SILICA GEL CATALYZED CONVERSION OF DIALKYL 2-(2-HYDROXY-1-NAPHTHYL)-3-(1,1,1- TRIPHENYL- λ^5 -PHOSPHANYLIDENE) SUCCINATES TO ALKYL 3-OXO-3H-BENZO[*f*]CHROMENE-1- CARBOXYLATES IN SOLVENT-FREE CONDITIONS

Ali Ramazani and Ali Souldozi

(Received November 19, 2002)

*Protonation of the highly reactive 1:1 intermediates produced in the reaction between triphenylphosphine and dialkyl acetylenedicarboxylates by 2-hydroxynaphthalene leads to vinyltriphenylphosphonium salts, which undergo aromatic electrophilic substitution reaction with conjugate base to produce dialkyl 2-(1-hydroxy-2-naphthyl)-3-(1,1,1-triphenyl- λ^5 -phosphanylidene) succinates. Silica gel was found to catalyze conversion of dialkyl 2-(1-hydroxy-2-naphthyl)-3-(1,1,1-triphenyl- λ^5 -phosphanylidene) succinates to alkyl 3-oxo-3H-benzof[*f*]chromene-1-carboxylates in solvent-free conditions at 60°C in fairly good yields.*

Keywords: Acetylenic esters; 2-hydroxynaphthalene; silica gel; triphenylphosphine; vinyltriphenylphosphonium salt

Chromene skeleton compounds occupy an important place in the realm of natural and synthetic organic chemistry. They are used as anticoagulants, additives in food and cosmetics, and in the preparation of insecticides, optical brighteners, and dispersed fluorescent and laser dyes.¹ Silica gel as an additive promotes the Wittig reactions of phosphorus ylides with aldehydes, including sterically hindered aldehydes to increase the rate and yields of alkenes.^{2,3} In the past we have established a convenient, one-pot method for preparing stabilized phosphorus ylides utilizing in situ generation of the phosphonium salts.^{4–9} In this article, we report on the catalytic activity of silica gel powder in the conversion of dialkyl 2-(1-hydroxy-2-naphthyl)-3-(1,1,1-triphenyl- λ^5 -phosphanylidene) succinates to alkyl

SCHEME 1

3-oxo-3*H*-benzo[*f*]chromene-1-carboxylates in solvent-free conditions^{9,10} at 60°C in fairly good yields (Scheme 1).

RESULTS AND DISCUSSION

The ylide (**5**) may result from initial addition of triphenylphosphine **1** to the acetylenic ester **2** and concomitant protonation of the 1:1 adduct, followed by the electrophilic attack of the vinyltriphenylphosphonium cation on the aromatic ring at *ortho* α -position relative to the strong activating group (Scheme 1). TLC indicated formation of ylides **5** in CH_2Cl_2 .

Silica gel powder was found to catalyze conversion of ylides **5** to alkyl 3-oxo-3*H*-benzo[*f*]chromene-1-carboxylates (**6a–b**) in solvent-free conditions^{9,10} at 60°C in fairly good yields (Scheme 1). TLC indicated that the reaction was completed after 1 h. In the absence of silica gel powder, this reaction was completed (**6a**) at reflux temperature (CH_2Cl_2 as solvent) after 120 h.¹¹ The structures **6a–b** were deduced from their 1H NMR and ^{13}C NMR spectra and via x-ray single crystal (for **6a**) structure determination (Figure 1).¹²

In summary, we have found that silica gel powder is able to catalyze conversion of ylides **5** to compounds **6** in solvent-free conditions. Other aspects of this process are under investigation.

EXPERIMENTAL

Melting points were measured on an Electrothermal 9100 apparatus and are uncorrected. 1H and ^{13}C NMR spectra were measured with a Bruker DRX-500 Avance spectrometer at 500 and 125 MHz respectively.

FIGURE 1 ORTEP drawing of **6a**.

General Procedure for the Preparation of Ylides **5** and Compounds **6a–b**

To a magnetically stirred solution of triphenylphosphine **1** (0.524 g, 2 mmol) and 2-hydroxynaphthalene **3** (0.288 g, 2 mmol) in CH_2Cl_2 (8 ml) was added dropwise a mixture of **2** (2 mmol) in CH_2Cl_2 (6 ml) at -10°C over 15 min. The mixture was allowed to warm to room temperature. Silica gel powder (2 g) was added and the solvent was evaporated. Dry silica gel and the residue were heated for 1 h at 60°C and then placed over a column of silica gel (10 g). The column chromatography was washed using ethyl acetate–light petroleum ether (1:10) as eluent. The solvent was removed under reduced pressure and the products were obtained as reddish crystals (**6a–b**). The characterization data of the compounds (**6a–b**) are given below.

Methyl 3-oxo-3H-benzo[f]chromene-1-carboxylate (6a)

Reddish crystals, m.p. $138.2\text{--}138.8^\circ\text{C}$; Yield: 56%. ^1H NMR (CDCl_3) δ_{H} : 4.08 (3H, s, OCH_3), 6.60 (1H, s, vinylic), 7.48 (1H, d, $^3J_{\text{HH}} =$

9.0 Hz, arom.), 7.5–7.7 (2H, m, 2CH, arom.), 7.78 (1H, d, $^3J_{\text{HH}} = 8.4$ Hz, arom.), 7.92 (1H, d, $^3J_{\text{HH}} = 7.8$ Hz, arom.), 8.03 (1H, d, $^3J_{\text{HH}} = 9.0$ Hz). ^{13}C NMR (CDCl_3) δ_{C} : 53.58 (CH_3), 115.62, 117.41, 123.32, 126.16, 128.20, 129.51, and 134.62 (7 CH), 110.12, 128.05, 130.96 and 145.93 (4C), 154.96 (C–O), 159.51 and 167.82 (2C=O, ester).

Ethyl 3-oxo-3H-benzo[f]chromene-1-carboxylate (6b)

Reddish crystals, m.p. 135.9–136.4°C; Yield: 60%. ^1H NMR (CDCl_3) δ_{H} : 1.43 (3H, t, $^3J_{\text{HH}} = 7.1$ Hz, CH_3 of Et); 4.56 (2 H, q, $^3J_{\text{HH}} = 7.1$ Hz, OCH_2 of Et); 6.59 (1H, s, vinylic), 7.48 (1H, d, $^3J_{\text{HH}} = 9.0$ Hz, arom.), 7.5–7.7 (2H, m, 2CH, arom.), 7.86 (1H, d, $^3J_{\text{HH}} = 8.4$ Hz, arom.), 7.92 (1H, d, $^3J_{\text{HH}} = 7.8$ Hz, arom.), 8.03 (1H, d, $^3J_{\text{HH}} = 9.0$ Hz). ^{13}C NMR (CDCl_3) δ_{C} : ^{13}C NMR (CDCl_3) δ_{C} : 13.96 (CH_3 of Et); 63.06 (OCH_2); 115.48, 117.37, 123.56, 126.10, 128.00, 129.42, and 134.52 (7 CH), 110.11, 128.02, 130.91 and 146.33 (4C), 154.91 (C–O), 159.58 and 167.34 (2C=O, ester).
