Received February 25, 2004

A bicyclic indolizidinone carboxylic acid and a tricyclic constrained analogue of L-proline were synthesized and evaluated for their ability to induce helix formation as L-Ala tetrapeptides. Variabletemperature NMR, DMSO titration, CD spectra, and X-ray structure analyses, in conjunction with molecular modeling, confirmed the existence of 3_{10} -helical motifs with di- and tetrapeptides of L-Ala.

Introduction

Studying the underlying principles of protein folding is crucial to our fundamental understanding of life processes. The pathogenesis of many diseases which originate as a result of misfolding of proteins may be viewed in a different context if a better knowledge of the relationship between structure and function was available.1

The ordered structural domains of proteins consist of α -helices and β -sheets.² In particular, α -helical motifs play a crucial role in a number of biological processes.³ α-Helices can adopt interesting three-dimensional structures, as for example, in the four-helix bundle⁴ and the coiled-coil.⁵ A better understanding of the formation of α-helices could, in theory, be achieved by using low molecular weight molecules as models. 6a However, this simulation is difficult because the small free energy difference necessary to stabilize the folded state over the unfolded one is difficult to achieve in practice. In addition, the nucleation of the helix is entropically disfavored because it requires the first four amino acids to adopt a helical conformation without being initially stabilized by hydrogen bonds with subsequent residues in the helix.^{7,8}

Many approaches have been developed to date to induce folding in short peptides.9 One of the most viable

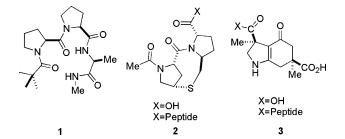

FIGURE 1. Helix-inducing nucleating motifs.

methods^{6a,b,10} is to propagate a desired conformation of a peptide chain from an ordered region starting with a conformationally restricted template (Figure 1). The entropy required to fold a linear peptide may thus be lowered relative to the existing conformational energy of the unfolded state. These templates normally direct the nucleation process by using hydrogen bonding or a mixture of hydrogen bonding and hydrophobic interactions. While L-Pro has a negative effect on helix stability when incorporated in an internal position of the peptide chain,^{2,11} it is frequently found at the N-terminus of naturally occurring peptides. 12 In this latter case, L-Pro does not interfere with the hydrogen bonding network of the backbone. Another advantage is that the ϕ value for L-Pro (\sim 60°) is close to the theoretical backbone ϕ value expected for a 3_{10} or α -helical conformation. ¹³ The idea of using simple L-Pro derivatives as potential α -helix nucleator templates for short peptides has already been exploited. Studies concerning the peptide Piv-L-Pro-L-Pro-

FIGURE 2. Constrained analogues of L-Pro.

NHMe ${\bf 1}$ in organic solvents¹⁴ suggested that 3_{10} -helix formation is elicited by the presence of contiguous Pro residues. However, Xaa-L-Pro-L-Pro-OH derivatives that can be linked to the N-terminus of the desired peptide, while attractive because of the potential proper orientation of three amide carbonyls with the correct pitch and spacing for helix-type structures, are usually not sufficiently constrained to enforce stable and consistent helical folding. In fact, energetically similar cis/trans isomers in the Xaa-L-Pro as well as L-Pro-L-Pro amide bonds may create multiple conformers. Moreover, L-Pro-L-Pro is known to be a poor turn-constraining unit, because of the small energy difference between turn-like and extended structures. 15 Kemp and co-workers 16 devised a helical template based on a conformationally restricted analogue of the Ac-L-Pro-L-Pro sequence 2 (Figure 1). A stable helix formation in aqueous media for peptides 5−11 residues in length was observed. This template also allowed independent evaluation of helix propensities for the Ala residue. 6 Bartlett and co-workers 10 have studied the semirigid template 3 in inducing helical conformations of appended hexapeptides using CD and NMR.

We recently reported the synthesis of constrained analogues of L-proline, represented by the tricyclic motif **5** (Figure 2).¹⁷ The synthesis of a precursor to the indolizinone 6, which encompasses a constrained bicyclic L-proline, was also recently communicated. ¹⁸ In this paper, we describe the synthesis of the prolyl L-TcaP (tricyclic constrained proline) 4, and the indolizidinone scaffold 6 with the objective to study their ability to induce L-Ala oligopeptides to adopt helical conformations. We first studied the solution conformation of 4, its methyl ester, and its L-Ala oligopeptides. While unable to predict which could be the preferred rotational isomer of the amide bond between L-proline and the core structure, we surmized that if properly oriented, the tripeptide Xaa-L-TcaP-L-Pro derived from 4 could deploy the three carbonyl groups in the correct pitch and spacing for a right-handed or a 3₁₀-helix. An acetyl group was selected as a mimic of the first amino acid (Xaa), and the choice of the methoxy substituent was based on synthetic precedent and convenience.¹⁷ We planned to study L-Ala oligopeptides as an amide appendage since it is reported to have a high propensity for helix formation. 19 Furthermore, alanine base oligopeptides offer the advantage of more easily interpretable NMR spectra.

Synthesis

The previously reported (2S,3aS,8aR)-(6-methoxy-1,2,3,3a,8,8a-hexahydro-3-aza-cyclopenta[a]inden-2-yl)methanol (7)¹⁷ was used as the starting material for the synthesis of Ac-L-TcaP-L-Pro-OH (4) (Scheme 1). N-Acetylation of the nitrogen was accomplished at 0 °C in dichloromethane with use of potassium carbonate as the base. This reaction was also sometimes accompanied by O-acetylation. Selective hydrolysis of the acetate was then performed with lithium hydroxide in a mixture of THF/water at room temperature giving rise, after purification, to the desired N-acetyl derivative (8) in 86% yield. Subsequent oxidation of the alcohol to the corresponding acid, using a mixture of NaClO2, commercial bleach, and catalytic TEMPO,20 afforded the acid Ac-L-TcaP-OH (9) in quantitative yield. The acid was then coupled with L-proline methyl ester hydrochloride, using standard conditions (PyBOP, diisopropylethylamine), to afford Ac-L-TcaP-L-Pro-OMe (10) in 82% yield, which was subsequently treated with lithium hydroxide in a mixture of THF/water at room temperature to afford the desired Ac-L-TcaP-L-Pro-OH (4) in 91% yield. The L-alanine-based oligomers were prepared in solution by using conventional chemical manipulation with N-benzyloxycarbonyl and *tert*-butyl ester as the orthogonal protective groups.

^a Reagents and conditions: (a) *t*-BuLi, CH₃I, THF, −78 °C, 76%; (b) *t*-BuLi, trisyl azide, THF, −78 °C, 63%; (c) Bu₄NF, THF, rt, 81%; (d) TEMPO, NaOCl, NaClO₂, CH₃CN, 35 °C, 95%; (e) CH₂N₂, CH₃OH, 100%; (f) (i) H₂, Pd/C, CH₃OH, (ii) Ac₂O, CH₃OH, rt, 85%, 2 steps; (g) 2 N LiOH, THF/H₂O, rt, 99% crude; (h) H-(L-Ala)_n-O/Bu, EDC, HOBt, DIPEA, DMF, 0 °C then rt; (i) H-(L-Ala)₄-O/Bu, EDC, HOBt, DIPEA, DMF, 0 °C to rt, 50%.

Ac-L-TcaP-L-Pro-L-Ala-OMe (11) was prepared by coupling template 4 with the commercially available L-Ala methyl ester hydrochloride (Scheme 1), using a conventional coupling protocol (EDC/ or HOBT, diisopropylethylamine, 67% yield). The same reaction conditions were employed to obtain Ac-L-TcaP-L-Pro-L-(Ala)₂-OfBu (12) in 68% yield. In the case of the longer peptide Ac-L-TcaP-L-Pro-L-(Ala)₄-OfBu (13), the use of DMF instead of CH₂Cl₂ afforded the desired product in 44% yield.

The synthesis of the second scaffold **6** follows a recently published protocol, ¹⁸ starting with S-pyroglutamic acid (Scheme 2). Intermediate **14** was transformed to the α -C-methyl derivative **15** via alkylation of the lithium enolate with *tert*-butyllithium as the most suitable base. Reformation of the Li enolate under the same reaction conditions and treatment with trisyl azide²¹ gave the desired tertiary azide **16** as the major product. The pseudoaxial methoxy group at C-8 appears to exert a stereocontrolling influence in the approach of the electrophilic azidating

FIGURE 3. Cis/trans acetamide conformational isomers.

reagent as in related cases.²¹ Subsequent steps involved functional group manipulations to give the alcohol **17**, followed by oxidation to **18**, reduction of the azide, and *N*-acetylation to give eventually **6**. Peptide coupling with H-(L-Ala)_n-O*t*Bu, using HOBT, gave the di- and tetrapetides **21** and **22**, respectively. We also prepared the tetrapeptide **23** by the same general procedure as a control.

Results

Proton NMR spectra of 10 in CDCl₃ showed a 3:1 ratio of two major conformational isomers, as determined by the ratio of the cleanly resolved pair of doublets at 5.4 and 5.7 ppm, attributed to the C-3a proton of the trans and cis isomers, respectively (Figure 3). This ratio changes to 1:1 in D₂O, and inverts to 1:1.5 in pyridine d_5 . NOESY experiments in CDCl₃ and in pyridine- d_5 allowed us to assign the upfield doublet to the transacetamido isomer and the downfield doublet to the cis isomer. The data are in agreement with literature precedents showing that the trans-acetamide isomer is usually predominant in small proline-containing peptides, and that the proportion of the cis isomer increases in more polar solvents. 22,23 The prevalence for the trans orientation of 10 in solvents of low polarity could be due to the proximity of the electron-rich phenyl ring and the so-called "benzene-oxygen repulsion". 24

To further establish the geometry of the amide bond between L-TcaP and the L-Pro unit in 10 we relied on ^{13}C chemical shifts as a diagnostic tool. The ^{13}C resonances of β - and γ -carbon atoms of the proline ring are known to be strongly influenced by the proximity effect of the carbonyl group of the amide function. 25 Comparison

 $^{\it a}$ Indicated isomer corresponds to a cetamido cis/trans orientation.

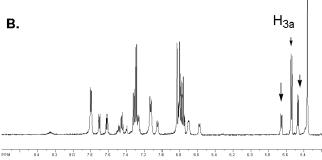

between the resonances of the β - and γ -carbon atoms in $CDCl_3$ led us to conclude that a trans orientation of the proline amide is preferred in $\bf 10$, regardless of the geometry of the acetamido group on the L-TcaP unit as indicated in the perspective drawings (Figure 3). These results were also valid in pyridine- d_5 (data not shown). The lack of NOE between the two α -protons in L-TcaP and L-Pro in $CDCl_3$ further confirmed the trans orientation of the inter-Pro bond.

One- and two-dimensional NMR experiments in CDCl₃ of the acid 4 showed a trans/cis ratio of 7:1 for the acetamide bond. ^{13}C resonances of $\beta\text{-}$ and $\gamma\text{-}\text{carbons}$ of the major isomer in CDCl₃ conform to the reported range for a trans-amide bond²⁶ (Table 1). The increase in the ratio of the trans vs cis isomer in the acid 4 compared to the ester 10 can be explained on the basis of an increased difficulty in aligning three carbonyl dipoles. In fact, the 7:1 trans—cis ratio observed in CDCl₃ for 4 drops to 1:1 in D₂O showing a strong solvent dependence.

L-TcaP L-Ala Oligopeptides. A qualitative assessment of the presence of intramolecular H-bonding in oligomeric peptides $11\!-\!13$ was done by analyzing the amide N–H stretching in the region of $3200\!-\!3500~{\rm cm^{-1}}$ by FT-IR²7 at a concentration of 1 mM in CDCl₃. An enhancement of intramolecular H-bonding was observed at $3320\!-\!3340~{\rm cm^{-1}}$ compared to that of the solvent-exposed free N–H amide at $3412\!-\!3418~{\rm cm^{-1}}.^{27}$ Analysis of Cbz-L-(Ala)₄-O*t*Bu used as a control at the same concentration in CDCl₃ showed only a small hydrogen bond stretching band, probably due to an irregular γ -turn-like structure.²8,29

Ac-L-TcaP-L-Pro-L-Ala-OMe (11) was analyzed by oneand two-dimensional NMR at a concentration of 5.8 mM (Figure 4A). Three conformers can be seen in a ratio of 1:1.6:1.4, as measured from the ratio of the clearly resolved doublets of C-3a at 5.66, 5.50, and 5.47 ppm, as well as by the ratios of the NH resonances. NOESY experiments in the same solvent confirm that the doublet peaks at 5.50 and 5.47 pm correspond to the major trans

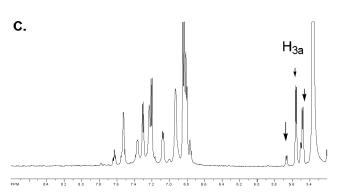

FIGURE 4. ¹H NMR (600 MHz) spectra in CD_2Cl_2 of compounds **11**, **12**, and **13** (A, B, and C, respectively). The shoulder at 5.49 ppm is a CH_2Cl_2 satellite peak.

isomer. The appearance of a second trans-isomer peak at 5.50 ppm corresponds to a minor component in **4** and **10**, which is amplified in **11** after attachment of the first Ala unit. This may be related to a H-bond resulting in an enthalpic advantage over the two other isomers. To gain some insight, we performed titration experiments³⁰ with increasing amounts of DMSO- d_6 (0–15% v/v) and temperature dependence of the NH chemical shifts³¹ in the range 210–290 K in CD₂Cl₂.²⁹ The presence of one intramolecularly H-bonded NH was obvious, which corresponded to the *trans*-acetamido isomer. A γ -turn H-bonded array was ruled out since it is known to have little or no enthalpic advantage over the non-H-bonded state.³²

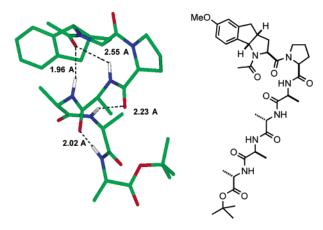

FIGURE 5. Lowest energy structures obtained by restrained conformational calculations from 2D NOESY data.

NMR studies on Ac-L-TcaP-L-Pro-L-(Ala) $_2$ -O $_2$ Bu (12) in CD_2Cl_2 at a concentration of 8.9 mM showed three conformers in a ratio of 1:3.4:1.8, as measured from the C-3a doublets at 5.65, 5.54, and 5.47 ppm (Figure 4B). As expected, COSY experiments showed that the two downfield doublets attributed to H-bonded NH groups belong to two different alanine units corresponding to the major trans-acetamido isomer. NOE contacts from 2D NOESY data allowed us to obtain a lowest energy structure using restrained conformational calculation (HyperChem) (Figure 5A). As depicted, the structure suggests a bifurcated H-bonding motif involving the trans-acetamido carbonyl group.

NMR studies on Ac-L-TcaP-L-Pro-L-(Ala)₄-OtBu (13) in CDCl₃ at a concentration of 5.6 mM showed the presence of three conformers in a ratio of 1:8.5:6.5 at 5.66, 5.56, and 5.48 ppm (Figure 4C). COSY experiments showed that the four doublets of the NH groups belong to four different alanine units, corresponding to the major transacetamido isomer. NOE contacts and 2D NOESY data with restrained conformational calculation (HyperChem) generated a motif encompassing an intramolecular Hbonding network (Figure 5B). The bifurcated H-bonded unit observed for 12 is now complemented by further contacts leading to a 3₁₀-helical folding in 13. CD spec tra^{29} for **12** and **13** in MeOH at a concentration of 1.9 \times 10^{-4} and 1.4×10^{-4} M, respectively, showed bands at 205 and 222 nm indicating a propensity for an 3₁₀-helix,³² rather than an α -helix. Unfortunately, DMSO- d_6 titra-

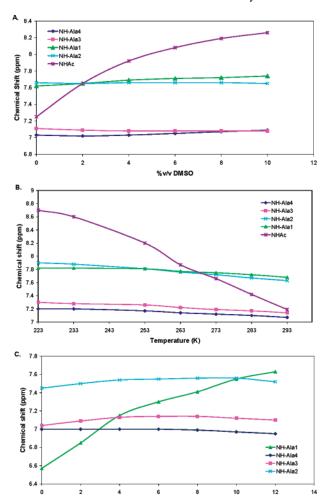

FIGURE 6. (A) DMSO titration experiment for compound **22**; (B) temperature variation experiment for compound **22**; and (C) % DMSO variation experiment for compound **23**.

tions and temperature-dependent NH shifts were difficult to quantitate due to overlapping signals.

Indolizidinone L-Ala Oligopeptides. We had anticipated that the L-Ala oligopeptides **21** and **22** attached to the bicyclic scaffold would adopt a helical folding shape, starting with one or more β -turn-type H-bonding arrays, with the axially disposed N-acetyl carbonyl and the first L-Ala amide. The prospects for such folding and structural organization were substantiated by NMR experiments. Thus, titration of **22** in CDCl₃ with increasing amounts of DMSO- d_6 clearly showed the prevalence of four NH signals that were unaffected up to 10% v/v of DMSO (Figure 6 A).

The only NH chemical shift change was due to the free N-Ac group. This behavior was corroborated by temperature variation studies for **22**, where the same four N-H signals were not influenced in the range 223–293 K (Figure 6B). As a control, the DMSO titration of the azido tetrapeptide **23** showed a similar pattern compared to the *N*-acetyl analogue **22**, except for the absence of a second β -turn H bond and distinctly different chemical shifts. The CD spectra of **21–23** in CDCl₃ or MeOH showed a similar pattern as for **11–13** with bands at ca. 208 and 222 nm characteristic of a 3_{10} -helix. ²⁹ 2D NOESY experiments with **22** corroborated the proposed helical

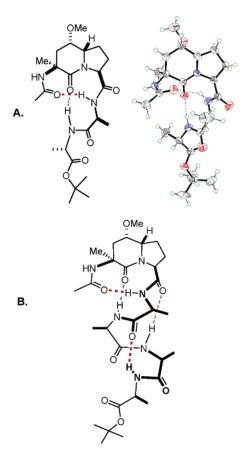

FIGURE 7. Top (A): Ortep diagram representation of **21**. Bottom (B): Modeled tetrapeptide **22**.

structure based on the NH correlations. We were gratified to obtain X-ray quality crystals of the dipeptide 21. As anticipated from the titration experiments we observed two characteristic intramolecular β -turn-type H bonds linking the lactam carbonyl and acetamide carbonyl oxygen atoms of the bicyclic scaffolds to NH amide groups of N_i and N_i + 1 Ala units (Figure 7A). On the basis of the H-bonding pattern seen in the X-ray structure of 21, the titration and temperature variation experiments, as well as the CD spectra characteristics, and 2D NOESY data, ²⁹ we propose that the tetrapeptide 22 adopts a 3_{10} -helical shape as depicted in Figure 7B.

Conclusion

We have described the synthesis of two novel constrained amino acid core structures that induce the formation of 3₁₀-helices from appended tetraalanine peptides in organic solvents. The first motif, consisting of Ac-L-TcaP-L-Pro tetrapeptide, exists in different conformations around the Pro-Pro amide bond with respect to the *N*-acetyl. The *trans*-acetamide conformation is favored in nonpolar solvents, which corroborates the observed bifurcated intramolecular H bond of two NHs on different Ala residues with the acetamide carbonyl.

The second motif utilized an indolizidinone as a potential nucleator for a di- and tetraalanine peptidic appendage. A 3₁₀-helical arrangement was observed by X-ray crystallography of the dipeptide **21**. Titration and variable-temperature experiments revealed that only one NH (NHAc) was affected under the NMR conditions of

measurement, suggesting a 3_{10} -type folding, as well. Goodman and Saltman²⁸ have already demonstrated the importance of a nucleating template based on the observation that linear homooligopeptides showed unfolded or irregular γ -turn-like structures in a variety of solvents.

Studies are ongoing in our laboratory to uncover other types of core structures capable of conferring stable secondary structures to appended polypeptides.

Experimental Section

The synthesis of compounds $\bf 8, \, 9$, and $\bf 10$ is given in the Supporting Information. ²⁹

Ac-L-TcaP-L-Pro-OH (4). To a stirred solution of Ac-L-TcaP-L-Pro-OMe (10; 65 mg, 0.168 mmol) in 1.3 mL of THF, at room temperature, was added a 2 N aqueous solution of LiOH (0.17 mL, 0.336 mmol) dropwise and the biphasic system was stirred at room temperature for 3 h. The solvent was evaporated; the resulting mixture was diluted with water (5 mL) and then washed with diethyl ether (2 \times 5 mL). The organic layers were discarded while the aqueous one was acidified to pH 3-4 with 1 N HCl, then extracted with dichloromethane (3 × 10 mL) and dichloromethane/methanol 9:1 (3 \times 10 mL). The combined organic phases were dried (Na₂-SO₄) and evaporated to dryness to afford a white solid (57 mg, 91%): mp 134–136 °C, 153–154 °C dec; $[\alpha]_D$ –209.0 (c 0.5, CHCl₃); ¹H NMR (CDCl₃, 400 MHz) for a mixture approximately 1:7 of major rotamers δ 7.68, 7.26 (0.12 H, d, J = 8.1Hz; 0.88 H, d, J = 5.5 Hz), 6.81 - 6.72 (2 H, m), 5.75, 5.46 (0.12H, d, J = 7.0 Hz; 0.88 H, d, J = 7.0 Hz), 4.68 (1 H, d, 5.8 Hz), 4.58, 4.52 (0.88 H, d, J = 9.0 Hz; 0.12 H, d, J = 9.0 Hz), 3.81, 3.78 (2.64 H, s; 0.36 H, s), 3.76-3.68 (1.76 H, m), 3.54-3.47 (2.24 H, m), 3.12-3.07 (1 H, dd, J = 16.4, 6.5 Hz), 2.71-2.67(1 H, d, J = 16.4 Hz), 2.42 (3.52 H, m), 2.33-2.29 (0.12 H, m),2.14-2.06 (2.12 H, m), 2.05 (1.24 H, m), 1.87-1.78 (1 H, m); ¹³C NMR (CDCl₃, 75 MHz) δ (174.0), 173.7, 173.0, (171.1), 170.7, 160.5, (160.2), 143.6, (142.7), (136.4), 134.2, (128.6), 125.7, 113.6, 111.5, (110.5), 68.2, (67.9), 59.9, (59.6), 59.5, 55.8, (55.7), 47.6, 42.9, (39.6), 35.2, 33.9, (28.7), 28.2, 25.4, 22.9, (22.8); MS (EI+) m/e 372 (M)+; HRMS (EI+) calcd for C₂₀H₂₄N₂O₅ 372.16852, found 372.16870.

Ac-L-TcaP-L-Pro-L-Ala-OMe (11). To a chilled solution of $\ensuremath{\text{L-alanine}}$ methyl ester hydrochloride (3 mg, 0.0156 mmol) in 2 mL of dichloromethane was added Ac-L-TcaP-L-Pro-OH (4; 5 mg, 0.013 mmol), HOBt (3 mg, 0.02 mmol), $1\mbox{-}[3\mbox{-}(dimethy$ lamino)propyl]-3-ethylcarbodiimide hydrochloride (4 mg, 0.02 mmol), and diisopropylethylamine (3 μ L, 2.5 equiv). The reaction mixture was stirred for 1 h at 0 °C and 48 h at room temperature. Water (2 mL) was then added to the reaction mixture and the phases were separated. The organic layer was washed with saturated NaHCO₃ aqueous solution (2 \times 2 mL) and brine (1 \times 2 mL), dried (Na₂SO₄), and evaporated to dryness. The resulting solid was purified via silica gel flash column chromatography (AcOEt/MeOH, 85:15). Compound 11 was obtained as a white solid (4 mg, 67%): $[\alpha]_D = 158$ (c 0.1, CHCl₃); ¹H NMR (CD₂Cl₂, 600 MHz) for a mixture of approximately 1:1.4:1.6 of major rotamers δ 8.53–8.52 (0.4 H, d, J = 7.8 Hz), 7.62 - 7.61 (0.25 H, d, J = 9.2 Hz), 7.32 - 7.31(0.35 H, d, J = 8.1 Hz), 7.30 - 7.29 (0.4 H, d, J = 8.1 Hz), 7.16 -7.15 (0.35 H, d, J = 6.5 Hz), 6.95-6.94 (0.25 H, d, J = 6.0Hz), 6.83-6.81 (1.2 H, m), 6.75-6.74 (0.8 H, m), 5.67-5.65 (0.25 H, d, J = 7.1 Hz), 5.51 - 5.50 (0.4 H, d, J = 7.1 Hz), 5.48 -5.47 (0.35 H, d, J = 7.1 Hz), 4.61-4.60 (1 H, d, J = 9.1 Hz), 4.57-4.54 (0.6 H, m), 4.53-4.48 (0.5 H, m), 4.45-4.40 (0.35 H, quint, J = 7.3 Hz), 4.32-4.29 (0.15 H, m), 4.25-4.24 (0.4 H, d, J = 8.1 Hz), 3.82 (2.2 H, s), 3.80 (0.8 H, s), 3.76 (1.5 H, s), 3.74-3.71 (0.5 H, m), 3.59-3.50 (1.4 H, m), 3.55 (0.6 H, m), 3.42-3.37 (0.8 H, m), 3.13-3.03 (1.2 H, m), 2.73-2.69 (1 H, m), 2.53-2.50 (0.5 H, dd, J = 12.4, 6.3 Hz), 2.40 (1 H, s), 2.38 (1.25 H, s), 2.32-2.23 (1.25 H, m), 2.19-1.87 (2.4 H, m), 1.94 (1 H, s), 1.86-1.80 (1.2 H, m), 1.77-1.69 (1 H, m), 1.68 $1.62~(0.4~\rm H,~m),~1.50-1.48~(1.2~\rm H,~d,~\it J=7.3~\rm Hz),~1.44-1.42~(0.75~\rm H,~d,~\it 7.1~\rm Hz),~1.41-1.40~(1.05~\rm H,~d,~\it J=7.1~\rm Hz);~^{13}C~\rm NMR~(pyridine-\it d_5,~125~\rm MHz)~\delta~174.5,~173.2,~171.3,~170.9,~160.9,~(144.5),~143.2,~137.7,~130.4,~(127.7),~116.0,~(115.9),~(113.2),~112.3,~(69.6),~69.5,~(67.7),~63.2,~61.8,~(61.4),~(56.9),~56.8,~53.2,~49.5,~(49.4),~(48.3),~48.2,~(43.6),~40.4,~36.8,~36.3,~(35.9),~(34.5),~30.4,~(30.0),~26.3,~(25.9),~(23.4),~23.2,~17.7,~(16.3);~\rm MS~(EI+)~\it m/e~458~(M+H)^+;~HRMS~(EI+)~calcd~for~C_{24}H_{32}N_3O_6~(M~+~\rm H)~458.22911,~found~458.22770.$

Ac-L-TcaP-L-Pro-L-Ala-L-Ala-OfBu (12). To a chilled solution of L-alanyl-L-alanine tert-butyl ester (13 mg, 0.06 mmol) in 5 mL of dichloromethane was added Ac-L-TcaP-L-Pro-OH (4; 19 mg, 0.05 mmol), HOBt (11 mg, 0.08 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (15 mg, 0.08 mmol), and diisopropylethylamine (23 μ L, 0.13 mmol). The reaction mixture was stirred for 1 h at 0 °C and 40 h at room temperature. Water (5 mL) was then added to the reaction mixture and the phases were separated. The organic layer was washed with saturated NaHCO₃ aqueous solution $(2 \times 5 \text{ mL})$ and brine $(1 \times 5 \text{ mL})$, dried (Na_2SO_4) , and evaporated to dryness. The resulting solid was purified via silica gel flash column chromatography (AcOEt/MeOH, 85:15). Compound 12 was obtained as a light-yellow solid (19 mg, 68%): [α]_D –110 (*c* 0.2, CHCl₃); ¹H NMŘ (CD₂Cl₂, 600 MHz) for a mixture approximately 1:1.8:3.4 of major rotamers δ 7.82-7.77 (0.55H, d, J = 7.3 Hz), 7.63-7.60 (0.16H, d, J =8.8 Hz), 7.33-7.30 (0.29H, d, J = 8.0 Hz), 7.30-7.27 (0.55H, d, J = 8.0 Hz), 7.26-7.22 (0.29H, d, J = 7.5 Hz), 7.14-7.10(0.55H, d, J = 8.0 Hz), 7.03-7.00 (0.16H, d, J = 7.1 Hz), 6.84-6.74 (2H, m), 6.70-6.66 (0.29H, d, J = 6.6 Hz), 6.57-6.54(0.16H, d, J = 7.1 Hz), 5.67 - 5.64 (0.16H, d, J = 7.5 Hz), 5.55 -5.53 (0.55H, d, J = 7.5 Hz), 5.48-5.45 (0.29H, d, J = 6.6 Hz), 4.69-4.65 (0.55H, d, J = 8.8 Hz), 4.62-4.59 (0.16H, dd, J =8.4, 3.5 Hz), 4.59-4.57 (0.29H, d, J = 9.6 Hz), 4.57-4.54 (0.29H, d, J = 8.3 Hz), 4.42-4.27 (2.71H, m), 3.82 (0.87H, s),3.80 (1.65H, s), 3.79 (0.48H, s), 3.76-3.72 (0.16H, m), 3.60-3.56 (1.68H, m), 3.55-3.35 (1.16H, m), 3.14-3.08 (1H, dd, J = 16.6, 7.5 Hz), 2.75-2.69 (1H, dd, J = 16.6, 6.6 Hz), 2.52-2.47 (0.58H, m), 2.44-2.42 (1.65H, s), 2.40-2.38 (0.87H, s), 2.34-2.27 (0.32H, m), 2.17-2.10 (1.1H, m), 2.09-2.00 (2.29H, m), 1.98-1.90 (1.19H, m + s), 1.89-1.80 (0.84H, m), 1.80-1.73 (0.16H, m), 1.49 (1.44H, s), 1.48–1.46 (2.52H, d, J = 7.4Hz), 1.42-1.40 (0.48H, d, J = 7.2 Hz), 1.40-1.38 (0.48H, d, J= 7.2 Hz), 1.31 (2.61H, s), 1.25 (4.95H, s), 1.23-1.21 (2.52H, d, J = 7.3 Hz); ¹³C NMR (pyridine- d_5 , 125 MHz) δ 173.3, 172.8, 172.4, 171.6, 170.3, (170.1), 160.6, 143.2, 137.4, 128.8, (126.1), 114.1, 110.5, 81.1, (68.2), 68.0, 61.8, 60.7, (60.5), (60.1), (55.5), 55.4, 49.5, (47.4), 47.3, (42.8), 39.8, 36.2, 35.7, (34.0), 30.1, 29.6, (29.3), 28.0, 25.5, (25.3), (23.1), 22.8, (18.9), 18.8, 17.8; MS $(FAB+) m/e 593 (M + Na)^+, 571 (M + H)^+; HRMS (FAB+)$ calcd for $C_{30}H_{42}N_4O_7Na$ 593.29512, found 593.29260.

Ac-TcaP-L-Pro-L-Ala-L-Ala-L-Ala-OtBu (13). To a chilled solution of L-alanyl-L-alanyl-L-alanyl-L-alanine tertbutyl ester (15 mg, 0.04 mmol) in 2 mL of dry DMF was added Ac-L-TcaP-L-Pro-OH (4; 17 mg, 0.045 mmol), HOBt (10 mg, 0.075 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (15 mg, 0.075 mmol), and diisopropylethylamine (22 μ L, 0.125 mmol). The reaction mixture was stirred for 1 h at 0 °C and 48 h at room temperature. DMF was evaporated under high vacuum and the orange residue was dissolved in dichloromethane (50 mL). The solution was washed with water (1 \times 20 mL), saturated NaHCO $_{\!3}$ aqueous solution (2 \times 20 mL), and brine (1 \times 20 mL), dried (Na₂SO₄), and evaporated to dryness. The resulting orange solid was purified via silica gel flash column chromatography (AcOEt/MeOH, 80:20). Compound 13 was obtained as a light yellow solid (16 mg, 44%): $[\alpha]_D$ -90 (c 0.2, CHCl₃); ¹H NMR (CD₂Cl₂, 600 MHz) for a mixture of approximately 1:6.5:8.5 of major rotamers δ 7.62– 7.60 (0.06H, d, J = 8.1 Hz), 7.62–7.60 (0.06H, d, J = 8.8 Hz), 7.56-7.54 (0.53H, d, J = 4.5 Hz), 7.40 (0.41H, br s), 7.30-7.56-7.547.29 (0.41H, d, J = 8.1 Hz), 7.26–7.25 (0.53H, d, J = 5.4 Hz), 7.21-7.19 (0.53H, d, J = 8.3 Hz), 7.12-7.10 (0.41H, d, J =8.0 Hz), 7.03 (0.18H, m), 6.97–6.96 (0.94H, d, J = 7.0 Hz), 6.86-6.76 (2.94H, m), 5.66 (0.06H, d, J = 7.7 Hz), 5.56 (0.53H, d, J = 7.1 Hz), 5.49-5.47 (0.41H, d, J = 6.9 Hz), 4.66-4.64(0.06H, d, J = 9.8 Hz), 4.61 - 4.59 (0.06H, d, J = 8.7 Hz), 4.57 -4.55 (0.12H, m), 4.51-4.47 (0.41H, br s), 4.45-4.43 (0.06H, m), 4.40 (0.41H, m), 4.39 (0.41H, m), 4.35-4.33 (0.53H, d, J=9.0 Hz), 4.30-4.26 (1.94H, m), 4.24-4.21 (0.53H, m), 4.16-4.12 (1.47H, m), 3.82 (1.23H, s), 3.81 (1.59H, s), 3.80 (0.18H, s), 3.74-3.71 (1H, m), 3.61-3.57 (1H, m), 3.49-3.44 (0.59H, m), 3.43-3.38 (0.41H, m), 3.18-3.14 (0.41H, dd, J=16.4, 6.6 Hz), 3.14-3.10 (0.59H, dd, J = 16.5, 6.9 Hz), 2.81-2.78 (0.41H, d, J = 16.4 Hz), 2.75-2.71 (0.06H, d, J = 16.5 Hz), 2.73-2.70 (0.53H, d, J = 16.5 Hz), 2.46 (1.59H, s), 2.44 (1.23H, s), 2.36-2.12 (2H, m), 2.07-2.03 (1H, m), 2.02-1.95 (1H, m), 1.93 (0.18H, s), 1.88-1.81 (2H, m), 1.56-1.54 (1.77H, d, J = 7.3Hz), 1.48-1.46 (1.23H, m), 1.48 (3.69H, s), 1.47 (4.77H, s), 1.45-1.43 (1.23H, d, J = 7.4 Hz), 1.41-1.39 (1.23H, d, J =8.1 Hz), 1.39–1.38 (1.77H, d, J = 7.4 Hz), 1.30 (0.54H, s), 1.23– 1.21 (1.77H, d, J = 7.3 Hz), 1.20 (1.77H, d, J = 7.3 Hz), 1.20– 1.19 (1.23H, m); 13 C NMR (pyridine- d_5 , 125 MHz) δ 173.5, 173.0, 172.9, 172.7, 171.6, 171.0, 170.8, 160.6, 143.3, 137.3, 128.8, 114.1, (111.5), 110.5, 81.1, (68.1), 69.7, 61.7, 60.8, (55.6), 55.5, 50.0, 49.7, 49.5, 49.1, (47.5), 47.4, 36.1, 35.7, (30.0), 29.7, 28.1, 25.5, (23.1), 22.9, 19.0, 18.9, 18.8, 18.6, 17.7; MS (FAB+) m/e 735 (M + Na)⁺, 713 (M + H)⁺, 657 (M - (CH₃)₂C=CH₂); HRMS (FAB+) calcd for $C_{36}H_{53}N_6O_9$ 713.38740, found

(3S,8S,9S)-3-(tert-Butyldiphenylsilanyloxymethyl)-8methoxy-6-methylhexahydroindolizin-5-one (15). To a stirred solution of lactam 1418 (1.18 g, 2.694 mmol) in 10.8 mL of THF at -78°C was added dropwise a 1.5 M solution of t-BuLi (1.98 mL, 2.239 mmol) in THF. The mixture was stirred for 30 min at this temperature then methyl iodide (0.24 mL, 3.853 mmol) was added. The reaction mixture was stirred for 30 min at -78 °C, and then the reaction was neutralized by adding slowly a saturated solution of NaHCO₃. The mixture was extracted with ethyl acetate and the combined organic phases were dried over sodium sulfate, filtered, and evaporated to dryness. The residue was purified via flash column chromatography on silica gel (30% AcOEt /hexanes) to give the mixture of diastereoisomers as a yellow oil (921 mg, 76%). A sample of the major isomer (α-Me) was separated via chromatography for spectroscopic data: ¹H NMR (CDCl₃, 400 MHz) δ 7.65-7.58 (4H, m), 7.43-7.34 (6H, m), 4.23-4.20 (1H, m), 4.12-4.08 (1H, dd, J=10.0, 4.0 Hz), 3.76-3.72 (1H, m), 3.70-3.66 (1H, dd, J = 10.0, 2.2 Hz), 3.56 (1H, m), 3.34 (3H, s), 2.47-2.32 (2H, m), 2.05-1.96 (3H, m), 1.85 (1H, m), 1.50-1.42 (1H, t, J = 13.1 Hz), 1.30–1.27 (3H, d, J = 7.0 Hz), 1.04 (9H, s); ¹³C NMR (CDCl₃, 100 MHz) δ 172.0, 135.9, 134.1, 133.9, 130.0, 129.9, 128.1, 128.0, 72.8, 64.6, 64.2, 58.4, 56.7, 33.2, 31.4, 27.3, 26.9, 26.8, 25.1, 19.8, 18.4; MS (FAB) m/e 452 (M + H)+; HRMS (EI+) calcd for C₂₇H₃₈NO₃Si 452.26209, found 452.26169.

(3S,6S,8S,9S)-6-Azido-3-(tert-butyldiphenylsilanyloxymethyl)-8-methoxy-6-methylhexahydroindolizin-5-one (16). To a stirred solution of lactam 15 (920 mg, 2.035 mmol) (mixture of diastereoisomers) in 8.2 mL of THF at −78 °C was added dropwise a 1.5 M solution of t-BuLi (1.49 mL, 2.239 mmol) in THF. The mixture was stirred for 1 h at this temperature then a solution of trisyl azide (756 mg, 2.442 mmol) in THF was added. The reaction mixture was stirred for 3 h at -78 °C and neutralized with a saturated solution of NaHCO₃; the mixture was then extracted with ethyl acetate and the combined organic phases were dried over sodium sulfate, filtered, and evaporated to dryness. The mixture of diastereoisomers was purified via flash column chromatography on silica gel (20% AcOEt /hexanes) to give the major isomer **16** as a yellow oil (628 mg, 63%): $[\alpha]_D$ -120 (c 0.6, CHCl₃); FT-IR (ν , cm⁻¹) 2957, 2103, 1645, 1428, 1109; ¹H NMR (CDCl₃, 400 MHz) δ 7.67–7.63 (4H, m), 7.43–7.39 (6H, m), 4.25-4.19 (2H, m), 3.85-3.82 (1H, m), 3.66-3.63 (1H, dd, J = 9.7, 1.6 Hz), 3.55-3.53 (1H, m), 3.36 (3H, s), 2.39-2.35 (1H, dd, J = 14.7, 3.8 Hz), 2.09–2.01 (3H, m), 1.94–1.92 (1H, m), 1.79-1.75 (1H, dd, J = 14.7, 2.1 Hz), 1.69 (3H, s), 1.06 (9H,

s); ^{13}C NMR (CDCl $_3$, 100 MHz) δ 168.4, 135.9, 133.9, 133.6, 130.1, 130.0, 128.2, 128.1, 73.8, 64.2, 63.5, 60.6, 59.2, 57.3, 37.3, 27.2, 27.0, 25.2, 25.1, 19.7; MS (EI) $\emph{m/e}$ 492 (M) $^+$, 435; HRMS (EI+) calcd for $C_{27}H_{36}N_4O_3Si$ 492.25567, found 492.25560.

(3S,6S,8S,9S)-6-Azido-3-hydroxymethyl-8-methoxy-6methylhexahydroindolizin-5-one (17). To a stirred solution of protected alcohol 16 (50 mg, 0.101 mmol) in THF was added a 1 M solution of tetrabutylammonium fluoride in THF (203 μ L, 0.203 mmol) dropwise. The reaction mixture was subsequently stirred at room temperature for 16 h. The mixture was concentrated under reduced pressure and was loaded directly onto a column of silica gel for purification (AcOEt/hexanes, 1:1). The desired compound 17 was obtained as a yellow oil (21 mg, 81%): $[\alpha]_D = 199.8$ (c 1.0, CHCl₃); ¹H NMŘ (CDCl₃, 400 MHz) δ 4.75 (1H, br s), 4.12–4.17 (1H, quad, J= 8.0 Hz), 3.69-3.72 (2H, m), 3.55-3.61 (2H, m), 3.36 (3H, s), 2.35-2.39 (1H, dd, J = 14.8, 3.6 Hz), 2.07–2.17 (1H, m), 1.97–2.04 (1H, m), 1.79-1.85 (1H, m), 1.73-1.77 (1H, dd, J = 14.8, 2.0 Hz), 1.66 (3H, s), 1.39–1.48 (1H, m); 13 C NMR (CDCl₃, 100 MHz) δ 171.4, 73.5, 67.6, 63.5, 63.0, 60.9, 57.3, 37.1, 26.8, 26.4, 24.9; MS (MAB) m/e 254 (M)⁺; HRMS (EI+) calcd for $C_{11}H_{18}N_4O_3$ 254.13789, found 234.13597.

(3S,6S,8S,9S)-6-Azido-8-methoxy-6-methyl-5-oxo-octahydroindolizine-3-carboxylic Acid (18). To a stirred solution of 17 (20 mg, 0.079 mmol) in acetonitrile (0.4 mL) was added a sodium phosphate buffer (0.3 mL of a 0.67 M aqueous solution of NaH₂PO₄·H₂O buffered at pH 6.8 with 2 N aqueous sodium hydroxide) and the mixture was vigorously stirred at room temperature for 5 min; TEMPO (1.0 mg, 0.005 mmol), a solution of sodium chlorite in water (18 mg dissolved in 0.1 mL of water, 0.158 mmol), and a commercial bleach solution, previously diluted with water (2 μ L of a 5.25% solution diluted in 0.4 mL of water, 0.025 mmol), were subsequently added. The resulting red-brown solution was stirred and heated at 35 °C for 24 h, cooled to room temperature, and diluted with water (2.0 mL) and the pH was adjusted to pH 8 by adding 5 drops of 2 N aqueous sodium hydroxide. The solution was then cooled to 0 °C and quenched with aqueous sodium sulfite solution (64 mg dissolved in 1.21 mL of water), stirred for 30 min at 0 °C, then extracted with ether (2 \times 10 mL). The organic phases were discarded, while the aqueous one was acidified (pH 2-3) with 1 N HCl then extracted with ether (2 \times 10 mL) and then with CH₂Cl₂ (5 \times 10 mL). The combined organic phases were dried over sodium sulfate, filtered, and evaporated to dryness. The resulting crude acid was obtained as a white foam and was used in the next step without any further purification (20 mg, 95%): $[\alpha]_D$ –241 (\hat{c} 1.0, MeOH); ¹H NMR (CDCl₃, 400 MHz) δ 4.57–4.60 (1H, t, J = 8.4 Hz), 3.80-3.82 (1H, m), 3.58-3.61 (1H, m), 3.37 (3H, s), 2.36-2.40 (1H, dd, J = 14.8, 3.8 Hz), 2.27–2.33 (2H, m), 2.03–2.13 (1H, m), 1.98-2.01 (1H, m), 1.78-1.82 (1H, dd, J = 14.8, 2.4 Hz), 1.69 (3H, s); 13 C NMR (CDCl₃, 75 MHz) δ 176.0, 168.8, 73.7, 62.8, 60.5, 60.7, 57.2, 37.2, 27.8, 27.0, 25.3; MS (MAB) m/e 268 $(M)^+$; HRMS (EI+) calcd for $C_{11}H_{16}N_4O_4$ 268.11715, found 268.11722.

(3*S*,6*S*,8*S*,9*S*)-6-Acetylamino-8-methoxy-6-methyl-5-oxooctahydroindolizine-3-carboxylic Acid Methyl Ester (20). Compound 19 (20 mg, 0.071 mmol) was dissolved in methanol

(2 mL) and hydrogenated (1 atm) with Pd/C 10% (10 mg, 10% mol) for 16 h at room temperature. After removal of the catalyst via filtration through Celite, the solvent was removed in vacuo to give 25 mg (quantitative) of amine as a yellow oil. To a solution of the amine (18 mg, 0.07 mmol) in methanol $(500 \,\mu\text{L})$ was added acetic anhydride $(17 \,\mu\text{L}, \, 0.18 \, \text{mmol})$. The reaction mixture was stirred at room temperature for 16 h, the solvents were removed under reduced pressure, and the residue was purified via flash column chromatography on silica gel (AcOEt/MeOH 8:2) to give the desired compound 20 as a yellow oil (17 mg, 85%): $[\alpha]_D$ –148.7 (*c* 1.0, MeOH); ¹H NMR (CDCl₃, 400 MHz) δ 6.20 (1H, s), 4.39–4.43 (1H, t, J = 8.1Hz), 4.06-4.10 (1H, m), 3.73 (3H, s), 3.58-3.59 (1H, d, J =2.8 Hz), 3.37 (3H, s), 2.61-2.66 (1H, dd, J = 14.7, 3.3 Hz), 2.40-2.44 (1H, dd, J=14.7, 1.7 Hz), 2.30-2.33 (1H, m), 2.12-2.122.17 (1H, s), 1.93 (3H, s), 1.87-1.93 (2H, m), 1.54 (3H, s); ¹³C NMR (CDCl₃, 100 MHz) δ 173.0, 171.0, 170.2, 74.1, 62.5, 59.5, 57.0, 55.5, 52.6, 35.6, 27.9, 27.3, 27.0, 23.9; MS (FAB+) m/e 299 (M)⁺; HRMS (FAB+) calcd for C₁₄H₂₃N₂O₅ 299.16069, found 299.16108.

(3.5,6.5,8.5,9.5)-6-Acetylamino-8-methoxy-6-methyl-5-oxoctahydroindolizine-3-carboxylic Acid (6). To a stirred solution of methyl ester 20 (17 mg, 0.057 mmol) in 500 μL of THF was added dropwise a 2 N aqueous solution of LiOH (60 μL , 0.114 mmol) and the biphasic system was stirred at room temperature for 24 h. The solvent was evaporated and the resulting mixture was diluted with water (5 mL) then washed with ethyl acetate (2 \times 5 mL). The organic layers were discarded while the aqueous one was acidified to pH 2 with 2 N HCl. The solution was then concentrated to dryness and the residue was used in the next step without any further purification.

L-BcaP-L-Ala-L-Ala-OtBu (21). To a chilled solution of H₂N-L-Ala-L-Ala-O*t*Bu hydrochloride (9 mg, 0.042 mmol) in 500 μ L of DMF was added **6** (10 mg, 0.035 mmol), HOBt (7 mg, 0.053 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (10 mg, 0.053 mmol), and diisopropylethylamine (18 μ L, 0.106 mmol). The reaction mixture was stirred for 1 h at 0 °C and 48 h at room temperature. The solvent was removed under reduced pressure and the residue was dissolved in dichloromethane (2 mL). Water (2 mL) was then added and the phases were separated. The organic layer was washed with saturated NaHCO $_3$ aqueous solution (2 \times 2 mL) and brine (1 × 2 mL), dried (Na₂SO₄), and evaporated to dryness. The resulting solid was purified via silica gel flash column chromatography (AcOEt to AcOEt/MeOH, 4:1). The desired compound **21** was obtained as a white solid (7 mg, 41%): $[\alpha]_D$ -102.5 (c 0.2, MeOH); ¹H NMR (CDCl₃, 400 MHz) δ 7.50– 7.52 (1H, d, J = 7.4 Hz), 7.46–7.48 (1H, d, J = 8.9 Hz), 6.18 (1H, s), 4.48-4.53 (1H, quint, J = 7.4 Hz), 4.36-4.47 (1H, quint, J = 7.4 Hz)quint, J = 8.9 Hz), 4.31-4.35 (1H, quint, J = 7.3 Hz), 3.99-4.04 (1H, m), 3.61 (1H, d, J = 3.2 Hz), 3.38 (3H, s), 2.49-2.56(1H, dt, J = 12.6, 7.7 Hz), 2.33–2.37 (1H, dd, J = 14.2, 2.1 Hz), 2.27-2.31 (1H, dd, J = 14.2, 3.4 Hz), 2.10-2.16 (1H, m), 1.91 (3H, s), 1.80-1.95 (3H, m), 1.51 (3H, s), 1.44 (9H, s), 1.42 (3H, d, J = 6.1 Hz), 1.35 (3H, d, J = 7.2 Hz); ¹³C NMR (CDCl₃, 75 MHz) δ 172.9, 172.0, 171.3, 171.0, 81.6, 73.9, 63.2, 61.9, 57.3, 54.9, 49.2, 48.9, 36.4, 28.7, 28.3, 27.3, 27.0, 23.5, 17.8, 17.4; MS (FAB+) m/e 483 (M + H)+; HRMS (FAB+) calcd for C₂₃H₃₉N₄O₇ 483.28187, found 483.28038.

L-BcaP-L-Ala-L-Ala-L-Ala-L-Ala-OtBu (22). To a chilled solution of $\rm H_2N$ -L-Ala-L-Ala-L-Ala-L-Ala-OtBu hydrochloride (16 mg, 0.042 mmol) in 500 μL of DMF was added 6 (10 mg, 0.035 mmol), HOBt (7 mg, 0.053 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (10 mg, 0.053 mmol), and disopropylethylamine (18 μL , 0.106 mmol). The reaction mixture was stirred for 1 h at 0 °C and 48 h at room temperature. The solvent was removed under reduced pressure and the residue was dissolved in dichloromethane (2 mL). Water (2 mL) was then added and the phases were separated. The organic layer was washed with saturated NaHCO3 aqueous solution (2 \times 2 mL) and brine (1 \times 2 mL), dried (Na2SO4), and

evaporated to dryness. The resulting solid was purified via silica gel flash column chromatography (AcOEt/MeOH, 4:1). The desired compound 22 was obtained as a yellow foam (7 mg, 32%): $[\alpha]_D$ -65.0 (c 0.7, MeOH); ¹H NMR (CDCl₃, 400 MHz) δ 7.66 (1H, d, J= 7.1 Hz), 7.62 (1H, d, J= 6.7 Hz), 7.25 (1H, s), 7.11 (1H, d, J = 7.7 Hz), 7.03 (1H, d, J = 7.2 Hz), 4.41-4.43 (1H, quint, J = 7.7 Hz), 4.30-4.35 (2H, m), 4.27-4.434.30 (1H, t, J = 8.2 Hz), 4.16–4.18 (1H, quint, J = 7.2 Hz), 4.05-4.07 (1H, m), 3.63 (1H, br s), 3.37 (3H, s), 2.50-2.54 (1H, m), 2.28-2.36 (2H, m), 2.14-2.16 (1H, m), 1.96 (3H, s), 1.94-1.98 (1H, m), 1.82-1.84 (1H, m), 1.50 (3H, s), 1.44 (3H, d, J=7.4 Hz), 1.43 (9H, s), 1.42 (3H, d, J = 8.0 Hz), 1.40 (3H, d, J = 8.0 Hz) = 7.3 Hz), 1.38 (3H, d, J = 7.2 Hz); ¹³C NMR (CDCl₃, 100 MHz) δ 174.0, 173.4, 172.8, 172.1, 171.8, 171.7, 170.8, 81.2, 73.1, 63.0, 61.8, 56.7, 54.2, 50.9, 49.7, 49.0, 48.8, 36.1, 28.4, 27.8, 26.7, 26.3, 22.8, 17.3, 17.1, 16.6, 16.1; MS (FAB+) m/e 647 (M + Na)⁺, 625 (M + H)⁺; HRMS (FAB+) calcd for $C_{29}H_{49}N_6O_9$ 625.35610, found 625.35623.

Azide-L-BcaP-L-Ala-L-Ala-L-Ala-L-Ala-OtBu (23). To a chilled solution of H2N-L-Ala-L-Ala-L-Ala-L-Ala-OtBu hydrochloride (17 mg, 0.045 mmol) in 500 μ L of DMF was added 18 (10 mg, 0.037 mmol), HOBt (8 mg, 0.056 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (11 mg, 0.056 mmol), and diisopropylethylamine (26 μ L, 0.149 mmol). The reaction mixture was stirred for 1 h at 0 °C and 48 h at room temperature. The solvent was removed under reduced pressure and the residue was dissolved in dichloromethane (2 mL). Water (2 mL) was then added and the phases were separated. The organic layer was washed with saturated NaHCO₃ aqueous solution (2 × 2 mL) and brine (1

× 2 mL), dried (Na₂SO₄), and evaporated to dryness. The resulting solid was purified via silica gel flash column chromatography (AcOEt/MeOH, 9:1). The desired compound 23 was obtained as a yellow foam (11 mg, 50%): $[\alpha]_D - 155$ (c 0.25, MeOH); ¹H NMR (CDCl₃, 400 MHz) δ 7.46 (1H, d, J= 6.6 Hz), 7.04 (1H, d, J = 8.2 Hz), 7.00 (1H, d, J = 7.3 Hz), 6.54 (1H, d, J = 5.2 Hz), 4.54 - 4.50 (1H, quint, J = 7.5 Hz), 4.39 - 4.31 (3H,m), 4.25-4.16 (1H, dq, J=8.1, 7.0 Hz), 4.00-3.93 (1H, m), 3.61-3.60 (1H, m), 3.37 (3H, s), 2.47-2.42 (2H, m), 2.22-2.07(1H, m), 2.05-1.92 (2H, m), 1.87-1.83 (1H, dd, J = 15.1, 2.1Hz), 1.66 (3H, s), 1.49 (3H, d, J = 7.0 Hz), 1.46 (9H, s), 1.44 (3H, d, J = 7.5 Hz), 1.43 (3H, d, J = 7.0 Hz), 1.39 (3H, d, J =7.5 Hz); 13 C NMR (CDCl₃, 100 MHz) δ 173.1, 172.7, 172.4, 172.2, 172.1, 171.5, 81.8, 73.4, 63.9, 62.5, 60.6, 57.3, 51.3, 50.6, 49.3, 49.2, 37.7, 28.3, 28.1. 27.2, 24.7, 18.2, 17.7, 17.6, 17.2; MS (FAB+) m/e 609 (M + H)+; HRMS (FAB+) calcd for C₂₇H₄₅N₈O₈ 609.33603, found 609.33549.

Acknowledgment. We thank NSERC for financial assistance, Pharmacia (Nerviano, Italy) for a sabbatical leave to G.P., and Dr. Michel Simard for the X-ray crystal structure analysis.
