## SYNTHESIS OF NOVEL TRIARYLPHOSPHINES BEARING A *m*-TERPHENYL-BASED DENDRIMER-TYPE FRAMEWORK

*Kei Goto, Yoshiko Ohzu, Hiroyuki Sato,  
and Takayuki Kawashima*  
*University of Tokyo, Japan*

(Received July 29, 2001; accepted 2001)

There has been considerable interest in the design and development of bulky phosphine ligands. Usually increasing the steric bulk of monodentate phosphines means the increase of the steric congestion around the phosphorus center, which results in both the larger cone angle and the larger substituent-phosphorus-substituent (SPS) angle. Here we report the synthesis and structure of novel nano-scale triarylphosphines **1** bearing a dendrimer-type framework. Phosphine **1a** was prepared by lithiation of the corresponding *m*-terphenyl bromide followed by the reaction with  $\text{PCl}_3$ .<sup>\*</sup> X-ray crystallographic analysis established the structure of **1a**, indicating that the cone angle of **1a** is about  $174^\circ$ , which is comparable with that of tri-*t*-butylphosphine ( $182^\circ$ ), while the SPS angle of **1a** is  $101^\circ$ , which is slightly smaller than that of triphenylphosphine (av.  $107^\circ$ ). Phosphine **1b** bearing isopropyl groups was also prepared by the similar method.
