$: Hf, 4.35%. Found: Hf, 4.33%. *Anal.* Calcd for $Hf[N(SO_2C_8F_{17})_2]_4$: C,18.75. Found: C, 18.65.

Typical procedure for the preparation of quinolines. A mixture of benzaldehyde (0.133 g, 1.2 mmol), aniline (0.116 g,

[a] The reaction condition: Hf(NPf)$_4$ (0.041 g, 0.01 mmol), benzaldehyde (0.133 g, 1.2 mmol), aniline (1.2 mmol) and electron-rich olefins (1 mmol), DCE (2 mL) and perfluorodecalin ($C_{10}F_{18}$, *cis* and *trans*-mixture, 2 mL), 80°C, 24 h; DDQ, 0.454 g, 2 mmol.
[b] Isolated yields base on the starting alcohol.

1.2 mmol), and allyltriisopropylsilane (0.198 g, 1 mmol) in the presence of Hf(NPf)$_4$ (0.041 g, 0.01 mmol) in DCE (2 mL) and perfluorodecalin($C_{10}F_{18}$, *cis* and *trans*-mixture, 2 mL). The mixture was stirred at 80°C for 24 h, then the mixture was cooled to ambient temperature, followed by addition of DDQ (0.454 g, 2 mmol), and the reaction mixture was stirred in the same temperature for 10 min. Then, the fluorous layer on the bottom was separated for the next reaction. The reaction mixture (organic phase) was filtered through a short pad of celite. The organic layer was added saturated aqueous solution of $NaHCO_3$, and the aqueous phase was extracted twice with $CHCl_3$. Combined organic layers were washed with saturated aqueous solution of $NaHCO_3$, dried over MgSO4, filtered, and concentrated *in vacuo*. The crude mixture was purified by column chromatography on silica gel column to afford the product (eluent: CH_2Cl_2/MeOH = 90/10). Selected data: 6-Trifluoromethyl-4-(triisopropylsilyl)methyl-2-phenylquinoline, colorless solid; mp 103–105°C; 1H NMR(500 MHz, CDCl3) $\delta = 1.10$ (d, $J = 10.5$ Hz, 18 H), 1.19–1.12 (m, 3H), 2.75 (s, 2H), 7.46–8.22 (m, 8H), 8.37 (s, 1H). MS (EI) m/z 444 (*M*+).

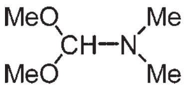
This review focuses on the use of dimethylformamide dimethyl acetal in the preparation of heterocyclic compounds *via* formylation of active methylene groups, methyl groups to give enamines, and formylation of amino groups to give amidines. These compounds are found to be useful intermediates in the formation and modification of heterocyclic compounds.

J. Heterocyclic Chem., **46**, 801 (2009).

Contents

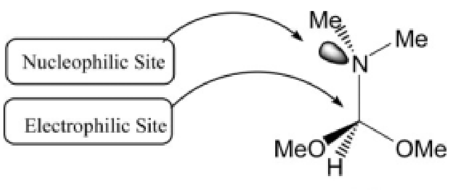
1. INTRODUCTION

N,*N*-dimethylformamide dimethyl acetal (DMFDMA) (**1**) is also called 1,1-dimethoxy-*N*,*N*-dimethylmethylamine and 1,1-dimethoxytrimethylamine. The molecular formula $(CH_3)_2NCH(OCH_3)_2$ and molecular weight 119.16. The Chemical Abstract Number is 4637-24-5.



(**1**)

DMFDMA (**1**) is a very important reagent in organic synthesis because of its higher reactivity. The DMFDMA molecule possesses a carbon atom attached to three electron withdrawing groups (2MeO and NMe_2) such that the carbon atom carries partial positive charge. While the nitrogen atom is attached to two methyl groups, the partially positive carbon atom, and carries a lone pair of electrons so that it ‘‘looks’’ like methyl amine. Therefore, DMFDMA carries two sites of reactivity, an electrophilic site and a nucleophilic site, respectively.



(**1**)

The main application of DMFDMA has been not only for functional group transformations but it may also be regarded as a one-carbon synthon in construction of the carbon skeletons.

Literatures referenced [1–10] highlight the methods of preparation and the major classes of reactions in which formamide acetals have been reported.

It has been found that reactions involving DMFDMA can be divided into two main categories, namely, methylation and formylation. DMFDMA acts as methylating agent [11,12] so that it has been used in the synthesis of methyl esters from acids, methyl ethers and thioethers from phenols and aromatic or heterocyclic thiols, and the methylation of active methines as shown in Scheme 1.

DMFDMA acts as formylating agent, so that it has been used in the synthesis of enamines from active methylenes and active methyl groups, and amidines from amines and amides or thioamide groups [12] as shown in Scheme 2.

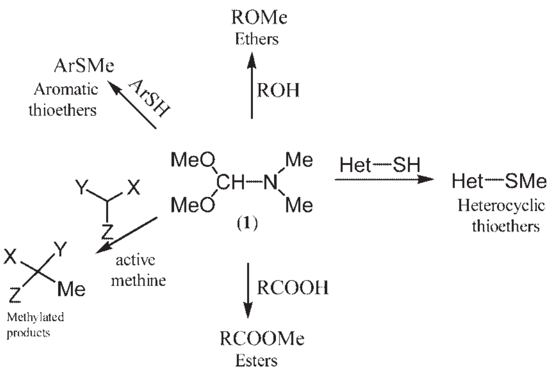
DMFDMA can also be used for cyclization of two functional groups to give heterocyclic compounds [11].

We will concentrate our review on the use of DMFDMA (**1**) for the preparation of heterocyclic compounds.

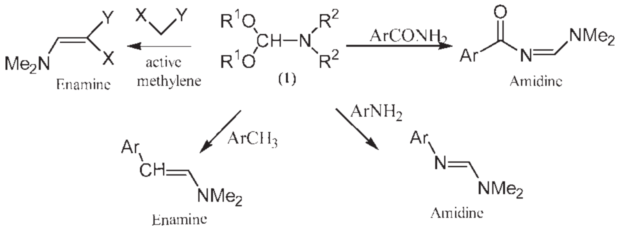
2. PREPARATION OF HETEROCYCLIC COMPOUNDS THROUGH THE FORMYLATION OF THE METHYLENE GROUP USING DMFDMA

2.1. Methylene of ethyl group. 4-Halopropiophenone (**2a–c**) condensed with DMFDMA to give the corresponding enamines (**3a–c**). 2,6-Bis(4-bromophenyl)-5-methylpyrimidine (**4**) was obtained by treatment of compound (**3a**) with *p*-bromobenzamidine. Compounds (**3a–c**) were subsequently treated with (4-sulfamoylphenyl)-hydrazine hydrochloride to provide pyrazoles (**5**), as in Scheme 3 [13,14]. The enamines (**3a–c**) are easily converted to the chloropropiniminium salt by the reaction with phosphorous oxychloride in dichloromethane which in turn is converted to the 2,3,4-trisubstituted pyrrole (**5′**) by condensation with ethyl *N*-methylglycinate in the presence of sodium hydride and DMF [15].

Scheme 1



Scheme 2



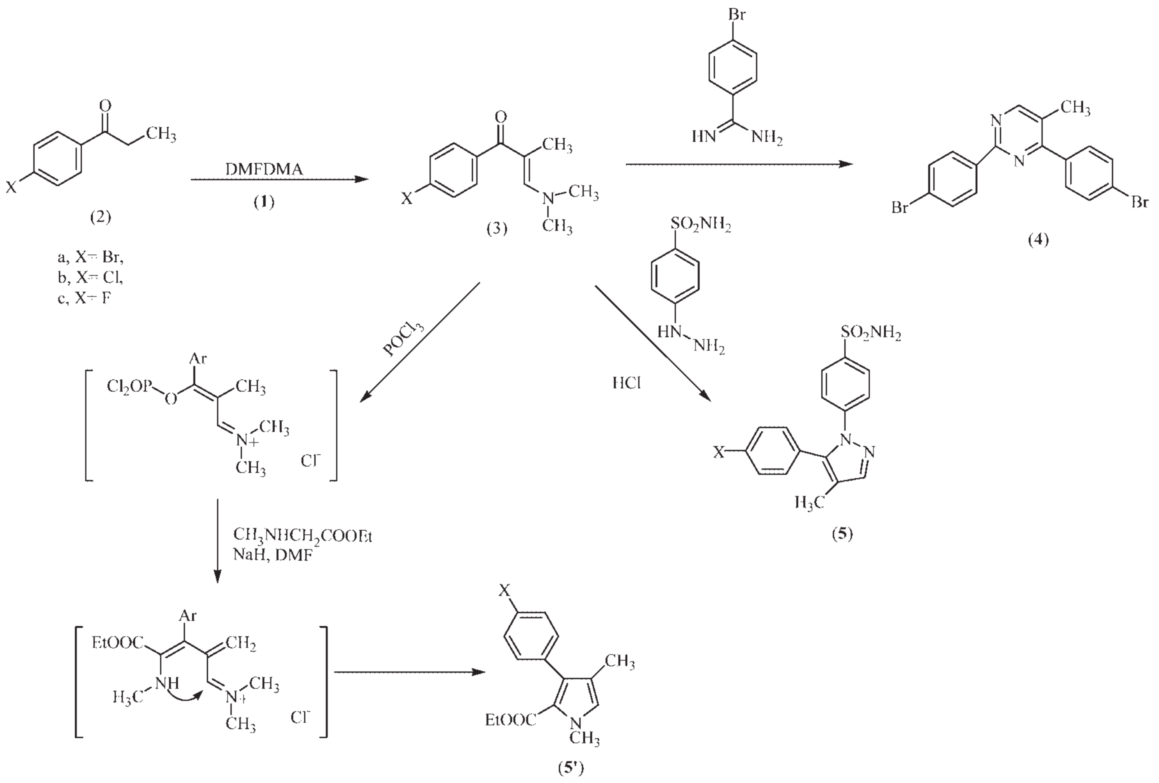
2.2. Active methylene group. DMFDMA was condensed with carbonyl compounds (**6**) yielding the corresponding enaminone (**7**), which reacted with cyanothioacetamide to yield polyfunctionaly substituted pyridines (**8**) [16–18]. Also the treatment of enaminone (**7**) with malononitrile dimer afforded 1,6-naphthyridine derivatives (**9**) [19], whereas treatment of the enaminones (**7**) with thiourea in the presence of sodium ethoxide affoded the corresponding 4,5-disubstituted pyrimidine-2-thiones (**10**) [20]. Although the treatment of enaminones (**7**) with hydrazine hydrate, phenyl, or alkyllhydrazine and hydroxylamine afforded 3,4-disubstituted azoles (**11**) as in Scheme 4 [21,22].

Consequently α-aryl or α-benzoylacetonitriles (**12a–c**) condensed with DMFDMA to afford enaminonitrile (**13a–c**). The reaction of enaminonitrile (**13a**) with 5-aminopyrazole afforded (**14**). Ring closure of enaminonitriles (**13a–c**) with hydrazine hydrate, and its derivatives and hydroxylamine in ethanol gave compounds (**15**) [23,24]. Although the reaction of enamine (**13c**) with hydrazine derivatives in the presence of HCl afforded 1-substituted-3-cyano-5-arylpyrazoles (**16**) as in Scheme 5 [14,25–27].

Also imidazo[1,2-*a*]pyridine derivative (**19**) could be obtained *via* reaction of (**17**) with DMFDMA. The reaction proceeds *via* the intermediate enamine derivative (**18**) as in Scheme 6 [28].

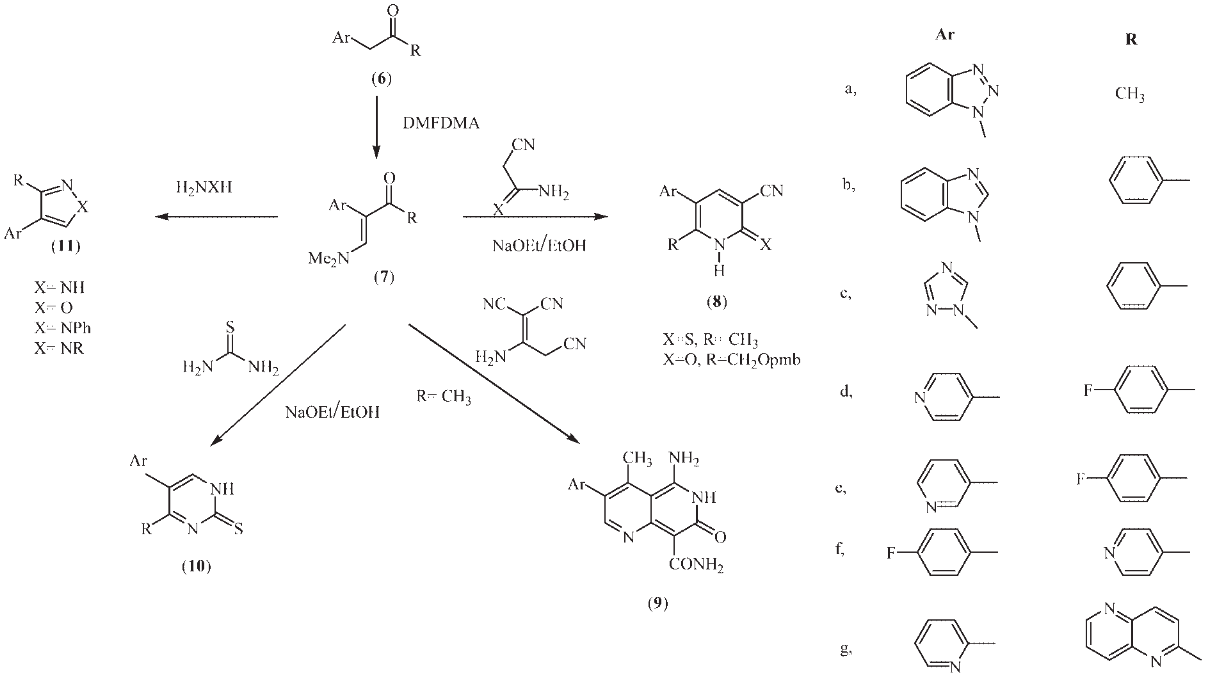
α-Phthaloylaminoacetophenone derivatives (**21a–c**) were obtained by the reaction of α-bromo- or α-chloroacetophenones (**20**) with phthalimide potassium salt in DMF. Reaction of (**21**) with 1.2 equivalents of DMFDMA gave the enamines (**22**), which on treatment with excess and one equivalent of hydrazine derivatives, produce (**23**) and (**24**), respectively, as in Scheme 7 [29,30].

Scheme 3

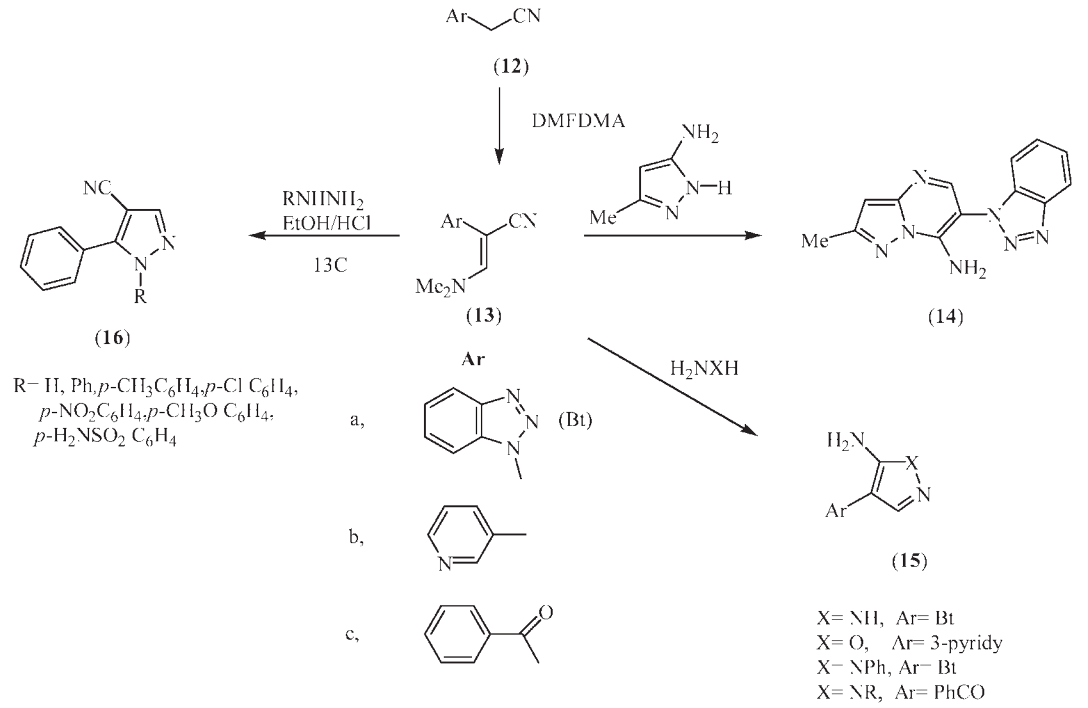


Refluxing of compound (**25**) with DMFDMA provided the enaminones (**26**), which were directly allowed to react with binucleophiles such as substituted guanidine and amino azoles (3-aminopyrazoles, 3-amino-1,2,4-triazole) to give the desired compounds (**27a,b**) and (**28a–d**), respectively, as in Scheme 8 [31,32].

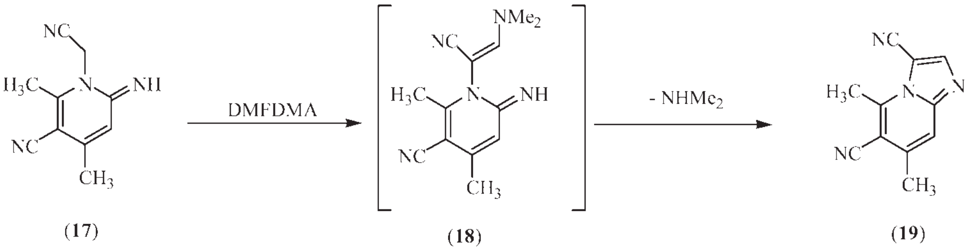
Scheme 4



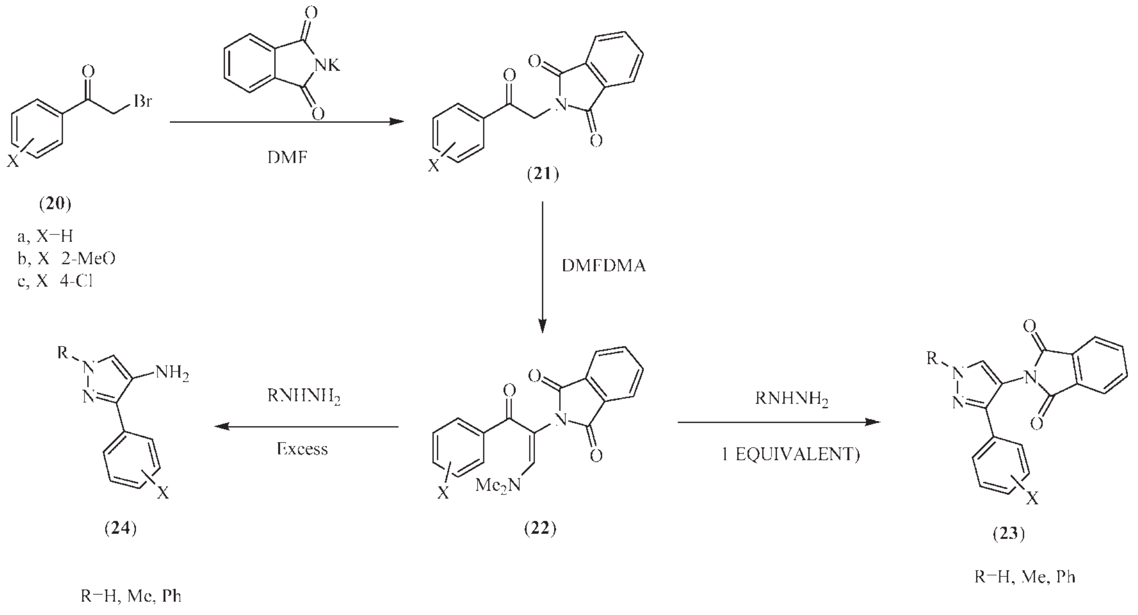
Scheme 5



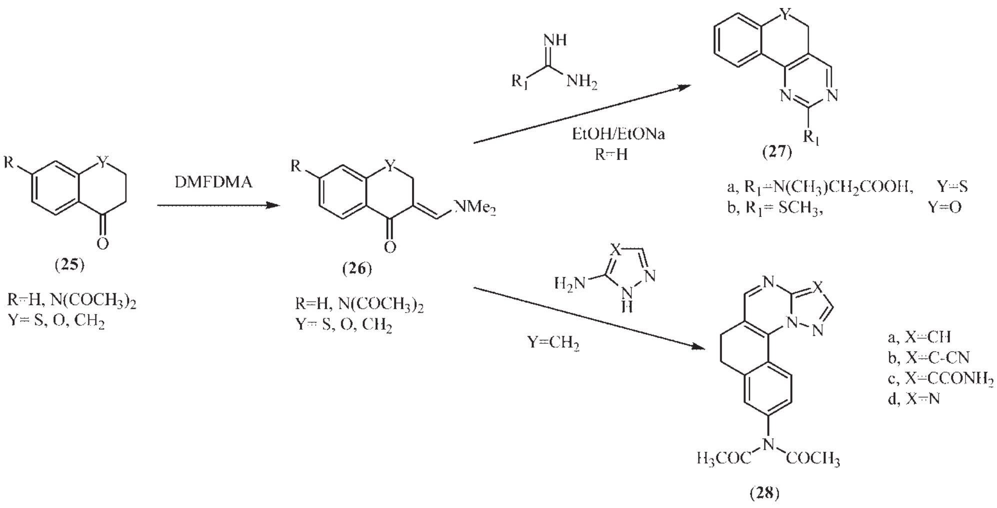
Scheme 6



Scheme 7



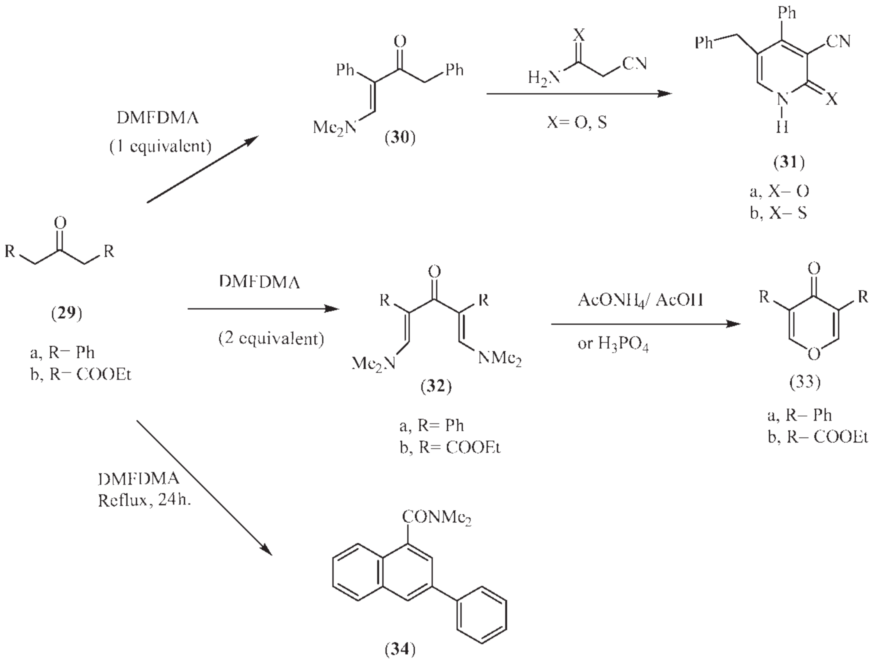
Scheme 8



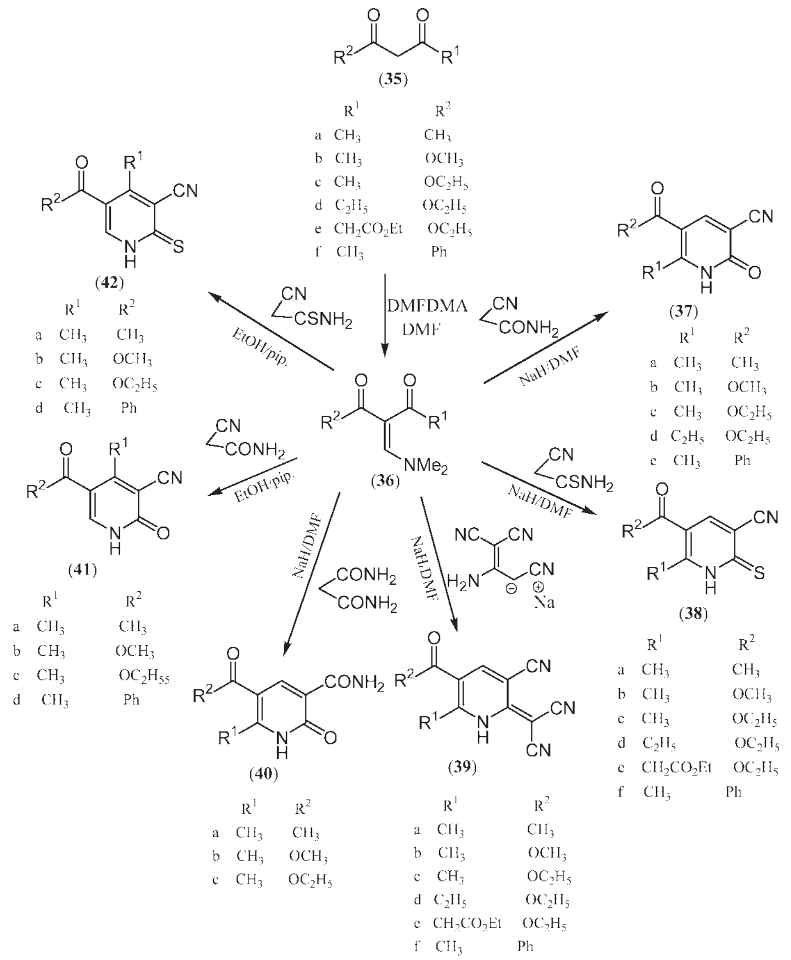
1,3-Diphenylacetone (**29a**) reacted with an equimolecular amount of DMFDMA to give the enaminone (**30**) which condensed with cyanoacetamide and with cyanothioacetamide to yield 2-oxo- and 2-thioxo-pyridine-3-carbonitrile derivatives (**31**). The 1,3-disubstituted acetones (**29a,b**) reacted with two molar equivalents of DMFDMA to give the dienaminones (**32**) which in turn reacted with an acetic acid ammonium acetate mixture or phosphoric acid to afford 3,5-disubstituted-pyrane-4-ones (**33a,b**) [33,34]. A mixture of 1,3-diphenylacetone and DMFDMA were left under reflux for 24 h to give the dimethylamide (**34**) as in Scheme 9 [35].

Abu-Shanab et al. [36–39] reported that, the reaction of 1,3-dicarbonyl compounds (**35a–f**) with DMFDMA in anhydrous DMF afforded the corresponding enaminones (**36a–f**) which reacted directly with the following nucleophiles using sodium hydride as a base in anhydrous DMF. Cyanoacetamide afforded 5,6-disubstituted-3-cyanopyridine-2(1*H*)-ones (**37a–d,f**). Cyanothioacetamide afforded 5,6-disubstituted-3-cyanopyridine-2(1*H*)-thiones (**38a–f**). Anion of malononitrile dimmer afforded 5,6-disubstituted-3-cyano-2-(dicyanomethylidene)-1,2-dihydropyridines (**39a–f**). Malonamide afforded 5,6-disubstituted-3-carboxamidopyridine-2(1*H*)-ones (**40a–c**). On the

Scheme 9

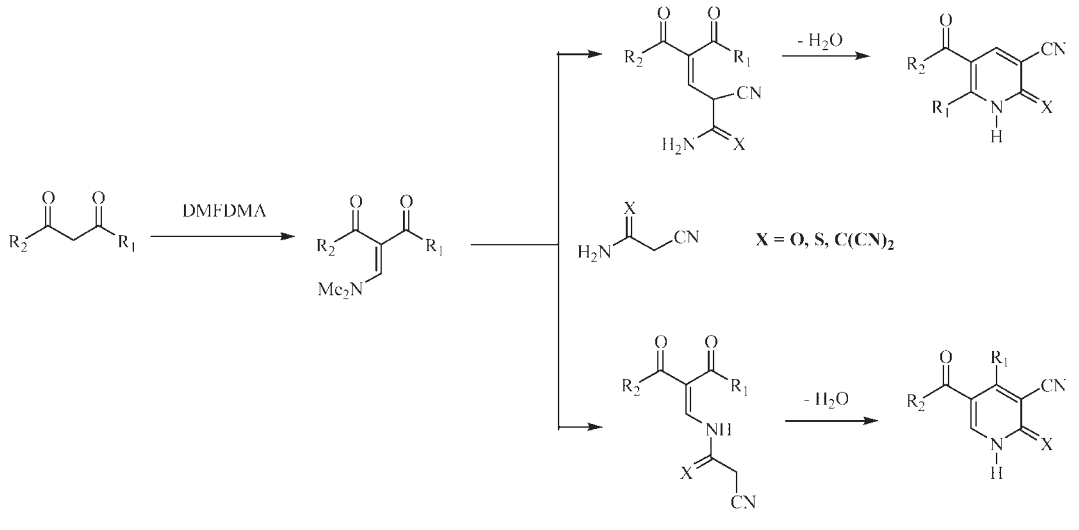


Scheme 10

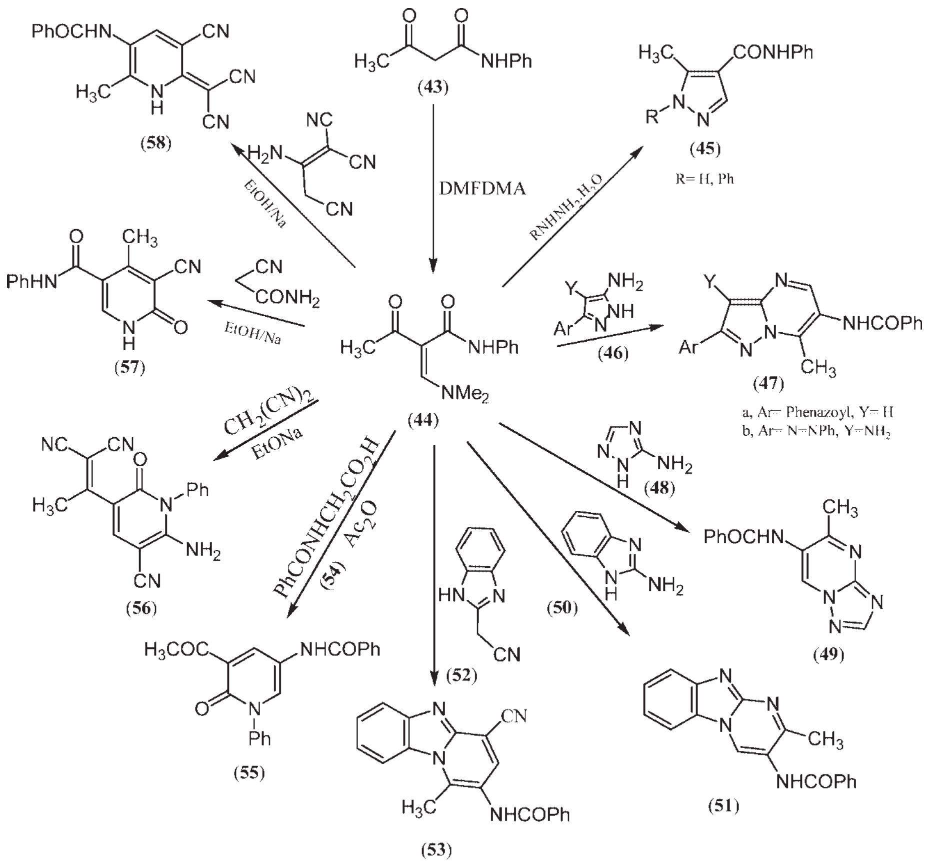


other hand, reactions analogous to those reported earlier, but using ethanol as a solvent and piperidine as a base, enaminones (**36**) reacted with the following nucleophiles: Cyanoacetamide to give 4,5-disubstituted-3-carboxamidopyridine-2(1*H*)-ones (**41a–c**). Cyanothioacetamide to give 4,5-disubstituted-3-carboxamidopyridine-2(1*H*)-thiones (**42a–d**) as in Scheme 10.

The structure of these compounds has been confirmed by X-ray crystallography [36,37]. The mechanism for the formation of the above products is as shown in the following.



Scheme 11



Also the reaction of DMFDMA with acetoacetanilide (**43**) gave enamine (**44**). Treatment of **44** with hydrazine hydrate and phenylhydrazine afforded pyrazoles (**45**). Pyrazolo[1,5-*a*]pyrimidines (**47**) were isolated when enamine (**44**) was reacted with pyrazoles (**46**). Enamine (**44**) reacted with 1,2,4-triazole (**48**) to produce triazolo[1,5-*a*]pyrimidine (**49**). 2-Aminobenzimidazole (**50**) reacted with (**44**) to give the pyrimido[1,2-*a*]benzimidazole (**51**). The reaction of enamine (**44**) with compound (**52**) afforded (**53**) and with hippuric acid (**54**) afforded the pyridine (**55**). Also the reaction of (**44**) with malononitrile, cyanoacetamide, and malononitrile dimer afforded (**56**), (**57**), and (**58**), respectively, as shown in Scheme 11 [40–47].

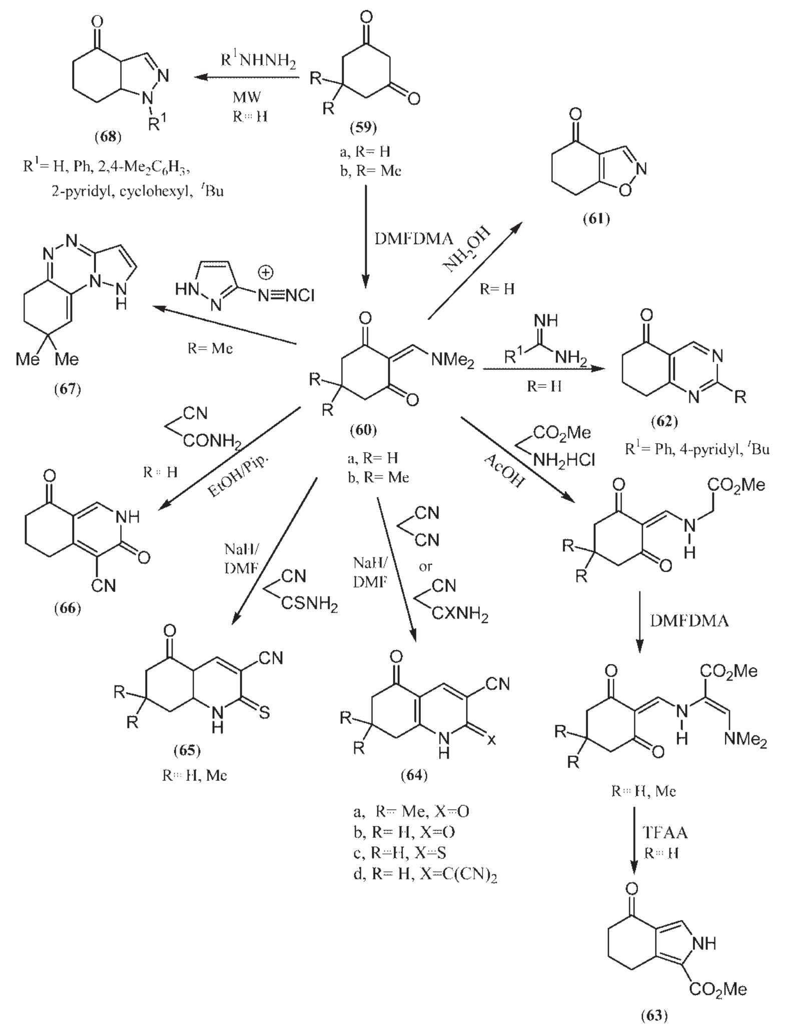
Further reactions for the preparation of heterocyclic compounds using DMFDMA are the condensation of 1,3-cyclohexanedione (**59a**) and 5,5-dimethyl-1,3-cyclohexanedione (**59b**) with DMFDMA to give the corresponding enaminones (**60a,b**). These compounds are also potentially valuable for the preparation of different types of heterocycles (**61–67**) as outlined in Scheme 12 [36,37,48–50]. Microwave irradiation of 1,3-cyclohexanedione (**59a**) with hydrazine hydrate and its derivatives afforded the corresponding pyrazole derivatives (**68**) [51]. The structure of these compounds has been confirmed by X-ray crystallography [36,37].

Diethyl ester (**69**) when refluxed with DMFDMA gave enamine (**70**), which was refluxed in DMF and ammonium acetate as a source of ammonia, the β-carboline (**71**) isolated Scheme 13 [52].

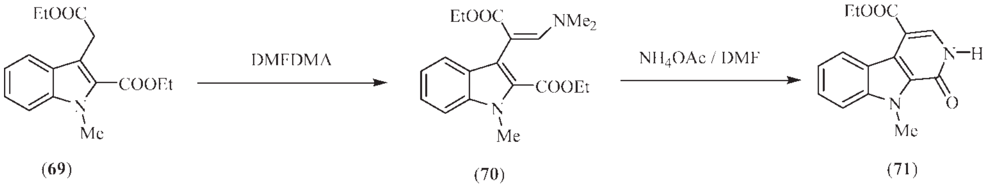
Enamines (**73a–c**) was obtained from (**72a–c**) with DMFDMA and converted directly to quinolinecarboxylic acid esters (**74**) by treatment with the requisite amines. Compounds (**75**) were prepared by reaction of (**73b**) with hydrogen sulfide in ethanol [53–55]. Also compound (**73a**) reacted with aryl hydrazine provided pyrazole (**76**) as shown in Scheme 14 [56,57].

Treatment of compounds (**77**) with excess DMFDMA gave compounds (**78**), which was cyclized to pyrrole ring (**79**) under various condition, EtOH in the presence of HCl (method A), AcOH (method B), AcOH and Ac_2O (method C), and $(CF_3CO)_2O$ (method D) as shown in Scheme 15 [58–60].

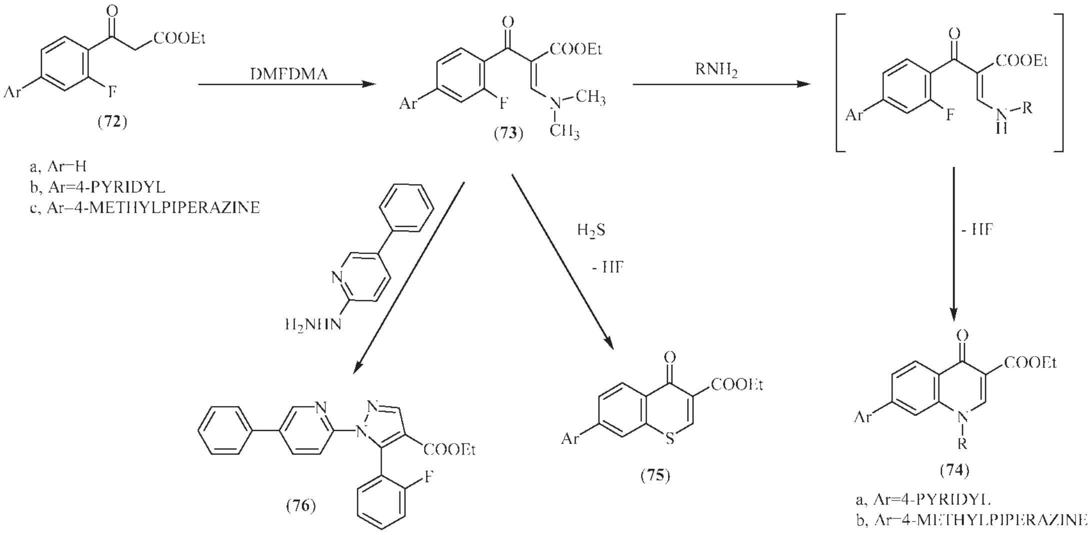
Scheme 12



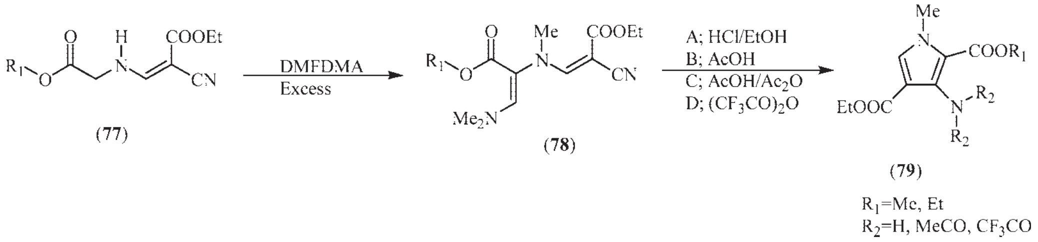
Scheme 13



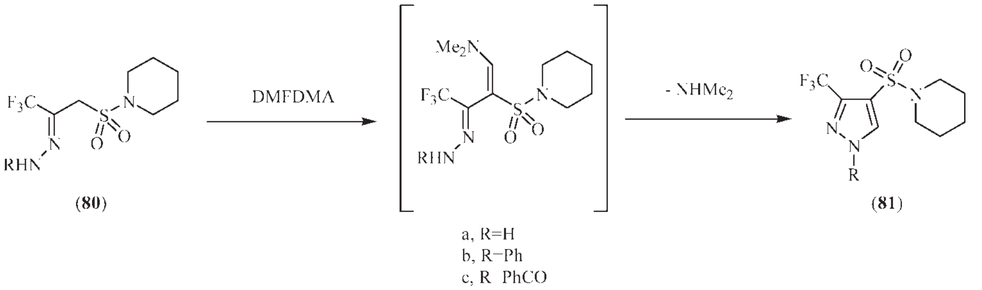
Scheme 14



Scheme 15



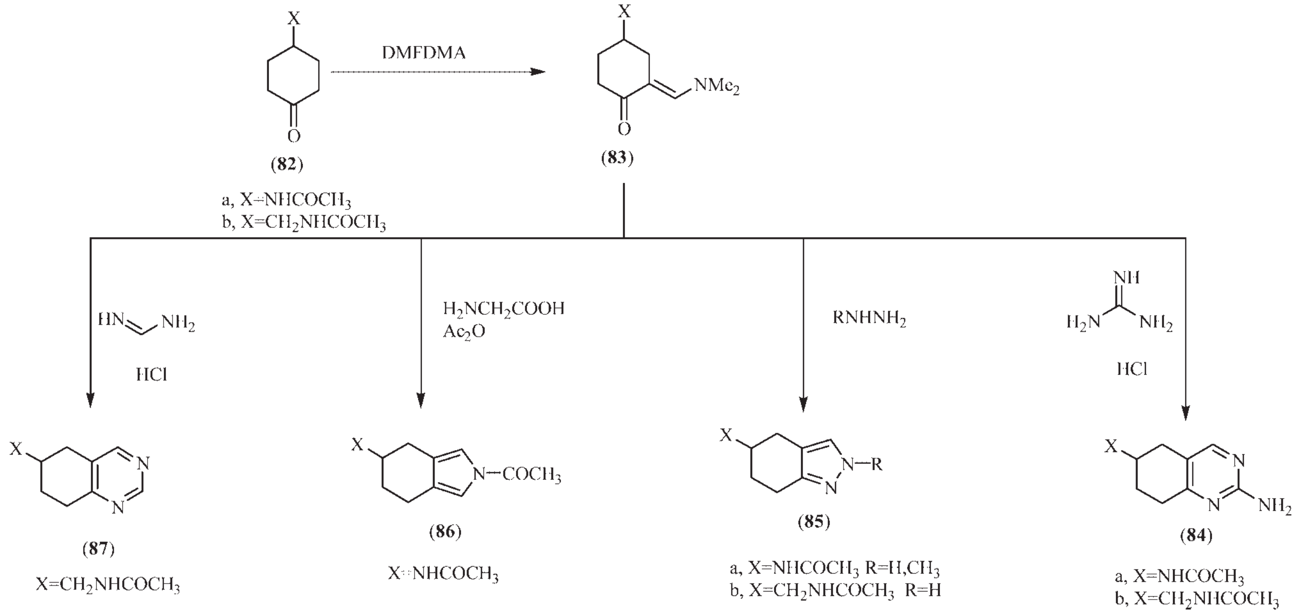
The reaction of hydrazones (**80**) with DMFDMA afforded 3-trifluoromethylpyrazole-4-sulfonamides (**81**) [61].



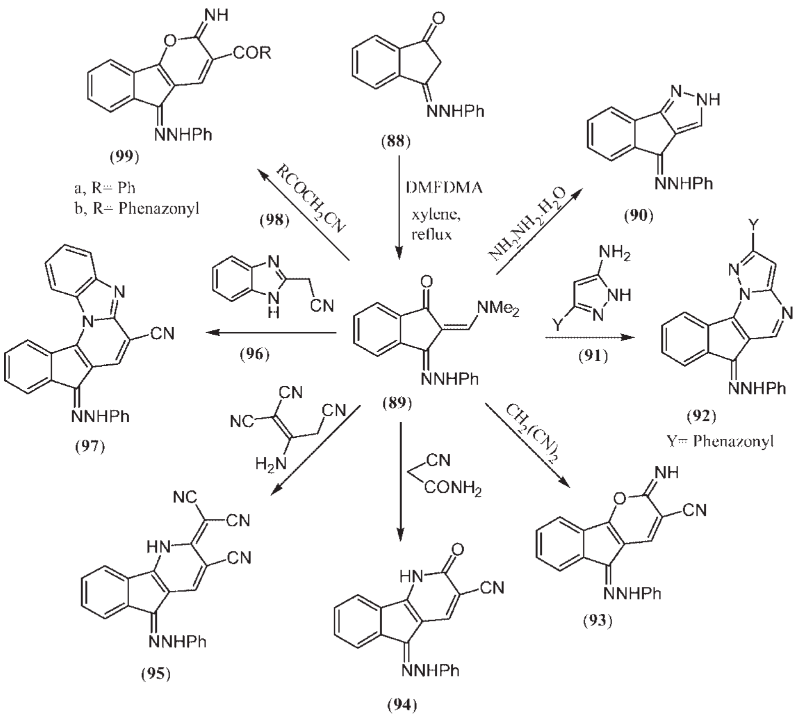
Condensation of 4-substituted cyclohexanones (**82a,b**) with DMFDMA provided enamino ketones (**83a,b**), which reacted with guanidine hydrochloride, hydrazine hydrate, *N*-methylhdrazine, glycine, and formamidine hydrochloride afforded heterocyclic compounds (**84a,b**), (**85a,b**), (**86**), and (**87**), respectively, as shown in Scheme 16 [18,62–67].

Also 3-(phenylhydrazono)indan-1-one (**88**) when reacted with DMFDMA gave the enaminone (**89**), which reacted with hydrazine hydrate to yield the indenopyrazole derivative (**90**). Treatment of (**89**) with pyrazole (**91**) gave the indenofluorene derivative (**92**). The reaction of compound (**89**) with malononitrile gave indenopyran derivative (**93**). When (**89**) reacts with cyanoacetamide, the

Scheme 16



Scheme 17

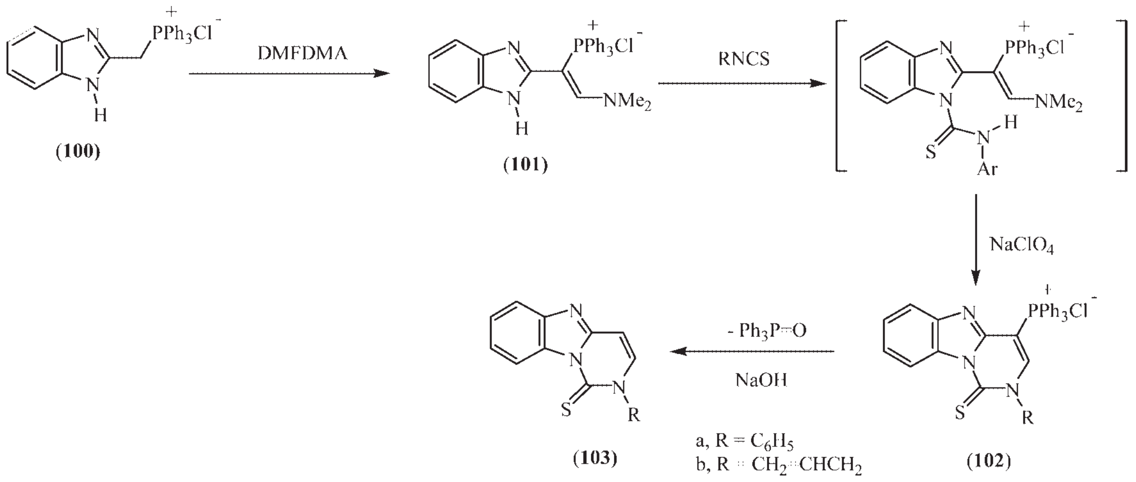


indenopyridine derivative (**94**) was formed. Also, compound (**89**) was reacted with malononitrile dimer to afford the trinitrile (**95**). Enaminone (**89**) reacted with compound (**96**) to afford the diazaindenofluorene derivative (**97**). The ω-cyano compounds (**98**) when reacted with (**89**) afforded compounds (**99a,b**) as shown in Scheme 17 [68].

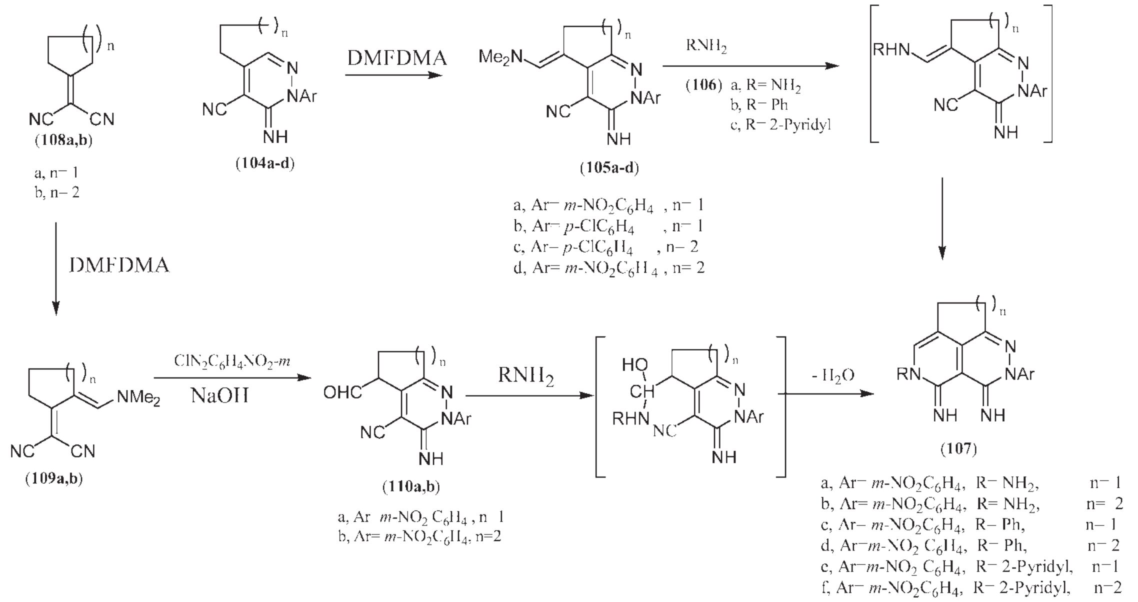
Treatment of the available phosphonium salt (**100**) with DMFDMA gives 2-vinylbenzimidazole derivatives (**101**) which on heating with phenyl or allyl isothiocyanate and sodium perchlorate afforded compounds (**102a,b**) followed by treatment with sodium hydroxide resulting thioxopyrimido[3,4-a]benzimidazoles (**103a,b**) as shown in Scheme 18 [69–72].

DMFDMA reacts with (**104a–d**) to give enamines (**105a–d**), which on treatment with hydrazine hydrate (**106a**) and aromatic amines (**106b,c**) gives pyridopyridazine derivatives (**107a–f**). The latter (**107a,b**) can also be prepared by treatment of (**108a,b**) with DMFDMA to give the corresponding enamines (**109a,b**) followed by coupling with diazonium salt of *m*-nitroaniline in sodium hydroxide to give the corresponding aldehyde derivatives (**110a,b**) followed by treatment with hydrazine hydrate and aromatic amines (Scheme 19) [73].

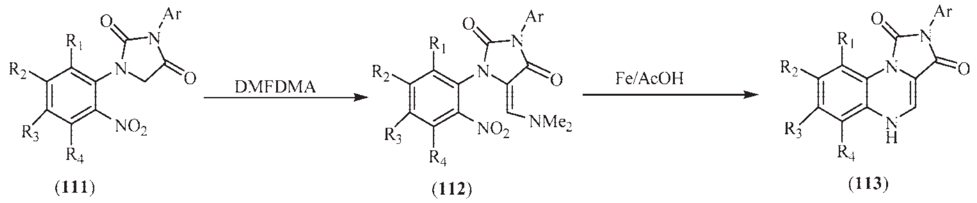
Scheme 18



Scheme 19

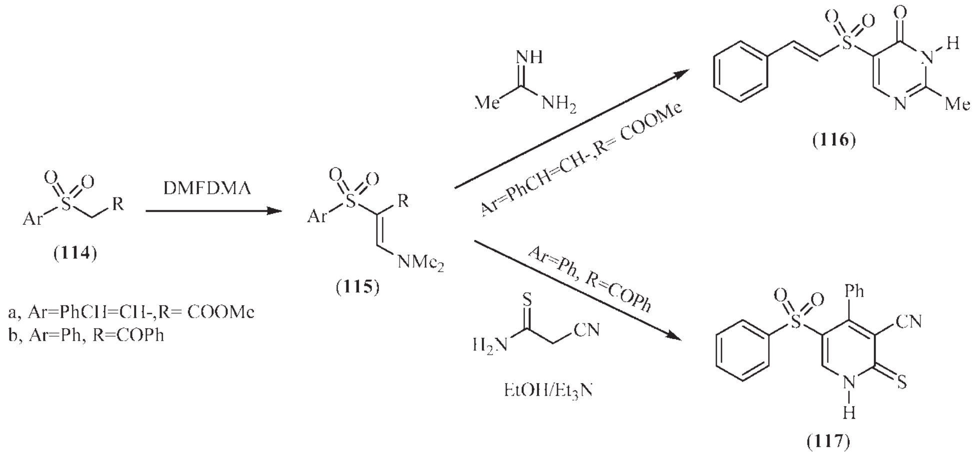


Imidazoquinoxalines (**113**) are biologically useful compounds, which can be prepared by the reaction of (**111**) with DMFDMA to give (**112**) followed by reductive cyclization using powdered Fe in AcOH [74].

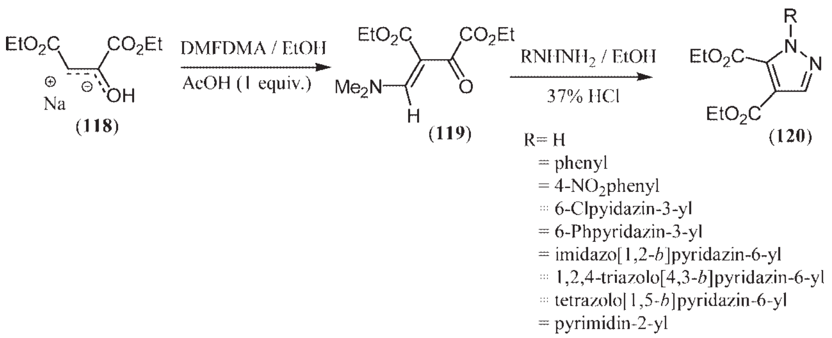


The treatment of compounds (**114a,b**) with DMFDMA afforded the corresponding arylsulfonylenamines (**115a,b**). Compound **115a** reacted with acetamidine to yield 5-styrylsulfonylpyrimidinone (**116**) [75]. Also compound **115b** reacted with cyanothioacetamide to give polysubstituted pyridine-2(1*H*)-thione in a good yield as shown in Scheme 20 [76].

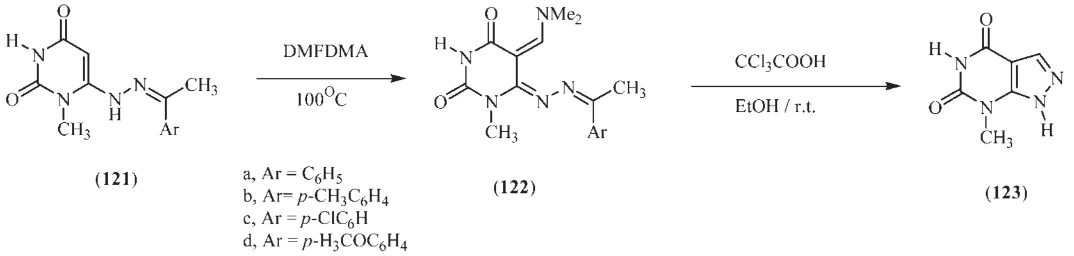
Scheme 20



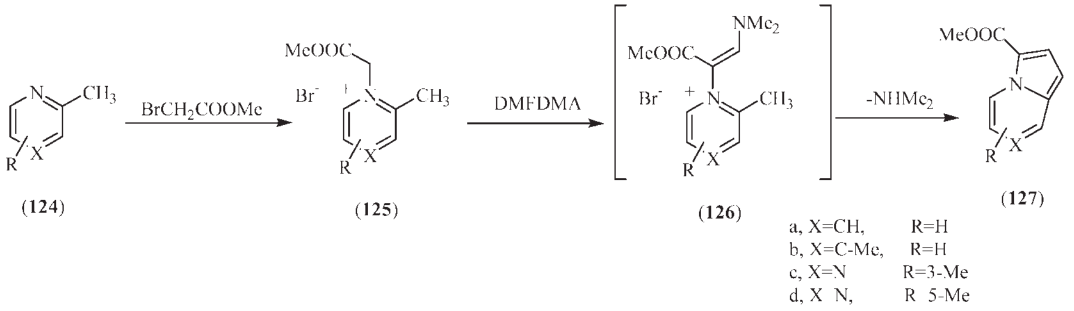
Enaminone (**119**) was prepared from the sodium salt of diethyl 2-oxosuccinate (**118**) by treatment with DMFDMA. Acid-catalyzed cyclocondensations of compound (**119**) were performed with hydrazine derivatives to give the corresponding 1-substituted diethyl 1*H*-pyrazole-4,5-dicarboxylates (**120**) [77].



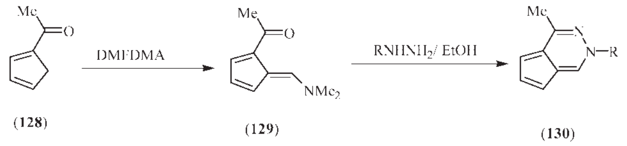
Heating of 6-(α-methylbenzylidenhydrazino)-1-methyluracils (**121a–d**) with an excess of DMFDMA at 100°C for 1 h led to the formation of enamines (**122a–d**) in good yields. Treatment of the products with trichloroacetic and hydrochloric acids (ethanol, room temperature, 15 min) gave rise to a ring closure with the loss of one mole of acetophenone and dimethylamine, affording 7-methylpyrazolo[3,4-*d*]pyrimidine-4,6(5*H*)-dione (**123**) [78].



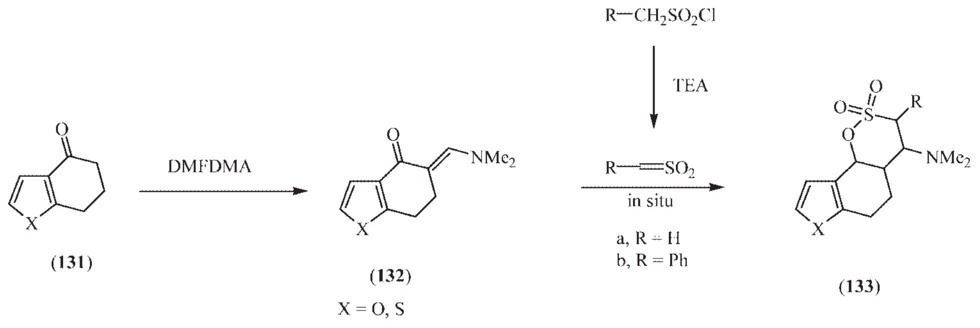
Quaternary salts (**125a–d**), which were prepared from (**124a–d**) and methyl bromoacetate, were treated with DMFDMA to afford fused heterocyclic compounds (**127a–d**) [26].



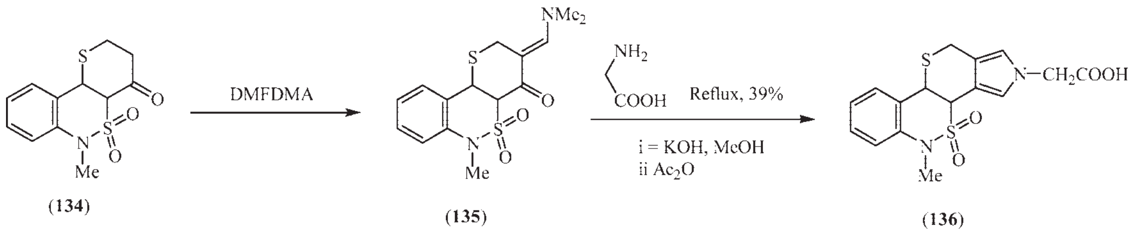
Also when the enamine and carbonyl functions are separated by a carbon, as in compound (**129**), which was prepared from compound (**128**) with DMFDMA, the reaction of (**129**) with a hydrazines gives a fused pyridazine ring, as cyclopenta[*d*]pyridazines (**130**) [79].



Treatment of compound (**131**) with DMFDMA afforded enaminones (**132**). A mixture of methanesulphonyl (or phenyl methylsulphonyl) chloride and triethyl amine produces a sulphene, RCH=SO_2 (R = H, Ph), which cyclizes enaminones (**132**) *in situ* at low temperature to an oxathiin ring (**133**) in high yields [80–85].

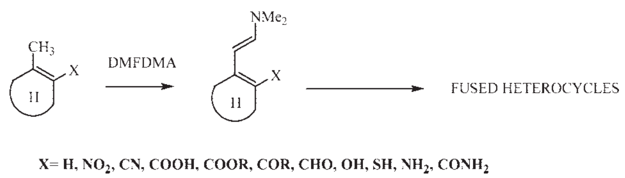


Reaction of (**134**) with DMFDMA afforded 2-keto-enamine (**135**) which reacts with glycine in alkali medium to form a pyrrole ring (**136**) [83].



3. PREPARATION OF HETEROCYCLIC COMPOUNDS THROUGH THE FORMYLATION OF THE METHYL GROUP USING DMFDMA

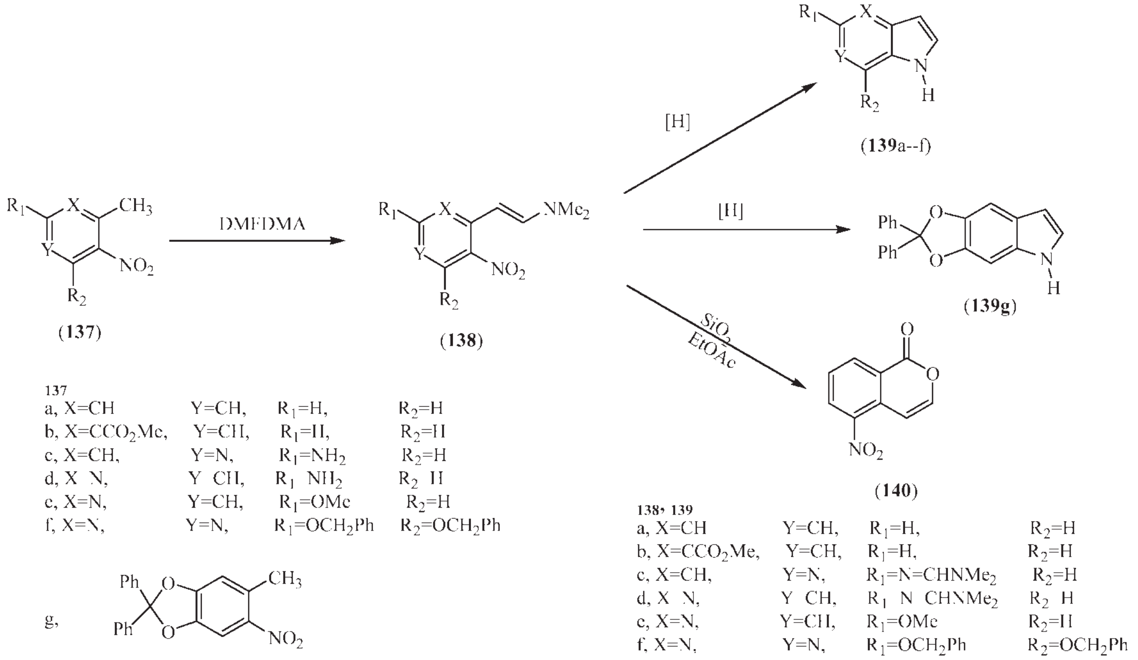
3.1. Ring methyl group. Abu-Shanab et al. reported the cyclization of the methyl group of azine compounds with different functional groups to give fused heterocycles using different organic reagents; DMFDMA is one of them [86].



Microwave irradiation of nitrotoluene (**137a**) with DMFDMA in the presence of anhydrous CuI gave the corresponding enamine (**138a**). Treatment of compounds (**137b–f**) with DMFDMA provided enamine (**138b–f**). Reductive cyclization of enamines (**138a–f**) using H_2/Pd-C or Fe/AcOH or zinc in acetic acid or hydrazine hydrate in the presence of Raney-Ni as a catalyst gave compounds (**139a-f**). Also, treatment of enamine (**138b**) with silica gel provides sufficient acid catalysis to hydrolyze the enamine and cyclises the intermediate enol to the isocoumarine (**140**) as shown in Scheme 21 [4,87–101].

Treatment of pyridazinones (**141a–d**) with DMFDMA in dry DMF afforded (*E*)-dimethylaminoethylenes (**142a–d**) in good yields. Compounds (**142a–c**) reacted with aromatic amines in glacial acetic acid to yield the 2,7-diarylpyrido[3,4-*c*]pyridazinones (**143a–g**). The 1-unsubstituted pyrido[3,4-*c*]pyridazinones (**143h–j**) were also formed on treatment of (**142a–c**) with ammonium acetate in acetic acid. Compound (**142a**) also reacted with 5-methylpyrazol-3-amine (**144**) and with hydrazine hydrate to yield pyrido[3,4-*c*]pyridazinones (**143k,l**), respectively. Refluxing (**142a–c**) in HOAc-HCl afforded carboxylic acids that may be formulated as (**145a–c**) as shown in Scheme 22 [102,103].

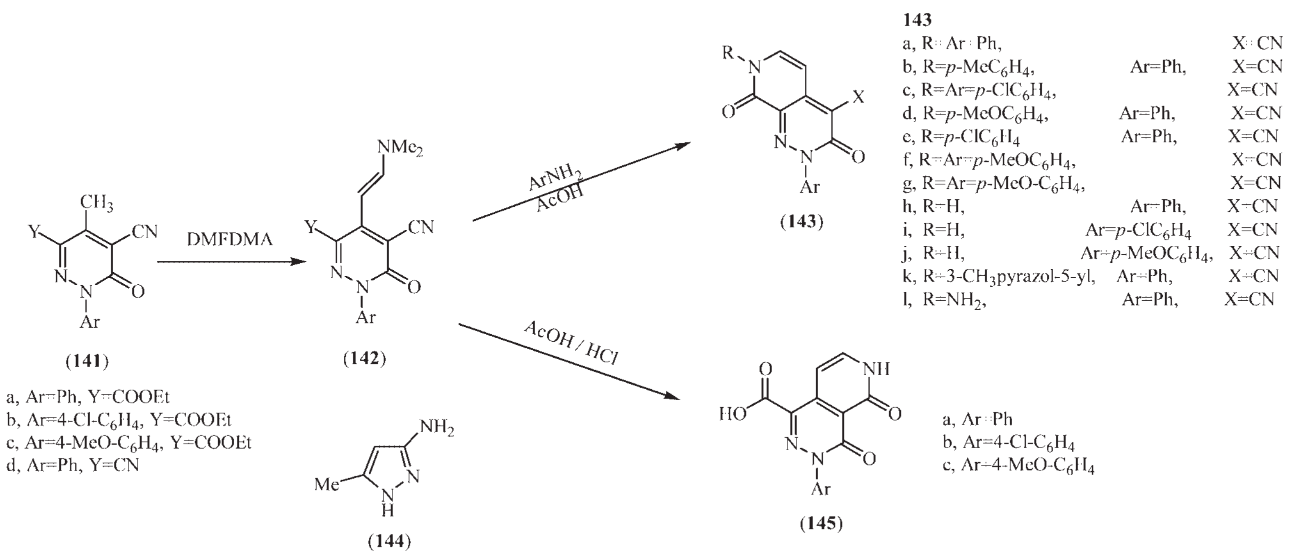
Scheme 21



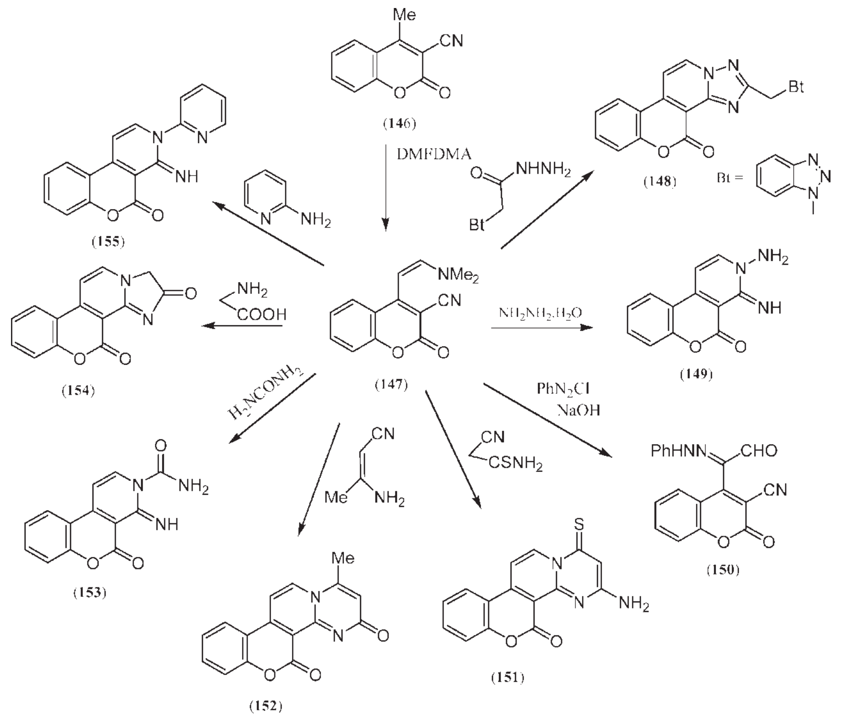
Also the treatment of 3-cyano-4-methylcoumarin (**146**) with DMFDMA in dry xylene afforded the (*E*)-dimethylaminoethylene derivative (**147**). Fusion of enamine (**146**) with benzotriazol-1-yl-acetic acid hydrazide afforded the corresponding [1,2,4]triazolo[1,5-*a*]pyrido[3′,4′-*c*]coumarin (**148**). Reaction of enamine (**147**) with hydrazine hydrate gave compound (**149**). Enamine (**147**) was also coupled with benzenediazonium chloride to afford 2-oxo-4-[2-oxo-1-(phenylhydrazono)-ethyl]-2*H*-chromene-3-carbonitrile (**150**). Treatment of (**147**) with cyanothioacetamide, 3-aminocrotononitrile, urea, glycine, and 2-aminopyridine affords fused heterocyclic compounds (**151–155**), respectively, as shown in Scheme 23 [104–106].

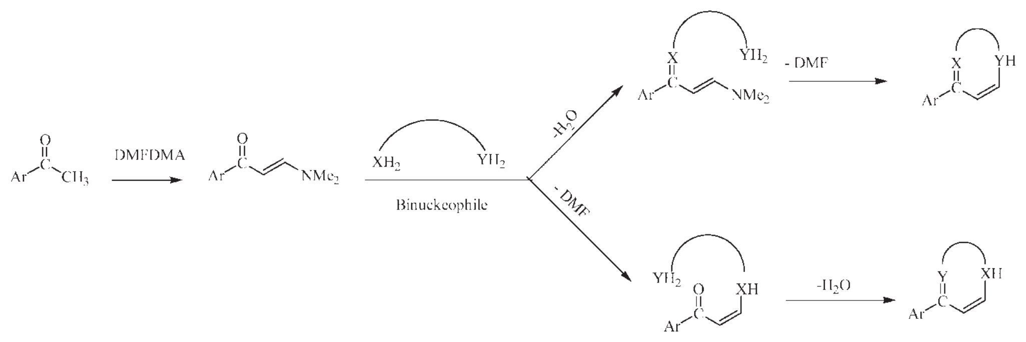
3.2. Methyl of acetyl group. In the acetyl group, the presence of the methyl group beside the carbonyl useful to give heterocyclic compounds using DMFDMA and different binucleophilic reagents. The general mechanism for this reaction is as shown in the following. The products of this reaction depend on the conditions under which the reactions were carried out and the type of the binucleophile used.

Scheme 22



Scheme 23



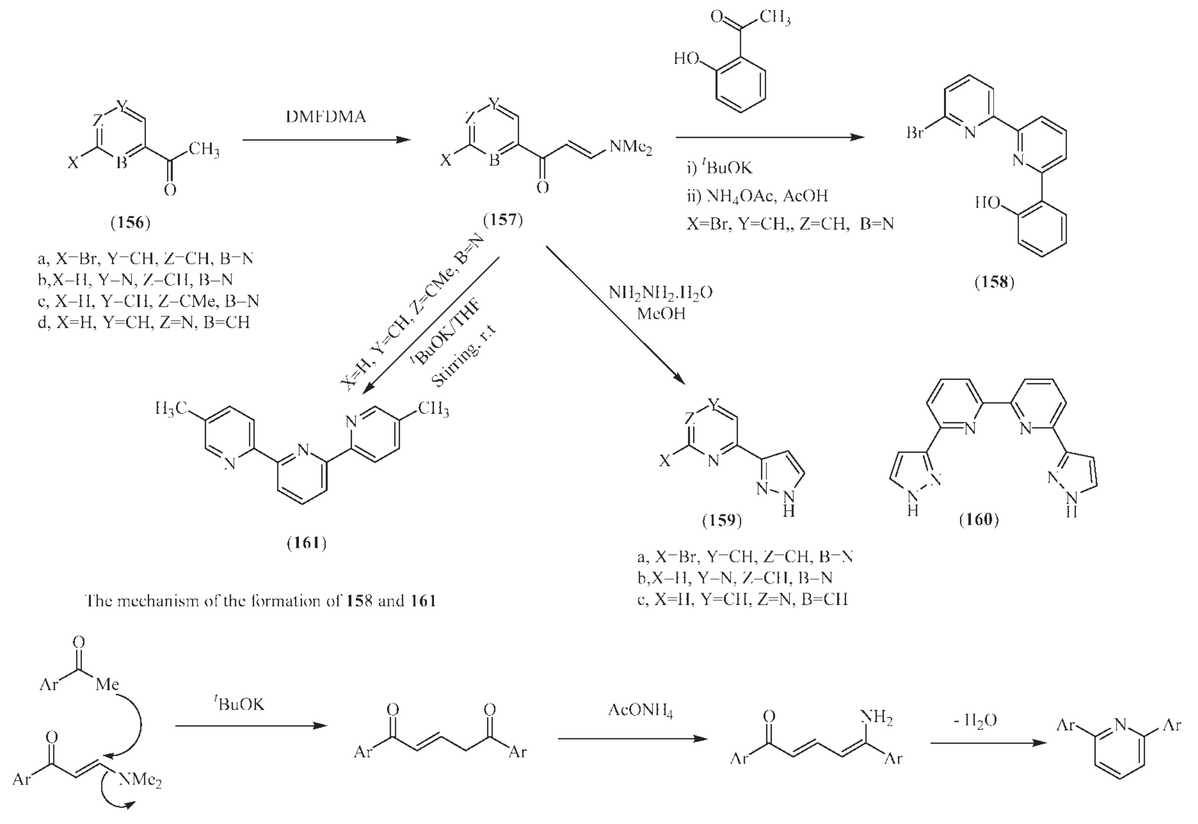


Reaction of acetyl azines (**156a–d**) with DMFDMA gave the corresponding enamines (**157a–d**). Compound (**157a**) reacted with 2-hydroxyacetophenone to afford 2,2′-bipyridine (**158**). When (**157a,b,d**) is reacted with hydrazine hydrate in hot methanol in a Schlenk tube, the pyrazolyl ring (**159a–c**) is formed. Also compound (**160**) is obtained similarly [107,108]. Also the reaction of (**157c**) with (**156c**) using potassium *t*-butoxide as a base gives 5,5’-dimethylterpyridine (**161**) as shown in Scheme 24 [109–112].

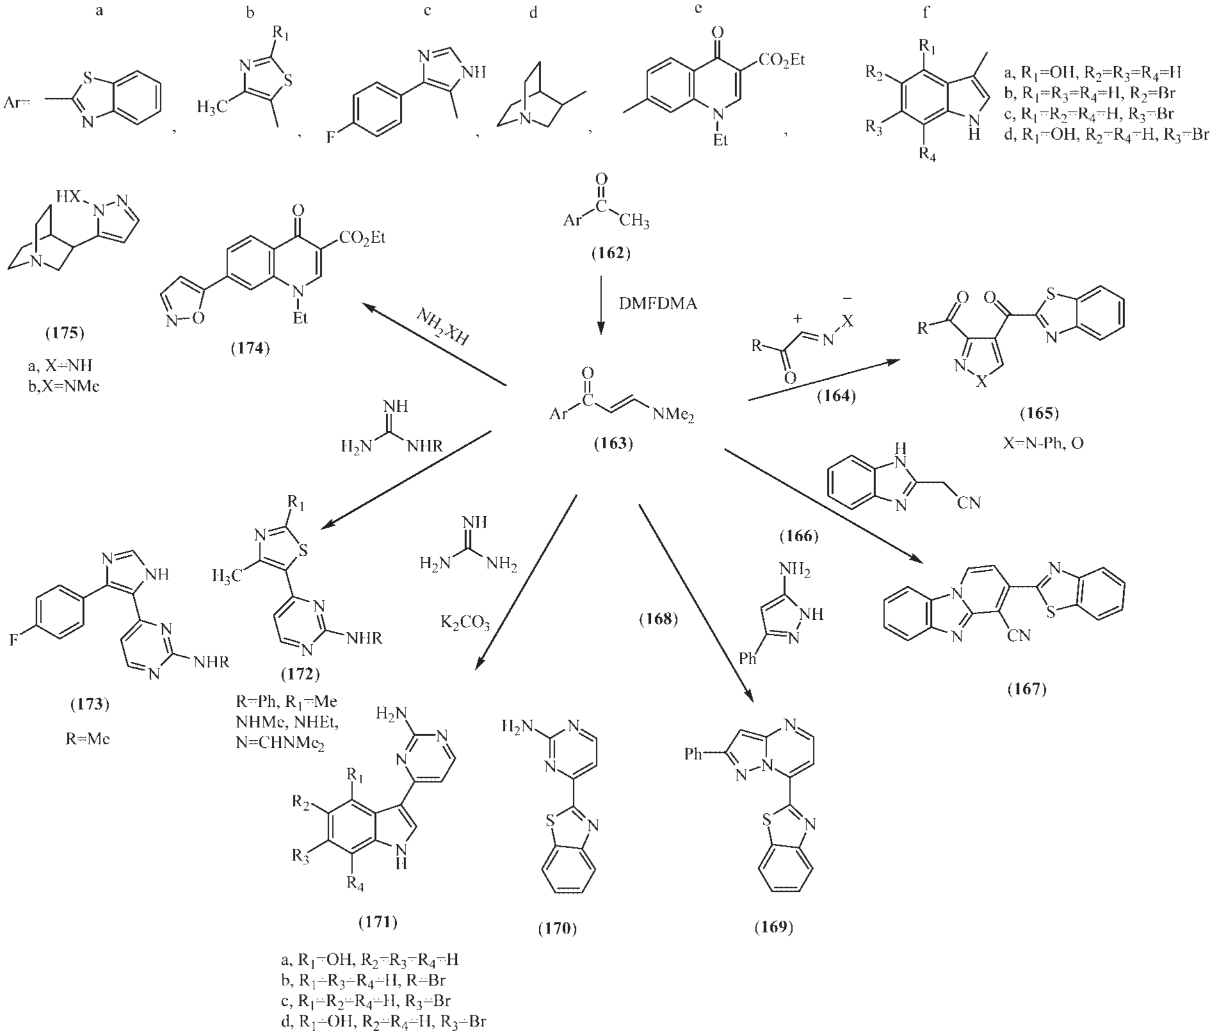
Also the treatment of some heterocyclic acetyl compounds (**162a–f**) with DMFDMA afforded *E*-1-heteroaryl-3-(*N*,*N*-dimethylamino)-2-propen-1-ones (**163a–f**). Cycloaddition of some nitrilimines and nitriles oxides (**164**) with the enaminone (**163a**) gave (**165**). Also the compound (**163a**) reacted with 1*H*-2-benzimidazoleacetonitrile (**166**) gave pyrido[1,2-*a*]benzimidazole (**167**). Also the enaminone (**163a**) reacted with 5-amino-3-phenylpyrazole (**168**) to yield pyrazolo[1,5-*a*]pyrimidine (**169**). Reaction of guanidine nitrate with (**163a,f**) afforded 2-amino-4-[2-benzothiazolyl]pyrimidine (**170, 171**), respectively. The reaction of (**163b,c**) with N-substituted guanidine carbonate at elevated temperature in alcoholic alkali afforded 2-[*N*-phenylamino]-4-[5-(2-substituted-4-methyl)thiazolyl]pyrimidine **172** and **173**, respectively. The treatment of **163c,d** with hydroxylamine or with alkylhydrazine afforded **174** and **175**, respectively, as shown in Scheme 25 [54,113–122].

Also, treatment of acetophenone and its derivatives (**176a–j**) with DMFDMA afforded 3-*N*,*N*-dimethylamino-1-aryl-prop-2-en-1-one (**177a–j**) in very good yield [123]. The reaction of enaminones (**177a–j**) with different nucleophiles afforded different heterocycles. Reaction of enaminone (**177a**) with 2-methoxyacetophenone

Scheme 24



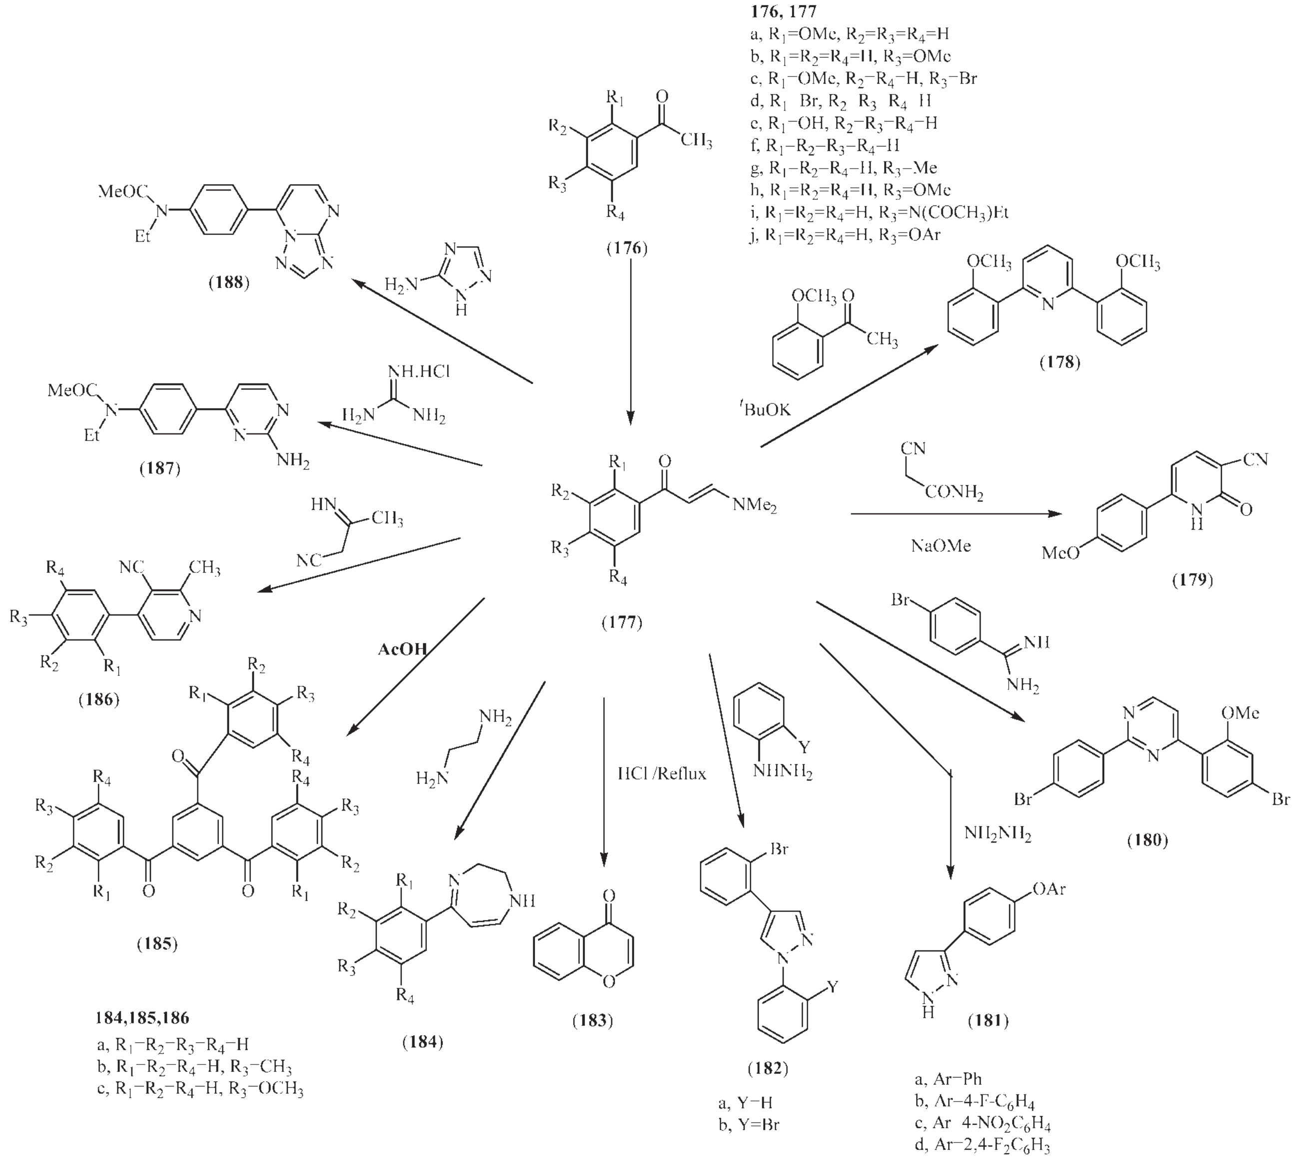
Scheme 25



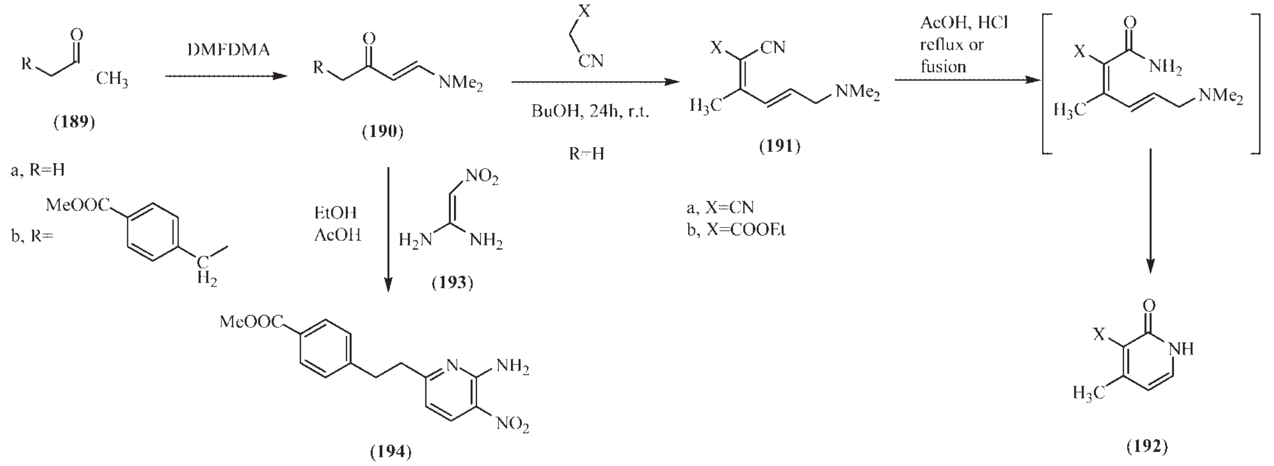
(**176a**) in the presence of potassium *t*-butoxide afforded pyridine derivative (**178**) [124]. The treatment of the dimethylaminopropenone (**177b**) with cyanoacetamide afforded pyridine-2(1*H*)-one (**179**) [125]. Formation of the pyrimidine ring (**180**) was achieved by the base-promoted condensation between 4-bromobenzamidine and 3-dimethylamino-1-(4-bromo-2-methoxyphenyl)-prop-2-en-1-one (**177c**) [126–128]. Enaminoketone (**177d**) was reacted with phenylhydrazine derivatives affording diarylpyrazoles (**182a,b**) [66,129]. Treatment of enaminone (**177e**) with hydrochloric acid under reflux gave 4*H*-benzopyran-4-one (**183**) [130,131]. The reaction of ethylenediamine with enaminones (**177f–h**) afforded the diazepenes (**184a–c**). Refluxing of enaminones (**177f–h**) in acetic acid gave (**185a–c**). The reaction of (**177f–h**) with 3-aminocrotononitrile afforded the pyridine derivatives (**186a–c**) [132]. 2-Amino-4-[4(*N*-acetyl-*N*-ethyl)aminophenyl]pyrimidine (**187**) was obtained by condensation of enaminone (**177i**) with guanidine hydrochloride. Enaminone (**177i**) reacted with 3-amino-1,2,4-triazole to give 1,2,4-triazolo[1,5-*a*]pyrimidine (**188**) [32,133] as shown in Scheme 26.

1-*N*,*N*-Dimethylaminobut-1-en-3-one (**190a**) and its derivatives (**190b**) were obtained by the reaction of acetone and its derivative (**189a,b**) with DMFDMA. The reaction of (**190a**) with either malononitrile or ethyl cyanoacetate afforded (**191a,b**) which was then refluxed in an acetic acid hydrochloric acid mixture to afford 3-substituted 4-methylpyridine-2(1*H*)-one (**192a,b**) in a good yield [134,135]. Treatment of phenethyl enaminone

Scheme 26

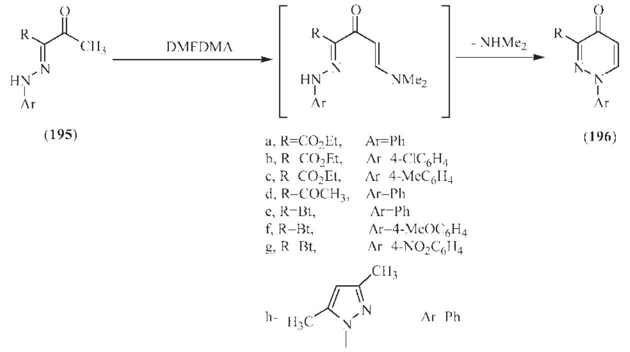


Scheme 27



(**190b**) with 2-nitroethene-1,1-diamine (**193**) gave pyridine (**194**) as shown in Scheme 27 [136].

Consequently arylhydrazones (**195a–h**) were condensed with DMFDMA to yield the pyrazolylpyridazine (**196a–h**) in good yields [137–139].

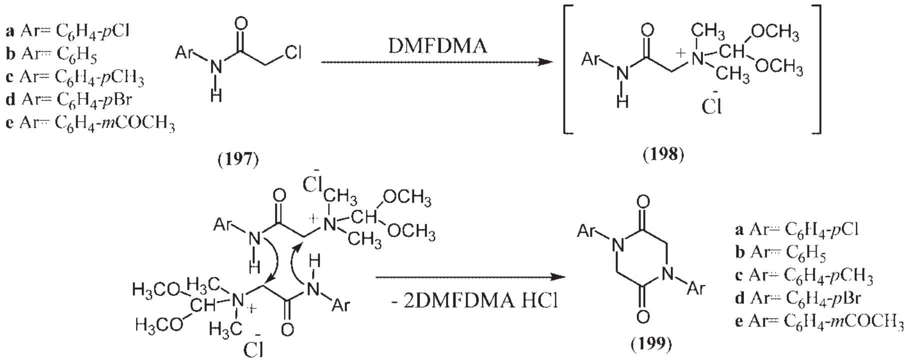


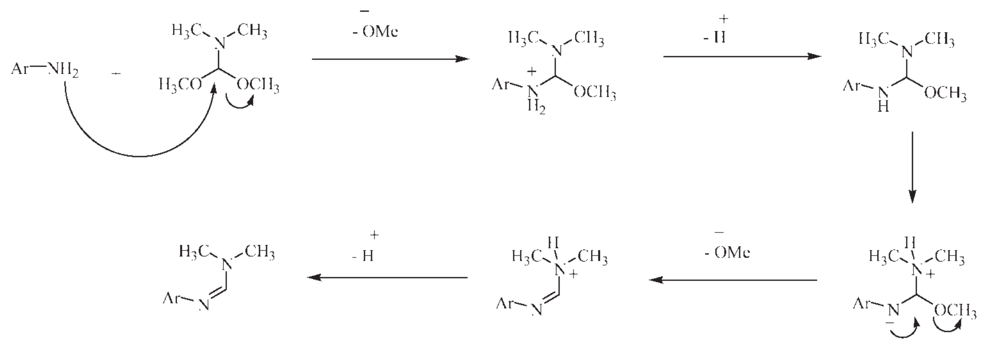
DMFDMA was found to react with α-chloroacetanildes (**197a–e**) to give the unexpected products 1,6-diarylpyrazine-2,5-diones (**199a–e**). Scheme 28 shows a possible alternative pathway, in which DMFDMA acts as a nucleophile which attacks the carbon carrying the chlorine in α-chloroacetamides (**197a–e**) to afford the salt (**198a–e**); dimerization with elimination of DMFDMA salt then gives 1,4-diarylpiperazine-2,5-diones (**199a–e**) [140].

4. PREPARATION OF HETEROCYCLIC COMPOUNDS THROUGH THE FORMYLATION OF THE AMINO GROUP USING DMFDMA TO GIVE AMIDINES

The reaction of the amino group with DMFDMA is easier and faster than the methyl and methylene groups because the amino group contains free lone pair of electrons, which make it a very good nucleophile. So that the reaction is nucleophilic substitution followed by elimination of methanol molecule to give the corresponding *N,N*-dimethylaminoamidine by the effect of NMe$_2$ group as shown in the following reaction mechanism.

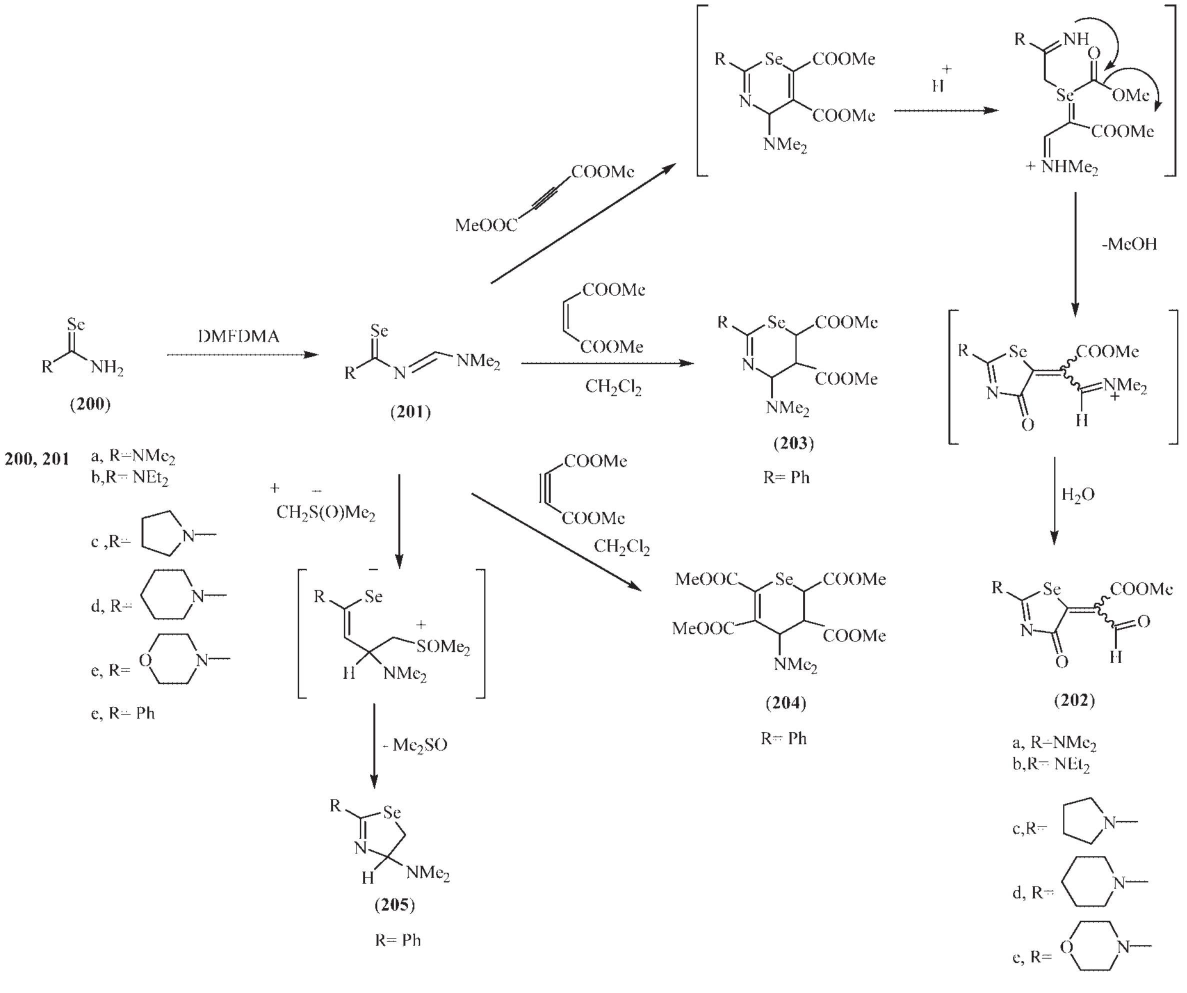
Scheme 28



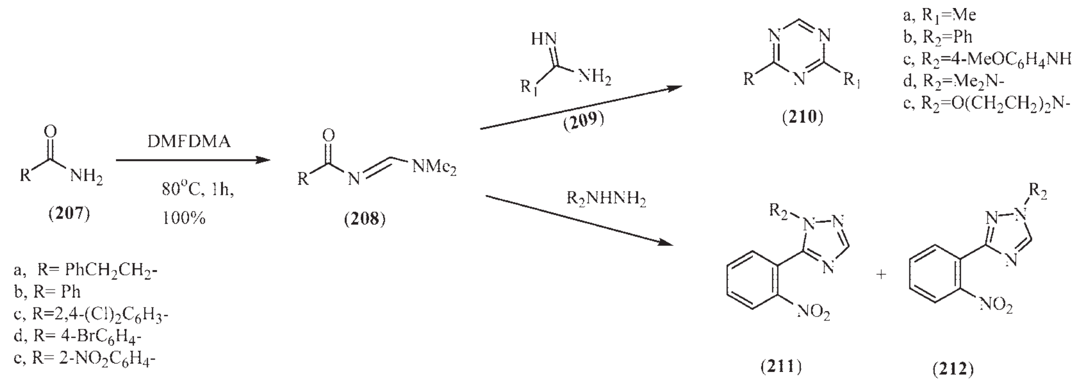


4.1. Amino of selenoamide group. Condensation of *N*,*N*-disubstituted selenourea (**200a–e**) with DMFDMA (1.5 equiv) at room temperature for 6 h afforded selenoazadienes (**201a–e**) in high yields. The presence of the selenium atom facilitates the cycloaddition reactions as a result of the presence of the vacant d-orbital which make it act as a Lewis acid. Interestingly, the reaction did not give the expected Diels-Alder adduct but a mixture of *E*/*Z* isomers of (**202**) was obtained. The reaction was carried out as shown in Scheme 29 [141]. The reactivity of the *N*-selenoacylamidine (**201e**) as 4π heterodienic system in [4 + 2] cycloaddition reactions with electrophilic dienophiles was investigated. Thus (**201e**) was quenched with an excess of methyl acrylate

Scheme 29



Scheme 30



affording 5,6-dihydro-4*H*-1,3-selenazine (**203**). The addition of dimethyl acetylenedicarboxylate (DMAD) afforded the 4*H*-selenopyran (**204**). Treatment of the trimethylsulfoxonium iodide with the *N*-selenoacylamidine (**201e**) gave the selenazol-2-ines (**205**) as shown in Scheme 29 [142].

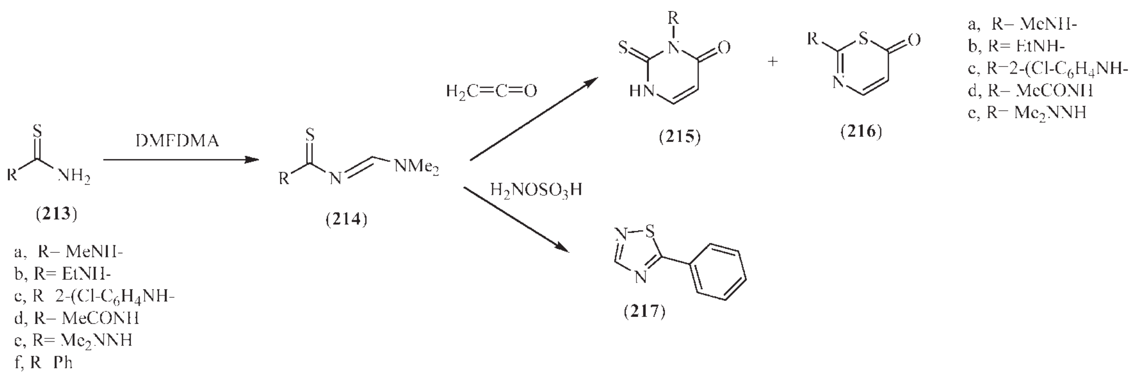
4.2. Amino of amide group. *N*′-Acyl-*N*,*N*-dimethylamidines (**208a–e**) were prepared in excellent yields by heating amides (**207a–e**) with DMFDMA. *N*′-Acyl-*N*,*N*-dimethylamidines (**208a–e**) were condensed with amidines or guanidines (**209a–e**) in aprotic solvent to give s-triazines (**210a–e**). Also 2-(2-nitrophenyl)-1,3,4-triazoles (**211**) and (**212**) were synthesized from treatment of (**208e**) with hydrazine derivatives Scheme 30 [143–146].

4.3. Amino of thioamide group. Treatment of thioamide (**213a–f**) with DMFDMA gave 2,4-diamino-1-thia-3-azabutadienes (**214a–f**). Thioxopyrimidinones (**215a–e**) and thiazinones (**216a–e**) were obtained from treatment of (**214a–e**) with ketene by [4 + 2] cycloaddition reaction [147]. 5-Phenyl-1,2,4-thiadiazole (**217**) was also synthesized from reaction of [dimethyl (amino)methylene]thiobenzamide (**214f**) with hydroxylamine-*O*-sulfonic acid at room temperature as shown in Scheme 31 [148].

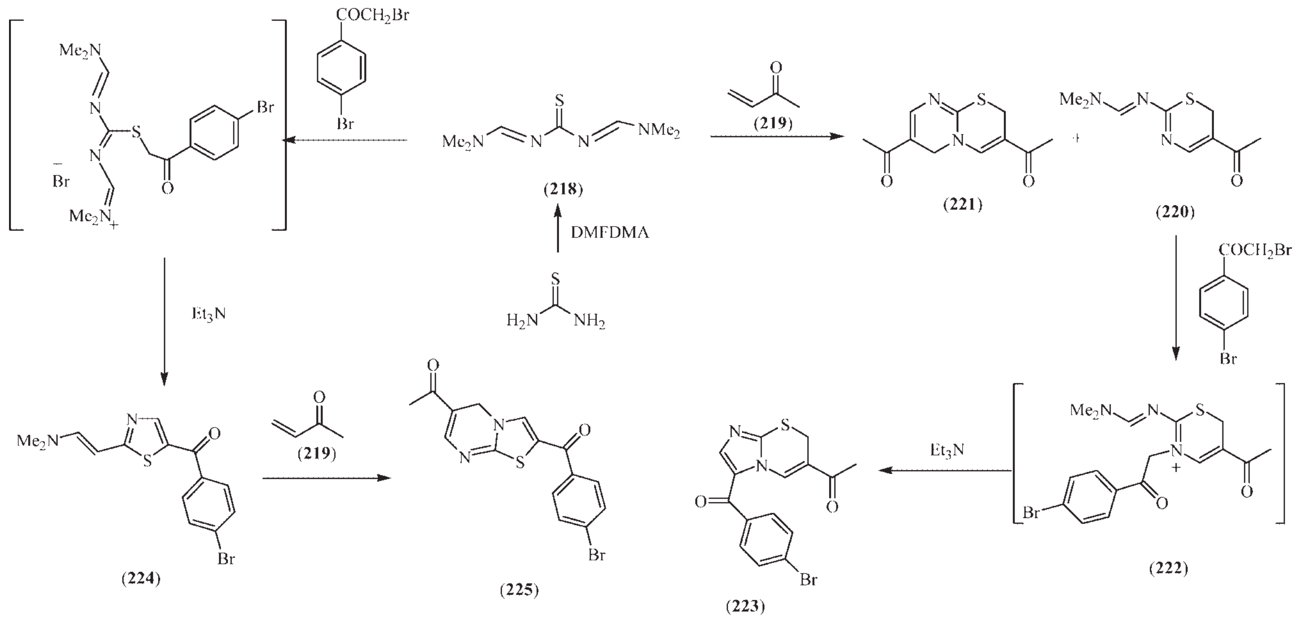
The reaction of thiourea with excess of DMFDMA in boiling dichloromethane afforded polyheteropolyene (**218**). The [4 + 2] cycloaddition reaction with methyl vinyl ketone (**219**), the thiazine (**220**), and pyrimido[2,1-*b*][1,3]thiazine (**221**) were formed. The alkylation of thiazine (**220**) by *p*-bromophenacyl bromide affected the endocyclic nitrogen atom providing the *N*-alkylated unisolated salt (**222**). Subsequent treatment with triethylamine afforded imidazo[2,1-*b*][1,3]thiazine (**223**). The reaction between polyheteropolyene (**218**) and *p*-bromophenacyl bromide afforded the corresponding S-alkyl bromide salt. This intermediate was deprotonated *in situ* by addition of triethylamine. Annulation proceeded spontaneously followed by loss of dimethylamine to provide thiazole derivative (**224**). The [4 + 2] cycloaddition reaction between thiazole (**224**) and methyl vinyl ketone (**219**) gave 5*H*-thiazolo[3,2-*a*]pyrimidine (**225**) as shown in Scheme 32 [149].

4.4. Amino group attached to the ring. Treatment of 2-aminoheterocyclic compounds (**226a–c**) with DMFDMA gave the corresponding amidines (**227a–c**). The treatment of (**227a–c**) with (*R*,*S*) isomer of *N*-trifluoroacetyl-5-bromo-4-oxonorvaline methyl ester (**228**) gave (**230a,b**) *via* the intermediate (**229**) as shown in

Scheme 31

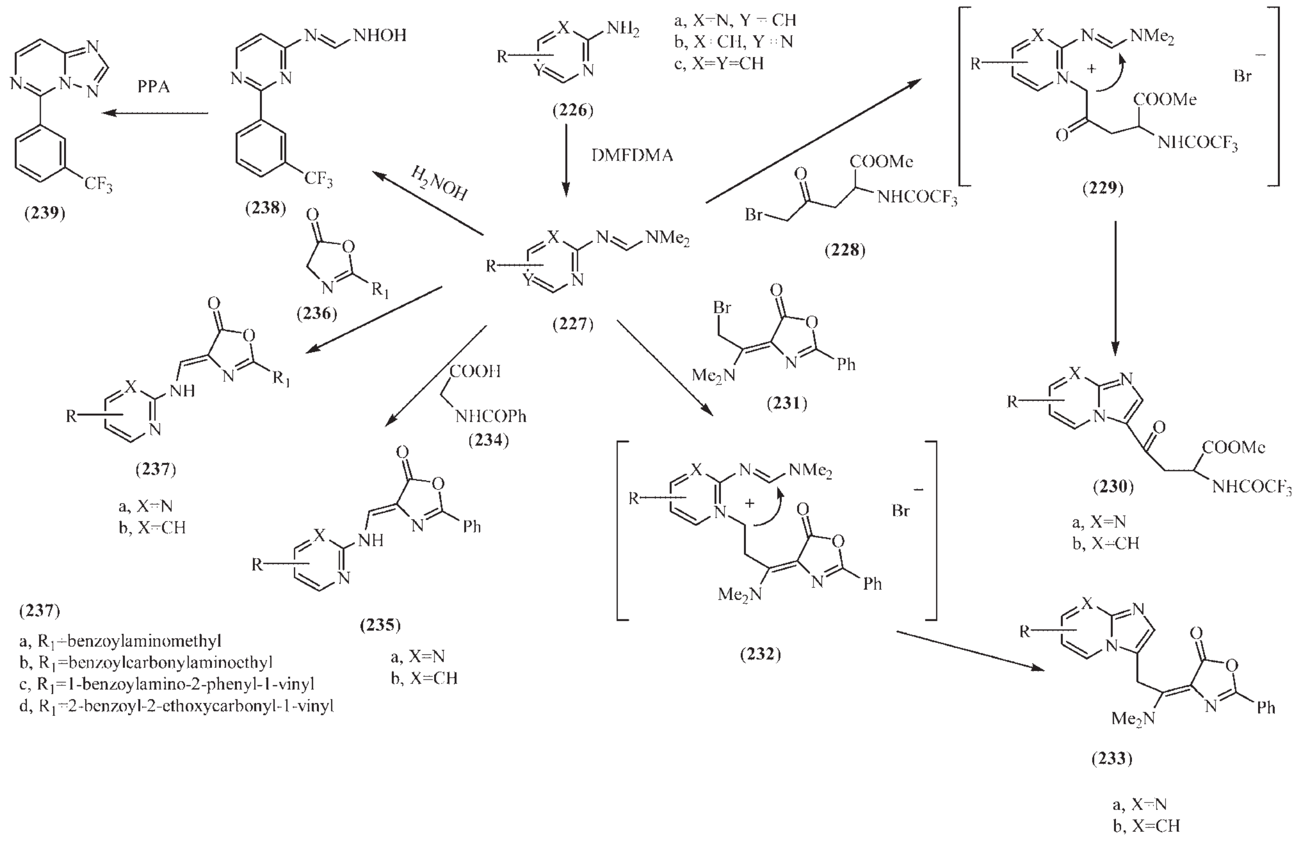


Scheme 32

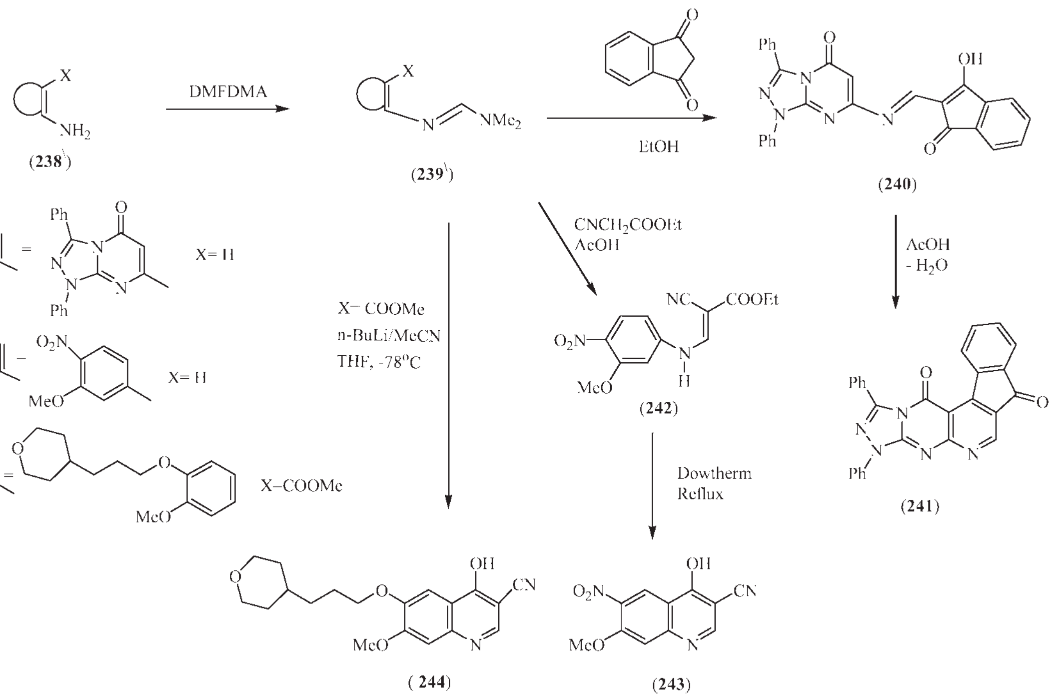


Scheme 33 [150]. Also the reaction of (**227a–c**) with 4-(2-bromo-1-dimethylaminoethylidene)-2-phenyl-5(4*H*)-oxazolone (**231**) in acetonitrile or DMF, the quaternary salt (**232**) was formed, which was cyclized into (**233a–c**) [151]. The reaction of (**227a–c**) with either huppuric acid (**234**) or oxazolones (**236**) afforded 2-substituted-4-

Scheme 33



Scheme 34



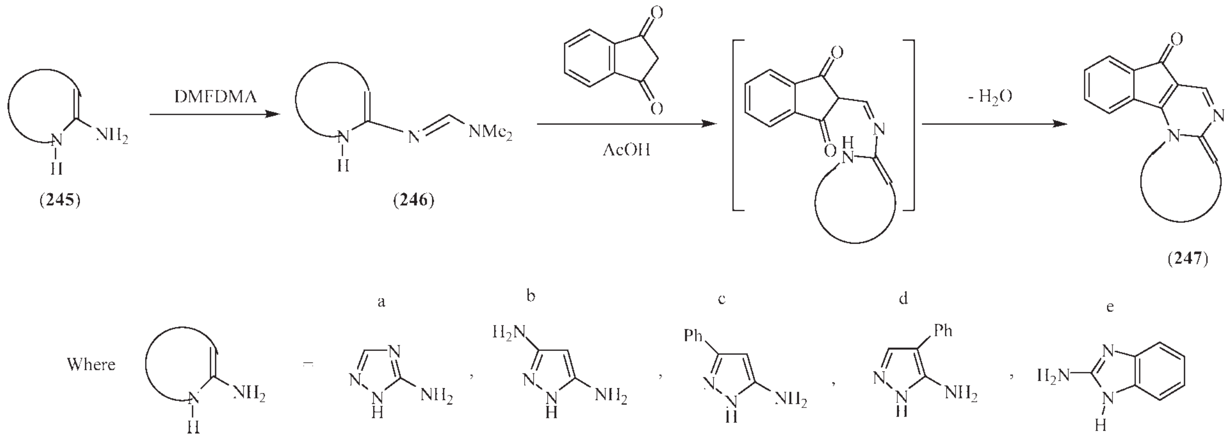
heteroarylaminomethylene-5(4*H*)-oxazolones (**235a–c**) and (**237**), respectively [152]. Triazolo[1,5-*c*]pyrimidine (**239**) was prepared by treatment of (**227b**) with hydroxylamine to give compound (**238**) followed by treatment with polyphosphric acid as is also shown in Scheme 33 [153,154].

Reaction of amino compounds (**238′a–c**) with DMFDMA yields the corresponding formamidine compounds (**239′a–c**). Treatment of compound (**239′a**) with indene-1,3(2*H*)-dione in boiling ethanol leads to the formation of acyclic structure (**240**), which is converted into cyclic compound (**241**) when boiled in glacial acetic acid [155]. Reaction of (**239b**) with ethyl cyanoacetate gave (**242**) as a mixture of isomers, which on thermal cyclization gave the 4-hydroxyquinoline (**243**). Hydroxyquinoline (**244**) was accomplished by treating (**239′c**) with the lithium anion of CH_3CN in THF at –78°C followed by quenching with AcOH, and warming to room temperature as shown in Scheme 34 [156].

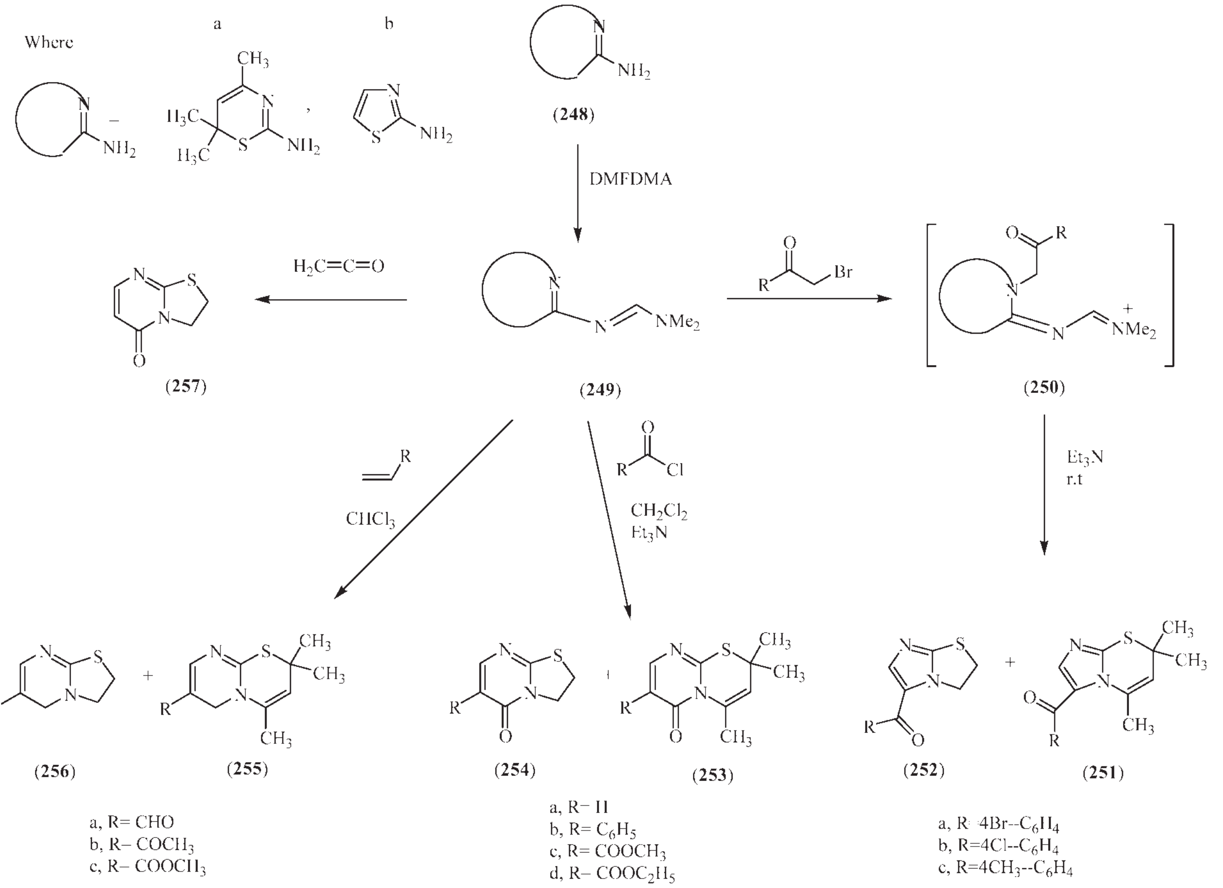
Also condensation of compounds (**246a–e**), which were prepared by reaction of (**245a–e**) with DMFDMA and indene-1,3-dione in boiling acetic acid leads to the formation of compounds (**247a–e**) as shown in Scheme 35 [155].

Treatment of 2-amino-4,6,6-trimethyl-6*H*-1,3-thiazine (**248a**) 2-aminothiazoline (**248b**) with DMFDMA

Scheme 35

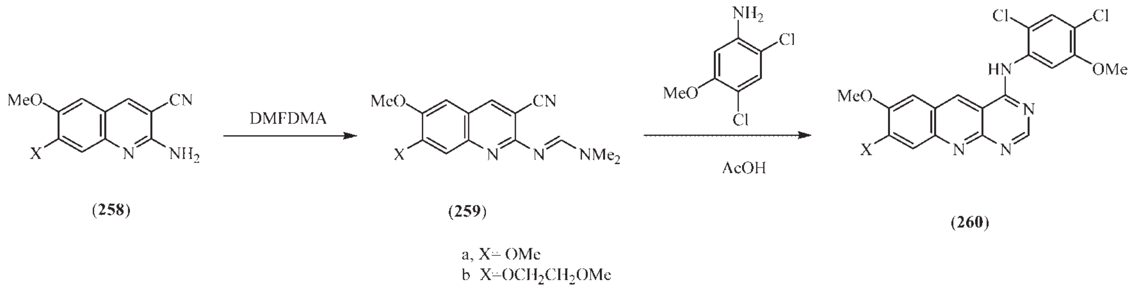


Scheme 36



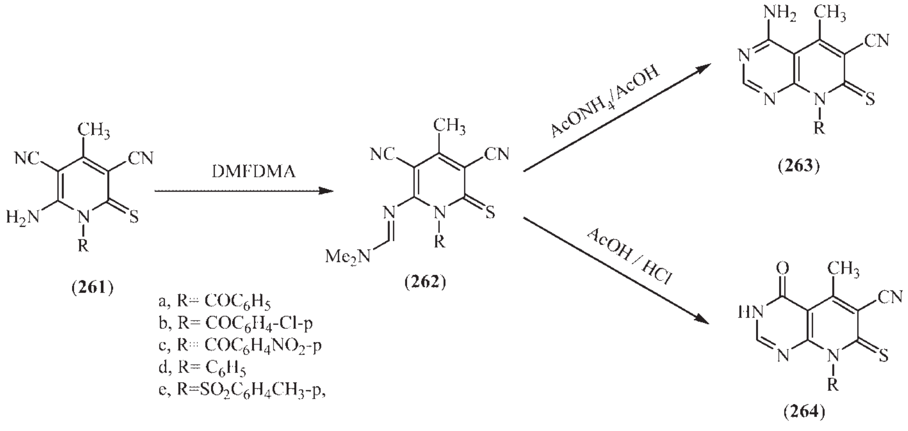
afforded (**249a,b**). Alkylation of compound (**249a,b**) with arylacyl bromides affected the intracyclic *N*-alkyl amidinium bromides (**250**). These salts transformed into 7*H*-imidazo[2,1-*b*][1,3]thiazines (**251**) imidazo[2,1-*b*]thiazoles (**252**), respectively, by addition of Et_3N. 2*H*,6*H*-Pyrimido[2,1-*b*][1,3]thiazin-6-ones (**253**) and (**254**) can be prepared from compounds (**249a,b**) with acid chlorides. 2*H*,6*H*-Pyrimido[2,1-*b*][1,3]thiazine derivatives (**255**) and thiazolo[3,2-*a*]pyrimidines (**256**) were obtained by the reaction of amidines (**249a,b**) with acrylic dienophiles in $CHCl_3$. Cycloaddition of amidine (**249b**) with ketene gave 6-unsubstituted thiazolo[3,2-*a*]pyrimidin-5-ones (**257**) as shown in Scheme 36 [157,158].

Treatment of quinoline derivatives (**258a,b**) with DMFDMA gave the corresponding amidines (**259a,b**). Subsequent addition of 2,4-dichloro-5-methoxyaniline in acetic acid provided the desired tricyclic derivatives (**260a,b**) as shown in the following [159].



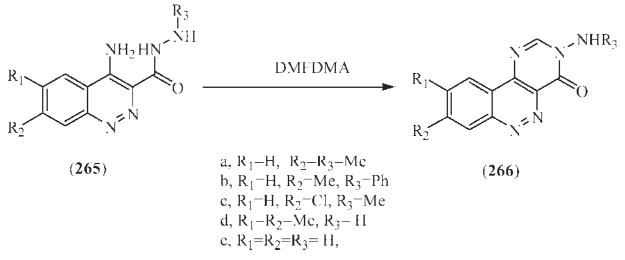
Also the treatment of 6-amino-3,5-dicyano-6-methyl-*N*-substitutedpyridine-2(1*H*)-thione (**261**) with DMFDMA in dry dioxane afforded the corresponding amidine (**262**) which on boiling with ammonium acetate in

Scheme 37

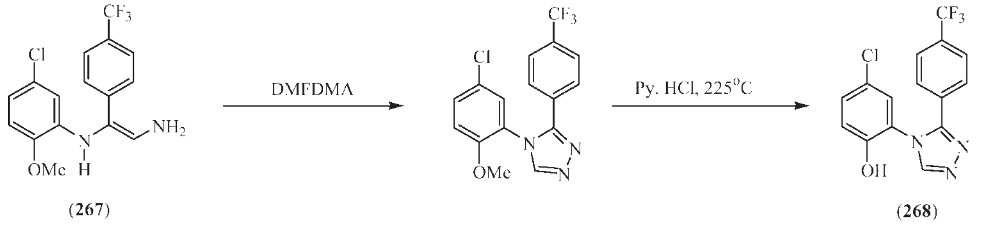


acetic acid and hydrochloric acid in acetic acid afforded pyrido[2,3-*d*]pyrimidine derivatives (**263**) and (**264**), respectively, as shown in Scheme 37 [160].

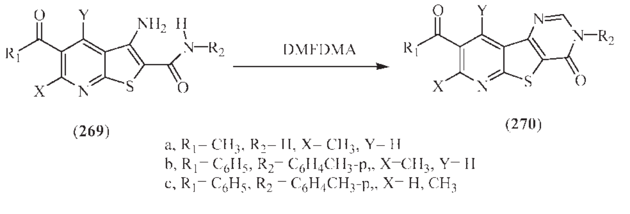
4.5. Cyclization of two amino groups by DMFDMA. Hydrazides (**265a–e**) were converted to 3-aminopyrimido[5,4-*c*]cinnolines (**266a–e**) by refluxing with DMFDMA in diethylene glycol dimethyl ether [161,162].



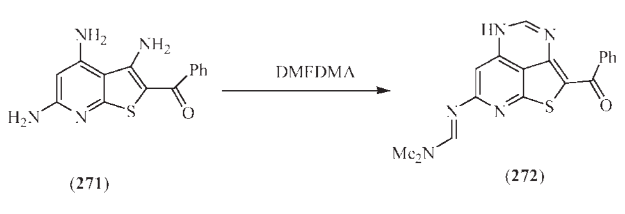
4-Chloro-2-[3-[4-(trifluoromethyl)phenyl]-4*H*-dihydro-1,2,4-triazol-4-yl]phenyl-phenol (**268**) was obtained by cyclization of compound (**267**) with DMFDMA to give triazole ring followed by hydrolysis [163].



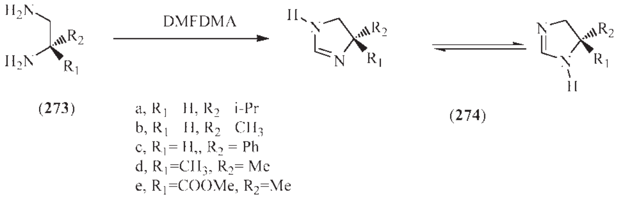
Thieno[2,3-*b*]pyridine derivatives (**269a–c**) on treatment with DMFDMA afforded a product that is formulated as pyrido[2,3-*b*]thieno[3,2-*d*]pyrimidin-4(3*H*)-one (**270a–c**) [38,39,164].



Also, treatment of thieno[2,3-*b*]pyridine (**271**) when treated with DMFDMA afforded the tricyclic compound (**272**) [165].



Imidazolines (**273a–e**) were prepared from the treatment of diamines (**274a–e**) with DMFDMA [166].



5. CONCLUSIONS

The reactions considered in this review clearly demonstrate the high synthetic potential of DMFDMA. Many biologically active heterocyclic compounds have been obtained based on this reagent. This suggests that DMFDMA can be particularly used in the synthesis of functionalized carbo- and heterocyclic compounds used in the design of novel highly effective pharmaceuticals with a broad spectrum of bioresponses. The great interest of chemists in such reagent is confirmed by the facts that many articles cited in this review are recently obtained, along with a multitude of patents.

A series of pyrano[3,2-*c*]pyridine derivatives were synthesized *via* reactions of 3,5-dibenzylidene-piperidin-4-one and malononitrile in *N*,*N*-dimethylformamide under microwave irradiation. It is a simple, efficient, and promising synthetic method to construct pyrano[3,2-*c*]pyridine skeleton.

J. Heterocyclic Chem., **46**, 828 (2009).

INTRODUCTION

Since the cytotoxic activity of (*E*)-3,5-bis (benzylidene)-4-piperidones **1** (Fig. 1) and their specificity toward leukemia cell lines with IC$_{50}$ values <10 μ*M* have been reported [1] in 1992, the design and synthesis of their derivatives have been an object of big interest because of their potential application. The practice of incorporating chalcones into heterocyclic nitrogenous ring has been noticed recently [2–6]. The studies show that compound **2** is potential broad-spectrum antitumor agents [4].

Microwave irradiation (MWI) of organic reactions has rapidly gained popularity because it accelerates a variety of synthetic transformations [7] and have the prominent advantages of short reaction time and high yield [8].

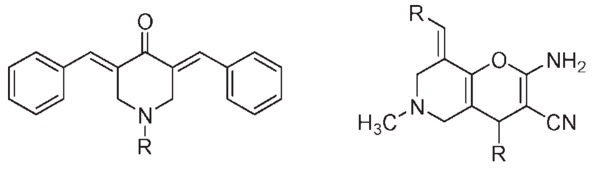
It is well known that the 2-amino-3-cyanopyrans was obtained by the reaction of chalcones with malononitrile, and several articles on this topic can be found in the literature [9]. However, there are few reports for the synthesis of **2**. These methods generally required long reaction time [4,5] or used EtONa [6] as catalyst. To provide vast new compounds for biomedical screening, a simple and efficient method for the synthesis of these molecules is urgently required.

In continuation of our recent interest in the construction of heterocyclic scaffolds [10], we herein describe a practical, inexpensive, rapid microwave-assisted method for the preparation of pyrano[3,2-*c*] pyridine derivatives *via* reactions of 3,5-dibenzylidenepiperidin-4-one and malononitrile in *N*,*N*-dimethylformamide (DMF) (Scheme 1).

RESULTS AND DISCUSSION

To explore conditions of the reaction of 3,5-dibenzylidenepiperidin-4-one **3** and malononitrile **4** in DMF (Scheme 1) under MWI, various reaction conditions were investigated, including solvent and temperature. To search for the optimal reaction solvent, the reaction of 3,5-bis(4-chlorobenzylidene)-1-methylpiperidin-4-one (**3c**) and malononitrile **4**, was examined in ethylene glycol, DMF, glacial acetic acid, and ethanol, respectively (Table 1, entries 1–4) under MWI at the maximum power of 200 W. As shown in Table 1, the reaction in DMF resulted in higher yields and shorter reaction time than others. So DMF was chosen as the appropriate solvent. To further optimize the reaction condition, the same reaction was carried out in DMF at temperatures ranging from 90 to 140°C (Table 1, entries 5–9), with an increment of 10°C each time. As shown in Table 1, the yields of product was increased and the reaction time was shortened when the temperature was increased from 90 to 120°C, however, further increase of the temperature from 130 to 140°C failed to improve the yield (Table 1, entries 9 and 10). Therefore, 120°C was chosen as the most suitable temperature for all further microwave-assisted reactions.

Based on these optimized conditions [DMF, 120°C, 200 W (maximum power)], reactions of different 3,5-dibenzylidenepiperidin-4-ones and malononitrile were performed, a series of pyrano[3,2-*c*]pyridine derivatives were synthesized with good yields. The results (Table 2, entries 1–12) indicated that for 3,5-dibenzylidenepiperidin-4-one bearing different functional groups such as



1 2

Figure 1. 3,5-Dibenzylidenepiperidin-4-one and its derivatives.

chloro, bromo, fluoro, nitro, or methyl the reaction proceeded smoothly in all cases. We have also observed the electronic effects: that is, 3,5-dibenzylidenepiperidin-4-one with electron-withdrawing groups (Table 2, entries 3–6) reacted rapidly, whereas electron-rich groups (Table 2, entry 2) decreased the reactivity, requiring longer reaction time.

A possible mechanism for the formation of the product **5** is outlined in Scheme 2. We proposed that the formation of **5** proceeds *via* an initial Michael addition reaction of chalcones and malononitrile to afford intermediate **6**, which then cyclized to give compound **5**.

The structures of all the synthesized compounds were established on the basis of their spectroscopic data. The IR spectrum of compound **5b** showed strong absorptions at 3389 cm^{-1} and 3295 cm^{-1} due to the NH$_2$ group, 2178 cm^{-1} due to the CN group. The ^{1}H NMR spectrum of **5b** showed a broad singlet at δ 6.76 due to the —NH$_2$ proton and a singlet at δ 6.87 due to the =CH proton. In the IR spectrum of compound **5h**, the appearance of bands at 3329 cm^{-1}, 3279 cm^{-1}, and 2192 $^{-1}$ due to the NH$_2$ and CN triple bound. The appearance of a broad singlet at δ 6.90 due to the NH$_2$ protons and a singlet at δ 6.92 due to =CH in the ^{1}H NMR spectrum further confirmed the structure of product.

In conclusion, we have developed a simple and efficient method for the synthesis of pyrano[3,2-*c*]pyridine derivatives. The protocol includes particularly valuable features of excellent yield, shorten reaction time, reduced environmental impact, and straightforward procedure.

EXPERIMENTAL

All reactions were performed in a monomodal Emrys^{TM} Creator from Personal Chemistry, Uppsala, Sweden. Melting points were determined in open capillaries and are uncorrected.

Scheme 1

Table 1

Optimization for the synthesis of **5c**.

Entry	Solvent	*T* (°C)	Time (min)	Yield (%)
1	HOAc	100	8	45
2	Glycol	100	8	86
3	DMF	100	8	91
4	EtOH	100	8	83
5	DMF	90	8	90
6	DMF	110	7	92
7	DMF	120	6	94
8	DMF	130	6	92
9	DMF	140	6	90

IR spectra were recorded on an FTIR-tensor 27 spectrometer. ^{1}H NMR spectra were measured on a DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. Elemental analysis was determined by using a PerkinElmer 240c elemental analysis instrument.

General procedure for the synthesis of compound 3N. In a 50 mL reaction vial, a mixture of 4-piperidone (10 mmol), the appropriate aldehyde (20 mmol), 1 mL 10% NaOH and 30 mL 95% EtOH was stirred at room temperature for 0.5–2 h. The separated solid was then filtered.

General procedure for the synthesis of compound 5 under MWI. In a 10 mL reaction vial, the 3,5-dibenzylidenepiperidin-4-one 3 (1 mmol), malononitrile (1.1 mmol), and DMF (2 mL) were mixed and then capped. The mixture was irradiated at 200 W (initial power 150 W, maximum power 200 W) at 120°C for a given time. On completion (the reaction was monitored by TLC), the reaction mixture was cooled to room temperature and poured into water (70 mL), filtered to give the crude product, which was further purified by recrystallization from 95% EtOH to give pure product.

A series of 1,4-pyranonaphthoquinone derivatives were synthesized *via* the reaction of arylidenemalononitrile and 2-hydroxynaphthalene-1,4-dione in the mixed solvent of N,N-dimethylformamide and glacial acetic acid (HOAc) under microwave irradiation without catalyst. This protocol has the notable advantages of short reaction time, high yield, and convenient operation.

J. Heterocyclic Chem., **46**, 832 (2009).

INTRODUCTION

Organic reactions under microwave irradiation (MWI) have attracted considerable attention in the past decade for the efficient and friendly synthesis of various organic compounds [1]. More attractively, many reactions that typically required hours or days with conventional heating could be realized in several minutes utilizing MWI [2]. The use of MWI for the formation of carbon-heteroatom and carbon-carbon bonds has been successfully demonstrated [3].

Pyran derivatives are important compounds, which exhibit antibacterial activity [4,5], antiproliferation [6] and antitumor activities [7], hypotensive effect [8], antiallergic effect [9,10], and biological activities of local anesthetic and antiarrhythmic [11]. Derivatives of 1,4-naphthoquinone possess potent and versatile biological activity, such as antiallergic and anticancer activities [12]. And they are also used as inhibitors of KB cells [13]. Derivatives of 1,4-pyranonaphthoquinone, possessing both pyran ring and 1,4-naphthoquinone motif were evaluated against human cancer cell lines, which are KB (human epidermoid carcinoma), HeLa (human cervical carcinoma) and $HepG_2$ (human hepatocellular carcinoma) cell lines employing the MTT colorimetric method [14].

Due to their diverse biological activities, several groups [15] have been interested in the synthesis of derivatives of this structural type. For example, Abboub and coworkers [15a] have reported the reaction of 2-hydroxynaphthalene-1,4-dione and arylidenemalononitrile in methanol with Et_3N as catalyst under reflux condition. However, this protocol has drawbacks such as: (a) narrow application scope of substrates, (b) poor to moderate yields, (c) prolonged reaction time, (d) drastic reaction conditions and tedious work up. Therefore, the development of a relatively convenient method to prepare these compounds is still desirable.

Herein, we wish to report an efficient synthetic route to 1,4-Pyranonaphthoquinone derivatives by the reaction of arylidenemalononitrile and 2-hydroxynaphthalene-1,4-dione. The reaction was carried out in the mixed solvent of DMF and HOAc under MWI without catalyst (Scheme 1).

RESULTS AND DISCUSSION

Choosing an appropriate solvent is of crucial importance for successful MW promoted synthesis in view of a rapid rise of temperature in the reaction mixture. To search for the optimum solvent, different organic solvents such as ethanol, HOAc, DMF and mixed solvent of DMF, and HOAc were tested in the synthesis of **3c** at 100°C under MW irradiation (initial power 200 W and maximum power 250 W). As shown in Table 1, we could see the reaction in the mixed solvent of DMF and

Scheme 1

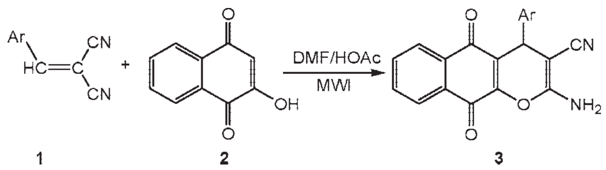

Table 2

Temperature optimization of synthesis **3c**.

Entry	Temp (°C)	Time (min)	Yield (%)
1	100	6	83
2	110	5	86
3	120	5	90
4	130	4	95
5	140	4	95
6	150	3	93

HOAc (the preferred volume ratio is 2:1) gave the best result (Table 1, Entry 5).

Moreover, to further optimize the reaction temperature, the synthesis of **3c** was performed in the mixed solvent of DMF and HOAc (2:1, V/V) at the temperatures ranging from 100 to 150°C in the increment of 10°C each time at 250 W. As illustrated in Table 2, when the temperature was increased from 100 to 130°C, the yield of **3c** obviously improved. However, no significant increase in the yield of **3c** was observed as the reaction temperature was raised from 130 to 150°C. Therefore, the temperature of 130°C was chosen for all further microwave-assisted reactions.

Under these optimized reaction conditions [mixed solvent (V_{DMF}/V_{HOAc}: 2:1, 1.5 mL), 130°C], a series of compounds **3** were synthesized with this simple procedure. The results were summarized in Table 3. As shown in Table 3, the applicability of this methodology is broad, not only to arylidenemalononitrile either with electron-donating groups or with electron-withdrawing groups, but also to heterocyclic arylidenemalononitrile (Table 3, entry 15). Therefore, we concluded that the electronic nature of the substituent has no significant effect on this reaction.

The proposed mechanism of this reaction may undergo a simple addition and cyclization progress (Scheme 2). The addition between arylidenemalononitrile **1** and 2-hydroxynaphthalene-1,4-dione **2** occurs to generate **4**, which subsequently undergoes intramolecular cyclization and isomerisation to afford final products **3**.

All the products were characterized by Mp, IR, ^{1}H NMR, and ^{13}C NMR spectral data, as well as by elemental analysis. The IR spectrum of compound **3b** showed strong absorptions at 3413 and 3329 cm^{-1} due to libration of NH_2 group, 2196 cm^{-1} due to CN group, 1662 and 1636 cm^{-1} due to C=O groups. The ^{1}H NMR spectrum of **3b** showed a singlet at δ 7.36 corresponding to proton from NH_2, and a singlet at δ 4.65 due to CH.

In summary, we have developed a rapid and facile method for the synthesis of highly functionalized 1,4-pyranonaphthoquinone derivatives of potential biological importance in excellent yields. Particularly, this protocol offers increased safety for small-scale high-speed synthesis, and the series of 1,4-pyranonaphthoquinone derivatives may provide expansive foreground for biomedical scopes.

Table 1

Solvent optimization of synthesis **3c**.

Entry	Solvent	Time (min)	Yield (%)
1	Ethanol	10	72
2	HOAc	7	74
3	DMF	8	70
4	DMF/HOAc(1:1)	6	76
5	DMF/HOAc(2:1)	6	83
6	DMF/HOAc(3:1)	6	78

EXPERIMENTAL

MWI was carried out with an Emrys™ Creator microwave oven from Personal Chemistry, Uppsala, Sweden. Melting points were determined in open capillaries and were uncorrected. IR spectra were recorded on a FTIR-Tensor 27 spectrometer in KBr. ^{1}H NMR spectra were measured on a DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. ^{13}C NMR spectra were measured on a DPX 100 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. Elemental analysis was

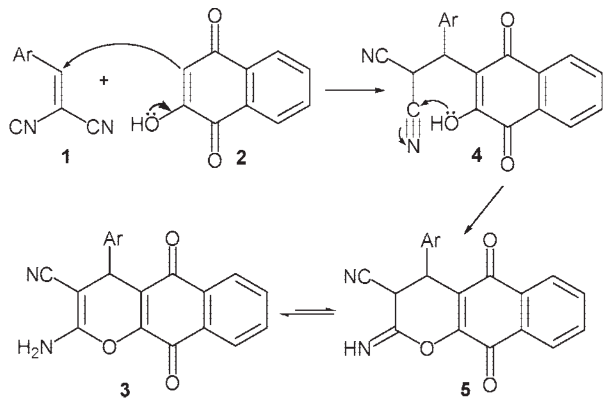
Scheme 2



determined with a Perkin-Elmer 240c elemental analysis instrument.

General procedure for 2-arylidenemalononitrile (1). A mixture of aromatic aldehyde (5 mmol), malononitrile (5 mmol), and ethanol (2 mL) was added to a 10 mL reaction vessel of the monomodal Emrys™ Creator microwave synthesizer and allowed to react under MWI at 150 W power and 100°C for 2–3 min. The reaction mixture was cooled to room temperature, then filtered to give the crude product, which was further purified by recrystallization from EtOH (95%).

General procedure for 2-Amino-5,10-dihydro-5,10-dioxo-4-aryl-4*H*-benzo-[*g*]chromene-3-carbonitrile derivatives (3). The reactions were performed in a 10 mL Emrys™ reaction vial, arylidenemalononitrile **1** (1 mmol), 2-hydroxynaphthalene-1,4-dione **2** (1 mmol), and DMF/HOAc (1.5 mL) (2:1, V/V) were mixed and then capped. The mixture was irradiated for a given time at 130°C under MWI (initial power 200 W and maximum power 250 W). Upon completion, monitored by TLC, the reaction mixture was cooled to room temperature, then filtered to give the crude product, which was further purified by recrystallization from EtOH (95%) to give pure 2-amino-5,10-dihydro-5,10-dioxo-4-aryl-4*H*-benzo[*g*]chromene-3-carbonitrile derivatives **3**.

2-Amino-4-(4-fluorophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo [*g*]chromene-3-carbonitrile (3a). This compound was obtained according to above general procedure; ir (potassium bromide): 3407, 3324, 2210, 1667, 1635 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.04 (m, 1H, ArH), 7.88–7.83 (m, 3H, ArH), 7.38 (t, 2H, *J* = 5.6 Hz, ArH), 7.35 (s, 2H, NH$_2$), 7.13 (t, 2H, *J* = 8.8 Hz, ArH), 4.65 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.55, 176.81, 162.37, 159.96, 158.28, 148.92, 139.82, 134.49, 134.12, 130.99, 130.64, 129.73, 129.65, 121.62, 119.24, 115.35, 57.33, 35.79. Anal. Calcd. for $C_{20}H_{11}FN_2O_3$: C, 69.36; H, 3.20; N, 8.09. Found: C, 69.54; H, 3.19; N, 8.11.

2-Amino-4-(4-chlorophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo [*g*]chromene-3-carbonitrile (3b). This compound was obtained according to above general procedure; ir (potassium bromide): 3413, 3329, 2196, 1662, 1636 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.05 (m, 1H, ArH), 7.88–7.84 (m, 3H, ArH), 7.38 (s, 4H, ArH), 7.36 (s, 2H, NH$_2$), 4.65 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.53, 176.78, 158.31, 149.03, 142.59, 134.51, 134.14, 131.67, 130.98, 130.63, 129.65, 128.47, 126.03, 125.78, 121.37, 119.16, 57.07, 36.98. Anal. Calcd. for $C_{20}H_{11}ClN_2O_3$: C, 66.22; H, 3.06; N, 7.72. Found: C, 66.43; H, 3.05; N, 7.74.

2-Amino-4-(4-bromophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo [*g*]chromene-3-carbonitrile (3c). This compound was obtained according to above general procedure; ir (potassium bromide): 3406, 3326, 2194, 1665, 1603 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.07–8.04 (m, 1H, ArH), 7.89–7.83 (m, 3H, ArH), 7.50 (d, 2H, *J* = 8.4 Hz, ArH), 7.39 (s, 2H, NH$_2$), 7.31 (d, 2H, *J* = 8.4 Hz, ArH), 4.63 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.52, 176.78, 158.30, 149.04, 143.01, 134.51, 134.14, 131.40, 130.97, 130.63, 130.02, 126.04, 125.78, 121.31, 120.20, 119.15, 57.00, 36.06. Anal. Calcd. for $C_{20}H_{11}BrN_2O_3$: C, 58.99; H, 2.72; N, 6.88. Found: C, 59.16; H, 2.73; N, 6.86.

2-Amino-5,10-dihydro-4-(4-methoxyphenyl)-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3d). This compound was obtained according to above general procedure; ir (potassium bromide): 3396, 3329, 2204, 1672, 1635 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.04 (m, 1H, ArH), 7.87–7.83 (m, 3H, ArH), 7.30 (s, 2H, NH$_2$), 7.22 (d, 2H, *J* = 8.4 Hz, ArH), 6.86 (d, 2H, *J* = 8.8 Hz, ArH), 4.56 (s, 1H, CH), 3.71 (s, 3H, OCH$_3$); ^{13}C NMR (100 MHz) (δ, ppm): 182.58, 176.88, 158.29, 148.55, 135.64, 134.49, 134.09, 131.02, 130.56, 128.82, 128.29, 126.02, 125.76, 122.25, 119.37, 113.93, 57.70, 55.04, 35.67. Anal. Calcd. for $C_{21}H_{14}N_2O_4$: C, 70.39; H, 3.94; N, 7.82. Found: C, 70.62; H, 3.95; N, 7.87.

2-Amino-5,10-dihydro-5,10-dioxo-4-*p*-tolyl-4*H*-benzo[*g*]-chromene-3-carbonitrile (3e). This compound was obtained according to above general procedure; ir (potassium bromide): 3404, 3327, 2197, 1662, 1603 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.04 (m, 1H, ArH), 7.87–7.83 (m, 3H, ArH), 7.32 (s, 2H, NH$_2$), 7.19 (d, 2H, *J* = 8.0 Hz, ArH), 7.11 (d, 2H, *J* = 7.6 Hz, ArH), 4.57 (s, 1H, CH), 2.25 (s, 3H, CH$_3$); ^{13}C NMR (100 MHz) (δ, ppm): 182.53, 176.86, 158.29, 148.73, 140.63, 136.25, 134.51, 134.10, 131.01, 130.58, 129.12, 127.56, 126.03, 125.77, 122.16, 119.33, 57.59, 36.09, 20.59. Anal. Calcd. for $C_{21}H_{14}N_2O_3$: C, 73.68; H, 4.12; N, 8.18. Found: C, 73.88; H, 4.11; N, 8.20.

2-Amino-5,10-dihydro-4-(4-nitrophenyl)-5,10-dioxo-4*H*-benzo [*g*]chromene-3-carbonitrile (3f). This compound was obtained according to above general procedure; ir (potassium bromide): 3421, 3328, 2201, 1673, 1604 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.21–8.19 (m, 1H, ArH), 8.11 (d, 1H, *J* = 8.4 Hz, ArH), 8.06 (d, 1H, *J* = 7.6 Hz, ArH), 7.88–7.84 (m, 4H, ArH), 7.63 (t, 1H, *J* = 8.0 Hz, ArH), 7.49 (s, 2H, NH$_2$), 4.88 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.56, 176.75, 158.46, 149.37, 147.94, 145.81, 134.77, 134.47, 134.14, 130.97, 130.05, 126.02, 125.79, 122.49, 120.58, 119.01, 56.63, 36.33. Anal. Calcd. for $C_{20}H_{11}N_3O_5$: C, 64.35; H, 2.97; N, 11.26. Found: C, 64.51; H, 2.96; N, 11.29.

2-Amino-4-(2-chlorophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3g). This compound was obtained according to above general procedure; ir (potassium bromide): 3434, 3327, 2192, 1663, 1635 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.08–8.06 (m, 1H, ArH), 7.87–7.84 (m, 3H, ArH), 7.45–7.40 (m, 2H, ArH), 7.37 (s, 2H, NH$_2$), 7.26–7.24 (m, 2H, ArH), 5.15 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.39, 176.78, 158.40, 149.52, 140.92, 134.57, 134.15, 132.01, 130.93, 130.57, 130.50, 129.38, 128.67, 127.79, 126.06, 125.80, 121.29, 118.77, 56.33, 33.55. Anal. Calcd. for $C_{20}H_{11}ClN_2O_3$: C, 66.22; H, 3.06; N, 7.72. Found: C, 66.41; H, 3.07; N, 7.70.

2-Amino-5,10-dihydro-4-(3-nitrophenyl)-5,10-dioxo-4*H*-benzo[*g*] chromene-3-carbonitrile (3h). This compound was obtained according to above general procedure; ir (potassium bromide): 3421, 3328, 2202, 1671, 1639 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.21–8.18 (m, 1H, ArH), 8.11 (d, 1H, *J* = 7.6 Hz, ArH), 8.07 (d, 1H, *J* = 7.6 Hz, ArH), 7.87–7.84 (m, 4H, ArH), 7.63 (t, 1H, *J* = 8.0 Hz, ArH), 7.49 (s, 2H, NH$_2$), 4.88 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.57, 176.76, 158.44, 149.37, 147.93, 145.82, 134.79, 134.47, 134.14, 130.96, 130.73, 130.05, 126.02, 125.79, 122.49, 122.16, 120.54, 119.03, 56.59, 36.32. Anal. Calcd. for $C_{20}H_{11}N_3O_5$: C, 64.35; H, 2.97; N, 11.26. Found: C, 64.51; H, 2.98; N, 11.23.

2-Amino-4-(benzo[*d*][1,3]dioxol-5-yl)-5,10-dihydro-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3i). This compound was obtained according to above general procedure; ir (potassium bromide): 3427, 3396, 2207, 1673, 1637 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.04 (m, 1H, ArH), 7.89–7.83 (m, 3H, ArH), 7.29 (s, 2H, NH$_2$), 6.89–6.86 (m, 1H, ArH), 6.83 (d, 1H, *J* = 8.0 Hz, ArH), 6.78 (d, 1H, *J* = 7.6 Hz, ArH), 5.97 (s, 2H, CH$_2$), 4.55 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.59, 176.84, 158.21, 148.82, 147.39, 146.23, 137.66, 134.45, 134.07, 131.04, 130.67, 126.00, 125.77, 121.75, 120.98, 119.29, 112.71, 108.13, 100.97, 57.70, 36.12. Anal. Calcd. for $C_{21}H_{12}N_2O_5$: C, 67.74; H, 3.25; N, 7.52. Found: C, 67.94; H, 3.26; N, 7.50.

2-Amino-4-(2,4-dichlorophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3j). This compound was obtained according to above general procedure; ir (potassium bromide): 3467, 3341, 2202, 1671, 1632 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.08–8.06 (m, 1H, ArH), 7.88–7.85 (m, 3H, ArH), 7.60–7.58 (m, 1H, ArH), 7.49 (d, 1H, *J* = 8.4 Hz, ArH), 7.42 (s, 2H, NH$_2$), 7.33 (d, 1H, *J* = 8.4 Hz, ArH), 5.14 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.43, 176.73, 158.37, 149.63, 140.21, 134.57, 134.20, 132.92, 132.26, 131.94, 130.89, 130.59, 128.66, 127.97, 126.07, 125.80, 120.70, 118.69, 55.77, 33.15. Anal. Calcd. for $C_{20}H_{10}Cl_2N_2O_3$: C, 60.48; H, 2.54; N, 7.05. Found: C, 60.67; H, 2.55; N, 7.02.

2-Amino-5,10-dihydro-4-(3,4-dimethoxyphenyl)-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3k). This compound was obtained according to above general procedure; ir (potassium bromide): 3418, 3324, 2195, 1688, 1632 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.06–8.04 (m, 1H, ArH), 7.90–7.83 (m, 3H, ArH), 7.28 (s, 2H, NH$_2$), 6.88–6.86 (m, 2H, ArH), 6.80 (d, 1H, *J* = 8.4 Hz, ArH), 4.56 (s, 1H, CH), 3.72 (s, 3H, OCH$_3$), 3.70 (s, 3H, OCH$_3$); ^{13}C NMR (100 MHz) (δ, ppm): 182.62, 176.91, 158.27, 148.66, 148.63, 147.96, 136.22, 134.47, 134.06, 131.07, 130.62, 126.01, 125.78, 122.04, 119.89, 119.38, 111.95, 111.68, 57.70, 55.62, 55.52, 36.05. Anal. Calcd. for $C_{22}H_{16}N_2O_5$: C, 68.04; H, 4.15; N, 7.21. Found: C, 68.26; H, 4.16; N, 7.23.

2-Amino-5,10-dihydro-4-(4-hydroxy-3-nitrophenyl)-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3l). This compound was obtained according to above general procedure; ir (potassium bromide): 3446, 3350, 2197, 1667, 1642 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 10.95 (s, 1H, OH), 8.06–8.04 (m, 1H, ArH), 7.90–7.83 (m, 4H, ArH), 7.53 (d, 1H, *J* = 8.4 Hz, ArH), 7.41 (s, 2H, NH$_2$), 7.07(d, 1H, *J* = 8.8 Hz, ArH), 4.68 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.60, 176.82, 158.37, 150.96, 149.01, 136.73, 134.87, 134.59, 134.47, 134.11, 131.02, 130.68, 125.99, 125.79, 124.03, 120.98, 119.15, 119.10, 56.89, 35.46. Anal. Calcd. for $C_{20}H_{11}N_3O_6$: C, 61.70; H, 2.85; N, 10.79. Found: C, 61.90; H, 2.84; N, 10.82.

2-Amino-5,10-dihydro-5,10-dioxo-4-phenyl-4*H*-benzo[*g*]-chromene-3-carbonitrile (3m). This compound was obtained according to above general procedure; ir (potassium bromide): 3401, 3325, 2200, 1671, 1636 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.07–8.05 (m, 1H, ArH), 7.90–7.83 (m, 3H, ArH), 7.34 (s, 2H, NH$_2$), 7.31 (d, 4H, *J* = 4.4 Hz, ArH), 7.23–7.22 (m, 1H, ArH), 4.61 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.53, 176.84, 158.37, 148.91, 143.55, 134.51, 134.12, 131.03, 130.63, 128.56, 127.65, 127.05, 126.05, 125.79, 122.04, 119.27, 57.54, 36.50. Anal. Calcd. for $C_{20}H_{12}N_2O_3$: C, 73.16; H, 3.68; N, 8.53. Found: C, 73.38; H, 3.69; N, 8.51.

2-Amino-5,10-dihydro-4-(3,4,5-trimethoxyphenyl)-5,10-dioxo-4*H*-benzo[*g*]chromene-3-carbonitrile (3n). This compound was obtained according to above general procedure; ir (potassium bromide): 3418, 3327, 2196, 1662, 1634 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.07–8.05 (m, 1H, ArH), 7.92–7.84 (m, 3H, ArH), 7.30 (s, 2H, NH$_2$), 6.57–6.55 (m, 2H, ArH), 4.57 (s, 1H, CH), 3.74 (s, 6H, 2OCH$_3$), 3.62 (s, 3H, OCH$_3$); ^{13}C NMR (100 MHz) (δ, ppm): 182.64, 176.88, 158.29, 152.87, 149.00, 139.28, 136.59, 134.43, 134.04, 131.08, 130.72, 125.99, 125.82, 121.48, 119.35, 105.13, 59.89, 57.54, 55.99, 36.76. Anal. Calcd. for $C_{23}H_{18}N_2O_6$: C, 66.02; H, 4.34; N, 6.70. Found: C, 66.24; H, 4.35; N, 6.72.

2-Amino-5,10-dihydro-5,10-dioxo-4-(thiophen-2-yl)-4*H*-benzo[*g*]chromene-3-carbonitrile (3o). This compound was obtained according to above general procedure; ir (potassium bromide): 3409, 3328, 2196, 1665, 1638 cm^{-1}; ^{1}H nmr (DMSO-d_6): δ 8.05–8.04 (m, 1H, ArH), 7.98–7.96 (m, 1H, ArH), 7.88–7.86 (m, 2H, ArH), 7.49 (s, 2H, NH$_2$), 7.40 (d, 1H, *J* = 4.0 Hz, ArH), 7.01 (d, 1H, *J* = 3.2 Hz, ArH), 6.95 (t, 1H, *J* = 2.8 Hz, ArH), 4.97 (s, 1H, CH); ^{13}C NMR (100 MHz) (δ, ppm): 182.38, 176.81, 158.93, 148.18, 147.10, 134.69, 134.29, 130.91, 130.48, 127.18, 126.16, 125.92, 125.41, 125.35, 121.87, 119.19, 57.10, 31.17. Anal. Calcd. for $C_{18}H_{10}N_2O_3S$: C, 64.66; H, 3.01; N, 8.38; S, 9.59. Found: C, 64.83; H, 3.00; N, 8.35; S, 9.61.

p-Phenylenediformamidine **1** is readily obtained upon treating *p*-phenylenediamine with dimethylformamide dimethyl acetal (DMFDMA) by heating or by microwave irradiation. Compound **1** was treated with active methylene nitriles followed by hydrazine hydrate derivatives to give bisaminopyrazole derivatives. Other bisazoles can be obtained by reacting **1** with aminoazole derivatives. Cyclization of Bis [2-(*p*-phenelyeneimino)malononitrile] to 1,10-diaminophenanthroline-2,9-dicarbonitrile is also reported.

J. Heterocyclic Chem., **46**, 837 (2009).

INTRODUCTION

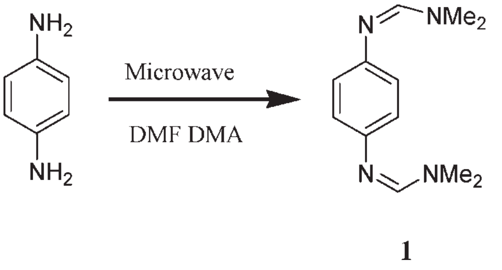
Heterocyclic compounds have attracted considerable interest. A lot of attention has been directed toward the synthesis of polyfunctionally substituted azoles because of their biological and pharmaceutical activities. For example, pyrazoles have shown many interesting biological and pharmacological properties such as inhibitors of p 38 MAP kinase [1] anti-tumor CDK inhibitors [2], potent inhibitors of type II topoisomerases [3]. Thiazolediamides are used as potent g-secretase [4], also as vanilloid receptor 1 (TRPV 1) antagonists [5]. Both imidazole and triazole potent CB_1 receptor antagonists related to SR141716 [6]. 4-Triazole-modified zanamivir analogs exert moderate inhibition against AIV (H5N1) [7]. Carroll *et al.* [8] reported that the heterocyclic replacement on substituted benzene ring showed a progressive loss of P2X-, potency in the order tetrazole > triazole > imidazole > pyrazole. He rationalized this result to overall electron density of the core heterocycle and P2X-, potency. Furthermore, phenylenediformamidine showed good acaricidal and insecticidal activity [9]. A combination of phenylenediformamidine and azoles in one system seemed to be useful. Thus, design of a simple and an efficient approach to the polyfunctionally substituted heterocycles on benzene ring is one of our goals. In conjugation with our previous work [10], here we report on the synthesis of bisazole using *p*-phenylenediformamidine as starting material.

RESULTS AND DISCUSSION

p-Phenylenediamine readily reacts with dimethylformamide dimethylacetal, DMFDMA, to give *N.N'*-*p*-phenylenediformamidine **1**, which agree with the literature in this data [11]. Formamidine, **1** could also be obtained by Vilsmeier reaction [12,13]. Synthesis of *p*-phenylenediformamidine **1** using microwave irradiation has not been described before. In this article, we have obtained *p*-phenylenediformamide **1** in an excellent yield and short time upon irradiating a mixture of *p*-phenylenediamine, DMFDMA, and xylene at 160°C (cf. Scheme 1). The reaction product was established based on mass spectrometry which showed *m*/*z* 260 (M^+). ^{1}H NMR revealed the presence of NMe_2 and aromatic protons as a singlet at d 3.49 and d 6.78 ppm, respectively. This NMR data confirm the symmetry in the molecule. Furthermore, the CH protons appeared at d 7.64 ppm.

Chemical reactivity of *p*-phenylenediformamidine **1** toward different active methylene has been investigated. Thus, compound **1** reacted with **2a–c** in glacial acetic acid to give the same reaction product **3**. This result prompted us to investigate the behavior of **1** in acetic

Scheme 1



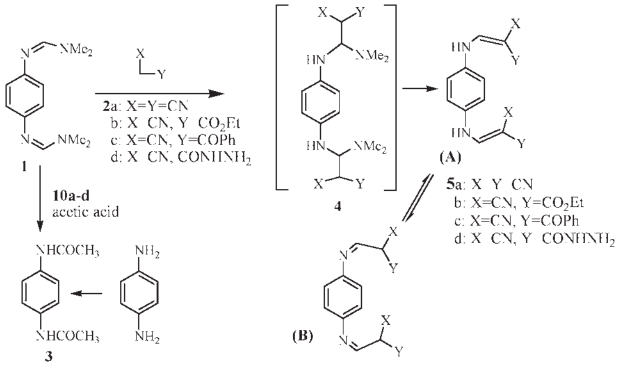
acid as a blank experiment. We also obtained here the same result as that obtained from its reaction with each of compounds **2a–c**. This supported our believing that the acetylation reaction had taken place between the solvent (acetic acid) and *p*-phenylenediformamidine **1**. This result was confirmed by refluxing *p*-phenylenediamine in glacial acetic acid which afforded the acetylated product **3**. Thus, the reaction of **2a–d** with *p*-phenylenediformamidine **1** in pyridine afforded the target products **5a–d**. The formation of these products are believed to proceed *via* addition of active methylene to the imine double bond to give the nonisolable intermediate **4** followed by loss of two molecules of dimethylamine. ^{1}H NMR spectrum of structure **5a** showed the low field signals as a doublet at d 8.45 ppm corresponding to CH protons, while aromatic protons appeared as a singlet at d 7.44 ppm. These data confirm the symmetry in the molecule. Signal at d 11.13 ppm was assigned to the NH protons. This signal underwent a facile hydrogen deuterium exchange upon addition of deuterium oxide. The NOE experiment showed the irradiation of NH protons enhancing the CH protons while the aromatic protons was not affected revealing the special proximity of NH and CH protons. The ^{13}C NMR spectrum revealed a low field signal at d 156.41 ppm and a high field signal at d 52.52 ppm corresponding to the imine carbon and ethylenic carbon, respectively. Other carbons appeared at expected positions. On the other hand, a structure of compound **5b** was established based on ^{1}H NMR which showed a triplet at d 1.27 ppm (J = 7.2 Hz) and quartet at d 4.21 ppm (J = 7.2 Hz) corresponding to methyl group and methylene group, respectively. Aromatic protons appeared at d 7.52 ppm as a singlet. Other synthetic method for **5b** [14] and **5a** [15] had been described *via* condensation of ethoxymethylene-malononitrile or ethoxymethylenethyl cyanoacetate with *p*-phenylenediamine. Similarly **5c** and **d** were elucidated (Scheme 2).

Enamine of **5a–d** (form A) may be tautomerized to the corresponding imine (form B). Thus, phenylenimino derivatives **5a–c** reacted with nucleophilic reagent, hydrazine hydrate, or phenyhydrazine, to afford the intermediate **6.** This could be formed *via* addition of the amino group of the hydrazine hydrate to the cyano function followed by further addition in case of **5a** and condensation in case of **5b** and **5c** to loss ethanol or water molecule, respectively, to give the final isolated product **7**, **8**, and **9.** An independent method for preparation of **9** took place through heating of **5d** for a long time in a basic medium. The obtained product was confirmed by mixing melting point and IR spectrum. The reaction product **9** is believed to proceed through intramolecular cyclization of **5d** through addition of amino group to cyano function. Reaction of **5a** and **5b** with phenylhydrazine produce the corresponding compounds **10** and **11**, respectively. The compounds **10** and **11** formed through addition of amino group of phenylhydrazine to the cyano function followed by addition to the second cyano group in case of **5a** or lose of ethanol in case of **5b** to cyclized to **10** and **11**, respectively. The structure of the reaction products are established based on the elemental analysis and spectral data. IR spectra in all cases revealed the absence of the cyano group and the presence of amino group. ^{1}H NMR confirms the presence of the imine protons, amino group, and NH. In addition, the absence of ethyl group was observed. Phenyl protons in **10** and **11** appeared at high field than those of corresponding **7** and **8** reflecting shielding effect of sp^3 nitrogen on aromatic protons (cf. experimental part) (Scheme 3).

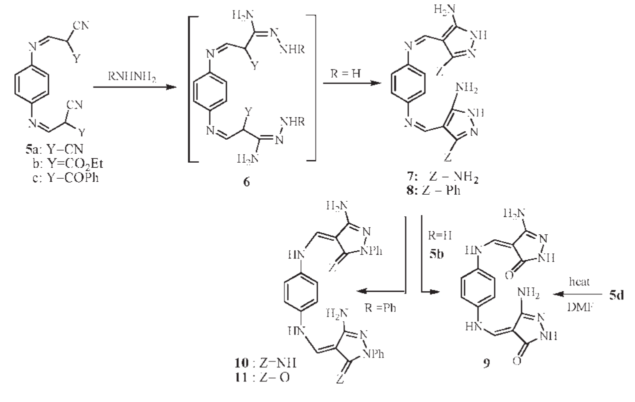
Moreover, bisazole derivatives **12–16** could be synthesized by direct treatment of *p*-phenylenedi-formamidine **1** with different heteroamines, for example, aminotriazole, aminoimidazole, aminothiazole, and aminobenzimidazole. The reaction products are believed to be formed through the addition of the nucleophilic amino group to the imine double bond to give the nonisolated intermediate **A** followed by loss of two molecules of dimethylamine to afford the final isolated products **B**, **12–16** (Scheme 4). The structure of the reaction products were confirmed by elemental analysis and spectral data as indicated in the experimental section.

Trials to cyclize **5a** to phenanthrolinedicarbonitrile derivative **17** or **18** in polyphosphoric acid or ionic

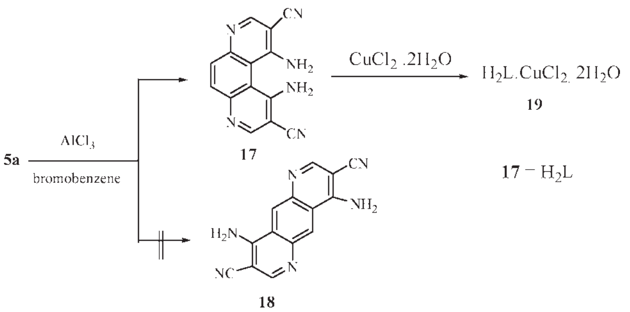
Scheme 2



Scheme 3

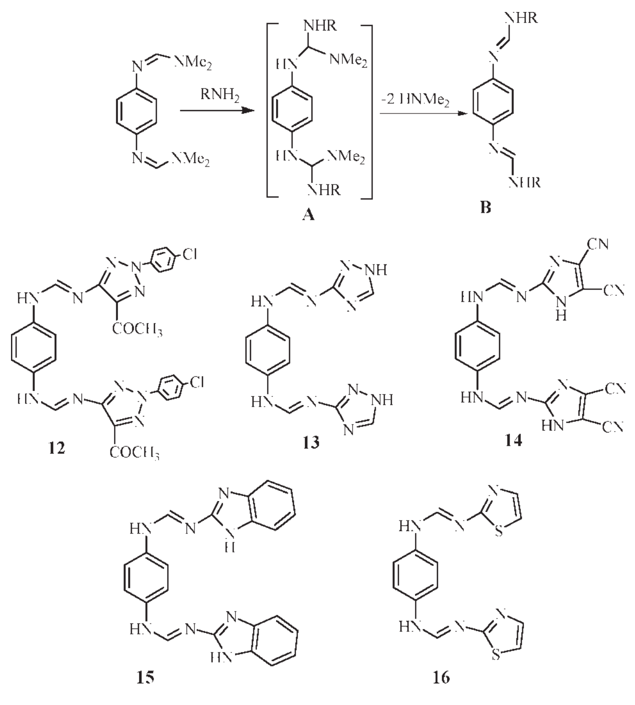


Scheme 5



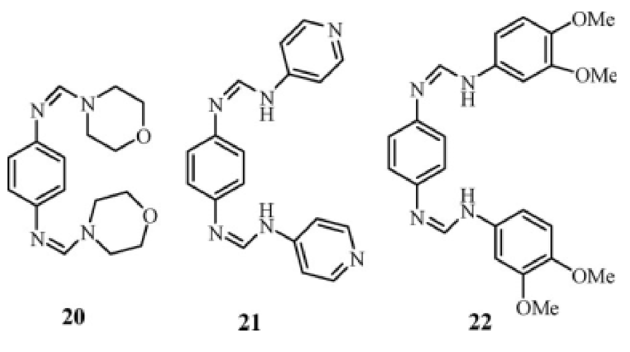
liquid (pyridinium hydrochloride) or by microwave irradiation for a long time has failed. An extension of Gould-Jacobs reaction [16–21] approach for cyclization of **5a** to **17**, a mixture of compound **5a** and anhydrous aluminum chloride has been heated under reflux in bromobenzene to give a product characterized **17** or **18**. The latter compound **18** is ruled out based on the NOE experiment which showed the protons of amino groups in opposite to the benzene protons. Where the irradiation of NH_2 protons has no effect on benzene ring protons which agree with compound **17**. In addition, the reaction product was established as 1,10-diaminophenanthroline-2,9-dicarbo-nitrile **17** based on elemental analysis and spectral data. ^{1}H NMR reveals the presence of amino protons at 11.12 ppm (D_2O-exchange), two protons of pyridine rings at 8.45 ppm, and a singlet proton at 7.47 ppm represent the symmetrical two protons of benzene ring. Bidentate **17** (H_2L) could also be confirmed by using as a ligand. Thus, compound **17** was uptake Cu(II) from its solution, which support that the two amino groups are in the same side, to give the complex **19**. Complex product **19** was established based on its elemental analysis and spectral data. IR reveals the presence of a broad band at 3440 cm^{-1} refers to presence of water molecules. IR also reveals the presence of amino and cyano bands at 3297, 3219, and 2215 cm^{-1}, respectively. In continuation of complex structure elucidation, energy-dispersive spectroscopy (EDS) reveals the presence of Cu(II). In addition to chlorine, carbon, hydrogen, and oxygen appeared clearly in the EDS chart. Furthermore, the electron spin resonance (ESR) confirmed the formation of the complex, where the π-band ESR spectrum of the Cu(II) complex at room temperature is of axial type consistent with d_{x2}-d_{y2} ground state (Scheme 5).

Scheme 4



Investigation of reactivity of **1** toward aliphatic, heteroaromatic, and aromatic amines was also studied. Thus, compound **1** reacted with morpholine, 4-aminopyridine, and 3,4-dimethoxyaniline in pyridine to give the N-substituted amine derivatives **20–22**, respectively (Scheme 6). This reaction is believed to be proceed through loss of two dimethylamine molecules.

Scheme 6



EXPERIMENTAL

All melting points are uncorrected. IR spectra were recorded in KBr disks using a Perkin-Elmer System 2000 FT-IR spectrophotometer. ^1H and ^{13}C-NMR spectra were recorded on a Bruker DPX 400, 400MHz super-conducting NMR spectrometer in DMSO-d_6 as solvent and TMS as internal standard; chemical shifts are reported in d units (ppm). Mass spectra were measured on a VG Autospec-Q (high resolution, high performance, tri-sector GC/MS/MS). Microanalyses were performed on a LECO CHNS-932 Elemental Analyzer. Microwave experiments were conducted using a microwave oven DAEWOO, edition II (KOR-8667).

Preparation of *N,N'*-Phenylenediformamidine (1). ***Method A.*** To a solution of *p*-pheneylenediamine 1.08 g (0.01 mol) in xylene (30 mL), dimethylformamide dimethylacetal (DMFDMA), 1.19 g (0.01 mol) was added. The reaction mixture was heated under reflux for 3 h. The solid product so formed after cooling was collected by filtration and crystallized from xylene.

Method B. To a solution of *p*-pheneylenediamine 1.08 g (0.01 mol) in xylene (5 mL), dimethylformamide dimethylacetal (DMFDMA), 1.19 g (0.01 mol) was added. The reaction mixture was irradiated for 15 min in microwave at 160°C. The solid product so formed was collected by filtration and crystallized from xylene. Melting point 116–119°C (ref. [14] mp 119–120°C; ref. [12,13] mp 120.5–121°C).

Compound **1** was obtained as yellowish white crystals 1.8 g (82%), while in case of microwave synthesis 1.98 g (91%) was obtained, from xylene, mp 116–119°C; ir: 1655 cm^{-1} (C=N); ^1H NMR: δ 7.64 (s, 2H, CH=), 6.78 ppm (s, 4H, C_6H_4), 3.49 (s, 12H. 4Me) ^{13}C NMR: δ 153.74 (—CH=), 147.52, 121.76 (aromatic carbons), 39.86 (Me); ms: *m/z* 218 (M^+, 100%). Anal. Calcd. for $C_{12}H_{18}N_4$ (218.30): C, 66.02; H, 8.31; N, 25.67. Found: C, 65.98; H, 8.06; N, 25.76.

General procedure for ylidene synthesis (5a–d). ***Method A.*** To a solution of (**1**) 2.18 g (0.01 mol) in ethanol (30 mL), active methylene compound (**2a**) or (**2b**) or (**2c**) or (**2d**) (0.01 mol) was added. The reaction mixture was heated under reflux for 3 h. The obtained product after cooling was collected by filtration and crystallized from the proper solvent.

Method B. To a solution of (**1**) 2.18 g (0.01 mol) in DMF (5 mL), active methylene compound (**2a**) or (**2b**), (0.01 mol), was added. The reaction mixture was irradiated for 30 min in microwave at 160°C in the case of (**2a**) and 155°C in the case of (**2b**). The obtained product after cooling was collected by filtration and crystallized from the proper solvent.

Bis [2-(*p*-phenelyeneimino)malononitrile] (5a). This compound was obtained as yellow crystals 1.62 g (62%) while in case of microwave synthesis 2.16 g (83%) was obtained), from acetone, mp > 300°C; ir: 3299, 3224 (2NH), 2223, 2210 (CN), 1655 cm^{-1} (C=N); ^1H NMR: δ 11.15 (br, 2H, 2NH), 8.49 (d, 2H, CH=), 7.44 ppm (s, 4H, C_6H_4). ^{13}C NMR: δ 156.41 (—CH=), 137.21, 119.81 (aromatic carbons), 117.37, 115.12 (CN), 52.52 (ethylenic carbon); ms: *m/z* 260 (M^+, 100%). Anal. Calcd. for $C_{14}H_8N_6$ (260.25): C, 64.61; H, 3.10; N, 32.29. Found: C, 64.95; H, 3.06; N, 31.99.

Bis[(Ethyl 2-cyano-2-(*p*-phenyleneimino) acetate] (5b). This compound was obtained as yellow crystals 1.77 g (50%) from acetone, mp > 300°C; ir: 3337 (br, 2NH), 2209 (CN), 1667 cm^{-1} (C=N); ^1H NMR: δ 10.77 (br, 2H, 2NH), 8.47 (d, 2H, CH=), 7.52 ppm (s, 4H, C_6H_4), 4.21 (q, 4H, $2CH_2$—, J = 7.2 Hz), 1.27 (t, 6H, 2Me, J = 7.2 Hz). ^{13}C NMR: δ 167.15, 165.58 (2CO), 153.32 (2—CH=), 137.82, 136.51, 119.93, 119.84, 119.74, 119.16 (aromatic carbons), 117.00 (CN), 75.01, 74.19 (ethylenic carbons); 61.31 (CH_2), 15.22 (Me); ms: *m/z* 354 (M^+, 100%). Anal. Calcd. for $C_{18}H_{18}N_4O_4$ (354.36): C, 61.01; H, 5.12; N, 15.81. Found: C, 61.36; H, 5.42; N, 16.18.

Bis[(3-oxo-3-phenyl-2-(*p*-pheneyleneimino) propanenitrile] (5c). This compound was obtained as red crystals 2.72 g (65%) from acetone, mp > 300°C; ir: 3449, 3349 (NH), 2204 (CN), 1703 cm^{-1} (CO); ^1H NMR: δ 10.52 (br, 2H, 2NH), 8.40 (d, 2H, CH=), 7.51–6.59 ppm (m, 14H, C_6H_4, $2C_6H_5$). ^{13}C NMR: δ 190.54 (CO), 153.65, 152.96, 147.98, 140.19, 130.70, 128.44, 128.22, 126.54, 121.22, 119.08 (aromatic carbons), 114.57 (CN), 87.15 (ethylenic carbons); ms: *m/z* 446 (M^+, 10%). Anal. Calcd. for $C_{26}H_{18}N_4O_2$ (418.45): C, 74.63; H, 4.34; N, 13.39. Found: C, 74.63; H, 4.01; N, 13.77.

Bis[2-cyano-2-(*p*-pheneyleneimino)acetamide] (5d). This compound was obtained as red crystals 1.79 g (55%) from acetone, mp > 300°C; ir: br, 3343 (NH & NH_2), 2210 (CN), 1670 cm^{-1} (CO). ^1H NMR: δ 10.93, 5.59 (br, 8H, 4NH, $2NH_2$), 8.45 (d, 2H, 2CH=), 7.39 ppm (s, 4H, C_6H_4); ms: *m/z* 296. (M^+, 10%). Anal. Calcd. for $C_{14}H_{14}N_8O_2$ (326.31): C, 51.53; H, 4.32; N, 34.34. Found: C, 51.78; H, 4.53; N, 34.34.

General procedure for synthesis of bisazoles (7, 8, 10, 11). To a solution of (**5a**) or (**5b**) or (**5c**), (0.01 mol), in DMF (30 mL) an equivalent amount of hydrazine hydrate or phenyl hydrazine was added. The reaction mixture was heated under reflux for 3 h. The obtained product after cooling was collected by filtration and washed by ethanol (3 × 10 mL). The obtained product was crystallized from the proper solvent.

***N*^{1},*N*^{4}-Bis[(3,5-diamino-4*H*-pyrazol-4-ylidene)methyl)benzene-1,4-diamine (7).** This compound was obtained as yellow crystals 2.10 g (65%) from acetone, mp 150–151°C; ir: 3164, 3112 cm^{-1} (NH & NH_2). ^1H NMR: δ 10.06 (br, 8H, $4NH_2$), 8.15 (s, 2H, 2CH=), 8.01 (s, 2H, 2NH), 7.91 ppm (m, 4H, C_6H_4); ms: *m/z* 324 (M^+, 6%). Anal. Calcd. for $C_{14}H_{16}N_{10}$ (324.34): C, 51.84; H, 4.97; N, 43.18. Found: C, 52.01; H, 5.12; N, 43.44.

***N*^{1},*N*^{4}-Bis[(3-amino-5-phenyl-4*H*-pyrazol-4-ylidene)methyl] benzene-1,4-diamine (8).** This compound was obtained as brown crystals 2.45 g (55%) from acetone, mp > 300°C; ir: 3211, 3114 (NH & NH_2); 1617 cm^{-1} (C=N). ^1H NMR: δ 10.14 (br, 4H, $2NH_2$), 9.44 (br, 2H, 2NH), 8.16 (s, 2H, 2CH=), 7.56–8.01 ppm (m, 14H, C_6H_4, $2C_6H_5$); ms: *m/z* 446 (M^+, 12%). Anal. Calcd. for $C_{26}H_{22}N_8$ (446.51): C, 69.94; H, 4.97; N, 25.10. Found: C, 70.11; H, 5.12; N, 24.98.

Synthesis of *N*^{1},*N*^{4}-bis(3-amino-4-methylidene-1*H*-pyrazol-5(4*H*)-one)benzene-1,4-diamine (9). ***Method A.*** To a solution of (**5b**) 3.54 g (0.01 mol) in DMF (30 mL), hydrazine hydrate 0.75 g (0.015 mol) was added. The reaction mixture was heated under reflux for 3 h. The obtained product after cooling was collected by filtration and washed by cold ethanol (3 × 10 mL). The obtained product was crystallized from the proper solvent.

Method B. A solution of (**5d**) 3.26 g (0.01 mol) was heated under reflux in DMF (30 mL) for 3 h. The obtained product after cooling was collected by filtration and washed by cold ethanol (3 × 10 mL). This compound was obtained as brown crystals 1.96 g (60%) from acetone, mp 163–164°C; ir: 3211, 3114 (NH & NH_2); 1668 (CO), 1617 cm^{-1} (C=N). ^1H NMR:

δ 10.04 (br, 2H, 2NH), 9.45 (br, 2H, 2NH), 8.14 (d, 2H, 2CH=), 8.01 (br, 4H, 2NH_2), 8.01 ppm (s, 4H, C_6H_4). Anal. Calcd. for $C_{14}H_{14}N_8O_2$ (326.31): C, 51.53; H, 4.32; N, 34.34. Found: C, 51.38; H, 4.03; N, 34.54.

***N^1,N^4*-Bis[(3-amino-5-imino-1-phenyl-1*H*-pyrazol-4(5*H*)-ylidene)methyl]benzene-1,4-diamine (10).** This compound was obtained as brown crystals 3.38 g (71%) from DMF/EtOH (1:1), mp > 300°C; ir: 3435, 3224 (br, NH & NH_2); 1667 cm^{-1} (C=N). ^1H NMR: δ 10.90 (br, 4H, 2NH_2), 10.60 (br, 2H, 2NH), 8.58 (m, 10H, 2C_6H_5), 7.09,7.07 (d, 2H, $J = 8$ Hz, C_6H_4), 6.54, 6.52 (d, 2H, $J = 8$ Hz, C_6H_4), 6.65 (d, 2H, 2CH=), 5.17 (br, 2H, 2NH). Anal. Calcd. for $C_{26}H_{24}N_{10}$ (476.54): C, 65.53; H, 5.08; N, 29.39. Found: C, 65.35; H, 4.97; N, 29.53.

***N^1,N^4*-Bis[(3-amino-5-oxo-1-phenyl-1,4*H*-pyrazol-4(5*H*)-ylidene)methyl]benzene-1,4-diamine (11).** This compound was obtained as brown crystals 3.45 g (72%) from DMF/EtOH (1:1), mp > 300°C; ir: 3274, 3182 (br, NH & NH_2); 1696, 1666 cm^{-1} (CO). ^1H NMR: δ 10.83, 10.77, 10.73 (br, 6H, 2NH & 2NH_2), 8.47–8.28, 7.54–7.49 (m, 10H, 2C_6H_5), 7.40 (s, 4H, C_6H_4), 7.95 (d, 2H, 2CH=). Anal. Calcd. for $C_{26}H_{22}N_8O_2$ (478.51): C, 65.26; H, 4.63; N, 23.42. Found: C, 65.04; H, 4.57; N, 23.56.

General procedure for synthesis bisazoles (12–16). To a solution of (**1**) 2.18 g (0.01 mol) in pyridine (20 mL), heteroamines (0.01 mol) was added. The reaction mixture was heated under reflux for 3 h. The reaction mixture was poured on ice-cold water. The obtained product was collected by filtration and washed by ethanol (3 × 10 mL). The obtained product was crystallized from the proper solvent.

***N^1,N^4*-Bis(5-acetyl-2-(4-chlorophenyl)-2*H*-1,2,3-triazol-4-yl) phenylenediformamidine (12).** This compound was obtained as yellow crystals 3.91 g (65%) from DMF/EtOH (1:1), mp > 300°C; irir: 3480, 3382 (NH); 1617 cm^{-1} (C=N). ^1H NMR: δ 8.00, 7.98 (d, 4H, C_6H_4, $J = 8.0$ Hz), 7.67, 7.66 (d, 4H, C_6H_4, $J = 8.4$ Hz), 7.64 (s, 4H, C_6H_4), 6.75 (d, 2H, 2CH=), 6.36 (s, 2H, 2NH), 2.59 ppm (s, 6H, 2Me). ^{13}C NMR: δ 193.40, 154.91 (triazole carbons), 146.00, 137.95, 132.62, 132.37, 130.16, 120.29 (Ar-carbons), 27.17 (Me); ms: *m*/*z* 601 (M^+, 30%). Diastereoselective γ-dispiroiminolactone products **4a–m** were obtained from a condensation of the highly reactive 1:1 intermediate of isocyanides and acetylenic esters with aromatic α-dicarbonyls compounds **3a, b**.

J. Heterocyclic Chem., **46**, 843 (2009).

INTRODUCTION

γ-Spirolactones and iminolactones are heterocyclic compounds obtained via ''one pot'' multicomponents condensation reaction [1,2]. They are generally used as precursors for the preparation of a wide range of compounds including antibacterial agents [3a]. Moreover, the ease of hydrolysis of iminolactones to spirolactones affords a number of biologically active natural products such as kijanolide, tetranolide, and chlorothricolide [3b–d]. Multicomponent reactions [4,5] are commonly used approaches for production of iminolactones by virtue of their convergence, facile execution, and generally proceed with high yields [1,2]. Recently, we have reported a series of iminolactones from the reaction of isocyanide with activated acetylenic esters in the presence of carbonyl compounds [6–8]. Intimately related condensation is the reaction of isocyanide with acetylenic diesters and carbonyl compounds affording *gama*-spiroiminolactones [1,2,9]. Continuing with our investigation of this reaction with activated α-diketones, we examined the reaction of 1,2-dicarbonyl groups of acenaphthenequinone and phendione with acetylenic esters in the presence of variety isocyanides and successfully prepared the γ-dispiroiminolactone derivatives reported herein.

RESULTS AND DISCUSSION

The reaction of alkyl isocyanides with dialkyl acetylenedicarboxylates in the presence of 1,2-diketones, acenaphthenequinone and phendione afford new γ-dispiroiminolactone products **4a–m** (Scheme 1). Such condensation reaction generally yields the γ-spiroiminolactone analogues [8–11]. For example, when the α-ketoester or α-ketoamide is used, the carbonyl of the ester or the amide functionality is not involved in the reaction [10]. This reaction is molar ratio dependent and influenced by the ratio of the dicarbonyl compounds to the isocyanide and the dialkyl acetylenedicarboxylate. The reaction of the preformed highly reactive zwitterionic intermediate with activated α-dicarbonyl ketone at 1:1:1 molar ratio of reactants **1**, **2**, and **3** favors γ-spiroiminolactones, whereas at 2:2:1 molar ratio the reaction yields γ-dispiroiminolactones [12]. We utilized the 2:2:1 molar ratio of reactants resulting in the participation of both carbonyl groups and the formation of γ-dispiroiminolactone products, **4a–f** and **4g–m** from acenaphthenequinone and phendione, respectively. The products are obtained as diastereoselective racemic mixture based on NMR and X-ray data (see Experimental section).

The reported products **4a–m** are stable solids and their structures determined by IR, ^{1}H, ^{13}C NMR, and

Mass spectrometry with **4a** and **4h** structurally authenticated by single X-ray single crystal diffraction. The ^{1}H NMR spectrum of compound **4a** exhibited two singlets arising from the methyl of the ester groups [δ 3.38 ppm (6H, s, 2OMe), 3.90 ppm (6H, s, 2OMe)] and one singlet [δ 4.55 ppm (4H, s, 2CH$_2$)] due to the methylene of the benzyl groups. The aromatic region of ^{1}H NMR spectrum clearly accounts for the protons associated with the aromatics of benzyl and naphthal moieties. The ^{13}C NMR data displays 19 distinct signals consistent with the structure of **4a**. The characteristic signal resulting from the spiro carbon was identified at δ 101.18 ppm. In addition, FTIR spectrum of compound **4a** showed strong absorptions at 1749 and 1733 cm^{-1} relevant to the ester groups and 1683 cm^{-1} attributed to C=N (see Experimental section). The mass spectrum of compound **4a** displayed a molecular ion peak of 700 (*m*/*z*). Single crystal of compound **4a** was grown from dichloromethane/ethanol (1:3) solution and the X-ray structure is in agreement with the NMR data for γ-dispiroiminolactone (Fig. 1).

Pertinent structural information is deduced from solution NMR for these class of compounds (**4a–m**). For example, the benzylic methylene proton signals for the compounds derived from the benzyl cyanide are diagnostic of the symmetry of the molecules. The mode of splitting is associated with spatial arrangement of the α-diketonic derived building block. The products bearing acenaphthenequinone derived moiety (**4a–f**) display one singlet accounting for four magnetically equivalent protons for the benzylic methylenes (C$_2$ symmetry). On the other hand for the products bearing pyridyl (**4g–m**), the benzylic methylene protons appear as an AB-quartet. The NMR mode of splitting is related to the lack of C$_2$ symmetry in the molecule associated with the formation of nonaromatic six-membered ring. Variable temperature ^{1}H NMR was performed on the model compounds, **4a** and **4h** and no dynamic effect was observed reflecting the structural rigidity of these compounds. The stereochemistry of all reported products are comparable with compound **4a** or **4h** obtained as racemate.

It is noteworthy to mention that the solvent has an effect on the reaction yield with good yields could be obtained using nonpolar solvents, such as benzene and toluene. However, some of the products in this work (e.g., **4a–i**) were obtained from a reaction using dichloromethane at 38°C for 27 h. Optimization of the reaction conditions was investigated and higher yields were obtained using dichloromethane and benzene mixture (1:4) at 75°C for 48 h. All the synthesized products,

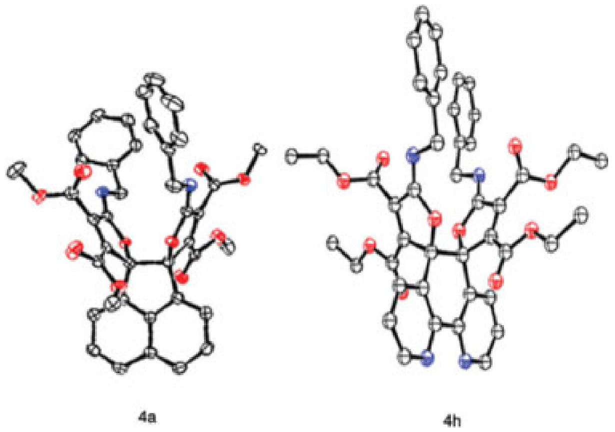

Figure 1. X-ray structure of **4a** and **4h** as model compounds. [Color figure can be viewed in the online issue, which is available at www.interscience.wiley.com.]

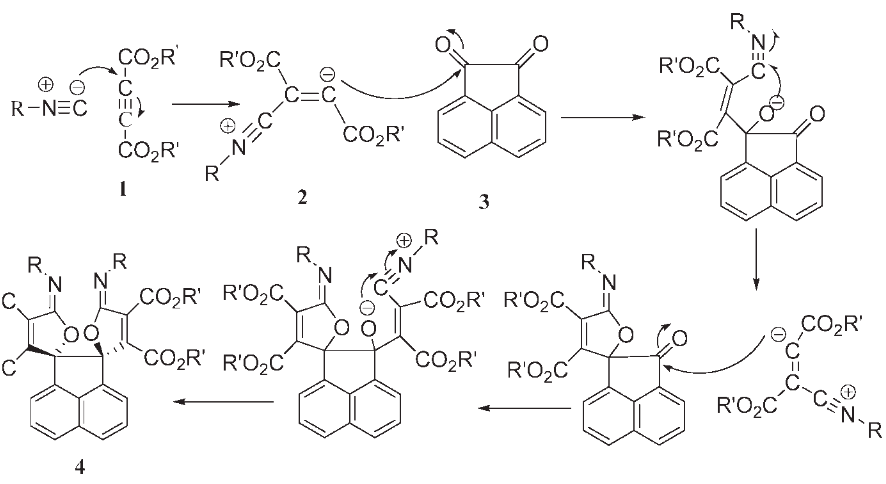
Scheme 2



4a–f were fully characterized and the formation can be rationalized by the mechanism shown in Scheme 2.

EXPERIMENTAL

Starting materials, dialkyl acetylenedicarboxylates; *tert*-butyl, cyclohexyl, and benzyl isocyanides; acenaphthenequinone and phendione were purchased from Fluka, Buchs, and Switzerland, and used as received. Melting point and IR spectra were measured on an Electrothermal 9100 apparatus and on Shimadzu IR-470 spectrometer. Elemental analysis for C, H, and N were performed using a Heraeus CHN-O-Rapid analyzer. The ^{1}H and ^{13}C NMR spectra were measured using Bruker DRX-500 AVANCE instrument in $CDCl_3$ at 300.1 and 75.5 MHz, respectively. Mass spectra were recorded on a Shimadzu GC/MS QP 1100 EX mass spectrometer operating at an ionization potential of 70 ev. X-ray diffracted intensities were measured from single crystals at 100 K on an Oxford Diffraction Gemini-R Ultra CCD diffractometer using monochromatized Cu-Kα (λ = 1.54178 Å). A partial projections of the heterocyclic rings with their atomic numbering are depicted in Figure 2. The interatomic distances and angles for each heterocyclic ring in compounds **4a** and **4h** are depicted in Table 1 and 2.

General procedures. The solution of alkyl isocyanide (1 mmol) in 3 mL of CH_2Cl_2 was slowly added dropwise to the mixture of acenaphthenequinone (0.5 mmol) and DMAD (1 mmol) in 20 mL of dry CH_2Cl_2 for 5 min at room temperature. The reaction mixture was heated to 38°C for 28 h. The crude product was collected by filtration and crystallized from dichloromethane-methanol (1:3) and washed with cold diethyl ether (2 × 5 mL).

Bis(Dimethyl-5-benzyl-5H-6H′)-dispiro[furan-2,5′-acenaphthenequinone]-3,3′,4,4′-tetracarboxylate (4a). Light brown powder, yield: 0.32 g (91%), m.p. 203–205°C, IR (KBr) (υ_{max}, cm^{-1}): 1744 and 1729 (4C=O), 1689 (2C=N). ^{1}H NMR: (300 MHz, $CDCl_3$): δ_H 3.38 (6H, s, 2OMe), 3.90 (6H, s, 2OMe), 4.55 (4H, s, $2CH_2$ of benzyl), 7.22–7.32 (10H, m, 10CH), 7.34 (2H, d, J = 7.0 Hz, 2CH), 7.64 (2H, t, J = 7.0 Hz, 2CH), 7.93 (2H, d, J = 8.0 Hz, 2CH). ^{13}C NMR (75.5 MHz, $CDCl_3$): δ_C 51.72 ($2NCH_2$), 52.53 and 53.36 (4OMe), 101.18 (2Cspiro), 120.33, 126.86, 126.91, 127.92, 127.75, 128.36, 128.51, 130.64, 134.90, 136.37, 138.70, and 144.10 (C=C$_{iminolactone}$ and C$_{arom}$), 156.26 (N=C$_{iminolactone}$), 160.29 and 161.35 (4C=O of esters). MS (m/z, %): 701 (M^{+} + 1) (1), 700 (M^{+} +3), 684 (1), 669 (1), 641 (2), 609 (6), 577 (1), 533 (3), 121 (4), 105 (3), 91 (100). Anal. A practical, inexpensive, and rapid method for the stereoselective synthesis of pyrazolo[4,3-*c*]pyridine derivatives *via* microwave-assisted reactions of 3,5-diarylidenepiperidin-4-ones with phenylhydrazine in ethylene glycol. This method has the advantages of good yield, operational simplicity, and simple purification procedure.

J. Heterocyclic Chem., **46**, 849 (2009).

INTRODUCTION

In recent years, microwave-assisted organic synthesis has received much attention [1] because of its shorter reaction times and formation of cleaner products compared with conventional heating. It is clear that the application of microwave technology to rapid synthesis of biologically significant molecules would be of great value for library generation [2]. This technology has recently been recognized as a useful tool for a drug-discovery program [3]. In addition, microwave-assisted synthesis of pyrazoles and pyrazolines *via* the cyclocondensation of phenylhydrazine with α,β-unsaturated ketones has been reported [4]. In conjunction with our continuous interest in combinatorial synthesis [5], we explore the use of microwave irradiation as a heating source in the synthesis of pyrazolo[4,3-*c*]pyridine derivatives.

Five and six-membered nitrogen-containing heterocycles are abundant in nature and exhibit diverse and important biological properties [6]. Pyrazolopyridine derivatives are the important heterocyclic compounds, which exhibit a diverse range of biological properties such as new inhibitors of xanthine oxidases [7], as Polo-like kinase 1 inhibitors [8], and HIF-1alpha prolyl hydroxylase inhibitors [9]. They also have proved to be active against Gram positive and Gram negative bacteria [10] and also as compounds for the inhibition of cholesterol formation [11]. Because of their biological activities, these compounds have distinguished themselves as heterocycles of profound chemical and biological significance. As a result, the synthesis of these molecules has attracted considerable attention.

The pyrazolo[4,3-*c*]pyridine derivatives were, previously, mostly synthesized through the reaction of α,β-unsaturated ketones with substituted hydrazine in different reaction conditions such as (i) catalyzed by NaOEt in HOEt for 10 h [12], (ii) in refluxing MeOH for 4 h [13], (iii) in refluxing EtOH for 6 h [14], and (iv) catalyzed by Et_3N in refluxing EtOH [15]. However, the continued development of a facile and versatile method to pyrazolo[4,3-*c*]pyridine derivatives is still desired.

With the aim to develop more efficient synthetic processes, reduce the number of separate reaction steps, and minimize byproducts, and in continuation of our recent interest in the construction of heterocyclic scaffolds [16], we herein describe a practical, inexpensive, and rapid method for the stereoselective synthesis of pyrazolo[4,3-*c*]pyridine derivatives **3** *via* microwave-assisted (MW) reactions of 3,5-diarylidenepiperidin-4-ones **1** with phenylhydrazine **2** in ethylene glycol (Scheme 1).

RESULTS AND DISCUSSION

To explore the scope and versatility of this method, various reaction conditions were investigated, including solvent and temperature variations. Highlighted in

Scheme 1

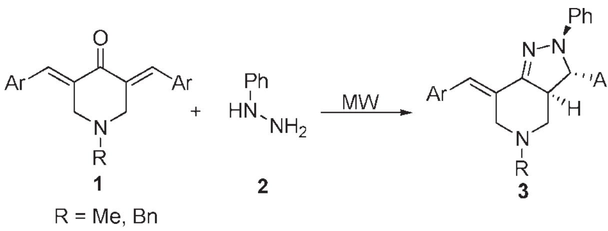

Table 1

Optimization of reaction conditions of compound **3a**.

Entry	Solvent	*T* (°C)	Time (min)	Yield (%)
1	Glycol	100	12	64
2	HOAc	100	16	35
3	EtOH	100	14	58
4	None	100	12	47
5	DMF	100	16	55
6	Glycol	90	16	61
7	Glycol	110	10	81
8	Glycol	120	8	89
9	Glycol	130	8	85
10	Glycol	140	8	88

Table 1 for compound **3a**, for example, is the influence of solvent on the reaction yield. The MW-assisted reaction of 3,5-bis(4-chlorobenzylidene)-1-methylpiperidin-4-one (**1a**, 1.0 mmol) with phenylhydrazine (**2**, 1.0 mmol) was examined using glycol, glacial acetic acid (HOAc), ethanol, and *N,N*-dimethylformamide (DMF) as solvent (1.0 mL) and solvent-free at 100°C, respectively. All the reactions were carried out at the maximum power of 200 W. The results were summarized in Table 1.

It was shown in Table 1 that the reaction using glycol as solvent gave the best result (Table 1, entry 8). So glycol was chosen as the reaction solvent. To further optimize reaction conditions, the same reaction was carried out in glycol at temperatures ranging from 90 to 140°C, with an increment of 10°C each time. The yield of product **3a** was increased and the reaction time was shortened as the temperature was increased from 90°C to 120°C (Table 1, entries 6–8). However, further increase of the temperature to 130–140°C failed to improve the yield of product **3a** (Table 1, entries 9–10). Therefore, 120°C was chosen as the reaction temperature for all further microwave-assisted reactions.

The use of these optimal microwave experimental conditions [glycol, 120°C, 200 W (Maximum power)] to the reactions of different 3,5-diarylidenepiperidin-4-ones afforded good yields of pyrazolo[4,3-*c*]pyridine. As shown in Table 2, at the beginning, we made a search for the 3,5-diarylidenepiperidin-4-ones substrate scope, phenylhydrazine **2** were used as model substrates (Table 2, entries 1–9 and 11–12), and the results indicated that 3,5-diarylidenepiperidin-4-ones bearing either electron donating or electron withdrawing functional groups such as nitro, chloro, hydroxyl, or methoxy were able to affect the synthesis of compounds **3**. Moreover, the heterocyclic3,5-diarylidenepiperidin-4-one such as thiophen-2-yl group (Table 2, entry 10) still displayed high reactivity under this standard condition.

Additionally, to demonstrate the microwave effects, the same temperature was applied to synthesize some of the products under classical heating (CH) conditions. The results listed in Table 3 showed the specific activation of this reaction by microwave heating. Simultaneously, the reaction times was strikingly shortened to minutes from hours required in traditional heating condition, and the yields were increased obviously too. The difference in yields (MW > CH) may be a consequence of both thermal effects and specific effects induced by the microwave field [17]. The reactants in these reactions contain dipoles and proceed *via* relatively polar

Table 2

4	**3f**	2	79
5	**3k**	2	72

intermediates, which enhance their interactions with MW and consequently benefit significantly from MW irradiation.

The structures of all the synthesized compounds were established on the basis of their spectroscopic data. The structural elucidation and the attribution of the relative stereochemistry rest upon NMR analysis and was unequivocally confirmed by X-ray diffraction of single crystals obtained by slow evaporation of the solvent in the case of **3j** (Fig. 1) [18]. The *anti* and *syn* isomers were identified by the coupling constants (J) of the vicinal protons adjacent to N-Ph and CH_2 in their ^1H NMR spectra. The coupling constants (J) of *anti* isomer is higher than that of the *syn* one [19]. The ^1H NMR spectrum of **3a** showed two doubles at $\delta = 4.83$, 3.78 from CH proton, and the corresponding coupling constant is $J = 12.4$; it is indicated that compounds **3** were *anti* configuration. Furthermore, because of exclusion between crowded aryl systems adjacent to N=C and CH, the molecule structure **3** is thermodynamic stable configuration (Fig. 2).

In summary, we have developed an efficient and improved stereoselective reactions of 3,5-diarylidenepiperidin-4-ones with phenylhydrazine **2** under mild conditions and have shown its application in the microwave-assisted synthesis of a wide range of pyrazolo[4,3-*c*]pyridine derivative in excellent yields. In light of its operational simplicity, simple purification procedure, and increased safety for small-scale high-speed synthesis, this protocol is superior to the existing methods.

EXPERIMENTAL

Microwave irradiation was carried out with a microwave oven Emrys^{TM} Creator from Personal Chemistry (Uppsala, Sweden). Melting points were determined in the open capillaries and were uncorrected. IR spectra were taken on a FT-IR-Tensor 27 spectrometer in KBr pellets and reported in cm^{-1}. ^1H NMR spectra were measured on a Bruker DPX 400 MHz spectrometer using TMS as an internal standard and DMSO-d_6 as solvent. HRMS (ESI) was determined by using micrOTOF-Q·HRMS/MS instrument (BRUKER). X-ray crystallographic analysis was performed with a Siemens SMART CCD and a Siemens P4 diffractometer.

General procedure for the one-pot synthesis of pyrazolo[4,3-*c*]pyridines 3 under microwave irradiation conditions. Typically, in a 10 mL Emrys^{TM} reaction vial, 3,5-bis(4-chlorobenzylidene)-1-methylpiperidin-4-one (**1a**, 1.0 mmol), phenylhydrazine (**2**, 1.0 mmol), and glycol (1.0 mL) were mixed and then capped. The mixture was kept for a given time at 120°C under microwave irradiation (initial power 100 W and maximum power 200 W). Upon completion, monitored by TLC, the reaction mixture was filtered to give the crude product, which was further purified by recrystallization from EtOH (95%) to give pure pyrazolo[4,3-*c*]pyridines **3**.

7-(4-Chlorobenzylidene)-3-(4-chlorophenyl)-3,3a,4,5,6,7-hexahydro-5-methyl-2-phenyl-2*H*-pyrazolo[4,3-*c*]pyridine (3a). IR (KBr): 2763, 1598, 1489, 1281, 1091, 1013, 889, 824, 756 cm^{-1}.

^1H NMR (DMSO-d_6, 400 MHz) δ: 7.49–7.38 (m, 8H, ArH), 7.16 (t, $J = 7.8$ Hz, 3H, =CH, and ArH), 6.94 (d, $J = 8.0$ Hz, 2H, ArH), 6.81 (t, $J = 7.6$ Hz, 1H, ArH), 4.83 (d, $J = 12.4$ Hz, 1H, CH), 3.78 (d, $J = 12.0$ Hz, 1H, CH_2), 3.17−3.03 (m, 3H, CH, and CH_2), 2.47 (d, $J = 8.0$ Hz, 1H, CH_2), 2.30 (s, 3H, CH_3); HRMS (ESI): *m*/*z* calcd for: 448.1342 $[M + H]^+$, found: 448.1369.

7-(4-Bromobenzylidene)-3-(4-bromophenyl)-3,3a,4,5,6,7-hexahydro-5-methyl-2-phenyl-2*H*-pyrazolo[4,3-*c*]pyridine (3b). IR (KBr): 2840, 1599, 1486, 1382, 1284, 1178, 1072, 1010, 889, 821 cm^{-1}.

^1H NMR (DMSO-d_6, 400 MHz) δ: 7.68–7.57 (m, 5H, ArH), 7.42–7.32 (m, 3H, =CH, and ArH), 7.16 (t, $J = 7.8$ Hz, 3H, ArH), 7.02–6.93 (m, 2H, ArH), 6.81 (t, $J = 7.4$ Hz, 1H, ArH), 4.82 (d, $J = 12.8$ Hz, 1H, CH), 3.79–3.70 (m, 1H, CH_2), 3.16–3.03 (m, 3H, CH_2), 2.48–2.37 (m, 1H, CH), 2.30 (s, 3H, CH_3).

HRMS (ESI): *m*/*z* calcd for: 536.0332 $[M + H]^+$, found: 536.0337.

7-(3-Nitrobenzylidene)-3,3a,4,5,6,7-hexahydro-5-methyl-3-(3-nitrophenyl)-2-phenyl-2*H*-pyrazolo[4,3-*c*]pyridine (3c). IR (KBr): 2950, 2796, 1597, 1525, 1498, 1351, 1298, 1097, 1034, 882, 746, 693 cm^{-1}.

^{1}H NMR (DMSO-d_6, 400 MHz) δ: 8.31 (s, 1H, ArH), 8.21–8.17 (m, 3H, ArH), 7.94 (d, *J* = 8.0 Hz, 1H, ArH), 7.83 (d, *J* = 8.0 Hz, 1H, ArH), 7.72 (t, *J* = 7.8 Hz, 2H, ArH), 7.34 (s, 1H, =CH), 7.18 (t, *J* = 8.0 Hz, 2H, ArH), 6.97 (d, *J* = 7.6 Hz, 2H, ArH), 6.84 (t, *J* = 7.4 Hz, 1H, ArH), 5.11 (d, *J* = 12.4 Hz, 1H, CH), 3.81 (t, *J* = 14.4 Hz, 1H, CH_2), 3.25–3.21 (m, 2H, CH_2), 3.15–3.12 (m, 1H, CH_2), 2.60–2.54 (m, 1H, CH), 2.32 (s, 3H, CH_3).

HRMS (ESI): *m*/*z* calcd for: 470.1823 $[M + H]^+$, found: 470.1804.

7-(2-Chlorobenzylidene)-3-(2-chlorophenyl)-3,3a,4,5,6,7-hexahydro-5-methyl-2-phenyl-2*H*-pyrazolo[4,3-*c*]pyridine (3d). IR (KBr): 2939, 1597, 1491, 1288, 1146, 1049, 998, 755 cm^{-1}.

^{1}H NMR (DMSO-d_6, 400 MHz) δ: 7.58–7.55 (m, 3H, ArH), 7.40–7.35 (m, 5H, ArH), 7.22–7.16 (m, 3H, CH, and ArH), 6.88–6.82 (m, 3H, ArH), 5.22 (d, *J* = 12.0 Hz, 1H, CH), 3.62 (d, *J* = 12.0 Hz, 1H, CH_2), 3.25–3.10 (m, 3H, CH_2), 2.59–2.57 (m, 1H, CH), 2.28 (s, 3H, CH_3).

HRMS (ESI): *m*/*z* calcd for: 448.1342 $[M + H]^+$, found: 448.1342.

7-Benzylidene-3,3a,4,5,6,7-hexahydro-5-methyl-2,3-diphenyl-2*H*-pyrazolo[4,3-*c*]pyridine (3e). IR (KBr): 2942, 2843, 1597, 1498, 1321, 1287, 1236, 1134, 1030, 1003, 889, 750 cm^{-1}.

^{1}H NMR (DMSO-d_6, 400 MHz) δ: 7.46–7.31 (m, 10H, ArH), 7.21 (s, 1H, =CH), 7.16–7.12 (m, 2H, ArH), 6.96 (d, *J* = 8.0 Hz, 2H, ArH), 6.79 (t, *J* = 7.2 Hz, 1H, ArH), 4.78 (d, *J* = 12.8 Hz, 1H, CH), 3.82 (d, *J* = 14.0 Hz, 1H, CH_2), 3.16–3.10 (m, 2H, CH_2), 3.07–3.03 (m, 1H, CH), 2.47 (d, *J* = 8.0 Hz, 1H, CH_2), 2.30 (s, 3H, CH_3).

In this study, methyl (±)-1-(2-nitrobenzyl)-4-oxo-2-cyclohexene-1-carboxylate and methyl (±)-(2-nitrobenzyl)-4-oxo-2-cyclopentene-1-carboxylate were prepared and subjected to reductive cyclization under dissolving metal conditions. The two reactants showed divergent behavior with the six-ring substrate reacting at the ester carbonyl and the five-ring substrate closing on the enone double bond. The difference in reactivity is attributed to the conformational flexibility, relative reactivity, and steric environment of C4-substituted six- and five-membered cyclic enones.

J. Heterocyclic Chem., **46**, 854 (2009).

INTRODUCTION

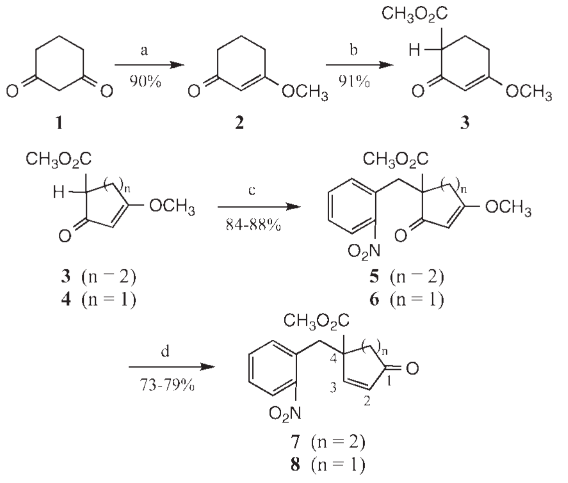
The reductive cyclization of 2-nitrobenzyl ketones under dissolving metal conditions is well established as a route to the synthesis of indoles [1,2]. Earlier work from our laboratory studied a tandem reduction–Michael addition variant of this reaction as a route to the synthesis of 1,2,3,4-tetrahydroquinoline-2-acetic esters [3], and we have recently used this reaction to synthesize 1,2,3,9-tetrahydro-4*H*-carbazol-4-one [4]. In this investigation, we sought to expand the scope of the tandem reduction–Michael sequence to access functionalized linear-fused tricyclic systems. For this study, we prepared six- and five-membered cyclic enones substituted at C4 by a methyl ester and a 2-nitrobenzyl group, and subjected each to mild reduction using iron in acetic acid. To our surprise, divergent reactivity was observed from the cyclohexenone and cyclopentenone substrates, resulting in two relatively uncommon ring systems. In addition, a mechanistically novel competitive ester reduction process was observed. Thus, we report our findings in this area.

RESULTS AND DISCUSSION

The syntheses of our cyclization substrates are summarized in Scheme 1. Ketoester **3** was prepared from 1,3-cyclohexanedione (**1**) by Lewis acid-catalyzed enol ether formation to give **2** [5] followed by kinetic deprotonation [6] and reaction with methyl cyanoformate [7]. In this case, we found that methyl cyanoformate gave better yields of the ketoester than methyl chloroformate with easier purification of the product. Ketoester **4** was prepared as previously described [8]. Alkylation of **3** and **4** with 2-nitrobenzyl bromide [9] using potassium carbonate and catalytic 18-crown-6 in acetonitrile under anhydrous conditions [10] gave products **5** and **6**, respectively. Reduction of the enone carbonyls in **5** and **6** with sodium borohydride in the presence of cerium(III) chloride [11], followed by treatment with aqueous acid resulted in 1,3-carbonyl transposition to give substrates **7** and **8**.

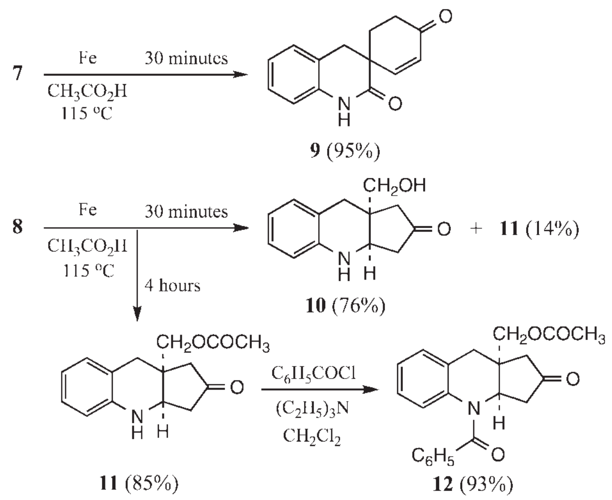
The results of our reduction-cyclization study are outlined in Scheme 2. In each case, the reaction was

Scheme 1 [a]



[a] Key: (a) CH_3OH, $CeCl_3{\cdot}7H_2O$-SiO_2, 22°C; (b) *i.* $LiN(i\text{-}C_3H_7)_2$, tetrahydrofuran, -78°C; *ii.* CH_3O_2CCN, -78°C → 22°C; (c) K_2CO_3, 18-crown-6, CH_3CN, 2-nitrobenzyl bromide, 82°C; (d) *i* $NaBH_4$, $CeCl_3{\cdot}7H_2O$, CH_3OH, 22 °C; *ii.* 3 M HCl.

Scheme 2



complete in 30 min and led predominantly to a single product. For cyclohexenone **7**, the expected reduction-Michael addition was not observed, but instead, reduction of the nitro group was followed by addition of the aniline nitrogen to the ester to give the spiro-fused 3,4-dihydro-2(1*H*)-quinolinone derivative **9** in 95% yield. For cyclopentenone **8**, the reduction–Michael sequence proceeded as planned, but was accompanied by reduction of the ester to afford **10** in 76% yield. Extended reaction times (4 h) led to further acylation of the primary alcohol in **10** to give **11**. The *cis* stereochemistry of the ring junction was confirmed by the conversion of **11** to its solid *N*-benzoyl derivative **12** and single crystal X-ray analysis (Fig. 1).

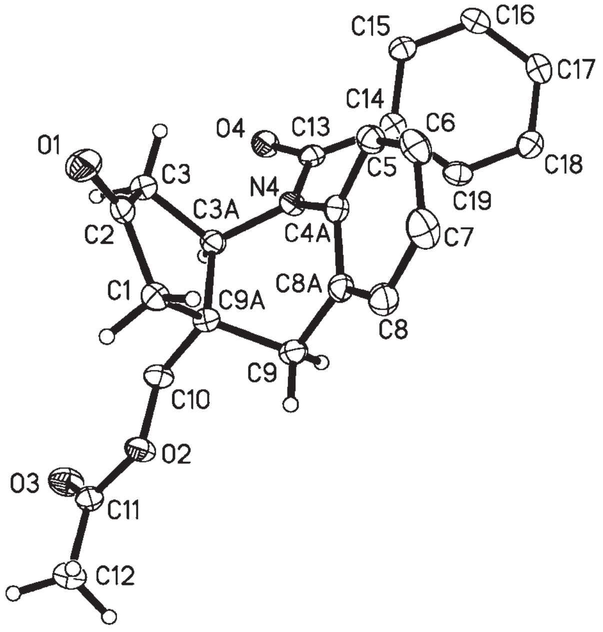


Figure 1. Molecular structure of compound **12**, with thermal ellipsoids drawn at the 50% probability level. Hydrogen atoms on C10 and on the aromatic rings have been removed for clarity.

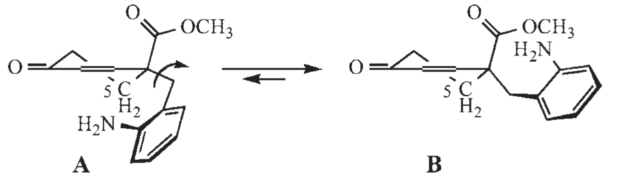
Scheme 3



Examination of molecular models provides some insight into the observed difference in reactivity. Following reduction of the nitro function in **7**, alignment of the amino group for addition to the enone would result in steric repulsion between the C5 methylene of the cyclohexenone and the aromatic ring as in **A** (Scheme 3). Rotation about the benzylic bond to minimize this interaction would then lead to conformation **B**, which is more prone to react at the ester carbonyl. By comparison, similar steric interference is not present in cyclopentenone **8**. Furthermore, the five-membered cyclic enone should be more reactive due to strain. Eclipsing interactions that develop in the five-membered ring of **10** during addition should not significantly deter cyclization since the starting enone also possesses considerable torsional strain. The eclipsing in the cyclized product is clearly visible in the X-ray structure of **12** (Fig. 1).

The preference for the *cis* stereochemistry of the ring junction in **10** is in accord with both strain and stereoelectronic considerations. The *cis*-fused stereochemistry would be expected based on strain arguments, with the *cis*-fused ring junction preferred over the more strained *trans* [12]. Stereoelectronically, it is well established that the *cis*-fused isomer is strongly favored in nucleophilic ring closures on pre-existing rings via an axial attack that permits a chair-like transition state [13]. Although, a true chair transition state is not possible due to the aromatic sp^2 carbons, pseudoaxial attack would still be expected to afford a *cis* product.

The reduction of the ester group in **8** is also an interesting observation. The reduction is analogous to the classical Bouveault-Blanc reaction [14], but would not be expected to occur with iron as the electron source [15]. In our substrates, the α,β-unsaturated ketone is the functional group most susceptible to reduction under dissolving metal conditions [16], and we believe that this moiety is the key to reduce the ester.

To explore this process without interference from the amino group, methyl (±)-1-benzyl-4-oxo-2-cyclohexene-1-carboxylate (**13**) and methyl (±)-1-benzyl-4-oxo-2-cyclopentene-1-carboxylate (**14**) were prepared using the method described for the nitro-bearing substrates. Treatment of **13** with iron in acetic acid for 24 h yielded a

33:67 mixture (by NMR) of starting material **13** and the double bond reduction product **15**. This ratio varied little with longer reaction times or increased amounts of iron. Similar reaction of **14** gave more interesting results, and the reaction was considerably faster. Exposure of **14** to iron in refluxing acetic acid gave nearly complete conversion to alcohol **18** in 15 min. Prolonged treatment (2 h) under the same conditions gave a 67:33 mixture (by NMR) of **18**:**20**, as the acetates, in 95% yield. These results are summarized in Scheme 4.

Mechanistically, the reduction of **13** and **14** is initiated by protonation of the enone carbonyls followed by the addition of two electrons to each conjugated system [16] to give anions **21** and **22**, respectively (Scheme 5). In **21**, the six-membered ring is conformationally flexible making the ester at C4 less accessible to attack by the anionic center at C3. Thus, protonation and tautomerization occur to give **15**. In the more rigid structure **22**, the C3 anion is closer to the C4 ester and cyclization occurs to afford the strained cyclopropanone hemiketal **23**. Under the acidic conditions of the reaction, **23** would undergo rapid proton and enol-assisted three-ring opening [17], as in **24**, followed by the loss of methanol to give aldehyde **25**. Further reduction of **25** would then afford alcohol **18** and, eventually, **20**.

The systems resulting from these ring closures have minimal precedent in the literature. The 3,3-dialkyl-3,4-dihydro-2(1*H*)-quinolinone scaffold of **9** is found in some antidepressants [18], but spiro-fused compounds have not been extensively investigated [19]. The 2,3,3a,4,9,9a-hexahydro-1*H*-cyclopenta[*b*]quinoline system has been reported [20] and is known to exhibit some antipsychotic activity [21], but structures with the functional group arrangement of **10** are unknown.

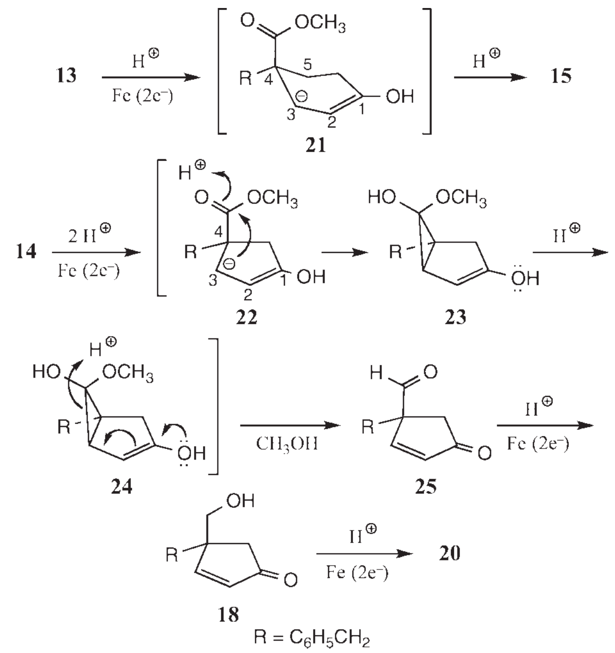
Scheme 5



CONCLUSIONS

Divergent behavior has been observed in the dissolving metal reduction–Michael reaction of two substrates differing only in the size of the ring incorporating the Michael acceptor. The disparate reaction pathways can be attributed to the differences in strain and steric environment of the enone acceptor as well as the alignment of the reacting functionality in the two systems. The reaction is clean and offers an efficient route to a relatively rare ring skeleton from each substrate. The reduction of the ester functionality in the five-membered ring substrate is novel and likely involves the participation of the enone moiety.

EXPERIMENTAL

Commercial reagents and solvents were used as received. Tetrahydrofuran was dried over potassium hydroxide pellets and distilled from lithium aluminum hydride before use. The hydrochloric acid (3*M*), ammonium chloride (saturated), sodium bicarbonate (saturated), and sodium chloride (saturated) used in workup procedures refer to aqueous solutions. All reactions were run under dry nitrogen in oven-dried glassware. Reactions were monitored by thin layer chromatography on silica gel GF plates (Analtech 21521). Preparative separations were performed using flash column chromatography [22] on silica gel (grade 62, 60–200 mesh) mixed with ultraviolet-active phosphor (Sorbent Technologies No. UV-5) or thin layer chromatography on 20 cm × 20 cm silica gel GF plates (Analtech 02015); band elution was monitored using a hand-held ultraviolet lamp. Hexanes used in chromatography had a boiling range of 65–70°C. Melting points were uncorrected. Infrared spectra were run as thin films on sodium chloride disks and were referenced to polystyrene. ^{1}H- and ^{13}C-NMR spectra were measured in deuteriochloroform at 300 MHz and 75 MHz, respectively, using tetramethylsilane as the internal standard; coupling constants (J) are reported in Hertz. Low-resolution mass spectra (electron impact/direct probe) were run at 30 eV.

3-Methoxy-2-cyclohexen-1-one (2). The procedure of Sabitha *et al*. [5] was modified. A mixture of 20.0 g of silica gel (Alfa-Aesar, 220–440 mesh) and 3.60 g (9.60 mmoles) of cerium(III) chloride heptahydrate in 60 mL of dry acetonitrile was stirred for 12 h at 22°C. The acetonitrile was removed under vacuum and a solution of 5.00 g (44.6 mmoles) of **1** in 20 mL of methanol was added. The mixture was stirred for 72 h at 22°C and filtered with ethyl acetate. The filtrate was concentrated under reduced pressure, and the crude product was purified by flash chromatography on a 30 cm × 2.5 cm silica gel column eluted with 50% ethyl acetate in hexanes to give 3.70 g (90%) of **2** as a colorless oil. IR: 1671, 1645, 1605 cm^{-1}; ^{1}H-NMR: δ 5.37 (s, 1H), 3.70 (s, 3H), 2.42 (t, 2H, J = 6.4), 2.35 (t, 2H, J = 6.9), 1.98 (quintet, 2H, J = 6.6); ^{13}C-NMR: δ 199.4, 178.4, 102.1, 55.4, 36.5, 28.6, 21.0.

Methyl (±)-4-methoxy-2-oxo-3-cyclohexene-1-carboxylate (3). To a stirred solution of 2.88 g (4.00 mL, 28.6 mmoles) of diisopropylamine in 30.0 mL of tetrahydrofuran at −78°C, was slowly added 17.0 mL of 1.75*M* *n*-butyllithium in hexanes (30.0 mmoles). After 30 min, a solution of 3.00 g (23.8 mmoles) of **2** in 20.0 mL of tetrahydrofuran was added dropwise and stirring was continued at −78°C for 30 min. A solution of 3.40 g (40.0 mmoles) of methyl cyanoformate in 10 mL of tetrahydrofuran was then added dropwise and the reaction was stirred for 1 h at −78°C. The reaction mixture was slowly warmed to 22°C, stirred for 30 min, cautiously added to saturated ammonium chloride and extracted with ether. The ether extracts were washed with saturated sodium bicarbonate (one time), water (one time), and saturated sodium chloride (one time), and then dried (magnesium sulfate) and concentrated under vacuum. The crude product was purified by flash chromatography on a 100 cm × 2.5 cm silica gel column eluted with 30% ethyl acetate in hexanes to give 0.60 g (20%) of **2** and 3.20 g (73%) of **3**. The yield of **3** was 91% based on recovered starting material. IR: 1740, 1656, 1606 cm^{-1}; ^{1}H-NMR: δ 5.41 (s, 1H), 3.76 (s, 3H), 3.72 (s, 3H), 3.35 (dd, 1H, J = 9.2, 5.3), 2.57 (m, 1H), 2.46 (m, 1H), 2.36 (m, 1H), 2.17 (m, 1H); ^{13}C-NMR: δ 193.5, 178.4, 170.6, 101.6, 55.8, 52.2, 52.0, 27.0, 24.0; ms: m/z 184 (M$^+$); *Anal*. Calcd. for $C_9H_{12}O_4$: C, 58.70; H, 6.52. Found: C, 58.77; H, 6.55.

Methyl (±)-4-methoxy-2-oxo-3-cyclopentene-1-carboxylate (4). This compound was prepared by the method of Fuchs and McGarrity [8]. The spectral data matched those reported.

Representative procedure for alkylation of 3 with 2-nitrobenzyl bromide: Methyl (±)-4-methoxy-1-(2-nitrobenzyl)-2-oxo-3-cyclohexene-1-carboxylate (5). The general procedure of Makosza and Tyrala [10] was used. A 100-mL three-necked, round-bottomed flask equipped with an addition funnel, a reflux condenser, and a magnetic stir bar was charged with 35 mL of dry acetonitrile, 4.87 g (35.2 mmoles) of anhydrous potassium carbonate, and 10 mg of 18-crown-6. Stirring was initiated and a solution of 2.16 g (11.7 mmoles) of **3** in 10 mL of acetonitrile was added dropwise at 22°C. The resulting blue solution was stirred for 10 min and a solution of 2.80 g (13.0 mmoles) of 2-nitrobenzyl bromide [9] in 10 mL of acetonitrile was added dropwise. The reaction was refluxed for 18 h at which time thin layer chromatography indicated complete consumption of **3**. The crude reaction mixture was cooled, diluted with ether, vacuum filtered, and concentrated under vacuum. The resulting dark yellow oil was purified by flash chromatography on a 100 cm × 2.5 cm silica gel column eluted with 20–30% ether in hexanes to give 3.30 g (88%) of **5** as a light yellow oil. IR: 1729, 1660, 1609, 1526, 1384, 1350 cm^{-1}; ^{1}H-NMR: δ 7.82 (dd, 1H, J = 8.2, 6.6), 7.47 (td, 1H, J = 7.5, 1.5), 7.36 (td, 1H, J = 7.9, 1.6), 7.35 (d, 1H, J = 7.0), 5.41 (d, 1H, J = 1.5), 3.87 (d, 1H, J = 14.1), 3.68 (s, 3H), 3.67 (s, 3H), 3.57 (d, 1H, J = 14.1), 2.59 (m, 1H), 2.39 (m, 1H), 2.27 (m 1H), 1.77 (m, 1H); ^{13}C-NMR: δ 193.9, 177.7, 171.1, 150.9, 133.4, 133.3, 131.5, 127.9, 124.7, 101.9, 57.0, 55.8, 52.7, 34.7, 28.3, 26.3; ms: m/z 319 (M$^+$). *Anal*. Calcd. for $C_{16}H_{17}NO_6$: C, 60.19; H, 5.33; N, 4.39. Found: C, 60.29; H, 5.36; N, 4.35.

Methyl (±)-4-methoxy-1-(2-nitrobenzyl)-2-oxo-3-cyclopentene-1-carboxylate (6). This compound (3.00 g, 84%) was obtained as a light yellow oil. IR: 1740, 1699, 1596, 1526, 1359 cm^{-1}; ^{1}H-NMR: δ 7.86 (dd, 1H, J = 8.1, 1.5), 7.47 (td, 1H, J = 7.5, 1.5), 7.38 (td, 1H, J = 7.9, 1.6), 7.35 (dd, 1H, J = 7.7, 1.5), 5.26 (t, 1H, J = 1.1), 3.80 (s, 3H), 3.75 (d, 1H, J = 14.6), 3.75 (s, 3H), 3.52 (d, 1H, J = 14.6), 3.17 (dd, 1H, J = 17.9, 1.1), 2.48 (dd, 1H, J = 17.9, 1.1); ^{13}C-NMR: δ 200.3, 191.0, 170.8, 150.5, 132.7, 132.2, 131.4, 128.0, 124.7, 102.0, 59.8, 59.1, 53.1, 37.0, 33.7; ms: m/z 305 (M$^+$). *Anal*. Calcd. for $C_{15}H_{15}NO_6$: C, 59.02; H, 4.92; N, 4.59. Found: C, 59.13; H, 4.96; N, 4.53.

Representative procedure for 1,3-carbonyl tranposition: Methyl (±)-1-(2-nitrobenzyl)-4-oxo-2-cyclohexene-1-carboxylate (7). The procedure of Luche was modified [11]. A 250-mL three-necked, round-bottomed flask equipped with a reflux condenser and a magnetic stir bar was charged with 20 mL of methanol followed by 4.60 g (12.4 mmoles) of cerium(III) chloride heptahydrate. The mixture was stirred for 10 min and a solution of 2.50 g (7.84 mmoles) of **5** in 10 mL of methanol was added dropwise. After 5 min, 1.25 g (32.9 mmoles) of sodium borohydride was added in small portions over a period of 20 min. (Note: Frothing is a problem if the added portions of sodium borohydride are too large). The reaction mixture was stirred for 15 min at which time 12 mL of 3*M* hydrochloric acid was added. After 20 min, the mixture was concentrated under vacuum to one-third its volume and extracted with ether (three times). The combined ether extracts were washed with water (three times) and saturated sodium chloride (one time), then dried (magnesium sulfate) and concentrated under vacuum. The resulting dark brown liquid was purified by flash chromatography on a 50 cm × 2.5 cm silica gel column eluted with 20–30% ether in hexanes to give 1.78 g (79%) of **7** as thick yellow oil. IR: 1732, 1685, 1609, 1528, 1351 cm^{-1}; ^{1}H-NMR: δ 7.92 (dd, 1H, J = 8.1, 1.5), 7.55 (td, 1H, J = 7.5, 1.3), 7.43 (td, 1H, J = 8.1, 1.5), 7.27 (dd, 1H, J = 7.7, 1.5), 6.82 (d, 1H, J = 10.4), 6.02 (d, 1H, J = 10.4), 3.70 (s, 3H), 3.66 (d, 1H, $J = 13.8$), 3.50 (d, 1H, $J = 13.8$), 2.45 (m, 2H), 2.36 (m, 1H), 2.06 (m, 1H); ^{13}C-NMR: δ 197.8, 172.8, 150.2, 149.0, 133.0, 132.7, 130.3, 129.7, 128.5, 125.2, 52.8, 48.6, 39.5, 34.4, 30.9; ms: *m*/*z* 289 (M^+). *Anal.* Calcd. for $C_{15}H_{15}NO_5$: C, 62.28; H, 5.19; N, 4.84. Found: C, 62.40; H, 5.24; N, 4.76.

Methyl (±)-1-(2-nitrobenzyl)-4-oxo-2-cyclopentene-1-carboxylate (8). This compound (1.65 g, 73%) was obtained as yellow crystals, mp 103–105°C. IR: 1712, 1679, 1608, 1526, 1352 cm^{-1}; ^{1}H-NMR: δ 7.86 (dd, 1H, $J = 8.2, 1.3$), 7.52 (td, 1H, $J = 7.5, 1.3$), 7.47 (d, 1H, $J = 5.7$), 7.39 (td, 1H, $J = 8.1, 1.5$), 7.29 (dd, 1H, $J = 7.7, 1.5$), 6.08 (d, 1H, $J = 5.7$), 3.65 (s, 3H), 3.50 (d, 1H, $J = 13.7$), 3.17 (d, 1H, $J = 13.7$), 2.36 (d, 1H, $J = 18.7$), 2.18 (d, 1H, $J = 18.7$); ^{13}C-NMR: δ 208.7, 167.3 (2C), 150.1, 134.9, 133.4, 132.6, 131.2, 128.1, 125.0, 67.7, 52.3, 42.6, 36.5; ms: *m*/*z* 275 (M^+). *Anal.* Calcd. for $C_{14}H_{13}NO_5$: C, 61.09; H, 4.73; N, 5.09. (±)-1′,4′-Dihydrospiro[2-cyclohexene-1,3′(2′*H*)-quinoline]-2′,4-dione (9). The procedure of Bunce *et al.* was used [1]. A mixture of 500 mg (1.73 mmoles) of **7**, 25 mL of acetic acid, and 773 mg (13.8 mmoles, 8.0 equiv) of iron powder (>100 mesh) was heated with stirring at 115°C (oil bath) until thin layer chromatography indicated complete consumption of starting material (*ca.* 30 min). The reaction mixture was cooled, diluted with 50 mL of water, and extracted with ether (three times). The combined ether layers were washed with water (one time), saturated sodium bicarbonate (three times), saturated sodium chloride (one time), then dried (magnesium sulfate) and concentrated under vacuum to give 373 mg (95%) of **9** as a pale white solid, mp 212–215°C. IR: 3195, 1667 cm^{-1}; ^{1}H-NMR: δ 8.69 (br s, 1H), 7.21 (complex, 2H), 7.05 (td, 1H, $J = 7.5, 1.3$), 6.82 (obscured, 1H) 6.81 (d, 1H, $J = 10.3$), 6.14 (d, 1H, $J = 10.3$), 3.13 (d, 1H, $J = 15.9$), 2.99 (d, 1H, $J = 15.9$), 2.73 (ddd, 1H, $J = 17.1, 8.4, 4.9$), 2.49 (ddd, 1H, $J = 17.1, 8.4, 4.9$), 2.34 (ddd, 1H, $J = 13.4, 8.4, 4.9$), 1.98 (ddd, 1H, $J = 13.4, 8.4, 4.9$); ^{13}C-NMR: δ 198.2, 172.1, 148.9, 136.1, 130.7, 128.6, 128.2, 123.7, 121.1, 115.2, 42.6, 36.6, 33.6, 29.4; ms: *m*/*z* 227 (M^+). *Anal.* Calcd. for $C_{14}H_{13}NO_2$: C, 74.01; H, 5.73; N, 6.17. Found: C, 74.00; H, 5.71; N, 6.20.

(±)-(3a*R, 9a*R**)-9a-Hydroxymethyl-1,3,3a,4,9,9a-hexahydro-2*H*-cyclopenta[*b*]quinolin-2-one (10).** The procedure used to prepare **9** was followed using 200 mg (0.73 mmoles) of **8** and 325 mg (5.84 mmoles) of iron powder in 12 mL of acetic acid. After 30 min at 115°C, workup and preparative thin layer chromatography using 40% ether in hexanes gave 120 mg (76%) of **10** as a light yellow oil. IR: 3395, 1733 cm^{-1}; ^{1}H-NMR: δ 7.01 (td, 1H, $J = 7.3, 1.2$), 6.98 (dd, 1H, $J = 7.5, 0.8$), 6.64 (td, 1H, $J = 7.3, 1.2$), 6.48 (dd, 1H, $J = 7.9, 0.8$), 3.92 (br s, 1H), 3.94 (t, 1H, $J = 6.4$), 3.59 (d, 1H, $J = 10.9$), 3.55 (d, 1H, $J = 10.9$), 2.74 (d, 1H, $J = 16.7$), 2.69 (obscured, 2H), 2.65 (d, 1H, $J = 16.7$), 2.37 (d, 1H, $J = 18.7$), 2.17 (dd, 1H, $J = 18.7, 1.6$), 2.20 (m, 1H); ^{13}C-NMR: δ 216.6, 141.7, 129.6, 127.4, 117.5, 117.4, 113.4, 66.6, 52.0, 46.4, 45.9, 41.3, 31.3; ms: *m*/*z* 217 (M^+). *Anal.* Calcd. for $C_{13}H_{15}NO_2$: C, 71.89; H, 6.91; N, 6.45. Found: C, 71.96; H, 6.95; N, 6.40. This reaction also gave 26 mg (14%) of compound **11**.

(±)-(3a*R, 9a*R**)-9a-Acetoxymethyl-1,3,3a,4,9,9a-hexahydro-2*H*-cyclopenta[*b*]quinolin-2-one (11).** The procedure used to prepare **9** was followed using 500 mg (1.82 mmoles) of **8** and 812 mg (14.6 mmoles) of iron powder in 30 mL of acetic acid. After 4 h at 115°C, workup and flash chromatography on a 25 cm × 2 cm silica gel column using 15% ether in hexanes gave 400 mg (85%) of **10** as a tan oil. IR: 3394, 1740 cm^{-1}; ^{1}H-NMR: δ 7.05 (m, 2H), 6.66 (td, 1H, $J = 7.5, 1.3$), 6.50 (dd, 1H, $J = 7.8, 0.8$), 4.10 (br s, 1H), 4.08 (d, 1H, $J = 11.4$), 4.02 (d, 1H, $J = 11.4$), 3.92 (t, 1H, $J = 6.4$), 2.80 (d, 1H, $J = 16.5$), 2.70 (d, 1H, $J = 16.5$), 2.70 (m, 1H), 2.27 (m, 2H), 2.21 (dd, 1H, $J = 5.4, 1.1$), 2.06 (s, 3H); ^{13}C-NMR: δ 214.9, 170.8, 141.4, 129.7, 127.6, 117.7, 116.8, 113.5, 67.6, 52.4, 46.3, 46.0, 39.6, 31.5, 20.8; ms: *m*/*z* 259 (M^+). *Anal.* Calcd. for $C_{15}H_{17}NO_3$: C, 69.50; H, 6.56; N, 5.41. Found: C, 69.52; H, 6.55; N, 5.39.

(±)-(3a*R, 9a*R**)-9a-Acetoxymethyl-4-benzoyl-1,3,3a,4,9,9a-hexahydro-2*H*-cyclopenta[*b*]quinolin-2-one (12).** To a stirred solution of 200 mg (0.77 mmoles) of **11** and 85.6 mg (0.85 mmoles) of triethylamine in 20 mL of dichloromethane, a solution of 120 mg (0.85 mmoles) of benzoyl chloride in 1 mL of dichloromethane was slowly added over a period of 5 min. The reaction mixture was stirred at 22°C for 2 h at which time thin layer chromatography confirmed the absence of starting material. The reaction mixture was poured into cold water and the dichloromethane layer was separated. The organic phase was washed with cold water (two times), dried (magnesium sulfate) and concentrated under vacuum. The resulting residue was passed through a small plug of silica gel with 30% ether in hexanes to give 260 mg (93%) of **12** as a light yellow solid, mp 108–110°C. IR: 1744, 1643 cm^{-1}; ^{1}H-NMR: δ 7.38–7.21 (complex, 6H), 7.07 (td, 1H, $J = 7.5, 1.1$), 6.93 (t, 1H, $J = 7.5$), 6.49 (d, 1H, $J = 7.9$), 5.19 (dd, 1H, $J = 9.0, 4.4$), 4.28 (d, 1H, $J = 10.9$), 4.20 (d, 1H, $J = 10.9$), 3.04 (ddd, 1H, $J = 19.4, 9.0, 1.8$), 2.94 (d, 1H, $J = 14.1$), 2.73 (d, 1H, $J = 14.1$), 2.29 (ddd, 1H, $J = 19.4, 4.4, 1.8$), 2.20 (dd, 1H, $J = 18.5, 1.8$), 2.10 (s, 3H), 2.06 (dd, 1H, $J = 18.5, 1.8$); ^{13}C-NMR: δ 214.1, 170.7, 169.8, 138.1, 134.8, 130.8, 130.6, 129.1, 129.0, 128.1, 127.4, 126.9, 126.1, 71.1, 57.4, 47.9, 45.6, 45.2, 34.6, 20.7; ms: *m*/*z* 363 (M^+). *Anal.* Calcd. for $C_{22}H_{21}NO_4$: C, 72.73; H, 5.79; N, 3.86. Found: C, 73.71; H, 5.79; N, 3.88.

X-ray crystallographic analysis of 12. Flat, elongated rods of **12** were obtained by slow diffusion of pentane into an ether solution of the compound. A sample measuring 0.4 mm × 0.4 mm × 0.1 mm, which was cut from a longer rod, was immersed in polyisobutylene and placed in a nylon loop under a nitrogen cold stream. X-ray intensity data were measured at 115(2) K on a Bruker SMART Apex II diffractometer. Graphite-monochromated Mo-Kα radiation ($\lambda = 0.71073$ Å, fine-focus sealed tube) was used with the CCD detector placed 6.0 cm from the sample. Data frames were collected in a series of ϕ and ω scans with 0.5° scan widths and 30-s exposure times. Data integration used the Bruker SAINT software package [23]. Data were corrected for absorption effects using the multiscan technique (SADABS) [24]. The structure was solved by direct methods and refined by full-matrix least-squares on F^2 using the Bruker SHELXTL software suite [25]. Non-hydrogen atoms were assigned anisotropic temperature factors. Hydrogen atoms were placed in calculated positions based on the geometry at carbon (riding model). Refined formula: $C_{22}H_{21}NO_4$, $M = 363.40$, monoclinic, space group $P2_1/n$, $a = 11.1983(2)$ Å, $b = 8.18310(10)$ Å, $c = 19.7453(3)$ Å, $\beta = 101.7010(10)°$, $U = 1771.80(5)$ Å^3, $Z = 4$, $D_c = 1.362$ g/cm, $\mu = 0.094$ mm^{-1},

T = 115(2) K, $2\theta_{max}$ = 50.6°, completeness to $2\theta_{max}$ = 100.0%, 13372 total reflections, 3227 independent (R_{int} = 0.0248), 2619 observed [$I > 2\sigma(I)$]. Final $R1$ [$I > 2\sigma(I)$] = 0.0336, $wR2$ (all data) = 0.0833, largest difference peak and hole 0.225 and −0.194 e$Å^{-3}$. CCDC 692896 contains the supplementary crystallographic data for compound **12**. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

Methyl (±)-4-benzyl-2-oxo-3-cyclohexene-1-carboxylate (13). The procedure used to prepare **5** was followed using 1.08 g (5.85 mmoles) of **3** and 1.11 g (6.5 mmoles) of benzyl bromide. Following flash chromatography, 1.52 g (95%) of methyl (±)-1-benzyl-4-methoxy-2-oxo-3-cyclohexene-1-carboxylate was isolated as a white solid, mp 68–70°C. IR: 1729, 1660, 1610 cm^{-1}; ^{1}H-NMR: δ 7.28–7.17 (complex, 3H), 7.14 (m, 2H), 5.41 (d, 1H, J = 1.2), 3.71 (s, 3H), 3.66 (s, 3H), 3.32 (d, 1H, J = 13.7), 3.23 (d, 1H, J = 13.7), 2.63 (m, 1H), 2.29 (m, 2H), 1.80 (m, 1H); ^{13}C-NMR: δ 194.4, 177.8, 171.5, 136.5, 130.4, 128.1, 126.7, 101.9, 56.9, 55.7, 52.4, 40.0, 28.1, 26.3; ms (30 eV): m/z 274 (M^+); *Anal.* Calcd. for $C_{16}H_{18}O_4$: C, 70.07; H, 6.57. Found: C, 70.12; H, 6.59.

Reduction and carbonyl transposition were carried out as described for the preparation of **7** using 1.52 g (5.56 mmoles) of the benzylated product from the earlier procedure. Following flash chromatography, 1.22 g (90%) of **13** was isolated as a colorless oil. IR: 1732, 1682 cm^{-1}; ^{1}H-NMR: δ 7.32–7.22 (complex, 3H), 7.09 (dd, 1H, J = 7.8, 1.8), 6.95 (d, 1H, J = 10.3), 6.02 (d, 1H, J = 10.3), 3.69 (s, 3H), 3.08 (s, 2H), 2.47 (m, 2H), 2.40 (m, 1H), 2.07 (m, 1H); ^{13}C-NMR: δ 198.3, 173.2, 150.3, 135.4, 129.8, 129.2, 128.4, 127.2, 52.3, 49.0, 44.5, 34.5, 30.5; ms: m/z 244 (M^+); *Anal.* Calcd. for $C_{15}H_{16}O_3$: C, 73.77; H, 6.56. Found: C, 73.81; H, 6.60.

Methyl (±)-4-benzyl-2-oxo-3-cyclopentene-1-carboxylate (14). The procedure used to prepare **5** was followed using 0.99 g (5.85 mmoles) of **4** and 1.11 g (6.50 mmoles) of benzyl bromide. Following flash chromatography, 1.46 g (96%) of methyl (±)-1-benzyl-4-methoxy-2-oxo-3-cyclopentene-1-carboxylate was isolated as white solid, mp 96–98°C. IR: 1741, 1699, 1597 cm^{-1}; ^{1}H-NMR: δ 7.27–7.17 (complex, 3H), 7.13 (m, 2H), 5.18 (s, 1H), 3.76 (2s, 6H), 3.30 (d, 1H, J = 14.1), 3.25 (d, 1H, J = 14.1), 3.11 (dd, 1H, J = 17.7, 1.0), 2.61 (dd, 1H, J = 17.7, 1.0); ^{13}C-NMR: δ 200.6, 190.3, 171.0, 136.2, 130.0, 128.2, 126.9, 102.3, 60.1, 59.0, 52.9, 39.1, 36.5; ms: m/z 260 (M^+). *Anal.* Calcd for $C_{15}H_{16}O_4$: C, 69.23; H, 6.15. Found: C, 69.29; H, 6.17.

Reduction and carbonyl transposition were carried out as described for the preparation of **7** using 1.46 g (5.62 mmoles) of the benzylated product from the earlier procedure. Following flash chromatography, 1.16 g (90%) of **14** was isolated as a colorless oil. IR: 1710, 1677 cm^{-1}; ^{1}H-NMR: δ 7.54 (d, 1H, J = 5.7), 7.32–7.20 (complex, 3H), 7.13 (m, 2H), 6.14 (d, 1H, J = 5.7), 3.62 (s, 3H), 2.97 (d, 1H, J = 13.3), 2.84 (d, 1H, J = 13.3), 2.29 (s, 2H); ^{13}C-NMR: δ 209.0, 168.2 (2C), 136.4, 134.7, 130.2, 128.3, 126.8, 67.3, 51.7, 43.0, 41.5; ms: m/z 230 (M^+). *Anal.* Calcd. for $C_{14}H_{14}O_3$: C, 73.04; H, 6.09. Found: C, 73.10; H, 6.12.

Reduction of 13 with iron and acetic acid: Methyl 1-benzyl-4-oxocyclohexane-1-carboxylate (15). The procedure used to prepare **9** was followed using 500 mg (2.05 mmoles) of **13** and 915 mg (16.4 mmoles) of iron powder in 35 mL of acetic acid. After 24 h, workup gave 450 mg of an inseparable 33:67 mixture of **13**:**15**. The spectral data for **15** were: IR: 1727, 1702 cm^{-1}; ^{1}H-NMR: δ 7.36–7.27 (complex, 3H), 7.12 (m, 2H), 3.77 (s, 3H), 2.96 (s, 2H), 2.56–2.33 (complex, 6H), 1.78 (m, 2H); ^{13}C-NMR: δ 210.4, 174.8, 129.4, 128.1, 127.9, 126.6, 51.6, 47.5, 45.6, 38.1, 33.1. The use of more iron and longer reaction times failed to significantly alter this product ratio.

Reduction of 14 with iron and acetic acid: (±)-4-Benzyl-4-hydroxymethyl-2-cyclopenten-1-one (18). The procedure used to prepare **9** was followed using 500 mg (2.17 mmoles) of **14** and 969 mg (17.3 mmoles) of iron powder in 35 mL of acetic acid. After 15 min, workup and preparative thin layer chromatography gave 320 mg (72%) of **18** as a colorless oil. IR: 3416, 1711, 1677 cm^{-1}; ^{1}H-NMR: δ 7.53 (d, 1H, J = 5.7), 7.30–7.21 (complex, 3H), 7.10 (d, 2H, J = 6.8), 6.11 (d, 1H, J = 5.7), 3.60 (d, 1H, J = 10.7), 3.58 (d, 1H, J = 10.7), 2.96 (d, 1H, J = 13.5), 2.81 (d, 1H, J = 13.5), 2.62 (br s, 1H), 2.29 (d, 1H, J = 18.6), 2.26 (d, 1H, J = 18.6); ^{13}C-NMR: δ 209.5, 168.7, 136.3, 134.4, 130.1, 128.2, 126.7, 67.0, 51.8, 42.9, 41.3; ms: m/z 111 (M^+-C_7H_7). *Anal.* Calcd. for $C_{13}H_{14}O_2$: C, 77.23; H, 6.93. Found: C, 77.29; H, 6.97. This reaction also afforded 10% of recovered **14**.

Upon prolonged heating for 2 h, the reaction gave 450 mg of an inseparable 67:33 mixture of **18**:**20** as the acetates. The spectral data for **18** (acetate): IR: 1743, 1715 cm^{-1}; ^{1}H-NMR: δ 7.46 (d, 1H, J = 5.7), 7.33–7.17 (complex, 3H), 7.09 (m, 2H), 6.13 (d, 1H, J = 5.7), 4.17 (d, 1H, J = 10.9), 4.00 (d, 1H, J = 10.9), 2.96 (d, 1H, J = 13.7), 2.84 (d, 1H, J = 13.6), 2.31 (s, 2H), 2.06 (s, 3H); ^{13}C-NMR: δ 207.6, 170.6, 166.7, 135.5, 134.6, 130.0, 128.4, 127.0, 67.7, 49.4, 43.0, 42.0, 20.7. The spectral data for **20** (acetate): 1743 cm^{-1}; ^{1}H-NMR: δ 7.34–7.18 (complex, 3H), 7.10 (m, 2H), 3.98 (d, 1H, J = 11.1), 3.89 (d, 1H, J = 11.1), 2.79 (s, 2H), 2.39–2.21 (complex, 2H), 2.33 (s, 2H), 2.10 (s, 3H), 1.93 (m, 2H); ^{13}C-NMR: δ 217.5, 170.7, 136.6, 130.0, 128.3, 126.7, 68.4, 47.0, 43.6, 42.3, 36.3, 30.2, 20.8.

Acknowledgment. B. N. thanks the Department of Chemistry at Oklahoma State University for a teaching assistantship. L.M.S. thanks the NSF for a Career Award (NSF-0645438). Funding for the 300 MHz NMR spectrometer of the Oklahoma Statewide Shared NMR Facility was provided by NSF (BIR-9512269), the Oklahoma State Regents for Higher Education, the W. M. Keck Foundation, and Conoco, Inc. Finally, the authors thank the OSU College of Arts and Sciences for funds to upgrade our departmental FTIR and GC-MS instruments.

A series of diversely substituted pyridodiazepines and benzodiazepines have been synthesized in solvent and catalyst free microwave condition from aryl/heteroaryl diamines and β-aryl vinyl ketones. The yields of the reactions varied with the substituents attached to the aryl/heteroaryl diamines. This common protocol is equally effective for the synthesis of pyridodiazepines and benzodiazepines with pharmacological interest, though in case of pyridodiazepines required time is comparatively higher than benzodiazepines.

J. Heterocyclic Chem., **46**, 861 (2009).

INTRODUCTION

The pyridodiazepines and benzodiazepines are important class of compounds for their versatile use in biological [2] and therapeutic purpose [3]. Different substituted benzodiazepines are effective as tranquilizing, anti-inflammatory, and anticonvulsant agents. These compounds are also important synthons for the synthesis of oxadiazol, triazol [4] like various fused heterocyclic ring benzodiazepine derivatives. In industry, benzodiazepine derivatives are used as dyes in photography [5].

For the considerable applications in medicinal chemistry, scientific community has a continuous drive for efficient synthetic methods of such compounds. So far the different methods, which have been developed for the synthesis of benzodiazepines include the condensation of 1,2-diamines with α,β-unsaturated carbonyl compounds [6], ketones and β-haloketones [7] in the presence of Al_2O_3-P_2O_5 [8], $SbCl_3$-Al_2O_3 [9], polyphosphoroic acid-SiO_2 [10], $Yb(Otf)_3$ [11], BF_3-etherate [12], MgO-$POCl_3$ [13], Zn $[L\text{-proline}]_2$ [14], Amberlyst-15 [15], $NaBH_4$ [16], ionic liquid [17], and AcOH [18]. Recently, alum $[KAl(SO_4)_2{\cdot}12H_2O]$ is also used as a catalyst for the synthesis of benzodiazepines [19]. However, all these reactions are carried out under hazardous reaction conditions and in the presence of a catalyst. Among all the available reports, there are very few examples for the synthesis of pyridodiazepines [20]. But according to our knowledge, there is no report for the synthesis of pyridodiazepines under microwave conditions.

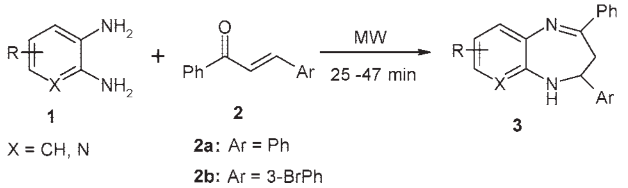
Nowadays, different organic synthesis has been carried out under microwave irradiation because of its very slight environmental impact and short reaction time [21]. This technique has been widely used in recent years for different organic transformations, including the synthesis of a wide range of heterocyclic compounds [22].

RESULTS AND DISCUSSION

In recent past, we have successfully exploited this microwave technique to develop new methodologies including the synthesis of different heterocyclic backbone [23]. Herein, we report the synthesis of pyridodiazepines and benzodiazepines by reacting heteroaryl/aryl diamines with β-aryl vinyl ketones in solid phase without using any catalyst and solvent under microwave irradiation (Scheme I). Previously microwave reactions for the synthesis of benzodiazepines from *o*-phenylenediamines with various ketones are carried out using Al_2O_3/P_2O_5 [8] or AcOH [18] catalyst. But in the present procedure benzodiazepines are synthesized in quite good yield without any catalyst.

In one representative procedure, pyridine-2,3-diamine (2 mmol) and β aryl vinyl ketone (2 mmol) are mixed thoroughly in solid phase and irradiated at 400 W for

Scheme 1. Synthesis of pyridodiazepines and benzodiazepines from 2,3-diaminopyridine and 1,2-diaminobenzene with β-aryl vinyl ketones (for R, X and Ar see Table 1).



27 min (Scheme 1, Table 1) in a microwave oven to afford 2,4-diphenyl-4,5-dihydro-3*H*-pyrido[2,3-b][1,4] diazepine (**3a**) in 80% yield, and no isomerisation product is obtained. The pyridodiazepines [3(**a**, **c**, **f** and **h**)] and benzodiazepines [24] [3(**b**, **d**, **e**, **g**, **i** and **j**)] are synthesized using this procedure with variable time, and power for each set of reaction and are also characterized by spectroscopic studies (Table 1).

In case of diaminopiridines the overall time for the microwave irradiation is higher than the unsubstituted 1,2-phenylenediamine to afford the respective diazepines. Similar trend is also observed in case of substituted 1,2-phenylenediamine. Here, both bromo (entries c, d, h and i) and nitro (entries e and j) groups may reduce the nucleophilicity of the amine group attached with the aromatic ring. This effect is very much pronounced in case of nitro group, which also affects the yield of the compounds **3e** and **3j**. The overall yield of the other diazepine compounds are varied from moderate to good, depending upon the reactivity of the starting diamines. The ^{1}H NMR spectra of the nitro group containing benzodiazepines (**3e** and **3j**) may tautomerise to the quinoid form of the compounds resulting the disappearance of N—*H* peak.

All these reactions probably proceed through Michael addition of amine to the β position of α,β-unsaturated ketone followed by condensation and dehydration (Scheme 2). In the case of 2,3 diaminopyridine, probably nucleophilic attack takes place through comparatively less reactive 2-amino group to the double bond of α,β-unsaturated ketone followed by cyclization of the more reactive amino group with the keto group to achieve only the substituted 4,5-dihydropyridodiazepine [23a,25]. The other isomer like substituted 2,3-dihydropyridodiazepine is not obtained under this reaction condition. The appearance of N*H* proton at δ 5.14 ppm in pyridodiazepine (**3a**) (more downfield because of amidine system *i.e* conjugated with pyridine ring "N") comparing with benzdiazepine (**3g**) with N*H* proton at 3.77 ppm also support the formation of 4,5 dihydropyridodiazepine. Formation of minor amount (5%) of aryl substituted benzimidazole (**4**) [26] by thermally induced ring contraction also favors the suggested mechanism in case of 1,2-phenylenediamine (**1a**) and β aryl vinyl ketone (**2b**) [27].

In conclusion we have developed a general straightforward method under microwave irradiation for the efficient synthesis of 4,5-dihydro-3*H*-pyrido[2,3-b][1,4] diazepines and 2,3-dihydro-1*H*-benzo[b][1,4]diazepines. Major advantage of this reaction is that same solvent and catalyst free condition is effective for both aryl and heteroaryl diamines. By this method different diazepines of pharmacological interest can be synthesized by varying the substituents at diamines, as well as the other substituted phenyl rings.

EXPERIMENTAL

General reaction procedure for the synthesis of 2,4 substituted-4,5-dihydro-3*H*-pyrido[2,3-*b*][1,4]diazepine/2,4 substituted-2,3-dihydro-1*H*-benzo[*b*][1,4]diazepine using β aryl vinyl ketone. A mixture of pyridine-2,3-diamine (218 mg, 2.0 mmol) (1a) and β aryl vinyl ketone (416 mg, 2.0 mmol) (2a) was thoroughly grinded and taken in an open-mouthed conical flask and then irradiated at 400 W for 27 min (Scheme 1, Table 1) in a domestic microwave oven (SANYO 800G). The residue was dissolved in water and then extracted with $CHCl_3$. The organic layer was evaporated under reduced pressure. The crude product was then purified by column chromatography (silica gel, 100–200 mesh) to afford a pure yellow colored 2,4-diphenyl-4,5-dihydro-3*H*-pyrido[2,3-b][1,4]diazepine (3a) in 80% yield using 5% ethyl acetate-petroleum ether as eluent.

Synthesis, structural characterization, and acid dissociation constants (pK_a) of a series of methyl- and phenyl-substituted furoxansulfonic acids and related sulfonamide derivatives, as well as their furazan analogues are described. The ability of furoxans to dilate rat aorta strips precontracted with phenylephrine is reported as an example of their NO-dependent pharmacological properties.

J. Heterocyclic Chem., **46**, 866 (2009).

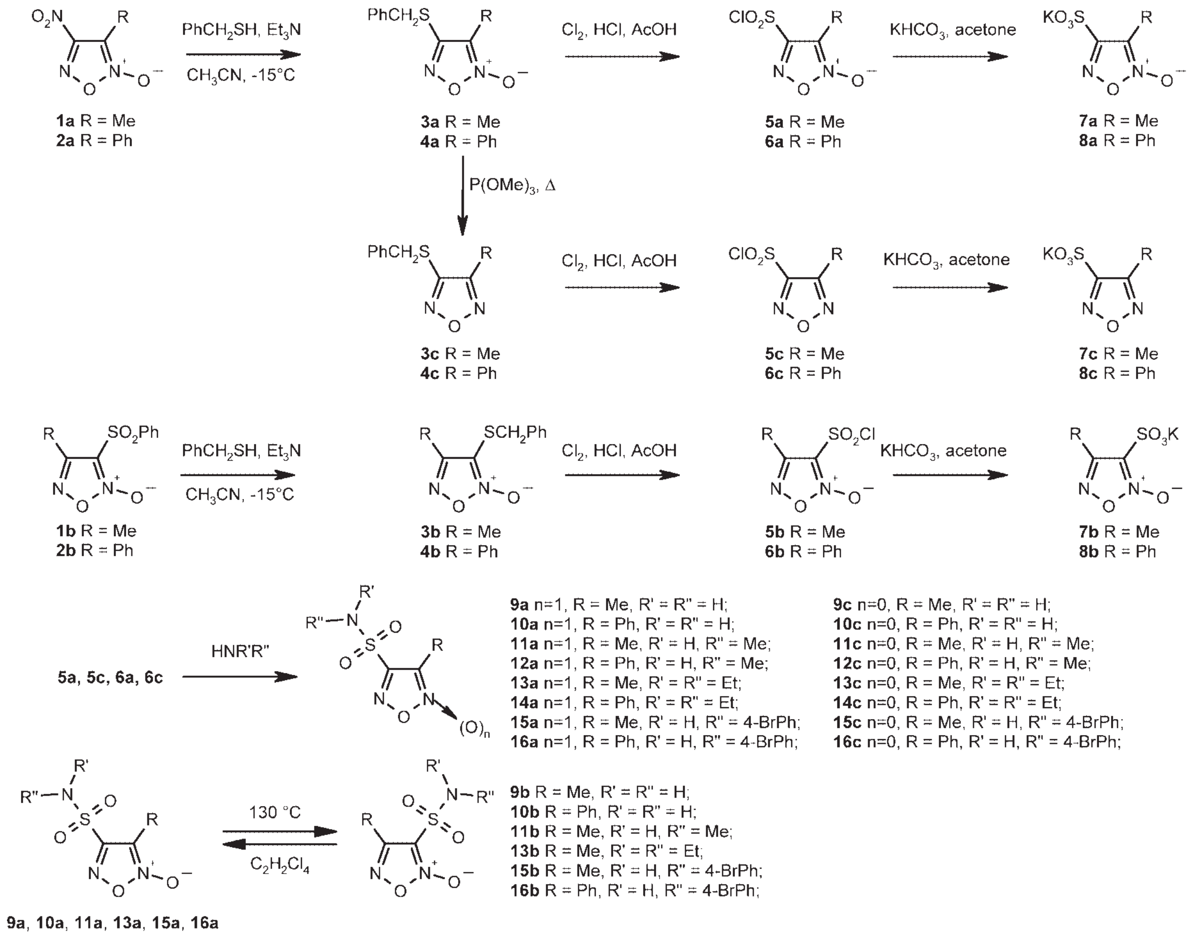
INTRODUCTION

The interest in furoxan (1,2,5-oxadiazole 2-oxide) derivatives is continuously expanding as it was shown that these products are able to release nitric oxide (NO) in physiological conditions, in the presence of thiol cofactors [1,2]. Consequently, they display a variety of pharmacological actions typical of NO [2,3]. A number of functional groups have been introduced into the simple furoxan ring, and their chemistry has been recently reviewed [4]. In previous works, we described the synthesis and chemical properties of many unsymmetrically substituted furoxans [5]. Currently we are using a number of them to design new NO-donor hybrid drugs [6,7], namely polyvalent products obtained by linking an appropriate drug, or a crucial part of it, with a NO-donor moiety through a suitable spacer. A paramount problem that must be addressed in this approach is the ''balance'' in the final hybrid of the activity deriving from its ability to release NO and the activity due to the presence of the native drug. The furoxan system seems to be a flexible NO-donor moiety for this scope as its NO-release profile can be easily modulated by changing the kind of substituent at heteroring. Surprisingly, a search in literature showed that no furoxan derivatives bearing either sulfonic or sulfonamide functions have been so far described. In this article, we report the synthesis, structural characterization, and ionization constants (pK_a) of a series of methyl- and phenyl-substituted furoxansulfonic acids and related sulfonamides, as well as their furazan analogues (1,2,5-oxadiazoles), devoid of the capacity to release NO. The ability of the furoxan derivatives to dilate rat aorta strips precontracted with phenylephrine is also discussed, as an example of their NO-dependent pharmacological properties.

RESULTS AND DISCUSSION

Chemistry. The synthesis of sulfonic acids both of the furoxan and the furazan series, and of the related sulfonamides is outlined in Scheme 1. The action of benzyl mercaptane on 4-nitro-substituted furoxans **1a**, **2a**, and 3-phenylsulfonyl-substituted furoxans **1b**, **2b** in acetonitrile solution, in the presence of triethylamine, afforded the corresponding benzylthiofuroxan derivatives **3a, 4a** and **3b, 4b**. Corresponding furazan analogues **3c, 4c** were obtained by action of refluxing trimethyl phosphite on **3a** and **4a**, respectively. All these sulphur intermediates were transformed in the related sulfonyl chlorides **5a-c**, **6a-c** by action of chlorine in acetic acid solution in presence of hydrochloric acid. In this reaction, benzyl chloride formed in equimolar amount with the expected sulfonyl chlorides. Solid sulfonyl chlorides **6a** and **6c** were purified by crystallization. All the attempts to isolate **5a-c** and **6b** failed due to their thermal and hydrolytic instability. Consequently, these compounds were used for further reactions in mixture with benzyl chloride. All sulfonyl chlorides afforded the final sulfonic acid potassium salts **7a-c**, **8a-c**, when treated with 1*N* $KHCO_3$ in acetone solution. Sulfonamides derivatives of 3-phenyl and 3-methylfuroxan series **9a-16a** and related furazans **9c-16c** were obtained by action of the appropriate amines on the

Scheme 1



corresponding sulfonyl chlorides in CH_2Cl_2, or in water solution when ammonia or methylamine were used. This synthetic approach failed in the preparation of the sulfonamide isomers of the 4-phenyl and 4-methylfuroxans series owing to the decomposition of the related sulfonyl chlorides in the presence of amine reagents. Consequently, we obtained the sulfonamides **9b**, **10b**, **11b**, **13b**, **15b**, and **16b** by thermal isomerization of the corresponding 3-phenyl and 3-methyl isomers at 130°C in 1,1,2,2-tetrachloroethane ($Cl_2CHCHCl_2$) solution. After solvent removal the mixtures of isomers were separated by HPLC. This separation failed in the case of **12a/12b** and **14a/14b** mixtures. The equilibrium constants (NMR or HPLC detection) between the isomer pair of sulfonamides, determined at 130°C in $Cl_2CHCHCl_2$, are listed in Table 1. In some cases the equilibrium was approached from both sides. In all cases the isomers bearing the sulfonamido groups from the opposite side of the exocyclic oxygen are favoured. ^1H and ^{13}C NMR spectra (Experimental) are in keeping with the structural assignments. In particular, in the case of the furoxan isomers they satisfy the rule that both in ^1H and in ^{13}C NMR spectra, the 3-CH_3 resonance signal is upfield with respect to the one of 4-CH_3 [8,9] and that in the ^{13}C NMR spectra the resonances of C(1) and C(4) carbons of the 3-Ph group appear upfield with respect to the corresponding resonances of the 4-Ph group [10]. Finally the chemical shift of C3 and C4 carbon atoms of the furoxan ring are in keeping with those observed in aryl- and alkylsulfonyl furoxans [9,11].

Ionization constants. The pK_a values of sulfonamide derivatives both of the furoxan and of the furazan series were measured by potentiometric technique using a Sirius GLpK_a apparatus. These values are listed in Table 1. The high acid strength of all the sulfonic acids, which are in keeping with the electron withdrawing properties of the furazan and furoxan rings [12], did not allow the detection of their dissociation constants with this technique. Some interesting structural considerations can be derived from the analysis of Table 1. In a pair of isomers the product bearing the sulfonamide function at the 4-position is always just a little less acid than the other isomer or displays the same acidity. The related furazans are always less acidic than the related furoxans. In

Table 1

Physicochemical parameters and pharmacological activities of furoxan and furazan sulfonic acids (**7, 8**) and related sulfonamides (**9–16**).

[a] Potentiometric titrations were performed in water containing methanol as a cosolvent in different ratios depending on the solubility of compounds: pK_a values were determined by extrapolation at 0% methanol using the Yasuda-Shedlovsky procedure (experimental).

[b] NMR determination.

[c] HPLC determination.

[d] EC_{50} could not be calculated as the relaxation at maximum concentration tested (100 μ*M*) did not reach 50%.

[e] The product completely relaxed the contracted tissue in a concentration independent manner; the tissue did not recover its contractility.

all the series, the presence on sulfonamide function of the *p*-bromophenyl group increases the acidity while the presence of the methyl group decreases it. This is in accordance with the ability of the former to delocalize the negative charge of the conjugated anion and with the opposite effect exerted by the latter.

Vasodilator activity. Furoxan derivatives display vasodilator properties. It is commonly accepted that this is due to their ability to release NO under the action of vessel intracellular thiols. The NO produced activates soluble guanylate cyclase (sGC) and this induces a series of events whose final result is dilation of the vessel [13]. All furoxansulfonamides described in this work were able to relax rat aorta strips precontracted with phenylephrine in a concentration dependent manner. The vasodilator potencies EC_{50}, namely the molar concentration able to induce 50% of the relaxing effect to the contracted tissue are reported in Table 1. When the experiments were repeated in the presence of 1 μ*M* 1*H*-[1,2,4]oxadiazolo[4,3-a]quinoxalin-1-one (ODQ), a decrease in the potencies was observed, in keeping with a NO-induced activation of the sGC as the mechanism, which underlies this effect. Products bearing a *p*-bromophenyl moiety behaved differently. They completely relaxed the contracted tissue in a concentration independent manner, both in the presence and in the absence of ODQ. In addition, the tissue did not recover its contractility in spite of extensive washing. It is worthy of note that also the furazan analogues **15c** and **16c** display similar behavior. This indicates that the vasodilator activity of these specific products is not NO dependent but probably connected with their tissue toxicity.

EXPERIMENTAL

^1H and ^{13}C NMR spectra were recorded on a Bruker Avance 300 at 300 and 75 MHz, respectively, using $SiMe_4$ as the internal standard. Low resolution mass spectra were recorded with a Finnigan-Mat TSQ-700. Melting points were determined with a capillary apparatus (Buchi 540). Flash column chromatography was performed on silica gel (Merck Kieselgel 60, 230–400 mesh ASTM), using the indicated eluents; PE stands for 40–60 petroleum ether. The progress of the reactions was followed by thin layer chromatography (TLC) on 5 × 20 cm plates with a layer thickness of 0.2 mm. Anhydrous magnesium sulfate was used as the drying agent for the organic phases. Organic solvents were removed under vacuum at 30°C. Preparative HPLC was performed on a LiChrospher® C18 column (250 × 25 mm, 10 μm) (Merck Darmstadt, Germany) with a Varian ProStar mod-210 with Varian UV detector mod-325. Elemental analyses (C, H, N) were performed by REDOX (Monza). Compounds **1a** [14], **2a** [15], **1b** [9], and **2b** [16] were synthesized as described elsewhere.

General procedure for preparation of benzylthiofuroxans (3a,b and 4a,b). To a stirred solution of appropriate furoxan derivative (24 mmol) in CH_3CN (25 mL), cooled at −15°C, Et_3N (3.4 mL, 24 mmol) was added. To the obtained solution benzylmercaptane (2.5 mL, 24 mmol) was added in one portion and the reaction was stirred at −15°C for 30 min. The cooling bath was removed and the reaction mixture was allowed to stir at room temperature for an additional 30 min. Benzylthiofuroxans were isolated as described.

4-Benzylthio-3-methylfuroxan (3a). The reaction mixture was diluted with CH_2Cl_2. The organic solvent was washed with H_2O, 1*N* HCl, $NaHCO_3$ saturated solution, brine, dried, and evaporated. The obtained oil was solidified by treating with PE at 0°C. The obtained solid was filtered, washed with cold PE, and crystallized from hexane to give the title compound as a white solid, yield 54%, mp 48–49°C (hexane); ^{1}H NMR ($CDCl_3$): δ 2.00 (s, 3H, CH_3), 4.38 (s, 2H, CH_2), 7.31–7.38 (m, 5H, C_6H_5); ^{13}C NMR ($CDCl_3$): δ 7.5 (3-CH_3), 35.2, 112.5 (*C*3 fx), 128.1, 128.8, 129.1, 135.4, 154.8 (*C*4 fx); ms: *m/z* 222 (M^+). *Anal.* Calcd. for $C_{10}H_{10}N_2O_2S$: C, 54.04; H, 4.53; N, 12.60. Found: C, 54.35; H, 4.51; N, 12.73.

3-Benzylthio-4-methylfuroxan (3b). The reaction mixture was diluted with CH_2Cl_2. The organic solvent was washed with H_2O, 1*N* HCl, $NaHCO_3$ saturated solution, brine, dried, and evaporated. The obtained oil was purified by flash chromatography (eluent 8/2 PE/CH_2Cl_2) to give the title compound as a colorless oil, yield 79%; ^{1}H NMR ($CDCl_3$): δ 1.90 (s, 3H, CH_3), 4.08 (s, 2H, CH_2), 7.14–7.18 (m, 2H) 7.24–7.31 (m, 3H) (C_6H_5); ^{13}C NMR ($CDCl_3$): δ 10.9 (4-CH_3), 34.9, 111.2 (*C*3 fx), 128.0, 128.7, 128.9, 135.4, 157.1 (*C*4 fx); ms: *m/z* 222 $(M)^+$. *Anal.* Calcd. for $C_{10}H_{10}N_2O_2S$: C, 54.04; H, 4.53; N, 12.60. Found: C, 54.26; H, 4.46; N, 12.42.

4-Benzylthio-3-phenylfuroxan (4a). The product precipitated from the reaction mixture. It was filtered, washed with cold CH_3CN, and crystallized from EtOH to give the title compound as a white solid, yield 57%, mp 111–113°C (EtOH); ^{1}H NMR ($CDCl_3$): δ 4.45 (s, 2H, CH_2), 7.31–7.49 (m, 8H), 7.83–7.87 (m, 2H) ($2C_6H_5$); ^{13}C NMR ($CDCl_3$): δ 35.5, 114.1 (*C*3 fx), 122.4 (*C*1 Ph), 127.3, 128.1, 128.8, 129.0, 129.3, 130.7 (*C*4 Ph), 135.0, 154.1 (*C*4 fx); ms: *m/z* 284 $(M)^+$. *Anal.* Calcd. for $C_{15}H_{12}N_2O_2S$: C, 63.36; H, 4.25; N, 9.85. Found: C, 63.58; H, 4.23; N, 9.84.

3-Benzylthio-4-phenylfuroxan (4b). The organic solvent was removed and the obtained oil was purified by flash chromatography (eluent 7/3 PE/CH_2Cl_2) to give the title compound as a colorless oil, yield 85%; ^{1}H NMR (DMSO-d_6): δ 4.16 (s, 2H, CH_2), 7.07–7.25 (m, 5H) 7.39–7.51 (m, 3H), 7.59–7.61 (m, 2H) ($2C_6H_5$); ^{13}C NMR ($CDCl_3$): δ 34.7, 110.6 (*C*3 fx), 126.1 (*C*1 Ph), 127.7, 128.0, 128.7, 128.8, 131.0, 135.5, 157.7 (*C*4 fx); ms: *m/z* 284 $(M)^+$. *Anal.* Calcd. for $C_{15}H_{12}N_2O_2S$: C, 63.36; H, 4.25; N, 9.85. Found: C, 63.15; H, 4.28; N, 9.87.

General procedure for preparation of benzylthiofurazans (3c and 4c). A solution of appropriate furoxan (45 mmol) in $P(OMe)_3$ (30 mL, 0.25 mol) was heated at reflux for 12 h. The reaction was cooled and poured into an ice/4*N* HCl (80 mL) mixture. The precipitate formed was filtered, washed with cold water and crystallized from MeOH to give the title compound as a white crystalline solid.

3-Benzylthio-4-methylfurazan (3c). Yield: 77%, mp 28–28.5°C (MeOH); ^{1}H NMR ($CDCl_3$): δ 2.23 (s, 3H, CH_3), 4.39 (s, 2H, CH_2), 7.25–7.41 (m, 5H, C_6H_5); ^{13}C NMR ($CDCl_3$): δ 8.0, 36.8, 128.0, 128.8, 129.1, 135.7, 149.8, 152.2; ms: *m/z* 206 (M^+). *Anal.* Calcd. for $C_{10}H_{10}N_2OS$: C, 58.23; H, 4.89; N, 13.58. Found: C, 58.20; H, 5.00; N, 13.60.

3-Benzylthio-4-phenylfurazan (4c). Yield 81%, mp 65.5–66.5°C (MeOH); ^{1}H NMR ($CDCl_3$): δ 4.49 (s, 2H, CH_2), 7.25–7.49 (m, 8H), 7.80–7.82 (m, 2H) ($2C_6H_5$); ^{13}C NMR ($CDCl_3$): δ 37.3, 125.3, 128.0, 128.0, 128.8, 129.0, 129.2, 130.7, 135.4, 151.1, 152.3; ms: *m/z* 268 (M^+). *Anal.* Calcd. for $C_{15}H_{12}N_2OS$: C, 67.14; H, 4.51; N, 10.44. Found: C, 67.24; H, 4.49; N, 10.45.

General procedure for preparation of sulfonylchlorides (5a-c and 6a-c). To the suspension/solution of benzylthioderivatives in acetic acid 4*N* HCl (0.5 mL) was added and chlorine was bubbled through reaction mixture for 2 h. After this time reaction, the mixture was stirred at room temperature for 1 h, then it was poured into H_2O and extracted with PE. The organic phase was washed with H_2O (3×), brine, dried, and evaporated. The obtained products were crystallized from hexane (in case of solids **6a** and **6c**) or used directly for further reaction in mixture with benzylchloride (1/1 molar ratio).

3-Phenylfuroxan-4-sulfonyl chloride (6a). White solid, yield 80%, mp 94–96°C (hexane); ^{1}H NMR ($CDCl_3$): δ 7.56–7.61 (m, 3H), 7.75–7.79 (m, 2H) (C_6H_5); ^{13}C NMR ($CDCl_3$) δ: 110.8 (*C*3 fx), 119.3 (*C*1 Ph), 129.1, 129.4, 132.1 (*C*4 Ph), 158.2 (*C*4 fx); ms: *m/z* 260/262 (M^+). *Anal.* Calcd. for $C_8H_5ClN_2O_4S$: C, 36.86; H, 1.93; N, 10.75. Found: C, 37.05; H, 1.99; N, 10.75.

3-Phenylfurazan-4-sulfonyl chloride (6c). White solid, yield 58%, mp 52–53°C (hexane); ^{1}H NMR ($CDCl_3$): δ 7.54–7.67 (m, 3H), 7.76–7.82 (m, 2H) (C_6H_5); ^{13}C NMR ($CDCl_3$) δ: 122.0, 129.3, 129.4, 132.2, 151.5, 156.9; ms: *m/z* 244/246 (M^+). *Anal.* Calcd. for $C_8H_5ClN_2O_3S$: C, 39.27; H, 2.06; N, 11.45. Found: C, 39.34; H, 2.21; N, 11.30.

General procedure for preparation of sulfonic acid potassium salts (7a-c and 8a-c). To a solution of the appropriate sulfonylchloride (2.5 mmol) in acetone (20 mL) 1*N* $KHCO_3$ (7.5 mL, 7.5 mmol) was added at 0°C. The reaction was allowed to reach room temperature and stirred for 2 h. The organic solvent was evaporated, the residue was dissolved in H_2O and the resulting solution was washed with CH_2Cl_2 (2×), filtered, and evaporated. The obtained solid was crystallized from water to give the title compound as a white solid.

Potassium 3-methylfuroxan-4-sulfonate (7a). White solid, yield 38% (for two synthetic steps), mp > 280°C dec. (H_2O); ^{1}H NMR (D_2O): δ 2.31 (s, 3H, CH_3); ^{13}C NMR (D_2O): δ 7.7 (3-CH_3), 114.9 (*C*3 fx), 160.5 (*C*4 fx). *Anal.* Calcd. for $C_3H_3KN_2O_5S$: C, 16.51; H, 1.39; N, 12.83. Found: C, 16.46; H, 1.41; N, 12.76.

Potassium 4-methylfuroxan-3-sulfonate (7b). White solid, yield 15% (for two synthetic steps), mp 277–280°C dec. (H_2O); ^{1}H NMR (D_2O): δ 2.47 (s, 3H, CH_3); ^{13}C NMR (D_2O): δ 12.1 (4-CH_3), 120.2 (*C3* fx), 154.4 (*C4* fx). *Anal.* Calcd. for $C_3H_3KN_2O_5S$: C, 16.51; H, 1.39; N, 12.83. Found: C, 16.45; H, 1.50; N, 12.65.

Potassium 3-methylfurazan-4-sulfonate (7c). White solid, yield 34% (for two synthetic steps), mp > 270°C dec. without melting (H_2O); ^{1}H NMR (D_2O): δ 2.06 (s, 3H, CH_3); ^{13}C NMR (D_2O): δ 8.4, 150.8, 157.5. *Anal.* Calcd. for $C_3H_3KN_2O_4S$: C, 17.82; H, 1.50; N, 13.85. Found: C, 17.71; H, 1.52; N, 13.66.

Potassium 3-phenylfuroxan-4-sulfonate (8a). White solid, yield 45%, mp 214–215°C (H_2O); ^{1}H NMR (D_2O): δ 7.58–7.60 (m, 3H), 7.86–7.90 (m, 2H) (C_6H_5); ^{13}C NMR (D_2O): δ 116.0 (*C3* fx), 121.7 (*C1* Ph), 129.4, 129.6, 132.0 (*C4* Ph), 159.7 (*C4* fx). *Anal.* Calcd. for $C_8H_5KN_2O_5S$: C, 34.28; H, 1.80; N, 9.99. Found: C, 34.05; H, 1.79; N, 9.83.

Potassium 4-phenylfuroxan-3-sulfonate (8b). White solid, yield 35% (for two synthetic steps), mp 250–255°C (H_2O); ^{1}H NMR (D_2O): δ 7.55–7.65 (m, 3H), 7.76–7.79 (m, 2H) (C_6H_5); ^{13}C NMR (D_2O): δ 119.4 (*C3* fx), 126.1 (*C1* Ph), 129.3, 129.7, 132.1 (*C4* Ph), 156.4 (*C4* fx). *Anal.* Calcd. for $C_8H_5KN_2O_5S$: C, 34.28; H, 1.80; N, 9.99. Found: C, 34.28; H, 1.93; N, 9.97.

Potassium 3-phenylfurazan-4-sulfonate (8c). White solid, yield 75%, mp 255–260°C (H_2O); ^{1}H NMR (D_2O): δ 7.55–7.64 (m, 3H), 7.92–7.95 (m, 2H) (C_6H_5); ^{13}C NMR (D_2O): δ 124.4, 129.6, 129.7, 132.0, 153.1, 156.6. *Anal.* Calcd. for $C_8H_5KN_2O_4S$ $\frac{3}{4}H_2O$: C, 34.58; H, 2.35; N, 10.08. Found: C, 34.50; H, 2.17; N, 10.07.

General procedure for preparation of sulfonylamides (9a, 9c, 10a, and 10c) and *N*-methyl sulfonylamides (11a, 11c, 12a, and 12c). An appropriate sulfonylchloride derivative was added to the vigorously stirred concentrated solution of amine in H_2O at −10°C. The ice-salt bath was removed and the reaction was stirred for 2 h at room temperature. Then reaction mixture was cooled again, the pH was adjusted to one with concentrated HCl and the product was purified as described.

3-Methylfuroxan-4-sulfonamide (9a). The acidified mixture was extracted with EtOAc. The organic phase was washed with H_2O, brine, dried, and evaporated. The resulting oil was purified by flash chromatography (eluent 8/2 PE/EtOAc) to give the colorless oil, which solidified at −78°C. The title compound was crystallized from 1,2-dichloroethane. White solid, yield 50% (for two synthetic steps), mp 93–93.5°C (1,2-dichloroethane); ^{1}H NMR (DMSO-d_6): δ 2.27 (s, 3H, CH_3), 8.67 (s, 2H, NH_2); ^{13}C NMR (DMSO-d_6): δ 7.7 (3-CH_3), 110.9 (*C3* fx), 160.2 (*C4* fx); ms: *m/z* 179 (M^+). *Anal.* Calcd. for $C_3H_5N_3O_4S$: C, 20.11; H, 2.81; N, 23.45. Found: C, 20.07; H, 2.86; N, 23.34.

3-Methylfurazan-4-sulfonamide (9c). The acidified mixture was extracted with EtOAc. The organic phase was washed with H_2O, brine, dried, and evaporated. The resulting oil was purified by flash chromatography (eluent 8/2 PE/EtOAc) to give the colorless oil, which solidified at −78°C. The title compound was crystallized from 1,2-dichloroethane/CCl_4 mixture. White solid, yield 34% (for two synthetic steps), mp 81–82°C (1,2-dichloroethane/CCl_4); ^{1}H NMR (DMSO-d_6): δ 2.54 (s, 3H, CH_3), 8.66 (s, 2H, NH_2); ^{13}C NMR (DMSO-d_6): δ 8.1, 149.6, 157.8; ms: *m/z* 164 [$(M+H)^+$]. *Anal.* Calcd. for $C_3H_5N_3O_3S$: C, 22.08; H, 3.09; N, 25.75. Found: C, 22.10; H, 3.08; N, 25.50.

3-Phenylfuroxan-4-sulfonamide (10a). Product precipitated from acidified reaction mixture. It was filtered, washed with cold H_2O, and crystallized from H_2O to give the title compound as a white solid, yield 75%, mp 147–148°C (H_2O); ^{1}H NMR (DMSO-d_6): δ 7.57–7.64 (m, 3H), 7.85–7.90 (m, 2H) (C_6H_5), 8.81 (s, 2H, NH_2); ^{13}C NMR (DMSO-d_6): δ 112.7 (*C3* fx), 121.0 (*C1* Ph), 128.7, 128.8, 131.0 (*C4* Ph), 159.7 (*C4* fx); ms: *m/z* 242 [$(M+H)^+$]. *Anal.* Calcd. for $C_8H_7N_3O_4S$ $\frac{1}{2}H_2O$: C, 38.40; H, 3.22; N, 16.79. Found: C, 38.45; H, 3.34; N, 16.42.

3-Phenylfurazan-4-sulfonamide (10c). The product precipitated from acidified reaction mixture. It was filtered, washed with cool water, and crystallized from H_2O to give the title compound as a white solid, yield 72%, mp 149.5–151°C (H_2O); ^{1}H NMR (DMSO-d_6): δ 7.57–7.68 (m, 3H), 7.89–7.97 (m, 2H) (C_6H_5), 8.92 (s, 2H, NH_2); ^{13}C NMR (DMSO-d_6): δ 123.3, 129.1 (two signals overlapped), 131.5, 151.9, 157.3; ms: *m/z* 225 [$(M+H)^+$]. *Anal.* Calcd. for $C_8H_7N_3O_3S$: C, 42.66; H, 3.13; N, 18.65. Found: C, 42.62; H, 3.19; N, 18.54.

***N*-Methyl-3-methylfuroxan-4-sulfonamide (11a).** The acidified reaction mixture was extracted with CH_2Cl_2. The organic solvent was washed with H_2O, brine, dried, and evaporated. The obtained solid was crystallized from CCl_4 to give the title compound as a white solid, yield 61% (for two synthetic steps), mp 77–79°C (CCl_4); ^{1}H NMR ($CDCl_3$): δ 2.13 (s, 3H, CH_3), 3.01 (d, 3H, CH_3), 5.19 (broad s., 1H, NH); ^{13}C NMR ($CDCl_3$): δ 8.0 (3-CH_3), 30.2, 110.3 (*C3* fx), 157.9 (*C4* fx); ms: *m/z* 193 (M^+). *Anal.* Calcd. for $C_4H_7N_3O_4S$: C, 24.87; H, 3.65; N, 21.75. ***N*-(4-Bromophenyl)-4-phenylfuroxan-3-sulfonamide (16b).** HPLC (60/40 CH_3CN/H_2O + 0.1% CF_3COOH; 20 mL/min) second eluted. The obtained solid was crystallized from CCl_4 to give the title compound as a white solid, mp 158–159°C (CCl_4); ^{1}H NMR ($CDCl_3$): δ 7.02–7.07 (m, 2H), 7.41–7.60 (m, 7H) (C$_6$*H*$_5$, C$_6$*H*$_4$), 7.26 (s, 1H, N*H*); ^{13}C NMR ($CDCl_3$): δ 117.2, 121.3 (*C*3 fx), 124.4 (*C*1 Ph), 124.9, 128.7, 129.2, 131.8 (*C*4 Ph), 132.5, 133.0, 155.3 (*C*4 fx); ms: *m*/*z* 396/398 [$(M+H)^+$]. *Anal.* Calcd. for $C_{14}H_{10}BrN_3O_4S$: C, 42.44; H, 2.54; N, 10.61. Found: C, 42.31; H, 2.62; N, 10.54.

Ionization constants measurements. The ionization constants were determined by a potentiometric method using GLpK_a apparatus (Sirius Analytical Instruments, Forest Row, East Sussex, UK). The titrations were carried out under nitrogen atmosphere, at constant ionic strength ($I = 0.15M$ KCl) and temperature ($t = 25.0 \pm 0.5$°C). Ionization constants of **9a-c**, **10a-c**, and **11a-c**, were determined by at least three aqueous titration: solutions of the compounds (20 mL, about 1 m*M*) were initially acidified to pH 1.8 with 0.5*N* HCl and the solutions were then titrated with standardized 0.5*N* KOH to pH 10.0. Because of the low aqueous solubility, compounds of **12a**, **12c**, **15a-c**, and **16a-c** required titrations in methanol–water mixtures according to the following procedure. At least five different hydro-organic solutions of the compounds (20 mL, about 1 m*M* in 15–65 Wt % methanol) were titrated with the same protocol aforementioned. The apparent ionization constants in water–methanol mixtures (p_sK_as) were obtained and aqueous pK_a values were determined by extrapolation at 0% methanol using the Yasuda-Shedlovsky procedure [17].

Vasodilator activity. Thoracic aortas were isolated from male Wistar rats weighing 180–200 g. As few animals as possible were used. The purposes and the protocols of our studies have been approved by the Ministero della Salute, Rome, Italy. Experiments were performed according to procedures described earlier [18]. Results are expressed as $EC_{50} \pm$ SE (μ*M*). Responses were recorded by an isometric transducer connected to the MacLab System PowerLab (ADInstruments, Bella Vista, Australia). Addition of the drug vehicle (DMSO) had no appreciable effect on contraction level.

A series of substituted 5-, 6-, 7-, and 8-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones (**5–8**) was synthesized by cyclization of corresponding dihydroxy-*N*-phenylbenzamides (**1–4**) with methyl chloroformate. The starting compounds **1–4** were prepared by the reaction of the respective dihydroxybenzoic acid, aniline and phosphorus trichloride *via* microwave irradiation. Thionation of compounds **8a–d** employing Lawesson's reagent was used to prepare 5-hydroxy-3-phenyl-4-thioxo-3,4-dihydro-2*H*-1,3-benzoxazin-2-ones (**10a–d**) and 5-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dithiones (**11a–d**). The position of sulfur in monothionated derivatives **9c** and **10a–d** was confirmed by 2D NMR methods. Attempts to prepare dithionated derivatives from the isomeric 6-, 7- or 8-hydroxy compounds **5–7** failed. All compounds were tested for their *in vitro* antifungal activity against eight test strains. Compounds **1–4** showed moderate activity and the cyclization to corresponding hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones (**5–8**) resulted in a decrease in antifungal activity. No antifungal activity was observed in thionated compounds **9c** and **10–11**.

J. Heterocyclic Chem., **46**, 873 (2009).

INTRODUCTION

Salicylanilides and their derivatives [1] are paid great attention to, particularly from the viewpoint of their antibacterial, antifungal, and other activities [2]. The most important analogs include benzoxazinediones [3] and thiosalicylanilides [4].

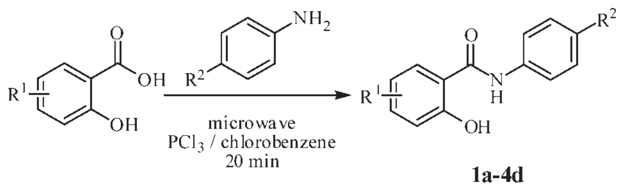
This article focuses on the synthesis of novel salicylanilide derivatives, dihydroxy-*N*-phenylbenzamides, which include two hydroxyl groups in the acyl moiety of the molecule, and their cyclic analogs hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones. Until now, the synthesized substances included mainly dihydroxy-*N*-phenylbenzamides with hydroxyl groups in positions 2 and 6, which were tested as anthelmintics and plant-protecting agents [5]. Resorantel, *N*-(4-bromophenyl)-2,6-dihydroxybenzamide, was introduced into practice as a veterinary anthelmintic agent [6]. As to the cyclic analogs, 5-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones were patented as fungicidally active agents against rice blast pathogen *Pyricularia oryzae* (*Magnaporthe grisea*) [7].

In the obtained derivatives an attempt was made to prepare the corresponding mono- and dithionated analogs.

RESULTS AND DISCUSSION

Chemistry. The starting dihydroxy-*N*-phenylbenzamides **1a–4d** were synthesized by the microwave-assisted reaction of dihydroxybenzoic acid, appropriate aniline

Scheme 1



R^1 = OH; R^2 = H, CH_3, Cl, OCH_3

and PCl_3 at 135°C for 20 min (Scheme 1). The crude reaction mixtures were purified by column chromatography on silica gel using acetone-hexane (1:5). The products were recrystallized from ethanol-water mixture. For the details of compounds **1a–4d** see Table 1.

For the sake of comparison, when the reaction was carried out using conventional oil bath heating, the reaction was completed in 3 h [2a,f]. The use of a microwave oven resulted in shortening of reaction times, as described by other authors [2d,13], but not in an increase of yields. The use of column chromatography before crystallization has a significant influence on practical yields.

The synthesis of hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones **5a–8d** was based on literature reports describing cyclization reactions of salicylanilides with methyl chloroformate [3a], ethyl chloroformate [3e], or triphosgene [14]. In our experiments, the cyclization reagent was methyl chloroformate in pyridine (Scheme 2). After 2–h refluxing followed by 10–h stirring at room temperature, the reaction mixture was acidified to pH ≈ 6 with 5% HCl. The resulting white heterogeneous mixture was cooled to obtain crystalline compounds. Recrystallization from ethanol gave products **5a–8d** in the yields of 77–94% (Table 1).

Further experiments concerned thionation of hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones **5a–8d**. The published methods include thionation using P_2S_5, either in solution [15] or in melt [3f], and Lawesson's reagent [16]. For the synthesis of hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dithiones, we made use melting of compounds **5a–8d** with Lawesson's reagent at 190–200°C for 4 min. Starting from 5-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-diones **8a–d**, this treatment afforded 5-hydroxy-3-phenyl-4-thioxo-3,4-dihydro-2*H*-1,3-benzoxazin-2-ones **10a–d** and 5-hydroxy-3-phenyl-2*H*-1,3-benzoxazine-2,4(3*H*)-dithiones **11a–d**, which were separated by column chromatography on silica gel (Scheme 3).
