United States Patent Office.

GEORGE R. DEXTER, OF NEW YORK, N. Y.

Letters Patent No. 113,748, dated April 18, 1871.

IMPROVEMENT IN SCARFS.

The Schedule referred to in these Letters Patent and making part of the same.

To all whom it may concern:

Be it known that I, GEORGE R. DEXTER, of New York, in the county and State of New York, have invented a new and useful Improvement in Scarfs, of which the following is a specification.

Figure I represents an elevation of my improved

ladies' tie embodying my invention.

Figure II shows a single strand of which the tie is made.

Figure III represents a piece of the material, show-

ing the manner the same is woven.

My invention consists in the combination of two, three, or more strands, A, of a double fringe band or cords of the desired length, which are twisted spirally, and then tied or fastened together at their ends a, where a suitable tassel, B, may be attached to make a finish of the article.

The material is woven in broad strips, as shown in Fig. III, by arranging the warp-threads n n, consisting of three or more threads, at intervals, leaving an open space, m m, of double the size of the desired length of fringe between them, the weft or woof-threads forming, then, the fringe, which may be made of any desired material, such as silk, cotton, or other suitable fabric.

After the material is woven the same is cut through in the center, between the warps, forming the strands A, as shown in Fig. II, and are then twisted in such a manner that the fringe part will form a spiral screw around the warp-threads, when two or more of these twisted strands are fastened together at their ends, forming the scarf, as represented in Fig. I.

Instead of making this scarf by a combination of two or more double-fringed strands, as above described, the same may be made of single-fringed strands, and a greater number of these single-fringed strands, twisted in the manner as above described, tied together at their ends.

What I claim as my invention, and desire to secure

by Letters Patent, is-

The herein-described scarf as a new article of manufacture, consisting of the combination of two or more single or double-fringed twisted strands, A, secured together at their ends, substantially as and for the purpose set forth.

GEORGE R. DEXTER.
