*(In final form July 5, 1999)*

TiO<sub>2</sub> and Pt have been intercalated in hectorite and H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>. The height of TiO<sub>2</sub> and Pt pillars was less than 0.8 nm and the band gap energy of TiO<sub>2</sub> pillars was ca. 3.3 eV. Both hectorite/TiO<sub>2</sub> and H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/(Pt,TiO<sub>2</sub>) were capable of hydrogen evolution following irradiation from a high pressure mercury arc ( $\lambda > 290$  nm) in the presence of methanol as a sacrificial hole acceptor and the hydrogen evolution was enhanced by co-incorporation of Pt, although hectorite and hectorite/Pt did not show photocatalytic activity. Incorporation of Pt or Pt and TiO<sub>2</sub> in the interlayer of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> has resulted in enhanced photo evolution of hydrogen, however, TiO<sub>2</sub> alone in the interlayer of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> showed adverse photocatalytic activity.

**Keywords:** intercalation; titania pillar; hexaniobate; photocatalyst

### **INTRODUCTION**

Recently, there has been an upsurge of interest in nanocrystalline semiconductor oxides because of their vital applications for solar fuel production and solar detoxification. For effective utilization of photo-induced charge carriers various studies have been performed.<sup>[1-9]</sup> Semiconductor pillars constructed in layered oxides are important because of their improved photocatalytic activity compared with that of unsupported semiconductors. Recent studies, from this

laboratory,<sup>[10,11]</sup> revealed that the incorporation of semiconductor in the interlayer of semiconductor sheet mitigates the recombination of photogenerated electrons and holes by separating them between the incorporated semiconductor and layer semiconductor sheet. In continuation of our studies on photofission of water, the photocatalytic activities of TiO<sub>2</sub> and Pt incorporated hectorite and H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> were evaluated.

## EXPERIMENTAL

**(a) Synthesis of hectorite/TiO<sub>2</sub> and hectorite/(Pt,TiO<sub>2</sub>)** Acetic acid (211 g) was first mixed with titanium tetraisopropoxide (50 g) for 30 min followed by the addition of water (64 g) to give a clear solution of [Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup>.<sup>[12,13]</sup> Then hectorite (2 g) was dispersed in the solution to allow intercalation of [Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> for 1 d at room temperature. The obtained sample, after being filtered off and washed with water, was calcined in air at 550°C for 2 h. The resulting materials is designated hectorite/TiO<sub>2</sub>. Hectorite/(Pt,TiO<sub>2</sub>) was prepared by reacting hectorite/TiO<sub>2</sub> (1.5 g) in 0.1 M [Pt(NH<sub>3</sub>)<sub>4</sub>]Cl<sub>2</sub> solution at room temperature for 3 d followed by the irradiation with UV light from a 450 W high pressure mercury lamp at room temperature for 10 h.

**(b) Synthesis of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/(Pt,TiO<sub>2</sub>)** Procedure employed for photodeposition of Pt into the layer of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> was the same as described for synthesis of hectorite/(Pt,TiO<sub>2</sub>). H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/TiO<sub>2</sub> and H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/(Pt,TiO<sub>2</sub>) were prepared by stepwise reactions of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> and H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/Pt with 50 vol.% C<sub>3</sub>H<sub>7</sub>NH<sub>2</sub> and [Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> solutions followed by photodecomposition of [Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> with UV light from a 450 W high pressure mercury lamp at room temperature for 10 h.

**(c) Characterization and photocatalytic reaction** Formation of TiO<sub>2</sub> and Pt pillars was confirmed by powder X-ray diffraction, UV-Vis absorption and

ICP atomic emission spectroscopy after alkali fusion with  $\text{Na}_2\text{CO}_3$  followed by dissolving the samples in 6 M HCl-15 wt%  $\text{H}_2\text{O}_2$ . The photoactivity of the catalyst was determined using an inner radiation type apparatus by measuring the volume of  $\text{H}_2$  evolved from 1250  $\text{cm}^3$  of 20 vol% methanol solution containing 1 g of dispersed catalyst at 60°C exposed to irradiation ( $\lambda > 290 \text{ nm}$ ) from a 450 W mercury arc with a gas burette.

## RESULTS AND DISCUSSION

DTA profiles of the samples are shown in Fig. 1.  $[\text{Ti}(\text{OH})_x(\text{CH}_3\text{COO})_y]^{z+}$  incorporated hectorite showed an exothermic peak at 453°C which corresponds to the combustion of  $\text{CH}_3\text{COO}$  group. The exothermic peak disappeared after calcination (500°C, 2 h), indicating that the  $\text{CH}_3\text{COO}$  group was decomposed.

FIGURE 1 DTA profiles of (a) hectorite and (b) hectorite/ $[\text{Ti}(\text{OH})_x(\text{CH}_3\text{COO})_y]^{z+}$  and (c) hectorite/ $\text{TiO}_2$ .

Figure 2 shows the powder XRD patterns of (a) hectorite and hectorite/ $[\text{Ti}(\text{OH})_x(\text{CH}_3\text{COO})_y]^{z+}$  (b) as-prepared, (c) calcined at 500°C and (d) calcined at 1000°C. The samples (c) showed no XRD peaks corresponding to  $\text{TiO}_2$  although sample (d) showed diffraction peak of rutile, indicating that  $\text{TiO}_2$  was incorporated in the interlayer.

FIGURE 2 Powder X-ray diffraction profiles of (a) hectorite and hectorite/[Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> (b) as-prepared, (c) irradiated UV-light, (d) calcined at 500°C and (e) calcined at 1000°C.

Figure 3 shows XRD patterns of (a) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>, (b) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/n-C<sub>3</sub>H<sub>7</sub>NH<sub>3</sub><sup>+</sup>, (c) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/[Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> and (d) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/TiO<sub>2</sub>. The main peak corresponding to (040) of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> changed significantly depending on the material incorporated.

FIGURE 3 XRD patterns of (a) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>, (b) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/n-C<sub>3</sub>H<sub>7</sub>NH<sub>3</sub><sup>+</sup>, (c) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/[Ti(OH)<sub>x</sub>(CH<sub>3</sub>COO)<sub>y</sub>]<sup>z+</sup> and (d) H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/TiO<sub>2</sub>.

The characteristics of the samples are summarized in Table 1. The gallery height which indicates the pillar height was less than 0.8 nm. The band gap energy of TiO<sub>2</sub> incorporated was slightly larger than that of unsupported TiO<sub>2</sub>. Photocatalytic hydrogen evolution behaviors from methanol solutions dispersed

TABLE 1 Summary of the characteristics of the prepared samples

Compound	Content (wt%)		Gallery height (nm)	Band gap (eV)
	Ti	Pt		
hectorite/TiO <sub>2</sub>	4.63	0	0.78	3.3
hectorite/(Pt, TiO <sub>2</sub> )	4.63	0.06	0.78	3.3
K <sub>4</sub> Nb <sub>6</sub> O <sub>17</sub>	0	0	0.50	3.4
H <sub>4</sub> Nb <sub>6</sub> O <sub>17</sub>	0	0	0.40	3.3
H <sub>4</sub> Nb <sub>6</sub> O <sub>17</sub> /TiO <sub>2</sub>	10.9	0	0.52	3.2
H <sub>4</sub> Nb <sub>6</sub> O <sub>17</sub> /Pt	0	0.26	0.40	3.3
H <sub>4</sub> Nb <sub>6</sub> O <sub>17</sub> /(Pt,TiO <sub>2</sub> )	11.6	0.26	0.52	3.2
TiO <sub>2</sub> (P-25)	59.9	0	-	3.1

various catalysts are shown in Fig. 4. Hectorite/TiO<sub>2</sub> was capable of hydrogen evolution and the activity was increased by co-incorporation of Pt, although hectorite and hectorite/Pt did not show photocatalytic activity. The activity of hectorite/TiO<sub>2</sub> was almost the same with that of P-25, although the TiO<sub>2</sub> content was 4.63 wt%. K<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> showed photocatalytic activity similar to P-25. The activity of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> is ca. 3.5 times greater than that of K<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>. Interestingly photocatalytic activity of H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub> was improved 4.2 and 8.5 times by the incorporation of Pt and co-incorporation of TiO<sub>2</sub> and Pt, but slightly decreased by incorporating TiO<sub>2</sub> alone. The promotion of hydrogen evolution in the

FIGURE 4 Cumulative amounts of hydrogen evolved by irradiating 450 W mercury arc ( $\lambda > 290$  nm) from the suspension of 1 g catalyst in 1250 cm<sup>3</sup> of 20 vol% methanol solution. (A)  $\circ$ : hectorite/TiO<sub>2</sub>,  $\bullet$ : hectorite/(TiO<sub>2</sub>, Pt),  $\blacktriangle$ : TiO<sub>2</sub> (Degussa P-25), (B)  $\blacktriangle$ : K<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>,  $\triangle$ : H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>,  $\bullet$ : H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/TiO<sub>2</sub>,  $\square$ : H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/Pt,  $\blacksquare$ : H<sub>4</sub>Nb<sub>6</sub>O<sub>17</sub>/(Pt, TiO<sub>2</sub>)

presence of Pt may be due to the electron transfer from  $\text{H}_4\text{Nb}_6\text{O}_{17}$  and/or  $\text{TiO}_2$  to Pt. When  $\text{H}_4\text{Nb}_6\text{O}_{17}/\text{TiO}_2$  was photoirradiated in methanol solution, the color of the samples changed from white to blue, indicating the reduction of  $\text{TiO}_2$ . It might be the reason why the incorporation of  $\text{TiO}_2$  alone showed adverse photocatalytic activity.

## CONCLUSION

The photocatalytic activity for  $\text{H}_2$  evolution from methanol solution was in the order  $\text{H}_4\text{Nb}_6\text{O}_{17}/(\text{Pt}, \text{TiO}_2) > \text{H}_4\text{Nb}_6\text{O}_{17}/\text{Pt} > \text{H}_4\text{Nb}_6\text{O}_{17} > \text{H}_4\text{Nb}_6\text{O}_{17}/\text{TiO}_2 > \text{hectorite}/(\text{Pt}, \text{TiO}_2) > \text{hectorite}/\text{TiO}_2 = \text{K}_4\text{Nb}_6\text{O}_{17} = \text{unsupporte TiO}_2$  (P-25).
