UNITED STATES PATENT OFFICE.

CHARLES T. BEARDSLEY, OF HAMDEN, CONNECTICUT.

IMPROVEMENT IN BROOM-HOLDERS.

Specification forming part of Letters Patent No. 116,140, dated June 20, 1871.

To all whom it may concern:

Be it known that I, CHARLES T. BEARDSLEY, of Hamden, in the county of New Haven and State of Connecticut, have invented a new Improvement in Broom-Holder; and I do hereby declare the following, when taken in connection with the accompanying drawing and the letters of reference marked thereon, to be a full, clear, and exact description of the same, and which said drawing constitutes part of this specification, and represents, in—

Figure 1, a perspective view; and in Fig. 2, a vertical central section, showing the device as supporting the broom.

This invention relates to a device for holding brooms, billiard-cues, or other articles desired to be suspended, the object being a holder which will allow the free introduction of the article to be suspended and retain the article, yet allow of its withdrawal by the exercise of very little force; and it consists in a socket of metal or any suitable material, into which is fixed an India-rubber ring, cut at one point, to allow its expansion, the interior diameter of the ring being little less than that of the article to be suspended, the under side of the said ring being made concave or with an inwardly-inclined edge, so that the end of the

article, being pressed up into the concavity, will spread the ring, to allow the article to pass into the ring, the friction of the rubber being sufficient to retain the article.

A is the socket, constructed so as to be secured to the wall or whatever it may be. B is a ring of India rubber cut through at *a*, by preference on the front side, and made concave or with an inwardly-inclined edge, as seen at *d*, Fig. 2. This ring is secured in the socket by means of a screw, *b*, or other suitable device. The end of the article to be secured is entered on the under side, the concavity facilitating the entrance, and thus passed into the ring, the slit *a* opening for the purpose, and, when fully entered, the friction of the rubber on the surface of the article is sufficient to retain it in position yet not so strong as to prevent its withdrawal.

I claim as my invention—

The herein-described broom-holder, consisting of the socket A and India-rubber ring B, substantially in the manner described.

CHARLES T. BEARDSLEY.
