(Received April 24, 1991; in final form July 23, 1991)

A new method for the synthesis of 1,3,4-thiadiazoles is described. Thus condensation of 4-methyl-4-phenyl-3-thiosemicarbazide with an aldehyde or ketone affords 1,1-disubstituted-6-[1-(arylethylidine)-amino]-2,5-dithiobiureas, rather than the anticipated 4,4-disubstituted-3-thiosemicarbazones. Refluxing the 2,5-dithiobiureas in ethanol containing acetic acid as catalyst gave the corresponding 1,3,4-thiadiazol-2-yl hydrazones. Furthermore, refluxing a solution of a 4,4-disubstituted-3-thiosemicarbazone in acetonitrile containing acetic acid as catalyst also afforded 1,3,4-thiadiazol-2-yl hydrazones in excellent yield. Arylethylideneamino-2,5-dithiobiurets are thought to be intermediates in the latter reaction.

Key words: 4,4-dialkyl-3-thiosemicarbazides; 4,4-dialkyl-3-thiosemicarbazones; 1,1-dialkyl-6-[1-(arylethylidene) amino]-2,5-dithiobiureas; (5-dialkylamino-1,3,4-thiadiazol-2-yl) hydrazones; acid catalyzed cyclization.

INTRODUCTION

The instability of 4,4-disubstituted-3-thiosemicarbazides (1) was first noted by Jensen. The decomposition of 4,4-dialkyl-3-thiosemicarbazides was studied by Larsen and Binderup, who showed that 4,4-dimethyl-3-thiosemicarbazide (1a) afforded 2-dimethylamino-5-mercapto-1,3,4-thiazole (2) upon standing at room temperature, whereas pyrolysis of 1a gave the dimethylammonium salt of 1-amino-2,5-dimercapto-1,3,4-triazole (3) in addition to the above mentioned thiadiazole. Pyrolysis of 4,4-diethyl-3-thiosemicarbazide (1b) or 4,4-dipropyl-3-thiosemicarbazide (1c) gave the corresponding 1-amino-6,6-dialkyl-2,5-dithiobiureas 4b, and 4c, respectively. Formation of heterocycles 2 and 3 was thought to result from different cyclization modes of intermediate aminobiureas 4a.

In preliminary publications, we have reported on the isolation of 1,3,4-thiadiazole-2-yl hydrazones during the attempted preparation of α -N-heterocyclic ketone thiosemicarbazones.^{3,4} In this communication we describe the application of the synthesis of 1,1-disubstituted-6-[1-(arylethylidene)amino]-2,5-dithiobiureas (5) to the preparation of 1,3,4-thiadiazole-2-yl hydrazones, 10.

1,1-Disubstituted-6-[1-(Arylethylidene)Amino]-2,5-Dithiobiureas (5)

Reaction of 4-methyl-4-phenyl-3-thiosemicarbazide 1d or related aromatic thiosemicarbazides with a variety of aromatic and heteroaromatic methyl ketones leads

to the formation of 1,1-disubstituted-6-[1-(arylethylidene)amino]-2,5-dithiobiureas, $\bf 5$, rather than the anticipated 4,4-disubstituted-3-thiosemicarbazones, $\bf 6$. This reaction indicates the ability of the *N*-alkylanilino moiety of $\bf 1d$ towards nucleophilic displacement.

1,3,4-Thiadiazol-2-yl Hydrazones (10)

When it became evident that reaction of 2-acetylpyridine with 4-methylphenyl-3-thiosemicarbazide (1d) could not be used to obtain 2-acetylpyridine 4-methyl-4-phenyl-3-thiosemicarbazone (8), the preparation of 8 by the condensation of methyl 3-[1-(2-pyridinyl)ethylidene]hydrazinecarbodithioate (9) with N-methylaniline was investigated. Carbodithioate 9 has been employed by us previously to prepare a large series of 4-aryl-3-thiosemicarbazones of 2-acetylpyridine. The hoped for 8 was not obtained by this reaction, but rather a product which could be formulated as either 1,3,4-thiadiazole 10a or 1,3,4-triazole 11. The structure of the product was established as 10a by a single-crystal X-ray study. Compound 10a could also be obtained by refluxing a solution in ethanol of 5a.

The formation of 10a might be rationalized as follows: reaction of 9 with N-methylaniline leads initially to the formation of thiosemicarbazone 8, which undergoes hydrolysis to afford thiosemicarbazide 1d and 2-acetylpyridine; reaction of 1d with either 8 or 9 results in formation of aminobiurea 5a; elimination of H_2S from 5a proceeds to give the cyclized product, 10a, resulting from the attack of one of the sulfur atoms, in thiol tautometric form, upon the remaining thiocarbonyl group

(cf. Scheme I). Attack of the N¹-nitrogen atom upon the C⁵-thiocarbonyl group would have led, alternatively, to triazole 11 (cf. Scheme II).

In support of the mechanism of Scheme I, we observed that a variety of conditions may be employed to prepare 1,3,4-thiadiazol-2-yl hydrazones (10). In Method A, a solution of a thiosemicarbazone in propionitrile containing a trace of acetic acid is heated at reflux. In Method B, a thiosemicarbazide is allowed to react with carbodithioate 9. In Method C, a thiosemicarbazone is condensed with a thiosemicarbazide. In each case, an aminobiurea is a likely intermediate.

The yields and properties of the various 1,3,4-thiadiazoles obtained by the above mentioned methods are summarized in Table I.

The identification of 1,3,4-thiadiazole **10a** as the reaction product was made on the basis of single crystal x-ray study (cf. Figure 1). The molecule is seen to consist of two planar segments; one plane is defined by the N-phenyl moiety, with all the remaining non-hydrogen atoms forming the second plane. The phenyl ring is rotated approximately 45° about the N-phenyl bond out of the main plane. Except for the normal single bond length of the N-methyl bond (1.464Å), all bond lengths fall between normal single and double bond values, indicating that conjugation extends throughout the molecule. Hydrogen-bonded dimers are apparent in the crystal; the NH group and the closest N atom of the thiadiazole ring act as donor and acceptor to the same atoms in a centrosymmetrically related molecule. The hy-

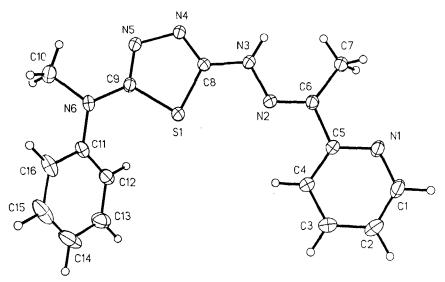

FIGURE 1 Diagram of 10a as determined by the X-ray analysis. Thermal ellipsoids have been drawn at the 20% probability level.

The attempted preparation of methyl 2-pyridinyl ketone (2-amino-1,3,4-thiadiazol-5-yl)hydrazone 10b through the reaction of carbodithioate 9 and thiosemicarbazide gave methyl 2-pyridinyl ketone (5-methylthio-1,3,4-thiadiazol-2-yl)hydrazone, 10c. The formation of 10c is difficult to rationalize unless one assumes that hy-

drolysis of 9 affords 2-acetylpyridine and methyl hydrazinecarbodithioate (14). Reaction of 14 with 9 could result in the formation of carbodithioate 15, which could undergo cyclization with loss of hydrogen sulfide, to give 10c. In support of this mechanism, we observe that reaction of carbodithioate 9 with 14 does indeed produce 1,3,4-thiadiazole 10c.

CONCLUSION

In some respects, the chemistry of the 4-alkylanilino-3-thiosemicarbazides 1d described in this communication is seen to resemble that which McElhinney has described for methyl hydrazinecarbodithioate (14).^{7,8} This author has shown that reaction of 14 with primary or secondary amines gives reasonable yields of thiosemicarbazides,⁷ 1, as well as the corresponding amine salts of 3.⁸ 1-Amino-2,5-dithiobiureas (4) or methyl carbodithioate (16), are likely intermediates in this cyclization reaction. Under the basic conditions employed by McElhinney⁸ (as well as for Larsen and Binderup²), the nucleophilicity of the N⁶-nitrogen atom may be enhanced by deprotonation. Subsequent attack of the N⁶-nitrogen atom upon the C²-thiocarbonyl group with expulsion of the methyl mercaptan gives triazole 3. Conversion of 4 to 3 presumably follows a similar course. However, the cyclization of the 2,5-dithiobiureas to give 1,3,4-thiadiazoles rather than 2-mercapto-1,3,4-triazoles suggests that under the acidic conditions investigated in this study, a thiocarbonyl sulfur atom acts as the intramolecular nucleophile.

EXPERIMENTAL

Melting points were determined on a Thomas Hoover apparatus and are uncorrected. Infrared spectra were recorded as KBr discs on a Perkin Elmer mdl 283 spectrophotometer. Proton magnetic resonance spectra were recorded on a Varian HR 220 spectrometer in CDCl₃ solution with tetramethylsilane as the internal standard. Microanalyses were performed by Spang Microanalytical Laboratory, Eagle Harbor, MI. Satisfactory microanalyses ($\pm 0.3\%$) were obtained for each compound.

Method A: Preparation of 1,3,4-thiadiazol-2-yl hydrazones from thiosemicarbazones. This method is exemplified by the following preparation of 10h: A solution of 1.0 g (33 mmole) of 3-azabicyclo[3.2.2]-nonane-3-thiocarboxylic acid 2-[1-(2-pyridinyl)ethylidene]hydrazide¹⁰ in 8 mL of EtCN was treated with a drop of glacial HOAc and heated at reflux at 48 h. The reaction mixture was chilled and the crystals which separated were collected, affording 248 mg (44%) of 10h, mp 236-238°C: ir 1613, 1580, 1510, 1457, 1437, 1225, 1205, 970, 777 cm⁻¹.

Anal. Calcd. for C₁₇H₂₂N₆S: C, H, N, S.

Method B: Preparation of 1,3,4-thiadiazol-2-yl hydrazones by reaction of methyl 3-[1-(2-pyridinyl)ethylidene]hydrazinecarbodithioate¹⁰ (9) and a thiosemicarbazide. This method is exemplified in the following preparation of 10d: A solution of 1.89 g (4.43 mmole) of 9¹⁰ and 1.0 g of 4,4-dimethyl-3-thiosemicarbazide⁷ in 10 mL of MeCN was heated at reflux for 10 h. The reaction mixture was then chilled and the crystals which had separated were collected. This afforded 795 mg (69%) of 10d (after recrystallization from DMF), mp 232–233°C: ir 1593, 1575, 1535, 1418, 1287, 1155, 780, 761, 742, 719, 675 cm⁻¹.

Anal. Calcd. for C₁₇H₁₄N₆S: C, H, N, S.

Method C: Preparation of 1,3,4-thiadiazol-2-yl hydrazones by the reaction of a thiosemicarbazone and a thiosemicarbazide. This method is exemplified by the reaction of $1\underline{H}$ -hexahydroazepine-1-thiocarboxylic acid 2-[1-(2-pyridinyl)ethylidene]hydrazide¹⁰ and $1\underline{H}$ -hexahydroazepine-1-thiocarboxylic acid hydrazide. ¹⁰ (1e): A solution of 1.55 g (8.66 mmole) of 1e and 2.89 g (8.66 mmole) of $1\underline{H}$ -hexahydroazepine-1-thiocarboxylic acid 2-[1-(2-pyridinyl)ethylidene]hydrazide in 5 mL of EtCN containing 2 mL of glacial HOAc was heated at reflux for 18 h. The solution was chilled and the crystals which separated were collected, affording 1.73 g (63%) of 10f, mp 216-218°C: ir 2930, 2830, 1590, 1575, 1523, 1429, 1287, 1150, 777 cm⁻¹. nmr δ 10.64 (br. s, NH), 8.52 ('d'', 1H, J = 4.5, H₆), 8.07 ("d", 1H, J = 8 Hz, H₃), 7.67 ("t of ds", 1H, J = 6 Hz, J = 2 Hz, H₄), 7.18 ("t', 1H, J = 5.5 Hz, H₅), 2.58 (t, 4H, J = 5.5 Hz, —CH₂NCH₂—), 2.54 (s, 3H, C—CH₃), 1.84 (4H), 1.61 (4H).

Anal. Calcd. for C₁₅H₂₀N₆S: C, H, N, S.

Methyl 2-pyridinyl ketone (5-methylthio-1,3,4-thiadiazol-2-yl)hydrazone (10c). A solution of 4.50 g (20 mmole) of carbodithioate 9 and 1.82 g (20 mmole) of thiosemicarbazide in 200 mL of EtOH was heated at reflux for 28 h. The pale yellow needles which separated were collected, affording 1.66 g (31%) of 10c, mp 229–231°C dec. An analytical sample prepared by recrystallization from DMF had mp 234–235°C: ir 3150, 3050, 3010, 2930, 1620, 1587, 1563, 1472, 1418, 1295, 780 cm⁻¹; mmr (d_6 -DMSO + CDCl₃) δ 8.56 ("d", 1H, J = Hz, H₆), 7.95 ("d", 1H, J = 8 Hz, J = 1 Hz, H₃), 7.80 ("t of ds", 1H, J = 8 Hz, J = 1.5 Hz, H₄), 7.34 ("t", 1H, J = 7 Hz, J = 1 Hz, H₅), 2.66 (s, 3H, S—CH₃), 2.39 (s, 3H, C—CH₃).

Anal. Calcd. for $C_{10}H_{11}N_5S_2$: C, H, N, S.

X-ray Experimental $C_{16}H_{16}N_6S$, triclinic, $P\overline{1}$, crystal size = $(.5 \times .7 \times .15)$ mm, cell constants (room temp.) based on least-squares refinement of 25 reflections are a = 7.743 (10)Å, b = 8.963 (12)Å, c = 11.964 (12)Å, α = 97.38 (8)°, β = 101.61 (8)°, and γ = 91.58 (9)°, z = 2. dcalc = 1.34 g cm⁻³, u = 2.0 cm⁻¹. Nicolet R3 diffractometer (MoK α , λ = 0.71069, graphite monochromator), θ -2 θ scan technique, $2^{\circ} \le 2\theta \le 45^{\circ}$, $-h \pm k \pm 1$, 2112 reflections. Data corrected for Lorentz-polarization effects, no absorption correction or extinction correction. Solved by direct methods, refined by full-matrix least-squares (on F) with anisotropic thermal parameters for non-H atoms and isotropic thermal parameters for H atoms (267 variables). Final R = 0.038 (Rw = 0.044) for 1793 reflections with $|F_0| \ge 3$ F₀, goodness of fit = 1.41, maximum absolute density in final difference map = .180eÅ³. All programs from Nicolet SHELXTL program library.^{11,12}
