STUDIES IN CYCLODIPHOSPHAZANES: SOME REACTIONS OF HEXACHLOROCYCLODI-PHOSPHAZANES (I) WITH AMINO ACIDS

I. M. ABD-ELLAH,† E. H. M. IBRAHIM and A. N. El-KHAZANDER Chemistry Department, Faculty of Science, Al-Azhur University, Nasr City, Cairo, Egypt

(Received June 14, 1986 in final form August 5, 1986)

Interaction of 1,3diaryl-2,2,2-4,4,4-hexachlorocyclodiphosphazanes (I_{-e}) with glycine, α - and β -alanine are described. The structure of the obtained aminocyclodiphosphazanes (II-V) were proposed on the basis of microanalytical data, ir, uv, ${}^{1}H$ n.m.r. and mass spectra. The mechanism of the reaction is also discussed.

The reaction of hexachlorocyclodiphosphazanes (I) with amino compounds has been investigated in great detail.¹⁻⁷ Analogous reactions with amino acids have received much less attention.

We have recently⁸ shown that the reaction of hexachlorocyclodiphosphazanes (I) with bifunctional reagents (such as urea and thiourea derivatives) furnished geminal and nongeminal aminocyclodiphosphazanes.

In the present investigation, glycine, α - and β -alanine reacted with halophosph(V)azanes (I_{a-g}) in acetonitrile to give a cyclosubstitution at the phosphorus atoms. The analytical data suggest structure (II_{a-g}) and (III_{a-e}) for these materials.

The interaction of o-Chlorophenylhexachlorocyclodiphosphazane (I_b) with glycine and o-Anisidylhexachlorocyclodiphosphazane (I_d) with α -alanine led to the formation of products for which we propose structures (IV) and (V) respectively.

$$R = C_6H_4$$
—Cl-o

 $R = C_6H_4$ —Cl-o

 $R = C_6H_4$ —OCH₃-o

The assignment of structure (IV) and (V) for the above compounds was based on: element analysis, uv spectra which demonstrated the presence of an absorption at $270-290 \,\mathrm{cm^{-1}}$ corresponding to the phosphazane four-membered ring, ir spectra which showed the characteristic vNH, vC=0, vP=0, vP=NH and vP=Cl stretching vibrations (see Table I), the appearance of the terminal P=0 group in (V) and its elemental analysis demonstrates that only one chlorine atom of the cyclodiphosphazane (I) has been replaced by an organic radical, the 1H n.m.r. spectra of (IV) and (V) are in good agreement with the proposed structures (see Table II).

MECHANISTIC PROPOSAL

We propose that the interaction between the amino acid and the hexachlorocyclodiphosphazane (I) is a nucleophilic reaction, involving direct substitution of halogen atoms by a nucleophilic attack on phosphorus, according to the following reaction scheme;

$$C_{3}P \xrightarrow{N} PCl_{3} \xrightarrow{NH_{3}CH_{2}COO^{-}} Cl_{3}P \xrightarrow{N} Cl_{N} NH_{2}CH_{2}COO^{-}$$

$$intermediate$$

$$I_{3-g}$$

$$NH_{3}CH_{2}COO^{-}$$

$$-HQ$$

$$C_{3}P \xrightarrow{NH_{3}CH_{2}COO^{-}} Cl_{3}P \xrightarrow{NH_{3}CH_{2}COO^{-}} Cl_{2}P \xrightarrow{NH_{3}$$

The direction of the course of the reaction depends on the nature of the amino acid and the type of substituents present (R). It is expected, however, that if (R) group attached to nitrogen is bulky and the amino acid contain a bulky group such an interaction will not be facile due to steric factors and led to the formation of an intermediate such as compound (IV) and (V).

The formation of the terminal P=O group in some products may be due to decomposition of (II) or air oxidation of the intermediate products.

The possibility, also exists that the nongeminal replacement pattern observed with compound (IV) and (V) may result from electron supply from the substituent to phosphorus, which lowers the reactivity of a Cl—P—N— unit below that of a Cl—P—Cl unit, or also due to steric factors in which little difficulty is encountered in effecting complete replacement of halogens in spite of

the steric retardation which must be involved and only a so called intermediate as the above compounds would be possible.

EXPERIMENTAL

Microanalytical determinations were carried out by the microanalytical laboratory, Cairo University. Infrared spectra were recorded on a Unicam Sp 1200 spectrophotometer (KBr technique). Ultraviolet spectra were recorded on a Unicam Sp 8000 ultraviolet recording spectrophotometer. ¹H n.m.r. spectra were measured on a Varian EM-360L, 60 MHz spectrometer and mass spectrometric measurements were carried out using a Finnigan MAT 1125 mass spectrometer by the direct inlet system.

PREPARATION OF COMPOUNDS

The preparation and purification of hexachlorocyclodiphosphazanes (I_{a-g}) has been described previously. ¹¹⁻¹² All the amino compounds used were B. D. H. reagentgrade products.

SYNTHESIS OF AMINOCYCLODIPHOSPHAZANE DERIVATIVES (II-V): GENERAL PROCEDURE

The solid amino acid (0.02 mole) was added in small portions to a well stirred solution of the hexachlorocyclodiphosphazane (I) (0.01 mole) in 100 ml acetonitrile during $\frac{1}{2}$ hour. After the addition was complete, the reaction mixture was heated under reflux for three hours. The solid formed subsequently dissolved with the evolution of HCl gas. After the completion of the reaction (HCl gas ceased to evolve), the reaction mixture was filtered while hot and the solid obtained was washed several times with acetonitrile, diethyl ether and dried in vacuo to give the corresponding aminocyclodiphosphazane derivatives (II-V); the data obtained are listed in Table III.
