

CORRECTION TO THE PAPER ON THE ZEROS OF POLYNOMIALS OVER DIVISION RINGS

BY
B. GORDON AND T. S. MOTZKIN⁽¹⁾

On p. 226 (116 (1965), 218–226) it is stated that the curve $\xi_2^3 = (\xi_1 + 1)^3 - \xi_1^3$ has exactly nine points in $\mathcal{Q}(\sqrt{-3})$. However, one of these is at infinity; hence $N(f) = 16$ rather than 18 for this example. An example of a quadratic polynomial over D with $16 < N(f) < \infty$ is

$$f(x) = (\xi_3 - \xi_2^2)e_1 + (\xi_1^2 - \xi_2\xi_3 - 1)e_2 + (\xi_4^2 - 1)e_3.$$

To find the roots of $f(x)$ we consider the system

$$\begin{aligned}\xi_3 &= \xi_2^2, \\ \xi_1^2 &= \xi_2\xi_3 + 1, \\ \xi_4^2 &= 1.\end{aligned}$$

Eliminating ξ_3 we obtain

$$(1) \quad \xi_1^2 = \xi_2^3 + 1.$$

Euler [1] proved in 1738 that the only solutions of (1) in $\mathcal{Q}$ are

$$(\xi_1, \xi_2) = (0, -1), (\pm 1, 0), \text{ and } (\pm 3, 2).$$

Hence by a theorem of Billing [2], there are only finitely many solutions of (1) in $\mathcal{Q}(\sqrt{-3})$. These include the eleven pairs $(\xi_1, \xi_2) = (0, -\omega)$, $(\pm 1, 0)$, and $(\pm 3, 2\omega)$, where ω is any cube root of unity. Corresponding to each (ξ_1, ξ_2) there is a unique value of ξ_3 , and two values for ξ_4 . Thus $22 \leq N(f) < \infty$.
