## **ABSTRACT**

$$R^{1}$$
  $H$   $+$   $R^{2}$   $R^{2}$   $R^{1}$   $R^{2}$   $R^{1}$   $R^{2}$   $R^{1}$   $R^{2}$   $R^{1}$   $R^{2}$   $R^{1}$   $R^{2}$   $R^{2$ 

An efficient procedure for the stereoselective synthesis of (*E*)- and (*Z*)-2-alkene-4-ynoates and -nitriles by a simple reaction of *vic*-diiodo-(*E*)-alkenes with acrylic esters and nitriles catalyzed by in situ prepared Pd(0) nanoparticles in water has been developed. Addition of acrylic esters leads to (*E*)-isomers exclusively, whereas (*Z*)-isomers are obtained in high stereoselectivity from reactions of acrylonitrile. The aqueous slurry of Pd nanoparticles is recycled. A probable mechanism has been suggested.

The 1,3-enyne unit is of considerable interest in organic synthesis as these moieties are present in many naturally occurring and biologically active compounds<sup>1</sup> such as terbinafine,<sup>2</sup> a potent drug for superficial fungal infections, and calichemicin  $\gamma_1$ ,<sup>3</sup> an effective antitumor antibiotic. The enynoates are also very useful synthetic intermediates.<sup>4</sup>

Only a limited number of procedures for the synthesis of conjugated enynes have been developed. One of the most prevalent protocols was Pd—Cu-catalyzed coupling between an alkyne or an organometallic alkyne and a vinyl halide.<sup>5,6</sup> Palladium-catalyzed oxidative alkynylation of alkenes has

also been demonstrated to produce enynes. Th.c Another alternative approach involved copper-catalyzed coupling of alkynes or alkyne derivatives with vinyl iodides. However, these methods suffer from some limitations such as preparation of an organometallic alkyne and stereodefined vinyl halide through lengthy procedures, poor functional group tolerance, and undesired side products resulting in low yields. Another with the products are sufficiently a simple reaction of *vic*-diiodoalkenes with an activated alkene catalyzed by Pd(0) nanoparticles in water (Scheme 1). The use of metal nanoparticles in reactions generating carbon—carbon bonds has attracted considerable attention in recent times because of their high reactivity, selectivity, and improved yields of products.

Scheme 1

$$R^{1} \downarrow H + R^{2} \xrightarrow{R^{2} PdCl_{2}, TBAB Na_{2}CO_{3}, H_{2}O} R^{1}$$

$$R^{1} = aryl, al kyl$$

$$R^{2} = CO_{2}Me, CO_{2}Bu, CN$$

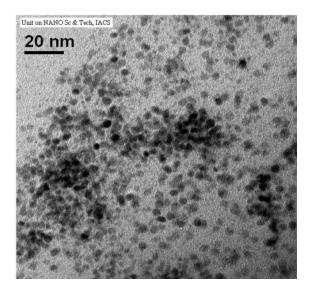

To identify a suitable catalyst and standardize the reaction condition the reaction of *vic-(E)*-diiodostyrene with methyl acrylate was studied with a variety of Pd catalysts at varied experimental conditions. These include Pd(OAc)<sub>2</sub>/*n*-Bu<sub>4</sub>NBr/Na<sub>2</sub>CO<sub>3</sub>, PdCl<sub>2</sub>/TBAB/Na<sub>2</sub>CO<sub>3</sub>/H<sub>2</sub>O, PdCl<sub>2</sub>/sodium dodecyl sulfate (SDS)/Na<sub>2</sub>CO<sub>3</sub>/H<sub>2</sub>O, PdCl<sub>2</sub>/TBAI/Na<sub>2</sub>CO<sub>3</sub>, and Pd-(dba)<sub>3</sub>/P(*o*-tol)<sub>3</sub>/Et<sub>3</sub>N/CH<sub>3</sub>CN. The results were summarized in Table 1. As evident from the results, the PdCl<sub>2</sub>/TBAB/

entry	catalytic system	time, condition	yield (%)
1	Pd(OAc) <sub>2</sub> , TBAB, Na <sub>2</sub> CO <sub>3</sub>	24 h (rt)	
2	Pd(OAc) <sub>2</sub> , TBAB, Na <sub>2</sub> CO <sub>3</sub>	microwave, 1 min (run time), 1 min (hold time), 100 °C, 100 W	20
3	Pd(OAc) <sub>2</sub> , TBAB, Na <sub>2</sub> CO <sub>3</sub> in water	6 h (80 °C)	65
4	PdCl <sub>2</sub> , TBAB, Na <sub>2</sub> CO <sub>3</sub> in water	6 h (80 °C)	82
5	PdCl <sub>2</sub> , SDS, Na <sub>2</sub> CO <sub>3</sub> in water	6 h (80 °C)	
6	PdCl <sub>2</sub> , TBAI, Na <sub>2</sub> CO <sub>3</sub> in water	12 h (80 °C)	10
7	Pd <sub>2</sub> (dba) <sub>3</sub> , P(o-tol) <sub>3</sub> , Et <sub>3</sub> N in CH <sub>3</sub> CN	24 h (reflux)	25

 $Na_2CO_3/H_2O$  system was found to produce the best results in terms of reaction time and yield and thus this reagent system is selected to be used for all the reactions.

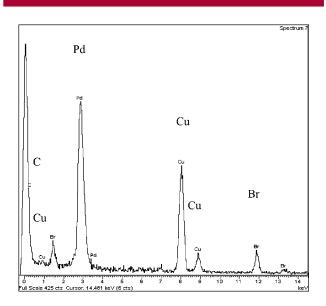

The experimental procedure is very convenient.<sup>10</sup> A simple reaction of *vic*-diiodoalkene and conjugated alkene in the presence of the PdCl<sub>2</sub>/TBAB/Na<sub>2</sub>CO<sub>3</sub>/H<sub>2</sub>O system provided the product. The palladium(0) nanoparticles were produced

in situ from this reagent system.<sup>11</sup> The formation of Pd nanoparticles was also detected by us from analysis of the reaction mixture by transmission electron microscopy (TEM) and Energy Dispersive X-ray spectroscopy (EDS). The TEM image and EDS showed the palladium nanoparticles with a size of 2–6 nm (Figures 1 and 2). The slurry of palladium

**Figure 1.** TEM image of Pd nanoparticle formed in the reaction mixture.

nanoparticles in water was recycled for two runs without any loss of efficiency. After two runs the reactivity decreases.

**Figure 2.** Energy dispersive X-ray spectra with use of a Cu-grid.

Several structurally diverse vic-diiodoalkenes underwent reactions with conjugated alkenes such as acrylic ester and

<sup>(10)</sup> Representative Experimental Procedure for Enyne Synthesis (entry 4, Table 2). To a stirred mixture of tetrabutylammonium bromide (323 mg, 1 mmol) and PdCl<sub>2</sub> (3.5 mg, 0.02 mmol) in water (3 mL) were added 1-(1,2-diiodovinyl)-4-methylbenzene (370 mg, 1 mmol), methyl acrylate (344 mg, 4 mmol; excess amount was used to avoid any loss during reflux), and Na<sub>2</sub>CO<sub>3</sub> (424 mg, 4 mmol). The mixture was then heated at 80 °C (oil bath) for 6 h (TLC). After being cooled the reaction mixture was extracted with Et<sub>2</sub>O (3  $\times$  10 mL). The ether extract was washed with water and brine and dried (Na2SO4). The solvent was evaporated under reduced pressure to leave a crude product that was purified by column chromatography over silica gel (ether-hexane 5:95) to afford the pure product, 5-ptolylpent-2-en-4-ynoic acid methyl ester (156 mg, 78%) as a yellow solid: mp 72-73 °C; IR (KBr) 2852, 2193, 1718, 1622 cm<sup>-1</sup>; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  2.33 (s, 3H), 3.78 (s, 3H), 6.28 (d, J = 15.7 Hz, 1H), 6.98 (d, J = 15.7 Hz, 1H), 7.15 (d, J = 8.1 Hz, 2H), 7.37 (d, J = 8.1 Hz, 2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 75 Hz) δ 21.7, 51.9, 86.0, 99.0, 119.2, 125.7, 129.1, 129.3 (2C), 132.0 (2C), 139.8, 166.6. Anal. Calcd for C<sub>13</sub>H<sub>12</sub>O<sub>2</sub>: C, 77.98; H, 6.04. Found: C, 77.88; H, 5.99. The combined aqueous layer and extract was concentrated under reduced pressure and was used for the next reaction.

nitriles catalyzed by in situ prepared Pd(0) nanoparticles in water to produce the corresponding 1,3-enyne esters and nitriles in good yields. The results are summarized in Table 2. The substituents on the aromatic ring of the diiodoalkenes

 Table 2.
 Cross-Coupling Reaction of Diiodo Compounds with

 Activated Alkenes

did not have any appreciable effect on the reaction. Both aryl- and alkyl-substituted alkenes participated in this reaction. However, reaction of dibromoalkenes in place of diiodoalkenes produced relatively low yields (30–40%). This method is compatible with a variety of substituents such as OMe, Cl, Br, and methylenedioxy. Significantly, coupling with acrylic esters always provided (*E*)-isomers exclusively, whereas acrylonitriles pushed the reaction to give (Z)-alkenes in high selectivity. This type of high selectivity with CO<sub>2</sub>R compared to the relatively small CN group is well addressed in Heck coupling.<sup>12</sup>

The mechanism of this reaction has also been investigated. Two alternative routes (a and b) as outlined in Scheme 2

**Scheme 2.** Possible Mechanism of the Coupling Reaction

have been considered. In route a the (E)-diiodoalkene is proposed to undergo elimination of HI to form iodoalkyne, which then couples with conjugated alkene in Heck fashion catalyzed by Pd(0) to form the enyne. Route b proposes the initial formation of an iodopalladium complex 1 via Heck coupling with conjugated alkene followed by  $\beta$ -elimination to form the hydridopalladium halide  $\pi$  complex 2, which may give rise to two isomers **A** and **B** by hydridopalladium halide elimination. Now, isomer **A** may lead to the product by syn elimination of HI, and on the other hand, **B** may produce the enyne through E-2 type elimination. On theoretical calculation it was found that **A** is energetically favorable by 0.3 kcal/mol compared to **B**. Thus, the formation of product through intermediate **A** is predicted.

Org. Lett., Vol. 9, No. 12, **2007** 

<sup>&</sup>lt;sup>a</sup> Yields refer to those of purified products characterized by IR, <sup>1</sup>H, and <sup>13</sup>C NMR spectroscopic data <sup>b</sup> Reaction was carried out under sonication.

B.; Adamo, C.; Jaramillo, J.; Gomperts, R.; Stratmann, R. E.; Yazyev, O.; Austin, A. J.; Cammi, R.; Pomelli, C.; Ochterski, J. W.; Ayala, P. Y.; Morokuma, K.; Voth, G. A.; Salvador, P.; Dannenberg, J. J.; Zakrzewski, V. G.; Dapprich, S.; Daniels, A. D.; Strain, M. C.; Farkas, O.; Malick, D. K.; Rabuck, A. D.; Raghavachari, K.; Foresman, J. B.; Ortiz, J. V.; Cui, Q.; Baboul, A. G.; Clifford, S.; Cioslowski, J.; Stefanov, B. B.; Liu, G.; Liashenko, A.; Piskorz, P.; Komaromi, I.; Martin, R. L.; Fox, D. J.; Keith, T.; Al-Laham, M. A.; Peng, C. Y.; Nanayakkara, A.; Challacombe, M.; Gill, P. M. W.; Johnson, B.; Chen, W.; Wong, M. W.; Gonzalez, C.; Pople, J. A. Gaussian 03, Revision B.03; Gaussian, Inc.: Pittsburgh, PA, 2003.

To check the feasibility of route a, a blank experiment with the starting diiodoalkene under identical experimental conditions without conjugated alkene was carried out, and significantly, no iodoalkyne as predicted in route a was obtained (eq 1). Thus, route a was eliminated. On the other hand, a reaction of *cis*-diiodostyrene with the same conjugated alkene under identical reaction conditions produced the corresponding 1,3-diene (eq 2). This certainly supports route b.

In conclusion, the present protocol using in situ prepared palladium(0) nanoparticles provides a very convenient and efficient method for a one-pot synthesis of conjugated enyne compounds from *vic*-diiodoalkenes. The significant improvements offered by this procedure are operational simplicity, excellent stereoselectivity, general applicability, high isolated yields of products, and reaction in aqueous medium avoiding hazardous organic solvents. To the best of our knowledge

this strategy for the stereoselective synthesis of conjugated enynoates and nitriles from diiodoalkenes involving palladium nanoparticles is novel and not reported earlier.
