G. A. KURTIS. STOVEPIPE ATTACHMENT.

No. 523,795.

Patented July 31, 1894.

UNITED STATES PATENT OFFICE.

GEORGE A. KURTIS, OF ERIE, PENNSYLVANIA.

STOVEPIPE ATTACHMENT.

SPECIFICATION forming part of Letters Patent No. 523,795, dated July 31, 1894.

Application filed November 28, 1893. Serial No. 492, 288. (No model.)

To all whom it may concern:

Be it known that I, GEORGE A. KURTIS, a citizen of the United States, residing at Erie, in the county of Erie and State of Pennsylvania, have invented a new and useful Stovepipe Attachment, of which the following is a specification.

This invention relates to stove-pipe attachments; and it has for its object to provide an improved device of this character adapted to be easily and conveniently attached to any ordinary stove-pipe at a convenient point above the top of the stove, and to combine therewith improved shelf and drying rack attachments, whereby vessels and kitchen utensils may be supported out of the way when removed from the stove, while at the same time means shall be provided for drying towels, &c.

To this end the main and primary object of the present invention is to construct an attachment for stove pipes in a manner which shall render the same extremely useful, while at the same time, when not in use, occupying but little space and therefore not being at all in the way.

With these and other objects in view which will readily appear as the nature of the invention is better understood, the same consists in the novel construction, combination and arrangement of parts hereinafter more fully described, illustrated and claimed.

In the drawings:—Figure 1 is a perspective view of a stove-pipe attachment shown 35 clamped on a stove pipe (a portion of which shows in dotted lines), with the drying racks or rack supports in proper position. Fig. 2 is a similar view of the attachment showing the stove shelves substituted for the racks. 40 Fig. 3 is an enlarged detail sectional view showing the lowered and upright folded positions of one of the supports fitted in one of the pipe collar brackets. Fig. 4 is a detail in perspective of one of the rack supports detached from the pipe, with the several parts thereof separated from each other. Fig. 5 is a detail in perspective of a portion of the sectional pipe collar or clamp showing particularly the construction of the hinge joint. 50 Fig. 6 is a bottom plan view of one of the support brackets.

Referring to the accompanying drawings, A represents a sectional pipe collar or clamp adapted to be placed on a stove pipe a, at a convenient point above the top of the stove, 55 so as to be useful for shelf and drying rack purposes as will presently appear. The said sectional pipe collar or clamp A, comprises the duplicate curved members B, provided at one end with the registering and overlap- 60 ping beveled lock edges b, and the overlapping horizontally disposed hinge lugs C, the lower of which is provided with an opening c, to receive the hinge or pivot stud \bar{c}' , projected from the upper one of such hinge 65 lugs, thus providing a secure hinge joint for one extremity of the collar members to provide for the ready attachment of the collar to the stove pipe by the opening and closing of the separate members, while the beveled 70 registering lock edges b, serve to prevent the disengagement of the pivot stud when the members are closed on the pipe. The other ends of the collar members B, are provided with the meeting bolt flanges D, which ac 75 commodate the clamping bolt d, passing therethrough and serving to tighten the collar on the stove pipe.

At regularly spaced points the sectional collar A, is provided with radial off-standing support brackets E. The radially disposed support brackets E, are arranged in a convenient number according to the size of the attachment, and are each provided with under recesses F, and longitudinally disposed side beveled sockets G, leading off from said under recesses up to the body of the collar and having the outer sides thereof terminate in the front abrupt rest shoulders g. The said off-standing support brackets E, are further provided onear their outer ends with the top openings H, leading into the under recesses F, and having in the opposite sides thereof the V-shaped notches I, the function of which will be presently referred to.

The several off-standing support brackets E, are each adapted to detachably and adjustably hold in position therein either of the supports J or J', the support J, being illustrated as being a rack support to furnish a roodrying rack, and the other support J', being illustrated as a stove shelf constructed in any

suitable shape and size as may be desired. Both of the supports J and J', are provided at one side with the downturned attaching arms K, from the lower outer extremities of which are extended the straight side beveled supporting tongues L, which terminate at their inner bases in the abrupt rest shoulders M, which are adapted to register with or bear against the rest shoulders g at the outer sides 10 of the beveled sockets G. The said supports J and J', are further provided at one side and at points at the base and opposite sides of the downturned attaching arms K, with the pointed catch bevels N, which are adapted 15 to be dropped into engagement with the Vshaped top notches I, of the support brackets E, whereby the supports may be held in an upright folded position out of the way, close against the sides of the stove-pipe when 20 not in use.

In placing the attachment supports in proper position within the off-standing support brackets E, it is simply necessary to insert the straight beveled supporting tongues 25 and the downturned attaching arms through the top openings H, of the brackets, and then lower the supports to a position which brings the beveled tongues L, into the beveled sockets G, of the brackets, and the shoulders M, 30 against the shoulders g. In this position the top of the support rests flat on the outer solid top portion of the support brackets E. the supports are not in use and it is desired to fold the same out of the way, it is simply necessary to turn the same in the support brackets E, to an upright position, which brings the pointed catch bevels N, into engagement with the V-shaped top notches I, of the brackets, thereby locking the supports in an upright

40 folded position. The support J', is simply a shelf, as previously noted, and may be substituted for the rack support or stick rack J, and this stick rack J, is provided with a stationary 45 stick socket O, projected from one side there-of and having a V-shaped outer end o, in which are formed aligned socket openings o', to receive the inner ends of a rack stick P, on which may be hung towels, &c. At each 50 side of the intermediate or central stationary stick socket O, are arranged the folding sockets Q. The folding sockets Q, are provided with inner angled ends q, pivotally clamped onto the body of the support by the pivot 55 bolts q', and the outer ends of the folding sockets are V-shaped and provided with aligned socket openings r, similar to the construction of the stationary socket. By reason of the pivotal attachment of the folding 60 sockets Q, to the support J, the same may be

spread out laterally away from the stationary socket to separate the rack sticks P, and provide a large hanging area. When not in use the sockets Q, are folded flat up against the

may be properly folded up against the stove

pipe in an upright position.

Changes in the form, proportion and the minor details of construction may be resorted to without departing from the principle or 70 sacrificing any of the advantages of this in-

Having thus described the invention, what is claimed, and desired to be secured by Let-

ters Patent, is-

1. In a stovepipe attachment, the combination of a sectional pipe collar or clamp comprising duplicate curved hinged members provided at one end with registering and overlapping beveled lock edges and overlapping 80 horizontal hinge lugs at one side of the lock edges, and at their other ends with meeting bolt flanges, one of said lugs being provided with an opening and the other with a depending hinge or pivot stud that is prevented 85 from disengagment from the lug with the opening, when the collar or clamp is closed on a pipe, by said registering and overlapping lock edges, a clamping bolt detachably engaging the meeting bolt flanges of the col- 90 lar members, and supports adapted to be mounted on said sectional collar, substantially as set forth.

2. In a stove-pipe attachment, the combination of a stove pipe collar or clamp having 95 a radial series of off-standing support brackets provided with under recesses, longitudinally disposed side beveled sockets leading off from said recesses and having their outer sides terminating in front abrupt rest shoul- 100 ders, top openings near their outer ends, leaving outer solid top portions and V-shaped notches in the opposite sides of said top openings, and attachment supports provided at one side with pointed catch bevels adapted 105 to engage said V-shaped top notches to secure the support in an upright folded position, and downturned attaching arms projected beyond said catch bevels and provided with straight side beveled supporting 110 tongues terminating at their inner bases in abrupt rest shoulders adapted to engage on the front shoulders of said sockets, said supports when folded out being adapted to rest on the outer solid top portions of the brack- 115 ets, substantially as set forth.

3. The combination with a suitable support; of a stick rack attachment comprising a body having a single off-standing stationary or fixed stick socket, opposite folding 120 sockets at each side of the central socket and provided with inner angled overlapping ends, and a single clamping bolt pivotally clamping the angled ends of the folding sockets onto the body of the rack in rear of the stationary or fixed socket, substantially as set

forth.

4. In a stove-pipe attachment, the combination of the pipe collar or clamp having a 65 stationary socket so that the entire stick rack | series of off-standing support-brackets, the 130 stick racks having separate folding sockets, and a single projecting attaching arm carrying said sockets and adapted to detachably engage said support-brackets of the collar and a single clamping bolt pivotally clamping the inner ends of the folding sockets together, substantially as set forth.

In testimony that I claim the foregoing as my own I have hereto affixed my signature in the presence of two witnesses.

GEO. A. KURTIS.

Witnesses: E. C. EVANS, CHARLES HEYDRICK.
