(Received in revised form 10 July 1995)

**Key Word Index**—*Daldinia* sp.; fungus; Ascomycetes; Xylariaceae; 10-phenyl-(11)-cytochalasans; 10-phenyl-22-oxa-(12)-cytochalasan; cytochalasins; hydroperoxide.

Abstract—Eleven new cytochalasins have been isolated from an unidentified *Daldinia* sp. of fungus. These were identified as 10 10-phenyl-(11)-cytochalasans and one 10-phenyl-22-oxa-(12)-cytochalasan. The latter metabolite is the first report of a 22-oxa-(12)-cytochalasan. Their structures were established by spectroscopic methods, in particular by high-field NMR spectroscopy.

#### INTRODUCTION

We have previously reported on the isolation and structure elucidation of five new 10-phenyl-(11)-cytochalasans (1-5) from an unidentified Daldinia sp. of fungus belonging to the Xylariaceae [1]. From the organic extract of the same species, we have now isolated a further 11 cytochalasins (6-16). Ten of these belong to the 10-phenyl-(11) class of cytochalasans (6-15) while the other is a 10-phenyl-22-oxa-(12)-cytochalasan (16). This latter compound is the first in a new class of cytochalasans. In this paper, we report on the isolation and characterization of these 11 new cytochalasins (6-16).

### RESULTS AND DISCUSSION

Chromatography on silica gel and preparative HPLC of the ethyl acetate extract of the *Daldinia* sp. yielded a further 11 new cytochalasins (6–16). Their structures were established by detailed analysis of the NMR spectra, which included phase-sensitive DQF-COSY [2], HMQC [3], HMBC [4] and NOESY [5] experiments, and also by comparison with the NMR data for cytochalasins 1–5 [1].

The HRMS of cytochalasin 6 gave the molecular formula  $C_{28}H_{35}NO_3$  ([M]<sup>+</sup> at m/z 433.2621). The intense fragments at m/z 342 and 91 in its MS suggested the presence of a benzyl group and its infrared spectrum showed the presence of hydroxyl, amidic and enone groups. The <sup>1</sup>H (Table 1) and <sup>13</sup>C (Table 2) NMR data are very similar to those of cytochalasin 1 [1] except for the absence of an oxygenated quaternary carbon with a tertiary methyl attached and the presence of a methine  $[\delta_H 2.63 \ (m); \delta_C 34.3]$  with a secondary methyl attached  $[\delta_H 1.14 \ (d, J = 7.1 \ Hz); \delta_C 17.6]$ . Moreover, in the

<sup>1</sup>H NMR spectrum both H-19 [ $δ_H$  6.52 (dd, J = 16.1, 6.8 Hz)] and H-20 [ $δ_H$  7.05 (dd, J = 16.1, 1.5 Hz)] appear as double doublets. This evidence reveals cytochalasin **6** as (11)-cytochalasa-6(12),13,19-triene-1,21-dione-16,18-dimethyl-7-hydroxy-10-phenyl-(7S\*,13E,16S\*,18R\*,19E).

Cytochalasin 7 has the molecular formula  $C_{28}H_{37}NO_3$  ([M]<sup>+</sup> at m/z 435.2772) corresponding to the dihydro derivative of 6. Its NMR data (Tables 1 and 2) contained signals for two methylene groups [ $\delta_H$  1.42 (m), 1.33 (m);  $\delta_C$  27.1 (t) and  $\delta_H$  3.56 (br dd, J=17.0, 8.0 Hz); 1.78 (m);  $\delta_C$  37.0 (t)] and a saturated ketone ( $\delta_C$  211.2) instead of the proton and carbon signals belonging to the enone moiety in 6. Furthermore, the infrared absorption band attributable to the enone group of 6 was no longer present in the spectrum of 7: The above spectral data indicates that 7 is the 19,20-dihydro derivative of 6. The structure of 7 is therefore represented as (11)-cytochalasa-6(12),13-diene-1,21-dione-16,18-dimethyl-7-hydroxy-10-phenyl-(7S\*,13E,16S\*,18S\*).

The HRMS of cytochalasin 8 showed an [M]<sup>+</sup> at m/z 451.2721, indicating a molecular formula of  $C_{28}H_{37}NO_4$ . The NMR spectra of 8 are similar to cytochalasin 7 (Tables 1 and 2). The differences can be explained by the presence of a secondary alcohol [ $\delta_H$  3.49 (br t, J=7.3 Hz);  $\delta_C$  70.3 (d)] in 8 relative to 7 and the absence of a methylene carbon. Thus 8 is (11)-cytochalasa-6(12),13-diene-1,21-dione-7,19-dihydroxy-16,18-dimethyl-10-phenyl-(75\*,13E,165\*,18R\*,19R\*).

Cytochalasin 9 has the molecular formula  $C_{28}H_{35}NO_3$  ([M]<sup>+</sup> at m/z 433.2610). Comparison of the <sup>1</sup>H (Table 1) and <sup>13</sup>C (Table 2) NMR data of 9 with cytochalasin 1 [1] showed similarities. It is clear that 1 and 9 have the same macrocyclic ring, but 9 has a modified six-membered ring relative to 1. This dissimilarity is explained by a trisubstituted double bond  $[\delta_H 5.46 \ (m); \ \delta_C 140.2 \ (s), 125.5 \ (d): \ \delta_H 1.75 \ (br \ s); \ \delta_C 20.0 \ (q)]$  in 9 relative to 1 instead of a secondary alcohol and

<sup>\*</sup>Values may be interchanged.

Assignments confirmed by two-dimensional experiments (HMQC and HMBC).

exomethylene groups. Therefore, cytochalasin 9 was formulated as (11)-cytochalasa-6,13,19-triene-1,21-dione-18-hydroxy-16,18-dimethyl-10-phenyl-(6Z,13E,16S\*, 18S\*,19E).

Cytochalasin 10 has the molecular formula  $C_{28}H_{35}NO_4$  ([M]<sup>+</sup> at m/z 449.2565) and it is obvious from its NMR spectra (Tables 1 and 2) that it is the C-12 primary alcohol derivative [ $\delta_H$  4.10 (br d, J = 13.2 Hz); 4.07 (br d, J = 13.2 Hz):  $\delta_C$  63.2 (t)] of cytochalasin 9. Thus, cytochalasin 10 is (11)-cytochalasa-6,13,19-triene-1,21-dione-12,18-dihydroxy-16,18-dimethyl-10-phenyl-(6E,13E,16S\*,18S\*,19E).

The molecular formula of cytochalasin 11 is  $C_{28}H_{35}NO_3$ , as determined by HRMS ([M]<sup>+</sup> at m/z 433.2622). The NMR data (Tables 1 and 2) for 11 reveal that it has the same six-membered ring as cytochalasin 9, but the macrocyclic ring is a little different from the cytochalasins isolated to date. The difference can be clarified by a C-17 secondary alcohol [ $\delta_H$  3.88 (m);  $\delta_C$  79.4] in 11 relative to the macrocyclic ring system of cytochalasin 6. The NOEs observed between (i) H-17 and H-20 and (ii) H-17 and H<sub>2</sub>-15, indicate the configuration at C-17 is R. Cytochalasin 11 is therefore (11)-cytochalasa-6,13,19-triene-1,21-dione-17-hydroxy-16,18-dimethyl-10-phenyl-(6Z,13E,16 $S^*$ ,17 $R^*$ ,18 $S^*$ ,19E).

The NMR data (Tables 3 and 4) of cytochalasin 12,  $C_{28}H_{35}NO_4$  ( $\lceil M \rceil^+$  at m/z 449.2567), show that it has the

same macrocyclic ring as 1 [1], but differs from 1 by the presence of a trisubstituted epoxide  $[\delta_{\rm H}~2.91~(d,J=5.9~{\rm Hz});~\delta_{\rm C}62.2~(d),~57.7~(s)]$  and a tertiary methyl  $(\delta_{\rm H}~1.22~(s,~3{\rm H});~\delta_{\rm C}~19.5~(q)]$  in the six-membered ring instead of a secondary alcohol and exomethylene groups. The NOEs observed between (i) H-7 and H<sub>3</sub>-12, (ii) H-7 and H-13 and (iii) H-3 and H<sub>3</sub>-12 indicate the configuration at C-7 is  $S~(cis-6\beta,7\beta$ -epoxide). Thus, cytochalasin 12 is (11)-cytochalasa-13,19-diene-1,21-dione-6,7-epoxy-18-hydroxy-16,18-dimethyl-10-phenyl- $(7S^*,13E,16S^*,18E^*,19E)$ .

When comparing the  $^{1}$ H (Table 3) and  $^{13}$ C (Table 4) NMR data of cytochalasin 13,  $C_{28}H_{37}NO_{5}$  ([M]<sup>+</sup> at m/z 467.2663), with cytochalasins 3 [1] and 12 (Tables 3 and 4) it is clear that 13 is a 10-phenyl-(11)-cytochalasan containing the macrocyclic ring of 3 and the six membered ring of 12. Cytochalasin 13 is therefore (11)-cytochalas-13-ene-1,21-dione-6,7-epoxy-18,19-dihydroxy-16,18-dimethyl-10-phenyl-(7S\*,13E,16S\*,18S\*, 19R\*).

Analysis of the NMR spectra (Tables 3 and 4) for cytochalasin 14,  $C_{28}H_{33}NO_5$  ([M]<sup>+</sup> at m/z 463.2364), and 1 [1] indicates that these are 10-phenyl-(11)-cytochalasans with similar structures. The most significant difference is that the <sup>13</sup>C NMR spectrum (Table 4) of cytochalasin 14 contains one more carbonyl carbon ( $\delta_C$  209.9 (s)) and one less methylene carbon relative to the

<sup>13</sup>C NMR spectrum of 1. From a more detailed analysis of the one- and two-dimensional NMR spectra of 14 it is clear that it contains a carbonyl group at C-17. Thus, cytochalasin 14 is (11)-cytochalasa-6(12),13,19-triene-1,17,21-trione-7,18-dihydroxy-16,18-dimethyl-10-phenyl-(7S\*,13E,16S\*,18R\*,19E).

Cytochalasin 15 has the molecular formula  $C_{28}H_{35}NO_5$  ([M]<sup>+</sup> at m/z 465.2514). Comparison of the NMR data (Tables 1-4) shows that 15 is a 10-phenyl-(11)-cytochalasan with the same macrocyclic ring as 11, but with a different six-membered ring from the cytochalasins isolated to date. The NMR spectra show that this ring contains a tetrasubstituted double bond  $(\delta_{\rm C} 130.9, 128.3)$ , two vinyl methyl groups [ $\delta_{\rm C} 17.3, 14.1$ ;  $\delta_{\rm H}$  1.73, 1.45 (both br s)] and an oxygenated methine  $[\delta_{\rm C} 83.3; \delta_{\rm H} 4.32 \ (br \ d, J = 10.0 \ {\rm Hz})]$ . The six-membered ring carbon skeleton shown for structure 15 was suggested by this data and confirmed by two-dimensional experiments. The 7-OH derivative of cytochalasin 15 was ruled out because when the <sup>13</sup>CNMR data for 15 (Table 4) were compared with cytochalasans [6-8] containing the same six-membered ring part structure, they revealed that C-7 in cytochalasin 15 ( $\delta_{\rm C}$  82.0 in DMSO- $d_{\rm 6}$ at 200 MHz) is substantially more deshielded (ca 14 ppm) than expected for an allylic alcohol and is more characteristic of an allylic carbon bearing a hydroperoxy group

[9–11]. This is supported by the signal at  $\delta_{\rm H}$  7.36 (s) as such low field signals are characteristic of a hydroperoxy group [12, 13]. Moreover, the HRMS gave ions at m/z 449.2559 (6%) for  $C_{28}H_{35}NO_4$  and 431.2456 (5%) for  $C_{28}H_{33}NO_3$  which reflect fragmentations of [M – O]<sup>+</sup> and [M –  $H_2O_2$ ]<sup>+</sup>, respectively, and support the presence of a hydroperoxy group [9, 12]. This evidence reveals cytochalasin 15 as (11)-cytochalasa-5,13-19-triene-1,21-dione-7-hydroperoxy-17-hydroxy-16,18-dimethyl-10-phenyl-(5Z,7S\*,13E,16S\*,17R\*,18S\*,19E). This is the first report of a cytochalasan hydroperoxide. However, cytochalasin U, isolated from *Phoma exigua* var. heteromorpha, has a peroxyester group [14].

Cytochalasin 16 has the molecular formula  $C_{28}H_{35}NO_5$  ([M]<sup>+</sup> at m/z 465.2513), as determined by HRMS. The <sup>1</sup>H and <sup>13</sup>C NMR data (Tables 3 and 4) are very similar to those for cytochalasin 1 [1]. The differences in NMR data can be explained by the enone system in 1 being changed to an  $\alpha,\beta$ -unsaturated ester in 16  $[\delta_{\rm H} 7.23 \ (d, J = 15.9 \ {\rm Hz}); 5.75 \ (d, J = 15.9 \ {\rm Hz}). \ \delta_{\rm C} 166.9$ (s), 159.0, 118.9 (both d)], thus increasing the size of the macrocyclic ring in 16 to 12 atoms. This is supported by the additional oxygen in the molecular formula of 16 relative to 1 and also the large downfield shift of C-9 (20.3 ppm) in 16 relative to 1. Thus, cytochalasin 16 is 22-oxa-(12)-cytochalasa-6(12),13,19-triene-1,21-dione-7,18-dihydroxy-16,18-dimethyl-10-phenyl- $(7S^*,13E,$ 16S\*,18S\*,19E). This is the first report of a 22-oxa-(12)cytochalasan.

NOESY experiments on cytochalasins 6-16 reveal that they have the same relative stereochemistry and the same conformation for the macrocyclic ring as cytochalasins 1-5, even cytochalasin 16 with 12 atoms in the macrocyclic ring. These results further support the deduction made by Buchanan et al. [1] for cytochalasins 1-5: "despite the large size of the macrocyclic ring and different functionalities the macrocyclic framework is a stable, relatively rigid structural unit and is not as flexible as might be expected."

The cytochalasins isolated from this fungal source, which possess a C-20 methylene group (2-5, 7, 8, 13), have their H-20S proton in an unusually downfield-shifted position. This is because the H-20S proton is lying in the plane of the adjacent carbonyl groups  $\pi$ -system and thus experiences deshielding by the anisotropic effect.

# EXPERIMENTAL

General. TLC and PLC: Merck precoated silica gel 60  $F_{254}$  and visualized under UV light (254 nm) and by spraying with 30%  $H_2SO_4$  and heating.  $R_f$  values refer to EtOAc as eluent. Flash CC: silica gel 60 (40–63  $\mu$ m); HPLC: Chemcosorb 5Si-U  $10 \times 250$  mm (B); NMR  $^1$ H, 600 MHz,  $^{13}$ C, 150 MHz: CDCl<sub>3</sub> soln relative to TMS at  $\delta_H$ 0 and CDCl<sub>3</sub> at  $\delta_C$  77.0. Multiplicities were determined by DEPT experiments and/or by an HMBC experiment. IR: CHCl<sub>3</sub>; [ $\alpha$ ]<sub>D</sub>: CHCl<sub>3</sub> or MeOH soln; EIMS: 70 eV.

Fungus. Daldinia sp. was collected at two separate sites in Tokushima, both samples were found growing on the same host plant, Quercus acutissima. One sample was

Assignments confirmed by two-dimensional experiments (HMQC and HMBC).

collected in June 1992 (259 g) and the other sample in June 1993 (515 g). The *Daldinia* sp. remains unidentified (the identity of this fungus was very difficult to determine, but it could very tentatively be identified as *D. vernicosa*). A voucher specimen is deposited at the Faculty of Pharmaceutical Sciences, Tokushima Bunri University.

Extraction and isolation. The fresh material (259 g and 515 g) was extracted with EtOAc to yield 11.43 g and 22.80 g of crude extract, respectively. Based on TLC and  $^{1}$ H NMR, the two extracts were combined (34.23 g) and then chromatographed by flash CC over silica gel using an n-hexane–EtOAc gradient. The most polar fractions eluted were further chromatographed by flash CC and PLC and final purification by HPLC to give cytochalasins 6 (37 mg,  $R_f$  0.61), 7 (4 mg,  $R_f$  0.54), 8 (4 mg,  $R_f$  0.48), 9 (37 mg,  $R_f$  0.48), 10 (7 mg,  $R_f$  0.17), 11 (34 mg,  $R_f$  0.53), 12 (5 mg,  $R_f$  0.27), 13 (9 mg,  $R_f$  0.21), 14 (2 mg,  $R_f$  0.44), 15 (2 mg,  $R_f$  0.46) and 16 (6 mg,  $R_f$  0.25).

(11)-Cytochalasa-6(12),13,19-triene-1,21-dione-16,18-dimethyl-7-hydroxy-10-phenyl-(7S\*,13E,16S\*,18R\*,19E) (6). Amorphous solid,  $[\alpha]_D$  —16.1° (CHCl<sub>3</sub>; c0.31). HRMS: m/z 465.2514 [M]<sup>+</sup> calcd for C<sub>28</sub>H<sub>35</sub>NO<sub>5</sub>: 465.2516, 449.2559 [M - O]<sup>+</sup> calcd for C<sub>28</sub>H<sub>35</sub>NO<sub>4</sub>: 449.2556, 431.2456 [M - H<sub>2</sub>O<sub>2</sub>]<sup>+</sup> calcd for C<sub>28</sub>H<sub>33</sub>NO<sub>3</sub>: 431.2460; EIMS m/z (rel. int.): 465 [M]<sup>+</sup> (3), 449 (6), 448 (4), 447 (9), 433 (3), 432 (4), 431 (5), 358 (26), 252 (24), 91 (100); IR  $v_{max}$  cm<sup>-1</sup>: 3347 (NH, OH), 1686 (C=O); <sup>1</sup>H and <sup>13</sup>C NMR: Tables 3 and 4.

22-Oxa-(12)-cytochalasa-6(12),13,19-triene-1,21-dione-7,18-dihydroxy-16,18-dimethyl-10-phenyl-(7S\*,13E,16S\*, 18S\*,19E) (16). Amorphous solid,  $[\alpha]_D + 67.8^\circ$  (MeOH; c 0.27). HRMS: m/z 465.2513 [M] + calcd for C<sub>28</sub>H<sub>35</sub>NO<sub>5</sub>: 465.2515; EIMS m/z (rel. int.): 465 [M] + (7), 447 (22), 405 (25), 374 (100), 356 (33), 338 (46), 91 (50); IR  $\nu_{\rm max}$  cm<sup>-1</sup>: 3360 (NH, OH), 1705 (C=O); <sup>1</sup>H and <sup>13</sup>C NMR: Tables 3 and 4.

Acknowledgements—We thank Miss Y. Kan (TBU) for measurement of 600 MHz NMR spectra and Miss Y. Okamoto (TBU) for measurement of mass spectra. Thanks are also due to Dr M. Toyota (TBU) for his help in carrying out this work. We also acknowledge financial support by a Grant-in-Aid for General Research from the Ministry of Education, Science and Culture, Japan, and to the Japan Society for the Promotion of Science for the award of a postdoctoral fellowship (to M.S.B.).
