The War introduced an abnormal period in the relations between employer and workman in every industrial country of importance, because all of them were belligerent. The paramount necessities of the State and the control which it exercised over the production of almost every article except those of purest luxury suspended the free play of economic forces. Though disputes and occasionally strikes occurred, usually for higher wages to meet swelling prices, they were quickly settled by government intervention instead of by the normal processes of industrial warfare. Nevertheless, the disturbance of all accepted values which the War created, the realisation of the national dependence on the industrial worker and the partial obliteration of class distinctions by the common struggle brought about a new attitude towards the whole question of industrial relations. It is not too much to say that with the Armistice industrial relations entered upon a new phase. As yet it is still in its very early stages. To suggest the lines of its ultimate development would be premature, but there are certain novel features which have emerged and which may be taken as marking a definite departure from pre-War conceptions. They may be illustrated from the experience of the three principal industrial countries, Great Britain, Germany and the United States, where under different forms and conditions similar tendencies may be traced. In contrast to them there is the Russian experiment where with the abolition of private capital the problem of industrial relations might be supposed to have been eliminated. Nevertheless the distinction between management and workers has gradually re-emerged and with it the problem once more begins to revive, as may be seen from the article RUSSIA.

I. THE WHITLEY COUNCILS IN GREAT BRITAIN

The Whitley Report.—In March 1917 a committee, presided over by Mr. J. H. Whitley, now Speaker of the House of Commons, and usually known by his name, presented its first report to the Minister of Reconstruction on the relations between employers and employed. It proposed the establishment of Joint Industrial Councils consisting of an equal number of the employers and workers in all well organised industries. Two points may at once be noticed as indicating that the authors of the report, who included several prominent employers and trade-union officials, had abandoned the view that the relation between capital and labour must necessarily be one of fundamental antagonism. In the first place, they proceeded on the assumption that trade unionism was an integral part of the industrial machinery and that any industrial reconstruction must be based on its frank recognition. Though it is true that this principle had been admitted before the War wherever collective bargaining had been firmly established, it has to be remembered that even in 1911 a national railway strike took place to secure its recognition by the companies and that in many of the lesser industries it was still far from being universally honoured.

Secondly, the committee emphasised the need for "the largest possible measure of co-operation between employers and employed." They declared that, in order to improve industrial relations, it was essential not merely to offer workpeople better conditions and a higher standard of comfort, but also "to enlist their active and continuous co-operation in the promotion of industry." The notion of co-operation was thus reintroduced into industrial history for the first time since the factory system came into existence. No doubt isolated attempts had previously been made to revive it in individual works by means of profit-sharing schemes, works committees and similar devices, but it had never been authoritatively laid down as a principle that should govern the whole field of industrial relations.

Joint Industrial Councils.—In consonance with these gen objectives, the Whitley Committee proposed three classe function for the Joint Industrial Councils. In the first pl they were to provide the means for settling wages and wor conditions. Secondly, they were to consider questions conc ing the development of their industries as a whole, such technical education, the initiation and utilisation of indus research and inventions, the improvement of processes and chinery. Thirdly, they were to discuss certain other mat which involved the partial association of the workpeople in general conduct of industry by utilising their practical kn edge, securing to them "a greater share in and responsib for the determination and observance of the conditions u which their work is carried on," "ensuring the greatest pos security of earnings and employment," and discussing "or isation and appropriate questions relating to manageme Moreover, in order to carry the spirit of co-operation from end of the industry to the other, it was recommended that councils should devolve some of their duties on district cou and works committees.

That this was a far-reaching programme involving a approach to the problem of industrial relations hardly n emphasis. That it should not yet have been fully realise hardly a matter for surprise, especially when the grave econc crisis which weighed heavily upon industry after the Wa borne in mind. Like other new institutions, the Joint Indus Councils have been roundly condemned as useless, because few years they have failed to perform a miracle by changing whole industrial atmosphere. But transformations as profo as those which the complete realisation of the Whitley sch would mean are only accomplished slowly. They deman long process of education both of employers and workers. W is important to notice is not the shortcomings but the achi ments of the councils.

Seventy-three councils were brought into existence with active assistance of the Ministry of Labour. At the end of 1 58 were still in operation. Fifteen had fallen by the ways usually because they were premature on account of an ins cient degree of organisation in their trades. The comprehen report issued by the Ministry in 1923 shows that the surviv had already accomplished a large amount of excellent work. is true that the greater part of it was devoted to settling ho wages and disputes, but when it is realised that many of industries concerned had never before possessed any machi for these purposes, their repeated success in solving the questions without conflict is in itself an immense testimon their value. Many councils, however, have gone further already performed work of a more constructive character.

Remarkable schemes have been set on foot in several tra for improving education and regulating the conditions of app ticeship. Much has been done to improve safety and healt collaboration with the factory inspectors and the Indust Fatigue Research Board. At least 12 councils have gone v carefully into commercial questions, such as foreign comp tion, the improving of transport facilities and the provisio raw materials. Finally, the pottery, tramway and wire-draw councils have set an important example by investigating costs, wages and finances of their industries. It is only by ex ining the detail of the work done that the progress which it resents and the influence which it has had on the relations tween the employers and the workpeople concerned can be fa estimated. Enough has been said, however, to justify the opi that the Whitley scheme is operating steadily and beneficia

Methods in the Five Great Industries.—One of the princ criticisms levelled against the scheme is that it has not b thought fit for adoption by the largest industries—mines, cott engineering, iron and steel and shipbuilding. In these indust machinery for bargaining and for dealing with disputes long been in existence, which they did not wish to alter i conformity with the Whitley model. It may, however, be nc in passing that, except in the iron and steel industry, seri stoppages have occurred in all the others since the Armist

may yet be found that some machinery for co-operation on a ader basis than now exists is necessary to ensure peace and sperity in these industries.

Finally, special mention must be made of the important innotion made in the relations between the railwaymen and the npanies by the Railway Act of 1921. It was originally prosed to provide for the inclusion of two Labour representatives the Board of Management, but this suggestion was dropped favour of a scheme setting up a Central and a National Board deal with wage claims and disputes, and Railway Joint Couns on each of the four great lines to deal with the local applican of national agreements, suggestions as to operating, working d kindred subjects, and other matters of mutual interest such "co-operation with a view to securing increased business, eater efficiency and economy." Under these councils are secnal councils, while in every station or dépôt where 75 men are ployed a local departmental committee is established, whose neral objects are to provide contact between management and ployees and to increase the latter's interest in their work by ving them an opportunity of discussing matters affecting not ly their own conditions but also the efficiency and organisan of the working of the railway. In other words, the Whitley inciple has been adapted to the railways and has certainly ntributed to their smoother working.

Conclusions.—This brief survey will have made it clear that Great Britain a distinct change is observable in industrial lations since the War. A rival notion to that of the diametrical position between capital and labour has been introduced in e shape of co-operation for the common benefit of both. This is involved not only the unqualified recognition of the trade ions as part of the machinery of industry, but also the admison of the right of the workman to some participation in its olicy and responsibilities. Lastly, except in the case of the ines and the railways, the demand for the direct nationalisaon of industry is perhaps less confident than it was before the periences of the War and the Russian Revolution, but the ea of syndicatising industries still on commercial lines with tate supervision has acquired a good deal of prominence.

II. THE GERMAN SYSTEM OF WORKS COUNCILS

The development of German industrial relations since the rmistice has taken place in a very different setting. Whereas n Great Britain the War produced a disturbing interlude which ft the general organisation of society unchanged in its outward rms, if modified in its spirit, in Germany the close of hostilities rought about a radical transformation. The German Revolun not merely substituted a republic for a monarchy, but it ltered the whole social equilibrium. For the first years of the ew Germany the Social Democratic party was the dynamic rce in the Government, and it was during that period that the onstitution of Weimar was framed. That remarkable docuent introduced profound changes in the sphere of industrial elations as in other spheres of German life. After laying down he principle that the "labour force" (*Arbeitskraft*) falls under he special protection of the Federal Govt. and enumerating arious measures to ensure that protection, the constitution rovided in Article 165 for the establishment of two institutions which are beginning to play an important part in German industrial life—the Federal Economic Council (*Reichswirtschaftsrat*) nd the works councils (*Betriebsräte*).

Operation of the System.—Works councils (*q.v.*) have not been ested during a normal period, and it is still premature to prounce any definite opinion on their value and possibilities. It may nevertheless be stated with considerable confidence that he works councils have established themselves as a permanent eature of the German industrial system, whatever modifications hey may be destined to undergo. To say this does not mean hat the employers are fully reconciled to them or that the workers are fully conscious of their possibilities. The former still show the greatest reluctance to admit the councils to any real participation in the problems of production. They have frequently placed obstacles in their way and have generally tried to restrict their functions to that of intermediaries between workers and management. As a result, the number of cases in which works councils can be stated to have had a beneficial effect on production is small, though on the other hand the employers' fears that they would have a subversive and pernicious influence have not been realised, save where the Communist element has succeeded in gaining control. The workers, on their side, have often not proved themselves capable as yet of using the new machinery effectively. Their lack of technical knowledge has hampered them, while in smaller works a considerable amount of indifference is still to be found. At the same time, they have established their right to receive important information, which the trade-union leaders regard as a means of gradually educating Works Councillors in their duties.

On the social side the results of the works councils have been more pronounced. They have played a considerable part in the enforcement of the eight-hour day by exercising a supervision on behalf of the trade unions, which has prevented abuses and secured closer observance of the collective agreements. But perhaps the most remarkable results achieved by the councils from the workers' standpoint have been in connection with dismissals. By investigating innumerable cases in which improper grounds of discharge have been alleged and by taking them before the conciliation boards, the works councils have gradually built up a jurisprudence which affords a real guarantee to the worker against arbitrary action on the part of his employer. If the councils had attained no other results, their action in this field alone would have justified their creation from the workers' point of view. On the whole, it may be said that, although their value and effectiveness vary greatly in accordance with the spirit which both sides have brought to bear on them, the works councils have justified themselves and are likely to acquire further authority as time goes on.

III. THE GERMAN FEDERAL ECONOMIC COUNCIL

Functions of the Council.—Any estimate of the influence of the Federal Economic Council on German industrial relations is subject to the same qualifications as in the case of the works councils. As an institution it is still in its infancy; in fact, its form is still provisional and remains to be finally determined by a bill under consideration in 1926. Hitherto it has consisted of 326 members, but experience has shown this number to be too large and the bill reduces it to 126, of whom 41 are to be nominated by the employers' organisations, covering industry, agriculture, commerce, banking and transport, 41 by the trade unions of various kinds, 14 are to represent private corporations such as the municipalities, co-operative associations and insurance companies, and 30 are to be appointed by the Federal Govt., including two representatives of the Press. The functions to be allotted to this permanent council are analogous to those which the provisional council has been exercising during the past six years. In the first place, all government bills of an economic or social character have to be submitted to it for advice and its views must be presented to the Reichstag, whether favourable to the Government's proposals or not. The council may also depute members to explain its conclusions while the bill is under discussion in Parliament. The council has a further power of considerable importance, namely, that of conducting "inquiries into questions of fact, in the economic and social field" (*Untersuchung tatsächlicher Verhältnisse auf wirtschafts- und sozial-politischem Gebiet*), and for this purpose the council is to be armed with compulsory power to obtain information and to hear evidence on oath.

Similar Institutions in other Countries.—It will be seen that the Federal Economic Council is not merely or even primarily concerned with industrial relations, but that it is called upon to advise upon all economic questions and to exercise functions of a semi-political character. In fact, it represents the modern tendency, which may be found in the formation of a *Conseil National Économique* in France and in the new Fascist *Consiglio Superiore dell' Economia Nazionale* in Italy, to submit economic questions to the consideration of expert professional bodies

instead of leaving them to be exclusively decided in the light of the political circumstances of the moment, which exert so large an influence on the deliberations of Parliaments and often produce results that are hardly consonant with the best interests of the country. From the point of view of industrial relations, however, such bodies are of considerable significance, as they mark once again the post-War tendency to admit representatives of the workers to direct consultation on the wider problems of industry, instead of leaving them as hitherto to be dealt with only by governments and employers. Enough has been said of the new bodies which the German Constitution has called into being to show that in Germany, as in Great Britain, this tendency has won a large measure of recognition and the status of the worker is undergoing a gradual development in the direction of participation in the responsibilities of management.

IV. TENDENCIES IN THE UNITED STATES

To turn from Europe to the United States is to discover industrial relations based on quite other conditions and determined by circumstances which find no parallel in the Old World. The industrial evolution of a new country with vast natural resources and incalculable possibilities of expansion must necessarily differ widely from that of small, highly developed areas such as Great Britain and Germany. The United States was a predominantly agricultural country until very recent times, and the phenomenal growth of its industry in the last two generations has not even yet been so great as to make it predominantly industrial rather than agricultural. There is still a far greater measure of fluidity in American than in European life. The workman of to-day may still be an employer to-morrow and a millionaire before he dies. A man who fails in the town can still return to the country, or who fails in one job can pass to another with the certainty of finding employment. In a word, the towering occupational and class barriers which hem in the European worker's progress through life only exist as yet in a very minor degree in the United States. The consequence has been a different attitude towards the whole subject of industrial relations. The outlook both of employers and workers remains essentially individualistic. While until recently the former has been uncompromising in the maintenance of his undivided sovereignty in his own plant, the latter have shown little interest in the orthodox doctrine of class warfare, only a moderate inclination to trade unionism and a positive repugnance to many forms of State interference. The late Mr. Samuel Gompers throughout his career fought vehemently against any endorsement of State schemes of insurance by the American Federation of Labor, and demands for industrial legislation which have been pressed for years by the trade unionists of Europe have been vigorously opposed by the trade unionists of America.

Besides this individualistic tradition, which is characteristically American, there is another factor which has directed industrial relations into unfamiliar channels. The ordinary growth of the population was quite insufficient to supply the vast demand for labour created by the rapid expansion of American industry. The result was a tremendous acceleration of the stream of immigration from about 1800 onwards, until in the years preceding the War it had attained an annual figure of over a million. A large proportion of these new American labourers were drawn from southern and eastern Europe, instead of from the northern countries which had previously furnished the main body of immigrants. They had little or no industrial experience, they were usually ignorant of the meaning of trade unionism, and even if they attempted to combine for trade purposes, they were unable to comprehend the speech either of their own officials or of their fellow members. As a result, the employers enjoyed a power in the United States which their European colleagues had long since forgotten. Trade unionism was weak and extremely difficult to promote in the face of the natural obstacles already mentioned, reinforced by the relentless and uncompromising hostility of the employers. Nevertheless, in certain industries, notably the garment trade, one of the worst paid and most difficult to organise, it made astonishing progress, and even in other industries such as the steel industry, c in coal districts like West Virginia, where organisation was un to obtain a solid foothold, the workers began to band toge for fighting purposes, often under the aegis of the loose extremist body known as the "Industrial Workers of World."

Industrial Warfare.—Under these conditions industrial fare was carried on by both sides with a violence and ruth ness never approached in Europe. In the face of the enorm power of American capitalism, which was often unsparingly to crush any incipient combination for protecting their inter the workers were driven by a feeling of desperation not me to resistance but to open revolt. Strikes were not just test endurance and organisation, but not infrequently prod armed conflict and considerable bloodshed. In the decade ceding the War and during the War itself industrial relat in America were apparently growing steadily worse, and it generally concluded by European observers that their deve ment was following the normal course already familiar in Eur that as the abyss between capital and labour widened, org sation would grow stronger on either side until each was fectly entrenched against the other. Despite certain pecu features, there was no essential difference in the problem a presented itself in the new world. America was a genera behind Europe in its trade unionism, but was pass through the same recognisable stages and would arrive at essentially similar conclusion. The damming of the immigrat river first by the War and then by "quota" legislation wo only hasten the process by solidifying the working masses in United States and removing one of the principal obstacles to growth of trade-union organisation.

American Proposals.—Though it would perhaps be rash assert that this view has already been falsified by experie events seem to point to a different evolution. Since the Ar stice there has been more discussion of industrial relations in United States than perhaps in any other country. The Ameri public seems to have awakened to its immense importance the whole future of the country. When President Wilson cal his industrial conference in 1919 to elaborate proposals for bet relations, it aroused far more interest among the general pul than did a similar conference convened by Mr. Lloyd George England in the same year. Although it reached no very posit conclusions, it probably served its purpose by acquainting American people with the elements of the industrial proble

Since that time their education has been steadily continued the Press of all grades. The output of books, magazine a newspaper articles on the subject has been immense. Big e ployers like Henry Ford, J. D. Rockefeller and Edward File distinguished men of learning such as President Eliot of H vard, politicians, journalists, church congresses and numer private bodies have contributed actively to the discussion, wh a great deal of industrial investigation has been done both individual research workers and by institutions such as t Russell Sage Foundation. The result has been to create atmosphere more favourable to the peaceful improvement industrial relations than exists in any European country. Wit out by any means pretending that the old prejudices or antag nisms as between capital and labour have been eliminated, may be said that they have been already softened by the fr play and approval given to liberal and progressive ideas, a restrained by the feeling of responsibility which the nation interest displayed has engendered.

What, then, are the tendencies which are beginning to sh themselves as the result of all this American discussion? In t first place, there is a marked insistence on the application democratic principles to industry. America is a country whi prides itself above all on its democracy, and once the questi is stated Americans find it as difficult to approve autocrat methods in industry as they do in politics. Moreover, they a beginning to believe that in a democratic country comple industrial autocracy is not really possible, or that, in Mr. Filene words, "industrial democracy is inevitable, because politic

wer has been given to the masses." In fact, the widespread terest evoked in the problem of industrial relations in the nited States is largely due to the belief that unless it can be lved by industrial methods within industry, it will become a olitical problem to be solved by political methods outside dustry. For many Americans, then, the solution of the indus- ial problem appears fundamental to the maintenance of democ- cy. The general view now gaining ground among them may summed up in a dictum of the Bureau of Industrial Research. One of the great tests of democracy in the years to come will the ability of American employers and wage-workers to find basis of democratic co-operation in the government of indus- y. Unless industry can be constitutionalised on a democratic asis, there is serious danger of class conflict culminating in me form of revolution."

Experiments in Certain Industries.—In order to "democra- se" industry numberless "plans" are now on trial. In the irment trade a regular system of co-operation has been estab- shed by the employers and the Amalgamated Clothing Workers America, starting with Messrs. Hart, Schaffner and Marx, ne of the largest firms in Chicago, and thence spreading through ne industry. On the railways an interesting experiment has en initiated on the Baltimore and Ohio Railroad which has nce been adopted by other great American lines and by the anadian National Railway. Joint committees have been set p rather similar to those which exist on the British railways, ne main objects of which are the promotion of efficiency, the imination of waste and the stabilisation of employment. All ne available evidence testifies to their success, both from the nployers' and the workers' standpoint. A large number of o-operative schemes may be found in other industries, varying idely in type but all based on the idea of securing the whole- earted collaboration of the workpeople by enlisting their direct terest in the running of the establishment.

In some cases constitutions have been set up on the American odel with a Senate and a House of Representatives, in others ne profit-sharing element is introduced in some shape or form. y no means all of these schemes have been instituted in agree- ent with the trade unions; in fact, it would probably be true o say that the majority were promoted by the employer with ne object of preserving the "open shop" and keeping unionism ut. But whatever their origins, these works committees have ndoubtedly done much to improve industrial relations. The atistics published by the National Industrial Conference oard, an important employers' organisation, show that in 1924 here were 814 establishments possessing works committees here 1,177,000 workpeople were employed, as against 225 mploying 391,000 in 1919. When compared with the whole of merican industry, this does not represent a very large propor- ion and as in the case of some of the British Whitley Councils, ome works councils have failed to survive in the United States. o maintain, therefore, that the "democratic" movement in ndustry is universal or overwhelming would be misleading. here is still a large section of employers who remain wedded to ld-fashioned methods and who are opposed even to collective argaining. There is no doubt, however, that the new method is aking steady progress, and what is perhaps most significant s the changing attitude of labour towards it.

Wages and Production.—As has already been pointed out, the ndividualist tendency and the vast influx of immigrants have endered trade-union organisation far more difficult in America han in Europe. In addition, the American working man is nore intent on earning good wages than on any other objective. His standard of living is considerably higher than that of any European worker and his principal aim is to elevate it still urther. He is therefore disposed to assist in increasing produc- ion, if by doing so he is assured of increasing his own income. He has no objection to adopting "capitalistic" methods, to wning bonds or to taking shares in the enterprise which employs im, if he sees in them the means of augmenting his material rosperity. As a result of this attitude one finds that the situa- ion in the United States differs from that in Europe.

In the first place, there has been a great increase of output per head since the War, due to the improvement of machinery and the more economical use of the forces of production, while on the workers' side there has been a reduction of hours and a rise in real wages. The American workman, so far from offering resistance to mechanical progress, has frequently promoted it, and some trade unions even employ their own experts on scientific management, to which until recently they were violently opposed.

Secondly, the purchase of stocks by employees has developed in a remarkable way. One American economist calculates that, whereas shareholders with an income between $1,000 and $5,000 only received $38,000,000 or 1·8% of the total dividends reported in 1916, they received in 1921 no less than $562,000,000 or 22·7%. To illustrate this point, it may be mentioned that out of the 60,000 employees of Armour & Co 40,000 are stockholders. In the Philadelphia Rapid Transit Co. 11,000 employees held over $10,000,000 worth of stock in 1925, more than double the value of their holdings in the previous year. Similar instances could be multiplied to show that the American worker is becoming a holder of capital.

Workers' Investments.—Thirdly, labour has initiated its own banking movement. The first labour bank was founded at Washington in 1920; at the end of 1924 there were 33 already in existence, with resources estimated at about $150,000,000. The leading part in this movement was taken by the Brotherhood of Locomotive Engineers, one of the strongest American trade unions, under the leadership of Mr. Warren S. Stone. Their objects, as he states them, are simply to offer the working man safe custody for his money and sound advice for its investment. But it is calculated that the American workers are in a position to save from $6,000,000,000 to $7,000,000,000 annually, and Mr. Stone asserted that "if they would save and carefully invest their savings, in 10 years they could be one of the dominating financial powers of the world." This suggests possibilities in labour banking which are at least still far from being realised. The experiment is yet in its childhood, but whatever its final form it must exert a considerable influence on the psychological attitude of American labour towards capitalist enterprise.

Co-operation Rather than Warfare.—Mr. Stone defined three phases in the trade-union movement. The first two—organisation and the struggle for collective bargaining—are familiar in all industrial countries. "The third cycle or phase," he says, "lies in constructive development towards a system of co-operation rather than war; and the most striking evidence of this phase is the labour bank." Though we have seen some evidence of a similar tendency in Great Britain and Germany, it is only in America that the labour movement seems to be consciously and openly adopting a co-operative policy. In doing so they are not abandoning the goal of securing an even larger share in the control of industry, but their method of approach is entirely different. Instead of preaching the destruction of capitalism, they are aiming at its peaceful penetration. Prof. Carver, of Harvard, goes so far as to claim that "the only economic revolution now under way is going on in the United States. It is a revolution that is to wipe out the distinction between labourers and capitalists by making labourers their own capitalists."

This is probably an overstatement of the case, but it is certain that the policy of co-operation with capital and of intensifying production is looked upon with favour by the American Federation of Labor. The last report of their Executive Council, after defining collective bargaining as the first function of trade unionism, states that "there is a still more important function that the union can render—that of participating in finding better methods of production and greater production economies." It recommends that the Baltimore and Ohio scheme of union-management co-operation should be closely studied and the advice of experts on shop management systematically sought. The Executives even recommend that their members should take part in works committees in establishments where the trade union is not recognised, on the ground that they promote solidarity among the workers and may thus assist trade union

organisation. Mutual confidence between employer and employed are essential in order that the latter may be assured a fair return for the increased efficiency which he helps to secure, but on this condition co-operation to promote industrial prosperity is put forward as the policy to which organised labour should give a fair trial.

It would be hazardous to conclude, however, that industrial relationships in America are definitely set in the path of conciliation and co-operation. The phenomena which have just been briefly reviewed are not universal in character and have occurred during a period of overwhelming prosperity. How far they may be its cause or its consequence is an undecided question. Some observers think that the enthusiasm of labour for high production would be killed by a period of trade depression; others that it depends for its maintenance upon the uninterrupted progress of mechanical invention, which by multiplying production without increasing prices has given the American worker a steadily rising standard of living. All that can be safely said at the moment is that the United States is experimenting boldly with a new relationship between employer and worker and that the success already achieved is sufficient to make its further development a matter of obvious interest and importance.

V. CONCLUSION

This bird's-eye view of the development of industrial relations seems to suggest that they are now entering a critical, perhaps a decisive, phase of their history. Just as the end of the War ushered in a new era in international politics, so it may be destined to mark a new point of departure in the politics of industry. It is certain that, like all other human institutions, they cannot remain stationary. Either they must develop further on the lines of conflict rendered constantly more menacing to the community, as the strength and resources of the organisations of both sides increase and become growingly capable of exerting pressure on its vital organs, or alternatively conflict must give place to co-operation based on the recognition of the essential partnership of labour and capital and on their common interest to stimulate production, if they are to survive in an age of aggravated competition. Whereas before the War the signs of this latter tendency were barely discernible, clear evidence of its growth has been shown to exist to-day in Great Britain, Germany and the United States. A similar movement may be found in other industrial countries such as Czechoslovakia, Austria and Norway, where compulsory works councils are in operation, or in France, where there are voluntary councils in many factories. But it is much too soon to suggest which of the two tendencies will prevail. The decision between them will only be slowly worked out over the coming decades. The ultimate answer will determine for good or for evil the future course of our industrial civilization.

INDUSTRIAL RESEARCH: *see* RESEARCH, INDUSTRIAL.

INDUSTRIAL SCHOOLS.—In Great Britain children may be sent to industrial schools on such charges as found begging, found wandering and not having any home, found destitute and having parents undergoing imprisonment, found in the care of a parent or guardian of criminal or drunken habits, frequenting the company of a reputed thief, residing in a disorderly house and for more serious offences, such as theft, larceny, housebreaking.

Industrial schools tend to approximate more and more closely to the ideal of residential elementary schools, situated in pleasant surroundings in rural districts, for the attendance of children suffering from parental neglect, or subjected to an environment likely to cause delinquency or criminal habits. The schools are inspected by the Home Office and the Board of Education, and as far as possible "institutional" life is eliminated. As much freedom is allowed as is consistent with the maintenance of order and good conduct, and the clothing supplied is similar to that worn by ordinary school children.

School Routine.—School routine, as a rule, consists of general educational work and vocational training in equal proportions. Sports and games are encouraged. The trades and occupations taught to boys are tailoring, shoemaking, carpentry, farming, gardening and instrumental music; a few of the institutions are training ships. Girls are trained in all branches of domestic work. The after-careers of the great majority of industrial school children are satisfactory, and many of the children obtain lucrative and congenial employment. With the decline in truancy truant schools have been discontinued, and truants are usually committed, in London and elsewhere, to industrial schools until they reach the age of 16.

Boarding-out.—Many education authorities have adopted schemes providing that children under eight years of age who are committed to industrial schools shall, whenever conditions are suitable, be boarded-out with foster parents. By this arrangement the children receive the advantages of home life, generally in rural surroundings, and can attend the local elementary schools. In 1925 nearly 300 London children were boarded-out with foster parents. Cordial and often enduring relations are formed between the children and their foster parents.

Statistics.—The number of persons dealt with in juvenile courts has decreased during recent years. In 1913, proceedings were taken against 37,520 children. During the War the number reached the high-water mark of 51,323 in 1917. There has since been a gradual decrease; in 1924 the number was 29,624. The majority of the "1924" children were dealt with as follows:—

Fined	9,190	Bound over . .	2,410
Dismissed . . .	6,560	Ordered to be whipped	607
Placed on probation .	5,812	Sent to reformatories	529
Charge withdrawn .	3,779	Sent to industrial schools	526

The decrease in the number of charges may be attributed to improved social conditions, increased and more efficient organisation of children's care work, and the development of the national system of elementary education. There has also been a large decrease in the number of committals to industrial or reformatory schools in proportion to the number of children charged, largely due to the greater use now made by the courts of the powers conferred by the Probation of Offenders Act, 1907. Magistrates hesitate to remove a child from its home unless they are satisfied beyond doubt that such a course is in the best interest of the child. (*See* CHILD LABOUR AND WELFARE.)

(G.H.GA.)

INDUSTRIAL WELFARE AND MEDICINE.—Human beings possess intelligence, and their health depends on psychological as well as on physiological environment. Mental and physical activity are necessary to health. From the industrial point of view both require to be maintained in order to ensure efficiency which spells for an employer a contented personnel and for the employed physical health and a "worth while" life. Appreciation of this point of view has in recent years been expressed through different activities aimed at maintaining mental contentment and physical health, at preventing sickness and mortality, and at restoring the sick to health; these lines of activity are not mutually exclusive. They may for convenience be considered under the headings of Industrial Welfare, Industrial Fatigue and Industrial Medicine.

I. INDUSTRIAL WELFARE

This entails not merely compliance with statutory requirements as to the provision of specified accommodation, but the sk of getting each worker to take an intelligent interest in his rn health and efficiency, in that of his fellows and in that of the tablishment to which he belongs. The movement, which was ly embryonic before the World War, received great impetus in reat Britain from the recommendation of the Health of Munin Workers' Committee that welfare work should be adopted r munition workers, and from the series of memoranda the mmittee issued explaining how the work should proceed.

Progress in Wartime.—A department was created in the inistry of Munitions to develop the scheme which at first was rticularly pursued for women, girls and boys. Welfare supersors were appointed to supervise (*a*) needs within the factory, d (*b*) needs outside the factory. The work within the factory vered the selection of workers for engagement; supervision of neral behaviour; of progress and apprenticeship; of transfer d disposal of workers; of general cleanliness, ventilation and mperature; of canteens; of ambulance, rest-rooms and first-d; of cloak-rooms and sanitary conveniences and of overalls. utside the factory it covered housing accommodation, transit cilities, sick visiting, recreation and education. The keeping d studying of personal records of earnings, sickness and accints was organised. Welfare committees composed of workers ere found invaluable to the activities of the superintendents. ne scheme was first developed for national factories, but the imulus to private firms of financial assistance from excess ofits duty helped greatly to wider extension of the policy.

While activity on these lines, which came to an abrupt termiation on the cessation of hostilities, was still in progress, the ome Office, in 1916, consolidated much of the ground won by taining powers under the Police, Factories, etc. (Miscellanes Provisions) Act, 1916, enabling the Secretary of State by der to require occupiers of factories to make reasonable prosions relating to "arrangements for preparing or heating and king meals; the supply of drinking water; the supply of proctive clothing; ambulance and first-aid arrangements; the pply and use of seats in workrooms; facilities for washing; commodation for clothing; arrangements for supervision of orkers." Under these powers 14 orders have already been made ncerned with the special needs of different industries. At the me time a series of valuable pamphlets have been issued to set rth how the requirements of the orders can be complied with. ction on these lines continues; but already some matters have come of general application, thus drinking water must now be pplied in all factories, while the provision of first-aid has beme generally compulsory under the Workmen's Compensation ct, 1923.

Extension of Voluntary Welfare.—Meanwhile activities which ay be called "voluntary" welfare have extended, notwithanding the tendency during trade depression to hold back from ew ventures. At least 1,000 firms to-day have welfare workers, s compared with about 30 in 1913. Housing efforts, recreation rounds, institutes, educational schemes, nurses and sick visiting, nteens and dental clinics at factories, all provide examples of tension of factory welfare without legal compulsion. In these ays modern industry is recognising that well-directed welfare an economic proposition and makes for contentment.

The Mining Industry.—Reference has so far been confined to ne welfare movement in reference to factory employment; but ction has not been confined entirely to this field. In England in 872 the Metalliferous Mines Regulation Act called for the rovision of accommodation for enabling persons employed in etalliferous mines to dry conveniently and change their clothes. n 1910 the Mines Accidents (Rescue and Aid) Act gave power o make orders relating to: (*a*) The supply and maintenance of appliances for use in rescue work, and the formation and training of escue brigades; (*b*) The supply and maintenance of ambulance ppliances and the training of men in ambulance work.

The Coal Mines Act of 1911 contained, too, an important lause providing for accommodation and facilities for taking baths and drying clothes where the majority of workmen employed in a mine desire such. Unfortunately this clause was a dead letter except at some half-dozen collieries. But under the Mining Industry Act, 1920, welfare work for miners received a great impetus. This Act provides a fund, derived from a levy of 1d. a ton on the output of each mine every year, to be applied for purposes connected with social well-being, recreation and conditions of living of workers, and with mining education and research, and with such purposes as the Board of Trade may approve; but the provision of dwellings is expressly excluded from such purposes.

The fund amounts to about £1,000,000 a year; its allocation is directed by an independent central committee on which both miners and colliery owners are represented. Four-fifths of the contributions coming from each coal-field must be spent within that field: the remaining one-fifth of the fund is devoted to welfare matters of mutual interest to the whole industry, such as the promotion of research into safety and health, and the provision of higher education for miners and their families, to each of which purposes the central committee has set aside approximately £500,000 out of the first five years' contributions to the fund. Expenditure from the fund is now year by year keeping pace with contributions. The Act of 1920 was due to expire in 1925, but the success achieved by the activities thus instigated has led to prolongation of the life of the levy to the fund for a further five years.

The total credits of the fund on Dec. 31 1925 amounted to £4,740,339; and apart from the £100,000 already mentioned, allocations had been made for district purposes as follows:—

Description	Total Number of Schemes	Total Number of Allocations	Money Allocated
Recreation (chiefly recreation ground and institutes) . .	844	1,455	2,027,564
Health (convalescent homes, pithead baths, ambulance and nursing services, etc.) . .	126	198	958,771
Junior education . . .	18	25	26,362
Expenses of district committees	..	96	25,464
Total	988	1,774	3,038,161

The research is directed by a safety-in-mines research board, acting in collaboration with a health advisory committee; higher education is effected by assistance given to local education authorities and universities.

The central committee consults with district committees concerning the amount and purposes of grants in each district. Interest attaches to the items shown on the table just given. They display the activities of the fund as progressing (with the one exception of a few allocations for pithead baths) on needs *outside* working hours; while progress in factory welfare made under statutory orders is extending with regard to needs *within* working hours. The contrast is sharp.

A Comparison.—In the case of factories voluntary effort is forwarding outside welfare schemes; but in the mines no similar efforts are taking place with regard to such needed inside welfare as the provision of drinking water, improved lighting, pithead baths or kitchens.

The procedure followed in these two lines of advance is also in contrast. Factory welfare proceeds through statutory orders, compliance with which can be enforced; while mining welfare consists of activities, originated and pursued by the mining community, but financed through a statutory levy. Thus the activities pursued for munition workers have been diverted into two separate streams. Still all welfare activities, in addition to their wide social aspect, undoubtedly exert a powerful influence in promoting industrial health.

II. INDUSTRIAL FATIGUE

The maintenance of health in industry, especially with regard to women and young persons, has always been a driving force in

our code of legislation controlling factories and mines, but its close study is practically a new science, known technically as the study of industrial fatigue. In Great Britain the study is to-day pursued on general principles by the Industrial Fatigue Research Board, an integral part of the Medical Research Council. This board came into existence in 1918, owing to appreciation of a national need for intensive investigation to which attention was directed during the War by the activities of the Health of Munition Workers' Committee. Problems of interest to particular establishments are tackled by the National Institute of Industrial Psychology (*see* INDUSTRIAL PSYCHOLOGY). Much practical knowledge as to human activity, embodied in over 30 reports issued by the board, and in the Journal of the Institute, has been placed on a scientific basis.

Certain points may be succinctly stated: work is necessary to health, and health is needed for efficient work; even steady work is better than spasmodic efforts; an optimum temperature, which should vary about a mean, exists for each process and is associated with best output, least sickness and fewest accidents; ventilation is to be read in the stimulating effect of air movement, rather than in change of air; rest periods during long spells of work, particularly if posture is changed, may increase output and lessen monotony; monotony in repetitive work, in temperature, in ventilation, in long spells of activity without pauses, and even in food supply, is disadvantageous; good factory canteens improve health and output; change of personnel, *i.e.*, labour turnover, reduces production and increases lost time due to sickness and accident; suitable overalls create pride in work and in person; vocational training adds joy to work; vocational selection on engagement increases output and reduces labour turnover; certain workers exhibit a predisposition to sustain accidents and should be employed only where accident-risk is at a minimum; the tendency to sustain accidents is associated with a tendency to fall sick.

The introduction into industrial organisation of such knowledge promises rapidly to revolutionise industrial management, and to prove the health-value to the community of well-conducted occupations. More knowledge as to the laws of human activity remains to be acquired; but by adopting what is already known, industry will prove to be our most powerful influence for maintaining public health.

III. INDUSTRIAL MEDICINE

Industrial medicine is concerned with the prevention of sickness and the restoration to health of the disabled. Prevention calls first for determination of causes, and is based on information gathered from various sources. Thus, the occurrence of industrial accidents must be notified by employers to inspectors of factories and of mines. Modern research into data so collected has enabled important protective measures to be adopted, and has also established the tremendous importance of personal, as contrasted with mechanical, factors; they account for 80% of industrial accidents. Further, just as in the case of sickness, the newly employed and those who are not-quite-well are disposed to sustain accidents, while some workers exhibit a definite predisposition to get hurt. Action should, therefore, aim at interesting workers in accident prevention through the safety-first movement (*see* SAFETY FIRST), at reducing labour turnover, at maintaining health, and at eliminating the susceptible. Under the heading of accidents are here included sudden gassings, *e.g.*, from carbon monoxide, nitrous fumes and arseniuretted hydrogen, as well as caisson disease.

Occupational Diseases.—Information as to the occurrence of certain occupational diseases, *e.g.*, anthrax, toxic jaundice, chrome and epitheliomatous ulcerations, and poisoning from lead, mercury and arsenic, is obtained from notification sent by practitioners to the chief inspector of factories. Lead poisoning is the leading instance; it has been used, on account of its specific effect upon women, as a stalking horse for legislative advance against industrial poisons; its causation, displayed by study of notified cases, has now been narrowed down to inhalation of dust and fumes containing lead. Measures adopted to prevent the generation of dust or to keep it under control, have proved successful that lead poisoning in factory industries has lo most of its terrors; only where measures have not been, or ca not be, adopted, as in the house-painting industry, is it still serious occupational menace; but constant alertness is need to perfect the protection of those employed as new processes cor into vogue, *e. g.*, the use of the oxyacetylene flame to cut throu steel plates coated with lead paint when breaking up old ship

Compensation claims for diseases named in the Schedule the Workmen's Compensation Act, 1906, give information co cerning the occurrence of other diseases, of which certain tro bles which particularly concern coal-miners are the most in portant, *i.e.*, nystagmus, and miners' beat knee, beat hand ar beat elbow. Here recent investigation into causation is shea of prevention; thus, the distressing trouble, nystagmus, of whic the manifest symptom is involuntary oscillation of the eyeba is associated with work for long periods in imperfectly lighte galleries of coal-mines; the worse the illumination, the great the prevalence of the disease. Owing, however, to the dang of explosions from mine-gases, the problem of improving tl lighting underground is not a simple one (*see* COAL; MINING).

Cataract.—In contrast stands another compensatible ey trouble, cataract, which occurs among glass blowers and fu nacemen exposed to glowing heat. Here means for preventio are known; they consist in wearing spectacles, the glass of whic has been specially devised for cutting off heat rays· but diffi culty arises in getting the workers to use them.

Phthisis.—Further knowledge is drawn from occupation mortality records. They reveal any undue prevalence among group or groups of workers of some particular cause of death phthisis is the most notable example (*see* TUBERCULOSIS). Re cent statistical investigation has shown that when this caus of death (*a*) is the only one in excess, its undue prevalence due to the spread of infection among persons whose daily wor brings them close together, *e.g.*, in tailoring, printing and makin boots and shoes; (*b*) is associated with excessive death-rate from other lung diseases, and occurs later in life than usual, a happens among sandstone masons, gold-miners, tin-miner grinders of metal, some pottery workers and others, its excessiv prevalence is due to inhaling fine dust of silica, which sets up condition in the lungs known as silicosis, a condition which take some years to develop and predisposes its victims to tuberculou infection; and (*c*) is associated with excessive death-rates fro all other causes of death, and occurs rather earlier in life tha usual, as occurs among publicans and inn-servants, its undu prevalence is caused by excessive indulgence in alcohol.

Knowledge of causation in each case points the way to pre vention: (*a*) Commodious, well ventilated and lighted premise associated with medical examination to eliminate the tuberc lous, will rid tailoring, printing and shoe-making from the scourg of phthisis. (*b*) Reduction to a minimum of risk from breathin silica dust must abolish silicosis; the problem now belongs t the technical engineer and is being solved in certain industrie Compensation is granted for silicosis on the South African gol mines, on the Broken Hill mines of Australia, in Ottawa, Canada and in Great Britain in the refractories industry under the power of the Workmen's Compensation (Silicosis) Act, 1918, which ma be extended to other industries. The financial burden of com pensation is promoting active attention to dust prevention an control. (*c*) Limitation of alcohol consumption, such as has bee taking place in this country in recent years, and could be extend ed, has already reacted not only upon the occurrence of phthisi in industry, but also of ill health from other causes, includin accidents.

Cancer.—Another disease to which mortality records hav directed attention is occupational cancer (*see* CANCER). Worker who handle pitch, a distillation product of gas-tar, and other who mix pitch with coal-dust in the manufacture of briquettes suffer from warts which appear on the exposed parts of th skin, and also on the scrotum. These warts show a special tend ency to become epitheliomatous with the formation of " pitch " cancer. Shale-oil workers coming in contact with crude paraffin

product obtained by distillation, similarly suffer from warts
id "paraffin" cancer; but workers manipulating refined paraf-
do not suffer. Chimney-sweeps have long been noted for
eir high death-rate from scrotal cancer which originates from
posure to soot, a distillation product of coal. Quite recently
equally high mortality from scrotal cancer has been revealed
nong mule-spinners in the cotton trade due to contact with
bricating oils, possibly obtained from shale. Cancer of the
s and buccal cavity is nearly confined to males who by smoking
pose these parts to the distillation products of tobacco. The
idence here summarised suggests that certain products ob-
ined by distilling vegetable substances can sensitise the skin
cancer, *i.e.*, to the filter-passing virus now known to be the
ecific agent concerned.

Evidence from the dye industry suggests that the products
question may possibly be benzene compounds. Workers in
is industry exposed to certain amino-benzene compounds, par-
ularly benzidine and naphthylamine (compounds which, when
ey gain access to the body, are excreted by the kidneys), have
en found to develop malignant tumours of the bladder. The
w growths which occur on the skin in the tar cases, and in
e bladder in the dye-workers, have certain features in common:
first there is a simple hyperplasia; the exact moment when
alignancy supervenes is a matter of doubt; and metastasis is
e exception. Possibly we have in these benzene compounds
stances of substances which, by modifying tissue growth,
ssess the power of preparing the way for the cancer virus.

More recently still lung cancer is reported among arsenic and
balt miners in Saxony, possibly due to radium emanations
m inhaled dust. To radium emanations is also described
crosis of the jaw, a most painful disease, among workers apply-
g luminous paint.

Effects of Treatment.—Treatment during the early stages of
ness and injuries sustained in occupation is not peculiar to
dustrial medicine, even though recent advances in ortho-
edic surgery have been of great benefit to those manually
nployed. But in a few cases treatment is special to the disease,
., the onset of caisson disease can be met by immediately
submitting the victim to the high pressure atmosphere from
hich he has just too rapidly emerged; or, again, persons over-
me by carbon monoxide gas can be best brought round by
e new method of administering a mixture of oxygen and carbon
oxide through artificial respiration; while burns caused by acids
alkalis, which must be specially neutralised before ordinary
eatment is applied, may be added to the list.

Convalescence.—The convalescent stage on the contrary may
profoundly expedited by occupation, particularly where re-
very is slow and tedious. The industrial convalescent tends
her to return to work too soon before he is ready for full em-
oyment, when he may quickly break down again, or, by saving
mself, develop bad habits; or to delay—particularly if he is
ceiving compensation—until he has lost skill, developed some
rmanent stiffness, or become neurasthenic. He needs, at an
rly stage, amusement to divert his thoughts; next, occupa-
onal therapy, in which work is performed for wages during
nited hours, in order to occupy his mind and assist in restoring
st or weakened function, *e.g.*, a hand stiff after a wound; or
stly, vocational training for new work when he cannot return
his previous occupation.

Occupational Therapy.—At each stage industry can play its
rt, but with regard to occupational therapy and training
is the only available agency. "After-care" in workshops,
d special settlements for those discharged from tuberculosis
natoria is pointing the way, which is equally valuable for ortho-
edic, mental and other cases. The need for occupational
erapy and vocational training is rapidly coming to the front
th in Great Britain and America; and industry is being called
on in its own interests in order to regain skilled workers, in the
terest of the patients, and of the community on which they
ust otherwise be a charge, to play its part in restoring to useful-
ss those who have broken down in its service and must either
gain their strength anew or start life afresh.

IV. WELFARE AND MEDICAL SERVICES

The need for welfare supervisors in factories is now well recognised; and, even though trade depression in recent years has held in check the creation of such posts, they continue to increase in number. The duties attached to the post must determine the staff required, but the following scale is some guide:—

Welfare supervisors for women and girls: up to 300 workers, one welfare supervisor; a further 300 workers, one assistant supervisor; a further 450 workers, a second assistant supervisor; a further 600 workers, a third assistant supervisor.

Total 1,650 women and girls, one senior welfare supervisor and three assistants. After this number one assistant should be added for every 600 workers. Welfare supervisors or apprentice masters for boys: up to 100 boys, one welfare supervisor; a further 200 boys, one assistant supervisor; a further 350 boys, a second assistant supervisor; a further 500 boys, a third assistant supervisor.

Medical Service.—Medical service in factories commenced with the appointment of certifying surgeons under the Factory Act of 1844, but it has not advanced with the importance of the work. A proposal was embodied, however, in the last Factory Bill, which may appear in the next consolidating Factory Act, to modify these posts in such a way as may be expected to improve the service. Already a few firms are employing whole-time medical men, and others part-time, to render service far in advance of anything now contemplated by legislation; they find the return from such service far outweighs the cost. The duties which must determine the size of the medical staff, often include examination of new comers, treatment of injuries and sickness originating on the premises, re-examination after a period of absence, ambulance lectures and organisation of first-aid treatment, health inspections of every part of the premises. Such duties for a personnel of 2,500 at an engineering factory are found to provide ample work for one whole-time medical officer. It is significant that no firm that has once established a medical service, has been known to abolish it; the tendency is rather to extend it. Closely allied comes dental service at factories, which is steadily increasing on account of the better health and time keeping which the service gives.

The varied activities outlined above, viewed as a whole, present an interesting and rapidly growing influence for good. The 19th century saw attentions directed to perfecting the power-driven machine and the industrial process, while the health and comfort of the worker were comparatively neglected. The seeds of deep-seated disaffection, a manifestation of ill-being, were thereby sown. To-day advances in processes and in machinery continue, but the need is being grasped for attention to the human machine. In industrial health lies the solution of many problems.

INDUSTRY, WAR CONTROL OF.—Government control of industry has appeared sporadically in every important war of modern times, under the form of commandeering of supplies and means of transportation and production. It has also occasionally assumed the form of price-fixing. But, except in the rare cases of cities under siege, governmental control never assumed the form of a general system, dominating the whole economical life

of a belligerent nation, before the World War of 1914–8. In that War the general control of industry was inaugurated promptly by Germany, after a considerable delay by France and England, and, after many half-way measures that proved ineffective, by the United States in the last year of the War. In the case of every belligerent nation the extension of control was a gradual process, which had by no means reached its logical limits when hostilities came to an end.

The conditions that forced control of industry upon the several warring nations were:—

1. Universal conscription, with its tendency to disorganise all industries, essential and unessential alike, by the withdrawal of the most energetic labourers and "key-men" in the technical and administrative staffs;
2. the vast consumption of material and equipment under the technical conditions of modern warfare;
3. the insatiate demand for financial resources for maintaining and supplying the huge armies in the field and the services incidental to them;
4. the maintenance of the health and spirit of the working civil population through the provision of the necessities of life at practicable prices.

While the conversion of national industry to the uses of war was nowhere complete, it is a conservative estimate that in all the chief belligerent states from three-fourths to four-fifths of all industry was by the time of the Armistice converted to the meeting of war requirements, direct or indirect.

I. GERMANY, FRANCE AND THE UNITED STATES

Germany.—The first systematic action toward industrial control was taken by Germany. Upon the declaration of war by England it became at once evident that overseas supplies of raw materials, on which German industry had become largely dependent, would be cut off. The conservation of supplies on hand and their appropriation to essential uses was imperative. Within a fortnight, at the instance of Walter Rathenau, the Government, in co-operation with the cartels, had completed a rapid survey of the material resources of the nation and had worked out a policy, based partly on the requisition of materials and plant, but mainly on voluntary agreements, which offered a reasonable assurance of the continuous supply of military necessities on the scale then contemplated as adequate—erroneously, as the development of the War proved. Through the Reichsbank and the system of financial institutions dependent on it the necessary credit was supplied without stint to all industrial enterprises regarded as essential for war. The mobilisation plans provided from the outset for the exemption of "key-men," technical and administrative, and the suppression of unessential industries provided labourers to take the place of those who had been called to the colours. On Dec. 2 1916, the control of industrial resources was strengthened by a law instituting an industrial conscription of labour, applying to all males between 16 and 60. Auxiliary measures stiffened Government control over industrial enterprises. But to the end of the War the essential basis of industrial control was the quasi-voluntary agreement between the Government and the independent business man or group of business men, with a reserve power of compulsion in the Government's hands resting on the control of materials, credit and labour. This power of compulsion served to secure supplies, but did not restrict prices so strictly as to preclude large war profits, with attendant manifestations of popular discontent that grew more serious as the War dragged on.

France.—In France the outbreak of the War was followed by a mobilisation of men for military service which took the experts and "key-men" out of industry along with those who could be easily replaced. In consequence economic life was seriously dislocated. Unemployment reached extraordinary proportions. After the mobilisation in Aug. 1914, the principal industries employed on the average only 60% of their normal personnel, and as late as Jan. 1915, 20% of the industrial working population was unemployed.

French industry, being highly individualistic in spirit, was far slower than that of Germany to adjust itself to war needs and war control. Gradually, however, a machinery of control was set up, of which the most effective part was the disposition of ma power. Committees of economic action composed of busine men and engineers were organised in the several departmen to co-operate with the military and administrative authoriti in supplying labour to agriculture and the essential industries.

Price control, so far as the munitions and supplies for t army were concerned, was effected through contracts, wi sufficient reserve power over labour, raw materials, transport tion and credit on the side of the Government to ensure reaso able terms. The prices of products for the use of the civil pop lation were subject to an informal and inadequate cont through the departmental committee of laymen co-operati with the administrative authorities. In neither case was t control rigid enough to check a rise in prices, which produc much discontent among the workers, whose wages did not ri in equal proportion.

United States.—The situation in America, upon her ent into the War, was in many respects peculiar. The Allies had ready attained to a practical maximum of their industrial w effort, and the demands of war were still rapidly expanding. this effort American industry had already come to play a co spicuous part. Allied war industry was drawing heavily America for steel, copper, cotton and a large class of wholly partly finished war materials. A powerful chain of war indu tries had been built up in America; labour and materials we rapidly advancing in price, and profits rose on a huge scale.

The American Govt. was forced to meet the problem supplying the American armies with the materials of war wit out cutting off the supplies needed by the Allies. Control w essential not only to national but to international ends. Where in the early part of the War each belligerent had aimed primari at effecting the most practicable distributions of resources b tween its own military and essential civil uses, the Unit States from the outset was confronted with the problem of ma ing the best practicable distribution among the military, Alli and essential civil uses. American control was bound to envisa the entire system of needs of the Allied and Associated Powe

More fundamentally, the United States represented the la reserve of men, munitions and money. There was no possibili of making good deficits in production from any neutral sourc except, of course, that certain raw materials like the nitrates Chile had to be drawn from neutral territories. In the circu stances the need for thorough-going control of industry w peculiarly vital.

The difficulties to be overcome in instituting control we however, all but insurmountable. No close relation betwe government and industry had been developed, as in German neither was the American administrative system adapted prompt co-ordination. At the outbreak of the War the army a navy, each enjoying the power of commandeering, were in position to enter the market for supplies, in competition wi the Allied purchasing agencies, and there was no authority an where competent to allocate limited supplies in the order of i portance of needs or to keep prices within bounds. A council national defence, consisting of the Secretaries of War, the Nav the Interior, Agriculture, Commerce and Labour, with a advisory council and a widely ramifying organisation of co mittees, of executives and experts, had been created prior to t declaration of war. Out of this grew a multiplicity of organs control, a War Industries Board, a railway control, a contr of ocean tonnage, a food administration, a fuel administratio and a War Trade Board. But there was no central co-ordinati principle except the war powers of the President, which in t nature of the case could be exercised only sporadically.

Co-ordinated control of industry came into existence March 4 1918, when the President, by a letter, reorganised t War Industries Board and specified its duties, constituting it effect the administrative organ with power to apply the Pre ident's war powers over industry. Mr. Bernard M. Baruch w named by the President chairman of the board, with direct r sponsibility for its functioning, the other members of the boa to act in an advisory capacity.

As finally reorganised the board controlled the exercise of the power of requisitioning. The army and navy, the railroad administration, the food and the fuel administrations, the War Trade Board, the Shipping Board, the War Finance Corporation, the Allied Purchasing Commission and other agencies dealing with industry, were required under the President's orders to co-operate with the War Industries Board. Thus it became possible to secure effective co-ordination in the whole field of industry. The board was in a position to control exports and imports, the movement of traffic over the railways and coastwise shipping; it was able to ration out materials, fuel, power, credit facilities to every business establishment in the country, to place a check upon every construction enterprise, public or private, except on proof of absolute necessity, to standardise production in the interest of economy, and in short to do everything necessary to ensure that the resources of the nation at war should be applied most effectively to the national needs, both of the people as a whole and of the military forces.

In America direct authority to fix prices was never granted by law nor established by executive order. The War Industries Board had, however, sufficient power to control prices in effect, and in case of need it actually controlled them. No specific theory of fair prices lay behind the board's control, but a conception of efficient economic organisation for war. The standard toward which price-fixing was working in its last phase was one which would have permitted peace-time profits and wages but nothing more. The problem of price-fixing in the United States was greatly increased because prices had already reached a very high level before America entered the War.

Labour.—War control of industry in its highest phase of development amounted in effect to nationalisation of economic resources, labour, capital, material things. Men could not work at what they liked best or put their capital to the most lucrative uses or sell their materials and goods to the highest bidder. They were called on to subordinate their private interests to the national needs. The conception of public service became generalised, as it were, and although with the end of hostilities private motives were again given free play, the conception of service retained a large measure of its vitality, exerting a considerable influence upon action.

Labour, conceived of as "man-power," won recognition early in the history of war control as the most vital of the national resources. The proper provisioning of labour, care for the health of the labourer and his family, maintenance of proper housing standards and the like, assumed the rank of military necessities. Here too the influences set in motion in war carried over into times of peace. In no country did public opinion settle back into its old indifference to the requirements of labour. It would be hardly an exaggeration to say that the ideal of a living standard of wages attained a new influence through the experience of war control.

Permanent Economic Results.—One of the most striking results of war-time control was the revelation of the extent of economic waste in the conventional scheme of production. By co-ordination, concentration of effort upon essentials and by curbing of excessive variety in forms through standardisation, it became possible for the United States, while maintaining 4,000,000 men under arms, to supply the civil needs of its population with no appreciable lowering of peace-time standards. While recognising that such extreme application to practical needs would in the long run be deadening to industry, most leaders of industry came out of the War convinced of the necessity of eliminating much waste that had gone unnoticed in the pre-War period.

War control of industry promptly fixed in the minds of those who participated in its decisions a conception of international economic interdependence. Control of the resources within a nation led straight to the necessity of controlling exports and imports, and this in turn led to an understanding of the need of permanent economic relations under which all nations might have equal access to the raw materials of the world. This remains a problem, the solution of which will tend to lessen the chances of war.

Another result of the war-time control was the more systematic survey of the potential resources, and their development where at all practicable. As a consequence, many resources are being developed in peace that formerly had been neglected. War control, with its compulsion to the use of substitutes, gave a greater freedom and elasticity to production, making a higher degree of efficiency possible in peace time. Incidentally to the control of industry, financial institutions, money and credit were everywhere subjected to control, with the result that new and more efficient methods of handling specie reserves and managing the flow of credit were devised and added to the normal equipment of peace times.

Some countries, finding themselves cut off because of the War from their usual sources of manufactured articles, soon learned to make these things for themselves, with the result that when peace returned the old manufacturing countries found that a part of their former markets for manufactured articles had been permanently lost. And so with raw materials; new sources of supply and substitutes were found. Thus, international trade is a longer time finding its normal ebb and flow.

For the most part the achievements of war control were made possible only by the solidarity of feeling and concentration upon national purposes engendered by extreme national necessity. No conclusions as to national control in peace time can be deduced from them. What may be deduced from the experience of the World War is that war under modern conditions demands drastic control of industry. War cannot now be conducted incidentally with business as usual. (B. M. B.)

II. CONTROL IN GREAT BRITAIN

During the first two years after the outbreak of the War comparatively few changes of importance were made in the British industrial and commercial system. In general, reliance was placed on the pre-War method of stimulating supplies to meet Government requirements by means of high prices. The slogan "Business as usual," which began as a useful injunction to people to keep their heads, exercised later a harmful influence in retarding the necessary transformation of industry and its subjection to an organised control without which the War could not have been won. The chief factors which finally overcame the resistance, not only of the business community, but also of the Government itself, to any drastic interference with industry were: (1) the rise in prices, which threatened to increase the cost of the War to an intolerable extent; (2) the competition of the civilian demand with vital requirements for war purposes; (3) the attitude of labour—the necessary corollary to "business as usual" is "strikes as usual"; (4) above all, the need for economising tonnage after the inception of the unlimited submarine campaign in Feb. 1917.

Fixing of Prices.—Unlike Germany, which began with the control of raw materials and was later driven to a (very inadequate) control of manufacturing processes, in Great Britain control started with the fixing of the prices of finished products and was then extended inevitably through each stage of production until it reached the raw material. Cost accountancy played an exceedingly important part in the British system of control. For each process of manufacture conversion costs were established, based on careful investigation, which allowed a reasonable profit to the normal firm. The restriction of profits on Government contracts increased the attractiveness of the civilian trade in which prices were not regulated, and, besides prejudicing military supplies, gave rise to great inequalities in the treatment of different firms. This led to powers being given under the Defence of the Realm Acts to the Government to requisition the output of any firm—which in turn immediately brought to the front the question of raw material prices. It was realised that a stable basis must be obtained on which to build up the series of conversion costs. Hence the Government was forced to purchase or control the supplies of the principal raw materials of industry so as to be able to allocate them to manufacturers at fixed prices. One of the greatest of these operations was the Government purchase in 1916 and following years of the

whole of the British and Australasian wool clips (*see* WOOL). By the end of the World War over 90% of the total imports into Great Britain were brought under the control of the War Office, the Ministry of Food, the Ministry of Munitions, the Board of Trade and the Admiralty.

In the munition industries the price of iron and steel was fixed in 1916, and the continual increases in the costs of production due to rising wages were met by subsidies to the producers. No private business was allowed to use any of the necessary raw materials without a certificate or licence from the Ministry of Munitions. The engineering industry was reorganised on a very comprehensive scale, and government factories were set up in great numbers. The experience obtained in these factories as to exact costs of production was very valuable in enabling prices of contracts given to the great armament and other outside firms to be reduced during the course of the War in spite of increases in wages. The labour problem, which was especially great in the engineering industries, was met, on the one hand by the suspension (for the duration of the War) of trade-union restrictions on women's labour, output, etc., and by a great restriction of the right to strike; and on the other hand, by the power given to the Government to declare any establishment to be a "controlled establishment" under the Munitions of War Acts, and as such liable to have its whole output requisitioned at prices fixed by the Government, and to pay to the Treasury 80% of its "War profits" (*see* MUNITIONS OF WAR).

In the face of great difficulties the system of price fixing based on costings was successfully applied to agriculture, and advantage was taken of the control of prices to stimulate in particular the direct human foodstuffs—wheat and milk— and to make their production relatively more profitable than meat and butter. Thus the mistakes made, especially in Germany and Austria, of fixing maximum prices which on the one hand tended to discourage agriculture and production, and on the other led to the over-stimulation of meat and animal fats, were avoided.

Decentralisation.—An essential feature of the British system of war-time control was decentralisation and the greatest possible measure of local autonomy. In some cases, branches of the departments themselves were decentralised, *e.g.*, the Department of Wool Textile Production had its headquarters in Bradford, and in the munitions and most other industries important local offices were set up in different parts of the country. Wherever possible the existing organisation of each trade was utilised and drawn into the scheme of control. While broad lines of policy were laid down by officials of the civil service (not necessarily permanent officials), their detailed application and local operation in each trade were largely left to representative bodies of the trade, working in co-operation with the Departments concerned. In two important industries autonomous bodies were set up with executive powers. The Board of Control of the Woollen Industry, sitting in Bradford, was composed in equal proportions of representatives of the War Department, the industrial and commercial interests, and labour, and to this body, on which the departmental representatives were in a minority, was transferred complete control over the whole civilian side of the industry (within the limits of the wool allocated by the military Supply Department for civilian consumption) together with other important functions. In the cotton industry, the Cotton Control Board sitting in Manchester was constituted the legislative organ for regulating the industry. This board also was composed of industrial and labour representatives with two nominees of the Board of Trade.

Very great importance was also attached to the establishment in the different branches of each trade of advisory committees of business men who gave their services voluntarily and did much valuable work in the practical operation of schemes of control. In the Ministry of Food an agricultural council representing producers and a consumers' council were set up, to which orders were submitted before they were issued, thus ensuring the willing co-operation of all concerned.

All Industry Under Control.—Until Feb. 1917, in many industries, government control was still somewhat perfunctory, but from then onwards the increasing intensity of the War and the submarine blockade led to a great tightening up of the whole system. The great decrease of tonnage, together with the inter-Allied pooling of supplies, imposed a tremendous pressure on British industry which could only be met by concentrating the whole resources of the country on essential services, and on those alone (*see* CONTROL, INTER-ALLIED). The Government made use of its control over raw materials to interfere drastically with the course of trade, and above all to restrict the freedom of industry working for civilian consumption. This it accomplished partly by rationing the supply of raw materials to non-military producers, or (in the case of food) to the home consumer, and partly by its man-power policy. In some industries, *e.g.*, boots, clothing, the state secured the adoption of schemes for the production of standardised articles, the profit at each stage of production and sale being limited on the same lines as military supplies. The popular discontent over the excessively high prices for such products was thus in some measure alleviated.

By the end of the War, virtually no important branch of industry had been left without some form of regulation or control. The system of Government control in England, which for comprehensiveness and efficiency of operation was unequalled in any other belligerent country, would have had even more favourable results if it had been possible to apply it earlier in the War, and if it had been supported by a system of war finance which avoided inflation, with all its evil consequences.

INFANTRY (*see* 14.517).—To appreciate the lessons learned from the experience of infantry in the World War in relation to the past as well as to the future, it is necessary to emphasise one particular aspect of infantry evolution—the gradual decrease in size of the unit which one man can command. It is desirable also to visualise what "command" really implies. A corporal is said to "command" the squad of recruits which he is training on a barrack square; he does it by shouting words of command to them. Marshal Foch also "commanded" the Allied armies in Western Europe in 1918; he did it, however, without raising his voice above its usual pitch.

Between the marshal and the corporal were a host of intermediate commanders of every sort, kind and description, but we are concerned here mainly with infantry commanders and especially with those in the junior ranks. For theirs is the hardest task in a battle, and it is upon them that success depends. "The wisest plans, the most thorough preparations, the most brilliant guidance avail nothing unless the fight is won by the fighters—by the platoons." The minds of superior officers therefore are devoted—especially in peacetime—to hard thinking on the problem of what they can possibly do or invent to make junior infantry commanders superior to the adversaries whom they may meet in action. A general's command implies much forethought as well as some experience in its holder, and thus his "command" again has a different meaning. He is a trainer, and it is with respect to this aspect of "command" that we are chiefly concerned.

UNITS AND WEAPONS

If we turn to the past for a moment, we find that the Greeks invented and trained their phalanx and the Romans their legion, and with these two systems the infantry arm dominated the known world for several centuries. Each of these formations was trained by precise drill, executed almost daily by junior commanders. Moreover this drill was in each case suited to the age and the *esprit de corps* of the period. In battle the voice of the infantry superior could be heard and was instantly obeyed, both in the phalanx and the legion. Then ensued the Dark Ages and comparative chaos dominated by feudal horse soldiers until archery made infantry again supreme. Precise drill was at the

ot of the success of the archers and fire orders were strictly enrced.

If we take Crécy (1346) as an example, we find that Edward I. initiated fire orders himself, though he left the command of ie front-line to his son, the youthful Prince of Wales, in charge the archers. A careful survey of the ground at Crécy from the ommanding position of its windmill, in which King Edward was osted, enables one to see how it was possible for him to issue te orders to the archers posted below him. They were only a w hundred yards from him, but he could see better than they ould when the crowd of French cavaliers would offer the best rget to the British longbowmen. These bowmen had under veral reigns been disciplined and drilled with precision in the se of their weapons, and that is why they defeated the gallant ut undisciplined mob of horsemen who attacked them without ethod at Crécy. It is also obvious that the diminutive size of he battle-field enabled the commander-in-chief, posted behind is reserve, to initiate fire orders and see their effect—in fact he erformed duties which now appertain to platoon commanders. Moreover, the size of the whole battle-field corresponded with a ector allotted to one battalion or at most to two in 1918.

Thus the process of devolution of the physical command occupied some five centuries, chiefly because it took all that time to lter infantry armament from bows to Lewis guns; partly also ecause each generation of professional soldiers clung with punctilious tenacity to the unsuitable drill of a previous age. Similar enacity is visible to-day but changes are in the air. Frederick he Great (1740) attained parade-ground precision even during he shock of encounter, and won his battles by means of remorseess drill, stepping to music and machine-like fire tactics with inccurate muskets. Such is the force of tradition that in 1914 German companies in Flanders illustrated Frederick's tactics with the aid of song to inspire their *Parademarsch* within close range of British infantry. But their opponents' rifles were accurate in 1914 and the death roll was enormous.

Frederick, however, did not teach one system on the barrack square and then practise a totally different one on active service; but that is what the British infantry did before the South African War (1899), and what some officers would like it to do again. Their line of reasoning is that, as every war alters tactical formations, it is not of much avail to learn any tactics which may perhaps be discarded in the next war.

British Infantry in 1913.—In Oct. 1913, the British infantry underwent a drastic change, in spite of much opposition. The old "Eight Company" battalion was altered, and the system was adopted of dividing battalions into four companies, each 200 strong. This change gave a peace strength of about 100 men per company available for training and the organisation of a battalion at the beginning of the War was as follows:—Headquarters, machine-gun section (two guns), four companies. A company consisted of its headquarters and four platoons; a platoon of four sections. A section was commanded by a non-commissioned officer and was a normal fire unit. Four battalions, from various regiments, were grouped into a brigade. In the British Army the regiment, is a unit of sentiment and the spring from which *esprit de corps* arises. It is based on a fixed regimental dépôt which is the common link of battalions scattered over the British Empire. The four-company battalion marked a stepping-stone in the history of the British infantry, because the platoon became the "tactical" unit instead of the company. As a logical consequence the fire unit (section) decreased in size and became the command of a junior N.C.O.—a corporal or lance-corporal. At first this change seemed incomprehensible to the lay mind, because it was contrary to the idea that in modern war the improvement of communications tends to centralisation and control by the higher authorities. But the extent of the modern battle-field and the increase and improvement of mechanical weapons tend to isolate and break up infantry units more and more. A further consequence of the change was that British infantry organisation became based on a four-unit system from the brigade to the platoon. This uniform distribution of units in multiples of four proved to be handier than the French or the German distribution in multiples of three. By the end of 1918 the four-unit system was pronounced to be the best, whether for tactics, administration, reliefs or daily routine—but especially for tactical handling in the field. One reason for this is that "odd" numbers destroy the even distribution of duties.

Other Armies, 1914.—In the German, French and U.S. armies the regiment consisted of three battalions, and was a tactical as well as an administrative unit. In Germany it was commanded by a colonel with a lieutenant-colonel as his second-in-command. The battalion, commanded by a major, was divided into four companies, each commanded by a captain. The company was divided into three sections (*Züge*) each under a subaltern who had as his understudy or second-in-command, either a sergeant-major, a "vice-sergeant-major" or a "sword-knot ensign" (aspirant-officer). On mobilisation for war one additional officer was allotted to each company. Prior to mobilisation every infantry regiment and Jäger battalion was provided with a machine-gun company of six guns, plus one spare.

The French company was organised into four sections, commanded in war by three subalterns and one adjutant (superior company sergeant-major). The sections were grouped in pairs to constitute *pelotons* (platoons) under the senior of the two section leaders. In peace there were only two subalterns on the establishment for the four sections. Machine-gun sections were allotted to battalions as in the British Army. In the United States the company was composed of three officers and 150 rifles, divided into two sections, each of three squads. In the World War, however, the U.S. infantry regiment was remodelled on the continental model, having also a regimental machine-gun company, a headquarters company and a supply company.

Thus before the War the infantry battalion was in almost every country about 1,000 rifles strong allotted to four companies each commanded by a mounted officer. But the British battalion was the weakest in fighting strength, because its First Line Transport and other services were deducted from its 1,000 rifles, whereas the regimental systems of continental infantry provide these services from a separate establishment. The subalterns were dismounted officers whose commands varied as follows: British 50 men, German 80 men, French 50 men, United States 75 men. But in the British infantry a large proportion of the 50 men borne on the strength of the platoons were absent on other duties. For instance, they were signallers or machine-gunners, or bandsmen or transport drivers or pioneers—they were in fact everything except fighting infantrymen, and they should never have been on the rolls of the fighting platoons. The British Treasury, however, ordained otherwise and thus made training and fighting difficult for every platoon commander.

Changes during 1914–8.—During the progress of the War the basic organisation of the infantry of the belligerent powers was not materially altered. The changes were chiefly in the direction of additional weapons and a multiplication of kit, which reduced the infantry soldier to a beast of burden laden under a weight which destroyed his mobility. In 1915 the British infantry, as compared with the German, suffered from a paucity of machine-guns, and was slow to increase its machine-gun strength. At first an increase was made (up to four per battalion), and when manufacturers raised their output these were formed into machine-gun companies. They were gradually divorced from the infantry and formed into a machine-gun corps, firstly as brigade machine-gun companies and finally as divisional battalions. By the time this had been accomplished the lighter Lewis gun had made its appearance and had been allotted to infantry units. The first issue (not long before the battle of Loos 1915) was only four guns per battalion, but by the end of Nov. 1915, when brigade machine gun companies had been formed, the establishment of Lewis guns was increased.

The tendency at first was to use this weapon like a heavy machine gun, but when its characteristics were better understood it took its place as a company weapon in 1916, and as a platoon weapon in Feb. 1917. By March 1918, 36 per battalion became available. We then find the platoon composed of four sections, two of which were armed with one Lewis gun each. The allot-

ment of an automatic weapon on such a scale marked an important step in the tactics of infantry. One of these new weapons, handled by only two men, could deliver a stream of bullets equal in number to, and more accurately aimed than, what could formerly be projected by 25 soldiers with rifles. Obviously the number of men required in the forefront of the battle could be reduced without affecting the volume of fire. This meant fewer casualties and bigger reserves and the maximum number of soldiers in every section was reduced to one leader and six men, making a total for all ranks of a platoon only 31 actually taken into action.

The Germans were faced with the man-power problem before any of the other belligerents, and they also appreciated the value of the light machine-gun. In March 1917 they issued three to every company, and afterwards raised this allotment to six by giving two guns to each platoon. Finally, each German battalion consisted of a heavy machine-gun company of 12 guns and three infantry companies armed with six light machine guns each, without counting the special machine-gun companies allotted to divisions for every battle. This tremendous increase in automatic weapons had an inevitable effect on infantry formations. The costly attacks on narrow frontages were abandoned. The successive lines or waves of men gave place to open formations. The four sections of a platoon were gradually separated from one another and compelled to manoeuvre and fight under their own leaders. When platoons were too weak to man four sections they fought with only two, one of which was armed with a Lewis gun. The frontages allotted to the leading platoons were increased and in some of the great battles of 1918 we find platoons attacking on frontages of 200 and even 300 yd. with very small effectives. Fire-power was at last understood.

Special Weapons.—In addition to the Lewis gun, rifle-grenade and hand-grenade, the Stokes light mortar proved to be a useful infantry weapon. Although it did not form an integral part of battalions, the brigade light-mortar batteries drew their personnel from the infantry and the mortars were allotted to battalions during operations. The light mortar was the nearest approach to an infantry gun in the British Army and, though not an ideal weapon, rendered great help in reducing enemy machine guns and strong points. The German mortars in the summer of 1918 were distributed as follows: each regiment had a regimental "*minenwerfer*" company, organised in three sections, each with three light *minenwerfer*, and in addition two or three medium *minenwerfer*. The important part played by these weapons in battle tended to prove that infantry, when scientifically armed and on ground that affords cover for movement, can act independently of other arms, and is capable of fighting its own local battle either with or without artillery support and tanks. To fulfil this rôle, however, it needs to be more highly and scientifically trained than before the World War. The importance of training the commanders of companies, platoons and sections cannot be over-emphasised, and it was the shortage of these trained officers and non-commissioned officers which caused so much deterioration after the battle of Ypres in 1917. It was also the cause of avoidable casualties in every subsequent battle.

Post-War Organisation.—The British infantry battalion is now organised in a battalion headquarter wing, and four companies. The wing includes a machine-gun platoon. Each company consists of company headquarters and four platoons, each platoon of headquarters and four sections, two of which are armed with one Lewis gun each. The platoon is the largest unit composed of men whose sole duty is to fight, and the War established it as the "tactical unit" of infantry. The section is the fire unit and consists of a leader and six men, a number which experience has proved is the largest that can be directly controlled in action by one commander. Thus the British subaltern officer's command in battle became 28 fighting men, as compared with 50 in 1914—but the Lewis guns, rifle-grenade and hand-grenade increased the fire-power of the platoon out of all proportion to the number of its men.

The French battalion comprises a headquarters group, three ordinary companies, a machine-gun company and a section of accompanying weapons (mortar or infantry gun). The company at war strength is composed of a headquarters section and four combat sections, and the section of three groups. The fighting group consists of a team of riflemen and a team of automatic riflemen, the team in either case comprising a corporal and five men. In peace or when the strength is lowered by casualties, the number of sections in the company, or groups in the section may be reduced, but the actual groups are maintained at full strength. The French nowadays place all their reliance upon the light automatic rather than on the rifle, and their new organisation is the outcome. Although their group is far stronger than the British section, to which it corresponds, the side of all its ten men centres round the service and introduction of the one *fusil-mitrailleur*, and the rifle team inevitably loses much of the value of its greater mobility. On the other hand, the British organisation, though possessing greater freedom and power of manoeuvre, means that the platoon commander has the difficult rôle of combining four sections of which two are radically dissimilar in arms and in action to the other two. The German battalion, also, consists of three companies and a machine-gun company. A company is organised in three sections; each section (*Zug*) is divided into four or five groups (*Gruppe*) of eight men each—two light machine groups and either two or three rifle groups.

The Rôle of Infantry

The question is sometimes put, "What is the use of infantry? Is it not butchery to expose men on foot to the mechanical horrors of the battle-field of to-day?"

Limitations of Machines.—Man on foot is still more universally mobile than any machine. The more destructive weapons become the more does man seek impregnable shelter in which he can escape the missiles of death-dealing machines. An enemy may conceal himself in a hiding place which is inaccessible to any machine; but where man has entered there also man can follow to seek him out, and until the assailant possesses a mechanical octopus he must himself go in to dislodge his adversary. The appliances manufactured by inventive genius only help to break down the barriers to this final act of combat. A great artillery bombardment will drive the enemy to ground, but even where concentration of shell-fire is achieved, it cannot dislodge him. He is safer in his dug-out than in flight. The tank is tangible, it is true, and therefore less petrifying, but man can avoid it or hide from it more easily than from infantry. Moreover it is less agile, more cumbersome, more limited in its modes of action than the foot-soldier. There are types of obstacles which it cannot yet surmount, ground which will not bear its weight, or which is too rough or steep to cross. Cavalry like infantry is a human arm, but it affords too easy a target, is too quickly stopped by rifle or machine-gun fire and is less mobile on rugged and broken ground. Its superior speed is insufficient compensation for these drawbacks except against broken and flying infantry. Thus we see that infantry is still essential in battle, that its power is based on human rather than on material factors, and that its tactics spring from moral elements of which one is fear.

Destruction of Enemy Morale.—To wear down the enemy's nerve control is the rôle of the commander, of the artillery, of bombing aeroplanes. When opposing armies are in close contact the infantry shares in the process by raids and false attacks. In the battle the part of the infantry is to snap, not wear down, the enemy's control over his fear. The fracture is effected by the enemy's realisation that he is powerless to ward off his assailant's blow. To accomplish this we must pass a sufficient though not necessarily a larger proportion of men through the curtain of his fire to a point so close to him that they can assault or offer the threat of an assault which he realises he is powerless to prevent. The key to this assault is fire at short range to pave a way for the onslaught. Hence formations which avoid loss by taking advantage of cover and conserve the will to close with the enemy are necessary. Surprise, the simpler, more certain and less costly method, is effected by assault from an unexpected direction against an unguarded spot. The key to infantry success is therefore movement or in military language

manoeuvre. Fear above all is caused by uncertainty and apprehension of the unknown which breaks down the will to resist and gives to the assault in flank or rear its supreme value. Thus close quarters mere numbers are not the deciding factor, and assaults are better launched by platoons than by battalions.

Strengthening One's Own Morale.—What are the factors which enable the average man to fight down fear? First undoubtedly comes confidence—confidence in his superiority to the enemy, based on his own skill in handling his weapons; faith in his leader's skill and judgment combined with devotion to him as man; trust in and comradeship with his fellows—the assurance that he will be backed up, that his efforts will not be in vain. Secondly, *esprit de corps*—which is allied to confidence. Thirdly, discipline—the power of association to overrule instinct. Lastly, habit to minimise reflection on the dangers to be faced.

The Training of Infantry

Confidence is born of training—the training of each individual, the training of the leader, the training of the unit. These successive trainings forge the infantry weapon and make it fit to act its part on the battle-field. Moreover these various trainings of human beings symbolise the truth that man is still the master of the machine. But no greater error is current today than that infantry is the most easily trained arm. None needs more care, more skill if it is adequately to play its part. For it is the least mechanical and by far the most human arm in existence. Yet experience of the World War indicates that of all the arms and services, infantry, the backbone, was the least trained. This defect was due not so much to the reason that less care, less research and thought were devoted to it—though these factors counted—but to the reason that it is the most difficult arm to train, because it possesses so few concrete elements. It is concerned with tactics and ground.

Elements of Training.—To train infantry is to exercise an art, whereas to train gunners is to apply a science; the one requires an artist, the other a calculator. The man in the ranks of the artillery, the tank corps, the air service, is often a mechanic—executing a concrete task in a definite manner. Initiative is the province of the officer, but even he in the subordinate ranks of other arms is concerned with producing a material effect. The infantryman's use of material—his weapons—is only a means to an end not an end in itself. He himself survives the scientific developments of countless wars because his human value remains unchanged. Even in the employment of his weapons he is guided by variable factors and conditions. But the use of his variety of weapons is only complementary to the use he makes of tactics and ground before he gets to grips with his enemy.

The variety of elements with which he has to deal has led as a rule to each different unit being trained—too often mistrained—according to the whims and prejudices of its temporary commander, who is apt to confine himself to such parts of the subject as he himself knows best. Hence a tendency towards over-emphasis of such matters as drill, musketry, bayonet fighting, which can be easily mastered by the intellect of the average officer. Hence also the neglect of tactical training, which demands thought and is difficult to learn and teach because it deals with moral and variable factors and requires a modicum of imagination.

Minor Tactics and Fire Tactics.—The tactics of infantry must be based on human nature and not on mechanics or geometrical perfection. Yet it is almost incredible how in the past showy evolutions deduced from the parade-ground have persisted on the battle-field. It is a truism to say that a revolution has been wrought in infantry tactics by the inventions which mechanical science has brought to bear on war. But it is no less true that the consequences of this revolution take years to understand. This lesson may be summarised in the phrase—"the power of manoeuvre." It needs a complete reorientation of military thought and fresh views before we begin to extract right methods from the melting pot of war. Yet that infantry which soonest learns its lesson will be supreme.

A mastery of elementary tactics is essential if infantry is to attain its goal in battle. It must be permeated by the best doctrine which the last war can teach, and its junior commanders must no longer be subjected to the whims or prejudices of whoever happens to be in temporary command. Moreover the doctrine should be adopted by authority and be expressed in language so simple and by metaphors and illustration so clear, that it can be as readily grasped by subalterns and corporals as by general officers. Its manual of instructions should be as intelligible to the Australian bushman as it is to the staff college graduate.

Development of Leadership.—In 1806–15 the British were capable of a sustained effort in the theory of tactics as originated by Sir John Moore, and there is reason to believe that British infantry could to-day be trained to as high a pitch of comparative excellence—but not without a definite doctrine of minor tactics and some evidence of leadership to inspire its wholesale adoption. This quality of leadership in peace-time needs the special ingredients of spirit, intelligence and human sympathy, together with sufficient character and determination to carry conviction to the mass. Just as Sir John French inspired a new doctrine of peace training at Aldershot after the South African War, so now could a leader develop the experiences of the last war and reduce fire tactics to simple exercises for platoon and company commanders.

Such a doctrine would probably be based on the little group of men following a corporal whom it knows because he has trained it. In the hurly-burly of modern war these little groups retain cohesion because men will follow a leader whom they see close to them, whose voice they can hear and whose presence is familiar. These groups (named sections), trained by higher leaders whom they trust, will forget themselves and accept any risks in battle if they are convinced by habit that their effort will not be in vain, that their successes will be immediately supported. A fire unit which forms part of a trained team will sink itself unhesitatingly if it knows that the rest of the team will not leave it in the lurch or allow it to bear the brunt alone; that, when it has spent itself to make an opening, others will relieve it of the burden. But can we reasonably expect generals who were trained in pre-War tactics to take the lead and compel their subordinates to alter their methods of training?

Tactics and Manoeuvre

For decades the infantries of all countries attempted to produce tactics adequate to the new weapons at their disposal by multiplying the lines which were successfully used by their forerunners in the days of the musket—with its short-range and slow rate of fire—and the case shot and solid shot of the artillery. They moved shoulder to shoulder with intervals. The idea of manoeuvre was absent. Even down to the closing stages of the World War the action of infantry units in battle—as distinct from a skirmish or an affair of outposts—was confined to frontal attacks. Manoeuvre was the weapon of the higher commanders only. A division or a brigade moved as a body; hence it was its commander alone who had the power of striking an enemy force at two or more different angles concurrently. We have already seen how slowly the idea of decentralised fire orders developed. It was the same with decentralised manoeuvre.

In any large action each of the infantry units was allotted only a fraction of the frontage of the force of which it formed a part. This narrow sector was hedged in on either side by neighbouring units of a corresponding size. How then was it possible for attack or defence on the part of infantry units to be aught but straight to their front? How can they manoeuvre if they have no space to move in? And how can they be expected to move to a flank if they possess no intervals and no flanks?

The Continuous Line.—Thus it came to pass that in spite of the fire effect produced by scattered Boers sitting on distant *kopjes* in South Africa (1899), and in spite of Japanese losses in assaults at Port Arthur and elsewhere in Manchuria (1904), European tacticians failed to shake off certain notions about continuous lines and storming masses. They appreciated the

importance of putting what they called "weight" into the decisive attack, but failed to realise that the weight or forcefulness of an attack no longer increases in proportion to the number of infantrymen thrown into it. In South Africa wide and premature extensions were adopted to minimise losses on the flat veldt, but such extensions did not lead to any idea of manoeuvre. On the contrary, the unmanageable thin lines one behind the other were incapable of intelligent manoeuvre—as was discovered in peace training after the South African War.

Even then the idea of manoeuvre to a flank by a small body was not grasped, or at any rate was not taught as a definite doctrine. Skirmishing lines in extended order made rushes and utilised ground; they fired in small bodies and opened at long ranges; at the decisive points they were gradually thickened up into a crowd. These crowds surged forward at a given signal and assaulted to their front. But the infantry soldier was so near his neighbour in these sham battles that he had scarcely sufficient space to load and fire his rifle without hitting one of his friends; the units became so mixed together in the process of thickening up that neither the corporal nor the subaltern could exercise control over his own men or any unit; often he could not find them during the decisive stage of the battle. Fortunately the "cease fire" sounded and reorganisation took place; but in 1914–8 there was no "cease fire" and no umpires and the warring infantries were slow to learn. This was no doubt inevitable, and is a sufficient reason to try now to gather the lessons of 1918, and it may not be out of place to suggest that the tactical experiences of 1918 have not been embodied in the tactical handling of units in 1926.

Group Formations.—Official manuals seem always to lag behind the age, and in fact human nature conquered the line formation before its breaking up was officially sanctioned. Tradition held fast to her pre-War habit, but the need for a control which could not be obtained with the extended line helped to breach the ramparts of orthodoxy. The group attained its final and complete recognition after its success against the German "pill-box" defence in the dreary wastes of the Ypres salient in the autumn of 1917. Also the Germans in their 1918 offensive deliberately trained their infantry in similar groups with orders to penetrate everywhere by infiltration. British dispersion, enforced by new weapons and human nature, rendered penetration possible by attacking infantry groups—termed "sections" in the British army—between the posts or machine-gun "nests" of the defenders. By exploiting every initial penetration the commander on the spot attacked in front and flank simultaneously such posts of the enemy as opposed him in his own sector. This newly acquired power of manoeuvre restored to infantry the master-key of victory, and retains for it still the important rôle which the old stereotyped tactics were rapidly losing. But it took three years of war and unprecedented losses to drive home a lesson which peace training may probably obliterate.

The Infantry Attack.—The outstanding lesson gained from the new-won possession of infantry units—the power of manoeuvre—is that tactics can be based on the fundamental principles which govern the action of other independent bodies which manoeuvre. The platoon is no longer fixed in a segment of the machine of battle but is an independent moving part fighting its own small action.

Its forward sections should press on unceasingly in order to find and penetrate any weak spots in the defence and to advance to the objectives assigned to them. If the forward body of a platoon is checked by an enemy post, it fixes it firmly by fire so that the enemy's attention is absorbed "by a menacing hand at his throat" whilst the manoeuvre body (termed the platoon reserve) works round his flank to deliver a surprise blow. This act of fixing can be achieved by a combination of fire with movement. There must be the threat of the forward spring in order to fix the enemy's attention. Fire alone, from the hastily chosen halting places of an attacker, cannot be relied on to absorb the whole attention of a defender behind selected cover. Unless each forward infantry section is imbued with a determination to press forward, the posts of the defence may be able to br cross-fire on groups which have penetrated the position. I there is still a further means by which the enemy can be fixe

Artificial Smoke Screen.—The World War added a use weapon to the infantry—armament-smoke. This new elem gives the user the conditions of day but imposes on his adv sary the conditions of night. Mist or fog has often been a decis but accidental factor in battle, but with the introduction artificial fog which can be projected at the will of the user, enemy's view is impeded whilst his own movements take pl in daylight. In attack, the forward sections may fix the ene posts more effectively by firing smoke to windward of them t by rifles or Lewis guns. Thus smoke helps small local assault

Decisive Manoeuvre.—The manoeuvre body of an infan company follows close behind its forward platoons and rema under the hand of the captain. If and when the whole of a f ward platoon is held up by the fire of an enemy centre of res ance, the captain uses his manoeuvre body to turn a fla To achieve this he might have to quit his allotted sector a follow in the wake of a more successful unit on his flank. Pass through the gap he turns and assaults an exposed flank of centre of resistance. Such a blow has the moral effect—com as a surprise and threatening the line of retreat—which is key to victory. But if the defenders of the post turn to m this flanking attack, the forward body should rush in and assa them from the front. Such combinations are simple if pe training is staged on the basic principle of "fixing and m noeuvre," as the key formula of fire tactics.

This combination of fixing and manoeuvre is the bed-r principle of every street fight. Watch a couple of small b tackling a bigger one. What happens? One of the small b rushes straight at the big boy, and when his attention is fix the other runs in from behind and delivers a blow. The fi small boy puts all his energy into this effort, for he knows stinctively that if he fails the opponent will beat them ea separately. But if the big boy attacks one of the small on the other in like manner rushes in from behind. Thus fixi and decisive manoeuvre should become a formula engraved the mind of every infantry corporal and subaltern, and he shou also be trained to act upon it instinctively. It has won gene acceptance since the end of the War and concerns above all t tactics of the platoon, which is the smallest unit which can and manoeuvre without waiting for orders from a superior.

Defence.—Attacking infantry, owing to its open formatic can offer immediate resistance to hostile counter-attack. halts and each unit consolidates its own ground forthwith, wi its defensive posts distributed in depth and disposed to gi each other support by fire. The rôle of the forward bodies is break up the enemy's organised attack. If the attacker mak a gap or effects a lodgment into the position of any forwa bodies, the reserves counter-attack to throw him out. Shou the attack break through the forward positions on a bro front, the reserves take him in flank by fire. Just as manoeuv is superior to frontal attacks, so is defence-fire which enfilad from a flank the more damaging to the attackers' morale. this as in all cases the training and determination of the bett infantry wins the day, but the great advantage possessed by t defence—almost its only advantage—is that its action can thought out beforehand. Its reserves can be placed on a fla in readiness for action, and can be practised on the actu ground to counter-attack from favourable positions with au iliary arms to help them.

Picture of an Infantry Battle.—Who is there with experien of big attacks embracing miles of country in France that h not seen the most resolute infantry suddenly assailed by a bur of surprise-fire from the flank or rear? Its self-forgetting dete mination grows uncertain; it ceases to move and looks furtive for cover. If the surprise-fire continues from invisible shooter the men become irresolute and nervous. The will to advance gone. If the threat of a counter-assault from a flank shou immediately follow they look to their rear and break or dribb away. Unless their own commander coming on from behi

throw in an opportune reserve to counter the counter-attack restore the local situation, the attack is stopped. That is w, so often in France, one German machine-gun nest—just little group inspired hy the will to resist, nourished in the nciple of surprise—would hold up the attack of a company sometimes of a whole battalion.

It is thus we learn to visualise the infantry unit—battalion, npany or platoon—in the battle of to-day. It possesses the wer of offensive movement and yet is protected by its open mations. Its articulation into interdependent moving bodies able of manoeuvre is the main infantry feature developed the World War. The illimitable extension of fronts, brought out by the vast numbers which nations in arms put into the ld, forced the military leaders to seek and discover a solution the deadlock—and they found it at last by granting the power manoeuvre to infantry units down to the platoon. This revoionary idea began to emerge in the Flanders attacks of 1917 t was still only in its chrysalis stage when the War terminated 1918. It still lacks a clear, simple working formula which can practised by lance corporals in their daily exercises.

Future Development

A question naturally arises as to the probable direction which e development of infantry will take under conditions caused new inventions, particularly mechanical ones. In what way ust we improve and reform our infantry methods in order to ghten the infantryman's burden in view of the probability at he may have to wear a gas mask in every future attack? he question may be considered under two heads: firstly, means increase mobility; secondly, tactical doctrine.

Mobility.—Almost every mechanical advance means a step wards greater mobility. Every arm and branch of the service becoming more mobile—or else decaying—under the influence the petrol era. In the transport of an army the horse has ready given way to the road motor, and this in turn promises yield to a cross-country tractor with caterpillar tracks. The eavy artillery is already motor-drawn, and the lighter field tillery will follow suit. Mobility is the foundation stone of the alue of infantry. Its unique position has always rested upon he fact that it is more *universally* mobile than other arms. ut on the normal field of battle, if it is to maintain its unrivalled osition as the "handyman" of war, its mobility must keep ace in proportion with that of the other arms. To give it ncreased mobility two problems must be solved. Firstly, means ust be devised for bringing infantry to the scene of its action ore quickly and with less fatigue than by the use of its legs. n the second place, infantry equipment must be lightened. he soldier must not again be treated as a beast of burden—ther means than piling loads on his back must be devised.

Equipment.—If infantry is to possess an adequate agility s weapons and ammunition must be lightened to an appreiable extent or they must be carried for him. In fact the nfantryman of the future must be regarded as an athlete. Every article which he does not need in the combat itself must e discarded or carried for him on accompanying transport.

Wanted: a Battle Drill.—A further development in tactical nethods which has been mooted is a controllable system of novement on the battle-field. At present armies retain drill novements for the parade-ground and throw them aside when hey go on active service. As human nature in battle retains nly that which has become instinctive habit it is scarcely surprising that in moments of crisis one has seen men advancing, gainst the deadly fire of machine-guns, in close-packed bodies. But if drill were brought up to date on the lines of open order nd the group, it is probable that moments and even hours of priceless value would be saved. But even during the actual ttack, there might well be occasions when an ingrained method of control could be used to quicken the manoeuvre of deployed units and direct them to take advantage of local situations. Voice control would be out of the question, but if signals were few and simple, visual control might be used, particularly if a clearer means of signalling were devised.

Let anyone with experience of war ask himself if there were not moments in his recollection when he might, had his men been drilled in such a system, have saved precious minutes, an opportunity which never returned, by the use of a signal instead of the slow method of sending a message by runner. The old close order was under control, but modern fire made it impossible. With extended order the battle degenerated into the chaotic movements of an uncontrolled mob. An ingrained system of battle drill, in which intervals and distances were purposely exaggerated, would enable sub-units to be manoeuvred, to be opened or closed in "concertina" fashion according to the ground and local circumstances. Such a system might go far to combine the flexibility of the old with the invulnerability of the modern formation.

It seems improbable that in the future we shall see the extensive and elaborate field fortifications of 1914–8. The new mobility brought in by the tank, the caterpillar tractor and the aeroplane, would appear to prevent the stagnation which produced labyrinthine entrenchments in the World War. (*See* Machine Guns; Strategy; Tactics; War.) (I. Max.)

INFANT WELFARE: *see* maternity and infant welfare.

INFECTIOUS FEVERS.—In this article the various infectious fevers are dealt with.

Chicken-pox, or Varicella (*see* 6.130).—Several writers have maintained within recent years that a close relationship exists between herpes zoster (shingles) and chicken-pox, and that the virus of the two diseases is identical, on the grounds that: (1) Chicken-pox in one individual may follow herpes zoster in another within the ordinary incubation period for the former, *i.e.*, within 21 days. (2) In such cases no other source of infection may be discoverable. (3) Much less frequently herpes zoster may be apparently contracted from a case of chicken-pox. (4) Herpes and chicken-pox may sometimes coexist in the same individual. The problem, however, cannot be solved until the causal agent of chicken-pox has been discovered.

Diphtheria (*see* 8.290).—The principal cause of the spread of this disease is now generally admitted to be the human carrier, whether sick or healthy. In the great majority of cases the disease is disseminated by the diphtheria bacillus being expelled from the mouth or nostrils by coughing, sneezing, spitting, kissing or speaking. Apart from tonsillectomy, which is not always practicable, there is no certain method of ridding the carrier of bacilli. On this account a remarkable change has taken place in the methods of prevention of diphtheria. In 1913 Bela Schick of Vienna devised a test whereby immunity or susceptibility to diphtheria can be determined. The test is performed by injecting intracutaneously a minute dose of diphtheria toxin. If the subject is immune, no reaction occurs, whereas susceptibility is shown by the appearance of a small red swelling at the site of injection within 24–48 hours. Those found to be susceptible are given three subcutaneous injections of a mixture of toxin and antitoxin, which was first introduced by Von Behring in 1913, but not used on an extensive scale until some years later by Park and Zingher in the United States. After the lapse of some weeks or months immunity as determined by the Schick test is established and lasts for some years, if not throughout life, whereas the immunity afforded by injection of diphtheria antitoxin is not likely to last longer than three or four weeks.

The experience of the years from 1910 to 1925 has confirmed the earlier observations as to the value of the antitoxin treatment of diphtheria. Death and severe paralysis are practically unknown when the patient receives an adequate dose within the first 24 hours, but become increasingly frequent with each 24 hours' delay. The intramuscular method is the best mode of administration, as it is quite as simple as the subcutaneous and ensures more rapid absorption of the antitoxin.

Measles (*see* 17.947).—Caronia of Rome has isolated (1923) a minute diplococcus, which he regards as the specific cause of measles, from the blood, bone-marrow, naso-pharynx and cerebrospinal fluid of children during the prodromal and eruptive periods. Injection of healthy children with attenuated cultures of this organism produced immunity to measles, but inoculation

of large and repeated doses gave rise to a typical though mild form of the disorder. Further confirmation of Caronia's investigations is required before his organism can be accepted as the cause of measles. Subcutaneous injection of the serum of convalescents within the first six days after exposure to infection is a preventive method first employed by Nicolle and Conseil in 1918 and subsequently carried out on a large scale by Degkwitz in Germany and other clinicians on the Continent and in the United States. In nearly all cases this method either prevents an attack of measles altogether or renders it very mild. In the absence of convalescent serum, which is often difficult to obtain, the whole blood or serum of adults, especially the parents, who have had measles, can be used.

Scarlet Fever (*see* 24.303).—The recent work of G.F. and G.H. Dick indicates that scarlet fever is a local infection of the throat caused by a particular type of *Streptococcus haemolyticus*, which is capable of producing a soluble toxin, absorption of which gives rise to the general manifestations of the disease. These observers successfully inoculated volunteers by swabbing their tonsils and pharynx with a culture of the organism. Subsequently they devised the "Dick test," which determines the susceptibility or immunity of an individual to scarlet fever, and is performed by injecting into the skin a filtrate of the culture which produced the disease. If the person is immune no reaction occurs, while susceptibility is shown by the appearance of a red area within 12–24 hours. Desquamation, which was formerly considered as the chief agent in the dissemination of the disease, is now generally regarded as harmless, unless the scales have been contaminated by discharges from the nose and ears. The duration of infectivity is now held to be much shorter than formerly. It is probable that most cases cease to be infectious in the course of the fourth week, unless they are complicated by discharges from the nose or ears. Specific immunisation against scarlet fever is still in the experimental stage, but very promising results have been obtained by subcutaneous injection of susceptible persons with a small amount of the toxic filtrate of the variety of *Streptococcus haemolyticus* which causes scarlet fever. Further observations are required to determine the duration of the immunity acquired by this method. Passive immunity can be acquired more rapidly by injection of a special scarlet fever antitoxin, but is probably less permanent.

The method employed by the late Dr. Robert Milne, consisting in inunction of the skin with olive oil and application of 1·20 carbolic oil to the throat, has proved to be valueless, as it does not prevent the spread of infection or the occurrence of complications and return cases. Encouraging results have been obtained from the use of an antitoxic serum prepared by injection of horses with gradually increasing doses of sterile scarlet fever toxin. It has been found that if the serum was given early the course of the disease was shortened, and the incidence of complications and sequelae greatly diminished.

Typhoid and Paratyphoid Fevers (*see* 27.503).—The great diminution in the incidence of these diseases in recent years in many countries has been due partly to immunisation in the army and navy during 1914–19 of a large proportion of a particularly susceptible age-group and partly to the careful supervision of the water and milk supplies, which has reduced the disease to such an extent that the health authorities are able to devote more attention to the prevention of contact and carrier cases. Numerous statistics have been published in various countries showing the efficacy of antityphoid and antiparatyphoid vaccination. Among the most striking are those given by Russell. During the two years in which the United States took part in the World War there were 1,065 cases of typhoid or paratyphoid or one among 3,756 men, with 156 deaths or one death among 25,641 men, as compared with one case for every seven men and one death among every 71 men in the Spanish-American War of 1898. The duration of immunity following inoculation varies from two to four years or longer, but under certain circumstances, such as ingestion of massive doses of typhoid bacilli and impairment of resistance, which are specially liable to occur among soldiers on active service, the immunity is lost in a much shorter time. The serum treatment of typhoid and paratyphoid fever is still in the experimental stage, the great decrease in these diseases having prevented a trial of it on a large scale in recent years. Vaccine treatment unlike vaccine prophylaxis has not become generalised, and the results obtained are inconstant. Some observers, indeed, regard the vaccine treatment of typhoid as an example of non-specific proteintherapy, as the same results have been obtained by injection of *B. coli* and staphylococci.

Diet.—The modern tendency is to feed rather than to starve the typhoid patient, who is now no longer condemned to an exclusively milk diet for several weeks, but may be allowed other readily digestible articles of diet from an early stage. A more liberal diet enables the patient to offer a better resistance to the disease, to be less liable to complications and to make a more rapid recovery.

Treatment of Carriers.—After the carrier state has lasted some months without being affected by drug treatment such as hexamethylene tetramine for urinary carriers, and chloroform, menthol and lacto-bacillin for intestinal carriers, operations such as removal of the gall-bladder (cholecystectomy) in the cases of intestinal carriers, or of the kidney (nephrectomy) in the case of urinary carriers must be considered.

Paratyphoid Fevers.—These are acute infectious diseases due to the action of bacilli, of which three varieties have been described, viz., *Bacillus paratyphosus A*, *Bacillus paratyphosus B*, and *Bacillus paratyphosus C*. Though on the whole less severe except in war time, they closely resemble typhoid fever in their clinical appearance and course, and can only be distinguished therefrom by bacteriological examination. Another point of difference is that while typhoid fever is an exclusively human disease, paratyphoid fevers may infect both man and animals, *e.g.*, dogs, cows, rabbits and pigs, and be transmitted from man to animals and vice versa.

Typhus (*see* 27.508).—As the result of their study of the epidemics which occurred in Tunis from 1906 to 1909 Nicolle and his collaborators have shown that typhus is transmitted by the bite or faeces of infected lice, and not by other insects such as bugs, fleas or mosquitoes, or by discharges from the mucous membranes as in other infectious diseases. Recent research indicates that the minute intracellular organism known as *Rickettsia prowazeki* is the cause of typhus, this conclusion being based on experiments showing that the virus of typhus and *Rickettsia prowazeki* are inseparable in infected lice, as well as on the presence of bodies indistinguishable from *Rickettsia prowazeki* in typhus lesions in man, where they have been found with great regularity in the blood-vessels of the various tissues.

The Weil-Felix reaction, which was described by Weil and Felix of Prague in 1915, occupies as important a position in the diagnosis of typhus as the Widal reaction in that of typhoid fever, or the Wassermann reaction in that of syphilis. It consists in the agglutination by the patient's serum in a dilution above 100 of a proteus-like organism named X 19 isolated from the urine of a typhus case. The reaction appears toward the end of the first week, rises rapidly to its maximum between the 11th and 13th days, and gradually falls in convalescence, but may remain positive for months and thereby enable a retrospective diagnosis of typhus to be made. The prophylaxis of typhus consists in the complete delousing of patients and contacts, as well as in the disinfection of clothing, which is best carried out by steam. The serum and vaccine treatment of typhus is still in the experimental stage.

Whooping Cough (*see* 28.616).—It is now generally recognised that the micro-organism in the form of a cocco-bacillus, described by Bordet and Gengou in 1906, is the causal agent of whooping cough. It is found in a practically pure culture in the catarrhal stage and first week of the paroxysmal stage, and then rapidly diminishes in number, being outgrown by numerous other organisms, especially *Bacillus influenzae* and the pneumococcus. In the great majority of cases, therefore, the disease ceases to be contagious long before the characteristic whooping has ceased. Recent writers have drawn attention to the fact that whooping cough is not so rare in adults as it is commonly sup-

posed to be, but that it may assume at this period atypical forms which are responsible for a spread of the disease. A vaccine prepared from the Bordet-Gengou bacillus usually in association with other micro-organisms has been used on a large scale in the prevention and treatment of whooping cough, but clinicians are by no means unanimous as to its value. Among the numerous drugs recommended for the treatment of the disease ether administered by intramuscular injection has recently enjoyed a considerable vogue on the ground that it reduces the number and severity of the paroxysms. (J. D. Ro.)

INFLATION: *see* CURRENCY.

INFLUENZA (*see* 14.552).—The term influenza will be used to imply "a pandemic outburst of disease characterised, clinically, by a rapid course, catarrh of the respiratory tract, pyrexia and some degree of prostration; and epidemiologically, by a tendency to occur in several successive waves at short intervals of time." This provisional definition is applicable to the visitation of 1918–9, and to other outbreaks of febrile respiratory catarrh more remote in time and about the distribution of which less is known, but is not applicable to the sporadic cases or even the localised epidemics of respiratory catarrh to which the name influenza has been so often applied, especially in the years following fairly closely upon pandemic outbursts.

The Influenza Pandemic of 1918–9.—This pandemic swept over the world in three successive waves, the first appearing quite suddenly in May and June 1918, the second starting at the end of September or early in October and waning in December, and the third wave, less uniform in character, appeared early in March 1919. This outbreak, attributed by France to Spain, by Spain to France and by America to Eastern Europe, seems to have appeared almost simultaneously amongst the nations of the "Entente" on the Western front, and amongst all those communities in intimate touch with them and in the closely linked theatres of war. It showed the explosive character that is possible only for a highly invasive infection assisted by conditions of swift communication such as obtain in modern war.

This first wave made its appearance a little later amongst the Central Powers and their neighbours. Early in July it attained its full proportions in Germany, Austria, Norway, Sweden and Denmark, Holland and Switzerland. In several large areas of the world's surface, in the South American republics, in Bermuda, the British West Indies, the Azores and in the islands of the Pacific and Australia, the summer of 1918 seems to have passed without an influenzal outbreak. In New Zealand, cases are said to have appeared in Aug., the harbingers, perhaps, of the autumn, rather than the first manifestations of the summer, wave.

This first wave passed rapidly, so that a "frequency curve" by weeks, in which the incidence in the worst week is taken as 100%, shows a steep ascent to a maximum, followed by an equally steep and almost symmetrical fall, the whole episode passing within about five or six weeks. So benign was the type that many cases among soldiers at the battle-front escaped record, as the men never "reported sick" but merely rested for a day or so in their units, and this was fortunate, as the army hospitals were soon overcrowded. The death-rate was inconsiderable, but there was an ominous tendency to a higher mortality amongst the later cases, just before the wave came to an end, seeming to suggest an increase in virulence. The first batch of cases looked "like a mild attack of measles without a rash." Respiratory catarrh, congested conjunctivae, headache, lassitude, pyrexia of short duration, a feeling of prostration with the return of temperature to normal, and then a rapid recovery of health; such was the course in the vast majority of the cases during the first wave. Complications were almost unknown during this outbreak. A few cases which developed broncho-pneumonia or haemorrhagic oedema of the lungs towards the end of the wave sent up the case mortality. In all these characters, the first wave closely resembled the outbreak of 1890, except that in 1890 the death-rate was greatest amongst the middle-aged and elderly, while in 1918 the chief sufferers were amongst the "young adult" groups.

The Second Wave.—Towards the end of September or early in October, the second wave suddenly gathered force and swept over the world. St. Helena is said to have escaped. Mauritius, too, had a reprieve; and the quarantine measures applied by Australia were successful for the moment but this fatal pandemic spread throughout Europe, America, Asia and Africa.

The upward curve of morbidity was almost precisely similar to that of the summer and the maximum was reached as quickly as in the previous wave, but the fall was much slower and less regular. The outstanding difference between the two waves was the marked tendency to pulmonary complications and the high death-rate of the second. The singularly uniform syndrome of the summer epidemic gave place, in the autumn, to several varieties of clinical picture depending on varying combinations of several factors, amongst which might be reckoned the virulence of the microbic invader, the resistance of the patient, the nature of the bacterial flora of his respiratory tract, and environmental conditions such as occupation, wages and housing. As a rule, the attack was ushered in by the catarrhal and pyrexial symptoms noted in May and June. In many cases, especially where circumstances permitted of immediate rest and treatment, the disease took a favourable course towards recovery, although prostration was clearly always a more marked feature than in the summer. In others, the early pyrexial catarrh was sometimes followed by intense toxaemia leading so rapidly to a fatal issue that there was no time for pulmonary complications to develop. But frequently the lungs became severely affected and the patient passed into a state of anoxaemia recalling that due to exposure to the "pulmonary irritants" of gas warfare.

But there was a formidable difference between the two conditions. While the "phosgene" patient had to deal with a sterile exudate, evoked by a chemical irritant and capable of rapid absorption if vitality was maintained, the lungs of the influenza patient were charged with an exudate evoked by a living virus which had already overcome tissue resistance and could offer to "secondary invaders" conditions of symbiosis favourable to their growth. Here lay the danger. The virus of influenza could open, as it were, the door to the *streptococci, pneumococci, staphylococci* and other organisms normally held within safe numerical limits upon the respiratory mucous membrane. The *post-mortem* appearances, while tending to have certain basal characters in common, varied considerably with the nature of the "secondary invaders" and other factors. In nearly all cases, there was a haemorrhagic tendency not often seen in other acute lung affections; and this sometimes amounted to a haemorrhagic oedema involving the greater part of both lungs. "Wet lungs," "dripping lungs," were expressions frequently heard in the *post-mortem* room. Areas suggesting haemorrhagic infarcts with their bases extending under the pleura were often noticed. The cut surface of the lungs showed, as a rule, peribronchiolitis and patches of broncho-pneumonia with a general state of oedema throughout the parenchyma of the lung; or a whole lobe might give the appearance of red, or in older cases, grey hepatisation.[1] The third wave had no distinctive characters. It resembled the first wave rather than the second, though pulmonary complications and fatal cases were fairly numerous.

Etiology.—As to the causative organism of influenza we remain, even now, still in doubt. The view that the *Bacillus influenzae* (Pfeiffer) was the cause of the disease, received little support from the new investigations carried out from 1918 onwards. This work was directed, for the most part, to the search for a "filter-passing virus." During the second wave of 1918, the researches of C. Nicholle and Lebailly in the French War Zone, of H. G. Gibson, F. B. Bowman and J. I. Connor at Abbeville, and of J. A. Wilson at Étaples, in the zone of the British Armies in France, afforded highly significant evidence in favour of a filterable virus, although the restrictions imposed upon bacteriological work by war conditions and the transitory nature of the epidemic rendered conclusive findings impossible.

[1] For a detailed account of the *post-mortem* appearances, together with their morbid histology, see the article by Maj. Tytler, R.A.M.C., in *Special Report Series No. 36*, Medical Research Council (1919).

In 1919, an investigation was undertaken by Zamanouchi, Sakakami and Iwashrima, in which the filtered and unfiltered emulsions of sputum from 43 cases of influenza were injected into the throats and noses of 24 healthy volunteers, six of whom had recently suffered from influenza. Of the 18 previously uninfected persons, all developed influenza after an interval of two or three days, but the six who had had the disease remained in good health. Similar results were obtained with the filtered blood of patients. At the same time, the spraying of cultures of Pfeiffer's bacillus, sometimes "pure," sometimes mixed with other respiratory bacteria, into the throats of 14 healthy persons failed to lead to illness of any kind.

P. K. Olitsky and F. L. Gates in the Laboratories of the Rockefeller Institute for Medical Research were able to approach the subject with much more deliberation and with a much better equipment than was available in France; and their results are proportionally more convincing. Like Gibson and his coworkers, they produced in rabbits a condition closely resembling human influenza by means of filtered or unfiltered nasal secretions taken from human patients during the earliest stages of the attack. They provided independent confirmation of the discovery of Gibson and Bowman that "cultures" in Noegouchi Medium were capable of transmitting the disease to animals, and showed that the anaerobic and filterable organism thus cultivated retained its activity after long exposure to glycerine and possessed antigenic properties. To the minute organism isolated by them in the course of this inquiry, they gave the name of *Bacterium pneumosintes* (*πνεύμων* lung: and *σίντης* injurer), "since a striking feature of its effect in rabbits is to diminish the resistance of the lungs to the action of ordinary pathogenic bacteria."

Their work received speedy confirmation at the hands of Dr. M. H. Gordon, C.M.G., F.R.S., in the course of an influenzal outbreak among the Nursing Staff of St. Bartholomew's Hospital, London, in 1922. Still further support for a "filter-passer" as the virus of influenza was later provided by Sir Spenser Lister in South Africa. These independent inquiries, leading to similar findings in America, England and South Africa, go far to establish the "case" for a filterable virus as the causative agent of influenza; but caution is still needed in drawing final conclusions until a more precise knowledge is available as to "filter-passers" in general (*see* FILTER-PASSING MICROBES).

Epidemiology.—In the absence of final knowledge as to the causative agent, many points of fundamental importance still remain obscure. Was the pandemic of 1918–9 a sudden awakening to virulence of some germ already widely distributed in western Europe or was it a "new arrival" operating in "virgin soil"? Then the question arises: "Where could such a germ come from?" If previous pandemics were due to the same agent, no doubt, somewhere, from one pandemic to another, some human individual or chain of individuals carried on the virus until the time was ripe for a fresh outbreak.

The first wave coincided with the arrival of the first drafts of American troops in Europe, who must have brought into common circulation pathogenic strains that had long remained dormant in isolated and relatively immunised communities. The crowded troopships afforded just the incubation places that would permit of the maturation of such an infection; and Europe, with its crowded concentration areas and billets, offered an unequalled opportunity for its spread. The last influenzal pandemic had occurred just 28 years before. There might be a few scattered "carriers" and perhaps some residual immunity among the middle-aged and the elderly; but the adolescents and the young adults would in 1918 be "virgin soil." It was just these lower age-groups that suffered most.

How, then, explain the second wave with its greater severity? —and the third? Surely, if immunity played a part, these waves should have been much less extensive, much more benign, and confined to those persons who had previously escaped. These are good, but not final, arguments. The passage of the first wave may have left behind it a virus of exalted virulence, many "carriers" and many "allergic" subjects whose behaviour to reinfection might betray the phenomena of hypersensitiveness of the respiratory surfaces and a tendency to inflammatory exudates on contact with the air-borne virus. Under such conditions a fresh outbreak would be specially likely to arise in the fall of the year, a period of rapid fluctuations of temperature when the chill evenings drive men into the warmth and close contact of crowded dug-outs, shelters and billets.

It is impossible to believe that the so-called "influenza" to which deaths were attributed every year between 1892 and 1918 was the same disease as the fulminating pandemic that followed. Apart from the extreme contrast in invasive power, the distribution of "influenza" mortality by age-groups[1] emphasises the essential difference between, let us say, the death-rates for 1917 and 1918, the one having a preponderating death-rate amongst the old, the other, amongst the young. Such differences can hardly leap into existence within a few months. The known facts of increase and diminution of bacterial virulence do not support the idea that such a vast alteration is probable or even possible in so short a time.

Acquired Immunity.—Evidence that morbidity and mortality were less marked, in the second wave, amongst those who had been attacked in the first, when thoroughly analysed[2] was found to indicate that "these data show a considerable immunising power in the summer attacks and we conclude, although with natural hesitation, that it is probable, on the average, that an appreciable degree of active immunity was attained by those who passed through an attack in its first and mildest manifestations."

The evidences for immunity are of varying efficiency in different places, and the populations of many areas show no tendency at all to acquire resistance to infection as judged by a comparison between the behaviour of those attacked and those missed by the first wave when confronted by the second.

We believe these data to be unsound as a basis for comparison. It is highly probable that many persons were infected during the summer and yet failed to show appreciable illness. The vast difference that may exist between the numbers *infected* and the numbers *affected* by a bacterial invasion can be judged from what we know of the meningococcus and the diphtheria bacillus. And yet these latent infections may confer active immunity, as we know from the "Schick Reaction" in the case of diphtheria and from many other examples as well. The mere fact of a previous "attack" is not a safe guide in classifying populations for inquiry as to their relative immunities. The best evidence of the acquisition of immunity is to be found in the phenomena of natural recovery of the individual and of the disappearance of pandemic waves from the community. The fact that these groups of pandemics are separated by long and fairly regular intervals, as a rule about 20 years, is not without significance in this connection, since at least this period might be necessary to reduce the residual "immune population" from the last pandemic to an ineffective number.

Artificial Immunity.—No vaccine can be entirely satisfactory unless it is known to contain the virus or germ of the disease in question. The vaccine issued by the War Office and afterwards by the Ministry of Health was confessedly of a provisional nature since the causative agent was still uncertain. Its formula was as follows:—

	Per cu. cm. of vaccine
Bacilli influenzae (Pfeiffer)	400,000,000
Pneumococci	200,000,000
Streptococci	60,000,000

Unless Pfeiffer's bacillus be accepted as the causative agent, this vaccine must be described as consisting entirely of the "secondary invaders." As such, its issue was entirely justifiable and its effects were such as might be expected: satisfactory in diminishing complications and mortality but practically *nil* in preventing the disease. Vaccine, then, cannot, as a prophylactic, help us much at present; nor can we, in the light of recent experience, hope for great results from general measures of hygiene.

INGE, WILLIAM RALPH (1860–), English divine, was born June 6 1860 at Crayke, Yorks., the son of William Inge, sometime provost of Worcester College, Oxford, and was educated at Eton, and at King's College, Cambridge. From 1884 to 1888 he was a master at Eton, and during the last two years of that time was fellow of King's College, Cambridge. From 1889 to 1904 he was fellow of Hertford College, Oxford. Bampton lecturer in 1899, and Paddock lecturer in New York in 1906, from 1905 to 1907 he was vicar of All Saints', Ennismore Gardens, London, and in 1907 was made Lady Margaret professor of divinity at Cambridge. In 1911 he became dean of St. Paul's, where his sermons attracted great attention owing to their originality, their caustic criticism of the tendencies of modern life and a somewhat pessimistic tone which earned for him the sobriquet of "the gloomy dean."

Among Inge's numerous historical and theological works may be mentioned *Society in Rome under the Caesars* (1888); *Christian Mysticism* (1899); *Types of Christian Saintliness* (1915); *Philosophy of Plotinus* (1918); *Outspoken Essays* (1919, Second Series 1922); *Personal Religion and the Life of Devotion* (1924).

INGLIS, ELSIE MAUD (1864–1917), British physician and surgeon, was born at Naini Tal, India, Aug. 16 1864. After a childhood spent in India and Australia, in 1878 she settled with her family in Edinburgh. She studied at the school of medicine for women in Edinburgh and at St. Margaret's College, Glasgow, graduating M.B. and C.M. In 1895 she took up private practice in Edinburgh and was instrumental in establishing a second school of medicine for women in that city. Dr. Inglis became one of the most prominent suffrage workers in Scotland. In Aug. 1914, inspired by her, a special committee of the Scottish Federation of Women's Suffrage Societies, aided by the National Union of Women's Suffrage Societies, undertook the organisation of the Scottish Women's hospitals for foreign service, and raised £449,000. She first went to Serbia in April 1915 to relieve Dr. Soltau at Kragujevac. In Nov., during the enemy invasion of Serbia, Dr. Inglis and a few others remained behind until Feb. 1916 as prisoners of the enemy to care for the Serbian wounded. In Aug. 1916 she took a unit to the Dobruja for service with the newly formed Serbian division attached to the Russian Army. She died at Newcastle-on-Tyne Nov. 27 1917. See Lady Frances Balfour: *Dr. Elsie Inglis* (1918).

INITIATIVE (*see* 23.1).—The initiative is one of the two forms of direct popular legislation, the other being the referendum. Switzerland is the classic land of both initiative and referendum. As late as 1910 its experience with these devices of popular rule was much more extensive than that of the rest of the world combined.

The Swiss example was copied first in the United States where the initiative was introduced by South Dakota as early as 1898. Subsequently nearly half the states in the American Union have adopted one or both forms of direct legislation. Most of these commonwealths are west of the Mississippi, but of more recent years five eastern states, among them Ohio and Massachusetts, have accepted the initiative. Twelve states provide for official bulletins of information, commonly known as "publicity pamphlets," containing texts of laws to be voted upon with arguments pro and con, which are distributed before the vote to all electors in the state. As a common feature of the commission and commission-manager forms of government now in effect in some 400 cities throughout the United States, direct legislative methods have also been made widely applicable to local charters and ordinances.

Following American developments in this field the next great step in the extension of the initiative was taken after the World War by the constitution makers of several revolutionised or new states of Europe. In varying forms this device has been established by the constitutions both of the German Reich (1919) and of the Prussian State; also by the constitutions of Austria, Estonia and the Free City of Danzig—all the latter dating from the year 1920. The constitution of the Irish Free State (1922) provides specifically for the referendum; it authorises also the Irish Parliament to establish the initiative by law, expressly stipulating that a petition signed by 50,000 voters shall be sufficient to start action either upon a constitutional amendment or upon an ordinary law.

Swiss Experience.—Up to 1908 the Federal initiative in Switzerland was employed, generally without success, to promote radical measures. Since that year it has scored a number of constructive achievements, among them the amendments providing for Federal regulation of water-power (1908) for election of the National Council by proportional representation (1918) and for the submission of treaties concluded for periods of 15 years or more to popular vote upon the same terms as ordinary legislation, *i.e.*, petition signed by 30,000 voters or demand of eight cantons (1921). In 1922 a drastic capital levy initiative proposal brought forward by the Socialists was defeated by a popular vote of 736,652 to 109,702 and by all cantons against none. Experience with direct legislation under the new constitutions of Europe has been too brief to warrant conclusions. In Germany where a petition requires 3,000,000 signatures, the initative has been used but once (June 20, 1926) but without success. (*See* GERMANY.)

American Experience.—In the United States the initiative has been freely employed, so freely indeed that in connection with referendum measures the ballots of certain states have been at times greatly overcrowded. The initiative has been repeatedly used by small reform groups to advertise their projects. In Oregon it was employed successfully to pass a so-called compulsory school attendance law (1922), obviously inspired by hostility to parochial schools, which was held by the Supreme Court of the United States (1925) to be unconstitutional. Coincident with the extension of direct legislation there has developed a tendency to exclude from its operation certain classes of measures, particularly finance bills and Acts of an urgent character. Thus in the United States the Massachusetts initiative and referendum amendment (1917) bristles with restrictions excluding from popular vote religious issues, judicial tenure and powers, local legislation, specific appropriations, anti-Prohibition measures and various personal and property rights. In spite of much criticism, however, direct legislation is generally sustained by popular opinion in those American states which have provided for its establishment.

Schultz, *Documents on the State-wide Initiative, Referendum and Recall* (1912); Amer. Acad. of Political and Social Science, *The Initiative, Referendum and Recall* (1912); W. B. Munro, ed., *The Initiative, Referendum and Recall* (1912); W. H. Taft, *Popular Government* (1913); Randolph Leigh, *The Citadel of Freedom* (1924). (R. C. B.)

INLAND WATER TRANSPORT.—Transport by navigable waterways in the last years before the War reached very high figures indeed. In 1875, 10,400,000 tons were carried by water in Germany; in 1910, 64,750,000 tons. The bulk of the increase was on the large rivers and canals; the less important waterways showed no advance, and in some cases actually a falling-off. In the Netherlands and Belgium the ports of Rotterdam, Amsterdam and Antwerp benefited by the great development of Rhenish industry in Germany, the Rhine being admirably suited for carrying both ores and coal. In the riparian states of the Danube the movement of industrial products downstream and of cereals and oil upstream has produced a similar increase in water-borne traffic.

This general development of traffic by navigable waterways everywhere led to the undertaking of important hydraulic work in the construction of new waterways and the improvement of existing ones. Steps were taken to regulate and canalise rivers; canals were cut to link up important rivers; existing canals were enlarged so as to be navigable by vessels of larger tonnage; and gradually a whole network of navigable waterways has spread over central and western Europe. The total length of the navigable waterways in France before the War was more than 11,000 kilometres. In Germany it exceeded 10,000. The capacity of the German waterways was on the whole greater than that of the French, since many of the canals in France were navigable only for vessels of 300 tons or less.

Effects of the War.—The World War interrupted the development of inland navigation, and its termination was followed by a transport crisis due mainly to the disorganisation of the railways through the wear and tear of rolling stock and rails, and the

destruction of considerable portions of tracks and railway installations. Normal currents of traffic had to be re-established, and demobilisation raised a difficult transport problem. Even the full use of navigable waterways was insufficient to meet immediate requirements. The destruction of many waterways with their works (bridges, locks, etc.) and of many vessels used in inland navigation, helped to make matters more difficult. But repairs were fairly quickly effected and in 1920–1, indeed, when the railway crisis was still acute in consequence of a shortage of rolling stock, there was a surplus of inland navigation tonnage owing to the considerable increase in freights due to the rise in the cost of living. Governments avoided or took measures to prevent any great increase in railway rates until the existence of large deficits showed that it was necessary to adapt rates to the increased expenditure. Navigation, on the other hand, being entirely in the hands of private individuals, had to adapt itself immediately to the increased working expenses.

Furthermore, governments in some cases used the railways to establish new currents of transport, which had become desirable in consequence of altered frontiers, or to help national seaports to compete with foreign seaports. Sometimes, too, by instituting competitive rates on the railways, governments tried to obtain larger receipts which would enable them to meet the deficit of the railway budget. Another factor which unfavourably affected the financial results of inland navigation concerns was the absence of proper upkeep of the waterways during the years 1914–8. Rivers which require constant attention suffered to a large extent in this respect, and it proved impossible to employ the river-craft to their full capacity.

But the main cause of the bad conditions of inland navigation after the War was that financial and economic crises, the instability of the exchanges, and general impoverishment did not allow the resumption of transport which had been expected.

In France the total amount of goods carried on rivers and canals, which was 41,896,754 tons in 1913, was only 21,500,000 in 1920. In 1924 the figure had risen to 36,758,000 tons, traffic assuming large dimensions in the north of France, as well as in respect of goods and vessels coming from and proceeding to the port of Strasbourg. The following figures for the port of Paris may be noted: in 1913, 4,786,649 tons were loaded and 11,709,824 tons unloaded; the figures for 1924 were respectively 2,769,166 tons and 10,221,228 tons.

The total traffic for the Rhine, which in 1913 was 54,562,574 tons, had fallen in 1918 to 25,608,609 tons and by 1923 as low as 16,608,609 tons. In that year—a quite abnormal one certainly, owing to the Ruhr occupation—traffic through the port of Duisburg-Ruhrort, which in 1913 was about 26,000,000 tons, and which was still 14,000,000 tons in 1922, fell to 3,980,412 tons.

The situation is exactly the same as regards traffic across the German-Dutch frontier near Lobith. From over 37,000,000 tons in 1913 the figures fell in 1918 to scarcely 5,000,000 tons, but by 1924 had risen again to 23,000,000.

On the Danube in 1911 the total movement of goods was 6,802,639 tons and in 1924, 3,757,010 tons. The year 1925, however, showed a considerable increase in traffic.

The same effects are observable in Russia, although, in this case, it is necessary to take account of the great disturbance caused by the Civil War, the Bolshevist régime and the famine which ravaged the Volga basin in 1921. In 1913 the total weight of goods carried by water amounted to 2,281,900,000 pouds (approx. 38,000,000 tons), of which corn accounted for 229,000,000 pouds. In 1920 the total figure had fallen to 665,500,000 pouds. The corresponding figure for corn is negligible. For 1925 the total figure was, according to official statements, 1,405,200,000 pouds.

Nevertheless, general improvement took place. Take as an example the port of Rotterdam. The total amount of goods transported on barges in 1924 was 19,000,000 tons, whereas in 1923 the figure was only 8,000,000 tons. Even allowing for the effects of the Ruhr occupation, this denotes a very considerable increase.

Extension of Waterways.—The improvement of navigable waterways was resumed after the War and, although many big schemes can hardly be expected to materialise, it is none the less true that a large number of far-reaching plans are already in course of being realised, or are ripe for execution.

Rhône-Rhine Navigation.—The navigable waterway which the canalisation of the Rhône would establish from Marseilles through Lyons and Geneva (if the French and Swiss governments agreed about the régime for the Lake of Geneva), might be of first-class importance for traffic to Switzerland, and the eventual continuation of this waterway through Switzerland by the canal known as Entre roches (a scheme warmly supported by the Swiss Assn. for Rhône Rhine Navigation), would increase its importance. This scheme for a navigable waterway between the Rhône and the Rhine through Switzerland seems still immature.

Rhine Navigation.—The second large scheme prepared by the French Govt. is for the great Alsace Canal between Huningue and Strasbourg. This canal, which will serve both for navigation and the supply of water-power, is to follow a course nearly parallel to the Rhine over a distance of about 114 kilometres. The plan involves the erection of a weir across the Rhine bed. Further, eight power stations will be constructed on the canal and two locks placed at each station. The dimensions of this waterway would allow barges of 1,200 tons, normal type on the Upper Rhine above Mannheim. The scheme for this canal required the approval of the Central Commission for Rhine Navigation. After giving its consent to the construction of the first reach of the canal in 1922, the commission in April 1925 approved the scheme for the seven other reaches subject to certain conditions.

Switzerland has prepared a scheme for the regulation of the Rhine between Strasbourg and Basel. This scheme has also been conditionally approved by the Central Rhine Commission, and the work may therefore shortly be put in hand (*see* RHINE).

Communication with Antwerp.—A clause in the Treaty of Versailles provides for the possible construction of a deep-draught canal from Antwerp to the Meuse and the Rhine, ending in the neighbourhood of Ruhrort. The early execution of this scheme is unlikely, especially as the plan for the Antwerp-Moerdijk canal, which is provided for in the new Dutch-Belgian Treaty, will secure for Antwerp advantages at least equal to those offered by the Antwerp-Ruhrort canal and at an infinitely smaller cost. No technical details are yet known of the Antwerp-Moerdijk canal scheme, but the waterway thus created will be made navigable for the large Rhine barges, that is to say, for vessels up to 3,000 tons.

Meuse Canalisation.—In the Netherlands the most important scheme now being carried out is the canalisation of the Meuse on Dutch territory, which further involves a junction canal between the Meuse and the Waal and the Juliana canal from Maasbracht southwards, the latter intended to link up the mining centre with the navigable waterways of the country. The canalised Meuse will be navigable for boats of 2,000 tons. Locks 260 metres long will be able to take a tug and two barges of 2,000 tons each. The Meuse-Waal canal will be navigable for boats of the same tonnage.

Completion of Rhine-Vistula System.—In Germany two large schemes are being carried out. The Mittelland canal, which will connect Hanover with the Elbe near Magdeburg, will establish an uninterrupted navigable waterway between the Rhine and the Vistula. This canal will form the last section of the waterway begun with the construction of the Dortmund-Ems canal between 1889 and 1899, followed by the Rhine-Herne canal, opened in 1914, and the Bevergern-Misburg canal constructed during the War. The last-mentioned canal, which is 172 km. long, is without locks. The total length without locks, including certain parts of adjacent canals, is no less than 213 kilometres. The Mittelland canal will be navigable for boats of 1,000 tons. It will cross the Elbe by a bridge, the plans for which have been submitted for the approval of the International Elbe Commission.

Rhine-Main-Danube Connection.—The second important scheme in process of execution is the junction between the Rhine, the Main and the Danube. The idea of linking up the Rhine and the Danube is a very old one. Charlemagne conceived the idea of constructing a canal, traces of which can still be seen. The Ludwig canal, opened in 1846, was only navigable by small boats up to 120 tons and has never been much used. It is anticipated that the area tapped by the Rhine-Main-Danube navigable waterway will exceed that of any other European river and canal system. The scheme involves the canalisation of the Main, the construction of lateral canals and of a junction canal between the Main and the Danube, joining up with the latter near Kelheim. It also necessitates the regulation of the Danube between Regensburg and Hofkirchen, and between Passau and the frontier and in addition its canalisation over the stretch between Hofkirchen and Passau, that is to say, in the Bavarian Kachlet. The waterway will be navigable for canal barges of 1,200 tons and for Rhine barges up to 1,500 tons. The scheme also provides for the utilisation of hydraulic power; in fact, it is the production of electric power that has made the scheme practicable.

Other German Schemes.—Among the other plans for the construction of canals in Germany, such as the Hansa canal, the canal from the Weser to the Main, the Kuesten-Kanal and the junction canal between Neckar and Danube, only the last deserves serious consideration at present. The canalisation of the Neckar might be of considerable value for the development of navigation and for the port of Mannheim. At one time it seemed that, mainly for political reasons, opinion in Germany was in favour of constructing the Weser-Main canal (the Weser being the only important river which has escaped internationalisation) in order to direct part of the traffic from the Danube to Bremen, after the construction of the Main-Danube canal. The Weser could also carry some of the traffic

normally carried by the Rhine and the Elbe. But the changed political situation makes it improbable that this scheme will be put into effect at any early date.

Italian Waterways.—In Italy a canal has been constructed from the Po to Brondolo on the Lagoon of Venice. A canal is also in course of construction from Milan to the confluence of the Adda and the Po, whereby Milan will be linked by waterway to Venice.

Czechoslovakian Waterways.—In Czechoslovakia, besides canalisation work on the Elbe and the Moldau and the regulation of the Danube, the Govt. has carefully considered two canal schemes, an Elbe-Danube canal and an Elbe-Oder canal navigable for vessels of 1,200 tons. The length of the Elbe-Danube Canal would be about 300 kilometres. Its course would follow as far as possible the line of the most important towns. Financial considerations are retarding the execution of these schemes.

Polish Waterways.—Polish plans include schemes for several canals which, navigable by boats of 1,000 tons, would constitute, together with the regulated parts of the Vistula, a complete system of navigable waterways across Poland. This plan would involve the construction of a canal which would start from Kattowitz in Upper Silesia, extend northwards and join the Vistula either at the mouth of the Brda or near Thorn, making use in several of its sectors of existing navigable waterways as, for example, Lake Goplo. Another canal would extend from Posen via Konin and Warsaw to Pinsk, taking in a part of the Warte and of the canalised Bug, together with the reconstructed King's canal between Brzesc and Pinsk. The latter waterway would have to be continued from Pinsk to the Russian frontier in order to link up with the great navigable system of Russia.

The Russian System.—The Russian rivers which are naturally navigable have suffered but little from the lack of upkeep in the course of the last 10 years. The proposal to construct the Rostov canal to unite the Volga and the Don may be carried into effect, though there are great technical difficulties in the way of this scheme. Its completion would reduce the cost of transport of oil from Baku, fish from Astrakhan, corn from the valleys of the Volga and the Kama, coal from the Donetz and merchandise from Persia. The importance of the proposed canal is obvious, as the immense system of the Volga, which is navigable for more than 16,000 km., will thus be linked up with the Black Sea, and the Baltic, Black and Caspian Seas will be connected by navigable waterways. There is already a service between Leningrad via the Mariinsky system and the Volga to Astrakhan and thence to the Persian port of Enzeli. The immense territory of Russia may become of capital importance in the future from the point of view of inland waterway communications. The system of waterways is more than 200,000 km. in length, of which at present some 40,000 are navigable. The Asiatic Russian system from the Ob-Yenesei mouths to Central Asia and Lake Baikal lies outside the scope of this article.

Economic Considerations.—Economic considerations will naturally play an extremely important part in any decisions taken in regard to the improvement of existing waterways or the construction of new ones. The question will inevitably arise whether a railway would not prove more serviceable than a waterway. The preference will clearly go to whichever mode of transport is cheaper. In comparing the advantages of waterways and railways, we must distinguish between rivers and canals; and we must further discriminate between canals built across flat country and those constructed across land where there are marked differences in level.

Rivers not naturally navigable may generally be rendered navigable by regulation works, such as spur dikes or longitudinal dikes, or by canalisation works such as the construction of dams across the bed of the river and locks to enable boats to pass. The forming of large reservoirs in the upper courses of waterways belonging to the basin of a large river may also constitute an excellent means of improving navigability by regulating the flow of water. In this way a greater minimum depth is obtained and the period of navigability during the year is lengthened.

As a rule the cost of building a railway having the same carrying capacity as a river is appreciably higher than the cost of making the river sufficiently navigable. Moreover, the cost of river-craft having a given loading capacity is less than that of railway rolling stock having the same capacity. Further, the haulage power of a locomotive is only a small fraction of that of a tug. This argument remains true even if a proper use of a waterway involves the execution of improvement works. Moreover, the economic development of the area served by the river leads to a considerable increase in passenger and parcels traffic, for which the railway is necessarily more suitable than the waterway, so that we always find railway lines alongside the river, connecting up the various important centres situated thereon. The argument that a river can compete with a railway holds good even if the traffic does not, strictly speaking, consist of heavy goods, such as ores or coal. The Danube is a case in point; before the War the volume of traffic on that river amounted to nearly 7,000,000 tons.

The case is different, however, if it is an artificial navigable waterway, *i.e.*, a canal, which has to be built. As a rule such a work is not justified from the economic point of view unless the prospective traffic in heavy goods (ores, coal, building material, cereals, and certain other agricultural products) is to amount to several million tons per annum. In order to determine the cost price of transport by canal we have to allow for possible profits and advantages derived from the exploitation of hydraulic power, and accordingly we have to make a distinction between a canal crossing flat country and a canal built in mountainous districts. Many projects for artificial waterways have been rendered feasible by the utilisation of water power. Wherever the configuration of the ground has permitted, recent schemes have combined the construction of a navigable waterway with the exploitation of hydro-electric power. The question therefore whether, in any given case, it is preferable from the economic point of view to construct a canal rather than a railway cannot be answered so readily as when the alternatives are a railway and a river; the answer depends upon a very large number of factors.

International Rivers.—A special category of waterways is constituted by those which come under the scope of the Convention on the Régime of Navigable Waterways of International Concern[1] concluded at Barcelona on April 20 1921. The criteria adopted at Barcelona were the fact of crossing or separating a number of countries, and natural navigability to and from the sea. In addition to the obligations which devolve upon riparian states, particularly in connection with works of upkeep, the Barcelona Convention lays down the principle of freedom of navigation and equality of treatment for all flags.

The objection has sometimes been raised that two different ideas have been confused, namely, the territorial idea and the idea of international traffic. It is clear that if it is in the interest of international traffic that there should be no flag discrimination, this principle applies wherever international navigation is carried on, independently of the fact whether the navigable waterway crosses or separates several states or not.

On the other hand it is only natural that, as regards international rivers, there was a desire to impose certain strict obligations on riparian states in connection with the hydraulic works to be carried out; these obligations, however, should rather be regarded as reciprocal obligations between riparian states. It would seem not impossible by drawing a clear distinc-

[1]In the application of the statute, the following are declared to be navigable waterways of international concern:

1. All parts which are naturally navigable to and from the sea of a waterway which in its course, naturally navigable to and from the sea, separates or traverses different states, and also any part of any other waterway naturally navigable to and from the sea, which connects with the sea a waterway naturally navigable which separates or traverses different states.

It is understood that:

(*a*) Trans-shipment from one vessel to another is not excluded by the words "navigable to and from the sea";

(*b*) Any natural waterway or part of a natural waterway, is termed "naturally navigable" if now used for ordinary commercial navigation, or capable by reason of its natural conditions of being so used; by "ordinary commercial navigation" is to be understood navigation which, in view of the economic condition of the riparian countries, is commercial and normally practicable;

(*c*) Tributaries are to be considered as separate waterways;

(*d*) Lateral canals constructed in order to remedy the defects of a waterway included in the above definition are assimilated thereto.

(*e*) The different states separated or traversed by a navigable waterway of international concern, including its tributaries of international concern, are deemed to be "riparian states."

2. Waterways, or parts of waterways, whether natural or artificial, expressly declared to be placed under the régime of the General Convention regarding navigable waterways of international concern either in unilateral Acts of the states under whose sovereignty or authority these waterways or parts of waterways are situated, or in agreements made with the consent, in particular, of such states.

tion between the territorial idea and the idea of international traffic, to lay down, for all navigable waterways on which international traffic can be carried on, contractual provisions similar to those which have been drawn up for maritime ports.

Inquiry into Existing Conditions.—In accordance with a resolution of the Economic Conference of Genoa, which was approved by the Council and Assembly of the League, the Organisation for Communications and Transit decided in 1924 to make inquiries of the various European governments concerned regarding the present situation of inland navigation in their respective territories. It also decided that the study of the complex problems which might be raised in connection with the great international rivers with many riparian states, should be entrusted to Mr. Walker D. Hines, United States Director of Transport during the War, who was appointed after the War as arbitrator in the allocation of river tonnage on certain international rivers. Accordingly Mr. Hines carried out an exhaustive study of the position of inland navigation on the Danube and also carefully examined the existing difficulties on the Rhine. It is hoped that Mr. Hines's reports on Danube and Rhine navigation as well as the results of the general inquiry will help to promote co-operation among the riparian states and to solve existing difficulties, in order that inland navigation may develop unhindered, and may occupy among the various means of communication a position which will enable it to play a great part in restoring economic stability and promoting the prosperity of the European nations. For the development of inland water transport in America *see* the articles GREAT LAKES AND ST. LAWRENCE and MISSISSIPPI RIVER.

INSANITY (*see* 14.597, and PSYCHIATRY; PSYCHOANALYSIS; PSYCHOSIS; PSYCHOTHERAPY).—A change in the conception and in the handling of the facts characterises the present century. Instead of "Lunacy" and "Insanity" we speak to-day of mental disorders, of psychoses and psychoneuroses, viewed as problems of the adaptation of the individual to his environment.

During the World War a wide range of mental disorders had to be met by medical and military officers many of whom had never before concerned themselves with such problems. A new type of sympathy and sense of duty towards the victims of "war shock" laid the foundation for a more understanding interest in mental disorders in general, and aroused the demand for their effective management, not by mere relegation to official asylums, but by active therapeutic measures.

Definition.—"Insanity"—implying as a rule an incapacity to grasp the fact and nature of the existing sickness or disorder and a lack of responsibility for personal care and conduct, with possible neglect of or actual danger to self or others—is a contingency rather than the essence of many disorders, and cannot properly be studied and understood by limiting oneself to the "insane" as we find them in the centres of segregation which we call asylums, refuges, retreats or mental hospitals. The wider field of psychiatry (*q.v.*) now includes mental and behaviour problems outside as well as inside hospital walls, and experienced help, medicinal at times but also to a large extent taking the form of guidance in the problems of adaptation, has supplemented or replaced mere custody in institutions. Mental hygiene, administered through mental health boards and committees in the United States and in several European countries, offers constructive and preventive measures which are carried out largely in centres where physicians, psychologists and soc workers collaborate in the work.

ADVANCES IN ETIOLOGY

Nationality and Race.—Interesting statistics on mental d orders in different nationalities making up the admissions the Massachusetts hospital at Worcester, and to the New Yo state hospital at Blackwell Island suggest that national and rac habits play an important part, the greatest differences lying the relative rôle of alcohol and syphilis and in the frequency temperamental and psychoneurotic maladjustments.[1] The Ir admitted had 27·69% alcoholic psychoses and 37% largely ps chogenic (temperament- and behaviour-determined) disorde while the Jews presented 0·32% alcoholic but 65% largely ps chogenic disorders. Of the Irish only 7·59% showed paresis (i a form of brain syphilis); of the Jews 14%; of the Germans 20 and of the negroes 29·41%.

Occupation.—The incidence of mental disorders in certa occupations is dependent largely on the degree of exposure harmful influences, and also on the temperamental factors whi may determine the choice of a profession.[2]

Heredity.—The question of heredity is not as simple as appeared in 1911. While the dispositions are inherited, it see highly probable that additional factors, in the form of life-exp riences, play a considerable rôle. The attempts to use Mendeli principles led to the conviction that affective disorders (man depressive psychoses) follow a dominant, and schizophrenic d orders a recessive type. The work of Mott and others appea to show that these two conditions may follow a law of anticip tion according to which the mental symptoms develop at earlier age in succeeding generations of psychopathic stoc Lately, we meet with the assumption that at least two or mo factors are needed to determine schizophrenic or manic-depr sive attacks, and geneticists like Jennings even tell us that had best forget the theory of unit characters, in man, because the complexity of the facts to be considered. Eugenics (*q.v.*) h shown itself applicable in two ways, negatively in the sterilis tion of the most obviously degenerate offspring of psychopath families, and positively in the training of the young towar healthy mating and sound sexual hygiene.

Infections.—The claims made with regard to the importan of infection (14.598) and in the publications of a few surgical inclined psychiatrists have not been borne out under rece scrutiny. Both the "agglutinines pointing to streptococc infections present in every case" of manic-depressive disorde and the claims of 80 to 90% recoveries after removal of foc infections and of the colon, are largely discredited, partly the very material of those making the claims. In the face of the propaganda, the theory of autointoxication and much of t more recent theory of endocrine disorders as etiological facto in mental disturbances are having an equally difficult time befo the rigorous tribunal of strict hospital and field work and stat tical tests. This does not mean that the "physical causes" a being neglected or belittled. Much research has been and still being carried out on the morbid anatomy and biochemist of the psychoses and psychoneuroses. Mott has demonstrat changes in the endocrine and particularly the generative glan of dementia praecox which in his view point to an "inborn la of vitality" in these patients. However, the old controver between the physiogenic and the psychogenic theories as to t causation of mental disorders is dying down before the new and more comprehensive conception of psychobiology, accordi to which the physical and mental make-up, the personali tendencies and the determining factors and situations are take into account in the study and treatment of the patient. Mo cases constituting or akin to the dementia praecox or schiz phrenia or parergasia group (described as katatonia and heb phrenia in 14.606) have been shown to be much more readi understood and formulated for purposes of treatment on genetic-psychodynamic basis, with special attention to the ci

umstances of the development of symptoms, than on the basis a sweeping claim of inevitable deterioration due to "unown" toxins or other causes, or on the theory of insufficiency endocrine glands.

Special Types of Disorder

Feeble-mindedness.—The study of feeble-mindedness has been nriched in various ways. The Binet-Simon tests and their odifications furnish a dependable and comparative measure of ie actual intelligence in terms of the "mental age" and the intelligence quotient" or I.Q., *i.e.*, the mental age attained vided by the chronological age. One speaks of idiots where the tainable age does not exceed three years, of imbeciles up to a ven-year level and of the higher grades of feeble-minded or orons between the eight and 15-year level. A retardation of less ian three years may lie within the range of error. The British yal commission of 1904 found that in groups of urban indus- ial and agricultural areas there was an average of ·32% of eble-minded children and adults in the general population, id of ·83% of feeble-minded among the children of school age, ith a higher percentage in towns than in country districts. A ouse-to-house survey of the children of school age of a well-cir- mscribed industrial district of Baltimore, Md., was undertaken the Henry Phipps Psychiatric Clinic and published by Dr. C. lacfie Campbell.[1] Since then numerous surveys in the United tates have corroborated the Baltimore results, which make it ear that about 2% of the children of a community should have ecial institutional training and some of these protection for fe, an additional 6% should be in special classes for the re- rded, and another 5% should have at least individual adapta- ons of the curriculum.

Greater attention to the psychology of education has revealed ie fact that children may fail to keep up to the standard of ieir age for causes other than feeble-mindedness, and may pre- nt problems of maladjustment which had best be handled by ie psychiatrist. In England and Scotland the Mental Defi- ency Act of 1913 has widened the range of defectives who may gally be committed to institutions and makes provision for ioral imbeciles. Early diagnosis and anti-syphilitic treatment f defect due to congenital syphilis is followed by improvement.

Acquired Mental Diseases.—A distinct advance is shown by ie fact that the disease entity concept is giving way to the less ogmatic concept of reaction-types. The specifications of the ypes of mental disease given in 14.597 are to-day largely replaced y a more genetic and constructive formulation and interpre- ation of patients or individualities.

Dementia Praecox.—An intermediate phase of rather opti- istic simplification had introduced the concepts of maniac- epressive (or affective) psychoses as essentially non-deteriorating, s opposed to the schizophrenic psychoses (also called dementia raecox), which are apt to pass into deterioration, emotional difference and apathy. The manias and the melancholias would constitute the manic-depressive psychoses, while hebe- hrenia and katatonia are now included in schizophrenia. But ven these diagnoses, which aim largely at prognosis, have had o yield to the recognition that one had best admit a number of ractically important reaction-types of special working and endency of evolution, requiring further a specification of the ausal factors and the assets of the patient both for the deter- mination of the intrinsic nature and the formulation of a prog- osis in each case.

The simple notion of "one patient one disease," and a classi- ication under a one-name diagnosis indicating either a good or bad outcome, cannot do justice to the multiplicity of points which demand consideration. A totally new conception of the onstitution of personality and its hereditary and individual omponents has supplemented the formerly dominant and almost xclusive conception of brain destruction by poisons and other gencies. There is to-day less interest in special disease entities han in the working of definite processes or developments vari- ously open to modification and adjustment.

[1] *Mental Hygiene*, 1917, i., pp. 96–147.

The psychoanalytic contributions towards our knowledge of personality and towards the interpretation of mental symptoms, and the methods of treatment based on these theories, are variously evaluated, but have been stimulating in the study and utilisation of life-experiences (*see* Psychoanalysis and Psychotherapy).

General Paralysis.—One of the most remarkable changes has occurred in our experience with the most fatal and disastrous form of mental disorder, general paralysis or paresis. There is no longer any doubt about its being due to an invasion of the brain by the spirochaete of syphilis. The disease may occur in children or adolescents through hereditary transmission of this organism, as well as in adults in whose cases symptoms may appear 10 or even more years after acquired syphilitic infection. But, far from being a uniformly fatal disease, it has now been found to yield to treatment. Early diagnosis, assisted by the application of the Wassermann test to the cerebrospinal fluid and not only the blood serum, and therapeutic infection with malaria (*q.v.*) or other recurrent fevers which appear to be incompatible with syphilis of the nervous system, enable as many as 40% of patients to enjoy a prolonged remission from their symptoms or to obtain a complete cure.

Commitment or Certification

It is unfortunate that there will probably always be a group of patients or phases of illness that lie between the two extremes of (1) voluntary co-operation and (2) forcible treatment. While there is a growing desire to extend facilities for treatment on a voluntary basis, it frequently happens that delay in dealing with an unwilling patient involves risks when suicidal or homicidal impulses are present. Following the lead of the continental clinics, hospitals have been opened in the United States and elsewhere for the study and treatment of early cases of mental disorders.

Most of the American institutions have an increasing number of "voluntary commitments" requiring in writing a "three days' notice of intention to leave," so that the physician may have the right to detain the patient pending the consideration of the best course to take in the further care. The commitments themselves in many states are left to a statement of two impartial physicians; in others they require court procedure or even jury trial, a method that is, however, more and more limited to habeas corpus actions, *i.e.*, a demand to show cause for the detention of a patient as a "committed" person.

The medico-legal problems of responsibility in mental disorders are still in an archaic state on account of the unfortunate fact that the rules of evidence which were invented for the normal are not favourable for the presentation of facts which have a psychiatric bearing. Another point of loose practice occurs in the United States in the proper disposal of patients who are declared "not guilty on account of insanity." A patient who gets into conflict with the laws should remain under safeguard until he shows evidence of insight and capacity for self-management.

The principles of equity procedure in use in juvenile courts promise beneficial reform and valuable experience based on a study of the individual delinquent according to psychiatric principles. The moral changes which are liable to follow an attack of epidemic encephalitis constitute a new and difficult problem (*see* Encephalitis Lethargica).

Statistics.—Statistics are notoriously inadequate where no continuous census and control of the population and its whereabouts is maintained. The number of "certified" insane patients under care in England and Wales was 131,557 on Jan. 1 1925, an increase of 1,217 over the number on Jan. 1 1924, but evidently less than the number before the War; 48·9% are males, 51·1% females. The recovery rate calculated on the direct admissions is given as 34·86%. The death-rate calculated on the daily average number of interned patients is 7·62%. The absence of any greater increase of numbers during and since the War is probably only apparent. The fifth report of the British Lunacy and Mental Deficiency Board of Control (1919) brought out a ratio of 208 (instead of the usual 76) cases of death to each

1,000 of the interned insane and defective population, owing to a temporary increase of tuberculosis, diarrhoea and dysentery, typhoid fever, etc. The lack of fresh milk and fats and the disorganising of the nursing through the War must have been largely responsible.

Effects of Prohibition.—Considerable interest adheres to the question of the effect of prohibition in the alcoholic mental disorders. Wherever the alcohol traffic has been brought under control the reduction of "alcoholic insanity" has been striking. Where propaganda against prohibition has been most active, a moderate return of the old conditions has been noticeable. The experiment is too short and too imperfectly carried out to furnish an answer to the many questions arising.

(A. MEY.)

INSECT BITES AND STINGS.—Insects may be the cause of disease or of morbid conditions in man in several different ways: (1) by living *on* his skin or hair, as in the case of three varieties of pediculi or lice (the head-louse, the body-louse, the crab-louse); or *in* his skin, as with the itch-insect (though this is strictly not an insect at all but a spider-like parasite), or with the tropical chigger, jigger or sand flea; (2) by depositing their eggs on the skin or mucous membrane, or on wounds, whence the larvae find their way below the surface, usually by boring or burrowing, as is the case with several tropical flies; (3) by being the instrument of transferring a bacterial infection to man from some other animal, as is the case with the rat-flea in plague, or by taking part as host in the life-cycle of a spirochaete or a protozoon and passing the parasite on to man, as is done by certain mosquitoes in yellow fever or in malaria; (4) by the direct and immediate effects of their bite or sting. It is with this last method only that the present article is concerned.

In Great Britain, as in most other countries, such bites and stings are exceedingly common, the most frequent biting insects being the common flea, the bed-bug, gnats and mosquitoes, and the most frequent stinging insects being the wasp, the bee, the hornet and the ant. It should be realised, too, that the effects of the louse are due not merely to its presence, as mentioned above, but to its actual bite.

The consequences of these bites and stings are well known, very few persons escaping some personal experience thereof, though susceptibility varies widely in different persons. Local irritation may be extreme, and the skin lesion produced may vary from a small reddened or erythematous patch or a tiny papule, to large urticarial or nettle-rash wheals, or even to a spreading cellulitis or inflammation of the tissues under the skin. These effects, though giving rise to intense discomfort, are rarely serious and usually pass off completely in a few hours or at most a day or two. Occasionally, however, dangerous developments occur.

The conditions most likely to lead to such developments are: (1) a very large number of stings, as when a swarm of angry bees settles on the body; (2) the lesion being on a mucous surface such as the tongue, the palate or the pharynx; (3) the supervention of some local complication such as erysipelatous or other streptococcal infection, or the direct transmission of some form of septic poisoning as by the bite of a fly which has been feeding on putrid material. In all such cases skilled surgical aid should at once be sought, as in extreme instances death has occasionally resulted and urgent measures may be necessary to deal with the situation.

Treatment.—The poison injected with an insect sting is, at least in many species, formed by a mixture of the secretions of two glands, one of which is acid (formic acid) and the other of which is alkaline. In most cases the acid predominates; hence weak alkaline solutions (soda or ammonia) are commonly effective in allaying the irritation. In some cases, however, especially, it is said, with the sting of some wasps, the alkaline element is predominant and in such instances a weak acid lotion (such diluted vinegar) gives most relief. Other local applications of effective character are alcohol, spirits of camphor, a solution menthol or of permanganate of potash, a dilute solution of c bolic acid, or even slices of the homely onion. In every case t sting itself, if it remains in the skin, should be carefully remov

As preventive measures when insects are prevalent, camph menthol, lavender and oil of eucalyptus appear to have so virtue; and skilful and assiduous campaigns against flies, m quitoes and wasps have of late added greatly to the amenities a number of localities. *See* BACTERIOLOGY; KALA-AZAR; PAR SITOLOGY.

(H. B. BR.)

INSTALMENT SELLING is in essence an extension of credit retail purchasers, under some form of contract by which t purchaser agrees to make partial payments at stated interva over a period of weeks, months or even years. It enables tho sands of persons of limited means to acquire goods which th could not otherwise possess. The goods purchased are usual delivered after the payment of an initial deposit. This deposit sometimes merely a nominal sum; but frequently it amounts one-fourth or one-third of the price of the goods. The seller r tains title, or its legal equivalent, in the property until the la instalment is paid. This is accomplished by means of a chatt mortgage, a conditional sales contract or a lease. The latter the method employed in Great Britain. In this article a résum of American developments will be given first.

I. IN THE UNITED STATES

The customary practice in the United States, where th greatest development of instalment selling has occurred, described as follows: "When goods are bought on lease or co ditional sales contract, the title remains in the sellers, an passes to the buyer only upon completion of the stipulate payment. Under the lease plan, instalment payments ar designated as 'rent.' (This form of instalment selling wa devised to conform to the laws of certain states.) But when th chattel mortgage form is used, the title passes immediately t the buyer, and he gives the mortgage as security for payment o the balance due. Under any of these forms, the sellers may re possess the property if the conditions of the sales contract ar not met by the buyer." (See *Instalment Merchandising, Com pilation No. 2*, issued by the National Association of Credit Men.)

A tremendous expansion of instalment selling took place in th years following the World War. The aggregate amount o instalment credit in force in the United States in 1926 wa estimated to be close to $3,000,000,000; and this estimate though based on insufficient data, is believed to be conservative in view of figures from the automobile industry showing that the total of automobile instalment paper then outstanding amounted to about $1,500,000,000. The grand total of all instalment sales in the United States in 1925 was said to be $5,000,000,000.

This extraordinary development was naturally viewed "with alarm" by many conservative economists, merchants and bankers. Aside from what might be called moral objections, the chief criticism was that large-scale instalment buying must lead to unhealthy inflation and consequent disorganisation of business and finance. It is probable that severe business depression, with its accompanying unemployment and the consequent failure of workers to pay their instalments, would prove disastrous to commercial firms that had failed to scrutinise carefully all credit applications. On the other hand, it was pointed out with much force that a high element of safety attaches to credit risks, each relatively small, which are widely scattered throughout the community. The continued success of many firms whose experience in instalment selling long antedates the latest boom, is proof that such a business may be as soundly and as profitably conducted as any other.

Credit merchandising, in fact, had made a rapid growth before the beginning of the present century. It was first applied extensively to the sale of subscription books and was later adopted by the piano and musical instrument business. It was

ien applied to the sale of furniture, sewing-machines, jewellery, is-stoves; and thousands of these products have been paid for / the month by people with moderate, steady incomes. A very rge proportion of instalment purchasers in the days before the itomobile were housewives who found it possible to make nall weekly or monthly payments out of their household lowances. Women have continued to exercise a large influence i this type of buying; and most articles thus obtained are ecided upon by the whole family.

For a long period a certain social disapproval hung over stalment buying, particularly if the articles purchased were xuries. The purchase of homes by this method was, however, ways regarded as praiseworthy, and most homes have been ought on this plan. The boom of recent years, which has most entirely removed the social stigma, began with the loption of this method of selling on a large scale by the auto- obile industry. When the United States entered the World Var the time payment plan was utilised in the sale of huge iantities of Liberty bonds; and in the years that followed many vestment houses did a considerable volume of business selling curities on deferred payments.

The volume of instalment sales of automobiles prior to 1916 was most insignificant. Mass production of motor-cars closely llowed the development of finance companies to care for in- alment business. Some of these finance companies were ganised outside of the automobile industry; others were ganised by large manufacturers. One of the most important these was the General Motors Acceptance Corp., the volume whose transactions grew from $10,000,000 in 1919 to nearly 150,000,000 in 1925. Alfred P. Sloan, Jr., President of the eneral Motors Corp., stated that the losses, *i.e.*, retail charge- f, during this whole period were only .199 of 1% of the volume f retail business handled. (See *Nation's Business*, April 1926.) . C. Hanch, General Manager of the National Assn. of Finance ompanies reported the results of an extensive survey completed uring 1924 as showing a loss ratio of less than $\frac{1}{8}$ of 1% on ggregate new and used car business, amounting to $195,500,000. See *American Bankers' Journal*, April 1926.) It is seen there- ore that losses in collection have been very small.

In 1926 there were more than 1,000 finance companies in the Jnited States created for the purpose of handling automobile urchases. More than 75% of all motor vehicles sold during the revious year were purchased on the instalment plan, the deposit sually being about $\frac{1}{3}$ of the price of the car, the balance being ivided into 12 equal monthly payments.

Finance corporations did two kinds of business, wholesale and etail; that is, they financed the purchase of cars by dealers from anufacturers and the purchase by retail buyers from dealers. n the case of one low-priced car it was possible in 1925 to get ossession by making an initial payment of $12.40, and furnish- ng two endorsements to the note. This was followed by weekly ayments of $5 for a year, and at the end of the year a so-called alloon-payment completed the transaction.

The fee of the finance company added to the purchase price vas known as the time-price. After deducting the initial pay- nent from this time-price the remainder was generally divided nto 12 or more equal parts which constituted the monthly pay- nents. Finance corporations usually calculated 15% per annum nterest on money actually outstanding, or from 6 to 8% on the urchase price. However, in some cases, where initial payments vere very low, the subsequent payments extending over more han a year, and with no responsibility by the dealer for col- ections, the final cost to the purchaser was as much as 30% bove the cash price.

Finance corporations secured their funds from the banks, nd the particular function they served was to provide the ecessary machinery for investigation, supervision and collection vhich the banks lacked. The different contract forms employed ave already been described. It was customary for the purchaser o make out a note to the dealer for the amount remaining after he initial payment. The dealer passed on this note to the inance corporation, which paid him its face value minus its own fee. The dealer would either indorse the note, and thus assume responsibility for the payment of the monthly instal- ments, or he would agree to re-purchase the car in case of de- fault by the purchaser. In some instances, however, the dealer assumed no responsibility: under this, the "no-recourse" plan, the charges of the finance company were higher. Under any plan the purchaser was usually required to insure the car against fire, theft and accident.

The prosperity of the automobile industry and the enormous sale of motor-cars in the United States was the direct outcome of instalment selling. This fact could not escape notice by manu- facturers and dealers in other products. Consequently many articles never hitherto distributed by this means were offered on the time-payment plan; and many retail merchants who had once frowned on instalment selling either adopted the method gladly as a proved means of increasing business, or did so re- luctantly to meet competition. In 1926, in the United States, it had become possible to purchase practically every article of consumption costing upwards of $25 (with the possible exception of food) on time payments.

This trend was well illustrated by the announcement in 1925 by a leading men's clothing store of Chicago of a so-called "budget system" under which garments might be purchased on a cash payment of $\frac{1}{8}$ to $\frac{1}{4}$ of the purchase price, the remainder be- ing payable in 10 weekly instalments. This shop had always con- ducted its business very conservatively, and had refrained from everything remotely related to instalment methods. Other retailers were inclined to be censorious, and clothing manufac- turers were divided as to the merits of this innovation. But the management reported, after a short test, that it was successful, and some interesting facts were brought out. This store, like many others of the same class, maintained charge accounts for a large number of customers; and it is stated that payment on these accounts was often delayed as much as 60 or 90 days. But the customer who pays $\frac{1}{4}$ down and then 10% of the balance each week pays for his goods more quickly than he would under the ordinary charge-account.

One of the most conservative stores in New York has in- stituted an elaborate budget system for the sale of furniture. This budget system is essentially a plan for selling on time pay- ments, but it has the advantage that the store first consults with the purchaser as to his income and furniture requirements, seeking by this means to minimise their risk and at the same time more accurately to satisfy the customer's needs. The con- sultation is of genuine benefit to the purchaser and often enables him to make a larger purchase with greater economy than if he bought haphazardly or piece by piece.

It is apparent that under these conditions credit can be ex- tended to thousands of persons to whom a merchant would hesitate to grant an open charge account. Moreover, the pur- chaser doubtless feels it safer and more convenient to budget his payments by the week or month rather than to have the entire amount fall due within 30 days and then allow the account to remain unpaid for a longer period, through the acquiescence of the store-keeper, but with a consequent impairment of the purchaser's credit standing.

Although it has been customary to add a time-price or in- terest charge in making instalment sales, some merchants have endeavoured to maintain the same price for the cash customer as for the instalment customer. This practice probably cannot long continue. Certain stores have already taken advantage of the situation to advertise "no credit" and "cut prices" for cash, with the idea of showing the public the cost of time purchases. The possibility of selling more cheaply on a strictly cash basis will doubtless prove sufficient incentive for the expansion of this class of business; and by the operation of ordinary economic law will serve as a salutary check on instalment buying.

The cost of instalment selling, considered by itself, is high. It has been estimated to be as much as $800,000,000 yearly in the United States. This might be regarded as sheer economic waste were it not for the fact that tremendously increased pro- duction, made possible by the time payment privilege, has

served to lower prices; so that the purchaser buys enough cheaper to pay the cost. Increased demand likewise keeps factories busy and gives employment to more workers. The protagonists of instalment selling insist that much of the prosperity of the United States since the War, in the face of strong European competition with its cheap labour, can be traced to the development of the home market by means of time-payment financing. It is even suggested that certain backward countries could benefit by the cautious introduction of this method of marketing.

It is typical of the diversity of opinion which still envelops the subject that some authorities regard instalment buying as tending to demoralise the purchaser, while others, probably more numerous, believe that it benefits the individual and society. "We are sorry," said the Babson Statistical Organisation in July 1925, "to see this stampeding to an instalment business. We don't believe that it is wise for anyone unnecessarily to get into debt, whether manufacturer, merchant or the public. Getting into debt has been the cause of most failures, and we are sorry to see another stratum of the public adopt it. On the other hand, is there any ethical reason why your employees are not justified in giving serial notes for their purchases of goods, as you are justified in giving notes for your purchases?"

The story is told by a writer opposed to instalment selling of a man on an income of $60 a week who had contracted for purchase amounting to $72 a week. He explained that he could not resist the persuasive suggestions of salesmen. But most observers agree that the American household had not lost its sense of proportion; and the occasional emergence of cases like this is a reflection on the credit departments of the sellers rather than on the principle of instalment selling. It is probably true, also, that further experience with deferred payments not only tends to make credit departments more cautious, but likewise trains the purchaser to be on his guard against undertaking obligations which he cannot meet.

This training must have considerable social value. The workingman who seeks to buy a piano or an automobile on credit soon learns the importance of having a good reputation for meeting his obligations promptly. The instalment merchant would prefer, as a matter of fact, to sell an expensive article to a man of moderate income with a proved reputation than to a more prosperous individual who was dilatory in meeting his obligations. Having bought his automobile or piano, having discovered the value of established credit, and having learned some of the mechanism of business, the buyer becomes a more stable unit in the community. He sees it will not be at all impossible for him to buy his own home, and, if his interests lie in that direction, to establish his own business.

The question is at once raised: why does not the instalment purchaser save the money in the first place? The psychologists could doubtless provide a complete answer; it is perhaps sufficient to say here that it is easier to pay for an article already acquired, especially if the sense of obligation is reinforced by a properly managed collection department, than it is voluntarily to lay aside each week or month a certain sum for the satisfaction of a desire that cannot immediately be realised. The wage-earner, attempting to save, necessarily finds it difficult to resist the demands made on his money, even though he manages to avoid petty temptations to squander; and instalment selling serves its best purpose when it provides the purchaser with products of enduring value. The fact is business could hardly go back to the pre-instalment days even if it wanted to.

An analysis of the population in the area between Boston and Chicago, the Great Lakes and the Ohio river, proved that for the purchase of an article costing $75 or more, after house-rent, groceries and clothing are taken care of, only 10% can pay cash; 30% are entitled to standard credit terms on a 30 to 90 day basis, and 60% must have four months to one year to pay. (See *Advertising and Selling Fortnightly*, April 22 1925.) It is only necessary to glance through the magazines and note the advertisements of hundreds of articles selling for more than $75 to realise that these businesses could not prosper if they were forced to reduce their output to the level of the cash dema Where, then, does the money come from to pay for these produc It is difficult to escape the conclusion that people work harder a deny themselves casual expenditures in order to pay for son thing of real worth which they greatly desire. In many instanc too, it is certain that the article so acquired promotes greater p ductivity on the part of the purchaser.

The opposition to instalment selling has come from ma sources. Partly, no doubt, it is inspired by manufacturers a merchants who have failed to change with the times; part from other manufacturers and merchants whose goods will n lend themselves to this method of merchandising and w suspect, rightly or wrongly, that money is being diverted fro the purchase of their goods. Open opposition has come fro labour leaders, who probably feel that the working-man who paying for goods on the instalment plan will be less disposed go on strike, and perhaps prove more docile in his attitu toward his employer. A few banks have expressed themselv as opposed to the instalment business, but the majority have bec willing to underwrite it in one form or another, otherwise t vast expansion already noted could not have occurred.

If instalment selling is to continue on a sound and profitab basis, there is no doubt that certain precautions must be ob served. (1) It seems undesirable to extend this method sale to expensive products of great fragility or little intrins worth. (2) An article combining high cost of operation, upkee and depreciation, with little or no earning power, is for the mos part unsuited for sale on long-term credit. (3) Special safeguard must be devised if the goods sold on time have little or no valu when repossessed, or if the period of payment is likely to outru their usefulness. (4) No company should engage in credi business without a well-equipped collection department unde the direction of an experienced credit man. (5) Credit should b granted only after sufficient investigation to give a reasonabl assurance of the applicant's ability and willingness to pay.

The last point is by all odds the most important; there coul hardly be any "problem" as to instalment selling if all credi departments were properly managed. The seller is never force to sell against his better judgment, and if abuses have crept in the seller must take the major share of the responsibility Fortunately, such abuses tend to rectify themselves. There is n surer road to business disaster than the extension of credit or terms that are too easy, or to irresponsible persons, or on goods that are utterly unsuited to anything but cash sale. These principles of sound instalment selling are not new; they were discovered by the first banking institutions that began to lend money for the promotion of business. They are principles, however, that may have to be learned all over again by certain finance corporations and business houses who have taken up instalment selling as a quick and easy means to greater profit.

(H. Bra.)

II. IN GREAT BRITAIN

The development of the system of purchase on the instalment plan in Great Britain and her colonies has proceeded on similar lines to those outlined above in the United States, though not in so accentuated a form. The idea was by no means new in England, since pianos were being sold on the hire-purchase system in London so far back as 1838. The present century, however, has seen an enormous expansion in instalment selling, which has been accelerated since the end of the World War. One instance of this will suffice. In 1919 few motor-cars were sold on the instalment plan in Great Britain. Four years later one of those best able to judge computed that of the £15,000,000 retail turnover on motor vehicles, over £4,000,000 was done on the hire-purchase system, the greater proportion of this latter amount being spent on commercial cars, including motor-vans, motor-lorries and motor chars-à-bancs. In 1925 the total turnover had risen roughly to £52,000,000, of which not less than one-half was done on the instalment payment system.

The estimate of the hire-purchase traders is that between 50% and 60% of the furniture turnover and over 50% of

he piano, motor-cycle, sewing-machine and farm implement usiness in the same year was done on the same basis. Even the ritish Govt. in 1926 was selling by instalments surplus army tores including aeroplanes and horses. The percentage of stalment selling of factory machinery in Great Britain is, owever, very low on account of the fact that British limited ability concerns prefer either to take a discount for cash or to ake credit for the full amount of the purchase, since many of hem are public companies. Particularly remarkable, however, re the successes reached through the sale of what may be called implements of business." For instance, the Remington Typeriter Co. offered their portable typewriters on the instalment ystem in April 1925, the terms being an initial payment of 2.2s.od., followed by eleven monthly payments of £1.1s.od. aking the sales for the six months preceding this offer at the rate f 100 per month (a purely fictitious figure) it was found that the les had increased in Oct. 1925 to 210, in Nov. to 269 and in Dec. 325. Thus in eight months instalment selling had increased ie sale of portable typewriters by over 200%, while the newsaper advertising for the eight months was only about 5% bove that for the preceding six months. To-day there is ractically no great London or provincial department store iat is not selling furniture, gramophones, wireless sets, pianos nd sewing-machines on the instalment system.

The financing of instalment selling in Great Britain has proeeded more slowly than in the United States. There is one nportant reason for this. The City does not like motor flotations t any time; and it likes motor finance corporations even less. ccordingly, these companies have usually had to go to the surance companies or their own directorate for their money. urther, the British public has never become enamoured of motor iares, and this dislike has extended to the shares of the finance mpanies. Yet there are several corporations in Great Britain oing a turnover of £2,000,000 to £5,000,000 per annum, and it is robable that the present prejudice of both the City and the nall investor against the shares of such concerns will be overome eventually. The system of financing motor hire-purchase Great Britain is identical with that in use in America. In the se of a new car, however, it is usual to ask 25% in cash as a rst payment, the remaining payments being spread over a eriod of 6 to 18 months. It is common for the financing comany to charge 7% to 8% on each transaction for 12 months' ccommodation. Obviously the actual rate of interest paid is ½% to 16% since the average amount on loan for each month only half of the total. It must be remembered, too, that ie retailer is normally charging his customer from 5% to 8% r the credit given, so that the net cost to the retailer is quite nall. It will be clear, therefore, that the use of the instalment ethod of selling entails a greater capital in relation to turnover an cash selling. In other words, it tends to turn a former cash siness back to the basis of the old-fashioned credit business, hen the customer took from 3 to 12 months' credit.

The question which exercises British business men is whether expansion of instalment selling similar to that which has ken place in the United States during the past six years would salutary or dangerous. Goods sold on the instalment system re, in a sense, put into stock. One of the main causes of any siness slump is the excess of goods in stock. In a time of pression it is clear that the number of failures to meet payment ould increase. How seriously would it increase? Further, as ie bank rate rose, the financing companies without large reerves would find their profits heavily cut, and possibly turned to losses. At the same time it would be difficult for them to cure new business on account of shortage of money and igher rates of interest. British finance and British business are mpelled to study this problem for themselves, since the conitions of American business are so different and no serious ump has occurred in the United States since instalment selling came so prevalent. The conclusion, however, would appear to that the sale by instalment of articles with a re-sale value, ., of articles which do not depreciate with enormous rapidity, safe within almost any achievable limits. But very large sales in articles unsuitable for re-sale owing to the heavy depreciation, *e.g.*, clothes, might be extremely dangerous if acute business depression became rapidly felt.

The legal aspects of instalment selling in Great Britain are somewhat different from those prevailing in the United States. The property in an article purchased on "deferred payments" passes to the purchaser, *i.e.*, he becomes owner from the moment of the first payment, whereas under the hire-purchase system the purchaser merely acquires the right of possession, no right or property passing to him until the final payment has been made. It is vital therefore for the business which desires to sell its goods on the instalment plan to see that the actual contract signed by the buyer is one for hire-purchase, in which the successive payments are considered merely as rent, until the final payment is made, prior to which latter event the ownership remains in the vendor. Otherwise the purchaser after obtaining possession will be able to sell or encumber the goods, and an innocent purchaser or mortgagee will obtain priority of title.

Another contingency which has to be considered in Great Britain is that of distraint for rent. In the United States generally the landlord does not possess this remedy. All he can do is to put the tenant who is in arrears out on the street together with his goods. In Great Britain the landlord can enter upon the premises, seize the tenant's goods found therein, and sell them to realise the amount of rent due, and this liability extends to goods purchased by the tenant under the hire-purchase system, other than pianos, sewing-machines, safes, gas-engines and printing-machines. On a par with this is the danger of the purchaser becoming bankrupt, in which case the trustee in bankruptcy may, and probably will, sell the goods in question for the benefit of the debtor's creditors, unless the agreement has been drawn up in consonance with the best British practice. The legal situation, generally speaking, is so full of pitfalls and the law on many points so uncertain that any firm considering entering into the instalment business should take care to obtain the best legal advice on all phases of the subject.

It should be added that, from a credit standpoint, the instalment business has proved quite as safe so far in Great Britain as in the United States. The average losses through bad debts by the members of the Hire Traders Protection Assn. is under 2% per annum. One of the leading London firms reported recently that their loss from bad debts was less than 1% per annum. Even in one of the most risky fields, that of the sale of motor-cars by instalment, the average percentage of losses from this cause has never been placed above 2½% by competent authorities. (C. CH.*)

INSULIN.—In 1889 Von Mering and Minkowski proved that the complete removal of the pancreas from animals produced signs and symptoms which are practically identical with those found in human beings suffering from diabetes mellitus. Previous to that year the pancreas, the gland which secretes powerful digestive enzymes into the first part of the small intestine, was not definitely associated with the utilisation of sugar by the animal body. It was soon shown that a small amount of pancreas grafted under the skin prevented the development of diabetes in an animal from which the rest of the pancreas had been removed. It was also discovered that blockage of the pancreatic duct did not produce diabetes, although degeneration of the pancreatic tissue, with the exception of numerous small structures called the islets of Langerhans, resulted.

Historical Notes.—These minute structures apparently unrelated to the acinous tissue which forms the digestive enzymes, were first noted by Paul Langerhans in 1869. Schafer was one of the first to suggest that pathological changes in the islet tissue might be responsible for the production of diabetes in man. He also suggested that "Insuline" would be an appropriate name for the hypothetical internal secretion by means of which some authorities believed the islet tissue to exert its control over sugar metabolism.

Experiments and Discovery.—In the year 1921 Banting and Best, at the University of Toronto, began a series of experiments the results of which proved that a substance could be obtained

from the pancreas which would enable diabetic animals to utilise sugar. This substance was originally secured from the degenerated pancreas of the dog. The degeneration was produced by tying the pancreatic ducts, which causes an atrophy of the cells of the gland which produce the digestive ferments, but leaves intact the islet tissue. The available supply of degenerated pancreas was, of course, very small and efforts were soon made to secure the material from other sources. After a series of experiments in which small amounts of material were obtained from the normal pancreas of the dog and from the fetal calf pancreas, the active substance was obtained from the adult beef pancreas by alcoholic extraction of the fresh tissue. This discovery provided ample material with which to study in detail its action on experimental animals and to apply it to the treatment of patients suffering from diabetes mellitus. Animals from which the pancreas has been removed suffer from the same symptoms that the human diabetic experiences (*see* DIABETES). The sugar which cannot be used accumulates in the blood and is excreted in the urine. The normal animal stores sugar in its liver in the form of glycogen, but the diabetic liver does not form this substance. The administration of insulin to the diabetic animal corrects all these abnormal conditions and enables the animal to utilise carbohydrate in a normal manner. The average life of a completely depancreatised dog before the discovery of insulin was less than three weeks. These animals have now been kept alive, by the administration of insulin, for over two years and will undoubtedly live much longer.

Use and Value.—Insulin was first applied to the treatment of diabetic patients in Jan. 1922. The results have been uniformly successful, and thousands of patients are now being kept alive by the hypodermic injection of this material. Insulin does not cure the disease but replaces the internal secretion which the diabetic has lost the power to produce. The substance is administered subcutaneously and is not effective when given by mouth.

Standardisation.—Insulin is standardised by observing the extent of lowering of the normal rabbit's blood sugar produced by small amounts of the active material. The administration of too much insulin to diabetic patients is dangerous but the situation can be recognised by the occurrence of definite symptoms. The condition can be quickly corrected by the ingestion of sugar in any convenient form.

Employment in Cases of Coma.—Previous to the discovery of insulin a large proportion of diabetics died of coma. The intelligent use of insulin combined with proper dietetic treatment prevents the development of coma. Patients in coma can in most cases be rescued by the administration of large doses of insulin.

Specific in Diabetes Mellitus.—Insulin has proved to be a specific in the treatment of diabetic coma. It is invaluable in the treatment of severe diabetes mellitus. The use of the active substance in the investigation of the physiology and the biochemistry of the carbohydrates in the animal body has already brought to light numerous important new facts. It is quite possible that it is in this last field that insulin will contribute most to the welfare of the human race and the progress of medical science. (C. H. B.)

INSURANCE (*see* 14.656).—The years immediately preceding the World War were not extraordinarily interesting from the insurance point of view, although those of military age who then effected assurances had, later, excellent reasons for satisfaction that they had done so, since all who were insured with British offices were covered, whether or not the risks of war were specifically excluded from the terms of the policy.

I. GREAT BRITAIN

LIFE INSURANCE

Most of the British offices transacting what is known as ordinary life assurance had issued policies free from all restrictions, whereas some of the companies transacting industrial assurance had specially excluded the risks of war. All these companies which had done so decided, however, to waive their rights. The value of the complete cover may be gauged by th facts that, after the outbreak of hostilities, an additional premiu of £7·7·0% was quoted to cover the war risks, and that the ra soon advanced to as much as 20% per annum.

Losses of the War Period.—What the World War meant f life assurance was indicated in a paper read by Mr. H. Brow assistant actuary of the Commercial Union Assurance Co before the Insurance Institute of London on Dec. 20 1920. R ferring to the British offices, Mr. Brown estimated the w losses during the five years 1914 to 1918 inclusive as follows:—

1. Mortality in excess of the pre-War ratio resulted in a loss about £3,000,000 a year.
2. Depreciation in excess of the amount for just before the W was estimated at £4,000,000 a year.
3. The reduction in the net rate of interest due to the high incom tax resulted in a loss, as compared with the pre-War period, about £500,000 a year.

The total losses, as compared with the period immediatel preceding the War could, therefore, be estimated at, roughly about £7,500,000 a year during the five War years. In the yea immediately before the War the total divisible profits of th British offices, in respect of ordinary life assurance, amounte to about £6,500,000 a year, of which about £6,000,000 wa divided among the policy-holders, and about £500,000 wa distributed among the shareholders of the proprietary com panies. During the War the normal profits continued to b realised subject to the deduction of the special war losses de scribed. The special war losses thus exceeded the normal profit of the same period and it may be estimated that, down to th end of 1918, the War probably cost the life offices, as a whole about five years' bonuses.

Post-War Conditions.—After the end of the War a great chang came over life assurance conditions. Instead of suffering de preciation in security values year by year, the investment began to appreciate, while favourable opportunities for th investment of funds continued. Against this fact had to be se the consideration that taxation continued to be heavy. Th offices were, however, relieved from the burden of the seriou war mortality. They were still guided in their calculations o premium rates by mortality tables relating to the experienc many years ago. Investigations are being made by the In stitute of Actuaries into mortality experience, but the result are not to be expected for some time. Meanwhile, these tw bodies have issued the results of their inquiries into the experi ence of annuitants. These show that the longevity of annuitant is distinctly greater than that of the general public. Conse quently, in 1924–5 most of the British offices amended thei annuity rates and would probably have further increased th prices asked but for the favourable rates of interest which they obtained on their investments.

While the difficulties of the British offices due to the Wa were serious, they were far less formidable than those of some o the continental companies in countries whose currencies de preciated heavily in value. Agreements were reached betwee the different countries respecting the basis of settlements. A large number of policies were, for instance, effected by Belgian with German institutions, and an agreement was only reache at the end of 1925 respecting the settlements. In the Unite States the effect of the War on the insurance offices was com paratively small. The American offices have mostly withdraw from life assurance outside the United States. This secession has provided opportunities for Canadian offices some of which have vastly increased their business within the last decade. The assurance per head in Canada and in the United States is very much greater than the corresponding amount in Great Britain. The average sum assured in the last-named is only about 50% of the corresponding sum assured in Canada and not much more than one-third the assurance per head in the United States.

Industrial Life Assurance.—Criticism of the industrial life assurance system in Great Britain led to the appointment in May 1919, of a departmental committee by the Board of Trade to inquire into the business carried on by industrial assurance

companies and collecting societies. The report of this committee was issued in July 1920, and made various recommendations. Evidence was given before the committee that the convenience and economy in collection could be improved by the introduction of the block system, under which an agent is assigned an exclusive area for his work. The lead in the reduction of working costs has been taken by the Prudential Assurance Co., which by gradual steps has lowered its working costs from 30·5% of the premium income in 1920 to 27·86% in 1924. This reduction made possible the introduction of a reversionary bonus system for the industrial policy-holders on the general lines applied to ordinary life assurance. The committee recommended the appointment of an industrial assurance commissioner, and his first report, which was issued in 1924, showed that the appointment had been of value to the assuring population, particularly in its relations with the less satisfactory type of offices.

Fire Insurance

Fire insurance was affected by the World War in so far as relations existed between insurance companies and the assured in countries which were at war with each other and also by the influence of the War on prices on commodities. This was particularly seen in the great increase in the amount of the claims during 1919–20. In fact, the cost of the claim settlements has been much higher in the post-War period than in the pre-War period. This development is illustrated by the estimates of the cost of the principal fires in Great Britain and Ireland. The cost of these, which only take into account fires in which the damage amounted to £1,000 or more, as estimated by *The Times*, amounted to £3,300,000 in 1916, to rather over £4,000,000 in 1917 and to £5,500,000 in 1918. In 1919 the cost of the principal outbreaks advanced sharply to £9,462,000; in 1920 they were £9,374,000; in 1921 they amounted to £8,128,000; in 1922 to £6,218,000; in 1923 to £7,192,000; in 1924 to £5,017,400; and in 1925 to £5,122,100. It will be seen that since 1920 the cost of the claim settlements has very much declined, which reflects, at any rate partly, lower values.

Losses from Fires.—In order that the total cost of all the fires in Great Britain and Ireland may be estimated, it is usual to assume that 50% may be added to the above figures in order to include the cost of all fires in which the damage amounted individually to less than £100,000. Excluding the exceptionally costly years 1919–20 it will be seen, therefore, that the total cost of all the fires in Great Britain and Ireland may be calculated at something like £10,000,000. These figures are small in comparison with the cost of the fires in North America, in which the British insurance companies transact a large volume of business. The losses in the United States vary very much from year to year, since losses, when they occur, are usually extremely costly. In 1922, for instance, the total cost was estimated at about £80,000,000.

Losses from Earthquakes.—There have been no other losses comparable with those caused by the earthquake at San Francisco in 1906. The British offices settled all claims made upon them promptly, in full. On Sept. 1 1924 there occurred the great earthquake in Japan. The British and American insurance companies had, however, been careful specifically to exclude the risk of earthquake from the terms of the insurance. It was generally held that, with such a definite exclusion, they could not pay claims for damage for which they were in no way liable. In order, however, to show practical sympathy with the Japanese people, the British companies offered to return all premiums for the year which had been paid in respect of property damaged or destroyed. The American offices also intimated their readiness further to return the premiums paid, and the attitude of the insurance companies was known to have created a favourable impression in Japan. Claims were also made in respect of the damage caused by a great fire at Smyrna in Sept. 1922, during a war between Turkey and Greece. Insurance companies maintained that the fire was a direct outcome of war, the risks of which had been definitely excluded from the policies covering property in the city. Their attitude was upheld in the courts.

Insurance managers have pointed out that claims are frequently paid in respect of damage for which they are not actually liable. By inadvertence, some fact may have been omitted from the proposal form, and insurance companies, instead of standing on their rights, have been ready to settle claims. In the case of damage directly caused by earthquake and war, an essential principle was involved which, it was declared, they could not throw to the winds in justice to the rest of the assured and to their shareholders.

The increase in the size of buildings has meant a great increase in the values at risk in limited areas, and losses in respect of commodities stored in warehouses now amount to very large figures. As an example, a fire in a tobacco warehouse in the Port of London in April 1923 amounted to as much as £1,050,000. The risk of damage caused by civil disturbance, which has been apparent in various countries since 1911, has induced the insurance companies to make the fact clear that such damage is not covered by the terms of the ordinary fire insurance policy. The risk may usually be covered for a small extra premium, and many commercial enterprises now take the precaution of specially effecting such insurance. When there are no exceptional circumstances rendering the risk unusually hazardous it is accepted for a nominal rate. In cases, however, in which the risk has seemed to be a quite serious one, high rates have at times been paid. The London market is the principal centre for the acceptance of such risks, and business has from time to time been transacted there in respect of most countries.

Marine Insurance

In the years immediately preceding the World War there was a demand for the insurance of ships and cargoes against war perils. The insurance was granted as a rule at nominal rates, but the existence of the demand was indicative of the uneasiness which prevailed. Happily for the maintenance of British commerce, a government scheme had been prepared in advance, since it had been realised that, unless the resources of the nation were behind British shipping, vessels would, on the outbreak of hostilities, remain in port or would immediately take shelter there and overseas commerce would have been brought to a standstill. When war broke out, schemes were immediately brought into operation. That designed to cover vessels was worked through the instrumentality of the mutual shipping clubs, and provided that, in return for a premium, the Government should assume the greater part of the risk. For the purpose of accepting the war risk on cargoes a government office was established in the city of London under the auspices of the Board of Trade and with the active assistance of leading underwriters.

At the same time, underwriters at Lloyds and of the insurance companies themselves wrote risks, with the result that the lesser risks were accepted by underwriters at rates below those quoted by the government office, which was thus called upon to assume the more serious risks. Underwriters also granted war insurance in respect of many neutral ships and their cargoes to which the British Govt. scheme did not apply. The maintenance of the government schemes was, however, of great value, especially at times when losses due to the submarine warfare were very heavy. But for the fact that the government scheme was available for the acceptance of the war risk, in respect of cargoes in British ships, the rates of premium quoted in the open market must at times have risen to very high, if not prohibitive, levels. A substantial surplus was realised on account of the government cargo insurance scheme.

Missing Ships.—One difficulty which had to be taken into account was that a large number of ships became missing, and that it was not always easy to decide if these had been lost though direct war perils, or if their loss had been due to the risks of navigation, especially as some of the usual aids had been withdrawn. This question was carefully considered by a committee representative of shipping and underwriting, and it was agreed that, in the event of vessels becoming missing, there should be arbitration. The underlying idea was that an arbitrator, after hearing such evidence as was possible, could form an opinion as to the probable loss of the vessels, whereas if the question had been taken into court the proceedings might have been long and costly and no better decision could have been expected. In some cases the loss was apportioned by the arbitrator in such proportions, as seemed reasonable, among the war-risk and marine-risk underwriters.

Underwriting.—In spite of the War, or rather because of it, large underwriting profits were made in the London market during the period of hostilities and immediately after it. Underwriters took great risks in which they were, as events showed, justified. The remarkable rises in the values of ships and commodities meant that premium incomes were very much augmented, and many companies, new and old, were attracted to the business. Two years after the cessation of hostilities there was a marked reaction. With the sharp decline in the values of

tonnage and commodities the amount of insurance business likewise declined. In view, especially, of the great increase in the size of the market, there was not enough insurance to feed it, particularly as underwriters had become accustomed to assuming far larger lines than they had been used to write before the War. Severe depression set in, and various attempts were made, extending into 1926, to try to obtain some stiffening of rates.

An extraordinary feature of marine underwriting in recent years has been the extended period over which claims have been presented. Before the War it was considered that an account could, for practical purposes, be considered as closed at the end of the third year. There might then be still a few claims unsettled, but the total of these would not be of sufficient magnitude to disturb the main results of the underwriting as then disclosed. After the War no such calculations could be made, and it is now common for claims to be presented for any of the years up to 10 after which the insurance was written. There were special reasons for such delays during, and immediately after, the war period, when tonnage was in keen demand. Any repairs that could be postponed were deferred for as long as possible, especially as the repairing yards were fully occupied with work.

Miscellaneous

Workmen's Compensation.—Important recommendations respecting the system of compensation for injuries to workmen in the United Kingdom were made by a departmental committee appointed by the Home Secretary in May 1919, which reported in July 1920. The committee was presided over by Mr. Holman Gregory, K.C., M.P., and included representatives of the workers and of insurance companies. The committee, after a thorough examination of the subject, found that there were certain defects in the system then obtaining, but were of opinion that these defects could be remedied, largely without resort to a state system of insurance, although not without the introduction of a certain measure of state control. They proposed that, in future, definite percentages of the premium income should be expended in benefits to injured workmen or their dependents and that the remainder should be available for the management expenses or profits of the companies, and the payment of commission to agents, the latter not to exceed 5% of the premium income in any case. They calculated that there would thus be saved on the then cost to employers a sum of between £1,250,000 and £1,500,000 a year, which, under the existing organisation, would be paid away in expenses of management, commission and profits.

In order to provide against the risk to the workmen of uninsured employers proving unable to meet the obligations placed on them by the Act, it was proposed that every employer other than the Crown, a local or public authority, a statutory company or a householder in respect of servants not employed by him for the purpose of his trade or business, should be required to insure against the workmen's compensation risk. Employers with an annual wage-roll exceeding £20,000 were to be entitled to claim exemption from compulsory insurance upon compliances with prescribed conditions. Householders were excluded from the provision of compulsory insurance because, as the risk of accidents to domestic servants is small, the premium charged by insurance companies is more or less nominal, and also because it was considered that the cost and difficulty of enforcement would be out of all proportion to the numbers of persons involved. The committee was informed that a large proportion of householders already insured, and they believed that when the proposed increased liabilities were effective, few would be so unwise as to fail to cover their risk by insurance. Up to the end of 1925 no legislative action had been taken on these recommendations.

Motor-Car Insurance.—The general insurance department of a composite company includes miscellaneous forms of insurance, among the chief of which is motor-car insurance. During the World War comparatively little was done in this type of business. In 1919–20, when private cars again came into use, the insurance experience was very unsatisfactory. Costs of repairs were on a high scale, and there was an epidemic of thefts. For 1920 some of the leading companies reported substantial losses. Early in 1921 rates of premium were advanced, and since then the business has, on the whole, been transacted on a fairly profitable basis.

Credit Insurance.—Of recent years notable developments have taken place in the insurance of bad debts in British oversea trade. This business has for many years been successfully transacted by the Trade Indemnity Co., in which the great composite insurance companies have taken a financial interest. In 1925, on the initiative of Mr. A. M. Samuel, M.P., then head of the Overseas Trade Dept. a committee of bankers, financiers and business men was set up in order to investigate the advantages that might be secured from a further extension of insurance facilities for this purpose. This committee, whose report was issued in the spring of 1926, made certain recommendations with a view to a further development of this type of business. (C. Ma.)

II. THE UNITED STATES

The business of insurance, with its basic element of mutu assistance, has shown a progress in the past 15 years both volume and ramification unsurpassed by that of any oth industry. In the United States as in no other country has i surance in all its various phases become universally recognised a an essential of commerce and industry. To this fact may b attributed in large measure the achievements of America i business enterprises. Insurance coverages permit men an corporations to hazard their resources on new development without fear of loss from natural and unavoidable catastrophe The importance of insurance as a national factor may b visualised by the fact that at the end of 1925 the combine companies had a premium income of $4,000,000,000 with tota admitted assets of over $14,000,000,000.

Life Insurance.—The life insurance companies aim to suppl the demand for life insurance as best suits the wants of all classe and conditions of men. The old life insurance policy, while th business was in an experimental stage, was so loaded wit conditions and restrictions and so limited in its applications that comparatively few persons availed themselves of this pro tection; but recently numerous forms of policies have bee devised to suit the wants of all sorts of people, and the condition and restrictions have been eliminated to such an extent tha practically the only exaction remaining is that the person insure shall pay his premium. The last 15 years have been notably prolific in the invention and development of plans of life insurance. Ordinary life insurance, through its several classes o policies—whole life, limited payment, term and endowment—provides ample choice for the selection of a form of protection best suited to the needs, financial resources and saving abilities of all classes from the average wage-earner to the multi-millionaire. The great industrial insurance companies, with their weekly payment contract, reach the homes of the working classes and enable them to provide for funeral benefits and against personal distress and dire want. Paramount among the recent innovations in life insurance is group insurance, through which industrial corporations collectively insure employees regardless of age or physical defect. The premium is lower than that which could be obtained through individual contracts, by reason of the overhead savings in insuring a large number under one policy. Other introductions include business and partnership insurance, disability, double indemnity benefits and monthly income insurance.

The comparative aggregates of the old line legal reserve companies are proof of life-insurance expansion. In 1910 the total life insurance in force was over $16,000,000,000 and the aggregate admitted assets totalled something short of $4,000,000,000. During 1910 the combined companies had a total premium income of about $600,000,000 and wrote during that year a trifle over $2,500,000,000 of new insurance. The totals for these companies for the year ending Dec. 31 1925, show that legal reserve life insurance companies had over $71,000,000,000 of insurance in force, including industrial business, and assets of over $11,600,000,000. The premium income was almost $2,500,000,000 and the new insurance written in 1925 was over $16,000,000,000. In a country with a population of 115,000,000 people, there were in 1926 practically 100,000,000 policies of life insurance in force, on what were estimated to be about 60,000,000 lives. So extensively has the idea of life insurance been sold in the United States that it is estimated that more than every other person in the country is insured.

Fire Insurance.—Because fire insurance has for years been recognised as an essential adjunct of industrial and commercial enterprise, its growth in the years since 1910 has not been, from a comparative standpoint, as spectacular as life, casualty or miscellaneous insurance. Nevertheless, its progress has kept pace with the industrial development of the country and has met the demands imposed upon it by the upheaval occasioned by the World War and the evolution of recent years and recent inventions. While in the period there was nothing in the nature of a catastrophe such as the conflagration and earthquake in

an Francisco in 1906, nevertheless losses were uniformly high nd consistent underwriting losses were incurred. In the period, 00, there were upward of 75 single fires in the United States aving property losses of over $2,000,000, and reaching as high 1 one instance as $35,000,000. The energy and resources of the re-insurance executives during the period have been directed long the lines of fire prevention and fire protection work. ire-insurance engineering experts are now consulted in every uilding operation, and there is no incorporated village or city hich has not taken cognisance of the fire hazard by the organ- ation of fire departments, by water systems and by the adoption f fire prevention and protection ordinances. Control of the hysical hazard, however, has been offset by the development of ie moral hazard to which a great part of the fire losses at the resent time may be attributed. The growth in resources and olume of the fire insurance business is indicated by a résumé f the total transactions of the companies. The figures show that ie assets of the companies totalled $550,000,000 in 1910, were ightly over $700,000,000 in 1915, over $1,000,000,000 in 1919, nd over $1,730,000,000 at the end of 1925. In 1910 the premium ncome of these companies was but $287,000,000. It had eached $353,000,000 by the end of 1915 and almost doubled self in the intervening four years, for during 1919 it was almost 700,000,000. Consistent progress during the succeeding years esulted in these companies showing a premium income in 1925 f $901,000,000. Modern industrial advancement has done uch to stimulate the growth of fire-insurance companies, while t the same time demanding a wider scope of indemnification. his has resulted in the undertaking of many additional lines f insurance by the fire-insurance companies, the principal of hich is motor-vehicle insurance. Other lines of insurance ransacted by fire companies include tornado, windstorm and yclone, hail, inland marine, sprinkler leakage, riot and civil ommotion, air-craft, explosion, earthquake, rain, crop, flood, ost and freeze, tourist baggage, parcel post, water damage, use nd occupancy, and registered mail. While the total premium olume from many of these lines is at the present time small, evertheless it indicates a comprehensiveness of service quite in eeping with the modern tendency to place upon insurance the urden of preventing economic or financial catastrophes from ny possible anticipated contingency.

Ocean Marine Insurance.—Ocean marine, which is the oldest nown form of insurance, reached a volume during the period of he World War never before approached. The demands placed pon insurance companies for marine coverages exhausted the esources of existing carriers, and induced the entry of most of he larger fire-insurance companies into this field. To supplement urther the demand during the War, there was organised a bureau f war risk insurance by the U.S. Treasury Department. This vas of inestimable assistance to American commerce, and pro- luced a premium volume during the period of its existence of bout $50,000,000, the bulk of which was obtained between Nov. 17 1916 and April 27 1918—almost $39,000,000. Ocean narine insurance, however, has not progressed in America with ther forms of insurance, because it is bound by national laws nd subject to national taxation, though it is an international usiness and in direct competition with international carriers, nrestricted by laws and not subject to the high taxation im- osed upon American carriers. The premium volume of Ameri- an companies for ocean marine insurance amounts to around 40,000,000 per year.

Casualty and Miscellaneous Insurance.—Casualty insurance is he latest development among the general classifications of nsurance prevailing in the United States. To a great extent it ypifies modern progress, and the bulk of its business is directly lue to modern economic and inventive conditions, workmen's ompensation and automobile liability insurance being the two eading classes in regard to premium volume. The forms of asualty and miscellaneous insurance cover accident; automobile ollision, property damage, and liability; bail bonds; bank leposits; burglary and theft; credit; check forgery; engine nd machinery; fidelity; flywheel; health; live stock; liability, public, elevator, employers, etc.; plate glass; property damage and collision; surety; steam boiler; sprinkler; title; workmen's collective and workmen's compensation. In 1910 casualty and miscellaneous insurance companies had total assets amounting to about $300,000,000, while their total premium receipts were $94,000,000, The leading classes of business were liability insurance, with premiums of $28,000,000; accident, with premiums of $23,000,000; fidelity and surety, $15,000,000; health, $6,000,000; plate glass, $3,500,000; burglary and theft, $2,500,000. In 1925 we find that companies offering the various forms of casualty insurance and miscellaneous insurance had over $1,700,000,000 of assets, while their premium volume was almost $650,000,000. In that year the leading classes of coverage were as follows: workmen's compensation, premium income, $130,- 000,000; automobile liability, $117,000,000; surety bonds, $56,000,000; liability (public, etc.), $47,000,000; accident, $45,000,000; automobile damage, $41,000,000; fidelity, $33,000- 000; burglary and theft, $28,000,000; health, $20,000,000; plate glass, $16,000,000. It is worth noting that the writings in two of the individual lines of casualty insurance in 1925 exceeded the total writings in all classes in 1910. (A. L. J. S.)

INSURANCE, SOCIAL (*see* 14.656).—Social insurance is the name given to the arrangements, whether provided by the state or private agencies, whether voluntary or compulsory, for paying a certain sum of money, or goods and services in kind, as compensation for the loss resulting from certain kinds of emergencies which in their nature lead to diminished capacity to earn or to an increase of expenditure. The object of all branches of social insurance is to protect the workman against the fact and fear of insecurity and its accompaniments—the exhaustion of savings, a lowered standard of living and recourse to public or private charity. This device gives him a legal right to a definite sum. The causes which may reduce the workman to want are of two kinds: those which are unexpected, catastrophic and undesired emergencies, and which entail a lowered capacity to earn or an inability to earn; and those which are desired and normal happenings, but entail an increase in expenditure even where the income has not diminished. In the former class should be included industrial accidents and occupational diseases, non-industrial accidents, ill health, invalidity, blindness and unemployment, burial, unprovided widowhood and unprovided orphanhood and, in the latter, old age, maternity and provision for growing children. In order to deal with these problems modern states have created new institutions, assumed control of existing machinery and provided subsidies, and their legislation on the subject constitutes in its totality a veritable code guaranteeing the workman a minimum of security in all his emergencies.

I. GENERAL INTRODUCTION

Origin of Social Insurance.—Social insurance began as a device employed voluntarily by workmen to protect themselves against

emergencies. Trade unions, friendly societies, employers' welfare funds and private insurance companies organised provision for the cost of burial, ill-health and unemployment, and settled the rates of contributions and of benefits. Germany, under Bismarck, was the first country to realise the value and necessity of the compulsory method of insurance against sickness, industrial accidents and old age, which was applied to practically the whole industrial population by the laws of 1883, 1884 and 1889. Great Britain was the first to experiment (in 1911) with a national compulsory system of unemployment insurance, and possesses the most comprehensive system of pensions for widows and orphans of any country in the world. The schemes first introduced in the Central and Western countries in Europe are now being copied by other countries, by the South American Republics and Japan.

Since the War new risks have been provided for in countries where before only one or two were recognised. Classes hitherto excluded from insurance legislation are being brought increasingly within its scope. Gradually the families of insured members are being recognised as standing in equal need of insurance with the breadwinner. Money and service benefits are being added to bring them up to an amount which will give the insured population a minimum sufficient to maintain them in efficiency.

A new factor which is likely to grow increasingly insistent is the effect of compulsory insurance on the costs of production and consequently on international competition. It is in the interest of countries like Great Britain and Germany, which spend heavy sums annually on social insurance, to press for the extension of similar activities in other countries. In 1924 Great Britain spent an aggregate of some £170,000,000 (contributed by employers, workers and the State) and Germany some £60,000,000 on the various branches of the social insurance systems. The International Labour organisation has adopted at its annual conferences a number of conventions and recommendations on unemployment insurance, maternity insurance and workmen's compensation, and the exhaustive studies made by its staff provide an armoury of information.

In Great Britain legislation in connection with provision against social risks, either by way of compulsory insurance, provision by the employer or regulation of voluntary insurance falls under the following heads: compensation for industrial accidents and industrial disease, old age pensions, sickness and invalidity insurance, maternity, unemployment, widows' and orphans' pensions, blind persons, family endowment (provision for children under the War Pensions and Unemployment Insurance Acts). Each of these is dealt with below.

Grea Britain may claim to have the most comprehensive system of social insurance in the world, but most industrial countries have adopted some schemes covering one or more risks. The two branches most highly developed in the United States of America are workmen's compensation and pensions for widows and orphans.

Basis of State Action.—Why does the State interfere in the matter of social insurance? From the days of the Elizabethan Poor Law the State has been the ultimate resort of those who are destitute. When all other means had failed those in distress, they could turn to their parish for relief, though this relief has generally been inadequate and granted only under deterrent conditions. Social insurance reduces the number of those who will become destitute.

Moreover, unless compulsion is applied, few will make adequate provision against these social emergencies. But to the community as a whole, assuming no change in our habits, these risks are unavoidable, and it is now regarded as the business of the State to contrive that they shall be provided for. Even the individual who is fully conscious of the dangers he runs will frequently be unable to make adequate provision, and therefore Parliament may decide that the immediate costs should be borne by the employer or by the State itself. Another consideration has been slowly emerging. Only Parliament can decide that large bodies of people shall be compulsorily insured. When it has gone so far it cannot allow private organisations to administer the insurance badly or at too great a cost. Since the administration is extremely simple, once the actuary has worked out costs in relation to benefits, there is everywhere a tendency for social insurance to be organised through State monopolised funds. Behind all these arguments of a practical nature lies the consideration that every worker is an asset to the State, and the community as well as the individual suffers when his health or efficiency is impaired.

Limits of Social Insurance.—Many of the older advocates of social insurance are beginning to be nervous about its colossal growth, and complaints are frequently made of the heavy burden which it imposes on the nation. It is misleading, however, to lump together, as some critics do, aggregate expenditures on pensions, health and unemployment insurance, workmen's compensation and burial insurance premiums, and bring out a grand total of some two or three hundred million pounds which is called "national expenditure." It is not national expenditure in the sense that it is all provided by the Exchequer. On workmen's compensation and burial insurance the State pays nothing. And its contributions in respect of the three compulsory insurance schemes are, of course, only a fraction, even if a substantial fraction, of the total cost.

The following tables show the respective shares of the workers, the employer and the State in Great Britain.

Health, Widows and Orphans and Old Age Contributory Pensions
(weekly contributions)

	Worker	Employer
Men	9d.	9d.
Women	6d.	7d.

State contribution (*a*) Health: two-ninths of the total cost of benefits (payable on disbursement). (*b*) Pensions: £4,000,000 a year. (There will be a slowly rising *additional* cost to the Exchequer in respect of old age pensions at 70, equal to £1,700,000 in 1926–7 and £4,700,000 in 1935–6. At the same time there will be a relief to the Exchequer in respect of health and unemployment insurance. The *net* Exchequer charge on all these pensions will, it is estimated, be £5,700,000 in 1926–7, rising to £6,400,000 in 1935–6. The finance of the scheme is complicated; it will be found discussed in detail in the Government Actuary's Report on the Financial Provisions of the Widows', etc., Pensions Bill, Cmd. 1925.

Unemployment
(weekly contributions)

	Worker	Employer	State
Men	7d.	8d.	8d.
Women	6d.	7d.	6d.
Boys (16–18) . . .	3½d.	4d.	4⅝d.
Girls (16–18) . .	3d.	3½d.	4⅜d.

Moreover, it is plain that if the State were not paying these millions which have been reduced by the Economy Act of 1926 into the insurance funds, it would be forced to pay as much, or perhaps even more, in other ways—*e.g.*, in supporting a public health service, in various palliations of unemployment, in extra Poor Law relief, or some similar form of public assistance. State-aided insurance, in short, is judged to be true economy. So it is that we find extensions and improvements being advocated in all directions. The paradox of social insurance, indeed, is its steady growth in spite of constant attacks upon it and the lack of any visible widespread enthusiasm for it.

Unification.—Parallel with the movement for the extension of social insurance there is a movement for its unification. At present all the emergencies are treated by different administrative machinery, with different methods for raising funds and different rates of contributions. Since the objects underlying all these schemes are broadly the same, the prevention of destitution, the abolition of the fear of insecurity and the provision of a minimum in all periods of need, it is undesirable that these variations should continue. Moreover, the workman, the insured person, wishes to be spared the trouble of dealing with a host of organisations. However the present medley has been brought about, it is surely desirable that all these different schemes should be unified. And unification must be taken to

mean not merely the correlating, co-ordinating or riveting together of all the schemes, but their complete amalgamation in respect of finance, administration and underlying principles.

The advantages claimed for a unified scheme are:—

(1) The problem of social emergencies will stand out prominently and steps for prevention will thus be encouraged.

(2) Administrative expenses would be very much less and insurance could be provided cheaply. The benefits given for the same premiums will consequently be higher.

(3) The workman dealing with one body will be more likely to know his rights and how to claim them.

(4) Existing anomalies, such as death by industrial accident receiving different treatment from death through a non-industrial accident, or natural causes, will be abolished.

(5) A department of state will be better able to tackle the whole problem than the variety of agencies that now are at work. Improvements will be carried out more easily, investigations will not be hampered by private interests.

No doubt such a department of state would be a huge affair. Nor would the change over from the present system be easy. Vested interests and inter-departmental jealousies would have to be overcome, and the machinery for dealing with every insured workman greatly extended and improved. But that is the direction in which social insurance is tending, and not only in Great Britain. In some of the more important recent codes of social insurance, those of Russia and Czechoslovakia, sickness, old age, invalidity and death are treated in unified schemes. The proposed French and Australian schemes are also very comprehensive. The unification of social insurance is also being debated in Germany.

II. WORKMEN'S COMPENSATION

In Great Britain the Employers' Liability Acts of 1880 and the Workmen's Compensation Acts of 1897, 1906 and 1923 constitute the legislative basis for providing compensation to workpeople who suffer "personal injury by accident arising out of and in the course of employment," or in consequence of one of the industrial diseases brought specifically under the Act of 1923. In the Act of 1880 negligence had to be proved against the employer. But in the Act of 1897 employers were held to be responsible for injuries arising out of work in their establishments, even when negligence could not be proved, on the ground that the workman was unable to bear unaided the monetary loss which injuries involved. In 1906 the scope of workmen's compensation was greatly increased. In the Workman's Compensation Acts the individual employer is alone held to be responsible for paying compensation, and neither the worker nor the State makes any contribution towards the cost. It is still open to the employer to choose whether he will insure himself in some private insurance company against the risk of having to meet compensation claims, or pay them himself.

The number of workpeople who obtain some measure of protection is estimated at over 17,000,000, but the statistics of its working relate only to some 8,000,000, to those employed in: shipping, factories (to which the Factory and Workshop Acts apply), docks (including wharves, quays, etc.), mines, quarries, constructional work (not including building construction) and railways.

Rates of Compensation.—The rates of compensation laid down by the Act of 1923 are broadly: for partial incapacity, a sum equal to half the difference between the man's earnings before and after the accident; for total incapacity, half-wages up to a maximum of 30s. a week. Compensation is payable from the fourth day of incapacity. Where, however, the incapacity lasts for four weeks, the first three days also rank for compensation. Thus in addition to the loss of at least half his wages the workman in most cases suffers the loss of the waiting period, the cost of doctors, medicines, artificial limbs, etc., the cost of training for a new job; and in all cases where disputes arise he is liable to meet the costs of litigation. Although in theory the employer is liable to bear the total costs of an accident, in practice it is doubtful whether much more than a third of its financial burden is placed upon him, the workman bearing still about two-thirds of the loss.

In fatal cases a sum of between £200 and £300 is paid to the widow, which may be raised by additional allowances for children up to a maximum of £600. It should be observed that whilst some provision is made for dependents in the case of fatal industrial accidents, no provision is made for their needs in the case of non-fatal accidents.

The Home Office has estimated that the total of the charges and expenses for workmen's compensation in the seven great industries was not less than £5,000,000 in 1913 and 1914, £6,000,000 in 1919, £8,500,000 in 1920, 1921 and 1922, £9,000,000 in 1923. But these figures relate only, as we have seen, to about half the industrial population. Assuming that the accident rate in the other occupations is only half what it is in the seven great industries, then in 1923 the cost of workmen's compensation to employers must have been about £13,500,000. Since, however, the workman is still made to bear between one-half and two-thirds of the loss resulting from an accident, it has been estimated that the annual loss due to industrial accidents and diseases amounts to between £30,000,000 and £40,000,000 per annum.

The administrative expense in the case of workmen's compensation has for many years been about 50% of the premium income. The Holman Gregory Departmental Committee reported in 1919 that "During the last five or six years the employers have had to pay £100 in premiums for every £48 paid out in benefits to insured workmen." The companies agreed in 1923 to confine administrative expenses to within 40% of the premiums they received, with a further reduction to 37½% at the beginning of 1927.

Although employers generally insure themselves against the risk of being called upon to pay workmen's compensation, they are not bound to do so, and very frequently the smaller employers fail to make any such provision. Cases thus arise where the workman is obliged to take less than he is entitled to by law. It has therefore been proposed that employers should be compelled to insure, so that the workers may be certain of receiving compensation.

Over 30 diseases have now been scheduled as being due specifically to various industries and in respect of which compensation is provided. But in the many kinds of industrial diseases which may also arise apart from the employment—*e.g.*, bronchitis in cotton workers—no compensation under the Act is provided. This system is also criticised as involving frequent litigation and delay in payment. Moreover, agents are alleged frequently to induce injured workmen to take smaller amounts than their due. Insurance companies, as often as they can, induce the workman to accept a lump sum, since in spite of their heavy cost of administration they have only clumsy machinery for making weekly payments and for the review of benefits as the children grow older or die. Lump sum payments very frequently mean the rapid dissipation of benefits.

Neglect of Preventive Measures.—Perhaps the most serious fault is the neglect of preventive measures. There is little evidence of a steady and significant decline in the number of industrial accidents, of which about 400,000 occur annually. The neglect of the well-known and tried devices of the "Safety First" Association, with their educational influence on the workpeople, both by employers and by the insurance companies, is a glaring piece of carelessness. Second only to this in importance is the scant attention paid to the rehabilitation of injured workmen.

It has been suggested that a Government fund for insuring employers against the liability to pay compensation could be run at a much lower administrative cost than private insurance. In the United States competitive funds have an administrative expense of 6 to 9%. Another suggestion is the linking up of workmen's compensation with health insurance and the scheme for widows' and orphans' pensions. This might be desirable in itself, but would necessitate compulsory insurance in a state scheme. It would indeed involve altering the whole basis of the present law. The device of workmen's compensation has been so widely adopted that the International Labour Organisation was able to adopt a convention on this subject at its conference in 1925.

III. PENSIONS

Old Age Pensions.—Old age pensions were first granted in Great Britain by the Act of 1908. This Act, which was amended in some particulars by the Acts of 1911, 1919 and 1924, provided for the payment of pensions to all persons who had reached

70 years of age, who had been British subjects for at least 10 years or if natural British subjects had resided in the United Kingdom for a period of not less than 12 years since attaining the age of 50.

The amount of the pension was to be adjusted to the means of applicants. They must be below a certain standard before they could claim, and the pension was in no case to exceed 10s. a week. The scheme was non-contributory in character, and the entire cost of the pensions and of the administration was defrayed out of national taxation. Under the existing Acts, the application for a pension must be made, in the first place, at the local post office on a "claim to pension" form. The local excise officers appointed under the Acts by the Treasury to be pension officers report on the means of the applicant; the pension committee decide on the validity of the report and the rate of pension. The claimant or pension officer, if dissatisfied with the decision, may appeal to the Minister of Health within seven days of receipt of the notice of the committee's decision. If the claim is allowed the applicant obtains his weekly pension at the local post office.

The Old Age Pension Act of 1908 was the first Act to provide permanent public assistance outside the Poor Law. Its advocates argued that even if the workman could save enough to provide for ill health or unemployment he could not be expected to save enough to provide both for himself and his wife after 70. The scheme adopted bore signs of its origin in the older system. The pension is granted only to those who are not, it is true, destitute, but necessitous. No one is eligible who has an income of £50 a year or over. The amount of the pension varies directly with the need of the applicant. The poverty qualification infringes the idea of social insurance, the essence of which is to grant a legal right to a definite sum. The pensions scheme, it is true, does this, but grudgingly and on conditions which savour of the Poor Law. It involves vexatious inquiries; it discourages thrift and the aid of relatives; it is unjust. On the other hand, it is the first branch of social insurance in which the State intervened directly. Its inquisitorial character was inevitable in a non-contributory scheme.

In 1910, the first full year of the working of the old age pension scheme, the cost was £8,468,128. In 1924 it amounted to £24,000,000. In 1965 the Government actuary estimates that the same scheme will cost more than double that amount, some £57,000,000. This is attributed to two causes, the growth in the annual number of births between 1850 and 1890 and the decline in the death rate. The cost of granting universal old age pensions without tests or a means limit would be an additional £14,000,000 a year, rising to about £19,000,000 in twenty years. The total net cost of administration of the scheme, covering the expenses of the pensions committee, was estimated for the year 1924 at £800,000. This constitutes an administrative expense of 3⅓%.

The operation of the old age pensions scheme revealed an appalling mass of poverty among those over 70, and it was known that the lot of those between 65 and 70 was little better. The Act of 1925 introduced contributory old age pensions at 65, and also abolished the means disqualification for those insured. This Act, however, allows the non-contributory pension at 70 to continue until it is slowly absorbed by the contributory insurance scheme.

Non-contributory old age pension schemes exist in:—

(1) Australia, Denmark, France, Great Britain, the Irish Free State, New Zealand, Norway, in certain of the United States and Uruguay.

(2) Contributory pension schemes have been introduced in Rumania, Spain, Switzerland, Belgium, Italy, the Netherlands, the Serb-Croat-Slovene kingdom, Bulgaria, Czechoslovakia, and recently in Great Britain.

The Act of 1891 passed by Denmark for assisting the aged has thus been the forerunner of the modern schemes of old age pensions and insurance which have now been adopted in most industrial countries.

Old age is assumed to occur at some stated age which varies from 50 to 70 years according to the country.

Pensions for the Blind.—In Great Britain the Blind Act of 1920 provided that all blind persons of the age of 50 or over should be granted pensions at the same rates and on the same conditions as those applying to persons of 70 and over. The local authorities are empowered to make provisions for the blind—such as the establishment of workshops, assistance to homeworkers, home teaching and assistance in book production—out of the public funds. Such provision is aided by a state grant.

Widows' and Orphans' Pensions.—The contributory Old Age and Widows and Orphans Act 1925 marked a new development in social insurance in Great Britain. Two methods are open to a Government for making provision for widows and orphans, that of compulsory contributory insurance, or as it is termed in Great Britain, contributory pensions, or that of non-contributory pensions.

From January 1926 widows have received a pension of 10s. a week, together with 5s. for the first child under 14, or under 16 if the child is still attending school, and 3s. for each of the others. This scheme has been linked with one for providing old age pensions of 10s. a week at 65 instead of 70 to all insured men and women without inquiry into their means. Both these schemes are joined to the existing scheme of contributory health insurance and the non-contributory old age pensions. It has been estimated that the benefits accruing to an insured man and his dependents under the Act are roughly equal in value to an endowment assurance for £200 payable at death or at the age of sixty-five.

But instead of being entitled to an old age pension, if his income was very restricted, at the age of 70, he will under the new scheme be able to draw his weekly pension of 10s. for the rest of his life on reaching the age of 65, whatever other sources he may possess and whether he gives up work or not. His wife will also be entitled to a pension at sixty-five.

The new scheme provides also that on his death—at whatever age—his widow will receive a weekly pension of 10s. until her death, unless she marries again; if he leaves children at school under the age of 16, his widow will be entitled to draw 5s. a week for the eldest and 3s. a week for each of the others; and if the children are motherless as well as fatherless payments will be made in respect of them until they reach the age of 14, at the rates of 7s. 6d. a week for the eldest child of a family and 6s. a week for each of the other children.

The pension age, it should be observed, is reduced only in the case of those who are insured, and it is only in their case that the existing means disqualification is to be removed. Those who have not been insured as workers remain under the existing system. The costs of health insurance may be expected to be lessened by the scheme, because many workers who will be drawing their old age pensions at 65 will no longer be entitled to their invalidity benefits. Under the Economy Act 1926 the Government lessened, therefore, the state contribution to health insurance.

The first full year in which old age pensions at 65 will be paid will be 1928–9, when the costs will be £12,400,000, from which they will steadily rise up to the maximum in 1965–6, when they will amount to £21,500,000. In that year the total cost of old age pensions will be £85,900,000. In the first complete year (1926–7) the cost of widows' and orphans' pensions will be nearly £11,000,000, and the amount will rise steadily until 1965–6, when it will be £38,800,000. In that year the total payment on account of old age pensions and widows' and orphans' pensions will be £125,000,000.

For many years to come the old age pensions scheme is to be a growing liability and the war pensions scheme a dwindling one. In 1926 these two services cost about £94,000,000. In forty years they will cost about £90,000,000. After that the state grants out of taxes grow less until, as the percentage of those who come in after 1956 increases, the Government will be called on to pay less and less, and its liability will gradually dwindle to nothing.

The contributions to be paid by the insured persons are 4½d. a week by a man and 2d. by a woman, while the man's employer also pays 4½d. and the woman's 2½d. The State also contributes its share under the new scheme.

As regards the administration of the scheme, contributions are collected in the same way as in the case of health insurance. In fact, the health and pensions contributions are combined, and the same stamp and the same card serve for both. The approved societies issue the certificates showing that a person is entitled to benefits, but the actual payment is made by the post office. It is calculated that the administrative expense will be no more than 2% of the contributions.

Germany, Czechoslovakia, Italy and Holland have very inadequate schemes on a contributory basis. New Zealand, most of the states of North America and Canada have adopted non-contributory schemes of pensions for widows and orphans.

IV. INDUSTRIAL INSURANCE

Abuses of the Unreformed System.—By industrial life assurance or burial insurance the working classes obtain benefits sufficient to cover the cost of burial. This form of insurance is common in Great Britain because of a very deep and wide

pread terror of a pauper's funeral. Between 1903 and 1924 the mount spent by the workers on this branch of insurance ncreased by about 400 per cent. The great success of the in-ustrial insurance companies is due to the army of some 70,000 gents employed by them to collect weekly the small premiums. Burial insurance is brought by them to the worker's home in uch a form and at such a price that he can provide for it out of is small earnings. Indeed, the agents have been able to per-uade many working class families, and especially the mothers, o take out one or more policies for each member of the house-old, so that it is a common thing for a workman to spend etween 1s. and 2s. a week for this branch of insurance. It has een claimed that "there is scarcely a home among the millions f the working classes in this country which is not visited at east once a week by these agents." In 1921 it was stated hat there were over 50,000,000 "industrial policies" in force, or which £35,000,000 was paid annually in premiums. To this hould be added the interest on invested capital. It is estimated hat expenditure for "death" benefits is equal to about twice r three times the amount spent on health, maternity, and dis-blement taken together.

This business has been subjected to very strong criticism. A epartmental committee, presided over by Lord Parmoor, eported in 1920. It was found that some 44% of the premiums ent in agency and management charges, proving that this nethod was needlessly costly. Excessive house-to-house can-assing led to considerable overlapping and wasteful competition. he persistence of the agents led to the purchase of policies by ersons who could not afford to pay for them, with the result hat some 5,000,000 policies lapsed annually. There had been ailures and scandals and the system was full of abuses.

Three policies were proposed for dealing with the situation:—

(1) To nationalise the business and to provide burial benefits *ompulsorily* under the national insurance scheme.

(2) To control it, to remove the more flagrant abuses, and to imit the joint charges of administration and profits.

(3) To control it, but to leave the insurance companies to remove he main causes of complaint themselves.

he Parmoor committee recommended this third policy, which vas in effect adopted by Parliament.

Statutory Regulation.—The Industrial Assurance Act 1923, he outcome of the report, made the Chief Registrar of Friendly ocieties the industrial assurance commissioner, with wide owers, and every office, whatever its constitution, which ransacts industrial assurance business is now required to make eturns to him. The companies are required to make an addi-ional deposit of £20,000 in respect of industrial assurance usiness, and the collecting societies have to make a similar leposit.

The accounts of the industrial assurance business must be kept eparate from other branches of insurance business. The commis-ioner has power to examine into and report upon the affairs of any ompany or collecting society where an offence has been committed r in his opinion is likely to be committed. Every office transacting his business had to have a valuation made by an actuary not later han the end of 1925, and where a deficiency was disclosed the com-missioner might present a petition for winding up the company. Attempts are being made to lower the administrative expenses in our ways. The "block system" of canvassing for business, by which a definite area or number of blocks of houses is assigned to one gent, is being substituted for the anarchic method which allowed every agent to canvass where he would. Companies will still com-pete with one another, but not the agents of the same company. There is also an increasing tendency to pay agents by salary rather han by commission. This will give the company greater control, nd encourage sounder methods of obtaining clients. In the third place, efforts are made to induce regularly employed people to pay premiums monthly. Fourthly, higher premiums are canvassed for n order to lower the proportion of administrative expense. One company working along these lines has reduced the expense from 40% to something below 30% in a few years. But we are warned that from even this company we must expect no reduction of the rate of administrative expenditure to premiums below 20%.

There are strong arguments against allowing the business to remain voluntary. The present method, apart from incidental abuses, is open to objection on the ground of its wasteful administra-tion and the undesirability of continuing the voluntary method when the compulsory is adopted in related branches of insurance. Now that we have a system of life insurance endowment policies in the widows' pension scheme, it is contended that it is absurd to omit life insurance burial policies.

Many countries grant this additional benefit in conjunction with their health insurance schemes, an arrangement which keeps administrative expenses low. The State can administer this benefit at an expense below 2% of the premium income.

V. HEALTH INSURANCE

The National Insurance Act of 1911 constituted in many respects a new departure in British social policy. Workmen's compensation was already in operation, but the judicial justification of the new scheme was entirely different, whilst the state was, and still is, very little concerned in its actual administration. The Old Age Pension Act might be regarded as the offspring of the old ideas of Poor Law, and it was very easy to administer. The device now introduced of contributory insurance conveying a legal right to a definite amount was unknown previously in Great Britain. The Act of 1911 was in fact a novel experiment, both as regards the health insurance and the unemployment insurance sections.

Health Insurance.—The National Insurance Act 1911, Part I., makes provision for insurance against loss of health and for the prevention and cure of sickness. It is compulsory on all manual workers between the ages of 16 and 70 and non-manual workers with incomes under £250 who have not claimed the right of exemption. Over 15,000,000 persons are included. The normal benefits provided under the scheme include:—

(1) The payment of a weekly benefit of 15s. for men and of 12s. for women for not more than 26 weeks as sick benefit.

(2) A disablement benefit after the 26th week of 7s. 6d. per week so long as the beneficiary is incapable of work.

(3) A maternity benefit of 40s. to the wife of an insured man, which is raised to £4 when she is herself an insured person.

(4) Provision for medical benefits. This medical benefit consists of such medical treatment as can consistently with the best interests of the patient be properly undertaken by a general practitioner of the usual professional skill. It also includes the provision of medicines and of such medical and surgical appliances as are approved by the regulations issued by the supervising body, the Ministry of Health.

The employer is responsible for the payment of the joint contribution for himself and for the employee, which since January 1926 is 9d. for each employed man and 8½d. for each employed woman, but he deducts 4½d. in the former case and 4d. in the latter case from their wages. But, as shown above, the contributions in respect of pensions are now combined with these, and the actual value of the weekly stamp affixed by the employer is 1s. 6d. for men, and 1s. 1d. for women. The purchase money of the stamps, which are obtained from the post office, is paid into the National Health Insurance Fund. The State adds two-ninths of the cost of the scheme. The benefits are determined actuarially on the basis of the contributions from the employers, the workers and the State.

The administration of the scheme is carried out by approved societies and insurance committees. Approved societies consist of trade unions and friendly societies, collecting societies and special branches of insurance companies, which are to be "recognised" if they are democratically controlled and non-profit making. The medical benefits are administered by the insurance committees. These consist of local bodies representing the interests concerned, the insured persons, the doctors and the Ministry of Health. Deposit contributors, of whom there are about 250,000 are persons unwilling or unable to become members of approved societies. They are entitled to benefits up to the amount of the contributions paid in respect of them. Unlike ordinary members, they cannot draw more than that amount if their illness continues.

Most approved societies have attracted the majority of their members from particular trades. In consequence some have a high sickness rate and some a low one. The latter are in a position to give additional benefits above the normal benefits; the former suffer from deficits even when they give only the normal benefits. This system involves a certain amount of unfairness, to counterbalance which four devices for securing some measure of equalisation have been introduced:—

(1) The system of "reserve values" to allow for the age distribution of members.

(2) The contingencies fund to guard against the probability of an excess of liabilities, or deficiency on valuation of a society due to expenditure for benefit being in excess of the expected.

(3) The central fund to guard against the probability of a deficiency on valuation caused by abnormal rates of sickness due to the nature of the occupation of the members or the environment in which they live, or an epidemic such as influenza, or some other cause beyond the control of the society.

(4) The women's equalisation fund to meet the fact that women, especially married women, have a high rate of disability, principally on account of child-bearing. This fund was withdrawn and a sum added to their reserve value in its place.

In spite of these funds, the benefits obtained by clerks and agricultural labourers are very much higher than those obtained by miners, and it has been suggested that the whole of the Government grant of two-ninths should be used to guarantee all insured members the same benefits.

Proposed Amendments.—A royal commission was appointed in July 1924 to inquire into the scheme of national health insurance, and to recommend any alterations or improvements that might seem desirable. It reported early in 1926. Two reports were issued, both recommending changes and extensions, but, the minority being a good deal bolder than the majority. There was general agreement on the fundamental soundness of the system, on the need for a considerable extension of benefits, and on abolishing the insurance committees and transferring their functions to the local health authorities. The extension of benefits advocated by the majority is, however, to be made only "as and when funds are available to meet the cost." The minority report, on the other hand, rejects this proviso, and makes definite recommendations in favour of an all round extension of benefits, and especially for (a) the provision of medical treatment and attendance for children of school leaving age and for the dependents of insurance; (b) extended provision for child-bearing women before, at and after confinement; and (c) increase of the rates of cash benefit paid under the Health Insurance Acts to the present rates under the Unemployment Insurance Acts—*i.e.*, 18s. a week for men and 15s. for women.

Furthermore, the minority recommended the abolition of the approved societies system. The approved societies, they hold, are a failure. They are not democratically controlled, they are uneconomical, and they are "a hindrance to the development of a complete public health policy." The local authorities, therefore, should take their place.

Compulsory health insurance schemes are to be found in many European countries, including Germany, Austria, Bulgaria, Czechoslovakia, Great Britain, Norway, Poland, Russia, Belgium and the Serb-Croat Slovene kingdom. All the States in Australia have introduced non-contributory maternity grants. Japan introduced a scheme of health insurance in 1922, and Chile in 1924. In Poland, Russia and the Serb-Croat Slovene kingdom the territorial fund has in effect a monopoly of insurance. In Germany, Austria and Czechoslovakia the territorial fund is the leading but not the sole insurance institution. In some countries, *e.g.*, Germany, Rumania and Bulgaria, survivors' insurance, consisting as a rule of both burial benefits and pensions for their dependents, is attached to the various health insurance schemes.

Unemployment Insurance.—Great Britain was the first country to introduce a system of compulsory unemployment insurance. The National Insurance Act 1911 (Part II.), as a first instalment, made provision for insurance against unemployment in certain selected trades. The scheme was extended to include additional groups of workers by the Munition Workers Act of 1916. The Act of 1920 brought into insurance all persons of the age of 16 and upwards employed under a contract of service, excepting domestic servants, outworkers, agricultural workers and non-manual workers employed at a rate of remuneration exceeding £250 a year. Employees of local authorities, railways and certain other public utility undertakings, members of the police forces, and persons with rights under a statutory superannuation scheme may, in certain circumstances, be excepted.

As in the case of Health Insurance, the scheme is contri utory, and the stamp and book method is employed for collecti contributions. Every insured person is given an unemployme book, on which his employer fixes a stamp weekly for the amou to be paid in contributions in respect of himself and his employe the part of the contribution made on behalf of the workman i of course, withdrawn from his wages.

The rates of contribution, as revised in 1926, are, for men, 8 a week from the employer, 7d. from the employee and 8d. fro the State; for women, 7d. from the employer, 6d. from tl employee and 6d. from the State. These contributions a paid into the unemployment fund, out of which come all ben fits and administrative expenses connected with the scheme.

Rates and Conditions of Benefits.—The rates and conditions benefits laid down in the 1924 Act are that after three day unemployment, provided no suitable work is available, me receive a flat rate of 18s. a week and women 15s. a week, with a additional allowance of 5s. a week for a dependent wife husband, and 2s. a week for each dependent child. Under th Act of 1920 one week of benefit was payable in respect of ever six contributions, and not more than 26 weeks of benefit wer payable in one year.

Every insured person claiming unemployment benefit must lod his unemployment book at an Employment Exchange when makin a claim. If the insurance officer is satisfied that no work in his ow trade is available, and that the workman is bona-fide unemploye he will receive his benefit. A workman is regarded as unemployed f the purposes of the scheme when he is able-bodied, efficient an though willing to work in his own trade at the current rates of pay, unable to find employment because of lack of work. Benefits are n paid to those thrown out of employment through trade disputes. Th employment exchange system, with its lists of employers in search work-people and of workers in search of employment, together wit other sources of information available to the officer in charge, en ables him to judge of the bona fide of applicants for benefit. they are offered suitable employment and refuse it, the benef is withheld.

Courts of referees of employers and employees constitute a cou of appeal from an insurance officer. He in turn has an appe against them to an umpire.

The total number of insured work-people in Great Britain an Northern Ireland has grown to nearly 12,000,000 and the annua receipts of the unemployment fund at the present rate of con tributions are between £40,000,000 and £50,000,000 per annum. I 1922 the expenditure of the fund was over £58,000,000, and a deb to the Treasury was incurred, most of which has since been slowl repaid.

The extended scheme of 1926, including also the mass of indus trial workers (agricultural workers and domestic servants are ex cluded), was introduced on the eve of the trade depression, so tha reserve funds had not been accumulated to meet the great demands Rates of contributions and of benefits have been frequently changed the unemployment fund instead of being a creditor has become debtor of the Treasury. The administrative checks on applicant originally intended and the limitation of benefits have not been applied. In 1920 there was introduced the system of what was a first called "uncovenanted" benefit, and is now known as "ex tended" benefit. Extended benefit is benefit allowed to unemployed persons who have exhausted their "standard" benefit (*i.e.*, wha they are strictly entitled to in respect of their contributions); it i granted under certain conditions and at the discretion of the Ministe of Labour. This discretion was taken away in 1924 and extended benefit was made a right, subject only to the fulfilment of th statutory conditions; but it was restored by the Act of 1925.

All this has led to unemployment insurance being decried as "dole" system. But dole is clearly a misnomer for the standar benefit. And even as regards extended benefit, the expectatio always is that the recipient of it is one who had contributed to th fund, and who will in the future pay the premiums against the bene fit he has drawn in advance. It should be noted that the debt to th Treasury is not very large, and is certain to be repaid from the un employment fund as soon as the volume of unemployment dimin ishes. During a period of four years from the beginning of the de pression in 1920 workers' contributions were £62,000,000; those o employers £71,500,000, and of the State £46,000,000. Thus th Exchequer provided slightly over a quarter of the total amoun spent. Taking the whole duration of the scheme, the State has give and lent very little more than was originally intended by Parliament (The Economy Act of 1926 provided for a reduction of the Stat grant in respect of unemployment insurance.) Nor is it a fact tha the same people have remained unemployed all these four years An investigation made in 1924 into 10,000 claims showed tha 4·7% of the claimants to unemployment benefit had had no insure employment from 0 to 29 of the 125 weeks of the period covered, tha

2·7% had done some insured employment in from 30 to 59 weeks; 3·5% in from 60 to 89 weeks; and 30·5% in from 90 to 125 weeks. But if it is wrong to say the workman is drawing a "dole," it is clear that the nature of the insurance scheme has changed owing to the intensity and continuance of the industrial depression. At present the scheme provides for the insurance of all workers in the insured trades by means of premiums paid by or in respect of those alone who are actually employed and not by all those who are insured.

Since unemployment is a normal feature of industry, there is a prima facie ground for making benefits equal wages. There is indeed a large school which demands "work or maintenance" for all unemployed, and maintenance at full rates of pay.

But the practical difficulties of this are obvious. Generally speaking, criticism of unemployment insurance takes the form of suggestions for improving and strengthening the existing scheme, not for abolishing it. It is proposed that agricultural workers and domestic servants should be included, that greater power should be given to advisory committees of employers and employees in its administration, that Parliament should set up a body with authority to advise what political and economic policies will mitigate unemployment, and an interdepartmental body for giving effect to such policies.

Thirteen years' experience has demonstrated that compulsory unemployment insurance is entirely practicable, that the British scheme has been conceived on right lines, that it embodies ideas which are socially desirable, that it is actuarially sound, that it is extremely elastic, and that it has been one of the signal successes of British administrative effort.

A departmental committee of inquiry into the whole question of unemployment insurance was set up by the British Government in 1925.

Compulsory unemployment insurance has now been adopted in six other countries. It was introduced in Italy by a legislative decree in 1919, which was superseded by a decree of 1923. Austria introduced it in 1920. Queensland adopted it in 1920 and Soviet Russia includes it in its Labour Code. Poland introduced a system in July 1924. The Irish Free State is continuing the compulsory system it took over from England.

The voluntary system of unemployment insurance supported by state subsidies previously known as "the Ghent system," is in operation in nine States, but the British method is steadily gaining more adherents.

Insurance by industry.—The proposal to organise insurance by industry has attracted special attention in relation to unemployment. But there is no reason why it should not be considered also in relation to the other branches of social insurance. Workmen's compensation in this country is organised in a manner which ought to satisfy the advocates of insurance by industry, and it is possible, if it is desired, to organise unemployment insurance and health insurance in a similar manner. This idea underlies Professor Commons' scheme for the American States.

The arguments in favour of this course and against it may be briefly summarised as follows:—

If the burden of these social emergencies in each industry is placed directly on that industry, a financial incentive will be given to the employers to prevent them in each industry, and a similar arrangement might even be made for each firm so as to prevent them in each firm, and so lessen their burden. Why not, it is asked, use this obvious instrument for stabilising employment? Each industry could form one representative organisation of all concerned in it, which would attempt to grapple with these social emergencies. Experience of working together in this way by employers and workpeople would enable them to face other problems. Thus insurance by industry is seen to be part of the wider policy of giving the workers some share of control in industry. Another argument used is the justice of adjusting benefits to earnings. Unfortunately, some of these arguments have little force. Thus the money incentive that can be offered would be relatively so small that experience with the rebate system offered under the 1911 Act to employers who kept a stable staff proves that it would have little or no effect in inducing employers to seek means to reduce the amount of unemployment. The desire to give the workman and his employer some share in the administration of the scheme can be achieved through increasing the functions of advisory committees both of employers and of work-people. Similarly the better adjustment of benefits to wages can be achieved in other ways.

There are many difficulties in the way of this proposal. First there is the difficulty of classifying and delimiting industries, though it must be admitted that the same difficulty will have to be tackled if Whitley Councils are ever to be made really effective. Nor have suggestions been wanting how to deal with the class of floating labour, especially of unskilled labour which finds employment now in one industry and now in another. It is argued also with force that in case of decaying trades the technical process may become obsolete, but the industry continues, and it is proper for the industry to bear the burden of maintaining those who are too old to adjust themselves to the new conditions.

But there are other serious objections. Each industry would have to institute its own system of exchanges, and this would make the administrative expenses of insurance high. Besides, workmen might be tempted not to transfer from a high benefit industry to a low one even when it was economically desirable for them to do so. Labour would tend to become immobile.

Moreover, it may be doubted whether it is really unfair for, say, clerks to pay towards the cost of insuring unemployment in the coal industry. They consume coal, the trades in which they are engaged probably use it. Shipbuilding is dependent upon the iron and steel manufacturing industry, engineering, woodmaking and other industries. Most industries are dependent on coal and transport, and they all use electricity and gas. When industry has grown so interdependent there seems to be no substantial injustice in a flat rate system. (J. Co.)

VI. MEDICAL ASPECTS OF HEALTH INSURANCE

Insured Persons.—The number of insured persons in Great Britain is approximately 15,000,000. They consist of persons under a contract or service, namely all manual workers without any income limit, and non-manual workers with an income limit of £250 a year. Certain other persons, within the same income limit, who have previously been employed insured persons or who have married an insured woman, are allowed to enter the scheme voluntarily. On the other hand some employed persons who have sources of income other than their employment may be exempted, and certain whole classes are excluded from compulsory insurance because they are serving under conditions which provide benefits equivalent to those of the insurance scheme.

The Medical Service.—This large proportion of the workers of the country has been entitled not only to the cash benefits described, but, since January 1913, to such medical advice and treatment as can reasonably be expected from general medical practitioners as a class, other than in respect to a confinement. This is a very wide range; and gratuitous service even beyond this range has repeatedly been given. There are about 15,000 medical practitioners engaged in this work. Every registered medical practitioner who wishes to do so has the right to take part in the service, unless and until he be removed therefrom after due inquiry according to prescribed methods and machinery. To this provision the medical profession has always attached the utmost importance. Equally important are the provisions that every insured person has a free choice of all available doctors, that he may change his doctor at any time, and that the doctor may, with due notice in the case of illness, request his patient to seek other advice. The maximum effective number of insured persons for whom any doctor may, single-handed, make himself liable is 2,500. With a doctor of quick mind, methodical habits, and considerable ability, who devotes the major part of his time to insurance practice this number is reasonable, but in an average case where a corresponding amount of private practice is undertaken, this number is probably too large for efficient work in times of stress. In some densely populated areas where the number of doctors is relatively few and the lists

correspondingly large a certain amount of complaint may at times have been justified, but these conditions are, by common consent, adjusting themselves and the service improving. In fact, the number of doctors who have lists effectively exceeding 2,000 is small, the average number of insured persons per doctor being less than a thousand.

The aim of all these arrangements is to make the conditions of insurance practice approximate as nearly as possible to those of private practice. The actual and legal relationship between doctor and patient is the same in both, the only modification of this statement (and that a small one) being that since the whole body of insurance practitioners of an area have undertaken the responsibility for attending all the insured persons of that area, each practitioner must attend any insured person in an accident or other emergency whereas this is merely an obligation of humanity in non-insurance practice. In addition, the doctor under the insurance system undertakes to give certain certificates with regard to incapacitating illness and to keep certain records and make certain reports as required by the Ministry of Health.

Effects of the System.—After 13 years of such a system it is true to say, in general, that the incidence of incapacitating illness among the working population has diminished, that whole classes of persons are now receiving a real medical attention which formerly they did not get at all, that the amount and character of that attention is immensely superior to that given under any of the old forms of contract practice, that illness is now coming under skilled observation and treatment at an earlier stage than formerly, and that the bias towards preventive rather than mere remedial treatment has been reinforced.

Good as this is it might yet be better. The existing definition of insured persons includes some—the higher-paid manual workers—who could make the necessary provision for themselves without state aid. Equally clearly it excludes many others who urgently need such aid,—*e.g.*, poor persons not under a contract of service, such as hawkers and small tradesmen. The dependents of all the lower-paid insured persons, however defined, manifestly need aid for securing adequate medical attention in some way and might well be brought within the insurance scheme. To make the required adjustments will give rise to some formidable difficulties but these should be faced and overcome. The difficulty with regard to the inclusion of dependents is almost wholly one of finance. The difficulty of including other poor persons is that of collecting compulsory contributions (not necessarily weekly) from those who have no employer. The difficulty of excluding the higher-paid of those now included is that of applying an income limit to the manual worker as well as to the clerk. These difficulties are not insuperable.

Extension of Scope of Treatment.—The extension of the scope of the medical advice and treatment available so that it shall include not merely such as can in the best interest of the patient be given by general medical practitioners as a class, but also consultant and specialist services (including dental treatment), and the advantage of pathological laboratories, would not only be of immense advantage to both doctors and patients, but would solve a good many of the minor problems which give rise to daily troubles under the existing system. The expense of such an extension as has been recommended by the royal commission on the Insurance Acts, to whose reports reference has already been made, would not be prohibitive, and experience already gained would greatly facilitate the necessary working arrangements with the medical profession. A subsequent further extension to cover residential institutional treatment, the provision of nurses, and other ancillary services would be quite practicable and would complete a national system designed to leave no one without the means of readily obtaining adequate medical attention in all forms of illness. (H. B. Br.)

Layton and others: *Unemployment Insurance in Great Britain* (1925).

Family Income Insurance: *Family Allowances* (The Inter-National Labour Office, 1924); J. L. Cohen, *Family Income Insurance* (1926); P. H. Douglas, *Wages and the Family* (1925); E. F. Rathbone, *The Disinherited Family* (1924).

INTELLECTUAL CO-OPERATION, International Institute of.—In Sept. 1921 the League of Nations, on the proposal of M. Léon Bourgeois, added to its existing technical committees an International Committee on Intellectual Co-operation, made up of distinguished scholars chosen first from 12, afterwards from 14, different countries. Its membership included, among others, Mme. Curie, Prof. Einstein, Prof. Gilbert Murray, M. Jules Destrée and Dr. Millikan. M. Henri Bergson was elected its first chairman.

The task assigned the committee was that of studying the better organisation, through united international effort, of literary, artistic and scientific work. The committee soon became convinced that if it were fully to accomplish its task it must have a permanent administrative organ to prepare its programme and carry out its plans. In 1924 the French Govt. offered to defray for the League the expenses of such an organ, asking only in return that Paris be its seat. The League accepted the offer; and in Sept. 1925 the International Institute for Intellectual Co-operation opened its offices in Paris, at the Palais Royal.

The institute is divided into seven specialised sections which are as follows:—

General Section.—This makes a preliminary survey of all problems submitted to the institute. It draws up an annual set of international statistics on intellectual life and its changes in level. It studies all general problems and suggestions that bear upon the international organisation of intellectual work.

Scientific Relations.—This section deals with specific problems of international scientific organisation. It keeps in touch with the important existing institutions and associations in this field, and aids them to co-ordinate their efforts, encouraging the creation of new bodies where these are necessary. It follows closely the powerful but still unco-ordinated activity of international scientific congresses.

Artistic and Literary Relations.—These two sections study the organisation, from an international point of view, of literary and artistic production. They prepared in 1926 a plan for an International Office for Museums. They investigate the question of general protective laws for artists and works of art.

University Relations.—This section acts as a link between institutions of higher education in all parts of the world. To this activity

the committee attached a particular importance from the first. In 1923 they suggested to the Council and the Assembly of the League the need for an International University Information Office, since created. In 1925 the Assembly decided to refer to the Institute for study the question of a general international *entente* in matters of education.

Legal.—This section deals with the legal problems raised by plans for international intellectual co-operation. In accord with the International Labour Office, it studies the economic conditions of intellectual workers.

Information.—This section studies also the means by which the results of intellectual work are diffused, particularly the problems of book production and printing. It seeks to co-ordinate the activity of periodical publications which treat the various phases of intellectual life.

The institute is strictly international in character. Its officials belong to 20 different nations: the section for general affairs, for instance, had as its first head an Englishman; the section for university relations a Pole; the information section an Italian; the section for artistic relations a Belgian; the section for literary relations a Chilean, a woman; the section for scientific relations a German; and the legal section a Spaniard.

The staff, drawn from all parts of the world, represent the most varied intellectual interests. But all of them, from the French director down, are moved by the same desire: to seek in each individual problem submitted to them, with all the exactness and modesty of experts who understand the clear limitations of a given task, the methods best adapted to reconcile the interests of each nation with those higher interests of the mind that govern the broad sphere of intellectual life.

INTELLIGENCE, ANIMAL (*see* 14.680).—A broad distinction is commonly drawn between instinctive and intelligent behaviour in animals, and it is necessary therefore to frame some definition of what is meant by intelligent action. In this matter McDougall (1923) writes as follows:—

The definition and demarcation of instinct and intelligence have been much debated of recent years; but no general agreement as to the precise use of the words has yet been reached nor can be reached until agreement as to the nature of the facts denoted shall have been achieved. But the great majority of all parties would agree that we may properly call "instinctive" those actions of animals which seem to be purposive (*i.e.*, exhibit the marks of behaviour) and which are performed by any animal independently of previous experience of similar situations. . . . Intelligent action, on the other hand, is generally defined as one which seems to show that the creature has profited by prior experience of similar situations, that it somehow brings to bear its previous experience in the guidance of its present action. Instinct (abstractly conceived and with a capital letter) is native or inborn capacity for purposive action; intelligence is the capacity to improve upon native tendency in the light of past experience (pp. 70, 71). (*See* PSYCHOLOGY.)

Some authors, particularly Fabre and Bergson, have attempted to make the distinction between instinct and intelligence an absolute one, attributing to instinctive animals psychical powers of an almost miraculous kind. This view is not widely accepted by those who have studied most carefully the manifestations of instinct. The fact is that neither form of behaviour appears "pure." Glimmerings of intelligence may be awakened in even the most stereotyped of instinctive actions, and intelligent action is often merely an extension and embroidery of instinctive behaviour. Their resemblances are more important than their differences—both are forms of purposive activity, adapted to fulfilling some end connected with the maintenance and continuance of life, and finding their driving force in the primary hormic impulses of the living thing (E. S. Russell, *The Study of Living Things*, 1924). The contrast is between the accuracy and mechanical undeviability of instinctive behaviour, inborn in the animal, and the probing tentativeness of intelligent action, which seeks to modify in the light of individual experience and to adapt to changing circumstance the blind impulsions of instinct.

Definition.—If we adopt this broad criterion—modifiability of behaviour in relation to past experience—we may say that intelligence in this sense is practically coextensive with animal life, for even the Protozoa alter their mode of reaction if their first response fails, and show the beginnings of "learning by experience" (Jennings 1906).

Animal Behaviour.—Since about 1900, much attention has been paid to the study of animal behaviour, both by zoologists, who have studied particularly the sensory physiology of animals and have tried to analyse their behaviour in terms of tropisms and reflexes (see, for instance, Loeb 1919), and by professional psychologists, who have studied particularly the intelligence of the higher animals (and some of the lower) by means of highly developed and ingenious mechanical contrivances, such as puzzle boxes, mazes, and the like. Nor should one omit to mention the good work done by field naturalists like Beebe and Miss Frances Pitt upon the behaviour of animals going about their ordinary business in their natural environment.

Experimental Work.—With respect to the question of the intelligence of animals, particularly of the higher forms, in the works of Yerkes, Thorndike and Hunter, and in the useful general account by Miss Smith (1923) and Kafka (1922), details are given of elaborate experimental researches carried out on habit-formation, the processes of association, sensory discrimination and so forth. Generally speaking, these experiments afford little evidence of anything like reasoning power even among the higher vertebrates. Learning appears to be a rather mechanical process, in which little intelligence, in the ordinary acceptation of the word, is shown. The objection may, however, be fairly made to many of these experiments that the animals are placed in unnatural conditions which inhibit them from developing the full range of their capacities. Of quite special interest in connection with the general problem of the intelligence of the higher animals are the experiments and observations of the distinguished German psychologist Köhler, on a number of chimpanzees which were kept at an experimental station in Teneriffe under very easy conditions of captivity. The apes had the run of a large open-air enclosure, and were allowed to develop a normal social life without undue interference.

The tests applied were simple and based upon a thorough and sympathetic knowledge of their normal behaviour. They consisted generally in setting the animal the problem of attaining a coveted object, say an attractive fruit, which was placed beyond their reach—outside the bars of the enclosure, for instance, or suspended high up from its roof. The use of a stick, or of anything which might function as a stick, to draw the object within reach was grasped at once, and one ape learned to join two sticks together if both were too short. The use of a short stick to draw within reach a longer stick with which to attain the objective also presented little difficulty to the more gifted individuals. Many learned to pile one box upon another in order to reach a high object—the best effort in this direction being a (somewhat ramshackle) construction of four boxes one on top of the other. What was really striking and significant about the experiments, however, was that the apes did not come by the solution of their problems by a random method of trial and error, but by suddenly grasping the situation after a longer or shorter period of puzzlement, and applying a correct solution straight away. Köhler argues very convincingly that these apes must possess a certain power of insight or judgment of the visual situation as a whole; their problem-solving is accordingly a very different thing from the gradual beating out of a solution through undirected effort and chance associations, which is found in the experiments of Thorndike and his school.

Thinking Animals.—In conclusion, a brief reference may be made to the so-called "thinking animals"—the Elberfeld horses, the Mannheim dog and others—which by means of signs can apparently spell out answers to questions and give the solution of mathematical problems. While the phenomena are not yet fully explained, there is a general consensus of opinion that these animals do not really reason, but are in some way guided unconsciously by their trainer—and perhaps by the

spectators also. On the question of trained animals in general the works of Hachet-Souplet should be consulted.

INTELLIGENCE, HUMAN (*see* 14.680).—This name is among the most widely used and hotly disputed in the psychology of today. To call any one "intelligent," or one of its synonyms, as "bright," "sharp," "brainy," or one of its antonyms, as "stupid" or "dull," is a universal custom, alike in scholastic work, industrial management and familiar conversation. The word has also long played a very conspicuous part as denoting the alleged distinguishing privilege of the human species.

But by far the greatest excitement has arisen from the claim raised that any person's intelligence can actually be measured by means of mental tests. After some important theoretical work by others (see later on), the first great practical success with these tests was effected by Binet and Simon in 1905. The test-scale devised by them was applied in a great many schools, and it still to this day—with radical revision—continues to be the standard scale, at any rate for young children. But the most startling achievement of the testing (chiefly by means of another scale) was its application to nearly 2,000,000 men of the American Army in 1918. The results proved to be so useful as to elicit a very high eulogy from the American Secretary of War. Since then, the application of one or other of the multiplying scales to schools, universities and other institutions has in most civilised countries extended so widely as to comprehend the greater part of the juvenile population.

What the Tests Measure.—Despite all this outward success, however, there has sprung up much and vehement criticism. The main source of trouble has been that those who are making such mental measurements cannot agree as to what they are measuring, or even as to what they ought to measure. For example, some think that intelligence should include memory, and they therefore introduce into their scales a certain amount of memorizing. But other testers rigidly exclude any such thing. Many—as Binet himself—first declare that memory does not appertain to intelligence, and then nevertheless proceed to make memorizing a conspicuous part of their actual tests. Similar confusion and inconsistency reign about imagination, about attention and about sensory perception; both theory and actual practice are at loggerheads as to whether the tests should include any or all of these. Some authorities go the length of wanting intelligence to embrace, not only the co-ordination of ideas, but equally that of movements. In short, this state of affairs can without exaggeration be called one of complete chaos.

Historical Development.—The key to understanding the situation appears to be supplied by historical considerations. With the old Latin-writing philosophers, intelligence (intelligentia) meant the using of the intellect (intellectus); and the latter word was their rendering of the still older νοῦς. This and sensory perception (αἴσθησις) were regarded as the two great faculties of man. The sensory perception was his evil genius, trickir him with all manner of appearances and illusions, whilst th intelligence opened his eyes to the real truth. But in course time other philosophers and psychologists brought into this th ory various complications. By some a further faculty of memor was added on. By others, imagination was honoured in th way. By yet others, attention, and even movement. Moreove alongside of this tendency to set up various faculties outside intelligence, and thus curtail the sphere of the latter, there als occurred some change in the opposite direction of expanding it sphere; in this way, it was sometimes made to comprehend eve sensory perception,—which had originally been regarded as it very antithesis.

With lapse of time, these diversified doctrines, each fairl distinct as handled by the school which advocated it, began t percolate down to wider and less instructed circles. In so doin they became more and more intermingled. What the wor eventually evoked in the mind of the man in the street—neve too nice about logical consistency—was a confused reverberatio of all the different views. The last phase of the history was whe modern psychologists—instead of properly moulding clear idea for themselves—complacently took over this old notion of in telligence from the popular usage. All went well enough unti they began to examine what they had really got into their hands which proved to be a word with so many meanings as practicall to have none.

Definitions.—To cure such equivocality, the natural cours would seem to be a definition. Accordingly, there have bee many attempts at this. Most adherents appear to have bee gained by the proposal to define intelligence as *conscious adapt ability to new situations* (W. Stern). But, unfortunately, nothing could be more equivocal than the term "adaptation" itself Admittedly it means a change that fulfils some purpose; but as to whose purpose, and of what kind, nothing is usually said widely divergent interpretations are possible, and actually given The next most favoured definition has been as *the capacity t learn* (Buckingham). But this "*learn*" is at least as bad as the "adapt." By the dictionary, it signifies the acquirement of any skill or knowledge. But most advocates of this definition evi dently mean neither the acquiring of skill nor many forms of acquiring knowledge (*e.g.*, memorizing). What they do mean is left unstated.

Education.—Another interpretation of intelligence has been extensively advocated, namely, as the power to perform what is called "*eduction*" (Spearman). This is said to have two forms, of which the first consists simply in the perceiving of relations between any two given ideas (taking "idea" in its broadest possible sense). The other form is when an idea and a relation are given, and from these two there has to be found the correlative idea. Now, eduction in this sense does escape the bane of equivocality. Also, it has shown itself to be a power of paramount importance, especially as contrasted with the only other possible ways of obtaining ideas (namely, by sensation and by reproduction). Moreover, this eduction does seem to indicate something which most persons will admit that they, in using the word intelligence, are really "driving at."

Difficulties of Measurement.—Any way, even after fitting the term intelligence with the most irreproachable definition there still remains a great difficulty in accepting the far-reaching claims to have *tested and measured it*. The rub consists in the fact that such a mental power—whichever of the definitions we may choose for it, even the last—always admits of being subdivided; hence, a separate measurement would seem to be indispensable for each subdivision.

Thus, Binet himself admitted that the intellect breaks up into several different faculties, and wrote about these: "The mental faculties of each subject are independent and unequal; with a little memory there may be so associated much judgment. . . . Our mental tests, always special in their scope, are each appropriate to the analysis of a single faculty" (*Les idées modernes sur les enfants*, Paris, 1910). If he thought this, then why did he not, why do not his followers, measure each of these independ-

ent faculties, memory, judgment, etc., one by one? Furthermore, each faculty itself can be divided up. For instance, why should not a person have a good memory for some things and a bad one for others? And if we push this argument far enough, the required measure- ments would seem to become infinitely numerous, and therefore incapable of ever being really executed.

Tests by Samples.—For this difficulty of measurement there have been only two solutions so far proposed that deserve serious consideration. The first and most widely known—especially associated with the name of Thorndike—is that the current tests measure *a representative sample* of the subject's abilities. But this view, plausible enough at first sight, does not bear scrutiny. In order to pick any genuinely representative sample of anything, every portion of this must be represented fairly (*see* LOGIC). For example, the sampling of a field of potatoes would be far from representative if we selected many from some particular areas and few or none from others; we ought to divide the field into equal parts, and pick an equal number from each. But in the case of mental abilities there seems to be no possible method of settling what parts are really equal.

Test Scales.—In a well known test-scale (Yerkes), judgment is made to supply three test-elements, whereas ideation supplies only one. On what conceivable ground can we settle whether judgment is or is not three times as large a faculty as ideation? Other test-scales no less arbitrarily reverse this ratio. As for the scale of Binet, this even within itself gives the most widely divergent ratios between different test-elements when the scale is applied to children of varying ages.

Coefficients of Correlation.—There remains the other serious attempt at solution (Spearman). If a large number of people are submitted to two tests, the degree in which the same persons tend to excel in both cases can be expressed numerically by what is called a coefficient of correlation. If several tests are used, there will of course be a correlation for each different pair of tests. Now, proof has been given that, when the magnitudes of all these correlations satisfy certain mathematical conditions, then and only then the score of each person in each test can be divided into two factors, of which the one has always the same value (for the same individual), whereas the other varies independently from one test to another. These two factors have been symbolised as " g " and " s " respectively.

Measurement of "g".—Further evidence has been furnished that, with suitable tests (of " eduction," *see* above), these mathematical conditions are actually fulfilled. It is easy to see, then, that if the tests are made sufficiently numerous, the independent values of the " s " must tend to neutralise one another on an average, leaving the " g " as a value uniformly characteristic of the individual. This " g " it is that has actually been measured —more or less accurately—by the mental tests now in usage. It is not in the least equivocal, for we know exactly under what conditions it always occurs. But there still remains the task of interpreting it; herein it resembles electricity, which was measured with great exactitude long before its intrinsic nature was even approximately understood. In both cases, too, the illumination does not arrive in a flash, but accumulates gradually.

At the present moment, " g " seems to be best conceived as a person's " general mental energy," whereas the " s " varying from test to test represents so many different mental " engines," into any of which (alternatively) the energy can be switched. In this " g," then, the " intelligence " receives yet another possible interpretation. Here, it would not consist in any entire ability whatever, but constitute a factor that enters into multitudinous (eductive) abilities. But whether or not the " g " be invested with this title of intelligence, it at any rate furnished the original inspiration for the miscellaneous mixture of test-elements that currently claim to measure it (in this respect, Binet appears to have been an unconscious borrower). Also, it supplies such tests with their sole genuine justification.

BIBLIOGRAPHY.—This is widely dispersed, for the most part in the many journals specially devoted to psychology. A general account may be found in *The Nature of Intelligence*, by C. Spearman (1923).

(C. SP.)

INTELLIGENCE, MILITARY AND NAVAL.—Under this designation may be considered the work of obtaining, collating, interpreting and distributing information, in peace and war, about foreign powers, the countering of foreign powers' efforts to obtain intelligence, and the organisation which performs these duties. Information as to actual or potential enemies, allies and theatres of war, has always been required and obtained by governments and commanders in the field; the employment of spies, the questioning of prisoners, date from the earliest times in history, but never have the scope, and what might be termed the technique of military intelligence, reached such a high degree of development as in the World War.

I. INTELLIGENCE IN PEACE TIME

In time of peace, the relative military power of a nation with regard to other foreign powers, and in particular to its immediate neighbours, necessarily affects its foreign policy. Every government therefore maintains an intelligence system, which generally forms a section of the headquarters staff of its military forces (known in most countries as the General staff), for the purpose of:—

(*a*) Providing its Government with all necessary information regarding the military power of foreign nations;
(*b*) Devising means whereby, in case of war, all essential information concerning the enemy, allies and theatre of war may be placed at the disposal of the commander and troops, and the supply of further information continued throughout the campaign;
(*c*) Preventing the acquisition of information by the enemy.

Type of Information Required.—The fighting power of a nation can only be gauged when accurate and detailed information is available on certain factors, the most important of which are the organisation, strength and power of expansion, armament, tactics and morale of its armed forces, the characteristics of its leaders, its defensive works and fortresses, its communications, such as road, railway, waterway, aerodrome, cable, telegraph and wireless telegraphy systems, its physical and political geography, climatic conditions and economic and industrial resources in relation to military requirements. This information also enables the General staff to prepare, and keep up to date, plans for offensive and defensive operations, together with estimates of the forces required for their execution against any power or combination of powers, with which the particular power, either alone or in co-operation with other powers, might be brought into conflict.

Sources and Value of Information.—The main sources from which information is derived in peace time are statistics and economic data obtained from foreign government publications, from the Press and technical works, foreign training manuals, military and geographical publications and from information procured by the Secret Service.

When war breaks out, this intelligence system provides the commander and troops about to take the field with maps and all available information regarding the theatre of war, the armed forces and military resources of allied and hostile powers, with their special characteristics; this information forms the basis of the plan of campaign, but requires to be supplemented with information concerning the enemy's mobilisation, concentration and order of battle in general. For this purpose preparations must be made beforehand and an intelligence organisation provided for the troops in the field; the intelligence section therefore lays down the foundation of the intelligence organisation required in war and makes arrangements for expansion by training the special personnel required.

II. INTELLIGENCE IN WAR TIME

In war, the greatly increased activities of the home or headquarters intelligence service are mainly directed to areas outside the theatre, or theatres, of operations. In the latter, the armies in the field are provided with intelligence services of their own, who form an additional source of information for the home intelligence service, which is responsible for the further collation and distribution of the information thus received.

Field Organisation.—In the field, the intelligence section of the General staff collects and collates all information regarding the enemy's forces and intentions and the theatre of war, supplies to the commander, staffs and fighting troops all information which will assist them in preparing and carrying out plans for the defeat of the enemy and endeavours to prevent the acquisition by the enemy of similar information. To be of practical value, the information supplied must be relevant, furnished in time to be of use and in such form as will admit of its immediate application by those concerned. These conditions require the closest co-operation and mutual understanding between the intelligence and operations sections of the General staff. The developments, technical and otherwise, of modern warfare have placed at the disposal of the intelligence section many resources for collecting information which were not available prior to the 1914–9 campaign. Intelligence in the field has become a large and intricate organisation, the varied and complex nature of whose duties necessitates the employment as assistants to the General staff proper, of a large number of highly trained specialists.

Knowledge of the enemy's intentions is of supreme value to a commander, and the intelligence section should therefore possess throughout the campaign early, accurate and continuous information regarding the enemy's "order of battle," his movements of men and war material, his tactical method, armament and equipment, the organisation of his defences and rear services, the topography of the theatre of war. The relative value of these different classes of information varies with circumstances; the character of the operations may change at any moment from open warfare to stabilised warfare, or the reverse; an intelligence service must therefore be elastic both in method and organisation. Method, accuracy and speed are essential for the collection, reception, transmission and collation of information, but this work is of no value unless timely deductions can be made from the evidence available. The making of deductions, appreciations and forecasts both as to the probable action of the enemy and the prospect of successful operations undertaken by its own troops is the most important duty of an intelligence section. Its true function, in fact, is to represent the operations section of the enemy, for broadly speaking it provides all information concerning the enemy, the allies and the theatre of war, whilst the operations section provides similar information regarding the troops of its own army.

Scope and Nature of Information.—Information regarding the enemy's "order of battle" is of paramount importance. It includes the organisation, composition and strength of hostile formations, the direction of their initial concentration and subsequent movements, their distribution, morale and fighting efficiency, the characters of their commanders, methods of recruiting and man-power available to replace wastage. The identification of units is the foundation of all "order of battle" intelligence. Movements of men, supplies and material on a large scale normally portend some important development or a change of the enemy's plans, but as they must take place along organised lines of communication are difficult to conceal. Detailed knowledge of the enemy's system of communications and means of transport is therefore essential; the capacity of railways, quality of roads, navigability of waterways at different seasons, system of aerodromes and auxiliary landing grounds must be carefully studied if reliable conclusions are to be arrived at regarding the size of any movement and the time required for its execution.

Full information regarding the tactics and armament of the enemy at the outbreak of war is usually available by the study of his peace training and organisation; but his methods of employing troops and their weapons in the field must be followed very closely in order to discover new developments as early as possible. In the World War full knowledge of each others' pre-War tactics and armament was possessed by the opposing armies, but almost from the beginning of hostilities modifications and new ideas were introduced, which frequently provoked counter measures. Instances were the employment of poisonous gases, flame and gas projectors, "storm troops," Stokes mortars and tanks. All the economic resources of a State may be required to meet the strain of a prolonged campaign, and accurate knowledge regarding these resources is one of the means of gauging the enemy's staying power.

Sources and Means of Collecting Information.—The main sources of information are prisoners, deserters, local inhabitants, captured documents and material, land reconnaissance and observation, hostile signalling communications, air reconnaissance and photography, the enemy and neutral Press and agents; the principal agencies for its collection are the fighting troops, the signal service, aircraft and secret service. The information, whether positive or negative, acquired by contact with the enemy is that on which every commander mainly relies in making his tactical plans. Hence, to keep the enemy under such close and continuous observation that he can make no movement without being detected is the primary object of all reconnaissance, whether on the ground or from the air.

Ground reconnaissance may be purely topographical, *e.g.*, the acquisition of unmapped information about the ground; it may be tactical, *e.g.*, to discover the enemy's positions, the strength and distribution of his defences, his tactics, movements and intentions; or for the purpose of obtaining "identifications," *i.e.* information about the hostile troops in line, their morale, armament and equipment, by the capture of prisoners or documents. These objects are achieved by sending out mobile troops, patrols or raiding parties, or by observation from fixed points. The latter may be visual or instrumental.

Visual observation for intelligence purposes is an organised system for the observation of all enemy activity within the range of vision of its observation posts by trained observers provided with a special equipment of maps, telescopes, periscopes, etc., its elements being generally so placed and co-ordinated that the exact location of the enemy activity recorded can be fixed by intersection, *e.g.*, "flash-spotting." Instrumental observation is mainly automatic, by instruments disposed to receive, transform and transmit impulses from outside, *e.g.*, sound-ranging installations, electrical listening posts, wireless interception and direction-finding apparatus.

Air Reconnaissance.—Information from the air is derived from balloon observation, aeroplane reconnaissance and air photography. The development of air reconnaissance and photography has to a great extent revolutionised the whole service of military intelligence in the field; not only are aircraft capable of assuming the duty of strategic reconnaissance, but the camera has made it possible to obtain, particularly in position warfare, a far more detailed and exact knowledge of the enemy's system of defence, communication and supply than has ever been possible before. The principal weakness of air reconnaissance and photography, however, lies in their necessary dependence on the weather.

Balloon observation is used principally for the observation of movement by road, railways, and in back areas, of defence works, the location of hostile batteries and the observation of hostile artillery activity. Aeroplane reconnaissance is used at the beginning of a campaign to locate the direction of the enemy's main concentration, to report on the movements and activities of the enemy's troops; and subsequently to supply information on the latter's tactical dispositions, the construction or destruction of bridges, the construction of new defences, etc.

Strategical reconnaissance involves long distance reconnaissances extending frequently to distances exceeding 100 m.; they are usually carried out by single aeroplanes flying at such an altitude as to minimise the chance of hostile interference; at this height, movements of troops on the ground are unnoticeable, and the information gained is largely confined to reports of railway movements, activity at important junctions, formations of large camps, etc. It is often necessary to fly at medium altitudes and to employ formations of aircraft capable of dealing with air opposition, to obtain more detailed strategical information. Tactical information can only be obtained in sufficient detail by aircraft flying low (close reconnaissance) who can be expected to distinguish troops in the open and artillery in action, can dive near enough to the ground to clear up a definite point, such as the existence of a machine gun emplacement or whether a trench system is occupied or not.

Photography forms an essential part of all air reconnaissance. Even in the cases of reconnaissances at high altitudes photographs may be expected to show road movements, tracks, camps, new

works, battery positions, dumps, hospitals, light railways, telegraph lines and other signs of military activity, while in the case of close reconnaissance carried out at lesser altitudes, photographs taken in favourable weather enable experts to discover the smallest details of the enemy's defences.

III. THE SECRET SERVICE

The secret service supplies information regarding matters behind the enemy's front, and in his home territory, including strength and location of reserves, rear defences and lines of communication, internal conditions in the enemy's country and the state of his resources in man power and material.

Secret Service Methods.—The methods employed in this branch of intelligence work can only be referred to in general terms. Broadly speaking, its duties are:—

1. Offensive, in the acquisition of information by means other than those described in Sections I. and II. above;
2. Defensive, in the prevention of the acquisition by foreign powers of information regarding the forces of its own country.

The duties of the offensive section, to which alone the name of secret service is popularly applied, are similar in peace and war, but war increases the importance, and with it the difficulties and dangers of the work of secret agents or spies.

Agents work *à poste fixè*, on definite missions or on general roving commissions; they penetrate into enemy territory through the ports, in the guise of peaceful neutrals armed with all the necessary papers, or get there by other means, which in war include penetrating the enemy lines, either in uniform or mufti, during the progress of an action; landing behind them from an aeroplane or free balloon or crossing a frontier guarded by sentries and electrified wire. False papers, disguises, secret ink and all the other tricks beloved of the spy novel may form part of their equipment, but in practice, the most dangerous and efficient spy is the least sensational in his methods; when arrested he invariably has all his papers in order, and is the most plausible person alive. An espionage system in war involves the employment of many thousands of men, women and even children of all grades of society and of all professions: post-boxes, smugglers, guides, train watchers, pigeon men, couriers, runners, etc. All have their part to play, and that part, far from being ignoble, may be, if actuated by patriotism, as noble, as dangerous and as heroic as any played in the armies in the field.

Contre-espionnage.—The duties of the defensive section, popularly described as *contre-espionnage*, are also the same in peace or war, but the machinery and methods vary when carried out in home territory, in occupied enemy or allied territory.

The *contre-espionnage* section in home territory commands in peace and war all the assistance of trained police, censorship, port control, hotel registration, the erection of arbitrary barriers such as prohibited areas and of all the preventive measures which are the outcome of years of experience in combating enemy espionage under all conditions. In occupied territory, intelligence in the field equally enjoys these powers, and, in addition, the arbitrary powers of an occupying army, but the whole population is potentially hostile. In allied territory the difficulties are greater, as it is the ally who controls in his own home territory all the real preventive machinery.

The object of *contre-espionnage* is, first and foremost, prevention. Information may be gained by the enemy's agents equally from one's own troops and from the civil population; the former may sell or convey information deliberately, but will more probably convey it to the enemy's agents through indiscretion.

"Leakage" may occur in several ways; gossip about impending operations among the troops, especially when on leave and out of the line; indiscreet conversations, messages and misuse of code on field telephones and telegraph; marking of railway trucks, transport and billets, with inscriptions giving identifications of units; indiscretion in correspondence; careless handling of confidential papers and books; taking orders, codes, books, papers of any kind, even private letters into the front line; wearing of badges and numbers, which reveal identifications and in many other analogous ways.

The *contre-espionnage* section is also responsible for the control of the civil population. This involves the control of circulation, of the use of telegraph, telephone and other methods of communication, which might be utilised by enemy agents.

(T. G. G. H.)

INTELLIGENCE TESTS.—An intelligence test or intelligence examination is an instrument to measure the amount of intelligence shown by a human being or a lower animal. The instrument consists of a series of questions to be answered, or directions to be followed, or things to be learned, or intellectual tasks of any sort to be performed. Intelligence or intellect may be defined as the ability to perform intellectual tasks; and an intelligence test is a specially instructive sampling of such tasks.

Sample Tests.—The tasks shown below are representative of those used in standard intelligence tests.

"Show me your nose. Put your finger on your nose." Same with eyes, mouth and hair. Three responses out of four must be correct.

What is the difference between: (*a*) Laziness and idleness; (*b*) Evolution and revolution; (*c*) Poverty and misery; (*d*) Character and reputation.

Repeating three digits. After some explanation and practice, the person tested is asked to say 6-4-1, then to say 3-5-2, then to say 8-3-7. The test is passed if one series out of three is repeated without error, after a single hearing.

Repeating six digits reversed. The series used are 4-7-1-9-5-2, 5-8-3-2-9-4 and 7-5-2-6-3-8. The test is passed if one series out of three is repeated without error.

Tom runs faster than Jim. Jack runs slower than Jim. Which is the slowest of the three?

John said: I heard my clock strike yesterday, 10 minutes before the first gun fired. I did not count the strokes, but I am sure it struck more than once, and I think it struck an odd number."

John was out all the morning from the earliest hours; and his clock stopped at five to five the same afternoon.

When do you think the first gun was fired?

After some explanation and practice, the person tested is asked to "Finish what I say." At night you sleep in . . . . Mary has a ring on her. . . . You wear gloves on your. . . . You wear a . . . on your head.

The . . . of character is its ability to . . . liberty . . . from licence. Judicial decisions are of . . . or less authority as precedents . . . to circumstances.

A person who has been tested in respect of an examination consisting of from 50 to 200 such tasks may be given a score, and so be put in comparison with all others who have been tested with the same collection of tasks.

Intelligence Quotient.—Subject to certain limitations, the score may be expressed in terms of a mental age, that is, the age at which the average child is able to attain it. Thus if John Doe, aged 12·0, scores 118 in the national intelligence examination, and if the average child of age 13·1 attains a score of 118 in this examination, John Doe has a mental age of 13·1 years. John Doe's intelligence quotient, or I.Q., is his mental age $\times 100$ divided by his chronological age, that is $\frac{13\cdot1\times100}{12\cdot0}$, or 109.

This form of statement is useful for individuals whose scores are not higher than those made by the average child of 14, and whose chronological ages are not over 18. For higher levels and later ages the method is of doubtful value.

The score may also be expressed in terms of the percentage of some defined group who would attain lower scores than it. Thus, if 71% of persons aged 12·0 score lower than 118, and 29% score higher, in the national intelligence examination, John Doe may be recorded as in the 71 percentile for his age. This method is especially useful in the case of the higher levels of intelligence and adult ages. A more refined measure of this type expresses any individual's score as a plus or minus deviation from the average for some defined group in terms of the variability of that group as a unit. The technique by which this is done is beyond the scope of this article.

Systems in Use.—There are 30 or more such intelligence examinations now in use. Some, like the Pintner-Cunningham Primary Tests, are adapted to measure very young children aged two to five years. The National Intelligence Examination is designed to fit the intellects of the level of ordinary children from nine to 15. The Terman Group Test is especially suited to measure young people from 14 to 20. Some, like the Thorndike Examination for High-School Graduates, are adapted to measure gifted adults. Some, like the Army Group Examination Alpha, require an ability to read and write; some, like the Binet, are given orally; some, like the Army Beta, are largely independent of language. Some, like the Otis group Intelligence Scale, measure chiefly intellect as it operates with words and numbers and abstract relations; some are more concerned with information

about things and persons. In some, the speed of response counts a great deal in determining the score made; in others, it counts very little, the time allowed being sufficient to permit almost everybody to do almost everything of which he is capable.

Historical Development.—Existing instruments for measuring intelligence developed from three roots: the tests of sensory acuity, memory, attention and the like devised in the early history of psychology; the interview, as of physician with patient or employer with candidate for employment; and the school examination. Galton, Cattell and Binet were pioneers in this field of psychology. Sir F. Galton's *Inquiries into Human Faculty* (1883) presented the general problem of the measurement of individual differences; and he soon thereafter set up in the South Kensington Museum in London a laboratory where any person could be measured in a series of physical and mental traits. Under the influence especially of Cattell, many short examinations or " tests " of special mental powers were devised and rather widely used in the United States from 1890 on. Important work was done by Kraepelin and Ebbinghaus in Germany. An eminent French psychologist, Alfred Binet, using the general form of an interview between physician and patient, enriched by suggestions from psychological tests proper, produced in 1905 what may be called a standardised interview, consisting of 30 questions and tasks, many of which were chosen from the tests of special powers now familiar to all psychologists. This " metric scale of intelligence " was further improved and divided into age levels in 1908, and finally revised in 1911. Many variations of it have been used in different countries.

While Binet was developing a scientific interview and record and score, various psychologists in America were testing children in groups by means of printed collections of tests. The next step was the arrangement of such a collection in a standardised unitary examination, after the general plan of written examinations in school subjects. One of the earliest and by far the most influential of such arrangements was the group examination Alpha prepared in 1917 for measuring recruits in the U.S. Army. This examination was taken by nearly 2,000,000 men, large groups (sometimes over 1,000) being sometimes examined at one time and place.

Modes of Use.—Since then, intelligence examinations have increased rapidly in number, have become diversified in nature, and have been much improved in respect of convenience in giving and scoring. They are widely used, especially in the United States, as an aid in the proper grading and classifying and treatment of school children; and in studies of special groups such as defectives, delinquents and dependents. The methods used in conducting intelligence examinations are also being applied to examinations in school subjects, producing the so-called " new-type " examinations and educational achievement tests. At least 1,000,000 such examinations were made in the case of school children alone in the year 1925. Some of the leading American universities require an intelligence examination as a part of the general admission requirement.

In spite of notable improvements during the last 20 years, existing instruments for measuring intelligence suffer from serious deficiencies. Just what they measure is not known; how far it is justifiable to treat the scores by ordinary arithmetic is not known; just what the scores signify concerning intelligence in general is in dispute. An intelligence examination is still a more or less undefined collection of tasks, its score is still a somewhat arbitrary summation of credits, and the correspondence of the scores to the abilities which they purport to measure is still far from perfect. Psychologists are working to supply these deficiences, seeking to replace the undefined collections of tasks by tasks rigorously defined in nature and graded by a true scale of intellectual difficulty, so that the score may mean the precise height of intellectual difficulty which the person in question can master (*see* EXAMINATIONS).

INTERNAL COMBUSTION ENGINES.—For the evolution of the internal combustion engine from its first appearance in practical form as the Otto Silent Gas Engine of 1876 down to the year 1910 *see* the articles GAS ENGINE and OIL ENGINE (11.49 and 20.35).

The essential feature of all internal combustion engines is the exceedingly rapid combustion, or explosion, within the working cylinder itself, of a mixture of air and some inflammable gas or vapour; great heat is liberated by the explosion and this causes a correspondingly great rise of pressure in the working mixture which then drives the piston forward, so performing the working stroke. All present-day internal combustion engines operate upon either the Otto (de Rochas) four-stroke, or upon the Clerk type two-stroke cycle; in the first of these only one working stroke, per single-acting cylinder, occurs in every alternate revolution at the crankshaft, while in the second a working stroke is obtained in each revolution.

The types from 1910 are conveniently referred for descriptive purposes to five groups, viz.:

Large gas engines (exceeding, say, 400 H.P.).
Medium gas engines (less than about 400 H.P.).
Engines using heavy oils as fuel.
Engines using light oils as fuel.
Special types.

Large Gas Engines.—The changes in this class between 1910 and 1925 consisted almost wholly in improvements in detail; in the extended employment of waste substances as fuel for the gas producers; in the employment of high-tension electrical methods of ignition; in better cooling and governing arrangements, etc. The increase in the number of gas engines of the inverted-vertical multi-cylindered, quick-revolution, floor-space-saving type is also noteworthy.

The large, horizontal, slow-speed type is illustrated by the Nürnberg, or M.A.N., four-stroke, single-cylinder or tandem, or twin-tandem, double-acting engines commonly using as fuel producer gas, coke-oven gas, blast-furnace gas or natural gas. One notable installation in Japan includes four horizontal tandem double-acting, single-crank, four-stroke cycle engines, each direct-coupled to a 1,500 kw. alternator.

The cylinders are $47\frac{1}{4}$ in. diameter and the stroke is $51\frac{1}{4}$ in.; each engine is capable of developing 2,500 H.P. at 100 r.p.m.; the fuel used is Mond producer gas, the producers (with ammonia recovery) yielding 111,000 cu. ft. of gas per ton of Japanese coal. These engines are very massive; each cylinder weighs 25 tons; the fly-wheel 100 tons (see fig. 2 on plate) and the complete engine about 400 tons. At full load the consumption of fuel was about 1·8 lb. per kw. hour. Among other similar installations is that at the San Mateo power station of twin-tandem, double-acting, horizontal four-strokers, each unit containing four cylinders, 42 in. diameter x 60 in. stroke, and developing 5,400 B.H.P. at 90 revolutions per minute. The M.A.N. type, though large and heavy and occupying considerable floor space, is exceedingly reliable and economical; thus, a 2,000 H.P. M.A.N. engine using blast-furnace gas ran day and night during 19 months; in 13,870 consecutive hours the engine actually ran during 13,687 hours, *i.e.*, 98·6% of the whole time; and the stoppages were due not to the engine but to repairs necessary to the blast furnace. A third noteworthy large installation has 17 horizontal, twin-tandem, double-acting, four-stroke M.A.N. type engines, capable of an aggregate output of over 50,000 horse-power.

Large Two-stroke Gas Engines.—The large two-stroke Clerk cycle engine has also found considerable favour in the horizontal designs at Koerting and Oechelhauser. (*See* 11.499–500.)

(Fig. 4. By courtesy of "The Motor Cycle." Fig. 5. By courtesy of Messrs. Rolls-Royce Limited.)

Koerting.—The double-acting, two-stroke Koerting engine, with its characteristic very long water-cooled piston and central ring of exhaust parts has been built in England in units of up to 1,000 H.P., with cylinders 37¾ in. diameter x 63 in. stroke, running at 70 r.p.m., while on the continent of Europe units giving 2,000 H.P. per cylinder 42 in. diameter x 55 in. stroke x 80–90 r.p.m. have appeared; the Koerting type engines installed at Buffalo aggregate 40,000 horsepower. The American Worthington Co.'s first large inverted-vertical, cross-head-type, double-acting, two-stroke engine, built in 1924, using oil as fuel in the Diesel manner, employed the Koerting type piston.

Oechelhauser.—The manufacture of this type of single-acting, two-stroke, opposed-piston, open-cylindered, internal combustion engine has been greatly stimulated by the ingenious arrangement adopted by Mr. Fullagar, who has retained the characteristic advantages of the type and has obtained in addition marked economy in space, weight and production cost by associating two Oechelhauser cylinders side by side with cross-over piston coupling rods, as his power unit. The Fullagar engine is built in England mainly for marine purposes, using heavy oil as fuel in the Diesel manner.

Vertical Gas Engines.—The considerable bulk and weight of the horizontal slow-revolution large gas engine has caused much attention to be devoted to the faster-running, multiple-cylindered, inverted-vertical type occupying much less floor space and of diminished bulk and weight. Prominent among builders of this type is the National Gas Engine Co. of England, who build a series ranging from a 4-cylinder, 2-crank, single-acting four-stroke, inverted-vertical tandem design of 300 B.H.P. at 300 r.p.m. to a 12-cylinder, 6-crank similar design of 1,500 B.H.P. running at 200 revolutions per minute. One installation of these National engines aggregates 11,500 horsepower. Horizontal multiple-cylindered engines are also built; one British installation includes six 500 H.P. four-cycle, four-crank, single-acting, horizontal, four-stroke engines running at 190 revolutions per minute. Fig. 3 on plate illustrates a horizontal gas engine with two cylinders in tandem, working on a four-stroke cycle.

Medium Gas Engines.—In gas engines of less than about 400 H.P. no essential change has occurred; there is a steady output by many builders of a practically standard type of four-stroke, horizontal, single-acting, single- or double-cylindered engine using coal gas or suction-producer gas as fuel, and employed in a great variety of services by the smaller classes of power users. Designs of two-cylindered engines range in power from about two up to some 300 H.P. or over. The gaseous fuel is provided by many more or less waste substances, including bituminous slack, peat, scrap wood, sawdust, straw, cocoa-nut husks, etc. These smaller gas engines, in conjunction with modern plant producing gas from industrial and vegetable refuse, are very valuable in enabling complete power plants to be installed and successfully operated by native labour in situations remote from civilised centres.

Engines Using Heavy Oils.—It is in the entirely successful use of heavy oil (petroleum oils having a flash point exceeding about 73° F.) as fuel in internal combustion engines that the greatest advance was made from 1910–25; this applied to all types of engines, from the smallest to the greatest, and particularly to the exceedingly important and rapidly extending marine applications where, owing to their relative compactness and the absence of boilers and bunkers, the space occupied by the propelling machinery is greatly reduced.

The earliest heavy-oil engines as, for example, those of Priestman (1885), Samuelson, Thornycroft, Gardner and others, included a vaporiser, heated by an external blow lamp, in which the fuel was gasified, and then, mixed with a suitable volume of cool air, exploded within the working cylinder by a hot tube. Compression pressures were necessarily low to prevent detonation, and the fuel consumption was correspondingly high. Next came Akroyd Stuart's (1886–90) epoch-making invention, successfully embodied in the Hornsby-Akroyd oil engine, of utilising the hot walls of an unjacketed vessel (communicating through a restricted passage with the water-cooled combustion chamber of the working cylinder) first to vaporise the charge of oil fuel pump-injected into it during the air-suction stroke, and then *automatically* to ignite the resulting charge of oil, vapour, and air at the end of the compression stroke. Equally important was the progress made by the Diesel engine (see fig. 1 on plate) from 1893 in both four-stroke and two-stroke designs; the essential feature of the true Diesel is defined as the injection of the oil fuel directly into the water-cooled combustion chamber at, or about, the end of the compression stroke; air alone is compressed to a pressure of some 500 lb. per sq. in., the resulting high temperature automatically igniting the explosive mixture of air and oil spray; the fuel feed is so regulated that combustion proceeds at approximately constant pressure during a small part of the working stroke.

The oil fuel was for long sprayed into Diesel engines by an air blast at a pressure of up to 1,000 lb. per sq. in., involving compressing plant costly in production and maintenance; moreover, the high compression pressure employed necessitated extremely strong and heavy parts, and an extraordinary refinement in workmanship in order to achieve permanently satisfactory running. The efficiency attained was, however, remarkable, and considerably greater than that of any other form of internal combustion oil engine. These practical drawbacks soon resulted in the production, for smaller powers, of a large, varied and important class of engines usually termed semi-Diesels, in which the charge of heavy oil fuel is sprayed, usually by a small force pump, into the combustion chamber at or about the instant of maximum compression. The heat of an uncooled portion of the combustion chamber wall, aided by the heat generated by the moderate compression of the air, then ignites the charge automatically as in the well-known Ruston C.C., and in the two-stroke Bolinder "hot-bulb" marine engine, as used in so many trawlers, and in ocean-going boats of up to 1,000 H.P. in two units. The semi-Diesel engines combine many of the advantages of the Akroyd and Diesel types in a practical manner, and show considerable economy in running.

More recently, about 1924, it was discovered that the "hot-bulb" or "hot-spot" in the combustion chamber could also be dispensed with, allowing the whole to be water-cooled as in the vertical, Vickers-Petter, two-stroke, two-part, heavy-oil, C-type engines which are built in sizes up to 500 H.P. running at 250 r.p.m., with six cylinders. In these the charge of oil is pump-injected into a completely water-cooled combustion chamber of approximately spherical form about one-half the diameter of the working cylinder; the compression employed, though much lower than that usual in the Diesel engine, is yet great enough to cause automatic ignition of the charge, and to ensure an economical use of the fuel; the cheapest grade fuel oils are used in these engines, having a flash point above 150° F., and otherwise also in accordance with B.E.S.A. specifications. The consumption of oil at full load in the larger engines is stated to be not more than 0·43 lb. per B.H.P. hour (*see* MARINE ENGINEERING). The progress evidenced in the application of the internal combustion engine to marine purposes of all types was of a revolutionary character during the period here contemplated, and continued at a constantly increasing rate; at the end of 1925 all the great British marine engineering companies had taken up their manufacture.

Engines Using Light Oil.—This comprises the petrol motor now applied universally to the propulsion of all types of road and land vehicles, aircraft, small motor-boats, farm tractors and miscellaneous small services. For road, land and air service they were still, in 1925, almost all four-strokers, with the exception of cars in the United States, where the six-stroker is equally popular except in the lightest classes, *e.g.*, motor-cycles, small motor-boats and a few light cars in which the simple three-port two-stroker had become well established. The progress of the petrol engine from 1910 consisted mainly in the perfecting of details of design, improved carburation, charging and ignition, in lighter moving parts, and in the commercial production of fuel mixtures free from liability to cause detonation or "pinking," thus enabling much higher revolution speeds to be maintained and greater mean effective pressures reached. The success attained

is indeed remarkable, tiny petrol engines rivalling in efficiency large, high-powered engines of almost any other type. Small engines of racing type have been run in contests at well over 6,000 r.p.m., *i.e.*, upwards of 50 complete cycles per sec.; and tiny four-cylinder four-stroke engines of only 2·2 in. bore and 3 in. stroke were in extensive use in small "occasional four-seater" motor cars capable of speeds, on the track, of fully 80 m. per hour! A number of very encouraging attempts have recently been made to increase power outputs still further by aid of supercharging devices. At the British Motor Car Show of 1925, 65% of the vehicle engines were four-cylindered: 27% six-cylindered: and 5% eight-cylindered. Side by side valves were fitted in 45% and overhead valves in 44% of the exhibits.

Producer Gas Lorries.—A post-War development of much interest and potential value is that of driving heavy motor lorries by small high-speed internal combustion engines of the usual type, but using as fuel gas supplied by specially designed very

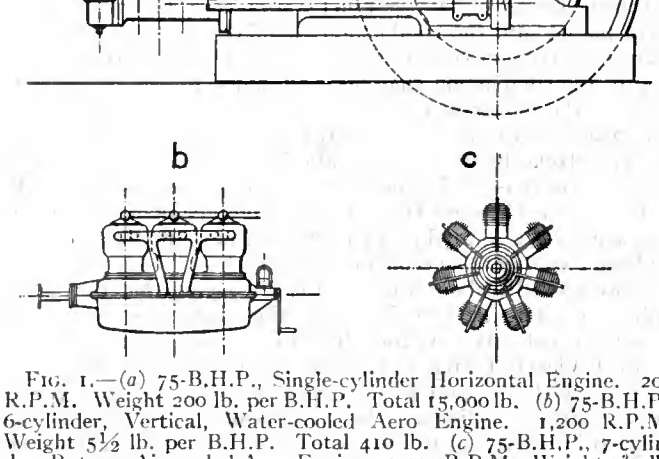

FIG. 1.—(*a*) 75-B.H.P., Single-cylinder Horizontal Engine. 200 R.P.M. Weight 200 lb. per B.H.P. Total 15,000 lb. (*b*) 75-B.H.P., 6-cylinder, Vertical, Water-cooled Aero Engine. 1,200 R.P.M. Weight 5½ lb. per B.H.P. Total 410 lb. (*c*) 75-B.H.P., 7-cylinder, Rotary, Air-cooled Aero Engine. 1,200 R.P.M. Weight 2¾ lb. per B.H.P. Total 205 lb.

small suction producers mounted upon the vehicle, and using anthracite, coke, charcoal, etc., as their fuel; encouraging progress has been made in this direction.

Engines for Aircraft.—Characterised by their extreme lightness, these internal combustion engines display the utmost skill in design and refinements in manufacture, and important advances have been made in all details since 1910. (*See* AERO ENGINES; AERONAUTICS.)

Special Types.—Among special types of internal combustion engines may be mentioned the Humphrey pump. In 1913 an installation of five large Humphrey pumps at the Chingford reservoir of the Metropolitan Water Board commenced operations; this plant is capable of dealing with 180,000,000 gal. daily, a quantity exceeding the whole daily supply of Greater London. At the end of 1925 these pumps continued in regular service, and a second similar installation was in course of erection in Australia. The construction of a 1,000 million-gallon-per-day plant near Alexandria (Egypt) was commenced, but was not completed on account of the outbreak of the World War.

A second recent design of internal combustion engine of much interest is the Michell crankless engine oil-operated in the Diesel manner. In this engine the working cylinders are grouped symmetrically around the driving shaft, with their axes all parallel to the shaft axis, and the rotation is effected through a "swash-plate," or inclined disc affixed to the shaft upon which the several pistons act through a bearing "pad" of the well-known Michell thrust-bearing type. Engines of three, four, five, seven and eight cylinders have been built, both of single-ended and double-ended type. An eight-cylinder Michell engine of 50 H.P. recently built, showed on test a mechanical efficiency of 86% at full load. The extremely great difficulties of the internal combustion turbines still remain to be overcome, and little or no real progress can be recorded in this type of motor during the period herein reviewed. (G. A. BU.)

INTERNATIONAL LABOUR ORGANISATION, THE.—This organisation was created in 1919 by Part XIII. of the Treaty of Versailles, headed "Labour." This part was reproduced in all the later peace treaties, appearing as Part XIII. of the Treaties of Saint Germain, Neuilly, Trianon, and Part XII. of the Treaty of Sèvres. These treaties are the first known to history to contain articles dealing with labour.

I. ORIGIN AND CONSTITUTION

The idea of protecting labour by international conventions is in reality not a new one. Strictly speaking, its origins might be traced back to the humanitarian theories of a handful of thinkers who over a century ago foresaw the necessity of establishing economic co-operation among the nations in order effectually to remedy the evils which might spring from the development of modern industry. The name of Robert Owen is often quoted as a pioneer of international Labour legislation on account of the two memoranda which he submitted to the Congress of Aachen in 1818. In reality, although Owen was indisputably a pioneer of protective legislation for national, wage-earning Labour, his memoranda do not contain the idea of an understanding between governments for the establishment of identical protective measures in favour of their wage-earners. A French industrialist, Daniel Le Grand, attempted to promote this idea between 1840–60. But it was only after 1890 that certain governments began to show an interest in it. A conference was held in Berlin, convened by the German Govt., but it confined itself to enunciating a few very general principles. At last, in 1900 the idea took form when a private organisation, encouraged and subsidised by certain governments, was formed under the name of the "International Association for Labour Legislation" (Assn. Int. pour la prot. légale des Travailleurs) with headquarters at Basel.

In 1903 a technical conference summoned by the Association worked out two draft labour conventions, the one dealing with the limitation of night work for women in industry, the other with the prohibition of the use of white phosphorus in the match industry. In 1906 a diplomatic conference adopted these drafts and a few states ratified them. A new technical conference was convoked in 1913 to regulate by new conventions the prohibition of night work for young persons employed in industry and to fix a 10-hour working day for women and young persons. The second diplomatic conference was due to assemble in the autumn of 1914. Meanwhile, the World War broke out. This is the work which was taken up again and officially consecrated by the peace treaties which concluded the War of 1914–8.

Labour in the Peace Treaties.—It may be asked why clauses dealing with the protection of labour were inserted in the peace treaties. The pre-War movement in favour of protection of labour was not in itself strong enough to enforce it. In most countries it was the work of intellectuals, legal experts, or politicians. With few exceptions (*e.g.*, Germany), the workers' organisations took little interest in it. But in almost all the belligerent States the War brought into prominence the share taken by the working classes in national defence and national life. The workers became conscious of this fact. As early as Sept. 1914 a manifesto of the American Federation of Labour declared that peace should not be signed without the participation of representatives of Labour. In July 1916 at a conference at Leeds, of the trade unions of the Allied countries, again in Oct. 1917 at a conference of the trade unions of the neutral countries and the Central Powers at Berne, then again at the conference of the inter-Allied Socialists at London in Sept. 1918 the same idea was again taken up.

"The Treaty of Peace which will end the war and will assure to the peoples political-economic liberty and independence;" said the London Manifesto, "must also safeguard the working

class of all countries from the attacks of international capitalist competiton and assure it a minimum guarantee of moral and material order as regards labour legislation, trade union rights, migration, social insurance," etc.

Immediately after the War these tendencies grew far more pronounced. Revolutions had broken out in the conquered countries and their character had been invariably social. In the victorious countries the leaders of the governments pronounced, in accordance with the general feeling, that " the old world must end " and that the working classes must receive a new place in the national communities. In Feb. 1919, at Berne, the trade unions of all European countries, allied, neutral, or defeated, claimed a labour charter and suggested that the old association, with its labour office, should be transformed into a great official organisation of international labour legislation. A few days earlier (Jan. 29 1919) the peace conference had resolved to constitute a commission for international labour legislation under the presidency of Samuel Gompers, and had called on it " to enquire into the international means necessary to secure common action on matters affecting the conditions of employment." The commission sat from Feb. 1–March 24 1919. It worked out a text which, having been adopted by the peace conference on April 11 and 28 1919, became Part XIII. of the Treaty of Versailles.

Principles and Procedure of the Organisation.—A preamble at the head of Part XIII. defined as follows the principles which gave birth to the organisation.

1. Universal peace, which it is the object of the League of Nations to establish, can be established only if it is based on social justice, and social justice implies the working out of equitable conditions of labour, which it is urgently necessary to apply.
2. The regulation of labour conditions can be accomplished only internationally because " the failure of any nation to adopt humane conditions of labour is an obstacle in the way of other nations which desire to improve the conditions in their own countries."
3. The equitable conditions of labour, and the " humane conditions of labour," which must be applied were defined: the establishment of a maximum working day and week, the prevention of unemployment, the provision of an adequate living wage, the protection of the worker against sickness, disease and injury arising out of his employment, the protection of children, young persons, and women, provision for old age and injury, protection of the interests of workers when employed in countries other than their own, recognition of the principle of freedom of association, the organisation of vocational and technical education and other measures.

In another article (427) of the Treaty of Peace, these principles are formulated afresh and in a more precise form and recognised as " well fitted to guide the policy of the League of Nations " in industrial matters. These principles having been laid down, the Peace Treaty prescribed that a permanent organisation should be established for their promotion. The commission, on meeting in Paris, was approached with proposals emanating from workers' representatives and even from certain States (such as Italy) which aimed at permitting a sort of international Parliament to decree labour conditions which every State would be compelled to adopt. Such proposals appeared incompatible with the idea of national sovereignty as entertained by most states. The International Labour Organisation, it was thought, should not form a " super-state," any more than the League of Nations. The Commission adopted as a basis of its deliberations a British draft which was more modest and, above all, more elastic, and attempted to reconcile the independence of individual States with the authority of an official organisation.

The system adopted was as follows: The International Labour Organisation consists of two essential organs: the General Conference of Representatives of the Members, and an International Labour Office controlled by a Governing Body. The conference meets " from time to time as occasion may require and at least once in every year." It is composed of four delegates of each of the member States, of which two are government delegates and the two others represent respectively the employers and the workpeople. These last two delegates must be chosen by the governments in agreement with the industrial organisations, if such organisations exist, which are most representative of employers or workpeople, as the case may be, in their respective countries. This shows a characteristic feature of the new organisation. In the Assembly of the League of Nations only Government delegates have seats, but here delegates representing the employers and the workpeople of the member states intervene. This indicates the solidarity of economic and protective forces which has imposed itself on the world since the War.

The conference deals with questions which have been included in its agenda by the governing body, and the agenda is transmitted to the member governments four months before the meeting of the conference. At the close of its discussions it may adopt Recommendations or Draft Conventions by a majority of two-thirds of the votes cast by the delegates present, but not otherwise. The member states undertake that, within a year at most from the closing of the Session of the Conferences, or if special circumstance prevent this, in no case later than eighteen months, they will bring the Recommendation or Draft Convention before the authorities within whose competence the matter lies, for the enactment of legislation or any other action. In the case of a Recommendation the member states will inform the Secretary General of the League of the action taken. In the case of a Draft Convention the member will, if it obtains the consent of the proper authorities, communicate the formal ratification of the Convention to the Secretary-General and will take all necessary action to make the Convention effective. In the case of a Convention the obligations which are assumed by member states on ratification are far stricter.

It is necessary to consider the exact weight which the system carries. The States, under the Peace Treaty, have not undertaken to ratify automatically all draft conventions adopted by the international Labour conference. They have simply undertaken to submit the drafts to the authorities competent to enact the legislation. Here lies the essential innovation. Finally, they are still free to ratify or not. But when there was only the International Association for Labour Legislation, before the War, the States which had sent plenipotentiaries to the diplomatic conferences were not even bound to approach their Parliaments with the resolutions adopted. Now they have undertaken this obligation. This obligation may seem to carry little weight, since each State remains free, within its sovereign rights, to ratify or not. But in essence the whole system rests on an appeal to the public opinion of each of these States, and an appeal to Parliament, which is, so to speak, the authoritative expression of this opinion. The whole mechanism invented by the negotiations of the treaty constitutes an act of faith in the feeling of justice which should animate corporate humanity.

Once the conventions have been ratified the mechanism of their application instituted by the Peace Treaty develops in the following manner: by the act of ratification the States contract a mutual agreement to respect equally all clauses contained in a convention. They must allow mutual supervision of their application of these clauses. By Art. 408 of the Treaty of Versailles they undertake to send an annual report to the conference in which they give a list of the measures for their application. Comparison of these reports may always form the subject of discussion at the conference. If one of the ratifying States fails to apply the convention, or applies it imperfectly, other ratifying States, or even industrial associations of employers or of workers may file complaints. When such complaints are received, the governing body of the international Labour office is charged to deal with them. If necessary it may submit the complaint to a commission of inquiry (Art. 409 and 414). In the last instance, the Permanent Court of International Justice can be called on to pronounce judgment. This court may even, under Art. 418, indicate the measures, if any, of an economic character which it considers to be appropriate and which other governments would be justified in adopting against a defaulting government.

II. THE I.L.O. IN OPERATION

The first conference was convoked at Washington in Oct. 1919. The international office was not yet constituted. The programme of the conference had been fixed in the peace treaty itself. A committee of organisation had been entrusted with its preparation. Six draft conventions were voted concerning:—

1. The limitation of hours of work in industrial establishments to eight hours a day and 48 hours a week.
2. Unemployment.
3. The labour of women before and after child-birth.
4. Night work for women.
5. The maximum age for the admission of children to industrial labour.
6. Night work for children in industry.

The Washington conference constituted the International Labour Office, and nominated its first governing body. This governing body appointed the director, M. Albert Thomas. In 1920 a conference was held at Geneva, which was devoted to maritime questions and passed three draft conventions. The first fixed the age of admission to work at sea, the second dealt with unemployment benefit in case of loss by shipwreck, the third dealt with finding employment for sailors.

In 1921 the third session at Geneva voted seven draft conventions dealing with:—

1. The age of admission for children to agricultural labour.
2. The right of combination and coalition of agricultural labourers.
3. Compensation for accidents incurred during work in agriculture.
4. The use of white lead in paint.
5. The application of the weekly rest to industrial establishments.
6. The age of admission of young persons to employment as trimmers or stokers.
7. The compulsory medical examination of children and young persons employed on board ship.

Each of these sessions voted at the same time a number of recommendations.

The fourth session at Geneva in 1922 only voted a recommendation concerning statistics and documents relative to emigration and immigration. The fifth session at Geneva in 1923 also voted only one recommendation concerning general principles for the organisation of inspection services destined to ensure the application of laws and regulations for the protection of workmen. The sixth session at Geneva in 1924 instituted the procedure of giving the conventions two readings, at intervals of one year. Some conventions were thus given a first hearing, most of them being voted in 1925. The session of 1924 only definitely passed one recommendation concerning the utilisation of the spare time of workmen. The seventh session, Geneva 1925, finally voted four draft conventions concerning (1) compensation for accidents arising out of employment, (2) compensation for sickness arising out of employment, (3) equality of treatment for workmen when employed in countries other than their own as regards compensation for accidents incurred during work, (4) night work in bakeries.

In all, then, not counting recommendations, twenty international Labour conventions were submitted to the States for ratification between 1919 and 1925. These conventions dealt with industry-commerce and in some cases navigation and agriculture. As regards agriculture a dispute arose in 1921. It was maintained that the international Labour organisation had not the right, under the Peace Treaty to deal with the protection of agricultural labourers. On this point the advice of the Permanent Court of International Justice was taken through the mediation of the League of Nations under Art. 14 of the Peace Treaty. The permanent court gave a judgment recognising the competence of the International Labour Organisation.

Ratifications.—In what proportion have the States ratified these conventions by the procedure indicated above? In March 1926 the League of Nations had registered 194 ratifications. This figure has given rise to much discussion. It is important to gain a just estimate of its worth. The International Labour Organisation includes 56 States. If one excepts the four last conventions of 1925, which could not be ratified by the time of writing, about 900 acts of ratification could in theory take place for the other 16 conventions. There are only 194—that is, about one-fourth. But this low figure calls for certain remarks. The same value cannot be attached to all ratifications.

1. There are a certain number of conventions which could not be ratified by all States, despite their general character. The maritime conventions, for example, do not interest the States which have neither coasts nor fleets. Similarly, there are countries of small proprietors where the number of wage-earning agricultural labourers is quite insignificant. There are others, again, where certain unhealthy industries against which conventions are directed have not established themselves.

2. There are numerous States in which industry is of little importance and where national labour legislation hardly exists. The Hedjaz, Siam and other States have indicated that the measures laid down in certain conventions are inapplicable to the conditions under which the wage-earning labourers in these countries work.

3. International action is only beginning, and all sorts of reasons delay ratification; not merely the inexperience and inattention of the great national administrations, for which the international conventions are often matters of secondary importance, but also the hesitation to contract obligations which sometimes appear to threaten the output or at least the competitive capacity of the country on the international market. But in spite of these delays important results have been obtained.

In the eight years preceding the War the two conventions of Berne had only been ratified by a very few States. When to-day such conventions as that which forbids night work for women or that which attempts to cope with unemployment obtain the ratification of 16 or 20 states, including great industrial countries like Great Britain, France or Italy, many thousands of workmen are definitely assured of the enjoyment of the benefits of reform. For, under the text of the conventions, the contracting States cannot, for a period of 10 years, go back on the obligations which they have assumed, even in crises where they would be tempted to do so. The effect of the ratifications has been also particularly important in certain countries, for example in India, where the conditions of labour have been greatly improved by the application of the measures contained in the international conventions such as that of Washington.

But even when the conventions are not ratified, they become the model on which the new national legislations form themselves. A country such as Belgium, for example, has established the eight-hour day, which was voted in 1921 in strict conformity with the clauses of the Washington Convention. Similarly, all the young States of Central and Eastern Europe which were formed or resuscitated in 1919 have modelled their entire labour legislation on the general rules laid down by the International Labour Organisation. It seems, then, that despite the difficulties inherent in its first constitution and despite the economic crises which most nations have gone through since 1920, the work accomplished by the unification of labour conditions on a relatively high level by the organisation has had appreciable results.

A Centre of Information.—The work of the International Labour Organisation is not confined to preparing the international conventions, to seeking to obtain their ratification by the States, or to watching over their application. Art. 396 of the Peace Treaty also assigns it further functions which include the "collection and distribution of information on all subjects relating to the international adjustment of conditions of industrial life and labour." Also "the conduct of such special investigation as may be ordered by the conference." It has "to edit and publish in French and English periodical publications." The conference may even assign to it, besides the functions mentioned above, "such other powers and duties" as it chooses.

Thus, since 1919, the International Labour Organisation has become a sort of great clearing house of all information on social questions. It has a library of 150,000 volumes. The ideal would be to make of it a centre where workers would be certain of finding all publications of all countries touching on the regulation of labour. This office collects by means of corresponding offices in Paris, Rome, Berlin, London, Washington and Tōkyō, and collaborators in other capitals, periodical information on social developments in most great countries. It publishes two general periodicals: the weekly *Industrial and Labour Information*, the task of which is to give an exact account of important news in the various branches of social life, and a scientific monthly review, the *International Labour Review*. It further publishes the *Industrial Safety Survey*, which reports all new measures taken and all experiences obtained regarding security of labour; and a *Monthly Record of Migration*. It publishes reviews or bulletins giving a summary of all these publications for the information of different countries, in German in Berlin, in Italian in Rome, in Spanish in Madrid and in Japanese in Tōkyō. Carrying on the tradition inaugurated before the War by the Basel office, it publishes an annual collection, in French, English and Italian, of the documents of social legislation promulgated every year in different countries (*Legislative Series*). Since its formation it has undertaken enquiries on a large scale in all matters of particular importance. Among them may be mentioned the great *Enquête sur la Production* which deals with the economic situation of the world between 1918 and 1925; an inquiry into the conditions of labour in all the coa

ducing countries; inquiry into legislation and labour conditions Russia; another into labour conditions in Asia, etc. It publishes arterly a *Bibliography of Industrial Hygiene*.

The I.L.O. has also attempted to simplify and unify methods of our statistics used in different countries. Two conferences of our statisticians have already been convoked under its auspices. ery year more demands for information are addressed to it by erent governments. Corresponding committees, consultations of erts and special commissions permit the Office to maintain con- t with technicians and scientists of the branches of social life.

Internal Organisation of the Office.—In order to deal with its fold task of keeping up daily contact with the governments, especially with the Ministries of Labour with which it corre- nds directly under Art. 397 of the treaty, and with the organi- ions of workers or employers, the office has to equip itself h a sound internal organisation. Under the Peace Treaty it administered by a governing body nominated for three years the Conference. The governing body consists of 24 members, which 12 represent the governments, six the employers and the workers. Of the 12 governmental representatives eight long *ex officio* to the most important industrial countries (Ger- ny, Belgium, Canada, France, Great Britain, India, Italy and an). If any dispute arises regarding relative industrial im- tance, this must be settled by the Council of the League of tions. A system of indexes has been adopted (based on pop- tion, working population in relation to the total population, am horse-power, length of railway lines, etc.) which makes possible to decide this point. The six workers' representa- es are nominated by the delegates to the conference represent- the workers, and the six employers' representatives by the ployers' delegates. The conference has proposed to enlarge the verning Body, but this will need the amendment of the Peace aty, and it has not yet been done on account of the slow cedure of ratification of the amendment, necessary under . 422 of the treaty.

The Governing Body nominates a director and gives him his tructions. The director nominated in 1920 was M. Albert omas, formerly a French Minister of State. He is assisted by a uty director, who is an Englishman, Mr. Harold B. Butler. The sonnel of the International Labour Organisation amounted in 6 to about 370 employees of all ranks, who were drawn from different nationalities. Under Art. 395 of the Peace Treaty director "shall as far as possible, with due regard to the ciency of the work of the office, select persons of different ionalities." The nations chiefly represented among the per- nel are France and Great Britain, because French and English the two official languages used by the office; next, Switzerland, ause the executive personnel is recruited locally.

The budget of the International Labour Organisation varies ween 7,000,000 and 8,000,000 gold francs. This budget is roduced annually by the governing body before the Assem- of the League of Nations. It is supplied for the most part by tributions from the states which are members of the organisa- n. This contribution is fixed under a scale adopted by the ague of Nations for its own contributions.

Relation to the League.—The International Labour Organisa- n is in fact part of the organisation of the League. For this son, since 1920 it has been established at Geneva. It was first talled in an old college. In 1922 the sum of 3,000,000 gold ncs was voted for the erection of a suitable building on a site ich had been given for this purpose by the Swiss Federation. e I.L.O. is attached to the League of Nations and entitled its assistance, when required, and receives the funds granted by the states through the League, but is nevertheless, like the rmanent Court of International Justice, an autonomous in- tution. Its decisions are not subject to the control of the uncil of the League. The Director of the office is in no way bordinate to the Secretary-General of the League. Indeed, membership of the League carries with it membership of the .O. (Art. 387), it was decided by the persons who negotiated e Peace Treaty as by the Assembly of the League of Nations in 21, that states which are not members of the League can be- me members of the I.L.O. Thus, since 1919 Germany has be- nged to the I.L.O. with equal rights without being a member of the League. A representative of the German Govt. has always sat on the governing body; the workers' group has regularly elected a German member, and the employers have also, since 1922, had a German member in the governing body. There are German employees throughout the office.

In order to gain general information and to carry through scientific research, the I.L.O. remains in almost daily contact with the U.S.A. and with Russia, the only two great states which, for various reasons, do not belong to the organisation.

Conclusion.—The organisation has often been criticised and attacked. It has been reproached with the desire to exceed the limits of its competence. The Permanent Court of International Justice decided, at least in the case of agriculture, that this criticism was not justified. It has also been reproached with being exclusively guided by the workers' interests, and even with being guided by Socialist thought. Yet, no instance has taken place which could justify such an accusation against the director or even less against the governing body. But one fact must not be forgotten, which was brought out in 1921 by a report of the Commission of Inquiry and Organisation of the League of Nations, that the International Labour Office is not simply an organ of conciliation or of keeping the balance between various industrial interests; it must look for conciliation only in order to attain a definite end, which is to realise the programme drawn up in the preamble to Part XIII. of the Peace Treaty. Experience also shows that measures protecting workmen are never fully carried through unless they are made by agreement with the workers and unless the workers are interested in their application.

It is one of the merits of the International Labour Organisation, as conceived and conducted since 1919, that it has been able to keep the sympathies and confidence of the important workers' mass organisations. It is true that the Communists, the leaders of the Third International, violently attack the collaboration of workers in the work of Geneva. But the International Federation of Amstersdam, with its 20,000,000 members, the Christian Unions, the Italian Fascist organisations, take regular part in the conferences of Geneva, and demand that the conventions be applied. It is equally remarkable that the employers continue to be represented at the conferences and on the governing body.

The office of the International Labour Organisation, while it aims at bringing about the "physical, moral and intellectual well-being of the wage-earners," attempts at the same time to take account both of the interests of production, and (to quote Art. 427 of the Peace Treaty) of the differences of climate, habits and customs of economic opportunity and industrial tradition, which make strict uniformity in the conditions of labour difficult of immediate attainment." Further, from the general point of view, the International Labour Organisation has helped to popularise among the industrial masses both of the workers and even of the employers the idea of a definite peace based on an economic understanding and the social solidarity of the nations. It is already the great centre of international collaboration. It is recognised as being one of the great factors of peace. Its history bears witness to all the difficulties attending new international creations. The life of a nation enjoys the natural support of geographical contiguity, of racial community and of age-long tradition. An international organisation can only come to birth and live if public opinion and the judgment of the governments favours a common programme. It appears that the programme of social justice drawn up in the Peace Treaty has sufficient authority and sufficient reason to assure the existence of the International Labour Organisation.

BIBLIOGRAPHY.—See *The Treaty of Peace between the Allied and Associated Powers and Germany*, Part XIII. (H.M. Stationery Office, London, 1925). A list of publications of the International Labour Office can be obtained from the Publications Department of the Office at Geneva, or from their correspondents in different countries.

(A. TH.*)

INTERNATIONAL LAW (*see* 14.694).—The outstanding developments in international law since 1910 are so distinctive that it has been considered expedient to deal with them under separate headings, rather than to attempt to present them in any one general article. The attention of the student is especially

drawn to the following articles: ARBITRATION, INTERNATIONAL; BLOCKADE; COVENANT; INLAND WATER TRANSPORT; INTERNATIONAL LABOUR ORGANISATION; LEAGUE OF NATIONS; MANDATES; MIGRATION; MINORITIES; PERMANENT COURT OF INTERNATIONAL JUSTICE; SANCTIONS AND GUARANTEES; TREATIES; WASHINGTON CONFERENCE.

INTERSTATE COMMERCE (*see* 14.711).—Since 1910 Acts of the United States Congress and decisions of the Supreme Court have extended the scope of Federal control over interstate commerce. The regulation of railways was made more complete, the Federal authority being widened to cover railway rates on traffic within the states when such rates affect interstate commerce. The Anti-Trust Act 1890 was broadened and strengthened by the decisions of the Supreme Court in the oil and tobacco cases in 1911 and by the Clayton Act 1913. In the adjustment of labour disputes between employers and employees engaged in interstate commerce the Government assumed a constantly larger rôle.

Railway Regulation.—The Interstate Commerce Commission was given authority by the Hepburn Act 1906 to establish reasonable maximum rates on interstate traffic, but could act on complaint only. The Mann-Elkins Act 1910 authorised the commission to establish reasonable rates after hearings initiated by itself. This Act also made the Interstate Commerce Act apply to telegraph and telephone companies, and gave the commission authority to suspend proposed increases in rates. While such proposed increases were to become effective in 30 days, the commission might suspend the increase for 120 days, and, if necessary, for an additional period not exceeding six months. The Mann-Elkins Act provided also that no carrier might charge more for a shorter intermediate haul than for a longer haul until he had applied to the commission and permission had been granted because of special circumstances. The Supreme Court subsequently decided that a shipper who, in violation of this provision, has been charged the higher rate for the shorter haul is entitled to the full amount of his resulting damages, but not the difference between the rate paid and the lower rate published for the longer haul (*Davis v. Portland Seed Co.*, 1923, 264 U.S. 403).

The Panama Act 1912 made it unlawful for any railway company or common carrier subject to the Interstate Commerce Act to secure control of any common carrier by water operating through the Panama Canal or elsewhere, provided the carrier by water and the railway company did or might compete with each other. Any questions of fact as to competition were to be decided by the commission. If the commission should be of opinion that the public interests would be served and competition would not be prevented or reduced by the continuance of a control exercised by a railway company over a competing carrier by water, the commission might extend the period of control. In enforcing this provision, the commission compelled the trunk-line railways operating passenger and freight lines on the Great Lakes to dispose of them, but railways were permitted to continue the operation of steamships coastwise between New England ports. The use of the Panama Canal by vessels owned by a competing railway was absolutely prohibited. Any rail carrier that had entered into through arrangements with a carrier by water operating from a United States port to a foreign country was required to enter into like arrangements with any or all other lines of steamships operating from the same port, a provision designed to ensure to shippers from interior points the benefits of competition by through routes to foreign destinations.

The most important legislation affecting carriers enacted after the passage of the original Interstate Commerce Law in 1887 was the Transportation Act 1920, by which the railways, after 26 months of government operation, were returned to their owners. This Act provided for a more comprehensive regulation of carriers by the commission and established new principles in the regulation of rates, revenues and capital expenditure of the carriers. The commission, already the final authority as to rates, was further empowered and directed to adjust rates with a view to enabling carriers, as a whole, to earn as nearly as may be 5½% on the aggregate value of their property devoted to the pul service. The commission might also authorise the carriers to e one-half of 1% per annum additional, the amount thus ear to be devoted to improvements without capitalising the amo so invested. Individual carriers whose net operating reven exceeded 6% were to devote one half of the excess to build up a company reserve fund until the amount reached 5%, other half of the excess being turned over to the Governm and placed in a fund from which advances might be made to carriers. At the end of two years after the passage of the A the commission was to determine the reasonable rate of ret on the aggregate value of the railways, and the commission fi the rate at 5¾% per annum. The Act also authorised the co mission to regulate railway securities, and amended the la against combinations so as to permit railway companies consolidate with the commission's approval.

Intrastate Rates.—The power of the Federal Govt. over trastate rates was extended by important decisions of the Supre Court and by the Transportation Act 1920. In the Minnesota R Case (*Simpson v. Shepard* (1914), 230 U.S. 352), the Supreme Co upheld the action of the State of Minnesota establishing railw rates within the state, although the facts showed that these int state rules affected the rates on interstate traffic and the revenues the carriers engaged both in interstate and intrastate traffic. 1914 the Supreme Court was also called on to consider the validity the order of the Interstate Commerce Commission in what is kno as the Shreveport Case. The business interests of Shreveport, L had complained to the commission that rates within the State Texas, which had been fixed by the state commission of Texas, w so much lower than the interstate rates that it was not possible the merchants of Shreveport to do business in northwestern Tex The commission decided that the wide difference between the int state and intrastate rates constituted an unreasonable discrimi tion, and the carriers were ordered to correct this. On appeal, t Supreme Court upheld the order of the commission (*Houston, E and West Texas Co. v. United States*, 234 U.S. 342).

The principle established by this decision was embodied in t Transportation Act 1920, which provided that when the Interst Commerce Commission finds that any intrastate rate constitutes unjust discrimination against interstate or foreign commerce, t commission may prescribe the maximum or minimum intrast rate thereafter to be charged. Another important decision of t Supreme Court, rendered in 1922, affirmed an order of the Interst Commerce Commission on this point in connection with what known as the Wisconsin Passenger Fares. The order of the comm sion required a horizontal increase of intrastate passenger fares a excess-baggage charges to correspond with fares and charges fix for like interstate service in the same state. The Wisconsin Railro Commission sought to have the commission's order overruled, b the petition was denied (*Wisconsin R. R. Comm. v. C. B. and Q. R. Co.*, 257 U.S. 563).

Amendments to the Anti-Trust Act of 1890.—Prior to 1911 t Supreme Court by a series of decisions (*see* 14.711) had defin the scope of the Anti-Trust Law of 1890, but the net effect of t interpretations had been to limit its effectiveness. Howev in the oil and tobacco cases decided in 1911 (221 U.S. 1 and 19 the Supreme Court adopted a "rule of reason" formulated Chief Justice White, which gave greater flexibility to the A and promised to make the law more effective. The court hel in effect, that the purpose of the law was to prevent und restraint of every kind, and that it did not deny to individua the right to enter into contracts when the right was not impro ly exercised. This interpretation of the Anti-Trust Law was u satisfactory to the extreme opponents of industrial combinatio and in response the Clayton Act was passed in 1914, prohibitin under specified provision, discriminations in prices. Labo unions and organisations of farmers were exempted from t provisions of this law. Interlocking directorates of banks we prohibited, and it was made unlawful for a corporation, engag in interstate commerce, to acquire control by stock ownersh of another corporation engaged in interstate commerce when su acquisition would lessen competition. Carriers engaged interstate commerce were prohibited, after two years from t passage of the Act, from dealing in securities or supplies a from making construction contracts amounting to more th $50,000 with a corporation, firm or partnership having on i board of directors or as one of its officers a person who was the same time a director or officer of the common carrier. Th

ovision was suspended until after the conclusion of the World ar, but was in force in 1921. An important decision of the preme Court subsequent to 1911 was its finding, in *United ates v. U.S. Steel Corporation*, March 1 1920, that the largest all industrial combinations was not a violator of the Anti-Trust t (251 U.S. 417). It reached the conclusion that the public erest would not be served by requiring the dissolution of the el Corporation, but that, on the contrary, its dissolution ght result in a material disturbance to American foreign trade.

Adjustment of Labour Disputes.—The Erdman Act 1898 was ended by the Newlands Act 1913, which provided for a board from five to nine men, and also created a board of mediation d conciliation composed of a commissioner and two other offi- ls designated by the Government. By 1916, however, the rail- y employees had become dissatisfied with the results of bitration, and demanded the establishment of an eight-hour y and a general increase in wages. The carriers resisted, and resulting deadlock was broken by the passage of the Adam- t Act 1916, establishing the standard eight-hour day in the lway service and providing for a commission to decide upon ges. The Supreme Court held the law to be constitutional 3 U.S. 232). The Transportation Act 1920 substituted new chinery for the adjustment of disputes as to wages and work- conditions in the place of the provisions of the Adamson Act. the Transportation Act it became the duty of employers and ployees to endeavour to settle their differences by negotiation. negotiation failed, disputes as to working conditions might be erred to boards of adjustment composed of an equal number representatives of both sides. These boards might be either al, district or national. Provision was also made for the ap- ntment by the president of a railroad labour board of nine n: three representing the public, three the employees and ee the companies. Such a board was constituted in 1920.

n 1926 Congress enacted the Railway Labor Act which sub- uted new machinery in place of that created in the Trans- tation Act of 1920. It makes it the duty of the carriers and ir employees to exert every reasonable effort to make and intain agreements. All disputes are first to be considered in ferences between the parties directly concerned; and adjust- nt boards either on individual lines, or regional, or national provided to adjust disputes arising under such agreements l to interpret and apply them. Disputes that cannot be so usted may be referred to a board of mediation by either ty, or the proposed board may intervene on its own initia- e, and if an amicable adjustment cannot be attained in this nner, an effort is to be made to induce both parties to agree voluntary arbitration. Should such effort be unsuccessful and interruption of commerce be threatened, the President is n authorised, in his discretion, to create a board to investi- e and report to him within the next succeeding thirty days, l a proviso is included to the effect, that, in the event that steps leading up to the appointment of this emergency board to bring about a settlement, transportation may not be errupted for a period of 60 days. It is understood that s act had the approval of large groups of railway executives, l employees, and is the result of a series of joint conferences.

United States Coal Commission.—In 1922 an Act was passed claring that a national emergency existed in the production, nsportation and distribution of coal and other fuel. It gave plementary powers to the Interstate Commerce Commission issue, in transportation of coal or other fuel, orders for orities in car service, embargoes and other suitable measures, l to take any other necessary steps for the priority in trans- tation, and for the equitable distribution, of coal or other fuel l prevent their purchase or sale at prices unreasonably high. 1923 an Amending Act established the U.S. Coal Commission not more than seven members for the purpose of securing rmation in connection with questions relative to interstate mmerce in coal and all questions and problems arising out of l connected with the coal industry. The commission's report tained a full account of economic conditions in the coal- ing industry.

(E. R. J.)

INVENTION.—Nothing is more significant of the activities of human ingenuity than the tale of the inventions which reach the national patent offices for record and official approval. The stimulus of social conditions and economic necessity are marked most significantly here. Why some inventions succeed is often obvious. Many inventions fail to achieve commercial success though valuable and useful in themselves, sometimes because existing processes adequately satisfy the need, sometimes because they are too advanced and the need for them has not yet arrived. Indeed, analysis of the causes of failure is full of interest. The phenomena of cultural lag deserve serious study.

Previous Knowledge.—All inventions, in a sense, are conditioned by existing knowledge, nearly all depend directly or indirectly on previous conditions. The motor-car, the aeroplane, wireless telegraphy, the steam turbine, could not have reached their present stage of development without a long series of prior inventions. The science of the metallurgist, the chemist, the physicist, has made it possible to produce materials which combine strength with lightness, which possess properties in the required degree—magnetic, electric, chemical—so that even the simplest product represents the sum of a series of minor inventions and contributions to knowledge.

The range of problems presented to the inventor is well shown by the progress of invention as applied to the motor-car. The development of the internal-combustion engine entailed improvements in the magneto, in carburettors, in the "timing" gear, in the valves, improvements due to advances in electrical science and metallurgy. With increase of power comes the necessity for greater brake power. Night travel demands better lighting. Popular demand requires mass production. That in turn involves standardisation and that is impossible without prior advances in the manufacture of machine tools (*q.v.*) and measuring instruments (*q.v.*). Here pure science is called in to solve the problems which underlie modern economic activity. Then there is the need for simplification and strength. The car must be made safe and foolproof. The tendency to elaboration is constantly checked by the need for simplicity.

Key Inventions.—There are, of course, key inventions which open vast ranges of further development. These attract attention and are, in every sense, of the highest importance. Nevertheless, there may be as much ingenuity and utility in a single device which simplifies some elaborate process or meets some widespread human need. Such inventions as these, too, deserve, even if they do not always achieve, success.

Every Patent Office throughout the world when its records are studied broadly on these lines tells the same tale. Thus, in Great Britain since 1910, the trend of invention has varied considerably owing to important changes in social conditions. The inventions of the years 1910–4, when social conditions were normal, present a trend very different from that of the War period and different from that of the years 1919–25, which was a period of recuperation and reconstruction. These three periods, however, have one important common feature, viz., that the numbers of inventions relating to locomotion and intercommunication were exceptionally great.

Inventions of the Period 1910–4

Motor-cars, etc.—The first application of self-starters to motor-cars seems to have been made by the Adams Manufacturing Co., of Bedford, in 1911 and was followed by many inventions for mechanism of this kind. There were also numerous inventions for variable-speed gears, lighting sets, detachable rims and spring wheels. In motor-cycles, the replacement of belt or chain variable-speed gearing by toothed gearing and the introduction of the kick starter determined the modern form. Many forms of lifeguards for use on trams and omnibuses were patented and, after the taxi dispute in 1911, there were many inventions for registering "extras" (*see* Motor Vehicles). Inventive activity was very marked in connection with internal-combustion engines, especially those of the fixed radial, revolving cylinder and "valveless" types, and in carburettors (*see* Internal Combustion Engine).

Aeronautics.—Many of the aeroplane inventions related to details of machines which, like the Farman biplane and the Morane monoplane, were well known. The use of these inventions eliminated, to a large extent, unsuitable flying-machines. Directly driven tractor screws and rear elevators became more generally adopted. The

importance of aircraft as an auxiliary in warfare was appreciated and, in 1911, inventions for launching aeroplanes from the decks of battleships were patented. The airships "Beta" and "Gamma," built at Farnborough, made several successful flights; they were inflated with hydrogen generated in Oerlikon electrolysers, which usually employed a pure solution of potash. About the year 1912, the seaplane, provided with floats, was brought into use (*see* AEROPLANE; AIRSHIP; SEAPLANE).

Railway Signalling.—A series of inventions for automatic signalling to prevent trains from being signalled into a section containing a standing train was patented in 1911, after the accidents at Hawes Junction and Pontypridd. In 1913, there were many inventions for automatically signalling and stopping trains and in 1914 for locking carriage doors from the guard's van (*see* RAILWAY SIGNALLING).

Life Saving.—Following the disaster to the "Titanic" (*q.v.*) in 1912, there were many inventions for life-saving appliances for personal wear, detachable ships' fittings to serve as rafts, and boat-lowering gear; there were also inventions for enabling a ship to receive wireless distress signals when the operator was off duty.

Transmission Gear.—The Constantinesco system of transmitting power by means of a pulsating column of water was applied to rock drills and other apparatus.

Water Supply.—In the year 1913, the Metropolitan Water Board brought into use, at their Chingford reservoir, a powerful pump of the pulsometer type, the Humphreys internal combustion pump (*see* PUMPS).

Telephones.—The first automatic telephone exchange for public use in England was opened at Epsom, in 1912. Following this, there were many inventions relating to junction and trunk line working for facilitating the gradual introduction of automatic systems (*see* TELEPHONES).

Fixation of Nitrogen.—Many inventions for the synthetic production of ammonia from the nitrogen of the atmosphere were patented, some of the most important being those of the Badische Anilin und Soda Fabrik, developing the catalytic Haber process. (*See* NITROGEN, FIXATION OF.)

Medicine.—Ehrlich's invention of Salvarsan, introduced in 1910, for the treatment of venereal and other spirochaetal diseases, has been of great value (*see* PHARMACOLOGY).

Rubber, etc.—In 1911–3, there were many inventions relating to the synthetic production of isoprene and of rubber, the coagulation of rubber latex and the cold process of vulcanisation by using sulphuretted hydrogen and sulphurous acid gas in succession (Peachey's process). The use of accelerators, *e.g.*, piperidine, was also introduced in vulcanising (*see* RUBBER).

In 1913, there were series of inventions for converting heavy oils into motor spirit and for obtaining light oils from coal by carbonising at a low temperature.

Stainless steel, a chromium-steel alloy, was brought into use toward the end of the period.

Electric Lamps.—In connection with filaments for incandescent electric lamps, many inventions related to the production of osmium, tantalum, niobium, molybdenum, and tungsten and to apparatus for swaging and wiredrawing these metals. One of the most important inventions of the period was the half-watt lamp, British Patent Specification, No. 10918 of 1913 (*see* ELECTRIC LIGHTING).

The thermionic valve for use in wireless was another very important invention.

In the textile industry, there were many inventions relating to collecting dust in and ventilating cotton-mills and to mechanical means for shuttle-threading. There were numerous inventions for gyro-compasses (*see* GYROSCOPES), artificial horizons, gyro-stabilisers, and other apparatus depending on the application of the gyro principle. The selection and intermittent exposure of advertisements and the projection of cinema pictures in natural colours were important subjects of invention. There were also many inventions for slider or "lightning" fastenings for corsets, boots and pouches.

INVENTIONS OF THE WAR PERIOD

The numbers of inventions connected with industries, other than those of importance in warfare, fell off considerably. Inventions connected with military and naval operations were brought into use in rapid succession; periscopes (*q.v.*), Mills bombs (*q.v.*), the Lewis gun, the paravane (*q.v.*) for protecting ships from mines and torpedoes, camouflage (*q.v.*) systems, depth charges and other means for use against submarines, Pomeroy and other explosive and incendiary bullets for use against Zeppelins, the tanks (*q.v.*), body armour, and combination knives, forks and spoons are only a few examples.

Aircraft.—The inventions connected with aircraft were of outstanding importance and their use resulted in the production of many highly efficient machines. The Fokker monoplane had an all-metal fuselage and a tractor screw through which a Maxim gun was arranged to fire by means of a synchronising gear. The D.H.2, a British single-seater biplane with pusher screw and a wide range of fire was used successfully until it was superseded by machines with a tractor screw through which a Vickers machine-gun was arranged to fire by means of Constantinesco's hydraulic synchronising gear. The twin-engined Gotha was a long-distance German bombing-machine and was provided with a sighting-telescope capable of being used with scientific accuracy.

Thermionic Valves, etc.—Thermionic valves (vacuum tubes) for use in telephony and wireless receivers (*see* VACUUM TUBES; WIRELESS) the recovery of benzene, toluene and other hydrocarbons in gas and coke manufacture, and the synthetic production of ammonia received a great deal of attention.

Michell Bearings.—The segmental pivoted thrust blocks known as Michell bearings were used on a large scale, especially in submarines (*q.v.*). These bearings were first made in 1905 and, in 1913, were fitted in the cross-channel steamer "Paris." Michell bearings take up a comparatively small space and are easily lubricated.

There was a large number of inventions for toys and games of a warlike kind and for the manufacture of dolls' heads and eyes which before the War, had been imported in large quantities.

INVENTIONS OF THE PERIOD 1919–25

The trend of invention reverted to a large extent toward improvements of commercial importance. It resembles the trend of invention for the period 1910–4, but presents the additional feature that rapid and extensive developments have been made possible by utilising inventions brought into use under war conditions. This is exemplified in aeronautics by the long-distance flights to many countries during the past few years; long-distance wireless telephony and broadcasting (*q.v.*) made possible by the use, during the War, of efficient thermionic valves in telephony from aeroplanes; and, in the chemical industry, by the recent successes in the commercial production of ammonia from the nitrogen of the atmosphere, following the improvements made during the War (*see* NITROGEN, FIXATION OF).

The Autogyro.—A remarkable form of aeroplane, the Autogyro, patented by Señor de la Cierva, of Madrid (British Patent Specification, No. 196594), is capable of descending vertically or nearly so with safety. It differs fundamentally from the Helicopter in that the windmill is not driven by power but, as its name indicates, turns freely upon its shaft (*see* AEROPLANE).

Internal Combustion Engines.—The use of the Diesel and other oil motors in place of steam-engines has made great progress. A recent invention by the Vulcan Co., of Stettin, introduces a hydraulic transmission gear between the motor and the ship's propellor to minimise the effects of vibration (*see* TRANSMISSION GEAR).

Turbines, etc.—During the last few years, there have been inventions for the application of turbine engines for driving locomotives and many inventions have had for their object the increasing of the efficiency of steam engines by using steam at very high pressures. In the Blonquist steam generator, producing steam at about 8,000 lb. per sq. in. the generator elements are horizontal steel tubes rotating rapidly so that the water in each tube forms an annulus. A boiler at Weymouth, Mass., operates at a pressure of 1200 lb. per sq. in. (*see* BOILER; STEAM ENGINE; TURBINE).

Motor-car Problems.—An inertia gear, invented by Constantinesco, is designed to adjust automatically the power developed by the motor of a vehicle in accordance with the varying resistance on inclined roads or on roads having surfaces of varying quality. For the supply of petrol to motor-cars and other vehicles on the road there have been brought into use many forms of petrol pumps and other delivery apparatus; these have been mostly of American origin (*see* MOTOR VEHICLES).

Shipbuilding.—In the construction of ships, a combination of the longitudinal and the transverse systems of framing has been brought into use and there is a tendency toward the use of the longitudinal for the bottom of the ship and the upper deck and the transverse for the sides (*see* SHIPBUILDING).

Gyroscopes.—There has been great attention devoted to the application of the gyroscope in the arts, especially in connection with automatic-steering apparatus, ship stabilisers, gun-control apparatus and aerial photography (*see* GYROSCOPES).

Vacuum Tubes and Thermionic Valve.—For the efficient working of thermionic valves, the use of high *vacua* is important and there have been inventions for obtaining these *vacua* by eliminating from the bulb or other vessel not only the air but also residual mercury vapour. These *vacua* have also been of great importance in X-ray tubes for shortening the time of exposure (*see* VACUUM TUBES). Thermionic valves have also been used in gramophones to replace the ordinary amplifying means; large diaphragms have also been used recently in gramophones for amplifying purposes.

Activated Carbon.—A form of carbon with an exceptionally high degree of porosity has been invented. It is called "activated carbon" and its gas-occluding, catalytic and filtering properties are very powerful; it is of great value in sugar refining.

Flotation Processes.—Oil and other flotation processes have been applied for the recovery of clean coal from coal residues and also for separating molybdenite and various metals from their ores.

Ore Deposits.—The location of ore deposits by means of electric nd magnetic apparatus has also received a great deal of attention.

Stainless Steel.—There have been many inventions for improving ne manufacture of the chrome-steel alloy used in making stainless teel (*see* RUSTLESS STEEL) for cutlery and other articles; a very ecently proposed use of stainless steel is for making the metal ttings of road vehicles.

Alcohol.—For obtaining methylic and higher alcohols (*see* ALCOOL) from carbonic oxide and hydrogen, the Badische Anilin und oda Fabrik has brought into use processes similar to their high-ressure processes for the synthetic production of ammonia.

The same company is also experimenting with processes for conerting coal into oil (*see* FUEL PROBLEMS).

Artificial Silk.—Many inventions for improving the manufacture artificial silk (*q.v.*) have been patented. The dyeing (*q.v.*) of acetate lk, the artificial silk usually called celanese, by the use of ionamines id by adding a protective colloid, which may be obtained by grind-g an insoluble dye with sodium sulphoricinoleate, to the dye baths is received attention during the past few years.

Rubber Processes.—There have been many inventions for the use accelerators capable of powerful action in the vulcanising process ee RUBBER), *e.g.*, aldehydes, amines and *p*-nitroso dimethylaniline. he treatment of rubber latex which has been delivered in large uantities by the rubber producing companies, has received a great al of attention. A receat invention (Hopkinson's British Specifition No. 157978) is for spraying the latex so as to atomize it; the ater in the sprayed latex is evaporated and crude rubber remains.

Artificial Foods.—Many inventions relate to the production of tificial foods containing large percentages of vitamins (*q.v.*) selected favour healthy development or to counteract tendencies towards ckets, beri-beri and other diseases. Many of the vitamins introced are of the fat-soluble A (cod-liver oil) type or of the water-luble B (yeast) type.

One of the most active subjects of invention has been the manucture of artificial limbs, the efficiency and value of which have been nsiderable. Destructible receptacles, intended for use once only id produced in vast numbers at a low cost have been patented in any forms. These receptacles, for use in serving jellies, ices, etc. e made of cardboard or other cheap material.

Photography.—Photographic surveying from aircraft, employed rgely during the War, has been utilised for topographic surveying. ne method has been found by archaeologists to be useful in discover-g and investigating traces of ancient encampments and other ttlements, for the views obtained show details not visible at close arters (*see* ARCHAEOLOGY: AIR SURVEY). Prof. Sir J. B. Henderon's gyroscopically controlled camera has been designed chiefly r use on aeroplanes. (T. E. L.)

IOWA (*see* 14.732).—The population of Iowa according to the ate census was 2,419,927 on July 1 1925, as against 2,404,021 1920 and 2,224,771 in 1910. In 1920 the native whites of ative parentage numbered 1,528,553; those of foreign or mixed rentage, 629,981; and the foreign-born whites, 225,647. The gro population was 19,005. There were in 1920 43·2 inhabints per square mile as against 40 in 1910. In 1920 the urban popuion was 36·4% of the whole. There were seven cities having a opulation of over 25,000 as follows:—

	1920	1910	Increase %
Des Moines	126,468	86,368	46·4
Sioux City	71,227	47,828	48·9
Davenport	56,727	43,028	31·8
Cedar Rapids	45,566	32,811	38·9
Dubuque	39,141	38,494	1·7
Waterloo	36,230	26,693	35·7
Council Bluffs	36,162	29,292	23·5

Agriculture.—In 1925 the aggregate crop acreage in Iowa was ,991,893 and the value of the farm lands and buildings was 4,961,427,734. In 1924 Iowa was first among the states in the creage, production and total value of both corn and oats. Iowa's rn crop in 1909 was 341,750,460 bu., valued at $167,622,834, om 9,229,378 ac.; in 1924, 304,752,000 bu., valued at 283,419,-00 from 10,884,000 acres. The number of cattle on Iowa farms 1925 was approximately 4,507,000, of horses 1,220,000 and sheep 891,000; while in the number of swine Iowa increased om 7,545,853 in 1910 to 10,539,000 in 1924, but decreased to ,958,000 in 1925.

Manufactures, Mining and Transportation.—Meat-packing ntinues to lead manufacturing industries, the value of prodcts of slaughtering and meat-packing having increased from 58,913,482 in 1909 to $152,631,945 in 1923. The second industry in value of products in 1923 was butter. In 1909 this product was valued at $24,440,715 and in 1923 at $67,972,113. Food preparations, including cereals and breakfast foods, were third, the value of these products increasing from $0,795,000 in 1909 to $37,698,210 in 1923. The value of all manufactured products was $259,237,637 in 1909; $690,042,714 in 1923. The most important mineral product in Iowa is bituminous coal; in 1910 the value was $12,682,106; in 1919 $16,003,358; in 1922 $16,119,000. The value of clay and clay products in 1919 was $8,127,000. Portland cement and gypsum products were also prominent. The railway mileage was 9,781.65 in 1910 and 0,843 in 1924. The mileage of interurban electric lines has increased from 373·92 to 946·49, or about 153%.

Education.—The Federal census of 1910 credited Iowa with the smallest percentage of illiteracy of any state in the Union (1·7 %.) In 1920, with a percentage of 1·1% it still maintained first place. State aid became an important factor in the development of public schools in the period following 1910. Legislation granted such aid to large, centrally located, consolidated schools, which replaced small scattered ones. At the close of 1920 there were 430 consolidated districts, including about 25% of the area of the state and taking care of approximately 50,000 pupils. In 1911 state aid was granted by law to high schools organising normal training of rural teachers of which schools there were, in 1918, 172. In 1917 a state board for vocational education was established to take advantage of the provisions of the Smith-Hughes Act offering Federal aid for vocational education. A law, enacted in 1919, provided for part-time schools for the benefit of children between the ages of 14 and 16 working on employment certificates. The establishment of these schools was required where there were 15 eligible pupils in the district, and attendance became compulsory.

Legislation.—The only constitutional change made during the period 1910–25 was an amendment ratified by the people in 1916 fixing the time of the general election for that year on the same day as the presidential election, the time of election thereafter to be determined by the General Assembly. In 1916 a constitutional amendment extending suffrage to women was submitted to the electors but was defeated. The Federal suffrage amendment was adopted in 1920. The vital portions of the "mulct tax" law of 1894 (*see* 14.734) were repealed by the General Assembly in 1915, thus restoring statutory prohibition in Iowa, but a prohibitory amendment to the state constitution was voted down by the electors in Oct. 1917. The Eighteenth (Prohibition) Federal Amendment was however ratified by Iowa Jan. 15 1919. The constitution of 1857 provided that in 1870 and every ten years thereafter the question, "Shall there be a Convention to revise the Constitution and amend the same?" should be submitted to a vote of the electors of the state, and in case of a favourable vote the General Assembly should provide by law for the election of delegates. In the election of 1920, for the first time, the vote showed a majority in favour of a convention.

The General Assembly in 1913 passed an Employers' Liability and Workmen's Compensation Act; and at the same session a Mothers' Pension Act was passed, providing for the granting to widowed and indigent mothers of sums not to exceed $2 per week for each child under 14 years of age. In 1915 the Perkins law was passed, providing free treatment for crippled children of poor parents. In 1917 an appropriation was made by the General Assembly for the erection and equipment of a hospital at Iowa City for such children. Two years later the General Assembly provided that adults as well might be sent to Iowa City for free medical and surgical treatment. In 1917 the General Assembly established at Iowa City a child-welfare station for the consideration of conditions and measures.

An important development was the farm bureau movement. By 1917 organisations among farmers in the state were numerous, and in that year the General Assembly passed an Act providing that where a farm-improvement association in any county had among its members 200 farmers or farm owners and had raised $500 in annual subscriptions, the county board of supervisors

was authorised to contribute $2,500 for the employment of a county agent. A law in 1919 modified the amount and terms of the payment by the county and made the contribution mandatory. The movement gained rapid headway, county associations being established for the betterment of both social and economic conditions and the improvement of agricultural methods. In 1920 there was a farm bureau in each county and two in Pottawattamie county, and a membership of over 100,000. There was also a considerable growth within the state of a farmers' educational and co-operative union which had over 20,000 members in 1920.

Government and Finances.—The commission plan of government, authorised in 1907 for cities of 25,000 or more inhabitants, was extended to cities of 2,000 or more inhabitants. By 1920, nine cities had organised under the commission plan: Burlington, Cedar Rapids, Des Moines, Fort Dodge, Keokuk, Marshalltown, Mason City, Ottumwa and Sioux City. In 1915 the General Assembly passed Acts allowing cities to organise their municipal government under city-manager plans, but they have not been generally taken advantage of. The General Assembly in 1913 provided that Supreme, District and Superior Court judges should be nominated and elected on a non-partisan ticket, but in 1919 the nomination and election of judges was restored to a party basis.

In 1911 the office of commerce counsel was created, the incumbent to be appointed by the Board of Railway Commissioners and to serve as expert counsel for that board. In 1913 the Department of Insurance was created, and in 1917 a state Banking Department was organised and the office of Superintendent of Banking created. In 1915 a state Board of Audit and a state Board of Accountancy were created, and the office of Document Editor was established to relieve the Secretary of State. The road administration was reorganised in 1913 when the General Assembly established a highway commission consisting of the dean of engineering of the State College of Agriculture and Mechanic Arts and two appointive members. Highway legislation in 1919 divided the highways into primary and secondary systems, and arranged for the distribution of Federal and state aid funds for the hard surfacing of primary roads.

In 1923 the assessed valuation of property in Iowa was $1,766,329,861 on which were levied taxes amounting to $12,523,228 ($5.09 *per capita*). The funded and floating debt of the state was $11,797,100; the net debt was $11,715,131 ($4.76 *per capita*).

History.—The history of Iowa in the years 1910–25 was marked by no economic or political changes of great importance. The state remained predominantly agricultural. Although its manufactures increased in importance, it was little disturbed by industrial controversies. The supremacy of the Republican party in politics was not seriously questioned. Owing to a split in the Republican party in 1912, the Democratic candidate for President received the electoral vote of Iowa, but the state returned to the Republican ranks in 1916, and in 1920 cast an overwhelming vote for Harding for President and for Nathan E. Kendall for governor. Throughout the period U.S. Senator Albert B. Cummins continued to represent the state. The death of Senator Jonathan P. Dolliver in 1910 caused a vacancy, filled temporarily by the appointment of LaFayette Young. In 1911, William S. Kenyon was chosen to fill the position; he was re-elected in 1913 and 1918. In 1920, Albert B. Cummins was again elected to the Senate, for the term ending March 4 1927. On Feb. 24 1922, William S. Kenyon resigned his office of Senator, Gov. Kendall appointing Charles A. Rawson of Des Moines to fill the vacancy until the next election. At the primary election held in June 1922, Smith W. Brookhart of Washington, Iowa, was chosen as the Rupublican candidate, and at the general election following was elected for the unexpired term. In 1924, Mr. Brookhart was nominated and elected for the term ending March 4 1931. Republican governors were elected or re-elected every two years, incumbents being: Beryl F. Carroll, 1909–13; George W. Clarke, 1913–7; William L. Harding, 1917–21; Nathan E. Kendall, 1921–5; John Hammill, 1925–

'IRAQ (*see* MESOPOTAMIA, 18.179), a mandated Arab kingdor in Asia Minor embracing the former Turkish vilayets of Baghdad Basra and Mosul. Area 143,250 square miles. Population 2,849,282 (1920). 'Iraq is bounded on the west by Transjordan, o the southwest by Arabia, on the south by a neutral zone, on th southeast by Al Kuwait and the Persian Gulf, on the east by Per sia, on the north by Turkey and on the northwest by Syria. Th British Empire is the Mandatory Power.

The terms of the mandate were never formally laid down b the League of Nations, but the relations between Great Britai and 'Iraq were defined in a treaty concluded on Oct. 10 192 and ratified on Dec. 19 1925. On Sept. 24 1924 the League ac cepted this definition as giving effect to the provisions of Art. 2 of the Covenant. The period of the treaty was extended t 20 years by a subsequent treaty executed on Jan. 13 1926, an ratified on March 30 1926. The 'Iraq Govt. is a limited mon archy on the Egyptian model, with a King, a senate of 20 nom inated members and a lower house of 88 deputies. The countr is divided into 12 liwas. The administration is in the hands o the 'Iraq Govt., represented in each liwa by a Mutasarrif who i assisted by a British official with advisory powers. The 12 liwa are Mosul, Erbil, Kirkuk, Sulaimaniya, Diyala, Baghdad, Du laim, Kut, Karbala, Hilla, Ad Diwaniya, Muntafiq and Basra

I. POLITICAL HISTORY

Nationalist Movement.—During the years from 1911 up to th outbreak of the World War, the Ottoman régime in the distan Mesopotamian vilayets showed marked deterioration. The las hope that any efficient administrative system might be estab lished in Mesopotamia vanished with the fall in 1911 of Nazir Pasha, an energetic man of singular integrity, who had set him self to the intricate task before him with all the rude strength o a Turkish soldier of the old order. The Italian and Balkan war had weakened the central Government, while in the Arab prov inces, in particular, the disappointment of hopes born of th constitution of 1908 was leading to a recrudescence of racia aspirations. Damascus and Beirut had long been centres o nationalist movements, but already, at the end of 1913, the secre society called the Ahd (the league) embraced the three Mesopo tamian vilayets as well as Syria. A prominent figure in the move ment was Saiyid Talib Pasha of Basra. He had reached th stage in his career when nationalist enthusiasm seemed best cal culated to serve his ambitions. He had, however, exhauste Turkish patience, and steps were about to be taken to dispose o him in true Turkish fashion when War was declared on Oct. 2 1914. Talib approached Sir Percy Cox, and offered to raise a Arab revolt in return for recognition as an autonomous local chie The reply was not satisfactory; he fled to Al Kuwait, and thenc to Ibn Sa'ud, who interceded for him. He ended by going t India, in voluntary exile, and, in 1917, was permitted to move t Egypt, where he remained till his return to Basra in Feb. 192

The Mesopotamian Campaign.—The declaration of war wa followed on Oct. 31 1914 by a proclamation by the Politica Resident in the Persian Gulf to local Arab rulers explaining tha Turkey had entered the War at the instigation of Germany an promising the chiefs who had enjoyed the protection of Grea Britain that no act of that country should threaten liberty o religion. With these assurances the princes of the Gulf wer satisfied. Before military operations had begun, Sir Percy Cox whose efforts had consolidated the British position in the Gulf joined the army concentrated at Bahrein as Chief Politica Officer. On Nov. 6, when the British took Fao fort, he issue a second proclamation repeating the assurances already given

A determined attempt was made by the Ottoman Govt. t rouse fanaticism by preaching a *Jihad*, but the tribesmen gave th Turks less than half-hearted support. By Nov. 21 the Turks ha abandoned Basra; the British position on the Shatt-al-'Ara

s secured, and the refinery of the Anglo-Persian Oil Company Abadan was safe. On Nov. 22 British troops entered Basra d, in the name of the general officer commanding-in chief, Sir rcy Cox published a third proclamation assuring the inhabiits that Turkish rule was dead and that Great Britain was eir good friend and protector. The British arrival at Basra s greeted with acclamation by the terror-stricken popue; civil administration was set up under the G.O.C., with Sir rcy Cox as Chief Political Officer. As success followed success, arge measure of law and order followed in the wake of the arm. The administration was well served by the revenue comssioner, Mr. Dobbs, now Sir Henry Dobbs, who made the first idy of agrarian conditions. His profound knowledge of tribal stom enabled him to discern and account for agrarian phenoma and the accompanying tribal unrest and, not least, to draw the tribal criminal disputes regulations, on a model which had

orked with success on the Indian frontier, thus solving the probm of administering to tribesmen justice which should be adeiate and also comprehensible to their primitive understanding. The advance from Basra to Baghdad is described under ESOPOTAMIA. A period of grave anxiety preceded the victory Shu'aiba, on April 12 1915, when a reverse would have enailed the annihilation of the Indian Expeditionary Force "D.', fter the retreat from Ctesiphon, Nov. 25 1915, and the fall of ut on April 29 1916, the fate of 'Iraq hung in the balance, but ie reorganisation of the force under General Maude laid the founations of victory, and Baghdad was occupied on March 11 1917. In the proclamation which General Maude issued upon the occuation of Baghdad a definite promise was given that alien initutions should not be imposed, that Arab aspirations should be alised and that on those grounds the collaboration with British olitical officials of Arab nobles, elders and representatives was equired. A further development of civil administration was ade when in July 1917, Sir Percy Cox was appointed Civil Comissioner. The country suffered great loss in the death in Nov. 917 of General Maude, whose distinguished powers as a military ader had earned the respect and admiration of 'Iraqis, but nder General Marshall the success of British arms was carried on. ate in Nov. 1917 the northern Euphrates was occupied up to amadi, and in March 1918 up to 'Ana. In the same month, a rious incident occurred on the middle Euphrates. The holy owns of Karbala and An Najaf were not only racked by internal ud, but both they and the adjacent tribesmen owned the sway f Persian divines to whom the secular interests of 'Iraq counted othing. In the first years the British government of occupation as fortunate in finding in the recognised leader of these Mujtahids man of singular personality who, while consistently refusing to give open advice on political questions, tacitly backed the Power which had been placed in command by the vicissitudes of war. Nevertheless, the holy towns presented a fertile field for intrigue, and when the government of occupation showed a determination to check the rapacity of the local chiefs of An Najaf, a plot, engineered from without, came to a sudden head with the murder of the newly appointed assistant political officer.

Sir Percy Cox was on his way home to attend a conference in London, but the situation was handled successfully by Colonel Wilson, afterwards Sir A. T. Wilson, who was in charge. He was aided by the universal condemnation of the An Najaf rebels by public opinion elsewhere and by the friendly relations which were maintained with the chief Mujtahid. Though An Najaf was blockaded, not a shot was fired; but the pressure exerted resulted in the handing over of the guilty by May 1. A court of specially qualified officers condemned 13 of the men to death. Over 100 persons were sentenced to transportation for life or for shorter periods, but all these have since been permitted to return.

Northeast of Baghdad, progress was hindered by the Russian débacle, but when, at the end of June 1917, the upheaval which was taking place in Russia obliged the Russians to retire, the British force gradually drove the Turks from the vacated positions, occupying Khanaqin in Dec. 1917, and Kifri in April 1918. The first task of the British administration was to save these provinces from the destitution and famine into which they had been plunged by the flux and reflux of Turkish and Russian armies, but again the British advance was impeded by the rapid dissolution of the Russian forces in Persia and the necessity of guarding northern Persia from Turkish attack. It was the more unfortunate, as nowhere was the establishment of administration effected more smoothly than among the Kurdish and Turkoman elements with which the British forces now came into touch. Kirkuk was reached in May, and immediately a provisional government under a local magnate, Shaikh Mahmud al Barzanji, was set up voluntarily in Sulaimaniya in friendly co-operation with the British. But the exigencies of the Persian situation made it impossible for the General Staff to maintain the position so easily acquired; the British, accompanied by a large number of the Christian population, abandoned Kirkuk, which was not reoccupied until the final advance, in Oct. 1918, ended in the occupation of the whole of the Mosul vilayet.

Liberation of 'Iraq.—On Nov. 7 1918, 10 days after the signature of the Turkish armistice at Mudros, the British and French governments issued a joint declaration of vital importance to the occupied Arab territories, stating their aims in the East to be:—

> The complete and final enfranchisement of the peoples so long oppressed by the Turks, and the establishment of national governments and administrations drawing their authority from the initiative and free choice of native populations.

The proclamation went on to promise encouragement and help in the establishment of native governments and administrations in Syria and Mesopotamia. General Maude's pronouncement had been made while the upshot of war was still doubtful, and was therefore discounted as a natural mode of propaganda, whereas the Anglo-French declaration was published after victory had been achieved. Together with President Wilson's Fourteen Points, it gave unbridled play to political speculation, which was further encouraged when the British Govt. directed Colonel Wilson to hold an inquiry as to whether the people of 'Iraq were in favour of a united Arab State from the northern boundary of the Mosul vilayet to the Persian Gulf under British tutelage, whether they desired that this state should be placed under an Arab Amir and if so whom would they suggest. In the light of experience it can safely be said that public opinion was not ripe to reply to these questions which, in the provinces, at any rate, were nothing but a bewilderment to tribesmen, landowners and cultivators. Save on the first point, which was unanimously approved, no definite answer was given. In Baghdad the representative Moslems assembled by the Sunni and Shi'ah Qadhis asked for an Arab State under a son of the Sharif Hussein. Elsewhere every variety of reply was given.

No action could be taken on replies so conflicting, but during the year 1919 some progress was made towards the appointment of local subordinates in an advisory capacity. Other factors had, however, come into play. The first of these was the establishment of an independent Arab State in Syria, largely the handiwork of a number of eager and adventurous 'Iraqis who were anxious to return home and enjoy the same powers as those of which they stood possessed in Damascus or Aleppo. They carried on an active propaganda in 'Iraq, and when, in March 1920, the Amir Faisal was proclaimed King of Syria they responded by electing the Amir 'Abdullah King of 'Iraq.

The movement in 'Iraq which led to the rebellion of 1920 was part of a general resentment against the policy of the British and their allies. In India, Persia, Egypt and Turkey, no less than in Syria and 'Iraq, a crisis was reached during the years 1919 and 1920, and the political credit of Great Britain fell low in the Eastern world. 'Iraq was in the centre of this hostile vortex, and was specially affected by the Persian Shi'ah divines, who were domiciled in the holy towns but were responsive to every shade of feeling in their own country. While the administration was still patently alien, British forces had been cut down to a minimum, and when, in May 1920, the British Govt. announced their acceptance from the League of Nations of a mandate over 'Iraq, the Damascus Govt. had already, in the absence of the Amir Faisal and contrary to his orders, begun its encroachments. In answer to objections raised against the mandate by a self-chosen committee in Baghdad, it was announced (June 20) that Sir Percy Cox would return in the autumn to establish a provisional Arab Govt. and call an Assembly, freely elected by the people, in consultation with which he would prepare an organic law. But nothing would then have satisfied the claims of the Nationalist leaders, and on July 2 1920, the turbulent Shi'ah tribes, encouraged by their religious leaders, broke into open revolt.

To restore peace and order was the first necessity. Troops were drafted in from India, and when Sir P. Cox reached Basra (Oct. 1), as High Commissioner, the rebellion in its main centres, the middle Euphrates, the Diyala and the adjacent part of Kirkuk district was already doomed to failure. By Nov. 10, a provisional Council of State was formed under the Naqib of Baghdad. It included Saiyid Talib Pasha as Minister of Interior, Sasun Effendi Haskail, the best known member of the Jewish community, as Minister of Finance, and Ja'far Pasha al 'Askari, distinguished for his services during the War and in the Syrian administration of King Faisal, as Minister of Defence. The Council of State, some of the members of which were without portfolios, represented all classes and sects of society; at its request some of the leaders of the rebellion who had been interned at Henjam were released at once. It gave immediate attention to the repatriation of 'Iraqi officers from Syria and the Hejaz; to the reorganisation of civil government under 'Iraqi officials, greatly facilitated by the return of many experienced men from Turkey; and to the preparation of an electoral law and the formation of an army. It was the arrival of 'Iraqi officers who had served under the Amir Faisal which set on foot a movement in his favour in 'Iraq. He had been driven from Syria in July 1920, and had since resided in England. To this movement Saiyid Talib was opposed, and during the absence of Sir Percy Cox in Feb. and March 1921, to attend the conference summoned at Cairo by Mr. Winston Churchill, Saiyid Talib's ambitions developed, and he assumed a menacing attitude towards the British efforts to secure a free discussion of the future government of 'Iraq by its people. In April, after a direct threat on the part of the Saiyid, the High Commissioner secured his deportation to Ceylon, and the political atmosphere cleared.

The first result of the Cairo Conference was the publication of a general amnesty in May, and at the same time an attempt was made to ascertain the wishes of the Kurdish provinces as to their inclusion in the 'Iraq State. The net result was that Sulaimaniya remained under the control of the High Commission, but the rest of the Kurdish population was content with the promise of Kurdish officials, under the 'Iraq Govt., and the local use of the Kurdish language.

Choice of a King.—Towards the end of June, the Amir Faisal arrived in Baghdad, as a candidate for the throne. This candidature was known to be acceptable to the British Govt., and on July 11, the Council of Ministers passed a resolution declaring him King of 'Iraq, on condition that his government should be constitutional, representative and democratic. But Sir Percy Cox fortified himself by consulting the people, and a referendum was carried out, through the Ministry of Interior, throughout the country, with the exception of Sulaimaniya, with the result that 96% of the votes were cast in favour of the Amir Faisal outside Baghdad most of the townships and districts stipulated for the continuance of the British mandate. The Amir was crowned on Aug. 23 1921, and entrusted the Naqib with the formation of his first cabinet.

Troubles on Turkish and Arabian Frontiers.—The early years of King Faisal's reign were troubled without and within. To the north, Turkish nationalism had taken a turn distinctly hostile to 'Iraq. Turkish garrisons on the frontier had increased, the tribes were flooded with propaganda, and a Turkish officer with a small party of irregulars had occupied Ruwāndiz in June 1921. From that advantageous position the Turks kept the whole of southern Kurdistan in a ferment till they were finally ejected in the spring of 1923. Turbulent chieftains roused some of the tribes of Sulaimaniya in the spring of 1922, and a general cry was started for the return of Shaikh Mahmud, who had been defeated by the British and deported in 1919. The British administration evacuated the province in 1922, and Shaikh Mahmud was reinstalled in the autumn, under binding assurances that he would be loyal to the British and 'Iraq governments. He entered at once into correspondence with the Turks.

On the Arabian frontier, since the beginning of 1921, the operations of Ibn Sa'ud against Ibn Rashid had profoundly disturbed the tribes. As early as April 1921, the Shammar of Ibn Rashid began to seek safety in 'Iraq where a large section of the tribe resides. Their presence embittered relations between 'Iraq and Nejd, and after the fall of Ibn Rashid's capital, Hail, in Nov. 1921, Ibn Sa'ud's pretensions increased, and he claimed the allegiance of the 'Anizah on the eastern side of the Syrian desert, who had always been attached to 'Iraq. In March 1922 he permitted the leaders of his Akhwan, or Brethren, to attack the 'Iraq desert camel corps and the shepherd tribes grazing under its protection about 30 m. south of the railway between Baghdad and Basra. Heavy loss was inflicted.

Anti-mandate Agitation and the Preliminaries of the 'Iraq Treaty.—These dangers on the frontiers coincided with a serious divergence of views between the British and 'Iraq governments as to the nature of their relations with one another. King Faisal and his Prime Minister asked for the complete abrogation of the mandate and its substitution by a treaty of alliance, whereas the British Govt. were aiming at a treaty within the scope of the mandate. The difference was largely technical, but it gave rise to grave misunderstandings and embittered controversy. It was alleged that the attack by Ibn Sa'ud, who was at that time in receipt of a subsidy from Great Britain, had been instigated by the latter in order to show the 'Iraq Govt. its weakness. At this point the Shi'ah divines took a hand in the matter and summoned a conference at Karbalā, nominally to consider measures of defence against the Akhwan, but with the underlying object of protesting against the British mandate. The conference assembled, but the Sunni shaikhs held off, the wiser among the Shi'ah nipped any subsidiary intentions in the bud, and the meeting confined itself to petitioning King Faisal to take steps against the Akhwan. But the heat engendered was not extinguished, the anti-mandate agitation continued through the summer, though in June the Council of Ministers accepted the treaty with Great Britain, subject to its acceptance by the Constituent Assembly. On Aug. 16 the Cabinet resigned, and Sir Percy Cox, when attending a levee, was greeted by an anti-mandate demonstration. He demanded and received an instant apology, but at the same moment it was announced that King Faisal was struck down by a dangerous attack of appendicitis, and an immediate operation was necessary.

Thus, by a singular combination of circumstances, the country is left with no authority but that of the High Commissioner. He issued a proclamation explaining the situation, arrested and deported certain agitators, and induced two of the Shi'ah divines to leave voluntarily for Persia. By Sept. 10 1922 the agitation had died out. On Oct. 10 1922 Sir Percy Cox and the Naqib signed a treaty of alliance between Great Britain and the 'Iraqi for 20 years (British Treaty Series No. 2), but ratification was delayed and negotiations over the subsidiary agreements dragged on until 1924.

No sooner was the internal situation stabilised than the north-western frontier again demanded attention. With Shaikh Mahmud in Sulaimaniya and the Turks in Ruwāndiz and its neighbourhood, effective administration had ceased east of Erbil, Kirkuk and Kifri. In Oct. 1922 a measure decided on at the Cairo Conference was put into force and the Air Marshal, Sir John Salmond, assumed charge of all imperial forces in 'Iraq, Mound troops, levies and air force. By his vigorous action he forced the Turks to retire to Ruwāndiz. But the autumn of 1922 was the period of Mustafa Kemal's great triumph over the Greeks. It influenced both the Shi'ahs of the Euphrates and the tribes of the north. On Oct. 21 1922 the King issued an Iradah ordering elections for the Constituent Assembly to begin; it was countered by a fatwah, signed by the Shi'ah divines of Karbala and Kadhimain forbidding participation in elections. In Nov. the Naqib resigned, and 'Abdul Muhsin Beg al Sa'dun formed a new Cabinet. In the same month elections were held in Great Britain, during which a campaign was conducted against the fulfilment of the pledges to 'Iraq. Mr. Bonar Law's Cabinet came in under obligation to consider the question, and Sir Percy Cox was summoned to London in Jan. 1923, to take part in the discussion. He left in charge Sir Henry Dobbs who had come out as Counsellor in the previous December. The position of the British Govt. was extremely difficult. A solution was found in the reduction of the term of the yet unratified treaty from 20 to a maximum of four years after the ratification of peace with Turkey,[1] with the prospect of renewal at the end of that period. The treaty would lapse in the event of 'Iraq becoming a member of the League of Nations. The protocol embodying this agreement was brought back by Sir Percy Cox on March 31 1923, and signed on April 30. Sir Henry Dobbs, who had acted since January, became High Commissioner in Sept. 1923.

Operations in Mosul.—Meantime, in March 1923, Sir Henry and the Air Marshal had been obliged to take steps against the Turkish threat in the north. The Amir Zaid, who had arrived in Baghdad in the previous autumn, went to Mosul, where he superintended the formation of a force of Arab irregulars to operate in the plains if necessary. The strong stand taken by Lord Curzon at Lausanne reacted on 'Iraq. Shaikh Mahmud, who was in league with the Turkish band at Ruwāndiz, was dealt with, and in April, by a brilliant military movement, supported by air action, the Turks were ejected from Ruwāndiz, and a Kurdish chief put in as Qaimmaqam under the Mutasarrif of Erbil. With a force of Assyrian levies behind him, Saiyid Taha had closed Ruwāndiz to Turkish influences. Though it was found impossible to set up a local administration in Sulaimaniya, the outlying parts were placed under the 'Iraq administration and Shaikh Mahmud was allowed to return to Sulaimaniya town and the mountains between the town and the Persian frontier, but in 1924 his intrigues made it necessary to eject him from Sulaimaniya town. This was done by a column of the 'Iraq Army, with levies and air force support; the Sulaimaniya liwa was included in 'Iraq in March 1924, and sent representatives to the Constituent Assembly. Shaikh Mahmud, with small robber bands, was still lurking on the frontier at the close of 1925; he had incurred the hostility of the Persian Govt. as well as that of the Govt. of 'Iraq.

The Elections.—In July 1923, King Faisal authorised his Government to deport the chief obstructionist among the Shi'ah divines, Shaikh Mahdi al Khalisi. This act was followed by the voluntary exodus to Persia of a number of other religious leaders, all Persian subjects. They were allowed to return after the Constituent Assembly had ratified the treaty, and have since passed out of political history. After its decisive handling of the Mujtahids, for which the 'Iraq Govt. deserves the greatest credit, the elections went forward without a hitch. From the Kurdish mountains to the Persian Gulf, primary electors enrolled themselves with surprising alacrity, and, in marked contrast to their practice in Turkish times, the tribal chiefs pressed their followers to come forward in great numbers. Secondary elections began in Feb. 1924, and all results were declared by the middle of March.

Settlement with Nejd.—During the winter of 1923–4 an attempt was made to settle the growing differences between 'Iraq and Nejd by a conference of representatives held at Al Kuwait under Colonel Knox. The main point of difference was the repatriation of Nejd tribes which had taken refuge in 'Iraq. The 'Iraq representatives rightly pointed out that, apart from the violation of tribal custom involved, they had not the requisite force to constrain these unwelcome guests to return to their own country, but they agreed to abide by stipulations considered satisfactory by the British Government. Though on lesser matters agreement was reached, Ibn Sa'ud proved obdurate on the major issue, and just as the conference was about to reassemble in March 1924, his followers carried out a brutal raid on the 'Iraq shepherd tribes. The conference thereupon broke up. Other raids occurred during 1924–5, and, as a result, the 'Iraq Govt. made a determined effort to remove the tribes from the vicinity of the frontier and Ibn Sa'ud gave orders to his Akhwan leaders to discontinue raiding. Finally, at the conference held at Bahra in the Hejaz between the Sultan and Sir Gilbert Clayton, in Nov. 1925, a treaty was drawn up between 'Iraq and Nejd on the lines proposed by H. M. Govt. and the 'Iraq Govt. at Al Kuwait.

Ratification of the Treaty.—Sir Henry Dobbs and the 'Iraq Govt. had been engaged during the winter of 1923 in discussing the provisions of the agreements subsidiary to the treaty. The resignation of 'Abdul Muhsin Beg, in Nov. 1923, occurred in the midst of these discussions, which were carried on with the new Cabinet presided over by Ja'far Pasha al 'Askari. The agreements were signed on March 25 1924, and the instrument of alliance being thus complete, the Constituent Assembly was opened by the King on March 27.

The debates on the treaty and agreements continued until June 10. There was much misrepresentation and some solid ground for dissatisfaction at the heavy burdens imposed on 'Iraq by the obligation simultaneously to expand the army, redeem the capital cost of the railways and shoulder a large share of the Ottoman Debt. H. M. Govt. gave an undertaking that after the ratification of the treaty they would be prepared to reconsider certain of the financial obligations of 'Iraq towards Great Britain, and the debates were brought to a close by the announcement of the determination of the British Govt. to raise before the League of Nations at the June session the whole question of the continuance of their mandate, and the warning that if the Assembly had not passed the treaty by June 10, it would be taken as a rejection. King Faisal and his government clearly discerned the attendant risks, the Cabinet called on its followers for support, and the treaty and agreements were accepted before midnight on the appointed date. The instrument was accepted by the League of Nations on Sept. 27 1924, as giving effect to the provisions of Art. 22 of the Covenant of the League for the regulation of the relations between 'Iraq and the mandatory Power, and was ratified by King George and King Faisal in the winter of 1924. The Constituent Assembly then passed the Organic and Electoral Laws, and was dissolved on Aug. 2 1924. Ja'far Pasha and his Cabinet having concluded their work, resigned office, and Yasin Pasha al Hashimi formed a new Cabinet.

The question which now overshadowed all others was the settlement of the northern frontier with Turkey. (*See* LEAGUE OF NATIONS; MOSUL.)

It had not been considered advisable to disturb the proceedings of the Frontier Commission sent by the League of Nations to Mosul in the spring of 1925 by the holding of elections; on

[1] This took place on Aug. 6 1924.

March 21 1925, however, the Organic Law was promulgated and elections for the first parliament began. Yasin Pasha's Cabinet had previously passed four notable measures, vital for the further prosperity and stability of 'Iraq. The first was the signature with the Anglo-Persian Oil Company of an agreement for the dredging of the Shattal-'Arab bar. The second was a trade transit agreement with Syria. The third was the granting to an international group, known as the Turkish Petroleum Company, of a concession for the development of oil in the Baghdad and Mosul vilayets, while the fourth was the signature of long term contracts with over a hundred experienced British advisers and officials.

The visit in April 1925 of the Secretaries of State for the Colonies and Air gave opportunities for frank and valuable exchange of views, and also resulted in the adoption of a scheme which should provide for the speedier training of the 'Iraq army, so that it might eventually assume responsibility for internal security and external defence.

Elections were completed by June 23 1925, but before parliament met Yasin Pasha resigned, owing to differences of opinion in his Cabinet, and 'Abdul Muhsin Beg was again charged with the formation of a government. Parliament, consisting of two chambers, a Senate of 20 members, appointed by King Faisal, and an elected house of 88 members, met on July 16 in extraordinary session to consider the budget and certain necessary amendments to the Organic Law. Its debates were characterised by earnestness and good sense, and when its task was finished it was prorogued, on Oct. 28, by the Amir Zaid, acting as Regent during King Faisal's absence. The second session was opened formally on Nov. 1, but was postponed for six weeks and met definitely on Dec. 20.

The New Treaty.—The settlement of the question of Mosul (*see* LEAGUE OF NATIONS) was accepted by 'Iraq with relief, and negotiations for the signature of the new treaty were initiated before the end of 1925. The treaty was signed by the representatives of the two governments on Jan. 13 1926, and accepted by the 'Iraq Parliament on Jan. 18 and by the British Parliament on Feb. 18. It is contracted for a maximum period of 25 years or until 'Iraq shall be permitted to become a member of the League of Nations. When the delimitation of the northern frontier along the Brussels line and of the Syrian frontier, which is as yet only provisionally fixed, has been completed, it will remain for 'Iraq to satisfy the League that the conditions of membership laid down in Article I of the Covenant have been fulfilled. The arrangement was not accepted by the Turks until June, 1926. (*See* MOSUL.)

Since 1920 great progress nas been made in this direction. A police force, which compares favourably with any in the East, does its part in preserving internal order; a body of responsible 'Iraq civil officials is coming into being; communication by rail and road are opening up the country, the trans-desert route, in particular, having brought 'Iraqi into much closer touch with Syria, Egypt and Europe; the tribal leaders are stepping into their place in public life, thus tending to reduce the former gulf between tribesmen and the effendis of the town. Justice is on the whole satisfactorily administered; the Ottoman Law still remains the principal system of law in use in the civil courts, while the criminal codes are founded on those of Egypt and the Sudan. Good hospitals exist in Baghdad, Basra and Mosul and smaller establishments in other provincial towns; the Baghdad hospital is as well equipped as any in Asia and is able to deal with and stamp out recurrent epidemics. Education has perhaps seen the greatest revolution since Turkish times. Arabic is now the medium of instruction, or the local vernacular in Kurdish or Turkoman districts. Great efforts have been made to provide a sound grounding. Four secondary schools are all that the Government can yet afford, but teachers are being trained, recruits engaged in Syria and the quality of education shows a marked improvement. The desert route has enabled many boys to seek higher education abroad. The agricultural department is raising the level of husbandry by providing selected seeds and has given special attention to the growing of cotton, which bids fair to become one of the most valuable crops of the country.

II. FINANCIAL AND ECONOMIC HISTORY

The truth about the public revenue and expenditure of 'Ira is very hard to determine. Figures dating back to the period Ottoman rule bear small resemblance to fact, and during th War period fancy played a large part in the preparation of figur relating to the "civil administration." To draw a distinctio during that period between military and civil expenditure, b tween the activities of the Expeditionary Force and those of th Civil Service, and to analyse the respective liabilities of the Im perial Govt., the Government of India and the civil administra tion of Mesopotamia were tasks which provided abundan exercise for a lively imagination.

Revenue and Expenditure.—The average revenue during th two years 1910–2 was made by the Treaty of Lausanne the de termining factor in 'Iraq's liability for the Ottoman Publi Debt, and the total figure for the three vilayets of Baghdad Basra and Mosul was £T. 1,492,953. 'Iraq was no source o profit to the Ottoman Empire. Basra, in spite of a complet lack of harbour facilities, was an important gateway, and custom receipts there were heavy. But 'Iraq was to all intents and pur poses a foreign dependency in which other revenues were only collected by means of minor military operations, the cost o which exceeded their proceeds.

The Review of the civil administration of Mesopotamia whic the British Govt. published in 1920 (Cmd. 1061 of 1920) gav figures showing a large balance of revenue over expenditure fo each of the four years ending with March 31 1919, and only a com paratively small deficit for the following year, and stated that for th whole period of five years "the aggregate civil expenditure wa approximately £8,000,000 . . . while the receipts amounted to abou £10,000,000." 1920–1 was a bad year, with a rebellion in progress little revenue coming in and expenditure inevitably heavy. I 1922 Parliament was asked to vote money to make good the "civi deficit" in Mesopotamia on March 31 1921, from which date re sponsibility for the finances lay with the 'Iraq Government. Th figure was put at £1,087,000, but ultimately only £559,000 wa required. Even this figure, although supported by appropriatio accounts and audits, hardly represents the real facts. There wa expenditure in Persia and in Nejd, expenditure on refugees fro Armenia and from Russia, and expenditure in connection with fan tastic War-time enterprises, which had no real connection with th public services of 'Iraq. The financial mission which reported to th British and 'Iraq Govts. in 1925 (Cmd. 2438) quoted the figure as follows:—

	1921–2	1922–3	1923–4	1924–5 (Revised Estimates)
	(In lakhs of rupees)			
Expenditure	572	479	418	460
Revenue	528	475	508	520
Surplus	..	..	90	60
Deficit	44	4	..	..

The mission pointed out that for the year 1925–6 'Iraq was face with a liability of about 80 lakhs for the Ottoman Public Debt an an increase in expenditure on the army of 34 lakhs, and that the cos of these two services was beyond the present financial capacity of th country. They maintained that a reduction of one or the other wa inevitable, and in fact the Ottoman Public Debt contribution ha not been paid, the actual determination of an amount not having re sulted from the Treaty of Lausanne. The position of the publi finances of 'Iraq affords no ground for pessimism. "History," say the report of the financial mission, "probably shows no instance o a state expected to do so much so soon."

The public revenue and expenditure are not a safe index of th resources of a country even when, as in 'Iraq, a large proportio of the revenue is derived from the Government's share in th agricultural output. The machinery of assessment and collection i primitive and defective; and the Government gets far less than it theoretical share, which over a large part of the country is as high a 40%.

Agriculture and Irrigation.—'Iraq is a country within which re found records and traces of very ancient civilisation. Great entres of population were in existence thousands of years ago places which are now desert, and these great centres depended or their existence on a highly-organised system of agriculture ased on irrigation. Down to the 13th century 'Iraq was an gricultural country made wealthy by the proceeds of its harests and its pastures. Those harvests and pastures depended on ne Tigris and the Euphrates rivers which, thanks to an ancient nd elaborate system of irrigation canals, fed vast areas which -day lie derelict. The destruction of that system is definitely raceable to the Mongol invasion of the 13th century. To that upreme catastrophe succeeded a long period of upheaval and nrest, and then the alien rule of the Ottoman Turk, inimical to ll attempts at reconstruction, and destructive not only of mateal resources, but also of the initiative and capacity by which uch resources are fostered and developed.

The irrigation problem in 'Iraq was made the subject of an laborate series of enquiries and reports in Turkish times by Sir Villiam Willcocks, and he was responsible for the one important ngineering enterprise which has been carried out in the country, he Hindiyah barrage across the Euphrates, which regulates the upply of water to an elaborate series of canals. The completion f the programme which he sketched out would entail a capital xpenditure far beyond the present resources of 'Iraq; and the ncreased difficulty of raising large sums of money for such enterrises after the Great War inevitably postpones the fulfilment f even a more modest programme. The whole question of irriation in 'Iraq requires further study and experiment before mbitious schemes are undertaken. Irrigation without drainage nay be a danger, and may even do more harm than good; for rrigated land easily becomes salt and water lavished on one rea may leave other areas, which need it equally, dry and unfervile. But the subject is now receiving close study, and it may e prophesied with confidence that the productivity of the counry will be increased by a better use of the water available. The mmediate need is for a systematic examination of possibilities nd a rigorous avoidance of pretentious schemes inadequately repared.

Population.—The population which once cultivated vast reas of arable land has disappeared, and its restoration must lepend less upon immigration from other Arab areas—for the ational spirit of 'Iraq will not tolerate an alien immigration—han upon a lowering of the death-rate, and especially of the ate of infant mortality, which will give the 'Iraqi nation the umbers for which the cultivation of such areas calls. The difference between desert and fertile land is summed up in this part of the world by the single word " water; " but fertile land will not be productive unless there is a population to cultivate it. Nowhere else in the world will peace, order and good government o surely find reflection in economic development. Improved onditions of health, education and social well-being mean quite lefinitely in 'Iraq increased productivity.

Cotton and Oil.—There are well-grounded hopes that new ources of wealth will be found in cotton and oil. A concession was granted in 1925 for the development of the oil resources of he Mosul and Baghdad Vilayets to the Turkish Petroleum Company, which represents a combination of international oil interests and is a development of the company which had obtained a promise of a concession from the Ottoman Govt. in 1914. The Anglo-Persian Oil Company enjoys similar rights, in virtue of the original Persian concession of the D'Arcy Exploration Co., in he " transferred territories " which were formerly part of Persia, nd here boring for oil has already been successful. The British Cotton Growing Association have interested themselves actively n the development of cotton cultivation. The production is, as yet, comparatively small, but the possibilities have been effectively proved, and with the improvement of public security the investment of more capital may be anticipated. There is therefore every reason to expect that a country which was once the chief granary of the eastern world will once more become a great grain-exporting land.

Communications.—To-day 'Iraq derives much profit from the transit trade with Persia. The route through Russia has been practically closed for some years, and its reopening must be dependent upon the most incalculable of all factors, the political and economic future of Russia. The 'Iraq railways, which have grown out of an emergency War-time line of communications, nearly reach the frontier of Persia, a country undeveloped as regards railways. Baghdad is the *entrepôt* of Persia and Basra its gateway, and the importance of fostering this transit trade is fully appreciated in 'Iraq. The motor service across the desert via Damascus to the Mediterranean at Beirut, due to the enterprise of a New Zealander, has already had far-reaching consequences, and an air service as yet in its infancy has possibilities which can hardly be gauged. 'Iraq looks West to-day, after looking East for thousands of years, and Baghdad is only a week from London.

Port of Basra.—'Iraq has inherited one asset of great value from the War period in addition to its railways—the port of Basra, where vessels of the deepest draught can lie alongside fine wharves fully equipped with railway connections, electric cranes and warehouses. Work is now in progress, and it is hoped nearing completion, which will provide a deep-water channel across the bar of the Shatt-al-Arab and thereby enormously improve the speed and reduce the cost at which vessels can be berthed and cleared. The Shatt-al-Arab is the way not only to the wharves of Margil and the navigable Tigris, but also to Abadan, where the refinery of the Anglo-Persian Oil Company is situated, served directly by a pipe-line from the oil-fields.

Imports and Exports.—Figures of imports into and exports from 'Iraq are as follows (in lakhs of rupees—re-exports excluded):—

	1922–3	1923–4	1924–5
Imports . .	969	879	890
Exports . .	370	422	423

They appear to indicate a heavy " adverse balance of trade," but like most figures relating to 'Iraq, they are misleading unless they are analysed. The expenditure of H.M. Govt. in 'Iraq on the maintenance of the garrison must be accounted an " invisible export," and there has also been a large export of currency—Indian rupees and rupee-paper—since the steady reduction of the garrison reduced the amount of currency needed for internal circulation. There is some reason for believing that the adverse balance has now almost reached vanishing point, and this view is confirmed by the latest movements of the exchange-rate with India. The percentage (in values) of imports from the United Kingdom in 1924–5 was 33, and of those from British India 30. Textile goods formed by far the largest item, sugar and carpets and tea coming next. All these items represent largely articles in transit between Europe and Persia. The principal items of local produce figuring among the exports were dates (183 lakhs in 1924–5), raw wool (84 lakhs) and grain (54 lakhs). (R. V. V.)

IRELAND, JOHN (1838–1918), American Roman Catholic prelate (*see* 14.742), died at St. Paul, Minn., Sept. 25, 1918.

IRELAND (*see* 14.742).—The first part of this article deals with the history of Ireland from 1910 to the creation of the Irish Free State, while the second discusses its agricultural development. Its history subsequent to that date is dealt with under IRELAND, NORTHERN; IRISH FREE STATE.

I. POLITICAL HISTORY

FROM 1910 TO THE OUTBREAK OF WAR

The year 1910 saw the opening of the most important period in the relations between Great Britain and Ireland since the Act of Union. The relative strength of the two great English parties in Parliament as the result of the general election in December made the Liberal Govt. dependent on the assured support of the Irish Nationalists; and this support could only be secured by a genuine effort to pass a Home Rule Bill into law.

Nationalist sentiment was by no means universal. There was a formidable minority for the maintenance of the Union. The line between Nationalists and Unionists coincided roughly with

the line between Catholics and Protestants, though a certain number of persons of either religion held the political views generally identified with the other. The Unionist minority existed in every part of Ireland, but was more concentrated in the North. Even in the Unionist North there was a respectable Nationalist minority in Belfast, and in the predominantly Unionist counties of Antrim, Down, Armagh and Derry; in Fermanagh and Tyrone and in the city of Derry Unionists and Nationalists divided the population; in Donegal, Cavan and Monaghan Unionists were in a minority.

All over Ireland, but more particularly in the North, the political cleavage was deepened, and differences exasperated, by the difference in religion. In such circumstances it would not have been reasonable to expect a compromise on the political question; and the Nationalist party as a whole hardly attempted to secure one, or to face the issue of the position of the Unionist population under Home Rule. They seemed to expect that the minority, after violent protests, would accept a position which they would be no longer able to alter. Some of the Nationalists, notably Mr. William O'Brien, saw the necessity of attempting to conciliate the minority; and the All for Ireland League was inaugurated in Cork on March 31 1910, its declared object being to combine " all the elements of the Irish population in a spirit of mutual tolerance and patriotic goodwill."

The Rise of Sinn Fein.—Outside the Nationalist party a small but earnest body of Irishmen, led by Mr. Arthur Griffith, had been for a dozen years[1] declaring that the Nationalist party was upon entirely wrong lines. Their policy was to assert the position that Ireland was a separate and independent kingdom united to Great Britain by only one link, that of the Crown. They went further than the most advanced Nationalists, and claimed for Ireland in the United Kingdom the same position that Franz Deák had claimed for Hungary in the Austro-Hungarian Empire. This party, afterwards known as *Sinn Fein*, had for years insisted that the National movement should include all classes of Irishmen; they recalled the fact that some great leaders of Irish Nationalism in the past, such as Henry Grattan, Wolfe Tone, Robert Emmet and Charles Stewart Parnell, had been Protestants, and tried to enlist Protestant Irishmen in a comprehensive National movement. They repudiated and ridiculed the parliamentary policy of the Nationalist party; they would have the Irish members withdraw from Westminster and devote themselves to building up a national culture and economic life, and to developing Irish industry and commerce, in the hope of ending the economic dependence of Ireland upon Great Britain.

This party, though more intellectually vigorous than the Nationalist party, was small and without any very wide influence in 1911. Its importance lay in its almost fanatical earnestness and in the fact, not then apparent, that a revolution in the affairs of Europe was at hand in which the most drastic constitutional changes would be regarded as almost normal occurrences. But while the Sinn Fein party proposed a peaceful, though extra-constitutional, policy for the immediate future, it did not refuse to contemplate the possibility that Ireland, strengthened by years of perseverance, might in the end find herself strong enough to assert her freedom by force of arms. This brought it much nearer to the revolutionary elements in Ireland than to the parliamentarians.

Republican feeling was represented by the Irish Socialist Republican party founded in Dublin by James Connolly in 1896. It was not till 1911 that this party became active in Irish politics, but during the next few years its influence through Connolly's paper, *The Workers' Republic*, became more and more marked upon the Republican side; and the Irish Transport and General Workers Union founded by him, though not professedly Republican, could always be depended on to cast its weight upon the side of the more " advanced " political parties.

The Ulster Protest.—During the year 1911 Nationalist Ireland was practically undisturbed, but the Northern Unionists were in a ferment of unrest and apprehension. The introduction of the Home Rule Bill was imminent; and while Nationalist Ireland awaited events in comparative quiet, Unionists were aware that, so far as Parliament was concerned, their cause was lost. They were convinced that they had an unassailable case. They held that Ireland as a whole had benefited by the Union and that in particular the industrial development of Northern Ireland had been made possible by it. They believed that a self-governing Ireland would prove an irreconcilable enemy of the British Empire, and, by its hostility in the case of a future war, would menace the safety of Great Britain. Ireland was, they argued, a strategic position which on naval and military grounds alike it would be madness to abandon.

Mr. John Redmond's prophecy that the grant of Home Rule would produce in Ireland a demonstration of " imperial loyalty " fell upon deaf ears, and it was not hard to produce statements of a very different tenour, not only from the acknowledged leaders of Irish Nationalism of a previous generation but even from other speeches of Mr. Redmond. Finally, they raised the religious objection to a Parliament which would be composed mainly of Roman Catholics, and declared that they would never sit in it or submit to any laws which it might pass. Their ideals as Protestants differed essentially from those ideals which would command the respect of a Parliament of Irish Catholics, and to force them to submit to the decrees of such a body would be tantamount to religious persecution.[2] They refused to credit any assurances from any quarter designed to allay their apprehensions, and declared that, in spite of any legislation to the contrary, they would retain the constitutional position in which they had stood for more than a century.

The views of the Irish Unionists had often been proclaimed, but their complete sincerity was called in question. The rest of Ireland had not forgotten the United Irishmen, a body that arose and had its chief strength in Northern Ireland, and they could not believe that the interval that had elapsed since 1798 had completely extinguished in the North the love of independence and the spirit of religious toleration which had once distinguished the Protestants of Ulster. They hoped with some confidence that this spirit would revive or that at the least Home Rule would be accepted under protest. And the British Govt. seemed to regard the often vehement defiance of their policy in Irish Unionist circles as but another example of Hibernian hyperbole.

On Sept. 23 1911 a great Unionist demonstration of protest against Home Rule, said by the Belfast newspapers to have been attended by 100,000 persons, was held at Craigavon near Belfast. It was addressed by Sir Edward (Lord) Carson, the leader of the Irish Unionist party. In the following week the Ulster Unionist Council, strengthened by representatives of the Unionist Clubs and the Orange Lodges, resolved to frame a constitution and appoint a Provisional Govt. for the province of Ulster, to come into operation when Home Rule should become the law of the land. This bold step aroused the Govt. to a sense of the nature of the resistance they might expect, and early in 1912 Mr. Winston Churchill decided to explain at a public meeting in Belfast the general principles underlying the government policy. The Unionist party organisers in Belfast decided that he should be prevented, by force if necessary, from speaking in the public hall which had been engaged for his meeting.

No steps were taken by the Govt. to meet the challenge, and their inaction was interpreted in Belfast as weakness. Mr. Churchill spoke (Feb. 8) under military protection, in a marquee erected on a football ground, and explained that any measure of Home Rule would be part of a general scheme of devolution, not in any sense inconsistent with the federation of the Empire. But nothing he could then say would have had the least effect; he was mobbed on his way to the meeting, and had to slip out of the town the moment it was over. A month later the Unionists

[1] Mr. Griffith's paper, *The United Irishman*, first appeared in 1899. The National Council of Sinn Fein was founded in 1905.

[2] The quite recent promulgation of the *Ne Temere* decree in Ireland did much to harden the attitude of Protestant Unionists, being interpreted as an attempt to subordinate the law of the land to the decrees of the Church.

a great counter-demonstration at Balmoral, a suburb of ast, over which the Protestant Primate presided. It was ressed by Sir Edward Carson and Mr. Bonar Law, the latter whom declared that Protestant Ulster formed a separate ation" which it would be unjust to force into any political bination with the rest of the population of Ireland. From time on resistance to the Home Rule bill took more and more form of the assertion of the distinct nationality of the Ulster testants, and it was this which finally led the Ulster Unionists dissociate their cause from that of the Southern Unionists.

Home Rule Bill of 1912.—In April 1912 the Home Rule bill introduced in the House of Commons by Mr. Asquith. It posed to establish in Dublin a parliament strictly subordinate Westminster (a large number of services being reserved for exclusive control of the British Parliament); it did not con- upon Ireland fiscal autonomy, nor did it propose to establish eparate Irish Treasury; and Ireland was still to be represented the Imperial Parliament as an integral part of the United gdom. The bill was so far from an attempt to repeal the of Union, that it might have been expected to appease ionist opposition: but it was received with uncompromising tility. No one in Ireland was entirely satisfied, although a tionalist convention officially endorsed the bill as satisfactory April 23. It was at best regarded as an instalment, while the reme Nationalists and the Republicans denounced the accep- ce of it as a surrender of Ireland's national rights. An amend- nt to exclude the four counties of Antrim, Armagh, Down l Londonderry put forward on June 11 was defeated, both the me Minister and Mr. Redmond declaring that Ireland must treated as a national unit; but the amendment was a sign of direction in which Ulster Unionists were moving.

The Southern Unionists, who would have been placed in a peless position by the acceptance of the amendment, or by solution of the controversy along similar lines, continued to test against any form of Home Rule; and English Unionists a great demonstration held at Blenheim on July 27 pledged mselves through the mouth of Mr. Bonar Law to an almost conditional support of Ulster in resisting the bill. Fortified this assurance the Ulster Unionists took still another step. Sept. 28, amid scenes of great enthusiasm, the "Ulster Cove- nt" was signed by large numbers, who pledged themselves defend their political position by the use of any means which ght be found necessary to defeat the imposition of Home Rule on Irish Unionists. This pledge was at the time understood be a pledge on the part of the Ulster Unionists to resist Home le for the whole of Ireland. Undeterred by the temper of ster, and the opposition of the English Unionist party, the vt. pressed on with their bill, its repeated rejection by the use of Lords serving only to delay its final enactment.

Resistance of Ulster.—Meanwhile the Ulster Unionists de- ded upon a final defiance. They had begun to form companies Volunteers, who were drilled and practised but not yet armed; d on Sept. 25 1913 the Ulster Unionist Council formally ok upon itself the duties of a Provisional Govt. for Ulster, d appointed Sir Edward Carson as head of that Government. n. Sir George Richardson, an officer on the retired list, was pointed to command the Volunteer force, which was formally spected by the head of the Provisional Govt.; committees re formed to manage the various public services, posts, cus- ms, excise; and the administration of justice and even educa- n were entrusted to the care of their special committees.

Ulster Unionists drew a distinction between loyalty to the own and submission to Parliament. In general they acknowl- ge both; as adherents of the Act of Union, they could not but mit the right of Parliament to legislate for every part of the nited Kingdom. But they held that the Imperial Parliament uld not, without the consent of the Protestants of Ulster, alter Act which had conferred upon them the position which by terms they held in the United Kingdom. If Parliament passed Act giving Home Rule to Ireland in any form which they did t approve, then their duty to submit to its decrees ceased to ist, and nothing remained but their loyalty to the King. When the royal assent to the Act was given some persons declared that the King had taken a step which put his authority upon a level with that of Parliament. But with the exception of momentary outbursts, the Ulster Unionists protested their entire loyalty to the Crown. This constitutional doctrine would be subjected to a delicate test if the King's army were called upon to support the decrees of Parliament, but it was hoped that the application of this test might be averted.

The proceedings in Ulster were not without effect on the rest of Ireland. The Parliamentary party and its supporters, with an easy optimism, assumed that the difficulty would settle itself, or that Parliament would in the last resort assert its own authority by force. But some elements hostile to the Parliamentary party held that what was happening was the just Nemesis of the policy which, they asserted, had persistently ignored the duty of persuading the Ulster Protestants to accept Home Rule under safeguards for their special interests and guarantees for their special rights. Nationalists of a more advanced type saw in Ulster's passionate repudiation of the authority of Parliament an assertion by a body of Irishmen that Irishmen had the right to the final decision of the terms upon which they would consent to be governed; and they were content to overlook the particular ground of the quarrel between Ulster and Parliament for the sake of the principle logically involved. The official Nationalists were not aware of the complete sincerity of the vast majority of Ulster Unionists, nor did they attach enough weight to the formidable objections to any attempt on the part of Parliament to enforce its authority; while the Nationalists who applauded Ulster overlooked the fact that Ulster's quarrel with Parliament was due not so much to the proposal to govern them in a particular way as to the proposal to divest itself of part of the functions of governing them.

The National Volunteers.—The example of Ulster was contagious. On Nov. 25 1913, at a meeting in the Rotunda in Dublin called by a Provisional Committee representing Sinn Fein, the Irish Republican Brotherhood and the Gaelic associations, it was decided to inaugurate the National Volunteers "to secure and maintain the rights and liberties common to all the people of Ireland, without distinction of class, creed or politics." This formula was a direct challenge to the Ulster Volunteers who held that, Ireland having no separate political existence, there were no rights and liberties which Ireland was specially called upon either to secure or maintain. The formation of the National Volunteers was not at all palatable to the Parliamentary party, who were still confident that Parliament would give adequate protection to any rights and liberties that might be endangered.

After the great strike which paralysed Dublin during the autumn of 1913, the Citizen Army[1] began to be enrolled, with headquarters in Liberty Hall, the property of the Irish Transport and General Workers Union. Though comparatively few in numbers, the Citizen Army, composed of men who with their families had suffered during the strike and were prepared to take great risks, played a very important part in later political developments.

The Govt. in Ireland, now awake to the possibilities of disturbance, proceeded to seize arms consigned either to Dublin or Belfast; and in December a proclamation was issued, in spite of the repeal of the Arms Act by Parliament in 1910, prohibiting the importation of arms into Ireland. The validity of the proclamation was immediately challenged in Belfast, and it was not until June 15 in the following year that the Court of King's Bench in Dublin ruled on appeal in favour of its validity. Meanwhile small consignments of arms were making their way into the country, and preparations were being made upon both sides for the wholesale purchase of arms on the Continent.

Proposals for Compromise.—A conference between representatives of the Govt., the two Irish leaders and the leader of the English Unionist party led to no result, Sir Edward Carson being now confident of his ability to beat the Govt., and Mr. Redmond being unwilling to consider the exclusion of any part

[1] The character and aims of this body are set out in *The Citizen Army* by P. O'Cathasaigh (Dublin, 1919).

of Ireland from the scope of the bill. The Prime Minister, however, on March 9 1914, proposed a compromise of his own, that six counties of Ulster should be excluded for five years, on the understanding that unless Parliament, at the end of that time, should otherwise determine they should be included without further delay. Both Irish leaders publicly refused to consider the expedient, Sir Edward Carson on the double ground that the security offered to his followers was insufficient, and that he could not agree to abandon the Unionists of the rest of Ireland. After his speech in Parliament he and the other Irish Unionist members withdrew from the House, and crossed to Belfast, where he issued his final challenge to the Govt.: " Give us a clean cut or come and fight us." The policy of the " clean cut " thus became the official policy of the Ulster Unionists as offering the best chance of success, but its adoption, nevertheless, was more or less a disappointment to Irish Unionists outside of Ulster.

The Curragh Incident.—It was clear now that Ulster Unionists were prepared, if necessary, to resort to arms, and the Govt. took measures to protect the military stores in Ulster from being seized. On March 20 the attitude of the army was brought into sudden prominence by the " Curragh incident." Gen. Hubert Gough, with a large number of the officers stationed at the Curragh in Co. Kildare, on being asked whether if ordered to Ulster they were prepared to go, replied by tendering their resignations, some of them (at least) on the ground that such a question should not have been put to an officer. Their refusal, though their resignations were subsequently withdrawn as the result of mutual explanations, led the Ulster Volunteers to believe that the army was with them, that it had yielded to the insistent appeals to refuse to be made the instrument of " coercing loyalists."

But the Ulstermen did not relax their vigilance, or countermand their orders for arms, on that account; and on the night of April 24 there was landed, under the superintendence of the Volunteers, at both sides of the mouth of Belfast Lough a consignment of nearly 50,000 rifles and 3,000,000 rounds of ammunition. The fact that the naval squadron, stationed at Lamlash for the purpose of supporting the army in the event of a conflict in Ulster, had not intercepted the vessel conveying the rifles was interpreted in Belfast as an indication that the sympathies of the navy, as of the army, were with Ulster.

On June 9 1914 Mr. Redmond identified himself formally with the Volunteers already in existence in Dublin and the South. The original committee, with some reluctance, for Mr. Redmond's policy was increasingly divergent from their own, allowed him to nominate additional members of the committee. The National Volunteers were still unarmed, but their arms were already on the way.

Meanwhile the Home Rule bill was nearing the end of its course. It passed its third reading on May 25 1914. The Govt. were considering an amending bill, as certain to be as strenuously opposed by the Upper House as the bill which it was intended to amend; and as a last resort a conference was called by the King at Buckingham Palace to see whether some compromise could be arranged. After three days the conference broke up on July 24, each party adhering stoutly to its original position. Two days later the National Volunteers landed a consignment of arms at Howth in broad daylight. The Deputy Commissioner of the Dublin Metropolitan Police, hearing of the landing, called upon the military for assistance, and intercepted the Volunteers who had superintended the landing as they marched back with their arms. After some parley, however, the details of which are uncertain, the Volunteers were allowed to retain their arms, on condition of disbanding before they reached Dublin, and the soldiers marched back to their barracks. On the way they were assaulted by a jeering mob, on which they turned and fired, killing three persons and wounding a considerable number. This occurrence caused a profound sensation. The Govt. decided to dissociate itself from the Dublin incident, and the Assistant Commissioner, whose zeal had brought it about, was eventually dismissed on the ground that he had exceeded his authority.

The War Period

When a few days later war was declared against Germa Mr. John Redmond, in a moving speech in the House of Cc mons, declared that all quarrels between Great Britain and I land were at an end, that Ireland ranged herself on the side England and her Allies, that English troops might with saf be withdrawn from Ireland, whose shores during the War wo be " defended by her armed sons." His attitude aroused great thusiasm in England, but in Ireland the response was less wa On his own side the more advanced of his followers thought t he had failed in his duty to Ireland by this unconditional d laration, and the Northern Unionists, though they received words with respect, were inclined to wait before committing the selves. It was not long before party passion was again arous The Cabinet had to decide upon their policy with regard to Ho Rule in the new circumstances. They chose to proceed as us to the royal assent (Sept. 1914), but of postponing the ope tion of the Act for a year (or to a date after the terminat of the War to be fixed by Order in Council), with a promise introduce, in the interests of Ulster, an Amending bill when t War should be over.

Their action was denounced by the Unionist party both England and in Ireland as a breach of the war-time truce party politics; in Nationalist Ireland the promise of an amend bill robbed the provisional enactment of Home Rule of much its value. The members of the committee in control of t National Volunteers divided into two sections, those in fav of Mr. Redmond's policy and those who adhere to the origi principles of the Volunteers. The latter seceded and formec distinct body, the Irish Volunteers, opposed to enlistment in t British Army and to any compromise upon the principle of t unity and independence of Ireland. But this party was ir minority, and the appeals of Mr. Redmond and the Pri Minister (who came to Dublin to address a recruiting meeti met with considerable success. Southern Unionists united o dially with Irish Nationalists in the efforts to enlist Irish soldie many of the National Volunteers joined the army, and it seem as if Mr. Redmond's enthusiastic support of the Allies was prevail.

In Ulster recruiting was more successful. The Ulster Volu teers did not (any more than the National Volunteers) flock the colours. They retained their arms, and they kept up th organisation. They found themselves faced by a double du that of protecting the Empire and that of securing their o political position. The Ulster Division, formed out of the Ulster Volunteers who enlisted and other Ulster recruits w did not join the Irish regiments of the line, did not readily adn Nationalists or Catholics to its ranks; the Ulster Catholics w enlisted were as a rule sent South to join the Division form out of the Nationalist recruits of the other three provinces; a Sir Edward Carson refused to address a recruiting meeting company with Mr. Redmond.

During the year 1915 the Ulster mills and shipyards we working at high pressure on Govt. orders and the farmers we extremely prosperous. A period began in which constant e ployment at good wages was open to the workers and lar profits could be made by the manufacturing and commerc community. As the War progressed this tended to check cruiting for the army. In Southern Ireland recruiting was first fairly satisfactory, though the percentage of able-bodi men who enlisted was not so high as in Northern Ireland, a agriculture began as in Northern Ireland to enter on a period great prosperity.

The political situation was peculiar. Nationalists and Unic ists in the South had sunk their old political difficulties in t task of inducing men to enlist, but their efforts were check and in the end nullified from two opposite quarters. The W Office in England made no concessions to the national feelings the Irish recruits, who desired to be allowed to carry the natio colours on service and were refused permission to do so. Diffic ties were thrown in the way of the formation of an Irish D (though one was eventually formed), while the Ulster Div. w

l to be favoured by the authorities. The Nationalist Irishmen o volunteered for the army resented this the more because it med to imply that the national claim was to be ignored in spite the service which Mr. Redmond's trustful policy had done to cause of England.

The Easter Rebellion.—The Sinn Fein party and the Irish publican Brotherhood had been long opposed to Mr. Redmond his policy. The more belligerent spirits revived the old max- that "England's difficulty was Ireland's opportunity," and, nting to the increasing difficulties of the Allies, asked whether time had not arrived for a vigorous attempt to secure what night not soon again be possible to claim with such apparent e of success. These arguments were enforced with growing dness in a number of papers, *Sinn Fein*, *The Workers' Re- olic*, *Irish Freedom*, *Eire* and *The Irish Volunteer*. These were pressed three months after war had broken out, and the im- tation of two American papers which proclaimed the same icy, *The Gaelic American* and the *Irish World* was prohibited. t other papers sprang up to take their place, such as *Scissors l Paste* and *Nationality*. Pamphlets, some of them written h considerable ability, in favour of the same policy, were ely circulated. Organisers formed branches of the Irish Volun- rs, spoke against recruiting, and spread the doctrines of Sinn n and the Republican Brotherhood. Arms, ammunition and losives were imported. The Govt. arrested and deported ne of the most active of these organisers and attempted, not ays with success, to secure the punishment by the courts of n arrested on the charge of breaking the regulations made by Defence of the Realm Act, 1914.

This party had agents and correspondents in the United tes, and early in the war Sir Roger Casement had gone to rmany, with the knowledge of the Irish Republican leaders, induce the German Govt. to lend armed assistance in the nt of an Irish rising. Most of these facts were known to the horities, but the Chief Secretary, mistaking the significant for accidental, took no drastic or immediate action. The Vol- eers drilled, paraded and practised war-like manoeuvres ler the eyes of the police.

As early as May 1915 the project of an immediate rising had n discussed by the Committee of the Irish Volunteers, but it was not till the early part of 1916 that there was general agree- nt that the right moment had arrived. America was still utral, and the friends of the Volunteers there could assist them h comparative freedom. Germany was, it is true, unwilling end help in the shape of an invading force, as Sir Roger Case- nt had requested, but was ready to send a vessel with warlike es. It was hoped that Sir Roger Casement would arrive with se late in the week preceding Easter, and Easter Monday was d as the date for the rising. The Volunteers throughout Ire- d were ordered to be ready for a "very interesting series of noeuvres at Easter." The German vessel, the "Aud," ived with her stores, but sighting no signals from the land and ng accosted by and requested to follow a British gunboat was ttled by her crew. Sir Roger Casement landed from a sub- rine on the Kerry coast; but by mistaking their directions, the upants of one of the two motor-cars told off to capture the marine cable station at Valentia drove into the sea and were wned; no one met Sir Roger Casement, who was captured by police and hurried across Ireland to prison in London.

The news reached Volunteer headquarters on the Saturday ore Easter. The chairman of the committee, Prof. John Mac- ll, at once countermanded the order for the "manoeuvres" Dublin, and sent messengers to warn the country battalions. a section had determined to persevere with their plans at all s, and, without the knowledge of the chairman, attempted Easter Monday to carry out their original design. On Easter nday they proclaimed the Irish Republic. They seized the t Office, the Four Courts, Stephen's Green, Boland's Mill and ob's Biscuit factory, all strategical positions; they seized ses on both sides of the road in Lower Mount Street, com- nding the route by which any troops summoned from England st have entered Dublin. But they failed to secure two very im- portant points, the Castle and Trinity College; and though they held the telegraph headquarters in the Post Office, they did not capture the telephone exchange.

The authorities, civil and military, were for the moment paralysed. So complete had been their confidence that the officers of the Dublin garrison had been granted leave of absence to attend the Fairyhouse races. But on the evening of Easter Tuesday April 25 1916, the first companies of the 178th Infantry Brigade landed at Kingstown and fought their way past the fortified houses that lined their route. The light artillery shelled the Post Office, and on the evening of April 29 the Volunteer stronghold surrendered unconditionally to Sir John Maxwell. Outside Dublin City there was practically no fighting. The rising was foredoomed to failure; and there is some evidence to show that some of those who actually led it knew that this was so, and hoped for no more than that by the sacrifice of their lives they might, as other Irishmen had done before them, furnish to their countrymen an example which would not be forgotten in other days.

Of the leaders 15 were tried by court-martial and shot, 160 prisoners were sent to penal servitude for various terms and 1,841 were deported to England and interned there. From the date of these executions Sinn Fein and the Republican party began to acquire an influence and a following which in a short time made them the dominant factors in Irish political life.

Mr. Lloyd George's Conferences and the Convention.—Early in June 1916, Mr. Lloyd George was entrusted with the task of making another attempt to settle the Irish difficulty on the basis of the exclusion of six Ulster counties. Mr. Redmond and his party would have agreed to a temporary exclusion of them, provided that the Home Rule Act were put into immediate operation in the rest of Ireland; Sir Edward Carson and his followers claimed that the exclusion should be definite and permanent. No agreement was reached,[1] and at the end of July Mr. Duke became Chief Secretary for Ireland and Sir James Campbell, Sir Edward Carson's chief lieutenant, was appointed as Irish Attorney-General. It seemed as if a stern policy of repression were in contemplation, but the new Chief Secretary was more inclined to conciliation. In Dec. Gen. Maxwell, who had been in command since Easter, was recalled, and just before Christmas 600 of the prisoners interned in England were released.

The next year (1917) saw a revival of the irrepressible national feeling of which Sinn Fein became more and more the authoritative exponent. In Feb. the publication of the Sinn Fein paper *Nationality* was resumed, and two by-elections in Ireland in Feb. and May resulted in the return of Sinn Fein candidates. A statement by the Prime Minister (now Mr. Lloyd George) in Parliament on March 7, declining to consider any proposal for Home Rule which would place the Ulster Unionists under an Irish Parliament against their will may be taken as the final step in the process by which the Irish Nationalist party finally lost its influence both in Parliament and in Ireland. Later in the month Count George Plunkett, the newly returned member for North Roscommon, called a convention in the Mansion House, Dublin, to inaugurate an Executive for Sinn Fein; while in the middle of the following month the Prime Minister proposed to summon a convention representative of all shades of opinion in Ireland, including even Sinn Fein, to draw up proposals for an Irish settlement.

Mr. Lloyd George's proposal was accepted by all parties except Sinn Fein, who were offered a representation unequal to their importance in the country and whose principle—Irish independence—would not have been even considered by the other parties. The Ulster Unionists, while sending delegates, insisted that they should have no power to agree to any proposal which

[1] Mr. Redmond asserted that Mr. Lloyd George had led him to believe that the exclusion contemplated was only temporary; even on this understanding he had great difficulty in persuading his followers (especially in Ulster) to agree to it. Sir Edward Carson claimed that he had understood Mr. Lloyd George to offer permanent exclusion, the only basis upon which he would negotiate; he was strengthened in his position by the attitude of prominent members of the House of Lords who, still opposed to Home Rule on principle, were likely to upset any arrangement with which the Ulster Unionists were not satisfied.

had not been communicated to and endorsed by the Ulster Unionist Council. As the Prime Minister had intimated that the Govt. would not be bound by the findings of the convention unless there was "substantial agreement" the Ulster Unionists were thus in a position practically to veto any finding which was not their own. On June 15, to provide an atmosphere of general goodwill for the convention, the remaining Irish prisoners were released and returned to Ireland. In July the vacancy in east Clare, caused by the death in action of Maj. Willie Redmond, resulted in the return of Mr. de Valera by an overwhelming majority. Mr. de Valera had been in command of a company during the Easter rising in Dublin and had just been released from prison.

But in the autumn the atmosphere of goodwill was disturbed. The Volunteers began again to drill and the Govt. began again to arrest. And on Aug. 15 the military raided the barracks of the National Volunteers throughout the country and carried off their arms. This action, coupled with the complete immunity from disturbance enjoyed by the Ulster Volunteers, was significant. On Oct. 25 Sinn Fein summoned a convention of its own, at which Mr. de Valera was elected President, in place of Mr. Arthur Griffith, who had been till then the sole acknowledged, as he was still the ablest, leader in the party. The election indicated the final amalgamation of the Sinn Fein and the Republican parties and the formal acknowledgment by Sinn Fein of the service done by the leaders of the Easter rising. But the inexperience of the new leader was, fortunately for Sinn Fein, still allied to the ripe wisdom and real ability of its older chief. Mr. Lloyd George's convention reported on April 8 1918, but there was no "substantial agreement." It was decided therefore that the report furnished no basis for legislation and the situation in Ireland remained where it was.

But the Cabinet had by this time decided upon the application of conscription to Ireland. It was a most serious decision. The Parliamentary party joined with every other section of Irish Nationalist opinion in resistance to it, and the decision in consequence could not be enforced. Mr. Redmond did not live to see this final collapse of all his efforts for peace between Great Britain and Ireland, for he had died on March 6, the very day on which an Irish district (the Co. Tipperary) had been named a "special military area."

Military Rule in Ireland.—On May 1 Mr. Edward Shortt succeeded Mr. Duke, the viceroy (Lord Wimborne) was replaced by Lord French and the viceregal court was transformed into the headquarters of a military administration; at the same time Sir James Campbell was raised to the office of Lord Chancellor of Ireland. The new administration began by arresting prominent Sinn Fein and Republican leaders, and Sinn Fein, the Republican Brotherhood and their allied societies were "proclaimed." Conscription was not put into force; voluntary recruits, who were promised grants of land after the War, were called for in a viceregal proclamation and recruiting continued with some degree of success until the end of the War. At the General election of 1918, out of 106 members for Irish constituencies, Sinn Fein returned 73, who immediately refused to take their seats in Parliament, formed themselves into the Assembly of Ireland (Dáil Eireann) and elected Mr. de Valera as President of the Irish Republic, with a number of ministers of departments, answerable to the Dáil. From this date until the conclusion of the Anglo-Irish Treaty the history of Ireland is the record of one long struggle between two forces, the British Govt. in Ireland relying upon the right of possession, the existing law and the troops, and Dáil Eireann, claiming to be representative of Ireland's right to freedom and adopting the usual methods of insurgent peoples.

From the Armistice to the Treaty

During the year 1919, a large portion of the country was portioned off into "special military areas." The plan usually adopted was to proclaim any district in which an officer of the Crown had been shot. But efforts were not wanting to bring about a peaceful solution. The Irish Centre party, later changing its title to that of the Irish Dominion League, in which the most prominent members were Sir Horace Plunkett, Gen. Sir H. Gough, Ca Stephen Gwynn and Capt. Henry Harrison, endeavoured to pr upon both English and Irish opinion through their organ, *Irish Statesman*, the necessity for a solution of the Irish questi along Dominion lines.

The Republican party on their side endeavoured in vain have the case of Ireland brought before the Peace Conference President Wilson. This hope had finally to be abandoned wh on May 31 the American Peace Delegation in Paris refused receive the Irish Republican envoys. In March the Govt. tr to placate Irish opinion by releasing their prisoners, and Mr. Valera, who had succeeded in Feb. in escaping from Lincoln j was able to proceed to America to put the case of Ireland bef American statesmen and the American public and to raise republican loan in the United States. Shortly after he left t policy of boycotting the families and dependents of the pol began to be put into force with the object of bringing about who sale resignations from the police force. Later in the year (Sept. 12) the Govt. retaliated by proclaiming Dáil Eireann "a dangerous association." This did little to ease the situatio and from the beginning of winter raids for arms, the burni of barracks and courthouses and the shooting of police beca matters of weekly occurrence. The first "reprisal" took pla on Sept. 17, when the soldiers at Fermoy wrecked the shops tradesmen who, as members of a coroner's jury, had brought an open verdict in the inquest on a soldier who had been shot leaving church by a number of armed men who deprived t church party of their arms.

The Last Home Rule Bill.—Towards the end of the year t Govt. introduced the last Home Rule bill, providing for t separate Parliaments in Ireland, one for six counties in Ulst the other for the rest of Ireland; each Parliament was to ha control of the government of its own area, while customs a excise, the army and navy, foreign relations and the Post Off were reserved for the Imperial Parliament, Ireland contributi as its share of the cost of their upkeep an annual sum of £18,00 000. The Act also contained provision for the amalgamati of the two Parliaments by mutual consent. It fell far short what the Republicans claimed; it was regarded with dismay those Southern Unionists who still wished to continue the fig against Home Rule and with still greater dismay by the Unionis of the three Ulster counties which were not to come under t Northern Parliament. The Unionist party in the six count agreed to accept it.

Repression in Ireland, 1920.—By April the Govt. had decid to make a final effort to suppress by force the Republican par and its sympathisers. On the 4th of the month, Sir Ham Greenwood was appointed Chief Secretary for Ireland, and t activities of the "Black and Tans" and the Auxiliaries, und the control of Maj. Gen. Sir Henry Tudor, began. In July Ge Macready was appointed commander-in-chief in Ireland with army of 60,000 men under his control. But on May 4 the co poration of Dublin formally acknowledged the authority of D Eireann, and its example was followed pretty generally throug out Southern Ireland. On May 19 the Sinn Fein courts began function, and in a short time had replaced the King's courts ov a large area of Ireland. The conflagration spread to the Nort on Aug. 8 the shooting of a district inspector of police in Lisbu (Co. Antrim) was the signal for the burning by a Protestant m of the shops and houses of prominent Catholics, and on Sept. the shooting of a detective in Belfast led to similar excesses the Four days before this the town of Balbriggan had been partial sacked as a reprisal for the shooting of two policemen in a publi house.

During the course of the year reprisals of this kind took pla in nearly 20 towns, culminating in the serious conflagration Cork on Dec. 18. These reprisals, except in the cases of Belfa and Lisburn, were the work of the Crown forces. But in t case of the "Black and Tans" and the Auxiliaries, recruit among ex-service men, it had been understood from the first th they were to be allowed a considerable freedom. Their excess

came notorious; roaming the country, armed to the teeth, they rrorised the countryside.

On the other side the Irish Republican Army, moving about night or in lonely places, sheltered and protected by the favour, d in some cases by the fear, of the inhabitants, laying ambushes, ooting spies or persons believed to have furnished information the Crown forces, picking off small parties of their opponents, ade life a nightmare to any members of the police and military o found themselves outside their barracks. Both sides fired threw bombs at the members of the other at sight, often in owded streets, to the danger of the civilian population. One of e most horrible of the incidents of the struggle took place on the orning of Nov. 21, when 21 officers were shot at an early hour in eir lodgings, without opportunity of defence or escape. Such as the condition of Ireland when on Dec. 23 the bill for the etter Government of Ireland became an Act of Parliament.

Policy of Reconciliation.—But early in 1921 it became apparent that the true facts of the state of Ireland could no longer concealed. The tide of opinion in Europe and America was beginning to set steadily against Great Britain. The policy of reprisals" was checked and exchanged for one of "official prisals." Gen. Macready issued an order that in future houses the vicinity of an ambush laid for the troops, whose inhabitants might be presumed to have known of it and had not given formation, were to be burned. But public opinion in England gan to be roused.

On April 21 Lord Fitzalan was appointed Viceroy of Ireland, e first Catholic to hold the position, and so great was the universal desire for peace that early in the following month Sir James raig, who had succeeded Lord Carson as the leader of the Ulster ionists, held a conference with Mr. de Valera with a view to a ttlement. During the same month, the elections for the two w Parliaments were held. In Southern Ireland out of 128 ats, 124 fell to the Republican party; in Northern Ireland out 52 seats the Unionists secured 40, the others being divided between the Nationalists and the Republicans. In Southern Ireand the Republicans refused to acknowledge the new Parliament hich, in consequence, could not meet. On May 25 the Customs ouse in Dublin with all its records was burned to the ground by party of the Republican Army, and on the following day the overnment resolved to send more troops to reinforce its army occupation.

Meanwhile preparations went on for the formal inauguration Home Rule in the six counties of Northern Ireland, which by e irony of fate were the first to accept a measure which a few ars before they had repudiated with anger. On June 7 the orthern Parliament was opened by the Viceroy, and on June 22 e King and Queen visited Belfast, when His Majesty addressg the new Parliament urged upon them and the rest of Ireland e necessity for harmony and goodwill. But the Govt. had relved to yield, and on July 8 at a conference in the Dublin ansion House between Gen. Macready and the Republican aders and representatives of the Southern Unionists, invited by r. de Valera, a truce was signed by which the trial of strength hich had lasted for so long was finally to be at an end.

The Irish Treaty.—The relief in Southern Ireland was intense. was hoped that the details of an agreement would be settled a conference between the Prime Minister and the Republican voys: but after seeing them on July 14, the Prime Minister had meeting with Sir James Craig, who made it clear that the six unties would not under any circumstances agree to a union th the rest of Ireland, though they would endeavour so far as ssible to co-operate on a basis of mutual independence. Mr. oyd George thereupon offered the Republican leaders for the counties the status of a Dominion with certain reservations, ainly with regard to the military, naval, fiscal and financial terests of Great Britain. On returning to Ireland and consultg Dáil Eireann and the Executive of Sinn Fein, Mr. de Valera timated to the Prime Minister, both on his own account and the spokesman of the Republican party, that these proposals uld not be entertained, and to this decision, in spite of lvice and threats, the party adhered firmly.

Long negotiations followed, in which it seemed at every step that a break was inevitable; until finally on Sept. 30 the Republican leader accepted, with no other comment than the words "our respective positions have been stated and understood," an invitation to send envoys to London "with a view to ascertaining how the association of Ireland with the community of nations known as the British Empire may best be reconciled with Irish national aspirations." The Irish envoys were Mr. Arthur Griffith, the founder of Sinn Fein, Mr. Michael Collins, who had chiefly organised the military policy of the Republicans and had been Finance Minister of Dáil Eireann, Mr. R. C. Barton and Mr. G. Gavan Duffy, with Mr. Erskine Childers as their secretary; they met the Prime Minister, Mr. A. Chamberlain, Mr. Winston Churchill, Lord Birkenhead, Sir Gordon Hewart, Sir L. Worthington Evans and Sir Hamar Greenwood.

After protracted discussions there was signed on Dec. 6 a treaty by which Ireland was accorded the constitutional status of a Dominion; the right of Northern Ireland to intimate its desire to remain under the Act of 1920, provided it did so within one month of the ratification of the treaty by Parliament, being secured and provision made in that event for a commission finally to decide upon its boundaries. The new Dominion was to have complete fiscal autonomy, the right, within certain limits, to maintain an army and was to have its financial obligations to Great Britain regulated by mutual agreement or arbitration. The treaty was ratified by the British Parliament on Dec. 16. It was not till Jan. 7 that a debate, which had begun on Dec. 14 in Dáil Eireann, concluded by a division in favour of the treaty. Mr. de Valera, who disapproved of it, ceased to be President of Dáil Eireann and his place was taken by Mr. Arthur Griffith, Mr. Michael Collins becoming head of the new Provisional Govt. appointed to carry the provisions of the treaty into effect; and on Jan. 16 1922, Mr. Collins formally took over from the Viceroy Dublin Castle and all the offices of Govt. in the name of the Irish Free State.

BIBLIOGRAPHY.—It is impossible to name all the books and pamphlets which have appeared on the Irish history of the years 1911–22. Current Irish events may best be studied in the files of the leading Irish newspapers, *The Irish Times* (Unionist), *The Freeman's Journal* (Nationalist) and the *Belfast Newsletter* (Ulster Unionist). The last named may be consulted for the manifestoes of the Ulster Unionist party and for the expression of the aims and feelings of the party. The Sinn Fein standpoint can best be studied in its newspapers, mentioned in the preceding article, files of which are preserved in the National Library, Dublin, and in its various pamphlets (to be found in the same library). The writings and pamphlets of Patrick Pearse, the intellectual author of the rising in 1916 and one of its principal leaders, furnish the best key to an understanding of the motives which gave rise to it. There are many official publications which should also be consulted; such as the *Report of the Royal Commission on the Rebellion in Ireland*, Cd. 8279 (1916); *Documents relative to the Sinn Fein Movement* (1916); *Report of the Proceedings of the Irish Convention* Cd. 9019 (1918), etc. On the conditions in Ireland during 1920 and 1921 the anti-Republican account is given in *The Administration of Ireland in 1920* (1921) and *Ireland in 1921* (1922) by I. O. (C. J. C. Street) published by Philip Allan & Co.; while the Republican account may be studied in the files of the *Irish Bulletin*. These should be supplemented by the *Report of the Labour Commission to Ireland* (London, 1921) and *Evidence on Conditions in Ireland* (American Commission, Washington, 1921).

(R. M. H.)

II. AGRICULTURAL CO-OPERATION

The main interest and importance of the co-operative movement in Ireland since the beginning of the World War consists in the struggle of its promoters to preserve and develop it as the chief agent for implementing a certain philosophy of rural life and evolving an agricultural policy consonant therewith. The movement had been initiated a quarter of a century before the War by men who were not themselves farmers, and its inspiration has ever since come from practical idealists. These men realised that in a country dependent upon a sound agricultural economy for the well-being of every section of the population, a technically educated and efficiently organised rural community was of the first importance.

In countries highly industrialised, agriculture could be neglected without disaster; in a country predominantly agricultural

the efficient production and economical distribution of food was what mattered most. Yet those who saw that these ends could best be obtained by the application of the co-operative principle and system to the occupation of farming were chiefly concerned for the building of a rural civilisation which would provide intellectual interests and social amenities calculated to counteract " the lure of the city.". For the solution of the modern rural problem as they saw it, they invented the formula: " Better Farming, Better Business, Better Living." To use a New World phrase, the " pivotal " thing was Better Business and Better Business was co-operation.

Agricultural Organisation Society.—The post-War civil disturbances in Ireland might well have wrecked the movement. War prices and a demand which ignored quality had considerably demoralised the dairy societies. The movement was in no condition to meet the sudden decline in prices which set in in 1920–1. It became clear that its future success—perhaps even its survival—would depend upon the ability of the Irish Agricultural Organisation Society to continue its service as guide, philosopher and friend of the societies. This central body had always derived from the farmers it served and from philanthropic individuals a large part of its funds. In the circumstances of the country, these subscriptions were bound to fall off. While the Development Commission, which was authorised by its Act to treat " the organisation of co-operation " as one of the ways of " aiding and developing agriculture," functioned in Ireland it subsidised the I.A.O.S. for this purpose. Under the Anglo-Irish Treaty the Commission transferred its functions and a proper proportion of its funds to the two Irish Governments. The I.A.O.S. had to be partitioned, an Ulster A.O.S. being formed to operate in the six northeastern counties.

The Govt. of the Irish Free State has from year to year continued the grants to the I.A.O.S. and for its first year the Govt. of Northern Ireland continued it to that part of the organisation movement which came within its territory. This, however, was not renewed, and in Northern Ireland the movement in consequence had greatly to restrict its work. But that the farmers there have come to realise its value is evident from the fact that of its total funds in 1925 more than two-thirds came from societies' contributions, so that it was able to end the year without a deficit.

The new Free State Govt. wished to reconstitute the agricultural policy of the country. This was to be expected in a land which, itself purely agricultural, had just obtained independence from a union of countries mainly industrial. The department was merged in a new Ministry of Lands and Agriculture, and a commission on Agriculture was set up which made many far-reaching recommendations, especially emphasing the importance of agricultural education and commending the development of co-operation as well as an increased subvention to the I.A.O.S. At present the Ministry and the organisation society are engaged in negotiations pointing towards iucreased Government aid.

Statistical Position.—In the country signs are not lacking of a renewal of co-operative enterprise. The largest trade federation of the movement, the Agricultural Wholesale Society, which made great progress in the more prosperous years, participated to the full in the country's economic depression; but " Irish Co-operative Meat, Ltd.," established in 1920, with headquarters in Waterford, is now preparing to work on a large scale. It was unable to function during the years of civil disorder, but has already a membership of 5,793, with a share capital of some £175,000, of which £65,000 has been paid up, the source of the capital being farmers or farmers' co-operative societies. The shipment of pigs was begun in 1925, and the society proposes shortly to deal weekly with 100 cattle, 1,000 pigs, and to be able to cold store 200 tons of butter (or equivalent produce) at one time. The Irish Co-operative Agency Society, which markets the butter of the creameries, had in 1924 a trade turnover of £555,649, representing a quantity of butter only slightly exceeded by the years 1920 and 1922, the highest recorded.

A further development took place in 1925. The credit societies were doing a dwindling business, largely because the I.A.O.S. could not pay for propaganda and inspection, but the Commission on Agriculture had recommended that this aspect of co-operative business be specially endowed; two winters disastrous for farming (1923–4 and 1924–5) had resulted in severe losses of live stock through fluke, etc., and the Dáil of the Free State, at the instance of the Minister for Agriculture, passed a vote for loans not to exceed £100,000, for restocking of lands, to be advanced to credit societies approved by the I. A. O. S., to whom the administration of the scheme was entrusted. Thus were re-established satisfactory relations between the state aid and the self help parts of a movement which may encourage other countries to adopt the device of an " organisation society," working in close co-ordination with the governmental Departments of Agriculture. There was, too, during the winter of 1925–6 a revival of energy among the dairying societies.

The organisation of about 150,000 farmers (in a country containing about 4,250,000 people) into a movement whose aggregate business for the decade 1914–23 (inclusive) was well over £80,000,000—to which creameries contributed about one-half—is not an unimportant factor in Irish economics.

Education.—The need of all co-operative movements is always education, and the higher the development the greater is that need. The hampered condition of the Central Organisation Society is probably the true cause of the halt of the movement as a whole. Up to the present, the I.A.O.S. has had to render many services, notably technical advice to creameries and other societies, which the Govt., through the Ministry, are now rendering under the Dairy Produce Act and the Agricultural Produce (Eggs) Act. To ensure the future of co-operation, technical instruction in itself is not the chief desideratum. When it can leave that to the Ministry, the Organisation Society will concentrate on educating the farmers not only in credit and the technique of co-operation, but in the co-operative spirit—without which loyalty and solidarity, essentials to success, must always be lacking. The standard of efficiency required of the modern farmer is only to be attained by an educated man.

The Govt. of Northern Ireland, like that of the Irish Free State, through its Dept. of Agriculture, enforces egg-grading, but the Ulster Organisation Society, with an income of £91 3s. 6d., cannot do the work necessary to educate the farmer up to a standard which the Govt. can only punish him for failing to reach. The work, therefore, cannot be expected to show immediate spectacular results, but that, it must be understood, is as much due to the width of the aim as to the narrowness of the resources. And these two have another connection. To-day the central society's funds are largely drawn from the fees the farmers will willingly pay it for technical instruction, which is not co-operative but a manufacturing technique. When that function is transferred to Govt. and the Organisation Society is devoted to its educational but less remunerative purposes, the farmers' financial support will for some time be considerably lessened.

Nevertheless, the founders of the movement were convinced that nothing less than a continual extension of the study of the rural problem—the regarding of agriculture as an *industry*, as *business* and as a *life*—could bring the country population even to the standard demanded under modern economic conditions. The next step, therefore, in this concerted advance was to gather and distribute knowledge of every side of agricultural co-operative evolution the world over, and to provide a centre at which students and organisers could study and compare the progress of local developments. To provide this, the Co-operative Reference Library had been founded in Dublin in 1913. One of the founders of the Irish movement has endowed a trust (which the trustees christened the Horace Plunkett Foundation) for the purpose of extending the Irish philosophy of rural life throughout the British Commonwealth.

Under its auspices there was convened at Wembley in July 1924, a conference on agricultural co-operation in the British Empire. The delegates, who were thoroughly representative of agriculture in this vast area, approved the Irish policy, and called upon the Foundation to establish an office in London to act as a clearing-house for the exchange of experiences and opinions of all organisations which were putting the co-operative principle into practice. This has been begun by opening a London centre which, when the Carnegie United Kingdom Trust promised to defray the cost of maintenance, naturally offered hospitality to the Co-operative Reference Library, an offer which the Carnegie United Kingdom Trust approved. Thus the Foundation is in a favourable position to see that Ireland is kept fully informed of the progress of similar movements in other countries

IRELAND, NORTHERN (*see* IRELAND, 14.742), a part of the ted Kingdom of Great Britain and Ireland, with a certain sure of local self-government. The population at the census 911 was 1,250,531; at the census of 1926 it was 1,255,881, ncrease of 5,350. The population of Belfast, the capital, in was 414,844. The area of 3,351,970 statute acres consists of six counties of Antrim, Down, Londonderry, Armagh, Ty- and Fermanagh, and the county boroughs of Belfast and donderry.

I. POLITICAL AND CONSTITUTIONAL HISTORY

nder the Govt. of Ireland Act, 1920, the Lord Lieutenant, in name of the King, summons, prorogues and dissolves liament. He gives and withholds the Royal Assent to Bills ed by the Senate and House of Commons, subject to the wing limitations:—

) He shall comply with any instructions given by His Majesty espect of any such bill or order; and

) He shall, if so directed by His Majesty, reserve any such Bill rder for the signification of His Majesty's pleasure, and a Bill rder so reserved shall not have any force unless and until within year from the day on which it was presented to the Lord Lieu-nt for His Majesty's assent, the Lord Lieutenant makes known it has received His Majesty's assent.

he Senate consists of the Lord Mayor of Belfast, the Mayor Londonderry and 24 senators to be elected by the members he House of Commons; the House of Commons consists of members; 13 members are returned to represent Northern land in the Parliament of the United Kingdom. The members he House of Commons are elected by the same electors and he same manner as members returned by constituencies in rthern Ireland to serve in the Parliament of the United gdom, except that, in any contest election of the full number members, the election is according to the principle of pro-tional representation, each elector having one transferable e. All election laws relating at the time of the passing of the A. to the Commons House of Parliament of the United King-n and the members thereof were, so far as applicable and sub-to the provisions of the Act, to extend to the House of Com-ns of Northern Ireland.

Money bills can only originate in the House of Commons and y not be amended by the Senate. If the Senate reject, or to pass, or pass with amendments to which the House of mmons will not agree a public bill which is sent up to the ate at least one month before the end of the session, and if House of Commons in the next session again pass the bill, h or without any amendments which have been made or eed to by the Senate, and the Senate reject or fail to pass it, pass it with amendments to which the House of Commons l not agree, provision is made for the holding of a joint session. Subject to the provisions of the Act, the Parliament has power erally to make for the peace, order and good government of rthern Ireland, with the limitations that it shall not have wer to make laws except in respect of matters exclusively ating to the portion of Ireland within its jurisdiction. The own, armed forces, defence of the realm, relations with eign States and certain other matters were excluded from its wer. The Parliament cannot make laws interfering with gious equality, taking property without compensation, etc All executive power in Northern Ireland continued vested in King, but exercised by the Lord Lieutenant or other chief ecutive officers for the time being appointed in his place. Certain taxes, such as customs and excise duties, were reserved to the Imperial Parliament; the postal service, post office savings bank, etc., were reserved temporarily, pending the formation of the proposed Irish union. The Act abolished the Supreme Court of Judicature for Ireland, and established the Supreme Court of Judicature of Northern Ireland, consisting of two divisions, the High Court and the Court of Appeal.

Developments After 1920.—A proclamation was issued by the Lord Lieutenant of Ireland (Viscount FitzAlan of Derwent) on May 4 1921 summoning a Parliament of Northern Ireland to meet in Belfast on June 7 following. The election of members of the House of Commons was held on May 24, the Unionists securing 40 seats to 6 Nationalist and 6 Sinn Fein. Elections for the Senate were held on June 12, and 24 Unionists were returned unopposed. The Ulster Unionist Council had on Feb. 4 unanimously elected Sir James Craig as leader of the party. The Nationalist and Sinn Fein members did not attend the opening of Parliament. The Hon. Hugh O'Neill was elected as Speaker of the House of Commons and the Marquess of Dufferin and Ava as Speaker of the Senate. On June 22 Parliament was formally opened by King George V. The first Cabinet was constituted as follows:—

Prime Minister, Sir James Craig.
Minister of Finance, Mr. H. M. Pollock.
Minister of Labour, Mr. J. M. Andrews.
Minister of Home Affairs, Sir R. D. Bates.
Minister of Education, The Marquess of Londonderry.
Minister of Agriculture and Commerce, Mr. E. M. Archdale.

Sir James Craig immediately made it clear that his policy was to preserve the existence of Northern Ireland as an integral part of the United Kingdom, and, while willing to contemplate common action with Southern Ireland under the Government of Ireland Act, to resist union with the rest of Ireland in any system which would involve separation from Great Britain and the abandonment of the representation of Northern Ireland in the Imperial Parliament.

The first task of the Government was to restore internal order. Political and religious animosities, to which unemployment arising from post-War decline in trade and industry had added fuel, had been kindled to a dangerous heat. Outbreaks of civil disorder leading to murder and arson had taken place. The anti-British party in Southern Ireland had undoubtedly contributed to increase the difficulties of the Government, presumably in the hope of forcing an all-Ireland form of government by making government under the Act of 1920 impossible. However, the disruption of this political party, which followed upon the Irish agreement of the winter of 1921–2, accompanied as it was by an outbreak of civil war in Southern Ireland, actually eased the situation in Northern Ireland, as it caused the withdrawal of certain elements of disorder which had been organised and introduced from outside and which were now called off to take part in the quarrels of their leaders.

After the setting up of the provisional Govt. in Southern Ireland, the Royal Irish Constabulary was disbanded under the Constabulary (Ireland) Act, 1922, which received the Royal Assent on Aug. 4 1922 and modified the provisions of the Govt. of Ireland Act by providing for the disbandment of the constabulary, in lieu of the transfer to the Govt. of Northern Ireland of the members of the forces serving in that area. Before this disbandment was completed the Parliament of Northern Ireland had established a new police force, the Royal Ulster Constabulary, and a considerable proportion of disbanded members of the Royal Irish Constabulary received appointments in the new Ulster force. A large body of auxiliary police was also organised and, thanks to vigorous measures both in and out of Parliament, order was restored in a comparatively short time.

The Irish Free State (Agreement) Act, 1922, affected Northern Ireland (although she was not a party to the agreement thereby given legislative sanction) in the following respects:—

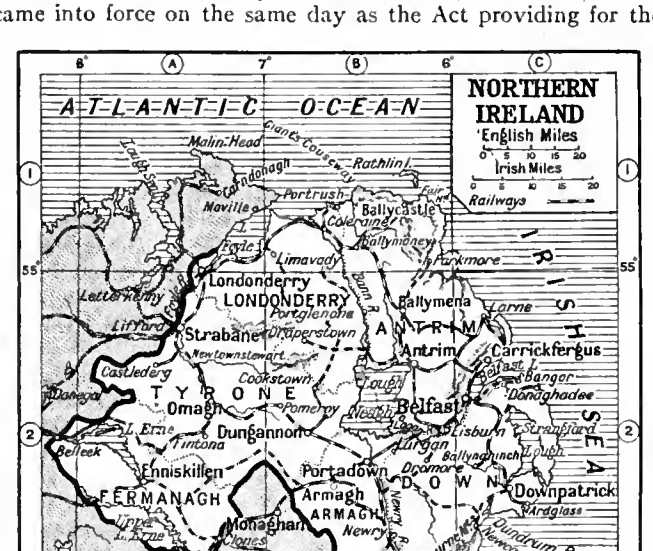
(*a*) it purported to give Dominion status to Ireland as a whole;
(*b*) it put a stay upon the exercise of the powers of the Parliament and Govt. of the Irish Free State, as respects Northern Ireland, until the expiration of one month;

(*c*) it enabled Northern Ireland to vote herself out of the Free State by means of an Address presented to His Majesty by both Houses of Parliament of Northern Ireland, before the expiration of the month above referred to, and it attached to the presentation of such an Address the consequence that a Commission was to be set up consisting of three members, one to be appointed by the Govt. of the Irish Free State, one to be appointed by the Govt. of Northern Ireland, and one (who was to be the Chairman) to be appointed by the British Govt., in order to "determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland";

(*d*) it expressly preserved the Council of Ireland and the Irish Free State representation thereon, whilst depriving the Council of any powers in that State; and

(*e*) it offered to Northern Ireland, as an alternative to going out of the Free State, a continued existence under the Govt. of Ireland Act, subject to an overriding jurisdiction of the Parliament and Govt. of the Irish Free State, in all matters in respect of which legislative power is withheld from the Parliament of Northern Ireland under that Act.

The majority of the points in which the Constitution of Northern Ireland was affected by the setting up of the Irish Free State received attention from the Imperial legislature in the Irish Free State (Consequential Provisions) Act, 1922, which came into force on the same day as the Act providing for the



Free State Constitution. This Act contained various provisions which were to take effect in the event of Northern Ireland voting herself out of the Irish Free State under Article 12 of the original Agreement. This voting out was immediately accomplished, and thus authority was given for various constitutional changes. Subject to the provisions of the first schedule (Modification of the Govt. of Ireland Act, 1920, etc.) to the Act, the Govt. of Ireland Act was only to apply to Northern Ireland. This schedule provided for the appointment of a Governor of Northern Ireland, and for the application of the provisions of the Govt. of Ireland Act, 1920, with respect to the Lord Lieutenant, to him. Further references in any other enactment to the Lord Lieutenant, were in their application to Northern Ireland, to be construed as references to the Governor of Northern Ireland. A Privy Council of Northern Ireland was to be established and there was to be a Great Seal of Northern Ireland. On Dec. 9 1922 the Duke of Abercorn was appointed Governor of Northern Ireland.

During 1923, in spite of continued trouble with the Free State over the failure to agree on the boundary question, Northern Ireland progressed. The most important legislative achievement of the year was the Education Act, which came into operation, in the face of condiderable hostility, on Oct. 1 1923. Based largely on the recommendation of a committee of enquiry appointed in 1921 under the chairmanship of Sir R. Lynn, M.P., the Act marked a new departure in Irish educational administration by establishing the principle of popular control. Provision was made for the establishment of local education authorities, to be formed by the county borough councils and county councils, with power to appoint administrative sub-areas under regional committees. The fiscal separation from the Irish Free State, dating from April 1 1923, had an adverse effect on trade between Northern and Southern Ireland owing to customs duties levied by the Government of the Irish Free State on certain goods crossing the land frontier.

Boundary Question.—The chief obstacle to the development of better relations with the Irish Free State during the years 1923 and 1924 was the boundary question. The Govt. of Northern Ireland declined to appoint a Commissioner under Article 12 of the Irish Free State (Agreement) Act, 1922, and, as a consequence of this refusal, the Irish Free State (Confirmation of Agreement) Act, 1924, was passed by the Imperial Govt. whereby, in the event of the continued refusal of the Govt. of Northern Ireland to appoint a Boundary Commissioner, the power of appointment residing in that Govt. was to be transferred to, and exercised by, the British Govt., any Commissioner so appointed being deemed to be a Commissioner appointed by the Govt. of Northern Ireland. The British Govt. and the Govt. of the Irish Free State had, in the meantime, appointed as their respective Commissioners, Mr. Richard Feetham, a Judge of the High Court of the Union of South Africa, and Prof. J. McNeill. Upon the passing of the above Act, the British Govt. appointed Mr. J. R. Fisher, barrister-at-law, as the Commissioner for Northern Ireland.

The Boundary Commission occupied upwards of a year in visiting, and hearing evidence in, the various border districts in Ireland, and in considering the information so obtained. In Nov. 1925, on the eve of the promulgation of the report of the Commission, the Free State Commissioner withdrew. A conference was then held in London between the three Govts. represented on the Commission, and a further Agreement was concluded on Dec. 3 1925. By this Agreement, the Ireland (Confirmation of Agreement) Act, 1925, the three Govts. "being united in amity" and "being resolved mutually to aid one another in a spirit of neighbourly comradeship" achieve at length the settlement which is set out in Article 1:—

> The powers conferred by the proviso to Article 12 of the said Articles of Agreement on the Commission therein mentioned are hereby revoked, and the extent of Northern Ireland for the purposes of the Govt. of Ireland Act, 1920, and of the said Articles of Agreement, shall be such as was fixed by sub-section (2) of Section one of that Act.

The Act also provided that April 1 1926 should be the date as from which the powers in relation to Northern Ireland, which by the Govt. of Ireland Act, 1920, were made powers of the Council of Ireland, were to be transferred to the Parliament and Govt. of Northern Ireland. The Constitution of Northern Ireland could not, before the consummation of this last Agreement, have been described as being settled with finality. The establishment of a separate legislature has not led to a further differentiation of the law in Northern Ireland from that in other parts of the United Kingdom, but to the assimilation of the laws in Northern Ireland to the law in Great Britain, and to the enlargement of the status of the subject in Northern Ireland to that of the subject in Great Britain. It is, perhaps, to this undertaking above all that the Parliament of Northern Ireland, on a study of its statute-book, will be found to have addressed itself with vigour from its earliest inception. (Lo.)

II. FINANCIAL AND ECONOMIC HISTORY

Finance.—The financial provisions of the Govt. of Ireland Act, 1920, were necessarily of a very intricate and comprehensive character, as not only did that Act completely overthrow the whole system of finance in force since the Act of Union of 1800, but went further and set up in Ireland two Exchequers each under an entirely separate jurisdiction. Subsequent events have considerably modified the operation of the 1920 Act and it is therefore not necessary to deal in this article with

Northern Ireland's position as regards the Irish Free State but simply to consider the relationship which exists under the Act between Northern Ireland and Great Britain, and the financial system which has been built up in Ulster since 1921.

The newly constituted State was not granted absolute financial autonomy. The Act of 1920 contemplated two distinct classes of revenue, and two classes of expenditure, (1) purely local revenue and expenditure and (2) taxation and expenditure which by reason of the wider issues involved, should not be delegated to a subsidiary authority. Under the first heading all such duties as stamp duties, death duties and licence duties, together with expenditure on services such as old age pensions, police, education, etc., while included in the second category are the more important duties of income tax and customs and excise, and expenditure on the higher administration of justice, the Land Commission and certain other services.

Revenue.—Approximately 90% of the taxes are imposed and collected by the Imperial Government. In the year 1922–3 the revenue yielded by taxes under the control of the Imperial Govt. amounted to £10,700,000, while the ordinary "transferred" tax revenue amounted to £923,000. This revenue, after deducting from it the cost of the various services reserved to the Imperial Govt., together with Ulster's contribution towards Imperial expenditure, is remitted to the Exchequer of Northern Ireland, and is used in the ordinary way to meet expenditure on local services. As a further source of revenue to meet the "additional expense incidental to the severance of the two Irish Govts.," it was provided that the produce of the Land Purchase annuities payable by those agricultural tenants who had bought out their holdings under the Land Purchase Acts (and who had effected their purchases by the payment of annuities extending over a period of 65 years) should be transferred to the Northern Government. After making provisions for a sinking fund with the object of ensuring a permanent revenue from this service, these land annuities produce a net revenue of £550,000 which should be added to the figures given above.

Fiscal Uniformity.—The control by the Imperial authority of the main sources of revenue requires almost complete fiscal uniformity between Ulster and Great Britain, and necessarily ensures that the industrial and general economic policy of the Province must, in practice, largely conform to that of the Imperial Govt., not only in a local sense, but also as regards its commercial relations with foreign countries. Hence no tariff barriers can be erected between Northern Ireland and Great Britain, and the normal flow of merchandise between the two areas has continued without the inconveniences and hindrances resulting from the imposition of customs duties.

Contribution to Imperial Expenditure.—The Act of 1920 enacted that the Province should make a fixed statutory contribution to "Imperial" services, but this proving unworkable, it was eventually agreed to set up an arbitration committee which, after sitting for two years and having heard expert evidence on both sides, issued its final award in March 1925, settling the principles upon which Ulster's contribution is in future to be assessed. In brief, the contribution will be the balance of revenue over expenditure; for the purpose of making this calculation the taxes over which Ulster has control are to be presumed to raise a sum proportionate to the yield of similar taxes in Britain; while on the expenditure side the Province is allowed for development and social service a sum proportionate to the amounts required by Britain for similar purposes.

Reduction in Revenue.—The reductions in taxation made by the Chancellor of the Imperial Exchequer from time to time in the intervening years between 1922 and 1925 have had their reaction on the revenues of Northern Ireland resulting in an annual diminution in revenue of approximately £1,889,000. The severe depression in trade has also been responsible for a further diminution in revenue; the actual yield of the taxes levied in Northern Ireland by the Imperial Govt. falling from £10,562,000 in 1922 to £8,217,000 in 1925. These reductions were naturally reflected in a corresponding decrease in the contribution which Northern Ireland was able to make towards the cost of Imperial services.

Public Debt.—Unhappily the establishment of the Government of Northern Ireland synchronised with the beginning of a period of profound commercial and industrial depression, with its natural reaction on employment. The principal industries of the Province—shipbuilding and the linen trade—suffered to an unwonted degree, thus compelling the newly-formed Government to finance the Unemployment Insurance Fund to an extent quite disproportionate to that of Great Britain, whose varied industries scattered over a wide area ensure a greater degree of solvency for its insurance scheme. At the end of the financial year—1924–5—the accumulated deficit of the unemployment fund was approximately £2,300,000.

Capital Funds.—On its establishment the Government of Northern Ireland had received its apportioned share of the different capital funds previously set up in Ireland for administrative purposes, and including amongst others the Church Temporalities Fund, Teachers' Pension Fund, Development Fund, etc. It had in addition created certain other capital and sinking funds. To a very considerable extent the requirements of the Unemployment Insurance Fund and of Local Authorities and others to whom loans were made have been met by the temporary utilisation of this available capital. These sources were, however, insufficient to meet all the demands made on the Government, and a public debt was therefore created by the issue of Ulster Savings Certificates in April 1922, followed by an Ulster Loan Stock issue of £2,000,000 in Nov. 1925. The former issue, guaranteed by the British Govt. and providing a remunerative investment for savings, met with an immediate and sustained response throughout the Province. By March 31 1925 a sum of £1,500,000 (after deducting repayments) had been invested in this way. The proceeds of the Ulster Loan Stock issue are available only for the purposes mentioned in the Government Loans and Exchequer Provisions Act (N.I.) 1925, which do not include the making of advances to the Unemployment Fund. Of the stock £1,000,000 was reserved for the investment of Government funds, the remaining moiety being taken up by public subscription.

The Budget.—Statistics regarding the public finances of Northern Ireland for the year ended March 31 1925 showed a total revenue, including Post Office receipts, of approximately £11,336,000; the total expenditure for the same period amounted to £7,713,000, leaving a balance of revenue over expenditure of £3,623,000. Of this £3,472,000 was contributed to Great Britain, leaving a net surplus of £151,000.

Production and Industry.—Agriculture is one of the principal industries of the country and large quantities of butter, eggs and general agricultural produce are exported to Great Britain. Considerable quantities of flax are also grown and it is expected that the research work now being undertaken in this branch of agriculture will not only improve the quality of the flax but will also greatly stimulate general interest in this product.

During the post-War period the trade in live stock greatly increased. Up to 1926 Ulster had escaped the ravages of foot-and-mouth disease, and indeed was particularly free from outbreaks of animal diseases generally. During 1924 a total of 424,000 cattle, etc., were exported, chiefly to Great Britain.

The main industries of Northern Ireland are the manufacture of linen, shipbuilding, engineering, rope making, and distilling. The linen industry normally employs directly or indirectly approximately 120,000 workers. Over 1,000,000 flax spindles are in use, representing one-third of the world's entire flax-spinning capacity; 40,000 looms are engaged in weaving. The major portion of the shipbuilding industry is located at Belfast, where a large number of the world's most famous vessels have been built, including the well-known "Titanic" and "Olympic." During 1923, 12 mercantile steam vessels with a total tonnage of 75,782 were launched in the North Irish yards.

Over 50 important firms are engaged in Belfast and the immediate vicinity in the manufacture of textile machinery of all kinds; heating, ventilating and drying plants and almost every variety of equipment for factories. There are some 12 modern distilleries operating in Ulster which together produced during the year ended March 31 1924 a total of 2,534,426 proof gallons of spirits. A number of other industries are carried on. Belfast possesses the largest ropeworks in the world, which employ over 3,500 persons and can produce 350 tons per week of all classes of ropes and twines. Tobacco, soap, woollen goods, felt and aerated waters are also manufactured.

Trade.—Northern Ireland carries on a very considerable export trade. Statistics for 1923 show that the value of the exports for that year to Great Britain and foreign countries totalled £66,000,000, while the imports for the corresponding period amounted to £65,000,000.

Finance.—There are three banking companies having their head offices in Northern Ireland, viz.: the Belfast, Ulster and Northern banks. In addition there are several other banks operating in Ulster. The purely North Irish banks have all a close working agreement with one of the leading English Joint Stock Banks. The deposits in these three banks amounted in 1924 to over £48,000,000 while the advances of various descriptions totalled £31,000,000. In addition to these deposits the sums deposited in Trustee and Post Office Savings banks amounted to almost £9,000,000 in 1924. On Dec. 31 1924, there were approximately 1,350 living companies registered in Northern Ireland with a nominal capital of £71,000,000 and a subscribed capital of £59,000,000.

An analysis of the registered capital produces the following results:—

Banking, etc.	£11,000,000
Brewing and distilling	2,250,000
Shipbuilding	13,500,000
Textile manufacturers	21,000,000
Engineering	10,000,000
Others	13,250,000
	£71,000,000

Communications.—The principal ports of Ulster are Belfast, Londonderry, Coleraine and Newry, while in addition there are Royal Harbours at Donaghadee and Ardglass. Of these Belfast is the most important. Belfast Harbour covers 2,287 acres and possesses a total lineal quayage of 26,512 feet. There are in addition, five graving docks, the largest of which is 850 ft. long and 96 ft. wide at the entrance. During 1923 the number of vessels arriving at ports in Northern Ireland totalled 12,383 with an aggregate tonnage of 4,872,225.

Northern Ireland is exceptionally well provided with roads and a very marked increase in the use of motor transport has been noticeable in the post-War period. There were altogether 12,892 m. of roads in 1925 consisting of:—

Main trunk roads and the more important inter-town routes	1,023
Less important inter-town routes	1,111
All other roads	10,758
	12,892

There are seven private railway undertakings situated wholly in Northern Ireland and five others extending into the Irish Free State. The total mileage in Northern Ireland in 1925 was as follows: standard gauge 815 m., narrow gauge 301 miles. The authorised capital of the railways wholly in Ulster is £1,888,757 and of those partly in Ulster and partly in the Free State £11,141,356. The total receipts in 1923 amounted to £1,090,526 in the case of Ulster railways and £2,395,285 in respect of the others. (H. M. P.)

IRISH FREE STATE (SAORSTAT EIREANN).—The Irish Free State, with the status of a British Dominion, came officially into being on Jan. 15 1922, when the Irish Peace Agreement, signed in London on Dec. 6 1921, by the British and Irish Delegations, already ratified by the British Parliament on Dec. 16, was adopted by a meeting of elected members of the Parliament of Southern Ireland convened by Mr. Arthur Griffith. In 1923 the State was admitted a member of the League of Nations. The New State is composed of 26 of the counties and four of the county boroughs of Ireland, and is divided into 269 baronies, 2,165 civil parishes and 51,158 townlands. Its area is 17,019,155 statute ac., and its estimated population in 1925 was 3,163,000.

I. POLITICAL HISTORY

The treaty which led to the creation of the Irish Free State was concluded by the British Govt. with representatives of an Irish Govt. which Great Britain had never recognised. From Jan. 1919, onwards, a large majority of the members of parliament elected for Irish constituencies had styled themselves Dáil Eireann—the Assembly of Ireland—had declared the Irish Republic in existence and had chosen a president and Ministers. In May 1921, when elections were held under the Government of Ireland Act 1920, Republican candidates were returned unopposed for all constituencies outside of Northern Ireland (except that of Dublin University) and for several constituencies in Northern Ireland. The Irish war was then at its height; there was no civic life in the country and the members chosen were simply nominees of the Republican Govt., which was in effect a council of the republican army.

This, the second Dáil, met for the first time after the truce at the Dublin Mansion House on Aug. 16 1921. All its members took the oath to the Republic. Negotiations with Great Britain at first conducted by E. de Valera, were resumed by a delegation headed by Arthur Griffith, "Vice-President of the Republic," and Michael Collins, its Minister of Finance. Great Britain's definite refusal to recognise an independent Irish Republic had been publicly repeated with emphasis.

When the terms of the treaty were published on Dec. 6 1921 Mr. de Valera's announcement of his opposition came as a shock. In the Dáil's debate, prolonged until Jan. 8 1922, it was generally admitted that the country at large was for acceptance. But some speakers declared that their oath bound them to the Republic; some that the desire for acceptance was merely due to fear of renewed war; some, that to compromise was dishonourable, and that the democracy had no right to do what was morally wrong. Many who advocated acceptance made the suggestion that it was a step to the Republic. The majority for acceptance was 64 to 57, and when Mr. de Valera resigned the Presidency Griffith was elected only by two votes. The wording of the decision hardly accepted the facts of the situation: Griffith was chosen President of the "Irish Republic."

The Provisional Government.—Under Article 17 of the treaty it was necessary to appoint a provisional government, and this was done at a meeting in which all members elected for constituencies in Southern Ireland were summoned. Opponents of the treaty absented themselves exactly as they had absented themselves from the British House of Commons; but the four members for Dublin University attended, and declared that they and those whom they represented were now "on a common basis with other citizens of the Free State" and could act whole-heartedly with them for the good of Ireland. Eight men were named members of the Provisional Government, Collins being chairman. Griffith remained outside it. So did Gen. Mulcahy, who had been chief of staff of the Republican Army and who now succeeded Cathal Brugha as Minister for Defence. In theory the army was still the army of the republic and the Provisional Govt. had no force at its disposal.

The old constabulary was at once disbanded; it had since 1920 ceased to be in any true sense a police force. Collins and his colleagues decided at once to form a new police, the Civic Guard, but it necessarily took time to organise, and its creators had decided in principle that it should be unarmed. British troops were rapidly evacuating the country, and those who had won the treaty felt it impossible to use support from this quarter. There was the Irish Army, now largely in uniform; but it soon became clear that the Army was a source of danger.

With the exception of Collins, only one man in the Provisional Govt. was widely known in Ireland. This was Professor Eóin MacNeill, for many years vice-president of the Gaelic League, who gained a new prominence at the close of 1913 as chief promoter of the Irish Volunteers and afterwards, from Sept. 1916, as their chief of staff. Of the others, Mr. William Cosgrave, Minister for Local Govt., had been a prominent member of the Dublin Corporation from 1913 on, and in 1917 was returned as a Sinn Fein Member of Parliament. Mr. Duggan had been one of the signatories to the treaty. The others, Mr. K. O'Higgins, Mr. J. Magrath, Mr. F. Lynch and Mr. P. J. Hogan were still young men with their careers yet to come. Mr. O'Higgins has thus described the situation: "The Provisional Govt. was simply eight young men in the City Hall" (where they met at first) "standing amidst the ruins of one administration, with the foundations of another not yet laid, and with wild men screaming through the keyhole."

Collins, a man of immense resource and energy, sought to strengthen his position by the success which would have most appealed to popular sentiment—the reunion of Ireland. Under the treaty, if Northern Ireland consented, all powers retained in

at province by the Parliament at Westminster would pass to e Parliament of the Free State. Interviews with Sir James raig, the Ulster Prime Minister, were arranged. Settlement was sirable for North as well as South, since in Belfast there raged murderous strife between Catholic and Protestant; but no commodation proved possible. The birth of the Free State is thus not unattended with difficulty.

Both Griffith and Collins desired a general declaration from e country by an election. But the republicans, knowing as ll as they what the result would be, resisted this, and Mr. de lera called instead, on Feb. 21, a convention of delegates of the ole Sinn Fein organisation. At this meeting, Collins, seeing at a vote would go against him, consented to delay the election : at least three months and not to hold it till the draft of a nstitution, based on the treaty, had been published.

There was some disorder. Control of the republican move-nt did not rest with Mr. de Valera; a section of officers in the my, headed by Mr. Rory O'Connor, who had directed en-neering operations in the campaign of destruction during the errilla war, demanded the right to be consulted on the terms any settlement. Meetings of this body were held in express fiance of orders in Dublin. Mutinous action was taken at onmel, where a store of arms was seized. This was followed by harper outbreak at Limerick, where a body of troops occupied barracks in the name of the republic. The officer commanding the Free State in the region was ready and anxious to act, t Collins, desirous at all costs to avoid war, caused an accom-dation to be patched up.

Meanwhile, Mr. de Valera proclaimed at meetings that there s only one legitimate Government in Ireland—that of the ublic. There was no law, and in parts of the south much olence was offered to Protestants, nominally in reprisal for acks on Catholics in Belfast, while raids across the border o the north intensified the danger of war. In March, Sir nry Wilson, who on retirement had entered Parliament for an ster seat, was put in charge of the Ulster defences, and organ-d the whole Protestant male population as an armed police. Southern Ireland, the extremist Republican party definitely ired renewal of war with England. They would stop at nothing their efforts to smash the treaty and their armed bands still ved uncontrolled, levying toll from banks and commandeering tor-cars.

t appeared from his public utterances that President Griffith ired drastic action; but Michael Collins, the head of the ovisional Govt., whose personal hold was stronger still, com-mised, and on May 20 announced that he had reached agree-nt with Mr. de Valera. An election was to be held, but Free ters and Republicans were to put forward a joint panel of ndidates, so arranged as to reproduce the distribution of views the existing Dáil. After the election a coalition ministry was be formed, giving Mr. de Valera four seats in nine. The result the election was not to be considered as a vote on the treaty. peal was made jointly that no other Candidates be selected. t organised Labour insisted on putting forward candidates, l other interests took courage to follow their example. Michael llins, at Cork, publicly advised the people to vote as they se. There resulted some appearance of a free election in ne constituencies, where the polling took place on June 16. irty-four candidates not on the agreed panel were elected—supporting the treaty. The Republican defeat was evident.

Civil War.—Aggressive actions by the mutinous section of the y followed, and on June 22 Sir Henry Wilson was murdered London by two Irishmen who had served in the British army. e British Govt. made it clear that the Free State must . A definite cause of action was afforded when the mutineers tured in Dublin the assistant chief of staff of the Free State ny and held him as a hostage. On June 28 the Four Courts dquarters were summoned to surrender, and on refusal ge was laid. So the disturbance began. After eight days' ting—so local in character that the city's ordinary life went o—the struggle in Dublin was over. Rory O'Connor was cap-ed after he had blown up the Four Courts with all their records. Mr. de Valera, who had joined the insurgents, escaped, but Cathal Brugha, after ordering his post to surrender, dashed out firing and was shot down.

Some districts of the country south and west was held by Republicans. The Government's army had neither a trained staff nor a system of supply: it had to improvise. But it had a few field guns to which, when brought into action, no resistance was offered. It was able to enlist practically as many ex-soldiers as it chose, but it refused to accept the offered service of professional officers who had held high command. Some ex-subalterns and company commanders, who had joined the I.R.A. in its fight against the British police, became generals. But the main successes in the field were due to General Murphy, a county surveyor who had got a commission early in the World War and ended by commanding a brigade.

To civil administration was now added military activity; five members of the Government took rank as generals, and Collins himself, flinging his whole energy into the struggle which he had so long sought to avoid became commander-in-chief. But on Aug. 12 Arthur Griffith died suddenly. Ten days later, on the 22nd, Michael Collins was killed in an ambush in the Co. Cork. Thus the task of establishing the Free State fell not to any man but to a group, representing a fraction of one section of the Irish people—the right wing of Sinn Fein.

Framing the Constitution.—It was necessary under the treaty that the third Dáil should as a provisional parliament frame a constitution which should also be adopted by the British Parliament before Dec. 6 1922. On Sept. 9 it was possible to summon this body to meet in Leinster House, the premises of the Royal Dublin Society, which contained a fine semi-circular concert hall. In the newly built College of Science, almost contiguous, the Government had established their offices. The block of buildings was placed under guard. None but carefully scrutinised representatives of the Press assisted at the nominally public debates. Under these conditions the Irish Parliament and Irish Govt. operated for nearly a year. Ministers lived as in a fortress.

At the Dáil's first meeting Mr. Cosgrave was elected President of the Irish Free State and he assumed the Ministry of Finance. Eleven ministers, proposed by him, were elected by the Dáil. The Dáil sat persistently to fulfil its task. The clauses of the constitution, which defined the relations between the Irish Free State and the British Crown and imperial defence, had been settled in discussion between Arthur Griffith and the British Govt., and to this extent freedom was limited. Ministers had the task of persuading the Dáil to accept the limitation; they had also to put forward their own proposals for all that was left free. Mr. Cosgrave entrusted exposition and defence very largely to Mr. Kevin O'Higgins, assisted by Mr. Ernest Blythe, who had become the minister for Local Govt., and Mr. Hogan, Minister for Agriculture. For legal advice they depended on the Attorney General, Mr. Hugh Kennedy, who was not then a member of the Dáil. The only constitutional lawyer in the assembly was Mr. Gerald FitzGibbon, one of the four members for Trinity College. His intervention in the debates was always received with great respect, and Mr. Cosgrave more than once recognised the steady goodwill of this little group of ex-unionists.

The constitution followed extreme democratic lines. Adult suffrage was adopted. But the political thought of the Dáil resented any departure from British models. Ministers desired to introduce the Swiss system of individual responsibility for ministers; a compromise was reached establishing one class of "extern" ministers who should be nominated and appointed by the Dáil at large, holding office for the duration of parliament, and at the same time a statutory executive council of not less than five nor more than seven, which must include the President and the Minister for Finance. Members of the executive council were vested with collective responsibility, and would fall as a body if the Government failed to obtain the support of Parliament while the "extern" ministers would remain in their posts. The referendum and power to initiate legislation by a popular vote were incorporated in the constitution, but without any sign of enthusiasm for these novelties.

The Restoration of Public Order.—The Dáil's real importance was that it brought back to Ireland some habit of public discussion by its criticism of the action of the executive. From 1919 onwards there had been a grave upset to civic life. The civil courts did not sit outside of Dublin; the press existed under a dual censorship—that of the British Govt. and that of the I.R.A. The old police force had been transformed into an irregular military force when the Free State came into being, for so long as open civil war could be said to exist the public and the Parliament acquiesced in the fact of military rule. But by the end of Sept. 1924 at latest, there were no formed forces of the irregulars in the field, and all towns were held for the Government. Demand began to be heard for courts to which men could bring their causes. But the essential was to restore order. Property of all kinds was assailed. Whole bands of men in the name of the Republic were commandeering what they required. Much private robbery followed. More serious than all, a trouble which had broken out in 1920, and had been repressed by Sinn Fein, now appeared again. The permanent land-hunger awoke, and even holdings which had been purchased under the Land Acts were invaded by rival claimants.

Courts were long in being framed, partly because the Govt. sought to find competent magistrates able to use Irish, which the constitution had declared to be the national language. The Civic Guard was being organised; but gunmen flouted, beat and in certain cases killed, members of this unarmed force. Mr. O'Higgins, Minister for Justice, however, stood resolutely to his principle: Ireland must be taught to regard the police, not as the agents of an outside power, but as its own servants, needing and deserving public assistance. He took a long view, and the issue has justified it; but for immediate purposes this body was useless. The irregulars were adopting against the Irish Govt. those tactics which the I.R.A. had used to make British Govt. impossible. The Government on its side was driven like the British to enrol a large force of soldiers, which finally exceeded 40,000. Its recruits joined a force without tradition of discipline; indeed, at the outset it professed semi-officially to condemn the ceremonies of saluting and other formalities. Such a force, hastily levied, with officers as untrained as the men, was not over trustworthy, and did not always give satisfaction by its conduct to the public for whose protection it was raised.

Neither was Ireland, at the close of a movement extending over more than 40 years, a country easily able to support government in the face of terrorism; and terror was applied. The ministry was slow to counter this menace. Trial by jury was futile in such a state of things. The gaols were crammed with prisoners, untried and unpunished. Power to try and to punish most drastically by court-martial was given by an act of the Dáil; yet till Nov. fear of the irregulars was stronger than fear of the Govt. throughout the country. At last a proclamation was posted announcing that four men had been tried, convicted and executed—in each case for having a revolver without licence. In the following week seven men were sentenced, on precisely the same charge, to long terms of penal servitude. Thus the right of Government to deal at its will with persons in arms against the state had been asserted. But the irregular campaign of wreckage went on. More executions followed, among them that of Erskine Childers, who had been the most powerful influence over Mr. de Valera. There was no improvement perceptible by Dec. 6, when the Irish constitution was formally ratified by both parliaments.

Formal Inauguration of the Free State.—Immediately this ratification was complete, Northern Ireland notified the British Govt., by address of both Houses of Parliament, that exercising its right under article 12 of the treaty, it refused to come under the Free State, and desired to retain its position created by the Act. The Free State being now formally constituted as a "Dominion," sensation was created by the appointment (Dec. 1922) of Mr. T. M. Healy, K.C.—so notable in the land war which preceded Home Rule—as its first Governor-General. He was duly sworn in on Dec. 7 by the new Lord Chief Justice. Next day, when the Dáil assembled to choose a senate, as provided by the constitution, President Cosgrave announced that one member of the Dáil had been shot dead and another wounded on the way to the meeting. The man killed, General Hales, was a popular hero of the guerrilla war, and next morning four of the leading irregulars who were in prison were shot without trial by way of reprisal. Among them was Mr. Rory O'Connor. All these had been arrested long before the proclamation of martial law. Mr. FitzGibbon deplored the action. Let the Government ask for what powers they liked and he would support them, but let them abide within their legal rights. General Mulcahy's justification of the step was not given till some months later, when he pointed out that no other member of the Dáil had been attacked. In fact, the counter-terror succeeded. It was largely carried out with the assistance of a criminal investigation department, armed police operating in plain clothes, over whom as representing Cabinet responsibility, Mr. Joseph Magrath, the Minister for Labour, presided.

The activities of the Free State Government were thus as vigorous and drastic as those of the British police in Sir Hamar Greenwood's régime, but there was this difference. The country might now be terrorised into silence by the irregulars, but it gave them no such willing support as it had given to the I.R.A. Information came, surreptitiously but steadily, to the Free State troops. Further, in Dublin, where courts were now in session, juries did their duty fearlessly. Evacuation by the British military, which had been suspended in early summer when the worst dangers threatened, was now completed; the division, concentrated near Dublin, embarked in Dec. 1922 among demonstrations of affectionate goodwill from the populace.

In forming the senate, President Cosgrave nominated one half of the 60 members; the Dáil elected the other 30. The President made good the promise given by President Griffith to leading Irish Unionists that they should be generously treated; his nominations comprised several leading landlords and other prominent Protestants. The Senate when constituted chose as its chairman Lord Glenavy, who as Sir James Campbell had been Sir Edward Carson's chief lieutenant.

No cleric of any denomination was included in the body. From the first, self-governing Ireland ignored the power of the Church. A few days after the Provisional Govt. assumed office, without any public announcement or legislative act, the two nominated boards which had controlled primary and secondary education were notified that they were dispensed with. This was the more significant, because the Catholic hierarchy as well as the Protestant churches were represented on both. Thus, in the midst of revolution, education was taken out of the hands of the clergy who had (by a series of compromises) indirectly controlled it under the British administration.

There was not the least opposition to these steps. Public criticism had virtually ceased to exist; the clergy were dumb as the laity, but all men doubted whether the new government could secure obedience. The most hopeful factor in the situation was that since the irregulars had been forced to concentrate their forces against the Free State Army, and provocation from them in Ulster no longer afforded justification for outrageous attacks on Catholics, Sir James Craig's government had succeeded in establishing order, though under a strict military control. Patrols of police enforced curfew all over the six counties.

In the rest of Ireland, the gravest danger was that foreseen by Michael Collins when he pointed out that criminal folly might destroy "our belief in ourselves as a nation." There was an orgy of destruction, which almost paralysed communication by road and rail: houses were burnt or bombed by dozens, and the Government, once started on their path of severities, pursued it ruthlessly. By the end of Jan. executions had risen to 50, and the prisoners to ten thousand. No government could be popular under such conditions. Yet signs of weakening began to show. By May 1923, Mr. de Valera called upon his followers to abandon hostilities and dump their arms in concealment. The sound of firing was no longer heard in the streets, and public meetings were once more held. When Aug. brought the annual Horse show ministers were seen moving freely in the crowd. The resumption of normal civic life may be dated from this time.

In April a marking fact had occurred: the Free State, still maintaining and collecting the British system of taxes, found it necessary to set up a customs system at the ports and along the Ulster border. The first object was merely ascertainment of revenue, but the machinery for a protective tariff existed. In June the Minister for Agriculture introduced a measure for the completion of land purchase, and this was carried through hastily. The third Dáil, which had passed the constitution, still existed, but a general election on the new register with adult suffrage was demanded and it was fixed for the last days of August. The result of this trial of strength was curious. The Government's action had exposed it to much odium. Some 10,000 prisoners were detained in gaol, mostly untried, and over 70 men had been executed. Yet President Cosgrave, Mr. O'Higgins and General Mulcahy were each returned by huge majorities at the head of the group in which they stood. But Mr. de Valera also headed the poll in County Clare (Professor MacNeill being second on the list) and his deputy in County Mayo defeated another minister, and the republicans returned no less than 44 members out of 128. Government had in its own following less than half the Dáil. But the various groups of Independents were notably increased. All these supported the treaty and the constitution. By Oct. the new parliament was formally opened with a speech from the Governor General. His predecessor, Lord FitzAlan, the last lord lieutenant, had given assent to the action of ministers while framing the constitution and crushing civil war. It was Mr. Healy's lot to represent the Crown during the reorganisation.

The New Government.—Ireland's accession to her new status was practically signified on Sept. 10 1923 when her representatives took their place with acclamation in the council of the League of Nations. A month later Mr. Cosgrave attended the Dominion conference in London, where he was warmly welcomed. At home the executive council was for the first time constituted, consisting of seven. Four other ministers were chosen as "extern," having individual, not collective, responsibility. These included the Postmaster General and the Ministers for Agriculture, for Fisheries and for Local Government. The last post was vacated by Mr. Ernest Blythe, who now became Minister for Finance. His successor, Mr. Burke, was little known.

The new Minister for Finance had at once to face a serious situation. It had become clear that the State would not be destroyed by violence—there was fear lest it should be bankrupt. Civil war had produced damages, then reckoned at £50,000,000, though, when compensation came to be paid, the bill reduced itself to about ten. But the army was costing over £14,000,000 a year, and taxation stood at the peak point to which Great Britain had raised it. Business men in the Senate urged that the financial situation should be regularised. In Dec. the Government came to the country for a loan of £10,000,000 at 5%—the issue figure being 95, repayable at par in twenty years. It was oversubscribed in ten days, the subscribers numbering over 22,000. This demonstration of confidence greatly cheered the country, and rounded off the satisfaction felt in comparing the settled order of Christmas 1923, with the ruinous anarchy in which the year opened.

Yet this optimism did not last. The year 1924 was a very unhappy period. Organised resistance to the State was withdrawn but the threat of it remained. Mr. de Valera's followers refused to surrender or hand in their army. More than this, Ireland was forced to realise how profoundly demoralisation had spread during a period in which law was defied and secret organisations enforced their mandates. There was much crime, especially robbery with violence. The army, so rapidly raised, was reduced, for motives of economy, with equal rapidity, and men were suddenly thrown out of employment. A bad harvest in 1923 had left acute financial depression, and work was scarce. Meanwhile many political difficulties threatened. Hitherto no steps had been taken to give effect to the provision in article 12 of the treaty under which, if Northern Ireland decided to remain outside the Free State, a commission of three was to be appointed to "determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland." But with the cessation of civil war Mr. Cosgrave's Government was pressed to demand its application. Immediately threats came from Ulster of resistance by force to the cession of a single inch of territory. Mr. MacDonald's Government attempted to settle the matter by private negotiation, but this failed. The Free State named Professor MacNeill as their representative on the commission; but Northern Ireland refused to make any appointment or recognise the commission in any way. In these circumstances, Mr. J. H. Thomas had much difficulty in finding a chairman. A pledge had been given that he should be a citizen of one of the dominions. Finally, Mr. Justice Feetham, a South African judge, consented to act. But Northern Ireland contended that in that representation, unless they themselves appointed a member, the constitution of the commission would in fact be void.

Threatened Mutiny.—A still more menacing situation arose in March 1924. A group of highly placed officers in the army issued a public demand to the Government that their opinions and interests should be consulted in framing public policy, and they withdrew themselves from duty. Steps were taken to place them under arrest as mutineers, and a fresh outbreak of fighting was narrowly averted, mainly by the personal efforts of Mr. Joseph Magrath, Minister for Labour. Angry debate followed in the Dáil, in which General Mulcahy declared that a secret society had for over a year existed in the army, and that the mutinous officers belonged to it. Mr. Magrath reported that the Fenian Society, or I.R.B., had also its adherents in the army, who influenced promotion in their own interest. The upshot was the resignation of Mr. Magrath, followed by that of General Mulcahy. Mr. Cosgrave in person assumed the post of Minister of Defence. The chief of staff, adjutant-general and quartermaster-general were dismissed. General Mulcahy as a private member moved a vote of censure on the government for these dismissals, but got no support in the Dáil. Mr. Magrath, followed by several other members, who had been prominent first against the British and later against the irregulars, resigned their seats — thus presenting to the country the spectacle of dissensions in the army and dissensions in that section of the original Sinn Fein party which provided and supported the government.

Legislation.—Added to all this was the unpopularity of the government's measures. Mr. Blythe reduced old age pensions from ten shillings to nine shillings. Taxation was severely levied; tenants in default with their land purchase annuities were forced to pay up; citizens who had withheld their income tax during the last years of the British administration, with Sinn Fein's approval, were now called upon for their arrears. More widely felt was the innovation of a customs barrier, causing delay in the delivery of goods; and, in addition, Mr. Blythe decided to embark experimentally on a measure of protection, its main function being a duty of 15% on imported boots.

In this, as in all else, government virtually acted entirely on their own initiative. The Oireachtas (or parliament) indeed had to endorse their acts, but since the republican delegates did not take their seats there was no powerful opposition nor any sustained criticism. Ireland had been traditionally concerned with politics in the abstract; concrete questions (except concerning land tenure) had never occupied the public mind. Thus, legislation was the work of the government, not of the parliament; and there was a great deal of it. Long before his second year of office was completed the Governor General had given his assent to over 100 bills. Many of these were temporary and provisional, but some were of the first importance. One of them indeed was not solely the work of the executive. In framing the new judicial system, government had the advice of a committee over which Lord Glenavy presided. The number of judges and their salaries were reduced, the office of Lord Chancellor disappeared; a supreme court was constituted and a high court, both sitting in Dublin. High court judges no longer went on circuit; a new order of circuit judges was instituted. As regards the magistracy, unpaid justices of the peace were abolished, and stipendiary district justices were appointed to cover the whole country.

Judges of the previous régime were free to retire on rather more than four-fifths of their salary, and most of them did so. In making the new appointments the Government showed a fine disregard of political record, and totally ignored religious differences. By 1925, five out of the nine high court judges were Protestants and several had been strong Unionists—for example, Mr. FitzGibbon, who became Lord Chief Justice. The effect of this was to confirm the allegiance already promised by the minority in the Free State; and from leading members of it, notably from divines of the Church of Ireland and of the Presbyterian Church, testimony was offered to the impartiality of the Government.

Yet one part of the legislative and administrative programme occasioned protests from the minority. The constitution had declared that the national language was Gaelic, which perhaps 10% of the existing population used in their homes. The Ministry of Education endeavoured to revive the national language by an intensive campaign in the schools, offering a much higher rate of endowment to those schools where Irish was not only a subject of teaching but the medium of it. Protestants, even when they desired to see Irish studied and preserved, regarded these provisions as unfair. Many of them, however, considered the whole study as a waste of time and money; and unquestionably many Catholics were of the same opinion. This was one great cause of the Government's growing unpopularity.

Yet the more unpopular the Government grew, the more people were forced to see that no alternative to it existed, and there was agreement on the necessity for some force to stand between the citizens and a relapse into anarchy. Ministers showed little disposition to win support by conciliating public feeling. They had succeeded by desperate courage in coming through when the State reeled about them, and they persevered in following out their own ideas. Mr. O'Higgins forced on a drastic bill to restrict the facilities for buying and selling drink; at another moment, with half a score of by-elections pending, he suppressed "goose clubs," a widespread form of Christmas sweepstakes. Mr. Burke, the new minister for local government, by simple administrative act suppressed the corporations of Dublin and Cork and put civic affairs into the hands of commissioners, young men not very well known. There was some outcry, but the country had got into the habit of taking orders; and presently, when the commissioners produced improved administration and reduced the inordinate rates, this experiment was approved. Outside the towns, the ministry abolished district councils, thus throwing more work on the county councils. A tendency to centralisation and even to bureaucratic administration showed itself in all directions.

Such a policy made enemies everywhere, and the weather was no friend to Mr. Cosgrave. A second bad season in 1924 hit the farmers hard, and Mr. Blythe was still levying taxes that were now actually higher than the British scale; for the reduction of income tax from 5/– to 4/6 in 1924 was not followed in the Free State. Also the post office had always been a losing service in Ireland. The new postmaster greatly cut down the public facilities, and kept the stamp at 2d when it was 1½d in Great Britain, and therefore in Northern Ireland. In short, if there had been any alternative ministry the Government would have fallen, but there was none: and the bellicose protestations of republicans kept them in power. Another thing assisted them: when a turn in English politics replaced a Labour Ministry by a strong Tory Government, English ministers kept faith absolutely with Ireland. The difficulty about constituting the boundary commission had been referred by Mr. MacDonald's Government to the Judicial Committee of the Privy Council, which found that without a new Act of Parliament enabling the Imperial Government to appoint a commissioner to represent Northern Ireland nothing could be done.

Parliament was summoned on Sept. 30 instead of on Oct. 28, as had been originally intended, in order to pass through its stages the Irish Free State (Confirmation of Agreement) bill, which had been introduced by the Government at the end of the session. The defeat of the Labour Government on another issue was not allowed to prejudice the Irish settlement, and just before the dissolution the bill was passed by the House of Lords and received the Royal Assent. In the House of Lords, Lord Carson had moved an amendment that confirmation of the bill also be required from the Parliament in Northern Ireland, but in the interests of peace was persuaded to withdraw the amendment, and contented himself with the fact that his protest had been entered in the records of the House. A well-known publicist, from Ulster, was appointed; and the commissioners after long preliminaries in London proceeded to investigate opinion on the border itself during several months in 1925 without the least disturbance. In the meanwhile, from many quarters, but notably from Mr. Cosgrave and his ministers, came utterances to the effect that there was no intention of coercing Ulster. She must choose her own time for uniting, if she chose, with the rest of Ireland. This indicated a departure from the expectations held out by Michael Collins after the treaty was signed, for he led Ireland to hope that the commission's award would transfer so much territory to the Free State that Northern Ireland would not be able to maintain its separate status.

At the opening of 1925 a group of by-elections showed definite support for the Government, and Mr. Blythe's budget of April marked an advance. He reduced the income tax by a shilling and he extended materially the area of protection, claiming that the tariffs already imposed had led to increased employment in the boot trade and minor industries. Broadly, all clothing imported ready made was now subjected to taxation.

This budget really marks the beginning of normal finance. The liabilities for compensation for damage were at last ascertained, amounting to less than £10,500,000, of which under £4,000,000 remained to be paid. The army charge was reduced to something over £3,000,000. Mr. Blythe considered anything over £2,000,000 as abnormal, but necessary in view of the continuing republican menace. The State's normal expenditure he estimated at £24,000,000 and the revenue at £26,000,000. Abnormal expenditure for compensation and the rest he proposed to meet by borrowing.

But it soon became apparent that the ministry were not proposing a mere negative policy of economy, and early in 1925 they committed themselves to a project of utilising the Shannon (*see* SHANNON) for a vast electric power scheme. Nor did this stand alone. By promise of a subsidy amounting to a total of over £1,000,000 a Belgian firm was induced to start the sugar beet industry on a large scale, Carlow being chosen as the site for the central factory. Simultaneously came a whole group of proposals for the development of Irish industry and Irish agriculture, which had been interminably discussed in and out of Parliament during the British régime. They stood committed to a policy of industrial development, having as the pivot of the whole an enterprise so colossal that its possibility had never even been seriously considered under the old order. In the meantime tranquillity returned to the country so completely that it seemed dull. Tourists refilled their old haunts in summer; the Dublin Horse Show enlarged its scope.

The Boundary Question.—In the late autumn a new crisis threatened not only its prestige but its existence. The report of the boundary commission was awaited without emotion, though a London newspaper published a forecast of its decision differing widely from any anticipations that had been formed in the Free State. No plebiscite had been taken;[1] the article gave no instructions for holding one; and it was (rightly) assumed that the commissioners would take it Roman Catholics desired inclusion in the Free State and Protestants inclusion in Northern Ireland. Three important towns, Derry, Enniskillen and Newry had been regarded as possible subjects of transfer to the Free State because in all three Catholics were in a majority. In Newry the proportion was 70%. In two of the border counties, Tyrone and Fermanagh, Catholics were about 55% of the whole. The forecast showed that all the three towns were left as they

[1] Under Article 12 of the Treaty the wishes of the inhabitants were to be considered subject to geographic and economic considerations.

ere: no county was transferred as a whole; and the cession to e Free State of districts (for the most part very poor) in Ar-agh, Fermanagh and Tyrone was offset by the transfer of a ch part of East Donegal. There was a fierce outcry, and Presi-nt Cosgrave in response to it reiterated the Free State's con-ntion that the commission was only entitled to transfer to eir natural destination those parts of the six counties whose habitants desired to be in the general body of Ireland. He nphasised also that the claim to Newry was in his opinion in-feasible. These declarations were followed by the announce-ent that the Free State representation had withdrawn from e commission. Professor MacNeill followed this up by resign-g his post on the executive council, and in the Dáil explained at after hearing the evidence he had agreed, for the general od, to sign a unanimous report whose terms were "not dis-milar" to the unauthorised forecast. He had never taken his lleagues in the ministry into his confidence at any point in the ork of the commission. But now in view of the expression of inion he felt that adding his signature to such a finding would ly embarrass his colleagues and not produce a settlement.

Both the Government and Professor MacNeill were attacked ith great violence in the Dáil and outside it. The Republican ader came into new prominence. Mr. Cosgrave refused to mmit himself publicly to any line of action, and went to Lon-on. Meanwhile it came to be generally admitted that no mem-r of the commission could invalidate the finding by refusing to gn the report; that the award then issued had immediate effect s law, and that the Free State minority had declared willingness advance to accept the award. On the other hand, it was udly declared that any attempt to transfer Free State territory Northern Ireland would be resisted by arms.

In London, however, negotiations proceeded, and Sir James raig was summoned from Ulster; and on Dec. 3, a fortnight fter Professor MacNeill's resignation, a new agreement was oncluded and made public, to which not only Great Britain and he Free States were parties, but Northern Ireland also. It was greed that the award of the commission should not be published nd that the existing boundary should stand. This gave to Ul-er all that Ulster claimed, but it gave to Ireland the repose of nality. Further, the treaty was altered by the cancellation of rticle 5, under which Ireland assumed liability for the public ebt of the United Kingdom as existing in 1921 "in such pro-ortion as may be fair and equitable, having regard to any just laims on the part of Ireland by way of set off on counter claims." his at once liberated the Irish exchequer from an undefined anging liability injurious to its borrowing power, while it wiped ff the British books what most people regarded as an irrecover-ble asset. Ireland, however, undertook to repay to Great ritain compensation already paid for war damages in the period 919–21, and to add 10% to the compensation awarded to laimants for damages suffered in the civil war from 1922 on. he total cost to Ireland was estimated at under £5,000,000.

Legislation embodying the terms of this agreement was car-ied without difficulty in Great Britain, and the Northern Par-ament expressed its satisfaction. But in the Dáil President osgrave was angrily opposed by the Labour party and by some f his own followers. Attempts were made by Labour to induce epublican members to come into the Dáil for the purpose of recking the agreement, but they failed, and after much talk he Bill was carried by 71 to 20. Business men as a whole re-arded the issue as fortunate for Ireland, which now definitely ecame a country with a total national debt of under £20,000,000 nd less than a gross revenue. Other sections found their chief atisfaction, as did President Cosgrave, in the changed relation f the government concerned, indicated in the preamble:—

The British Govt. and the Government of the Free State being nited in amity with the Government of Northern Ireland and being esolved mutually to aid one another in a spirit of neighbourly com-radeship, hereby agree . . .

An immediate consequence was the disbandment of the Ulster pecial police in two of its three branches. There could be no learer proof that a great cause of danger to Ireland has been definitely removed. It is also plain that while the conduct of this business by President Cosgrave and his colleagues has been criticised, the policy of those who desired to tear up the settlement ran counter to the public desire. The Irish Govt. has been therefore strengthened by a difficulty which threatened its destruction.

II. THE CONSTITUTION

The present political status of the Irish Free State is that of a co-equal member of the community of nations forming the British Commonwealth. It has a written constitution which rests on the provisions of an Act passed by Dáil Eireann sitting as a constituent assembly in the autumn of 1922, entitled an "Act to enact a constitution for the Irish Free State (Saorstát Eireann) and for implementing the treaty between Great Britain and Ireland signed at London on the 6th day of Dec. 1921."[1]

It is provided in this Act that the Constitution shall be construed with reference to the Treaty and that if any provision of the constitution or of any amendment thereof or of any law made thereunder is in any respect repugnant to any of the provisions of the treaty, it shall, to the extent of such repugnancy, be void and inoperative. It is also provided that to the extent to which they are not inconsistent with the constitution all laws in force in the Free State at the time of passing of the constitution are to continue to have full force and effect until repealed or amended by the Oireachtas.

In conformity with practice in the British Commonwealth the executive authority is vested in the King. The governor-general represents and fulfils the functions of the Crown. He is appointed "in like manner as the governor-general of Canada and in accordance with the practice observed in the making of such appointments"—which ensures that the Government of the Free State shall be consulted before any appointment is made. His powers are strictly limited as in the case of the Sovereign in Great Britain, all executive acts being done on the advice of the executive council. The latter consists of not more than seven nor less than five ministers, and is directly responsible to Dáil Eireann, retiring from office when it has ceased to retain the support of a majority of deputies.

Dáil Eireann may not at any time be dissolved except on the advice of the executive council, and Article 53 of the Constitution provides that the Oireachtas shall not be dissolved on the advice of an executive council which has ceased to retain the support of a majority in Dáil Eireann. The Parliament of the Free State cannot therefore be dissolved except with its own consent. The maximum life of a parliament is four years. The president of the Executive council, who is appointed on the nomination of Dáil Eireann, nominates the vice-president and the other ministers who form the Executive Council. The council is collectively responsible for all matters concerning the departments of state administered by its members.

Other ministers, however, who shall not be members of the executive council, may be appointed on the nomination of committee of Dáil Eireann, and these ministers are directly and individually responsible to the Dáil for the administration of their departments. Members of the executive must be members of Dáil Eireann, but this provision does not apply to other ministers. The legislature, known as the Oireachtas, consists of the King and two Houses, Dáil Eireann (the Chamber of Deputies) and Seanad Eireann (the Senate). In the Oireachtas is vested "the sole and executive power of making laws for the peace, order and good government of the Irish Free State."

[1] The Royal Assent was given to the Act passed by the Imperial Parliament to give effect to the Irish Free State Constitution on Dec. 5 1922, and on the next day the King signed the proclamation announcing the adoption of the Constitution.

The Senate.—Seanad Eireann is composed of 60 members, the term of office of each member being 12 years. One-fourth of the members are elected every three years by proportional representation, the whole of the Free State forming one electoral area. At every election a panel of candidates is formed, consisting of three times as many persons as there are senators to be elected. Two-thirds of the panel is nominated by the Dáil, and one-third by the Seanad. In addition to these all persons who have at any time been senators have a right to be added to the panel if they so desire. Candidates, who must have reached the age of 35 years, are chosen on the ground that they " have done honour to the nation by reason of useful public service or that, because of special qualifications or attainments, they represent important aspects of the nation's life." Casual vacancies in the Seanad are filled by co-option, and co-opted members retire at the next triennial election.

The Chamber of Deputies.—Dáil Eireann (the Chamber of Deputies) is composed of members directly elected by constituencies determined by law. The number of members at present is 153. This number may, however, be varied from time to time, but shall not be fixed at less than one member for each 30,000 or more than one member for each 20,000 of the population of the State. In addition each university elects three members. As in the case of the Seanad, election to the Dáil is carried out on the system of proportional representation.

All citizens, without distinction of sex, who have reached the age of 21 years and who comply with the electoral laws, have the right to vote for members of Dáil Eireann, and all citizens who have reached the age of 30 years and who similarly comply with the electoral laws have the right to vote for members of Seanad Eireann. Voting is by secret ballot, and no voter may exercise more than one vote at any election.

Members of both Houses receive an allowance for expenses which is fixed at £360 per annum. Every member of the Oireachtas must take the following oath before taking his seat:—

I.....do solemnly swear true faith and allegiance to the constitution of the Irish Free State as by law established, and that I will be faithful to H. M. King George V., his heirs and successors by law, in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of Nations forming the British Commonwealth of Nations.

Powers of the Senate.—The powers of Seanad Eireann are limited. It has no authority to amend a money bill, but may make recommendations to Dáil Eireann regarding such bill within 21 days after a bill certified to be a money bill has been passed by Dáil Eireann. The definition of a money bill given in article 35 of the constitution is adopted from the United Kingdom " Parliament " Act of 1911. There is a proviso that the decision of the chairman of Dáil Eireann as to whether the bill is or is not a money bill may be appealed against before a committee consisting of three members of each House presided over by a judge of the Supreme Court. The Seanad may reject or amend all other bills, and may initiate legislation, but a bill passed by the Dáil which has not been passed by the Seanad 270 days after it was first sent to the Seanad is deemed to have been passed by both Houses in the form in which it was last passed by Dáil Eireann. Any bill passed or deemed to have been passed by both Houses may be suspended for a period of 90 days on the written demand of two-fifths of the members of Dáil Eireann or of a majority of the members of Seanad Eireann presented to the President of the executive council not later than seven days from the day on which such bill shall have been so passed or deemed to have been so passed. During the period of suspension the bill shall be submitted to a referendum if so demanded by one-twentieth of the voters on the register or by three-fifths of the members of the Seanad. These provisions do not apply to money bills or to bills declared by both Houses to be necessary for the immediate preservation of the public peace, health or safety.

Defence.—The Oireachtas has the exclusive right of raising and maintaining armed forces in the Free State, but under the provision of the treaty the army shall not exceed in size such proportion of the army in Great Britain as that which the population of Ireland bears to the population of Great Britain. Save in the case of actual invasion the Irish Free State shall not be committed to actual participation in any war without the assent of the Oireachtas.

Nationality, etc.—Every person domiciled in the Free State at the time of the coming into operation of the constitution, who was born in Ireland or either of whose parents was born in Ireland, or who has been ordinarily resident in the area of the jurisdiction of the Free State for not less than seven years is entitled to citizenship in the Free State. No title of honour in respect of services rendered in the Free State may be conferred on any citizen without the consent of the executive council. Freedom of conscience and the free profession and practice of religion are, subject to public order and morality, guaranteed to every citizen. No law may be made to endow any religion or to give any preference or to impose any disability on account of religious belief. No discrimination may be made as respects state aid between schools under the management of different religious denominations.

Court of Appeal.—The constitution provides that the Supreme Court of the Free State is a court of final appeal and that its decision shall not be reviewed by any other court, tribunal or authority whatsoever, provided that nothing in the constitution shall impair the right of any person to petition His Majesty for special leave to appeal to His Majesty in council or the right of His Majesty to grant such leave. There is no provision, however, that decisions by the King in council shall be binding on Irish Courts.

The judges of the Supreme Court and of the High Court and of all other courts established in pursuance of the constitution can only be removed for stated misbehaviour or incapacity and then only by resolutions passed by both houses of the Oireachtas. See J. G. Swift McNeill, *Studies in the Constitution of the Irish Free State* (Dublin, 1925). (J. G. D.)

III. DEFENCE

The evacuation of the British garrisons from Free State territory began with the ratification of the Anglo-Irish Treaty by Dáil Eireann in Jan. 1922. Dublin was held until the treaty was finally confirmed 11 months later, and then handed over to detachments of the Irish Republican Army which had given adherence to the Provisional Government.

Administration.—As a result of an inquiry into the civil war which began in June 1922, and the mutiny of March 1924, changes were made in army administration. The command-in-chief is now vested in the executive council and exercised through out in the name of the Minister of Defence who, however, may not allocate to himself any executive military command. He is assisted by a council of defence, composed of a civil member acting as Parliamentary Secretary to the Minister and responsible for the finance of the Defence Forces, and by three military members, the chief of staff, the adjutant-general and the quartermaster-general, whose business it is to deal with training, organisation, equipment and discipline.

The Army Vote for the year ending March 1926 was £3,076,774, and the strength of the forces amounted to 1,053 officers and 16,187 non-commissioned officers and men. The Free State is divided into four military districts—the Eastern, Western and Southern Commands, and the Curragh camp where all recruits undergo their training. Head-quarters of the three commands are at Dublin, Athlone and Cork, and are in charge of major-generals. There are nine brigade districts, and the infantry are organised in 27 battalions. The remaining services are air, artillery, armoured car, engineers, signal, military police, medical and transport Corks, a school of music and a military college. There is an Irish-speaking battalion and all officers and non-commissioned officers are instructed in giving and receiving executive words of command in both Gaelic and English. The strength of the Air Force is 18 officers, 131 other ranks and 18 machines.

Defence Provisions of the Treaty.—Under the Irish treaty it was agreed, with a view to securing the international limitation of armaments, that the Irish Defence Forces should not exceed in relation to military establishments maintained in Great Britain the proportion which the population of Ireland bears to that of Great Britain. The treaty also provides that defence by sea of Great Britain and Ireland shall be undertaken by Imperial forces. After five years from the date of the treaty (Dec. 6 1921) a conference is to be held with a view to Ireland undertaking a share of her own coastal defences. Harbour defences at Berehaven, Queenstown and Lough Swilly remain in charge of British care and maintenance parties. In time of war or strained relations with a foreign power the Free State is pledged to afford such harbour and other facilities as the British Govt may require for purposes of defence. (J. W. Go.)

IV. EDUCATION

Since taking control, the Government of the Irish Free State has carried through changes in the educational system.

The first step was to unify control over educational matters ader a Minister for Education. This involved the abolition of ie three independent bodies through which, previous to 1922, lucation in Ireland was financed. The powers exercised by the oard of National Education were at once taken over by the ree State Ministry. The programme for primary schools has een considerably modified with a view to making it simple, oncentrated and national. Attention is concentrated on funda- ental subjects, Irish, English, reading, writing and arithmetic. rovision is made for studying local needs in applying this pro- ramme in any given locality. The salary question had already een satisfactorily settled under the British régime.

As regards tenure and method of appointment of teachers the d managerial system, under which the power of appointment nd dismissal lay, under certain limitations, with the manager the school (usually a clergyman) has been retained. This stem means that each religious denomination controls the ppointment of teachers in schools attended by the children of at denomination. The old "National" system provided for mbined literary and moral and separate religious instruction r pupils of different religions. The regulations provide that pportunities must be afforded to the pupils of all schools for ceiving such religious instruction as their parents or guardian pprove. Religious instruction is given at a time not counted hen computing attendance, and does not come under the super- ision of the officers of the Department. An outstanding defect herited from the old régime, the absence of any real system of mpulsory education, will be rectified at an early date. A bill escribed by the president of the Free State Executive as "of a rastic type" has been laid before the Oireachtas.

Important changes with regard to the training of teachers are eing introduced. It is proposed to establish six preparatory olleges for candidates for the training colleges, five of these are o be situated in those districts in which Gaelic is still a living anguage, and staffed with teachers capable of teaching the sec- ndary school programme entirely through the medium of Irish. n this way the future teachers will enter the training colleges s fluent speakers, and having passed through a complete secon- ary course given in Irish. Thus a supply of teachers will be ecured capable of carrying through the Department's programme r primary schools, aiming at the restoration of Irish as the ernacular.

Secondary Education.—As regards secondary education a ider problem confronted the Government. The administration f the funds devoted to this branch was still hampered by the lause of the Intermediate Education Act of 1878 which pre- cribed that results fees were to be paid to schools on the results f a general public examination. A system, advocated by the ntermediate Board in its Report of 1916 and by the Viceregal Committee on Secondary Education set up in 1918, has been rought into operation by the present Government. Payment y results has been replaced by a capitation grant, dependent n the reports of inspectors, who will take into account every eature of the school. The old rigid system with its fixed pro- ramme has been replaced by freedom, and examinations have een reduced to their proper place.

A salary scheme for teachers in secondary schools has been ut into force. Under it, men teachers are to receive from state unds 10 annual increments of £12 each, and subsequently six nnual increments of £15 each, while women receive 12 annual ncrements of £10 each. Holders of an honours degree of an rish or British university receive additional increments.

The Intermediate Education Board was replaced by two com- missioners in June 1923; and as from April 1 1925 their functions were transferred to the Minister for Education. The funds pro- vided by the Act of 1878 and subsequent Acts for secondary ducation were transferred to the Department of Finance. In uture education in the Free State will be financed out of sums nnually voted by Parliament. Technical instruction has been laced under the control of the Minister for Education, retaining he organisation under local committees.

In 1925 there were 5,636 primary schools in the Irish Free State, with a total of about 500,000 pupils, and 286 secondary schools providing for 25,600 pupils. There were also 60 tech- nical schools, with 21,800 pupils; 5 training colleges for primary teachers, with 820 teachers in training; while the names on the register of secondary teachers numbered 2,083.[1] (W. F. B)

V. ECONOMIC AND FINANCIAL HISTORY

The area of the Free State is 17,019,155 statute acres, made up as follows in 1918:—

Area under	Statute acres
Crops	4,406,105
Grass	7,775,137
Mountain lands, grazed	2,124,190
Mountain lands, barren	466,272
Woods and plantations	248,878
Turf bog	766,353
Marsh	339,297
Water, roads, fences town and building ground, etc.	892,523

In 1914, the valuation of the rural districts was £8,741,631 and of the urban districts £2,391,170, the total valuation being £11,132,801.

Population.—The last census of Ireland was taken in 1911. In 1911 the population of the 26 counties composing the Free State was 3,139,688, being 71·5% of the total population of Ireland; in 1925 it was estimated at 3,163,000.

In 1924, the number of marriages registered was 14,822, being 4·69 per 1,000 of the population, the number of births was 63,402, being 20·06 per 1,000 of the population, and the number of deaths was 45,- 180, being 14·29 per 1,000 of the population. While the reduction in the mortality from tuberculosis has been steady and continuous for many years, the death rate from cancer is increasing. Of the total deaths at all ages 15·2% were deaths of children under five years of age, and the number of deaths of infants under one year was equiva- lent to a rate of 7·2% of the birthrate. Infantile mortality is de- creasing year by year.

Practically no emigration took place from Ireland during the War. It is estimated that the number of emigrants to "places out of Europe and not within the Mediterranean Sea" was 15,000 in 1922, 20,570 in 1923, and 19,077 in 1924. Of the emigrants in 1924, 12,016 were bound for the United States, 5,237 for British North America, 1,138 for Australia, 192 for New Zealand, 160 for British South Africa, 112 for India and 222 for other countries. The population of the Free State is overwhelmingly rural. There are only two towns with more than 50,000 inhabitants, namely, Dublin and Cork, and two others with more than 20,000, namely, Limerick and Waterford.

In 1911 the population of the 26 counties now forming the Free State contained 2,812,509 Roman Catholics, 249,535 members of the Church of Ireland, 45,058 Presbyterians and 3,805 Jews. The great majority of the population were English-speaking, but 16,869 spoke Irish only, and 536,848 were bi-lingual. Of persons aged nine years and upwards, 260,694 could neither read nor write, and 74,001 could read but could not write. The number of houses in the 26 counties in 1911 was 642,541, or one house for 4·88 inhabitants.

Agriculture.—The total acreage under crops was 3,832,240 in 1922; 3,739,146 in 1923; and 3,783,823 in 1924. The following are figures of acreage under crops and numbers of livestock in the Free State in 1922–3–4:—

Crops	1922	1923	1924
Wheat	34,469	31,764	27,465
Oats	813,970	785,939	756,313
Barley and bere	167,765	151,309	163,642
Rye	6,142	6,414	6,424
Beans and peas	447	428	408
Flax	4,915	8,066	10,499
Fruit	10,924	10,795	10,652
Hay	2,062,694	2,026,841	2,099,639
Live Stock	**1922**	**1923**	**1924**
Cattle	4,326,294	4,215,253	4,194,189
Sheep	3,067,473	2,994,420	3,127,921
Pigs	919,449	1,555,905	937,814
Goats and kids	192,298	195,022	193,484
Horses used in agriculture	306,552	312,410	308,552
Unbroken horses	122,549	96,888	79,988
Mules and jennets	25,276	23,919	23,160
Asses	221,991	220,468	218,439

There are 442,606 agricultural holdings, of which 86,035 are less than one acre, 223,991 above one and not exceeding 30 acres, 130,807 above 30 and not exceeding 500 acres and 1,775 above 500 acres.

[1] *Annual Report of the Department of Education* (April 1926).

Unpublished official figures show that the percentage of land ploughed varies inversely with the size of the holding; that for equal acres of crops and pasture, the number of livestock (especially milch cows, pigs and poultry, and excepting sheep) rapidly increases as the size of the holding diminishes; and that the larger the percentage of land tilled, the larger the number of animals supported.

The cultivation of cereal crops plays a comparatively unimportant part in the agricultural economy of the Free State, and the bulk of the attention of the farmer is devoted to the raising of stock. As between the production of beef and of dairy produce, conditions vary in different parts of the country. In certain areas the soil, climate and type of holding favour the production of dairy breeds; in others beef breeds are predominant.

In accordance with detailed recommendations made by the Commission which reported in 1924, an Act was passed (No. 35 of 1924) providing for the testing, grading and packing of exported eggs, for the prohibition of the export of dirty or bad eggs, and for the registration of all premises where grading, packing or preserving is carried on. Another Act (No. 58 of 1924) made elaborate provision for the regulation of the butter trade. Butter can now be exported only by registered creameries, factories or exporters, and must be packed and marked in a specified manner. The most minute regulation of creameries and factories is insisted on, and provision is made for the establishment at a later date of a national mark or brand for creamery butter. The licensing of bulls was made compulsory by another statute (No. 3 of 1925). This measure, together with the Government's scheme for providing premium bulls and boars and for subsidising the purchase of pedigree rams, has resulted in levelling up the standard of the livestock in the country. Owing to the acute agricultural depression in 1924, power was given to county councils to abate rates on agricultural land for the year ending March 31 1925 and the budget of 1925 provided for the doubling of the agricultural grant.

Early in 1925 serious losses were sustained by farmers in many districts as a result of the prevalence of fluke disease. The Government supplied farmers in the affected areas with cheap supplies of suitable medicine and granted credit facilities to assist in the restocking of farms. £100,000 was provided from public funds for the purpose of making loans through the channel of co-operative credit societies in the districts concerned.

Land Purchase.—The total amount of the purchase money for which advances have been made under the Land Purchase Acts of 1870–1909 in respect of lands in the Free State is £99,110,046, the total area comprised in the sales being 11,159,356 acres. In addition, there are pending proceedings for which agreements for purchase had been entered into under the acts of 1903–9 representing a purchase money of £830,000 and an area of 120,000 acres. The British Govt. assumed responsibility for the completion of all sales pending at the date of the Treaty.

The Land Act of 1923 aimed at attaining the dual object of completing land purchase and relieving congestion. This Act provided for the creation of land bonds, bearing interest at the rate of 4½% in which all payments to landlords and encumbrancers were to be made. These bonds were later guaranteed, as to principal and interest, by the British Government. Advances made to purchasers were to be repaid by an annuity at the rate of 4¾% of the amount advanced, and the price to be paid was roughly equal to about 15 years purchase of the value of the holding, of which the Government contributed 10% in relief of the tenant. Very wide powers were given to the Land Commission to acquire untenanted land for the creation of holdings in relief of congestion, and to consolidate and exchange holdings with the same object.

The area of untenanted land already acquired by the Land Commission and the late Congested Districts Board and utilised for the relief of congestion amounts to 820,000 acres. Advances were authorised to be made to tenants of uneconomic holdings, tenants exchanging their holdings, persons who had been evicted and labourers who had lost their employment through the progress of land purchase. The money required by the Land Commission for making roads, fences, drains, etc., and for erection of buildings on newly created holdings is provided out of public funds, and so much as the Land Commission decides can be repaid by the purchasers is made repayable by them along with their purchase annuities. All arrears of rent due before the first gale day of 1920 were wiped out; but rent due after that date (subject to 25% reduction) was made recoverable.

It is estimated that advances amounting to £30,000,000 will be required to complete land purchase under the 1923 Act. As regards tenanted land, holdings situated on 6,000 estates have to be dealt with, while as regards untenanted land, the Land Commission has inspected or is making inquiries in respect of 750,000 acres, with a view to their acquisition for the purpose of distribution; and of this area the Land Commission has acquired or entered into agreements for the acquisition of over 100,000 acres.

Congested Districts Board.—The Congested Districts Board was dissolved in 1923 and its functions transferred to the Irish Land Commission. (Land Law, (Commission) Act, 1923, No. 27 of 1923). By the Ministries Act of 1923 the agricultural and land branches of the Congested Districts Board were put under the Minister for Agriculture and the fisheries and rural industries branches under the Minister of Fisheries.

Fisheries.—The work formerly done by the Department of Agriculture and the Congested Districts Board in connection with the fisheries and with rural industries has now been transferred to a separate Ministry, whose policy is to develop the deep sea fisheries and to organise the home demand for fish, which is at present very small. The Government is helping the fisheries by making loans for boats and gear, erecting and maintaining curing stations, and subsidising fishery schools. A brand for mackerel has been instituted. One urgent requirement is being delayed for financial reasons, namely a second patrol boat to keep the coast free from the numerous foreign trespassers who at present infest it.

Manufacturers.—Ireland was, even before partition, an overwhelmingly agricultural country, but the predominance of agriculture became greater than ever after the exclusion of the six counties. The Agricultural Commission reckoned that three-quarters of the real wealth produced in the Free State is farm produce. Too great dependence upon any one industry is always undesirable, and the government has taken steps to redress the unequal balance between the agricultural and manufacturing industries. The object aimed at by the government's policy is the development, not of large-scale urban industries, but of rural industries, especially those concerned with the working up of agricultural produce.

The treaty left the Free State at liberty to frame its tariff policy as it chose. There was a widespread popular belief that Irish industry could best be revived by the adoption of a high protectionist tariff, and the Government appointed a small committee of economists to inquire into the probable effects of protective duties. The report of this committee was strongly free trade in tone. It pointed out the numerous factors, besides external competition, that operate to retard the growth of industry in Ireland. The necessity for a predominantly agricultural country of the lowest possible prices of raw material and consumable commodities was pointed out. Nevertheless the Government proceeded to institute a number of experiments in protection.

The Finance Act of 1924 imposed a duty of 3⅗d per lb. on sugar confectionery, of 6d per lb. on cocoa preparations, of 10% ad valorem on candles, 15% ad valorem on boots and shoes, 33⅓% on glass bottles (not white glass) and 10% ad valorem on soap. The McKenna duties were altered so as to provide encouragement for the building of commercial motor bodies, and the imperial preference on manufactured tobacco was abolished. The Finance Act of 1925 went a good deal further in the same direction, but the Minister for Finance declared that the new duties were purely experimental in nature. This Act imposed a duty of 15% ad valorem on clothing, wearing apparel, blankets, and blanketing, and 33⅓% on bedsteads and wooden furniture; the duty on bottles was extended, and an additional duty of 10% was put on toilet soaps. On the setting up of the customs barrier in 1923 the manufacture of tobacco automatically secured a small measure of protection. The only corresponding steps taken in the direction of free trade were the repeal of the Dyestuffs Import Regulation Act, the Safeguarding of Industries Act, and the McKenna duties on gramophone records.

At the same time, some important revenue duties were abolished or reduced. It would appear, however, from the cost of living index numbers that the result of the new tariff (in conjunction with other causes, such as high wages and a bad system of retail distribution) has been to prevent the cost of living in the Free State from being reduced at the same rate as in Great Britain. This is shown by the following table:—

Cost of Living Index Numbers (Basis: July 1914 = 100)

Month	Free State			Great Britain and Northern Ireland		
	1923	1924	1925	1923	1924	1925
January	190	188	195	178	177	180
April	181	178	188	174	173	175
July	180	183	188	169	170	173
October	186	193	188	175	176	176

In addition to giving the protective assistance outlined above, the Government has endeavoured to encourage industry by means of subsidies, the development of cheap sources of power, and the pro-

tion of credit facilities. The growth of sugar beet and the manufacture of beet sugar were encouraged by the grant of a subsidy payable for 10 years to persons manufacturing in the Free State sugar from home-grown sugar beet. A large Belgian-Czechoslovak group, encouraged by the subsidy, has arranged to open a sugar beet factory in Carlow.

An important attempt is also being made to provide the Irish manufacturer with cheap power. The Government sought the advice of Messrs. Siemens-Schückert, who drew up a scheme for utilising the great water power of the Shannon (*q.v.*). Another method by which the Government attempted to encourage industry was by helping enterprises to obtain capital on easy terms under the Trade Loans Guarantee Act (No. 41 of 1924). The maximum amount that might be advanced under Government guarantee under the Act was fixed at £750,000. The Minister was further authorised to grant or to guarantee loans proposed to be raised by any public authority or any association of producers or consumers "calculated to promote reduction in the retail prices in Saorstát Eireann of essential commodities." The maximum grant under this action was limited to 0,000, and the maximum grant and guarantee together to £250,000. An amending Act (No. 19 of 1925) the period in which this assistance might be rendered was extended; and the Finance Act of 25 provided for the advance of £300,000 to the National Land ank for the purpose of trade loan guarantees. Finally the Ministry Industry and Commerce has set up advisory committees in more an 30 of the principal industries to assist the Government in acuiring information and in forming policy.

Banking.—All the banks having their head offices in the Free ate have numerous branches in Northern Ireland, and two of the elfast banks have numerous southern branches. Shortly after the eaty, the Belfast Bank, which is affiliated with the Midland Bank, ld its branches situated in the Free State to the Royal Bank of eland. The Free State Government holds all the shares in the ational Land Bank. The Government's banking business, with a w minor exceptions, is transacted by the Bank of Ireland. The gricultural Commission recommended the formation of a department for granting long term loans to farmers to be capitalised by the isting banks jointly, but this recommendation has not been followed. Recently, there has been formed a company known as the dustrial Investment Trust for the purpose of affording financial sistance to industry by means of long term loans. The National an, both as regards principal and interest, is repayable in sterling, are also the bonds created under the Land Purchase Act. The thorised issue of the six Irish banks of note issue is £6,352,000, and ie average circulation of these banks' notes in May, 1925, was 6,364,000, against which £10,688,000 was in gold and silver coin.

Trade.—The customs barrier between the Free State and Northern eland was set up in April 1923, but it was not until the beginning the following year that accurate values of imports and exports ere obtained. The trade figures for 1924 are as follows:—

Class	Imports 1924 £	Exports 1924 £
1. Food, drink and tobacco . .	29,523,000	41,549,000
2. Other raw materials . . .	6,314,000	2,490,000
3. Other manufactured goods .	29,204,000	2,593,000
4. Live animals not for food . .	770,000	1,816,000
Totals	65,811,000	48,448,000

During the first nine months of 1925 the value of imports was 45,225,383, of exports £29,623,566 and of re-exports £814,034.

It is probable that, if a full account of the international balnce of indebtedness were obtainable, it would appear that the visible items would more than make up for the adverse visible rade balance. Very large sums are received from British and oreign investments, and from emigrants' remittances from merica. On the other hand, the Free State remits large sums n account of land purchase annuities and pensions. There is o sign, as far as can be gathered from banking or stock exchange ources, that the Free State is living on its capital.

Communications.—In 1914, there were in Ireland 28 railway companies operating 3,454 miles of line. The Irish railways were placed nder the control of the British Government in 1917 and were released in August, 1921, a few months before the treaty. During the ontrol period, the net receipts for 1913 were guaranteed, and on the essation of control the Government paid the railways £3,000,000 in ull settlement of all claims. Meanwhile, wages had been raised by bout 200%, while freight and passenger rates had been raised only y 120 and 100% respectively. The resulting difficulties led to the Railways Act of 1924, modelled on the British Act of 1921, for malgamating all the lines situated wholly in the Free State. On an. 1 1925, came into being the new Great Southern Railway, omprising all the companies in the Free State but excluding the reat Northern Railway (Ireland), which is partially situated in Northern Ireland. The average weekly receipts of the Great Southern Railway in 1925 were £12,500 lower than in 1924, and the interim dividends on the ordinary and preference shares due to be declared in July were passed. All classes of stock have fallen heavily in the market. The conditions which prevail in the Free State render the competition of the road vehicle very formidable; the average journey is short, and many places in the country are several miles from a railway station. The number of motor vehicles and cycles increased in two years from 22,240 to 36,836.

Finance.—The following table shows the revenue and expenditure of the Free State from 1922 to 1925:—

Year	Revenue	Expenditure	Deficit
	£	£	£
1922–3	28,611,600	31,395,589	2,783,989
1923–4	31,869,628	42,792,312	10,922,684
1924–5	27,542,200	29,718,631	2,176,631

The Minister of Finance, in introducing the 1925 budget, stated that the total amount payable out of the public funds of the Free State in respect of compensation for property losses and personal injuries, both pre-truce and post-truce, would not exceed £10,300,000, a considerably lower figure than had been at one time anticipated. Compensation for pre-truce damage would amount to about £7,660,000, towards which Great Britain would contribute about £3,560,000; and the damage committed after the truce would account for about £6,100,000. When the abnormal army expenses had been reckoned, and the consequential losses to trade and industry taken into account, the civil war had cost the people at least £30,000,000. In view of the greatly improved condition of the national finances, he proposed to meet about £6,000,000 of the estimated expenditure of £30,000,000 for 1925–6 by borrowing, as it was of an abnormal and non-recurrent character, and to relieve the taxpayer by lowering the income tax and making large reductions in indirect taxation.

Public Debt.—In Nov. 1923, the Irish Free State floated its first loan. The nominal amount raised by this loan was £10,000,000. The interest offered was 5% and the issue prices 95, the flat yield being thus about 5¼%. The loan is redeemable at par between 1935 and 1945. The Minister of Finance authorised the statement that both principal and interest would be paid in sterling. The loan was a great success, being oversubscribed in the Free State; no part of it was underwritten or taken by the banks. Provision was shortly afterwards made for the satisfaction of persons who had contributed to the official Sinn Fein loans floated during the Anglo-Irish fighting. Irish subscribers were to receive savings certificates, and subscribers elsewhere were to have their holdings redeemed.

The indebtedness of the Free State on Nov. 28 1925, was £13,483,693, made up as follows: Ways and means advances by public departments, £1,530,000; annuities under Telegraph Acts, £202,944; savings certificates, £1,488,000; national loan, £9,760,859; compensation stock, £501,850. The price of the national loan on Jan. 9 1925 was 98⅜ and of compensation stock 93⅝. The agreement made between the British and Free State governments in Dec. 1925, provided that the outstanding liabilities of the Free State under the treaty in respect of the British National Debt should be settled by an annual payment of £250,000 for a period of 60 years.

Taxation.—The system of taxation in operation at the time of the treaty was taken over and, owing to the difficult financial situation created by the civil war, no reductions were attempted for a couple of years. In the years 1923–4 and 1924–5 the income tax was maintained at the rate of 5s., and the corporation profits tax was retained. In both these respects, the Free State taxes were higher than the British. The budget of 1924 reduced the super tax on very high incomes, and reduced the tea duty from 8d. to 5d. per pound. In 1925 the income tax was reduced to the British rate of 4s., and the exemption limit to corporation profits tax was raised. The duty on sugar was considerably reduced and imperial preference in that commodity discontinued, and the duties on tea, coffee, cocoa and chicory were abolished. The relief which the taxpayer might have derived from these concessions was counterbalanced by the burden of the new protective duties.

In addition to the sums raised by national taxes, the following sums were raised by local taxation: Year ending March 1922, £6,762,672; March 1923, £4,153,060; March 1924, £5,327,341.

The total (national and local) taxation amounts to £8 19s. 5d. per head of the population and the public debt amounts to £4 5s. 3d. per head. The debt is equal to 58·4% of the annual revenue.

(G. O'B.)

IRISH LANGUAGE (*see* 5.622).—It is difficult to say with any certainty how far the Irish language has maintained itself in Ireland since 1910. The action of Dáil Eireann in making it the official language of their first meeting, nothing else being spoken on that day, gave a great stimulus to it in popular estimation. The Dáil did not, however, live up to the headline thus set. Speeches there are seldom made in Irish, and practically never in the Senate, where not a dozen, perhaps not more than half a dozen of the 60 Senators could understand, much less speak it. It was decided, however, that all legislation must be passed in both English and Irish, and an efficient staff of Irish scholars and translators was retained for this purpose.

Several books written in Irish were translated into German, Swedish and Norwegian. Dr. Pokorny of Berlin published translations of some of Pearse's, O'Conaire's and O'Siochfhradha's stories under the not very felicitous title of *Die Seele Irlands* (Max Niemeter, Halle, Saale). From this book the reader will get a good idea of the short story in contemporary Irish literature. Dr. von Sydow of Lund University translated Father O'Leary's novel *Séadna* into Swedish. Käte Müller-Lisowski published, with notes and introduction, in 1923 a volume containing 39 Irish folk-tales. She had previously translated Dr. Hyde's "True Storyteller of the Week." Dr. Reidar Christiansen also published an illustrated volume of Irish folk-tales in Norwegian.

Irish was recognised as the national language by the Dáil, and a corollary to this recognition seemed to be that it should be taught in the primary schools of the Free State, and so far as the schools are concerned the Government made great efforts to Gaelicise them. Naturally one of the principal difficulties that the new Government had to face was the fact that the great majority of the teachers were not qualified to teach Irish, much less to use it as a medium for teaching. With a view to remedying this, annual courses for the training of teachers in Irish were established in 1922. The courses for primary teachers extended over eight weeks in 1922, five weeks in 1923 and four weeks in 1924. Approximately 12,000 teachers attended annually at about 180 centres or colleges. The cost in 1922 was £76,000; in 1923, £66,000; in 1924, £42,500; and in 1925 about £45,000. Similar courses were held for about four weeks in each of the years 1922–3–4–5, at a cost of between £3,000 and £4,000 per year, for teachers employed in secondary schools.

Formerly many people might have been noticed, especially young men and women, wearing a gold ring on their dress in the streets of the bigger cities and towns. This was to show that they spoke Irish and wished to be addressed in that language. It was observed that many of these people came to a violent end, and the wearing of this ring was consequently to some extent discontinued. It is significant that after the formation of the Free State the wearing of this ring was largely resumed. For examinations held under the auspices of the civil service commission in the Irish Free State Irish was made an essential subject. Indeed, it seems certain that a knowledge of Irish will be in future years a necessity for all aspirants to Government posts and that no young man who does not know something about it will be looked upon as properly educated. From 1927–8 forward Irish is to be compulsory in all secondary schools.

Finally, it may be said that whilst the reading, writing and speaking of the Irish language increased very much during this period in the towns, amongst the cultured classes in the north-west, west and south, where it was naturally spoken, it did not fare so well; in many of these places barely holding its own against English. (D. Hy.)

IRISH LITERATURE: ENGLISH (*see* 5.622).—The literary revival in Ireland was the first evidence of a resurgent national spirit. It had its origin in the study of the older heroic literature and of the folk poetry which still existed in Irish.

Poetry.—Its first expression was in poetry which retained the double mark of its origin set in W. B. Yeats' work to a standard of well-nigh perfect artistry and marked in George Russell's ("Æ") writings with a profound consciousness of the divine origin and destiny of man. In time the poets broke away from folk themes which were becoming a mannerism but not before Padraic Colum had written verses of grave, deliberate beauty and Joseph Campbell had used similar material effectively but not without sophistication.

By 1910 the group of young poets, whose association in *New Songs* (1904) gave the appearance of a school, had broken bounds. Seumas O'Sullivan had perfected his fastidious art and began to show the shift of interest from country to town together with a new and mordant note. A transition to prose marked the passing of youth and the coming of age of the movement. Movement now it could hardly be called. It had become a diverse development of personality. James Stephens' *Insurrections* (1909) may be taken as the turning point. Passing indifferently from poetry to prose and back again, reincarnating in both forms and in a modern spirit the old prose sagas or the 17th century poetry of O'Bruadar, O'Rathaille and Keating, passing from *The Charwoman's Daughter*, a Dublin slum idyll, to the riotous invention of the *Crock of Gold* and *Demi-Gods*, and exhibiting at each turn the same leaping, exuberant fancy and the same wise and witty humanity, Stephens fitly represents the transition from the older generation and the growing attraction to prose.

One mentions the poets of the Rebellion, Pearse, MacDonagh and Plunkett, executed in 1916, the tragic intensity of Dora Sigerson Shorter and the name of Francis Ledwidge, killed in Flanders in 1917, whose verse is lit throughout with sudden glimpses of natural beauty. Since their date one powerful poetic talent has appeared with Austin Clarke, whose eager imagination is fitly exercised in epic subjects. F. R. Higgins has written some charming verses but his output is still too small to write of him with assurance. Equally limited but more derivative is the work of H. Stuart in whom the later rhythms of W. B. Yeats are faintly echoed.

Prose.—The transition to prose synchronised with growing pre-occupation with public affairs. Æ's prose of imaginative revery sharpened in his attempt, *The National Being*, to shape a national polity and to bring back the thoughts of his countrymen from the frontiers and surfaces of political controversy to their spiritual base. His book has left its imprint on the Irish Constitution. In *The Interpreters*, written when political controversy had come to an issue, he breaks away characteristically from the passing shows of things to track political moods back to spiritual origins and "to relate the politics of Time to the politics of Eternity." Here and in *The Candle of Vision*, a book of pure mysticism, where he explores the creative imagination in an attempt to discover the operation of the divine imagination in the mind of the individual artist, George Russell's prose reaches its height. The chief stimulating literary influence of his period, and always more interested in life than in the shadows of life. Æ's work reconciles the superficial conflict of national and universal art. The aim of the former was clearly expressed in the writings of Pearse and MacDonagh—Pearse in his *Irish Anthology* and in a remarkable series of pamphlets, the most effective political writing since John Mitchell's, and MacDonagh in his analysis of Gaelic verse-forms and the Irish way of speech on Anglo-Irish literature. This form of criticism, the result of the language movement, has been reinforced by Daniel Corkery in a study of the Irish schools of the 17th and 18th centuries and is a growing formative influence on the younger writers.

The rebellion of 1916 played an inevitable part in the novels of this period, of which Eimar O'Duffy's are the most notable, but the psychology of its participants is best studied in Corkery's short stories, wherein whoever cares for the artistic presentation of a passionate human struggle will find a clear glass. His single novel, *The Threshold of Quiet*, written before 1916, is a study in

uturity and self-immolation, a shadow-play in whose penumbra he characters dwell in intense if quiet reality. The other signifiant novel of this period is Colum's *Castle Conquer*. The premaure death of Seumas O'Kelly was a grave loss to Irish literature; is *Weaver's Grave* is the best short story that has come out of reland. Succeeding disillusions born of civil war is expressed n the recent work of Liam O'Flaherty, where a powerful creative faculty atones for much brutality. There remains the unique igure of James Joyce, the delicately stepping grace of whose *Chamber Music* is in singular contrast to his experimental, morphous prose.

Drama.—John M. Synge, the outstanding dramatist of the Abbey Theatre, died in 1910. He founded no school, his tragic magination was not hereditable, and without that inheritance t would be grotesque parody to imitate his manner of imaged, highly coloured speech. Colum was the earliest of the peasant playwrights; his best play, *Thomas Muskerry*, was produced at he Abbey in the year of Synge's death, and it was to his idiom hat the new dramatists returned. Colum studied the peasant n relation to his surroundings. His fable was always significant, his construction taut and solid, his dialogue unforced. St. John Ervine treated of certain situations peculiar to North East Ulster with some effectiveness, but most of the newcomers developed only the genre study of the individual, detaching him from his *milieu* and leaning too often to melodrama or farce. Lady Gregory has comic verve and inexhaustible invention, but to the Abbey repertoire her exuberant and uncritical talent added nothing save *The Image* (1910) to surpass her early *Spreading he News* and *The Rising of the Moon*. Her real work lay in the administration of the theatre through stormy days. The notable newcomers before 1923 were Lord Dunsany, T. C. Murray and Lennox Robinson. Dunsany's highly personal talent ranges from he grotesque horror of *A Night at the Inn* and the *Queen's Enemies* to the imaginative conception of *The Gods of the Mountain* and *The Tents of the Arabs*. He has singular inventiveness, verbal felicity and at his weakest can construct a charming fable. T. C. Murray's seven plays, of which *Birthright* (1910), *Maurice Harte* (1912) and *Autumn Fire* (1924) are the chief, show a strong sense of dramatic situation with a capacity for easy, beautiful prose. Lennox Robinson, *Harvest* (1910) *The Whiteheaded Boy* (1916), *The Lost Leader* (1918), possesses a less acute sense of dramatic construction, but has an unusual talent for inventing interesting character.

The period under review closes in Dec. 1925 with the coming of age of the Abbey Theatre. In its 21 years the Abbey has produced 216 plays, the work of 86 authors, of whom 72 are Irish contemporaries. This record does not include the entire Irish dramatic output, since certain secessions from the Abbey and an Irish-speaking Drama League have produced interesting results. That the vital impulse which was born in 1902 of the junction of the writers Russell and Yeats with the players W. G. and Frank Fay is not yet exhausted is proved by the advent in 1923 of Sean O'Casey, the most powerful talent that has come to the Irish theatre since Synge. His plays *The Shadow of a Gunman* (1923), *Juno and the Paycock* (1924), *The Plough and the Stars* (1926), measure the change of 25 years. The heroic play in verse or prose has given place to the drama of realism, Cuculain to the gunman. Casey has a consummate power of creating and energising character, a speech that holds rich local savour without losing rhythm, pity and humour that transcend the squalor of the slums. In these gifts and in his passion for truth, the fruit of enthusiasm and disillusion, lies his promise.

Bibliography.—As a brilliant and scandalous chronicle of the period George Moore's *Ave, Salve, Vale* (1911–4) is indispensable; Lady Gregory, *Our Irish Theatre* (1914) *Æ Imaginations and Reveries* (1915); Thomas MacDonagh, *Literature in Ireland* (1916); E. A. Boyd, *Ireland's Literary Renaissance* (1916); *id.*, *The Contemporary Drama of Ireland* (1918); Padraic Colum, *Anthology of Irish Verse* (1922); W. B. Yeats, *Plays and Controversies* (1923); Lennox Robinson, *Golden Treasury of Irish Verse* (1925).

IRISH LITERATURE: GAELIC (*see* 5.622).—The decade following 1910 was a period of much activity in the publication of literature written in the Irish language. This activity took two forms, one the editing of older texts which had never seen the light before, and the other the creation of wholly new works. The Irish Texts Society in London, the learned magazine *Eriu* published in Dublin, the *Zeitschrift für celtische Philologie* published at Halle, the *Revue Celtique* of Paris and the *Celtic Review* of Edinburgh (which ceased publication after 1915) were the principal media for the publication of the older texts. The Irish Texts Society, in particular, published a number of handsome volumes, all *editiones principes* of important works. The veteran Dr. Whitley Stokes died in 1909. His last work, the Irish version of Lucan's Pharsalia, was published posthumously at Leipzig. Kuno Meyer died in 1919. The great native scholar Standish Hayes O'Grady had passed away in 1915.

The Gaelic Journal, which had been founded in 1882, came to an end in 1906 with the 197th number, and the want of a scholarly magazine dealing with the phases and difficulties of the more modern language was keenly felt. In 1912 T. O'Rahilly, later professor of Irish in Trinity College, Dublin, started a magazine *Gadelica*, to which he himself was the chief contributor, which reproduced all the best and most scholarly features of the old *Gaelic Journal*. Unfortunately this magazine came to an end in 1913. *Editiones principes* of valuable Irish texts published by various scholars are Manus O'Donnell's *Life of Columille* (Chicago, 1918), the first part of O'Clery's recension of the *Book of the Conquests of Ireland* (1916), *The Maguires of Fermanagh*, *The Flight of the Earls*, *The Book of the MacSweeneys*, *The Son of the Eagle*, Sean O'Neachtain's *Adventures of Edmund O'Clery*, the poems of *Pádraigin Hackett*, and others.

Perhaps amongst modern writers the name of Canon Peter O'Leary, parish priest of Castlelyons, must be mentioned above all others. Although he began to write late in life, after the rise of the Gaelic League, he produced an amazing number of excellent works, of which his first book, *Séadna* (1898) is nearly sure to live. His great merit is that he was the first to turn his back resolutely upon everything that was bookish and old and obscure, and to go for his mode of expressing himself to the folk speech of his native county of Cork. How suitable the speech of the people became in his hands to express the whole gamut of the emotions was to many a revelation. He died in 1920 and has left his trace upon the language more deeply than any other writer of his time. Father O'Leary stands for the most representative writer of the southern half of Ireland. The elder Pádraig O'Conaire (or Conry) would probably be regarded by many in 1925 as the best living writer of the northern half.

Irish literature got a great set-back during the political troubles following the rebellion of 1916. Two monthly magazines which published stories and folk-lore were burnt, one in Munster and one in Connacht (Connaught). The Connacht editor was "on the run" in the mountains, and of the joint editors of the southern paper one was "interned" and the other had his house burnt, with all the MSS. which he had spent half a lifetime collecting, and all the songs and music he had taken down from old people, now for the most part dead. Pádraig O'Conaire, too, had his little hut in the Dublin mountains burnt and several plays destroyed.

(D. Hy.)

IRON AND STEEL (*see* 14.801).—Developments during 1910–26 in iron and steel were improvements in processes and equipment rather than new methods. An increase in the *per capita* consumption, far greater than the remarkable increase of the preceding decade, forced attention to means of securing maximum outputs as well as to the ever-present effort to secure economies. Larger units of manufacture were generally favoured and so-called "duplexing" and "triplexing" were outstanding features in steel-making. The latter part of the decade was marked also by a marvellous growth in popularity of the electric furnace, until at the end of 1922 there were 1,175 such furnaces in the world for steel-making alone, against 114 in 1910. The World War gave an artificial stimulus in general to plant expansion to meet the demands for ships and shells and resulted in a realignment of national capacity. In the main the following

analysis is devoted to the economic side of the evolution of the period.

Iron Blast Furnace Construction.—Design was influenced by local experience of experts in the different iron-producing districts. Profiles depend on raw materials—quality of coke, nature and concentration of ores. Generally speaking, tendency toward greater bosh and shaft angles continued (bosh angle 75° to 80°; shaft angle 84° to 86°). The size of stack increased only in the districts treating low-grade ore, while with high-grade ore (50% to 62% iron) the 500- to 600-ton-per-day size became the standard and many old furnaces were enlarged. In the Minette district of Europe, where the ore charged contained between 30% and 35% iron, the 200- to 250-ton unit became popular in all new construction. The cubical capacity of a blast furnace ranged between 40 and 100 cu. ft. per ton of pig-iron blown in 24 hours.

Individual parts of blast furnaces received particular attention. The hearth construction became reinforced and often cooled to avoid breakouts of the molten metal, and greater attention was given to brickwork to limit the downward destructive action of the metal. Emergency tuyeres at mid-height of the bosh—standard in the Minette district—lost their popularity and disappeared in nearly all new furnaces. For the handling of the material—ore, limestone and coke—mechanical devices won increased favour owing to the enormous masses involved and to the growing scarcity of labour. In America, the simple skip hoist was almost universally adopted in new plants, while in Europe the drop-bottom bucket hoist became popular and its design was ingeniously varied. It is noteworthy that the drop-bottom bucket, which was originated in America (Duquesne works) and was perfected in Germany during the years 1905–10, was little used in the United States ten years later.

It had been supplanted by the cup-and-cone top with a rotary distributor (McKee); in Europe the double cup-and-cone construction, giving low drop height and assuring less breakage of the softer coke, was preferred. These two solutions were more or less linked to the hoist system adopted. The furnace interiors were bricked up, in America of standard-shaped refractories giving a multitude of joints, while it was customary all over Europe to use special large-volume brick, shaped to reduce the joints. Both systems seemed to give satisfaction to the operators, and comparisons were not possible owing to the difference in the operating conditions. Speaking generally, the American design with a plate lining involved less steel for construction, while the Luxembourg-Lorraine type of blast furnace was conservative and substantial.

Blast Furnace Operation.—General progress was marked; greater familiarity with the chemical problems and increased mechanical equipment made operation more easily controllable, results more positive and disturbances less frequent. The use of excessively fine ore was accompanied by a high-solution loss of coke, and agglomerating of ore was recognised as desirable. This led to increasing attention to sintering fine ore mixed with flue-dust, and recharging of dust without treatment seemed likely to die out. Higher temperature of the air blast was a noteworthy development, as each increase of 200° F. has been reflected by 4% to 5% reduction in coke consumption. In the Minette district 850° to 900° F. blast temperatures were quite common. The blast pressure, which remained without much change, varied according to districts and the forcing of the operation from 4 to 15 lb. per sq. inch. In case of a relatively cold spell within the furnace due to overfluxing, bad coke or dropping of a hanging, the introduction of kerosene (paraffin) through the tuyeres proved a quick remedy, although it necessarily required care and progressive application to avoid accidents. The use of this cure rendered superfluous the auxiliary tuyeres at mid-height of bosh. The use of the oxygen torch to burn out the iron notch in case of metallic incrustations, extremely difficult to remove, proved a great help to the working crews. Mechanical appliances in cast-houses were installed in increasing numbers to supplant hand work, especially in sand casting floors. Cranes equipped with lifting magnets and pneumatic hammers elastically suspended proved a step toward the best method of moulding, breaking and handling of sand-cast pig-iron. For all qualities of pig-iron the continuous casting machines continued to be the accepted standard. In plants adjoining steel-works transport ladles of larger size (30 to 50 tons) and designs assuring better insulation and easier skimming of slag were evolved.

Blast Furnace Gas.—Continuously increasing price of coal and coke affected the economics of the blast-furnace gas and made it a by-product of great importance. The fuel value of this original waste became more and more recognised in America. The first effort, to avoid all gas losses so far as possible, led to the installation of double furnace tops, which became universal. Next gas-cleaning processes were developed to remove dust impurities from the by-product fuel, thus increasing its adaptability to combustion and securing greater efficiencies in its utilisation. To facilitate operation and render supervision automatic pressure-regulating devices were evolved and accumulators were installed to equalise supply and provide steady outflow. Gas-cleaning attracted the attention of operators in European countries greatly in need of fuel, because the calorific value of the gas counterbalanced the cost of purification. In America the coal shortage, due to inordinate demand and dislocation of railway service, produced the same result. The first step in gas-cleaning was the installation of a dust collector close to the off-takes and the downcomers of each blast furnace. In it the coarse dust was deposited by a slowing-down of the gas flow and a sudden change in its direction. This apparatus was independent of all further cleaning methods.

To separate the fine dust particles two different processes were applied: (1) wet method; (2) dry filtration.

(1) By the wet method the gases were cooled by injection of water, and the dust particles, passing through the fog artificially produced, were arrested by scrubbers. Experience led to a subdivision of the operations, called medium cleaning and fine cleaning, with apparatus protected by patents. The sludge of dust and water was removed by the application of centrifugal force, separating gas and liquid in specially designed fans or washers (Theissen, Brassert, etc.). The disposal of the water created a problem, as contamination of rivers is against the law in most industrial countries. In deposit ponds the settling of the impurities was incomplete and its removal a tedious manual operation; and the Dorr thickener, developed in ore-concentration districts, was adopted, as assuring continuous service automatically by means of a special mud pump requiring little attention. A drawback of wet systems was that the sensible heat of the blast furnace gas was absorbed by the cleaning water and lost beyond recovery. On the other hand, it permitted the installation of smaller gas-piping and dispensed with the insulation of the lines against heat loss, thus saving appreciable capital outlay in the case of long-distance distribution. Another drawback of the wet method was that recovery of the dust required driving off the water from the heavy mud in any briquetting or concentrating process attempted.

(2) The dry methods of gas-cleaning had their advocates where every little economy was watched, such as retaining the sensible heat of the gas and saving the expense of water-handling in keeping the dust dry. To separate the dust out of the hot gases, filtration appeared to be the best process. With mechanical filtration, finely woven cloth or asbestos-fabric bags or slag-wool layers let the gas pass at low velocity but retained the solid dust, which was removed periodically by return currents of clean gas. The principle was adopted in the Beth-Halberg system in Europe and the Kling-Weidlein apparatus in the United States.

The chief ways in which blast-furnace gases were utilised were as follows:—

(*a*) *Cowper or Hot-blast Stoves.*—The absence of dust in the gas provided for rational stove design, as the complicating side issues of clogged-up passes and slagged-up checker holes disappeared, as well as the periodic waste of cooling, cleaning and warming-up of each unit. The clean gas meant a reduction of the area of heating surfaces and brick volume expressed by fewer stoves per blast furnace—three to four per furnace against four to five 10 years earlier. Then began a systematic study of the heat-transmission phenomena within the mass of checker work.

(*b*) *Boilers.*—Clean blast-furnace gas allowed for advantageous use in connection with steam boilers; first, through more efficient combustion, in effect less gas per pound of steam produced; second, higher ratings of boilers, in effect more steam per unit of boiler evaporating surface or fewer boilers for a given plant capacity; and, third, quick adaptation to any load required, in effect flexibility or ease of operation. Many efficient burners were invented and some were installed on a large scale.

(*c*) *Metallurgical Furnaces.*—The removal of flue-dust made possible a wider distribution of the blast-furnace gas, and in Europe use was made of the surplus gas with success in all kinds of furnaces.

he low calorific value coupled with the small amount of air required r complete combustion, opened fields where so-called mellow heat- ig flames are demanded, such as core drying, mould drying, anneal- ig, roasting and ore concentrating.

(d) Gas Engines.—The principle that clean gas was indispensable r internal-combustion engines was long recognised, but its practical pplication did not occur until after 1910. Also a cool gas was re- arded as essential to secure adequate volumetric efficiency of each ylinder. Among gas engines, the four-cycle type outranked con- iderably the two-cycle type. Devices for close regulation were eveloped on the principle of qualitative-quantitative mixture. he built-up cylinder seemed to win greater favour than the one- iece casting. The safety of operation reached a parity with that of team-engines or turbines, the gas being clean. The exhaust heat f the engines, representing some 40% of the energy, was utilised o generate steam, and 70% was thus recovered in some instances.

Of all the various uses made of the gaseous by-products of the blast urnace only the heating of the hot-blast stoves was universally pplied. All experts agreed that 30% to 40% of the gases are best mployed for that purpose. The surplus of 60% to 65% was utilised or the other purposes already mentioned. In the utilisation to pro- luce blast pressure and to develop power, the battle for suprem- icy between the gas-engine using blast-furnace gas and the steam oiler using the gas to supply energy to engine or turbine remained ndecided. Thermal efficiencies were not the only issues at stake. n Europe, the gas-engine had the firmer standing, while in America he boiler seemed to be the more in favour. Even for generating the last pressures, the competition between gas-engine-driven air com- ressors, steam-engine blowing engines and turbo-blowers had gone on without absolutely proving the superiority of any one combina- tion. Varying economic conditions in each country and different ocal considerations, as well as the purely technical aspects of the problem, were deciding factors. Europe, with its skilled workmen nd more stabilised market conditions, presented a background different from that of America with its fluid trade conditions and its unsettled unskilled labour.

Plant Layout and Size.—A single blast furnace, built alone on a site, no matter how well chosen, proved not to be a logical industrial enterprise. The number of such plants existing was the result of competition, of fluctuating market conditions, and constituted an economic waste, speaking generally. With combined units the ac- cessory equipment became cheaper in installation cost and in terms of iron output and more efficient in operation, through flexibility and insurance against breakdown. Three to six furnaces grouped in well-laid-out plants were established as an economic whole. To avoid the loss of the sensible heat of the molten pig-iron and to refine the metal without cooling, steel-works were logically joined to blast-furnace plants. The two separate departments were thus combined in one industrial unit, with the added advantage that the surplus of power available at the furnaces could be absorbed in the rolling-mills.

Electric Pig-Iron Furnaces.—Tests made at Trollhättan, Sweden, were conclusive only for high-grade pig-iron similar to the Swedish charcoal pig-iron. Since 1918, the Domnarfvet works in Sweden had operated several shaft-type furnaces (with gas circulation using 60% to 62% of iron ore and charcoal as a reducing agent). Mixtures of charcoal and coke up to 50% coke were found satisfactory. Per ton of pig-iron produced, 3,400 lb. of ore (containing 61·5% Fe), 120 lb. of lime and 740 lb. of charcoal were charged; 15,000 cu. ft. of gas at 240 B.T.U. per cu. ft. were captured at the top; 2,150 kilowatt-hours was the electric energy consumption per 2,000 lb. of pig-iron. The problem of using electric current for supplying heat in the blast furnace reactions had particular interest for the eastern Pyrenees in France, British Columbia, Brazil, Italy, as well as Sweden and Norway, where fuel is scarce and low-priced electricity might be made available.

The Steel Plant.—The usefulness of mixers as an important adjunct of the steel-making plant was universally recognised, as numerous installations attest. Their field was established in equalising qualitatively the successive outgivings of the blast furnaces and in de- sulphurising the molten metal. To accelerate the removal of sul- phur, less than 0·5% of manganese proved most helpful. The shape of the mixer that gave best results was the simple cylinder rotating on its axis. The most popular size proved to be 1,000 to 1,400 tons' containing capacity. Simple oil or gas burners without regenerating chamber in the United States, with pre-heating checkers sometimes in Europe, completed the equipment. In Germany, a 2,000-ton- capacity mixer was reported built, but only after considerable dis- cussion as to its size. The mixer was, of course, brought into being for receiving metal from the blast furnace and delivering to the ladle for transport to the steel plant as needed. Slag that floats on the top of the bath must be skimmed off from time to time.

Converter Plants.—No noteworthy development took place in the acid-operating (Bessemer) converter or in the basic-operating (Thomas) converter for making steel. The 20- to 25-ton-capacity vessel remained nearly universal. A 40-ton size was proposed in 1918 by a Belgian engineer. As between Europe and the United States, the hydraulic tilting mechanism of the former did not give way to the electric drive of the latter, nor did the gas-engine blowing units succumb to the turbo-blowers of American practice.

Open-hearth Plants.—Without radical change in type, sizes of open-hearth furnaces increased up to and above 100 tons' capacity, but the tendency was toward fully controllable sizes. The practice in the United States settled to 80 to 100 tons and in Europe 40 to 50 tons. Volumes of checker chamber increased to get better so-called flywheel effect. Greater attention was paid to port and head con- struction to lengthen life, and to a reinforced roof. Reversing valves were marketed for reducing flow resistance and waste of gas. Waste heat boilers were more generally installed, but not universally adopted because of their interference with concentration and general elec- trification of plants. Marked superiority or inferiority was not shown for the tilting construction of furnace when tested by use beside the stationary type. Natural gas disappearing in America, producer gas was the more generally adopted fuel. Powdered coal was tried with some success but without proved superiority; one difficulty was that checker chambers got clogged by ashdust. By-product tar and crude oil proved fuels well suited for the purpose if available at low price and in large quantities.

Electric Steel Furnaces.—The electric steel furnace for refining and melting iron and steel developed to a surprising extent in the decade 1910-20 in size and in number of installations. It proved ideally suited for quality products and high-grade materials, because no complication through fuel medium exists and because atmosphere and temperature are attainable practically at will. From 500-lb. capacity, single furnaces were built to 40 tons, with most of them of 5- to 8-ton capacities. (For electric furnace statistics, see *Iron Age*, Jan. 1 1921.) Of the 960 known electric steel furnaces in existence in Jan. 1921, 356 were in the United States, 150 in England, 100 in Germany, 60 in France and 43 in Canada. Of the total, 308 were Héroult arc furnaces, 102 Rennerfelt induction furnaces and 90 Greaves-Etchells furnaces. The electric furnace was adopted for making metal mixtures, ferro-alloys, special steels of high quality in large amounts—strict repetition being possible in an absolute positive way. A disadvantage was that the metal is not at rest but always in motion, through electric or magnetic influences. Though agitation was often desirable, the action hampered the separation of the slag and the rising of impurities out of the molten mass. A remedy for this was repeated skimming of slag and careful super- vision. One unusual utilisation of the electric furnace was the making of pig-iron out of scrap, especially in the United States, to supply deficiencies in the amount of low-phosphorus pig-iron, particularly in the manufacture of ordnance. It amounted to a synthetic recon- version of steel into pig-iron. Fine coke was added to the slagged refined scrap for carburisation, and the method promised to be com- mercially feasible in regions having electric power but little local fuel available and situated so that delivered pig-iron was high in price. For deoxidation in the refining process and for recarburisation, ferromanganese and spiegeleisen retained their popularity in spite of high prices under erratic market conditions. In Europe pre-heating, often pre-melting, of the addition was the current practice, to save in the amount needed and to accelerate effects. In America the wasteful method of cold additions prevailed. Ferrotitanium, with carbon or carbon-free, was used, as well as ferrosilicon and aluminium in small quantities. Some steel plants made additions in the ladle, others finished the operation in the furnace.

Steel-making Operations.—The outstanding feature of steel- making operations was the recognition of splitting the refining process into two phases, or the two-slag method, to increase production and to lower production costs. The efforts of Bertrand-Thiel and Talbot recognised in effect this principle; and duplexing and triplexing were only operating variations of the same principle, to remove the im- purities of the pig-iron stepwise in the furnaces best suited for each purpose. Thus sulphur and manganese pass out in the mixer; silicon and part of the carbon in the converter; the rest of the carbon and phosphorus in the open-hearth furnace; additions were made and alloys were added in the electric furnace. The plant necessitated considerable equipment, but it secured ease of operations, exact control of results and made possible quantity production. Below 1,600 tons per 24 hours, savings in operation were regarded as hardly possible, as in slack market periods overhead expense was too large. During the World War about 10 duplexing plants, refining in an acid converter and finishing in basic open-hearth furnaces, were built in the United States under the pressure created by an ammunition famine. Electric duplexing plants (meaning melting and preparing in open-hearth furnaces and finishing in electric furnaces) were built in large numbers, offering a special-quality product on a large scale. A number of new independent efforts were made to produce steel direct from the ore without the interpolation of the iron blast fur- nace, but none could be said to have been proved feasible on a scale beyond that of the laboratory.

The Shaping of Steel.—Rolling-mills (used if the demand for a product is large and if its shape lends itself to a continuous process, like rails, angles, plates, bars, etc.) and the forge-shop (if the shapes to be produced are complicated, short in length, unsuited for the rolling-mill), both change the shape of the metal heated at high temperature, about 2,000° to 2,300° Fahrenheit. Both require finishing departments to straighten, shear or bundle the rolled product or to clean off the fins, rough off the unevenness of the forging operations, and they may need annealing and pickling facilities to improve the quality of the product. A special process of milling the top and bot-

tom of rail blooms, to remove cracks and roughness from the semi-finished steel and also surfaces decarbonised in the heating furnaces, was put into use at the Lackawanna mills in America and resulted in a reduction in the number of finished rails classed as seconds.

In the period 1908–26 the development of the rolling-mill was influenced, first, by the great manufacturing principles of concentration and specialisation, and, second, by the electrification of the motive power. Concentration demanded large production in one

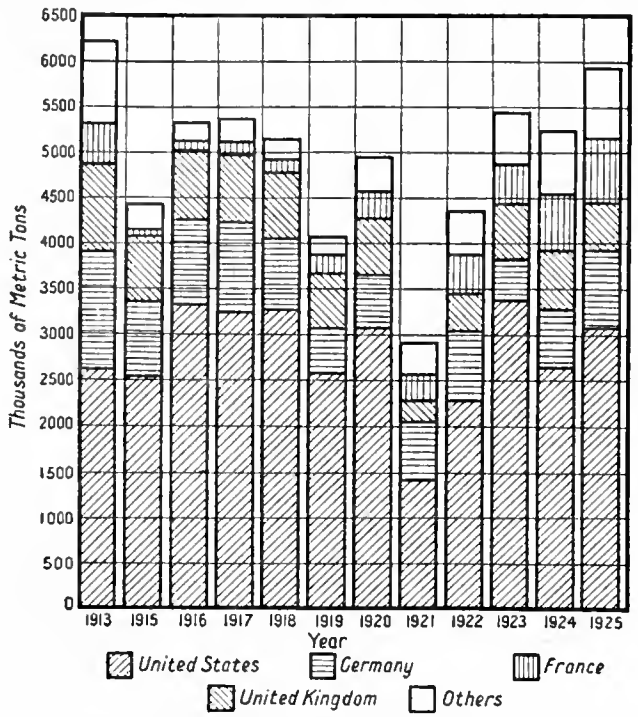

FIG. 1.—Diagram showing the production of Pig-iron in the principal producing countries, for 1913 and 1915–25 (monthly average). *Note:* "Others" include Luxembourg, Belgium, the Saar, Sweden, Canada, Poland and the Union of Socialist Soviet Republics.

unit and suitable equipment to attain that aim; in other words, mechanical devices in preference to hand operation. Specialisation was applied to the shape to be rolled as well as to the mill used for production. Standardisation of rails, beams and angles, the reduction of the number of profiles, and the simplification of shapes were consequences, as well as the installation of mills for specific purposes. The application of these rational principles was accelerated by the use of the electric motor. The advantages were recognised about 1905, but the next 15 years brought their practical realisation. The numerous little steam-engines disappeared and the electric motor revolutionised the handling of the material by cranes and overhead trolleys as well as the mill accessories, like tables, skids, transfers, etc. The first step was the creation of central power plants where electricity was generated either in turbine or gas-engine generators, preferably with the help of the surplus gas from the blast furnace. Many steel plants in 1920 were equipped with 20,000- to 40,000-K.W. power stations. The second step was the development of speed reducing devices made necessary by the high speed of electric motors. The advance of the gear-cutting industry and the advent of spiral-type teeth, single or herring-bone, and the development of new types of teeth giving less wear, more rolling surface, and, later, the use of special hardened, heat-treated steels were eagerly taken up by the designers of mill machinery to increase the quality of their product. Reduction gears transmitting up to 5,000 H.P. came into daily use, and the ratio of 10 or 12 to 1 in one reduction gave satisfactory service. The third step was the development of speed-regulating devices, especially in connection with alternating-current motors, to secure efficient operation for variable conditions. The fourth step was the solving of the load problem of large, intermittently operating motors, reversing their direction of rotation by means of the motor-flywheel set advocated by the Austrian engineer Ilgner in connection with suitable controllers of which the Ward-Leonard system was the prototype. Much work and inventive genius were concentrated on these difficulties to bring about in less than 15 years the high efficiency and great safety of operation by electricity of steel mills. The development of the rolling mills is still progressing.

For driving continuous mills electricity was preferred to the steam-engine. The uniflow steam-engine found favour up to 3,000-H.P. units, but installations were few. Where the effort was to bring about a complete electrification of the plant, steam-engines proved unpopular, possible economy being counterbalanced by complication of maintenance and other administrative considerations. For the reversing drive of large units, requiring loads up to 20,000 or 25,000 H.P., the electrical drive was not necessarily in the ascendancy. The high initial cost of the motor generator flywheel set with direct-current motor directly connected to pinion and mill was made the chief argument against universal adoption of electricity and numbers of old plants were reluctant to change their somewhat obsolete steam equipment. In America only a few engines as large as 25,000 to 30,000 H.P. (Weirton and Lukens) were installed in new work, and in England large vertical engines were built. The electrical units, however, increased considerably in number and size and considerable progress was realised in the matter of manoeuvring capacity, in standardisation of winding and accessories, in records of output and efficiency of running. In 1925 the electrical industry was aggressively working on betterments, while the partisans of the steam-engine rested on past laurels. Parity existed on all points except first cost of installation. Even for smaller mills of the reversing type electrical drives were built, such as 24-in. mill (Mark, Indiana Harbor), 26-in. mill (Atlanta, Ga.). Two-high reversing plate-mills also disputed the field with the three-high type in the medium-sized equipment, and latest universal-mill installations were of

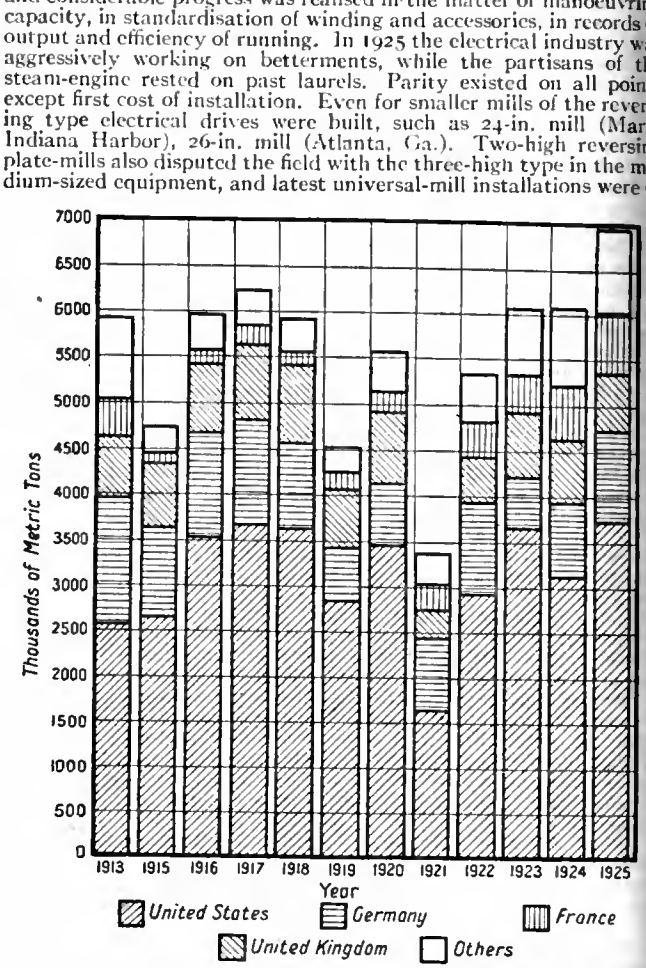

FIG. 2.—Diagram showing the production of Crude Steel in the principal producing countries, for 1913 and 1915–25 (monthly average). *Note:* "Others" include Luxembourg, Belgium, the Saar, Sweden, Canada, Poland, Italy and the Union of Socialist Soviet Republics.

the reversing type electrically driven. The largest mill for plates, 192 in. wide, at Lukens, Pa., which was completed in 1918, was of special design, reversing and steam-driven. (*Iron Age*, Jan. 2 1919.)

The concentration of production in large well-balanced plants with adequate resources and sales organisation permitted a logical subdivision of the rolling-mill programme with a subsequent reduction of production cost. The smallest bloom section, 6x6 in., had a tendency to grow toward 8x8 in., as some experts claimed that 50 sq. in. was the economic limit of the range of a large mill. To reduce the time required for roll changing, complete spare housings, completely mounted, came to be good mill practice, these being dropped on the shoeplates by the cranes. In some specialty plants sometimes two or three housings were changed together.

Furnaces.—The development of soaking, reheating and annealing furnaces was influenced by the increasing price of fuel and considerable efforts were made to boost heating efficiencies. In Europe gas-firing with recuperation and regeneration of waste heat was the favourite, especially because producer-gas firing was much used and remarkable results achieved. In America continuing shortage of natural gas for industrial purposes in regions such as the Pittsburgh district made a substitute market for crude oils, coke-oven gas and powdered coal. Especially since 1915, the use of powdered coal developed to a surprising degree for all kinds of metal-heating applications. Mechanical stokers were evolved in numerous designs to dispense with hand labour and to control by mechanical contrivances the combustion of coal in an efficient way.

Mill Equipment.—Roller tables, skids, transfers, cooling-beds and ters were perfected and installed in increasing numbers owing ainly to the efficiency and handiness of electric motors. Variable-eed drives gained in favour. Straighteners, saws, punches and ears were made in conformity with the availability of electric ower. Hydraulic devices were pushed in the background and elec-ic drives supplanted engines in the field of these mill accessories.

Metallographic Progress.—Metallographic knowledge spread the period 1910–25 from the university laboratory to the eel mill, outgrowing the narrow circle of students to become e helpmate of the operator. Pyrometers or temperature re-rders and the scientific control of temperature came as a matter course in numbers of steel mills. The variety of alloy steels fered for practical uses was due to the theoretical investigations the metallograph. Chromium and vanadium, nickel and balt, tungsten and molybdenum added their special properties steel, and improved heat-treating methods enhanced these alities with a skill and positiveness hitherto unknown.

Beyond the realm of iron and steel making, properly regarded, it coming within the purview of the industry, the remarkable velopment of the period was the heat treatment of metals. went hand-in-hand with the study (by means of the micro-ope, and thus of the photomicrograph) of grain structure and ic transformations which take place in the so-called solid solu-ons, according to the degree of heating and cooling given to the etal. Practical applications of the investigations of the scientist ere numerous, and the history of the temperature experience a given metal product going into an article of commerce was cepted as equally important with the chemical constituents, r two pieces of steel, identical chemically, may be made to ehave physically very differently according to their crystalline ate. (*See* METALLOGRAPHY.)

Other developments which must be briefly enumerated were: fforts to test a material's fitness or agreement to specifications with-ut destroying it, as by X-ray photographs (sheets), or by magnetic analysis (by noting changes in permeability of an article of constant cross-section, as a rifle-barrel, wire or steel rail, by moving it through a magnetic field); these, however, were not definitely of commercial dependence, pending further investigation; success in making large chains of cast-steel links followed by heat treatment, such as annealing; efforts to cast in centrifugal moulds, such as cast-iron pipe by introducing molten iron into the rotating mould; commercial recovery of potash from blast-furnace flue-dust deposits at the base of hot stoves; making iron pipe by an electrolytic process of depositing iron on a rotating cathode in a ferrous-chloride electrolyte; commercial manufacture of a stainless steel having 10% to 15% of chromium, which, Harry Brearley in England discovered, gave amazing resistance to corrosion, so that it became the base of an important cutlery industry and offered a satisfactory material for rifle-barrels, turbine blades and steel articles subject to both erosion and corrosion; additions to the numberless varieties of alloy steels, largely to secure some desired physical characteristic for specific needs, such as increased tensile strength in terms of lighter members of a fabricated steel product; elements like cerium and zirconium entered the ferro-alloy circle, but a delineation of the various alloys and of their definite fields of usefulness was not completed.

Production.—The accompanying table shows the relative producing capacity of the leading industrial nations of the world. The figures are of actual production as well as capacity to produce. The world's steel-making capacity was put, in 1926, at 116,000,000 tons in round numbers. One-half was credited to the United States, which could make more than four times as much as Great Britain and more than three times as much as Germany. The United States' percentage of the world's pig-iron-making facilities was somewhat over 46%. More than one-third of the total annual output of iron ore in the world came from the United States, and of the American production 85% came from the Lake Superior district. The Lorraine ore-fields supplied about 25% of the world needs, 80% of its output going to France and Germany.

World statistics of the production of ore, pig-iron, and crude and finished forms of steel are obtainable from the National Federation of Iron and Steel Manufacturers, London.

Iron and Steel of the World

	Capacity to Produce		Largest Production Ever Made			
	Pig-iron	Steel Ingots and Castings	Pig-iron	Year	Steel	Year
United States	49,000,000	56,000,000	40,361,146	1923	45,430,000	1925
Canada	1,300,000	1,900,000	1,107,000	1918	1,695,000	1918

Figures in tons: gross, for England, United States, etc.; metric, for France, Germany, etc.

[1] Includes both Luxembourg and Alsace-Lorraine; 1913 pig-iron production of Luxembourg (2,547,861 tons) and of Alsace-Lorraine (3,864,000 tons), deducted from the reported figure, leaves 12,897,311 tons for Germany. Similarly, for steel, deducting the 1,336,263 tons of Luxembourg and 2,286,354 tons of Alsace-Lorraine, leaves 15,312,472 tons for Germany.

[2] Austria-Hungary in 1916 produced 2,380,000 tons of pig-iron and 3,278,000 tons of steel.

[3] Includes production of Poland.

[4] One plant only.

IRRIGATION ENGINEERING (*see* 14,841).—During the present century development has continued at an accelerated pace; one of the many causes was and is the desire to meet the world's demand for cotton, particularly the more valuable long staple varieties.

Barrages and Dams.—Where areas to be served were large enough, barrages have been built; where rivers have a very irregular discharge, dams have been erected to impound water from the flood seasons to augment the supply in drier periods. From the barrages or dams high-level gravitation canals lead the water to the soil. Where the barrage system is not possible, modern water-lifting appliances serve new lands, or in many cases replace in areas already cultivated both the hand-worked water-lifting appliance known in Egypt as the *shadoof* and the cattle-driven water-wheel. Irrigation is thus serving an ever increasing area throughout the world in regions where suitable soil, climate and plain exist in combination.

Distribution.—With these extensions, in places approaching the limits imposed by the volume of water available, the problem of equal distribution becomes important. This, in turn, depends on an accurate estimation of the volume. Measurements were formerly made by means of data obtained from noting the speed of objects floating with the stream at various depths. In the last 30 years, current meters replaced floats and give more regular results, but it was not definitely known whether these results indicated actual volumes.

Measurements.—This doubt has now been settled through the full-scale measurements made since 1905 at Aswan by which the Nile discharge has been calibrated to within an error of 1% of the actual volume passing during all but the very highest levels, and it is hoped in time these will be measured also. Current meter discharges taken simultaneously with the measurement at the dam, repeated a few times and the mean taken, gave very similar results and thus proved the accuracy of current meters. The data obtained from small scale models can be depended upon to within a small percentage of error.

WORK IN EGYPT

The cultivable area to-day in Southern or Upper Egypt, from Aswan to Cairo, is about 2,500,000 ac. of which 2,200,000 were cultivated in 1910, 1,000,000 ac. being under the perennial form of irrigation and 1,200,000 ac. under the older basin system. In the Delta there were about 3,000,000 ac. cultivated, all under the perennial system, out of a total cultivable area of about 4,800,000 acres.

The area of all Egypt is, however, over 500,000,000 acres. Thus only about 7,300,000 ac. of this vast extent can be cultivated from the waters of the Nile. All the remainder must continue in its present inhospitable state unless a climatic change occurs.

In 1902 the completion of the original and low level Aswan dam permitted 1,000,000,000 tons of water to be stored annually from the season of excess waters in the river, to be released again in the following spring and summer. In the few years following 1902 the need for an immediate increase in the volume of water available for summer irrigation became pressing if the area then cultivated was to be annually assured of an adequate supply in really low years and if some new areas not hitherto cultivated were to receive water at all times. The work of storing more water at Aswan by heightening and thickening the original masonry dam and increasing its capacity to 2,400,000,000 tons, was completed in 1912. The need of existing areas for all the water available was accentuated by the phenomenally low flood of 1913, which was followed as a natural consequence by a poor spring and summer supply in 1914.

The 1913 flood was estimated to be the lowest for 150 years and except for the existence of the various barrages and the dam across the river, would have spelt famine as well as financial disaster to the country. The 1914 river, even when increased by the whole of the stored water from Aswan, was only just sufficient to ensure the safety of the cotton crop of that year. Additional supplies of summer water are needed for some of the still uncultivated areas in the delta, and the conversion of further areas in Upper Egypt from basin to perennial irrigation can only be satisfied by still greater control of the Nile.

The construction of a dam on the White Nile near Khartoum is now being taken in hand, forming another, though not the final stage in the provision of water for Egypt. The very least quantity of water storable each autumn by the new dam will be greater than that now annually held up by the Aswan dam, and like it, the water can be used in the following spring and summer in Egypt. With a minimum of 3,000,000,000 tons thus provided, an additional 1,000,000 ac. of Egypt's waste lands may be given summer water.

Further Developments.—Further works must, however, be undertaken in the Sudd region of the Sudan and even beyond it, before the final stage of an Egypt cultivated to its capacity with an adequate supply of water to meet all her requirements is reached. These works will most probably consist of training the waters through the Sudd region to prevent waste and the erecting of a dam at Lake Albert.

The Sudd region lies on the White Nile and commences about 500 m. south of Khartoum and is in reality a vast plain through which the White Nile meanders for 250 m. with its water either at or just above ground level. As a consequence the whole forms a great reedy marsh interspersed with open lagoons; into it flow the flood season waters of the White Nile; they evaporate themselves away to such an extent that no great variation of volume is normally experienced at its outlet. The lost waters could, in great measure, be stored in Lake Albert and let out in such a manner as best to suit the requirements of Egypt. Conservation from evaporation when passing through the Sudd region can be secured by confining the flow to a definite channel. The increased acreage which it will then be possible to cultivate in Egypt will bring the total area up to its maximum of about 7,300,000 acres.

DEVELOPMENTS IN THE SUDAN

Previous to 1910, except for a few thousand acres served by pumps, all the crops grown in the Sudan along the main Nile from Wady Halfa to Khartoum and the White Nile from Khartoum to the Sudd region were sown on land naturally inundated on its low banks by the annual rise of the Nile. On the Blue Nile, rainfall alone was depended on to fertilise the crops grown.

About 1909 one of the uncultivated areas below Khartoum was turned into a perennial irrigation farm and was among the first to produce cotton in the Sudan, by means of water pumped from the Nile. Soon after that date the possibility of growing cotton in the Gezira, that huge tract which lies in the fork of the Blue and White Niles, became apparent. Here some 5,000,000 ac. form a gently sloping plain stretching along between both rivers for about 200 m. from Khartoum. From this point southward the plain is interspersed with small isolated granitic hills which, as a line south-east is traversed, increase in number and height. Of the 5,000,000 ac. plain probably 3,000,000 will form the maximum area cultivable. On the remaining 2,000,000 ac. near Khartoum the soil is said not to be so good, being of a more sandy nature.

Two experimental farms of a few hundred acres each were set down in the cultivable area and proved after a few years' trial the suitability of the soil for cotton growing. The summer climate, however, was found to be too trying, although below Khartoum and in Egypt cotton is entirely a summer crop. Cotton sown in mid-July in the Gezira and picked in the following spring gave a return on an average of 400 lb. per ac., a figure equal to the normal Egyptian production. This result was obtained at a season of the year when there is usually an abundance of water in the river.

The cotton plant in the Gezira is in the soil from mid-July, when it is sown, to final picking in April, or a period of about nine months.

exceptional circumstances a final watering may be required as te as April 15, though normally the last watering is expected to be ven by March 31. Long before either of these dates Egypt, notithstanding her great reservoir at Aswan, in low river years requires l that the Blue Nile can supply. It became necessary, therefore, devise the best method of lifting water from the Blue Nile on to ie plain and of storing a sufficient volume of it to meet the demands the Gezira in those months when Egypt requires all that flows in ie river. The decision arrived at was to build a combined dam id weir at a point 5 m. south of Sennar, where a narrow belt of bbro rock, which scarcely rises above the level of the plain on ther side, runs across the river.

The construction of the combined dam and weir was proceeded ith and completed in July 1925, at a cost of about £6,000,000, the inal system bringing the total up to about £9,000,000. The dam an store about 600,000,000 tons of water for use in the critical eriod, which extends from Jan. to March and possibly to April, hen Egypt requires all that passes down in a very low year. The ain canal leading from the dam is some 60 km. long before reaching ie point where branch canals spread out from it on to the land to be rigated. The area judged sufficient to form a commercial proposion in view of the cost of the works was 300,000 acres. It is now elieved this area can be considerably increased without endangering gypt's supply. Certainly if an amicable agreement can be arrived t between the two countries, greater areas can be cultivated in the ezira in all other years than the phenomenally low one on which ie 300,000 ac. scheme was based.

New Projects.—When still greater areas have to be brought nto cultivation, and it is possible that 3,000,000 ac. may evenually be cultivated in the Gezira, either new storage works nust be built or such further control of the Nile be organised s will permit Egypt to reduce her demands on the volume in he Blue Nile. Special storage works for the Sudan can probably e best built by permission of Abyssinia. At the exit of Lake 'sana in that country at the source of the Blue Nile, by storage n the lake, the annual flood waters can be controlled and about ,000,000,000 tons of water conserved for use at a later period, hus permitting a great increase in the area cultivable in the ezira.

There are possible alternatives, such as the building of a miniture Aswan dam somewhere near Roseires. Here a regulation f the river will not be quite such a simple matter as at Lake sana, as the flood waters at Roseires are heavily laden with ilt. These must be allowed to pass and water only be abstracted t a subsequent but still high stage when little or no silt is still resent, otherwise Egypt would be deprived of this valuable naterial. If collaboration with Egypt in works in the Sudan is dopted, then the White Nile dam will be made as large as is onsistent with safety so as to store as much water as can be ecured from the flood waters.

Whatever capacity be given to the White Nile dam Egypt nust still provide herself with more water than even it can hold, nd some regulation of the Sudd region must of necessity be one f the features of such a provision, coupled with a huge dam at he source of the White Nile and the mouth of Lake Albert. Besides the Gezira Plain the Sudan has other irrigation areas where great improvements have taken place, as at Tokar and Kassala.

Tokar.—The river Barakat rises in the rainy season in the Abyssinian hills and rushes as a chocolate-coloured thick stream on to the Tokar Plain where it eventually spreads out into a thin film which is sucked up by the thirsty soil. The plain, however, is much greater in extent than the water can cover, although some finds its way to the sea as recorded in 1921. Great anxiety is continually caused by the liability of the flood to break away into areas not hitherto cultivated or, even if cultivated, so far from Tokar as to be inconvenient for transport. In recent years designs were studied for the purpose of exercising some control over the direction of flow. These have been carried out and have so far been successful. The total area served varies greatly from year to year. In 1921–2 about 55,000 ac. were flooded, though not all were cultivated.

Kassala.—The river Gash rises in the Abyssinian foothills and becomes of considerable volume in the flood season by the time it reaches Kassala. Here it spreads itself over the plain in such a manner that none of its waters ever reach the Nile or its nearest tributary the Atbara. Some control has been exercised over the flow to keep the water annually to definite areas.

In a really good year with the supply of water at a maximum, 50,000 ac. of cotton might be cultivated. Owing to the poor flood of 1925 only 11,000 ac. have been sown.

Progress in India

Irrigation gives valuable aid in the fight against those periodic famines which always happened after rainfall failures, and it also causes an increase in production through its extension into new and suitable areas hitherto lying fallow. During 40 years, 1885–1925 in particular, developments have steadily progressed. 10,500,000 ac. were irrigated in 1878–9; 19,250,000 ac. at the beginning of the century, and 28,000,000 ac. in 1923–4. Additional works now under construction will add 2,500,000 acres. New schemes are contemplated which will add a further 4,750,000 acres. When completed they will bring the irrigated area of British India up to about 36,000,000 acres.

These figures exclude the water supplied from the Punjab canals to 650,000 ac. in the native states. The Sutlej Valley project, mainly for the benefit of the native states, will increase the total by a further 3,250,000 ac., making in the proximate future a grand total of about 40,000,000 ac. of irrigated land in all India.

Mileage of Channels.—In 1900–1, 39,142 m. of channels were in operation; by 1920–1 this had increased to 55,202 m. or an average addition of about 800 m. of channels per annum. The annual revenue return is between 7% to 8% on the capital invested in government irrigation works.

The following table shows the acreage of crops matured during 1923–4 by means of government irrigation systems compared with the total area under cultivation in the several provinces of India:—

Province	Net area cropped	Area irrigated by government irrigation works	Percentage of area irrigated to total cropped area	Capital cost of government irrigation and navigation works to end of 1923–4	Estimated value of crops raised on areas receiving state irrigation
	Acres	Acres	%	Lakhs of rupees	Lakhs of rupees
Madras	36,424,000	6,891,000	18·9	1,207	3,556
Bombay Deccan	39,000,000	418,000	1·0	881	538
Sind	4,134,000	3,427,000	82·9	479	1,054
Bengal	22,806,000	93,000	0·4	422	78
United Provinces	35,011,000	1,979,000	5·6	1,577	1,348
Punjab	26,731,000	10,207,000	38·2	2,543	5,505
Burma	13,857,000	1,730,000	12·5	363	812
Bihar and Orissa	24,665,000	954,000	3·9	627	622
Central Provinces	17,427,000	438,000	2·5	483	281
North West Frontier Province	2,583,000	359,000	13·9	276	226
Rajputna	281,000	16,000	5·7	35	5
Baluchistan	286,000	26,000	9·0	32	5
Total	223,205,000	26,538,000	11·9	8,925	14,030

Thus nearly 12% of the net area cropped was irrigated by government works. The annual value of the crop so irrigated amounted to 1½ times the capital outlay expended on the works.

New Schemes; Madras Presidency.—(1) The improvement of the, at present, somewhat irregular supply of water in the Cauvery Delta canals will add about 301,000 ac. to the 1,000,000 ac. already served. (2) The Vengalapuran scheme will provide water for 50,000 acres. (3) The Kishna river storage will serve about 1,750,000 acres. The Lower Bhavari project will command 110,000 acres.

Bombay Presidency.—Although only 1% of the land cropped was irrigated in the Bombay Deccan district, its annual average of irrigated land is now about 418,000 acres. The Bhavari river works and the Nira right bank canal scheme will increase this area by 35,000 acres.

Sind.—The rainfall in Sind averages only about 6 in. per

annum. In one year out of five it is almost certain to be less than 2 inches. Sind, however, has the Indus carrying a supply of water which is capable of meeting her needs if properly utilised.

In 1926 inundation canals supplied what land is irrigated. There are no means of regulating the river level artificially and continuing the supply when the river falls, consequently these canals obtain a full supply only when the Indus is in flood. In the cold weather when the river is low, only the most fortunately situated obtain any supply at all and a minimum of 600 tons per sec. run to waste.

The cultivable area of the province is about 14,000,000 acres. The Indus is estimated to be capable of irrigating 12,000,000 ac. in the hot weather and 8,000,000 ac. in the cold season, or say 20,000,000 ac. in all of crop. In 1923–4 the net area cropped was 4,134,000 ac. of which 82·9 % or 3,427,000 ac. was irrigated; this is the highest percentage of irrigated to cropped area in the whole of India. The province naturally divides itself up into three main tracts, upper, central and lower Sind, and three large barrage projects are contemplated at an estimated cost of £50,000,000 to deal with them.

The main project now in hand consists of a barrage across the Indus just below Sukkur where the river passes through a deep gorge. From the barrage, seven canals (four on the left bank and three on the right) will run southwards and extend facilities for cultivation to the enormous area of 5,500,000 acres. 2,000,000 ac. represent the existing inundation irrigation area and will be given in addition an assured perennial supply by the new canals. The barrage when completed will measure 4,725 ft. between the faces of the regulators on either side. It will have a masonry floor across the river, above which an over-bridge of 66 spans, each of 60 ft., will be constructed. From this over-bridge shutters 60 ft. long and 18½ ft. high can be lowered on the floor when the river falls, thus pounding up the water to the level required in the canals; conversely, when the river rises, they can be lifted and the whole of the waterway of the bridge will be left free for the passage of the annual floods. These floods will be greater than those passing any other regulating structure in the world, at the maximum they will be nearly double the Nile flood.

The supply required by the whole system of canals will vary throughout the year from 22,600 cu. ft. per sec. in Jan. and Feb. to 46,000 cu. ft. per sec. from June to September. It is estimated that the annual net revenue after paying working expenses will be 10½ % on the capital expended. This is the return from water rates alone, but a further large increase in general revenues may be reckoned upon from the 3,500,000 ac. of waste land which will be brought under cultivation.

Bengal.—The percentage of 0·4 of irrigated to cropped area in Bengal is the lowest in the whole of India, the net area cropped being 22,806,000 ac. of which only 93,000 ac. are irrigated. The average rainfall is about 55 in. per annum. A project for a canal from the Damodar river is sanctioned which will irrigate 196,000 acres. Several minor works are being considered.

Punjab.—With the exception of Sind no portion of India is so favourably situated as regards its rivers, or so unfavourably as regards its rainfall, as the Punjab proper, expecially the tract between the Jhelum and the Sutlej—the greater portion of this district having less than 15 in. of rainfall per annum and much of it less than 10 inches. As a consequence great developments have already taken place in the irrigation scheme of the province. In all 10,207,000 ac. were irrigated in 1923–4. Further large works are contemplated which will increase the total and reduce to a minimum the waste areas.

The United States

One of the larger projects is that connected with the Colorado river which serves two distinct areas. The upper is at a considerable elevation above sea level and covers 4,500,000 acres. Of this about 1,500,000 ac. are now irrigated. In the lower basin there are 960,000 irrigable acres, of which about 670,000 are irrigated. When the works are complete the Colorado river will be controlled to a very large extent and thus reduce the dangers arising from excessive floods.

An interesting feature of U.S. irrigation works is the series of very high dams which have been built to control and conserve river supplies. The Elephant Butte dam has a height of 306 ft. and the reservoir has a storage capacity of 3,200,000,000 tons of water. So far this is the largest reservoir in the world. The Shoshone dam has a height of 328 ft. and has a capacity of 550,000,000 tons of water. The Roosevelt dam has a height of 280 ft. and the reservoir has a capacity of 1,650,000 tons of wat The Arrowrock dam has a height of 348·5 ft. and the reserv has a capacity of 340,000,000 tons of water. The Pathfind dam is 218 ft. high and the reservoir can contain about 1,30 000,000 tons of water. In all, the Bureau of Reclamation has schemes either in operation or in process of construction.

Canada

Irrigation in Canada has been so far very partially develop and only in those provinces where extensive farming operatio are in progress, such as Alberta, Saskatchewan and Manitob Developments are based upon the administration of the Feder Irrigation Act of 1894, under which the ownership of all surfa water supply is vested in the Crown and the latter grants t necessary licences for its use.

Occasional droughts occur all over the wheat-growing belt provision, however, is steadily and systematically being ma to supply as much as possible irrigation water to countera their effects. The government authorities are systematical obtaining data with a view to providing the maximum ar financially possible with water and are yearly carrying o expensive systems of irrigation.

On the eastern section of the Canadian Pacific Railway Co a census of the yields obtained and the water used by a group 10 farmers during the past season, 1924, shows that the avera yield of wheat on these 10 farms was 19½ bu. per ac. with o irrigation of 4 in. deep plus rainfall; with two 4-in. irrigations t yields received were from 30 to 35 bu.; and with three 4-in. ir gations were as high as 43 bu. per acre. In this district the tot precipitation for 12 months was 11·24 in. of which 9·68 in. fe during the growing season. The water available for irrigatio varies greatly in different provinces, some are much more favou ably situated than others to receive it and certain provinces o the other hand hardly require irrigation. That the total wat resources of Canada, however, are enormous can be gauged fro the fact that it is estimated that there could be developed wit it 41,400,000 H.P. of which only 3,227,414 h.p. was being use up to Feb. 1 1924. Some of the more important irrigation area are mentioned below.

Alberta.—About 1,000,000 ac. were irrigated in 1923, of which 130 000 ac. were brought in about 20 years ago in the Lethbridg section.

Canadian Pacific Railway, Western Section.—A scheme has bee in operation in this district for about 16 years, the area bein 218,980 acres. The 1923–4 season was, however, so ideal for cro production, owing to favourable moisture conditions, that littl irrigation was used, and only 3,074 ac. were irrigated, chiefly fo alfalfa and meadow grasses.

Canadian Pacific Railway, Eastern Section.—Irrigation has bee in operation in this section for about 10 years, the total irrigabl area is 400,000 ac. which are gradually being developed, and o which 124,000 have been taken up. The conditions here rende irrigation more necessary than in the western section owing to lowe precipitation and slightly higher temperature.

Taber District.—Irrigation was established in May 1924, in th Taber district. Of 17,244 irrigable acres, 3,625 ac. have already bee taken up and irrigated.

Lethbridge Northern Irrigation District.—This project was com pleted in May 1923. The irrigable area is about 105,000 acres.

United Irrigation District.—The irrigable area of this scheme i about 36,000 acres.

New West Irrigation District.—The irrigable area is 4,500 acres.

Bellaw Lomond Irrigation District.—The irrigable area is abou 55,000 acres.

There are other smaller installations now working, and many more are proposed.

Irrigation in Australia

Owing to the lack of an adequate rainfall the advantages o irrigation appealed many years ago to Australians. At first the object aimed at was to develop in unoccupied territory. While these efforts generally proved successful, in recent years the policy has been to extend irrigation to existing pastoral settlements, and some very large conservation of flood water scheme have been carried out under which considerable areas of land are now in process of intenser settlement.

New South Wales.—The principal works in this state include:—

(1) *Murrumbidgee Gravitation Irrigation Scheme.*—The Murrumbidgee river is controlled by a dam 240 ft. high at Burrinjuck which can conserve about 960,000,000 tons of water. The scheme is to irrigate about 200,000 ac. of which 120,000 ac. were settled by June 1923. They are mainly devoted to vegetable and fruit-growing and dairying purposes.

(2) *Pump Irrigation Areas.*—(*a*) At Curlwaa on the Murray river about 2,000 ac., out of an area of about 10,600 ac., are receiving irrigation. (*b*) At Hay about 1,000 ac., out of an area of 4,500 ac. are receiving water from pumps on the Murrumbidgee river.

(3) *Projected Schemes.*—New South Wales is investigating schemes which will utilise its share of the Murray river waters and which it expects may amount to 150,000,000 tons. This should bring under irrigation an area of at least 100,000 ac. of land. It has also under consideration a number of smaller schemes affecting the Lachlan, Macquarie, Hunter, Namoe and Peel rivers, but it is not possible to give any estimate as yet of the areas which may be irrigated by them.

Victoria.—In Victoria the principal irrigation works are on the Goulbourne, Murray, Loddon, Werribee and MacAllister rivers. While the works for some of these schemes were completed before 1910, the areas to be irrigated are still only in process of settlement and extension of the works are from time to time taking place. In 1923, 350,727 ac. were irrigated.

Under the Goulbourne scheme, which comprises an area of about 850,000 ac. and where 800,000,000 tons of storage has already been provided for, a dam is being built at Sugarloaf in two stages, the first one of which was so far completed that storing of water took place in 1922. It may ultimately be 190 ft. high and may eventually contain about 1,100,000,000 tons of water. The Murray river scheme already serves an area of 340,000 ac. and is capable of expansion when the Hume storage reservoir is completed. This will form the largest sheet of fresh water in Australia, as it will cover 47 sq. m. and may contain about 2,500,000,000 tons of water. The Loddon river gravitation scheme serves 74,000 acres. The Werribee river gravitation schemes at Bacchus Marsh and Werribee serve 3,350 and 10,000 ac. respectively.

The Mildura pump irrigation scheme lifts water from the Murray river and serves 45,000 ac., of which 13,000 ac. are under intense cultivation. The MacAllister river scheme consists of a storage reservoir from which a gravitation supply will command about 80,000 ac. and is far advanced. These watering schemes are usually conjoined with domestic water supply schemes for towns and villages, and do not in the ordinary sense irrigate land, although they do, in fact, make great areas of land available for pasturing purposes. There are also some flood protection schemes, one of which at Kooweerup and Cardinia enabled 100,000 ac. of land to be brought into cultivation.

Queensland.—The Dawson valley scheme now under construction comprises a dam 140 ft. high at Nathans Gorge to impound about 3,100,000,000 tons of water. When completed it will be the second largest reservoir in the world. The area to be served is about 250,000 acres. The Inkerman irrigation area of 4,500 ac. is served by 230 shallow well pumps. Provision is being made to increase it to 10,000 acres. There are a number of smaller pump schemes at Townsville, Rockhampton, Bingera and Fairymead, which collectively serve about 4,000 acres.

South Australia.—The Renmark scheme serves 7,850 ac., mainly fruit producing. The Murray river pumping plants serve 17,800 ac. and are being extended to serve a further 11,000 acres. The Cadett scheme serves about 1,200 ac. and is supplied with water pumped through 90 ft. of height. The Waikerie scheme serves about 9,800 ac. and has the water lifted through 150 ft. of head.

The Kingston scheme serves 500 acres. The Moorook scheme serves 1,000 acres. The Cobdoyla scheme is ready to serve about 3,600 ac. which can be increased to 30,000 ac. of irrigable land. The Berri scheme serves 7,700 acres. The Chaffey scheme will serve 14,000 acres. The Murray Swamp land scheme will eventually make available for irrigation 13,700 ac. of which 5,800 ac. are now cultivated. Smaller schemes serve about 10,000 ac. in all. In Western Australia the Harvey irrigation scheme serves 4,000 acres.

The Union of South Africa

Irrigation was at first confined to small schemes whose entire works usually lay within the boundary of one farm. Works of greater magnitude were made easier of accomplishment when the Govt. of the Cape of Good Hope, to encourage irrigation, passed the Act of 1876 known as the "Right of Passage of Water Act" in terms of which a proprietor was permitted to conduct water over the property of any other owner.

A further Act in 1877 provided for:—

(*a*) The establishment of Irrigation Districts and Boards,

(*b*) The granting of government loans to private individuals, and

(*c*) The repayment thereof at the rate of 8% per annum over a period of 24 years.

In the case of private schemes, both in the Cape and in the other provinces also, no complete record of the irrigable area has been made and even in the case of Board schemes such data as are available are frequently not based on actual surveys but are only estimates of the irrigable areas made during the earlier stages. Since 1916 great progress has been made with irrigation based upon conservation of water schemes.

The completed schemes, although numerous, are individually small in area, none exceeding 10,000 acres. Among those under construction or development are some of considerable magnitude. These latter include the Great Fish river scheme, where 75,000 ac. are to be irrigated, the Sundays river scheme of 36,000 ac. and the Kamanassie river scheme of 28,000 acres. The area of land under irrigation in South Africa as at March 31 1923 under Board schemes was about 130,000 ac. and the area to be served by works under construction is about 225,000 acres. Up to 1925 the state expended over £4,000,000 on completed schemes. Neither interest nor redemption can be paid on this sum until the land is wholly settled.

Work in China

China with its huge population of about 300,000,000 has no doubt a very large area of irrigated land but no statistics are available as to its extent except in a few small special districts where Europeans reside or have commercial interests. Hitherto engineering has been largely devoted to preventing the rivers in more than average floods overflowing their banks and inundating the land, an effect which has been many times accompanied by great loss of life. Commissions have studied river control and the conservancy boards in recent years have reported on and carried out important works with this end in view.

Quite obviously there is a large field in China for this form of development, and no doubt in time it will be followed by the more usual irrigation works. The following opinion of the engineer reporting on the Yangtse in 1923 gives a remarkably clear indication of the conditions there—it applies with equal force to the other great rivers of China.

> To anyone who has inspected the Yangtse from the Goyes to the sea, and who has given the faintest consideration to the question of restraining a river of this magnitude in its course through hundreds of miles of low-lying land, thousands of square miles of its area being below high water level, and therefore subject to inundation, it must be obvious that draining works, to be effective, would have to be constructed on a gigantic scale, and although the river is, in itself, and its tributaries and creeks, practically the one means of transport and communication serving a population of nearly 200,000,000 people with ever-growing transport requirements, it must be obvious that, unless improvement works can be made self supporting, it is futile seriously to embark upon them. Such are the conditions which prevail to-day and so they must remain for many years; in fact, until the growth of trade and growth of means which would follow thereon bring the necessity for works within the bounds of commercial possibility.

Developments in Other Countries

'Iraq.—The construction of the Hindia barrage was one of the first steps undertaken. In 1925 the Diala Cotton Co. inaugurated a great scheme whereby 108,000 ac. will be fertilised by water from the Diala river, a tributary of the Tigris. The company, it is understood, intends to extend its operations as fast as possible under its concession; and a time can be envisaged when adequate control of the Euphrates and Tigris, under conditions

of peace and good government, will allow of great areas of the arid plains of 'Iraq to be once again cultivated.

Spain and Portugal.—Irrigation has been developed in a number of places in the peninsula since the beginning of the century and schemes for further works are being considered. None of those so far completed are of any great magnitude, but among the proposals there is one for the irrigation of 120,000 ac. on the Guadalquivir. The possibilities of this river are being studied for other areas, and are great if by regulation of its excess flow in flood time its waters can be conserved for use in the drier periods of the year. On the Tagus a scheme near Villa Franca is now being surveyed which, if carried out, will enable 30,000 ac. to be irrigated.

Arabia.—An interesting irrigation development is the possibility of reviving agriculture by its aid in the Yemen. A syndicate is now (1926) studying a project to examine the many reservoirs which in ancient times controlled flood waters for the benefit of agriculture in that region.

Mexico.—In Mexico, and particularly in northern Mexico where the rainfall is negligible in the lower or plain country, strips of land are cultivated near the rivers by irrigation. The total area is considerable, but there are no records of its extent. The works are somewhat primitive but have been constructed entirely by private enterprise and good results in crop are obtained from them.

South America.—An irrigation scheme on the Rio Negro was carried out in 1914 whereby 230,000 ac. are being developed. There are other minor irrigation works in the country. There are irrigation works, carried out almost entirely by private enterprise, in the other South and Central American republics.

(M. Mac.)

IRWIN, EDWARD FREDERICK LINDLEY WOOD, 1st Baron (1881–), British politician, was born April 16 1881. The only surviving son of the 2nd Viscount Halifax, he was educated at Eton and at Christ Church, Oxford, being elected fellow of All Souls College in 1903. In Jan. 1910 he was returned to Parliament as Conservative member for the Ripon Division of Yorkshire, and retained his seat until 1925. During the World War he served in France 1915–7 with the Yorkshire Dragoons, in which he held the rank of major, being mentioned in dispatches, and was an assistant secretary to the Minister of National Service 1916–8. In April 1921 he was appointed Under-Secretary of State for the Colonies. In this capacity he made a tour of the West Indian colonies, and published his conclusions on the administrative and economic problems which he encountered in a report issued in June 1922. From Oct. 1922 to Jan. 1924 he was President of the Board of Education. In Nov. 1924 he became Minister of Agriculture and Fisheries in Mr. Baldwin's second Government. In Oct. 1925 he was appointed governor-general of India in succession to the marquess (then earl) of Reading, being raised to the peerage as Baron Irwin of Kirkby Underdale two months later. Like his father, Lord Irwin, who had been sworn of the privy council in 1922, took a keen interest in ecclesiastical affairs, and published a study of John Keble in the "Leaders of the Church Series." He married in 1909 Lady Dorothy Onslow, younger daughter of the 4th Earl of Onslow by whom he had three sons and two daughters.

ISHII, KIKUJIRO, Viscount (1866–), Japanese diplomatist, was born at Chiba, Japan. Like other members of his family, he was destined to enter official life. His intention was to become a lawyer, but his studies in international law gave him a deep interest in foreign affairs. His early days were full of incident: the Meiji reconstructions took place before his eyes, and the constant stream of foreign influences soon aroused in him a desire to see and understand other countries. Leaving the law faculty of the Imperial University in Tokyo in 1890, he was made attaché to the Japanese Legation in Paris. During his stay in Paris he applied himself to the study of European languages and became proficient in French and English. He was made third secretary in 1893, and about this time he devoted much attention to the problems of economics and international trade. He was distressed to observe that Japan did not hold such a position in the world's mart as in the opinion of most Japanese she deserved, and he set himself to find out the causes of the trouble. He endeavoured to form a Franco-Japanese mutual trade association, and although his efforts did not at first meet with the full success he desired, a certain stimulus was at once felt. Some part of the fruits of Ishii's labours were seen in the commercial mission which was sent from France to Japan in 1925.

In 1896 he was appointed Consul to Chemulpho (Jinsen) in Korea. After this he was made second secretary and later first secretary at the Japanese Legation in Peking. He was, therefore, in Peking in an official capacity during the Boxer rising. In 1900 he was appointed Secretary of the Head Office and chief of the telegraph section of the Home Office Department, which post he held until he became director of the Commerce Bureau in 1904. In 1907 he was sent to San Francisco and Vancouver in connection with the anti-Japanese riots there. His success in this matter was the direct cause of his appointment in the following year as Vice-Minister for Foreign Affairs. His love of France and understanding of French problems made him an easy favourite for the ambassadorship to Paris in 1912, and on his return he took over the portfolio for Foreign Affairs in the new Government. He was chief of the Foreign Office for the period 1915–6, and in the latter year he was created Viscount, having been made Baron in 1912. He played a great part in American-Japanese relations and was a special envoy to the United States in 1917. He was nominated a member of the House of Peers in 1916. In 1920 Viscount Ishii was for the third time officially delegated to Paris.

Perhaps Ishii's greatest claim on his country's gratitude was his work in connection with the so-called "Gentlemen's Agreement" made between Washington and Tokyo in 1907. Lansing was the United States representative in the negotiations, for which reason the arrangement is sometimes called the "Lansing-Ishii Pact." The western coast of the United States made representations to Congress deploring the increasing immigration of Asiatics, notably Chinese and Japanese. It was claimed that owing to the Asiatic standard of living being lower than that of Americans, there was a serious possibility of California becoming a Japanese colony, and the aid of legislation was invoked. The Lansing-Ishii pourparlers resulted in the postponement of suggested legislative measures, and a yearly maximum (tentatively fixed at 150) was proposed. Japan, through Ishii, agreed not to issue passports for more than this number annually to enter the United States as residents, and it was through Japan's alleged breach of faith in connection with this agreement that the Immigration Restriction Act was passed by Congress in 1924. In substance, this Act was one of the proposals originally shelved by the labours of Lansing and Ishii.

In Dec. 1920 Viscount Ishii became Japanese delegate to the 11th session of the Council of the League of Nations. In Aug. 1923 he became President of the Council of the League and in the following month was one of the Vice-Presidents of the Assembly. In Sept. 1925 he was again a Vice-President of the Assembly. In March 1926 he was President of the Council at its 39th session, and as such acted as President of the Assembly (March 1926) until the election of the new President. (A. N. J. W.)

ISLAMISM: *see* Pan-Islamism.

ISMET PASHA (1884–), Turkish statesman, was born in Smyrna of a Turkish family of Malatia. He received his education in the military schools of Turkey, and in 1903 graduated as an artillery lieutenant. Three years later he became a captain on the General Staff. After the Young Turk revolution of 1908, he was sent several times on military expeditions to Yemen. During the World War he served with distinction on the Syrian front, and at the close of the War held the rank of colonel, and commanded an army corps. During the Armistice he occupied important positions in the War Office. At the time of the occupation of Constantinople by the Allies he escaped to Angora disguised as a common soldier and was appointed by the Great National Assembly to be Chief-of-staff during the military opera-

ns of the Nationalists against the Caliphate army and Ar-nia. Later he became Commander-in-chief of the Turkish stern front, and in this capacity insisted on the formation of a gular army in place of the irregular Nationalist forces. In the antime, the irregular forces were unwilling to submit, and the eck Army had taken the offensive. At Inonu, Ismet defeated e Greeks, checked their offensive, subdued the irregular forces, d succeeded in completing the organisation of a regular army. remained in command of the western front until after the ttle on the Sakharia and the fall of Smyrna, in which events he is the right-hand man of Mustafa Kemal Pasha. In 1922 he gned the Armistice concluded at Mudania with the Allies, and cceeded in securing the evacuation of Eastern Thrace. In 22–3, as Minister of Foreign Affairs and senior Turkish dele-te to the Lausanne Conference, he most ably defended the terests of his country, and signed the Treaty of Lausanne.

During the autumn of 1923, at the time of the declaration of e republic, he became Prime Minister. After a short rest, due failing health, he became Prime Minister a second time, to-ards the end of 1924, and shared in the suppression of the Shiekh id revolt in Kurdistan. The abolition of the Caliphate, the osing of the medressehs (religious schools) and of the tekkes nonasteries), the abolition of the tithe, the adoption of the wiss civil code, and the wearing of the hat are some of the mo-ientous changes which were realised during Ismet's tenure of ffice.

ISONZO, BATTLES OF THE: *see* ITALIAN CAMPAIGNS.

ISOSTASY.—When the great Trigonometrical Survey of India as initiated, it was found that the deflection of the plumb-line y the Himalayas was much less than the calculated amount ue to the theoretical attraction of the visible mass of the moun-ains. Sir G. B. Airy suggested that this might be caused by the resence of a mass of matter, of less than the average density, nder the mountains; this explanation was further investigated y Archdeacon J. H. Pratt, who applied the term "compensa-ion" to the negative effect of the underlying defect of density, n compensating the direct effect of the attraction of the visible nass of the mountains.

In 1892 Maj. C. E. Dutton, discussing the greater problems of hysical geology, deduced a general principle that the weight of natter under any unit area of the earth's surface tended to be-ome uniform, and suggested that this was brought about by an nderground transfer of material to balance the visible surface transport from regions of erosion to those of deposition. To this principle he gave the name *isostasy* (ἴσος equal, and στάσις position), not as a synonym for Pratt's compensation, but as a name for the principle and process, by which it was brought about. In 1909 there appeared a very complete and elaborate investigation of the subject by J. F. Hayford, in which the word "isostasy" is used as synonymous with what Pratt called "compensation," and this use of the term has since become general among geodesists. Some inconvenience results from this two-fold use of the word, to express either a measurable effect, or one theory of the cause by which this effect is produced; but the usage is too firmly established to be overcome, and the inconvenience is lessened as it has become recognised that the deep-seated variations in density, and consequently in bulk, to which Archdeacon Pratt gave the name "compensation," may be the primary phenomenon and cause of the major differences of surface level. (*See* also GEODESY; GEOLOGY.)

Hayford, *The Figure of the Earth and Isostasy, from Measurements in the United States* (Washington, 1909); W. Bowie, "Abnormal Densities in the Earth's Crust disclosed by Analysis of Geodetic Data," *Geog. Jour.*, 1924, vol. 63, p. 26.

(R. D. O.)

ISOTOPES (Gr. *ἴσος* equal + *τόπος* place), is the term first applied by F. Soddy in 1913 to substances which, though they had different atomic weights, yet had identical chemical properties and occupied the same place in the periodic table of the elements. Over a century earlier Dalton had postulated that atoms of the same element are similar to one another and equal in weight. A little later Prout suggested that the atoms of all elements were composed of atoms of a primordial substance which he endeavoured to identify with hydrogen.

If both these theories were right, the atomic weights of all elements would be comparable with each other as whole numbers. This the chemists soon showed was quite incompatible with experimental evidence. It is true that many were very nearly whole numbers, far too many for the effect to be pure chance, but others, like chlorine, were hopelessly fractional. Of the two alternatives Dalton's is much the simpler from the chemical point of view and was therefore quite rightly chosen as a working hypothesis. From this in course of time it developed into an article of scientific faith, and, despite the complete absence of positive evidence in its support, no serious questions as to its validity were raised until late in the 19th century. Of such speculations those of Crookes were founded on unsound evidence and were soon discredited. The question could not be settled by ordinary chemical methods, which employ countless myriads of atoms and could therefore only give a mean result, and it was only by the discovery of radioactivity and the development of accurate methods of weighing individual atoms that the existence of isotopes was disclosed. The two advances were nearly contemporaneous but the first definite convincing proof of isotopy was found among the radioactive elements and their products.

The Radioactive Isotopes.—In 1906 Boltwood discovered ionium and found that it had similar chemical properties to thorium. Further research using the most delicate radioactive methods failed to indicate the slightest chemical separation of these two elements once they had been mixed, and even more surprising their spectra appeared to be identical. Other pairs of elements in the radioactive group showed corresponding identities and later investigations on the chemistry of the products of radioactive disintegrations enabled the chemical law of radioactive change to be formulated (*see* RADIOACTIVITY). This stated that a radioactive element when it loses an alpha particle goes back two places in the periodic table; when it loses a beta particle it goes forward one place. An alpha particle is a helium nucleus of weight 4, whereas a beta particle is an electron of negligible weight. It follows that if a body loses one alpha and two beta particles it will be back again in the same place in the periodic table although it will have lost a mass equal to four units of atomic weight.

Isotopic Bodies Predicted.—Supported by this law, which he was the first to state in its most general form, Soddy boldly claimed that these "isotopic" bodies would be both chemically and spectroscopically indistinguishable. He also predicted that the lead produced by the disintegration of uranium would have an atomic weight 206, while that of the lead produced from thorium would be 208, and that consequently the atomic weight of the lead found in uranium minerals should be less than that of ordinary lead (207·2) while that of lead from thorium minerals should be greater. These predictions were amply vindicated during the War by the work of experts on atomic weights (Richards, Hönigschmid and others), and it was shown beyond all dispute that the isotopic leads, though they differed by the predicted amount in properties such as atomic weight, density, and solubility which depend directly on the weight of their atoms, in all others, which do not—atomic volume, boiling-point, melting-point, refractive index and spectrum—were quite indistinguishable.

Practical Utilisation of Indicators.—The impossibility of separating isotopes has been utilised in ingenious manner by Hevesy and Paneth. By the addition of a small quantity of a radioactive isotope to an ordinary inactive element, the latter is, so to speak, indelibly labelled and can be followed by the methods of radioactivity, which are incomparably more delicate than those of chemistry. In this way the solubility of very insoluble salts can be readily determined. By the addition of a little thorium B, an isotope of lead, valuable information has been obtained on the assimilation of the salts of the latter element by living plants. The use of such radioactive indicators affords a direct proof of the ionic dissociation theory, it has led to the discovery of certain metallic hydrides and to the deter-

mination of the velocity of diffusion of molecules among themselves, an otherwise insoluble problem.

Positive Ray Analysis.—It is clear that the reasoning which led to the discovery of isotopes among the radioactive elements is inapplicable to those much more abundant ones which do not exhibit this property. Among the latter the presence of isotopes can only be demonstrated by weighing their individual atoms. This can be done by the analysis of positive rays, also called *Kanalstrahlen* or mass rays, which are electrically charged atoms of matter moving with such high velocities that they can be detected by means of their impact on a fluorescent screen or photographic plate. The usual method of producing these is by the discharge in gases at low pressure. In the region of the Crookes dark space and negative glow in front of the cathode the gas is ionised; that is to say, its atoms are split up into positively and negatively charged parts. The latter are the same whatever the nature of the gas, they are electrons and fly away from the cathodes constituting the well-known cathode rays. The remaining positively charged particles will fly toward the cathode. Their masses may vary from that of the lightest atom to that of the heaviest molecule in the gas, and their energies from an indefinitely small value to a maximum expressed by the product of the charge they carry, multiplied by the total potential applied to the electrodes. If the cathode be pierced, the rays pass through the aperture and form a stream of particles heterogeneous both in mass and velocity, which can be subjected to analysis.

The "Parabola" Method.—In Sir J. J. Thomson's "parabola" method of analysis, the particles, after reaching the surface of the cathode, pass through a long and very fine metal tube. By this means a narrow beam of rays is produced, which is passed through electric and magnetic fields causing deflections at right angles to each other, and finally falls upon a photographic plate. It can be shown that, if the mass of any particle is m and its charge e, when both fields are on together, the locus of impact of all particles of the same e/m, but varying velocity, will be a parabola. Since e must be the electronic charge, or a simple multiple of it, measurements of the relative positions of the parabolas on the plate enable us to calculate the relative masses of the particles producing them—that is, the masses of the individual atoms or molecules. The fact that the streaks were definite, sharp parabolas, and not mere blurs, constituted the first direct proof that atoms of the same element were, even approximately, of equal mass. For some time the results of the application of this method of analysis appeared to support the hypothesis of Dalton, as the elements introduced into the discharge tube gave single, or apparently single, parabolas in the positions expected from their chemical atomic weights. (*See* GASES, ELECTRICAL PROPERTIES OF.)

Examination of Neon.—But when, in 1912, neon was examined, the trace obtained was definitely double. The brighter curve corresponded roughly to an atomic weight of 20, the fainter companion to one of 22, the atomic weight of neon being 20·20. The line 22 could only be explained as due to a hitherto unknown elementary constituent of neon. This agreed well with the new idea of isotopic elements which was just then emerging from the investigations on radioactivity, so that it was of importance to investigate the point as fully as possible. The first line of attack was an attempt at separation by fractional distillation, but the result was entirely negative. The second method employed was that of fractional diffusion through pipe-clay which gave a small, but definite, positive indication of separation. It therefore seemed probable that neon was a mixture of isotopes.

The Mass-Spectrograph.—By the time that research on the subject was resumed at the Cavendish Laboratory in 1919, the existence of isotopes among the products of radioactivity had been proved beyond all reasonable doubt by the work on the atomic weight of lead. This fact automatically increased the value of the evidence of the complex nature of neon and the urgency of its definite confirmation. It was realised that separation could only be very partial at the best, and that the most satisfactory proof would be afforded by measurements of atomic weight by the methods of positive ray analysis. These would have to be so accurate as to prove beyond dispute that the accepted atomic weight lay between the real atomic weights of the two constituents, but corresponded with neither of them. The parabola method was not equal to this, but the required accuracy was achieved by means of an instrument shown in diagram in fig.

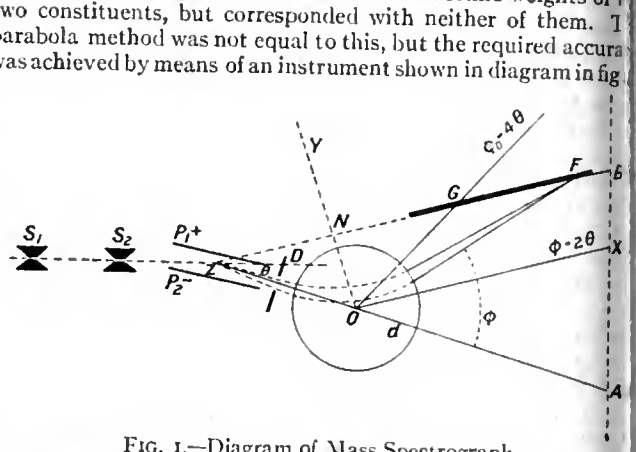

FIG. 1.—Diagram of Mass Spectrograph.

Positive rays are sorted out into a thin ribbon by two paral slits S_1S_2, and are then spread into an electric spectrum means of the charged plates P_1P_2. A portion of this spectrum d flected through an angle θ is selected by the diaphragm D and pass between the poles of a powerful magnet O, the field of which is su as to bend the rays back again through an angle ϕ more th twice as great as θ. The result of this is that rays having a consta mass (or, more correctly, constant em) will converge to a focus and if a photographic plate is placed at GF as indicated, a spectru dependent on mass alone will be obtained. On account of its analo to optical apparatus, the instrument has been called a mass-spe trograph and the spectrum produced a mass-spectrum.[1]

Mass-Spectra.—Fig. 2 shows a number of typical mas spectra that are obtained by this means. The numbers abo the lines indicate the masses they correspond to on the sca o = 16. It will be noticed that the displacement to the right wit increasing mass is roughly linear. The measurements of ma are not absolute, but relative to lines which correspond to know masses. Such lines due to hydrogen, carbon, oxygen and the compounds, are generally present as impurities or purposel added, for pure gases are not suitable for the smooth working the discharge tube. The two principal groups of these referen lines are the C_1 group, due to C (12), CH (13), CH_2 (14), C (15), CH_4 or O (16), and the C_2 group (24–30) containing th very strong line C_2H_4 or CO (28). These groups will be seen i several of the spectra reproduced, and they give, with the C (44) line, a very good scale of reference.

Mass Measurements.—Measurements of mass can be mad with an accuracy of 1 part in 1,000. It must be remembere that the ratio of mass to charge is the real quantity measured b the position of the lines. Many of the particles are capable carrying more than one charge. A particle carrying two charge will appear as having half its real mass; one carrying three charge as if its mass was one-third, and so on. Lines due to these ar called lines of the second and third order. Lines of high orde are particularly valuable in extending our scale of reference.

When neon was introduced into this apparatus, four new line made their appearance at 10, 11, 20 and 22. The first pair (no shown in diagram) are second order lines. All four are well place for direct comparison with the standard lines, and a series consistent measurements showed that to within about one par in a thousand, the atomic weights of the isotopes composin neon are 20 and 22 respectively. Ten per cent of the latter woul bring the mean atomic weight to the accepted value 20·20, an the relative intensity of the lines agrees well with this propor tion. The isotopic nature of neon was therefore settled beyon doubt. Spectrum I. on fig 2 (*see* next page) shows the first orde lines of neon and some of the reference lines with whic they were compared.

Analysis of Chlorine.—The element chlorine was naturally th next to be analysed, and the explanation of its fractional atomi weight (35·46) was obvious at once. Its mass-spectrum is char

[1] A full description of the Mass-Spectrograph is given in *Isotope* by F. W. Aston, Cambridge University Press, pp. 44 *et seq.*

acterised by four strong lines 35, 36, 37, 38. The simplest explanation of the group is to suppose that the lines 35 and 37 are due to the isotopic chlorines, and the lines 36 and 38 to their corresponding hydrochloric acids. The elementary nature of 35 and 37 is indicated by their second order lines at 17·5 and 18·5, and also when phosgene was used, by the occurrence of lines at 63 and 65 due to $COCl^{35}$ and $COCl^{37}$.

Later it was found possible to obtain the spectrum of the negatively charged atoms of chlorine. This showed only two lines 35 and 37, so that the lines 36 and 38 cannot be due to isotopes of the element. These results show that chlorine is a complex element, and that its isotopes are of atomic weight 35 and 37. Spectra II., III. and IV. show the results with chlorine taken with different field strengths (*see* CHEMISTRY).

Other Elements.—As the work progressed with other elements further interesting results were obtained. Some elements, such as carbon and oxygen, were found to be "simple"; that is, not mixtures of isotopes. This was to be expected from their whole-number atomic weights. Even more proved "complex," some consisting of 7, and in the case of xenon possibly 9 isotopes. The complexity of mercury is indicated by the blur of its unresolved third and fourth order groups seen in spectrum IV. Its lines have been resolved by means of a more powerful instrument. Mass rays of the metallic elements, which are in the majority, cannot in general be produced in the ordinary vacuum discharge. They can be investigated by means of anode rays.

The constitution of the alkali metals was first discovered by the use of an anode consisting of a platinum strip coated with salts of the metals, and heated electrically. Dempster, at Chicago, produced mass rays of metals by heating the element in a furnace and ionising the vapour produced by electron impact. To analyse the rays so formed he used low velocities and an electrical method of detection. By this means he made the first analyses of magnesium, calcium and zinc, and also confirmed the results already obtained for the lighter alkali metals.

More recently a large number of elements, including some of the rare earths, have been successfully attacked by means of the special method of "accelerated anode rays," and in all 56 out of the 80 known non-radioactive elements have been analysed into their constituent isotopes or shown to be simple.

The Whole-Number Rule.—By far the most important general result of these investigations is that, with the exception of hydrogen, the weights of the atoms of all the elements measured, and therefore almost certainly of all elements, are whole numbers to the accuracy of experiment. With the mass-spectrograph, this accuracy is generally one part in a thousand. Of course, the error expressed in fractions of a unit increases with the mass measured, but with the lighter elements the divergence from the whole-number rule is extremely small. This enables sweeping simplifications to be made in our ideas of mass.

The original hypothesis of Prout can now be restated with the modification that the primordial atoms are of two kinds: protons and electrons, the atoms of positive and negative electricity. According to the modern theory of the nucleus atom (*see* ATOM; MATTER) all the protons and about half of the electrons are packed very close together to form a central, positively charged nucleus, round which the remaining electrons circulate, somewhat like the planets round the sun. All the spectroscopic and chemical properties of the atom depend on the net positive charge on the nucleus, which is the excess of protons over nuclear electrons. This is also clearly the number of planetary electrons in the neutral atom; it is called the "atomic number" and is actually the number of the element in the periodic classification: 1 for H, 2 for He, 3 for Li, and so on.

The whole-number weight of the atom, on the other hand, will be the total number of neutral pairs of protons and electrons it contains. This is also the number of protons in its nucleus, and is called the "mass-number" of the atom: 1 for H, 4 for He,

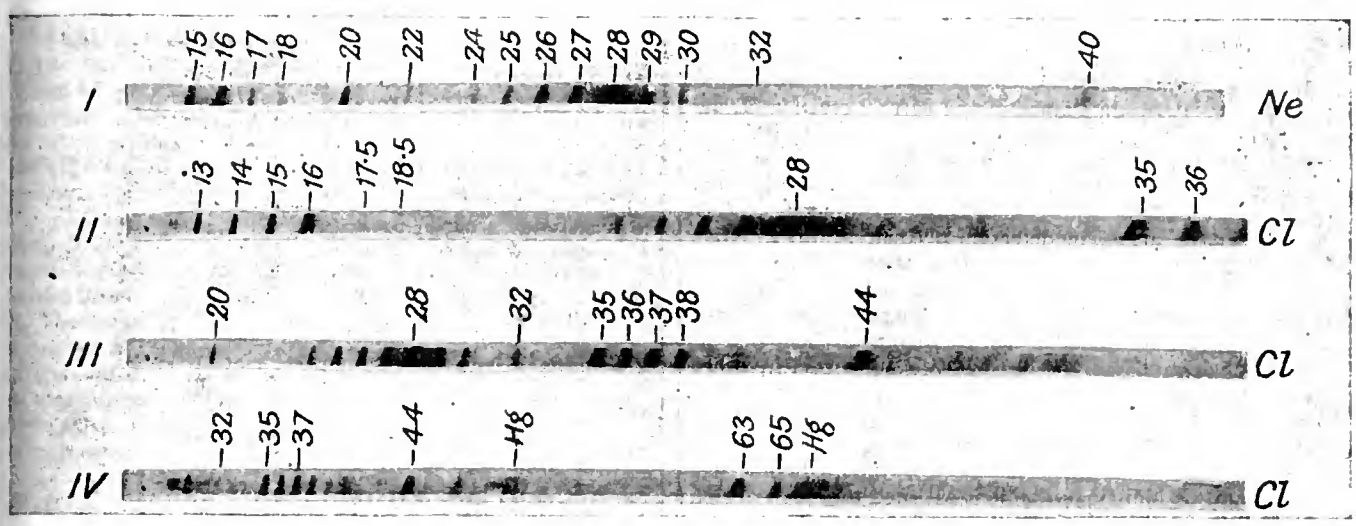

Fig. 2. Typical Mass Spectra

6 and 7 for the isotopes of Li, and so on. For the purpose of distinguishing isotopes it is customary at present to use the chemical symbol of the complex element with an index corresponding to the mass-number of the particular isotope, *e.g.*, Ne^{22}, Rb^{87}.

Packing Effect.—The whole-number rule is not mathematically exact, for owing to the extremely close packing of the charges of opposite sign in the nucleus, this will have a weight slightly less than the sum of the weights of its constituents. This loss of weight is called the "packing effect." Hydrogen, which has for its nucleus a single proton, will have no packing effect, and may therefore be expected to have an abnormally large weight. Comparison of this element with others by means of the mass-spectrograph, using special methods, shows that, within experimental error, the weight of its atoms on the chemical scale (O = 16) is indistinguishable from that obtained by chemical methods, namely, 1·0077.

The divergences of other elements are barely measurable at present, but the isotopes of lithium appear heavier than whole numbers by about 1 part in 1,000. Most of the heavier elements show a slight defect, which is to be expected if we take oxygen as having normal packing. The defect in the case of the isotopes of tin appears to be at least 2 parts in 1,000, which is 0·2 of a unit of atomic weight.

These considerations are of the greatest interest theoretically, for upon them rests the hope of the future liberation of the so-called "atomic energy." (*See* ATOMIC ENERGY.) The theoretical importance of chemical atomic weight has been somewhat reduced by the discovery that for so large a number of elements it merely represents a statistical mean. Its position as a natural numerical constant associated with an element has now been taken by the atomic number, which indeed defines the element, though from the point of view of chemical analysis, the mean

atomic weight is as important as ever. The anomalies shown by those elements which, by their atomic weights, appear out of their right order in the periodic table, are now open to the simplest explanation. Thus argon, in which the heavier of two isotopes predominates, has a greater mean weight than potassium, in which the reverse is the case. The same explanation applies to cobalt, nickel, tellurium and iodine.

Since the atomic number only depends on the *net* positive charge on the nucleus, arithmetically any element can possess an indefinite number of isotopes. The table herewith shows that those present in detectable quantity are restricted both in number and range of weight, though the causes of these restrictions are at present unknown. No element of odd atomic number has more than two isotopes and, above atomic number 9, the mass-numbers of the isotopes always differ by 2, and the lighter is the more abundant constituent. The number of nuclear electrons tends to be even. That is, in the great majority of cases even atomic number is associated with even mass-number, and odd with odd. Beryllium and nitrogen are the only elements consisting entirely of atoms whose nuclei contain an odd number of electrons.

If the mass numbers of the various species of atoms are plotted against their relative abundance in the earth's crust, a strong preponderance of those of type 8n may be seen. There is an extreme difference of range between the abundance of isotopes in an element and elements in nature. In the case of elements of an odd atomic number this cannot be ascribed merely to lack of delicacy in the means of detection of their isotopes. Thus while there are only about three Cl^{35} atoms to one Cl^{37} and about two Ga^{69} atoms to one Ga^{71}, yet there are a thousand million more atoms of chlorine than of gallium. This suggests that isotopes have some relation in common more fundamental than that of identity of nuclear charge, an idea which is supported by other independent lines of reasoning.

Spectra of Isotopes.—As regards their series spectra, in which, on Bohr's theory, the two bodies concerned are an electron and an enormously more massive atomic nucleus, the prediction that isotopes should be indistinguishable is satisfied to a high degree of precision. So far the only effect detected is a minute difference of wave-length between the lines of Carnotite lead (206) and ordinary lead (207·2). The most accurate measurements by Merton indicate that this has a maximum value of 0·011 Å for the line $\lambda = 4058$. Smaller shifts are detectable in a few other lines, the wave-length for the lighter atom being the greater in all cases. In band spectra, where two nuclei are concerned, the isotope effects are much larger and in excellent agreement with theory. In the case of HCl bands in the infrared region the duplicate peaks are as much as 14 Å apart, and in position and relative intensity, correspond exactly with the results expected from the presence of HCl^{35} and HCl^{37}.

More recently by investigation of band spectra produced in the visible region by boron oxide and silicon nitride, Millikan has shown that separate band heads appear corresponding to the two isotopes of boron, in the one case, and to three isotopes of silicon in the other. These results constitute valuable independent confirmation of the results of the mass-spectrograph.

Separation of Isotopes.—It is perhaps a fortunate thing for the simplicity of chemical arithmetic that the artificial separation of isotopes is excessively difficult, while at the same time no process tending to that end in nature appears to exist at all. Of the artificial methods the only one giving complete separation is the actual analysis of the mass-rays, during which the isotopic atoms strike the plate at different points and therefore, if collected, would yield pure specimens. The quantities so produced would, with the means at present available, be far too minute to be of any practical value.

A large number of methods for partial separation have been suggested and tried. The first successfully used, which is only applicable to gases, is that of free diffusion through pipe-clay or other suitable porous material. The diffusion rates are inversely proportional to the square roots of the masses concerned. It follows that if a large volume V of a mixture of isotopes is allowed to diffuse, leaving a small residue v, the latter will be richer in the heavier constituent than was the original gas. The actual numerical value of this enrichment, under ideal conditions, with isotopes, such as those of neon, which differ by 10% is only 20 (V/v) so that only by the use of very large volumes, or laborious repetitions, can any measurable change be achieved. The original experiments with neon gave a shift of atomic weight of rather more than 0·1 of a unit. Harkins, at Chicago, by the use of 10,000 litres of HCl, was able to obtain considerable samples in which the atomic weight of chlorine differed by 0·055 unit.

Table of Elements and Isotopes

Element	Atomic number	Atomic weight	Minimum number of isotopes	Mass numbers of isotopes in order of intensity
H	1	1·008	1	1
He	2	4·00	1	4
Li	3	6·94	2	7, 6

Another method, following much the same numerical laws, is that of Bronsted and Hevesey, which consists of free evaporation from a liquid surface at very low pressure. They obtained two samples of about 0·2 cc. of mercury differing in density by 5 parts in 10,000, or 0·1 of a unit. The atomic weights showed a corresponding difference, but the electrical conductivity of the two samples was indistinguishable to one part in a million.

Other methods of separation such as chemical action, centrifuging, ionic migration and thermal diffusion have only yielded negative or entirely negative results. A very large number of attempts have been made in recent years to discover any variation in the chemical atomic weight of elements known to be complex, which would indicate a change in the proportions of the isotopes present. Boron, silicon, chlorine, iron and nickel have all received attention, but in no case with any certain positive result. From their experiments on silicon from no less than 12 different terrestrial and meteoric sources, Jaeger and Dijkstra concluded that these gave products not differing in density by more than 0·00004%.

The accumulation of negative evidence of this kind is very impressive, and supports the idea that the evolution of the elements, apart from those produced by radioactive disintegration, must have been such as to lead to a proportionality of isotopes which was constant from the start, and, since we know of no natural process of separation, has remained constant ever since. See F. W. Aston, *Isotopes*, 2nd ed., 1924. (F. W. A.)

ISRAËLS, JOSEF (1824–1911), Dutch painter (*see* 14.885b), died at The Hague Aug. 12 1911.

ITAGAKI, TAISUKE, COUNT (1837–1919), Japanese statesman, died in 1919. True to his liberal principles, he forbade his son to apply for the succession to his title and it lapsed.

ITALIAN CAMPAIGNS.—Italy entered the World War as a combatant on May 23 1915, when she declared war on Austria. The following article constitutes an outline of the struggle between Italy and Austria from that date until the signing of the Austro-Italian Armistice on Nov. 3 1918. The article has been divided into five sections, namely: I. Italy's Strategical Position; II. The First Year's Campaign; III. Battles of the Isonzo and the Carso; IV. The Austro-German Effort; V. The Collapse of Austria. More detailed accounts of the outstanding battles in the campaign are given under separate headings, namely: ASIAGO, BATTLE OF; CAPORETTO, BATTLE OF; and VITTORIO VENETO, BATTLE OF.

I. ITALY'S STRATEGICAL POSITION

At the outbreak of the World War the Italian General staff had no worked-out plan for an offensive campaign against Austria-Hungary. The great military superiority of the Habsburg Empire and the unfavourable frontier drawn in 1866 seemed to deny the possibility of Italian offensive action. A glance at the map makes the position clear.

Original Italian Plan.—When Italy was preparing to enter the War, the fact that Austria-Hungary was already heavily engaged elsewhere offered the chance of an Italian attack, and Gen. Cadorna, who took command on the declaration of war, had worked out his scheme in expectation of simultaneous offensive action on the part of Russia and Serbia. The plan was based on the idea that Italy must hold on the north and push towards the east. The eastern front, though difficult enough, seemed less impervious to an offensive than the Alpine masses on the north. An attack in this direction was calculated to occupy a much larger number of enemy troops, which was obviously a part of Cadorna's duty, and was further a direct threat against a vital part of the monarchy. These advantages were rightly held to compensate for the fact that an advance eastward meant the lengthening of a front already very long, and increased, moreover, the menace of the Trentino salient.

This threat was mitigated by the expectation of Allied action on the northeast and southern fronts of Austria-Hungary, which would prevent the enemy taking advantage of the weakness indicated. But, on the eve of Italy's declaration of war, the situation had changed. The Russian armies north of the Carpathians had given way before the attacks of Mackensen and Böhm-Ermolli. There was no word of movement, even of demonstration, on the part of Serbia, in spite of requests from the Allies, and in May the Austro-Hungarian troops on the Serbian front were reduced by five divisions, which were sent to the Isonzo-Carso front, their place being taken by three newly-formed German divisions.

Disposition of the Forces.—On the eve of war Cadorna's dispositions were as follows: Gen. Roberto Brusati's I. Army, with five divisions and 10 Alpine battalions, was to conduct a limited offensive in the Trentino, with the object of shortening the line and securing strong defensive positions. Gen. Nava's IV. Army, five divisions and seven Alpine battalions, was to attack the enemy communications in the Pusterthal and co-operate in an advance towards Tarvis; this advance was to be carried out by the "Carnia Force," consisting of one infantry division and 16 Alpine battalions under Gen. Lequio. The II. and III. armies, under Gen. Frugoni and the Duke of Aosta respectively, were to attack with all speed on the Isonzo front. Frugoni had eight divisions and the Duke of Aosta six, with three cavalry divisions. But on May 24 only three corps (seven divisions) and three cavalry divisions were ready to attack.

On May 20 the Austrian armies, which had been placed under the command of the Archduke Eugene, with Gen. Krauss as his chief-of-staff, formed little more than a screen. Gen. Dankl, lately in command of the Austrian I. Army, had about two divisions in Tirol, with some Landstürm battalions; Gen. von Rohr had a similar force to oppose an advance on Tarvis; and the Isonzo front, from Monte Nero to the sea, was lightly held by three divisions under Gen. Ludwig von Goiginger. But reinforcements were close at hand. Within a few days Rohr had two more divisions at his disposal, and by May 27 Gen. Boroević von Bojna, to whom the Isonzo front had been entrusted, had 90 battalions between Monte Nero and the sea.

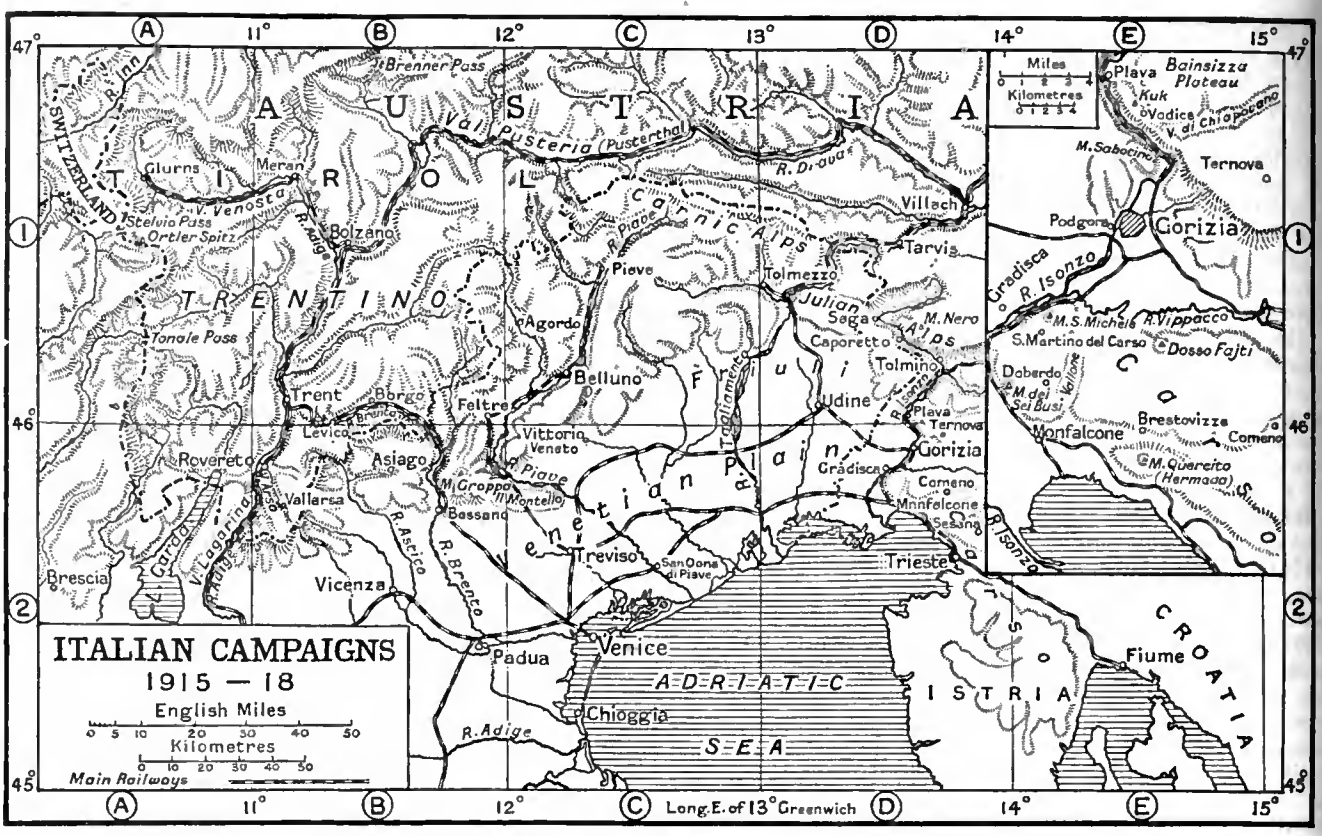
II. THE FIRST YEAR'S CAMPAIGN

The opening moves of the Italian offensive, all-important as they were in relation to the future operations, failed to obtain the results hoped for in Cadorna's design. The I. Army performed its limited task quickly and satisfactorily, but the IV. Army was very slow. Here, almost certainly, a good chance was missed. Lequio's Carnia force was quick to move and found that the enemy was equally quick. This sector was all-important to the Austrians, from the point of view both of offence and defence. It was essential to prevent a break-through to Tarvis and Villach, and if they could hold the frontier line it preserved for them the chance of the attack down the valleys leading to the Tagliamento. Here alone the way was blocked against any but an overwhelming force.

Italy Takes the Offensive.—Meanwhile, the II. and III. armies were on the move. Frugoni, with the five divisions of his army that were ready, attacked along the line of the Isonzo from the Saga to opposite Gorizia. The Duke of Aosta, with a single corps and two cavalry divisions, was to force the passage of the lower Isonzo and push on towards the Carso. The Austrians had withdrawn beyond the river, except at the two strong bridge-heads opposite Tolmino and Gorizia, which were held in force, and south of Gorizia the line of defence chosen was the Carso plateau. Speed and initiative were essential if the opening moves of the Italian offensive were to be successful, and at various points speed and initiative were lacking. The bridge-heads were invested, as were several other strong positions held by the enemy.

On the other hand, the country is extraordinarily difficult, and roads were few and mostly bad; and those which were suitable for the movement of troops and guns led only to the points which the enemy was holding in some force. Fortune, too, was against the attacking armies. Appalling weather made movement in the mountains almost impossible during the critical period, and when the chance of a surprise had gone the great barrier of the Julian Alps was an insuperable obstacle to such forces as the Italians could bring against it. Guns, machine-guns and transport were lacking. Farther south, in the plain west of the Carso, the Isonzo came down in sudden and violent flood and held up the Duke of Aosta's advance. The fords were impassable and bridges had been blown up by the retreating enemy.

By the end of the third week in June the Italians had gained several important positions, some of them after very hard fighting, but they had been brought to a stop before the Austrian



main lines, and it became clear that the hopes of a war of movement must be given up, that only the slow processes of trench warfare could lead to success. The Italian mobilisation was now completed, and Cadorna had ready some 35 divisions. Against these the Archduke Eugene had some 20 divisions, including the Bavarian *Alpenkorps*, which had been sent to Tirol, although Germany and Italy were not yet at war. Boroević and Dankl were much weaker in infantry strength than the armies opposed to them. But they were strong in artillery, were very much better equipped with machine-guns, and held positions that were naturally ideal for defence and had been well prepared.

First and Second Battles of the Isonzo.—On June 23 began what is known as the first battle of the Isonzo. The II. Army, with a strength of 10 divisions and two Alpine groups, attacked the enemy lines in the Tolmino sector, and from Plava to Podgora, while the III. Army, with six divisions, moved to the assault of the western rim of the Carso plateau. The Italians had not sufficient heavy artillery; Boroević had now nine divisions, with their march battalions, and further reserves were on the way. After very heavy fighting at Plava, where the earlier Italian advance had established a small bridge-head, at the Gorizia bridge-head (M. Sabotino and M. Podgora) and on the edge of the Carso the action was broken off on July 7. During the fortnight's fighting the Italians had gained a little ground at the cost of about 19,000 casualties. The Austrian casualties to date were 22,000.

After 10 days' breathing space Cadorna attacked again in the same sectors. Boroević had now 13 divisions under his command, but Cadorna had concentrated all his slender supply of heavy guns on the Isonzo front. No headway was made by the II. Army but a fierce struggle took place on the Carso. Monte San Michele was taken on July 20 but lost again, and six days later a fresh attack had the same result. The second battle of the Isonzo ended on Aug. 3 with the Italians close under the crest of Monte San Michele and the village San Martino del Carso, and in possession of most of Monte dei Sei Bus, farther south. The Italians lost some 34,000 men, but the Austrians also suffered severely and lost over 10,000 prisoners.

The Autumn Offensive, Oct.–Dec.—Various isolated actions were carried out on the long front during the summer, but the time was devoted chiefly to preparation for a big offensive in the autumn. By the middle of Oct. Cadorna could dispose of 312 battalions on the Julian front. The II. Army now consisted of 12 divisions and the III. of seven, while a reserve of five divisions lay ready in the Friuli plain. When the attack began Boroević had about half this number of troops, but within a fortnight he had the equivalent of 15 divisions at his disposal. It was on the II. Army front that the Italian numerical superiority was great; on the Carso the Duke of Aosta had no marked advantage in numbers over the Archduke Joseph, who had assumed the command in this sector in July. But the terrain on Boroević's right was such that he could expect to hold with greatly inferior forces, especially in view of the Italian weakness in artillery. The offensive went badly. By his main attack Cadorna had hoped to turn the Gorizia positions from both north and south, and as a secondary operation, after crossing the middle Isonzo, to threaten Tolmino from the south, as well as from west and north. After a first phase lasting a week, the attack was renewed four days later on a narrower front, but the third battle of the Isonzo closed on Nov. 4 with little tangible result.

Six days later the fourth battle of the Isonzo was begun, and the struggle went on for more than three weeks, the offensive being finally broken off on Dec. 5. As men and munitions became exhausted the scope of the action had been gradually reduced to an attack on the Gorizia bridge-head and still another struggle for Monte San Michele. Once more the artillery proved insufficient, and the main feature of the fighting was the heroic efforts of the infantry on both sides. During the two battles, which were fought in persistent bad weather, the Italians lost over 113,000 men and the Austrians about 90,000. The result of the first seven months' campaigning was disappointing to those who had hoped for far greater effects from Italy's intervention. It was not generally recognised how poorly the Italian Army was provided with the material necessary to modern war. Inevitably, moreover, the Austrians had a great advantage in their nine months' war experience. They were clearly superior in skill to their opponents, and their superior skill was backed by a spirit which the armies of the dual monarchy sometimes failed to show on the Eastern Front.

Preparations for 1916.—The winter months were busily em-

yed, especially in the munition factories. It was beginning to recognised in Rome that estimates regarding numbers of men d shells had to be revised. During the winter the small total heavy and medium guns was increased sevenfold, and great still inadequate efforts were made to increase the supply of ells. An important innovation of the winter was the *bombarda*, big trench mortar, large numbers of which were constructed make up for the deficiency in heavy artillery. The *bombarda* s in fact much more than what is usually understood by the m trench mortar. Its range was much longer, and the de-uctive power of its big projectile was very great.

The supply of men, no less than that of material, required to be plenished and augmented. In seven months the Italian losses the field were close upon 280,000—66,090 killed, 190,400 unded and 22,520 missing or prisoners. The Austrian losses re 28,000 killed, 97,000 wounded and 31,000 missing or prison-s, in all 156,000. The Italian figure was in addition to casual-s from sickness, which were heavy, including as they did the ses from an outbreak of cholera in the II. Army. Men had to found not only to fill up the gaps but to make new formations. uring the winter the gaps were filled, and eight new divisions re ready in the spring, while others were in process of forma-n, and Cadorna had succeeded, after some difficulty, in having e classes required for drafts called up well ahead of his imme-ate needs.

III. BATTLES OF THE ISONZO AND THE CARSO

During the early months of 1916 the only fighting of any im-rtance took place in March, when Cadorna opened a big dem-nstrative action on the Julian front, with the object of preventing e dispatch of Austrian forces to Verdun. The action contin-d from March 11 to March 29, and received the name of the fifth Battle of the Isonzo. Although it was only a demonstration, me hard fighting took place, and both sides suffered consider-le loss. Meanwhile, preparations for a real Italian offensive on e Julian front were well advanced, when news came that the ustrians were preparing a big attack in the Trentino.

Austrian Failure in the Trentino.—This attack, which is de-ribed elsewhere (*see* ASIAGO, BATTLE OF) had a big initial suc-ss, but it was already condemned to failure when Brusilov, nswering the appeal for co-operation made by Cadorna on May 9, attacked the weakened Austrian lines in front of him on June 4, and won the great victory that, if Cramon may be believed, ame within an ace of being decisive. The attack in the Trentino, ased on a miscalculation, nearly ended in the collapse of Aus-ia's eastern front, and brought only a slight territorial gain that as no compensation for the defeat elsewhere and for the losses ffered. Nor did the penalty end with these. Cadorna refrained om knocking his head against the lines upon which his retreat-ng enemy turned and stood. The positions he reached were ade-uate to his aims in the Trentino, which were purely defensive, nd instead of persisting in his counter-offensive he rapidly wung his reserves back to the Julian front, smashed through the Gorizia bridge-head and took Gorizia, and drove the Austrians rom the western section of the Carso plateau.

The Taking of Gorizia.—During the winter of 1915–6, in prep-ration for an attack upon Gorizia and the Carso, the right ing of the II. Army had been transferred to the III., so that he front from north of Monte Sabotino down to the sea was nder the Duke of Aosta. At the end of July, when the delayed ttack was imminent, the Duke had 16 divisions and a dis-nounted cavalry division. He had 1,250 guns, of which 520 ere heavy or medium, and these were supplemented by nearly 300 *bombarde*.

On the Carso and about Gorizia Boroević was badly prepared o meet the Italian attack. He had only five divisions in line etween Monte Sabotino and the sea, and one in immediate re-erve, when the Duke launched his attack, and the Austrians ere taken by surprise. On Aug. 4 the Duke began with a feint gainst the low hills east of Monfalcone, and two days later the eal attack developed, when the VI. Corps attacked the Gorizia ridge-head and the XI. the summits of Monte San Michele. The VI. Corps, commanded by Gen. Luigi Capello, had outgrown the dimensions of an army corps, for it consisted of no fewer than six divisions. Capello's attack was brilliantly successful. Monte Sabotino, which had resisted so many attempts at capture, was taken on the run in 40 min., while the greater part of the Podgóra ridge was torn from the Austrians and some Italian detachments reached the river at sunset. The Austrians defended with the most obstinate valour, and gained precious time for their hard pressed commander.

Italian troops crossed the river on the night of Aug. 8, and the town of Gorizia was occupied next day without resistance, while a general attack on the Carso was breaking down the stubborn defence which had survived the loss of Monte San Michele early in the first days' fighting. On Aug. 10 the Austrians were driven back across the Vallone, the deep cut that separates the San Michele-Doberdo section of the Carso from the main plateau. Both to the east of Gorizia and on the far side of the Vallone the advancing Italians found themselves faced by new lines hidden among the woody slopes beyond the town and the stony undulations of the Carso. Attempts to continue the offensive were not successful. The sixth battle of the Isonzo was an important Italian success, but there was not sufficient weight of guns and ammunition to push the attack home.

Closing Operations of 1916.—In Sept., Oct. and again at the beginning of Nov. the Duke of Aosta attacked on the main Carso plateau, between the Vippacco and the Brestovizza valley, punching out a big salient on the northern half of the Carso, driving the Austrians back to their last line of trenches and occupying the important position of Dosso Fajti. But the seventh, eighth and ninth battles of the Isonzo were each broken off as soon as the attack slowed down. Cadorna was attempting to gain position for a bigger attack later on, when men, guns and shells should be more plentiful. Bad weather prevented another blow, and prevented also an attack in the Asiago uplands, which had been planned for the middle of November.

The year had seen much heavy fighting, and both sides had suffered severely. The Italian casualties were nearly 120,000 dead, 285,000 wounded and 78,000 prisoners, the bulk of the latter taken in the first days of the Austrian offensive in May. The Austrian losses were also heavy, well over 200,000 killed and wounded and some 60,000 prisoners. If the territorial gains at the end of the year's fighting were not great, Cadorna's continued attacks, following upon the costly failure of the Austrian offensive in the Trentino, had done their work in occupying an increasing number of the enemy's troops and wearing down his resistance. Cadorna's rôle was clearly marked out; so long as the plans of the Allies were based upon the policy of attrition, he had to hammer when he could, with what means he could collect from month to month as the output of guns and munitions increased and fresh troops were trained, keeping always in view as an essential aim that of attracting to his front, and wearing out, the maximum number of enemy forces. Judged from this standpoint, the Italian effort of 1916 was of the greatest value to the Allied cause.

Although Cadorna was strongly opposed to the dispersal of his forces in *petits paquets* and had resisted the suggestion of an expedition to Libya to quell the rising which had reduced the Italian occupation to a few points on the coast, the importance of the Balkan front had not been lost sight of by the Italian Government. Fresh troops were sent to strengthen the Italian position in Albania, and in Aug. a strong force arrived in Salonika under the command of Gen. Petitti di Roreto to take part in the Allied advance on Monastir. Early in Oct. an Italian column occupied Argyrokastron, and before Nov. the Italians were in touch with the left wing of the Allied forces based upon Salonika.

IV. THE AUSTRO-GERMAN EFFORT

At the Allied conference held in Rome in Jan. 1917 the formal proposal was made that an Allied force should join the armies of Italy in an attempt to smash the weaker of the two Central Powers. In spite of Mr. Lloyd George's advocacy the plan did not commend itself to the French and British military authori-

ties, who offered, however, to send 300 heavy guns to Italy on condition that they were returned to the French front by the month of April. Cadorna declined the offer, on the ground that the season was unsuitable for an offensive on his front, and that the guns would have to be returned at the moment when they would be most useful. The question of closer co-operation was dropped for the time being, but the conference organised a line of communications through Italy to Salonika, via the southern Italian ports, a route which greatly lessened the dangers from submarine attack, and at the same time made a much smaller demand on the diminishing tonnage of the Allies.

Cadorna's Plan.—Cadorna embodied his proposals in a memorandum written after the Rome conference; they were as follows: If the Allies would give him at least 300 heavy guns he would make two attacks on the Trentino and Julian fronts—his own artillery was insufficient for this double offensive—and so find the enemy's weak point. He had the advantage of interior lines, and would move his reserves of guns and men from the Venetian plain according to the development of the two actions. If, on the other hand, the Allies would send a minimum of eight divisions in addition to the heavy guns, he would concentrate upon the Julian front and attack from Tolmino to the sea, with the object of breaking through towards Ljubljana (Laibach). Such an attack, in Cadorna's view, would have had decisive results. He believed that Austria could not recover from so severe a blow.

The plan was tempting, but it did not commend itself to the Allied commands. French and British opinion was against any further diversion of effort from the Western front, for there was the chief enemy, upon whose defeat the result of the war depended. And there were obvious technical difficulties in the way of supplying large French and British forces on the Julian front. Nivelle and Robertson, who visited the Italian front in the spring, agreed to the principle of direct co-operation by the dispatch of troops and guns in the event of necessity, but both were inclined to prefer co-operation by simultaneous attack, and while a scheme for the quick transport of troops from France to Italy was prepared, no definite engagements were taken. It was agreed, on the other hand, between Cadorna and Nivelle, that the Italian and French spring offensives should be timed to coincide as nearly as possible.

The Italian Spring Offensive.—Cadorna's attack was slightly delayed owing to a threat of an Austrian offensive in the Trentino, and later, by bad weather. But the Italian guns, which had been reinforced by 11 batteries of British 6-in. howitzers and 35 French heavy guns, opened fire on May 12. Cadorna feinted with the III. Army on the Carso, making his real attack with the II. Army, now under Gen. Luigi Capello, against the hills north and east of Gorizia. North of the town the greater part of the long ridge (Kuk-Vodice) running southward from above Plava was gallantly stormed and held against the most determined counter-attacks, but little progress was made east of the town. As soon as the occupation of the Kuk-Vodice ridge seemed assured Cadorna moved the bulk of his heavy guns southward and attacked with the III. Army on the Carso. Useful progress was made here also, a number of positions being captured, and the VII. Corps on the right carrying one line after another till they were half-way up Monte Hermada (Querceto). But ammunition was running very low; the offensive was broken off at a moment when it seemed as though further success lay very near. On the evening of May 26, when the attack on the Hermada was stopped, the defenders of the battered hill were reduced to under 100 men, each of whom received the Maria Theresa medal.

There was only a short breathing space. On June 4 the Austrians on the Carso counter-attacked in the most determined manner. Finding a weak resistance on the part of the troops who has come into line as reliefs, they freed the lower slopes of Monte Hermada, and took a large number of prisoners. During the four weeks' fighting Cadorna used 31 divisions and lost 132,000 killed and wounded and 25,000 prisoners. Boroević had held his ground, or nearly, with 17 divisions, and his losses, including 25,000 prisoners, were close upon 120,000.

The rumour of battle had scarcely ceased on the Julian fro when the Italians attacked in force north of Asiago, on a fro of nine miles. The attack failed. Progress was made at one poi only, on Monte Ortigara, and here too, after a long and blood struggle, the attacking troops were thrown back. Between Jun 10 and June 29 the Italians lost 24,000 killed and wounded an 2,000 prisoners. The Austrian casualties were over 9,000.

Cadorna's Second Offensive, Aug.–Sept.—The general situa tion at the end of June gave cause for disappointment and som anxiety. Russia was going out of action. The prospect of a Entente victory with which the year had opened was clearl removed to a distance, and war weariness was making itself in creasingly felt in Italy. The question of Allied co-operation o the Italian front was once more discussed but without result. I was decided that Cadorna should attack alone in August. Th army was strung to the highest point of tension, awaiting th order to attack, when Pope Benedict XV. launched his appea for peace. Parts of the army were shaken, for the Pope, in hi impartiality, placed the two contending groups of Powers on th same level; he held out the hope that Germany and Austria wer ready to consider certain territorial questions "in a conciliator spirit," taking into account "the aspirations of the peoples" and to the long and weary struggle he attached the label "useles slaughter." Some of the commands were anxious about thei men when the attack began, on the night of Aug. 18.

As a matter of fact, the troops put aside their questionings and the blow dealt to the Austrians was a very heavy one. Th Isonzo was crossed in many places between Tolmino and Plav and the greater part of the Bainsizza plateau was occupied b troops of the II. Army, while the southern end of the Chiapo vano valley was passed and a footing obtained on the weste corner of the Ternova plateau. But a long sustained effor brought no further success. Cadorna intended to renew his offen sive at the end of Sept. by an attack against the Ternov plateau, in the hope of definitely turning the Gorizia position from the north and cutting the main line of communications be tween the Austrian right and left. But towards the middle o the month news came of increased enemy forces and a probabl counter-offensive at an early date, and Cadorna, after takin stock, decided he must stand on the defensive. The four weeks fighting in Aug. and Sept. had cost him over 166,000 men—40,000 killed, 108,000 wounded and over 18,000 prisoners The toll taken by sickness had also been very heavy. The unit were at low strength and the new drafts had not been satisfac torily absorbed. A breathing space was urgently needed.

British and French Reinforcements.—The Austro-German suc cess against the II. Army, the retreat of the Italian forces to th Piave, and the resistance in the new positions are describe in a separate article (*see* CAPORETTO, BATTLE OF). When th gravity of the situation became clear, England and France acte with all possible speed. The order was given for six French an five British divisions to entrain for Italy, and Foch and Robert son hastened to the spot. An Allied conference at Rapallo bega on Nov. 4, and from its discussions were born the Supreme Allie Council, which was to meet, once a month if possible, at Ver sailles, and the Versailles Military Council, which was to sit per manently. It was agreed that the failure of the Italian armie to resist the enemy attack called for a change in the Italian com mand, and Cadorna was appointed Italian military representa tive at Versailles. He was succeeded by Gen. Armando Diaz commander of the XXIII. Army Corps, and the functions o Gen. Porro, who was also relieved of his post, were divided be tween Gen. Giardino, who had been Minister of War during th summer, and Gen. Badoglio, commander of the XXVII. Corps.

V. THE COLLAPSE OF AUSTRIA

After the failure of Krauss and Conrad to break through t the Venetian plain, the Italian front saw no action of first clas importance for nearly six months. The time was well occupie in reorganisation, but there were several minor combats. Th German divisions left Italy at the beginning of 1918, in anticipa tion of the great offensive which was being prepared on th

'estern front. Gen. Plumer, who commanded the British forces, so left Italy to take up his old command. He had acquired a eat popularity, and his departure was much regretted. Fortuitely he had a worthy successor in the Earl of Cavan. When e German offensive in March 1918 pierced the line of the Brit- n V. Army four French and two British divisions were immedi- ely withdrawn from Italy. They were followed by the Italian . Corps under Gen. Albricci. This left Diaz with 55 divisions o Italian and five Allied) as against 60 freshly organised Aus- ian divisions, who were preparing for an early offensive.

Austrian Attacks Fail.—The original proposal of the Austrian eneral staff, now under Gen. Arz von Straussenburg, was to ake a drive on both sides of the Brenta. Conrad, now in com- and in the Trentino, pressed for an attack in the Asiago up- nds. Krauss disapproved of both plans and urged an offensive i both sides of the Lake of Garda. Conrad's plan was chosen, ut Boroević urged that this offensive should be accompanied by straight drive by his armies across the Piave. This was agreed , and both army groups attacked on June 15. Conrad attacked ith Scheuchenstuel's XI. Army from south of Asiago to Monte rappa, while the Archduke Joseph attacked the Montello and Verzel von Wurm crossed the lower Piave. Conrad had 27 ivisions at his disposal, and Boroević 23.

Conrad's attack was a complete failure. It went well to begin ith, but at the end of the day all hope of success had gone, and y the evening of June 16 he was finally beaten. Boroević, on ie other hand, made good headway on the first two days, for the rchduke Joseph took half the Montello, and Werzel von Wurm stablished an extensive bridge-head opposite San Donà di iave. But at the end of a week's fighting the Austrians were losely held, and the order was given to retire across the Piave. he failure was complete, and very costly. Conrad lost 36,000 ien and Boroević over 60,000. The defeat broke forever the ffensive power of the Austro-Hungarian Empire. The consciousess of impending disaster grew and spread through the monrchy, and the troops were greatly disheartened by failure.

Final Italian Offensive.—It was felt in many quarters that Diaz should have followed up the victory by a strong counterttack, but he was unwilling to attack in force without careful reparation. He had had heavy casualties, over 40,000 killed nd wounded and a very large number of prisoners, and he preerred caution. Plans were drawn up and preparations made for n offensive between the Vallarsa and the Brenta in September. Early in Sept. Diaz went to Paris to discuss the situation. He was still pre-occupied in regard to his reserves, and asked hat a strong American force should be sent to Italy. This was efused, and in spite of criticism he delayed his offensive still urther, while working out secretly a more ambitious scheme vhich was to be adopted if the chance should offer.

In the middle of Sept. the victorious advance from Salonika began, and the chance seemed to have come. 'On Sept. 25 orders were issued for a rapid concentration of troops, artillery nd technical services in the sector chosen for the attack, which vas no longer the plateau, but the Middle Piave." (Gen. Diaz's Report). The attack (*see* VITTORIO VENETO, BATTLE OF) was aunched exactly a year after the disaster of Caporetto, and it shattered the armies of Austria-Hungary. Seldom in history has so great a disaster been followed by so complete a triumph. Yet the final overwhelming success of Vittorio Veneto was not Italy's greatest victory. The way to it was paved by greater deeds, the wonderful recovery on the new line after the great reteat, and the successful resistance against the last Austrian offensive that was the first ray of light to break upon those gloomy months when the fortune of the Allies seemed at their lowest. Nor can the sum of Italian achievements be judged by the issue of those battles which were crowned with victory.

Conclusion.—Italy's contribution to the long effort that led to the triumph of the Allies can only be gauged by a review of the campaign as a whole, by a realisation of the extent to which she drained the resources of Austria-Hungary, and of the price which she paid. Her dead totalled 600,000; and 570,000 men were permanently disabled for military service by wounds or disease. For two and a half years the Italian armies were a constant threat to the Habsburg Empire and kept employed a number of divisions that increased from 20 to 40 (in the summer of 1917). During the last three months of 1917 the number of enemy divisions rose to 55, and in 1918 practically the whole effective strength of Austria-Hungary was arrayed against Italy, the number of divisions at one time approaching 70.

The figures speak plainly, and Ludendorff, in an interview published in the spring of 1919, placed among the chief causes of the German defeat "the lack of support from Austria, gripped ever more tightly at the throat by Italy." Cadorna rightly claimed that Italy's "grip on Austria's throat from 1915, compelling her to immobilise against us ever increasing forces, constituted the most notable result of our war, though it was little apparent to the eyes of civilians. It contributed largely to the victory of the Allied arms and to our final triumph."

ITALIAN LITERATURE (*see* 14.897).—The development of Italian literature, including philosophy and history, during the period 1910–26 was remarkable. Carducci and Verga mark the end of the stage during which Italians were finding themselves intellectually and politically. Pascoli, Fogazzaro, and D'Annunzio really belong to the new period which crystallised in the years immediately preceding the World War, and came to fruition in the social, political and spiritual revolution which followed it. These writers, together with Benedetto Croce and Giovanni Gentile, in the field of aesthetics and philosophy were largely responsible for widening the scope of intellectual activity and culture, so that they ceased to be narrowly Italian and became European.

The works produced in the first 25 years of the present century, and more particularly during 1910–25, are characterised by a spirit of daring, restlessness and youth; by intellectual curiosity, love of novel experiments and experiences, and above all by self-analysis, which, in some cases, led to egocentricity and decadence. Such defects, however, were due to the ebullience of youth seeking vent for its new-found energy rather than to weariness and to the search after sensations for their own sake. Writers aimed at the discovery of new forms of expression to supersede the old; thus, the Futurists were of service to the new literature, if only by reason of their attempt to break down inherited and stereotyped traditions in prose and verse. Prose underwent a remarkable change. It became crisper and at the same time more flexible, while language attained the unity long advocated by Manzoni.

Fresh interest was awakened in the most varied forms of criticism, in history, culture and philosophy of all times and in all countries. In this eclectic tendency Renato Serra, a young and promising critic who was killed in the War, saw the beginnings of a new form of classicism. Interest in foreign literatures, including those of the East as well as of the West, produced a vast library of translations varying in quality, but on the whole showing a marked tendency towards treating translation as an art. With the exception of Adolfo de Bosis' remarkable version of *The Cenci* (1916) and *Epipsychidion*, Carlo Linati's *Tragedie Irlandesi di W.B. Yeats* (1914), Raffaello Piccoli's *Drammi Elisabettiani* (1914) and Mario Praz's magnificent tour de force represented by his anthology of verse renderings *Poeti Inglesi dell' Ottocento* (1925), English literature found less translators than German, French or Russian, and contemporary writers, apart from Kipling, Shaw, Galsworthy and Barrie, are only available in the original. This cosmopolitan spirit acted as a stimulus to the growth of the new national literature rather than to imitation of foreign models. A further significant evidence of this new energy are the changes which have taken place in the publishing world, where the output has increased and the technical production improved as a direct result of the increase of the reading public of all classes.

Fiction.—Although strictly belonging to the preceding generation, Alfredo Oriani (1852–1909) and Carlo Dossi (1847–1910) did not receive due recognition until after their deaths. The former was obsessed by ugliness and horrors and at the same time had an intense love of beauty. The impartiality and variety of outlook was in part the reason for his popularity among the younger generation. And Dossi, by his harsh and elliptical style and his original and vivid treatment of his subject matter, unfashionable in his own day, opened out new paths to his successors. G. Pietro Lucini (1867–1914) is also of interest on account of his reaction to the various decadent European schools and as a forerunner of the Futurists who claimed him as one of themselves. Of an entirely different character is the work of Alfredo Panzini (b.1863) one of Carducci's best pupils. Possessing a quiet sense of humour tinged with irony, his attitude towards life is detached but not aloof. In what are generally considered to be his masterpieces *Le Fiabe della Virtu* (1905), *La Lanterna di Diogene* (1909), *Santippe* (1914) and *Viaggio di un Povero Letterato* (1919), Panzini is acutely sensitive to all forms of beauty and to the conflict between them and the evils and uglinesses of the world. He has the temperament of a poet; his style is pure, simple, direct and moving, the prose counterpart of Carducci's best lyrics.

Adolfo Albertazzi (b. 1865) learned the art of the short story from the Italian masters of the past and the modern writers of foreign countries. Some of those collected in the *Diavolo nell'Ampolla* (1918) and in other volumes are among the best of the kind published in modern times. It is worthy of notice that most of the novelists, dramatists and critics of to-day—men and women—have tried their hand at the short story of the magazine type. Of these Luciano Zuccoli (b. 1870), Virgilio Brocchi (b. 1876), Antonio Beltramelli (b. 1880), Guido da Verona (b. 1881) and Ugo Ojetti (b. 1871) who is also a very highly esteemed art connoisseur, and among the women writers Clarice Tartufari (b. 1868), Sibilla Aleramo (b. 1879), Neera (1846–1916), Amalia Guglielminetti (b. 1885) and Carola Prosperi (b. 1883) are the most popular. Generally speaking, most of these works are of value mainly as documents of social history rather than as literature.

The New School.—The younger novelists and story writers, though very numerous, shared a tendency to be egotistic, self-analytical and autobiographical, and cultivated a lyrical prose style. The lack of any national literary centre comparable with Paris or London has created regional groups united by geographical convenience, the individual members of which continued to follow, in part at least, the literary and intellectual tradition of their several provinces which, however, amounted to little more than impressionistic landscape-painting in words, as in the case of Carlo Linati, who in the finely written *Sulle Orme di Renzo* (1919) has given a poetical interpretation of the Lombard spirit as revealed in the countryside. The War practically destroyed narrow provincialism and successfully fused its best characteristics into a wider nationalism.

The great national and international reputation acquired by Croce and Gentile, both Neapolitans, the influence exerted on criticism by their review *La Critica*, founded in 1903, the fact that a considerable proportion of the best-known novelists and dramatists of the past 50 years (Capuana, Verga, Serao, Bracco, Pirandello) have been Southerners and, lastly, historical, geographical and racial conditions, have all contributed to produce a strong clan-feeling different from that of other regional groups. Of these the most important was perhaps the Florentine called "Gruppo della Voce," from the periodical of that name founded by Giovanni Papini and Giuseppe Prezzolini about 1909, itself the off-spring of an earlier review—*La Leonardo* (1903–7), which gave a great impulse to philosophical studies. Both periodicals had for their programme the revaluation of old values and the diffusion of new ideas in literature, art and philosophy. Scarcely one of the younger writers of any note did not contribute to one or the other of these reviews, which, in many cases, were the first to discover them. Not all of the contributors were of equal merit or free from any defects, but they showed the presence of a new spirit and vitality much needed, and exerted an influence as far reaching as it was important and often superior to their individual achievements. Papini (b. 1881), however, is the only one who is at all known outside Italy mainly on account of the much-advertised *Storia di Cristo* (1921), a work which has added little to a reputation really founded upon his autobiography, *Un Uomo Finito* (1912), *Cento Pagine di Poesia* (1915), and the brilliant provocative, and at times superficial critical essays *Stroncature* (1916). Papini's encyclopaedic mind, ever in quest of new knowledge and intellectual experience, admirably typifies the vices and virtues of the historical movement which came to an end on the outbreak of the World War. Papini, as the imposing bibliography of his works shows, has passed through many phases, Pragmatism, Futurism and later Neo-Catholicism, always preserving a style, essentially Tuscan in character, at times colloquial to the point of vulgarity, yet rich, vivid, lucid with a slight tendency to rhetoric. Giuseppe Prezzolini also wrote some excellent critical essays, mostly on his contemporaries, but later abandoned literature and philosophy for politics. Of the other principal contributors to *La Voce*, Scipio Slataper (1888–1915), a Triestino killed in the War, is best known for his noteworthy lyrical autobiography in prose, *Il Mio Carso* (1912) and a suggestive study on Ibsen published posthumously (1916).

Ardengo Soffici (b. 1879) is one of the most remarkable of the group. His best writings are a fragment of a novel, *Lemmonio Boreo* (1912), two autobiographical journals, *Giornale di Bordo* (1915) and *Kobilek, Giornale di Guerra* (1918), and the art criticism in *Il Caso Medardo Rosso e l'Impressionismo* (1909) and *Scoperte e Massacri* (1919). Soffici as a writer is both thoughtful and forceful and uses language impressionistically, frequently introducing exact and unexpected similes. The latter two works did much to rouse the artistic youth of Italy to an intelligent appreciation of the significance of modern art movements by their insistence upon the necessity for the art-critic to be an artist (Soffici himself was a painter of some repute) and thoroughly conversant with the technique of painting while possessing the capacity for feeling the values of form, colour and composition. Renato Serra, killed at the Front in 1915, was one of the most promising of the younger writers, who is best known for his remarkable psychological document, the *Esame di Coscienza di un Letterato*, published in 1916, in which he examines the attitude of an artist and an intellectual towards the War with great acuteness. The fact that some of it is mainly now of historical interest does not detract from its high literary value, which makes it and D'Annunzio's *La Leda senza Cigno* (1916–8) two of the very few works of art inspired in Italy by the War. Several other writers such as Federigo Tozzi (1883–1920), Ferdinando Paolieri (b. 1878), Bruno Cicognani (b. 1879) and Piero Jahier (b. 1884) also have points of contact, in spirit and in style, with the Florence group. Several journalistic and literary coteries were found in Rome, such as that of *La Ronda* (1919), a short-lived but lively periodical, edited by Emilio Cecchi (b. 1884). Among the contributors were Antonio Baldini (b. 1889) and Riccardo Bacchelli (b. 1891). Since the advent of the Fascist Govt., however, Rome is rapidly developing into the centre of Italian culture.

The Futurists.—It was very natural that the Futurist movement should have been started in Milan, since that city has always taken the lead in any new intellectual movement, and in the present case, as the most modern and "mechanical" city in Italy, was peculiarly adapted to be its headquarters. It is also significant that after the World War it moved to Rome with an entirely new body of supporters, though still under the leadership of its founder, F. T. Marinetti (b. 1878). In the first Futurist manifesto published in 1909 in the Paris paper *Figaro* Marinetti announced the new aesthetic of the machine, considered as symbol, source and teacher of a new artistic sensibility, and preached the beauty of speed. It was rapidly followed by the "Technical Manifesto of Futurist Literature" (1912), which decreed that syntax should be replaced by "wireless imagination and words at liberty," and by others dealing with the theatre, art, architecture and life. Apart from its sensationalism and self-advertisement and its principles of destructiveness, Futurism

e the less acted as an irritant and forced writers, and particu- poets, to react against stagnation and to define poetry anew, the difference between it and prose. Of the many books pub- ed by the first generation of Futurists some, like Filippo maso Marinetti's (b. 1878) extraordinary novel *Mafarka le Futuriste* (1910), *Le Roi Bombance* (1910), a play, written origi- y in French, and *Zang-Tumb-Tumb* or *The Siege of Adrianople* 2)—an experiment in "free-words"—are among the curios- of literature. On the other hand, Palazzeschi's (b. 1885) ically grotesque tale, *Il Codice di Perela* (1911), and the vol- of free verse *L'Incendiario* (1910), Luciano Folgore's (b. 8) *Canto dei Motori Versi liberi* (1912) and a few of Mari- i's earlier poems practically sum up the best literary ducts of the movement.

The Poets.—Carducci, Pascoli and D'Annunzio have had a ain number of followers and imitators, but either through of inspiration and technical ability or because fiction offered ore profitable market none have produced anything of defi- importance excepting Salvatore di Giacomo (b. 1860). He written some of the finest dialect poetry in Italian literature ired, like most of his other work, by the life of the Neapolitan ulace. The poignant "Tarantella scura," the dramatic son- sequence "A San Francisco," and the very beautiful song occhie de suonno," republished in *Poesie* (1907), possess the iversal quality of true poetry, which is sometimes found also few of Pascarella's and Trilussa's poems in Roman dialect. the others, Guido Gozzano (1883–1916), Marino Moretti 1885), Enrico Pea (b. 1881), Amalia Guglielminetti (b. 1889) e evidence at first of technical skill and lyrical vein which has e degenerated into affectation and mannerisms. As the very ful anthology, *Poeti d'Oggi: 1900–1920* (1920), edited by ini and Pancrazi paradoxically yet conclusively proves, those o write poetry to-day choose to do so by using prose instead of se for their medium. In this sense many of the writers dealt h above may justly be considered poets.

The Drama.—There have been since D'Annunzio some suc- sful attempts at poetic drama such as Benelli's historical gedies *Maschera di Bruto* (1909) and *Cena delle Beffe* (1909), tten in effective blank verse, Ettore Moschino's *Tristano e Ilda* (1910), Enrico Butti's fanciful *Castello del Sogno* (1910), l E. L. Morselli's (1882–1921) *Orione* (1910) and *Glauco* 19). The latter of these are written in lyrical prose and are by the best productions of this type of drama. Some of the other ywrights like Dario Nicodemi have portrayed, with varying ality, society life, according to the formula derived from the nch dramatists. Others, following the realistic tradition of puana, Verga and Giacinto Gallina, have written light come- s or dramas in dialect or local vernacular. Many of these are y charming and well constructed, especially the Florentine es, *L'Acqua Cheta* (1908) by Augusto Novelli and *I'Pateracchio* 10) by F. Paolieri. Some notable plays of the grand-guignol e have been written in Neapolitan dialect by Salvatore di acomo, *Assunta Spina* and *O' Mese Mariano* (1910), Ernesto urolo and Roberto Bracco, and, in Sicilian, by Pirandello *iolà*, 1917). The fame of Roberto Bracco as a dramatist sts, however, on *Piccola Fonte* (1905) and *Piccolo Santo* (1912), e latter being one of the masterpieces of modern Italian amatic literature. Most of his plays present psychological and iritual tragedies with hardly any external action, and are pro- uncedly feminist in sympathies. Technically, they are remark- le for austere simplicity of construction and lack of any ternal appeal to the emotions.

The essential difference between Bracco and Pirandello is that e is intellectual, the other cerebral. In Pirandello (*q.v.*) the amatic form is a natural step from the novel and the short ries, in which the characters are, *dramatis personae* always talk- g among themselves but unable to make each understood to e other, until they begin to doubt whether they really exist and e not shadowy forms conjured up by the imagination of those nong whom they live and by which they are bound. The dra- atic situations arise out of the contrast between what the in- vidual is, what he conceives himself to be and what others think him. What is reality, if indeed there be such a thing, and what is unreality? Is there a dividing line between madness and sanity? Can life have a meaning outside the ever-changing, and arbitrary value attached to it by an individual? These are the problems which constantly reappear in his fiction and in his plays—the logical, if extreme, outcome of the introspective and psycho-analytical tendencies of his period. Pirandello has revealed his sense of theatrical technique but his situations are the result of logic rather than of ingenuity. He is responsible for introducing a new prose style, clear-cut, dry and nervous on the stage, a considerable achievement which may have far-reaching effects on his successors.

Next to Pirandello, Rosso di San Secondo (b. 1887), a Sicilian known also for his short stories, and Federico Valerio Ratti, author of a remarkable tragedy on Judas Iscariot, are the most promising dramatists. The work of the former has as its dominant motif the contrast of Life governed by discipline as opposed to impulse, symbolised respectively by the North and the South. The characters of *Marionette, che Passione!* (1918), *La Bella Addormentata* (1919), which he describes as a "painted adventure," and *Lazzerina fra i Coltelli*, his most recent and abstract work, are allegorical and poetical, and achieve a certain original and dramatic effectiveness. Luigi Chiarelli's play, *La Maschera e il Volto* (1917), presents in light comedy form many of Pirandello's ideas. Its success, perhaps, was due to the label of "grotesque" which he gave it and subsequently adopted loosely to denote plays of a similar genre such as Luigi Antonelli's *L'Uomo che incontro se stesso* (1919), Fausto Maria Martini's *Fiore sotto gli Occhi* (1922), and Cantoni-Gibertini's *Fantoccio*; other experiments were encouraged more by the desire to appear original than by dramatic ability.

Criticism.—Towards the beginning of the 20th century critical theories underwent a considerable change. This was due to the general reaction against positivism and materialism in favour of idealism, which found its most eminent supporter in Benedetto Croce (*q.v.*) Many have applied these principles, and even those who disagree with them have felt their influence. Croce has further made some notable contributions to the history of Naples, not counting those to philosophy. In this respect Gentile shares with Croce the right to be treated as one of the most important philosophical thinkers of the present day and as a critic. Among the older idealist—though not Crocean—critics, Arturo Farinelli, author of *Il Romanticismo in Germania* (1911), *Michelangelo e Dante* (1918), and several other valuable works; Cesare de Lollis, and Alfredo Galletti, who succeeded Pascoli in the chair of Italian literature at the University of Bologna and to whom he had devoted a very brilliant and profound critical study, are the most important.

To these three university professors all of whom combined wideness of literary sympathies and knowledge with uncommon critical abilities, should be added the name of a younger man—G. Toffanin—who at the time of writing has already given several proofs of originality, talent and scholarship of a very high order. The work of the militant critics is represented among other works by Thovez's essays *Il Pastore il Gregge e la Zampogna* (1910) and *Mimi dei Moderno* (1919); by Renato Serra's *Scritti Critici* (1910), and *Le Lettere* (1914), a brilliant survey of contemporary literature and its characteristics, as well as by the critical writings of Papini and G. A. Borgese (b. 1882) who, besides the *Storia della Critica Romantica in Italia* (1903) has also written *Rubé* (1921) an interesting autobiographical novel. In some ways their views are often paradoxical and exaggerated, but they possess, however, the frank enthusiasm and charm of youth added to knowledge and aesthetic appreciation.

ITALO-TURKISH WAR.—Following the diplomatic discussions which took place between Rome and Constantinople during the summer of 1911, an ultimatum from Italy was delivered to the Porte on Sept. 28, demanding Turkey's consent to a military occupation of Tripolitania and Cyrenaica. A period of 24 hours was set by the ultimatum, and as the Turkish reply did not meet the Italian demands a state of war was declared as from 2:30 P.M. on Sept. 29.

Italian Naval Activity.—Military action was slow to succeed the formal declaration of war, and it was not till Oct. 11 that the first transports reached Tripoli. Meanwhile the Italian navy had been busy. On Sept. 28 a squadron appeared off Tripoli, and notice was given that if the town were not surrendered it would be bombarded. The obsolete fortifications were bombarded for two hours on Oct. 3, after the Turkish authorities had declined to surrender the town. By next day, the Turkish garrison, acting upon orders received from Constantinople, had retired into the sandy plains, and on Oct. 5 a force of 1,600 sailors was disembarked.

Meanwhile hostilities had been begun elsewhere. On Sept. 29 and 30 Italian destroyers under the command of the Duke of the Abruzzi sank the Turkish torpedo-boats off Prevesa in Epirus and on Oct. 1 Admiral Aubry left Augusta to go in search of the Turkish fleet, which the declaration of war had found at Beirut. But the orders given him were suddenly countermanded, and instead of steaming to the Aegean in order to intercept the Turks, he was sent to Tobruk, which was occupied by a detachment of sailors on Oct. 4.

The renunciation of the attempt to cut off the Turkish fleet was inspired by political reasons. The Italian Govt. believed that the Porte would soon realise that it was impossible to defend the Tripolitan provinces, and would be willing to enter into some arrangement that would satisfy Italian aspirations and save the face of Turkey. Another reason was the desirability of localising the conflict. Other European Powers were not willing that hostilities should be extended, and the other members of the Triple Alliance were particularly energetic in their disapproval.

Italian Expeditionary Force.—A week elapsed between the landing of the sailors at Tripoli and the arrival of the expeditionary force, and it was not till Oct. 20 that all the equipment had been put on shore. The force consisted of some 9,000 rifles with a few field and mountain batteries and two squadrons of cavalry. There was very little transport, for it had not been anticipated that the Turks would retreat towards the interior and receive support from the native tribesmen. That Neshat Bey, the Turkish commander in Tripoli, did receive this support was largely due to two men—Ferhat Bey, deputy for Tripoli and Suleiman el Baruni, a Berber from Fessato, who was deputy for the Jebel region.

Meanwhile Homs, Derna and Benghazi had been occupied. There was some resistance at each place, especially at Benghazi, but the first fighting of any importance was a sudden attack on Oct. 23 upon the Italian lines at Shara Shat in the Tripoli oasis, backed by a rising behind the lines. Two companies of Bersaglieri were cut to pieces, and the rest of the regiment were hard put to it to hold their own. Further attacks led to a withdrawal of the line, and to the clearing of the oasis behind the trenches.

Large reinforcements were sent from Italy, and by the fourth week in Nov. Gen. Caneva, who was in command of the expedition, had about 25,000 rifles and 16 batteries. He took the offensive, and in two actions cleared the oasis and sent the Turks and their tribesmen allies packing. Turkish headquarters were established at Aziziya, some 30 m. south of Tripoli.

Political Aspect.—At the beginning of Nov. the Italian Govt. had considered the possibility of extending the theatre of war, on the sea at least, in the hope of inducing Turkey to give up the struggle. Austro-Hungary intervened, backed by Germany, invoking Article VII. of the Triple Alliance. Italy's action being limited in this way, it was necessary to solve the problem directly, but the task was more difficult than it need have been owing to the limitations laid upon Gen. Caneva by the Italian Government. Gen. Caneva's orders appear to have been that he must not risk reverses or suffer heavy loss. In circumstances, an expedition in pursuit of the Turks and t mobile allies seemed hardly practical.

In any event, months went by without any action of im tance in Tripolitania. In Cyrenaica there was one fight r Benghazi, when a force of Arabs who had come near the t were attacked and severely punished. Derna was closely b throughout the winter, and Enver Bey, who had succeeded reaching Cyrenaica towards the end of the year, organise formidable resistance, securing relative unity among the tril men, and a willingness to co-operate with the Turks, which never before existed.

Italian Offensive Renewed.—In April, the long spell of in tion in the western province came to an end, and from that t onward the resistance of the Turks and Arabs was gradu broken by a series of operations at various points.

In April, also, Italian warships appeared off the entrance the Dardanelles. They were fired on by the Turkish forts their answer drew a fresh and very energetic protest from Vien The northern Aegean was left alone by the Italians hencefo but in May the island of Rhodes and 12 small islands of Sporades (subsequently famous as the Dodecanese) were oc pied by Italy. During the summer there were a number of s cessful actions in Tripolitania, and peace negotiations w begun at Ouchy in August. Progress was very slow, and it not until Oct. 15, when two important victories had been by the Italians, at Derna and Sidi Bilal (near Zanzur) that Treaty of Ouchy was signed.

Conclusions.—The conduct of the Tripoli campaign was pr diced, first, by the failure of the Italian Govt. to judge the sit tion correctly, and secondly, by the limitations which were upon the military command. It was not possible at once launch a desert expedition, and the difficulties of an advance the Jebel, through country largely waterless, may be said justify the adoption of a less ambitious plan. What is difficul understand is the practical veto upon action of any kind, wh immobilised large forces from Dec. till April and dela the carrying out of the policy which eventually put an end hostilities, the policy of extending the area of operations striking a blow whenever the chance offered.

The operations of the summer changed the situation, but I ian prestige was not wholly restored by the later successes, o the subsequent actions against the tribesmen who did not down their arms when the treaty was signed. The policy of Government bore heavily upon the army, which came in much unfair criticism and increased the difficulties of those undertook the administration of the country after the pe The troubles which were to come with the outbreak of the W War may be traced in part at least to the hesitations and un tainties of the six months following the landing.

ITALY (*see* 15.1).—A country of Southern Europe and a m ber of the League of Nations. The additions to the territory Italy under the peace treaties are shown in the attached r (*see* also ST. GERMAIN, TREATY OF). The area was increased 9,005 sq. m. to a total of 119,624 square miles. The census 1921 gave a total population of 38,755,576. The population of new territories at the date of the census was Trento Ven Tridentina 641,747; Fiume, Pola, Trieste and Zara (toget constituting Venezia Giulia) 728,544; making a total acces population of 1,370,291.

I. POLITICAL HISTORY

The Giolitti Government.—On the resignation of the Luzz Cabinet (March 18 1911), Sig. Giolitti formed a governm During the previous few years relations with Turkey had come strained owing to the restrictions placed by the Porte Italian enterprise in Tripoli, the only part of North Africa wh

lian expansion was still possible. At the same time the policy of Germany aroused the suspicion that she was contemplating action in that province. The Nationalist movement, created at the Florence Congress of 1910, and directed towards awakening the country to the necessity of a more vigorous foreign policy, advocated the occupation of Tripoli. The success was such that Giolitti himself, anxious as he was to avoid foreign complications, could not afford to disregard it.

After a series of diplomatic incidents, an ultimatum was presented to Turkey on Sept. 28 1911, and no satisfactory answer being obtained, war was declared on the 29th. Except for the Socialists, public opinion strongly supported the government, regarding the war not merely as a colonial enterprise, but as a patriotic reaction against the old pusillanimous policy and the petty intrigues of Parliament. On Nov. 5 Italian sovereignty was extended to Tripolitania and Cyrenaica. Foreign Powers were not friendly to Italy's African policy, and while Austria forced a veto on the extension of the campaign to the Balkans, a serious diplomatic incident arose with France over the searching of Italian cruisers of the French steamers "Carthage" and "Manouba," suspected of carrying contraband. Although the affair was satisfactorily settled at The Hague, it did not improve Italo-French relations. On Oct. 15 1912 the peace preliminaries were signed at Ouchy, and the treaty on the 18th, the Sultan retaining only spiritual authority over the inhabitants of the annexed territories, Italy remaining in occupation of Rhodes and the Dodecanese until Turkey had withdrawn all her troops from Libya and fulfilled her other treaty undertakings. The total cost of the campaign had been 458 million lire. Fighting, however, did not end immediately, as the Arabs, secretly supported by Turkey, continued to resist in the interior.

Sig. Giolitti's proposals for the extension of the franchise (raising the electorate from three to eight million voters), payment of members and a government monopoly of life insurance were voted without much opposition, as Parliament did not wish to embarrass the Cabinet during the War. At the Socialist congress of Reggio Emilia (June 1912) a group of leaders, including Leonida Bissolati and Ivanoe Bonomi, who approved of the government's African policy, were expelled from the party and formed a new group called the Reformist Socialists, prepared to collaborate with the Constitutional parties. The majority styled itself thenceforth the "Official" Socialist party. In the field of labour there were strikes at the Fiat works in Turin, and among the agricultural workers of Ferrara and a general strike at Milan in the summer of 1913.

During the Balkan Wars of 1912–3 Italy and Austria had agreed to the creation of an independent Albanian state, thereby excluding the Serbs from Durazzo and the Greeks from Valona. In spite of this settlement and of the Marquis di San Giuliano's attempts to arrive at a friendly understanding with Austria, relations were strained to breaking-point by Austria's treatment of her Italian-speaking subjects and the menaces of the Austrian military party against Italy.

At the elections of Oct. 26–Nov. 2 1913, under the extended franchise, the Socialist group was increased to 79. For the first time a Catholic party presented itself to the polls, the Pope having withdrawn the *non expedit*, and 33 Catholics were returned, while a number of Liberals and Democrats owed their success to Catholic support. Sig. Giolitti's position was somewhat shaken, for, although the Socialists were ready to give him tacit support in exchange for concessions to their co-operative societies and certain measures of a demagogic character, disagreement among his own followers over the question of Catholic support, and the threatened railway strike were likely to cause trouble. On March 10 1914 he resigned and was succeeded by Antonio Salandra, a Right-wing Liberal of high standing. San Giuliano remained at the Foreign Office, but Gen. Spingardi was succeeded as War Minister by Gen. Grandi. The revolutionary *Sindacato ferroviari* now demanded a general increase of wages, but, owing to financial difficulties, the government could offer an increase only to the lowest categories; the *Sindacato* threatened a strike, but eventually gave way.

On the national festival of the Statuto (June 7 1914) riots broke out at Ancona because the authorities had forbidden the holding of an anti-militarist meeting. A general strike ensued in the town and the trouble spread to other parts of the Marche, to Romagna, and most of the larger cities. The movement was of a mainly revolutionary character; its leader was the Anarchist Enrico Malatesta, and Benito Mussolini (*q.v.*), editor of the *Avanti*; played a prominent part in it. For a week many towns were under mob rule, until a popular reaction led by the Nationalists cleared the streets of the seditious elements and the troops and police restored order. Sig. Salandra was criticised for his lack of energy in dealing with the outbreak, while the Socialists attacked him for his "reactionary" methods; a group of Giolittian deputies, headed by Orlando and Schanzer, tried to bring about his fall, but he secured a vote of confidence.

The World War and the Peace

The Austrian ultimatum was presented to Serbia on July 23 1914. Italy co-operated with Great Britain in trying to avert a catastrophe, and public opinion, although realising that if a *casus foederis* under the terms of the Triple Alliance were to arise, Italy would be bound to stand by her Allies, was hostile to the idea of siding with Austria. General relief was caused by Italy's declaration of neutrality on Aug. 3 which was based on (1) Austria's failure to co-ordinate with Italy before taking action, (2) the fact that Italy had not been given time to act in favour of peace, or to make adequate military preparations and (3) the fact that Italy was not bound by the terms of the Alliance to take part in an aggressive policy. It was afterwards announced that no *casus foederis* could arise for Italy in a conflict in which Great Britain was involved.[1]

Neutrality declared, military preparations began. The reorganisation and re-arming of the whole army was largely the work of the new Chief of the General Staff, Gen. Luigi Cadorna (*q.v.*). The question now was whether Italy should remain neutral to the end of the War. The Triplicists, although fairly numerous in Conservative and diplomatic circles, and in a part of the army, hardly went so far as to advocate intervention on the side of the Central Powers, for the invasion of Belgium had created a very unfavourable impression, but they advocated neutrality. The Catholics were neutralists from dislike of "atheist" France and Orthodox Russia and from sympathy with Catholic Austria. The "Official" Socialists were neutralists because they opposed all war except class-war, but ended by openly espousing the Austro-German cause. The Nationalists, Irredentists and some Liberals, realising that this was the last chance for completing Italian unity and affirming Italy's position as a Great Power, favoured intervention, while the Democrats, Freemasons, Republicans and Reformist Socialists were interventionists from sympathy with France. Mussolini's little group of Syndicalists desired intervention, partly for the same reason as the Nationalists, but also in the hope that war would promote social changes. Mussolini resigned the editorship of the *Avanti!* and founded a new paper, *Il Popolo d'Italia*, which supported intervention.

On Oct. 9 1914 Gen. Grandi resigned on account of a disagreement with Gen. Cadorna, and was succeeded by Gen. Zupelli. A week later the Marquis di San Giuliano died, and the Prime Minister temporarily took over the Foreign Office. On Oct. 31 the Treasury Minister Rubini resigned on a question concerning the supply of funds for the army, and the Cabinet followed suit. But Sig. Salandra himself reconstructed it by Nov. 5, and selected Baron Sonnino as Foreign Minister. Owing to the troubles in Albania, the departure of Prince William of Wied and the Greek invasion of the southern districts, Italy occupied the islet of Saseno on Oct. 31, and on Dec. 26 the town and harbour of Valona. 1915 began with a serious earthquake in the Abruzzi (Jan. 13), which caused the death of 30,000 people.

The Treaty of London.—Meanwhile the interventionist tendency grew stronger. Both Salandra and Sonnino were determined not to let the War end without trying to acquire at least

[1] *See* Europe. The treaty of 1882 stated that "the treaty was not in any case directed against England."

a part of the Italian districts of Austria, and to secure a rectification of the frontiers of 1866 which left Italy open to invasion. In Dec. 1914 Italy had reminded Austria that the invasion of Serbia, by tending to destroy the balance of power in the Balkans, gave Italy a right to compensation under the terms of Article 7 of the Alliance as renewed in 1887. Austria began by rejecting the claim, then suggested compensation at the expense of France, and finally offered a part of the Trentino to be ceded after the War, but Sonnino insisted on immediate cession, and to this Austria at last agreed. Sonnino demanded all the Trentino, the Isonzo valley, some of the Dalmatian islands, a free hand in Albania and the formation of Trieste and Northwestern Istria into an independent state, Italy in return to remain neutral to the end of the War. As Austria continued to give evasive replies, Italy opened negotiations with the Entente. On April 26 1915 the Treaty of London was concluded between Italy, Britain, France and Russia, to be completed by naval and military conventions. Italy undertook to intervene, and was promised the Trentino and Upper Adige valley to the Brenner pass, Trieste, Gorizia-Gradisca, Istria and the Istrian islands, Cherso and Lussin, Dalmatia as far as Cape Planka, Valona, full possession of Rhodes and the Dodecanese and in Asia Minor a zone of influence and eventually a share in its partition. If an independent Albania were created, it would be under Italian control, while Italy would not oppose the cession of the northern and southern districts to Serbia and Greece if the other signator so desired.

The poet D'Annunzio by his fiery speeches, and Mussolini by his articles, largely influenced public opinion in favour of intervention. On May 3 1915 Italy denounced the alliance with Austria, but Prince von Bülow made a last effort to secure Italian neutrality through Giolitti. That statesman believed in the necessity for neutrality, as he had no confidence in Italy's powers of resistance, and, although informed by Salandra of Italy's engagements with the Entente, he continued his neutralist activities in collaboration with von Bülow. Salandra, knowing that if Giolitti declared his opposition, the Cabinet must fall, resigned on May 13. It seemed as though Giolitti's triumph were assured, but the voice of the country then made itself heard. Huge popular demonstrations in favour of Salandra and intervention were made all over Italy, and the King refused Salandra's resignation; Austria's final offer, no improvement on the last, communicated by Von Bülow to Giolitti before being communicated to the government, was rejected.

Italy Enters the War.—On May 20 1915 the Chamber and the Senate granted the Government full powers. Neutralism and Germanophilism had apparently disappeared, except among the Official Socialists. On the 23rd the general mobilisation was ordered, and on the 24th war against Austria was declared, while diplomatic relations with Germany were broken off. Owing to the persecution of Italian subjects in Turkey and Turkish assistance to the rebels in Libya, where Italian occupation was reduced to Tripoli and Homs and a port of Cyrenaica, War was declared against the Porte on Aug. 21, and against Bulgaria in September. On Dec. 1 Baron Sonnino adhered to the London Agreement, undertaking not to conclude a separate peace. An expeditionary force was sent to Albania, where it saved the remnants of the Serbian Army driven from its own country.

The initial successes of the Italian offensive were satisfactory, but did not lead to definite results. The subsequent defeats sustained in the Trentino and on the Asiago plateau (May 1916) shook the Cabinet's position, and on June 10 Sig. Salandra resigned. The Giolittians regarded this as a victory of theirs, but the new Cabinet was in no wise Giolittian. Sig. Paolo Boselli, the veteran statesman, respected by all parties, formed a Cabinet in which all shades of opinion, except the Socialists and Neutralists, were represented. Sonnino remained at the Foreign Office, while Orlando was transferred from the Ministry of Justice to that of the Interior.

The Austrian Trentino offensive had delayed Gen. Cadorna's attack on Gorizia, but this was now resumed, and on Aug. 4 1916 after 11 days' desperate fighting, the fortress fell and public confidence was thereby restored. That same month an expeditionary force was sent to Macedonia where it played a distinguished part in the Eastern operations. On Aug. 27 Italy declared war on Germany, owing to the assistance she had afforded to Austria and the seizure of Italian property by the Imperial Government. In April 1917 the British, Italian and French Premiers concluded a convention at St. Jean de Maurienne wherein it was agreed that in a future partition of Anatolia the Smyrna area was to be assigned to Italy.

During the operations of 1916 and 1917 the Italians achieved some important successes, and above all pinned down Austria's best troops, preventing her from sending reinforcements to the West. But the protracted struggle, the fearful losses, the collapse of Russia, and the grave privations at home had accentuated the feeling of depression in Italy, to which enemy and neutralist propaganda contributed. The Socialists fomented discontent. Claudio Treves's phrase, "next Winter not a man in the trenches," the German peace offensive, the Pope's allusion to "the useless carnage" and the defeatist campaign of the Giolittians began to affect public opinion and the war-weary troops. There were revolutionary riots in Turin (Aug. 1917) and signs of a diminished military spirit among certain units at the front. Gen. Cadorna had repeatedly warned the government, and particularly the Minister of the Interior, Orlando, but no attention was paid to him. This state of affairs and certain military errors of Generals Cadorna, Capello, Badoglio and others resulted in the Caporetto disaster (Oct. 23 1917).

The Recovery.—After a defeat of these proportions it appeared impossible that the army and people could recover. But by Nov. 22 the army had reconstituted its front on the Asiago-Grappa-Piave line, and the enemy's advance was definitely held. The British and French forces hurried to assist Italy, but did not come into action till December. Cadorna was relieved of his command and succeeded by Gen. Diaz. At the Rapallo international Allied conference on Nov. 4 the Military Committee of Versailles was formed. In consequence of the Caporetto disaster the Boselli Cabinet resigned (Oct. 26), and on the 30th Sig. Orlando succeeded, he himself becoming Prime Minister, Sonnino remaining at the Foreign Office and Nitti became Treasury Minister. The necessity for relieving the refugees from the invaded area was a serious problem, but it was efficiently handled, and the sight of the refugees helped to strengthen the spirit of resistance. The army was rapidly reorganised and the losses in material made good through the enterprise of the Italian manufacturers and the technical genius of Gen. Dalollio, Minister of Munitions.

On Jan. 8 1918 President Wilson published his famous Fourteen Points. Those referring to Italy—"the rectification of the Italian frontiers on clearly recognised national lines," and "autonomy" for the peoples of Austria-Hungary—were of a nature to raise anxiety as to his intentions. From April 8 to 10 the congress of nationalities oppressed by Austria met in Rome, and although organised by a private committee, its delegates were received by Orlando, to whom they presented the so-called "Pact of Rome," this should have been an earnest of mutual good-will between Italy and the Yugoslavs, but it had no binding force and compromised the solution of the territorial problems involved. Meanwhile the Yugoslavs were conducting a propaganda to induce Britain and France to rescind the objectionable clauses of the London Treaty, and even proposed that, should Italy remain obdurate, the Allies and America should cut off her supplies of food and fuel, a request which was rejected. The economic situation was becoming worse, but Italy submitted to privations greater than those of any other Allied country. The shipping losses were serious, the bread ration was reduced to 250 grammes per head per day, meat was sold only twice a week, and many goods were unobtainable.

In June 1918 the Austrians launched a powerful new offensive on the Asiago-Piave front, but after a few initial successes, were driven back with heavy losses. The Italian contingent in Macedonia, commanded by Gen. Mombelli, contributed materially to the victory in the Balkans (Sept. 15–29). On Oct. 24 Diaz launched his attack on the Austrians from Asiago to the sea, and by Nov. 3 "what had been one of the most power-

ies in the world," as the victory communiqué stated, "was ihilated." Some 600,000 prisoners, 7,000 guns and immense ntities of material were captured. The same day at Villa sti near Padua the armistice between the Italian and tro-Hungarian armies was signed, the enemy under- ng to evacuate all the territories assigned to Italy by the don Treaty. The Armistice came into force on Nov. 4, fol- ed a week later by that with Germany; to the latter's col- e the Italian victory had contributed, as it had opened the into the heart of Germany. The whole area within the Ar- tice line was rapidly occupied, as well as certain points be- d it for the maintenance of order. Italy's losses had amounted vell over 600,000 killed and a million seriously wounded, in- ling 220,000 permanently disabled. The knowledge of these es created a deep impression in Italy, but it was felt that they e not adequately appreciated in Allied countries.

The Peace Conference.—On Feb. 7 1919 the Italian Govt. pre- ted a memorandum to the Peace Conference, embodying and ifying its territorial claims, which corresponded to those eed upon in London, but Fiume was also mentioned, because Oct. 31 1918 the National Council of that town had, in the ne of the Italian majority, applied for annexation to Italy. ere were no difficulties about the Trentino as its population wholly Italian. The Alto Adige contained a German- aking population, but it would have been difficult to devise a isfactory frontier south of the Brenner. In the Venezia Giulia ut half the population was Italian, but many of the Slavs been recently imported by Austria to swell the non-Italian centage; of the natives the majority were Italian, including the more civilised inhabitants. In Dalmatia the great major- was Slav, but the civilisation and traditions of the province e Italian. Italian public opinion was unanimous in desiring atisfactory frontier and the protection of the *Italianità* of the lian communities east of the Adriatic, but was divided as to details of the settlement. The Nationalists demanded the aty of London territories plus Fiume. The *rinunciatari* were dy to give up Dalmatia, part of Istria and the Trieste hinter- d, because they wanted to conciliate the Yugoslavs and disre- ded strategic necessities, but demanded Fiume. Sig. Bissolati, nister without portfolio, wished even to renounce the o Adige. In the Italian Peace Delegation too, opinion was ided; while Sonnino stuck to the Treaty of London and did t insist on Fiume, Orlando demanded the latter, but was pre- red to compromise on Dalmatia. The Yugoslav counter- ims extended to the old Italo-Austrian frontier and even yond it, and this attitude aroused much indignation in Italy, more so as, until the very eve of Austria's collapse, the Croats d Slovenes had behaved as faithful subjects of the Dual onarchy and had fought in the war against Italy, whereas w they made their claims posing as Allies, and were treated as ch by British, French and American statesmen.

The Government had many internal difficulties to contend th. The army could not yet be demobilised owing to the un- ttled conditions on the frontiers and the necessity for keeping rces in Albania, Bulgaria, etc. In Italy itself the Socialists and mmunists, now that the war régime and the censorship were laxed, took advantage of the general weariness of the people to ment revolutionary agitation, hoping to emulate their com- des in Russia. The financial situation was serious and Sig. itti's budget statement for 1917–8, presented on Nov. 2 1918, owed a deficit of 6,271 millions. Sig. Bissolati, disagreeing ith his colleagues over the Alto Adige and Dalmatia, resigned. n Jan. 1 1919 the state of war was declared at an end throughout aly, except in the Veneto. On the 3rd, President Wilson ar- ved in Rome and was received with frenzied enthusiasm as the an who had contributed the most to end the War, but the linisters who discussed politics with him suspected him of little mpathy with the more extreme Italian aspirations.

The Adriatic Question.—The ministerial crisis initiated by issolati's resignation came to a head on Jan. 18, and resulted in ie resignation of Nitti, who wished to prepare the way for suming the premiership himself, and of four other ministers. The Italian Peace Delegation to the Paris Conference, which first met on that same day, was composed of Sig. Orlando, Baron Sonnino, Sig. Salandra, Sig. Barzilai and the ambassador, Marquis Salvago-Raggi. On Feb. 17 the debate on the Adriatic question began, but led to no result. In the meanwhile frequent incidents between Italian and Yugoslav soldiers occurred on the frontier. The Adriatic debate in Paris was adjourned to give precedence to the treaty with Germany; to this the Italian delegation agreed, accepting all the proposals of the Allies, including the partition of the German colonies from which Italy was excluded. The delegation was severely blamed in Italy on this account. The Adriatic discussion was then resumed, and on April 23 Wilson published his famous appeal to the Italian people over the heads of their government, setting forth his reasons for opposing certain claims. The message caused wide-spread astonishment as a violation of the rules of secret diplomacy, while in Italy it aroused great indignation. Orlando started for Rome on the 24th to consult Parliament and the country, and was received with enthusiastic demonstrations. In the Chamber his policy was approved by 382 votes to 40 and found adherents even in the Socialist camp.

D'Annunzio took up the Fiume-Dalmatia question with fiery eloquence, and the Nationalists urged the government to annex both. Orlando failed to take advantage of the anxiety of Britain and France that Italy should sign the treaty with Germany, or of Wilson's desire that she should adhere to the League Covenant, to secure advantages for his country, and on May 5 he returned to Paris without having obtained any guarantees for Italy's claims. He found the German treaty ready and Italy's diplomatic position worse than when he had left. Discussions on the Adriatic question were resumed, and various proposals for its solution were advanced, including one suggested by M. Tardieu, on which agreement would have been possible, if President Wilson had not agreed to rejection by Yugo-Slavia. Orlando returned to Rome in June, and on the 19th he was beaten in the Chamber and resigned. Sig. Nitti now formed a new Cabinet, with Senator Tittoni at the Foreign Office, Senator Schanzer at the Treasury and Gen. Albricci as War Minister. On June 28 the new Peace delegation, presided over by Senator Tittoni, left for Paris, and the same day the treaty with Germany was signed by Baron Sonnino and the Marquis Imperiali.

Internal Troubles.—The internal situation now grew more serious. Prices had risen considerably. The government's measures for limiting them merely made the goods disappear for a time and then reappear at still higher prices. The bread subsidy involved a huge deficit in the budget, the doles to the unemployed encouraged idleness, and the regulations hampering trade rendered production ever more difficult. The workers received high wages, but were discontented because prices were rising, while both they and the war profiteers indulged in an orgy of extravagance. The people with fixed incomes felt the pinch most, but everyone grumbled. The Socialists, who now adopted the name of "Maximalists" to affirm their dependence on Moscow, encouraged the workmen in the belief that the War had been fought solely to enrich the capitalists, and that now it was the workers' right to secure all the wealth of the country. Ex-neutralists also helped to foment discontent. In Jan. 1919 the Partito popolare italiano (Catholic) was formed; it had a more definite programme and a more complete organisation than the old Catholic group, and it developed rapidly under the guidance of its political secretary, the Sicilian priest, Don Luigi Sturzo. It advocated reforms of a Christian-Socialist character, including the expropriation of the landed estates for the benefit of the peasants, but with compensation to the landlords. Its foreign policy professed to be patriotic, and favoured co-operation between capital and labour. It attracted some peasants and workers who would otherwise have gone Red.

A series of avowedly revolutionary strikes broke out in every trade, and even in the public services. A postal strike was threatened in Dec. 1918, fomented by the Socialist party, and only called off on the government's promise of higher wages. During a Bolshevik demonstration on April 13 1919 at Milan, a shot was fired at a patriotic *cortège*, which provoked a reaction in

the crowd and the offices of the Socialist paper *Avanti!* were wrecked. Strikes of tramwaymen, employees of the secondary railways and the merchant seamen followed in quick succession.

At the Peace Conference, during the absence of the Italian delegation, Mr. Lloyd George and M. Clemenceau ignored the St. Jean de Maurienne agreement, and in accord with President Wilson decided to send Greek troops to Smyrna. Immediately after the Greek landing Italian troops occupied various points in southwest Anatolia. Italian forces co-operated with the British and the French in occupying other parts of Turkey, but the Italian view was that real peace could only be secured by a more conciliatory attitude towards the Turks. At the same time, in order to try to conciliate Greece, Sig. Tittoni concluded an arrangement with M. Veniselos in July 1919 for the delimitation of their respective spheres of military occupation, leaving the Greeks a free hand in Southern Albania. This last clause had an unfortunate effect on Italo-Albanian relations, but the whole agreement was afterwards rescinded, as Greece proved unable to carry out her part of the bargain. Meanwhile Italian steamship companies, banks and business firms showed considerable enterprise in the Near East.

D'Annunzio and Fiume.—Fresh troubles broke out at Fiume (*q.v.*), where on July 2–5 1919 the alleged antipathy of the French troops (mostly colonials) to the Italians and alleged sympathy with the Croats, led to reprisals, in which some French and Annamite soldiers were killed or wounded. The Peace Conference thereupon appointed an inter-Allied commission of inquiry, which proposed the dissolution of the Fiume National Council, elections to be held under inter-Allied control, the disbanding of the Fiume volunteers, the reduction of the Italian garrison, and the importation of British or American police. These proposals were about to be carried out when on Sept. 12 D'Annunzio arrived at Fiume from Ronchi, at the head of some Italian troops, whom he had induced to follow him to save the town for Italy, and a number of volunteers. Most of the Italian troops and seamen in the town and port joined him, and he set up a government of his own. The Allied troops departed, and Nitti stigmatised the poet's conduct in the most violent terms, calling on the workmen and peasants of Italy to back him up against the *Patriotards*. But a large part of Italian opinion supported D'Annunzio, and volunteers, including men of the highest character and also many adventurers, flocked to his standard.

Riots against high prices broke out in the summer of 1919 in various parts of Italy, and agents of the Chambers of Labour illegally requisitioned foodstuffs and other goods for which they paid prices far below the market rates. The Government did nothing. The Socialists and Communists then organised a general protest strike for July 20–1 against the policy of the bourgeois governments towards Soviet Russia and Hungary. But there was no revolutionary outbreak, and the strike was only partial, largely owing to the beginnings of reaction on the part of public opinion voiced by the various citizen committees, rather than to government action. The Fascist movement, under Benito Mussolini now began to arise as a patriotic reaction (*see* FASCISM). Strikes and disorders continued in various parts of Italy, but Sig. Nitti expressed the belief that the only remedy was to let the spirit of unrest wear itself out, regardless of the immediate danger to the country. He had created a new police force, the Guardia Regia, which, however, proved costly and unequal to its duties. The Premier's treatment of the army caused much dissatisfaction. In his desire to restore the "Peace spirit," he failed to protect the soldiers from outrage and insult, and advised them to go about in mufti and disarmed when off duty. A decree of the Minister of War, issued at the instance of Sig. Nitti, granted an amnesty to deserters, thereby placing them on an equal footing with those who had done their duty in the War. In consequence of the findings of the Committee of Inquiry on Caporetto, Cadorna and other generals were put on the retired list.

On Sept. 10 1919 the Peace Treaty with Austria was signed at St. Germain-en-Laye (*see* ST. GERMAIN, TREATY OF), whereby Italy definitely acquired the frontiers assigned to her by the Treaty of London on the north and northeast, plus the Sexten valley and Tarvis. The German inhabitants of the Alto Ad were dissatisfied with this decision, but their treatment that time gave no reason for discontent. On Nov. 12 Sena Tittoni resigned from the Foreign Office and the peace d gation, and was succeeded by the eminent jurist, Sena Vittorio Scialoja.

INDUSTRIAL AND POLITICAL UNREST

In spite of, or because of, the government's restrictive me ures, prices had more than doubled. The government had m the wheat trade a state monopoly. While it requisitioned dom tic wheat at a price below the cost of production, it had to b foreign wheat at the market price. Thus wheat-growing discouraged at home, and bread was sold below cost ther increasing the deficit by six milliards. Transport was disorg ised. While the traffic had decreased, the staff, for demagc reasons, had been increased from 154,000 to 180,000, and af wards to 240,000; the railwaymen had become more and m idle and insubordinate and were wholly under the influence the revolutionary syndicate, and thefts of goods on the railw had reached unheard-of proportions.

The Extremists.—By the electoral law of Sept. 1919 the prop tional system, whereby the voter voted not for a candidate but a list, was adopted to please the Socialists and the Popolari, w as the only two mass parties hoped to derive benefit from it. Socialists at the Bologna Congress decided to present a M malist programme demanding the abolition of capital and institution of a Soviet Republic, but the extremist group p posed abstention from the polls and an armed rising. The Po lari decided to present their own candidates instead of co-oper ing with other parties; an extreme wing, led by Sig. Migli promoted strikes and disorders and differed little from the Soc ists. The Constitutional groups were split up and were with a programme or organisation. The government was discredi and unpopular. The elections were held on Nov. 16 1919: Socialists, 101 Popolari and 30 Combatants were returned, none of the Fascist candidates. On the opening of Parliam by the King on Dec. 1 the Socialist deputies withdrew from Chamber, and as a protest against this insult a patriotic dem stration was held outside, in which some Socialist deputies w injured. A general strike was proclaimed in consequence, at Mantua there were serious riots, the anarchists committing s eral murders, breaking open the prisons and pillaging the sho

Fresh incidents occurred on the Adriatic coast, and at S lato (Split) the Yugoslav mob attacked the Italian inhabita under the eyes of the American admiral. Early in Oct. Sena Tittoni had proposed a *modus vivendi* to D'Annunzio, where Italian troops would occupy Fiume pending a settlement Paris, Italy undertaking not to permit the annexation of Fiu to Yugoslavia; but D'Annunzio refused to agree. At the Pe Conference various proposals were suggested, but the Al and the United States reached no settlement.

The Socialist successes at the election resulted in further orders. On Jan. 13 1920 the postal employees went on str because their demands for higher wages were not instantly co plied with; volunteers replaced the strikers, in spite of offi discouragement, and this broke the back of the agitation. I on the 22nd the railwaymen struck, and although here too v unteers enabled the management to maintain a reduced servi on the 29th Sig. Nitti came forward with concessions and und took not to punish a single striker, in spite of the explicit p visions of the regulations. The strike ended in a triumph for t revolutionists. In the spring there was a two months' strike the secondary railways of Lombardy, and one at the Mazzo cotton mills in Piedmont, where the government legitimised t arbitrary seizure of the factories by the workmen. The railwa men in general refused to run trains conveying soldiers or pol to places where there were disorders; there was a railway str at Cremona and elsewhere because the station-master, who h dared to dispatch a train supposed to be conveying war mate to Poland, then at war with Soviet Russia, was not dismiss

Sig. Nitti, finding himself unable to conduct the Governme

e face of the growing opposition, had resigned a first time on
:h 12 1920, but as no one else was prepared to assume office
ese difficult conditions, he reconstructed his Cabinet with a
hanges. On April 17 the Supreme Council met at San Remo
epare the peace with Turkey, the Adriatic problem was also
discussed, but at the request of M. Trumbich, the Yugo-
Foreign Minister, direct negotiations were instituted at
nza a few days later. On May 12 the Cabinet, having been
ted in the Chamber, resigned, and the crisis broke up the
nza conference. No other combination having proved pos-
, Sig. Nitti was again asked to reconstruct his Cabinet, which
ccomplished by May 21, but even in its third reincarnation
oved stillborn. The Prime Minister's failure to solve the
atic problem and the indignation aroused by the arrest of
Dalmatians and Fiumani in Rome on account of an alleged
, made his position untenable. On June 4 he enacted a de-
reducing the bread subsidy, but yielding to the threats of the
alists, he withdrew it five days later and resigned without
ing for a vote.

iolitti's Difficulties.—Sig. Giolitti now appeared the only
. capable of forming a government, and this he achieved by
2 16. Count Sforza was chosen Minister for Foreign Affairs.
budget statement for 1920–1, presented on June 27 1920,
ved a deficit of 14 milliards.

roubles now broke out in Albania. In 1917 Gen. Ferrero had
laimed an Italian protectorate over Albania, but the subse-
nt agreements whereby Italy undertook to allow Yugoslavia
Greece to occupy parts of the country aroused much
atisfaction among Albanians. An Albanian Govt. had been
ned at Tirana and the Italian garrisons were greatly reduced;
he spring of 1920 Albanian bands began to disturb the Italian
ops, and on June 5 they attacked and captured some of the
posts. An attack on Valona was repulsed with loss to the
my, but on June 24 Sig. Giolitti, alarmed at a mutiny which
broken out as a result of anarchist propaganda at Ancona,
yielding to the Socialist demands, announced that Italy
uld withdraw her troops from Albania and negotiate with the
ana Govt. An agreement was arrived at on Aug. 3, and
Sept. 2 the last Italian troops departed, only the islet
Saseno being retained.

At the Spa Conference (July 5–16 1920) Italy succeeded in
ting her share of the German indemnity raised to 10%, and
t of the Austrian, Hungarian and Bulgarian indemnities to
%. On Aug. 6 the Tittoni-Veniselos agreement was rescinded,
l on the 10th the treaty with Turkey was signed at Sèvres; by
terms of the tripartite agreement Italy obtained "economic
ority" over a wide zone of Anatolia south and east of the
eek zone (Smyrna) and a concession for exploiting the Heraclea
il-fields. By a separate agreement with Greece,[1] Italy under-
k to cede to the latter the Dodecanese minus Charki and Cas-
lorizo, which together with Rhodes were to remain Italian for
years, and then, if Britain ceded Cyprus to Greece, a plebis-
e was to decide the fate of Rhodes.

The Rapallo Conference.—Serious anti-Italian disorders oc-
rred on July 11 at Spalato, where the Croat mob murdered the
mmander of the cruiser "Puglie" and wounded several officers
d men; protest demonstrations were held at Trieste, and shots
ving been fired from one of the Yugoslav institutions, several
them were set on fire. At Fiume the National Council resigned
d D'Annunzio proclaimed the Reggenza del Carnaro, for
hich he drafted a curious, mystical, semi-medieval statute. As
esident Wilson's term of office was nearly up, the Yugoslavs
t that a direct understanding with Italy would be the best
lution. The Italian Govt. communicated its proposals to those
Britain and France, which advised Yugoslavia to accept them.
conference was held at Rapallo on Nov. 8, Italy being repre-
nted by Sig. Giolitti, Count Sforza, Sig. Bononi, Gen. Badoo
io and Admiral Acton; Yugoslavia by MM. Vesnich, Trumbich,
osta, Stoyanovich and Col. Kalafatovich. On the 12th the
eaty was signed. Italy waived her rights over Dalmatia, except
r the town of Zara, and the following frontier was agreed upon:
Mount Pec, Mount Yalovets, the watershed between the Isonzo and the Wurzen See and the Wocheiner Save, northeast slope of Mount Mezik, east slope of Mount Porzen, west slope of Mount Blegos, Zelse, Cabranska, east of Mount Trstenik, east of Griza, east of Mattuglie, frontier of the Fiume State on the Fiume-Castua road; the islands of Cherso, Lussin, Lagosta and Pelagosa were assigned to Italy, while both Powers recognised the independence of Fiume; the Italian-speaking inhabitants of the territories assigned to Yugoslavia were entitled to opt for Italian citizenship without having to leave the country, and full freedom of language, culture and religion were granted to Yugoslavs in Italian territory.

By a secret clause, which soon became public property, although Count Sforza denied its existence, Porto Baros, an integral part of the port of Fiume, was promised to Yugoslavia. D'Annunzio, however, refused to recognise the treaty, and his *legionari* occupied Castua and the islands of Vegli and Arbe (assigned to Yugoslavia) and tried to invade Dalmatia. But the Government, determined to enforce the treaty, established a blockade round Fiume; on Dec. 23, as D'Annunzio refused to obey Gen. Caviglia's summons to submit, military operations were commenced. There was some fighting, but on the 30th D'Annunzio authorised his plenipotentiaries to accept the conditions imposed. Fiume was to be placed under its own town council, with a local volunteer force to maintain order, assisted by Italian carabinieri, until after the elections for the Constituent Assembly. D'Annunzio left Fiume on Jan. 18 1921. But the elections in the spring of that year led to disorders necessitating the maintenance of Italian troops. The evacuation of Dalmatia, divided for the purpose into three zones, began in the spring of 1921.

Industrial Disturbances.—The internal troubles reached their zenith in the autumn of 1920. There were industrial, agricultural and railway strikes in various parts of the country, and in Sept. a very serious agitation broke out in the metal trades. These industries had earned large profits during the War and were paying high wages. But the cost of production was increasing, and there were signs of a coming slump, so that it was impossible to grant the still higher wages which the workmen now demanded. The workmen of the Romeo works in Milan now adopted obstructive tactics and sabotage, and the management retorted by a lock-out on Aug. 20. Thereupon the F.I.O.M. (*Federazione italiana operai metallurgici*) ordered all the metal workers in Milan to remain in permanence at the mills without working. The Federation of Mechanical Industries then extended the lock-out to the whole of Italy on the 31st, and the workmen, many of them armed, seized a number of factories in Lombardy, Piedmont and elsewhere.

Encouraged by the passive attitude of the authorities, they kidnapped owners and managers and tried to force them to run the works exclusively for the workers; armed "Red Guards" were organised, revolutionary tribunals set up and persons approaching the factories were shot at. At Turin the factory councils attempted to sell the goods manufactured during the occupation, although the owners warned the public of the nullity of such sales. But the workmen found themselves incapable of running the factories unaided, and the occupation ended by becoming merely an occasion for orgies. On Sept. 6 the General Confederation of Labour expressed its approval of the occupation, but declared that the movement must be placed under its own guidance in order to secure "collective management," and forbade any further extension of the seizures for the present. Nevertheless the extremists became more truculent, and at Turin a Nationalist student and a prison warder who happened to be passing near an "occupied" factory were brutally murdered by "Red Guards," and in many works the safes were broken open and the contents pocketed by the leaders.

Sig. Giolitti at last felt that he must do something. He summoned the representatives of the owners and the workers to meet him on Sept. 19 in Rome. At this meeting an agreement was arrived at; wages were to be raised and a form of workmen's control over industry, which the Government undertook to embody in a bill, was agreed to. The owners also agreed to pay for the

[1] Denounced by Italy, Oct 8. 1922.

work performed during the occupation, with deductions for damage done to the plant, but they refused to readmit all the workmen as the Government demanded, and only did so at last under protest against this imposition. The factories were evacuated on the 27th and work was resumed on Oct. 4. As a practical attempt to establish Communism, as the group by Bombacci hoped, the agitation had failed, and Giolitti claimed that by proving to the workmen that they could not run industry without the capitalist and the expert, they had been taught a useful lesson. But the Premier's real motive was probably the fear of provoking revolution and distrust of the nation's patriotism and courage. Incidentally the "occupation" wrought serious injury to Italian credit at home and abroad.

The Fascists.—About this time agrarian troubles had also broken out in various parts of Italy, notably in the Veneto, the provinces of Bergamo and Cremona, the Lazio, Tuscany and Sicily. The peasants demanded contracts which, if accepted, would have left the landlords without enough income to pay the taxes. In this agitation Socialist and Left-wing Popolari vied with each other in revolutionary methods. The public meanwhile was beginning to weary of these constant disorders and of the tyranny of a factious minority, and the middle classes set to work to organise resistance. The Agrarian Association of Bologna was particularly active, but it was the Fasci, now arising all over Italy, under Mussolini's leadership, which organised the national reaction. The first attempt at resistance at Bologna, the hotbed of revolution, was on Sept. 20, when, as the result of a Communist attack on a patriotic procession, a kiosk where seditious papers were sold was destroyed. At a strike demonstration in the same city in Oct. 14 1920 against the "white terror" in Hungary, the Anarchist, Malatesta, incited the mob to violence, and a police inspector and a Guardia Regia were murdered. Small groups of Nationalists and Fascists thereupon paraded the streets; in an instant the tricolour flag appeared everywhere and the strike ceased. The municipal elections in Oct. and Nov. registered a decline in Socialist influence in Rome, Naples, Turin, Genoa, Venice and Florence, but at Milan and Bologna revolutionary majorities were again returned.

The assumption to office of the Red administrations was to offer occasion for fresh outbreaks of violence. In Bologna the Communist deputy, Bucco, secretary of the local Chamber of Labour who had been the Red tyrant of the province, now began to fear for his own safety and applied for police protection against the Fascists; he was spirited out of the city and after his departure a deficit of a quarter of a million was found in the accounts of the Chamber of Labour. On Nov. 21 1020 the first meeting of the new Bologna town council was intended to be the occasion for an armed rising organised by the Communists, with the help of the municipal guards and the fire brigade. There were anti-Socialist demonstrations in the streets organised by the Nationalists and Fascists, supported by other citizens, but in the town hall two councillors of the constitutional minority, Giordani, a disabled ex-officer, and Colliva were murdered by Communists. The upheaval of public opinion was now irresistible; the Red leaders had to fly for their lives and the whole fabric of Bolshevik organisation in Bologna crashed. The town council never met again and was eventually dissolved, while the Fascists wrecked or burned down various Socialist institutions. At Modena a Fascist was murdered and several others shared a like fate while attending their comrades' funeral; this led to a general anti-Socialist uprising there also, and similar episodes occurred at Ferrara. Throughout the Po valley the Fascists proceeded to break the tyranny of the "Red baronies"; the revolutionary *leghe* which had dominated labour in that area, were dissolved, and one Red town council after another resigned or was dissolved by the prefects, while ever increasing masses of workers, industrial and agricultural, went over to Fascism and thus formed the basis of the Fascist labour movement.

Socialist Dissensions.—During the last months the Maximalist Socialist party had begun to show signs of dissension. The extremist group led by Bombacci and Gennari advocated an immediate revolution, while the Turati-Treves group opposed the idea; at the Reggio Emilia congress Nofri and Ponzani had returned from Russia, proceeded to condemn the S system. The Russian leaders demanded the absolute submi of the Italian party to the orders of Moscow and the expu of all Socialists tainted with the Reformist heresy. At the eral congress of the party in Leghorn (Jan. 13–22) a resoli in favour of a middle tendency, supported by Turati, Tr Buozzi, Baldesi, D'Aragona and the G.C.L., who called t selves *Unitari* and were prepared to collaborate with bour Governments, was adopted. The Communists (represente 18 deputies) thereupon broke away and formed a party of own. The new party now tried to affirm itself by a series o rorist outrages in the hope of promoting revolution. Bombs thrown in Florence on Feb. 27, killing and wounding several sons, whereupon the Fascists retaliated by murdering Lavag a notorious Communist railway organiser; the railwaymen electricians went on strike and various affrays between Com nists and Fascists occurred, until the troops intervened restored order. At Empoli a number of unarmed sailors were dered by Communists, and the Fascists, summoned from va parts of the country, inflicted severe reprisals. Similar o rences took place at Foiano della Chiana and other places. everywhere the popular reaction, guided by Fascists and tionalists, was vigorous and unmistakable. The Governm unable to tackle the situation, itself, left the Fascists a free h to fight the Reds.

Sig. Giolitti now had the courage to propose the abolitio the bread subsidy, and presented a bill to that effect, which voted by a large majority on March 1, in spite of Socialist struction. The bill in favour of syndicalist control over indus presented by the Premier in accordance with the agreemen the preceding Sept., encountered much opposition in Pa ment and was finally dropped.

Giolitti Resigns.—The Parliamentary position was becon insecure, and a hostile motion on foreign policy proposed by Amendola was rejected only by a small majority. On Apr 1920 Sig. Giolitti dissolved the Chamber, and on May 15 elections were held. Out of 535 seats (27 had been added for new provinces) the Liberals and Democrats of various sha secured 275, the Popolari rose from 101 to 107, the Socialists from 156 to 122 Unitari and 16 Communists; there were in ac tion four Germans for the Alto Adige and five Slavs for the Ve zia Giulia. The Fascists were 38 and the Nationalists 10. though the composition of the new Chamber was not very dif ent from that of the old, the Socialists and Communists w now faced by a vigorous Fascist-Nationalist group supported sympathisers belonging to other parties. On June 11 Parliam opened, and in the debate on the speech from the Throne, Nationalist Federzoni (*q.v.*) delivered a strong attack on Co Sforza's foreign policy. On June 26 the Cabinet secured onl small majority on a vote of confidence on foreign policy, Sig. Giolitti resigned.

Sig. Bonomi formed an administration composed as follo Bonomi (Presidency and Interior), Marquis Tomasi della T retta (Foreign Affairs), Giradini (Colonies), Rodinò (Justic Soleri (Finance), De Nava (Treasury), Micheli (Public Work Belotti (Industry and Trade), Bergamasco (Marine), Corbi (Education), Mauri (Agriculture), Beneduce (Labour), Giuffri (Post Office), Ranieri (Liberated Territories). The Cabi comprised members of many parties, but the Popolari w predominant and Don Sturzo ruled Sig. Bonomi with a rod iron. Under Popolare influence, strengthened by that of these Socialists Giuffrida and Beneduce, further advanced legislati was enacted. A bill enabling any public body to expropri land which in its opinion was inadequately cultivated, the own to be indemnified with land bonds of uncertain value paid for the whole community was introduced but aroused violent opp sition and never became law.

Sig. Bonomi had the merit of deciding that the celebration the ceremony for the Unknown Soldier should at last be held; took place on Nov. 4 1921. Two days later the Fascist congre was opened in Rome, and Fascism was definitely constituted in

political party. On the 10th the Communists and Socialists proclaimed a general strike as a protest against the presence of the Fascists in Rome; disorders ensued, in which five persons were killed and several wounded. The troubles had ceased by the 14th, after which the Fascist congress broke up. The debate in the Chamber on the eligibility of the deserter Misiano, who had been returned for Turin and Naples, led to violent scenes, until on Dec. 20 his election was annulled. During this same month the Banco di Sconto failed, and the Government was severely blamed for not having prevented the collapse of so important an institution, whose actual condition was by no means hopeless; as was proved at the subsequent legal proceedings before the Senate,[1] the failure caused serious prejudice to the general financial and economic situation of the country.

The publication by a French journalist of an account of an imaginary insult attributed to M. Briand against the Italian Army at the Washington disarmament conference led to anti-French demonstrations at Turin and elsewhere, until the misunderstanding was cleared up. The attempt to conclude a commercial treaty with Russia failed, as the Soviet Govt. refused to ratify the agreement. In Jan. 1922 Sig. Bonomi attended the Cannes meeting of the Supreme Council, where it was decided to hold an economic conference in Genoa in the spring.

The Facta Govt.—The Bonomi Cabinet was now attacked on all sides, and when on Feb. 2 1922 the Democrats, 16 of whom were in the Government, went over to the Opposition, Sig. Bonomi resigned. The King, however, asked him to go before Parliament, in order that by its vote it might give some indication for a solution. This Bonomi did, and the Cabinet having been beaten on the 17th resigned definitely. It was not until the 25th that a new Cabinet was formed by Sig. Luigi Facta. He was a thoroughly honest man, and his acceptance of office in these circumstances was proof of his patriotism, but he was not a first-class statesman. He selected Senator Schanzer for the Foreign Office, while the other Ministers were of respectable mediocrity. On March 15 the Premier communicated to the Chamber the Government's programme, based on the restoration of order, and secured a vote of confidence.

In 1922 the reconquest of Tripolitania was commenced with the reoccupation of the port of Misurata at the end of January. After a series of operations lasting through 1922 and 1923 the whole colony was reoccupied. The Governor in this period was Count Giuseppi Volpi, afterwards Finance Minister.

Trouble now broke out in the port of Naples between the Red dockers' union, which wished to retain its labour monopoly, and the new Fascist dockers' union, created to combat the prevailing conditions of anarchy and graft brought about by the Reds. The Red union proclaimed a strike in all the Italian ports on March 18 as a protest against the existence of the Fascist union, and the Government referred the solution of the conflict to the *enti-autonomi* of the ports, a decision which caused much dissatisfaction in non-Socialist circles, as those bodies were notoriously under Socialist influence. But the Fascists eventually succeeded in breaking the Red monopoly and restoring order and freedom of labour in the ports, to the great advantage of the maritime trade of Italy.

The Genoa conference was inaugurated on April 10. Sig. Facta presided with dignity, but the hardest work was accomplished by Sig. Schanzer, who often succeeded in composing differences between the British and the French and between the French and the Germans and Russians. The Russian delegation was at first alarmed at the possibility of an unfriendly reception by the Fascists, but the Fascist party directorate assured the Bolsheviks that if they abstained from interference in Italian internal affairs they would not be molested; this they undertook to do, and they carried out their undertaking.

The railway syndicate at Bologna issued an order that all traffic was to be held up on May 1, and although the management was able to secure an almost complete service, many railwaymen did cease work, thereby causing inconvenience and delay. This time the Government did indict the members of the executive committee of the syndicate, and some of the leaders were punished. On May 24 the funeral procession escorting the body of the war hero Enrico Toti to the cemetery in Rome was fired on by Communists in the San Lorenzo quarter, with the result that two persons were killed and several wounded. The next day the Committee of Proletarian Defence and the Alleanza del Lavoro, a newly formed coalition of the Communist, Socialist and Republican parties and the G.O.L., ordered a general strike in Rome; the Fascists tried to organise a counter-demonstration, but were dispersed by the police. This strike, which ended on May 26, intensified the exasperation of all law-abiding citizens against agitators.

The Bologna Reds.—In the province of Bologna the Red unions had lost much of their influence, but the leaders managed to maintain authority with the acquiescence of the Government. While locally there was a scarcity of labour and very high wages, in the neighbouring provinces there was unemployment, but the Bologna union leaders were determined to prevent the migration of these "foreign" workers, lest their own monopoly should be menaced, and they induced the prefect to forbid it. The prefect's action was *ultra vires* as it violated the rights of individuals in the interest of a privileged class, and the Fascists, voicing the general indignation which it aroused, concentrated on Bologna in military formation and demanded the revocation of the decree and the removal of the prefect. Sig. Mussolini, having obtained satisfactory assurances from the Government, ordered the Black Shirts to demobilise and evacuate the city, which they did on June 2; the decree was then revoked, and the prefect transferred.

There were now rumours of a new cabinet crisis, and the Socialists were divided on the question of collaborating with a bourgeois government. The Fascists, Nationalists and the Right were opposed to any sort of Socialist infiltration, which would involve unlimited extravagance and more advanced legislation. On July 12 1922 Sig. Peano, the Treasury Minister, issued his financial statement for 1921–2, which showed a deficit of 4,500 million lire, while experts estimated it at 6,500 million; public opinion was seriously alarmed, but in Parliament the deputies were too busy over lobby intrigue in view of the expected crisis to worry about finance. There were disorders at Cremona, provoked by the left wing Popolari led by Miglioli and the Socialists; the Fascists mobilised and wrecked several Socialist institutions and Miglioli's own law offices. The Democrats in the Chamber seized the occasion to contract an alliance with the Popolari, and on July 19 Sig. Facta was outvoted and resigned. But it proved impossible to form a new Cabinet, and after various unsuccessful attempts by Bonomi, Orlando and Meda, during which even the Socialist Turati was summoned to the Quirinal for consultation, the King sent for Facta once more, and the old Cabinet was reconstructed, with Senator Taddei, prefect of Turin, as Minister of the Interior.

The General Strike.—On Aug. 1 a general strike throughout Italy was suddenly proclaimed by the Alleanza del Lavoro, as the result of a Communist initiative, supported by the Socialists, who were disappointed at having failed to secure a Democratic-Socialist Cabinet, and Turati proclaimed it a "legalist" strike, because its professed object was to affirm the authority of the State against the Fascists. Work was suspended in many factories and a part of the railwaymen struck; but the Fascists and Nationalists ordered a general mobilisation, and the Fascist directorate issued a manifesto calling on the public servants and the workers "to shake off the yoke of the politicians by whom they were led," and giving the Government 48 hours within which to prove that it possessed authority over its own employees and those who were attempting to destroy the nation. "On the expiry of this delay Fascism will assume full freedom to supplant the State." Serious conflicts between Fascists and Communists occurred at Milan, Ancona and other places, but the strike rapidly collapsed, and on the 2nd the Alleanza del Lavoro ordered it to cease; by the 4th all disturbances were over. During the strike agitation the Fascists delivered an attack on the Communist-

[1] The case was tried by the Senate because there were senators among the accused.

Socialist municipality of Milan, which had for years ruled the city, bringing it to the verge of ruin and indulging in the most scandalous graft; the deficit was 375,000,000, there were bills for 101,000,000 lire overdue, and the richest city in Italy could obtain no credit anywhere.

The Liberal *Corrière della Sera*, as well as the Fascist press, had been conducting a very vigorous campaign against the administration, but the Government did not interfere. On Aug. 1 the tramwaymen, electricians, sweepers, employees of the waterworks and firemen of the city, all struck, but the Fascists and other citizens took their places; on the 3rd the Fascists succeeded in getting into the town hall and expelling the few assessors present, and for the first time since 1914 the tricolour was raised on Palazzo Marino amid scenes of great popular enthusiasm. The Fascists withdrew on the 4th and handed over the building to the prefect's commissioner. On the 27th, after the disastrous results of the inquiry into its financial administration, the council was dissolved and a royal commissioner placed in charge.

At Genoa the Fascists led a similar operation against the port consortium, which was largely under the influence of the Red dockers' union. Under Fascist pressure the consortium was dissolved and a royal commissioner appointed. The Fascists extended their action against a number of Socialist, Communist and Popolare town councils and institutions, forcing the administrators to resign; sometimes violence was resorted to, but in most cases the administrations resigned from sheer fright; very frequently evidence of embezzlement was discovered. Another operation was carried out against the provincial administration of Trento, and the Governor, Sig. Credaro, accused of being under the influence of the anti-Italian Pan-German elements of Bolzano, was recalled by the Government on the initiative of the Fascists. All these actions were of course illegal, but public opinion approved of them because it considered that the Fascists were doing what the Government should have done before.

The Fascist Programme.—Facta's position was daily weakening, and indeed the whole machinery of government was obviously breaking down. At the Socialist congress held on Oct. 3 the party split into two groups, the *Unitari* or collaborationists and the uncompromising *Massimalisti;* as a result of this split the G.C.L. broke off its alliance with the Socialist party and declared itself a non-political body, but many of its adherents had already gone over to Fascism. The Partito Popolare was also divided by conflicting tendencies, and the Pope enjoined on the bishops and clergy to abstain from partisan political activity. The moment was now ripe for a bold Fascist move. Sig. Mussolini considered that it was not enough to crush Bolshevism, and that if Italy was to become a really great nation the whole body politic must be reformed on Fascist lines, and the national finances re-established by eliminating extremist legislation and extravagance.

Although many Liberals approved of the Fascist programme, the Fascists themselves were convinced that it could not be carried out under normal Parliamentary conditions. They now demanded of the Government either a dissolution or the resignation of Facta and the formation of a new Cabinet comprising five Fascist Ministers; but the Premier rejected both alternatives. At a Fascist gathering at Udine on Sept. 20 Mussolini made an important declaration in favour of the monarchy, thereby securing the support of many non-Fascists. His hints at a revolution, however, were still regarded as figures of speech, but he was now entrusted by the party directorate with a mandate to conduct a political and even military action to bring Fascism into power. On Oct. 24 another Fascist congress was held at Naples, where 40,000 Fascists in military formation paraded the streets. In his speech at the San Carlo theatre Mussolini said that "what we have in view is the introduction into the Liberal State, which has fulfilled its functions . . . of all the forces of the new generation which has emerged from the War and the victory." In another speech he declared that "either the Government will be given to us or we shall seize it by marching on Rome."

March on Rome.—That same evening the Fascist Quadrumvirate was formed, composed of Michele Bianchi, general secretary of the party, Italo Balbo, commander of the armed *squad*, Gen. De Bono (ex-commander of the IX. Corps), who h organised them, and the deputy C. M. De Vecchi, while Di Grandi, an authority on labour problems, was entrusted with t political functions of the enterprise. The congress broke up a Salandra and Orlando, acting on behalf of the Quadrumvirat called on Facta to resign, which, after some hesitation, he did the 27th. In the meanwhile the general mobilisation of the Fa cists had been ordered, and they proceeded to concentrate Rome in four columns. Both the Fascist leaders and the Arm officers were anxious to avoid any conflict between the *squad* and the troops, and the news that martial law had been pr claimed caused deep consternation. Facta had indeed draft and issued the decree, but the King refused to sign it as it wou have meant civil war, and it was immediately withdrawn. Si Salandra was now entrusted with the formation of a Cabine and he offered portfolios to De Vecchi and Grandi; but Mussoli on being consulted rejected the proposal, for the formation of Cabinet of the old parliamentary type was now impossible. O Salandra's advice the King sent for Mussolini. The Fascist co umns began to enter Rome on the morning of Oct. 30 1922 an the city was peacefully occupied; the only regrettable incident were the murder of a Fascist at Valmontone by Communist and the murder of some Communists by Fascists in the Sa Lorenzo quarter of Rome. Mussolini reached Rome from Mila the same day, and at once presented himself to the King, with h Cabinet list already prepared, which the King at once acceptec As the presence of the *squadre* in Rome was no longer necessary and might lead to trouble, Mussolini ordered them to depart this they began to do on Oct. 31, after paying a tribute of honou to the tomb of the Unknown Soldier and homage to the King by Nov. 2 all had left the capital.

The new Cabinet was composed as follows: Mussolini, Premie and Minister of Foreign Affairs and the Interior; Gen. Dia (War), Adm. Thaon di Revel (Marine), Prof. Alberto De Ste fani (Finance), Prof. Tangorra (Treasury), Duke di Cesar (Post Office), Federzoni (Colonies), Prof. Gentile (Education) De Capitani (Agriculture), Carnazza (Public Works), Coun Teofilo Rossi (Industry), Cavazzoni (Labour), De Vecchi (Un der-Secretary for Pensions). Although predominantly Fascist the Cabinet comprised members of all the chief groups excep the anti-national parties; Rossi was a Giolittian, Cesarò Social Democrat, Gentile[1] and De Capitani Liberals, Tangorr and Cavazzoni Popolari. Sig. Mussolini did not have a Parlia mentary majority, but he was supported by the mass of publi opinion even outside Fascist circles. He gave stringent order for the cessation of all acts of violence, and for the reinstate ment of the town councils which had been forced by the Fascists to resign after Nov. 1. Occasional conflicts still occurred, but on the whole order was restored with surprising rapidity.

On Nov. 16 the Premier informed the Chamber that for the second time the Italian people had given themselves a Govern ment independent of any Parliamentary designation,[2] that he might have closed Parliament and formed a purely Fascist Cabi net, but that he preferred, at all events in the first phase, to form a coalition with all the national parties. He undertook to balance the budget, provide for the working classes, but not in accordance with any extravagant theories, and conduct the foreign policy of Italy with firmness and dignity. He finally asked for full powers for a year to carry out the necessary reforms, and these were granted by 275 votes to 90. The Nationalists were now absorbed into the Fascist party.

The Deficit.—The most urgent problem before the new Government was finance. The estimated deficit for 1922–3 was 6,500 million lire and Sig. De Stefani at once proceeded to adopt drastic economies, reorganise taxation and encourage economic activity without hindrances to production. Prof. Tangorra having died on Dec. 21 De Stefani took charge of the Treasury as well. The Ministry of the Liberated Territories and several under-secretaryships were abolished, and by the decree of Jan. 23 1923 the Gov-

[1] Gentile afterwards became a Fascist.
[2] The first was in May 1915.

nment was enabled during one year to place on the retired list l officials who were too old or otherwise incapable of fulfilling eir duties, and to revise all appointments made under special ar legislation since May 1915. The Guardia Regia, which had ot answered its purpose on account of defective discipline and ganisation, was disbanded. The Fascist and other armed *uadre* were also disbanded, and the *Milizia Volontaria per la icurezza nazionale* (*see* FASCISM), composed of *ex-squadristi* and ficered by ex-army officers, was created in Jan. 1923 to assist the maintenance of order. In the administration of justice ie four courts of cassation were reduced to one, and many minor ourts suppressed. The railway staff, which amounted to 225,000 hen the Fascists came into power, was reduced to 170,000.

A large number of abuses were eliminated; the eight hours' ay, which had been reduced to five or six hours of real work, as restored; railway thefts and damage to property were brought own to trifling proportions, the system of equalising wages, so hat a linesman or engine-driver was paid as highly as, or more han, an important official, was done away with; the free passes sued to the leaders of the revolutionary *sindacato ferrovieri* and iany other persons were withdrawn, discipline was re-established and bonuses for economy reintroduced. These reforms, which were largely the work of the special high commissioner or the railways, Sig. Edoardo Torre, resulted in improving the ervice out of all recognition, and converting the railway deficit, which in 1921–2 amounted to 1,400 million lire, into a surplus of 76,000,000 for 1924–5. A similar transformation was effected n the postal and telegraph services, where insubordination and disorganisation had reached incredible proportions under the previous governments; here too a deficit of some 500,000,000 was onverted into a surplus of 43,000,000. Originally the Government intended to restore the railways and some of the postal services to private enterprise; this has been done for the telephones rom July 1 1925, but not for the railways. Reforms of a similar nature were introduced into many other departments, and everywhere the number of officials was reduced.

The Yannina Murders.—Soon after coming into power Sig. Mussolini attended the opening of the Lausanne conference on he peace with Turkey, and there he first came into contact with his British and French colleagues. On Aug. 27 1923 the Italian General Tellini, president of the inter-Allied commission for the delimitation of the Graeco-Albanian frontier, and four of his staff were murdered by Epirote bands near Yannina on Greek territory, as a result of a violent campaign in the Greek press against Tellini, who was accused of unduly favouring the Albanian claims. On the 29th the Italian Govt. presented an ultimatum to Greece demanding immediate satisfaction and an indemnity of 50,000,000 lire. As the Greek Govt. rejected some of the conditions, and denied responsibility for the crime, an Italian fleet was sent to Corfu to occupy the island. The Greek commander having refused to lower the flag a few shots were fired on the fort, one of which killed or wounded a number of refugees,[1] who, unknown to the Italian admiral, were lodged in it. The island was then occupied. On Sept. 1 Greece appealed to the League of Nations Council, but as the Conference of Ambassadors had also been invested with the conflict, the Italian delegate to the League Council, Sig. Salandra, maintained that the Conference alone was competent to deal with the matter, whereas the British delegate, Lord Robert (now Viscount) Cecil; the Greek delegate, M. Politis; and the delegates of the small Powers insisted on the League's right to intervene. After arranging that an inquiry should be conducted by the four Great Powers[2] the Conference of Ambassadors finally decided that Greece should make full satisfaction in the most solemn form to Italy and pay the indemnity of 50,000,000 lire. Italy declared that the occupation of Corfu had no other object than that of obtaining satisfaction for its demands. On the 13th the Conference announced Greece's acceptance of its decision and Italy's undertaking to evacuate Corfu by the 27th, which was done. As a result of the conflict Italo-Greek relations were much improved, but there were controversies in the League Council between Sig. Salandra and Lord Robert Cecil and the delegates of Sweden and Norway.

The next important action of the Fascist Govt. in the field of foreign affairs was the settlement with Yugoslavia. As Sig. Mussolini had long recognised the difficulty of fully carrying out the Rapallo and Santa Margherita agreements, he had suggested, as early as Nov. 1922, to M. Ninchich the advisability of a more complete agreement. The Santa Margherita convention was ratified on Feb. 21 1923, and Italy proceeded to evacuate the third Dalmatian zone,[3] but the existence of the Fiume Free State was the chief obstacle to a real understanding. Sig. Depoli, head of the government, had resigned, as he could not continue to rule the town, which was threatened with starvation, and Sig. Mussolini sent Gen. Giardino to Fiume in Sept. 1923 to take charge of the administration, and provided him with adequate funds. Negotiations with Yugoslavia were then resumed, and on Jan. 27 1924 the various agreements were signed in Rome. By the first of these the two Powers undertook to collaborate in maintaining the conditions established by the peace treaties and to assist each other politically and diplomatically in case of a conflict. By a second convention Italy recognised Yugoslavia's full sovereignty over Porto Baros and the Delta, while Yugoslavia recognised that of Italy over Fiume; a free customs zone was also established comprising Fiume and Castua (the latter ceded to Yugoslavia). Ratifications were exchanged on Feb. 22, and subsequently a series of commercial agreements was concluded.

Mussolini and Parliament.—One of the main considerations of the Fascist party was the relation of the executive to the legislature. Parliament in Italy had long been degenerating, and after the War conditions had become worse than ever. Sig. Mussolini was determined not only to eliminate certain evils, but to prevent their recurrence, and above all to give stability to the government. In the summer of 1923 he drafted a bill whereby the country was divided into 15 constituencies, each voter to vote for the party list which he preferred, the party securing relatively the largest number of votes to be entitled to two-thirds of the seats in the Chamber, while the remaining third was divided among the other parties on a proportional basis. The bill encountered much opposition among the Socialists and the Popolari, and also among some sections of the Liberals, but it was admittedly only a temporary and tentative measure, and it was voted by a large majority in the Chamber in July and by the Senate in Nov. 1923. At a Cabinet Council on Dec. 31 the government renounced the full powers granted to it by Parliament a year previously, and on Jan. 25 1924 Parliament was dissolved.

Sig. Mussolini stated that he now wished to appeal to the country for a verdict on the work accomplished, but that, while recognising the value of the elective Chamber, it must not be accorded absolute predominance over the other organs of the State—the Crown, the Senate, the Executive—all of which have their allotted functions. He rejected the idea of electoral and political alliances with other parties, but decided to include in the government electoral list men of all parties or no party who might be counted on to render services to the country. He approached certain leading Liberal and Democratic statesmen of Southern Italy, where Fascism had less hold than in the North, in order to include them in the Government list. Salandra, Orlando, De Nicola and De Nava accepted. The Duke of Cesarò, Minister of Posts and Telegraphs, having quarrelled with the Premier over the latter's refusal to contract an alliance with the Social Democratic party, and also because he disapproved of certain influential Fascists, resigned and presented an opposition list of his own, chiefly in Sicily.

The Government list was prepared by the Fascist representa-

[1] Colonel Lowe, of the Near East Relief Organisation, deposed that the casualties amounted to 100, including 20 dead, of whom 16 were children.

[2] For full details of the incident see the article by "Verax" in *La Vita italiana* for Dec. 15 1923; and for text of report see *The Janina Murders* and *The Occupation of Corfu*, George Glasgow (London, 1923).

[3] The port of Dalmatia assigned to Italy by the Treaty of London and ceded by her to Yugoslavia at Rapallo had been divided for the purpose of evacuation into three zones.

tives in each constituency, passed by the "Pentarchy" (Finzi Michele Bianchi, Giunta, Acerbo and Cesare Rossi) and finally submitted to Mussolini for approval. In four constituencies there were extra lists for government supporters for whom there was no room in the government list proper. The government candidates comprised 200 ex-combatants, and a number of men eminent in science, literature, business, agriculture and industry. The opposition groups competed for the 179 seats reserved for the minorities. The elections were held on April 6, and, except in a very few cases, went off without disturbances. In all 7,628,850 votes were recorded (75% of the registered voters, a larger percentage than at any previous election). Of these 4,693,690 were for the government, *i.e.*, 65·25% of the recorded votes, not including those in favour of minority candidates who had declared themselves supporters of the Government; the Government thus would have been entitled to two-thirds of the seats independently of the new law. The supporters of the Government were 355 (Sig. De Nava having died), of whom 260 were Fascists and 114 members of other groups. The opposition groups were distributed as follows: Constitutional Opposition 12, Liberal Democrats 17, Social Democrats 11, Popolari 40, Massimalists 22, Unitari Socialists 27, Communists 17, Republicans seven. Of the ex-Premiers, Bonomi was not returned; Nitti and Facta did not stand, but Facta was raised to the Senate soon afterwards.

The Matteotti Murder.—Parliament was opened by the King on May 24 1924. After his overwhelming victory at the polls Sig. Mussolini held out the olive branch to the Opposition parties, and everything seemed to point to a return to normal political conditions; on June 7 the Chamber gave the Cabinet a vote of confidence by 361 to 107. But on June 10 the Socialist deputy Giacomo Matteotti, Secretary of the Unitario group, mysteriously disappeared, and a day or two later it was discovered that he had been kidnapped in a motor-car by Dumini, Volpi and other Fascists of shady antecedents and carried off to an unknown destination. The kidnappers, suspected of complicity in attacks on other anti-Fascist leaders, were caught at once, and four prominent Fascists—Marinelli, the administrative secretary of the party; Filippelli, editor of the *Corriere italiano;* Cesare Rossi, head of the official press bureau; and Naldi, the editor of the *Nuovo Paese*—were also arrested as accomplices. The body of Matteotti was discovered on June 13 buried in a lonely spot 20 km. from Rome.

The affair created a sensation, and the Opposition deputies and press seized on it to indulge in the gravest accusations against all the leading Fascists. On June 15 the Opposition deputies withdrew from the Chamber, stating that they would not return until the Matteotti mystery and the so-called "moral question"—that is, the supposed complicity of the Government in the affair—had been cleared up. The Opposition by this so-called "withdrawal on to the Aventine"[1] thus hoped to render Parliamentary business impossible and to exploit the consternation aroused by the crime to upset the Fascist Government. Among the persons more directly accused was Aldo Finzi, Under-Secretary for the Interior; he immediately resigned, and his resignation was accepted by the Premier as he had not proved equal to his duties, but when he brought libel actions against his accusers they were unable to prove their case by evidence.

The Chamber was now adjourned, and on the 16th Gen. De Bono, whose activities as chief of police had appeared faulty, was replaced by Sig. Crispo Moncada, prefect of Trieste. The same day Sig. Federzoni was transferred from the Colonial Ministry to that of the Interior: he immediately cleared the department of the doubtful elements who had taken advantage of their connection with it for purposes of their own. On the 30th all the Ministers placed their portfolios in the Premier's hands, and he effected the following changes: Federzoni, who had become Minister of the Interior, was replaced at the Colonial Ministry by Prince di Scalea, Gentile (Education) by Count Alessandro Casati, Carnazza (Public Works) by Gino Sarrocc Corbino (National Economy) by Cesare Nava. Most of under-secretaries were also changed, and many undesirab expelled from the Fascist party.

Opposition Tactics.—The Opposition saw in the Matteo affair a chance of mobilising a part of the nation against t Government, and secured the support of many who had adhe to Fascism only as long as they had believed it to be invincib and were ready to abandon it the moment they thought that days were numbered. Orlando, who had been elected on t Government list, and Giolitti, who had declared himself bene lently independent, joined the Opposition, professedly on co stitutional grounds, but did not withdraw from the Chamb The "Aventine" groups on June 27 confirmed their abstenti from Parliamentary activity, demanded the disbanding of t Milizia nazionale, the repression of all acts of violence by Fa cists (without mentioning those committed by non-Fascist and formed a committee for joint action; their unofficial lead was Giovanni Amendola. The conduct of the constitutior Opposition, in allying itself with the revolutionary Socialis and the Popolari extremists, was much criticised even in no Fascist circles. Various new Opposition associations were no formed, such as the Lega italica, the Italia libera (with whi Gen. Peppino Garibaldi was connected), the Unione naziona etc. The directorate of the ex-combatants' association al assumed an attitude of veiled hostility to the Government, a as this created a sharp division within its ranks the Governme dissolved the directorate and placed a temporary board in charg

The press campaign now reached an unparalleled degree violence, Don Sturzo's *Popolo* vying with the Socialist *Avan* and Amendola's *Mondo*, and was a direct incitement to mar acts of violence committed against Fascists.[2] Sig. Mussoli therefore decided on July 8 to call into force the decree of Ju 12 1923 drafted by the Duke of Cesarò, and the prefects we ordered to apply Art. 3 of the Communal and Provincial la whereby in the interests of public order they were empower to confiscate issues of papers containing seditious matter incitements to violence, and in the case of repeated offenc temporarily to suspend their publication. This measure w afterwards completed by the royal decree of March 4 192 Several Liberal and Democratic organs which systematical attacked the Government were acquired by pro-Fascists.

The Crespi family, who were the chief shareholders of th Milan *Corrière della Sera*, bought out Senator Albertini and h brothers, who had for many years edited the paper; it the became more favourable to the Government in its outlook. Th Milan *Secolo*, the Rome *Giornale d'Italia* and the Naples *Mattin* as well as some other papers, have undergone a similar transfo mation; many of the members of the staff remained with the respective papers under the new conditions, while those wh refused to do so received large indemnities under the very liber provisions of the Italian law on journalistic contracts. Severa opposition papers continued to exist, including the Democrat *Mondo*, the *Voce Republicana*, the *Avanti!*, etc., but can exercis little influence. These measures were admittedly of a tempo rary character, enacted in view of the transition from the ol to the new régime. An important reform was carried out in th Milizia nazionale; the decree of Aug. 4 provided that its member should swear allegiance to the King. On Oct. 28 the Milizi took the oath.

In the field of foreign affairs a treaty was concluded wit Britain whereby the Transjuba territory was ceded to Italy There had been a previous agreement to that effect, but th British Foreign Office had raised difficulties, claiming that th question should be settled together with that of the Dodecanese the Italian Govt. persuaded Mr. Ramsay MacDonald that th two questions were wholly unconnected, and the treaty wa signed on July 15 1924, whereby Italy secured a larger are than had been at first contemplated. Ratifications were ex changed on May 1 1925.

[1] After the withdrawal of the Roman *plebs* on to the Aventine Hill as a protest against the aristocracy. Opposition deputies did not, as has often been reported in the foreign press, actually meet on the Aventine.

[2] Since the Matteotti murder 65 Fascists have been murdered by their opponents; among the victims was the deputy Casalini.

Mussolini's Skill.—The Government's position had been doubtedly shaken by the Matteotti affair, but no evidence s produced implicating any of its members in it, and Sig. ussolini parried the attack with consummate skill. The Fas- t party, except for an insignificant number of defections, lied round him solidly, and after the first bewilderment non- ty opinion continued its support of him. The country tended calm down, in spite of occasional regrettable incidents pro- ed by both sides, of which the most serious was the murder the Fascist deputy Casalini by a Communist on Sept. 12 1924. e Chamber opened on Nov. 12, Orlando and the Communists ng present, while later Giolitti's attack on the Government its unconstitutional methods caused some surprise as coming m a statesman who while in office had proved a past-master the art of violating the Constitution. The Premier had come the conclusion that the electoral law enacted in 1923 had not ved satisfactory, and on Dec. 20 he presented a bill to Parlia- nt providing for the re-establishment of the old one-member nstituency system, eventually passed by 307 votes to 33, and proved by the Senate on Feb. 10 1925. This measure divided "Aventine," as the Democrats and Liberals were in favour it while the Socialists and Popolari were proportionalists. his speech in the Chamber on Jan. 3 1925, Mussolini reaffirmed uncompromising policy of Fascism, rejecting all alliances, d stated that the Government was determined to *Fascisitize* the state, and that if the Opposition did not abstain from tious violence severe repressive measures would be resorted . These declarations induced Salandra to withdraw his sup- rt, although, like Orlando and Giolitti, he did not retire on the "Aventine;" a part of his group (the Liberal Right) oke away and formed the pro-Fascist National Liberals. In arch Sig. Roberto Farinacci was appointed general secretary the Fascist party, which he proceeded to reorganise, giving a rigidly intransigent character. His speeches and articles present the extremist attitude of Fascism.

National Defence.—The bill presented by the Minister of ar, Gen. Di Giorgio, for reorganising the army on the basis of reduction of the peace-time effectives, the sums thus econo- ised to be devoted to material, encountered much opposition military circles and in the Senate. On April 1 the Premier oposed the adjournment of the debate and appealed to the nerals in the Senate to collaborate in improving the nation's fences. Gen. Di Giorgio felt called upon to resign, and Sig. ussolini himself took charge of the War Ministry *ad interim*, ith Gen. Cavallero as Under-Secretary; Gen. Badoglio was ppointed chief of the staff and entrusted with the co-ordination the army, navy and air force. On May 5 Adml. Thaon di evel resigned, and Sig. Mussolini took over the Ministry of larine and the newly created Air Ministry as well, with Adml. rianni and Gen. Bonzani as Under-Secretaries. This arrange- ent is regarded as leading the way to a future Ministry of ational Defence. A great manifestation in honour of the King's bilee was held on June 7. It was generally recognised that the restige of the monarchy had been greatly strengthened by the ascist régime.

The Government was rapidly regaining the ground it had st in consequence of the Matteotti affair. The decision of the enate judicial committee, rendered on June 12 1925, on Sig. onati's charges against Gen. De Bono, acquitted the latter of uilt in connection with the Matteotti affair and of the other ore serious accusations, only certain minor counts being de- lared not proven. At the municipal elections of Palermo on ug. 2 1925 the anti-Fascist list was supported by Orlando, ho had mobilised his adherents in its favour, but the Fascist st secured a large majority. In consequence Orlando resigned is seat, declaring that there was no longer a place for him in talian political life. His withdrawal from politics made very ttle impression, as he had already to a very large extent lost is political influence. The findings of the prosecuting section f the Court of Appeal on the Matteotti case in Dec. 1925, hile committing Dumini and four accomplices to trial for mur- er, excluded premeditation and exonerated members of the Government and officials from complicity. Cesare Rossi, Marinelli and Filippelli were consequently set free.

The trial of the five men accused of having caused the death of Sig. Matteotti was ended on March 24 1926, at Chieti. Dumini, Volpi and Poveromo were found guilty of non-premeditated unintentional homicide extenuated by the subnormal physical resistance of Sig. Matteotti and by other circumstances; Viola and Malacria were found not guilty. The sentence on Dumini, Volpi and Poveromo was 5 years 11 months and 20 days penal servitude of which 4 years are remitted under the recent amnesty and one year and 9 months were already served in awaiting trial. They had therefore to serve only 2 months and 20 days imprisonment.

Financial Reform.—In the spring of 1925 financial difficulties had arisen resulting in the serious depreciation of the lira, which fell from a little over 100 to the £ to close on 150; this was partly due to the heavy excess of imports over exports in consequence of the bad harvest of 1924, but also to speculation initially promoted by certain members of the Opposition who hoped to break Fascism through a financial disaster and the consequent panic in a part of the public, which believed that the Government intended to reduce the currency to zero after the example of Germany. The measures enacted to restrain speculation aroused much opposition in stock exchange circles and caused a temporary suspension of operations. Prof. De Stefani subsequently modified the regulations, but the Premier felt that a bold treasury policy was now necessary, requiring the services of a practical financier. De Stefani's great task in reorganising the fiscal system and balancing the budget was accomplished; for 1924–5 a surplus of 209 millions was announced, which eventually rose to 417 millions. In July he resigned and was replaced by Count Giuseppe Volpi, Governor of Tripoli, and formerly a business man of wide experience.

The American Debt.—After enacting new regulations, which effectively restrained illicit speculation and improved the currency (the lira rose to 120 to the £) he undertook the settlement of the War debt to the U.S., which was weighing heavily on Italian finance. On Oct. 22 he sailed for Washington, accompanied by Dino Grandi, Under-Secretary for Foreign Affairs, the manufacturer Pirelli, the banker Alberti and the diplomat Count Bonin Longare; on Nov. 14 an agreement was concluded whereby Italy's debt, originally $2,148,000,000, was reduced to $2,042,000,000 to be spread over 62 years, which, calculating the interest at 5%, reduces the actual value of the debt to $360,000,000 (a reduction of 82%); as the interest to be paid amounts to $73,000,000 the total to-day (1926) is $433,000,000. Five millions were to be repaid in each of the first five years, thereafter $20,000,000 till the 30th year, and $50,000,000 for the remainder. The agreement was ratified by the U.S. senate on April 21. A loan floated by the American banks for $100,000,000 to enable the Government to stabilise the exchange was subscribed several times over, while other loans for public works and the railways were also successfully floated in New York. On Jan. 27 1926 Count Volpi signed with Mr. Churchill an agreement in settlement of the Italian War debt of £610,000,000, whereby Italy contracted to pay an annual sum of £4,500,000, slightly reduced at first, over a period of 62 years. The first payment of £2,000,000 was made in March 1926.

The Government undertook several important reforms in the field of internal legislation with the object of giving a more essentially Fascist character to the state. In order to bring Southern Italy up to the standard of the more progressive North a series of measures were enacted for co-ordinating agricultural land reclamation, drainage, the building of roads and railways, etc., for which adequate funds were provided and a suitable civil service organisation created. The wheat crop of 1925 had beaten all records, amounting to 64,000,000 quintals (the pre-War average was 49,000,000), but Mussolini was determined to spare no efforts to increase the output until the 75,000,000 annually required by the population could be grown at home, thereby avoiding heavy payments abroad; all forms of encouragement to producers were adopted and various agricultural

measures enacted, constituting what was known as "the battle for wheat."

Fascist Legislation.—Of the political Fascist measures the following are the most important:—

In order to eliminate the influence of Freemasonry in the administrative and political life of the country often inspired by foreign interests, a law was enacted in Dec. 1925 whereby all associations are obliged to communicate their statutes and their membership lists to the authorities, and, should secret societies continue nevertheless to exist, civil servants are forbidden to belong to them on pain of dismissal.

The law of Jan. 31 1926 provides that Italians living abroad who commit acts calculated to promote sedition in Italy or injure Italian interests shall be deprived of Italian citizenship, and in the graver cases even of their property.

The Government is empowered up to Dec. 31 1926 by the law of Nov. 1925 to dismiss from the public service officials who commit overt acts against the state and existing institutions or attempt to prevent the enforcement of the laws or to frustrate its policy.

The conditions of certain municipalities also called for reform. That of Rome, owing to the heavy charges entailed by the fact that it is the capital, could not defray expenditure out of the local revenues alone and constantly had to call upon the Government to make up the deficit; moreover it appeared desirable that the city should not be the scene of political wrangles and party conflicts. Consequently by the law of Oct. 28 1925, instead of an elective mayor and town council, a governor of Rome was created, to be appointed by Royal decree, assisted by two vice-governors, 10 *rettori* and an advisory council of 80 *consultori* to be selected from lists presented by the various economic, professional and educational bodies and certain other associations.

The law of Feb. 4 1926 provides that communes of less than 5,000 inhabitants, where municipal affairs were often run for the benefit of the mayor and assessors and their families, shall be administered by a *Podestà* appointed by royal decree, assisted by an advisory council of *consultori;* a *podestà* can also be appointed for five years in larger communes where the elective council has been dissolved twice in two years.

The authority of the prefects is strengthened with a view to co-ordinating the various provincial services (law of March 1926), while the advisory provincial economic councils are created (law of March 1926) to assist the prefects and the Government in all matters of an economic character composed partly of ex-officio and partly of elective members. The law of Dec. 24 1925 conferred greater power of Parliamentary initiative on the Prime Minister and otherwise extended his authority; it also provides for the infliction of penalties for committing offences against him.

Labour Tribunals.—The most important measure of all is the law of April 3 1926, whereby the labour corporations are recognised and invested with the right of legally representing the various categories (employers, workers, employees, professional men, landlords, peasants, experts, etc.), and all labour conflicts are referred to the labour tribunals attached to courts of appeal; strikes and lock-outs are declared illegal and persons promoting them or participating in them are liable to penalties; the original draft of the bill provided that recourse to these tribunals should be voluntary in industrial conflicts, and obligatory only in those concerning agriculture, and Sig. Benni, president of the Industrial confederation, supported this distinction, whereas Sig. Rossoni, president of the labour syndicates, insisted that such recourse should be obligatory in both cases. Sig. Mussolini intervened in the debate with a powerful speech. After he had taken a day for reflection, he decided in favour of Rossoni's view, which was then accepted even by Benni himself, who withdrew his objections.

Although most of the "Aventinians" continued to remain absent from the Chamber, the groups led by Salandra and Giolitti were present, together with Orlando's followers and the Communists and a few stray Aventinians who had begun to drift back and the Communists; the latter took part in the debates and an amendment proposed by one of them was adopted. The unity of the Aventiniani was gradually breaking up through internal dissensions and personal jealousy. The general internal situation continued to improve, although affrays between Fascists and anti-Fascists occurred from time to time. The most serious of these was the attack on Sig. Amendoli, (*q.v.*) near Montecatini, in the summer of 1925, and the outbreak in Florence on Oct. 3, when as the result of the murder of the Fascist provincial secretary Luporini by a leading Freemason, the latter and two Communists were murdered by Fascists, and the shops and offices of several persons supposed to be Freemasons were wrecked. The affair was most regrettable, but it had been provoked by the anti-Fascists, and the persons responsible, whether Fascists, or opponents, were all apprehended, and while those charged with murder were awaiting trial before the assizes, the lesser offenders had already been tried and condemned. The prosperity of the country and the absence of unemployment have greatly weakened the Oppositions, many of whose members as well as many dissident Fascists have shown a tendency to abandon their uncompromising attitude, and not a few are applying for the Fascist *tessera*, but the party directorate are rigid in their refusal to readmit them. In March 1926 Farinacci, who had been counsel for the defence of Dumini in the Matteotti trial, resigned from the secretaryship of the Fascist party, and was succeeded by Augusto Turati; the party directorate was also changed at the same time, and on April 23 it decided to admit no new recruits to the party until 1927.

The object of these various measures and of the general policy of the Government is to give an essentially Fascist character to the state and its institutions, so that the main principles of Fascism, notably the idea of the duty of all citizens toward the state and the necessity that all should co-operate under the guidance of the government and of the men best suited for the task in every field of activity, for the common good and the dignity, prosperity and greatness of Italy, should come to be taken for granted by the nation. It is a policy similar to that of the men of the Risorgimento who succeeded in getting the then novel ideas of the unity and independence of Italy accepted by the mass of the people, who had until that time been indifferent or opposed to them. The gradual elimination of the opposition was based on the view that an opposition in the sense of a reasoned criticism of the Government's policy, which the Government itself would have welcomed, did not exist; there were only the survivors of groups belonging to a dead past, who hoped by a policy of factious scandalmongering, in alliance with the avowedly anti-national groups, to reconquer their old predominance. Hence the lack of interest on the part of the mass of the public at their disappearance.

The Plot against Mussolini.—A sensation was caused on Nov. 5 1925 when it was announced that a plot had been discovered to murder Sig. Mussolini. The Socialist ex-deputy Zaniboni, was arrested in a room in a hotel commanding the Palazzo Chigi, armed with a rifle with which he intended to shoot the Premier while he was taking the salute during the march past of the patriotic societies on Armistice Day (Nov. 4). Gen. Capello (*q.v.*) ex-commander of the II. Army, an active Freemason and a bitter opponent of the Government, was arrested for complicity in the attempt. Mussolini was greeted with enthusiastic demonstrations in consequence of his escape. Another attempt on his life was made by the Hon. Violet Gibson, an apparently demented Irishwoman, on April 7 1926, on the eve of his departure for Tripoli. The Premier was slightly wounded in the nose, but proceeded nevertheless on his journey to visit Italy's North African colony.

In the field of foreign affairs a treaty with Egypt was concluded, whereby the Jaghbub oasis was ceded to Italy, who in exchange ceded to Egypt es Sollum. The oasis is important both as the headquarters of the Senussi sect and because it dominates the caravan routes between Egypt and Cyrenaica; by possessing it Italy will be able to prevent the contraband of arms from Egypt to the rebel tribes. The question had been long debated between Britain and Italy, and although Jaghbub had been promised to Italy, Lord Milner had informed Senator Scialoja in April 1920 that, as in the case of Transjuba, the agreement would only become effective after a general settlement of all the problems before the Peace Conference, thus coupling the Jaghbub question with that of the Dodecanese. As we have seen, this connection was rejected by Italy, and Britain had ended by accepting the Italian view, but with the concession of independence to Egypt in 1922 negotiations had had to be renewed with that country, and were concluded on Dec. 6 1925.

The policy of the Fascist Govt. to enforce the teaching of Italian in the schools of the Alto Adige, and otherwise to give an Italian character to this district inhabited by 180,000 to 200,000 Germans, aroused irritation in Germany, and the pan-German elements voiced by Herr Held, the Bavarian Premier, promoted an agitation against Italy, advocating a boycott of Italian goods, and accusing the Italian authorities of terrorising the population. Sig. Mussolini on Feb. 6 1926 delivered a vigorous speech in the Chamber denouncing this campaign and warning the German Govt. that unless it ceased Italy would not hesitate to adopt strong measures. This outburst caused widespread excitement abroad, but it achieved its object. Herr Stresemann replied in a very minor tone, admitting that the charges of persecution and terrorism were untrue, and this was confirmed by a part of the German Press, although the Italianisation of the district was deplored. In Italy Sig. Mussolini's conduct received general approval, as it was believed that he had spoken to the Germans in the only language which they understood. The anti-Italian agitation in Germany in fact died down, and relations between the two countries had become better than they had been for a long time.

The Italian Govt. attached particular importance to a good understanding with the Balkan States, and on the occasion of the visit to Rome of M. Ninchich in Feb. 1926 the question of Italo-Yugoslav relations was gone into once more, the conclusion arrived at being that in view of the general state of Europe, a yet closer collaboration between the two countries than had heretofore been realised was desirable. The visit to Rome of the Greek Minister M. Roufos, while not leading to any definite result, was an indication of the cordial sentiments of Greece towards Italy.

The year 1925 was proclaimed by Pope Pius XI., an *Anno Santo*, and over 1,000,000 pilgrims flocked to Rome from all parts of the world. The Italian Govt. and the Rome municipality collaborated with the Vatican in organising the transport of the pilgrims and in making arrangements for their stay. Imposing ceremonies were held in St. Peter's and the other churches, undisturbed by any untoward incident, in spite of the attempts of the anti-Clericals and the Freemasons to discourage the pilgrimages. Relations between the Church and the State continued to improve in spite of occasional misunderstandings, the Facsist Govt. attaching particular importance to conciliating the Vatican.[1]

II. THE PROBLEM OF DEFENCE

No country, with the exception of India, is protected by nature in the way that Italy is protected by the formidable barrier of the Alps, which not only affords a defence against invasion by land, but also protects her, to a great extent, from attack from the air. By the treaty of peace signed at Vienna in 1866 Italy was denied the full advantage of her natural strategic frontier and Austria was allowed to retain a foothold south of the Alps in the north and east of the province of Venice; throughout the Great War Italy was never able to overcome the advantage which this adjustment conferred on Austria.

As the result of the Treaty of St. Germain Italy, for the first time in modern history, has secured as her political frontier the line that must always be her strategic frontier. The Italian frontier now follows the high Alps from end to end. This frontier, fixed by nature, has been strengthened by diplomacy, for one-third of it is bounded by the neutral and buffer State of Switzerland.

The ethnographical frontier, however, is not identical with the strategic frontier, and Italy now suffers the disadvantage of including within her boundaries about 250,000 Austrians in the Trentino and 250,000 Slovenes in Istria. As an offset to her strong land frontier Italy suffers strategically from a very extended coastline, though with the former great Austrian naval base of Pola now in her hands the Adriatic may almost be considered as a purely Italian sea.

The Military Forces.—The importance which Italy attaches to her military forces is best indicated by her military budget, which for 1924–5 and 1925–6 in millions of lire were as follows:—

	1924–5	1925–6
Army	1,990	2,130
Navy	925	980
Air Force	399	449
Colonial troops	195	252

The above forces are under a Minister of War, a Minister of Marine and a Minister of Air. After the World War, Italy followed the British example in establishing an air force distinct from the army and navy; at first this was under an under secretary responsible to the Minister of the Interior, but in 1925 a Minister for Air was created on an equality with the Minister for War and the Minister of Marine. The three offices were, however, temporarily in the hands of Sig. Mussolini, the Prime Minister.

In 1925 also the appointment of a chief of the general staff was created; this officer, who will be a marshal or general of army, will be responsible to the Minister for War for the army and to the President of the Supreme Commission of Defence (Prime Minister) for everything relating to the execution of the Supreme Commission of Defence and for the eventual operations of war of the three services.

The Regular Army.—The army is now organised in 10 army corps stationed as follows: I. Turin, II. Milan, III. Verona, IV. Bologna, V. Trieste, VI. Florence, VII. Rome, VIII. Naples, IX. Bari, X. Sicily. It will be seen that five of these army corps are stationed in or about the valley of the Po. These 10 army corps consist of 30 divisions, three of three brigades each, 16 of two brigades each, and 11 of one brigade each, making a total of 52 brigades. In addition to the 30 divisions there are three cavalry brigades, three groups of Alpini, each of nine battalions, 12 regiments of Bersaglieri, a tank corps. The length of service in the army is for 18 months. The numbers called up each year are about 180,000. The recruits are called up in May; so between May and Sept. there are therefore

[1] In the autumn of 1925 Mussolini made speeches of an unmistakably imperial nature. After the Locarno conference he said in the Chamber at Rome that "while the words of peace glisten on the horizon I must recognise that the skies have become populated with prodigious airplanes and that new and deadly weapons are appearing within the sea." Early in 1926 he went to Tripoli, where he addressed the Colonial Agricultural Congress, saying "We are hungry for land because we are prolific and intend to remain so. There is no doubt that my journey is destined to have profound repercussions on the spirit of the Italian people, repercussions which will be beneficial since that is our indestructible will." On July 23 he delivered another speech, breathing the same spirit. Although Mussolini has thus been very outspoken in his addresses to his own people, he has been conciliatory in his relations with other European powers, and is very ready to deny any thought of aggression by force, trusting rather to friendly agreement to secure his ends. (ED. *E. B.*)

two classes with the colours, less the number dismissed after 12 months' service (about 60,000); the maximum strength in these months is therefore about 300,000.

The Colonial Army.—The colonial army consists of both Italian and native units, the latter with Italian officers and a proportion of native N. C. O.s. In 1925 the colonial garrisons consisted of 12,350 Italians and 23,000 native troops, of which all except 8,500 were in Tripolitania and Cyrenaica.

The National Militia.—The national militia is the development of the Fascisti militia. In Oct. 1924 this force by decree was declared to be part of the armed forces of the state, took the oath of allegiance to the King, and became subject to the same disciplinary and penal regulations as the regular army. In peace the national militia is directly under the orders of the Prime Minister; on mobilisation such members as are liable to join as reservists are drafted into the army, navy or air force; other militiamen come under the control of the Minister of War. The members of the national militia are all volunteers. The functions of this force embrace co-operation with the army and public security services in the maintenance of internal order and the defence of Italian interests throughout the world.

The militia is divided into two battalions. In 1925 the strength of the 1st battalion was 175,000 and of the 2nd battalion 120,000; the 1st battalion is composed of men who by reason of their occupation or domicile are liable to be called up at any moment. A general calling up of the national militia can only be ordered by the Prime Minister himself.

The Air Force.—This force, which is under a Minister for Air, is subdivided into four portions: An independent air force, which will consist of 78 squadrons; the army air force, which will consist of 57 squadrons; the naval air force, which will consist of 35 squadrons and six airships; the colonial air force, which will consist of 12 squadrons. These auxiliary air forces, although working under the orders of the other services, will depend on the air force in regard to technical matters, administration and promotion.

Munition Factories.—During the World War Italy was handicapped to an extent unknown by other Powers by her lack of raw materials and by the limited capacity of her munition factories, and was largely dependent on the Allies. Her home resources in coal and oil are extremely limited (*see* ECONOMIC HISTORY, below), and she has only very limited quantities of iron ore. During the War she developed her metallurgical industry with great energy and determination; the great works of Ansaldo and Fiat are a remarkable testimony of this development. In the manufacture of aeroplanes, airships and mechanical transport Italy is now in the forefront of manufacturing nations, whilst in regard to armament she is now self-supporting. Although her lack of raw materials must always present an almost insuperable difficulty to Italy, she has remedied this deficiency as far as is possible by exploiting her limited resources and by the development of electrical power. In regard to man power, Italy has no difficulties; her population of 40,000,000, which increases at a rate of 500,000 a year, is ample for her purposes. (J. Du.)

III. ECONOMIC AND FINANCIAL HISTORY[1]

Population.—A remarkable increase of the Italian population took place between 1910 and 1925. The losses due to the War, to epidemics and disasters and to the decrease of births in the years 1916–9, failed to check the increase, since they were balanced by the return of a number of emigrants (estimated at about 1,000,000) while comparatively few, about 363,000 have since left the country. Thus, it is estimated that the 34,600,000 enumerated in the 1911 census, giving a density of 121 to the sq. km. had increased at the end of 1925 to 40,500,000 or 131 to the sq. km. (including the restored territories, which are more sparsely populated than the peninsula), and this in a country two-thirds mountainous or very hilly, poor in minerals and with a soil exploited by some 3,000 years of cultivation.

The birth-rate, like that of most countries, shows a continuous decline since the 'seventies, but infantile mortality has also diminished. The increase in the number of marriages has compensated for the decrease during the War, but the birth-rate per marriage is only at the pre-War level.

This rapid increase has resulted in the flooding of the labour market. The number of workers between the ages of 16 and 25 is probably about 24,000,000 as against about 20,500,000 in 1911. The difficulty of absorbing this mass of labour would have been even greater than it has been were it not for improvements in industrial equipment, factory organisation, agricultural technique and also the extension of Italian territory. The pressure, however, is increased by the great number of war victims, who are unable to contribute their full share of work.

Period	Marriages Per 1000 of pop.	Births Per 1000 of pop.	Deaths Per 1000 of pop.	Natural Increase[4] Per 1000 of pop.
1908–10	8·01	33·30	20·07	11·40
Normal pre-War[1] period	7·53	31·86	19·61	12·14
War period[2]	3·43	20·53	22·99	1·83
Post-War period[3]	10·31	30·00	17·60	12·60
Average of years 1911–24	7·40	27·80	19·60	8·25

[1] 1909–15 for births, 1909–14 for all other columns.
[2] 1916–19 for births, 1915–8 for all other columns.
[3] 1919–24 for births, 1920–4 for all other columns.
[4] Excess of live births over deaths.

Emigration.—In 1911 the Italians abroad numbered 5,500,000, including those who had emigrated long before that date but had retained their nationality, and whose children had declared themselves Italians. As the result of a special investigation, Savorgnan found that in the 40 years 1872–1913 emigration had effected a reduction of at least 3,800,000 persons in the natural increase of the population of Italy. During the War the movement naturally slackened. Conscription, and the intense demand for manpower at home removed alike the possibility of and the incentive to migration. The total number of emigrants in the four years was, in fact, barely three-fifths of the pre-War annual average. With the return of peace began a feverish race abroad, which was at its height in 1920 when those who had returned from the United States during the War realised that if they delayed they might not be able to get back at all. The numbers of those repatriated since 1921 have amounted annually to about half the total number of emigrants. In all probability the proportion was formerly greater, since nearly all of those in Europe and about 55% of those overseas returned for the winter. Nevertheless, when a census of Italians abroad was taken in 1921, it was found that there were 7,500,000 of them scattered about the world. For statistics of the movement of population and the restriction of migration to the United States *see* MIGRATION.

The present stream of emigrants differs considerably from that of 1909–13 in respect of quantity and quality, countries of destination and districts of origin. The restrictions introduced by the United States and other countries have not only reduced the total number of emigrants, but have tended especially to exclude the Southern Italians, whose need for an outlet is greatest. The average of Italian emigrants to North America was about 200,000 for the years 1919 and 1920, and for the years 1921–5 about 50,000; whereas the yearly quota allowed in 1926 was under 4,000.

Percentage Distribution of Italian Emigration

Destination	From N. Italy		From Central Italy		From South Italy	
	1909–13	1922–4	1909–13	1922–4	1909–13	1922–4
Europe and the Mediterranean basin	30	46	7	6	4	6
Countries overseas	10	13	7	5	42	24

[1] Note should be taken of the varying value of the lire. Expressed in lire the annual average value of sterling was:

1914	25.35	1920	99.79
1915	27.90	1921	93.91
1916	31.27	1922	91.86
1917	33.03	1923	99.75
1918	30.31	1924	102.14
1919	50.08	1925	121.54

The parity value of the lire is 25.22.

In 1924 France took 201,715 Italians, mainly from North Italy, and since the Armistice the annual average has been 126,000, or nearly double the number employed there in 1914. This state of things is, however, unlikely to continue; the reconstruction of the invaded districts is practically complete, and the demand for agricultural workers in the Gironde and the Garonne has now been almost satisfied. In the near future Italians will only be wanted in the industrial regions of Northern France. After France, the largest market for their labour is the Argentine Republic; Switzerland, Germany and Austria will assuredly not need them as they did in the past. This slackening in the flow of emigration has not, however, checked the tendency to an increase in the proportion of skilled workers among the emigrants, and a lessening of the former preponderance of agricultural labourers.

Percentage of Emigrants

Period	Agriculturists	Labourers	Bricklayers	Industrial Workers	Domestic Servants	Other occupations
1909–13	32	30	12	12	3	11
1919	16	13	9	17	17	21
1920	26	20	10	22	12	9

Production and Industry

Agriculture.—Despite considerable fluctuations from 1911 onwards agriculture has afforded a profitable occupation to 52 per cent of the population, *i.e.*, to 11 millions over 10 years of age. Besides food for direct consumption, the products included the raw materials of more than half the total of the country's manufactures, indirectly providing occupation for 27·8% of those employed in industry. In the years immediately preceding the War the average annual production was valued at about 7,800 million lire. Soil and conditions vary greatly, ranging from the rich fertility of some parts of Campania and Sicily, which will grow all kinds of luxury produce, to the moorlands of the north or the chalk-hills of Tuscany and the Lucan clays; from the plains of Lombardy and Venetia, where the "special" crops (tomatoes, sugar-beet, hemp, rice, vegetables, fruit) give a good return to energetic and prudent cultivators, to bare pastures scorched by the sun all through the rainless summers, and marshy lands where the farmer is handicapped by malaria and the poverty of the soil. Regions of the most intensive and extensive cultivation border on one another; the large estates situated on the gentle slopes which rise from the sea shore to the hills adjoin land divided into thousands of tiny holdings. Next to miserable marshlands with neither houses, trees, shade nor water, may be seen fertile oases with olives, oranges and lemons.

These various agricultural regions do not all permit of the utilisation of large capital in the form of machinery, selected seeds, pedigree stocks, proper buildings and skilled workers. Where climate and soil are favourable the owner can create a garden; elsewhere the struggle is long and hard and the return extremely small. In such areas capital is not the chief need, but the Government can do valuable work in preventing the damage done by erosion in the mountainous regions and by making roads and aqueducts.

Progress in these directions is slowly being made, though it suffered a set-back during the four years of war, when, owing to the requirements of the army, labour, fertilisers, machinery and means of transport, were all difficult to obtain, and produce was requisitioned at fixed prices which were far too low to compensate for the many months of laborious toil. Faced by all these difficulties and by the necessity of slaughtering large numbers of cattle and cutting down the forests for military requirements, Italian agriculturists have achieved a great feat in surmounting this troubled period without experiencing an excessive diminution of crops, cattle and forests. The greatest difficulties, however, came in the next years, 1919–22, when the effects of the great deterioration of the soil during the War period were felt; the supply of fertilisers was still very scarce, and cultivators suffered from the uncertainty of prices, the constant disputes with the wage-earners, and the high costs of transport. But these troubles ended at last, and the abundant harvests of 1923 and 1925 made ample amends for the former privations.

The increase in production has been obtained with scarcely any increase in the area under cultivation. Much is due to the intensification of effort, to a more generous use of fertilisers. The efforts and sacrifices of the small proprietors, above all the new settlers, were specially meritorious, for the acquisition of the land had often deprived them of most of their savings, with the result that they had to reduce their standard of living to a very low level in order to scrape together their working capital. Superphosphates, nitrates, basic slag, potash and other fertilisers, supplies of which were heavily reduced during the War, are all now being used in greater quantities than in 1913. The import figures of agricultural machinery do not, owing to the changes in the tariff, give a correct index of the increase or decrease in the purchase of farm machinery; it is certain that the home manufacture increased after the War. Irrigation is also making progress, and year by year new schemes are being started; at the same time water-logged areas are being drained by means of electrical power with the result of abolishing malaria as well as improving the fertility of the land.

In 1911 Italy was nearly self-supporting as regards agricultural produce, except in wheat and timber, and the amounts of these imported were almost entirely paid for by the exports of other agricultural products, so that the agricultural balance is really about even. Moreover, the industry is highly profitable; at the average prices current, the gross value of the total produce of the soil is estimated at 41,700 million lire. The total value would probably have to be increased by several hundred million lire if the whole of the peasant production could be brought into the account, for it must be remembered that no less than 87% of the rural proprietors cultivate very small holdings, most of which are less than half a hectare, though 6/7ths of the total agricultural land is being held by 214,000 "large" and "medium sized" and 500,000 "small" owners. But even excluding this supplementary amount, the figure of 41,700 million lire represents an average of 3,180 lire contributed by each agricultural worker over ten years of age; and an average value of 1,467 lire

Principal Agricultural Products (in thousands of Quintals)

Hemp	850	100	880	103	815	96	603	71	740	87	1,170	138

of heavy produce for each hectare of agricultural or forest land, the lowest regional average being Sardinia with 460 lire and the highest, Lombardy with 2,580 lire.

Industry.—Of the 5,000,000 adults shown by the census of 1911 as occupied in industry, probably not less than a third were not employed in factories; and it must not be forgotten that a number of women and children entered as domestic workers actually help in the manufacture of articles of daily use or in making the numerous local products which reflect Italian artistic traditions, good taste and native skill, and which enter largely into the export trade. Such wares are embroidery, lace, carved furniture and terra cottas, wrought iron and chased metal work, decorative glass, spun glass and mosaics, stamped leather and illuminated vellum, all of which give ample opportunity to skilled workers and are mainly fashioned in small workshops. The multiplicity of such workshops and the extent of the sales to the public show the importance of these crafts.

Evidence of industrial development is generally sought for in the progress of large undertakings where thousands of workers are massed together, and certain branches of heavy industry are usually looked on as providing the best indices of the aggregate national activity. In Italy, however, the scarcity of fuel and of minerals, the difficulties of land transport due to the mountainous nature of the country, and also the special qualities of the working classes, who are not excessively robust, though quick, industrious and intelligent, have led to a preference for the working up of food products, textiles of various kinds, delicate machinery and housing accessories.

The census of industries which was taken on Jan. 10 1911 showed a very large number of undertakings (243,926), distributed throughout the country, the larger units being concentrated in North Italy, the smaller spread over the other parts of the peninsula. The larger units were comparatively few (only one-tenth of the total number—22,413 to be exact—employed more than 10 persons each), but this tenth possessed three-quarters of the aggregate mechanical and labour power. The distribution of the women, who constituted a third of the total number of persons employed, indicates the importance of the textile industries. These have been traditional for centuries in Italy, and were to be found in every valley, while domestic production had not yet disappeared. Next in importance, in respect of numbers of undertakings and employees, came food manufactures, while the steel and engineering industries were making but slow progress.

The War stimulated nearly every branch of industry, and the introduction of the shift system led to the expansion of plant and to new kinds of manufacture in which by-products, formerly neglected, could be utilised. The extraction of iron ore, pig-iron production and steel showed great increases. In addition to arms and munitions the requirements of the army included a vast number of commodities ranging from cloth to canvas, from shoes to motor-cars, from rubber to paper and from chemicals to naval dockyards. All these shared in the boom which followed the cessation of hostilities.

Employment.—After the Armistice a crisis was brought about by the necessity of substituting other industries for those of the War period, and the difficulties of forecasting demands were intensified by the shortage of raw materials, and by a fierce struggle for the control of associated or subsidiary products. With the assistance of industrial exhibitions organised at Milan, Padua and Naples, and of vertical combines which were formed on an extensive scale, the very difficult period of 1919–20 was at length surmounted. The workers' desire for a "new order" which should give them control of the factories, provoked a number of vast conflicts and strikes. In the first year after the Armistice 1,600,000 workers "downed tools," and 2,300,000 in the following year. In the two succeeding years the world crisis made itself felt, and the effects were intensified because, owing to the bad harvests, the spending power of the poorer classes was greatly reduced and the demand for manufactured goods thereby lessened. But in 1922 conditions began to improve; in that year there were less than 448,000 strikers, and the number of unemployed, which in Jan. 1922 had reached the maximum of 607,000, fell in the summer to half that figure and did not rise to any very great extent in the following winter. At the end of 1925, the number of unemployed was still reduced to the very small figure of 122,000. Certain undertakings which had been over-capitalised failed, and this directed attention to the necessity of reducing costs of production, which became of vital importance when active competition was renewed.

Price Level.—The recovery was brought about by the closing of the gap between internal and foreign price levels during 1924 and by the diminution in the violence of fluctuations. Prospective costs and profits could then be estimated with less uncertainty. Another contributory cause was the halt in the upward course of wages; in 1921 these were five and a half times higher than the pre-War level, but they fell in 1922, and throughout 1923 and in 1924 remained at barely five times the pre-War figure, *i.e.*, the rise was a little less than that in the cost of living, which was nearly six times the pre-War level. But in 1925 statistics show a very marked upward trend of the level of wages, caused by the ever-increasing cost of living. Imports of raw materials increased, and the mining industry almost entirely recovered.

Heavy Industry.—The production of pig-iron rose to only about a tenth below the 1910–4 average, and less was imported, since scrap was being more and more utilised for the manufacture of steel, both by the Martin and electric processes.

	Imports of Principal Raw Materials (thousands of metric tons)			National Production (thousands of metric tons)		
Annual average	Iron and Steel Scrap	Pig-iron	Copper	Iron Ore	Pig-iron	Iron and Steel
1910–4	340	230	36	563	369	973
1915–8	212	243	74	829	407	1,150
1919–21	102	146	42	427	130	740
1922	306	136	46	311	158	1,046
1923	434	132	50	341	236	1,219
1924	538	201	58	219	304	1,359
1925	958	265	66	..	..	1,600

A still greater expansion of the steel industries was hindered by the scarcity of minerals and of coal, the inferior physique of the workers and the difficulties both of organising vertical combinations and of maintaining their efficiency. Hence the preference of the Italians for industries where these drawbacks are not felt in the same degree; such are the building industry, the making of cement blocks and the preparation of foodstuffs for which there is abundant demand. Tanneries and stocking factories have greatly increased in number and capacity, and their products, like those of automobile works, are very largely exported. The film and armament industries have fallen to a very low level, the results of which are especially felt in the redeemed provinces where they were formerly of great importance. On the other hand, beet sugar is being produced in 53 factories as against a little over 30 in 1911, and the production, which averaged 1,700,000 quintals in the five years preceding the War, has lately reached 2,750,000 quintals; it is true that in 1925 the amount fell to the 1910 level, but the set-back is merely temporary. As soon as the stocks accumulated during the boom period have been sold off, the beet area will certainly be extended both in Emilia and the Veneto, where four-fifths both of the cultivation and of the manufacture are carried on. In Campania about half of the preserved vegetable foodstuffs are made, of which the annual value is about 368,000,000 lire, and three-fifths are exported.

Textiles.—As regards textiles, the woollen branches of the industry seem on the whole to have made most progress; larger quantities of raw material are being consumed, and certain processes are being undertaken which were formerly not attempted in Italy. Washing and combing are no longer done almost entirely abroad, thanks to the improvements in machinery and equipment which have been made since 1915, especially in

Annual average	Raw silk production	Exports		Production		Imports	
		of raw silk[2]	of cotton, spun and woven	of electric power	of lignite	of coal	of petroleum, benzene and residual products
	(kilogrammes)	(kilogrammes)	(quintals)	(in million kilowatts)	(tons)	(tons)	(quintals)
1910–4	4,780,000	7,193,400	538,800	2,300	654,000	9,940,000	1,387,000
1915–8	2,492,000	4,720,000	586,000	3,200	1,540,000	682,000	2,260,000
1919–21	3,600,000	4,740,000	575,000	4,100	1,335,000	645,000	2,310,000
1922	3,990,000	4,410,000	390,600	4,300	946,000	8,838,000	2,911,000

1924	5,563,000	5,440,000	775,500	6,000	1,048,000	11,221,000	3,767,000
1925[1]	..	6,370,000	800,000	7,600	..	10,500,000	4,250,000

[1] The whole year.
[2] Considerable quantities of cocoons are imported—hence the excess of export over home production.

Piedmont and the Vicentino. The silk and cotton manufactures are also expanding; better qualities of raw materials are being used (*e.g.*, Egyptian cotton) and equipment and processes have been modernised and improved. In fine, owing to the cheapness of female labour the textile industries have passed beyond the stage of catering for the home demand and for the poorest of the foreign markets, and the exports are no longer confined to the coarser kinds of fabrics, but include grades of medium fineness. The manufacture of mixed fabrics has been greatly facilitated by the increasing development of artificial silk, for which until a few years ago Italy depended largely upon foreign countries.

Motive Power.—An index of the manufacturing capacity of Italy is afforded by the figures of consumption of fuel and motive power; although the Italian mines yield only one-twentieth of the country's industrial requirements, the amount of hydro-electric energy (leaving out of account the periods of interruption due to the exceptional drought) is almost three times as great as in 1913 and takes the place of at least 7,000,000 tons of coal. In addition, the imports of coal are about the same as in 1913, while those of petroleum and benzene have nearly trebled in quantity.

Savings.—During the 15 years 1911–25 savings have experienced various set-backs, especially in the form of deposits in savings institutions and investments at fixed rates of interest. The effects of monetary depreciation have been felt by those who did not wish or did not know how to transfer their holdings of fixed interest bearing securities into industrial shares or real estate. The rate of interest on bonds has risen from 4% to 6% and over. It is questionable whether the 35·7 milliard lire deposited in various credit and savings institutions in the middle of 1924 represented an equivalent purchasing power to the 7·6 milliard lire similarly deposited in June 1914. In view of the rise of prices and diminution in the purchasing power of the lira, the deposits in the middle of 1924 were probably equivalent to about 5·5 milliard lire (pre-War values), but it should be observed that current savings are more often invested directly instead of through the medium of credit institutions. The issue of both long and short dated treasury bonds, the total of which rose from a few hundred millions in 1914 to 30 milliard lire over a period when the consolidated public debt also trebled in amount, indicates one of the many new avenues for savings which formerly found their way into banks and savings institutions. (A still larger field is now offered by industry, for example, the resumption of building after the War has absorbed a considerable amount of savings.) It has been estimated that new savings in 1925 amounted to 15 milliard lire, equivalent to about 2½ milliard lire (pre-War values). The accompanying tables show the amount deposited in savings and credit institutions, the official discount rate, and the number and capitalisation of joint stock companies:—

Number and Amount of Capital of the Principal Joint Stock Companies at the Beginning of Each Year

Year	Number	Total capital (million lire)	Amount per society (million lire)	Aggregate capital, calculated on the basis of 1913 purchasing power of the lira (million lire)
1913	2,951	5,506	1,870	5,506
1918	3,463	7,257	2,090	6,770
1922	6,075	20,249	3,340	8,975
1923	6,734	21,293	3,160	9,345
1924	7,782	23,421	3,020	10,170
1925	8,946	28,261	3,160	10,402
1926	10,515	36,278	3,450	11,444

Stock-exchange quotations of securities reflect the judgment of the market as to the resources, prospective profits, etc., of each undertaking. When grouped together for each industry the figures provide an index of the general financial forces influencing the different branches of economic activity.

	Index Numbers of Stock-Exchange Quotations for the Principal Joint Stock Companies and State Securities Calculated by Riccardo Bachi. Basis 100 for 1913

State Securities	96	69	64	66	71	66

Bankruptcies.—The number of bankruptcies, after falling to one-third during the War period and to less than one-seventh in the following three years, rose in 1924 to the level of 10 years previously. As the population has become denser and those engaged in industry and commerce more numerous, this figure may be regarded as normal.

	1914	1918	1920	1922	1923	1924	1925
Amounts deposited in the Postal and other Savings Institutions, banks, credit banks and peoples' banks, Monti di pietà, etc. (in millions of lire)	7,595	12,231	20,659	28,316	32,334	35,698	36,000
Official rate of discount	5–5·50	5–5·50	5–6	6–5·50	5·50	5·50	5·50–7
Rate of interest on the public debt (from annual averages)	3·62	5·66	6·62	6·55	5·97	5·28	5·44
Index numbers of wholesale prices of commodities (R. Bachi) (from annual average)	100	409	624	562	575	585	690

Sales of Property.—The sales of fixed property, which increased in the period of social upheaval and threats of expropriation, continue to be somewhat numerous, owing to the profitability of small holdings and to the break up of the large estates. The very small values of the average transfer indicate a new reduction in size of properties transferred. Allowing for a certain amount of evasion it is possible that this reflects an increase in the number of transfers of small properties for building purposes.

Annual Average	Number of Bankruptcies	Transfers of Fixed Property		
		Financial Year	Number	Millions of Lire
1912–4	7,170	1914–5	343,332	1,006

1923	5,691	1923–4	462,700	5,664
1924	7,276	..	..	..
1925	7,218	..	..	..

Trade and Transport

The development of Italy's foreign trade has been affected both by the depreciation of the currency and by the increase of her population; allowing for the reduced purchasing power of money, the average value per head of the population was less in 1925 than in the period immediately preceding the War, but was tending to increase.

Directions of Trade.—The directions of both imports and exports show considerable changes, compared with pre-War. Imports from the United States and the Argentine increased by 10 times, only surpassed by Switzerland with a 12-fold increase, while imports from France, England and Germany increased only from three to five times. The extension of Italian exports has been greatest to England, France and Switzerland, followed by Germany, the Argentine and the United States.

Balance.—The adverse annual balance of trade, which was 1·1 milliard lire in 1909–13, rose in 1925 to about 8 milliard lire; against this must be set the expenditure of foreign visitors and the remittances of Italian emigrants, the former being probably of the larger importance. Movements in the values of total imports and exports are given in the following table:—

Foreign Trade 1910–25 (Special Trade)

Year	Imports			Exports		
	Total millions of lire	Amount per head of pop. in lire		Total millions of lire	Amount per head of pop. in lire	
		a	*b*		*a*	*b*
1910–14	3,381	97	97	2,281	65	65
1919–21	20,123	546	105	8,700	236	45
1922	15,765	404	72	9,302	238	42
1923	17,189	436	76	11,086	281	49
1924	19,388	486	83	14,318	359	61
1925[1]	26,254	648	73	18,277	451	48

[1] The whole year.
(*a*) In lire. (*b*) In lire on the basis of purchasing power.

Transport.—The demands made by the War on both railway lines and rolling stock were very heavy; the length of railways was increased by 1,000 km., while another 1,000 km. were taken over in the restored provinces. On the state-operated lines the number of passengers increased during the last decade by 7%, and since 1922 the volume of goods carried has shown a considerable increase, following on the improvement in railway material and greater security of delivery. The charges both for passengers and for goods have been increased, while the *personnel* has been reduced and the price of coal has fallen from the excessive level of 1921, hence the deficit which arose during the years immediately succeeding the War has disappeared.

The net tonnage of the mercantile marine registered in Italian ports doubled between 1912 and 1924. The losses from submarines and mines were more than replaced by the shipping taken over in Trieste and Istria, and the ships as a whole are faster and more modern than before the War. Though the total weight of goods carried to and from Italy shows no appreciable increase compared to pre-War, a larger proportion is carried in Italian vessels, in spite of the obvious preference of importers from overseas to employ their own vessels.

All this economic development and also the emergence of Milan as a centre of importance in international trade could not fail to be reflected in the figures of the credit clearing-houses. The clearings, which in 1913 amounted to 63 milliard lire, rose in 1925 to 1,030 milliards or by 16 times.

Year	Length of the Rlys. Km.	Railways		Tonnage of Mercantile Marine	Shipping		Credit Clearing House Figures
		Railway Traffic			Goods loaded and unloaded at Italian Ports		
		Passengers	Goods		Italian Flag	Foreign Flags	
		(millions)	(mln. tons)	(mln. tons)	(mln. tons)	(mln. tons)	(mlds. of lire)

National Finance.—The revenues of the state were about 2,400 million lire in 1910–1. This was the last of a series of years, beginning 1898–9, in which there was a continual surplus of revenue over expenditure; from then onwards, first the Libyan War and then the World War occasioned a long succession of financial deficits. The period 1911–25 falls naturally into four divisions.

1. *1911–2 to 1913–4.*—Owing to the Libyan War expenditure rose by 152 million in 1911–2, by 250 million in 1912–3, and by 181 million in 1913–4, resulting in deficits for the three years of 111·8, 257·5 and 163·9 million lire respectively. These deficits do not include sums borrowed by the Treasury, as a result of which the National Debt increased from 15,746·5 milliard lire to 17,080·2 milliard lire.

2. *1914–5 to 1918–9.*—The War years thus began with a budget which could have been balanced with a very slight effort, and with a public debt of about 17·5 milliard lire. The following table shows the increase in public expenditure due to the War:—

Year	Military Expenditure	Civil Expenditure	War Pensions	Total	Revenue	Deficit
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
1914–5	3,296	2,099	..	5,395	2,560	2,835
1915–6	8,317	2,307	1	10,625	3,734	6,892
1916–7	14,069	3,497	30	17,595	5,345	12,250
1917–8	19,142	6,002	154	25,299	7,533	17,766
1918–9	23,280	8,942	229	32,452	9,676	22,776
Total for 5 years	68,104	22,847	414	91,366	28,847	62,519

The expenditure during the War years would have appeared much greater had it not been that many items remained in suspense and burdened the budgets of subsequent years. The increase of civil expenditure was due partly to the rapid rise in the cost of living, which necessitated increased salaries and bonuses, partly to allowances to the families of soldiers and to the refugees from invaded districts, partly to the taking over by the state of the administration of the mercantile marine, and partly to the interest on the National Debt, which rose from 530 millions in 1913–4 to 2,624 millions in 1918–9. It was impossible to raise revenue to within measurable distance of such expenditure.

A part of the increase in revenue was automatic, arising as it did from the depreciation of money, and the consequent increase in the receipts from indirect taxation. The resources of the financial administration were greatly strained by the withdrawal of men for the army, by the dislocation caused through inflation, and by the task of collecting the new taxation imposed during the War, such as new monopolies (matches, playing cards, coffee); a 5% tax on the letting of houses; the War *centesimo* on incomes above 10,000 lire; the tax on War profits, etc. None of these new taxes brought in any considerable sums to the exchequer, with the exception of the tax on War profits. Framed on lines somewhat similar to those of the excess profits duties of the United Kingdom and the United States, this tax was at first levied by the Royal Decree of Nov. 21 1915 on all profits of the War years in excess of 8%, the rates varying from 10 to 30%, this latter rate being applicable to all profits in excess of 20% on the capital invested in the undertaking. The growing feeling against War profiteers caused the rates to be raised to from 12 to 35% (decree of Aug. 31 1916), and shortly afterwards to 20 to 60% (decree of Nov. 9 1916). The yield of the tax increased from 108·2 million in 1916–7 to 451·6 million in 1917–8, and 805·8 million in 1918–9.

3. *1919–20 to 1921–2.*—The following table shows that the highest expenditure was reached, not during the War, but during the period of liquidation immediately after the War.

	Military Expenditure	Civil Expenditure	War Pensions	Total Expenditure	Revenue	Deficit
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
1919–20	8,085	13,851	1,158	23,093	15,207	7,886
1920–1	9,212	25,780	1,236	36,229	18,820	17,409
1921–2	6,798	27,114	1,549	35,461	19,701	15,760
Total for 3 years	24,095	66,745	3,943	94,783	53,728	41,055

Of the civil expenditure 13 milliards were required for the service of the debt, 5·1 milliards for exchange transactions, etc., 3·5 milliards for the cost of the merchant shipping services, 5·3 milliards for food supplies, 3·1 milliards for deficits on the state railways, 3·9 milliards for War pensions, and 6·8 milliards for the reconstruction of invaded or restored territories. The costs of all these services were greatly enhanced by the depreciation of the currency.

Fortunately, the fall in the value of the lira also increased the public revenue, which during the War had varied from 2·6 to 9·7 milliards, and which rose in 1921–2 to 19·7 milliards. Part of this increase was due to confiscatory legislation passed under the influence of the socialistic and demagogic tendencies which prevailed after the War. A levy was imposed on increments in the values of property, which ranged from 10 to 80% of the War gain remaining to the taxpaper after the payment of the War profits tax. Before this had come into force it was increased by the law of Sept. 24 1920, which involved a tax of 100% on all the War profits of industrialists and traders. In no country was so high a rate imposed, and during the three years of liquidation the yield of the tax reached over 4,796 million lire. Further, an extraordinary levy on property was imposed, which was designed to be a progressive tax on capital, levied at rates varying from 5 to 50%, but owing to the impossibility of collecting the whole tax in a single year, it was necessary to spread it over a period of years, fixed, first at 30 and then at 10 to 20 years.

Among taxes already in existence the succession duty especially appealed to the new social theorists, and by means of various technical modifications and by changes in the method of assessment, this was raised to 30, 50, 80, and, incredible as it may seem, to 103% of the amount inherited. At the same time it must not be forgotten that credit is due for the abolition, on the initiative of Signor Giolitti, of the disastrous policy of regulating the price of bread, which for political reasons was sold below cost and threatened to send the Italian lira into the abyss after the German mark.

4. *1922–3 to 1924–5.*—Expenditure and receipts and the eventual balancing of the budget are shown in the following table:—

Year	Military Expenditure	Civil Expenditure	War Pensions	Total Expenditure	Receipts	Difference between Receipts and Expenditure (+ or −)
	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire	mill. lire
1922–3	3,248	16,976	1,608	21,832	18,803	−3,029
1923–4	3,704	15,820	1,475	21,000	20,584	− 418
1924–5	3,286	15,284	1,453	20,023	20,440	+ 417

Except for the first four months, the period of transition from large deficits to the budget equilibrium of 1924–5 took place under the control of Signor de Stefani, head of the combined Ministry of Finance and the Treasury. He contrived to restrict expenditure within the limits of revenue by gradually eliminating abnormal expenditure and by a return to the sound conditions of Treasury control and supervision of accounts which had been largely abrogated during the troubled War years. The Italian Treasury has always been accustomed to publish monthly statements of its position, but this has been developed by Signor de Stefani with the result that figures are now published relating to all the various aspects of the economic life of the country. It has not merely been necessary to cut down expenditure, but also to make provision against the disappearance of abnormal War revenues, in particular the tax on War profits and on property. Many relatively unproductive War-taxes were abolished in 1923 and 1924, and the remainder were simplified and given a permanent place in the tax system. Being convinced that certain taxes had been raised to an excessive height, he carried through important modifications and reductions; thus he abolished the inheritance tax on property passing within the family, and reduced it largely in other cases. Again, he reduced to half or less the taxes on land and on factories, and decreed a gradual modification of the rates of tax on incomes from other sources. But at the same time he instituted investigations into taxable incomes in such a way as to bring the taxpayers' returns nearer to the real incomes and to reduce evasion to a minimum. It may be noted that in 1918 the manufacturers, traders and professional persons subject to tax numbered 543,184, and that the aggregate revenue from this source was over 704 million lire, while in 1924 the number rose to 762,137, and the tax yield to about 2,793 million lire. There were also added to the number of direct taxpayers 1,260,090 agriculturists, proprietors, cultivators, and metayers, who in 1923, for the first time in the history of Italy, were subjected to an income tax, the resulting yield being 2,081 million lire.

Public Debt.—The series of heavy deficits during the 10 years 1914–23 inevitably affected the public debt of the state; moreover, the method of partly meeting the deficit by the issue of paper money was, in its turn, a powerful cause of the increase of expenditure and of indebtedness, much of which would not have existed but for the disturbing influence of the issue of paper money. Below is a summary statement of the movements of the Italian State debt since 1911, in millions of lire:—

Italian State Debt (in millions of lire)

	June 30 1911	June 30 1914	June 30 1919	June 30 1922	June 30 1923	June 30 1925	Dec. 31 1925
Perpetual and long term debt	13,833	14,840	28,581	49,368	49,317	50,847	50,901
Treasury bonds 3, 5, 7 and 9 years	..	..	5,835	7,232	10,718	12,411	12,223
Treasury bills 3, 6, 9 and 12 months	82	380	15,054	25,417	24,835	17,583	18,307
Current accounts bearing interest	57	61	450	415	351	832	942
Total interest bearing debt	13,972	15,281	49,920	82,432	85,221	81,673	82,373
Notes issued by the Government or on Government account	436	490	10,293	10,316	10,192	9,168	9,163
Foreign debt at par	..	..	19,206	21,615	22,187	23,404	..

The foreign debt is not comparable with the internal debt, as it was contracted in dollars and sterling, and is here converted into lire at par, *i.e.*, gold lire, which are very different from the paper lire of the rest of the debt.

The internal debt reached its maximum on June 30 1923, which marked the end of extraordinary War expenditure. From then onward the amount decreased, and by Dec. 31 1925 the internal debt had contracted by 2·85 milliard lire. This affords the most significant proof of the improvement in economic conditions, of the growing yield of the ordinary taxes, and of the restriction of expenditure which characterised the long period of Signor de Stefani's control of finance. His successor, Signor Volpi, continued the process of financial reconstruction, and in particular settled the War debts with United States and Great Britain. The agreement concluded with the United States in Nov. 1925 reduced the debt from a nominal value of $2,042,000,000 to a present value at 5% of $430,000,000, distributed over 62 annuities rising from an initial minimum of $5,000,000 to a final maximum of $82,000,000. The agreement concluded with Great Britain in Jan. 27 1926 was set on payments distributed in 62 years, with yearly payments from £4,000,000 and £4,250,000 in the first six years, to £4,500,000 a year from 1931 to 1987. Considering that the national wealth of Italy was estimated at the beginning of the War at 100 milliards lire, and the national income at 20 milliards, it has involved a tremendous burden to maintain War expenditure which in the heaviest years reached 35 milliards, though reckoned in a currency which was continually decreasing in purchasing power.

Currency.—It is not surprising that the Italian economy should still bear the marks of this economic effort, of which the deepest is the decline in the value of money. The table on p. 578 shows the note circulation, the average circulation per head, and the average value of the lira in terms of gold.

During the period of actual fighting, when there was a deficit of 62·5 million lire, which could not be covered by internal loans amounting to 34·6 milliards, and foreign loans of 19·2 milliards, the state was forced to obtain advances from the banks, to the sum of 10·3 milliards, and the lira in consequence depreciated. In 1920 the value of the lira had fallen to 22 gold *centesimi*, and the total circulation had attained its maximum of 22 milliards. In terms of gold the circulation per head of the population increased only from 76·18 to

	Circulation (in millions of lire)			Paper lire per head of pop.	Rate of exchange of the paper lire in gold centesimi (average of the six months preceding and six months following Dec. 31)	Gold lire per head of pop.
	Bank	State	Total			
Dec. 31 1911	2,193·4	485·3	2,678·7	76·94	99	76·18
Dec. 31 1912	2,212·4	499·0	2,711·4	76·94	99	76·18
Dec. 31 1913	2,283·5	499·1	2,782·6	78·17	99	77·39
Dec. 31 1914	2,936·0	657·2	3,593·2	99·48	92·5	92·02
Dec. 31 1915	3,968·1	1,082·1	5,050·2	138·19	80	110·55
Dec. 31 1916	5,012·3	1,317·3	6,329·6	173·19	74·5	128·89
Dec. 31 1917	8,425·0	1,747·8	10,172·8	276·89	59·5	160·75
Dec. 31 1918	11,750·3	2,124·0	13,874·3	377·63	73	272·67
Dec. 31 1919	16,281·3	2,270·3	18,551·6	515·05	34	175·11
Dec. 31 1920	19,731·6	2,268·4	22,000·0	606·02	22	133·32
Dec. 31 1921	19,208·9	2,267·0	21,475·9	582·02	24	139·68
Dec. 31 1922	18,012·0	2,267·0	20,279·0	544·01	24	130·56
Dec. 31 1923	17,246·6	2,427·8	19,674·4	495·20	23	114·01
Dec. 31 1924	18,114·2	2,400·0	20,514·2	510·76	22	112·37
Dec. 31 1925	19,468·2	2,100·0	21,568·8	532·23	..	..

112·37 lire or not more than 50% of the increase in countries remaining on a gold standard; but the increase in the *per capita* circulation of paper money was the cause of a profound alteration in incomes and in the burden of taxation. It is estimated that the pre-War national income of 20 milliard gold lire had increased to 100 milliard paper lire in 1924–5. On the former income, the burden of taxation, both central and local, amounted to 2·5 milliards, or 12·5% of the national income, while in 1925, on the same basis, the tax burden rose to 20 milliards, or 20% of the national income of 100 milliards. These two proportions, 12·5% and 20%, reflect the changes in the burden of taxation resulting from the War. When it is considered that this increase in taxation was borne by a population whose average income per head before the War was about 500 to 550 gold lire a year (£20 to £22 sterling), and in 1925 was about 2,500 paper lire (£21 sterling), it is clear that if it was hard to pay 12·5% in taxation of an income of 500 to 550 gold lire, it is exceedingly hard to pay in taxes 20% of incomes of 2,500 paper lire. We may well speak of the heroic efforts of the Italian taxpaper, which have been the product of the War.

(L. E.)

IVORY COAST (*see* 15.98).—A French colony on the Gulf of Guinea. The area is 122,000 sq. m.; the population in 1925 was estimated at 1,400,000, of whom 1,100 were Europeans. From the lagoon port of Abijan a railway, 193 m. long, was opened to Bwake in 1913. Thence a motor road connects with the Upper Volta colony. Besides palm-oil and -kernels, fine woods, including mahogany and ebony, are exported. Forests cover two-thirds of the colony. *See* WEST AFRICA, FRENCH.

IWASAKI, KOYATA, 2ND BARON (1879–), Japanese philanthropist, was born in 1879, and succeeded to the barony in 1909. Educated at the Imperial University of Tōkyō and at Cambridge, England, he became president of the banking department of the Mitsubishi Company. His vast wealth was largely expended in experiments and benefactions. He instituted a research farm in the north of Japan for stock raising. His visit to England convinced him of the educational value of public libraries, and when the library of Dr. G. E. Morrison, for many years *The Times* (London) Correspondent in Peking, came into the market, Baron Iwasaki bought it for the students of Japan. He added to it the bulk of his own collection and in addition to buying a site and erecting a building to contain it, he allotted a sum of money annually to the institution for the purpose of keeping it up to date by the purchase of new books. The library is called the *Tōyō Bunko* (Oriental Library) and is situated in Kamifujimae Chō in Hongō, Tōkyō.

IZVOLSKY, ALEXANDER PETROVICH (1856–1919), Russian statesman, was born at Moscow March 17 1856, of an ancient Polish family which had been settled in Russia for generations. He graduated at the Imperial Lyceum of St. Petersburg (Leningrad) with the highest honours attainable, whereupon he became attaché to the chancellery of Prince Gorchakov. In 1879 he was appointed first secretary of the Russian Legation at Bucharest. After a spell of service in Washington he was charged with the resumption of relations between the Tsar's Govt. and the Holy See, a task which he fulfilled with great tact to the entire satisfaction of his chief, and incidentally won golden opinions of Cardinal Rampolla and Leo XIII. and received the post of Minister-Resident at the Vatican.

About this time he married Countess Toll, a friend of the dowager Empress Maria Feodorovna, to whose influence Izvolsky owed much of his professional success. His next posts, as minister plenipotentiary, were in Belgrade, Munich and Tokio. From the Japanese capital he warned Lamsdorff who was his chief of what was brewing for Russia in the Far East, but his reports on the warlike preparations were shelved as impertinent and ridiculed as absurd. He was next instrumental in having the Marquis Ito sent to Europe (1902) to settle differences with Russia, but the court camarilla in St. Petersburg thwarted all efforts towards an understanding. Two years later Izvolsky obtained from Japan moderate proposals for a friendly accord, which however were also rejected by the Tsar. Before hostilities broke out Izvolsky returned to Europe and through the Dowager Empress' influence became Minister Plenipotentiary at Copenhagen (1903). In the year 1906 he succeeded Count Lamsdorff as Minister of Foreign Affairs, moulding Russia's external relations and influencing the course of her domestic policy, as a Liberal, until the year 1910. From 1910 to 1917 Izvolsky was Russian Ambassador in France and after the revolution he fell ill and died in Paris Aug. 16 1919.

Izvolsky was endowed with more than average talents, considerable powers of observation, refined artistic tastes and a high sense of honour and duty. An omnivorous reader, he could talk interestingly about literature, art and history. But these and other accomplishments were neutralised by his consequential airs, his oracular pronouncements and his disdainful attitude. He carried self-respect to the point of self-worship and preferred stateliness to the close intercourse of friendship, and as he lacked the magnetic personal current which might have covered these defects, hosts of enemies confronted him at every stage of his career, countering his exertions and embittering his life. Few men have been more bitterly attacked than Izvolsky, whose main crime consists in his having practised the code of public morality that obtained in the school of diplomacy in which he graduated.

As the trustee of the Russian Empire in its external relations Izvolsky has no claim to high statesmanship nor indeed to genial gifts of any kind. He was a clever diplomatist—according to King Edward VII., the cleverest in Russia—with a very definite and circumscribed aim which he pursued with unflagging energy, an endless variety of means and untiring perseverance. When he became Foreign Secretary, France and Russia were but nominally allies, each one speculating on the intentions of the other; and the cardinal principle of his policy was to convert that alliance into an efficacious reality. This he did with occidental thoroughness. Hence he strove to draw Britain, Italy, Turkey, Bulgaria and Rumania into the Entente. Accepting as an axiom the inevitability of a great European war, the principal belligerents being France and Germany in the west, and Russia and Austria in the east, he came to the conclusion that between those future enemies there might be episodic arrangements and temporary makeshifts, but that there could be no complete settlement of differences except by the fortune of war.

Izvolsky's first success was the liquidation of the war with Japan, which he accomplished with remarkable foresight, breadth of view, thoroughness and moral courage. His next task was more arduous; the displacement once and for all of the causes of the rivalry between Russia and Britain. And it was largely to Izvolsky's personal efforts that the realisation of this plan was due. He began by coming to an arrangement with Britain about Persia, Afghanistan and Tibet (1907). This reconciliation definitely baffled Aehrenthal's scheme which the Tsaritza of Russia favoured—of a renewal of the Three-Kaiser Alliance.

Soon after this Izvolsky sounded Vienna unofficially as to how Austria would view an attempt by Russia to obtain the freedom of the Straits. Aehrenthal, then Minister of Foreign Affairs, who was still on relatively friendly terms with Izvolsky, since his residence as Ambassador in St. Petersburg, replied unofficially that no objection would be raised if Russia on her side agreed to the annexation of Bosnia and Hercegovina. This question and answer were, however, followed by a marked coolness in the mutual relations of the two Empires, and the matter dropped. The two states came together again when charged by Europe to draft and execute a scheme for the reform of justice in Macedonia. But Austria secretly obtained from Turkey, whose conduct she was supposed to be vigilantly supervising, a railway concession in the Sandjak of Novi Bazar. In St. Petersburg, London and Belgrade the news aroused intense indignation. But after King Edward's visit to Reval (June 1908), Izvolsky wrote a letter to Aehrenthal announcing that Russia had no objection to the Sandjak Railway if Austria would assent to an Adria Railway for Serbia. At the same time he proposed that the Tsardom should obtain the freedom of the Straits and Austria promulgate the annexation of Bosnia and Hercegovina. Izvolsky and Aehrenthal then met at Buchlau, the Moravian residence of Count Berchtold (Sept. 15 1908), and agreed to this arrangement. Izvolsky held that he made the proviso that the two points be referred to a European Conference, while Achrenthal asserted that he announced the annexation as impending. Both were probably right. A few days later Aehrenthal acting in good faith annexed the two provinces without more ado, whereas Russia was kept out of her *quid pro quo* owing to the refusal of England and France to open the Straits question at that inopportune moment.

After this the relations of the two Ministers became personally estranged and the intercourse between their respective countries grew almost hostile. Indeed war was in sight for a while and was seriously discussed in St. Petersburg, but Russia being unprepared, it was staved off. Izvolsky sought compensation for his diplomatic defeat in bringing about a meeting between the Tsar and the King of Italy at Racconigi (Oct. 23–5 1909) and making the first serious effort to draw Italy into the orbit of the Allies. In spite of this Russia and Germany seemed for a brief while to become friends again and during the Tsar's two months sojourn in Germany Izvolsky was relieved of his office and sent to Paris as ambassador. In this capacity he continued to sway the policy of his country over the head of his nominal chief in virtue of his knowledge, tact and energy.

Izvolsky's strength lay in his resourcefulness in adjusting means to ends and above all in his rare tenacity of purpose. His weakness lurked in a morbid sensitiveness which at time incapacitated him for distinguishing between the satisfaction of personal rancour and the furtherance of national interests. But neither his qualities nor his defects justify the hyperbole that he was responsible for the World War. His policy like that of his Austrian rival is a sequence of cruel illusions for which their respective peoples have had to pay. (E. J. Dr.)

JACKS, LAWRENCE PEARSALL (1860–), British Unitarian divine, was born in Nottingham, where he received his early education. Afterwards he studied at London University, and at Göttingen and Harvard. In 1887 he became assistant to Rev. Stopford A. Brooke, at Bedford Chapel, London, and in 1889 he married Brooke's daughter, Olive Cecilia. He was subsequently minister of Unitarian churches in Liverpool and Birmingham. In 1902, on the foundation of *The Hibbert Journal*, Jacks was appointed first editor. In the following year he became instructor in philosophy at Manchester College, Oxford, and in 1915 was chosen principal of that college. Jacks wrote a number of books, of which the best known is his *Life and Letters of Stopford Brooke* (1917); others include *All Men are Ghosts* (1913); *From the Human End* (1916); *From Authority to Freedom* (1920); *The Challenge of Life* (1924); and *The Faith of a Worker* (1925).

JACKSON, HENRY (1839–1921), British classical scholar, was born at Sheffield March 12 1839. He was educated at the Sheffield Collegiate School, at Cheltenham College and at Trinity College, Cambridge, where he was elected fellow in 1864 and vice-master in 1914. From 1875 to 1906 he was praelector in ancient philosophy, and in 1906 was appointed regius professor of Greek, being given the O.M. in the same year. He resigned the vice-mastership of his college in 1919, and died at Bournemouth Sept. 25 1921. His important work in translating and commenting upon Aristotle's *Ethics* is alluded to in 2.513. He published *Texts to Illustrate a course of elementary lectures on Greek Philosophy from Thales to Aristotle* (1901) and a series of articles on "Plato's Later Theory of Ideas" (*Journal of Philology*); also *About Edwin Drood* (1911).

JÄGER, GUSTAV (1832–1917), German naturalist and hygienist (*see* 15.124), died at Stuttgart May 14 1917.

JAMAICA (*see* 15.132), a possession of Great Britain with dependencies in the West Indies. The area is 4,450 sq. m. and the estimated population (1924) 905,363.

Political History.—Immediately after the outbreak of the War (Aug. 4 1914) the legislature raised a Jamaica Volunteer Defence Force. Later it was decided to send a contingent overseas. War contingent funds were raised, and on Nov. 8 1915 the first contingent sailed for England. In all, Jamaica sent 243 officers and 10,168 men, who were enrolled in the British West Indies Regiment, which was formed on Oct. 26 1915 and saw much distinguished service in France, Egypt, Palestine and elsewhere. On March 22 1917 an Act for compulsory military service was passed, but conscription was never actually enforced. The Legislature agreed to pay the whole expenses of her contingents in the form of a contribution to the Imperial Treasury of £60,000 annually, beginning a year after the War. In 1921 the Hon. Edward Wood (now Lord Irwin) visited the Colony with a Colonial Office Mission, and made recommendations for the amendment of its constitution, which are still under discussion.

Fruit.—The chief staples are still fruit, sugar and the raising of stock. Owing to the prohibitive tariff in the United States of America, and the absence of steamers to carry oranges, etc., to the United Kingdom, the citrus fruit industry still languishes. In 1911 the export of bananas reached the record figure of 16,497,385 bunches. Exports, which fell after disastrous droughts and hurricanes in 1915–6–7 to 2,394,514 bunches, recovered, and in 1925 reached 14,896,581. Jamaica, which was not a party to the Canada-West Indies trade agreement of 1912, was a signatory of the agreements of June 18 1920 and July 6 1925. Under the latter, Canada will impose a customs duty of 50 c. per bunch on foreign bananas and admit Jamaica bananas free and will also provide a fortnightly mail passenger and freight service with refrigeration for 70,000 bunches of bananas, alternating with a fortnightly freight service with refrigeration for 50,000 bunches between Canadian ports and Kingston. At present the fruit industry is handled by five concerns, of which all but one carry the fruit to America. In 1925 the planters formed an association, one of whose objects is to secure the establishment of an alternative and independent direct line of steamers to carry fruit of all kinds to England.

Sugar.—Under the Canada-West Indies agreement Jamaica sugar will enjoy the increased preference of $1.00 per 100 lb. on 96° sugar entering the Dominion. In the United Kingdom the preference of British sugar, which was reduced in 1924 to 1s. 8·3d. per cwt. consequent upon the lowering of the duty, was restored in 1925 to 3s. 8¾d. per cwt., and the undertaking was given by Parliament that it would remain at that figure for 10 years. This has helped to establish confidence in the industry. In 1925 the Jamaica Sugar Estates Ltd. was floated with capital of £400,000 and a loan guaranteed under the Trades Facilities Acts to develop sugar production in St. Thomas-in-the-East.

Trade.—The percentage of total exports in 1923 were: Fruit 54·4; sugar 15·8; coffee 5·6; rum 1·2. The area under canes rose to 48,184 ac. in 1924, while that under bananas fell slightly to 74,548 acres. The total volume of trade shows expansion, imports having risen from £2,614,943 in 1910 to £4,827,074 in 1924, and exports from £2,568,222 to £3,122,961. In 1920 imports and exports reached the record figures of £10,313,300 and £7,146,000 respectively. In 1910–1 the colony's revenue was £990,399 and its expenditure £987,304. In 1924 the figures were £1,922,963 and £2,022,746. (*See* WEST INDIES.)

JAMES, HENRY (1843–1916), Anglo-American novelist (*see* 15.143), renounced the nationality of his birth and became a naturalised British subject in July 1915. The act was symbolic of his lifelong love for the country of his adoption, and hardly less of his strong support of British conduct during the World War. It enabled him to be the recipient, in 1916, of the Order of Merit, the crowning official recognition of his distinguished career as a man of letters. James's work after 1911 included a series of informally autobiographical volumes: *A Small Boy and Others* (1913); *Notes of a Son and Brother* (1914); and *The Middle Years* (1917), which give interesting glimpses of his youth and that of William James. Some volumes of essays and prose studies also appeared: *The Ivory Tower* (1917); *Within the Rim* (1919); and *In the Cage* (1919). James died in Chelsea, London, on Feb. 28 1916. A selection from his letters, edited by Percy Lubbock, was published in 1920.

JAMES OF HEREFORD, HENRY JAMES, 1ST BARON (1828–1911), British lawyer and politician (*see* 15.144), died at Epsom, Surrey, Aug. 18 1911.

JAMESON, SIR LEANDER STARR (1853–1917), British politician (*see* 15.147). The union of the South African colonies in 1909 accomplished the principal object which Jameson had set before himself as a political leader. He wished to carry the spirit of union further by forming a combination of political parties to support a non-racial government for the new Union, regarded Gen. Botha as the natural leader of such a combination, and was completely ready to serve under him. This project of a "best man" government, however, was not accepted by Botha, who thought that the Dutch-speaking people of South Africa were not ready for it. The alternative, to which Jameson then set himself, was the formation of a new party representing the majority of the English-speaking people in the Cape, the Transvaal, the Orange Free State and Natal. The programme of the new Unionist party of South Africa showed his influence in every clause.

At the first South African general election in Sept. 1910 the Unionists won a considerable measure of success especially in the Cape and Transvaal provinces. Natal, where the English-speaking people were in a great majority, withheld from Jameson the general support which it might have been expected to give.

For two years Jameson led the Unionists in the South African House of Assembly with great moderation and self-restraint, but was compelled by ill-health to retire from the leadership of the party in 1912. He returned to England and settled in London, devoting himself, when his health took a turn for the better, to business interests, but on Nov. 26 1917 he succumbed after a short illness. Jameson's name will stand very high among those of the men who did service to South Africa and Rhodesia. Diffident and utterly free from self-seeking, his labours for racial reconciliation and material progress in South Africa were conspicuous, and the close friendship of Botha was a final proof of the quality of his patriotism. Jameson was created a K.C.M.G. on the inauguration of the Union in 1909 and a baronet in 1911.

JAMMES, FRANCIS (1868–), French poet and novelist, was born at Tournay Dec. 2 1868, and when still a child went to live at Orthez. He studied at the Collège de Pau and the Collège de Bordeaux, and afterwards became for a short time a notary's clerk at Orthez. It was during this uncongenial employment that he published his first verses, in 1893. After that date, his poems and novels succeeded each other rapidly. The chief characteristics of his style are a great simplicity and a preoccupation with the quotidian and humble manifestations of life. He takes great liberties with the alexandrine, which gives his poetry a novel and refreshing charm. His works reflect a sympathy for the poor and for animals, and a profound sincerity in the painting of French provincial life.

His works are: *Vers* (1893); *De l'Angelus de l'aube à l'Angelus du soir* (1898); *Clara d'Ellébeuse* (1899); *Le roman du lièvre* (1903); *pomme d'Anis* (1904); *Clairières dans le ciel* (1906); *Les georgiques chrétiennes* (1912); *Feuilles dans le vent* (1914); *Le Rosaire au Soleil* (1916); *Le curé d'Ozeron* (1918); *Le poète rustique* (1920); *Les livres des quatrains* (1923–5); *Ma France poétique* (1926). See also T. Braun, *Des poètes simples: Francis Jammes* (1900); A. de Bersancourt, *Francis Jammes, poète chrétien* (1910); A. Lowell, *Six French Poets* (1915); P. Lasserre, *Les chapelles littéraires* (1920).

JANÁČEK, LEOŠ (1854–), Czech composer, was born in Hukvaly, Moravia, and educated in the monastery of the Austrian Friars in Brno under Paul Křížkovsky. After studies in Prague, Leipzig and Vienna he returned to Brno, where in 1881 he became director of the organ school, and later professor of composition in the master school of the state conservatoire into which the organ school developed. Janáček followed in Křížkovsky's footsteps as a collector of folk songs, especially of Moravia, but went deeper than his master into their psychology. The chief characteristics of his works are spontaneity and richness of colour, together with vigour of idea and expression. Technically, his melodies proceed strictly from the verbal rhythm, and the orchestra is also assigned the function of a more creative atmosphere than is usual in modern symphonic accompaniments. Among his operatic compositions are *Jönufa: Její pastorkyňa*, a psychological drama of Moravian village life, first produced in Prague 1916; and *Katya Kabanova* (1922), based on *The Storm*, a Russian drama by Ostrovsky. In lighter mood are *The Excursions of Mr. Brouček* (1920), an operatic satire, and *Liška bystrouška* (1925), an animal opera. Janáček's remaining works include a dramatic song cycle, *The Notebook of One who Vanished;* a symphonic poem *The Fiddler's Child;* an orchestral rhapsody *Taras Bulba;* a string quartette; a concertino for small orchestra; the *Kreutzer sonata* and a sextette *Youth*. See F. Bartoš and L. Janáček, *Kytice z národních písní moravských kterouž uvili F. Bartoš a L. Janáček* (1890).

JANEWAY, THEODORE CALDWELL (1872–1917), American physician, was born in New York City Nov. 2 1872. He was educated at the Sheffield Scientific School, Yale University, and the college of physicians and surgeons, Columbia University. From 1898 to 1906 he taught medical diagnosis in New York University. In 1907 he became associate in medicine in Columbia University, and two years later professor of medicine. In 1914 he was called to Johns Hopkins University as professor of medicine, and became physician-in-chief to John Hopkins Hospital. His investigations in the phenomena of blood pressure opened up a hitherto unexplored field of medical research. After America's entrance into the World War, he became major in the Medical Officers' Reserve Corps and was engaged in research in Washington, D.C. He died at Baltimore, Md., Dec. 27 1917. He was a member of the board of scientific directors of the Rockefeller Institute for Medical Research. He was the author of *The Clinical Study of Blood Pressure* (1904).

JAPAN (*see* 15.156).—An empire of eastern Asia, one of the Great Powers, and a member of the League of Nations. The area, including Formosa, Karafuto (Japanese Sakhalin) and Chosen (Korea) is 262,826 sq. m. and the population (1920) 77,005,510.

I. POLITICAL AND SOCIAL HISTORY

The German Model.—Owing to the necessity of establishing a strong central authority—imposed upon Japan for self-defence as a result of the apparently aggressive policies in the Far East of Western Powers towards the end of the 19th century—and probably from an excess of conservative caution, as the country had just cast off its feudal traditions, the makers of modern Japan often turned to German legislation in seeking for models for the constitution and other laws. But an important factor that should not be lost sight of by students of Japanese politics is that English has long been by far the most extensively studied foreign language among the people. Whilst the static institutions remain more or less Teutonic in form, dynamic inspiration has continuously been drawn from English-speaking sources. That explains why the Japanese understand democracy along the lines of its common acceptation in the English-speaking nations; why the Press and students of politics often advocate the development of a polity somewhat like the British parliamentary system. The political history of Japan in the decade beginning 1910 was the last phase of the struggle between the cause of national security with which *the genros*, the Elder Statesmen, are popularly identified, and the progressive outcry for the emancipation of the people's will. As external dangers diminish, the *vox populi* speaks more effectively.

After the longest tenure of office in the constitutional history of Japan, four and a half years, the Marquis Katsura resigned the premiership in Aug. 1911, "with a view to renovating the spirit of the people." With the collaboration of Marquis Komura, Foreign Minister, Marquis Katsura had accomplished various financial reforms, the annexation of Korea, and the revision of commercial treaties with Western Powers. Katsura was succeeded by Marquis Saionzi, who had led the Seiyukai party since the retirement of Prince Ito (*see* 15.272). During the premiership of Marquis Saionzi a severe shock was experienced by the whole nation on account of the death on July 30 1912 of the revered and beloved Emperor Mutsuhito. Meiju Tenno, as he was posthumously styled, after the name of the era of his 45 years' reign, was succeeded by his son, Yoshihito Shinno, who ascended the throne at the age of thirty-three.

Fall of the Saionzi Cabinet.—The downfall of the Saionzi Cabinet arose out of the paramount instinct of national self-defence. Before the end of 1912, the establishment of two army divisions in Korea (Chosen) had been tenaciously persisted in by Lt.-Gen. Uyehara, Minister of War. But his colleagues in the Cabinet, as well as the Press, counselled retrenchment and economy. Uyehara resigned, and the Premier sought for his successor. But no soldier would accept the post without a promise by Saionzi as to the two-division increase; and by law a Minister of War must hold the rank of a general or lieutenant-general in the active service. The Premier was constrained to request the Emperor to relieve him of his office. There followed a ministerial deadlock, until Katsura, actuated by chivalrous motives, descended upon the confused arena. He had been created a prince, and had made up his mind to offer the young Emperor loyal but non-political services for the rest of his life in the capacity of grand chamberlain and lord keeper of the great seal.

But the young and care-free generation of Japan had come to assert themselves, and the unconstitutional tendency of the *Genro's* activities had been made the object of popular criticism. The widespread suspicion that he hoped to direct the affairs of state unconstitutionally "from behind the sleeves of the Sacred

Dragon," coupled with his personal failing health, made the path of Prince Katsura's renewed political life immeasurably thorny and arduous. He found the Lower House unexpectedly intractable. Mr. Ozaki's resolution of no confidence caused a tremendous sensation; riotous mobs demolished the offices of *The Kokumin*, a newspaper which had been loyally supporting the ministerial programme. No choice was left to Katsura but to tender his resignation.

Prince Katsura then sought to prove his sincere desire for the constitutional development of the Empire by starting a political party, the *Rikken Doshikai* (the Constitutional Comrades Association). Under this banner there rallied all the members of the Chuo Club, and a majority of the members of the *Kokuminto* (the National party). But Katsura died in the following December. The Yamamoto Cabinet which followed (Feb. 20 1913) was short-lived, owing to the unfortunate "naval scandal," involving the arrest and trial of high officials in the navy, a foreign company having dispensed bribes in connection with the building of a Japanese warship.

Politics During the World War.—After the refusal of Prince I. Tokugawa, and the abortive attempt by Viscount Kiyoura, to form a Cabinet, Count Okuma, the "grand old man" of Waseda undertook, on April 16 1914, to stand at the helm of the Empire, backed by the legacy of Katsura, the *Doshikai;* and Baron Kato, the leader of that party, was entrusted with the portfolio of Foreign Affairs. It fell to the lot of this Cabinet to deal with the invitation of Great Britain to join in the World War under the Anglo-Japanese Alliance. In Nov. 1915 the enthronement of the Emperor was conducted with the time-honoured imposing ceremonies at Kyoto, and the whole nation was *en fête* for seven days in honor of the event.

Count Okuma, in tendering his resignation on account of ill-health in the summer of 1916, recommended Viscount Kato, who had yielded the charge of foreign affairs to Viscount Ishii and was outside the Cabinet, to be his successor. At that moment however, the *Genros* were reported to have intervened, and, in spite of the fact that Kato's new party—the *Kenseikai* (the Constitutionalists), which was an amalgamation of the *Doshikai*, the *Chuseikai* and the Koyu Club—commanded a majority in the Diet, Marshal Terauchi was appointed Premier on Oct. 9. This alleged irregular development excited the hostility, not only of the Kenseikai, but of the general public, and ended in an antagonistic attitude on the part of the Diet towards the new government. Parliament was dissolved, and a general election took place on April 20 1917. The result was a signal victory for the government party, the Seiyukai winning 157 seats, whilst the number of the Kenseikai dwindled from 204 to 117.

Actuated by the desire, in view of the War, to effect unity of all shades of opinions, Marshal Terauchi created the Temporary Diplomatic Investigation Council (*Rinji Gaiko Chosa Kai*), where leaders of all political parties were represented. Kato was invited to join, but refused on the ground that he could not associate himself with the idea of establishing a responsible body for external affairs outside the Cabinet itself. The "rice riot" and the ensuing serious disturbances and strikes, which raged like wildfire in various parts of Japan in the summer of 1918, sealed the fate of the Terauchi Cabinet, which tendered its resignation in the middle of September.

Growth of Democracy.—By that time democratic ideas had been gaining strength on account of the War and internal social unrest. Moreover, the manner in which the Terauchi Cabinet was installed had its inevitable reaction. The people demanded that the next administration should be more in keeping with the spirit of the parliamentary system. Mr. Takashi Hara, the leader of the Seiyukai in succession to the Marquis Saionzi, was entrusted with the task of forming a new Cabinet; he was the first commoner to hold the office of Premier in Japan. The ministers, except those holding the portfolios of war and the navy, were for the first time, a body of party politicians more or less free from the bureaucratic savour which had always clung to the former administrations. Incidentally, a new minister—the Minister for Railways—was included in the Cabinet.

In March 1918, in response to the popular demand, a political reform bill was passed, lowering the property qualification of voters to the payment of a direct national tax of three yen instead of 10 yen. The number of electors was thus more than doubled, increasing from 1,450,000 to 3,000,000. The people were, however, not satisfied, and popular clamour for universal suffrage followed. In Feb. 1920 a universal suffrage bill was at last introduced by the Opposition in the House of Representatives. But on the ground that no election on the basis of extended franchise had as yet taken place, and that consequently it was premature to make any further attempt at suffrage reform, the Diet was immediately dissolved. The nation was called upon to express its opinion on the matter by the general election of May 10. The result was a decided victory for the Seiyukai, the government party, which secured 280 seats, whilst the Kenseikai registered 110.

Cabinets of 1919 to 1924.—It fell to the fate of the Hara ministry to conclude the treaties of peace ending the World War in 1919, and to send delegates to the Washington Conference in 1921. But before the conference actually began its deliberations, Hara was assassinated by a misguided and youthful megalomaniac on Nov. 4. Viscount Korekiyo Takahashi, Minister of Finance, succeeded to the leadership of the Seiyukai party and assumed the premiership on Nov. 13. There immediately followed an occurrence of great political moment when the Crown Prince Hirohito was appointed as Prince Regent on Nov. 25, owing to the continued indifferent health of the Emperor Yoshihito. Takahashi attempted early in the next year the reorganisation of his ministry, which was a legacy from Hara and was not quite amenable to his leadership. He failed in the enterprise and tendered his resignation.

Adml. Baron Tomosaburo Kato, who had been Minister of the Navy in the past four successive cabinets and the chief delegate to the Washington Conference, was nominated Premier on June 12 1922. He had no party affiliations, but had been assured of the unconditional support of the Seiyukai party; and his colleagues were drafted from the Kenkyukai and the Koyu Club of the House of Peers, both of which maintained close connections with the Seiyukai party. The first thing that Kato did after the assumption of office was to abolish the anomalous institution of the Temporary Diplomatic Investigation Council. Kato took upon himself the faithful enforcement of the Washington treaties and, in domestic affairs, endeavoured to bring the nation out of the business slump and to cope with the social unrest that had been gathering strength. However, before he could accomplish much in internal administration, he died on Aug. 24 1923.

The Cabinet resigned on the advice of the acting Premier, Count Uchida, and Adml. Count Yamamoto, who had lived in retirement since his downfall in 1914, was commanded by the Throne to form a cabinet. Whilst he was busily engaged in the formation of his ministry, there happened the historic earthquake of Sept. 1. Late in the evening of the 2nd, the Yamamoto Cabinet was installed with "national solidarity" as its slogan. Yamamoto gathered round him men of long political experience and recognised ability, and seemed determined to keep aloof from party politics. The Cabinet took prompt and effective steps for the relief of the stricken population, but in considering the reconstruction plans had to face dissensions within the Cabinet itself. Viscount Goto's ambitious project was not fully countenanced by his fellow ministers, and the machinations of the Seiyukai party further complicated the situation. When an attempt on the Prince Regent's life was made by a fanatic on Dec. 27, the Yamamoto Ministry resigned, holding itself answerable for the outrage.

A ministry was formed on Jan. 7 1924 under the premiership of Viscount K. Kiyoura, who was supported by the Kenkyukai of the Upper House. This was again a non-party administration and its marked bureaucratic complexion combined with its apparent weakness soon met with popular disapproval as "a cabinet of the privileged class." At the same time the Seiyukai party, that had long been on friendly terms with the Kenkyukai, divided into two factions, one avowing its support of its old allies,

and the other denouncing the irregularity of non-party methods. The former seceded and set to work to form a new party called the *Seiyu Honto*.

General Election of May 1924.—Amidst such political developments there intervened the general election of May 10, the result of which turned out to be a victory for the Kenseikai party with 162 seats, the Seiyukai obtaining 137, the Seiyu Honto 94, the Jitsugyo Doshikai (Business Men's party) 9, the Shinsei Club 24, the Dokokai 21 and non-party 17. It was the first important instance in which the government party failed to win a general election.

Kiyoura resigned and Viscount Taka-aki Kato, as the leader in the Kenseikai, formed a coalition cabinet on June 11 1924, including Mr. Korekiyo Takahashi (having renounced his viscounty) of the Seiyukai and Mr. Tsuyoshi Inukai of the Kakushin Club. The Kato administration was made historic by the passage of the universal manhood suffrage bill on March 29 1925. All males over 25 years of age could vote and it was estimated that the number of electors would increase fourfold and become about 12,000,000. In April 1925 fissiparous tendencies became discernible in the coalition cabinet, when Takahashi resigned his leadership of the Seiyukai as well as his ministerial chair. In May Inukai also announced his determination to retire from politics. After the succession to the leadership of the Seiyukai of Gen. Baron Giichi Tanaka, the reunion of the Seiyukai and the Seiyu Honto was frequently suggested. The crisis came in July, when the tax reduction scheme invited opposition from the Seiyukai ministers. Kato resigned but was ordered again to form his Cabinet. On Aug. 2 he again became Premier, with his colleagues composed exclusively of the Kenseikai partisans. Kato died on Jan. 28 1926 and his Cabinet was reconstructed under the premiership of Mr. Reijiro Wakatsuki, hitherto Minister of Home Affairs.

Social Changes.—The chronological change from the Era of Meiji (Enlightened Peace) to the Era of Taisho (Great Righteousness) in 1912 incidentally marks an important period in the cultural history of the Japanese people. The wars with China and Russia had given them the assurance that their country was safe from any foreign aggression, the fear of which had been a perpetual nightmare to the founders of modern Japan. Their considerable achievements in the domains of trade and industry had strengthened their belief in the destiny of the nation. Especially the younger generation, whose cradles were neither haunted by the shapes of armed foreign "black ships" nor deluged by the overwhelming influx of novel knowledge and strange customs, were beginning to see that the undigested application of Western laws and institutions would do more harm than good to the national wellbeing. The question in the mind of young Japan was whether it was not the mission of the Japanese people to create a new civilisation by harmonising and uniting the East and West. The external relations of Japan, too, contributed their quota to the cumulative change in the mentality of the people. Korea was annexed; China started a revolution; California legislatively discriminated against Japanese; the World War occurred; and Russia turned Bolshevist—all these quickened national and social aspirations.

At the beginning of the Taisho Era there was social disquietude in the air. The alleged attempt on the person of the Emperor Meiji in 1910—a solitary occurrence in the age-long history of a loyal people—the repeated famines in the northeast districts of Japan, the disastrous eruption of the Sakurajima volcano, the rapid rise in the cost of living, the revelation of naval bribery scandals, the frequent change of cabinets—these had combined to engender misgivings in the people's minds. When the World War came, the Taisho era was but two years old. Profiteers sprang up like mushrooms overnight; into the maw of factories was poured a tremendous army of labour; the cost of living advanced by leaps and bounds; and an age of Western capitalism was in sight. Public sentiment in Japan was further stirred by the Allied assertions that the War was a democratic crusade against the rule of despotism and imperialism. Strikes, which had long been stifled by restraining circumstances, began to be more and more frequently organised. As a consequence of successful strikes in 1917, no fewer than 417 occurred in 1918, a sudden increase in the occurrence coming in the wake of the "rice riot" started by fisherwomen in Toyama; and in 1919 the number increased to 497, which registered the high-water mark of labour agitation. Since the economic panic of 1920, the prospects of lower wages and unemployment have threatened the labourers, and strikes have come to take a defensive rather than an aggressive complexion. There were registered 282 cases of strikes in 1920; 246 in 1921; 250 in 1922; 270 in 1923 and 333 in 1924. These figures are in striking contrast to the average of 30 cases a year for seven years preceding the World War.

In the meantime, no fewer than 380 labour organisations had been formed by 1922. Until 1920, the Yuai Kai founded in Tokyo in 1912 by Mr. Bunji Suzuki had been the only trade union worth mentioning. It was expanded and renamed the "Nippon Rodo Sodomei" (General Federation of Japanese Labour) in 1921, and is considered the most important. Other large unions include the Government Employees' General Federation (Osaka), the Printers' Association (Tokyo), the Osaka Printers' Union, the Japan Seamen's Union (Kobe), the Kanto Transport Workers' Union (Tokyo) and the Federation of Mechanics' Union (Tokyo). Side by side with labour agitation in industries, tenancy disputes in agricultural districts became increasingly frequent. Local tenants' unions were organised by hundreds in the course of 1920–2, and they were amalgamated in the Japanese Farmers' Union (Osaka) and the Kanto Federation of the Japanese Farmers' Union (Tokyo) in 1922. It is significant that labour leaders, however drastic their theories may be, are generally moderate in practice, and that the General Federation of Japanese Labour passed a resolution in Feb. 1924 that when the universal suffrage bill then under discussion became law its members would effectively exercise their franchise. The law was passed in March 1925, and the Labourers' and Farmers' party was organised on March 5 1926 in Osaka.

Culture.—The rise of naturalism in Japanese literature synchronised with the war with Russia (1904–5), the attendant social changes encouraging men of letters to discard the old shibboleth and to proceed to the free, bold and realistic study of human life and nature. (*See* JAPANESE LITERATURE.)

Pure Japanese style painting has successfully been revived and developed in the hands of great artists like Gaho Hashimoto, Gyokusho Kawabata, Kogyo Terasaki, Taikwan Yokoyama and Seiho Takeuchi. In their works are noticeable traces of influence from Western masters. Works after genuine western canons have also been produced by pioneer artists such as Viscount Kiyoteru Kuroda, Fusetsu Nakamura, Saburosuke Okada, Eisaku Wada and Hiroshi Yoshida. They do not yet command the same respect and popularity as those of the native schools, but with the growth of popular appreciation of such paintings and the increase of buildings of a Western type, with their incidental demand for articles of interior decoration, the future development of the Western school of pictorial art seems assured in Japan. In the field of music, native and Western forms had in the past little or no influence upon each other in Japan. But the visits of great artists like Elman and Kreisler, as well as the popularising influence of phonographs, have aroused love and enthusiasm for Western music among the younger Japanese. How this trend will react upon the old Japanese music is yet to be seen.

The Great Earthquake.—On Sept. 1 1923 (11 hr. 58 min. 44 sec. central standard time) a great earthquake visited Japan. The severest shocks were felt along the coast of Sagami Bay in the districts of Hakone, Odawara, Kamakura, Yokosuka, Yokohama and Hojo, but even such distant places as Kobe and Osaka in the west and Fukushima and Sendai in the east were affected. The tremor that shook Tokyo was of secondary intensity. Scientists conclude that the earthquake was caused by a sudden depression in the bottom of Sagami Bay and a corresponding rise of land on its northeastern coast. Fires following the earthquake destroyed three-fourths of Tokyo (nearly 2,000 ac.), and the whole city of Yokohama, and were mainly responsible for the terrible loss of life.

According to the Social Bureau of the Department of Home Affairs, which published its official report in 1926, the casualties were as follows:—

Place	Killed	Injured	Missing	Total
Affected districts . .	91,344	52,074	13,275	156,693
Tokyo (city) . . .	58,104	26,268	10,556	94,928
Yokohama (city) . .	21,384	10,118	1,951	33,453

According to the Department of Education, the foreign casualties in Tokyo and Yokohama were:—

	Number of foreign residents	Killed	Injured	Missing	Total
Chinese . .	4,647	2,011	600	52	2,663
Other nationalities . .	3,616	146	852	715	1,713

The loss of property has been variously estimated, the industrial bank computing it at 4,800 million yen, consisting of 1,000 million yen for government property and 3,800 million yen for that of the inhabitants.

The earthquake occurred almost without warning. A large number of independent fires broke out at the same time, 122 being counted within 30 min. after the earthquake. Many of the fires were due to the combustion of chemicals, outbreaks in restaurants—it being meal-time when the earthquake occurred—and to the intense heat generated. The fire-brigades were in many cases unable to make use of the water-supply, owing to the damage caused to the water-pipes. In Tokyo the greatest tragedy of the earthquake occurred in the ground (230 ac. in extent) belonging to the Army Clothing Department in Honjo, where 40,000 people took refuge, most of them taking with them their belongings. At four o'clock in the afternoon fire approached this enclosure from three sides, and ultimately the whole 40,000 were destroyed in a furious tornado of flame. Brick buildings fared worst in the disaster; wooden-framed buildings of the European style behaved much better than the native ones; and the seismic value of reinforced concrete buildings was fully confirmed, though even they collapsed when their design was seismically imperfect. About 64% of all the buildings in Tokyo were destroyed.

The earthquake coincided with the Cabinet crisis caused by the death of the Premier Tomosaburo Kato, but emergency relief measures were nevertheless quickly and effectively taken. The requisition of foodstuffs and other relief materials was ordered; and Tokyo, Yokohama and its vicinity were placed under martial law. In the trying circumstances, the stricken population in general showed great courage, fortitude and *esprit de corps*. The army and the navy won the gratitude of the nation by their magnificent services in maintaining order and in re-establishing communications. Foreign countries were not slow in showing their sympathies. Their contributions in money and materials amounted to 27,000,000 yen, the largest share being taken by the American Red Cross, which gave more than $11,000,000. The relief services of the American Asiatic Fleet under Adml. Edwin A. Anderson that came to Yokohama from Dairen, and of the American military contingent under orders of Gen. Frank R. McCoy, were timely and efficient.

Undismayed by the appalling calamity, the Government and people immediately proceeded to the work of reconstruction. The official reconstruction plans of Tokyo and Yokohama were considered by the Reconstruction Council and the Reconstruction Board. Viscount Shimpei Goto, Home Minister and President of the Reconstruction Board, first proposed an ambitious plan for Tokyo with a view to reviving from the ashes an ideal modern city. But the Cabinet preferred a less expensive project, which was again drastically curtailed by the Imperial Diet in Feb. 1924. The plan thus decided upon authorises an expenditure of 468,438,849 yen, spread over six years, ending in 1928, to build new and wider streets, a modern sewage system, canals, bridges, parks and better means of transportation, and further to perfect agencies of social service, such as employment bureaux, day nurseries and infirmaries. In 1925 the population of Tokyo registered 1,995,303 and that of Yokohama 405,999 or 85% and 92% of the pre-earthquake population respectively.

II. FOREIGN RELATIONS

General Survey 1910–25.—Having emerged victorious from the Russo-Japanese War, Japan was relieved from the long nightmare that Korea might be engulfed in the Russian hegemony and constitute a permanent menace to her national safety; moreover, the wrong done to her by the three-Power intervention in wresting from her the natural fruits of her victory in the Chino-Japanese War—the Liaotung peninsula—was avenged. But the Russian grip on North Manchuria and Mongolia was not only unabated but, on the contrary, was greatly tightened. There were even fears of a renewed clash between the former foes. Statesmanship, however, counselled Japan and Russia to come to a friendly entente in 1907. A similar understanding between Japan and France followed in the same year. Further, the complicated post-War situation in Manchuria was decisively, if not definitively, disposed of by the Chino-Japanese understandings of 1909. In 1910 and 1916 more definite agreements were reached between Japan and Russia with the view of maintaining the status quo of Manchuria. Korea was, in the meantime, made a protectorate of Japan, and the gradual development of affairs in that country led to the final annexation. The Anglo-Japanese alliance, which had been not only the keystone of Japan's foreign relations but the mainstay of the general tranquillity of Eastern Asia, was renewed (1911).

Whilst Japan's position in the Far East became thus more or less reassuring, the dark cloud of anti-Japanese sentiment on the Pacific coast of the United States loomed up on the horizon. China's revolution in 1911, instead of bringing immediate peace and liberty to the citizens of the Celestial Empire, divided the nation into irreconcilable camps, and contributed to the political instability of the Extreme Orient. This meant an exacting burden upon the diplomatic wisdom and tact of Japan. Japan was, on the one hand, still seriously considering how to cope with the situation in China and, on the other, how to safeguard Japanese residents against discriminatory treatment in the west of America, when the fateful Aug. of 1914 demanded other decisions.

Japan's part in the World War dwindles into insignificance in face of the stupendous efforts of other great Powers espousing the Allied cause. But she contributed what little she could with her very limited national strength and resources. Her geographical situation, however, afforded her, from the economic point of view, a position of vantage. In pre-War days she was still struggling in financial straits as a result of her Russian conflict, but she came out of the World War with overflowing coffers, even if these coffers were of modest dimensions. At the Peace Conference in Paris, she lost her case on the question of racial dignity, but her claims with regard to Shantung and the South Sea Islands were recognised, and her position among the Great Powers was assured. But her immediate outlook in 1920–1 bristled with difficulties and complexities. China had refused to negotiate on Japan's offer to restore Shantung; the Washington Govt. would not agree to the Japanese point of view on the Yap question; several states on the Pacific coast of America were quite determined to abridge the civil rights of Japanese residents; Korean malcontents abroad were in a fitful mood of rebellion; the Siberian situation was far from tranquil. Japan's natural path of development was beset with suspicions and misunderstandings. In these circumstances, Japan welcomed the Washington Conference of 1921–2 as a fitting opportunity for her clearly to expound her foreign policies. Subsequently, the summary exclusion of Japanese prescribed in the American immigration law of 1924 dealt a tremendous shock to the Japanese mind; the Chinese situation continued to be unsettled; and Russia still remained an international enigma. But the progress of affairs in Eastern Asia testified to the sincerity of Japan's pronouncements at the conference table of Washington. Despite the differences which arose over many questions, there has developed a conviction that there would be no solution of the problems involved. At Geneva and elsewhere the pacific attitude of Japan was recognised.

Pre-War Questions

Manchurian Questions.—Prior to the outbreak of the Russo-Japanese War, the growing international rivalry for spheres of influence in the Chinese Empire had convinced the interested Powers of the necessity of establishing the policy of the "open door" and equal opportunities for commerce and trade in that country. That principle was from time to time enunciated by Great Britain in the later decades of the 19th century, but it was reserved to Mr. John Hay, Secretary of State under President McKinley's administration, to make its definite pronouncement to the world. In Secretary Hay's Circular Note addressed to various Powers under date of July 3 1900, it was declared that the policy of the United States was to assure permanent safety and peace to China, to preserve Chinese territorial and administrative entity, to protect all rights guaranteed to friendly Powers by treaty and international law and to safeguard for the world the principle of equal and impartial trade with all parts of the Empire. The doctrine was accepted in principle by Japan, Great Britain, Russia, France and Germany. Japan went so far as to conclude specific agreements for its execution with Russia (July 30 1907) and France (June 6 1907). It was, however, understood that the spheres of influence already established—Great Britain in the Yangtze Kiang valley, Tibet and Weihaiwei; Germany in Kiaochow; Russia in Manchuria and Mongolia; France in Yunnan—were not to be prejudiced by the newly professed principle of commercial impartiality.

The Russo-Japanese War brought about the tenure by Japan in S. Manchuria of a similar position to that which the great Western Powers had held in other parts of China. But "because Manchuria had been the scene of the greatest war of modern times," the world's eye became fixed upon every act of Japan in that region in "an exceptionally rigorous scrutiny" and "the nations behaved as though they expected her to live up to a standard of almost ideal altitude." Meanwhile, China, for her part, fell into a mood of impatient irritation on account of the presumed encroachments upon her sovereignty, and the "rights-recovery campaign," clamorously conducted throughout that Empire, somewhat strained her relations with Japan in the early part of 1909 in respect of various questions in Manchuria. However, in Aug. of that year, a series of agreements was reached between the two States by which all those outstanding problems were composed. Among the rest, Chinese sovereignty over Chientao was confirmed, and arrangements about railways, including that of the Antung-Mukden line, were effected.

From out of the blue, there came from America a proposal for the neutralisation of the Manchurian railways in Jan. 1910. In the view of Mr. Philander C. Knox, Secretary of State, that was best calculated to further the principle of the "open door" by putting an end to the abnormal conditions obtaining in Manchuria. But Russia and Japan could not accede to the scheme, on the grounds that their established rights and interests ought to be respected and that they were by no means threatening the Chinese sovereignty or the "open door" principle. Great Britain kept aloof, declaring that the question should be settled among the immediately interested Powers, namely, China, Japan and Russia. Nor was the proposal to the taste of China, who regarded it as a further encroachment upon her sovereignty. She replied that her treaty obligations with Japan and Russia precluded her from supporting the American idea. And the proposal fell through. Meanwhile, the Russo-Japanese negotiations as to their future attitude in Manchuria and Mongolia came to a satisfactory conclusion and a steadying element was added to the situation in the Far East in the form of an agreement between Japan and Russia, signed at St. Petersburg on July 4, 1910, under which they pledged themselves to maintain the *status quo* in Manchuria and to abstain from any unfriendly competition in the development of that region. The Russo-Japanese *rapprochement* was further solidified, in view of the World War, by the Convention[1] of July 3 1916, which provided that each of the two countries would not become a party to "any political arrangement or combination" directed against the other and that they would take counsel together for the necessary measures, "should the territorial rights or the special interests in the Far East of one of the High Contracting Parties be threatened." The agreement made greatly for the maintenance of good order in the Orient until the Russian Revolution brought about the drastic change of the whole situation. For later developments *see* paragraph on Washington Conference below.

The Annexation of Korea.—Japan had waged two wars, one against China and the other against Russia, in order to prevent Korea (*q.v.*) from becoming "a dagger pointed against Japan's heart." In June 1905 she established a protectorate over the Hermit Kingdom so as to put a definite end to the wayward and suicidal diplomacy of the Seoul courtiers, but the whole peninsula could not be cleansed of its inveterate political and social iniquities. The hopelessness of real reform under the existing régime had become manifest; and the assassination of Prince Ito by a Korean in Oct. 1909 was the climax.

The Tokyo Govt. thus came to the conclusion that "the responsibilities devolving upon Japan for the due administration of the country (Korea) cannot be justly fulfilled without the complete annexation of Korea to the Empire." The fusion was accomplished by a treaty concluded between the Governments of Japan and Korea on Aug. 22 1910. It was decided that the ancient name of Chosen should be revived in lieu of Tai-Han and in future be officially used. Under the terms of the treaty the Korean Imperial House was assured of high honours and dignities as well as a liberal grant for maintenance. Japan, at the same time, notified the foreign Powers concerned that their treaties with Korea, including those of extra-territoriality, were all annulled; but that, nevertheless, their vested rights and interests would be fully respected; that the tariffs in force in Korea would be maintained for 10 years; that cabotage would be permitted to foreign vessels for the same period; and that the port of Masanpo would be closed for naval reasons, but Shin Wiju or Gishu would be added to the open commercial ports.

The Anglo-Japanese Alliance.—The general changes of situation in the Orient after the Russo-Japanese War, notably the annexation of Korea to the Japanese Empire in 1910, impelled the British and the Japanese Govts. to revise the Agreement of Alliance concluded in 1905. The negotiations in London between Sir Edward (afterwards Viscount) Grey and Baron (afterward Count) T. Kato ended in the renewal of the Alliance on July 13 1911. The important feature of the new agreement was the inclusion of an Article exempting either high contracting party from the obligation to come to the armed assistance of the other against a third party when a general arbitration treaty was concluded between that other Power and a third party (Article 4). At that particular time a treaty of such a description was under negotiation between the British and the American Govts., and it was with the particular object of excluding the United States from the application of the Alliance that Article 4 was inserted. The general arbitration treaty failed to obtain the consent of the American Senate for its ratification, but the British and Japanese Govts. undertook on several occasions to make it clear that the spirit in which the article was conceived had not on that account been altered in the least. The Alliance of 1911 was to last for 10 years, and, in the absence of a year's notice from either contracting party to terminate the agreement, it would automatically continue in existence, even after July 1921, until such denunciation was made. The World War, into which Japan readily entered on account of the Anglo-Japanese Alliance, ended with the Treaty of Versailles which brought forth the League of Nations. The question was then mooted, though more academically than politically, whether the Anglo-Japanese Alliance would not be in contravention with the letter of the Covenant of the League, and on July 8 1920 the two high contracting parties addressed a joint note to the Secretary-General of the League to the purport that the Agreement of Alliance would in case of its renewal be made to conform to the Covenant in its form. The renewal of the Alliance was discussed at the British Imperial Conference in London in June 1921; and it was then announced

[1] Russian and Japanese notes printed Temperley, *Hist. of Peace Conference*, vi, 634.

that, under the terms of the treaty, it would continue, without definite renewal. But at the Washington Conference, in Dec., the agreement made for a four-Power treaty (America, France, England, Japan) provided for the Anglo-Japanese Alliance being brought to an end.

The War and the Peace

The World War.—No sooner had the World War broken out in 1914 than there took place several exchanges of views between the British and the Japanese Govts. as to possible assistance by Japan in the protection of British trade in the Far East. Japan soon made it clear that she was prepared to take the responsibility imposed upon her by the Anglo-Japanese Agreement of Alliance, should the menace of the Germans to British interests necessitate such a step. It was not long before such a contingency arose, and on Aug. 15 1914 the Japanese Govt. sent an ultimatum to Berlin demanding the immediate withdrawal of the German warships from Chinese and Japanese waters and the surrender of Kiaochow to Japan by Sept. 15, with a view to eventual restoration of the leased territory to China; a week was allowed to the German Govt. in which to make a definite reply. On Aug. 23, the term having expired without any answer being forthcoming from the Kaiser's Govt., Japan declared war against Germany. In coming to this decision Japan remembered that it had been through the machinations of the Berlin Govt. that Germany, France and Russia acted jointly in 1895 in "advising" Japan in the name of peace in the Orient, and not without a hint of force, to retrocede to China the peninsula of Liaotung, which had been won by Japan at a heavy sacrifice of life and treasure and ceded to her under the Shimonoseki Treaty, and further that it was barely two years after that incident that Germany had installed herself at Tsingtao on a flimsy pretext. The Japanese nation welcomed the opportunity of eradicating the German menace in the East which owed its inception to such unfortunate circumstances.

The first part which Japan took upon herself to play after she aligned herself with the Allies was the reduction of the German stronghold in the Far East. Tsingtao, on the bay of Kiaochow, had been converted in the hands of the Germans into one of the most impregnable fortresses in the Orient—the "mailed fist" calculated to intimidate any possible objectors to the Kaiser's imperialist aims. It served at the outset of the war as the only base of operations in E. Asia for the German marauders menacing the Allied trade routes. The five German warships forming the main part of Adml. von Spee's squadron had been running amok, not only in Chinese and Japanese waters, but as far as the South Seas. It was imperative to make these raiders homeless, if they could not be captured or destroyed, and the military and naval operations against the redoubtable base, which was under the command of Capt. Meyer-Waldeck and garrisoned by some 13,000 men, of whom 5,599 were German regulars, were started with the utmost dispatch.

On Aug. 27 the blockade of Kiaochow Bay was declared by the Japanese Navy and Lungkow, 150 m. N. of Tsingtao, was chosen as the point for landing troops. The selection of Lungkow as the spot for disembarkation had been agreed upon between the Japanese and British commanders, who saw the necessity of clearing the hinterland prior to the landing of troops at some point nearer the fortress. However, the point being outside the zone of the leased territory, it was thought necessary to have a war zone established, following the precedent of the Russo-Japanese War and negotiations with that view were started between the Japanese and the Chinese Govts. as early as Aug. 20. An understanding was soon come to between the two Governments, and the Peking Govt. issued a declaration establishing such a war zone on Sept. 3. The Chinese Govt., in the meantime, intimated to the Japanese Govt. that it might nevertheless be found advisable to enter a formal protest to Japan against her troops' landing at Lungkow, for the sole purpose of exonerating themselves from all responsibility towards the German Government. Upon Germany's strong protest against permitting the Japanese troops to land in the neutral territory, the Chinese Govt. went so far as to point out that Germany herself had in a measure created the situation through her unauthorised fortification of Tsingtao. For an account of the actual operations and the taking of Tsingtao by the Anglo-Japanese forces, *see* Tsingtao, Capture of.

Although Tsingtao was thus early captured, there still remained the important task of locating and disposing of Adml. von Spee's squadron, consisting of the "Scharnhorst," the "Gneisenau," the "Nürnberg," the "Leipzig," and the "Dresden," which were seriously menacing the Allied commerce in the South Seas. It had further been reported that several German warships were at large in the Pacific Ocean. As early as Aug. 26 the battle cruiser "Ibuki" and the cruiser "Chikuma," and shortly afterwards six more Japanese cruisers, were ordered to join the British China Squadron under the command of Adml. Jerram. There were further dispatched a squadron of eight cruisers to the China and the East Seas and two squadrons—one comprising two battle cruisers, two cruisers, and a division of torpedo destroyers and the other one battleship and two cruisers—to the South Pacific Ocean. The cruiser "Idzumo," which happened to be in Mexican waters, as well as the "Asama" and the "Hizen," were entrusted with the patrol of the western coast of America, in co-operation with the Canadian "Rainbow" and the British cruiser "Newcastle."

In the middle of Sept. a great sensation was aroused by the dramatic appearance in the Bay of Bengal of the German raider "Emden," which had effected her egress from Tsingtao before the blockade was instituted by the Japanese navy. Several British merchantmen fell victims to her ruthless attack in appalingly swift succession, and it was only after two months' strenuous chase by the British and the Japanese squadrons that the "Emden" was sunk by the Australian cruiser "Sydney" near the island of Cocos. In the meantime, Australian and New Zealand troops were being hurried to various theatres of war in Europe, and Japanese warships assisted in the convoy of the transports across the Indian Ocean. At one time, whilst the "Emden" was still working havoc in Indian waters, the "Ibuki" was obliged to convoy no fewer than 38 troopships by herself. Apart from the anxious as well as hazardous task of convoy, Japanese warships were, in Feb. 1915, called upon to hurry to Singapore and land troops there to assist the British forces, side by side with French and Russian marines, in suppressing a mutiny of Indian soldiers who had come under German influence. In 1917, and after, the Japanese Navy undertook the guardianship of the safety of the Indian Ocean as far as the Cape of Good Hope. Von Spee's squadron, as a result of the concerted operation of the British and the Japanese navies, was chased in the direction of Cape Horn towards the end of 1914, and on Dec. 8 was encountered by Adml. Sturdee's squadron off the Falkland Is. and was completely annihilated, with the exception of the "Dresden," which, however, was also sunk by the British off Chile three months later. Meanwhile the German gunboat "Geier" was disarmed and interned at Honolulu, and thus the Pacific Ocean was cleared of the enemy, greatly to the relief of Allied commerce.

The next, and not the least important, contribution of the Japanese Navy toward the successful conduct of the War, was the sending of the cruiser "Akashi" and three destroyer divisions under the command of Rear-Adml. Sato to the Mediterranean. The German submarine warfare was about that time beginning to be carried on in a ruthless manner, and the British Navy had been earnestly requesting Japanese help. Whilst the British, French and Italian forces were engaged in blockading the Adriatic Sea and the Dardanelles, Adml. Sato's squadron assumed the all-important duties of convoying Allied vessels to and fro between ports in the Mediterranean. The Japanese destroyers successfully escorted 21 British warships, as well as 623 British, 100 French, 18 Italian and 26 other troopships or merchantmen, totalling 788 ships, and they cruised altogether 220,000 miles.

The Peace Conference.—At the Peace Conference in Paris in 1919 Japan was represented by Marquis (afterwards Prince Saionzi; Baron (afterwards Viscount) Makino; Viscount (afterwards Count) Chinda; Mr. (afterwards Baron) K. Matsui; and Mr. (afterwards Baron) K. Ijuin. The plenipotentiaries went to

France with the firm conviction, as Baron Makino had made unmistakably clear before he left Japanese shores, that the attitude of Japan at Paris should be, not so much to advance her own case before the comrade nations in the War, as to take counsel with them in the creation of a new world in which justice and humanity would reign supreme and which would assure an enduring peace. The first claim laid on the peace-table by the Japanese delegates was for the recognition of racial equality. The public opinion of Japan demanded that, if a new era of righteousness and fairness was to be established and peace and good-will among men were to be assured for all time, one of the postulates should be the principle of the equal dignity of races. The Japanese nation had been deeply conscious of the discriminatory treatment meted out to its nationals in various parts of the world. It recognised that differences in ability, power and character among men always exist; but it appeared wrong that there should be inequality of opportunities—inequality before the law. The present state of human civilisation having been achieved by a series of social, religious, political and economic emancipations, it seemed certainly to be time that racial emancipation should, in the interests of the real progress of civilisation, be foreshadowed and approved at least in principle. The original Japanese proposal for insertion in the Covenant of the League of Nations read:—

The equality of nations being a basic principle of the League of Nations, the High Contracting Parties agree to accord, *as soon as possible*, to all alien nationals of the states members of the league equal and just treatment in every respect, making no distinction, either in law or in fact, on account of their race or nationality.

In explaining the Japanese position, Baron Makino made it clear that "the question being of a very delicate and complicated nature involving the play of a deep human passion, the immediate realisation of the ideal equality was not proposed, but that the clause presented enunciated the *principle* only and left the actual working of it in the hands of the different Governments concerned." Every national of the States in the League was expected " to share military expenditure for the common cause and, if need be, sacrifice his own person. In view of these new duties . . . arising before him . . . each national would naturally feel, and in fact demand, that he be placed on an equal footing with the people whom he undertook to defend even with his own life." The Japanese proposal, which was later somewhat modified in terminology in an attempt to meet objections, obtained 11 votes out of 17 in its favour, but it was ruled that unanimity was necessary. Japan abided by that decision, reserving the right to raise the question again at an opportune moment.

Kiaochow.—The disposition as regards Kiaochow was the next question with which the Japanese delegates had to grapple. When the Japanese people gave a hearty send-off to their plenipotentiaries, they had no shadow of doubt as to the final issue of this question. The greater, therefore, was their disappointment, if not stupefaction, when the Chinese delegates came out with a demand for the direct restoration of the ex-German stronghold. Japan claimed Kiaochow in recognition of all her military and naval services. It was at the same time made clear that Japan would be content, having once secured Kiaochow in her hand, not to retain it in her possession, but to offer it to China as a mark of good will and friendship. The Chinese delegates, however, insisted that the declaration of war by China against Germany on Aug. 14 1917 had abrogated all her treaties with Germany, including that of the lease of Kiaochow. Whether a lease treaty is not a sort of *pacta transitoria* is, it was argued, a moot question; it would appear to be contrary to common sense to contend that a paper declaration of war could as if by a magic wand transfer to her possession a formidable fortress which China could never have reduced with her own resources. China's further plea was that her engagement of May 1915 had been made under duress and was therefore null and void. It is a fact, however, that China did not question the validity of that engagement, when she willingly concluded the formal understanding of Sept. 24 1918, which was actually based on the above-mentioned agreement of May 1915, and accepted an advance of 20,000,000 yen under that understanding. The position of Japan, it should be observed, had furthermore been fortified by the previous undertakings of Great Britain, France, Russia and Italy in 1917, to support or at least raise no objection to the Japanese claim. The Supreme Council finally decided in favour of Japan, on May 5 1919 (Arts. 156–158, Treaty of Versailles).

The ex-German islands in the Pacific lying north of the equator, which had been under the Japanese occupation since 1914, were allocated to the Japanese administration under mandate at the Supreme Council held at the Trianon Palace on May 7 1919. They include the Marshall, Caroline, Palau (Pelew), and Marianne (Ladrone) islands.

The Rendition of Kiaochow

With the coming into force of the Treaty of Versailles on Jan. 10 1920 the German rights and interests in Shantung passed to Japan, and the Tokyo Govt., in conformity with their obligation to China, and true to their public avowals (by Baron Makino in Paris on May 4 1919; by Viscount Uchida in Tokyo, May 17 and Aug. 2 1919), immediately instructed Mr. Obata, the Japanese Minister, to invite the Peking Govt. to open negotiations for effecting the restoration of the ex-German possessions in Shantung Province (Jan. 19). It was desired that the necessary preparations for accepting the restoration should forthwith be started, and that China should organise a police force to take over the charge of guarding the Tsinan-Kiaochow railway. As soon as such an organisation was completed—even were it prior to an agreement being reached as to the restoration—the Japanese troops would be immediately withdrawn. Three months passed without any response coming from Peking in reply to the Japanese overtures.

Japan repeated on April 26 her desire to start negotiations, and the Chinese reply (May 22) was that she could not conduct direct negotiations with Japan as to the question of Kiaochow on the basis of the Treaty of Versailles, which she did not sign, and further, that the whole public of China had assumed a strongly antagonistic attitude regarding this question; whereupon the Tokyo Govt. asked the Chinese Govt. to reconsider the matter, assuring the latter that they were ready to begin negotiations at any time China might deem convenient. But Peking again remained deaf, and at the first assembly of the League of Nations, in 1920, Dr. Wellington Koo reserved for " a more appropriate time in the future " the matter of bringing before the League certain "subjects of vital interest to China, affecting international relations."

Independently of the Washington Conference, an informal conversation regarding Shantung was started between the Japanese and Chinese delegates to that conference on Dec. 1 1921, through the personal good offices of Mr. Charles E. Hughes and Mr. Arthur Balfour (afterwards Lord Balfour). After a protracted discussion, especially in respect of the disposition of the railway, a treaty was signed on Feb. 6 1922 under which the restoration of the former German leased territory to China was finally agreed upon. For five months, beginning June of the same year, negotiations as to the execution of the treaty were conducted in Peking, and in Dec. all detailed arrangements were concluded. The administration of Tsingtao was transferred to China on Dec. 10; the Japanese garrison was withdrawn on Dec. 17; the Shantung railway changed hands on New Year's Day of 1923; and thus passed into history the 24 years' episode of Kiaochow Bay.

The Yap Controversy.—The council of the League which met in Geneva on Dec. 17 1920 decided upon the statute relative to " C " class mandates, under the terms of the Covenant of the League (Art. 22, 6) and pursuant to the decision of the Supreme Council on May 7 1919, allocating the ex-German South Sea Islands to Great Britain, Australia, New Zealand and Japan. The Japanese Govt. had been contending that, according to their legal interpretation, the principle of equal opportunities for trade and commerce should, under the Covenant, be assured to " C " class as well as to " B " class mandates (Art. 22, 5) (*see* MANDATES). But in view of the importance of unity and co-operation among the Allied nations, Japan gave her assent to the issue of the statutes, on the understanding that that " decision should

not be considered as an acquiescence by the Japanese Govt. in the submission of Japanese subjects to discriminatory and disadvantageous treatment in the mandated territories, nor have they thereby discarded their claim that the rights and interests hitherto enjoyed by Japanese subjects in these territories should be fully respected."

To the statute relative to the islands north of the equator which came under the Japanese mandate, " as an integral portion of its territory," the United States took exception, on the plea that the island of Yap should not be included in the islands to be so assigned. It was argued that President Wilson had submitted to the Supreme Council his proposal of having that island internationalised for reasons vitally affecting the world communications, and that its decision, published on May 7 1919, should not be regarded as by any means conclusive. Further, the Washington Govt. declared that they had never ratified the Treaty of Versailles and accordingly were not bound by that instrument in any sense; but the United States should, treaty or no treaty, have a voice in the disposition of the affairs immediately arising from the World War. So far as the status of the island was concerned, Japan's position was that, if the published decision of the Supreme Council were not final, she did not know what she could rely upon as definite finality; the Allied Powers in Europe appeared to support the Japanese view. In the presentation of their case, the American Govt. further stated that " even if Yap should be assigned under mandate to Japan, all other Powers should have free and unhampered access to the island for the landing and operation of cables." Japan contended that " the (cables) question seems to be one which should be freely settled by the nation which has the charge of the place." During the Washington Conference an agreement between Japan and the United States was eventually signed on Dec. 12 1921 by which Japan's authority (as the mandatory Power) in Yap was admitted by the United States, while Japan accorded to the United States full rights and facilities regarding cables and other matters.

European Tour of the Crown Prince.—Japan's age-long tradition was broken when an heir to the throne left his native shores on March 31 1921. Crown Prince Hirohito set forth, escorted by Prince Kan-in and Count Chinda, upon a tour of study and observation in Europe. The battleship " Katori," carrying him on board, called at Hongkong, Singapore, Bombay, Port Said, Malta and Gibraltar, en route to Portsmouth, where she anchored on May 8. The reception by King George V. and the public of Great Britain was most cordial and spontaneous, befitting the alliance uniting the two nations for the past two decades. The Imperial tour subsequently extended to France, Belgium, Holland and Italy, and was everywhere attended with success. The Crown Prince returned to Japan on Sept. 31 1921. The minute reports of his foreign tour which daily reached home had a tremendous and almost historic effect in diffusing international and democratic ideas amongst the Japanese people.

The Washington Conference.—In the early months of 1921, when the renewal of the Anglo-Japanese Alliance and the proposal for universal disarmament were simultaneously discussed in Great Britain and the United States, Japanese public opinion evinced misgivings as to the real motives held by the chancelleries at London and Washington. But when President Harding dispatched his informal invitations for an international conference and his sincerity of purpose was evident, the Japanese Govt. entrusted Adml. Baron (later Viscount) Tomosaburo Kato, Minister of the Navy, Baron Kijuro Shidehara, Ambassador to Washington, Prince Iyesato Tokugawa, President of the House of Peers, and Mr. Masanao Hanihara, Vice-Minister for Foreign Affairs, to represent Japan at the conference on the limitation of armaments. Japan's attitude at the conference was to " place all cards face up on the table," and was considered worthy of great credit for enabling the conference to reach a successful end. Coincident with the disarmament conference, the Shantung conversations (*see* above) were started between the Japanese and Chinese representatives and the settlement of the protracted controversy is deemed a happy product of the harmonious diplomatic atmosphere created by the main conference.

In conformity with the agreements of Washington, Japan completely withdrew her garrisons from Hankow in July 1922, from northern Manchuria in Sept. 1922, from Siberia in Oct. 1923 and from Tsingtao in Dec. 1923. With the scrapping of the superdreadnought Tosa on Feb. 11 1925 the provisions of the disarmament treaty were fully carried out, except in the case of the battleship " Mikasa." She was the flagship of Admiral Togo at the battle of the Japan Sea in 1905, and the Japanese people wished to preserve her as a historic memorial. The consent of the signatory Powers was officially obtained, and the " Mikasa," dismantled, lies in Yokosuka Bay as a floating naval museum.

Relations with China

The Chinese Loan Consortium.—A gradual change came about in the opening years of the 20th century in the general policies toward China of the Great Powers, who had become convinced of the fruitlessness of mutual competition; signs also became visible of the altered attitude of Western financiers in regard to the investments in that Empire. In 1908, a British and a German bank undertook to finance in common the Tientsin-Pukow railway. In 1911, a four-Power group consisting of Great Britain, Germany, France and the United States, was formed in connection with the Hankow-Szechwan railway loan, as well as the loan for currency reform in China and industrial enterprise in Manchuria. Japanese and Russian bankers agreed to joint this Consortium in 1912, with the understanding that the special interests of Japan and Russia in Manchuria and Mongolia would not be interfered with in the internationalisation of the Chinese loans. With the inauguration of Mr. Woodrow Wilson as President in 1913, the U.S. Govt. decided to withdraw their bankers from the Consortium, and subsequently the World War prevented Germany from remaining in the financial league. In 1917 the Consortium, now comprising the four Powers, Great Britain, France, Japan and Russia, invited the United States to rejoin in its activities. The American Govt. hesitated at first to respond to this call, but in June 1918 took the initiative for the reconstruction of the financial group.

By that time the Tsarist régime in Russia had come to an end, but the other nations interested expressed their assent to the American proposal; and negotiations were started in May 1919, in Paris, between the financial representatives of Great Britain, France, Japan and the United States, simultaneously with the Peace Conference. After considerable interchange of views, part of which concerned the reservations by Japan as to S. Manchuria and E. Inner Mongolia, an agreement was signed in New York on Oct. 15 1920. The most important feature of the new agreement was that the object was purely and simply economic, being entirely free from any political complexion. All the members were to pool their existing and future loans (*i.e.*, options) both as regards industrial and administrative undertakings, with the exception of the industrial enterprises upon which substantial progress had already been made. As to Manchuria and Mongolia, the Powers arrived at a satisfactory understanding, Japan withdrawing her previous reservations. The statement of the Japanese Govt. issued on April 1 1921 contained the assurance that Japan only desired in those regions definitely to ensure " her national defence and the security of her economic life," and she was confident that she could safely rely upon the mutual trust and friendship of the Powers in regard to the exigencies of any situation that might arise in future.

Equality of opportunity was fully guaranteed to all members, thus eliminating unnecessary and harmful competition. It was believed that this co-operative action of the various banking groups, which alone could offer the enormous amount of capital necessary for the reconstruction of Chinese economic life and for the building of sufficient means of communication and transportation all over her vast territory, would be in the best interests of the Chinese people.

" *Twenty-one Demands* " *upon China.*—No country regretted more sincerely the continued internal troubles and disorder in China, which had been divided into warring camps since the Republic was proclaimed, than Japan herself, whose national

destiny is so intimately entwined with that of China. On Jan. 18 1915 the Tokyo Govt., impatient of Chinese diplomacy, presented "21 demands," as they were called. First, China must "give full assent" to Japan's disposal of Shantung and pledge herself not to cede or lease either territory or island to a third power under any pretext. Also China must agree to Japan building a railway from Chefoo to Lungkou, and to the opening of treaty ports by agreement with Japan. Secondly, in South Manchuria and Eastern Mongolia, China recognises Japan's "special position," and grants to Japanese subjects a right or freedom to reside, own land for trade, manufacture or mining, with important railway concessions. Over China's "political, financial or military advisers or instructors," in these provinces, "the Japanese Govt. shall first be consulted." Thirdly, the Hanyehping Company with its mines is to be made "a joint concern of the two nations" in which China shall not "dispose of the rights and property" except "with the previous consent of Japan." Fourthly, "the Chinese Govt. engages not to cede or lease to a third power any harbour or bay along the coast of China." Group V. of the so-called "demands" was presented secretly as "wishes." By Article I. "the Chinese Govt. shall employ influential Japanese as advisers in political, financial and military matters." The "wishes" also cover the employment of Japanese advisers; land ownership by Japanese hospitals, temples and schools; the purchase of munitions of war from Japan; the right to construct the Wuchang-Nanchang and Nanchang-Hangchow railways; the priority of Japanese capital regarding railways, mines and harbour works in Fukien province; and Japanese missionary propaganda. The ambitious programme of the Tokyo Cabinet evoked adverse criticism from various quarters, and it was unfortunate that whatever cogent reasons there might have been, the "wishes" were not placed on the table from the outset as well as the "demands." As to their intrinsic merit, the London *Times* (Feb. 13 1915) observed: "Even in the Peking version . . . these terms do not look harsh or unreasonable in principle."

Even granting that some of the proposals were unwisely conceived, the general belief that Japan purposed at that time to establish a veiled protectorate over China was a misconception of her true attitude. For Japan it was a matter of superlative interest and importance that her neighbours should attain a good government, a prosperous industry and a flourishing trade. For these reasons, Japan pressed the Peking Govt., on May 7 1915, to give a definite answer within a time limit. In the end the Chinese President, Yuan-Shi-k'ai, acceded to the Japanese proposals; and on the 25th of the same month, under the signature of Mr. Hioki and Lu Cheng-hsiang, the Chinese Minister for Foreign Affairs, two treaties were concluded—one respecting the province of Shantung, and the other regarding South Manchuria and Eastern Inner Mongolia—and 13 notes were exchanged.

With reference to Shantung, the Japanese Minister, in an exchange of notes, made the following declaration:—

> If upon the conclusion of the present War the Japanese Govt. should be given an absolutely free disposal of the leased territory of Kiaochow Bay, they will return the said territory to China, subject to the following conditions:
> 1. Opening of the whole of Kiaochow as a commercial port;
> 2. Establishment of a Japanese settlement in the locality to be designated by the Japanese Government;
> 3. Establishment, if desired by the Powers, of an international settlement;
> 4. Arrangements to be made, before the return of the said territory is effected, between the Japanese and the Chinese Govts. with respect to the disposal of German public establishments and properties and with regard to the other conditions and procedures.

China's Pledges.—By the treaty respecting South Manchuria and Eastern Inner Mongolia, the Chinese Govt. pledged themselves that the terms of lease of Port Arthur and Dairen, and of the South Manchuria railway and the Antung-Mukden railway, should be extended to 99 years respectively; the Japanese should be permitted in South Manchuria to lease land for residential, commercial, industrial and agricultural purposes, and further should be free to enter, travel, reside and pursue various vocations; that in Eastern Mongolia Japanese should be permitted to carry on, jointly with Chinese, agricultural undertakings; that Japanese conducting business in those regions should be submitted to Chinese police laws and taxation; that civil and criminal cases should be tried by the Japanese consul or by Chinese officials according as the defendant was Japanese or Chinese, save in cases of land disputes, where a mixed tribunal would have the power of adjudication (all this pending the eventual reform of the Chinese judicial system); that suitable cities and towns would early be opened to foreigners of China's own accord; and that various agreements relating to the Kirin-Changchun railway should early be revised.

At the Washington Conference of 1921–2 the Chinese delegation asked for the annulment of the treaties and notes of 1915 on the ground that they had been wrested from China under duress and without any *quid pro quo*. Baron Shidehara contended that a dangerous precedent would be established in international law if a treaty were to be revoked for the reason that it had been concluded against the spontaneous will of a party. He declared, however, that, in view of the changes that had taken place in the general situation since the signing of those treaties and notes, Japan was ready to modify some of their stipulations. Mr. Hughes claimed for the Americans all rights granted to Japanese nationals under these documents by virtue of the most favoured nation principle, while refraining from touching upon the validity question. Dr. Koo made a reservation as to China's "right to seek a solution, on all future appropriate occasions, concerning those portions of the treaties and notes of 1915 which did not appear to have been expressly relinquished by Japan."

The Ishii-Lansing Agreement.—In the course of the conversations that took place between Mr. Robert Lansing, the United States Secretary of State, and Viscount Ishii, when the latter went to Washington as Japan's special ambassador on the war mission in 1917, it was found advisable that a public announcement of the desires and intentions of the two Governments with regard to China should once again be made "in order to silence mischievous reports" that had been circulated. On Nov. 2 notes were exchanged declaring in part:—

> The Governments of Japan and the United States recognise that territorial propinquity creates special relations between countries, and consequently the Government of the United States recognises that Japan has special interests in China, particularly in the part to which her possessions are contiguous. . . . The Governments of Japan and the United States deny that they have any purpose to infringe in any way the independence or territorial integrity of China, and they declare, furthermore, that they always adhere to the principle of the so-called "open door" or equal opportunity for commerce and industry in China.

In view of the understandings reached at the Washington Conference of 1921–2, the two Governments declared the termination of the Ishii-Lansing Agreement in the form of notes exchanged between Ambassador Hanihara and Secretary of State Charles E. Hughes on April 14 1923.

Japan and Russia

Japanese Expedition to Siberia.—After the Russian revolution in 1917 an anomalous situation developed in Siberia owing to the contact established by German and Austro-Hungarian prisoners-of-war with Bolshevik forces, the former assuming the practical command. These Teutonic-Bolshevik allies seriously threatened the safety of the Czechoslovak troops who had essayed through the only available route of Siberia to join the Allied armies fighting on the Western Front in France. The U.S. Govt. proposed to the Japanese Govt. in the early part of 1918 to dispatch an Allied contingent to Eastern Siberia to assist the Czechoslovaks. To this Japan gave her assent, and on Aug. 11 1918 dispatched a contingent to Vladivostok; the United States and Great Britain also dispatched troops to Siberia. Early in Sept. Khabarovsk was captured by the Allied forces, and during the month of Oct. Bolshevik influence in Eastern Siberia signally declined, and the Czechoslovaks in the interior

[1] For the text see Temperley, *Hist. of the Peace Conf.*, vol. vi., p. 631 *seq.*

succeeded in re-establishing communication with their compatriots in the littoral districts. The Allied successes in Siberia endowed the anti-Bolsheviks, rallying under the banner of Admi. Kolchak, with fresh power; and the authority of the Omsk Govt., established in Nov. 1918, extended as far as the Ural regions by the end of that year.

But in May 1919 the anti-Bolshevik forces sustained a crushing reverse at the hands of the Red Army; and Admi. Kolchak's Govt. first removed from Omsk and then, toward the winter, to Chita. In the face of such unfavourable developments, Japan saw the necessity of speedily arriving at a definite understanding with the U.S. Govt. as to the future dispatch of reinforcements to Siberia. The Washington Govt., however, responded in Jan. 1920 with a sudden decision to withdraw all the American troops and railway experts; firstly, because the repatriation of the Czechoslovak forces was about to be completed, and secondly because the very unstable situation in Siberia would render futile any military assistance to the attempt to establish an autonomous Russian Govt. in Siberia. The American Govt. further stated that if Japan would continue in her endeavours in Siberia single-handed they had no objection whatever. In point of fact, the exigencies of the situation soon obliged Japan to send reinforcements. But the Bolsheviks were in the spring of 1920 fast establishing ascendancy in Eastern Siberia, having their headquarters at Vladivostok, Verkhne Udinsk, and Blagovyeshchensk—the three centres being more or less independent of each other. After the arrest and execution by Bolsheviks of Admi. Kolchak in Feb. 1920, the only remaining Tsarist leader was Gen. Semenoff, who had established his government at Chita and had the whole province of Trans-Baikalia under his sway.

The Nikolaievsk Massacre.—In March 1920 a most sanguinary incident occurred at Nikolaievsk, on the river Amur; all the Japanese residents of that city, men, women and children, numbering over 700, including Consul Ishida and his family, were tortured and massacred by the "Partisans," a Bolshevist guerilla gang infesting the littoral regions. The Japanese Govt. declared on July 3 that as there existed no responsible administrative centre in Russia which could negotiate concerning this flagrant outrage on Japan's prestige at Nikolaievsk, the Japanese forces would occupy certain places in Sakhalin province, pending the establishment of a legitimate government. At the same time, it was made known that Japanese contingents would soon be withdrawn, as in fact they were, from Trans-Baikalia, inasmuch as the Czechoslovak troops had been successfully assisted on their homeward journey (the last troops left Vladivostok in Sept. 1920), but that Vladivostok and Khabarovsk would still have to be garrisoned by a small military force. Upon inquiry from the Washington Govt., it was explained by the Japanese Govt. that Vladivostok was the prolific hatching ground of Korean revolutionary plots, and further that the safety of the Japanese residents had to be provided for and that Khabarovsk had a close strategic connection with Nikolaievsk. As soon as signs became visible of the growing stability of Khabarovsk, in Sept. evacuation of that region was immediately started.

Meanwhile, the Bolsheviks at Verkhne Udinsk began to style themselves the "Far Eastern Republic," and, in concluding an agreement for the suspension of hostilities with the Japanese military authorities in July 1920, drew up a memorandum to the effect that the Republic would follow democratic and not communist principles of administration, and would constitute itself a buffer state in the interests of a speedy return of peace and order to Siberia. Then the movement for the unification of the several "governments" in Eastern Russia was started, and in Nov. the so-called Amalgamation Assembly at Chita declared the independence of the "Far Eastern Republic" (adopting the name at first conceived at Verkhne Udinsk), holding as its territory the Russian provinces east of the Selenga river and professing anti-communist democracy as its basic political principle. The *coup d'état* which was carried out by the reactionary Kappelists in Vladivostok on May 26 1921 showed that the Siberian situation was still as unstable as ever.

In accordance with Japan's pledge at the Washington Conference of 1922, she withdrew her troops from Russian soil except Northern Sakhalin as soon as the situation warranted the withdrawal, namely by Oct. 25 1923. Northern Sakhalin was evacuated on May 15 1925, following an arrangement made at the time of Japan's recognition of the Soviet Government.

Japan's Recognition of Russia.—Geographical propinquity and economic needs made it highly desirable for Japan to re-establish normal international relations with Siberia as soon as the situation warranted such a course. A similar desire was apparently held by the Far Eastern Republic having its capital at Chita, and informal negotiations were conducted between the representatives of the Japanese Govt. and the Chita Govt. at Dairen in Aug. 1921 and at Changohun in Sept. 1922; but no agreements were reached at these conferences. In the meantime, the Far Eastern Republic came to be amalgamated with the Soviet Union. At the end of 1922 Viscount Shimpei Goto, in the private capacity of President of the Japan-Russia Society, invited M. Joffe to visit Japan for the twofold purpose of recuperating his health and of talking informally about Japanese-Russian relations. Private conversations were carried on between Goto and Joffe in the spring of 1923 (Feb.–May) at Tokyo and Atami. Subsequently, the Japanese Govt. officially started the preliminary informal negotiations with M. Joffe in Tokyo in June 1923, with Mr. Toshihiko Kawakami representing it as a plenipotentiary.

The conference lasted until July, but owing mainly to the divergence of views as to the settlement of the Nikolaievsk incident it again failed to arrive at a definite agreement. Then for some months the question of reopening the Russo-Japanese negotiations remained in abeyance. But in Feb. 1924 Russia invited protests from Japan by successive drastic actions, such as the withdrawal of recognition to the Japanese consuls in Vladivostok and elsewhere, the discontinuation of postal services between Vladivostok and Tsuruga, the expulsion of Japanese press correspondents from Russia and the arrest of Japanese military and consular officials at Vladivostok. It was suspected that, in taking such steps, Russia hoped to compel Japan to resume negotiations at an early date. Mr. Kenkichi Yoshizawa, the Japanese Minister at Peking, approached his colleague, M. Karakhan, the Soviet Minister, with insistent demands to make speedy amends for such flagrant irregularities. After several meetings of the two representatives, it was decided that the thread of discussions at the Tokyo Conference would be taken up by them at Peking on May 14 1924. The Peking Conference was protracted to the end of the year, holding no fewer than 77 sessions. At length a "convention embodying the basic principles of the relations between Japan and the Union of Soviet Socialist Republics" was signed on Jan. 20 1925 and came into force on Feb. 26. Through this convention and the accessory papers,

(1) Japan gave full recognition to the Soviet Union, re-establishing diplomatic and consular relations;

(2) Russia formally tendered Japan "an expression of sincere regrets" for the Nikolaievsk massacre of 1920, Japan having withdrawn her claim for reparations and promising the withdrawal of the Japanese garrison in North Sakhalin by May 15 1925;

(3) In laying down the principles for a future treaty of commerce and navigation, Russia recognised the doctrine of private ownership "to the widest possible extent and on condition of reciprocity;"

(4) It was further agreed that propaganda would not be worked either overtly or covertly by the governments themselves or by their official agents;

(5) Regarding the question of natural resources, Russia signified her willingness to grant to Japanese, concessions for the exploitation of minerals, forests and other natural resources in all Russian territories. As for oil, Russia pledged herself specifically to grant to Japanese concerns the privilege of exploiting 50% in area of the oil fields already explored or to be explored on the east coast of North Sakhalin during the period of five to 10 years. Coalfield concessions on the west coast of North Sakhalin and the Dui district were also pledged;

(6) The fishery rights in Russian waters were granted to Japanese in principle, the private *modus vivendi* of 1924 being recognised;

(7) As for debts and obligations, a settlement was reserved for future negotiations on condition that the Japanese Govt. and people would not "be placed in any position less favourable" than that which might be accorded to other governments or nationals.

Mr. Tokichi Tanaka went to Moscow as the first Japanese Ambassador to the Soviet Union in July 1925, and in company with him went a Japanese delegation to negotiate with Russian authorities regarding Sakhalin concessions. A detailed agreement as to oil exploitation was reached in Nov. following, and the foundation of Russo-Japanese economic co-operation was thereby laid.

The Emigration Question

Anti-Japanese Movement in America.—In the opening years of the century, the continuous influx of a large number of Japanese immigrants from the Hawaiian Islands to California had caused much alarm to the labour organisations in that state, and even in wider circles. Anti-Japanese feeling first overtly manifested itself by the attempted segregation in 1906 of Japanese children in the public schools of San Francisco. President Roosevelt early discerned that public sentiment on the Pacific slope towards the Japanese was taking an untoward course, and, bent upon stemming the tide in time, in 1906 he pleaded, in his presidential message to the Federal Congress, that an Act should be passed investing the Japanese, who had "won in a single generation the right to stand abreast of the most intelligent and enlightened peoples of Europe and America," with the right to naturalisation, which had been reserved to "free white persons, aliens of African nativity and persons of African descent." The Congress at Washington, however, did not, or could not on account of the agitation in the West, so proceed with the question. Nevertheless, an informal agreement was reached between the Washington and Tokyo Govts., by which Japan pledged herself that she would not issue passports for the continental United States to those classes of Japanese who would, or might, engage in manual labour. Those Japanese who had previously resided in the United States, or were the immediate relatives of Japanese immigrants already in the United States, or the "settled agriculturists" who were to assume active control of an already established farming interest (only three or four persons actually came under this last category), were to be accepted. Japan promised to observe this arrangement voluntarily, and the sincere efforts of her government in executing it received recognition from many American publicists.

This "gentleman's agreement," as it was generally styled, was confirmed by a declaration on the part of Japan made simultaneously with the revision of the treaty of commerce and navigation in Feb. 1911. However, the feeling against the Japanese in the United States subsequently became more and more pronounced. Apart from sporadic legislation imposing restrictions on them with regard to civil rights, such as marriage and the pursuit of an avocation, the Alien Land Act was passed by the California Legislature in May 1913, and put into force three months later, despite strong Japanese protests and repeated admonitions from President Wilson's Cabinet. This law prohibited aliens ineligible to citizenship of the United States (including companies the majority of whose interests were under the control of such aliens either in point of their number or the amount of capital held) from owning land in the state of California, allowing them only the privilege of leasing land on a three years' tenure. The terminology employed invested this law with an appearance of innocent impartiality, but it was none the less obvious that the Japanese alone would, in point of fact, be the sufferers from a serious discrimination. (The ineligibility to citizenship was confirmed by the United States Supreme Court in a decision on Nov. 13 1922.)

Californian Agitation.—American participation in the World War tended to lull Californian opposition towards the Japanese. But with the termination of the War it was renewed. In spite of the efforts of the Japanese Govt. to respect the susceptibilities of their American neighbours, of which the stoppage of passports in the spring of 1920 to the so-called "picture brides" was an example, the day of the presidential election—Nov. 2—witnessed the passage by the Californians of the most drastic law yet enacted against "ineligible aliens," by which they were deprived of even those rights which they had formerly been allowed to retain of holding land under a three years' lease. The Federal authorities had been averse to such a step, but the "initiative" poll decided in favour of the enactment by a majority of three to one (668,483 to 202,086 votes), and the law came into force as from the Dec. following. Thus in 1921 no Japanese might own or lease land, neither could he act as guardian of his own American-born offspring (who are of right American citizens) in whose name land is held, nor might he possess a share even in American-controlled landowning companies.

Anti-alien land legislation seemed to have become the fashion in 1921, the example set by California being emulated by Nebraska, Idaho, Oregon and Washington; the last two states, be it remarked, had systematically refused to make common cause with California during the past decade.

In this connection there would appear to be some misapprehension with regard to the rights of foreigners in Japan to hold land, and it has been stated that no such rights exist. This is not the case, as all persons, without discrimination, who are not Japanese subjects, may enjoy absolute ownership of land, if they are formed and registered under Japanese law as a juridical person, that is, as a partnership or corporation. There are, in fact, many such corporations in existence in Japan, composed exclusively of aliens.

Foreigners are further permitted to acquire rights in land, other than ownership, on the same footing as Japanese nationals, the following being some of the most important of these rights:—

1. *Superficies.*—This is a right *in rem* by virtue of which land belonging to another person can be used for the purpose of owning thereon structures, trees or bamboos. It can be created even though no structures, trees or bamboos are actually in existence on such land, provided that the object and intention are to use the land for the purposes named. The law contains no limitation upon the period of time for which that right can be created; consequently, a superficies for, say, 1,000 years will sell for a sum closely approximating to the value of a right of absolute ownership.

2. *Emphyteusis.*—This is the right *in rem* to carry on agricultural or stock farming on the land of another person. The period of time for its duration is to be fixed by the parties concerned at not less than 20 years and not more than 50 years.

3. *Lease in Perpetuity.*—This is a lease without limit as to its duration, and for all practical purposes it is as good as ownership. It was originally granted to foreigners within the foreign settlements for a nominal consideration paid to the Japanese Government. Although the foreign settlements were abolished in 1898, perpetual leasehold survives and is still enjoyed by foreigners.

4. *Leasehold.*—This is a right *in personam* effective only as between the parties concerned. When registered, however, it can be set up against third persons as the effect of such registration. The duration period is fixed at 20 years, renewable for a further 20 years from the time of renewal.

The climax of the Anti-Japanese movement was reached when an immigration bill containing a clause excluding Asiatics was passed by the American Congress on May 15 1924. A notable aspect of the controversy was that certain senators imparted to Ambassador Hanihara's phrase "grave consequences," an unintended meaning of a "veiled threat." Fears were expressed that the American Congress might suffer the abridgment of its prerogative to legislate about the question of immigration. The Japanese public keenly resented what they considered an overt affront, since they could not reconcile themselves to a proposal under which the Japanese quota would have been a negligible number of 100 immigrants a year. On July 1 the law came into force, and Japanese friendship toward the United States strengthened by the Washington Conference and American generosity at the time of the earthquake disasters, appeared to decline. But thinking Japanese knew that the American press united in disapproving the action of Congress, and felt that this legislation did not correctly reflect the sentiments of Americans as a whole.

III. NATIONAL DEFENCE

The Army.—After the Russo-Japanese War six divisions were added to the Japanese Army, making the whole strength 19 divisions and in 1915 two more divisions were established for the defence of Chosen. After the World War it was planned to bring the Japanese military organisation up to the standard of efficiency and equipment necessitated by the lessons of the War. An 18-year reorganisation scheme involving 180,000,000 yen (£18,400,000) was passed by the Diet in 1918, and in 1920 it was decided not only to alter the scheme considerably, but also to expedite its execution and have it completed in 14 years, the estimate passed being 290,000,000 yen (£29,600,000).

Under the new scheme the number of divisions was to remain the same, but as a result of the disbandment of several small units the total peace strength of the army was to be reduced by 56,000 officers and men by 1925, and much of this disbandment has taken place. But, with the evacuation of Hankow and the withdrawal of Japanese forces from Shantung, Siberia and the mainland of Sakhalin, and also from Southern Manchuria, there has been a considerable redistribution of the Japanese Army, which has maintained the total strength of the home forces despite the reduction scheme. In war time this force could be expanded to 41 divisions with a total strength of 1,000,000 all arms. According to the latest budget figures, the total number of effectives in the land forces is 235,056, consisting of 16,879 officers, 216,114 other ranks and 2,063 gendarmerie. A Japanese division, it should be added, is generally composed of two brigades of infantry, one regiment of cavalry, one regiment of field artillery (with the exception of the 9th and 11th divisions, for which a mountain artillery regiment is provided), one battalion of engineers and one battalion of army service.

For the purpose of carrying out the new scheme for military aviation in 1919, the Army Department created an aviation section. In Jan. 1920 a military aviation school was started to train in the first year about 100 students, including both commissioned and non-commissioned officers. The military air service consists of six flying battalions and one balloon corps, and is now equipped with 150 standing machines.

Under the system of conscription, able-bodied males from 17 to 40 years of age are liable for service in the army. Those who have completed the middle school education, or have had an equivalent education, can apply for the volunteer service of one year instead of the ordinary three years' service. A young man who is receiving a liberal education may be exempted from military service until it is finished; residents abroad are also exempted.

The Navy.—As a sequel to the Russo-Japanese War, the Japanese naval authorities came to the conclusion that the most efficient fleet unit would be the so-called "8-8 plan;" viz., a unit consisting of eight battleships, eight battle cruisers and a suitable strength of subsidiary vessels. The Diet agreed to the scheme in principle in 1917, but owing to financial reasons it was decided to start with an 8-4 fleet. In the following year, the Diet passed an expanded plan of 8-6 unit, spread over seven years. On account of the strengthened financial situation, the naval authorities proposed, in Dec. 1920, an additional appropriation of 751,900,000 yen (£76,990,000) beyond the 408,000,000 yen (£41,700,000) previously assigned for warship construction, with a view of completing the 8-8 unit scheme in eight years. The Diet gave its assent to this proposal in passing the Budget for 1921–2, and, according to this plan, Japan was expected to have in commission, by 1927 four battleships, four battle cruisers, 12 cruisers, 32 destroyers, five gunboats, 12 fleet auxiliaries, six minesweepers, and several submarines, thus bringing the strength of the Japanese navy in ships not exceeding eight years in age to eight battleships, eight battle cruisers, 23 cruisers, 73 destroyers, approximately 80 submarines, five gunboats, 27 fleet auxiliaries and 120 submarines. In conjunction with this 8-8 scheme, the expansion of the naval air force was decided upon, and by 1923 the formation of 17 service and two practice corps had been completed.

In 1910 the tonnage of the Japanese Navy was 524,273; in 1920 it was 769,288. In 1920 its strength was 15 battleships, 7 battle cruisers, 16 light cruisers, 14 coast-defence vessels, 8 gunboats, 87 destroyers, 20 torpedo-boats and about 20 submarines.

In accordance with the agreements at the Washington Conference, reduction was made in the naval strength of Japan, including the abolition of the 8–8 fleet programme. The "Hizen," the "Kashima," the "Katori," the "Ikoma," the "Ibuki," the "Kurama," the "Amagi," the "Tosa," the "Atago" and the "Takao" were broken up; the "Satsuma" and the "Aki" were sunk; the "Settsu" was converted to a target ship and the "Akagi" and the "Kaga" to aircraft carriers—all this completed by Feb. 9 1925.

The naval strength of Japan in 1925 was six battleships (191,320 tons), namely, "Nagato" (1919), "Mutsu" (1920), "Ise" (1916), "Hiuga" (1917), "Fuso" (1914), "Yamashiro" (1915); four battle-cruisers, "Kongo" (1912), "Hiyei" (1912), "Haruna" (1913), "Kirishima" (1913); one aircraft carrier (9,500 tons); 16 light cruisers (82,210 tons); 72 destroyers (77,025 tons); 41 submarines (32,838 tons); and two fleet submarines (2,800 tons). In the course of building were two aircraft carriers (53,800 tons); nine light cruisers (73,995 tons); nine destroyers (12,960 tons); four submarines (3,659 tons); seven fleet submarines (11,510 tons) and three mine-laying submarines.

Regarding naval aviation, a new programme passed by the Diet will give the Japanese Navy when completed 17 fleets and 136 planes, stationed as follows: Kosumiga-ura, seven; Yokosuka, five; Sasebo, three; and Omura, two.

See *Armaments Year Book*, League of Nations (Geneva, 1926).

(H. Sa.)

IV. NATIONAL FINANCE

The State Budget.—The table at top of p. 593 shows the increasing figures of the Japanese state budget for the fiscal years from 1910–1 to 1924–5.

Although in the early months of the War the more or less disturbed economic conditions in Japan checked the normal increase of revenue in general, the gradual recovery, followed by the unprecedented prosperity of industry and commerce, caused the revenue to show an upward tendency. From 1916–7 the yield of income-tax, adjusted to meet national needs, had rapidly increased, and receipts from public undertakings and state property contributed enormously to the general growth of the revenue. A war profits tax, enacted in 1918, required of those liable to the tax the payment of either not less than 20% of their income in excess of the average profits of pre-War days, or, in case such could not be ascertained, of 10% of their invested capital.

In addition to the adjustment of the income tax to yield a larger revenue, the "saké" tax, the postal, telegraph and telephone charges and the price of tobacco (a government monopoly) were all increased. Japan emerged from five years of the World War with her financial position considerably strengthened, though during 1920–1 industrial unrest and economic depression reacted adversely on national finance. The Government explored every available channel in order to counteract the loss of revenue by retrenchment.

Emergency Expenditure on Account of the Earthquake.—In the middle of the financial year 1923–4, however, as a consequence of the great earthquake, the Government was compelled to provide for various emergency measures, the reconstruction of the devastated areas, and at the same time to make good the deficiency arising from the reduction of taxes or exemption from taxation and other de-

Budget Figures 1910–25 (in 1,000 Yen)

Year	Revenue			Expenditure			Surplus Revenue
	Ordinary	Extraordinary	Total	Ordinary	Extraordinary	Total	
1910–1	491,331	181,542	672,873	412,009	157,144	569,154	103,719
1911–2	508,558	148,633	657,192	409,889	175,485	585,374	71,817
1912–3	552,085	135,306	687,392	416,895	176,701	593,596	93,796
1913–4	575,428	146,547	721,975	415,635	157,998	573,633	148,341
1914–5	536,342	198,305	734,648	399,225	249,195	648,420	86,227
1915–6	538,999	169,616	708,615	386,516	196,753	583,269	125,346
1916–7	622,052	191,256	813,308	386,065	204,729	590,795	222,513
1917–8	763,760	321,198	1,084,958	437,821	297,202	735,024	349,934
1918–9	911,579	567,536	1,479,115	490,167	526,868	1,017,035	462,080
1919–20	1,063,121	745,512	1,808,633	502,786	669,542	1,172,328	636,305
1920–1	1,174,677	825,975	2,000,652	709,314	650,664	1,359,978	640,674
1921–2	1,283,812	781,899	2,065,711	841,750	648,106	1,489,856	575,855
1922–3	1,428,206	659,139	2,087,345	891,257	538,432	1,429,689	657,656
1923–4	1,303,588	741,464	2,045,052	960,452	560,597	1,521,049	524,003
1924–5	1,265,652	388,458	1,654,110	1,082,400	571,710	1,654,110	..
1925–6	1,299,321	250,493	1,549,814	1,021,763	528,050	1,549,813	..

Note.—The figures to the financial year 1923–4 represent the settled accounts; those for the financial years 1924–5 and 1925–6 the budget estimates.

creases in revenue. Under these exceptional circumstances the Government, in order to avoid any serious weakening of the national finances, curtailed expenditure and postponed public works, and so framed for the financial year a working budget which amounted to 1,292,821,754 yen both in revenue and in expenditure. Of this sum the fall in taxes consequent on the disaster reached an amount of 130,000,000 yen less than the original estimate.

At the 47th extraordinary session of the Diet in 1923 a programme for the reconstruction of Tokyo was agreed upon after discussion, and a supplementary budget was voted for the purpose; out of the total thus voted, 13,180,721 yen was allotted to the fiscal year 1923–4. In addition to the above vote for reconstruction a further sum of 4,883,989 yen was voted to the working budget, so that after these additions the revised working budget for 1923–4 amounted to 1,311,687,188 yen. The dissolution of the 48th session in Jan. 1924 having rendered abortive the general budget for 1924–5, the Government drew up a working budget as follows:—

Revenue and Expenditure in Yen

	Revenue	Expenditure
Ordinary	1,214,788,272	1,028,156,564
Extraordinary	194,265,814	380,897,522
Total	1,409,054,086	1,409,054,086

The extraordinary expenditure includes the following reconstruction appropriations:—

Expenditure in Yen

Reconstruction outlay	..	87,607,000
Tokyo	77,955,000	..
Yokohama	9,652,000	..
Loans	..	1,283,000
Subventions	..	3,816,000
Interest granted for local reconstruction loans	..	38,000
Total	..	92,744,000

In July 1924 a supplementary estimate, consisting of the following amounts, was submitted to Parliament and approved:—

	Yen
(*a*) Supplementary expenditure for reconstruction of Tokyo as a consequence of the earthquake	40,400,000
(*b*) Expenditure for reconstruction work on official buildings, and a grant for damage sustained by local authorities	122,300,000
(*c*) Other supplementary expenditure not concerning reconstruction	102,900

Further Emergency Measures.—As a result of the abnormal economic and financial circumstances, following the earthquake disaster, a number of emergency measures became necessary, of which the following are the principal:—

(1) Of the 84 Tokyo associated banks, no fewer than 74 had their principal offices burnt down, with the result that the banking machinery almost ceased to work. An Imperial emergency ordinance was issued on Sept. 7 1923 proclaiming a moratorium of 30 days within the stricken area on all pecuniary obligations due on or before Sept. 30 1923, under the civil code in force before the catastrophe.

(2) The Bank of Japan having done its utmost to respond to the aforementioned measure by accommodating banks with the funds necessary for resuming their business, an ordinance was promulgated on Sept. 27 under which the Government undertook to indemnify the bank to the extent of 100,000,000 yen in respect of losses incurred in rediscounting the earthquake bills.

(3) The operation of the customs law was temporarily suspended, and import duties were either abolished or reduced until March 31 1924 (*see* TRADE, INTERNATIONAL).

(4) In the stricken area exemption, reduction and deferred payment of taxes were allowed according to the circumstances.

(5) With the assistance of the deposit bureau of the financial department the Hypothec Bank of Japan and the Industrial Bank of Japan liberally financed their clients.

(6) An ordinance was issued by which state aid was to be given to fire insurance companies which voluntarily paid "sympathy money" to policy holders who suffered loss either directly or indirectly from the earthquake. The subsidy was to be repaid in accordance with terms prescribed by the Government.

(7) A law was promulgated by which an import duty—operative from Aug. 1 1924—of 100% *ad valorem* was placed on luxury and certain other articles.

(8) Reconstruction Savings Certificates were issued in small denominations.

Budget of 1925–6.—In drawing up the Budget for the financial year 1925–6 further retrenchment and reforms in finance and administration were effected, and the total estimates (in yen) were as follows:—

Budget of 1925-6 in Yen

Revenue	..	1,524,000,000
Ordinary	1,300,000,000	..
Extraordinary	224,000,000	..
Expenditure	..	1,524,000,000

Compared with the preceding year's estimates there was an increase of 35,000,000 yen in the ordinary expenditure and a decrease of 126,000,000 yen in the extraordinary, making a net reduction of 91,000,000 yen in the total expenditure. The Government adopted the policy of avoiding recourse to public issues, thus relieving the money market from the demands of state finance. At the same time, by the retrenchment of expenditure, it exerted itself to encourage thrift. The chief items of revenue and expenditure for 1925–6 were as follows:—

Revenue and Expenditure, 1925–6 (in 1,000 Yen)

Ordinary Revenue:—	
Land tax	74,004
Income tax	195,855
Business tax	57,282
Tax on liquors	196,377
Sugar excise	70,099
Consumption tax on textile fabrics	53,672
Customs duty	98,825
Other taxes	49,116
Stamp duty	82,142
Receipts from postal, telegraph, telephone services	203,603
Forests	39,288
Profits of monopoly	130,276
Other receipts from public undertakings and state property	22,023
Miscellaneous receipts	18,220
Transferred from special accounts	8,529
Total	1,299,311

Extraordinary Revenue:—	
Proceeds of sale of state property	4,715
Receipts from the issue of public loans	100,000
Local contributions to expenses incurred by the state for the benefit of certain prefectures	13,039
Funds belonging to special accounts transferred	26,077
Surplus of the preceding year transferred	104,119
Miscellaneous receipts	2,540
Total	250,490
Total revenue	1,549,801
Ordinary Expenditure:—	
Imperial household	4,500
Foreign affairs	15,783
Home affairs	41,177
Finance	282,341
Army	170,875
Navy	122,349
Justice	28,515
Public instruction	79,751
Agriculture	21,388
Industry and commerce	3,161
Communications	251,919
	1,021,759
Extraordinary Expenditure:—	
Foreign affairs	3,454
Home affairs	206,500
Finance	38,083
Army	28,514
Navy	105,016
Justice	2,075
Public instruction	19,212
Agriculture	20,690
Industry and commerce	7,646
Communications	96,856
Total	528,046
Total expenditure	1,549,805

Administrative Changes.—The principal changes in the financial and administrative system of the country made after the earthquake are:—

(1) the establishment of a special fund by means of a sum of about 130,000,000 yen to be taken out of the reserve capital of the Imperial mint, this fund to be applied to the improvement of national education and the development of industries in agricultural districts;

(2) the reorganisation of the deposit section of the department of finance by revising the administration and the mode of employing the fund belonging to that section, mainly post-office deposits, and by appointing a commission to advise the finance minister as to the proper method of employing the fund (this commission was set up in April 1925);

(3) the division of the old department of agriculture and commerce into two independent departments, one for agriculture and forestry and the other for commerce and industries (in March 1925);

(4) the creation of several new parliamentary secretarial posts (in Aug. 1924).

The National Debt.—The National Debt stood at 4,553,471,000 yen at the end of Aug. 1925, of which 3,051,455,000 yen represented the internal, and 1,502,016,000 yen the foreign loans. Of the external loans, an amount of 544,975,000 yen was raised in Feb. 1924: in New York $150,000,000 and in London £25,000,000. The proceeds were applied to the conversion and redemption of the outstanding balances of the Imperial Japanese Govt. 4½% loans, first and second series, issued on March 28 1905 and July 11 1905, respectively, and also to meet the expenditure for reconstruction work necessitated by the earthquake of Sept. 1923. The figures of the debt are as follows:—

Debt 1914-25 (in million Yen)

Financial year	Internal loans[1]	Foreign loans[1]	Total	Debt per head in yen
1914-5	991·5	1,514·8	2,506·3	46·968
1915-6	1,028·0	1,461·1	2,489·1	45·976
1916-7	1,097·4	1,370·2	2,467·6	44·919
1917-8	1,159·9	1,338·7	2,498·6	45·911
1918-9	1,268·8	1,311·1	2,579·9	45·976
1919-20	1,482·4	1,311·1	2,793·5	49·297
1920-1	1,809·6	1,424·3	3,233·9	56·506
1921-2	2,184·8	1,359·0	3,543·8	61·187
1922-3	2,450·1	1,358·5	3,808·6	64·887
1923-4	2,576·1	1,621·3	4,197·4	70·595
1924-5	2,822·9	1,506·7	4,329·6	80·000

[1]Amount outstanding at the end of the financial year.

V. ECONOMIC HISTORY

War Conditions.—Before the World War, Japan had already nearly recovered from the effects of the Russo-Japanese War, and her economic activities had been making steady and more or less symmetrical progress. During the early days of the War the disturbance of international commercial relations brought about conditions which affected the Japanese nation in common with the whole world. This state of affairs, however, changed later, when a huge demand arose on the part of the Allied Powers for the supply of immense quantities of munitions of war, and when, in addition, the inability of the European belligerents to continue their overseas commerce on the pre-War scale caused a demand for Japanese products in the markets of India, the South Seas, Australia, South America and even Africa. These factors, together with the natural decline in imports from the European countries at war, conduced to turn the balance of Japanese trade in her favour practically for the first time in 20 years.

A great increase in the amount of specie held by Japan abroad inevitably followed, while the stock of gold accumulated at home rapidly grew. Then the rate of interest was lowered, and the prices of shares began to soar, thus causing general buoyancy in the stock market. As a result Japan was placed in such a position as to be able to redeem her foreign debt and to accord financial assistance to her Allies. This is shown in the following transactions:—

Foreign debt redeemed	
4½% bonds	£20,516,400
Franc bonds	Fr. 200,009,500
Amount lent	
To Great Britain	¥280,000,000
France	126,000,000
Russia	240,053,067

Soon a considerable number of new undertakings, notably in the field of shipbuilding, iron and steel manufacture and the chemical industry were brought into being. The rate of interest once again showed an upward tendency, and the issue of banknotes increased rapidly. The trend of circumstances described above became more and more accentuated as time went on, until at the end of 1916 the premature peace talk engendered a spirit of temporary caution among Japanese manufacturers and merchants.

The general international confusion of 1917, such as the introduction by the Germans of ruthless submarine warfare, the declaration by the United States of war upon Germany, the débâcle of the Russian revolution, and, in addition, the continuous internal troubles of China, all had repercussions upon Japanese commerce. Nevertheless, in spite of the far-reaching effects of these great outside influences, Japan's trade and industry continued on the whole to register a steady development.

Post-War Depression.—With the conclusion of the Armistice in Nov. 1918 the demand for warlike materials came to an abrupt end, and the branches of industry and commerce dealing with iron, steel, copper, dyestuffs and chemicals received a sudden and serious blow. There were even signs of economic depression, but the revived demand for foodstuffs and industrial materials necessary for the economic reconstruction of Europe, coupled with the trade activities in the United States, temporarily maintained a prosperous state in Japan's commerce. A telling blow to trade and industry was administered, however, by the financial panic which occurred in April 1920, due to over-speculation and the misuse of credit in certain quarters.

Readjustment.—Following the setback of the preceding year the economic market had to devote itself in 1921 to the work of readjustment, which caused general lethargy in industrial enterprises and dullness in commercial transactions. It was in these circumstances that in June 1922 the Government declared a new policy of financial and administrative retrenchment and readjustment, which was rigorously pursued until the whole outlook became distinctly brighter; demand for money in the home-market declined, the balance in foreign trade improved, and the issue of banknotes decreased. In the latter part of

Nov. of the same year, however, this tendency was suddenly checked by the suspension of business of a few provincial banks. Emergency measures were successfully taken by the Government as well as by the Bank of Japan, but at the end of the year money was still very tight and demands upon the bank for advances reached an enormous amount, with the result that a new record was established in the issue of bank-notes.

In 1923, while the economic conditions of the country were still in a state of unrest, Japan was suddenly visited by the unparalleled catastrophe on Sept. 1, when the earthquake and conflagration in the Kwanto district caused terrible loss of life as well as severe material destruction. The effect on the country's sound economic and industrial foundation, however, was not very serious, because the area devastated covered only a consuming part of Japan, not a producing part. But the effect of the disaster on the money market was felt to such a degree that for a time absolute financial confusion seemed imminent. Fortunately, emergency measures were promptly and effectively taken by the Government, the Bank of Japan and the other financial authorities to restore order in the business world. At the end of Sept. 1925 the first step was taken towards the return to a gold standard, when a shipment of 4,000,000 gold yen was consigned by the Bank of Japan to the Federal Reserve Bank in New York. On Dec. 19 the removal of the embargo on the shipment of silver bullion was announced.

Prices.—The following table shows, by wholesale price numbers based on Oct. 1899, the rise in prices of commodities in Tokyo between 1913 and 1924:—

Prices of Commodities
(Oct. 1889 = 100)

	1913	1916	1919	1923	1924

Population, Production and Trade

Population.—The first national census took place on Oct. 1 1920. The following table gives the census figures for Japan proper, Formosa and Japanese Sakhalin, together with those obtained for Korea from the local registrars' records. The figures for Japan proper (area 148,756 sq. m.) show that she ranks sixth in order of population among the countries of the world, her number only being exceeded by those of China, India, Russia, the United States and Germany. With regard to the density of population, Japan proper (376 per sq. m.) ranks third, following Belgium (658), the Netherlands (536) and above Great Britain (374).

	House-holds	Population (1920)		
		Male	Female	Total
Japan proper	11,222,053	28,044,339	27,918,714	55,963,053
Taiwan (Formosa)	690,000	1,893,541	1,761,767	3,655,308
Karafuto (Japanese Sakhalin)	22,087	62,327	43,572	105,899
Chosen (Korea)	3,297,285	8,903,000	8,361,119	17,264,119
Total	15,231,425	38,903,207	38,085,172	76,988,379

The following table gives the census figures for 16 cities with a population numbering more than 100,000:—

Principal Cities

	House-holds	No. of Pop.		House-holds	No. of Pop.
Tokyo	456,820	2,173,201	Hakodate	29,155	144,749
Osaka	276,331	1,252,983	Kure	28,268	130,362
Kobe	138,986	608,644	Kanazawa	29,287	129,265
Kyoto	128,892	591,323	Sendai	21,861	118,984
Nagoya	92,426	429,997	Otaru	21,275	108,113
Yokohama	95,241	422,938	Sapporo	20,038	102,580
Nagasaki	37,036	176,534	Kagoshima	19,942	103,180
Hiroshima	34,553	160,510	Yawata	22,322	100,235

There are 31 cities with a population of from 50,000 to 100,000; 136 with from 20,000 to 50,000, and 374 from 10,000 to 20,000. On Oct. 10 1925 the second national census took place, but at the time of writing the full figures are not available. The results received to date show that Japan proper has a population of 59,736,000, including 30,012,000 males, an increase of 3,772,947 since the 1920 census. On Oct. 1 1924 the population of Japan proper was estimated at 59,138,900, which represented a yearly increase of about 800,000 for the five years ending 1924. In point of birth-rate, however, a tendency to decline has already set in, 36·2 per 1,000 in 1920 being the high-water mark.

Agriculture.—Japan, in common with most European countries, has witnessed a decrease in the number of people engaged in agriculture. During 1916 and 1917, when Japan was putting forth her greatest effort in producing munitions of war for the Allies, the number of those actually holding land decreased to the extent of 20,800 and 36,400 respectively; whilst in 1918, when the war boom in industry was practically over, the gain to agriculture was only 20,200 persons. This migration of the agrarian population toward cities, together with the modern industrial tendency of the nation, is making it more and more difficult for landowners to find tenants. Rural reorganisation has been an economic problem for some time.

Farmers and Tenant Farmers

	Farmers cultivating own land	Tenant farmers	Farmers combining tenantship
	%	%	%
1908	33·27	27·58	39·15
1923	30·60	28·23	41·17

The high proportion of small holders in Japan is characteristic of the agricultural life of the country, as is shown by the following table giving the percentage of total landholders with holdings of under 1·23 ac., etc.:—

	Under 1·23 ac.	Over 1·23 ac.	Over 2·45 ac.	Over 4·90 ac.	Over 7·35 ac.	Over 12·25 ac.
1908	37·28	32·61	19·51	6·44	3·01	1·15
1923	35·11	33·59	21·39	5·88	2·57	1·46

Rice still remains the staple food of the country, and the area under cultivation is nearly twice that devoted to the production of barley, rye and wheat. Intensive cultivation of all crops is carried out, and the limit of return has actually been reached in some cases.

Cotton, hemp and indigo were all retrogressive, the cotton chiefly owing to the large imports of cheaper cotton from abroad. The following table shows the area under cultivation and the production of the chief food products:—

Principal Crops

	Area under Cultivation		Production	
	1914 Hectares	1923 Hectares	1914 Hectolitres	1923 Hectolitres
Rice	3,008,298	3,121,363	102,834,926	100,056,199
Barley	611,218	473,859	17,225,132	13,701,265
Rye	721,306	557,774	13,001,461	10,564,001
Wheat	474,721	483,833	8,096,399	9,366,031
		1922		1922
Millet	203,087	151,630	3,984,178	3,511,698
Beans	589,694	580,712	8,256,823	8,278,735
Buckwheat	160,222	124,624	2,469,232	1,984,797
Rapeseed	123,092	90,609	1,593,065	1,229,310
			Metric tons	Metric tons
Potatoes	83,125	100,102	879,385	915,379
Sweet potatoes	302,493	288,372	3,679,155	3,768,963
Seed cotton	2,452	2,105	3,081	1,876
Hemp	10,926	10,023	9,469	11,815
Indigo (leaf)	4,476	4,652	8,176	8,333
Sugar-cane	22,414	25,711	1,001,078	812,489

Industrial Development.—Although the expansion of Japanese industries was enormous during the World War, the rate of progress registered in the pre-War period of 1908-13 had also been remarkable. In 1908 there were 11,390 industrial establishments and 196 Government factories; in 1913 the Government factories had decreased to 188 (in 1918 there was a further drop to 161), but the other industrial establishments had increased in number to 15,811, or by 38·8%. By 1918 the figure had risen to 22,391, an increase of 41·6% on 1913 and 96·6% on 1908. In a decade, that is to say, Japan had practically doubled the number of factories in operation; but the after-War trade depression affected industrial development to some extent.

The following table illustrates the development:—

Industrial Progress

Government factories	No.	Motors	Kilowatts	Operatives	
				Men	Women
1913 (Mar. 31)	188	5,211	217,965	99,992	29,994
1918 (Mar. 31)	161	7,014	269,475	123,087	36,349
1922 (Dec. 31)	..	8,679	635,112	124,725	43,429

Industrial establishments	No.	Motors	H.P.	Operatives	
				Men	Women
1913 (end of)	15,811	19,084 1,330	1,122,597	375,596	540,656
1918 (end of)	22,391	41,689 878	2,006,098	646,115	763,081
1922 (end of)	46,427	86,312 804	2,942,730	834,314	856,705

Shipbuilding.—In 1898 a steamer of 6,000 tons, the first large boat to be built in a Japanese yard, was completed by the Mitsubishi dockyard at Nagasaki for the Nippon Yusen Kaisha. Subsequently the same dockyard and the Kawasaki establishment constructed steamers of over 10,000 tons, as well as cruisers for the Imperial Japanese Navy and for China. In 1912 these two dockyards had reached such a high state of development that each was entrusted with the building of a dreadnought of 27,500 tons. Soon after the outbreak of the World War the private shipyards enlarged their capacity for building and made marked progress, though handicapped by an inadequate supply of materials and skilled labour. But the yards have been suffering from post-War depression, and also from the effects of the Washington Agreement (*see* WASHINGTON CONFERENCE); being obliged to curtail the scope of their work, and, in some cases, completely to suspend it.

The number and total tonnage of ships launched in the years 1913, 1918, 1921-4 is as follows:—

Ships launched	Steamships		Sailing Vessels		Total	
	No.	Tonnage	No.	Tonnage	No.	Tonnage
1913	115	51,525	659	43,598	774	95,123
1918	443	540,531	1,804	161,964	2,247	702,495
1921	69	226,081	12	1,711	81	227,792
1922	57	71,076	14	2,167	71	73,243
1923	56	74,284	1	2,500	57	76,784
1924	39	71,440	6	1,006	45	72,446

With regard to her merchant fleet, Japan advanced during June 1914 to June 1920 from sixth to third position among the world Powers, since at the latter date she possessed 2,996,000 tons as against 1,708,000 tons in 1914, thus emerging after the War with an increase of 1,288,000 gross tons.

Raw Silk and Silk-Weaving.—The manual dexterity peculiar to Japanese women is a factor which ensures the lasting prosperity of Japan's raw-silk industry, and when full advantage has been taken of the various modern processes of production in silk filatures enhanced benefit should accrue. Japanese silk goods have made great progress, and particularly silk pongee, which has now practically driven the Chinese product from the markets of the United States. At the end of 1922 there were 2,863 factories engaged in the silk industry, employing 23,893 male and 262,732 female operatives.

Cotton Spinning.—In spite of the difficulties during the World War of importing from Great Britain and the United States sufficient machinery to meet the enhanced demand for cotton yarn, the spinning-mills of Japan prospered exceedingly. The paid-up capital invested in the mills at the end of June 1920 was 248,180,000 yen, equivalent to an increase of 288% over the pre-War figure; whilst the number of spindles in use in 1918 was 3,384,800, and in June 1920 3,689,000, compared with 2,409,900 in 1914. At the end of 1918 there were 6,710 factories, with 65,316 male and 218,041 female operatives, the total number of workers in the textile industries being 777,655. The latter figure includes about 25,000 who are engaged in the production of knitted goods, consisting principally of gloves, stockings and underwear, in which a large trade, chiefly with British India, has grown up in the last few years. As knitting was formerly entirely a domestic industry, there have been difficulties in producing goods of uniform quality for export, and a system of inspection was therefore instituted towards the end of 1917, under which the exportation of articles of inferior quality was prohibited. Previous to the War, the average output of knitted goods was 6,660,000 doz., valued at 8,937,000 yen, but during the five years of the War the output averaged 15,143,000 doz., valued at 23,073,000 yen. According to the report of the Cotton Spinning Association, at the end of 1923 the factories numbered 241, with an aggregate paid-up capital of 376,273,000 yen, while the spindles numbered 4,422,000.

Iron Foundries.—Before the War there were only some 20 iron foundries in Japan, but the difficulties experienced during the War in obtaining from abroad the large quantities of iron and steel required to meet the boom in industry resulted in the establishment of over 250 foundries before the close of 1919. In 1914 the output of pig-iron amounted to 302,000 tons and of steel materials to 283,000 tons. In spite of the slump in the iron industry which occurred after the Armistice, 613,000 tons of pig-iron and 553,000 tons of steel materials were produced in 1919. The total investments in iron foundries at the end of 1921 amounted to 350,000,000 yen. In the same year the working capacity of the ironworks was 1,412,000 tons of pig-iron, 1,033,000 tons of steel, and roughly 1,450,000 tons of steel materials; while the actual output amounted to less than one-half the capacity, *i.e.*, 556,531 tons pig-iron and 557,826 tons steel materials.

Machine and Tool-Making.—At the end of 1922 about 6,720 factories were engaged in various forms of machine-making; and also in many branches of metalwork and metalware. The manufacture of machinery for the production of electric apparatus and lamps, as well as the construction of dynamos, telephones, railway signals and measuring instruments, are practically new growths of the iron and steel industrial activity.

Dyestuffs.—The manufacture of dyestuffs was an untried industry in Japan prior to the War, and in 1913 no fewer than 6,000 tons of dyestuffs, valued at 8,000,000 yen, were imported for use in the cotton and silk industries. After the outbreak of the War the cessation of foreign supplies, chiefly derived from Germany, compelled Japan to make an effort to become, to some extent, self-supporting. In 1915 certain dyes were produced, the largest quantity being sulphuric black, then alizarin, acid blue and aniline salt. These were followed by yellow, red and blue acid, yellow and red direct, and purple, blue and brown basic colours. Early in 1916 the Government started and subsidised the Japan Dyestuff Manufacturing Co., which later succeeded in producing an artificial indigo, though only on a laboratory scale. By 1918 they were in a position to export Japan-made dyes, but within a short time foreign dyes reappeared on the market, apart from the German indemnity dyestuffs which arrived in May 1921. Though the *ad valorem* duty was raised to 35% in 1920, these foreign products almost strangled the infant industry. In 1923, 23 factories, with a capital of 13,565,500 yen, were in existence.

Chemicals.—The manufacture of chemicals in Japan does not owe its inception to the War, but its great development and the many innovations introduced were the direct result of War-time conditions. There was, however, a sharp decline in the prosperity of the chemical industry immediately after the Armistice. In 1916 the Government set up a subsidised company for the production of glycerine, and as the result of extensive investigations at the industrial institute into the qualities of seaweeds and vegetable ash, the production of basic chloridised alkali increased from 2,000 tons in 1913 to 10,000 tons in 1917. The match industry, which formerly derived chlorate of potash from European sources, by the end of 1917 was able to depend on the home supply, and gained an important place in export trade; but of late, owing to the advance in price of raw materials, and also the rise in wages at home, the industry has been beaten, chiefly by the Swedish match industry, especially as regards exports.

The soda industry, although it existed as long ago as 1880, did not reach a high standard of technical perfection before the War, and also failed to satisfy the total annual requirements in caustic soda, amounting to about 25,000 tons. During the War, however, the number of factories increased to about 20, and the annual production rose to 14,000 tons in 1918 and 20,000 tons in the following year.

Some of the chief products in the chemical industry are: sulphuric, hydrochloric and nitric acids, sodium sulphate, carbonate of soda, caustic soda, iodine, potassium iodine, potassium chloride, ammonium sulphate, acetic acid, acetone and wood spirit.

JAPAN'S FOREIGN TRADE

The rapidity with which Japan's foreign trade had developed, both in volume and extent, during the half-century preceding 1925 provides a remarkable record in commercial history. The total value of exports and imports, which in the first year of Meiji (1868) amounted to the insignificant total of 26,000,000 yen (£2,650,000), increased 10-fold in 1895, 100-fold in 1917, and 167-fold in 1920; and though

in the three following years it had shown a great decrease, the trade for 1924 again mounted to 4,260,623,000 yen.

Favourable Balance.—The most striking progress was made during the World War, when Japan's foreign trade leapt from 1,362 million yen (£139,000,000) in 1913 to 4,284 million yen (£438,000,000) in 1920; although it should be remarked that these figures do not correctly represent the proper rate of increase in the volume of trade, owing to the inflation of prices. In the very beginning the War reacted prejudicially upon foreign trade, as well as upon other branches of the country's commerce and industry, and the first appreciable effect of the War in increasing trade showed itself in the returns for 1915, when the adverse balance which had obtained for 20 years—with the exception of the years 1906 and 1909—was superseded by a favourable one. This favourable tendency was accelerated until the excess of exports over imports attained 371,000,000 yen (£38,000,000) in 1916 and 567,000,000 yen (£58,000,000) in 1917.

The sudden expansion of trade due to the War was occasioned both directly through the great demand by the Allied belligerents for munitions of war; and also indirectly through the temporary retirement of the great industrial Powers of Europe from the arena of world commerce and trade. Soon after the outbreak of the War Japanese goods—chiefly consisting of semi-manufactured and finished articles, such as cotton fabrics, leather goods, watches, silk tissues and so forth—found their way in large quantities not only to the established markets in the Far East, but also to various quarters of the world hitherto but little explored by Japanese traders, namely, the South Seas, South America and even Africa. The most conspicuous expansion, however, was effected in the exports to China and India, and, until the outbreak of the Russian revolution in 1917, large shipments of munitions of war and foodstuffs to Vladivostok for use in European Russia assisted to augment the volume of trade with Asia. The United States began to buy heavily in 1916, when the figures advanced from 204,000,000 yen (£20,900,000) in the preceding year to the substantial amount of 340,000,000 yen (£34,800,000) the goods purchased consisting mostly of raw silk, "habutai" (silk piece goods) cotton yarns, cotton fabrics and tea. British America and also Mexico increased their orders from Japan, and the South American trade showed such prospects as to induce Japanese companies to open shipping facilities to Brazil through the Straits of Magellan.

The import trade, which had been on the wane in the early days of the War, commenced to revive in 1916, owing to larger purchases of raw materials and semi-manufactured goods, such as raw cotton, iron, wool, crude caoutchouc, flax and jute. By far the largest volume of raw cotton came from British India, but the United States had doubled her exports of that article to Japan as well as of iron in a twelvemonth. Australia supplied Japan largely with wool.

An Adverse Balance.—The War was the cause of serious vicissitudes in 1917, and in a measure militated against the expanding trend of Japan's commerce. The entry of the United States of America into the War, with its attendant embargo on steel, iron and gold, temporarily disturbed the economic equipoise of the Far Eastern empire. The Russian revolution and the subsequent repudiation of all foreign liabilities by the Bolshevik commissaries introduced a fresh factor of discouragement in the export trade of Japan. The internal political feuds in China would also have dismayed Japanese exporters but for the tremendous appreciation in the price of silver, which resulted in maintaining an abundant demand for Japanese articles. But in spite of all, Japan's foreign trade made progress more or less on the lines previously indicated, until a complete change in the situation was brought about by the conclusion of the Armistice in the autumn of 1918. The demand for munitions of war naturally came to an end, but the rate of exchange on Europe continued at a high level. At home the cost of production had greatly increased owing to the advance in wages and the higher prices of industrial materials, while the enriched public demanded a higher proportion of the necessaries of life. An anti-Japanese boycott was proceeding in China to add to the curtailment of Japan's exports.

All these circumstances, reinforced by the Imperial ordinance of Nov. 1919 for the regulation of the price of commodities, temporarily exempting certain foodstuffs and industrial materials from import duties and restricting the exportation of cotton yarns, reversed the balance of foreign trade, which had been favourable to Japan for the preceding four years. This unfavourable tendency continued in succeeding years, showing an adverse balance of trade in 1920 as high as 387,780,170 yen. The Government had under consideration several suggestions as to the best method of bringing about an improvement in foreign trade, but, though no special steps were taken, there were prospects of improvement, owing to the certainty that the economic condition of the country was advancing little by little, and in view of the fact that the adverse balance of 1922 was only 252,856,414 yen—a decrease of 135,000,000 yen compared with the year 1920.

Unfortunately, however, the great earthquake of 1923 dissipated these anticipations, for, on the one hand, the export trade declined sharply owing to the burning of large stocks of raw silk, silk fabrics, etc., and the partial destruction of the productive capacity of cotton yarn, cotton fabrics and other articles usually so prominent among the exports; while, on the other hand, the volume of imports continued to increase, due to the abnormal increase in the demand for wool, woollen yarn, etc. Also, in order to facilitate the supply of goods after the earthquake, an Imperial ordinance was promulgated, providing for the suspension until March 31 1924 of import duties on rice, beef, etc., and for the suspension or reduction of import duties on certain other necessaries of life, tools, machinery and materials for construction and civil engineering, with the result that imports were stimulated.

Thus the excess of imports over exports in 1923 reached the huge amount of 534,479,850 yen. In 1924 the tendency became even more pronounced—the amount being 646,157,000 yen—and this in spite of the expiration of the ordinance just mentioned, and the introduction of a tax of 100% imposed from June 1924 on the value of certain luxury articles. The excess of imports was chiefly due to the purchase of materials necessary for reconstruction.

Foreign trade prospects in 1925, however, were considerably brighter, owing to the fact that fewer reconstruction materials were being imported, while the economic conditions of Japan were becoming normal again, and the "Buy Japanese goods" slogan was having effect. In the latter part of the year 1925 such an excess of exports over imports shown would counteract to a great extent the excess of imports over exports shown during the first six months of that year.

The following table gives the foreign trade of Japan for 1913-25, and the movement of coin and bullion:—

Foreign Trade (in 1,000 Yen)

	Merchandise		Gold and Silver Bullion and Specie	
	Exports	Imports	Exports	Imports
1913	632,460	729,432	27,093	1,021
1914	591,101	595,736	29,650	9,107
1915	708,307	532,450	44,566	24,297
1916	1,127,468	756,428	28,079	101,030
1917	1,603,005	1,035,811	153,736	392,225
1918	1,962,101	1,668,144	938	5,016
1919	2,098,873	2,173,460	5,054	327,477
1920	1,948,395	2,336,175	3,897	404,727
1921	1,252,838	1,614,155	..	138,622
1922	1,637,452	1,890,308	2,180	1,672
1923	1,447,751	1,982,231	5,466	196
1924	1,807,258	2,453,390	5	4,099
1925[1]	1,656,188	2,033,345	4,008	138

[1] Up to end of Sept.

Exchange.—The dollar rate, which dropped to $38.50 per 100 yen at the end of 1924, rose by the middle of April 1925 to $41.50, this being the highest figure during the first half of 1925. At the end of Nov. 1925 it stood at about $42.00. In the sterling exchange steady improvement was also perceptible, the rate having risen from 19¼d. in Jan. 1925 to 21⅛d. per yen in the middle of Nov. 1925.

Distribution of Foreign Trade.—The geographical distribution of Japan's remarkable expansion in foreign commerce according to continents is as follows:—

Exports by Continents (in 1,000 yen)

To	1913	1920	1923	1924
Asia	275,928	998,374	587,397	757,061
America	191,761	632,245	634,212	782,882
Europe	147,225	195,590	79,838	175,051
Australia	8,638	58,115	32,639	41,907
Africa	1,846	39,620	25,240	41,202

Imports by Continents (in 1,000 yen)

From	1913	1920	1923	1924
Asia	348,055	942,547	814,470	998,603
America	127,035	910,648	546,832	721,325
Europe	220,290	305,318	437,457	581,091
Australia	14,943	62,459	96,623	119,971
Africa	7,189	88,449	22,716	22,072

In receipt of exports from Japan the United States of America (41%) has always headed the list, the zenith of purchase being reached in 1919—828,097,621 yen; China (including Kwantung Province) follows with 23%; and then come British India (7%), France (5%), Hongkong (4%). The percentages refer to Japan's export trade in 1924. Notable, also, are the advances of Australia, the Philippine Islands, Germany, Italy, Peru, Belgium and others in the scale of demand for Japanese goods.

As regards imports into Japan, British India, which had been the chief supplier for several years precedent to the World War, yielded her place to the United States in 1916. The import trade of Japan in 1924 was shared by the United States of America (27%), China (17%), British India (16%), England (13%), Germany (6%), Australia (5%), Dutch Indies (4%), Canada (2%).

The following tables show the development of Japan's foreign trade in the more important commodities:—

Principal Exports (in 1,000 Yen)

	1914	1919	1924
Silk (raw, waste, floss)	161,797	623,618	706,220
Habutai	30,890	101,289	57,368
Silk tissues	34,022	162,476	125,842
Cotton yarn	78,554	114,232	109,537
Cotton tissues	34,840	280,311	326,750
Woollen tissues	1,198	11,124	2,401
Hosiery	..	..	22,024
Braids	14,355	20,014	9,170
Matches	11,052	32,968	9,212
Copper	28,467	25,889	2,366
Coal	23,914	37,723	22,396
Potteries	5,913	22,629	25,435
Paper	2,826	25,402	15,582
Aquatic products	13,416	16,191	24,786
Tea	12,709	18,402	12,781
Refined sugar	12,382	21,627	28,967

Principal Imports (in 1,000 Yen)

	1914	1919	1924
Raw cotton	218,974	667,866	605,271
Wool	14,783	61,304	88,041
Woollen and worsted yarns	4,140	668	63,510
Woollen tissues	10,225	12,301	61,648
Oil cake	34,864	135,188	103,674
Iron	36,319	227,797	196,398
Sulphate of ammonium	15,145	27,435	26,543
Coal	6,690	18,588	29,057
Timber	1,490	10,889	129,076
Paper	4,886	18,386	27,360
Machinery	24,494	89,221	128,345
Rice	24,823	162,070	70,804
Sugar	21,678	58,183	63,849
Wheat	8,488	38,530	73,839
Beans and peas	13,320	35,302	60,877

Communications

Railways.—The first railway line in Japan was opened to traffic in 1872, subsequent development of the railway being chiefly in the hands of private companies. In March 1906 the railway nationalisation law was passed, and in the next two years the Government gradually assumed control of some 17 leading railway companies. On the completion of nationalisation the Government possessed 4,371 m. of railway, representing a capital of 700,000,000 yen. By the end of 1917 the process of absorption was practically complete. In the decade 1913–23 the mileage of the state railway system increased fron 5,473 m. to 7,013 m., and in the same period the number of passengers carried increased from 167,773,143 to 512,754,754. A marked advance was seen in the financial year 1918–9 in the receipts, which amounted to 104,135,074 yen, while in 1922–3 the receipts were 199,877,464 yen. A railway tunnel between Moji and Shimonoseki, under the Shimonoseki Straits, has been projected and its construction is expected to be started in 1927. This tunnel, which will be completely under the sea for one mile, will connect the island of Kiushu with Honshu on the mainland.

Posts.—The postal service of Japan has developed steadily, both in extent and efficiency, since 1908. There are three grades of post-office, known as first, second and third class. The first class is confined to the larger cities, such as Tokyo and Osaka, and these offices not only act as supervising offices for those of lower category, but also control maritime affairs in their respective districts. The great majority of the post-offices belong to the third grade, and are conducted on a contract system, which has proved eminently satisfactory. The post-offices in Japan include in their operations such diverse matters as the carrying, within limits as to size and weight, of every kind of freight, the collection of taxes and bills, the distribution of advertisements, and the paying of pensions and annuities on behalf of the national Treasury. The post-offices also undertake the business of state life insurance by a simplified process for the benefit of the middle and working classes. The expansion of the postal services is shown in the following table:—

Postal Service

End of fiscal year	Number of post-offices	Number of messages	Number of parcels
1909–10	6,946	1,464,557,721	20,281,823
1911–2	7,166	1,634,423,611	23,178,936
1913–4	7,268	1,798,716,674	25,370,165
1915–6	7,358	1,888,002,293	26,128,093
1917–8	7,647	2,362,802,401	33,243,648
1919–20	7,900	3,359,758,218	41,308,098
1920–1	8,025	3,815,527,979	43,322,650
1921–2	8,230	4,001,817,560	48,936,915
1922–3	8,477	4,126,958,030	51,355,991

The post-office savings bank was first inaugurated in 1875, and the rate of interest was raised from 4·2% to 4·8% in April 1915. The number of depositors increased from 11,882,069 on March 31 1913 to 27,057,867 in 1922, the deposits having advanced in the same period from 191,122,853 yen to 994,976,098 yen.

Telegraphs.—Since 1879 Japan has belonged to the International Telegraph Convention, and in June 1908 she ratified her membership of the International Wireless Union. The expansion of her home telegraph service has been noteworthy. In 1910, with a total of 3,951 telegraph offices, 101,500 m. of wires were in use and 28,205,032 messages were sent; in 1923 there were 6,460 offices, 156,662 m. of wires in use, and 71,592,928 messages were transmitted.

Wireless.—Japan associated herself with the International Wireless Union in 1908. In addition to the main wireless station of Funabashi, erected in Nov. 1916, Japan has 11 other Government stations, with a daytime transmission distance varying between 300 and 600 nautical m., the night distance being between 1,000 and 1,800 nautical miles. Two of these stations, Choshi and Osezaki, have been reconstructed and have a daytime transmission power of 1,500 nautical m., with 3,000 m. at night. In the twelve months ended March 31 1914 there were 36,313 wireless messages, and 172,853 in 1922–3.

Telephones.—When first inaugurated in Dec. 1890 the telephone service failed to attract many subscribers, but its popularity gradually increased. The authorities started in 1909 a system of giving preference for an installation in consideration of a payment varying between 150 and 285 yen, according to locality, and this system, which has been very successful, still obtains. The maximum annual charge for the telephone service is 66 yen and the minimum 36 yen, according to locality, and at the end of the fiscal year 1922–3 there were 415,058 subscribers and 3,988 telephone offices, besides 1,538 fitted with automatic apparatus. In the same period the length of telephone lines was 14,526 m., the length of wires 1,197,861 m. and the number of messages in the year was 1,933,759,123.

See *Japan Year Book* (annual, Tokyo); reports of the American Bureau of Commerce and of the British Department of Overseas Trade. (K. M.)

JAPANESE LITERATURE (*see* 15.168). *The Taisho Era.*—The glory of Meiji was, alas, not to be sustained. Whether the mistake lay with the old giants of the Meiji era or in the insufficiency of their sons it is impossible at this close range to decide. In the later years of the Meiji period it became obvious that the spirit animating the intellectual and literary leaders was dying; some of the old magic still clung to the name of the dynasty, but nothing more. The new writers lacked the capability for sustained effort, their works were spasmodically produced, and were often completely without style. There was an unrestrained crudeness about the new literature which horrified those who still remembered the early Meiji period.

The change was almost complete when the young men began banding themselves together into various associations, such as the "New Romanisation Society" (Shin Romaji Kai), the "Foreign Language Research Society" (Gaikokugo Kenkyu Kai), the "Japanese Script Society" (Nipponji Kai), etc. These unofficial organisations achieved very little, except of positive harm. Americanisms, cant and slang terms, undistinguished from "standard English," were imported freely and incorporated into novels, belles lettres and even scientific treatises. The free-verse writers of England and America must be held responsible

for a peculiarly unpleasing form of composition which, while entirely foreign to the genius of the Japanese language, was adopted by the writers of this period in place of the *tanka* and *hokku* as the only possible style of poetic composition. The actual result of these liberal importations from foreign fields was the flood of ineffective and often vulgar books offered to foreign students as Japanese contemporary literature. While book-production was never so ample, it was never so uniformly devoid of merit.

The Meiji era translations of European classics and contemporary works, though marred by many faults of inexperience, are still to be preferred to later versions. Bacon, Shakespeare, Macauley, Milton, Byron, Shelley, Keats, Victor Hugo, de Maupassant, Dante, Heine, were all retranslated under this dynasty. The new translations are, however, far from being reliable. In many cases, whole sections of the original are left untranslated at the whim of the editor. Despite this, the character " zen " (complete) is found on the back of the book and on the title-page. This renders such versions useless for class-work or even for purposes of reference. In other cases, scenes which are purely national in the original work are recast, details being altered to suit Japanese surroundings. Thomas Hardy's novels suffer particularly in this unnatural transmutation: in one or two popular translations now in vogue Hardy becomes merely a mediocre Bakin leading some dull puppets over dreary Japanese marshes.

Russian Influence.—The outstanding literary feature of the Taishō era is the inundation of Japan by Russian works. Tolstoi ceased to be fashionable; Andreyev, Balmont, Sologub, Pushkin, Zinaida Hippius, Lermontov, Gogol, Tchekhov and Turgeniev held the imagination of youthful Japan during these years. Although no further impulse was needed, it was supplied by the signing of the Russo-Japanese Treaty early in 1925, when numerous societies for the encouragement of research into Russian literary and philosophic fields sprang into existence. Russian plays were hastily and imperfectly translated into Japanese (*The Cherry Orchard* was a noteworthy exception), and produced by Japanese actors at the Little Theatre in Tsukiji, Tokyo.

The modern native literature borrowed most of its colour and much of its form from Russia. Gogol, in his more dreary moods, was freely translated into novels of social life, and the sentimentality so characteristic of the true Japanese novelist becomes tinctured with a despair imported from the Siberian steppes. Arishima Takeo, an idol of the young reader in modern Japan, demonstrated this phase not only in his novels, but in his life and death. He was a married man, drawn by " misunderstandings " into an intrigue with a woman journalist (the " new woman " of his later novels). The truth of the affair was never revealed; in true dramatic fashion, Arishima and his paramour committed " *shinju* " (double suicide for love), in a house in an unfrequented country place. This happened in 1922, and it can be safely asserted that Arishima was more loved after his well-staged exit than he was during his lifetime. Obituary notices drew parallels between this successful writer and such dimly envisioned figures as Gogol and Andreyev. That the points of contact were more imaginary than real did not deter editors from flights of the wildest fancy as to the effect Arishima's death would have on Russia and the world generally.

The new-world treatment of women engaged the attention of writers of all classes, and political writers condemned the drastic changes proposed by the novelists. Women in Japan began to assert themselves, they emerged from the obscurity of feudalism into the open highway of competition with men. Journalism, government departments, politics, municipal undertakings, social work, all claimed the attention of intelligent women. Foremost, perhaps, not only of modern woman-novelists but of all since the days of Murasaki Shikibu is Mrs. Yayoi Nogami, wife of Nogami Toyoichiro, the greatest living Japanese authority on the classical drama (Nō), and translator of Bernard Shaw. A later novel of hers, *Kaishin Maru* (The Sea-god Ship), is justly esteemed above all contemporary works.

Notable Writers.—No account of modern Japanese literature would be complete without reference to certain writers who, in spite of their lack of real merit, have captured and held the popular imagination. Natsume Sōseki is chiefly remembered for his *Wagahai wa Neko de Aru* (I am a Cat) and *Botchan* (The Boy). He died before the full force of change induced by indiscriminate importation had been felt, and his work was modelled rather on the later Meiji style. " *The Two Kikuchi*," as they were familiarly called (Kikuchi Kan and Kikuchi Yuhō), devoted themselves to the writing of novels in which women's problems are discussed and advanced views of social life are set forth. Kume Masao, Satomi Ton and Akutagawa Ryunosuke, also, in some measure gratified the current passion for original styles and exotic scenes. Kurata Hyakuso is regarded as the leading spirit of modern Japanese drama; one of his plays, *The Priest and his Disciples*, has been translated into English and published with the original text by Glenn Shaw (Tokyo, 1923). The sex-novel of Europe has its imitations in works by Tanizaki Junichirō and Morita Sōhei. Tanizaki writes very colloquially on the subject of hysterical women, psychoanalytic studies in the West providing him with unlimited material. Morita Sohei was once considered a very brilliant writer, his *Baien* (Sooty Smoke) being an exceptional success. It is an autobiography or diary of the new woman, and, from the Japanese point of view, Morita has solved the problem of woman definitely and finally. At the time of the issue of *Baien*, Morita's style became settled and followed closely the best traditions of mid-Meiji; this no doubt accounted later for his lack of popularity. He afterwards turned his attention to translations of Ibsen's plays, but his " originals " were English versions, and it readily appears from the Japanese that Morita frequently failed to understand the text he was translating. Ibsen's *Doll's House* (Morita's Japanese translation) was performed at the Imperial Theatre in Tokyo in 1923.

Matsuura Hajime was the only literary man of this period who remained true to the best traditions of his country's literary history. Unaffected by the many new movements for the development of art, letters and the drama, he is the foremost poet and essayist of modern Japan. In 1925 he resigned his professorship at the Imperial University in Tōkyō, " as a protest against the insincerity and shallowness of modern academicians, artists and writers, who would profane the shrine of pure art by setting up base images of foreign clay." He published two volumes of his university lectures on literature among his other writings, and it is probable that his works will be ranged alongside the best productions of the Meiji era by the literary historian of the future. In his *Bungaku no Byakkō* (The Pure White Light of Literature) Matsuura displays a sensitiveness and purity of ideal which had been lost to Japan since the close of the Nara period.

The constitutional ban on revolutionary and socialist doctrines resulted in the issue of a complete Marxian library and a series of handbooks purporting to be short cuts to Bolshevism. Imperfectly conceived dogmas were presented in attractive guise as the European panaceas: for all Japan's troubles there exists a very simple melting-pot, and this is a weird communism in which the state should be a machine very far removed from the activities of daily life. " Freedom " became the slogan of Young Japan, but the " freedom " publications are very pale shadows of their European parents, and even omit to define the freedom to which they relate. (A. N. J. W.)

JAQUES-DALCROZE, ÉMILE (1865–), Swiss composer and teacher of musical eurhythmics, was born at Vienna July 6 1865, of French-Swiss parents. He went to Geneva in 1875 where he attended the college and the university, and followed the courses at the Conservatoire. He then studied (1887) at the Conservatoires of Vienna and Paris and completed his musical education under Délibes. In 1886 he accepted the post of *chef d'orchestre* at Algiers. He then returned to Vienna and studied composition under R. Fuchs and A. Bruckner. After the death of Hugo de Senger, he directed the sol-fa and harmony courses at the Conservatoire of Geneva (1891). He has written

many charming songs, including *Chansons populaires*, *Chansons du coeur qui vole*, *Chansons de route*, etc. These are written in the simple form of the folk song and have obtained great popularity, not only in Switzerland, but in other countries. His other musical compositions are very numerous, and include three string quartettes, two violin concertos and several orchestral suites; also symphonies and choral works on a large scale such as *La Veillée* (1893) and *Le Festival Vaudois* (1003).

Among his other descriptive compositions may be mentioned: *Le violon maudit* (1893), *Janie* (1803), *Sancho Panza* (1897), *Le poème alpestre* (1896), *Le bonhomme jadis* (1905), *Les jumeaux de Bergamo* (1008), *Echo et Narcisse* (1912), *La fête de Juin* (1914), *Les premiers souvenirs* (1018), *La fête de la jeunesse* (1923), etc. His great work has been the development of the eurhythmic instinct, particularly in children, and since 1015 he has been the director at Geneva of the *Institut Jaques-Dalcroze*, which he originally founded at Hellerau in Bavaria. His method consists of a development of the instinct for rhythm in close conjunction with the sense of hearing and the instinct for tone, and is based on defined relations between bodily movements and the movements of sound. Special schools, based on the Dalcroze Method have been founded in London, Paris and elsewhere. The system may be studied in the following works by É. Jaques-Dalcroze: *Rhythmic Movements* (1920); *Rhythm, Music and Education* (1921); *The Importance of being Rhythmic* (1925); and *The Eurhythmics of Jaques-Dalcroze*, by various authors (1912). (*See* EURHYTHMICS.)

JASPAR, HENRI (1870–), Belgian politician, was born at Schaerbeek, Brussels, July 28 1870. While Minister of Economic Affairs in Nov. 1918, he organised the reconstruction of Belgian industries; becoming deputy for Liége in 1919. In 1920, having been appointed Minister of the Interior and afterwards Minister for Foreign Affairs, he endeavoured, during the Inter-Allied Conference in which he took part, to strengthen the entente between England, France and Belgium, and to secure reparations and security for his own country. In 1922 he negotiated a pact of security and guarantee with England; this, however, owing to the defeat of the French Govt., failed to come into operation. Belgium's entry into the League of Nations was due to the efforts of M. Jaspar, as also was her representation on the Permanent Court of International Justice at The Hague. In July 1921 he concluded an economic agreement between Belgium and Luxembourg and other commercial treaties. He took part in the Dawes Plan negotiations in 1924, but resigned as Minister for Foreign Affairs on March 11 on the rejection by the Chamber of the Franco-Belgian Convention. In May 1926 took office as prime minister and minister of the interior. (*See* BELGIUM.)

JASTROW, MORRIS (1861–1921), American Orientalist, was born in Warsaw, Poland, Aug. 13 1861, but went to Philadelphia at the age of five. Educated at the schools of that city and in the University of Pennsylvania, he studied subsequently at the Universities of Leipzig, Breslau, Paris and Strasbourg, returning in 1885 to the University of Pennsylvania as professor of Semitic languages and librarian. He died June 22 1921 at Jenkintown, Pa. He published numerous works on the religions and civilisation of Babylonia and Assyria, and, in connection with the World War: *The War and the Baghdad Railway* (1917); *The War and the Coming Peace* (1918); *A Gentle Cynic* (1919); *Zionism and the Future of Palestine* (1919).

JAURÈS, AUGUSTE MARIE JOSEPH JEAN (1859–1914), French socialist leader, was born at Castres, Tarn, Sept. 3 1859, of an old but not very prosperous local family. His ancestors on his father's side included two admirals, of whom one was ambassador to Spain and to Russia, and Minister of Marine. His mother's family included distinguished professors, of whom one was for a long time mayor of Castres. Jean Jaurès was of pure bourgeois stock. His father, a man of exceptional physique and of a lively intelligence, carried on at Castres various commercial activities, but without much method or practical sense. His mother exercised a real influence over her sons, and Jean had always a deep reverence for her. Her prudent intelligence and her good sense made her the true soul of the family and the educator of her children. A strictly orthodox Catholic, but without fanaticism, she inspired in her sons a respect for all sincere beliefs and opinions.

Jaurès began his studies at a private school; then, with his older brother, who became an admiral, he entered, thanks to a scholarship, in Oct. 1868, the college at Castres. He was a pupil of exemplary conduct and remarkable intelligence, devoted to his work, "le premier en tout." Mingling little in the rough games of his comrades, he possessed already that depth of serious gravity which he preserved all his life under the cloak of his natural liveliness and unfailing good humour. This "rare combination of high intellectual qualities" obtained for him a scholarship at the Collège Sainte Barbe at Paris, where he went in 1876. He was enabled thus to pursue his studies for two years at the Lycée Louis le Grand and to prepare himself for the entrance examinations of the École Normale Supéricure, to which he was admitted in 1878 with the first place. His career there was the most brilliant possible, and his fellow students, among them being Henri Bergson, predicted for him a great political future.

After having passed the "concours d'agrégation" Jaurès was elected, in 1881, professor of philosophy at the Lycée d'Albi. In 1883 he became lecturer in the University of Toulouse. But he had already set his mind upon a parliamentary career, although his mother did her best to dissuade him. At the legislative elections of Oct. 4 1885 he stood for the department of the Tarn and was elected deputy, heading the list with 48,000 votes. He was 26 years old. During the first two years of his term, he took little part in debates. His poetic and burning eloquence embarrassed parliamentarians accustomed to the so-called "britannique" eloquence of Clemenceau, Waldeck-Rousseau, Ribot, Pelletan, Freycinet and others. His maiden speech was delivered Oct. 21 1886 on a question relating to primary education. In 1887 he spoke three times; but the following year, more self-confident and more familiar with the peculiar atmosphere of the Chamber, he made numerous speeches, some of them very important, on the most diverse subjects, which he approached each time with an amazing competence and a constantly growing sense of authority. On every question with which he dealt, he adopted a courageous attitude which showed him incapable of sacrificing his principles to parliamentary compromise or to motives of self-interest. Without allying himself to any party, he devoted himself passionately to the public good and to the general welfare; but at the close of the session the meagre results of his efforts discouraged him so much that he decided to abandon politics, and asked to be reinstated in his post of professor at the University of Toulouse.

However, upon the insistence of his friends, Jaurès consented to stand for Parliament once more. Before dissolution, the Chamber had substituted the "scrutin d'arrondissement" for the "scrutin de liste" and Jaurès presented himself in the first district of Castres, which had long been in the hands of the reactionary parties. But on Sept. 22, at the first poll, he found himself in a minority of 856 votes though he himself had obtained almost 9,000.

In Nov. Jaurès resumed the professor's chair. His lectures were now thronged with students, workmen, middle class folk, other professors, men of science, men of learning. During this period he wrote his theses for the doctorate. His French thesis was entitled *De la realité du monde sensible*. In his Latin thesis he traced the origins of German socialism *De primis socialismi germanici lineamentis apud Lutherum, Kant, Fichte et Hegel*. About this time an ardent religious revival had stirred the imagination of many liberal minds. The questions thus raised were discussed by Jaurès in his lectures; but his robust and healthy rationalism resisted the tendencies of the day, just as later he opposed the vogue of pragmatism. An admirer of Renan, he would not admit dilettantism in matters of religion and the "subjectivism of faith" never had any attractions for him.

In the midst of the formidable labours which his personal work and the preparation of his lectures involved, Jaurès found time to comment regularly on topics of the moment in the impor-

tant local organ *La Dépêche*. There his ideas on politics and economics were seen to turn more and more towards Socialism, to which, at the close of 1890, he at last publicly announced his adhesion. At the same time, public life claimed him again. On July 27 1890 at a local election, he was chosen municipal councillor of Toulouse, and his colleagues appointed him forthwith deputy mayor, in special charge of public education. He took thus an important part in elevating the school of medicine into a faculty. After the strike at Carmaux, in the course of which he defended the claims of the miners, Jaurès was elected deputy, in 1893, at a local election, and his term of office was renewed at the general elections of 1894. Defeated again in 1898, he was re-elected in 1902; and his electorate remained faithful to him from that time on.

In Parliament, as soon as he returned, he assumed a position of great authority in politics. He took a large part in the debates on the Panama and Boulangist crises, in discussions of agrarian and colonial questions, on fiscal policy and protectionist measures, on syndicalism and the separation of Church and State, on military laws and electoral reform. In the Dreyfus affair his energetic intervention captured the Socialist party, which hesitated at first to take part in a conflict which seemed not to concern the proletariat. He carried on a formidable campaign in favour of the condemned and innocent man, a "living witness to military lies, to political cowardice, to the crimes of authority," nor did he cease until Dreyfus was definitely rehabilitated. His speeches and his articles on this affair are collected in one volume called *Les Preuves*, a masterpiece of analysis and eloquent logic.

Led by the logical development of his metaphysical and religious ideas to social conceptions which obliged him to accept the Socialist teaching, Jaurès adhered closely to the Socialist party, which at each new election gained a larger number of representatives in Parliament. But he realised at once that the fragmentation of Socialists into groups and sects would be a source of political weakness and an obstacle to the ideals of social justice and the liberation of humanity which he wished to attain. For him the "sublime joy of leading all men towards the fullness of humanity," lay in the effort to achieve these ideals. The socialism of Jaurès differs essentially from the Marxian doctrine, the principle of which is pseudo-scientific. "Our socialism," writes Jaurès, "is French in origin, French in inspiration, and French in character." His ultimate aim was harmony founded on justice. Social harmony implies the disappearance of an injustice which provokes conflicts, hatreds and their horrible consequences, an injustice originating in capitalist ownership. Jaurès was a socialist because "the domination of one class is an outrage against humanity." Into this doctrine he breathed his own glowing and generous ideas and, at the same time, drew from it the strength with which he animated it. "No serious social programme can be realised without a definite social doctrine," he wrote, and for him the whole socialist ideal must inspire organic reformatory action and thus establish a socialism, democratic, republican and lay.

All socialist sects have the same social ideal, but their differences in tactics and methods paralyse common action. Jaurès strove to bring about unification. At the Congress of 1901, a section of groups rallied to him under the name of the *parti socialiste français*, while the others formed the *parti socialiste de France*. After the Amsterdam Congress in 1905, the two groups coalesced and Jaurès became, in fact, their moral and intellectual chief. Thereafter his political activity was bound up with that of the unified Socialist party, whose parliamentary activity he directed with great skill. He drafted most of the resolutions at Socialist congresses and defended them in an admirably conciliatory spirit.

His philosophy of history, unlike that of Marx, did not hold that the development of human society is subject to a blind determinism; he postulated for it an intelligent directing force and an ideal wisdom. "History," he wrote, "although a phenomenon which develops according to mechanical laws, is nevertheless an aspiration to realise itself according to an ideal law. . . . The universe is but an immense, a vague, aspiration towards order, beauty, liberty." To conform to this aspiration, Socialism, according to Jaurès, should seek reform to bring about a less contradictory social order, whose institutions would be less exclusive, less bitterly egotistic, less mischievous, which would cease to perpetuate strife, hatred and want; which would permit men to pass from a state of brutal competition and conflict to the state of co-operation; which would transform the economic passivity of the masses into initiative and responsibility, in which social energies, instead of being wasted on sterile and insane conflicts, would be co-ordinated for common action. To uphold these convictions, Jaurès, after the Amsterdam Congress in 1905, struggled alone against the entire International for a share of power and for the preservation of the democratic-socialist *bloc*. He violently attacked and denounced as impotent the German Social Democracy which dominated the Congress and was supported by the old French Socialist organisations. On April 17 1904 Jean Jaurès, with Aristide Briand, founded *l'Humanité*, which has become the daily organ of the Socialist party. His daily leading article in it was written for the most part from his seat in the Chamber.

Jaurès early discerned the danger which threatened the world. He foresaw that the unstable equilibrium of the Triple Alliance and the Triple Entente was bound to end in a catastrophe, and he wished to avert it by the simultaneous international action of the proletariat. A passionate lover of France, he sought to spare his country the horrors of devastation by war. While he maintained that a democracy should not have an aggressive policy, he did not deny the duty of every nation to defend itself. To prevent misunderstanding between socialism and patriotism he wrote: "A nation which could not count, in days of crisis or when its life is in danger, upon the national devotion of the working class, would be a wretched thing indeed." He supported the policy of arbitration and all measures to secure international peace, but at the same time, in the name of the workers of France, he insisted "that the nation organise all its military forces, irrespective of class or caste, for the sole purpose of national defence." Against Germany, militarist and absolutist, stood France, a nation in arms, practising "a policy of supreme national defence which would lead not only to peace but to the assurance of peace." Jaurès expounded and developed his ideas on the organisation of "a nation in arms" in his book, *L'armée nouvelle*.

The policy of world-wide solidarity which Jaurès proclaimed was of no avail against the blind forces which precipitated the War, but Jaurès continued to strive for peace. On July 28 1914, before the outbreak of war, he, and some of his most eminent Socialist colleagues, went to Brussels to confer, in the name of the French Socialist party, with representatives of international labour on the best means of averting the threat of war, which he still thought could be avoided. But he was none the less full of anguish over the fate of France, compelled to defend herself against aggression. On this subject, he certainly felt no hesitation, for he had always been animated by the purest patriotism.

"Il y a un groupement historique qui s'appelle la France, qui a été constitué par des siècles de souffrances communes, d'espérances communes; les lentes formations monarchiques en ont peu à peu juxtaposé et soudé les morceaux, et les ardentes épreuves de la Révolution l'ont fondu en un seul métal. C'est la patrie française . . . Oui, il y a des luttes, des antagonismes profonds de classe. Mais quels que soient ces luttes politiques, ces divisions économiques, ces antagonismes sociaux, ils ne peuvent pas porter atteinte à l'idée même de la patrie. . . . Si notre patrie est menacée . . . nous serions des premiers à la frontière pour défendre la France dont le sang coule dans nos veines, et dont le fier génie est ce qu'il y a de meilleur en nous."

These noble words leave no doubt as to the attitude which Jaurès would have taken, or of the rôle which he would have played in the "holy war for our beloved France if ever she were attacked." But on the very eve of mobilisation, in Paris, on July 31 1914, at 9:40, Jaurès succumbed to the bullets of an assassin—a wretched half-wit, impelled to this stupid crime by the calumnies of the adversaries of the great tribune. His obsequies were celebrated on Aug. 4 in the midst of an immense

popular gathering, and his body was interred at Albi. In 1925 his mortal remains were brought back to Paris, and, borne on the shoulders of his faithful miners of Carmaux, deposited in the Panthéon. (Ed. He.)

JEBAVÝ, VÁCLAV (1868–), Czech poet universally known as Otakar Březina, was born at Počátky, Bohemia, Sept. 13 1868. After an education in science he became a secondary school teacher in Southern Moravia, where he lived a life of contemplative seclusion, declining the honours and material advantages offered him by the Government. His published works consist of five books of poetry: *Secret Distances* (1895); *Dawn in the West* (1896); *Polar Winds* (1897); *Temple Builders* (1899) and *The Hands* (1901), and a volume of prose essays, *Music of the Springs* (1903); besides a number of poems scattered in various literary papers.

Březina is admittedly the greatest modern Czech poet, and is even judged by some foreign critics to be the greatest mystic poet of all nations. His development as a mystic philosopher and religious visionary passed from the subjective pessimism of his early poems, through a transcendental revelation of mystic realities, to an evolutionary optimism and a joyful belief in cosmic brotherhood. His art manifests an analogous development from an intimate lyrical impressionism through ecstatic incantations of a high-priest and a seer to an impersonal, super-personal, dythyrambic poetry of the elements, suns and stars, and of human effort, suffering and mystic destiny. His diction is so concentrated and pregnant with thought that it presents considerable difficulty at first reading; but this is more than compensated for by the superlative beauty and entrancing music of his verse, the remarkable wealth of his imagery and the extraordinarily human and personal appeal of his philosophy which has its roots in the mystic tradition of the medieval Czech religious sects. He brought Czech poetical language to a stage of perfection which it had never before attained and which is difficult to surpass.

See Paul Selver, *Anthology of Modern Slavonic Literature* (1919); *Modern Czech Poetry* (1920), and *A Study in Czech Literature* (1921). (J. Cl.)

JELLICOE, JOHN RUSHWORTH JELLICOE, 1st Earl (1859–), British Admiral, was born Dec. 5 1859, the son of J. H. Jellicoe, a captain in the mercantile marine. His great-grandfather was Sir James Whalley Smyth Gardiner, the third and last baronet of that name. Educated at Rottingdean, he entered the navy as a Naval Cadet at the age of thirteen. He obtained his commission as sub-lieutenant in 1880, and his hard work and marked ability won him three first class certificates in his three examinations for the rank of lieutenant. He soon developed a strong interest in gunnery and joined the Royal Naval College in 1883 for the theoretical part of the course for gunnery lieutenant, where he distinguished himself by winning a special £80 prize. The following year he spent in H.M.S. "Excellent," and became a fully qualified gunnery officer. From now onwards gunnery was his speciality, though his interests were by no means confined to this branch.

His first sea-going ship as a gunnery lieutenant was H.M.S. "Monarch," in which he served from 1886 to 1888. During his first year on board he went to the rescue of the crew of a stranded steamer, taking charge of a gig, manned by volunteers. The boat upset in a heavy sea and he and the crew saved themselves with difficulty. He received the Board of Trade silver medal for his plucky effort. After two years on the senior staff of the Gunnery School, he was appointed to the Admiralty as an assistant to the director of naval ordnance. In 1893 he was promoted to commander, and shortly afterwards was appointed to H.M.S. "Victoria," flagship of Admiral Sir George Tryon, commander-in-chief of the Mediterranean Fleet. When the "Victoria" was rammed and sunk by the "Camperdown," Commander Jellicoe had to take to the water. As he was seriously ill at the time he would have fared badly but for the support he received from a young naval cadet, Mr. P. D. Roberts-West, until rescued.

Commander Jellicoe soon recovered and two months later was appointed to the battleship "Ramillies" which flew the flag of the new commander-in-chief, Admiral Sir Michael Culme-Seymour. After a three years commission in that ship he was promoted to captain on Jan. 1 1897, and served on the Ordnance Committee. In 1898 he was appointed to the command of H.M.S. "Centurion," where he became flag captain to Admiral Sir Edward Seymour, commander-in-chief of the China Station. As the latter's chief of staff he took part in the expedition to relieve the legations in Peking during the Boxer rising in 1900. During these operations Captain Jellicoe was badly wounded. He was subsequently awarded the C.B. for these services.

Service at the Admiralty.—He returned to the Admiralty in 1902 to be the naval assistant to the controller (Third Sea Lord). Here he acquired an insight of the work of that department which was to be of great value to him later. In Aug. 1903 he went to sea again to take command of the fine armoured cruiser "Drake" for a year. The year 1905 saw him in the responsible post of director of naval ordnance at the Admiralty. During his period of office he did much to further the advance of long range firing and to assist the development of naval gunnery on lines which more closely approximated to the real conditions of war. Towards the end of his time he reached the top of the captains' list and was promoted to flag rank in Feb. 1907. In Aug. of that year he hoisted his flag afloat in H.M.S. "Albemarle" as rear-admiral in the Atlantic Fleet. The appointment was for a year's duration only, when once more he returned to the Admiralty, this time to become a member of the Board as Third Sea Lord and Controller of the Navy. In Dec. 1910 he was appointed acting vice-admiral in command of the Atlantic Fleet, being confirmed in that rank in the following November. At the end of the year he transferred his flag to H.M.S. "Hercules," on appointment to the command of the 2nd Division of the Home Fleet.

In 1912 important gunnery experiments were carried out by two battleships of this division, the "Thunderer" and "Orion," the former being fitted with this system of director firing which Sir Percy Scott had been perfecting. The trials culminated in competitive firings which took place under Admiral Jellicoe's personal supervision. It was as a result of these practices and largely due to Admiral Jellicoe's insistent pressure that this most valuable system was adopted as the primary one for laying and firing the guns of practically all classes of H.M. ships. The event may be regarded as yet another milestone on the path of that gunnery progress for which he was greatly responsible. After a year in this command he returned to the Admiralty to rejoin the Board as Second Sea Lord.

The War Period.—He left Whitehall temporarily in 1913 to become commander-in-chief of the "Red" fleet during manoeuvres, flying his flag in H.M.S. "Thunderer," but had returned to the Admiralty, when, on the eve of War, he was sent to join the Home Fleet at Scapa as second in command. The period of command of Admiral Sir George Callaghan was due to expire in a few months and Vice-Admiral Jellicoe had already been designated as his successor. When war could no longer be averted, it was considered desirable that the change in this most responsible naval command should not be delayed and Sir John Jellicoe was appointed commander-in-chief with acting rank of admiral. He had to perform a peculiarly difficult and trying duty in relieving his former chief, who was trusted and respected in an unusual degree throughout the fleet. That he achieved it so successfully was due to the chivalrous attitude of these two flag officers towards each other and to the very high reputation and strong personal regard which Sir John himself enjoyed.

Admiral Jellicoe was confirmed in his rank in March 1915, and for two years bore the exceptionally heavy burden of organising and training the Grand Fleet and keeping it ready for battle. His great command was put to the test at the battle of Jutland. Now that the full details of that action are better understood, the skilful handling of the British forces against an elusive enemy in conditions of low visibility and approaching darkness, is being increasingly appreciated. The German fleet escaped at night and took refuge in harbour with many ships severely damaged, and such was the impression left by Jutland that Germany

never again risked a meeting with the Grand Fleet. The fruits of Admiral Jellicoe's leadership on that day and of his incomparable services throughout his period of command were seen in the historic surrender of German ships at the end of the War.

In the latter part of 1916 Admiral Jellicoe was invited to become First Sea Lord and regretfully left his last and greatest command afloat to take up that appointment. It was largely due to his tireless labours and wide experience that the grave danger of the German submarine menace was eventually overcome, although others reaped where he had sown. He left the Admiralty at the end of 1917. After the Armistice he was sent on a special mission to visit the Dominions and advise on the post-War organisation of their navies. On this tour he flew his flag in H.M.S. "New Zealand." He was promoted to Admiral of the Fleet in 1919 and the following year was made Governor of New Zealand. During his four years in this high office he greatly endeared himself to the people of that Dominion.

For his services in the War Admiral Jellicoe received the thanks of Parliament and a grant of £50,000, and at the end of 1918 he was raised to the peerage as Viscount Jellicoe of Scapa, subsequently taking the additional title of Viscount Brocas of Southampton. On his return from New Zealand and in recognition of his services as governor he was, in 1925, created an Earl. He received the K.C.V.O. in 1907, G.C.B. in 1915 and G.C.V.O. in 1916; he also holds a number of foreign orders. He married, in 1902, the daughter of Sir Charles Cayzer, Bart., and has four daughters and a son and heir, Viscount Brocas, who was born in 1918. Earl Jellicoe possesses in remarkable degree the power of inspiring others with his own loyalty and singleness of purpose. Few naval commanders since Nelson's time have enjoyed such devotion and confidence as he did as commander-in-chief of the greatest fleet that ever set forth to do battle. (E. A.*)

JELLINEK, GEORGE (1851–1911), Hungarian jurist (*see* 15.315), died at Heidelberg, Jan. 12 1911.

JENA, UNIVERSITY OF (*see* 15.315).—In 1910 the number of students was 1,946 and in 1925 it had risen to 2,153, when it had 271 foreign students, of whom 69 came from Latvia and 49 from Russia. The faculty of medicine is specially attractive to foreign students. The university library possesses 325,000 volumes and a large collection of pamphlets.

JENSEN, JOHANNES VILHELM (1873–), Danish author, was born at Farsö, North Jutland, Jan. 20 1873, of a family of peasant extraction. He studied at the University of Copenhagen and afterwards travelled extensively, writing a number of novels, sketches, essays and letters of travel and some volumes of poetry. Jensen belongs to the new school of Danish literature which came into being about 1900. Influenced by Whitman, Kipling and H. C. Andersen, he repudiated the Brandes school with its imitation of French literature and wrote of nature and outdoor life. Among his novels may be mentioned: *Kongens Fald* (1899–1902), a historical novel of the 16th Century; *Madame d'Ora* (1904); and *Den lange Rejse* (1908–21) describing the evolution of the Northern race from the glacial epoch to the time of Columbus. In *Himmerlandshistorier* (1898–1910); *Skovene* (1904); *Eksotiske Noveller* (1907–15) and *Myter oś Jagter* (1007–24) he described life and scenery in his native country and abroad with brilliant imaginative talent and mastery of language. Jensen, who became a firm believer in evolution, adopted in later years a purely atheistic and biological view of life. See Otto Gelsted, *Johannes V. Jensen* (1913).

JENSEN, WILHELM (1837–1911), German author (*see* 15.321), died near Munich Nov. 24 1911. His last work was *Fremdlinge unter den Menschen* (1911). See W. Barchfeld, *Wilhelm Jensen als Lyriker* (1913).

JERSEY CITY, N.J., U.S.A. (*see* 15.331), produced 5,000 different kinds of articles in its 1,325 industrial plants in 1925. Because of the diversity of its industries and the staple character of their products, Jersey City was less affected by the War than some manufacturing cities, and suffered less in the succeeding depression. The aggregate value of manufactures rose from $125,775,000 in 1909 to $374,183,000 in 1919; and then, after falling to $289,796,274 in 1921, rose again to $313,000,142 in 1923. The average number of wage earners in factories for the same years was 25,454; 36,981; 30,026; 33,264.

The most important new industry is the manufacture of radio apparatus and supplies, for which several plants were established in 1924 and 1925. The population in 1910 was 267,779; in 1920, 298,103, including 8,000 negroes and 76,294 foreign-born (a slight decrease), of whom 14,855 were Italians, 12,451 Irish, 12,145 Poles and 11,113 Germans. In 1925 the official estimate was 315,280. A development plan, prepared about 1920, provides, among other engineering improvements, for the construction of a bulkhead across a part of Newark Bay, by which one square mile of territory suitable for industrial sites will be added to the area of the city. By improvements in the fire department, the city secured a rating in class A for fire insurance. Boyle's Thirty Acres, widely advertised as the largest arena in the world, was opened in 1921. The opening of the Hudson Tubes (1909) gave some impetus to building in the residence section on "the hill," which was thereby brought within eight min. of the financial district of New York. The completion of the double-tube vehicular tunnel in 1926 makes the connection still closer. The commission form of government was adopted in 1913.

JERUSALEM, Palestine (*see* 15.331), is now the seat of the Government of Palestine under the mandate given to Great Britain in July 1922 and the chief town of its province. A large hospice outside the Jaffa Gate, which was built and endowed by the German Empress in 1910, is used as Government House. The population in 1922 was 62,678, of whom 33,971 were Jews. An Armenian Patriarch was elected in 1921 with the formal approval of King George, and the position of the Orthodox Patriarch of Jerusalem has been confirmed by a commission appointed by the British administration.

On Dec. 9 1917 Gen. Allenby made an unostentatious entry into Jerusalem. Military administration was carried on until 1920, when a civil administration with an advisory council was set up. Since 1917 much good work has been done in the city, which under the Turkish régime was squalid and filthy. The streets are scavenged and thoroughly cleaned, and work has been begun on a drainage system. The old and inadequate water supply from Solomon's Pools has been replaced. The ancient aqueduct leading from the springs of Birket-el-'Arub, 14 m. distant, to Solomon's Pools has been cleared, and is used in part to lead the water to a large reservoir, whence it is distributed by gravity to Jerusalem. There is a second reservoir at Lifta, giving a total supply of 150,000 gal. daily. Since the completion of the installation the amount of water used in Jerusalem has increased tenfold. A town plan and civic survey have been made and several garden villages in the neighbourhood designed. The houses have been numbered and the streets named; some roads have been widened, and in 1924 King George V. avenue was opened. Laws have been promulgated against large shop signs and advertisement boardings, a chamber of commerce has been formed and a telephone system installed.

Roads fit for motor traffic all the year round have been made to Jaffa, Jericho, Hebron and Damascus. There is, however, no longer through railway connection with Cairo, as the swing bridge over the Suez Canal at El-Qantara was removed in 1920 at the instance of the Suez Canal Co., and the canal has to be crossed by ferry. The Government department of antiquities, founded soon after the establishment of the British administration, has the archaeological schools of the different nations under its control, with the assistance of an advisory board of representatives from the schools. Previously all antiquities found their way to Constantinople, but over 6,000 specimens have now been catalogued as a nucleus of a Palestine museum at Jerusalem. Excavating is only permitted to recognised scientific bodies.

Much good work nas recently been done by the Palestine Exploration Society. The citadel has been cleared of débris and modern accretions, as also the Cotton Bazaar; the ornate clock tower on the Jaffa Gate has been removed and re-erected, shorn of its trimmings, in Allenby square, and the walk on the ramparts in part reinstated. Important excavations on Mount

Ophel have also been recently carried out by the society, following earlier efforts on the site in 1909–11 and 1913–4. Remains have been found of the north wall and tower of the Jebusite fortress, which was conquered by King David and formed the site of his city; and it is hoped to discover his tomb. In 1920 the ruins of a 4th-century church of much interest were discovered by Franciscan friars in the course of digging foundations for a church in the Garden of Gethsemane, and its excavation was completed by the Dept. of Antiquities. In 1921 the ancient school of St. Etienne, founded by French Dominicans, became the headquarters of the French Archaeological Society. The foundation stone of a Hebrew university was laid in 1918 on Mount Scopus, but until 1924 there was no teaching organisation. An institute of Jewish studies was started in that year, and in April 1925 the university was formally opened by Lord Balfour. The foundation stone of an institute of physics and mathematics was laid the day after the opening of the university.

JERUSALEM, UNIVERSITY OF.—The idea of creating a university in Jerusalem was first put forward in 1882 by Dr. Schapira, *Privatdozent* in mathematics in Heidelberg. After preliminary steps it was approved by the 11th Zionist Congress in 1913, and a committee of the congress purchased a site on Mt. Scopus (near the Mount of Olives) in 1914, the foundation stone was laid in 1918 by Dr. C. Weizmann, the president of the Zionist organisation, and the university was formally opened by Earl Balfour on April 1 1925. The object of the university was twofold; to carry out research in all departments, and teaching especially in the departments of Jewish and Oriental Studies, for which the university should be a world-centre. Departments of chemistry including physical chemistry, microbiology and Jewish studies are in existence, and there is an important agricultural research institute at Tel-Avio in connection with the university. The library already contains over 120,000 volumes and the estimated recurring expenditure for 1926 is £45,000. The scientific research is especially directed with a view to the material development of Palestine. See *The New Palestine* (New York) for March 27 1925.

JESPERSEN, JENS OTTO HARRY (1860–), Danish philologist, was born at Randers, Denmark, July 16 1860. He graduated in modern languages at the University of Copenhagen in 1884 and gained his doctor's degree in 1891 by a thesis on English laws. In 1893 he was appointed professor at the University of Copenhagen. From 1909–10 he lectured at Columbia University, New York. He produced a number of books on English grammar, the history of language, general phonetics and the philosophy of language, many of which were written in English. A practical philologist, Jespersen's view of the development of language was influenced by Herbert Spencer and Wilhelm Ostwald. His most important works are *Progress in Language* (1894); *Phonetics* (1897–9); *Growth and Structure of the English Language* (1905, Prix Volney, 1906); *Lehrbuch der Phonetik* (1913); *Language, its Nature, Development and Origin* (1922); *Philosophy of Grammar* (1924).

JESUS CHRIST: *see* BIBLICAL CRITICISM; CHRISTIANITY.

JEWISH LITERATURE: *see* HEBREW LITERATURE.

JEWS (*see* 15.371).—The Jewish population of the world on the outbreak of War in 1914 may be estimated at about 14,900,000. Of these, two-thirds were concentrated in eastern and south-eastern Europe, including (in round figures) just under 7,000,000 in Russia, 2,250,000 in Austria-Hungary and nearly 250,000 in Rumania. Of the remainder, about two-thirds lived in the United States, which had a Jewish population of close on 3,000,000, leaving a balance of about 1,500,000 for other parts of the world. There were about 600,000 Jews in Germany, and about 500,000 in the British Empire, including 250,000 in Great Britain and Ireland.

I. THE PRE-WAR PERIOD

Events in Russia.—In the years immediately preceding the World War, the condition of the Jews in Russia went from bad to worse. The legal restrictions by which the Jews were harassed were vigorously enforced and in some respects made still more burdensome. In 1910 there was a round-up of Jews in Kiev. Jewish houses were systematically raided by the police, and hundreds of families, who were unable to prove their right of residence, were abruptly expelled. The expulsions continued in 1911–2 and were extended to other cities in which only privileged Jews were permitted to reside—notably Moscow, St. Petersburg and Kursk—as well as to a large number of villages in various parts of the pale of settlement, where the government's policy was to confine the Jews to the towns.

During the same period further disabilities were imposed on the Jews in the sphere of education. In 1910 the percentage rule, which limited the number of Jewish pupils to a fixed proportion, was extended to schools of surgery and dentistry and to the schools of painting and architecture in the St. Petersburg Academy of Fine Arts. The percentage rule was even applied to the Jewish secondary schools, which had hitherto been exempted as private institutions. As a result promising young Jews and Jewesses, who found higher education out of their reach in Russia, began to leave the country in increasing numbers to pursue their studies abroad. A third line of attack was marked by what was known as the "scheme for the Russification of commerce." This scheme, designed to drive the Jews out of Russian trade, was launched during the premiership of M. Stolypin. M. Kokovtzeff, who succeeded M. Stolypin in 1911, viewed it with misgiving, but the anti-Jewish forces were too strong for him and, though never formally approved by the Govt. or the Duma, the scheme was put into practical operation, existing restrictions being used to cripple public companies under Jewish management and generally to discourage Jewish commercial enterprise. In Russian Poland the Jews also suffered severely from an economic boycott organised by the Warsaw Nationalists, whose candidate for the Fourth Duma was defeated by Jewish votes at the election of 1912. At Easter, 1911, a Christian boy was killed at Kiev. The anti-Semites at once accused the Jews of ritual murder, and a Jew named Beilis was arrested. Beilis was kept for more than two years awaiting his trial which ended in Nov. 1913 in his acquittal.

In the Third Duma a bill for the abolition of the pale of settlement received a considerable measure of support, while the Fourth Duma also contained liberal-minded elements. But though the Jews were not altogether friendless, their position grew worse rather than better. The Govt. remained fixed in its determination to crush them, and Jewish life in Russia presented a picture of almost unrelieved gloom.

Jews in Southeast Europe.—In Rumania the Jews were subjected to much the same treatment as in Russia. In one respect their position was even worse. Jews, as such, were deemed by the Rumanian Govt. to be aliens, even though they were native-born and had no claim to any other nationality. As a sequel to the Berlin Treaty of 1878, under which the Powers recognised her independence, Rumania undertook in 1880 to give the Jews liberal facilities for naturalisation. Had this pledge been fulfilled, their status would have been gradually regularised, but the spirit in which it was carried out is shown by the fact that between 1880–1913, about 200 Jews were actually naturalised out of a Jewish population, mainly native-born, of over 200,000. The Rumanian declaration of war on Bulgaria in 1913 brought 15,000 Jewish reservists to the colours. This produced a certain revulsion of feeling and it looked for a moment as though at last the Jewish soldiers would now be naturalised *en bloc*. A few individual applications were granted, but the anti-Jewish forces soon regained the upper hand, and the elections of 1914 brought into power a reactionary Govt. from which Jews had nothing to hope.

In Austria-Hungary the Jews were subject to no legal disabilities. In 1912–3 there were various affrays between Jewish and German or Polish students at the universities of Vienna, Czernowitz and Lemberg, but these incidents, though symptomatic, were in themselves of no great consequence. In Morocco the Jews suffered severely from an outbreak of disorder in 1912, when mutinous troops of the Sultan's army sacked the Jewish quarter at Fez, 60 Jews being killed and many severely wounded. A considerable number of Jews were affected by the territorial

changes resulting from the Balkan Wars of 1912–3, and more especially by the transfer of Salonika from Turkey to Greece. Among the 200,000 inhabitants of Salonika there were about 90,000 Jews, who played a predominant part in its commercial life. Though the Greek Govt. gave satisfactory assurances, the change of sovereignty was viewed by the Jews with misgivings which have proved not altogether unfounded.

As a result of the conditions prevailing in Russia and Rumania, Jews continued to emigrate overseas in large numbers. Some of them settled in Palestine, where Jewish colonisation was making gradual progress with the support of Baron Edmond de Rothschild and under the inspiration of the Zionist Movement The great majority, however, made their way to the United States, where 495,450 Jewish immigrants were officially recorded in the five years 1910–4 (*see* MIGRATION).

II. EFFECTS OF THE WAR

The War completely changed the face of the Jewish world. In the Russian Empire it brought the Jews political emancipation, but it also brought them unspeakable suffering and ended by submerging them in the flood of anarchy which followed the collapse of orderly government. As a result, the influential Jewish community in the United States increased to 3,600,000 persons. Finally, the War led up to the Balfour Declaration, which foreshadowed the establishment under international guarantees of a national home for the Jews in Palestine.

Eastern Europe.—The crowded Jewries of eastern Europe felt the full impact of the War from the outset. The Russian pale of settlement became almost at once a theatre of operations. So, too, did Galicia, with its poverty-stricken Jewish population of over 800,000. The Jews were bound in any case to suffer in common with their neighbours, but their miseries were aggravated by wholesale deportations. Within a year of the outbreak of war, nearly 1,500,000 Jewish refugees had been set adrift. To make matters worse, the Polish Nationalists vigorously pursued their vendetta against the Jews and revived the boycott which began in Warsaw in 1912. So pitiful was the condition of the Jews that the Russian Govt. which had already made substantial grants to the Petrograd Jewish Relief Committee, eventually issued, as a temporary measure, a decree permitting the Jews to reside freely in any of the towns of the Empire, with certain specified exceptions, of which the most important were Petrograd and Moscow. This decree was dated Sept. 3 1915. The concessions thus granted gave the Jews some relief, though its effect was minimised by the illiberal spirit in which it was administered.

Public opinion was ripe for much more sweeping reforms. Of this there was ample evidence in the friendly welcome which the Jewish refugees received from their Christian neighbours in their new homes, in the action of a number of important public bodies who petitioned the Govt. in favour of the emancipation of the Jews, and in the protest of many enlightened Russian patriots against a policy which they regarded as detrimental to Russian interests and inconsistent with the spirit of unity which the national crisis demanded. But the reactionary traditions of the old régime were too powerful. Nothing was done for the Jews in 1916, and the inquiries of other Allied Govts., which were sympathetically interested in their case, showed that they had nothing to hope for.

It was not until the revolution of 1917 that their emancipation became a possibility. The Jews whole-heartedly supported the revolution, and one of the first acts of the Lvoff Govt. was to issue a decree, dated April 3 1917, for the repeal of "all restrictions of a religious and national character." This decree at one stroke relieved the Jews of all disabilities, and it only remained for them to take their place in the new Russia. There was much discussion in Jewish circles as to what that place should be, and there was a strong feeling in favour of what was called national autonomy, the suggestion being that the Jews should be recognised as a national unit and enjoy, in common with every other nationality in Russia, a limited measure of self-government.

The Jews had hardly been emancipated before these dreams were rudely shattered by the seizure of power by the Bolsheviks. Among the Bolshevik leaders and their satellites were a certain number of Jews, none of whom, however, played any part in the Jewish community, or had any ties with it beyond their Jewish birth. The great majority of the Jews sided with the moderates and suffered accordingly under the Soviet régime. The communal organisations were broken up, and many of their leaders were imprisoned. Living, as most of them did, by trade, the Jews suffered severely from the economic débâcle which the Bolshevik revolution brought with it, and to add to their distress it became increasingly difficult to send them relief from abroad.

In Rumania the conditions of the Jews remained as deplorable as ever, though they did not suffer from the War in the same degree as in Russia. On May 11 1917, representatives of the committee of native Jews were received by the King, who gave them vague but encouraging assurances. There, however, the matter ended and nothing was done for the Jews until a limited measure of emancipation was dictated by the Germans in the Treaty of Bucharest. The relief thus granted was of little practical value, and there was no change in the policy of the Rumanian Govt., which continued to harass the Jews and treated them with exceptional harshness in the occupied province of Bessarabia.

United States.—As already stated, one result of the disruption of Jewish life in eastern Europe was that the centre of gravity tended to shift to the United States. An American Jewish relief committee, later incorporated in the joint distribution committee, was founded in 1914 and took the lead in organising relief work among the Jews in the stricken areas in eastern Europe and elsewhere. The funds raised for this purpose in the United States during the War and the post-War period are stated to have reached a total of $60,000,000. American Jewry was also active in the defence of Jewish rights in eastern Europe, though in this field at least an equally prominent part was played by the English Jews, who also contributed considerable sums for relief work. At the same time, the American Jews began to play a part of growing importance in the Zionist movement, and were concerned in the negotiations leading up to the Balfour Declaration, of which President Wilson was a consistent and influential advocate (*see* ZIONISM).

III. THE JEWS UNDER THE PEACE TREATIES

The territorial changes which followed the War closely affected the Jews of eastern and southeastern Europe. Two-fifths of them were taken over by Poland, which had more than 3,500,000 Jews among its 27,000,000 inhabitants. About 250,000 Jews were included in Lithuania, about 100,000 in Latvia and about 8,000 in Estonia. Only 3,000,000 Jews remained under Russian rule, as compared with about 7,000,000 in 1914. Of these, two-thirds were in the Ukraine. About 350,000 Jews were left in Austria and about 500,000 in Hungary, as compared with about 2,250,000 in the former Austro-Hungarian Empire. Of the remainder, about 350,000 passed to Czechoslovakia, while as a result of the annexation of Transylvania and the Bukowina, together with the Russian province of Bessarabia, Rumania increased her Jewish population from a little over 200,000 to more than 1,000,000. These changes of allegiance were in themselves not necessarily for the worse, but they involved the disruption of old-established communities and broke them up in fragments, each of which had at once to reorganise its internal life and establish a *modus vivendi* with new and in most cases none too friendly rulers.

The Peace Conference.—It was in these circumstances that the Jewish problem was brought to the attention of the Peace Conference. It presented itself in a twofold aspect. The Allies had already undertaken to facilitate the establishment of a national home for the Jews in Palestine. This undertaking held good, but it was none the less necessary to define and safeguard the rights of the Jewish minorities in eastern and southeastern Europe. As to what those rights should be Jewish opinion was divided. The east European Jews themselves, speaking through their representatives on a body known as the committee of Jewish delega-

tions at the Paris Peace conference, demanded the recognition of the Jews in the succession states as "national minorities" enjoying a substantial measure of self-government. This view was supported by the Jewish delegates from the United States but was opposed by those from Great Britain and France, who limited themselves to a programme of "minority rights" not implying the creation of anything in the nature of a state within the state.

This more moderate claim was eventually conceded in the Minority Treaties, of which the first was signed by Poland on the one hand and the principal Allied and Associated Powers on the other on June 28 1919. This treaty makes it impossible for Poland to create a class of foreigners possessing no national status, such as the Jews had been in pre-War Rumania. Racial, religious and linguistic minorities are to enjoy complete equality before the law, the free use of their own languages, the right to control their own religious, educational and social institutions and an equitable share of public funds allotted to educational, religious or charitable purposes.

Over and above these provisions, which apply to minorities generally, the treaty specifically empowers the Jews to appoint local committees for the management of their own schools and provides that they shall not be under any disability by reason of their refusal to attend courts of law or vote at elections on the Sabbath. Poland recognises these stipulations as matters of international concern and agrees that they shall be guaranteed by the League of Nations. The league formally guaranteed the treaty on Feb. 13 1920.

Similar obligations, in each case guaranteed by the league, were accepted by Czechoslovakia, Yugoslavia, Rumania, Austria, Hungary and Bulgaria. One important result of these transactions was the emancipation of the Jews in Rumania, including the inhabitants of the old kingdom, as well as of the territories annexed as a result of the War. After the close of the Peace Conference, undertakings on the lines of those contained in the Minority Treaties, though on the whole less stringent, were secured by the Council of the League from Lithuania, Latvia and Estonia. It was only in the exceptional case of Poland that it was thought necessary to make express provision for the Jews, but if the rights which they shared with other minorities were respected, they had little to fear.

Jews in Eastern Europe.—While the Minority Treaties were being negotiated in Paris a dangerous situation was developing in eastern and southeastern Europe. The Jews were in an unenviable position, both in the succession states, where an intolerant Nationalism was in the ascendant, and in what was left of the dismembered empires, where scapegoats had to be found for the humiliations of the peace settlement. They were peculiarly exposed to attack in the atmosphere created by Bolshevism in Russia and its momentary irruption into Hungary.

The Tsarist régime had subjected the Jews to a pitiless and systematic persecution. Most of them threw themselves, when the revolution came, on to the side of the Moderates, but among them were some who, goaded to desperation, developed what may be called a destructive mania. There was no Jewish blood in Lenin himself, but both in Russia and in Hungary a prominent part in the Bolshevik movement was played by men who, though long dissociated from the Jewish community, were nevertheless of Jewish birth. In both countries the overwhelming majority of the Jews were anti-Bolshevik, not only on grounds of principle, but also because the bulk of them were traders and belonged to the very class which had most to lose from a Bolshevik victory. Nevertheless, the enemies of the Jews branded them indiscriminately as Bolsheviks, and the alarm which the Bolshevik menace excited in Europe at the close of the War gave an impetus to reactionary forces which singled out the Jews as their targets.

In Poland the Armistice was followed by a series of anti-Jewish excesses which led the British Govt. to send out Sir Stuart Samuel on a mission of inquiry. The Samuel report shows that in disorders which occurred in the year after the War not less than 348 Jews were killed and a much larger number wounded. The more serious excesses were confined to the areas of Lemberg, Pinsk and Vilna, where Poland was still at war with the Ukrainians and the Bolsheviks, but there were spasmodic outbreaks in many parts of Poland proper, and throughout the country the Jews were suffering from a sustained commercial boycott.

In Hungary, the collapse of the Bolshevik revolution under Béla Kun led to a violent reaction, which vented itself in attacks on Jewish life and property, while the sufferings of the Jewish population were aggravated by acute economic distress. There were also disturbing, though less violent, outbreaks of anti-Semitism in Austria and in various parts of Germany, more especially in Bavaria. But the principal storm-centre was in southern Russia, where the Poles, the Bolsheviks and the armies of Gen. Denikin fought over the body of the still-born Ukrainian Republic. The British Minister in Warsaw reported in June 1920 that "the massacres of Jews by Ukrainian peasant bands can find, in their extent and thoroughness, no parallel except in the massacres of Armenians in the Turkish Empire" (Sir H. Rumbold to Lord Curzon, in *Report of Sir S. Samuel on His Mission to Poland*, Cmd. Paper 674, 1920). It was not until 1921 that the storm began to die down. By 1922 the Soviet Govt. which was now in possession, had restored some measure of order, but massacre was succeeded by famine and pestilence. Early in 1923 there were reported to be 100,000 homeless Jewish orphans in the Ukraine, and in Odessa the Jewish death-rate in 1922 is said to have reached 200 per 1,000. In Soviet Russia there were no massacres, but though order was fairly well maintained, the Jews suffered from the Communist régime, which deprived them of their livelihood as traders, waged war on Judaism in common with other religions, and was ruthless in its measures against "counter-revolutionaries," with whom it was disposed to class the Zionists and, indeed, all Jews who clung to their religious or national traditions.

As a result of the conditions thus created in eastern Europe, 200,000 destitute Jewish refugees were set adrift in the borderland between Russia, Poland and Rumania. Responsibility for their maintenance and eventual evacuation was assumed by the Jewish Colonisation Assn. and other Jewish bodies. As late as the end of 1925 there was still a residue to be provided for, but the bulk of the refugees had by that time either been repatriated to Russia or been enabled to find new homes in the United States, Canada, Cuba, Argentina, Mexico or Palestine. This was only one, though it was the most poignant, aspect of the problem of the Jewish emigration. Throughout the crowded Jewries of eastern Europe there was a growing desire to escape from conditions which seemed to hold out little prospect of a tolerable future. Between 1919–23, 238,000 Jews emigrated to the United States, while between 1919–25, 67,000 Jews emigrated to Palestine. In 1924 the Johnson law virtually closed the United States to emigrants from eastern Europe. There was no longer room for immigrants in Great Britain, and Palestine stood by itself as the one country in which the Jews had in principle an assured right of entry under an international guarantee.

The Period Since 1922

Since 1922 there have been no anti-Jewish excesses on the scale of those which occurred immediately after the War, though in many parts of Europe there have been spasmodic outbreaks. Nor have the Minority Treaties been entirely ineffective in safeguarding the rights of Jews, though it has occasionally been suggested that they have not been an unmixed blessing, in so far as they may have tended in some cases to keep minorities and majorities apart. But though anti-Semitism has changed its character, it has by no means ceased to give trouble. It has shown itself in particular in systematic attempts to limit the number of Jews in schools and universities by means of a *numerus clausus*. Action on these lines has been semi-officially taken in Poland and Austria, but the leading case is that of Hungary, where a *numerus clausus* based on legislation enacted in 1920 has been openly enforced. The matter has been brought before the League of Nations as the guarantor of the minority clauses of the Treaty of Trianon. The Council decided in Dec. 1925 to take no immediate steps, in view of the Hungarian Govt.'s

assurance that the law was an emergency measure which would be amended in the near future. In Poland, anti-Semitism has mainly taken the form of a commercial boycott combined with administrative pin-pricks, the cumulative effect of which has been to place the Jews at a disadvantage in every walk of life. Since 1924, however, the situation has shown some improvement, and in the summer of 1924 a more favourable atmosphere was created by a formal reconciliation between the Govt. and the Jewish group in the Chamber of Deputies. There is no reason to doubt the Government's sincerity, but at the end of 1925 it had still to be seen whether it would be able to translate its assurances of goodwill into substantial concessions.

In Rumania the emancipation of the Jews has been almost completed, and only a few exceptional cases remain in dispute. On the other hand, the Jews are living under the shadow of an anti-Semitic agitation which gives them no peace. If they have been saved from serious excesses, it is due solely to the energy with which the Govt. has intervened to keep order. The same is true of Austria. Vienna is a hot-bed of anti-Semitism, and serious rioting took place during the Zionist congress which met there in the summer of 1925. In Lithuania, where the Jews at first received liberal treatment, the short-lived Ministry of Jewish Affairs was abolished in 1924, and the Jews, like the Poles, have suffered severely from the intolerant Chauvinism which is now in the ascendant. In Soviet Russia the condition of the Jews is more desperate than in any other part of eastern Europe. Elsewhere they may at least hope for better days, but under the Communist régime there can be no future for the traders who form the great bulk of the Jewish population.

Land Settlement and Zionism.—In these circumstances, experiments have been made in the settlement of Jews on the land. Of these the most important is that undertaken in 1925 by the American Jewish relief organisation known as the Joint Distribution Committee, which has made arrangements with the Soviet Govt. for the colonisation of an extensive tract of land in the Crimea. By a large body of Jewish opinion in the United States the project has been viewed with misgiving, not so much on its merits, as because it has been suspected of being backed by forces unfriendly to Zionism. It has thus had the indirect effect of provoking Zionist demonstrations on an unparalleled scale, culminating in Nov. 1925 in a conference at Baltimore at which representatives of almost all sections of American Jewry pledged themselves to support the establishment of the Jewish national home in Palestine. This incident served to illustrate both the growing strength of the Zionist movement and the importance of the part which American Jewry has begun to play in Jewish affairs. When the Jewries of eastern Europe were engulfed in the War, the centre of gravity at once began to shift to the United States, and the change in the balance of forces has since become yet more marked, though American Jewry is still in process of building up a Jewish tradition. In the United States, as in England, the Jews did not escape the back-wash of the anti-Semitic agitation which swept over Europe after the Armistice and in both countries they have been to some extent on the defensive against hostile propaganda, though it has not been of a character to cause them serious anxiety.

The history of the Jews as a body during the past 15 years is unhappily bound to be, for the most part, the history of their reactions to anti-Semitism. In this somewhat sombre picture Palestine stands out in sharp relief as the scene of a Jewish renaissance in which the Jews, as such, are beginning to express themselves as a constructive force. It is for this reason that the establishment in Palestine of the Jewish national home has kindled the imagination of a multitude of Jews in all parts of the world, who see in it, not merely a promise of relief for the victims of persecution, but the hope of a happier and more dignified future for the Jewish race as a whole (*see* ZIONISM).

(L. ST.)

JEX-BLAKE, SOPHIA (1840–1912), British medical practitioner, was born Jan. 21 1840 at Hastings, Sussex. After holding a post as mathematical tutor at Queen's College, London, she studied the education of girls in America and became a pupil of Dr. Elizabeth Sewell and later of Dr. Lucy Sewell. Returning to England in 1868, in 1869 after some difficulty she was admitted with other women students to classes in medicine at Edinburgh University and in 1871 to hospitals. After attempting unsuccessfully to compel the university authorities to grant her a degree, she returned to London in 1874 and was largely instrumental in establishing the London School of Medicine for Women. In 1877 she obtained the M.D. degree of Berne and became a licentiate of the College of Physicians, Dublin. In 1878 she began practice in Edinburgh, where in 1886 she established the Edinburgh School of Medicine for women. She retired in 1899 and died at Mark Cross, Sussex, Jan. 7 1912. Her written works include *Medical Women* (1872) and *American Schools and Colleges* (1886). Her niece Katherine (b. 1860) became mistress of Girton College, Cambridge, in 1916; and another niece, Henrietta (b. 1862), became principal of Lady Margaret Hall, Oxford, in 1900. Both retired in 1921.

JIREČEK, HERMENEGILD, RITTER VON SAMAKOW (1827–1909), Bohemian jurisconsult (*see* 15.417), died in Hohenmauth (Vysoké Mýto) Dec. 29 1909. KONSTANTIN JOSEF JIREČEK (1854–1918), nephew of the above, archaeologist and historian, died in Vienna Jan. 10 1918.

JOB ANALYSIS.—This term, widely used since the World War, was applied by the personnel division of the American army to the analysis of occupational activities into their components, by means of which job specifications were drawn up showing exactly what a worker in each occupation was expected to do and be. On the basis of these specifications men were selected to fill positions such as those of chauffeur, gunsmith, etc. After the War the concept of job analysis was carried into industry, education and allied fields, where it is applied not only to the work involved in a trade or part of a trade, but also to the work involved in a profession. In view of this wide use of the term, analysis as it is employed in all kinds of occupational activities must be considered.

Though the term "job analysis" is recent, the technique it employs is not new. Under the term vocational analysis, investigators in vocational guidance have for some years analysed vocational activities into their component parts so as to secure a basis on which a person can choose a vocation. A pioneer study of this nature, *The Machinist*, was made in 1910 by Frederick J. Allen for the Vocation Bureau of Boston, Mass. Similar studies have followed in a number of other communities and for a number of other occupations. Again, the technique, if not the name, was used by the efficiency engineers of the early part of the 20th century. Taylor and others, in endeavouring to discover the unnecessary motions made by workers in industrial operations and in establishing standards of efficient performance, made analyses, dividing each job into units as minute as possible.

Community Surveys.—Educators have used the term and the method in seeking to establish a scientific basis for organising and teaching courses in vocational training. In 1914 the city

of Richmond, Va., organised a survey of the community in order to discover its vocational opportunities and needs. Similar surveys followed in other cities, one of the most thorough being that of Cleveland. These surveys employed the method of job analysis, and their reports contain fairly detailed classification and descriptions of the operations involved in the various vocational activities in the communities. In addition to these surveys, analyses have been made in a more or less laboratory manner, having as their aim the dissection of vocational activities for the purpose of formulating methods of giving instruction. Under these circumstances Charles Allen formulates the steps to be taken as follows: (*a*) divide the work into unit operations; (*b*) divide each operation into operating points; (*c*) divide the operating points into two kinds, machine operating points and human operating points. These are then taught to apprentices as units or are put together into projects and taught as larger units.

Analyses by even more strict laboratory procedure have been carried out, chiefly by psychologists, in the effort to discover facts about learning which could be put to use in the training of apprentices. Bryan and Harter investigated telegraphing and discovered the rate at which learners could receive and send at various stages of their progress. Book made a similar study of typewriting. Wells and, later, Hoke investigated, among other things, the nature of the errors which a typist makes. On the basis of these facts a teacher of typewriting can direct a learner in the avoidance of errors and the more rapid acquisition of skill.

Procedure.—Analysis should be made from a number of points of view. Especially is this necessary when made for the purpose of drawing up job specifications or qualifications that must be possessed by the worker. Economic questions should be answered, such as how much money may be earned, how the demand for workers fluctuates, etc. From the physical point of view the analysis should specify the movements that the worker makes, the weights to be lifted and the like. Physiological data should be gathered showing such things as preferable age, height, sensory acuity and also liability to accident or to occupational disease. The psychological phase of the analysis involves a statement of the mental processes involved in the work, the degree of intelligence required, amount and kind of education, temperamental requirements. From the sociological point of view, inquiry should be directed toward the class of workers engaged in the occupation, their nationality, family status, etc. Thus true analysis requires and results in a complete, all-round view of occupational activity.

Prominent Errors.—In carrying out such complex investigations some mistakes are made, such as those due to the temptation to rely on opinions obtained by questioning workers and their employers. This "questionnaire method" has received severe condemnation from scientists and should be used sparingly by investigators in the field of job analysis. In the first place it yields chiefly opinions showing what some one thinks the work is like. Secondly, it usually states the components of the job in general, abstract words such as "accuracy," "quickness" and the like, which do not characterise any occupation in particular, being required in hundreds of different jobs.

Too great dependence on psychological tests is another error. There is a procedure whereby a number of psychological tests are chosen which seem to resemble the work being analysed. Those tests in which the good workers excel and the poor workers fall short are considered to call forth the same mental activities as those required in the job and to constitute therefore the analysed components of the work. As a matter of fact such an assumption is not valid. The activities called forth by the tests are merely test-activities and nothing more. No one can say that they are identical with the psychological processes of the work under consideration.

Scientific Method.—In formulating a procedure which promises scientifically valid results, and will be applicable regardless of the ends for which an analysis may be made, the underlying requirement is that the procedure must conform to the rigid technique of scientific method. It must be unbiassed and dominated only by the desire for the exact determination of conditions. Thorough analysis can be carried on only by trained scientists, though they must have the co-operation and assistance of experts in the occupational fields as well.

In conducting an analytic investigation the first task is to survey the entire vocational field in which the activity lies, to determine its relation to the social organisation, then to divide it into its occupational sections. These are to be described in terms of their relations with each other and their relation to the whole field. Then each occupational section is described and divided into smaller units. This division may be made by mere observation, and the operations may at first be described in qualitative terms, but the descriptions should also be couched in quantitative terms.

Use of Measurements.—Measurement is an indispensable part of the process. The early quantitative analyses of Taylor were made with a stop-watch reading in fifths of a second. As the principle of measurement has become more widely extended, however, there has come a demand for measurements of greater precision, made with instruments used in the psychological laboratory for the measurement of intervals of time as small as one-thousandth of a second. For example, pictures have been made of the eye-movements made by proof-readers. The chronocinematographic method of Gilbreth offers much promise for the exact measurement of motions and time intervals involved in work operations. Motion pictures of the worker at his work are taken, in which is placed a clock that measures time in millionths of an hour. The background in each picture is cross-sectioned into squares of predetermined size. By examining the exact position of the worker in each succeeding picture in relation to these squares and to the time-recorder it is possible to determine how much he has moved and at what rate.

Developments in Britain.—Excellent analytic work is being done in England by the Industrial Fatigue Research Board, organised during the World War for the purpose of assisting workers to do their work with as little fatigue as possible. The board has made analytical investigations on such matters as rest pauses, conditions affecting accidents, elimination of waste motion. Though these analyses were instituted primarily to discover and eliminate the causes of unnecessary fatigue, the results have been found useful in other ways, especially in giving a basis for more effective training of apprentices.

Some indication of the fundamental part which job analysis can play will be furnished by this list of ends which have motivated the various analyses that have been made: elimination of waste motions; determining standard day's tasks; wage setting; figuring accurate costs; arranging grades and routes of promotion; inventing trade tests; establishing a curriculum for vocational education; determining methods of teaching vocational activities; securing a basis for choice of a vocation; securing job specifications for the selection of workers. *See* also INDUSTRIAL PSYCHOLOGY; INTELLIGENCE TESTS.

(H. D. K.)

JOFFRE, JOSEPH JACQUES CESAIRE (1852–), French soldier, was born Jan. 12 1852 at Rivesaltes, at the edge of the Eastern Pyrenees. According to a tradition preserved in the family, his stock is Spanish and noble, and its proper name is Goffre. His great-grandfather fled from Spain for political reasons, came to France, gave his name the French spelling of Joffre, and became a merchant. The grandson of this first Joffre adopted the trade of a cooper. He had 11 children, one of them being the future victor of the Marne.

The studies of young Joffre at the École Polytechnique were interrupted by the Franco-German War and he took part in the defence of Paris in 1870. Afterwards he passed out from the Polytechnique into the engineers and worked on the fortification of Paris. In 1876 he was promoted captain. The loss of his wife so affected him, however, that he applied for a transfer to

Indo-China, where he took part in the occupation of Formosa in 1885 and remained three years at Hanoi as chief of engineers. In 1888 he returned with General Mensier to Paris. In 1889 he entered the railway regiment. In 1892 he was sent to Senegal to build a railway from Kayes to Bafoulabe. At the end of 1893, a column commanded by Colonel Bonnier marched on Timbuktu *via* the Niger. Joffre, who was a major, was ordered to form a second column, which was also to march on Timbuktu by the left bank of the river. He left Segou on Dec. 27, to receive the news at Goundam at the end of Jan. that Colonel Bonnier had been murdered on the 15th. Nevertheless, he continued his march on Timbuktu undaunted, and entered the town on Feb. 12 1894 after marching 813 kilometres. Some years later he went to Madagascar to form the base at Diego-Suarez. He was appointed general of brigade in 1900 and general of division in 1905. While commander of the II. Army Corps at Amiens he was called to the Conseil Supérieur de la Guerre in 1910. This council, re-established in 1872, consisted of the generals who in time of war would have the chief commands. General Joffre was entrusted with the direction of the lines of communication.

Under the system then existing, the vice-president of the Higher Council became in time of war commander-in-chief of the armies in the field. But in time of peace he had very little authority over his future subordinates. He could not determine either promotion or commands. The real authority lay with the chief of general staff of the army. General Michel, vice-president of the Higher Council, resigned in July 1911, and the Minister of War, M. Messimy, decided to unite the functions of vice-president and those of chief-of-staff of the army in one person, so that in the eventuality of war, the chief of the general staff would become commander-in-chief. Who was to exercise these united duties, which constituted a position of considerable power? M. Messimy thought of General Pau, who refused on the ground that he had only 18 months' more service on the active list. General Galliéni was due to pass into the reserve even sooner. M. Messimy's choice accordingly fell on Joffre, who was only 59 years old, and had therefore five years more on the active list.

For three years Joffre exercised complete authority over the army. He had laid his plan of campaign, known as Plan 17, before the Conseil Supérieur on April 18 1913. Germany having declared war on France on Aug. 3 1914, he took up the post of commander-in-chief on the 5th. From this day on, the history of his life for more than two years was that of the War itself. This silent general, jealous of his authority but undismayed by the most tragic events, had to bear on his broad shoulders a weight which only his coolness and energy enabled him to sustain. After having attempted in vain to throw himself on the flank of the advancing Germans, he was obliged to withdraw his left wing a considerable distance. He resumed the offensive on Sept. 6, and threw the Germans back to the Aisne in the memorable battle of the Marne. He attempted then to turn their right wing, a frustrated manoeuvre which ended with the rival fronts resting on the sea. The Germans first made the attempt to break the allied line on the Yser in Nov. 1914, and they failed. The French, in turn, tried vainly to break the German front in Champagne, in the Woevre, in Artois and simultaneously in Artois and Champagne (Sept. 1915).

These checks, following on rash promises and high hopes, had alarmed public opinion. A campaign was conducted against the commander-in-chief, on the one hand by the friends of General Galliéni, who accused general headquarters of having stolen the glory of the Marne; and on the other by the yet more powerful friends of General Sarrail, whom General Joffre had relieved of his command in July 1915. They reproached general headquarters for their blind confidence in 1914. They accused Joffre of rejecting all superior authority and organising a regular government at Chantilly. So long as Millerand was Minister of War he protected the commander-in-chief. But Millerand was replaced on Oct. 30 1915 by General Galliéni. Joffre had served under the latter at Madagascar, and Galliéni had suggested Joffre to Messimy in 1911 for the post of chief of general staff. But at the beginning of the War, Galliéni, although designated successor to Joffre, had been left as military governor of Paris instead of being called to general headquarters. Then came the battle of the Marne, followed by rivalry, if not between the two commanders, at least among their general staffs. On Dec. 3 1915, however, General Joffre received, instead of the simple command of the north and northeast, the supreme command of all the French Armies, an appointment which put under his authority the Army of the Orient, commanded by none other than General Sarrail. But trouble was not slow in arising. On Dec. 16 the Minister for War demanded information on the state of the defences before Verdun. On the 18th he received a stiff reply from General Joffre, who offered to resign. Galliéni answered on the 22nd that Joffre enjoyed the complete confidence of the Government. Nevertheless, two months later, on Feb. 21 1916, the Germans attacked in front of Verdun, and the defences, which were incomplete, were forced in as far as the line of forts, to a depth of eight kilometres in four days. On March 7 Galliéni read to the council of ministers a memorandum pointing out the necessity of reforming the high command. His advice was not accepted; he was also ill; he therefore resigned, and was replaced on March 17 by General Rocques.

The new Minister was a personal friend of General Joffre. Nevertheless, the campaign against him lasted throughout 1916. This was partly due to the apparently indecisive result of the great Allied battle on the Somme, and the personal quarrel between Sarrail and Joffre continued. Finally, General Nivelle, commander of the II. Army operating before Verdun, having retaken the fort of Douaumont, appeared as a possible successor to Joffre. A decree of Dec. 13 1916 conferred on Joffre the title of technical adviser to the Government in matters concerning the direction of the War. He continued to hold the title of commander-in-chief of the French Armies. General Nivelle received the command of the north and northeast—that is to say, of the French front. The Army of the Orient again became independent of general headquarters.

What was this post of commander-in-chief and technical adviser? The Senate demanded an explanation. In a secret committee, which sat from Dec. 19 to 23, M. Briand, as Prime Minister, explained the decree of the 13th. The title of commander-in-chief was left to a man who had played an historic part and who deserved every consideration; but it implied no authority either over General Nivelle or General Sarrail, who remained free to conduct operations as they wished. Joffre would be consulting member in the War committee, which was merely an organ of preparatory work, its decisions being submitted to the council of ministers. However, on Dec. 13, M. Briand had made changes in the Cabinet, and had called General Lyautey to the Ministry of War in place of General Galliéni. Lyautey arrived in Paris on the 24th. He considered the post of commander-in-chief and technical adviser granted to General Joffre as incompatible with the authority of the Minister of War. These two offices were suppressed, but in compensation, General Joffre was created Marshal of France on Dec. 26. In the spring of 1917 he made a journey to North America. The Academie française made him a member on Feb. 14 1918, and he took his seat there on Dec. 19th. (H. Bl.*)

JOHANNESBURG (*see* 15.431).—In 1921 the population of the municipal area was 282,921, and of the suburbs 5,210. Of the inhabitants 151,836 were whites and 6,229 Asiatics. In 1911 the population was 237,104, compared with 155,642 in 1904. Its prosperity is bound up with the gold mines of the Witwatersrand, and it is the centre for the other municipalities on the Rand. Between 1910 and 1925 the town council acquired and worked all public utility services and the live-stock and produce markets. Law courts, a town hall and a municipal art gallery were completed by 1915. In 1922 the University of the Witwatersrand was constituted; it had grown out of the South African school of mines and technology. New buildings for it were erected in Milner Park, the site being given by the town council. In 1922 the

Anglican diocese of Johannesburg was created. A cathedral in the Romanesque style was designed, the Lady Chapel being first built. On the other hand, the Asiatic and native locations at Vrededorp, within a mile of the centre of the city, remained in an insanitary and shocking condition. The South African Asiatic Inquiry Commission wrote of the location in 1920: "It is difficult to conceive a worse slum existing in any part of the world." Certain reforms followed, and in 1924 the Union Government took powers to enforce throughout the Union decent conditions in native locations.

Johannesburg was the scene of riots in 1913-4 arising out of strikes by white miners and railwaymen, and in 1915, when, following the sinking of the "Lusitania," German property valued at fully £500,000 was destroyed. In 1917 the first South Africa trade union congress was held in the city. In 1919 there were strikes and disturbances among the native workers in the mines. Early in 1922 the white miners on the Rand went on strike; the movement was captured by communists and developed into an armed revolt, with street fighting extending to the centre of the city. Prompt action crushed the revolt by the end of March.

JOHN, AUGUSTUS EDWIN (1879–), British painter, was born at Tenby, Wales, Jan. 4 1879. He received his art education at the Slade School, London, and afterwards worked in Paris, later spending some time in Provence. He became a regular exhibitor at the New English Art Club, and in 1901–2 was teacher of art at University College, Liverpool, returning to London in 1902. His earlier work includes "The Way Down to the Sea" (1906), "The Kitchen Garden," "The Smiling Woman" (1910) and "The Mumpers" (1912). For the Arts and Crafts Exhibition at Burlington House, London, 1916, he executed a mural decoration illustrating "Peasant Industry." During the World War he held a commission as official artist in the Canadian Corps, and exhibited at the Canadian War Memorial Exhibition, 1919, a cartoon for a large decoration, "Canadians opposite Lens." He was later commissioned to paint the chief characters of the Peace Conference. He also painted portraits of Mr. Lloyd George (1916), Mr. Bernard Shaw (1916), Lord Fisher (1917), Lord Sumner (1918–9) and the Marchesa Casati (1918–9). His etchings form an important part of his work, the majority being produced between 1901–10. He is represented in the Tate Gallery by several pictures, including "The Smiling Woman," "Peasant Industry," "Robin," (1917–8), and "Rachael," and in the Print Room of the British Museum. His early work, with its definite contour enclosing areas of colour, relates him to the *quattrocento* Italian painters. Distortion for personal emphasis and decorative effect is another marked characteristic. In 1921 he was elected A.R.A. The Alpine Galleries Exhibition held in London (1923) showed John's versatility and energy in astonishing degree, interest being especially roused by his portrait of Mme. Suggia, the large imaginative composition entitled "Symphonie Espagnole"—in the vein of El Greco—and the studies of "Gitanas."

JOHNS HOPKINS UNIVERSITY (*see* 15.460).—The period from 1910 to 1925 was one of marked expansion. The productive endowment rose from some $4,500,000 to more than $21,000,000. The faculty grew from 189 to 394, with 67 additional instructors in the afternoon, evening and summer courses; students from 752 to 4,260 (2,601 not being candidates for degrees); the library from 148,242 to 273,652 bound volumes. Frank Johnson Goodnow, of Columbia University, constitutional adviser to the Republic of China, succeeded Ira Remsen as (third) president in Oct. 1914. Upon an initial state appropriation of $600,000, continued by annual grants of $50,000, a School of Engineering was opened in 1913, with instruction in civil, electrical and mechanical branches, extended in 1924 to include gas engineering, through gifts of the Southern Gas Assn. for five years. For this school two laboratories and a powerhouse have been erected.

In 1916 the move from the old site to Homewood was completed except for chemistry, which occupied its new laboratory in 1924. The tract is expertly developed, the arrangement of buildings a Latin cross, the style Colonial. A war memorial dormitory was opened in 1923 in the name of the alumni. An ingeniously equipped laboratory in plant physiology, botanical garden and arboretum, athletic fields and concrete grand-stand complete the development to 1925.

In 1909 the university, in co-operatoin with Goucher College, initiated college courses for teachers (now the College for Teachers); in 1911, summer courses; in 1916, evening courses, without degrees, for technical workers and in business economics. Extension to other state centres was authorised in 1917. A School of Business Economics, providing academic training for business careers, and conferring the degree of Bachelor of Science in economics, was opened in 1922.

Teaching in Medicine.—Medical development was pronounced in this period. The university received from 1913 to the present, gifts and grants to about $20,000,000. The clinical departments of medicine, surgery, pediatrics, obstetrics, psychiatry and ophthalmology were placed on a full-time basis. The General Education Board led with several large grants in all these cases, besides two laboratories—the new Hunterian (1915) and the pathological (1923)—and $3,000,000 for expansion now in process, including central heating plant (1925). Capt. Joseph R. DeLamar, who died in 1918, left bequests amounting to over $3,700,000 to date. In 1923, $2,000,000 was voted by the Carnegie Corp. for a new dispensary, and a similar amount was raised to endow the university Dept. of Psychiatry and the Phipps Psychiatric Clinic at the Johns Hopkins Hospital, one-half coming from the founders, Mr. and Mrs. Henry Phipps. In 1925, the Wilmer Ophthalmological Institute, named after the first director, Dr. William Holland Wilmer, with endowment of the university Dept. of Ophthalmology, was established at the hospital on a fund of $3,000,000 raised. Advanced ophthalmological training in America is thus for the first time possible. The university has also profited from the establishment of the three other clinical institutes at the hospital, Harriet Lane Home for pediatrics (1912), Brady Urological Institute (1914) and the Woman's Clinic for obstetrics (1923), all teaching hospitals staffed from the school.

In 1918, under the direction of Dr. William H. Welch, assisted by Dr. William H. Howell, former dean of the School of Medicine, a School of Hygiene and Public Health was opened, with an annual grant from the Rockefeller Foundation, which in 1922 became an endowment of $5,000,000, with another million for a building, which was completed and occupied in 1925. This is the only institution of its kind in the United States, and, placed alongside the Hospital and the School of Medicine, it creates one of the strongest medical centres in the Americas. The main objects of this school are to train for public health work, promote investigation and disseminate sound hygienic knowledge. The degrees granted are Doctor of Public Health, Doctor of Science in Hygiene and Certificate in Public Health. Of the 150 students enrolled in 1924–5, 42 came from foreign countries. In 1925 the Institute of Biological Research was established on a five-years' grant from the Rockefeller Foundation, and in the same year announcement was made of the Walter Hines Page School of International Relations, a pioneer memorial to a former fellow. A minimum endowment of $1,000,000 was being sought in 1925, and it was announced that the school was expected to open in 1927.

Scientific Expeditions.—The university dispatched four scientific expeditions abroad during this period, two botanical to Jamaica in 1910 and 1919, and two geological to South America, for the first detail cross-section of the Andes, in 1919 and 1924, while a fifth, to the Near East for archaeological exploration and excavation (1924), was under the conduct of a faculty member. Publication was very active, a current report recording some 600 printed contributions a year.

War Services.—The institution's service in the World War was prompt, notably its staffing of Base Hospital No. 18, which crossed with the first contingent and provided the A.E.F. with its chief consultants in medicine, surgery, genito-urinary diseases and medicine to the Air Service. An ambulance unit was

organised. Schools of navigation and marine engineering, under the Shipping Board, were operated. The laboratories were turned over to experimentation, while large numbers of the faculty and students scattered to a great variety of service, field and civilian. Twenty-four, who made the supreme sacrifice, are memorialised on marble in Gilman Hall. (M. L. R.)

JOHNSON, HIRAM WARREN (1866–), American politician, was born at Sacramento, Cal., Sept. 2 1866. He entered the University of California, but did not finish his course. He became a reporter, at the same time studying law in his father's office; was admitted to the bar 1888, and practised with his father and his brother in Sacramento. In 1902 he opened an office in San Francisco, where he became widely known in 1906–7 for the vigour and success with which, as prosecuting attorney, he proceeded against dishonest public officials and corporations. He was elected Governor of California for the term of 1911–5; and in 1912 was an unsuccessful candidate for vice-president (on the ticket with Theodore Roosevelt), as nominee of the National Progressive party, which he had helped to organise. As governor he signed in 1913 the Webb anti-alien bill, designed to prohibit the ownership of land in California by Japanese, although the President had asked for delay. He was re-elected governor 1915–0, but resigned in 1917, having been elected a U.S. Senator. He opposed many of the policies of President Wilson's administration and declared that a league of nations would involve the United States in European wars. At the Republican National Convention in 1920 he had considerable support as presidential candidate, especially from those opposed to the League of Nations and the Treaty of Peace as submitted to the Senate. He was re-elected U.S. Senator for the term 1923–9.

JOHORE: *see* MALAY STATES.

JOINTS AND SINEWS: *see* MANIPULATIVE SURGERY.

JONES, ROBERT EDMOND (1887–), American theatrical designer, was born at Milton, N.H., Dec. 12 1887. He graduated from Harvard University in 1910 and began designing scenery for the theatre in New York City the following year. He attracted attention by the boldness and originality of his conceptions and exerted a marked influence in American theatrical art. Among the plays for which he designed the stage settings were *The Man Who Married a Dumb Wife*, for Granville Barker (1915); *The Jest* (1919), *Richard III* (1920) and *Macbeth* (1921), for Arthur Hopkins; *The Birthday of the Infanta* for the Chicago Opera Association (1920); and *Beyond* and *Desire Under the Elms* for the Provincetown Playhouse (1924). He published with K. MacGowan *Continental Stagecraft* (1922) and *Drawings for the Theatre* (1925).

JONES, THOMAS RUPERT (1819–1911), British geologist (*see* 15.500), died at Chesham, Bucks. April 14 1911.

JONESCU, TAKE (1858–1922), Rumanian statesman, was born at Ploesci Oct. 26 1858, and after studying law in Paris was in 1884 elected a deputy. He was Minister of Public Instruction and Finance in various Conservative Cabinets until 1908 when he founded the Conservative-Democratic party. In 1912 his group formed a Coalition Cabinet under Maiorescu, in which Jonescu was Minister of the Interior. He represented Rumania at the Peace Conference of Bucharest in 1913, and in 1914 he negotiated at Athens the peace between Greece and Turkey. When the World War broke out, Jonescu was, from the first, in favour of intervention on the side of the Allies. In 1918 he went to Paris, and as head of the Rumanian national committee he contributed greatly to the re-integration of Rumania in her rights as an ally when Germany was finally defeated. Jonescu was appointed foreign minister in April 1920, in the Averescu Govt. and, together with Dr. Benes and Ninčič, the Czechoslovak and Yugoslav foreign ministers, he laid the foundation of the Little Entente (*q.v.*). In Dec. 1921 he was entrusted by the King with the formation of a new Cabinet on the understanding that he should endeavour to govern with the same Chambers. This proved to be impossible and on Jan. 18 1922 he resigned. He died in Rome June 21 1922.

JORDAN, DAVID STARR (1851–) (*see* 16.406), American educationalist and naturalist, was born at Gainesville, N.Y., Jan. 19 1851. He studied at Cornell University and at the Indiana Medical College. He was instructor in botany at Cornell 1871–2, and professor of natural history at Lombard University, Ill., 1872–3. He taught in the Indianapolis high schools 1874–5, in which latter year he was appointed professor of biology at Butler University, Indianapolis. In 1879 he became professor of zoology at Indiana University, of which institution he was made president in 1885. In 1891 he was appointed president of Leland Stanford Jr. University, becoming its chancellor in 1913 and retiring in 1916. He was a member of the U.S. Fish Commission, 1877–91, 1894–1909; U.S. Commissioner in charge of fur, seal and salmon investigations for Alaska; and international commissioner of fisheries for Canada and the United States, 1908–10. He was active in promoting the cause of international peace, being chief director of the World Peace Foundation, 1910–4, president of the World's Peace Congress, 1915, and vice-president of the American Peace Society.

He was the author of a large number of books, among which are *Fishes of North and Middle America* (with B. W. Evermann, 4 vol., 1896); *Evolution and Animal Life* (with V. L. Kellogg, 1907); *World Peace and the College Man* (1914); *Classification of Fishes* (1922), and *Days of a Man* (autobiography in two vol., 1922).

JORGA, NICOLAS (1871–), Rumanian historian and statesman, was born at Botosani June 17 1871. At the age of 13 he was already writing articles on foreign politics in the *Românul*, a provincial newspaper. At 19 he finished his university studies in Jassy and went to Paris, Berlin and Leipzig. In 1894 he was appointed professor of universal history at the University of Bucharest. A man of great culture, Jorga made extensive researches in libraries and archives abroad and collected notes referring to the history of the Rumanian nation. As a result of his researches, he published over 20,000 documents in the *Annals* of the Rumanian Academy, of which he became one of the most prominent members.

Jorga produced numerous biographical and historical works, as well as many volumes on Rumanian art, towns, monasteries and historical monuments. He wrote several plays (historical dramas and comedies) which form part of the repertory of the Rumanian national theatres. He became also the director of *Neamul Românesc*, the official organ of the National Rumanian party. Jorga was for many years the chief of the nationalist party, which fused with the National party of Transylvania and the followers of Take Jonescu under the name of the National Rumanian party.

Among his best known works are: *Geschichte des rumänischen Volkes* (1905); *Geschichte des osmanischen Reiches*, 5 vol. (1908, etc.); *The Byzantine Empire* (Engl. trans. by A. H. Powles, 1907), and *Histoire des états balcaniques jusqu'à 1924* (1925). He also wrote numerous historical works in French, Italian and Swedish.

JOURNALISM: *see* NEWSPAPERS.

JOUVENEL, HENRI DE (1876–), French politician, was born in Paris April 2 1876. Having secured his degree in philosophy, he adopted a political career. Secretary of the committee of democratic conferences in 1900, he was made *chef de cabinet* in the ministry of justice in 1902, and *directeur de cabinet* in the ministry of commerce in 1905. He entered journalism shortly afterwards as chief correspondent on *Le Matin*. In Jan. 1921 M. de Jouvenel was elected Senator for the Corrèze. As member of the foreign affairs commission, he played an important part in the debates of the Senate, and attracted much attention by his ardour and outspokenness. He was chosen by M. Poincaré in 1922 to represent France on the Assembly of the League of Nations where he was instrumental in admitting Abyssinia to the League, and took an active part in the work of the commission of intellectual co-operation. He again represented his country in the League in 1924, and also became Minister of Public Instruction in the second Poincaré Cabinet in the same year. In 1925 he was appointed French high commissioner in Syria in succession to General Sarrail, whose administration had been signalised by serious disturbances. De Jouvenel at once set himself to the task of pacification, but realising the need of amicable relations with neighbouring countries he went to Angora early

in 1926 and prepared a treaty with Turkey to be ratified by the French Government.

JOWETT, JOHN HENRY (1864–1923), British divine, was born near Halifax, Yorkshire, Aug. 25 1864. He was trained for the Congregational ministry at Airedale College, Bradford, the University of Edinburgh and Mansfield College, Oxford. In 1889 he was elected minister of a Congregational church at Newcastle-upon-Tyne, which pastorate he held until 1895 when he was chosen to succeed Dr. R. W. Dale at Carr's Lane Chapel, Birmingham. During the 15 years of his ministry there his reputation as a preacher grew steadily, and his name became known, not only throughout Great Britain, but also in America. In 1911 he went to the United States to become pastor of Fifth Avenue Presbyterian Church, New York. After the signing of the Armistice in 1918, he returned to London as minister at Westminster Chapel, Buckingham Gate, London. In 1920 his health began to fail, and two years later he was obliged to retire. He died Dec. 19 1923. In the course of his career he was chairman of the Congregational Union and president of the Free Church Council.

Jowett published a number of books of a devotional character, including *The High Calling* (1909); *Our Blessed Dead* (1909); *The Whole Armour of God* (1916); *The Friend on the Road* (1921); *Life in the Heights* (1924). See A. Porritt, *John Henry Jowett* (1924).

JOYCE, JAMES (1882–), Irish author, was born in Dublin Feb. 2 1882, and was educated at Clongowes Wood College, Belvedere College, and at University College, Dublin. His first published work was a small volume of lyrics, *Chamber Music* (1907). *Dubliners*, a set of tales and studies of Dublin personalities, followed in 1914, a novel, *A Portrait of the Artist as a Young Man*, in 1916, and *Exiles*, a play in 1918. Meanwhile Joyce had left Ireland, and lived abroad, in Rome, Zurich, Trieste and Paris. In 1922 appeared the fruit of his work between 1914 and 1921, *Ulysses*, published in Paris. This book, conceived and executed on a very ambitious scale, attracted much attention among critics and men of letters, in France as well as in England and America, as a portent of certain modern tendencies in the development of the novel; but its legally restricted sale, apart from its grammatical, verbal and moral difficulty, has left it little known to the general public.

JOYNSON-HICKS, SIR WILLIAM (1865–), British politician, eldest son of Henry Hicks, of Bexhill, was born on June 23 1865. The additional name of Joynson was assumed on his marriage in 1895 to Grace, daughter of Richard Hampson Joynson, of Chasefield, Bowdon. From 1888 he practised as a solicitor in London. He contested N. Manchester (1900) and N. W. Manchester (1906) as a Conservative, both unsuccessfully, but in 1908 he won the latter seat from Mr. Winston Churchill, who had sought re-election on his appointment as President of the Board of Trade. At the first general election of 1910, however, he was defeated. He returned to Parliament in 1911 as member for the Brentford division of Middlesex, and from 1918 represented the Twickenham Division. During the latter days of Mr. Lloyd George's administration Sir William—he had been created a baronet in 1919—was prominent among those who favoured the withdrawal of the conservatives from the Coalition, and in the Conservative Govt. which was formed by Mr. Bonar Law in 1922 he was successively Parliamentary Secretary to the Overseas Trade Department, Postmaster-General and Paymaster-General and Financial Secretary to the Treasury (with a seat in the Cabinet). When Mr. Baldwin succeeded Mr. Bonar Law as Prime Minister (1923), he became Minister of Health and, in Mr. Baldwin's second administration (1924) he was appointed Home Secretary. Sir William took an active part in the affairs of the Church of England and was recognised as one of the lay leaders of the Evangelical party. He did valuable work in connection with the development of automobilism in Great Britain—notably as chairman of the motor legislation committee of the House of Commons—and is the author of *The Law of Heavy and Light Mechanic Traction on the Highways* (1906).

JUBALAND, East Africa, formerly a province of Kenya Colony. On June 29 1925 the sovereignty over some 36,000 sq. m., the greater part of the province, and including the port of Kismayu, was transferred from Great Britain to Italy. Trans-Juba (Oltre Giuba) the ceded territory, which adjoins Italian Somaliland, was placed under a high commissioner, directly dependent on the Colonial office in Rome. Before the transfer the river Juba (*see* 15.531) formed the frontier. The valley of the Juba is fertile, the rest of the area is semi-arid. The inhabitants (some 150,000) are Somalis whose chief wealth is in cattle and camels. (*See* KENYA; SOUTH AFRICA: HISTORY.)

The British White Paper *Treaty Series No. 29 (1925)* gives the text of the Anglo-Italian treaty and a map. See also R. Cani, *Il Giubaland* (Naples, 1921).

JUDAISM: 1910–25 (*see* 13.186).—It is no exaggeration to say that the 15 years under review have been to Israel a period of woe and disaster, as well as of consolation and hope, such as no similar period since the Dispersion.

Russia.—The darkest part of the picture is Russia, the fountain in modern times of the old Jewish life and, before the War, the home of one-half of the world's Jewish population. When the period opened, Mendel Beilis, and with him Judaism as a religion and the whole Jewish people, stood arraigned in the courts of the Tsar at Kieff to answer the hideous charge of ritual murder. In vain the friends of humanity in England, France and Germany protested that this accusation of religious cannibalism was an utterly baseless libel on Judaism, an insult to Western culture, and a dishonour to those who formulate it. The Russian bureaucracy recoiled from no means that would insure the conviction of Beilis, as it would have furnished a convenient apologia for pogroms, past and future. However, in Nov. 1913, an all-Russian jury acquitted Beilis.

One other instance to show the atmosphere in which Russian Judaism had to live during the last years of the Romanoffs. In the same year, at the International Congress for the Suppression of the White Slave Traffic held in London, Hertz called the attention of the world to the infamy of the Tsarist "yellow ticket," by which any Jewish woman, if she was willing to be registered as a prostitute, was permitted free and unrestricted residence throughout the Empire; whereas all other Jews and Jewesses were confined to the pale of Settlement, which was one of the fiercest battlegrounds of the World War.

The Jewish cities were taken and retaken by the rival armies, with attendant bombardments, burnings and pillagings. Added to these were the summary expulsions and calculated inhumanities which the Russian military authorities perpetrated against the Jewish population. As a result, scores of important communities were ruined, and their religious institutions, their rabbinical academies, together with every form of Jewish cultural activity, destroyed to their foundations. Of the surviving communities, hundreds were later annihilated during the massacres of the Jewish population in the Ukraine during the years 1919–21, massacres that for thoroughness and extent are surpassed by those in Armenia alone.

The Russian revolution completed this break-up of Russian Jewry and its religious life. At first constitutional, the revolution brought full religious emancipation to all, but in the unique persecution of all religion that began soon after the Bolshevists came into power, Judaism had to suffer most. Jewish communists have, from the first, taken a sinister delight in the proscription of all Jewish religious teaching—whether in the rabbinical colleges, in the elementary religious schools or even in homes. Synagogues were confiscated and converted into workmen's clubs (as late as Sept. 14 1925), and even into stables.

During 1925 the bitter fight against religion seemed to have relaxed somewhat, and Christian and Mahommedan bodies are now allowed to give religious instruction to small "groups" of their children after school hours. In the case of Jews, however, two children have been declared to constitute a school, and subject to the dire penalties for teaching religion or Bible to children at a school. Religious instruction is therefore given clandestinely, underground or in lofts and at midnight, as in the days of the Inquisition. In Dec. 1925 two teachers were sentenced at Kieff to six months imprisonment with hard labour

for this offence; and 200 children were imprisoned at Vinnitza, Podolia, for refusing to betray the name and whereabouts of their religious teachers. Zionists were pursued with a Tsar-like ferocity, hundreds of them having been banished to Siberia. The use of Hebrew as a bourgeois language is suppressed.

These persecutions called forth among the faithful remnant a new fervour and a deeper self-sacrifice for their faith; but Jewish institutional religion became paralysed in Soviet Russia, and the religious outlook for the growing generation is dark indeed. Before the War, the intense religious and intellectual life of Russian Jewry was duly reflected in the works of a whole galaxy of rabbinical, Hebrew and Yiddish writers. With the outbreak of hostilities all Hebrew and Yiddish publications of any kind were forbidden. After the revolution there was a brief literary revival, which was soon strangled by the Bolshevists.

Poland, Baltic and Balkan States.—Jewish religious life has in the main resumed its pre-War aspect in Poland, the Baltic and the Balkan countries, despite the economic ruin of a large portion of the Jewries wrought by racial hatred and social unrest in those politically immature states. In Poland a widely ramified net of Hebrew-speaking schools, both elementary and secondary, has been founded by the *Tarbuth* organisation, and is recognised by the Government. In Greece, the only large, and autonomous Jewish community of Salonika is declining in consequence of the failure of the Greek Govt. to keep the solemn pledges it gave to respect the Jewish Sabbath. Its important rabbinate is unfilled. In Turkey, the status of all religions has undergone violent transformation under the secularising Kemalist *régime*. The activities of the Chief Rabbinate, which hitherto had practically the same powers as the Patriarchates of other denominations, were limited to ecclesiastical matters, and the congregations were organised on autonomous lines. The Chief Rabbi, Chacham Bashi Bijerano, introduced far-reaching reforms in the Jewish law of divorce. These have, however, not found recognition with the rabbinic authorities of other lands.

France and Central Europe.—Judaism in France has been strengthened by the accession of the important religiously conservative congregations of Alsace-Lorraine; as well as by the Moroccan communities now under French control. In 1924, the Grand Rabbi of France, M. Israel Levi, appealed to the leaders of east European orthodoxy to consider the enactment, in accordance with rabbinic law, of modifications in certain aspects of the Jewish marriage and divorce law (Agunah). Italian Jewry found itself threatened by the new education law, with its compulsory Catholic instruction.

Even a graver danger is its dearth of native rabbis. In Geneva Jewish questions of great religious consequence are often discussed. In Feb. 1925 a proposal was submitted to the League of Nations Commission of Inquiry into the reform of the calendar to introduce" blank days" (*i.e.*, the last day or days of the year to be considered outside the calendar). As one result of this would be a constantly backward moving day of rest, the proposal was strongly and successfully opposed by the representatives of the Jewries of the East and of the West. In Germany, Czechoslovakia, Austria and Hungary, the War and the dire conditions that followed it are responsible for the impoverishment of the Jewish schools of learning and the thinning of the ranks of the scholars and students.

Literature.—Among the noteworthy productions in the study of Judaism written during this period by Central European scholars are the works of the neo-Kantian philosopher Hermann Cohen, *Die Religion der Vernunft aus den Quellen des Judentums* (1919), the magnum opus of Immanuel Loew, *Flora der Juden*, of Simon M. Dubnow, *Weltgeschichte des Jüdischen Volkes* (World History of the Jewish People) in 10 vol. appearing in German and Hebrew (1925, etc.), of Ismar Elbogen, *Der Jüdische Gottesdienst*, on the Jewish Liturgy (1913), of S. Krauss, *Talmudische Archäologie*, 3 vol., on Jewish life in Talmudic times, and the *Monumenta Talmudica* (1914, etc.). The following savants died in the period under review: Wilhelm Bacher, Abraham Berliner, David Hoffmann, D. H. Müller, A. Harkavy, A. Epstein, Hermann Cohen and Jakob Guttmann.

British Empire.—In England Dr. Hermann Adler, the Chief Rabbi of British Jewry, died in 1911, and was succeeded by Dr. J. H. Hertz. In 1913 a Yeshivah—an institution devoted exclusively to Talmudic instruction—was for the first time opened in London. After the cessation of hostilities a comprehensive educational scheme was launched as a Jewish war memorial; and in 1920 the Chief Rabbi started on the first pastoral tour ever undertaken to the Jewish communities of the British overseas dominions. The Liberal Jewish movement, inaugurated at the beginning of the century, finally established itself by the erection of a synagogue in 1925. An attempt to attach a Liberal wing to Jews' College—the theological seminary of the Orthodox congregations—met with strong opposition. In Anglo-Jewish scholarship there are Principal Büchler's learned monographs; Israel Abrahams' *Studies in Pharisaism and the Gospels* (1917, etc.); Jacob Mann's *Jews in Egypt* (1920–2); and M. Gaster's *Exempla of the Rabbis* (1924). *The Pharisees* (1924) —by R. T. Herford, a Christian scholar—is a remarkable achievement. Israel Zangwill has produced a translation of Ibn Gabirol's Poems, *Selected Religious Poems* (1923); Nina Salaman, of Yehudah Halévy; and Dr. A. Cohen, of Berakhoth, *The Babylonian Talmud* (1921). Among popular works, there are C. G. Montefiore's books *Liberal Judaism* (1903–24) and the Chief Rabbi's anthology, *A Book of Jewish Thoughts* (1917 and 1920).

The United States.—The 3,600,000 Jews of America have now their own English version of the Bible, the result of many years' labour on the part of a group of scholars, among them Solomon Schechter and Joseph Jacobs. America has acquired great Jewish libraries, that of the New York Jewish Theological Seminary (including the Elkan Adler collection) being the largest in the world. The older rabbinical colleges are workshops of Jewish learning. To these have been added the Yitzchak Elchanan Yeshivah and the Jewish Institute of Religion, representing the two religious poles in American Judaism. Of scholarly works, there appeared Schechter's *Studies in Judaism*, third series (1924), H. Malter's *Saadia Gaon* (1921), J. Jacobs' *Jewish Contributions to Civilisation* (1919) and Israel Davidson's *Thesaurus of Mediaeval Hebrew Poetry*, vol. i. (1924).

The New Diaspora.—Eastern European Jewish emigrants, fleeing from racial hatred and economic ruin, find the doors of the United States all but barred and bolted to them. In consequence, they are scattered and dispersed to distant lands where grave dangers await their Jewishness and Judaism. Outside the Argentine Republic, the fresh arrivals find in most Latin-American countries little organised Jewish life and, too often, total abandonment of Judaism on the part of the earlier settlers. The Jewish Colonisation Assn. of Paris appointed I. Raffalovich as Grand Rabbin of Brazil to lay the religious foundations of the new Jewish centres in the youngest diaspora. Mention must also be made of the praiseworthy efforts of Dr. J. Faitlovich to bring the forgotten Jewish tribes of Abyssinia—the Falashas—into touch with the general body and religious currents of European Jewry.

Palestine.—The brightest spot on the Jewish horizon throughout this period is Palestine. The beginnings of the Jewish revival in the Holy Land date from long before the Balfour Declaration, when Eliezer ben Yehudah began his gigantic undertaking to make Hebrew the language of everyday speech, as well as of instruction in schools. One half of his monumental *Dictionary of the Hebrew Language, Ancient, Mediaeval and Modern*, was published in his life-time. Palestine became the home of Ahad Ha'am—the philosopher of Zionism—and of Ch. N. Bialik, the great neo-Hebrew poet. A Rabbinate for the whole of Palestine was called into existence, with A. I. Kook (Ashkenazi) and Jacob Meir (Sephardi) as joint Chief Rabbis. A Communities' Ordinance will, it is hoped, be promulgated, providing a democratic religious organisation for the Jewish population of the Holy Land.

The zenith of the spiritual revival was reached when the Hebrew University was opened by the Earl of Balfour on April 1 1925. It may be some time before the Jerusalem University fulfils the hope of being the sanctuary of the Jewish genius;

but a land focuses a people and calls forth, as nothing else can, its spiritual potentialities. It is the ardent faith of the architects of the New Palestine that the resurrection of the Jewish people on its own soil will reopen its sacred fountains of creative energy. As of old, only a remnant will return to the land of their fathers. But it is the national rejuvenation of that remnant that may open a new chapter in the annals of the human spirit. *See* JEWS.

BIBLIOGRAPHY.—*Reports*, for the years 1911–25, of the London Jewish Board of Deputies, Anglo-Jewish Assn., and the American Jewish Committee. The surveys of the year in the *American Jewish Year Book* in *Jahrbuch für jüdische Geschichte und Literatur*, and in *The Jewish Chronicle* at the end of the Jewish Year. General summaries of the Jewish situation covering longer periods are presented in the opening addresses at Zionist Congresses and in those of the Chief Rabbi at the Conferences of Anglo-Jewish Preachers. See J. H. Hertz, *Decade of Woe and Hope* (1923). (J. H. H.*)

JUDD, CHARLES HUBBARD (1873–), American psychologist, was born at Bareilly, India, Feb. 20 1873. He came to the United States in 1879, and graduated from Wesleyan University, continuing his studies at the University of Leipzig (Ph.D., 1896). He taught philosophy and psychology at Wesleyan University, New York University and the University of Cincinnati, 1896–1902. From 1902 to 1909 he was a member of the faculty of Yale University, becoming professor of psychology and director of the psychological laboratory. In 1909 he was appointed professor and head of the department of education and director of the school of education at the University of Chicago, where he served also for a period as chairman of the department of psychology. He took part in educational surveys of Cleveland, Denver, St. Louis, the States of Texas and Utah and the New York State rural survey.

His published works include *Psychology, General Introduction* (1907); *Psychology Laboratory Course* (1907); *Psychology of High School Subjects* (1915); *Introduction to the Scientific Study of Education* (1918); and *Psychology of Social Institutions* (1926).

JUDICIAL REFORM.—By judicial reform is here meant changes in municipal law which have for their object the classification and simplification of law or improvement in the administration of justice. It includes, therefore, the more orderly expression of the law as well as changes in the training and qualifications required of members of the bar in the organisation of courts and in judicial procedure. On the other hand, the term does not include those changes in municipal law induced by changes in political, social or economic conditions. The article deals only with the United States, as changes in this direction in other countries from 1910 to 1926 have not been very serious.

Characteristics of the Bar in the United States.—Since the close of the Civil War (1865) judicial reform in the United States, though encouraged and in a sense started by general public criticism of existing conditions, has been carried out only as the result of the efforts of the legal profession.

A member of the bar in the United States is one who has a right to practise in one or more courts of record. The bar in the United States or in any state is not a legally organised body. While each member of the bar of a court has, as such, rights and duties, the members as a group are not a corporation and do not as a body have any privileges or duties. They have not the right to exclude others from being admitted to practice, or even to determine the standards which must be complied with by those seeking the right to practice. They have not the right to establish rules for the regulation of the fees to be charged clients nor to prescribe the conduct to be followed by members of the bar in the practice of law, and they cannot disbar any member of the bar for unethical conduct.

Sources of Judicial Reform.—Judicial reform in the United States, therefore, has come, not through an officially organised bar with definite legal powers, but rather as the result of the action of voluntary associations of members of the legal profession—judges, practitioners and law teachers.

These voluntary law associations are of two kinds—selective and scientific. There are over 400 selective bar associations. These choose their members from the lawyers within a definite territory rather than from the practitioners at a particular court, though, practically, they never admit a person who is not a member of the bar of some court. Thus, there is a national bar association known as the American Bar Assn. founded in 1878, and a state bar association in each of the states, as well as local bar associations in all the large cities and in many of the counties. There has been no integration of these associations. A lawyer may be a member of the American Bar Assn., his state association and his local county or city association. As the name under which they are here classified indicates, these associations are all organised on the selective principle. The fact that a person is a member of the bar of a particular court, as for instance, the bar of the highest court of his state, while it may be a prerequisite for admission, does not entitle him to membership in a bar association. Before admission to a particular bar association his application must be passed upon by a committee of the association, the thoroughness of the scrutiny varying with different associations and in the same association at different times.

With the exception of a few local associations which date from the first part of the 19th century nearly all the local, as well as all the state bar associations, and also the American Bar Assn. have come into existence since the close of the Civil War. The several scientific legal societies are the American Institute of Criminal Law and Criminology, the American Society of International Law, the American Judicature Society and The American Law Institute. All are of comparatively recent origin. They are all nation-wide in membership and each has been founded to carry on investigation and promote improvement in law, either generally or with reference to particular subjects. Besides these associations the Assn. of American Law Schools, composed of some 60 schools conforming to certain standards of admission, organisation and conduct, has done much to promote improvement in legal education.

The American Bar Assn. and practically all the state and nearly all the local bar associations have committees which from time to time submit to their respective associations drafts of proposed legislation relating to the organisation of the courts or to procedure and other matters pertaining to judicial reform. If the association approves the draft, the committee will be authorised to submit it to the Legislature of the state and urge its adoption. Rules of court, as well as legislative changes in procedure and cognate matters, usually have their origin in the action of these bar associations.

Classification of Recent Judicial Reforms.—In recent years such judicial reforms as have taken place in the United States may be classified as follows:—

1. Those designed to elevate the character and improve the efficiency of the members of the bar.
2. Those designed to improve court organisation.
3. Those designed to unify, clarify or simplify existing law.
4. Those designed to improve procedure.

Reforms Designed to Improve the Efficiency and Elevate the Character of Members of the Bar.—The existing requirements for admission to the bar are usually a general education equivalent to graduation from a high school (the school in which students prepare for college or university), followed by three years of legal study either in a law school, or in a lawyer's office. Two states require at least a year in a lawyer's office irrespective of the amount of law school training received, and in some of the southern states the required period of legal study is still only two years. Comparing the present requirements with those of the last quarter of the 19th century a decided elevation of standards and improvements in the methods of examination is observed. This has been due in the main to two factors: the development of good law schools in the majority of the states, especially the schools connected with the great state universities where the tuition is practically free, and the activities of the selective bar associations. Nearly all of these associations have committees on legal education and admission to the bar and in many states these committees have been active in urging on courts and Legislatures the necessity for more stringent requirements. In this movement for the elevation of educational standards the American Bar Assn. has taken the lead.

The legal training of the would-be practitioner being now, especially in the larger centres of population, left almost exclusively to the law schools, the selective law associations are taking a constantly increasing interest in the ethics of members of the bar. A code of legal ethics has been formally adopted by the American Bar Association. In some of the larger cities committees appointed by the local judges at the instances of the bar association make an exhaustive examination of the history of each applicant for admission with the view to determining his character. There is in most of the counties and in the larger cities a committee of censors either appointed by the judges or by the local bar association. These committees receive complaints against attorneys, and where they believe the complaints well founded and the matter serious, institute in the courts proceedings for disbarment.

Reform in the Organisation of State Courts.—The unit of state court organisation in the United States was, and largely still is, the county or a unit called the judicial district composed of one or more counties. The principal trial court of each county or district is independent of similar courts in other counties or districts of the state. From each of these county or district courts there is an appeal on questions of law to an appellate court of state-wide jurisdiction. In some states there are two appellate courts, one for cases involving comparatively small amounts, and in some other states a system of intermediate appellate courts, the case on appeal going from the trial court first to the intermediate appellate and finally to the highest court.

As legal business in the larger states increased the first tendency was to create two or more county courts with co-ordinate jurisdiction in the counties in which a city was situated. Thus, in the city of Philadelphia, which is territorially co-terminus with the county of the same name, there are five separate courts each having identical civil jurisdiction.

The striking feature of the state court organisation in the United States is the absence of any co-ordination of the various state courts for the efficient carrying on of judicial business. Some progress has been made toward better co-ordination. In many states, as in New York, the state has been divided into judicial districts, each district including several counties, though the extent to which the courts in each district have been welded into a single and simple organisation varies. Again, in some states power has been given to the highest appellate court, or to the chief justice of such court to transfer temporarily a judge sitting in one county or district which has little judicial business to a county or district where the judges need assistance. There still remains, however, though in varying degree in the several states, much to be desired in the way of greater unification of court organisation.

Though little definite progress toward this goal has been made in the last 25 years, there now exists a general recognition of its importance. Perhaps on account of the difficulties involved, the initial steps toward better court organisation have come, not so much through the selective bar associations as through a single scientific legal association—the American Judicature Society. This society was organised in 1913. It has drafted acts establishing a unified system of courts for a large municipality and for a state as a whole. The reforms embodied in these acts usually involve changes in state constitutions as such constitutions invariably contain at least the general framework and often the detailed organisation of the state courts. The more recent state conventions called to draft new state constitutions have embodied in part at least the suggestions of the society, but the constitutions themselves have failed of adoption, though the failure cannot be ascribed to the embodiment of the reforms suggested but rather to a general reaction on the part of the electorate against any constitutional changes. In Louisiana a partial adoption of the suggestions of the society has been effected, and one city—Detroit—has adopted a unified criminal court, the only one in the country.

Though the record of the attempts to adjust court organisation to the needs of modern America is significantly small, there is every sign that the next decade will witness considerable progress, and this because there has already been adopted in several important states acts which create judicial councils with power to collect data concerning judicial administration and the operation of the rules of procedure.

Reform in the Organisation of the Federal Courts.—The Federal courts, other than the Supreme Court of the United States, were re-organised by the Act of Congress of March 3 1911. Prior to the Act, while continental America was nominally divided into nine judicial circuits, the real division for all practical purposes was the district, a much smaller unit. In each district there was a district court and a circuit court, the district court having Federal criminal jurisdiction and jurisdiction in a few classes of civil cases. The circuit courts were the principal Federal civil courts of first instance. There was an appeal directly from the district and circuit courts to the Supreme Court of the United States. The Act referred to abolished the circuit courts, made the district court a court of first instance in practically all Federal civil and criminal matters and divided the United States into nine circuits, with a circuit court of appeal in each circuit to act as an intermediate appellate court on questions of law. The re-organisation of the lower Federal courts has proved of very considerable practical advantage while the establishment of the circuit courts of appeal has greatly relieved the Supreme Court. Had such relief not been given, the great increase in the number of Federal cases, owing partly to the natural growth of the country and more especially to the adoption of prohibition and its enforcement by Federal statute, would have created a congestion of cases in the Supreme Court which would have indefinitely delayed all appeals.

Reforms Tending to Unify Existing Law—The existence of 48 separate state jurisdictions naturally leads in practice to a wide diversity in legislation. Again, while all the states, except Louisiana, have the English common law as modified to meet local conditions, there is no Federal supreme tribunal to reconcile conflicting interpretations of the common law by the highest courts of the several states, and therefore, there exists a very considerable diversity in the law. The fact that land law, or the law of inheritance, or even the criminal law varies from state to state causes little or no inconvenience. The United States, however, has attained a remarkable degree of uniformity in economic and social conditions. Economically and socially it is one nation. Diversity in commercial law, therefore, or the law of personal property, or the law of marriage and divorce is a fruitful source of much inconvenience and considerable injustice. One of the objects of the formation of the American Bar Assn. was to promote uniformity of legislation and of judicial decision throughout the United States. The group, who in 1878 founded this association, as early as 1881, began to take steps to effectuate this purpose.

The principal outcome of their efforts was the establishment in 1892 of the National Conference of Commissioners on Uniform State laws. This conference is composed of delegates appointed by the governors of the several states, usually under state Acts authorising the appointment. As its name indicates, its object is to draft statutes which it recommends to the state Legislatures for adoption. In 1925 the conference had drafted during the 33 years of its existence 34 Acts. Many of these Acts which deal with commercial subjects have been widely adopted not only by the states but by Alaska and the island possessions of the United States—the Negotiable Instruments Act by 54 jurisdictions; the Warehouse Receipt Act by 48; the Bills of Lading Act by 26. The experience of the conference would seem to show that it takes from 20 to 25 years from the adoption of a uniform commercial Act by the conference before it is generally adopted in all the more important states. The conference is not confining its activities to the preparation of commercial Acts. Its Desertion and Non-Support Act has been adopted in 21 states. On the other hand, its draft Act relative to judicial procedure in divorce and its draft Acts dealing with social legislation have met with little acceptation, though many of the provisions of such an Act as the Child Labor Act have been incorporated into subsequently adopted state statutes on the subject.

The Clarification and Simplification of the Common Law—Work of The American Law Institute.—Perhaps the most important of the legal institutions which the United States owes to England is the common law system of expressing and developing law. The fundamental feature of the system is the general judicial recognition that a decision of a court in one case has a degree of binding force when later a case arises which presents similar or analogous facts. The common law is the law developed and expressed by judicial decisions. As a whole the decisions of the English and American courts form one of the two great systems of law in force in the world to-day, the Roman Law, the ultimate principal source of the codes of continental Europe and Central and South America, being the other.

The characteristic difference between a principle of law founded on decisions of the courts and a principle expressed in a statute is that the former, or common law principle, is never absolutely binding on a court. The power that makes can always modify if the strict application of the prior rule to the instant case would, in the opinion of the court, produce injustice. The common law, therefore, has a flexibility which the law of statutes and codes does not possess. This flexibility often prevents injustice. Systems of law, however, as human beings, have the defects of their qualities. There is an element of uncertainty in the common law from which law expressed in properly drawn statutes is free. This uncertainty has not often proved a serious defect when the law is expressed and developed by one court or group of courts organised in a unified system. But in the United States with 48 separate state jurisdictions and a large number of Federal courts distinct from the state courts, the conflict between the decisions in different states and between the states and the Federal courts, as well as the uncertainty as to the law in any one state, produces the most unfortunate consequences. When law is uncertain persons with just claims hesitate to assert their rights while opportunity is given to the party with an unjust claim or defence to begin or prolong litigation. Besides all this the common law system tends to accumulate a bewildering mass of precedent.

The multiplication of decisions regarded as precedent is a growing evil even where the precedents are confined to the decisions of a single jurisdiction. But in the United States there are 48 separate state jurisdictions, each with its separate system of courts, as well as the entirely separate system of Federal courts. The reported decisions in the United States already number (1926) approximately 700,000 cases recorded in about 11,000 volumes, and to this mass there is being added annually some 153,000 printed pages. To this accumulation of American precedent must be added the decisions of the English courts and the courts of other parts of the British Empire in *pari materia*, any one of which may be cited as persuasive authority in an appropriate case. It has become manifest that the whole common-law system threatens to fall through the accumulation of an undigestible amount of authority.

The conditions described have given rise to an attempt on the part of the American legal profession to preserve the common-law system by producing an orderly expression of the common law, which, though it will not have the binding force of statute law, will at least be regarded as having an authority far superior to that accorded any existing legal treatise.

The organisation undertaking the execution of this work is The American Law Institute, founded in 1923. The institute is a voluntary organisation with two classes of members—life members and official members. The number of life members is limited to 750, the membership being confined to the leading judges and lawyers in the several states. The official members are the members of the Supreme Court of the United States, the chief judge of the court of last resort in each state, the senior judge of each of the nine Circuit Courts of Appeal, the deans of the law schools belonging to the Assn. of American Law Schools, the president and principal officials of the American Bar Assn., the presidents of the state bar associations and the presidents of the principal scientific legal societies. The orderly expression of the common law on which the institute is engaged is called the Restatement of the Law.

The work on this Restatement has been (1926) under way for three years. Already tentative drafts of parts of the law of Contracts, the law of Torts, the law of Agency and the law of Conflict of Laws have been printed and distributed to the members and to the profession generally for criticism and suggestion with a view to improvement. The plan of work adopted is to have the preliminary drafts prepared by a reporter for the consideration of a small group of persons especially cognisant of the subject of the draft. When the smaller group of experts has, by conference and discussion, produced a draft satisfactory to it, the draft is sent to the council of the institute, a body of some 33 judges and lawyers of national reputation, and later, as amended by the council, the draft is distributed as a tentative draft to the members of the institute. The object of this elaborate machinery is not only to insure that the final draft when officially published shall be well done, but that the legal profession as a whole, especially the leading members thereof, shall have such a part in its preparation that they will feel responsible for the work and give to it on final publication that authority which it is essential it should possess if it is to counteract the existing tendency toward uncertainty and confusion as to what the law is.

Whether regarded from the point of view of expenditure of money, time or skilled professional labour, no work of equal importance or magnitude has ever been undertaken by the members of any legal profession. Indeed, the only work to which it can be compared is the work on the Code, the Digest and the Institutes of the Roman law by Tribonian and his associates undertaken at the direction of the Emperor Justinian. That work, however, as well as the modern Code Napoléon and the more recent codes of the nations of continental Europe and South America have had behind them the sanction of the state. The analogous work on the common law on the other hand, is being undertaken by the lawyers of America as a voluntary enterprise, though they have turned to one of the great public foundations—The Carnegie Corp.—for the necessary financial assistance.

(W. D. L.)

The Reform of Procedure

Inheriting from the colonies, which in turn had copied and adapted it from familiar English sources, the early courts of the several sovereign states followed the system of procedure in lawsuits known as English common-law pleading, a system based upon writs or forms of action, through which certain rights could be enforced in formal manner. The rapid territorial extension of jurisdiction and the growth of cities, with corresponding complexities in the nature of rights to be asserted and wrongs remedied, soon began to cause gradual modification in each state by statutes passed from time to time, as shortcomings in the simple legal machinery of formerly rural communities were apprehended. There was no uniformity in these efforts, but generally speaking, such legislative alterations were limited in scope, probably because usually inspired by difficulties arising in specific cases, and the principal outlines of common-law pleading remained intact. During the first half of the 19th century, the chief result of these improvements was to permit some fusion of the forms of equity with common law.

However, in 1848, New York adopted a Code of Civil Procedure introducing a system of procedure and pleading which was rapidly copied by other, and adopted by new, states until to-day it is in use in well over half of all. This was the culmination of an agitation and effort for procedural reform largely led by David Dudley Field, based upon earlier writings of Jeremy Bentham in England, Edward Livingston in Louisiana, and Napoleon's Code of Civil Procedure. The objects of the New York Code whose provisions can be found almost verbatim in most other American procedural codes, were to consolidate all forms, writs and causes of action into one simple universally applicable form, to remove all distinctions between law and equity, to permit free joinder of parties and causes of action, and to substitute for the previously highly technical and formal language used in the written statements required of parties, a simple, cogent and natural style of expression more in accord with the practice of daily life.

With regard to all but the last of these objects, the code has been successful. Its benefits were felt even in England, where its example was persuasive in forwarding the reforms introduced by the Common Law Procedure Acts of 1852 and 1860, and later the great Judicature Acts of 1873 and 1875. These, in turn, influenced the American Codes, which, since their first enactment, have not remained static but have, just as has the procedure in the so-called common-law states, been frequently amended and, in some cases, improved, by legislative act. In many non-code states most of the procedural reforms of the codes have been adopted without wholly abandoning distinctions and formulas traditionally dear to practitioners trained to revere them.

While the Federal Courts in each state are required by the Conformity Act to follow the procedure of the state in actions at law, they are free of such restriction in proceedings in equity, and on that side their practice is uniform throughout the country. The Federal Equity Rules of 1912, promulgated by the Supreme Court in that year, are another landmark in the struggle for reform of procedure, simplifying and modernising, as they did, a technical but important class of litigations, not only locally but in every state in the Union.

Since the great period of commercial expansion which culminated in the Spanish-American War, the best minds at the American bar have more and more had forced upon them an appreciation of the inadequacy of the courts to dispose efficiently of the volume of work being brought into them. Inspired by the delays and uncertainties which marred the work of the regular courts of law, two strong movements away from the courts have manifested themselves. First is the tendency to create administrative quasi-judicial tribunals, manned presumably by experts and unhampered by the traditions and rules of evidence and procedure which strike the average layman and legislator as being responsible for the clumsiness of the courts. In Federal matters instances are the Interstate Commerce Commission, the Federal Trade Commission, the appeal boards for taxes and customs, and numerous minor bodies in government departments; in the individual states the Workmen's Compensation Boards and the Public Utility Commissions show a similar drift.

Insofar as such bodies relieve the courts of difficult and technical questions of fact, they are an unmixed blessing; at the same time it is unavoidable that they are creating, each in its peculiar field, bodies of precedent and law which are making ever more difficult and multifarious the science of jurisprudence. The second tendency away from the courts is the reaction of the business man rather than the legislator, impatient of the ignorance of juries and the stump speeches of eloquent counsel. This induces the growth of arbitration of commercial disputes by trade bodies or organisations on behalf of their members. Large classes of commercial differences are thus kept out of the courts and, as knowledge of the benefits to be gained by this method, and confidence in it, spreads, it will be more and more resorted to.

In another direction it has been sought to improve procedure by creating special courts such as courts for administration of estates of decedents, municipal courts with strictly urban jurisdiction, juvenile courts, domestic relations courts, conciliation courts and similar divisions. In these cases, the procedure prescribed is generally less elaborate and more expeditious and *ad hominem* than in the courts of general jurisdiction. To suppose, however, that there is satisfaction with the results so far accomplished is an error, for many influences are at work to negative the value of the real improvements which have been attempted.

To-day, the greatest promise for reform in methods of procedure lies in the spread of admiration in the U.S.A. for the success achieved by the English courts in simplifying procedure, under the system introduced in the Judicature Acts, by which procedure is regulated not by statutory enactment but by flexible rules made by the courts themselves. A strong movement has developed for the adoption of this system both in the Federal courts and in the state courts in the U.S.A., forwarded by the writings and utterances of Chief Justice William H. Taft and Mr. Elihu Root among public men, Dean Roscoe Pound of Harvard, Dean John H. Wigmore of Northwestern and Prof. Edson R. Sunderland of Michigan among scholars, Thomas W. Shelton of Virginia, Moorfield Story of Massachusetts and others among practising lawyers, and most of all, by the American Judicature Society and its secretary, Herbert Harley, under the munificent endowment of Charles F. Ruggles of Michigan. The success of the nation-wide improvement in Federal equity practice under the rules of 1912 has demonstrated the efficacy of this line of approach.

BIBLIOGRAPHY.—Roscoe Pound has prepared a complete bibliography of procedural reform which he has brought down to 1920 in the form in which it is printed in 5 Mass. *Law Quarterly*, 332. JUTLAND, BATTLE OF.—Called by the Germans the battle of the Skagerrak, this battle was fought in the North Sea between the British Grand Fleet, under Adm. Sir J. R. Jellicoe, and the German High Seas Fleet, under Adm. Reinhard Scheer, on May 31 1916. The scene of the main action was about 75 m. from the Dutch coast in the neighbourhood of lat. 57° N. long. 6° E. The encounter is memorable as being the only occasion throughout the World War on which the rival battle fleets met, also for the fact that it left the British fleet undisputed master of the German one up to the day of the latter's surrender. As a test of modern naval material it was prolific in lessons for both sides.

I. INTRODUCTORY

The movements of the fleets and squadrons were necessarily governed to a large extent by highly technical considerations, and the battle is not an easy one for the layman to follow without a painstaking study of its successive phases and the motives which produced them. Moreover, in order to obtain a true perspective of events it is necessary to keep in mind the following fundamental facts:—

(*a*) The Allied cause rested absolutely on the retention by Britain of that sea supremacy of which the Grand Fleet was the fulcrum.

(*b*) By the date of Jutland Germany's surface navy had already been rendered largely immobile and her mercantile marine had been swept off the seas.

(*c*) It was the definite policy of the British naval command to bring the German main fleet to action and annihilate it if possible, but there was no intention to gamble with the Allied fortunes by seeking an engagement in waters where mines, submarines and shore defences would give the enemy a definite advantage, nor under conditions where the outcome would be largely dependent on chance, such as a fleet action at night.

(*d*) It was the definite policy of the German High Command not to risk a decisive action until, by a process of attrition, the British forces might have become so weakened as to give good prospects of success.

(*e*) It was to pursue this policy of attrition that Scheer set out prior to Jutland, his object being to lure the British fleet out in the hope of falling on a section of it before it could be supported; but the last thing he intended or desired was to meet a united Grand Fleet.

The order of events can be conveniently summarised as follows:—

1. The German plan to entice the British fleet to sea while submarines were lying in wait for it, and in the hope of concentrating the High Seas Fleet on a detached part of it.
2. The sailing of the rival forces, neither realising the full significance of the coming impact.
3. The first contact and battle-cruiser action on the run south to the High Seas Fleet.
4. Beatty's run north leading the High Seas Fleet up to the Grand Fleet.
5. Jellicoe's main engagement with his combined Grand Fleet against the combined High Seas Fleet.
6. The German fleet's break-through the British destroyer flotillas at night, and the failure to send intelligence to Jellicoe which resulted in the escape of the enemy next day.

Situation before the Battle.—Adm. Jellicoe[1] has summarised the causes which led up to Jutland as follows:—

[1] Earl Jellicoe's Personal Narrative of the Battle of Jutland in *These Eventful Years*, p. 327.

Third Light Cruiser Squadron	4 Light Cruisers	Rear-Admiral Napier.
First Flotilla (part)	1 Light Cruiser and 9 Destroyers	Captain Roper.
Thirteenth Flotilla	1 Light Cruiser and 10 Destroyers	Captain Farie.
Ninth Flotilla (part)	4 Destroyers	Commander Goldsmith.
Tenth Flotilla (part)	4 Destroyers	Commander Hodgson.
Attached	Engadine, Seaplane Carrier	Lieut.-Commander Robinson.

1. The pressure of the British blockade had led to insistent calls for action by the German fleet.

2. Scheer, who had assumed command of the High Seas Fleet in Jan. 1916, was chafing under his enforced inactivity.

3. A strong protest from President Wilson had caused the withdrawal of German submarines from the trade routes and thereby rendered them available for enterprises of a military character.

4. Scheer may have been led to believe that the steps announced in England to prevent a recurrence of such episodes as the Lowestoft raid, indicated that some division of the Grand Fleet was intended.

While Scheer was planning a new attack on the east coast of England, certain changes had, in fact, been made in the distribution of the British forces. Jellicoe, with the main part of the Grand Fleet, was still at Scapa Flow awaiting the completion of the outer defences of the Firth of Forth before transferring his base to the more southerly harbour, but he had detached the 5th Battle Squadron of four fast "Queen Elizabeths"[1] to replace the 3rd Battle-Cruiser Squadron of three "Invincibles," which were at Scapa for gunnery practice, and sent them to reinforce Beatty's Battle-Cruiser Fleet at Rosyth. A third force, consisting of the 2nd Battle Squadron, 1st Cruiser Squadron and a destroyer flotilla, was based on Invergordon.

THE FORCES ENGAGED

The Grand Fleet.—Immediately prior to the battle of Jutland the following was the distribution and composition of the British forces which took part in the action:—

At Harwich were five light cruisers and about 20 torpedo craft under Commodore Tyrwhitt, and at Sheerness was the 3rd

1 "Barham," "Valiant," "Warspite" and "Malaya." The "Queen Elizabeth" herself was in dock.

Battle Squadron consisting of the "King Edward" and the "Dreadnought" flying the flag of Adm. Bradford. These two commands, however, took no part in the battle.

The High Seas Fleet.—The main German forces, in preparation for Adm. Scheer's project, had been concentrated in the Jade Basin. They were organised as follows:—

TABLE II. *German High Seas Fleet*

Unit	Ships	Commander
Fleet Flagship	Friedrich der Grosse	Vice-Admiral Scheer.
First Battle Squadron		
1st Division	Ostfriesland, Thüringen, Helgoland, Oldenburg	Vice-Admiral Schmidt.
2nd Division	Posen, Rheinland, Nassau, Westfalen	Rear-Admiral Engelhardt.
Second Battle Squadron		
3rd Division	Deutschland, Hessen, Pommern	Rear-Admiral Mauve.
4th Division	Hannover, Schlesien, Schleswig-Holstein	Rear-Admiral F. von D. zu Lichtenfels.
Third Battle Squadron		
5th Division	König, Grosser Kurfürst, Kronprinz, Markgraf	Rear-Admiral Behncke.
6th Division	Kaiser, Kaiserin, Prinzregent Luitpold	Rear-Admiral Nordmann.
Destroyer Flotillas	3rd, 5th, 7th and half 1st Flotillas	Commodore Michelsen.
SCOUTING FORCES		
First Scouting Group Flagship	Lützow	Vice-Admiral Hipper.
Battle Cruisers	Seydlitz, Moltke, Derfflinger, Von der Tann	
Second Scouting Group	6 Light Cruisers	Rear-Admiral Boedicker.
Fourth Scouting Group	5 Light Cruisers	Commodore von Reuter.
Destroyer Flotillas	2nd, 6th and 9th Flotillas	Commodore Heinrich.

Attached to the High Seas Fleet were sixteen U boats and ten "L" class airships, but these took no part in the action.

The following is a summary of the principal armaments of the capital ships of the rival fleets:—

In preparation for the execution of this scheme the U boats had already set out in order to be in their appointed stations by May 23, while some six or eight Flanders submarines had gone north to reconnoitre between Norway and the Firth of Forth. From that date to June 1 was the period during which it was intended to bring off the bombardment. But the weather continued to be unfavourable for airship reconnaissance. Scheer would not risk an advance on the English coast without ample warning of the approach of the British fleet, meanwhile the limit of endurance of his submarines was nearly spent.

TABLE III. *Comparison of British and German Capital Ships at Jutland and Their Main Armaments*

BRITISH					GERMAN		
No. of each Class	Total Turret Guns				No. of each Class	Total Turret Guns

37 Capital Ships	48	10	142	144	27 Capital Ships	192	52
	Total Turret Guns			344		Total Turret Guns	244

To sum up the British Fleet consisted of 37 capital ships, 8 armoured cruisers, 26 light cruisers and 80 flotilla leaders and destroyers. The German Fleet consisted of 27 capital ships, 11 light cruisers, 63 flotilla leaders and destroyers.

THE GERMAN PLAN

An order issued to the High Seas Fleet on May 18 ran as follows:—

The bombardment of Sunderland by our cruisers is intended to compel the enemy to send out forces against us. For the attack on the advancing enemy the High Seas Fleet forces to be south of the Dogger Bank, and the U boats to be stationed for attack off the East Coast of England. The enemy's ports of sortie will be closed by mines.

This order may be taken as defining the strategy of the enemy on the above date.

On May 30, when he could wait no longer, he abandoned the bombarding plan and ordered Hipper, with the Scouting Forces to sail next day and to demonstrate off the southwest coast of Norway. This he anticipated would soon be known to the British Admiralty, and he hoped, by following the Scouting Force with the battle fleet, but keeping out of sight until the enemy appeared, that he might fall on a detached portion of the Grand Fleet, which would probably be sent out to protect the cruiser patrol and shipping to the northward. But events turned out otherwise.

II. THE PRELIMINARY ACTIONS

The Grand Fleet Sails.—The British Naval Intelligence Dept. was, however, already aware both of the movement of German submarines and that there was a "certain liveliness" in the Jade Roads, and Jellicoe was warned that a large operation on the part of the enemy appeared to be imminent. At 5:40 P.M. on May 30 the commander-in-chief and the admiral commanding the Battle Cruiser Fleet were sent orders to proceed to the predetermined rendezvous eastward of the Long Forties[1] in readiness for eventualities. A warning was also sent to the Harwich Forces and 3rd Battle Squadron at the Nore. By 10:30 P.M. the three sections of the Grand Fleet had left their respective bases at Scapa Flow, Invergordon and Rosyth and were heading

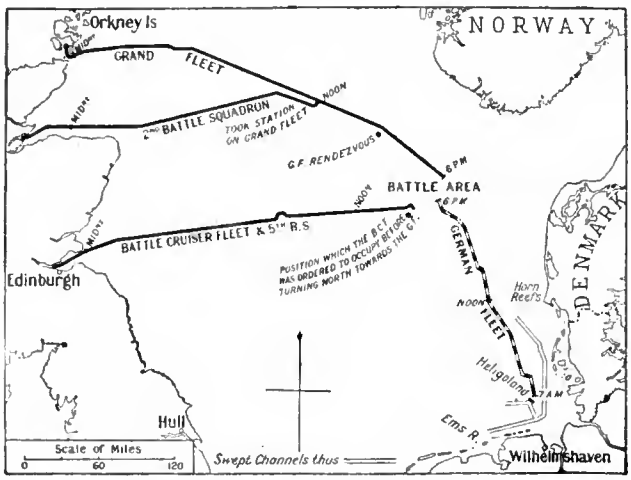

FIG. 1.—Approach of Rival Fleets.

out across the North Sea. The main battle fleet shaped course to a rendezvous in lat. 57° 45′ N. long. 4° 15′ E. where the forces under Adm. Jerram from Invergordon would meet him at 2 P.M. next day. Beatty, with the Rosyth force, was making for a point 69 m. S.S.E. of the battle fleet's position. (*see* fig. 1.) These dispositions would enable the battle fleet to intercept an enemy trying to attack the 10th Cruiser Squadron on the northern patrol, while the Rosyth force would guard against a raid.

When the British fleet put to sea 13 hostile submarines were lying off the coast; also U-67 was south of the Dogger Bank; and U-75, having laid the mines, which afterward sank the "Hampshire," was on her way home. The German submarines made few ineffective attacks; but in the main the under-water craft, as usual, proved unable to prevent free movement of the fleet.

To Jellicoe the position was by no means clear when he set out. The evidence pointed to another cruiser raid being afoot, but a misleading telegram sent from the Admiralty during the forenoon of May 31 informed him that directional wireless signals placed the German fleet flagship in the Jade river, thereby leaving Jellicoe with the impression that there was no reason for undue haste and he regulated his speed so as to economise his destroyers' fuel consumption.

First Contact.—Hipper, with the scouting forces left the Jade at 2 A.M. on May 31 and steamed northward, keeping well out of sight of the Danish coast. Scheer followed 50 m. astern with the battle fleet. During the early morning the German commander-in-chief received wireless reports from his U boats, but these proved vague and misleading, so much so that far from gleaning that a combined advance was being made by the British forces, he alludes to "our hope of meeting with separate enemy divisions" as being "likely to be fulfilled."[2]

At 2 P.M. Beatty, having arrived at his rendezvous, prepared to turn north in accordance with his instructions. Then followed one of those seemingly trivial events which are sometimes destined to have momentous issues. A stray merchant steamer attracted the attention of Commodore Alexander-Sinclair in the "Galatea," on the eastern wing of the light cruiser screen. He stood on to the E.S.E. to examine her. Simultaneously the "Elbing," on the western wing of the German scouting force, sighted the same steamer and detached a destroyer to investigate. Another instant and the rival warships had seen each other. At 2:20, just as Beatty had turned to the northward, "Galatea" hoisted the signal "enemy in sight." (See fig. 2.) The result was to hasten a meeting which otherwise would, most probably, have occurred further North and therefore nearer the British battle fleet. Beatty at once set out to cut off the line of retreat of the enemy's light cruisers towards Horn Reefs, but finding that they were apparently following the "Galatea" to the northwest, he hauled round more to the northward. He had been steering northeast for some 10 minutes when the heavy smoke of Hipper's five battle cruisers was sighted on his starboard bow, whereupon he turned back to the east.

Owing to the greater visibility to the westward, Hipper had already sighted the six British battle cruisers, and now realised that they were heading to cross his stern and cut off his line of retreat, and that he must hasten to fall back on the battle fleet. Beatty, knowing nothing of the greater forces to the south, could only regard this as a golden opportunity for getting to grips with the enemy. There followed a hot running fight to the southward between the opposing battle cruisers. The 5th Battle Squadron under Rear-Adm. Evan-Thomas which had been stationed five miles astern, panted after them trying to get into action. (*see* fig. 2.)

THE BATTLE CRUISER ACTION

At 3:34 Beatty formed the battle cruisers into single line, increased to 25 knots and made for the enemy. About this time the "Engadine" sent up a seaplane which reported Hipper's course south. This is noteworthy as being the only occasion on which British aircraft was used throughout the operations, and the report failed to reach the battle-cruiser's flagship. At 3:45, however, the enemy could be made out distinctly from the "Lion," and Beatty formed his ships on a line of bearing north-

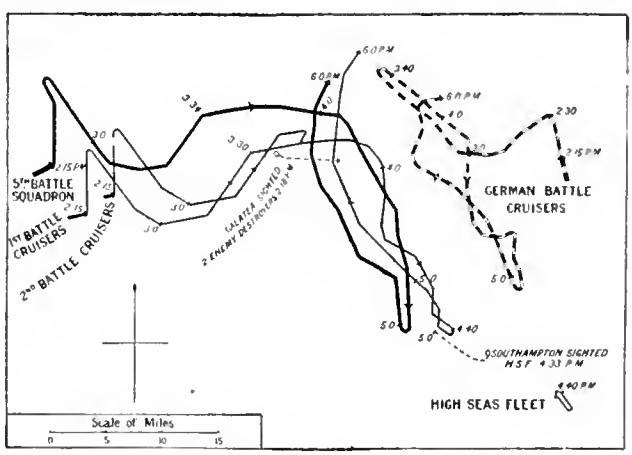

FIG. 2.—First contact and the Battle Cruiser Action. (2:15 P.M. to 6:0 P.M.)

west to clear the smoke and bring their guns to bear, while he turned to E.S.E. At about 3:48 fire was opened almost simultaneously on both sides at a range of approximately 16,000 yards.

The British battle cruisers were at considerable disadvantage, for they showed up well against the western sky, while visibility to the eastward was poor for observing their fire. German accounts agree that the British firing during this part of the action was somewhat ragged, while they pay high tribute to that of the 5th Battle Squadron when it got within range. The better protection of the enemy's battle cruisers and the better shell with which the heavy guns of his fleet generally were provided stood him in good stead, while the confusion in the interpretation of the signals for distribution of fire added to the disadvantages of the British battle cruisers.

[1] The Long Forties are about 60 m. east of the Scottish Coast.
[2] *Germany's High Seas Fleet in the World War*, Adm. Scheer, p. 141.

The range was rapidly decreasing as the courses of the rival forces converged. A few minutes after 4 P.M. the "Lion" was heavily hit by a shell from the "Lützow" which plunged into her midship turret and killed nearly the whole of the gun's crew. But for the presence of mind and devotion to duty of Major F. J. W. Harvey, R.M.L.I., who when mortally wounded saw to the flooding of the magazine, the flagship would doubtless have been destroyed. Up to this time, owing to a misunderstanding, the "Derfflinger" had been left unfired at, but was now engaged by the "Queen Mary." In the rear of the line the "Von der Tann" and "Indefatigable" were fighting a furious duel when a salvo of three shells from the former crashed into the vitals of the British ship; she fell out of the line sinking by the stern, at 4:06 P.M another salvo hit her and with a rending explosion she turned over and sank with her 57 officers and 960 men. Now came a moment's respite; both sides, finding the fighting too hot, decided to open the range, and soon the German shells were falling short and their fire ceased.

Meanwhile Evan-Thomas, by cutting corners, had manoeuvred the 5th Battle Squadron into range, and shortly after 4 o'clock the "Barham" opened fire on the "Von der Tann" at about 19,000 yards. In spite of the poor visibility the battleships' firing was very accurate, and Hipper had to take to zigzagging to dodge the great 15 in. salvoes. Nothing but the poor quality of the British shells, which burst without penetrating the enemy's armour, could have saved his rear ships from destruction. The van of the German line was not long out of action.

At 4:10 Hipper turned inwards two points while Beatty, having established sufficient overlap, started to press his way to the eastward again. The effect was to close the range rapidly and the engagement was fiercely renewed.

The "Lion" seems to have been still enveloped in the smoke of her burnt-out turret, and practically invisible, with the result that she was left in peace while the "Seydlitz" concentrated her guns with those of the "Derfflinger" on the "Queen Mary." The latter was fighting gallantly when at 4:26, a salvo crashed into the "Queen Mary" forward, a red flame shot up and an explosion rent her asunder. In another instant only a great pall of smoke marked the grave of this noble ship and her 57 officers and 1,209 men.

About this time a subsidiary battle was being fought between the lines. The 13th Destroyer Flotilla, having attained a suitable position, was launched to attack. At the same moment a German flotilla advanced into the arena making for the 5th Battle Squadron. The two flotillas met; the enemy destroyers fired twelve torpedoes at long range and hastily retired before the superior gun-fire of the British craft. Evan-Thomas swung his Battle Squadron away two points and safely avoided the torpedoes. Part of the British flotilla chased the fleeing enemy towards the van of the German battle cruisers, while Commander Bingham in the "Nestor," followed by the "Nicator," pursued those making for the rear. When within 5,000 yd. of the "Lützow," the two destroyers fired their torpedoes, but Hipper adopted the same dodging tactics and swung his ships away while the torpedoes ran clear or fell short of their mark. The gallant pair of destroyers pressed on and fired more torpedoes at a range of only 3,500 yd. under a hail of shell from the enemy's secondary armament. The "Nicator" escaped, but the light cruiser "Regensburg" appeared suddenly from behind the battle cruisers and crippled the "Nestor" with two shots in her boiler. The "Nomad," another destroyer, was also hit and left helpless between the lines. Another small force of British destroyers had accounted for two of their opponents, "V.27" and "V.29," when at 4:43 the "Lion" ran up the destroyers' general recall. Events suddenly took a new and dramatic turn. To Hipper, sorely pressed ahead and astern, came welcome and timely relief. The German battle fleet was in sight.

German Battle Fleet in Sight.—The head of the German battle fleet was first sighted by the "Southampton" in which was Commodore Goodenough leading his 2nd Light Cruiser Squadron about two miles ahead of the "Lion." At 4:33, he made the signal "battleships southeast." Holding boldly to his course he was soon able to identify the High Seas Battle Fleet in full array. Mindful of the extreme importance of his information, he sent a wireless message direct to Jellicoe. Within ten minutes of this signal being dispatched the commander-in-chief had quickened the pulses of his own great command with the signal "enemy battle fleet is coming north."

Goodenough stood down to within 13,000 yd. of the enemy so that he could identify him in detail before turning north under a hail of shell fire. An admirable piece of cruiser work had not only galvanised many and far distant forces into activity, but it had crystallised the whole position for the British commands. Beatty also held his course until the German battle fleet was in sight, then, at 4:40, he turned 16 points in succession and started the run north, assuming the rôle of the pursued instead of that of pursuer. To Scheer it seemed as if his opportunity to fall on a detached part of the British fleet had come, but Beatty was happy in the knowledge that if the enemy was not frightened off prematurely he would be confronted with the whole Grand Fleet.

Fortunately Hipper was too occupied with the British destroyers' attacks to be able to take advantage of the target presented by the British battle cruisers as they wheeled in succession round the same point. By 4:50 Beatty with his line now reduced to four ships had straightened up on a northerly course and was re-engaging his late enemy. Hipper had just resumed his southerly course, after turning away from the British destroyers, when a torpedo hit the "Seydlitz" tearing a huge hole under water and putting a 15 cm. gun out of action. The ship's stout construction saved her, however, and she kept her place in the line. By 5 P.M. Hipper, too, had turned 16 points to the northward and taken up his station ahead of the battle fleet. Meanwhile the 5th Battle Squadron could not see the "Lion's" flag signal to turn about. Adml. Evan-Thomas saw Beatty turn, but was intent on hanging on to the rear of the enemy's battle cruisers, who were still on a southerly course, with the result that the two British squadrons passed each other at high speed. The "Lion" now repeated the signal to turn, direct to the 5th Battle Squadron, but before it could be obeyed, that squadron found itself under the guns of the German battle fleet.

Evan-Thomas turned 16 points at practically the same instant as Hipper, but in the process the "Barham" received a heavy shell which cost her casualties and the use of her wireless gear. The rear battleship of the line, the "Malaya," was a target for at least a whole division of enemy battle ships and suffered even more severely.[1] For some 20 min. she was straddled again and again and received serious damage below the waterline, but held on and eventually the whole squadron forged ahead and got clear. A plucky attempt by the destroyers "Onslow" and "Moresby" to attack the enemy battle cruisers just as they had turned north was defeated by the German light scouting group, but the "Moresby" stood on to within 8,000 yd. of the enemy's battle fleet and fired a torpedo at the third ship of the line; it did not take effect, but both destroyers escaped miraculously under a very hot fire. Scheer continued to hasten north after the apparently hard-pressed British squadrons. As he did so the motionless "Nestor" and "Nomad" came drifting down between the lines. They scorned surrender and fired their last torpedoes at the oncoming battleships but without effect. A moment later they were overwhelmed in a storm of shell. The undaunted "Nestors" gave three cheers for their sinking ship and sang a verse of "God Save the King" before the crews took to boats and Carley rafts, from which they were chivalrously rescued by enemy destroyers.

Once the 5th Battle Squadron had shaken off the German battle fleet the firing slackened. At 5:40 Hipper's squadron reappeared out of the mist and there was a temporary burst of firing from the British battle cruisers and the leading battleships, but Beatty was intent on joining his commander-in-chief and was reserving his forces for the greater issues impending.

1 "Barham" lost 26 killed and 37 wounded, "Malaya" 63 killed and 33 wounded.

III. THE MAIN ACTION

Meeting of the Battle Fleets.—Coming down from the north-west was Jellicoe in the "Iron Duke," at the head of a centre division of his six lines of battleships, each in single line ahead at manoeuvring distance apart. Directly ahead of him was the 4th Light Cruiser Squadron which with the destroyer flotillas was acting as an anti-submarine screen. Further ahead and spread for scouting were the 1st and 2nd Cruiser Squadrons. Twenty-one miles to the eastward were Hood's three ships of the 3rd Battle Cruiser Squadron, with two light cruisers and four destroyers.

Up to 2:45, the fleet had been steaming at economical speed, but, with the arrival of wireless messages indicating the presence of an enemy to the southward, the commander-in-chief increased to 17 knots and ten minutes later to 18 knots. Course was shaped southeast by south for Horn Reefs as previously arranged. At 3:59, as soon as he learnt that the enemy's battle cruisers had been sighted, Jellicoe increased to 20 knots and then sent Hood on to Beatty's support, so that when the report was received that the enemy's battle fleet was coming north there was nothing better to be done at the moment than to stand on as he was doing. The battle fleet was closed up in cruising formation, and it would have been useless, indeed dangerous, to deploy into line of battle until it was known on what bearing the enemy would be met. The leaders of divisions were already disposed at right angles to the most likely line of bearing on which to sight the enemy in order that they might wheel their ships into line with a minimum of delay. So the rival battle fleets approached, charging towards each other at a rate of nearly 40 knots, but as yet out of sight.

When in due course contact was made it did not come about quite as Jellicoe expected. The "Iron Duke" and "Lion" had communicated their respective positions from time to time, but zig-zagging and many other alterations of course had caused both flagships to be out in their reckoning. The "Iron Duke" was in fact some $4\frac{1}{2}$ m. ahead (*i.e.*, to the southeastward) and the "Lion" $6\frac{3}{4}$ m. to the westward of their estimated positions as they approached each other. The reports of the enemy received by the commander-in-chief were therefore somewhat perplexing, and by the time it became evident that the German Battle Fleet would be met on a starboard bow bearing instead of right ahead it was too late to alter his dispositions. Hood, also, was thrown out in his calculations. Steering as he thought to join Beatty he found himself on the opposite side, *i.e.*, to eastward of the enemy. It was at this juncture that fighting broke out with renewed vigour.

At 5:40 the Battle Cruiser Fleet converging on the 1st Scouting Group, from the westward, saw the "Lützow" and her consorts emerging from the mist. Fire was opened at a range of about 14,000 yards. This apparently disconcerted Hipper, who turned away to the eastward. Hardly had he done so before he heard the guns of the 3rd Battle-Cruiser Squadron engaging his 2nd Scouting Group. The trap was closing in on him, but as yet he was unaware of the far greater menace to the northward; but he seems to have sensed danger and at 6:34, hotly pursued by Beatty, he turned southeast only to see his light cruisers being attacked by four British destroyers. These latter he took to be the forerunners of the British Battle Fleet and, now thoroughly alarmed, he doubled right back to southwest to seek the cover of his own battleships. In fact what he had seen were Hood's light forces. These had been hotly engaged with Boedicker's 2nd Scouting Group. In the initial skirmish the "Chester"[1] was badly mauled by the German light cruisers, but they in turn suddenly found themselves overwhelmed by the fire of the three "Invincibles." The "Wiesbaden" was reduced to a wreck and the "Pillau" and "Frankfurt" were badly damaged and only escaped by using their torpedoes, which forced Hood to turn away and break off the pursuit.

The destroyers which Hipper had seen were part of the 4th flotilla. Led by the "Shark," they gallantly went for the "Regensburg" and nine or ten enemy torpedo craft which seemed to be preparing to attack the 3rd Battle-Cruiser Squadron. In the course of this encounter the "Shark" was severely battered and eventually sank, fighting to the last under her mortally wounded captain, Commander Loftus Jones.[2] Hood avoided this attack by turning his squadron sharply to starboard; and almost at the same instant he sighted the "Lion" racing up from the westward. He turned to meet her and then swung his squadron into station ahead of the Battle Cruiser Fleet and led the line on a south-easterly course. Jellicoe was left in doubt until the very last minute as to the exact position of the enemy. Somewhere to the southward was the High Seas Fleet, but between him and his adversary were battle cruisers, cruisers and destroyers belching smoke and gun fire and obscuring his view. Beatty, hot on the heels of his own particular quarry again, had lost sight of the enemy battle fleet and at the moment could not answer the commander-in-chief's urgent enquiry. Nine minutes the latter waited, then at 6:10 repeated his question "Where is enemy's battle fleet?" The first definite information came from the "Barham," now rapidly closing with the 5th Battle Squadron from the southwest. She reported "Enemy's battle fleet S.S.E." At 6:14 the "Lion," having regained touch, reported it too, bearing S.S.W.

The Deployment (see fig. 3).—Within a minute of the "Lion's" report, Jellicoe had ordered the fleet to deploy on the port or easterly column. The manoeuvre was a vital one and the commander-in-chief made a masterly decision. Had he followed his

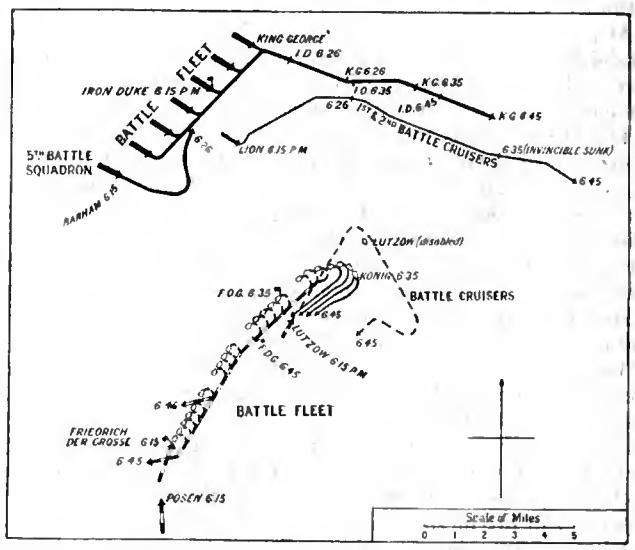

FIG. 3.—Deployment of British Battle Fleet, and first retirement of German Fleet. (6:15 P.M. to 6:45 P.M.)

natural inclination to deploy to starboard, *i.e.*, on the side toward the enemy, the ships on that wing would have found themselves at grave disadvantage; the enemy would have been able to concentrate his fire on them while they would have been masking the other columns until each could turn up in rear in succession. Moreover, the head of the British line would have had to make a sharp turn to port at once to prevent the enemy crossing the "T." It is not too much to say that had Jellicoe made a wrong decision at this moment irretrievable disaster might have followed. As it was the Grand Fleet was placed at the outset in a position of overwhelming tactical advantage.

The deployment, it will be seen, developed in the form of an obtuse-angled "L," one arm of which steadily lengthened to envelop the head of the enemy's line, while, during the process, the British ships could give each other the maximum of support. The battle cruisers hurried to their station at the head of the line, the 5th Battle Squadron slipped into place astern, cruisers and destroyers automatically took up their pre-arranged positions. The whole was a magnificent piece of fleet work, the culmination of fine organisation and training and a clear indication

[1] Boy Jack Cornwell was awarded a posthumous V.C. for his exemplary conduct in this action.

[2] Awarded a posthumous V.C.

of a high standard of leadership on the part of the flag officers commanding the several divisions and squadrons.

But now a tragedy occurred in the foreground of this impressive scene. Up to the moment of deployment Arbuthnot in the "Defence" with his 1st Cruiser Squadron had been scouting ahead of the battle fleet, but on contact being made, it became his duty to engage the enemy's cruisers. Boedicker's 2nd Scouting Group was faintly visible to the southward and, followed by the "Warrior," Arbuthnot turned to pursue them. He was about to deliver a *coup de grâce* to the now blazing and disabled "Wiesbaden," when out of the mist came both the British and German battle cruisers hotly engaged. Holding on tenaciously, close across the bows of the "Lion," the two cruisers soon found themselves in a hurricane of fire as Hipper endeavoured to cover the stricken "Wiesbaden." Two great salvoes hit the "Defence" in quick succession and at 6:19 Arbuthnot and his flagship disappeared in a sheet of flame. The "Warrior" limped away, and was only saved for the time being by the battleship "Warspite" performing an involuntary circle round her, owing to the sudden jamming of the latter's steering gear. Clear of the fighting, the sea-plane carrier "Engadine" made a brave effort to tow her home, but the "Warrior" had to be abandoned at 7 A.M. the following morning and eventually sank.

As the cloud of smoke over the spot where the "Defence" had gone down rolled away, the full measure of his peril was revealed to Scheer. The High Seas Fleet was heading into the crook of the rapidly extending arm of the whole combined British Battle Fleet. It seemed to Jellicoe a glorious opportunity to fall on his enemy and crush him. The signal was actually hoisted for the Grand Fleet to close, when the commander-in-chief realised that his line had not yet straightened out, and the battle cruisers were not yet clear of his van; to turn to S.S.E. by subdivisions, as he wished, was not practicable at the moment. He had to cancel the signal and hold on on a course which nevertheless sharply converged with that of the enemy battle fleet.[1]

Now yet another misfortune befell the British. Proudly leading the 10-m. line of capital ships, was Hood in the "Invincible." Having closed to a bare 9,000 yd., she was furiously engaging the "Derfflinger," hitting her again and again with well directed salvoes, when the "König," leading the van of the enemy battle fleet, came to the rescue of the battle cruiser. Once again the plunging shell sought the vitals of the lightly armoured British ship; the "Invincible" was torn asunder, her stem and stern rising high out of the water before she disappeared (6:34). With her went Hood, who had so finely upheld the traditions of his historic name, and his splendid crew of over a thousand officers and men. The British battle cruisers had indeed suffered heavily. Valuable as their work had been in bringing about the main action, they were clearly unsuited for "in-fighting." From now onwards they rightly confined themselves to harassing the van of the enemy when opportunity served, leaving the battleships to take the shock of closer contact. But close contact was the last thing Scheer was seeking. He was in a trap and needed all his wits to escape impending disaster.

The possibility of such a situation had not been overlooked by the German commander-in-chief, and he had practised his command in a manoeuvre known as the *Gefechtskehrtwendung*, which was really an "emergency retirement." In this the destroyers dashed out, fired their torpedoes "into the brown," and put up a smoke screen while each big ship did a right-about turn and retreated precipitately. This manoeuvre he ordered when at 6:35 he found battleship after battleship of the Grand Fleet concentrating on the head of his line. It was not unattended with risk, but it was boldly ordered and skilfully executed. (See fig. 3.) In less than three minutes the evasive enemy had disappeared for the first time. The destroyer attack had not been pressed home, and, although some of the British battleship divisions swung away momentarily to avoid the torpedoes, the course of the fleet as a whole was not deflected. Burney's flagship, the "Marlborough," was hit by a torpedo, but the damage was not so great as to force her to leave the line. The German light cruiser "Wiesbaden," now the only enemy in sight, came under a heavy fire and in ten minutes, a blazing wreck, she sank from sight.

Jellicoe, too, had foreseen the problem which now confronted him, and he had not been alone in seeking, for some time past, a satisfactory solution; it was agreed by the highest tactical authorities that to follow directly in the path of an enemy's battle fleet in a position where it could obtain the maximum advantage from torpedoes and mines,[2] was sheer foolhardiness. In fact, he had already summed up the situation when he wrote "Nothing but ample time and superior speed can be an answer, and this means that unless the meeting takes place fairly early in the day, it is most difficult, if not impossible, to fight the action to a finish." In point of fact, so little was the Grand Fleet superior to the High Seas Fleet in speed that even had Jellicoe pursued it directly it is doubtful whether he would have caught up with it before nightfall. It was now 6:40. There remained little more than two hours daylight. The enemy was out of sight somewhere to the south and west, but another advantage which the deployment to port had given was the overlap to the eastward which the Grand Fleet had secured. (See fig. 4.) Jellicoe was therefore in a position to work his way steadily between the High Seas Fleet and its possible lines of retreat to the German coast, and this he proceeded to do. At 6:44 he turned his divisions southeast. Simultaneously Goodenough turned south and led his Light Cruiser Squadron to look for the enemy. By 7 he was able to report the hostile battle fleet bearing S.S.W.

Five minutes before this Jellicoe had altered course to south, and now, knowing that he was again in a position of considerable tactical advantage, he ordered a turn of "3 points to starboard together" to close more rapidly. About this time a number of reports of submarines were being made to the commander-in-chief. The "Lion" had just reported sighting one, the "King George V.," leading the battle fleet, sent a warning that a submarine was just ahead of the "Iron Duke," then the "Duke of Edinburgh" reported one "2 points from right ahead." It is now known that there were no submarines in the vicinity, but these reports could not well be ignored, so Jellicoe took the best course possible and turned directly towards the supposed menace. Incidentally this brought the course of the fleet back to south and re-formed the divisions into line ahead, the leaders being disposed quarterly. Hardly was the turn completed before the enemy reappeared out of the mist.

The Battle Fleets Re-engage

Having extricated his fleet from one trap it seems incredible that Scheer should have deliberately walked into another (see fig. 5). In his official despatch[3] he says: "It was as yet too early to assume night cruising order. The enemy could have compelled us to fight before dark, he could have prevented our exercising our initiative, and finally, he could have cut off our return to the German Bight." If ever there was a man who wanted to avoid decisive action it was the man who penned those words, yet in the next paragraph of his despatch he makes the illogical statement: "There was only one way of avoiding this: to deal the enemy a second blow by again advancing regardless of the consequences, and to bring all the destroyers to attack." The manner in which the High Seas Fleet renewed the action was such that its course was practically at right angles to that of the Grand Fleet, whose battleships were stretched across his bows so that they could concentrate on the leading German ships, while those in rear trailed astern out of action. The evidence goes to show that Scheer hoped to pass astern of the British line and thence make his way to the eastward, possibly engaging a detached force en route. If he had succeeded, he could then have made for

[1] The Grand Fleet deployed on a course southeast at 6:15. The deployment (excluding the 5th B.S.) was completed by about 6:40. The German battle fleet approached on a northeasterly course. At 6:27, the "König," leading battleship, turned east, the remainder following in succession (see fig. 3).

[2] Adm. Jellicoe had been informed by the Naval Intelligence Dept. that the German capital ships were known to carry mines.

home, fighting a rearguard action with the attendant difficulties for his enemy.

But Jellicoe had forestalled him. The British Battle Fleet was fair across his path and, in the low visibility prevailing, the commander-in-chief had not risked dividing his forces. First some enemy light cruisers appeared to the southwest of the "Iron Duke." A few minutes later, at 7:12, the 1st Battle Squadron at the northward end of the line was seen to open fire. The "Marlborough's" gunnery efficiency had not been impaired by her underwater injuries, and she discharged salvo after salvo at the "König" as the head of the enemy battle fleet came into sight. The rest of the squadron took up the engagement and soon the leading German ships were smothered in shell at a range of less than 9,000 yards. At 7:13 the "Iron Duke" came into action again. Once more the Grand Fleet was in a position of overwhelming tactical advantage and ship after ship joined her fire and picked out a battleship or battle-cruiser target as occasion offered. Meanwhile a small force of enemy destroyers had developed an attack which caused Sturdee to swing his 4th Division away two points to avoid their torpedoes. Directly the attack had expended itself, he turned back to the course of the fleet, approximately south, which brought him into line astern of the 3rd Division led by the "Iron Duke."

Jellicoe had been holding steadily on his course across the head of the enemy, but seeing his rear divisions in some danger of segregation he ordered them to form astern of him, while the "King George" was directed to lead the van into line ahead. And now the full fire-effect of the British battleships was rapidly developing, and Scheer saw that his leading ships were in danger of annihilation; another "right-about turn" was imperative. But the enemy seemed right on top and half round him. Drastic measures were necessary to get clear. The German battle cruisers would have to be sacrificed, if need be, to save the battle fleet. He made a signal to them which, read literally, meant "charge the enemy; ram; ships are to attack without regard to consequences." At the same time the destroyers, once again, were launched *en masse* to attack.

The "Lützow" had been completely disabled in the first contact of the main engagement, and was still ablaze and out of action. Hipper had not yet been able to get on board another battle cruiser, but Capt. Hartog, in the "Derfflinger" with the remaining three, led off gallantly on what the Germans have called a "death ride." To make matters worse, the British battle cruisers which had been working round on the outer arc of the circle, so to speak, were now coming into action again. So the enemy's 1st Scouting Group became the centre of a perfect hurricane of fire. The "Derfflinger" had two turrets shattered to bits and was being hit again and again, the "Seydlitz," "Moltke" and "Von der Tann" were also suffering severely when the welcome signal came permitting them to withdraw. By 7:20 the German Battle Fleet had repeated its former tactics and was retreating pell-mell to the westward behind a dense smoke screen put up by its destroyers. The latter pressed on to attack with more determination this time. There was no other enemy in sight so Jellicoe was free to concentrate his attention on this one. A heavy fire was opened on the oncoming torpedo craft which made them loose their torpedoes at long range. At 7:21 the British commander-in-chief swung his ships away in two quick successive turns of two points each before the torpedoes could reach the line. The result was that this attack was completely foiled. A second and third attack were countered by Commodore Le Mesurier's 4th Light Cruiser Squadron which, crossing from its station on the disengaged bow, drove furiously at the enemy. One German destroyer, "S.35," was sunk and several badly damaged. Jellicoe was, for the time being, in complete ignorance of what his main enemy was doing, but directly the torpedo attack had spent itself he, at 7:35, swung the fleet back five points to starboard and steered S.by W. (see fig. 4.)

Beatty had by now worked his way round to the starboard bow of the Battle Fleet and was heading southwest. At 7:40 he signalled to the commander-in-chief to say that the enemy was about 10 m. N.W. by W. But the "Lion" was quite out of sight from the fleet flagship, and her own position, as she gave it, was obviously wrong. Jellicoe, however, turned southwest, on the same course as his battle cruisers. At 7:45 Beatty again reported the position of the enemy, this time adding that the latter's course was about southwest. This signal was made to the "Minotaur" by searchlight, passed by her to the "King George V.," who passed it on to the "Iron Duke," where it did not arrive till 7:59. Jellicoe promptly turned the battle fleet west by divisions, and increased to 17 knots to regain touch with the

enemy. Hardly had he done so before a wireless message came to hand from Beatty saying: "Submit van of battleships follow battle cruisers. We can then cut off whole of the enemy's battle fleet." The commander-in-chief at once ordered Adml. Jerram to comply with this request, but, owing to the unavoidable delay in cyphering, transmitting and decyphering the message, the "Lion" had by then lost sight of the enemy; moreover, the battle cruisers were not in sight from the "King George V." In point of fact, the battle fleet was already steering straight for the enemy.

Although he had twice butted his head into trouble and twice withdrawn it considerably battered, Scheer was loath to be forced further to the westward and away from home. So, at 7:53, he hauled round and made his way tentatively to the southward. (*see* fig. 4.) Jerram had been somewhat at a loss to carry out his orders, but hearing gunfire on the port bow, he turned his division towards it, and at 8:21 was heading W.S.W. The firing came from Rear-Adml. Napier's 3rd Light Cruiser Squadron, which was engaging the 4th Scouting Group at the head of the High Seas Fleet. After a sharp conflict the enemy turned away and disappeared. Meanwhile, Beatty, who was also steering west, had again sighted the German battle cruisers and beyond them the pre-Dreadnought battleships steering south. He thereupon turned in succession to W.S.W. and opened fire. An attempt by hostile destroyers to attack the British battle cruisers was frustrated by Le Mesurier's light cruiser squadron. Beatty held on his course and was beginning to inflict severe punishment on the sorely stricken enemy battle cruisers; but they could stand no more, and, running out of action to the westward, sought cover behind the old ships of Admiral Mauve's 2nd Battle Squadron.

Meanwhile Jellicoe had good reason to be satisfied with the situation. His battle cruisers had made contact, he was between the German fleet and its own coast, and he seemed on the point of renewing the engagement. At 8:28 he turned by divisions to southwest and stood down on a converging course expecting momentarily to meet his adversary. But Scheer foresaw the impending collision, indeed his headmost ships were already in the track of the on-coming storm. He had no intention of suffering again from its full blast, and by 8:35 he had turned hastily to the westward and disappeared before the British battle fleet came in sight. So the firing died away and now the mists of night rolled down between the rival forces. It was past 9:00 before Jellicoe was fully informed as to the situation; then he received a message from the "Lion" reporting that at 8:40 the enemy's battle cruisers and pre-Dreadnought battleships bore from that ship N. 34° W. 10 to 11 m. and were steering southwest. Beatty at the same time made his position and gave his course also as southwest.

It was now an hour after sunset and growing darker every moment. The hazards of a fleet action at night were unthinkable to a wise commander. It only remained for Jellicoe to maintain his position between the enemy and the German coast until he could fight to a finish the next day. He therefore set about making his dispositions for the dark hours.

IV. EVENTS OF THE NIGHT

There were three potential lines of retreat for the High Seas Fleet. (*see* fig. 1.) The northerly one led to Horn Reefs, and thence down the swept channel inshore of the Amrun Bank minefield to the mouth of the Jade; the second would be reached by a southerly course to a swept channel which led eastward close to Heligoland; lastly, there was the swept channel which led from the vicinity of the Ems river parallel to the coast to the entrance into the Jade. (See fig. 1.)

Jellicoe's Dispositions.—At 9:17 Jellicoe ordered the fleet to take up night cruising stations. This meant that the battle fleet were to close up into three parallel columns with the 5th Battle Squadron, now consisting of three ships only,[1] on the port quarter. Beatty had already anticipated his commander-in-chief's wishes and having taken station ahead and placed the 1st and 3rd Light Cruiser Squadrons to the southward and westward of him, assumed the course and speed of the fleet; these were south, 17 knots. Five miles astern of the battle fleet Jellicoe massed his destroyer flotillas. This had the following advantages:—

(*a*) It covered the rear of the fleet from attacks by hostile flotillas.
(*b*) It increased the chances of intercepting the enemy should he endeavour to make to the eastward, and of obstructing his passage by torpedo attacks.
(*c*) It kept the Grand Fleet destroyers clear of their own battleships and therefore minimised the chances of disastrous mistakes in the dark.

The value of these dispositions was to some extent diminished by the difficulty of communicating their purport to commanding officers, especially those of the innumerable destroyers, but, in effect, the British fleet ploughing through the night presented a living wall of steel barring the enemy's passage home.

Scheer's Return.—Scheer also prepared for the night. His 1st Battle Squadron led the line and was followed by the 3rd Battle Squadron; then came the older ships of the 2nd Battle Squadron and lastly the three sorely wounded battle cruisers.[2] The light cruisers of the 2nd and 4th Scouting Groups were stationed near the head of the battle fleet, while in advance of all were the majority of the German destroyers groping like antennae into the darkness. About 9:30 Scheer started to feel his way to the eastward, the van of his line turning S.S.E.¼E., a course which headed for Horn Reefs. Shortly after 10:00 his advanced light cruisers came into contact with the right wing of the flotillas bringing up the rear of the Grand Fleet. A sharp fight took place in which the "Castor," leading the 11th flotilla, was severely handled. The near-by destroyers would probably have retaliated with more effect had they not been deceived by the enemy making part of the British challenge for the day. This he appears to have picked up through indiscreet flashing signalling between the "Lion" and "Princess Royal," about half an hour previously.

The High Seas Fleet recoiled slightly after this brief encounter, but even the rival forces continued to converge and now Goodenough's light cruisers once more came into the forefront of the scene. He had been keeping in touch with the "Marlborough's" division, but owing to the under-water injuries of the flagship, the latter was lagging nearly three miles astern of its proper station. The "Castor's" engagement had put the "Southampton" and her consorts on the alert, and they were well prepared when, about 10:30, they suddenly found themselves abreast the 4th Scouting Group. A fierce contest ensued. The "Southampton" was the most vigorously assaulted. Her upper deck became a shambles and she was blazing like a haystack from cordite fires, but in the midst of this holocaust she fired a torpedo which sunk the "Frauenlob" with all hands. At the end of a quarter of an hour the enemy had had enough and drew off into the darkness. The German light cruisers had already reported the presence of enemy light forces and the order stationing the British destroyer flotillas astern had been intercepted and translated to Scheer by a shore wireless station. From these reports he probably realised that our battle fleet had drawn ahead. In any case he was determined to force his way to the eastward. At 10:30 he turned back to S.E.½E. heading direct for Horn Reefs Light Vessel.

The British Destroyers in Action.—The rest of the story of that night is one of sudden encounters with an enemy fighting desperately to get home while the British destroyers gallantly threw themselves in his path whenever opportunity served. The German fleet was frequently in a state of much confusion, the "Elbing" was rammed by the "Posen" and later had to be sunk to prevent capture. The "Rostock" was torpedoed by the 4th Flotilla and also had to be sunk. On the British side the destroyers suffered severely. About 11:30 the "Tipperary" was so badly damaged by gunfire that she sank the next morning. The "Spitfire" met the great battleship "Nassau" nearly end on, tore twenty feet from the latter's plating and carried it off

[1] The "Warspite" after her involuntary circle at 6:20 P.M. continued to have trouble with her steering gear. At 7:00 she withdrew from the action and at 8:50 was ordered back to Rosyth. She had been badly hit in the earlier fighting.

[2] The "Lützow" was limping along to the northward sinking deeper and deeper by the bows. At 2 A.M. she had to be abandoned and was afterwards sunk with a torpedo.

on her forecastle. She was badly damaged but had done good execution with her small gun armament, putting out the big ship's searchlights and causing a number of casualties.

The shock of this conflict again caused the German fleet to waver and the leading battleships turned away nearly eight points to the westward, but Scheer was adamant in his determination to break through at all costs while darkness gave hope of escape. He forced his van back, and by 11:34 the "Westfalen" was again leading the line to the south-eastward. In another encounter a few moments later the "Broke's" steering gear was disabled and she and the "Contest" rammed the "Sparrowhawk," and the latter had to be sunk the next day. Between midnight and 12:30 A.M. the "Fortune" and "Ardent" were sunk and the "Porpoise" disabled by gunfire, and the "Turbulent" was rammed and sunk with all hands. Again and again the British light craft attacked, but from now onwards the enemy held his course; and the tragedy of that night was that no accurate information of the German battle fleet was vouchsafed to Adm. Jellicoe.

Admiralty Messages.—Two reports, based on intercepted wireless messages, were sent to Jellicoe by the Admiralty. One, despatched at 9:58, received in the "Iron Duke" about 10:23, but not decyphered and read until 11, gave an obviously wrong position of the rear ships of the enemy battle fleet at 9 P.M. A second message, despatched at 10:41, received at 11:05, and read about 11:30, stated that the German battle fleet had been ordered home at 9:14, battle cruisers in rear, course S.S.E. ¾E., 16 knots. This latter was a summary of several intercepted signals but most unfortunately it omitted the fact that Scheer, at 9:06, had made an urgent call for airship reconnaissance off Horn Reefs at daylight, clearly indicating his intended line of retreat. The second Admiralty message referred to the enemy's movements at 9:14, but at 11:38 Goodenough's report was received[1] saying: "Have engaged enemy cruisers at 10:15 bearing W.S.W.," and about the same time the "Birmingham" also reported from astern: "Battle cruisers probably hostile in sight northeast course south" (11:30). These reports came from ships which had actually sighted the enemy long after the time referred to in the Admiralty messages. They indicated that he had not yet turned home. The "Birmingham," unfortunately, sighted the German heavy ships at a moment when they had turned away from our torpedo attacks, his report therefore was misleading, but other ships might have saved the situation.

At 11:35 the "Valiant," last ship but one of the 5th Battle Squadron, noted what appeared to be "two German cruisers with at least two funnels and a crane amidships, apparently steering to the eastward at a high speed."[2] These details make it certain that the ships were battleships and should have been recognised as such. The "Malaya," the last ship of the squadron, had a clearer view and noted at 11:40 "enemy big ships, three points abaft the starboard beam, steering the same way as ours." By the flash of an explosion the leading ship was seen to have "two masts, two funnels and a conspicuous crane (apparently "Westfalen" class)."[3] It was obvious that the enemy's main fleet had closed in from the westward and was edging its way across the wake of the 5th Battle Squadron, yet for some inconceivable reason these two ships neglected to report what they had seen. Had they done so it would have greatly increased the chances of an overwhelming victory next day. The courage and self-sacrifices of the British destroyers did not provide the one thing lacking, *i.e.*, information. Before the curtain of darkness had lifted, Scheer had hacked his way through the light forces and passed to the eastward.

Scheer was not yet out of the wood, however. About 1:45, just as a faint grey light was heralding the approaching dawn, Capt. Stirling, in the "Faulkner" with his fine 34 knot 12th Flotilla, sighted large ships on his starboard bow, steering a southeasterly course. Even as he manoeuvred to attack he thought to send a wireless report to his commander-in-chief. The attack, carried out with the greatest dash and gallantry, resulted in the battleship "Pommern" being sunk without a trace. Again Capt. Stirling made his wireless message, but neither of his reports reached the "Iron Duke." About 2:25 in the growing light, the "Champion" with three destroyers sighted the enemy. One of the latter, the "Moresby," broke off at once and made a plucky attack which sank the German destroyer "V4," but the "Champion" turned to the eastward and made no report.

At 2:39 A.M. Jellicoe turned north. He had been left with the impression that the enemy had been following him south and now, with daylight rapidly returning, he was anxious to get in touch with a view to renewing the engagement. It had been his intention to close Horn Reefs at dawn, but the night fighting had scattered his flotillas and he deemed it imprudent to thrust into enemy waters until he could collect a destroyer screen. A signal from the Admiralty, despatched at 1:48 A.M. but not received in the "Iron Duke" until 2:40 informed the commander-in-chief that enemy submarines were apparently coming out from German ports. The battle fleet formed single line on the northerly course so as to be ready for emergency in the early morning haze, and so, retracing his path, Jellicoe expected momentarily to fall in with his destroyer flotillas and possibly the damaged "Lützow." Tyrwhitt's Harwich Force had, at last, been ordered to sea, and by 3:50 A.M. he was under way, much too late to be of service. From 3:15 A.M. Zeppelins began to be sighted and at 3:42 A.M. the battle fleet had turned expectantly towards the sound of guns, but found that it was only some British cruisers engaging one of the enemy airships. It was obvious, however, that by now the position of the British fleet must be known to the German command. The hope of meeting the enemy which had been growing fainter was finally shattered by an Admiralty message received at 4:15 A.M. saying that at 2:30 A.M. the High Seas Fleet was only 16 m. from Horn Reefs steering S.E.b.S. at 16 knots.

Beatty was still clinging to the idea that the enemy was to the south-westward, and asked permission to sweep in that direction; but at 4:30 A.M., having re-formed into cruising formation, Jellicoe regretfully made the signal "Enemy fleet has returned to harbour." Scheer reached Horn Reefs Light Vessel about 3 A.M. There he lingered for a short space receiving reports from his airships and taking stock of the condition of his fleet. At 3:30 A.M. he was informed that the "Lützow" had had to be sunk. The rest of the 1st Scouting Group was in no condition for serious action, the battleships which had been in the van had also suffered considerably, and he had only three light cruisers serviceable; moreover the visibility was such that he could not rely on airship reconnaissance. Indeed many of the reports which he received from this source have since been proved to be very inaccurate. A policy of discretion was obviously dictated, and he gave the order for the whole fleet to return to harbour. On the way in, the battleship "Ostfriesland" struck a mine laid in the channel by the British destroyer "Abdiel" but got home.

The losses may be summarised as follows:—

Ships	British	German
Battleships	Nil	1
Battle Cruisers	3	1
Cruisers	3	Nil
Light Cruisers	Nil	4
Torpedo Craft	8	5

Personnel	British	German
Officers (killed)	328	160
Men (killed)	5,769	2,385
Officers (Prisoners)	10	Nil
Men (Prisoners)	167	Nil
	6,274	2,545

[1] The delay was due to "Southampton's" wireless gear having been shot away.
[2] "Valiant's" report in Jutland despatches, p. 211.
[3] "Malaya's" report in Jutland despatches, p. 220.

On the face of them these figures would appear to leave the balance of Jutland in favour of Germany, so far as destruction of men and ships is concerned, but the value of the battle must be measured in its after effects and not in its momentary losses. There Britain was the gainer.

Results.—The broad effects of Jutland are a matter of history, but they may be summarised as follows:—

1. The High Seas Fleet after "consistently refusing action and manoeuvring with the sole object of returning safely to its base," as Jellicoe has put it, left the Grand Fleet in undisputed possession of the arena.

2. Although the German High Command must have realised that the Grand Fleet as a "fleet in being" was the fulcrum of the whole Allied cause, the High Seas Fleet only once left the Heligoland Bight after Jutland; this was on Aug. 19 of the same year. On this occasion Scheer was warned by airship reconnaissance that the British Battle Fleet was advancing to meet him, whereupon he returned to his base.

3. In Nov. 1918 Scheer ordered the High Seas Fleet to sea "to break the blockade." It was to have been a final bid for victory, but inaction had only served to crystallise the memories of Jutland; the crews refused to weigh anchor. This mutinous outbreak at Wilhelmshaven widened the fissure which shortly afterwards engulfed the whole German cause.

4. The full fruits of Jellicoe's domination of the German Fleet at Jutland were yielded on Nov. 21 1918, when Beatty received the surrender of the greater part of the High Seas Fleet.

JUVENILE COURTS: *see* CHILDREN'S COURTS.

KAISER, GEORG (1878–), German dramatist, was born at Magdeburg Nov. 25 1878, the son of a merchant. Educated in his native city, he became a merchant and joined the staff of the Deutsch-Ueberseeischen Elektrizitäts-Gesellschaft, Buenos Aires. After three years he was forced to return to Germany owing to ill-health. He lived for some time at Magdeburg and at the Seeheim (Mariners' Home) in Berlin. In 1903 he published his first drama and from that time onwards wrote numerous farces, and plays dealing with social and ethical problems. In 1920 he was prosecuted for embezzlement and sentenced to a term of imprisonment. His work attracted considerable attention both in his own country and abroad. His play *Von Morgen bis Mitternachts* was produced in English as *From Morn to Midnight* at the Regent Theatre, London, in 1926.

His works include: *Die jüdische Witwe* (1911); *König Hahnrei* (1913); *Die Bürger von Calais* (1914); *Von Morgen bis Mitternachts* (1916); *Die Sorina* (1917); *Die Versuchung* (1917); *Gas* (1918 and 1920); *Die Koralle* (1918); *Die Flucht nach Venedig* (1923); *Kolportage* (1924).

KALA-AZAR (*see* 15.637).—In 1881 a malaria-like fever, with great enlargement of the spleen, was found to be causing serious mortality at the foot of the Garo Hills in Assam, from whence it spread slowly eastward during the next two decades over some 200 m. of the Brahmaputra valley, carrying off about one-third of the inhabitants.

Causation and History of Parasite.—It was attributed by successive investigators to hookworm disease, epidemic malaria, and Malta fever respectively, until in 1903 Leishman and Donovan independently discovered its cause in a new minute protozoal parasite, Leishmania donovani, found in the spleen. In the following year L. Rogers developed a flagellate stage of the organism in cultures, and suggested a biting insect, probably the bedbug, as its carrier, a supposition which was supported by Patton demonstrating the flagellate stage of the parasite in bedbugs fed on the blood of kala-azar patients in 1905. But in 1925 Knowles and Napier, of the Calcutta School of Tropical Medicine, appear to have solved the difficult problem by incriminating a sand fly, Phlebotomus argentipes, as the true agent in transmitting the disease; this minute insect, together with kala-azar cases, being far more prevalent in areas of Calcutta with much vegetation than in the more crowded Indian quarter. After the discovery of the causative parasite in 1903 it was soon found that what had for a century been called malarial cachexia in Bengal was nothing but a widely distributed sporadic form of the Assam epidemic kala-azar, the virulence of the latter being due to its invasion of an area previously free from the disease. The disease is now recognised as being very prevalent over all Bengal, Bihar, the eastern part of the United provinces and in Madras, but the comparatively dry Punjab and north-west frontier are practically free from the disease, a certain degree of humidity being necessary for it. A form of kala-azar especially affecting children is also prevalent all round the Mediterranean basin and in Egypt and the Soudan.

Symptoms.—Kala-azar is characterised by very prolonged fever, often typhoid-like in the early stages, and frequently showing two or three rises and falls in 24 hours, the characteristic double remittent fever, but with long intervals of low continued or intermittent fever, the total duration being seldom less than seven months and often extending, with periods of freedom from fever, over several years; accompanied by extreme wasting, very great enlargement of the spleen, and later of the liver, some anaemia and extreme reduction of the white corpuscles of the blood, which lowers the resisting power of the patients to secondary infections with septic diseases, pneumonia, dysentery and phthisis, which are far more frequently the ultimate cause of death than the original disease, the case mortality having been until recently from 80 to 96%.

Prophylaxis and Treatment.—As the result of his Assam researches of 1897, L. Rogers established a house and site infection of kala-azar and worked out a system of moving the sites of the villages and tea garden coolie lines, whereby the further progress of the epidemic up the Assam valley was checked for many years. J. Dodds Price successfully applied the same plan to stamping out the disease from a number of badly infected tea estates, thereby saving the industry in the Nowgong district. The debilitating effects of the 1918 influenza pandemic led to a recrudescence of kala-azar in the Assam valley, including the more eastern and little infected area. Fortunately by this time an effective treatment had been discovered in intravenous injection of tartar emetic and other antimony preparations, which now enables some 90% of the cases to be cured; a greater saving of life perhaps than has been effected in any such fatal illness by modern medical research, with the result that many thousand cases have been treated successfully each year in Assam and Bengal. Given adequate funds and organisation, this, the most terrible of tropical fevers, might be nearly stamped out of the large areas which it has decimated for centuries past and further epidemics prevented. See L. E. Napier and E. Muir, *Kala-Azar* (1923). (L. Ro.)

KAMERUN: *see* CAMEROONS.

KANSAS (*see* 15.654).—The population of Kansas on July 1 1925, according to the State census of that date, was 1,812,936, as compared with 1,769,257 by the Federal census of 1920. The estimated population on July 1 1926 was 1,820,296. Four cities (Kansas City, Wichita, Topeka and Hutchinson) had over 25,000 inhabitants in June 1926. 43.5% of the population lived in cities and towns of over 1,000 inhabitants. In the ten years from 1915 to 1925 the rural population increased only 5,000 while the urban population increased 135,000.

Agriculture.—Kansas is pre-eminently an agricultural state. It is the largest producer of wheat and corn taken together in the Union. The wheat crop in 1924 was 151,690,970 bu., and the corn crop was 118,789,236 bushels. The crops next in importance were oats and barley. There is an extensive livestock industry.

Mineral Products.—There are considerable deposits of bituminous coal along the eastern border of the state; production amounted in 1924 to about 4,150,000 short tons. Natural gas yielded 27·8 billion cu. ft. in 1920. There has been little effective control of the distribution of gas, and distributing companies have fixed rates in total disregard of their original contracts. The most striking development of the decade in this field had been in the production of petroleum which stood at only 3,000,000 barrels in 1914, jumped to 36,500,000 in 1917, reached the peak at 45,500,000 in 1918 and stood at 28,483,000 in 1924. The supply of materials for cement seems inexhaustible and the value of this product is exceeded only by those of oil, coal and gas. Kansas ranks fourth in the Union in the production of salt, of which the production in 1924 was reported by the State Geological Survey at 794,303 short tons, valued at $3,176,000. The Joplin zinc and lead field overlaps the southeast corner of the State, but while the field approaches exhaustion on the Missouri side, it is capable of indefinite development in Kansas. The output of zinc in 1924 was 105,392 short tons, valued at $13,700,960.

Manufactures and Transport.—Federal statistics distinguish 36 industrial groups in each of which the value of the annual output exceeds $300,000. The larger interests are based upon products of agriculture. The largest is the slaughtering and packing of meat, which in 1923 produced products valued at $224,661,483—almost one-tenth of the total output of the United States. Nearly the whole of this industry is localised in Kansas City. The next largest industry is the milling of flour, which is widely distributed over the State. Slaughtering and milling together contribute considerably more than half the value of the manufactured products of the State. Railways and the industries subsidiary to them employ a large part of the labour of the State.

The railway mileage was 9,384 in 1923. The electric interurban railway mileage was 582 in 1923. With the building of hard-surfaced roads motor-bus lines are superseding electric railways.

Constitution.—Kansas in 1925 was still governed by her original constitution, adopted in 1859. Twenty-one amendments were made prior to 1910 and seven have been added since that time. The suffrage was extended to women in 1912, and under pressure of the World War the suffrage was limited in 1918 to citizens of the United States. Provision was made for recall of public officers in 1914, but the Supreme Court decided that the clauses are not self-executing, in that they make no provision for special elections, and the Legislature has not seen fit to give them effect. The constitutional requirement that all property be taxed at a uniform rate has delayed tax reform. An amendment permitting the classification of property for purposes of taxation was rejected by the people in 1914 and 1920 but finally carried in somewhat altered form in 1923. Two amendments were adopted in 1920. One, resulting from the efforts of Gov. Allen to reduce farm tenantry, authorised the creation of a fund to assist in the purchase of farm homes. The other so far removed the prohibition of State action in works of internal improvement as to allow the State to assist counties in building roads. No action has been taken by the Legislature under either head.

Legislation.—Generally speaking, legislation has followed the drift in other states. An exception was the "blue sky" law, for the regulation of investment companies, passed in 1911 and amended in detail in 1913 and 1915. It prohibits the sale in the State of stocks not approved by a board, consisting of the Secretary of State, the Attorney-General and the State Bank Commissioner, and thus prevents the floating of worthless securities. It has been extensively copied in other states. Another step in advance was the act of 1913 which provides for the nomination and election of judges by separate ballots without party designation. Since 1910 the administration of the State has become centralised to a high degree. The first step was taken in 1913 in reference to the various educational institutions, and in 1925 all the higher educational institutions were put under the control of a single board called a Board of Regents, consisting of nine members appointed by the governor for terms of four years and electing their own chairman. A provision that part of the board retire annually is intended to give it permanence and remove it from political control. An attempt, made by Gov. Capper in 1917 and renewed by Gov. Allen in 1921, to consolidate on a similar plan the various bureaux that compose the State Board of Agriculture did not succeed. In 1911 the State Board of Railroad Commissioners was superseded by a Public Utilities Commission, modelled on the commissions already established in New York and Wisconsin, to which was given supervision of all public utilities in the State.

The Eighteenth (Prohibition) Federal Amendment was ratified Jan. 14 1919. In 1919 a general strike in the coal-fields broke out, which suspended production and threatened a coal famine in the midst of an exceptionally severe winter. Gov. Allen took over the coal-mines and began their operation by means of volunteers recruited chiefly from among the students in the educational institutions, and called the Legislature in special session to provide against the recurrence of such conditions. The result was the passage in 1920 of an act which created a Court of Industrial Relations, consisting of three members. The act declared the manufacture of food and clothing, the mining of fuel and transport to be essential industries and "affected with a public interest" to such a degree as to justify public control. The right of collective bargaining was recognised but strikes were prohibited and the court was given authority, either on its own initiative or on complaint, to investigate and to issue orders regulating limitation of production, hours and conditions of labour, and rate of wages. Originally the Public Utilities Commission was merged in the Industrial Court, but in 1921 the former was re-established—a separate body and the Labour Bureau and the Industrial Commission were merged in the latter. Finally in 1924 the Tax Commission, the Public Utilities Commission and Court of Industrial Relations, including the Department of Labour, were consolidated in a single board of five members called the Public Service Commission. The power of the court to fix wages has been annulled by the courts but in other respects it functions satisfactorily operating with the Bureau of Labour as a department of the Public Service Commission. A considerable number of cities have abandoned the old city council form of government. An act passed in 1907 and amended in 1909 and 1913 authorised the adoption of a commission form of government in cities of the first and second class. Up to 1917, 54 cities reorganised under this law. In 1917 the Legislature authorised the city-manager plan. All cities that have reorganised since then (14 by 1925) have adopted this plan.

History.—Kansas has been overwhelmingly Republican in politics and there has been practically no Democratic press in the State. The following have been governors since 1909: W. R. Stubbs, Rep., 1909 and 1911. G. M. Hodges, Dem., 1912. A. Capper, Rep., 1914 and 1916. H. J. Allen, Rep., 1918 and 1920. J. Davis, Dem., 1922. S. Paulen, Rep., 1924.

Bibliography.—Session laws and Senate and House journals are issued after each legislative session. The last edition of the *Compiled Statutes* was issued in 1923. Reports of executive departments are brought together in a collective volume entitled *Combined Department Reports*. Other important publications are the *Biennial Reports* of the State Board of Agriculture and the State Board of Health and the collections of the State Historical Society. The State Library issued in 1920 a reprint of the *Proceedings of the Constitutional Convention of 1859*, with much supplementary historical matter, edited by H. G. Larimer. (F. H. H.*)

KANSAS CITY, Kan., U.S.A. (*see* 15.660), annexed about 1,000 acres of territory between 1910 and 1920 and over 2,000 more, including Rosedale, in the following years. Its area is now (1926) 23 square miles. The population in 1920 was 101,177 (104.9 males to 100 females), of whom 14,405 were negroes and 11,721 foreign born; in 1925 the state census gave it as 116,053. The meat packing industry, in which the city ranked next to Chicago, continued to overshadow all other industries, contributing 75–80% of the total value of factory products within the city limits, which totalled $164,081,000 in 1909, $468,686,000 in 1919, $235,561,733 in 1921 and $262,446,752 in 1923. The packing industry and the livestock market illustrate the economic unity of the two Kansas Cities. The packing houses are on the Kansas side; the state line runs through the stockyards, of which 92% are in Kansas; the livestock exchange is in the Missouri city. By 1925 over $7,000,000 had been invested in the water, light and power plant; the park area had been increased to 300 acres; the connecting boulevards to 25 m. and plans for 50 m. more had been made by the city planning commission. A zoning ordinance was adopted in 1924. A city hall was erected in 1911; a memorial building, dedicated to those who lost their lives in the wars of the country, in 1925; and a beautiful county court house was under construction in 1926.

KANSAS CITY, Mo., U.S.A. (*see* 15.661), the nineteenth city in point of size, and the seat of a Federal Reserve Bank, was in 1924, with its contiguous neighbour across the state line, the largest market in the country for hay, stock and feed cattle, and stock hogs. It ranked first in distribution of lumber, seeds, kaffir corn and agricultural implements; second in meat-packing and as a live-stock and horse and mule market; third in manufacture of flour and soap and as a grain market; fifth in capacity of grain elevators; sixth in post-office receipts; and tenth in bank clearings.

The population in 1920 was 324,410, of whom 30,719 were negroes and 27,320 foreign born; in 1925, according to the official estimate, it was 367,481. In 1924 the output of the manufacturing plants of Greater Kansas City was valued at $604,526,719; the goods distributed by the wholesale houses at $727,327,171. Manufacturing was increased after the World War by the establishment of branch plants of many eastern firms. The making of open-hearth steel for local consumption developed. Large oil refineries were built, with direct pipe-lines from the producing fields. Transportation facilities were increased by auto-bus lines over hard-surfaced roads built in every direction; and by the Kansas City Terminal Railway, which

operates a system of depressed tracks, constructed at a cost of $50,000,000, and a Union passenger station opened in 1914.

By 1925 the public school system included 90 elementary schools, five senior and three junior high schools, a teachers' college, a junior college, 31 combination and special schools; a bond issue of $5,000,000 for new buildings and equipment had just been authorised. The common "chest" for 45 philanthropic agencies was nearly $1,000,000; a city plan had been adopted (1922); there were 3,470 ac. in the parks and playgrounds, 95 m. of continuous boulevard, an exceptionally fine baseball park and 10 golf courses; a comprehensive zoning ordinance had been passed (1923); a new water supply plant to cost $11,000,000 was under construction; the Liberty Memorial, designed as the central feature of a group of buildings for cultural purposes, was nearing completion opposite the Union Station Plaza. The cost of living in Kansas City is relatively low (94·4% of the average for 31 American cities, Dec. 1924). In 1925 a new charter—the fourth prepared within eight years, and the third submitted to the voters—was adopted by a large majority, setting up the council-manager form of government.

KAPOK: *see* CELLULOSE; FIBRES.

KAPP, WOLFGANG (1868–1922), German politician, was born in New York July 24 1868. He was the son of Friedrich Kapp, a National Liberal member of the Reichstag in Bismarck's time, and grew up under the Bismarckian influences. Having held various minor official posts, he founded the agricultural credit institute in East Prussia, which achieved great success in promoting the prosperity of landowners and farmers. He was consequently in close touch with the Junkers of East Prussia and during the World War made himself their mouthpiece in an attack on Bethmann Hollweg (*Die Nationalen Kreise und der Reichskanzler* (1916). He was also one of the founders of the "Vaterlandspartei." For a brief period in 1918 he was a Conservative member of the Reichstag.

Kapp remained in the background till March 12 1920, when the Republican Govt. suddenly issued an order for his arrest. It became known that he had organised, with General von Lüttwitz and other officers, a conspiracy to occupy the Government offices, and assume power in Berlin. This he actually succeeded in doing on the morning of March 13. Kapp was installed in the Imperial Chancellary and at once styled himself "Chancellor of the Reich." President Ebert and most of his ministers fled, first to Dresden and then to Stuttgart. The Kapp Govt. was, however, short-lived. The working classes of Berlin rendered its continuance impossible by declaring a universal strike, and on the evening of March 17, Kapp and Lüttwitz fled to Berlin. Warrants were issued for their arrest, but Lüttwitz disappeared completely, and Kapp eventually escaped by aeroplane to Sweden. In April 1922 he returned to Germany and was immediately arrested for high treason, but he died on June 12 from the consequences of an eye operation at Leipzig, before the case was heard.

KARACHI, India (*see* 15.672), has grown very rapidly, and the population, which was 216,883, half Hindu and half Moslem, in 1921, has nearly doubled since 1901. In 1920–1, 364 plans for new buildings were approved, and 367 in 1921–2. Among notable public buildings are the municipal offices, begun before the World War but unfinished in 1923; the fine Port Trust offices and customs house (1915); a small causes court, revenue office and paper currency office; the Jehangir Kothari hall; a home for poor and defective persons, a new maternity home, and a Welfare Association building; a masonic temple, a commercial college and several schools. The foundation stone of a new building for the chamber of commerce was laid in 1924. A parade with terraces and a pier to the water's edge was opened at New Clifton in 1921, and a People's Park has been laid out in the old bed of the river Lyari. A new embankment road skirts the old town and forms the southern boundary of the park. A contract was placed in 1925 for a new conduit from Malir, 16 m. long, to increase the supply.

Karachi is a progressive port with a great future. It receives the produce of the Punjab, Sind, Baluchistan, Afghanistan, much of Rajputana, and part of the United Provinces, while the Delhi trade has shown a tendency to pass through Karachi rather than Bombay. The great Sukhur barrage scheme, which received official approval in 1921, will bring the exportable produce of a further 3,500,000 acres to the port. Trade has recovered gradually from the effects of the War, and the exports are largely wheat. The imports are mostly cotton and woollen goods and yarn. A new boat basin was built in 1911, a wharf for coasting steamers in 1912 and work on other extensions is in progress. It is planned to build 13 new berths on the west side of the harbour. Land for six berths was reclaimed in 1923–4, and it is hoped that three berths, each 550 ft. long, will be finished by 1927. The North-Western Railway, on which Karachi is dependent, is now double-tracked as far north as Samasata.

KARNEBEEK, HERMAN ADRIAAN VAN (1874–), Dutch statesman, was Netherland's delegate to the Second Peace Conference at The Hague in 1907. In 1911 he became burgomaster of The Hague, holding this position until 1918, when he was appointed Foreign Secretary. In 1921 he presided at the second Assembly of the League of Nations.

KÁROLYI, MICHAEL, COUNT (1875–), Hungarian politician, born on March 4 1875, and descended from a famous and wealthy family, Count Károlyi, after a delicate childhood, took his degree at Budapest University, exhibited keen interest in horse breeding and horse racing and became, in succession to his uncle, president of the Hungarian Co-operative Society (Hangya). He then travelled a good deal, spending much time in Paris. In 1902 he stood for Parliament as a Liberal but was defeated. In 1905 he was elected to a short Parliament and took no further part in Hungarian public life until 1909 when he became president of the Hungarian Agricultural Society, and worked for the creation of an agrarian Centre party. He then resigned from the conservative Agricultural Society and, having come under the influence of the writings of Karl Marx, became leader of the Radical wing of the Independence party, and led the Parliamentary opposition against Count Stephen Tisza, then Prime Minister, with whom he fought a duel.

Opponents of Count Károlyi have maintained that his jealousy of Tisza and his enmity against the older statesman were the dominating motives of his career. Count Károlyi, in his autobiography, *Fighting the World*, while admitting that it was Tisza who drove him into a democratic camp, has maintained that his political ambitions were to break the relations between Austria and Hungary, substituting for them a Russo-Hungarian *rapprochement*, and also to destroy the capitalist system. In order to provide party funds for these purposes he entered into secret negotiations with the French Govt. and visited America. His return from that country coincided with the outbreak of the World War and he was interned in France, but was soon released on the understanding that on reaching Hungary he would do his best to bring the War to a speedy conclusion. He then seceded from the Independence group and founded the Károlyi party for the purpose of breaking with the Germans and entering into a separate treaty of peace. In spite of these opinions he married, on Nov. 7 1914, the step-daughter of Count Julius Andrássy, a statesman with utterly opposite views, and became an officer in the National Defence Hussars. He concentrated his activities throughout the War on pacific aims in the hope that their realisation would achieve in Hungary the enactment of universal suffrage, socialisation of industry and the division of land amongst the people.

On Oct. 25 1918, when the War was clearly lost, Count Károlyi founded the National Council composed of his own personal supporters, Social Democrats and Radicals. The Werkerle Cabinet resigned, and Count Hadik was appointed Premier by King Charles. On Oct. 30 there was a revolution, led by the Soldiers' Council and supporters of the National Council, who occupied practically all strategic points in Budapest. The next day Count Hadik resigned and in the name of King Charles Archduke Joseph had no alternative but to appoint Count Károlyi as Prime Minister, who then took the oath of allegiance to the King. The same day, Oct. 31 1918, Count Tisza was assassinated in his Budapest home by revolutionaries. On Nov

16 the Hungarian People's Republic was proclaimed at a public meeting under the auspices of the National Council, and full powers were entrusted to the Cabinet of which Károlyi was Prime Minister. On Jan. 11 1919 the National Council formally proclaimed Károlyi as President of the People's Republic.

It was a short-lived triumph. The forces of disruption and discontent soon got completely out of hand and on March 21 1919 Count Károlyi handed over the Government to the Soviet of Bela Kun. Count Károlyi remained in the country unmolested until the eve of the collapse of terrorism and then left Hungary for Czechoslovakia. Later he was expelled from Italy for Communist propaganda and made his headquarters in Paris, visiting the United States, where he was prohibited by the Government from continuing propaganda presumably against the Hungarian Govt., which might have affected the League of Nations' loan for Hungarian reconstruction.

The High Court of Hungary found, after public trial at which Count Károlyi was legally represented, that on account of his actions during the War and in organising the revolution he was guilty of high treason and felony. As a result of that verdict Count Károlyi's estates were confiscated, a large portion of them being divided under Land Reform, among some 5,000 smallholders. Other accusations made against Count Károlyi by his fellow-countrymen were that by his systematic encouragement of mob-law and military indiscipline and by his weakness as Prime Minister and President he was the direct cause of the Bolshevist reign of terror and the subsequent occupation of Hungary by the Rumanian Army. It is further officially maintained that by negotiating a separate armistice with Gen. Franchet d'Esperey at Belgrade Károlyi deprived Hungary of many territorial and other rights to which she was entitled under an armistice previously concluded by Gen. Diaz on the Italian front with the Austro-Hungarian armies. (W. Go.*)

KATA THERMOMETER.—In considering measurement of ventilation we must bear in mind that the ordinary thermometer merely gives the average temperature of its surroundings. While the human body produces heat, and all day long is keeping itself at body temperature, the thermometer does not produce heat, but just registers the effect of the surrounding atmosphere upon itself. An instrument is needed, then, to indicate the cooling and evaporating power of the air.

The Kata thermometer is such and is far more indicative of human feeling than the ordinary thermometer. It records not only the effect of the temperature of the surrounding air on the cooling of its surface when at body temperature, but of the wind and any movement of the air, and also how quickly cooling takes place when its surface is wet, as the skin is when perspiration is going on. The Kata thermometer is a large-bulbed alcohol thermometer of standard size with stem graduated from 100° to 95° Fahrenheit. It is warmed up in hot water till the meniscus rises above 100° F.; the bulb is then dried, and the rate of cooling of the meniscus from 100° to 95° F. taken with a stop-watch. From a factor number determined for each instrument the cooling power is deduced in millicalories (1/1000 gramme calorie) per sq. cm. of the surface of the bulb at body temperature per second. In still air the dry Kata thermometer has a cooling power of about 10 at 0° C., and about 5 at 20° C.; with a wind of 9 m. per hour it has a cooling power of about 40 at 0° C., and 20 at about 15° or 16° C., and so on with different rates of wind. Wind is far more important than temperature to the cooling of the body; thus the still air is easily borne. In the case of the wet Kata thermometer a wet muslin glove covers the bulb. In factories, schools, etc., the reading of the cooling power of the dry Kata thermometer should not be less than 5–6 with a temperature of about 60° F., 7 at 70 and 8 at 80°, otherwise the efficiency of the worker and pupil will tend to go down. Observations made by the Industrial Fatigue Board in pottery, boot and shoe, cotton and printing works, showed that a great number of readings were below 6. The general mortality is greater in the trades with the lower readings. Great improvements could yet be made in this respect. See Medical Research Council, *Special Report, No.* 73 (1923). (L. E. H.)

KATO, TAKA-AKIRA, Count (1859–1926), Japanese statesman (*see* 15.696), resigned his post as ambassador in London in Dec. 1913, having in the previous year been created a baron. Returning to Japan, he joined Prince Katsura's third Cabinet as foreign minister for the third time but resigned soon after. He then reorganised the Doshikai, created by Katsura, and renamed it the Kenseikai or Constitutionalist party, of which he became president in 1913 (*see* Japan). In April 1914 he joined the Okuma Cabinet as foreign minister, resigning in 1915. It was during his incumbency that Japan sent the so-called 21 demands to China. In Aug. 1915 he was elected a crown member of the house of peers and in the following year was created a viscount. The following decade proved a quiet period for Kato, but in 1924 he became premier of the Coalition Cabinet of the Kenseikai, the Seiyukai and the Kakushin Club. His administration was made historic by the passage of the universal manhood suffrage law. Owing to dissensions among members of the Cabinet, Kato reorganised his Ministry on Aug. 1 1925, forming it exclusively with members of the Kenseikai party. On Jan. 28 1926 he died in Tokyo while in office. The Emperor, learning the gravity of his illness, conferred upon him the dignity of count.

KATSURA, TARO, Prince (1847–1913), Japanese soldier and statesman (*see* 15.697).—In Aug. 1911 he resigned the premiership in favour of Marquess Saionzi, after completing the work of financial reform and treaty revision which he had undertaken, and received the rank of prince. On Dec. 20 1912 he again accepted office as Premier. In Feb. 1913, however, a vote of censure on the Premier was moved in the Diet for the alleged misuse of imperial rescripts, and on Feb. 10 the Prince resigned office. His health was already failing, and he died in Tokyo Oct. 10 1913.

KAVALLA (*see* 15.701).—This port on the coast of eastern Macedonia, with an exposed harbour, has a population of about 20,000. The immediate hinterland is a rich tobacco-growing country, but Kavalla is handicapped by the fact that the railway from Salonika to Dedeagach runs through Drama, 22 m. inland from the coast, with no branch line to Kavalla. Kavalla has belonged to Greece since the Balkan War of 1912–13. It was coveted by Bulgaria as a maritime outlet, and M. Veniselos was inclined to concede it to her, but this policy was ruled out by the outbreak of the second Balkan War. After the outbreak of the World War, when Bulgaria was still neutral, the British Govt. attempted to attach Bulgaria to the Allied cause by offering to cede Cyprus to Greece, on condition that Greece ceded Kavalla to Bulgaria. This offer was rejected by King Constantine's Govt.; Bulgaria intervened on the side of the Central Powers; and Kavalla has remained under Greek sovereignty, though the Bulgarians occupied it during the Salonika campaign. During the negotiations over the peace treaty of Neuilly (*q.v.*) with Bulgaria, M. Veniselos offered to connect Kavalla with the already existing narrow-gauge railway in the Struma valley, which runs from the Bulgarian side of the frontier to Sofia. This would have contributed to the fulfilment of Article 48 of the treaty, in which the principal Allies assured to Bulgaria an economic access to the Aegean Sea; but no action has been taken upon the offer of M. Veniselos. See *Handbook of Macedonia*, (British Admiralty, 1920).

KEANE, JOHN JOSEPH (1839–1918), American Roman Catholic archbishop (*see* 15.706), died at Dubuque, Ia., June 22 1918. He had retired in 1911.

KEITH, SIR ARTHUR (1866–), British anthropologist, was born at Old Machar, Aberdeen, Feb. 5 1866. He studied medicine at Aberdeen University; University College, London; and Leipzig. He lectured extensively on anatomy and surgery, became a leading authority on anthropology, and an expert on the reconstruction of prehistoric man from fragments or fossil remains. He was Fullerian professor of comparative anatomy at the Royal Institution from 1917 to 1923, became conservator of the Museum and Hunterian professor at the Royal College of Surgeons in 1908 and acted as honorary secretary of the Royal Institution from 1923. He was secretary and later president of the Anatomical Society of Great Britain, president

of the Royal Anthropological Institute (1913–7), and in 1913 was elected F.R.S. and *membre de la Société d'anthropologie de Paris*. He was knighted in 1921, and was designated as president of the British Association for 1927. (*See* MAN, EVOLUTION OF.)

His published works include *Introduction to the Study of Anthropoid Apes* (1897); *Human Embryology and Morphology*, 4th ed. (1921); *Ancient Types of Man* (1911); *The Human Body* (1912); *Antiquity of Man* (1915, 2nd ed. 1925); *Menders of the Maimed* (1919); *Engines of the Human Body* (1919, 2nd ed. 1925); *Nationality and Race* (1919); and *Religion of a Darwinist* (1925).

KELANTAN: *see* MALAY STATES.

KELLER, ALBRECHT (1845–1920), German painter (*see* 15.718), died in Munich July 13 1920.

KELLERMANN, BERNHARD (1879–), German novelist, was born at Fürth on March 4 1879. In his early books he endeavoured to describe his emotional experiences, *Yester und Li* (1904), *Ingeborg* (1906), *Der Tor* (1909), English translation *The Fool* (1925). As the result of his travels abroad he wrote *Das Meer* (1910), English translation *The Sea* (1925), an exotic novel, and his Japanese book *Sassa Yo Yassa* (1912), the main part of which is devoted to a description of Japanese dances. His novel *Der Tunnel*, dealing with the future, chiefly concerns the relations between Europe and America and caused a great sensation on its appearance in 1913. He wrote articles on the World War in his capacity as correspondent, and also produced two books, *Der Krieg im Westen* (1915) and *Der Krieg im Argonnerwald* (1916). After a long interval he published in 1920 his novel on the German Revolution, *Der 9. November*, English translation *The 9th November* (1925), and later still his novel *Schwedenklees Erlebnis* (1923). In addition to a further novel, *Die Heiligen* (1922), he also wrote the drama *Die Wiedertäufer von Münster* (1925).

KELLOGG, CLARA LOUISE (1842–1916), American singer (*see* 15.719), died at New Hartford, Conn., May 13 1916. She was the author of *Memoirs of an American Prima Donna* (1913).

KELLOGG, FRANK BILLINGS (1856–), American diplomat and lawyer, was born at Potsdam, N.Y., Dec. 22 1856. In 1865 he went with his parents to Minnesota, where he studied law and was admitted to the bar in 1877. He practised in Rochester, Minn., for 10 years, removing in 1887 to St. Paul. He was retained as special counsel for the United States in the actions against the Paper Trust and the Standard Oil case. He also appeared as special counsel for the Interstate Commerce Commission in the investigation of the Harriman railways, and for the United States in the action to dissolve the Union Pacific and Southern Pacific railway merger. He was a delegate to the Republican National Conventions of 1904, 1908 and 1912, and was elected U.S. Senator from Minnesota for the term 1917–23. He was also U.S. delegate to the fifth International Conference of American States at Santiago, Chile, 1923. In 1924 he was appointed ambassador to Great Britain, succeeding G. B. M. Harvey. He resigned in Feb. 1925, to accept an appointment as U.S. Secretary of State. In this capacity he took a firm stand in support of United States citizens whose property rights in Mexico were threatened by proposed Mexican legislation.

KELLOGG, VERNON LYMAN (1867–), American zoologist, was born at Emporia, Kan., Dec. 1 1867. He graduated from the University of Kansas, subsequently studying at Cornell University, Leipzig and Paris. He was successively assistant and associate professor of entomology at the university of Kansas, 1890–4, and professor of entomology and lecturer in bionomics at Stanford University, 1894–1920. Having acted as a director, in Brussels, of the American Commission for Relief in Belgium, 1915, he served as assistant to the U.S. Food Administrator, 1917 and in various capacities with the American Relief Commission in Poland and Russia, 1918–21. He became permanent secretary and chairman of the division of educational relations of the National Research Council, Washington, D.C., 1919. He wrote *American Insects* (1904); *Evolution and Animal Life*, with D. S. Jordan (1907); *Darwinism To-day* (1907); *The Animals and Man* (1911); *Headquarters Nights* (1917); *Herbert Hoover, the Man and His Work* (1920); *Nuova, or the New Bee* (1921); *Human Life as the Biologist Sees It* (1922); *Mind and Heredity* (1923); and *Evolution* (1925).

KENDAL, WILLIAM HUNTER (1843–1917), British actor (*see* 15.727), died in London Nov. 7 1917.

KENT, ROCKWELL (1882–), American painter, was born at Tarrytown Heights, N.Y., June 21 1882. His early education was obtained in a boarding school in Connecticut. He studied architecture for a time, but turned to painting, and was a pupil of Robert Henri. Of a roving disposition, he went to sea as ship's carpenter, painting what he saw in his travels, and writing his impressions. His work was quite individual in its character, and attracted great attention by its unique qualities of light and shade. He also produced some book illustrations. His chief paintings in the United States are "Marine" in the Metropolitan Museum, New York City, and "Lone Woman" and "Mother and Child," in the Brooklyn Museum. He wrote two books of travel *Wilderness* and *Voyaging*, and contributed to magazines.

KENTUCKY (*see* 15.740), a State of the United States of America. The population in 1920 was 2,416,630, as compared with 2,289,905 in 1910—an increase of 5·5 per cent. There were 1,227,494 males and 1,189,136 females. The whites numbered 2,180,560, an increase since 1910 of 7·5%; the negroes, 235,938, a decrease of 9·8%; foreign-born whites, 30,780. The density in 1920 was 60·1 to the sq. m.; in 1910, it was 57%. The urban population increased from 24·3% in 1910 to 26·2% in 1920. The estimated population of 1925 was 2,488,423. The population of towns with over 20,000 inhabitants in 1910 and 1920 was as follows:—

	1910	1920
Louisville	223,928	234,891
Covington	53,270	57,121
Lexington	35,099	41,534
Newport	30 309	29,317

Education.—The large number of illiterates reported in 1910 (208,084) led to the creation of two illiteracy commissions in 1914 and 1918 respectively. In Rowan county in 1911 night schools for adult illiterates were inaugurated. A compulsory attendance law, consolidated schools, better organisation, and more revenue, reduced illiteracy from 12·1% in 1910 to 8·4% in 1920. An Act of 1920 granted to counties and cities ample taxing powers to provide for their schools. The census reported 702,391 children of school age, of whom 654,092 were enrolled in 1925. High schools shared in this expansion, increasing from 83 in 1910 to 493 in 1924. New State normal schools were established in 1922 at Morehead and Murray.

Agriculture.—The number of farms increased from 259,185 in 1910 to 270,626 in 1920, but improved land decreased from 14,354,471 acres to 13,975,746 acres, despite the efforts of the reclamation service, which expended $1,620,027 in the counties bordering on the great rivers and in the western coal area. This drainage and flood-prevention work involved 471,874 acres. The number of farm owners increased from 170,332 in 1910 to 179,327 in 1920; the number of tenants decreased in the mining counties and increased in Mason, Boyle, Mercer, Fayette, Bourbon, and Jessamine. The value of farm property rose from $773,797,880 in 1910 to $1,511,901,077 in 1920. The average value of farms in 1910, $2,452, rose to $4,823 in 1920, and the average value of the land from $21.83 per acre to $48.62. Live stock on Jan. 1 1925 included 334,000 horses, 272,000 mules, 536,000 milch cows, 433,000 other cattle, 715,000 sheep and 859,000 swine. The total value of live stock in 1920 was $148,125,506. The total value of farm crops in 1924 was $200,760,000; in 1925, $178,816,000.

Field crops in 1920 were valued at $347,338,888; and in 1924 at $200,760,000. Low tobacco prices in 1913 and 1920 led to demands for co-operative marketing associations, of which the most notable were organised under the Bingham Act of 1922. In general, these efforts were successful, although the dark tobacco "pool" released its members from their contracts in 1925. Tobacco is the chief crop: in 1922 there were 525,000 acres under cultivation yielding 446,290,000 lb. worth $87,019,000

but in 1924 corn (76,200,000 bu.) exceeded in value the tobacco yield.

Minerals.—The output of coal rose from 14,623,319 tons in 1910 to 55,187,000 tons in 1925; to provide for the increased output, most of which was produced in the eastern counties, the Louisville and Nashville Railroad constructed 333 m. of track and expended $30,000,000 during the decade of 1910–20. Because of low prices, petroleum was only marketed in small quantities before 1916. Stimulated by the War demand, prices rose from $2.05 per barrel on Jan. 1 1917 to $4.50 at the close of 1920. The following table shows the production during certain periods:

	No. of barrels produced	Value
1919	9,226,472	$24,459,016
1920	8,949,185	33,556,241
1925	7,064,553	14,129,106

The most productive pool, Big Sinking, was opened in Lee county, and a new field appeared in the south western counties, centering about Allen and Warren. In many locations the drillers opened gas wells which have reduced the State's dependence on West Virginia's supply, and Mt. Sterling, Winchester, Paris, Lexington, Frankfort, and Louisville now obtain natural gas. The principal oil refinery is at Louisville. From 1909 to 1919 the capital invested in mines, quarries and wells rose from 26 to 201 millions, or 651%; the value of products from 12 to 98 millions, or 715%. The value of manufactured products in 1921 was $302,742,000.

Communications.—Steam railway track increased from 3,641 m. in 1910 to 3,956 m. in 1923. There were 403 m. of electric railway track in 1924. Additional pipe-lines for oil were supplemented by river boats, for which locks were built by the United States Government. The state highway commission, set up in 1920, which had an income in 1924 of $11,157,000, controlled 2,360 m. of road in 1925. A new bridge has been erected at High Bridge; and, near by, the Dix river dam, developing 30,000 H.P. of electric current.

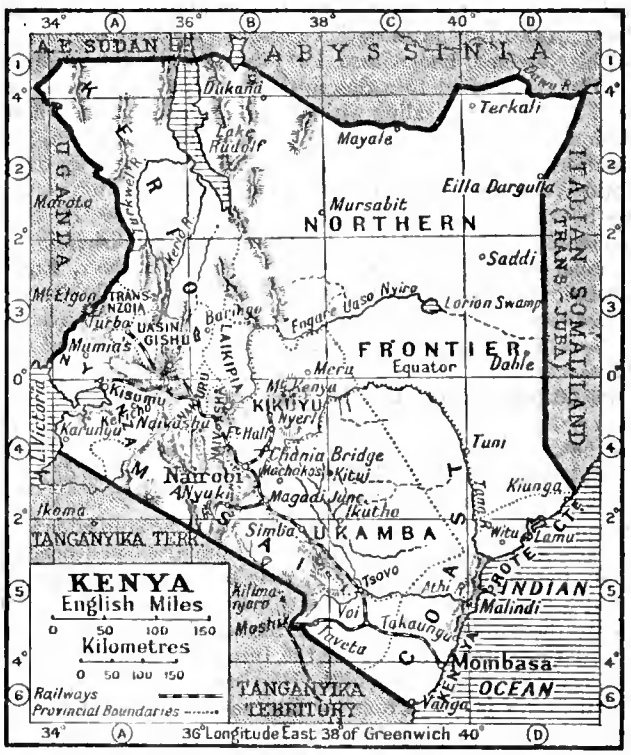
Finance.—The old revenue system, based on a general property tax, proved inadequate to meet the cost of progressive legislation. The Assembly in 1917 created a tax commission and classified grouping replaced the old property tax, so that the rate on general property became 50 cents per $100 assessed valuation. There is a graduated inheritance tax. Increased by licence and franchise revenues, the general fund is apportioned to various purposes. Under the new law, bank deposits rose from $11,000,000 in 1916 to $170,000,000 in 1917; assessed values from $922,000,000 in 1917 to $2,184,202,703 in 1925; railway valuations from $160,000,000 in 1917 to $233,372,000 in 1924. The total revenue in 1925 was $25,038,577. On July 1 1926 the bonded debt was $3,959,298. A floating debt, in the form of treasury warrants, sometimes exceeds $10,000,000.

Legislation.—The Acts of the General Assembly contain many provisions in regard to labour, education, and public health. The Child Labour Act of 1908 was improved in 1910, 1912, 1914 and 1916. Other progressive laws cover the subjects of tax reform, prisoners, banking, insurance, vital statistics and sanitation. In general the Assembly has welcomed all offers of Federal co-operation in matters of agricultural extension, road-building, and public health. An Act of 1920 to prevent the sale of worthless securities was due to the speculation in oil shares after 1916. A series of Acts permits all cities to adopt the commission plan.

History.—The increase of prices during the World War brought prosperity to purveyors of coal, petroleum, live stock, food and tobacco, and lured many producers into unwise ventures where they suffered severe losses after 1920. Kentucky felt keenly the advent of national prohibition, inasmuch as her distilling industry in 1914 occupied first place, with an output valued at $48,862,526. Between 1910 and 1925 the Democrats controlled the Assembly and elected three governors: J. B. McCreary (1911–5), A. O. Stanley (1915–9) and W. J. Fields (1923–7). The Republicans in 1919 elected as governor E. P. Morrow, who had been defeated by only 471 votes in 1915. They chose as United States senators, R. P. Ernst in 1920 and F. W. Sackett in 1924, in which year, for the first time in her history, Kentucky cast all her electoral votes for the Republican party. In 1912 the 120th county (McCreary) was organised out of parts of Pulaski, Wayne, and Whitley. In Nov. 1917 the United States Supreme Court declared void Louisville's race-segregation ordinance.

BIBLIOGRAPHY.—On the administrative features see *Report of the Efficiency Commission*, 2 vol. (Frankfort, 1924); education, *Public Education in Kentucky* (N.Y., 1921); history, *History of Kentucky*, ed. by C. Kerr, 5 vol. (Chicago, 1922). (E. T.*)

KENYA COLONY, formerly known as British East Africa (*see* 4.601), has an area (1926) of about 223,000 sq. miles. In 1925 the greater part of the province of Jubaland (*q.v.*) was ceded to Italy. Population 1926 census: Europeans 12,529, Asiatics (excluding Arabs) 26,789, Arabs 10,557, Africans (estimated) 2,483,500. A census of non-natives taken in 1926 gave the following result: Europeans 12,505; Indians 26,758; Arabs 10,552 others 3,821. An unofficial estimate placed the natives at some 2,600,000. The Arabs are people long settled in the coast lands the other Asiatics are mainly British Indians (22,822 in 1921) The chief towns are Mombasa and Nairobi (*q.v.*).



I. POLITICAL HISTORY

Kenya presents problems not found in other parts of tropical Africa, where the white population is practically confined to officials, missionaries and traders, inasmuch as it contains an elevated area of about 15,000 sq. m. where climatic conditions have made it possible for a European community to make a permanent home. Indian population presented another racial factor, and the task of the administration was largely to reconcile the claims of the Europeans with those of the Indians, and the claims of both races with the rights and interests of natives.

White settlement in the highlands began in 1904; the census of 1911 showed 3,175 Europeans in the country, as against 11,886 Asiatics. The settlers had the advantage of finding the Uganda railway built. They engaged in stock-raising and grew coffee, maize, wheat, barley, flax and vegetables. In the lowlands sisal, tobacco and coco-nut plantations were started. For manual labour they were dependent on the natives, and the bulk of the

farm work was done by the Kikuyu, a tribe with an aptitude for agriculture. Sir Percy Girouard (governor 1909–12) achieved the somewhat difficult task of working harmoniously with the settlers, whose grievances then were chiefly over the delay in getting land grants, but who were already beginning to claim a share in the government. The next year (1913) was most noticeable for the acute controversy which arose over a missionary conference at Kikuyu, when the Bishop of Mombasa (Dr.W.G. Peel) officiated at a communion service in a Presbyterian church at which Anglicans, Presbyterians, Wesleyans and others communicated. Apart from the theological controversy this service aroused, it served to draw attention to the fact that, up to that period, by far the greater part of the work not only of Christianising but of civilising the natives and giving them industrial as well as literary education was in the hands of missionaries.

The War Period.—The World War caused a setback in the economic conditions of the country. The majority of the white male settlers went on active service and agriculture and stock-raising suffered in consequence. Very heavy demands were also made on the natives, who had to supply carriers, transport oxen and meat to the troops. They responded well to these demands and large numbers of natives joined the combatant ranks. After the War a brief period of revival in trade was followed by a longer period of depression. Major-General Sir Edward Northey, who took over the governorship on Jan. 31 1919, had to deal with the difficulties created by a period of change and strain. The white settlers were restive, the Indians were demanding political rights, the natives were in great need of careful guidance—so that on the one hand they should cultivate their reserves and on the other hand supply the labour required for public works and the farms and plantations of Europeans. To add to the trials of the people, white, black and brown, a currency crisis arose through the rise in the exchange value of the rupee—the Indian rupee being the legal currency. An ill-advised stabilisation of the rupee at 2s. in Feb. 1920 was quickly followed by the introduction of a coinage based on British currency. In May 1921 the shilling (divided into 100 cents) was made the standard coin. These currency troubles inflicted much hardship on the producing classes. Dissatisfaction arose also over the great difficulties encountered in carrying out a scheme launched in 1919 to establish ex-soldiers from Great Britain on the land. By 1924, however, the settlement was, on the whole, a success. Over 700 farms out of 1,000 granted to ex-combatants were being worked.

Change of Status.—During this period of strain the change from a protectorate to a crown colony was effected (July 1920). The new colony was named after Mount Kenya, the most commanding natural feature of the country. The coast lands which formed part of the Sultanate of Zanzibar were not annexed but became the Kenya Protectorate. In 1919 a change in the constitution had introduced, for Europeans, an elective element in the Legislative council, 11 single-member constituencies being created, with adult franchise on a residential qualification. At the same time two members were nominated to represent the Indian community. This discrimination against Indians was deliberate. Sir Edward Northey, the then Governor, stated in July 1919 that "though Indian interests should not be lost sight of, European interests must be paramount." Prolonged agitation followed. The Indians claimed equal rights with Europeans and a common franchise, and they had the strong and unremitting support of the Government of India. The white settlers, to whom the development of the country's resources was very largely due, vehemently contested the claims of the Indians, most of whom were clerks, mechanics, shop assistants, small traders and labourers, though they included professional men and merchants of high standing. The whites further alleged that the Indian influence on the natives was bad.

The whole question came under consideration by the British Govt., whose decision was given in the Kenya White Paper in July 1923. The most significant part of this decision was that—

> The interests of the African natives must be paramount, and that if, and when, those interests, and the interests of the immigrant races [European and Asiatic] should conflict, the former should prevail. As in the Uganda Protectorate, so in the Kenya Colony, the principle of trusteeship for the natives, no less than in the mandated territory of Tanganyika, is unassailable.

In respect to the franchise the British Govt. decided on a communal system of representation—that is, separate electoral rolls for Europeans, Indians and Arabs. The 11 seats on the Legislative Council for Europeans were retained; five seats on the council were allotted to the Indians and one seat to the Arab community, all on an elective basis; while one member was nominated specially to represent the natives. By means of other nominated members the Government, however, retained control of the council. The franchise apart, the British Govt. decided against the segregation of Indians in townships, but the practice which had been followed of reserving land in the highlands for Europeans was maintained.

The European community, despite some disappointment, loyally accepted the British Govt's. decision; the Indians continued their agitation—which included a refusal to pay the poll tax—and refused to elect members to the council. In Dec. 1924, however, more moderate counsels prevailed and it was decided to accept seats on the council. This settlement was largely due to the wisdom and courage of Sir Robert Coryndon, who became governor in Sept. 1922, and, while a firm upholder of native rights, fully recognised the work done by the Europeans and the services rendered by the Indians. Sir Robert died at Nairobi on Feb. 10 1925 and was succeeded by Sir Edward Grigg.

In respect to the natives, the policy of the administration was to guide them through their own chiefs and tribal organisations, and gradually to teach them the art of government. These efforts, supported by the missionaries and by many of the white settlers, met with a considerable measure of success. In 1922 they were extended to include, in addition to medical, educational and other services, direct encouragement of stock breeding and agriculture in the native reserves. This lessened the potential supply of labour for the Europeans, some of whom held that the first duty of the native was to work for the white man—though figures showed that the natives working on European farms increased from 53,000 in 1919–20 to 87,000 in 1923–4. Compulsory labour for private persons had been definitely prohibited in 1920. The root of the labour difficulty was that the population was insufficient for the intensive cultivation both of the European farms and the native reserves. In 1925 certain companies obtained permission to import labourers from Portuguese East Africa.

In 1924 a parliamentary commission, of which Mr. Ormsby-Gore was chairman, spent two months in Kenya, one of its main objects being to consider plans for the development of East Africa as a whole. It was followed in Feb. 1926 by a conference at Nairobi of the governors of all the East African territories. The parliamentary commission wrote in terms of high praise of the European settlers, "pioneers in a hurry," who desired to build in the highlands "a distinctive type of British civilisation" while obtaining "a more complete inter-relation and co-operation between the European and the African than exists either in South or West Africa."

II. ECONOMIC CONDITIONS

Under agreements reached in May 1926 the Masai reserves were increased by a portion of the disputed area known as the "Promised Land." The triangular portion of the Yatta plateau, which was to have been included as far as the Wakamba Reserve was omitted, as no natives have occupied it.

Kenya depends almost wholly on agriculture (including stock-raising), and development is largely a matter of increased means of communication. External trade passes through Mombasa (*q.v.*). The railway to that port also carries the produce of Uganda. Since 1917 Kenya and Uganda have formed an administrative unit for customs purposes, and there is complete freedom of trade between the two territories. The figures of trade therefore represent the total of both territories. On analysis it is shown that Kenya takes the bulk of the imports and Uganda supplies more than half the exports. The value of com-

mercial imports into Kenya in 1913–4 was £2,147,000, the value of exports £1,482,000. For 1924, a normal year, the value of imports for consumption in Kenya was £4,038,000, while the domestic exports of Kenya were valued at £2,239,000. The chief exports from Kenya were coffee, maize, hides and skins (the last chiefly from native reserves). Kenya coffee is of high quality and is much favoured on the London market. It was not until 1922 that serious efforts were made to cultivate cotton, and the area in Kenya suitable for cotton is not very large. Up to 1925 the output was small but prospects were encouraging. The main mineral export is carbonate of soda from the Magadi lake.

Communications.—The transport system of Kenya and Uganda is under one administration, known officially as the Kenya and Uganda railway, marine and ancillary services. Since April 1921, when a central railway council was instituted the revenues from this source have been devoted exclusively to transport purposes; and in Feb. 1926 the office of High Commissioner of Transport was created, it being held by the Governor of Kenya. In 1911–2 a branch line (91 m.) was built to the Magadi soda lake; another railway (32 m.) was built from Nairobi to theThika river (towards Mount Kenya). In 1915–6, for military purposes, a railway was built from Voi *via* Taveta to Kahe in (then) German East Africa. It links the Uganda railway with the Tanga railway. The Voi-Taveta line was bought by the Uganda railway in 1923 and reconditioned.

In 1921 a bold policy of railway development, accompanied by harbour improvements, was adopted, both to meet the needs of the settlers in the Uasin Gishu and Trans-Nzoia districts and the requirements of Uganda for the transport of its cotton crop. It was decided to build a line from Nakuru on the Uganda railway across the Uasin Gishu plateau to the border of Uganda, whence it would be continued to the Nile. By 1925 this railway had reached Turbo, 145 m. from Nakuru, and the next section of 75 m. to Tororo, inside the Uganda Protectorate, was under construction. In 1923–6 the Nairobi-Thika line was extended another 90 m. to Nyeri, and other smaller branch lines built. Road development was slow, but a motor road was made from Nairobi to Tanganyika Territory and another motor road from Nairobi to the Sudan. There are aerodromes at Kisumu and Nairobi.

Revenue.—Since 1912 the country has been self-supporting. Between 1909–10 and 1913–4 revenue increased from £503,000 to £1,123,000 and expenditure from £669,000 to £1,115,000. In 1920–1, the last year in which the railway returns were included in the ordinary budget, the figures were, revenue £2,978,786, expenditure £2,976,960, a surplus of £1,826 only. In 1922 and 1923 expenditure considerably exceeded revenue, but in 1924 revenue was £2,111,665 and expenditure £1,861,511—a surplus of £250,054—evidence that the years of acute commercial depression had passed. At the end of 1924 the funded public debt of Kenya was £8,500,000,incurred principally for transport development. The railway revenue in 1924 amounted to £1,635,000, and the gross expenditure to £878,000.

The Kenya White Paper (Cmd. No. 1922) of 1923 and the Report of the East Africa Commission (Cmd. No. 2387) 1925, are important British official publications, of which a full list is given in the *Colonial Office List* (London, yearly). See also the annual *Reports* issued by the Colonial Office, and the annual railway, native administration and other *Reports* issued at Nairobi; Lord Cranworth, *A Colony in the Making* (1912) and *Profit and Sport in British East Africa* (1919); C. W. Hobley, *Bantu Beliefs and Magic* (1912); Norman Leys, *Kenya* (1924); *A Handbook of Kenya Colony and Protectorate*, a British Admiralty publication (1920); *The East African Red Book, 1925–6* (Nairobi, 1925), and the *Year Book and Guide to South and East Africa* (London, annually). (F. R. C.)

KENYON, SIR FREDERIC GEORGE (1863–), British scholar, was born in London Jan. 15 1863. Educated at Winchester and New College, Oxford, he became a fellow of Magdalen College, Oxford, in 1888. The following year he was appointed an assistant in the British Museum, and became in 1898 assistant keeper of MSS. In 1909 he was appointed director and principal librarian. Created K.C.B. in 1912, he was president of the Classical Association in 1913, of the British Academy 1917–21 and of the Society for the Promotion of Hellenic Studies 1919–24. In 1918 he became professor of ancient history in the Royal Academy. He was created G.B.E. in 1925. Among his numerous published works are three editions of Aristotle's *Constitution of Athens* (1891, 1904, 1920); *Classical Texts from Papyri in the British Museum* (1891); *Catalogue of Greek Papyri in the British Museum* (1893, 1898, 1907); *Our Bible and the Ancient Manuscripts* (1895); *Palaeography of Greek Papyri* (1899); *Handbook to the Textual Criticism of the New Testament* (1901, 1912). A student of Elizabeth and Robert Browning's poetry, in 1912 he edited the centenary edition of Robert Browning's works. In 1914 he published an account of the buildings of the British Museum.

KER, WILLIAM PATON (1855–1923), British man of letters, was born at Glasgow Aug. 30 1855 and educated at Glasgow University and Balliol College, Oxford. He was elected fellow of All Souls College in 1879, professor of English literature and history at Cardiff in 1883 and of English literature at University College, London, in 1889, a post which he held until 1922. In 1920 he was elected professor of poetry at Oxford. His studies of mediaeval literature were specially noteworthy, and among his publications were *Epic and Romance* (1897); *The Dark Ages* (1904); *Essays on Mediaeval Literature* (1905); *Sturla the Historian* (1907); *The Art of Poetry* (1923); and a number of collected essays and lectures published in 1925. But these last works of this singularly inspiring teacher, a scholar of wide and humane sympathies, were posthumous. He died suddenly in the Alps, at Macugnaga on July 17 1923 and was buried there.

KÉRATRY, ÉMILE, COMTE DE (1832–1904), French author and politician (*see* 15.753), died in Paris April 7 1904.

KERENSKY, ALEXANDER FEODOROVICH (1881–), Russian politician, was born at Simbirsk, and studied at the University of St. Petersburg, where he took his degree in law, and afterwards joined the St. Petersburg Bar. In 1912 he was elected to the Fourth Duma and joined the Labour Group. He was in reality an adherent of the Social Revolutionary party, but as it was impossible in those days to enter the Duma under this flag he chose the Group of Toil (Labour) in preference to the Social Democrats, whom he considered to be too pedantic and distant from the people. As a member of the Duma he attained a certain notoriety by impassioned speeches, but he was never conspicuous for constructive statesmanship. When the first revolutionary Government was formed Kerensky was nominated Minister of Justice and was for a short time head of the provisional Government. (*See* RUSSIA.)

KEY, ELLEN (1849–1926), Swedish author, was born Dec. 11 1849 at Sundsholm, the daughter of Emil Key and Countess Sophia Posse. She early showed a keen interest in religious, literary and political affairs and lectured on various subjects in her native village. In 1868 her father became a member of the Riksdag, and the family accordingly moved to Stockholm. It was then that she started to contribute to the feminist periodical *Idun*. In 1879, owing to family misfortune, she was forced to adopt the teaching profession. She also established lecture courses for young women. Her success as a lecturer was such that she was able to abandon teaching, and in 1903 went abroad on a number of lecturing tours. She wrote numerous works in many languages, chiefly concerned with the welfare of women and children. Her liberal theories concerning love and marriage at the time met with great opposition. She died in April 1926. Her principal work is *Tankebilder*, "Ideas," 2 vol. (1898); and *Lifslinjer*, Eng. tr. "Lines of Life," 3 vol. (1903–6).

See G. Monod in *La Revue Bleue* (1907) and E. Faguet in *La Revue Latine* (1907).

KEYES, SIR ROGER JOHN BROWNLOW (1872–), British sailor, was born Oct. 4 1872 and entered the navy in 1885. He took part in the Vitu expedition in 1890 and for his service in China in 1900 was promoted commander. From 1905 to 1907 he served as naval attaché at Rome, Vienna, Athens and Constantinople. In 1912 he was appointed commodore in charge of the submarine service. During the World War he took part in the battle of Heligoland Bight, Aug. 1914, and in the Cuxhaven

raid. In 1915 he became chief of staff to Admiral de Robeck, in command of the Eastern Mediterranean Squadron in the Dardanelles. He was promoted rear-admiral in 1917, appointed director of plans at the Admiralty and later took command of the Dover Patrol. In this capacity he directed the naval raid on Zeebrugge and Ostend, April 23 1918, and was rewarded with the K.C.B. In 1919 he was created a baronet and received a grant of £10,000 in recognition of his services. He commanded the Battle Cruiser Squadron of the Atlantic Fleet from 1919 until 1921 when he was promoted vice-admiral and became deputy-chief of the naval staff. In 1925 he was appointed commander-in-chief of the Mediterranean Station.

KEYNES, JOHN MAYNARD (1883–), British economist, was born at Cambridge, June 5 1883, the son of John Neville Keynes, registrar of Cambridge University. Educated at Eton and King's College, Cambridge, where he was 12th Wrangler (1905), and president of the Union Society (1905), he entered the civil service in 1906 and from 1906 to 1908 served at the India Office. He was a member of the royal commission on Indian finance and currency 1913–4, and in 1915 he joined the Treasury, where during the World War he did important work in connection with loans to the Allies. At the Paris Peace Conference he was the chief representative of the Treasury and deputised for the Chancellor of the Exchequer on the Supreme Economical Council, Jan.–June 1919. He advocated certain principles which he considered should be applied to the financial and reparation clauses of the Peace Treaty with Germany and when they were rejected he signified his disagreement with the treaty by resigning in June 1919, and published in the same year his famous *The Economic Consequences of the Peace.* He was made fellow and subsequently bursar of King's College, Cambridge. In 1924, he became chairman of *The Nation*, Ltd. In 1925 he married Lydia Lopokova, the famous Russian dancer. His works include *Indian Currency and Finance* (1913); *A Treatise on Probability* (1921); *A Revision of the Treaty* (1922); and *A Tract on Monetary Reform* (1923).

KEYSERLING, HERMANN, COUNT (1880–), German philosopher, was born at Könno in Livonia on July 20 1880, of a noble family. Until he was 14 years of age, Keyserling remained on the Könno and Rayküll estates. He then went to the Russian school at Pernau, and afterwards studied geology and zoology at Geneva, chemistry at Dorpat, and geology at Heidelberg. In 1902 he became a doctor of philosophy and in 1903 went to Paris, where he wrote criticisms on art, and also philosophical articles. His first literary works were *Das Gefüge der Welt* (1906) and *Unsterblichkeit* (1907). During the years 1907–11 he travelled in Europe. In 1910, the *Prolegomena zur Naturphilosophie* appeared, and he then turned his attention to the study of metaphysics. In 1919 he married the granddaughter of Prince Bismarck. His principal work is *Das Reisetagebuch eines Philosophen* (1919), which has been translated into English as *The Travel Diary of a Philosopher* (1925). He also founded the "School of Wisdom" at Darmstadt. See H. Keyserling, *Der Weg zur Vollendung* (Darmstadt, 1919).

KHIVA (*see* 15.777), was once the capital of the Khroahrezm Republic, whose territory has now been absorbed into Turkmenistan (*see* SIBERIA). Khiva has always held a unique status in Russian Asiatic dominions and even now is understood to be itself, together with a small area surrounding the town, administered directly from Moscow, though the surrounding country forms part of other political units.

KIAMIL PASHA (1832–1915), Turkish statesman, was the son of an artillery officer, Salih Agha. Having completed his military training in Egypt as a cavalry lieutenant, he was appointed by the Khedive, Abbas Pasha, tutor in English to his son Ibrahim Pasha. In 1861 Kibrizli Mehemmed Pasha took him into the service of the Ottoman Government. He was twice governor of Jerusalem and three times governor of Beirut. In 1878 he was appointed governor of Kossova and soon afterwards of Aleppo, with the rank of Pasha. He resigned as the result of the British protest against his conduct during the Armenian revolt at Zeitoun, and returning to Constantinople became Under-Secretary for the Interior. In 1881 he became minister of Evkaf, and after the resignation of the Kutchuk Said Pasha Cabinet in that year, Grand Vizier. In spite of his forced resignation from the governorship of Aleppo he steadily pursued a pro-British policy. He resigned the Grand Vizirate in 1887 owing to Russian intervention, but was reappointed in 1896. He was dismissed by Sultan Abdul Hamid, however, owing to his proposal that a Cabinet responsible to the nation should be formed, and was sent to Smyrna as governor, where he remained for 12 years.

After the promulgation of the constitution (1908) Kiamil Pasha joined the Kutchuk Said Pasha Cabinet and soon after became Grand Vizier for the third time. He was, however, strongly opposed by the Union and Progress party. During the Balkan War (1912) he became Grand Vizier for the fourth time, but was forced to resign in 1913 as the result of a military coup d'état and the unpopularity of the peace terms accepted by him. He retired to Egypt, and although he returned later to Constantinople he was forced by the Government immediately to leave. He went to Cyprus and died there in 1915. Kiamil Pasha knew English, French and Arabic and published a book on Turkish history in three volumes.

KIEL CANAL (*see* 11.816 and 15.787).—The Kiel Canal connects the North Sea and the Baltic. The sluices at the entrances at Holtenau (the harbour of Kiel) and Brunsbüttelkoog (mouth of the Elbe) are 1,082·6 ft. long, 147 ft. wide and 45·9 ft. high. The canal is 53·3 nautical m. long and 37·07 ft. deep. Vessels are admitted on it which do not exceed the following dimensions: depth 29·7 ft., width 131·2 ft., length 1,033·5 ft., height of masts over the water line 131·2 feet. Steam and motor-propelled vessels pass up the canal under their own power. The highest speed permitted is 8·1 knots, the lowest 5·4. Other vessels are tugged, either by private tugs or the tugs of the canal administration, as desired. Pilots are compulsory. They come on board outside the canal wharves in front of the entrances and are advisers to the ships' captains, who remain responsible for the conduct of their ships while using the canal.

Management.—The Kiel canal is owned by the German Reich, which administers it through the Reichskanalamt in Kiel. The managing director in Kiel and the port captains at the entrances to the canal are in charge of the shipping and the administration of their sluices under the Reichskanalamt. Special officials are in charge of the preservation of the canal works. Art. 380–386 of the Treaty of Versailles (June 28 1919) lay down certain regulations respecting the Kiel Canal. Canal and pilotage dues are limited to a rate sufficient to cover the cost of administration, maintenance and improvements. All mercantile and war vessels of nations at peace with Germany have permanent free use of the canal, without special permission, and on an equal footing (but as foreign ships of war pass through German territorial waters in approaching or leaving the canal they are expected to obtain permission through diplomatic channels). Subjects, goods and vessels of all nations enjoy equal treatment as regards payments and attention. Traffic on the canal is subject only to general police, shipping and sanitary and customs regulations. Goods in transit arrive under seal or are accompanied by customs officers and are not subject to any further customs formalities. In the event of violations of any of these conditions, or of disputes as to the interpretation of them, any interested Power can appeal to the jurisdiction instituted for the purpose by the League of Nations. A local German authority at Kiel is qualified to deal with disputes in the first instance.

The Kiel Canal being the safest, most convenient, shortest and cheapest route from the North Sea and the Baltic is increasingly used by merchant vessels. In 1913, 53,382 ships passed with 10,350,000 tons net displacement; in 1924, 45,843 ships with 14,070,000 tons net displacement. (M. C. M.)

KINDERSLEY, SIR ROBERT MOLESWORTH (1872–), British financier, was born Nov. 21 1872 and educated at Repton School. He entered upon a business career in London and became a partner in the banking firm of Lazard Bros. and Company. During the World War he became widely known to the public as president of the National Committee for War Savings. His

services were recognised with the award of a K.B.E. in 1917 and three years later he was created G.B.E. He became a director of the Bank of England and in 1924 was appointed a member of the body which prepared the Dawes scheme after inquiring into Germany's capacity to pay her War debts. (*See* SAVINGS MOVEMENT.)

KINEMATOGRAPH: *see* MOTION PICTURES.

KING, WILLIAM LYON MACKENZIE (1874–), Canadian statesman, was born at Berlin—now Kitchener—Ontario, Dec. 17 1874, the son of John King and Isabel Grace, daughter of William Lyon Mackenzie, M.P., who had been prominent in the struggle for political freedom in 1837. He was educated at Toronto University, and became fellow of political economy in the University of Chicago and of political science in Harvard University. Mr. King entered the public service of Canada in 1900 as deputy Minister of Labour, and acted as editor of *The Labour Gazette* for some years. He was chairman of several royal commissions on industrial and immigration problems. In 1906 he represented Canada in negotiations with the British Govt. on immigration from Britain, and in the same year the honour of C.M.G. was conferred on him. He was Canadian representative to the Govt. of India on immigration from the Orient and was one of the British delegates on the International Opium Commission in China in 1909. He was elected as a Liberal member of Parliament for North Waterloo in 1908, and in 1909 was appointed Minister of Labour in the Laurier administration.

From 1914–7, under the auspices of the Rockefeller Foundation, Mr. King investigated the subject of industrial relations, and afterwards wrote *Industry and Humanity, a Study in the Principles Underlying Industrial Reconstruction* (1918), as well as other studies on economic subjects. During the World War he assisted leading industrial corporations in America to maintain a continuous maximum output of essential war supplies, and industrial representation plans were drafted under his direction which were adopted by the Colorado Fuel and Iron Co., the Bethlehem Steel Corporation, the Bethlehem Shipbuilding Corporation, the General Electric Co., the Consolidation Coal Co., the International Harvester Co. and other industrial corporations in America. At the National Liberal Convention at Ottawa in 1919 he was selected as the successor to Sir Wilfrid Laurier, and became leader of the Opposition in the same year. In 1921 he became Prime Minister of Canada, and in this capacity he attended the Imperial conference in 1923.

As Premier.—Mr. King's administration followed the Coalition Govt. which had been created during the War, and, although formerly there had been two parties in the House, a third party, known as the Progressives, was also returned in the general elections of 1921. It was this party which supported the Liberal Government. On the dissolution of the House in 1925 an attempt was made to return to the two-party system of government, but the Progressives were still given support. The Prime Minister himself was defeated, together with several of his ministers, but owing to the support and co-operation of the Progressives he was enabled to retain control. After the War many new problems arose, and both the Conservatives and the Liberals declared their policy. An able speaker, Mr. King in his appeal to the electorate urged the adoption of a tariff for revenue, and suggested that the problem of taxation could be solved with the aid of an advisory board on taxation. He also stated his willingness to give the principle of public ownership of railroads a fair trial, though he was averse to either a privately or publicly owned railway monopoly. The Liberal party further advocated the reform of the Senate of Canada by fixing an age limit, and by abolishing the life tenure of office for senators. The object of this reform was to make the Senate more responsive to public opinion. Mr. King maintained that the principle of Canadian nationalism could best be developed within the British Empire, and that the bonds of Empire would be strengthened by reciprocal trade treaties. He stated that no attempt would be made to dictate to Great Britain how she should tax her people. The policy of the Liberal party as expressed by Mr. King may be summed up as "unity, moderation and progress." (A. G. D.)

KIPLING, RUDYARD (1865–), British man of letters (*see* 15.825).—The appearance of *Puck of Pook's Hill* in 1906 marked the last attempt of Kipling to essay any new kind or manner of writing. With one doubtful exception, all his later books can be referred to the existing categories. In 1909 appeared an unauthorised volume called *Abaft the Funnel*, into which an American publisher collected a number of unprinted sketches and stories belonging to the period 1888–90. Mr. Kipling issued an authorised edition in New York (1909), but it has never been published in England. The first authorised collection to follow *Actions and Reactions* (1909), was *Rewards and Fairies* (1910), a companion volume to *Puck of Pook's Hill*, and neither better nor worse than its predecessor. This pair of volumes tries to create for the young a semi-historical mythology of the English countryside.

The attempt was quite well worth making, and some of the stories and verses are good; but they are not told simply enough. Mr. Kipling's love of England is not of the kind that goes to the making of myth. In 1911 Mr. Kipling joined Mr. C. R. L. Fletcher in the production of a *History of England* for the young. His contribution took the form of 24 poems, some of which are happily stimulative to the historical imagination, though as read with the accompanying text, presenting to the young a rather limited view of national duty. The years from 1912–4 brought nothing but reprints and recensions, notably *Songs from Books* (1913), containing the verses and chapter headings from all the volumes except the *Jungle Books* and *Just So Stories*.

Mr. Kipling inevitably contributed to the literature of the War. For several newspapers he wrote poems and sets of articles, the most important of the latter being *The New Army in Training* (1915), *France at War* (1915), *The Fringes of the Fleet* (1915), *Tales of the Trade* (1916), and *Destroyers at Jutland* (1916). The last three were collected into a volume called *Sea Warfare* (1916). In 1917 appeared *A Diversity of Creatures*, a collection of stories and verses in the old manner, clever, but not attractive. Another volume of poems, *The Years Between* (1919), contained occasional verses written in war time, with some others of earlier date. The volume is vaguely accusatory and oracular, and contains as much of the publicist as of the poet. In the same year appeared the pamphlet *The Graves of the Fallen*, describing the work of the Imperial War Graves Commission. *Letters of Travel* (1920) reprinted some 24 articles ranging in date from 1892 to 1914, and showed how little the author had changed in style and matter over a long period. The one work by Mr. Kipling that lay outside his usual range was *The Irish Guards in the Great War* (1923), a lengthy and competent compilation, including some original matter in the old familiar manner. *Land and Sea Tales for Scouts and Guides* (1923) intended for the instruction or inspiration of the young, is unworthy of the author and the purpose. Mr. Kipling received many honours from universities at home and abroad, and in 1922 was elected Rector of St. Andrews. The rectorial address, which was published as *Independence* (1923), attracted much attention.

Mr. Kipling is, like Macaulay, a writer who remained to the end what he was at the beginning. Some of his writings are better than others, but none of them are older or younger than others. His earliest work conveys a sense of full experience; his latest has no other sign to post-maturity than a growing acerbity and tendency to scold. His immense efficiency was never of the kind in which genuine growth or development is possible; but such as it was it remained undecayed. Mr. Kipling's prose is clear, firm, tense and terse and the shaping of his best stories is admirable. He possessed (as Shakespeare possessed) the journalist's ability to use with apparent mastery the "cant" of many trades and callings: but this gift, though engaging, is artistically unimportant. Mr. Kipling often wrote as a publicist; but it is as a creative writer that he must be judged. Regarded merely as a political teacher he would have to take a low place. No large or consistent or even practical body of doctrine can be drawn from his vague accusations and rhetorical warnings, and, indeed, none need be looked for. The creeds of poets are more important

to themselves than to their readers. Mr. Kipling did his best work for Empire, not by thinking or writing imperially, but by revealing India artistically.

Mr. Kipling always worked in the spirit of a good craftsman. Though immediately popular as a writer, he never sought personal publicity, and never consciously wrote down to the groundlings, even of politics. His general style indicates a long study of the Bible and his metres show that the influence of Swinburne was strong and enduring upon him. Admiration of the Biblical prophets, however, produced in both writers a tendency to the large, cloudy, oracular utterance that appears more profound than it is. But in all essentials, Mr. Kipling is an original and underived writer. He noticeably added to the public stock of quotations and to the repertory of poems known to everybody. Few writers have found such a large body of sincere admirers in so many regions, ranks and callings of British people.

KITCHEN EQUIPMENT: *see* HOUSEHOLD APPLIANCES.

KITCHENER, HORATIO HERBERT KITCHENER, EARL (1850–1916), British field-marshal (*see* 15.838).—Kitchener was promoted field-marshal just before he left India in 1909, and the Order of St. Patrick was conferred on him on his arrival in England in 1910; but between India and England had occurred a visit to Australasia, where he had been invited to examine the military arrangements, and where the very thorough suggestions which he made for their improvement were acted on with a promptitude which bore full fruit in 1914.

Except for his command of the troops at the coronation of King George, Kitchener was now for the first time for nearly 40 years to enjoy some months of leisure; but the failure of the Government to employ him aroused unfavourable comment, which was only silenced when in the late summer of 1911 he accepted the post of British agent and consul-general in Egypt. The next three years were perhaps the happiest of his life; he was in familiar circumstances though he had many changes to note, since he had handed over the Sirdarieh to Sir Francis Wingate.

On the day he landed at Alexandria, Italy was presenting an ultimatum to Turkey, and there is no doubt that Kitchener's presence and his prestige were mainly responsible for the safe passage of Egypt through the critical period of the Tripoli and Balkan wars, and that no one but himself would have been able to prevent collisions between the Greek and Italian colonists and the natives. His idea was to keep the country busy with the contemplation of its own affairs, and he initiated a policy of economic reform the effects of which were to be enduring. His programme comprised such items as village savings banks, the five Feddan law, the opening of cotton markets all over the country, cantonal courts, the promotion of the Department for Agriculture to a ministry, school buildings, sanitation and press supervision, and the heightening of the Aswan dam—all of absorbing interest to him, all receiving his assiduous care. Lord Cromer's great service in Egypt had been rewarded by an earldom while he was still at the Agency, and the Prime Minister advised the King that no lesser title should adorn his successor during his tenure of the office. The *London Gazette* of June 1914 announced that the sovereign had been pleased to confer on Viscount Kitchener the honour of an earldom, and the telegram announcing his new dignity reached him just as he was starting for England on his annual leave.

At the War Office.—Kitchener had intended that leave to last until Sept., but on July 31 all heads of missions were ordered to repair to their posts, and on Aug. 3 Kitchener was actually on board the Channel boat when a message arrived from the Prime Minister requiring him to stay in England. Three days later he took over the seals of the War Office, to find, in his own words, "There is no army." The meaning of that trenchant observation was that for the titanic task the country had undertaken the British miniature Expeditionary Force, however gallant, was manifestly inadequate. Kitchener instantly laid his plans for an army of 70 divisions, coolly calculating that its maximum strength would be reached during the third year of the War, just when the enemy would be undergoing a sensible diminution of his resources in man-power. His scheme, of course, ran clean contrary to all accepted ideas: it had always been held that in time of war, though armies could be expanded, they could not be created, and to imagine otherwise seemed as surprising to our friends as to our enemies. The French general staff gracefully remarked that men had called new armies into being and men had utilised and maintained existing armies, but that for Lord Kitchener it was reserved to perform the two feats simultaneously. The Germans derided the Kitchener plan as impracticable.

In the early days of 1916 Kitchener could tell the Cabinet that 67 divisions were afoot and three in the mould; he was met by a representation that we must choose between a diminution of our forces and a reduction of our monetary advances to our Allies. He declined the dilemma. He did not think that England could present either of these conclusions to her Allies without proof positive that expenditure could not be reduced nor national income increased, that her administration was free from extravagance, that her taxable capacity was fully exploited and that all parts of the Empire were pulling their weight. The conflict of opinion was sharp and short, with the upshot that the 70 infantry divisions were assured of their existence, and the way was prepared for the Kitchener armies to take their part in the battle of the Somme which he knew was planned for the coming summer. "I have no fear," he said, "about winning the War; I fear very much we may not make a good peace." If he did not live to take his place at Versailles, at least as regards the creation and placing in the field of the great force which was to hold high England's honour he could review a finished work, for his last division to go overseas took ship the very day on which he himself set out on the journey from which he was not to return.

Kitchener's vision or intuition served him to protest, though vainly, against the concentration of the original B.E.F. so far forward as Maubeuge; his rapid and accurate grasp of a situation caused him to hurry to France after the retreat from Mons to insist, in the name of the Government, on the British Army remaining in the Allied line; and enabled him in 1915 to pronounce that the evacuation of the Gallipoli peninsula could be effected with infinitely less loss than had been gloomily predicted. Apart from these occasions he did little to interfere with the actual conduct of operations in the field. He knew and sympathised with the commanders, gave full consideration to their views, and did all that lay within human power to provide them with what was necessary for the performance of the duties assigned to them: moreover, he gave them his entire trust and his unswerving support; what this means to a commander perhaps only those with the experience of a commander can realise, and Kitchener himself had tasted of that experience.

Of the great difficulties which beset the Secretary for War, perhaps the greatest and the most discussed was that of providing guns and ammunition for a constantly and rapidly increasing army. The real root of the trouble was that the nation had plunged into Armageddon without armaments; there was not only a lamentable lack of munitions, but a total absence of all machinery for producing them. With barely means to keep the original expeditionary force on its feet, Kitchener had to provide

for a long and far-flung struggle with a powerful enemy who for 40 years had devoted himself to preparation. A friend who in the early weeks of the War noted in him signs of strain asked him if he were sleeping well. "I shall never have a good night's rest," he answered, "until I have 2,000,000 rifles and their ammunition, and that cannot be yet." The output of arms and ammunition—when one remembers that a start was made from zero and that at the battle of Neuve Chapelle more stuff was fired than in the whole South African campaign—reached an amazing total in the first nine months of the War, and no finer provision of material was made from end to end of it. It was alleged at one time that the great production of ammunition in the autumn of 1915 was due to the energy of the newly born Ministry of Munitions, and a confident claim was made on behalf of this department to the increased supply of high explosive shells. Before the end of the War Kitchener's work was challenged in some quarters on this point; the answer furnished by the dossier of the master-general of ordnance presented a defence of the War Office, whence, as a matter of fact, came the first proposal of high explosive for use in France.

To be precise, the Ministry of Munitions was set up during the first week of June 1915. It was not until the end of Oct. 1915 that a single component of ammunition worth speaking of was delivered from the Ministry of Munitions' factories or orders, and not until April 1916 that the first complete round, made and filled under the orders and arrangements of the Ministry, was delivered to the army authorities. In other words, the army, for a period of more than 18 months, was furnished with continually increasing supplies under the former arrangements.

With the change of the Government in 1915, when the Prime Minister and the War Secretary alone retained their offices, an unhappy attempt was made from G.H.Q. in France to inflame public opinion against the man to whom a few weeks earlier the Commander-in-Chief had written, "Thank God you are there, and I mean it." The attempt failed to shake the rock of public confidence on which Kitchener stood, right up to and even beyond, his last hour: messages of goodwill poured in to him from camps at home and overseas, and from every class and community and corner of England; a month later he received, on his way to and from the Guildhall, one of the greatest ovations of his life—and the Order of the Garter. If Kitchener did not travel quite easily on political lines, his close personal touch with England's Allies was not the least of his contributions to the War, and his early and constant friendship with France gave him, so to speak, a flying start in gaining the best relationships with her public servants.

Russia's rôle was to him a matter of vital importance if the War was to be brought even within his own three year's limit; but in the autumn of 1915 he said to Joffre at Chantilly, "You are calculating on Russia remaining till the end of the War; I am making my calculations on her being out within six months." He had not been afraid to commit himself to serious responsibilities as to arming and equipping the almost weaponless Russian hosts, but even so it is as difficult to account for, as it is impossible to deny, the almost uncanny influence which his name exercised throughout the great eastern empire. He was thus able to criticise Russian methods with a freedom and to press his advice—more especially at the critical moment when Italy was hanging back—with an insistence that would have been tolerated at the hands of no other foreigner.

Proposed Visit to Russia.—Early in May 1916 the Tsar urged that Kitchener should visit Russia, promising that his counsel would be taken to the full even if that counsel included certain transfers of control into British hands. The consent of the British sovereign was obtained, and it was decided that Kitchener should start from Scapa Flow on June 5 for Archangel. He was asked to examine thoroughly the whole Russian situation: he was given a free hand to make arrangements and conditions which he thought advisable; he was to use all the influence which he had already acquired with the Tsar and the Russian military authorities to set the Russian military house in order, and he was asked to come back to England with all speed.

On the afternoon of the appointed day, Kitchener, having paid a visit to Lord Jellicoe on his flagship, embarked on the "Hampshire," which was directed to proceed on what, with the prevailing wind—as reported—would be the lee side of the Orkneys and Shetlands. The arrangements made for the voyage of the cruiser have been, and perhaps always will be, open to question. It is at least certain that an unswept channel was chosen for her passage and that, under stress of weather, the destroyers who formed her titular escort turned about, leaving the vessel, with her priceless freight, to steam to her doom. A faithful steward had suddenly to give an account of his stewardship. The same electrical impulse which the next morning proclaimed Kitchener's death to the world induced an emotional current so intense as to lack precedent or parallel. For a moment it seemed as if a hush had fallen as universal as it was profound, and when the hush was broken there was exposed in full the sway which Kitchener had established over the hearts and minds of all sorts and conditions of men, and that the one man in England who had taken the least pains to win popularity was the hero of many peoples.

A week later the sovereign and his consort passed through the throngs in and around St. Paul's Cathedral to a simple service of hymn and prayer; simultaneously, at two-mile intervals from the sea to the Somme, British soldiers bade a *vale* to the great soldier; while in all parts of the world where two or three Englishmen were gathered together the name of a great Englishman was commemorated. The Queen-Mother at once placed herself at the head of a movement to secure a permanent and practical memorial, and in answer to her appeal there poured in from every point of the Empire—from men, women and children of all colours, classes and creeds—a stream of money, gathering in volume until it reached the astonishing sum of over £700,000. On Dec. 10 1925 a memorial chapter in St. Paul's Cathedral was dedicated to Earl Kitchener and all who fell in 1914–8.

(G. Ar.)

KLEIN, FELIX (1849–), German mathematician, was born at Düsseldorf April 25 1849, and after studying at the universities of Bonn, Göttingen and Berlin was appointed professor of mathematics at the University of Erlangen. He later took up similar professorships at the Munich Technical College and at the universities of Leipzig and Göttingen (1886), and finally became at the latter university director of the school of mathematical physics. Klein, who became a member of the Prussian Academy of Sciences, specialised in the practical application of mathematics and mechanics, and in conjunction with A. Sommerfield worked on the problem of gyratory motion. He took special interest in educational questions, and his well-known treatise on the teaching of mathematics in Germany appeared in 1909. Among Klein's other works should be mentioned *Vorlesungen über das Ikosaeder und die Auflösungen der Gleichungen vom fünften Grad* (1884) and *Vorträge über ausgewählte Fragen der Elementargeometrie* (1895).

KLINGER, MAX (1857–1920), German painter, etcher and sculptor (*see* 15.847), died July 4 1920 at Grossjena near Naumburg.

KLUCK, ALEXANDER VON (1846–), Prussian general, was born May 20 1846 at Münster, Westphalia. He took part in the Austro-Prussian War of 1866 and the Franco-Prussian War of 1870, and was twice wounded at the battle of Colombey-Neuilly. In 1906 he was promoted to the rank of general of infantry, and at the outbreak of the World War was inspector-general of the VIII. Army Inspection. He was placed in chief command of I. Army of the West, which he led in the battles of Maubeuge and St. Quentin and the advance upon the Marne. (*See* Frontiers, Battles of the.) At the battle of the Marne, the faulty disposition of the German forces in the line of battle and the success of the Allied offensive compelled Von Kluck to withdraw his army to the Aisne positions. (*See* Marne, First Battle of the.) In March 1915 he was wounded while visiting the front trenches, and was placed on the retired list in Oct. 1916. He gave his account of the earlier operations in *Der Marsch auf Paris und die Marne-Schlacht* (1920).

KNIGHT, DANIEL RIDGWAY (1845–1924), American artist (*see* 15.851), died in Paris March 9 1924. Of his paintings, "Hailing the Ferry" is in the Pennsylvania Academy, Philadelphia, and "The Shepherdess" in the Brooklyn Institute Museum.

KNIGHTHOOD AND CHIVALRY (*see* 15.851).—The following changes have taken place among the orders of knighthood and chivalry since 1910. While many orders have disappeared, several have been instituted since that date.

Austria-Hungary.—The World War, closed the history of the Orders belonging to the Dual Empire.

British Empire.—As was inevitable, the huge number of people engaged in the World War made it necessary that appointments to all the British Orders should be made on a greatly increased scale, while two additional Orders were instituted. A change in the method of wearing the badge of the Third Class (Companion) of some British Orders was made. Where it used to be worn medal-fashion on the left breast, it is now hung round the neck.

Order of the British Empire.—This was instituted in June 1917, to reward War services in all capacities, military and civil. In 1918 a Military Division of the Order was created. The essential features of the latest statute of the Order, published on Dec. 29 1922, are as follows:—

There are five classes of the Order, which (like the Order of the Bath) is divided into military and civil divisions. Each class can be conferred upon men and women equally.

Highest Class—Knights Grand Cross and Dames Grand Cross (G.B.E.).

Second Class—Knights Commander and Dames Commander (K.B.E. and D.B.E.).

Third Class—Commanders (C.B.E.).

Fourth Class—Officers (O.B.E.).

Fifth Class—Members (M.B.E.).

The two highest classes of the Order wear a star, which is of silver, of two designs. In the centre is a golden medallion showing a representation of Britannia seated, surrounded by a circlet of crimson enamel bearing the motto of the Order, "For God and the Empire."

The members of the first class wear the larger star on the left breast, and the badge of the Order (*see* below) is also worn on the sash, which, in the case of men, is 3¾ in. wide, in the case of women, 2¼ in. wide, and crosses the breast from the right shoulder to the left hip, the badge resting on the hip. A collar has been instituted for this class.

The members of the second class wear the smaller star on the left breast, with the badge suspended, in the case of men, by a ribbon 1¾ in. wide passing round the neck, and in the case of women, from a bow of ribbon of the same width, placed on the left side, above the star. The third class wear the badge, in the case of men, from a ribbon of the same width as the second class round the neck, and, in the case of women, from a bow on the left side. The fourth and fifth classes wear the badge on the left breast, from a ribbon 1½ in. wide, medal-fashion in the case of men, from a bow in the case of women.

The badge is a cross patonce, bearing in the centre the medallion and circlet as in the star. An imperial crown in gold surmounts the cross. For the first three classes the cross is enamelled in pearl grey, bordered with gold, while the circlet is of red enamel with the motto in gold. The commander's badge is smaller than that for the other two classes. The badge of the fourth class is entirely silver gilt, while that of the lowest class is entirely silver. The ribbon of the Order is purple for the civil division, and purple with a narrow red central stripe for the military division.

There are also two medals belonging to the Order: The gallantry medal, which is rare, and is only awarded for conspicuous bravery, where the recipient knew, when he performed the deed of gallantry, that his life was in danger, and the meritorious service medal, given for meritorious service.

Companion of Honour.—This order was instituted in June 1917, at the same time as the Order of the British Empire. It may be conferred upon either men or women who have rendered conspicuous national service, and for whom the distinction is deemed the most appropriate form of recognition, constituting, as it does, an honour dissociated either from acceptance of title or classification of merit, for it confers no title or precedence, simply the initials "C.H." after the recipient's name.

It consists of the Sovereign and 50 members, and there is only one class.

The insignia consists of a badge, worn by men suspended from the ribbon of the Order which is passed round the neck, and by women suspended from a bow of ribbon placed upon the left shoulder.

The badge is oval, and consists of a blue circlet ensigned with the imperial crown in enamelled colours and bearing in letters of gold the motto of the Order, "*In Action Faithful and in Honour Clear.*" In the centre is an oblong plaque, with thereon, on the dexter a representation of a mounted knight in armour, and on the sinister an oak tree, from the boughs of which hangs a shield charged with the Royal Arms. The ribbon is 1½ in. wide, of carmine silk with an interlaced border of gold wire.

The Order ranks next to, and immediately after, the first class of the Order of the British Empire.

Estonia.—This country has established the *Liberty Cross.*

Finland.—The chief Finnish Order is the *White Rose of Finland.*

Germany.—Officially, the old Orders of the German Empire have ceased to exist, but they are still worn in many cases.

Greece.—In addition to the *Order of the Redeemer* (*see* 15.865), the *Order of George I.* was instituted in 1912, and has six classes—collar, grand cross, grand commander, officer, knight and companion. There are also two medals of the Order, silver and bronze. The ribbon is red.

Owing to the establishment of the Greek Republic, it is possible that some changes may be made with regard to these two Orders.

Latvia.—Latvia has instituted the *Order of the Three Stars.*

Persia.—It is not improbable that the new Shah may alter the present chief Persian Order, the *Timsal-I-Humayun* (the Shah's portrait), but the *Lion and the Sun* may still be continued.

Poland.—Since the restitution of Poland's freedom, the old Polish *Order of the White Eagle* has been re-instituted.

This is the premier Polish Order, only awarded for most exceptional services. There is only one class. The ribbon is light blue.

The origin of the *Order of Polonia Restituta* needs no explanation. There are five classes—grand cordon, grand officer, commander, officer and chevalier. The insignia is worn after the fashion of that of the French Legion of Honour. The badge is a white cross with the Eagle of Poland thereon, and the ribbon is of the Polish national colours, red, with white edges.

Russia.—All the Russian Orders of Chivalry have been discontinued, though they still continue to be worn by adherents of the monarchy who have refused to acknowledge the present régime.

Egypt.—In the days before the World War, services rendered to the Egyptian Govt. were recognised by the award of the Turkish Orders of the Osmanieh and Medjidieh (*see* 15.867), but the change in the administration of the country made it inevitable that these would disappear, and that the King of Egypt would institute new Orders. There are now six of these:—

Order of Mohammed Ali, instituted in 1915 in memory of the founder of the present dynasty. The premier Egyptian Order and rare. Three classes—collar, grand cordon and commander. Star and Badge similar in design, consisting of a sun of which the rays are alternately gold and silver; upon this is a six-pointed green star, each point terminating in a golden lotus flower. In the centre is a green enamelled disc, with the Arabic inscription "Mohammed Ali" surrounded with an inscription to the effect that "Clemency, Justice and Generosity are the strength of a Reign." The ribbon is of watered green silk with a white line close to each edge. Two medals, gold and silver, belong to the Order. They bear on the obverse the Arabic inscription, "Honour to Bravery."

Order of Ismail, instituted 1922 in memory of the father of King Fuad. Second Egyptian Order. For eminent services rendered to Egypt. Four classes grand cordon, grand officer, commander and officer. The Badge is a five-pointed azure-blue enamelled star, having in the centre a round plaque with the Arabic inscription "Ismail" surmounted by a wreath of laurel with red knots. Star is similar, but has silver rays between the angles. The ribbon is dark blue with a stripe of red towards each edge.

Order of the Nile, instituted in 1915, for useful service rendered to Egypt. Five classes—grand cordon, grand officer, commander, officer and chevalier. The badge and star are of practically the same design, and consist of a star of 10 rays, alternately gold and silver, thereon a white enamel five-pointed star surmounted by the crown of Egypt. In its centre is a golden disc with an Arabic inscription in blue, "What benefits does Egypt owe to the Nile, the source of her prosperity and happiness." The crown in the badge is placed between the two top rays. The ribbon is of watered blue silk, with a golden-yellow stripe at each edge. The officer has a rosette on his ribbon.

Order of Al Kamal, instituted in 1915, is for ladies only. Four classes—"Decoration of Al Kamal," first, second and third classes. The decoration is in brilliants, and is reserved for the Queen of Egypt and princesses of royal blood. The insignia is a star enriched

with precious stones, worn on the left breast, and a cordon of light blue watered silk with golden edges, which, passing over the right shoulder, suspends a jewelled badge resting on the left side. The insignia of the first class (grand cordon) is similar in appearance and is worn after the same fashion, but it is not jewelled. The second and third classes wear a badge on the left breast, attached to the ribbon of the Order which is tied on in a bow, the second class having a rosette thereon. The star is gold, charged with ten ornamental flowers, and bearing in the centre the inscription "Al Kamal," surrounded by the words "Charity," "Duty," "Devotion," "Nobility," and "Pity." The badge is a star, of which the 10 rays are formed by the same flowers as on the star, surmounted by the Crown, and bearing the inscription "Al Kamal" in the middle.

Order of Agriculture, established 1915, is a reward for services rendered to agriculture. There are two classes—commander and chevalier. The insignia of the commander is a badge, attached to the ribbon of the Order, worn round the neck, while that of the chevalier is a similar badge worn medal-wise on the left breast. The badge is a five-rayed star, enamelled white, with leaves and pods of the cotton plant enamelled in colour. In the centre in green Arabic characters is the inscription, "Decoration of Agriculture," and above this, between the top rays a cartouche inscribed in Arabic, "He who sows, reaps." Above all is the Royal Crown in gold. The ribbon is watered silk, striped with green and golden-yellow.

Order of the Military Star of King Fuad.—This dates from 1919, and is conferred on natives and foreign officers of the Egyptian Army. It is a white enamel five-pointed star, suspended from a bar. The obverse is bordered with gold, each arm having a golden fillet in the centre. The centre is enamelled in red and blue (the colours of the Royal House of Egypt), and bears a garland of laurel surmounted by the Royal Crown which surrounds two crossed sabres of oriental type. The reverse bears the inscription in Arabic, "The Military Star of King Fuad." The ribbon has five equal stripes of blue, chamois, black, chamois and blue. Bars may be awarded for additional services. (A. V. W.-H.)

KNOWLEDGE, THEORY OF.—Theory of knowledge is a product of doubt. When we have asked ourselves seriously whether we really know anything at all, we are naturally led into an examination of knowing, in the hope of being able to distinguish trustworthy beliefs from such as are untrustworthy. Thus Kant, the founder of modern theory of knowledge, represents a natural reaction against Hume's scepticism. Few philosophers nowadays would assign to this subject quite such a fundamental importance as it had in Kant's "critical" system; nevertheless it remains an essential part of philosophy. It is perhaps unwise to begin with a definition of the subject, since, as elsewhere in philosophical discussions, definitions are controversial, and will necessarily differ for different schools; but we may at least say that the subject is concerned with the general conditions of knowledge, in so far as they throw light upon truth and falsehood.

It will be convenient to divide our discussion into three stages, concerning respectively (1) the definition of knowledge, (2) data, (3) methods of inference. It should be said, however, that in distinguishing between data and inferences we are already taking sides on a debatable question, since some philosophers hold that this distinction is illusory, all knowledge being (according to them) partly immediate and partly derivative.

I. THE DEFINITION OF KNOWLEDGE

The question how knowledge should be defined is perhaps the most important and difficult of the three with which we shall deal. This may seem surprising: at first sight it might be thought that knowledge might be defined as belief which is in agreement with the facts. The trouble is that no one knows what a belief is, no one knows what a fact is, and no one knows what sort of agreement between them would make a belief true. Let us begin with belief.

Belief.—Traditionally, a "belief" is a state of mind of a certain sort. But the behaviourists deny that there are states of mind, or at least that they can be known; they therefore avoid the word "belief," and, if they used it, would mean by it a characteristic of bodily behaviour. There are cases in which this usage would be quite in accordance with common sense. Suppose you set out to visit a friend whom you have often visited before, but on arriving at your destination you find that he has moved, you would say "I thought he was still living at his old house." Yet it is highly probable that you did not think about it at all, but merely pursued the usual route from habit. A "thought" or "belief" may, therefore, in the view of common sense, be shown by behaviour, without any corresponding "mental" occurrence. And even if you use a form of words such as is supposed to express belief, you are still engaged in bodily behaviour, provided you pronounce the words out loud or to yourself. Shall we say, in such cases, that you have a belief? Or is something further required?

It must be admitted that behaviour is practically the same whether you have an explicit belief or not. People who are out of doors when a shower of rain comes on put up their umbrellas, if they have them; some say to themselves "it has begun to rain," others act without explicit thought, but the result is exactly the same in both cases. In very hot weather, both human beings and animals go out of the sun into the shade, if they can; human beings may have an explicit "belief" that the shade is pleasanter, but animals equally seek the shade. It would seem, therefore, that belief, if it is not a mere characteristic of behaviour, is causally unimportant. And the distinction of truth and error exists where there is behaviour without explicit belief, just as much as where explicit belief is present; this is shown by the illustration of going to where your friend used to live. Therefore, if theory of knowledge is to be concerned with distinguishing truth from error, we shall have to include the cases in which there is no explicit belief, and say that a belief may be merely implicit in behaviour. When old Mother Hubbard went to the cupboard, she "believed" that there was a bone there, even if she had no state of mind which could be called cognitive in the sense of introspective psychology.

Words.—In order to bring this view into harmony with the facts of human behaviour, it is of course necessary to take account of the influence of words. The beast that desires shade on a hot day is attracted by the sight of darkness; the man can pronounce the word "shade," and ask where it is to be found. According to the behaviourists, it is the use of words and their efficacy in producing conditional responses that constitutes "thinking."[1] It is unnecessary for our purposes to inquire whether this view gives the whole truth about the matter. What it is important to realise is that verbal behaviour has the characteristics which lead us to regard it as pre-eminently a mark of "belief," even when the words are repeated as a mere bodily habit. Just as the habit of going to a certain house when you wish to see your friend may be said to show that you "believe" he lives in that house, so the habit of saying "two and two are four," even when merely verbal, must be held to constitute "belief" in this arithmetical proposition. Verbal habits are, of course, not infallible evidences of belief. We may say every Sunday that we are miserable sinners, while really thinking very well of ourselves. Nevertheless, speaking broadly, verbal habits crystallise our beliefs, and afford the most convenient way of making them explicit. To say more for words is to fall into that superstitious reverence for them which has been the bane of philosophy throughout its history.

Belief and Behaviour.—We are thus driven to the view that, if a belief is to be something causally important, it must be defined as a characteristic of behaviour. This view is also forced upon us by the consideration of truth and falsehood, for behaviour may be mistaken in just the way attributable to a false belief, even when no explicit belief is present—for example, when a man continues to hold up his umbrella after the rain has stopped without definitely entertaining the opinion that it is still raining. Belief in this wider sense may be attributed to animals—for example, to a dog who runs to the dining-room when he hears the gong. And when an animal behaves to a reflection in a looking-glass as if it were "real," we should naturally say that he "believes" there is another animal there; this form of words is permitted by our definition.

It remains, however, to say what characteristics of behaviour can be described as beliefs. Both human beings and animals act so as to achieve certain results, *e.g.*, getting food. Sometimes they succeed, sometimes they fail; when they succeed, their

[1] See J. B. Watson, *Behaviorism* (1925).

relevant beliefs are " true," but when they fail, at least one is false. There will usually be several beliefs involved in a given piece of behaviour, and variations of environment will be necessary to disentangle the causal characteristics which constitute the various beliefs. This analysis is effected by language, but would be very difficult if applied to dumb animals. A sentence may be taken as a law of behaviour in any environment containing certain characteristics; it will be " true " if the behaviour leads to results satisfactory to the person concerned, and otherwise it will be " false." Such, at least, is the pragmatist definition of truth and falsehood.

Truth in Logic.—There is also, however, a more logical method of discussing this question. In logic, we take for granted that a word has a " meaning"; what we signify by this can, I think, only be explained in behaviouristic terms, but when once we have acquired a vocabulary of words which have " meaning," we can proceed in a formal manner without needing to remember what " meaning " is. Given the laws of syntax in the language we are using, we can construct propositions by putting together the words of the language, and these propositions have meanings which result from those of the separate words and are no longer arbitrary. If we know that certain of these propositions are true, we can infer that certain others are true, and that yet others are false; sometimes this can be inferred with certainty, sometimes with greater or less probability. In all this logical manipulation, it is unnecessary to remember what constitutes meaning and what constitutes truth or falsehood. It is in this formal region that most philosophy has lived; and within this region a great deal can be said that is both true and important, without the need of any fundamental doctrine about meaning. It even seems possible to define " truth " in terms of " meaning " and " fact," as opposed to the pragmatic definition which we gave a moment ago. If so, there will be two valid definitions of " truth," though of course both will apply to the same propositions.

The purely formal definition of " truth " may be illustrated by a simple case. The word " Plato " means a certain man; the word " Socrates " means a certain other man; the word " love " means a certain relation. This being given, the meaning of the complex symbol " Plato loves Socrates " is fixed; we say that this complex symbol is " true " if there is a certain fact in the world, namely, the fact that Plato loves Socrates, and in the contrary case the complex symbol is false. I do not think this account is false, but, like everything purely formal, it does not probe very deep.

Uncertainty and Vagueness.—In defining knowledge, there are two further matters to be taken into consideration, namely, the degree of certainty and the degree of precision. All knowledge is more or less uncertain and more or less vague. These are, in a sense, opposing characters: vague knowledge has more likelihood of truth than precise knowledge, but is less useful. One of the aims of science is to increase precision without diminishing certainty. But we cannot confine the word " knowledge " to what has the highest degree of both these qualities; we must include some propositions that are rather vague and some that are only rather probable. It is important, however, to indicate vagueness and uncertainty where they are present, and, if possible, to estimate their degree. Where this can be done precisely, it becomes " probable error " and " probability." But in most cases precision in this respect is impossible.

II. THE DATA

In advanced scientific knowledge, the distinction between what is a datum and what is inferred is clear in fact, though sometimes difficult in theory. In astronomy, for instance, the data are mainly certain black and white patterns on photographic plates. These are called photographs of this or that part of the heavens, but of course much inference is involved in using them to give knowledge about stars or planets. Broadly speaking, quite different methods and a quite different type of skill are required for the observations which provide the data in a quantitative science, and for the deductions by which the data are shown to support this or that theory. There would be no reason to expect Einstein to be particularly good at photographing the stars near the sun during an eclipse. But although the distinction is practically obvious in such cases, it is far less so when we come to less exact knowledge. It may be said that the separation into data and inferences belongs to a well-developed stage of knowledge, and is absent in its beginnings.

Animal Inference.—But just as we found it necessary to admit that knowledge may be only a characteristic of behaviour, so we shall have to say about inference. What a logician recognises as inference is a refined operation, belonging to a high degree of intellectual development; but there is another kind of inference which is practised even by animals. We must consider this primitive form of inference before we can become clear as to what we mean by " data."

When a dog hears the gong and immediately goes into the dining-room, he is obviously, in a sense, practising inference. That is to say, his response is appropriate, not to the noise of the gong in itself, but to that of which the noise is a sign: his reaction is essentially similar to our reactions to words. An animal has the characteristic that, when two stimuli have been experienced together, one tends to call out the response which only the other could formerly call out. If the stimuli (or one of them) are emotionally powerful, one joint experience may be enough; if not, many joint experiences may be required. This characteristic is totally absent in machines. Suppose, for instance, that you went every day for a year to a certain automatic machine, and lit a match in front of it at the same moment at which you inserted a penny; it would not, at the end, have any tendency to give up its chocolate on the mere sight of a burning match. That is to say, machines do not display inference even in the form in which it is a mere characteristic of behaviour. Explicit inference, such as human beings practise, is a rationalising of the behaviour which we share with the animals. Having experienced A and B together frequently, we now react to A as we originally reacted to B. To make this seem rational, we say that A is a " sign " of B, and that B must really be present though out of sight. This is the principle of induction, upon which almost all science is based. And a great deal of philosophy is an attempt to make the principle seem reasonable.

Whenever, owing to past experience, we react to A in the manner in which we originally reacted to B, we may say that A is a " datum " and B is " inferred." In this sense, animals practise inference. It is clear, also, that much inference of this sort is fallacious: the conjunction of A and B in past experience may have been accidental. What is less clear is that there is any way of refining this type of inference which will make it valid. That, however, is a question which we shall consider later. What I want to consider now is the nature of those elements in our experiences which, to a reflective analysis, appear as " data " in the above-defined sense.

Mental and Physical Data.—Traditionally, there are two sorts of data, one physical, derived from the senses, the other mental, derived from introspection. It seems highly questionable whether this distinction can be validly made among data; it seems rather to belong to what is inferred from them. Suppose, for the sake of definiteness, that you are looking at a white triangle drawn on a black-board. You can make the two judgments: " There is a triangle there," and " I see a triangle." These are different propositions, but neither expresses a bare datum; the bare datum seems to be the same in both propositions. To illustrate the difference of the propositions: you might say " There is a triangle there," if you had seen it a moment ago but now had your eyes shut, and in this case you would not say " I see a triangle"; on the other hand, you might see a black dot which you knew to be due to indigestion or fatigue, and in this case you would not say " There is a black dot there." In the first of these cases, you have a clear case of inference, not of a datum.

In the second case, you refuse to infer a public object, open to the observation of others. This shows that " I see a triangle " comes nearer to being a datum than "There is a triangle there." But the words " I " and " see " both involve inferences, and

cannot be included in any form of words which aims at expressing a bare datum. The word "I" derives its meaning, partly, from memory and expectation, since I do not exist only at one moment. And the word "see" is a causal word, suggesting dependence upon the eyes; this involves experience, since a new-born baby does not know that what it sees depends upon its eyes. However, we can eliminate this dependence upon experience, since obviously all seen objects have a common quality, not belonging to auditory or tactual or any other objects. Let us call this quality that of being "visual." Then we can say: "There is a visual triangle." This is about as near as we can get in words to the datum for *both* propositions: "There is a triangle there," and "I see a triangle." The difference between the propositions results from different inferences: in the first, to the public world of physics, involving perceptions of others; in the second, to the whole of my experience, in which the visual triangle is an element. The difference between the physical and the mental, therefore, would seem to belong to inferences and constructions, not to data.

It would thus seem that data, in the sense in which we are using the word, consist of brief events, rousing in us various reactions, some of which may be called "inferences," or may at least be said to show the presence of inference. The two-fold organisation of these events, on the one hand as constituents of the public world of physics, on the other hand as parts of a personal experience, belongs to what is inferred, not to what is given. For theory of knowledge, the question of the validity of inference is vital. Unfortunately, nothing very satisfactory can be said about it, and the most careful discussions have been the most sceptical. However, let us examine the matter without prejudice.

III. METHODS OF INFERENCE

It is customary to distinguish two kinds of inference, Deduction and Induction. Deduction is obviously of great *practical* importance, since it embraces the whole of mathematics. But it may be questioned whether it is, in any strict sense, a form of inference at all. A pure deduction consists merely of saying the same thing in another way. Application to a particular case may have importance, because we bring in the experience that there is such a case—for example, when we infer that Socrates is mortal because all men are mortal. But in this case we have brought in a new piece of experience, not involved in the abstract deductive schema. In pure deduction, we deal with x and y, not with empirically given objects such as Socrates and Plato. However this may be, pure deduction does not raise the problems which are of most importance for theory of knowledge, and we may therefore pass it by.

Induction.—The important forms of inference for theory of knowledge are those in which we infer the existence of something having certain characteristics from the existence of something having certain other characteristics. For example: you read in the newspaper that a certain eminent man is dead, and you infer that he is dead. Sometimes, of course, the inference is mistaken. I have read accounts of my own death in newspapers, but I abstained from inferring that I was a ghost. In general, however, such inferences are essential to the conduct of life. Imagine the life of a sceptic who doubted the accuracy of the telephone book, or, when he received a letter, considered seriously the possibility that the black marks might have been made accidentally by an inky fly crawling over the paper. We have to accept merely probable knowledge in daily life, and theory of knowledge must help us to decide when it really *is* probable, and not mere animal prejudice.

Probability.—Far the most adequate discussion of the type of inference we are considering is obtained in J. M. Keynes's *Treatise on Probability* (1921). So superior is his work to that of his predecessors that it renders consideration of them unnecessary. Mr. Keynes considers induction and analogy together, and regards the latter as the basis of the former. The bare essence of an inference by analogy is as follows: We have found a number of instances in which two characteristics are combined, and no instances in which they are not combined; we find a new instance in which we know that one of the characteristics is present, but do not know whether the other is present or absent; we argue by analogy that *probably* the other characteristic is also present. The degree of probability which we infer will vary according to various circumstances. It is undeniable that we do make such inferences, and that neither science nor daily life would be possible without them. The question for the logician is as to their validity. Are they valid always, never or sometimes? And in the last case, can we decide when they are valid?

Limitation of Variety.—Mr. Keynes considers that mere increase in the number of instances in which two qualities are found together does not do much to strengthen the probability of their being found together in other instances. The important point, according to him, is that in the known cases the instances should have as few other qualities in common as possible. But even then a further assumption is required, which is called the principle of limitation of variety. This assumption is stated as follows (p. 256): "That the objects in the field, over which our generalisations extend, do not have an infinite number of independent qualities; that, in other words, their characteristics, however numerous, cohere together in groups of invariable connection, which are finite in number." It is not necessary to regard this assumption as *certain;* it is enough if there is some finite probability in its favour.[1]

It is not easy to find any arguments for or against an *a priori* finite probability in favour of the limitation of variety. It should be observed, however, that a "finite" probability, in Mr. Keynes's terminology, means a probability greater than some numerically measurable probability, *e.g.*, the probability of a penny coming 'heads' a million times running. When this is realised, the assumption certainly seems plausible. The strongest argument on the side of scepticism is that both men and animals are constantly led to beliefs (in the behaviouristic sense), which are caused by what may be called invalid inductions; this happens whenever some accidental collocation has produced an association not in accordance with any objective law. Dr. Watson caused an infant to be terrified of white rats by beating a gong behind its head at the moment of showing it a white rat (*Behaviorism*, p. 126). On the whole, however, accidental collocations will usually tend to be different for different people, and therefore the inductions in which men are agreed have a good chance of being valid. Scientific inductive or analogical inferences may, in the best cases, be assumed to have a high degree of probability, if the above principle of limitation of variety is true or finitely probable. This result is not so definite as we could wish, but it is at least preferable to Hume's complete scepticism. And it is not obtained, like Kant's answer to Hume, by a philosophy *ad hoc;* it proceeds on the ordinary lines of scientific method.

Grades of Certainty.—Theory of knowledge, as we have seen, is a subject which is partly logical, partly psychological; the connection between these parts is not very close. The logical part may, perhaps, come to be mainly an organisation of what passes for knowledge according to differing grades of certainty: some portions of our beliefs involve more dubious assumptions than are involved in other parts. Logic and mathematics on the one hand, and the facts of perception on the other, have the highest grade of certainty; where memory comes in, the certainty is lessened; where unobserved matter comes in, the certainty is further lessened; beyond all these stages comes what a cautious man of science would admit to be doubtful. The attempt to increase scientific certainty by means of some special philosophy seems hopeless, since, in view of the disagreement of philosophers, philosophical propositions must count as among the most doubtful of those to which serious students give an unqualified assent. For this reason, we have confined ourselves

[1] The argument which leads to this conclusion is long and technical. It has been criticised by Jean Nicod, *Le Problème logique de l'Induction* (Paris, 1924), whose contentions are rebutted by Mr. R. B. Braithwaite in *Mind* (Oct. 1925). The outcome is to justify Mr. Keynes in the main, though not in every detail.

to discussions which do not assume any definite position on philosophical as opposed to scientific questions.

KNOX, PHILANDER CHASE (1853–1921) (*see* 15.882d), American politician, was born at Brownsville, Pa., May 6 1853. He graduated from Mount Union College, Alliance, O., in 1872 and was admitted to the Bar in 1875. The following year he was appointed assistant U.S. Attorney for the western district of Pennsylvania. In 1877 he opened an office in Pittsburgh and soon developed a lucrative practice. In 1901 he was appointed attorney-general by President McKinley and was retained by President Roosevelt. While he was attorney-general many important suits were instituted, notably those against the "Beef Trust" and the Northern Securities Company. He resigned in 1904, having been appointed to fill the unexpired term of Matthew S. Quay, deceased, as Senator for Pennsylvania, and was re-elected to serve 1905–11. In 1909 he resigned to enter the cabinet of President Taft as Secretary of State, holding that office for four years. He was again returned to the Senate for 1917–23. In 1920 he offered a resolution declaring that war with Germany was at an end, which was adopted by both Senate and House, but was vetoed by President Wilson. A similar joint resolution of Congress was approved by President Harding July 2 1921, and a formal treaty of peace with Germany signed Aug. 25. He died in Washington, D.C., Oct. 12 1921.

KNUTSFORD, SYDNEY GEORGE HOLLAND, 2ND VISCOUNT (1855–), eldest son of the first Viscount Knutsford, was born on March 19 1855. He was educated at Wellington and at Trinity Hall, Cambridge, where he secured honours in law and distinguished himself in athletics. He was called to the bar in 1879, and in 1883 married Lady Mary Ashburnham, daughter of the 4th Earl of Ashburnham. He succeeded to the title on the death of his father in 1914. He became a director of the Underground Electric Railways Co. and other important companies, and was associated with a number of philanthropic enterprises. He was appointed chairman of the London Hospital, and his proposal that certain city churches should be demolished in order to provide funds for the sustentation of hospitals, though it attracted several supporters, embroiled him in controversy.

KOBE, Japan, with a population of 714,976 in 1921 (including 4,727 foreigners, largely Chinese), has increased in importance as a port as a result of the earthquake of 1923. A considerable part of the trade of Yokohama was diverted to it, and part of this transference will probably be permanent, owing to the excellent railway facilities of Kobe. The foreign population has also increased. Large sums have been spent on port improvement and land reclamation, and work is still in progress. In 1922 there were four quays, with berths for 19 vessels, and 19 more berths were projected for the completion of the extension scheme. A large shipbuilding yard, the fourth, was opened in 1917. In 1910 the bed of the Minatogawa river was reclaimed; the upper part has been made into a park, with a city hall and large market. The tramways have been extended to Hyogo, which is now administratively a part of Kobe. The city stretches five miles between the hills and the river, and is extending rapidly towards Osaka, with which it is connected by electric railway; the hill of Rokko-Zan behind the city has become a favourite summer resort. Many Japanese have erected office buildings in the settlement, which is well laid out. The water supply, previously very inadequate, has been extended. Although the south and southwest parts of Japan are supposed to be immune from serious earthquakes, a shock in the neighbourhood of Kobe caused considerable damage and some loss of life in May 1925.

KODÁLY, ZOLTÁN (1882–), Hungarian composer, was born at Kecskemét, Hungary, Dec. 16 1882. He studied under Hans Koessler at the Budapest Academy of Music, where he became professor of composition in 1907. A leading exponent of the ultra-modern tendency in Hungarian music, he devoted himself enthusiastically to the collection and arrangement of Hungarian and Slovak folk-songs and his pioneer work in this connection was of great importance; for he and Bartók discovered a certain type of Hungarian national music, of a much greater purity and originality than the popular gipsy-music. This had a remarkable effect in transforming modern Hungarian music, and in opening up a new perspective. In his arrangement of folk-songs, Kodály successfully penetrated their inner meaning, and preserved their poetic spirit. His musical criticisms have appeared in Hungarian, American, French and Italian papers. His works include *Johannes Hary*, a musical comedy; *Psalm LV.*, for chorus and orchestra; two string quartets; a trio for strings; sonatas, piano solos, songs, etc.

KOKOSCHKA, OSKAR (1886–), German poet and painter, was born at Pöchlarn, Austria, March 1 1886. He was an expressionist, and produced a number of semi-dramatic works, written in whimsical vein, in which the problems of life were treated in a somewhat loose and vague manner. *Mörder, Hoffnung der Frauen* (1907), *Der brennende Dornbusch* (1911), *Hiob* (1917) and *Orpheus und Eurydike* (1918) were first published in the *Sturm* and afterwards appeared in collected form under the title of *Vier Dramen* (1919). *Mörder, Hoffnung der Frauen* and *Hiob* were performed for the first time in Dresden in 1919 and *Der brennende Dornbusch* was produced in Berlin under Kokoschka's direction by the "Junge Deutschland." In his staging of this piece Kokoschka revealed much original talent. His verse is, for the most part, complementary to the accompanying pictures. His poetical works include *Die träumenden Knaben* (Vienna, 1908; Leipzig, 1917); *Der weisse Tiertöter* (1920); *Der gefesselte Kolumbus* (1921); and among his more notable pictures and drawings are "Auswanderer" and "Der irrende Ritter." See Paul Westheim, *O. Kokoschka* (1919).

KOLÁČEK, FRANTIŠEK (1851–1913), Czech physicist, studied in Prague under E. Mach and in Vienna under Stefan. In 1882 he was appointed lecturer at the Brno (Brünn) Polytechnic, and in 1891 became professor of mathematical physics at the Charles University in Prague. His numerous publications (mostly in Czech and German) dealing with electromagnetic and optical theory and hydrodynamics include: "Dispersionserklaerung nach der elektromagnetischen Lichttheorie" (*Ann. der Physik* 1887, 1888), which gives the first explanation of dispersion on the basis of Maxwell's electromagnetic theory; "Theorie der Doppelbrechung" (*ibid.*, 1892); *Theorie des Kerr'schen Reflexion Phaenomens* (Prague, 1895); "Ueber Magnetostriktion" (*Phys. Zeitschr.*, vol. 6, p. 143, 1905), and "Zur Theorie der elektromagnetischen Gleichungen in bewegten Medien" (*Ann. der Physik.*, vol. 23, p. 698, 1907), which derives electromagnetic equations for moving media independently of the electron theory, and arrives at Lorentz equations which are related to a system of co-ordinates connected with the observer, thus satisfying the relativity criterion; also the excellent textbooks *Hydrodynamika* (Prague, 1899), and *Elektřina a Magnetism* (Prague, 1904). Koláček died in Dec. 1913.

KOLCHAK, ALEXANDER VASILIEVICH (1875–1920), Russian admiral, was born in 1875 and entered the Russian Navy in 1888. He served in the Russo-Japanese War of 1904–5 and at the beginning of the World War was in command of a destroyer in the Baltic. In the summer of 1916 Kolchak was appointed commander of the Black Sea Fleet, with the rank of rear-admiral. After the revolution in 1917 he took an active part in the fighting against the Bolshevists in Siberia. On Nov. 18 1918, by a decision of the Russian Govt. at Omsk, Admiral Kolchak assumed the title of Supreme Ruler of Russia. During the first half of 1919 the anti-Bolshevist army under his command met with considerable success but in the summer the army disintegrated, there were risings in the rear, and Omsk, the capital of the Siberian Govt., was captured on Nov. 15 1919. The Government was then transferred to Irkutsk, but after the creation of a new socialist administration at Irkutsk, Kolchak was asked to resign, and on Jan. 4 1920 he signed a ukase transferring his powers to Gen.

Denikin. Later he fell into the hands of the Bolshevists and was shot at Irkutsk on Feb. 7 1920.

KOMURA, JUTARO, MARQUESS (1855–1911), Japanese diplomat and statesman (*see* 15.892), was foreign minister in the second Katsura administration (1908–11) and died at Hayama Nov. 24 1911.

KOORT, JAN (1883–), Estonian sculptor, was born Nov. 7 1883 in the Tartu (Dorpat) district. He received his artistic training in the Baron Stieglitz Art School at St. Petersburg (Leningrad) and from 1905–8 studied at the École des Beaux-Arts in Paris under Prof. Mercier. For the purpose of completing his training he worked in the private studios in Paris of Adler, R. Collin and Lucas. He was represented in the exhibitions of the Paris spring and autumn salons in 1908 and in the Tartue exhibition, 1909. After a short stay in his own country, Koort again went to Paris in 1910 where he remained until 1915. In 1910 he exhibited in the Helsingfors art exhibition. In 1915 he went to Moscow, where his best work was produced, and in 1915 and 1916 took part in the exhibitions known under the name of "Mir Iskusstwa." The Tretjakow Gallery in Moscow acquired his granite "Frauenkopf" and the portrait of his wife executed in black granite is in the Moscow Gallery. Koort, who worked in granite, marble and wood, produced various decorative works in memory of those who fell in the Estonian War of Independence. His great talents are most forcibly revealed in a number of finely executed character heads.

KORAN: *see* ARABIC LITERATURE.

KÖRBER, ERNST VON (1850–1919), Austrian statesman, was born at Trieste Nov. 6 1850. He began his career as an official in the Austrian state service, and when the Emperor Francis Joseph was compelled to rely on cabinets of officials in view of the obstruction in Parliament, Körber became minister of trade under Gautsch in 1897, of the interior under Clary in 1899 and Prime Minister in 1900. He was the first man other than an aristocrat to hold this post since Schmerling. Körber attempted to solve the nationalist question by honest negotiation and compromise, but his efforts first to bring Germany and the Czechs in Bohemia to an agreement, and later to solve the language problem by dividing Bohemia into a German, a Czech and a mixed district, broke down. He succeeded in restoring confidence between the Germans and the Crown, but the Czechs renewed their obstruction and Körber was forced to rule, as his predecessors had done, with the help of para. 14 of the Austrian constitution (which allowed a Government to pass any measure on its joint responsibility, with "provisional validity," should it prove impossible to pass the measure through Parliament in the ordinary way). Körber employed this expedient on no fewer than 33 occasions. He evolved the Great Austrian canal scheme, the only example of constructive legislation on a large scale in Austria of modern times, which was voted but never carried into action. He was also able to introduce a better spirit into industrial disputes, winning the confidence of masters and men alike.

Körber resigned office in Dec. 1904, when the obstruction of the Hungarian party of independence made it impossible to carry through the periodical compromise with Hungary. He returned to politics as common finance minister in Feb. 1915 and became prime minister for the second time in Oct. 1916 after the murder of Count Stürgkh. His old confidence, however, was gone. He resigned in Dec. 1916 after a fresh dispute concerning the Hungarian compromise and died in Baden, disregarded and embittered, March 5 1919.

KOREA or CHOSEN.—On Aug. 22 1910 Korea (*see* 15.908) became an integral part of the Japanese Empire, under its ancient name of Chosen, formerly in use for over five centuries and now officially restored. With this event a new era dawned for what was formerly the "Hermit Kingdom." The ordered and systematic progress, already inaugurated by Japan in 1906, advanced steadily.

The peninsula of Chosen, with its outlying islands, has an area of 86,000 square miles. It is thus about as large as the mainland of Japan, or about two-thirds of the size of the British Isles. The population on Oct. 1 1920 was 17,264,119, including about 337,000 Japanese and about 23,000 foreigners. The density was only about 208 per sq. m., compared with 376 in Japan and about 374 in Great Britain. On Oct. 1 1924 the population was estimated at 18,677,800. The climate is dry and bracing, without intense variations of cold and heat, and, in contrast to Japan, there is an absence of hurricanes and practically no visitation of earthquakes. The country is mountainous, especially in the north, but there are extensive plains, well watered with good rivers, on the south and west, where are situated the excellent harbours of Fusan, Mokpo, Chemulpho and Chinnampo. The mineral wealth of the country is concentrated in the north, while agriculture is the predominant characteristic of the level and fertile southwest. Chosen's geographical position affords her easy access to the markets of China, Manchuria and Siberia, and a railway line now connects her with northern Asia and thus to the heart of Europe.

I. POLITICAL HISTORY

Subsequently to the annexation, the functions of the Japanese residency-general and of the Korean Govt. were merged in those of a governor-general, the first to be appointed being Gen. Terauchi, with Mr. I. Yamagata, son of Prince Yamagata, as administrative superintendent. In Oct. 1916 Gen. Terauchi vacated his post to become Premier of Japan, and was succeeded by Gen. Count Hasegawa, Mr. Yamagata continuing in office. An important reform effected in this period was the unification of the police and the gendarmerie service, by which a better control of the outlying districts was obtained where hitherto the peace and security of the inhabitants had been frequently disturbed by bands of robbers and marauders.

But widespread disturbances took place in March 1919. The Koreans desired to achieve at one step that measure of "self-determination" which President Wilson's utterances appeared to them to justify. The disturbances, however, were quickly subdued, and the Japanese Govt. hastened forward reform measures which had already been contemplated. The heads of the administration resigned, and Baron (later Viscount) Makoto Saito was appointed governor-general and Dr. R. Midzuno administrative superintendent. The reforms introduced were: (1) the extension to civil officials of eligibility to the post of governor-general, hitherto only open to a military officer of the rank of general; (2) the governor-general, formerly only directly responsible to the Throne, to be amenable to the Prime Minister of Japan; (3) the governor-general to be relieved, even when a military officer, of the right to the military command, which should be exercised only by the commander of the army; (4) the substitution of a police force for the mixed system of gendarmerie and police. The Premier, Mr. Hara, also issued a statement that the Government were desirous of further eliminating, as time went on, all differences between Japan proper and Chosen in matters of education, industry and the civil services. A system of provincial and municipal administration, similar to that in Japan, would also gradually be evolved.

Peace was thus established, although various agitators and malcontents who had fled either to Shanghai or to Manchuria from time to time made abortive attempts to stir up discontent. Episodes which occurred in the autumn of 1920 in the Chientao district, when a Japanese consulate was burned and attacks were made on peaceful Japanese and other civilians, were subsequently found to have been engineered by Korean agitators.

II. FINANCIAL AND ECONOMIC HISTORY

Finance.—After the Russo-Japanese War, 1904–5, Japan turned her attention more actively to the reform of Chosen fiscal affairs. Detailed regulations regarding revenue and expenditure were promulgated in June 1906, the system of public tenders was introduced, and a bureau of audit was established. The Seoul branch of a Japanese joint-stock bank was authorised to act as the central treasury of the Chosen Govt., and the post-offices were also entrusted with Treasury business. In Sept. 1906 regulations with regard to the collection of taxes were issued and assessors appointed, all being made directly responsible to the Minister of Finance.

A law of 1901, not then put into force, by which the coinage system was to be made analogous to that of Japan, became operative in June 1905, and it was further provided that the standard money of

Japan, or bank notes, should become the standard money of Chosen. Thus Chosen became a gold country.

In consequence of the steady expansion of financial and economic affairs, the Bank of Korea (renamed the Bank of Chosen in 1911) was established as a central bank in Oct. 1909, and took over the duties previously attended to by the First Bank, Ltd. The Bank of Chosen, which has an authorised capital of 40,000,000 yen and a paid-up capital of 25,000,000 yen, acts as cashier to the Treasury and handles loan business, and, in addition, is authorised to issue bank notes and to engage in ordinary banking and trust business, such as the discounting of drafts and other commercial papers. Also, subject to the approval of the Governor-General of Chosen, it may make advances to public corporations without security and represent other banks. Being the principal medium of exchange in Chosen, the volume of the note issue has steadily expanded with the development of economic affairs in the peninsula. Since Dec. 1917 the notes have been allowed unlimited circulation in the Kwantung territory and the South Manchuria Railway Co.'s leased districts. At the same time the notes were made to replace the gold notes formerly issued in Manchuria by the Yokohama Specie Bank, this further swelling the volume of circulation bank notes issued by the Korean banks.

In March 1906, during the protectorate régime of Japan, the Agricultural and Industrial Bank Regulation was enacted with the object of giving relief to the straitened money market in the provinces by the creation of a number of agricultural and industrial banks. The Government extended them help, such as by subscribing to the capital, making loans free of interest and so forth. By the end of 1917 six head offices and 41 branches had been established in various parts of the peninsula. In time they were adjudged inadequate for the rapidly growing industrial and economic requirements, and this resulted in the promulgation in June 1918 of the Chosen Industrial Bank Law, in virtue of which a central bank bearing this title was established in Oct. of the same year by amalgamating the agricultural and industrial banks then existing.

At the end of 1923 there existed in Chosen 18 banks with 58 branches or agencies in addition to their head offices, 17 branch offices and agencies of banks which had their head offices in Japan proper, and at the end of June 1924 as many as 499 local credit associations with a total membership of 357,000 persons.

The country's ordinary revenue rose from 44,764,559 yen in 1916–7 to 102,383,844 in 1924–5; while the extraordinary revenue rose from 23,437,548 yen in 1916–7 to 38,439,857 yen in 1924–5. The total expenditure, which in 1916–7 was 57,562,710 yen, was 140,823,701 yen in 1924–5.

Foreign Trade.—The external trade of Chosen rapidly increased with the development of her agriculture and industry. Exports, valued at 5,616,608 yen in 1912 (in addition to exports to Japan itself of 15,369,009 yen), increased to 20,403,305 yen in 1923 (with 241,262,427 yen to Japan); and imports, 26,359,434 yen in 1912 (plus 40,756,013 yen from Japan), rose to 98,338,377 yen in 1923 (plus 167,452,350 yen from Japan).

During the same period the ratio of trade with Japan to that with foreign countries may be seen from the following table:—

	Trade with Japan (including Taiwan and Karafuto)	Trade with foreign countries
	%	%
1912	67	33
1914	72	28
1916	75	25
1918	81	19
1920	70	30
1921	79	21
1922	76	24
1923	77	23

In 1924 the trade with foreign countries amounted to: imports, 97,882,000 yen, exports 22,495,000 yen.

Government Enterprises.—In 1908 a special Government office was established to control and foster the cultivation of the medicinal plant ginseng. The area under cultivation increased to 1,724 ac., the annual value of the medicinal ginseng raised being 2,000,000 yen.

In 1907 the Government commenced operations for the natural evaporation of salt, a product hitherto obtained by the artificial boiling process, and the manufacture was developed as a Government enterprise. By 1918 saltpans covering an area of 2,528 ac. were in operation, but, as the quantity of salt produced was still insufficient for home consumption, in 1920 the Government began laying out an additional 6,370 ac., the work to be completed in seven years. The salt produced in 1923 amounted to 67,000,000 kin (88,600,000 lb.).

The production and manufacture of tobacco has been greatly fostered by the Government. The area under cultivation increased from 33,261 ac. in 1915 to 42,525 ac. in 1919, the total value having risen from 4,878,127 yen to 14,501,169 yen in the same period. In 1923, however, the area had decreased to 19,885 ac., and the total value for the year was 22,217,642 yen.

Agriculture and Industry.—Rice is the staple agricultural product, followed by barley, Italian millet, soy beans, wheat and red beans, in addition to which there are also such special products as cotton, tobacco, hemp and ginseng. The cultivation of fruit-trees has produced very good results, and the area of their cultivation is gradually extending, fruit-farming having received considerable impetus through the establishment of model agricultural farms. The Government undertook the reorganisation of sericulture in 1906, and the industry is now being carried on everywhere. Both fruit-farming and sericulture are engaged in as subsidiary industries by the agricultural class. The breeding of cattle, horses, goats and pigs is carried on nearly everywhere in the peninsula, though not as an independent enterprise. The cattle are well known for their great size and good quality, and a large number of them are exported annually to Japan proper and Asiatic Russia.

At the time of annexation a large part of the forests and plains of Chosen was in a state of utter desolation, but since the year 1907 afforestation has progressed uninterruptedly, with Government assistance, many private forestry enterprises having also sprung up in various localities. The total area of the forests of Chosen is believed to be about 13,500,000 acres.

The principal native industrial products are: textile fabrics, paper, pottery, metal ware, manufactured tobacco, brewed drinks and leather, but as these works are mostly carried on as subsidiary house industries, the production is insufficient to meet the demand, and even common articles of daily use have in many cases to be imported. With the steady development of manufacturing industries and the rapid strides with which agriculture, mining and other primary industries have grown, Chosen has begun to attract wide attention as a promising field of enterprise, especially in spinning, filature, the manufacture of pulp, cement, beet-sugar, matches, milling and iron founding.

In 1922 there were 53 agricultural companies with a total paid-up capital of 23,988,000 yen, 178 industrial with 27,390,000 yen, 261 commercial with 22,994,000 yen, 79 transportation with 27,694,000 yen and 188 others with 116,883,000 yen, making a total of 759 companies with a capital of 218,950,000 yen.

Mining.—A mining law enacted after the annexation, and made operative on April 1 1916, prohibited foreigners from acquiring mining rights in Chosen unless as a legal Japanese corporation, although the rights existing and already granted to foreigners by the former Korean Govt. were strictly respected. The principal mineral products, in addition to gold, are silver, zinc, copper, lead, iron, tungsten ore, graphite, coal (especially anthracite), quartz sand and kaolin. A number of Japanese mine-owners have recently commenced operations in the peninsula, and mining enterprise shows a steady expansion. The total annual yield of all the mines in the country was as follows:—

1910	6,067,952 yen	1918	30,838,074 yen
1912	6,815,121 yen	1920	24,204,688 yen
1914	8,522,418 yen	1922	14,503,781 yen
1916	14,078,188 yen	1923	17,326,894 yen

Fisheries.—The advance in the fisheries was mainly due to the provisions of the Fishery Law of 1911 under which new fishing associations have been formed, havens for the fishing fleet provided, and proper investigations conducted into the suitability of gear and the movements and location of fish. As a result, the fishing population increased from 93,400 with 16,709 boats in 1910, to 346,349 with 53,118 boats in 1918, the total value of the catch having risen from 7,871,910 yen to 32,863,402 yen in the same period. The total catch in 1923 reached the value of 51,700,000 yen.

Communications.—Some 3,850 m. of road construction and repair were undertaken at Government expense, and the cost of another 1,000 m. was shared between the Government and the local authorities, the total outlay being about 25,000,000 yen. The first railway line in Chosen, between Seoul and Chemulpho, was completed by a Japanese syndicate in 1900 and opened to traffic in Oct. of that year, whilst the same syndicate undertook the construction of the Seoul-Fusan railway (274 m.), which was

completed and opened to traffic in Jan. 1905. The trunk line Seoul-Wiju (309 m.), which traverses the peninsula lengthwise, was built by the Japanese Army and completed in 1906. Branch lines were added from time to time, so that by the time Chosen became part of the empire some 750 m. of railway were in operation. By 1923–4 this figure had been increased to 1,189 miles.

Posts, etc.—Since 1910–11 the expansion of the postal, telegraph and telephone services in Chosen has been normal, the number of post-offices having increased from 447 in 1910–1 to 618 in 1922–3, the postal packets from 100,265,041 to 347,779,584 and the parcels from 1,589,722 to 4,565,571. The length of telegraph lines increased in the same period from 3,389 m. to 5,087 m.; the length of wires from 7,740 m. to 19,635 m.; and the number of messages from 7,127,235 to 9,850,157. The length of telephone lines increased from 314 m. to 4,447 m.; the wires from 10,121 m. to 45,704 m.; and the messages from 21,260,918 to 72,328,480.

A great increase both in the number of depositors and the amount of their savings was a feature of the Post-Office Savings Bank in Chosen; in 1911–2 there were 223,599 depositors (4,365,096 yen), and in 1922–3 there were 1,590,470 depositors (19,875,093 yen).

KORNILOV, LAVR GEORGIEVICH (1870–1918), Russian soldier was born July 18 1870 in Ust-Kamenogorodsk, Siberia, his father being a Cossack officer. He entered the army, and was in 1892 commissioned and posted to the Turkistan artillery brigade. He devoted himself to service in Turkistan, whence he undertook journeys into Afghanistan, Chinese Turkistan, Persia and Baluchistan. He saw service as a staff officer in the Russo-Japanese War of 1904–5, and subsequently spent four years (1907–11) as Russian military attaché in Peking. In Galicia, Kornilov commanded an infantry division. He himself was captured and sent to the fortress of Laka, in Hungary, but he managed to escape, reaching Russia in the autumn of 1916. He was at once appointed commander of the XX. Army Corps. At the beginning of March 1917, with the outbreak of the Russian Revolution, Kornilov was appointed to command the troops of the military district of Petrograd.

He found the troops, in such a demoralised state that he asked to be relieved and sent to the front, and at the beginning of May he was made commander of the VIII. Army. Appointed by Kerensky supreme commander-in-chief, Kornilov presented his programme enforcing discipline in the army. The programme was, however, rejected, and this was the beginning of a split between Kerensky and Kornilov and the struggle between them ending in the outbreak of Sept. 8–12; Kerensky gained an apparent victory, and Kornilov was interned in Bikhov. On his release after the November revolution, Kornilov assisted Gen. Alexeyev in forming the Volunteer Army in which he took a command. On March 31 1918 he was killed in the Caucasus by the bursting of a shell.

KOSSUTH, FRANCIS (1841–1914), Hungarian statesman (*see* 15.916), died in Budapest May 25 1914.

KÖVESLIGETHY, RADÓ DE (1862–), Hungarian astronomer, was born at Verona, Italy, Sept. 1 1862. Educated at Pozsony and the University of Vienna, he became assistant to H. C. Vogel at Potsdam Observatory and later astronomer at the Ó-Gyalla Observatory. While still a student he evolved from Greenwich observations of velocities in the line of sight a first approximation of solar velocity. He constructed further for the Kis Kartal Observatory a handy and powerful spectrophotometer based on the principle of extinction by polarisation. After a year's collaboration at the Central Institute of Meteorology and Terrestrial Magnetism at Budapest he became assistant to Baron Eötvös. In 1897 he was appointed extraordinary, and in 1904 ordinary professor of cosmography and geophysics at the University of Budapest. In 1905 he became general secretary of the International Seismological Association, a position he held till the dissolution of the Association in 1916. In 1905 he founded the Seismological Institute of Budapest. After the great earthquake of Messina he investigated the conditions under which a rational prevision of earthquakes would be possible (*Sur l'hystérisis sismique*, 1912).

KOVNO or KAUNAS (*see* 15.921), with a population of 92,446 in 1923, became the capital of Lithuania in place of Vilna (Wilno) when that town was included in Poland. Kovno has changed greatly since the World War. Previously a quiet, somewhat poor town, with no water supply, gas or modern drainage, it has now electricity and other services and a number of new buildings, including large shops and theatres. Its improvement is largely due to the fact that the taxes of Lithuania are now spent in the country, since it gained its independence. A Lithuanian university, called the Gedimine University in honour of a medieval prince, was opened in 1922. Kovno is the industrial centre of the country, nearly one-fifth of the industrial establishments in existence in 1921 being in the city. Kovno was thought to be a first-class fortress, but was reduced in a few days by German forces during the World War. Two churches were wrecked, mills razed and much damage done. Great efforts to Germanise the town were made during the occupation. The independence of Lithuania was ratified by the Constituent Assembly at Kovno in May 1920.

KRASSIN, LEONID BROISSODICH (1870–), Russian politician, was born in Kurgan, Tobolsk, the son of a civil servant. He was expelled from the St. Petersburg Technical Institute in 1891 for taking part in a political demonstration on the occasion of the funeral of Shelgunov. He was arrested in 1894, 1907 and 1908 and banished for three years to Nijni Novgorod. He combined continuous revolutionary activity with great success in the engineering profession, taking important part in many large works in Russia and holding eventually a responsible post in the company of Siemens and Schuckert. After the Nov. Revolution, 1917, he organised the supply of munitions to the Red Army during the civil war and became People's Commissar for Trade and Industry. In 1920 he was president of the Soviet delegation that concluded the trade agreement with England. In 1922 he was a member of the Soviet delegation to Genoa. In London he concluded an agreement with Mr. Urquhart concerning concessions in Siberia, but this agreement was not ratified in Russia, owing to the personal intervention of Lenin. When the Commissariats of Internal and Foreign Trade were united, Krassin became assistant commissar. He was for some time Soviet diplomatic representative in Paris and was appointed to London at the end of 1925.

KRAUS, KARL (1874–), Austrian critic and poet, was born April 28 1874 at Jičin, Czechoslovakia. He attended the university of Vienna and attracted notice by two brochures, *Die demolierte Literatur* and *Eine Kron für Zion*, and by his periodical, *Die Fackel*. This review, of which he became editor in 1899, was at first largely, and later entirely, written by him. It began its career by violent attacks upon abuses in literary, theatrical, social and political circles in Vienna, and especially upon the newspaper Press. Gradually it became the mouthpiece of a pitiless and scathing critic and, though the satirist's point of view changed in the course of time, the middle classes and the liberal Press always remained the chief objects of Kraus's attack. His satire was most acute in his collected essays, *Sittlichkeit und Kriminalität* (1902) and his volume of anti-war poetry *Die letzen Tage der Menschheit* (1918) was compared with that of Juvenal and Swift. Kraus has great pathos at his command, but his lyrical talent, as shown in *Worte in Versen* (1918), is cramped by his mordant wit. Nevertheless his influence upon the younger generation in Austria and Germany was very considerable. As a lecturer upon his own and upon foreign

works, he achieved great success both in his own country and abroad. He must also be reckoned, with Lichtenberg, Novalis and Nietzsche, among the German masters of aphorism. Kraus's other works include *Sprüche und Widersprüche* (1909); *Pro domo et mundo* (1912); *Nachts* (1919).

See L. Liegler, *Karl Kraus und sein Werk* (1920); B. Viertel, *Karl Kraus* (1921).

KREHBIEL, HENRY EDWARD (1854–1923), American writer and critic, was born at Ann Arbor, Mich., March 10 1854. He studied law at Cincinnati 1872–4, but drifted into journalism, devoting himself more particularly to musical criticism. He was on the staff of the Cincinnati *Gazette*, 1874–80, then editor of the New York *Musical Review*, and finally musical critic for the New York *Tribune* till his death, which occurred in New York City, March 20 1923. He was one of the most influential musical critics of his time, and in addition to lecturing on musical topics, wrote a number of popular books. Among these are *Studies in Wagnerian Drama* (1891); *How to Listen to Music* (1896); *Music and Manners in the Classical Period* (1898); *The Pianoforte and Its Music* (1911); *Afro-American Folk Songs* (1914); also works explaining grand opera plots, motives and music. He was the American editor of the 2nd ed. of Grove's *Dictionary of Music and Musicians* (1904–10), edited Thayer's *Life of Ludwig van Beethoven*, 3 vol. (1921) and translated a number of foreign musical works.

KREISLER, FRITZ (1875–), Austrian violinist, was born at Vienna Feb. 2 1875. At the age of seven he was admitted to the Vienna Conservatoire and in 1887 won the Grand Prix on graduation from the Paris Conservatoire, where he studied under Massenet and Delibes. In 1889 he made a successful tour of the United States, but then abandoned music for some years, studying medicine and serving in the Austrian Army as an officer in a Uhlan regiment. His reappearance on the concert stage in Berlin, March 1899, was followed by a wonderful tour of the United States and Great Britain in 1900–1, and he later visited the chief musical centres of the world. On the outbreak of the World War in 1914 he rejoined his former regiment, but was wounded and discharged from service, thereafter resuming his musical career. He published his war experiences, *Four Weeks in the Trenches*, in 1915. He has also written numerous arrangements of music for the violin and piano, and his operetta, *Apple Blossoms*, was produced in New York in 1919.

KRILOFF, ALEXEI NIKOLAIEVICH (1863–), Russian mathematician and naval architect, was born Aug. 3 1863 in Alātyr, Simbirsk province, and educated in the naval school and naval academy at St. Petersburg (Leningrad). In 1881 he joined the navy. In 1896 and 1898 he read before the Institution of Naval Architects in London two remarkable papers on the oscillation of a ship on waves and was awarded the gold medal of the Institution. From 1900 to 1908 he was superintendent of the experimental tank at St. Petersburg; and from 1908 to 1910 director of naval construction. In 1890 he became professor at the naval academy and in 1916 member of the Russian Academy of Sciences. He devised for the Russian Navy a series of special high-grade optical instruments, and published many scientific papers and textbooks, among which the most original are: *On Approximative Calculations* (1906) and *On Differential Equations of Mathematical Physics* (1912). He was also interested in theoretical astronomy and translated into Russian Isaac Newton's *Principia* with a valuable commentary, published by the naval academy in 1916.

KROGH, SCHACK AUGUST STEENBERG (1874–), Danish physiologist, was born at Grenaa and took his doctor's degree in 1903 by a thesis on the respiration of frogs. In 1916 he became professor of animal physiology at the University of Copenhagen. Krogh made important discoveries by his experiments in connection with respiration, and in 1906 was awarded a prize by the Vienna Academy of Science for the investigations which he carried out and described in a treatise, *Mechanism of Gas Exchange in Lungs*. In 1920 he was awarded the Nobel Prize for medicine for his discovery of the capillary regulation of the conveyance of blood to the muscles. He afterwards continued his investigations of the capillaries and the blood, in which he discovered an element which influences the contraction of the capillaries. (*See* PHYSIOLOGY.)

Among his publications are: *The Respiratory Exchange in Animals and Man* (1916) and *The Anatomy and Physiology of Capillaries* (1922); and articles in *The Journal of Physiology*.

KROHG, CHRISTIAN (1852–1925), Norwegian painter and author, was born at Christiania (Oslo) Aug. 13 1852. After graduating in law, he went to Germany to study painting. During the following 30 odd years he lived alternately at Christiania and in Paris, until in 1909 he was appointed professor and director at the newly founded academy of painters and sculptors, Christiania. Krohg was the pioneer of the art of open-air painting in Norway which had its heyday in the first half of the 'eighties. He specialised in depicting the sea and the life of the pilots, which he rendered with a wonderful vigour and originality of incident and colouring. His deep interest in the social problems of his age is shown in his "Struggle for Existence" (1890) in the Oslo National Gallery. Krohg, besides being an excellent portrait painter, also possessed literary and journalistic talent. A selection of his literary works in four volumes appeared in 1920–1. He died on Oct. 16 1925.

KROPOTKIN, PETER ALEXEIVICH, PRINCE (1842–1921), Russian author (*see* 15.928), returned to Russia in June 1917, and died near Moscow, after a long illness, Feb. 8 1921.

KU KLUX KLAN (*see* 15.942).—On Thanksgiving night in 1915 William Joseph Simmons, preacher, travelling salesman and experienced promoter of fraternal orders, gathered some friends on Stone Mountain, near Atlanta, Ga., before a "fiery cross" and administered the oath of the "Invisible Empire, Knights of the Ku Klux Klan." A state charter gave corporate rights to his organisation. As Imperial Wizard, Simmons could hold office for life and have final authority unless opposed by two-thirds of the Imperial Kloncilium, council of supreme officers and delegates from other states.

Activities of Simmons.—Thus legally established, Simmons called upon the world to witness that his was a "high-class, mystic, social, patriotic, benevolent association" devoted to the sacred duty of protecting womanhood, to the idea of the "Fatherhood of God, Brotherhood of Man," to the principle of "white supremacy"—in short, to "real patriotism" and "pure Americanism." Simmons capitalised the mask of secrecy and roaming by night that had made so effective the old Klan. In the next four years, his order won some 5,000 adherents, mostly in the southern states. They displayed the patriotism of Klansmen on the "home front," against alien enemies, idlers, draft-dodgers, strikers in war industries and immoral women. Nevertheless, the tradition of the old Klan lost vitality. Simmons met financial difficulties. The order would have languished had not new impetus been given.

Growth of the Organisation.—On June 7 1920, Simmons contracted with E. Y. Clarke to increase the membership. As Imperial Kleagle, he was to receive $8 of the $10 admission fee, and $2 for every member added to a local Klan within six months after its organisation. He agreed to pay all expenses of the central office and $75 a week to Simmons. When Clarke's system was perfected, $4 of the original fee went to the local Kleagle, $1 to the King Kleagle or state sales-manager, $0.50 to the Grand Goblin, or head of the local Klan. The remaining $4.50 went to Atlanta. Other revenues accumulated from the sale of regalia by the subsidiary Gate City Manufacturing Company. When Congress made an investigation in Oct. 1921, it found that the Klan had funds enough to purchase an Imperial Palace and to take over control of Lanier University. The Invisible Empire then had a membership little short of 100,000. Expert salesmanship alone, however, did not account for the rapid growth of the Klan. It was not checked by the revelations before the Congressional Committee nor by the devastating attacks of such newspapers as *The New York World*. The control slipped from the grasp of Simmons and Clarke into the hands of Klansmen from the state of Texas and soon the order spread rapidly through the United States.

The Appeal of the Klan.—The appeal of the Klan came to a people suffering from the hysteria of the World War. Those who had enjoyed power in citizens' committees which forced the purchase of Liberty Bonds, intimidated German sympathisers and hounded slackers, saw in the Klan a continued outlet for their patriotism. Those who were outraged by immorality flaunted before inert police used the terror of the Klan to punish evildoers. Those chafed by the deliberation of the courtroom and convinced that the guilty too often slipped through some loophole in the law, found the Klan a direct way to prevent the miscarriage of justice. Whether authorised or not, many acts of violence were perpetrated in the name of the Invisible Empire. But far more numerous were those who cherished the racial and religious prejudices of their ancestors. Kleagles had no difficulty in selling membership in a crusade for Protestant Christianity and native Americanism. In the south, where the negro is a social problem, purity of womanhood and white supremacy are stressed in the creed of Klansmen. On the Pacific coast, Japanese compete with native farmers and labourers. There the cry is against aliens. In the eastern states the Klan is most suspicious of Jews and Catholics. To the Klansman, the Knights of Columbus are in conspiracy against the Constitution to prostrate the American people before the Pope.

From religious hatred the Klan in every section of the United States draws vitality. It has gained its greatest strength in the south and west, among descendants of the first white stock of America, those English and Scotch-Irish pioneers, strong Protestants, who laid the foundations of American society. A secret order offered to such persons escape from the dullness of frontier life into romance with weird ritual, exalted titles and closer friendships. It was the same impetus that during the middle of the 19th century spread "Know Nothing" (*q.v.*) lodges over the land. Jealousy and hatred of the Irish-Catholic newcomers swept them on into politics. For much the same reasons, descendants of the pioneers have joined the Ku Klux Klan and concentrated its power at the polls.

In Jan. 1926 it was impossible to say whether the Klan was still growing, or whether, like its predecessor, the Know Nothing movement, it would prove only another temporary though meteoric organisation.

Simmons, *The Klan Unmasked* (1923); J. M. Mecklin, *The Ku Klux Klan: A Study of the American Mind*, (1924); S. Frost, *The Challenge of the Klan* (1924). (A. B. DA.)

KUN, BELA (1886–), Hungarian politician, was born near Györ, of middle class Jewish parentage. He passed his youth unnoticed, and he eventually entered the University of Kolozsvár, where he graduated in jurisprudence. He intended to become a lawyer, but soon tired of the profession and took up journalism and politics. His upbringing and ideas naturally led him to sympathise with the "under-dog" and he early became an extremely active member of the Socialist party. But his work as a party organiser and agitator did not go beyond the limits of his province, and the same may be said about his influence and popularity. Having entangled himself in the question of the mismanagement of the funds of a workmen's co-operative society, he fell into disgrace and was obliged to withdraw temporarily from public life. He therefore went to Budapest and some time after succeeded in getting a minor post on the socialist daily paper, *Nepszava*.

Soon after the outbreak of the World War he was appointed lieutenant-commander of an ammunition supply column on the Galician front. Captured by the Russians early in the War, he was in Russia at the time of the revolution. He immediately ranged himself on the side of the Bolsheviks and became an apostle of their gospel among the Hungarian prisoners of war. After the Armistice, he planned to return to his country in order to help to win her to Bolshevism. He was already known to, and appreciated by, Lenin. He was therefore furnished with a false passport, and, disguising himself as a Red Cross doctor, succeeded in crossing the frontier together with some of his companions in captivity, all anxious to upset the present order.

Although Lenin did not fail to supply Kun with money to aid him in his plans, more than money contributed to his success, namely the critical condition of Hungary at that time: unaccustomed to self-government, and flooded with crowds of ex-soldiers, embittered at finding no employment or means of livelihood and ready for the first opportunity to revolt. Kun's wild and revolutionary gazette, *Vörös Ujsag* (*Red News*) which he began to publish soon after his return to Budapest, therefore found numerous readers amongst all those who, for one reason or another, disliked the Karolyi Government. Kun soon found himself in conflict with the police and on one occasion shortly before his advent to power was badly injured and imprisoned. He had not yet recovered and was still in gaol when the Karolyi Cabinet as a protest against the harsh conditions of the victorious powers decided to hand over the government to the Bolsheviks, and placed Kun at their head.

Kun's programme was to "arm at once, and forcibly transfer every industry and all landed property without conservation into the hands of the proletariat." At first he collaborated with the Social democrats, but soon shouldered them aside, nationalised all banks, all concerns with over 20 employees, all landed property over 1,000 acres, every building other than workmen's dwellings. All jewellery, all private property above the minimum (*e.g.*, two suits, 4 shirts, 2 pairs of boots and 4 socks) was seized; servants abolished, bathrooms made public on Saturday nights; priests, with the insane, criminals and shopkeepers employing paid assistants were declared incapable of the active or passive suffrage. International loans of over 10,000 kronen were repudiated. All this entailed prodigious work and the creation of a new bureaucracy which was most unpopular. Moreover, the reforms were unsuccessful; in practise the former owners of estates and factories remained on as their managers, the only difference being that production deteriorated very rapidly and the State had to pay the wages and make up the deficit. Kun started to issue a new currency, which the peasants, already disappointed that the large estates had not been parcelled out, and fearful that their turn would come to be nationalised, refused to accept. They boycotted the towns; and as the blockade was still on, the urban population starved, while prices soared.

Kun planned to convert the peasants to communism by force of arms; but meanwhile there were foreign campaigns to wage. After a first failure with the "soldiers councils" system, Kun and Boehm organised a well-disciplined army, with which they attacked and defeated the Czech troops occupying Slovakia. Kun, who considered himself Lenin's advance guard in Central Europe, and held long daily conversations by wireless with his master, made tireless communist propaganda at home and in Vienna, and tried hard and not unsuccessfully to play off the Allied great and lesser Powers against each other. When, however, the Entente stopped the Hungarian advance in Slovakia, he could no longer appeal to nationalist feelings, and his position became desperate. The peasants were discontented, the counter-revolution was organising. Kun commenced a "Red terror" against his enemies in Hungary, and again attacked the Rumanians, but they easily drove his forces back, and he fled to Vienna on Aug. 1. Here he was interned in the local lunatic asylum, but after an attempt had been made to murder him by means of poisoned Easter eggs (which, being a Jew, he did not eat), he was allowed to go to Russia.

Kun was a man of medium size, rather plump, On his short neck was a square, massive, bold head. He resembled a small shop-keeper rather than a tribune or revolutionary leader. He was, however, the only man amongst the Hungarian Bolsheviks who possessed at the same time an aptitude for ruling a country and the exalted faith of an apostle. It was this idealism, his firm belief in the truth of Bolshevism which gave him this superiority. He was a cruel and violent man only when he thought it necessary for the triumph of his ideas. He was, however, impulsive and incredibly naïve, with an extremely limited knowledge of men. (G. R*.; C. A. M.)

KUPKA, FRANTISEK (1871–), Czech painter, was born at Dobruska in Bohemia. He studied at the Academy of Fine Arts in Prague, at Vienna and in Paris, where he took up his permanent residence. His inventive talent, strengthened by a close knowledge of contemporary society and coloured by his sceptical outlook, was manifested notably in satirical drawings and caricatures which appeared in such Parisian papers as *Cocorico*, *L'assiette au beurre* and *Le Canard Sauvage*. He became known principally through a series of drawings entitled "L'Argent" and through his admirable illustrations to the book *L'homme et la terre* by E. Reclus (1905). In 1908 Kupka provided the illustrations for a bibliophile edition of *The Fates* by C. M. R. Leconte de Lisle and three years later for the Lysistrata of Aristophanes. He later began to experiment in new directions and looked for a new form of artistic expression. He became an adherent of the tendency known as "Orphism," and produced large canvases in which the interest of the subject matter is subordinated to the rhythm of the colour scheme. His ironical powers of observation, his bold imagery and philosophical outlook make Kupka one of the most interesting and distinguished artistic figures of his time.

KURDISTAN (*see* 15.949), is an expression applied to the geographical area stretching north and south from Mount Ararat down to the river Diyālā, and east and west from Persia to the river Kara Su. It is now divided between Turkey, 'Iraq (under British mandate) and Persia, and has a Kurdish population of approximately 1,500,000 people.

Turkish Kurdistan consists of certain parts of the vilayets of Diarbekr, Bitlis, Hakkiari, Van, Erzerum and Adana, and is inhabited by some of the oldest tribes like the Millis, Haiderans, Ravandis, and the large group of tribes known under the generic appellation of Bohtan. 'Iraq comprises the core of Kurdistan proper: the cities of the ancient kingdom of Shehrizor, such as Erbil, Kirkuk, Sulaimaniya and the whole region of the two Zab rivers, as well as the ancient and famous tribes like the Babans, the Hamavends, Jaffs and the historic Bahdinan. Persian Kurdistan consists of the two *Valyats* (governments) of Luristan and Ardelan, and contains the Bakhtiaris, the Lurs, the Kalhoris, the Ardelanis and their numerous sub-divisions. Between the lakes of Urmia and Van are scattered the great tribes of Shikaks, Jallalis, the Hartoshis, the Mukris and others. This division of the Kurdish race under three sovereignties is likely to retard the growth of the Kurdish people into a homogeneous community, and may result in disastrous consequences for their future.

The Kurds before the War.—From an administrative point of view the Kurds of Persia since 1911 have undergone little change. The Young Turk revolution 1908, however, gave new opportunities to the masses of the Kurdish people. With the fall of 'Abdul Hamid were also suppressed the privileges of the so-called Kurdish Hamidiye Cavalry, which since 1890 had been a scourge indiscriminately for the peaceful Kurdish and Armenian peasants. The suppression of the Hamidian régime brought forward more constructive and enlightened elements of the Kurdish people, and several Kurdish deputies in the Turkish Chamber and the Senate took up the cause of their nationality. Kurdish newspapers and party clubs were established in Constantinople, Baghdād and Mōsul to cultivate a common language for the use of all Kurds. This nationalist movement was ably conducted by two great Kurdish leaders, Sheikh 'Abdul Kader, a senator (hanged in Aug. 1925 by the Turks) and Baban Zadé Ismail Hakki.

Concurrently with this ensued war between the Young Turks and several Kurdish tribal chiefs. The former met strong opposition in 1909–12 in their attempt to repress those Kurdish chiefs who were favoured by the fallen Sultan. The Young Turks waged regular war against Ibrahim Pasha of the Millis, the Sheikh Barzani near Mōsul, the Hamavends and the tribes of Dersim. In spite of this warfare in particular areas, the tribes and the settled people greatly benefited by the general prosperity which resulted from greater liberty allowed under the Young Turk régime. As a result of the Turkish defeat in the Balkans, Sheikh Said 'Ali, of Khizan (southeast of Bitlis) rebelled in 1913. But he was soon captured and hanged.

The Kurds in the War.—None of the Kurdish tribes had any interest in the World War; yet from the beginning they were involved both on the Caucasian and the Mesopotamian fronts. Most of their manhood was killed in the War, and whole tribes suffered terrible losses owing to forced retreats and the consequent evils.

Kurdistan in the Peace Treaties.—At the Peace conference in Paris in 1919, Sherif Pasha, a Kurd, presented the claims of the Kurdish race demanding independence from Turkey. In the Treaty of Sèvres, Kurdistan was defined as a narrow strip of territory lying between the southern frontier of Armenia and northern 'Iraq. The Treaty of Lausanne did not mention Kurdistan. It left the delimitations of the northern boundary of 'Iraq to a friendly agreement between Great Britain and Turkey; failing this, the dispute was to be solved by the Council of the League of Nations (*see* MOSUL).

While the Council of the League was discussing this essentially Kurdish problem, a Kurdish rebellion broke out in Turkey in Feb. 1925, having Ginj and other middle Taurus heights as its centre. A Sheikh Said, followed by some well-known tribal chiefs, had some initial successes. The Turks collected regular troops, and after some short and decisive assaults broke the Kurdish rebellion and captured the Kurdish ringleaders. It was noted at the time that the powerful tribes of Bohtan, of Sasun and of Armenia in general did not rise in any way. A Turkish court-martial was set up at Diarbekr, which condemned to death Sheikh Said, Dr. Fuad, and 46 other Kurdish Nationalist leaders. They were all executed in Aug. 1925. The Kurdish leaders died with the independence of Kurdistan on their lips. The president of the Turkish court-martial stated later that the Kurdish rebellion had a purely nationalist motive.

KUROKI, ITEI, COUNT (1844–1923), Japanese general (*see* 15.952), was put on the reserve list in 1909 and died in Tokyo Feb. 4 1923.

KUROPATKIN, ALEXEI NIKOLAIEVICH (1848–1921), Russian general (*see* 15.952), died at the village of Shemshurino in the Pskov district on or about Feb. 10 1921.

KUT, SIEGE OF: *see* MESOPOTAMIA, OPERATIONS IN.

LABOR, DEPARTMENT OF (*see* 16.25).—The U.S. Department of Labor is the outgrowth of an agitation that began shortly after the Civil War, when Federal recognition of interests and rights of the great group of wage-earners was first sought. This agitation resulted in the creation of a Bureau of Labor in the Department of the Interior in 1884. In 1888 this bureau was enlarged and made an independent establishment of the Government, with its head reporting directly to the President. In 1903, under the administration of President Roosevelt, the Department of Commerce and Labor was created, and the Bureau of Labor was transferred to this new department. Continued demand that the wage-earners be represented in the President's Cabinet led to the law of 1913 creating the present Department of Labor and transferring to it the Bureau of Labor (now the Bureau of Labor Statistics), the Children's Bureau and the Bureau of Immigration and Naturalisation. By the terms of this organic law, "The purpose of the Department of Labor shall be to promote, foster and develop the welfare of the wage-earners of the United States, to improve their working conditions and to advance their opportunities for profitable employment." The law also gave the Secretary of Labor authority to conciliate industrial disputes submitted to him for settlement, and this conciliation service has become one of the major functions of the department.

At the end of the World War the Women's Bureau and the U.S. Employment Service were taken over as normal and necessary adjuncts to the department, and built up from skeleton organisations left from work in the War. Of the strictly war services only the Bureau of Industrial Housing and Transportation remains, to dispose of the vast amount of property which it acquired for the convenience of workers and for the acceleration of production during the War. The Department of Labor as constituted in 1926, therefore, includes the bureaux of immigration, naturalisation, labour statistics, conciliation, women and children, whose titles sufficiently indicate their scope. (J. J. D.)

LABORI, FERNAND (1860–1917), French lawyer, was born at Reims April 18 1860. Educated at Reims and Paris, he spent several years in England and Germany. He was called to the bar in 1884, and rapidly made a reputation as a brilliant lawyer and advocate, being counsel for the defence in most of the important political trials of the day during a period of nearly 30 years. It was his conduct of the Dreyfus case, however, which placed him at the top of his profession and earned him his unique reputation. He fought with unremitting energy for his client during both the first and second revisions of the trial, in 1898 and 1899, a task attended with considerable danger, as political passions were so strongly excited at the time that Labori was shot at and wounded at Rennes on the eve of his cross-examination of the witnesses for the prosecution. Dreyfus was not finally declared innocent until 1906, and Labori never once relaxed his efforts on behalf of the unfortunate officer. Other notable trials in which he was concerned were the prosecution of Émil Zola for libel (1898) which arose out of the Dreyfus case; the Humbert affair (1902); and the trial of Madame Caillaux for the murder of M. Calmette, editor of *Le Figaro* (1914), when he secured her acquittal. He died in Paris March 14 1917.

LABOUCHÈRE, HENRY DU PRÉ (1831–1912), British politician, was born in London Nov. 9 1831. He was educated at Eton, and, after spending a short time at Trinity College, Cambridge, entered the diplomatic service in 1854, becoming in 1863 second secretary to the British embassy at Constantinople. In 1864 he abandoned diplomacy for politics, and in 1866 was elected Liberal member for Windsor, but was unseated on petition. In 1867 he won a by-election for Middlesex, but failed to be re-elected in 1868. In 1880 he again entered the House of Commons as Radical member for Northampton, and this seat he retained until his retirement in 1906. He began his journalistic career with *The Daily News*, of which he became part proprietor just before the Franco-German War. In 1874 he became associated with Edmund Yates on *The World* (*see* 28.908); but three years later he started *Truth* which had a remarkable record in the exposure of shams and organised impostures, especially frauds on the charitable. Labouchère was a strenuous advocate of the abolition of the House of Lords (*see* 20.845, 846); at the time of the Parnell Commission he had much to do with the unmasking of Pigott; and he was a member of the inquiry into the Jameson Raid, his hostility to Mr. Chamberlain being as pronounced as against Lord Rosebery when the latter became leader of the Liberal party. After 1903 he lived mainly in Italy, at a villa near Florence, where he died Jan. 15 1912. See A. L. Thorold, *Life of Henry Labouchère* (1913).

LABOUR: *see* HOURS OF LABOUR; INTERNATIONAL LABOUR ORGANISATION; INDUSTRIAL RELATIONS; STRIKES; etc.

LABOUR, MINISTRY OF.—This department of the British Govt. was set up in 1916 to deal with the increasing amount of administrative work caused by the extended activities of the state. It took over certain duties from the Board of Trade and also the administration of the national health insurance scheme, hitherto under the Treasury. The Ministry looks after most matters affecting the welfare of the wage-earners, including unemployment insurance, although the inspection of factories and workshops remains under the Home Office. It is also the authority for dealing with industrial disputes. The Minister of Labour is the head of the department: his chief assistants are the parliamentary secretary, like himself a politician, and the permanent secretary, who is a civil servant. The head offices of the Ministry are at Montagu House, Whitehall, S.W.1. Some of the self-governing states of the British Empire have a public department charged with similar duties, and known as the Ministry of Labour.

LABOUR PARTY (*see* 16.28).—The year 1910 found the Labour party in Great Britain marking time. In Parliament it was hampered by the conflict between the two Houses; within itself the Osborne decision (1908), that trade unions could not legitimately subscribe money to political objects, had created financial difficulties which had not been got over. In the election of Jan. 1910 it ran 98 candidates, returned 40 and suffered a net loss of five seats; in the Dec. election, of the same year, owing to financial stringency, it ran only 56 candidates, but returned 42. At the beginning of the year it polled a total of 505,690 votes; at the end 370,802. From 1911 till the outbreak of the World War in 1914 the parliamentary embarrassments of the party continued. Pledged to Home Rule for Ireland, the provisions of the Parliament Act compelled it to keep the Liberal Govt. in office, and deprived it of complete freedom of action.

Industrially, the position was not good. The history of the Labour movement is marked by decided swings backwards and forwards, between a trust in industrial and in political action. Between 1906 and 1910, the swing was towards politics; between 1911 and the outbreak of the World War it was towards industrial, or, as it is called, direct action. Trade union membership was on the increase; industry, especially railways and coal-mining, was disturbed; the Osborne judgment drove active trade unionists on to the left as the political road seemed to be barred; trade-union action, as regards this Labour demand and that, gave swift and decisive results that justified the impatient mood of the time, whilst political action seemed to be impotent and slow.

Rise of the Syndicalists.—Moreover, in France and America the new school of syndicalists had arisen. Its doctrines were laid down in the former country by G. Sorel in his *Reflections sur la Violence* (1912), and elaborated in a series of books and pamphlets written by members of the *Confédération Général du Travail;* in the latter country De Leon, as a disciple of Marx, preached a similar doctrine, and the Industrial Workers of the

World, a rival to the American Federation of Labor, was founded to enforce it. The influence of these doctrines was felt in Great Britain. Several new socialist societies were started from splits in the existing ones, like the Socialist party of Great Britain and the Socialist Labour party, and though their membership never reached more than 100 or 200, their virulent and virile criticisms had some effect in spreading discontent amongst sections of the Labour party. This was reflected in the literature of the time, which consisted largely in defences of the parliamentary position and of political as against direct action. Looking back upon those years, one really finds the beginnings of what later on has become known as Bolshevism. Upon this philosophy of the inevitable revolution the Russian Social Democratic party split (1903) into the two schools which were to make history by the two revolutions of March and Nov. 1917.

Repeal of the Osborne Judgment.—At last, in 1913, the parliamentary party succeeded in getting the Osborne judgment repealed by the Trade Union Political Levy Act. To make this possible the annual conference of 1911 had decided to abolish the pledge imposed upon all Labour members to act with the party and to be independent of other parties. This political success was an effective weapon against the syndicalists and revolutionary trade unionists, and in the year preceding the outbreak of war, the pendulum had begun to swing back towards a belief in political action, and syndicalism had evidently gone beyond its zenith. In addition to the Trade Union Act, the party in Parliament had directed its attention (1911) to electoral reform, the women's suffrage agitation then being in evidence, a minimum wage, the feeding of necessitous school children, and the government proposals for national health insurance. On the question of national insurance, the party was much divided, and in the report which the parliamentary members made to the annual conference the action of the recalcitrant minority was reported in terms of censure. In that year (1911) payment of members was begun and a fund from which the party had made allowances to its members to meet some of their expenses was terminated. The year 1912 was one of industrial trouble and was marked by the passage of the Coal Mines (Minimum Wage) Act to end a coal strike—a historical departure from which much in both government and trade union policy dates.

The Party before the War.—The question of discipline within the party distracted its attention and reduced its efficiency, and the annual report for this year drew attention to the grave effect that the action of certain members was having upon party fortunes. Nevertheless, by-elections showed a steady strengthening of the grip of the party in the country, the first approaches to a political understanding with the co-operators were made, and *The Daily Citizen*, the first Labour newspaper, appeared. Meanwhile, the party had settled down to face seriously the question of organisation, and 1912 and 1913 show a great improvement in that respect. The first disappointment with parliamentary methods was still vocal, but was working itself out. The state of the country, owing to the Ulster agitation, was overshadowing everything else. Civil war seemed to be imminent and preparations for it were being made. Obviously a general election had first of all to be held so as to get a vote of confidence for the Government's Home Rule policy. Overtures were being made to ascertain how the party would stand in the conflict, and offers made to its leaders to join the Government; but another cloud was hurrying up to blacken the whole sky. The annual conference records are blank between Feb. 1914 and Jan. 1916. The World War had come.

Labour in the War.—The party hesitated. It had steadily opposed Sir Edward Grey's European policy, and it associated itself at first with the neutrality committee. On Aug. 2 1914 it resolved to oppose Britain's entry into the War, but on Aug. 6, by a majority, it decided to make no statement when the first war credits were to be voted. Some of its leaders, including Mr. Ramsay MacDonald, its chairman, resigned, and thenceforth the activities of the party were those of the nation. Throughout the War, however, it never ceased to discuss the best form of peace. It joined in an international conference of the socialist parties of the Allied countries in Feb. 1915, and issued a declaration of war aims; in May 1915 by a majority it joined the Coalition Govt.; in Jan. 1916 it was instructed by a special national conference to oppose conscription, and the Labour ministers resigned, but withdrew their resignation pending the annual conference which was about to meet. This condemned conscription, but refused by a narrow majority to ask for the repeal of the Act that had just been passed. The ministers remained. When in Dec. 1916 the new Coalition was formed, the party, by a majority, agreed to remain in it with added representation.

Meanwhile, the party was pursuing its discussion of peace terms, and in May 1917 decided to be represented at the abortive Stockholm Conference, to which delegates from the enemy states had been invited. This led to Mr. Henderson's severance from the Cabinet in August. The party was returning to its independence. At the annual conference held at Nottingham in Jan. 1918 a war-aims programme was agreed upon, in furtherance of a forward movement, and a new constitution making the enrolment of individual members possible was considered. Hitherto, the party had been a federation of socialist societies and trade unions; now, it proposed to form local labour parties in the constituencies, consisting of individual members as well as delegates from affiliated bodies. It also took a stand against Bolshevism and in favour of constitutional democracy. At a special national conference held in London in June, the declaration of the policy and principles of the party known as the new social order was launched, the truce had been broken in the Salford by-election won by Labour (Nov. 2 1917), and in Nov. 1918 the party withdrew its ministers from the Govt., and once more stood independent.

Labour in Office.—After the election that followed in Dec., the party strength was only 57, though its poll was increased to 2,244,945. A capital levy was advocated in 1920, and by 1922 the question of unemployment again came to the front. By-elections were encouraging and by the end of the Parliament the Labour party numbered 75 members. The election of Nov. 1922 brought up the number to 142 and Labour became the official opposition. Its vote in the country had increased to 4,236,733. In Dec. 1923 another election was held, and 191 Labour members were elected and the party vote increased to 4,348,379. The Govt., though in a minority, decided to meet Parliament. When it did so, in Jan. 1924, it was defeated by 328 votes to 256 and thereupon the first Labour Govt. in this country was formed with Mr. Ramsay MacDonald as Prime Minister. The Govt. could rely upon the support of less than one-third of the House of Commons and legislation was difficult. It directed its attention to unemployment, housing and to the preparation of national schemes for internal development. It had also to face a dangerous development in the Irish boundary problem and take legislative action to enable it to set up the Irish Boundary Commission.

Its foreign policy was devised to secure international co-operation and to pacify Europe, and it was successful in settling outstanding reparation difficulties at the London Conference (Aug. 1924) and was responsible for the protocol which was drafted at the Assembly of the League of Nations that year. It was also bent upon creating good diplomatic relations with Russia, for both economic and political reasons, and negotiated two treaties which were not ratified by its successor. The Govt. was defeated (Oct. 8) on its handling of a Communist prosecution, but really fell on its Russian policy. When the election came next month, the eleventh-hour publication of a letter, known as the Zinovieff letter, had considerable effect on the results, and, though the party vote increased to 5,551,549, its members fell to 151. The Govt. at once resigned and the party became the official Opposition. (J. R. M.)

LABRADOR (*see* 16.28).—By the end of 1925 considerable progress had been made by the agents of Canada and Newfoundland with the proposed case for submission to the Privy Council for its decision as to the boundary between the areas claimed

by the two Dominions. Newfoundland claimed broadly, that her jurisdiction should embrace the whole watershed draining into the Atlantic, while Canada contended that a strip of seaboard a mile deep from high water is all Newfoundland should have. The territory in dispute contains the famous "Grand Falls" of Labrador, one of the greatest waterfalls in the world, besides several minor cascades capable of producing vast hydro-electric energy, while in the river valleys are large areas of forest growth capable of being converted into pulp and paper, so that the potential value of the region is very great. The population of Newfoundland Labrador at the census of 1921 was 3,774: this showed roughly a 10% decrease since 1911, mainly among the Esquimaux population in the Northern section, who were decimated by the epidemic of influenza in the winter of 1918–0. These natives do not exceed 1,000 in all, a decline of about one-half in some 35 years.

Lumbering, which in the period 1900–10 was undertaken in Hamilton Inlet, virtually ceased, largely because of difficulties arising out of the boundary dispute. The missionaries in the north, the Hudson Bay and Revillon Fur Companies further south and Newfoundland traders all over the region conduct its limited commerce. The Grenfell Mission pursues its humane activities among both transient fisherfolk and permanent settlers, and the Churches in Newfoundland, both Protestant and Catholic, maintain missionaries there in the summer, with one or two residing permanently. The hinterland is unpeopled save by some wandering tribes of Indians, who number only a few hundreds altogether, and are slowly dying out. Industrial conditions continue unchanged and the annual value of fish, furs and other articles exported from the coast to foreign markets averages about $500,000. Codfish to the value of about $1,000,000 a year is taken on the coast, brought to Newfoundland to be cured, and figures in the exports from that country.

BIBLIOGRAPHY.—W. T. Grenfell, *Vikings of Today* (1898); W. T. Grenfell, *Labrador* (1922); W. G. Gosling, *Labrador, its Discovery, Exploration and Development* (1910). (P. T. M.)

LACROSSE (*see* 16.54).—Lacrosse still has its stronghold in Canada, where it is looked upon as the national game. The number of amateur clubs to-day in the Dominion is approximately 1,465, as against 950 in pre-War days, but the professional game is practically dead, only three or four clubs having survived. Ontario is perhaps the chief centre, but Quebec, Manitoba, Saskatchewan, Alberta and British Columbia are all strong supporters. In the United States lacrosse is advancing more rapidly than in any other part of the world. The country has over one hundred teams, including many of the large universities and colleges, and the United States Military and Naval academies, whilst in California and elsewhere the game has taken a strong hold in the women's colleges. In Australia lacrosse is making headway, especially round Melbourne, Sydney and Perth.

The Game in England.—In England the game was increasing in popularity up to the outbreak of the World War, when all the clubs were depleted and disbanded. Players in the north of England, chiefly grouped round Manchester and Yorkshire, have always been far more numerous and generally more expert than in the south, where the game is centred round London and Bristol. It is also played at Oxford and Cambridge. In Ireland there has been no serious attempt to revive the game, which once had a good following round Belfast. In 1912 teams from Manchester and London played exhibition matches in Brussels and Ostend, and in 1913 similar teams visited Paris and Stockholm. Preliminary plans were on foot for a visit of a representative English team to tour Canada in 1914, but the World War put an end to the plan. Lacrosse, as played by ladies, has made great strides since the War, and ladies' clubs are numerous. It is largely played in girls' schools all over the country. The laws have been modified to suit the requirements of ladies, and inter-county and territorial matches are annual events. (C. O. L.)

LADD, GEORGE TRUMBULL (1842–1921), American philosopher (*see* 16.59), died at New Haven, Conn., Aug. 8 1921.

LAERMANS, EUGÈNE (1864–). Belgian painter, was born at Molenbeek St. Jean (Brabant) Oct. 22 1864. Deaf and dumb from birth, but gifted with a keen intelligence, he developed his talent in almost total isolation. He devoted himself to painting scenes of humble life, and might be considered a modern Pierre Brueghel the Elder. He has adopted, in place of the passive objectivity or dark humour of the old masters, a liberal sympathy similar to that found in the works of Charles Degroux or Constantin Meunier, but which Laermans has interpreted in a different manner, with feeling and power inspired by the injustice and inherent misery of an ill-organised social state. Denied the usual channels of expression, he expresses, through the medium of form and colour, his pessimistic view of life. This pessimism is not only illustrated by his choice of subject but also by the design and colour schemes which lend individuality to his work. Notwithstanding the rare harmonies of colour found in the work of M. Laermans which show him to be a master of technique as well as a painter, the artistic value would appear subservient to its moral significance. This artist, already deaf and dumb, was further unfortunate in the loss of his sight. His works may be seen in the Luxembourg, Paris, and at Venice, Brussels, Antwerp, Ghent, Liége and other places. (P. L.)

LA FOLLETTE, ROBERT MARION (1855–1925), American politician, was born on a farm in Primrose township, Dane co., Wis., June 14 1855. He graduated from the University of Wisconsin in 1879, studied law there for one term, and was admitted to the bar in 1880. He began immediately to practise in Madison and served as district attorney for Dane co. for two terms (1880–4). From 1885 to 1891 he was a representative in Congress, and, as a member of the Ways and Means Committee, helped to draft the McKinley Tariff bill. On being defeated for Congress in 1891 he returned to practise in Madison. In 1896 he was a delegate to the Republican National Convention. He was elected governor of Wisconsin in 1901 and was re-elected in 1903 and 1905. It was largely due to him that state laws were passed for taxing railways according to valuation (1903), for nominating all candidates for public office by direct vote of the people (1904) and for regulating the railways in the state through a state commission (1905). He resigned the governorship in 1905 on being elected to the U. S. Senate, and was reelected for three succeeding terms.

Mr. La Follette was an unsuccessful candidate for the presidential nomination at the Republican National Convention in 1908. In 1915 he was sponsor in the Senate for the Seamen's bill providing for better working conditions and increase of life-saving equipment on board ship. He favoured, in 1916, an embargo on the shipment of arms from America, but supported armed intervention in Mexico. After America's entrance into the World War he was a pronounced pacificist. The Republican National Convention held at Cleveland, O., in June 1924 rejected a platform presented on behalf of Senator La Follette by the Wisconsin delegation, and he received only 34 votes on being placed in nomination for President. Accordingly a Convention for Progressive Political Action was convened at Cleveland on July 4, at which, following a letter from La Follette denouncing both the Republican and Democratic parties, he was endorsed as a presidential candidate. He selected the name "Progressive" for his party, and his platform included advocacy of public ownership of water power and railways, strict public control of all national resources, a recognition of agriculture as the basic industry of the country and abrogation of the power of the Supreme Court to nullify legislation. During the election campaign the American Federation of Labour agreed to support him. In the ensuing election he was beaten by both Republican and Democratic candidates, his electoral vote being 34, as against 382 for Coolidge and 136 for Davis, the popular vote being 4,686,681 for La Follette, 15,748,356 for Coolidge and 8,617,454, for Davis. His own state, Wisconsin, was the only one to give him a majority. He died at Washington, D.C., June 18 1925.

His son ROBERT M. LA FOLLETTE, who was born in Madison, Wis., Feb. 6 1895, was elected by a large plurality Sept. 29 1925, to fill the unexpired term of his father's senatorship. He stood as a supporter of his father's platform of 1924.

LAGERLÖF, SELMA (1858–), Swedish author, was born Nov. 20 1858 at Mårbacke in Vermland where she grew up in a province rich in local tradition, and became a teacher in Landskrona. In a literary competition in a weekly paper she won the highest prize for some chapters of her first work *Gösta Berlings Saga* (Eng. tr. 1898), which was published in two volumes in 1891 and attracted great attention. The book is a collection of stories of Vermland life in the year 1830, related with vivid imagination and lyric style. In 1894 she published *Osynliga Länkar* (Invisible Links) and from 1895 onwards was able to devote herself entirely to writing. After visiting Italy for the purpose of extending her studies, she published in 1897 *Antikrists Mirakler* (Eng. tr. 1898) depicting life in Sicily. In 1899 appeared *Drottningar i Kungahälla* (Eng. tr. 1917), historical legends, as well as *En Herrgårdssägen* (Eng. tr., *The Legend of the Manor*, 1922). After a journey to Palestine and the East in 1900 she published *Jerusalem*, 2 vol. (1901–2, Eng. tr. 1903), describing a religious movement in the Swedish province of Dalarne, which led to an emigration to Palestine. She also wrote *Kristuslegender* (1904); *Nils Holgerssons underbara resa*, 2 vol. (1906–7, Eng. tr. 1908), a book for children; *Liljecronas Hem* (1911, Eng. tr. 1913); *Korkarlen* (1912); *Dunungen* (1914), a dramatised novel; *Kejseren af Portugalien* (1914, Eng. tr. 1916); *Troll och Manniskor* (*Demons and Men*), 2 vol. (1915, 1921) and *Charlotte Löfvensköld* (1925). In 1909 she won the Nobel Prize for literature, and in 1914 was elected the first woman member of the Swedish Academy. Most of her books have been translated into English and many other languages.

See J. Mortensen, *Literary Biography* (1908); André Bellesort, *La Suède* (1910); also works with title *Selma Lagerlöf* by O. I. Levertin (1904); M. Jepson (1913); M. Kristensen (1917).

LAGOS (*see* 16.74), the principal port and capital of the British colony and protectorate of Nigeria, West Africa. The population, including Iddo and Apapa, is 99,690 natives and about 1,000 whites (1921). The town is built on an island in a large lagoon and is reached from the Bight of Benin over a shifting sand bar. Moles protect the entrance to the harbour and vessels drawing 23 ft. can enter it. Lagos is linked to Iddo Island, on which the terminus of the railway to Kano is situated, by Carter bridge, and Iddo in its turn is joined to the mainland by Denton bridge. The customs wharf at Lagos is 1,183 ft. long and vessels of 22 ft. draught can lie alongside. At Iddo is a wharf 860 ft. long, draught 18 feet. At Apapa, on the mainland, facing Lagos town, a wharf 1,800 ft. long, under construction in 1924, was designed to take vessels drawing 26 ft., to which depth the bar was being dredged. There are several smaller wharfs and floating docks. By the draining of swamps much has been done to improve sanitary conditions. The town has fine public and commercial buildings and ample water and electric light supplies. Some 25% of the inhabitants are Christians and 53% Moslems. Lagos has been since 1919 the seat of an Anglican bishopric. In April 1925 the Prince of Wales laid the foundation stone of the cathedral. The port takes all the trade of Nigeria served by the railway to Kano (over 700 m. long) and has a considerable canoe-borne trade with the neighbouring regions. The former colony of Lagos is now part of Nigeria. See *The Nigerian Handbook* (Lagos, 1925).

LAGUERRE, JEAN HENRI GEORGES (1858–1912), French lawyer and politician (*see* 16.79), died June 17 1912.

LAHORE, India (*see* 16.81), the capital of the Punjab, India, and a centre for agricultural produce, is of little importance industrially, except for the works of the North-Western Railway. The population was 281,781 in 1921. The Dyal Singh College, undenominational and affiliated to Calcutta University, was founded in 1910, and the Sanatan Dharma College in 1916. Western towers were added to the Cathedral Church of the Resurrection in 1913. An iron bridge over the Ravi was opened in 1915. In 1824 the old fort was taken over by the police, and a new fort built by the military.

LAIDONER, JOHAN (1884–), Estonian soldier, was born in the Viljandi district. He completed his military studies at the Vilna military school and the Nikolai military academy in St. Petersburg (Leningrad). On the outbreak of the World War, he was a staff officer on the Caucasian front, and in 1915 became divisional chief of the staff of the Russian Western Front. In 1917 he was promoted lieutenant-colonel in command of the Caucasian Grenadier Division and then chief of staff to the 62nd Division. On the formation of the Estonian National Army he was appointed to command the first Estonian Division. During the period of German occupation (1918) he negotiated with Soviet Russia concerning the prevention of the annexation of Estonia by Germany. He also organised from St. Petersburg the transport of the Estonian Army, via Archangel and Murmansk, to the Allied front. At the beginning of the Estonian War of Independence, (1918–9), Laidoner was appointed commander-in-chief of the Estonian Army; at the same time he became by arrangement leader of the Russian Northern Army until the latter reached Russian territory, when Yudenich took over the leadership. He conducted the operations with both military skill and political ability. On the conclusion of the War he left the army and entered politics, being elected representative of the Agrarian party in the first and second Riigikogu. He became president of the commission for foreign affairs and state defence of the Riigikogu, and Estonian delegate to the League of Nations. In 1925 he presided over the League of Nations Commission appointed to inquire into the Mosul frontier dispute between Great Britain and Turkey. (*See* ESTONIA.)

LAISANT, CHARLES ANNE (1841–1920), French politician (*see* 16.84), died at Asnières, near Paris, May 5 1920.

LAMMASCH, HEINRICH (1853–1920), Austrian jurist, was born at Seitenstetten, Lower Austria, May 21 1853. He was appointed professor at the University of Vienna in 1889, became eminent as a teacher of criminal and international law and his publications on these subjects deeply influenced their practice. Four times a member of the International Court of Arbitration at the Hague, being president three times, he helped to settle, among other cases, the dispute between Great Britain and America on the fishery rights off the North Coast of America in 1910. He was, perhaps, the most prominent Austrian pacifist during the World War and, as such, while incurring bitter hostility in the Austrian Herrenhaus, to which he had belonged since 1899, he inspired confidence elsewhere, and was chosen to preside over the final ministry which liquidated the central administration of the older Austria (Oct. 26–Nov. 13 1918). He published in 1919 *Der Völkerbund* and *Europas elfte Stunde*. Lammasch died at Salzburg Jan. 6 1920.

LAMONT, THOMAS WILLIAM (1870–), American banker, was born at Claverack, N.Y., Sept. 30 1870. He was educated at Phillips Academy, Exeter, N.H., and at Harvard where he graduated in 1892. He was for two years with the New York *Tribune*, and then for some time actively engaged in business. From 1903 to 1909 he was with the Bankers Trust Co. in New York, as secretary and treasurer and, after 1905, as vice-president. In 1909 he was elected vice-president of the First National Bank of New York City, serving for two years. On Jan. 1 1911 he entered the firm of J. P. Morgan and Co. He was active in raising additional endowment for the Harvard School of Business Administration. He took part in floating the British, French and Russian loans in America during the World War and from 1918–22 he was proprietor of the New York *Evening Post*. In 1919 he was financial and economic advisor of the American delegation to the Peace Conference in Paris. He was U.S. delegate on the international consortium for assisting Chinese industries and railways, and visited China as the representative of the American group. In 1921 he became chairman of the American committee for the China Famine Fund, and was chairman of the international committee of bankers which handled the question of the Mexican foreign debt.

LANCIANI, RODOLFO AMADEO (1846–), Italian archaeologist, was born in Rome Jan. 1 1846. He was educated in that city and in 1872 became secretary of the archaeological commission. In 1878 he was appointed director of excavations and professor of ancient topography in the University of Rome. Lanciani devoted his life to the study of the antiquities of an-

cient Rome, while by no means neglecting those of the Middle Ages; and in both fields he came to be recognised as a leading authority. He made important discoveries in the House of the Vestals, the Basilica Julia, the imperial palace on the Palatine, the baths of Caracalla, the temple of Jupiter Capitolinus, Ostia, Trajan's harbour at Porto and Hadrian's villa below Tivoli. He also worked with the minister, Guido Baccelli, to create the Passeggiata Archeologica, arranged the collections in the Antiquarium and organised the classical side of the Rome exhibition of 1911. In 1911 he was created a senator.

He wrote a great number of works on archaeological subjects in Italian and English of which the most important are: *Ancient Rome in the Light of Recent Discoveries* (1888); *Pagan and Christian Rome* (1892); *The Ruins and Excavations of Ancient Rome* (1897); *Destruction of Ancient Rome* (1899); *New Tales of Old Rome* (1901); *Storia degli Scavi e Musei di Roma* (1902); *Wanderings in the Campagna* (1909); *Ancient and Modern Rome* (1925).

LAND LAWS: *see* PROPERTY, LAW OF.

LAND TENURE (*see* 16.155).—There are in the course of recent history two outstanding and epoch-making events each of which was of great moment in bringing about far-reaching changes in existing conditions of rural tenure: the French and the Russian revolutions. The one has already receded into historic perspective, the second is an actual fact of to-day. The former broke up the feudal land system and did away with the obligations attaching to property in land, with the result that agricultural development became involved in a capitalist economy; the Russian revolution, while abolishing private property in land, swept away the capitalist agrarian conditions which had grown up during the 19th century. The land was nationalised, and the state gave the full use of the land to all who were prepared to cultivate it with their own labour.

Just as the ideas of the French revolution influenced the whole of European agrarian legislation, so the influence of the Russian revolution was felt throughout eastern Europe—that is, in the countries on the borders of Russia, all of which are agricultural countries in the fullest sense. Thus agrarian reform was undertaken by a whole series of states; and, speaking generally, the more closely the states followed the Russian agrarian revolution, the more radical were their reforms, both in principle and in practice. Estonia and Latvia came nearest in this respect, while the model was least closely followed by Finland, Austria and Germany. Between these two groups there lies a whole gamut of variously devised agrarian reforms. The objects of all reform schemes were: by means of a transformation of the existing conditions of land tenure to create a peasantry which is socially and economically sound; and to retain in the country the numbers of peasants who would otherwise emigrate, and thereby to identify them more and more closely with the homeland itself. In the realisation of these aims the War acted as an accelerating and releasing force.

I. THE JURIDICAL BASES OF LAND REFORMS

The juridical bases for the accomplishment of the agrarian reforms are to be found in the agrarian laws of different states.

If the land hunger of the population is to be satisfied—whether by the formation of new holdings, or by the apportionment of additional land to small peasant holdings already existing, or even by assignment of parcels of land to the land workers—a land fund of corresponding extent is obviously a first essential. This was usually achieved by devoting the state lands and the public land to the purpose, and, in varying degrees, by the expropriation of the large estates.

Russia.—A complete expropriation of rural land ownership in favour of the state, acting on behalf of the peasant, has been carried through only in Russia. The first so-called Land Decree of Nov. 8 1917 ordered the expropriation, without exception, of all the landed property of the large landowners, of all lands formerly the appanage of the Crown, and of monastic and Church lands. In the agrarian legislation of subsequent years this fundamental principle was retained (*see* RUSSIA). Some 40,000,000 desiatines in all (not including Siberia) were thus transferred from private large landowners to the peasantry as a whole. A similar solution by expropriation was originally enacted in Estonia by the law of Oct. 10 1919. On May 15 1925, however, the Assembly amended this enactment by permitting 50 hectares of land to be restored in usufruct to the original owners. In all an area of 2,147,100 desiatines—97% of the area held in large estates—was expropriated in Estonia.

Latvia and Lithuania.—Partial expropriation was carried out in certain countries. In Latvia, by the law of Sept. 24 1920, the state land fund was formed of the state domains and forests, and to a limited extent by the expropriation of large estates. On an average 50 hectares of land was restored to the original owners. After the expropriation the total state property in land amounted to 3,700,000 hectares. In Lithuania the law of Feb. 15 1922 enacted that state lands be appropriated, and that landed property belonging to the former Russian Nobles' and Peasants' Agricultural Banks, ecclesiastical lands and lands of private owners, in excess of 80 hectares in any case, be expropriated. Owners of not more than 150 hectares farming their own lands were expropriated only after the division of the large estates.

Balkan Countries.—In Rumania the law of Dec. 14 1918, later somewhat modified for the newly acquired territories, contemplated the entire expropriation of crown lands, the estates of charitable societies, of absentees and foreigners and the establishment of a land fund of 2,000,000 hectares by partial expropriation of the private large landowners of over 100 hectares, the size of the expropriation shares increasing as the areas to be expropriated became larger.

In Bulgaria, according to the law of May 10 1921, the state land fund is formed, *inter alia*, by expropriation of private estates, leaving, however, 30 hectares to the owner when he works the land himself. In the case of non-cultivation by the owner four hectares only are restored to the owner, or 10 hectares for the whole family; under the extending law of July 21 1924 a family with more than five members is allowed five hectares per member.

In Yugoslavia the decree of Feb. 25 1919 orders that the entire landed property, including entails and estates with from 56 to 280 hectares of cultivable ground, be expropriated, providing about 1,100,000, hectares for distribution. In the autumn of 1925 a new legislative project was laid before the Skupshtina, which was intended finally to settle the question of the expropriation of the large estates. In Greece the agrarian laws of 1920–2 provide for an expropriation of properties of over 100 hectares. According to a recommendation of the Ministry of Agriculture dated Feb. 11 1925, land is to be restored, district by district, to the extent of from 300 to 500 hectares. Cultivation is compulsory on pain of fresh liability to expropriation. The process of obtaining land in Austria may be ranked as expropriation rather on formal grounds than in actual fact, since the expropriation does not press at all harshly and is not to any perceptible extent prejudicial to the tenure of large property. The object of the resettlement laws of 1919 and 1921 was the resumption of cultivation of farms which the large holders, more particularly the owners of forest land, had devoted to purposes of sport or luxury. In such cases land which had been farmed land at any period since 1870 may be expropriated on the demand of a qualified applicant.

Czechoslovakia.—The agrarian legislation of Czechoslovakia followed a middle course. In Czechoslovakia, by a law of April 16 1919, the State Land Office is empowered in the first instance to impose certain restrictions on the property rights of large land-owners; by the law of April 8 1920 the state must give at least six months' notice of expropriation to persons farming such land. Any area is regarded as a large estate on which there are more than 150 hectares of agricultural land, or which itself exceeds 250 hectares.

Poland.—In Poland, where the state merely regulates the conditions of tenure without forming a proper state land fund, the land reserve according to the Seim decree of July 10 1919, and the agrarian law of July 15 1920, is made up of the following categories of land: the state lands, the property of the former ruling dynasties, of the former Russian Peasants' Bank

and of the former Prussian land settlement commission, mortmain lands, and also land acquired by forced sale of private properties which are more than 180 hectares in extent. In the industrial and urban districts this limit may be reduced to 60 hectares, and in the west and east regions of Poland may be extended to 400 hectares.

Under a law dated Dec. 28 1925 these limits may be exceeded, by agreement between the Ministry of Agrarian Reform and the Ministry of Agriculture, in the cases of large farms which have a special importance in the economy of the country, such as farms with sugar factories, distilleries, etc., or farms giving employment to many workers, on condition, however, that the aggregate area in the whole country of the farms to which this provision is applied shall not exceed 500,000 hectares. In any case, before a forced sale the owner is given 30 days in which to effect a voluntary sale of his parcel to the state. The area proposed for the land reserve is estimated at about 5,000,000 to 6,000,000 hectares.

Hungary.—In Hungary the state has recourse to expropriation only when the required parcels of land are not to be obtained either by purchase in the open market or on the basis of a legal right of pre-emption by the state, at the time of the alienation of parcels. However, there may be expropriated, *inter alia*, property to the extent of 100 cadastral *joch* (1 *joch*=0·575 hectare), which was bought during the War; such large estates as have changed hands in the way of sale since July 28 1864 and in particular so much of each estate as still to allow the remaining portion to be brought under systematic cultivation. The area coming under the reform schemes is estimated at over 7,000,000 hectares. For home colonisation in Finland there are available in the first place, under the law of Nov. 25 1922 (Lex Kallio), the state lands and the lands of public bodies, communities, churches, share companies, etc.; after these the property of private owners is purchased in the open market, and only when that does not suffice, is the expropriation of estates of over 200 hectares (in the north of over 400 hectares) carried out.

Generally speaking the percentage taken of the large property corresponds to the number of complete hundreds of hectares included in it; thus in the case of 200 hectares at least 2% is expropriated, and as a maximum 50% in the case of 5,000 hectares and over. The lands illegally acquired by the timber companies were expropriated before any other lands.

Germany.—Finally, in Germany, under the National Settlement Law of Aug. 11 1919, state lands, heath and waste land are already set aside for the provision of land for settlement and in addition land acquired by the state right of pre-emption on the occasion of large sales of private parcels of land. Only after this is recourse had to the expropriation of a part of the large estates. The Land Supply Unions (*Landlieferungsverbände*), the members of which are large landowners possessing over 100 hectares, are obliged to assign for settlement purposes at least one-third of the total area of the large estates in the district, or to reduce the cultivable area of the large estates to 10% of the total agricultural area in the district. In this way over 2,000,000 hectares of large landed property are to be expropriated in Prussia in the coming years.

The methods of acquiring land are thus very various—complete or partial expropriation with notice in advance, pre-emption by the state on the occasion of alienation of property, purchase in the open market—and each method is in its turn significant of the spirit in which the land reforms were undertaken.

Compensation for Expropriation.—Very striking differences are also found in assessing compensation for the expropriated estates, varying from the expropriation without compensation in Russia to the payment of the full value of the land which obtains in Germany. Latvia, following the precedent of Russia, decided not to give any compensation to the expropriated owners of large estates. In Estonia the question was still under discussion in 1926. In Lithuania compensation is reckoned on the basis of the average prices of the years 1910–4. Owners who possess not more than 200 hectares receive the average market prices at the time of the surrender of the land for areas under 150 hectares. Pre-War prices are also paid in Czechoslovakia with a corresponding reduction of the price in the case of estates of more than 1,000 hectares. In Rumania 40 years' rental is given for arable land and 20 years' rental for meadow land on expropriation; in no case, however, may the sum paid in compensation exceed the selling price of the year 1913. Compensation in Greece amounts to nearly 1·3 times the selling price. In Poland, as also in Bulgaria according to the law of 1924, half of the average local market price is fixed as the estimate of the compensation. In Yugoslavia, pending the final settlement of the question of compensation, a rent is paid to the expropriated owners up to the amount of the former net return. Payment of the average market price for the expropriated parcels has been established in Hungary, Finland and Austria, as in Germany.

Division of the Land Fund Among the Applicants.—In the distribution of the expropriated lands the principle of priority for ex-service men and their families runs through the whole agrarian legislation of the post-War period. In the states of western Europe measures were also taken for encouraging the settlement of ex-soldiers on the land, and legislation was passed with this object. In particular in England, according to a report of the Ministry of Agriculture ("Land Settlement in England and Wales, 1919 to 1924," London, 1925, p. 139) 16,461 ex-service men were, up to Dec. 31 1924, settled permanently, of whom 14,061 occupied 213,343 ac. of land. Much has been accomplished in this direction in France, Italy, Belgium and other countries.

The size of the peasant holdings newly brought into being is either determined according to an economic principle, or is fixed numerically. The former is the case in Russia, where the measure for land division is applied, sometimes in accordance with the farming system predominant in the different districts, sometimes according to the "work norm," *i.e.*, according to the sum of the work capacity of the family, or according to the "requirement norm," *i.e.*, according to the number of persons in the family. In Estonia, Bulgaria, Yugoslavia and in Finland, the size of the peasant holding is usually determined according to the "work norm," though sometimes also reaching the maximum numerical limit. In Germany the holdings must, according to the law, be of sufficient size to maintain a family. In the other states the average size of the holding is numerically fixed; thus in Latvia it is 22 hectares, in Lithuania from 8 to 20 hectares, in Poland not more than 15 hectares, in Czechoslovakia 6 to 10 or 15 hectares, in Rumania not more than 7 *joch*, in Hungary, 15 cadastral *joch*, and in Greece an average of 10 hectares.

Form of Management of the Farm Undertakings.—The most prevalent form of management of the new type of holdings in all the states is individual. In Russia 3% of the total area of the expropriated land was reserved for collectivist enterprises, 11% for the Soviet estates and 86% for individual holdings. The collectivist holdings have scarcely been able to maintain themselves, and since 1921 their number has fallen off. This seems the more remarkable, as a similar form of ownership was earlier familiar to the Russian peasant in the institution of the *mir*, although this juridical form was imposed on the peasants at the time of the freeing of the peasants in 1861 not on theoretical or socialistic grounds but rather for technical and fiscal reasons. Peasant enterprises managed co-operatively in very various forms are instituted under the agrarian reforms in Estonia, Latvia, in Czechoslovakia, Rumania, Hungary, Bulgaria and Greece. In the latter states the parcels expropriated by the Government are handed over to co-operative societies, which in their turn undertake the distribution of land to their members.

Legal Protection of New Peasant Holdings.—With a view to preventing any reversion, as the result of alienation, division, etc., to the former conditions of the apportionment of agricultural land, special measures have been included in the agrarian legislation of all countries, limiting the liberty of the peasants to dispose of the new holdings. In Russia, for instance, the land can be neither sold nor mortgaged nor given in free gift. It may not even be divided among the members of a family, unless the division leaves economic units of production. In Latvia a minimum limit of 10 hectares, and in Lithuania of 8 hectares, is fixed

for the land parcels to be divided in the future. In Poland no parcelling of the newly formed holdings may take place, so long as they are burdened with a mortgage in respect of the unpaid balance of the purchase price, and in no case before the lapse of 25 years from their formation. Peasant holdings in Rumania may only be sold, divided, etc., after the lapse of 5 years from the definite conveyance of ownership. According to the extending law of March 1925, the state has the right of pre-emption in the case of alienation of peasant holdings, etc.

In retrospect it may be stated that in all the land reforms undertaken the endeavour is to modify the conditions of rural tenure within the limits of the existing land property rights. The principle of private property in the land as such is, as perhaps is clear from the expropriation legislation, not merely protected, but even placed upon a much wider basis and riveted more firmly into the general consciousness. In Russia alone not only are the conditions of land tenure reformed, but land tenure itself is subjected to a reform in the socialistic sense by a breaking down of the existing land rights. In the agrarian legislation of Estonia and Latvia some echoes of the theories of Henry George may be noted, and the land reforms in Finland, Austria and Germany rather bear the character of home colonisation.

II. THE RESULTS OF LAND REFORM

If the War, as has been said, acted as an accelerating force in the initiation of agrarian reforms, the period of their execution was very unfavourable from the economic standpoint. In the confusion prevailing in the whole after-War economy, the absence of capital and the depreciation of the currencies, and in view of the special interstate trade relations of the Central European countries, which tend towards an extreme protectionist policy and prevent any speedy re-establishment of the national economic policy in each case, the progress of the land reforms has been beset with difficulties. The distance in time from the introduction of the reforms is still too small to make it possible to pass a final judgment on the economic results of these important changes in land tenure. The results achieved cannot of course be looked upon exclusively as the consequence of the land reforms—*post hoc, ergo propter hoc*—but rather are regarded as the outcome of the whole development of agriculture in the separate countries. But the parallelism in the course of the two phenomena may be noted—the transformation of the conditions of tenure of agricultural land and the simultaneous increase in agricultural production.

Russia.—Virtually the whole of the large landed property was divided into nearly 20,000,000 peasant holdings. The first years of the revolution, during the period of militant communism, witnessed the gradual shrinkage of the area in cereal cultivation. Since the introduction of the new economic policy in 1921, and the publication of the Agrarian Code in 1922, cereal production has steadily increased, and, according to the data published by the International Institute of Agriculture at Rome in Dec. 1925, reached in 1925 the total of 180,000,000 quintals, as compared with an average of 205,000,000 quintals for the years 1909–13. The cereal export has also increased since 1922, and according to the original estimates of the Russian Central Statistical Office, in the commercial season 1925–6 to nearly 600,000,000 *poods, i.e.*, the equivalent of the pre-War annual grain export. In reality, the exports have been considerably lower than was anticipated, owing, amongst other reasons, to the deficiency in the country of industrial products serving either for the farms or for the household consumption of the peasants. The result of this deficiency is that the peasant withholds his grain from the market, and it cannot, therefore, be exported. However, as was remarked in the issue of Jan. 1926 of the *Bulletin de renseignement de l'Office commercial pour la Russie et les pays limitrophes*, published by the French Ministry of Commerce and Industry, "all the evidence confirms that the peasants had their barns well filled."

Baltic States

Estonia.—In Estonia the process of land reform is nearly accomplished. Of the 1,060,400 desiatines of land under cultivation belonging to the large landowners, 431,900 desiatines were already previously rented to small holders. The agricultural land thus available for the purpose of the land reform was 628,500 desiatines. According to official data 30,766 new farms have been established in the years 1919–24, and bover a total extent of 598,837 desiatines.[1] The number of families who have profited by the land reform is of course, higher than the number of newly established farms, as a larger parcel of land was often assigned to two or more families. Under the new conditions of the distribution of land the production of flax for seed rose from 78,971 quintals in 1921 to 131,700 quintals in 1925 (as compared with 164,126 in 1909–13), and the production of flax as fibre from 67,202 to 148,100 (as compared with 169,171 in 1909–13). The export of linseed was 12,768 quintals in 1921 and 28,240 in 1924, and of flax fibre 52,280 and 104,328 quintals in the corresponding years. In both cases in the course of three years there is thus a 100% rise. The export of butter has also advanced, amounting to a value of about 2,000,000 marks in 1925 (or over 20% of the total exports), as compared with 1,000,000 marks in the previous year.[2]

Latvia.—In Latvia before the land reforms the estates of the nobles in Livonia embraced 463,449 hectares (32·3% of privately owned rural land), and in Courland, 533,689 hectares (30%). In 1924 more than half, viz., 61% of the agricultural and forest land, had passed under state control, and approximately 50,000 new holdings had been established on such land.[3] The area cultivated in flax in Latvia showed an even more rapid increase than in Estonia: from 30,499 hectares in 1921 it rose to nearly 78,100 hectares in 1925, as compared with an average of 69,619 hectares in the years 1909–13. In absolute figures, the export of flax, as seed, rose from 48,547 quintals in 1921 to 176,122 quintals in 1924, and the export of flax as fibre rose in the same period from 62,758 quintals to 204,458 quintals. In both cases accordingly the export has more than trebled.

Lithuania.—In Lithuania 36% of the agricultural area belonged before the War to the large landowners, almost all of whom possessed more than 2,000 hectares. There were 110,000 small holdings, belonging to 28% of the agricultural population, which contained on an average less than three hectares. Half a million persons, or from 15 to 20% of the agricultural population, were landless.[4] In the course of the land reform about 1,360,000 hectares, including 400,000 hectares of agricultural land and 960,000 hectares of forest, passed into the land reserve for the formation of small holdings. In this connection also a rapid increase in the production per area is to be noted. The flax growing area increased from 51,200 hectares in 1922 to about 81,000 hectares in 1925, as compared with the average area under cultivation of 55,167 hectares in the years 1909 to 1913, and the production rose in the same period from 281,500 quintals of linseed to nearly 486,600 quintals and from 205,000 to 421,500 quintals of fibre. A fair export trade is developing and amounts to nearly half the total production in flax.

Finland.—In Finland, where in 1910 out of the total area of 32,997,217 hectares not less than 91·4% was forest, moorland, etc., while the cultivated land only accounted for 5·7%, and the meadow land for only 2·9%, the forest wealth is naturally the determining element for the national economy. Of the total rural population of 2,820,000 persons (84·2% of the whole population of Finland), only 40·6% are owners or tenant farmers and 59·4% are agricultural workers of different kinds, who draw no assured subsistence from the land.[5] A systematic scheme of land settlement has been in progress since the beginning of the century. Up to Sept. 30 1925, by means of grants from the land colonisation fund, 437,319 hectares were settled, 11,845 new farms established, 4,078 small holdings enlarged and 6,000 sites for farm workers' dwellings granted.[6] The object of post-War legislation has been to facilitate the transition of the tenancies into free ownership, as also the wider employment of land for settlement purposes; 43,343 small holdings were established between Oct. 25 1918, and March 1 1925. The wheat production of Finland has risen from 157,538 quintals in 1921 to 202,900 quintals in 1925, and the export of butter from 64,652 quintals in 1921 to 131,910 in 1925; in 1913, 126,400.

Central European States

Poland.—Out of 1,000,400 peasant families in Galicia there were 813,000 who did not make an adequate living out of the land, while 1,220,000 peasant inhabitants of Russian Poland owned no land at all. Up to Jan. 1 1923, 271,197 hectares of land were available for land reform purposes, and 18,018 new farms were established, 27,256 were enlarged, 3,199 workers' homesteads were erected and 360 special farms instituted.[7] An Agrarian Reform bill was passed in Dec. 1925, which provided for the distribution of 20,000 hectares a year among peasant farmers over a period of ten years, the maximum areas tenable being 60 hectares in industrial areas, 300 acres in the border provinces, and 175 in other areas. Compensation to the owners was at the present value, from 25 to 50 per cent being paid in cash, and the remainder in bonds.

[7] Ludkiewicz Zdzislav, "La question agraire en Pologne," *Revue d'Économie Politique* (Paris, Dec. 1923).

Czechoslovakia.—In Czechoslovakia the land reform was practically complete in 1926. Before the War the great estates of over 500 hectares in extent absorbed altogether one-third of the total agricultural land. The land available for agrarian reform has been 1,229,688 hectares of arable and meadow land. Of this one-third remains in the hands of the large landowners, 80,000 hectares is left with the former tenants under the form of tenancy, and 820,000 hectares are being apportioned into small and very small holdings. The number of farms of 2·5 hectares in extent has doubled, and that of farms of from 5 to 10 hectares has quadrupled, and the number of peasant farms of over 10 hectares has increased to a remarkable extent.[1] The production of sugar-beet advanced from 40,716,551 quintals in 1921 to 84,083,300 quintals in 1925. The export of sugar returned in 1921 as 376,328 metric tons, amounted in 1924 to 1,015,155 tons. The republic holds the first place among European sugar-exporting countries and the third on the international sugar market.[2]

Hungary.—In Hungary before the land reform large estates of over 1,000 *joch* amounted to 35·88% of the agricultural area, the medium-sized estates of 100–1,000 *joch* to 16·62%, and the small holdings under 100 *joch* to 47·5%.[3] The very small holdings up to 3 hectares formed 53·6% of the total number of holdings and only 5·8% of the agricultural area; holdings larger than 575 hectares formed 0·2% of the total number of holdings, but nearly one-third of the entire agricultural area. Before Jan. 1925, 597,094 *joch* had been assigned to the peasants, and 127,471 sites allotted for houses. The production of wheat has risen from 8,052,950 quintals in 1921 to 18,385,000 quintals in 1925. The wheat exports have also increased very considerably, having in fact advanced from 176,949 quintals in 1921 to 1,803,918 quintals in 1924. A great impetus has been given to the cultivation of vines, but owing to tariff difficulties the export of wine is at present very much reduced.

Austria.—In Austria only 156 peasant holdings, covering 2,824 hectares, had been settled up to June 30 1924, in accordance with the Resettlement law.[4]

Germany.—In Germany 1,468,915 hectares of large landed property in Prussia ought, according to the Land Settlement law, to have been made available for home colonisation in the years 1919–22, whereas the area actually so available was only 95,576 hectares. What form will be taken, under stable economic conditions, by this home colonisation, as it was envisaged by the originator of the scheme, Prof. Max Sering, and how far the cry of the land-hungry population is really stilled,[5] only the future can determine.

Balkan States

Rumania.—In Rumania nearly half of the total agricultural area belonged before the War to the large landowners, though their number was scarcely more than ½% of the total number of all the agriculturists. At the beginning of 1925, 5,713,598 hectares of land, or 30% of the whole agricultural area, were expropriated under the land reform and assigned to the applicants for land. In consequence of this the small holdings now amount in Old Rumania to 80·94% of the cultivable area and in Transylvania to 49·34%.[6] The production of wheat had fallen off in Rumania, as compared with the pre-War production, but it again shows a very marked upward tendency. The area under wheat increased from 2,488,335 hectares in 1921 to 3,300,900 hectares in 1925, and the production from 21,381,484 quintals to 28,946,700 in the corresponding years. The wheat export has also recovered to some extent: it rose from 756,903 quintals in 1921 to 1,216,150 in 1924, and the wheat flour export from 194,223 to 1,165,270 quintals. Expansion of the cereals export was, however, made impossible on account of the increased duty, partly imposed on political and financial grounds, partly with a view to ensuring low prices for bread in Rumania, but this duty was eventually reduced. Quite apart from this, it has been necessary to import a considerable volume of cereals into Transylvania from the parts of Rumania where the supply was abundant.

Yugoslavia.—In Yugoslavia the conditions of rural land tenure varied very much according to the provinces. Generally speaking, every peasant in Old Serbia had his piece of land, and there was little scope for land reform. In those provinces, however, which were previously under Turkish rule, mediaeval feudal conditions still prevailed in the country districts: in Bosnia and Hercegovina, the *Kmet* régime, in Macedonia and a part of Montenegro the *Tchiftchius* system. The agrarian reform completely did away with this régime, and the former *Kmets* became small proprietors. In the former Austrian provinces such as Croatia, Slavonia, etc., more than half of the agricultural land was in the hands of the large landowners. Up to the end of 1923 in the whole of Yugoslavia 501,966 *joch* of cultivable land were divided among 185,905 families.[7] Wheat growing has made satisfactory progress, the yield rising from 14,100,300 quintals in 1921 to 22,403,100 in 1925, while the wheat export advanced from 470,729 quintals in 1921 to 1,772,764 in 1924.

Bulgaria.—In Bulgaria it is hardly possible to speak of a predominance of large ownership. The principal object of the land reform was to secure a better distribution of land between the medium sized and small farms, and up to the end of 1923, 1,885 hectares of land had been assigned to 780 persons. The cultivation of tobacco, which takes an important place in the agriculture of Bulgaria, has shown remarkable progress. In 1924 the production amounted to 436,975 quintals as compared with 129,848 quintals in 1914. In 1924 there was an export of 31,735,000 kg. of tobacco of the value of 1,828,109,000 leva.[8] In 1925 for various reasons the production of tobacco fell off to a perceptible extent.

Greece.—In Greece 832 large estates were expropriated up to 1923, and 7,500 small farmers were presented on an average with 13·5 hectares each. The peasants grow for the most part commercial crops, such as currants and wine-grapes, the export of which has noticeably increased.

Western European Countries

In western Europe even less than in Germany or Austria is it possible to speak of agrarian reform in the sense in which it has occurred in the countries of eastern Europe. The conditions of tenure of agricultural land have undergone slow though continuous modification without any remarkable alteration having come about in the traditional agrarian system of the separate countries. In England, the classic instance of a country of large estates and large and medium sized tenancies, the number of occupying owners has almost doubled. In 1910 there were 55,433 such owners, holding 3,329,015 ac., while the total number had in 1924 become 94,236 holding 6,574,074 ac., or nearly one-quarter of the total area of England and Wales, 29,739,000 acres.[9] Thus there has come about in this country what the Hon. Edward Wood (Lord Irwin) called (Dec. 9 1924) "a silent revolution." Indeed, in view of the fact that the rôle of the large landowner as the provider of credit for agriculture is disappearing, while at the same time this function devolves more and more upon the state, he added " . . . and so you may well find yourselves in the course of the next 30 or 40 years within measurable distance of something like nationalisation by a side wind." This would imply the virtual realisation of the land reform programme as proposed by Lloyd George—the taking over of the land by the state, which then assigns it to tenants in hereditary usufruct.

Italy.—In Italy there were in 1912 4,931,000 agricultural holdings, including 3,275,000 of less than one hectare each, 614,000 of from one to two hectares, and 450,000 of two to four hectares. At the same time in some provinces the extent of the latifundia was very considerable for example, in Caltanisetta, out of the whole area of 322,865 hectares, 134,807 were latifundia, or 41·7%; in the province of Palermo the percentage was 35·0, and in the provinces of Sicily taken as a whole nearly one-third.[10] A bill of the transformation of the latifundia for purposes of home colonisation was passed by the Chamber of Deputies on Aug. 19 1922, but was thrown out by the Senate at the end of the same year.

Denmark.—The agrarian policy is directed increasingly towards the promotion of rural small ownership. The object of the so-called old Small Holdings Act of 1899 was mainly the settlement of land workers. The land was procured for this purpose on the open market with the help of state loans. From 1900 to 1924, 11,451 small holdings were formed in this way, the state assistance amounting to about 100,000,000 crowns.[11] (*See* Denmark: Agriculture).

The intention of the framers of the new Small Holdings Act of Oct. 1919 was to establish peasant holdings as economically independent units, the Govt. supplying land on favourable terms to applicants by purchase of church lands, of entailed lands, etc. The average size of the holdings is now fixed at 7½ hectares, as compared with 3½ before the War. In accordance with this law in the years 1920–24, 2,251 new holdings were formed covering 15,874 hectares, and 3,040 hectares were allotted for 1,258 very small holdings. In all 14,960 peasant holdings have been formed since 1900. At the present time the question is being asked whether the obtaining of land for small holdings would not be greatly facilitated by expropriation of land in the case of property which exceeds a given extent.

III. CONCLUSION

The changed conditions of tenure of agricultural land are to be traced back almost entirely to social causes, and land reform is thus rather a problem of the more equal division of property

than one of increase of production from landed property. None the less the land reforms are already of proved economic value, although the peasant holdings that are their outcome are still in the first stage of adaptation to the new conditions. The advance of agricultural production is determined, not merely by the greater or less area of the peasant farms, but in a marked degree also by the psychological attitude of the peasant to his land, his joy in production and will to work. It is this imponderable factor, defying measurement, but, when multiplied a million fold, yielding in due time great results, that is the true achievement of the agrarian reforms. The lessons of the War come to this, that a sound distribution of ownership, together with a large peasant class, tends to conditions of agricultural progress and forms the essential presupposition of social peace. (*See* also FARM ORGANISATION.)

BIBLIOGRAPHY.—The principal agrarian laws of the different countries are reproduced in the *International Year-book of Agricultural Legislation* (1919–25). The bibliography of Russian agrarian legislation is given in "Agrarian Policy in Soviet Russia," by M. Tcherkinsky, in the *International Review of Agricultural Economics*, No. 4 (Oct.–Dec. 1924). The data on agricultural production and export, where no special reports are quoted, have been taken from the *International Year-book of Agricultural Statistics* for 1924–5 and the *International Crop Report and Agricultural Statistics* (Rome). LANE, FRANKLIN KNIGHT (1864–1921), American public official, was born near Charlottetown, P.E.I., Canada, July 15 1864. He graduated from the University of California in 1886. He began his career as a newspaper reporter, studied law and was admitted to the bar in 1889. He practised in San Francisco, drafted a charter for that city and soon afterwards, in 1897, was elected city attorney, to which office he was twice re-elected. In 1902 he was the unsuccessful Democratic candidate for governor of California, and the following year failed in his election for the U.S. Senate. In 1905 he was appointed by President Roosevelt a member of the Interstate Commerce Commission and was retained by President Taft, serving for eight years, part of the time as chairman. In 1913 he entered the Cabinet of President Wilson as Secretary of the Interior. During his term of office the wealth of Alaska was made more accessible by the construction of a Government railway. Dams were built in several western states for conserving the water supply in dry regions. To the Indians he gave special attention, maintaining that perpetual tutelage was wrong. He advocated development of national resources without waste as being reasonable conservation. He was an earnest advocate of reclamation of land. In 1916 he was a member of the American-Mexican Joint High Commission, and the following year became a member of the Council of National Defense. In 1920 he resigned his post as Secretary of the Interior. He was treasurer of the European Relief Council. He died at Rochester, Minn., May 18 1921. He was the author of *The American Spirit* addresses delivered in War time (1918). See also A. W. Lane and L. H. Wall, *The Letters of Franklin K. Lane, Personal and Political* (1923).

LANE, SIR HUGH PERCY (1875–1915), Irish art collector, was born in Co. Cork Nov. 9 1875, the son of the Rev. J. W. Lane. He entered the firm of Colnaghi & Co. in 1893 and rapidly made a name as a connoisseur of extraordinary perception. In 1898 he began dealing on his own account. He took a prominent part in the revival of an interest in art in Ireland, especially in establishing a gallery of modern art in Dublin. A fine collection was ultimately made, and housed in Harcourt Street, Dublin, where it was opened in 1906. He was knighted in 1909. Lane offered a number of old masters to the city of Dublin but, owing to the attitude of the Dublin corporation, his gift did not take effect. He acted as adviser on the formation of the Johannesburg Municipal Gallery of Modern Art (1909), and brought together the Cape Town National Gallery collection of 17th century Dutch pictures (1912). He was in 1914 appointed director of the National Gallery of Ireland. He was drowned in the sinking of the "Lusitania," May 7 1915.

See Lady Gregory, *Hugh Lane's Life and Achievements: with some account of the Dublin Galleries* (1920).

LANESSAN, JEAN MARIE ANTOINE DE (1843–1919), French statesman and naturalist (*see* 16.169), retired from politics in 1914. Among his latest works were *La crise de la République* (1914); and *L'histoire de l'entente cordiale Anglo-Française* (1916). He died at Écouen, Seine-et-Oise, Nov. 8 1919.

LANG, ANDREW (1844–1912), British writer (*see* 16.171), died at Banchory, Aberdeenshire, July 20 1912.

LANG, COSMO GORDON (1864–), Anglican divine, was born in Aberdeen Oct. 31 1864, the son of John Marshall Lang, sometime moderator of the Church of Scotland. Educated at Glasgow University and Balliol College, Oxford, he graduated in 1886 and two years later was elected a fellow of All Souls. In 1890 he was ordained and was appointed curate of the parish church of Leeds. From 1893 to 1896 he was fellow and dean of divinity of Magdalen College, Oxford, and from 1894–96 vicar of the University church of St. Mary's. In 1896 he became vicar of Portsea, and in 1901 suffragan bishop of Stepney, London, and canon of St. Paul's Cathedral. In 1908 he was appointed archbishop of York. His eloquence and clear common sense made him an influential member of the House of Lords, and in 1909 he was appointed a member of the royal commission on divorce.

His published works include *The Miracles of Jesus as Marks of the Way of Life* (1901); *Thoughts on some of the Parables of Jesus* (1906); *The Opportunity of the Church of England* (1905).

LANGLOIS, HIPPOLYTE (1830–1912), French general (*see* 16.177), died in Paris Feb. 12 1912.

LANGMUIR, IRVING (1881–), American chemist, was born in Brooklyn, N.Y., Jan. 31 1881. He studied at the Columbia school of mines, proceeding in 1903 to the University of Göttingen. He was instructor in chemistry at Stevens Institute, Hoboken, N.J., from 1906 to 1909, since which time he has engaged in physico-chemical research for the General Electric Co., Schenectady, New York. He invented the gas-filled tungsten lamp and the condensation pump for producing high vacua; his inventions in the field of electric discharges are largely responsible for the modern vacuum tube used in radio. In 1911 he discovered the atomic form of elementary hydrogen, and subsequently developed a process for welding metals by flames of atomic hydrogen. In 1917–8 he was engaged at the Naval Experimental Station, Nahant, Mass., developing devices for submarine detection. For his work in the field of molecular physics he received in 1918 the Hughes Medal of the Royal Society, London.

LANGUAGES: *see* FOREIGN LANGUAGES; PHONETICS.

LANKESTER, SIR EDWIN RAY (1847–), British biologist, was born in London May 15 1847, and was educated at St. Paul's School, Downing College, Cambridge, and Christ Church, Oxford. In 1872 he was elected to a fellowship at Exeter College, Oxford. During 1874–90 he was professor of zoology and comparative anatomy at University College, London, and from 1891–8 Linacre professor of comparative anatomy at Oxford. From 1898 to 1907 he was director of the natural history department of the British Museum, and from 1898–1900 he held the Fullerian professorship of physiology and comparative anatomy at the Royal Institution, London. He did valuable research work on the comparative structure of animals, both living and extinct. To the general public he became known owing to his successful presentation of scientific subjects in a popular form. He was elected F.R.S. in 1875, and was awarded the Royal Medal in 1885 and the Copley Medal in 1913. In 1884 he founded the Marine Biological Association, becoming its president in 1892. He was awarded K.C.B. in 1907. His numerous publications include *Comparative Longevity* (1871); *Degeneration* (1880); and the several editions of *Science from an Easy Chair* (1908, 1910, 1912); *Diversions of a Naturalist* (1915); *Science and Education* (1919); *Secrets of Earth and Sea* (1920); and *Great and Small Things* (1923). He was for many years editor of *The Quarterly Journal of Microscopical Science.*

LANREZAC, CHARLES LOUIS (1852–1925), French soldier, was born at Pointe-à-Pitre, Guadeloupe, July 31 1852. While at the École de Guerre, the new French doctrine of strategy and tactics was being established under the influence of Maillard, Langlois and Bonnal. To this doctrine Lanrezac himself contributed in his study *La manoeuvre de Lützen.* He became colonel in 1902, general of brigade in 1906, and general of division in 1911. In 1912 he commanded the XI. Corps, and on April 10 1914 succeeded Galliéni as a member of the Conseil Supérieur de la Guerre and commander-designate of the V. Army. His theories as summarised in the article *Stratégie* of the *Dictionnaire militaire* were not in accordance with the modern theory of an incessant and universal offensive, of which plan 17 was an example. This plan assumed that the V. Army would attack east of the Meuse towards Neufchâteau. Lanrezac pointed out in his report of July 31 1914 that if the extreme German right crossed the Meuse north of Givet the V. Army at Neufchâteau would be turned. Neither he nor Joffre anticipated the magnitude of the German attack, though he feared an enemy attack between Namur and Givet aimed at Chimay and the sources of the Oise and the direct road to Paris. He therefore sought and obtained permission on Aug. 12 to place the I. Corps (left) in the Dinant region, and to make preliminary arrangements for moving the rest of his army towards the northwest. On Aug. 15 the Germans having endeavoured to cross the Meuse at Dinant, General Joffre ordered the transfer of the army on the left bank.

On Aug. 21 Lanrezac asked Joffre whether he should attack the following day, but was then violently attacked by Von Bülow's army, and the battle of Charleroi began. The arrival of the III. German Army forced the I. French Corps to fall back on the Meuse, while the III. Corps had to yield. On the evening of the 23rd Lanrezac was obliged to order a retreat, which lasted from Aug. 24 to Sept. 5. On Aug. 27 orders were given to renew the offensive at Saint-Quentin in order to assist the British. This order provoked a violent disagreement between Joffre and Lanrezac. Nevertheless Lanrezac renewed his offensive on the 29th and at the battle of Guise, won a brilliant tactical success. But the retreat continued, and on Sept. 3 Gen. Lanrezac was relieved of his command. In 1917 he was offered the post of Major General of the armies by M. Painlevé, but he refused and suggested Gen. Pétain. "He is one of my own children," he said, "and I can answer for him." On July 3 1917 he was made grand officer of the Legion of Honour and on Aug. 29 1924 he was given the grand cross of the same order. He died on Jan. 18 1925.

See Lanrezac, *Le plan de campagne français et le premier mois de la guerre* (1920); Jules Isaac, *Joffre et Lanrezac* (1022); F. Engerand, *Lanrezac* (1926). (H. Bl.*)

LANSBURY, GEORGE (1859–), British politician, was born on Feb. 21 1859 in Suffolk. Working in a timber business, in London, he became a member and trustee of the National Union of General Workers. He abandoned his early Liberalism to found the Church Socialist League and to join the Independent Labour party. In 1909, as a member of the Royal Commission on the Poor Laws, he signed the Minority Report, and started an active campaign for its adoption. Elected M.P. for Bow in 1910, he supported the militants in the women's suffrage movement, and in 1912 resigned his seat to test opinion on the subject, but was defeated; he recaptured it, however, in 1922. In 1913 he became editor of *The Daily Herald*, which he carried on as a weekly during the War period. From 1920, on its revival as a daily, he was again editor, becoming general manager in 1922. In 1925 he resigned this post and founded *Lansbury's Weekly*, a journal friendly to communism. He visited India and Russia, publishing his book, *What I Saw in Russia*, in 1920. He was elected a borough councillor in 1901 and was mayor of Poplar from 1919–20 but he refused a post in the Labour Govt. (1924) and criticised its policy in many respects.

LANSDOWNE, HENRY CHARLES KEITH PETTY FITZMAURICE, 5TH MARQUESS OF (1845–), British statesman (*see* 16.184), had, during his tenure of office as Foreign Secretary (1900–5), definitely set his mark on British foreign policy at a critical period of history. In 1900 Great Britain felt all the disadvantages of isolation. Lord Salisbury's system of a general reliance on Germany and the Triple Alliance (Germany, Austria and Italy) had become no longer possible, in view of the open expression of German ill-will during the Boer War, and of the German resolve to build a fleet sufficiently large to constitute a serious challenge to the British Navy. On the other hand, Great Britain had nearly come to blows with France over Fashoda (Kodok), and her historical friction with Russia continued. Her isolation was especially marked in the Far East. Germany, Russia and France had forced Japan, after her Chinese War, to relinquish her conquest of the Liaotung peninsula. England had refused to join the other European Powers in their action, but had simply stood on one side. Subsequently Russia had over-run Manchuria and seized Port Arthur; France had effected a favourable revision of her frontier in the Mekong valley, and Germany had seized Kiaochow. It is Lord Lansdowne's main title to fame that he rescued Great Britain from this position of peril, procured her an ally in the rising maritime Power of the Pacific, Japan, and in Europe established her on terms of friendship and mutual understanding with France, by clearing away all the sources of bickering between Paris and London.

When the Duke of Devonshire resigned from Mr. Balfour's Government in 1903, Lord Lansdowne became the Conservative leader in the House of Lords, and though the fall of the Ministry in Nov. 1905 transferred him to the Opposition bench he remained the leader of the majority of that House till Dec. 1916. His polished and courteous manner, his thorough acquaintance, both with his work and with the idiosyncrasies of the peers, his cool temper and the sweet reasonableness of his expositions of policy speedily rendered his leadership most acceptable to his followers, in spite of the drawback, from the point of view of the Tory majority among them, that he was himself an old Whig. He rendered consistently patriotic support to the development by Sir Edward Grey of the foreign policy for which he himself had been responsible. In domestic politics he endeavoured, as far as possible, to limit points of difference with the Commons; but the measures of the Liberal Ministry almost inevitably brought about a conflict, which came to a head over Mr. Lloyd George's budget of 1909. In advising the Lords to reject it—as they did—he claimed that it was not an ordinary budget, but emphatically one which ought to be referred to the electorate to decide. Next year, however, he accepted the result of the general election of Jan. 1910, as making it obligatory on the peers to pass the Finance bill.

After the second general election of 1910 on the point of the Lords' veto, Lord Lansdowne brought forward in 1911, as an alternative to the Parliament Bill, a scheme for reconstructing

the Upper House, which however was dropped after a second reading. When the Parliament Bill itself came up to the House of Lords, he moved and carried, by 253 to 40, an amendment providing for a submission to a popular vote of bills affecting the constitution or otherwise of great gravity. From that amendment he and his friends would not, he said, recede so long as they were "free agents." Ministers immediately announced that they would not accept the amendment, and that the King had consented to create, if necessary, sufficient peers to ensure the passage of the bill in its original form. Lord Lansdowne held that, after this threat of coercion, the peers had ceased to be free agents, and he therefore advised them to desist from further resistance. In this advice he was supported by Mr. Balfour; but a vehement opposition developed in the Conservative party, headed by the ex-Lord Chancellor, Lord Halsbury, and these "Diehards" were supported by such a large body of opinion that the bill was only carried eventually by 17 votes.

This episode gave a shock to Lord Lansdowne's authority both in the House and in the Conservative party, but he remained leader and co-operated cordially with Mr. Bonar Law after Mr. Balfour's resignation. He fought the Irish Home Rule Bill and the Welsh Disestablishment Bill strenuously on their successive appearances in the House of Lords, and procured their rejection by large majorities. But he was always ready for an agreement by consent over the Irish question, to avoid the "irremediable misfortune," the "overwhelming catastrophe," of civil war. The World War reduced all these issues to minor significance, and Lord Lansdowne associated himself with Mr. Bonar Law in tendering at once the support of the Opposition to the Government in rallying to the assistance of France and Russia. In 1915 he joined Mr. Asquith's Coalition Ministry without portfolio; and took the lead in pressing the military service bills on the House of Lords. At the close of that Ministry he retired from office, the leadership of the House and of the Conservative majority passing to Lord Curzon. In his retirement he got somewhat out of touch with public opinion, and published in *The Daily Telegraph*, in Nov. 1917, a letter in which, to the general surprise, he advocated a negotiated peace instead of the policy of Thorough, on which the Ministry and the Empire were set. His ideas received hardly any support save from the small pacifist section. In subsequent years he suffered much from ill-health, and so took little or no active part in politics.

Lord Lansdowne's great and various services to his country were rewarded with the K.G., G.C.S.I., G.C.M.G. and G.C.I.E. He was a trustee of the National Gallery and chairman of the British Royal Red Cross Society 1915–20; he received honorary degrees from Oxford, Cambridge, McGill and Leeds. His elder son, Lieut.-Col. the Earl of Kerry, D.S.O., married Elizabeth Caroline, only daughter of Sir E. S. Hope. His younger son, Lord Charles Mercer Nairne, was killed in action in France in 1914. Of his two daughters the elder married the 9th Duke of Devonshire and the younger the 6th Marquess of Waterford and, after his death, Lord Osborne de Vere Beauclerk. (G. E. B.)

LANSING, ROBERT (1864–), American diplomatist, was born at Watertown, N.Y., Oct. 17 1864. He graduated from Amherst in 1886, was admitted to the bar in 1889, and for the next 18 years practised at Watertown. In 1892 he was associate counsel for the United States on the Bering Sea Commission, and later was American counsel or agent before several important arbitral tribunals or mixed commissions, including the Alaskan Boundary Tribunal (1903), the Hague Tribunal for the arbitration of the North Atlantic fisheries (1910) and the Anglo-American commission (1911) for settling outstanding claims between Great Britain and the United States. In 1914 he was appointed counsellor of the Department of State. When W. J. Bryan resigned (June 8 1915), Mr. Lansing was appointed Secretary of State *ad interim*. He was definitely appointed Secretary of State on June 23 1915. In his attempts to uphold American rights he was called upon to direct notes to all the countries at war. In reply to a note addressed by England to neutrals, asking that all belligerent submarines be excluded from neutral waters, he said that the nature of each submarine must govern the decision. He thus drew an important distinction between the "Deutschland," which had peacefully brought a cargo to America, and the U53, which had raided several ships off the New England coast, Oct. 7 1916. In 1917 he notified President Carranza, of Mexico, that the United States would not adopt his proposed Pan-American plan of stopping the shipment of food and munitions to all the European belligerents. In Nov. 1917 he signed an agreement with Japan (the Lansing-Ishii agreement) which, while recognising Japan's special interests in China, provided for a continuance of the "open door" policy for commerce.

Lansing was a member of the American commission to negotiate peace at Paris, 1918–9, and, together with Viscount Cecil and Col. House, prepared a draft of the League of Nations in Jan. 1919. On Feb. 13 1920 he resigned as Secretary of State on being reprimanded by the President for having called together the heads of the executive departments of the Government. Such meetings of the Cabinet had, however, frequently been called before during the President's illness, naturally by the Secretary of State as ranking member. In Aug. 1920 he opened a law office in Washington. He was the author of *The Peace Negotiations* (1921); and *The Big Four and Others* (1921).

LAPWORTH, CHARLES (1842–1920), British geologist (*see* 16.208), died at Birmingham March 13 1920.

LARDNER, RING W. (1885–), American author and humorist, was born at Niles, Mich., March 6 1885. He received his education at the Niles High School and the Armour Institute of Technology, Chicago. He was a reporter on the South Bend (Ind.) *Times*, 1905–7, after which he spent four years in Chicago, contributing to the sporting columns of various newspapers there. He was editor of *The Sporting News*, St. Louis, 1910–1, and sporting writer for the Chicago *Tribune* 1913–9, after which date he was connected with the Bell syndicate. His humour is based in part on its racy use of vernacular and the language of illiteracy. He wrote a number of books, among which are *Bib Ballads* (1915); *You Know Me, Al* (1916); *Gullible's Travels* (1917); *Treat 'em Rough* (1918); *The Real Dope* (1919); *How to Write Short Stories* (1924); and *The Love Nest* (1926).

LARMOR, SIR JOSEPH (1857–), British mathematician, was born at Magheragall in Ireland on July 11 1857, and was educated at the Royal Belfast Academical Institution, Queen's College, Belfast, and St. John's College, Cambridge. From 1880–5 he held the post of professor of mathematics in the Queen's University, Ireland, and from 1885–1903 he was lecturer in mathematics in the University of Cambridge, subsequently becoming Lucasian Professor there. He carried out much valuable research work in mathematics and mathematical physics, displaying a particular interest in the problems of electrodynamics and thermodynamics, and in the electrical properties of ether and matter. He was intimately connected for many years with the Royal Society, of which he became a fellow in 1892, serving on the council and acting as secretary from 1901–12. He received the Royal Medal in 1915, and the Copley Medal in 1921. In addition to these he was the recipient of many British and foreign honours and awards, including in 1914 the de Morgan Medal of the London Mathematical Society of which he was at that time President. He was knighted in 1901, and from 1911–22 was Unionist member of Parliament for Cambridge University. His writings include *Ether and Matter* (1900), and numerous memoirs on mathematics and physics.

LASCELLES, HENRY GEORGE CHARLES, VISCOUNT (1882–), eldest son of Henry Ulick Lascelles, 5th Earl of Harewood, was born Sept. 9 1882. He was educated at Eton and entered the Army as a lieutenant in the Grenadier Guards. For a time he exchanged military for diplomatic service, becoming an honorary attaché to the Embassy in Rome 1905–7, and A.D.C. to the governor-general of Canada (Earl Grey) 1907–11. He served in France during the World War, being three times wounded, and winning the D.S.O. with bar, as well as the Croix de Guerre. In 1922 (Feb. 28) he married Princess Mary, only daughter of King George V., and he was the same year created a Knight of the Garter. Through his grandmother, Elizabeth Joanna,

daughter of the 1st Marquess of Clanricarde, he inherited the property, though not the titles, of his great-uncle, the second and last marquess, who died April 12 1916.

LATIN LITERATURE (*see* 16.257).—During the period from 1911 to 1926 the progress of Latin scholarship ran on well-marked lines. The closing decades of the 19th century witnessed a great revival of classical study, parallel, if not due, to the great discoveries in natural science. It was realised that the doctrines which were current, in almost every branch of the study of antiquity, needed to be re-examined; and that the evidence available was far more extensive than previous generations of scholars had been willing or able to contemplate.

Hence came a great addition to the original sources of information accessible. Newly discovered inscriptions, papyri, monuments of stone and bronze and ancient remains of every kind; manuscripts and the products of ancient and medieval scholarship were newly read or newly analysed, and so made available for wholly new study, often in monumental publications like the *Corpus Inscriptionum Latinarum*, which, despite its 15 volumes, is still not yet complete. This new stream of research, strictly scientific in character, still continues with hardly any diminution; and students of Latin literature have learnt to give heed to the methods and the fruits of these studies.

Study of the Great Writers.—But the special feature of the years since 1910 has been a reassertion of the older and larger objects of classical study, namely, the interpretation and appreciation of the greatest authors, not in a spirit of opposition to the new research, but in alliance with it, and on the strength of its results. Thus, for example, in 1896 Theodor Mommsen was content to determine the date of an inscription, then newly discovered on the island of Philae in the Nile, and to show that it was probably one of the monuments set up or permitted to be set up in his own honour by Cornelius Gallus during his governorship of Egypt in 26 B.C.; and hence that it was one of the causes of the anger of Augustus and of the fall and suicide of Gallus—all good history, but, so far as Mommsen took it, with no particular literary bearing.

But Mommsen's results have since[1] been combined with what we have now learnt about the poet-soldier Gallus from a deeper study of Virgil's *Eclogues*, and with what the ancient commentators record about the curious ending—or want of ending—of Book IV. of the *Georgics*, so as to make clear how it was that Virgil came to mutilate what was probably the most perfect poem he ever wrote; and to suggest also how innocent his bosom-friend Gallus, despite his Gascon vanity, had been of the graver charges laid against him. In this way a fact of Virgil's experience, which must have contributed profoundly to shape his general outlook, appears in clearer light, and the standing riddle of the Aristaeus - Proteus - Orpheus - digression has found its final solution; the whole patchwork is nothing but a half-hearted attempt to replace the *Praise of Gallus* (and of Egypt) by piecing together three epyllia, of the poet's own earlier work, short narrative poems in the Alexandrine style.

Of similar interest is the discovery by Prof. G. E. K. Braunholtz, in the course of studies of the ancient place-names of North Italy and of the family-names of the same area recorded on inscriptions, of new evidence which places Virgil's farm near Calvisano, 30 Roman m. northwest of Mantua, not at the traditional site two m. to the southeast in the marshes of Pietole. This has elucidated the story of his expulsion from his farm in 41 B.C., and thrown much light on all the *Eclogues* whose scene is laid in North Italy—that is, as has been now pointed out, all those with odd numbers.

New and more searching methods of manuscript study have also added much to our knowledge of Latin authors. The Oxford series of texts with critical notes, though they vary a good deal in the fullness of their record, have at least made it difficult for an editor of any ancient book to frame his text or comment without regard to the evidence of the different manuscripts and the judgment of competent scholars upon their worth; just as no future editor of Juvenal can dispense with Prof. A. E. Housman's text (1905), or of the *Culex* (now attributed to Virgil by a clear and marked preponderance of expert opinion) without the same scholar's *Apparatus Criticus;* or of the *Metamorphoses* of Ovid without the critical edition by H. Magnus. Dr. J. P. Postgate's *Tibullus* and *Phaedrus*, and Profs. R. S. Conway and C. F. Walters' Livy I.–V. and VI.–X., Prof. H. W. Garrod's Statius (*Thebaid* and *Achilleid*)—all five volumes in the Oxford series—have offered similar service towards the better understanding of these authors.

Further, the more profound analysis of the history of manuscripts due to such scholars as L. Traube, A. C. Clark and E. K. Rand, besides the editors just mentioned, has revealed the frequency, not to say regularity, of certain causes of corruption—especially the loss of whole lines, or groups of lines, in uncial codices, and has thus imposed a certain check on haphazard emendation, and given new guidance for our procedure (or non-procedure) in difficult cases. One result is that the formula with which the most brilliant critical scholar of the 19th century, J. N. Madvig, was wont to cut the worst knots—"Livius scribere debuit" (so and so)—has disappeared from the work of self-respecting scholars. We have learnt so much more of the possibilities of error in tradition that we are humbler in framing judgments on the writings of great authors in the form in which the centuries have left them.

These illustrations will suffice to show the way in which new knowledge in epigraphy, in the study of place names and in textual criticism has deepened the study of ancient literature. It would be easy to increase their number by others drawn from comparative grammar, comparative religion, glossography and the many recent developments of archaeology. A typical example of the application of several different lines of inquiry to a literary purpose is W. Warde Fowler's exposition[2] of the *Carmen Saeculare* of Horace and its performance on June 3 17 B.C., which combines the results of his own studies of Roman ritual with the evidence of recent excavation on the Palatine and of the inscription of Augustus (discovered in 1890) recording the celebration and containing the words *Carmen composuit Q. Horatius Flaccus.*

To such indications of growing knowledge perhaps it may be serviceable, so far as the judgment of an individual scholar may be trusted in such a matter, to suggest a few parts of the field of Latin study which seem to have been comparatively neglected in the period under review. Chief among these is certainly the text of *Horace*, where the number of MSS. is very large, and our knowledge of them, both in quantity and quality, lamentably small. Next, the metre and language of *Plautus;* for, despite the work recorded below, no commentator seems yet to have realised the far-reaching effects of the Sonnenschein-Wallstedt[3] discovery of the lawfulness of a spondee, even one whose first syllable bears the word-accent, in the fourth foot of an Iambic Senarius, provided that accent and ictus coincide in the fifth and sixth feet; *e.g.*, in Trinummus, 410,

"Quam si tu obicias formicis papaverem,"

the fourth foot *mícis* is a spondee with the first syllable accented, but is legalised by the coincidence of word-accent and verse-ictus in the quadrisyllable (*papáverem*); a similar solution applies to the corresponding difficulty in Trochaics.

Catullus, Tibullus and Statius, though frequently edited in whole or part, have not yet been adequately handled in the light of our present knowledge, though on Statius much valuable work has been recently done. For a commentary on the *Natural History of Pliny*, that discursive encyclopaedia of ancient learning, the student is often obliged to go far back into the 19th century, or farther still, for even the most obvious kind of help.

Besides actual commentaries, this period has produced a wealth of critical studies, directed to determining as precisely as possible, in the light of all the evidence yet available, what were the actual thoughts and motives of the greatest authors viewed in relation to the history of their times, rather than to

[1] *See* below under D (*New Studies of a Great Inheritance*, c. V.).

[3] Emil Wallstedt, *Studia Plautina*, Lund Univ. Årskrift, 1909. Afd. 1 (esp. p. 89 ff.). E. A. Sonnenschein, *Accent and Quality in Plautine Verse*, Class. Rev. 20, p. 156 (1906).

appraising their merit in the abstract—a vain ambition, responsible for much writing of a type fashionable in the 19th century, which now seems superficial. Contrast, for example, Conington's introduction to his edition of Virgil with that of S.G. Owen to Ovid's *Tristia* (Book 2); or with the series of volumes initiated by Warde Fowler, devoted at first to the interpretation of the *Aeneid*, book by book, and later to other Virgilian topics; such a series could hardly have been projected or published in any earlier epoch of scholarship.

Linked with this interpretative effort has been a desire, manifest alike in Britain, America, France, Italy, Germany, Holland and Scandinavia, to arrive at a clearer conception of the personality of the different authors, a desire more manifest than in any period since the New Learning of the 16th century. Indeed, in this and other ways the enterprising spirit of scholarship in the last quarter of a century has proved itself akin to that of the times of Thomas More, Spenser and Ben Jonson. Another is the multitude of translations of Latin authors begun in this period and still being poured out in many different series, affording no less clear evidence of quickened popular interest in classical study than did, in their own great way, the famous renderings of the Elizabethan era, North's *Plutarch* and Holland's *Livy*, to name no others; and in yet another feature, the abundance of what may be called propagandist literature which has grown up around Latin studies, the work of the 20th century shows a striking tendency to parallel, if not to imitate, the warm-hearted pleading of Roger Ascham or Sir Philip Sidney.

It is well to add that one of the features of the period has been the new organisation of the classical periodicals published in Great Britain; others have been newly established in the United States, Italy, Germany and Sweden. *The Classical Quarterly* had been separated, as an organ of research, from *The Classical Review* in 1906; but in 1910 both became the property of the Classical Assn., a body whose influence has done much to evoke and to guide the active work just described. In 1910 also a concordat was made between that association and the Society for promoting Hellenic Studies and the then newly formed Society for promoting Roman Studies respectively, by which the province of *The Classical Quarterly* was declared to be Greek and Latin language and literature (including texts, manuscripts and Indo-European Philology) approached by all methods save those mainly dependent on architectural remains or other archaeological evidence; whereas all study largely concerned with these was reserved for *The Journal of Hellenic Studies* and *The Journal of Roman Studies* in their proper spheres. This agreement has been happily carried out.

Further, when *The Journal of Philology*, long maintained by the support of the Cambridge Philological Society, was allowed to lapse (in 1920), that support was transferred to *The Classical Quarterly*. The *Review* and the *Quarterly*, with *The Year's Work in Classical Studies*, established by the Classical Assn. in 1906, are managed for it by the Classical Journals Board, on which the philological societies of Oxford and Cambridge are represented. All the Classical periodicals of Great Britain are therefore now conducted on a definite scheme which precludes overlapping. In America, beside the old-established *American Journal of Philology* and *Classical Philology* (a quarterly established in 1907), *The Classical Journal* (appearing in nine months of the year), which was founded in 1905, had by 1916 become the organ of the three powerful associations which now represent Classical studies in nearly the whole area of the United States.

In Italy the *Rivista Indo-Greco-Italica* began in 1916; in Germany *Glotta* (*Zeitschrift für Griech. u. Lat. Sprache*) at Göttingen in 1911; *Die Antike* (at Berlin) in 1923; and *Gnomon* at Berlin in 1924. In Sweden there was founded in 1925 *Litteris, an International Critical Review of the Humanities*, edited by Scandinavian scholars with associates in Germany, Denmark, England and France.

To this brief survey of the general tendencies of Latin scholarship may be added for practical purposes a brief list of the chief contributions to its different branches which have appeared in the period under review. The list is necessarily incomplete, but care has been taken to make it as representative as possible. It is largely based on surveys by Prof. J. F. Dobson and Mr. A. D. Nock in *The Year's Work*, where fuller information will be found.

The following list excludes (*a*) all publications dealing with a portion only of some large work, and (*b*) all new editions of books published before 1911, save a few in either class of exceptional importance.

A. Critical Texts of Latin Authors; and Textual Studies.

1. Five excellent Series, two begun in this period, all continue: (*a*) in the Oxford Bibliotheca Classica, *Livy 1–5* (1914) and *6–10* (1919); R. S. Conway and C. F. Walters jointly (*21–25* in the press); Ovid, *Tristia, Halieutica, Fragmenta*, S. G. Owen (1915); Phaedrus, J. P. Postgate (1919); Statius, *Silvae* (2nd ed., 1918), J. S. Phillimore; *Thebaid* and *Achilleid* (1911), H. W. Garrod; *Tibullus*, J. P. Postgate (1914).

(*b*) In Teubner's texts (many re-edited): *e.g.*, *Apicius*, C. Giarratano and F. Vollmer (1922); *Cato* (1923), G. Goetz; *Livy 41–45* and *Fragments* (1912); W. Heraeus; *Martianus Capella*, A. Dick (1925).

(*c*) In the Corpus Paravianum (Turin): *e.g.*, *Caesar, Bellum Civile* (1916), D. Bassi; *Catullus* (1916) and *Cicero, De Republica* (1916), both by C. Pascal; *Justin* (1921), M. Galdi.

(*d*) In the Collection Budé (Paris): *e.g.*, *Lucretius*, A. Ernout; *Ovid, Ars Amatoria*, H. Bornecque; *Seneca, Consolationes*, R. Waltz.

(*e*) In Hans Lietzmann's *Kleine Texte* (Bonn): *e.g.*, *Cicero Pro Milone*, with Asconius and the Schol. Bobiensia (1911), P. Wessner; *Vitae Virgilianae* (1911), E. Diehl.

2. Single works: *Ovid, Metamorphoses* (Berlin, 1914), H. Magnus. *See* also under B.

3. *Textual Studies: Apuleius*, D. S. Robertson, *Class. Quarterly* (18), 1924. *Ibis*, A. E. Housman, *Journal of Philology*, 35 (1920), p. 287. *Livy;* R. S. Conway, C. F. Walters, J. F. Dobson, A. Kyd, Florence Whitehead, *Class. Quarterly*, 4–2 (1910–8), W. B. Anderson, in *Class. Quarterly*, from 5 (1911) to 11 (1917). *Martial* and *Persius;* A. E. Housman, *Class. Quarterly*, 13 (1919) and 7 (1913); *Thebaid;* E. H. Alton, *Class. Quarterly*, 17 (1923), p. 175. *Thebaid 2*: W. B Anderson, *Class. Quarterly*, 18 (1924), p. 203. *Virgil: Culex*, E. H. Alton, Hermathena, 14 (1920), p. 68 (based on A. E. Housman's "Apparatus Criticus to the Culex," *Camb. Phil. Soc. Trans.*, 7, 1908).

B. Editions with Commentary:

Prose authors: Caesar, *Bell. Gallicum* (Oxf., 1914), T. Rice Holmes; Cicero, *De Divinatione* (Illinois, 1923), A. S. Pease; *Disput. Tusculanae* (Berlin, 1918), M. Pohlenz; *Ad Q. Fratrem* (Leipzig, 1911), H. Sjögren; *De Finibus 1, 2* (Camb., 1925), J. S. Reid; of the great commentary on the whole *Correspondence* (Dublin, 7 vol.), R. Y. Tyrrell and L. C. Purser, the second edition as far as vol. 5 was completed by L. C. Purser in 1915; *Livy 6–8*, O. Rossbach (1925); *Ammianus Marcellinus*, C. U. Clark (1910 onwards); *Asconius* (Rome, 1920), C. Giarratano; Apuleius, *Apologia* (Città di Castello, 1914), G. Marchesi, also (Oxf., 1915), H. E. Butler and A. S. Owen; *Quintilian*, Book 1 (Camb., 1924), F. H. Colson; *Minucius Felix* (Utrecht, 1923), J. Van Wageningen; *St. Augustine, De Civitate Dei* (London, 1924), J. E. C. Welldon.

Poets: Ennius (Cambridge, 1925), Ethel M. Steuart; Lucretius 1 and 2 (Paris, 1925), A. Ernout; and posthumously (Berlin, 1923), H. Diels; Horace, *Odes and Epodes* (Cambridge, 1921), H. Darnley Naylor, also (Berlin, 1917), R. Heinze; *Satires* (Paris, 1912), F. Plessis and P. Lejay jointly; Virgil, *Culex* (Paris, 1912), C. Plésent, *Bucolics* (Paris, 1915), F. Plessis; *Georgics* (Paris, 1915), P. Lejay; *Grattius* (Oxford, 1918), P. J. Enk; *Manilius 1–4* (London, vol. 4, 1921), A. E. Housman, also completely (Amsterdam, 1921), J. Van Wageningen; Ovid, *Tristia* 2, (Oxf., 1925), S. G. Owen.

C. Translations.

1. *Series:* (a) *Oxford Translations, e.g., Catullus* (in English verse, 1924), Sir W. S. Marris. (b) *Loeb Series: e.g.*, Caesar's *Gallic War* (1914), H. J. Edwards; *Cicero's Letters to Atticus* (1914), E. O. Winstedt; *Velleius* (1914), F. W. Shipley; *Apuleius' Metamorphoses* (1914), S. Gaselee. 4. Chronology: *The Chronicle of S. Jerome* (2 vol., London, 1923), J. K. Fotheringham. (R. S. C.)

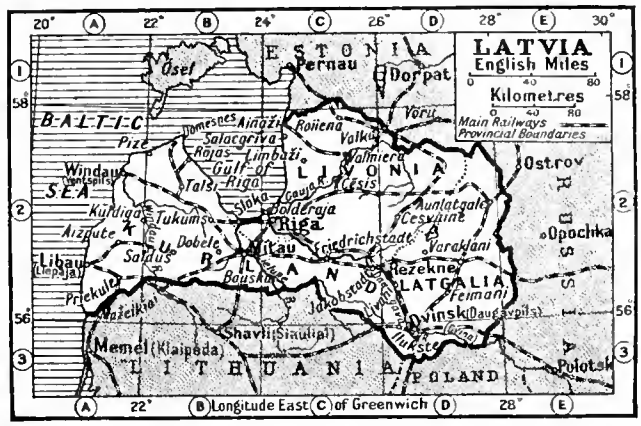
LATVIA.—A Baltic state and a member of the League of Nations. The Republic of Latvia, lying east and south of the Gulf of Riga, was proclaimed on Nov. 18 1918. It embraces the provinces of Vidzeme, Kurzeme, Zemgale and Latgale, covering an area of 24,400 sq. m., with a population of approximately 2,000,000 inhabitants, mostly Lutherans, divided, according to the census of 1925, in the following proportions: Letts 75·93%, Russians 10·28%, Jews 4·5%, Germans 3·4%, Poles 2·5% and other nationalities 3·39%. The principal towns with their populations are Riga, 337,699; Libau (Liepaja), 60,762; Dvinsk (Daugavpils), 40,640; Mitau (Telgava), 28,325; and Windau (Ventspils), 16,384.

I. CONSTITUTION

The Constitution law, passed on Feb. 15 1922, came into force on Nov. 7, on the election of the first Latvian Parliament (Saeima) composed of one Chamber. The supreme executive power is vested in the electorate, which is composed of authenticated citizens of either sex who have attained the age of 21 years.



No lists are made of the electors, and consequently the voters are not bound to wards. The elections are effected by general, equal, direct voting, on the basis of proportional representation. The electorate is entitled (*a*) to elect 100 members of Parliament (Saeima); (*b*) at the instance of the president of the republic to decide, by means of a referendum, upon the dissolution of the Saeima, and thus indirectly on the president's resignation; (*c*) to submit to the Saeima amendments of the constitution or other proposed legislation on the demand of not less than one-tenth of the electorate; and finally, to demand a referendum for the adoption or rejection of bills and legislative resolutions. This right may be exercised in three ways: (1) by the obligatory referendum for proposed amendments to the constitution; (2) by the permissive referendum, in case on his own initiative or on the motion of at least one-third of the members of the Saeima, the president postpones for two months the promulgation of a law passed by the Saeima, and if not less than one-tenth of the electorate demand a referendum; (3) a legislative proposal brought forward by the nation is also put to the public vote if not accepted by the Saeima without alterations in the text.

The Saeima is elected for a term of three years, and its authority expires on the convocation of the new Saeima. The elections take place on the first Saturday and Sunday in Oct., and the new House assembles on the first Tuesday in November. The minority of the Saeima (not less than one-third) may demand the establishment of an inquiry commission and the shelving of a law passed by the Saeima for two months pending a referendum. The president of the republic is elected by the Saeima for a term of three years, with the possibility of being returned for a further period of three years, but his tenure must not exceed six consecutive years. The president has the power of initiating legislation, of granting amnesty rights, he is the chief of the armed forces of the state, and is vested with a suspensive veto right, though he may dissolve the Saeima only after a referendum. He may not be under 40 years of age.

The Cabinet of ministers is the executive organ. The responsibility of the Ministers to the Saeima is formulated in Article 59 of the constitution. The Prime Minister and the members of his Cabinet require the confidence of and are responsible to the Saeima for their official actions. The whole Cabinet must resign if the Saeima passes a vote of censure against the Prime Minister. If a vote of no confidence is passed on one of the ministers, he must resign, and the Prime Minister appoints another person in his stead. By the Cabinet law of April 1 1925, a vote of confidence of the Saeima is required before the Cabinet or a new minister may take up office. The Cabinet has the right in certain cases to proclaim martial law, and to issue emergency regulations. Resort was had to these powers on different occasions in the early days of the republic. The constitution secures freedom of action for the courts of law. The State Control law of Aug. 2 1923, based on paragraph 88 of the constitution provides Latvia with a completely independent and active State Control Department. The constitution of the Latvian Republic does not contain the usual legal guarantees for the citizens, but the right of assembly and the freedom of the Press are guaranteed by special laws which were passed by the first Latvian Parliament. The cultural autonomy of the national minorities has been legalised by the National Council.

II. POLITICAL HISTORY

Latvia's geographical location contributes to its political importance. This constant factor has always influenced the

historical development of the country. Thus an important part is played by Latvia in connection with the problem of the *dominium maris Baltici* in the history of north-eastern Europe. The solution of this problem one way or the other has always affected the political position of the peoples on the Baltic seacoast. In the 9th century the Vikings crossed the Baltic to Russia, in the 12th the Germans proceeded from Bremen and Lübeck to colonise the Baltic coast, establishing a staple market at Wisby (Gothland). By then, the already politically organised Latvian tribes (Kurs, Semgallians, Seli, Talavians, Latgalians), moving seawards, had reached the mouth of the river Dvina and the seacoast, and assimilated the inhabitants of the coast, the Livs (of Finnish origin). The Latvian tribes, however, had not yet crystallised into an organised united state, and, while the Scandinavians were distracted by internal disturbances, the Germans gained a footing in Livonia.

After fighting until about 1450, an episcopal state was founded in conjunction with the Livonian Order, as the precursor of the Federal State of Livonia founded about the middle of the 15th century, and embracing Estonia and Latvia of to-day. The problem of the Baltic Sea was again acute towards the middle of the 16th century, when Moscow turned to the Baltic coast after having destroyed the trade of Novgorod (a Hanseatic creation) and annexed the Ruthenian duchies bordering on Latvia. Then it was that the Hanseatic structure of all the Baltic began to fall, while Germany was in the throes of the reformation movement and Sweden evinced a desire to establish itself beyond the Baltic Sea. Having made a union with Lithuania, Poland too, showed a tendency to expand in the same direction. These conflicting efforts led to a partition of Livonia, and so Estonia became Swedish, Livonia Polish, Pilten in North Courland and the isle of Oesel Danish, while Courland was converted into a duchy under Polish suzerainty, and later became an important state under Duke Jacob, a godson of James I. of England.

Simultaneously with the expansion of Sweden's power, Livonia and Riga were occupied at the beginning of the 18th century, whereby the Swedes contributed largely to the cultural progress of these parts by founding schools, establishing legal and clerical order, protecting the peasantry and translating the Bible. Latgalia alone was left under Polish rule. By then an united Latvian people had evolved out of the separate tribes, though the estate owners were not Latvians. This continued until the beginning of the 18th century, when, in alliance with Poland, Russia undermined Sweden's power and under the Treaty of Nystad, 1721, occupied South Finland, Estonia and Livonia, afterwards turning on Poland and destroying her.

The whole of Latvian territory was united under Russian rule after the partitions of Poland (1772–95). The reforms introduced by the Swedes were rescinded, and the estates which were formerly held in fee became the hereditary possession of the nobility. The position of the peasants grew worse, and repeated revolts ensued. Only in 1807 a law was passed in St. Petersburg giving the peasants hereditary possession of the land cultivated by them on their own behalf. But after Napoleon's downfall, this law was modified to the effect that the landlords retained possession of the land, which the peasants could acquire by purchase only. The landed proprietors, mostly German Balts, also recovered all their feudal privileges, as game and fishing rights, and patrimonial rights. They also enjoyed the sole right to establish industrial enterprises.

This state of affairs lasted till the beginning of the 20th century, and only shortly before the World War was the idea of a limited self-government with the participation of the more important small landowners conceived. During the 19th century the co-operative movement, loan-banks, etc., enabled the growth of a larger and more independent class of Latvian small farmers; the landless proletariat went to the towns and evolved in a revolutionary direction. A Latvian educated class came into being; a Latvian daily press and theatre were founded. A nationalist and revolutionary movement began to grow. The national leaders, A. Kronvalds, K. Valdemars, J. Kalnins, F. Grosvalds and others, received much valuable assistance from some liberal German clergymen. In the Latvian revolution of 1904–5, the first declaration of Latvian independence was made. Russia had to reinstate herself by armed force. She put the revolution down with much bloodshed. There was practically no improvement in the position of the peasants, as not even the Russian conception of self-government (the Zemstvo) was extended to this region (*see* also LITHUANIANS AND LETTS, 16.789).

The War Period.—At the outbreak of the World War, the full force of the attack fell on Latvia and the other frontier regions. In the year 1915 Tsar Nicholas II. permitted the organisation of a national Latvian Army, which subsequently proved to be the foundation of Latvia's political independence. Nevertheless the Latvian nation was subjected to great suffering in consequence of compulsory evacuation to Russia.

After the Russian revolution in 1917 the Latvian Refugees Committee developed into a powerful organisation, and deputed its representatives J. Chakste and Z. A. Meierovics to Stockholm and from thence to Paris, where they took part in the peace negotiations. On Nov. 30 1917, shortly after the Bolshevist revolution, the Latvian National Council, under the leadership of V. Zamuels, was formed in Walk, Riga having been under German occupation since September. The National Council issued an exhortation to the people to make practical use of the right of self-determination proclaimed by President Wilson. The delegations sent to Paris and London were vested with full powers by the National Council in Walk. The Brest-Litovsk Treaty of 1918 was most emphatically rejected by the Latvian National Council. Solemn protest was raised against the dismemberment of the Latvian nation by the then leaders of Germany's eastern policy, which purported to create a Duchy of Courland in personal union with the Kingdom of Prussia, and to make of Livland, Estonia and the adjacent islands a Baltic state under German suzerainty. Latgale was to be ceded to Russia in order to lend another direction to Polish irredentism. Germany's Baltic policy was really introduced by the agrarian regulation of Field-Marshal Hindenburg of July 17 1918 for the colonisation of Courland. A colonisation union, after the German pattern, was formed in Courland, at the disposal of which one-third of the landed property of the Baltic nobility was voluntarily placed. The Hindenburg agrarian order nullified Baltic private rights in respect of land agreements for a period of 30 years, but made no provision for Latvian peasants.

The Allied victory in the autumn of 1918 frustrated these plans. The Democratic Bloc led by K. Ulmanis was formed in Riga, and pursued the aims of the National Council in Walk. After the collapse of German power in the Baltic, the Democratic Bloc gained a firmer footing and by Nov. 18 1918 the members of the Refugees' Committee in Petrograd and those of the Walk National Council had arrived in Riga. The All-Latvian National Council was composed of representatives of the peasantry, of the workmen, making together two-thirds, while the last third was made up of the representatives of Latvian merchants and manufacturers, house-owners and national minorities, of whom the representatives of the liberal Balts were particularly active.

Independence.—The *de facto* recognition of the Latvian National Council by Great Britain on Nov. 11, and shortly afterwards by other Powers, led to the solemn proclamation of the Latvian Republic on Nov. 18 1918. A provisional government was formed under K. Ulmanis pending the convocation of a Constituent Assembly. J. Chakste, a barrister and former Latvian deputy in the Russian Duma, was elected president of the National Council, then president of the Constituent Assembly and eventually by the Parliaments of 1922 and 1925, president of the republic.

The Provisional Govt. was practically penniless, and lacked military power. The Latvian regular troops, left in the lurch by the Russians, had retreated before the advancing Germans from the Dvina front to Russia, where their sense of discipline was exploited by successive governments. Only after the conclusion of the Latvo-Russian peace treaty in 1920 were they able to return home. The work of national organisation was

interrupted by Bolshevist invasion until May 22 1919. The Provisional Govt. and the National Council retired, under Bolshevist pressure, to Libau, where they held their ground with the help of troops mobilised in Courland. A Latvian Army was formed, commanded first by Col. Kolpaks, and after his death by Col. (General) Balodis. The German-Baltic Landeswehr also joined the anti-Bolshevist front. Libau was then the seat of the German occupation administration under Gen. von der Goltz. The social democrat Winnig functioned as representative of the German Government. Amidst these chaotic conditions the German "Putsch" of April 16 1919 was foiled in the attempt to overthrow the Cabinet of K. Ulmanis.

The loyal forces, with the Baltic Landeswehr, advanced against the Bolsheviks, liberated Riga on May 22 1919 and pursued the enemy to the Russian frontier. Similar operations were conducted in North Livland by the North Latvian Army under Col. Semitan, with whom the Estonians sided against the Bolsheviks. After the failure of the second adventure of the German Balts near Wenden, the Provisional Govt. headed by K. Ulmanis returned to the capital on July 7 1919 and resumed the work of organising the state, despite the obstacles presented by a continuous state of war. The complete repulse of the Bolshevists would have been effected much sooner had Riga not been attacked on Oct. 8 1919 by the "Bermondt-Avalov" troops, composed of Russians and Germans in disguise, instigated by the Baltic nobility. This invasion from the direction of Lithuania and Courland was liquidated by the end of Nov. 1919 with the help of British and French naval artillery. Latgale was liberated from the Bolshevists in Jan. 1920 by combined Polish-Latvian action; all Latvian territory was now free. With Germany, which had assumed the protection of the Bermondt troops, an agreement was made on July 15 1920 for the resumption of normal relations. Peace was concluded with Russia on Aug. 11 1920.

Meanwhile the Latvian Constituent Assembly had met on May 1 1920 and elected Mr. J. Chakste to the presidency. The Constituent Assembly, summoned by general vote, passed the Agrarian law of Sept. 16 1920, which liquidated the system of big landed properties, and placed the expropriated land at the disposal of a special land fund. The landlords were left in possession of a certain portion of their estates, not larger than 50 hectares, with live stock and inventory. The law limits the area of the new farms to 22 hectares. In this way the number of small farms was increased to over 200,000 and the state was placed on a firm social basis (*see* FINANCIAL AND ECONOMIC HISTORY, below). Many other important laws were passed, *e.g.*, the Free Port Law of May 20 1920.

Political Parties.—The first Latvian Parliament, which met on Nov. 7 1922, consisted of 62 non-Socialist and 38 Socialist members. In the second Parliament, elected in Oct. 1925, there were 63 non-Socialists, and only 37 Social Democrats, four of whom belong to the Revisionist branch. Communism is weak in Latvia, and is legally banned. The non-Socialist deputies are divided among several parties. Many non-Socialists are returned by the peasantry. In the second Parliament, for instance, the Farmers Bloc, including representatives of the so-called Young Farmers, was 27 strong. The townspeople elected representatives of the middle classes, besides the Social Democrat deputies. There is also a conservative representation originating from the parishes. The number of parties is partly due to the system of proportional representation, which entitles every 100 electors to add to the list of candidates. Moreover the minorities form national groups in Parliament. In the second Parliament there were 5 Germans, 5 Russians, 2 Poles, 4 Jews.

The Social Democrats adhere to the Second International, and stand for the promotion of industry, protective labour legislation, and the international neutralisation of Latvia. The Farmers' Union stand for development of agriculture, for protective duties, amelioration credits, restoration of the devastated regions, in general for intensifying agriculture, and for efficient means of defence, civil order, property rights and, politically, for a union of the Baltic States. The Democratic Centre share radical democratic views based however, on the sovereignty of the state. The groups of the Right, for example, the National Christians, are strongly clerical. Another section represents trade and industry. The different Latgallian parties present a variety of local demands, though they side with the corresponding Lettish parties in questions of general State policy. In ecclesiastical matters certain groups of the Left demand the separation of the Church from the state and the cessation of the state subsidy to the Church. The racial minorities make special demands, the Jews asking for extensive modifications in the law regarding citizenship, while others watch the interests of the landowners dispossessed under the Agrarian Reform laws.

Foreign Relations.—In the sphere of foreign policy the idea of a Baltic States Union is predominant. The so-called "small" programme seeks a union with Estonia and Lithuania—a lesser group advocating a Baltic Union embracing Finland and Poland. Towards proposals for a four-state-union excluding Poland, Finland maintains an attitude of reserve. In accordance with the Latvo-Estonian Treaty of Nov. 1 1923 negotiations were undertaken for a Customs Union between these two states. Latvia also entered into a defensive alliance with Estonia. No passports or visas are required for nationals crossing the Latvo-Estonian frontier. Negotiations with Poland led only to the conclusion of a consular convention. With Finland, as with the Scandinavian states, a treaty of commerce has been concluded, together with an arbitration agreement which was signed by the representatives of Latvia, Estonia, Finland and Poland at the conference of the Baltic states in Helsingfors in 1924. Latvia has also entered into a number of trade agreements and legal protection treaties with the European Powers, in particular a Treaty of Commerce and Navigation with Great Britain on July 22 1923, a trade convention with France on Oct. 29 1924, as well as trade agreements with Switzerland, Czechoslovakia, Turkey, Hungary, Austria, Japan, Belgium, Italy and the United States. In its trade agreements Latvia makes provision for the so-called Baltic and Russian clause, reserving the possibility of closer economic contact with the Baltic states and the development of transit traffic with Russia, which was facilitated by the technical agreements concluded in Aug. 1924. Relations with Russia are good and becoming more and more normal.

Latvia joined the Permanent Court of International Justice at The Hague, and couples the conclusion of trade agreements with the signature of legal protection and arbitration conventions. Negotiations for an economic treaty were begun with Lithuania on May 19 1924. With Germany an agreement was reached in principle regarding an arbitration convention and mutual settlement of claims.

As Latvia was recognised *de jure* by the Great Powers on Jan. 26 1921, and admitted to the League of Nations on Sept. 22 of the same year, diplomatic relations are maintained with the corresponding states. A concordat was signed with the Holy See on May 30 1922.

III. ADMINISTRATION, EDUCATION, ETC.

There are some 6,000 state officials. Teachers, judges, foresters, railwaymen, the agents and employees of government enterprises and monopolies are paid by the state. The Latvian Army is directed by experienced staff officers and graduates of the Riga Officers' School, who complete their military education in France and in Poland. Apart from the regular army there is a territorial voluntary defence force, divided into regiments and companies after the model of the Finnish Defence Corps. The Latvian Defence Corps include cavalry and cyclist companies. Military games and rifle clubs are also popular. The young people receive military training, and the Boy Scout movement is well developed in Latvia.

The whole country is divided into 19 administrative districts and 3 prefectures: Riga, Libau, Daugavpils. Extensive autonomy is granted to the towns and parishes. The smallest units of rural self-government are the rural communes, of which there are about 510 in all. Markets are held in 80 towns and villages, 37 of these having town councils.

Justice.—The administration of justice is entrusted to the justices of the peace, four district courts, the Court of Appeals and the Senate. The judges cannot be dismissed from office. The old local Baltic provincial law is still in force; and in Latgale the Russian law in part, pending codification. As the constitution provides only for a single legislative Chamber, the Saeima, the functions of a second Chamber are to some extent fulfilled by various committees in the different departments, as, for example, the financial council attached to the Ministry of Finance, the Agricultural Council to the Ministry of Agriculture, special committees for music, theatres, etc., attached to the Ministry of Education, and so forth. Civil interests are protected by numerous recognised associations, as chambers of commerce, guilds, etc.

Vital Statistics.—The bulk of the population of Latvia are engaged in agriculture, only 35% of the population being urban. 41,172 births and 28,399 deaths were registered in 1924.

Co-operation.—The co-operative system is widespread and both consumers' and agricultural societies are largely developed. The system of social clubs and unions is extensively adopted in rural districts, and is generously supported by the so-called Culture Fund created by levying a 3% tax on railway tickets. It has thus been possible to establish public libraries, co-operative houses, etc., in the country. Education is further promoted by an itinerant theatre, several provincial theatres, and an opera house in Libau ranking second to the National Opera House in Riga.

Education and Culture.—School attendance is compulsory in Latvia. In addition to the public elementary schools there are secondary schools, commercial colleges, several language institutes, and other advanced and specialised educational institutions. Illiterates form only 8·5% of the population, and for every 100,000 of the population there are 300 university students. The study of German or English is compulsory in the middle schools, German holding the first place; French and Russian are optional. Due encouragement is also given to the elementary and middle schools of the national minorities in the form of state grants to German, Russian, Jewish and Polish schools.

IV. FINANCIAL AND ECONOMIC HISTORY

Latvia lost nearly 40% of her population in the World War, mainly by emigration in consequence of the German invasion. Hardly 300,000 have returned out of the refugee population of 1915–7. The greater part of the missing, near 650,000, perished. Almost all the industries and the industrial population were evacuated to Russia; 10,000 farms were utterly destroyed. Machinery and equipment of industries employing over 100,000 factory hands were sent to Russia in 20,000 railway trucks. Of these the Bolshevists have restored barely 200 trucks under the Peace Treaty of Aug. 13 1920. In Courland the population and cultivated areas at the time of the German occupation, 1915 to 1918, had diminished to one-third. Over half of the farms were destroyed or stood empty.

Production—Cultivated Areas.

	1909–13 hectares	1920 hectares	1924 hectares
Rye	351,000	196,000	266,000
Wheat	33,000	16,000	43,000
Barley	191,000	124,000	179,000
Oats	306,000	216,000	334,000
Mixed grain	..	46,000	77,000
Peas	23,000	20,000	39,000
Potatoes	80,000	49,000	75,000
Flax	70,000	30,000	60,000

The total cultivated area was thus in 1924, except for mixed grain, 996,000 hectares, *i.e.*, 5·2% less than in 1909–13.

The harvests were:—

	1909–13 metric tons	1920 metric tons	1924 metric tons
Rye	325,000	119,000	199,000
Wheat	38,000	11,000	43,000
Barley	173,000	66,000	162,000
Oats	279,000	113,000	271,000
Mixed grain	..	29,000	76,000
Peas	18,000	13,000	35,000
Potatoes	639,000	375,000	676,000
Flax (fibre)	30,000	10,000	25,000
Flax (seed)	25,000	10,000	26,000

The grain harvest, apart from mixed grain, reached 833,000 metric tons in 1909–13, in 1920 only 322,000, in 1924 only 710,000. Only the potato harvest reached its pre-War figure, the linseed crop was the same, the flax fibre one-sixth less. Four-fifths of the flax fibre harvest is exported.

Finances.—When the Latvian Republic was formed on Nov. 18 1918, the country was greatly impoverished owing to the requisitioning of corn, cattle, horses, etc., by the German armies of occupation, though part of the supplies which could not be carried away were sold back to the peasants on the evacuation of the troops. In April 1919, a new paper currency, the Latvian rouble, was issued by the Govt., which continued for a considerable period to finance its requirements by this means, with the result that the exchange in terms of sterling rose from 215·5 roubles on Jan. 1 1920, to 2,000–2,400 roubles in May, 1921. After the demobilisation of the army in the autumn of 1920, the fresh issues of currency were mainly for production purposes, and flax, hides and linseed were purchased by this means from the peasants. The sale of the stocks thus acquired brought in 2,000,000,000 paper roubles to the state and enabled the Finance Minister in office in March 1921, Ringold Kalning, to raise the value of the rouble to 1,140 to the pound sterling, at which point it was stabilised. The currency was backed by gold to the value of 15,000,000 gold francs and by foreign balances amounting to 7,730,000 gold francs. The lat (=gold franc) was fixed at a value of 50 paper roubles, and the 2,270,000,000 paper roubles in circulation were thus covered to the extent of about 50% in gold. In 1923 the Bank of Latvia was founded and provided by the state with a capital of 10,000,000 lats.

The total foreign debt amounted to 39,360,000 lats in the middle of 1922, of which one-third had been paid off by the middle of 1925. At the end of 1925 there remains a debt of 5,500,000 dollars to the United States for famine relief in the summer of 1919, and of about £1,350,000 newly regulated debt to England for War deliveries. The finances in the last three years have been very soundly handled; not only has the foreign debt been considerably reduced, but loans to the value of 30,000,000 lats were made from current revenue. The Budget of 1925–6 provides for further loans amounting to 35,000,000 lats from current revenue for agricultural purposes and for the construction of railways. The actual revenue for 1924–5 amounted to 215,680,000 lats and expenditure to 214,000,000. The Budget for 1925–6 balances at 160,000,000 lats (excluding railway receipts and the expenses of the spirits monopoly).

Trade.—Latvia's trade balance has been adverse since 1920. The official figures showed the following results:—

Calendar year	Imports (In millions of gold lats)	Exports (In millions of gold lats)
1920	97·0	62·3
1921	73·4	28·9
1922	107·4	102·0
1923	211·9	162·0
1924	256·4	170·6

But an inquiry undertaken by the Latvian "Ekonomists" in 1925 No. 22 showed that the import figures were 10% too high.

Taking into consideration the circumstance that the 221,000 refugees who had returned since the middle of 1920 had brought back at least 33,000,000 lats, that moreover the Letts who had emigrated to America had remitted at least 33,000,000 to Latvia, that goods in transit to Soviet Russia brought in 18,000,000, that unregistered exports amounted to about 40,000,000, etc., the "Ekonomists" reckoned that the balance of payments to Jan. 1 1925, in reality showed a surplus of 3,000,000 lats in favour of Latvia. The present writer considers, after comparing the figures of the Latvian exports and those of English statistics of imports, that the Latvian export figures are about 10% too low, so that in reality a surplus of about 55,000,000 lats would result in the Latvian balance sheet from 1920 to Jan. 1 1925. In the year 1925, the imports, according to official statistics, amounted to 280,000,000, the exports to 179,600,000 lats.

By reducing the import figure by 10%, and raising the export figure by 10%, the adverse balance is reduced from 70,000,000 to 41,000,000 lats. But unsold imported goods valued at 70,000,000 are said to be in Latvian warehouses. Meanwhile the adverse balance has created such anxiety, that Parliament decided in 1926 to increase the existing high customs duties of 20% to 100%.

Latvia's chief exports are timber amounting to about 60,000,000 lats, about four-fifths of which goes to England, and flax export amounting to about 20,000 tons, valued at 50,000,000 lats. In the calendar year (1925) the butter export was estimated to be 7,150,000 kilogrammes, valued at 30,300,000 lats.

The chief imports are textiles, 50,000,000 lats, machines 24,000,000, foodstuffs 70,000,000. In 1924 110,000 tons of rye and wheat were imported, 20,000 tons of sugar, 4,000,000 lats worth of tobacco. The imports of tea and coffee are small, also of fruits, on account of the high customs duties.

Agrarian Reform.—Under the agrarian laws, 499 private estates were appropriated in Courland with an area of 1,124,000 hectares; in Livonia 1,300,000 hectares; in Latgale about 750,000 hectares. But from this area must be deducted the old peasant properties, also forest and uncultivable land. In reality there remained for division among the newly established peasant properties in Livonia and Courland only an area of 832,000 hectares of agricultural land, *i.e.*, arable, meadow and grazing land, in Latgale rather more than 250,000 hectares. Up to June 15 1925, 82,761 new farms were established, enclosing 100,000 hectares of forest land. The newly founded peasant properties consisted of 15 to 17 hectares, the largest to 22 hectares. But included in the above-mentioned 82,761 new farms are about one-third garden and artisans' holdings with an area of about 2 to 3 hectares. A further 20,000 small holdings are to be established. The state has retained about 1,500,000 hectares of forest and about 500,000 hectares of uncultivable land, chiefly peat moor; the former landowning nobility have only retained 50 hectares of land each.

LAUE, MAX VON (1879–), German physicist, was born Oct. 9 1879 at Pfaffendorf near Coblenz. He attended the universities of Strasbourg, Göttingen and Munich, and became an assistant in the University of Berlin, and later in Munich, being subsequently called to the University of Zürich as professor. From here he went to the newly formed University of Frankfurt (on the Main), finally proceeding to Berlin University as a director of the Institute for Theoretical Physics. He specialised in theoretical physics, and is regarded as one of the most zealous champions of modern theories, and especially of Einstein's theory of relativity. He also devoted his attention to the quantum theory, to the Compton-effect (alteration of the frequency of Röntgen rays), to Bohr's atomic model, to the "Einstein-Bohr equation" and the disintegration of atoms. In 1914 he was awarded the Nobel prize for physics. Besides his work for scientific publications, he also writes for the daily Press.

Since 1910 he has published the following books: *Ueber e. Versuch z. Optik d. bewegten Körper* (1911); *Die Beugungserscheinungen an vielen unregelmässig verteilten Teilchen* (1915); *Ueber d. Möglichkeit neuer Versuche an Glühelektroden* (1919); *Die Relativitätstheorie* (1919); *Ueber d. Auffindung d. Röntgen-strahlinterfereuzen* (1920); *Das physikalische Weltbild* (1921); *Die Bedeutung d. Nullkegels in d. allgemeinen Relativitätstheorie* (1922); *Die Lösungen d. Feldgleichungen d. Schwere v. Schwarzschild* (1923); *Zur Theorie d. v. glühenden Metallen ausgesandten positiven Ionen und Elektronen* (1924); and with Dr. W. Gordon, *Ein Verfahren z. Bestimmung d. Wärmeleitfähigkeit bei Glühtemperaturen* (1922).

LAUNDRY WORK (*see* 16.282).—Modern laundry work in its commercial aspect requires an elaborate mechanical plant very different from the crude appliances which were the first outgrowth of domestic processes of treading, pounding or rubbing. Its success owes much also to chemistry, by which suitable soaps, bleaches and solvents have been evolved.

Machinery.—The washing-machine consists of a horizontal outer drum in which revolves the inner cylindrical cage which holds the clothes. This cage is divided into compartments of various sizes, thereby offering a chance for sorting the clothes and so reducing, or almost eliminating, the need of marking garments. Within each compartment, wash bags, "nets," are frequently used to hold fabrics of the same kind, thereby safeguarding delicate garments. The machine is equipped with hot and cold water and high-pressure steam, the latter serving as a heating as well as a sterilising medium. With the rotation of the cage, which is reversed by automatic gearing every few revolutions, the clothes are rubbed or pounded, producing a displacement of dirt through the soap and water which are forced through the fabric. The operations of soaking, washing, bleaching (when needed), sterilising, rinsing, blueing and even starching, are done in the machine without removal of the garments and often without inspection during the process. Sterilising was formerly accomplished through boiling (212° F.), a process which, due to its tendency to weaken the fabric, has been replaced by keeping the garments at about 180° F. for a time sufficient to effect the result. Stains insoluble by soap and water require special chemical cleansing (*see* DRY CLEANING).

The process of drying, formerly accomplished by twisting by hand or pressing between hard rubber revolving wringers, is effected industrially by machines which in recent years, have been adapted for use in the home (*see* HOUSEHOLD APPLIANCES). The extractor consists of a metal basket revolving in a closed outer drum. There are two types, the "under-driven" and the "over-driven." The latter is used for the heavy-type work like the wet-wash or bundle work. The basket makes 1,000 to 1,400 revolutions a minute, the water being expelled by centrifugal force until the desired degree of dryness is attained. The drying is completed by means of box dryers, which, in their more improved form, consist of a heated revolving cage, called a tumbler, within which hot air is agitated by means of suction fans and blowers. This device prevents the yellowing and scorching of fabrics through excessive heat and eliminates the adherence of lint to the clothes. A softer finish also is imparted by this means to woollen garments and the time required for finishing is greatly reduced.

Ironing.—Having been washed, starched and dried, the garments are then transferred to the ironer. The earlier form of ironer was the box mangle, by which clothes were calendered as in paper or textile manufacturing. This mangle, sometimes known as the "flat-work ironer," has been replaced in more up-to-date laundries by gas and steam-heated revolving rolls, which press against concave beds of polished metal or over-felted rolls, as a flat iron is used on a padded ironing table. Ironers may be operated by hand, gas, gasolene, electricity or steam. While it was formerly customary for laundries to charge for work by the piece, a "rough dry" service has been widely offered, in which the cost is based on weight, none of the work being ironed. Another service is "float iron," in which everything is pressed by the "flat-work ironer," the cost being considerably less than for work finished by hand.

Statistics.—The annual volume of business done by laundries in the United States in 1923–5 was between $300,000,000 and $500,000,000. The production of laundry machinery in 1923 was valued at $19,000,000, an increase of 46% over the corresponding figure for 1921. In the same period the output of home washing-machines increased 69%, standing at $57,000,000 in 1923. These increases reflect several economic and social factors, the more important being an increase in wealth and the scarcity of domestic help, both of which have operated to transfer laundering from the home to central plants. The same factors have led to the installation of numerous electric washers and ironers in the home. The popularity of light, delicate fabrics in women's garments together with the lavish use of colour have placed an added burden on laundries, making necessary the services of textile experts. The interests of the industry are furthered by laboratories, research bureaux and professional schools financed by the trade. Trade papers, courses in technical schools, co-operation among operators, and other factors have done much to improve the status and efficiency of the industry.

LAURIER, SIR WILFRID (1841–1919), Canadian statesman (*see* 16.286), was defeated at the general election in 1911, but remained leader of the Opposition until his death. Previous to the dissolution of Parliament in 1911, he had begun negotiations for reciprocity with the United States which was vigorously opposed in the Dominion House of Commons, and was, in a manner, responsible for the fall of his party. The Banking Act introduced by the Conservative party was much on the same lines as that outlined by Sir Wilfrid during the last years of his administration. In the prolonged naval debate in 1913 Sir Wilfrid urged the maintenance of a purely Canadian Navy. At the outbreak of the World War in 1914 he eloquently defended Great Britain's cause and supported the urgent measures that were adopted for the maintenance of the Canadian troops. He was however strongly opposed to conscription on the ground that it was a departure from the enactments of the Military Service Act, and a still wider departure from the principles of constitutional government. When Sir Robert Borden was invited to attend continuous meetings of the War Cabinet in London, Sir Wilfrid expressed his desire to facilitate public business in Canada in order to make the absence of the Premier possible. He declined, however, to enter the Cabinet in the Coalition Government. In 1918 Sir Wilfrid took part in the debate on hereditary titles and honours in Canada and was pronounced in his utterances against them. He died in Ottawa Feb. 17 1919.

LAUSANNE, CONFERENCE OF:—The Conference of Lausanne, between the Turkish Govt. established at Angora, and the gov-

ernments of the four principal Allied Powers (Great Britain, France, Italy, Japan), Greece, Bulgaria and Yugoslavia, with the United States represented by an observer, lasted, with a break in the middle, from Nov. 20 1922 to July 24 1923, and resulted in the signatures of no less than 17 diplomatic instruments.

The most important of these were:—

1. The Treaty of Peace itself (July 24 1923).
2. Convention respecting the régime of the Straits (July 24 1923).
3. Convention respecting the Thracian frontiers (July 24 1923), under which neutralised and demilitarised zones were established.
4. Convention respecting conditions of residence and business and jurisdiction in Turkey (July 24 1923), to replace the capitulations.
5. Commercial convention (July 24 1923).
6. Convention respecting the exchange of Greek and Turkish populations and protocol (Jan. 30 1923).
7. Greco-Turkish agreement on the restitution of interned civilians and the exchange of prisoners of war (Jan. 30 1923).
8. Declaration relating to the administration of justice (July 24 1923) to replace the capitulations (No. 11).
9. A protocol relating to the evacuation of the Turkish territory occupied by the British, French and Italian forces, and declaration (July 24 1923) (No. 14).
10. Protocol relating to the Karagach territory, and to the islands Imbros and Tenedos (July 24 1923) (No. 15).
11. Protocol relating to treaties regarding the protection of minorities in Greece, and regarding Thrace, which had been concluded on Aug. 10 1920 between Greece and the principal Allied Powers (July 24 1923) (No. 16). (*See* DARDANELLES; DEDEAGAACH; MOSUL; TURKEY.)

Conditions before the Conference.—The Lausanne Conference took place under conditions quite different from those which had prevailed during the Peace Conference of Paris, and the resulting diplomatic instruments therefore bore a different stamp from the four European peace treaties and the instruments subsidiary to them. At the time of the Paris Conference the Powers just defeated in the War of 1914–8 had been temporarily impotent, and the victorious Powers had agreed among themselves as to what the terms of peace should be. The draft treaties embodying inter-Allied agreements had simply been submitted to the defeated Powers for their observations, which the victors had then accepted or rejected at their discretion, after which the vanquished parties had been compelled to sign the instruments by *force majeure*. At the conference of San Remo (*q.v.*) a peace treaty between the Allies and Turkey had been drawn up by the same procedure, and after the representatives of the Ottoman Govt. of Constantinople had submitted their observations, and these observations had been rejected, they were compelled, at Sèvres, on Aug. 10 1920, to sign the terms presented to them. By this time, however, the Constantinople Govt. had ceased to exercise any authority in Turkey outside the narrow areas under the military occupation of the principal Allied Powers. The greater part of the country was under the effective control of a new national government seated at Angora; and this Govt. was carrying on a war against the Greeks (who had landed at Smyrna on May 16 1919, at the invitation of Great Britain, France and the United States).

The Angora Govt. repudiated the Treaty of Sèvres, and continued to fight for the terms laid down in the Turkish National Pact of Jan. 28 1920. In Sept. 1922 the Greco-Turkish War in Anatolia was brought to a decision by the complete victory of the Turkish Nationalist forces, who drove the Greeks into the sea, and came into direct contact with the British forces in the zone of the Straits. On Sept. 23 1922 the principal Allied Powers invited the Angora Govt. to a peace conference on two bases: (1) the restoration of Turkish sovereignty over Constantinople and Thrace up to the line of the river Maritsa; (2) the exclusion, pending the final settlement of Turkish military forces from Thrace, and respect by the Turks for certain zones adjoining the Straits which the Allied authorities had declared neutral during the Greco-Turkish conflict. On Sept. 23 the Angora Govt. accepted this invitation, and proposed a preliminary armistice conference, which met at Mudania on Oct. 3 and resulted in the signature of an armistice convention on the 11th.

Results of the Conference.—Thus the Turkish delegates came to Lausanne as victors in their recent local war with the Greeks, and on an equal footing with the principal Allied Powers, by whom they had been defeated four years earlier in the War of 1914–8. Indeed, during the whole period of the Lausanne conference, the Turks were less unwilling to resume hostilities than were the principal Allied Powers, who had long ago demobilised the greater part of their forces in the East under pressure from their taxpayers, and who could now no longer call upon the Greeks to fight their battles for them. This complete reversal of the situation reflected itself in the contrast between the terms of the Treaty of Lausanne and the Treaty of Sèvres, as well as in the method by which the Lausanne conference was conducted. This conference was noteworthy as the first meeting between ex-allies and ex-enemies in the World War, in which peace was negotiated and not dictated. In this respect it anticipated the London reparations conference of 1924 and the Locarno security conference of 1925.

The Turkish Gains.—In brief, the Turks secured at Lausanne practically everything which they had demanded in their national pact. In respect of territorial boundaries, the former Arab provinces of Asiatic Turkey, which had been detached from Turkey as a result of the World War and had been mandated to France and Britain under the supervision of the League of Nations, were not restored, but otherwise Turkey recovered everything which she had possessed in 1914, particularly Smyrna, Constantinople and Eastern Thrace. Even as regarded the Arab territories, she obtained some concessions, since the Lausanne Treaty confirmed the rectification of the northern frontier of Syria in Turkey's favour, which had been made by the so-called "Franklin-Bouillon" Agreement of Oct. 20 1921, while the destiny of the Mosul province was referred, by agreement between Turkey and Great Britain, to the League of Nations. In regard to the Dardanelles and the Bosporus, the settlement made at Lausanne has been described elsewhere (*see* DARDANELLES). The special spheres of influence in Anatolia which had been assigned to France and Italy by a tripartite agreement of Aug. 10 1920, between those two Powers and Great Britain, were tacitly dropped, and there was no further question of giving autonomy to Northern Kurdistan or of ceding Turkish territory to the Armenian Republic of Erivan, which had now been included in the dominions of Turkey's ally, the Union of Socialist Soviet Republics.

Again, no restrictions were imposed on the Turkish naval and military forces, and no control was asserted by the Allies over Turkish finance, though certain financial questions, such as the rate of exchange at which the pre-War creditors of Turkey were to receive payments, remained contentious. The capitulations under which foreign residents in Turkey had lived since the 16th century were swept away, and the only special safeguard left to foreigners was the institution of legal councillors, without executive power, who were to be nationals of ex-neutral states. As for such minorities as remained in Turkey after the great exodus of Christians from Anatolia and Eastern Thrace which accompanied the Greek débâcle of 1922, it was settled at Lausanne that they should receive all, and only, the guarantees which had been secured to minorities in Europe in the special minority treaties or minority clauses in the peace treaties signed after the World War. Meanwhile, on Jan. 30 1923, the Greek and Turkish delegations had signed a separate convention providing for the compulsory interchange of minorities left on the wrong side of the new frontier, with a special exemption in favour of Christians domiciled in the city of Constantinople, and of Moslems domiciled in Western Thrace.

LAVERAN, CHARLES LOUIS ALPHONSE (1845–1922), French physician, was born in Paris June 18 1845 and was educated at the Strasbourg faculty of medicine. In 1874 he joined the staff of the Val-de-Grâce military school of medicine, and four years later was sent to Algeria. He remained there until 1883 and in

1884 was appointed professor of military hygiene and clinical medicine at Val-de-Grâce. In 1894 he relinquished these posts and took up work at Lille and Nantes. He was in 1895 elected a member of the French Academy of Science. His chief contribution to medical science was his discovery of the *hématozoaire*, a parasite that causes malarial fever. He was the author of important studies of sleeping sickness and of the rôle played by mosquitoes in epidemics. Laveran, who retired from active practice in 1897 and received the Nobel Prize for medicine in 1907, died in Paris May 18 1922.

His works include *Traité des maladies et des épidémies des armées* (1875); *Du Paludisme et son hématozoaire* (1891); *La prophylaxie du Paludisme* (1903); with Félix Mesnil, *Trypanosomes et trypanosomiases* (1912).

LAW, ANDREW BONAR (1858–1923), British statesman, was born in New Brunswick, Canada, Sept. 16 1858, the son of a Presbyterian minister, the Rev. James Law, by his marriage with Eliza, daughter of William Kidston of Glasgow. A Scot on both sides, he came to Scotland when still a boy and finished his education at Glasgow High School. He entered at once into commercial life in Glasgow, and became a member of a kinsman's firm, William Kidston and Sons, iron merchants, subsequently joining William Jacks & Co., also iron merchants. After acquiring a sufficient competence in business, he went into Parliament in 1900 as Conservative member for the Blackfriars division of Glasgow.

His commercial experience had led him to the conclusion that free trade, in the Cobdenite sense, was no longer beneficial for Great Britain. A speech which he made on April 22 1902, in favour of Hicks-Beach's corn duty, having favourably impressed the House, he was promptly appointed parliamentary secretary to the board of trade in the Conservative Government. When Mr. Chamberlain started his tariff reform movement in 1903, he found a warm supporter in Mr. Law, who wished to see more raw material imported and fewer manufactured goods, who resented "dumping," and who held the true field of commercial expansion to be within the Empire and therefore advocated preferential duties. Mr. Law shared in the general rout of the Conservatives in Jan. 1906, and had another electoral mishap in Dec. 1910; but in each case came back to the House shortly at a by-election, and took his full share in the Opposition attack on Mr. Lloyd George's 1909 budget and on the Parliament Bill. He kept aloof from the "Die-hard" movement, and warmly defended his leader, Mr. Balfour, from the reproaches cast upon him. This loyal attitude, no doubt, was one of the reasons, and his strong Tariff Reform programme was another, which recommended him to his party as Mr. Balfour's successor in the leadership when the claims of Mr. (afterwards Sir) Austen Chamberlain and Mr. (afterwards Lord) Long appeared to divide the Conservatives pretty evenly. Both the rivals stood aside, and on Nov. 13 1911 Mr. Law was unanimously elected leader in the Commons, Lord Lansdowne continuing to lead the party in the Lords.

As Opposition leader, Mr. Law was very trenchant in his criticism of the Government, and put up a strong fight against the ministerial bills introduced to take advantage of the Parliament Act, his principal concern being the Home Rule Bill, and the situation created in Ireland by its introduction. At Easter 1912 he went to Belfast, and, at a great demonstration presided over by Sir E. Carson, encouraged the Ulstermen to trust to themselves; and at a large Unionist gathering at Blenheim on July 27 he said that the Ulster people would submit to no ascendancy, and that he could imagine no lengths of resistance to which they might go in which he would not be ready to support them, and in which they would not be supported by the overwhelming majority of the British people. Meanwhile, he had to deal with differences inside his own party as to the extent to which the Tariff Reform policy should be carried. A considerable section, especially strong in Lancashire, were definitely against any duties on food; and the assurances which Mr. Law gave in a speech at Ashton-under-Lyne on Dec 16 1912 did not convince them that there was no possibility of food taxes being imposed without reference to the people. As the party dreaded a split, Mr. Law and Lord Lansdowne, in response to a general appeal, gave on Jan 14 1913 a formal promise that food duties should not be imposed without the approval of the electors at a subsequent general election. The imminent danger of the Ulster problem, on which Mr. Law had insisted for two years, brought ministers in 1914 to express a readiness for compromise; but no settlement, satisfactory to the Opposition, had been formed when the World War supervened.

Directly the crisis became acute Mr. Law wrote, on Sunday Aug. 2, on behalf of Lord Lansdowne and their colleagues, tendering to Mr. Asquith the unhesitating support of the Opposition in any measures necessary to support France and Russia; and when hostilities began he aided the national cause and promoted recruiting by speeches at the Guildhall, London, and in Belfast and elsewhere. Even when criticism of the management of the War began legitimately to spring up in the early months of 1915, he used his influence to repress or moderate its expression in Parliament. He promptly accepted Mr. Asquith's proposal in 1915 to assist in forming a Coalition Govt. and brought seven of his colleagues into the Cabinet, accepting himself the Colonial Secretaryship. He took charge in the House of Commons of the first military service bill in Jan. 1916 and got it through all its stages with little difficulty. He promoted the economic conference in Paris in June 1916 and, as principal representative of his country, was largely influential in carrying through the co-operative and protective resolutions then adopted. He was a member of the War Committee of the Cabinet, but, like Mr. Lloyd George, he was far from satisfied with its organisation and powers. It was natural therefore that he should be one of the four persons, besides Mr. Lloyd George, to whom that statesman, forcing the issue on Dec 1 1916, asked Mr. Asquith to confide the absolute conduct of the War. In the confused crisis which followed, the Premiership was offered to Mr. Law; but he recognised that Mr. Lloyd George was the Prime Minister whom the nation demanded, and to a Ministry formed under him, the Conservative leader brought the full cooperation of his party.

In this second coalition, Mr. Law, whose followers supplied the main body of the ministerial supporters, was partner rather than second-in-command of his chief. Besides Chancellor of the Exchequer and member of the War Cabinet, he became leader of the House of Commons, so as to enable the Prime Minister to devote the whole of his energies to the prosecution of the War. The House was at first disposed to resent this arrangement; but before long its respect and indeed affection were won by its new leader's business habits, his courtesy, his readiness to yield in non-essentials coupled with firmness in essentials, his exceptional clearness of head and of expression, and his extraordinary capacity for impromptu reply, without taking a note, at the close of a long debate on an intricate subject involving perhaps complicated figures.

It was his duty, as Chancellor of the Exchequer, to find the money to meet the gigantic cost of the War, and this was done principally by means of two great loans and by numerous increases of taxation. The first loan was launched in Jan. 1917, and its basis was the issue of a 5% Government Stock at 95, while there was also a 4% tax-compounded loan issued at par. This brought in £1,000,312,950 from 5,289,000 subscribers. The second loan, launched in Oct. of the same year, was in form of National War Bonds, combining the advantages of short-term securities such as Exchequer bonds, and three sorts of longer-dated securities for 7 and 10 years, interest being, as before, 5% or 4% tax-compounded. The amount was unlimited; all the securities were for continuous sale till further notice, so that there might be a steady and persistent flow of money loaned to the State. This novel device was most successful. Down to Jan. 11 1919, £1,446,625,613 of these bonds had been sold, and nearly £50,000,000 small post-office bonds in addition.

Mr. Law's first budget, that of 1917, only raised the excess profits tax from 60 to 80%, and increased the taxes on entertainments, tobacco and dogs. But in his second budget, in 1918,

he imposed additional taxation calculated to bring in £114,000,000. Income tax was raised from 5s. to 6s.; farmers' tax was doubled; supertax was increased; the stamp on cheques became 2d.; beer and spirit duties were doubled and tobacco and match and sugar duties raised; letters were to be 1½d. and postcards 1d. It must have been with peculiar gratification that Mr. Law announced in April 1917 that the Imperial War Cabinet had accepted the principle of imperial preference. Throughout the War he opposed a firm front both to pacifists and to pessimists, and never doubted that there could be no peace "until the Germans are beaten and know that they are beaten."

As the general election of 1918 approached he responded heartily to Mr. Lloyd George's proposal that the Coalition should be continued to forward after-War reconstruction, and he joined with him in issuing the letters, or certificates, nicknamed "coupons," accepting coalition candidates. The Coalition obtained an immense majority, and among the Coalitionists Mr. Law's special followers, the Unionists, had a considerable predominance. When the Ministry was reconstituted in Jan. 1919 the arrangement by which Mr. Law led the House was continued, as the Prime Minister would be much away at the Peace Conference; but he was relieved of the Exchequer, and took the sinecure office of Privy Seal. He was one of the British peace plenipotentiaries, though his duties at Westminster seldom permitted him to go to Paris; and he appended his signature to the Treaty of Versailles. During 1919 and 1920 he had a strenuous time, dealing with after-War disorders and projects, and in particular with the passing of the Home Rule Act of 1920, constituting two subordinate Governments and Parliaments in Ireland.

Mr. Law's incessant labours during and after the War undermined his health, which suddenly broke down in March 1921; and, on the advice of his medical advisers, he resigned office at once, and went away to rest in the south of France. His retirement was felt in Parliament as a personal loss, and there was corresponding satisfaction when he returned in the autumn greatly (but not, as it turned out, permanently) restored, and took part in recommending the Irish Treaty to the House of Commons. During the first half, and more, of 1922 he only spoke occasionally, but he watched carefully the increasing reluctance of the Conservative party to support Mr. Lloyd George and the Coalition; a reluctance which had indeed resulted in the formation of a large group of independent "Die-hards" under Lord Salisbury's leadership. When the question was brought to an issue at the Carlton Club meeting on Oct. 19, the decisive factor was Mr. Law's declaration that the only method of preserving the unity of the party was to come out of the Coalition and to appeal to the country as an independent body. Mr. Lloyd George at once resigned, and Mr. Law, after being unanimously elected to his old post of party leader, formed a purely Conservative Government, which did not include the most prominent Conservative Coalitionists. His action was endorsed by the country at the general election in Nov., when the Conservatives returned 344 strong, a majority of 74 over all other parties put together. He at once reduced the inflated Cabinet secretariat, and restored the Foreign Office to its former position in the official hierarchy; and he carried through Parliament the bill to establish the Irish Free State Constitution.

Though he proclaimed the policy of his Government to be one of tranquillity and stability, he found himself in the winter deeply involved in political troubles. Unemployment was rampant, with Labour unrest and housing problems threatening; a European Conference at Lausanne proved impotent in face of the obstinacy of Nationalist Turkey; and M. Poincaré, the French Premier, insisted, in spite of Mr. Law's personal intervention at Paris, on despatching a French military expedition to the Ruhr to exact reparations from Germany. Mr. Baldwin, his Chancellor of the Exchequer, did indeed succeed in concluding in January at Washington an arrangement to fund the British war debt to the United States; but the terms were so severe that the Prime Minister was at first reluctant to accept them. After such an anxious winter it is not surprising that in the spring his health once more gave way, and he resigned office on Whitsunday, May 20, after a Ministry which only lasted 209 days. He survived for five months, dying on Oct. 30 1923. He was buried in Westminster Abbey, with every sign of general and genuine mourning, the pallbearers including the Prince of Wales, and past, present and future holders of the office of Prime Minister. He married in 1891 Annie Pitcairn, daughter of Harrington Robley, of Glasgow, by whom he had a family; but he was left a widower in 1909. Two sons perished in the World War. (G. E. B.)

LAWN TENNIS (*see* 16.300).—The recent history of lawn tennis may conveniently be dated from the year 1911. In that year the late Anthony Wilding (killed on the Menin Road during the World War) was defending his title to the world championship he had won in 1910, and one of the Wimbledon championships was won by France for the first time when Max Decugis and André Gobert beat Wilding and Ritchie in the challenge round of the Men's Doubles. In that year, also, Mrs. Lambert Chambers defeated her challenger, Miss Boothby, herself an ex-champion, by 6–0, 6–0.

France might have advanced still further in 1912, but André Gobert always seemed to be fated to break down at Wimbledon. In those days the champion (in this case still A. F. Wilding) had to stand out while the rest of the players fought for the honour of meeting him. Gobert met A. W. Gore, and looked a certain winner until the English player managed to pass him two or three times at the net and broke up his brilliant attack. Gore, however, failed to beat Wilding, who was at this time approaching the zenith of his powers.

Wilding and McLoughlin.—The year 1913 can fairly be described as the first big "boom" year in lawn tennis, the reason being the presence of a great personality. This was a 24-year-old boy named Maurice McLoughlin, who had won the championship of America the year before. He was called the "American comet" and, with his merry eyes and his mop of red hair he instantly took the fancy of the great international crowd at Wimbledon. His service was tremendously fast, but swerved and broke as well, and like Tilden's and Patterson's of a later day, it frequently beat his opponent outright—a feat rarely accomplished in first-class tennis today. It swept him straight through the competition, past J. C. Parke and S. N. Doust, then at their best, with only one check when Roper Barrett took the match to five sets by sheer finesse. But Wilding to the surprise of everyone, instead of standing back to McLoughlin's service, stood up to it, and after a few failures, seemed to send it back harder the harder it came at him. It was a great battle, possibly one of the greatest Wilding ever fought. Roper Barrett and C. P. Dixon beat the crack German players Rahe and Kleinschroth for the Men's Doubles, while Mrs. Lambert Chambers, returning after a year's absence, once more won the Ladies' Singles quite easily. The prestige of British tennis was retrieved.

The year 1914 has been very rightly called "Brookes' year." Brookes had not been at Wimbledon since 1907 when he won his second championship, and there was a good deal of speculation as to whether in view of the improved standard of play he would be able to hold his own. On this occasion the international element was less prominent as the American champion, R. N. Williams, was not competing, but in any case, judging by form, it is doubtful if he could have beaten Brookes. The English players were largely what were coming to be termed "the old guard." Their skill was waning, and it was left to a German, Fritzhein, to give Brookes the most stubborn contest. It was touch and go all the way through the fifth and deciding set, but the old champion's steadiness and generalship pulled him through. Wilding won the doubles in company with Brookes, and, once again, Mrs. Lambert Chambers proved that she had no really dangerous rival among the women.

G. L. Patterson.—The years of the World War saw little championship lawn tennis, even in those countries which were not directly involved. In America R. N. Williams, W. M. Johnston and Maurice McLoughlin shared the highest honours,

but, even there, in 1917, there was no competition. But as soon as the War was over there was a vigorous revival and a real beginning of a world-wide competition. The year 1919 saw many newcomers with many new styles, but perhaps the most notable was the Australian, G. L. Patterson, one of the most forceful players ever seen on a tennis court. His style was not unlike that of Maurice McLoughlin, and his fastest service was almost untakable. He depended on it very largely, but, as was shown in the following season, he had weak points of which advantage could be taken once the fierceness of his first onslaught was checked. In the final he beat A. R. F. Kingscote, the English international. In 1919 Mlle. Lenglen beat Mrs. Lambert Chambers.

Tilden and the "All Court" Game.—In 1920 William T. Tilden, probably the greatest player the world has ever known, made his first appearance in this country, and defeated Patterson, the holder of the championship. He was the first American champion. There was a notable feature about Tilden's victory, and indeed about the play of all the Americans. For some time lawn tennis, although increasing in speed, had, in the opinion of many of the best judges, been declining in skill and finesse. There had for some time been a reign of the serving and volleying specialists, but Tilden and his compatriots brought back to England what is known as the all-court game. This tradition, which demands that a player shall be master of every shot, was first laid down by Renshaw, and Pim, Baddeley, the Dohertys and Wilding strengthened it. The ascendancy of the all-court game was completed by the victory of Williams and Garland in the Men's Doubles.

In 1921 lawn tennis became still more a cosmopolitan game and there was a large increase in the entries for the World Championship from European countries. The meeting was memorable for the contest between Tilden and a young South African, B. I. C. Norton. The brilliant promise which the latter had shown was naturally gratifying to British spectators, for there had been no British Singles Champions since 1909, only one British finalist in the All-comers since 1912, and no British lady champion since 1914. It was true that Lycett and that remarkably versatile sportsman Max Woosnam had won the Doubles Championship, but this was the only honour which the Empire held, save Lycett's further participation in the Mixed Doubles honour with Miss Ryan. Tilden, although ill, insisted on playing, and almost paid the penalty. The first set opened rather tamely, with Tilden leading, but suddenly Norton blazed out and took the set 6–4. He followed this up by winning the next set 6–2, and the defeat of the champion seemed inevitable. Then there came an inexplicable collapse. Norton lost the next two sets 6–1, 6–love. Nevertheless even then he was able to keep the issue in doubt to the last, and twice was within a stroke of victory and the world championship before he lost the final set, 7–5.

The New Wimbledon.—The New Wimbledon was opened in the following year (1922). The title "world's championships" was dropped, the meeting being now designated simply "the championships." The fact that there were no American entries in 1922 was erroneously attributed to this change. But if there were no Americans there were worthy challengers from Australia. Patterson, the ex-champion, J. O. Anderson and P. O'Hara Wood were a trio of Australia's best and figured in everything until the finish. Patterson, who had seen the wisdom of playing an all-round game, beat Lycett in the championship, but Lycett had his revenge when, in one of the greatest Men's Doubles matches ever fought, he and Anderson, after looking hopelessly beaten, snatched a glorious victory from Anderson's compatriots Patterson and P. O'Hara Wood. Miss Ryan and Mlle. Lenglen won the Doubles, for the fourth year in succession. The latter won the Ladies' Singles, her opponent in the final round being Mrs. Mallory.

An American Year.—America was supreme in 1923. Not only did she win the Davis Cup again, with comparative ease, but also, sending her players over to Wimbledon without the assistance of Tilden, won the championship with W. M. Johnston, while another American, F. T. Hunter, was Johnston's opponent in the final. There was also in Europe in 1923 an American player, Vincent Richards, barely 20 years of age, who certainly had all the promise of becoming as great a champion as his tutor, Tilden.

Winners of the Championships at Wimbledon, 1911–26

Year	Gentlemen's Singles	Ladies' Singles	Gentlemen's Doubles	Mixed Doubles	Ladies' Doubles
1911	A. F. Wilding	Lambert Chambers	M. Decugis and A. H. Gobert		
1912	A. F. Wilding	Larcombe	H. Roper Barrett and C. P. Dixon		
1913	A. F. Wilding	Lambert Chambers	H. Roper Barrett and C. P. Dixon	Hope Crisp and Mrs. Tuckey	McNair and Boothby
1914	N. E. Brookes	Lambert Chambers	N. E. Brookes and A. F. Wilding	J. C. Parke and Mrs. Larcombe	Ryan and A. M. Morton
1915–8		*No Competitions*			
1919	G. L. Patterson	S. Lenglen	R. V. Thomas and P. O'Hara Wood	R. Lycett and Miss Ryan	Lenglen and Ryan
1920	W. T. Tilden	S. Lenglen	R. N. Williams and C. S. Garland	G. L. Patterson and Mlle. Lenglen	Lenglen and Ryan
1921	W. T. Tilden	S. Lenglen	R. Lycett and M. Woosnam	R. Lycett and Miss Ryan	Lenglen and Ryan
1922	G. L. Patterson	S. Lenglen	R. Lycett and J. O. Anderson	P. O'Hara Wood and Mlle. Lenglen	Lenglen and Ryan
1923	W. M. Johnston	S. Lenglen	R. Lycett and L. A. Godfree	R. Lycett and Miss Ryan	Lenglen and Ryan
1924	J. Borotra	K. McKane	V. Richards and F. T. Hunter	J. B. Gilbert and Miss McKane	Wightman and H. Wills
1925	R. Lacoste	S. Lenglen	R. Lacoste and J. Borotra	J. Borotra and Mlle. Lenglen	Lenglen and Ryan
1926	J. Borotra	Mrs. L. A. Godfree	H. Cochet and Z. Brugnon	L. A. Godfree and Mrs. Godfree	

Borotra and Lacoste.—The fact that the Olympic games were taking place in Paris a fortnight after Wimbledon, contributed to make the international entry of 1924 one of the greatest in the history of the championship. For the first time the device of "seeding the draw," as it is called, was adopted. Under the old system it was quite possible that, if, say, America's four best players had entered for the championship, their names might come out of the hat one after the other, in which case two would disappear in the first round and one more in the second. This luck of the draw imposed great hardships on players who might have travelled some 6,000 miles to try their luck, and it was decided, internationally, that overseas associations might nominate not more than four players in singles, or four pairs in doubles, as representative players, and that these players should be drawn in four separate quarters of the draw. Smaller numbers were treated proportionately and the result proved excellent. Of course it was still possible that the two best players of two different countries might meet in the first round but that in fact did not occur.

Washer, the hard-hitting Belgian international, disposed of Brookes in the fourth round, and then, in "the last eight" were left Lacoste (France), Washer (Belgium), Williams (America), Kingscote (England), Borotra (France), Richards (America), Raymond (South Africa) and Washbourn (Africa). For the first time two Frenchmen, Jean Borotra and Rene Lacoste, appeared in the final. Borotra's brilliance, on this occasion, triumphed over Lacoste's steadiness, although in the remarkable repetition of that final, for Borotra and Lacoste were to meet again for the title in 1925, the result was reversed in unmistakable fashion. America shared a similar honour in the Men's Doubles, Vincent Richards and F. T. Hunter winning over their fellow countrymen R. Williams and W. Washburn. Owing to illness, Mlle. Lenglen, who should have met the English champion, Miss K. McKane, in the semi-final, was obliged to retire. Miss McKane met Miss Helen Wills, the young player from America of whom much had been heard. After looking almost hopelessly beaten at one time, the English player pulled the game out of the fire and scored a brilliant victory. On the other hand, with the aid of Mrs. Wightman, Miss Wills carried off the Ladies' Doubles, beating Mrs. Covell and Miss McKane. Miss McKane finally held a doubles championship, for, with the English international J. B. Gilbert, she won the Mixed Doubles.

The year 1925 may be claimed as French. Lacoste met and beat Borotra, the champion, in the final, while Borotra and Mlle. Suzanne Lenglen won the Mixed from de Morpurgo and Miss Ryan. Mlle. Lenglen and Miss Ryan got back the title of Doubles Champions which they had held together for so long. French players also did well in 1926, although Mlle. Lenglen was obliged to withdraw. (S. L.)

LAWRENCE, DAVID HERBERT (1885–), British novelist, was born at Eastwood, Nottinghamshire, Sept. 11 1885, and educated at Nottingham High School and University College, Nottingham. With his first books, *The White Peacock* (1911), *The Trespasser* (1912) and *Sons and Lovers* (1913), it became evident that a writer of great force and originality was rising in the younger generation. A police prosecution of *The Rainbow* (1915) seemed for a time to check Lawrence's fertility, but he issued *Amores*, poems, and travel impressions, *Twilight in Italy*, in 1916, further poems, *Look! We have Come Through!* in 1917, and another novel, *The Lost Girl*, 1920. Hereafter Lawrence's outlook and style were being deeply influenced by a study of psychoanalytical doctrine and by travel in Italy, Sardinia, New Mexico and Australia: a new note is evident in *Women in Love* (1921), *Aaron's Rod* (1922), *Kangaroo* (1923), *The Ladybird* (1923), *England, My England!* (1924), *St. Mawr* (1925) and *The Plumed Serpent* (1926). Miscellaneous writings include *Sea and Sardinia* (1921), *Psychoanalysis and the Unconscious* (1921), *Fantasia of the Unconscious* (1922), *Studies in Classic American Literature* (1923), two plays, *The Widowing of Mrs. Holroyd* (1914) and *Touch and Go* (1920). He wrote also a historical study, *Movements in European History*, which was issued as by "Lawrence H. Davison" in 1921, and under his real name in 1925.

LAWRENCE, THOMAS EDWARD (1888–), British explorer and scholar, was born in Wales Aug. 15 1888, of a Leicestershire family one branch of which had moved to the neighbourhood of Dublin and thence to Oxford. The second of five brothers, he was educated at the Oxford High School and at Jesus College, Oxford, where, in 1910, he took a first class in modern history. In order to study Crusading architecture he made in that year a tour through Syria on foot; and the colloquial Arabic, which he then picked up, and his interest in and knowledge of archaeology, commended him to D. G. Hogarth, who was about to lead an expedition to Jerablus on the Euphrates and excavate the site of Carchemish for the British Museum. Thither Lawrence went in 1911, helped by a postgraduate endowment at Magdalen College; and at Carchemish he worked on and off till 1914, taking several opportunities to explore Syria and Mesopotamia in native company, and accepting for a few weeks an appointment under the Palestine Exploration Fund, which attached him to the Survey of North Sinai carried out by Col. Newcombe, R.E., for the War Office in the winter of 1913–4. Though naturally inclined to scholarship and letters, he showed singular practical ability and capacity for leadership, and a remarkable power of inspiring confidence in Arabs.

On the outbreak of the World War, Lawrence, being below standard height, obtained at first no more active service than a post in the geographical section of the War Office. But soon after Turkey had joined the Central Powers he was sent by Lord Kitchener to Egypt and attached to a rudimentary Military Intelligence Section. He was a moving spirit in the negotiations leading to an Arab revolt and in the organisation of the Arab Bureau which, as finally constituted early in 1916, acted as staff and intelligence office for the Arab campaigns. In the autumn Lawrence, feeling that stalemate would ensue if closer liaison between ourselves and the Arabs were not contrived, asked leave to go down to Jidda; and once there, was transferred definitely from military control to the Arab Bureau which was under the Foreign Office. Hearing good accounts of the Emir Faisal, he persuaded Sharif Hussain to let him go inland and visit the force which had been driven back from Medina. He soon won the confidence of Faisal, and induced him to reorganise his army and move North so as to threaten the communications of Medina by attacking the Hejaz Railway. When his chief was established at Wejh, and the army of another brother, 'Abdulla, had been brought to Wadi Ais to co-operate, Lawrence rode off into the interior to raise the northern tribes, and so extend the area to be held and defended by the Turks. He pushed right up to and beyond Ba'albek, *i.e.*, far behind the enemy lines in Syria, and on his return, having picked up a Huweitat force under the famous raider, Auda Abu Tayyi, he routed a Turkish battalion near Ma'an, and forced a passage to 'Aqaba which was occupied for Faisal in Aug. 1917. For this exploit he was promoted to field rank and given decorations, British and French, which, however, he would not accept.

Lawrence, now cordially helped by General Allenby, prompted the successive forward moves made by Faisal's force, after 'Aqaba had become its base, and himself organised and led a battle in Wadi el-Hesa, near Esh Shobek, in which the enemy suffered his worst defeat in the open. He turned his attention in particular to train-wrecking and had such success that Medina became virtually isolated, and a large reward was advertised for the capture of "El-Orens, destroyer of engines." Early in 1918 he made a desperate attempt to cut the Turkish Palestine army's railway communication with Damascus, and failed only by a hair's breadth. In that summer, in concert with Allenby, he induced Faisal to move up to Qasr Azraq and organise a new force to advance on Damascus. This duly moved up in the autumn side by side with Allenby's thrust and after breaking up the enemy's trans-Jordan army, entered Damascus some hours ahead of the British. Lawrence took charge of the city till Allenby could reach it, and suppressed attempts at reaction.

Called to the Peace Conference, Lawrence became one of its outstanding figures during the spring of 1919. His legendary fame as organiser and inspirer of guerilla tactics was enhanced by

the forcible part that he played when Faisal, whom he had accompanied on a British tour, came to Paris. But fight as Lawrence might against French plans for Syria, he could not prevail in that milieu, and at last, retiring to his tent, he sat down to write the narrative of his adventures. The first manuscript was subsequently lost; but he began again, and, after many recensions, it was announced that the book, under the title *The Seven Pillars of Wisdom*, would be issued in 1926. He was elected a Research Fellow of All Souls, Oxford, in 1919, and resided there for a year, but without much share in the college life. In 1921 Mr. Winston Churchill called him to the Colonial Office as Adviser on Arab affairs, in which capacity he had a large share in making Faisal King of 'Iraq. But, disgusted with the failure of the Allies to fulfil adequately what he considered their moral obligations to the Arabs, and remorseful for the part he himself had played in leading them on, Lawrence abruptly left Government service in 1922 and, abjuring all official rank and decorations and even his surname, enlisted as a mechanic in the Royal Air Force. Thence in 1923 unwelcome publicity drove him to hide in the Tank Corps, but, in 1925, he was re-transferred to the R.A.F., still as a mechanic, this being the only grade that he would accept. (D. G. H.)

LAWSON, VICTOR FREMONT (1850–1925), American editor and philanthropist, was born at Chicago, Ill., Sept. 9 1850, the son of Iver H. Lawson, a Norwegian immigrant, and educated at Phillips Academy, Andover, Massachusetts. He took charge of his father's interest in *The Daily Skandinavian*, and in July 1876 bought an interest in *The Chicago Daily News*, which had been organised six months before by Melville E. Stone as the first one-cent newspaper in the West. It was a four-page five-column daily. In 1881 Lawson and Stone started a morning edition called *The Chicago Record*, since discontinued. In 1888 Lawson bought Stone's interest, and remained sole proprietor until his death, Aug. 19 1925. His principal achievement was the development of *The Chicago Daily News* as a powerful newspaper with cultural influence; to this end he divorced politics and news; supported non-partisan organisations for investigating political candidates; maintained free public lectures; developed a wide-spread foreign news service, and established *The Daily News* fresh-air fund sanatorium for sick babies. His advocacy of a postal savings bank caused him to be called the father of the law establishing such a bank.

Lawson supported Stone in his development of the Associated Press, of which he was president from 1894 to 1900, and a director until his death. In 1923 the University of Michigan, and in 1924 Columbia University, gave him the degree of doctor of laws. He aided numerous colleges, hospitals, churches and schools; by the terms of his will his estate benefited, among many others, the Chicago Congregational Missionary and Extension Society, The Young Men's Christian Association of Chicago, The Chicago Theological Seminary (Congregational), the International Committee of the Young Men's Christian Association of New York City, Northland College, Berea College and the Northfield, Conn., schools. (H. H.*)

LAZAREV, PETR PETROVICH (1878–), Russian physicist, was born in Moscow April 1 1878. A doctor of medicine of Moscow University, he did research work in science at Strasbourg and in 1907 was appointed *Privatdozent* in physics and assistant to Prof. P. N. Lebedev at the University of Moscow. In 1912 he became professor at the technical college in Moscow, and in 1917 member of the Russian Academy of Sciences and director of the research institute of physics and biophysics in Moscow. Lazarev's early investigations were in photochemistry; he showed by experiment that the velocity of photochemical reactions is proportional to the absorbed energy and does not depend on the wave length of light. Another series of his investigations is in molecular physics. His main work is on the fundamental problem of biophysics—the stimulation of living matter. His ionic theory of stimulation explains the process of senses and of muscular contraction and forms the basis of his theory for the functions of the central nervous sytem. In 1918 Lazarev became head of the geophysical survey of the Kursk Magnetic and Gravimetric Anomaly. Some of his papers have been published in French (Comptes rendus de l'Académie, 1923–4) and in English (*Science, Lancaster, Pa.*); *Jour. of General Physiology* (Baltimore, 1924).

LEACOCK, STEPHEN BUTLER (1869–), Canadian author and economist, was born at Swanmoor, Hants., Dec. 30 1869 and went to Canada at the age of six. He graduated at the University of Toronto and became a master of modern languages at Upper Canada College, where he remained 1891–9. The next four years he spent in the graduate school of the University of Chicago, where he took the degree of Ph.D. In 1903 he was appointed to the staff of McGill University, Montreal, becoming professor of political economy in 1908, and subsequently head of his department. In 1907–8 he made a tour of the British Empire, lecturing on Imperial Organisation under the auspices of the Cecil Rhodes Trust. His serious work includes biographies of R. Baldwin and La Fontaine in the "Makers of Canada" series; *Elements of Political Science* (1906); and *The Unsolved Riddle of Social Justice* (1920). It was as the author of a number of delightful short stories, parodies and skits, however, that Prof. Leacock became most widely known to the general public. His humourous works include *Literary Lapses* (1910); *Nonsense Novels* (1911); *Sunshine Sketches of a Little Town* (1912); *Behind the Beyond* (1913); *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Further Foolishness* (1916); *Frenzied Fiction* (1918); *Winsome Winnie* (1920); *My Discovery of England* (1922); and *The Garden of Folly* (1924).

LEAD (*see* 16.314).—The principal lead producing countries in the world are now the United States, Spain, Germany, Australia, Mexico. Other important producers are India, Canada, Italy and Poland. Russia and China possess deposits of ore which, adequately worked, would yield a very large output, but at present their production is quite small. The United States has widely distributed deposits, and an output of at least four times that of any other country. The magnitude of her reserves, moreover, ensure her retaining this eminence for many years. The home market, however, consumes practically the whole of her production, the export being almost negligible.

Spain ranks second to the United States as a producer of ore, and, with Australia, is the largest exporter in the world. The principal German lead mines are in Upper Silesia, which, before the War, produced about half the ore smelted in the country, the balance being imported. Other deposits occur in Saxony, Nassau, Westphalia and the Black Forest. In Australia, the largest part of the output comes from Broken Hill, New South Wales. Before the War 50% of the production was shipped for smelting elsewhere, Germany being the principal buyer. Since the War, however, Australia has done her own smelting at Port Pirie (S.A.) and Cockle Creek (N.S.W.). Mexico has large quantities of lead ores, but disturbed conditions and inadequate communications militate against production in proportion to the country's resources. She has, nevertheless, a large output. The principal mines are situated in the northern and central states. The following table gives the production of lead ore of the countries mentioned in the years 1921, 1922 and 1923:—

Country	1921	1922	1923
	long tons	long tons	long tons
United States	370,081	426,458	487,135
Spain	133,677	117,484	125,465
Germany	36,500	39,400	27,500
Australia	83,878	151,929	171,857
Mexico	59,540	108,681	153,217
India	47,300	56,400	68,900
Canada	29,768	41,655	49,658
Italy	14,796	15,083	21,153
Poland	580	7,106	15,000
Russia[1]	1,500	2,000	2,000
China[1]	2,000	2,500	2,000

LEADER, BENJAMIN WILLIAMS (1831–1923), British painter (*see* 16.320), died at Burrow's Cross near Guildford, Surrey, March 22 1923.

LEAF, WALTER (1852–), British banker and scholar, was born at Norwood, London, Nov. 26 1852. Educated at Harrow and Trinity College, Cambridge, he graduated as senior classic in 1874, and in 1875 was made a fellow and in 1920 honorary fellow of his college. In 1877 he entered the firm of Leaf, Sons and Co., becoming in 1888 chairman of Leaf and Co. Ltd. Later he became chairman of the Westminster Bank. Leaf was one of the founders of the International Chamber of Commerce, of which he was elected president in 1925. In 1918–9 he was chairman of the committee of the London clearing banks, and from 1919 to 1921, president of the Institute of Bankers. His scholastic attainments were recognised in his presidency of the Hellenic Society and the Classical Association. Among his classical works are *The Iliad* (1886–8, 1900–2), with English notes and introduction; *Companion to the Iliad* (1892); *Troy, a Study in Homeric Geography* (1912); *Homer and History* (1915); *Little Poems from the Greek* (1922); and *Strabo on the Troad* (1923). In 1882 he collaborated with Andrew Lang and E. Myers in a translation into English prose of Homer's *Iliad*.

LEAGUE OF NATIONS.—The Covenant of the League of Nations, incorporated in the Treaty of Versailles and the other Treaties of Peace in 1919, was perhaps the most remarkable of all the direct results of the World War. For the text of this document *see* COVENANT. (*See* also EUROPE; SECURITY).

I. ORIGINS AND FOUNDATION

The League of Nations may be regarded as a necessary result of the development of human society in political organisations. It is not an abnormal achievement of human idealism—a great leap in advance beyond the achievements of the present age, outstripping the practical needs and requirements of the world. On the contrary, it is a practical method for achieving practical ends which are of importance to every citizen of every country. The demand for an international organisation to prevent war has often been made in the last four centuries. Fundamentally, this demand is that the relations of States shall be subjected to something analogous to the system of law and order to which men have subjected themselves within the smaller units in which they live. It is one example of the truth of the maxim of the Roman lawyers—*ubi societas ibi lex*. But the purpose and the content of the rules for the conduct of their relations—the *lex*—necessarily depend on the nature of the units of the society and on the nature of their relations.

When Grotius wrote his famous work on the Law of Nations, he was writing of a Society of States whose intercourse was disturbed by the continual outbreak of war. Indeed, Europe had been convulsed by the Thirty Years' War for a whole generation prior to the publication of his work. Thus it was natural and indeed inevitable that the rules which Grotius produced for the guidance of the Society of States, as he knew it, amounted to little more than a code of laws for the better conduct of war. He did, indeed, sketch the outlines of a law for the pacific relations of States, and, in the following century and a half, his successors developed to some extent what he had begun. But only after the Napoleonic wars was the first serious attempt made to establish an organised system of conducting international affairs with a view to the avoidance of war.

To Alexander of Russia's scheme of a holy alliance we need only briefly allude. Though admirable in intention, it was rejected as "sublime nonsense and mysticism" by Castlereagh, and it eventually degenerated into a mere prop of despotism supported by the empires of Central Europe and France. But the work of Castlereagh himself is worthy of closer attention. He tried to substitute for the chaotic political methods of the past a system of diplomacy by conference, confining his efforts, however, to the Great Powers, though he desired to make their attitude to the smaller Powers one of "influence rather than authority." He provided his "Conference of Ambassadors" with an organised plan of work and with a secretariat, and he supplemented it by occasional conferences of the principal statesmen of the Concert. His conference of ambassadors continued to sit in one form or another for almost six years, and he held four or five of his conferences of principal statesmen.

The European Concert.—Later in the 19th century, Castlereagh's work bore fruit in the European Concert, which proved on many occasions to be an effective instrument for the joint settlement of Balkan problems and for the maintenance of European peace. But at the time, and for the purpose for which he had created it, Castlereagh's system of diplomacy by conference almost completely failed. It did so because it never had in it the seeds of life. Its members differed fundamentally on all the greater issues of international politics—while some of them were independent and autocratic sovereigns, subject to no control, and without the pressure behind them of a general democratic will for peace. It could truly be said that international society was not ready for such schemes.

Since the Napoleonic wars, however, forces have been at work which have changed the economic condition of the world, knitting its many parts together, and making possible a permanent international political organisation. The first of these forces is the revolution in communications in the course of the last century, which has brought the most remote parts of the world nearer to each other than neighbouring towns were 100 years ago. The second of the forces—a result of the first—is the remarkable raising of the standards of civilisation through the co-operation of mankind in ever larger groups and in enterprises conceived and conducted on an ever greater scale. To-day, much of the world's commerce is international, and it has become evident that the interests of any one civilised country are indissolubly bound up with those of every other country, so much so that no sensible statesman will ever again base his policy on the principle that his country will gain by another country's loss.

Nor is this community of interests between peoples confined to their material well-being. It extends to every sort of scientific, political and moral activity in which men co-operate for the progress of their race. On the other hand, revolution in communications, rapidly destroying the factors of space and time, has rendered possible a development of warfare which has changed its whole character and rendered it universal and destructive in a sense never hitherto imagined. Indeed, it is not too much to assert that another World War would almost certainly throw mankind back into the dark ages. For these, among other reasons, some sort of international organisation for the conduct of the relations of States was, in 1919, essential, if the human race was not to abandon the hopes and the ideals for which it had striven during centuries of progress.

ESSENTIAL CONDITIONS OF A LEAGUE

With the reasons for the failure of the earlier scheme of a century before, and with the nature of modern national States in our minds, we can perhaps now proceed to lay down the essentials of a league of nations.

It may be taken as commonly accepted that the purposes and objects of a league are the following: first, the maintenance of peace; second, and as a corollary to the first, the solution of international disputes by methods of law, if and when the necessary law exists; when it does not, their solution by political methods, by public debate, by impartial investigation and by conciliation on the basis of the accepted canons of right and justice; third, the promotion of international co-operation

wherever necessary or useful, between States and between the citizens of different States. The promotion of such co-operation will imply the development of rules and the general acceptance of common machinery and common practice in ever wider spheres of international activity.

Further, a first principle which must be borne continually in mind is that the fundamental basis of all law, and the primary condition of all political organisation, is the consent of those who are to obey it. And an important and relevant corollary of this proposition is that the force, even the united force, of the greater or more powerful members of a society cannot in the long run coerce the will, or replace the consent, of the others. It is useless, therefore, to plan any organism which depends on the co-operation of the powerful States, but which will not also receive the willing acceptance and co-operation of the great body of other States.

An examination of the results of these limiting conditions, and of the lessons to be drawn from historical experience, and of the accepted objects which it is desirable that a league should achieve, will indicate the minimum of rules and of machinery which is essential.

Membership.—In the first place, then, there must be rules laying down the conditions of membership of the League. As the members of the League, in order to carry out the objects which they agree upon, must give reciprocal undertakings, they must have some guarantee that those with whom they associate themselves are willing and able to carry out what they promise. Next, it is essential that all the members should enter into agreements to meet in conference from time to time. Third, it will in practice be necessary that there should be some smaller organ than the full conference of all the members, which in the current business of the League, and when executive action is required, can act for and represent the whole. It is evident that the composition of such an executive organ will—in a society in which members are so unequal in size, population and power—involve most difficult problems of representation such as those that arose in 1926.

Secretariat.—A further consequence of any attempt to organise international affairs through regular conferences of all the members of the League, and through a smaller executive organ, is the necessity for a secretariat which shall be charged with the duty of preparing the work of the organs of the League, which shall act as a central exchange for information among members and shall organise the central and technical services. The secretariat would also have to keep the records of the League, supervise the execution of the League's decisions, and in general act as an organising agency for the promotion of international co-operation. It is, perhaps, theoretically possible that these duties should be fulfilled by means of national secretariats attached to the representatives who compose the full conference or the executive organ of the League; but there are great practical advantages in an international secretariat whose members are individually independent of national governments.

The above represents the minimum machinery that is essential to the effective working of any league. We must next consider the minimum mutual obligations which the members of the League must assume if it is to prove an effective instrument for the maintenance of peace.

Peaceful Settlement of Disputes.—It is evidently essential that every member must agree that it will not go to war with any other member without previously submitting the dispute to peaceful methods of settlement. Further, and as a corollary to this first undertaking, there must be a second one providing for common action against members who break this fundamental agreement. What the nature of this common action must be is a matter for discussion; but it must at the least provide for united and energetic moral pressure by the whole body of the League against the recalcitrant member. It may well be argued that in the world as it is to-day this united moral pressure should be supported in whatever way may be possible by united material pressure as well. What in any case is essential is to find some means of bringing home to every citizen of a member which breaks its League agreements the universal disapprobation of the other members. Thirdly, it is practically, if not theoretically, necessary to lay down in advance, some method, or methods, for the settlement of disputes by peaceful means.

Great elasticity may be left as to the nature of these methods, and as to the choice of method which the parties to a dispute may adopt. But the agreements of the League should include plans for settlement by conciliation, or arbitration or judicial verdict; and these plans should be based on the essential principles by which alone moral pressure can be brought to bear on individuals or on Governments—that is to say, on strictly impartial inquiry into the merits of disputes, and on full publicity for the contentions of the parties and for the proceedings by which settlement is attempted.

It is further essential that the agreements of the League should include the automatic abrogation by members of all treaties or undertakings which are not consistent with their obligations as members of the League. No general organisation, such as a league of nations, can operate or inspire confidence in its members if the undertakings to which they agree by their membership are overborne or superseded by other inconsistent agreements which they may enter into with individual States.

The organisation and the undertakings indicated seem to constitute the minimum that can serve as the basis of any effective international organisation for the prevention of war. Beyond this minimum, there are other things not absolutely essential but highly desirable. For example, judicial verdict implies a court of international law. It is true that such a court might be set up *ad hoc* for any dispute in which it is required, but it is far better that a permanent court should be established as part of the machinery of the League. Such a court, indeed, appears to be a necessity if we are to achieve the development of international law as an increasingly important factor in the relations between States.

Again, it is highly desirable, though it is not theoretically essential, that the agreements of the League should provide that any dispute, or any circumstances affecting the peace of the world, should be a matter of general concern to every member, so that any member may be within its right in demanding the consideration of any such matter by the organs of the League.

Interdependence of States had so far advanced during the course of the 19th century that this principle received some slight and tentative recognition in the conventions for the peaceful settlement of international disputes drawn up by the conferences at The Hague. But the principle needs full recognition and application if countries are to be prevented from drifting into armed conflicts which in these times will certainly involve the interests of their neighbours.

And lastly, it is desirable, though again not essential, that the League should be given the necessary powers to enable it to act as the co-ordinating agency for the international activities of its members in all the multifarious spheres hitherto governed by international bureaux, by general treaties and by other forms of official and unofficial co-operation.

The Essential Provisions of the Covenant

Impartial consideration of the Covenant will show that it embodies every one of the features which have been enumerated as the essentials of an effective league. It may further be said that where it goes beyond the essentials it does so in a way which was intended to make, and does make, for greater completeness and efficiency.

Membership.—Article 1 of the Covenant consists of the rules of membership. It stipulates that the original members of the League shall be the signatories to the Covenant and such other States named in the annex thereto as shall accede to it without reservation; and that any fully self-governing State, dominion or colony may become a member if its admission is agreed to by two-thirds of the members and provided that it shall give effective guarantees of its sincere intention to observe its international obligations and shall accept the regulations of the League in regard to its military forces. These rules constitute a statement of the principles concerning membership that are essential if the members of the League are to have confidence that their mutual undertakings will be carried out.

Representation.—With regard to agreements to meet in conference, Articles 2, 3 and 4 of the Covenant stipulate for the creation of an Assembly consisting of three representatives of each member of the League, and for a smaller Council consisting of representatives of four great Powers and of four smaller ones. The Covenant does not lay down the intervals at which these bodies shall meet: it merely stipulates that the Assembly shall meet at stated intervals and from time to time as occasion may require; and that the Council shall meet in the same way, and at least once a year. It leaves these questions to be dealt with in whatever rules of procedure the council and the assembly might respectively consider it wise to adopt.

The question of representation of the members at the assembly was one which naturally involved serious difficulties. It was solved by according to every member an equal right to send three representatives.

The question of representation on the Council was still more difficult. A definite preponderance of influence in international affairs had been accorded prior to the World War, to the Great Powers of the world. It was inevitable, and right, that the Great Powers who are members of the League should be given permanent representation on its principal executive organ. The representation of the smaller Powers—an exceedingly difficult matter—was dealt with by providing that the four non-permanent members of the Council shall be selected by the Assembly from time to time in its discretion.

Articles 6 and 7 provide for the necessary secretariat, and for the nomination of a secretary-general, who shall make all the appointments to the staff with the approval of the Council. These articles also provide that every position in the secretariat shall be open to women. So much for the institutional organisation of the League as it was established by the Covenant.

Disputes.—With regard to the agreements not to resort to war, which are included above, among the essentials, the Covenant embodies almost everything that any responsible authority had in 1919 advocated as practicable. By Article 12 the members agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to inquiry by the council, and they agree that they will in no case resort to arms until three months after an award has been made by the arbitrators or a report has been made by the council. Article 12 thus not only embodies an agreement not to go to war without previous recourse to peaceful methods of settlement for disputes, but also lays down two alternative procedures by which, through the agency of the League, settlement can be effected. The first is ambiguously referred to as "arbitration," but it is evident from Articles 13 and 14 (the latter of which provides for the establishment of a permanent court) that the use of the word "arbitration" is a loose one, and that what is really intended is recourse to legal decision. These two articles, indeed, leave great elasticity, but their purpose was to secure the establishment of a permanent court of international law to which the parties should in the normal course take disputes of a legal nature.

There is, moreover, at the end of Article 14, a clause designed to increase the value of the permanent court. This clause provides that the court may give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly. Thus, if a litigant should bring to the League a dispute in which it believes the law to be on its side, it will be able to demand, even if the other party does not agree, that the Council shall secure on the juridical questions at issue an advisory opinion from the court; and the court, in rendering this opinion, will give the Council the elements for a decision which would have all the force of a legal verdict. Thus the Covenant included provisions which went far towards securing that all international disputes of a genuinely legal nature shall be determined by legal methods.

With regard to the other alternative method provided for the settlement of disputes, which members agree to by Article 12, that is to say, inquiry by the Council, Article 15 lays down in considerable detail the procedure which is to be adopted. It provides that any party to a dispute can oblige the League to take cognizance of it by giving notice to the secretary-general. The parties undertake to communicate to the secretary-general as promptly as possible statements of their case, with all the relevant facts and papers. The Council is then given discretion to endeavour to effect a settlement of the dispute, and it is provided that if its efforts are successful, a statement shall be made public giving such an account of the dispute and of the settlement arrived at as the council may deem proper. If the council fails to settle the dispute, it is to make a report setting forth the merits of the dispute and the recommendations which the Council thinks would be suitable for a settlement, and this report is to be published. A report may be made either unanimously or by a majority vote, and any individual member of the League which is represented on the Council has a right to make its own public statement concerning the dispute.

There is a further provision in Article 15 to the effect that if such a report is agreed to by the Council unanimously, with the exception of the representatives of one or more of the parties to the dispute, the members of the League—including the parties—agree that they will not go to war with any party to the dispute who complies with the provisions of the report. This is a most important additional limitation of the right of members to resort to arms. Article 15 also allows an appeal from the Council to the Assembly, provided it is made within 14 days after the submission of the dispute to the Council. If a dispute is so referred to the Assembly, the Assembly is to deal with the matter in the same way as the Council, and if its report is agreed to by all the members of the League represented on the Council, and by a majority of the other members of the League, exclusive in each case of the representatives of the parties to the dispute, it has the same force as a unanimous report agreed to by the Council, *i.e.*, the members of the League must not go to war with any of the parties to the dispute which accept it.

These Articles, then, provide two, or rather three, methods by which disputes can be settled by peaceful means through the agency of the League. The first provides for legal verdicts by the permanent court, when such verdicts are possible and useful; the second for arbitration by some special tribunal agreed to by the parties to a dispute; and the third, for settlement by the political agency of the Council or the Assembly, in accordance with procedure based on the principles of full publicity and strict impartiality. The authors of the Covenant believed that publicity would of itself ensure impartiality; that it was not conceivable that a council, acting as the representative of the whole body of the League and in circumstances of utmost publicity, should conduct its inquiries into a dispute in any way not consistent with the strictest fairness to all the parties concerned.

Sanctions.—Articles 12 to 15 also make provision for the next essential of a league—united pressure by all the members against any of their number which disregards its undertakings. In providing for a public report by the Council on the merits of a dispute and for the publication of its recommendations as to a settlement, the Covenant lays down a method which, in practice, must exert the strongest moral pressure on any state which in defiance of Article 12 is disposed to go to war.

But the Covenant goes beyond this, and provides in Article 16 that, if any member of the League in contravention of its agreements resorts to arms, such a member is *ipso facto* "deemed to have committed an act of war against all other members of the League," and the other members are obliged to prevent all financial, commercial or personal intercourse between the nationals of the Covenant-breaking State and the nationals of any other State. It was difficult in the disturbed condition of the world after the War to realise just what would be the effect of such a complete economic and financial boycott in times of normal peace. But it is not too much to say that no civilised State would, in 1914, have ventured to declare war had it been threatened by such a universal boycott as is stipulated by Article 16 of the Covenant.

It is sometimes held that in providing for such a universal boycott, the Covenant goes beyond the essentials of a league. It is sometimes even held that it goes beyond what is practicable and wise. But it must be remembered that Article 16 only comes into force if a State insists on going to war without waiting for any attempt at peaceful settlement, or where an agreed tribunal or a unanimous council have given a decision which has been accepted by the other party. In other cases ultimate resort to war is envisaged under the Covenant as legitimate, and the obligations of Article 16 would not come into force. Indeed against a genuinely recalcitrant member of the League, the Covenant goes even further. Article 16 lays down that in addition to the blockade which is an automatic obligation of all the members of the League, the council shall consider and shall *recommend* to the several Governments concerned, what military, naval or air forces members of the League shall severally contribute to the armed forces to be used to protect the Covenant. In other words, while leaving again the greatest possible elasticity, the Covenant foreshadows united military action, if it is necessary, against a Covenant-breaking State.

To turn to another matter, the Covenant provides by Article 20 for the abrogation of treaties, obligations and understandings which are inconsistent with its own terms, and thus meets in yet another particular, the essentials of a league.

Further Provisions of the Covenant

How far, and in what respects, does the Covenant go beyond these essentials?

Guarantees.—First, there are the much-discussed provisions of Article 10. This Article has been very generally misunderstood. Its effect is to guarantee the members of the League *against external aggression* which would impair their territorial integrity or political independence; but this guarantee is only to be enforced as the Council acting unanimously shall agree. In practice the protection against sudden and unjust attacks provided by Articles 12–16 will probably be much more useful, and, if executed, all that is required. Article 10 is really only a rather clumsy assertion that territorial or political changes shall not be made by aggressive war. Such changes, if required, must be made under Article 19, which enables the Assembly to reconsider treaties which have become obsolete or dangerous to peace.

Armaments.—Second, it may perhaps be said that, by the provisions of Article 8 on the subject of armaments, the Covenant introduces something which is extraneous to an agreement to preserve the peace. But the history of the 20th century has demonstrated that if you prepare for war you will have war; that increase of armaments in one country provokes increase of armaments in other countries, and that if rivalry in preparation for war continues, within a certain time war will break out. The authors of the Covenant believed that unless rivalry in armaments could be prevented, any league of nations, however it be constituted, would fail. They therefore thought an agreement not to engage in unlimited competition in armaments absolutely necessary to the peace of the world. The Covenant deals with the matter in a way which is pre-eminently practical and sane. It recognises that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety, and directs the Council to formulate plans for such reduction for the consideration of the several members of the League. In other words, the members agree to co-operate in working out a general international plan embodying scales in accordance with which their armaments shall be limited or reduced.

Further, the members agree that they will, through the League, endeavour to take measures for abolishing the evil effects of the private manufacture of armaments and material of war, and they agree to exchange full information as to their armaments, their preparations for war and the condition of their industries which may be adapted to warlike purposes. Lastly, by Article 23 they agree that, subject to conventions to be arranged, the international traffic in arms, admittedly one of the minor contributing causes of war, shall be placed under the League's supervision.

These are only general principles. In themselves they would be of small value. But it was hoped by the authors of the Covenant that the action of the permanent machinery of the League would in time enable its members to give effect to the purpose of Article 8; and that thus great strides would be made towards the disarmament which everyone desires. In this respect, as in others, the authors of the Covenant were careful not to travel too fast; they laid foundations on which those who were to wield authority in the League could later build.

Secret Treaties.—By providing in Article 18 for the publication of all treaties, the Covenant again goes beyond essentials. Yet no reasonable man can doubt that, under the diplomatic system which prevailed before 1914, secret treaties of alliance, directly by their mere existence and indirectly through the mistrust which they created, were one of the serious causes of international conflict.

Mandates.—Article 22 of the Covenant introduces a new principle into international affairs which is certainly extraneous to the central purpose of a league. The mandates system which it creates is a great experiment in the government by advanced peoples of backward territories and races. The main principles are simple. The Article is based on the proposition that backward peoples and territories are not for the future to be exploited for the exclusive benefit of those who govern them; that, on the contrary, their interests and well-being constitute a sacred trust of civilisation and that the way in which they are ruled is a matter of interest to the world at large. The Article therefore lays down that in the government of such territories the interests and progress of the inhabitants must be the guiding purpose of the administration. The methods by which their interests are to be protected and their development secured vary, of course, in every case with the nature of the territory and the character of the people concerned. But in every case the fundamental principles are the same; and to secure the observance of them the Covenant imposes on the mandatories a duty to make annual reports for submission to a permanent mandates commission; which is, in turn, to report to the Council. Here again the Covenant relies on publicity and public opinion as a guarantee that Article 22 will be faithfully carried into effect.

International Co-operation.—With regard to international co-operation, the Covenant in Articles 23 and 24 goes a great deal further than might be considered essential. It provides in general terms for the establishment of a labour organisation (which in fact has been elaborated separately by another agreement); for the equitable treatment of commerce; for the development of freedom of transit; for League supervision of the traffic in arms; for League action in matters of public health and for the general supervision by the League of all official, and also, if necessary or useful, of unofficial, international offices established for international purposes of general interest. The general effect of these provisions is to make the League what it is clearly desirable that it should be—a central organism through which international activities of every sort can be co-ordinated and, when useful, assisted by the council and the secretariat. There can be no doubt that the result of this must be to prevent waste of effort and promote efficiency in the conduct of international business of every kind.

Amendments.—In the last place the Covenant, by Article 20, provides a method by which it can itself be amended; and this, it may be held, is not an essential of a league. It is true that the Covenant might have been regarded as an ordinary international treaty, valid, as most treaties are now made, for a certain fixed period, at the end of which it might have been renewed or changed by the ordinary methods. But it was precisely because the authors of the Covenant did not regard it as an ordinary international treaty that they provided a special means for amendment; and there can be no doubt that, morally, Article 26 is of great significance, and that practically it may prove to be of great constitutional value. It still leaves it difficult to secure amendment of the terms of the Covenant. It can only be done if all the members of the council and the majority of the members of the assembly are agreed. But the fact that amendment is definitely envisaged is in itself important.

Generally, it may be said that when the Covenant goes beyond the essential features which are necessary to any effective league to preserve peace, it does so with one of two objects in view. Either it is with the purpose of giving real life to the machinery which it establishes: of bringing the international forces actually at work into effective co-operation, in order that members of the League may be brought closer together, and the League itself be strengthened and have the vitality that comes from continuous and varied work; or else it is with the purpose of removing those deep-seated causes which public opinion has recognised as having led to war. It is not by chance that the Covenant contains more or less elaborate provisions concerning armaments, the traffic in arms, annexation by conquest, the avoidance of unfair economic competition, imperial rivalry in the exploitation of backward countries, secret treaties and alliances. It is because these things have led to war in the past that the Covenant seeks to deal with them in a practical and effective way, to the end that war may be rendered less probable in the future.

It has already been said that the authors of the Covenant confined themselves to laying down the essentials of the organisation which they considered the League required and the general rather than the detailed obligations to which they thought that members of the League must agree. Elasticity is one of the chief "notes" of the whole machinery of the League. The Council and the Assembly are free to develop their own methods and

systems as they choose, to appoint committees and commissions at their discretion, and to draw up codes of procedure which they can themselves change; they are thus able to give to the general principles of the Covenant the free development which experience may dictate.

It is in pursuit of this same elasticity that in several cases the Council is charged to carry into execution plans which the authors of the Covenant felt to be essential, but which they were not themselves, for lack of time and for lack of expert technical advice, able immediately to prepare. Much valuable work has been done under these provisions.

Preparation and Enforcement

The Covenant was prepared by a special Commission of the Peace Conference of Paris, consisting of ten representatives of the Great Powers and nine representatives of the smaller Allied States. This commission, appointed on Jan. 20 1919, was a body of remarkable authority. Presided over by President Wilson, its members included Colonel House, General Smuts (later Prime Minister of South Africa), Lord Robert (Viscount) Cecil, M. Léon Bourgeois (former Prime Minister of France), M. Veniselos (Prime Minister of Greece), M. Pessoa (later President of Brazil), M. Vesnitch (later Prime Minister of Yugoslavia), M. Scialoja (later Foreign Minister of Italy), M. Hymans (Foreign Minister of Belgium) and others.

The first draft prepared by the commission, based on proposals put forward jointly by the British and American delegations, was laid before the Peace Conference at a public meeting on Feb. 14; it was thereafter amended in the light of criticisms made by the conference, by the Press and by the neutral Powers at a special meeting held for the purpose of hearing their views; and the final draft was adopted by the Plenary Conference at another public meeting on April 28. It was, on the insistence of President Wilson, inserted as Part I. of the Peace Treaties made with Germany, Austria, Hungary and Bulgaria. By this device the Allied Powers were prevented from making peace with their enemies without being members of the League.

With the entry into force of the Treaty of Versailles on Jan. 10 1920, the League of Nations came legally into existence. Prior to this date, preliminary organisation of its work had been carried on by the secretary-general under the authority of a committee of the Powers. When all the Allied Powers had ratified the Peace Treaties (except the U.S.A., Hejaz and Ecuador, who failed to do so) the members of the League numbered 29. To these were added during the course of 1920 the neutral Powers, 13 in all, who in accordance with Article I. of the Covenant acceded to it without reservation. By successive admissions of ex-enemy and other States, the number of members had by 1925 risen to 56.

II. THE WORK OF THE FIRST SIX YEARS

In order to understand what has determined the character, scope and varying efficacy of the League during the first six years of its existence, it is necessary to bear in mind both the general conditions under which, and the organisation through which, it has been working. It is only by realising these conditions that we shall understand why some of the main international problems have been dealt with by the League and some outside it; and why its success in those which it has undertaken has varied from case to case.

The first of the determining political conditions is that the process of settling the terms of peace, of resolving the immediate problems left by the World War, was only begun and not ended by the treaties of peace signed in 1919. For years afterwards peace was still being negotiated in every capital in Europe. One of the treaties, indeed, the Treaty of Sèvres, was never ratified. Renewed war between Greece and Turkey, rather the continuation, after an interval, of one section of the World War than the outbreak of a new one, was to precede the new Treaty of Lausanne of 1923. But even those treaties which were duly ratified left unsettled questions of the first political importance, in the forefront " reparation " and in the second rank a host of secondary, but still difficult and important, problems.

But the task of completing and executing the terms of settlement between recent combatants is very different from that of permanently preserving the peace of the world. The Covenant (*q.v.*), designed to create a permanent instrument, is naturally drafted as if the immediate war problems had been settled by the treaties of peace and as if, peace and normal conditions having been established, it was the task of the League to maintain them. The questions left unsettled directly concerned the late belligerents, not the world as a whole. Their settlement was essentially a corollary of the treaties and a part of the same work. It was natural, therefore, that they should be dealt with, not by the new world organisation, the League, but by conferences of the Allies or of the late belligerents similar in composition and in character to those which had negotiated the treaties.

Limiting Factors.—In the second place, the scope of the League's work has been limited by the fact that, while in essence a world organisation, it has not yet received the adhesion of all countries, and in particular three of the seven principal countries of the world have during the whole period now under review been outside its membership.

These conditions derive additional importance from the fundamental character of the League as an organisation. The League is not a super-state with either the right or the authority to impose its will on the sovereign States which compose it. It is essentially an organ for securing agreement between them, and its power of action is at any time limited by the extent of possible agreement. Except in a few special cases, of which the most important is that members undertake not to go to war to enforce a claim rejected by all the members on the Council except the disputants themselves, signature of the Covenant does not involve an obligation on any State to accept a decision of the League without its own consent.

For the great bulk of its work, therefore, the League requires unanimity. It can persuade, it can elicit a collective world opinion, both private and official, which it may use to aid its persuasion, but, except before the imminent threat of war, it cannot compel; and even in this case unanimity of the non-disputant members of the Council is required. It follows, therefore, that the power of the League varies with the policies and characters of the countries which compose it and of their relations between each other. How far this is from involving impotence, how great is the difference between the policy a country would pursue if left alone from that which it can be induced to follow under the persuasion of collective opinion, the following account will show. But however wide the range within which such persuasion can be effective, there is at any given moment a limit beyond which a country cannot be moved. And beyond such limits the League is, for the great bulk of its work, impotent. In dealing with its various problems the League has to deal with exactly the same forces and differences of policy and interest as if they were handled by other methods of negotiation; and the organs of the League, the Assembly, and the Council comprise, indeed consist of, representatives of interested governments themselves.

It follows that any serious divergencies of policy between members of the League, and especially its more important members, will be likely to enfeeble the League for its general work. And it is obvious that the obstinate differences on reparation and other questions touching Germany and on Near Eastern affairs, affecting as they did for some years the general relations of some of the principal countries on the council, necessarily limited the League's general power and progress.

The limiting factors have diminished in importance as the years have passed. Little by little, the specifically War problems have found a settlement, the transitional instruments of negotiation, supreme councils or allied conferences or the Conference of Ambassadors (*see* SAN REMO; SPA; PARIS; LONDON; CANNES; GENA; LAUSANNE; and LOCARNO; also AMBASSADORS, CONFERENCE OF; SUPREME COUNCIL) have ended or retired to a secondary place; and the permanent organisation has come into the foreground. The number of member States has risen from the 4 of the first Assembly to 55, in 1925, and the improvement in international relations which, while largely developed at Geneva, found its expression at Locarno, has immensely added to the strength of the League to deal with such future troubles as may occur.

ORGANISATION OF THE LEAGUE

The principal organs of the League are the Assembly, meeting usually once a year and representing all States; the Council, meeting usually every third month and consisting of four permanent members (Great Britain, France, Italy and Japan—to which Germany will doubtless shortly be added)—and six non-permanent members elected by the Assembly; the permanent secretariat; a whole series of special organisations and committees (for finance and economics, transit, health, armaments, mandates, intellectual co-operation, opium, traffic in women, etc.) and, working independently of the Council and Assembly, the permanent court of international justice, and the international labour office.

The respective spheres of competence of the Assembly and the Council are not exactly defined in the Covenant. Each may deal with any matter within the League's competence or affecting the peace of the world. In practice, the size, composition and time of meeting of the two bodies determine their functions. The Assembly affords an opportunity for an annual review, by the responsible representatives of the Governments of the world, of the international situation. It largely creates the atmosphere and determines the general lines of policy for the ensuing year, and it is a convenient instrument for the concluding stages in the negotiations of conventions and general agreements of world interest. The Council, on the other hand, has become the League's executive organ. It deals with the host of special questions that arise for settlement throughout the year, and directs the multifarious permanent tasks of the League and the special organisations through which they are carried on.

These special organisations are in some respects the most interesting feature of the League as an administrative machine. They consist for the most part of permanent committees, composed of specialists and experts drawn either from the departments of the national governments or from private institutions. These experts work normally in their own countries, and they have the special knowledge of national forces and conditions, and possess the national influence, which no purely international officials can retain. But they meet periodically as members of a regular organisation. By this system, which follows closely the principles of the inter-Allied central organisation built up in the later years of the World War, the League obtains an executive instrument more expert, more effective and more economical than could possibly be obtained by the unaided service of its own whole-time officers. It binds together the national administrations of the world and forms them into an instrument of international work. More than this, it permeates with its own spirit those who in their own countries are carrying on national work which reacts on the interests of other countries.

In these six years some thousands of such persons, no small proportion of those who throughout the world are forming and executing the policy which determines international relations, have learnt, in regular co-operation with those of corresponding position in other countries, the international point of view. It is this a system which, apart from its direct utility, effects a peaceful penetration of the League point of view into national systems. In this elaborate and elastic system the permanent secretariat is the uniting element—the "coupling." Its importance results from the immense range and variety of the organs which it serves, and from the fact that these organs consist of councils, commissions or committees meeting periodically, not in permanent session, and consisting of persons whose main work is elsewhere, in their respective countries.

POLITICAL DISPUTES

It is the task of the League to prevent political disputes causing war. It is most successful where it has been able, by patient work in improving international relations, to remove the causes of disputes before they arise. In this wider sense most of the work of the League has a political aspect. In its mandates and minorities work, for example, the League is continually trying to establish conditions which will diminish the risks of future conflict; and in such a piece of international co-operation as the reconstruction of Hungary, the existence of political differences constituted one of the main obstacles to success, and their settlements one of its main rewards. The definite political disputes threatening to disturb international relations and, in some cases, the peace of the world, which have been submitted to the League of Nations are treated in this work under the individual headings, but something must be said here to illustrate the methods by which the League discharges its primary responsibility of preserving the peace.

Aaland Islands.—The first of these disputes was between Sweden and Finland in 1920 over the Aaland Islands (*q.v.*). Neither country appealed to the League, but as the danger of conflict increased, Great Britain brought the matter to the Council under Article 11 of the Covenant. Both countries were invited to become members of the Council for the purpose, Sweden as a member State under the specific provision of Article 4, and Finland, not then a member, by special resolution in accordance with the general spirit of Article 17. Sweden urged the strong and persistent desire of the islanders themselves for union with Sweden, and her representative declared that "if Finland . . . failed to withdraw her troops a conflict was likely to arise." Finland claimed that her legal sovereignty was indisputable and that the Council was not competent because the matter was one which by international law was solely within the domestic jurisdiction of Finland. The Council, with the concurrence of both parties, appointed a commission of three international jurists to give an advisory opinion on this point (the court of justice not yet being established), and on the basis of its report declared itself competent. It then sent a committee of inquiry, consisting of a Belgian, a Swiss and an American, to investigate on the spot and propose a settlement. In conformity with the report of the committee and after hearing the views of the islanders, as well as the Finns and Swedes, the Council, in June 1921, decided that Finland's claims to sovereignty over the islands must be recognised but that the claim of Sweden and the islanders should be met by detailed guarantees ensuring neutralisation and a large measure of autonomy. This decision was followed by a conference of 10 Powers in Oct. to frame a convention providing for the neutralisation and demilitarisation of the whole archipelago. The convention was duly ratified and came into force in April 1922. No trouble has since arisen, and the settlement appears to be accepted as final and conclusive.

Vilna (*Wilno*).—The next dispute marked a failure in League action. The Treaty of Versailles left the eastern frontier of Poland to be fixed later by the Principal Allied Powers. No definite frontier was fixed, but a provisional line was drawn which left Vilna (*q.v.*) in the territory of Lithuania, a newly created State. A dispute arose between Poland and Lithuania over this line, and hostilities became imminent. The Council, in Sept. 1920, sent a military commission which prevented hostilities and provisionally arranged the disposition of the respective forces. But General Zeligowski, a senior Polish officer, crossed the line and entered Vilna with a considerable force. The Polish Government repudiated his action, but refused to send troops against him. The League's military commission arrested hostilities by establishing three neutral zones between the opposing forces, and the Council proceeded to deal with the territorial dispute. They first attempted a referendum and arranged to send a small international police force to maintain order during the plebiscite. But the inflammation of public opinion made it very unlikely that a fair expression of opinion could be maintained, and this plan failed. The Council next attempted conciliation by direct negotiations between the two Governments under the presidency of M. Hymans, the Belgian member of the council. A proposal made by M. Hymans himself that the Vilna territory should be an autonomous canton within the Lithuanian State was not accepted, and the effort at direct negotiation thus failed. The council then made a formal "recommendation" in accordance with Article 15; they adopted M. Hymans' report unanimously and with the assent of the full Assembly which discussed the proposal in Sept. 1922, called upon both countries to accept it. They refused, and the League did not enforce

the recommendation. Finally, early in 1923, the Conference of Ambassadors, acting on behalf of the principal Allies under Article 87 of the Treaty of Versailles, definitely fixed the eastern frontier of Poland in such a way as to include the district of Vilna within it. The *fait accompli* prevailed. The League had succeeded in averting hostilities which would otherwise have been inevitable, but it had failed to secure the adoption of its own solution on the substance of the dispute.

Upper Silesia.—The next dispute was equally difficult, and again resulted from the incompleteness of the terms of peace signed in 1919. The Treaty of Versailles provided that a frontier was to be drawn in German Upper Silesia (*q.v.*), dividing the district between Germany and Poland in accordance with the "wishes of the inhabitants" as indicated by a plebiscite and taking account of "geographical and economic conditions"—two conflicting criteria which pointed to very different conclusions. The plebiscite was held in March 1921, but neither the Plebiscite Commission, nor a committee of experts, nor the Governments composing the "supreme council" could agree as to the line to be drawn. A Polish insurrection broke out, and production in the rich mining and industrial area of the "triangle" was stopped. There was the greatest tension not only between Poland and Germany but between the Allies—France proposing a line based on the plebiscite, giving the bulk of the disputed area to Poland, and Great Britain proposing a line more in accordance with economic considerations, giving the bulk of it to Germany. Repeated and prolonged attempts to effect an agreement failed. There was rioting and, indeed, for some days, fighting between organised volunteers. Work was stopped and there was danger of a serious rupture between the Allies. Having failed to reach agreement through their normal organ, the Supreme Council, the Allies, in Aug., asked the League to propose a frontier in accordance with the treaty, binding themselves to accept any agreed recommendation. The Council met in special session on Aug. 29 and referred the problem for preliminary examination to a committee consisting of the representatives of Belgium, Brazil, China and Spain—states which had taken no part in the previous discussions.

This committee came to the conclusion that the only practicable solution was to be found in drawing such a frontier as would attribute to each country a number of inhabitants proportionate to the votes recorded in its favour, while arranging special guarantees against the dislocation of the economic life of the district for a period long enough to enable it to be adjusted to the new frontier. That is, instead of trying to determine a frontier on a compromise between the conflicting plebiscite and economic considerations, they proposed to take the plebiscite as the basis of the first and to meet the second by an appropriate economic convention. This solution was adopted by the council, and by the Allied Powers, who traced the frontier accordingly. A Germano-Polish convention, ensuring the continuity of the economic life of Upper Silesia for a period of 15 years, was subsequently drawn up in agreement by the two Powers negotiating under the presidency of a Swiss statesman appointed by the League.

This settlement was severely criticised both in Germany and Great Britain. It must, however, be remembered that the League had no authority to fix an ideal frontier line, but only to apply the treaty provisions. The whole case is an illustration of the difficulty already mentioned of the League, designed as an impartial instrument for the preservation of peace, being used to complete the terms of a peace settlement between recent combatants. But at last agreement was reached, a cause of dissension between the Allies was removed, work was resumed and rioting ceased.

Albania.—A further risk of hostilities occurred in 1921 through a delay in the definitive settlement of a frontier. Albania (*q.v.*) was admitted as a member of the League in 1920, but the frontier question was still under consideration by the Conference of Ambassadors. In April 1921 Albania called the attention of the League to encroachments on her territory by Serbia and Greece. The Council, unwilling to complicate the task of the Conference of Ambassadors by separate intervention, asked the Conference to hasten their decision and called on the three countries to abstain from any hostile action. The question being still unsettled in Sept., however, the League appointed a committee of three impartial persons from Luxembourg, Norway and Finland to report on the situation. Before its arrival in Nov., however, Yugoslav troops entered the Mirdita district of Northern Albania. There was heavy fighting, and the defeat of Albania was almost complete. The British Govt. at once demanded the summoning of a special meeting of the Council under Article 11 to consider the situation and if necessary to agree upon measures under the "sanctions" article, No. 16, of the Covenant. At the meeting of the Council on Nov. 18, the Serb-Croat-Slovene State agreed to evacuate its troops and to respect the frontier which had now been definitely fixed by the Conference of Ambassadors. The League Commission of Inquiry personally accompanied the departing troops, and on Dec. 10 were able to report that the evacuation had been successfully completed without untoward incidents. A serious threat of conflict had again been averted and has not since recurred.

Memel.—The Memel problem is another instance of a peace treaty question handed over to the League because the Allies, acting through their normal machinery, had been unable to settle it. There was a strong reason for invoking the services of the League in this case because it involved extremely complex technical questions of transit and port facilities, with which the League's technical organisation was particularly fitted to deal. Lithuania, having suffered from a *fait accompli*, pending the definite fixing of a frontier at Wilno, successfully tried a coup of her own at Memel in Jan. 1923. The Conference of Ambassadors fixed the frontier in a way which left Memel in Lithuania on condition of a large measure of autonomy to the German population and guarantees for the development of the port as an international outlet. But they failed to frame a convention acceptable to Lithuania to give effect to this condition. Active conflict being threatened, the Conference in Sept. asked the League to deal with the matter. The Council appointed an impartial commission, which made a thorough investigation of the local conditions, and in March 1924 presented a complete draft convention to the council. This convention (for the terms of which *see* MEMEL) was accepted by both parties and endorsed by the Allied governments.

The Corfu Dispute.—A much more important dispute, affecting a principal power, was brought before the League in the autumn of 1923. An Italian General and his staff, who were engaged as representatives of the Conference of Ambassadors in fixing the frontier between Albania and Greece, were murdered on Greek soil, by persons unknown, on Aug. 27 1923. The Italian Govt. demanded reparation and apologies of the Greek Govt., who accepted some of the conditions and refused others. The Italian naval authorities thereupon occupied the island of Corfu, loss of life occurring in the operation (*see* CORFU). Greece appealed to the League, but also stated her willingness to accept any decision of the Conference of Ambassadors. The position of the Conference, as a body whose decision both parties agreed to accept and as itself directly interested, made the formal competence of the Council doubtful. The Council therefore confined itself to discussing detailed suggestions for a settlement and forwarding them to the Conference of Ambassadors. The Conference adopted most of these suggestions, but with an important modification on the question of reparation. With regard to this it dispatched an Allied committee of inquiry and, on receipt of its report, which it withheld from publication, it awarded Italy the full amount of reparation which she had demanded. Corfu was then evacuated. The immediate question thus settled, the Council referred to a committee of jurists the question of legal principle which the case had raised with regard to the competence of the Council, the right of coercive action and the responsibility of a state for political crimes committed on its territory. Unanimous replies were received to these questions and were transmitted by the Council to the Assembly; and the legal position was thus more clearly established as regards similar incidents in the future.

The case was an extremely intricate one, and there has been much difference of opinion as to the action of the League. The League facilitated a quick settlement, the early evacuation of Corfu and the avoidance of hostilities; and the actual proposals which it made as to the details of settlement are not open to adverse criticism. But it did not secure the adoption of all these proposals. The action of the Conference of Ambassadors, in giving its award, while withholding the report on which it purported to base it, would have been impossible if the League had been in full control of the case. The factors which made effective League action difficult were partly the special and dual position of the Conference of Ambassadors in the question and partly, it must be recognised, the fact that one of the parties involved was a Great Power and that the general relations of the Powers were at the moment complicated by other questions of policy. The degree and limits of the League's action accurately reflect the extent to which it was possible to make a collective world opinion effective under the conditions created at the moment by the relations between the governments, and especially the Great Powers on the council. That this collective opinion had an important influence on the settlement is indisputable, and the expression of this opinion, made possible by the meeting of the Assembly, was indeed a revelation to all who witnessed it of what is bound to be henceforth a new force of the first importance in the political life of the world.

Mosul.—The Conference of Lausanne in 1923 found that its most difficult question in the settlement of the terms of peace with Turkey was the frontier line between Turkey and the British "mandate" territory of 'Iraq. Agreement having failed, the treaty provided that Turkey and Great Britain should attempt to reach agreement by friendly negotiations, and that, if these did not succeed within nine months, the question should be referred to the Council of the League. The negotiations failed, and in Aug. 1924 the question was accordingly brought before the Council, who appointed a commission of three (a Swede, a Hungarian and a Belgian) to investigate on the spot. The commission worked for eight months and then presented a report in which, after reviewing exhaustively all the factors of the case, they recommended unanimously that the best solution would be for the disputed district, including the town of Mosul, to be included in 'Iraq if the British mandate could be continued for 25 years, but that, if this were impossible, it would be better to assign it to Turkey. When the Council had this report before them in Sept. 1925, they were faced with the contention of Turkey that the Council's task under the Treaty of Lausanne was one of mediation, not arbitration, and that no decision could be binding unless Turkey herself had assented to it. The Council asked

an advisory opinion of the Permanent Court of International Justice, who replied that the Treaty had given arbitral powers and that the consent of the two parties was not required, though unanimity of the other members was necessary. With this opinion, the Council in Dec. decided, by a unanimous vote of all members other than the disputants, that the territory should be assigned to 'Iraq, subject to the prolongation of the British mandate and the assurance of full protection for the Kurdish population. The Turks refused to accept the court's opinion that an arbitral decision was binding, and withdrew from the Council at which the above decision was taken. The British Govt. undertook to ask for authority to accept the prolongation of the mandate for 25 years or until such earlier date as 'Iraq could be accepted as a member of the League, and announced their intention to attempt the renewal of negotiations with Turkey.

During this difficult period the Council took various measures to assist in the maintenance of the *status quo* without hostilities and to investigate complaints as to Turkish deportations of Christians and violations of the frontier. The mission of Gen. Laidoner on behalf of the League for this latter purpose is of special interest as being the first of its kind. (For the general settlement *see* MOSUL.)

The Greco-Bulgar Incident.—On Oct. 19 1925 shots were exchanged between two Greek and Bulgarian sentries occupying frontier posts separated by 40 yards on the frontiers northeast of Salonika. On Oct. 22 Greek troops, under orders from Athens, entered Bulgarian territory through the Struma valley and penetrated about 8 km. on a front of about 32 kilometres. Bulgaria telegraphed an appeal to Geneva asking the secretary general to convene a special meeting of the Council under the powers conferred on him by Article 11 of the Covenant. This appeal arrived on Friday morning, Oct. 23. The secretary general at once decided to convene the Council, and after telephonic conversation with M. Briand, the president for the time being, fixed it at the most quickly accessible place, Paris, and at the earliest date physically possible for members requiring to come from Stockholm, London and Rome, Monday, Oct. 26. At the same time it was arranged that a telegram should be sent to both governments in M. Briand's name, as president, calling on both sides to abstain from all hostilities. This telegram was also dispatched the same Friday morning. Preparations had been made for a Greek attack on the Bulgarian town of Petrich with a force of 1,000 men and three batteries at 6 A.M. on Saturday, Oct. 24; and the Bulgarian Commander had orders to resist. Briand's telegram, arriving in the two capitals on Friday, was immediately effective. Orders arrived from Athens just in time to stop the Greek attack on Petrich.

On Monday, the 26th, the Council met in Paris. The situation of immediate danger, viz., the presence of Greek troops in Bulgarian territory, was at once dealt with. Evacuation was demanded within a time-limit of 60 hours, and an assurance that the necessary orders had been given was asked within a time-limit of 24 hours. The same day orders were telegraphed to British, French and Italian military attachés to proceed from Belgrade and Athens to supervise the evacuation. The attachés received their instructions on Tuesday, proceeded immediately by special trains, and arrived on the scene of action about 2 P.M. on Wednesday, Oct. 28. There followed one of the most dramatic and significant scenes in history. The attachés at once summoned the two commanders and gave them detailed instructions in the name of the League of Nations as to the evacuation, prescribing the times at which the evacuating troops should move and the interval which was to elapse before Bulgarian troops might enter the abandoned territory. Within about 11 hours of the officers' arrival, and eight hours before the expiration of the time limit, the last Greek soldier left Bulgarian soil.

The Council proceeded to deal with the question of reparation and of safeguards against the recurrence of similar incidents. They appointed a commission, under the chairmanship of Sir Horace Rumbold, and including French and Italian generals and Dutch and Swedish civilian members. The commission reported to the council at Geneva at its meeting in the first week in December. Its findings (*see* BULGARIA) were approved by the Council and accepted by the two governments. The incident was closed and future security in the Balkans substantially increased.

The League in this case acted with promptitude and efficacy. The spirit expressed and developed at the recent Locarno conference, the relative weakness of the countries directly concerned and the fact that this was the kind of problem with which the League was designed to deal, and was not complicated by the difficulties of incompletely defined treaty provisions, all doubtless contributed to this result.

These eight cases have been chosen as best illustrating the character of the political problems with which the League was faced during the years 1920-5, and its method of working. Other disputes were brought before the League: between Hungary and Rumania about the expropriation of certain Hungarian nationals in Transylvania; between Hungary and Austria about the Burgenland; between Hungary and Czechoslovakia about a frontier delimitation; between Finland and Russia about Eastern Karelia; a frontier dispute (Jaworzina) between Poland and Czechoslovakia, and a dispute between France and Great Britain with regard to the nationality of persons born of British parents but resident at Tunis.

Two Comments.—In reviewing the League's action in these political disputes as a whole, two comments at once suggest themselves:—

1. The extent of the League's power to act effectively necessarily varies with the general international relations of the governments in and outside the League. After Locarno the Council deals promptly and decisively with the Greco-Bulgar trouble. With the Vilna incident, which occurred when the relations between the principal powers were difficult and complicated by many divergencies of policy in other questions, the action is slow, indecisive and unsuccessful.

2. The League, whose normal task is to preserve peace on the basis of treaties fully concluded, is placed in a difficult position when it is asked to complete the work of settling terms of peace. In the Upper Silesia, Memel, Vilna and 'Iraq cases this was a complicating factor. In such cases the treaties are either incomplete or ambiguous; they may be complicated by *obiter dicta* in the course of the negotiations; the League is held responsible by public opinion not only for a decision within the limits of its mandate but for the character of the mandate which it has had no power to vary; and by the very fact that it is continuing the work of making terms imposed by a victor its impartiality is compromised.

DISARMAMENT AND SECURITY

The reduction of armaments is the first of the specific tasks imposed by the Covenant. There is none on which the League has achieved so little direct and tangible result, for armaments remain, in the world as a whole, at a level not very substantially lower than in 1913, and no reduction is directly traceable to League action. But the indirect results have been of great importance. For it at once appeared that reduction of armaments required an increased sense of security; and the search for methods of obtaining this led to the growth of a belief in all-inclusive arbitration, the most notable and fruitful political development since the Covenant.

The first action of the League was to appoint a "temporary mixed commission" to prepare the way for armament reduction. This commission, consisting partly of politicians (though not representing their governments), partly of military and other technical experts, and partly of persons representing special classes of public interest (*e.g.*, working-class opinion), finally elaborated a draft treaty of mutual assistance. The basic principle was a combination of a general and special guarantees. Within the cadre of a general treaty, groups of states would enter into detailed arrangements to support each other if attacked, and as a condition of being entitled to this support they would agree to proportional disarmament. The proposal was criticised on the ground that the detailed plans for reciprocal military support contemplated would be unlikely in fact to lead to reduced armaments and, above all, that the authorised grouping of friendly states against prospective enemies was in conflict with the essential spirit of the League. At the 1924 Assembly, when it was clear that these objections would be fatal to the draft Treaty, the whole problem was reviewed on another basis. In a month the "Geneva Protocol" was elaborated and unanimously agreed for recommendation to the governments (*see* SECURITY).

This second scheme also failed to win acceptance, the new Conservative Govt. of Great Britain taking the lead in its rejection as the previous Labour Govt. had led the opposition to the earlier treaty. Great Britain was not prepared to accept the unlimited obligation of arbitration in her own disputes, or the responsibility of assisting the enforcement of such arbitration over an unrestricted range of other countries who might accept the obligation.

Apart from the objection of substance made to certain of the principles of these two schemes, it may be suggested that their rejection was in part due to the methods and procedure by which they were framed, which differed from the ordinary practice and traditions of the League. The temporary mixed commission included in one body diverse elements (statesmen, experts, etc.) who, under the ordinary League system, are separated into

clearly differentiated committees, each with its own competence and defined rôle. In fact, serious misunderstandings sometimes arose as to the extent to which a statesman connected with a government, but not on this matter representing it, might be taken to be reflecting its policy or a policy it might be induced to accept. Moreover, the commission for a technical body, which it was in principle, perhaps worked too long without the effective direction of a political authority like the Council. The Geneva Protocol, on the other hand, was dealt with too rapidly by the political body, the Assembly, the work of experts having to proceed simultaneously with the political discussions and not having preceded them, as is the normal League method. The consequence was that the Assembly was acting more as an advisory body recommending a scheme than a political authority of fully accredited representatives. For so important a project the work of political preparation had been inadequate.

When all is said, however, it is difficult to regret even the haste of the 1924 Assembly, for the demonstration which it gave of the genuine desire of a large part of Europe for all-inclusive arbitration, and the impetus it gave to the movement towards arbitration throughout the world, have been perhaps the most important factors in political history since 1919.

Certainly the preparation of these two schemes was essential to the Locarno agreements of 1925. By " preparation " of course is not meant merely the technical elaboration of the proposals. In international agreements, that is always the least part of the work. It is the preparation of the public opinion of the world, of the minds of ministers and their advisers, which is the important thing. The preparation, in this wider sense, at Geneva was the indispensable basis of the Locarno treaties. These treaties provide for all-inclusive arbitration, on very much the Protocol principle, but over a restricted though wide range of countries; and for mutual guarantees and support somewhat similar to those of the original treaty of mutual assistance. It is, however, of their essence that the main vital guarantee is " bilateral " and not based upon a grouping of Powers presumed to be friendly against others presumed to be unfriendly.

Traffic in Arms.—Apart from these efforts to deal with the fundamental problem involved in the reduction of armaments the League has worked at the two subsidiary and connected questions of the traffic in arms and their private manufacture.

A Draft Convention to regulate traffic in arms was drawn up at a conference of 44 states, including the United States, Germany and Turkey, in Geneva in June 1925. The object of this Convention is to establish a general system of supervision and publicity over the international trade in arms and munitions, and a special system for certain land areas and maritime zones. Governments alone are to have the right to export or import arms exclusively designed for war, and a licensing system is provided for. In general, it may be said that the Convention does not give any effective authority to control traffic by international action, but is likely to provide the publicity which is the first condition of either national or international restriction when that proves practicable. This international aspect of private manufacture of arms, is still (1926) under preliminary study.

The Saar, Danzig, Mandates, Minorities

In certain areas of the world the League, normally an instrument through which sovereign states settle their differences or co-operate in matters of international concern, has itself direct and special responsibilities for government and administration. In the Saar it has the full responsibility of a sovereign state, exercised through a permanent commission appointed by and responsible to the Council. The small free city of Danzig is under its special protection, and a resident High Commissioner of the League acts as arbitrator on disputes between the free city and Poland. Over the large area of the mandated territories separated from the German and Turkish Empires by the terms of peace, it is responsible for seeing that the mandatory powers govern and administer in accordance with the mandate and the provisions of the Covenant. And in a number of states it has duties with regard to the protection of minority populations.

The Saar Basin.—The Saar Basin (*q.v.*) is a mining district, with a predominant German population of some 700,000, which the Treaty of Versailles transferred from Germany to the trusteeship of the League for 15 years, after which its future fate is to be decided by a plebiscite. The treaty prescribes the form of government through a governing commission, subject to the Council of the League only, the inhabitants having no rights of representative government outside purely local administration, though the Commission are required to consider the views of elected representatives before changing the laws or imposing new taxes. The treaty also transferred the property in the mines to France in compensation for the destruction of the mines in Northern France.

The Saar Govt. is thus, by treaty provision, not by League decision, purely autocratic and unrepresentative. With an overhanging plebiscite and situated between France and Germany, it was inevitable that its inhabitants should have developed an extremely sensitive political consciousness and that the district should have been a mirror reflecting the controversies of its two great neighbours. There has in fact been considerable political friction and tension, varying directly with the changing political relations of France and Germany.

The Council and the Commission have been criticised for some of the appointments on the Commission, for the introduction of the French franc as the sole legal tender, for questions affecting education, for certain administrative decrees designed to prevent disturbances during a strike in 1923, for the presence of French troops for the maintenance of order which the treaty contemplated would be undertaken by local gendarmerie, and in general for an undue regard for French interests. The inquiry made by the League in July 1923 showed that some of the charges were not without foundation. The Commission has now developed an elected advisory council, designed to give as full representation to the wishes of the inhabitants as is possible under the autocratic régime imposed by the treaty; the administrative measures complained of in 1923 were changed with the termination of the strike; French troops were gradually replaced by local gendarmerie, and the political tension generally relaxed with the improved relations of France and Germany.

The main grievances, substantial though they had often been, have in reality been complaints against the provisions of the treaty, against conditions which those provisions made practically inevitable. Entrusted with the execution of terms imposed by the victor, the League is at once compelled by those terms to action which bears the mark of its origin, and at the same time is criticised by the standards properly applicable to an international authority which is not only impartial but unfettered.

Danzig.—The free city of Danzig, a small wedge between East Prussia and the Polish Corridor, is important as the chief outlet to the sea for Polish trade. To act as a kind of court of first instance for the disputes bound to arise out of the intricate and nicely balanced provisions of the Danzig constitution (*see* Danzig) it was provided by the Treaty of Versailles that the League should appoint a resident high commissioner, a further appeal lying to the Council. There has been great tension and mutual suspicion throughout practically the whole six years between Danzig and Poland, such as sometimes almost to make negotiations between the two impossible. Under these conditions the Council has had to devote much time at nearly every meeting to disputes of which the one about Poland's right to have post-boxes under her own control within Danzig is typical and the best known. The economic life of the city has on the whole been satisfactory, the vessels entering the port and the exports rising considerably above the pre-War level. The demoralisation of the German mark caused great difficulties, however, and capital was urgently needed to adjust her port and other facilities to the new conditions. The League gave an expression of its special interest in the city by assisting her to introduce successfully a stable currency of her own and later to raise a municipal loan for development purposes.

Mandates.—The German colonies and the Arab provinces of the Turkish Empire, ceded as a result of the World War, were not transferred to other states in full sovereignty. Their administration was entrusted to different mandatory powers under the general supervision of the League. For the terms on which the mandates were given and the general supervision exercised by the League through the permanent mandates commission, *see* Mandates.

It is difficult to measure the extent to which this system of supervision does in fact modify colonial administration. No indication can of course be found by searching the League records for instances of censure and repentance. That is not the way in which the influence of a collective opinion operates, or can operate, without disruptive results on the conduct of Great Powers. That does not mean, however, that this influence is not profoundly effective. Mandatory powers and their administrators are keenly sensitive to the candid and informed criticism which is always forthcoming in the Commission's meetings, even if it finds little reflection in the public resolutions; and the desire to avoid risk of exposure to it is a factor in daily colonial administration comparable with the influence exercised by Parliament on Whitehall by the right to ask questions of the responsible minister.

Minorities.—The work of the League in the protection of minorities (*q.v.*) is one of the most important, and perhaps the most delicate

of all its current duties. Nine states are under treaty obligation, and five others have by declarations accepted a similar engagement, to observe in their administration certain principles designed to secure to racial and religious minorities within their territories protection of life and liberty, the free exercise of religious rights and the free use of their native tongue, with opportunities of education in it where it is the native tongue of a considerable proportion of the population. The minorities number in all some 30,000,000, and are so situated that no possible treaty provisions or frontiers could have given them rights of sovereign self-government without creating innumerable states or enclaves. They are free citizens of the states to which they belong, and the only ultimately satisfactory solution is that they should become indistinguishably incorporated in the general political life of the country. In the meantime the racial, religious and traditional feelings of enmity between them and those who form the majority of the population subject them to the dangers of differential majority government and administration.

The difficulties so caused constitute perhaps the greater part of the political troubles and political dangers of Europe. It is a problem of peculiar delicacy, for the minorities constitute a kind of state within the state, and interference with or even open criticism of the government on which the daily conditions of their life depend may always do more harm than good. For this reason complaints are only considered officially by the Council if they are put on the agenda by a member of the Council, who satisfies himself that they are sufficiently serious and well founded to justify this action; and the council itself deals directly with these questions, not entrusting them beforehand to any technical committee. The League's influence is exercised for the most part in the form of private representations and conversations which gain their authority from the fact that the sanction of a public discussion at the Council always remains as a possibility in the background.

Economic and Financial Reconstruction

The reconstruction work of the League shows, better than anything else, that the League is not confined to a limited range of special tasks, but is an instrument which the governments of the world can use for any form of international co-operation they wish to undertake. The Covenant imposes scarcely any specific economic or financial duties. It implies the preparation of economic sanctions; it contains the obligation to secure and maintain freedom of communications and transit and (in a vague and ambiguous phrase) equitable treatment for the commerce of all member states; but there is nothing which directly contemplates such tasks as that of the financial restoration of a country.

The League's work in this sphere began with the Brussels financial conference held under its auspices in Sept. 1920. Experts from 39 countries, named by the governments but not representing their policy, met to consider the methods by which stable finances and currencies could be restored. They drew up a series of unanimous resolutions which, elaborated as they were by the later Genoa Conference of 1922, have since served as a useful guide and support to countries attempting to restore their finances. More important, however, than the establishment of this general body of doctrine was the League's practical work in itself restoring the finances of two countries, Austria and Hungary, whose problem was beyond their own unaided resources.

Austria.—It is interesting to observe the mechanism of the League in dealing with the extraordinarily complex political and financial problem of the republic of Austria (*q.v.*). A sub-committee of the Council handled the political aspects of the question. The financial committee worked out a technical scheme of reconstruction; the economic committee considered what immediate economic measures would be useful; a legal committee worked side by side and prepared the formal instruments to embody the technical recommendations; and behind all the Assembly provided the motive force of the collective good will of the world towards an effort to save a member state from destruction. The composition of the financial committee, on which the heaviest burden fell, deserves special attention. It consisted of experts, partly drawn from national treasury departments and partly from private finance. They sat as experts and not as representatives of governments, and were thus able to recommend proposals involving government action, without waiting for the assent of the governments. At the same time, their position enabled them to estimate with special knowledge how far it was possible to induce the several governments to go.

The principles of the scheme proved of such importance in the future history of European recovery, and were so novel and untried at the time, that it is well to summarise them briefly. The immediate trouble with Austria was that her currency was rapidly falling to zero. This was due primarily to the fact that the revenue was insufficient for the public expenditure, and the government, having no other resources, was meeting the deficit by printing notes. The scheme therefore provided that the inflationary issue of notes should cease and, to assure this, that the right of note issue should be transferred from the government to an independent Bank of Issue, working on commercial principles. This of course did not solve the problem. Inflation resulted from the unbalanced budget. Austria was, therefore, required to undertake internal reforms which would bring the budget into equilibrium. As this would take some years, and it was essential to stop inflation at once, it was proposed to raise an external loan of some £27,000,000 which would be available to meet deficits during this period. As security for this loan Austria's assets, primarily her customs and tobacco receipts, were assigned and placed under control. At the time, however, there was an obvious danger that Austria herself would fall to pieces, in which case her customs and tobacco receipts might also disappear. They were, therefore, an insufficient basis on which to issue a loan. This difficulty was met by securing government guarantees of the loan, in different proportions, from Great Britain, France, Italy, Czechoslovakia, Sweden, Holland, Belgium and Denmark, two other countries, Spain and Switzerland, associating themselves with the loan in a somewhat different form. In addition, a political protocol was signed assuring Austria's political and economic independence. Lastly, there was to be a Commissioner-General responsible to the council in general control of the whole scheme, controlling the assigned revenues, holding the proceeds of the loan, and supervising the reform of the Austrian budget.

The scheme was therefore essentially one of *financial* reconstruction. It did not directly undertake the economic restoration of the country. Its contribution to economic development was to afford the indispensable basis of a sound currency.

This work is now practically completed. The currency was at once stabilised in 1922 and has remained absolutely stable ever since, the only currency in Europe remaining stable throughout the period. Taxation receipts covered ordinary expenditure during 1924–5 and a large part of the reconstruction loan has been available for increasing the capital resources of the country by productive investment. The control of the budget ceased on Dec. 31 1925, and it is anticipated that the office of the Commissioner-General will be terminated before the end of June 1926.

Hungary.—The results in Austria led, a year later, to a request for similar aid from Hungary, whose currency and finances reached the same position as Austria's, though more slowly. Here the problem was technically easier, as Hungary had a solid agricultural basis for her economic life and was more than self-sufficient in the primary necessities of food. But it was politically more difficult, for her neighbours, particularly Czechoslovakia, Serbia and Rumania, speculated anxiously as to the attitude of a restored and strengthened Hungary, and their relations with her were embittered by many unsettled disputes. The League could not act except at the unanimous wish of all the interested countries, who included Hungary's neighbours, and it looked as if this would prove an insuperable obstacle. Under the influence of the League, however, these disputes were settled—with an incidental advantage to the political situation of Central Europe extending far beyond the immediate results of the reconstruction scheme.

The scheme was identical in its main principles with the Austrian, but the loan was less than half the amount, it was issued without government guarantees and provision was made for a moderate reparation payment under technical conditions which afforded a valuable precedent for the German problem. The Hungarian crown was at once stabilised in relation to sterling and with sterling has now gone on to gold. The budget recovered its balance after the first few months. Control began on May 1 1925. The first subsequent financial year (July 1 1924 to June 30 1925) showed a surplus of 63,000,000 gold crowns and there was a further surplus in the first six months of the following financial year. The great bulk of the loan, therefore, not being required for its primary purpose of meeting budget deficits, will be devoted to productive investment. It is anticipated that the control will end with a declaration by the Council that the financial stability of Hungary is assured at about the same time as the Austrian, *i.e.*, in June 1926.

German Reparation.—Though the League had no direct responsibility for handling the German reparation problem, the experience gained in the Austrian and Hungarian schemes certainly contributed to its solution. The most important principles of the Dawes scheme had been anticipated, and for the most part tried in practice, in these earlier schemes. It is sufficient to mention the stabilisation of the currency, the foundation of an independent bank of issue, the provisions for the maintenance of budget equilibrium (with the important difference that no general budget control was necessary in Germany), the fixation of reparation payments not for all time but for a considerable period, the principles of the control of the assigned revenues and the "transfer" system.

Greek Refugee Settlement.—Reconstruction work of a somewhat different kind has been undertaken by the League in the settlement of Greek refugees (*see* Refugees) who to the number of nearly 1,500,000 or more than a fifth of the population of Greece, fled back to Greece as a result of the Greco-Turkish War, a task evidently beyond the unaided resources of Greece. With the aid of the League a loan of £10,000,000 was raised and employed to settle the refugees

in productive employment, mainly upon the land. The work, directed by a refugee settlement commission, consisted of an American chairman and a British vice-chairman, selected by the League, and two Greek members, chosen with the Council's approval by the Greek Government. The bulk of the refugees were housed, allotted land, and started on their new careers with a small initial capital and the necessary equipment.

Among other work carried on under the direction of the financial committee have been the introduction of a new and stable currency, later followed by a municipal loan, for Danzig; financial advice to Estonia and Albania; and a study, which is still continuing, of the problem of double taxation.

Trade and Commerce.—Meantime the economic committee has been working patiently at the task of securing more "equitable treatment" for commerce in the spirit of Article 23 of the Covenant, and in removing impediments to international trade. The most important achievement in this sphere was the conclusion in Oct. 1923, of a convention for the simplification of customs formalities. In addition, a convention has been arranged which has removed some of the obstacles to commercial arbitration. The committee have also considered the equitable treatment of foreigners (the recommendation of a code of principles to guide governments in their treatment of foreign enterprises established in their territories) and the suppression of fraudulent trade marks. They have embarked upon an attempt to secure the abolition of prohibitions of exports and imports.

A communications and transit committee, with numerous subcommittees, includes experts in land, sea and air transport, and is responsible to a periodical conference. The first important conference was held at Barcelona in 1921, when two conventions were approved laying down the general principles that transport originating in one state and crossing a second into a third, or transport making use of through international waterways (*see* INLAND WATER TRANSPORT), should enjoy complete liberty of transit with equal treatment for all flags and freedom from customs duties and vexatious dues. A second conference held at Geneva in Nov. 1923 dealt with international railway traffic, equality for shipping in maritime ports, the transmission of electric power across a third state and the development of hydraulic basins situated between two or more states. The maritime forts convention, drawn up at this conference, provides for equal treatment of all states in port dues and regulations, while the railway convention codifies existing railway practice as regards international traffic and aims at simplifying frontier formalities for passenger and goods traffic. All the conventions concluded at these conferences provide for machinery of compulsory arbitration similar to those contained in the clauses of the Peace Treaties of 1919 relating to communications and transport. In such cases the transit committee of the League acts as a mediatory body before a case goes for compulsory settlement to the international court of justice. The transit organisation has been instrumental in effecting considerable improvements in the passport system (particularly in the abolition of visas in many cases) and it has arranged a further passport conference to continue this work in 1926.

Among other questions studied are the reform of the calendar, commercial aerial law, wireless regulations, international motor drivers' licences, etc.

MISCELLANEOUS QUESTIONS

The League is also an instrument of positive co-operation in work of general benefit to the world. The short space here allotted to this must not be taken as an adequate measure of its relative importance in the general achievements of the League. For its health work the League has the assistance of a technical health committee, composed, like the financial, economic and transit committees, of experts. This health organisation has had the active co-operation of the United States, Germany and Russia, as well as the member states, and its activities have extended throughout Europe and the Eastern Mediterranean, tropical Africa and the Far East.

Public Health.—Its first important work was to assist Poland by means of an Epidemic Commission with the best western experience to prevent the spread of typhus through Poland to Europe. For this purpose it was necessary to attack the problem in Russia itself, and the Commission went to Russia, established effective co-operation and opened offices in Moscow and Kharkov. This was followed by a European conference at Warsaw in May 1922, attended by Soviet Russia, the Ukraine, Turkey, Germany and 24 other states. A draft convention was drawn up and has since become the basis of bi-lateral agreements between the nations adjoining Poland and Russia. Public health courses were arranged for health officers at Moscow, Kharkov and Warsaw. The Epidemic Commission next gave assistance to the Greek health authorities in dealing with the dangers of epidemic resulting from the sudden immigration of masses of Greek refugees in and after the Greco-Turkish war.

Apart from such emergency assistance, much has been done to secure an interchange of knowledge and experience between the public health organisations of the world, to promote their co-operation and to study the characteristics of special epidemic or endemic diseases and the methods of combating them. Various missions have visited the Eastern Mediterranean, the Far East, Greece and Albania, the Balkan States, Russia and Italy, Palestine and Syria and Persia. Scientific work is also being done with a view to the standardisation of sera and of certain drugs for the treatment of diphtheria, tetanus and dysentery.

An interesting experiment, which has been made possible on a large scale by the generosity of the Rockefeller Foundation, is the interchange of selected officers of health administrations. Officers of one country visit those of another, study their methods, participate for some weeks or months in practical work and then meet at Geneva to compare results. Lastly, the health organisation maintains an epidemiological intelligence service, publishing at regular intervals detailed information of the movement of epidemic disease throughout the world.

Drug Traffic.—Of what may be called the social questions handled by the League the control of noxious drugs, and particularly opium, has been the most difficult and important. The League took as its starting point the Opium Convention of 1912, which had been signed by most countries in the world. An advisory committee was appointed to prepare a plan to make the application of this convention more effective in practice. They took as their aim the restriction of the traffic to medicinal and scientific requirements, and started an investigation to discover the extent of these requirements. Finally, the U.S. Govt. sent a delegation to participate in the work of this committee, and in any conference which might follow, and to attend the 1924 Assembly which reviewed the progress of the previous year and a half. Two plenipotentiary conferences followed in the winter of 1924–5. The first of these dealt with the question of the gradual suppression of opium smoking in the Far East with a view for its ultimate abolition.

At this an agreement was reached under which the signatory states undertook (*a*) to strengthen the measures already provided for in the convention of 1912 and (*b*) to suppress entirely the consumption of prepared opium in their respective territories within 15 years from the date at which the poppy-growing countries should succeed in preventing the clandestine exportation of raw opium from constituting a serious obstacle to the restriction of consumption in the former territories. The second conference drew up a convention for the more effective restriction of the production or manufacture of narcotics and of the international trade in them. The latter is to be controlled in particular by a system of export authorisations and import certificates. A permanent central board is to be established which is to receive periodical estimates from the contracting parties of the quantities of narcotics they need and ask for explanations if they are such as to suggest a danger of illicit traffic. A further protocol engages the signatory states to take measures which shall completely prevent, within five years, the smuggling of opium out of their territories from constituting a serious obstacle to the suppression of the use of prepared opium in other countries.

The American delegation had brought a complete programme of their own, which they failed to get adopted. The chief difference was that they wanted a more definite undertaking than the other countries thought practicable for the restriction of the growth of the raw product and for the cessation within a term of years of the prepared opium. They ultimately withdrew from the conference, as did China.

White Slave Traffic.—Certain work has also been done by the League in connection with the traffic in women and the protection of children. A convention was drawn up by the 1921 Assembly strengthening in certain respects the provisions of two pre-War conventions dealing with traffic and has been signed by 33 states. The problem is also being studied by one of the two committees of the Commission for the protection and welfare of

children and young people, which includes representatives of voluntary organisations and makes annual recommendations to the Assembly. The study of child welfare is undertaken by the Child Welfare Committee of this Commission.

Apart from this general work the League took direct practical measures in 1921 to rescue, and where possible restore to their own people, women captured and removed from their homes during the military operations in the Near East, houses of refuge being established at Constantinople and Aleppo. Lastly, in 1923, the League arranged a conference at which a convention was drawn up to assist in the suppression of the international traffic in obscene publications.

Humanitarian Work.—Two important pieces of humanitarian work have been undertaken by the League through Dr. Nansen. In 1920 large numbers of war prisoners were still in Russia and adjacent countries awaiting the means of repatriation. With the aid of certain charitable societies Dr. Nansen organised a fleet of steamers under League charter in the Baltic and Black seas and 427,386 prisoners of 26 different nationalities were repatriated at the astonishingly low cost of less than £1 a head. Dr. Nansen also undertook somewhat similar work for the settlement of large numbers of Russian refugees. Their movements were assisted by the invention of a special system of identity certificates, as a substitute for passports, and considerable progress has been made in finding them employment.

Two other pieces of humanitarian work may be mentioned in conclusion, a convention drawn up at the 1925 Assembly for the suppression of slavery (*q.v.*) and restriction of forced labour, and the scheme prepared by Senator Ciraolo and now being worked out in collaboration with Red Cross organisations, for the provision of insurance against national calamities such as earthquakes. Among other tasks, the most novel departure has perhaps been the work of the committee on Intellectual Co-operation (*q.v.*) which has till recently been presided over by M. Bergson and has included among its members Prof. Einstein, Madame Curie and Prof. Gilbert Murray.

Under Article 24 of the Covenant some international bureaux established by convention must be, and others may be, brought under the League. Four such organisations have now been affiliated, viz.: relief bureau (for the repatriation of distressed persons), a hydrographic bureau (to secure co-ordination in hydrographic work), an office for the control of liquor traffic in Africa and a committee for air navigation. The League issues a handbook giving information about some 360 international organisations and a quarterly bulletin giving some account of their work.

Summary of Work

In these six years (1919–25), therefore, the League has averted hostilities in some half-dozen cases and probably prevented at least minor wars in several of them. It has made a substantial contribution to Europe's recovery by the guidance and influence of the Brussels Financial Conference; by the direct reconstruction of Austria and Hungary; by the model so afforded for the solution of the German problem and the self-restoration achieved in other countries; and by a series of transit and customs formalities Conventions and other measures designed to remove the impediments to international trade. It has repatriated some hundreds of thousands of refugees and established nearly 1,000,000 in productive employment in Greece. It has exercised a varying but increasing influence over the government of some 30,000,000 of minority populations entrusted to its guidance. It has supervised the mandatory administration of the former colonial Empire of Germany and Turkey. It has directly governed the district of the Saar and has assisted in the government of Danzig. It has worked at a number of social problems, the regulation of opium and other drugs, and the protection of women and children.

Apart from these tangible and visible results, it has penetrated and modified the policies of national governments through the regular contact, and co-operation in international work, of Foreign Ministers, quarterly and annually at meetings of the Council and Assembly, and of their advisers and technical assistants both at these meetings and at a series of technical conferences and discussions. Beginning with disarmament but extending to security, it has prepared the way for the great extension of comprehensive arbitration embodied in the Locarno agreements and doubtless destined to extend beyond them.

On the other hand, the League remained long impotent before the protracted conflicts which reflected the incompleteness of the conclusion of peace in 1919 both in diplomacy, as in the reparation question, and in actual hostilities, as between Greece and Turkey. In some of the disputes which it has handled, it has been indecisive or ineffective; in others, the nature of its action has apparently been determined as much by the relative strength of the disputants as by considerations of ideal justice. It has made no material progress in securing disarmament. Its work in removing the fundamental causes of war, and in particular those which spring from economic policy, has only begun.

Whether these results will be regarded as disappointing or as satisfactory will doubtless depend mainly on the standard by which they are judged. By comparison with the pre-War position and methods of negotiation there can be no doubt that they represent a very great achievement. No better illustration can perhaps be found than in two references to Lord Grey's book, *Twenty-five Years* (1926). Of the London Conference of Ambassadors of 1913, for example, he says in effect that it lasted eight months, discussed minor questions and settled nothing, but was well worth while because it gave the world a sense of confidence to think that there was some method of international contact during a period of tension.

In contrast with this, even the Assembly of 1925, the least spectacular of recent years, in three weeks dealt with a mass of useful work, of real if secondary importance, and the assurance of a regular method of international contact is now not temporary but permanent. Still more significant is the account which Viscount Grey gives of the conference of the Balkan Powers when they met, as it happened in London, after the first Balkan conflict of 1912. He believed that the policy they were discussing would mean both the resumption of war and a disastrous result, as indeed it did. But neither Great Britain nor any other Great Power was directly concerned. If his opinion were asked in unofficial conversations he gave it, informally, tentatively—and in fact without effect. Neither he nor anyone else felt able to intervene in a matter directly affecting only the negotiating States. The second disastrous war followed. In contrast with this the settlement of the recent Greco-Bulgar dispute of 1925 illustrates the recognition of the new principle that a war is the concern of the whole world.

If, however, our standard of judgment for the results of the six years is not the pre-War position but the ultimate ideals of the League, it is no less clear that the League's work is only in its infancy. The League is not yet universal in its composition. Its ability to deal with a first-class dispute between first-class Powers has fortunately not yet been tested. There is as yet no complete assurance that such a dispute would find the League united and effective. Nor has more than a beginning been made in removing the causes from which such disputes may arise. This, the ultimate object of the League, must in the nature of the case be a progressive, and indeed a permanent task. It means a complete, if gradual, revolution in the traditional and historic attitude of the nations of the world to each other and a transformation of many of their policies. In this work the League may lead, but it can never advance far beyond, the public opinion of the world. The scope is illimitable and the task unending.

Bibliography.—The main authorities are the League's own publications, which give complete information as to all its activities. In the first place the *Official Journal* contains the minutes of the Council with the documents presented to it; while the records of Assembly meetings are issued in special supplements. All Treaties registered under Article 18 of the Covenant are published in the *Treaty Series*. All reports of specially appointed League Commissions are at once published, as are also the periodical reports of permanent officers and authorities carrying on League work (such

as the Commissioners General in Austria and Hungary, the Greek Refugee Settlement Commission, the Saar Governing Commission, etc.). As these official records are very voluminous the League also publishes (*a*) an abbreviated *Monthly Summary*, giving a regular account of League activities and (*b*) a series of special pamphlets as to special tasks (health work; reconstruction of Austria; mandates, etc.) and a general summary "A Survey." In addition, the League issues technical publications on various subjects of world interest. Of these the most important are the *Economic Publications* (including a *Monthly Bulletin of Statistics*, which gives a synopsis of all main statistics indicative of economic development throughout the world, and annual publications on *Currency, Public Finance, Trade and Commerce*), a *Military Year Book* and a *Monthly Epidemiological Report*. These publications are issued in English and French through League agents (in England Messrs. Constable).

Books on the League work are numerous, especially with regard to special subjects (the Saar, Opium, etc.) and the general principles and conception of the League. Of those which summarise the general work of the League the following may be mentioned: Publications by the League of Nations Union (1920, etc.); Organisers of the League of Nations, *The League of Nations Starts* (1920); W. Schücking und H. Wehberg, *Die Satzung des Völkerbundes. Kommentiert* (1921); L.V.A. Bourgeois, *L'Oeuvre de la Société des Nations 1920–1923* (1923); P. Munch, *Les Origines et l'Oeuvre de la Société des Nations* (1923); R. Williams, *The League of Nations To-day* (1923); H. G. Alexander, *The Revival of Europe* (1924); M. Fanshawe, *Reconstruction*, a full summary to 1925, well documented (1925). League of Nations Information Section, *Pamphlets on the League of Nations*, its Covenant and its various activities; P. J. N. Baker, *The Geneva Protocol for the Pacific Settlement of International Disputes* (1925); Sir G. G. Butler, *A Handbook to the League of Nations, brought down to the end of the 5th Assembly*, with an explanation of the Protocol . . . with an introduction by the Right Hon. Viscount Cecil of Chelwood, 2nd ed. (1925). The publications of the World Peace Foundation include a number on the work of the League. Among these are *Handbook on the League of Nations, 1920–24*, and the *Yearbook of the League of Nations* (1925). (A. Sr.)

LEARNED SOCIETIES.—Incorporated by royal charter in 1902 "for the promotion of historical, philosophical and philological studies," the British Academy has since 1910 proved itself a potent force in the branches of learning which come within the scope of its activities.

The Proceedings of the British Academy, of which 10 vol. have been published, comprise "communications," together with special annual lectures endowed by private benefactors, or by public subscription. Other publications are *Supplemental Papers* (1911, etc.) and the annual *Schweich Lectures* on Biblical Archaeology, inaugurated in 1908.

The Fund—an anonymous endowment of £10,000—has also enabled the Academy to help forward the work of excavation in Bible lands. The series of *Social and Economic Records* under the direction of the late Sir Paul Vinogradoff, was started in 1908, with the support of a Government grant; five vol. have now been published. A renewed grant in aid of the Academy's work has furthered the continuation of this series. The publication, by the Clarendon Press, of the facsimiled *Old Testament of the Codex Sinaiticus* (1911–22) was made possible by an anonymous gift.

National Commemorations.—Since, in 1908, it organised the commemoration of the tercentenary of Milton's birth, the Academy has become the recognised co-ordinating body for the organisation of similar national commemorations, aided in this by the foundation of the annual Master Mind Lecture (one of a number of endowments, under the will of the late Henriette Hertz). The Academy's activities in furthering the Shakespeare tercentenary in 1916 were stimulated by the establishment, in 1911, of the annual Shakespeare Lecture (endowed by the late Mrs. Frida Mond). The annual Raleigh Lectures on History (founded by Sir Charles Wakefield, in 1919) the tercentenary of the death of Sir Walter Raleigh, were inaugurated by Lord Bryce, president of the Academy, with a survey of world history.

Among other endowments may be mentioned the Warton Lecture on English Poetry; the Philosophical Lecture; the Italian Lecture; the Lecture on Aspects of Art; the Lecture on English Philology and Literary History; the Cromer Prize for Greek Essay; the biennial Prize for English Studies. The Academy administers also the Rose Mary Crawshay prize fund for English literature, an annual prize of £100 awarded to a woman of any nationality for work on English literature.

Educational Work.—The Academy has provided a platform for dealing with educational needs. Thus, the School of Oriental Studies, now an integral part of the University of London, was largely the outcome of a scheme submitted to the Academy in 1904 by the late Professor Rhys Davids. The organisation of Imperial Studies, now recognised in London and in other British universities, was directly due to proposals made by Sir Sidney Low, in a paper read before the Academy in 1912. The English Place-Name Society, founded in 1921, to carry out the survey of English place-names, was inaugurated under the auspices of the British Academy in 1923, as the result of a statement submitted by Professor A. Mawer, now Director of the Society. The membership of the Society, drawn from all parts of the country, already numbers some 700. The foundation of the British School of Archaeology in Jerusalem in 1919 was brought about by the Academy, in conjunction with the Palestine Exploration Fund. Students are now being trained at the school to fill posts created by the formation of a Government Department of Antiquities. The compilation of a register of the archaeological sites of Palestine has been taken in hand. The Government Museum of Antiquities has been organised. The exploration of various sites in Palestine and, not least, the excavation of two palaeolithic caves in Galilee, and the discovery of the "Galilee" skull, are among the early achievements of the school, under the directorship of Professor J. Garstang. The establishment of the British School at Jerusalem, in which the late Professor Leonard King was primarily concerned as initiating the idea, must take an important place among the more recent efforts of the Academy. In all this archaeological work the Palestine Exploration Fund has been foremost and active, and among its recent excavations are those on the Hill of Ophel at Jerusalem, the results of which confirm the view as to the site of the City of David. Meanwhile remarkable discoveries have been made in the Near East (*see* ARCHAEOLOGY: *Western Asia*).

Among the enterprises promoted by the Academy is the *Encyclopaedia of Islam* (1908, etc.)—perhaps the most important project of the International Associations of Academies (which lapsed at the outbreak of the World War). The scheme was launched at the meeting of the Association held in London, 1904. The encyclopaedia is issued in English, French and German. Sir Thomas Arnold, nominated by the Academy, acts as English editor. The Government of India, through the Academy, contributes towards the publication of the English issue.

International Relations.—Internationally, the Academy is closely associated with the newly established Union Académique Internationale, in which body it represents Great Britain. The principal proposals of the *Union* in which the Academy is concerned are the following: (*a*) *Corpus vasorum* (1922, etc.); (*b*) *Catalogue of Alchemical MSS* (1926, etc.); (*c*) *Dictionary of Mediaeval Latin;* (*d*) *Forma Imperii Romani;* and (*e*) supplements to the *Corpora Inscriptionum graecarum et latinarum.*
