S. KUH. ADVERTISING APPARATUS.

No. 489,961.

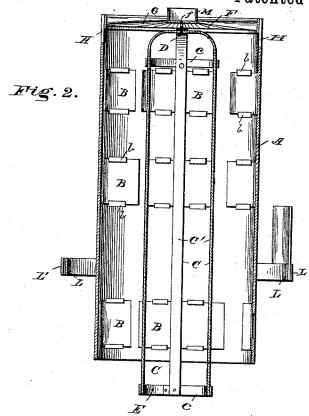

Patented Jan. 17, 1893.

UNITED STATES PATENT OFFICE.

SOLOMON KUH, OF SIOUX FALLS, SOUTH DAKOTA.

ADVERTISING APPARATUS.

SPECIFICATION forming part of Letters Patent No. 489,961, dated January 17, 1893.

Application filed August 27, 1892. Serial No. 444, 303. (No model.)

To all whom it may concern:

Be it known that I, SOLOMON KUH, a citizen of the United States, residing at Sioux Falls, in the county of Minnehaha and State of South Dakota, have invented a new and useful Advertising Apparatus, of which the following is a specification.

My invention relates to improvements in advertising devices, the object in view being to provide a simple device to be used in connection with a lamp, or other illuminating device, and capable of rotation, whereby advertising cards, signs, &c., may be arranged thereon and displayed to advantage.

In carrying out my invention I employ a certain novel combination of devices which will be clearly described hereinafter in connection with the drawings, the novel features being pointed out in the appended claims.

20 In the drawings; Figure 1 is a perspective view of an advertising apparatus embodying my invention; Fig. 2 is a vertical central sectional view; Fig. 3 is a plan view of the concentric rings for supporting and displaying 25 advertising cards; Fig. 4 is a plan view of the fan.

A represents a tubular body, provided with illuminated letters and figures, formed by puncturing the walls of the body portion and 30 covering said perforations or punctures with semi-transparent shields, B, held in place by elips b. Arranged axially in the tubular body, is a vertical supporting frame, C, comprising the vertical bars, C' C', connected by rings, c35 c, said bars being united at their upper ends to support the pivot pin, D. The connecting ring at the bottom of the supporting frame is provided with a pivoted latch, E, whereby the frame may be adjusted to the body of a lamp 40 or a burner, which is arranged within the body of the apparatus. Pivotally mounted within the tubular body, near its top, is the rotary fan, F, which is provided at its center with a socket f, to bear upon the upper end of the 5 pivot pin, and is secured at its periphery to the sides of the body. This fan is provided with deflecting wings, G G, which cause a rotation of the device by the ascending heat from the inclosed lamp. Inspection openings, 50 H H, are formed in the walls of the body near its top, to enable the light and the pivot to be

To the outer surface of the body portion are attached keepers, I I, in which are arranged angular supporting arms, K K, adapted to 55 support advertising cards, &c.

L' represent twin rings, the inner one of which is provided with supporting arms to engage keepers, l, on the outer surface of the body portion, and the outer one of which fits 60 over the inner ring to engage advertising eards, as shown in Fig. 1.

The light of the inclosed lamp shows through the semi-transparent shields which cover the perforations or punctures in the side walls of 65 the body portion, and illuminate the cards which are supported upon the brackets.

To the upper side of the fan is attached an angular bracket, M, to which may be attached advertising cards one of which is shown in 70 position at m, in Fig. 1.

From the above description it will be seen that the entire apparatus, with the exception of the interior support, is rotated by means of the heat ascending from the inclosed lamp, 75 thus successively displaying the cards and advertising devices formed in and carried by the tubular body.

The device is simple in construction and may be cheaply manufactured, as will be read- 80 ily seen from the foregoing description.

Having thus described my invention, what I claim and desire to secure by Letters Patent of the United States, is:—

1. In an advertising apparatus, a cylindri- 85 cal rotatable body-portion provided with apertures in its walls, clips arranged adjacent to said apertures, and semitransparent shields covering said apertures and engaged at their edges by the clips, substantially as specified. 90

2. In an advertising apparatus, a cylindrical rotatable body-portion, having apertured side walls covered by semitransparent shields, a fan fitted in the upper end of the body-portion, and a bracket M attached centrally to said fan to support advertising cards, substantially as specified.

3. In an advertising apparatus, the combination with the rotatable shell, of twin rings arranged concentrically therewith and supported by brackets attached to said shell, substantially as specified.

its top, to enable the light and the pivot to be 4. In an advertising apparatus, the combiviewed in order to insure proper adjustment. In an advertising apparatus, the combiviewed in order to insure proper adjustment.

gaged at their inner ends in keepers upon the exterior of the shell, and the twin rings, one of which is attached to the outer ends of said brackets and the outer ring being adapted to engage the outside of the inner ring to hold advertising cards, substantially as specified.

In testimony that I claim the foregoing as

my own I have hereto affixed my signature in the presence of two witnesses.

SOLOMON KUH.
