

DRESSER-RAND-POWER

DR61G(000)-1-4

CHAPTER 1

GENERAL DESCRIPTION

DRESSER-RAND-POWER

DR61G(000)-1-4-1

The following Chapters detail those functions considered to be within the scope of the Operator's responsibility.

Routine inspection of the Control System Monitors as well as visual inspection of the Gas Turbine Generator Unit enables the Operator to note trends in operation and visual indications of physical deterioration.

These indications, if they are attended to punctually by **qualified** Service Personnel, may prevent a shut-down of the Installation during a critical operating period.

Routine inspections by the Operator are in addition to the recommended Maintenance Schedule, detailed in Part 1, Chapter 4. The Maintenance Schedule is also to be found in the Technical Manual for this installation.

An observation by the Operator of a progressive change in monitor readings during a period of stable operating conditions can provide invaluable and time saving information for the Service Personnel.
