# UNITED STATES PATENT OFFICE.

CHARLES C. NASH, OF PROVIDENCE, RHODE ISLAND.

## PORTABLE WATER-CLOSET.

SPECIFICATION forming part of Letters Patent No. 302,351, dated July 22, 1884.

Application filed March 7, 1883. (No model.)

*To all whom it may concern:*

Be it known that I, CHARLES C. NASH, of Providence, county of Providence, and State of Rhode Island, have invented an Improved Portable Water-Closet, as hereinafter fully described.

The accompanying drawing shows my invention complete, being a front view thereof, with portions broken away to show the interior structure and arrangement. In brief, it consists of a bowl with a seat thereon and a valve thereto, a surrounding water-tank with a suitable pump for forcing water around the bowl, a chamber for slops beneath, with a suitable spout thereto, and all in the compact and convenient form of a pail.

A represents the bail or handle, by which it can be carried; B, the top or seat; C, the cover to the hole; D, the bowl; E, the handle or knob by which the valve F is operated; G, the water-tank; H, the nozzle for filling the same; I, the pump, with outlet-pipe *i*, connecting it with the bowl; J, the handle of the pump; K, the tube through which the rod extends that connects the knob E and valve F; L, the slop-chamber; M, the outlet-spout, and N the cover thereto.

As represented, the water-tank is tight, so that slops can be turned from the lower chamber without disturbing or spilling the water.

The valve is so constructed as to hold a little water, thus sealing the bottom of bowl, and

effectively preventing any odor from escaping through it. A little water is pumped into it for this purpose, after the contents of the bowl have been dumped into the slop-chamber, and the bowl washed out by forcing water around it.

It is obvious that any style of pump or valve could be used with my invention, and therefore I do not claim any particular style thereof.

It is also obvious that instead of entirely surrounding the bowl the water-tank could extend only part way around, though for many reasons not as desirable as the structure shown.

It is further obvious that the slop-chamber could be made separable from the upper part of the closet and still my arrangement be maintained; but though coming within my invention it would not be as practical as when made all together.

Having thus fully described and illustrated my invention, what I claim as new, and desire to secure by Letters Patent, is—

Top or seat B, bowl D, knob E, and valve F, with rod connecting them, tube K, water-tank G, pump I, with handle J, and slop-chamber L, all combined and arranged to operate substantially as set forth.

CHAS. C. NASH.
