PREPARATION AND REACTIONS OF BULKY ETHYNYLPHOSPHINES

Katsunori Nishide, Shigekazu Ito, and Masaaki Yoshifuji
 Tohoku University, Japan

(Received July 29, 2001; accepted December 25, 2001)

Ethynylphosphine system is expected to show the interaction between the lonepair of phosphorus and π -orbital of $C\equiv C$ group, and some spectroscopic and theoretical investigations have been performed so far.¹ Although some ethynylphosphines have been derived, their instability limits the synthetic and structural study.² We report the preparation and some reactions of ethynylphosphines possessing the bulky 2,4,6-tri-*t*-butylphenyl (Mes^*) group. Ethynylbenzene **1** was lithiated and allowed to react with chlorobis(dimethylamino)phosphine to afford **2**, and **2** was chlorinated with HCl to afford **3** as a thermally stable solid. Dichlorophosphine **3** was allowed to react with $LiAlH_4$ to give the corresponding primary phosphine **4** as a thermally-stable compound and the product was characterized by spectroscopic study. The Tungsten complex **5** derived from **4** reacted with Mes^*PCl_2 to afford a tungsten complex of diphosphene **6**.
