think. possible.

On sale 24 January 2021
to 23 February 2021

Our very own specialists have developed this fun and challenging Arduino® compatible project to keep you entertained this month with special prices exclusive to Club Members.

BUILD YOUR OWN: Micro ROS Controller

Do you build robots and need a neat and easy way to control them? Perhaps you've heard of the Robotic Operating System (ROS) but don't know where to begin to create your own? Then have a look at our new project utilising our popular UNO with Wi-Fi board and LCD controller.

This project gives you everything you need to set up a ROS environment on your PC and builds a small controller which you can use to control a simulator around on the page. Once you've built it, you can easily transport the controller to control any other ROS robot with a flick of a command.

You can use your ROS controller on countless robotic projects: from 2 wheeled robotic platforms, to robotic arms, and anything in between, thanks to the capabilities of the Robotic Operating System.

SKILL LEVEL: Beginner
TOOLS: Side Cutters

WHAT YOU NEED:

1 x Arduino® Compatible UNO Board with Wi-Fi XC4411 \$39.95
1 x Arduino® Compatible 2 x 16 LCD Controller Module XC4454 \$19.95

Editorial Viewpoint

New computer technology

We haven't published articles on personal computers in quite some time. The last one that I can find, in May 2012, is on optimising ADSL internet connections. There was also an article on the Linux operating system in July 2011 and a Macbook review in March 2010.

Partly that's because SILICON CHIP isn't a computer magazine, but of course, computers are made from silicon chips. The most advanced, powerful and flexible chips ever made are computer processors of various

types. They contain billions of transistors and result from countless hours of engineering and testing, plus extremely impressive manufacturing techniques.

One reason we've published so few computer articles of late is that computer technology has been somewhat stagnant over the last decade. There have been plenty of improvements in that time, but they've mostly been incremental. I think that's starting to change now, so I plan to give computers some coverage. If you aren't into computers, don't worry, we'll still have plenty of DIY and other articles. We'll just be occasionally adding a computer-themed article into the mix.

As evidence of the recent advances in computing technology, three major product series launches at the end of last year saw stocks of these new products almost immediately exhausted as production could not keep up with demand. Those were AMD's Ryzen 5000 CPUs and Radeon 6000 series GPUs (graphics cards), and Nvidia's RTX 3000 series GPUs.

Apple also just released a line of Macs using their own ARM-based processors (the Apple Silicon M1) which have incredible levels of power efficiency and some other impressive features.

The lack of availability was partly due to these new devices being so much more capable than the previously available equivalents, at similar prices (if you can find one). There were also supply problems due to COVID-19 (and many people being forced to stay at home also increased demand).

It's mind-boggling to realise that for a couple of thousand dollars, you can put together a computer that can perform over 30 **trillion** (3×10^{13}) calculations per second!

Solid-state data storage has also come a long way in the last year or two, with incredible speeds (more than four gigabytes per second for consumer-level parts!), very high capacities and relatively low costs.

So, we will likely have a handful of computer how-to articles this year. The first, in this issue, shows how to upgrade a PC to the latest AMD Ryzen 5000 series of CPUs (it is also mostly applicable to Intel CPU-based systems). We'll also have some in-depth stories on the technology behind the incredible power of modern computers.

The articles we have planned will describe some fascinating technology that I think many of our readers will not have heard of, or if they have, won't know a lot about.

To throw another almost unbelievable number out there, it is now possible to build a computer with over ten thousand computing units, each capable of executing instructions and performing calculations. We plan to do that and describe some of the challenges involved.

By the way, SILICON CHIP used to run quite a few computer columns in the early days, including one called "Computer Bits" from July 1989 to December 1998. We also had all sorts of other articles on topics like setting up a network, upgrading computer CPUs, computer reviews etc.

Of course, PCs were not as mainstream back then and required a lot more DIY. So I don't plan to go back to that sort of content. But the odd article on computer technology and some interesting computers you can build or modify yourself should be part of the mix of a magazine named after the very technology behind them.

Helping to put you in Control

PR200 programmable relay 230VAC

A programmable logic relay with 8DI + 8DO + 4AI + 2AO (4-20 mA), LCD, 2x RS485 (Modbus RTU/ASCII) ports and 230VAC powered. Free easy to use Function-Block Software.

SKU: AKC-002

Price: \$399.95 ea + GST

Simex SLI-8 8 Counter Modbus RTU module

An 8 isolated digital input module with Modbus RS485 communications. Provides a non volatile 32 bit counter for each input. 24VDC powered.

SKU: SID-003

Price: \$239.95 ea + GST

SPT-61 Transmitter PT100/500/1000

The SPT-61 signal converter is equipped with Pt 100 / Pt 500 / Pt 1000 type input, 4-20mA output. Loop powered.

SKU: SIB-001

Price: \$134.95 ea + GST

BACnet MSTP Slave/Modbus Master - Converter

The HD6767 1-MSTP-4-A1 BACnet Slave / Modbus Master Converter allows you to integrate a BACnet network with a Modbus net. It allows you to connect a BACnet Master (for example a Supervisory System...) with some Modbus slaves.

SKU: ADW-001

Price: \$586.80 ea + GST

AirGate Modbus (Gateway RS-485/Wireless)

Wireless gateway for extending Modbus networks. USB and RS-485 interfaces.

SKU: NOW-001

Price: \$473.50 ea + GST

1-port isolated RS-422/485 Modbus Gateway

Modbus TCP to Modbus ASCII/RTU converter gateway allows Modbus TCP masters to communicate with serial Modbus slave devices via isolated RS-422/485 interfaces with TB5 screw terminals.

SKU: ATO-162

Price: \$330.00 ea + GST

Loop Powered 4-20mA Surface Temperature Sensor

This is a simple 4-20mA output loop powered temperature sensor with measurement range from 0°C to +100°C designed for monitoring battery, heatsink and surface temperatures.

SKU: KPS-015

Price: \$83.00 ea + GST

Radio time signals throughout the world

Wouldn't it be great if all your watches and clocks would adjust themselves automatically to the current time and also adjust themselves for daylight saving? There is a simple way to do this in many countries – and possibly even in Australia. It doesn't require internet access or even a GPS receiver!

Many people today use a phone, or a smartwatch linked to their phone, to tell the time. The time on most phones is very accurate, being derived from atomic clocks and associated time servers which is then broadcast over the mobile network.

But some people still use a conventional watch or a clock to tell the time. Most digital watches are very accurate, only gaining or losing around 15-30 seconds per month, but they still have to be set manually. That is difficult to do precisely.

Some clocks connect to WiFi networks and are synchronised to atomic clocks via time servers, and we have published several such designs in the past. Others synchronise to GNSS satellites such as GPS, which carry atomic clocks; again, we have published quite a few projects which do that.

But some watches and clocks synchronise their time with atomic clocks via radio signals, and that is the subject of this article.

Timekeeping devices can receive radio signals through several methods. One is dedicated LF (low-frequency, 30-300kHz) signals from dedicated transmitters, which are operated in Europe, the United States, Japan and China.

Another method is by dedicated signals transmitted on the shortwave band, with transmitters broadcasting on a variety of frequencies from 2.5MHz to 25MHz. These dedicated LF and SW time signals contain the time, date, leap second and other information encoded in digital form.

Some stations such as DFC77 also

encode weather or other information.

Many of these time signals can also be used as basic frequency standards.

You can hear audio samples of a variety of LF and SW time signals at www.sigidwiki.com/wiki/Category:Time

Many normal AM (medium-wave) broadcast band stations also broadcast hourly "pips" at 1kHz, usually on the hour. These pips were first introduced by the BBC in 1924, and they were originally synchronised to Greenwich Mean Time (which varies slightly due to wobbles in the Earth) but since 1971 have been synchronised to International Atomic Time (which is more consistent).

For those interested in those signals, there is additional information at www.miketodd.net/other/gts.htm

No commercial receivers appear to take advantage of these pips, which

Creality® LD-002R Resin 3D Printer

**Affordable entry level
resin printer for fast,
strong & smooth prints.**

Resin based 3D printers are rapidly becoming the go to tool for high resolution 3D prints. They offer a faster print process with excellent accuracy and a stronger finished product thanks to UV curing on each layer. The LD-002R can print objects up to 120 x 65 x 165mm. It is capable of printing up to 20-30mm per hour, making it much faster than traditional FDM 3D filament printers.

FREE! 500ml of UV resin

Jumbo QC3.0/USB C Power Bank

Offering both the latest QuickCharge 3.0 charging and 18W USB-C PD output, this enormous 20,000mAh power bank will keep your devices charged away from mains power. 136x70x25mm

Lithium/Lead Acid Solar Charge Controller

NEW!
\$79.95

N 2019A

Suitable for 12/24V systems with either lead acid or lithium chemistry batteries. Supports LiNiCoMn & LiFePO4. 30A max charge current.

Portable Battery Bank Jump Starter

An all round portable charging device - plus vehicle jump starter! Not just for car battery emergencies, this high capacity battery bank also wirelessly charges your phone, powers laptops and other devices. Jumpstarts most 4-6 cylinder vehicles.

NEW!
\$249

M 8193

Keeps devices charged with wireless & USB charging!

5A Waterproof Charge Controller

Provides a max charge current up to 5A (suits solar panels up to 60W). The entire PCB assembly is housed in an epoxy filled housing 80Wx37Dx22Hmm. IP67.

NEW!
\$34.95

N 2005

Handy Power Panels For Cars, Boats & Caravans

These panels can be easily surface mounted to custom panels to provide power to your devices & portable appliances. Both have 15A DC breaker. P 0697: 50x130x70mm. P 0698: 50x187x70mm.

\$49.95

P 0698 Car Acc + USB + Volt.

\$36.95

P 0697 Car Acc + USB

Quantum-dot Cellular Automata

We introduced QCA technology in the August 2019 issue (siliconchip.com.au/Article/11774) as a possible future alternative to CMOS digital logic. It could possibly operate much faster than traditional logic and at a much smaller scale, but has not yet been made to work in commercial processes. This article investigates a more energy-efficient approach to QCA than the traditional 3-input majority gate structure.

As described in the previous article, Quantum-dot Cellular Automata (QCA) is an emerging nanotechnology-based approach for designing and implementing electronic circuits. The aim is to beat the well-developed Complementary Metal Oxide Semiconductor (CMOS) technology.

QCA has the possibility of running at exceptionally fast speeds (in the terahertz range – 1000GHz plus!), at

smaller sizes and with extremely low power consumption (in the picowatts).

The two basic gates used in QCA logic are the inverter and the 3-input majority gate. Any digital circuit can be designed using these two gates. The majority voting function can be written in Boolean logic as $M(A,B,C) = AB + BC + AC$.

This article describes a new style of 3-input majority gate (MG) struc-

ture, which is analysed with the help of mathematical modelling. Fig.1(a) shows the standard 3-input majority gate, while Fig.1(b) shows the proposed new structure. Fig.1(c) is the truth table for both gates (they are logically equivalent).

The main advantage of the new structure is that it gives the designer the flexibility to move all of the cells utilised by a certain amount.

Fig.1: a comparison of the 'standard' QCA 3-input majority gate (a), the novel one described here (b), along with its truth table (c).

Fig.2: here's how a two-input AND gate (a) or OR gate (b) can be formed from a single 3-input majority gate. Note that the fixed input (zero or one, shown in grey) can be any of the three. It's up to the logic designer, and depends on the best routing for the other signals. Also note that the whole thing can be rotated or flipped to suit the design.

Off grid? On grid with battery backup? How do you monitor the state of your batteries?

By TIM BLYTHMAN

BATTERY MULTI LOGGER

Knowing the condition of your batteries is essential for keeping them healthy long-term. A system that can monitor and log vital battery statistics is a great aid, and can help you to avoid having to shell out for expensive replacements. It can also be used for troubleshooting, such as when you don't know which device is responsible for periodically discharging a battery.

Solar and wind power is growing in use and getting cheaper, so there is a need to maintain batteries associated with such systems. You might also have a large battery in a shed, caravan, boat or another vehicle that you need to monitor. Backup batteries for mains power failures are another case where you might need a battery monitor or logger.

Our new Battery Monitor Logger is versatile and capable, being able to handle a charger and two separate loads out-of-the-box. It is based on a Micromite LCD Backpack, so can be reprogrammed in MMBasic, Micromite's variant of the BASIC language. But as we have written software with many useful features, you don't need to do any programming.

We last published a Battery Capacity Meter in June & July 2009 (www.siliconchip.com.au/Series/44).

It featured a PIC microcontroller capable of monitoring a battery's voltage and current via an external current meas-

uring shunt. It could log data as well as calculate such things as battery capacity and estimated battery run time.

New features

The 2009 Battery Capacity Meter used a single shunt so it could only monitor the overall current moving into or out of the attached battery.

Our new design supports up to three shunts, so it can monitor three separate current paths, helping you to split out the charging or discharging figures across multiple loads and/or generators.

It even includes a fourth internal shunt for monitoring its own power usage.

For example, you might have a solar panel array and a wind generator (or several) and want to keep track of the energy they generate separately.

Or you might have several loads like a fridge, lights and a kettle and want to see which one is consuming the most energy.

The old design was also limited to around 60V at its input (compared to 100V for this one) and could also store a minimal amount of data in the PIC. The PIC32 we have used in this design has much more storage space, so it can record more data for longer.

The battery voltage and currents are sampled at 10-second intervals. That data is averaged every hour to give up to two days of hourly samples. The hourly samples are also averaged over each day to give about a fortnight of daily values.

The flow of both charge and energy is logged, to provide capacity values in Ah (amp-hours) and Wh (watt-hours). You specify the full and empty voltages of your battery, plus the battery capacity, so that the unit can self-calibrate when the battery is either fully charged or discharged.

A simple, linear voltage state-of-charge value is also calculated, giving a rough indication of battery state when the more accurate information is not available.

Operating concept

Fig.1(a) shows the simplest way to use the Battery Monitor Logger. The battery connects to a two-way screw terminal (CON3) while the positive ends of up to three loads or charging sources connect to the contacts of three-way screw terminal CON3a.

The negative ends of those loads/charging sources connect directly to the battery negative (ground).

This allows the Battery Monitor Logger to independently measure and display the current flowing to or from each load or charging source.

It also produces a total current in/out figure and uses this to keep track of the battery's state-of-charge in amp-hours (Ah). Multiplying this by the battery's current voltage gives a nominal watt-hours (Wh) figure for the current state of charge.

If you have more than three external devices to connect, they can share terminals on CON3a, as shown in Fig.1(b). For example, one terminal is shared by two loads (LOAD1 & LOAD2). The measurement on that channel will be the total load current for these two devices. Another terminal is shared by two charging sources (SOLAR & WIND), and likewise, their currents will be summed.

The third terminal is shared by LOAD3 and a mains charger. In this case, the unit will measure the net current flow in/out – ie, it will see a flow into the battery if the charger current exceeds the current drawn by LOAD3, a flow out if the situation is reversed, and will measure zero if the two currents are equal (ie, the LOAD3 current is supplied by the charger).

If you need to monitor currents over

10A, you can use the same arrangement except with external shunts.

These will typically have a lower resistance and also can handle higher dissipation, both factors allowing greater currents to flow safely. For example, you can get 100A shunts quite easily, or even 500A shunts.

Circuit design

The circuit of the Battery Monitor Logger is shown in Fig.2. It has been designed as a complete Micromite-compatible board, rather than an add-on board for a Micromite LCD Backpack.

This allows us to control its power usage better, reducing the current drawn from the battery.

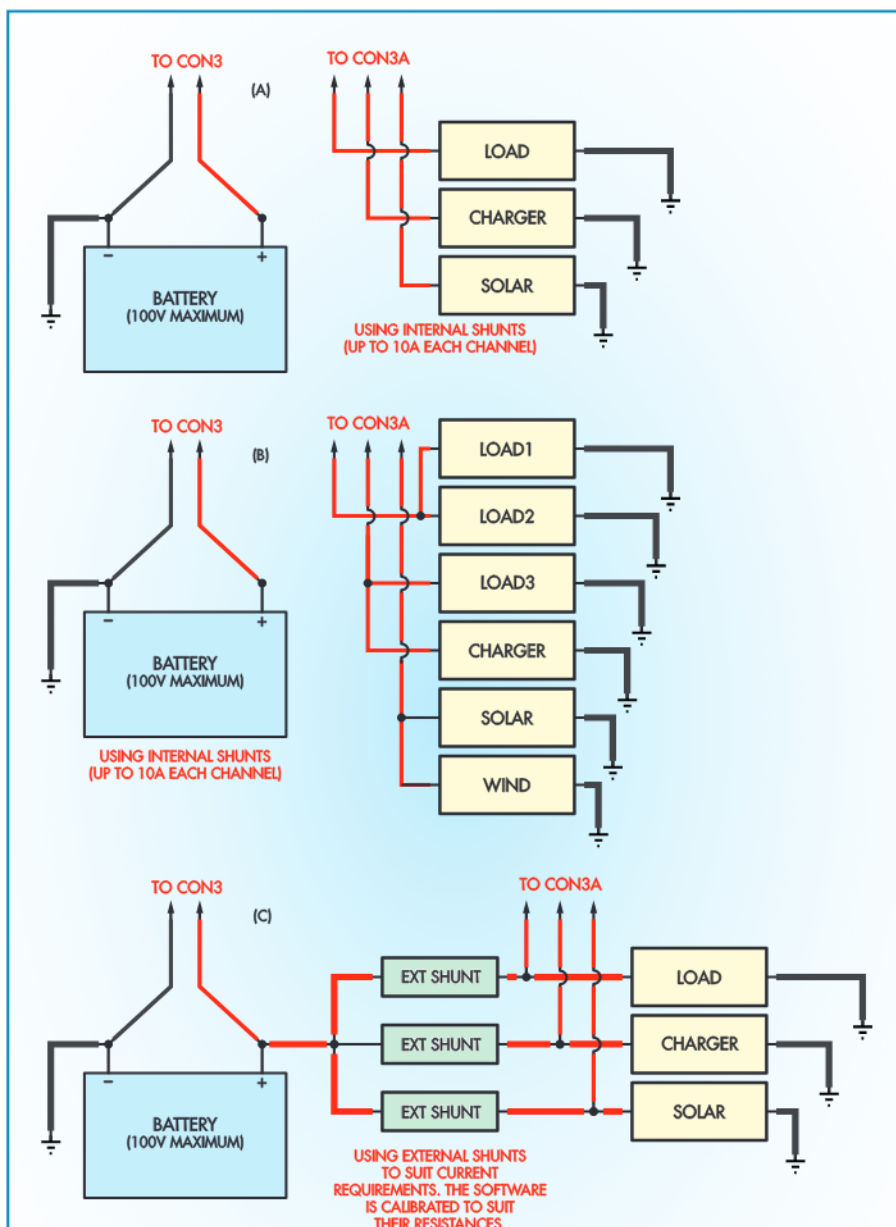

Fig.1: three examples of how you could use the Battery Logger/Monitor. The simplest configuration, at top, uses its internal shunts to monitor the currents (up to 10A) into or out of three loads/charging sources. Or as shown in (B), you can connect more than three loads/charging sources, with some of them sharing shunts. For higher-current applications (up to hundreds of amps), external shunts can be used, as in (C).

Arduino-based Adjustable Power Supply

By
Tim Blythman

We have published all sorts of fancy bench supplies over the years: linear, switchmode, hybrid, high-voltage, high-current, dual-tracking... But sometimes, all you need is a basic power supply with voltage and current monitoring and limiting; something that's convenient and easy to set up and use. That's exactly what this is – a very useful little power supply built on an Arduino shield!

Lately, like many others, I have mostly been working from home. But unfortunately, my home workshop is not equipped to the same degree as the SILICON CHIP office/lab.

I could bring my 45V 8A Linear Bench Supply prototype home (published in October-December 2019; see siliconchip.com.au/Series/339).

It would do pretty much everything I need, but my space is limited, and it would be a rare event to make use of its full capabilities.

So I need something more compact but still useful. I decided to base it on something I already had at home, an Arduino Uno. It's capable of delivering up to 14V at a maximum of 1A.

That is modest, to be sure, but handy enough for most smaller projects. And multiple units can be combined if you need several different voltages (eg, 5V & 3.3V).

Arduino considerations

Using Arduino hardware means that it would be possible to add one of many plentiful shields and modules to add a custom display or controls for the Supply. But as I already have a computer on my desk, I decided to use the existing screen and keyboard to control it.

I wrote a small computer program that controls the Power Supply, providing all of its useful functions without taking up valuable bench space.

Thus, the Supply can sit tucked away out of sight, with nothing more than the two output leads snaking out to wherever they are needed. The control program takes up only a small amount of screen space.

The combination of the micro-controller on the Uno and the control program allows many features to be added with no extra hardware.

For example, the control program allows five preset combinations of voltage and current to be created

SERVICEMAN'S LOG

Dave Thompson

A feline-themed cautionary tale

Cats can be quite difficult to manage, especially if they each need specialised food. With modern tech you now have devices like a microchip pet feeder, which allow only certain cats access to a particular food/medicine bowl. However, there's always a caveat with all-encompassing one-trick problem solvers.

Items Covered This Month

- Do (not) feed the cat
- Tektronix TDS744A oscilloscope repair
- Restoring an electronic organ

**Dave Thompson runs PC Anytime in Christchurch, NZ.*

Website: www.pcanytime.co.nz
Email: dave@pcanytime.co.nz

It's no secret we own a few cats (or should I say that we serve a few cats?). I have mentioned them before in this column.

One of the problems with having multiple cats is that they are very much individual characters, with their own preferences for food and attention. So it is hard to implement a strategy for one cat without affecting the others.

For example, one of our cats has allergies to something in the soil around our cat run. Every spring, these allergies flare up, but the other two cats aren't affected at all. Having to dish out special food or medication to one cat and not the others can be a lesson in frustration, as they all graze on each others' food.

So when we saw an advertisement for "Microchip Pet Feeders", we thought it might be the answer to our problems. Our cats are all microchipped within a few weeks of birth (as all pets should be). Having the ability to allow one cat to feed from a particular food/medicine bowl while the others have no access is very appealing.

That is exactly what these devices claim in their advertising bumph; apparently, you can program access for up to 30 individual animals into each feeder using their unique microchip ID tag. In our situation, we only needed to register the one cat to it.

To shop online or not

We ordered one of these units online, and it duly arrived on the doorstep. I'm a modern guy; I like this 'new' way of buying products; not because I'm lazy, but these days one tries to avoid going out of the house (if one is even allowed!).

Clearly, online shopping is boom-

ing at the moment. I have to wonder whether many people will go back to the 'old ways' even when restrictions are lifted. Who wants to deal with the hassle of driving to a shopping centre, finding a parking space and pushing your way through crowds to the shop, only to be disappointed that what you want isn't even in stock?

It's quite convenient just to have stuff show up at your door a couple of days after clicking some buttons on the computer, and overall it doesn't cost that much more since you are saving on petrol, stress and (perhaps more importantly) time.

However, there are still problems with this approach. If you know what you want, or have used the products before, or they are the sort of items you can buy based on specifications (like a lot of electronic devices), it's perfect because you know exactly what you are getting. But online shopping isn't that suitable for buying the likes of clothes or shoes, for example.

Unless you have gone to a bricks-and-mortar store to try on the same product beforehand, and know it fits, buying these things over the Internet can be fraught with problems. What if it doesn't fit? You are then in a position where you have to go through the hassle of contacting the vendor, returning the item, and possibly paying the return shipping costs.

That can mean that your item ends up costing you more than if you had just gone down to the store and purchased it in the first place. At worst, you have no usable product and are out of pocket for all the related expenses.

Defects and warranty returns can also be a can of worms. Some online sellers are great about returns, such as

ELECTRONIC Wind Chimes

Aaaah . . . wind chimes! They're so soothing . . . listening to the random notes as the wind creates its own melodies. But what do you do if there's no wind? Aim a fan at it? We have a better idea: our Electronic Wind Chimes removes your reliance on the wind, and even gives you the possibility of playing tunes using the wind chime, enriching the experience!

This circuit drives a wind chime using solenoids. It does so in a way that neither affects the tonality of the result, nor prevents the chimes from being operated by the wind in the normal way. So you get the best of both worlds.

More good news is that electronically, it is fairly simple and uses readily-available parts. So you should not have difficulty building it, nor is it likely to break the bank.

However, you will need a degree of mechanical skill to make

it. Read on to understand why this is so.

Wind chime basics

Wind chimes play a series of notes that are generated by a clapper striking the sides of chime tubes. These tubes hang freely, so they can resonate

at their tuned frequency when struck. The clapper is moved by a sail, which is driven by the wind. Fig.1 shows the basic arrangement.

The notes and sounds are very dependent on chime tube length, thickness and diameter and the hanging point.

The frequency is higher with smaller wind chimes – these tinkle away with a light breeze, producing high-pitched notes at a fast rate. Larger wind chimes produce lower-frequency tones at a slower rate.

Features & Specifications

- Drives wind chimes with up to 12 elements (or multiple smaller chimes)
- Suits a wide range of sizes from miniature chimes up to large ones
- Individual calibration of solenoid drive control parameters
- Sequence recording and playback
- Sequences with long delays can be recorded in shorter periods
- Optional randomisation of the time between chime strikes
- Adjustable randomisation parameters
- Optional automatic switch-off in darkness

Making Android Apps with App Inventor

The Android logo is Copyright Google Inc.

App Inventor is a free, cloud-based tool that lets you make your own Android apps. It's maintained by MIT and is run through most standard web browsers. Roderick Wall shows you how it can be used to make a simple TDR (time domain reflectometry) calculator for your phone, which can help with testing electrical cables for faults.

By Roderick Wall

The Massachusetts Institute of Technology (MIT) in the USA has released a free "App Inventor". This allows you to use blocks to design applications that run on Android phones and tablets.

I used it to create a TDR (time domain reflectometry) calculator, which calculates the distance to a fault in a transmission line, as in the TDR Dongle project from December 2014 (siliconchip.com.au/Article/8121).

You can download my SILICON CHIP TDR Android calculator app from siliconchip.com.au/Shop/6/5733 – see the end of this article for hints on how to install it on a phone or tablet.

Building an App

I used the following steps to design and create the TDR application. You can use a similar procedure to make your own custom Android application.

App Inventor is a cloud-based tool, which means you can build applications right in your web browser. The website offers all the support you need to learn and how to develop basic applications. Start by opening the following link in your browser: <https://appinventor.mit.edu/explore/get-started>

MIT also has an App Inventor Community forum where you can ask ques-

tions about your project. See <https://appinventor.mit.edu/explore/library>

While designing your project, if you run into a problem, try doing a Google search like "App Inventor How to X" (where X is replaced with your query) for quick answers to your questions. There is lots of information on how to use App Inventor on the internet.

Fig.1 shows the first window of the MIT App Inventor. To start a new project, click "My Projects" and select "Start new project". Note that you can download a source code file for the project (with a .aia file extension) that can be shared with your friends. It is a good idea to use this method to save

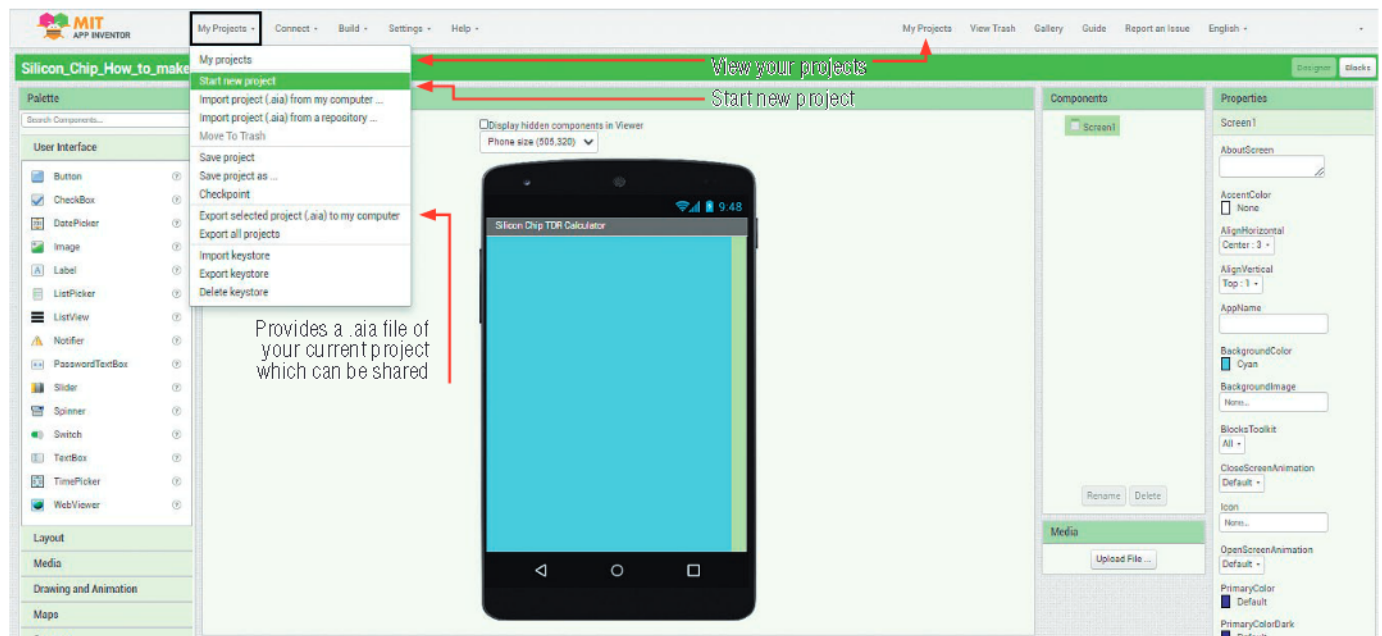

Fig.1: starting a new project in App Inventor is quite simple and the interface isn't as complex as most programming IDEs.

By Tim Blythman

It's great to work in a well-provisioned electronics lab with lots of bench space and plenty of test instruments and tools. But we don't all have that luxury! So we decided to come up with a way to cram all the most essential electronics tools into a small space, such as a typical desk, sharing space with a computer and possibly other gear. We even managed to keep the cost low!

We noted in our Mini Digital PSU project starting on page 38 that its design was partly driven by the need to create a compact solution that would fit on a small workbench.

Not only is the hardware for that design small, but because it can be controlled from a PC via a USB interface, it can be tucked out of sight altogether, taking up practically zero space on your bench.

We realised that, in addition to a power supply, another vital piece of test gear which usually takes up a lot of bench space is an oscilloscope. USB oscilloscopes have been around for a while now, so we decided to look into adding one to our setup.

BitScope Micro

A scope is very handy to have when it is needed, but you might go weeks

or even months without touching it. And we wanted to keep the cost low.

After doing a bit of research, the BitScope Micro appeared to be a good option. It has two analog channels with 20MHz bandwidth as well as six digital logic channels – enough for common jobs like sniffing serial, I²C and/or SPI traffic.

It interfaces with programs that can run on Windows, macOS and Linux, including on the Raspberry Pi. There isn't just one suitable piece of software, but several.

A DSO program allows the BitScope Micro to be used as either a digital or mixed-signal oscilloscope, and it can also generate analog waveforms.

There is also a Logic program which can perform protocol analysis, including SPI, I²C, CAN and UART and a generator program can be used to generate arbitrary waveforms.

The Micro is only one of an extensive range of BitScope test gear; their products all work with the same software.

In any case, because the BitScope Micro is one of the cheapest USB oscilloscopes, and it can run from a Raspberry Pi, we decided to get one to test. And then we had an idea . . .

The Virtual Workbench

While testing the Mini Digital PSU, it occurred to us that sometimes it would be necessary to isolate the power supply output from the control PC. The grounds may need to be at different potentials; a direct connection cannot work as the ground of the Mini Digital PSU is plugged into the ground of the USB host it is connected to, which is typically Earthed.

You could use a laptop or notebook computer running from its internal

Every article in every issue of

SILICON CHIP

Can now be yours forever in
digital (PDF) format!

**Nov 1987-
Dec 2019**

- High-res printable PDFs*
- Fully searchable files - with index
- Viewable on 99.9% of personal computers & tablets

* Some early articles may be scans

Software capable of reading PDFs required (freely available)

Digital edition PDFs are supplied as five-year+ blocks, covering at least 60 issues. They're copied onto quality metal USB flash drives (at least 32GB). Just order which block(s) you want!

- November 1987 - December 1994
- January 1995 - December 1999
- January 2000 - December 2004
- January 2005 - December 2009
- January 2010 - December 2014
- January 2015 - December 2019

Each five-year block is priced at just \$100, and yes, current subscribers receive the normal 10% discount. If you order the entire collection, the 6th block is FREE (ie, pay for five, the sixth is a bonus!). All PDFs are high resolution (some early editions excepted) and the USB Flash Drives are high quality metal USB3.0, so if you save the files to your PC hard disk, the USB Flash Drives can be used over and over!

SUBSCRIPTIONS TO SILICON CHIP REMAIN THE SAME!

Of course, so you won't miss out on a current issue you can still subscribe to SILICON CHIP . . . and you'll \$ave money over the newsstand price. Your SILICON CHIP will be delivered every month right to your mail box . . . no waiting!

The latest desktop processors from AMD, dubbed Zen 3 but also known as the Ryzen 5000 series, offer a 20% improvement in performance compared to their predecessors, making them the fastest desktop CPUs available at the moment. They are also quite affordable, and upgrading is relatively easy if you have a Ryzen processor on a newer motherboard.

I was prompted to upgrade my office PC (and write this article) by the very impressive performance numbers and reasonable prices that were revealed at AMD's Zen 3 launch last November.

At the time of writing this article, this line of CPUs (currently four strong) have taken the performance crown from Intel and are quite reasonably priced, with a choice of 6, 8, 12 or 16 cores.

For most people, the 5600X CPU with six cores for \$469 is more than

adequate, and will be a significant upgrade from previous generation chips.

If you have an AMD motherboard and upgrade your cooler and memory at the same time as upgrading the CPU, you can get a 30-50% increase in performance for around \$600.

You might even get a bigger boost if you are using an earlier processor, and if you are willing to spend a bit more (up to say \$1000), the gains can be huge.

I bought my previous CPU only a year ago, in January 2020, for \$315 (a

Ryzen 3600). It had six cores, with a base clock of 3.6GHz and a boost clock of up to 4.2GHz. It was already a massive upgrade over my previous (quite old) computer.

I decided to upgrade to a 5800X with eight cores, a base clock of 3.7GHz and a boost clock of 4.6GHz, and I am delighted that I did since the difference is very noticeable!

Even better, with the large air cooler I added, I am achieving clock speeds above AMD's specification, with a

base clock of 3.77GHz, a boost clock of 4.84GHz and sustained boost to 4.7GHz on all eight cores under load.

Or to put it in layman's terms, what a little ripper!

Upgrade requirements

To upgrade to one of the new Zen 3 CPUs (Ryzen 5600X, 5800X, 5900X or 5950X), you need an AMD chipset motherboard with a three-digit code starting with a 4 or 5. That means a 450B, 470X, 550B or 570X based board.

Assuming you have one of those, you need to perform a BIOS update to support the new CPUs. Then it's just a matter of swapping over the chips, and away you go.

As I mentioned earlier, unless you have a high-end air cooling or water cooling solution, it's probably also a good time to upgrade that.

With dynamic thermal throttling, the cooler you can keep the CPU, the faster it will perform under load. And also you can get silent operation at idle or moderate loads with a decently efficient cooler.

Air vs water cooling

The 'stock' heatsink/fan combination that came with my original Ryzen 3600 CPU did its job, but I immediately regretted not spending a bit more money on a custom cooler to make the computer quieter and run a bit faster under heavy load (going into thermal throttling later).

Decent third-party air coolers range from about \$50 up to \$150 or so. Water cooling solutions start at the upper end of that range.

The main advantage of water cooling a CPU is the potential for slightly better and somewhat quieter cooling under heavy load, and a much larger thermal mass which means that they cope well with 'bursty' loads.

But they cost more, and while these days leaks are rare, they can happen. And air coolers are quieter at idle and light loads. So most people will probably stick with air cooling.

We'll cover air vs water cooling more in a future article.

For my system, I bought a Deepcool Assassin III dual tower, dual-fan cooler for around \$134 from Amazon as it was considerably cheaper than the other well-regarded large air coolers like the Noctua NH-D14, NH-U14S or NH-DH15. Since then, I have seen the Assassin III on sale for \$20 off (about \$114), which I think is an excellent deal.

One thing that you should do, which I didn't, is to compare the height specification of the cooler to the amount of space available in your case (ie, from the top of the CPU to the inside panel of the case) to make sure it will fit. This almost caused a disaster, which was narrowly averted, as you shall see.

Choosing faster RAM

Assuming that you have a compatible motherboard and can get your hands on a Ryzen 5000-series CPU, order a suitable cooler and then have a think about upgrading your RAM. Zen 3 CPUs can take advantage of very fast RAM, and 4000MHz DDR4 is ideal.

I had 3200MHz RAM and decided to upgrade to 3600MHz, as I found that to

be the best value (faster RAM than that is very expensive).

You could also consider increasing your RAM capacity while you're at it. But don't forget to consider the column address strobe (CAS) latency, generally specified as a number following the letters "CL".

For example, you might see 2 x 8GB (16GB) 3600MHz DDR4 DIMMs for \$135 and 2 x 16GB (32GB) 3600MHz DDR4 DIMMs for \$239. The 2 x 16GB seems like a better option than two lots of 2 x 8GB (assuming your board has four DIMM slots) as it is \$31 cheaper.

But if you look closer, the first option is CL17 and the second option is CL18. That means that the 16GB DIMMs take one clock cycle longer to respond to column address changes compared to the 8GB DIMMs.

How much does that matter? I am not sure. I suspect the CL17 DIMMs will give a couple of percent better performance in some tasks. I don't think that is necessarily worth spending the extra \$31 and also halving the maximum RAM you can install in your system, but it is something to keep in mind.

I have seen other cases where doubling the memory per stick takes you from CL17 to CL19, or from CL16 to CL18, which is going to have a more significant impact, and often the price difference is negligible.

Ultimately, you will have to do some shopping around and decide what combination of MHz rating, CL rating,

Obviously (!) not to scale, here are the components which form the heart of my computer upgrade: at lower left is the ZEN 3 CPU; behind that a pair of 8GB 3600MHz DIMM sticks, while at right is the Deepcool Assassin 3 dual tower, dual-fan cooler. The first two items give dramatic improvement in performance; the latter ensures it all keeps its cool.

AUSTRALIA'S OWN MICROMITE TOUCHSCREEN BACKPACK

Since its introduction in February 2016, Geoff Graham's mighty Micromite Backpack has proved to be one of the most versatile, most economical and easiest-to-use systems available – not only here in Australia but around the world! Now there's the V3 Backpack – it can be plugged straight into a computer USB for easy programming or re-programming – YES, you can use the Micromite over and over again, for published projects, or for you to develop your own masterpiece!

The Micromite's Backpack colour touchscreen can be programmed for any of the following SILICON CHIP projects:

Many of the **HARD-TO-GET PARTS** for these projects are available from the **SILICON CHIP Online Shop** (siliconchip.com.au/shop)

- Poor Air Quality Monitor (Feb20 – siliconchip.com.au/Article/12337)
- GPS-Synched Frequency Reference (Oct18 – siliconchip.com.au/Series/326)
- Tariff Super Clock (Jul18 – siliconchip.com.au/Article/11137)
- Altimeter & Weather Station (Dec17 – siliconchip.com.au/Article/10898)
- Radio IF Alignment (Sep17 – siliconchip.com.au/Article/10799)
- Deluxe eFuse (Jul17 – siliconchip.com.au/Series/315)
- DDS Signal Generator (Apr17 – siliconchip.com.au/Article/10616)
- Voltage/Current Reference (Oct16 – siliconchip.com.au/Series/305)
- Energy Meter (Aug16 – siliconchip.com.au/Series/302)
- Super Clock (Jul16 – siliconchip.com.au/Article/9887)
- Boat Computer (Apr16 – siliconchip.com.au/Article/9977)
- Ultrasonic Parking Assistant (Mar16 – siliconchip.com.au/Article/9848)

FREE PROGRAMMING
Buy either V2 or V3 Backpack, tell us which project you want it for and we'll program it for you, **FREE OF CHARGE!**

Micromite V3 Backpack: JUST \$7500*
See August 2019 (Article 11764)
P&P: Flat \$10 PER ORDER (within Australia)
*Price is for the Micromite Backpack only; not for the projects listed.

KITS & SPECIALISED COMPONENTS

MINIHEART HEARTBEAT SIMULATOR (CAT SC5732)	(JAN 21)	\$5.00
All SMD parts, including IC2 – does not include PCB		
AM/FM/SW RADIO	(JAN 21)	\$2.50
- PCB-mount right-angle SMA socket (SC4918)		\$3.00
- Pulse-type rotary encoder with integral pushbutton (SC5601)		\$7.50
- 16x2 LCD module (does not use I ² C module) (SC4198)		
LED CHRISTMAS ORNAMENTS (CAT SC5579)	(NOV 20)	\$14.00
Complete kit including micro but no coin cell (specify PCB shape & colour)		
RGB STACKABLE LED CHRISTMAS STAR (CAT SC5525)	(NOV 20)	\$38.50
Complete kit including PCB, micro, diffused RGB LEDs and other parts		
D1 MINI LCD WIFI BACKPACK KIT	(OCT 20)	\$70.00
Complete kit including 3.5-inch touchscreen, PCB and ESP8266-based module		
SHIRT POCKET AUDIO OSCILLATOR	(SEP 20)	\$40.00
Kit including 3D-printed case, and everything else except the battery and wiring		
- 64x32 pixel white OLED (0.49-inch/12.5mm diagonal)		\$10.00
- Pulse-type rotary encoder with integral pushbutton		\$3.00
COLOUR MAXIMITE 2 in stock now	(JUL 20)	
Short form kit: includes everything except the case, CPU module, power supply, optional parts and cables (Cat SC5478)		
Short form kit (with CPU module): includes the programmed Waveshare CPU module and everything included in the short form kit above (Cat SC5508)		\$140.00

MICROMITE LCD BACKPACK V3 KIT (CAT SC5082)	(AUG 19)	\$75.00
Includes PCB, programmed micros, 3.5in touchscreen LCD, UB3 lid, mounting hardware, Mostfets for PWM backlight control and all other mandatory on-board parts		
Separate/Optional Components:		
- 3.5-inch TFT LCD touchscreen (Cat SC5062)		\$30.00
- DHT22 temp/humidity sensor (Cat SC4150)		\$7.50
- BMP180 (Cat SC4343) OR BMP280 (Cat SC4595) temp/pressure sensor		\$5.00
- BME280 temperature/pressure/humidity sensor (Cat SC4608)		\$10.00
- DS3231 real-time clock SOIC-16IC (Cat SC5103)		\$3.00
- 23LC1024 1MB RAM (SOIC-8) (Cat SC5104)		\$5.00
- AT25SF041 512KB flash (SOIC-8) (Cat SC5105)		\$1.50
- 10µF 16V X7R through-hole capacitor (Cat SC5106)		\$2.00
VARIOUS MODULES & PARTS		
- 15mΩ 3W SMD resistor (Battery Multi Logger / Arduino Power Supply, Feb21)		\$2.50
- DS3231 or DS3231M real-time clock SMD IC (Battery Multi Logger, Feb21)		\$3.00
- MCP4251-502E/P (Arduino Power Supply, Feb21)		\$3.00
- Pair of CSD1953A (Electronic Wind Chimes, Feb21)		\$6.00
- IPP80P03P4L04 (Dual Battery Lifesaver / Vintage Radio Supply, Dec20)		\$5.00
- 16x2 PC LCD (Digital RF Power Meter, Aug20)		\$7.50
- WS2812 8x8 RGB LED matrix module (Ol' Timer II, Jul20)		\$15.00
- MAX038 function generator IC (H-Field Transanalyser, May20)		\$25.00
- MC1496P double-balanced mixer (H-Field Transanalyser, May20)		\$2.50
- AD8495 thermocouple interface (DIY Reflow Oven Controller, Apr20)		\$10.00
- S8751AB 2.6kV isolated Mosfet driver IC (Charge Controller, Dec19)		\$5.00
- I/O expander modules (Nov19):		
PCA9685 – \$6.00 PCF8574 – \$3.00 MCP23017 – \$3.00

The Geekcreit LCR-T4 Mini Digital Multi-Tester

It's hard to believe, but you can get a compact digital tester which will identify, check and analyse bipolar transistors, JFETs, Mosfets, diodes, LEDs and thyristors, resistors, capacitors and inductors for less than most joints charge for lunch these days! The Geekcreit LCR-T4 does all of the above and will cost you about \$12.50, or more if you want it in a case rather than just a bare board.

When I first saw the Geekcreit LCR-T4 advertised on the Banggood website, I thought it was too good to be true.

It was described as a "128x64 LCD Graphical Transistor Tester Resistance Capacitance ESR SCR Meter", priced at only \$8.74 plus \$3.94 for airmail to Australia – a total of just \$12.68! I was curious and so ordered a couple straight away.

When they finally arrived (about five weeks later), unfortunately, I found that one of the two LCR-T4s was damaged in transit. There was a chunk of glass broken off the top right of its LCD panel, and the bottom half of the screen wasn't working. Luckily, the other unit worked fine, so I was able to proceed with the review.

I then discovered that it is also available with an assemble-it-yourself clear plastic shell, for \$21.18 plus \$3.93 air parcel shipping – a total of \$25.11. I ordered one of those as well, based on my positive impression of the 'naked' version, but it hasn't arrived yet.

Components and construction

The multi-tester is built on a sin-

gle PCB measuring 73 x 60mm. The only components on the front are the 128x64-pixel LCD panel with green LED backlighting, a 14-pin ZIF socket used to connect to the device being tested, and a pushbutton switch to initiate testing.

The rest of the tester's components are on the rear of the PCB, including an ATmega328 MCU (microcontroller unit), an 8MHz crystal, a 78L05 regulator, a TL431AN 2.5V voltage reference, three small SOT-23 bipolar transistors, two 1N4148 diodes and a handful of passive components.

The tester uses a 14-pin ZIF socket because it provides a range of options when it comes to components with different pin configurations and spacing. Although there are only three inputs (logically labelled 1, 2 and 3), the two rows of seven pin positions on the ZIF socket are connected in this order: 1-2-3-1-1-1-1 (left to right). This gives you quite a bit of flexibility for connecting different devices.

There's also a small 'D-PAK' type array of plated copper pads for receiving SMD components, just to the right of the ZIF socket. Presumably, SMD de-

vices to be tested have to be pressed against the PCB to make decent contact during testing.

The complete tester is powered by a standard 9V battery via a battery clip lead.

It's straightforward to use

What, no power switch? Well, the pushbutton switch on the front of the PCB does everything. If it hasn't been pressed, the tester is in 'sleep' mode with its current drain from the battery less than 20nA.

When you do press the button, the tester springs to life. The LCD backlight immediately turns on, and the screen displays the message "Testing ...", together with an indication of the battery voltage, like "[Vbat = 9.15V]".

Then the tester starts checking to see if anything is connected to the inputs. If it doesn't find anything, it displays a large question mark, plus the message "No, unknown or damaged part".

But if it does find an NPN or PNP bipolar transistor, a JFET, a Mosfet, a diode, an SCR, a Triac, a resistor, a capacitor or an inductor connected to the

VINTAGE RADIO

Philips BX205 B-01 superhet radio

By Charles Kosina

This 1950s valve radio is switchable between AM broadcast band and shortwave reception. Strangely, it uses battery valves but does not have a battery compartment, and it also has no internal antenna. Nor does it have any stations marked on the dial. It's a bit of a head-scratcher!

I bought this radio a couple of years ago on eBay. It didn't work, and as I couldn't immediately figure out why, I got bored with it.

So it sat in a corner (metaphorically speaking) for quite a while. With the previous lockdown in Melbourne, "one of these days" finally arrived, so I decided to resurrect it.

Its tuning covers two bands: the usual medium-wave band from 530kHz to 1600kHz, plus a shortwave band from about 5MHz to 16MHz.

It uses four battery valves with 1.5V filaments, but there is no battery compartment. It came with a cord attached, but no plug on the end. Presumably, the idea was that you wired it up to

a pair of batteries hidden away in a nearby cabinet.

As it has no internal loop or ferrite rod antenna, it requires an external antenna. It doesn't seem to be a model made specifically for Australia as the dial does not show radio station names, just a rough indication of frequency and wavelength.

When I got it, the radio was in reasonable condition, with only minor scratches on the Bakelite case. To remove the chassis required removal of the rear heavy cardboard cover, two screws that held the chassis in place, and the knobs. The loudspeaker looked rather moth-eaten with a couple of holes, but seemed workable.

The speaker transformer is in an unusual large cylinder at top right, visible in the top view of the chassis. The bottom view shows the messy wiring which is typical of radios of that era. It makes modifications somewhat tricky.

The circuit diagram (Fig.1) shows that it is a fairly standard design. The copy I managed to download did not have very readable lettering, but with the aid of Photoshop, I cleaned it up. I also added the component values and pin numbers for the valves. That made circuit tracing much easier.

One of the banana sockets on the back of the set is for a ground connection and the other two are the antenna inputs. The top one connects directly to the input coil (S1 or S3) via the band selection switch. The second connection is via 100kΩ resistor R14 and is marked for LOCAL stations. I think that the station would have to be awfully close to get through that much attenuation.

The input transformer secondaries (S2 or S4) are applied to grid 3 of B1, the DK92/1C2 pentagrid valve, again via the band selection switch. The local oscillator uses grids 1 and 2. The tuning capacitor is a two gang unit, C4 and C5.

Band changing

The switching between the two bands is rather complex, and interpreting the diagram is no mean feat! On the antenna coil side, it is essentially a 4-pole, 2-position switch.

Two poles are used for switching the antenna between the medium-wave, S3 coil and the short wave S1 coil. The other two poles switch grid 3 of B1 between the tuned secondary coils, S2 and S4.

The local oscillator gets a bit more complicated. The medium-wave tuning range is 985kHz to 2050kHz, ie, 450 kHz above the tuned input frequency. The padding capacitor C14 (476pF) is

PCB PRODUCTION

PCB MANUFACTURE: single to multi-layer. Bare board tested. One-offs to any quantity. 48 hour service. Artwork design. Excellent prices. Check out our specials: www.ledelectronics.com.au

FOR SALE

GREAT VALUE PARTS and more are found in the Tronixlabs eBay store via tronixlabs.com.au – for enquiries or support please email support@tronixlabs.com

LEDs, BRAND NAME and generic LEDs. Heatsinks, fans, LED drivers, power supplies, LED ribbon, kits, components, hardware, EL wire. www.ledsales.com.au

ASSORTED BOOKS FOR \$5 EACH
Selling assorted books on electronics and other related subjects – condition varies. All books can be viewed at: siliconchip.com.au/link/aawx

Email for a postage quote, quote photo numbers when referring to a book: silicon@siliconchip.com.au

KIT ASSEMBLY & REPAIR

VINTAGE RADIO REPAIRS: electrical mechanical fitter with 36 years experience and extensive knowledge of valve and transistor radios. Professional and reliable repairs. All workmanship guaranteed.

\$17 inspection fee plus charges for parts and labour as required. Labour fees \$38 p/h. Pensioner discounts available on application.

Contact Alan, VK2FALW on 0425 122 415 or email bigalradioshack@gmail.com

DAVE THOMPSON (the Serviceman from SILICON CHIP) is available to help you with kit assembly, project troubleshooting, general electronics and custom design work. No job too small. Based in Christchurch, NZ but service available Australia/NZ wide. Email dave@davethompson.co.nz

KEITH RIPPON KIT ASSEMBLY & REPAIR:

* Australia & New Zealand;

* Small production runs.

ADVERTISING IN MARKET CENTRE

Classified Ad Rates: \$32.00 for up to 20 words (punctuation not charged) plus \$1.20 for each additional word. Display ads in Market Centre (minimum 2cm deep, maximum 10cm deep): \$82.50 per column centimetre per insertion. All prices include GST. Closing date: 5 weeks prior to month of sale. To book, email the text to silicon@siliconchip.com.au and include your name, address & credit card details, or phone Glyn (02) 9939 3295 or 0431 792 293.

WARNING!

SILICON CHIP magazine regularly describes projects which employ a mains power supply or produce high voltage. All such projects should be considered dangerous or even lethal if not used safely. Readers are warned that high voltage wiring should be carried out according to the instructions in the articles.

When working on these projects use extreme care to ensure that you do not accidentally come into contact with mains AC voltages or high voltage DC. If you are not confident about working with projects employing mains voltages or other high voltages, you are advised not to attempt work on them. Silicon Chip Publications Pty Ltd disclaims any liability for damages should anyone be killed or injured while working on a project or circuit described in any issue of SILICON CHIP magazine.

Devices or circuits described in SILICON CHIP may be covered by patents. SILICON CHIP disclaims any liability for the infringement of such patents by the manufacturing or selling of any such equipment. SILICON CHIP also disclaims any liability for projects which are used in such a way as to infringe relevant government regulations and by-laws.

Advertisers are warned that they are responsible for the content of all advertisements and that they must conform to the Competition & Consumer Act 2010 or as subsequently amended and to any governmental regulations which are applicable.

Notes & Errata

Busy Loo Indicator, January 2021: at the bottom of the left-hand column on p79, where the text says the inputs of IC1b are normally high, it should read IC1d instead.

Mini Digital AC Panel Meters, January 2021: if the current transformer secondary is not terminated with a low impedance, it will generate a very high (and potentially dangerous) voltage if any significant AC current is flowing in the primary. So make sure to connect the secondary leads of the CT to the panel meter before any current is allowed to flow through the primary.

Radiating test antenna for AM Radios, Circuit Notebook, January 2021: the ferrite rod is 200mm long, not 400mm as stated in the text.

Vintage Battery Radio Li-ion Power Supply, December 2020: on page 28, the text refers to a 220µF capacitor being charged via a 220Ω resistor. The capacitor value is actually 10µF.

Colour Maximite 2, July & August 2020: the SD card socket specified for this project (Hirose DM1AA-SF-PEJ(21)) is being discontinued by the manufacturer. Instead, use the DM1AA-SF-PEJ(82) which costs the same and fits the existing footprint on the PCB.

The March 2021 issue is due on sale in newsagents by Thursday, February 25th. Expect postal delivery of subscription copies in Australia between February 23rd and March 12th.

Small in Size, Big on Battery Life

The Industry's Smallest Sub-GHz Module for Multi-Year Battery Life

Designers of wireless, space-constrained sensor nodes require connectivity solutions that minimize size and provide multiple years of battery life. The SAM R30 is the industry's smallest IEEE 802.15.4-compliant module that combines an ultra-low-power microcontroller (MCU) with a sub-GHz radio, accelerating time to market and providing long-lasting battery life in wireless-networked sensors. At half the size of the next smallest module on the market, the SAM R30 module meets the needs of space-conscious designs such as home automation sensors and controls.

Highlights

- Compact size (12.7 x 11.0 mm) for small, easy-to-deploy sensors
- Extremely low-power sleep modes for multiple years of battery life
- Proprietary self-healing mesh connectivity
- Reliable sub-GHz connectivity for IoT sensors that require communication through exterior walls
- Reduced development time with a regulatory-certified solution, excellent development tools and code examples
