Early References.—Cricket, like much else in English history, was not born, but slowly evolved itself as a specialized variety of the generic club-ball. Various authorities have tried to identify its infancy with the Scottish "Cat-and-Doug," with stool-ball, or with a 15th century game "Handyn or Handoute": but Cat-and-Doug was a species of tip-cat, not specifically referred to as a game until 1688 when cricket had already a local habitation and a name: stool-ball was a cousin to cricket, but a younger one and of the weaker sex, an adaptation of the country-boys' game for the dairymaids' use. The claims of "Handyn or Handoute" to be cricket's parent rest solely on the opinion of an 18th century lawyer: commenting in 1766 on the Statute 17 Edw. IV. c. 3 which banned with heavy penalties the said game as one of those detrimental to the practice of archery, he says: "This is perhaps the most severe law ever made against gaming, and some of these forbidden sports seem to have been manly exercises, particularly the handyn and handoute, which I should suppose to be a kind of cricket, as the term hands is still retained in that game." Such a coincidence is surely far too slender to support his deduction: it would, incidentally, be far more appropriate to rackets, in which game both terms still survive intact.

For the practice of cricket in its elementary form of club-ball there is pictorial evidence as early as the middle of the 13th century (*Chronique d'Angleterre, depuis Ethelbert jusqu'à Hen. III.*), and again in a ms. dated 1344 No. 264 in the Bodleian library and as part of the illumination to a decretal of Pope Gregory IX., *circa* 1230 (British Museum, Royal mss. 10 E iv.). This latter has been reproduced in postcard form and is on sale (No. 11 of Set 58) at the British Museum. The first written reference to the game is possibly to be found in an extract from the wardrobe accounts of the 28th year of Edward I.'s reign which, written as was customary in Low Latin, speaks of certain sums disbursed by his chaplain on behalf of the young Prince Edward "ad ludendum ad creag' et alios ludos." It is, at least, arguable that the word "creag" was an attempt to reproduce phonetically a French version (Piers Gaveston was a Gascon) of the native cric- or crig- et, the termination being represented by the ' as was the scribe's practice.

Be this as it may, cricket was being played by boys of the free school of Guildford in or about 1550: for in 1598, John Derrick, then aetat. 59, giving evidence before a jury, testified in so many words to his having played there as a boy himself at "crickett and other plaies." (*History of Guildford,* 1801, p. 202.) In 1598 the London edition of Giovanni Florio's *A World of Words* defines "squillare" as "to make a noise as a cricket, to play cricket-a-wicket, and be merry"; in 1611 Randle Cotgrave's *A Dictionary of French and English* translates "crosser" as "to play at cricket."

Sir William Dugdale (born 1605) refers in some royalist propaganda to Oliver Cromwell as indulging in his youth in "cricket and football," and as acquiring "the name of royster." John Timbs (b. 1801), on the enthusiastic but rather dubious authority of the Rev. Lisle Bowles (b. 1762), refers in his *Schooldays of Eminent Men* to Thomas Ken, in his first week as a scholar at Winchester (Jan. 1650) as "attempting to wield a cricket bat." To support this statement there is evidence for the game being played by Winchester scholars on "Hill's" as early as 1637 (*vid.* the Latin poem by Robert Mathew included in A. K. Cook's *About Winchester College*).

In *The Life and Death of Thomas Wilson* (1672) George Swinnock tells us how that Puritan divine (1601–?1653) went far to convert Maidstone to the proper observance of the Sabbath, though that was "formerly a very profane town insomuch as I have seen morrice dancing, cudgel playing, stool-ball, *crickets* and many other sports openly and publicly on the Lord's Day." In 1654 the churchwardens and overseers of Eltham fined seven of their parishioners for playing cricket on the Lord's Day. Four years later there is a ludicrously lugubrious reference to a cricket ball in *The Mysteries of Love and Eloquence* by John Milton's nephew, Edward Phillips. There appears to have been a cricket club at St. Albans as early as 1666, and ten years later comes the first reference to cricket overseas in the diary of Henry Teonge, chaplain to H.M.S. "Assistance," who records how in May of that year some of the ship's company rode up from Antioch to Aleppo and there "did in a fine valley pitch a princely tent and divert themselves with various sports including 'Krickett'."

Already, in 1668, the proprietor of the Ram Inn, Smithfield, had been rated for a cricket ground; in 1699 the author of *A Worlde Bewitched* is lamenting that cricket in summer "will be very much in fashion"; by 1707, Chamberlayne's *State of England* has been forced to include cricket among the people's recreations and in 1720, the Rev. John Strype, editing Stow's *Survey,* has followed suit.

Organization and Development.—The first definite match of which there is record is to be found in *The Post-Boy* of March 1700, billed to take place on Clapham Common. In 1707 London plays as such, and in 1719 "the Londoners" meet "the Kentish men" in what is virtually the first county match, London being synonymous with Middlesex. There seems no doubt that for the first half of the 18th century, Kent enjoyed the cricket ascendancy, though Sussex had a great cricket nursery in Slindon, and a great champion in Richard Newland, captain of "England" in 1744, and cricket tutor to Richard Nyren, the head and right arm of the famous Hambledon club. Surrey, too, encouraged by the patronage of Frederick Louis, prince of Wales, often pressed Kent hard: Hants is first mentioned in 1728, but though Gloucester appears to have played the game as a county in the same year, and half a dozen other counties had taken the field well before the end of the century, there is no doubt that the greatest enthusiasm and the most expert skill was concentrated in London and in the enclave of the Weald. This was the veritable home of cricket where it had first been developed from the haphazard play of boys with, in all probability, much variant and local custom, into the systematized and serious game of men. Here, on the short turf of the open downs and the meadows of the Inner Weald, it was discovered by Society, when Society, during the Commonwealth, found London uncomfortable and withdrew to its country seats, and from here it was transplanted at the Restoration, partly to the home grounds of its great patrons, the Vine, at Sevenoaks, belonging to the Sackvilles, Bishopsbourne Paddock, near Canterbury, Sir Horace Mann's ground, and perhaps at Goodwood park, where the second and fourth dukes were very great patrons of the game. In London great matches were played on all the southern commons from Chelsea to Clapham, on the White Conduit fields, near King's Cross station, and Lamb's Conduit fields, near the Foundling hospital. But by far the most famous cricket centre was "The Artillery Ground," Finsbury, where the H.A.C. still play to-day. In the middle of the 18th century it seems to have been leased, at least for cricket purposes, to a certain George Smith, host of the "Pyed Horse" inn who settled the gate, normally 2d. but occasionally raised to 6d., did good business over luncheons, dealt faithfully with a gate sometimes, it is said, amounting to 20,000, and numbered among his patrons many of the most distinguished gentlemen in the land. Here was played on June 18, 1744, the famous match Kent *v.* All England, the first game of which the full score is preserved, the first to be enshrined in *Scores and Biographies* and celebrated by the well-known heroic poem by James Love (*alias* Dance) (*see* Ashley-Cooper's edition published by Richards of Nottingham).

The enthusiasm for the game shown by many of the most prominent men of the day, naturally provided a target for the criticism of political opponents and moralizing pedants: Pope and Soames Jenyns both echo this note, whilst in 1778 a bitter lampoon, "The Noble Cricketers," was levelled at the earl of Tankerville and the 3rd duke of Dorset. Much more deserving of censure were the heavy stake-money and side-bets that more often than not depended on big matches, but in a betting age cricket could not escape. The crowds were often disorderly and violently partisan, but could probably bear comparison with some at, *e.g.,* Sydney, a century and a half later.

The next, and an important stage, in the game's development was marked by the rise of the famous Hambledon club. For long celebrated by cricket historians as the "cradle of cricket," this little Hampshire village, some seven miles S.W. of Petersfield, must now resign the title to the hamlets of the Eastern weald and of an earlier day. But glory enough remains: here on the smiling shoulder of Broad-Halfpenny Down (the historic site is now the property of Winchester college and, we may hope, secure from violation), and later on Windmill Down, much closer to the village, the Hambledon club which, it is only fair to say, cast its net as far afield as western Surrey, for 30 years challenged and held at bay all comers: indeed, in June 1777 they beat a representative England XI. by an innings and 168 runs. This phenomenal ascendancy owed something to the eager activities of its greatest patron, the Rev. Charles Powlett, and of its first captain, nay "general," Richard Nyren, but resulted in the main from the coincidence in the area of some dozen men of extraordinary cricket genius, whose profound influence on the evolution of the game's technique will be studied in another place. Fortunate, too, was the club in its historian, John Nyren, Richard's son; his *Cricketers of My Time,* together with *The Young Cricketer's Tutor,* edited by Cowden Clarke and published in 1833, are the first prose classics in cricket's literature.

The Hambledon club played its last recorded match in 1793, appropriately enough at Lord's. This, the acknowledged Mecca of all cricketers, was first opened as a private ground for the benefit of certain members of the White Conduit club by Thomas Lord, a man of Yorkshire stock whose family had lost their considerable property in the '45 and who had himself become ground bowler to that club. Lord had the backing of the earl of Winchelsea and Charles Lennox, subsequently fourth duke of Richmond, two of cricket's greatest patrons; his first ground was rented from the Portman family in the then almost wholly rural district of Dorset Square: in 1809, on Portman proposing to raise the rent, Lord removed to a new ground, part of the St. John's Wood estate, belonging to the Eyre family, but four years later, with the proposed Regent's canal threatening the site, he removed again to the present situation: in each case he relaid the original Dorset Square turf, enclosing his newest ground with a high fence and building on it a pavilion and a tavern. The Marylebone club, which has always made its home at Lord's, was founded in 1788, and that its authority was from the start accepted as paramount is proved by its revision of the laws in the first year of its existence.

For half a century, at least, the M.C.C. was the great match-making agency in cricket, inviting subscriptions from its members to meet match expenses, and advertising the games in advance at the chief London social clubs. County cricket for long owed its existence to the patronage of local enthusiasts: the days of the regular country cricket club were not yet. Most of the big matches were still played for money and were a field for heavy wagering by professional backers, even the famous Crockford and Gully being sometimes visible with less distinguished "legs" in front of the pavilion at Lord's. With a close match the first consideration, games were constantly arranged at odds, whether of numbers or of given men. Single wicket matches also excited great interest, and at intervals challenge games were played for a so-called single wicket championship: with the laws governing single wicket favouring the fast bowler and hard hitter, it is not surprising that Alfred Mynn in the '30s should have stood *facile princeps.*

In 1836 the first North *v.* South match was played, clear evidence of the spread of cricket: as a matter of fact, Nottingham was playing Sheffield in what was for long a local test match, as early as 1771; and the M.C.C. visited Nottingham 20 years later. Notts. first took the field as a county in 1835 and Yorkshire in 1833: Leicester, Norfolk, with Fuller Pilch as a native, and Cambridgeshire soon followed their lead. The missionary efforts of the M.C.C. began in 1846, to be seconded by the touring cricket of the All-England eleven, a team representing the flower of English cricket, mainly professional, but including one or two of the leading amateurs, the organization and maintenance of which over a period of years was due to the business enterprise of the great Notts. bowler, William Clarke. This eleven played all over the country and were the focus of attraction wherever they went, winning to knowledge and appreciation of the game whole districts where hitherto it had been unappreciated or undeveloped: their matches were the great trials of budding talent, and many a young professional was discovered and launched on a successful career through the medium of the "A.E.E." The success of Clarke's venture, and possibly his close-fistedness, led in 1852 to the secession of some of the leading professionals and their formation, under the management of John Wisden and Dean of Sussex, of the United All-England XI. These two elevens virtually monopolized the best cricket talent in the country, and the annual match between the two at Lord's, on Whit Monday, first played in 1862, continued for nearly 20 years to be voted the great event of the season. Eventually they had both to give way before the rising tide of county cricket.

County Cricket.—The origin of county cricket may be found in the local antagonism of eastern and western Weald: with the adoption of the game by the "gentry" and its rapid systematization, we can trace successive county supremacies enjoyed by Kent (*circa* 1750), Hampshire (1780–90), Surrey (1790–1810), when William Beldham and William Lambert, the two greatest players of their day, made the county a yearly match for the Rest of England; Sussex (*circa* 1825), thanks to their round arm bowlers, Lillywhite and Broadbridge, and the great Kent XI. of the '30s and '40s when

> With five such mighty cricketers 'twas but natural to win,
> As Felix, Wenman, Hillyer, Fuller Pilch and Alfred Mynn.

With the approach of the '60s the balance of power began to move northwards: an explanation may in part be found in the numerical advantage of the industrial areas, now enlightened by the missionary work of the past two decades, partly to the fact that the system of home piecework, in the days before the big mechanical looms, allowed the operatives so to adjust their working week as to make time for both practice and matches. From this time such places as Sutton-in-Ashfield and Lascelles Hall begin to appear as apparently inexhaustible mines of cricket talent.

Surrey, first organized as a county club in 1845, had under F. P. Miller, and thanks to the prowess of Caffyn, Stephenson, Lockyer and George Griffith, enjoyed a renewed ascendancy in the late '50s and early '60s, but in between '67 and '70 Yorkshire, with a wholly professional eleven including a very great fast bowler in Freeman, had been thrice rated as champions. The county championship proper is generally reckoned to date from 1873, when the M.C.C. first laid down rules governing county qualification: in the next five years, Gloucestershire, owing almost everything to the Grace brothers, E. M., W. G. and G. F., were three times champions, but it was another ten years before the honour again came south. The '80s were a great decade for Notts., for whom Shaw and Attewell were marvels of bowling accuracy, Barnes and Flowers two fine all-rounders, and William Gunn and Arthur Shrewsbury the greatest professional batsmen of the age. In 1887 the headship passed to Surrey, under the leadership of J. Shuter, and between that year and 1895, that county was eight times at the head of the table. The great Surrey bowlers were Lohmann, Lockwood and Richardson, the latter of whom actually took over 1,000 wickets in four consecutive home seasons, 290 in 1895, a record till 1928 when Freeman of Kent took 304. The batsmen were the amateur W. W. Read, and the professionals M. Read, Abel, Brockwell, a dashing player and, at the end of the period, T. Hayward, who became the best professional batsman in England and played in the classic style.

Yorkshire, after a very lean period, now enjoyed a great revival in which they owed much to their captain, Lord Hawke; unlike the great majority of their rivals, their eleven consisted almost entirely of native-born men and its success evoked proportionately greater enthusiasm in the county: at the top of the table in 1893, '96 and '98, they were again champions for the first three years of this century, and once more in 1905. Always strong in bowling, Yorkshire had a remarkable sequence of slow left-handers in Peate, Peel and Rhodes: the last mentioned, who first appeared for his county in 1898 and who is still playing, has taken more wickets in first-class cricket than any other man in the game's history: George Hirst, a fast left-hand bowler and vigorous right-handed batsman, particularly strong in the hook and pull, was a man of great personality and unbounded energy: the only cricketer who has ever taken 200 wickets and made 2,000 runs in a season (208 wickets and 2,385 runs in 1906), he was the greatest force in the eleven and has strong claims to be considered the best all-round professional cricketer who has yet appeared. Other good Yorkshire bowlers were E. Wainwright and Schofield Haigh, the latter a bowler of deadly "break-backs." There was a great opening pair of batsmen in Brown and Tunnicliffe, whose partnership of 554 against Derbyshire in 1898 is still a record for the first wicket, and a brilliant, adventurous stroke-player in Denton. Of the amateurs by far the most distinguished was F. S. Jackson (governor of Bengal, 1927–32): captain of England in 1905, Jackson was always, when he could find time to play, a batsman of extraordinary gifts and unbounded confidence: the bigger the occasion the better he played; he was also a very good medium-paced bowler. Another fine all-round amateur was E. Smith. It is arguable that the Yorks. XI. *c.* 1900, were the strongest county side that has yet been seen.

In the last 12 years before the war the championship was won by six different counties, a variety of fortune that was excellent for the game's welfare, and in which no victory was more popular than that of Warwickshire in 1911. The first county outside the Big Six (Yorks., Lancs., Notts., Kent, Surrey and Middlesex) to win the honour for 34 years, Warwick owed her success in great part to the brilliant all-round play of her young captain, F. R. Foster. The most consistent success in this period, however, fell to Kent, who were champions in 1906, '09, '10 and '13. Blest in her beautiful grounds and a fine county cricketing tradition, and owing much to her quondam captain, Lord Harris, Kent at this time played most attractive cricket: J. R. Mason, a very popular captain, gave place about 1906 as the all-round force of the eleven, to an even greater in Woolley, then a good slow bowler and still a most graceful and effective batsman who enjoys the unique distinction of having played in 52 consecutive test matches. Among many fine amateur batsmen, K. L. Hutchings was conspicuous, but the main match-winning forces were Fielder, a fine fast bowler, and Colin Blythe, a wonderful artist with his left-hand slows: in August they were reinforced by D. W. Carr, at this time the one reliable "googly" bowler in England.

Surrey, with Hayward and Hobbs in wonderful batting form, and a hard-working and fast bowler in Hitch, carried off the honours in the curtailed 1914 season. When county cricket was resumed in 1919, it was amid such misgivings that the ill-advised experiment was made of confining championship matches to two days, but all doubts as to public interest were soon set at rest, attendances and enthusiasm for the game being greater than ever. Naturally enough, after so long an interregnum, the standard, especially in bowling, had seriously fallen away, and though the war had not depleted the ranks of the professionals as much as might have been anticipated, a great part of a generation of amateurs was lost to the game. After Yorkshire had won the first post-war championship, Middlesex scored two most popular successes in the next two years. She owed much to the captaincy of P. F. Warner, an admirable batsman and one of the shrewdest and most enthusiastic cricketers, to the batting of Hendren and to the all-round cricket of J. W. Hearne, a younger relative of J. T. Hearne who, 20 years before, had been the best medium-paced bowler in England. In 1922 Yorkshire regained the leadership and retained it for the following three years, actually winning in the period 81 championship games as against six losses. With Rhodes enjoying as a bowler an Indian summer of extraordinary success, two other good left-handers in Kilner and Waddington, a good spin bowler in Macaulay and a "swinger" in Robinson, the Yorkshire attack was in a different class from any other county's. The body of her batting was not perhaps as strong as in the great years 1900–02, but in Sutcliffe and Holmes she had an opening pair whose partnerships for the first wicket have now passed all records. So inevitable was Yorkshire's supremacy beginning to appear that the game was all the better for its interruption by the advance of Lancashire who, with a well-balanced side almost exclusively professional, ended at the head of the table in 1926, '27, '28, '30 and '34. Notts. won the championship in 1929, and Yorkshire re-established herself at the head of the table in 1931, '32, '33 and '35.

County cricket to-day commands as much interest as ever, but the competition is becoming increasingly professionalized; the number of amateurs who are able and willing to play regularly is decreasing, and a more or less settled personnel is important to a team's success. The expenses of county clubs are heavy and though Yorkshire, with a membership of over 6,000, has no financial anxiety, a wet season such as 1927 can land the majority in difficulties; their share distributed by the M.C.C., in the profits arising out of tours in Australia and test matches at home, is an important item in their budgets. In Nov. 1928, the Advisory County Cricket Committee decided that each county must play 28 matches. It also abolished the system of percentages in favour of point scoring. With 17 counties now competing, it is impossible for them all to play each other, and no really satisfactory system of point counting has yet been evolved; the first-class season is overfull and the best English bowlers certainly suffer from overwork. Some are quite naturally tempted away into the League cricket which spreads an enthusiastic and highly-organized network over much of the industrial area from Stoke to Durham; the cricket here is fiercely competitive, and the bowling, for the most part in the hands of professionals, one of whom may play for each club, is of a high class. Conversely, the leagues often furnish recruits to the northern counties.

There is a subsidiary division of 23 second-class counties, and in this competition the majority of players are amateurs, except in the case of the second elevens of some first-class counties who use it as a training ground for their young professionals. Since its official recognition in 1901, Staffordshire, with six championships, leads the field, a success due almost entirely to the phenomenal bowling of Barnes, the England bowler of 1911–12.

INTERNATIONAL CRICKET

Europe.—Wherever Englishmen, and especially English soldiers and sailors or missionaries, have gone, they have taken cricket with them. But for the outbreak of the Revolution it would have been played in Paris in 1789 under the auspices of the British Ambassador; the Light Division enjoyed it at Lisbon before the battle of Busaco; some of the "secretariat" indulged in it on the Prater during the congress of Vienna; the game had been played in Italy by 1828, in Corfu during the British Protectorate (1815–63), in Odessa in 1881, whilst a cricket club was formed in Geneva as early as 1850 and in Christiania by 1866. Of European countries to-day the Dutch and the Danes are the keenest and most proficient.

India.—There was a cricket club in Calcutta before the end of the 18th century, and fostered by the enthusiasm of the Army and the encouragement of such men as Lord Harris, when governor of Bombay, the natives rapidly mastered the game; the triangular tournament between Europeans, Parsees and Hindus dates from 1907, the Mohammedans joining in 1912. The first "test" match with England was played in 1932 in England, when the Indians lost. In India, in 1933–4, the M.C.C. won two matches and drew one. Of test matches played, up to 1935, between England and the West Indies, England won 7, West Indies 3, and 4 were drawn; West Indies winning the rubber against the M.C.C. tourists in 1934–35.

America.—Cricket has been played all over the American continent, and a match at New York took place as early as 1751. The first team of professional cricketers that ever left England toured the U.S.A. and Canada in 1859, an example that has been enjoyably followed by many subsequent teams, including Kent County in 1904. The compliment has been returned by the Philadelphians, Pennsylvania and Haverford universities. Though the U.S.A. has produced some fine cricketers, notably the brothers Newhall in the '70s, J. A. Lester, who captained the Philadelphians in 1904, H. V. Hordern, a first-rate googly bowler, and above all, J. B. King, in 1904, one of the very best bowlers in the world, cricket has never become a national game.

New Zealand.—Cricket is popular in New Zealand, where the standard of play has recently risen so far as to admit of the playing of "test" matches with England and South Africa. Up to 1932, however, New Zealand had failed to win any of these matches; England and South Africa having each won two.

South Africa.—Cricket was brought to South Africa by British troops in the '40s, Maritzburg and Wynberg being the earliest centres, with Pretoria following in the '60s and Johannesburg later still. The standard of play made a real advance after the first visit of a S.A. team to England in 1894, and ten years later a team captained by the old Cambridge cricketer, F. H. Mitchell, only lost three out of 26 fixtures in England, E. A. Halliwell proving himself a great wicket-keeper, J. J. Kotze as fast a bowler as any in England, and J. Sinclair an all-round cricketer of very high class. In 1905 the M.C.C. sent out a strong team under P. F. Warner, only to see it lose four out of the five test matches to a side of great all-round strength, the decisive factor being the googly bowling of R. O. Schwarz, G. A. Faulkner, A. E. Vogler and Gordon White. It was only fair that the S.A. team that visited England in 1907 should be accorded the honour of test matches; they lost the only one of the three that was finished, but only after a desperate fight in which their bowlers had a very fine English batting side in consistent trouble. Their captain, P. Sherwell, made a historic 115 to rescue his team from disaster at Lord's. Another strong M.C.C. XI., sent out in 1909, lost the rubber by three matches to two, only Hobbs, who batted most brilliantly, being able to master the googly bowling; Faulkner, who scored over 2,000 runs for a South African team touring Australia in the following winter, losing four out of the five tests, was at this time perhaps the finest all-round cricketer in the world. From that tour, however, the googly bowlers never recovered, and the side that completed in the Triangular Tournament of 1912 were outclassed and overwhelmed, an inferiority further emphasized by South Africa's heavy defeat at the hands of the M.C.C. XI. which visited her in 1913. Once again Hobbs was superlative, but an even more decisive factor was the bowling of Barnes who, after taking 34 wickets for 282 runs in the three test matches against them in 1912, proved even more difficult on the matting and had all their batsmen, except H. W. Taylor, at his mercy. Since the war the South Africans have visited England in 1924, 1929, 1935, and have been visited by M.C.C. teams in 1922–23, 1927–28, 1930–31. The achievements of South Africans during these post-war matches ranged from heavy defeat in 1924, through a progressive improvement of form, to triumph in 1935, when they won the rubber. Within recent memory the outstanding feature of S.A. cricket has been the batting of H. W. Taylor, who can be ranked in the very highest class for style and effectiveness alike: A. D. Nourse has batted for a quarter of a century with wonderfully consistent success. The most important domestic cricket in South Africa is an inter-provincial tournament, known as The Currie Cup, inaugurated in 1890 and named after Sir Donald Currie who, with Sir Abe Bailey, was the great patron of cricket there. All South African cricket is played on matting, stretched on turf, as at Cape Town, or on ant-heaps, as at the Wanderers' ground, Johannesburg, the headquarters of the country's cricket: this undoubtedly handicaps the South African cricketer when he comes to play under conditions native to the game, a fact that is now recognized and supports a growing movement for the cultivation of turf wickets.

Australia.—The earliest cricket centre in Australia seems to have been Sydney, where the game took root very early in the 19th century, Hobart, Melbourne, Perth and Adelaide all being converted before 1850. Conditions, except at Melbourne, and the standard of play generally, remained, however, somewhat primitive until the visit of the first English team in 1861–62, a professional combination captained by H. H. Stephenson and organized as a business venture by Spiers and Pond, who are said to have cleared over £10,000 as a result. Thereafter, thanks to the coaching of English professionals, the enthusiasm of the Australians, and further visits from English teams in 1863–64, and, under Grace's leadership, in 1873, progress was rapid, and a notable milestone was reached when, in March 1877, Australia won by 45 runs the first of all test matches, a success almost entirely due to an innings of 165 by C. Bannerman. A still more decisive step was taken a year later when the first Australian team visited England: most of the fixtures arranged for them were second class, and so little was generally known of them in advance that a famous English cricketer was heard enquiring about their colour, and Lord's was virtually empty when they drove on to the ground to meet the M.C.C. Before the day was over, F. R. Spofforth and H. F. Boyle had made history by dismissing a really strong M.C.C. eleven for 33 and 19, and winning the match for their team by nine wickets. The monopoly of English cricket was now seriously threatened and the threat became a reality when, after a most honourable defeat in the first home test match at the Oval, in 1880, Australia beat England by seven runs on Aug. 29, 1882, in what is still the most famous of these games, a victory celebrated in the *Sporting Times* by the obituary notice that created the "Ashes" legend. Though Australian batting had made great strides in this decade, and W. L. Murdoch was established as a batsman equal to any but "W. G.," with H. H. Massie, a brilliant hitter and A. Bannerman, a great defensive player, it was the trio of bowlers, Spofforth, Boyle and Palmer, supported by a great wicket-keeper in Blackham, that made the team so formidable. Their bowling was a revelation to English cricketers: Spofforth, originally very fast, but at his best fast medium, with a very fast ball, was universally acclaimed the greatest bowler in the world; his deadly control of his off-break and, on the field, an almost satanic malevolence of bearing, early won for him the still unchallenged title of "the Demon."

Two years later an equally strong side lost the one test match that was finished, but had distinctly the best of the two that were drawn; in the latter of these, at the Oval, Murdoch scored 211, still the highest innings made in an England *v.* Australia match in England, and only a famous ninth wicket partnership of 151 between W. W. Read and Scotton saved England. The years that followed were a black period for Australian cricket, and between Dec. 1884 and Aug. 1893, England won 16 of the 21 games finished; in part this was due to the dropping away of the old stalwarts and the inability of the still limited cricket resources of the country to find at once adequate substitutes, but internal quarrels also contributed, and some of her elevens were far from representative. Moreover, English cricket was very strong indeed at this time; as batsmen, Grace, Shrewsbury and Gunn were at their best, and F. S. Jackson, then the Cambridge captain, made a wonderful début in the matches of 1893. The Australians had a splendid all-round player in G. Giffen, and a really great pair of bowlers in C. T. B. Turner (nicknamed "the Terror") and J. J. Ferris who, on the 1888 tour, together bowled nearly 20,000 balls and took 534 wickets out of 663 that fell. But their batsmen were no match for such bowlers as Lohmann, Peate, Briggs and Peel, the slow left-handers being then, as now, a particular thorn in Australian flesh.

The tide began to turn in the winter of 1894–95 when a very strong team under A. E. Stoddart, for which the captain, A. C. Maclaren, Ward and Brown batted splendidly, and Richardson bowled in his best form, only just won the odd game out of five. Three years later Stoddart's second team was decisively beaten by four matches to one, and in 1899 J. J. Darling's eleven defeated England at Lord's by ten wickets, and drew the other four games. A new and accomplished generation of Australian players had now arrived: Darling himself, and C. Hill, were a very fine pair of left-handed batsmen, S. E. Gregory, a most consistent run-getter, and a brilliant field, M. A. Noble, a great all-rounder, whilst E. Jones's extreme pace, Howell's off-breaks, and Trumble's mastery of length and pace changes made the attack very formidable. An attempt to recover the Ashes by a team under A. C. Maclaren in the winter of 1901–02 was heavily repulsed in spite of brilliant batting by its captain, and in 1902 Darling again led a team to victory, defeating England by two games to one. The Australians' three runs victory at Manchester and England's one wicket success in the fifth game at the Oval, are historic in the series. The feature of the tour was the batting of Victor Trumper, a modest genius whose effortless brilliancy has never been surpassed.

In the winter of 1903–04 the M.C.C., determined to restore the prestige of English cricket, themselves organized a team which, under P. F. Warner's captaincy, succeeded in recovering the Ashes; the batting of R. E. Foster who, in his first test match innings at Melbourne, scored 287 runs, of Tyldesley and Hayward, the bowling of Rhodes and the surprise effect of J. Bosanquet's googlies, were the deciding factors. The following year England's success was repeated, when F. S. Jackson, winning the toss in all five games and batting brilliantly himself, led his side to victory in the only two matches that were finished. In the next winter, however, the advance guard of a new generation of players recovered the honours for Australia, defeating a rather moderate M.C.C. eleven captained by A. O. Jones, by four games to one, and in 1909, Noble, a consummate tactician, profited by some ill-judged decisions by the English selection committee, and won two out of the three finished games. The very fast bowling of Cotter, the all-round form of Armstrong and Macartney, and the success of the two young left-handed batsmen, Ransford and Bardsley, were the features of the tour; the latter created a record by scoring a century in each innings of the last test match. Once again the pendulum swung over and in the winter of 1911–12, the splendid batting of the opening pair, Hobbs and Rhodes, and the most formidable bowling of Barnes and F. R. Foster, won decisive victory for P. F. Warner's second M.C.C. XI. This tour set the seal upon Hobbs's batting reputation, whilst Australian opinion was unanimous that Barnes was the finest English bowler they had yet seen; he and Foster, whose pace off the pitch was a revelation to his opponents, took 66 wickets of the 95 that fell, but were well supported by J. W. H. T. Douglas. The Australian team that took part in the Triangular Tournament of 1912 was far from representative, and though they easily accounted for the South Africans, they were no match for a very strong England XI.

The war hit Australia much less hard than England and she was soon into her cricket stride again. A tour in England by an Australian Imperial Forces eleven in 1919 served to introduce J. M. Gregory, for whose pace as a bowler the game in England could offer no approach to a parallel. There now followed the greatest humiliation ever sustained by English cricket when her representatives suffered defeat in eight consecutive tests; weakness in bowling and fielding was mainly responsible for the loss of all five games by the M.C.C. side which toured under Douglas's captaincy, but at home it was the complete inability of the English batsmen to deal with the fast bowling of Gregory and Macdonald, whose energies were carefully husbanded for the tests, well used by an able captain in Armstrong and ably supported by the slow bowling of the captain himself and of A. A. Mailey, a most persevering and successful googly bowler. England made a better showing in the last two test matches which were drawn, and heavy though the blow was to her prestige, her cricketers, in the long run, benefited by this reverse which served to recall the cardinal principles of a straight bat and a good length. Three winters later a M.C.C. team, under A. E. R. Gilligan, though only winning one test match in Australia, gave a much better account of themselves. Hobbs and Sutcliffe did wonders as an opening pair, running up over 100 together four times—thrice in succession. Sutcliffe's first four test match innings were 59, 115, 176 and 124, whilst Hobbs, with three centuries, bringing his total to nine, surpassed Trumper's previous record of six for the series; unfortunately, the body of our batting was disappointing and failed to profit by the successful starts. Conversely the Australians, time after time, made splendid recoveries from disastrous starts, for which the bowling of Tate was responsible. This young Sussex professional beat even Barnes's figures by taking 38 wickets in the five matches, bowling with a fire and persistency that won universal acclamation from the Australians, who rated his bowling as high as any that had been seen in their country. The English change bowling was, however, very weak. For the first time in cricket history, eight-ball overs were obligatory, an innovation confined to Australia and since abandoned. These matches, the first three of which ran to seven days apiece, were premonitory of the endurance tests into which, thanks to the pluperfect pitches formed of the Bulli soil, and the intense determination of all batsmen not to get themselves out, cricket in Australia seems fast degenerating.

In 1926, after losing 12 tests out of 13 completed, England at last turned the tables, and after bad weather had played a large part in drawing the first four games, won decisively in the fifth at the Oval which was, in any case, to be played to a finish—an innovation in England—but for which, as it turned out, four days sufficed. Once again it is a case of Hobbs and Sutcliffe, the famous pair defying some very accurate bowling on a very difficult wicket throughout the third morning and laying the foundations for a long score; in the last innings the Australians quite collapsed before some accurate bowling of the old-fashioned type by Rhodes, who had played his first test match 27 years before, and some good fast bowling by a new star, Larwood of Notts. Hobbs, who in the previous year had, at the age of 42, surpassed "W.G.'s" achievement of 126 centuries, batted with marvellous consistency in these five test matches, scoring 486 runs with an average of 81, and easily outstripping Hill's previous record aggregate of 266 for this cricket. Sutcliffe's batting was on the same level. For Australia, Macartney batted as brilliantly as ever, and Woodfall and Ponsford did excellently on this, their first tour: but the attack was the weakest for many years and sadly lacked medium-paced spin bowling. England's victory created enthusiasm.

Up to and including the tour of the Australian team visiting England in 1934, 134 test matches have been played; Australia won 53 (38 in Australia), England 52, 29 being drawn. Considering the initial handicap of inexperience, the disparity in population, and the natural difficulty of adapting themselves to English conditions, Australian cricketers may well be proud of such a record; but it is to be remembered that the climate favours athletic development, that the teams that have visited the country from England have often been far from representative, and that Australian cricketers, especially the bowlers, play much less first-class cricket than their opponents, and avoid the staleness and overwork which has curtailed many an English bowler's best powers. In a domestic season in Australia, first-class cricket is virtually confined to the inter-state matches of the Sheffield Shield competition, so called because played for a cup presented by Lord Sheffield at the close of the tour which he organized to Australia in 1891–92. In the winter seasons of 1926 and 1927, W. H. Ponsford scored centuries in eleven consecutive matches in these games; and in 1929–30 D. G. Bradman made 452 not out for N. S. Wales *v.* Queensland at Sydney—the highest individual innings ever played in a first-class match.

The tables opposite summarize the work of the outstanding players in England *v.* Australia matches to the close of 1934 tour.

Amateur Cricket.—Though economic pressure and possibly a changing standard of values is steadily reducing the number of amateurs able and willing to play first-class cricket with any regularity, and though the highest standard of technique must always depend upon professional cricketers, especially bowlers, yet amateurs have in the past played a vital part in the game's development, and it cannot to-day dispense either with their leadership, or with the spirit of enterprise and the attractive method that, as a rule, characterizes their play. Though county elevens have been successfully captained by professionals, notably Notts., and Yorkshire in the middle of the 19th century, and though such men as Lilley of Warwickshire have captained the Players' eleven with marked ability, professionals as a whole would not welcome the responsibilities involved in regular captaincy, which naturally extend far beyond the field of play. It is not too much to say that some counties have, for a time, at least, been made by their captains, amongst whom the outstanding figures in the last half-century are perhaps Lord Hawke (1860–1938) (Yorks.), Lord Harris (Kent), A. N. Hornby (Lancs.), J. Shuter (Surrey), I. D. Walker, A. J. Webbe and P. F. Warner (Middlesex), A. O. Jones (Notts.) and S. M. J. Woods (Somerset).

There have, of course, been brilliant professional batsmen—Hammond in 1927 was probably the most attractive in the world—but it is only natural that men who depend on the game for their livelihood should concentrate first on security and that it should be left to the amateur to supply what has been termed "the champagne of cricket." Certainly the great stylists in cricket history have often been amateurs, *e.g.*, C. G. Taylor (1817–1869), R. Hankey (1832–1886), R. A. H. Mitchell (1843–1905), A. Lyttelton (1857–1913), A. G. Steel (1858–1914), A. E. Stoddart (1863–1915), L. C. H. Palairet (1870–1933), A. C. Maclaren (1871–1944), the brothers, H. K. (1873–) and R. E. Foster (1877–1914), R. H. Spooner (1880–), D. J. Knight (1894–) and A. P. F. Chapman (1900–). Naturally, the ranks of the hitters have been mainly recruited from amateurs, the two greatest of them, by general consent, being C. I. Thornton (1850–1929) and G. L. Jessop (1874–). If Thornton was consistently the longer driver (several hits of 150–160yd. are authenticated for him), Jessop, thanks to his extraordinary quickness of foot and freedom of swing, was the more versatile and the fastest scorer that the game has known. In 1900 he made 157 runs against the West Indians between 3:30 P.M. and 4:30 P.M., and a rate of 100 runs an hour was normal with him when at his best.

In bowling, the amateurs have, as a rule, been definitely inferior to the professionals, especially in accuracy, but they have numbered amongst them some of the greatest fast bowlers, *e.g.*, Alfred Mynn, Harvey Fellows, a positive terror in the '40s, S. M. J. Woods, C. J. Kortright, W. Brearley and N. A. Knox. Of all bowlers, Kortright is still thought to have been the fastest. Mention must also be made of one or two slow spin bowlers who stood, in their respective epochs, as figures of creative originality: such were David Buchanan, a slow left-hander who did wonders for "the Gentlemen" between 1868 and '74; "W. G." himself who, with his flight and generalship was for two decades "the best change bowler in the world"; A. G. Steel who re-discovered the leg-break in the later '70s, and B. J. T. Bosanquet, the inventor of the googly at the beginning of this century. Similarly as V. E. Walker was almost alone in bowling lobs in the middle of the

19th century, so D. L. A. Jephson and G. H. Simpson-Hayward were the sole, though successful, exponents of the art 50 years later.

The Gentlemen v. Players Match.—In any purely domestic season the match played in the middle of July at Lord's between the best amateurs and professionals, stands as the high-water mark, and selection for these elevens is a much coveted distinction. The match was first played in 1806, and not again until 1819, since when it has been played regularly. For many years, the Gentlemen were no match at all for the Players, and various handicaps, odds, given men and unequal sized wickets, were vainly tried to equalize the sides. The '40s brought them a spell of some success, due largely to Alfred Mynn, but from 1850–64, the Players won every match except that in 1853 when Sir Frederick Bathurst and M. Kempson bowled unchanged throughout both innings. In these dark days the amateurs' batting was hopelessly outclassed. In 1865 "W.G." played for the Gentlemen for the first time, and in the next 16 years he was only twice on the losing side; for this wonderful run of success his personal prowess both with bat and ball was mainly responsible. No cricketer has a record for these matches even comparable with his, but he was well supported by the bowling of his brother, E. M. Grace, and of D. Buchanan, whilst a strong vein of batting talent was running from the 'varsities, Eton and Harrow, notably in the persons of W. W. Yardley, A. Lubbock, the Lytteltons and a little later, A. G. Steel, one of the greatest all-round amateur cricketers, and A. P. Lucas. The Players recovered most of their lost ground in the '80s, but the next decade saw honours fairly divided: in 1894, F. S. Jackson and S. M. J. Woods bowled unchanged through the match and won it for a side, the average age of which, leaving out "W. G." was but 25; two years later, one of the strongest of all elevens that have represented the Gentlemen, won a notable fight by six wickets, and in 1898, a match timed to coincide with "W. G.'s" 50th birthday, produced cricket wholly worthy of the occasion. The fast bowling of Woods and Kortright, and the batting of Shrewsbury, lent peculiar distinction to this epoch.

In the present century the match has continued to provide much splendid cricket, though the amateurs of recent years have found the task of dismissing the very strong batting sides of the Players increasingly beyond their powers. In the opening match of this period, R. E. Foster made 102 and 136, but the Players won the game by scoring over 500 runs in the last innings. Three years later the Gentlemen turned the tables when, after being outplayed for two days, they made 500 for two wickets—C. B. Fry (232 not out) and A. C. Maclaren (168 not out), adding 309 runs in less than three hours.

The centenary celebration in 1906 is always known as "the fast bowlers' match"; Fielder took all 10 wickets in the amateurs' first innings, and N. A. Knox and W. Brearley, with H. Martyn of Somerset standing up to both behind the stumps, combined in a terrific and, in the end, successful assault. In the years just before the World War, the Players were very strong, Barnes bowling superbly, and Hobbs inaugurating an extraordinary series of batting achievements; but the Gentlemen won a fine victory in 1911, and again in 1914, when J. W. H. T. Douglas bowled with splendid persistency and control of swerve. In the matches since the war the amateurs have won only in 1934, though A. P. F. Chapman and D. R. Jardine have batted admirably. Hobbs, in these games, has a remarkable record, having now scored five centuries since 1919, four in successive years. Amongst the best teams that have appeared in this match may be noted the Gentlemen elevens of 1878, 1896, 1898, 1906 and 1911, and the Players in 1887 and 1911, whilst some of their post-war sides, if not reaching the highest bowling standard, have been as strong in batting as any of their predecessors. Though never enjoying the same prestige as the Lord's fixture, similar matches between Gentlemen and Players have taken place regularly at the Oval since 1860, at Scarborough since 1885 during the very popular festival there at the end of the season, and, intermittently, at Prince's, London, Brighton and Hastings.

University Cricket.—Though by no means enjoying the virtual monopoly that they once did, the universities of Oxford and Cambridge are still the chief nurseries of amateur cricket; the competition for cricket "blues" is keener than ever, and for a young cricketer there can be no more thrilling and exacting moment than his first appearance in the University match. This game was first played in 1827, when Charles Wordsworth (O.) and Herbert Jenner (C.) were captains. With the exception of five games, all at Oxford, it has always been played at Lord's and, apart from the war years, regularly since 1838. Of the 91 matches now played, Cambridge has won 43, Oxford 36, and 10 have been drawn. The match has produced sensations in plenty, notably the finishes of 1870 when F. C. Cobden "did the hat-trick" with the last three balls to win the game for Cambridge by two runs, and of 1875 when the Oxford captain, A. W. Ridley, put himself on with "lobs" at the crisis and won the match by six runs. By common consent the Cambridge XI. of 1878 was the best that has ever appeared in the match; they won all eight matches they played, annihilated Oxford, and beat the Australians by an innings. The brothers, E. and A. Lyttelton and A. P. Lucas were splendid batsmen, Morton a destructive fast bowler, and A. G. Steel, then a freshman from Marlborough, almost the best all-round player in England. The Cambridge side of 1882 also beat the Australians and was very strong, and so were those of 1890–93 in which G. MacGregor kept wicket to the fast bowling of S. M. J. Woods, and F. S. Jackson played himself into an undisputed place in the England XI., and as many as eight men subsequently appeared for the Gentlemen at Lord's. Since the war they have had good teams in 1920 and 1922. For Oxford the elevens of 1863–4–5 under the captaincy of R. A. H. Mitchell were very strong; M. C. Kemp led a fine side in 1884 which included seven freshmen, that beat both the Australians and Cambridge by seven wickets, whilst the batting, and even more the fielding, of H. D. G. Leveson-Gower's team which in 1896 scored 330 in the last innings for six wickets, will long be remembered. It is impossible here to refer to individual performances and players, but mention must be made of the distinguished part played by some families in the match: such were the Lytteltons, Fords, Studds and Ashtons for Cambridge; the Riddings, Fosters and Evans for Oxford. The Cambridge brothers, C. E. M. and E. R. Wilson, have an astonishing family record. The University match may no longer provide so much of the "champagne of cricket" as of old, but it still remains a unique feature in the English season, a focus for ardent patriotism, a rendezvous where generations of friends and foes renew happy memories, and an arena where the best cricket, especially the fielding, reaches a high level, and the worst is raised to a higher power by the chivalrous vigour with which the game is fought. Both universities have fine grounds, known at Oxford as "the Parks," at Cambridge as "Fenners," where a professional coaching staff is engaged. The colleges also have admirable grounds, though in the last generation lawn tennis has made distinct inroads into college cricket.

School Cricket.—Cricket being in origin a boy's game, it is not surprising to find the schools supplying some of our earliest references to it; it was being played at the Free School at Guildford in the middle of the 16th century, the Wykehamists were playing it on "Hills" 100 years later, at Eton the game was firmly established by the beginning of the 18th, the duke of Marlborough was probably playing it at St. Paul's a few years earlier, and Westminster provided at least three men to form the "Star and Garter" committee that revised the laws in 1774. Cricket at Harrow was of rather later growth, possibly introduced by an Etonian headmaster (!) but certainly established well before the end of the 18th century. The most famous of all school matches, Eton *v.* Harrow, was first played at Lord's in 1805, the poet Byron being a member of the Harrow team; from 1822 this game has been played virtually without a break and of exactly 100 matches now played, Eton has won 40, and Harrow 35. Between 1851 and 1869 Eton only won once, and again only once between 1888 and 1903, but the pendulum swung with a vengeance in this century and Eton had a run of successes. Once quite a domestic affair, the match has long constituted almost the climax of the London season and now attracts a huge and brilliantly dressed crowd, an important item in the financial budget of the M.C.C. who dispense a large yearly grant to support cricket at the two schools. In 1825 Harrow first met Winchester at Lord's, and a year later Eton followed suit, thus inaugurating what was known as "the Schools' Week," a triangular contest which lasted till 1854, when Winchester withdrew subsequently playing Eton home and home matches, and reviving the Harrow match after the war. For more than half last century these three schools supplied a very high percentage of university "blues," with Rugby an easy fourth, but following the lead of Uppingham, who had five Cambridge blues in 1876, other schools, noticeably Malvern and Repton, have successfully challenged that monopoly, and the composition of the university teams is now quite catholic, with some of the most notable of recent performances standing to the credit of Rhodes scholars and other students from the Dominions. Rugby and Marlborough, Cheltenham and Haileybury, Tonbridge and Clifton all play each other at Lord's at the end of the summer term, and these matches are now followed by representative games, organized by the M.C.C., between an eleven selected from the schools that play at Lord's and "the Rest," and subsequently between a public school eleven and the Army. In 1926 a XV. of the public schools played the Australians. Cricket at the schools, from the junior nets at a preparatory school to the matches just mentioned, is now intensively organized, and young cricketers of promise are systematically coached; of the professional coaches, the most famous was H. H. Stephenson at Uppingham in the '70s; of amateurs we may cite the Hon. R. Grimston and the Hon. F. Ponsonby for Harrow, and R. A. H. Mitchell and C. M. Wells for Eton, whilst many others, if less illustrious, have worked most unselfishly and with splendid results in the same cause. Largely as a result the general standard of school cricket has shown a steady advance, immense in the aggregate since, say, 1860: the best school batsmen have always been able to take their places at once in first-class cricket, but bowlers who have made a similar immediate mark are so few that we can specify A. G. Steel and H. Rotherham of Uppingham, C. L. Townsend of Clifton, E. M. Dowson of Harrow, J. N. Crawford of Repton and G. T. S. Stevens of University College school: the latter in 1919 was actually selected to play for the Gentlemen at Lord's, whilst still at school.

Evolution of Technique.—Cricket, the boys' game, was no doubt played in Tudor and perhaps even in Plantagenet times, in a haphazard, makeshift way; in the woodland districts of the Weald, the natural base for attack and defence was the tree "stump," of which the exigencies of Cinque Ports shipbuilding would provide no lack; the mark being low, it would be natural to "bowl" at it. On the down lands, however, the shepherd lads used another mark, the hurdle gate into their sheep pens, consisting of two uprights and a crossbar resting on their slotted tops; the latter is still called by stockmen a "bail" and the whole gate a "wicket," deriving its name from the A.S. wican, to give way, *i.e.*, the place where the pen yields and admits entry. The fact that the bail could be dislodged when the wicket was struck made this preferable as a mark to the "stump," and the "woodmen" were converted to its use, preserving, however, a memory of their original habit by applying the term stumps to the hurdle uprights.

The dimensions of this wicket would at first vary widely in different districts; Nyren speaks of "a small manuscript" enshrining the recollections of an old cricketer about the game as he knew it at the beginning of the 18th century. This describes the wicket as 1ft. high by 2ft. wide, with a hole between the uprights into which the ball had to be "popped" (*cf.* popping crease) to run-out or stump a batsman; this tradition is also supported by a picture at Lord's, No. 17 in the M.C.C. collection, and the wider than high wicket by other representations of the game. It is probable, however, that this practice was local to the Western Weald, and that the true tradition of the game's home, Kent and East Sussex, is preserved in the first official regulations that we know, the "London Laws" of 1744. These laws clearly represent a sophisticated edition, probably by the cricket committee of the Artillery Ground, of a much earlier and probably oral version: indeed "H. P-T's" pamphlets (*see* Bibliography) have convincingly disentangled the new from the old. The other important authority for the earliest "regulation" game is a Latin poem by William Goldwin, sometime scholar of Eton and King's, published in 1706 as one of a collection called "Musae Juveniles." The original wicket then was 22in. by 6in., the popping crease (or "scratch"—whitening did not come in until "W.G's" time) was 46in. in front of it, and the pitch was 22yd. long. These measurements all correspond with divisions or multiples of the early Tudor units of length measure, the "gad" of 16½ft. and the ell or cloth yard of 45 inches. The further evolution of the wicket took place as follows:—A middle stump was added in, or shortly after, 1775; by 1798 two inches had been added to the height and one to the width, and in 1817 the size of the wicket was increased to its present dimensions (27in. by 8in.) and, perhaps a year later, the original bail was split into two.

The ball was probably much the same in the 17th century as it is to-day: Duke of Penshurst told Farington, the diarist, in 1811 that his family had been making cricket balls for 250 years. It was certainly leather-covered (coriaceus orbis in Goldwin) and crimson dyed, almost certainly hemp or hair stuffed. By the 1744 laws it might weigh anything between five and six ounces; its present precise specifications in weight and circumference were laid down in 1774 and 1838 respectively.

The primitive bat was no doubt a shaped branch of a tree; at the beginning of the 18th century it resembled a modern hockey stick, but was considerably longer and very much heavier, well adapted for dealing with the only form of attack, then at least properly called "bowling." It has been customary to credit the Hambledon men with the invention of "length-bowling," but a poem, "The Game of Cricket: an Exercise at Merchant Taylors' School," published in *The Gentleman's Magazine* in Oct. 1756, and conceivably the work of James Dance (Love), who entered that school in 1732, refers to the ball as

> "now toss'd, to rise more fatal from the ground,
> exact and faithful to the appointed bound,"

which looks uncommonly like a cult of "length." It is at least certain that the Hambledon cricketers elaborated this instinct into an art: David Harris, learning his lesson from Richard Nyren, became a great bowler with the three sovereign qualities of length, pace and quickness of rise from the pitch. In reaction the batsmen, following the example of John Small of Petersfield, one of the most picturesque characters in Nyren's pages, evolved a new technique, meeting the length ball with the straight bat, shortened in the handle and straightened and broadened in the blade; for a time perhaps their play was rather defensive, "puddling about the crease," but a new generation of Hambledon men opened up the game by forward play, quick-footed driving and the cut. Even Harris's bowling was no greater than the batting of William Beldham (1766–1862) who "took the ball as Burke did the House of Commons, not a moment too soon or too late."

In spite of the combination of length with break and swerve and flight, with which the Hambledonians, Lamborn, Noah Mann and Tom Walker are respectively credited, or rather because of the scarcity of men who could master and maintain those arts, the batsmen steadily asserted their superiority, even after the attempt of one, "Shock" White of Reigate, to use a bat of preposterous width had been defeated by the legislators of 1774 who limited its width to 4½in.; about the same time the original provision of "standing unfair to strike" was elaborated into the first l.b.w. law by which the umpire was confronted with the impossible task of deciding whether such obstruction had been deliberate. With the dawn of the 19th century, most bowlers seem to have been favouring the high-tossed, lobbing variety, originally evolved by Tom Walker of Hambledon, hailed by his contemporaries as "baby-bowling," but at first, no doubt by reason of its novelty, highly successful. But the batsmen, notably Beldham, and a left-handed hitter, John Hammond, soon learnt to "give her the rush," and run-getting once again rapidly increased.

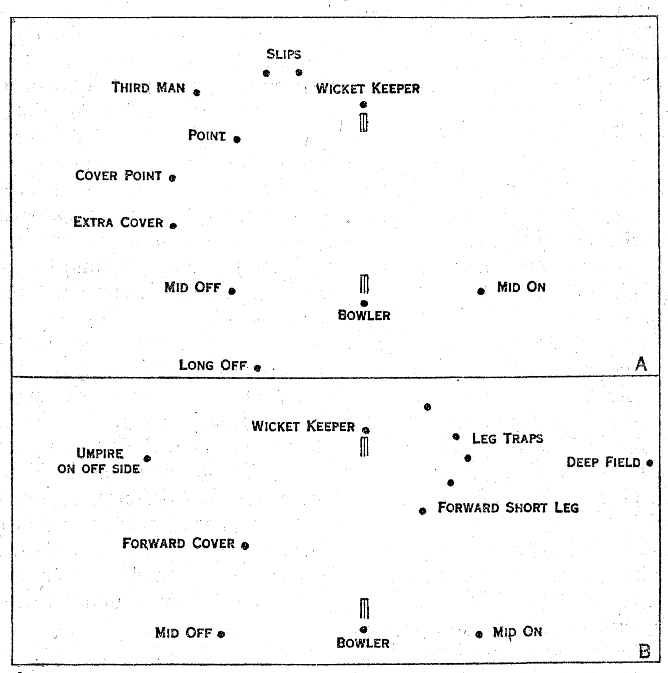
An answer was found in the next great bowling development, "the Round Arm Revolution," or, as it was then called, bowling of the "March of Intellect" style. Though Tom Walker had apparently attempted something of the sort before the break up of the Hambledon club, and been barred for his pains, the true apostle of the new bowling seems to have been one John Willes of Sutton Valence, inspired, it is said, by the model of a cricketing sister who used to bowl, or throw, at him in practice. From 1806 to 1822 Willes persevered in his missionary endeavour in face of determined opposition, until he was no-balled for throwing in a great match at Lord's and rode out of the ground and the game for ever. His mantle fell on two great Sussex bowlers, William Lillywhite and James Broadbridge who, perfecting the new style, carried all before them. Eventually, in 1827, three "experimental matches" were played between Sussex and All England, of which Sussex won the first two, and a reconstituted England side the third. Controversy raged furiously, but the M.C.C. wisely moved with the times, though the reshaping of Law X. to their satisfaction caused them great difficulty; in 1835 it countenanced the hand being raised as high as the shoulder, but ten years later the bowler was taking such liberties that the umpire was then expressly forbidden to give him the benefit of the doubt.

The new style was rapidly attended with a great increase in pace: of the new "fast and ripping" school, Alfred Mynn, Samuel Redgate and John Wisden were the first great exponents. As time went on bowlers tended to raise the hand higher and higher in defiance of the law, until it became more honoured in the breach than the observance. Eventually, Edgar Willsher of Kent was no-balled for throwing in a big match at the Oval (Aug. 27, 1862), and the whole fielding eleven, except its two amateur members, left the field in protest. This brought matters to a head and in 1864 the bowler was officially accorded full liberty to bowl. There has, at intervals since, been trouble over the "throwing" question. In the mid-'80s, Lancashire had three offenders in their team, whose activities were, in the end, curbed by the stand taken up by Lord Harris. There was more unfair bowling in the nineties, but the County captains in 1900 took concerted action, and to-day the evil is virtually unknown.

With the exception of William Clarke, V. E. Walker and Tinley, of Notts, all three successful "throw-backs" to the old high and lobbing school, most bowling continued to be fast through the middle of the 19th century, and good though such wicket-keepers as T. Box (Sussex), T. Lockyer (Surrey) and Herbert Jenner (C.U.C.C.) were, the rôle of long stop became most important: in fact, two long stops were at times necessary for dealing with some of the very wild bowling that was all too common, especially in amateur cricket. The number of wides in some of the university and big school matches of this period was really preposterous. Against this onslaught the batsman learnt to protect himself with additional armour: H. Daubeny invented pads in 1836 and N. Felix the tubular batting glove about the same date, whilst in 1853 Nixon greatly increased the resiliency of the bat by inventing the cane handle. Fortified by these aids, the batsman refused to be intimidated and actually developed the scope of his art. George Parr, the "Lion of the North," exhibited the perfection of leg-hitting; Julius Caesar of Surrey, experimented with "the pull"; William Caffyn of Surrey and Ephraim Lockwood of Yorkshire excelled in the cut. Carpenter of Cambridgeshire was a great back player who was, at the same time, quick on his feet to punish slow bowling, and Thomas Hayward the elder, his compatriot, the first man to develop forcing strokes to the on off the over-pitched ball, whilst the classic principles of elegance and the straight bat, inherited through Fenner and Fuller Pilch, were transmitted in apostolic succession by the Notts. players, Joseph Guy and Dick Daft, to the later generation of Shrewsbury and William Gunn. Though, however, these champions, all, be it noted, professionals, held their own with any bowling they had to meet, the fast bowlers had less gifted men, and nearly all amateur batsmen, rather at their mercy, nor is this surprising when we recall that such men as Jackson of Notts. and Tarrant of Cambridgeshire were as fast as any men bowling to-day, whilst the grounds were incomparably worse. There were, in fact, in the '50s and '60s, only four grounds—The Oval, Brighton, Canterbury and Fenners—where good wickets were the rule, and until 1849, when permission was first given to sweep and roll the pitch at the beginning of each innings, it was unlawful to touch it from beginning to end of a match.

Such was the general state of cricket when W. G. Grace (b. 1848) played his first county match in 1864. Grace is still acclaimed by universal consent the greatest all-round cricketer that the game has yet known and volumes have been written upon his career. No one player has had so decisive an effect on the game, perhaps on any game. By his extraordinary achievements, arresting appearance (he was a big man with a black beard who always wore the M.C.C. red and yellow cap), and of lovable, if at times, cantankerous, personality, he concentrated upon himself, and, through himself, upon the game, an attention quite unparalleled before; wherever he went thousands swarmed to watch; he was, at least, as well known to every class of Englishman as was Gladstone at his zenith. His personal prowess restored the prestige of amateur cricket in the Gentlemen *v.* Players matches at Lord's. As a batsman, Grace revolutionized the art: "he turned it from an accomplishment into a science; he united in his mighty self all the good points of all the good players and made utility the criterion of style; he turned the old one-stringed instrument into the many-chorded lyre. But in addition he made his execution equal his invention." Incidentally, Grace killed fast bowling; to the very end of his career, pace, even on a fiery wicket, had no terrors for him, and in his prime he dealt with it so mercilessly that its exponents were almost afraid to bowl within his reach.

This decline of fast bowling coincided, in the '70s, with a rapid improvement of grounds, due to the advent of the heavy roller even more than to the perfection of the lawn-mower, and under "W.G.'s" example, batsmen generally, though they never succeeded in imitating his intensely individual methods, adopted a more generally aggressive attitude to the attack. The bowlers sought to hold their own by concentrating on accuracy of length at the sacrifice of pace, and a new school of slow or slow medium



A. PLAN OF FIELD AS SET FOR AN "OFF-THEORY" BOWLER IN 1895
B. PLAN OF "LEG-TRAP" FIELD AS SET FOR ROOT, THE ENGLISH TEST MATCH BOWLER, IN 1926

bowlers gradually emerged, with Alfred Shaw of Notts. as its model and master. The astonishing accuracy of Shaw's bowling is well attested by the fact that in a cricket career of 31 years he actually bowled 16,922 maidens out of a total of 24,700 overs, his 2,051 wickets costing him less than 12 runs apiece. The bowlers of this era often sought to curb further the batsmen's aggression by keeping the ball some distance wide of the off stump; of this "off-theory" bowling, as it was called, the Gloucester amateur, R. F. Miles, is said to have been the originator; Attewell of Notts. was its greatest exponent; it was accompanied, of course, by a concentration of the fieldsmen on the offside of the wicket, mid-on very often being the solitary man left to guard the "on." A few natural "rebels," notably W. W. Read (Surrey) took advantage of the opportunity to defy the canons of orthodoxy, follow the example of E. M. Grace ("W.G.'s" elder brother) and pull the off-ball round to the denuded on, but for the most part the off-theory was countered by a policy of masterly inactivity. It was nothing out of the way, especially with some of the northern professionals, to see a whole over allowed to go by with no attempt made to play the ball. Indeed, the pace of some county cricket became so funereal that interest in the game sensibly flagged and attendances fell off. In a Yorks. *v.* Notts. match in 1887, three fine days and a fast wicket produced 702 runs in 625 overs. Cricket was in some danger of falling victim to an academic formalism. From such a fate it was saved by a transfusion of new and vigorous blood.

Profiting by the coaching and example of English professionals, some of whom stayed on in their country as coaches at the end of the earliest tours and working at the same with immense enthusiasm, the Australians developed their cricket, especially their bowling, so rapidly that when, on their first visit in 1878, they startled England and four years later actually defeated her full strength, it was recognized that a further evolution in technique had taken place. Their great bowlers, notably Spofforth, Boyle, Allen and Palmer, combined pace with spin and variety of flight, bowled much straighter than was the convention in England and made full use of a much more elastic field; when the pitch helped his off break, Spofforth would get many wickets from catches by Boyle standing in the then unprecedented place of silly mid-on, some six or seven yards from the bat. Blackham, in standing up to a bowler of Spofforth's pace, dispensing with a long-stop and taking the ball cleanly even on the leg side, set a new standard in wicketkeeping. Gradually English bowling, too, began to show greater versatility: A. G. Steel had resurrected with immense success the leg-break with which, in an earlier day, Buttress of Cambridgeshire, and Martingell, first of Eton's professional bowlers, had done great execution; Peate of Yorkshire was the first of a great sequence of slow left-arm bowlers, destined to play a major part in England's battles with Australia where, perhaps, owing to the super-excellence of the wickets, they have rarely arisen, while Lohmann (Surrey) was a master of subtle pace-changes and, in Grace's opinion, the greatest medium-pace bowler he had met. With the beginning of the nineties, we find a new generation of fast bowlers, noticeably Richardson and Lockwood, both of Surrey, and C. J. Kortright, an Essex amateur, whose pace and devil has never been surpassed.

During these last two decades batting continued on generally orthodox lines, with the off drive and the cut as the principal scoring strokes; L. C. H. Palairet (Somerset) was, perhaps, the most beautiful of all off-drivers, and F. S. Jackson and J. T. Brown, both of Yorkshire, and A. C. Maclaren (Lancs.), the best cutters of their day, though neither of them equalled in execution the Hon. C. G. Lyttelton of an earlier generation; most defence, on good wickets, at least, was by forward play; on bad wickets against the best bowlers it was, compared with present-day standards, quite ineffective, though Shrewsbury was a supremely good back-player and, probably, as great a defensive batsman under really difficult conditions, as the game has known.

Back play began its real development at the very end of the century under the influence of K. S. Ranjitsinhji, an Indian prince (now the Jam Sahib of Nawanagar) who got into the Cambridge XI. in 1893, played for England in 1896, and was a batsman of great and original genius whose theory and practice has often been summed up in the cliché "play back or hit." He and his friend and disciple, C. B. Fry, at this time the most versatile athlete in Great Britain and as a batsman profoundly influenced by his association with the Indian prince for Sussex, also developed on-side play to an extent undreamt of before, most noticeably in the hook stroke to the short ball and the forcing strokes wide of mid-on from balls pitching on the line of their legs or of the leg-stump. Indeed, these two batsmen may fairly be said to have laid down the lines upon which first-class batting has subsequently moved. Naturally this made for a strengthening of the on-side field, a tendency already set in motion by the success of a group of leg-break bowlers, notably C. L. Townsend, Braund, C. M. Wells and Vine, who bowled at the batsman's legs and leg-stump with considerable spin from leg, and had as many as six of their fieldsmen on the on-side. A *reductio ad absurdum* of this form of attack was, however, provided by W. W. Armstrong who, in two test matches for the 1905 Australian side, bowled wide of the batsman's legs with virtually all his field to the on, with the sole object of slowing down the English rate of scoring.

The opening years of this century show an orgy of run-getting and drawn games, so formidable as to induce serious debate by the M.C.C. on the reforms desirable to restore a fairer balance between bat and ball; a general meeting of the club agreed so to alter Law X. as to make it no longer necessary for the ball to pitch straight to secure a verdict of l.b.w. The majority, however, though large, was not the two-thirds requisite for any alteration in the laws proper, and the M.C.C. contented itself with a ukase to the counties denouncing the over-preparation of pitches which, at this time, with the help of special clay-dressing—most noticeably Nottingham marl—and of binding solutions such as liquid manure, the groundsmen up and down the country had reduced to a fine art. This appeal by the M.C.C. met with considerable success.

The heavy run-getting of this epoch is not, however, to be put down mainly to the ease of the conditions; it was rather due to a generation of great batsmen—a striking number of them were amateurs—who triumphed over much varied and formidable bowling by methods at once more attractive, more versatile and more individualistic than obtain to-day. As a spectacle, English cricket has never been better than in the years 1900–1905.

The next factor to influence the game—and it did so profoundly—was the so-called "googly" bowling, or the art of bowling at a slow or, at the most, slow-medium pace, an off-break with what appeared to be a leg-break action. This bowling was invented by B. J. T. Bosanquet, first successfully exploited by him in Australia in the winter of 1903–04, learnt from him by his Middlesex colleague, R. O. Schwarz, who took the art with him to South Africa, there to see it brought to something like perfection by himself, G. A. Faulkner, A. E. Vogler and Gordon White. The bowling of these four men, whether on their native matting in 1905, or as visitors in 1907 on our own turf wickets, created a real sensation: R. E. Foster, the England captain in the Tests of that year, hailed Vogler as the most difficult bowler in the world, and both he and A. C. Maclaren expressed grave misgivings as to the effect of googly bowling on cricket generally, suggesting that the batsman, if not positively immobilized, would at least be limited to cramped defence. Fortunately the difficulty of combining the googly with a good length, due largely to the physical strain involved, proved too great for most who attempted it, though both England and Australia have since produced successful bowlers of this type—notably D. W. Carr, Freeman, Richmond and R. Tyldesley in England; H. V. Hordern, A. A. Mailey and Grimmett in Australia.

Nevertheless, the googly's influence on batting, if not decisive, has been considerable; it has reinforced the tendency towards back-play already discernible before its advent, but on new and unfortunate lines. In his anxiety to delay his stroke until the line of the break shall have declared itself, the batsman tended to play back even to the over-pitched ball, and to reinforce his bat with his legs as a second line of defence. Only too often he contracted the habit of moving back and across the wicket with the right foot, before he knew the length of the ball, facing down the pitch with both feet pointing towards the bowler. The initial position inevitably denied to him the use of left-arm, elbow and shoulder, and with them the possibility of making any strokes except those executed with the right forearm, *i.e.,* the jab, the hook and the glide.

To such a practice another factor besides the googly substantially contributed. Ever since Noah Mann, of Hambledon, there have been at intervals in cricket history, bowlers accredited with the gift of the "swerve," *i.e.,* the gift of being able to make the ball change the direction of its flight in the air; the claim was made for Alfred Mynn in the '30s, and can be fully substantiated for Allen of Australia, Walter Wright of Kent, and Rawlin of Middlesex 50 years later, but such men had no idea how and why they swerved; then the American baseball pitchers developed the art, Albert Trott of Middlesex and M. A. Noble of Australia came under their influence, and before the first decade of the new century was ended, swerving was a common phenomenon in English cricket; most right-handers swerved from leg to off and bowled for catches in the slips, but some, such as the great pioneer of the style, J. B. King of Philadelphia, could swerve the ball in from the off, and the left-hand bowlers, such as Hirst and F. R. Foster, were often deadly with the new ball, supported as they were with a semi-circle of close-up fielders, known as leg-traps, ready to catch all edged or mishit balls. Some bowlers, notably Relf, Barnes and J. W. H. T. Douglas, could swerve either way, at least into a head wind. The ability to continue to swerve after the gloss begins to wear off the ball is contingent for most bowlers on one or more of such factors as a suitable breeze, a heavy atmosphere, favourable surroundings, *e.g.*, trees. Contemporary, and in part connected with these developments, there came a much more intelligent and elastic use of the field; great tacticians, amongst whom the Australian captain Noble was unsurpassed, would study each batsman's strokes individually, and block them with an inner and an outer ring. The on-side became increasingly guarded.

The combined influence of the googly and the swerve dominated English batting in the years immediately after the war with disastrous effects; with very few exceptions the leading batsmen concentrated on back-play, and the right-hand on-side strokes, abandoning almost entirely the drive and the cut; the weakness of English bowling in that period encouraged them to believe in their method, but they were cruelly undeceived by their own helplessness before the pace of Gregory and Macdonald, and the accuracy of Armstrong of the 1921 Australian team. Since then English batting has been slowly achieving a reasonable compromise between the new style and the old; it is undeniable that, under the influence of "unlimited" test match cricket in Australia and the yearly increasing rivalry and publicity of county cricket, the game is now less attractive as a spectacle than it was. Admittedly the general level of defence, especially on difficult wickets, is greatly advanced, but first-class batting is much more stereotyped, and less versatile and adventurous. Fortunately there have still been a few—Hobbs, Woolley and Macartney in particular—to prove that genius cannot be fettered, and that it is possible to master the new bowling without sacrificing the glamour and grace of the old batting; but for the most part, first-class cricketers, of whom all other cricketers are only too imitative, have subscribed to the modern doctrine that, even in a game, efficiency must decide.

Some Records and Curiosities.—A list of a few outstanding cricket achievements, compiled by permission, mainly from Wisden's *Almanack*, in first-class cricket may be interesting.

The highest individual innings in a test match was W. R. Hammond's 336 not out *v.* New Zealand at Auckland (1932–33); six centuries in successive innings in first-class cricket were made by C. B. Fry in 1901; 16 centuries in one season of first-class cricket by J. B. Hobbs in 1925; 189 runs in 90 minutes by E. Alletson for Notts. *v.* Sussex at Brighton in 1911; 555 runs for a first wicket partnership by P. Holmes and H. Sutcliffe for Yorkshire *v.* Essex at Leyton in 1932; 3,518 runs in a season's first-class cricket by Hayward (T) in 1906. W. G. Grace, between 1865 and 1908, scored 54,896 runs and took 2,876 wickets in first-class cricket. In 1895, Richardson (T) took 290 wickets, while in the second Australian tour (1880), F. R. Spofforth took 391 wickets in England; G. H. Hirst in 1906 scored 2,385 runs and took 208 wickets. The feat of scoring over 1,000 runs and taking over 100 wickets in the same season has been accomplished by Rhodes (W.) on 16 different occasions. W. G. Grace played his first match for the Gentlemen *v.* the Players in 1865 and his last in 1906, scoring in these games 6,008 runs, with an average of 42·60, and taking 271 wickets for 18·78 runs each. For Australia *v.* South Africa, at Manchester, in 1912, T. J. Matthews took three wickets with successive balls in each inning —a feat without parallel in test matches. In 1896 A. D. Pougher

took five wickets for 0 runs for the M.C.C. and Ground *v.* Australians at Lord's. In 1884 F. R. Spofforth took 7 wickets for 3 runs for the Australians *v.* an England XI. at Birmingham. C. Blythe for Kent *v.* Northamptonshire at Northampton, in 1907, took 17 wickets in one day. In the season of 1913, F. H. Huish, keeping wicket for Kent, took 102 wickets, catching 70 men and stumping 32. The highest aggregate innings in first-class cricket is 1,107 runs scored by Victoria *v.* New South Wales at Melbourne in 1926–27.

For many years A. C. Maclaren's 424 runs, scored for Lancashire against Somerset in 1895, held the record for a single innings score, but this has been three times exceeded: twice by W. H. Ponsford at Melbourne, in 1922–23 with 429 (Victoria *v.* Tasmania), and in 1927–28 with 437 (Victoria *v.* Queensland); and by D. G. Bradman in 1929–30 with 452 not out (N.S.W. *v.* Queensland at Sydney). Up to the end of the 1935 season ten players had 100 or more centuries to their credit, J. B. Hobbs' total (197) being the highest.

The highest recorded individual score in any match is A. E. J. Collins's 628 in a junior house match at Clifton in 1899, his innings of 6 hrs. 50 mins. being spread over five afternoons.

CRICKET, an insect of the family Gryllidae (*see* ORTHOPTERA); universally known because of the musical chirping of the males. Crickets have threadlike antennae, jumping hind legs, three-jointed tarsi, a slender ovipositor and tegmina which lie flat across the abdomen with abruptly downbent sides; many are short-winged or wingless. The hind wings are often ample, folding into slender "tails" that project behind the body. The subfamily *Gryllinae* includes the familiar house and field crickets. The house cricket (*Gryllulus domesticus*), widely distributed in the old world and established in the United States, is yellowish-gray marked with brown. It frequents houses, and often seeks warmth near fireplaces, whence the phrase, "the cricket on the hearth." Its chirp is lively but monotonous. The common European field cricket is *Gryllus campestris,* that of North America *Gryllulus assimilis;* the latter occurs with many variations throughout the new world. Both are large brown or black species with similar habits. They dig short burrows or make chambers under logs and stones; sitting in the entrance the male chirps loudly day and night. Pugnacious, he defends his home against an intruding male with vicious open-jawed lunges accompanied by shrill "angry" chirps; but no damage is ever done in these "fights." Sometimes he seems as much annoyed by the approach of a female as by that of a male, as if he were singing for pure pleasure and did not wish interruption; if seeking a mate, however, he caresses her with his antennae and chirps softly. The musical apparatus consists of about 130 minute ridges on the stridulating vein of one tegmen, which are scraped rapidly over a sharp-edged vein in the other while both tegmina are held in an elevated position. The ground crickets (*Nemobiinae*), abundant in Europe and North America, resemble miniature field crickets in form. The delicate green tree crickets (*Oecanthinae*) have very musical notes; one common N. American species (*Oecanthus niveus*) sings by the thousand in unison at night, a short beat of about 100 to the minute, so that the forest seems to pulsate. The mole crickets (*Gryllotalpinae*) suggest miniature moles in habits and appearance, with their digging fore legs, cylindrical body, and velvety coat of hairs. They are of wide occurrence; the common European species is *Gryllotalpa gryllotalpa,* also established in North America. The latter region also has five other species of two genera; two of them (*Scapteriscus vicinus* and *acletus*) are serious crop pests in Georgia and Florida. Mole crickets burrow through the soil and feed upon tender plant roots and insects. About 1,400 species of crickets are known. In some regions crickets are caged for their song, and cricket fighting is a favourite sport in China. (T. H. HL.)

CRICKHOWELL, market town and civil parish, Breconshire, Wales, in the S.E. of the county on the left bank of the Usk, guarding the northern exit of the road into the county between the Brecon Beacons and the Black mountains. Pop. (1931) 1,076. The town is said to derive its name from Crûg Hywel, an early fortress north-northeast of the town. The mediaeval castle, of which only a tower remains, probably dates from the Norman intrusion. Although tradition regards the manor of Crickhowell as a borough by prescription there are no records of its ever having possessed any municipal institutions. Curfew is still rung there. The region is wholly agricultural and although in touch with the Newport and Brecon canal, the little market town is off the main railway routes. After World War I, communications were much improved by the extended use of motor traffic.

CRICKLADE, market town of Wiltshire, England, 9 mi. N.W. of Swindon, on the G.W.R. Pop. (1931) 1,378. Cricklade owed its importance in Saxon times to its position at the passage of the Thames, and is mentioned in the *Anglo-Saxon Chronicle.* It possessed a mint in the time of Edward the Confessor, and William of Dover fortified a castle here in the reign of Stephen. In the reign of Henry III a hospital dedicated to St. John the Baptist was founded. Cricklade was a borough by prescription at least as early as the Domesday Survey, and returned two members to parliament from 1295 until the act of 1885. The borough was never incorporated, but certain liberties, including exemption from toll and passage, were granted by Henry III and confirmed by successive sovereigns. In 1257 Baldwin de Insula obtained a grant of a Thursday market, which later was much frequented by dealers in corn and cattle, and an annual three days' fair at the feast of St. Peter ad Vincula. During the 14th century Cricklade formed part of the dowry of the queens of England.

The cruciform church of St. Sampson is mainly Perpendicular, with a fine ornate tower, and an old rood-stone in its churchyard. The small church of St. Mary has an Early English tower, Perpendicular aisles and a Norman chancel arch. Pop. of rural district with Wootton Bassett (1938) 11,230. Area, 71.8 sq.mi.

CRIEFF, a small burgh, Perthshire, Scotland, and the capital of Strathearn, $17\frac{3}{4}$ mi. W. of Perth by the L.M.S.R. Pop. (est. 1938) 5,242. It occupies the southern slopes of a hill on the left bank of the Earn. Its climate is healthful, the air being pure and dry, and it has recently become a health resort. Its charter is said to date from 1218, and it was the seat of the courts of the earls of Strathearn till 1747, when heritable jurisdictions were abolished. A Runic sculptured stone, believed to be of the 8th century, and the old town cross stand in High street, but the great cattle fair, for which Crieff was once famous, was removed to Falkirk in 1770. It was probably in connection with this market that the "kind gallows of Crieff" acquired their notoriety, for they were mostly used for the execution of Highland cattle-stealers. Among the principal buildings are Morison's academy (founded in 1859), and Strathearn house, a hydropathic establishment built on an eminence at the back of the town, and itself sheltered by the Knock of Crieff (911 ft.). There is a distillery, and preserves are made. Drummond castle, about 3 m. S., is celebrated for its gardens planned by the 2nd earl of Perth (d. 1662). They cover an area of 10 acres, are laid out in terraces, and illustrate Italian, Dutch and French styles. The keep dates from 1490, but much of the original building was demolished in 1689. The present structure was erected after the Jacobite rebellion.

CRILE, GEORGE WASHINGTON (1864–1943), American surgeon, was born in Chili, O., on Nov. 11, 1864. He graduated from Ohio Northern university, Wooster university medical school, and studied in London, Vienna and Paris. He was distinguished as a surgeon of the respiratory system, developed the nerve-block anaesthesia, and performed the first direct blood transfusion. He was a member of many American and European honorary societies, and was awarded numerous prizes and medals. During World War I he was professional director and consultant of U.S. Base Hospital No. 4 in France, and was awarded the distinguished service medal. He was founder of the Cleveland Clinic foundation. He died in Cleveland, Ohio, Jan. 7, 1943.

He is author of *Surgical Shock* (1897); *Surgery of Respiratory System* (1899); *Certain Problems Relating to Surgical Operations* (1901); *On the Blood Pressure in Surgery* (1903); *Hemorrhage and Transfusion* (1909); *Anemia and Resuscitation* (1914); *Nature of the Emotions* (1915); *A Mechanistic View of War and Peace* (1915); *Man, An Adaptive Mechanism* (1916); *The Kinetic Drive* (1916); *A Physical Interpretation of Shock Exhaustion and Restoration* (1921); *The Thyroid Gland* (with others) (1922); *Notes on Military Surgery* (1924); *A Bipolar Interpretation of Living Processes* (1925); *Problems in Surgery* (1928); *Diseases Peculiar to Civilized Man* (1934); and *The Phenomena of Life* (1936).

CRILLON, LOUIS BALBIS DE BERTON DE (1543–1615), French soldier, called by Henry IV. "the bravest of the brave," was born at Murs in Provence. As a boy of 14 he joined the army of the duke of Guise and won distinction at the capture of Calais and Guines and afterwards at, among other battles, those of Jarnac and Moncontour. At all these engagements Crillon was wounded. In 1570, he went to serve with Don John of Austria against the Turks, and though wounded at the battle of Lepanto, was charged with carrying news of the victory to the pope and the French king. Crillon was in Paris during the massacre of St. Bartholomew, which he strongly condemned. He took part, however, in the siege of La Rochelle, where he was wounded and although he was loyal to Henry III. in his struggle with the League, after the death of that king he gave his whole allegiance to Henry IV. He fought at the battle of Ivry and was present at the siege of Paris. After the peace with Savoy was concluded Crillon retired to his estate and gave himself to pious exercises. It is related of him that being present at church one day when the story of the Passion was being read, the old soldier became enraged at hearing of the outrages which Christ had suffered, and drawing his sword cried out "Where were you then, Crillon?" Crillon, who was one of the greatest captains of the 16th century, died at Avignon on December 2, 1615.

CRIME. Many attempts have been made to find an accurate definition of crime, such as "an anti-social act," "a failure or refusal to live up to the standard of conduct deemed binding by the rest of the community," and "some act or omission in respect of which legal punishment may be inflicted on the person who is in default whether by acting or omitting to act." Under all these definitions the man who rides a bicycle without a light, or pulls the communication cord in a railway carriage as a stupid joke, is as much guilty of crime as the man who shoots a night watchman and runs away with the contents of the safe. Yet, if crime is defined as the commission of a grave offence, manslaughter is a crime and men have been convicted of manslaughter for driving a vehicle so carelessly as to cause the death of another: the offence was not intentional and in the eye of the ordinary citizen the careless driver is not a criminal.

The Nature of Crime.—That brings us to the motive; but here we encounter a new difficulty. Who can divine the secrets of the heart? The only material on which our fallible human judgment can work is the act itself. The matter is further complicated by the question of responsibility, for a certain number of persons who come before the criminal courts—probably not so large a number as is generally supposed—are mentally unstable, even if not certifiably insane. When we know so little of the secret temptations and the hidden faults of our intimate friends, how can we expect the criminal courts, which have not our advantage, to do more than rough justice? As long as human nature remains what it has always been, and what it will continue to be until the race disappears from the globe, that is all that human judges can ever do. Most of us have been guilty at some time of an "anti-social act" and all of us, as we have confessed in places of worship, deserve punishment. It is more difficult to give an answer to the question "What is crime?" than it is to reply to the question of Pontius Pilate who expected no answer.

Crime is not a fixed quantity. Certain acts such as apostasy, or the practice of witchcraft have been savagely punished in the past and are not now treated as crimes. The treacherous seduction of a wife under circumstances condemned in every moral code may be treated as a crime in one country and not in another. A grave offence in one century may be a trivial offence in another. Every new invention, every new social combination, begets new forms of crime among those who use their wits to prey upon society.

Punishment.—Nevertheless, though we cannot give any satisfactory definition, all of us know what we mean by "crime" and why we punish it. What is not so generally recognized is that the criminal is for the most part a man of like passions with ourselves, only less restrained, less prudent and far more unlucky. Human society, even when it was in a rudimentary state, tried to protect itself by punishing those who defied its customary law, not primarily as an act of retribution, but from a sense of compensation—an eye for an eye and a tooth for a tooth—and as civilization advanced, so did the theory of punishment as an instrument of deterrence. It is to this principle that the barbarous punishments that persisted in civilized countries up to the end of the eighteenth century were principally due.

It is now generally recognized that for punishment to be effective in reducing crime, three conditions are necessary—all criminals must be caught, their punishment must be justly awarded and there must be no delay in carrying out the sentence. It was only the third of these conditions that primitive and mediaeval society could achieve; it is the condition which is in danger of being lost sight of in many civilized communities. The first condition has not yet, and probably never will be, achieved at all. If detection and punishment were as certain as it is that a hand thrust into the fire will be burned, one could count upon the fingers the number of persons who would adventure upon crime.

During the centuries covered by history, no doubt for long before history was written, a state of war has existed between the criminal and the forces of law and order, with fluctuating fortune, and whenever the criminal appeared to be victorious, the penalties exacted from those enemies of society who were unlucky enough to fall into the hands of authority became more savage in the vain hope that the majority—the undetected—might take warning and be deterred. The desecration of tombs in Ancient Egypt, then the most serious of all crimes, went on in spite of the atrocious punishments inflicted.

The torture inflicted on accused persons up to 150 years ago to extort confessions was not, as is commonly supposed, resorted to merely from cruelty, but was part of a judicial system which hesitated to execute condemned persons before they had confessed.

Until quite late in the Christian era, the only conception of punishment for crime was death or the infliction of bodily pain. Under the Roman empire prisons were not places of punishment, but were used only for detaining prisoners until they could be tried or executed. In the list of Roman penalties—death by hanging, by hurling from the Tarpeian rock, crucifixion, beheading, and drowning in the sack, exile or beating with rods—there is no mention of the *carcer*. According to the reasoning of that day, a man who had declared war upon society had forfeited his right to belong to it and was better out of the way: society was not called upon to pay for maintaining him upon the doubtful chance that his nature might be regenerated. It was in the monastic system of the early Christian church that the idea of imprisonment first took root. The church attached great importance to solitude as a first condition of penitence. Solitude was the inspiration of the monastic system. "Solitary confinement," as we understand the words, dates from the *detrusio in monasterium* of the old Canonical Law. When the French had the machinery for keeping people in prison, they used their prisons for secluding persons obnoxious to the court under *lettres de cachet*. The Declaration of the Rights of Man enunciated in 1789 contained the first suggestion of a methodical system of imprisonment for lawbreakers, which appeared in the French code of 1791. Beccaria had already published his treatise against arbitrary and savage penalties and had insisted that punishments should be limited to what was necessary for the defence of the community. Before his day there had been sporadic experiments in Europe. In 1593 the Protestants in Amsterdam had built a prison for women who were to be reformed by regular work and religious influences. Experiments of the same kind were made in Germany and the Hanseatic towns. In 1703 Pope Clement XI. had built the famous prison of St. Michel for young prisoners, and later in the century the cellular prison, which evoked the admiration of John Howard, was built at Ghent.

The modern prison system in England dates from Jeremy Bentham and John Howard. Prison reform was older than the reform of English penal laws of which Sir Samuel Romilly said as late as 1817 "The laws of England are written in blood." The savagery of the French criminal law was swept away by the Revolution, but more than twenty years later, men and women were being executed in England for thefts of more than forty shillings in value. This conservatism was due in part to a disinclination to copy the methods of our enemies, but there was also the feeling that unless criminals could be terrorized into good behaviour, they would become the masters of society; as is always the case in communities with a defective police organization. The criminal, and especially the highwayman, was a popular hero; the class from which he sprang was at war with those who possessed property and was glad to shield offenders from a law so sanguinary and pitiless; the lives of the working class in cities were not such as to attract the adventurous, and though to "cut a dash" on the highway generally brought a man to Tyburn before he was twenty-five, he took his last ride in the cart under the admiring eye of the only audience whose opinion he valued, and strutted into Eternity. The policy of terror failed as it has always failed. During the last decade of the 18th century the annual depredations upon property lying in the Thames amounted to the value of more than half a million sterling, and the highways near London were so unsafe for mail coaches that the Government had a force of mounted patrols to escort the coaches to their destination.

Jeremy Bentham did not approach the problem from the humanitarian standpoint: there was no sentiment about his "Panopticon," which was a prison so planned as to give the maximum security against escape with the minimum of expenditure of staff. His plan was to educate, to classify and to provide for the discharged prisoner, but its main purpose was to prevent crime by discovering and removing its causes. He laid, in fact, the foundation of our modern system. Bentham lived before his time. He found few converts in the England of his day, which Lecky described as standing high in political, industrial and intellectual eminence, but "ranked in the treatment of crime and of prisoners shamefully below the average of the Continent."

John Howard was a reformer of a different mould. "He surveyed all Europe," said Burke, "not to view the sumptuousness of palaces, but to survey the mansions of sorrow and of pain; to collect the distresses of men in all countries. His plan was original and full of genius as of humanity: it was a voyage of discovery." Howard had himself been captured by a French privateer and interned in a dungeon at Brest where his experiences had sunk deep into his mind. His book, *The State of Prisons at Home and Abroad,* published at his own expense in a provincial town, awakened the public conscience to the scandal and disgrace of our penal system.

The criminal was gaining on the gallows and the population of Great Britain was then under nine millions. It was thus that transportation came into being. In the reign of Charles II. the moss-troopers of the Border had been transported to North America. In the Bloody Assize of 1685, Judge Jeffreys sentenced no less than 841 persons to slavery on the plantations. When the United States became independent, Australia and Bermuda provided a new outlet, but by 1852, Great Britain was compelled to "consume her own smoke."

Serious crimes may be the result of passion, impulse or premeditation; they may be committed to escape from threatened ruin, or crime may be deliberately adopted as a profession. Experience has shown that the professional criminal is morally far worse than the accidental, and that the murderer from passion is less dangerous to the community than the hardened thief. If all were detected and caught, there would be no professional criminals and it would not matter what punishments were awarded; the certainty of punishment would be an effective deterrent. It is indeed uncertain how far severity of punishment affects the statistics of crime. In the early 'sixties there was a sudden rise in the figures and this was ascribed to the leniency of prison treatment. This was tightened up and the figures fell, but it is far from certain that the one had anything to do with the other. The crime of garroting ten years later was said to have been put down by the award of corporal punishment for highway robbery, but this, too, may be doubted. What is certain at least is that delay in the execution of punishment—either through facilities for criminal appeals, or delays in adjudication—does foster lawlessness, and this mistaken form of humanitarianism is a by-product of civilization in some of our modern States.

Anomalies.—The history of the movement of crime discloses anomalies that are impossible to explain; the lines of particular offences do not follow gentle curves upward or downward, but are subject to sudden leaps with corresponding falls as the years go by. Probably the imitative instinct in criminals has much to do with these fluctuations; one sensational crime widely reported in the newspapers produces others of the same kind. How far the so-called "crook" films affect the problem is a matter of dispute: it is certain that since their exhibition in the Far East, young native criminals equipped with masks, safe-breaking implements and automatic pistols have come into being. But some of the fluctuations seem to defy explanation. During the last five years there has been a dramatic rise in homicides all over the Malay Peninsula, generally unconnected with dacoity or robbery, but rather as the result of sudden passion. After the Napoleonic wars there was a striking increase of crime in England and during the World War this was quoted to prepare the world for a similar phenomenon after the Peace; but there was no increase in crimes of violence; rather the contrary.

Many writers on crime have been betrayed into taking the prison statistics as a basis for their arguments, but these figures depend solely upon the efficiency of the police and the criminal courts. The only real material for comparison is the number of crimes reported to the police and figures of these are not accessible for comparison in all countries.

In Britain the apparent decrease of crime that followed the World War was due to causes independent of the moral well-being of the community. The Borstal system for the treatment of young offenders and the Probation Act had come into force a few years before the outbreak of war, and both have undoubtedly had some influence in reducing the volume of professional crime, though it is not to be supposed that the reduction in the daily average of persons undergoing imprisonment signifies that crime is progressively waning. The total daily average of the prison population in England and Wales has fallen by nearly half what it was in the last years before the World War, and 25 prisons have been closed. Since petty offences are often the product of want, the unemployment dole has no doubt had some influence on the figures. Nevertheless, a scrutiny of the criminal statistics of the last fifty years will show that there is a tide in crime, and that it is unwise to found arguments upon the level at low water. The tide is apt to turn as it did when it reached the high water mark of the first decade of the 20th century.

CRIMEA (anc. Tauris or Tauric Chersonese), called by the Russians by the Tatar name *Krym* or *Crim,* an A.S.S.R. in the Russian republic, created by decree in Oct. 1921, forming a peninsula on the north side of the Black sea, with the mainland of which it is connected by the Isthmus of Perekop (3–4 mi. across). It extends for 200 mi. between 44° 23′ and 46° 10′ N., and 110 mi. between 32° 30′ and 36° 40′ E. Its area is 9,952 sq.mi. The population in 1939 was 1,126,824; urban, 585,701 and rural, 541,-123, mainly Russians and Crimean Tatars, the latter much modified by racial intermixture with Greek, Turkish and other elements.

Its coasts are washed by the Black sea, except on the north-east, where is the Sivash or Putrid sea, a shallow lagoon separated from the Sea of Azov by the Arabat spit of sand. The shores are broken on the west side of the Isthmus of Perekop by the Bay of Karkinit; on the south-west by the open Bay of Kalamita, on the shores of which the allies landed in 1854, with the ports of Eupatoria, Sevastopol and Balaklava; by the Bay of Arabat on the north side of the Isthmus of Yenikale or Kerch; and by the Bay of Kaffa or Feodosiya (Theodosia), with the port of that name, on the south side of the same. The south-east coast is flanked at a distance of 5 to 8m. from the sea by a parallel range of mountains, the Yaila-dagh or Alpine Meadow mountains, and these are backed, inland, by secondary parallel ranges; but 75% of the remaining area consists of high arid prairie lands, a southward continuation of the Pontic steppes, which slope gently north-westwards from the foot of the Yaila-dagh. The main range of these mountains shoots up abruptly from the deep floor of the Black sea to an altitude of 2,000 to 2,500ft., beginning at the south-west extremity of the peninsula, Cape Fiolente (anc. Parthenium), supposed to have been crowned by the temple of Artemis in which Iphigeneia officiated as priestess. On the higher parts of this range are numerous flat mountain pastures (Turk. *yailas*), which, except for their scantier vegetation, are analogous to the *almen* of the Swiss Alps, and are crossed by various passes (*bogaz*), of which only six are available as carriage roads. In this range are the peaks of Demir-kapu or Kemal-egherek (5,040ft.), Roman-kosh (5,060 ft.), Chatyr-dagh (5,000ft.), and Karabi-yaila (3,975ft.). The second parallel range, 1,500 to 1,900ft., forms steep crags to the south-east and a gentle slope towards the north-west. In the former slope are thousands of small caverns, probably inhabited in prehistoric times; and several rivers pierce the range in picturesque gorges. A valley, 10 to 12m. wide, separates this range from the main range, while another valley 2 to 3m. across separates it from the third parallel range, 500 to 850 feet. Evidences of a fourth and still lower ridge can be traced towards the south-west. Short streams, none of them anywhere navigable, form mountain cascades in spring, *e.g.,* the Chernaya, Belbek, Kacha and Alma, to the Black sea, and the Salghir, with its affluent, the Kara-su, to the Sivash lagoon.

Climate and Flora.—In climate and vegetation there exist marked differences between the open steppes and the south-eastern littoral, sheltered by the Yaila-dagh. The former, although grasses and Liliaceae grow on them in great variety and luxuriance in the early spring, become completely parched by July and August, when the air is filled with clouds of dust. High winds prevail, and snowstorms, hailstorms and frost. Parts of the steppes are impregnated with salt, or studded with saline lakes. Water is scarce, and mainly obtained by sinking artesian wells. *Kurgans* or burial-mounds of the ancient Scythians remain on the steppe. Behind the Yaila-dagh the narrow strip of coast and the slopes of the mountains are smothered with greenery. This Russian Riviera stretches all along the south-east coast from Cape Sarych (extreme south) to Feodosiya (Theodosia), and is studded with summer sea-bathing resorts—Alupka, Yalta, Gursuv, Alushta, Sudak, Theodosia. Numerous Tatar villages, mosques, monasteries, former palaces of the Russian imperial family and Russian nobles, now used as sanatoria and rest homes for workers from all parts of the U.S.S.R., and picturesque ruins of ancient Greek and mediaeval fortresses nestle amongst underwoods of hazel and other nuts, groves of bays, cypresses, mulberries, figs, olives and pomegranates, vineyards, tobacco plantations, and gardens gay with all sorts of flowers. The higher slopes of the mountains are thickly clothed with forests of oak, beech, elm, pines, firs and other Coniferae. In the south-east there have become acclimatized such plants as magnolias, oleanders, tulip trees, bignonias, myrtles, camellias, mimosas and many tender fruit-trees. The vineyards produce wine of a good quality and fruits grow in abundance, especially cherries, apples and pears. In some winters the mountains are covered with snow, but snow seldom falls to the south of them. The heat of summer is moderated by breezes off the sea, and the nights are cool and serene; the winters are mild and healthy. Fever and ague prevail in the lower-lying districts for a few weeks in autumn. Dense fogs occur sometimes in March, April and May, but seldom penetrate inland. The rainfall is everywhere scanty; it varies greatly, however, from year to year; *e.g.,* at Simferopol from 7·5 to 26·4in. per annum. Of the whole area, 35% is under cultivation, and 2% of this is garden, vineyard and tobacco cultivation. Winter wheat 49·1%, barley 31·9% and oats 13·6% are the chief crops. Of summer crops maize occupies the chief place, together with melons, cucumbers, flax and millet. The Yaila mountain area affords pasture for sheep and cattle.

Industries.—Iron is mined in the Kerch peninsula and exported to the Ukrainian factories and salt is exported especially from Lake Sakch near Eupatoria. Porphyry and limestone are also exported. Fish abound all around the coast, such as red and grey mullet, herring, mackerel, turbot, soles, plaice, whiting, bream, haddock, pilchard, a species of pike, whitebait, eels, salmon and sturgeon. Industries include shipbuilding, flour-mills, ironworks, jam and pickle factories, soap-works and tanneries. The Crimean Tatars are peasants noted for their leather, wool and metal work. A railway, coming from Kharkov, crosses the peninsula from north to south, terminating at Sevastopol and sending off branch lines to Theodosia, Kerch and Eupatoria. The chief towns are Simferopol, the capital, the important naval station and trading port of Sevastopol, the ports of Eupatoria, Theodosia, Kerch (*qq.v.*) and Yalta, a health resort on the south-east coast.

History.—The earliest inhabitants of whom we have any authentic records were the Celtic Cimmerians, who were expelled by the Scythians during the 7th century B.C. A remnant, who took refuge in the mountains, became known subsequently as the Tauri. In that same century Greek colonists began to settle on the coasts, *e.g.,* Dorians from Heraclea at Chersonesus, and Ionians from Miletus at Theodosia and Panticapaeum (also called Bosporus). Two centuries later (438 B.C.) the archon or ruler of the last-named assumed the title of king of Bosporus, a State which maintained close relations with Athens, supplying that city with wheat and other commodities. The last of these kings, Paerisades V., being hard pressed by the Scythians, put himself under the protection of Mithridates VI., king of Pontus, in 114 B.C. After the death of this latter sovereign his son Pharnaces, as a reward for assistance rendered to the Romans in their war against his father, was (63 B.C.) invested by Pompey with the kingdom of Bosporus. In 15 B.C. it was once more restored to the king of Pontus, but henceforward ranked as a tributary State of Rome. During the succeeding centuries the Crimea was overrun or occupied successively by the Goths (A.D. 250), the Huns (376), the

Khazars (8th century), the Byzantine Greeks (1016), the Kipchaks (1050), and the Mongols (1237). In the 13th century the Genoese destroyed or seized the settlements which their rivals the Venetians had made on the Crimean coasts, and established themselves at Eupatoria, Cembalo (Balaklava), Soldaia (Sudak) and Kaffa (Theodosia), flourishing trading towns, which existed down to the conquest of the peninsula by the Ottoman Turks in 1475. Meanwhile the Tatars had got a firm footing in the northern and central parts of the peninsula as early as the 13th century, and after the destruction of the Golden Horde by Tamerlane they founded an independent khanate under a descendant of Jenghiz Khan, who is known as Hadji Ghirai. He and his successors reigned first at Solkhat (Eski-krym), and from the beginning of the 15th century at Bakhchi-sarai. But from 1478 they ruled as tributary princes of the Ottoman empire down to 1777, when, having been defeated by Suvórov, they became dependent upon Russia, and finally in 1783 all of the Crimea was annexed to the Russian empire. The Crimean War of 1854–56 is treated under a separate article. At various times, *e.g.*, after the acquisition by Russia, after the Crimean War of 1854–56, and in the first years of the 20th century, Crimean Tatars emigrated in large numbers to the Ottoman empire. It was occupied by the Germans in 1941. (*See* BOSPORUS CIMMERIUS; RUSSIA: *Bibliography*.)

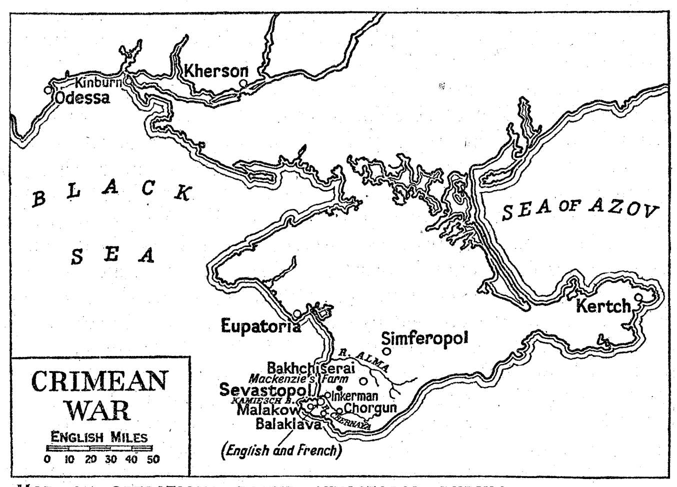
CRIMEAN WAR. The causes of the Crimean War, in which Great Britain and France, allies for the first time for two centuries, drifted into war with Russia, were involved if not obscure. Russia, to whom popular opinion of the times, in flat defiance of history, attributed a power in arms little short of invincibility, continued to pursue the policy of expansion towards Constantinople laid down for her in the legendary will of Peter the Great, and early in 1853 seized the opportunity of a petty religious quarrel about "a few Greek priests," to arrogate to herself the unofficial but lucrative rôle of protector of the Orthodox Christians *in partibus infidelium,* as a preliminary to an eventual reversion of the bulk of the estate of "the sick man," as her ruler, tsar Nicholas I., believed Turkey to be. This line of policy brought her in sharp opposition in the first place to England, who saw in a Russian occupation of Constantinople a potential threat to the overland route to India too formidable to be countered even by the possession of Egypt, which the tsar was ready to bestow on her as the reward of complicity. Nicholas, moreover, on the day when he preferred to address the newly-crowned emperor of France as a friend rather than as a brother, had raised up for himself another and more implacable enemy. Napoleon III. was too good a son of the Catholic Church to acquiesce in the Russian claims to special treatment for Orthodox Christianity in the Ottoman empire; too much a Bonaparte not to wish to revenge 1812 and the occupation of Paris; and too uncertain of his new throne not to welcome a successful war, that first and last thought of an insecure dynasty. The emperor of Austria too, who owed it to the tsar's military aid in 1849 that he still sat on the throne of his fathers, was so nervous of Russia's advance in the Balkans that he was prepared to astonish Europe by his ingratitude and take the side of France and Britain. Amid all these jealous and suspicious rivals Turkish diplomacy pursued a sure but tortuous course, in large measure directed from behind the scenes by the British ambassador, Stratford de Redcliffe, another man of whom the tsar had made a powerful personal enemy, and to a greater degree than any other individual the author of the Crimean War. A Russian ultimatum was delivered and politely rejected by the Turks. A European congress met and arrived at a solution of the problem which no one understood, and no one but the tsar accepted; and in July 1853 Russia mobilized and her armies occupied the portion of Turkey lying north of the Danube. A few weeks later a Russian fleet attacked and destroyed a Turkish squadron in the Black sea, despite the presence of French and British warships in the Bosporus. After this, war, though still long in coming, was inevitable; and by March 1854 France and Britain found themselves in alliance with each other against Russia.

In Jan. 1854, as soon as the Allies had decided that the Ottoman empire must be protected against the tsar, Sir John Burgoyne, an engineer officer, had been sent to elaborate a scheme for the defence of Constantinople, and gave it as his opinion that this could best be done by fortifying Gallipoli. Marshal Vaillant, the French minister of war, another engineer, concurred, and the Crimean War began ominously, as far as the Allies were concerned, as a defensive war. But in war one cannot defend unless one is attacked, and before the French and British expeditionary forces had completed their assembly at Varna on the western shore of the Black sea, it became clear that they would not be attacked; for Russia, in obedience to the ungrateful pressure of Austria, drew back her army from the captured trans-Danube provinces, thus leaving the Allies apparently no *casus belli.* But it is easier to let loose the dogs of war than to catch and kennel them again. The expeditionary forces could not be left at Varna, where there had broken out a severe cholera epidemic. Nor was either France or England prepared to bring home troops without something attempted, if not done; so there came up the question of the invasion of the Crimean peninsula, on the southern coast of which was situated Sevastopol, Russia's only naval base in the Black sea.

This distinctly formidable enterprise was certainly undertaken, like another and more formidable one, *à coeur léger.* Little was known of the country; as Prince Albert most sensibly put it, "the first difficulty is the absence of all information as to the Crimea itself." Even the more volatile French court realized this; the great Napoleon was consulted by means of a planchette; two sketches of Sevastopol and Balaklava by Raffet were carefully studied as the possible basis of a plan of campaign; and the great strategical authority, Jomini, was sought out in the *Café Anglais,* where, despite the cheerfulness of his surroundings, he could only prophesy disaster. The British cabinet however, observing from a cursory glance of the map that the Crimea was a peninsula, conceived that there could be nothing easier than for the British fleet to cut it off from the mainland by commanding the isthmus with its guns—nor could there have been but for the fact subsequently discovered, that the depth of the sea on either side of this isthmus was little more than two or three feet. The decisive despatch authorizing the attack on the Crimea, and impressing on its recipient the importance of selecting favourable weather, was sent by the British cabinet to Lord Raglan, the commander-in-chief, on June 29; Marshal St. Arnaud, his colleague, received the less precise but probably no less helpful instructions "to act as circumstances might require." On July 18, therefore, the allied generals and admirals held a council of war, at which the invasion of the Crimea was decided on.



MAP OF OPERATIONS ROUND SEVASTOPOL DURING CRIMEAN WAR, 1853–1856

The siege of Sevastopol ended in the Allies entering, on Sept. 9, 1855, a burning, empty city, in the defence of which the Russians had lost 102,670 men

The British commander, Lord Raglan, the Fitzroy Somerset of the Peninsular War, had seen no service since 1815, and had spent most of his time at the Horse Guards: a courtly and polished gentleman, his chief merit was that, despite his incurable habit throughout the campaign of referring to his enemy as "the French," he was admirably adapted to lessen the friction inevitable in coalition wars. His French colleague, St. Arnaud, had had a variegated career. He had distinguished himself in Algeria at the siege of Constantine, and had helped to engineer the *coup d'état* which placed Napoleon III. on the throne. At the opening of the campaign, however, he was already stricken with a mortal sickness. Omar Pasha, the Turkish commander, who had seen much service in the Near East, was the most experienced soldier of the three. The most remarkable thing about the British divisional generals was their age; all with the exception of the duke of Cambridge were approaching 70, and were of the stock and pipeclay school.

On Sept. 7 the combined forces embarked at Varna, 57,000 in all, the largest expedition that had ever set out for war overseas. The "Caradoc," having on board Raglan, Burgoyne and Brown, preceded the flotilla to look for a likely landing place and steamed so close to the Crimean coast that Russian officers could be seen looking at her through their telescopes, and "on perceiving this the English officers took off their hats and bowed." The Russian governor of Eupatoria, close to which the Allies decided to land, was equally punctilious; on receiving the formal summons to surrender, he first fumigated the document, then read it, and, realizing that he must yield to superior numbers, insisted that the British and French troops on landing must consider themselves in strict quarantine. The disembarkation took place unopposed, and without a hitch.

The English army at this time knew neither training nor manoeuvres outside the barrack square; the "picnics" in Surrey, as field days were then called, had taught it little or nothing. Its generals were, as Lord Wolseley said of those of Wellington's day, "mostly duffers" but the men were of that tough stolid stock whose "phlegm" throughout the Peninsula and at Waterloo had never admitted defeat. Whereas in England the army had been hidden away, in France it had been paraded; and French dash and English solidity made a formidable combination. The Russian army was ever behind the times. The regiment belonged to the colonel, not the colonel to the regiment; peculation and corruption were rife in all branches; and its tactics were still based on Suvorov's motto, "The bullet's a fool, the bayonet's a fine boy." The Russian soldier was armed with a smooth bore, while the Allies had the Minié rifle; and so indifferent a marksman was he that at the Alma the men in the rear rank fired over the heads of those in the front. His obstinate courage was, however, proverbial, and his priests with the ikons accompanied him on to the battlefield to encourage him to fight to the death.

The advance towards Sevastopol, about 30m. away, began on Sept. 19, the French on the right next to the sea, the British inland; the French complained—not for the first or the last time in history—of British slowness. Next day the battle of the Alma was fought. As no combined plan of attack on the Russian position behind the Alma river had been arranged beforehand, co-operation between the Allies was conspicuous by its absence, and they fought two actions side by side. An attempt to turn the left of the enemy line miscarried, so the battle degenerated into a purely frontal attack which was eventually successful in establishing itself on the Russian position. Generalship was equally absent on the side of the Russians where "no one received any orders and every man did what he thought best." The steady advance of the British up the slope across the river made an unforgettable impression on the French general, Canrobert; they went forward, he said, "as though they were in Hyde Park!" Some years later, at a Court ball in Paris given in honour of Queen Victoria and the Prince Consort, as he watched the careful precision with which Her Majesty went through the complicated manoeuvres of a quadrille, never faltering, never missing a step, memories of the Alma came back to him, and he cried "The British fight as Victoria dances."

The battle was an Allied victory, but as the French cavalry had not yet been landed and Raglan was resolved "to keep his in a band box," there was no pursuit. Two days were spent in burying the dead and evacuating the wounded to the fleet, as no provision for their care had been made. On the 23rd, the advance was resumed, and on the 25th the English, much to their astonishment, all but collided with a Russian column marching at right angles to their front. Menschikoff, the Russian commander believing that the Allies would attack Sevastopol from the north side, was moving the bulk of his army out of the fortress towards Bakshiserai, in order to keep open his communications with the mainland. The Allies had no maps of the Crimea, and those in possession of the Russians were so indifferent that one regiment, after marching steadily for the whole of the 20th, finally found itself back in front of Sevastopol. Todleben, Niel and Lord Wolseley have all argued that Sevastopol must have fallen an easy prey to an immediate Allied attack; Burgoyne and Hamley held the contrary opinion. The attempt was not made and the Allies marched solemnly round the fortress and sat down to besiege it in due form, so "playing," as Lord Wolseley said, "into the Russians' hands."

The British took the right or eastern flank of the line, as their fleet had already taken possession of the harbour of Balaklava, the only one on the south coast, believed fit for use as a base. How fateful and fatal was their choice the coming winter was to show. The French on the left established their base at Kamiesch. Scarcely had the armies got into position than St. Arnaud died, and the command passed to Canrobert, a soldier of high character and great personal charm, though to the English he "appeared with his gestures and grimaces like a play actor"; a more serious defect was that he always thought so much was to be said on both sides of any question that he could never make up his mind which side had most to be said for it.

The fortifications of Sevastopol had been rendered formidable by Todleben, the chief engineer in the fortress, and ships sunk by the Russians in the harbour mouth rendered it difficult for the fleet to co-operate in the attack. The Allied bombardment opened on Oct. 17, but no assault followed, and a week later the Russian field army made its first essay at relieving the fortress by a sudden attack on the British right and rear aimed at Balaklava. Their onset was checked by a brilliant charge of the Heavy Cavalry Brigade but unfortunately in the first stage of the action some Turkish batteries were overrun and captured, and Raglan, faithful as ever to the tradition of Wellington who "never lost a British gun," sent orders by an aide-de-camp, Nolan, to the Light Cavalry Brigade to retake them. Nolan, who was a cavalry fanatic, and firmly believed in the omnipotence of that arm on the battlefield, so fulfilled his mission as to launch the brigade in quite a different direction—straight at the Russian artillery in position. The charge took place, one of the most heroic and useless episodes in English military history; and the battle ended, on the whole to the advantage of the Russians, who had cut the only good road between the British and their base at Balaklava. A few days later, on Nov. 5, another vigorous blow fell, this time at the junction of the British siege corps and their covering army on Inkerman heights. Thick fog veiled the field, prevented either Russian or Allied commanders from exercising such talents for generalship as they possessed, and reduced the battle to a pounding match between the soldiery. The aid rendered by the French proved invaluable at the crisis. The Russian masses ebbed sullenly back, and the armies settled down to a winter of siege warfare.

The horror, misery and suffering of that winter are, as regards the British, too well known to need detailed description here; Russell and other "low and grovelling" war correspondents with the army told the terrible tale in full in their despatches, and if, as the soldiers said, the information they gave was as useful to the enemy as any that an army of spies could have furnished, they aroused people at home to a belated realization of the fatal consequences of sending out men to fight without taking forethought as to how they were to be fed, clothed, warmed and cared for. The French lost even more men from disease, but their more docile press was too effectively muzzled for any whisper of this fact to get out. The plight of the Russians was the worst of all; the sufferings of the garrison in Sevastopol and of the army in the field were terrible enough, but were as nothing to those of the unhappy recruits sent forward to the front from the interior; two out of every three of these last named perished by the wayside of sickness or starvation.

The British situation, which became serious immediately after the loss of their supply ships in the great storm on Nov. 14, was rendered acute by the loss of the paved road from Balaklava to the army; it was said that of the 3,000m. from Plymouth to the British camp it was these last six that offered almost insuperable difficulties. Before the end of the year there were 8,000 men sick, and less than half the army was fit for service; while the state of the hospitals was such as to increase rather than diminish the suffering of those who reached them and to tend to death rather than cure. It was not till the coming of Florence Nightingale—"the angel with the lamp"—that these hospitals attained some degree of efficiency, and it was not till the coming of spring, and with it ample supplies and necessaries from home, that the British force recovered something of its strength and again became fit for action. The construction of the "Balaklava tram" and a new paved road between the base and the army on the heights insured the latter against any repetition of the horrors of the winter months.

The spring, however, brought its own if rather different trials—if not to the armies, at least to their leaders—in the form of an electric cable which reduced the time of transit of correspondence between headquarters in the field and their respective capitals from ten days to 24 hours. The uses to which either nation put this new facility of intercommunication were significantly different; Napoleon III., for whom, as Prince Napoleon acutely remarked, military failure meant not, as in England, merely the doubtful drawback of a change of ministry, but the serious prospect of a change of dynasty, showered advice, instructions and suggestions upon his commander-in-chief; the British War Office on the other hand concerned itself more with enquiries as to the health of Capt. Jarvis, believed to have been bitten by a centipede, and a heated discussion as to whether beards were an aid to desertion. It was small wonder that Gen. Simpson, Raglan's successor, was kept at work answering correspondence from 4 A.M. to 6 P.M. daily, or that he expressed the view that the telegraph had "upset everything."

Meanwhile siege operations, which had continued spasmodically throughout the winter, were actively resumed with the coming of finer weather in April. Tsar Nicholas was dead, the disgraceful failure of a Russian attempt to retake Eupatoria had broken his heart, and the chill hand of "Gen. Février turned traitor" had stricken him into a welcome grave. His successor, however, was no less resolved to continue the struggle; and the attention of the Allied ministers and generals, which should have been concentrated on pushing forward with the siege, was now side-tracked into an attempt to thwart a sudden new plan, conceived by Napoleon III., for a campaign in the field against the main Russian host, to be undertaken by a new army under his personal command. This scheme met with universal discouragement and remonstrance, but it was late summer before its aggrieved author finally abandoned it. Meanwhile the Allied leaders had fallen out over a proposal for a joint expedition to Kertch, the Russian base in the eastern Crimea; Raglan desired it, Canrobert agreed to it, then, on remonstrance from Paris, thought better of it, and recalled his troops. Mutual recrimination ensued; Raglan declined to discuss any more subsidiary enterprises, and Canrobert wisely resigned the chief command and returned to the head of his own corps.

His successor, Pelissier, was a free-spoken, tough, resolute soldier who knew his own mind and feared nobody and nothing. At his suggestion it was agreed to send out another expedition to Kertch, which met with complete success, and also to attempt the assault of Sevastopol on the anniversary of Waterloo, which met with an equally complete failure. One result of this last event was a change in command both on the British and Russian side; Todleben, the soul of the defence, was severely wounded; Raglan, now a weary and disappointed man, fell sick and died, regretted by all who had known him. His chief of staff, Simpson, succeeded him; shortly after his accession to command the Russian field army made a last and unavailing attempt to break the investing ring at the Tchernaya—a battle most noteworthy as giving Piedmont, who had joined in on the Allied side chiefly because her prime minister, Cavour, saw in it a means of publicity for a new power, an opportunity for achieving her war aims. Meanwhile Pelissier was growing weary of being the recipient of incessant strategical disquisitions from Paris, and became more and more curt with his self-constituted counsellors, the emperor and Marshal Vaillant, as also with Niel who, as a *missus dominicus* of Napoleon, had been sent to the Crimea to keep him in leading strings. In the end he sought, but was refused, permission to resign the command, which he stated to be "impossible to carry on at the paralysing end of an electric cable." Eventually the atmosphere was cleared, thanks to the good sense of Vaillant, who first held up and afterwards secured the withdrawal of a somewhat intemperate letter of censure from the emperor, and Pelissier was let go his own way. On Sept. 8 a final assault on Sevastopol was delivered; the English attack on the Redan failed, but the French, assaulting at the hour of relief of the trench garrison, established themselves in the Malakoff. The fate of Sevastopol was sealed, and the Russians withdrew from their works to the north side of the harbour; none thought of pursuing them, and when Simpson, in explanation of this inaction, declared that he must wait to know the Russian plans, Queen Victoria wrote that she "was tempted to advise a reference to St. Petersburg for them." Simpson resigned, and Codrington, though junior to Colin Campbell, took his place; but there was little more fighting to be done. The capture of Kinburn finally convinced Russia of the hopelessness of continuing the struggle; Napoleon had grown weary of the war; and though Britain, smarting under the memory of her inglorious share in the final assault on Sevastopol, would willingly have continued the campaign, she was not prepared to do so alone. The war therefore faded gradually into peace, and the Treaty of Paris, signed in Feb. 1856, had as sole tangible result the exclusion of Russian warships from the Black sea—and even this endured only for 15 years.

As far as concerns the military art, the Crimean War is usually regarded as worthy of remembrance only as perhaps the most ill-managed campaign in English history, and a standing example of the difficulties and dangers of a coalition war. Yet from a broad point of view it may well be regarded as a highly creditable feat of arms on the part of the Allies. An expeditionary force of never more than 200,000 men, composed of troops of different nationalities and under divided and incompetent leadership, was yet able to set foot on the territory of an enemy immeasurably superior in every resource of war; to rend from his grasp a strong fortress, the possession of which was vital to the pursuit of his chosen policy; and to inflict on him during the struggle losses amounting to more than double its own strength. History affords no more striking demonstration of the range and potency of armies based on sea power—a demonstration which for Great Britain at least must always hold a lesson of permanent value. (F. J. Hu.; E. W. S.)

CRIMINAL APPEAL, COURT OF. In discussing the question of appeals in criminal cases in England and Wales, it is convenient to consider (1) the position before the Criminal Appeal Act 1907, (2) the terms of the act, (3) the experience gained by working the act.

As to (1) the position before the Criminal Appeal Act 1907, for many years the question of criminal appeal in general had been a matter of great controversy. As early as 1844 a bill had been unsuccessfully introduced for the purpose of establishing appeal in criminal cases, and from that time up to 1906 nearly 30 bills were brought forward with the same object, but none succeeded in passing. In 1892 the question was referred to the Council of Judges and favourably reported upon by them. It may be remarked that England was practically the only civilized country in which there was no appeal in criminal cases. It is true there was an appeal on questions of law arising at the trial (*see* APPEAL), a development undoubtedly hastened by the report in the case of Adolph Beck (1904) showing clearly that the Home Office was not a satisfactory tribunal of final appeal. In 1906 the lord chancellor (Lord Loreburn) introduced another Criminal Appeal bill which passed the House of Lords, but was dropped in the House of Commons after a first reading. The next year the act (Criminal Appeal Act 1907) which was ultimately carried was introduced into the House of Commons.

The Criminal Appeal Act 1907.—As to (2) the terms of the Criminal Appeal Act 1907, by s. 1 of the act the court of criminal appeal was constituted and consisted of the lord chief justice of England and eight judges of the king's bench division of the High Court of Justice. By a short amending act, the Criminal Appeal Amendment Act 1908, it was enacted that all the judges of the king's bench division should be judges of the court. The lord chief justice of England, or in his absence the senior member of the court, acts as president. In practice the lord chief justice has almost invariably presided. By s. 3 a person convicted on indictment may appeal under the act to the court (*a*) against his conviction on any ground of appeal which involves a question of law alone, and (*b*) with leave of the court (a single judge may give leave to appeal, s. 17) or upon the certificate of the judge who tried him that it is a fit case for appeal, on any ground of appeal which involves a question of fact alone, or a question of mixed law and fact, or any other ground which appears to the court to be a sufficient ground of appeal, and (*c*) with the leave of the court against the sentence passed on his conviction unless the sentence is one fixed by law. By the Prevention of Crime Act 1908 a person sentenced to preventive detention may appeal against sentence without the leave of the court of criminal appeal. By the Criminal Justice Administration Act, 1914, one sentenced by a court of quarter sessions to detention in a Borstal institution may appeal against the sentence of the court of criminal appeal as if he had been convicted on indictment, and under the Children Act 1908 a parent or guardian may appeal against an order under s. 99 (6), if made by a court of assize or court of quarter sessions. Finally a person convicted at a petty sessional court and subsequently sentenced as an incorrigible rogue under the Vagrancy Act 1824 may appeal with leave against his sentence. There is no appeal by way of bills of exception which are commonly used in criminal cases in the United States or by writ of error, nor is it possible for a new trial to be granted in a criminal case (s. 20 [1]), but where the court comes to the conclusion that a trial has been a nullity, it has power to order that the appellant shall take his trial on the indictment in respect of which the appeal was brought.

The present modes of appeal are (1) under the Crown Case Act 1848 by cases stated by the judge on a question of law arising on the trial, (2) under the Criminal Appeal Act 1907, (3) under the case of indictments of common law for obstruction or non-repair of a highway, the appeal is to the Civil Court of Appeal (s. 20 [3]).

A person who wishes to appeal must apply to the court within ten days of the conviction or sentence, but the court has power in all cases to extend that time except in convictions involving sentence of death (s. 7). The act does not extend to Scotland or Ireland (s. 23), nor does it apply to convictions on indictment, or inquisitions of any peer or peeress convicted of an offence not triable by a court of assize (s. 20 [2]). Nothing in the act affects the prerogative of mercy (s. 19).

In practice application for leave to appeal are dealt with by a single judge from whose decision there is an appeal to the full court. An appellant is entitled to be present, if he desire, at the hearing of his appeal, unless the question of the appeal is one of law only. He has no right to be present at an application for leave to appeal. The court has power to allow witnesses to be called, a power which is, however, seldom exercised, and by an important proviso to s. 4 the court may, notwithstanding that they are of opinion that the point raised in the appeal might be decided in favour of the appellant, dismiss the appeal if they consider that no substantial miscarriage of justice has actually occurred. This proviso has often been acted upon.

On an appeal against sentence the court has power to quash the sentence passed at the trial and pass such other sentence as is warranted in law by the verdict, whether more or less severe (s. 4 [3]). This is a power which is seldom exercised and never without warning to the appellant that the court has the power. It is one of the few checks upon frivolous appeals.

The Court has power to release an appellant on bail pending the determination of his appeal (s. 14 [2]). While waiting in prison pending a determination of his appeal, the appellant is specially treated as an appellant, but if his appeal is unsuccessful, such time of waiting is not counted as part of his sentence, unless leave to appeal has been given, or the court otherwise directs. This is another check on frivolous appeals, the result being that in most cases the appellant is kept in custody for about four or five weeks longer than he would have been had he not appealed or applied for leave to appeal.

Shorthand notes are taken of the proceedings at the trial of any person on indictment who if convicted is entitled or may be authorized to appeal, and copies are made in the event of application for leave to appeal or an appeal. The cost of such shorthand notes is defrayed out of moneys provided by parliament (s. 16).

The court must consist of not less than three judges, of whom, as above pointed out, the chief justice is almost invariably one (s. 1). In some 30 or 40 cases the court has been constituted with more than three judges, and in one case the court consisted of 13 judges. In almost every case one judgment alone is pronounced, but where the question is a question of law, separate judgments may be pronounced if in the opinion of the court such a course would be convenient (s. 1 [5]).

If in any case the director of public prosecutions or the prosecutor or defendant obtain the certificate of the attorney-general that the decision of the court of criminal appeal involves a point of law of exceptional public importance and that it is desirable in the public interest that a further appeal should be brought, he may appeal from that decision to the House of Lords (s. 1 [6]). Otherwise the determination of the court of criminal appeal is final. There have been a few appeals to the House of Lords. For further details reference should be made to the act.

Working of the Act.—As to (3) the experience gained by the working of the act, the court sat for the first occasion on May 15, 1908, so there has been about 20 years' experience. The space at the disposal of the writer forbids full details, but it may be stated that just about 7% of the total number of convicted persons have appealed. The highest number of appellants was in 1910, when there were 712, the lowest number in 1919, when there were 355. Out of the 712 appeals in 1910, convictions were quashed in 39 cases and sentences reduced in 42. Out of the 355 appeals in 1919, convictions were quashed in 17 and sentences reduced in 17 cases. One other figure may be given. In 1926 there were 425 appeals, with 23 convictions quashed and 27 sentences reduced. It should be mentioned that many cases never reached the full court at all, as appellants have an absolute right to abandon their appeals or applications and sometimes do so. For example, in 1926 101 appellants abandoned their appeals or applications, 57 before their cases had been considered at all, and 54 after the single judge had refused leave to appeal. The court has sat on an average 39 days a year in recent years. In 1925 it sat 42 days, in 1926 it sat 35 days and there is always a sitting of the court during the long vacation. The average time that elapses from the receipt of the notice of appeal or application for leave to appeal till the same is finally determined by the court is from four to five weeks, a short time when it is remembered that it is necessary to get copies of the shorthand notes made and the case prepared for the court. The expenses of the court, paid out of money provided by parliament, were for the year ending April 1924 £11,730, for the year ending April 1925 £11,929, for the year ending April 1926, £12,963. These payments do not include any part of the salaries of the judges, nor the salary of the registrar, who as such receives no salary.

It is thought that the court has amply justified its existence. It has improved the administration of the criminal law and established more uniformity and certainty in its practice and procedure. No attempt has been made to standardize sentences, nor is it considered that such a course would be desirable. The prevalence of crime in a particular district or at a particular time may call for an increase in the severity of sentences. On the other hand temptation and provocation may mitigate punishment in particular cases. Whether it is the creation of the criminal court of appeal, or a growing recognition of a more humane treatment of those convicted for crime, it is certain that the sentences imposed to-day are less severe than the sentences imposed a generation ago.

By the Criminal Appeal Scotland Act 1926 a court of criminal appeal on similar lines to the English court was constituted for Scotland with an interesting provision in s. 2 (3) which provides that on an appeal, not only against sentence, but against conviction, the court may quash the sentence passed at a trial and substitute another sentence whether more or less severe. This is a power that the English court does not possess, but it is certainly a useful power as it tends to prevent frivolous appeals.

There have been persons who held the opinion that not only a convicted person should be entitled to appeal to the Crown, but that the prosecutor should be entitled to appeal where the prisoner has been acquitted, and in the early days of the court expressions may be found in some of the judgments favouring such a course. Those expressions have not been made in recent years and the general opinion is that it is not desirable that the court should have a power to order a new trial in cases where the person charged has been found not guilty. Lord Hewart, lord chief justice of England, when visiting Canada and the United States in 1927, gave a lucid and interesting exposition of the history and principles of the act.

See H. Cohen, *The Criminal Appeal Act 1907* (1908); R. E. Ross, *The Court of Criminal Appeal* (1911); W. O. Russell, *A Treatise on Crimes and Misdemeanours* (8th ed., 1923) vol. ii., p. 1840; J. F. Archbold, *Pleading, Evidence and Practice in Criminal Cases* (27th ed., by R. E. Ross, 1927), p. 307. (J. Sa.)

CRIMINAL LAW. By criminal, or penal, law is now understood the law as to the definition, trial and punishment of crimes, *i.e.,* of acts or omissions forbidden by law which affect injuriously public rights, or constitute a breach of duties due to the whole community. The sovereign is taken to be the person injured by the crime, as he represents the whole community, and prosecutions are in his name. Criminal law includes the rules as to the prevention, the investigation, prosecution and punishment of crime (*q.v.*). It lays down what constitutes a criminal offence, what proof is necessary to establish the fact of a criminal offence and the culpability of the offender, what excuse or justification for the act or omission can be legally admitted, what procedure should be followed in a criminal court, what degrees and kinds of punishment should be imposed for the various offences which come up for trial. Finally, it regulates the constitution of the tribunals established for the trial of offences according to the gravity of the infraction of law, and deals with the organization of the police and the proper management of prisons, and the maintenance of prison discipline. (*See* Evidence; Prison; Police.)

Many acts or omissions, which are technically criminal and classified as offences and punished by fine or imprisonment, cannot be said to have a strictly criminal character, since they do not fall within the popular conception of crime. To this class belong such matters as stopping up a highway under claim of right, or failing to repair it, or allowing a chimney to emit black smoke in excessive quantities, or to catch fire from being unswept, or breach of building by-laws, or driving a motor car on a highway at a speed in excess of the legal limit. Such breaches of law are, under the French law, described as *contraventions.* In England most of them are described as misdemeanours or offences punishable on summary conviction, or less happily as "summary offences," and some writers speak of them as *mala prohibita* as distinguished from *mala in se, i.e.,* as not involving any breach of ordinary morality other than a breach of positive regulations. Continental jurists at times speak of crimes *de droit commun* (*i.e.,* offences common to all systems of law as distinguished from offences which are crimes only by a particular municipal law). To this class of crimes *de droit commun* belong most of the offences included in extradition treaties.

Criminal and civil law overlap, and many acts or omissions are not only "wrongs" for which the person injured is entitled to recover compensation for his own personal injury or damage, but also "offences" for which the offender may be prosecuted and punished in the interest of the State. In non-English European systems care is taken to prevent civil remedies from being extinguished by punishment: it is quite usual for the civil and criminal remedies to be pursued concurrently, the individual appearing as *partie civile* and receiving an award of compensation by the judgment which determines the punishment to be inflicted for the offence against the State. Under English common law civil and criminal remedies cannot be pursued in the same proceeding, or compensation awarded to the injured party in criminal proceedings, and he is left to seek his remedy by action. But there are statutory exceptions, and among these are the restitution of stolen goods on conviction of the thief if the prosecution has been at the instance of the owner of the goods (Larceny Act, 1916, sec. 45), and the award of compensation to persons who have suffered injury to property by felony (Forfeiture Act, 1870).

As Sir Henry Maine says: "All civilized systems of law agree in drawing a distinction between offences against the State or community (crimes or *crimina*) and offences against the individual (wrongs, *torts* or *delicta*)." But the process of historical development by which this distinction has been ultimately established has given great occasion for study of early laws and institutions by eminent men, whose researches have disclosed the extremely gradual evolution of the modern notion of criminal law enforced by the State from the primitive conceptions and customs of barbarous or semi-civilized communities. Of the oldest codes or digests of customs which are available to the student it has been said the more archaic a code the fuller and minuter is its penal legislation: but this penal legislation is not true criminal law; it is the law, not of crimes, but of wrongs. The intervention of the community or tribe is in the first instance to persuade or compel the wronged person or his family or tribe to abandon private vengeance or a blood feud and to accept compensation for the wrong collectively or individually sustained; and in the tariffs of compensation preserved in early laws the importance of the injured person was the measure of the compensation or vengeance which he was recognized to be entitled to exact, and the scales of punishment or compensation are fixed from this point of view.

Anglo-Saxon Law.—In England under Alfred some part of the Levitical law (Exod., xxi. 12–15) was incorporated, just as in 1567 the criminal law as to incest in Scotland was taken bodily from Leviticus, xviii. The stage which the development of criminal law had reached in England by the reign of Edward the Confessor is thus described by Pollock and Maitland (*Hist. Eng. Law*): "On the eve of the Norman Conquest what we may call the criminal law of England (but it was also the law of torts or civil wrongs) contained four elements which deserve attention: its past history had in the main consisted of the varying relations between them. We have to speak of outlawry, of the blood feud (*faidus*), of the tariffs of *wer* and *wite* (*fredus* or *friede*), and *bot,* of punishment in life and limb. As regards the malefactor the community may assume one of four attitudes: it may make war on him; it may have him exposed to the vengeance of those whom he has wronged; it may suffer him to make atonement; it may inflict on him a determinate punishment, death, mutilation or the like." The *wite* or sum paid to the king or lord is now thought to have been originally not a penalty but a fee for time and trouble taken in hearing and determining a controversy. But at an early stage fines for breach of peace were imposed. An evil result from the public point of view followed from the system of atoning for crime by pecuniary mulct. "Criminal jurisdiction became a source of revenue." So early as Canute's time certain crimes were pleas of the Crown; but grants of criminal jurisdiction, with the attendant forfeitures, were freely made to prelates, towns and lords of manors, and some traces of this jurisdiction still survive (*e.g.*, the criminal jurisdiction of the justices of the *soke* [*soc*] of Peterborough, and the rights of some boroughs, *e.g.*, Nottingham, to forfeitures). Outlawry soon ceased to be a mode of punishment, and became, as it still is, a process to compel submission to justice (Crown Office Rules, 1906, rules 88–110). Certain crimes, such as murder, rape, arson and burglary, became unamendable or bootless, *i.e.*, placed the offender's life, limb, lands and goods at the king's mercy. These crimes came to be generally described by the name felony (*q.v.*). Other crimes became punishable by fines which took the place of *wites*. These were styled trespasses and correspond to what is now called misdemeanour (*q.v.*).

Anglo-Norman Period.—Minor acts of violence, dishonesty or nuisance, were dealt with in seigniorial and borough courts by presentment of the jurors of courts baron and courts leet, and punished by fine or in some cases by pillory, tumbril or stocks. Grave acts were dealt with by the sheriff as breaches of the peace. He sat with the freeholders in the county court, which sat twice a year, or in the hundred court, which sat every four weeks. So far as this involved dealing with pleas of the Crown the sheriff's jurisdiction was abolished and was ultimately replaced by that of the justices or conservators of the peace. The sheriff then ceased to be a judge in criminal cases, but remained and still is in law responsible for the peace of his county, and is the officer for the execution of the law. The royal control over crime was effectually established by the itinerant justices sent regularly throughout the realm, who not only dealt with the ordinary proprietary and fiscal rights of the Crown but also with the graver crimes (treason and felony), and ultimately were commissioned to deal with the less grave offences now classed as indictable misdemeanours. The change resulted from the strengthening of royal authority throughout England, which enabled the Crown gradually to enlarge the pleas of the Crown and to weaken and finally to supersede the criminal jurisdiction, notably of the sheriff, but also of prelates and lords in ecclesiastical and other manors and franchises. "In the early English laws and constitution there existed a national sovereignty and original criminal jurisdiction, but the ideas of legislative power and crime were very slowly developed." During the 12th century the criminal law was affected by the influence of the Church, which introduced into it elements from the Canon and Mosaic laws, and also by the memory of the Roman empire and the renewed study of the Roman law, which enabled lawyers to draw a clearer distinction than had before been recognized between the criminal (*dolus*) and civil (*culpa*) aspect of wrongful acts. The Statute of Treasons (1351) is to a large extent an admixture of Roman with feudal law; and to the same source is probably due the more careful analysis of the mental elements necessary to create criminal responsibility, summed up in the somewhat misleading expression *nemo reus est nisi mens sit rea*.

In the 14th century justices of the peace and quarter sessions were established to deal with offences not sufficiently important for the king's judges, and from that time the course of criminal justice in England has run substantially on the same lines, with the single and temporary interruption caused by the court of Star Chamber.

Classification of Crimes.—The penal laws of modern States classify crimes somewhat differently, but in the main on the same general principles, dividing them into: (1) Offences against the external and internal order and security of the State; (2) Offences against the administration of justice and against public authority; (3) Acts injurious to the public in general; (4) Offences against the person; (5) Offences against property.

The terminology by which crimes are described by reference to their comparative gravity varies considerably. In many Continental codes distinctions are drawn between crimes (Ger. *Verbrechen;* Norse *vorbrydelser;* Span. *crimenes;* Ital. *reato*), delicts (Ger. *Vergehen;* Ital. *delitti;* Span. *delitos*), and contraventions (Ital. *contravenzioni;* Span. *faltas*).

The classification adopted by English law is peculiar to itself, "treason," "felony" and "misdemeanour," with a tentative fourth class described as "summary offences." The particular distinctions between these three classes are dealt with under the titles TREASON; FELONY; MISDEMEANOUR, etc. Here it is enough to say that the distinction is a result of history, and that felonies were those crimes that formerly involved capital punishment, and until 1870 forfeiture of the offender's property. Treason and most felonies and some misdemeanours would under foreign codes fall under the head of crime. Misdemeanour, roughly but not exactly, corresponds to the French *délit,* and summary offence to *contravention.*

Elements of Criminal Responsibility.—In all systems of criminal law it is found necessary to determine the criterion of criminal responsibility, the mental elements of crime, the degrees of criminality and the point at which the line is to be drawn between intention and commission.

The full definition of every crime contains expressly or by implication a proposition as to a state of mind, and in all systems of criminal law, competent age, sanity and some degree of freedom from coercion, are assumed to be essential to criminality; and it is also generally recognized that an act does not fall within the sanction of the criminal law if done by pure accident or in an honest and reasonable belief in circumstances which if true would make it innocent; *e.g.*, when a married person marries again in the honest and reasonable but mistaken belief that the former spouse is dead. Honest and reasonable mistake of fact stands on the same footing as absence of the reasoning faculty, of which *Reg.* v. *Tolson* (16 Cox. C.C. 629) is a good example, as in infants, or perversion of that faculty, as in lunatics. But ignorance of law does not excuse.

Besides the elements essential to constitute crime generally, particular mental elements, which may differ widely, are involved in the definition of particular crimes; and in the case of statutory offences adequately and carefully defined, the mental elements necessary to constitute the crime may be limited by the definition so as to make the prohibition of the law against a particular act absolute for all persons who are not infants or lunatics. As a general rule of English law, it is enough to prove that the acts alleged to constitute a crime were done by the accused, and to leave him to rebut the presumption that he intended the natural consequences of the acts by showing facts justifying or excusing him or otherwise making him not liable. Children are conclusively presumed to be incapable of crime up to seven years of age; and from seven to 14 the presumption is against the capacity, but is not absolute.

Under the common law, insanity was an absolute answer to an accusation of crime. As to insanity the rule applicable is to be found in *McNaghten's Case* (10 Cl. and F. 200), decided in 1843, where it was laid down that to establish a defence on the ground of insanity it must be proved that at the time of committing the offence the accused was labouring under such a defect of reason as not to know the nature and quality of the act he was doing, or, if he did know it, he did not know that what he was doing was wrong. It is true that the rules in *McNaghten's Case* have been much criticized by writers, but they have been accepted and acted upon by the courts down to the present time. Since 1883, where insanity is proved to have existed at the date of the commission of the incriminated acts, the accused is found guilty of the acts but insane when he did them, and is relegated to a criminal lunatic asylum. Insanity produced by drunkenness would be a defence to crime, but that may be considered the limit to drunkenness as an excuse for crime, save when a specific intent is necessary to constitute a crime. But the mere fact that the mind is so affected by drink that violent passions are not controlled affords no defence, and it was so held by the House of Lords, in 1920, reversing the Court of Criminal Appeal in *Beard's Case* (26 Cox. C.C. 573) where the accused, under the influence of drink, in the course of committing an act of rape suffocated his victim.

Physical compulsion or coercion is an excuse for crime, but not where the force is moral such as threats or duress. There was also at common law a presumption that a married woman committing certain crimes in the presence of her husband did so under his coercion. But this presumption was abolished by the Criminal Justice Act, 1925, and coercion made a matter of proof. Speaking generally, the attitude of English law towards criminal responsibility is to be found in the maxim *actus non facit reum nisi mens sit rea*. But to this there are certain well-defined exceptions. By a particular statute the *necessity* for intent or knowledge may be negatived, such as in the case of breaches of the licensing law and the law as to the adulteration of food. Again, as we have said, ignorance of the law is no excuse, so *a bonâ fide* belief that the accused has been divorced, where only a decree *nisi* has been pronounced, is no defence to a charge of bigamy (*Rex* v. *Wheat*, 26 Cox. C.C. 717).

Distinctions are also drawn between degrees of guilt or complicity.

English criminal law punishes attempts to commit crime if the attempt passes from the stage of resolution or intention to the stage of action, when the completion of the full offence is frustrated by something other than the will of the accused. Except in the case of attempt to commit murder, which is a felony, attempts to commit a crime are punished as misdemeanours. It also punishes the solicitation or incitement of others to commit crime, as a separate offence if the incitement fails, as the offence of being accessory before the fact or abettor if the offence is committed as a result of the incitement; and it punishes persons who, after a more serious crime—felony—has been committed, do any act to shield the offender from justice. In the case of the crimes described as felonies the law distinguishes between principals in the first or second degree and accessories before or after the fact. In the case of misdemeanours the same punishment is incurred by the principal offenders, and by persons who are present aiding and abetting the commission of the offence, or who, though not present, counselled or procured the commission of the offence. (*See* ACCESSORY.) Besides these degrees of crime there is one almost peculiar to English law known as conspiracy, *i.e.*, an agreement to commit crime or to do illegal acts (including interference with the due course of justice), which is punishable even if the conspiracy does not get beyond the stage of agreement. (*See* CONSPIRACY.)

The English law does not, but most European laws do, allow the jury to reduce the penalty of an offence by finding in their verdict that the commission of the offence was attended by extenuating circumstances; but when the jury recommend to mercy a person whom they find guilty the judge may give effect to the recommendation or report it to the Home Office.

In systems of criminal law derived from England the forms of crime or degrees of complicity above stated reappear with or without modification, but as to conspiracy with a good deal of alteration. In the Indian penal code, for instance, conspiracy is limited to cases of treason (sec. 121 A), and when it goes beyond agreement in the case of other offences it is merely a form of abetment or participation (sec. 107).

The criminal law of England is not codified, but is composed of a large number of enactments resting on a basis of common law. A very large part is reduced to writing in statutes. In 1861 various consolidation acts were passed dealing with larceny, malicious damage, forgery, coinage offences, and offences against the person. And of recent years, still further progress has been made in dealing with the law relating to particular subjects in one consolidating statute, examples of which are the Children Act, 1908, the Perjury Act, 1911, the Forgery Act, 1913, the Indictment Act, 1915, and the Larceny Act, 1916. The unwritten portion of the law includes (1) principles relating to the excuse or justification of acts or omissions which are *prima facie* criminal, (2) parts of the law relating to procedure. The law is very rich in principles and rules embodied in judicial decisions and is extremely detailed and explicit. So far as the legislature is concerned there is an absence of systematic arrangement. The definitions of many crimes are still to be sought in the common law and the decisions of the judges. Thus the crime of murder, as settled by the existing law, would include offences of such very different moral gravity as killing a man deliberately for the sake of robbing him, and killing a man accidentally in an attempt to rob him. On the other hand, offences which ought to have been criminal were constantly declared by the judges not to fall within the definition of the particular crimes alleged, and the legislature has constantly had to fill up the *lacunae* in the law as interpreted by the judges.

Jurisdiction.—The jurisdiction to deal with crime is primarily territorial, and can be exercised only as to acts done within the territory or territorial waters, or on the ships of the law-giver. *Extra territorium jus dicenti impune non paretur.* No State will enforce the penal laws of another nor permit the officer of another State to execute its laws outside its own territory. But international law recognizes the competence of a State to make its criminal law binding on its own subjects wherever they are, and perhaps even to punish foreigners who outside its territory do acts which menace its internal or external security, *e.g.*, by dynamite plots or falsification of coin. Apart from extradition arrangements the national law cannot reach such persons, be they citizens or aliens, until they come within the territory of the State whose law has been broken.

The codes of France, Germany and Italy make the penal law national or personal and not territorial. In some British colonies whose legislatures have a derived and limited legislative authority, indirect methods have been taken to deal within the colony with persons who commit offences outside its territory.

Throughout the development of the English criminal law it showed one particular characteristic that crime was treated as local, which means not merely that the common law of England was limited to English soil, but that an offence on English soil could be "enquired of, dealt with, tried, determined and punished" only in the particular territorial division of England in which it was committed, which was and is known as the *venue* (*q.v.*). But from time to time exceptions have been made by statute, and now by the Criminal Justice Act, 1925, a prisoner can be tried where he was apprehended, and there are wide powers under that statute to commit for trial to "convenient" assizes or sessions if the accused will suffer no hardship. Each township was responsible for crimes within its boundaries, a responsibility made effective by the "view of frankpledge," now obsolete, and the guilt or innocence of every man had to be determined by his neighbours. This rule excluded from trial by the courts of common law, treasons, etc., committed by Englishmen abroad and piracy; and it was not till Henry VIII.'s reign (1536–1544) that the common-law mode of trial was extended to these offences. The legislature has altered the common law as to numerous offences, but on no settled plan, and except for a bill introduced about 1888, at the instance of the 3rd marquess of Salisbury, no attempt has been made to make the English criminal law apply generally to subjects when outside the realm; and in view of the complicated nature of the British empire and the absence of a common criminal code it has been found desirable to remain content with extradition in the case of crimes abroad, and with the provisions of the Fugitive Offenders Act, 1881, in the case of criminals who flee from one part to another of the empire.

The localization in England of crime, and the procedure for punishing it, differ largely from the view taken in France and most European countries. The French theory is that a Frenchman owes allegiance to the French State, and commits a breach of that allegiance whenever he commits a crime against French law, even although he is not at the time within French territory. In modern days this theory has been extended so as to allow French and German courts to punish their subjects for crimes committed in foreign countries, and by reason of this power certain countries refuse to extradite their subjects who have committed crimes in other States.

The principle of the French law, though not expressly recognized in England, must be invoked to justify two departures from the English principle—(1) as regards offences on the high seas, and (2) as regards certain offences committed outside Great

Britain. In early days offences committed by Englishmen on the high seas were punished by the lord high admiral, and he encroached so much on the ordinary courts as to render it necessary to pass an act in Richard II.'s reign (15 Rich. II. st. 2, c. 3) to restrain him.

In the time of Henry VIII. (1536, 28 Hen. VIII. c. 15) an act was passed stating that, as the admiral tried persons according to the course of civil law, they could not be convicted unless either they confessed or they or the witnesses were submitted to torture, and that therefore it was expedient to try the offences according to the course of the common law. Under that act a special commission of oyer and terminer was issued to try these offences at the Old Bailey, and English law was satisfied by permitting the indictment to state that the offence was committed on board a ship on the high seas, to wit in the county of Middlesex. Further provision was made by the Admiralty Offences Act, 1844, and in 1861 each of the Criminal Law Consolidation Acts of that year provided that all offences in those statutes mentioned committed on the high seas may be tried as if they had been committed in England. As regards offences on land, it was found necessary as early as the reign of Henry VIII. (1543) to provide for the trial in England of treasons and murders committed on land outside England. This was largely due to the constant presence in France of the king and many of his nobles and knights, and the aid of this statute was invoked in 1903 in the case of Lynch, tried for treason in South Africa, and in the case of Casement in 1917. By sec. 9 of the Offences against the Person Act, 1861, any murder or manslaughter committed on land out of Great Britain, whether within the king's dominions or without, and whether the person killed were a subject of His Majesty or not, may be dealt with in all respects as if it were committed in England. The jurisdiction has been extended to other cases such as slave trade, bigamy, perjury committed with reference to proceedings in an English court, and offences against the Foreign Enlistment Act, 1870, and the Official Secrets Acts, 1911 and 1920. But these offences must be committed on land and not on board a foreign ship, because if a man takes service on board a foreign ship he is treated for the time as being a member of the foreign State to which that ship belongs. The principle has been also extended to misdemeanours committed in India, and oppressions, crimes and offences committed by public officers out of Great Britain, whether within or without the British dominions. Thus a governor or an inferior officer of a colony, if appointed by the British Government, may be prosecuted for any misdemeanour committed by him by virtue of his office in the colony; and cases have occurred where governors have been so prosecuted, such as that of Gen. Picton at the beginning of the 19th century, and of Governor Eyre of Jamaica in 1865.

Punishment.—An essential part of the criminal law is the punishment or sanction by which the State seeks to prevent or avenge offences. *See* also under CRIMINOLOGY. Here it is enough to say that during the 19th century great changes have been made throughout the world in the modes of punishing crime.

In England until early in the 19th century, punishments for crime were ferocious. The severity of the law was tempered by the rule as to benefit of clergy and by the rigid adherence of the judges (*in favorem vitae*) to the rules of correct pleading and proof, whereby the slightest error on the part of the prosecution led to an acquittal. Bentham pointed out that certainty of punishment was more effective than severity, that severe punishments induced juries to acquit criminals, and that thus the certainty of punishment was diminished. But his arguments and the eloquence of Sir Samuel Romilly produced no effect until after the reform of parliament in 1832, shortly after which statutes were passed abolishing the death sentence for all felonies where benefit of clergy existed. Subsequent statutes have abolished the death penalty save in the cases of murder, treason, piracy and offences against the Dockyards Protection Act, 1772. By the Children Act, 1908, the death sentence is not to be pronounced or recorded where the offender is under 16. The severity of capital sentences was greatly modified by the pardoning power of the Crown, which pardoned convicts under sentence of death on their consenting to be transported to convict settlements in the colonies. (*See* DEPORTATION.)

The punishments now in use under the English law for indictable offences are:—

1. Death, inflicted by hanging, and carried out within prison walls since 1868, with a provision that decapitation may be authorized by royal warrant in cases of high treason.

2. Penal servitude, which in 1853 was substituted for transportation to penal settlements outside Great Britain. The minimum term of penal servitude is three years (Penal Servitude Act, 1891), and the sentence is carried out in a convict prison, in Great Britain, but there is still power to send the convicts out of Great Britain.

3. Imprisonment in a local prison, which must be without hard labour unless a statute specially authorizes a sentence of hard labour. At common law there is no limit to a term of imprisonment without hard labour for misdemeanour; but for many offences (both felonies and misdemeanours) the term is limited by statute to two years, and in practice this limit is not exceeded for any offence. But where a person is liable to terms of imprisonment in the aggregate for three years or more, the court by the Penal Servitude Act, 1926, substitutes penal servitude for imprisonment. The treatment of prisoners is regulated by the prison acts and rules.

4. Police supervision under the Prevention of Crimes Act, 1871, and preventive detention on conviction as an habitual criminal under the Prevention of Crimes Act, 1908. This statute also instituted Borstal treatment for youthful offenders between 16 and 21 years of age.

5. Pecuniary fine, a punishment appropriate only to misdemeanours and never imposed for a felony except under statutory authority, *e.g.*, manslaughter (Offences against the Person Act, sec. 5). The amount of the fine is in the discretion of the judge, subject to the directions of Magna Carta and the Bill of Rights and of any statute limiting the maximum for a particular offence.

6. Whipping was a common law punishment for misdemeanants of either sex. The whipping of females was prohibited in 1820, and the punishment by the Criminal Justice Administration Act, 1914, may not be inflicted on males except under statutory authority. That is given in the case of certain assaults on the sovereign, of certain forms of robbery with violence, of some offences against women and girls, of incorrigible rogues and certain other offences by youthful offenders.

7. Recognizances to keep peace and be of good behaviour, *i.e.*, a bond with or without sureties creating a debt to the Crown not enforceable unless the conditions as to conduct therein made are broken. It may be required in addition to other punishment. This bond may be taken from any misdemeanant, and, under statutory authority, from persons convicted of felony (except murder). *See* the Malicious Damage, Coinage Offences, and Offences against the Person Acts of 1861, the Forgery Act, 1913, and the Larceny Act, 1916.

8. In the case of any offence which is not capital the court, if any grounds for mercy appear, may simply bind the offender over to come up for judgment when required, intimating to him that if his conduct is good no further steps will be taken to punish him. Provisions as to probation orders and recognizances are contained in the Probation of Offenders Act, 1907, the Criminal Justice Administration Act, 1914, and the Criminal Justice Act, 1925. By the Criminal Justice (Amendment) Act, 1926, the court may order the offender to pay costs, damages or compensation.

Except in the case of the death penalty, the court of trial has a discretion as to the *quantum* of a particular punishment, no minimum being fixed. In the case of offences punishable on summary conviction the maximum punishment is always fixed by statute. As to the punishment of youthful offenders and children *see* JUVENILE OFFENDERS.

In the criminal law of Europe the scale of punishments is on similar lines in most States, and is more elaborate than that of England, and less is left to the discretion of the court of trial.

Tribunals.—In England indictable offences which are not such as can be dealt with summarily by justices and must be tried by a judge and jury are thus dealt with:—

1. Courts of assize (sitting under old commissions known as commissions of assize, oyer and terminer, and general gaol delivery), are held three times or oftener in every year in each county and also in some large cities and boroughs. They are the lineal successors of the justices *in eyre* of the middle ages; but they are now integral parts of the High Court of Justice. These courts can try any offence which is not specifically excluded from their jurisdiction.

2. For the counties of London and Middlesex and certain adjoining districts, a special court of assize known as the central criminal court sits monthly.

3. In all counties the justices of the peace sit quarterly or oftener under the commission of the peace to try the minor indictable offences. In cities and boroughs with a separate court of quarter sessions, cases are tried before the recorder (*q.v.*). (*See* QUARTER SESSIONS, COURT OF.)

4. The High Court of Justice in the king's bench division tries a few special offences in its original jurisdiction, and where justice requires may transfer indictments from other courts for trial before itself.

5. The court of criminal appeal has been instituted by the Criminal Appeal Act, 1907; to it all persons convicted on indictment have a right of appeal; and there is a limited right of appeal from this court to the House of Lords. (*See* APPEAL.)

Summary jurisdiction in criminal cases is exercised by justices of the peace at petty session. It extends to all offences that can be dealt with summarily and certain minor indictable offences. In most cases the bench must consist of two or more justices, but a stipendiary magistrate, who is appointed under statute, can act alone.

The substantive law as to crime applies in England to all persons except the reigning sovereign, and criminal procedure is the same for all subjects alike, except in the case of peers or peeresses charged with felony, who have the right of trial by their peers in the House of Lords if it be sitting, or in the court of the lord high steward.

There are in England no courts of a special character, such as exist in some foreign countries, for the determination of disputes between the governing classes themselves or with the governed classes, whether of a civil or criminal character. There are a few exceptional courts with criminal jurisdiction. The court of chivalry, which used to punish offences committed within military lines outside the kingdom, is obsolete. Special tribunals exist for trying naval or military offences committed by members of the navy and army, but those members are not exempt from being tried by the ordinary tribunals for offences against the ordinary law, as though they were civilians. (*See* MILITARY LAW; MARTIAL LAW.)

The ecclesiastical courts, which were formerly very powerful in England, and punished persons for various offences, such as blasphemy (*q.v.*), perjury, swearing, and sexual offences, have now almost fallen into disuse. Their authority over Protestant dissenters from the Established Church was taken away by statute; their authority over lay members of the Church of England has disappeared by disuse. Occasionally suits are instituted in them against the clergy for offences either against morality or against doctrine or ritual. In these cases their sentences are enforced by penalties, such as suspension, or deprivation of benefice, or by imprisonment, which has replaced the old punishment of excommunication.

Procedure.—A system of procedure, with the judicial machinery required to work it, may be created either by the direct legislative action of the supreme power or by custom and the action of the courts. Both at Rome and in England it was through usage, and by the courts themselves that the earlier system was slowly moulded; both at Rome and in England it was direct legislation that established the later system.

Criminal prosecutions are ordinarily undertaken by the individuals who have suffered by a crime. There is not in England, as in Scotland and all European countries, a public department concerned to deal with all prosecutions for crime. The result is that the prosecution of most ordinary crime is left to individual enterprise or the action of the local police force or the justices' clerk.

The attorney-general has always represented the Crown in criminal matters, and in State prosecutions appears in person on behalf of the Crown, and when he so appears has certain privileges as regards the reply to the prisoners' defence and the mode of trial. In the Prosecution of Offences Acts of 1879, 1884 and 1908 there is to be found the nucleus of a system of public prosecution such as obtains in other countries in case of crime. Under these acts the director of public prosecutions (*q.v.*) (up to 1908 an office conjoint with that of solicitor to the Treasury) acts under the attorney-general, but unless specially directed he only undertakes a limited number of prosecutions, *e.g.*, for murder, coining and serious crimes affecting the Government.

The procedure of the trial of persons accused of criminal offences in England may now be considered; firstly, where such offence may be dealt with summarily by justices at petty sessions; and secondly where the nature of the offence requires a trial before a jury either at quarter sessions, assizes or the central criminal court.

Summary Trials.—Justices of the peace may under many statutes convict in a summary manner (without the intervention of a jury) for offences of minor importance. The procedure for punishing summary offences is before two justices, or a stipendiary magistrate. This proceeding must not be confused with the preliminary enquiry before justices for an indictable offence which may be sent for trial before a jury (which will be dealt with later), nor with the procedure before justices in relation to civil matters, such as the recovery of small sums of money. The proceeding begins either by the arrest without a warrant of the accused, or by the issue of a warrant for the arrest of the person charged, in which case a sworn information must be filed, or by a summons directing the person charged to appear on a certain day to answer the complaint made by the prosecutor. The justices must hear the case in open court; the person charged can make his defence either in person or by his solicitor or counsel, he can cross-examine the witnesses for the prosecution, call his own witnesses and address the justices in his defence. The justices, after hearing the case, either acquit or convict him, and in case of conviction award the sentence. Imprisonment with or without hard labour can be inflicted as the provisions of the statute authorize, but aggregate sentences must not exceed 12 months. If the sentence is a fine, and the fine is not paid, the person convicted is liable to be imprisoned without hard labour for the term fixed by the justices, not exceeding a scale fixed by statute, the maximum of which is three months, but this has been exceeded by some acts of parliament.

Of late years this summary jurisdiction of the justices has received very large extensions, and many offences which were formerly prosecuted as serious offences by an indictment before the court of assize or quarter sessions have, where the offence was a trivial one, been made punishable, on summary proceedings before justices, by a fine or a term of imprisonment.

The principal statutes dealing with the jurisdiction of justices to dispose of cases summarily are the Summary Jurisdiction Acts, 1848 and 1879, the Criminal Justice Administration Act, 1914, and the Criminal Justice Act, 1925. Extended powers were given these tribunals of dealing with children and young persons, save in the case of homicide, and by the last-mentioned statute the power of the justices to deal with adults in specific cases and under certain circumstances, always with the consent of the accused, was further enlarged.

In all cases of summary trial where peremptory imprisonment for more than three months can be inflicted, the accused has a right to trial by jury and must be informed of this right. And by statute there is a general right of appeal to quarter sessions from a conviction by or an order of a court of summary jurisdiction where there has not been a plea of guilty, or even in the latter case against the sentence.

Trials at Quarter Sessions and Assizes.—We now come to consider the trial of the more serious indictable offences at quarter sessions or assizes, which cannot, or owing to their nature should not, be dealt with by justices at petty sessions. Where such an offence has been committed the accused is arrested, with or without the warrant of a justice, according to the nature of the offence, or is summoned by a justice before him. On his appearance a preliminary enquiry is held for the purpose of ascertaining whether there is a *prima facie* case against him. The procedure is regulated by the Indictable Offences Act, 1848, and is entirely different from the procedure for summary offences. It may be, though rarely is, held in private; it is an enquiry and not a trial. The evidence of the witnesses given on oath, and any statement made by the accused is taken down by the clerk, and then the justices have to consider not whether the man is guilty, but whether there is such a *prima facie* case against him that he ought to be tried. If they think that there is, they commit him to prison to wait his trial, or require him to give security, with or without sureties, to the amount named by them, for appearing to take his trial either at quarter sessions or assizes. Otherwise they discharge the accused.

At common law any person could prefer an indictment for an indictable offence to a grand jury, and so, even although justices declined to send an accused person for trial, the prosecutor might proceed further. But by the Vexatious Indictments Act, 1859, in the case of certain offences, which have been extended by subsequent legislation, no indictment is to be presented to a grand jury without the consent of a judge or law officer, or unless the accused has been committed or the prosecutor has been bound by recognizance to prosecute. Justices are bound to take that recognizance even although they have declined to commit.

The Grand Jury.—Whether there has or has not been a preliminary enquiry before a magistrate, no person can be tried for any of the graver crimes, treason or felony, except upon indictment found by a grand jury of the county or place where the offence is said to have been committed or is by statute made cognizable. In olden days, and even now in theory, the grand jury enquire of their own knowledge, by the oath of good and lawful men of the neighbourhood, into the crime of the county, but in practice the charges against the accused persons are always first submitted to the proper officer of the court. The grand jurors are instructed as to their inquisition by a charge from the judge, as regards the indictments concerning which they are called upon to enquire whether there is a *prima facie* case to send them for trial to the petty jury. The grand jury must consist of not less than 12, nor more than 23, good and lawful men of the county. But any person who prefers an indictment is entitled to have it presented to the grand jury. Officers of the court lay the indictments before the grand jury. The charges are then called bills, and if the grand jury considers that there is good ground for the trial of the accused, they find a "true bill," but if they think there is no *prima facie* case the foreman endorses the bill with the words "no true bill," and it is then presented to the judge. The jury are then said to have ignored the bill, and if the person charged is in custody he is released, but is liable to be indicted again on better evidence.

In many colonies the Scottish system has been adopted, by which the ordinary form of accusation is by indictment framed by the public prosecutor, and a grand jury is only empanelled in cases where an individual claims to prosecute an offence as to which the public officials decline to proceed. In England criminal informations by the attorney-general, or by leave of the court without the intervention of a grand jury, are permitted in cases of misdemeanour, but are now rarely preferred.

If a coroner's jury, on enquiring into any sudden death, finds that murder or manslaughter has been committed, that finding has the same effect as an indictment by a grand jury, and the man charged may be tried by the petty jury accordingly. The law and procedure of the coroner's courts are now regulated by the Coroners Acts, 1887 and 1926. But now by the later statute if criminal proceedings are pending, "in the absence of reason to the contrary," the inquest is to stand adjourned until their conclusion.

Trial by Jury.—When an indictment (*q.v.*) is found by the grand jury (12 at least must concur) the person charged is brought before the court, the indictment is read to him, he is arraigned (*see* ARRAIGNMENT) and asked whether he is guilty or not guilty. If he pleads guilty he is then sentenced by the court; if he pleads not guilty, a petty jury of 12 is formed from the panel or list of jurors who have been summoned by the sheriff to attend the court. He may peremptorily challenge jurors in cases of treason or felony and "for cause" also in misdemeanour. He is tried by these jurors in open court.

On the trial before the petty jury the procedure and the rules of evidence differ in few points from an ordinary civil case. The proceedings as already stated are accusatory. The prosecutor must begin to prove his case. Confessions (*q.v.*) and admissions alleged to have been made by the accused are regarded with suspicion and are not admitted unless it is clear that they were not extracted by inducements of a temporal nature held out by persons in authority over him. The accused may not be interrogated by the judge or the prosecuting counsel unless he consents to be sworn as a witness. The accused may, if he choose, be defended by counsel, and if poor may get legal aid at the public expense if the court certify for it. He is entitled to cross-examine the witnesses for the prosecution and to call witnesses in his defence. At the conclusion of the evidence and speeches the judge sums up to the jury both as to the facts and the law, and the jury by their verdict acquit or convict. Immediate discharge follows on acquittal; sentence by the judge on conviction.

Appeal After Trial by Jury.—In English law until 1907, where a criminal case had been tried by a jury, the verdict of the jury of guilt or innocence was final and there was no appeal on the facts. Any considerable defect or informality in the procedure might be the subject of a writ of error. And if any question of law arose at the trial, the judge might, if he chose, reserve it for the opinion of the court for the consideration of Crown cases reserved, by whom the conviction might be either quashed or confirmed.

By the Criminal Appeal Act, 1907, a new court was established to which any person convicted on indictment or criminal information might appeal. This statute abolished writs of error and the old practice of the king's bench as to granting new trials. It allowed appeals on questions of law and fact and on mixed questions of law and fact, and also against sentences, and on the certificate of the attorney-general that a point of law of exceptional public importance is involved, a further appeal is permitted to the House of Lords. There is no provision for appeals against acquittals and no power to order a new trial. A court of criminal appeal was established for Scotland in 1926. (*See* APPEAL.)

Costs.—The expenses of prosecution for crime in England are dealt with in the following manner. In the case of summary offences justices under the Summary Jurisdiction Acts can order the defendant on conviction to pay to the prosecutor all costs that are just and reasonable, and where the information is dismissed can order the prosecutor to pay costs to the accused. At common law there was no jurisdiction to order costs, and the power to do so rests upon statute. The subject, so far as indictable, as opposed to summary offences are concerned, is governed by the Costs in Criminal Cases Act, 1908, and by that statute (1) a court of assize, including the central criminal court, or a court of quarter sessions before which any indictable offence is tried; (2) a court of summary jurisdiction dealing summarily with an indictable offence; and (3) justices examining but not trying an indictable offence may direct the payment of the costs of the prosecution or defence out of the funds of the county or county borough as in the act provided. There is power under the same act for the court to order the costs of the prosecution to be paid by the accused if convicted, and in certain cases a private prosecutor may be ordered to pay the costs of the defence. In the case of an appeal to the court of criminal appeal under the act of 1907, no costs are allowed on either side, but the expenses of assigned counsel or solicitor and of witnesses are to be defrayed out of local funds.

Characteristics of English Criminal Law.—The characteristics of English criminal law and procedure which most distinguish it from the procedure of other countries are as follows:

1. It is litigious or accusatory and not inquisitorial. It is for the prosecutor to prove by legal evidence the commission of the alleged offence, and the accused is not required to prove his inno-

cence.

2. According to the law of England there is no prescription in criminal law (with a few exceptions created by statute). *Tempus non occurrit regi.* An offender is always liable to punishment whatever time may have elapsed since the committal of the offence. On the Continent of Europe the limitation of a judgment and sentence for a crime is 20 years; five years for a *délit,* and for a contravention two years. No proceedings can be taken as regards a crime after a lapse of ten years, whilst as regards a *délit* the limit is three years, and two years for a contravention.

3. A criminal prosecution directed on European criminal procedure at once passes into the hands of the State as an infringement of law which must be repressed, on the ground that the whole community bases its security on obedience to law. It is true that in England prosecutions are carried on in the name of the Crown, but only in serious matters do the attorney-general, the director of public prosecutions, or the police act, and much of the repression of minor crime is left to the injured party.

4. In England every criminal trial from beginning to end is public. Preliminary enquiries into an indictable offence may be, but rarely if ever are, conducted in private. On the Continent of Europe, with rare exceptions all preliminary proceedings in a criminal charge are secret, and there are limitations to the rights of the legal advisers of the accused. At the trial the powers of counsel are much wider. In England also it is an established law that an accused person should have the right of publicity of the proceedings and the right to defend himself by counsel and by witnesses at all stages of the proceedings.

5. In England the single-judge system is universal, save in courts of summary jurisdiction, at quarter sessions for counties and on appeal; on the Continent of Europe plurality of judges is insisted upon, save in the most trivial cases, where the punishment is insignificant.

6. In England the accused has a right to be tried by a jury for all serious crime, and all professional judges are chosen from the bar, and do not form a particular caste, and are only removable for misbehaviour.

Northern Ireland and Scotland.—The criminal law of Northern Ireland is to a great extent the same as that of England, resting on the same common law and on statutes which extend to both countries or are in almost the same terms, and is administered by courts of assize and quarter sessions, and by justices, as in England. In a few instances statutes passed for England or Great Britain before the Union have not been extended to Ireland, or statutes passed by the Irish parliament before the Union or by the British parliament since the Union create offences not known to English law.

In Scotland not many crimes are constituted by statute law, the common law having great elasticity. Criminal procedure in Scotland is regulated by an act of 1887 which greatly simplified indictments and proceedings. The prosecution of crime is in the hands of public officers, procurators fiscal, under the control of the lord advocate. Private prosecutions are possible, but rare. Except in the case of the law of treason, imported from England at the Union, no grand jury is required, and the indictments are filed by the public officer.

The criminal law of England forms the basis of the criminal law of British possessions abroad, with a few exceptions, *e.g.*, the Channel Islands (still subject to the custom of Normandy), and the anomalous case of Cyprus, where Ottoman law is to some extent in force. As to India, see *infra.*

In many British colonies the criminal law has been codified or at the least consolidated. The criminal law of South Africa, which is based on the Roman-Dutch law, including the *Constitutio Criminalis Carolina* (1532), is not codified. In the Transvaal and Orange River colonies codes of criminal procedure are in force, drawn mainly from the common and statute law of the Cape Colony with the addition of provisions borrowed from English and colonial legislation.

Codification.—"Criminal law has everywhere grown out of custom, and has in all civilized States been largely dealt with by direct legislation. In most civilized States (including Japan) it has been codified by statute, to the general satisfaction of the people; and the conspicuous success of the Indian Penal Code shows that English criminal law is susceptible of being so treated" (Bryce, *Studies,* ii. 34).

The expediency, if not the necessity, of codifying the criminal law of England has long been apparent. The writings of Bentham drew attention to many of its substantial defects, and the efforts of Romilly and Mackintosh led to certain improvements embodied in what are known as Peel's Acts (1826 to 1832). In 1833, at the instance of Lord Chancellor Brougham, a royal commission was appointed to deal with the criminal law. The nature of the instructions indicate the crudity of the ideas then ruling as to codification. The commissioners were directed to digest into one statute all enactments touching crimes and the punishment thereof, and into another statute the provisions of the common unwritten law touching the same. The commission was renewed in 1836 and 1837, and in 1843 a second commission was appointed. Numerous and voluminous reports were published, including (1848) a bill for consolidating and amending the law as to crimes and punishments, and (1849) a like bill for criminal procedure, indicating that the commissioners had in the meantime learned the distinction between substantive and adjective law. Lord Brougham in 1848 unsuccessfully introduced the first bill, and in the end the only fruit of the reports has been certain amendments of procedure in 1851 and the passing of the seven Criminal Law Consolidation Acts of 1861, which deal with the statute law as to larceny, forgery, malicious injuries to property, coinage offences and offences against the person. During the present century the law relating to perjury, forgery, indictments and larceny has been consolidated in several statutes.

India.—The Indian Penal Code and Criminal Procedure Code, by their history, their form, and the extent and diversity of the races and peoples to which they apply, are perhaps the most important codes in the whole world. Between 1834 and 1837 Macaulay with three other commissioners, Macleod, Anderson and Millet, prepared a draft penal code for India, for which they drew not only upon English and Indian laws and regulations but also upon Livingstone's Louisiana code and the Code Napoléon. Little or nothing was taken from the Mohammedan law. A revised draft of the Penal Code by Sir B. Peacock, Sir J. W. Colville and others was completed in 1856. In framing it the reports of the English criminal law commissioners (published after Macaulay's draft code) were considered. The draft was presented to the Legislative Council in 1856, but owing to the mutiny and to objections from missionaries, etc., its passing was delayed until Oct. 6, 1860. A draft scheme of criminal procedure was prepared in India in 1847–48, which, after submission to a commission in England, was moulded into a draft code which passed the India Legislative Council in 1861 (Act No. XXV.) and came into force in 1862. It has been re-enacted with amendments on various occasions and in 1898 (Act V.).

The result is that in India the criminal law is the law of the conqueror, though for many civil purposes the law of race, religion and caste governs. Under the codes, one set of courts has been established throughout the country, composed of well-paid, well-educated judges, many of the high judicial appointments being held by Englishmen; all those who hold subordinate judicial posts at the same time are subjected to a combined system of appeal and revision. The arrangement of the Indian Penal Code is natural as well as logical; its basis is the law of England stripped of technicality and local peculiarities, whilst certain modifications are introduced to meet the exigencies of a country such as British India.

Passing on to the system of criminal procedure which is set forth in detail in the Code of Criminal Procedure as re-enacted in 1898, it is no doubt modelled on the English system, but with considerable modifications. The principal steps are: (1) arrest by the police and enquiries by the police; (2) the issue of summons or warrant by the magistrate; (3) the mode of procedure before the magistrate, who may either try the accused himself or commit him to the sessions or the high court, according to the importance of the case; (4) procedure before the court of session;

(5) appeals, reference and revision by the high court.

Foreign Codes.—It has already been stated that most European States had codified their criminal law. The earliest of Continental codes is that of Charles V., promulgated in 1532, and known as *Constitutio Criminalis Carolina.* Austria made further codes in 1768 (*Constitutio Criminalis Theresiana*) and 1787 (Emperor Joseph's Code). A new code was framed in 1803, and amended in 1852 by reference to the Code Napoléon; and in 1906 a completely new code existed in draft. The Hungarian Penal Code dates from 1880. The Bavarian Code of 1768 of Maximilian, revised in 1861, and the Prussian Code of 1780, have been superseded by the German Penal Code of 1872.

The most important of the Continental criminal codes are those of France, the *Code Pénal* (1810) and the *Code d'Instruction Criminelle* (1808)—the work of Napoleon the Great and his advisers, which professedly incorporate much of the Roman law.

The Belgian Codes (1867), and the Dutch Penal Code (1880) closely follow the French model. In Spain the Penal Code dates from 1870, the Procedure Code from 1886. The Spanish-American republics for the most part also have codes. Portugal has a Penal Code (1852). In Italy the Procedure Code and the Penal Code, perhaps the completest yet framed, are of 1890, but a new penal code under the Fascist régime is now (1928) under consideration. The Swedish Code dates from 1864. The Norwegian Code was passed in May 1902, and came into force in 1905. Japan has a code based on a study of European and American models.

In the United States no Federal criminal code is possible; but many States have digested their criminal law and procedure more or less effectually into penal codes.

It may be generally stated that the English criminal law and procedure forms the basis of that which obtains in English-speaking countries, while the French Codes of Napoleon are the models of Continental criminal law. (W. DE B. H.; X.)

UNITED STATES

In one sense there is no single body of criminal law of the United States. For purposes of the administration of criminal justice each of the 48 States, and the Federal Government, is a sovereign State with its own law, its own exclusive jurisdiction, its own judges and other officers of justice, its own system of penalties and its own rules of procedure, subject only, in the case of the States, to certain restrictions of the Federal Constitution. Yet, in another sense, there is a criminal law of the United States.

When the American Colonies were first settled by the English, it was held by the settlers and by the judges and lawyers of England, that they brought with them so much of the common law of England and the statutes then in force there as was applicable to their local situation and change of circumstances. But each Colony judged for itself what parts of this common law were applicable to its new condition, and adopted some parts and rejected others. The common law here spoken of is that great body of principles evolved by the English judges during the centuries.

Therefore, while each of the several States of the United States has its own distinct body of criminal law, these bodies of law have a common source, viz., the common law of England, and this common law furnishes a great body of principles which forms the basis of the law of each of the several States and of the Federal Government. Thus, subject to exceptions mentioned hereafter, every act that was a crime by the common law of England at the time the English emigrated to America is a crime to-day in the several States. There are three exceptions to this statement. (1) Under the rule that the English brought with them to America only so much of the common law as was suited to their changed conditions, offences cognizable only in the ecclesiastical courts in England, such as incontinence, were generally held not punishable in America unless made so by statute. (2) In a few States the legislatures have undertaken to codify the criminal law, and the courts of these States have held that in so doing the legislatures intended to include in the code all acts that were thereafter to be punishable, and that no act not animadverted upon in the code should henceforth be a crime in that State. (3) The Federal courts hold that there are no common law crimes against the Federal Government; that only such acts as have been declared criminal by Congress can be punished by the Federal courts.

Not only were some common law crimes rejected in the United States, but many of the common law punishments in vogue in England at the time of the settlement of the Colonies were not accepted there. In an early Pennsylvania case the court said:—"The common law punishment of ducking (which was the punishment for the offence of being a common scold in England) was not received nor embodied by usage, so as to become a part of the common law of Pennsylvania. It was rejected, as not accommodated to the circumstances of the country, and against the notions of punishment entertained by this primitive and humane community; and although they adopted the common law doctrine as to inferior offences, yet they did not follow their punishments. . . . A gross libel in England was sometimes punished by the pillory. I believe Mr. Prynne lost both his ears. Though the offence is the same here, yet the sentence is very different."

On this basis of the common law of England, each of the States and the Federal Government have separately, through the medium of legislation, built their individual bodies of criminal law. The criminal law legislation has been exercised mainly in the direction of the creation of new crimes, the changing of the penalties of the old ones, the organization of courts and changes in procedure.

Classification of Crimes.—Offences are usually classified in the United States in respect to their effect, as offences (1) against the law of nations, (2) against public justice and authority, (3) against the public peace, (4) against trade, (5) against public decency, (6) against the person, (7) against property. The United States has inherited from England the classification of crimes, in respect to their gravity, into treason, felony and misdemeanour. In England many crimes were placed in the category of treason. In the United States this term has been restricted to one offence; viz., the levying of war against the State or adhering to its enemies. Felonies, at common law, included all crimes punishable by death and forfeiture of property, but since forfeiture of property for crime was abolished early in the United States and the death penalty was restricted to a few crimes, this term has lost its original signification and now, generally speaking, characterizes all the more serious crimes. Furthermore, this category has been affected by statutes, so that what is a felony in one State may be only a misdemeanour in another. In some States a general rule has been adopted defining felony, as in New York, where all offences punishable by imprisonment for one year are declared felonies; while in other States, as in Pennsylvania, the legislature, in defining each crime, prescribes whether it shall be a felony or a misdemeanour. The term misdemeanour includes all offences punishable by the State which are not treason or felony.

FIXING RESPONSIBILITY

Elements of Crime.—The elements of a crime, under the laws of the Federal Government and of the States, are the same as in other systems of law. The rule is expressed in the maxim—every crime consists of an act, or an omission to act, and an accompanying state of mind. The act must be a willed act, and the omission must be the omission of a legal, as distinguished from a moral, duty. A blow caused by a mere muscular reflex will not make one criminally liable nor will an omission by a stranger to rescue a drowning person, though such rescue could be effected by a minimum of effort. Except in a small but growing class of statutory offences of a minor character, there must exist, together with the act or omission, an accompanying state of mind, to render the person causing injury criminally liable. This state of mind varies in the case of different offences and is either malice, negligence, knowledge of certain facts or some particular intent. Thus murder consists of an act causing death to a human being, accompanied by malice; voluntary manslaughter consists of the same act with intent to kill, but without malice; while in involuntary manslaughter we have the same act done with a merely negligent mind. Most of the serious offences require, in addition to an act, a certain specific intent. Thus in burglary there must be the act of breaking and entering a dwelling house in the night time, with an intent to commit some felony therein; in larceny there must be coupled with the act of taking an intent to deprive the owner permanently of the property taken; in robbery there must be the forcible taking of property, with the intent required in larceny. In addition to these common law crimes there is a long catalogue of statutory offences requiring a specific intent for their commission; such are assaults, with intent to kill, to maim, to wound, etc.

Elements of Criminal Responsibility.—To be responsible, criminally, for his acts, the person charged must be of competent age and sane. In the United States, as in England, a child under seven years of age is not criminally liable for any act, and between the ages of seven and 14 he is presumed not to have such knowledge and discretion as to make him liable. The burden of proving such knowledge or discretion is on the prosecution. While in the law both of England and the United States an insane person is not responsible for his acts, the legal test of the kind and degree of that insanity which excuses him is not the same. Indeed, it is not the same in all the States of the Union. In England, the test, adopted in 1843, in *McNaghten's Case,* in accordance with the medical theories of the day, was what has become known as the "right and wrong" test, viz., did the accused know the nature and quality of the act he did, or, if he did know it, did he know that he was doing wrong. This test has been adopted in many of the States, and under it it is held in these States that a person is not excused who kills another under an insane irresistible impulse, or homicidal mania. A growing number of States, however, influenced by modern psychiatry, have repudiated the "right and wrong" test and hold that even if the accused knew the nature and quality of his act and knew that it was wrong, yet if he was driven to do the act by an insane, irresistible impulse, he is not responsible. A third group of States hold that there is no legal test of insanity; that insanity is a question of fact, not of law, and if the defendant had a mental disease, and the act done by him was a product of that disease, he should not be convicted. If insanity exists in such a degree as to excuse, the origin, or cause, of such insanity is immaterial; thus insanity brought on by indulgence in liquor, if it be real insanity—a disease of the mind—and not merely a temporary irrationality due to intoxication, is as effective to render one non-liable for acts due to such insanity as though the insanity were congenital. Insanity plays another rôle in the criminal law in that though the accused was sane at the time he committed an offence, he cannot be put on trial if he is insane when his case comes on to be tried, as in such event he cannot intelligently present his defence; nor can he be punished if he is insane at the time of the sentence.

Drunkenness, not involving insanity, is a valid excuse in the case of all crimes requiring a specific intent for their commission, if the drunkenness is so great as to negative the fact that the accused had, at the time he did the act, the accompanying intent necessary to constitute the particular crime with which he is charged. Thus a person cannot be convicted of larceny, if at the time he took the property he was too drunk to entertain the intent to steal; nor can he be convicted of arson if he was too drunk to have the intent to burn. Ignorance or mistake of law or of fact affords a valid excuse for a crime if such crime requires a specific intent or knowledge, and the ignorance or mistake negatives the existence of the requisite intent or knowledge. Thus if a person mistakenly thinking that a piece of property belongs to him, carries it away, he is not guilty of larceny, since his mistake negatives the intent to deprive the owner of the property, which intent is necessary to larceny; or if a person votes, believing erroneously that he has the right to vote under existing law, he cannot be convicted under a statute providing penalties for "knowingly" voting illegally.

Since the theory of the criminal law is that a crime is an offence against the State rather than against the individual, the consent of the person injured affords no defence except in crimes such as rape, larceny, etc., that require the non-consent of such person by their very definition. Thus on an indictment for murder it is no defence to show that the person killed consented to his death or asked the accused to kill him. For the same reason, contributory negligence, or guilt, or condonation, of the person injured, is no defence in criminal law. Physical compulsion or coercion is a valid excuse for what would otherwise be a crime because in such case the act done is not the act of the person seeming to act but of the person compelling. Moral compulsion, such as threats, has been held in the United States to excuse some crimes and not to excuse others. Thus where an American enlisted in the enemy army it was held he was not guilty of treason if he enlisted through fear of immediate death (*Respub.* v. *McCarty,* 2 Dallas, 86). On the other hand, one is never excused for killing an innocent person even to save oneself from immediate death at the hands of a third person (*Brewer* v. *State,* 72 Ark. 145). The fact that one was induced or commanded to commit a crime affords no excuse. There are two partial exceptions to this rule. A wife is excused for the commission of any but one of the more serious crimes if she is coerced by her husband and the crime is committed while he is present; and a person in the military or naval service is excused for illegal acts done by command of his superior officer, unless the order was so clearly illegal that a person of ordinary intelligence would recognize its illegality on its being given. In addition to the above-mentioned excuses, there are certain justifications for acts which, without such justification, would be criminal. In this category are the arrest, detention and, in the case of serious crimes, even the killing, of a person who has committed or is about to commit a serious felony, if there is no other means of arresting him or of preventing the felony. A parent, or one standing *in loco parentis,* may likewise justify a battery on the person in his charge if the battery is for purposes of correction and is not excessive. The well-known doctrine of self-defence likewise comes within the category of justifiable acts. Also, what one may do in self-defence, another may do in defence of him. A person may also protect his dwelling or his property by force, short of killing or serious bodily harm.

Combinations of Persons in Crime.—A person may be concerned in a crime either as a principal in the first degree, a principal in the second degree, an accessory before the fact or an accessory after the fact. The principal in the first degree is one who commits the crime with his own hand or acting through a legally irresponsible agent—such as a child under seven years of age, an animal or a mechanism. A principal in the second degree is one who is present, aiding or abetting the principal in the first degree. An accessory before the fact is one who induces the principal in the first degree to commit the crime but is not present when it is committed. An accessory after the fact is one who, knowing that another has committed a felony, shelters him or aids him to escape. These degrees of participation in crime hold only in the case of felonies. In treason and misdemeanours all persons concerned are principals.

In the United States, as in England, attempts falling short of the commission of the crime intended are themselves regarded as crimes unless the crime intended is of a very minor character. In this class of crime, as in others, there must be a concurrence of act and intent. A distinction is made between preparation to commit the offence and attempt to commit it. If the act done toward the commission of the crime has not gone beyond mere preparation to commit it, the technical "act" has not been done and no offence has taken place. Thus buying a pistol for the purpose of killing a person is not an attempt to kill—it is only "preparation"; but if the actor has proceeded so far as to point the pistol at his victim the attempt is complete though his attempt should be frustrated or he should at this point voluntarily relinquish his design. Many fine-spun distinctions have been made both in England and in the United States as to whether one could be convicted of an attempt to do something, the doing of which was at the time impossible—as an attempt to pick an empty pocket. There is authority in England to the effect that this is not a punishable attempt. The authority in the United States is generally to the contrary. There is general agreement, however, on the proposition that one cannot be guilty of an attempt to do a thing which is legally, as distinguished from factually, impossible. Thus a person could not be guilty of an attempt to steal goods, even though he proceeded far enough in his attempt to pass beyond preparation, if it happened that, unknown to him at the time, the goods were his own goods.

POWERS OF VARIOUS STATES

Punishment.—The punishments inflicted in the United States for crime are: (1) Death. In some States the death penalty is inflicted by hanging, in others by electrocution and in one by lethal gas. In several States the death penalty has been abolished. Death is the usual penalty for treason and for murder in the first degree—generally a wilful, deliberate and premeditated murder, or a killing done in the commission of or attempt to commit one of the more serious felonies. In the Southern States rape is also generally punished by death. (2) Imprisonment in the State penitentiary. The more serious offences not punished by death are thus punished. (3) Pecuniary fines, varying in amount with the gravity of the offence. (4) Whipping, as a penalty for certain offences, is still practised in Delaware. (5) Imprisonment in the county gaol. The less serious crimes are punished in this manner. In many States, second and subsequent offenders are punished more severely than first offenders. New York has gone furthest in this direction, punishing by life imprisonment one who is for the fourth time convicted of any felony.

In general, in the United States, the maximum punishment for each offence is fixed by statute, the trial judge being given discretion to mete out any given penalty less than the maximum. In some States the jury may, in convicting the accused, recommend him to mercy, and in others the jury itself, instead of the judge, fixes the penalty in each case. There are provisions also in many States for the probation and parole of prisoners, especially in the case of first offenders. "Cruel and unusual" punishments are forbidden by the Federal Constitution.

Jurisdiction and Venue.—Jurisdiction as here used means the power of the State to punish offences; venue means the local sub-division of the State in which an offence must be tried. Without a special statute authorizing it, a State can punish only those offences which are committed within its boundaries, and, perhaps, crimes affecting its well-being by its own citizens elsewhere. By statute, however, a State can punish anyone who does an act anywhere against its sovereignty or security. Statutes so providing have been enacted by the U.S. Congress. Also the peace officers of a State have no authority beyond its territory and hence cannot apprehend one who has committed a crime within the State and taken refuge in another State. The only recourse in such a case is for the governor of the offended State to request the governor of the State to which the criminal has fled to procure his arrest and return. Whether the request will be efficacious depends entirely on the good pleasure of the second governor, though in practice the request is seldom refused. By special agreement between some of the States, concurrent jurisdiction has been given these States over crimes committed on rivers separating them. Much difficulty is experienced in the administration of the criminal law in the United States, not only by the fleeing of criminals from one State to another, but also by fugitive witnesses whose testimony is needed at the trial. To obviate this difficulty, agreements have been made by a few States under which the State to which a witness has fled will return the witness to the State needing his testimony. The common law principle that an offence must be prosecuted in the county in which it was committed obtains generally in the United States. Several States, however, have enacted statutes allowing prosecution in another county; *e.g.*, in the cases of a wounding in one county resulting in death in another, of offences committed near the county line of adjoining counties and of offences committed on moving trains.

By the Federal Constitution and by most State Constitutions, all persons are protected from being prosecuted more than once for the same offence. In the Constitutions of a few States this protection is confined to capital cases. These provisions do not prevent the Federal Government from prosecuting a person for an act for which he has already been prosecuted by a State, if the act is an offence against both the State and the Federal Government, and the same principle applies to a prosecution by a State after a prosecution by the Federal Government.

All but a few States provide in their Constitutions that, before conviction, every person accused of crime shall have the right to be released from custody on bail, except in capital cases. In a few States this right is not guaranteed in the case of murder, whether murder be a capital offence or not; and in a few States treason is also excepted.

Though known by varying names, there are in general in the United States three classes of courts having jurisdiction in criminal cases in each State: (1) Courts having cognizance of petty offences. These are generally known as magistrate's courts or courts of the justice of the peace. (2) Courts having jurisdiction of indictable offences—variously named. (3) In some of the larger cities there are also courts having cognizance of juvenile offenders. (4) Courts of appeal. In only two States are there courts of appeal for criminal cases alone. In the other States the same court hears appeals in both civil and criminal cases.

Procedure.—In the United States the prosecution of the criminal is not left, as generally in England, to the initiative of the individual who has suffered by the crime, but is conducted by an officer of the State whose sole public duty is the enforcement of public justice. He is known by various titles, such as States attorney, prosecuting attorney, district attorney, solicitor, etc., of whom there is usually one for each county or district in the State. Important cases are sometimes conducted by the attorney-general. The summary prosecution of cases both before a magistrate or justice of the peace and before a court having jurisdiction of indictable offences in the United States is so similar to the prosecution before the justice of the peace in England as not to require a separate description. In the United States generally, only one magistrate hears the case, though in many States he may call in a magistrate of another county to sit with him if he so desire. It is believed that no legislation similar to the Vexatious Indictments Act of England exists in the United States and that, therefore, an indictment may be considered by the grand jury in all cases of indictable offences whether or not the magistrate has declined to hold an accused person to trial. The finding of a "true bill" by a grand jury as a prerequisite to putting a person on trial for all but petty offences was a part of the common law inherited by the United States from England, and still obtains in half of them. In 24 States, however, the prosecution may be begun, without the intervention of a grand jury, by the filing of an "information," *i.e.*, accusation, by the prosecuting attorney, except, in a few States, in cases punishable by death or imprisonment for more than ten years. It is still lawful to proceed by indictment by a grand jury in these States, but in practice prosecution by information has superseded that by indictment as simpler, less expensive and more expeditious.

Trial by Jury.—When an indictment has been presented, or an information filed, against a person, he is arrested, if he is not already in custody or released on bail, and is brought before the court. On appearing, he is arraigned (*see* ARRAIGNMENT). The indictment is read to him, even though in some States he has been given a copy of the indictment a prescribed time previously. He is then required to plead by being asked whether he is guilty or not. In answer to this he may plead any one of the following pleas: (1) guilty; (2) not guilty; (3) former jeopardy; (4) former acquittal; (5) former conviction; (6) *nolo contendere*—which is, for practical purposes, equivalent to a plea of guilty; (7) to the jurisdiction; *i.e.*, that the court has no jurisdiction of the case; (8) in abatement—as that he has been erroneously named in the indictment; (9) he may demur to the indictment; (10) in some States the accused must enter a special plea of insanity if he desires to defend on this ground; in others this defence may be given under the plea of "not guilty." If the accused pleads guilty, no trial is necessary in most States, but the judge proceeds to sentence. In a few States, however, the judge, or jury, is required to hear the witnesses as to any facts that may aggravate or mitigate the offence. If the accused refuses to enter any plea, a plea of "not guilty" is entered for him by the court. If the defendant pleads "not guilty," or stands mute, a jury is selected to try the case. In most States this jury is composed of 12 persons, and the accused cannot be convicted unless all the jurors unite in finding him guilty. In some States a trial may be had by a smaller number of jurors, and in some a unanimous verdict is not required in the case of all crimes. The burden of proving the accused guilty is on the prosecution and the prisoner is entitled to acquittal unless the jury is satisfied, beyond a reasonable doubt, of his guilt. The accused is entitled to be represented by counsel, and if he is unable to procure counsel, it must be assigned to him, in some States in all cases of felony, in others in cases of trials for homicide. He is entitled, as is the State, to have process to compel witnesses to attend and testify. When the evidence has all been heard, counsel for the State and for the prisoner address the jury, and the judge instructs the jury as to the law of the case. In the Federal courts and in the courts of a few States, the judge may comment on the evidence of the case in order to assist the jury in reaching a just verdict, but in most States the judge is forbidden by law to comment on the facts.

In all States the accused, on conviction, may petition the court which tried him for a new trial of the case, which will be granted if the court is persuaded that his conviction was not in accordance with the law. In addition to this, the accused has the right to have his case reviewed by a higher court—in a few States, as to matters of law only; in most States, as to both the law and the facts. The appellate court in its review is confined to the record and cannot examine witnesses, nor can it modify or increase the sentence. It can only affirm the legality of the original trial or send the case back for a new trial. (W. E. Mi.)

CRIMINOLOGY, a modern term invented to describe the results of recent inquiries into the personal or social factors which determine criminal misconduct, but which has, in the hands of its more recent exponents, come to include the whole problem of crime and its treatment in human society. A comprehensive study of the subject to-day would, therefore, draw its material from history, sociology and law, as well as from psychology, anthropology and social ethics. It gathers criminal statistics with the view of ascertaining the crime rate and its upward or downward trend in different countries and, in the same country, in different areas of population, in communities of varying national or racial origin or living on different economic levels. It seeks the springs of misconduct and of criminal propensity through the intensive study of the mental and social history of the individual delinquent, and it undertakes to classify criminals on the basis of the causative factors thus disclosed. It aims to establish a rationale of punishment or of other treatment of the delinquent by a similar study of the efficacy and the social utility of the machinery of criminal justice in various countries, ranging from the method of the police and the courts to the prisons, the death penalty and the modern devices of probation and parole. All these fields of activity are being industriously and hopefully explored by eager students in all parts of the civilized world. If the results thus far realized are too meagre and uncertain to constitute a body of true scientific knowledge, the same may be said of any other of the so-called social sciences. Certainly criminology has struck at the core of its problem in its present resolute effort to win an understanding of the criminal mind.

It seems incredible, but it is nevertheless a fact, that, prior to the publication of Lombroso's *L'Uomo delinquente* (The Criminal), which was given to the world in 1876, there had never been offered a serious, scientific approach to the study of the criminal. It is true that some 75 years earlier the Viennese physician and phrenologist, Franz Joseph Gall, then resident in Paris, had laid down the proposition that criminal tendencies were probably innate, and might be detected by the conformation of the skull, but his suggestion was not taken up by his disciples. There is no evidence that it was known to Lombroso.

The Positive School.—Lombroso's theory of the criminal as a sub-human anthropological freak, marked by anatomical and other stigmata and doomed by his nature to a criminal career, was at once accepted by a majority of students in Italy, and by scholars and writers of distinction in other European countries. Though subjected to weighty criticism, and though never received in any English-speaking community, it became, and for a generation remained, the dominant doctrine of European students of the problem of crime. The adherents of the doctrine, at first known as the Italian and later as the Continental school of criminology, have, under the influence of its most eloquent and learned modern interpreter, Enrico Ferri, claimed the title of the Positive school.

But the central doctrine of these thinkers did not long stand in the unqualified form in which it was originally promulgated. Even Lombroso himself, before his death in 1909, had modified his views to the extent of admitting that the born anthropological criminals numbered perhaps not more than half of those committing criminal offences. These were the true criminals, the other half being made up of the victims of circumstances. These modifications of the original doctrine were the result partly of the researches and conclusions of some of Lombroso's immediate Italian disciples, such as Raffaele Garofalo and Enrico Ferri, but even more, perhaps, of the challenging writings of the Dutch publicist, William A. Bonger, who emphasized the influence of economic conditions, and of the French philosopher, Gabriel Tarde, and others, who attributed criminality mainly to the psychic impulse of imitation. While all these efforts, like the doctrine impeached by them, were vitiated by the aim of furnishing a single explanation of the extremely complicated and puzzling problem of the persistence of crime in an orderly civilization, each and every one of them, nevertheless, made a contribution to the criminology of the future.

Absence of Physical Criminal Type.—It remained, however, for an English physician, Dr. Charles Goring, medical officer of H.M. prison service, to demonstrate the fallacy of the central assumption of the Italian criminologists. Adopting more rigorous methods of examination and measurement of inmates of the English prisons and correlating the results with similar examination and measurements of members of the law-abiding community, he proved conclusively that criminals, as a class, differ more widely among themselves than they do from the community outside and that the latter show the same stigmata of criminality that criminals possess. In his work, *The English Convict* (1913), Dr. Goring announced, as an "inevitable conclusion" from his researches "that there is no such thing as a physical criminal type," a conclusion which is now accepted by every criminologist of standing. Dr. Goring's further conclusion, stated with equal positiveness, that "there is no such thing as a mental criminal type," while it is also generally accepted, rests upon no such satisfactory basis of evidence and may be regarded as open to contradiction.

Whatever may be the merits or the defects of the specific doctrine which will always bear Lombroso's name, his work has these outstanding merits: it first gave the study of the criminal a scientific basis and it powerfully stimulated technical as well as popular interest in the problem. Prior to his time there had been few to question the traditional view of the criminal as a wicked person deliberately and perversely choosing the evil rather than the good. Even the penal reforms with which the names of the Italian Beccaria and the English Romilly and Bentham are associated were inspired almost entirely by humanitarian motives. But since Lombroso's death the scientific study of the criminal and of the personal and social factors that are favourable to his development has been going on with increasing momentum.

The New Psychology.—Except in the field of penology (*q.v.*), America was late in getting into the current of criminological thought. Here there were eminent prison reformers before Howard and Romilly, and the first American penitentiary, for better or for worse, became the model of the European convict prison. It is in the United States, too, that the most hopeful and daring experiments in the treatment of the convicted offender were undertaken. But it was not till the first decade of the present century that the scientific study of the criminal began to receive the serious attention of students of the subject. This significant change of emphasis was, perhaps, primarily due to the rapidly developing interest of the new psychology in morbid and defective mental conditions, an interest which has powerfully stimulated the growth of that branch of medical science now known as psychiatry (*q.v.*). The psychologist found his most interesting and revealing material for the study of the mind in the asylums or hospitals for the insane, and it was only a short step further to the study of similar abnormal types of personality in the prison, with the result that it is scarcely too much to say that in 1929 every psychiatrist was a criminologist. This development, which went on *pari passu* in England and on the Continent and was, in fact, largely inspired by the writings of Freud, Jung and other European students, has, in recent years, become the dominant influence in criminological thought on both sides of the Atlantic.

Social Mechanism and Crime.—During the same quarter-century that has witnessed this extraordinary development of psychologic thought, the social sciences have been turning more and more from speculation and the discussion of general principles to the concrete study of the workings of the social mechanism. Particularly in America, where sociology is a highly favoured study, the science has been greatly enriched and is being in a measure reconstructed through the critical investigation of existing personal and social conditions. Thus we have surveys of cities and towns or of rural communities in which the social conditions which breed dependency and delinquency are brought to light, and "case-studies" of dependent families or of children "in trouble," through which the domestic or individual factors which lie behind the trouble are disclosed and analyzed. Usually the psychologist with his mental tests or the psychiatrist, with his psychoanalytic apparatus and his interpretation of the reaction of the individual to his specific environment, is at hand to contribute his diagnosis to make up the sum of knowledge which the social worker requires. (*See* SOCIOLOGY.)

From these combined influences three results of first-rate importance are already in evidence. The first of these is that criminology is less and less concerned with the identification and description of the criminal and more and more with the understanding of the individual offender; the second, that the principal emphasis is being laid, perhaps to an excessive degree, on the mental study of the delinquent; and the third, that the medical concept of treatment is by way of superseding the legal concept of punishment. The reference here is, of course, to the attitude of the criminologist and not of the public nor of the agencies of law enforcement, which cling to their idols. It is worthy of note how impervious the public and the courts are to the influence of criminological thought. Even the doctrines of Lombroso, during the generation when they were in the ascendant and commanded the allegiance of most Continental students, made practically no impression on the criminal law or procedure of any European country.

The Criminal and the Community.—Opinion among criminologists differs too much as to causes of criminal misconduct to justify a confident statement of their views, but the following tentative summary may, perhaps, be ventured as representing the trend, if not a consensus, of opinion. There is no criminal class except in so far as criminal misconduct has with certain individuals become habitual. Criminals are selected by force of circumstances (and here the economic factor comes into play) from the community at large. The insane, the mentally defective and the psychopathic stand the best chance of being so selected.

It has been upon the whole a fortunate circumstance that, as outlined above, criminology has been adopted into the family of the social sciences. If this robs it of the independent status conferred upon it by its parentage, it has, on the other hand, enormously enlarged its range and utility. Crime now presents itself as only one of many inter-related social phenomena of a malignant character, such as the persistence of poverty, of widespread disease, and of mental disorder and defect. Criminology profits by, and it makes its peculiar contribution to, the study of each of these related disorders of the social body and, like the other social sciences, it furnishes a reflection of the state of health of the community in which crime is permitted to flourish.

BIBLIOGRAPHY.—Only a few items from the abundant literature of the subject can be given here. For the purposes of the general reader the following are perhaps the most useful: J. Devon, *The Criminal and the Community* (1911); C. Goring, *The English Convict* (1913); K. Birnbaum, *Die Psychopathischen Verbrecher* (1914); W. Healy, *The Individual Delinquent* (1915); M. Parmelee, *Criminology* (1918); C. Mercier, *Crime and Criminals* (1919); W. I. Thomas, *The Unadjusted Girl* (1923); E. H. Sutherland, *Criminology* (1924); Jane Addams and others, *The Child, The Clinic and The Court* (1925); Miriam Van Waters, *Youth in Conflict* (1925); J. L. Gillin, *Criminology and Penology* (1926); Boris Brazol, *The Elements of Crime* (1927); *Journal* of the American Institute of Criminal Law and Criminology (1910–28); H. Wyndham, *Criminology* (1929).

(G. W. Ki.)

CRIMMITSCHAU or KRIMMITSCHAU, town of Germany, in the *Land* of Saxony, on the Pleisse and the main Leipzig-Hof railway, 7 mi. N.W. from Zwickau. Pop. (1939) 26,942. The most important industries are the spinning of carded yarn and wool, and the processes of dyeing, finishing and wool-spinning connected with these. Among other manufactures are boilers and machinery.

CRIMP, an agent for the supplying of soldiers and sailors, by kidnapping, drugging, decoying or other illegal means. Crimps were formerly regularly employed in the days of impressment (*q.v.*). Now the term is used, first of any one who engages to supply merchant seamen without a license from the Board of Trade, and is not either the owner, master or mate of the ship, or is not *bona fide* the servant, and in the constant employment of the owner, or is not a superintendent (Merchant Shipping Act, 1894, III.); and, with a wide application, of the extortionate lodging or boarding-house keepers, who are generally in league with the "crimp" proper.

Sections 212 to 219 inclusive of the above Act provide for the protection from imposition of merchant seamen in sea-going British ships registered in or out of Great Britain or which ought to be so registered. Local officials at seaports have power to make by-laws for licensing and regulating of sailors' lodging-houses, and to inflict penalties for infringement thereof. If this power be not exercised, the Board of Trade may do so. Penalties are also imposed by the act for overcharging by lodging-house keepers, for detaining of seamen's effects, and for soliciting. Unauthorized persons are prohibited from boarding a ship in port without leave. The Board of Trade officer at a port may provide money for sending a seaman to his home on discharge, and may forward his wages after deducting the expenses. Facilities are also given for having wages sent home from foreign ports at a small charge.

In the ports of the United States of America crimping was long prevalent, especially on the Pacific coast, and its prevention was very difficult, but State regulations as to the licensing of boarding-houses, and the limitation of the amount of so-called "blood-money" paid by masters of vessels to the suppliers of crews to ships denuded by desertions, have reduced the abuse.

CRIMSON, a strong, bright red colour tinged to a greater or less degree with purple. The dye is produced from the dried bodies of the cochineal insect. The word is adapted from the Med. Lat. *cremesinus* or *carmesinus,* the dye produced from the insect *Kermes*. From the Lat. *carminus,* a shortened form of *carmesinus,* comes "carmine" (q.v.).

CRINAGORAS, of Mytilene, Greek epigrammatist, flourished during the reign of Augustus (Strabo, xiii. p. 617). A number of epigrams appear under his name in the Greek Anthology. From inscriptions discovered at Mytilene, he appears to have been one of the ambassadors sent from that city to Rome in 45 and 26 B.C.

The epigrams have been edited by M. Rubensohn (1888).

CRINAN CANAL, a small ship-canal in Scotland, extending from Ardrishaig on Loch Gilp to Crinan on Loch Crinan. It was made by a company incorporated in 1793, and was opened for traffic in 1801. At various times it received grants of public money, and ultimately in respect of these it passed into the hands of the government. In 1848 it was vested by parliament in the commissioners of the Caledonian canal, who had in fact administered it for many years previously. The length of the canal is 9 m., and it saves vessels sailing from the Clyde a distance of about 85 m. as compared with the alternative route round the Mull of Kintyre. Its highest reach is 64 ft. above sea-level;

its locks number 15, and admit vessels up to a draught of $9\frac{1}{2}$ ft.

CRINOIDEA, a class of the Echinoderma (*q.v.*) including the feather stars (*q.v.*) and stalked crinoids or sea lilies. Most stalked crinoids are fossil. In the present seas 80 species in 26 genera are known.

CRINOLINE, a stiffening material made of horse-hair and cotton or linen thread. Substitutes for this, such as the straw-like material used in making hat shapes, are also known by the same name. From the use of the material to expand ladies' skirts the term was applied in the 19th century to the whalebone and steel hoops employed to support the wide skirts then worn (*see* DRESS).

CRINUM, a genus (family Amaryllidaceae) of bulbous plants with fleshy leaves and a solid leafless flower stalk, bearing a cluster of handsome white or red funnel-shaped regular flowers. There are 100 or more species, native to tropical regions, some well known in cultivation. The swamp lily (*C. americanum*), of the southern U.S., is sometimes planted for ornament. *C. longifolium* of South Africa is the best known garden sort.

CRIOBOLIUM, the sacrifice of a ram in the cult of Attis and the Great Mother (Gr. κριοβόλιον). Perhaps it was a ceremony instituted after the rise, and on the analogy of the taurobolium (q.v.), which it probably resembled, but was in honour of Attis, for when it was performed in conjunction with the taurobolium, the altar was almost invariably inscribed to both the Mother and Attis, while the inscription was to the Mother alone when the taurobolium only was performed. It was sometimes performed alone (*Corp. Inscr. Lat.* vi. 505, 506).

CRIPPLE CREEK, a city near the centre of Colorado, U.S.A., in a granite pocket 9,600ft. above sea-level; the county seat of Teller county and the heart of one of the greatest gold-producing districts of the world. It is connected with Colorado Springs by the tortuous Midland Terminal railway. The population in 1940 was 2,358. Gold was discovered in Poverty gulch, just northeast of the present city, in 1891 by Bob Womack, a cowpuncher, who died poor; and the Independence vein, on what is now the site of Victor, was struck on July 4, 1891, by W. S. Stratton, a contracting carpenter, who left a fortune of $20,000,000. Before the spring of 1892 the hills swarmed with prospectors.

The railway to Colorado Springs was completed Dec. 16, 1893; the Florence and Cripple Creek railroad was opened the following July.

Twice the town was almost destroyed by fire, after which it was rebuilt of stone and brick. In 1894 and again in 1903–04 there were serious strikes, attended by violence and loss of life.

The Short Line railway was built into the district in 1901.

The gold output was valued at $1,930 in 1891; in 1893 at $2,025,518; and it increased each year until 1900, when the peak was reached at $18,199,736. In recent years it has averaged about $5,000,000.

The higher price of gold, $35 per ounce, set in 1934 gave new impetus to the mining industry in Cripple Creek. While Cripple Creek has dwindled from the booming town of the early period of its history, mining was responsible for a return to prosperity after the early 1930s.

The Cripple Creek district in 1941 produced, through its many active mines, more gold than the combined output of all other mining districts in Colorado.

CRIPPLES. Cripples may be divided into four main categories:

(1) Those suffering from congenital defects;

(2) Those who have become deformed after birth from lack of light, air, exercise and proper diet;

(3) Those who have become deformed as a result of a crippling disease, of which the chief are infantile paralysis and tuberculosis;

(4) Those who have become deformed as the result of injury.

The first category is relatively small, but important, for, as a rule the congenital defect, if skilfully dealt with at once, can be easily rectified, but if not so dealt with grows progressively worse. The second owes its origin to causes which are essentially, if not easily, preventable. The third category is on a somewhat different footing; here the cripple owes his deformity to a specific disease and the deformity can only be removed with the prevention or prompt cure of that disease. The fourth category includes a large and important group, namely, the cripples who are the victims of injuries to spine and limbs. Most deformities are due not to a predisposing cause but to neglect of proper measures of prevention and cure. The potential cripple only becomes as a rule, a cripple in fact, if the necessary treatment is not given in time. Modern methods aim primarily not at housing or training existing cripples, but at preventing or eliminating their disabilities. Experience has shown that 90% or even 95% of potential cripples would never become deformed if they received the right treatment at the right time. It is the object of all concerned with cripples to devise a successful technique, legal, medical and administrative, for securing the early discovery and prompt treatment of every potential cripple who needs it.

A successful national scheme for dealing with cripples requires:—

(a) Adequate bodies of persons to work it, with the necessary legal and financial sanctions behind them, and

(b) Efficient methods for the discovery, treatment, cure and training of cripples.

EUROPE

The varying measures and methods adopted in some of the leading European countries may be briefly indicated.

Great Britain.—In England and Wales, as regards the first of the above mentioned requirements, there are statutes which lay upon certain public bodies the legal responsibility for the care of cripples. For children under school age, there are the local Committees set up by the Maternity and Child Welfare Act, 1918. Non-tuberculous children of school age fall under the care of the Local Education Authorities, who are required by the Education Act, 1921, to submit all school children to periodic medical examinations and provide the necessary medical care and appropriate education for all physically defective children. Lastly, all tuberculous patients fall to the care of Local Public Health Authorities working under the Public Health (Tuberculosis) Act 1921.

The Local Education Authorities work under the general direction of the Board of Education, and the Maternity and Child Welfare Committees and Public Health Authorities under the Ministry of Health. In each case the actual work is organized and carried out by the Local Authorities who receive from the Government Departments concerned a grant which amounts, as a rule, to 50% of expenditure incurred with their approval. Broadly, the above named acts provide for the care and cure of all cripples other than non-tuberculous cripples over school age for whom at present no public body is responsible.

In addition, there exist many voluntary associations, supplementing the work of the public bodies and working as a rule in close co-operation with them. They frequently act as their agents, supplement their activities by undertaking work which is outside any statutory sanction or which is called for in areas where the Public Authorities are backward. In carrying out their duties, they focus public opinion with a view to stimulating the public authorities to assume their legal responsibilities. These local associations are represented on a central voluntary body known as the Central Council for the Care of Cripples, which has offices at 117 Piccadilly, London, W. 1. This Central body is representative of all the societies and persons, including orthopaedic surgeons, who are concerned with cripples, and is in touch with the Ministry of Health, the Board of Education and the Ministry of Labour. It includes representatives from Wales, Scotland and Ireland. Thus, both centrally and locally, means exist for the co-operation of the public and private bodies concerned.

Preventive and Remedial Measures.—The second requisite for a successful national scheme for dealing with cripples is an efficient organization for the early discovery, treatment, cure and training of cripples. The organization which has now been developed in England and Wales is based upon the fundamental idea of an *orthopaedic unit, i.e.,* an area which contains within itself the personnel, buildings, apparatus, etc., for dealing with all the cripples and potential cripples in that area. The orthopaedic requirements of such an area are:—

(a) A skilled orthopaedic surgeon and a body of trained orthopaedic nurses;
(b) A central orthopaedic hospital, including a hospital school and workshops;
(c) Clinics in convenient parts of the area, served by the surgeon and nurses from the central hospital, with local help.

A case found early may be treated quickly and cheaply in its own home and at the neighbouring orthopaedic clinic. The more serious case will go to the orthopaedic hospital where education will be provided for the child and vocational training in workshops for the older patient. When hospital treatment is over, the patient will be returned to his own home, but will be kept under observation until all fear of a relapse is passed.

Efficient orthopaedic schemes are not yet to be found in every area, but the parts of the country where little or no provision is made for cripples are rapidly growing fewer. The provision made for the training and employment of the formed cripple lags behind. This is due largely to the fear that has existed that advocacy of schemes for training cripples might obscure the greater issue and divert to training, energy and funds more profitably spent in prevention.

The first efforts at hospital organization for cripples date from the foundation of the Birmingham Orthopaedic Hospital in 1817, and the Royal National Orthopaedic Hospital in London in 1838, the Alexandra Hospital, the Sevenoaks Hospital, and the Cheyne Hospital, all founded soon after the middle of the last century, and the special orthopaedic department in general hospitals, starting with that at St. Bartholomew's in 1867. Of open-air hospitals the first founded was that at Heswall in 1899, and this has been followed by the establishment of a large number of country hospitals designed to give their patients the utmost benefit from open-air and sunlight.

The first efforts at the education of cripples consisted in the foundation of vocational schools. One for girls, now situated at Winchmore Hill, was founded in 1851, and two others for boys soon afterwards. The best known vocational school, the Heritage School at Chailey, was only founded in 1903. Special elementary education for invalid and crippled children owes its origin to the late Mrs. Humphrey Ward, who started a day school in London in 1898. This was followed by the passing of an Act of Parliament authorizing Education Authorities to maintain such schools, and a rapid extension of special elementary education of cripples able to get to school has taken place, first in London and afterwards in certain other large cities.

In Scotland the general principles for dealing with cripples follow in the main those of England. The same is true of Ireland where the efforts, though sporadic, are becoming co-ordinated.

France.—In France, tuberculosis of bones and joints is the dominating crippling disease in children and for such patients special hospitals have been available for many years.

In 1919 the segregation and treatment of necessitous individuals suffering from tuberculosis became compulsory. Treatment in French special hospitals is financed from local taxation with additional contributions from the state taxes on racing and gambling. About 8,000 beds are available, either on the sea coast or in high altitudes. Of the marine centres Berck-sur-Mer, on the English Channel, is the most important; here, some 6,000 patients are usually under treatment in various hospitals, clinics or hotels. The large Maritime Hospital at Berck, controlled by the city of Paris and the Department of the Seine, is world famous. Similar centres with less accommodation exist on the Mediterranean coast near Toulon and on the North Sea at Zuydcoote. The mountain hospitals are smaller and are situated in the Pyrenees and Maritime Alps.

In the treatment of non-tuberculous cripples voluntary organizations are still called upon to bear the chief responsibility, but they tend to work more and more under a certain amount of State control, and thus a nucleus of a complete national scheme is foreshadowed. The colony of St. Fargeau in the suburbs of Paris, founded in 1919, deals entirely with children suffering from infantile paralysis. There is adequate provision for the purely surgical treatment of the cripple in the hospitals of the University centres and larger towns.

Italy.—Italy possesses a number of orthopaedic hospitals which are second to none in equipment and efficiency. The most notable are the Istituto Ortopedico Rizzoli, in Bologna, and the Istituto dei Rachitici at Milan. These hospitals and others of a similar type originated many years ago as special schools for the treatment of rickety children. The first school was established at Florence in 1839, followed by similar institutions in Turin, Genoa, Mantua, Cremona, Verona, Venice, Padua, and elsewhere. A striking feature of these special hospitals is the workshop installation in which the Italian reputation for skilled engineering is well exemplified. Special maritime hospitals for the treatment of surgical tuberculosis were founded as long ago as 1853, the most important being at Viareggio, Rimini, Spontorno, Ligure and Palermo. In the newly acquired Trieste region there is now a large hospital of 500 beds, organized by the Italian Red Cross, part of which is devoted to orthopaedic surgery.

The most recent addition (1923) to the special hospital group is the Codivilla Institute for surgical tuberculosis at Cortina, in the Dolomites, which is affiliated to the Rizzoli Instituto at Bologna.

Germany.—The German Association for the Care of Cripples has as its main object the professional training of cripples and their general care and education. Throughout Germany the welfare of cripples is the responsibility of the State and they have by law the right of being educated, instructed and trained for a profession. The law also compels all cripples whose cases cannot be improved by treatment, to enter special institutions where their education and training are dealt with, and when they are trained for a trade or profession the Board of Professional Training is obliged to find suitable work for them. Where parents are not able to meet the cost of treatment, this is paid by Local Care Authorities who are also obliged to hold public lectures on crippledom, its prevention and treatment. There is a Central Institute, the Oscar Helene Heim, at Berlin, for the exploration and continued work for the care of cripples in Prussia and the German Republic. In addition to this, there are 78 Cripple Homes in Germany, of which ten are supported by the State; the others, although recognized by the Authorities, are organized by an independent Association of Cripple Workers under the name of "Selbsthilfebund der Korperbehinderten." Training centres at which instruction in different trades and professions for boys and girls is given, are run in connection with these Homes.

Since 1920, according to the law for the protection of physical defectives, a proportion of physically handicapped workers, at least 50% disabled, has to be employed in certain trades and professions.

Austria.—There is at present no central organization in Austria with the prevention of crippledom and the cause and cure of cripples as its aim. It was hoped that by the end of 1928 such an organization would be founded under the name of the "Austrian Central Council for the Care of Cripples." At the present time the only assistance offered to the cripple by the State is through the Poor Law System.

The city of Vienna has an orthopaedic hospital and an Institute for Cripple Welfare and in the province of Steiermark there is an Institution for Cripples where training is given and employment provided. In 1927 a progressive step was taken by the opening of a School for physically defective children which is run much on the same lines as the schools for physically defective children in England. There is no facility for transport from homes to school although free tickets on trams are provided for each child and attendant.

In 1927 a Society ("First Austrian Society for Work for Cripples") was founded by Herr Braun who is himself a cripple, in Vienna. The aims of the Society are:—

(a) To foster in cripples themselves the desire to escape from pauperism and become self-supporting and useful members of society;

(b) To bring before the country the present position and need of its cripples.

With a view to furthering this work, a census was taken of all cripples in the country and the Austrian Government approached with the idea that:—

(1) Education be made obligatory for crippled children.

(2) In each province of Austria a Committee be appointed consisting of a special medical authority for health for cripples, an education authority and a member of Herr Braun's Association.

(3) Adequate national cripple schools, homes and training homes be erected to provide for the care, training and employment of cripples.

(4) Orthopaedic surgery be included in the ordinary medical examinations.

The society has, since its inauguration, opened workshops for training in various crafts and trades from its headquarters in Vienna and has opened several independent branches.

The city of Vienna, in recognition of the service done for its crippled citizens, gave both the accommodation for the workshops in Vienna and a small subsidy. Other support is raised from subscribers and to a large extent from members of the Association.

Denmark.—Denmark was one of the first countries to realize its responsibility towards its cripples and to see the necessity of combining their treatment with an education and training which enabled them to become useful and self-supporting members of the community. The "Samfundet" founded in 1871 as a central bureau for the assistance of crippled and invalid workers, formed the nucleus of the present central association "Samfundet og Hjemmel" (Association and home for the Help and Protection of the Crippled) in Copenhagen. The administration of the association is carried out by an executive committee which acts in an advisory capacity on all matters concerning the welfare of cripples and which is at the same time responsible for the running of the central Association and all its departments. The "Samfundet" comprises an orthopaedic hospital with all its appliances, a special department for remedial treatment, massage, etc., an out-patient clinic for the examination of patients, the treatment of the less serious cases, the fitting and adjusting of instruments and plaster bandages, and supervision of patients discharged from the wards. In addition a residential school for crippled children, and an industrial home for the vocational training of older cripples of both sexes, are run in connection with the institution. The instructors at the training centre are themselves physically handicapped, and the trainers are, as far as possible, employed by the association when sufficiently proficient in their trade. During their training the students are kept under strict supervision and undergo necessary treatment at the same time.

A convalescent home at Boinely, on the coast, is annexed to the central institute, and accepts patients for the completion of their treatment after leaving hospital and also students from the industrial school who are in need of rest. In most cases the cost of maintenance is borne by the State.

The administrative committee gives its services entirely voluntarily and the institute itself, although partly supported by Government grants, is dependent on the payment of patients, and voluntary donations.

Holland.—In Holland, so far, the State has made no laws to regulate treatment of cripples and gives no financial assistance to the voluntary bodies. Moreover, neither public opinion nor private charity has yet risen to the needs of the country. The Institutes for Cripples are the Johanna Institute with 37 beds; the Adrian Institute, with complete hospital, dispensary, 17 beds, and much land; the Wilhemina Hospital in Amsterdam with an orthopaedic department and 16 beds; and the University of Leyden with a similar Department and three beds. There are in addition five orthopaedic dispensaries.

Norway.—Few, if any, countries have developed their organization for the care of cripples more thoroughly than Norway. There is a central board for cripples established by law under the Minister of Social Affairs, to organize the care of cripples in co-operation with voluntary bodies. One of the first acts of the board was to recommend the various communities throughout the country to elect municipal cripples committees, with the object of securing unity of administration. Practically every community has adopted this recommendation. A register of cripples was soon started and this was followed in 1920 by a general census of cripples taken by the central board. Thus, Norway is exceptionally well provided with the data of the cripple problem. The central board does not maintain institutions of its own, but acts as a central advisory body and publishes pamphlets of interest to cripple committees.

The headquarters of orthopaedic work in Norway is the Central Institute for Cripples in Oslo, itself the outcome of the Handicraft School for Cripples, started in 1892. The institute is designed for 300 cripples and is to include every provision that a first-rate orthopaedic unit involves—hospital, workshops, clinic, show-rooms for work made at the Institute, accommodation for men, women, boys and girls respectively.

An interesting feature is the establishment of more than 1,500 Cripples Unions by the cripples themselves. The originator of the movement was a cripple who now edits a paper "Solglimt" (Sunbeam) devoted to the cause of cripples, which has over 4,000 subscribers. All the work now being done in Norway is voluntary. A "Cripples Law" which would give statutory sanction to a comprehensive national scheme, is under consideration.

Sweden.—There are no laws in Sweden regulating the orthopaedic treatment, industrial training, and social care of cripples. But there are four voluntary associations devoted to their assistance, of which those at Stockholm, Gothenburg and Helsingburg, have established recognized institutions aided by the State. These associations are connected by means of the Central Committee for the care of cripples, which aims at the organization of cripple treatment all over the country. The three institutions have clinics, dispensaries, industrial schools, homes for pupils, evening schools, and in addition a residential school and educational home for badly crippled children. They depend in part, on patients' payments. Those who cannot pay for treatment are helped by the Poor Law. In the 10 years 1915–1925, over 23,000 patients passed through the dispensary and clinic departments, while in 1923 the number of operations was over 4,000. In addition orthopaedic clinics and departments are attached to some of the general hospitals, as for instance, those at Malmo and Lund. The St. Gorens Hospital, Stockholm, has a department for tuberculosis of the bones and joints. There are also certain seaside hospitals for children suffering from non-pulmonary tuberculosis. In 1920 a Royal Commission issued a report urging considerable extension of the present activities, but the necessary financial aid has not yet been granted by the Swedish Government.

UNITED STATES

The public concern which has developed since 1919, aroused by the number of cripples in the United States, and the interest displayed in their welfare are evidences of that broader humanitarianism that characterizes the modern attitude to all defectives. From 1863, when the hospital for the ruptured and crippled was opened in New York city during the Civil War, until 1914, interest in cripples was confined to limited circles, and their care was largely institutional. The White House social workers' conference on dependent children, summoned by President Roosevelt in 1909, first awakened the interest of the public in these unfortunates. This interest became intensified by the sufferings of the crippled victims of the infantile paralysis epidemics in Vermont and New York during the period 1914 to 1916, when in New York city alone 6,574 surviving children required clinical treatment. After the care lavished on disabled soldiers during the World War, the conviction became general that these other cripples should be aided and encouraged also.

Causes and Prevention.—Two of the main causes of crippling are diseases affecting children and industrial accidents. Accidents on streets and highways and in the home also cause much disablement. In 1916 a survey of cripples in New York city disclosed

35,928, 63% becoming crippled before the age of 16. About 8,000 were under 5 and approximately 10,000 between 5 and 15. Of these, 7,000 cases were remediable or correctible and 6,300 cases of rickets might have been benefited by medical and surgical attention. A survey in New York State, 1924–25, showed 30,000 crippled children. In North America, according to an estimate made in 1927, there are 500,000 cripples under 21. Of crippling conditions among children infantile paralysis accounts for 27·26%; bone and joint tuberculosis, 23·65%; congenital deformities, 13·15%; rachitic deformities, 8·05%; traumatic conditions, 4·20%; osteomyelitis, 3·67%; and other conditions, 20·20%. Add to the 58·96% of cripples whose condition is caused by infantile paralysis, bone tuberculosis and rickets the 13·15% of those congenitally deformed, and it is apparent that 72·11% are young children, fully 50% being of pre-school age who, treated soon enough, might be cured or relieved (*see* BLOODLESS SURGERY). Between 12,000 and 15,000 are crippled by infantile paralysis in non-epidemic and probably 40,000 in epidemic years. Legislation indicates the preventive trend. Massachusetts as early as 1905 made a State survey. California, Illinois, Michigan, Ohio, West Virginia and Wisconsin require the enumeration of cripples. Minnesota (1897), New York (1899), Pennsylvania, Nebraska (1905), Massachusetts (1907), New Jersey, Michigan, Montana and Vermont (1913), Iowa (1915), Oregon and Virginia (1917), Kansas and Texas (1920), Indiana (1921), North Carolina (1922), North Dakota and Oklahoma (1923) and California and Missouri (1927) provide orthopaedic treatment in State institutions or elsewhere at public expense.

The hearings before the Congress committee concerned with the bill to promote rehabilitation of persons disabled while following their vocations, in Dec. 1918, brought out the fact that at least 800,000 men in general employment are incapacitated each year for a period of more than four weeks and require physical restoration. The average age of disability is 33. An estimate made in 1927 and based on accident statistics and rehabilitation programmes asserts that 50,000 persons each year are in need of vocational rehabilitation.

Education.—Among the earliest private schools for cripples founded in any country, and the first in the United States, was that conceived in 1861 and established in 1863 in New York city by Miss Cornelia and Dr. James Knight. In 1890 the New York city Children's Aid Society opened the Rhinelander Industrial school for crippled children. Boston followed in 1893 with the well-known Industrial school for crippled and deformed children based on the Milan (Italy) plan; Chicago came next, in 1897, the city assuming the responsibility within two years; and Cleveland in 1900, when the first kindergarten was opened. Excluding the work done at the Minnesota State hospital and home for crippled children, established in 1897, the first institution started entirely by public initiative, the first public school was that planned in 1899 in Chicago and opened in 1900. The board of education little thought that it was taking an advanced step and setting an example. New York city in 1906 took over under its public school system the payment of the teachers and furnished schoolroom equipment for two of the private schools. It also started classes for crippled children, the first at Public school 104, after investigating classwork under the Association for the Aid of Crippled Children, the latter maintaining the buses for transportation up to 1913, when the board of education undertook this responsibility. Among private schools for cripples the Widener Memorial school, built at a cost of $1,132,000 and opened in 1906, for children between 9 and 10 years who remain until between 18 and 20, is noteworthy. It is lavishly and beautifully planned on the cottage system, with a summer home facing the sea at Longport, New Jersey. It is maintained with the income from a $4,000,000 trust fund created by P. A. B. Widener and the expenditure per head is $1,115.

In 1914 there were 2,862 crippled pupils in public and private schools, 988 of whom attended the 51 public school classes in Chicago, New York, Cleveland and Detroit. Fifteen States have now passed laws making the education of crippled children in special schools or classes, or by home teaching for those confined to the home, a public responsibility. According to the survey of the International Society for Crippled Children made in 1923–24 there were 6,225 crippled pupils in 82 special schools. Bus transportation at public expense is in general practice, the boards of education maintaining vehicle, attendant and chauffeur to convey the children to school, to clinic, to hospital or to places of special information or recreation, as required. Crippled children in most rural areas, however, lack facilities afforded those in urban districts unless they leave home for a State institution. Forty out of 88 counties in Ohio do provide home teaching for cripples. Kentucky has a permanent commission which insures education and physical correction in rural territories as well as in large cities. With the State superintendent of public instruction it is responsible for the registration of crippled children; the conduct of public diagnostic clinics; in co-operation with the school authorities and probate courts, for treatment in properly equipped hospitals of the State; education of crippled children during convalescence; payment of costs of care and education of poor patients and pupils; and the proper "follow-up" supervision of cases after discharge. Provision was made for education at about 150 private hospitals, convalescent institutions and homes for crippled children in 1924, which school work is supervised and supported by the educational authorities.

The education of cripples is threefold: the usual curriculum general in most schools; physical exercises and corrective and curative treatment including heliotherapy, special diets and rest cures; and prevocational and vocational training suited to the particular handicap, teaching loom-work, garment, fancy flower and favour making, sheet-metal work and decorative designing. Its "excess cost" averages about $200 per year where the pupil is not boarded. Properly equipped and trained teachers are somewhat lacking. It was advocated in 1928 that training centres for teachers and nurses for crippled children as well as for field workers of both young and adult be established in the various States. The Michigan State Normal college at Ypsilanti, the University of Michigan at Ann Arbor, and Hunter college, New York city, alone make provision, though similar courses were contemplated (1928) at the Ohio State university and in Marion, Ill., in co-operation with the Southern Illinois State teachers college.

Training and Welfare.—Cripples are treated at special hospitals owned and maintained at public expense in connection with State university hospitals; public institutions entirely owned and operated by the State; private institutions receiving various types of State aid; and private institutions for which fraternal or social organizations are responsible. Shriners, Rotarians, Kiwanians, Lions, Elks, the Women's Federation of Clubs, the Parent-Teachers' Association and others all make provision for surgical treatment, hospital care and braces and appliances for cripples. The Ancient and Accepted Order of the Mystic Shrine, for example, has ten hospitals costing from $304,000 to $661,000, and five "mobile units" which reach many crippled children in California, Illinois, Kentucky, South Carolina, Louisiana, Massachusetts, Minnesota, Missouri, Oregon, Pennsylvania, Hawaii, Utah and adjacent territory; the Scottish Rite maintains a hospital in Georgia; and there are Masonic hospitals in Texas, Kentucky and Pennsylvania.

Following the establishment of the Hospital for the ruptured and crippled in New York city referred to, the New York Orthopedic hospital was founded in 1866. Both provided medical attention only. The first home for cripples was the Home of the Merciful Saviour (1884) and the House of St. Michael and All Angels for young coloured cripples (1887) both in Philadelphia, with a summer home at Avon, New Jersey. Two were started next in New Jersey in 1892 and 1893, ten others established before 1900, and 20 between 1902 and 1912. Twenty-seven additional ones cared for a few crippled persons as subsidiary to their main work. Apart from support and training in institutions and a private school for adult men between 16 and 35 opened in New York city in 1912 by Dr. Charles Jaeger in which is taught the making of reed articles, metal work, mechanical drawing, engraving and woodwork, little had been done before 1917 for the rehabilitation of adult cripples. In that year Minnesota began a study into their condition and Wisconsin in 1918 started some placement work. It was the interest of Jeremiah Millbank in them that led to the establishment in January 1918, of what is now the Institute for the Crippled and Disabled, New York city, the work of which indirectly laid the foundation for the vocational rehabilitation of the disabled in the United States.

At first, the institute confined its attention to men but now also includes women. Its experience shows that complete rehabilitation means physical restoration, training for a suitable job, maintenance during training, assistance in obtaining proper artificial aids and appliances and placement through a bureau skilled in finding work for disabled persons. The first is outside its province; in all else its record has won national commendation. Cripples are taught printing, mechanical and architectural drawing, motion picture projection, typewriter repair and jewellery making, optical mechanical work, surface grinding and edge grinding of lenses and oxy-acetylene welding. Artificial appliances are made on the premises with special devices to enable the person to do a particular line of work, as, for instance, a kind of hook by which a one-handed man can drive a five-ton truck and a typing finger for a girl born without fingers. For its placement bureau, a survey was made of 2,000 businesses in New York city. Its "sheltered workroom" gives employment to otherwise unemployable cripples previously considered home-bound and another service takes work on a piece-basis to those confined to their homes. Cleveland and Chicago also have such institutions.

The Federal Government's programme for the vocational rehabilitation of disabled persons was inaugurated on June 2, 1920, following the principle that workmen's compensation alone is inadequate. The original bills introduced in September 1918, by Senator Smith and Representative Bankhead failed to pass the 65th Congress but became law the following session when reintroduced by Senator Kenyon and Representative Fess. Six States had established such a rehabilitation service before the passage of the national act—Massachusetts 1918; New Jersey, Minnesota, Pennsylvania and California, 1919; and New York, 1920. Provisions of the Kenyon-Fess bill were made operative for four years but a 1924 amendment extended the period to June 30, 1930.

In 1928, 41 States had enacted laws accepting the provisions of this Federal act and providing for the promotion under State and Federal auspices of programmes of vocational rehabilitation. Federal aid offered to each State accepting the act is on the basis of dollar for dollar annually in the amount of $1,000,000 for all of the States, each receiving a share on the basis of the proportion of its population to that of the entire country, with the provision that no State shall receive less than $5,000 annually. But in practice the States have expended more money; $3,335,713 for the period 1921–26 as against $2,586,918 from federal funds; 24,034 persons were rehabilitated. The number of women is generally small. In 1926, it was 13% but four times as many men as women become disabled. The cost of rehabilitation per case has decreased from $393 in 1922 to $233 (the cost of maintaining a person unable to work for a living in a poor house or institution is from $300 to $500).

As implied by the title of the act rehabilitation is vocational not physical. Case work methods are used. Maintenance during training is a difficulty when compensation money is lacking or inadequate. Therapeutic treatment, too, must come through other agencies, for this rehabilitation service is held to be "primarily economic and only secondarily social and humanitarian." Another problem in rural areas is lack of employment for the crippled. To achieve complete rehabilitation the State service maintains co-operative relations with all agencies in a position to meet phases of the problem other than the vocational.

CRISA or **CRISSA,** an ancient city of Greece, is in Phocis, on one of the spurs of Parnassus. In the *Iliad* and the Homeric *Hymns,* it is described as powerful, with rich fertile territory, reaching from the sea to the sanctuary of Pytho. As the town of Delphi grew up around Pytho, and the seaport of Cirrha arose on the Crisean Gulf, Crisa lost importance. By the ancients the name of Cirrha was often substituted for that of Crisa. From its position Cirrha commanded the approach to Delphi, and became obnoxious to Greeks from the heavy tolls exacted from pilgrims. The Amphictyonic Council declared the first "Sacred War" against it in 595 B.C., razed the town to the ground, and consecrated its territory to the temple at Delphi, selling the plunder to defray the expenses of the Pythian games. In 339 B.C. the people of Amphissa began to rebuild the town and to cultivate the plain. This act brought on the second "Sacred War," entrusted by the Amphictyons to Philip of Macedon, who took Amphissa (mod. Salona) in the following year. The ruins of Crisa are at the mouth of the Pleistus ravine; its name is probably preserved by the modern village of Chryso.

See J. G. Frazer, *Pausanias,* v. 459 (note on x. 375).

CRISFIELD, a town of Somerset county, Maryland, U.S.A., on Tangier sound of Chesapeake bay, opposite the mouth of the Potomac river; the terminus of a line of the Pennsylvania railway. The population in 1920 was 4,116 (28% Negroes), and was 3,908 in 1940 by the federal census. Crisfield is the centre of the crab industry of the bay, and it has oyster-packing and shipbuilding plants. The town was settled about 1866 and incorporated in 1872.

CRISPI, FRANCESCO (1819–1901), Italian statesman, was born at Ribera in Sicily on Oct. 4, 1819. In 1846 he established himself as advocate at Naples. On the outbreak of the Sicilian revolution at Palermo (Jan. 12, 1848) he hastened to the island and took an active part in guiding the insurrection. Upon the restoration of the Bourbon government (May 15, 1849) he was excluded from the amnesty and compelled to flee to Piedmont. Here he eked out a penurious existence by journalism. Implicated in the Mazzinian conspiracy at Milan (Feb. 6, 1853) he was expelled from Piedmont, took refuge at Malta, whence he fled to Paris. Expelled from France, he joined Mazzini in London and continued to conspire for the redemption of Italy. On June 15, 1859, he returned to Italy after publishing a letter repudiating the aggrandizement of Piedmont, and proclaiming himself a republican and a partisan of national unity. Twice in that year he went the round of the Sicilian cities in disguise, and prepared the insurrectionary movement of 1860.

Upon his return to Genoa, he organized, with Bertani, Bixio, Medici and Garibaldi, the expedition of the Thousand, and overcoming by a stratagem the hesitation of Garibaldi, secured the departure of the expedition on May 5, 1860. After the fall of Palermo, Crispi was appointed minister of the interior and of finance in the Sicilian provisional government, but he resigned soon after. Entering parliament in 1861 as deputy of the extreme Left for Castelvetrano Crispi acquired the reputation of being the most aggressive and most impetuous member of the republican party, but in 1864 he made at the chamber a monarchical profession of faith in the famous phrase afterwards repeated in his letter to Mazzini. "The monarchy unites us, the republic would divide us." On the outbreak of the Franco-German War he sought to impede the projected alliance with France, and to drive the Lanza cabinet to Rome. The death of Ratazzi in 1873 induced Crispi's friends to put forward his candidature to the leadership of the Left; but Crispi, anxious to reassure the crown, secured the election of Depretis. After the advent of the Left he was elected (Nov. 1876) president of the chamber.

In Dec. 1877 he replaced Nicotera as minister of the interior in the Depretis cabinet, his short term of office (70 days) being signalized by a series of important events. On Jan. 9, 1878, the death of Victor Emmanuel and the accession of King Humbert enabled Crispi to secure the formal establishment of a unitary monarchy, the new monarch taking the title of Humbert I. of Italy instead of Humbert IV. of Savoy. On Feb. 9, 1879, the death of Pius IX. necessitated a conclave, the first to be held after the unification of Italy. Crispi helped by Mancini and Cardinal Pecci (afterwards Leo XIII.) persuaded the Sacred College to hold the conclave in Rome. Unfortunately a storm of indignation was conjured up by Crispi's opponents in connection with a charge of bigamy not susceptible of legal proof and he was compelled to resign office. For nine years Crispi remained politically under a cloud, but in 1887 returned to office as minister of the interior in the Depretis cabinet, succeeding to the premiership upon the death of Depretis (July 29, 1887).

Basing his foreign policy upon the Triple Alliance as supplemented by the naval *entente* with Great Britain, Crispi assumed a resolute attitude towards France, breaking off the prolonged and unfruitful negotiations for a new Franco-Italian commercial treaty. At home he secured the adoption of the Sanitary and Commercial Codes and reformed the administration of justice. Forsaken by his Radical friends, Crispi governed with the help of the Right until on Jan. 31, 1891, an intemperate allusion to the *sante memorie* of the conservative party led to his overthrow. In Dec. 1893 the impotence of the Giolitti cabinet to restore public order, then menaced by disturbances in Sicily and in Lunigana led to a general demand that Crispi should return to power. Crispi's uncompromising suppression of disorder, and his refusal to abandon either the Triple Alliance or the Eritrean colony, or to forsake his colleague Sonnino, minister of finance, caused a breach between him and the radical leader Cavallotti, who then began against him a pitiless campaign of defamation. An unsuccessful attempt upon Crispi's life by the anarchist Lega brought a momentary truce, but Cavallotti's attacks were soon renewed more fiercely than ever. The general election of 1895 gave Crispi a huge majority, but a year later, the defeat of the Italian army at Adowa in Abyssinia brought about his resignation. The ensuing Rudini cabinet lent itself to Cavallotti's campaign and at the end of 1897 the judicial authorities applied to the chamber for permission to prosecute Crispi for embezzlement. A parliamentary commission, appointed to inquire into the charges against him, discovered only that Crispi, on assuming office in 1893, had found the secret service coffers empty, and had borrowed from a state bank the sum of £12,000 for secret service, repaying it with the monthly instalments granted in regular course by the treasury. The commission, considering this proceeding irregular, proposed, and the chamber adopted, a vote of censure, but refused to authorize a prosecution. Crispi resigned his seat in parliament, but was re-elected by an overwhelming majority in April 1898 by his Palermo constituents. Soon afterwards, however, his health began to fail and he died at Naples on Aug. 12, 1901.

In regard to foreign politics Crispi did much to raise Italian prestige and to dispel the reputation for untrustworthiness and vacillation acquired by many of his predecessors. If in regard to France his policy appeared to lack suavity and circumspection, it must be remembered that the French republic was then engaged in active anti-Italian schemes and was working, both at the Vatican and in the sphere of colonial politics, to create a situation that should compel Italy to bow to French exigencies and to abandon the Triple Alliance.

Salvemini, *La Politica estera di Francesco Crispi* (1919).

CRISPIN and **CRISPINIAN,** the patron saints of shoemakers, whose feast falls on Oct. 25, have a legendary history, traceable to the 8th century. It is said that they were brothers, of a noble Roman family and that they travelled to Soissons, where they supported themselves by shoemaking and made many converts. The emperor Maximianus (Herculius) condemned them to death but they escaped from the ordeals imposed by his prefect Rictiovarus. At last Maximian had their heads cut off (*c.* 286). Their remains were buried at Soissons, but were afterwards removed, partly by Charlemagne to Osnabrück and partly to the chapel of St. Lawrence in Rome. There are also relics at Fulda, and a Kentish tradition claims that their bodies were cast into the sea and floated ashore at Romney Marsh (see *Acta SS.* Bolland, xi. 495; A. Butler, *Lives of the Saints,* Oct. 25).

In France, especially, the festival of St. Crispin was for centuries the occasion of solemn processions and merry-making, in which gilds of shoemakers took the chief part. In England the day acquired additional importance as the anniversary of Agincourt (*cf.* Shakespeare, *Henry V.* iv. 3).

CRISTÓBAL, Panamá Canal Zone, the American port adjoining the city of Colón, at the northern terminus of the canal. (*See* PANAMÁ CANAL and COLÓN.)

CRITIAS, Athenian orator and politician. In his youth he was a pupil of Gorgias and Socrates. In 415 B.C. he was implicated in the mutilation of the Hermae (*q.v.*) and imprisoned. In 411 he helped to put down the Four Hundred, and was instrumental in procuring the recall of Alcibiades. He was banished (probably in the democratic reaction of 407) and fled to Thessaly, where he stirred up the *Penestai* (the helots of Thessaly) against their masters, and endeavoured to establish a democracy. Returning to Athens he became one of the Thirty Tyrants who in 404 were appointed by the Lacedaemonians. He was killed in battle against Thrasybulus and the returning democrats. Critias was a man of varied talents—poet, orator, historian and philosopher. Some fragments of his elegies will be found in Bergk, *Poeta Lyrici Graeci.*

BIBLIOGRAPHY.—*See* Xenophon, *Hellenica,* ii. 3. 4. 19 (a biased narrative) *Memorabilia,* I. 2; Cornelius Nepos, *Thrasybulus,* 2; R. Lallier, *De Critiae tyranni vita ac scriptis* (1875); Nestle, *Neue Jahrb. f. d. kl. Attert.* (1903).

CRITICAL POINT, in physics, the point above or below which certain physical changes will not occur. In the study of *change of state* (*see* HEAT and THERMODYNAMICS) the properties of the substance at this point are called its *critical constants.* In mechanics, the smallest angle which an inclined plane must make with the horizontal in order that a body resting on it should slide is called the *critical angle.* (*See* FRICTION.) In an oscillating system the *critical damping* is the minimum amount of damping that will cause the value of its potential energy to fall to zero without further oscillation. (*See* VISCOSITY; CONDENSER [ELECTRICAL] and INSTRUMENTS, ELECTRICAL.) There are numerous other instances of this application of the word critical in the sense of "limiting."

CRITICISM, the art of judging the qualities and values of an aesthetic object, whether in literature or the fine arts. It involves the formation and expression of a judgment on the qualities of anything, and Matthew Arnold defined it in this general sense as "a disinterested endeavour to learn and propagate the best that is known and thought in the world."

It may be laid down as the definition of criticism in its pure sense, that it should consist in the application, in the most competent form, of the principles of literary composition. Those principles are the general aesthetics upon which taste is founded; they take the character of rules of writing. From the days of Aristotle the existence of such rules has not been doubted, but different orders of mind in various ages have given them diverse application, and upon this diversity the fluctuations of taste are founded. Over-legislation has been the bane of official criticism, and originality, especially in works of creative imagination, has been condemned because it did not conform to existing rules. Such instances of want of contemporary appreciation as the reception given to William Blake or Keats, or even Milton, are quoted to prove the futility of criticism. As a matter of fact they do nothing of the kind. They merely prove the immutable principles which underlie all judgment of artistic products to have been misunderstood or imperfectly obeyed during the life-time of those illustrious men. False critics have built domes of glass, as Voltaire put it, between the heavens and themselves, domes which genius has to shatter in pieces before it can make itself comprehended. In critical application formulas are often useful, but they should be held lightly; when the formula becomes the tyrant where it should be the servant of thought, fatal error is imminent. What is required above all else, by a critic is knowledge, tempered with good sense, and combined with breadth of sympathy and an exquisite delicacy of taste.

To pass to an historical examination of the subject, we find that in antiquity Aristotle was regarded as the father, and almost as the founder, of literary criticism. Yet before his day, three Greek writers of eminence had examined, in more or less fullness, the principles of composition; these were Plato, Isocrates and Aristophanes. The comedy of *The Frogs*, by the latter, is the earliest specimen we possess of hostile literary criticism, being devoted to ridicule of the plays of Euripides. In the cases of Plato and Isocrates, criticism takes the form mainly of an examination of the rules of rhetoric. We reach, however, much firmer ground when we arrive at Aristotle, whose *Poetics* and *Rhetoric* are among the most valuable treatises which antiquity has handed down to us. Of what existed in the literature of his age, extremely rich in some branches, entirely empty in others, Aristotle speaks with extraordinary authority; but Mr. G. Saintsbury has justly remarked that as his criticism of poetry was injuriously affected by the non-existence of the novelist, so his criticism of prose was injuriously affected by the omnipresence of the orator. This continues true of all ancient criticism. A work by Aristotle on the problems raised by a study of Homer is lost, and there may have been others of a similar nature; in the two famous treatises which remain we have nothing less important than the foundation on which all subsequent European criticism has been raised. It does not appear that any of the numerous disciples of Aristotle understood his attitude to literature, nor do the later philosophical schools offer much of interest. The Neoplatonists, however, were occupied with analysis of the Beautiful, on which both Proclus and Plotinus expatiated; still more purely literary were some of the treatises of Porphyry. There seems to be no doubt that Alexandria possessed, in the 3rd century, a vivid school of critic-grammarians; the names of Zenodotus, of Crates and Aristarchus were eminent in this connection, but of their writings nothing substantial has survived. They were followed by the scholiasts, and they by the mere rhetoricians of the last Greek schools, such as Hermogenes and Aphthonius. In the 2nd century of our era, Dio Chrysostom, Aristides of Smyrna, and Maximus of Tyre were the main representatives of criticism, and they were succeeded by Philostratus and Libanius. The most modern of post-Christian Greek critics, however, is unquestionably Dionysius of Halicarnassus, who leads up to Lucian and Cassius Longinus. The last-mentioned name calls for special notice; in "the lovely and magnificent personality of Longinus" we find the most intelligent judge of literature who wrote between Aristotle and the moderns. His book *On the Sublime* (Περὶ ὕψους), probably written about A.D. 260, and first printed in 1554, is of extreme importance, while his intuitions and the splendour of his style combine to lift Longinus to the highest rank among the critics of the world.

In Roman literature criticism never took a very prominent position. In early days the rhetorical works of Cicero and the famous *Art of Poetry* of Horace exhaust the category. During the later Augustan period the only literary critic of importance was the elder Seneca. Passing over the valuable allusions to the art of writing in the poets, especially in Juvenal and Martial, we reach, in the silver age, Quintilian, the most accomplished of all the Roman critics. His *Institutes of Oratory* has been described as the fullest and most intelligent application of criticism to literature which the Latin world produced, and one which places the name of Quintilian not far below those of Aristotle and Longinus. He was followed by Aulus Gellius, by Macrobius (whose reputation was great in the middle ages), by Servius (the great commentator on Virgil), and after a long interval, by Martianus Capella. Latin criticism sank into mere pedantry about rhetoric and grammar. This continued throughout the dark ages, until the 13th century, when rhythmical treatises, of which the *Labyrinthus* of Eberhard (1212?) and the *Ars rhythmica* of John of Garlandia (John Garland) are the most famous, came into fashion. These writings testified to a growing revival of a taste for poetry.

It is, however, in the masterly technical treatise *De vulgari eloquio,* generally attributed to Dante, first printed (in Italian) in 1529 that modern poetical criticism takes its first step. The example of this admirable book was not adequately followed; throughout the 14th and 15th centuries, criticism is mainly indirect and accidental. Boccaccio, indeed, is the only figure worthy of mention, between Dante and Erasmus. With the Renaissance came a blossoming of Humanist criticism in Italy, producing such excellent specimens as the *Sylvae* of Poliziano, the *Poetics* (1527) of Vida, and the *Poetica* of Trissino, the best of a whole crop of critical works produced, often by famous names, between 1525 and 1560. These were followed by sounder scholars and acuter theorists: by Scaliger with his epoch-making *Poeticus* (1561); by L. Castelvetro, whose *Poetica* (1570) started the modern cultivation of the unities and asserted the value of the epic; by Tasso with his *Discorsi* (1587); and by Francesco Patrizzi in his *Poetica* (1586).

In France, the earliest and for a long time the most important specimen of literary criticism was the *Défense et illustration de la langue française,* published in 1549 by Joachim du Bellay. Ronsard, also, wrote frequently and ably on the art of poetry. The theories of the Pléiade were summed up in the *Art poétique* of Vauquelin de la Fresnaye, which belongs to 1574 (though not printed until 1605).

In England, the earliest literary critic of importance was Thomas Wilson, whose *Art of Rhetoric* was printed in 1553, and the earliest student of poetry, George Gascoigne, whose *Instruction* appeared in 1575. Gascoigne is the first writer who deals intelligently with the subject of English prosody. He was followed by Thomas Drant, Harvey, Gosson, Lodge and Sidney, whose controversial pamphlets belong to the period between 1575 and 1580. Among Elizabethan "arts" or "defences" of English poetry are to be mentioned those of William Webbe (1586), George Puttenham (1589), Thomas Campion (1602), and Samuel Daniel (1603). With the tractates of Ben Jonson, several of them lost, the criticism of the Renaissance may be said to close.

A new era began throughout Europe when Malherbe started, about 1600, a taste for the neo-classic or anti-romantic school of poetry, taking up the line which had been foreshadowed by Castelvetro. *Enfin Malherbe vint,* and he was supported in his revolution by Regnier, Vaugelas, Balzac, and finally by Corneille himself, in his famous prefatory discourses. It was Boileau, however, who more than any other man stood out at the close of the 17th century as the law-giver of Parnassus. The rules of the neo-classics were drawn together and arranged in a system by René Rapin, whose authoritative treatises mainly appeared between 1668 and 1674. It is in writings of this man, and of the Jesuits, Le Bossu and Bouhours, that the preposterous rigidity of the formal classic criticism is most plainly seen. The influence of these three critics was, however, very great throughout Europe, and we trace it in the writings of Dryden, Addison and Rymer. In the course of the 18th century, when the neo-classic creed was universally accepted, Pope, Blair, Kames, Harris, Goldsmith and Samuel Johnson were its most distinguished exponents in England, while Voltaire, Buffon (to whom we owe the phrase "the style is the man"), Marmontel, La Harpe and Suard were the types of academic opinion in France.

Modern, or more properly romantic, criticism came in when the neo-classic tradition became bankrupt throughout Europe at the very close of the 18th century. It had been heralded in Germany by the writings of Lessing, and in France by those of Diderot. Of the reconstruction of critical opinion in the 19th century it is impossible to speak here with any fullness, it is contained in the record of the recent literature of each European language. It is noticeable, in England, that the predominant place in it was occupied, in violent contrast with Disraeli's dictum, by those who had obviously *not* failed in imaginative composition, by Wordsworth, by Shelley, by Keats, by

Landor, and pre-eminently by S. T. Coleridge, who was one of the most penetrative, original and imaginative critics who have ever lived. In France, the importance of Sainte-Beuve is not to be ignored or even qualified; after manifold changes of taste, he remains as much a master as he was a precursor. He was followed by Théophile Gautier, Saint-Marc, Girardin, Paul de Saint Victor, and a crowd of others, down to Taine and the school of individualistic critics, comparable with Matthew Arnold, Pater and their followers in England. Tolstoi's *What is Art?* was the most revolutionary and challenging book of criticism to appear in the last quarter of the 19th century. Critical writing has become so abundant in recent years that it would be possible to fill a library with the works of living critics alone. Philosophers like Benedetto Croce, and poets like Mr. Bridges have helped to swell the stream. Some of the happiest contributions have been made in England by Mr. G. Saintsbury, Mr. A. C. Bradley, Sir Edmund Gosse and Sir Arthur Quiller-Couch.

CRITIUS AND NESIOTES, Greek sculptors of the time of the Persian wars. When Xerxes carried away to Persia the statues of Harmodius and Aristogiton made by Antenor, Critius and Nesiotes were commissioned to replace them. By the help of coins and reliefs, two statues at Naples, wrongly restored as gladiators, have been identified as copies of the tyrannicides of Critius; and to them well apply the words in which Lucian (*Rhetor, praecepta,* 9) describes the works of Critius and Nesiotes, "closely knit and sinewy, and hard and severe in outline." Critius also made a statue of the armed runner Epicharinus.

See E. A. Gardner, *Handbook of Greek Sculpture,* pp. 206–211 (1915); H. Stuart Jones, *Ancient Writers on Greek Sculpture* (§65–67), (1895).

CRITOLAUS, Greek philosopher, was born at Phaselis in the 2nd century B.C. He lived to the age of 82 and died probably before 111 B.C. He studied philosophy under Aristo of Ceos and became one of the leaders of the Peripatetic school. In general he was an orthodox Peripatetic (*cf.* Cicero, *De Fin.* v. 5), though in some respects he went beyond his predecessors. For example, he held that pleasure is an evil (Gellius, *Noctes Atticae,* ix. 5. 6), and definitely maintained that the soul consists of aether. The end of existence was to him the general perfection of the natural life. Cicero says in the *Tusculans* that the goods of the soul entirely outweighed for him the other goods ("tantum propendere illam bonorum animi lancem"). Further, he defended against the Stoics the Peripatetic doctrine of the eternity of the world and the indestructibility of the human race. Of the life of Critolaus one incident alone is preserved. He was sent with Carneades and Diogenes to Rome in 156–155 B.C. to protest against the fine of 500 talents imposed on Athens (*Cic. Acad.* [ii] 45). The three ambassadors lectured on philosophy in Rome and Cato had them dismissed from the city.

CRITTENDEN, JOHN JORDAN (1787–1863), U.S. statesman, was born in Versailles (Ky.), on Sept. 10, 1787. After he had graduated from the College of William and Mary in 1807, he began the practice of law in his native State. He was attorney general of Illinois Territory, and, from 1811 to 1817, after he had returned to Kentucky, was a member of the Kentucky house of representatives, of which he was speaker 1815–16. From 1817 to 1819 he was a U.S. senator. Again in 1825 and 1829–32 he was in the Kentucky house of representatives, acting as speaker 1829-32. From 1827 to 1829 he was U.S. district attorney. He was removed by President Jackson, to whom he was radically opposed. In 1835, as a Whig, he was again elected to the U.S. Senate, and was re-elected in 1841, but resigned to enter the cabinet of President W. H. Harrison as attorney general, continuing after President Tyler's accession from March until September. He was again a member of the U.S. Senate from 1842 to 1848. In 1848–50 he was governor of Kentucky. He was an ardent and outspoken supporter of Clay's compromise measures, and in 1850 he entered President Fillmore's cabinet as attorney general, serving throughout the administration. From 1855 to 1861 he was once more a member of the U.S. Senate.

He was then one of the foremost champions of union in the South, and strenuously opposed the Kansas-Nebraska bill, which he said would unite the elements of opposition in the North and render the breach between the parts of the country irreparable. Nevertheless, he laboured unceasingly in the cause of compromise, gave his strong support to the Bell and Everett ticket in 1860, and in 1860–61 proposed and vainly contended for the adoption by Congress of the compromise measures which bear his name. When war became inevitable, he threw himself zealously into the Union cause, and lent his great influence to keep Kentucky in the Union. In 1861–63 he was a member of the Federal House of Representatives, where, while advocating the prosecution of the war, he opposed such radical measures as the division of Virginia, the enlistment of slaves and the Conscription acts. He died at Frankfort (Ky.), July 26, 1863.

See the *Life of J. J. Crittenden,* by his daughter Mrs. Chapman Coleman (Philadelphia, 1871); C. A. Keith, *The Life of John J. Crittenden of Kentucky* (University of Indiana, 1926); and Channing, *History,* VI., pp. 293–296.

His son, GEORGE BIBB CRITTENDEN (1812–1880), soldier, was born in Russellville (Ky.), on March 20, 1812, and as a captain of mounted rifles in the Mexican War was breveted major for bravery at Contreras and Churubusco. In June 1861, he entered the service of the Confederacy, was commissioned major-general and given a command in south-east Kentucky and Tennessee; but after the defeat of his forces by General George H. Thomas at Mill Springs (Jan. 9, 1862), he was censured and gave up his command. He then became a volunteer aide on the staff of General John S. Williams. From 1867 to 1871 he was State librarian of Kentucky. He died at Danville (Ky.), Nov. 27, 1880.

Another son, THOMAS LEONIDAS CRITTENDEN (1815–1893), soldier, was born at Russellville (Ky.). He studied law, and in 1842 became Commonwealth's attorney. He served in the Mexican War and from 1849 to 1853 was U.S. consul at Liverpool, England. Like his father, he was a strong Union man, and in Sept. 1861 he was commissioned by President Lincoln a brigadier-general of volunteers. He was promoted to the rank of major-general in July, 1862. He was in command of a corps in the Army of the Ohio, and took part in the battles of Stone river and Chickamauga, and participated in the Virginia campaign of 1864. In July 1866 he entered the Regular Army with the rank of colonel of infantry, received the brevet of brigadier-general in 1867, served on the frontier and in several Indian wars, and retired in 1881. He died on Oct. 23, 1893.

CRIVELLI, CARLO, Venetian painter, was born between 1430–1435. He died after 1493. Though born in Venice, Crivelli worked chiefly in the March of Ancona, and especially in and near Ascoli. He was probably an offspring of the Murano school and was influenced by Squarcione's academy at Padua. He signed as "Carolus Crivellus Venetus"; from 1490 he added "Miles," having been then knighted ("Cavaliere") by Ferdinand II. of Naples. Among his earliest works are the "Madonna" in the Verona museum and an altarpiece at the Municipio of Mazza Fermana (1468). The National Gallery in London has fine examples of Crivelli; in Berlin is a "Madonna and Saints" (1491); in the Vatican Gallery a "Dead Christ"; and the Brera of Milan contains several examples, among which is his masterpiece of later years, "The Coronation of the Virgin" (1493). Crivelli is a painter of marked individuality—hard in form, crudely definite in contour; stern, forced, energetic, yet well capable of a prim sort of prettiness; and sometimes admitting into his pictures objects actually raised in surface; distinct and warm in colour, with an effect at once harsh and harmonious. It is surmised that Carlo was of the same family as the painters Jacopo and Vittorio Crivelli. Pietro Alamanni was his pupil.

CROATIA-SLAVONIA, formerly part of Austria-Hungary, has since 1918 been a constituent element of the Serb, Croat and Slovene State. (*See* YUGOSLAVIA and BALKAN PENINSULA.)

HISTORY

Mediaeval History.—What has in modern times been known as Croatia-Slavonia formed part of the Roman province of Pannonia, the chief towns being Siscia (Sisek), Emona (Ljubljana) and Sirmium (Mitrovica in Syrmia). It was conquered by the Ostrogoths, recovered by Justinian in 535 and conquered in 568 by the Avars, who also seized most of the Dalmatian towns. The Croats (Chrobati, Hrvati), a Slav tribe closely related to the Serbs, overpowered the Avars in about 640, and held most of the modern Croatia-Slavonia, north-west Bosnia and Dalmatia, except the coast towns, where municipal freedom survived. The Croats and Slovenes were loosely organized under *Župani* or tribal chiefs, and late in the 8th century their western territory fell an easy prey to Charles the Great as he was organizing the marches of the empire. During a century of chaos, in which the Croats stood in changing relations to the Franks, Byzantium, Venice, Moravia, the short-lived Bulgar state in Pannonia and eventually its Magyar conquerors, the Croatian duchy slowly took definite shape, till in 924 Duke Tomislav assumed the royal title (Rex Chroatorum), allied himself with Byzantium and received from it the protectorate of the Dalmatian towns of Zadar, Trogir and Split (Zara, Traù, Spalato). He was recognized by the pope, and Split became the archiepiscopal see: from this early time dates the special Glagolitic Slav rite which still survives in certain Catholic churches along the coast. His fifth successor, Drzislav (969–997), received the coronation insignia from the emperor Basil II., in consideration for his help against the Bulgarians; but Krešimir III. (*c.* 1000–30) had to acknowledge Byzantine suzerainty. Stephen I. married a daughter of the Venetian doge Orseolo, and their son Peter Krešimir (1058–74) further strengthened Croatia's ties with the Roman see; and in 1076 Demetrius Zvonimir was crowned king at Split by the legate of Gregory VII., only after the episcopate in full synod and the future king had ratified the papal demands. Anarchy followed Zvonimir's death in 1089, and certain Croat nobles called in King Ladislas of Hungary, as a kinsman of the royal house. For two years his nephew Almos was king of Croatia, and in 1094 a new bishopric was founded in Zagreb, to which the centre of ecclesiastical gravity soon shifted. In 1097 the last Croat national king, Petrus, fell in battle, and in 1102 King Koloman of Hungary consolidated the work of his uncle Ladislas and was crowned king of Croatia and Dalmatia at Belgrad near Zadar, asserting the triple claims of conquest, inheritance and election.

Croatia and Hungary.—Henceforth Croatia forms for eight centuries an autonomous kingdom under the Holy Crown of St. Stephen. Its bans, or viceroys, were at first chosen sometimes among princes of the house of Árpád, but more and more among great feudal families, some of whom conducted a semi-independent policy in Bosnia and along the coast. It was as sovereigns of Croatia that the Hungarian kings became involved in repeated wars with Venice. On the extinction of the Hungarian national dynasty in 1301, the Croatians crowned the Angevin prince Charles Robert as their king at Zagreb, while Hungary elected first a Bohemian and then a Bavarian prince, only recognizing Charles Robert and reuniting the two Crowns in 1309. On the death of Louis the Great, Croatia turned against his daughter Mary and supported the candidature of her Neapolitan cousins, Charles and Ladislas of Durazzo, the latter being crowned at Zadar in 1403. Mary's husband, Sigismund, however, finally enforced his claim to both thrones, though in 1420 he had to ratify the cession of Dalmatia to Venice, to which Ladislas had rashly consented in 1409 as a means of financing his campaigns. On the fall of Bosnia before the Turks (1463) the Croat nobles played the chief part in organizing the banat of Jajce, as a barrier against further invasion. A minor cause of the fatal defeat of Mohács (*q.v.*) in 1526 was that King Louis gave battle without waiting for the Croat reinforcements under Ban Krsto Frankopan to arrive. While Hungary was disputed between the Habsburgs and John Zápolya, the Croatian estates, sitting at Cetin on Jan. 1, 1527, unanimously elected Ferdinand of Austria as their king, and confirmed the succession to him and his heirs (a step which Hungary only took in 1687). Most of the country between Save and Drave shared the fate of central Hungary and fell into Turkish hands. Zagreb, hitherto belonging to "Slavonia," became a border fortress and henceforth the Croatian capital and seat of the ban and the diet. But the constant danger of invasion is fatal to constitutional development, and the estates were summoned only to vote subsidies. Necessity dictated in 1578 the formation of special provinces known as the "military frontiers" (*q.v.*) (Vojna Krajina)—the Slavonian between Drave and Kulpa with Varaždin as its centre, the Croatian between the Kulpa and the sea, with Karlovac (Karlstadt), so named after Archduke Charles of Styria, who held the supreme command. Their reincorporation was repeatedly demanded by the Croatian estates but without effect, and they retained their identity till long after the expulsion of the Turks.

During the 16th and 17th centuries the Croat nobility, alarmed at the growth of the royal power, drew steadily closer to that of Hungary, and in 1625 the ban first took his seat in the Hungarian house of magnates. Count Nicholas Zrinski won great fame by his defence of Sziget against Sultan Suleiman in 1566, immortalized by his grandson of the same name (1620–64) in the first Hungarian epic written under Italian influence, while his brother Peter translated it into Croat. The latter, with his kinsman Krsto Frankopan and the Magyar magnates Nádasdy and Wesselényi, were in 1671 implicated in a plot against the Habsburgs and in defence of Hungarian and Croat local privileges, and executed at Wiener Neustadt. This event was momentous for Croatia, for the extinction of the Zrinski and Frankopan families and the confiscation of their vast estates definitely turned the scale in favour of the Crown in Croatia and brought foreign elements into the Croat nobility.

By the Treaty of Karlovci (Karlowitz) in 1699 all Croatia-Slavonia was recovered from the Turks; and henceforward Karlovci was to be the centre of the Serbian Orthodox Church, the patriarch of Peć, with thousands of Serbian refugees from Turkey, having settled in Slavonia and south Hungary under a special charter from Leopold I. in 1690. In 1712 the Croatian diet accepted the Pragmatic Sanction 12 years earlier than the Hungarian, declaring in default of male heirs for that Habsburg princess who should rule over Austria, Styria and Carniola; and their assertion that "neither force nor conquest united us to the Hungarians" was not challenged at the time. The name "Croatia" now came to be applied to the whole territory between Save and Drave. In 1767 Maria Theresa erected a special council in Zagreb, dealing direct with Vienna, but in 1779 Croatia was again subjected to the council of lieutenancy in Pest, and was regarded by the Magyars as *partes adnexae* of Hungary, though the Croats claimed the status of *regna socia.* In 1776 Fiume (*q.v.*) was united with Croatia, but in 1779 was declared an integral part of Hungary. In 1769, 1774 and 1776 Serbian national congresses were allowed to meet at Karlovci, and again in 1790 at Temesvár, when Serb privileges were confirmed by Leopold II. Croat national sentiment was stirred in the French revolutionary wars and received a strong impetus from Napoleon's creation of an "Illyrian" state. The east Adriatic territories which Austria had acquired from Venice in 1797 were ceded in 1806 to Napoleon's puppet kingdom of Italy, and after Wagram (1809) these, with Trieste, Istria, Carniola, parts of Croatia and the defunct republic of Ragusa, were united as "the Illyrian Provinces." Their viceroy, Marmont, had his headquarters at Ljubljana (Laibach) and Dubrovnik (Ragusa). The first Croat and Slovene newspapers appeared, schools were opened, roads and public institutions built. In 1813 the Austrians drove out the French, Dalmatia and Ragusa became a single Austrian province. In 1822 Croatia-Slavonia recovered her old boundaries and her connection with the Hungarian Crown was reaffirmed.

Rise of Croat Nationality.—The rise of Magyar national feeling and the linguistic legislation passed by the Hungarian diet from 1830 onwards adversely affected Magyar-Croat relations; and in the forties a strong "Illyrian" movement arose in Croatia under Ljudevit Gaj and Count Drašković, aiming at the eventual union of all Southern Slavs, preferably by Austria's help and in open defiance of Hungary's claims. The law of 1843, passed at the diet of Pressburg, making Magyar compulsory for official business and for education, had given Croatia a special respite for six years; but before the term expired there was an open breach, and in Oct. 1847 the Croatian diet introduced Croat, not Magyar, throughout its territory. The famous series of laws passed by Hungary in April 1848 rode roughshod over Croatia's special position and were firmly resisted by the Croats under Count Josef Jellačić, whom the Court appointed as ban in March and who, in close co-operation with the Serbs under Patriarch Rajačić of Karlovci, defied Hungary, pushed a series of national laws through the diet of Zagreb, and after an abortive attempt at compromise with the revolutionary Hungarian Government, led his troops across the Drave in September and marched against Budapest in the emperor's name. Owing to her racial and political differences with Hungary Croatia found herself identified with Habsburg reaction, and after the suppression of the Hungarian revolution in 1849 "received" (in the words of Pulszky) "as reward what Hungary received as punishment." When, in 1861, the Croatian diet was again allowed to meet it unanimously declined to send delegates to the new centralist *Reichsrat* in Vienna, and was speedily dissolved. In 1866 the Croats followed a federalist policy and claimed that the events of 1848 had dissolved the legal bond with Hungary. But in 1867 Hungary and the Crown concluded the *Ausgleich* over the heads of Austria and still more of Croatia, which was left to make what terms it could with Budapest. The nagoda (or compromise) of 1868 is in the form of a law ratified by the two parliaments of Budapest and Zagreb, though the texts differ on important points (notably Fiume, which was detached from Croatia and given an autonomous status under a governor appointed direct by Budapest). It was only passed at Zagreb as the result of very corrupt elections prepared by the ban, Baron Levin Rauch, on orders from Budapest. Under its provisions Croatia was represented by 40 delegates in the lower and three in the upper house at Budapest. The ban, as head of the Zagreb Government, was nominated by Budapest, yet responsible to the Croatian diet, and there were three autonomous departments (home, justice and education) at Zagreb, with sectional chiefs. Croat was the official language throughout the territory and the judicial system was entirely autonomous. The weakest spot was Croatia's financial subordination to Hungary.

BY COURTESY OF "TRAVEL"
A FAMILY OF CROAT PEASANTS

The period 1868 to 1914 was for Croatia one of great political activity and of steady development in every sphere. Among the most notable Croat leaders of the period were Bishop Strossmayer (*q.v.*) of Djako, to whose munificence the foundation of the Southern Slav academy (1867), Zagreb university (1874) and art gallery (1884) and other public institutions was largely due; Ivan Mažuranić, known as "the Peasant Ban" (1873–80) and author of a famous epic; Rački the historian, and Ante Starčević, founder of the party of right, which followed strongly Serbophobe lines. The Eastern Crisis of 1875–78 evoked a lively agitation in favour of Bosnia's incorporation with Croatia, as part of a Pan-Croat programme; and Dalmatia was always regarded as belonging *de iure* to the "Triune Kingdom of Croatia-Slavonia-Dalmatia," though *de facto* held by Austria. The Bosnian problem accentuated the Magyar-Croat conflict, which broke out in 1883 in riotous protests against the inscriptions over Government offices in Zagreb. The Croatian constitution was temporarily suspended by Hungary and after a general had acted as royal commissioner for some months, Count Khuen-Hédervàry, a cousin of Tisza, was appointed ban in Dec. 1883. His rule of 20 years is regarded as the most humiliating in modern Croatian history.

The Yugoslav Movement.—From 1903 onwards there was a marked growth of national feeling. The disturbances of that year were suppressed, but in 1905 the Croat and Serb parties in all provinces of the Dual Monarchy adopted a joint programme in the Resolutions of Fiume and Zara, and next year the Serbo-Croat coalition in Croatia came into power, as the result of a compact with the Hungarian coalition. Its chief leaders were Supilo and Trumbić (*q.v.*), both Dalmatians. Already in 1907, however, the Croats and Magyars again quarrelled; Baron Rauch became ban and on orders from Budapest "made" elections, but, having failed to secure a majority, suspended the Croatian diet and instituted a repressive régime. This culminated in the scandal of the Zagreb treason trial of 1909, in which 53 Serbs of Croatia-Slavonia were accused of treasonable relations with Serbia. The attempts of Rauch and his chiefs in Budapest and Vienna to implicate the leaders of the Serbo-Croat Coalition during the Bosnian annexation crisis gave to the trial an international importance, which was heightened by scandals in court and by Prof. Masaryk's public intervention in the Austrian parliament. The sequel was a libel action brought by the coalition leaders before a Viennese court against the historian Friedjung and the editor of the *Reichspost* (Dec. 1909), and it was established that the charges of treason rested upon numerous documents forged by the connivance of the Austro-Hungarian minister in Belgrade and his staff and given to Friedjung on the authority of Aehrenthal and the Ballplatz. These trials and the Rauch régime welded the Serbo-Croat coalition still more closely together, and stimulated the movement for Yugoslav unity. After a temporary truce under Rauch's successor, Tomašić, the Hungarian Government on April 3, 1912, suspended the Croatian constitution and appointed Cuvaj as dictator with wide powers. An attempt on his life by the student Jukić on June 8 was followed by further repression and by the suspension of Serbian Church autonomy. The Cuvaj régime caused lively protests among the Yugoslavs of Bosnia, Dalmatia, Istria and Carniola, with increasing support from the Slovenes. The excitement and unrest, already acute, was greatly increased by the victories of the Balkan League and especially Serbia against the Turks; and the younger generation in particular became infected by revolutionary ideas and hailed Serbia as the Piedmont of a future Yugoslav union. The murder of the archduke was the sixth of a series of outrages by young Croats or Serbs, two being upon Cuvaj and two upon his successor Skerlecz.

On Dec. 27, 1912, Cuvaj was replaced by a colourless official, but it was not till Nov. 1913 that the dictatorship was abolished and Baron Skerlecz appointed ban. Elections—the fifth since 1906—still gave the coalition a large majority; and there was still a truce rather than a settlement between Zagreb and Budapest when the World War broke out.

The World War and Union with Yugoslavia.—Measures of extreme severity were taken by the civil and military authorities of Austria-Hungary throughout their Yugoslav provinces. Thanks to the purely opportunist policy of the Serbo-Croat coalition, the diet of Zagreb was still allowed to meet, but while avoiding any pronouncement offensive to Budapest it also steadily refused to disavow the Yugoslav committee which was formed in London early in the war by a number of Serb and Croat exiles (Trumbić, Supilo, Hinković, Meštrović, etc.) and whose programme was complete independence and union with Serbia. In Dec. 1916 the coalition even sent delegates to Charles's coronation in Budapest, and by secret arrangement left all initiative to the committee abroad, and after the resumption of parliamentary life in Austria to the unified Yugoslav Club in the *Reichsrat*, working in close alliance with the Czechs. The maximum Yugoslav programme found expression in the Declaration of Corfu (July 20, 1917) between Pašic and Trumbić, which the Yugoslav parties inside the Dual Monarchy naturally could not publicly endorse, but always declined to repudiate. Count Tisza's visit to Zagreb and Sarajevo in Sept. 1918, to win support for a Magyar solution of the Southern Slav question, met everywhere with a blank refusal. On Oct. 1, encouraged by Bulgaria's surrender, the Czech and Yugoslav deputies in the *Reichsrat* proclaimed their absolute right to decide their own future State allegiance; and on Oct. 10 the Yugoslav national council, which had already been constituted at Ljubljana, was transferred to Zagreb and representatives of all parties were included. A week later the Yugoslavs repudiated Emperor Charles's proposals for federalization, and local committees in Dalmatia and Bosnia, recognizing the authority of the Zagreb council, proceeded to disarm the troops pouring northward from the broken Balkan fronts. On Oct. 23, a Croat regiment took possession of Fiume, and on the 28th the Zagreb military command handed over its authority to the council. Next day the diet declared Croatia's independence from Hungary, appealed to the Entente and urgently invited the help of the Serbian army. On Nov. 23 the union of the Yugoslav provinces of the former monarchy with Serbia and Montenegro was resolved in Zagreb, and on Dec. 1 the council's delegates visited the prince regent Alexander in Belgrade and invited him to proclaim the union. In the first Yugoslav Cabinet the Slovene Clerical leader Korošec was vice-premier and Trumbić foreign minister. The office of Croatian ban was at first retained, but abolished under the new constitution of June 28, 1921. The centralist character of this constitution was largely due to the abstention of the Croat Peasant Party under Stephen Radić. The latter's capitulation to Pašić and his acceptance of office in a Radical Cabinet in 1925 ended the most acute phase of conflict between centralist and federalist tendencies in the new State.

CROCE, BENEDETTO (1866–), Italian philosopher, born on Feb. 25, 1866, at Pescasseroli, Aquila, of an Abruzzese family, the seat of which had been transferred to Naples by his grandfather. There Croce was educated at a Catholic school. In 1883, having lost both his parents in an earthquake, he went to live in Rome with his paternal uncle and guardian, Silvio Spaventa. He entered the university, but did not pursue his studies there, returning to Naples in 1886, where he occupied himself for several years with researches into local history and antiquities. His contributions to philosophy began with two essays (1893) upon the nature of history and the method of literary criticism, the leading ideas of which he developed in two later papers in 1900 and 1904–5. Between 1896 and 1900 he published also a group of essays on points of Marxian economic doctrine. Shortly after, in 1902, he began the systematic exposition of his Philosophy of the Spirit, divided into Aesthetic, Logic, Philosophy of Conduct (Economics and Ethics) and Theory and History of Historiography. In 1903 he founded the journal *La Critica,* in which he reviewed the whole fine literature of Italy for 50 years, and later similarly reviewed its contributions to historical literature. His collected works in 1926 filled nearly 20 volumes. Though actively interested in educational administration, he never sought or occupied any university office. In 1910 he was nominated to the senate of the kingdom, and was Minister of Education in the Giolitti Cabinet (June 1920–July 1921).

Croce's Philosophy.—The philosophy of Croce, often erroneously classed as "Hegelian," had its avowed sources in the ideas underlying the literary criticism of Francesco de Sanctis, and, more generally and remotely, in those adumbrated in the *Scienza Nuova* of G. B. Vico, both, like himself, Neapolitans. More significantly, it arises from and perpetually returns to his own personal experience in his lifelong and multifarious activity as a student of literature and history. Here he finds himself in vital touch with concrete reality, and deliberately confines his reflections to the content of actual or enacted history with a view to its interpretation. Hence he has been led to assert the identity of concrete philosophy with history, and to define the task of abstract philosophy as the discovery and formulation of the immanent methodology of history. From the common domain of both he excludes any supposed realities which transcend experience, and abstains from speculations about such, as he also does about primal origins and ultimate ends. History as enacted and occurring and history as interpreting what is thus "given" he views as the work of one Spirit, which there expresses and embodies itself. In every part and moment of history that Spirit is wholly and indivisibly present and active. Its presence and operation are not confined to human history, but extend in all directions to the utmost bounds of experience. The Spirit which is thus omnipresent throughout the whole content of experience is indivisibly one, but its unity is also a quaternity, and it has in its structure four eternally distinct and distinguishable "grades," the ordered circle of which in its life or progress it perpetually traverses, so endowing or filling itself with experience and ever enriching its being. Its four functions in their conjoint exercise generate the contents of experience, within which we can and must distinguish four corresponding grades, stages, kinds or realms, the respective subject-matters of aesthetic, logical, economic and ethical theory, departments of philosophy, which together without addition constitute the whole of it.

In its total cognitive function this Spirit manifests itself as art, the first or "dawn" form of knowledge. In this grade it expresses itself in individual embodiments; in so expressing itself it at once creates and beholds what it creates, and has for its objects (which are also its works) whatsoever in experience presents a characteristic individuality. In its second cognitive grade, as logic or abstract philosophy, it expresses, brings to existence and view, and so knows whatsoever is universal. Uniting, as it cannot but do, both functions, and thus becoming concrete in history, it effects an *à priori* synthesis between what is individual and what is universal; in doing so, it wins actual understanding of the real and enters upon a course of knowledge which runs from sense-perception up to explicit history. The history which thus comes to be understood is wholly the work of the same Spirit in the exercise of its total practical function, which has two corresponding grades, in the lower or earlier of which it enacts what is individual, in the higher or later what is universal, or, rather again, in its actual or concrete exercise, enacts both in one, and so fills the stage of history with its deeds. Still more actually or concretely, it is active at once as making or creating and as knowing or understanding its own history, which is its whole self. The only reality which can truly be called absolute is a history without beginning and without end, self-begotten and self-explaining.

The developments and applications which Croce gives to this fundamental doctrine are extraordinarily various, and often highly novel and even paradoxical. They have excited widespread interest and evoked abundant criticism and opposition. Against his critics Croce carries on a sustained and skilful polemic. He exercises an increasingly profound influence on higher thought. To many his philosophy seems to have already established a place in the world of contemporary philosophy comparable with that occupied during a great part of the 19th century by the system of Hegel. For a fuller account of Croce's theory of Aesthetics, *see* that article written by him, in volume I of this *Encyclopædia.*

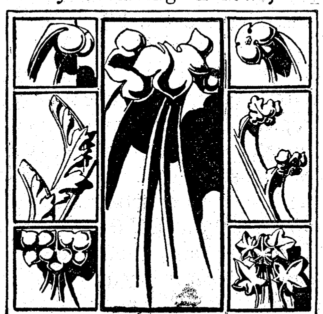
CROCIDOLITE, a mineral described in 1815 by M. H. Klaproth under the name *Blaueisenstein* (blue ironstone), and in 1831 by J. F. Hausmann, who gave it its present name because of its nap-like appearance (Gr. κροκύς, nap of cloth). It is a blue fibrous mineral belonging to the amphibole group and closely related to riebeckite; chemically it is an iron sodium silicate. Its resemblance to asbestos has gained for it the name Cape Asbestos, the chief occurrence being in South Africa. The mineral suffers alteration by removal of alkali and oxidation of the ferrous iron, and further by deposition of silica between the fibres, or by their replacement by silica; a hard siliceous mineral is thus formed which when polished shows, in consequence of its fibrous structure, a beautiful chatoyance or silky lustre. This is the ornamental stone which is known when blue as "hawk's-eye," and when of rich golden brown colour as "tiger-eye." The latter, which represents the final alteration of the crocidolite, has become very fashionable as "South African cat's eye," and is often termed "crocidolite," though practically only a mixture of quartz with brown oxide of iron.

CROCKET, in architecture, a small, independent, sharply projecting mediaeval ornament, usually occurring in rows, and decorated with foliage. In the late 12th century, when it first appeared, it had the form of a ball-like bud, with a spiral outline, like an uncurling fern frond; but in the later Gothic period it took the form of out-curved, fully developed leaves reaching, in the 15th century, complex, involuted richness. Crockets are used especially on the inclined edges of spires, pinnacles and gables, and are also found on capitals, cornices, and, occasionally, around arches.



FROM VIOLLET-LE-DUC, "DICTIONNAIRE RAISONNÉ DE L'ARCHITECTURE FRANÇAISE"

EXAMPLES OF CROCKETS

CROCKETT, DAVID (1786–1836), American frontiersman, son of an Irish immigrant, was born in Greene county, Tenn., on Aug. 17, 1786. His education was obtained chiefly in the rough school of experience in the Tennessee backwoods, where he acquired a wide reputation as a hunter, trapper and marksman. In 1813–14 he served in the Creek War under Andrew Jackson, and subsequently became a colonel in the Tennessee militia. In 1821–24 he was a member of the state legislature, having won his election largely by telling stories. In 1827 he was elected to the national house of representatives and was re-elected in 1829. At Washington his shrewdness, eccentric manners and peculiar wit made him a conspicuous figure, but his opposition to the president's Indian policy led to administration influences being turned against him with the result that he was defeated for re-election in 1831. He was again elected in 1832, but in 1835 lost his seat a second time, being then a vigorous opponent of many distinctively Jacksonian measures. Discouraged and disgusted, he followed his usual remedy of emigration, this time to Texas. There he lost his life as one of the defenders of the Alamo at San Antonio on March 6, 1836.

A so-called "autobiography" (1834), which he very probably dictated, is typical of the crude but racy humour of the frontier; a work purporting to be a continuation of this autobiography and entitled *Colonel Crockett's Exploits and Adventures in Texas* (Philadelphia, 1836) is undoubtedly spurious. There have been several editions of these works in combined form. Numerous popular biographies have been written, the best by E. S. Ellis (Philadelphia, 1884). *See* also D. C. Seitz, *Uncommon Americans* (1925) and the article by C. T. Crowell in the *American Mercury* (Jan., 1925).

CROCKETT, SAMUEL RUTHERFORD (1860–1914), Scottish novelist, was born at Duchrae, Galloway, on Sept. 24, 1860, the son of a Galloway farmer. He was brought up on a Galloway farm, and graduated from Edinburgh university in 1879. After some years of travel he became in 1886 minister of Penicuik, but eventually abandoned the Free Church ministry for novel-writing. The success of J. M. (later Sir James) Barrie had created a demand for stories in the Scottish dialect when Crockett published his successful story of *The Stickit Minister* in 1893., *The Raiders, The Lilac Sun-bonnet* and *Mad Sir Uchtred,* all published in 1894, were followed by many others.

CROCKFORD, WILLIAM (1775–1844), proprietor of Crockford's Club, was born in London in 1775, the son of a fishmonger, and for some time himself carried on that business. After winning a large sum of money (according to one story £100,000) either at cards or by running a gambling establishment, he built, in 1827, a luxurious gambling house at 50 St. James's street, which, to ensure exclusiveness, he organized as a club. Crockford's quickly became the rage; every English social celebrity and every distinguished foreigner visiting London hastened to become a member. Hazard was the favourite game, and very large sums changed hands. Crockford retired in 1840, when, in the expressive language of Capt. R. H. Gronow, he had "won the whole of the ready money of the then existing generation." He took, indeed, about £1,200,000 out of the club, but subsequently lost most of it in speculations. Crockford died on May 24, 1844.

CROCODILE-BIRD (*Pluvianus aegyptus*), a species of plover (*q.v.*) which derives its name from its frequent association with the Nile crocodile (*Crocodylus niloticus*) from the teeth and hide of which it picks and devours parasites. It is also of service to the crocodile by uttering warning cries on the approach of danger.

CROCODILIAN, a name applicable to any member of the reptilian order Crocodilia. The order contains only 24 living species, but the geological history of the group can be traced back at least as far as Jurassic times (*see* REPTILES).

Crocodilians are the largest living reptiles, but it is difficult to be sure of their maximum size owing to the number of exaggerated stories with wide currency. The largest species is the salt-water or estuarine crocodile (*Crocodylus porosus*), which reaches a length of more than 20 ft., and the smallest is one of the South American caimans (*Paleosuchus palpebrosus*), which scarcely attains a length of 4 ft. Very large specimens of any species are undoubtedly becoming more and more rare; modern arms are too well distributed for many very old individuals to survive.

Because of the interest taken in crocodiles regarding their size, their attacks on man and on domestic animals, and the trophies that they yield to the sportsman, a key, based on characters of the head and skull, is given by means of which a specimen may be identified at least as far as its genus.

I. Snout very long and slender; the halves of the lower jaw fused in front as far back as the 15th tooth.
   - (*a*) 27-29 teeth on each side of the upper jaw. *Gavialis* (the gavial of N. India).
   - (*b*) 20-21 teeth on each side of the upper jaw. *Tomistoma* (the false gharial of Borneo and Sumatra).

II. Snout moderately elongate, triangular or rounded; the halves of the lower jaw not fused farther back than the eighth tooth.
   - (*a*) The fourth tooth of the lower jaw fits into a notch in the side of the upper jaw. Crocodiles.
     - (1) Nasal bones dividing the nasal aperture into two. *Crocodylus* (Africa to south China, north Australia and the Fiji Islands; southern United States to Venezuela and Ecuador).
     - (2) Nasal bones not dividing the nasal aperture;

snout turned up in front. *Osteolaemus* (W. Africa).

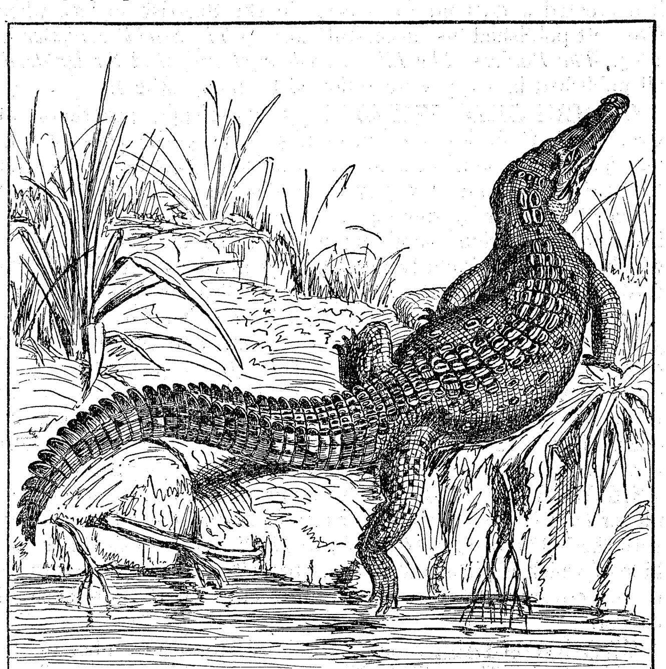
(3) Nasal bones not dividing the nasal aperture; snout not turned up. *Osteoblepharon* (Congo).

(*b*) The fourth tooth of the lower jaw fits into a pit in the upper jaw. Alligators.

(1) Nasal bones dividing the nasal aperture. *Alligator* (southern United States and south China).

(2) Nasal bones not dividing the nasal aperture. *Caiman, Melanosuchus* and *Paleosuchus* (Tropical South America).

The two first-mentioned genera, each with only a single species, are highly specialized fish-eating forms, the long, slender snout



AFTER BREHM

FIG. 1.—THE COMMON AMERICAN CROCODILE

and numerous, sharp, interlocking teeth forming an efficient fish-catching mechanism. The remaining genera are much broader snouted and, though fishes form their staple food, they will also eat anything they can overpower; lying idly in the water with only the nostrils, eyes and perhaps part of the back showing they look like floating logs and any unwary bird or beast approaching within range of the powerful jaws is seized, dragged under water and eaten. There are undoubtedly occasional man-eaters but generally they recognize man as their chief enemy and become wary and difficult to approach.

All the species reproduce by means of eggs. The sexes are able to find one another by hearing and by smell; during the mating season the males, at least, exercise their vocal powers, the call varying with the species but usually being an intermittent bellow that may be heard for a considerable distance. Both sexes are provided with two pairs of scent glands; one pair lies at the sides of the throat and the other inside the cloaca. The glands on the throat are normally only visible as a pair of small slits but excitement may cause them to be turned inside out so that they appear as rounded excrescences. Both pairs of glands are close to the soil when the animal is at rest on the bottom or basking on the shore and their secretion, which has a strong musky odour, leaves a trail that can be followed by other members of the species. The eggs are white, oval, covered with a thick calcareous shell and are laid on land; the number in a clutch varies according to the size of the individual and may vary from 20 to 90. The site and type of "nest" vary. The Nile crocodile (*C. niloticus*) deposits its eggs in the sand, the hole being from 18 in. to 2 ft. deep and the eggs arranged in two layers with a layer of sand between. Many other species including the West African crocodile (*C. cataphractus*) and the North American alligator (*A. mississipiensis*), sweep together a mound of vegetable trash and deposit the eggs in the centre of this pile. Incubation is carried out chiefly by the heat of the sun but in the second case the heat of fermentation of the vegetable matter probably assists; the mother remains in the vicinity of the nest, visiting it from time to time and, warned by the hiccough-like cries which the young produce when ready to leave the egg, scratches away the covering of the nest and conducts her brood to the water. The young are able to break their way through the strong eggshell by means of an "egg tooth," which develops on the tip of the snout but which is lost soon after hatching. The hatchlings are two or three times as long as the eggs from which they emerge and are at once able to fend for themselves. Growth is fairly rapid, usually about a foot a year under favourable conditions for the first few years and more slowly thereafter.

The habits of all, whether crocodiles or alligators, are very similar. They are essentially aquatic, living, as a rule, in sluggish streams and lakes. They swim by powerful strokes of the flattened tail, the limbs being folded against the body. Their powers of locomotion on land are not to be despised. Ordinarily their progress is a mere crawl, the body and tail being dragged along, but when excited they can run at a considerable pace with the body held well off the ground. Much of their time is spent basking in the full glare of the sun on sandbanks, often with the mouth agape. Some species hibernate buried in the mud during the colder parts of the year and others may aestivate in the same manner during the dry season when the rivers and pools dry up; it is not unusual, however, for them to undertake long emigrations overland when in search of new quarters and there are records of the invasion of a town by numbers of the Indian crocodiles (mugger or marsh crocodile, *C. palustris*) which had been compelled to leave their water hole by a severe drought.

The salt-water crocodile (*C. porosus*) has the most extensive range, being found from Bengal to southern China, northern Australia and the Fiji Islands, and this species is the one most frequently found at sea; the remaining species, except for the Nilotic and the common American crocodiles, frequent fresh waters only. The genus *Crocodylus* is found throughout the tropics; the best known species are the Nile crocodile which, though formerly plentiful, is now rare in lower Egypt and which extends southward to Rhodesia; the mugger of the Indian region; the North American crocodile (*C. acutus*), which occurs throughout the West Indies and from the southern United States to Colombia; and the Orinoco crocodile (*C. intermedius*). The genus *Alligator* occurs only in the southern United States (*A. mississipiensis*) and southern China (*A. sinensis*); and the caimans (two species of *Caiman*, one of *Melanosuchus*, and two of *Paleosuchus*) are confined to Central and South America.

These creatures have a definite economic value, their hides being in demand for the making of fancy leathers; this has led to considerable slaughter and great reduction in the numbers of many species, which is especially the case with the North American alligator. (*See* also ALLIGATOR; REPTILES.)

(D. M. S. W., K. P. S.)

CROCOITE, a mineral consisting of lead chromate ($PbCrO_4$), and crystallizing in the monoclinic system. It is sometimes used as a paint, being identical in composition with the artificial product chrome-yellow. It is found as well-developed crystals of a bright hyacinth-red colour, which are translucent and have an adamantine to vitreous lustre. On exposure to light much of the translucency and brilliancy is lost. The streak is orange-yellow; hardness $2\frac{1}{2}$–3; sp. gr. 6.0. Crystals were first found in the Urals in 1763 in quartz veins traversing granite or gneiss. Gold is often found associated with this mineral. Crystals far surpassing in beauty any previously known have been found in the Adelaide mine at Dundas, Tasmania; they are long, slender prisms, 3 or 4 in. in length, with a brilliant lustre and colour.

(L. J. S.)

CROCUS, a genus of plants of the family Iridaceae, containing 75 species, natives of Europe, North Africa, and temperate Asia, and especially developed in the dry country of south-eastern Europe and western and central Asia. The plants are admirably adapted for climates in which a season favourable to

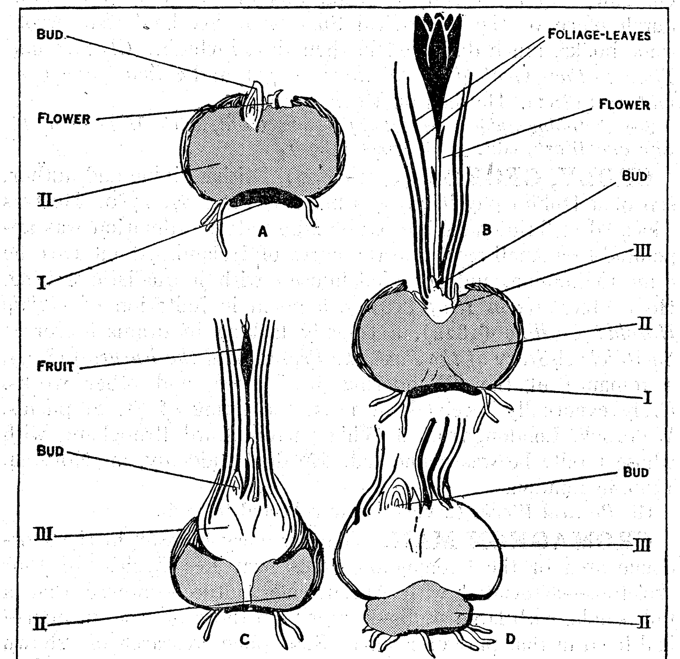
HATCHING OF A CROCODILE IN A JAVA LABORATORY

1. A crocodile egg belonging to the *Crocodylus porosus* species, common in the East. The crocodile in the final embryonic stage is preparing to break the shell and emerge
2. The egg a few hours later, with nose of crocodile showing. A strong egg tooth on the tip of the snout helps in breaking through the heavy shell. The tooth is lost soon after hatching
3. Crocodile head protruding from egg
4. The reptile snapping at a finger held near his mouth. Even before being completely hatched, the crocodile shows signs of savagery
5. Crocodile pushing himself still further out of the egg
6. Leaving the egg behind. The new born reptile is three or four times as large as the egg in which he grew. He is at once able to take care of himself

growth alternates with a hot or dry season; during the latter they remain dormant beneath the ground in the form of a short thickened stem protected by the scaly remains of the bases of last season's leaves (known botanically as a "corm"). At the beginning of the new season of growth, new flower- and leaf-bearing shoots are developed from the corm at the expense of the food-stuff stored within it. New corms are produced at the end of the season, and by these the plant is multiplied.

The crocuses of the flower garden are mostly horticultural varieties of *C. vernus, C. versicolor,* and *C. aureus* (Dutch crocus),



FROM GROOM'S "ELEMENTARY BOTANY" (G. BELL & SONS LTD.)

SHOWING THE YEARLY HISTORY OF THE GARDEN CROCUS (CROCUS VERNUS)

A. Resting in winter
B. Flowering
C. Fruiting
D. Preparing for winter—rest after fruiting

the two former yielding the white, purple, and striped, and the latter the yellow varieties. The crocus succeeds in any fairly good garden soil and is often planted as a border plant.

CROESUS, last king of Lydia, of the Mermnad dynasty (560–546 B.C.), succeeded his father Alyattes after a war with his half-brother. He completed the conquest of Ionia by capturing Ephesus, Miletus and other places, but lack of sea-power forced him to give up his project of subduing the islands, whom he enlisted as allies. He also allied himself with Sparta, and extended the Lydian empire as far as the Halys. His wealth, due to trade, was proverbial. He was also a client of the oracle at Delphi, where a number of rich gifts of his dedication were seen by Herodotus. Various legends were told about him by the Greeks, one of the most famous being that of Solon's visit to him with the lesson it conveyed of the divine nemesis which waits upon overmuch prosperity (Hdt. i. 29, *seq.*: but *see* SOLON). After the overthrow of the Median empire (549 B.C.) Croesus found himself confronted by the rising power of Cyrus, and along with Nabonidus of Babylon took measures to resist it. A coalition was formed between the Lydian and Babylonian kings, Egypt promised troops and Sparta its fleet, and Croesus took the initiative by invading Cappadocia. After an indecisive battle at Pteria he returned to Sardis to gather the forces of the confederacy. Cyrus followed him, took him completely by surprise, and stormed Sardis. We may gather from Bacchylides (iii., 23–62) that he hoped to escape his conqueror by burning himself on a funeral pyre, but that he fell into the hands of Cyrus. A different version of the story is given (from Lydian sources) by Herodotus (followed by Xenophon), who makes Cyrus condemn his prisoner to be burnt alive. Apollo, however, came to the rescue of his worshipper with a rainstorm, and the name of Solon uttered by Croesus resulted in his deliverance. According to Ctesias, who uses Persian sources, and says nothing of the attempt to burn Croesus, he subsequently became attached to the court of Cyrus and received the governorship of Barene in Media. Fragments of columns from the temple of Artemis now in the British Museum have upon them a dedication by Croesus in Greek.

See R. Schubert, *De Croeso et Solone fabula* (1868); M. G. Radet, *La Lydie et le monde grec au temps des Mermnades* (1892–1893); A. S. Murray, *Journ. Hell. Studies,* x. pp. 1–10 (1889); *Cambridge Ancient History,* vol. iii. (1925); for the supposition that Croesus did actually perish on his own pyre *see* G. B. Grundy, *Great Persian War,* p. 28; Grote, *Hist. of Greece* (ed. 1907), p. 104. *Cf.* CYRUS; LYDIA.

CROFT, SIR HERBERT, BART. (1751–1816), English author, was born at Dunster Park, Berkshire, son of Herbert Croft of Stifford, Essex, and was educated at University college, Oxford. In 1780 he published *Love and Madness, a Story too true, in a series of letters between Parties whose names could perhaps be mentioned were they less known or less lamented.* In *Love and Madness* Croft inserted, among other miscellaneous matter, information about Thomas Chatterton gained from letters which he obtained from the poet's sister, Mrs. Newton, and used without payment, a proceeding for which he was attacked by Southey in the *Monthly Review.* In 1790 Croft proposed a revised edition of Johnson's *Dictionary,* but subscribers were lacking and his 200 volumes of ms. remained unused. Croft was a good scholar and linguist, and the author of some curious books in French.

See *The Love Letters of Mr. H. and Miss R. 1775–1779,* edited from Croft's book by Mr. Gilbert Burgess (1895). *See* also John Nichols's *Illustrations . . .* (1828), v. 202–218.

CROFT, SIR JAMES (d. 1590), lord deputy of Ireland. After representing Herefordshire in parliament in 1541 he became governor of Haddington in 1549, lord deputy of Ireland 1551, and later governor of Berwick. In 1570 Elizabeth made him a privy councillor and controller of her household. He was one of the commissioners for the trial of Mary Stuart, and in 1588 was sent to arrange peace with the duke of Parma. He died on Sept. 4, 1590.

His grandson, HERBERT CROFT (1603–1691), Chaplain to Charles I., held a prebend's stall at Worcester, a canonry of Windsor, and, under Charles II., the bishopric of Hereford. He was the author of the controversial work: *The Naked Truth or the True State of the Primitive Church* (London, 1675).

BIBLIOGRAPHY.—*See* D. Lloyd, *State Worthies from the Reformation to the Revolution* (2 vols. 1766); Anthony Wood, *Athenae Oxonienses* (ed. Bliss, 1813–20); J. Strype, *Annals of the Reformation* (Oxford, 1824); R. Bagwell, *Ireland under the Tudors,* vol. i. (1885).

CROFT (or CROFTS), **WILLIAM** (1678–1727), English composer, was born at Nether Ettington in Warwickshire. He received his musical education in the Chapel Royal under Dr. Blow whom he succeeded as organist there on the latter's death in 1708, becoming at the same time organist of Westminster Abbey. In 1724 he published, under the name of *Musica Sacra,* an edition of his choral music in 2 vols. folio, including his noble Burial Service which has been justly described as one of the masterpieces of English Church music. He died at Bath and was buried in Westminster Abbey.

CROFTER, a term used, more particularly in the highlands and islands of Scotland, to designate a tenant who rents and cultivates a small holding of land or "croft." This O.E. word, meaning originally an enclosed field, seems to correspond to the Dutch *kroft,* a field on high ground or downs. The ultimate origin is unknown. By the Crofters' Holdings (Scotland) act 1886, a crofter is defined as the tenant of a holding who resides on his holding, the annual rent of which does not exceed £30 in money, and which is situated in a crofting parish. The wholesale clearances of tenants from their crofts during the 19th century, in violation of, as the tenants claimed, an implied security of tenure, has led in the past to much agitation on the part of the crofters to secure consideration of their grievances, which have been the subject of royal commissions and of subsequent amending acts to the Crofters' Act of 1886.

CROISETTE, in architecture, the form produced at the outer ends of the upper part of the architrave of an opening or panel, when the top or lintel projects on either side beyond the width of the architrave below. The form developed through primitive construction in which the lintel stone was much wider than the opening, but remained commonly in use in all the classic styles long after any structural reason existed.

CROKER, JOHN WILSON (1780–1857), British statesman and author, was born at Galway on Dec. 20, 1780, being the only son of John Croker, the surveyor-general of customs and excise of Ireland. He was educated at Trinity College, Dublin, where he graduated in 1800. Immediately afterwards he was entered at Lincoln's Inn, and in 1802 he was called to the Irish bar. His interest in the French Revolution led him to collect a large number of valuable documents on the subject, which are now in the British Museum. In 1804 he published anonymously *Familiar Epistles to J. F. Jones, Esquire, on the State of the Irish Stage,* a caustic satire in verse on the management of the Dublin theatres, which ran through five editions in one year. Equally successful were the *Intercepted Letter from Canton* (1805), a satire on Dublin society, and *The State of Ireland, Past and Present* (1807), in which he advocated Catholic emancipation.

In 1807 he entered parliament as member for Downpatrick and in 1808 became deputy chief secretary for Ireland to Sir Arthur Wellesley. This connection led to a friendship which remained unbroken until Wellington's death. His speech (March 14, 1809) defending the duke of York against the charges of Colonel Wardle won for him in 1810 the office of secretary to the Admiralty, which he held without interruption under various administrations for more than twenty years. Among the first acts of his official career was the exposure of a fellow-official who had misappropriated the public funds to the extent of £200,000.

A determined opponent of the Reform Bill, he vowed that he would never sit in a reformed parliament; his parliamentary career accordingly terminated in 1832. Two years earlier he had retired from his post at the Admiralty on a pension of £1,500 a year. Croker had been an ardent supporter of Peel, but finally broke with him when he began to advocate the repeal of the Corn Laws. He is said to have been the first to use (Jan. 1830) the term "conservatives." He was for many years one of the leading contributors on literary and historical subjects to the *Quarterly Review,* with which he had been associated from its foundation. The rancorous spirit in which many of his articles were written did much to embitter party feeling. It also reacted unfavourably on Croker's literary reputation. He had no sympathy with the younger school of poets who were in revolt against the artificial methods of the 18th century, and he was responsible for the famous *Quarterly* article on Keats. It is, nevertheless, unjust to judge Croker by the criticisms which Macaulay brought against his *magnum opus,* his edition of Boswell's *Life of Johnson* (1831). Croker made no reply, but when the first two volumes of the History appeared he took the opportunity of pointing out inaccuracies in the work. Croker was occupied for several years on an annotated edition of Pope's works. It was left at the time of his death and afterwards completed by the Rev. Whitwell Elwin and Mr. W. J. Courthope. He died at St. Albans Bank, Hampton, on Aug. 10, 1857.

The chief works of Croker not already mentioned were his *Stories for Children from the History of England* (1817), which suggested Scott's *Tales of a Grandfather; Military Events of the French Revolution of 1830* (1831); and several lyrical pieces of some merit, such as the *Songs of Trafalgar* (1806); and *The Battles of Talavera* (1809). He also edited the *Suffolk Papers* (1823), Hervey's *Memoirs of the Court of George II.* (1817), the *Letters of Mary Lepel, Lady Hervey* (1821–22), and *Walpole's Letters to Lord Hertford* (1824). His memoirs, diaries and correspondence were edited by Louis J. Jennings in 1884 under the title of *The Croker Papers* (3 vols.).

CROKER, THOMAS CROFTON (1798–1854), Irish antiquary and humorist, was born in Cork on Jan. 15, 1798, and died in London on Aug. 8, 1854. In 1819 he became a clerk in the Admiralty. Moore was indebted to him in the production of his *Irish Melodies* for "many curious fragments of ancient poetry." In 1825 he produced his most popular book, the *Fairy Legends and Traditions of the South of Ireland,* which he followed up by the publication of his *Legends of the Lakes* (1829), his *Adventures of Barney Mahoney* (1832), and an edition of the *Popular Songs of Ireland* (1839). He wrote *Narratives Illustrative of the Contests in Ireland in 1641 and 1688* (1841), for the Camden Society, *Historical Songs of Ireland, etc.* (1841), for the Percy Society, and several other works. He was a member of many learned societies, and one of the founders of the British Archaeological Association.

CROLL, JAMES (1821–1890), Scottish scientist, was born near Cargill (Perthshire), on Jan. 2, 1821. He was self-educated, but in 1859 was made keeper of the Andersonian museum in Glasgow, and from 1867 to 1880 was in charge of the Edinburgh office of the Geological Survey of Scotland. He wrote some books, much discussed in their day, including *Climate and Time, in their Geological Relations* (1875), and *Climate and Cosmology* (1885). He died on Dec. 15, 1890.

See *Autobiographical Sketch of James Croll, with Memoir of his Life and Work,* edit. J. C. Irons (1896).

CROLY, GEORGE (1780–1860), British divine and author, son of a Dublin physician, was born on Aug. 17, 1780. He was educated at Trinity college, Dublin, and after ordination was appointed to a small curacy in the north of Ireland. About 1810 he came to London, and occupied himself with journalistic writing. He wrote *Paris in 1815* (1817), a poem in imitation of *Childe Harold; Catiline* (1822), a tragedy lacking in dramatic force; *Salathiel: A Story of the Past, the Present and the Future* (1829), a romance of the "Wandering Jew" type, and other works. Croly eventually received, in 1835, the living of St. Stephen's, Walbrook, London, from a Whig patron, Lord Brougham, with whose family he was connected. He died suddenly, on Nov. 24, 1860, in London.

His *Poetical Works* (2 vols.) were collected in 1830.

CROMAGNON MAN. The discovery in 1868 in the Dordogne area of the Cromagnon cave—near Les Eyzies—of four skeletons—associated with Aurignacian culture—showed that a tall people, with large skulls—larger than those of modern man—had lived in that part of France. Subsequent research has shown that people of this type inhabited a wide area in Europe. The women of this race were shorter than the men, and there are features capable of interpretation as evidence of contact with negroid elements.

See Sir A. Keith, *Antiquity of Man,* 2nd ed. (1925).

CROMARTY, GEORGE MACKENZIE, 1ST EARL OF (1630–1714), Scottish statesman, joined the Scottish rising on behalf of Charles II. in 1654 and was in exile until the Restoration when he became a lord of session with the title of Lord Tarbat. His opposition to Lauderdale kept him out of official employment from 1664 to 1678, but he then became lord justice general (1678), lord clerk register and a lord of session (1681), and from 1682 to 1688 he was the chief minister of Charles II. and James II. in Scotland. He made his peace with William, and held high office both under William and Mary and Anne. He received his earldom in 1703, and died on Aug. 17, 1714. His grandson George, 3rd earl (*c.* 1703–1766), forfeited his peerage for his share in the rising on behalf of Charles Edward in 1745. The 3rd earl's son, LORD MACLEOD (1727–1789), was also an active supporter of Prince Charles, and was only pardoned in 1746 on the surrender of all his rights. He went abroad, and served in the Swedish army until 1777, when he returned to Scotland, took service under the crown, and helped to raise, chiefly from the Mackenzie clan, the battalion which became the Highland Light Infantry. His estates were restored in 1784, and he died on April 2, 1789.

CROMARTY, a small burgh and seaport, Ross and Cromarty, Scotland. Pop. (est. 1938) 785, excluding men of the Royal Navy. It is situated on the southern shore of the mouth of Cromarty Firth, 5 m. E. by S. of Invergordon on the opposite coast, with which there is daily communication by steamer, and 9 m. N.E. of Fortrose, the most convenient railway station. Before the union of the shires of Ross and Cromarty, it was the county town of Cromartyshire. Its name gave the title to the earldom of Cromarty. The harbour is a naval station; but the herring fishery, once the staple industry, has failed; some white fishing is carried on. The town, however, is in growing repute as a summer resort. The thatched house with crow-stepped gables in Church Street, in which Hugh Miller (1802–56), the geologist, was born, still stands, and a statue has been erected to his memory on a hill above the town.

The former shire of Cromarty was incorporated with Ross-shire in 1889 under the designation of the county of Ross and Cromarty. Its nucleus consisted of the lands of Cromarty in the north of the peninsula of the Black Isle. To this were added from time to time the various estates scattered throughout Ross-shire—the most considerable of which were the districts around Ullapool and Little Loch Broom on the Atlantic coast, the area in which Ben Wyvis is situated, and a tract to the north of Loch Fannich—which had been acquired by the ancestors of Sir George Mackenzie (1630–1714), afterwards Viscount Tarbat (1685) and 1st earl of Cromarty (1703). Desirous of combining these properties into one shire, Viscount Tarbat was enabled to procure their annexation to his sheriffdom of Cromarty in 1685 and 1698, the area of the enlarged county amounting to nearly 370 sq.m. (*See* ROSS AND CROMARTY.)

Cromarty Firth.—Cromarty Firth, an inlet of the North Sea, extends inland for 19 m. from Moray Firth in a westerly and then south-westerly direction. Except at the Bay of Nigg, on the northern shore, and Cromarty bay, on the southern, where it is about 5 m. wide (due north and south), and at Alness bay, where it is 2 m. wide, it has an average width of 1 m. and a depth varying from 5 to 10 fathoms, forming one of the safest and most commodious anchorages in the north of Scotland. The principal places on its shores are Dingwall near the head, Cromarty near the mouth, Kiltearn, Invergordon and Kilmuir on the north. The entrance is guarded by two precipitous rocks—the one on the north 400 ft., that on the south 463 ft. high—called the Sutors from a fancied resemblance to a couple of shoe-makers (Scots, souter), bending over their lasts. The erection of defenses for the naval base was begun in 1912, and the base was used throughout World War I.

CROME, JOHN (1768–1821), English landscape painter, founder and chief representative of the "Norwich school"—often called Old Crome, to distinguish him from his son—was born at Norwich, on Dec. 22, 1768. His father was a weaver and his early years were spent in work of the humblest kind. During his apprenticeship to a house-painter he sometimes painted signboards, and devoted what leisure time he had to sketching from nature. Through the influence of a rich art-loving friend he was enabled to become a drawing-master; and in this he was engaged throughout his life. About 1790 he was introduced to Sir William Beechey, from whom he gathered additional knowledge and help in his art. In 1805 the Norwich Society of Artists took definite shape. Crome was its president and the largest contributor to its annual exhibitions. Among his pupils were James Stark, Vincent, Thirtle and John Bernay (Barney) Crome (1794–1842), his son. J. S. Cotman, a greater artist than any of them, was also associated with him.

Crome first exhibited at the Royal Academy in 1806. With very few exceptions Crome's subjects are taken from the familiar scenery of his native county. Fidelity to nature was his dominant aim. His most important works are: "Mousehold Heath, near Norwich," now in the National Gallery; "Clump of Trees, Hautbois Common"; "Oak at Poringland"; the "Willow"; "Coast Scene near Yarmouth"; "Bruges, on the Ostend River"; "Slate Quarries"; the "Italian Boulevards"; and the "Fishmarket at Boulogne." He executed a good many etchings, and the great charm of these is in the beautiful and faithful representation of trees. He died at Norwich on April 22, 1821. His son, J. B. Crome, was his assistant in teaching, and his best pictures were in the same style.

A collection of "Old" Crome's etchings, entitled *Norfolk Picturesque Scenery,* was published in 1834, and was re-issued with a memoir by Dawson Turner in 1838, but in this issue the prints were retouched by other hands. *See* also G. A. Stephen, *Norfolk Artists* (1915); H. M. Cundall, *The Norwich School* (1920); C. H. C. Baker, *Crome* (1921).

CROMER, EVELYN BARING, 1ST EARL (1841–1917), British statesman and diplomatist, was born on Feb. 26, 1841, the ninth son of Henry Baring, M.P., and Cecilia Anne, eldest daughter of Admiral Windham of Felbrigge Hall, Norfolk. He passed through Woolwich Academy into the Royal Artillery in 1858, and was appointed in 1861 A.D.C. to Sir Henry Storks, high commissioner of the Ionian Islands; he acted as secretary to the same chief during the inquiry into the Jamaica outbreak in 1864. While in the West Indies he took the opportunity of visiting the United States, and spent some time in Grant's camp before Petersburg. After his return to England he passed through the Staff college and served in the War Office in what became later the Intelligence Division. In 1872 he went out to India as private secretary to his cousin, Lord Northbrook, and in 1877 was appointed British commissioner of the Egyptian public debt office.

The appointment of a comparatively untried major of artillery as the British representative on a financial board composed of representatives of all the Great Powers was considered a bold one. Within a very short time it was recognized that the Englishman, though keeping himself carefully in the background, was unmistakably the predominant factor on the board. He was mainly responsible for the searching report, issued in 1878, of the commission of inquiry, appointed to investigate the financial methods of the Khedive Ismail; and when the khedive was driven to abdicate in 1879, Major Baring became the British controller-general in the renewed Dual Control. He maintained that administrative reform and the easing of the burdens of the fellahin were prerequisite to the collection of interest on the bonds. But he had hardly been in office more than six months before Lord Ripon asked him to go out to India as financial member of the viceroy's council. His Egyptian reputation had preceded him at Simla, but during the three years he spent in India he proved to be a wise and masterly economist.

When the British Government, saddled with the responsibility of re-establishing ordered government in Egypt after Arabi Pasha's revolt (*see* EGYPT), recalled Sir Evelyn Baring (he had received a K.C.S.I. for his Indian services), he returned to Egypt with the style of British agent and consul-general, with plenipotentiary diplomatic rank. Though junior to the other members of the Diplomatic corps, he was in fact the most powerful, because it was known that he had the backing of the British army of occupation. From the date of his return (Sept. 1883), the history of Sir Evelyn Baring, who became Baron Cromer in 1892, G.C.B. in 1895, viscount in 1897, and earl in 1901, is identified with the history of Egypt, and requires only the barest mention here. From the outset he realized that the task he had to perform could only be effected piece-meal and in detail. His very first measure was one which, though severely criticized at the time, has been justified by events. In any case it showed that he shirked no responsibility, and was capable of adopting heroic methods. He counselled the abandonment, at least temporarily, by Egypt of its authority in the Sudan provinces, already challenged by the mahdi. His views were shared by the British ministry of the day and the policy of abandonment enforced upon the Egyptian Government. At the same time it was decided that efforts should be made to relieve the Egyptian garrisons in the Sudan and this resolve led to the mission of General C. G. Gordon (*q.v.*) to Khartum. Lord Cromer subsequently told the story of Gordon's mission at length, making clear the measure of responsibility resting upon him as British agent. The proposal to employ Gordon came from the British Government and twice Sir Evelyn rejected the suggestion. Finally, however, in view of the strength of British popular feeling, Baring gave way and agreed that Gordon would be "the best man," if he clearly understood that his duty was to evacuate the Sudan, not to hold it. Gordon was instructed in London to go by the Nile route, and Baring vetoed his journey via Suakin, a decision which he afterwards repented. Once Gordon was on his way Baring gave him all possible support, and in the critical matter of the proposed despatch of Zobeir to Khartum, he—after a few days' hesitation—cordially endorsed Gordon's request, but the British Government refused.

From Jan. 1884 till the catastrophe at Khartum became known in Feb. 1885, the management of Egyptian affairs was more than usually complicated by the obstruction of the bondholders and the conflicting instructions of the British Government. Gordon's death was a terrible blow to Baring, who regretted that he had not held firmly to his own first judgment. But Baring did not allow his private sorrow to unnerve him in serving Egypt. He gave his mind to securing the reluctant assent of the bondholders to a new loan, necessary for the irrigation works and the relief of the burden on the fellahin. With the assistance of Sir Colin Scott Moncrieff, in the public works department, and Sir Edgar Vincent, as financial adviser, these two great departments were practically put in order before he gave more than superficial attention to the rest. The ministry of justice was the next department seriously taken in hand, with the assistance of Sir John Scott, while the army had been reformed under Sir Evelyn Wood, who was succeeded by Sir Francis (afterwards Lord) Grenfell. Education, the ministry of the interior, and gradually every other department, came to be reorganized, or, more correctly speaking, formed, under Cromer's carefully persistent direction. All this was accomplished with no further patent of authority than that of an adviser to the Khedive Tewfik. The death of Tewfik in 1892 threatened danger for his son and heir; Abbas was in Europe and a minor. But before the Sultan at Constantinople could interfere in the succession, Baring had brought Abbas to Egypt and had circumvented the fact of his minority by reckoning his age in lunar months. His work then proceeded unhindered.

In the meantime, the rule of the mahdi and his successor, the khalifa, in the temporarily abandoned provinces of the Sudan, had been weakened by internal dissensions; the Italians from Massawa, the Belgians from the Congo State and the French from their West African possessions, had gradually approached nearer to the valley of the Nile; and the moment had arrived at which Egypt must decide either to recover her position in the Sudan or allow the Upper Nile to fall into hands hostile to Great Britain and her position in Egypt. Lord Cromer was as quick to recognize the moment for action and to act as he had 15 years earlier been prompt to recognize the necessity of abstention. In March–Sept. 1896 the first advance was made to Dongola under the Sirdar, Sir Herbert (afterwards Lord) Kitchener (*q.v.*); and on Sept. 2, 1898, the battle of Omdurman finally crushed the power of the khalifa and restored the Sudan to the rule of Egypt and Great Britain. In the negotiations which resulted in the Anglo-French Declaration of April 8, 1904, whereby France bound herself not to obstruct in any manner the action of Great Britain in Egypt and the Egyptian Government acquired financial freedom, Lord Cromer took an active part. He also successfully guarded the interests of Egypt and Great Britain in 1906 when Turkey attempted by encroachments in the Sinai Peninsula to obtain a strategic position on the Suez Canal. All this he effected in the face of the greatest difficulties—political, national and international—and at the same time raised the credit of the country from a condition of bankruptcy to an equality with that of the first European powers. He was in England when the Denshawai executions took place, and when he returned to Egypt he found the country seething with discontent. In April 1907, in consequence of the state of his health, he resigned after 24 years in Egypt. In July of the same year parliament granted £50,000 out of the public funds to Lord Cromer in recognition of his "eminent services" in Egypt. In 1908 he published in two volumes *Modern Egypt,* in which he gave an adroit yet impartial narrative of events in Egypt and the Sudan since 1876, and dealt with the results to Egypt of the British occupation of the country. Lord Cromer took some part in the political life at home after his retirement, joining the free-trade wing of the Unionist party.

But in his leisure he turned to the study of the classics, the fruit of which appeared in a lecture delivered to the Classical Association in 1910 on *Ancient and Modern Imperialism.* Three volumes of *Political and Literary Essays* consist of reviews contributed to the *Spectator.* Even during his busy years in Egypt he wrote his *Paraphrases from the Greek Anthology.* He returned to Egyptian affairs in a supplement (1915) to *Modern Egypt.* In 1916 the Government called on him to preside over the Dardanelles Commission. The strain was too great, and after one of the meetings, he collapsed. He died on Jan. 29, 1917.

Lord Cromer married in 1876 Ethel Stanley, daughter of Sir Rowland Stanley Errington, 11th baronet, but was left a widower with two sons in 1898; in 1901 he married Lady Katherine Thynne, daughter of the 4th marquess of Bath.

CROMER, urban district and watering-place of Norfolk, England, 24 mi. N. of Norwich on the L.N.E. and Mid. and G.N. Jt. railways. Pop. (1938) 3,963. Standing on cliffs of considerable elevation, the town has repeatedly suffered from ravages of the sea. A wall and esplanade extend along the bottom of the cliffs, and there is a fine stretch of sandy beach. The church of St. Peter and St. Paul is Perpendicular (largely restored) with a lofty tower. Cromer is a coast-guard and life-boat station, and there is some fishing. Area 1.8 sq.mi.

CROMLECH, a megalithic structure consisting of a large horizontal capstone supported on uprights, forming part of a prehistoric stone chamber. In Britain the word is practically synonymous with *dolmen,* while in France it is applied to the collection of such stones usually known as a "stone circle" (*see* STONE MONUMENTS, PRIMITIVE).

CROMORNE, also **CRUMHORNE,** an ancient wind instrument of wood in which a cylindrical column of air was set in vibration by a reed. The lower extremity was turned up in a half-circle, and from this peculiarity it gained the French name *tournebout.* The reed of the cromorne was not, like that of the bassoon, in contact with the player's lips, but was covered by a cap pierced in the upper part with a raised slit against which the performer's lips rested, the air being forced through the opening into the cap and setting the reed in vibration. The reed itself was therefore not subject to the pressure of the lips, and the compass of the instrument was in consequence limited to the simple fundamental sounds produced by the successive opening of the lateral holes. The cromornes, which were made in various sizes, were in very general use in Europe from the 14th to the 17th century.

CROMPTON, SAMUEL (1753–1827), English inventor, was born on Dec. 3, 1753, at Firwood, near Bolton-le-Moors, Lancashire, and went into a spinning-mill as a lad. The defects of the spinning jenny inspired him with the idea of devising something better, and for five or six years the effort absorbed all his spare time and money, including what he earned by playing the violin at the Bolton theatre. About 1779 he succeeded in producing a machine which span yarn suitable for use in the manufacture of muslin, and which was known as the muslin wheel or the Hall-in-the-Wood wheel, and later as the spinning mule. After his marriage in 1780 a demand arose for the yarn which he made at Hall-in-the-Wood, but he could not afford to take out a patent and decided to reveal the secret of his machine, on the promise of a number of manufacturers to pay him for the use of the mule, but all he received was about £60. He then resumed spinning on his own account, but with indifferent success. In 1800 a sum of £500 was raised for his benefit by subscription, and in 1812 parliament allowed him £5,000. With this money he embarked in business, first as a bleacher and then as a cotton merchant and spinner, but without success. In 1824 friends bought him an annuity of £63. He died at Bolton June 26, 1827.

CROMPTON, an urban district of Lancashire, England, 2½ mi. N. of Oldham. Pop. (est. 1938) 13,360. Area, 4.5 sq.mi. Textile industries (chiefly spinning) are carried on, and there are coal mines.

CROMWELL, HENRY (1628–1674), fourth son of Oliver Cromwell, was born at Huntingdon on Jan. 20, 1628, and served under his father in the latter part of the Civil War. In 1650 he took some troops to assist Oliver in Ireland and was one of the Irish representatives in the Little, or Nominated, Parliament of 1653. In 1655 he was appointed major-general of the forces in Ireland and a member of the Irish council of state. On the departure for England of the lord-deputy, Charles Fleetwood, in Sept. 1655, Henry was left for practical purposes the ruler of Ireland. He diverged from Fleetwood's policy, in protecting the interests of the English settlers and in holding the scales evenly between the different Protestant sects; and his undoubted popularity in Ireland is attested by Clarendon. In Nov. 1657 Henry was made lord-deputy; but on the succession of Richard Cromwell to the office of protector, at his father's death, although Henry was now appointed lieutenant and governor-general of Ireland, it was only with great reluctance that he remained in that country. Having rejected proposals to assist in the restoration of Charles II., Henry was recalled to England in June 1659 just after his brother's fall. He resigned office at once, and although he lost some property at the Restoration, he was allowed to keep the estate he had bought in Ireland. His last years were passed at Spinney Abbey in Cambridgeshire, where he was unmolested by the Government and where he died on March 23, 1674. In 1653 he married Elizabeth (d. 1687), daughter of Sir Francis Russell, and left five sons and two daughters.

See J. Waylen, *The House of Cromwell* (new ed. 1897).

CROMWELL, OLIVER (1599–1658), Lord Protector of England, was the son of Robert Cromwell of Huntingdon and Elizabeth Steward. His father was the great-grandson of Morgan Williams, who married the sister of Thomas Cromwell, the ruthless Minister of Henry VIII. Richard, the son of Morgan, acted as agent to Thomas Cromwell, and took his name. The son of Richard, Henry, inheriting the spoils of the abbey of Ramsey and the priory of Hinchinbrook near Huntingdon, by his splendid profusion earned the name of the Golden Knight, and his eldest son, Sir Oliver, by like extravagance, almost completed the dissipation of those fine properties. Robert, the younger brother, was of a serious character, and lived on his modest portion at Huntingdon. He is alleged to have been a brewer, but his main occupation was no doubt that of a gentleman farmer.

Oliver received his education at Huntingdon School under Dr. Beard, whose belief in the direct interposition of God for the punishment of the wicked may have influenced him throughout all his life. In 1616, Cromwell entered Sidney Sussex College, Cambridge, where he would come again under puritanical influence; but in 1617, on the death of his father, he returned to Huntingdon, to take up, as the only surviving son, the care of his mother, his five sisters and the family affairs. He married in 1620 Elizabeth Bourchier, the daughter of a city merchant, who survived him.

Save for this great event, what is known of his life between 1616 and 1628 is trivial. If he studied law, as is alleged, it was to little effect, for many years later he confessed haughtily that he knew as little of arithmetic as of law. There can be no doubt that he loved horses, as did his son Richard. He may have studied the art of war as set forth in the accounts of the practice of Gustavus, for military experts find him soon after his first appearance in the field strangely skilled in war according to the best manner of the period. There is no doubt that at some time, or at many times, he suffered from religious depression and the searing conviction of sin. It may be inferred that he passed through that spiritual crisis known as conversion, for on his death-bed he drew hope from the recollection that at one time he had certainly been in grace. There is evidence that he was forward in protecting his humbler neighbours against legal and other injustice. But the chief proof of his active, useful and respected life, is in his election as member for Huntingdon to the Parliament of 1628. His family connections were many and widespread; at Westminster he would meet his cousins, John Hampden and Oliver St. John. By their side he was introduced to religious and political controversy on the larger scale. After the dissolution of that Parliament he disappears once more from the public view.

In 1631 he sold his land near Huntingdon and moved to St. Ives, where his business was that of a grazier on hired land. In 1636 he succeeded to the estate of his maternal uncle, Sir Thomas Steward, and to his profits and activities as farmer of the Cathedral tithe of Ely. Huntingdon, St. Ives, Ely, each is within an easy ride of Cambridge, such journeys were taken often, not only for private but for public affairs; important relations must have been formed somehow, for in 1640 he was elected as burgess for Cambridge. A contemporary gives this sketch of his appearance in the House:—"very ordinarily apparelled in a plain cloth suit made by a country tailor, his linen plain and not clean, his hat without a hat-band. His stature of a good size, his sword stuck close to his side, his countenance swollen and reddish, his voice sharp and untuneable, and his eloquence full of fervour, for the matter would not bear much of reason, . . . yet he was very much hearkened unto." Indeed, though no orator, he was active in the House from the first; he moved the second reading of the bill for Annual Parliaments (1640), and served on many committees. He worked with St. John, Harry Vane, Arthur Hazelrigg and Edward Dering for the Root and Branch Bill—to destroy the power of the bishops and transfer it to commissioners to be named by Parliament. In Nov. 1641, he carried a motion appointing the Earl of Essex to command the train-bands of England, south of Trent, and in Jan. 1642, for a committee to put the kingdom "in a posture of defence." It is probable that his zeal for freedom of religion (as conceived by himself) was greater than his love of civic liberty; on the other hand, he declared that, if the Grand Remonstrance had not been carried, he would have sold all and left the country; it is characteristic of the man that he was associated with the two first practical measures for mobilizing armed force against the King.

When Charles had left London (Jan. 1642), when his Queen had left England, when Hotham, the Governor, had refused to admit his monarch within the walls of Hull, war was in sight. The 19 propositions of the Parliament sketched a new constitution for the kingdom which Charles could only accept under duress. On his rejection of those terms Parliament set up a Committee of Safety, and resolved to raise 10,000 men; Essex was made their General. The time for action had come. While one party was endeavouring to enforce the King's Commissions of array, and the other to carry out the ordinance of the Parliament for control of the train-bands, Cromwell was not inactive. He held Cambridge and its resources against the King and for the Parliament; he raised a troop of 60 horse and in August joined the army of Essex. We may assume that he chafed at the delays of his chief, who allowed the king to collect an army and only moved when the king started to march on London. At Edgehill where the forces met (Oct. 23, 1642) Cromwell was present, and his troop stood firm when others had fled. As a leader of cavalry he then learnt a lesson from the errors of Rupert, which served him well thereafter. He also formed the conviction that for this great cause troops must be found with a spirit which would carry them "as far as gentlemen would go; such men as have the fear of God before them." And in Jan. 1643 he asked leave for himself and his men, betook himself to the Eastern Counties, where he was known, and began his work with the Eastern Association which had been shortly before founded by Ordinance of Parliament. Cambridge was its headquarters. By May 1643 he had 12 troops chosen and disciplined to his own high standard. With them he beat twice his own numbers at Grantham, "charging fiercely at a pretty round trot." After a short spell at Nottingham, where the force, assembled for the aid of the Fairfaxes in Yorkshire, was paralysed by treachery, Cromwell returned to the Eastern Association, now assailed by the Royalists, and collected a force for the relief of Gainsborough, where he won a noteworthy success (July 28, 1643). Confronted then with Newcastle's main army, he effected a masterly retreat to Lincoln, and prepared to levy a new force to be led by the Earl of Manchester. Thomas Fairfax shipped his horsemen from Hull and joined Cromwell; under Manchester, the two moved to recover Lincolnshire, and won the day at Winceby, where Cromwell's horse was killed under him. Lincoln and Gainsborough were recovered, and Ferdinando, Lord Fairfax of Cameron, by a sally, raised the siege of Hull. In Jan., 1644, Cromwell was appointed Lieut.-General for the Eastern Association, and in the following month he became a Member of the Committee of Both Kingdoms. He is reported to have had supreme influence with Manchester, and for a time he inspired his chief with his own vigour, and the army with his own discipline and spirit.

In 1644 the Scots under Leslie crossed the border; in April the King's northern army under Newcastle was driven into York, where it was besieged by Leslie and the Fairfaxes. Waller and

Essex were preparing to advance on Oxford, when the army of the Eastern Association took the field in Lincolnshire. In June Manchester joined the armies besieging York. Cromwell was then in command of 3,000 cavalry. But in June Rupert, marching east from Lancashire with a superior force, drew off the besieging armies to meet him, eluded them, and entered York. The Parliamentary armies, thus baffled, retreated southwards; Rupert followed, and forced an engagement at Marston Moor (July 2). The honours of this victory fell to Cromwell, who commanded the cavalry on the left. Victorious after hard fighting over Rupert's horse, he returned to find the right wing of his own party routed and the centre broken, though Manchester's brigades of foot and the Scots were maintaining a valorous struggle. Taking the enemy in the rear, he defeated first the Royalist Horse on the enemy's left, and then turned to attack the infantry who were pressing the Scots back. The Scots and David Leslie deserve high credit, but the highest meed must fall to Cromwell. The three generals, Leven, Manchester and the elder Fairfax, had fled as from a complete rout. In the result, of about 18,000 men, Rupert re-assembled about 6,000, and York, the prize at stake, surrendered a fortnight later. It was at this battle that Rupert gave the name of Ironsides to Cromwell's troops, which could not "be broken or divided."

Meanwhile things had gone badly in the west. Charles had defeated Waller at Cropredy Bridge (June 29). He then followed Essex into Cornwall, while the army of the Eastern Association under Manchester lay idle at Lincoln; the commander himself unwilling to push the war home; Crawford and Cromwell estranged by political and religious dissension. The force of Essex was destroyed, and when Charles moved towards Oxford, Manchester was reluctant to accept the order to march against him. "This army," he said, "cannot be commanded by the Parliament without the consent of the Association which raised it for its own defence." When the armies ultimately met at Newbury, the command on the side of the Parliament had been entrusted to a Committee. In consequence the attack was ill-planned (Oct. 27), and Charles was able to reach Oxford. Cromwell blamed Manchester as unwilling to push the attack against Charles to the extreme conclusion. Manchester replied in kind. The Scotch were ill-disposed to Cromwell, as he to the Presbyterian cause. The incident seemed about to lead to an alliance directed immediately against Cromwell. Cromwell evaded rupture by urging reorganization of the army and a change in its commanders. In the result, the second Self-denying Ordinance was adopted in April, 1645, which required all members of either House holding office to lay down their commissions within 40 days, but did not exclude the possibility of re-appointment. Sir Thomas Fairfax was made general of the New Model army. Cromwell with his regiment was put under Waller, whom he readily accepted as his chief. His command was prolonged on May 10 for another 40 days, and on June 10, at the urgent request of Fairfax, he was named as Lieut.-General.

The essence of the New Model army was a single command, corporate unity without regard to local interests, regular supply and regular pay for officers and men. The numbers were fixed at 22,000, with some supernumeraries, and impressment was ordered to complete this total. The necessary money was to be raised by monthly levies on the counties. The changes in the high command were important, but the changes in organization were equally important. It would appear that these great measures of reform were the work of Parliament actuated then by constructive common sense. The scheme accorded with Cromwell's ideas. He acted with discretion throughout. He refused to be drawn into a quarrel with Manchester. He refused to antagonize the Scots and their friends on the religious question. The thorny question of the Covenant was evaded. The Ordinance appeared at first sight to exclude Cromwell from command; it turned out to admit him as if by a deliberate manoeuvre. He cannot in his heart have been prepared to stand aside, but there is found no evidence of subtle intrigue on his own part. On this occasion, as on many others, the drive of circumstances and the potency of personality shaped events so as to push him to the front. As a passive waiter on the direction of Divine Providence, his attitude mitigated opposition and disarmed jealousy, leaving him ready to accept what presented itself as a duty.

The New Model army took some time to get into shape, and its action was hampered by orders from the Parliamentary committee. At length Fairfax was given a free hand to advance against the forces of Charles and Rupert which had recently taken and sacked Leicester. Just in time Cromwell joined up at Naseby with 600 horse and took command of the cavalry. The King's forces were less in numbers but their foot were veterans, while of the infantry on the side of Fairfax a large part were raw conscripts. The attack of the Royalist foot (June 14) was at first successful; and on the parliamentary left Rupert broke the Parliamentary horsemen under Ireton. But Cromwell, on the right, with his troopers drove all before him, and then turned on the Royalist foot, who after a resolute defence were defeated and captured almost to a man. The Parliamentary army then formed up again and attacked the Royalist horse which had gathered once more; unsupported, they could not stand; they fled and the pursuit continued for many miles. The King took refuge in Wales. A month later, Fairfax and Cromwell defeated Goring at Langport, and drove him into Bridgwater, which was taken by assault. A year was then spent in reducing cities, forts and isolated garrisons, until the war was terminated by the surrender of Oxford on June 24, 1646. King Charles took refuge with the Scots at Newark. His cause was greatly damaged by the discovery of his attempts to obtain aid from Lorraine, from France, from Denmark and from Ireland.

Up to this time Cromwell had shown a natural aptitude for war. Vigorous in action, rapid in decision, steadfast in self-control, firm in discipline, but master of the hearts of his men, what he had learnt by study he had perfected in the field, on the march and in the camp. When things looked hopeless, in April 1647, he seriously thought of accepting service abroad under the Elector Palatine. Two things kept him at home: his zeal for freedom of belief, within his own arbitrary limits—and his devotion to the army with which he had served. These two master motives forced him into politics. The Parliament, having abolished Episcopacy and sequestrated the lands of the Church, seemed about to force upon the nation another religious tyranny—a Presbyterian rule in religion—a religion formulated by Parliament. During the year following the surrender of Oxford, first the Scots had endeavoured to persuade the King—their guest or prisoner—to accept their own Presbyterian system. When they had failed with Charles, they made terms with the Parliament for their arrears of pay, handed over the King, and retired to their own country (Jan. 30, 1647). Charles was taken in custody to Holmby in Northants. Parliament thought that an agreement with the King on a basis of Presbyterianism and the control of the armed forces of the nation was in sight; they accordingly proposed to disband a great part of the army without security for their arrears of pay, and to send 12,000 of the remainder to Ireland. The army elected "agitators" to focus their resistance; and Cromwell, Skippon, Ireton and Fleetwood were sent by the Parliament to headquarters at Saffron Walden, to deal with the malcontents. Cromwell discharged his duty faithfully, attempted to pacify the soldiers, and laid their case before Parliament; but disbandment without satisfaction was ordered for June 1. The army refused to disband; and Cromwell joined the army. On the same day the King was seized at Holmby, and passed into the custody of the army.

The army forthwith organized itself. A Council was set up to represent the army in political matters:—the general officers with four representatives from each regiment. In military matters the general and his council of war were to be supreme. Order and discipline were soon restored. The army then advanced towards London. Toleration was demanded and proposals were made for a new Parliament to be elected on a more equitable scheme of constituencies and representation. Under this pressure Parliament rescinded its orders for disbandment, discharged the soldiers enlisted to resist the army and restored the old committee for the Militia of London which had been displaced by Presbyterians; but the London mob took charge, and forced the repeal of these orders and the issue of an invitation to the King to come to

London. A number of the legislators took refuge with the army, which advanced towards London to "restore the liberty of Parliament." A regiment of cavalry in Hyde Park persuaded Parliament to return to their last position but one. The most ardent Presbyterians took refuge on the continent.

Cromwell, on behalf of the army, now undertook to negotiate with the King. The "Proposals" made to him were more lenient to the Royalists than those of the Parliament. But they involved the reservation to the Parliament for ten years of the control of the militia and the appointment of officers of State, and the limitation of the royal power by a co-ordinate Council of State. They excluded control, Episcopal or Presbyterian, of religious opinion. In details the Council of the Army showed itself conciliatory; but, whatever amendments might be allowed, the King saw his power in the Church annulled, and his power in the State curtailed. He thought he could do better by playing off the army against the Parliament. On the other hand the firebrands of the army thought Cromwell and Ireton too indulgent. The "Agreement of the People" was put forward in Oct. 1647, demanding a new parliament, new constituencies, manhood suffrage, triennial Parliaments, government by Parliament under certain reservations (stated but without sanction or guarantee), and without any mention of the King. This Cromwell and his friends were strong enough to put aside. It was Cromwell who then laid down that in judging any new political scheme the first thing to be considered was, "whether the spirit and temper of the people are prepared to go along with it." On this ground he judged monarchy best; though not a politician, he had sound political sense. The King had a third party to which he could turn—the Scots. To gain greater freedom in negotiation he escaped from Hampton Court to Carisbrooke Castle in the Isle of Wight (Nov. 1647). Charles counted on the dangerous divisions in the army; these were, however, repressed by Cromwell's courage and firmness. But on Dec. 27 Charles made his treaty with the Scots and rejected the terms of the Parliament, in the vain hope that he would be able to escape to the continent and bring aid thence to his Scottish allies. In Jan. 1648, the Parliament voted to break off all dealings with Charles: in their action Cromwell concurred. Soon afterwards the Second Civil War broke out.

The rising began in Wales. In the north the Royalists, preparing for the army promised by the Scots, seized Berwick and Carlisle. In May, 1648, Cromwell left London for Wales: Pembroke Castle held out for six weeks, till it was starved into submission (July 11). Three days earlier the Scots under Hamilton had crossed the border. The Royalists had risen in Kent and Essex, and the fleet in the Downs had declared for the King. Fairfax dealt with these risings and laid siege to Colchester. In the north Lambert had to give way before the Scots, who moved forward slowly. Cromwell sent part of his force to the aid of Lambert and followed himself with the remainder. They joined forces in the West Riding on August 12. Here he learnt that Hamilton was marching south towards Preston; he marched west "choosing to put ourselves between their army and Scotland." He caught Hamilton with his forces divided. Cromwell destroyed Langdale's division and Hamilton's rearguard, occupied Preston, and set out in pursuit of Hamilton's main force. He followed them almost to Warrington, where there was some hard fighting: the main part of the army were prisoners by August 20; the rest surrendered in detail or escaped in disguise. When Colchester surrendered on August 27, the Second Civil War was in effect concluded.

But there was still work to be done. Cromwell marched into Scotland, and aided by a rising in the west made terms with the duke of Argyll and his partisans which protected England for a time against interference. Meanwhile Parliament had been treating with the King; and preliminaries were agreed on at Newport on Sept. 18. The army feared that peace thus made would put the Presbyterians in power and lead to the dismissal of the soldiers without payment of arrears or indemnity for their acts while under arms. On Nov. 20 the army in the south presented to Parliament a Remonstrance drawn up by Ireton, demanding *inter alia* that the King be "brought to justice for the treason, blood and mischief he is guilty of." The Parliament continued to treat, and action was taken. The King was removed by orders of Fairfax from Newport to Hurst. The officers in London allied themselves with the Independent minority in Parliament to drive out the Presbyterian majority. This was effected on Dec. 6 and 7 (Pride's Purge). Cromwell took his seat with the minority.

The assembly thus constituted had no semblance of legality. It was what is called in revolutionary cant a provisional government. The Council of the Army was another such provisional government. Cromwell was a member of both bodies and the strongest personality in each. He cannot escape the fullest responsibility for the act which followed. Yet it seems certain that he struggled long against the ultimate decision, and there is no reason to question the sincerity of his doubts. At last he could see no way except that which was taken. Nowadays the execution of the King might be defended on the ground that the safety of the people is a supreme interest above all law. If Cromwell justified the act by saying that the Providence of God had cast it upon him, that was the manner of thought which he had learnt from the Old Testament. The mutilated House of Commons, ignoring the House of Lords, appointed an arbitrary tribunal to judge the King, of which not half the members accepted the charge laid upon them. The conclusion was inevitable: no plea of law or right or fact could avail; Charles went to his death on Jan. 30, 1649.

After his death, such House of Commons as remained passed laws abolishing the House of Lords, abolishing the monarchy, and establishing a "Commonwealth or Free State," a Republic, with which Cromwell later dealt as he had with his King according to the law of necessity. But first he had tasks to perform which were more congenial to his nature and his gifts. For the moment he was a member of the Council of State created by the purged Parliament. Many tasks were taken in hand, which had hitherto been perforce neglected; in these activities his influence, where not certain, may be surmised. The navy was reorganized and re-equipped. Discontent and anarchical propaganda were rife in the army and demanded severe measures of repression. Though his faith and wisdom were needed for these and other duties, the Council of State was a competent body and for a time could manage home affairs. Where war was needed, Cromwell had no rival, or plausible substitute. The case of Ireland was the most pressing. The rebellion of 1641 had been exacerbated by the measures of the Parliament, which proscribed the Popish religion and offered two and a half million acres of Irish land to adventurers, as a means of raising funds for the reconquest. With the turmoil and confused intrigue that followed this biography is not concerned—until the time in 1647 when Ormonde, Lord Lieutenant for the King, surrendered Dublin to the Parliament. The reconquest of the island was then planned, but postponed owing to the Second Civil War; after this war Ormonde returned and formed a considerable party of Catholics and Anglo-Irish against the Parliament. The prince of Wales was invited to take the lead. Rupert appeared at Kinsale with his ships. The Republican force in Ireland was confined to Dublin, Drogheda and Derry. The situation was critical, and on March 30, 1649, Cromwell accepted the command of an army of reconquest.

Ormonde had at first considerable success, capturing Drogheda and other strongholds, but on Aug. 2 Michael Jones, commander at Dublin, routed him at Rathmines, and when Cromwell landed at Dublin (Aug. 13) there was no longer an opposing army in the field. The best of Ormonde's troops were in Drogheda; thither Cromwell led his men and stormed the town, putting all its defenders and all Catholic priests to the sword. A few days later Wexford shared the same fate. By the end of the year the coast from Londonderry to Cape Clear was in Cromwell's hands, excepting Waterford; but not much beyond the coast. In January his recall was voted to face the threat of a Scottish invasion; but he did not leave till May. Just before his departure he suffered a severe repulse in an assault on Clonmel—though the place came into his hands by the subsequent retirement of the garrison. The Irish expedition adds little to Cromwell's military fame. The ignorance of Irish history displayed in his public utterances is colossal. Claiming to be a judge "to ask an account of the innocent blood" shed in 1641, he lost all sense of justice through religious rancour; and the "righteous judgment" of which he spoke fell upon those who had no part in the original crimes.

The conquest of Ireland was completed in 1652 by his successors in command. The Cromwellian Settlement—as it is called and rightly called, for he approved its principles—was not completed until 1658. The means of the settlement were the transfer to new owners of the property in land over two-thirds of Ireland; the aim was the conversion of Ireland from a Catholic to a Protestant country; the method was called the impartial administration of justice. The Instrument of Government gave to the Irish representation in parliament, but the representatives were so chosen as to represent, not the Irish, but the English in Ireland. It may be conceded that Cromwell used his influence to mitigate for Ireland the burdens of taxation. For the last three years of Cromwell's life, his son, Henry, was acting as governor in the island; under his rule, some order began to emerge from chaos.

The execution of a Scottish King had touched the Scots on the point of national pride. On hearing the news, they at once proclaimed Charles II. king, not only of Scotland, but of Great Britain and Ireland. His first plan was to use Ireland as a starting point; but first the confusion of parties in Ireland, and afterwards the blows of Cromwell, closed to him this field of action. He landed in Scotland on June 23, 1650, having accepted the Scotch terms. They were that he should impose Presbyterianism on England and Ireland, take the oath to both Covenants, and disavow both Ormonde and Montrose. Cromwell urged on the Council of State that they should forestall the Scots by invading Scotland. Fairfax declined to take any part in such action, and Cromwell was made Captain General and Commander-in-Chief. He entered Scotland at the end of July, and was confronted by David Leslie with an army superior in numbers but inferior in quality. He failed to force Leslie to accept battle. A month so passed, until Cromwell found himself with his back to the sea at Dunbar, with the Scots commanding the road to Berwick. In order to prevent the escape of his enemy by sea, Leslie came down from the hills on Sept. 2. Cromwell's force was much reduced by sickness, and in numbers was half that of the Scotch. But he saw his opportunity and planned his attack with Lambert for the dawn of Sept. 3. Feinting an attack on the Scotch left, he threw the whole of his main strength on their right and centre. When the Scottish right wing had been broken, their centre was rolled up between the hills and a ravine which blocked their left. Three thousand Scots were killed, and ten thousand prisoners were taken. This battle was a masterpiece of tactics, resolutely carried out, with full advantage taken of the ground.

Leslie retired with the remnants of his force to Stirling, while Cromwell occupied Edinburgh and Leith. Lambert was sent against the extreme covenanters in the west. Charles was crowned at Scone on Jan. 1, 1651. Cromwell fell ill, and when at length in July he was able to take the field again, he failed to bring Leslie into action where he lay before Stirling. Accordingly he determined to turn his position, risking or inviting an invasion of England. On August 2 he occupied Perth, having passed through Fife. Here he learnt that the whole Scottish army had started on their march south. Cromwell left Monk, with 6,000 men, to hold Scotland, sent his cavalry under Lambert and Harrison to follow the King, the one in the rear, the other on the flank, and himself marched through Yorkshire, as he went, collecting bodies of the English militia. On Aug. 22 Charles reached Worcester. Meanwhile Cromwell had joined forces with Lambert and Harrison and lay at Evesham. Making good use of his superior strength, he sent Lambert and Fleetwood across the Severn to block the retreat into Wales. Himself he advanced from the south-east towards the city, threatening it on the south and on the east. On Sept. 3, the day of action, Fleetwood advanced to the Teme and engaged the army. Cromwell crossed the Severn by a bridge of boats and took Fleetwood's opponents in flank. This enabled Fleetwood to cross the Teme, and the combined forces "beat the Scots into" Worcester. Charles made a sally on the east against the forces left by Cromwell. Thereupon Cromwell again crossed the Severn and completed his victory. The Scottish foot laid down its arms; the horse retreated towards Scotland, but were hunted down by the local militia and the country folk. No organized body of troops reached Scotland. This campaign shows a high mastery of great strategical movements. All Cromwell's forces were collected at the critical time and place; the intelligence must have been good, and the supply well managed; and in the battle itself the difficulties of the ground were made to help rather than to impede the concerted action of the whole army. Charles escaped as is well known; but there was no more fighting in England while Cromwell lived. Monk completed the conquest of Scotland, and in 1654 the last efforts at resistance were crushed.

On Sept. 12, 1651, Cromwell entered London in triumph. Parliament voted to him a revenue of £4,000 a year, and gave him Hampton Court for his residence. His position was that of Captain-General of the Army, a member of the Council of State and a member of such parliament as there was. He entered now on one of those periods when, as we might say, he waited to be convinced by the logic of events that certain action was necessary, or, as he would himself say and believe, to be "put by the Lord on the doing" of certain work. He was anxious that the Parliament should "period" themselves, *i.e.*, that they should fix a date for the termination of their power by a new election. All the members were loth to resign their power; many clung to the illegitimate profit, patronage and influence, which their position put within their reach. He was anxious that an act of indemnity should be framed for the war-like acts done in the course of the rebellion; such an act of oblivion was passed in February 1652, but, in his opinion, it was unduly limited. He desired a settlement of the Church with due regard to the liberty of conscience. The Parliament offered him a scheme fettered by 15 fundamental principles. They drifted into war with the Dutch, not so much because of the Navigation Act passed by them in 1651, as because of disputes arising out of their claim to the right of search for French goods in Dutch vessels. This war was distasteful to Cromwell, whose mind dwelt on joint action with Protestant princes on the Continent for the restoration and maintenance of freedom of conscience. To meet the necessary expenses of army and navy the Parliament resorted once more to the oppressive and impolitic expedient of confiscating the estates of alleged "malignants." They put the crown on their offences and omissions by hurrying forward a bill for a "New Representative" which would leave the sitting members unchallenged in their seats and the judges of the fitness of any new members who might be chosen. The bill was on the point of passage, when on April 20, 1653, Cromwell drove them from the judgment seat. He followed up this action by dispersing the Council of State, whose authority was dependent on that of the disbanded Parliament.

The only established authority left was that of the Captain-General, under whom a temporary Council of State dealt with the current business. In the hope of securing an assembly of "men fearing God and hating covetousness" he called upon the Congregational churches all over the kingdom to nominate suitable persons. From the list thus supplied, the Council of officers chose 140, including five to represent Scotland, and six to represent Ireland. This body went hopefully and prayerfully to work. It constituted itself a Parliament, and nominated a working Government. It undertook to reform the law and reform the Church. It impeded peace with the Dutch, which Cromwell desired. Its doctrinaire attitude encouraged the extremists and the fanatics. Finally the assembly came to hopeless disagreement over the reconstitution of the Church. Under some influence—not, it would seem, that of Cromwell—a majority decided to resign their powers into the hands of the Captain-General. "My power," as he said later, "was again by this resignation as boundless and unlimited as before." (*See* BAREBONE'S PARLIAMENT.)

A scheme had already been put forward by the officers of the army, called the Instrument of Government. This scheme put the executive power in the hands of a Protector and a Council of State, nominated for life. A fixed revenue was assigned to the Government. Legislation was to be by a Parliament to be summoned not less than once in three years, and to sit when summoned for not less than five months. The Protector was to have the appointment of all magistrates, and the command of the forces by sea and land. Only for some of the very highest offices was the assent of Parliament required, or, if Parliament was not sitting, then that of the Council. For all foreign policy the Protector with his Council were made responsible. A ministry was to be established, but liberty of conscience was given to all Christians except papists and prelatists. In the absence of Parliament, the Protector was empowered to make Ordinances with the consent of the Council. In its original form this scheme gave the name of King to the head of the State; the term Protector was adopted to meet Cromwell's doubts or scruples. After the failure of the Little Parliament, Cromwell accepted the Instrument, and was solemnly installed as Protector on Dec. 16, 1653, in the significant black coat of a civilian. The document itself had no authority except that of the heads of the army and the acceptance of the Captain-General. Its validity rested on the logic of facts, but its construction shows practical wisdom. Its chief provisions stood the test of experience during Oliver's lifetime.

It has been said that the events of 1640 to 1660 proved that the King could not govern this country without a Parliament and that the Parliament could not govern without a King. Cromwell's experience under the Instrument of Government supports both theses. His own position as a quasi-king preserved the experiment from complete failure; his actions proved his sincere desire to work in concert with some kind of parliament. But he was not invested with the magic of kingship; those who obeyed his orders had not the legal protection given by statute to those whose acts were covered by the commands of a *de facto* king; and the parliaments which he could bring together lacked the valid title of a royal summons. Owing to the restrictions on free election necessitated by the political situation, Parliament could not claim the full support of the people; and the traditions of the Long Parliament did not encourage harmonious working between Parliament and Protector. It is probable, indeed, that the Protector himself was not well-fitted to work in with popular institutions.

Under the Instrument, Cromwell with his Council had authority to issue Ordinances having the effect of law when parliament was not sitting. Thus from Dec. 1653 until Sept. 1654, there was an opportunity of clearing many difficulties out of the way. Peace was made with Holland in April 1654. The union of the three kingdoms was enacted and provision made for the government of Scotland and Ireland. The attempt to reform the law, civil and criminal, cannot be regarded as successful. Cromwell had not the lucid and logical mind of a Napoleon; the mentality of the English lawyers did not lead them to favour his projects of reform or to assist in their realization. The reform of the ministry was more after his heart. It was tolerant within the limits of the time. A body of "Triers" was appointed to examine the fitness of candidates for livings: without their certificate none was in future to be admitted to a benefice. Presbyterians, Independents and Baptists were eligible as Triers, and from the point of view of doctrine members of any of these sects were acceptable. Grace and godly conversation were the main titles to acceptance. Another body was appointed to weed out the unworthy incumbents. Liberty of worship was allowed to all who "do profess faith in Jesus Christ," excepting papists and prelatists. In practice, the prelatists were little molested, except when the Royalists were active in conspiracy. Cromwell would willingly have extended some indulgence to the Catholics, but the public opinion of the country was too strong for him. Such favour as he showed to Jews and Quakers was in advance of his age, and could not be too openly manifested. He refused to abolish tithe, and recognized the rights of patrons, subject to the review of the Triers. He encouraged and protected the universities, and fostered and supervised the maintenance of schools. By temperament a religious fanatic, in an age of religious war, tired out himself in the bitterest religious strife, he yet made no war upon opinions but on the harmful acts to which opinions led.

When Cromwell became Protector, he was master of a powerful standing army. He had a stronger fleet than any English ruler before him. That fleet had been first built up to deal with the remains of the Royalist navy led by Rupert. It had driven Rupert to the Mediterranean, it had pursued him thither and destroyed his power. It had recaptured the Scilly Islands, Jersey and Guernsey, from other Royalist freebooters; it had reduced Barbados and the West Indian islands and received the submission of Virginia and Maryland. In 1652 there was in effect between England and France a state of war. Since 1652 there had been war with the Dutch, in which the English had more and more the advantage. At the end of 1652 the French king announced the recognition of the British Commonwealth; but mutual seizure of merchant vessels did not cease. After peace had been made with the Dutch in April 1654, the situation was still difficult. Cromwell settled his disputes with Denmark and Portugal, and concluded an alliance with Sweden. He hoped to form a league of Protestant Powers to further religious freedom in Central Europe. But meanwhile he received tempting offers both from France and Spain, who were then at war. Another man might have planned to win popularity by maintaining peace, reducing forces and remitting taxes. But Cromwell was a man of war and had a powerful instrument ready to his hand. The God in whose direct guidance he had faith was a God of battles, by whom power was given that thereby the truth might be spread. Spain was identified in his mind with the extremest school of papistical fanaticism. Yet he played with the idea that by the support of Spain he might win advantages for the Huguenots in France. He also tried to obtain from France recognition of his right to intervene in favour of the Huguenots if their liberties were infringed. Obtaining no satisfaction from either side, he attacked the Spanish colonies in the west without ceasing to capture French ships. Meanwhile Blake in the Mediterranean displayed his country's power, bombarded the castles of the Dey of Tunis, and burnt his ships. When, in 1655, news came of the massacre of the Vaudois by the troops of Savoy, he offered to France his alliance in return for her good offices on behalf of the victims. Spain declared war in consequence of the Protector's attacks on the West Indies; and the treaty with France was concluded (Oct. 24, 1655). The war with Spain was vigorously conducted. Treasure ships were captured or sunk, and Jamaica was occupied. In 1657 Cromwell agreed to join with France in an attack on Spain in Flanders. Mardyke was taken on October 3, 1657, and handed over to Great Britain. In June of the following year the English played a prominent part under Turenne in the Battle of the Dunes. The capture of Dunkirk followed, and Charles's hopes of invading Britain with Spanish help were shattered.

Meanwhile Cromwell was pursuing his plans for furthering the Protestant cause in Central Europe. But he entirely miscalculated the situation. Gustavus of Sweden, whose cause he espoused, was as ready to swallow up Protestant Denmark as Catholic Poland. Protestant Brandenburg saw in Gustavus a rival, an enemy, rather than a friend. The Dutch were more interested in their own commerce than in the propagation of the faith. In truth, the spirited foreign policy of Cromwell was inspired by ignorance and inexperience. The friendship of France was dependent on the needs of the moment; once those needs had been served she was not likely long to endure an English foothold on the southern shore of the Channel. Meanwhile, the expense of all this activity increased the financial difficulties in which the Protectorate was involved.

Cromwell's colonial adventures had little more substantial success. The disastrous attempt to conquer Hispaniola was not compensated by the possession of Jamaica until many years had passed. But action in this district was harmonious with the destiny of Britain as afterwards worked out, while the subsequent sale of Dunkirk was more profitable than its possession could ever have been, and the engagements contemplated in Central Europe would have been perilous if they had not proved ineffectual. Neither Cromwell nor his advisers, it must be remembered, had any traditional knowledge of the art and practice of international politics. Yet even his enemies admitted that England under the Protector was feared and respected in Europe as she had not been since the time of Henry V. Though Oliver ran some risks and entertained some projects that a more experienced ruler would have avoided, yet in action he never hazarded more than he could afford and seldom lost his stake—except perhaps at Hispaniola.

Cromwell entered upon his public career as a champion of the Parliament against the King. Yet from 1647 onwards he was in constant conflict with parliament when there was any parliament to dispute with. Pride's Purge may not have been his work, but he certainly accepted its result, and he acknowledged the authority of the purged remnant. The relations of the Protector with parliament have a permanent as well as a passing interest. This was the age when the prestige of parliament was established, and its evolution as a sovereign body was well begun before the Restoration.

Cromwell drew all the legal authority that he had from the parliament which constituted him Captain-General. The Army itself, on which his power was founded, was the creation of parliament. Although he might expel parliaments, nominate them, reform them, summon them, pack them, hector them, dissolve them, he felt in his heart, and rightly felt, that through parliament alone could a stable and peaceful settlement be reached. That he could not reach it by this means proves in him the lack, which is otherwise patent, of supreme political art. But the task of guiding an inexperienced assembly, inflamed by recent conflict, exalted by success and torn into tatters by religious dissension, religious fever, religious hatred, was, perhaps, beyond the wit of man. His own "Independent" views on religion had their anarchical repercussion in politics; if authority be denied in religion, where can its true basis be found? His advisers who wished him to assume the kingship, his own instinct that impelled him that way, were right in so far as parliament was concerned. The magic and the mystery of a king were sorely needed: they vanished when the Head of the State came down into the arena as a partisan. He needed Ministers—as a screen and as a veil—to fight his parliamentary conflicts, to exercise on his behalf parliamentary persuasion, to carry through parliamentary negotiations and consolidate a party in the House. It must be admitted that his parliaments, even with such expert assistance, would not have been easy either to pull or to push.

The "Barebone's" Parliament, the Parliament of Saints, was ridiculous from its birth (1653), and departed unhonoured and unregretted. The first Parliament of the Protectorate (1654) spent its time in digging under its own foundations. It drew from Cromwell an interesting declaration of the fundamental principles of the Constitution necessary for their joint work. Government must be by a single person and parliament: the control of the armed forces must be divided between Protector and parliament; parliaments must not have the power to perpetuate their own term of authority: they must not interfere with the liberty of conscience. Since the parliament declined to observe these restrictions—especially the liberty of belief—and to make adequate provision for the army, it was dismissed after 20 weeks. The Instrument said five months; by reckoning in lunar months the Protector saved himself from 13 bad days.

The year 1655 was a troubled year—with plots of Royalists and plots of fanatics; it became necessary to shut up no less a man than Major-General Harrison. Fortunately Cromwell's secret service, of which Thurloe was the organizer, was very efficient. In spite of these troubles Cromwell was able to reduce the standing force. In compensation he set up a military police organized in 12 districts, each under a Major-General, to forestall conspiracy, and watch over public morals. The standing militia of 6,000 men, which was put at the disposal of these Governors, was paid for by levies of ten per cent on the revenues of the Royalist country gentlemen. Thus the policy of reconciliation was for the time abandoned. In addressing Parliament in 1654, Oliver had claimed that the sheriffs, the justices of the peace and the other local officers, had accepted his authority, and that the judges had taken new commissions from his hand. Now the lawyers and the judges began to show scruples; there were resignations, and resistance; more accommodating judges were found; inconvenient counsel were punished. "I am as much for government by consent as any man," said Cromwell, "but where shall we find that consent?" Failing consent, what remedy but force?

In 1656 Cromwell called another Parliament. It was thought necessary to exclude 100 of the elected members. Even by the vote of the submissive remainder, the Major-Generals and the "decimation" by which they were maintained were condemned. At length, in March 1657, by a majority of two to one, a new draft constitution—the Humble Petition and Advice—was passed and presented to the Protector. Cromwell was to take the title of King, and to name his successor. The members of the Council and the chief officers of State were to be nominated by him, subject to the consent of parliament. There was to be a Second Chamber, its members to be nominated by the Protector and approved by the Commons. There was to be a permanent revenue, with a special vote for three years to cover the cost of the war. Elections to parliament were to be controlled by parliament itself and not by the Protector or his council. After some weeks' hesitation, Cromwell accepted the constitution, but under pressure from his most trusted officers he declined the "title of king." Cromwell desired the kingship for the greater security of the settlement which it offered. The lawyers desired a king for the legal and constitutional implications attached to the name. The conjecture may be hazarded that the soldiers disliked it because the lawyers and civilians desired it; he was their Cromwell, and they were not willing to share him with the civilians. But no doubt in some of the soldiers republican sentiment was strong. As Cromwell did not live long, the decision was not so important as it appeared. In January 1658 parliament met again. The situation was not improved. About 40 of Cromwell's chief supporters had been called to the Upper House. The fire-brands excluded in 1657 had now to be admitted. The Commons at once began to challenge the constitution, and especially the position of the "other House." Feeling began to rise outside the House, and after a fortnight Cromwell sent his last parliament about their business.

During his last year he was at the culmination of his power and his glory. The Battle of the Dunes was fought on June 4, 1658, and peace with Spain was now in sight. Sir Charles Firth says that "the history of the Protectorate is the history of the gradual emancipation of the Protector from the political control of the army." The most difficult of the officers had been gradually eliminated. The fanatics had been purged out of the ranks. The army had become professional. The military opposition to the assumption of the kingship in 1657 was perhaps the last kick. Finance was embarrassing, the floating deficit was great; but with peace the deficit might be reduced. The heavy and unjust taxation was a greater danger. If Cromwell had lived to meet the parliament which he had summoned for December in the year of his death, he might perhaps have been able to reduce the expenditure and make a more equitable distribution of burdens. If all the circumstances be taken into account, his financial administration deserves praise rather than blame. But he was already aging: though not yet 59, he had lived a hard life, and had been weakened by serious illnesses. His later handwriting shows clear signs of the shock of years and toil. Had he lived longer it is doubtful whether he could have had the strength to achieve a peaceful settlement. On the magic date of Dunbar and Worcester, September 3, at the height of his renown, he died (1658). The frame of his constructive work was swept away, but the impress of his deeds and personality has helped to shape the life of his nation through the succeeding centuries.

The outward history of Cromwell gives the true measure of the man as a fighting and governing force. On the moral side, from the days of the Restoration until the 19th century the verdict of Clarendon was generally accepted—"a brave, bad man, with all the wickedness for which hell fire is prepared." Yet Clarendon relents in a measure—"he had some virtues which have caused the memory of some men in all ages to be celebrated." In the first half of the last century W. S. Landor and John Forster agreed that he "lived a hypocrite and died a traitor." Carlyle by his publication of the Life and Letters in 1845 did a service to history—though he somewhat prejudices the cause of his hero by his smoky rhapsodies. The charge of hypocrisy, when not inspired by party passion, arose from a misapprehension. Cromwell lived in an age when religion had been inflamed to white heat by the revolt against the Church of Rome. Authority had been shaken or thrown down; the right of private judgment was set in its place. Cromwell, like others, believed without qualification that the Old Testament, as well as the New Testament, was the authentic word of God. It would have been blasphemy in his eyes to call in question the morality of the Old Testament or the mental attitude of the belligerent Psalms. He believed that the truth of God could be reached by any man who would faithfully and prayerfully study the word of God. He needed no philosophic dogma to reconcile divergent interpretations. Every man must painfully and sincerely seek; and what is revealed to each comes from God and is truth for him: on that he must act. He believed in the immediate government of the fortunes of men by God. If the virtuous and the faithful suffered misfortune it was a trial for their good, or perhaps a fatherly chastisement for their want of faith, their weakness and their shortcomings. If they were successful in their undertakings it was a direct sign of the favour of the Almighty. If they were in doubt as to the course that it was right to follow, they must seek the Lord with prayer and humility until the path was shown to them from on high. Thus it happened that over and over again when Cromwell was in inward doubt he would speak obscurely, gropingly, this way and that, as though endeavouring to mask his purpose: in truth the purpose had not been formed. When he had reached decision his utterance was plain enough: when prompt action was needed, he was such that decision came to him as a flash: it might well seem to be a flash straight from the God whom he worshipped. His career is to all of us marvellous; to him it might well seem miraculous. He did not look for explanation in the recesses of his unexplored mentality or in any star or luck. He believed that his whole course was directed by God, and that his deeds and inspirations were crowning mercies of the Most High. The language of the Scripture, which was the only literary language he knew well, came to his lips more easily than any other. Thus, what in others might have been hypocrisy was in him the expression of complete faith in the language of faith. That he was in himself a good man is shown in this: that, although highly tried as a revolutionary leader, he has few crimes to his score; he was not greedy, or lustful, or cruel, nor unmerciful—save only, as in Ireland, where his fanatic zeal overmastered his humane qualities. His last biographer, Sir John Fortescue, says: "It is from Cromwell that we derive the origin of our military discipline and especially the great tradition that an army marching through a country must take nothing without payment." In his private life he was a good son, husband and father; he could be cheerful, jovial and merry; he was no ascetic: he was a lover of music. The words of Clarendon—"he possessed a wonderful understanding in the natures and humour of men" explain a great part of his success. (S. Ls.)

CROMWELL, RICHARD (1626–1712), lord protector of England, eldest surviving son of Oliver Cromwell and of Elizabeth Bourchier, was born on Oct. 4, 1626. He served in the parliamentary army, and in 1647 was admitted a member of Lincoln's Inn. In 1649 he married Dorothy, daughter of Richard Mayor or Major, of Hursley in Hampshire. He represented Hampshire in the parliament of 1654, and Cambridge university in that of 1656, and in Nov. 1655 was appointed one of the council of trade. But he was not brought forward by his father or prepared in any way for his future great position, and lived in the country occupied with field sports, till after the institution of the second protectorate in 1657 and the recognition of Oliver's right to name his successor. On July 18 he succeeded his father as chancellor of the University of Oxford, on Dec. 31 he was made a member of the council of state, and about the same time obtained a regiment and a seat in Cromwell's House of Lords. He was received generally as his father's successor, and was nominated by him as such on his death-bed. He was proclaimed on Sept. 3, 1658. Richard not being "general of the army as his father was," his elevation was distasteful to the officers, who desired the appointment of a commander-in-chief from among themselves, a request refused by Richard. The officers in the council, moreover, showed jealousy of the civil members, and to settle these difficulties and to provide money a parliament was summoned on Jan. 27, 1659, which declared Richard protector, and incurred the hostility of the army by criticizing severely the arbitrary military government of Oliver's last two years, and by impeaching one of the major-generals. A council of the army accordingly established itself in opposition to the parliament, and demanded on April 6 a justification and confirmation of former proceedings, to which the parliament replied by forbidding meetings of the army council without the permission of the protector, and insisting that all officers should take an oath not to disturb the proceedings in parliament. The army now broke into open rebellion and assembled at St. James's. Richard was completely in their power; he identified himself with their cause, and the same night dissolved the parliament. The Long Parliament (which reassembled on May 7) and the heads of the army came to an agreement to effect his dismissal; and in the subsequent events Richard appears to have played a purely passive part, refusing to make any attempt to keep his power or to forward a restoration of the monarchy. On May 25 his submission was communicated to the House. He retired into private life, heavily burdened with debts incurred during his tenure of office, and narrowly escaping arrest even before he quitted Whitehall. In the summer of 1660 he left England for France, where he lived in seclusion under the name of John Clarke, subsequently removing elsewhere, either (for the accounts differ) to Spain, to Italy or to Geneva. He was long regarded by the Government as a dangerous person, and in 1671 a strict search was made for him but without avail. He returned to England about 1680 and lived at Cheshunt, in the house of Sergeant Pengelly, where he died on July 12, 1712, being buried at Hursley, Hampshire. According to Mrs. Hutchinson, Richard Cromwell was "gentle and virtuous but a peasant in his nature and became not greatness."

CROMWELL, THOMAS, EARL OF ESSEX (1485?–1540), English politician, the only son of Walter Cromwell, alias Smyth, a brewer, smith and fuller of Putney. He is said to have quarrelled with his father, who had a bad local reputation, and fled to Italy, where he served as a soldier in the French army at the battle of Garigliano (Dec. 1503). He escaped from the battle-field to Florence, where he was befriended by the banker Frescobaldi. He is next heard of at Antwerp as a trader, and about 1510 he was induced to accompany a Bostonian to Rome in quest of some papal indulgences for a Boston gild; Cromwell secured the boon by the timely present of some choice sweetmeats to Julius II. In 1512 there is some slight evidence that he was at Middelburg, and also in London. About the same time he married Elizabeth Wykes, daughter of a well-to-do shearman of Putney, whose business Cromwell carried on in combination with his own.

In 1520 we find him advising Wolsey on legal points and from that date he occurs frequently, not only as mentor to the cardinal, but to noblemen and others when in difficulties, especially of a financial character; he made large sums as a money lender. In 1523 he emerges into public life as a member of parliament. In 1524 he was admitted at Gray's Inn. In 1525 he was Wolsey's agent in the dissolution of the smaller monasteries which were designed to provide the endowments for Wolsey's foundations at Oxford and Ipswich. For these he drew up the deeds, and was receiver-general of cardinal's college, constantly supervising the workmen there and at Ipswich. His ruthless vigour and his accessibility to bribes made him exceedingly unpopular, but he grew in Wolsey's favour until his fall. On Wolsey's disgrace many of the cardinal's servants had been taken over by the king, but Cromwell had made himself particularly obnoxious. However, he rode to court from Esher to "make or mar," as he himself expressed it, and offered his services to Norfolk. Cromwell could indeed be most useful to the government in parliament, and the government, represented by Norfolk, undertook to use its influence in procuring him a seat. This was on Nov. 2, 1529; the elections had been made, and parliament was to meet on the morrow. A seat was, however, found or made for Cromwell at Taunton. He signalized himself by a powerful speech in opposition to the bill of attainder against Wolsey which had already passed the Lords. The bill was thrown out, possibly with Henry's connivance, though no theory has yet explained its curious history so completely as the statement of Cavendish and other contemporaries, that its rejection was due to the arguments of Cromwell.

Cromwell's influence over the government from 1529–1533 has been grossly exaggerated. It was not till 1531 that he was admitted to the privy council nor till 1534 that he was made secretary though he had been made master of the jewel-house, clerk of the hanaper and master of the wards in 1532, and chancellor of the exchequer (then a minor office) in 1533. It is not till 1533 that his name is as much as mentioned in the correspondence of any foreign ambassador resident in London. Cromwell, in fact, was not the author of Henry's policy, but he was the most efficient instrument in its execution. Even in this capacity, his power has been overrated, and he is supposed to have invented those parliamentary complaints against the clergy which were transmuted into the legislation of 1532. But the complaints were old enough; many of them had been heard in parliament nearly 20 years before, and there is ample evidence to show that the petition against the clergy represents the "infinite clamours" of the Commons against the Church, which the House itself resolved should be "put in writing and delivered to the king." The actual drafting of the statute, as of all the Reformation Acts between 1532 and 1539, was largely Cromwell's work, and the success with which parliament was managed during this period was also due to him. It was not an easy task, for the House of Commons more than once rejected Government measures, and members were heard to threaten Henry VIII. with the fate of Richard III.; they even complained of Cromwell's reporting their proceedings to the king. There was, of course, room for manipulation, which Cromwell extended to parliamentary elections; but parliamentary opinion was a force of which he had to take account, and not a negligible quantity.

From the date of his appointment as secretary in 1534, Cromwell's biography belongs to the history of England, but it is necessary to define his personal attitude to the revolution in which he was the king's most conspicuous agent. He was included by Foxe in his *Book of Martyrs* to the Protestant faith; more recent historians regard him as a sacrilegious ruffian. Now, there were two cardinal principles in the Protestantism of the 16th century—the supremacy of the temporal sovereign over the church in matters of government, and the supremacy of the Scriptures over the Church in matters of faith. There is no room for doubt as to the sincerity of Cromwell's belief in the first of these two articles; he paid at his own expense for an English translation of Marsiglio of Padua's *Defensor Pacis,* the classic mediaeval advocate of that doctrine; he had a scheme for governing England by means of administrative councils nominated by the king to the detriment of parliament; and he urged upon Henry the adoption of the maxim of the Roman civil law—*quod principi placuit legis habet vigorem* ("what is the pleasure of the ruler has the force of law"). He wanted, in his own words, "one body politic" and no rival to the king's authority, and he set the divine right of kings against the divine right of the papacy. There is more doubt about the sincerity of Cromwell's attachment to the second article; it is true that he set up a Bible in every parish church, and regarded them as invaluable, and the correspondents who unbosom themselves to him are all of a Protestant way of thinking. But Protestantism was the greatest support of absolute monarchy. Hence its value in Cromwell's eyes. Of religious conviction there is in him little trace, and still less of the religious temperament. He was a polished representative of the callous, secular middle class of that most irreligious age. Sentiment found no place, and feeling little, in his composition.

In 1534 Cromwell was appointed master of the rolls, and in 1535 chancellor of Cambridge university and visitor-general of the monasteries. The policy of the Dissolution has been theoretically denounced, but practically approved in every civilized state, Catholic as well as Protestant. The need for reform was admitted by a committee of cardinals appointed by Paul III. in 1535, and it had been begun by Wolsey. Cromwell was not affected by the iniquities of the monks, except as arguments for the confiscation of their property. He had boasted that he would make Henry VIII. the richest prince in Christendom. He had learnt how to visit monasteries under Wolsey, and the visitation of 1535 was carried out with ruthless efficiency. During the storm which followed, Henry took the management of affairs into his own hands, but Cromwell was rewarded in July 1536 by being knighted, created lord privy seal, Baron Cromwell, and vicar general and vice-regent of the king in "spirituals."

In this last, offensive capacity he sent a lay deputy to preside in Convocation, taking precedence of the bishops and archbishops, and issued his famous injunctions of 1536 and 1538; a Bible was to be provided in every church; the Paternoster, Creed and Ten Commandments were to be recited by the incumbent in English; he was to preach at least once a quarter, and to start a register of births, marriages and deaths. During these years the outlook abroad grew threatening because of the alliance, under papal guarantee, between Charles V. and Francis I.; and Cromwell was allowed to proceed with his one independent essay in foreign policy. Under these circumstances Henry acquiesced in Cromwell's negotiations for a marriage with Anne of Cleves. Anne herself was the weak point in the argument. Henry conceived an invincible repugnance to her from the first; he was restrained from an immediate breach with his new allies only by fear of Francis and Charles. In the spring of 1540 he was reassured on that score; no attack on him from that quarter was impending; there was a rift between the two Catholic sovereigns, and there was no real need for Anne and her German friends.

From that moment Cromwell's fate was sealed; the Lords loathed him as an upstart even more than they had loathed Wolsey; he had no church to support him; Norfolk and Gardiner detested him from pique as well as on principle; his only friend in the council was Cranmer, and the royal favour now failed him. Cromwell did not succumb without an effort, and a desperate struggle ensued in the council. In April the French ambassador wrote that he was tottering to his fall; a few days later he was created earl of Essex and lord great chamberlain, and two of his satellites were made secretaries to the king; he then despatched one bishop to the Tower, and threatened to send five others to join him. At last Henry struck as suddenly and remorselessly as a beast of prey; on June 10, Norfolk accused him of treason; the whole council joined in the attack, and Cromwell was sent to the Tower. A vast number of crimes was laid to his charge, but not submitted for trial. An act of attainder was passed against him without a dissentient voice, and after contributing his mite towards the divorce of Anne, he was beheaded on Tower Hill on

July 28 repudiating all heresy and declaring that he died in the Catholic faith.

In estimating Cromwell's character it must be remembered that his father was a blackguard, and that he himself spent his formative years in a vile school of morals. Yet he civilized himself to a certain extent, and his atrocious acts were done in no private quarrel, but in what he conceived to be the interests of his master and the State. Where those interests were concerned he had no heart and no conscience and no religious faith; no man was more completely blighted by the 16th century worship of the State.

The authorities for the early life of Cromwell are the Wimbledon manor rolls, used by Mr. John Phillips of Putney in *The Antiquary* (1880), vol. ii., and the *Antiquarian Mag.* (1882), vol. ii.; Pole's *Apologia*, i. 126; Bandello's *Novella*, xxxiv.; Chapuy's letter to Granville, 21, Nov. 1535; and Foxe's *Acts and Mon.* From 1522 see *Letters and Papers of Henry VIII.*, vols. iii.–xvi.; Cavendish's Life of Wolsey; Hall's *Chron.*; Wriothesley's *Chron.* These and practically all other available sources have been utilized in R. B. Merriman's *Life and Letters of Thomas Cromwell* (1902). For Cromwell and Machiavelli *see* Paul van Dyke's *Renascence Portraits* (1906), App.

CRONJE, PIET ARNOLDUS (*c.* 1840–1911), Boer general, was born about 1840 in the Transvaal about the time of the Great Trek, and began the insurrection in the Transvaal after 1880 by resisting the distraint for taxes on the goods of a Boer who had declined to pay. He took part in the first Boer War with the rank of commandant, and commanded in the siege of the British garrison at Potchefstroom (1881), though he was unable to force their surrender until after the conclusion of the general armistice. The Boer leader was at this time accused of withholding knowledge of this armistice from the garrison. He held various official positions in the years 1881–99, and commanded the Boer force which compelled the surrender of the Jameson raiders at Doornkop (Jan. 2, 1896). In the war of 1899 Cronje was general commanding in the western theatre of war, and began the siege of Kimberley. He opposed the advance of the British division under Lord Methuen, and fought, though without success, three general actions at Belmont, Graspan and Modder river. At Magersfontein, early in Dec. 1899, he completely repulsed a general attack made upon his position, and thereby checked for two months the northward advance of the British column. In the campaign of Feb. 1900, Cronje opposed Lord Roberts's army on the Magersfontein battleground, but he was unable to prevent the relief of Kimberley; retreating westward, he was surrounded near Paardeberg, and, after a most obstinate resistance, was forced to surrender with the remnant of his army (Feb. 27, 1900). As a prisoner of war Cronje was sent to St. Helena, where he remained until released after the conclusion of peace. He died at Klerksdorp, Transvaal, Feb. 4, 1911. (*See* South African War, 1899–1902.)

CRONUS, an ancient deity, not much worshipped in Greece, probably belonging to the pre-Hellenic population (etymology unknown; ancient explanation = χρόνος, Time, impossible; probably not Greek). His functions are connected with agriculture; in Attica his festival (*Kronia, Hekatombaion 12, i.e.*, harvest-time) resembled the Saturnalia (Accius *ap.* Macrob., *Saturn.*, 1, 7, 37; *cf.* Saturn). In art, he is shown as an old man holding a curved implement, probably originally a sickle, but interpreted as the *harpe* (*see* below).

In mythology, he is son of Uranus and Ge (Heaven and Earth). Uranus, when his children were born, hid them in the body of Ge, who, unable to bear the pressure longer, begged them to deliver her. Cronus alone consented; Ge gave him a curved sword (*harpe*) wherewith he castrated Uranus. Thus (like similar heroes in Maori, Indian and Chinese myth) he separated earth and heaven. He now became the lord of his brothers, the Titans, and shut up the most dangerous (the *Hekatoncheires* or Hundred-handed Ones) in Tartarus. His consort was his sister Rhea. Ge and Uranus warned him that his own child should overthrow him; so he swallowed Hestia, Demeter, Hera, Hades, and Poseidon when they were born. But Rhea hid away the infant Zeus in Crete, and tricked Cronus into swallowing a stone instead, which afterwards was shown and venerated at Delphi. Zeus grew up, made Cronus disgorge his brethren, rebelled, and was victorious. Cronus was imprisoned in Tartarus, or (*see* the late story in Plutarch, *De Defect. Orac.*, 18) on an island near Britain, and guarded by the *Hekatoncheires;* or he became lord of Elysium (*q.v.*). The swallowing myth has savage parallels.

Under the rule of Cronus, men lived in a state of Paradisal innocence (ὁ ἐπὶ Κρόνου βίος, *Saturnia regna*), and the earth bore all things untilled. It was the Golden Age. Cronus in time was rationalized into a great and beneficent western king. Hence the late and artificial Italian tale that he came to the future site of Rome, was welcomed there by Janus (also euhemerized into a king), founded a city there, and taught the people navigation, coinage, and other useful things. (*See* Saturn.)

On account of his swallowing of his children, Cronus is frequently identified with foreign gods, notably the Semitic Ba'al (Baal Saturnus on numerous inscriptions of Roman Africa) and Moloch, to whom human sacrifices, particularly of children, were made.

See Preller-Robert, *Griech. Mythologie*, i., p. 46 *et seq.;* L. R. Farnell, *Cults of the Greek States*, i., chap. i.; M. Meyer in Roscher's *Lexikon, s.v.*

CROOKES, SIR WILLIAM (1832–1919), English chemist and physicist, was born in London on June 17, 1832. He studied chemistry at the Royal College of Chemistry and became an assistant under A. W. von Hofmann. In 1854 he became assistant in the meteorological department of the Radcliffe observatory, Oxford, and in 1855 he obtained a chemical post at Chester. From the time of his marriage in 1856 to Ellen Humphrey he lived in London, devoting himself uninterruptedly to scientific work of various kinds. He founded and conducted the *Chemical News,* and had a private laboratory at his house in Kensington Park gardens. He was knighted in 1897 and received the Order of Merit in 1910. He was president at different times of many learned societies; from 1913–15 he was president of the Royal Society. He died in London on April 4, 1919.

In 1861 spectroscopic observations on the residue from the manufacture of sulphuric acid led Crookes to the discovery and isolation of thallium, a specimen of which was shown in public for the first time at the exhibition of 1862. In the course of investigations on the properties of thallium he observed the curious behaviour of the hot element while being weighed in vacuo. This led Crookes to construct the radiometer (*q.v.*).

His researches on the electrical discharge through a rarefied gas led to the observation of the dark space which bears his name, and Crookes developed his theory of "radiant matter" or matter in a "fourth state." (*See* Electricity, Conduction of: *Gases.*) In 1883 Crookes began an enquiry into the nature and constitution of the rare earths, his observations on yttrium led him to the theory that all elements have been produced by evolution from one primordial stuff. He succeeded in artificially making minute diamonds; and on the discovery of radium he took up the study of its properties. He invented the spinthariscope which shows the presence of traces of radium salt by the production of phosphorescence on a zinc sulphide screen. Crookes was constantly consulted by the Government on chemical questions, and one of his many practical contributions to the public welfare was his production of a glass which would effectively shield the eyes of the workers from the deleterious rays emitted from molten glass. Crookes wrote or edited various books on chemistry and chemical technology, including *Select Methods of Chemical Analysis*, which went through a number of editions. He was a keen student of psychic phenomena and sought to effect some correlation between them and ordinary physical laws.

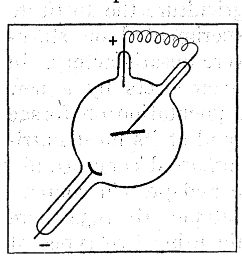

Fig. 1.—The X-ray tube invented by Sir W. Crookes

See E. E. Fournier d'Albe, *Life of Sir William Crookes* (1923).

CROOKES' TUBE: *see* Electricity, Conduction of; X-Rays, Nature of.

CROOKSTON, a city of northwestern Minnesota, on the Red Lake river, 18 mi. from the North Dakota border; the county seat of Polk county. It is on federal highways 2 and 75; is served by the Great Northern and the Northern Pacific railways; and has an airport. Dams on the river provide fine water power, and the city has varied manufactures, notably flour and tow. It has a large jobbing business, and is an important distributing point for wheat, dairy products and livestock. The North-west School of Agriculture of the University of Minnesota, and its North-west Agricultural Experiment station, are located there. The Red River valley winter show (of livestock and agricultural products) is held at Crookston annually. Crookston was settled about 1872, and was chartered as a city in 1883. It was named after an early settler, William Crooks. Pop. (1940) 7,161.

CROP, the *ingluvies,* or pouched expansion of a bird's oesophagus, in which the food remains to undergo a preparatory process of digestion before being passed into the true stomach; the produce of cereals or other cultivated plants. The term "white-crop" is used for such grain crops as barley or wheat, which whiten as they grow ripe; "green-crop" for such as roots or potatoes which do not, and also for those which are cut in a green state, like clover (*see* AGRICULTURE: A GENERAL SURVEY). Other uses of the word are, in leather dressing, for the whole untrimmed hide; in mining and geology, for the "outcrop" or appearance at the surface of a vein or stratum, and particularly in tin mining, for the best part of the ore produced after dressing. A "hunting crop" is a short thick stock for a whip, with a small leather loop at one end, to which a thong may be attached. From the verb "to crop," *i.e.,* to take off the top of anything, comes "crop" meaning a closely-cut head of hair.

CROP-DRYING. The special handling or use of machines to remove the amount of moisture necessary to prevent spoilage of crops in climates where natural drying is precarious has long been attempted. The Romans gave attention to proper stacking and ventilation but relied solely on the natural agents, sun and wind. Apparently Jethro Tull's description of an Oxfordshire farmer's success in drying grain in a malt kiln about 1700 is the earliest account of artificial drying (see *Horse-Hoeing Husbandry,* 1733).

In 1866, George Dyson patented a stack drier consisting of a hollow vertical cylinder through which air was blown or removed by a fan. Both James Paxman and W. A. Gibbs exhibited driers at the Royal Agricultural society's show in 1869. When Martin J. Sutton offered a prize of £100 in 1882 "for the most efficient and economical method of drying hay or corn crops artificially either before or after being stacked," Gibbs was one of the eight contestants. His hay-making machine agitated the unstacked hay while hot air was driven through it; six others used exhaust fans in the stack, and one forced ventilation into the stack through perforated drums.

Various types of motor-driven fans continued to be developed, but in 1919 Charles Tinker of Kilmartin patented a stack drier consisting of a cone-shaped coil of steam-heated pipes around which the crop was stacked, the drying being done in a Dutch barn. At the request of the ministry of agriculture the Institute of Agricultural Engineering at Oxford experimented on stack-drying from 1923 to 1925, but the results were unsatisfactory. In 1927 the institute succeeded in drying sugar beets by a new process employing a conveyor drier. Experimentation on forage crops proved that grass dried while young and at its most nutritious stage could provide a substitute for imported concentrates. Artificially dried hay was high in carotene and protein content, remained green and sweet, and was very palatable. By 1938 there were 96 centres for drying in Great Britain using five types of commercial driers.

In the United States experimentation on artificial drying did not begin until 1910, but as early as 1875 the department of agriculture published a notice of Gibbs' machine in the *Annual Report.* The design of the first drier for forage crops was inspired by lumber kilns. The department experimented from 1910 to 1912 with a drier built at Hayti, Mo. By 1915, several commercial companies had produced various types of driers, but the federal government withdrew its support and interest lagged until 1925, when the emphasis on hay and forage crops as substitutes for cotton in the southern states, where the heavy rainfall made the production of hay extremely difficult, revived the interest of the department of agriculture, the various state experiment stations, commercial companies, and individuals in artificial drying. Independently, Arthur J. Mason, an engineer interested in preserving alfalfa, built an experimental plant at West Point, Miss., in 1911, patented a conveyor drier in 1916, and by 1926 made installations at the Walker-Gordon farm at Plainsboro, New Jersey.

The artificial drying of grass and alfalfa was also tried in Holland and Switzerland where the main emphasis was on small, farm-size driers. Germany and Scandinavia experimented largely with factory-size plants capable of drying both root and forage crops. However, as late as 1939 the process had not advanced very far into commercial farming on the continent.

The standard types of driers in Great Britain and the United States are apron-conveyor, revolving drum, tray, and pneumatic, using oil, gas, and coal for heating. In the tray and apron-conveyor types the material is dried whole at low temperature over a long period, whereas in the revolving drum and pneumatic types the forage is chopped into small pieces and dried at high temperature for a short period. An important contribution of U.S. designers was the use of straight furnace gases for drying, a procedure that increased thermal efficiency and lowered costs. Special cutting and loading equipment was developed simultaneously to cut down on labour requirements and speed delivery of the crop to the drier. A mower-crusher for large stemmed legumes such as soybeans reduced the drying time and enabled the mass to be more evenly dried.

(H. L. E.)

CROPS. In face of the immense variety of crops throughout the world, it is surprising how uniform are the cultivated farms of Europe. Flying across the country you look down on a succession of rough rectangles of ground, some of permanent grass, some sown with one of the four cereals, some with rotation grasses or leguminous crops and with roots. This trim mosaic, as it seems from above, is broken chiefly by woodland and by vineyards, some cut out of the riverside hills, as along the Rhine and Moselle, some covering spacious plains, as the valley of the Garonne; and on a smaller scale by orchards of fruit and hops.

A similar flight over tropical or semitropical countries reveals a very different pattern. The variety of crops may be greater, but at the same time very wide areas may be covered by one crop —by sugar, tea, cocoa, coffee or cotton. In some places, as in a famous view in Honolulu from the Pali heights, rice and pineapples, though more vivid in hue, resemble the trim familiar fields of temperate climes. When we take an historical view of the cultivated crops we shall see a steady increase in variety due to discovery, to selection, of late years to hybridization, and to inventions that enable man to extract the essential virtues from plants, as linen from flax, sugar from cane and beetroot, opium from poppies, cotton from a seed covering, fibre from coco-nut; to the discovery of the qualities of dried or infused parts of plants, such as the coffee bean or tea leaf or tobacco leaf. But this multiplication of plants found useful for cultivation involves from time to time the rejection of others, driven out by discovery of better substitutes or a change of taste. Lord Ernle, in his admirable history of "English Farming Past and Present," wrote on this head.

"As the linen trade became more concentrated in particular localities, flax was more rarely cultivated. The hemp-yards which were once attached to many cottages and farmhouses were similarly abandoned. The use of teasels by clothiers was displaced by machinery, and the crop no longer cultivated. Woad, madder, and saffron found cheaper substitutes. Liquorice disappeared from Nottinghamshire, camomile from Derbyshire, canary seed from Kent, caraway from Essex."

New Crops.—But with a few exceptions the history of practical agriculture is divided into chapters by the discovery of the value of additional crops. Potatoes, sainfoin and lucerne, turnips and sugar-beet, have all produced crucial changes on the farms of Europe. In British official statistics of the 20th century the crops are now grouped together under the following heads (not perfectly accurate linguistically). The two largest divisions are: corn crops, so called, and green crops. Under corn crops are included: wheat, barley, oats, rye, beans and peas. Under green crops: potatoes, swedes and turnips, mangolds, cabbage, kohl-rabi and rape, carrots, vetches or tares and lucerne, beetroot, sugar-beet. After these two great divisions come clover, sainfoin and artificial grasses. Then pasture grasses, and finally a miscellaneous group consisting of hops, flax and small fruit.

The turnip, introduced chiefly through Sir Richard Weston in 1650, introduced a crucial change in British farming. At a later date few if any crops have made so much difference to the agriculture of a continent as the sugar-beet, which owed its early vogue largely to Napoleon. Throughout Europe the standard farm relies on some rotation of grain, clovers and roots; and this need has been forced upon farmers even in the most exclusively grain-bearing districts, such as the Prairie Provinces of Canada, by the need of clearing ground of weeds. The intervention of a root crop is almost as useful for clearing the ground as for increasing its production. In no country have the relative proportions of the different crops been so nearly standardized as in Denmark. A characteristic small farm in the dairying districts of that country, which is of all countries the most vitally dependent on its farm crops, consists of a small patch of permanent grass, a rather bigger patch of lucerne and a root and grain crop. The essential virtue of the famous Norfolk rotation prevails: roots, barley, clover, wheat. With many additions and qualifications and substitutes of like genera, these remain the master crops of the farms of temperate climes. Only in wide pastoral countries, given up to great ranches or stations, such as some South American republics or Queensland or the more northern parts of Western Australia, is the percentage of grass to arable bigger.

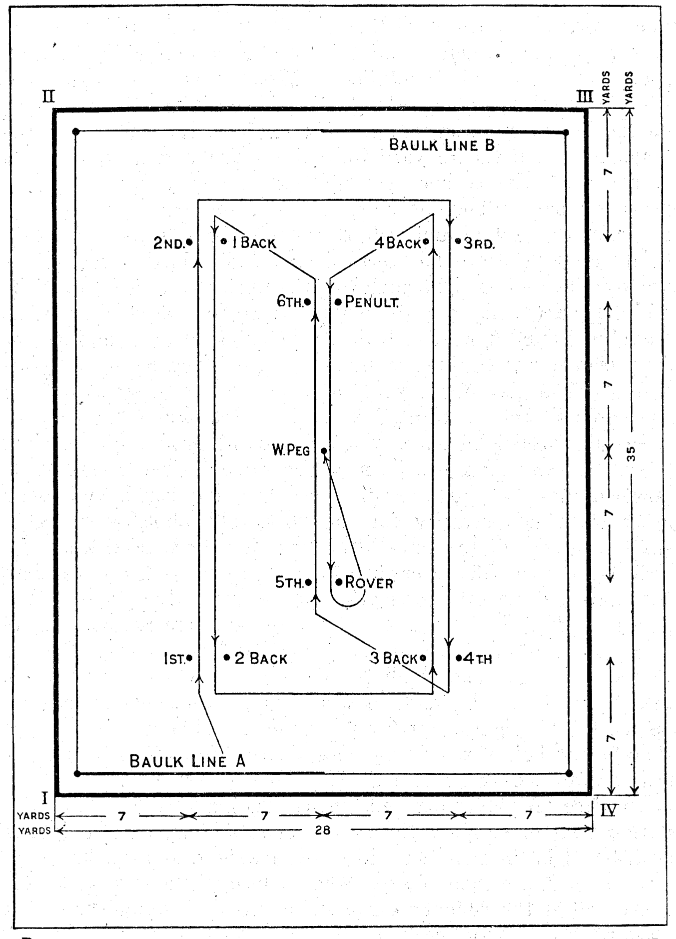
Suiting Crops to Areas.—Areas especially suited for particular crops may be very sharply defined; and curious examples are to be seen within most countries. For example in Canada the deep silt of the southern end of the Okanagan valley was found to be of especial virtue for fruit. Apple trees yielded a heavy crop every year without intermission. In spite of the need of expensive irrigation this valley in a most mountainous country quickly became an almost continuous orchard; and in spite of its remoteness planted orchards reached a value of £250 an acre. Artificial irrigation as an influence on production—of which of course the valley of the Nile is the classical example—is well seen in previously barren areas in Australia (especially on the borders of New South Wales and South Australia) converted into small farms for the production of all sorts of fruits: citrus fruits, stone fruits and grapes, grown chiefly for raisins.

The relative importance of the crops of a country cannot, of course, be gauged merely by area. The distinction between intensive and extensive crops, though not everywhere applicable, holds good in general. Permanent grass is the thinnest and most extensive and scarcely deserves the name of crop, compared with the production of hops on which as much as £150 an acre may be spent in a year with prospects of a good profit, or of the garden of a French market gardener who may sell £500 or £600 worth a year from a single acre.

Even more intensive than such so-called French gardens as are found near Paris or at Rouen, or the Dutch gardens that multiply round Delft and The Hague, are the crops grown under glass—in Guernsey, for example, or on the edge of London. No less than £900 worth of tomatoes and cucumbers has been sold from an acre of glass in Essex. Many examples of such a movement may be found; but contrary tendencies are not less obvious. (W. B. T.)

(For list of agricultural objects, *see* AGRICULTURAL ARTICLES.)

CROQUET, a lawn game played with balls, mallets, hoops and one peg (from Fr. *croc,* a crook, or crooked stick). The game has been evolved, according to some writers, from the *paille-maille* which was played in Languedoc at least as early as the 13th century. However that may be, croquet was played in England in 1856, or perhaps a few years earlier, and soon became popular. In 1868 the first all-comers' meeting was held at Moreton-in-the-Marsh. In the same year the All England Croquet club was formed, the annual contest for the championship taking place on the grounds of this club at Wimbledon. After being for ten years or so the most popular game for the country house and garden party, croquet was practically ousted by lawn tennis, until, with improved implements and a more scientific form of play, it was revived about 1894–95. In 1896–97 was formed the United All England Croquet association, now known as the Croquet association. There are 111 clubs affiliated to the association. There



PLAN OF CROQUET COURT SHOWING SETTING OF HOOPS AND PEGS, AND ORDER OF PLAY IN ACCORDANCE WITH THE OFFICIAL LAWS (1928) OF THE CROQUET ASSOCIATION

Only those portions in heavy outline need be marked on the ground. The order of making the points is indicated by the arrows

were by 1935 approximately 1,500 associates whose nominal subscription entitles them to a copy of the *Gazette* and entry to the ground during tournaments controlled by the association. Its headquarters are at the Roehampton club and the chief events of the year are played on the club croquet lawns, including the final rounds of the All England handicap, a competition attracting more than 500 competitors. The tournaments at Hurlingham, Ranelagh, Eastbourne, Brighton, Cheltenham, Lewes and Buxton are specially popular. Croquet flourishes throughout the British empire and there are 15 affiliated associations in Melbourne, Adelaide, Sydney, Auckland, Queensland and Tasmania. Some of these associations have many clubs affiliated to them, amounting to about 300 in all. A team from Australia visited England in 1925 and the test matches were won by the home country. Further test matches were played in 1928 and 1935 (won by Australia) and in 1937 (won by England). Croquet players were also catered for in the south of France during the winter. The game is very popular in the U.S. and is usually played in rural districts wherever grass plots are large enough and level enough for a court. The rules and court dimensions differ in Great Britain and the U.S., the following regulations governing croquet in Great Britain.

The Game.—The game of croquet is played between two sides, playing alternate "turns," each side consisting either of one or of two players. Four balls are used, one side playing blue and black, and the other side red and yellow. Any ordinary turn may be played with either ball of the side, provided that no ordinary turn may be played with the same ball again until all the balls are in play. When a side consists of two players, one partner plays throughout with one ball of the side, and the other partner with the other. The game is won by the side which first scores all its "points" in order. The court is rectangular, 35 yd. long by 28 yd. wide, within a boundary defined by a continuous line. Portions of the yard line 13 yd. long, measured from the corner spots at corners I and III, towards corners IV and II respectively, are called "Baulk lines." Eight white pegs, not exceeding $\frac{3}{4}$ in. in diameter or 3 in. in height above the ground are placed on the boundary, at distances of 3 ft. from the corners of the boundary. The square yard formed at each corner by the two corner pegs, the corner spot and the corner flag, is called a "corner square." The hoops are of round iron, from $\frac{5}{8}$ in. to $\frac{3}{4}$ in. in diameter, and of uniform thickness. They stand 12 in. in height above the ground, vertical and firmly fixed. The crowns are straight and at right angles to the uprights, which should be $3\frac{3}{4}$ in. apart (inside measurement), $3\frac{11}{16}$ in. for the championship, from the ground upwards. The winning peg is of wood and of uniform diameter above the ground of $1\frac{1}{2}$ in. The setting of the hoops and peg is in accordance with the diagram, the order of making the "points" being indicated by the arrows. Each hoop is run twice and the peg hit once, which may be hit from any direction.

The above setting has been in general use since 1922. It is, however, not well adapted for "peeling," and has largely done away with the necessity for the "pass-roll" shot, both highly skilful features of the game. "Peeling" is a term used when the striker causes a ball, other than his own, to run a hoop in order; that ball is then said to have been "peeled." Like most other games croquet is subject to alteration and amendment in its rules and laws and no absolute finality has been reached in regard to the setting. Mallets may be of any size and weight, but the head must be made of wood only, except that metal may be used for weighting or strengthening it. The two end faces shall be parallel, of wood only, and identical in every respect, and each face may have a rounded edge which shall be considered part of the face. A player may not change his mallet more than once during a game, except in the case of *bona fide* damage. The balls shall be $3\frac{5}{8}$ in. in diameter and of even weight, and not less than $15\frac{3}{4}$ oz. nor more than $16\frac{1}{4}$ oz. The hoop or peg next in order for every ball at the commencement of a turn is distinguished by a clip of the colour of the ball.

The object of the player is to score the points of the game by striking his ball through each of the hoops and the peg in a fixed order; and the side wins which first succeeds in scoring all the points with both the balls of the side. No point is scored by passing through a hoop or hitting the peg except in the proper order. Each player starts in turn from either of the baulk lines. If he fails either to make a point or to "roquet"[1] (*i.e.*, drive his ball against) another ball in play, his turn is at an end and the next player in order takes his turn in like manner. If he succeeds in scoring a point, he is entitled (as in billiards) to another stroke; he may then either attempt to score another point, or he may roquet a ball. Having roqueted a ball (provided he has not already roqueted the same ball in the same turn without having scored a point in the interval) he is entitled to two further strokes: first he must "take croquet," *i.e.*, he places his own ball (which from the moment of the roquet is "dead" or "in hand") in contact with the roqueted ball on any side of it, and then strikes his own ball with his mallet, being bound to move or shake both balls perceptibly. If at the beginning of a turn the striker's ball is in contact with another ball, a "roquet" is held to have been made and "croquet" must be taken at once. After taking croquet the striker is entitled to another stroke, with which he may score another point, or roquet another ball not previously roqueted in the same turn since a point was scored, or he may play for safety. Thus, by skilful alternation of making points and roqueting balls, a "break" may be made in which point after point, and even all the points in the game (for the ball in play) may be scored in a single turn, in addition to three or four points for the partner ball. The chief skill in the game perhaps consists in playing the stroke called "taking croquet" (but *see* below on the "rush"). Expert players can drive both balls together from one end of the ground to the other, or send one to a distance while retaining the other, or place each with accuracy in different directions as desired, the player obtaining position for scoring a point or roqueting another ball according to the strategical requirements of his position. Care has, however, to be taken in playing the croquet stroke that both balls are absolutely moved or perceptibly shaken, and that neither of them be driven over the boundary line, for in either event the player's next stroke is forfeited and his turn brought summarily to an end.

There are two main styles in playing croquet and it being impossible to dogmatize as to the better, either generally or for the individual, players would be well advised to give both an exhaustive trial. The essential features of all styles, whether to make a roquet or run a hoop is that the eye, the ball and the object aimed at should form a vertical right angle. The "upright" style is played with a long mallet of about 39 in. The player faces the object to be hit, holding the top of the mallet with his left hand, the arm being close to the side. The right hand grasps the shaft lower down and is solely responsible for the necessary power of the strike, the left hand merely acting as the fulcrum of the swing. Either the right or the left foot may be in advance, and should be parallel to the line of aim, the player's weight being mainly on the front foot. For the other style, commonly known as "front play" or Irish, a much shorter mallet of about 33 in. is used. The mallet is swung between the feet and the grip employed is similar to the Vardon grip in golf, the hands being close together and often overlapping. The former has advantage over the other in two important points, viz., ability to stop shot and power. It is apt, however, to fail in two important shots, a six-yard roquet and the long rush, and fails for the same reason in both cases; the player being further from the ball there is a larger margin of error, or, in other words a greater liability to be slightly inaccurate. The Irish style is undoubtedly more tiring and the strain on wrists very great; whereas in the upright method the fingers do practically no work and owing to its being less fatiguing is far easier to maintain, especially on a slow lawn.

In making a shot the ball should be hit in the centre and as low down as possible with the exact middle of the mallet. The eyes must be concentrated on the spot and the head of the mallet drawn back slowly. This is the secret of all successful shots, either for roquets or hoop running; the more difficult the angle of the hoop the slower the back swing—any jerking is fatal. The "rush stroke" is a roquet and used to drive the pilot ball some distance; this must be hit full in the face for a straight rush. The hands and mallet should be kept down and follow well through. True hitting should be aimed at, not force. When it is desired to drive a ball in an angular direction the pilot ball must be aimed at off the centre, when the angle required is extremely oblique the outer and opposite side of the pilot should be hit. The "roll" is a croquet stroke in which both balls are rolled along the same distance and is attained by standing well forward with the hands in front of the head of the mallet. The stroke is not a hit, but a sweep. The "pass roll" is the most difficult of all as unless it is played firmly and with deliberation the mallet will hit the ball twice and the stroke is a foul. The stance is similar to that for the "roll," but the ball is hit higher up and the curtailed back swing is more vertical, resulting, if the stroke is smooth, in the player's ball passing the pilot ball. The "split shot" is utilized when two balls are to be driven in opposite directions. Line the balls so that they point in the direction that the pilot ball is to travel, then play the stroke facing the midway between that point and where the striker's ball is being directed. The angles are the same as in billiards, though it is difficult to obtain an absolute right angle. The "stop shot" is also analogous to billiards, the object being to drive the pilot ball a long distance and to keep the striker's ball back. Stand farther behind than usual, hitting the ball very near the

[1]The words "roquet" and "croquet" are pronounced as in French, with the *t* mute.

bottom of the face of the mallet with a short, sharp hit. The proportion of a good "stop shot" is one in six, *i.e.,* that the player's ball goes one yard while the pilot ball travels six yards. "Taking off" is a croquet shot and consists in taking off from a ball which is to be left behind and merely shaken to another ball or given spot on the lawn.

A first-class croquet lawn should be as level as possible with a true and consistent surface; no obstacle to an all-round break is therefore present other than the player's lack of skill. If games were won by all-round breaks much of the interest would be missing. The picking up and assembling of the balls and the laying of a break at the conclusion of a turn generally require infinitely more skill and thought than the somewhat automatic execution of a three- or four-ball break. Once the balls have been assembled no difficult shot is required throughout the break, provided the player has acquired a certain degree of proficiency in the standard shots. The main principle in either three- or four-ball breaks is always to keep the pilot balls straight in front and sweep them, as it were, along the path of direction. The whole secret of break-making is correctly rushing the pilot ball to the right spot after running a hoop; by doing so the next shot is made easy and the approach to the following hoop will become a short straight stop shot, ensuring a good position for hoop running. This positioning is the hallmark of first-class players and it is noteworthy that it is the incompetent player who gives himself during a break difficult and oblique approaches to hoops, ultimately leading to long and angular hoops to run and eventually to a breakdown with the balls adjacent and to the advantage of the opponent. During a three-ball break the player must keep in mind the earliest and safest opportunity for bringing the fourth ball into play, for though it may be quite simple to continue with only three balls it is impossible to finish the break satisfactorily unless all four balls are in command. The usual method is to leave the opponent's balls wired from one another across whichever hoop the player's backward ball requires, and retire with the remaining balls as far away as possible, taking care that both the opponent's balls have an absolutely open shot. If the opponent misses the long roquet his ball is at once brought into play; should he retire into a corner the earliest opportunity of digging him out must be taken. A four-ball break is easier to play, but as some 90 continuous strokes are required to complete the round, the demand on patience and concentration is very great, and unless a player is in good practice, the hand and eye tire with the simplest shots.

Peeling, though adding considerable risk to the successful completion of a break, may have to be essayed where bisques have to be given. The break for a double peel (the last two hoops) is played in the usual way, care being taken that the ball to be peeled (the peelee) and another are sent to the sixth hoop, and immediately after making that hoop the peelee is sent through the penultimate and the break continued. On the way up to two back the peelee must be positioned for the rover hoop, and opportunities will occur before making three back and the penultimate, or even at the time when making the rover hoop, to complete the peel. A triple peel is played in like manner, four back being peeled immediately after running the third hoop and the ball positioned before making the sixth hoop, when play becomes similar to that for a double peel. Tactics play an important part in the game and must be guided by the knowledge of your own skill and by what you know of your opponent's strength or weakness. Broadly speaking, two points must be considered before shooting: what will be gained if the roquet is successful and how will it affect the opponent's next turn if unsuccessful. If, for instance, by going into a corner the opponent will be left with a difficult start for a three-ball break, and if by shooting and failing to roquet a four-ball break is presented, the course of action is obvious. When bisques have to be conceded, the balls at the end of the break should not be left less than eight yards from the boundary, thus compelling the opponent either to roll up gently, when the chances of making the roquet are minimized, or else if he shoots hard and misses, he is faced with a seven-yard return roquet should he elect to take a bisque. Although either ball of a side may be played much can be done to compel the opponent to shoot with his forward ball. It can be left near the hoop of the player's backward ball and in many ways it is possible to influence the progress of the adversary.

The problem of devising a game between two experts in which each player should have an equal chance still awaits solution. Execution on a good lawn has become so accurate that the result of a match too often depends on the spin of a coin. For instance, J. Tuckett, meeting C. Corbally in a round of the open championship (1913), played blue, the first ball, to the left-hand boundary. Corbally hit with red and progressed to four back on a two-ball break. His opponent missed the long shot with black and Corbally finished the game with a triple peel with the fourth ball in play. As an exhibition of perfect croquet it will rarely be equalled and yet can scarcely be called a match. It is a frequent occurrence in first-class croquet for the third ball in play to go to the peg and finish the game with the fifth ball. On the other hand, the wide range of handicapping (from minus four to plus 18) gives the less talented players fair chances of being on the court; more especially is this the case as there is no limit regarding the number of possible bisques a player may take in succession in any game.

GLOSSARY

Roquet: when the striker's ball in play hits another ball in play.

Croquet: when a ball has been roqueted, croquet is taken by placing the striker's ball in contact with the ball roqueted, and the striker's ball is then hit.

Bisque: an extra turn, given in a game played under handicap.

Half Bisque: a restricted extra turn, no point can be scored for any ball.

A Point: when a ball runs a hoop or hits the peg in order.

Rover: a ball that has run all the hoops.

Pilot Ball: the ball aimed at.

Object Ball: the ball from which croquet is taken.

Peelee: ball to be peeled.

Tice: one of the opening shots of the game played to such a spot as will tempt the opponent to shoot.

Wire: a ball is wired from another ball when (1) any part of the peg or an upright would impede the direct course of any part of it towards any part of the other ball; or (2) any part of the peg or hoop so interferes with any part of the swing of the mallet that the striker cannot drive his ball freely towards any part of the other ball.

UNITED STATES

In the U.S., croquet is usually played on a court 30 ft. by 60 ft., or 25 ft. by 60 ft., surrounded by boundary lines formed by strong cord fastened to the four corners. (*See* Spalding's *Lawn Sports,* No. 43 R.) The arrangement of the arches or wickets (oval shaped) and stakes should be similar to that shown in the diagram.

Stakes are set just outside the playing line, half way between the end corners, the first arch 8 ft. from the boundary line and the second 7 ft. from the first; the side arches in line across the field with the second arch, and 5 ft. 9 in. from the boundary line, and so on according to the diagram.

The so-called "pendulum stroke," done by swinging the mallet between the legs, made with two hands, is most reliable in directing the ball, but ladies find the outside stroke less awkward. The first object of the game is to strike the ball to a certain distance and no further in its position near another ball; to be near the front of its arch; to wire it so that there can be no direct shot on the ball; to put a ball beyond the open shot of a ball already wired. The greatest skill is required to drive the object ball to a desired position, and especially to make a ball pass to the right or left. Making a ball jump over another or over one or more arches is also difficult but can be accomplished with some practice.

The balls are of wood or hard rubber; the stakes of hard wood $1\frac{1}{4}$ in. in diameter, set at the middle of the court just outside the playing line and projecting above the court only $1\frac{1}{2}$ in., so as to allow a ball to be shot from in front of it in any direction. The handles of the mallets are made in various lengths to conform to the size of the player; the size and weight of the wood in the head also varies. Balls should have coloured painted bands to distinguish them.

Grounds are laid out in America in various ways, some being elliptical in form; arches are often placed at widely different points, although in America uniformity generally prevails. This game is one in which there should be an international uniformity, if possible, as a basis for possible international competition for honours in this attractive outdoor pastime. The terms used in America for croquet as well as the definitions are different from those in Great Britain. The following terms and definitions are used in America:—

Ball in hand, a ball that has roqueted another ball. *Ball in play,* after a ball in hand has taken croquet it is a ball in play. *Bisque,* an extra stroke allowed at any time during a game.

Bombard, to drive one ball by croquet so as to displace another. *Boundary line,* the outside limits of the court.

Carom, a rebounding of a ball from stake, arch or another ball.

Combination, the using of two or more balls to effect some particular play. *Croquet,* to place one ball against another and play from it or with it any way. This is imperative after a roquet.

Danger ball, that ball of the adversary which is to be played next—the "guilty ball."

Dead ball, a ball from which or upon which the player has taken his turn since making a point. It is then dead to all direct shots till he makes another point, or has another turn or play.

Direct shot, when the ball struck with the mallet directly passes to another ball, or makes carom thereon from a stake or an arch.

Drive shot, a shot made so as to send the object ball to some desired position. *Finesse,* to play a ball where it will be of least use to adversary.

Follow shot, when the playing ball in taking croquet is made to follow the object ball in nearly or quite the same direction.

Foul strike, a false one—one at variance with the rules.

Innocent ball, the last-played ball of adversary.

Jump shot, striking a ball so as to make it jump over any obstacle between it and the object aimed at.

Live ball, a ball upon which the playing ball has a right to play. *Object ball,* the ball at which the player aims.

Odds, extra stroke or strokes allowed by superior players to equalize playing. (*See* BISQUE.)

Playing line, real or imaginary line 30 in. inside of boundary line, on which balls are placed for playing when they have passed beyond it or outside the boundary line.

Run, the making of a number of points in one turn of play.

Split shot, any croquet from a ball upon which a ball has counted. *Set-up,* a position of advantage secured by a player in the interests of his partner ball.

Wiring, to wire a ball is to place it so that it will be behind a wire (or arch), thus preventing an open or direct shot.

"Tight Croquet," another variety of the sport, is really considered a giant game of pool or billiards, requiring strategy and great skill. It is played on a court 38 ft. by 44 ft. with hard rubber balls $3\frac{3}{8}$ in. in diameter, weighing about 1 lb. each. The mallets weigh from 2 to 5 lb. each, and the heads are bound at either end with heavy brass bands. The mallets are swung with one hand instead of two. One wicket is placed in the middle of the court, facing the ends and in line with the other four, instead of two placed in the centre facing the sides as in the original game. "Tight Croquet" was originated by C. L. Rice in 1876. J. H. Welsh started the Union Croquet Club in Central park, New York, in 1890; this club meets every day, except in exceptionally stormy weather, on the sheep meadow near the mall in the park.

The Brooklyn Croquet Club meets in Prospect park, and this organization includes many expert players among its members.

"Hun Croquet," another version, is played in Central park by an exclusive gathering. This game, too, is slightly different from the others. (J. B. P.)

CRORE: *see* RUPEE.

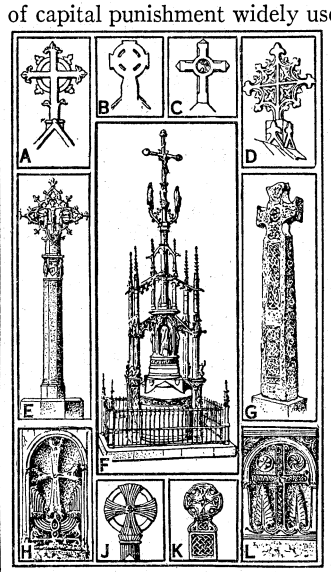
CROSBY, FANNY (Mrs. Frances Jane Crosby Van Alstyne (1820–1915), American hymn writer, was born in Southeast, Putnam county, N.Y., on March 24, 1820. As a result of an illness at the age of six weeks, she lost her sight. In March 1835, she entered the Institution for the Blind in New York city, remaining 12 years as a pupil and 13 years as an instructor, and devoting much time to the study of poetry. On March 5, 1858, she married Alexander Van Alstyne. She was interested in religious work, being closely associated with Dwight Moody, George C. Stebbins, Ira D. Sankey and William H. Doane. Her first hymn to attract attention and to be translated into many languages was "Pass Me Not, O Gentle Saviour," written in 1868. Among the best known of her many hymns are: "Safe in the Arms of Jesus"; "Saved by Grace"; "Rescue the Perishing"; "Blessed Assurance"; "Saviour, More Than Life to Me"; "Some Day the Silver Cord Will Break."

See S. Trevana Jackson, *Fanny Crosby's Story of Ninety-four Years* (1915).

CROSBY, a municipal borough in the Bootle and Ormskirk parliamentary divisions of Lancashire, England, at the mouth of the Mersey between Liverpool, from which it is 5 mi. N.W., and Southport, being a residential district for both.

Population (est. 1938) 55,780. Area (including foreshore) 10.7 sq.mi. The borough was incorporated in 1937 and consists of the former urban districts of Great Crosby and Waterloo-with-Seaforth.

CROSS and **CRUCIFIXION,** an instrument, and method, of capital punishment widely used in ancient times. It is doubtful whether crucifixion was employed by the Greeks; the Romans, who inflicted it only on slaves and criminals of the lowest class, probably borrowed it from the Carthaginians, among whom its use was frequent. Hints of its use among the Jews have been seen in Deut. xxi. 22–23; Josh. viii. 29, x. 26.



BY PERMISSION (D.) SIR B. FLETCHER, "HISTORY OF ARCHITECTURE," 1928 (BATSFORD); (E., F.) VIOLLET-LE-DUC, "DICTIONNAIRE"
A, B. SIMPLE ENGLISH GOTHIC; C. MODERN FRENCH; D, J. COMPLEX ENGLISH FORMS; E, F. FRENCH GOTHIC; G, K. CELTIC; H. ARMENIAN; L. 9TH CENTURY ROMAN

The victim of this cruel punishment was either impaled on, or bound to, an upright stake (*crux simplex*); or else fastened, by cords or by nails through his hands and feet, to an upright post (*stipes*) with a cross-bar (*patibulum*). In either case he was then left to die of exhaustion, thirst and wounds (under the Romans crucifixion was always preceded by scourging). Besides the simple stake, the Romans used three kinds of cross: the *crux commissa,* or tau cross (T), sometimes called St. Anthony's cross; *c. immissa,* or Latin cross (✝); *c. decussata,* or St. Andrew's cross (X). By general tradition, it was on a *crux immissa* that Christ died; but some hold it was the *tau* cross. After the scourging, the criminal was made to carry his cross to the place of execution; he was then stripped naked, and nailed or bound to the cross as it lay on the ground, or after it had been set up in position. The former method is most frequently found in representations of the crucifixion of Christ; but a few miniatures and other paintings depict Him as mounting a ladder placed against the cross, and the ladder is not infrequently found among the mediaeval "Emblems of the Passion."

Pre-Christian Crosses.—The cross has been used both as a religious symbol and as an ornament from the dawn of man's civilization. Various objects, dating from periods long anterior to the Christian era, have been found, marked with crosses of different designs, in almost every part of the old world. India, Syria, Persia and Egypt have all yielded numberless examples, while numerous instances, dating from the later Stone age to Christian times, have been found in nearly every part of Europe. The use of the cross as a religious symbol in pre-Christian times and among non-Christian peoples may probably be regarded as almost universal, and in very many cases it was connected with some form of nature worship. Two of the most frequent forms of pre-Christian cross are the tau cross, so named from its resemblance to the Greek capital letter Τ, and the *swastika* or *fylfot* 卐 also called *"Gammadion"* or *crux gammata,* owing to its form being that of four Greek capital letters *gamma* Γ placed together. The tau cross with a handle (☥ *crux ansata*) often occurs in Egyptian and Assyrian sculptures as a symbol of divinity. The *swastika* has a very wide range of distribution and is found on all kinds of objects. It was used as a religious emblem in India and China many centuries before the Christian era, and is met with on prehistoric monuments from various parts of Europe, Asia and America. It is, in fact, a device of such common occurrence on objects of pre-Christian origin that it is hardly necessary to specify individual instances. The cross, as a device in different forms and often enclosed in a circle, is of frequent occurrence on coins and medals of pre-Christian date in France and elsewhere. Indeed, objects marked with pre-Christian crosses are to be seen in every important museum.

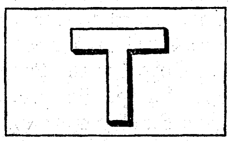


FIG. 1.—PRE-CHRISTIAN CROSS CALLED "TAU" FROM ITS RESEMBLANCE TO GREEK LETTER "T"

Early Christian Crosses.—The death of Christ on a cross necessarily conferred a new significance on the figure, which had hitherto been associated with a conception of religion not merely non-Christian, but in essence often directly opposed to it. It was not, however, till the time of Constantine that the cross was publicly used as the symbol of the Christian religion. Till then its employment had been restricted and private among the Christians themselves. Under Constantine it became the acknowledged symbol of Christianity, just as long afterwards the crescent was adopted as the symbol of the Mohammedan religion. Constantine's conversion to Christianity is attributed to his vision of the cross in the sky with the accompanying words ἐν τούτῳ νίκα ("in this conquer"), on the eve of his victory over Maxentius in 312. The finding of the holy cross by his mother, St. Helena, in 326, is commemorated by a festival, on May 3, called the "Invention of the Holy Cross." The legend is that when visiting in Palestine, she was guided to the site of the crucifixion by an aged Jew, who had inherited traditional knowledge as to its position. After the ground had been dug to a considerable depth three crosses were found, together with the superscription placed over the Saviour's head and the nails with which He was crucified. His cross was identified by the miraculous cure of a sick woman who was stretched upon it. This legend is related by writers such as St. Ambrose, Rufinus, Sulpicius Severus and others, but it is discounted by the silence of Eusebius and by the existence of an older legend, according to which the true cross was found by Protonice, the wife of the emperor Claudius. It is clear, however, that before the end of the 4th century there was at Jerusalem what was believed to be a relic of the true cross; and it seems probable that this was found during the excavations conducted by Macarius, bishop of Jerusalem, *c.* 327.

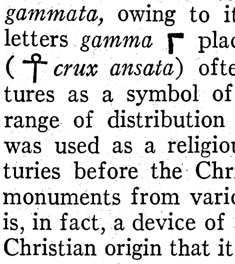

FIG. 2.—FYLFOT PRE-CHRISTIAN CROSS, COMPOSED OF FOUR CAPITAL GAMMAS, Γ, WITH BASES SET. IT IS ALSO CALLED "SWASTIKA"

Another festival of the holy cross is kept on Sept. 14 and is known as the "Exaltation of the Holy Cross." It seems to have originated at Jerusalem, to commemorate first the dedication, in the year 335, of the churches built on the sites of the crucifixion and the holy sepulchre and afterwards the restoration by Heraclius, in 629, of the relic which had been carried off by the Persians in 614. It came into observance at Rome before the end of the 7th century and has long been one of the principal feasts of the Roman Catholic Church.

The superscription placed over the Saviour's head, which St. Helena is said to have found with the cross, seems to have been sent by Constantine to Rome, where it is now preserved in the church of S. Croce in Gerusalemme. As regards the nails, a question has arisen as to their number. In most of the early pictures of the Crucifixion the feet are shown as separately nailed to the cross, but at a later period they are crossed, and a single nail fixes them. In the former case there would be four nails, in the latter only three; and it has been argued that there were probably only two, one for each hand. Four is the number generally accepted: one is said to have been cast by St. Helena into the sea, during a storm, in order to subdue the waves; another is said to have been beaten out into the iron circlet of the crown of Lombardy, now preserved at Monza. Some 30 more "holy nails" are preserved among the relics at Milan, Carpentras and other places.

The employment of the cross as the Christian symbol has been so manifold in its variety and application, and the different forms to which the figure has been adapted and elaborated are so complex, that it is only possible to deal with the outline of the subject.

We learn from Tertullian and other early Christian writers of the constant use which the Christians of those days made of the sign of the cross. Tertullian (*De Cor. Mil.* cap. iii.) says: "At each journey and progress, at each coming in and going out, at the putting on of shoes, at the bath, at meals, at the kindling of lights, at bedtime, at sitting down, whatsoever occupation engages us, we mark the brow with the sign of the cross." We should naturally expect, therefore, to find it very frequently used in the public worship of the Church. The earliest liturgical forms are comparatively late, and are without rubrics, but allusions by early writers to the ceremonial use of the sign of the cross in the public services are so numerous, and lay such stress upon it, that we are left in no doubt on the point. St. Augustine, indeed, speaks of the sacraments as not duly ministered if the use of the sign of the cross were absent from their ministration (*Hom. cxviii. in St. Joan*). As to its later liturgical use we need only refer to the service books of the Greek and Latin churches, which plainly indicate the frequency of, and the importance attached to, its employment. Its occasional use is retained by the Lutherans, and in the Church of England it is authoritatively used at baptism, and at the "sacring" or anointing of the sovereign at the coronation.

Besides the forms of cross already described, the equilateral or Greek cross (+) should be mentioned. It appears, though rarely, on early Christian monuments, and from the 4th century onwards has been of frequent use, especially in the Eastern Churches.

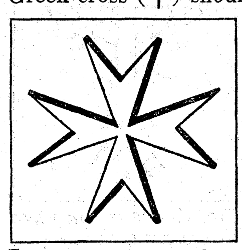

FIG. 3.—MALTESE CROSS, BADGE OF THE KNIGHTS OF MALTA

Heraldic Crosses.—The cross in one form or other appears on the flags and ensigns of many Christian countries. The English cross of St. George is a plain red cross on a white ground; the Scottish cross of St. Andrew is a plain diagonal white cross (heraldically termed a saltire) on a blue ground, and the Irish cross of St. Patrick is a plain diagonal red cross on a white ground. These three crosses are combined in the Union Jack. (*See* FLAG.)

The cross has also been adopted by many orders of knighthood. Perhaps the best known of these is the cross of the knights of Malta. It is a white cross of eight points on a black ground (fig. 3) and is the proper Maltese cross, a name which is often wrongly applied to the cross *patée* (fig. 4). The knights of the Garter use the cross of St. George, as do those of the order of St. Michael and St. George; the knights of the Thistle use St. Andrew's cross, and those of St. Patrick the cross of St. Patrick charged with a shamrock leaf.

Akin to the crosses of knightly orders are those which figure as charges on coats of arms. The science of heraldry evolved a wonderful variety of cross-forms during the period it held sway in the middle ages. The different forms of cross used in heraldry are, in fact, so numerous that it is only the larger works on that subject, which attempt to record them all. (For such crosses *see* HERALDRY.)

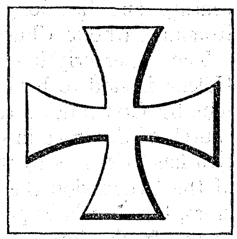

FIG. 4.—CROSS PATÉE

Church Crosses.—In the middle ages the cross-form, in one way or another, was predominant everywhere, and was introduced whenever opportunity offered itself for doing so. The larger churches were planned on its outline, so that the ridge line of their roofs proclaimed it far and wide. This was more particularly followed in north Europe, but when it was first introduced is not quite certain. Practically all the ancient cathedral churches of England and Wales are cruciform in plan; Llandaff is an exception.

The artistic skill and ingenuity of the mediaeval designer have produced cross designs of endless variety and of singular elegance and beauty. Some of the most beautiful of these designs are the gable crosses of the old churches. Fig. 5 shows the west gable cross of Washburn church, Worcestershire; fig. 6 that of the nave of Castle Acre church, Norfolk; and fig. 7 the east gable cross of Hethersett church in that county. They may be taken as good examples of a type of cross which is often of great beauty, but it is overlooked owing to its bad position for observation.

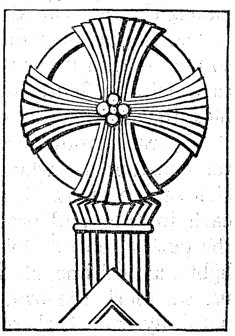

FIG. 5.—WEST GABLE CROSS OF WASHBURN CHURCH, WORCESTERSHIRE

Other architectural crosses, of great beauty of design, are those which occur on the grave slabs of the middle ages. Instances of a plainer type occur in Saxon times, but after the 11th century they were fashioned after the intricate and beautiful designs with which ancient churches are, as a rule, so plentifully supplied. Sometimes these crosses are incised in the slab, sometimes they are executed in low relief. The long shaft of the cross is most commonly plain, but in many instances branches, with leaf designs, are thrown out at intervals down the entire length of the shaft. The Calvary cross (Latin cross on steps) is sometimes found. Fig. 8 from Stradsett church, Norfolk, and fig. 9 from Bosbury church, Herefordshire, are good examples of the designs at the head of sepulchral crosses. Of upright standing crosses the Irish and Iona types are well known, and their great artistic beauty and elaboration and excellence of sculpture are universally recognized. These crosses are sometimes spoken of as "Runic Crosses," some of them bearing inscriptions in Runic characters. Standing crosses, of different kinds, were commonly set up in every suitable place during the middle ages, as the mutilated bases and shafts still remaining readily testify. Such crosses were erected in the centre of the market place, in the churchyard, on the village green, or as boundary stones, or marks to guide the traveller. Some, like the Black Friars cross at Hereford, were preaching stations, others, like the beautiful Eleanor crosses at Northampton, Geddington and Waltham, were commemorative in character. Of these latter crosses, which marked the places where the funeral procession of Queen Eleanor halted on its way from Nottinghamshire to Westminster, there were originally ten or more, erected between 1291 and 1294. These crosses, like the Black Friars cross at Hereford, are elaborate architectural erections, and very similar to them in this respect are the beautiful market crosses at Winchester, Chichester, Salisbury, Devizes, Shepton Mallet, Leighton Buzzard, etc. Of churchyard crosses, as distinguished from memorial crosses in churchyards, one of the most perfect now remaining stands in the churchyard of Somerby, in Lincolnshire (Tennyson's birthplace), a tall shaft surmounted by a pedimented tabernacle, on one side of which is the Crucifixion, on the other the Virgin and Child. Churchyard crosses may have been used as occasional preaching stations, for reading the Gospel in the Palm Sunday procession, and for public proclamations after the chief Sunday morning service, much in the same way that market crosses were used for proclamations on market days.

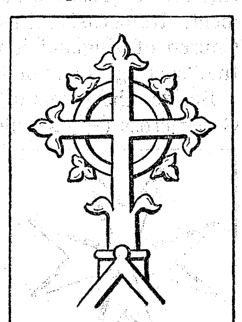

FIG. 6.—CROSS ON NAVE OF CASTLE ACRE CHURCH, NORFOLK

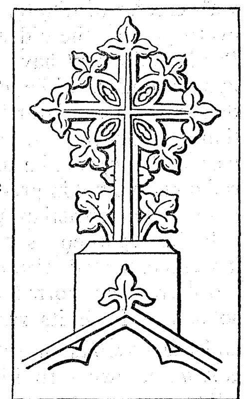

FIG. 7.—EAST GABLE CROSS OF HETHERSETT CHURCH, NORFOLK

Bishops' Crosses.—Mention should be made of ecclesiastical crosses and their ceremonial use. From a fairly early period it has been the prerogative of an archbishop or metropolitan to have a cross borne before him within the limits of his province. The archiepiscopal cross must not be confused with the crozier or pastoral staff. The latter, which is formed with a crook at the end, is quite distinct, and is used by archbishops and bishops alike, who bear it with the left hand in processions, and when blessing the people. The archiepiscopal cross, on the contrary, is always borne before the archbishop or during the vacancy of the archiepiscopal see before the guardian of the spiritualities *sede vacante*. Good illustrations of the archiepiscopal cross occur on the monumental brasses of Archbishop Waldeby, of York (1398), at Westminster Abbey, and of Archbishop Cranley, of Dublin (1417), in New College chapel, Oxford.

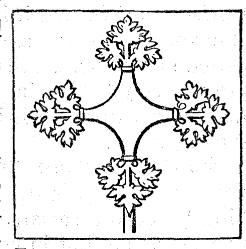

FIG. 8.—SEPULCHRAL CROSS FROM STRADSETT CHURCH, NORFOLK

The custom of carrying a cross at the head of an ecclesiastical procession seems to have been general in early times. The long shaft was sometimes removable, so that the cross or crucifix at the top could be set in a stand and kept on the altar. This was perhaps the origin of the altar-cross, of whose use there seems no indisputable evidence before the 11th century. (*See* H. Thurston, *Cath. Encyl.*, iv. 533.)

As a personal ornament the cross came into common use, and was usually worn over the chest (and so called a pectoral cross), suspended by a chain from the neck. A cross of this kind, of very great interest and beauty, was found about 1690 on the breast of Queen Dagmar, the wife of Waldemar II., king of Denmark (d. 1213). It is of Byzantine design and workmanship, and is of enamelled gold (fig. 10 shows both sides of it); on one side is the Crucifixion, on the other the half-figure of our Lord in the centre, with the Virgin and St. John the Evangelist on either side, and St. Chrysostom and St. Basil above and below. At the present day a pectoral cross forms part of the recognized insignia of a Roman Catholic bishop, and is worn by him over his robes, but this official use of the pectoral cross is quite modern. The custom appears to have taken rise in the 17th century on the Continent. A cruciform reliquary was found on the body of St. Cuthbert when his tomb was opened in 1827, but it was evidently worn as an object of devotion, not as part of his episcopal attire. The custom of wearing a pectoral cross over ecclesiastical robes has, curiously enough, been copied from the comparatively modern Roman Catholic usage by the Lutheran bishops and superintendents of Scandinavia and Prussia; and in Sweden the cross is now

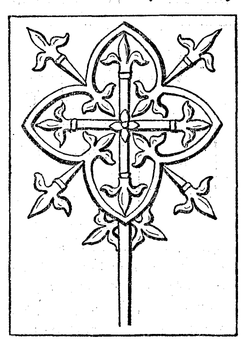

FIG. 9.—SEPULCHRAL CROSS FROM BOSBURY CHURCH, HEREFORDSHIRE

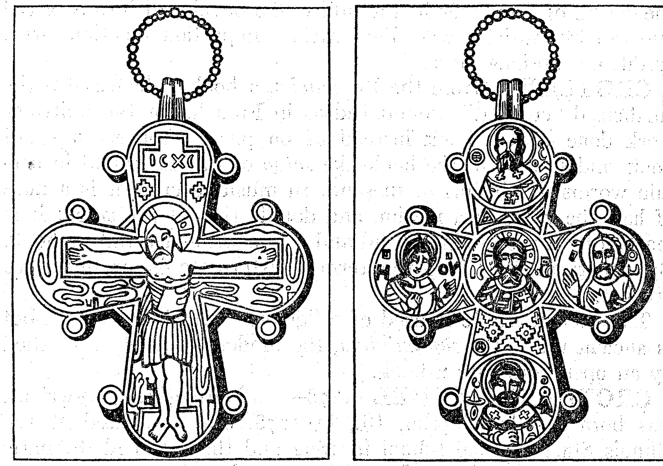
delivered to the new bishop, on his installation in office, by the archbishop of Uppsala, together with the mitre and crozier. Within the last generation the use of a pectoral cross, worn over their robes as part of the insignia of the episcopal office, has been adopted by some bishops of the Church of England, but it has no ancient sanction or authority.



FIGS. 10 AND 11.—THE OBVERSE AND REVERSE OF AN ENAMELLED GOLD CROSS OF BYZANTINE DESIGN AND WORKMANSHIP FOUND IN 1690 ON THE BREAST OF QUEEN DAGMAR, WIFE OF WALDEMAR II., KING OF DENMARK (D. 1213). ONE SIDE SHOWS THE CRUCIFIXION: THE OTHER, CHRIST WITH THE VIRGIN AND ST. JOHN ON EITHER SIDE, ST. CHRYSOSTOM ABOVE, AND ST. BASIL BELOW

CROSSBILL, the common name of a genus (*Loxia*) of the finch family (*Fringillidae*), remarkable in that the upper and lower sheaths of the bill cross one another obliquely. This is correlated with the bird's habit of feeding on pine seeds, the formation of the bill enabling it to hold apart the scales while extracting the seed with its tongue. (*See* Yarrell, *Zool. Journ.,* iv. pp. 457–465, Pl. xiv., figs. 91–7.) The common crossbill (*L. curvirostra*) is about the size of a skylark, but more stoutly built. The plumage of the adult cock is a rich crimson, with patches of flame-colour; these are replaced in captivity by dull orange or bright golden yellow. The female is yellowish green; the young, before the first moult, a dull olive. Crossbills live in small flocks and are great wanderers. The nest is rudely constructed and the eggs resemble those of the greenfinch, but are larger. This species is distributed throughout Europe and Northern Asia and in the woods of the Atlas mountains. The larger parrot-crossbill (*L. pityopsittacus*) inhabits Scandinavia. Two species are found in America; *L. curvirostra minor* differs from the British species in its smaller bill; the second form, *L. leucoptera,* is smaller, rose-coloured, and with white wing-bars.

BY COURTESY OF AMERICAN MUSEUM OF NATURAL HISTORY

AMERICAN RED CROSSBILL ON THE BRANCH OF A FIR TREE, THE CONES OF WHICH IT OPENS WITH ITS PLIER-LIKE BILL

CROSS-BOW. An ancient missile-throwing weapon consisting of a bow fixed transversely upon a stock that contains a groove to guide the missile, a notch to hold the string of the bow, and a trigger to release it. There were several varieties of cross-bows, viz.—goat's-foot, windlass, catch, German, cross-bow à galet, ramrod, the Chinese and the arbalest, which usually fired quarrels or square-headed bolts, and was so stiff that a mechanical contrivance was required to bend it. Those of the cavalry were lighter than those of the infantry.

CROSSED CHEQUE: *see* CHEQUE.

CROSSEN, a town of Germany, in the Prussian province of Brandenburg, on the Oder, 31 mi. S.E. of Frankfort-on-Oder by rail. Pop. (1939) 10,584.

It was founded in 1005 and was important during the middle ages as a point of passage across the Oder. It attained civic rights in 1232 and was for a time the capital of a Silesian duchy, which passed to Brandenburg in 1482.

There are manufactories of copper and brass ware, while in the surrounding country fruit growing is important. Trade is mainly in wine, fruit and fish.

CROSS-HEAD, the joint between a piston rod and a connecting rod (*q.v.*) constrained to move so that the piston rod travels to and fro in a straight line and the connecting rod oscillates about the junction.

(*See* STEAM ENGINE.)

CROSSING, in architecture, the intersection of the nave and transept.

CROSSKEY, HENRY WILLIAM (1826–1893), English geologist and Unitarian minister, was born at Lewes in Sussex, on Dec. 7, 1826. He became an authority on glacial geology, and in conjunction with David Robertson wrote many papers on the post-tertiary fossiliferous beds of Scotland (*Trans. Geol. Soc. Glasgow*). He also prepared for the British Association a valuable series of reports (1873–92) on the erratic blocks of England, Wales, and Ireland. With David Robertson and G. S. Brady he wrote the *Monograph of the post-tertiary Entomostraca of Scotland,* etc., for the Palaeontographical Society (1874). He died at Edgbaston, Birmingham, on Oct. 1, 1893.

See R. A. Armstrong, *H. W. Crosskey: his Life and Work* (1895).

CROSS RIVER, a river of West Africa, over 500m. long. It rises in 6° N., 10° 30′ E. in the mountains of the Cameroons and flows at first north-west. In 8° 48′ E., 5° 50′ N. are a series of rapids; below this point the river is navigable for shallow-draught boats. At 8° 20′ E., 6° 10′ N., its most northern point, the river turns south-west, and then south, entering the Gulf of Guinea through the Calabar estuary. The Calabar river, which rises about 5° 30′ N., 8° 30′ E., has a course parallel to, and 10 to 20m. E. of, the Cross river. Near its mouth, on its east bank, is the town of Calabar (*q.v.*). It enters the estuary in 4° 45′ N. The Cross, Calabar, Kwa and other streams farther east, which rise on the flanks of the Cameroon mountains, form a large delta.

CROSS-ROADS, BURIAL AT, in former times the method of disposing of executed criminals and suicides. The explanation is that the ancient Teutonic peoples often built their altars at the cross-roads, and as human sacrifices, especially of criminals, formed part of the ritual, these spots came to be regarded as execution grounds. After the introduction of Christianity, criminals and suicides were buried at the cross-roads during the night, in order to assimilate their funeral to that of the pagans. An example of a cross-road execution-ground was the famous Tyburn in London, which stood on the spot where the Oxford, Edgware and London roads met.

CROSS SPRINGER, in architecture, the block from which the diagonal ribs of a vault spring or start.

CROSSWORD. A word-guessing puzzle, consisting of a diagram, usually rectangular, divided into squares, into each of which, when not cancelled, a certain letter of the alphabet is to be inserted.

In properly keyed puzzles, each letter forms a part of two words, one running downward and one across. Accompanying the diagram are numbered definitions for the horizontal and vertical columns of squares. These correspond to identical numbers in the puzzle so that when the proper solution is fitted, the words of the puzzle interlock perfectly.

The first crosswords seem to have been printed in England during the 19th century. These were of an elementary kind, apparently derived from the word square, and printed in various periodicals and in books of general puzzles for the nursery. However, it was in the United States that the puzzle developed into

37. Note of scale

a serious adult pastime. In 1913 the *New York World* began publishing crossword puzzles in its Sunday supplement, *Fun.* Gradually the desire for them spread, and in 1923 they became the most talked-of form of entertainment in the United States, being published by most of the popular newspapers, and in a few months had returned to take England by storm. Though American enthusiasm for them has diminished somewhat, and though they have failed to become firmly established in other European countries, England has remained faithful to these puzzles for many years, and there seems to be no sign of waning in their popularity.

Though the majority of puzzles are confined to (*a*) symmetrical patterns of shaded or blacked out squares (*see* fig.) within the rectangle, variations have by no means been an exception. These include (*b*) an asymmetrical scattering of squares, (*c*) a plain diagram with no squares cancelled and the ends of words marked simply by a thick line, (*d*) isolated but quite successful examples of pictorial designs, either in outline containing the diagram, or in line inside the diagram, or a combination of both, and (*e*) diagramless puzzles with no clue given to the position or length of the words.

The "general" type of crossword has also been subject to changes. A number of words in one puzzle may bear upon some announced theme such as music, sports, literature or geography. Many of the puzzles in this category are difficult and serve as the medium for a generally recondite examination. Again, some clues will be omitted altogether, but a direction be given that the words thus neglected belong to a particular class: jewels, for example, or the words in a quotation. Or every word will have some given prefix, suffix, or part in common, and only the rest of the word will actually fill the spaces in the diagram: (cat)alepsy, (Cat)hay, etc.; unc(tion), cap(tion), etc.; qu(it)e, cr(it)ic, etc. (G. E. Lr.)

CROTCH, WILLIAM (1775–1847), English musician, born at Norwich, who was a musical prodigy at the age of two. At the age of four he went to London and gave daily organ recitals in the rooms of a milliner in Piccadilly. He developed into a sound and worthy musician who filled various important positions with credit, but nothing more.

CROTCHET (from the Fr. *croche,* a hook; whence also the Anglicized "crochet," pronounced as in French, for the knitting-work done with a hook instead of on pins), properly a small hook, and so used of the hook-like *setae* or bristles found in certain worms which burrow in sand. In music, a crochet is a note of half the value of a minim, and double that of a quaver; it is marked by a round black head and a line without a tail or hook. By American musicians the term quarter-note is preferred to crochet.

The French *croche* is used of a "quaver" which has a tail, but in ancient music the *semiminima,* the modern crochet, is marked by an open note with a hook.

CROTHERS, RACHEL (1878–), American playwright, was born in Bloomington, Ill., in 1878. She graduated at the Illinois State Normal school in 1892 and then studied dramatic art in Boston and New York. She made her first stage appearance as a member of Felix Morris' company in New York city, and was afterwards a member of Madame Rhea's company. Her first play to be professionally produced was *The Rector* at the Madison Square theatre, N.Y., on April 3, 1903. She has produced and directed her own plays, the most representative of them dealing with the general question of woman's rights, the most popular of them being *A Man's World,* produced in 1909 (published in Boston, 1915); *He and She,* produced in 1911 (published in A. H. Quinn's *Representative American Plays,* 1917); *Old Lady 31,* produced in 1916 (published with *Mary the Third* and *A Little Journey* in *Three Plays* by Rachel Crothers, 1923); *Nice People,* produced in 1921 (published in M. J. Moses' *Representative American Dramas,* Boston, 1925, in A. H. Quinn's *Contemporary American Plays,* 1923, and also with *Expressing Willie,* produced 1924, and *39 East,* produced 1919, in *Three Plays* by Rachel Crothers, 1924).

Her one-act plays were published in London in *One-Act Plays for Stage and Study,* and in *Six One-Act Plays,* Boston, 1925. Later plays were *When Ladies Meet* (1932) and *Susan and God* (1937).

CROTONA, CROTO or **CROTON** (Gr. Κρότων, mod. Crotone), a Greek town in southern Italy on the east coast of the territory of the Bruttii (mod. *Calabria*), 7 mi. N.W. of the Lacinian promontory. It was founded by a colony of Achaeans led by Myscellus in 710 B.C. Like Sybaris, it soon became a city of power and wealth. It was especially celebrated for its successes in the Olympic games from 588 B.C. onwards, Milo being the most famous of its athletes. Pythagoras established himself there between 540 and 530 B.C. and formed a society of 300 disciples (among whom was Milo). In 510 B.C. Crotona was strong enough to defeat the Sybarites, and raze their city to the ground. Shortly afterwards, however, the disciples of Pythagoras were driven out, and a democracy established. The victory of the Locrians and Phlegians over Crotona in 480 B.C. marked the beginning of its decline. It suffered after this from the attacks of Dionysius I, who became its master for 12 years, of the Bruttii and of Agathocles, and even more from the invasion of Pyrrhus, after which in 277 the Romans obtained possession of it. Livy states that the walls had a length of 12 mi. and that about half the area within them had at that time ceased to be inhabited.

After the battle of Cannae, Crotona revolted from Rome, and Hannibal made it his winter quarters for three years.

The importance of the city was mainly due to its harbour, which, though not a good one, was the only port between Tarentum and Rhegium. Remains of a ship loaded with a cargo of classical marbles were found in it. The original settlement occupied the hill above it (143 ft.) and later became the acropolis. Its healthy situation was famous in antiquity, and to this was ascribed its superiority in athletics; it was the seat also of a famous medical school. Of the exact site of the ancient city and its remains practically nothing is known. On the Lacinian promontory was the famous temple of Hera Lacinia of which only one column is standing. It was approached by a processional way from Croton, which, in front of the gate into the enclosure wall, was some 20 yards wide.

CROTONALDEHYDE is formed from aldol (*see* ALDEHYDES: *Aldolization*) when the latter loses water. Its chemical formula is $CH_3{\cdot}CH{:}CH{\cdot}CHO$, and on oxidation it passes into crotonic acid, $C_4H_6O_2$. It is of importance in the manufacture of rubber (*see* RUBBER: PRODUCTION AND MANUFACTURE).

CROTON OIL, an oil prepared from the seeds of *Croton Tiglium,* a tree belonging to the family Euphorbiaceae, and native or cultivated in India and the Malay Islands. The seeds resemble those of the castor-oil plant, but have not their polished and mottled surface. The kernels contain from 50 to 60% of oil, which is obtained by pressing them, when bruised to a pulp, between hot plates. Croton oil is a transparent and viscid liquid of a brownish or pale-yellow tinge, and acrid, peculiar and persistent taste, a disagreeable odour and acid reactions. It is soluble in volatile oils, carbon disulphide and ether, and to some extent in alcohol. It contains acetic, butyric and valeric acids, with glycerides of acids of the same series, and a volatile body. $C_5H_8O_2$, tiglic acid, metameric with angelic acid, and identical with methyl-crotonic acid, $CH_3{\cdot}CH{:}C\ (CH_3)\ (CO_2H)$. The odour is due to various volatile acids, which are present to the extent of about 1%. A substance called crotonal appears to be responsible for its external, but not its internal, action. The latter is probably due to crotolinic acid, $C_9H_{14}O_2$, which has active purgative properties. The maximum dose of croton oil is two minims, one-fourth of that quantity being usually ample.

Applied to the skin, croton oil acts as a powerful irritant, inducing so much inflammation that definite pustules are formed. Taken internally, even in minute doses, croton oil very soon causes much colic and a fluid diarrhoea. In larger doses it produces severe gastroenteritis. The same result may follow absorption of croton oil by the skin.

The minuteness of the dose, the certainty of the action, and the large amount of fluid drained away constitute this the best drug for administration to an unconscious patient, especially in apoplexy, or to insane patients refusing to take any drug. One drop of the oil, placed on the back of the tongue, must inevitably be swallowed by reflex action. A dose should never be repeated. The characters of this drug obviously contra-indicate its use in all cases of organic disease or obstruction of the bowel, in pregnancy, or in cases of constipation in children or the aged.

CROTUS, RUBIANUS (JOHANNES JÄGER) (*c.* 1480–*c.* 1539), German humanist, born at Dornheim and educated at Erfurt, later becoming professor of theology at Cologne. In 1515 he contributed to the collection, *Epistolae Obscurorum Virorum,* his satirical letters on scholasticism and monasticism. After four years in Italy, Crotus became rector of Erfurt university (1520) and there entertained Luther. Three years later he went to Fulda, but finally settled in Halle, where he reverted to his old religion (*c.* 1530) and became a canon. His *Apologia* appeared at Leipzig 1531.

See Kampschulte, *De J. Croto Rubiano Commentatio* (Bonn, 1862); Einert, *Johann Jäger aus Dornheim* (1883); and Brecht, *Die Verfasser der Epistolae obscurorum virorum* (1904).

CROUP, a name formerly given to diseases characterized by distress in breathing accompanied by a metallic cough and some hoarseness of speech. It is now known that these symptoms are often associated with diphtheria (*q.v.*), spasmodic laryngitis (*q.v.*), and a third disease, spasmodic croup, to which the term is now alone applied. This occurs most frequently in children above two years of age; the child goes to bed quite well, and a few hours later suddenly awakes with great difficulty in inspiration, the chest wall becomes markedly retracted, and there is a metallic cough. He becomes cyanosed, and seems moribund. In the course of four or five minutes normal respiration starts again, and the attack is over for the time being; but it may recur several times a day. The seizure may be accompanied by convulsions. The best treatment is to plunge the child into a warm bath, and sponge the back and chest with cold water. Subsequently this can be done two or three times a day. Should the cyanosis become very severe, respiration can be restarted by vomiting induced by ipecacuanha wine, or other means. Rickets, enlarged tonsils or adenoids if present should be treated.

CROUSAZ, JEAN PIERRE DE (1663–1748), Swiss writer, was born at Lausanne. In 1700 he became professor of philosophy and mathematics there, and in 1724 theological disputes about the *Consensus* (a document drawn up as a test of Protestant orthodoxy as to the doctrine of grace) led to his going to a similar chair at Groningen. In 1726 he went as governor to the young prince Frederick of Hesse-Cassel, and in 1737 was reinstated at Lausanne. He introduced the philosophy of Descartes and Locke to Lausanne, and was a violent opponent of Leibnitz and Bayle.

The most important of his works are *Nouvel Essai de logique* (1712); *Géométrie des lignes et des surfaces rectilignes et circulaires* (1712); *Traité du beau* (1714); *Examen du traité de la liberté de penser d'Antoine Collins* (1718); *De l'éducation des enfants,* dedicated to the then Princess of Wales (1722); *Examen du pyrrhonisme ancien et moderne,* an attack chiefly on Bayle (1733); *Examen de l'essai de M. Pope sur l'homme,* an attack on the Leibnitzian theory of that poem (1737); *Logique* (1741); *De l'esprit humain* (1741); *Réflexions sur l'ouvrage intitulé: La Belle Wolfienne* (1743).

CROW, a Siouan Plains Indian tribe, also known as Absaroka. They formerly lived in the drainage of Yellowstone river and numbered 3,000–4,000. In 1922 there remained 1,800 on their reservation in Montana. Their speech resembles the Hidatsa (*q.v.*), from whom their separation is probably not ancient. *See* Frank B. Linderman, *American* (Life Story of a Crow Chief, 1930).

See Lowie in *Anthr. Pap. Am. Nat. Hist.,* vols. xi., xvi., xxi., xxv. (1913–22).

CROW, a general name for several birds of the genus *Corvus,* of the family *Corvidae.* It is applied particularly in England to the carrion crow (*C. corone*) and hooded crow (*C. cornix*) and in America to the American crow (*C. brachyrhynchos*). The *Corvidae* are the most highly developed family of birds, and include, besides the crows proper, the magpies, jays, choughs, the rook and the raven (*qq.v.*).

Of the true crows, the black or carrion crow is resident in Britain. It shares its range with a second species, the grey or hooded crow. Both forms migrate south in winter, a line from the Firth of Clyde to the head of the Adriatic dividing, roughly, their summer homes; the carrion crow occurs to the south-west of this, the hooded crow to the north-east. Where the ranges overlap, the two species appear to inter-breed freely, sometimes producing intermediate types. The "hoodie" differs from its congener in possessing a grey instead of a black body. Both species feed on carrion, small birds, eggs, etc.; they are some 18 or 19 in. in length and build isolated nests in which they lay four to six bluish-green eggs blotched with brown.

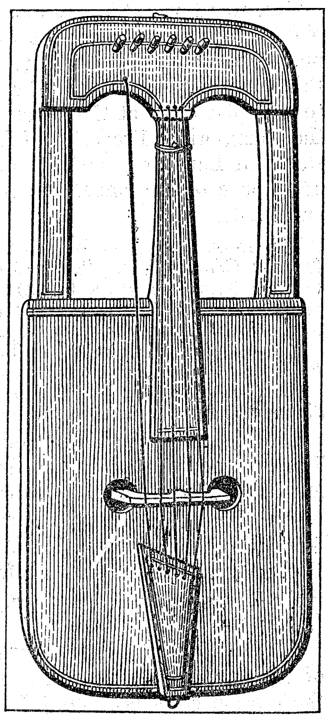
The American crow is, unlike the preceding, gregarious and feeds largely on grain; hence it is very unpopular with farmers. It is smaller than the European species. The fish crow (*C. ossifragus*) is also American and lives largely on fish, molluscs and garbage cast up by the sea. The Indian house crow (*C. splendens*) is abundant in India, where it is very tame and useful as a scavenger. The so-called carrion crow of the United States of America is the black vulture.

CROWBERRY or **CRAKEBERRY** (*Empetrum nigrum*), the English name for a low-growing heath-like shrub belonging to the family Empetraceae, found on heaths and rocks in the British Isles and across northern Europe, Asia and North America and also in the Andes. It has slender, wiry, spreading branches covered with short, narrow, stiff leaves, the margins of which are recurved to form a hollow cylinder concealing the hairy under surface. The minute flowers are succeeded by black, edible, berry-like fruits, one-fourth to one-third of an inch in diameter, which are much eaten by birds.

CROWD, Crouth, Crowth (Welsh *crwth;* Fr. *crout;* Ger. *Chrotta, Hrotta*), a mediaeval stringed instrument derived from the lyre, characterized by a sound-chest having a vaulted back and an open space left at each side of the strings to allow the hand to pass through in order to stop the strings on the finger-board. The Welsh crwth, which survived until the end of the 18th century, is represented by a specimen of that date preserved in the Victoria and Albert Museum.

The earliest representation of the crwth yet discovered dates from the Carolingian period. In the miniatures of the Bible of Charles the Bald, in the Bibliothèque Nationale, Paris, one of the musicians of King David is seen stopping strings on the fingerboard with his left hand and plucking them with the right; this crwth has only three strings, and may be the crwth *trîthant* of Wales. It will be understood that the crwth was not an exclusively Welsh instrument, but only a late survival in Wales of an archaic instrument once generally popular in Europe but long obsolete elsewhere than in Wales.

(K. S.)



BY COURTESY OF THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM

THE WELSH CRWTH (CROWD), WHICH WAS USED IN WALES UNTIL THE 18TH CENTURY

CROWDER, ENOCH HERBERT (1859–1932), American soldier, was born in Missouri on April 11, 1859. He graduated at the U.S. military academy in 1881, and was commissioned in the cavalry. After serving four years in campaigns against the Apache and Sioux Indians, he was detailed as commandant at the University of Missouri, where he also studied law and received his graduate degree in law in 1886. From 1891–95 he was acting judge advocate of the military department of the Platte. Upon the outbreak of the Spanish-American War he was appointed judge advocate of the American troops sent to the Philippine Islands. While in the Philippines he served as secretary to the military governor and as associate justice of the supreme court of the Philippines for two years (1899–1901). Returning to the United States in Aug. 1903, he was chief of the 1st Division of the general staff (1903–07). During the Russo-Japanese War, he went to Manchuria as American military observer with the Japanese army (1904–05). From 1906–08, he was in Cuba as secretary of State and justice, in which position he devised the first electoral laws of the island. In July 1910 he was a member of the fourth Pan-American Conference in Argentina, and in September of the same year visited Chile on a special mission. He became advocate general of the army in February 1911 and in this position made sweeping changes. When the United States entered the World War, he was directed to draft the selective service bill. From May 1917 to July 1919, he was provost marshal, charged with the duties of administering the new act, and in 1919 he was reappointed judge advocate general. Crowder was recognized as an expert in military law. In his book, *The Spirit of Selective Service* (1920), he describes the method whereby within 18 months after America had entered the World War, 2,000,000 men were in France, almost as many more were in cantonments, and altogether no fewer than 24,000,000 had been registered and classified. He visited Cuba in March, 1919, upon the invitation of the Cuban Government to assist in the revision of the Cuban electoral laws, and on the completion of his work, received the thanks of the Cuban Congress. He served as personal representative of Presidents Wilson and Harding in Cuba from Dec. 31, 1920, to March 5, 1923, when he became U.S. ambassador to Cuba. On Sept. 1, 1927, he retired from the diplomatic service by resignation, having completed 50 years of public service. He died May 7, 1932.

CROWE, SIR EYRE ALEXANDER (1864–1925), British civil servant, was born at Leipzig, July 30, 1864. Educated at Düsseldorf, Berlin and Paris, he entered the Foreign Office in 1885, became counsellor of embassy in 1907, and assistant under-secretary of State in 1912. He was a British delegate at the second Hague Conference of 1907 and at the International Naval Conference held in London in 1908. He conducted the British case in the arbitration of 1911 regarding the recapture in France of the Indian agitator Savarkar, and was created K.C.M.G. Though his mother and wife were German, he was a vigilant critic of German foreign policy, and before the World War prepared an impressive memorandum for the Cabinet on the subject, whilst his scheme for seizing German shipping in British ports was adopted when the crisis came. He was one of the committee of six who drew up for Great Britain a draft convention of the League of Nations, and he took part in the Paris Peace Conference. In 1920 he was promoted G.C.M.G. and became permanent under-secretary for foreign affairs. He died April 28, 1925.

See his correspondence and memoranda in *British Documents on the Origins of the War, 1898–1914,* ed. G. P. Gooch and H. W. V. Temperley (1926).

CROWE, SIR JOSEPH ARCHER (1825–1896), English consular official and art critic, son of Eyre Crowe, was born in London on Oct. 25, 1825. He studied painting under Delaroche in Paris, where his father was correspondent of the *Morning Chronicle.* During the Crimean War he was the correspondent of the *Illustrated London News,* and during the Austro-Italian War represented *The Times* in Vienna. He was British consul-general in Leipzig from 1860 to 1872, and in Düsseldorf from 1872 to 1880, when he was appointed commercial attaché in Berlin, being transferred to Paris in 1882. In 1883 he was secretary to the Danube conference in London; in 1889 plenipotentiary at the Samoa conference in Berlin; and in 1890 British envoy at the Telegraph congress in Paris, in which year he was made K.C.M.G. During a sojourn in Italy, 1846–47, he cemented a lifelong friendship with the Italian critic Giovanni Battista Cavalcaselle (1820–97), and together they produced several historical works on art of classic importance, notably *Early Flemish Painters* (London, 1857); *A New History of Painting in Italy from the Second to the Sixteenth Century* (London, 1864–71, 5 vols.). In 1895 Crowe published *Reminiscences of Thirty-Five Years of My Life.* He died at Schloss Gamburg in Bavaria on Sept. 6, 1896.

Crowe and Cavalcaselle's great *History of Painting* was under revision by Crowe up to the time of his death, and subsequently by S. A. Strong (d. 1904) and Langton Douglas.

CROWFOOT, the name applied to several species of *Ranunculus,* most of which are better known as buttercups (*q.v.*). The water crowfoot (*R. aquatilis*) has a floating stem bearing finely-divided submerged leaves and lobed floating leaves. The flowers are white. (*See* also Ranunculus, Ranunculaceae.)

CROWLAND or **CROYLAND,** town in Holland, Lincolnshire, England; in a low fen district, on the river Welland, 8 mi. N.N.E. of Peterborough, served by branches of the L.N.E.R. Pop. (1931) 2,809. The origin of the monastery, which existed here in 1051, is very obscure. Its traditions were put together by Ordericus Vitalis, but the history supposedly written by Ingulf, the first Norman abbot (1085–86) was shown to be a forgery and probably the work of prior Richard Upton, who became abbot in 1417. His object in writing it seems to have been to supply evidence showing the rights of the monastery for lawsuits in which it was involved with the people of Moulton, Weston, Spalding and Pinchbeck. These suits were decided in the abbey's favour in 1415. However, religious life may have begun at Crowland in 699, when Guthlac, a celebrated hermit, settled on the then island with two followers, and it is not improbable that King Aethelbald founded the monastery following Guthlac's death in 714. By the time of Domesday it was well established and then held properties valued at £57 1*s.* 4*d.* In 1091 fire destroyed part of the church, but a new building was begun by Abbot Geoffrey (1110–

24). The west front is of early English date, with Penpendicular restoration. The north aisle is restored and used as the parish church. A curious triangular bridge spanned three streams, now covered, and affords three footways, which meet at an apex in the middle. The town suffered from fire (1469–76), but the abbey tenants were given money to rebuild it. The annual fair of St. Bartholomew, which originally lasted 12 days, was first mentioned in Henry III's charter of 1227. The fair is now held on Sept. 4. With the dissolution of the monastery the prosperity of the town rapidly decreased.

See *Victoria County History,* Lincolnshire, ii, 105–118.

CROWLEY, ROBERT (1518?–1588), English religious and social reformer, was educated at Magdalen college, Oxford, where he was a foundation scholar and a fellow. He set up a printing-office in Ely Rents, Holborn, where he printed many of his own writings.

As a typographer, his most notable production was an edition of *Pierce Plowman* in 1550, and some of the earliest Welsh printed books came from his press. His "Information and Petition against the Oppressors of the poor Commons of this realm," addressed to the parliament of 1547, is remarkable for its attack on the "more than Turkish tyranny" of the landlords and capitalists of that day. While repudiating communism, Crowley was a Christian Socialist, and warmly approved the efforts of Protector Somerset to stop enclosures.

In his *Way to Wealth* (1550), he attributes the failure of the Protector's policy to the organized resistance of the richer classes. His *Voice of the Last Trumpet Blown by the Seventh Angel* (1550), his *One-and-Thirty Epigrams* (1550) and *Pleasure and Pain* (1551) were edited for the Early English Text society in 1872 (Extra Ser. xv). Crowley was ordained deacon by Ridley on Sept. 29, 1551.

During Mary's reign he was among the exiles at Frankfort. At Elizabeth's accession he was made archdeacon of Hereford in 1559, and prebendary of St. Paul's in 1563, and was incumbent first of St. Peter the Poor in London, and then of St. Giles's Without, Cripplegate.

He refused to minister in the "conjuring garments of popery," and in 1566 was deprived and imprisoned for resisting the use of the surplice by his choir. His "A Brief Discourse against the Outward Apparel and Ministering Garments of the Popish Church," is "memorable," says Canon Dixon, "as the first distinct utterance of Nonconformity."

In 1576 he was presented to the living of St. Lawrence Jewry. Nor had he abandoned his connection with the book trade, and in 1578 he was admitted a freeman of the Stationers' company.

He died on June 18, 1588. The most important of his works not hitherto mentioned is his continuation of Languet and Cooper's *Epitome of Chronicles* (1559).

See J. M. Cowper's *Pref. to the Select Works of Crowley* (1872); Strype's *Works;* Gough's *General Index to Parker Soc. Publ.;* Machyn's *Diary;* Macray's *Reg. Magdalen College;* Newcourt's *Rep. Eccles. Lond.;* Hennessy's *Nov. Rep. Eccl.* (1898); Le Neve's *Fasti Eccl. Angl.;* Pocock's *Burnet;* Pollard's *England Under Somerset;* R. W. Dixon's *Church History.*

CROWLEY, a city in southwestern Louisiana, U.S.A.; the capital of Acadia parish. It is on federal highway 90, and is served by the Missouri Pacific, the Southern Pacific and the Texas and Pacific railways.

The population in 1920 was 6,108; in 1930, 7,656; and in 1940, 9,523 by the federal census. It is the centre of a rice-growing district.

The city has a large trade in tractors and other agricultural machinery. Crowley was settled in 1887, and was incorporated in 1889.

CROWN, an English silver coin of the value of five shillings; hence used to express the sum of five shillings. It was originally of gold and was first coined in 1526, in imitation of the French "Crown of the Sun" period. Edward VI introduced silver crowns and half-crowns, and down to the reign of Charles II crowns and half-crowns and sometimes double crowns were struck both in gold and silver. In the reign of Edward VI also was introduced the practice of dating coins and marking them with their current value.

The "Oxford crown" struck in Oxford in 1644, was designed by Thomas Rawlins and included a view of that city on the obverse. Since the reign of Charles II the crown has been struck in silver only. At one time during the 19th century it was proposed to abandon the issue of the crown, and from 1861 until 1887 none was struck. From the latter year until 1902 it was in limited circulation.

Between 1902 and 1927 no crowns were minted, but small quantities were struck in the years 1928–37, the largest coined being 714,769 in 1935 on the occasion of King George V's jubilee. The half-crown continued to be minted in large quantities.

The figure of St. George first appeared on the obverse side of the crown in 1818. The design of the reverse was altered in 1937 and after that consisted of the ensign's armorial of the United Kingdom contained in a shield surmounted by the royal crown with supporters both standing on a mount with the royal motto, and an inscription. (*See* also NUMISMATICS.)

(W. D. C.)

CROWN and **CORONET,** an official or symbolical ornament worn on or round the head. The crown at first had no regal significance. It was a garland, or wreath, of leaves or flowers, conferred on the winners in the athletic games. Afterwards it was often made of gold, and among the Romans was bestowed for honourable service performed. The *corona obsidionalis,* of grass and flowers plucked on the spot, was given to the general who conquered a city. The *corona civica,* of oak leaves with acorns, was bestowed on the soldier who in battle saved the life of a Roman citizen.

The mural crown (*corona muralis*) was for the soldier who was the first to scale the walls of a besieged city, and was usually a circlet of gold adorned with turrets. The naval crown (*corona navalis*), decorated with a series of prows of ships, was the reward of a notable victory at sea.

Many other forms of crown were used by the Romans, as the conqueror's triumphal crown of laurel, the myrtle crown, and the convivial, bridal, funeral and other crowns. Some of the emperors wore crowns on occasion, as Caligula and Domitian, at the games, and stellate or spike crowns are depicted on the heads of several of the emperors on their coins, but no idea of imperial sovereignty was indicated thereby. The Roman people, who had accepted imperial rule as a fact, were very jealous of the employment of its emblem on the part of their rulers. That emblem was the diadem, and although the diadem and crown are frequently confused with each other they were quite distinct. The diadem, of eastern origin, was a band of linen or silk, richly embroidered, worn tied round the forehead. Selden says that the diadem and crown "have been from ancient times confounded, yet the diadem strictly was a very different thing from what a crown now is or was, and it was no other then than only a fillet of silk, linen or some such thing." The confusion between them has, perhaps, come about from the fact that the modern crown seems to be rather an evolution from the diadem than the descendant of the older crowns. The linen or silk diadem was eventually exchanged for a flexible band of gold, worn in its place round the forehead. The further development of the crown from this was effected by the addition of an upper row of ornament. Thus the mediaeval and modern crowns may be considered as radiated diadems, and so the diadem and crown have become, as it were, merged in one another.

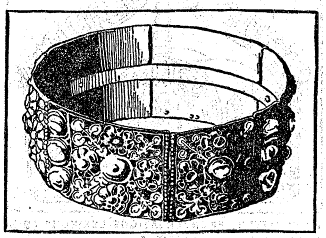


FIG. 1.—IRON CROWN OF LOMBARDY

Among the historical crowns of Europe, the Iron Crown of Lombardy (fig. 1), preserved at Monza, claims notice. It is a band of iron, enclosed in a circlet formed of six plates of gold, hinged one to the other, and richly jewelled and enamelled. It is regarded with great reverence, owing to a legend that the inner band of iron has been hammered out of one of the nails of the true cross. The crown is so small, the diameter being only 6in., and the circlet only $2\frac{1}{2}$in. in width, that doubts have been felt as to whether it was originally intended to be worn on the head or was merely meant to be a votive crown. The legend as to the iron being that of one of the nails of the cross is rejected by Muratori and others, and cannot be traced far back. Another historical crown is that of Charlemagne, preserved at Vienna. It is a series of four larger and four smaller plaques of gold, rounded at the tops and set together alternately. The larger plaques are set with emeralds and sapphires, and the smaller plaques have each an enamelled figure of Our Lord, David, Solomon, and Hezekiah respectively. A jewelled cross rises from the large front plaque, and an arch bearing the name of the emperor Conrad springs across from the back of this cross to the back of the crown.

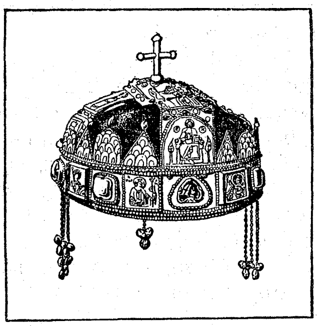

FIG. 2.—CROWN OF ST. STEPHEN OF HUNGARY

At Madrid is the crown of Svintilla, king of the Visigoths (621–631), a circlet of thick gold set with pearls, sapphires and other stones. It has been given as a votive offering at some period to a church, as was often the custom. Attached to its upper rim are the chains whereby to suspend it, and from the lower rim hang letters of red-coloured glass or paste which read +Svintilanvs Rex Offeret. Two other Visigothic crowns are preserved with it in the Almeria Real.

In 1858 a most remarkable discovery was made, near Toledo, of eight gold crowns of the 7th century, fashioned lavishly with barbaric splendour. They are now in the Cluny Museum, at Paris, having been purchased for £4,000, the intrinsic value of the gold, without reckoning that of the jewels and precious stones, being not less than £600. The largest and most magnificent is the crown of Reccesvinto, king of the Visigoths from 653 to 675, a circlet of pure gold set with pearls and precious stones in great profusion. It is 9in. in diameter and more than $\frac{1}{2}$in. in thickness, the width of the circlet being four inches. It has also been given as a votive offering to a church, and has the chains to hang it by attached to the upper rim, while from the lower rim depend pearls, sapphires, and a series of richly jewelled letters 2in. each in depth, which read +Reccesvinthvs Rex Offeret. The second of these crowns in size is generally thought to be that of the queen of Reccesvinto. It has no legend, but merely a cross hanging from it. The six others are smaller; they are believed to have been the crowns of Reccesvinto's children. From one of them hangs a legend which relates that they were an offering to a church, which has been identified with much probability as that of Sorbas, a small town in the province of Almeria. It has been surmised that in the disturbances which soon afterwards followed they were buried for safety. For a detailed description of these most remarkable crowns the reader must be referred to a paper by Albert Way (*Archaeological Journal,* xvi. 253). Mr. Way says of the custom of offering crowns to churches that frequent notices of the usage may be found in the lives of the Roman pontiffs by Anastasius. "They are usually described as having been placed over the altar, and in many instances mention is made of jewelled crosses of gold appended within such crowns as an accessory ornament. . . . The crowns suspended in churches suggested doubtless the sumptuous pensile luminaries, frequently designated from a very early period as *coronae,* in which the form of the royal circlet was preserved in much larger proportions, as exemplified by the remarkable *corona* still to be seen suspended in the cathedral at Aix-la-Chapelle over the crypt in which the body of Charlemagne was deposited."

FIG. 3.—CROWN OF THE GERMAN EMPIRE

Of modern Continental crowns the imperial crown of Austria (fig. 5) may be mentioned. It is composed of a circlet of gold, adorned with precious stones and pearls, heightened with fleurs-de-lys, and is raised above the circlet in the form of a cap which is opened in the middle, so that the lower part is crescent-shaped; across this opening from front to back rises an arched fillet, enriched with pearls and surmounted by a cross, above which is a jewel of pearls.

FIG. 4.—CROWN OF THE HOLY ROMAN EMPIRE

The papal *tiara* (a Greek word, of Persian origin, for a form of ancient Persian popular head-dress, standing high erect, and worn encircled by a diadem by the kings), the triple crown worn by the popes, has taken various forms since the 9th century. It is important to remember that the tiaras in old Italian pictures are inventions of the artists and not copied from actual examples. In its present shape, dating substantially from the Renaissance, it is a peaked head-covering not unlike a closed mitre (*q.v.*), round which are placed one above the other three open crowns.[1] Two bands, or *infulae,* as they are called, hang from it as in the case of a mitre. The tiara (*q.v.*) is the crown of the pope as a temporal sovereign.

Pictorial representations in early manuscripts and the rude effigies on their coins are not very helpful in deciding as to the form of crown worn by the Anglo-Saxon and Danish kings of England before the Norman Conquest. In some cases it would appear as if the diadem studded with pearls had been worn, and in others something more of the character of a crown. After the Conquest the great seals, monumental effigies, and coins become more and more serviceable in determining the forms the crown took.

The crown of William the Conqueror and his immediate successors seems to have been a plain circlet with four uprights, which terminated in trefoils (fig. 7), but Henry I. enriched the circlet with pearls or gems (fig. 8), and on his great seal the trefoils have something of the character of fleurs-de-lys. The effigy of Richard I. at Fontevrault shows a development of the crown; the trefoil heads are expanded, chased and jewelled. The crown of John is shown on his effigy at Worcester, though unfortunately it is rather badly mutilated. It shows, however, that the upper ornament was of fleurons set with jewels. Fig. 9 shows generally this development of the crown in a restored form. The crown on the effigy of Henry III. at Westminster had a beaded row below the circlet, which is narrow and plain, and from it rises a series of plain trefoils with slightly raised points between them. The tomb was opened in 1774, and on the king's head was found an imitation crown of tin or latten gilt, with trefoils rising from its upper edge. This, although only made of base metal for the king's

FIG. 5.—CROWN OF THE AUSTRIAN EMPIRE

[1]A coloured drawing, done in the first half of the 18th century, of the magnificent tiara made by the celebrated goldsmith, Caradosso, for Julius II. is in the British Museum. This tiara was refashioned by Pius VI., but went with other treasure as part of the indemnity to Napoleon. The splendid emerald at the summit, which was engraved with the arms of Gregory XIII., was restored by Napoleon and now adorns another papal tiara at Rome. In this drawing the three crowns (a feature introduced at the beginning of the 14th century) are represented by three bands of X-shaped ornament in enamelled gold.

burial, may nevertheless be taken as exhibiting the form of the royal crown at the time, and it may be usefully compared with that on the effigy of the king, which was made in Edward I.'s reign (fig. 10). Edward I. used a crown of very similar design. In the crown of Edward II. we have perhaps the most graceful and elegant of all the forms which the English mediaeval crown assumed, and this form seems to have continued without any marked alteration during the reigns of Edward III. and Richard II. The crown on the head of the effigy of Henry IV. at Canterbury evidently represents one of great magnificence, both of design and ornament. What is perhaps lost of the grace of form of the crown of Edward II. is made up for by a profusion of adornment and ornamentation unsurpassed at any subsequent period. The circlet is much wider and is richly chased and jewelled, and from it rise eight large leaves, the intervening spaces being filled with fleurs-de-lys of definite outline. It will be noted that this crown is, like its predecessors, what is known as an open crown, without any arches rising from the circlet, but in the accounts of the coronation of Henry IV. by Froissart and Waurin it is distinctly stated that the crown was arched in the form of a cross. This is the earliest mention of an arched crown, which is not represented on the great seal till that of Edward IV. in 1461. The crown, as shown on Henry IV.'s effigy, very probably represents the celebrated "Harry crown" which was afterwards broken up and employed as surety for the loan required by Henry V. when he was about to embark on his expedition to France. Fig. 11 shows the crown of Henry V. The crown of Henry VI. seems to have had three arches, and there is the same number shown on the crown of Henry VII., which ensigns the hawthorn bush badge of that king. The crown of Edward IV. (fig. 12) shows two arches, and a crown similarly arched appears on the great seal of Richard III. Crowns, both open and arched, are represented in sculpture and paintings until the end of the reign of Edward IV., and the royal arms are occasionally ensigned by an open crown as late as the reign of Henry VIII. The crown of Henry VII. on his effigy in Westminster Abbey shows a circlet surmounted by four crosses and four fleurs-de-lys alternately, and has two arches rising from it. A similar crown appears on the great seal of Henry VIII. The crown of Henry VII. (fig. 13), which ensigns the royal arms above the south door of King's college chapel, Cambridge, has the motto of the order of the Garter round the circlet. Fig. 11 shows the form of crown used by Edward VI., but a tendency (not shown in the illustration) began of flattening the arches of the crown, and on some of the coins of Elizabeth the arches are not merely flattened, but are depressed in the centre, much after the character of the arches of the crown on many of the silver coins of the 19th century prior to 1887. The crowns of James I. and Charles I. had four arches, springing from the alternate crosses and fleurs-de-lys of the circlet. The royal crown which, strangely enough, surmounts the shield with the arms of the Commonwealth on the coins of Oliver Cromwell (as distinguished from those of the Commonwealth itself, which have no crown) is a royal crown with alternate crosses and fleurs-de-lys round the circlet, and is surmounted by three arches, which, though somewhat flattened, are not bent. On them rest the orb and cross. The crown used by Charles II. shows the arches somewhat depressed in the centre, a feature of the royal crown which seems to have been continued henceforward till 1887, when the pointed form of the arches was resumed, in consonance with an idea that such a form indicated an imperial rather than a regal crown, Queen Victoria having been proclaimed empress of India in 1877. In the foregoing account the changes of the form of the crowns of the kings have been briefly noticed. Those crowns were the personal crowns, worn by the different kings on various state occasions, but they were all crowned before the Commonwealth with the ancient crown of St. Edward, and the queens consort with that of Queen Edith. There were, in fact, two sets of regalia, the one used for the coronations and kept at Westminster, and the other used on other occasions by the kings and kept in the Tower. The crowns of this latter set were the personal crowns made to fit the different wearers, and are those which have been briefly described. The crown of St. Edward, with which the sovereigns were crowned, had a narrow circlet from which rose alternately four crosses and four fleurs-de-lys, and from the crosses sprang two arches, which at their crossing supported an orb and cross. These arches must have been a later addition, and possibly were first added for the coronation of Henry IV. (*vide supra*). Queen Edith's crown had a plain circlet with, so far as can be determined, four crosses of pearls or gems on it, and a large cross rising from it in front, and arches of jewels or pearls terminating in a large pearl at the top. A valuation of these ancient crowns was made at the time of the Commonwealth prior to their destruction. From this valuation we learn that St. Edward's crown was of gold filigree or "wirework" as it is called, and was set with stones, and was valued at £248. Queen Edith's crown was found to be only of silver-gilt, with counterfeit pearls, sapphires, and other stones, and was only valued at £16. At the Restoration an endeavour was made to reproduce as well as possible the old crowns and regalia according to their ancient form, and a new crown of St. Edward was made on the lines of the old one for the coronation of Charles II. The framework of this crown, bereft of its jewels, is in the possession of Lady Amherst of Hackney. The crowns of James II., William III. and Queen Anne generally resembled it in form. Although the marginal note in the coronation order of Queen Victoria indicates "K. Edward's crown" as that with which the late queen was to be crowned, it was actually the State or imperial crown worn by the sovereign when leaving the church after the ceremony that was used. It had been altered for the coronation, and the arches were formed of oak leaves. Fig. 14 shows Queen Victoria's crown with raised arches and without the inner cap of estate, which since the reign of Henry VII. has been degraded into forming a lining to the crowns of the sovereigns and the coronets of the peers. Fig. 15 shows the coronation crown of King Edward VII. The crown of Scotland, preserved with the Scottish regalia at Edinburgh, is believed to be composed of the original circlet worn by King Robert the Bruce. James V. made additions to it in 1535, and in general characteristics it much resembles an English crown of that date.

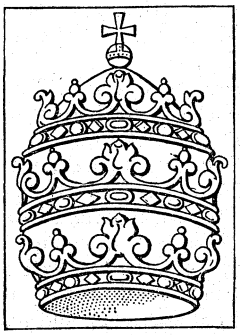

FIG. 6.—PAPAL TIARA (WITHOUT THE INFULAE)

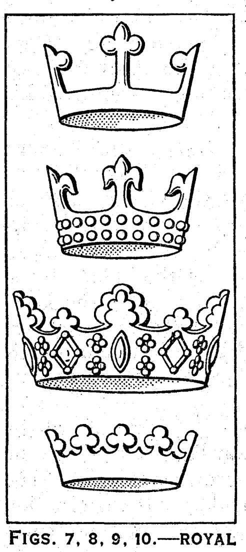
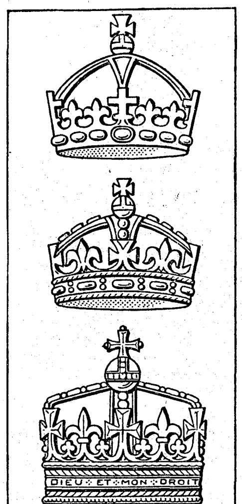


FIGS. 7, 8, 9, 10.—ROYAL CROWNS OF ENGLAND, WILLIAM I. TO HENRY IV.



FIGS. 11, 12, 13.—ROYAL CROWNS OF ENGLAND, HENRY V. TO CHARLES I.

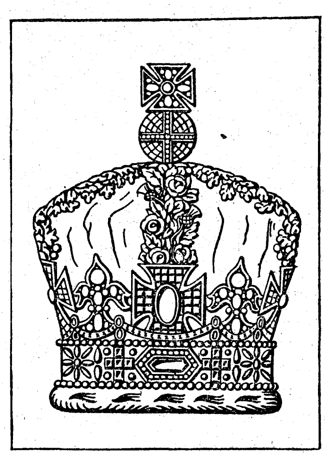


FIG. 14.—CORONATION CROWN OF QUEEN VICTORIA

The kings of arms in England, Scotland, and Ireland wear crowns, the ornamentation of which round the upper rim of the circlet is composed of a row of acanthus or oak leaves. Round the circlet is the singularly inappropriate text from Psalm. li., *Miserere mei Deus secundum magnam misericordiam tuam.* The form of these crowns seems to have been settled in the reign of Charles II. Before that period they varied at different times, according to representations given of them in grants of arms, etc.

This brings us to the crowns of lesser dignity, known for that reason as coronets, and worn by the five orders of peers.

The use of crowns by dukes originated in 1362, when Edward III. created his sons Lionel and John dukes of Clarence and Lancaster respectively. This was done by investing them with a sword, a cap of maintenance or estate, and with a circlet of gold set with precious stones, which was imposed on the head. Previous to this dukes had been invested at their creation by the girding on of a sword only. In 1387 Richard II. created Richard de Vere marquess of Dublin, and invested him by girding on a sword, and by placing a golden circlet on his head. The golden circlet was confined to dukes and marquesses till 1444, when Henry VI. created Henry Beauchamp, earl of Warwick, premier earl, and the letters patent effecting this concede that the earl and his heirs shall wear a golden circlet on the head on feast days, even in the royal presence. As to the form of these circlets we have no clear knowledge. The dignity of a viscount was first created by Henry VI. in 1439, but nothing is said of any insignia pertaining to that dignity. It is believed that a circlet of gold with an upper rim of pearls was first conferred on a viscount by James I., who conceded it to Robert Cecil, Viscount Cranborne. However, in 1625–26 it is definitely recorded that the viscounts carried their coronets in their hands in the coronation procession from Westminster Hall to the Abbey church. The use of a coronet by the barons dates from the coronation of Charles II., and by letters patent of Aug. 7, 1661, their coronet is described as a circle of gold with six pearls on it.

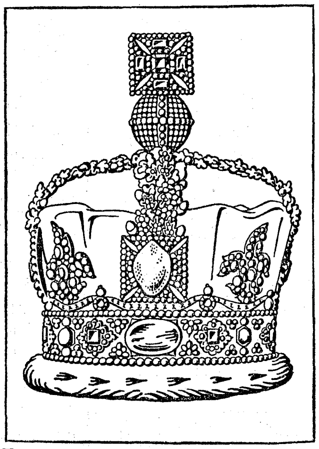

FIG. 15.—CORONATION CROWN OF KING EDWARD VII.

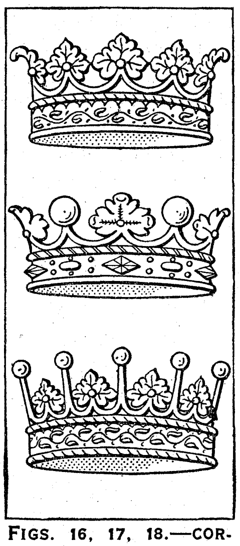
At the present day the coronet of a duke (fig. 16) is formed of a circlet of gold, from which rise eight strawberry leaves. The coronet of a marquess (fig. 17) differs from that of a duke in having only four strawberry leaves, the intervening spaces being occupied by four low points which are surmounted by pearls. The coronet of an earl (fig. 18) differs again by having eight tall rays on each of which is set a pearl, the intervening spaces being occupied by strawberry leaves one-fourth of the height of the rays. The coronet of a viscount has 16 small pearls fixed to the golden circlet, and the coronet of a baron has six large pearls similarly arranged.



FIGS. 16, 17, 18.—CORONETS OF DUKES, MARQUESSES AND EARLS

See Stothard, *The Monumental Effigies of Great Britain* (1817); L. G. Wickham Legg, *English Coronation Records* (1901); *The Ancestor,* Nos. i. and ii. (1902). (T. M. F.)

CROWN DEBT, in English law, a debt due to the Crown. By various statutes—the first dating from the reign of Henry VIII. (1541)—the Crown has priority for its debts before all other creditors even in bankruptcy proceedings. At common law the Crown always had a lien on the lands and goods of debtors by record, which could be enforced even when they had passed into the hands of other persons. By the Act of 1541 specialty debts were put practically on the same footing as debts by record. Simple contract debts due to the Crown also became specialty debts, and the rights of the Crown are enforced by a summary process called an *extent.* (*See* WRIT.) The difficulty of ascertaining whether lands were subject to a Crown lien or not was often very great, and a remedy was provided by the Judgments Act, 1839, and the Crown Suits Act, 1865. Later, by the Land Charges Act, 1900, no debt due the Crown operated as a charge on land until a writ of execution for the purpose of enforcing it has been registered under the Land Charges Registration and Searches Act, 1888. Both Acts were repealed and substantially re-enacted by the Land Charges Act, 1925.

The preference for debts due to the Crown, the duchy of Lancaster and the duke of Cornwall was abolished in the case of insolvent estates by the Administration of Estates Act, 1925.

CROWNE, JOHN (*c.* 1640–1703), British dramatist, was a native of Nova Scotia and was born about 1640. His father "Colonel" William Crowne, accompanied the earl of Arundel on a diplomatic mission to Vienna in 1637, and wrote an account of his journey. He emigrated to Nova Scotia, where he received a grant of land from Cromwell, but the French took possession of his property, and the home government did nothing to uphold his rights. Crowne came to England, and began his literary career with a romance, *Pandion and Amphigenia, or the History of the coy Lady of Thessalia* (1665). In 1671 he produced a dull play, *Juliana, or the Princess of Poland.* The earl of Rochester procured for him a commission to supply a masque, *Calisto,* which gained him the favour of Charles II. Crowne's heroic play, *The Destruction of Jerusalem by Titus Vespasian* (1677), contained a thinly disguised satire on the Puritan party, and *c.* 1683 he produced *The City Politiques,* satirizing the Whig party and containing characters which were readily recognized as portraits of Titus Oates and others. This made him many enemies, and he petitioned the king for a small place that would release him from the necessity of writing for the stage. The king exacted one more comedy, which should, he suggested, be based on the *No puede ser guardar una mujer* of Moreto. This had already been unsuccessfully adapted, as Crowne discovered later, by Sir Thomas St. Serfe, but in Crowne's hands it developed into *Sir Courtly Nice, It Cannot Be* (1685), an entertaining comedy which kept its place as a stock piece for nearly a century. Of his many other pieces the best are the two comedies, *The English Friar* (1690), which owes something to Molière's *Tartuffe,* and *The Married Beau* (1694) based on the "Curioso Impertinente" in *Don Quixote.* It is stated that Crowne was still living in 1703, but nothing is known of his later life.

See *The Dramatic Works of John Crowne* (1873), edited by James Maidment and W. H. Logan for the *Dramatists of the Restoration.*

CROWN JEWELS or **REGALIA** are the visible emblems of royalty which pertain to a monarch. They vary greatly in different countries both in significance and value, but in European countries a crown, generally richly jewelled, is the chief of the insignia of sovereignty. The only crown jewels, except the Danish, that are on view are the crown jewels of England, which are kept in the Tower of London and guarded by a battalion of His Majesty's Guards. Upwards of 350,000 people of all nations annually view the crown jewels.

The king of England has three crowns:—(1) King Edward the Confessor's crown, also known as St. Edward's crown; (2) The imperial State crown; (3) The imperial crown of India. The crown known as St. Edward's crown was made for the coronation of Charles II. in 1662 after the pattern of the ancient crown destroyed by the Commonwealth. It consists of a circlet of gold adorned with rosettes of precious stones, surrounded by diamonds. The centre gems of these rosettes are rubies, emeralds and sapphires. From the circlet rise four crosses-paté, and four fleurs-de-lys alternately, adorned with diamonds and other gems. From the tops of the crosses rise two complete arches of gold crossing each other. These arches are considered to be the mark of independent sovereignty. They are edged with rows of silver pearls, and have gems and clusters of gems upon them. On the top of the arches is a mound of gold surmounted by a cross, all richly jewelled. This is the crown of England and is the one used at English coronation ceremonies.

4

RUSSIAN CROWN JEWELS

1. The Great Imperial Crown, made by Posier, jeweller to the court of Catherine II., in St. Petersburg, 1762. The crown, in the shape of a mitre, has on its summit a cross of five magnificent diamonds supported by a large uncut but polished ruby. A foliated arch containing 11 diamonds rises from the front and back to support the ruby and cross, and on either side of this arch is a hoop of 38 perfect pearls in mitre formation. The spaces on the side of the arches are filled with ornamental silver work studded with diamonds and underlaid with purple velvet. The band encircling the head contains 28 diamonds

3. Top view of the Great Imperial Crown, with the ruby and cross detached, showing foliated arch which supports them

2. Part of chain of Order of St. Andrew, probably executed in 1795, which contains 20 detachable pieces of different designs, each of which may be used as an independent jewel. Top jewel is accessory piece bearing the personal emblem of Paul I. Bottom jewel is insigne of the Order of St. Andrew. The crowned eagle is ornamented with two pear-shaped diamonds and 51 diamonds of medium cut. Between crown and eagle is a large blue diamond. The cross of St. Andrew, on a base of blue enamel, is surrounded by small rose diamonds

4. Imperial diadem of pearls and diamonds, probably of the 19th century, containing 13 large ancient pearls, 113 additional pearls of various sizes but of very fine quality, 84 brilliants and 500 rose diamonds

The imperial State crown was made for Queen Victoria in 1838. Many of the gems in this crown are of very ancient origin. Amongst these are the Black Prince's ruby, which is as large as a small hen's egg, and was owned first by the Black Prince, and later worn by Henry V. at the battle of Agincourt; the great sapphire from the crown of Charles II., known as the Stuart sapphire; the second largest portion of the Star of Africa diamond weighing 309 carats; Queen Elizabeth's pearl ear-drops; and the sapphire from the coronation ring of Edward the Confessor. There are altogether in this crown, exclusive of the larger stones, four rubies, 11 emeralds, 16 sapphires, 277 pearls and 2,783 diamonds. It is the most valuable and beautiful crown in the world.

The imperial crown of India owes its origin to the law which forbids the crown of England being taken out of England. When, therefore, George V. was crowned in Delhi emperor of India, a new crown had to be made for him and his successors to the throne. This crown is finely designed on the English pattern, with four crosses-paté and four fleurs-de-lys set alternately on the upper rim of the circlet. From this spring eight half-arches which in their turn support a rich mound and cross at the top, all thick set with diamonds. There are several very fine emeralds, rubies, and sapphires in this crown. It cost £60,000.

Next in importance are the queen's crowns or diadems:—(1) the crown of Queen Mary of Modena, consort of James II.; (2) the diadem of the same queen; (3) the State crown of Queen Mary, consort of George V. The crown of Queen Mary of Modena is of the usual formal shape and studded throughout with diamonds and pearls, no coloured stones being used. Queen Anne, in her statue outside St. Paul's cathedral, may be seen wearing this crown. The diadem of Queen Mary of Modena has along its upper edge a row of large pearls rising to a point in the front, with a single diamond at its highest point. Beneath this is a rich floral spray, in thick gold open-work, having large diamonds as leaves and flowers. On each side of the spray are a succession of large rosettes with large diamonds in their centres and small diamonds set all round them. This diadem cost £110,000. The State crown of Queen Mary is a beautiful and light diamond crown, having in the centre of the circlet one of the lesser portions of the Star of Africa weighing 96 carats. In a cross-paté above this is the Koh-i-Noor the most renowned diamond in the world. It weighs in its present condition $106\frac{1}{16}$ carats (having originally weighed 800 carats). After a tragic history of many centuries, the diamond was captured by the British and presented by the Army of the Punjab to Queen Victoria after the Sikh Wars. The cross that surmounts the mound at the top of the crown is set with yet another lesser portion of the Star of Africa weighing 64 carats. The prince of Wales's crown is of gold without jewels and has one arch to distinguish it from a coronet. The arch was introduced by Charles II.

There are five sceptres:—(1) the king's royal sceptre with the cross; (2) the king's sceptre with the dove; (3) the queen's sceptre with the cross; (4) the queen's sceptre with the dove; (5) the queen's ivory rod. At the head of the king's royal sceptre is the greatest diamond in the world, known as the principal Star of Africa. It weighs $516\frac{1}{2}$ carats, more than four times the weight of any other known diamond. This sceptre dates from Charles II. and is carried in the king's right hand at the coronation. The Star of Africa diamond was introduced by Edward VII.

There are two orbs:—(1) the king's orb; (2) the queen's orb. The orb is a golden ball, surmounted by a beautiful jewelled cross. The orb and cross are held to signify the domination of the Christian religion over the world. It is placed in the king's left hand at the coronation. The reason for there being two orbs is that William and Mary were jointly crowned king and queen of England, a second orb being made for the occasion.

St. Edward's staff, known also as the Rod of Justice and Equity, is of gold 4 ft. $7\frac{1}{2}$ in. in length and is supposed to guide the king's footsteps. It was re-made for Charles II. after the pattern of the old staff destroyed during the Commonwealth.

The Ampulla or Golden Eagle, and the Anointing Spoon are used at the coronation for the anointing of the king. These were both overlooked and escaped destruction during the Commonwealth. They are very ancient indeed, and may well be of Byzantine origin.

There are five swords:—(1) the sword of State; (2) the jewelled sword of State; (3) the swords named (*a*) Curtana or the sword of Mercy, (*b*) sword of Justice, spiritual, (*c*) sword of Justice, temporal. The sword of State, a long two-handled sword, is carried before the king on all State occasions such as the opening of parliament. The jewelled sword of State is used only at the coronation, when the king lays it on the altar to demonstrate that he places his military power at the service of the Church. This is very richly jewelled and is the most valuable in the world. The three swords, Curtana, the Sword Spiritual, and the Sword Temporal, are alike except that the point of Curtana has been broken off as a token of mercy.

The Golden Spurs of St. George are, as in the case of the jewelled sword, placed on the altar by the king at his coronation, with a like significance.

The bracelets, another very ancient token of royalty, may be seen with the rest of the regalia at the Tower of London. As far back as ancient Hebrew days a bracelet was one of the insignia of a king.

Some portions of the Scottish regalia have been preserved and are kept in Edinburgh Castle. The chief of these is the Scottish crown, which is among the most ancient pieces of State jewellery in the kingdom. This crown seems to have been made for Robert Bruce in 1314, and, with some reconstruction by French workmen, was worn by James V. about 1540; Mary Queen of Scots was crowned with it when nine months old. Another interesting item is the coronation ring of Charles I. which was bequeathed to George III. by Cardinal York together with other Stuart relics.

The Irish crown jewels were stolen from Dublin Castle some years ago and have never been recovered. There was nothing of historic or of great intrinsic value amongst them.

See G. J. Younghusband and C. Davenport, *The Crown Jewels of England* (1919). (G. Yo.)

EUROPEAN STATES

Although examples of Merovingian (*c.* 450–650) jewels have come down to us, it is not until the Carlovingian period (750–980) that we find authentic evidence of crown jewels. Of Charlemagne we have his crown, his sword, *La Joyeuse,* and his spurs. The crown is composed of eight gold plates, arched at the top, four incrusted with precious stones, four enamelled with the figures of Solomon, David, Hezekiah and Christ, to which Conrad II. (11th century) added a Latin cross with a single arch. The sword has a scabbard of gold with insertions of cloisonné enamel and incrustations of precious stones; the hilt was added in 1804 by Napoleon I. who brought it back from Vienna. It is at the Louvre, Paris, where are also to be seen the great Emperor's gold spurs with repousée ornament; a hand of Justice in gold and ivory of the 10th century, the sceptre of Charles V. (14th century), tipped with a statuette of Charlemagne springing from a lily; a beautiful chased gold clasp from the cloak of Louis IX.; the finger ring of Louis X. bearing for bezel a sapphire engraved with the effigy of St. Louis; a statuette reliquary in rock crystal, mounted in silver gilt and enamel, and enclosing "deux chevaux de Notre Dame," besides much else. The Valois, Bourbons and Bonapartes were all great collectors of gems and patrons of jewellers, but their treasures were often remounted and dispersed. The typical Bourbon crown, as introduced by Louis XIV. was a mass of diamonds, the jewelled band surmounted by eight fleur-de-lis, whence sprang arches supporting a large double fleur-de-lis. The Orleans branch placed a wreath of laurels round the band and substituted a mound for the double fleur-de-lis. Napoleon I. used for his coronation a fillet of gold incrusted with flowers in precious stones, surmounted by eight arches supporting a mound and cross, but a later crown had eight eagles with uplifted wings and eight palms supporting the mound and cross. The French crown diamonds and gems were constantly re-set for each succeeding monarch, who added to the collection or alienated much of the treasure. Famous jewels and stones were lost during the Revolution, among these being the famous Regent diamond and the Dragon or Côte de Bretagne ruby, both of which were subsequently recovered. The Regent or Pitt diamond originally weighed 410 carats, but was reduced to $186\frac{1}{16}$ carats after cutting. It was sold by Thomas Pitt, Governor of Fort St. George, to Philip of Orleans, and was at various times mounted in the crown, on the mound, and on the hilt of the state sword (by Napoleon I.). In 1848 the crown jewels of France were scheduled for sale, a scheme which was not carried out, but by a law of 1887 they were dispersed at auction (only a few, such as the Regent and those mentioned as preserved in the Louvre being kept). The sale (which included the famous eight Mazarin diamonds, a legacy from the great Cardinal) realized 7,207,252 francs.

The most precious item of the crown jewels of Italy is the iron crown of Lombardy, made to the order of Princess Theodolinda, widow of Authoris, king of Lombardy, and presented, A.D. 594, to the duke of Turin. It consists of a broad band of gold incrusted with rosettes in enamel and precious stones, with an inner circlet of iron, said to be forged from a nail from the True Cross. The modern crown is of gold and precious stones with 18 arches.

The crown of the German Empire, dating from 1871, is designed on the lines of that of Charlemagne, but four of the gold plates have a Latin cross between four small crosses in precious stones, and the four others have spread eagles with a star above; it has, however, four arches supporting a mound and cross, and is lined with a high cap in gold brocade. The Prince Imperial's coronet is of gold, jewelled, and consists of a broad band surmounted by four crosses pattée and four displayed eagles, the arches supporting a mound and cross. Each of the States of the former German Empire had its crowns and jewels, the most famous of which are the White Diamond of Saxony, $48\frac{1}{4}$ carats, acquired by Augustus the Strong (16th century), and the Green Diamond of Dresden, 40 carats, which has belonged to the Saxon crown since 1743.

The crown jewels of Portugal were amassed over a long period and contained a wonderful assortment of great value, among which is the Braganza diamond, claimed to be the largest known diamond. It is a Brazilian stone of 1,680 carats, but is probably a topaz.

Vienna was once the repository of priceless crown jewels, though some of these Napoleon I. took back to Paris, but Vienna is still very rich, the regalia being a mass of diamonds and rubies. The Imperial crown, made for Rudolph II. consists of a head-band from which spring four small and four large lily-shaped ornaments in diamonds and rubies, tipped by large pearls, and within the circle is a globular cap in two sections, bordered by enamelled bands and pearls, representing the coronation ceremonies, and between these sections are two hoops supporting a large sapphire. Far older, and more interesting, is the crown of Hungary or St. Stephen (10th century). It consists of a broad band of gold ornamented with panels of saints in enamel and precious stones, and an upper part (given by Pope Silvester II. when he bestowed the title of Apostolic King on Stephen, *c.* 1071), of square and pointed enamelled panels and four hoops supporting a cross, while from the sides and back jewelled trefoils hang from small chains.

Probably the most splendid collection of crown jewels belonged to the Romanoffs and were mostly preserved at the Winter palace, though now apparently dispersed. The imperial crown, begun for Catherine II. and finished for Paul I., is a superb piece of goldsmith's work, incrusted with diamonds, pearls and rubies. It consists of a broad head band, and above this a high globular cap in two sections, in front laurel leaves and palms and between the sections two half hoops of large stones, supporting a huge uncut ruby surrounded with brilliants and tipped with a cross. The Empress's crown was only slightly less magnificent. There were also a number of diadems, tiaras and nuptial crowns in diamonds, rubies and other precious stones. One of these nuptial crowns, a diamond tiara designed as wheat-ears and foliage, the jewelled sword of Paul I., with many other jewels were sold at auction in London in 1927. Among the other treasures in the white saloon of the Winter Palace is the imperial orb surmounted by diamond cross, the sceptre tipped with the Orloff diamond, the uncut diamonds known as the Moon of the Mountain, 120 carats bought by Catharine II., the Shah, 85 carats, and a pale red ruby the Polar star, 40 carats. The Orloff is one of the famous diamonds of the world. It weighs $194\frac{3}{4}$ carats, is said to have been the eye of an idol in Mysore, was purchased by count Orloff at Amsterdam in 1776, and was presented by him to the crown. There were also a large number of Russian and foreign orders, with stars and collars in diamonds and other precious stones. A miniature set of the imperial insignia in gold and brilliants was preserved in the Hermitage palace.

The Rumanian crown is unique in Europe, being of bronze and steel, made from Turkish guns captured at Plevna.

CROWN LAND, in Great Britain, land belonging to the Crown, the hereditary revenues of which were surrendered to parliament in the reign of George III.

In Anglo-Saxon times the property of the king consisted of (*a*) his private estate, (*b*) the demesne of the Crown, comprising palaces, etc., and (*c*) rights in the folkland of the kingdom. By the time of the Norman Conquest the three became merged into the estate of the Crown, that is, land annexed to the Crown, held by the king as king. The king, also, ceased to hold as a private owner, but he had full power of disposal by grant of the crown lands, which were increased from time to time by confiscation, escheat, forfeiture, etc. The history of the crown lands of the reign of William III. was one of continuous alienation to favourites. Their wholesale distribution by William III. necessitated the intervention of parliament, and in the reign of Queen Anne an act was passed limiting the right of alienation of crown lands to a period of not more than 31 years or three lives. The revenue from the crown lands was also made to constitute part of the civil list. At the beginning of his reign George III. surrendered his interest in the crown lands in return for a fixed "civil list" (*q.v.*). The control and management of the crown lands is now regulated by the Crown Lands Act, 1829, and various amending acts. Under these acts their management is entrusted to the commissioners of woods, forests and land revenues, who have certain statutory powers as to leasing, selling, exchanging, etc.

State lands in the British colonies are vested in the Crown, and they are called crown lands; actually, however, the various colonial legislatures have full control over them and power of disposal. Acts dealing with crown lands are usually called "land acts."

CROWN POINT, a village of Essex county, New York, U.S.A., in a township of the same name, about 90m. N.E. of Albany and about 9 mi. N. of Ticonderoga, on the west shore of Lake Champlain. The population of the township in 1930 was 1,468; in 1940 by the federal census it was 1,661. Among the manufactures are lumber and woodenware. One of the chief sources of income in the vicinity is dairy farming. In 1609 Champlain fought the Iroquois Indians there and began the enmity between the Five (later Six) Nations and the French. Subsequently Dutch and English traders trafficked in the vicinity. Realizing the town's strategic importance, the French in 1731 built Fort Frédéric, the first military post at Crown Point. Despite English and colonial expeditions sent against it, Crown Point remained in French hands until 1759. Crown Point was then occupied by Lord Jeffrey Amherst, who began the construction, near old Fort Frédéric, of a large fort, which was garrisoned but was never completed. At the outbreak of the War of Independence the fort was captured by Col. Seth Warner and a force of "Green Mountain Boys," and it remained in American hands save for a brief period in 1777, when it was occupied by a detachment of Burgoyne's invading army.

CROWTHER, SAMUEL ADJAI (1809?–1891), African missionary-bishop, was born in Ochugu in the Yoruba country, West Africa, and was sold into slavery in 1821. Next year he was rescued, with many other captives, by H.M. ship "Myrmidon," and was landed at Sierra Leone. Educated there in a missionary school, he became a teacher and afterwards missionary on the Niger. In 1842 he entered the Church Missionary College in London, and in June 1843 was ordained by Bishop Blomfield. Returning to Africa, he worked amongst his own people and afterwards at Abeokuta. Here he devoted himself to the preparation of schoolbooks, and the translation of the Bible and Prayer-Book into Yoruba and other dialects. In 1864 he was consecrated first bishop of the Niger territories. Crowther died of paralysis on Dec. 31, 1891.

CROYDON, a municipal, county and parliamentary borough of northeast Surrey, England, suburban to London. Pop. (1891), 102,695; (1938), 243,400. Area 19.7 sq.mi. The borough embraces a great residential district. It has ten stations on the main and branch lines of the Southern railway. The original site was farther west than the present town and is mentioned in Domesday. Still earlier settlement is indicated by the prehistoric remains near Addington Park. There are a number of springs in the neighbourhood which are important determinants of settlement in a chalk country. The manor of Croydon was presented by William I to Archbishop Lanfranc, founder of the archiepiscopal palace in which his successors lived occasionally till 1750, and of which the chapel and hall remain. The church associated with the archiepiscopal residence is Norman and Early English in style. Croydon is a bishopric suffragan in the diocese of Canterbury. In 1596 Archbishop Whitgift founded the hospital or almshouse which bears his name. It was saved from destruction in connection with a road-widening scheme in 1925 after a long dispute. His grammar-school was housed in new buildings in 1871 and again in 1931. At Addiscombe was formerly a mansion dating from 1702, and acquired by the East India company in 1809 for a military college, which on the abolition of the company became the Royal Military college for the East Indian army, and was closed in 1862. The government civil customs aerodrome, operated by the civil aviation department of the Air Ministry, is at Waddon, 2 mi. S.W. of Croydon town hall. It is officially known as the London Terminal Aerodrome, Croydon, and is one of the busiest air ports in the world (*see* AERODROME), normally with direct regular services to several continental capitals, air connections to more distant European cities being obtained by special interworking. It was the first place bombed during the heavy "blitz" on London in 1940. Croydon was formed into a municipal borough in 1883, a parliamentary borough, returning one member, in 1885 and a county borough in 1888. It has returned two members since 1918. There are 220 mi. of roads in the borough, which controls 1,338 ac. of open spaces.

CROZAT, PIERRE (1661–1740), French art collector, was born at Toulouse. He became treasurer to the king in Paris, and acquired a magnificent collection of pictures and *objets d'art,* which descended to his nephews, Louis François (d. 1750), Joseph Antoine (d. 1750), and Louis Antoine (d. 1770), and were dispersed after their deaths; the collection of Louis Antoine Crozat went to St. Petersburg (Leningrad).

CROZET ISLANDS, an uninhabited group in the Indian ocean, in 46°–47° S. and 51° E., belonging to France. They are mountainous, with summits from 4,000–5,000 ft. high and include two groups—Penguin or Inaccessible, Hog, Possession and East islands; and the Twelve Apostles. Like other islands in these waters, they appear to be of igneous formation; but owing to the bleak climate and inaccessibility they are seldom visited. They were discovered in 1772 by Marion-Dufresne and are named after one of his officers. Possession, the loftiest, has a snow-clad peak said to exceed 5,000 ft.

The hogs released on Hog island by an English captain have disappeared; the rabbits survive.

CROZIER, JOHN BEATTIE (1849–1921), British philosopher, was born at Galt, Canada, of Scottish parentage, on April 23, 1849. After graduating in medicine at Toronto University in 1872, he bought a practice in London, England, and then began a systematic study of philosophy and economics. His first publication *The Religion of the Future* (1880), attracted little attention; but *Civilisation and Progress* (1885) reached a fourth edition and was translated into Japanese. His *History of Intellectual Development* (1897–1901) was followed by the grant of a Civil List pension, some compensation for failing eyesight and the loss of his medical practice. His further publications include *My Inner Life,* an autobiography (1898), *The Wheel of Wealth* (1906); *Sociology Applied to Practical Politics* (1911) and *Last Words on Great Issues* (1917). He died Jan. 8, 1921.

CROZIER, WILLIAM (1855–1942). U.S. artillerist and inventor, was born at Carrollton, O., Feb. 19, 1855. He graduated at West Point in 1876 and served on the western frontier for three years thereafter against the Sioux and Bannock Indians. In 1888 he was sent by the war department to study artillery in Europe, and upon his return he was placed in full charge of the construction of gun carriages for the army. With Gen. Adelbert R. Buffington (1837–1922), the chief of ordnance, he invented the Buffington-Crozier disappearing gun carriage (1896). He also invented a wire-wound gun and perfected many appliances connected with heavy and field ordnance. During the Spanish-American War he was inspector-general for the Atlantic and Gulf coast defenses. In 1899 he was one of the American delegates to the Hague Peace conference. He later served in the Philippines and in 1900 was chief of ordnance of the U.S. army. During 1912–13 he was president of the army war college. In 1917, he was made major general and chief of ordnance and in 1918 major general of the line. As a member of the war council he was in France and Italy during the first half of 1918. His *Notes on the Construction of Ordnance* was adopted as a textbook in the schools for officers. He died Nov. 10, 1942.

CROZIER or **PASTORAL STAFF,** in the Christian Church, an ensign of office or dignity. It is some 5 ft. long, ending at the top in a crook (*volute*) bent inward, and made of metal, ivory or wood. If of metal, it is hollow; if of wood, it usually is covered with metal. The crook is usually richly ornamented and is divided from the shaft by a boss; the shaft is commonly separated into sections, so that it can be taken to pieces.

"Crozier" is probably derived from the *lituus* of the Roman augurs, and so called from O.Fr. *crocier,* Med. Lat. *crociarius,* crook-bearer. The "crook" was formerly called "crozier's staff," afterward abridged to "crozier." It is conferred on bishops at consecration and on mitred abbots at investiture and is the ensign proper of cardinals (except cardinal-deacons) and bishops; but the former are entitled to use it only in the churches from which they derive their titles, the latter only in their dioceses. The popes, as early as the time of Innocent III, did not carry the pastoral staff, and it would seem never to have been the custom. Abbots carry the pastoral staff only when specially empowered by the pope to do so, and then only in the territory under the jurisdiction of their monastery and in the churches subordinated to it. With certain restrictions, it is also sometimes conceded to dignitaries of cathedral and collegiate churches.

CRUCIAL, having the form of a cross, as the "crucial ligaments" of the knee-joint, which cross each other, connecting the femur and the tibia (Lat. *crux,* a cross); from Francis Bacon's expression *instantia crucis* (from the finger-post or *crux* at cross-roads), decisive, finally choosing between two alternatives, hence, generally, a synonym for "critical."

CRUCIBLE CAST STEEL. The crucible process, the oldest of the four leading methods for the manufacture of steel, and one which holds the premier position for quality, came into use in 1870 as the result of experiments by Benjamin Huntsman, who attempted to modify the irregularity of the imported blister steel or converted bar, and ultimately succeeded by melting the steel in crucibles. Huntsman made his discovery about 1740 in Sheffield, England.

The furnace used for melting, a sketch of which is given in fig. 1, is of very simple construction, and consists of a more or less elliptical melting chamber about 3 ft. 6 in. deep, 2 ft. 6 in. from front to back and 1 ft. 6 in. wide, lined with fire-brick and rammed ganister, and large enough to hold two crucibles. The top of the furnace is level with the melting-house floor, and is closed by a loose fire-brick cover. Under the melting-house is a vaulted cellar through which access is gained to the fire-bars and ash-pit of the furnace. The upper part of the furnace is connected by a short horizontal flue with a tall chimney about 40 ft. high. The melting-house is so arranged that the furnaces occupy two sides of the building leaving the centre free for the casting operation.

The Crucibles.—Either clay or plumbago crucibles may be used; for the production of castings the latter are preferred on account of their somewhat greater durability, but in the case of tool steel, where the content in carbon must lie between narrow limits, clay crucibles are almost exclusively employed.

Before lighting up, any clinker adhering to the furnace walls must be removed. These precautions having been completed, fireclay stands, slightly less in diameter than the bottoms of the crucibles and about 3in. thick, are placed on the fire-bars, and crucibles, which have been gradually heated up overnight in an annealing furnace, are placed on them. Ignited coke from the annealing furnace is now spread over the fire-bars, and, when the fire is well alight, coke is added until it is level with the tops of the crucibles.

By the time this fire has burnt down, the crucibles will be at a white heat; in the case of handmade crucibles a handful of sand must be thrown into the crucible to fill up the hole in the bottom. The charge is now introduced through a charger—a wrought iron funnel long enough to reach from the mouth of the crucible to the top of the furnace-lids placed in the crucibles, and the furnace filled with coke to a point well above the covers of the crucibles. When this fire, which is known as the first or steeling fire, has burnt down, which takes from 40 to 50 minutes, the furnace is again filled with coke and allowed to burn down a second time. The melter then examines the charge in the crucible to ascertain whether the whole of the charge is melted; if so, the third or killing fire is added. The fire is necessary to expel dissolved gases from the steel, which, if not removed would give rise to cavities, technically known as blowholes, in the ingots. When everything is deemed satisfactory by the melter, he instructs his assistant, "the puller out," to get ready for casting. The crucible lids are taken off, the slag removed from the surface of the metal, the crucibles withdrawn from the furnace, and their contents poured into ingot moulds; these are rectangular in section, and are generally made of cast-iron, in two separate halves, held together by wrought iron rings and wedges, to facilitate the removal of the ingot. Immediately after casting the crucibles are cleared of adhering clinker and returned to the furnace ready for the next charge. The first charge generally takes from five to six hours, and succeeding charges from two and a half to three hours.

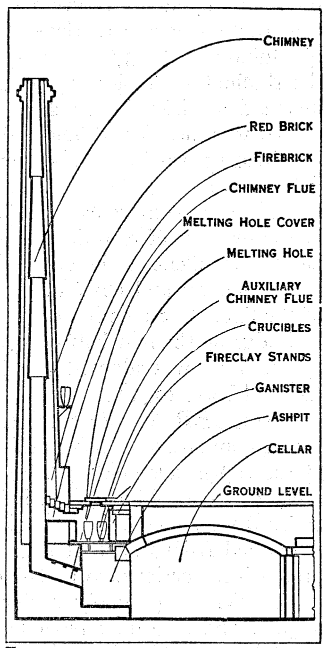

FIG. 1.—SECTIONAL VIEW OF THE HUNTSMAN COKE-FIRED CRUCIBLE FURNACE. FIREBRICK IS USED IN ALL FLUES

Such is the method as originally devised by Huntsman; later it was found that the third or killing fire did not remove entirely the dissolved gases from the steel, and that chemical aid was necessary; this was provided by the addition of ferro-manganese—an alloy of iron and manganese containing about 80% of manganese—to the charge before applying the third fire. Aluminium may also be used for this purpose, but although somewhat more active in removing the dissolved gases (the third fire in many cases not being necessary), it is held by many that the ingots are not so clean as when manganese is used, and that they are more difficult to weld. Most often a combination of the two methods is employed, manganese additions being made with the third fire, and a chip of aluminium added just before casting.

Nature of Process.—The process is not essentially a chemical one, but slight changes in composition do take place. The silicon in the steel will be about double, and the manganese half, of what would be expected from the mean composition of the charge. This arises from the fact that part of the manganese is oxidized to manganous oxide, and this reacts with the silica in the walls of the crucible, forming a manganous silicate slag from which silicon is reduced by the carbon in the steel. The sulphur will also tend to increase, due to absorption from the furnace gases, the amount of such absorption depending on the purity of the coke with regard to this element. With a sulphur content of 2% in the coke, the increase of this element in the steel will amount to ·01%.

Modifications of the method are used extensively. Instead of starting with blister steel, advantage may be taken of the affinity of molten iron for carbon, by melting bar iron in contact with sufficient carbon to give steel of the required hardness; or wrought iron and white cast-iron may be melted together. Whatever method is employed, however, it is of the greatest importance to see that the proportions of silicon and sulphur in the raw materials are sufficiently low to allow for the increases in these elements which occur during the process.

The desire to obtain more rapid melting and a lower consumption of fuel than is possible in the natural draught furnace, has led to the application of forced draught to the ordinary coke-fired furnace, and to the use of furnaces specially designed for the use of producer gas, water gas, natural gas or oil. These furnaces generally possess a greater capacity than the Huntsman type, and may contain from four to 50 crucibles at one time. Although the quantity of steel contained in a single crucible is only small (50 to 100lbs.), it is possible to utilize the process as a step in the manufacture of quite large forgings, by combining the contents of several crucibles in a common ladle prior to casting. By this means ingots weighing as much as 80 tons have been produced.

As the process is simply a means of obtaining a steel with the average composition of the materials charged into the crucible, practically any grade of steel can be produced, but it is in the manufacture of high grade tool and cutlery steels that it finds its chief application. Of late years, especially in countries where electric power is cheap, it has found a serious rival in the electric furnace.

Bibliography.—Sir R. A. Hadfield, "The Early History of Crucible Steel," *Journal of Iron and Steel Institute,* vol. ii. (1894); D. Carnegie and S. C. Gladwyn, *Liquid Steel* (2nd ed., 1918); F. W. Harbord and J. W. Hall, *The Metallurgy of Steel* (7th ed., 1923). (T. Ba.)

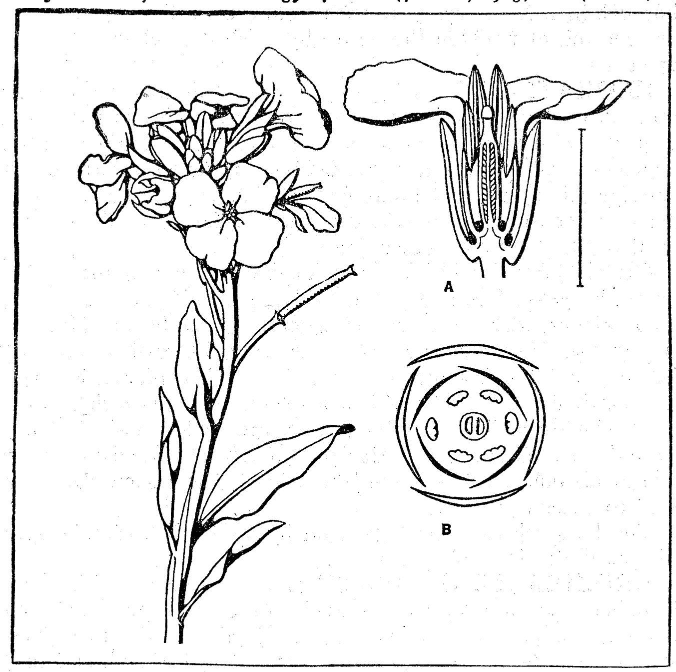

FIG. 1.—WALLFLOWER (CHEIRANTHUS CHEIRI), A HARDY PERENNIAL NATIVE TO SOUTHERN EUROPE, LONG A GARDEN FAVOURITE. A. FLOWER OF THE WALL-FLOWER IN VERTICAL SECTION. B. FLORAL DIAGRAM OF WINTER CRESS (BARBAREA VULGARIS)

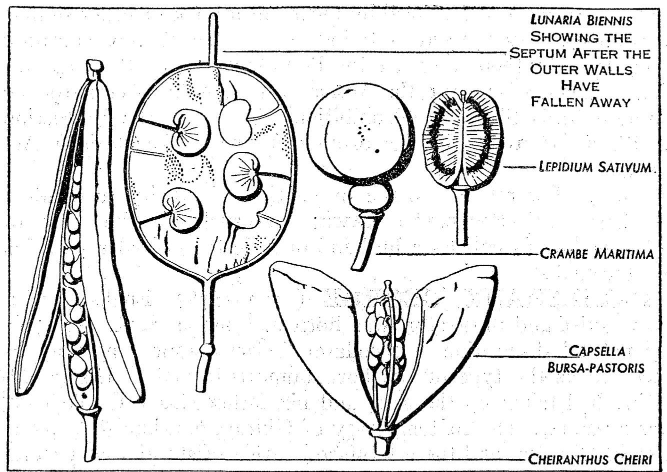
CRUCIFERAE, a family of flowering plants, which derives its name from the cruciform arrangement of the four petals of the flower. It is a family of herbaceous dicotyledons, many of which, such as wallflower, stock, mustard, cabbage, radish and others, are well-known garden or field-plants. Many are annuals; among these



AFTER BAILLON, "HISTOIRE DES PLANTES"

FIG. 2.—DETAILS OF THE FRUITS PRODUCED BY CRUCIFEROUS PLANTS
The Cruciferae include among other members the radish, turnip, cauliflower, watercress, wallflower, sweet alyssum, wild mustard and pepper grass

are some of the commonest weeds of cultivation, shepherd's purse (*Capsella Bursa-pastoris*), charlock (*Brassica Sinapis*), hedge mustard (*Sisymbrium officinale*), Jack-by-the-hedge (*S. Alliaria*). Others are biennials producing a number of leaves on a short stem in the first year, and in the second sending up a flowering shoot at the expense of the nourishment stored in the thick tap-root during the previous season. Under cultivation this root becomes much enlarged, as in turnip, swede and others. Wallflower (*Cheiranthus Cheiri*), however, is a perennial. The leaves when borne on an elongated stem are arranged alternately and have no stipules. The flowers are in racemes without bracts; during the life of the flower its stalk continues to grow so that the open flowers of an inflorescence stand on a level (that is, are corymbose). The flowers are regular, with four free sepals arranged in two pairs at right angles, four petals arranged crosswise in one series, and two sets of stamens, an outer with two members and an inner with four, in two pairs placed in the middle line of the flower and at right angles to the outer series. The four inner stamens are longer than the two outer; and the stamens are hence collectively described as tetradynamous. The pistil, which is above the rest of the members of the flower, consists of two carpels joined at their edges to form the ovary which becomes two-celled by subsequent ingrowth of a septum from these united edges; a row of ovules springs from each edge. The fruit is a pod or siliqua splitting by two valves from below upwards and leaving the placentas with the seeds attached to the *replum* or framework of the septum. The seeds are filled with the large embryo, the two cotyledons of which are variously folded. In germination the cotyledons come above ground and form the first green leaves of the plant.

AFTER BAILLON, "HISTOIRE DES PLANTES"

FIG. 3.—CRUCIFERAE
A. Floral diagram (Brassica)
B. Cardamine pratensis. Flower with the perianth removed

Pollination is effected by insects. The petals are generally white or yellow, more rarely lilac or some other colour, and between the bases of the stamens are honey-glands.

Cruciferae is a large family containing 350 genera and about 3,000 species. It has a world-wide distribution, but finds its chief development in the temperate and frigid zones, especially of the northern hemisphere, and as Alpine plants. In the subdivision of the family into tribes use is made of differences in the form of the fruit and the manner of folding of the embryo. When the fruit is several times longer than broad it is known as a siliqua, as in stock; when about as long as broad, a silicula, as in shepherd's purse.

The family is well represented in Britain—among others by *Nasturtium* (*N. officinale*, water-cress), *Arabis* (rock-cress), *Cardamine* (bitter-cress), *Sisymbrium* (hedge mustard), etc.; *S. Irio* is London rocket (so-called because it sprang up after the fire of London in 1666), *Brassica* (cabbage and mustard), *Diplotaxis* (rocket), *Cochlearia* (scurvy-grass), *Capsella* (shepherd's purse), *Lepidium* (cress), *Thlaspi* (penny-cress), *Cakile* (sea rocket), *Raphanus* (radish), and others. Of economic importance are species of *Brassica*, including mustard (*B. nigra*), white mustard, used when young in salads (*B. alba*), cabbage (*q.v.*) and its numerous forms derived from *B. oleracea*, turnip (*B. campestris*), and swede (*B. Napus*), Chinese cabbage or Pakchoi (*B. chinensis*), *Raphanus sativus* (radish), *Cochlearia Armoracia* (horse-radish), *Nasturtium officinale* (water-cress), *Lepidium sativum* (garden cress). *Isatis* affords a blue dye, woad. Many of the genera are known as ornamental garden plants; such are *Cheiranthus* (wallflower), *Matthiola* (stock), *Iberis* (candytuft), *Alyssum* (Alison), *Hesperis* (dame's violet), *Lunaria* (honesty), *Aubrietia* and others. In North America the family is represented by about 50 genera, many of the species having been introduced from Europe as weeds, which have become distributed over a wide territory. In the eastern region the largest genera are rock cress (*Arabis*) and bitter cress (*Cardamine*); while in the western mountain region the largest genus is Whitlow-grass (*Draba*).

For a treatment of the genera *see* O. E. Schulz, *Cruciferae;* Engler and Prantl, *Die Natürlichen Pflanzenfamilien* 17b:227–658, fig. 121–426 (1936).

CRUDEN, ALEXANDER (1701–1770), author of the well-known Biblical concordance (*q.v.*), was born at Aberdeen on May 31, 1701, and educated at Marischal college. After a term of confinement for insanity he removed to London, where he became a tutor, and afterwards opened a bookseller's shop in the Royal Exchange. In 1735, he obtained the unremunerative post of bookseller to the queen, and then in 1737 he finished his concordance. Cruden's piety and exceptional intellectual powers were marred by periods of insanity. After a brief confinement in a madhouse at Bethnal Green, he published a pamphlet dedicated to Lord H. (probably Harrington, secretary of state) entitled *The London Citizen Exceedingly Injured, or a British Inquisition Displayed,* and dedicated an account of his trial to the king. About 1740 he became a proofreader, and several editions of Greek and Latin classics are said to have owed their accuracy to his care. In 1750, he published a small *Compendium of the Holy Bible,* and also a larger edition of the *Concordance.*

Adopting the title of "Alexander the Corrector," he assumed the office of correcting the morals of the nation, especially with regard to swearing and Sunday observance, and petitioned parliament for an appointment in this capacity. On being released from a third confinement for insanity, he published *The Adventures of Alexander the Corrector* (1755). *The Corrector's Earnest Address to the Inhabitants of Great Britain* (1756) was occasioned by the Lisbon earthquake. The *Scripture Dictionary* was printed in Aberdeen in two volumes shortly after his death. His biographer, Alexander Chalmers, says that a verbal index to Milton (edition of Thomas Newton, bishop of Bristol, in 1769) was Cruden's.

Cruden died in London on Nov. 1, 1770.

CRUDEN, village and civil parish on the east coast of Aberdeenshire, Scotland. Pop. (1931) 2,554. It is situated at the head of Cruden bay, $29\frac{3}{4}$ mi. N.N.E. of Aberdeen by the L.N.E.R. branch line from Ellon to Boddam. There is a fine golf course, good bathing and a large hotel. The district has been promoted as a holiday resort by the L.N.E.R. There is good fishing at Port Erroll, called Ward of Cruden, at the north end of the sands. Near Ardendraught, not far from the shore, Malcolm II is said to have defeated Canute in 1014. The Water of Cruden, which rises a few miles to the west, flows through the village into the North sea. Slains castle, a former seat of the earl of Erroll, lies to the north of Cruden, but the old castle of Slains is about 5 mi. to the southwest, near the point where, according to tradition, the "St. Catherine" of the Spanish Armada foundered in 1588.

CRUELTY is the disposition to inflict unnecessary pain or the actual infliction of it. It would appear at the first blush that some human beings, even children, have such a disposition. Dr. Pfister (*The Psycho-analytic Method,* 1915) reports the case of a boy whom the sight of a charming kitten promptly filled with the desire to ill-treat it. "A fearful interest seized him until he had procured a stick and struck the sleeping animal on the nose with all his strength. The young cat was half dead from pain and fright, but the boy had a strong feeling of pleasure." The same boy, we are told, enjoyed putting flies to death as slowly as possible. Nevertheless, the independent existence of such a disposition cannot be said to be established. It is remarkable that no such disposition has been observed among the lower animals; and lovers of animals rather resent the common identification of cruelty with brutality as an insult to the innocent brutes. The fact is that manifestations of cruelty among human beings are usually accompanied by such emotional attitudes as anger or masterfulness, and it is not altogether easy to disentangle the moment of cruelty in the total disposition from the element of masterfulness or of anger and its multifarious causes. It is noteworthy that cruelty is sometimes found together with a spirit of destructiveness, as was the case with the above-mentioned boy. And destructiveness is frequently merely a manifestation of instinctive self-assertion or masterfulness, or just an expression of superfluous energy uncontrolled by imagination or intelligence. When acts of cruelty are carried out in a fit of anger or wrath, it seems clear that they are not the result of a cruel disposition but of an emotion which notoriously blinds the agent so that he does not realize the results of his conduct adequately, much less sympathetically. Now anger arises whenever a strong impulse is thwarted, and so it is not surprising that some cases of cruelty arise in connection with the repression of sexual impulses.

The view that cruelty is not a primary tendency or disposition but rather the result of other tendencies and deficiencies, is borne out to some extent by cases in which cruelty has a definite range. That the sympathy of most people is limited to certain spheres is a familiar fact; and, something similar happens in some cases with the disposition to cruelty. Prof. G. Stanley Hall (*Adolescence,* 1905) has drawn attention to such cases. Presumably in such cases cruelty begins where the limited sympathy and insight end. "Many youthful murderers (writes Stanley Hall), callous to the sufferings of their victims, have had the keenest sympathy with pets and even with children. . . . The juvenile torturers often seem to have specialized psychic zones, where tenderness is excessive, as if to compensate for their defect. They weep over the pain, actual or imaginary, of their pets while utterly hardened to the normal sentiments of kindness and help for suffering."

On the whole, it would appear that cruelty is not an independent instinct or disposition but rather a derivative phenomenon resulting positively from self-assertion or masterfulness, and negatively from the blindness caused by anger or by limitations of sympathy.

The English common law has never taken cognizance of the commission of acts of cruelty upon animals, and direct legislation upon the subject, dating from the 19th century, was due in a great measure to public agitation, supported by the Royal Society for the Prevention of Cruelty to Animals (founded in 1824). Various acts were passed in 1822 (known as Martin's Act), 1835, 1837, 1849 and 1854, and the law relating to domestic and captive animals is now to be found in the Protection of Animals Act 1911 and the amending Act of 1912 together with various minor amendment acts down to 1927. These statutes replace the acts of 1849 and 1854. The Cruelty to Animals Act 1876 was passed for the purpose of regulating the practice of vivisection (*q.v.*). The Ground Game Act 1880 prohibits night shooting, or the use of spring traps above ground, or poison. The Diseases of Animals Acts and orders thereunder are for the purpose of securing animals from unnecessary suffering, as well as from disease. Finally, the Wild Birds Protection Acts 1880 to 1908, with various game acts (*see* GAME LAWS), extend the protection of the law to wild birds and their eggs, and impose penalties for the setting of pole traps and the taking of a wild bird by means of a hook or other similar instrument. Other statutes relating to the subject, whose purpose is disclosed by their titles, are the Poultry Act 1911, the Exportation of Horses Act 1914, the Animals Anaesthetics Act 1919, the Captive Birds Shooting (Prohibition) Act 1921, the Protection of Birds Act 1925, the Performing Animals (Regulation) Act 1925.

For the law relating to the prevention of cruelty to children *see* CHILDREN, PROTECTIVE LAWS; for cruelty in the sense of such conduct as entitles a husband or wife to judicial separation *see* DIVORCE.

CRUIKSHANK, GEORGE (1792–1878), English artist, caricaturist and illustrator, was born in London, Sept. 27, 1792. By natural disposition and collateral circumstances he may be accepted as the type of the born humoristic artist. His grandfather had taken up the arts, and his father, Isaac Cruikshank, was a painter. The contemporary of Gillray, Rowlandson, Alken, Heath, Dighton, and the established caricaturists of that generation, George developed great proficiency as an etcher. Gillray's matured and trained skill had some influence upon his executive powers. Prolific and dexterous beyond his competitors, for a generation Cruikshank delineated Tories, Whigs and Radicals with fine impartiality. Satirical capital came to him from every public event—wars abroad, the enemies of England (for he was always fervidly patriotic), the camp, the court, the senate, the church; low life, high life; the humours of the people, the follies of the great. George Cruikshank's technical and manipulative skill as an etcher was such that Ruskin placed his productions in the foremost rank. He died at 263, Hampstead road, London, on Feb. 1, 1878, and was buried in St. Paul's cathedral.

A vast number of Cruikshank's spirited cartoons were published as separate caricatures, all coloured by hand; others formed series, or were contributed to satirical magazines, the *Satirist, Town Talk, The Scourge* (1811–16) and the like ephemeral publications. In conjunction with William Hone, G. Cruikshank produced political satires, *The Political House that Jack Built* (1819), and others, re-issued by Hone in 1827 under the general title, *Facetiae and Miscellanies.*

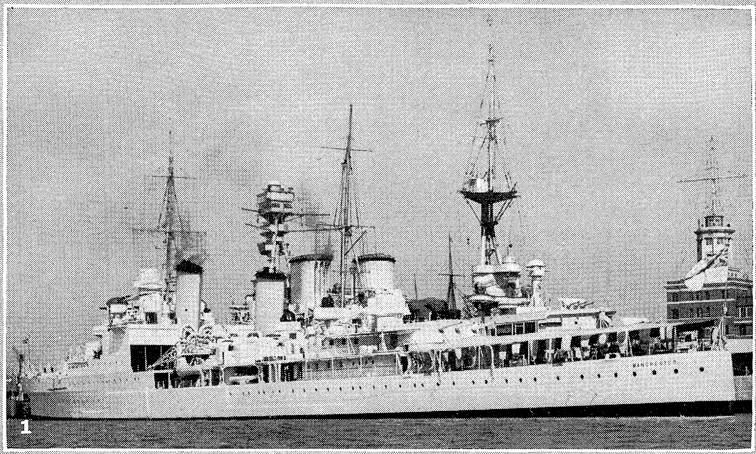
Of a more genially humoristic order are his famed book illustrations. Early in this series came *The Humorist* (1819–21) and *Life in Paris* (1822), the well-known series of *Life in London,* conjointly produced by the brothers I. R. and G. Cruikshank, and Grimm's *Collection of German Popular Stories* (1824–26), in two series, with 22 inimitable etchings. To the first 14 volumes (1837–43) of *Bentley's Miscellany,* Cruikshank contributed 126 of his best plates, etched on steel, including the famous illustrations to *Oliver Twist, Jack Sheppard, Guy Fawkes* and *The Ingoldsby Legends.* For W. Harrison Ainsworth, Cruikshank illustrated *Rookwood* (1836), and *The Tower of London* (1840). For C. Lever's *Arthur O'Leary* he supplied ten full-page etchings (1844), and 20 spirited graphic etchings for Maxwell's lurid *History of the Irish Rebellion in 1798* (1845). The best known of the pictures and illustrations produced by Cruikshank as an enthusiastic advocate of abstinence are *The Bottles,* 8 plates (1847), with its sequel, *The Drunkard's Children,* 8 plates (1848), with the ambitious work, *The Worship of Bacchus,* published by subscription after the artist's oil painting, now in the National Gallery, London, to which it was presented by his numerous admirers.

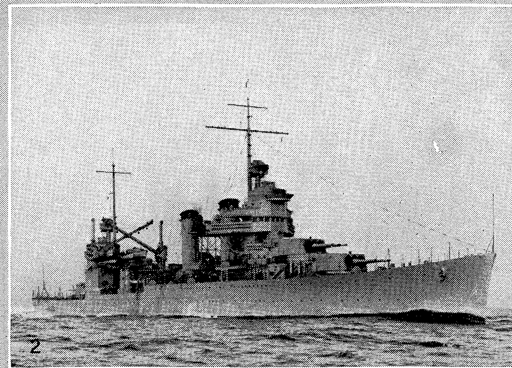
See *Cruikshank's Water-Colours,* with introduction by Joseph Grego (1903).

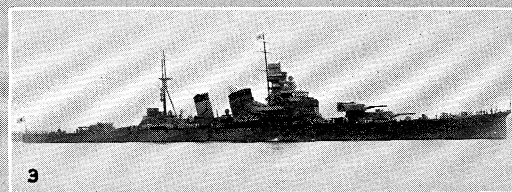
CRUISER. A fast and well-armed warship, specially designed for two main functions: (a) to guard the sea routes, (b) to act as an advance guard or scouting force for the battle fleet.

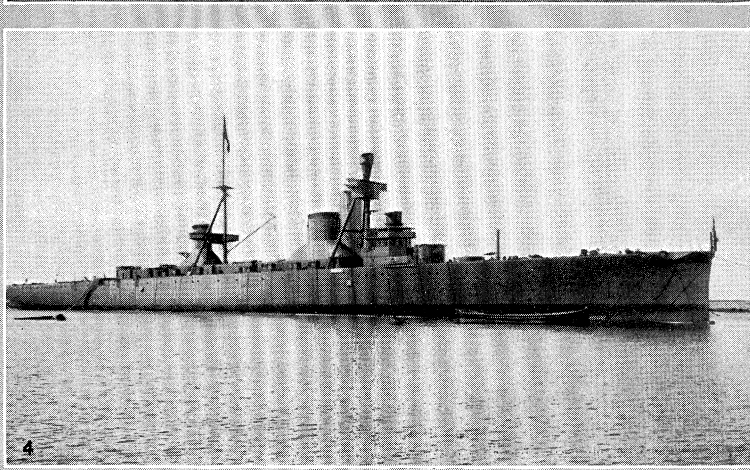
GENERAL PRINCIPLES

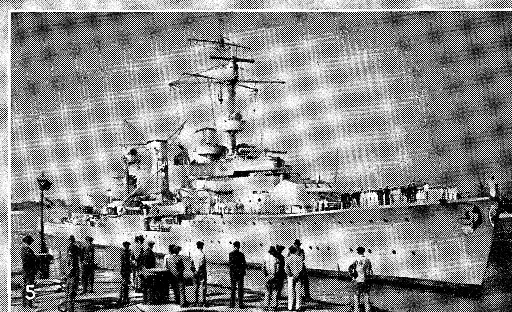
The first traces of that elaborate classification of warships into types with distinctive functions which is characteristic of the modern fleet can be discovered in the second half of the 17th century. Before that time fleets were not formed for action upon any generally accepted principle; warships of all types and sizes took part at the same time and the action resolved itself into a series of isolated combats as the separate units found oppor-

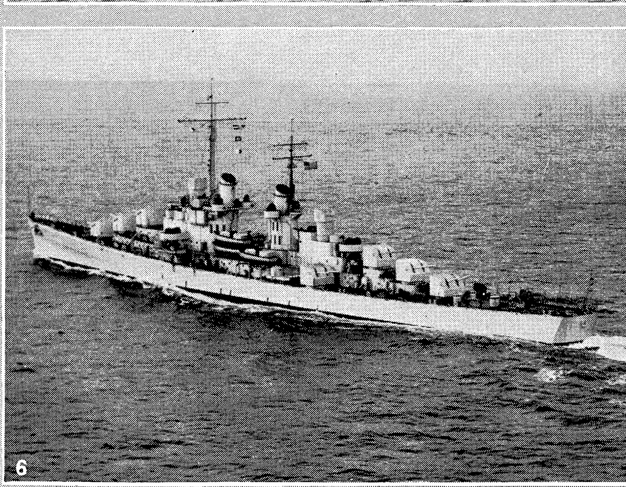


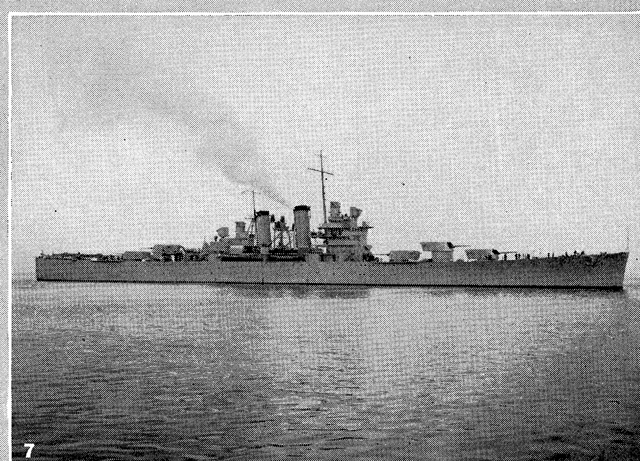












BY COURTESY OF (2, 7) THE UNITED STATES NAVY DEPARTMENT, (4) NAVAL ATTACHÉ, ITALIAN EMBASSY, LONDON; PHOTOGRAPHS (1) FROM EUROPEAN, (3) FROM "JANE'S FIGHTING SHIPS," (5) BRITISH COMBINE, (6) INTERNATIONAL

CRUISERS OF FIVE NAVIES

1. H.M.S. "Manchester," Southampton class cruiser. Displacement, 9,400 tons. Armament: twelve 6-in. guns, eight 4-in. anti-aircraft guns, 21 other; six 21-in. torpedo tubes; carries 3 aircraft. Armour: 1-2-in. turrets, 4-3-in. side, 4-in. conning tower. Speed, 32.3 knots
2. U.S.S. "Vincennes," heavy cruiser. Displacement, 9,950 tons. Armament: nine 8-in., 55-calibre; eight 5-in. guns. Carries 2 catapults and 4 aircraft. Armour: 5-in. vertical side, two 3-in. decks, 5-6-in. gunhouses, 8-in. conning tower. Speed, 32 knots. Sunk Aug. 9, 1942
3. Japanese cruiser "Aoba." Displacement, 7,100 tons. Carries six 8-in. guns, four 4.7-in. anti-aircraft, twelve 21-in. torpedo tubes (above water), and 2 seaplanes. Speed, 33 knots
4. Italian cruiser "Trento." Displacement, 10,000 tons. Armament: sixteen 3.9-in. anti-aircraft, eight 8-in. guns, eight 21-in. torpedo tubes, in pairs (above water); carries 2 planes. Armour: 2¾-in. side, amidships and turrets, 2-in. deck. Speed, 36 knots
5. German light cruiser "Königsberg," 6,000 tons, sunk by British naval dive-bombers at Bergen, Norway, April 9, 1940
6. U.S.S. "Atlanta," light cruiser. Displacement, 6,000 tons. Armament: twelve 5-in., 38-calibre dual purpose guns; 12 others; six 21-in. torpedo tubes; carries 2 or 3 planes. Armour: 3½-in. side, 2-in. deck. Speed, at least 38 knots
7. U.S.S. "St. Louis," light cruiser. Displacement (estimated), 10,000 tons. Armament: fifteen 6-in. guns, eight 5-in. anti-aircraft guns, 12 other; carries 4 aircraft. Armour (unofficial): 1½-4-in. side, 3 in. + 2-in. decks, 3-5-in. gunhouses, 8-in. conning tower. Speed, 32.5 knots

tunity. The Queen's ships under the command of the Lord High Admiral operating against the Spanish Armada ranged from the "Triumph" of 1,100 tons to the "Signet" of 30 tons.

In the naval war of 1652 the Dutch fleet fought to protect convoys or to clear the seas for merchant traffic. It was as if the German battle fleet had made its way out of Kiel during the World War to engage the British fleet, so that a vast convoy of German merchantmen might slip safely away with their cargoes. Dutch trade suffered to so great an extent that in subsequent wars of the period the Dutch merchant ships were withdrawn to port, while the Dutch fleet endeavoured to secure permanent command of the seas. Thus the primary duty of a fleet came to be regarded as that of seeking out and destroying the enemy.

About the same time, the growing use of the fireship (there were 87 such ships working with the British Navy of 123 warships in 1690–1700) formed a pressing reason for developing the "line of battle": that formation by means of which, by opening their intervals, the fleet could best avoid fireship attack. The line of battle necessitated uniformity of sailing and gun power in order to be effective, and large offensive power per vessel so that the line should not be too long. These requirements precluded the employment of the smaller warships of the day in the line. On the other hand, the breaking up of convoys into smaller and less valuable groups, withdrew from the capital ship the temptation to make the capture of these her objective and opened opportunities both of attack and defence for the smaller fighting ships.

Developments were of slow growth, but by the middle of the 18th century the line of battleship, the frigate, a faster and more lightly armed vessel to act as observer for the line of battleship, but not to occupy a place in the line, and the light cruiser, a still more lightly armed vessel for commerce protection, were accepted types. The principles of sea warfare, which brought these types into being, have not always been clearly recognized, but war has inevitably brought them into prominence.

At the beginning of the Napoleonic wars there was considerable heterogeneity of type both among battleships and frigates, but by the closing years the main battle fleet was composed almost entirely of 74-gun ships (85 out of 99 capital ships), the many classes of frigates were in course of replacement by a uniform type of 38 and 36-gun ships, and there were 403 ships of below 20 guns out of the 550 cruising ships of the Navy required for convoy and look-out duties, and this notwithstanding the unchallenged command of the sea which the main fleet had obtained.

It is also possible to trace the gradual standardization of types after the wooden and sailing Navy had given way to more modern construction. Cruisers, to use the general term, gradually came to be grouped into four fairly well defined classes:—the battle cruiser; the armoured cruiser; the protected cruiser, and the light cruiser. The first of these may be regarded as the culminating point of cruiser design.

Battle Cruiser.—The development of the armoured cruiser with 9-in., or, in the case of Japan, even 12-in. guns, seemed to call for a new type of warship, one faster than any class afloat except the destroyer, and with an armament second only to that of the battleship. This resulted in the battle cruiser, the first example of which was the "Invincible" class, contemporaries of the improved "Dreadnought" class of battleship. (*See* Technical section of this article.)

It was conceived that a squadron of such ships would be able to drive in the enemy's cruiser forces, unmask his battle fleet and harry the latter's van and rear during the main action.

Battle cruisers were not originally intended to engage in prolonged duels with ships of their own class, as they actually did in the Dogger Bank action and in the preliminary stages of the battle of Jutland (*q.v.*). For such "hammer and tongs" fighting they, as a class, and the British design in particular, were not well suited and the latter suffered accordingly; but the fact that the World War found Germany with a powerful battle cruiser fleet, made such engagements almost inevitable, particularly in the low visibility which so often prevails in the North Sea.

The most striking success of the battle cruiser as a type was that achieved by the two British ships at the battle of the Falkland Islands (*q.v.*), but there they were overwhelmingly superior to their opponents in speed and in the range and calibre of their guns; moreover, the weather conditions gave them every opportunity to make the most of their advantages. There, too, they filled a rôle which was unforeseen when they were designed; viz., that of making a sudden descent on an enemy cruiser force in distant seas. Nevertheless, they were most effective in it, thanks to the master-hand of the man who was chiefly responsible for their conception—the veteran First Sea Lord, Admiral of the Fleet Lord Fisher. The secrecy and promptness with which they were despatched, the timely arrival of a force so powerful that it left nothing to chance, formed a striking example of correct and vigorous strategy.

The Washington Treaty (*q.v.*) having limited the amount of capital ship tonnage, it seems probable that the sea powers will prefer to make use of their respective quotas for battleship construction only; in which case the battle cruiser as a type will gradually die out; in fact, with the extinction of the German battle cruiser fleet, Britain and Japan are the only two nations whose navies include this type of warship, which was not adopted by any of the other great sea powers.

Armoured Cruisers.—The heavy armoured cruiser, such as the "Defence" class, has become practically extinct. It did not prove of much value in the World War. Too slow, as compared with the modern battleship, it was not a useful auxiliary to the battle fleet, it could not face the enemy battle cruisers, while it was needlessly costly and unsuitable in other ways for guarding the trade routes. At Jutland the British armoured cruisers suffered heavily and could be of very little service.

Protected Cruisers.—The term has now died out, but ships of this type, such as the "Amphitrite" class, were representative of the ocean-going, commerce-protecting cruiser of their time, and the forerunners of the 10,000-ton cruiser of to-day.

Light Cruisers.—As the place of the big cruiser was taken by the armoured cruiser and eventually by the battle cruiser, and with the growing size and power of the destroyer, there came an ever-increasing demand for light, fast cruisers to act as fleet auxiliaries. As the World War went on, this type became more and more numerous and produced a more or less standard design of "fleet cruiser"—ships of about 3,500 to 5,000 tons, armed with six-in. guns. The type was chiefly intended for work in the North Sea and since the War has not proved adequate to replace older and much larger ships required for high-sea work, but long since worn out and scrapped.

Some years after the War, the British Admiralty decreed that, in future, there would be only two categories of cruisers—the "battle cruiser" and the "cruiser"; but, in fact, the latter category was still in 1928 divided into the large cruiser and the small cruiser, known as "A" and "B" classes, heavy and light cruisers.

The names "light cruiser" and "heavy cruiser" are actually misnomers. It is the common conception that the former ship is lighter in tonnage than the latter while this is not necessarily the case. Both types of ship have been built up to a tonnage of 10,000 tons; in fact, most of the later light cruisers are listed at 10,000 tons, while the so-called heavy cruisers are listed as low as 8,250 tons. The difference in designation is made according to the size of the largest guns, the heavy cruisers carrying 8 in. guns while the light cruisers carry 6 inch. The British heavy cruisers run from 8,250 tons with 6 8 in. guns to 10,000 tons with 8 8 in. guns while the U.S.A. ships go from 9,050 tons to 10,000 tons carrying either 9 or 10 8 in. guns.

The British light cruisers run from 4,580 tons with 6 6 in. guns to 10,000 tons with 12 6 in. guns while the U.S.A. has vessels of this class ranging from 7,500 tons with 10 6 in. guns to 10,000 tons with 15 6 in. guns.

A new development in naval shipbuilding is the anti-aircraft cruiser. This vessel is one built on the same lines as the light cruiser displacing about 5,000 tons and carrying armament guns whose primary function is defence against aircraft.

To the British Empire, scattered all over the world and knit together by the long sea routes, the question of cruisers is a vital one. The very life and sustenance of the inhabitants of the British Isles depend on these sea arteries being secure throughout their entire length. This can only be ensured by a sufficiently large number of cruisers to police them; but such a force, with its units widely distributed, as they always are and must be, does not constitute a menace or challenge to other nations; for it could only be concentrated into one large fleet at the risk of exposing the sea arteries to being severed at many distant points. This would cause the dismemberment of some parts of the Empire, while the heart would be starved of some vital commodity.

Nelson and many another old-time sea commander complained bitterly of the lack of frigates. At the beginning of the World War, Britain had more than double the number of cruisers she possessed in 1928, yet the Admiralty were at their wits' end for ships of this class.

To-day the cruiser, as a type, stands for security for those of all nations who "pass on the seas on their lawful occasions"; they are the safeguards of civilization lest it should be assailed by the many wild and uncontrolled forces which still abound in and around the waters of the world. But for the cruisers of the various sea Powers, piracy, gun-running and slavery would be rampant again. In fact, the cruiser should be respected and maintained as a powerful factor in preserving peace and tranquillity the world over. (E. A.; X.)

TECHNICAL

The progress in technical science, which marked the opening years of the 19th century and has continued without pause for more than a hundred years, gave to the naval constructor iron for wood (1850–60), steel for iron (1877), the screw (1845), the turbine (1902), the geared turbine (1914), the rifled gun (1865), the breech loader (1880), barbettes securing extensive arcs of fire (1880), wrought iron armour (1860), and cemented armour (1900). Corresponding changes took place in the character and construction of warships, but the broad principles of the functions of the cruising type, as of the battleship (*q.v.*), remained unaffected.

During the interval within which these scientific developments were becoming accessible there was naturally considerable diversity in design, and among the cruising vessels on active service were frigates, corvettes, 2nd class cruisers, despatch vessels and torpedo cruisers, sloops and gun vessels. It was not until the British Naval Defence Act of 1889 that types of present-day cruisers came into being; when the ships built under this Act were completed in 1892, cruisers were arranged in first, second and third classes; type ships being "Blenheim" (1890) of 9,000 tons displacement, speed 20½ knots, armed with 2 9·2in. and 10 6in. guns, with a protective deck 3 inches thick; "Apollo" class (1891), of 3,400 tons displacement, speed 20 knots, armed with 2 6in. and 6 4·7in. guns with a protective deck 1 in. thick; and "Philomel" (1890), of 2,575 tons, 19 knots, armed with 8 4·7in. guns, with a protective deck 1 in. thick.

The "Blenheim" type continued till 1898, when the "Diadem" class of 11,000 tons and 21 knots were the last of the large cruisers protected only by a thick deck. The "Apollo" type continued until they were displaced by the armoured cruiser and the light cruiser, the last class being "Chatham" (1911) of 5,400 tons displacement, speed 25½ knots, which ship had a 3in. nickel steel belt amidships, in addition to the protective deck. The "Philomel" type ended with the "Amphion" class (1911), of 3,440 tons displacement and speed 25½ knots, after which they merged into the light cruiser type.

The Armoured Cruiser.—The introduction of Harveyised armour, enabled armour only 6in. thick to provide very substantial protection to the sides of cruisers, which was first taken advantage of in the "Cressy" class (1901), which vessels were the forerunners of both the armoured and battle cruisers. The ships were of 12,000 tons displacement, speed 21½ knots, armed with 2 9·2in. and 12 6in. guns and two submerged torpedo tubes. They had a protective deck of 2–3in. thick and side armour 6in. thick. The types passed through several stages until the "Minotaur" (1905) of 14,000 tons, 23 knots, armed with 4 9·2in. and 10 7·5in. guns and five torpedo tubes.

The Light Cruiser.—The "Arethusa" class were the first vessels of this new type of fast lightly armoured cruisers. Their displacement was 3,500 tons and speed 29 knots. The machinery was of 40,000 s.h.p. and was the same as in the L class destroyers. They were the first cruisers to burn oil fuel only. The armament was 2 6in. and 6 4in. guns, and the side had protective plating 3–2in. thick. The following classes, "Calliope" and "Danae," were similar in many respects but embodied important improvements, geared turbines in "Champion" and later vessels, while in the later "C" class vessels and in the "D" class, a uniform armament of 6in. guns all mounted on the middle line, gave each vessel a powerful broadside. The "Emerald" class followed in 1917, the speed being increased to match the high speed of the German cruisers then building. Machinery of 80,000 s.h.p. was fitted. The displacement was 7,500 tons, speed 33 knots, and they were armed with 7 6in. guns and 12 21in. torpedo tubes.

The Ocean Cruiser.—The cruisers of the war period were of a type suitable for service in the North Sea, but in 1915 designs were prepared for the "Raleigh" class, more especially suited for ocean work in any part of the world. They have a speed of 30 knots and are armed with 7 7·5in. guns, five of which are on the middle line and two, one on either side, amidships. They are adapted for burning coal and oil. The 3in. belt of earlier vessels is repeated and in addition they are bulged against torpedo attack.

The Battle Cruiser.—The 1904 Committee on Designs, which produced the "Dreadnought" also recommended a new type of cruiser which has been designated a battle cruiser, the same calibre of guns being mounted as in battleships. The overruling consideration was speed, therefore it was necessary to surrender a certain number of guns and a great deal of armour as compared with the battleships.

The first ships of this type were "Invincible," "Inflexible" and "Indomitable," 530ft. in length, 17,250 tons, 41,000 h.p., turbine machinery, quadruple screws and 25 knots speed. Eight 12in. guns were fitted in four turrets. The armour protection was on a 6-in. basis only.

Successive improvements were made in "Indefatigable," "Australia" and "New Zealand" with increased displacement, and then the 28-knot ships "Lion" and "Princess Royal" were laid down in 1909–10. The horse power rose to 70,000 and 8 13·5in. guns were provided, the displacement rising to 26,350 tons. The armour protection was on a 9in. basis. The "Queen Mary" (1911) was generally similar. Further improvement was made in the "Tiger" (1912), of 28,500 tons, in which ship 12 6in. guns were fitted in addition to the main armament of 8 13·5in. guns.

The success of the battle cruisers "Invincible" and "Inflexible" at the Falkland Islands battle led to the building of two fast cruisers, "Renown" and "Repulse," in lieu of two battleships of the "Royal Sovereign" class which had been laid down. These vessels had 6 15in. guns and 17 4in. guns and an armour belt of 6in. thickness. The machinery was virtually a repeat of that of "Tiger," and with 112,000 h.p. the "Repulse" obtained 32·6 knots on the measured mile trial. They were 750 ft. long, with a displacement of 26,500 tons and they carried 4,250 tons of oil fuel. The construction of these vessels in about 20 months from the initiation of the design constitutes a record in design and construction.

The "Hood" was designed as a battle cruiser in 1916 and during building the lessons of the Battle of Jutland were incorporated in the ship. The protection was brought up to battleship standard, the belt being 8–12in. and barbettes 9–12in., and the thickness of the protective deck was also considerably increased over previous ships. A bulge to provide protection against torpedo attack was also a part of the design. She was armed with 8 15in. guns and 12 6in. guns. Geared turbines were adopted for the machinery, giving a total power of 144,000 s.h.p., and the ship attained 32 knots on her trials.

Germany in 1906 passed an act authorizing an extensive building program of war vessels to be completed by 1917, which beside battleships and torpedo craft, included twenty large and thirty-eight small cruisers. A series of armoured and battle cruisers was started, "Blücher," of 15,500 tons displacement, speed 24 knots, armed with 12 8·2in. and 8 5·9in. guns and 4 18in. torpedo tubes, being the first, followed by "Von Der Tann," "Moltke," "Goeben," "Seydlitz," "Derfflinger," "Lützow" and "Hindenburg." They were all fast powerful vessels, and the last-named had a displacement of 27,000 tons, speed 28 knots (85,000 s.h.p.), armed with 8 12in. and 14 5·9in. guns and 4 19·7in. torpedo tubes, armour 7in. thick on side, 10in. on barbettes. For light cruisers, a continuous building programme of about 3 vessels per year took place, the vessels varying from "Dresden" class, 3,500 tons displacement, 24 knots, armed with 4·1in. guns and 4 torpedo tubes, to "Köln" of 5,600 tons, 27½ knots, armed with 8 5·9in. and 3 8·8cm. guns, and 4 torpedo tubes.

Japan was the only other nation to complete battle cruisers before the World War, with the "Kongo" class (4), 27,500 tons displacement, speed 28 knots, armed with 8 14in. and 16 6in. guns and 8 21in. torpedo tubes, completed in 1913. Her armoured cruisers completed after 1906 are the "Tsukuba" class (2) and "Kurama" class (2), the latter of 14,600 tons displacement and 21½ knots, completed in 1910. The last light cruisers completed before the war were the "Yahagi" class (3) of 4,950 tons and 26 knots, armed with 8 6in. and 4 3in. guns and 3 18in. torpedo tubes. Since the World War about 14 fast light cruisers have been built of about 5,500 tons displacement, 33 knots, armed generally with 7 5·5in. guns and 6 or 8 21in. torpedo tubes. Also the "Furutaka" class (4), which vessels are of 7,500 tons displacement, 33 knots (100,000 s.h.p.), armed with 6 8in. and 4 4·7in. guns and 12 21in. torpedo tubes.

The United States did not complete any battle cruisers, and in 1914 the latest armoured cruisers in the American navy were the vessels of the "Tennessee" class (4), completed about 1908, of 14,500 tons displacement, speed 22½ knots, armed with 4 10in. and 16 6in. guns, and 4 21in. torpedo tubes, and the "Pennsylvania" class (6), of 13,680 tons, 22 knots, armed with 4 8in. and 14 6in. guns and 2 18in. torpedo tubes. Prior to the World War the "Chester" class (3), completed in 1908, were the newest light cruisers, but in 1916 the 10 vessels of the "Omaha" class were authorised. These ships are of 7,500 tons displacement, 33½ knots (90,000 s.h.p.), armed with 12 6in. and 4 3in. guns and 6 21in. torpedo tubes.

France and Italy also did not build battle cruisers, but each had several classes of armoured cruisers completed after 1905. These were, for France, the "Waldeck Rousseau" class (2), the "Ernest Renan" (2), and the "Léon Gambetta" (2), the first-named ships being of 14,000 tons displacement, 23 knots, with a main armament of 7 6in. guns; and for Italy, the "San Giorgio" class (2) and "Pisa" class (2). These vessels were of 10,000 tons displacement, 23 knots, and with a main armament of 2 or 4 10in. guns, 8 7·5in. guns and 3 18in. torpedo tubes.

The Washington Agreement of 1921 fixed a limit of 10,000 tons displacement for war vessels other than capital ships, and of 8in. for the gun mounted in such vessels. Since this conference, the five Powers concerned have each started building cruisers up to the limits allowed. Great Britain has completed the vessels of "Kent" class (5) and "London" class (4), and has two vessels of "Dorsetshire" class under construction. The U.S.A. has completed 18 heavy cruisers with 8-in. guns, nine light cruisers with 6-in. guns and has under construction 48 cruisers of various types. Japan has completed the "Nachi" class (5) and has under construction five vessels of "Takao" class. France has completed the "Duquesne" class (2) and "Suffren." Two more vessels of "Suffren" class were under construction in 1930. Italy has completed "Trento" class (2), and has under construction four vessels of "Zara" type.

These vessels are all designed to obtain speeds of more than 30 knots, and in some cases, by the deletion of any protective plating, very high speeds have been obtained. In general, they carry a main armament of 8 or 10 8in. guns with anti-aircraft guns and torpedo tubes. The weakness of the type is the insufficiency of protection that can be provided on the limited displacement, but it is too soon to state what will be the ultimate influence exercised by this important type of ship upon cruiser design.

By the Treaty of Versailles, Germany was not allowed to exceed a cruiser displacement of 6,000 tons, and she has produced the "Emden," "Karlsruhe" class (3) and "Leipzig." The last ship has a speed of 32 knots and a main armament of 9 5·9in. guns in triple turrets. (W. J. B.; X.)

Note: Particulars regarding the cruisers of other nations as well as additional particulars regarding the navies of the different countries of the world will be found in the section headed *Defence* in the articles on the various countries, as United States, France, Japan, Italy, etc. To these the reader is referred.

CRUNDEN, JOHN (d. 1828) English architectural and decorative designer. Most of his early inspiration was drawn from Chippendale and his school; later the influence was a bastard classicism. He produced and published many designs.

CRUSADES, the name given to the series of campaigns undertaken by the Christians of western Europe from 1096 to 1291 for the recovery of the Holy Land from the Mohammedans, so called from the cross worn as a badge by the Crusaders. By analogy the term "crusade" is also given to any campaign undertaken in the same spirit.

Significance of the Crusades.—The crusades may be regarded partly as the *decumanus fluctus* in the surge of religious revival, which had begun in western Europe during the 10th, and had mounted high during the 11th century; partly as a chapter, and a most important chapter, in the history of the interaction of East and West. Contemporaries regarded them in the former of these two aspects, as "holy wars" and "pilgrims' progresses" towards Christ's Sepulchre; the reflective eye of history must perhaps regard them more especially from the latter point of view. Considered as holy wars the crusades must be interpreted by the ideas of an age which was dominated by the spirit of otherworldliness, and accordingly ruled by the clerical power which represented the other world. They are a *novum salutis genus,* a new path to Heaven, to tread which counted "for full and complete satisfaction" (*pro omni poenitentia*) and gave "forgiveness of sins" (*peccaminum remissio*); they are, again, the "foreign policy" of the papacy, directing its faithful subjects to the great war of Christianity against the infidel. As such a *novum salutis genus,* the crusades connect themselves with the history of the penitentiary system; as the foreign policy of the Church they belong to that

clerical purification and direction of feudal society and its instincts, which appears in the institution of "God's Truce" and in chivalry itself. The penitentiary system, according to which the priest enforced a code of moral law in the confessional by the sanction of penance—penance which must be performed as a condition of admission to the sacrament of the Eucharist—had been from early times a great instrument in the civilization of the raw Germanic races. Penance might consist in fasting; it might consist in flagellation; it might consist in pilgrimage. The penitentiary pilgrimage, which seems to have been practised as early as A.D. 700, was twice blessed; not only was it an act of atonement in itself, like fasting and flagellation; it also gained for the pilgrim the merit of having stood on holy ground. Under the influence of the Cluniac revival, which began in the 10th century, pilgrimages became increasingly frequent; and the goal of pilgrimage was often Jerusalem. Pilgrims who were travelling to Jerusalem joined themselves in companies for security, and marched under arms; the pilgrims of 1064, who were headed by the archbishop of Mainz, numbered some 7,000 men. When the first crusade finally came, what was it but a penitentiary pilgrimage under arms—with the one additional object of conquering the goal of pilgrimage? That the Pilgrims' Progress should thus have turned into a Holy War is a fact readily explicable, when we turn to consider the attempts made by the Church, during the 11th century, to purify, or at any rate to direct, the feudal instinct for private war (*guerra*). Since the close of the 10th century diocesan councils in France had been busily acting as legislatures, and enacting "forms of peace" for the maintenance of God's Peace or Truce (*Pax Dei* or *Treuga Dei*). In each diocese there had arisen a judicature (*judices pacis*) to decide when the form had been broken; and an executive, or *communitas pacis*, had been formed to enforce the decisions of the judicature. But it was an easier thing to consecrate the fighting instinct than to curb it; and the institution of chivalry represents such a clerical consecration, for ideal ends and noble purposes, of the martial impulses which the Church had hitherto endeavoured to check. In the same way the crusades themselves may be regarded as a stage in the clerical reformation of the fighting laymen. As chivalry directed the layman to defend what was right, so the preaching of the crusades directed him to attack what was wrong—the possession by "infidels" of the Sepulchre of Christ. The crusades are the offensive side of chivalry: chivalry is their parent—as it is also their child. The knight who joined the crusades might thus still indulge the bellicose side of his genius—under the aegis and at the bidding of the Church; and in so doing he would also attain what the spiritual side of his nature ardently sought—a perfect salvation and remission of sins. He might butcher all day, till he waded ankle-deep in blood, and then at nightfall kneel, sobbing for very joy, at the altar of the Sepulchre—for was he not red from the winepress of the Lord? One can readily understand the popularity of the crusades, when one reflects that they permitted men to get to the other world by fighting hard on earth, and allowed them to gain the fruits of asceticism by the way of obedience to natural instincts. Nor was the Church merely able, through the crusades, to direct the martial instincts of a feudal society; it was also able to pursue the object of its own immediate policy, and to attempt the universal diffusion of Christianity, even at the edge of the sword, over the whole of the known world.

Thus was renewed, on a greater scale, that ancient feud of East and West, which has never died. For 1,000 years, from the Hegira in 622 to the siege of Vienna in 1683, the peril of a Mohammedan conquest of Europe was almost continually present. From this point of view, the crusades appear as a reaction of the West against the pressure of the East—a reaction which carried the West into the East, and founded a Latin and Christian kingdom on the shores of Asia. They protected Europe from the new revival of Mohammedanism under the Turks; they gave it a time of rest in which the Western civilization of the middle ages developed. But the relation of East and West during the crusades was not merely hostile or negative. The Latin kingdom of Jerusalem was the meeting-place of two civilizations: on its soil the East learned from the West, and—perhaps still more—the West learned from the East. The culture developed in the West during the 13th century was not only permitted to develop by the protection of the crusades; it grew upon materials which the crusades enabled it to import from the East. Yet the debt of Europe to the crusades in this last respect has perhaps been unduly emphasized. Sicily was still more the meeting-place of East and West than the kingdom of Jerusalem; and the Arabs of Spain gave more to the culture of Europe than the Arabs of Syria.

Historical Causes of the Crusades.—Within 15 years of the Hegira, Jerusalem fell before the arms of Omar (637), and it continued to remain in the hands of Mohammedan rulers till the end of the first crusade. For centuries, however, a lively intercourse was maintained between the Latin Church in Jerusalem, which the clemency of the Arab conquerors tolerated, and the Christians of the West. Charlemagne in particular was closely connected with Jerusalem: the patriarch sent him the keys of the city and a standard in 800; and in 807 Harun Al-Rashid recognized this symbolical cession, and acknowledged Charlemagne as protector of Jerusalem and owner of the church of the Sepulchre. Charlemagne founded a hospital and a library in the Holy City; and later legend, when it made him the first of crusaders and the conqueror of the Holy Land, was not without some basis of fact. The connection lasted during the 9th century; kings like Alfred of England and Louis of Germany sent contributions to Jerusalem, while the church of Jerusalem acquired estates in the West. During the 10th century this intercourse still continued; but in the 11th century interruptions began to come. The fanaticism of the caliph Hakim destroyed the church of the Sepulchre and ended the Frankish protectorate (1010); and the patronage of the Holy Places, a source of strife between the Greek and the Latin Churches as late as the beginning of the Crimean War, passed to the Byzantine empire in 1021. This latter change in itself made pilgrimages from the West increasingly difficult: the Byzantines, especially after the schism of 1054, did not seek to smooth the way of the pilgrim, and Victor II. had to complain to the empress Theodora of the exactions practised by her officials. But still worse for the Latins was the capture of Jerusalem by the Seljuk Turks in 1071. Without being intolerant, the Turks were a rougher and ruder race than the Arabs of Egypt whom they displaced; while the wars between the Fatimites of Egypt and the Abbasids of Baghdad, whose cause was represented by the Seljuks, made Syria (one of the natural battle-grounds of history) into a troubled and unquiet region. The native Christians suffered; the pilgrims of the West found their way made still more difficult, and that at a time when greater numbers than ever were thronging to the East. Western Christians could not but feel hampered and checked in their natural movement towards the fountain-head of their religion, and it was natural that they should ultimately endeavour to clear the way. In much the same way, at a later date and in a lesser sphere, the closing of the trade-routes by the advance of the Ottoman Turks led traders to endeavour to find new channels, and issued in the rounding of the Cape of Good Hope and the discovery of America. Nor, indeed, must it be forgotten that the search for new and more direct connections with the routes of oriental trade is one of the motives underlying the crusades themselves, and leading to what may be called the 13th-century discovery of Asia.

It was thus natural, for these reasons, that the conquest of the Holy Land should gradually become an object for the ambition of Western Christianity—an object which the papacy, eager to realize its dream of a universal church subject to its sway, would naturally cherish and attempt to advance. Two causes combined to make this object still more natural and more definite. On the one hand, the reconquest of lost territories from the Mohammedans by Christian Powers had been proceeding steadily for more than 100 years before the first crusade; on the other hand, the position of the Eastern empire after 1071 was a clear and definite summons to the Christian West, and proved, in the event, the immediate occasion of the holy war. As early as 970 the recovery of the territories lost to Mohammedanism in the East had been begun by emperors like Nicephorus Phocas and John Zimisces: they had pushed their conquests, if only for a time, as far as Antioch and Edessa, and the temporary occupation of Jerusalem is attributed to the East Roman arms. At the opposite end of the Mediterranean, in Spain, the Omayyad caliphate was verging to its fall: the long Spanish crusade against the Moor had begun; and in 1018 Roger de Toeni was already leading Normans into Catalonia to the aid of the native Spaniard. In the centre of the Mediterranean the fight between Christian and Mohammedan had been long, but was finally inclining in favour of the Christian. The Arabs had begun the conquest of Sicily from the East Roman empire in 827, and they had attacked the mainland of Italy as early as 840. The popes had put themselves at the head of Italian resistance: in 848 Leo IV. is already promising a sure and certain hope of salvation to those who die in defence of the cross; and by 916, with the capture of the Arab fortress on the Garigliano, Italy was safe. Then came the reconquest of the Mediterranean islands near Italy. The Pisans conquered Sardinia at the instigation of Benedict VIII. about 1016; and, in a 30 years' war which lasted from 1060 to 1090, the Normans, under a banner blessed by Pope Alexander II., wrested Sicily from the Arabs. The Norman conquest of Sicily may with justice be called a crusade before the crusades; and it cannot but have given some impulse to that later attempt to wrest Syria from the Mohammedans, in which the virtual leader was Bohemund, a scion of the same house which had conquered Sicily. But while the Christians of the West were thus winning fresh ground from the Mohammedans, in the course of the 11th century, the East Roman empire had now to bear the brunt of a Mohammedan revival under the Seljuks—a revival which, while it crushed for a time the Greeks, only acted as a new incentive to the Latins to carry their arms to the East. The Seljuk Turks, first the mercenaries and then the masters of the caliph, had given new life to the decadent caliphate of Baghdad. Under the rule of their sultans, who assumed the rôle of mayors of the palace in Baghdad about the middle of the 11th century, they pushed westwards towards the caliphate of Egypt and the East Roman empire. While they wrested Jerusalem from the former (1071), in the same year they inflicted a crushing defeat on the Eastern emperor at Manzikert. The result of the defeat was the loss of almost the whole of Asia Minor; the dominions of the Turks extended to the Sea of Marmora. An appeal for assistance, such as was often to be heard again in succeeding centuries, was sent by Michael VII. of Constantinople to Gregory VII. in 1073. Gregory listened to the appeal; he projected—not, indeed, as has often been said, a crusade[1], but a great expedition, which should recover Asia Minor for the Eastern empire, in return for a union of the Eastern with the Western Church. In 1074 Gregory actually assembled a considerable army; but his disagreement with Robert Guiscard, followed by the outbreak of the war of investitures, hindered the realization of his plans, and the only result was a precedent and a suggestion for the events of 1095. The appeal of Michael VII. was re-echoed by Alexius Comnenus himself. Brave and sage as he was, he could hardly cope at one and the same time with the hostility of the Normans on the west, of the Petchenegs (Patzinaks) on the north, and of the Seljuks on the east and south. Already in 1087 and 1088 he had appealed to Baldwin of Flanders, verbally and by letter[2], for troops; and Baldwin had answered the appeal. The same appeal was made more than once, to Urban II.; and the answer was the first crusade. The first crusade was not, indeed, what Alexius had asked or expected to receive. He had appealed for reinforcements to recover Asia Minor; he received hundreds of thousands of troops, independent of him, and intending to conquer Jerusalem for themselves, though they might incidentally recover Asia Minor for the Eastern empire on their way. Alexius may almost be compared to a magician, who has uttered a charm to summon a ministering spirit, and is surrounded on the instant by legions of demons. In truth the appeal of Alexius had set free forces in the West which were independent of, and even ultimately hostile to, the interests of the Eastern empire.

Mixture of Motives.—The primary force, which thus transmuted an appeal for reinforcements into a holy war for the conquest of Palestine, was the Church. The creative thought of the middle ages is clerical thought. It is the Church which creates the Carolingian empire, because the clergy think in terms of empire. It is the Church which creates the first crusade, because the clergy believe in penitentiary pilgrimages, and the war against the Seljuks can be turned into a pilgrimage to the Sepulchre; because, again, it wishes to direct the fighting instinct of the laity, and the consecrating name of Jerusalem provides an unimpeachable channel; above all, because the papacy desires a perfect and universal church, and perfect and universal church must rule in the Holy Land. But it would be a mistake to regard the crusades (as it would be a mistake to regard the Carolingian empire) as a pure creation of the Church, or as merely due to the policy of a theocracy directing men to the holy war which is the only war possible for a theocracy. It would be almost truer, though only half the truth, to say that the clergy gave the name of crusade to sanctify interests and ambitions which, while set on ends other than those of the Church, happened to coincide in their choice of means. There was, for instance, the ambition of the adventurer prince, the younger son, eager to carve a principality in the far East, of whom Bohemund is the type; there was the interest of Italian towns, anxious to acquire the products of the East more directly and cheaply, by erecting their own emporia in the eastern Mediterranean. The former was the driving force which made the first crusade successful, where later crusades, without its stimulus, for the most part failed; the latter was the one staunch ally which alone enabled Baldwin I. and Baldwin II. to create the kingdom of Jerusalem. So far as the crusades led to permanent material results in the East, they did so in virtue of these two forces. Unregulated enthusiasm might of itself have achieved little or nothing; enthusiasm caught and guided by the astute Norman, and the no less astute Venetian or Genoese, could not but achieve tangible results. The principality or the emporium, it is true, would supply motives to the prince and the merchant only; and it may be urged that to the mass of the crusaders the religious motive was all in all. In this way we may return to the view that the first crusade, at any rate, was *un fait ecclésiastique*. It is indeed true that to thousands the hope of acquiring spiritual merit must have been a great motive; it is also true, as the records of crusading sermons show, that there was a strong element of "revivalism" in the crusades, and that thousands were hurried into taking the cross by a gust of that uncontrollable enthusiasm which is excited by revivalist meetings to-day. But it must also be admitted that there were motives of this world to attract the masses to the crusades. Famine and pestilence at home drove men to emigrate hopefully to the golden East. In 1094 there was pestilence from Flanders to Bohemia: in 1095 there was famine in Lorraine. *Francigenis occidentalibus facile persuaderi poterat sua rura relinquere; nam Gallias per annos aliquot nunc seditio civilis, nunc fames, nunc mortalitas nimis afflixerat* (Ekkehard, *Chronica*, p. 213). No wonder that a stream of emigration set towards the East, such as would in modern times flow towards a newly discovered gold-field—a stream carrying in its turbid waters much refuse, tramps and bankrupts, camp-followers and hucksters, fugitive monks and escaped villeins, and marked by the same motley grouping, the same fever of life, the same alternations of affluence and beggary, which mark the rush for a gold-field to-day.

Such were the forces set in movement by Urban II., when, after holding a synod at Piacenza (March, 1095), and receiving there fresh appeals from Alexius, he moved to Clermont, in the south-east of France, and there on Nov. 26 delivered the great speech which was followed by the first crusade. In this speech he appealed, indeed, for help for the Greeks, *auxilio . . . saepe acclamato indigis* (Fulcher i. c. i.); but the gist of his speech was the peril of Christianity. Let the truce of God be observed at home; and let the arms of Christians be directed to conquering the infidel in an expedition which should count for full and complete penance. Like Gregory VII., Urban had thus sought for aid for the Eastern empire; unlike Gregory, who had only mentioned the Holy Sepulchre in a single letter, and then casually, he had struck the note of Jerusalem. The instant cries of *Deus vult* which answered the note showed that Urban had struck aright. Thousands at once took the cross; the first was Bishop Adhemar of Puy, whom Urban named his legate and made leader of the first crusade (for the holy war, according to Urban's original conception, must needs be led by a clerk). Fixing Aug. 15, 1096, as the time for the depar-

[1]Tradition credits a pope still earlier than Gregory VII. with the idea of a crusade. Silvester II. is said to have preached a general expedition for the recovery of Jerusalem, and the same preaching is attributed to Sergius IV. in 1011. But the supposed letter of Silvester is a later forgery; and in 1000 the way of the Christian to Jerusalem was still free and open.

[2]The Count de Riant impugned the authenticity of Alexius's letter to the Count of Flanders. It is very probable that the versions of this letter which we possess, and which are to be found only in later writings like Guibert de Nogent, are apocryphal; Alexius can hardly have held out the bait of the beauty of Greek women or have written that he preferred to fall under the yoke of the Latins rather than that of the Turks. But it is also probable that these apocryphal versions are based on a genuine original.

ture of the crusaders, and Constantinople as the general rendezvous, Urban returned from France to Italy. It is noticeable that it was on French soil that the seed had been sown[1]. Preached in France by a pope of French descent, the crusades began—and they continued—as essentially a French (we may almost say a Norman-French) enterprise; and the kingdom which they established in the East was essentially a French kingdom, in its speech and its customs, its virtues and its vices. It was natural that France should be the home of the crusades. She was already the home of the Cluniac movement, the centre from which radiated the truce of God, the chosen place of chivalry; she could supply a host of feudal nobles, somewhat loosely tied to their place in society, and ready to break loose for a great enterprise; she had suffered from battle and murder, pestilence and famine, from which any escape was welcome. To the Normans particularly the crusades had an intimate appeal. They appealed to the old Norse instinct for wandering—an instinct which, as it had long before sent the Norseman eastward to find his El Dorado in Micklegarth, could now find a natural outlet in the expedition to Jerusalem: they appealed to the Norman religiosity, which had made them a people of pilgrims, the allies of the papacy, and, in England and Sicily, crusaders before the crusades: finally, they appealed to that desire to gain fresh territory, upon which Malaterra remarks as characteristic of Norman princes. No wonder, then, that the crusading armies were recruited in France, or that they were led by men of the stock of the d'Hautevilles. Meanwhile newly conquered England had its own problems to solve; and Germany, torn by civil war, and not naturally quick to kindle, could only deride the "delirium" of the crusader (Ekkehard, *Chronica,* p. 214).

THE FIRST CRUSADE

The first crusade falls naturally into two parts. One of these may be called the crusade of the people: the other may be termed the crusade of the princes. Of these the people's crusade—prior in order of time, if only secondary in point of importance—may naturally be studied first. The sermon of Urban II. at Clermont became the staple for wandering preachers, among whom Peter the Hermit (*q.v.*) distinguished himself by his fiery zeal[2]. He has been described as riding on an ass from place to place through France and along the Rhine, carrying away by his eloquence thousands of the poor. Some three or four months before the term fixed by Urban II., in April and May 1096, five divisions of *pauperes* had already collected. Three of these, led by Fulcher of Orleans, Gottschalk and William the Carpenter respectively, failed to reach even Constantinople. The armies of Fulcher and Gottschalk were destroyed by the Hungarians in just revenge for their excesses (June); the third, after joining in a wild *Judenhetze* in the towns of the valley of the Rhine, during which some 10,000 Jews perished as the first-fruits of crusading zeal, was scattered to the winds in Hungary (August). Two other divisions, however, reached Constantinople in safety. The first of these, under Walter the Penniless, passed through Hungary in May, and reached Constantinople, where it halted to wait for the Hermit, in the middle of July. The second, led by Peter himself, passed safely through Hungary, but suffered severely in Bulgaria, and only attained Constantinople with sadly diminished numbers at the end of July. These two divisions (which in spite of good treatment by Alexius began to commit excesses against the Greeks) united and crossed the Bosporus in August, Peter himself remaining in Constantinople. By the end of October they had perished utterly at the hands of the Seljuks; a heap of whitening bones alone remained to testify to the later crusaders, when they passed in the spring of 1097, of the fate of the people's crusade.

Meanwhile the knights had already begun to assemble in March 1096. In small bands, and by divers ways, they streamed gradually southward and eastward, in a steady flow, throughout 1096. But three large divisions, under three considerable leaders, were pre-eminent among the rest. Godfrey of Bouillon, with his brother Baldwin, led the crusaders of Lorraine along "the road of Charles the Great," through Hungary, to Constantinople, where he arrived on Dec. 23. Raymund of Toulouse (the first prince to join the crusading movement) along with Bishop Adhemar, the papal commissary, led the Provençals down the coast of Illyria, and then due east to Constantinople, arriving towards the end of April 1097. Bohemund of Otranto, the destined leader of the crusade, with his nephew Tancred, led a fine force of Normans by sea to Durazzo, and thence by land to Constantinople, which he reached about the same time as Raymund. To the same great rendezvous other leaders also gathered, some of higher rank than Godfrey or Raymund or Bohemund, but none destined to exercise an equal influence on the fate of the crusade. Hugh of Vermandois, younger brother of Philip I. of France, had reached Constantinople in Nov. 1096, in a species of honourable captivity, and had done Alexius homage; Robert of Normandy and Stephen of Blois, to whom Urban II. had given St. Peter's banner at Lucca, only arrived—the last of the crusaders—in May 1097 (their original companion in arms, Count Robert of Flanders, having left them to winter at Bari, and crossed to Constantinople before the end of 1096).

The Rival Princes.—Thus was gathered at Constantinople, in the spring of 1097, a great host, which Fulcher computes at 600,000 men (I. c. iv.), Urban II. at 300,000, and which was probably some 150,000 strong[1]. Before we follow this host into Asia, we may pause to enquire into the various factors which would determine its course, or condition its activity. On the Western side, and among the crusaders themselves, there were two factors of importance, already mentioned above—the aims of the adventurer prince, and the interests of the Italian merchant; while on the Eastern side there are again two—the policy of the Greeks, and the condition of the Mohammedan East. We have already seen that among the princes who joined the first crusade there were some who were rather *politiques* than *dévots,* and who aimed at the acquisition of temporal profit as well as of spiritual merit. Of these the type—and, it may almost be said, the inspirer of the rest—was Bohemund. From the first he had an Eastern principality in his mind's eye; and if we may judge from the follower of Bohemund who wrote the *Gesta Francorum,* there had already been some talk at Constantinople of Antioch as the seat of this principality. Bohemund's policy seems to have inspired Baldwin, the brother of Godfrey of Bouillon to emulation; on the one hand he strove to thwart the endeavours of Tancred, the nephew of Bohemund, to begin the foundation of the Eastern principality for his uncle by conquering Cilicia, and, on the other, he founded a principality for himself in Edessa. Raymund of Provence, the third and last of the great *politiques* of the first crusade, was, like Baldwin, envious of Bohemund; and jealousy drove him first to attempt to wrest Antioch from Bohemund, and then to found a principality of Tripoli to the south of Antioch, which would check the growth of his power. The political motives of these three princes, and the interaction of their different policies, were thus a great factor in determining the course and the results of the first crusade. The influence of the Italian towns did not make itself greatly felt till after the end of the first crusade, when it made possible the foundation of a kingdom in Jerusalem, in addition to the three principalities established by Bohemund, Baldwin and Raymund; but during the course of the crusade itself the Italian ships which hugged the shores of Syria were able to supply the crusaders with provisions and munitions of war, and to render help in the sieges of Antioch and Jerusalem[2]. Sea-power had thus some influence in determining the victory of the crusaders.

The Eastern Empire.—In the East the conditions were mainly

[1]The *Chanson de Roland,* which cannot be posterior to the first crusade—for the poem never alludes to it—already contains the idea of the holy war against Islam. The idea of the crusade had thus already ripened in French poetry, before Urban preached his sermon.

[2]Later legend ascribed the origin of the first crusade to his preaching, and the legend has been followed by modern historians; but in point of fact Peter is a figure of secondary importance. (*See* F. Duncalf, "The Peasants' Crusade," in the *American Historical Review* for 1921, pp. 440–53.)

[1]Godfrey's army numbered some 30,000 infantry and 10,000 cavalry (Röhricht, *Erst. Kreuzz.* 61); Urban II. reckons Bohemund's knights as 7,000 in number (*ibid.* 71, n. 7).

[2]The Genoese had been invited by Urban II. in Sept. 1096 "to go with their gallies to Eastern parts in order to set free the path to the Lord's Sepulchre."

favourable. The one difficulty—and it was serious—was the attitude adopted by Alexius. Confronted by crusaders where he had asked for auxiliaries, Alexius had two alternative policies presented to his choice. He might, in the first place, have frankly admitted that the crusaders were independent allies, and treating them as equals, he might have waged war in concert with them, and divided the conquests achieved in the war. A boundary line might have been drawn somewhere to the north-west of Antioch; and the crusaders might have been left to acquire what they could to the south and east of that line. Unhappily, clinging to the conviction that all the lands which the crusaders would traverse were the "lost provinces" of his empire, he induced the crusaders to do him homage, so that, whatever they conquered, they would conquer in his name, and whatever they held, they would hold by his grant and as his vassals. Thus Hugh of Vermandois became the man of Alexius in Nov. 1096; Godfrey of Bouillon was induced, not without difficulty, to do homage in Jan. 1097; and in April and May the other leaders, including Bohemund and the obstinate Raymund himself, followed his example. The policy of Alexius was destined to produce evil results, both for the Eastern empire and for the crusading movement. The West had already its grievances against the East: the Greek emperors had taken advantage of their protectorate of the Holy Places to lay charges on the pilgrims, against which the papacy had already been forced to remonstrate; nor were the Italian towns, with the exception of favoured Venice, disposed to be friendly to the great monopolist city of Constantinople. The old dissension of the Eastern and Western Churches had blazed out afresh in 1054; and the policy of Alexius only added new rancours to an old grudge, which culminated in the Latin conquest of Constantinople in 1204. On the other hand, the success of the crusading movement was imperilled, both now and afterwards, by the jealousy of the Comneni. Always hostile to the principality, which Bohemund established in spite of his oath, they helped by their hostility to cause the loss of Edessa in 1144, and they hastened the disintegration of the Latin kingdom of Jerusalem. Yet one must remember, in justice to Alexius, the gravity of the problem by which he was confronted; nor was the conduct of the crusaders themselves such that he could readily make them his brethren in arms.

Mohammedan Dissensions.—The condition of Asia Minor and Syria in 1097 was in many respects calculated to favour the success of the crusaders. The Seljuk sultans had only achieved a military occupation of the country which they had conquered. There were Seljuk garrisons in towns like Nicaea and Antioch, ready to offer an obstinate resistance to the crusaders; and here and there in the country there were Seljuk armies, either cantoned or nomadic. But the inhabitants of the towns were often hostile to the garrisons, and over wide tracts of country there were no forces at all. Accordingly, when the crusaders had captured the town of Nicaea, and defeated the Seljuk field-army at Dorylaeum their way lay clear before them through Asia Minor. Not only so, but they could count, at the very least, on a benevolent neutrality from the native population; while from the Armenian principalities in the south-east of Asia Minor, which survived unsubdued in the general deluge of Seljuk conquest, they could expect active assistance (the hope of which will explain the north-easterly line of march which they followed after leaving Heraclea). But the purely military character of the Seljuk occupation helped the crusaders in yet another way. Strong generals were needed in the separate divisions of the empire, and these, as has always been the case in Eastern empires, made themselves independent in their spheres of command, because there was no organization to keep them together under a single control. On the death of Malik Shah, the last of the great Seljuk emperors (1092), the empire dissolved. A new sultan, Barkiyāroq or Barkiarok, ruled in Baghdad (1094–1104); but in Asia Minor Kilij Arslan held sway as the independent sultan of Konia (Iconium), while the whole of Syria was also practically independent. Not only was Syria thus weakened by being detached from the body of the Seljuk empire; it was divided by dissensions within, and assailed by the Fatimite caliph of Egypt from without. In 1095 two brothers, Ridwan and Dekak, ruled in Aleppo and Damascus respectively; but they were at war with one another, and Yagi-sian, the ruler of Antioch, was a party to their dissensions. Ridwan and Yagi-sian were only stopped in an attack on Damascus by news of the approach of the crusaders, which led the latter to throw himself hastily into Antioch, in the autumn of 1097. Meanwhile the Fatimites were not slow to take advantage of these dissensions. A great religious difference divided the Fatimite caliph of Cairo, the head of the Shiite sect, from the Abbasid caliph of Baghdad, who was the head of the Sunnites. The difference may be compared to the dissension between the Greek and the Latin Churches; but it had perhaps more of the nature of a political difference. In any case, it hampered the Mohammedans as much as the jealousy between Alexius and the Latins hampered the progress of the crusade. The crusading princes were well enough aware of the gulf which divided the caliph of Cairo from the Sunnite princes of Syria; and they sought by envoys to put themselves into connection with him, hoping by his aid to gain Jerusalem (which was then ruled for the Turks by Sokman, the son of the amir Ortok)[1]. But the caliph preferred to act for himself, and took advantage of the wars of the Syrian princes, and of the terror inspired by the advance of the crusaders to conquer Jerusalem (Aug. 1098). But though the leaders of the first crusade thus failed to utilize the dissensions of the Mohammedans as fully as they desired, it still remains true that these dissensions very largely explain their success. It was the disunion of the Syrian amirs, and the division between the Abbasids and the Fatimites, that made possible the conquest of the Holy City and the foundation of the kingdom of Jerusalem. When a power arose in Mosul, about 1130, which was able to unify Syria—when, again, in the hands of Saladin, unified Syria was in turn united to Egypt—the cause of Latin Christianity in the East was doomed.

Siege of Antioch.—We are now in a position to follow the history of the first crusade. By the beginning of May 1097 the crusaders were crossing the Bosporus, and entering the dominions of Kilij Arslan. Their first operation was the siege of Nicaea, defended by a Seljuk garrison, but eventually captured, with the aid of Alexius, after a month's siege (June 18). Alexius took possession of the town; and though he rewarded the crusading princes richly, some discontent was excited by his action. After the capture of Nicaea, the field-army of Kilij Arslan had to be met. In a long and obstinate encounter, it was defeated at Dorylaeum (July 1); and the crusaders marched unmolested in a south-easterly direction to Heraclea. Here Tancred, followed by Baldwin, turned into Cilicia, and began to take possession of the Cilician towns, and especially of Tarsus—thus beginning, it would seem, the creation of the Norman principality of Antioch. The main army turned to the north-east, in the direction of Caesarea (in order to bring itself into touch with the Armenian princes of this district), and then marched southward again to Antioch. At Marash, half way between Caesarea and Antioch, Baldwin, who had meanwhile wrested Tarsus from Tancred, rejoined the ranks; but he soon left the main body again, and struck eastward towards Edessa, to found a principality there. At the end of October the crusaders came into position before Antioch, which was held by Yagi-sian, and began the siege of the city, which lasted from Oct. 21, 1097 to June 3, 1098. The great figure in the siege was naturally Bohemund (who had also been the hero of Dorylaeum). He repelled attempts at relief made by Dekak (Dec. 31, 1097) and Ridwan (Feb. 9, 1098); he put the besiegers in touch with the Genoese ships lying in the harbour of St. Simeon, the port of Antioch (March 1098)—a move which at once served to remedy the want of provisions from which the crusaders suffered, and secured materials for the building of castles, with which Bohemund sought—in the Norman fashion—to overawe the besieged city. But it was finally by the

[1]Thus already on the first crusade the path of negotiation is attempted simultaneously with the holy war. On the third crusade and above all on the sixth, this path was still more seriously attempted. It is interesting, too, to notice the part which the laity already plays in directing the course of the crusade. From the first the crusade, however clerical in its conception, was largely secular in its conduct; and thus, somewhat paradoxically, a religious enterprise aided the growth of the secular motive and contributed to the escape of the laity from that tendency towards a papal theocracy, which was evident in the pontificate of Gregory VII.

treachery of one of Yagi-sian's commanders, the amir Firuz, that Bohemund was able to effect its capture. The other leaders had, however, to promise him possession of the city, before he would bring his negotiations with Firuz to a conclusion; and the matter was so long protracted that an army of relief under Kerbogha of Mosul was only at a distance of three days' march, when the city was taken (June 3, 1098). The besiegers were no sooner in the city, than they were besieged in their turn by Kerbogha; and the 25 days which followed were the worst period of stress and strain which the crusaders had to encounter. Under the pressure of this strain "spiritualistic" phenomena began to appear. It was in the ranks of the Provençals, where the religiosity of Count Raymund seems to have extended to his followers, that these phenomena appeared; and they culminated in the supposed discovery of the Holy Lance, which had pierced the side of the Saviour. The excitement communicated itself to the whole army; and the nervous strength which it gave enabled the crusaders to meet and defeat Kerbogha in the open (June 28), but not before many of their number, including even Count Stephen of Blois, had deserted and fled.

Capture of Jerusalem.—With the discovery of the Lance, which became as it were a Provençal asset, Count Raymund assumes a new importance. Mingled with the religiosity of his nature there was much obstinacy and self-seeking; and when Kerbogha was finally repelled, he began to dispute the possession of Antioch with Bohemund, pleading in excuse his oath to Alexius. The struggle lasted for some months, and helped to delay the further progress of the crusaders. Raymund, indeed, left Antioch in November, and moved south-east to Marra; but his men still held to positions in Antioch, from which they were not dislodged by Bohemund till Jan. 1099. Expelled from Antioch, the obstinate Raymund endeavoured to recompense himself in the south (where indeed he subsequently created the county of Tripoli); and from Feb. to May 1099 he occupied himself with the siege of Arca, to the north-east of Tripoli. It was during the siege of Arca that Peter Bartholomew, to whom the vision of the Holy Lance had first appeared, was subjected, with no definite result, to the ordeal of fire—the hard-headed Normans doubting the genuine character of any Provençal vision, the more when, as in this case, it turned to the political advantage of the Provençals. The siege was long protracted; the mass of the pilgrims were anxious to proceed to Jerusalem, and, as the altered tone of the author of the *Gesta* sufficiently indicates, thoroughly weary of the obstinate political bickerings of Raymund and Bohemund. Here Godfrey of Bouillon finally came to the front, and placing himself at the head of the discontented pilgrims, he forced Raymund to accept the offers of the amir of Tripoli, to desist from the siege, and to march to Jerusalem (in the middle of May 1099). Bohemund remained in Antioch: the other leaders pressed forward, and following the coast route, arrived before Jerusalem in the beginning of June. After a little more than a month's siege, the city was finally captured (July 15). The slaughter was terrible; the blood of the conquered ran down the streets, until men splashed in blood as they rode. At nightfall, "sobbing for excess of joy," the crusaders came to the church of the Sepulchre from their treading of the winepress, and put their blood-stained hands together in prayer. So, on that day of July, the first crusade came to an end.

It remained to determine the future government of Jerusalem; and here the eternal problem of the relations of Church and State emerged. It might seem natural that the Holy City, conquered in a holy war by an army of which the pope had made a churchman, Bishop Adhemar, the leader, should be left to the government of the Church. But Adhemar had died in Aug. 1098 (whence, in large part, the confusion and bickerings which followed at the end of 1098 and the beginning of 1099); nor were there any churchmen left of sufficient dignity or weight to secure the triumph of the ecclesiastical cause. In the meeting of the crusaders on July 22, some few voices were raised in support of the view that a "spiritual vicar" should first be chosen in the place of the late patriarch of Jerusalem (who had just died in Cyprus), before the election of any lay ruler was taken in hand. But the voices were not heard; and the princes proceeded at once to elect a lay ruler. Raymund of Provence refused to accept their nomination, nominally on the pious ground that he did not wish to reign where Christ had suffered on the cross; though one may suspect that the establishment of a principality in Tripoli—in which he had been interrupted by the pressure of the pilgrims—was still the first object of his ambition. The refusal of Raymund meant the choice of Godfrey of Bouillon, who had, as we have seen, become prominent since the siege of Arca; and Godfrey accordingly became—not king, but "advocate of the Holy Sepulchre." A few days afterwards Arnulf, the chaplain of Robert of Normandy, and one of the sceptics in the matter of the Holy Lance, became "vicar" of the vacant patriarchate. Godfrey's first business was to repel an Egyptian attack, which he accomplished successfully at Ascalon, with the aid of the other crusaders (Aug. 12). At the end of August the other crusaders returned, and Godfrey was left with a small army of 2,000 men, and the support of Tancred, now prince of Galilee, to rule in some four isolated districts—Jaffa, Jerusalem, Ramlah and Haifa. At the end of the year came Bohemund and Godfrey's brother Baldwin (now count of Edessa) on a pilgrimage to Jerusalem. The result of Bohemund's visit was new trouble for Godfrey. Bohemund procured the election of Dagobert, the archbishop of Pisa, to the vacant patriarchate, disliking Arnulf, and perhaps hoping to find in the new patriarch a political supporter. Bohemund and Godfrey together became Dagobert's vassals; and in the spring Godfrey even seems to have entered into an agreement with the patriarch to cede Jerusalem and Jaffa into his hands, in the event of acquiring other lands or towns, especially Cairo, or dying without direct heirs. When Godfrey died in July 1100 (after successful forays against the Mohammedans which took him as far as Damascus), it might seem as if a theocracy were after all to be established in Jerusalem, in spite of the events of 1099.

THE LATIN KINGDOM OF JERUSALEM

The First Three Kings (1100–1143).—The theocracy, however, was not destined to be established. Godfrey had died without direct heirs. Dagobert had at first consented to the dying Godfrey's wish that his brother, Baldwin, in far Edessa, should be his successor; but when Godfrey died he saw an opportunity too precious to be missed, and opposed Baldwin, counting on the support of Bohemund, to whom he sent an appeal for assistance[1]. But a party in Jerusalem, headed by the late "vicar" Arnulf, opposed itself to the hierarchical pretensions of Dagobert and the Norman influence by which they were backed; and this party, representing the Lotharingian laity, carried the day. Baldwin was summoned from Edessa; and when he arrived, towards the end of the year, he was crowned king by Dagobert himself. Thus was founded, on Christmas day 1100, the Latin kingdom of Jerusalem; and thus was the possibility of a theocracy finally annihilated. A feudal kingdom of Frankish seigneurs was to be planted on the soil of Palestine, instead of a *dominium temporale* of the patriarch like that of the pope in central Italy. Nor were there great difficulties with the Church to hamper the growth of this kingdom. For two years, indeed, a struggle raged between Baldwin I. and Dagobert: Baldwin accused the patriarch of treachery, and attempted to force him to contribute to the defence of the kingdom. But in 1102 the struggle ceased with the deposition of the patriarch and the victory of the king. The contention was renewed for a time by the patriarch Stephen in the reign of Baldwin II. The new struggle was of short duration (1128–30) and was soon ended by Stephen's death.

The establishment of a kingdom in Jerusalem in 1100 was a blow, not only to the Church but to the Normans of Antioch. At the end of 1099 any contemporary observer must have believed that the capital of Latin Christianity in the East was destined to be Antioch. Antioch lay in one of the most fertile regions of the East; Bohemund was almost, if not quite, the greatest genius of his generation; and when he visited Jerusalem at the end of 1099, he led an army of 25,000 men—and those men, at any rate in

[1]The genuineness of the letter (on which, by the way, depends the story of Godfrey's agreement with Dagobert) has been impeached by Prutz and Kugler, and doubted by Röhricht. It is accepted by von Sybel and Hagenmeyer.

large part, Normans. What could Godfrey avail against such a force? Yet the principality of Godfrey was destined to higher things than that of Bohemund. Jerusalem, like Rome, had the shadow of a mighty name to lend prestige to its ruler; and as residence in Rome was one great reason of the strength of the mediaeval papacy, so was residence in Jerusalem a reason for the ultimate supremacy of the Lotharingian kings. Jerusalem attracted the flow of pilgrims from the West as Antioch never could; and though the great majority of the pilgrims were only birds of passage, there were always many who stayed in the East. There was thus a steady immigration into the kingdom, to strengthen its armies and recruit with new blood the vigour of its inhabitants. Still more important, perhaps, was the fact that the ports of the kingdom attracted the Italian towns; and it was therefore to the kingdom that they lent the strength of their armies and the skill of their siege-artillery—in return, it is true, for concessions of privileges so considerable as to weaken the resources of the kingdom they helped to create. While Jerusalem possessed these advantages, Antioch was not without its defects. It had to meet—or perhaps it would be more true to say, it brought upon itself—the hostility of strong Mohammedan powers in the vicinity. As early as 1100 Bohemund was captured in battle by Danishmend of Sivas; and it was his captivity, depriving the patriarch as it did of Norman assistance, which allowed the uncontested accession of Baldwin I. Again, in 1104, the Normans, while attempting to capture Harran, were badly defeated on the river Balikh, near Rakka; and this defeat may be said to have been fatal to the chance of a great Norman principality[1]. But the hostility of Alexius, aided and abetted by the jealousy of Raymund of Toulouse, was almost equally fatal. Alexius claimed Antioch; was it not the old possession of his empire, and had not Bohemund done him homage? Raymund was ready to defend the claims of Alexius; was not Bohemund a successful rival? Thus it came about that Alexius and Raymund became allies; and by the aid of Alexius Raymund established, from 1102 onwards, the principality which, with the capture of Tripoli in 1109, became the principality of Tripoli, and barred the advance of Antioch to the south. Meanwhile the armies of Alexius not only prevented any further advance to the northwest, but conquered the Cilician towns (1104). No wonder that Bohemund flung himself in revenge on the Eastern empire in 1108 —only, however, to meet with a humiliating defeat at Durazzo.

Expansion of the Kingdom.—Thus it was that Baldwin waxed while Bohemund waned. The growth of Baldwin's kingdom, as it was suggested above, owed more to the interests of Italian traders than it did to crusading zeal. In 1100, indeed, it might appear that a new crusade from the West, which the capture of Antioch in 1098 had begun, and the conquest of Jerusalem in 1099 had finally set in motion, was destined to achieve great things for the nascent kingdom. Thousands had joined this new crusade, which should deal the final blow to Mohammedanism: among the rest came the first of the troubadours, William IX., count of Poitiers, to gather copy for his muse, and even some, like Stephen of Blois and Hugh of Vermandois, who had joined the first crusade, but had failed to reach Jerusalem. The new crusaders cherished high plans; they would free Bohemund and capture Baghdad. But each of the three sections of their army was routed in turn in Asia Minor by the princes of Sivas, Aleppo and Harran, in the middle of 1101; and only a few escaped to report the crushing disaster. Edward I. had thus no assistance to expect from the West, save that of the Italian towns. From an early date Italian ships had followed the

[1]Yet the north always continued to be more populous than the south; and the Latins maintained themselves in Antioch and Tripoli a century after the loss of Jerusalem. The land was richer in the north: it was protected by its connection with Cyprus and Armenia: it was more remote from Egypt—the basis of Mohammedan power from the reign of Saladin onwards.

crusaders. There were Genoese ships in St. Simeon's harbour in the spring of 1098 and at Jaffa in 1099; in 1099 Dagobert, the archbishop of Pisa, led a fleet from his city to the Holy Land; and in 1100 there came to Jaffa a Venetian fleet of 200 sail, whose leaders promised Venetian assistance in return for freedom from tolls and a third of each town they helped to conquer. But it was the Genoese who helped Baldwin I. most. The Venetians already enjoyed, since 1080, a favoured position in Constantinople, and had the less reason to find a new emporium in the East; while Pisa connected itself, through Dagobert, with Antioch[1], rather than with Jerusalem, and was further, in 1111, invested by Alexius with privileges, which made an outlet in the Holy Land no longer necessary. But the Genoese, who had helped with provisions and siege-tackle in the capture of Antioch and of Jerusalem, had both a stronger claim on the crusaders, and a greater interest in acquiring an eastern emporium. An alliance was accordingly struck in 1101 (Fulcher II. c. vii.), by which the Genoese promised their assistance, in return for a third of all booty, a quarter in each town captured, and a grant of freedom from tolls. In this way Baldwin I. was able to take Arsuf and Caesarea in 1101 and Acre in 1104. But Genoese aid was given to others beside Baldwin (it enabled Raymund to capture Byblus in 1104, and his successor, William, to win Tripoli in 1109); while, on the other hand, Baldwin enjoyed other aid besides that of the Genoese. In 1110, for example, he was enabled to capture Sidon by the aid of Sigurd of Norway, the Jorsalafari, who came to the Holy Land with a fleet of 55 ships, starting in 1107, and in a three years' "wandering," after the old Norse fashion, fighting the Moors in Spain, and fraternizing with the Normans in Sicily. At a later date, in the reign of Baldwin II., Venice also gave her aid to the kings of Jerusalem. Irritated by the concessions made by Alexius to the Pisans in 1111, and furious at the revocation of her own privileges by John Comnenus in 1118, the republic naturally sought a new outlet in the Holy Land. A Venetian fleet of 120 sail came in 1123, and after aiding in the repulse of an attack, which the Egyptians had taken advantage of Baldwin II.'s captivity to deliver, they helped the regent Eustace to capture Tyre (1124), in return for considerable privileges—freedom from tolls throughout the kingdom, a quarter in Jerusalem, baths and ovens in Acre, and in Tyre one-third of the city and its suburbs, with their own court of justice and their own church. After thus gaining a new footing in Tyre, the Venetians could afford to attack the islands of the Aegean as they returned, in revenge for the loss of their privileges in Constantinople; but the hostility between Venice and the Eastern empire was soon afterwards appeased, when John Comnenus restored the old privileges of the Venetians. The Venetians, however, maintained their position in Palestine; and their quarters remained, along with those of the Genoese, as privileged commercial franchises in an otherwise feudal State.

In this way the kingdom of Jerusalem expanded until it came to embrace a territory stretching along the coast from Beirut (captured in 1110[2]) to el-Arish on the confines of Egypt—a territory whose strength lay not in Judaea, like the ancient kingdom of David, but, somewhat paradoxically (though commercial motives explain the paradox), in Phoenicia and the land of the Philistines. With all its length, the territory had but little breadth: towards the north it was bounded by the amirate of Damascus; in the centre, it spread little, if at all, beyond the Jordan; and it was only in the south that it had any real extension. Here there were two considerable annexes. To the south of the Dead sea stretched a tongue of land, reaching to Aila, at the head of the eastern arm of the Red sea. This had been won by Baldwin I., by way of revenge for the attacks of the Egyptians on his kingdom; and here, as early as 1116, he had built the fort of Monreal, half way be-

[1]Pisa naturally connected itself with Antioch, because Antioch was hostile to Constantinople, and Pisa cherished the same hostility, since Alexius I. had in 1080 given preferential treatment to Venice, the enemy of Pisa.

[2]This is the year in which the kingdom may be regarded as definitely founded. The period of conquest practically ends at this date, though isolated gains were afterwards made. The year 1110 is additionally important by reason of the accession of Maudud al Mosul, which marks the beginning of a Muslim reaction.

tween Aila and the Dead sea. To the east of the Dead sea, again, lay a second strip of territory, in which the great fortress was Krak (Kerak) of the Desert, planted somewhere about 1140 by the royal butler, Paganus, in the reign of Fulk of Jerusalem. These extensions in the south and east had also, it is easy to see, a commercial motive. They gave the kingdom a connection of its own with the Red sea and its shipping; and they enabled the Franks to control the routes of the caravans, especially the route from Damascus to Egypt and the Red sea. Thus, it would appear, the whole of the expansion of the Latin kingdom (which may be said to have attained its height in 1131, at the death of Baldwin II.) may be shown to have been dictated, at any rate in large part, by economic motives; and thus, too, it would seem that two of the most powerful motives which sway the mind of man—the religious motive and the desire for gain—conspired to elevate the kingdom of Jerusalem (at once the country of Christ, and a natural centre of trade) to a position of supremacy in Latin Syria. During this process of growth the kingdom stood in relation to two sets of powers—the three Frankish principalities in northern Syria, and the Mohammedan powers both of the Euphrates and the Nile—whose action affected its growth and character.

Of the three Frankish principalities, Edessa, founded in 1098 by Baldwin I. himself, was a natural fief of Jerusalem. Baldwin de Burg, the future Baldwin II., ruled in Edessa as the vassal of Baldwin I. from 1100 to 1118; and thereafter the county was held in succession by the two Joscelins of Tell-bashir until the conquest of Edessa by Zengi in 1144. Lying to the east of the Euphrates, at once in close contact with the Armenians, and in near proximity to the great route of trade which came up the Euphrates to Rakka, and thence diverged to Antioch and Damascus, the county of Edessa had an eventful if brief life. The county of Tripoli, the second of these principalities, had also come under the aegis of Jerusalem at an early date. Founded by Raymund of Toulouse, between 1102 and 1105, with the favour of Alexius and the alliance of the Genoese, it did not acquire its capital of Tripoli till 1109. Even before the conquest of Tripoli, there had been dissensions between William, the nephew and successor of Raymund, and Bertrand, Raymund's eldest son, which it had needed the interference of Baldwin I. to compose; and it was only by the aid of the king that the town of Tripoli had been taken. At an early date, therefore, the county of Tripoli had already come under the influence of the kingdom. Meanwhile the principality of Antioch, ruled by Tancred, after the departure of Bohemund (1104–12), and then by Roger his kinsman (1112–19), was, during the reign of Baldwin I., busily engaged in disputes both with its Christian neighbours at Edessa and Tripoli, and with the Mohammedan princes of Mardin and Mosul. On the death of Roger in 1119, the principality came under the regency of Baldwin II. of Jerusalem, until 1126, when Bohemund II. came of age. Bohemund had married a daughter of Baldwin; and on his death in 1130 Baldwin II. once more became the guardian of Antioch. From this time, therefore, Antioch may be regarded as a dependency of Jerusalem; and thus the end of Baldwin's reign (1131) may be said to mark the time when the Latin kingdom of Jerusalem stands complete, with its own boundaries stretching from Beirut in the north to el-Arish and Aila in the south, and with the three Frankish Powers of the north admitting its suzerainty.

Muslim Reaction.—The Latin power thus established and organized in Syria had to face in the north a number of Mohammedan amirs, in the south the caliph of Egypt. The disunion between the Mohammedans of northern Syria and the Fatimites of Egypt, and the political disintegration of the former, were both favourable to the success of the Franks; but they had nevertheless to maintain their ground vigorously both in the north and the south against almost incessant attacks. The hostility of the decadent caliphate of Cairo was the less dangerous; and though Baldwin I. had at the beginning of his reign to meet annual attacks from Egypt, by the end he had pushed his power to the Red sea, and in the very year of his death (1118) he had penetrated along the north coast of Egypt as far as Farama (Pelusium). The plan of conquering Egypt had indeed presented itself to the Franks from the first, as it continued to attract them to the end; and it is significant that Godfrey himself, in 1100, promised Jerusalem to the patriarch, "as soon as he should have conquered some other great city, and especially Cairo." But the real menace to the Latin kingdom lay in northern Syria; and here a power was eventually destined to rise, which outstripped the kings of Jerusalem in the race for Cairo, and then—with the northern and southern boundaries of Jerusalem in its control—was able to crush the kingdom as it were between the two jaws of a vice. Until 1127, however, the Mohammedans of northern Syria were disunited among themselves. The beginning of the 12th century was the age of the atabegs (regents or stadtholders). The atabegs formed a number of dynasties, which displaced the descendants of the Seljuk amirs in their various principalities. These dynasties were founded by emancipated mamelukes, who had held high office at court and in camp under powerful amirs, and who, on their death, first became stadtholders for their descendants, and then usurped the throne of their masters. There was an atabeg dynasty in Damascus founded by Tughtigin (1103–28): there was another to the north-east, that of the Ortokids, represented by Sokman, who established himself at Kaifa in Diarbekr about 1101, and by his brother Ilghazi, who received Mardin from Sokman about 1108, and added to it Aleppo in 1117[1]. But the greatest of the atabegs were those of Mosul on the Tigris—Maudud, who died in 1113; Aksunkur, his successor; and finally, greatest of all, the atabeg Zengi, who ruled in Mosul from 1127 onwards.

Before the accession of Zengi, there had been constant fighting, which had led, however, to no definite result between the various Mohammedan princes and the Franks of northern Syria. The constant pressure of Tancred of Antioch and Baldwin de Burg of Edessa led to a series of retaliations between 1110 and 1115; Edessa was attacked in 1110, 1111, 1112 and 1114; and in 1113 Maudud of Mosul, who may be regarded as the first to begin the *jihad,* or counter-crusade, had even penetrated as far as the vicinity of Acre and Jerusalem. But the dissensions of the Mohammedans made their attacks unavailing; in 1115, for instance, we find Antioch actually aided by Ilghazi and Tughtigin against Aksunkur of Mosul. Again, in the reign of Baldwin II., there was steady fighting in the north; Roger of Antioch was defeated by Ilghazi at Balat in 1119, and Baldwin II. himself was captured by Balak, the successor of Ilghazi, in 1123, but on the whole the Franks held the upper hand. Baldwin conquered part of the territory of Aleppo in 1121 and the following years, and extorted a tribute from Damascus (1126). But when Zengi established himself in Mosul in 1127, the tide gradually began to turn. He created for himself a great and united principality, comprising not only Mosul, but also Aleppo, Harran, Nisibin and other districts; and in 1130, Alice, the widow of Bohemund II., sought his alliance in order to maintain herself in power at Antioch. In the beginning of the reign of Fulk of Jerusalem (1131–43) the progress of Zengi was steady. He conquered in 1135 several fortresses in the east of the principality of Antioch, and in this year and the next pressed the count of Tripoli hard; while in 1137 he defeated Fulk at Barin, and forced the king to capitulate and surrender the town. If Fulk had been left alone to wage the struggle against Zengi, and if Zengi had enjoyed a clear field against the Franks, the fall of the kingdom of Jerusalem might have come far sooner than it did[2]. But there were two powers which aided Fulk, and impeded the progress of Zengi—the amirate of Damascus and the emperors of Constantinople. The position of Damascus is a position of crucial importance from 1130 to 1154. Lying between Mosul and

[1]Ilghazi died in 1122. His successor was Balak, who ruled from 1122 to 1124, and succeeded in capturing in 1123 Baldwin II. of Jerusalem. The union of Mardin and Aleppo under the sway of these two amirs, connecting as it did Mesopotamia with Syria, marks an important stage in the revival of Mohammedan power (Stevenson, *Crusades in the East,* p. 109).

[2]Stevenson, however, believes that Zengi was *not* animated by the idea of recovering Jerusalem. He thinks that his principal aim was simply the formation of a compact Mohammedan State, which was, indeed, in the issue destined to be the instrument of the *jihad,* but was not so intended by Zengi (*op. cit.* pp. 123–124).

Jerusalem, and important both strategically and from its position on the great route of commerce from the Euphrates to Egypt, Damascus became the arbiter of Syrian politics. During the greater part of the period between 1130 and 1154 the policy of Damascus was guided by the vizier Muin eddin Anar, who ruled on behalf of the descendants of the atabeg Tughtigin. He saw the importance of finding an ally against the ambition of Zengi, who had already attacked Damascus in 1130. The natural ally was Jerusalem. As early as 1133 the alliance of the two Powers had been concluded; and in 1140 the alliance was solemnly renewed between Fulk and the vizier. Henceforth this alliance was a dominant factor in politics. One of the great mistakes made by the Franks was the breach of the alliance in 1147—a breach which was widened by the attack directed against Damascus during the second crusade; and the conquest of Damascus by Nureddin in 1154 was ultimately fatal to the Latin kingdom, removing as it did the one possible ally of the Franks, and opening the way to Egypt for the atabegs of Mosul.

The Eastern Empire.—The alliance of the emperors of Constantinople was of far more dubious value. We have already seen that it was the theory of the Eastern emperors—a theory which logically followed from the homage of the crusaders to Alexius—that the conquests of the crusaders belonged to their empire, and were held by the crusading princes as fiefs. We have seen that the action of Bohemund at Antioch was the negation of this theory, and that Alexius in consequence helped Raymund to establish himself in Tripoli as a thorn in the side of Bohemund, and sent an army and a fleet which wrested from the Normans the towns of Cilicia (1104). The defeat of Bohemund at Durazzo in 1108 had resulted in a treaty, which made Antioch a fief of Alexius; but Tancred (who in 1107 had recovered Cilicia from the Greeks) refused to fulfil the terms of the treaty, and Alexius (who attempted—but in vain—to induce Baldwin I. to join an alliance against Tancred in 1112) was forced to leave Antioch independent. Thus, although Alexius had been able, in the wake of the crusading armies, to recover a large belt of land round the whole coast of Asia Minor—the interior remaining subject to the sultans of Konia (Iconium) and the princes of Sivas—he left the territories to the east of Cilicia in the hands of the Latins when he died in 1118. Not for 20 years after his death did the Eastern empire make any attempt to gain Cilicia or exact the homage of Antioch. But in 1137 John Comnenus appeared, instigated by the opportunity of dissensions in Antioch, and received its long-denied homage, as well as that of Tripoli; and in the following year he entered into hostilities with Zengi, without, however, achieving any considerable result. In 1142 he returned again, anxious to create a principality in Cilicia and Antioch for his younger son Manuel. The people of Antioch refused to submit; a projected visit to Jerusalem, during which John was to unite with Fulk in a great alliance against the Muslim, fell through; and in the spring of 1143 the emperor died in Cilicia, with nothing accomplished. On the whole, the interference of the Comneni, if it checked Zengi for the moment in 1138, may be said to have ultimately weakened and distracted the Franks, and to have helped to cause the loss of Edessa (1144), which marks the turning-point in the history of the kingdom of Jerusalem.

THE ORGANIZATION OF THE KINGDOM

Before we turn to describe the second crusade, which the loss of Edessa provoked, and to trace the fall of the kingdom, which the second crusade rather hastened than hindered, we may pause at this point to consider the organization of the Frankish colonies in Syria. The first question which arises is that of the relation of the kingdom of Jerusalem to the three counties or principalities of Antioch, Tripoli and Edessa, which acknowledged their dependence upon it. The degree of this dependence was always a matter of dispute. The rights of the king of Jerusalem chiefly appear when there is a vacancy or a minority in one of the principalities, or when there is dissension either inside one of the principalities or between two of the princes. On the death of one of the princes without heirs of full age, the kings of Jerusalem were entitled to act as regents, as Baldwin II. did twice at Antioch, in 1110 and 1130; but the kings regarded this right of regency as a burden rather than a privilege, and it is indeed characteristic of the relation of the king to the three princes, that it imposes upon him duties without any corresponding rights. It is his duty to act as regent; it is his duty to compose the dissensions in the principality of Antioch, and to repress the violences of the prince towards his patriarch (1154); it is his duty to reconcile Antioch with Edessa, when the two fall to fighting. The princes on their side acted independently: if they joined the king with their armies, it was as equals doing a favour; and they sometimes refused to join until they were coerced. They made their own treaties with the Mohammedans, or attacked them in spite of the king's treaties; they dated their documents by the year of their own reign, and they had each their separate laws or assizes. There was, in a word, co-ordination rather than subordination; nor did the kings ever attempt to embark on a policy of centralization.

The relation of the king to his own barons within his immediate kingdom of Jerusalem is not unlike the relation of the king to the three princes. In Norman England the king insisted on his rights; in Frankish Jerusalem the barons insisted on his duties. The circumstances of the foundation of the kingdom explain its characteristics. As the crusaders advanced to Jerusalem, says Raymund of Agiles (c. xxxiii.), it was their rule that the first-comer had the right to each castle or town, provided that he hoisted his standard and planted a garrison there. The feudal nobility was thus the first to establish itself, and the king only came after its institution—the reverse of Norman England, where the king first conquered the country, and then plotted it out among his nobles. The predominance of the nobility in this way became as characteristic of feudalism in the Latin kingdom of Jerusalem as the supremacy of the Crown was of contemporary feudalism in England; and that predominance expressed itself in the position and powers of the high court, in which the ultimate sovereignty resided. The kingdom of Jerusalem consisted of a society of peers, in which the king might be *primus*, but in which he was none the less subject to a punctilious law, regulating his position equally with that of every member of the society. In such a society the election of the head by the members may seem natural; and Godfrey and the first two Baldwins were elected in this way. But the conception of the equality of the king and his peers in the long run led to hereditary monarchy; for if the king held his kingdom as a fief, like other nobles, the laws of descent which applied to a fief applied to the kingdom, and those laws demanded heredity. Yet the high court, which decided all problems of descent, would naturally intervene if a problem of descent arose, as it frequently did, in the kingdom; and thus the barons had the right of deciding between different claimants, and also of formally "approving" each new successor to the throne. The conception of the kingdom as a fief not only subjected it to the jurisdiction of the high court; it involved the more disastrous result that the kingdom, like other fiefs, might be carried by an heiress to her husband; and the proximate causes of the collapse of the kingdom in 1187 may be found in this fact and the dissensions which it occasioned.

Thus conceived as the holder of a great fief, the king had only the rights of *suzerain* over the four great baronies and the 12 minor fiefs of his kingdom. He had not those rights of *sovereign* which the Norman kings of England inherited from their Anglo-Saxon predecessors, or the Capetian kings of France from the Carolings; nor was he able, therefore, to come into direct touch with each of his subjects, which William I., in virtue of his sovereign rights, was able to attain by the Salisbury oath of 1086. Amalric I. indeed, by his *assise sur la ligèce,* attempted to reach the vassals of his vassals; he admitted *arrière-vassaux* to the *haute cour,* and encouraged them to carry their cases to it in the first instance. But this is the only attempt at that policy of *immédiatisation* which in contemporary England was carried to far greater lengths; and even this attempt was unsuccessful. No real alliance was actually formed between the king and the mesne nobility against the immediate baronage. The body of the tenants-in-chief continued to limit the power of the Crown: their consent was necessary to legislation, and grants of fiefs could not be made without their permission. Nor was the Crown only limited in this way. The duties of the king towards his tenants are prominent in the assizes. The king's oath to his men binds him to respect and maintain their rights, which are as prominent as are his duties; and if the men feel that the royal oath has not been kept, they may lawfully refuse military service (*gager le roi*), and may even rise in authorized and legal rebellion. The system of military service and the organization of justice corresponded to the part which the monarchy was thus constrained to play. The vassal was bound to pay military service, not, as in western Europe, for a limited period of 40 days, but for the whole year—the Holy Land being, as it were, in a perpetual state of siege. On the other hand, the vassal was not bound to render service, unless he were paid for his service; and it was only famine, or Saracen devastation, which freed the king from the obligation of paying his men. The king was also bound to insure the horses of his men by a system called the *restor:* if a vassal lost his horse otherwise than by his own fault, it must be replaced by the Treasury (which was termed, as it also was in Norman Sicily, the *secretum*)[1]. But the king had another force in addition to the feudal levy—a force of *soudoyers,* holding fiefs, not of land, but of pay (*fiefs de soudée*)[2]. Along with these *soudoyers* went another branch of the army, the Turcopuli, a body of light cavalry, recruited from the Syrians and Mohammedans, and using the tactics of the Arabs; and an infantry was found among the Armenians, the best soldiers of the East, and the Maronites, who furnished the kingdom with archers. To all these various forces must be added the knights and native levies of the great orders, whose masters were practically independent sovereigns like the princes of Antioch and Tripoli; and with these the total levy of the kingdom may be reckoned at some 25,000 men. (For the history of the orders *see* the articles on the TEMPLARS; ST. JOHN OF JERUSALEM, KNIGHTS OF; KNIGHTHOOD AND CHIVALRY.) But the strength of the kingdom lay less, perhaps, in the army than in the magnificent fortresses which the nobility, and especially the two orders, had built; and the most visible relic of the crusades to-day is the towering ruins of a fortress like Krak (Kerak) des Chevaliers, the fortress of the Knights of St. John in the principality of Tripoli. These fortresses, garrisoned not by the king, as in Norman England, but by their possessors, could only strengthen the power of the feudatories, and help to dissipate the kingdom into a number of local units.

Judicial System.—In the organization of its system of justice the kingdom showed its most characteristic features. Two great central courts sat in Jerusalem to do justice—the high court of the nobles, and the court of burgesses for the rest of the Franks. (1) The high court was the supreme source of justice for the military class; and in its composition and procedure the same limitation of the Crown, which appears in regard to military service, is again evident. The high court is not a *curia regis,* but a *curia baronum,* in which the theory of *judicium parium* is fully realized. If the king presides in the court, the motive of its action is none the less the preservation of the rights of the nobles, and not, as in England, the extension of the rights of the Crown. It is a court of the king's peers: it tries cases of dispute between the king and his peers—with regard, for instance, to military service—and it settles the descent of the title of king. (2) The court of burgesses was almost equally sovereign within its sphere. While the body of the noblesse formed the high court, the court of the burgesses was composed of 12 legists (probably named by the king) under the presidency of the *vicomte*—a knight named by the king, who was a great financial as well as a judicial officer. The province of the court included all acts and contracts between burgesses, and extended to criminal cases in which burgesses were involved. Like the high court, the court of burgesses also had its assizes—a body of unwritten legal custom[1].

[1]There are certain connections and analogies between the kingdom of Sicily and that of Jerusalem during the 12th century. In either case there is an importation of Western feudalism into a country originally possessed of Byzantine institutions, but affected by an Arabic occupation. The subject deserves investigation.

[2]The holders of fiefs both held fiefs of land and received pay; the paid force received pay only. An instance of the latter is furnished by John of Margat, a vassal of the seignory of Arsuf. He has 200 bezants along with a quantity of wheat, barley, lentils and oil; and in return he must march with four horses (Rey, *Les Colonies franques en Syrie* p. 24).

The independent position of the burgesses, who assumed a position of equality by the side of the feudal class, is one of the peculiarities of the kingdom of Jerusalem. It may be explained by reference to the peculiar conditions of the kingdom. Burgesses and nobles, however different in status, were both of the same Frankish stock, and both occupied the same superior position with regard to the native Syrians. The commercial motive, again, had been one of the great motives of the crusade; and the class which was impelled by that motive would be both large and, in view of the quality of the Eastern goods in which it dealt, exceptionally

[1]As was noticed above, there were apparently separate assizes for the three principalities, in addition to the assizes of the kingdom. The assizes of Antioch have been discovered and published. The assizes of the kingdom itself are twofold—the assizes of the high court and the assizes of the court of burgesses. (1) The assizes of the high court are preserved for us in works by legists—John of Ibelin, Philip of Novara and Geoffrey of Tort—composed in the 13th century. We possess, in other words, *law-books* (like Bracton's treatise *De legibus*), but not *laws*—and law-books made after the loss of the kingdom to which the laws belonged. There are two vexed questions with regard to these law-books. (*a*) The first concerns the origin and character of the laws which the law-books profess to expound. According to the story of the legists who wrote these books—*e.g.,* John of Ibelin—the laws of the kingdom were laid down by Godfrey, who is thus regarded as the great νομοθέτης of the kingdom. These laws (progressively modified, it is admitted) were kept in Jerusalem, under the name of "Letters of the Sepulchre," until 1187. In that year they were lost; and the legists tell us that they are attempting to reconstruct *par oir dire* the gist of the lost archetype. The story of the legists is now generally rejected. Godfrey never legislated: the customs of the kingdom gradually grew, and were gradually defined, especially under kings like Baldwin III. and Amalric I. If there was thus only a customary and unwritten law (and William of Tyre definitely speaks of a *jus consuetudinarium* under Baldwin III., *quo regnum regebatur*), then the "Letters of the Sepulchre" are a myth—or rather, if they ever existed, they existed not as a code of written law, but, perhaps, as a register of fiefs, like the Sicilian *Defetarii.* Thus the story of the legists shrinks down to the regular myth of the primitive legislator, used to give an air of respectability to law-books, which really record an unwritten custom. The fact is that until the 13th century the Franks lived *consuetudinibus antiquis et jure non scripto.* They preferred an unwritten law, as Prutz suggests, partly because it suited the barristers (who often belonged to the baronage, for the Frankish nobles were "great pleaders in court and out of court"), and partly because the high court was left unbound so long as there was no written code. In the 13th century it became necessary for the legists to codify, as it were, the unwritten law, because the upheavals of the times necessitated the fixing of some rules in writing, and especially because it was necessary to oppose a definite custom of the kingdom to Frederick II., who sought, as king of Jerusalem, to take advantage of the want of a written law, to substitute his own conceptions of law in the teeth of the high court. (*b*) The second difficulty concerns the text of the law-books themselves. The text of Ibelin became a *textus receptus*—but it also became overlaid by glosses, for it was used as authoritative in the kingdom of Cyprus after the loss of the kingdom of Jerusalem, and it needed expounding. Recensions and revisions were twice made, in 1368 and 1531; but how far the true Ibelin was recovered, and what additions or alterations were made at these two dates, we cannot tell. We can only say that we have the text of Ibelin which was used in Cyprus in the later middle ages. At the same time, if our text is thus late, it must be remembered that its content gives us the earliest and purest exposition of French feudalism, and describes for us the organization of a kingdom where all rights and duties were connected with the fief, and the monarch was only a suzerain of feudatories. (2) The assizes of the court of burgesses became the basis of a treatise at an earlier date than the assizes of the high court. The date of the redaction (which was probably made by some learned burgess) may well have been the reign of Baldwin III., as Kugler suggests: he was the first native king, and a king learned in the law; but Beugnot would refer the assizes to the years immediately preceding Saladin's capture of Jerusalem. These assizes do not, of course, appear in Ibelin, who was only concerned with the feudal law of the high court. They were used, like the assizes of the high court, in Cyprus; and, like the other assizes, they were made the subject of investigation in 1531, with the object of discovering a good text. The law which is expounded in these assizes is a mixture of Frankish law with the Graeco-Roman law of the Eastern empire which prevailed among the native population of Syria.

In regard to both assizes, it is most important to bear in mind that we possess not laws, but law-books or custumals—records made by lawyers for their fellows of what they conceived to be the law, and supported by legal arguments and citations of cases. But, as Prutz remarks, Phillip of Novara *lehrt nicht die Wissenschaft des Rechts, sondern die des Unrechts:* he does not explain the law so much as the ways of getting round it.

prosperous. Finally, when one remembers how, during the first crusade, the *pedites* had marched side by side with the *principes*, and how, from the beginning of 1099, they had practically risen in revolt against the selfish ambitions of princes like Count Raymund, it becomes easy to understand the independent position which the burgesses assumed in the organization of the kingdom. Burgesses could buy and possess property in towns, which knights were forbidden to acquire; and though they could not intermarry with the feudal classes, it was easy and regular for a burgess to thrive to knighthood. Like the nobles, again, the burgesses had the right of confirming royal grants and of taking part in legislation; and they may be said to have formed—socially, politically and judicially—an independent and powerful estate. Yet (with the exception of Antioch, Tripoli and Acre in the course of the 13th century) the Frankish towns never developed a communal government: the domain of their development was private law and commercial life.

Fiefs and Immunities.—Locally, the consideration of the system of justice administered in the kingdom involves some account of three things—the organization of the fiefs, the position of the Italian traders in their quarters and the privileges of the Church. Each fief was organized like the kingdom. In each there was a court for the noblesse, and a court (or courts) for the bourgeoisie. There were some 37 *cours de bourgeoisie* (several of the fiefs having more than one), each of which was under the presidency of a *vicomte*, while all were independent of the court of burgesses at Jerusalem. Of the feudal courts there were some 22. Each of these followed the procedure and the law of the high court; but each was independent of the high court, and formed a sovereign court without any appeal. On the other hand, the revolution wrought by Amalric I. in the status of the *arrière vassaux*, which made them members of the high court, allowed them to carry their cases to Jerusalem in the first instance, if they desired. Apart from this, the characteristic of seignorial justice is its independence and its freedom from the central court; though, when we reflect that the central court is a court of seigneurs, this characteristic is seen to be the logical result of the whole system. Midway between the seignorial *cours de bourgeoisie* and tne privileged jurisdictions of the Italian quarter, there were two kinds of courts of a commercial character—the *cours de la fonde* in towns where trade was busy, and the *cours de la chaîne* in the sea-ports. The former courts, under their bailiffs, gradually absorbed the separate courts which the Syrians had at first been permitted to enjoy under their own *reïs;* and the bailiff with his 6 assessors (4 Syrians and 2 Franks) thus came to judge all commercial cases in which Syrians were involved. The *cours de la chaîne*, whose institution is assigned to Amalric I. (1162–74), had a civil jurisdiction in admiralty cases, and, like the *cours de la fonde*, they were composed of a bailiff and his assessors. Distinct from all these courts, if similar in its sphere, was the court which the Italian quarter generally enjoyed in each town under its own consuls—a court privileged to try all but the graver cases, such as murder, theft and forgery. The court was part of the general immunity which made these quarters *imperia in imperio:* their exemptions from tolls and from financial contributions is parallel to their judicial privileges. Regulated by their mother-town, both in their trade and their government, these Italian quarters outlasted the collapse of the kingdom, and continued to exist under Mohammedan rulers. The Church had its separate courts, as in the West; but their province was perhaps greater than elsewhere. The Church courts could not indeed decide cases of perjury; but, on the other hand, they tried all matters in which clerical property was concerned, and all cases of dispute between husband and wife. In other spheres the immunities and exemptions of the Church offered a far more serious problem, and especially in the sphere of finance. Perhaps the supreme defect of the kingdom of Jerusalem was its want of any financial basis. It is true that the king had a revenue, collected by the vicomte and paid into the *secretum* or Treasury—a revenue composed of tolls on the caravans and customs from the ports, of the profits of monopolies and the proceeds of justice, of poll-taxes on Jews and Mohammedans, and of the tributes paid by Mohammedan powers. But his expenditure was large: he had to pay his feudatories; and he had to provide fiefs in money and kind to those who had not fiefs of land. The contributions sent to the Holy Land by the monarchs of western Europe, as commutations in lieu of personal participation in crusades, might help; the fatal policy of razzias against the neighbouring Mohammedan powers might procure temporary resources; but what was really necessary was a wide measure of native taxation such as was once, and once only, attempted in 1183. To any such measure the privileges of the Italian quarters, and still more those of the Church, were inimical. In spite of provisions somewhat parallel to those of the English statute of mortmain, the clergy continued to acquire fresh lands at the same time that they refused to contribute to the defence of the kingdom, and rigorously exacted the full quota of tithe from every source which they could tap, and even from booty captured in war. The richest proprietor in the Holy Land[1], but practically immune from any charges on its property, the Church helped, unconsciously, to ruin the kingdom which it should have supported above all others. It refused to throw its weight into the scale, and to strengthen the hands of the king against an over-mighty nobility. On the other hand, it must be admitted that the Church did not, after the first struggle between Dagobert and Baldwin I., actively oppose by any hierarchical pretensions the authority of the Crown. The assizes may speak of patriarch and king as conjoint seigneurs in Jerusalem; but as a matter of fact the king could secure the nomination of his own patriarch, and after Dagobert the patriarchs are, with the temporary exception of Stephen in 1128, the confidants and supporters of the kings. It was the two great orders of the Templars and the Hospitallers which were, in reality, most dangerous to the kingdom. Honeycombed as it was by immunities—of seigneurs, of Italian quarters, of the clergy—the kingdom was most seriously impaired by these overweening immunists, who, half-lay and half-clerical, took advantage of their ambiguous position to escape from the duties of either character. They built up great estates, especially in the principality of Tripoli; they quarrelled with one another, until their dissensions prevented any vigorous action; they struggled against the claims of the clergy to tithes and to rights of jurisdiction; they negotiated with the Mohammedans as separate Powers; they conducted themselves towards the kings as independent sovereigns. Yet their aid was as necessary as their influence was noxious. Continually recruited from the West, they retained the vigour which the native Franks of Palestine gradually lost; and their corporate strength gave a weight to their arms which made them indispensable, while their great wealth and vast estates made them at the same time an object of fear and envy.

Degeneration of the Franks.—In describing the organization of the kingdom, we have also been describing the causes of its fall. It fell because it had not the financial or political strength to survive. "Les vices du gouvernement avaient été plus puissants que les vertus des gouvernants." But the vices were not only vices of the Government: they were also vices, partly inevitable, partly moral, in the governing race itself. The climate was no doubt responsible for much. The Franks of northern Europe attempted to live a life that suited a northern climate under a southern sun. They rode incessantly to battle over burning sands, in full armour—chain mail, long shield and heavy casque—as if they were on their native French soil. The ruling population was already spread too thin for the work which it had to do; and exhausted by its efforts, it gradually became extinct. A constant immigration from the West, bringing new blood and recruiting the stock, could alone have maintained its vigour; and such immigration never came. Little driblets of men might indeed be added to the numbers of the Franks; but the mass of crusaders either perished in Asia Minor, as in 1101 and 1147, or found themselves thwarted and distrusted by the native Franks. It was indeed one of the misfortunes of the kingdom that its inhabitants could

[1]For instance, the abbey of Mount Sion had large possessions, not only in the Holy Land (at Ascalon, Jaffa, Acre, Tyre, Caesarea and Tarsus) but also in Sicily, Calabria, Lombardy, Spain and France (at Orleans, Bourges and Poitiers).

never welcome the reinforcements which came to their aid[1]. The barons suspected the crusaders of ulterior motives, and of designing to get new principalities for themselves. In any case the native Frank, accustomed to commercial intercourse and diplomatic negotiations with the Mohammedans, could hardly share the unreasoning passion to make a dash for the "infidel." As with the barons, so with the burgesses: they profited too much by their intercourse with the Mohammedans to abandon readily the way of peaceful commerce, and they were far more ready to hinder than to help any martial enterprise. Left to itself, the native population lost physical and moral vigour. The barons alternated between the extravagances of Western chivalry and the attractions of Eastern luxury: they returned from the field to divans with frescoed walls and floors of mosaic, Persian rugs and embroidered silk hangings. Their houses, at any rate those in the towns, had thus the characteristics of Moorish villas; and in them they lived a Moorish life. Their sideboards were covered with the copper and silver work of Eastern smiths and the confectioneries of Damascus. They dressed in flowing robes of silk, and their women wore oriental gauzes covered with sequins. Into these divans where figures of this kind moved to the music of Saracen instruments, there entered an inevitable voluptuousness and corruption of manners. The hardships of war and the excesses of peace shortened the lives of the men; the kingdom of Jerusalem had 11 kings within a century. While the men died, the women, living in comparative indolence, lived longer lives. They became regents to their young children; and the experience of all mediaeval minorities reiterates the lesson—woe to the land where the king is a child and the regent a woman. Still worse were the frequent remarriages of widowed princesses and heiresses. By the assizes of the high court, the widow, on the death of her husband, took half of the estate for herself, and half in guardianship for her children. *Liberae ire cum terra,* widows carried their estates or titles to three or four husbands; and as in 15th-century England, the influence of the heiress was fatal to the peace of the country. (*See* A. Herzog, *Die Frau auf den Fürstenthronen der Kreuzfahrstaaten,* 1919.) At Antioch, for instance, after the death of Bohemund II. in 1130, his widow Alice headed a party in favour of the marriage of the heiress Constance to Manuel of Constantinople, and did not scruple to enter into negotiations with Zengi of Mosul. Her policy failed; and Constance successively married Raymund of Antioch and Raynald of Chatillon. The result was the renewed enmity of the Greek empire, while the French adventurers who won the prize ruined the prospects of the Franks by their conduct. In the kingdom matters were almost worse. There was hardly any regular succession to the throne; and Jerusalem, as Stubbs writes, "suffered from the weakness of hereditary right and the jealousies of the elective system" at one and the same time. With the frequent remarriages of the heiresses of the kingdom, relationships grew confused and family quarrels frequent; and when Sibylla carried the crown to Guy de Lusignan, a newcomer disliked by all the relatives of the Crown, she sealed the fate of the kingdom.

FROM LAVISSE-PARMENTIER, "ALBUM HISTORIQUE," AFTER SCHLUMBERGER

FIG. 3.—SARACEN ARMY ON THE MARCH AGAINST THE CRUSADERS. REPRODUCED FROM AN ILLUMINATION ON A 13TH-CENTURY ARABIC MANUSCRIPT

[1]One must remember that these reinforcements would often consist of desperate characters. It was one of the misfortunes of Palestine that it served as a Botany Bay, to which the criminals of the West were transported for penance. The natives, already prone to the immorality which must infect a mixed population living under a hot sun, the immorality which still infects a place like Aden, were not improved by the addition of convicts.

It may be doubted—though it seems a harsh verdict to pass on a kingdom founded by religious zeal on holy soil—whether the kingdom possessed that moral basis which alone can give a right of survival to any institution or organization. The crusading States had been founded by adventurers who thirsted for gain; and the primitive appetite did not lose its edge with the progress of time. We cannot be certain, indeed, how far the Frankish lords oppressed their Syrian tenants: the stories of such oppression have been discredited; and if we may trust the evidence of a Mohammedan traveller, Ibn Jubair, the lot of the Mohammedans who lived on Frankish manors was better than it had been under their native lords[1]. But the habits of the Franks were none the less habits of lawless greed: they swooped down from their castles, as Raynald of Chatillon did from Krak of the Desert, to capture Saracens and hold them to ransom or to plunder caravans. The lust of unlawful gain had infected the Frankish blood, as it also infected England during the Hundred Years' War; and in either case Nemesis infallibly came. The Muslims might have endured a State of "infidels"; they could not endure a State of brigands.

THE SECOND CRUSADE

We speak of first, second and third crusades, but, more exactly, the crusades were one continuous process. Scarcely a year passed in which new bands did not come to the Holy Land. We have already noticed the great if disastrous crusade of 1100–01 and the Venetian crusade of 1123–24, and reference is made to the crusade of Henry the Lion in 1172 and that of Edward I. in 1271–72—all famous crusades which are not reckoned in the usual numbering. Crusades appear to have been dignified by numbers when they followed some crushing disaster—the loss of Edessa in 1144, or the fall of Jerusalem in 1187—and were led by kings and emperors; or when, like the fourth and fifth crusades, they achieved some conspicuous success or failure. But it is important to bear in mind the continuity of the crusades—the constant flow of new forces eastward and back again westward; for this alone explains why the crusades formed a great epoch in civilization, familiarizing, as they did, the West with the East.

The years 1143–44 are in many ways the turning point in the history of the Latin East. In 1143 began the reign of the first

[1]The manorial system in the Latin kingdom of Jerusalem was a continuation of the village system as it had existed under the Arabs. In each village (*casale*) the *rustici* were grouped in families (*foci*); the tenants paid from $\frac{1}{4}$ to $\frac{1}{2}$ of the crop, besides a poll-tax and labour-dues. The villages were mostly inhabited by Syrians: it was rarely that Franks settled down as tillers of the soil. Prutz regards the manorial system as oppressive. Absentee landlords, he thinks, rack-rented the soil (p. 167), while the "inhuman severity" of their treatment of villeins led to a progressive decay of agriculture, destroyed the economic basis of the Latin kingdom, and led the natives to welcome the invasion of Saladin (pp. 327–331).

The French writers Rey and Dodu are more kind to the Franks; and the testimony of contemporary Arabic writers, who seem favourably impressed by the treatment of their subjects by the Franks, bears out their view, while the tone of the assizes is admittedly favourable to the Syrians. One must not forget that there was a brisk native manufacture of carpets, pottery, ironwork, gold-work and soap; or that the Syrians of the towns had a definite legal position.

native king[1]; and about this date may be placed the final organization of the kingdom, witnessed by the completion of its body of customary law. At the same date, however, the decline of the kingdom also begins; the fall of Edessa is the beginning of the end. In 1143 John Comnenus and Fulk had just died, and Zengi, seeing his way clear, was able to throw himself on the great Christian outpost, and finally entered on Christmas day 1144. Two years later Zengi died; but he left an able successor in his son, Nureddin, and an attempt to recover Edessa was successfully repelled in Nov. 1146. Not only so, but in the spring of 1147 the Franks were unwise enough to allow the hope of gaining two small towns to induce them to break the vital alliance with Damascus. Thus, in itself, the position of affairs in the Holy Land in 1147 was certainly ominous; aid from the West seemed a necessity.

Early in 1145 news had come from Antioch to Eugenius III. of the fall of Edessa, and at the end of the year he had sent an encyclical to France—the natural soil, as we have seen, of crusading zeal. The response was instantaneous: Louis VII. of France himself, who bore on his conscience the burden of an unpunished massacre by his troops at Vitry in 1142[2], took the crusading vow on Christmas Day of 1145. But the greatest success was attained when St. Bernard—no great believer in pilgrimages, and naturally disposed to doubt the policy of a second crusade—was induced by the pope to become the preacher of the new movement. To the crusading king of France St. Bernard added the king of Germany, when, in Christmas week of 1146, he induced Conrad III. to take the vow by his sermon in the cathedral of Spires. Thus was begun the second crusade, under auspices still more favourable than those which attended the beginning of the first, seeing that kings now took the place of knights, while the new crusaders would no longer be penetrating into the wilds, but would find a friendly basis of operations ready to their hands in Frankish Syria. But the more favourable the auspices, the greater proved the failure. Already at the final meeting at Étampes, in 1147, difficulties arose. Manuel Comnenus demanded that all conquests made by the crusaders should be his fiefs; and the question was debated whether the crusaders should follow the land route through Hungary, along the old road of Charlemagne, or should go by sea to the Holy Land. On this question the envoys of Manuel and of Roger of Sicily, who were engaged in hostilities with one another, took opposite sides. Conrad, related by marriage to Manuel, decided in favour of the land route, which Manuel desired because it brought the crusade more under his direction, and because, if the route by sea were followed, Roger of Sicily might be able to divert the crusading ships against Constantinople. As it was, a struggle raged between Roger and Manuel during the whole progress of the crusade, which greatly contributed towards its failure, preventing, as it did, any assistance from the Eastern empire. Nor was there any real unity among the crusaders themselves. The crusaders of northern Germany never went to the Holy Land at all; they were allowed the crusaders' privileges for attacking the Wends to the east of the Elbe—a fact which at once attests the cleavage between northern and southern Germany (intensified of late years by the war of investitures), and anticipates the age of the Teutonic knights and their long crusade on the Baltic. The crusaders of the Low Countries and of England took the sea route, and attacked and captured Lisbon on their way, thus helping to found the kingdom of Portugal, and achieving the one real success which was gained by the second crusade[3].

[1] After 1143 one may therefore speak of the period of the Epigom—the native Franks, ready to view the Muslims as joint occupants of Syria, and to imitate the dress and habits of their neighbours.

[2] Doubt has been cast on the view that a troubled conscience drove Louis to take the cross; and his action has been ascribed to simple religious zeal (*cf.* Lavisse, *Histoire de France,* iii. 12).

[3] This body of crusaders ultimately reached the Holy Land, where it joined Conrad (who had lost his own original forces), and helped in the fruitless siege of Damascus. The services which it rendered to Portugal were repeated by later crusaders. Crusaders from the Low Countries, England and the Scandinavian north took the coast route round western Europe; and it was natural that, landing for provisions and water, they should be asked, and should consent, to lend their aid to the natives against the Moors. Such aid is recorded to have been given on the third and fifth crusades.

Among the great army of crusaders who actually marched to Jerusalem there was little real unity. Conrad and Louis VII. started separately, and at different times, in order to avoid dissensions between their armies; and when they reached Asia Minor (after encountering some difficulties in Greek territory) they still acted separately. Eager to win the first spoils, the German crusaders, who were in advance of the French, attempted a raid into the sultanate of Iconium; but after a stern fight at Dorylaeum they were forced to retreat (Oct. 1147), and for the most part perished by the way. Louis VII., who now appeared, was induced by this failure to take the long and circuitous route by the west coast of Asia Minor; but even so he had lost the majority of his troops when he reached the Holy Land in 1148. Here he joined Conrad (who had come by sea from Constantinople) and Baldwin III., and after some deliberation the three sovereigns resolved to attack Damascus. The attack was impolitic: Damascus was the one ally which could help the Franks to stem the advance of Nureddin. It proved as futile as it was impolitic; for the vizier of Damascus, Muin-eddin-Anar, was able to sow dissension between the native Franks and the crusaders; and by bribes and promises of tribute he succeeded in inducing the former to make the siege an absolute failure, at the end of only four days (July 28, 1148). The second crusade now collapsed. Conrad returned to Constantinople in the autumn of 1148, and Louis VII. returned by sea to France in the spring of 1149. The only effects of this great movement were effects prejudicial to the ends towards which it was directed. The position of the Franks in the Holy Land was not improved by the attack on Damascus; while the ignominious failure of a crusade led by two kings brought the whole crusading movement into discredit in western Europe, and it was utterly in vain that Suger and St. Bernard attempted to gather a fresh crusade in 1150.

Consequences of Failure.—The result of the failure of the second crusade was the renewal of Nureddin's attacks. The rest of the county of Edessa, including Tell-bashir on the west, was now conquered (1150); while Raymund of Antioch was defeated and killed (in 1149), and several towns in the east of his principality were captured. Baldwin III. attempted to make head against these troubles, partly by renewing the old alliance with Damascus, partly by drawing closer to Manuel of Constantinople. For the next 20 years, during the reigns of Baldwin and his brother Amalric I., there was a close connection between the kingdom of Jerusalem and the East Roman empire. Baldwin and Amalric both married into the Comnenian house, while Manuel married Mary of Antioch, the daughter of Raymund. In the north Manuel enjoyed the homage of Antioch, which his father had gained in 1137, and the nominal possession of Tell-bashir, which had been ceded to him by Baldwin III.: in the south he joined with Amalric I. in the attempt to acquire Egypt (1168–71). In this way he acquired a certain ascendancy over the Latin kings: Baldwin III. rode behind him at Antioch in 1159 without any of the insignia of royalty, and in an inscription at Bethlehem of 1172 Amalric I. had the name of the emperor written above his own[1]. The patronage of Constantinople, to which Jerusalem was thus practically surrendered, contributed to some slight extent in maintaining the kingdom against Nureddin. But there were dissensions within, both between Baldwin and his mother, Melisinda, who sought to protract her regency unduly, and between contending parties in Antioch, where the hand of Constance, Raymund's widow, was a desirable prize; and from without the horns of the crescent were slowly closing in on the kingdom. Nureddin pursued in his policy the tactics which the Mohammedans used against the Franks in battle: he sought to envelop their territories on every side. In 1154 fell Damascus, and the crescent closed perceptibly in the north: the most valuable ally of the kingdom was lost, and the way seemed clear from Aleppo (the peculiar seat of

[1] Manuel was an ambitious sovereign, apparently aiming at a world-monarchy, such as was afterwards attempted from the other side by Henry VI. As Henry VI. had designs on Constantinople and the Eastern empire, so Manuel cherished the ambition of acquiring Italy and the Western empire, and he negotiated with Alexander III. to that end in 1167 and 1169: *cf.* the life of Alexander III. in Muratori, *S.R.I.* iii. 460.

Nureddin's power) into Egypt. On the other hand, in 1153 Baldwin III. had taken Ascalon, which for 50 years had mocked the efforts of successive kings, and by this stroke he might appear to have closed for Nureddin the route to Egypt, and to have opened a path for its conquest by the Franks. For the future, events hinged on the situation of affairs in Egypt, and in Egypt the fate of the kingdom of Jerusalem was finally decided (*see* EGYPT: *History,* "Mohammedan Period"). There was a race for the possession of the country between Nureddin's lieutenant Shīrgūh or Shīrkūh and Amalric I., the brother and successor of Baldwin III.; and in the race Shīrkūh proved the winner.

Since the days of Godfrey and Baldwin I., Egypt had been a goal of Latin ambition, and the capture of Ascalon must obviously have given form and strength to the projects for its conquest. Plans of attack were sketched; routes were traced; distances were measured; and finally in 1163 there came the impulse from within which turned these plans into action. The Shiite caliphs of Egypt were by this time the playthings of contending viziers, as the Sunnite caliphs of Baghdad had long been the puppets of Turkish sultans and amirs; and in 1164 Amalric I. and Nureddin were fighting in Egypt in support of two rival viziers, Dirgham and Shawar. For Nureddin the fight meant the acquisition of an heretical country for the true faith of the Sunnite, and the final enveloping of the Latin kingdom[1]: for Amalric it meant the escape from Nureddin's net, and a more direct and lucrative contact with Eastern trade. Into the vicissitudes of the fight it is not necessary here to enter; but in the issue Nureddin won, in spite of the support which Manuel gave to Amalric. Nureddin's Kurdish lieutenant, Shīrgūh, succeeded in establishing in power the vizier whom he favoured, and finally in becoming vizier himself (Jan. 1169); and when he died, his nephew Saladin (Sala-ed-din) succeeded to his position (March 1169), and made himself, on the death of the caliph in 1171, sole ruler in Egypt. Thus the Shiite caliphate became extinct: in the mosques of Cairo the name of the caliph of Baghdad was now used; and the long-disunited Mohammedans at last faced the Christians as a solid body. But nevertheless the kingdom of Jerusalem continued almost unmenaced, and practically undiminished, for the next 16 years. If a religious union had been effected between Egypt and northern Syria, political disunion still remained; and the Franks were safe as long as it lasted. Saladin acted as the peer of Nureddin rather than as his subject; and the jealousy between the two kept both inactive till the death of Nureddin in 1174. Nureddin left only a minor in his place: Amalric, who died in the same year, left a son (Baldwin IV.) who was not only a minor but also a leper; and thus the stage seemed cleared for Saladin. He was confronted, however, by Raymund, count of Tripoli, the one man of ability among the decadent Franks, who acted as guardian of the kingdom; and he was also occupied in trying to win for himself the Syrian possessions of Nureddin. The task engaged his attention for nine years. Damascus he acquired as early as 1174; but Raymund supported the heir of Nureddin in his capital at Aleppo, and it was not until 1183 that Saladin entered the city, and finally brought Egypt and northern Syria under a single rule.

Loss of Jerusalem.—The hour of peril for the Latin kingdom had now at last struck. It had done little to prepare itself for that hour. Repeated appeals had been sent to the West from the beginning of the Egyptian affair (1163) onwards; and in 1184–85 a great mission, in which the patriarch of Jerusalem and the masters of the Templars and the Hospitallers were associated, came to France and England, and offered the crown of Jerusalem to Philip Augustus and Henry II.[2] in turn, in order to secure their presence in the Holy Land. The only result of these appeals was the rise of a regular system of taxation in France and England, *ad sustentationem Hierosolimitanae terrae,* which starts about 1185 (though there had already been isolated instances in 1147 and 1166), and may almost be described as the beginning of modern taxation. In the East itself, with the exception of the tax of 1183[1], nothing was done that was good, and two things were done which were evil. Sibylla married her second husband, Guy de Lusignan, in 1180—a marriage destined to be the cause of many dissensions; for Sibylla, the eldest daughter of Amalric I., carried to her husband—a French adventurer—a presumptive title to the Crown, which would never be admitted without dispute.

In 1186 Guy eventually became king, following the death of Baldwin V. (Sibylla's son by her first marriage); but his coronation was in violation of the promise given to Raymund of Tripoli (that in the event of the death of Baldwin V. without issue the succession should be determined by the pope, the emperor and the kings of France and England), and Guy, with a weak title, was unable to exercise any real control over the kingdom. At this point another French adventurer, who had already made himself somewhat of a name in Antioch, gave the final blow to the kingdom. Raynald of Chatillon, the second husband of Constance of Antioch, after languishing in captivity from 1159 to 1176, had been granted the seignory of Krak, to the east and south of the Dead sea. From this point of vantage he began depredations on the Red sea (1182), building a fleet, and seeking to attack Medina and Mecca—a policy which may be interpreted either as mere buccaneering, or as a calculated attempt to deal a blow at Mohammedanism in its very centre. Driven from the Red sea by Saladin, he turned from buccaneering to brigandage, and infested the great trade-route from Damascus to Egypt, which passed close by his seignory. In 1186 he attacked a caravan in which the sister of Saladin was travelling, thus violating a four years' truce, which, after some two years' skirmishing, Saladin and Raymund of Tripoli had made in the previous year owing to the general prevalence of famine. The coronation of one French adventurer and the conduct of another, whom the first was unable to control, meant the ruin of the kingdom; and Saladin at last delivered in full force his long-deferred attack. The crusade was now at last answered by the counter-crusade—the *jihad;* for though for many years past Saladin had, in his attempt to acquire all the inheritance of Nureddin, left Palestine unmenaced and intact, his ultimate aim was always the holy war and the recovery of Jerusalem. The acquisition of Aleppo could only make that supreme object more readily attainable; and he had therefore spent his time in acquiring Aleppo, but only in order that he might ultimately "attain the goal of his desires, and set the mosque of Aksa free, to which Allah once led in the night his servant Mohammed." Thus it was on a kingdom of crusaders who had lost the crusading spirit that a new crusade swept down; and Saladin's army in 1187 had the spirit and the fire of the Latin crusaders of 1099. The tables were turned; and fighting on their own soil for the recovery of what was to them too a holy place, the Mohammedans easily carried the day. At Tiberias a little squadron of the brethren of the two Orders went down before Saladin's cavalry in May; at Hattin the levy *en masse* of the kingdom, some 20,000 strong, foolishly marching over a sandy plain under the heat of a July sun, was utterly defeated; and after a fortnight's siege Jerusalem capitulated (Oct. 2, 1187). In the kingdom itself nothing was left to the Latins by the end of 1189 except the city of Tyre; and to the north of the kingdom they held only Antioch and Tripoli, with the Hospitallers' fortress at Margat. The fingers of the clock had been pushed back; once more things were as they had been at the time of the first crusade; once more the West must arm itself for the holy war and the recovery of Jerusalem—but now it must face a united Mohammedan world, where in 1096 it had found political and religious dissension, and it must attempt its vastly heavier task without the morning freshness of a new religious impulse, and with something of the weariness of 100 years of struggle upon its shoulders.

[1]Nureddin, unlike his father, was definitely animated by a religious motive: he fought first and foremost against the Latins (and not, like his father, against Muslim States), and he did so as a matter of religious duty.

[2]Henry II., as an Angevin, was the natural heir of the kingdom of Jerusalem on the extinction of the line descended from Fulk of Anjou. This explains the part played by Richard I. in deciding the question of the succession during the third crusade.

[1]The taxation levied in the West was also attempted in the East, and in 1183 a universal tax was levied in the kingdom of Jerusalem, at the rate of 1% on movables and 2% on rents and revenues. *Cf.* Dr. A. Cartellieri, *Philippe II. August,* ii. pp. 3–18 and p. 85.

THE THIRD CRUSADE (1189–1192)

The 40 years from 1189 to 1229 form a period of incessant crusading, occupied by crusades of every kind. There are the third, fifth and sixth crusades against the "infidel" Mohammedans encamped in the Holy Land; there is the Albigensian crusade against the heretic Cathars; there is the fourth crusade, directed in the issue against the schismatic Greeks; lastly, there are the crusades waged by the papacy against revolted Christians—John of England and Frederick II. Our concern lies with the first kind of crusade, and with the other three only so far as they bear on the first, and as they illustrate the immense widening which the term "crusade" now underwent—a widening accompanied by its inevitable corollary of shallowness of motive and degradation of impulse.

It was Conrad, the marquis of Montferrat, who as much as any one man was responsible for the third crusade. Compelled to leave the court of Constantinople, which he had been serving, he had sailed for the Holy Land and reached Tyre about three weeks after the battle of Hattin. He had saved Tyre; and from it he sent his appeals to the West. Not the least effective of these appeals was a great poster which he had circulated in Europe, and which represented the Holy Sepulchre defiled by the horses of the Mohammedans. Meanwhile the papacy, as soon as the news reached Rome, despatched encyclicals throughout Europe; and soon a new crusade was in full swing. But the third crusade, unlike the first, does not spring from the papacy, which was passing through one of its epochs of depression; it springs from the lay power, which, represented by the three strong monarchies of Germany, England and France, was at this time dominant in Europe. In Germany it was the solemn national Diet of Mainz (Easter 1188) which "swore the expedition" to the Holy Land; in France and England the agreement of the two kings decided upon a joint crusade. The very means which Philip Augustus and Henry II. took, in order to further the crusade, show its lay aspect. A scheme of taxation—the Saladin tithe—was imposed on all who did not take the cross; and this taxation, while on the one hand it drove many to take the cross in order to escape its incidence, on the other hand provided a necessary financial basis for military operations. The "economic" motive for taking the cross was strengthened by the regulations made in favour of debtors who joined the crusade. Thousands must have joined the third crusade in order to escape paying either their taxes or the interest on their debts; and the atmosphere of the gold-digger's camp (or of the cave of Adullam) must have begun more than ever to characterize the crusading armies. The lay basis of the third crusade made it, in one sense, the greatest of all crusades, in which all the three great monarchs of western Europe participated; but it also made it a failure, for the kings of France and England carried their political rivalries into the movement, in which it had been agreed that they should be sunk. Spiritually, therefore, the third crusade is inferior to the first, however imposing it may be in its material aspects. Yet it must be admitted that the idea of a spiritual regeneration accompanied the crusading movement of 1188. Europe had sinned in the face of God; otherwise Jerusalem would never have fallen; and the idea of a spiritual reform from within, as the necessary corollary and accompaniment of the expedition of Christianity without, breathes in some of the papal letters.

We may conceive of the third crusade under the figure of a number of converging lines, all seeking to reach a common centre. That centre is Acre. The siege of Acre, as arduous and heroic in many of its episodes as the siege of Troy, had been begun in the summer of 1189 by Guy de Lusignan, who, captured by Saladin at the battle of Hattin, and released on parole, had at once broken his word and returned to the attack. The army which was besieging Acre was soon joined by various contingents; for Acre, after all, was the vital point, and its capture would open the way to Jerusalem. Two of these contingents alone concern us here—the German and the Anglo-French. Frederick I. of Germany, using a diplomacy which corresponds to the lay character of the third crusade, had sought to prepare his way by embassies to the king of Hungary, the Eastern emperor and the sultan of Iconium. Starting from Regensburg in May 1189, the German army marched quietly through Hungary; but difficulties arose, as they had arisen in 1147, as soon as the frontiers of the Eastern empire were reached. The emperor Isaac Angelus had not only the old grudge of all Eastern emperors against the "upstart" emperor of the West; he had also allied himself with Saladin, in order to acquire for his empire the patronage of the Holy Places and religious supremacy in the Levant. The difficulties between Frederick and Isaac Angelus became acute: in Nov. 1189 Frederick wrote to his son Henry, asking him to induce the pope to preach a crusade against the schismatic Greeks. But terms were at last arranged, and by the end of March 1190 the Germans had all crossed to the shores of Asia Minor. Taking a route midway between the eastern route of the crusaders of 1097 and the western route of Louis VII. in 1148, Frederick marched by Philadelphia and Iconium, not without dust and heat, until he reached the river Salef, in Armenian territory. Here, with the burden of the day now past, the fine old crusader—he had joined before in the second crusade, 40 years ago—perished by accident in the river; and of all his fine army only 1,000 men won their way through, under his son, Frederick of Swabia, to join the ranks before Acre (Oct. 1190). The Anglo-French detachment gained a greater immediate success. War had indeed disturbed the original agreement of Gisors between Philip Augustus and Henry II., but a new agreement was made by Henry's successor, Richard I., and the French king at Nonancourt (Dec. 1189), by which the two monarchs were to meet at Vezelay next year, and then follow the sea route to the Holy Land together. They met, and by different routes they both reached Sicily, where they wintered together (1190–91). The enforced inactivity of a whole winter was the mother of disputes and bad blood; and when Philip sailed for the Holy Land, at the end of March 1191, the failure of the crusade was already decided. Richard soon followed; but while Philip sailed straight for Acre, Richard occupied himself by the way in conquering Cyprus—partly out of knight-errantry, and in order to avenge an insult offered to his betrothed wife Berengaria by the despot of the island, partly perhaps out of policy, and in order to provide a basis of supplies and of operations for the armies attempting to recover Palestine. In any case, he is the founder of the Latin kingdom of Cyprus (for he afterwards sold his new acquisition to Guy de Lusignan, who established a dynasty in the island); and thereby he made possible the survival of the institutions and assizes of Jerusalem, which were continued in Cyprus until it was conquered by the Ottoman Turks. From Cyprus Richard sailed to Acre, arriving on the 8th of June, and in little more than a month he was able, in virtue of the large reinforcements he brought, and in spite of dissensions in the Christian camp which he helped to foment, to bring the two years' siege to a successful issue (July 12, 1191). It was indeed time; the privations of the besiegers during the previous winter had been terrible; and the position of affairs had only been made worse by the dissensions between Guy de Lusignan and Conrad of Montferrat, who had begun to claim the Crown in return for his services, and had, on the death of Sibylla, the wife of Guy, reinforced his claim by a marriage with her younger sister, Isabella. In these dissensions it was inevitable that Philip Augustus and Richard I., already discordant, should take contrary sides; and while Richard naturally sided with Guy de Lusignan, who came from his own county of Poitou, Philip as naturally sided with Conrad. At the end of July it was decided that Guy should remain king for his life, and Conrad should be his successor; but as three days afterwards Philip Augustus began his return to France (pleading ill-health, but in reality eager to gain possession of Flanders), the settlement availed little for the success of the crusade. Richard stayed in the Holy Land for another year, during which he won a battle at Arsuf and refortified Jaffa. But far more important than any hostilities are the negotiations which, for the whole year, Richard conducted with Saladin. They show the lay aspect of the third crusade; they anticipate the crusade of Frederick II.—for Richard was attempting to secure the same concessions which Frederick secured by the same means which he used. They show again the closer approximation and better understanding with the Mohammedans, which marks this crusade. Nothing is more striking in these respects than Richard's proposal that Saladin's brother should marry his own sister Johanna and receive Jerusalem and the contiguous towns on the coast. In the event, a peace was made for three years (Sept. 2, 1192), by which Lydda and Ramlah were to be equally divided, Ascalon was to be destroyed, and small bodies of crusaders were to be allowed to visit the Holy Sepulchre. Meanwhile Conrad of Montferrat, at the very instant when his superior ability had finally forced Richard to recognize him as king, had been assassinated (April 1192): Guy de Lusignan had bought Cyprus from Richard, and had sailed away to establish himself there[1]; and Henry of Champagne, Richard's nephew, had been called to the throne of Jerusalem, and had given himself a title by marrying Conrad's widow, Isabella. In this condition Richard left the Holy Land, when he began his eventful return, in Oct. 1192. The crusade had failed—failed because a leaderless army, torn by political dissensions and fighting on a foreign soil, could not succeed against forces united by religious zeal under the banner of a leader like Saladin. Yet it had at any rate saved for the Christians the principality of Antioch, the county of Tripoli, and some of the coast towns of the kingdom[2]; and if it had failed to accomplish its object, it had left behind, none the less, many important results. The difficulties which had arisen between Isaac Angelus and Frederick Barbarossa contain the germs of the fourth crusade; the negotiations between Richard and Saladin contain the germs of the sixth. National rivalries had been accentuated and national differences brought into prominence by the meeting of the nations in a common enterprise; while, on the other hand, Mohammedans and Christians had fraternized as they had never done before during the progress of a crusade. But what the third crusade showed most clearly was that the crusading movement was being lost to the papacy, and becoming part of the domain of the secular State—organized by the State on its own basis of taxation, and conducted by the State according to its own method of negotiation. This after all is the great change; and even the genius of an Innocent III. "could not make undone what had once been done." On the contrary, the thing once done would go further; and the State would take up the name of crusade in order to cover, and under such cover to achieve, its own objects and ambitions.

[1]The crusades in their course established a number of new States or kingdoms. The first crusade established the kingdom of Jerusalem (1100); the third, the kingdom of Cyprus (1195); the fourth, the Latin empire of Constantinople (1204); while the long crusade of the Teutonic knights on the coast of the Baltic led to the rise of a new State east of the Vistula. The kingdom of Lesser Armenia, established in 1195, may also be regarded as a result of the crusades. The history of the kingdom of Jerusalem is part of the history of the crusades: the history of the other kingdoms or States touches the history of the crusades less vitally. But the history of Cyprus is particularly important—and for two reasons. In the first place, Cyprus was a natural and excellent basis of operations; it sent provisions to the crusaders in 1191, and again at the siege of Damietta in 1219, while its advantages as a strategic basis were proved by the exploits of Peter of Cyprus in the 14th century. In the second place, as the Latin kingdom of Jerusalem fell, its institutions and assizes were transplanted bodily to Cyprus, where they survived until the island was conquered by the Ottoman Turks. But the monarchy was stronger in Cyprus than in Jerusalem; the fiefs were distributed by the monarch, and were smaller in extent; while the feudatories had neither the collective powers of the *haute cour* of Jerusalem, nor the individual privileges (such as jurisdiction over the bourgeoisie), which had been enjoyed by the feudatories of the old kingdom. Till 1489 the kingdom of Cyprus survived as an independent monarchy, and its capital, Famagusta, was an important centre of trade after the loss of the coast-towns in the kingdom of Jerusalem. In 1489 it was acquired by Venice, which claimed the island on the death of the last king, having adopted his widow (a Venetian lady named Catarina Cornaro) as a daughter of the republic. On the history of Cyprus, *see* Stubbs, *Lectures on Medieval and Modern History,* 156–208. The history of the kingdom of Armenia is closely connected with that of Cyprus. The Armenians in the south-east of Asia Minor borrowed feudal institutions from the Franks and the feudal vocabulary itself. The kingdom was involved in a struggle with Antioch in the early part of the 13th century. Later, it allied itself with the Mongols and fought against the Mamelukes, to whom, however, it finally succumbed in 1375.

[2]The kingdom of Jerusalem is thus from 1192 to its final fall, a strip of coast, to which it is the object of kings and crusades to annex Jerusalem and a line of communication connecting it with the coast. This was practically the aim of Richard I.'s negotiations; and this was what Frederick II. for a time secured.

THE FOURTH CRUSADE (1202–1204)

The history of the fourth crusade is a history of the predominance of the lay motive, of the attempt of the papacy to escape from that predominance, and to establish its old direction of the crusade, and of the complete failure of its attempt. Until the accession of Innocent III. in 1198 the lay motive was supreme; and its representative was Henry VI.—the greatest politician of his day, and in many ways the greatest emperor since Charlemagne. In 1195 Amalric, the brother of Guy de Lusignan, and his successor in Cyprus, sought the title of king from Henry and did homage; and at the same time Leo of Lesser Armenia, in order to escape from dependence on the Eastern empire, took the same course. Henry thus gained a basis in the Levant; and the death of Saladin in 1193, followed by a civil war between his brother, Malik-al-Adil, and his sons for the possession of his dominions, weakened the position of the Mohammedans. As emperor, Henry was eager to resume the imperial crusade which had been stopped by his father's death; and both as Frederick's successor and as heir to the Norman kings of Sicily, who had again and again waged war against the Eastern empire, he had an account to settle with the rulers of Constantinople. The project of a crusade and of an attack on Constantinople wove themselves into a single thread, in a way which very definitely anticipates the fourth crusade of 1202–04. In 1195 Henry took the cross; some time before, he had already sent to Isaac Angelus to demand compensation for the injuries done to Frederick I., along with the cession of all territories ever conquered by the Norman kings of Sicily, and a fleet to co-operate in the new crusade. In the same year, however, Isaac was dethroned by his brother, Alexius III.; but Henry married Isaac's daughter Irene to his brother, Philip of Swabia, and thus attempted to give the Hohenstaufen a new title and a valid claim against the usurper Alexius. Thus armed he pushed forward the preparations for the crusade in Germany—a crusade whose first object would have been an attack on Alexius III.; but in the middle of his preparations he died in Sicily in the autumn of 1197, and the crusade collapsed. Some results were, however, achieved by a body of German crusaders which had sailed in advance of Henry; by its influence Amalric of Cyprus succeeded Henry of Champagne, who died in 1197, as king of Jerusalem, and a vassal of the emperor thus became ruler in the Holy Land; and the Teutonic order, which had begun as a hospital during the siege of Acre (1190–91), now received its organization. Some of the coast towns, too, were recovered by the German crusaders, especially Beirut; and in 1198 the new king Amalric II. was able to make a truce with Malik-al-Adil for the next five years.

"The true heir of Henry VI.," Ranke has said, "is Innocent III.," and nowhere is this more true than in respect of the crusading movement. Throughout the course of his crowded and magnificent pontificate, Innocent III. made the crusade his ultimate object, and attempted to bring it back to its old religious basis and under the papal direction. By the spring of 1200, owing to Innocent's exertions, a new crusade was in full progress, especially in France, where Fulk of Neuilly played the part once played by Peter the Hermit. Like the first crusade, the fourth crusade—in its personnel, but not its direction—was a French enterprise; and its leading members were French feudatories like Theobald of Champagne (who was chosen leader of the crusade), Baldwin of Flanders (the future emperor of Constantinople), and the count of Blois. The objective, which these three original chiefs of the fourth crusade proposed to themselves, was Egypt[1]. Since 1163 the importance of acquiring Egypt had been definitely understood; in the summer of 1192 Richard I. had been advised by his counsellors that Cairo and not Jerusalem was the true point of attack; and in 1200 there was the additional reason for preferring an

[1]M. Luchaire, in the volume of his biography of Innocent III. called *La Question d'Orient,* shows how, in spite of the pope, the fourth crusade was in its very beginnings a lay enterprise. The crusading barons of France chose their own leader and determined their own route, without consulting Innocent.

attack on Egypt, that the truce in the Holy Land between Amalric II. and Malik-al-Adil had still three years to run. It is Egypt therefore—to which, it must be remembered, the centre of Mohammedan power had now been virtually shifted, and to which motives of trade impelled the Italian towns (since from it they could easily reach the Red sea, and the commerce of the Indian ocean)—which is henceforth the normal goal of the crusades. This is one of the many facts which differentiate the crusades of the 13th from those of the preceding century. But, with Syria in the hands of the Mohammedans, the attack on Egypt must necessarily be directed by sea; and thus the crusade henceforth becomes—what the third crusade, here as elsewhere the turning-point in crusading history, had already in part been—a maritime enterprise. Accordingly, early in 1201, envoys from each of the three chiefs of the fourth crusade (among whom was Villehardouin, the historian of the crusade) came to Venice to negotiate for a passage to Egypt. An agreement was made between the doge and the envoys, by which transport and active help were to be given by Venice in return for 85,000 marks and the cession of half of the conquests made by the crusaders.

Diversion to Constantinople.—But the fourth crusade was not to be plain sailing to Egypt. It became involved in a maelstrom of conflicting political motives, by which it was swept to Constantinople. Here we must distinguish between cause and occasion. There were three great causes which made for an attack on Constantinople by the West. There was first of all the old crusading grudge against the Eastern empire, and its fatal policy of regarding the whole of the Levant as its lost provinces, to be restored as soon as conquered, or at any rate held in fee, by the Western crusaders—a policy which led the Eastern emperors either to give niggardly aid or to pursue obstructive tactics, and caused them to be blamed for the failure of the crusades of 1101, of 1149 and of 1190. It is significant of the final result of these things that already in 1147 Roger of Sicily, engaged in war with Manuel, had proposed the sea-route for the second crusade, perhaps with some intention of diverting it against Constantinople; and in the winter of 1189–90 Barbarossa, as we have seen, had actually thought and spoken of an attack on Constantinople. In the second place, there was the commercial grudge of Venice, which had only been given large privileges by the Eastern empire to desire still larger, and had, moreover, been annoyed not only by alterations or revocations of those privileges, such as the usurper Alexius III. had but recently attempted, but also by the temporary destruction of its quarter in Constantinople in 1171. Lastly, and perhaps most of all, there is the old Norman blood-feud with Constantinople, as old as the old Norse seeking for Micklegarth, and keen and deadly ever since the Norman conquest of the Greek themes in south Italy (1041 onwards). The heirs of the Norman kings were the Hohenstaufen; and we have already seen Henry VI. planning a crusade which would primarily have been directed against Constantinople. It is this Hohenstaufen policy which becomes the primary occasion of the diversion of the fourth crusade. Philip of Swabia, engaged in a struggle with the papacy, found Innocent III. planning a Guelph crusade, which should be under the direction of the Church; and to this Guelph project he opposed the Ghibelline plan of Henry VI., with such success that he transmuted the fourth crusade into a political expedition against Constantinople. To such a policy of transmutation he was urged by two things. On the one hand, the death of the count of Champagne (May 1201) had induced the crusaders to elect as their leader Boniface of Montferrat, the brother of Conrad; and Boniface was the cousin of Philip, and interested in Constantinople, where not only Conrad, but another brother as well, had served, and suffered for their service at the hands of their masters. On the other hand Alexius, the son of the dethroned Isaac Angelus, was related to Philip through his marriage with Irene; and Alexius had escaped to the German court to urge the restoration of his father. On Christmas Day 1201, Philip, Alexius and Boniface all met at Hagenau[1] and formulated (one may suppose) a plan for the diversion of the crusade. Events played into their hands. When the crusaders gathered at Venice in the autumn of 1202, it was found impossible to get together the 85,000 marks promised to Venice. The Venetians—already, perhaps, indoctrinated in the Hohenstaufen plan—indicated to the leaders a way of meeting the difficulty: they had only to lend their services to the republic for certain ends which it desired to compass, and the debt was settled. The conquest of Zara, a port on the Adriatic claimed by the Venetians from the king of Hungary, was the only object overtly mentioned; but the idea of the expedition to Constantinople was in the air, and the crusaders knew what was ultimately expected. It took time and effort to bring them round to the diversion: the pope—naturally enough—set his face sternly against the project, the more as the usurper, Alexius III., was in negotiation with him in order to win his support against the Hohenstaufen, and Innocent hoped to find, as Alexius promised, a support and a reinforcement for the crusade in an alliance with the Greek empire. But they came round none the less, in spite of Innocent's renewed prohibitions. In Nov. 1202 Zara was taken; and at Zara the fatal decision was made. The young Alexius joined the army; and in spite of the opposition of stern crusaders like Simon de Montfort, who sailed away ultimately to Palestine, he succeeded by large promises in inducing the army to follow in his train to Constantinople. By the middle of July 1203 Constantinople was reached, the usurper was in flight, and Isaac Angelus was restored to his throne. But when the time came for Alexius to fulfil his promises, the difficulty which had arisen at Venice in the autumn of 1202 repeated itself. Alexius's resources were insufficient, and he had to beg the crusaders to wait at Constantinople for a year in order that he might have time. They waited; but the closer contact of a prolonged stay only brought into fuller play the essential antipathy of the Greek and the Latin. Continual friction developed at last into the open fire of war; and in March 1204 the crusaders resolved to storm Constantinople, and to divide among themselves the Eastern empire. In April Constantinople was captured; in May Baldwin of Flanders became the first Latin emperor of Constantinople. Venice had her own reward; a Venetian, Thomas Morosini, became patriarch; and the doge of Venice added "a quarter and a half" of the Eastern empire—chiefly the coasts and the islands—to the sphere of his sway. If Venetian cupidity had not originally deflected the crusade (and it was the view of contemporary writers that Venice had committed her first treason against Christianity by diverting the crusade from Egypt in order to get commercial concessions from Malik-al-Adil[1], yet it had at any rate profited exceedingly from that diversion; and the Hohenstaufen and their protégé Alexius only reaped dust and ashes. For, however Ghibelline might be the original intention, the result was not commensurate with the subtlety of the design, and the power of the pope was rather increased than diminished by the event of the crusade. The crusaders appealed to Innocent to ratify the subjugation of a schismatic people, and the union of the Eastern and Western Churches; and Innocent, dazzled by the magic of the *fait accompli*, not unwillingly acquiesced. He might soothe himself by reflecting that the basis for the crusade, which he had hoped to find in Alexius III., was still more securely offered by Baldwin; he could not but feel with pride that he had become "as it were pope and apostolicus of a second world." Yet the result of the fourth crusade was on the whole disastrous both for the papacy and for the crusading movement. The pope had been forced to see the helm of the crusades wrenched from his grasp; and the Albigensian crusade against the heretics of southern France was soon afterwards to show that the example could be followed, and that the land-hunger of the north French baronage could exploit a crusade as successfully as ever did Hohenstaufen policy leagued with Venetian cupidity. The crusade lost its *élan* when it became a move in a political game. If the third crusade had been directed by the lay power towards the true spiritual end of all crusades, the fourth was directed by the lay power to its

[1]There seems to be little doubt of Philip's complicity in the diversion of the fourth crusade to Constantinople (*cf.* M. Luchaire, *La Question d'Orient*, pp. 84–86).

[1]It is true that in 1208 Venice received commercial concessions from the court of Cairo. But this *ex post facto* argument is the sole proof of this view; and it is quite insufficient to prove the accusation.

own lay ends; and the political and commercial motives, which were deeply implicit even in the first crusade, had now become dominantly explicit. In a simpler and more immediate sense, the capture of Constantinople was detrimental to the movement from which it sprang. The precarious empire which had been founded in 1204 drained away all the vigorous adventurers of the West for its support for many years to come, and the Holy Land was starved to feed a land less holy, but equally greedy of men. No basis for the crusades was ever to be found in the Latin empire of the East; and Innocent, after vainly hoping for the new crusade which was to emerge from Constantinople, was by 1208 compelled to return to the old idea of a crusade proceeding simply and immediately from the West to the East.

THE FIFTH CRUSADE (1218–1221)

The glow and glamour of the crusades disappear save for the pathetic sunset splendours of St. Louis, as Dandolo dies, and gallant Villehardouin drops his pen. But before St. Louis sailed for Damietta there intervened the failure of one crusade, and the secular and diplomatic success of another. The fifth crusade is the last started in that pontificate of crusades—the pontificate of Innocent III. It owed its origin to his feverish zeal for the recovery of Jerusalem, rather than to any pressing need in the Holy Land. Here reigned, during the 40 years of the loss of Jerusalem, an almost unbroken peace. Malik-al-Adil, the brother of Saladin, had by 1200 succeeded to his brother's possessions not only in Egypt but also in Syria, and he granted the Christians a series of truces (1198–1203, 1204–10, 1211–17). While the Holy Land was thus at peace, crusaders were also being drawn elsewhere by the needs of the Latin empire of Constantinople, or the attractions of the Albigensian crusade (*see* ALBIGENSES). But Innocent could never consent to forget Jerusalem, as long as his right hand retained its cunning. The pathos of the Children's crusade of 1212 only nerved him to fresh efforts. A shepherd boy named Stephen had appeared in France, and had induced thousands to follow his guidance: with his boyish army he rode on a wagon southward to Marseille, promising to lead his followers dry-shod through the seas. In Germany a child from Cologne, named Nicolas, gathered some 20,000 young crusaders by like promises, and led them into Italy. Stephen's army was kidnapped by slave-dealers and sold into Egypt; while Nicolas's expedition left nothing behind it but an after-echo in the legend of the Pied Piper of Hamelin. But for Innocent these outbursts of the revivalist element, which always accompanied the crusades, had their moral: "the very children put us to shame," he wrote; "while we sleep they go forth gladly to conquer the Holy Land." In the fourth Lateran Council of 1215 Innocent found his opportunity to rekindle the flickering fires. Before this great gathering of all Christian Europe he proclaimed a crusade for the year 1217, and in common deliberation it was resolved that a truce of God should reign for the next four years, and for the same period all trade with the Levant should cease. Here two things were attempted—neither, indeed, for the first time[1]—which 14th-century pamphleteers on the subject of the crusades unanimously advocate as the necessary conditions of success; there was to be peace in Europe and a commercial war with Egypt. This statesmanlike beginning of a crusade, preached, as no crusade had ever been preached before, in a general council of all Europe, presaged well for its success. In Germany (where Frederick II. himself took the cross in this same year) a large body of crusaders gathered together: in 1217 the south-east sent the duke of Austria and the king of Hungary to the Holy Land; while in 1218 an army from the north-west joined at Acre the forces of the previous year. Egypt had already been indicated by Innocent III. in 1215 as the goal of attack, and it was accordingly resolved to begin the crusade by the siege of Damietta, on the eastern delta of the Nile. The original leader of the crusade was John of Brienne, king of Jerusalem (who had succeeded Amalric II., marrying Maria, the daughter of Amalric's wife Isabella by her former husband, Conrad of Montferrat); but after the end of 1218 the cardinal legate Pelagius, fortified by papal letters, claimed the command. In spite of dissensions between the cardinal and the king, and in spite of the offers of Malik-al-Kamil (who succeeded Malik-al-Adil at the end of 1218), the crusaders finally carried the siege to a successful conclusion by the end of 1219. The capture of Damietta was a considerable feat of arms, but nothing was done to clinch the advantage which had been

This fortress was constructed about the beginning of the 13th century by the Knights of St. John of Jerusalem. It stands on a height in the county of Tripoli, north of the old kingdom of Jerusalem, and was captured by Bibars, Sultan of Egypt, in 1271

won, and the whole of the year 1220 was spent by the crusaders in Damietta, partly in consolidating their immediate position, and partly in waiting for the arrival of Frederick II., who had promised to appear in 1221. In 1221 Hermann of Salza, the master of the Teutonic order, along with the duke of Bavaria, appeared in the camp before Damietta; and as it seemed useless to wait any longer for Frederick II., the cardinal, in spite of the opposition of King John, gave the signal for the march on Cairo[1]. The army reached a fortress (erected by the sultan in 1219, afterwards, from 1221, the town of Mansura), and encamped there at the end of July. Here the sultan reiterated terms which he had already offered several times before—the cession of most of the kingdom of Jerusalem, the surrender of the cross (captured by Saladin in 1187), and the restoration of all prisoners. King John urged the acceptance of these terms. The legate insisted on a large indemnity in addition: the negotiations failed, and the sultan prepared for war. The crusaders were driven back towards Damietta; and at the end of Aug. 1221 Pelagius had to make a treaty with Malik-al-Kamil, by which he gained a free retreat and the surrender of the Holy Cross at the price of the restoration of Dammietta. The treaty was to last for eight years, and could only be broken on the coming of a king or emperor to the East. In pursuance of its terms the crusaders evacuated Egypt, and the fifth crusade was at an end. It is difficult to decide whether to blame the legate or the emperor more for its failure. If Frederick had only come in person, a single month of his presence might have meant everything: if Pelagius had only listened to King John, the sultan was ready to concede practically everything which was at issue. Unhappily Frederick preferred to put his Sicilian house in order, and the legate preferred to listen to the Italians, who had their own commercial reasons for wishing to establish a strong position in Egypt, and to the Templars and Hospitallers, who did not feel satisfied by the terms offered by the sultan, because he wished to retain in his hands the two fortresses of Krak and Monreal.

[1] A canon of the third Lateran Council (1179) forbade traffic with the Saracens in munitions of war; and this canon had been renewed by Innocent in the beginning of his pontificate.

[1] He had promised the pope, at his coronation in 1220, to begin his crusade in August 1221. But he declared himself exhausted by the expenses of his coronation; and Honorius III. consented to defer his crusade until March 1222. The letter of the pope informing Pelagius of this delay is dated June 20; it would probably reach his hands *after* his departure from Damietta; and thus the cardinal gave the signal for the march, when, as he thought, the emperor's coming was imminent.

THE SIXTH CRUSADE (1228–1229)

The sixth crusade succeeded as signally as the fifth had failed; but the circumstances under which it took place and the means by which it was conducted made its success still more disastrous than the failure of 1221. The last crusade had, after all, been under papal control: if Richard I. directed the third crusade, and the policy of the Hohenstaufen and the Venetians directed the fourth, it was a papal legate who steered the fifth to its fate. The crusade of Frederick II. in 1228–29 finds its analogy in the projected crusade of Henry VI.; it is essentially lay. It is unique in the annals of the crusades. Alone of all crusades (though the fourth crusade offers some analogy) it was not blessed but cursed by the papacy: alone of all the crusades it was conducted without a single act of hostility against the Mohammedan. St. Louis, the true type of the religious crusader, once said that a layman ought only to argue with a blasphemer against Christian law by running his sword into the bowels of the blasphemer as far as it would go: Frederick II. talked amicably with all unbelievers, if one may trust Arabic accounts, and he achieved by mere negotiation the recovery of Jerusalem, for which men had vainly striven with the sword for the 40 years since 1187. It was in 1215 that the leader of this strange crusade had first taken the vow; it was 12 years afterwards when he finally attempted to carry the vow into effective execution. Again and again he had excused himself to the pope, and been excused by the pope, because the exigencies of his policy in Germany or Sicily tied his hands. After the failure of the fifth crusade—for which these delays were in part responsible—Honorius III. had attempted to bind him more intimately to the Holy Land by arranging a marriage with Isabella, the daughter of John of Brienne, and the heiress of the kingdom of Jerusalem. In 1225 Frederick married Isabella, and immediately after the marriage he assumed the title of king in right of his wife, and exacted homage from the vassals of the kingdom[1]. It was thus as king of Jerusalem that Frederick began his crusade in the autumn of 1227. Scarcely, however, had he sailed from Brindisi when he fell sick of a fever which had been raging for some time among the ranks of his army, while they waited for the crossing. He sailed back to Otranto in order to recover his health, but the new pope, Gregory IX., launched in hot anger the bolt of excommunication, in the belief that Frederick was malingering once more. None the less the emperor sailed on his crusade in the summer of 1228, affording to astonished Europe the spectacle of an excommunicated crusader, and leaving his territories to be invaded by papal soldiers, whom Gregory IX. professed to regard as crusaders against a non-Christian king, and for whom he accordingly levied a tithe from the churches of Europe. The paradox of Frederick's crusade is indeed astonishing. Here was a crusader against whom a crusade was proclaimed in his own territories; and when he arrived in the Holy Land he found little obedience and many insults from all but his own immediate followers. Yet by adroit use of his powers of diplomacy and by playing upon the dissensions which raged between the descendants of Saladin's brother (Malik-al-Adil), he was able, without striking a blow, to conclude a treaty with the sultan of Egypt which gave him all that Richard I. had vainly attempted to secure by arduous fighting and patient negotiations. By the treaty of Feb. 18, 1229, which was to last for ten years, the sultan conceded to Frederick, in addition to the coast towns already in the possession of the Christians, Nazareth, Bethlehem and Jerusalem, with a strip of territory connecting Jerusalem with the port of Acre. As king of Jerusalem Frederick was now able to enter his capital: as one under excommunication, he had to see an interdict immediately fall on the city, and it was with his own hands—for no churchman could perform the office—that he had to take his crown from the altar of the church of the Sepulchre, and crown himself king of his new kingdom. He stayed in the Holy Land little more than a month after his coronation; and leaving in May he soon overcame the papal armies in Italy, and secured absolution from Gregory IX. (Aug. 1229). By his treaty with the sultan he had secured for Christianity the last 15 years of its possession of Jerusalem (1229–44): no man after Frederick II., until our own day, ever recovered the holy places for the religion which holds them most holy. Yet the Church might ask, with some justice, whether the means he had used were excused by the end which he had attained. After all, there was nothing of the holy war about the sixth crusade: there was simply huckstering, as in an Eastern bazaar, between a free-thinking, semi-oriental king of Sicily and an Egyptian sultan. It was indeed in the spirit of a king of Sicily, and not in the spirit—though it was in the rôle—of a king of Jerusalem, that Frederick had acted. It was from his Sicilian predecessors, who had made trade treaties with Egypt, that he had learned to make even the crusade a matter of treaty. The Norman line of Sicilian kings might be extinct; their policy lived after them in their Hohenstaufen successors, and that policy, as it had helped to divert the fourth crusade to the old Norman objective of Constantinople, helped still more to give the sixth crusade its secular, diplomatic, non-religious aspect.

[1]John of Brienne had only ruled in right of his wife, Mary. On her death (1212) John might be regarded as only ruling "by the courtesy of the kingdom" until her daughter, Isabella, was married, when the husband would succeed. That, at any rate, was the view Frederick II. took.

Forty years of struggle terminated in the possession of Jerusalem for 15 years. During those 15 years the kingdom of Jerusalem was agitated by a struggle between the native barons, championing the principle that sovereignty resided in the collective baronage, and taking their stand on the assizes, and Frederick II., claiming sovereignty for himself, and opposing to the assizes the feudal law of Sicily. It is a struggle between the king and the *haute cour:* it is a struggle between the aristocratic feudalism of the Franks and the monarchical feudalism of the Normans. Already in Cyprus, in the summer of 1228, Frederick II. had insisted on the right of wardship which he enjoyed as overlord of the island[1], and he had appointed a commission of five barons to exercise his rights. In 1229 this commission was overthrown by John of Ibelin, lord of Beirut, against whom it had taken proceedings. John of Beirut, like many of the Cypriot barons, was also a baron of the kingdom of Jerusalem; and resistance in the one kingdom could only produce difficulties in the other. Difficulties quickly arose when Frederick, in 1231, sent Marshal Richard to Syria as his legate. This in itself was a serious matter; according to the assizes, the barons maintained, the king must either personally reside in the kingdom, or, in the event of his absence, be represented by a regency. The position became more difficult, when the legate took steps against John of Beirut without any authorization from the high court. A gild was formed at Acre—the gild of St. Adrian—which, if nominally religious in its origin, soon came to represent the political opposition to Frederick, as was significantly proved by its reception of the rebellious John of Beirut as a member (1232). The opposition was successful: by 1233 Frederick had lost all hold on Cyprus, and only retained Tyre in his own kingdom of Jerusalem. In 1236 he had to promise to recognize fully the laws of the kingdom: and when, in 1239, he was again excommunicated by Gregory IX., and a new quarrel of papacy and empire began, he soon lost the last vestiges of his power. Till 1243 the party of Frederick had been successful in retaining Tyre, and the baronial demand for a regency had remained without effect; but in that year the opposition, headed by the great family of Ibelin, succeeded, under cover of asserting the rights of Alice of Cyprus to the regency, in securing possession of Tyre, and the kingdom of Jerusalem thus fell back into the power of the baronage. The very next year (1244) Jerusalem was finally lost. Its loss was the natural corollary of these dissensions. The treaty of Frederick with Malik-al-Kamil (d. 1238) had now expired, and new succours and new measures had become necessary for the Holy Land. Theobald of Champagne had taken the cross as early as 1230, and in 1239 he sailed to Acre in spite of the express prohibition of the pope, who, having quarrelled with Frederick II., was eager to divert any succour from Jerusalem itself, so long as Jerusalem belonged to his enemy. Theobald was followed (1240–41) by Richard of Cornwall, the brother of Henry III., who, like his predecessor, had to sail in

[1]Amalric I. of Cyprus had done homage to Henry VI. from whom he had received the title of king (1195).

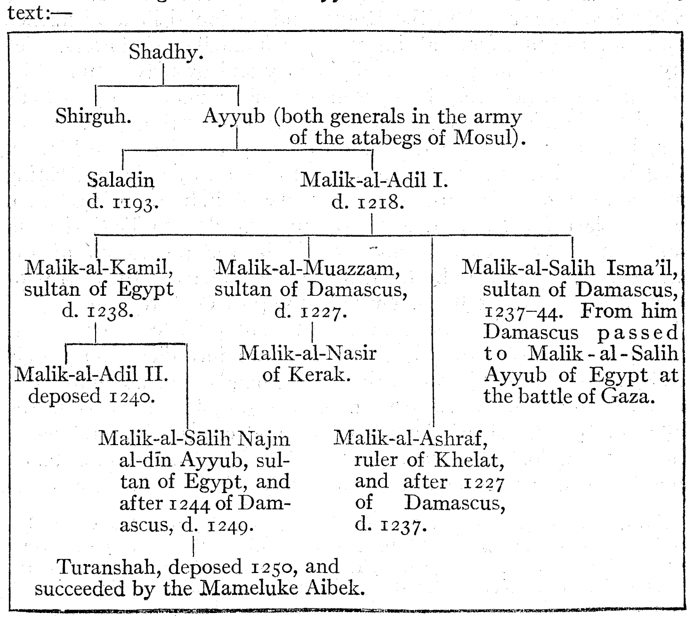
the teeth of papal prohibitions; but neither of the two achieved any permanent result, except the fortification of Ascalon. It was, however, by their own folly that the Franks lost Jerusalem in 1244. They consented to ally themselves with the ruler of Damascus against the sultan of Egypt; but in the battle of Gaza they were deserted by their allies and heavily defeated by Bibars, the Egyptian general and future Mameluke sultan of Egypt. Jerusalem, which had already been plundered and destroyed earlier in the year by Chorasmians (Khwarizmians), was the prize of victory, and Ascalon also fell in 1247.

THE CRUSADES OF ST. LOUIS

The Seventh Crusade.—As the loss of Jerusalem in 1187 produced the third crusade, so its loss in 1244 produced the seventh: as the preaching of the fifth crusade had taken place in the Lateran council of 1215, so that of the seventh crusade began in the Council of Lyons of 1245. But the preaching of the crusade by Innocent IV. at Lyons was a curious thing. On the one hand he repeated the provisions of the Fourth Lateran Council on behalf of the crusade to the Holy Land; on the other hand he preached a crusade against Frederick II., and promised to all who would join the full benefits of absolution and remission of sins. While the papacy thus bent its energies to the destruction of the crusades in their genuine sense, and preferred to use for its own political objects what was meant for Jerusalem, a layman took up the derelict cause with all the religious zeal which any pope had ever displayed. Paradoxically enough, it was now the turn for the papacy to exploit the name of crusade for political ends, as the laity had done before; and it was left to the laity to champion the spiritual meaning of the crusade even against the papacy. It was at the end of the year in which Jerusalem had fallen that St. Louis had taken the cross, and by all the means in his power he attempted to ensure the success of his projected crusade. He sought to mediate, though with no success, between the pope and the emperor; he descended to a whimsical piety, and took his courtiers by guile in distributing to them, at Christmas, clothing on which a cross had been secretly stitched. He started in 1248 with a gallant company, which contained his three brothers and the sieur de Joinville, his biographer; and after wintering in Cyprus he directed his army in the spring of 1249 against Egypt. The objective was unexpected: it may have been chosen by St. Louis, because he knew how seriously the power of the sultan was undermined by the Mamelukes, who were in the very next year to depose the Ayyubite dynasty, which had reigned since 1171, and to substitute one of their number as sultan. Damietta was taken without a blow, and the march for Cairo was begun, as it had been begun by the legate Pelagius in 1221. Again the invading army halted before Mansura (Dec. 1249); again it had to retreat. The retreat became a rout. St. Louis was captured, and a treaty was made by which he had to consent to evacuate Damietta and pay a ransom of 800,000 pieces of gold. Eventually he was released on surrendering Damietta and paying one-half of his ransom, and by the middle of May 1250 he reached Acre, having abandoned the Egyptian expedition. For the next four years he stayed in the Holy Land, seeking to do what he could for the establishing of the kingdom of Jerusalem. He was able to do but little. The struggle of papacy and empire paralysed Europe, and even in France itself there were few ready to answer the calls for help which St. Louis sent home from Acre. The one answer was the Shepherds' crusade, or crusade of the Pastoureaux—"a religious Jacquerie," as it has been called by Dean Milman. It had some of the features of the Children's crusade of 1212. That, too, had begun with a shepherd boy: the leader of the Pastoureaux, like the leader of the children, promised to lead his followers dry-shod through the seas; and tradition even said that this leader, "the master of Hungary," as he was called, was the Stephen of the Children's crusade. But the anti-clerical feeling and action of the Shepherds was new and ominous; and moved by its enormities the Government suppressed the new movement ruthlessly. None came to the aid of St. Louis; and in 1254, on the death of his mother, Blanche, the regent, he had to return to France.

The Mamelukes.—The final collapse of the kingdom of Jerusalem had been really determined by the battle of Gaza in 1244, and by the deposition of the Ayyubite dynasty by the Mamelukes. The Ayyubites had always been, on the whole, chivalrous and tolerant: Saladin and his successors, Malik-al-Adil and Malik-al-Kamil, had none of them shown an implacable enmity to the Christians. The Mamelukes, who are analogous to the janissaries of the Ottoman Turks, were made of sterner and more fanatical stuff; and Bibars, the greatest of these Mamelukes, who had commanded at Gaza in 1244, had been one of the leaders against St. Louis in 1250, and became sultan in 1260, was the sternest and most fanatical of them all. The Christians were, however, able to maintain a footing in Syria for 40 years after St. Louis' departure, not by reason of their own strength, but owing to two powers which checked the advance of the Mamelukes. The first of these was Damascus. The kingdom of Jerusalem, as we have seen, had profited by the alliance of Damascus as early as 1130, when the fear of the atabegs of Mosul had first drawn the two together; and when Damascus had been acquired by the ruler of Mosul, the hostility between the house of Nureddin in Damascus and Saladin in Egypt had still for a time preserved the kingdom (from 1171 onwards). Saladin had united Egypt and Damascus; but after his death dissensions broke out among the members of his family[1] which more than once led to wars between Damascus and Cairo. It has already been noticed that such a war between Malik-al-Kamil and his rivals accounts in large measure for the success of the sixth crusade; and it has been seen that the battle of Gaza (1244) was an act in the long drama of strife between Egypt and northern Syria. The revolution in Egypt in 1250 separated Damascus from Cairo more trenchantly than they had ever been separated since 1171: while a Mameluke ruled in Cairo, Malik-al-Nāsir of Aleppo was elected as sultan by the emirs of Damascus. But an entirely new and far more important factor in the affairs of the Levant was the extension of the empire of the Mongols during the 13th century. That empire had been founded by Jenghiz Khan in the first quarter of the century; it stretched from Peking on the east to the Euphrates and the Dnieper on the west. Two things gave the Mongols an influence on the history of the Holy Land and the fate of the crusades. In the first place, the south-western division of the empire, comprising Persia and Armenia, and governed about 1250 by the Khan Hulaku or Hulagu, was inevitably brought into relations, which were naturally hostile, with the Mohammedan Powers of Syria and Egypt. In the second place, the Mongols of the 13th century were not as yet, in any great numbers, Mohammedans; the official religion was "Shamanism," but in the Mongol army there were many Christians, the results of early Nestorian missions to the far East. This

[1] The following table of the Ayyubite rulers serves to illustrate the text:—



last fact in particular caused western Europe to dream of an alliance with the great khan "Prester John," who should aid in the reconquest of Jerusalem and the final conversion to Christianity of the whole continent of Asia. The crusades thus widen out, towards their close, into a general scheme for the Christianization of all the known world[1]. About 1220 James of Vitry was already hoping that 4,000 knights would, with the assistance of the Mongols, recover Jerusalem; but it is in 1245 that the first definite sign of an alliance with the Mongols appears. In that year Innocent IV. sent a Franciscan friar, Joannes de Plano Carpini, to the Mongols of southern Russia, and despatched a Dominican mission to Persia. Nothing came of either of these missions; but through them Europe first began to know the interior of Asia, for Carpini was conducted by the Mongols as far as Karakorum, the capital of the great khan, on the borders of China. Again in 1252 St. Louis (who had already begun to negotiate with the Mongols in the winter of 1248–49) sent the friar William of Rubruquis to the court of the great khan; but again nothing came of the mission save an increase of geographical knowledge. It was in the year 1260 when it first seemed likely that any results definitely affecting the course of the crusades would flow from the action of the Mongols. In that year Hulagu, the khan of Persia, invaded Syria and captured Damascus. His general, a Christian named Kitboga, marched southwards to attack the Mamelukes of Egypt, but he was beaten by Bibars (who in the same year became sultan of Egypt), and Damascus fell into the hands of the Mamelukes. Once more, in spite of Mongol intervention, Damascus and Cairo were united, as they had been united in the hands of Saladin; once more they were united in the hands of a devout Mohammedan, who was resolved to extirpate the Christians from Syria.

While these things were taking place around them, the Christians of the kingdom of Jerusalem only hastened their own fall by internal dissensions which repeated the history of the period preceding 1187. In part the war of Guelph and Ghibelline fought itself out in the East; and while one party demanded a regency, as in 1243, another argued for the recognition of Conrad, the son of Frederick II., as king. In part, again, a commercial war raged between Venice and Genoa, which attracted into its orbit all the various feuds and animosities of the Levant (1257). Beaten in the war, the Genoese avenged themselves for their defeat by an alliance with the Palaeologi, which led to the loss of Constantinople by the Latins (1261), and to the collapse of the Latin empire after 60 years of infirm and precarious existence. On a kingdom thus divided against itself, and deprived of allies, the arm of Bibars soon fell with crushing weight. The sultan, who had risen from a Mongolian slave to become a second Saladin, and who combined the physique and audacity of a Danton with the tenacity and religiosity of a Philip II., dealt blow after blow to the Franks of the East. In 1265 fell Caesarea and Arsuf; in 1268 Antioch was taken, and the principality of Bohemund and Tancred ceased to exist. In the years which followed on the loss of Antioch several attempts were made in the West to meet the progress of the new conqueror. In 1269 James the Conqueror of Aragon, at the bidding of the pope, turned from the long Spanish crusade to a crusade in the East in order to atone for his offences against the law matrimonial. An opportune storm, however, gave the king an excuse for returning home, as Frederick II. had done in 1227; and though his followers reached Acre, they hardly dared venture outside its walls, and returned home promptly in the beginning of 1270. More serious were the plans and the attempts of Charles of Anjou and Louis IX., in which the crusades may be said to have finally ended, save for sundry disjointed epilogues in the 14th and 15th centuries.

The Eighth Crusade.—Charles of Anjou had succeeded, as a result of the long "crusade" waged by the papacy against the Hohenstaufen from the Council of Lyons to the battle of Tagliacozzo (1245–68), in establishing himself in the kingdom of Sicily. With the kingdom of Frederick II. and Henry VI. he also took over their policy—the "forward" policy in the East which had also been followed by the old Norman kings. On the one hand he aimed at the conquest of Constantinople as Henry VI. had done before; and by the Treaty of Viterbo of 1267 he secured from the last Latin emperor of the East, Baldwin II., a right of eventual succession. On the other hand, like Frederick II., he aimed at uniting the kingdom of Jerusalem with that of Sicily; and here, too, he was able to provide himself with a title. On the death of Conradin, Hugh of Cyprus had been recognized in the East as king of Jerusalem (1269); but his pretensions were opposed by Mary of Antioch, a granddaughter of Amalric II., who was prepared to bequeath her claims to Charles of Anjou, and was therefore naturally supported by him. But the policy of Charles, which thus prepared the way for a crusade similar to those of 1197 and 1202, was crossed by that of his brother Louis IX. Already in 1267 St. Louis had taken the cross a second time, moved by the news of Bibars' conquests; and though the French baronage, including even Joinville himself, refused to follow the lead of their king, Prince Edward of England imitated his example. Louis had been led to think that the bey of Tunis might be converted, and in that hope he resolved to begin this eighth and last of the crusades by an expedition to Tunis. Charles, as anxious to attack Constantinople as he was reluctant to attack Tunis, with which Sicily had long had commercial relations, was forced to abandon his own plans and to join in those of his brother. St. Louis had barely landed in Tunis when he sickened and died, murmuring "Jerusalem, Jerusalem" (Aug. 1270); but Charles, who appeared immediately after his brother's death, was able to conduct the crusade to a successful conclusion. Negotiating in the spirit of a Frederick II., and acting not as a crusader but as a king of Sicily, he not only wrested a large indemnity from the bey for himself and the new king of France, but also secured a large annual tribute for his Sicilian exchequer. So ended the eighth crusade—much as the sixth had done—to the profound disgust of many of the crusaders, including Prince Edward of England, who only arrived on the eve of the conclusion of the treaty. Baulked of any opportunity of joining in the main crusade, Edward, after wintering in Sicily, conducted a crusade of his own to Acre in the spring of 1271. For over a year he stayed in the Holy Land, making little sallies from Acre, and negotiating with the Mongols, but achieving no permanent results. He returned home at the end of 1272, the last of the western crusaders; and thus all the attempts of St. Louis and Charles of Anjou, of James of Aragon and Edward of England left Bibars still in possession of all his conquests.

Two projects of crusades were started before the final expulsion of the Latins from Syria. In 1274, at the Council of Lyons, Gregory X., who had been the companion of Edward in the Holy Land, preached the crusade to an assembly which contained envoys from the Mongol khan and Michael Palaeologus as well as from many western princes. All the princes of western Europe took the cross; not only so, but Gregory was successful in uniting the Eastern and Western Churches for the moment, and in securing for the new crusade the aid of the Palaeologi, now thoroughly alarmed by the plans of Charles of Anjou. Thus was a papal crusade begun, backed by an alliance with Constantinople, and thus were the plans of Charles of Anjou temporarily thwarted. But in 1276 Gregory X. died, and all his plans died with him; there was to be no union of the monarchs of the West with the emperor of the East in a common crusade. Charles was able to resume his plans. In 1277 Mary of Antioch ceded to him her claims, and he was able to establish himself in Acre; in 1278 he took possession of the principality of Achaea. With these bases at his disposal he began to prepare a new crusade, to be directed primarily (like that of Henry VI. in 1197, and like his own projected crusade of 1270) against Constantinople. Once more his plans were fatally crossed: the Sicilian Vespers, followed by the coronation of Peter of Aragon as Sicilian king (1282), gave him troubles at home which occupied him for the rest of his days. This was the last serious attempt which was made in the West

[1] Though Europe indulged in dreams of Mongol aid, the eventual results of the extension of the Mongol empire were prejudicial to the Latin East. The sultans of Egypt were stirred to fresh activity by the attacks of the Mongols; and as Syria became the battle-ground of the two, the Latin principalities of Syria were fated to fall as the prize of victory to one or other of the combatants.

at a crusade on behalf of the dying kingdom of Jerusalem; and its collapse was quickly followed by the final extinction of the kingdom. A precarious peace had reigned in the Holy Land since 1272, when Bibars had granted a truce of ten years; but the fall of the great power of Charles of Anjou set free Kalā'ūn, the successor of Bibars' son, to complete the work of the great sultan. In 1289 Kalā'ūn took Tripoli, and the county of Tripoli was extinguished; in 1290 he died while preparing to besiege Acre, which was captured after a brave defence by his son and successor Khālil in 1291. Thus the kingdom of Jerusalem came to an end. The Franks evacuated Syria altogether, leaving behind them only the ruins of their castles to bear witness, to this very day, of the crusades they had waged and the kingdom they had founded and lost.

THE GHOST OF THE CRUSADES

The loss of Acre failed to stimulate the Powers of Europe to any new effort. France, always the natural home of the crusades, was too fully occupied, first by war with England and then by a struggle with the papacy, to turn her energies towards the East. But it is often the case that theory develops as practice fails; and as the theory of the Holy Roman empire was never more vigorous than in the days of its decrepitude, so it was with the crusades. Particularly in the first quarter of the 14th century, writers were busy in explaining the causes of the failures of past crusades, and in laying down the lines along which a new crusade must proceed. Several causes are recognized by these writers as accounting for the failure of the crusades. Some of them lay the blame on the papacy; and it is true that the papacy had contributed towards the decay of the crusades when it had allowed its own particular interests to overbear the general welfare of Christianity, and had dignified with the name and the benefits of a crusade its own political war against the Hohenstaufen. Others, again, find in the princes of Europe the authors of the ruin of the crusades; they, too, had preferred their own national or dynastic interests to the cause of a common Christianity. They had indeed, as has been already noticed, done even more; they had used the name of crusade, from the days of Henry VI. onwards, as a cover and an excuse for secular ambitions of their own; and in this way they had certainly helped, in very large measure, to discourage the old religious zeal for the Holy War. Other writers, again, blame the commercial cupidity of the Italian towns; of what avail, they asked with no little justice, was the crusade, when Venice and Genoa destroyed the naval bases necessary for its success by their internecine quarrels in the Levant (as in 1257), or—still worse—entered into commercial treaties with the common enemy against whom the crusades were directed? On the very eve of the fifth crusade, Venice had concluded a commercial treaty with Malik-al-Kamil of Egypt; just before the fall of Acre, the Genoese, the king of Aragon and the king of Sicily had all concluded advantageous treaties with the sultan Kalā'ūn. A fourth cause, on which many writers dwelt, particularly at the time when the suppression of the Templars was in question, was the dissensions between the two orders of Templars and Hospitallers, and the selfish policy of merely pursuing their own interest which was followed by both in common. But one might enumerate *ad infinitum* the causes of the failure of the crusades. It is simplest, as it is truest, to say that the crusades did not fail—they simply ceased; and they ceased because they were no longer in joint with the times. The moral character of Europe in 1300 was no longer the moral character of Europe in 1100; and the crusades, which had been the active and objective embodiment of the other worldly Europe of 1100, were alien to the secular, legal, scholastic Europe of 1300. While Edward I. was seeking to found a united kingdom in Great Britain; while the Habsburgs were entrenching themselves in Austria; above all, while Philippe le Bel and his legists were consolidating the French monarchy on an absolutist basis, there could be little thought of the Holy War. These were hard-headed men of affairs—men who would not lightly embark on joyous ventures, or seek for an ideal San Grail; nor were the popes, doomed to the Babylonian captivity for 70 long years at Avignon, able to call down the spark from on high which should consume all earthly ambitions in one great act of sacrifice.

But it is long before the death of any institution is recognized; and it was inevitable that men should busy themselves in trying to rekindle the dead embers into new life. Pierre Dubois, in a pamphlet *"De recuperatione Sanctae Terrae,"* addressed to Edward I. in 1307, advocates a general council of Europe to maintain peace and prevent the dissensions which—as, for instance, in 1192—had helped to cause the failure of past crusades. Along with this advocacy of internationalism goes a plea for the disendowment of the Church, in order to provide an adequate financial basis for the future crusade. Other proposals, made by men well acquainted with the East, are more definitely practical and less political in their intention. A blockade of Egypt by an international fleet, an alliance with the Mongols, the union of the two great orders—these are the three staple heads of these proposals. Something, indeed, was attempted, if little was actually done, under each of these three heads. The plan of an international fleet to coerce the Mohammedan is even to this day ineffective; but the Hospitallers, who acquired a new basis by the conquest of Rhodes in 1310, used their fleet to enforce a partial and, on the whole, ineffective blockade of the coast of the Levant. The union of the two orders, already suggested at the Council of Lyons in 1245, was nominally achieved by the Council of Vienne in 1311; but the so-called "union" was in reality the suppression of the Templars, and the confiscation of all their resources by the cupidity of Philippe le Bel. The alliance with the Mongols remained, from the first to the last, something of a chimera; and the last visionary hope vanished when the Mongols finally embraced Mohammedanism, as, by the end of the 14th century, they had almost universally done.

Isolated enterprises somewhat of the character of a crusade but hardly serious enough to be dignified by that name, recur during the 14th century. The French kings are all crusaders—in name—until the beginning of the Hundred Years' War; but the only crusader who ever waged war in Palestine and sought to shake the hold of the Mamelukes on the Holy Land was Peter I., king of Cyprus from 1359 to 1369. Peter founded the order of the Sword for the delivery of Jerusalem; and instigated by his chancellor, de Mézières (one of the last of the theorists who speculated and wrote on the crusades), he attempted to revive the old crusading spirit throughout the west of Europe. The mission which he undertook with his chancellor for this purpose (1362–65) only produced a crop of promises or excuses from sovereigns like Edward III. or the emperor Charles IV.; and Peter was forced to begin the crusade with such volunteers as he could collect for himself. In the autumn of 1365 he sacked Alexandria; in 1367 he ravaged the coast of Syria, and inflicted serious damages on the sultan of Egypt. But in 1369 he was assassinated, and the last romantic figure of the crusades died, leaving only the legacy of his memory to his chancellor de Mézières, who for nearly 40 years longer continued to be the preacher of the crusades to Europe, advocating—what always continued to be the "dream of the old pilgrim"— a new order of knights of the Passion of Christ for the recovery and defence of Jerusalem. De Mézières was the last to advocate seriously, as Peter I. was the last to attempt, a crusade after the old fashion—an offensive war against Egypt for the recovery of the Holy Sepulchre. From 1350 onwards the crusade assumes a new aspect; it becomes defensive, and it is directed against the Ottoman Turks, a tribe of Turcomans who had established themselves in the sultanate of Iconium at the end of the 13th century, during the confusion and displacement of peoples which attended the Mongol invasions. As early as 1308 the Ottoman Turks had begun to settle in Europe; by 1350 they had organized their terrible army of janissaries. They threatened at once the débris of the old Latin empire in Greece and the Archipelago, and the relics of the Byzantine empire round Constantinople; they menaced the Hospitallers in Rhodes and the Lusignans in Cyprus. It was natural that the popes should endeavour to form a coalition between the various Christian Powers which were threatened by the Turks; and Venice, anxious to preserve her possessions in the Aegean, zealously seconded their efforts. In 1344 a crusade, in which Venice, the Cypriots and the Hospitallers all joined, ended in the conquest of Smyrna; in 1345 another crusade, led by Humbert, dauphin of Vienne, ended in failure. The Turks continued their progress; in 1363 they captured Philippopolis, and in 1365 they entered Adrianople; the whole Balkan peninsula was threatened, and even Hungary itself seemed doomed. Already in 1365 Urban VI. sought to unite the king of Hungary and the king of Cyprus in a common crusade against the Turks; but it was not till 1396 that an attempt was at last made to supplement by a land crusade the naval crusades of 1344 and 1345. Master of Serbia and of Bulgaria, as well as of Asia Minor, the sultan Bayezid was now threatening Constantinople itself. To arrest his progress, a crusade, preached by Boniface IX., led by John the Fearless of Burgundy, and joined chiefly by French knights, was directed down the valley of the Danube into the Balkans; but the old faults stigmatized by de Mézières, *divisio* and *propria voluntas,* were the ruin of the crusading army, and at the battle of Nicopolis it was signally defeated. Not the Western crusades but an Eastern rival, Timur (Tamerlane), king of Transoxiana and conqueror of southern Russia and India, was destined to arrest the progress of Bayezid; and from the battle of Angora (1402) till the days of Murad II. (1422) the Ottoman power was paralysed. Under Murad, however, it rose to its old height. To meet the new danger a new union of the Churches of the East and the West was attempted. As in 1074 Gregory VII. had dreamed of such a union, to be followed by a joint attack of East and West on the Seljuks, so in 1439, at the Council of Florence, a new union of the two Churches was again attempted and temporarily secured, in order that a united Christendom might face the new Turkish danger[1]. The logical result of the union was the crusade of 1443. An army of cosmopolitan adventurers, led by the cardinal Caesarini, joined the forces of Wladislaus of Poland and John Hunyadi of Transylvania, and succeeded in forcing on Murad II. a truce of ten years at Szegedin in 1444. But the crusaders broke the truce, to which Caesarini had never consented; and, attempting to better what was already good enough, they were defeated at Varna. Here the last crusade ended; and nine years afterwards, in 1453, Mohammed II., the successor of Murad, captured Constantinople. It was in vain that the popes sought to gather a new crusade for its recovery; Pius II., who had vowed to join the crusade in person, only reached Ancona in 1464 to find the crusaders deserting and to die. Yet the ghost of the crusades still lingered. It became a convention of diplomacy, designed to cover any particularly sharp piece of policy which needed some excuse; and the Treaty of Granada, formed between Louis XII. and Ferdinand of Aragon for the partition of Naples in 1500, was excused as a thing necessary in the interests of the crusades. In a more noble fashion the crusade survived in the minds of the navigators; "Vasco da Gama, Christopher Columbus, Albuquerque, and many others dreamed, and not insincerely, that they were labouring for the deliverance of the Holy Land, and they bore the Cross on their breasts." "Don Henrique's scheme," it has been said, "represents the final effort of the crusading spirit; and the naval campaigns against the Muslim in the Indian seas, in which it culminated 40 years after Don Henrique's death, may be described as the last crusade."

RESULTS OF THE CRUSADES

In one vital respect the result of the crusades may be written down as failure. They ended, not in the occupation of the East by the Christian West, but in the conquest of the West by the Mohammedan East. The crusades began with the Seljuk Turk planted at Nicaea; they ended with the Ottoman Turk entrenched by the Danube. Nothing is more striking in history than the recession of Christianity in the East after the 13th century. In the 13th century the whole of Europe was Christian; part of Asia Minor still belonged to Greek Christianity, and there was a Christian kingdom in Palestine. Nor was this all. A wide missionary activity had begun in the 13th century—an activity which was the product of the crusades and the contact with the Muslim which they brought, but which yet helped to check the crusades, substituting as it did peaceful and spiritual conquests of souls for the violence and materialism of even a Holy War. The Eastern mission had been begun by St. Francis, who had visited and attempted to convert the sultan of Egypt during the fifth crusade (1220); within 100 years the little seed had grown into a great tree. A great field for missionary enterprise opened itself in the Mongol empire, in which, as has already been mentioned, there were many Christians to be found; and by 1350 this field had been so well worked that Christian missions and Christian bishops were established from Persia to Peking, and from the Dnieper to Tibet itself. But a Mohammedan reaction came, thanks in large measure to the zeal of Timur; and central Asia was lost to Christianity. Everywhere in the 15th century, in Europe and in Asia, the crescent was victorious over the cross; and crusade and mission, whether one regards them as complementary or inimical, perished together. But while from this point of view the crusades appear as a failure, it must not be forgotten that elsewhere than in the East crusades did attain some success. A crusade won for Christianity the coast of the eastern Baltic (*see* TEUTONIC ORDER); and the centuries of the Spanish crusade ended in the conquest of the whole of Spain for Christianity.

The history of the crusades must be viewed rather as a chapter in the history of civilization in the West itself, than as an extension of Western dominion or religion to the East. It is a chapter very difficult to write, for while on the one hand an ingenious and speculative historian may refer to the influence of the crusades almost everything which was thought or done between 1100 and 1300, a cautious writer who seeks to find documentary evidence for every assertion may be rather inclined to attribute to that influence little or nothing[1]. The dissolution of feudalism, the development of towns, the growth of scholasticism, all these and much more have been ascribed to the crusades, when in truth they were concomitants rather than results, or at any rate, if in part the results of the crusades, were in far larger part the results of other things. At most, therefore, it may be admitted that the crusades *contributed* to the dissolution of feudalism by putting property on the market and disturbing the validity of titles; that they aided the development of towns by vastly increasing the volume of trade; and that they furthered the growth of scholasticism by bringing the West into contact with the mind of the East. If we seek the peculiar and definite results of the crusades, we must turn to narrower issues. In the first place, the crusades represent the attempt of a feudal system, bound under the law of primogeniture, to dispose of its younger sons. They are attempts at feudal colonization; and as such they resulted in a number of colonies—the kingdom of Jerusalem, the kingdom of Cyprus, the Latin empire of Constantinople. They resulted, too, in a number of "chartered companies"—that is to say, the three military orders, which, beginning as charitable societies, developed into military clubs, and developed again from military clubs into commercial companies, possessed of banks, navies and considerable territories. In the second place, as has already been noticed, the crusades represent the attempt of Western commerce to find new and more easy routes to the wealth of the East; and in this respect they led to various results. On the one hand they led to the establishment of emporia in the East—for instance, Acre, and after the fall of Acre, Famagusta, both in their day great centres of Levantine trade. On the other hand, the commodities which poured into Venice and Genoa from the East had to find a route for their diffusion through Europe. The great route was that which led from Venice over the Brenner and up the Rhine to Bruges; and

[1]The union of 1274, conceded by the Palaeologi at the Council of Lyons in order to defeat the plans of Charles of Anjou, had only been temporary.

[1]Authors like Heeren (*Versuch einer Entwickelung der Folgen der Kreuzzüge*) and Michaud (in the last volume of his *Histoire des croisades*) fall into the error of assigning all things to the crusades. Even Prutz, in his *Kulturgeschichte der Kreuzzüge,* overestimates the influence of the crusades as a chapter in the history of civilization. He depreciates unduly the Western civilization of the early middle ages, and exalts the civilization of the Arabs; and starting from these two premises, he concludes that modern civilization is the offspring of the crusades, which first brought East and West together.

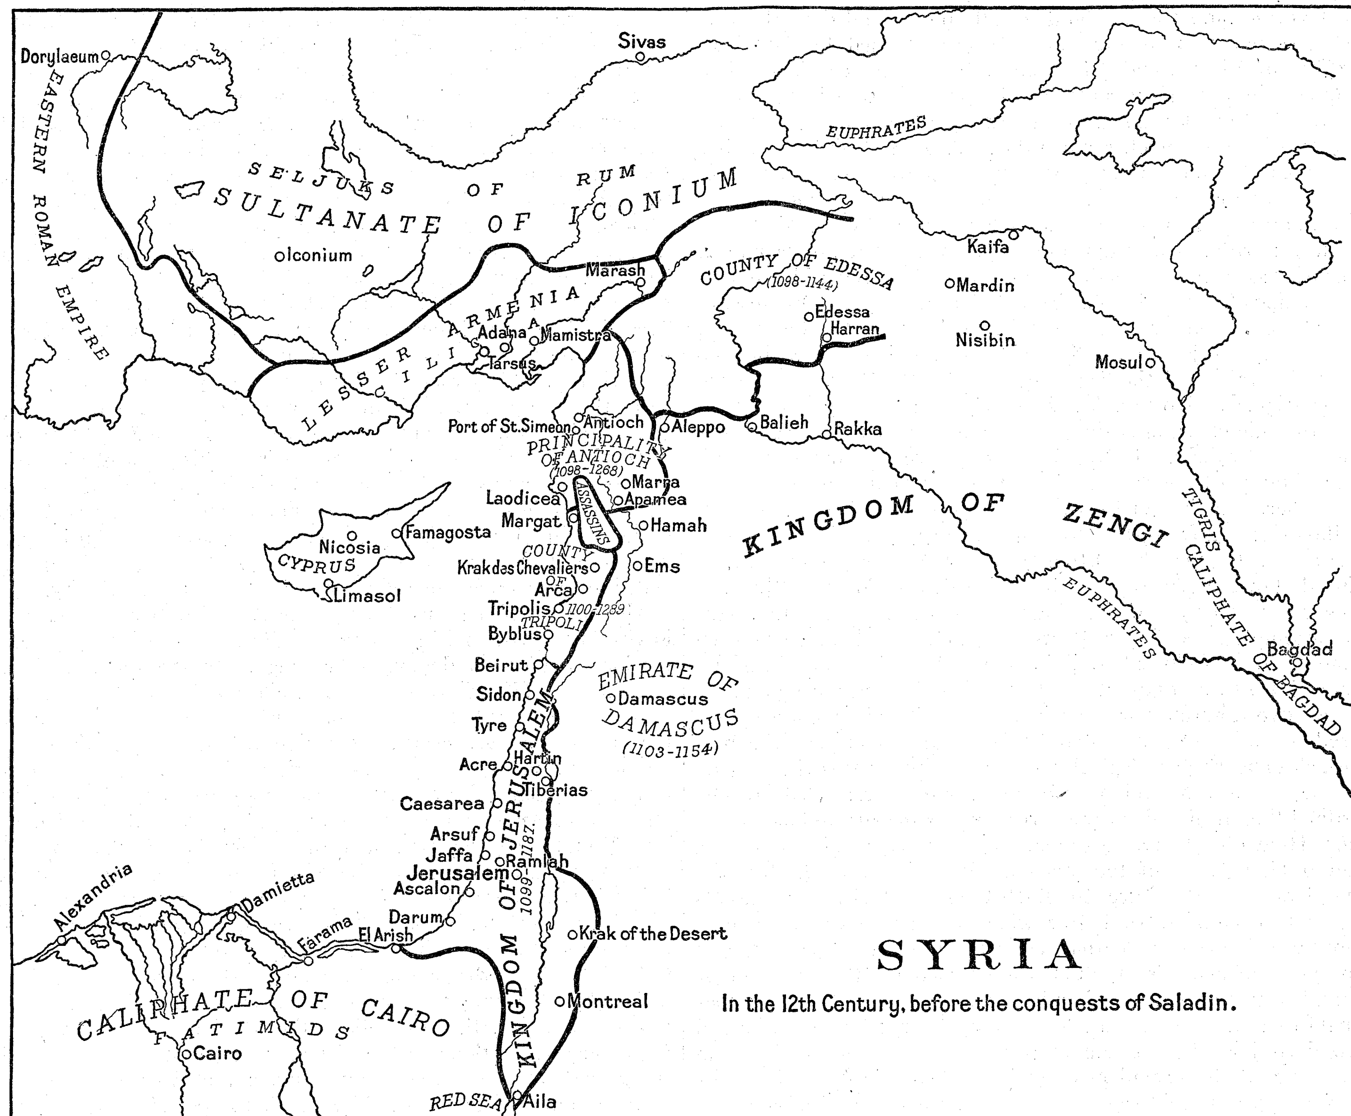


FIG. 5.—THE BATTLEGROUND OF CRUSADERS AND MOHAMMEDANS FOR TWO CENTURIES
There were eight crusades, the first beginning in 1096, the last ending in 1291. During this period Jerusalem was taken, retaken, and ceded, several times. Famous among Crusaders were Godfrey of Bouillon, Conrad II., Louis VII., Richard Coeur-de-Lion, Frederic I., Philip Augustus, St. Louis and Prince Edward of England, while Saladin and Bibars stand out with equal prominence among the Mohammedans

this route became the long red line of municipal development, along which—in Lombardy, Germany and Flanders—the great towns of the middle ages sprang to life. Partly as a result of this trade, ever pushing its way farther east, and partly as a result of the Asiatic missions, which were themselves an accompaniment and effect of the crusades, a third great result of the crusades came to light in the 13th century—the discovery of the interior of Asia, and an immense accession to the sphere of geography. When one remembers that missionaries like Piano Carpini, and traders like the Venetian Polos, either penetrated by land from Acre to Peking, or circumnavigated southern Asia from Basra to Canton, one realizes that there was, about 1300, a discovery of Asia as new and tremendous as the discovery of America by Columbus two centuries later. At the same time the old knowledge of nearer Asia was immensely deepened. It has already been noticed how military reconnaissances of the routes to Egypt came to be made; but more important were the guide-books, of which a great number were written to guide the pilgrims from one sacred spot of Bible history to another. There were mediaeval Baedekers in abundance for the use of the annual flow of tourists, who were carried every Easter by the vessels of the Italian towns or of the Orders to visit the Holy Land and to bathe in Jordan, to gather palms, and to see the miracle of fire at the Sepulchre.

Colonization, trade, geography—these, then, are three things closely connected with the history of the crusades. The development of the art of war, and the growth of a systematic taxation, are two debts which mediaeval Europe also owed to the crusades. Partly by contact with the Byzantines, partly by conflict with the Mohammedans, the Franks learned new methods both of building and of attacking fortifications. The concentric castle, with its rings of walls, began to displace the old keep and bailey with their single wall, as the crusaders brought back news from the East[1]. The art of the sapper and miner, the use of siege instruments like the mangonel, and the employment of various "fires" as missiles, were all known among the Mohammedans; and in all these respects the Franks learned from their enemies. The common use of armorial bearings, and the practice of the tournament, may be oriental in their origin; the latter has its affinities with the equestrian exercises of the Jerid, and the former, though of prehistoric antiquity, may have received a new impulse from contact with the Arabs. The military development which sprang

[1]It is difficult to decide how far Arabic models influenced ecclesiastical architecture in the West as a result of the crusades. Greater freedom of moulding and the use of trefoil and cinquefoil may be, but need not be, explained in this way. The pointed arch owes nothing to the Arabs; it is already used in England in early Norman work. Generally, one may say that Western architecture is independent of the East. It is even possible that the concentric castle was developed originally in the West and only imitated afterwards in Syria.

from the crusades is thus largely a matter of borrowing; the financial development is independent and indigenous in the West. As early as 1147 Louis VII. had imposed a tax in the interests of the crusades; and that tax had been repeated by Louis, imitated by Henry II. in 1166, and still further extended in the Saladin tithe of 1188. The taxation of 1166 is important as the first to fall on "moveables"; the whole scheme of taxation may be regarded as the beginning of a modern system of taxation. But it was not only to the lay power that the crusades gave an excuse for taxation; the papacy also profited. Tithes for the crusades were first imposed on the clergy by Innocent III. at the Lateran Council of 1215; and clerical taxation was thus part of the whole statesmanlike project of the fifth crusade as it was sketched by the great pope. Henceforth tithes for the crusades are regular; under Gregory IX. they become a great part of the papal resources in the crusade against the Hohenstaufen; and in the 16th century they are still a part of the Church government.

In many other ways the Europe over which the crusades had passed was different from the Europe of the 11th century. In the first place, many political changes had been wrought, largely under its influence. Always in large part French, the crusades had on the whole contributed to exalt the prestige of France, until it stood at the end of the 13th century the most considerable Power in Europe. It was France which had colonized the Levant; it was the French tongue which was used in the Levant; and the results of the ancient and continuous connection with the East are still to be traced to-day. Of the other great powers of Europe, England and Germany had been little changed by the crusades, save that Germany had been extended towards the East by the conquests of the Teutonic Order; but the Eastern empire had been profoundly modified, and the papacy had suffered a great change. The Eastern empire had been for a time annihilated by the movement which in 1095 it had helped to evoke; and if it rose from its ashes in 1261 for two centuries of renewed life it was never more than the shadow of its old self, with little hold on Asia Minor and less on Greece and the Archipelago, which the Latins still continued to occupy until they were finally conquered by the Ottoman Turks. The papacy, on the other hand, had grown as a result of the crusades. Popes had preached them; popes had financed them; popes had sent their legates to lead them. Through them the popes had deposed the emperors of the West from their headship of the world, partly because through the crusades the popes were able to direct the common Christianity of Europe in a foreign policy of their own without consultation with the emperor, partly because in the 13th century they were ultimately able to direct the crusade itself against the empire. Yet while they had magnified, the crusades had also corrupted the papacy. They became an instrument in its hands which it used to its own undoing. It cried crusade when there was no crusade; and the long crusade against the Hohenstaufen, if it gave the papacy an apparent victory, only served in the long run to lower its prestige in the eyes of Europe.

When we turn from the sphere of politics to the history of civilization and culture, we find the effects of the crusades as deeply impressed, if not so definitely marked. The crusades had sprung from the policy of a theocratic government counting on the motive of otherworldliness; they had helped in their course to overthrow that motive, and with it the government which it had made possible. In part they had provided a field in which the layman could prove that he, too, was a priest; in part they had brought the West into a living and continuous contact with a new faith and a new civilization. They had torn men loose from the ancestral custom of home to walk in new ways and see new things and hear new thoughts; and some broadening of view, some lessening in the intensity of the old one-sidedness, was the inevitable result. It is not so much that the West came into contact with a particular civilization in the East, or borrowed from that civilization; it is simply that the West came into contact with something unlike itself, yet in many ways as high as, if not higher than, itself. The spirit of *Nathan der Weise* may not have been exactly the spirit engendered by the crusades; and yet it is not without reason that Lessing stages the fable which teaches toleration in the Latin kingdom of Jerusalem. In any case the accusations made against the Templars at the time of their suppression prove that there was, at any rate in the ranks of those who knew the East, too little of absolute orthodoxy. While a new spirit which compares and tolerates thus sprang from the crusades, the large sphere of new knowledge and experience which they gave brought new material at once for scientific thought and poetic imagination. Not only was geography more studied; the crusades gave a great impulse to the writing of history, and produced, besides innumerable other works, the greatest historical work of the middle ages—the *Historia transmarina* of William of Tyre. Mathematics received an impulse, largely, it is true, from the Arabs of Spain, but also from the East; Leonardo Fibonacci, the first Christian algebraist, had travelled in Syria and Egypt. The study of oriental languages began in connection with the Christian missions of the East; Raymundus Lullus, the indefatigable missionary, induced the Council of Vienne to decide on the creation of six schools of oriental languages in Europe (1311). But the new field of poetic literature afforded by the crusades is still more striking than this development of science. New poems in abundance dealt with the history of the crusades, either in a faithful narrative, like that of the *Chanson* of Ambroise, which narrates the third crusade, or in a free and poetical spirit, such as breathes in the *Chanson d'Antioche*. Nor was this all. The crusades afforded new details which might be inserted into old matters, and a new spirit which might be infused into old subjects; and a crusading complexion thus came to be put upon old tales like those of Arthur and Charlemagne. By the side of these greater things it may seem little, and yet, just because it is little, it is all the more significant that the crusades should have familiarized Europe with new plants, new fruits, new manufactures, new colours, and new fashions in dress. Sugar and maize; lemons and melons; cotton, muslin and damask; lilac and purple (azure and gules are words derived from the Arabic); the use of powder and of glass mirrors, and even of the rosary itself—all these things came to mediaeval Europe from the East and as a result of the crusades. To this day there are many Arabic words in the languages of western Europe which are a witness of the crusades—words relating to trade and seafaring, like tariff and corvette, or words for musical instruments, like lute.

When all is said, the crusades remain a wonderful and perpetually astonishing act in the great drama of human life. They touched the summits of daring and devotion, if they also sank into the deep abysms of shame. Motives of self-interest may have lurked in them—otherworldly motives of buying salvation for a little price, or worldly motives of achieving riches and acquiring lands. Yet it would be treason to the majesty of man's incessant struggle towards an ideal good, if one were to deny that in and through the crusades men strove for righteousness' sake to extend the kingdom of God upon earth. Humanity is the richer for the memory of those millions of men, who followed the "way of the Holy Sepulchre" in the sure and certain hope of an eternal reward. The ages were not dark in which Christianity could gather itself together in a common cause, and carry the flag of its faith to the grave of its Redeemer; nor can we but give thanks for their memory, even if for us religion is of the spirit, and Jerusalem in the heart of every man who believes in Christ.

Bibliography.—In dealing with the literature of the crusades, it is perhaps better, though ideally less scientific, to begin with chronicles and narratives rather than with documents. One of the results of the crusades, as has just been suggested above, was a great increase in the writing of history. Crusaders themselves kept diaries or *itineraria;* while home-keeping ecclesiastics in the West—monks like Robert of Reims, abbots like Guibert of Nogent, archbishops like Balderich of Dol—found a fertile subject for their pens in the history of the crusades. The history of a series of actions like the crusades must primarily be based on these accounts, and more particularly on the former: narratives must precede documents where one is dealing, not with the continuous life of an organized kingdom, but with a number of enterprises—especially when those enterprises have been, as in this case, excellently narrated by contemporary writers.

I. Chronicles and Narratives of the Crusades.—(1) Collections. The authorities for the crusades have been collected in Bongars, *Gesta*

GENEALOGY OF THE KINGS OF JERUSALEM

Godfrey, advocatus 1099–1100.

Baldwin I., brother of Godfrey, king 1100–18.

Baldwin II., nephew of Godfrey and Baldwin I., and king 1118–31.

- **Fulk of Anjou,** king 1131–43. = Melisinda
  - **Baldwin III.,** king 1143–62.
  - **Amalric I.,** king 1162–74.
    - **Baldwin IV.,** king 1174–83.
    - Sibylla = (1) William of Montferrat;
      - **Baldwin V.,** king 1183–86.
    - Sibylla = (2) **Guy de Lusignan,** king 1186–92.
    - Isabella = (1) Humfred of Turon.
    - Isabella = (2) **Conrad of Montferrat,** acknowledged king in 1192.
      - Mary, queen under a regency from 1205–10. = **John of Brienne,** king 1210–25.
        - Isabella = **Frederick II.,** emperor of the West and king of Jerusalem 1225–50.
          - **Conrad IV.,** king of Germany and of Jerusalem 1250–55.
            - **Conradin,** king 1255–68.
    - Isabella = (3) **Henry of Champagne,** king 1192–97.
      - Alice = Hugh I. of Cyprus, son of Amalric II. by his first wife.
        - Henry I. of Cyprus = Plaisance of Antioch.
          - Hugh II. of Cyprus.
        - Isabella = John de Lusignan.
          - **Hugh** (III. of Cyprus and) **I. of Jerusalem,** 1269–84.
            - **John I.,** king of Cyprus, 1284–85.
            - **Henry** (III. of Cyprus and) **II. of Jerusalem,** king from 1285 to the fall of the kingdom in 1291.
    - Isabella = (4) **Amalric II.,** brother of Guy de Lusignan, king 1197–1205 (also king of Cyprus).
      - Melisinda = Bohemund IV.
        - Mary of Antioch, who died 1277, leaving her claims to Charles of Anjou (king of Sicily).
- Alice = Bohemund II. of Antioch (*q.v.*).

Dei per Francos (Hanover, 1611) (incomplete); Michaud, *Bibliothèque des croisades* (1829) (containing translations of select passages in the authorities); the *Recueil des historiens des croisades*, published by the Académie des Inscriptions (1841 onwards) (the best general collection, containing many of the Latin, Greek, Arabic and Armenian authorities, and also the text of the assizes; but sometimes poorly edited and still incomplete); and the publications of the Société de l'Orient Latin (founded in 1875), especially the *Archives*, two volumes published in 1881 and 1884, and the volumes of the *Revue*, which contain not only new texts, but articles and reviews of books. (2) Particular authorities. The crusades—a movement which engaged all Europe and brought the East into contact with the West—must necessarily be studied not only in the Latin authorities of Europe and of Palestine, but also in Byzantine, Armenian and Arabic writers. There are thus some four or five different points of view to be considered.

The First Crusade, far more than any other, became the theme of a multitude of writings, whose different degrees of value it is all-important to distinguish. Until about 1840 the authority followed for its history was naturally the great work of William of Tyre. For the first crusade William had followed Albert of Aix; and he had consequently depicted Peter the Hermit as the prime mover in the crusade. But about 1840 Ranke suggested, and von Sybel in his *Geschichte des ersten Kreuzzuges* (1841) proved, that Albert of Aix was *not* a good authority, and that consequently William of Tyre must be set aside for the history of the first crusade, and other and more contemporary authorities used. In writing his account of the first crusade, von Sybel accordingly based himself on the three contemporary Western authorities—the *Gesta Francorum*, Raymund of Agiles, and Fulcher. His view of the value of Albert of Aix, and his account of the first crusade, have been generally followed (Kugler alone having attempted, to some extent, to rehabilitate Albert of Aix); and thus von Sybel's work may be said to mark a revolution in the history of the first crusade, when its legendary features were stripped away, and its real progress was first properly discovered.

Taking the Western authorities for the first crusade separately, one may divide them, in the light of von Sybel's work, into four kinds—the accounts of eye-witnesses; later compilations based on these accounts; semi-legendary and legendary narratives; and lastly, in a class by itself, the "History" of William of Tyre, who is rather a scientific historian than a chronicler.

(*a*) The three chief eye-witnesses are the anonymous author of the *Gesta Francorum*, Raymund of Agiles, and Fulcher. The anonymous author of the *Gesta* (*see* Hagenmeyer's edition, Heidelberg, 1890) was a Norman of south Italy, who followed Bohemund, and accordingly depicts the progress of the first crusade from a Norman point of view. He was a layman, marching and fighting in the ranks; and thus he is additionally valuable as representing the opinion of the ordinary crusader. Finally he was an eye-witness throughout, and absolutely contemporary, in the sense that he wrote his account of each great event practically at the time of the event. He is the primary authority for the first crusade. Raymund of Agiles, a Provençal clerk and a follower of Raymund of Toulouse, writes his *Historia Francorum qui ceperunt Jerusalem* from the Provençal point of view. He gives an ecclesiastic's account of the first crusade, and is specially full on the spiritualistic phenomena which accompanied and followed the finding of the Holy Lance. His book might almost be called the "Visions of Peter Bartholomew and others," and it is written in the plain matter-of-fact manner of Defoe's narratives. He, too, was an eye-witness throughout, and thoroughly honest; and his account ranks second to the *Gesta*. Fulcher of Chartres originally followed Robert of Normandy, but in Oct. 1097 he joined Baldwin of Lorraine in his expedition to Edessa, and afterwards followed his fortunes. His *Historia Hierosolymitana*, which extends to 1127, and embraces not only the history of the first crusade, but also that of the foundation of the kingdom of Jerusalem, is written on the whole from a Lotharingian point of view, and is thus a natural complement to the accounts of the Anonymous and Raymund. His account of the first crusade itself is poor (he was absent at Edessa during its course), but otherwise he is an excellent authority. A kindly old pedant, Fulcher interlards his history with much discourse on geography, zoology and sacred history. Besides these three chief eye-witnesses we may also mention the *Annales Genuenses* by the Genoese consul Caffarus, and the *Annales Pisani* of Bernardus Marago, useful as giving the mercantile and Italian side of the crusade; the *Hierosolymita* of Ekkehard, the German abbot of Aura, who first came to Jerusalem about 1101 (partly based on the *Gesta*, but also of independent value: *see* Hagenmeyer's edition, Tübingen, 1877); and Ralph of Caen's *Gesta Tancredi*, composed on the basis of information supplied by Tancred himself. The last two works, if not actually the works of eye-witnesses, are at any rate first-hand, and belong to the category of primary writers rather than to that of later compilations. Finally, to contemporary writers we may add contemporary letters, especially those written by Stephen of Blois and Anselm of Ribemont, and the three letters sent to the West by the crusading princes during the first crusade (*see* H. Hagenmeyer, *Epistulae et Chartae*, etc., Innsbruck, 1901, and the *Inventaire critique* of the Comte de Riant, Paris, 1880).

(*b*) The later compilations are chiefly based on the *Gesta*, whose uncouth style many writers set themselves to mend. In the first place, there is the *Historia de Hierosolymitano itinere* of Tudebod, which according to Besly, writing in 1641, is the original from which the *Gesta* was a mere plagiarism—an absolute inversion of the truth, as von Sybel first proved two centuries later. Secondly, besides the plagiarist Tudebod, there are the artistic *rédacteurs* of the *Gesta*, who confess their indebtedness, but plead the bad style of their original—Guibert of Nogent, Balderich of Dol, Robert of Reims (all *c.* 1120–30), and Fulco, the author of a Virgilian poem on the crusades, continued by Gilo (*ob. c.* 1142). Of these, the monk Robert was more popular in the middle ages than either the pompous abbot Guibert or the quiet garden-loving archbishop of Dol.

(*c*) The growth of a legend, or perhaps better, a saga of the first crusade began, according to von Sybel, even during the crusade itself. The basis of this growth is partly the story-telling instinct innate in all men, which loves to heighten an effect, sharpen a point or increase a contrast—the instinct which breathes on Icelandic Sagas such as that of *Burnt Njal;* partly the instinct of idolization, if it may be so called, which leads to the perversion into impossible greatness of an approved character, and has created, in this instance, the legendary figures of Peter the Hermit and Godfrey of Bouillon (*qq.v.*); partly the religious impulse, which counted nothing wonderful in a holy war, and imported miraculous elements even into the sober pages of the *Gesta*. These instincts and impulses would be at work already among the soldiers during the crusade, producing a saga all the more readily, as there were poets in the camp; for we know that a certain Richard, who joined the first crusade, sang its exploits in verse, while still more famous is the princely troubadour, William of Aquitaine, who joined the crusade of 1100. If we are to follow von Sybel rather than Kugler, this saga of the first crusade found one of its earliest expressions (*c.* 1120) in the prose work of Albert of Aix (*Historia Hierosolymitana*)—genuine saga in its inconsistencies, its errors of chronology and topography, its poetical colour, and its living descriptions of battles. Kugler, however, regards Albert as a copyist, somewhat in the manner of Tudebod, of an unknown writer of value, who belonged to the Lotharingian ranks during the crusade, and settled in the kingdom of Jerusalem afterwards (*see* B. Kugler, *Albert von Aachen*, Stuttgart, 1885)[1]. In the *Chanson des chétifs* and the *Chanson d'Antioche* the legend of the crusades more certainly finds its expression (*see* Pigonneau, *Le Cycle de la Croisade*, 1877, and J. Bedier, *Les Chansons des Croisades*, 1909). The former, composed at Antioch about 1130, contained an idolization of the Hermit: the latter is a poem written about 1180 by Graindor of Douai, who used as his basis the verses of the crusader Richard (*see* the edition of P. Paris, 1848). It shows the growth of the legend that Graindor regards the vision of the Hermit as responsible for the crusade, and makes the crusade led by him precede, and indeed occasion by its failure, the meeting at Clermont (which is dated in May instead of November). Into the legendary overgrowth of the first crusade we cannot here enter any further; but it is perhaps worth while to mention that the French legend of the third crusade equally perverted the truth, making Richard I. return home in disgrace, while Philip Augustus stays, captures Damascus and mortally wounds Saladin (*cf.* G. Paris, *L'Estoire de la guerre sainte*, 1897; Introduction).

(*d*) William of Tyre is the scientific historian and rationalizer, weaving into a harmonious account, which was followed by historians for centuries, the sober accounts of eye-witnesses and the picturesque details of the saga—with somewhat of a bias towards the latter in regard to the first crusade. He was a native of Palestine, born about 1130, and educated in the West. On his return he was happy in winning the good opinion of Amalric I.; he was made first canon and then archdeacon of Tyre, and tutor of the future Baldwin IV. (1170); while on Baldwin's accession he became chancellor of the kingdom and archbishop of Tyre (1174–75). He was a man often employed on missions and negotiations, and as chancellor he had in his care the archives of the kingdom. His temper was naturally that of a trimmer; and he had thus many qualifications for the writing of well-informed and unbiassed history. He knew Greek and Arabic; and he was well acquainted with the affairs of Constantinople, to which he went at least twice on political business, and with the history of the Mohammedan Powers, on which he had written a work (now lost) at the command of Amalric. It was Amalric also who set him to write the history of the crusades which we still possess (in 22 books, with a fragment of a 23rd)—the *Historia rerum in partibus transmarinis gestarum*. He wrote the book at different times between 1170 and 1183, when it abruptly ends, and its author as abruptly disappears from sight. The book falls into two parts, the first (books i.–xv.) derivative, the second (books xvi.–xxiii.) original. In the second part he had his own knowledge

[1]Von Sybel's view must be modified by that of Kugler, to which a scholar like Hagenmeyer has to some extent given his adhesion (*cf.* his edition of the *Gesta*, pp. 62–68). Hagenmeyer inclines to believe in an original author, distinct from Albert the copyist; and he thinks that this original author (whether or no he was present during the crusade) used the *Gesta* and also Fulcher, though he had probably also *"eigene Notizen und Aufzeichnungen."*

of events and the information of his contemporaries as his source: in the first he used the same authorities which we still possess—the *Gesta,* Fulcher and Albert of Aix—in somewhat of an eclectic spirit, choosing now here, now there, according as he could best weave a pleasant narrative, but not according to any real critical principle. His book thus begins to be a real authority only from the date of the second crusade onwards; but the perfection of his form (for he is one of the greatest stylists of the middle ages) and the prestige of his position conspired to make his book the one authority for the whole history of the first century of the crusades. Nor was he (apart from his reception of legendary elements into his narrative) unworthy of the honour in which he was held; for he is really a great historian, in the form of his matter and in his conception of his subject—diligent, impartial, well-informed and interesting, if somewhat rhetorical in style and vague in chronology.

[During the middle ages his work was current in a French translation, known as the *Chronique d'outremer,* or the *Livre* or *Roman d'Éracles* (so called from the reference at the beginning to the emperor Heraclius). This translation also contained a continuation by various hands down to 1277; while besides the continuation embedded in the *Livre d'Éracles,* there are separate continuations, of the nature of independent works, by Ernoul and Bernard the Treasurer. These latter cover the period from 1183 to 1228; and of the two Ernoul's account seems primary, while that of Bernard is in large part a mere copy of Ernoul. But the whole subject of the continuators of William of Tyre is dubious.]

To the Western authorities for the first crusade must be added the Eastern—Byzantine, Arabic and Armenian. Of these the Byzantine authority, the *Alexiad* of Anna Comnena, is most important, partly from the position of the authoress, partly from the many points of contact between the Byzantine empire and the crusaders. Anna's narrative both furnishes a useful corrective of the prejudiced Western accounts of Alexius, and serves to bring Bohemund forward into his proper prominence. The Armenian view of the first crusade and of Baldwin's principality of Edessa is presented in the *Armenian Chronicle* of Matthew of Edessa. There is little in Arabic bearing on the first crusade: the Arabic authorities only begin to be of value with the rise of the atabegs of Mosul (*c.* 1127). But Kemal-ud-din's *History of Aleppo* (composed in the 13th century) contains some details on the history of the first crusade; and the *Vie d'Ousāma* (the autobiography of a sheik at Caesarea in northern Syria, edited and paraphrased by Derenbourg in the *Publications de l'École des langues orientales vivantes*) presents the point of view of an Arab whose life covered the first century of the crusades (1095–1188).

For the Second Crusade *see* B. Kugler, *Studien zur Geschichte des zweiten Kreuzzuges* (1866). The primary authority in the West is the work of Odo de Deuil, *De profectione Ludovici VII. regis Francorum in Orientem.* Odo was a monk attached by Suger to Louis VII. during the second crusade; and he wrote home to Suger during the crusade seven short letters, afterwards pieced together in a single work. The *Gesta Friderici Primi* of Otto of Freising (who joined in the second crusade) gives some details from the German point of view (i. c. 44 *seq.*). The former is supplemented by the letters of Louis VII. to Suger; the latter by the letters of Conrad III. to Wibald, abbot of Stablo and Corvey. The Byzantine point of view is presented in the Ἐπιτομή of Cinnamus, the private secretary of Manuel, who continued the *Alexiad* of Anna Comnena in a work describing the reigns of John and Manuel. It is from the second crusade that William of Tyre, representing the attitude of the Franks of Jerusalem, begins to be a primary authority; while on the Mohammedan side a considerable authority emerges in Ibn Athīr. His history of the atabegs was written about 1200, and it presents in a light favourable to Zengi and Nureddin, but unfavourable to Saladin (who thrust Nureddin's descendants aside), the history of the great Mohammedan Power which finally crushed the kingdom of Jerusalem.

Side by side with Beha-ud-din's life of Saladin, Ibn Athīr's work is the most considerable historical record written by the Arabs. Generally speaking the Arabic writings are late in point of date, and cold and jejune in style; while it must also be remembered that they are set religious works written to defend Islam. On the other hand they are generally written by men of affairs—governors, secretaries or ambassadors; and a fatalistic temper leads their authors to a certain impartial recording of everything, good or evil, which seems of moment.

The Third Crusade was narrated in the West from very different points of view by Anglo-Norman, French and German authorities. The primary Anglo-Norman authority is the *Carmen Ambrosii,* or, as it is called by M. Gaston Paris, *L'Estoire de la guerre sainte.* This is an octosyllabic poem in French verse, written by Ambroise, a Norman *trouvère* who followed Richard I. to the Holy Land. The poem first came to be known by scholars about 1873, and has been edited by M. Gaston Paris (1897). The *Itinerarium Peregrinorum,* a work in ornate Latin prose, is (except for the first book) a translation of the *Carmen* masquerading under the guise of an independent work. There seems no doubt that it is a piece of plagiary, and that its writer, Richard, "canon of the Holy Trinity" in London, stands to the *Carmen* as Tudebod to the *Gesta,* or Albert of Aix to his supposed original. The third crusade is also described from the English point of view by all contemporary writers of history in England, *e.g.,* Ralph of Coggeshall, who used information gained from crusaders, and William of Newburgh, who had access to a work by Richard I.'s chaplain, Anselm, which is now lost. The French side is presented in Rigord's *Gesta Philippi Augusti* and in the *Gesta* (an abridgement and continuation of Rigord) and the *Philippeis* of William the Breton. The two French writers represent Richard as a faithless vassal: in the German writers—Tagino, dean of Passau, who wrote a *Descriptio* of Barbarossa's crusade (1189–90); and Ansbert, an Austrian clerk, who wrote *De expeditione Friderici Imperatoris* (1187–96)—Richard appears rather as a monster of pride and arrogance. From the Arabic point of view the life of Richard's rival, Saladin, is described by Beha-ud-dīn, a high official under Saladin, who writes a panegyric on his master, somewhat confused in chronology and partial in its sympathies, but nevertheless of great value. The various continuations of William of Tyre above mentioned represent the opinion of the native Franks (which is hostile to Richard I.); while in Nicetas, who wrote a history of the Eastern empire from 1118 to 1206, we have a Byzantine authority who, as Prof. Bury remarks, "differs from Anna and Cinnamus in his tone towards the crusaders, to whom he is surprisingly fair."

For the Fourth Crusade the primary authority is Villehardouin's *La Conquête de Constantinople,* an official apology for the diversion of the crusade written by one of its leaders, and concealing the *arcana* under an appearance of frank naïveté. His work is usefully supplemented by the narrative (*La Prise de Constantinople*) of Robert de Clary, a knight from Picardy, who presents the non-official view of the crusade, as it appeared to an ordinary soldier. The *Χρονικὸν τῶν ἐν ῾ρωμανία* (composed in Greek verse some time after 1300, apparently by an author of mixed Frankish and Greek parentage, and translated into French at an early date under the title "The Book of the Conquest of Constantinople and the Empire of Rumania") narrates in a prologue the events of the fourth (as indeed also of the first) crusade. The *Chronicle of the Morea* (as this work is generally called) is written from the Frankish point of view, in spite of its Greek verse; and the Byzantine point of view must be sought in Nicetas. On the bibliography of the fourth crusade *see* Klimke, *Die Quellen zur Geschichte des vierten Kreuzzuges* (Breslau, 1875).

The history of the Later Crusades, from the fifth to the eighth, enters into the continuations of William of Tyre above mentioned; while the *Historia orientalis* of Jacques de Vitry, who had taken part in the fifth crusade, and died in 1240, embraces the history of events till 1218 (the third book being a later addition). The *Secreta fidelium Crucis* of Marino Sanudo, a history of the crusades written by a Venetian noble between 1306 and 1321, is also of value, particularly for the crusade of Frederick II. The minor authorities for the fifth crusade have been collected by Röhricht, in the publications of the Société de l'Orient Latin for 1879 and 1882; the ten valuable letters of Oliver, bishop of Paderborn, and the *Historia Damiettina,* based on these letters, have also been edited by Röhricht in the *Westdeutsche Zeitschrift für Geschichte und Kunst* (1891). The sixth crusade, that of Frederick II., is described in the chronicle of Richard of San Germano, a notary of the emperor, and in other Western authorities, *e.g.,* Roger of Wendover. For the crusades of St. Louis the chief authorities are Joinville's life of his master (whom he accompanied to Egypt on the seventh crusade), and de Nangis' *Gesta Ludovici regis.* Several works were written on the capture of Acre in 1291, especially the *Excidium urbis Acconensis,* a treatise which emerges to throw light, after many years of darkness, on the last hours of the kingdom. The oriental point of view for the 13th century appears in Jelaleddin's history of the Ayyubite sultans of Egypt, written towards the end of the 13th century; in Maqrizi's history of Egypt, written in the middle of the 15th century; and in the compendium of the history of the human race by Abulfeda (d. 1332); while the omniscient Abulfaragius (whom Rey calls the Eastern St. Thomas) wrote, in the latter half of the 13th century, a chronicle of universal history in Syriac, which he also issued, in an Arabic recension, as a *Compendious History of the Dynasties.*

II. The Documents bearing on the history of the crusades and the Latin kingdom of Jerusalem are various. Under the head of charters come the *Regesta regni Hierosolymitani,* published by Röhricht, Innsbruck, 1893 (with an *Additamentum* in 1904); the *Cartulaire générale des Hospitaliers,* by Delaville Leroulx (1894 *seq.*); and the *Cartulaire de l'église du St. Sépulcre,* by de Rozière (1849).

Under the head of laws come the assizes of the Kingdom, edited by Beugnot in the *Recueil des historiens des croisades;* and the assizes of Antioch, printed at Venice in 1876. G. Schlumberger has written on the coins and seals of the Latin East in various publications (and has also published *Prise de St. Jean d'Acre en l'an 1291 par l'armée du Soudan d'Egypte,* 1914, and *Récits de Byzance et des croisades,* 1916). E. G. Rey has written an *Étude sur les monuments de l'architecture militaire* (1871). The genealogy of the Levant is given in *Le Livre des lignages d'outre-mer* (published along with the assizes).

III. Modern Bibliographies.—The best account of original authorities for the crusades is that of A. Molinier, *Les Sources de l'histoire de France* (1901–06), vols. ii. and iii. W. Wattenbach, *Deutschlands Geschichtsquellen,* gives an account of Albert of Aix (vol. ii., ed., 1894, pp. 170–180) and of Ekkehard of Aura (*ibid.* pp. 189–198). Von Sybel's *Geschichte des ersten Kreuzzuges* contains a full study of the authorities for the first crusade; while the prefaces to Hagenmeyer's editions of the *Gesta* and of Ekkehard are also valuable. Gaston Dodu, in the work mentioned below, begins by a brief account of the original authorities, which is chiefly of value so far as it deals with William of Tyre and the history of the assizes; and H. G. Prutz has also a short account of some of the historians of the crusades (*Kulturgeschichte,* pp. 453–469). Finally, reference may be made to the works of Kugler and Klimke mentioned above, and to J. F. Michaud, *Bibliographie des croisades* (1822).

Modern Writers.—The various works of R. Röhricht present the soundest, if not the brightest, account of the crusades. There is a *Geschichte des ersten Kreuzzugs* (Innsbruck, 1901), a *Geschichte des Königreichs Jerusalem* (*ibid.,* 1898) and a *Geschichte der Kreuzzüge in Umriss* (*ibid.,* 1898). For the first crusade von Sybel's work and F. Chalandon's *Alexis Ier Comnène* (1900) may also be mentioned; for the fourth, A. Luchaire's *Innocent III.: La Question d'Orient* (1907); while for the whole of the crusades W. Norden's *Papsttum und Byzanz* (1903) is of value. B. Kugler's *Geschichte der Kreuzzüge* (1880) still remains a suggestive and valuable work; and L. Bréhier's *L'Église et l'orient au moyen âge* (1907) contains not only an up-to-date account of the crusades, but also a full and useful bibliography, which should be consulted for fuller information. The most recent work is that of A. Ruville, *Die Kreuzzüge* (Bonn, 1920). On points of chronology, and on the relations between the crusaders and their Mohammedan neighbours, W. B. Stevenson's *The Crusaders in the East* (1907) is very valuable. A large and important work of reference is G. Golubovich's *Biblioteca bibliografica della Terra Santa e dell' Oriente francescana* (1907, 1915, 1919). On the constitutional and social history of the Latin kingdom of Jerusalem, G. Dodu *Histoire des institutions dans le royaume latin de Jérusalem* (1894), is very useful; E. G. Rey, *Les Colonies franques de Syrie* (1883), gives many interesting details; and H. G. Prutz, *Kulturgeschichte der Kreuzzüge* (1883), gives an estimate of the effects of the crusades on the progress of civilization. The works of Gmelin and J. Delaville-Leroulx on the Templars and Hospitallers respectively are worth consulting; while for Eastern affairs the English reader may be referred to G. Le Strange, *Palestine under the Moslem* (1890), and to S. Lane-Pool, *Mahommedan Dynasties* (1894), a valuable work of reference. For a brief popular account, *see* Konrad Bercovici, *The Crusades* (1929). (E. B.)

CRUSENSTOLPE, MAGNUS JAKOB (1795–1865), Swedish historian, was born at Jönköping on March 11, 1795. His first important work was a *History of the Early Years of the Life of King Gustavus IV. Adolphus* (1837) which was followed by a series of monographs and by some politico-historical novels, of which *The House of Holstein-Gottorp in Sweden* is considered the best. In 1838 he was sentenced to three years' imprisonment for his bitter attacks on the Government. Few Swedish writers have wielded so pure and so incisive a style as Crusenstolpe, but his historical work is vitiated by political and personal bias. He died at Stockholm on Jan. 18, 1865.

CRUSHER-GAUGE, an instrument for the indirect measurement of the pressure in a gun when fired. Lead is the registering agent for shot-guns, but copper is used in other instances. The original type was screwed into the wall of a gun, and the explosion drove a knife-edged piston into a copper disk, the power required to penetrate to various depths being read off from a table. The modern form of gauge is a copper cylinder, compressed between two flat surfaces. Tables are prepared, for various crushers of standard length and diameter, from which the force in tons per square inch can be ascertained easily. Several crushers are tried in turn to give an average. The copper is first given an initial compression in manufacture, a record of the results being made. The simpler method of placing is in the chamber at the back of the charge. A rifle gauge is illustrated in the drawing, before and after firing. It consists of a massive steel block into which a rifle-barrel is locked by means of a screwed gland-fitting. The cartridge base rests on a piston through which the firing pin (striker pin) passes. As the piston is driven back by the explosion it compresses the copper crusher lying behind the piston.

CRUSHER: *see* DISINTEGRATOR.

CRUSIUS, CHRISTIAN AUGUST (1715–1775), German philosopher and theologian, was born on Jan. 10, 1715, at Leuna, near Merseburg, in Saxony. He was educated at Leipzig, and became professor of theology there in 1750, and principal of the university in 1773. He died on Oct. 18, 1775. Crusius opposed the philosophy of Wolff from the standpoint of religious orthodoxy. He attacked it mainly on the score of the moral evils that must flow from any system of determinism. The most important works of this period of his life are *Entwurf der nothwendigen Vernunftwahrheiten* (1745), and *Weg zur Gewissheit und Zuverlässigkeit der menschlichen Erkenntniss* (1747). Though diffusely written, and neither brilliant nor profound, Crusius' philosophical books had a great but short-lived popularity.

There is a full notice of Crusius in Ersch and Gruber's *Allgemeine Encyclopädie.* Consult also A. Marquardt, *Kant und Crusius;* and art. in Herzog-Hauck, *Realencyklopädie.*

CRUSTACEA, a very large division of the animal kingdom comprising the crabs, lobsters, crayfish, prawns, shrimps, sand-hoppers, woodlice, barnacles, water-fleas and a vast multitude of less familiar forms that are not distinguished by any popular names. In systematic zoology they are ranked as one of the classes forming the phylum (or sub-phylum) arthropoda, (*q.v.*) and are distinguished from the members of the other classes by being generally of aquatic habits, breathing by gills or by the general surface of the body, having two pairs of antenna-like appendages in front of the mouth and at least three pairs of post-oral limbs acting as jaws. There is so much diversity, both of structure and of habits, within the class, that it is all but impossible to give a brief definition which shall apply to all its members, and all the characters mentioned are subject to modification in parasites and other highly specialised forms.

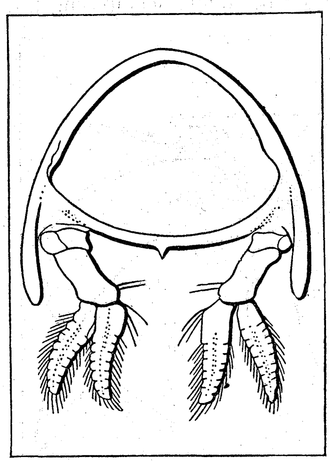

FIG. 1.—SEGMENT OF ABDOMEN OF LOBSTER, VIEWED FROM THE FRONT
Below are the pair of appendages, swimmerets, each with two branches, endopodite and exopodite, which are separated

It would not be altogether misleading to describe the Crustacea as the "insects of the sea." In the great oceans and in the narrow seas their teeming multitudes, the "things creeping innumerable" of the Psalmist, play a part not unlike that taken by the true insects in the life of the land. In fresh waters, where they have to meet with the competition of insects, they are hardly less abundant and there is scarcely a ditch or pond that does not harbour at least some of the more minute forms. On land they are less common, but the woodlice of our gardens and the land-crabs of tropical regions have solved the problem of adaptation to a sub-aerial life.

The most familiar Crustacea are the larger crabs and lobsters which are used as food by man, but the part which these play in the economy of nature is small compared with that of the amphipods and isopods which swarm in the shallower waters of the sea and serve as scavengers, feeding on all kinds of animal and vegetable refuse and forming, in their turn, the food of many of the larger marine animals such as fishes. Vastly more important than any of these, however, are the minute pelagic copepods, of which the shoals may discolour the surface waters of the ocean for many miles and serve to guide the fisherman and the whaler to the most profitable fishing grounds. They form an important constituent of plankton (*q.v.*), the assemblage of minute floating animal and vegetable life in the surface waters of the ocean. It is on the plankton that a great part of the higher animal life of the sea ultimately depends for food. The copepods live upon the diatoms and other microscopic plant life of the plankton and themselves form the food of many fishes such as the herring and the mackerel and even of the gigantic whales.

MORPHOLOGY

External Structure: Body.—As in all arthropods the firm outer covering or exoskeleton of the body consists of a series of segments or somites which may be jointed together or more or less coalesced. The typical form of a somite is seen, for instance, in the segments which make up the abdomen or "tail" of a lobster or crayfish. Each consists of a shelly ring separated from the rings in front and behind by areas of softer integument forming movable joints. The arched plate which forms the dorsal part of the segment is distinguished as the tergum and the narrower ventral bar as the sternum. The tergum is produced on either side as a free plate, the pleuron, and each segment has a pair of limbs articulated to the sternum. The posterior terminal segment of the body, on which the opening of the anus is situated, never bears typical limbs and is known as the telson. Its morphological nature is shown by its development. In the larvae of the more primitive Crustacea, the number of somites, at first small, increases by the successive appearance of new somites between the last-formed somite and the terminal region which bears the anus. The "growing-point" of the body is, in fact, situated in front of this region, and, when the full number of somites has been reached, the unsegmented part remaining forms the telson of the adult. In no crustacean, however, are all the somites of the body distinct and separate from each other. The fore part of the body of the lobster, for instance, has an undivided shelly covering, the "barrel" or carapace, and the number of somites composing this region is only to be inferred from the appendages attached to it. In all Crustacea an anterior region is marked off by having the somites obscured in this way. Apart from the possible existence of an ocular somite corresponding to the eyes (the morphological nature of which is discussed below) the smallest number of somites so united in any adult crustacean is five. Even where a larger number of somites are fused there is generally a marked change in the character of the appendages after the fifth pair, and, since the integumental fold which forms the carapace seems to originate from this point, it is usual to regard these five somites as constituting the head or cephalon. It is quite possible, however, that in the primitive ancestors of existing Crustacea a still smaller number of somites were united in the head. The first three pairs of appendages are alone present in the "nauplius" larva, and they show certain peculiarities of structure and development that seem to place them in a different category from the other limbs. There is therefore some ground for regarding the three corresponding somites as forming a "primary cephalon."

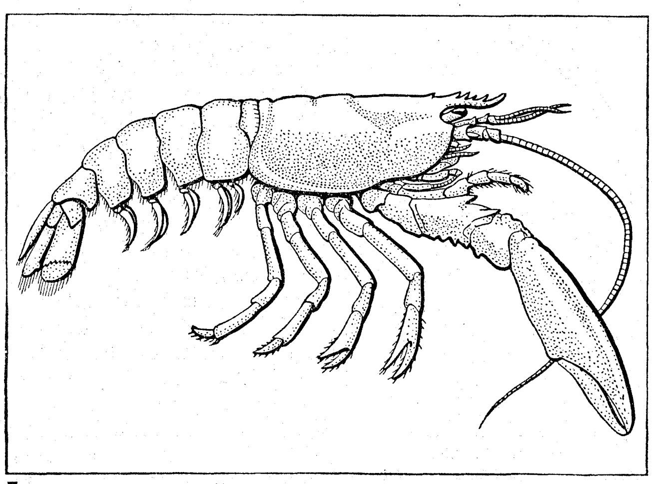

FIG. 2.—COMMON LOBSTER, FEMALE (HOMARUS GAMMARUS) SEEN FROM THE SIDE, THE APPENDAGES OF ONE SIDE ONLY BEING REPRESENTED

In the sub-class Malacostraca, which includes all the larger and better-known Crustacea, the body proper is divided into two regions sharply distinguished by the character of the appendages. These are the "thorax" of eight somites and the abdomen. In the other sub-classes, although the terms thorax and abdomen are often used as descriptive terms, the regions so named are not homologous with those of the Malacostraca. In many of the latter, as, for example, in the lobster, the head and thorax form a single undivided region which is known as the "cephalo-thorax." The shell or carapace covering this region is not simply formed by the coalesced terga of the somites. In some of the lower Malacostraca, such as the Mysidacea, the carapace is a fold of the integument, enveloping, but remaining free from, the thoracic somites. In the lobster and other Decapoda, the carapace has coalesced with the thoracic terga in the middle of the back but remains free at the sides, enclosing a pair of chambers within which lie the gills.

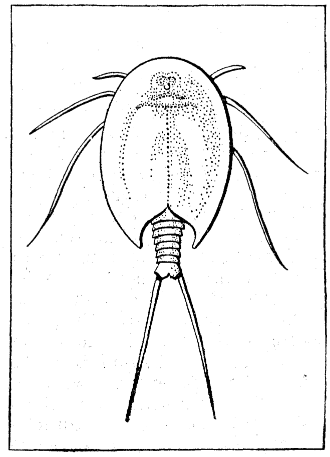

FIG. 3.—APUS CANCRIFORMIS, ONE OF THE BRANCHIOPODA, SHOWING THE BROAD SHIELD-SHAPED CARAPACE COVERING THE GREATER PART OF THE BODY

The possession of this carapace, arising as a dorsal fold from the posterior margin of the head-region, is a character which recurs in the most diverse groups of the Crustacea and is probably to be regarded as a primitive attribute of the class. The carapace may have the form of a bivalve shell, entirely enclosing the body and limbs, as in many Branchiopoda and in the Ostracoda. In the Cirripedia it forms a fleshy mantle strengthened by shelly plates which may have a very complex structure. In the Isopoda and Amphipoda, where, as a rule, all the thoracic somites except the first are distinct, there seems at first to be no carapace-fold. A comparison with the related Tanaidacea and Cumacea, however, suggests that the coalescence of the first thoracic somite with the head really involves a vestigial shell-fold and this is possibly the case also in the Copepoda. The only Crustacea in which there appears to be no trace of a carapace are the anostracous Branchiopoda and the remarkable syncaridan *Bathynella.*

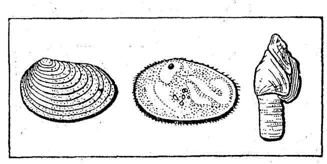

FIG. 4.—THREE TYPES OF CARAPACE

Left, *Estheria* (Branchiopoda), bivalved carapace showing lines of growth. Middle, *Cypris* (Ostracoda), bivalved carapace without lines of growth, and right, *Lepas* (Cirripedia), multivalved carapace at the end of a fleshy stalk

The most extreme modifications of the general form of the body are shown in those Crustacea which have adopted a sedentary or a parasitic habit of life. The Cirripedia or barnacles are, in the adult state, rooted to one spot by the head, and tend, in varying degrees, towards the radial symmetry which is often associated with a sedentary life. In parasites, the segmentation of the body tends to disappear and the general shape is often distorted in a fantastic manner. In the Rhizocephala, and other parasitic cirripedes, the adults have lost nearly every trace, not only of crustacean but even of arthropodous structure.

General Structure of Limbs.—Amid the great variety of forms assumed by the appendages of Crustacea, it is possible to trace, more or less plainly, the modifications of a fundamental type consisting of a peduncle, the protopodite (or sympodite), bearing two branches, the endopodite and exopodite. This simple biramous form is shown in the swimming feet of Copepoda, the "cirri" of Cirripedia and the abdominal limbs of Malacostraca, and it is also found in the earliest and most primitive type of larva known as the "nauplius." The protopodite may have, on its inner and outer margins, additional lobes or processes, known as endites and exites respectively. Some of the exites often function as gills, and the endites of appendages near the mouth frequently form jaw-processes, assisting in mastication and known as gnathobases. In the flattened leaf-like limbs characteristic of the Branchiopoda the endites and exites are so developed that the biramous form of the limb is obscured. It has been supposed that this form of limb, the "phyllopodium," represents the primitive type from which the biramous type has been derived. The recurrence of the biramous type, however, in the most diverse forms of Crustacea and in the simplest larvae, and the evidence of the remarkable fossil branchiopod *Lepidocaris,* all go to show that it represents the fundamental plan of the crustacean limb.

In many Crustacea the paired eyes are borne on stalks which are movably articulated with the head and may be divided into two or three segments. The view has been held that these eye-stalks are really limbs, homologous with the other appendages. The evidence of embryology, however, is decidedly against this view. The stalks appear late in the course of development, after many of the trunk-limbs are fully formed, and the eyes, at their first appearance, are sessile on the sides of the head and only later become pedunculated. The most important evidence in favour of the appendicular nature of the eye-stalks is found in the fact that when the eye-stalk is removed from a living lobster or prawn, a many-jointed appendage like the flagellum of an antenna may grow in its place. It is open to question, however, how far the evidence from such "heteromorphic regeneration" (*see* HETEROMORPHOSIS; REGENERATION IN ANIMALS) can be regarded as conclusive on points of homology.

Special Morphology of Limbs.—The antennules (or first antennae) are generally regarded as true appendages, although they differ from all the other appendages in the facts that they are always innervated from the "brain" (or preoral ganglia) and that they are uniramous in the earliest larvae and in the adults of all sub-classes except the Malacostraca, where they are biramous or sometimes triramous. It is unlikely that the two branches of the biramous type (seen, for instance, in the antennules of the

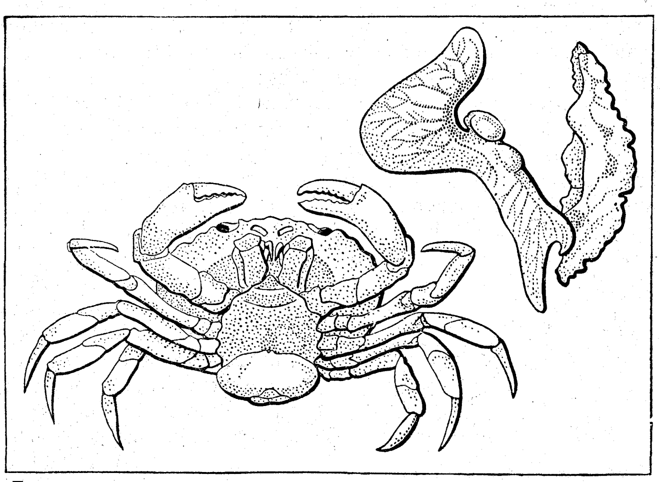

FIG. 5.—EXTREME MODIFICATIONS OF GENERAL FORM IN CRUSTACEA
Left: *Sacculina carcini* (Rhizocephala), attached to the under side of the Shore Crab (*Carcinides maenas*). Right: *Portunion maenadis* (Isopoda), an internal parasite of the same species of crab

lobster) correspond to the endopodite and exopodite of the other limbs.

The antennae (or second antennae) are of special interest on account of the clear evidence that, although preoral in position in all adult Crustacea, they were originally postoral appendages. In the "nauplius" larva they lie at the sides of the mouth and their basal portion carries a hook-like process which assists the similar processes of the mandibles in pushing food into the mouth.

In most Crustacea the antennules are purely sensory in function and carry numerous "olfactory" hairs. They are used as swimming organs in many larvae and some adults, and sometimes, in the male sex, they form clasping organs for holding the female. In the Cirripedia the antennules of the larvae carry the openings of the cement glands and become, in the adult, involved in the attachment of the animal to its support.

The antennae are frequently swimming organs, but may assume other functions as organs of attachment in parasites, as creeping

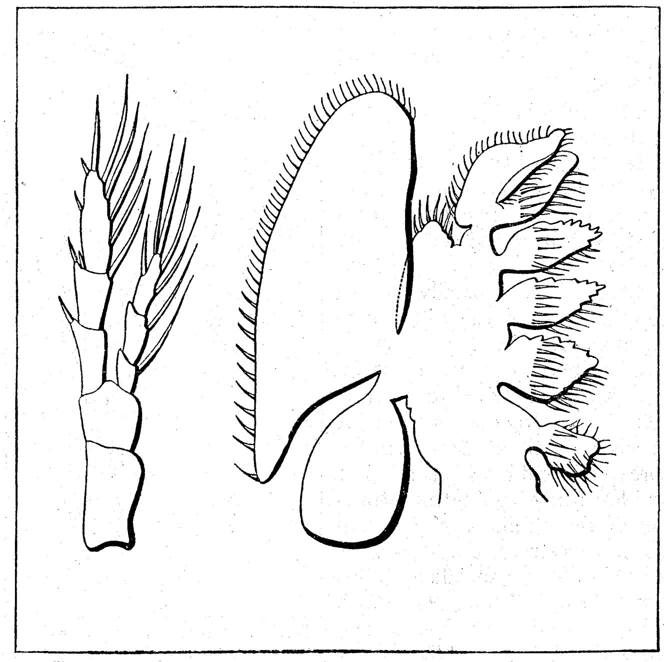

FIG. 6.—SWIMMING FOOT OF A COPEPOD AND A BRANCHIOPOD
Left: one of the swimming-feet of a Copepod (*Calanus*), showing the simple two-branched type of Crustacean appendage. Right: one of the trunk-like limbs of a Branchiopod (*Apus*), showing the flattened leaf-like type, phyllopodium

legs, or as male claspers. In the Malacostraca they are chiefly sensory, the endopodite forming a long many-jointed lash (flagellum) while the exopodite is often a flattened plate, probably used as a balancer in swimming.

The mandibles, like the antennae, have, in the nauplius, the form of biramous swimming limbs, with a jaw-lobe on the protopodite. This form is retained in some adult Copepoda and Ostracoda. In most cases, however, the palp loses its exopodite and it often disappears altogether, and the basal lobe becomes a powerful jaw with the edge variously armed with teeth and spines. In blood-sucking parasites the mandibles are often piercing stylets enclosed in a tubular proboscis formed by the upper and lower lips.

The maxillulae and maxillae, or, as they are often called, first and second maxillae, are nearly always flattened leaf-like appendages with gnathobasic lobes or endites borne by the protopodite. The endopodite, when present, forms a palp of one or a few segments, and exites may also be present.

The limbs behind the head-region show little differentiation among themselves in the Branchiopoda, Cirripedia and many Copepoda. It is characteristic of the Malacostraca that the trunk-limbs are divided into two sharply-defined series or "tagmata," eight corresponding to the thoracic and six to the abdominal region. The thoracic series have the endopodites converted, for the most part, into more or less efficient walking-legs, while the exopodites are swimming organs or disappear. It is usual for one or more of the anterior pairs to be modified as "foot-jaws" or maxillipeds. The abdominal limbs are usually biramous and natatory, the last pair being large and flattened and forming with the telson a lamellar "tail-fan."

Gills.—In many of the smaller Crustacea no special gills are present and respiration is carried on by the general surface of the body and limbs. When gills are present they are generally formed by some of the exites near the base of the limb, which are flattened, thin-walled, and permeated by a network of blood-channels.

In the Decapoda the gills are inserted, in three series, at or near the bases of the thoracic limbs, and lie within a pair of branchial chambers covered by the carapace.

Adaptations for aerial respiration are found in those Crustacea that have taken to terrestrial life. In the land-crabs (of several different families) the branchial chambers are enlarged and serve as lungs, the lining membrane being richly supplied with blood-vessels. In some of the terrestrial Isopoda or woodlice the abdominal appendages contain tufts of branching tubules filled with air, like the tracheae of insects and other terrestrial Arthropoda.

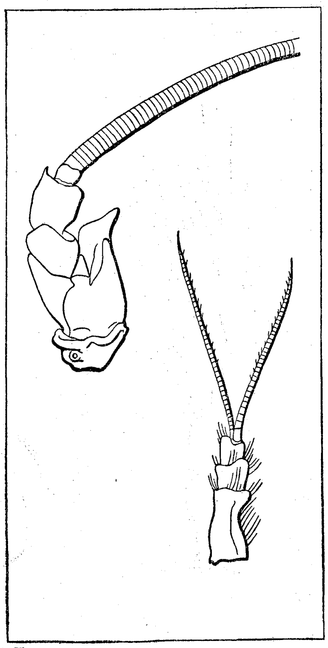

FIG. 7.—LEFT: ANTENNA OF LOBSTER, SHOWING BASAL PORTION ONLY, OF THE FLAGELLUM; RIGHT: ANTENNULE

Internal Structure: Alimentary System.—In almost all Crustaceae the food-canal runs straight through the body, except in front where it curves downwards to the ventrally placed mouth. In a few cases its course is sinuous or twisted and in one or two instances (Cladocera, Cumacea) it is actually coiled upon itself. As in other arthropoda, it consists of three divisions, the fore-, mid- and hind-gut, the first and last being lined by an inturning of the chitinous cuticle. In the Malacostraca, the fore-gut is dilated to form a so-called "stomach," furnished internally with ridges armed with spines and hairs forming a straining apparatus. In the Decapoda this apparatus reaches its greatest complexity, forming a "gastric mill" in which three teeth connected with a system of articulated ossicles are moved by special muscles so as to triturate the food which is passed into the stomach.

The mid-gut is essentially the digestive and absorptive region of the alimentary canal and its surface is, in nearly all Crustacea, increased by pouch-like or tubular outgrowths which not only serve as glands for secretion of the digestive juices, but aid in the absorption of the digested food. In the Decapoda these outgrowths form a massive digestive gland or "liver." In some decapods, as the crayfish, the mid-gut is very short, nearly the whole length of the food-canal being formed by the fore and hind guts. In a few highly modified parasites the alimentary canal is vestigial or absent throughout life as in the Rhizocephala (Cirripedia, *q.v.*).

Circulatory System.—As in the other Arthropoda, the circulatory system in Crustacea is largely lacunar, the blood flowing in spaces or channels without definite walls. The heart is of the usual arthropodous type, lying in a pericardial blood-sinus with which it communicates by valvular openings or ostia. In most Branchiopoda and in some Malacostraca the heart retains more or less completely the primitive form of a long tube, extending throughout the greater part of the length of the body and having a pair of ostia in each somite. In most Crustacea however, it is shortened and gives off one or more main arteries which carry the blood for some distance to pour into the blood-spaces of the body. In many of the smaller Crustacea there is no heart, and it is impossible to speak of a circulation in the proper sense of the word, the blood being merely driven hither and thither by the movements of the body and limbs and of the alimentary canal.

Excretory System.—The most important excretory or renal organs of the Crustacea are two pairs of glands lying at the base of the antennae and of the maxillae respectively. The two are rarely functional together, although one may replace the other in the course of development. In the adult it is sometimes the antennal, sometimes the maxillary gland which persists. The structure of both glands is essentially the same and they are to be regarded as the survivors of a primitive series of segmentally arranged nephridia. Each consists of a thin-walled "end-sac," which development shows to be a vestigial portion of the coelom, communicating with the exterior by a convoluted duct, part of which has glandular walls. Probably in most cases the greater part of this duct arises from mesoblast and only a short terminal part from epiblast, but it is stated that in some cases the whole duct is epiblastic. In the Decapoda the antennal gland is largely developed and is known as the "green gland." The external part of the duct is often dilated into a bladder, and may sometimes send out diverticula forming a system of sinuses ramifying through the body.

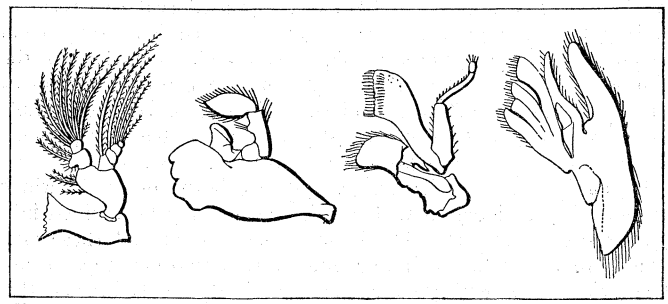

FIG. 8.—MOUTH PARTS OF CRUSTACEA, SHOWING FROM LEFT TO RIGHT: Mandible of *Calanus* (Copepoda) with biramous palp; Mandible of Lobster, with palp reduced and unbranched; Maxillula of Lobster; Maxilla of Lobster

Other excretory organs have been described in certain Crustacea, consisting of groups of mesodermal cells in various parts of the body within which the excretory products are stored up instead of being expelled. Possibly some of these are vestiges of segmentally arranged Nephridia.

Nervous System.—The central nervous system is constructed on the same general plan as in other Arthropoda, consisting of a supraoesophageal ganglionic mass or "brain," united by circumoesophageal connectives with a double ventral chain of segmentally arranged ganglia. In the primitive Branchiopoda the ventral chain retains the ladder-like arrangement found in some annelids, the two halves being widely separated and the pairs of ganglia connected together across the middle line by double transverse commissures. In the other groups the two halves of the chain are more or less coalesced, and, in addition, the ganglia tend to draw together in a longitudinal direction and to fuse, ultimately, into a single mass representing the whole of the ventral chain. This is seen, for example, in the true crabs (Brachyura) among the Decapoda. The brain, or supraoesophageal ganglion, shows various degrees of complexity. In the Branchiopoda it contains two pairs of ganglionic centres giving origin, respectively, to the optic and the antennular nerves. The centres for the antennal nerves form ganglionic swellings on the oesophageal connectives. In the higher forms these centres have moved forwards to become incorporated in the brain, but the fibres which unite them still run backwards to form a transverse commissure behind the oesophagus. This is of importance as showing that the antennae were originally postoral limbs. In the higher Decapoda, additional centres are developed in the brain and its structure becomes very complex. A system of visceral nerves and ganglia associated with the alimentary canal and the heart is well developed in the Decapoda.

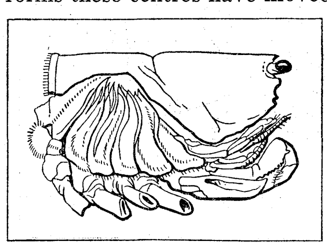

FIG. 9.—GILLS OF LOBSTER, EXPOSED BY CUTTING AWAY THE SIDE OF THE CARAPACE

Eyes.—The eyes of Crustacea are of two kinds, the unpaired, median or "nauplius" eye, and the paired compound eyes. The median eye is generally present in the earliest larval stages (nauplius) and in some instances, as in the Copepoda, it forms the sole organ of vision. It may persist along with the paired eyes, as in the Branchiopoda, or it may become vestigial or disappear in the adult, as in most Malacostraca. It consists typically of three cup-shaped masses of pigment, the cavity of each cup being filled with columnar retinal cells connected at their outer ends with nerve

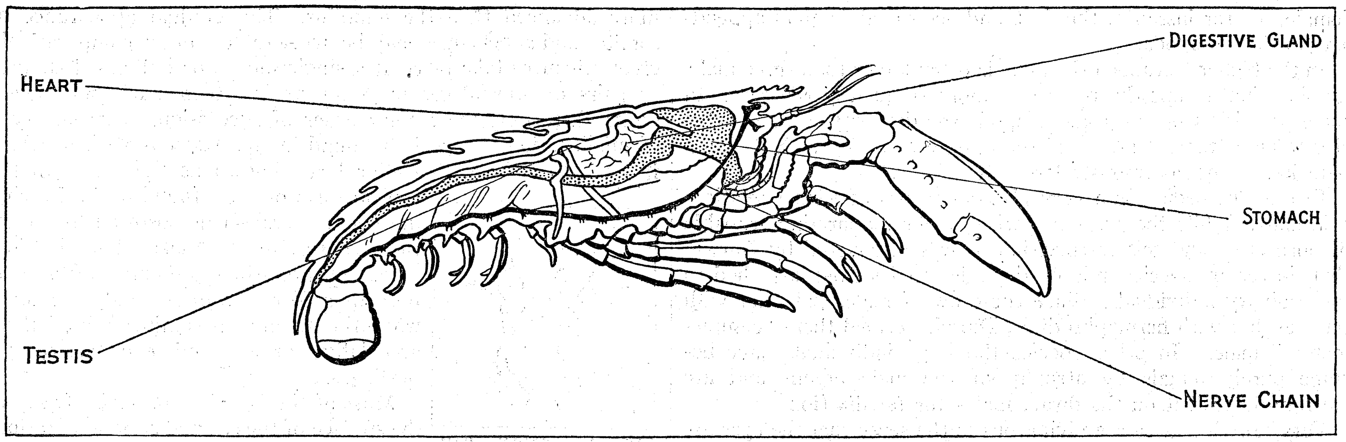

FIG. 10.—DISSECTION OF MALE LOBSTER, FROM THE SIDE
The nervous system is shown in black, the food-canal is stippled. Running downward from the long tubular testis to the base of the last walking-leg is the male genital duct. The heart, lying under the carapace, is continued backward by a large blood vessel, the posterior aorta, and sends downward another large vessel, which is seen in front of the genital duct. The digestive gland or "liver" is a large mass occupying most of the space in the carapace on each side of the stomach

fibres from the brain.

The compound eyes are very similar in the details of their structure to those of insects, consisting of a varying number of visual elements or "ommatidia" separated by pigment sheaths and each terminating in a "crystalline body" covered by the transparent external cuticle which forms the cornea. In most cases the cornea is divided into lens-like facets corresponding to the underlying ommatidia.

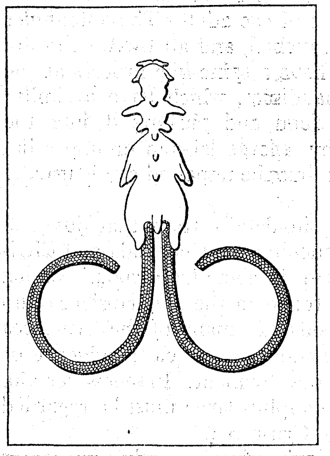
FIG. 11.—NERVOUS SYSTEM OF BRANCHINECTA SHOWING THE "LADDER-LIKE" VENTRAL CHAIN

Other Sense-organs.—As in other Arthropoda, the hairs or setae on the surface of the body are important organs of sense and are variously modified for special functions. Many, perhaps all, of them are organs of the sense of touch. When feathered or provided with secondary barbs the setae will respond to movements or vibrations in the surrounding water and some of this sort have been supposed to have an auditory function. Organs formerly regarded as auditory, but now known to be connected with the maintenance of equilibrium of the body, are the "statocysts" found in various positions in different Crustacea, notably at the base of the antennules in most Decapods. These are open or closed vesicles having sensory hairs on their inner surface and containing one or more "statoliths" which may be grains of sand introduced from the exterior.

Another type of sensory setae is associated with the sense of smell, or rather, perhaps, the "chemical sense." These are bluntly pointed filaments in which the cuticle is extremely delicate. They are found chiefly on the antennules, and are often especially developed in the males, which they are supposed to guide in their pursuit of the females.

Glands.—The most important glandular structures in Crustacea (in addition to the digestive and excretory glands already mentioned) are various types of dermal glands which occur on the surface of the body and limbs. Some of these in the neighbourhood of the mouth or on the walls of the oesophagus have been regarded as salivary, but in some cases are now known to produce a mucous secretion which serves to entangle minute food-particles and is swallowed along with them. In some Amphipoda the secretion of glands on the surface of the body and limbs is used in the construction of protective cases in which the animals live. In some freshwater Copepoda the dermal glands secrete a gelatinous envelope enabling the animals to resist desiccation. The greatly-developed cement glands of the Cirripedia which serve to attach the animals to their support probably also belong to the category of dermal glands.

Phosphorescent Organs.—Like many other marine animals certain Crustacea belonging to very diverse groups (Ostracoda, Copepoda, Mysidacea, Euphausiacea, Decapoda) possess the power of emitting light. All of them are inhabitants of the deep sea or of the surface waters of the ocean. No freshwater Crustacea are phosphorescent. The organs concerned in light-production are curiously varied. In the Ostracoda and Copepoda certain dermal glands produce a luminous secretion. In some Mysidacea and Decapoda the secretion of the excretory organs (maxillary or antennal glands) is luminous. In the Euphausiacea and certain Decapoda the light-producing organs found on the body and limbs are complex structures provided with a reflector and a condensing lens and movable by special muscles so as to vary the direction of the emitted beam. The part which phosphorescence plays in the life of the animals can only be conjectured. In some instances it may serve to attract prey; in others it may help individuals of the same species to keep together in a shoal or to find their mates. The clouds of luminous secretion thrown out by some species may serve to baffle pursuers like the cloud of ink thrown out by a cuttlefish. The elaborate "search-lights" may illuminate objects within the range of vision. But even conjecture seems at a loss when we find that certain deep-sea prawns have complex light-organs placed so as to illuminate the interior of the gill-chambers.



FROM SCOTT, "BRITISH PARASITIC COPEPODA" (RAY SOCIETY)
FIG. 12.—CHONDRACANTHUS (COPEPODA), A FISH PARASITE
Showing the female carrying a pair of long sausage-shaped egg masses. At the base of the right hand egg mass is a small oval body, the dwarfed male

Reproductive System.—In the great majority of Crustacea the sexes are separate, but in the Cirripedia and in some parasitic Isopoda hermaphroditism is the rule, and isolated instances occur in other groups, especially among Decapoda. Parthenogenesis is common in Branchiopoda and Ostracoda and occurs in at least one genus of terrestrial Isopoda. Where the sexes are separate, sexual dimorphism is often striking. The males are often provided with clasping organs for holding the female, and these may be formed by modification of almost any of the appendages, antennules, antennae, thoracic limbs, or even some of the mouth-parts. Some of the appendages in the neighbourhood of the genital openings may be modified for the purpose of transferring the sperm to the female, as, for instance, the first and second abdominal appendages in the Decapoda.

In the higher Decapoda the male is often larger than the female, but in other groups the reverse is more frequently the case. In some parasitic Copepoda and Isopoda the disparity in size is carried to an extreme degree, and the minute male is attached, like a parasite, to the enormously larger female.

In the Cirripedia some very aberrant types of sexual relationship exist. While the great majority are hermaphrodites capable of both cross and self fertilization, it was discovered by Darwin that, in certain species, minute degraded males exist, attached to the ordinary individuals. Since these dwarf males pair, not with females, but with hermaphrodites, Darwin termed them "complemental" males. In other species the large individuals have become purely female by atrophy of the male organs and are entirely dependent on the dwarf males for fertilization.

Very few Crustacea are viviparous in the sense that the eggs are retained within the body until hatching takes place, but, on the other hand, nearly all carry the eggs in some way or other after extrusion. They are retained between the valves of the carapace in some Branchiopoda and Ostracoda or within the mantle-cavity in Cirripedia. Among the Malacostraca the Peracarida have a brood-pouch formed by overlapping plates attached to the bases of some of the thoracic legs. In most Decapoda the eggs are carried by the female attached to the abdominal appendages. In a few cases the developing embryos are nourished by a special secretion while in the brood-chamber (Cladocera, terrestrial Isopoda).

EMBRYOLOGY

The majority of Crustacea are hatched from the egg in a form differing more or less from that of the adult, and pass through a series of free-swimming larval stages. There are many instances, however, in which the metamorphosis is suppressed, and the newly-hatched young resemble th parent in general structure.

In those Crustacea in which the series of larval stages is most complete the starting-point is the form already mentioned under the name of nauplius. In the typical form, this has an oval unsegmented body and three pairs of limbs corresponding to the antennules, antennae and mandibles of the adult. The antennules are simple, the others each two-branched, and all three pairs are used in swimming. The antennae have a spine-like process at the base, and they share with the mandibles, which have a similar process, the function of seizing food and pushing it into the mouth. The mouth is overhung by a large labrum or upper lip. The paired eyes are as yet wanting, but the unpaired eye is usually conspicuous.

A nauplius larva differing only in details from that just described is found in most of the Branchiopoda, Copepoda and Cirripedia, and in a more modified form, in some Ostracoda. Among the Malacostraca, the nauplius is found in the Euphausiacea and some of the most primitive Decapoda. In many of the Crustacea that hatch at a later stage there is more or less clear evidence of a nauplius stage in the embryonic development. It seems certain, therefore, that the possession of a nauplius larva must be regarded as a very primitive character of the Crustacea.

As development proceeds, the body of the nauplius elongates and its posterior part becomes segmented, new somites being added at successive moults from a formative zone in front of the telsonic region. The appendages appear as buds on the ventral surface of the somites, and become differentiated, like the somites that bear them, in regular order from before backwards. With the elongation of the body, its dorsal covering begins to project behind as a shell-fold, the beginning of the carapace. The paired eyes appear under the cuticle at the sides of the head, but only become pedunculated at a comparatively late stage.

The course of development here outlined, in which the somites and appendages appear in regular order, agrees so well with that observed in the typical Annelida that it must be regarded as the most primitive. It is most closely followed in some Branchiopoda and Copepoda. In most Crustacea, however, this primitive scheme is more or less modified. The earlier stages may be passed through within the egg, so that the larva, on hatching, has reached a stage more advanced than the nauplius. The gradual appearance of somites and appendages may be accelerated so that comparatively great advances take place at a single moult, or individual somites or pairs of appendages may appear in advance of their neighbours, disturbing the regular order of succession. This last type of modification is especially found in the Malacostraca, in which it leads to the very peculiar larva known as the zoëa. In the typical form of zoea, found in the Brachyura (or true crabs) the posterior five or six thoracic somites are delayed in development and are still represented by a short unsegmented region of the body at a stage when the abdominal somites behind them are fully formed and even carry appendages.

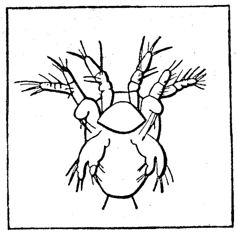


FIG. 13.—EARLY NAUPLIUS LARVA OF A COPEPOD (CYCLOPS)

Most of the larval forms swim freely at the surface of the sea and show adaptations to this "pelagic" habit of life. Various spines and processes from the surface of the body are often developed and are probably less important as defensive organs than as aids to flotation, and the same purpose may be served by the greatly developed carapace of stomatopod larvae and the extreme flattening of the body in the membranous *phyllosoma* larvae of the spiny lobsters and their allies.

Complete suppression of metamorphosis is found in the fresh-water crayfish and the river-crabs, but is by no means universal among freshwater Crustacea. On the other hand, a few marine crabs are known to be hatched in a form differing little from that of the adult.

CLASSIFICATION

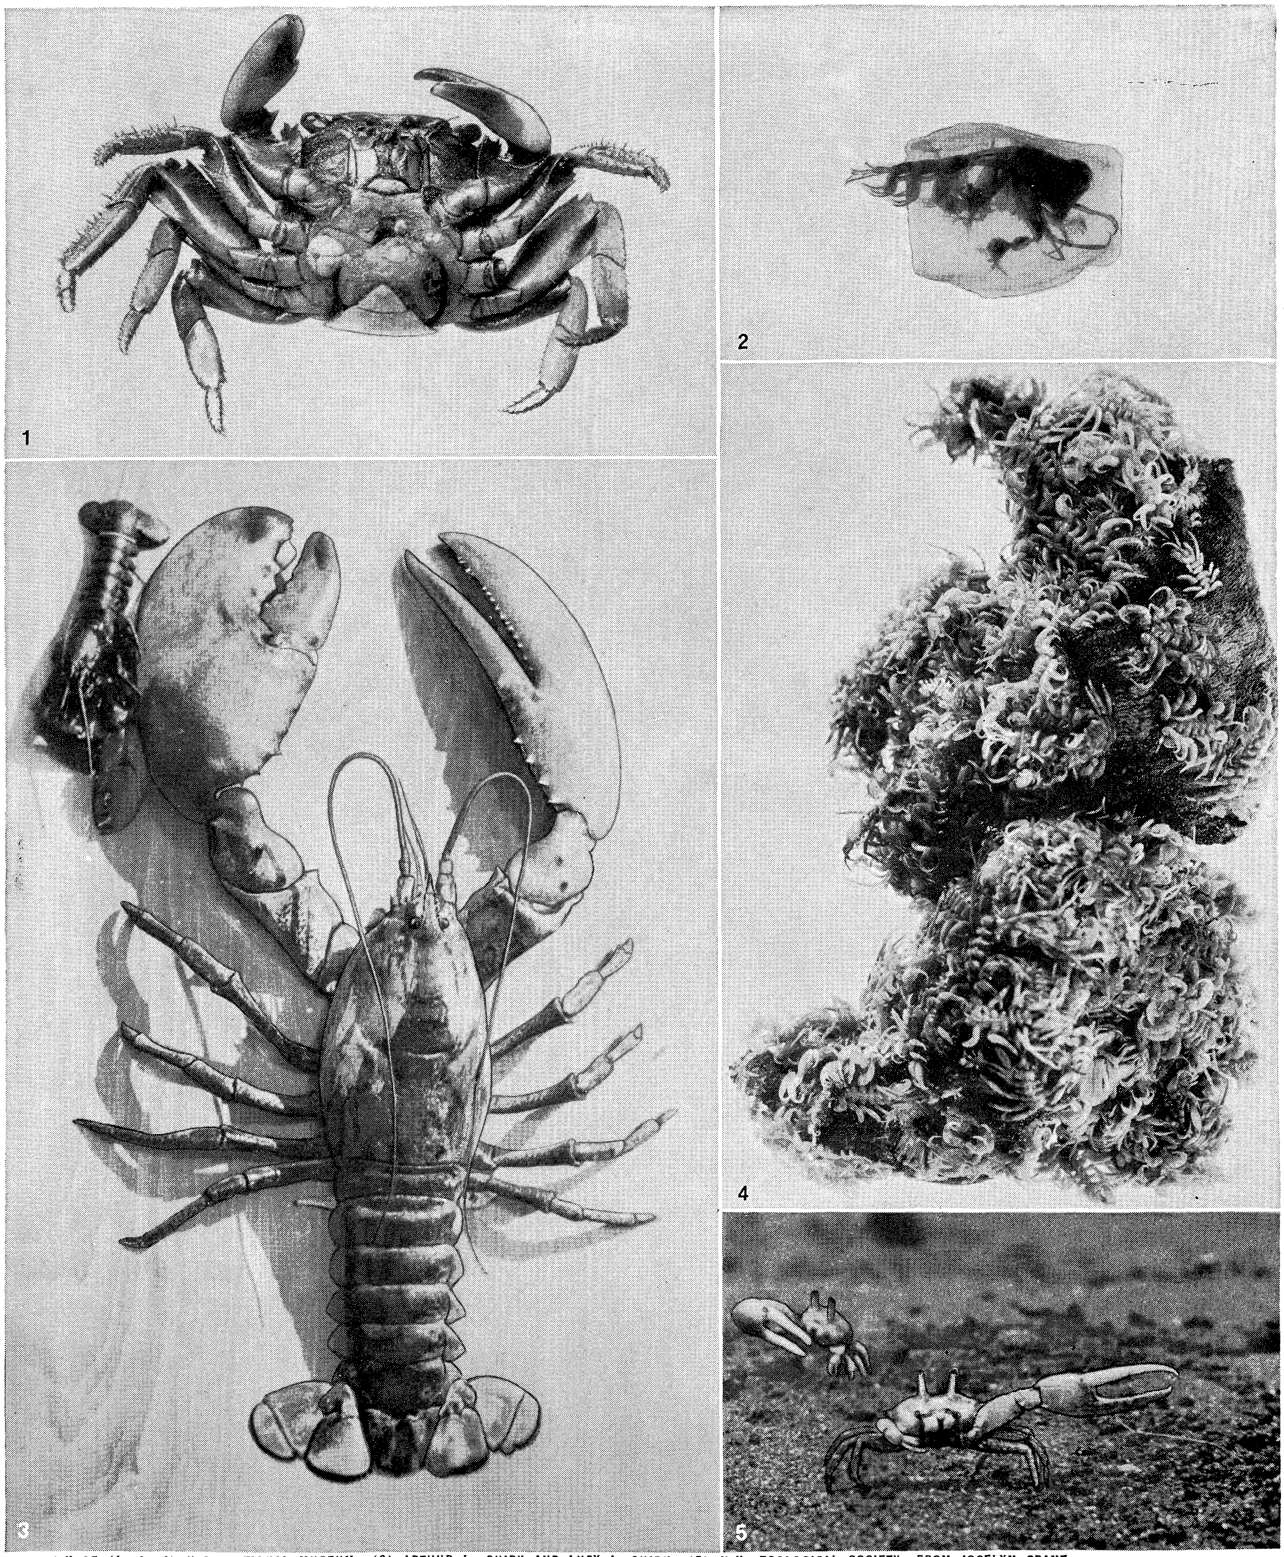
The diversity of structure in the members of the class Crustacea is much greater than in any of the other classes of Arthropoda, and the scheme of classification which must be devised in order to express their affinities is correspondingly complex. Early in the 19th century P. A. Latreille divided the class into two main groups, Malacostraca and Entomostraca, and this dichotomy has persisted in text-books down to the present, but it is now generally recognized that while the Malacostraca constitute a natural and sharply-defined group, the Entomostraca are a heterogeneous assemblage, defined only by negative characters and having no claim to retention in a natural system of classification.

The following is a synopsis of the classification. Some further details will be found in the articles dealing with the sub-classes.

Class CRUSTACEA
- Sub-class *Branchiopoda*
  - Orders *Anostraca, Lipostraca, Notostraca, Conchostraca, Cladocera.*
- Sub-class *Ostracoda.*
  - Orders *Myodocopa, Podocopa.*
- Sub-class *Copepoda.*
  - Orders *Calanoida, Harpacticoida, Cyclopoida, Notodelphyoida, Monstrilloida, Caligoida, Lernaepodoida, Arguloida.*
- Sub-class *Cirripedia.*
  - Orders *Thoracica, Acrothoracica, Ascothoracica, Apoda, Rhizocephala.*
- Sub-class *Malacostraca.*
  - Division *Phyllocarida.* Order *Nebaliacea.*
  - Division *Syncarida.* Order *Anaspidacea.*
  - Division *Peracarida.* Orders.—*Mysidacea, Thermosbaenacea, Cumacea, Tanaidacea, Isopoda, Amphipoda.*
  - Division *Eucarida.* Orders.—*Euphausiacea, Decapoda.*
  - Division *Hoplocarida.* Order *Stomatopoda.*

PAST HISTORY

Fossil remains of Crustacea are abundant in strata belonging to all the main divisions of the geological time-scale from the most ancient up to the most recent, but they teach us disappoint-



COURTESY OF (1, 2, 4) U.S. NATIONAL MUSEUM, (3) ARTHUR L. QUIRK AND LUCY I. QUIRK, (5) N.Y. ZOOLOGICAL SOCIETY, FROM JOCELYN CRANE

VARIOUS CRUSTACEA

1. Crab, *Pachygrapsus marmoratus* (Eucarida, Order Decapoda, Reptantia, Section Brachyura), a common Atlantic and Mediterranean species ranging from the Canaries and Azores to the Black sea; from the underside, with the large tumour-like *Sacculina carcini* (Cirripedia, Order Rhizocephala) attached to sternum and partly shielded by the crab's abdomen; on the sternum adjacent to the *Sacculina* are two small barnacles or acorn shells, *Balanus* species (Cirripedia, Order Thoracica). Natural size
2. *Phronima*, one of the pelagic amphipods (Peracarida, Order Amphipoda, Suborder Hyperiidea) in its floating house, the test of a pelagic tunicate made use of by the amphipod after eating its original owner. Seen by transmitted light, compare with Plate I, fig. 7 Malacostraca. Natural size
3. Lobster, *Homarus americanus* (Eucarida, Order Decapoda, Reptantia, Section Astacura) from Rhode Island. The larger specimen, 24 in. in length of body, is an example of the size to which a lobster may grow if left unmolested; weight 28 lb.
4. Parasitic amphipods, *Cyamus* (Peracarida, Order Amphipoda, Suborder Caprellidea) on portions of skin of infested whale, taken in Shark bay, West Australia, natural size, many adult and younger specimens
5. Fiddler crabs, *Uca stenodactyla* (Eucarida, Order Decapoda, Section Brachyura), a species occurring on the west coast of America from El Salvador to Valparaiso, Chile. About two-thirds natural size

ingly little regarding the phylogeny of the class. This is partly due to the fact that many important forms must have escaped fossilization altogether owing to their small size and delicate structure, while very many of those actually preserved are known only from the carapace or shell, the limbs being absent or represented only by indecipherable fragments. The fortunate accident which has preserved with marvellous completeness the minute branchiopod *Lepidocaris* in the rhynie chert (old red sandstone) is not likely to have been often repeated. But *Lepidocaris* is of recent date as compared with the varied fauna of Crustacea discovered by Walcott in the Middle Cambrian of the Canadian Rockies and there is reason to believe that many of the chief groups were already differentiated before the beginning of the geological record as we now know it. Shrimp-like forms that can be definitely referred to the Malacostraca begin to appear in the Upper Devonian and Mysidacea and Syncarida can be recognized in the Carboniferous, but it is not until true decapods appear in the Trias that anything like a connected story can be made out.

In the dearth of trustworthy evidence from palaeontology we are compelled to rely on the data afforded by comparative anatomy and embryology in attempting to reconstruct the course of evolution within the class. It is perhaps unnecessary to insist that conclusions reached in this way must remain more or less speculative so long as they cannot be checked by the results of palaeontology.

The earlier attempts to reconstruct the genealogical history of the Crustacea started from the assumption that the successive stages of the larval history, especially the nauplius and zoea, reproduced the actual structure of ancestral types. It is now generally agreed that this "theory of recapitulation" cannot be applied to the zoea, the characters of which must be due to secondary modification. As regards the nauplius, however, the constancy of its general structure in the most diverse groups of Crustacea strongly suggests that it is a very ancient type, and

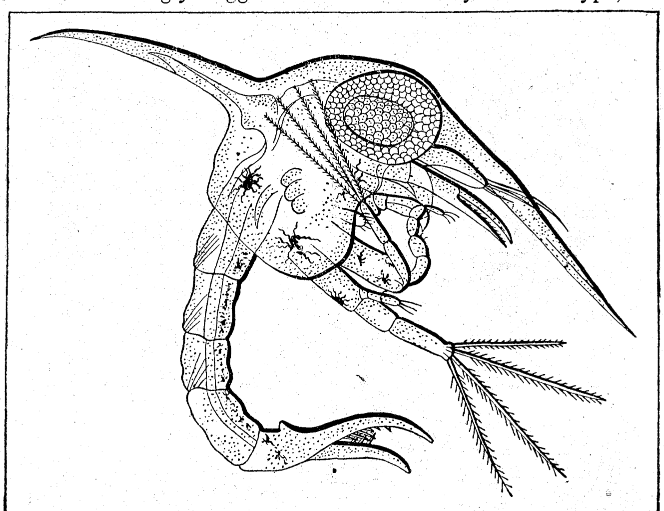


FIG. 14.—ZOEA LARVA OF THE SHORE CRAB (CARCINIDES MAENAS)
In this stage the telson is furcate and the following appendages developed: Antennule, antenna, maxillula, maxilla, mandible, first and second maxillipeds (the first folded up against carapace, second extended). The three little "buds" (showing through the side of the carapace) are the rudimentary third to fifth thoracic appendages.

the view has been strongly advocated that the Crustacea must have arisen from an unsegmented nauplius-like ancestor.

The objections to this view, however, are considerable. The resemblances between the more primitive Crustacea and the annelid worms, in such characters as the structure of the nervous system and the mode of growth of the somites, can hardly be ignored, and it is reasonable to suppose that the Crustacea originated from some stock which already possessed these characters.

If we are to attempt to reconstruct a hypothetical ancestral crustacean, we must suppose it to have approximated, in general form, to some such branchiopod as *Apus,* with an elongated body composed of numerous similar somites and ending in a caudal fork, with a carapace originating as a shell-fold from the maxillary somite, with the eyes, probably, stalked, and the antennae and mandibles both biramous and armed with masticatory processes, and with the trunk-limbs all similar, biramous, with additional endites and exites, and probably all bearing gnathobases. It is to be noted that, except for the absence of a carapace-fold and of eye-stalks, the trilobites are not very far removed from the primitive crustacean here sketched.

(W. T. C.; W. L. St.)

CRUSTUMERIUM, an ancient town of Latium, on the edge of the Sabine territory, near the headwaters of the Allia, not far from the Tiber. Rome conquered it in 500 B.C. according to Livy, the *tribus Crustumina* (or *Clustumina*) being formed in 471 B.C. Pliny mentions it among the lost cities, but the name clung to the fertile district around it. The site is unknown.

CRUVEILHIER, JEAN (1791–1874), French anatomist, born at Limoges on Feb. 9, 1791, was professor of anatomy in Paris. He gave the first description of disseminated sclerosis, and left an early account of progressive muscular atrophy, but he erroneously supposed that pyemia was always the result of phlebitis which he referred to as an original coagulation of the blood. He even went to the extreme of asserting that phlebitis dominates all pathology. Cruveilhier died at Jussac on March 6, 1874. His chief works are *Anatomie descriptive* (1834–36); *Anatomie pathologique du corps humain* (1829–42), with many coloured plates; *Traité d'anatomie pathologique générale* (1849–64); *Anatomie du système nerveux de l'homme* (1845); *Traité d'anatomie descriptive* (1851).

CRUZ, RAMÓN DE LA (1731–1794), Spanish dramatist. His *sainetes* or farcical sketches of Madrid life, such as *Las Tertulias de Madrid* and *El Prado por la noche,* are delightful specimens of satiric observation.

See E. Cotarelo y Mori, *Don Ramón de la Cruz y sus obras* (1899).

CRUZ E SILVA, ANTONIO DINIZ DA (1731–1799), Portuguese heroic-comic poet, son of a carpenter, was born at Lisbon and educated at the University of Coimbra, where he took his degree in law in 1753. He then settled in Lisbon and began to write. He founded the literary society known as the Arcadia Lusitana, which aimed at resuscitating national poetry. From 1764 to 1774 Diniz held the appointment of auditor to a regiment stationed at Elvas. There he had the opportunity of observing the many intrigues of a cathedral and garrison town. The result was the witty satire in eight cantos of blank verse, *Hyssope* (1772), describing a quarrel between the bishop and the dean. It is much more amusing than Boileau's *Lutrin,* if not so finished a production. Diniz was sent in an official capacity to Brazil, and remained there, as chancellor of the Relação in Rio and then as councillor of the *Conselho ultramarino,* until his death.

BIBLIOGRAPHY.—Diniz's poems were published in 6 vols. (1807–1817). The best edition of *Hyssope,* to which he owes his lasting fame, is that of J. R. Coelho (1879), with an exhaustive introductory study on his life and writings. A French prose version of the poem by Boissonade has gone through two editions (1828 and 1867), and English translations of selections have been printed in the *Foreign Quarterly Review,* and in the *Manchester Quarterly* (April 1896). *See* also Theophilo Braga, *A Arcadia Lusitana* (Oporto, 1899).

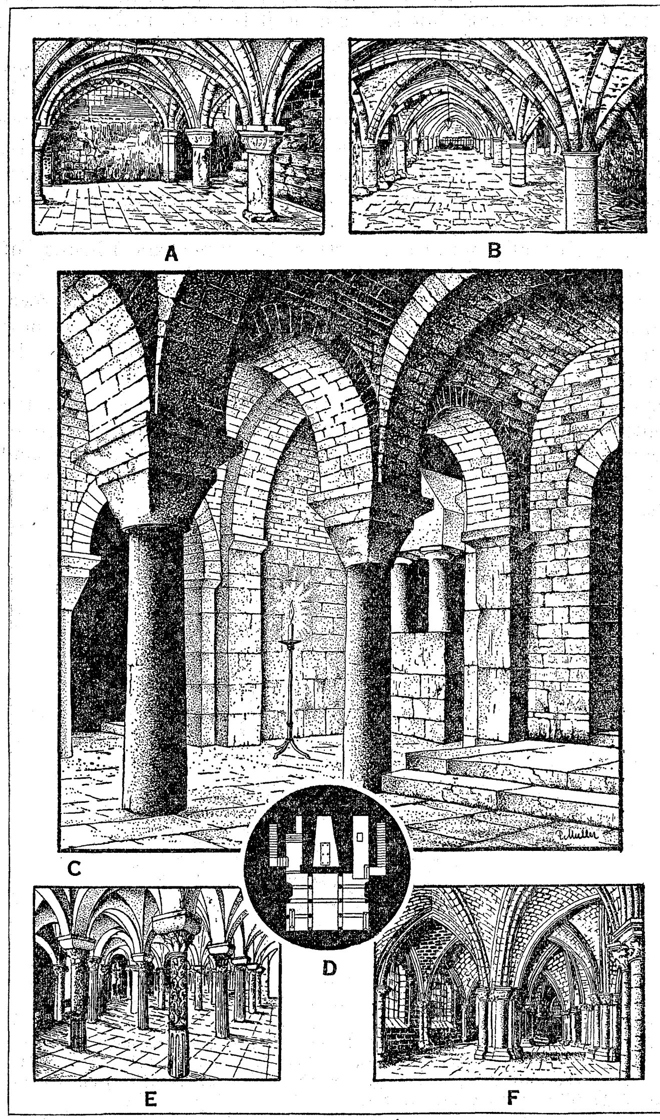
CRYOLITE, a mineral discovered in Greenland by the Danes in 1794, and found to be a compound of fluorine, sodium and aluminium. From its general appearance, and from the fact that it melts readily, even in a candle flame, it was regarded by the Eskimos as a peculiar kind of ice, hence it acquired the name of cryolite (from Gr. *κρύος,* frost and λίθος, stone). Cryolite occurs in colourless or snow-white, cleavable masses, often tinted brown or red with iron oxide, and occasionally passing into a black variety. It is usually translucent, becoming nearly transparent on immersion in water. It cleaves in three nearly rectangular directions, and the crystals occasionally found in the crevices have a cubic habit, but they belong to the monoclinic system. The hardness is 2·5 and the specific gravity 3.

Cryolite occurs almost exclusively at Ivigtut (sometimes written Evigtok), on the Arksut Fjord in south-west Greenland. It has been extensively used as a source of metallic aluminium, and as a flux in smelting the metal. It is largely employed in the manufacture of certain sodium salts, as suggested by Julius Thomsen of Copenhagen, in 1849; and it has been used for the production of certain kinds of porcelain and glass, remarkable for their toughness, and for enamelled ware.

CRYPT, a vault or subterranean chamber, especially under a church floor. In Latin, *crypta* designated any vaulted building partially or entirely below the ground level, such as a sewer (*crypta Suburae,* Juvenal, *Sat.* v., 106); the vaulted stalls for horses and chariots in a circus; farm storage cellars (Vitruvius vi., 8); and a long, vaulted gallery known as *crypto porticus,* like that on the Palatine hill. Seneca (*Epist.* 57) calls the tunnel now known as the Grotto of Posilipo, through which the road passes to Puteoli, *crypta Neapolitana.* It was natural, therefore, for the early Christians to call their catacombs crypts, and when churches came to be built over the tombs of saints and martyrs, subterranean chapels, known as *confessiones,* around the actual tomb, were included. These also were called crypts. The most famous of these was St. Peter's, built on the site of St. Peter's martyrdom, over the circus of Nero (fourth century). Other notable Roman examples are those of S. Prisca, S. Prassede and S. Lorenzo fuori le Mura. In the basilica of S. Maria Maggiore a crypt was furnished, although there was no tomb or martyrdom site to commemorate; it is interesting that as early as this Constantinian church, the crypt was considered a normal part of the church building.

Further incentive to the building of crypts was given by the growing practice of burials within the church walls. This was a much debated usage, and the Council of Braga (563) gave permission for burials only within the churchyard, but not within the church itself. The Council of Mainz (813), however, stated that no one should be buried in a church except bishops, abbots, worthy priests or loyal laymen, and from that time burials within the church multiplied. These were usually in the crypt. An early example of such a burial crypt exists in the church of S. Apollinare in Classe, Ravenna (sixth century), where it takes the form of a small, underground passage around the altar and just within the apse walls (*see* Apse). Later the size of the crypt was increased to include the entire space under the floor of the church choir (*q.v.*), as in the tenth century crypt of S. Ambrogio at Milan. With the increased desire for richness in all parts of the church and increased technical skill, a further step was taken by raising the choir floor boldly and opening the front of the crypt to the nave (*q.v.*), which was on an intermediate level between the crypt and the choir, with monumental flights of steps leading down to the crypt in the centre and up to the choir on either side. The arcaded fronts of these crypts form an effective decoration for the church, as in the 12th century church of S. Zeno in Verona, and that of S. Miniato at Florence (1013). The latter is particularly rich with inlaid polychrome marbles. These crypts within were usually apsidal and the ranges of columns whose vaults supported the floor above gave interesting perspective effects. Where Byzantine influence was strong, crypts are less common, and when found, are of a totally different type, frequently existing as cellars under the entire church area, as in Trani cathedral in southern Italy (12th century), apparently designed by an architect named Nicolaus Sacerdos. St. Mark's at Venice has a remarkable crypt of Greek cross plan, with many short and stumpy columns. This crypt is, in fact, a secondary church; its choir screen is still extant.

Outside Italy there is great variation both in frequency and size of crypts. Lombard influence in Germany is shown by the number of Rhenish churches that follow the Italian precedent of an appreciably raised choir with an important crypt beneath it. The end beneath the nave is usually closed, however. Elsewhere in western Europe the choir level is much less raised and the crypt, where present, tends more and more to become a lower church with a plan largely reproducing that of the church above. The cathedral of S. Bénigne at Dijon possesses the strange crypt of a curious round chapel which seems to date back to the sixth century. It was built over the tomb of the patron saint and is peculiar in the fact that the central circular area, surrounded by a double aisle, ran up through the upper portion of the building and was open to the sky. There is also a remarkable crypt in the cathedral of Auxerre believed to date from 1085, and several examples in Normandy, notably that of Bayeux and the Abbaye aux



FROM (C, D) VIOLLET-LE-DUC, "DICTIONNAIRE RAISONNÉ DE L'ARCHITECTURE FRANCAISE"

Dames at Caen, both of the late 11th century. These are in a crude Norman style with many similarities to contemporary crypts in England. The crypts of Chartres and Bourges cathedrals deserve notice as instances of the more developed type of early Gothic of the late 12th and early 13th centuries.

Crypts were highly developed in English work throughout the Romanesque and Gothic periods (*see* Byzantine and Romanesque Architecture; Gothic Architecture). The one at Canterbury, the western half of which is attributed to Ernulf (*c.* 1100), and the eastern half to William the Englishman, 75 years later, forms a large and complex church, with apse and chapels. The extreme east end, under Trinity chapel, is famous as the original burial-place of Thomas à Becket. Slightly earlier (late 11th century), the crypts of Winchester, Worcester and Gloucester are similarly apsidal, but simpler in plan. Of these Worcester (1084), is the most decorative. Parts of the crypt at Rochester, that at Hereford and the crypt, no longer existing, of old St. Paul's in London, were of rich Gothic type, the last so large that it served as the parish church of St. Faith. Other notable examples in Great Britain are the exquisite crypt of St. Stephen's chapel at Westminster, now incorporated within the Houses of Parliament, and the richly carved 13th century crypt of the cathedral at Glasgow. Small crypts under parish churches are common in England, as at Lastingham in Yorkshire (probably 1080), notable for its size and the crude pseudo-classic character of its ornament; and at Repton in Derbyshire; another very fine Norman example is the crypt of St. Peter's-in-the-East at Oxford.

Technically, as many mediaeval houses were built over vaulted substructures, they may be said to have had crypts, and remains of such non-ecclesiastical crypts occur widely throughout Europe. The German *Rathaüser* have many fine and richly decorated crypts, such as the famous cellar of the Bremen town-hall; a notable monastic cellar still exists in Mainz, and the cellars of the residential buildings at Mont St. Michel in France furnish numerous examples of great size and magnificence, in almost all the mediaeval styles dating from the 11th to the 15th century. Oxford, Rochester and Bristol, in England, contain many remains of vaulted mediaeval cellars, and the city of Chester is built, in great areas, over ranges of such vaults. Notable examples in London are those of Gerard's Hall, now destroyed (reign of Edward I.), and that of the Guildhall, which dates from 1411, and is notable for its rich and intricate ribbed vault, in the design of which the subsidiary ribs, called liernes, play an important part.

Many great modern cathedrals contain crypts. Notable examples exist at Washington, D.C. and St. John the Divine, New York, which contains an elaborate mosaic altar and reredos.

(T. F. H.)

CRYPTEIA, secret police in ancient Sparta (Gr. κρύπτειν hide) founded, according to Aristotle, by Lycurgus. The institution was under the supervision of the ephors (*q.v.*), who, on entering office, annually proclaimed war against the helots (*see* HELOTS), and thus absolved from the guilt of murder any Spartan who should slay a helot. It was instituted as a precaution against the ever-present danger of a helot revolt, and young Spartans were sent out by the ephors to keep watch on the helots and assassinate any who might appear dangerous.

After the revolt of 464 B.C. (*see* CIMON), there was a secret massacre of 2,000 helots who, on the invitation of the ephors, claimed to have rendered distinguished service (Thuc. iv. 80).

See A. H. J. Greenidge, *Handbook of Gk. Const. Hist.* (1896); G. Gilbert, *Gk. Const. Antiq.* (Eng. trans., 1895); L. Whibley, *Companion to Greek Studies* (1923).

CRYPTOBRANCHUS, a genus of aquatic, but lung-breathing, tailed Amphibia of the family Cryptobranchidae, characterized by a heavy, flattened build, a porous tuberculated skin, with a frilled fold along each side, short stout limbs with four fingers and five toes, and minute eyes without lids. Three forms of the family are known. One is a European Tertiary fossil, *Andrias* (first described as that of a man), nearly related to the second type, the giant salamanders of Japan and China of the genus *Megalobatrachus;* the third is *Cryptobranchus,* the hell-bender of North America. The giant Japanese form grows to a length of over 5 ft. and is the largest salamander known. The eastern hell-bender of the United States, *C. alleganiensis,* reaches 27 in.

The eggs of both the giant salamander and the hell-benders are laid in strings. Those of the Japanese salamander are deposited in deep holes in the water, where they form large clumps (70 to 80 eggs) round which the female coils herself. The giant salamander has bred in the Amsterdam zoological gardens. The larva on leaving the egg is about an inch long, provided with three branched external gills on each side, and mere rudiments of the limbs. The tail is used in swimming.

(K. P. S.)

CRYPTOGRAPHY, or writing in cipher (from Gr. κρυπτός hidden, and γράφειν, to write), called also steganography (from Gr. στεγάνη, a covering), the art of writing in such a way as to be incomprehensible except to those who possess the key to the system employed. The unravelling of the writing is called deciphering. Secret modes of communication have been in use from the earliest times. The Lacedemonians had a method called the *scytale,* from the staff (σκυτάλη) employed in constructing and deciphering the message. Polybius has enumerated other methods of cryptography. The art was in use also amongst the Romans.

John Trithemius (d. 1516), the abbot of Spanheim, was the first important writer on cryptography. His *Polygraphia,* published in 1518, has supplied the basis upon which subsequent writers have worked. A *Steganographia* published at Lyons (?1551) and later at Frankfort (1606) is also attributed to him. The next treatises of importance were those of Giovanni Battista della Porta, the Neapolitan mathematician, who wrote *De furtivis litterarum notis,* 1563; and of Blaise de Vigenère, whose *Traité des chiffres* appeared in Paris, 1586. Cryptography having become a distinct art, Bacon classed it (under the name *ciphers*) as a part of grammar. He proposed an ingenious system on the plan of what is called the double cipher. John Wilkins, subsequently bishop of Chester, published in 1641 an anonymous treatise entitled *Mercury, or The Secret and Swift Messenger.* The deciphering of many of the royalist papers of that period has by Henry Stubbe been charged to the celebrated mathematician, Dr. John Wallis (*Athen. Oxon.* iii. 1,072), whose connection with the subject of cipher-writing is referred to by himself in the Oxford edition of his mathematical works, 1689, p. 659. Subsequent writers on the subject are John Falconer (*Cryptomenysis patefacta*), 1685; John Davys (*An Essay on the Art of Decyphering: in which is inserted a Discourse of Dr. Wallis*), 1737; Philip Thicknesse (*A Treatise on the Art of Decyphering and of Writing in Cypher*), 1772; William Blair (the writer of the comprehensive article "Cipher" in Rees's *Cyclopaedia*), 1819; and G. von Marten (*Cours diplomatique*), 1801 (a fourth edition of which appeared in 1851). Perhaps the best modern work on this subject is the *Kryptographik* of J. L. Klüber (Tübingen, 1809), in which the different methods of cryptography are classified. Amongst others of lesser merit who have treated of this art may be named Gustavus Selenus (*i.e.,* Augustus, duke of Brunswick), 1624; Cospi, translated by Niceron in 1641; the marquess of Worcester, 1659; Kircher, 1663; Schott, 1665; Ludwig Heinrich Hiller, 1682; Comiers, 1690; Baring, 1737; Conrad, 1739, etc. *See* also a paper on Elizabethan Cipher-books by A. J. Butler in the Bibliographical Society's *Transactions,* London, 1901.

The simplest and commonest of all the ciphers is that used by Julius Caesar, in which the writer selects in place of the proper letters certain other letters in regular advance. Caesar wrote *d* for *a, e* for *b,* and so on. There are instances of this arrangement in the Jewish rabbis, and even in the sacred writers. An illustration of it occurs in Jeremiah (xxv. 26), where the prophet writes *Sheshak* instead of Babel (Babylon), *i.e.,* in place of using the second and twelfth letters of the Hebrew alphabet (*b, b, l*) from the beginning he wrote the second and twelfth (*sh, sh, k*) from the end. Another Jewish cabalism of like nature was called Albam; of which an example is in Isaiah vii. 6, where Tabeal is written for Remaliah. A rough key to this method of transposition, in its adaptation to English, may be derived from an examination of the respective quantities of letters in a typefounder's bill, or a printer's "case." The decipherer's first business is to classify the letters of the secret message in the order of their frequency. The letter that occurs oftenest is *e*; and the next in order of frequency is *t.* Similarly the commonest words of two, three and four, etc., letters can be ascertained. The decipherer may obtain other hints from Poe's tale called *The Gold Bug.* Rules for deciphering messages in the Continental languages constructed upon this system may be derived from Breithaupt's *Ars decifratoria* (1737).

Bacon remarks that though ciphers were commonly in letters and alphabets yet they might be in words. Upon this basis codes have been constructed, classified words taken from dictionaries being made to represent complete ideas. Figures and other characters have been also used as letters; and with them ranges of numerals have been combined as the representatives of syllables, parts of words, words themselves, and complete phrases. Under this head must be placed the despatches of Giovanni Michael, the Venetian ambassador to England in the reign of Queen Mary, documents which have only of late years been deciphered. Many of the private letters and papers from the pen of Charles I. and his queen are of the same description. One of that monarch's letters, consisting entirely of numerals purposely complicated, was in 1858 deciphered by Professor Wheatstone, the inventor of the ingenious crypto-machine, and printed by the Philobiblon Society. Other letters of the like character have been published in the *First Report of the Royal Commission on Historical Manuscripts* (1870). In the second and subsequent reports of the same commission several keys to ciphers have been catalogued. In this connection also should be mentioned the "characters," which the diarist Pepys drew up and which are frequently mentioned in his journal.

The plan of importing shorthand marks and other arbitrary characters into cryptographic systems to represent both letters and words is said to have been first put into use by the old Roman poet Ennius. A large quantity of these characters has been engraved in Gruter's *Inscriptiones*. The correspondence of Charlemagne was in part made up of marks of this nature. In Rees's *Cyclopaedia* specimens were engraved of the cipher used by Cardinal Wolsey at the court of Vienna in 1524, of that used by Sir Thomas Smith at Paris in 1563, and of that of Sir Edward Stafford in 1586; in all of which arbitrary marks are introduced. The first English system of shorthand—Bright's *Characterie,* 1588—almost belongs to the same category of ciphers. A favourite system of Charles I., made up of an alphabet of twenty-four letters, represented by four simple strokes varied in length, slope and position, is engraved in Clive's *Linear System of Shorthand* (1830).

Complications have been introduced into ciphers by the employment of "dummy" letters, by spelling words backwards, making false divisions between words, and especially by the use of elaborate tables of letters, arranged in the form of the multiplication table, the message being constructed by the aid of preconcerted key-words. A method of this kind is explained in the Latin and English lives of Dr. John Barwick.

An excellent modification of the key-word principle was constructed by Admiral Sir Francis Beaufort. Ciphers have been constructed on the principle of altering the places of the letters without changing their powers. In the celebrated cipher used by the earl of Argyll when plotting against James II., sentences of an indifferent nature were constructed, but the real meaning of the message was to be gathered from words placed at certain intervals. This method, which is connected with the name of Cardan, is sometimes called the trellis or card-board cipher.

The wheel-cipher, which is an Italian invention, the string-cipher, the circle-cipher and many others are fully explained, with the necessary diagrams, in the authorities named above—more particularly by Klüber in his *Kryptographik.*

For modern developments *see* CODES and CIPHERS.

CRYPTOMERIA or **JAPANESE CEDAR,** a genus of conifers, containing a single species, *C. japonica,* a native of Japan. It is one of the finest of Japanese trees, reaching a height of 100 or more feet, usually divested of branches along the lower part of the trunk and crowned with a conical head. The narrow, pointed leaves are spirally arranged and persist for four or five years; the cones are small, globose and borne at the ends of the branchlets, the scales are thickened at the extremity and divided into sharply pointed lobes, three to five seeds are borne on each scale. *Cryptomeria* is extensively used in Japan for reafforesting denuded lands, as it is a valuable timber tree; it is also planted to form avenues along the public roads. Many curious varieties have been obtained by Japanese horticulturists, including dwarf forms a few feet in height. When grown in Great Britain or the northern United States, *Cryptomeria* requires a deep, well-drained soil with plenty of moisture, and protection from cold winds.

CRYPTO-PORTICUS, an architectural term for a concealed or covered passage, generally underground, though lighted and ventilated from the open air. Such passages were much used by the Romans to furnish private communication between various buildings of a group, as in the Palace of the Caesars in Rome, and the Villa of Hadrian in Tivoli.

CRYSTAL-GAZING or **SCRYING,** the term commonly applied to the induction of visual hallucinations by concentrating the gaze on any clear deep, such as a crystal or a ball of polished rock crystal. Some persons do not even find a clear deep necessary, and are content to gaze at the palm of the hand, for example, when hallucinatory pictures, as they declare, emerge. Among objects used are a pool of ink in the hand (Egypt), the liver of an animal (tribes of the North-West Indian frontier), a hole filled with water (Polynesia), quartz crystals (the Apaches and the Euahlayi tribe of New South Wales), a smooth slab of polished black stone (the Huille-che of South America), water in a vessel (Zulus and Siberians), a crystal (the Incas), a mirror (classical Greece and the middle ages), the finger-nail, a sword-blade, a ring-stone, a glass of sherry, in fact almost anything. For a discussion of the problems raised by crystal gazing and similar practices, *see* DIVINATION; PSYCHICAL RESEARCH; SPIRITUALISM and allied articles.

CRYSTALLITE, a name given by Vogelsang to the microscopic bodies occurring in many glassy igneous rocks, such as obsidian, pitchstone and tachylyte. Though possessing no distinct reaction on polarized light and often no recognizable crystallographic form, they are to be regarded as incipient crystals. The larger bodies, often with good crystal form and evident double refraction, are termed microlites. According to their shape and structural arrangement crystallites are subdivided into globulites (small globules), margarites (coalescing globules arranged in rows), cumulites (cloudy aggregate of globules), and globospherites (groups of globulites with a radiate arrangement). Other crystallites assume thread-like forms (trichites) or appear as elongated cylinders or rods (longulites, belonites, baculites). When sufficiently large to be recognizable as mineral species (microlites) they can usually be referred to felspar, pyroxene, amphibole or iron oxides. Acicular microlites bearing divergent arborescent branches are termed scopulites. The pitchstones of Arran are well known for the variety and beauty of their crystallite and microlite constituents (amphibole). In the basaltic glasses of Hawaii similar growths are formed of pyroxene.

CRYSTALLIZATION, the art of obtaining a substance in the form of crystals. It is an important process in chemistry, since it permits the purification of a substance or the separation of the constituents of a mixture. Generally a substance is more soluble in a solvent at a high temperature than at a low, and consequently, if a boiling strong solution be allowed to cool, the substance will separate in virtue of the diminished solubility. The slower the cooling the larger and more perfect will be the crystals formed. If, as sometimes occurs, such a solution refuses to crystallize, the expedient of "inoculating" the solution with a minute crystal of the same substance, or with a similar substance, may be adopted; shaking the solution, or the addition of a drop of another solvent, may also occasion the desired result. "Fractional crystallization" consists in repeatedly partially crystallizing the salt content of a solution so as to separate the substances of different solubilities. Examples are especially presented in the study of the rare-earths. Other conditions under which crystals are formed are given in the article CRYSTALLOGRAPHY.

CRYSTALLOGRAPHY, the science of the forms, properties and structure of crystals. Homogeneous solid matter, the physical and chemical properties of which are the same about every point, may be either amorphous or crystalline. In amorphous matter all the properties are the same in every direction in the mass; but in crystalline matter certain of the physical properties vary with the direction. The essential properties of crystalline matter are of two kinds, viz., the general properties, such as density, specific heat, melting-point and chemical composition, which do not vary with the direction; and the directional properties, such as cohesion and elasticity, various optical, thermal and electrical properties, as well as external form. By reason of the homogeneity of crystalline matter the directional properties are the same in all parallel directions in the mass, and there may be a certain symmetrical repetition of the directions along which the properties are the same.

When the crystallization of matter takes place under conditions free from outside influences the peculiarities of internal structure are expressed in the external form of the mass, and there results a solid body bounded by plane surfaces intersecting in straight edges, the directions of which bear an intimate relation to the internal structure. Such a polyhedron (πολύς, many, ἕδρα, base or face) is known as a crystal. An example of this is sugar-candy, of which a single isolated crystal may have grown freely in a solution of sugar. Matter presenting well-defined and regular crystal forms, either as a single crystal or as a group of individual crystals, is said to be crystallized. If, on the other hand, crystallization has taken place about several centres in a confined space, the development of plane surfaces may be prevented, and a crystalline aggregate of differently orientated crystal-individuals results. Examples of this are afforded by loaf sugar and statuary marble.

After a brief historical sketch, the more salient principles of the subject will be discussed under the following sections:—

I. Crystalline Form.
- (*a*) Symmetry of Crystals.
- (*b*) Simple Forms and Combinations of Forms.
- (*c*) Law of Rational Indices.
- (*d*) Zones.
- (*e*) Projection and Drawing of Crystals.
- (*f*) Crystal Systems and Classes.
  1. Cubic System.
  2. Tetragonal System.
  3. Orthorhombic System.
  4. Monoclinic System.
  5. Anorthic System.
  6. Hexagonal System.
- (*g*) Regular Grouping of Crystals (Twinning, etc.).
- (*h*) Irregularities of Growth of Crystals: Characters of Faces.

II. Physical Properties of Crystals.
- (*a*) Elasticity and Cohesion (Cleavage, Etching, etc.).
- (*b*) Optical Properties (Interference Figures, Pleochroism, etc.).
- (*c*) Thermal Properties.
- (*d*) Magnetic and Electrical Properties.

III. Relations Between Crystalline Form and Chemical Composition.

Most chemical elements and compounds are capable of assuming the crystalline condition. Crystallization may take place when solid matter separates from solution (*e.g.*, sugar, salt, alum), from a fused mass (*e.g.*, sulphur, bismuth, felspar), or from a vapour (*e.g.*, iodine, camphor, haematite; in the last case by the interaction of ferric chloride and steam). Crystalline growth may also take place in solid amorphous matter, for example, in the devitrification of glass, and the slow change in metals when subjected to alternating stresses. Beautiful crystals of many substances may be obtained in the laboratory by one or other of these methods, but the most perfectly developed and largest crystals are those of mineral substances found in nature, where crystallization has continued during long periods of time. For this reason the physical science of crystallography has developed side by side with that of mineralogy. Really, however, there is just the same connection between crystallography and chemistry as between crystallography and mineralogy, but only in recent years has the importance of determining the crystallographic properties of artificially prepared compounds been recognized.

History.—The word "crystal" is from the Gr. κρύσταλλος, meaning clear ice (Lat. *crystallum*), a name which was also applied to the clear transparent quartz ("rock-crystal") from the Alps, under the belief that it had been formed from water by intense cold. It was not until about the 17th century that the word was extended to other bodies, either those found in nature or obtained by the evaporation of a saline solution, which resembled rock-crystal in being bounded by plane surfaces, and often also in their clearness and transparency.

The first important step in the study of crystals was made by Nicolaus Steno, the famous Danish physician, afterwards bishop of Titiopolis, who in his treatise *De solido intra solidum naturaliter contento* (Florence, 1669; English translation, 1671) gave the results of his observations on crystals of quartz. He found that although the faces of different crystals vary considerably in shape and relative size, yet the angles between similar pairs of faces are always the same. He further pointed out that the crystals must have grown in a liquid by the addition of layers of material upon the faces of a nucleus, this nucleus having the form of a regular six-sided prism terminated at each end by a six-sided pyramid. The thickness of the layers, though the same over each face, was not necessarily the same on different faces, but depended on the position of the faces with respect to the surrounding liquid; hence the faces of the crystal, though variable in shape and size, remained parallel to those of the nucleus, and the angles between them constant. Robert Hooke in his *Micrographia* (London, 1665) had previously noticed the regularity of the minute quartz crystals found lining the cavities of flints, and had suggested that they were built up of spheroids. About the same time the double refraction and perfect rhomboidal cleavage of crystals of calcite or Iceland-spar were studied by Erasmus Bartholinus (*Experimenta crystalli Islandici disdiaclastici,* Copenhagen, 1669) and Christiaan Huygens (*Traité de la lumière,* Leyden, 1690); the latter supposed, as did Hooke, that the crystals were built up of spheroids. In 1695 Anton van Leeuwenhoek observed under the microscope that different forms of crystals grow from the solutions of different salts. Andreas Libavius had indeed much earlier, in 1597, pointed out that the salts present in mineral waters could be ascertained by an examination of the shapes of the crystals left on evaporation of the water; and Domenico Guglielmini (*Riflessioni filosofiche dedotte dalle figure de dei sali,* Padova, 1706) asserted that the crystals of each salt had a shape of their own with the plane angles of the faces always the same.

The earliest treatise on crystallography is the *Prodromus Crystallographiae* of M. A. Cappeller, published at Lucerne in 1723. Crystals were mentioned in works on mineralogy and chemistry; for instance, C. Linnaeus in his *Systema Naturae* (1735) described some forty common forms of crystals amongst minerals. It was not, however, until the end of the 18th century that any real advances were made, and the French crystallographers Romé de Lisle and the abbé Haüy are rightly considered as the founders of the science. J. B. L. Romé de Lisle (*Essai de cristallographie,* Paris, 1772; *Cristallographie, ou description des formes propres à tous les corps du règne minéral,* Paris, 1783) made the important discovery that the various shapes of crystals of the same natural or artificial substance are all intimately related to each other; and further, by measuring the angles between the faces of crystals with the goniometer (*q.v.*), he established the fundamental principle that these angles are always the same for the same kind of substance and are characteristic of it. Replacing by single planes or groups of planes all the similar edges or solid angles of a figure called the "primitive form" he derived other related forms. Six kinds of primitive forms were distinguished, namely, the cube, the regular octahedron, the regular tetrahedron, a rhombohedron, an octahedron with a rhombic base, and a double six-sided pyramid. Only in the last three can there be any variation in the angles: for example, the primitive octahedron of alum, nitre and sugar were determined by Romé de Lisle to have angles of 110°, 120° and 100° respectively. René Just Haüy in his *Essai d'une théorie sur la structure des crystaux* (Paris, 1784; *see* also his Treatises on Mineralogy and Crystallography, 1801, 1822) supported and extended these views, but took for his primitive forms the figures obtained by splitting crystals in their directions of easy fracture of "cleavage," which are always the same in the same kind of substance. Thus he found that all crystals of calcite, whatever their external form (*see*, for example, figs. 1–6 in the article CALCITE), could be reduced by cleavage to a rhombohedron with interfacial angles of 75°. Further, by stacking together a number of small rhombohedra of uniform size he was able, as had been previously done by J. G. Gahn in 1773, to reconstruct the various forms of calcite crystals. Fig. 1 shows a scalenohedron built up in this manner of rhombohedra; and fig. 2 a regular octahedron built up of cubic elements, such as are given by the cleavage of galena and rock-salt.

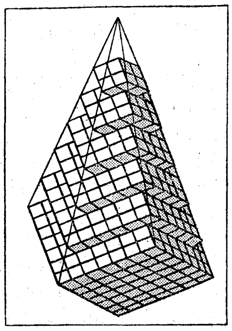

FIG. 1.—SCALENOHEDRON BUILT UP OF RHOMBOHEDRA

The external surfaces of such a structure, with their step-like arrangement, correspond to the plane faces of the crystal, and the bricks may be considered so small as not to be separately visible. By making the steps one, two or three bricks in width and one, two or three bricks in height, the various secondary faces on the crystal are related to the primitive form or "cleavage nucleus" by a law of whole numbers, and the angles between them can be arrived at by mathematical calculation. By measuring with the goniometer the inclinations of the secondary faces to those of the primitive form Haüy found that the secondary forms are always related to the primitive form on crystals of numerous substances in the manner indicated, and that the width and the height of a step are always in a simple ratio, rarely exceeding that of 1:6. This laid the foundation of the important "law of rational indices" of the faces of crystals.

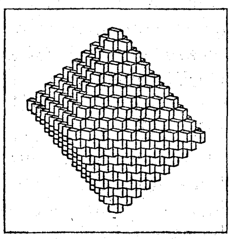

FIG 2.—OCTAHEDRON BUILT UP OF CUBES

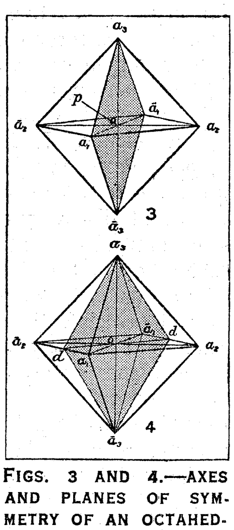
The German crystallographer C. S. Weiss (*De indagando formarum, crystallinarum charactere geometrico principali dissertatio*, Leipzig, 1809; *Übersichtliche Darstellung der verschiedenen natürlichen Abtheilungen der Krystallisations-Systeme*, Denkschrift der Berliner Akad. der Wissensch., 1814–1815) attacked the problem of crystalline form from a purely geometrical point of view, without reference to primitive forms or any theory of structure. The faces of crystals were considered by their intercepts on co-ordinate axes, which were drawn joining the opposite corners of certain forms; and in this way the various primitive forms of Haüy were grouped into four classes, corresponding to the four systems described below under the names cubic, tetragonal, hexagonal and orthorhombic. The same result was arrived at independently by F. Mohs, who further, in 1822, asserted the existence of two additional systems with oblique axes. These two systems (the monoclinic and anorthic) were, however, considered by Weiss to be only hemihedral or tetartohedral modifications of the orthorhombic system, and they were not definitely established until 1835, when the optical characters of the crystals were found to be distinct. A system of notation to express the relation of each face of a crystal to the co-ordinate axes of reference was devised by Weiss, and other notations were proposed by F. Mohs, A. Lévy (1825), C. F. Naumann (1826), and W. H. Miller (*Treatise on Crystallography*, Cambridge, 1839). For simplicity and utility in calculation the Millerian notation, which was first suggested by W. Whewell in 1825, surpasses all others and is now generally adopted, though those of Lévy and Naumann are still in use.



FIGS. 3 AND 4.—AXES AND PLANES OF SYMMETRY OF AN OCTAHEDRON

Although the peculiar optical properties of Iceland-spar had been much studied ever since 1669, it was not until much later that any connection was traced between the optical characters of crystals and their external form. In 1818 Sir David Brewster found that crystals could be divided optically into three classes, viz., isotropic, uniaxial and biaxial, and that these classes corresponded with Weiss's four systems (crystals belonging to the cubic system being isotropic, those of the tetragonal and hexagonal being uniaxial, and the orthorhombic being biaxial). Optically biaxial crystals were afterwards shown by J. F. W. Herschel and F. E. Neumann in 1822 and 1835 to be of three kinds, corresponding with the orthorhombic, monoclinic and anorthic systems. It was, however, noticed by Brewster himself that there are many apparent exceptions, and the "optical anomalies" of crystals have been the subject of much study. The intimate relations existing between various other physical properties of crystals and their external form have subsequently been gradually traced.

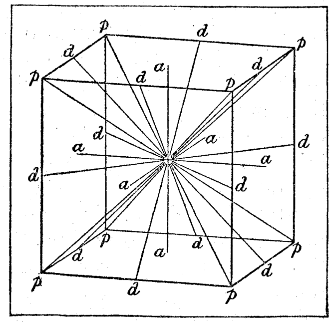


FIG. 5.—AXES OF SYMMETRY OF A CUBE

The symmetry of crystals, though recognized by Romé de l'Isle and Haüy, in that they replaced all similar edges and corners of their primitive forms by similar secondary planes, was not made use of in defining the six systems of crystallization, which depended solely on the lengths and inclinations of the axes of reference. It was, however, necessary to recognize that in each system there are certain forms which are only partially symmetrical, and these were described as hemihedral and tetartohedral forms (*i.e.*, half-faced and quarter-faced forms).

As a consequence of Haüy's law of rational intercepts, or, as it is more often called, the law of rational indices, it was proved by J. F. C. Hessel in 1830 that thirty-two types of symmetry are possible in crystals. Hessel's work remained overlooked for sixty years, but the same important result was independently arrived at by the same method by A. Gadolin in 1867. At the present day, crystals are considered as belonging to one or other of thirty-two classes, corresponding with these thirty-two types of symmetry, and are grouped in six systems. More recently, theories of crystal structure have attracted attention, and have been studied as purely geometrical problems of the homogeneous partitioning of space.

The historical development of the subject is treated in greater detail by the following: C. M. Marx, *Geschichte der Crystallkunde* (Karlsruhe and Baden, 1825); W. Whewell, *History of the Inductive Sciences*, vol. iii. (3rd ed., London, 1857); F. von Kobell, *Geschichte der Mineralogie von 1650–1860* (München, 1864); P. Groth, *Entwicklungsgeschichte der mineralogischen Wissenschaften* (Berlin, 1926).

I. CRYSTALLINE FORM

The fundamental laws governing the form of crystals are:—

1. Law of the Constancy of Angle.
2. Law of Symmetry.
3. Law of Rational Intercepts or Indices.

According to the first law, the angles between corresponding faces of all crystals of the same chemical substance are always the same and are characteristic of the substance.

(*a*) *Symmetry of Crystals*

Crystals may, or may not, be symmetrical with respect to a point, a line or axis, and a plane; these "elements of symmetry" are spoken of as a centre of symmetry, an axis of symmetry, and a plane of symmetry respectively.

Centre of Symmetry.—Crystals which are centro-symmetrical have their faces arranged in parallel pairs; and the two parallel faces, situated on opposite sides of the centre (*O* in fig. 3) are alike in surface characters, such as lustre, striations and figures of corrosion. An octahedron (fig. 3) is bounded by four pairs of parallel faces. Crystals belonging to many of the hemihedral and tetartohedral classes of the six systems of crystallization are devoid of a centre of symmetry.

Axes of Symmetry.—Consider the vertical axis joining the opposite corners a_3 and $\bar{a}_3$ of an octahedron (fig. 3) and passing through its centre O: by rotating the crystal about this axis through a right angle (90°) it reaches a position such that the orientation of its faces is the same as before the rotation; the face $a_1a_2a_3$, for example, coming into the position of $a_1\bar{a}_2a_3$. During a complete rotation of 360° (=90°×4), the crystal occupies four such interchangeable positions. Such an axis of symmetry is known as a tetrad axis of symmetry. Other tetrad axes of the octahedron are $a_2\bar{a}_2$ and $a_1\bar{a}_1$.

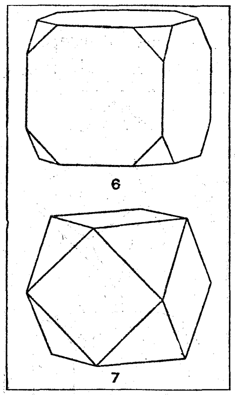

FIG. 6.—CUBE IN COMBINATION WITH OCTAHEDRON. FIG. 7.—CUBO-OCTAHEDRON

An axis of symmetry of another kind is that which passing through the centre O is normal to a face of the octahedron. By rotating the crystal about such an axis Op (fig. 3) through an angle of 120° those faces which are not perpendicular to the axis occupy interchangeable positions; for example, the face $a_1a_3a_2$ comes into the position of $\bar{a}_2a_1\bar{a}_3$, and $\bar{a}_2a_1\bar{a}_3$ to $a_3\bar{a}_2\bar{a}_1$. During a complete rotation of 360° (=120°×3) the crystal occupies similar positions three times. This is a triad axis of symmetry; and there being four pairs of parallel faces on an octahedron, there are four triad axes (only one of which is drawn in the figure).

An axis passing through the centre O and the middle points d of two opposite edges of the octahedron (fig. 4), *i.e.*, parallel to the edges of the octahedron, is a dyad axis of symmetry. About this axis there may be rotation of 180°, and only twice in a complete revolution of 360° (=180°×2) is the crystal brought into interchangeable positions. There being six pairs of parallel edges on an octahedron, there are consequently six dyad axes of symmetry.

A regular octahedron thus possesses thirteen axes of symmetry (of three kinds), and there are the same number in the cube. Fig. 5 shows the three tetrad (or tetragonal) axes (aa), four triad (or trigonal) axes (pp), and six dyad (diad or diagonal) axes (dd).

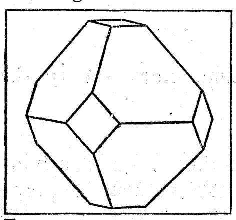

FIG. 8.—OCTAHEDRON IN COMBINATION WITH CUBE

Although not represented in the cubic system, there is still another kind of axis of symmetry possible in crystals. This is the hexad axis or hexagonal axis, for which the angle of rotation is 60°, or one-sixth of 360°. There can be only one hexad axis of symmetry in any crystal. (*See* figs. 77–80.)

Planes of Symmetry.—A regular octahedron can be divided into two equal and similar halves by a plane passing through the corners $a_1a_3\bar{a}_1\bar{a}_3$ and the centre O (fig. 3). One-half is the mirror reflection of the other in this plane, which is called a plane of symmetry. Corresponding planes on either side of a plane of symmetry are inclined to it at equal angles. The octahedron can also be divided by similar planes of symmetry passing through the corners $a_1a_2\bar{a}_1\bar{a}_2$ and $a_2a_3\bar{a}_2\bar{a}_3$. These three similar planes of symmetry are called the cubic planes of symmetry, since they are parallel to the faces of the cube. (Compare figs. 6–8, showing combinations of the octahedron and the cube.)

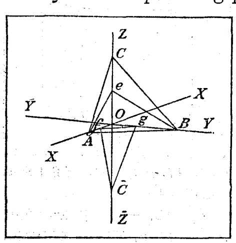

FIG. 9.—CRYSTALLOGRAPHIC AXES OF REFERENCE

A regular octahedron can also be divided symmetrically into two equal and similar portions by a plane passing through the corners a_3 and $\bar{a}_3$, the middle points d of the edges $a_1\bar{a}_2$ and $\bar{a}_1a_2$, and the centre O (fig. 4). This is called a dodecahedral plane of symmetry, being parallel to the face of the rhombic dodecahedron which truncates the edge a_1a_2. (Compare fig. 14, showing a combination of the octahedron and rhombic dodecahedron.) Another similar plane of symmetry is that passing through the corners $a_3\bar{a}_3$ and the middle points of the edges a_1a_2 and $\bar{a}_1\bar{a}_2$, and altogether there are six dodecahedral planes of symmetry, two through each of the corners a_1, a_2, a_3 of the octahedron.

A regular octahedron and a cube are thus each symmetrical with respect to the following elements of symmetry: a centre of symmetry, thirteen axes of symmetry (of three kinds), and nine planes of symmetry (of two kinds). This degree of symmetry, which is the type corresponding to one of the classes of the cubic system, is the highest possible in crystals. As will be pointed out below, it is possible, however, for both the octahedron and the cube to be associated with fewer elements of symmetry than those just enumerated.

(*b*) *Simple Forms and Combinations of Forms*

A single face $a_1a_2a_3$ (figs. 3 and 4) may be repeated by certain of the elements of symmetry to give the whole eight faces of the octahedron. Thus, by rotation about the vertical tetrad axis $a_3\bar{a}_3$ the four upper faces are obtained; and by rotation of these about one or other of the horizontal tetrad axes the eight faces are derived. Or again, the same repetition of the faces may be arrived at by reflection across the three cubic planes of symmetry. (By reflection across the six dodecahedral planes of symmetry a tetrahedron only would result, but if this is associated with a centre of symmetry we obtain the octahedron.) Such a set of similar faces, obtained by symmetrical repetition, constitutes a "simple form." An octahedron thus consists of eight similar faces, and a cube is bounded by six faces all of which have the same surface characters and parallel to each of which all the properties of the crystal are identical.

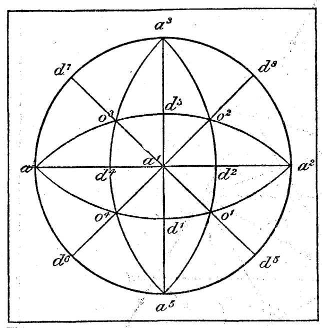

FIG. 10.—STEREOGRAPHIC PROJECTION OF A CUBIC CRYSTAL

Examples of simple forms amongst crystallized substances are octahedra of alum and spinel and cubes of salt and fluorspar. More usually, however, two or more forms are present on a crystal, and we then have a combination of forms, or simply a "combination." Figs. 6, 7 and 8 represent combinations of the octahedron and the cube; in the first the faces of the cube predominate, and in the third those of the octahedron; fig. 7 with the two forms equally developed is called a cubo-octahedron. Each of these combined forms has all the elements of symmetry proper to the simple forms.

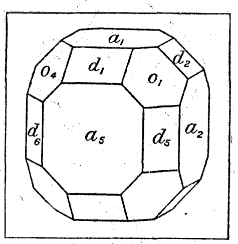

FIG. 11.—CLINOGRAPHIC DRAWING OF A CUBIC CRYSTAL

The simple forms, though referable to the same type of symmetry and axes of reference, are quite independent, and cannot be derived one from the other by symmetrical repetition, but, after the manner of Romé de l'Isle, they may be derived by replacing edges or corners by a face equally inclined to the faces forming the edges or corners; this is known as "truncation." Thus in fig. 6 the corners of the cube are symmetrically replaced or truncated by the faces of the octahedron, and in fig. 8 those of the octahedron are truncated by the cube.

(*c*) *Law of Rational Intercepts*

For axes of reference, OX, OY, OZ (fig. 9), take any three edges formed by the intersection of three faces of a crystal. These axes are called the crystallographic axes, and the planes in which they lie the axial planes. A fourth face on the crystal intersecting these three axes in the points A, B, C is taken as the parametral plane, and the lengths $OA{:}OB{:}OC$ are the parameters of the crystal. Any other face on the crystal may be referred to these axes and parameters by the ratio of the intercepts

$$\frac{OA}{h}:\frac{OB}{k}:\frac{OC}{l}.$$

Thus for a face parallel to the plane ABe the intercepts are in the ratio $OA{:}OB{:}Oe$, or

$$\frac{OA}{1}:\frac{OB}{1}:\frac{OC}{2}$$

and for a plane $fg\bar{C}$ they are $Of:Og:O\bar{C}$ or

$$\frac{OA}{2}:\frac{OB}{3}:\frac{O\bar{C}}{1}.$$

Now the important relation existing between the faces of a crystal is that the denominators h, k and l are always rational

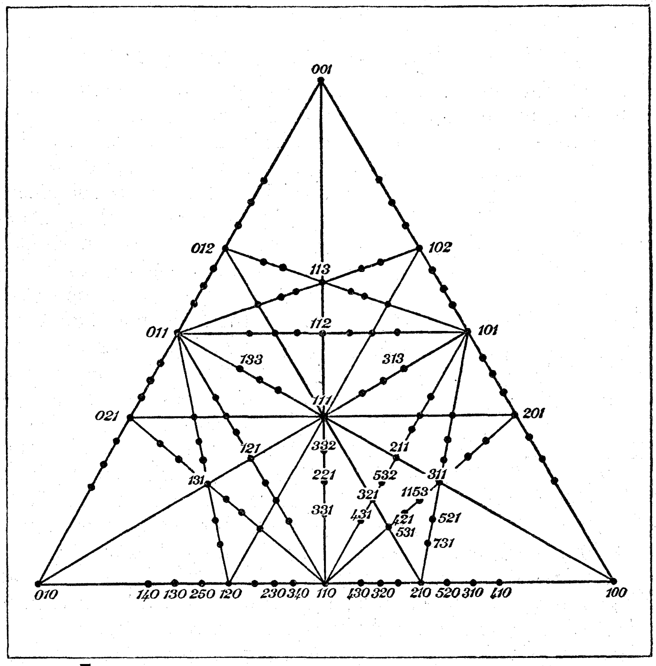

FIG. 12.—GNOMONIC PROJECTION OF A CUBIC CRYSTAL

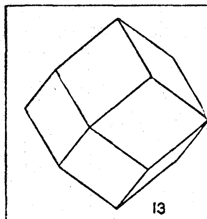
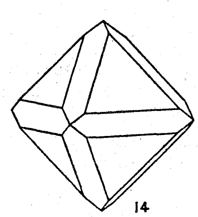
whole numbers, rarely exceeding 6, and usually 0, 1, 2 or 3. Written in the form $\{hkl\}$, h referring to the axis OX, k to OY, and l to OZ, they are spoken of as the indices (Millerian indices) of the face. Thus of a face parallel to the plane ABC the indices are $\{111\}$, of ABe they are $\{112\}$ and of $fg\bar{C}$ $\{23\bar{1}\}$. The indices are thus inversely proportional to the intercepts, and the law of rational intercepts is often spoken of as the "law of rational indices."

The angular position of a face is thus completely fixed by its indices; and knowing the angles between the axial planes and the parametral plane all the angles of a crystal can be calculated when the indices of the faces are known.



13



14

FIG. 13.—RHOMBIC DODECAHEDRON

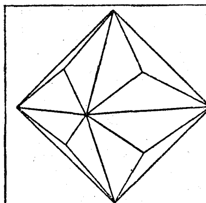
FIG. 14.—COMBINATION OF RHOMBIC DODECAHEDRON AND OCTAHEDRON

Although any set of edges formed by the intersection of three planes may be chosen for the crystallographic axes, it is in practice usual to select certain edges related to the symmetry of the crystal, and usually coincident with axes of symmetry; for then the indices will be simpler and all faces of the same simple form will have a similar set of indices. The angles between the axes and the ratio of the lengths of the parameters $OA:OB:OC$ (usually given as $a:b:c$) are spoken of as the "elements" of a crystal, and are constant for and characteristic of all crystals of the same substance.

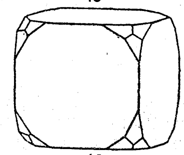
The six systems of crystal forms, to be enumerated below, are defined by the relative inclinations of the crystallographic axes and the lengths of the parameters. In the cubic system, for example, the three crystallographic axes are taken parallel to the three tetrad axes of symmetry, *i.e.*, parallel to the edges of the cube (fig. 5) or joining the opposite corners of the octahedron (fig. 3), and they are therefore all at right angles; the parametral plane (111) is a face of the octahedron, and the parameters are all of equal length. The indices of the eight faces of the octahedron will then be $\{111\}$, $\{\bar{1}11\}$, $\{1\bar{1}1\}$, $\{\bar{1}\bar{1}1\}$, $\{11\bar{1}\}$, $\{\bar{1}1\bar{1}\}$, $\{\bar{1}\bar{1}\bar{1}\}$, $\{\bar{1}\bar{1}\bar{1}\}$. The symbol $\{111\}$ indicates all the faces belonging to this simple form. The indices of the six faces of the cube are $\{100\}$, $\{010\}$, $\{001\}$, $\{\bar{1}00\}$, $\{0\bar{1}0\}$, $\{00\bar{1}\}$; here each face is parallel to two axes, *i.e.*, intercepts them at infinity, so that the corresponding indices are zero.

(*d*) *Zones*

An important consequence of the law of rational intercepts is the arrangement of the faces of a crystal in zones. All faces, whether they belong to one or more simple forms, which intersect in parallel edges are said to lie in the same zone. A line drawn through the centre O of the crystal parallel to these edges is called a zone-axis, and a plane perpendicular to this axis is called a zone-plane. On a cube, for example, there are three zones each containing four faces, the zone-axes being coincident with the three tetrad axes of symmetry. In the crystal of zircon (fig. 88) the eight prism-faces, a, m, etc., constitute a zone, denoted by $[a, m, a'$, etc.$]$, with the vertical tetrad axis of symmetry as zone-axis. Again the faces $[a, x, p, e', p', x''', a'']$ lie in another zone, as may be seen by the parallel edges of intersection of the faces in figs. 87 and 88; three other similar zones may be traced on the same crystal.



15



16

FIG. 15.—TRIAKIS-OCTAHEDRON

FIG. 16.—COMBINATION OF TRIAKIS-OCTAHEDRON AND CUBE

The direction of the line of intersection (*i.e.*, zone-axis) of any two planes $\{hkl\}$ and $\{h_1k_1l_1\}$ is given by the zone-indices [uvw], where $u=kl_1-lk_1$, $v=lh_1-hl_1$, and $w=hk_1-kh_1$, these being obtained from the face-indices by cross multiplication as follows:

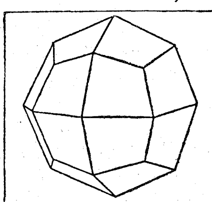
$$\begin{array}{cccccc} h & k & l & h & k & l \\ & \times & \times & \times & & \\ h_1 & k_1 & l_1 & h_1 & k_1 & l_1. \end{array}$$

Any other face $(h_2k_2l_2)$ lying in this zone must satisfy the equation

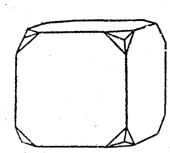
$$h_2u+k_2v+l_2w=0.$$

This important relation connecting the indices of a face lying in a zone with the zone-indices is known as Weiss's zone-law, having been first enunciated by C. S. Weiss. It may be pointed out that the indices of a face may be arrived at by adding together the indices of faces on either side of it and in the same zone; thus $\{311\}$ in fig. 12 lies at the intersections of the three zones $\{210, 101\}$, $\{201, 110\}$ and $\{211, 100\}$ and is obtained by adding together each set of indices.

(*e*) *Projection and Drawing of Crystals*



17



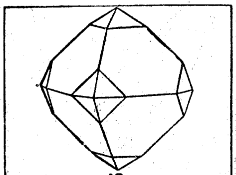
18

FIG. 17.—ICOSITETRAHEDRON

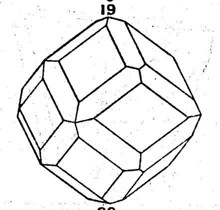
FIG. 18.—COMBINATION OF ICOSITETRAHEDRON AND CUBE

The shapes and relative sizes of the faces of a crystal being as a rule accidental, depending only on the distance of the faces from the centre of the crystal and not on their angular relations, it is often more convenient to consider only the directions of the normals to the faces. For this purpose projections are drawn, with the aid of which the zonal relations of a crystal are more readily studied and calculations are simplified.

The kind of projection most extensively used is the "stereographic projection." The crystal is considered to be placed inside a sphere from the centre of which normals are drawn to all the faces of the crystal. The points at which these normals intersect the surface of the sphere are called the poles of the faces, and by these poles the positions of the faces are fixed. The poles of all faces in the same zone on the crystal will lie on a great circle of the sphere, which are therefore called zone-circles. The calculation of the angles between the normals of faces and between zone-circles is then performed by the ordinary methods of spherical trigonometry. The stereographic projection, however, represents the poles and zone-circles on a plane surface and not on a spherical surface. This is achieved by drawing lines joining all the poles of the faces with the north or south pole of the sphere and finding their points of intersection with the plane of the equatorial great circle, or primitive circle, of the sphere, the projection being represented on this plane. In fig. 10 is shown the stereographic projection, or stereogram, of a cubic crystal; a^1, a^2, etc., are the poles of the faces of the cube, o^1, o^2, etc., those of the octahedron, and d^1, d^2, etc., those of the rhombic dodecahedron. The straight lines and circular arcs are the projections on the equatorial plane of the great circles in which the nine planes of symmetry intersect the sphere. A drawing of a crystal showing a combination of the cube, octahedron and rhombic dodecahedron is shown in fig. 11, in which the faces are lettered the same as the corresponding poles in the projection. From the zone-circles in the projection and the parallel edges in the drawing the zonal relations of the faces are readily seen: thus $[a^1o^1d^5]$, $[a^1d^1a^5]$, $[a^5o^1d^2]$, etc., are zones. A stereographic projection of a rhombohedral crystal is given in fig. 72.



19



20

FIG. 19.—COMBINATION OF ICOSITETRAHEDRON AND OCTAHEDRON
FIG. 20.—COMBINATION OF ICOSITETRAHEDRON (211) AND RHOMBIC DODECAHEDRON

Another kind of projection in common use is the "gnomonic projection" (fig. 12). Here the plane of projection is tangent to the sphere, and normals to all the faces are drawn from the centre of the sphere to intersect the plane of projection. In this case all zones are represented by straight lines. Fig. 12 is the gnomonic projection of a cubic crystal, the plane of projection being tangent to the sphere at the pole of an octahedral face {111}, which is therefore in the centre of the projection. The indices of the several poles are given in the figure.

In drawing crystals the simple plans and elevations of descriptive geometry (*e.g.*, the plans in the lower part of figs. 87 and 88) have sometimes the advantage of showing the symmetry of a crystal, but they give no idea of solidity. For instance, a cube would be represented merely by a square, and an octahedron by a square with lines joining the opposite corners. True perspective drawings are never used in the representation of crystals, since for showing the zonal relations it is important to preserve the parallelism of the edges. If, however, the eye, or point of vision, is regarded as being at an infinite distance from the object all the rays will be parallel, and edges which are parallel on the crystal will be represented by parallel lines in the drawing. The plane of the drawing, in which the parallel rays joining the corners of the crystals and the eye intersect, may be either perpendicular or oblique to the rays; in the former case we have an orthographic drawing, and in the latter a clinographic drawing. Clinographic drawings are most frequently used for representing crystals. In representing, for example, a cubic crystal (fig. 11) a cube face a^3 is first placed parallel to the plane on which the crystal is to be projected and with one set of edges vertical; the crystal is then turned through a small angle about a vertical axis until a second cube face a^2 comes into view, and the eye is then raised so that a third cube face a^1 may be seen.

22

FIG. 21.—FLAT TETRAKIS-HEXAHEDRON, APPROACHING THE CUBE IN FORM
FIG. 22.—STEEP TETRAKIS-HEXAHEDRON, APPROACHING THE RHOMBIC DODECAHEDRON IN FORM

(*f*) *Crystal Systems and Classes*

According to the mutual inclinations of the crystallographic axes of reference and the lengths intercepted on them by the parametral plane, all crystals fall into one or other of six groups or systems, in each of which there are several classes depending on the degree of symmetry. In the brief description which follows of these six systems and thirty-two classes of crystals we shall proceed from those in which the symmetry is most complex to those in which it is simplest.

1. CUBIC SYSTEM

(Isometric; Regular; Octahedral; Tesseral.)

In this system the three crystallographic axes of reference are all at right angles to each other and are equal in length. They are parallel to the edges of the cube, and in the different classes coincide either with tetrad or dyad axes of symmetry. Five classes are included in this system, in all of which there are, besides other elements of symmetry, four triad axes.

In crystals of this system the angle between any two faces P and Q with the indices $\{hkl\}$ and $\{pqr\}$ is given by the equation

$$\cos PQ = \frac{hp+kq+lr}{\sqrt{(h^2+k^2+l^2)\,(p^2+q^2+r^2)}}.$$

The angles between faces with the same indices are thus the same in all substances which crystallize in the cubic system: in other systems the angles vary with the substance and are characteristic of it.

Holosymmetric Class

(Holohedral; Hexakis-octahedral.)

Crystals of this class possess the full number of elements of symmetry already mentioned above for the octahedron and the cube, viz., three cubic planes of symmetry, six dodecahedral planes, three tetrad axes of symmetry, four triad axes, six dyad axes and a centre of symmetry.

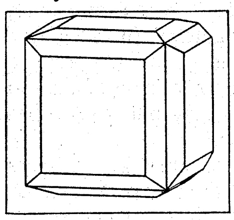

FIG. 23.—COMBINATION OF TETRAKIS-HEXAHEDRON AND CUBE

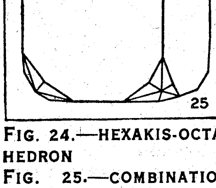
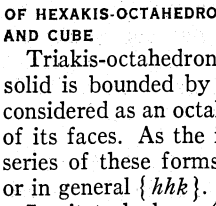
There are seven kinds of simple forms, viz.:—

Cube (fig. 5).—This is bounded by six square faces parallel to the cubic planes of symmetry; is known also as the hexahedron. The angles between the faces are 90°, and the indices of the form are {100}. Salt, fluorspar and galena crystallize in simple cubes.

Octahedron (fig. 3).—Bounded by eight equilateral triangular faces perpendicular to the triad axes of symmetry. The angles between the faces are 70° 32′ and 109° 28′, and the indices are {111}. Spinel, magnetite and gold crystallize in simple octahedra. Combinations of the cube and octahedron are shown in figs. 6–8.



24



25

FIG. 24.—HEXAKIS-OCTAHEDRON
FIG. 25.—COMBINATION OF HEXAKIS-OCTAHEDRON AND CUBE

Rhombic dodecahedron (fig. 13).—Bounded by twelve rhomb-shaped faces parallel to the six dodecahedral planes of symmetry. The angles between the normals to adjacent faces are 60°, and between other pairs of faces 90°; the indices are {110}. Garnet frequently crystallizes in this form. Fig. 14 shows the rhombic dodecahedron in combination with the octahedron.

In these three simple forms of the cubic system (which are shown in combination in fig. 11) the angles between the faces and the indices are fixed and are the same in all crystals; in the four remaining simple forms they are variable.

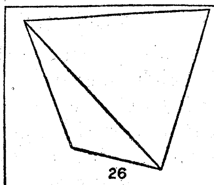
Triakis-octahedron (three-faced octahedron) (fig. 15).—This solid is bounded by twenty-four isosceles triangles, and may be considered as an octahedron with a low triangular pyramid on each of its faces. As the inclinations of the faces may vary there is a series of these forms with the indices {221}, {331}, {332}, etc., or in general $\{hhk\}$.

Icositetrahedron (fig. 17).—Bounded by twenty-four trapezoidal faces, and hence sometimes called a "trapezohedron." The indices are {211}, {311}, {322}, etc., or in general $\{hkk\}$. Analcime, leucite and garnet often crystallize in the simple form {211}. Combinations are shown in figs. 18–20. The plane ABe in fig. 9

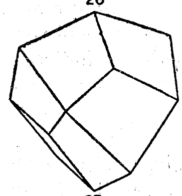
is one face $\{112\}$ of an icositetrahedron; the indices of the remaining faces in this octant being $\{211\}$ and $\{121\}$.

Tetrakis-hexahedron (four-faced cube) (figs. 21 and 22).—Like the triakis-octahedron this solid is also bounded by twenty-four isosceles triangles, but here grouped in fours over the cubic faces. The two figures show how, with different inclinations of the faces, the form may vary, approximating in fig. 21 to the cube and in fig. 22 to the rhombic dodecahedron. The angles over the edges lettered *A* are different from the angles over the edges lettered *C*. Each face is parallel to one of the crystallographic axes and intercepts the two others in different lengths; the indices are therefore $\{210\}$,$\{310\}$,$\{320\}$, etc., in general $\{hk0\}$. Fluorspar sometimes crystallizes in the simple form $\{310\}$; more usually, however, in combination with the cube (fig. 23).

Hexakis-octahedron (fig. 24).—Here each face of the octahedron is replaced by six scalene triangles, so that altogether there are forty-eight faces. This is the greatest number of faces possible for any simple form in crystals. The faces are all oblique to the planes and axes of symmetry, and they intercept the three crystallographic axes in different lengths, hence the indices are all unequal, being in general $\{hkl\}$, or in particular cases $\{321\}$, $\{421\}$, $\{432\}$, etc. Such a form is known as the "general form" of the class. The interfacial angles over the three edges of each triangle are all different. These forms usually exist only in combination with other cubic forms (for example, fig. 25), but $\{421\}$ has been observed as a simple form on fluorspar.



26



27

FIG. 26.—TETRAHEDRON
FIG. 27.—DELTOID DODECAHEDRON

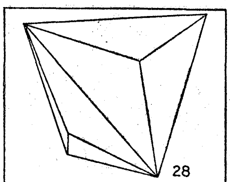
Several examples of substances which crystallize in this class have been mentioned above under the different forms; many others might be cited—for instance, the metals iron, copper, silver, gold, platinum, lead, mercury and the non-metallic elements silicon and phosphorus.

Tetrahedral Class

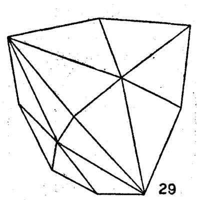
(Tetrahedral-hemihedral; Hexakis-tetrahedral.)

In this class there is no centre of symmetry nor cubic planes of symmetry; the three tetrad axes become dyad axes of symmetry, and the four triad axes are polar, *i.e.*, they are associated with different faces at their two ends. The six dodecahedral planes are the same as in the last class.

Of the seven simple forms, the cube, rhombic dodecahedron and tetrakis-hexahedron are geometrically the same as before, though on actual crystals the faces will have different surface characters. For instance, the cube faces will be striated parallel to only one of the diagonal (fig. 90), and etched figures on this face will be symmetrical with respect to two lines, instead of four as in the last class. The remaining simple forms have, however, only half the number of faces as the corresponding form in the last class, and are spoken of as "hemihedral with inclined faces."



28



29

FIG. 28.—TRIAKIS-TETRAHEDRON
FIG. 29.—HEXAKIS-TETRAHEDRON

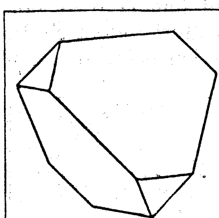
Tetrahedron (fig. 26).—This is bounded by four equilateral triangles and is identical with the regular tetrahedron of geometry. The angles between the normals to the faces are 109° 28′. It may be derived from the octahedron by suppressing the alternate faces.

Deltoid dodecahedron (fig. 27).—This is the hemihedral form of the triakis-octahedron; it has the indices $\{hhk\}$ and is bounded by twelve trapezoidal faces.

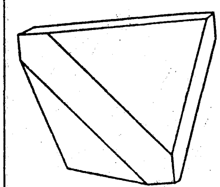
Triakis-tetrahedron (fig. 28).—The hemihedral form $\{hkk\}$ of the icositetrahedron; it is bounded by twelve isosceles triangles arranged in threes over the tetrahedron faces.

Hexakis-tetrahedron (fig. 29).—The hemihedral form $\{hkl\}$ of the hexakis-octahedron; it is bounded by twenty-four scalene triangles and is the general form of the class.

Corresponding to each of these hemihedral forms there is another geometrically similar form, differing, however, not only in orientation, but also in actual crystals in the characters of the faces. Thus from the octahedron there may be derived two tetrahedra with the indices $\{111\}$ and $\{\bar{1}11\}$, which may be distinguished as positive and negative respectively. Fig. 30 shows a combination of these two tetrahedra, and represents a crystal of blende, in which the four larger faces are dull and striated, whilst the four smaller are bright and smooth. Figs. 31–33 illustrate other tetrahedral combinations.



30



31

FIG. 30.—COMBINATION OF TWO TETRAHEDRA
FIG. 31.—COMBINATION OF TETRAHEDRON AND CUBE

Tetrahedrite, blende, diamond, boracite and pharmacosiderite are substances which crystallize in this class.

Pyritohedral Class

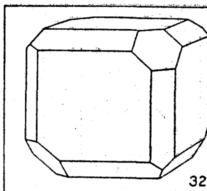
(Parallel-faced hemihedral; Dyakis-dodecahedral.)

Crystals of this class possess three cubic planes of symmetry but no dodecahedral planes. There are only three dyad axes of symmetry, which coincide with the crystallographic axes; in addition there are three triad axes and a centre of symmetry.

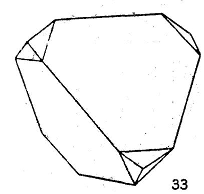
Here the cube, octahedron, rhombic dodecahedron, triakis-octahedron and icositetrahedron are geometrically the same as in the first class. The characters of the faces will, however, be different; thus the cube faces will be striated parallel to one edge only (fig. 89), and triangular markings on the octahedron faces will be placed obliquely to the edges. The remaining simple forms are "hemihedral with parallel faces," and from the corresponding holohedral forms two hemihedral forms, a positive and a negative, may be derived.

Pentagonal dodecahedron (fig. 34).—This is bounded by twelve pentagonal faces, but these are not regular pentagons, and the angles over the three sets of different edges are different. The regular dodecahedron of geometry, contained by twelve regular pentagons, is not a possible form in crystals. The indices are $\{hk0\}$: as a simple form $\{210\}$ is of very common occurrence in pyrites, and it is known as the "pyritohedron."

Dyakis-dodecahedron (fig. 35).—This is the hemihedral form of the hexakis-octahedron and has the indices $\{hkl\}$; it is bounded by twenty-four faces. As a simple form $\{321\}$ is met with in pyrites.



32



33

FIG. 32.—COMBINATION OF TETRAHEDRON, CUBE AND RHOMBIC DODECAHEDRON
FIG. 33.—COMBINATION OF TETRAHEDRON AND RHOMBIC DODECAHEDRON

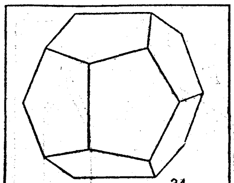
Combinations (figs. 36–39) of these forms with the cube and the octahedron are common in pyrites. Fig. 37 resembles in general appearance the regular icosahedron of geometry, but only eight of the faces are equilateral triangles. Cobaltite, smaltite and other sulphides and sulpharsenides of the pyrites group of minerals crystallize in these forms. The alums also belong to this class; from an aqueous solution they crystallize as simple octahedra, sometimes with subordinate faces of the cube and rhombic dodecahedron, but from an acid solution as octahedra combined with the pentagonal dodecahedron $\{210\}$.

Plagihedral Class

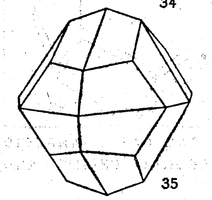
(Plagihedral-hemihedral; Pentagonal-icositetrahedral; Gyroidal.)

In this class there are the full number of axes of symmetry (three tetrad, four triad and six dyad), but no planes of symmetry and no centre of symmetry.

Pentagonal icositetrahedron (fig. 40).—This is the only simple form in this class which differs geometrically from those of the holosymmetric class. By suppressing either one or other set of alternate faces of the hexakis-octahedron two pentagonal icositetrahedra {*hkl*} and {*khl*} are derived. These are each bounded by twenty-four irregular pentagons, and although similar to each other they are respectively right- and left-handed, one being the mirror image of the other; such similar but nonsuperposable forms are said to be enantiomorphous (ἐναντίος, opposite, and μορφή, form), and crystals showing such forms sometimes rotate the plane of polarization of plane-polarized light. Faces of a pentagonal icositetrahedron with high indices have been very rarely observed on crystals of cuprite, potassium chloride and ammonium chloride, but none of these are circular polarizing; nor is the internal structure, as determined by means of X-rays, in agreement with this external development of the faces.



34



35

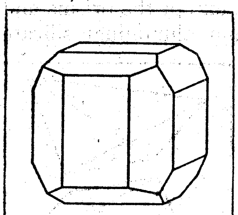
FIG. 34.—PENTAGONAL DODECAHEDRON
FIG 35.—DYAKIS-DODECAHEDRON

Tetartohedral Class

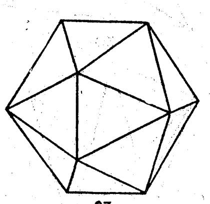
(Tetrahedral-pentagonal-dodecahedral.)

Here, in addition to four polar triad axes, the only other elements of symmetry are three dyad axes, which coincide with the crystallographic axes. Six of the simple forms, the cube, tetrahedron, rhombic dodecahedron, deltoid dodecahedron, triakis-tetrahedron and pentagonal dodecahedron, are geometrically the same in this class as in either the tetrahedral or pyritohedral classes. The general form is the

Tetrahedral pentagonal dodecahedron (fig. 41).—This is bounded by twelve irregular pentagons, and is a tetartohedral or quarter-faced form of the hexakis-octahedron. Four such forms may be derived, the indices of which are {*hkl*}, {*khl*}, $\{\bar{h}kl\}$ and $\{\bar{k}hl\}$; the first pair are enantiomorphous with respect to one another, and so are the last pair. Barium nitrate, lead nitrate, sodium chlorate and sodium bromate crystallize in this class, as also do the minerals ullmannite ($NiSbS$) and langbeinite ($K_2Mg_2(SO_4)_3$).



36



37

FIG. 36.—COMBINATION OF PENTAGONAL DODECAHEDRON AND CUBE
FIG. 37.—COMBINATION OF PENTAGONAL DODECAHEDRON AND OCTAHEDRON

2. TETRAGONAL SYSTEM

(Pyramidal; Quadratic; Dimetric.)

In this system the three crystallographic axes are all at right angles, but while two are equal in length and interchangeable the third is of a different length. The unequal axis is spoken of as the principal axis or morphological axis of the crystal, and it is always placed in a vertical position; in five of the seven classes of this system it coincides with the single tetrad axis of symmetry.

The parameters are $a:a:c$, where a refers to the two equal horizontal axes, and c to the vertical axis; c may be either shorter (as in fig. 42) or longer (fig. 43) than a. The ratio $a:c$ is spoken of as the axial ratio of a crystal, and it is dependent on the angles between the faces. In all crystals of the same substance this ratio is constant, and is characteristic of the substance; for other substances crystallizing in the tetragonal system it will be different. For example, in cassiterite it is given as $a:c=1:0{\cdot}67232$ or simply as $c=0{\cdot}6723$, a being unity; and in anatase as $c=1{\cdot}7771$.

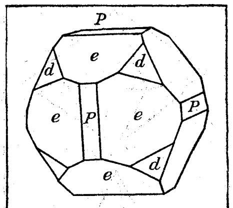
Holosymmetric Class

(Holohedral; Ditetragonal-bipyramidal.)

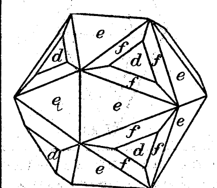
Crystals of this class are symmetrical with respect to five planes, which are of three kinds; one is perpendicular to the principal axis, and the other four intersect in it; of the latter, two are perpendicular to the equal crystallographic axes, while the two others bisect the angles between them. There are five axes of symmetry, one tetrad and two pairs of dyad, each perpendicular to a plane of symmetry. Finally, there is a centre of symmetry.

There are seven kinds of simple forms, viz.:—

Tetragonal bipyramid of the first order (figs. 42 and 43).—This is bounded by eight equal isosceles triangles. Equal lengths are intercepted on the two horizontal axes, and the indices are {111}, {221}, {112}, etc., or in general {*hhl*}. The parametral plane with the intercepts $a:a:c$ is a face of the bipyramid {111}.



38



39

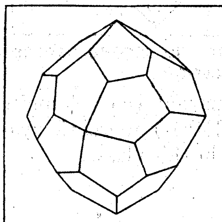
FIG. 38.—COMBINATION OF PENTAGONAL DODECAHEDRON e, CUBE P AND OCTAHEDRON d
FIG. 39.—COMBINATION OF PENTAGONAL DODECAHEDRON e (210), DYAKIS-DODECAHEDRON f (321) AND OCTAHEDRON d (111)

Tetragonal bipyramid of the second order.—This is also bounded by eight equal isosceles triangles, but differs from the last form in its position, four of the faces being parallel to each of the horizontal axes; the indices are therefore {101}, {201}, {102}, etc., or {*h*0*l*}.

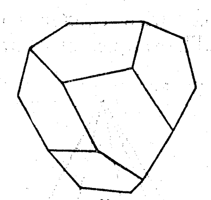
Fig. 44 shows the relation between the tetragonal bipyramids of the first and second orders when the indices are {111} and {101} respectively: *ABB* is the face (111), and *ACC* is {101}. A combination of these two forms is shown in fig. 45.

Ditetragonal bipyramid (fig. 46).—This is the general form; it is bounded by sixteen scalene triangles, and all the indices are unequal, being {321}, etc., or {*hkl*}.

Tetragonal prism of the first order.—The four faces intersect the horizontal axes in equal lengths and are parallel to the principal axis; the indices are therefore {110}. This form does not enclose space, and is therefore called an "open form" to distinguish it from a "closed form" like the tetragonal bipyramids and all the forms of the cubic system. An open form can exist only in combination with other forms; thus fig. 47 is a combination of the tetragonal prism {110} with the basal pinacoid {001}. If the faces {110} and {001} are of equal size such a figure will be geometrically a cube, since all the angles are right angles; the variety of apophyllite known as tesselite crystallizes in this form.



40



41

FIG. 40.—PENTAGONAL ICOSITETRAHEDRON
FIG. 41.—TETRAHEDRAL PENTAGONAL DODECAHEDRON

Tetragonal prism of the second order.—This has the same number of faces as the last prism, but differs in position; each face being parallel to the vertical axis and one of the horizontal axes; the indices are {100}.

Ditetragonal prism.—This consists of eight faces all parallel to the principal axis and intercepting the horizontal axes in different lengths; the indices are {210}, {320}, etc., or {*hk*0}.

Basal pinacoid (from πίναξ, a tablet).—This consists of a single pair of parallel faces perpendicular to the principal axis. It is therefore an open form and can exist only in combination (fig. 47).

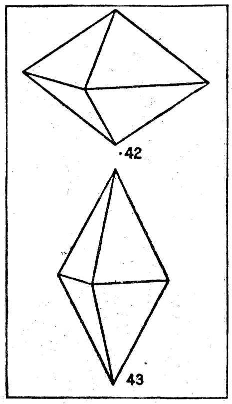
Combinations of holohedral tetragonal forms are shown in figs. 47–49; fig. 48 is a combination of a bipyramid of the first order with one of the second order and the prism of the first order; fig. 49 a combination of a bipyramid of the first order with a ditetragonal bipyramid and the prism of the second order. Compare also figs. 87 and 88.

Examples of substances which crystallize in this class are cassiterite, rutile, anatase, zircon, thorite, idocrase, apophyllite, phosgenite, also boron, tin, mercuric iodide.

Scalenohedral Class

(Bisphenoidal-hemihedral.)

Here there are only three dyad axes and two planes of symmetry, the former coinciding with the crystallographic axes and the latter bisecting the angles between the horizontal pair. The dyad axis of symmetry, which in this class coincides with the principal axis of the crystal, has certain of the characters of a tetrad axis, and is sometimes called a tetrad axis of "alternating symmetry"; a face on the upper half of the crystal if rotated through 90° about this axis and reflected across the equatorial plane falls into the position of a face on the lower half of the crystal. This kind of symmetry, with simultaneous rotation about an axis and reflection across a plane, is also called "composite symmetry."



FIGS. 42 AND 43.—TETRAGONAL BIPYRAMIDS, OBTUSE AND ACUTE

In this class all except two of the simple forms are geometrically the same as in the holosymmetric class.

Bisphenoid (σφήν, a wedge) (fig. 50).—This is a double wedge-shaped solid bounded by four equal isosceles triangles; it has the indices {111}, {211}, {112}, etc., or in general {*hhl*}. By suppressing either one or other set of alternate faces of the tetragonal bipyramid of the first order (fig. 42) two bisphenoids are derived in the same way that two tetrahedra are derived from the regular octahedron.

Tetragonal scalenohedron or ditetragonal bisphenoid (fig. 51).—This is bounded by eight scalene triangles and has the indices {*hkl*}. It may be considered as the hemihedral form of the ditetragonal bipyramid.

The crystal of chalcopyrite ($CuFeS_2$) represented in fig. 52 is a combination of two bisphenoids (*P* and *P′*), two bipyramids of the

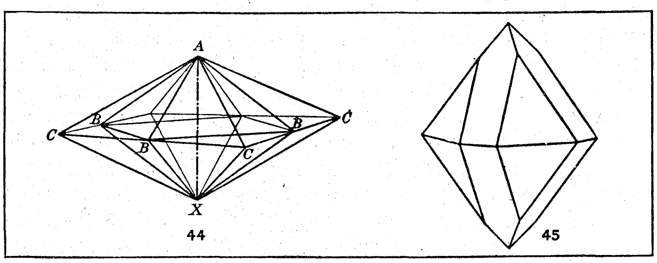


FIG. 44.—TETRAGONAL BIPYRAMIDS OF THE FIRST AND SECOND ORDERS
FIG. 45.—THE SAME IN COMBINATION

second order (*b* and *c*), and the basal pinacoid (*a*). Stannite (Cu_2FeSnS_4), acid potassium phosphate (H_2KPO_4), mercuric cyanide, and urea ($CO(NH_2)_2$) also crystallize in this class.

BIPYRAMIDAL CLASS
(Parallel-faced hemihedral.)

The elements of symmetry are a tetrad axis with a plane perpendicular to it, and a centre of symmetry. The simple forms are the same here as in the holosymmetric class, except the prism {*hk*0}, which has only four faces, and the bipyramid {*hkl*} which has eight faces and is distinguished as a "tetragonal pyramid of the third order."

Fig. 53 shows a combination of a tetragonal prism of the first order with a tetragonal bipyramid of the third order and the basal pinacoid, and represents a crystal of fergusonite. Scheelite (*q.v.*), scapolite (*q.v.*), and erythrite ($C_4H_{10}O_4$) also crystallize in this class.

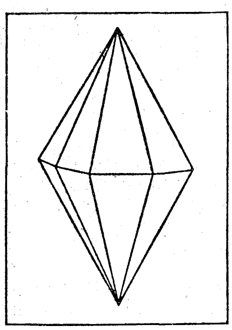

FIG. 46.—DITETRAGONAL BIPYRAMID

PYRAMIDAL CLASS
(Hemimorphic-tetartohedral.)

Here the only element of symmetry is the tetrad axis. The pyramids of the first {*hhl*}, second {*h*0*l*}, and third {*hkl*}, orders have each only four faces at one or other end of the crystal and are hemimorphic. All the simple forms are thus open forms.

Examples: wulfenite ($PbMoO_4$) barium antimonyl dextro-tartrate ($Ba(SbO)_2(C_4H_4O_6)\cdot H_2O$), and iodosuccimide ($C_4H_4O_2NI$).

DITETRAGONAL PYRAMIDAL CLASS
(Hemimorphic-hemihedral.)

Here there are two pairs of vertical planes of symmetry intersecting in the tetrad axis. The pyramids {*hhl*} and {*h*0*l*} and the bipyramid {*hkl*} are all hemimorphic.

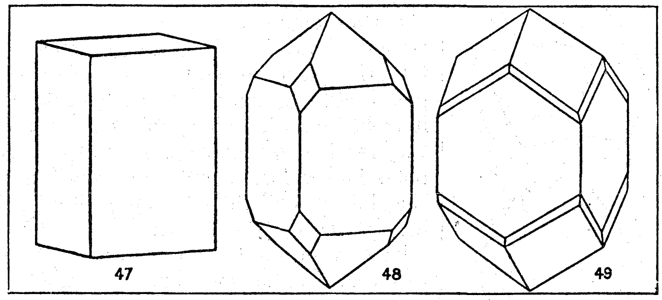

FIG. 47.—COMBINATION OF TETRAGONAL PRISM AND BASAL PINACOID
FIGS. 48 AND 49.—COMBINATIONS OF TETRAGONAL PRISMS AND PYRAMIDS

Examples are silver fluoride ($AgF\cdot H_2O$) and penta-erythrite ($C_5H_{12}O_4$). No examples are known amongst minerals.

TRAPEZOHEDRAL CLASS
(Trapezohedral-hemihedral.)

Here there are the full number of axes of symmetry, but no planes or centre of symmetry. The general form {*hkl*} is bounded by eight trapezoidal faces and is the tetragonal trapezohedron.

Examples are nickel sulphate ($NiSO_4\cdot 6H_2O$) guanidine carbonate ($(CH_5N_3)_2H_2CO_3$), strychnine sulphate
($(C_{21}H_{22}N_2O_2)_2\cdot H_2SO_4\cdot 6H_2O$).

BISPHENOIDAL CLASS
(Bisphenoidal-tetartohedral.)

Here there is only a single dyad axis of symmetry, which coincides with the principal axis. All the forms, except the prisms and basal pinacoid, are sphenoids. The calcium aluminium silicate $2CaO\cdot Al_2O_3\cdot SiO_2$ and meliphane are perhaps representatives of this class.

3. ORTHORHOMBIC SYSTEM

(Rhombic; Prismatic; Trimetric.)

In this system the three crystallographic axes are all at right angles, but they are of different lengths and not interchangeable. The parameters, or axial ratios are $a:b:c$, these referring to the axes OX, OY and OZ respectively. The choice of a vertical axis, $OZ=c$, is arbitrary, and it is customary to place the longer of the two horizontal axes from left to right ($OY=b$) and take it as unity: this is called the "macro-axis" or "macro-diagonal" (from μακρός, long), whilst the shorter horizontal axis ($OX=a$) is called the "brachy-axis" or "brachy-diagonal" (from βραχύς, short). The axial ratios are constant for crystals of any one substance and are characteristic of it; for example, in barytes ($BaSO_4$), $a:b:c=0{\cdot}8152:1:1{\cdot}3136$; in anglesite ($PbSO_4$), $a:b:c=0{\cdot}7852:1:1{\cdot}2894$; in cerussite ($PbCO_3$), $a:b:c=0{\cdot}6100:1:0{\cdot}7230$.

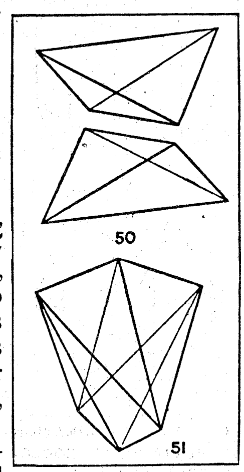

FIG. 50.—TETRAGONAL BISPHENOIDS
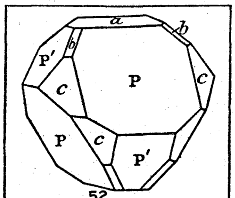
FIG. 51.—TETRAGONAL SCALENOHEDRON

There are three symmetry-classes in this system:—

HOLOSYMMETRIC CLASS
(Holohedral; Bipyramidal.)

Here there are three dissimilar dyad axes of symmetry, each coinciding with a crystallographic axis; perpendicular to them are three dissimilar planes of symmetry; there is also a centre of symmetry. There are seven kinds of simple forms:—

Bipyramid (figs. 54 and 55).—This is the general form and is bounded by eight scalene triangles; the indices are {111}, {211}, {221}, {112}, {321}, {213}, {123}, etc., or in general {*hkl*}, The crystallographic axes join opposite corners of these pyramids and in the fundamental bipyramid {111} the parametral plane has the intercepts $a:b:c$. This is the only closed form in this class; the others are open forms and can exist only in combination. Sulphur often crystallizes in simple bipyramids.



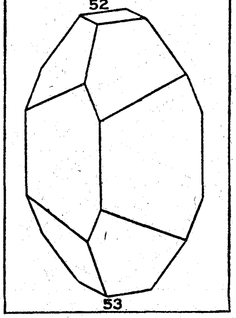


FIG. 52.—CRYSTAL OF CHALCOPYRITE
FIG. 53.—CRYSTAL OF FERGUSONITE

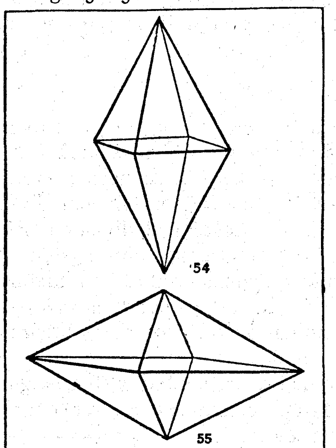
Prism.—This consists of four faces parallel to the vertical axis and intercepting the horizontal axes in the lengths *a* and *b* or in any multiples or sub-multiples of these; the indices are therefore {110}, {210}, {120} or {*hk*0}.

Macro-prism.—This consists of four faces parallel to the macro-axis, and has the indices {101}, {201} . . . or {*h*0*l*}.

Brachy-prism.—This consists of four faces parallel to the brachy-axis, and has the indices {011}, {021} . . . {0*kl*}. The macro- and brachy-prisms are often called "domes."

Pinacoids.—The basal pinacoid consists of a pair of parallel faces perpendicular to the vertical axis; the indices are {001}. The macro-pinacoid {100} and the brachy-pinacoid {010} each consist of a pair of parallel faces respectively parallel to the macro- and the brachy-axis.

Figs. 56–58 show combinations of these six open forms, and fig. 59 a combination of the macro-pinacoid (*a*), brachy-pinacoid (*b*), a prism (*m*), a macro-prism (*d*), a brachy-prism (*k*), and a bipyramid (*u*).



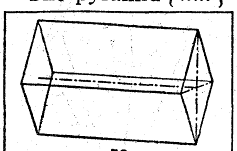
FIGS. 54 AND 55.—ORTHORHOMBIC BIPYRAMIDS

Examples of substances crystallizing in this class are extremely numerous; amongst naturally occurring minerals are sulphur, stibnite, cerussite, chrysoberyl, topaz, olivine, nitre, barytes, columbite and many others; and amongst artificial products iodine, potassium permanganate, potassium sulphate, benzene, barium formate, etc.

PYRAMIDAL CLASS
(Hemimorphic.)

Here there is only one dyad axis in which two planes of symmetry intersect. The crystals are usually so placed that the dyad axis coincides with the vertical crystallographic axis, and the planes of symmetry are also vertical.

The pyramid {*hkl*} has only four faces at one end or other of the crystal. The macro-prism and the brachy-prism of the last class are here represented by the macro-dome and brachy-dome respectively, so called because of the resemblance of the pair of equally sloped faces to the roof of a house. The form {001} is a single plane at the top of the crystal, and is called a "pedion"; the parallel pedion $\{00\bar{1}\}$, if present at the lower end of the crystal, constitutes a different form. The prisms {*hk*0} and the macro- and brachy-pinacoids are geometrically the same in this class as in the last. Crystals of this class are therefore differently developed at the two ends and are said to be "hemimorphic."



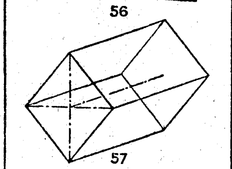


FIG. 56.—MACRO-PRISM AND BRACHY-PINACOID
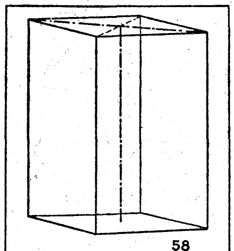
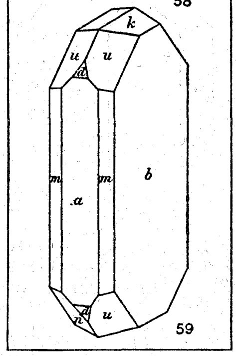
FIG. 57.—BRACHY-PRISM AND MACRO-PINACOID

Fig. 60 shows a crystal of the mineral hemimorphite ($H_2Zn_2SiO_5$) which is a combination of the brachy-pinacoid {010} and a prism, with the pedion {001}, two brachy-domes and two macro-domes at the upper end, and a pyramid at the lower end. Examples of other substances belonging to this class are struvite ($NH_4MgPO_4{\cdot}6H_2O$), bertrandite ($H_2Be_4Si_2O_9$), resorcin, and picric acid.

BISPHENOIDAL CLASS
(Hemihedral.)

Here there are three dyad axes, but no planes of symmetry and no centre of symmetry. The general form {*hkl*} is a bisphenoid (fig. 61) bounded by four scalene triangles. The other simple forms are geometrically the same as in the holosymmetric class.





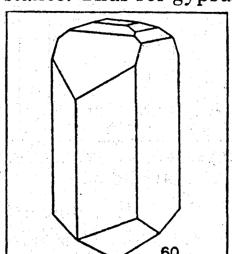
HOLOHEDRAL ORTHORHOMBIC COMBINATIONS
Fig. 58.—Prism and Basal Pinacoid
Fig. 59.—Crystal of Hypersthene

Examples: epsomite (Epsom salts, $MgSO_4{\cdot}7H_2O$), goslarite ($ZnSO_4{\cdot}7H_2O$), silver nitrate, sodium potassium dextro-tartrate (seignette salt, $NaKC_4H_4O_6{\cdot}4H_2O$), potassium antimonyl dextrotartrate (tartar-emetic, $K(SbO)C_4H_4O_6$), and asparagine ($C_4H_8N_2O_3{\cdot}H_2O$).

4. MONOCLINIC SYSTEM

(Oblique; Monosymmetric.)

In this system two of the angles between the crystallographic axes are right angles, but the third angle is oblique, and the axes are of unequal lengths. The axis which is perpendicular to the other two is taken as $OY=b$ (fig. 62) and is called the ortho-axis or orthodiagonal. The choice of the other two axes is arbitrary; the vertical axis ($OZ=c$) is usually taken parallel to the edges of a prominently developed prismatic zone, and the clino-axis or clino-diagonal ($OX=a$) parallel to the zone-axis of some other prominent zone on the crystal. The acute angle between the axes OX and OZ is usually denoted as β, and it is necessary to know its magnitude, in addition to the axial ratios $a:b:c$, before the crystal is completely determined. As in other systems, except the cubic, these elements, $a:b:c$ and β, are characteristic of the substance. Thus for gypsum $a:b:c=0{\cdot}6899:1:0{\cdot}4124$; $\beta=80°\ 42'$; for orthoclase $a:b:c=0{\cdot}6585:1:0{\cdot}5554$; $\beta=63°\ 57'$; and for cane-sugar $a:b:c=1{\cdot}2595:1:0{\cdot}8782$; $\beta=76°\ 30'$.



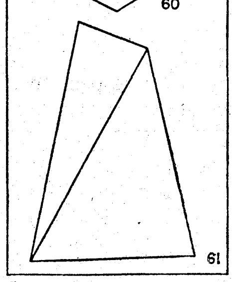


FIG. 60.—CRYSTAL OF HEMIMORPHITE
FIG. 61.—ORTHORHOMBIC BISPHENOID

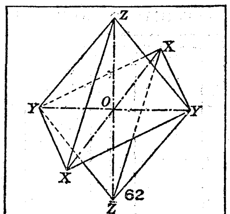
HOLOSYMMETRIC CLASS
(Holohedral; Prismatic.)

Here there is a single plane of symmetry perpendicular to which is a dyad axis; there is also a centre of symmetry. The dyad axis coincides with the ortho-axis OY, and the vertical axis OZ and the clino-axis OX lie in the plane of symmetry.

All the forms are open, being either pinacoids or prisms; the former consisting of a pair of parallel faces, and the latter of four faces intersecting in parallel edges and with a rhombic cross-section. The pair of faces parallel to the plane of symmetry is distinguished as the "clino-pinacoid" and has the indices {010}. The other pinacoids are all perpendicular to the plane of symmetry (and parallel to the ortho-axis); the one parallel to the vertical axis is called the "ortho-pinacoid" {100} whilst that parallel to the clino-axis is the "basal pinacoid" {001}; pinacoids not parallel to the arbitrarily chosen clino- and vertical axes may have the indices {101}, {201}, {102} . . . {*h*0*l*}, or $\{\bar{1}01\}$, $\{\bar{2}01\}$, $\{\bar{1}02\}$ . . . $\{\bar{h}0l\}$, according to whether they lie in the obtuse or the acute axial angle. Of the prisms, those with edges (zone-axis) parallel to the clino-axis, and having indices {011}, {021} $\{0\bar{1}2\}$ . . . {0*kl*}, are called "clino-prisms"; those with edges parallel to the vertical axis, and with the indices {110}, {210},

$\{120\}$ . . . $\{hk0\}$, are called simply "prisms." Prisms with edges parallel to neither of the axes OX and OY have the indices $\{111\}$, $\{221\}$, $\{211\}$, $\{321\}$ . . . $\{hkl\}$ or $\{\bar{1}11\}$ . . . $\{\bar{h}kl\}$, and are usually called "hemi-pyramids" (fig. 62); they are distinguished as negative or positive according to whether they lie in the obtuse or the acute axial angle β.

Fig. 63 represents a crystal of augite bounded by the clino-pinacoid (l), the ortho-pinacoid (r), a prism (M), and a hemi-pyramid (s).



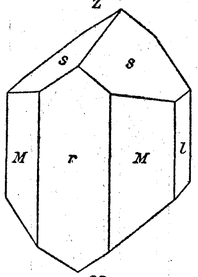


FIG. 62.—MONOCLINIC AXES AND HEMI-PYRAMID FIG. 63.—CRYSTAL OF AUGITE

The substances which crystallize in this class are extremely numerous: amongst minerals are gypsum, orthoclase, the amphiboles, pyroxenes and micas, epidote, monazite, realgar, borax, mirabilite ($Na_2SO_4 \cdot 10H_2O$), melanterite ($FeSO_4 \cdot 7H_2O$) and many others; amongst artificial products are monoclinic sulphur, barium chloride ($BaCl_2 \cdot 2H_2O$), potassium chlorate, potassium ferrocyanide ($K_4Fe(CN)_6 \cdot 3H_2O$)), oxalic acid ($C_2O_4H_2 \cdot 2H_2O$), sodium acetate ($NaC_2H_3O_2 \cdot 3H_2O$) and naphthalene.

Hemimorphic Class

(Sphenoidal.)

In this class the only element of symmetry is a single dyad axis, which is polar in character, being dissimilar at the two ends.

The form $\{010\}$ perpendicular to the axis of symmetry consists of a single plane or pedion; the parallel face is dissimilar in character and belongs to the pedion $\{0\bar{1}0\}$. The pinacoids $\{100\}$, $\{001\}$, $\{h0l\}$ and $\{\bar{h}0l\}$ parallel to the axis of symmetry are geometrically the same in this class as in the holosymmetric class. The remaining forms consist each of only two planes on the same side of the axial plane XOZ and equally inclined to the dyad axis (*e.g.*, in fig. 62 the two planes XYZ and $\bar{X}Y\bar{Z}$); such a wedge-shaped form is sometimes called a sphenoid.

Fig. 64 shows two crystals of tartaric acid, a a right-handed crystal of dextro-tartaric acid, and b a left-handed crystal of laevo-tartaric acid. The two crystals are enantiomorphous, *i.e.*, although they have the same interfacial angles they are not superposable, one being the mirror image of the other. Other examples are potassium dextro-tartrate, cane-sugar, milk-sugar, quercite, lithium sulphate ($Li_2SO_4 \cdot H_2O$); amongst minerals the only example is the hydrocarbon fichtelite ($C_{18}H_{32}$).

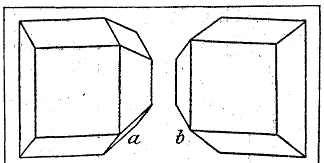

FIG. 64.—ENANTIOMORPHOUS CRYSTALS OF TARTARIC ACID

Clinohedral Class

(Hemihedral; Domatic.)

Crystals of this class are symmetrical only with respect to a single plane. The only form which is here geometrically the same as in the holosymmetric class is the clino-pinacoid $\{010\}$. The forms perpendicular to the plane of symmetry are all pedions, consisting of single planes with the indices $\{100\}$, $\{\bar{1}00\}$, $\{001\}$, $\{00\bar{1}\}$, $\{h0l\}$, etc. The remaining forms, $\{hk0\}$, $\{0kl\}$ and $\{hkl\}$, are domes or "gonioids" (γωνία, an angle and εἶδος, form), consisting of two planes equally inclined to the plane of symmetry.

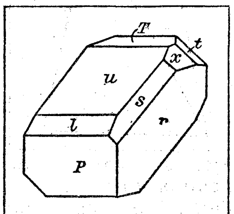

FIG. 65.—CRYSTAL OF AXINITE

Examples are potassium tetrathionate ($K_2S_4O_6$), hydrogen tri-sodium hypophosphate ($HNa_3P_2O_6 \cdot 9H_2O$); and amongst minerals, clinohedrite ($H_2ZnCaSiO_4$) and scolectite.

5. ANORTHIC SYSTEM

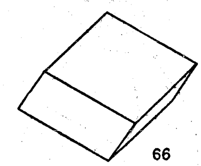
(Triclinic.)

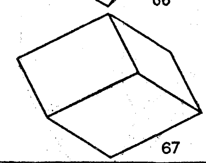
In the anorthic (from ἀν, privative, and ὀρθός, right) or triclinic system none of the three crystallographic axes are at right angles, and they are all of unequal lengths. In addition to the parameters $a:b:c$, it is necessary to know the angles, α, β, and γ, between the axes. In anorthite, for example, these elements are $a:b:c = 0{\cdot}6347:1:0{\cdot}5501$; $\alpha = 93° \ 13'$, $\beta = 115° \ 55'$, $\gamma = 91° \ 12'$.

Holosymmetric Class

(Holohedral; Pinacoidal.)

Here there is only a centre of symmetry. All the forms are pinacoids, each consisting of only two parallel faces. The indices of the three pinacoids parallel to the axial planes are $\{100\}$, $\{010\}$ and $\{001\}$; those of pinacoids parallel to only one axis are $\{hk0\}$, $\{h0l\}$ and $\{0kl\}$; and the general form is $\{hkl\}$.





FIGS. 66 AND 67.—DIRECT AND INVERSE RHOMBOHEDRA

Several minerals crystallize in this class; for example, the plagioclastic felspars, microcline, axinite (fig. 65), kyanite, amblygonite, chalcanthite ($CuSO_4 \cdot 5H_2O$), sassolite (H_3BO_3); among artificial substances are potassium dichromate, racemic acid ($C_4H_6O_6 \cdot 2H_2O$), dibrom-para-nitrophenol, etc.

Asymmetric Class

(Hemihedral, Pediad.)

Crystals of this class are devoid of any elements of symmetry. All the forms are pedions, each consisting of a single plane; they are thus hemihedral with respect to crystals of the last class. Although there is a total absence of symmetry, yet the faces are arranged in zones on the crystals.

Examples are calcium thiosulphate ($CaS_2O_3 \cdot 6H_2O$) and hydrogen strontium dextro-tartrate ($(C_4H_4O_6H)_2Sr \cdot 5H_2O$); there is no example known amongst minerals.

6. HEXAGONAL SYSTEM

Crystals of this system are characterized by the presence of a single axis of either triad or hexad symmetry, which is spoken of as the "principal" or "morphological" axis. Those with a triad axis are grouped together in the rhombohedral or trigonal division, and those with a hexad axis in the hexagonal division. By some authors these two divisions are treated as separate systems; or again the rhombohedral forms may be considered as hemihedral developments of the hexagonal. On the other hand, hexagonal forms may be considered as a combination of two rhombohedral forms.

Owing to the peculiarities of symmetry associated with a single triad or hexad axis, the crystallographic axes of reference are different in this system from those used in the five other systems of crystals. Two methods of axial representation are in common use; rhombohedral axes being usually used for crystals of the rhombohedral division, and hexagonal axes for those of the hexagonal division; though sometimes either one or the other set is employed in both divisions.

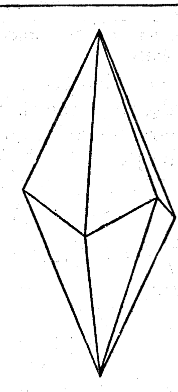


FIG. 68.—SCALENOHEDRON

Rhombohedral axes are taken parallel to the three sets of edges of a rhombohedron (fig. 66). They are inclined to one another at equal oblique angles, and they are all equally inclined to the principal axis; further, they are all of equal length and are interchangeable. With such a set of axes there can be no statement of an axial ratio, but the angle α between the axes (or some other angle which may be calculated from this) may be given as a constant of the substance. Thus in calcite the rhombohedral angle (the angle between two faces of the fundamental rhombohedron) is $74° \ 55'$ or the angle between the normal to a face of this rhombohedron and the principal axis is $44° \ 36\frac{1}{2}'$; whilst the angle α between the axes is $101° \ 55'$, this being the plane angle of the rhomb-shaped faces.

Hexagonal axes are four in number, viz., a vertical axis coinciding with the principal axis of the crystal, and three horizontal axes inclined to one another at 60° in a plane perpendicular to the principal axis. The three horizontal axes, which are taken either parallel or perpendicular to the faces of a hexagonal prism (fig. 71) or the edge of a hexagonal bipyramid (fig. 70), are equal in length (a) but the vertical axis is of a different length (c). The indices of planes referred to such a set of axes are four in number; they are written as $\{hikl\}$, the first three ($h+i+k=0$) referring to the horizontal axes and the last to the vertical axis. The ratio $a:c$ of the parameters, or the axial ratio, is characteristic of all the crystals of the same substance. Thus for beryl (including emerald) $a:c=1:0{\cdot}4989$ (often written $c=0{\cdot}4989$); for zinc $c=1{\cdot}3564$.

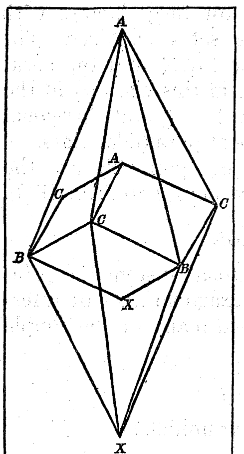

FIG. 69.—SCALENOHEDRON WITH INSCRIBED RHOMBOHEDRON

RHOMBOHEDRAL DIVISION

In the rhombohedral or trigonal division of the hexagonal system there are seven symmetry-classes, all of which possess a single triad axis of symmetry.

HOLOSYMMETRIC CLASS

(Holohedral; Ditrigonal-scalenohedral.)

In this class, which presents the commonents type of symmetry of the hexagonal system, the triad axis is associated with three similar planes of symmetry inclined to one another at 60° and intersecting in the triad axis; there are also three similar dyad axes, each perpendicular to a plane of symmetry, and a centre of symmetry. The seven simple forms are:—

Rhombohedron (figs. 66 and 67), consisting of six rhomb-shaped faces with the edges all of equal lengths: the faces are perpendicular to the planes of symmetry. There are two sets of rhombohedra, distinguished respectively as direct and inverse; those of one set (fig. 66) are brought into the orientation of the other set (fig. 67) by a rotation of 60° or 180° about the principal axis. For the fundamental rhombohedron, parallel to the edges of which are the crystallographic axes of reference, the indices are $\{100\}$. Other rhombohedra may have the indices $\{211\}$, $\{4\bar{1}\bar{1}\}$, $\{110\}$, $\{22\bar{1}\}$, $\{11\bar{1}\}$, etc., or in general $\{hkk\}$. (Compare fig. 72; for figures of other rhombohedra *see* CALCITE.)

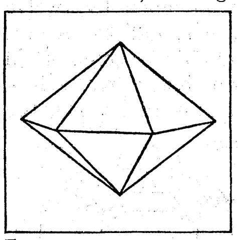

FIG 70.—HEXAGONAL BIPYRAMID

Scalenohedron (fig. 68), bounded by twelve scalene triangles, and with the general indices $\{hkl\}$. The zigzag lateral edges coincide with the similar edges of a rhombohedron, as shown in fig. 69; if the indices of the inscribed rhombohedron be $\{100\}$, the indices of the scalenohedron represented in the figure are $\{20\bar{1}\}$. The scalenohedron $\{20\bar{1}\}$ is a characteristic form of calcite, which for this reason is sometimes called "dog-tooth-spar." The angles over the three edges of a face of a scalenohedron are all different; the angles over three alternate polar edges are more obtuse than over the other three polar edges. Like the two sets of rhombohedra, there are also direct and inverse scalenohedra, which may be similar in form and angles, but different in orientation and indices.

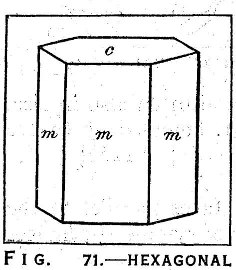

FIG. 71.—HEXAGONAL PRISM AND BASAL PINACOID

Hexagonal bipyramid (fig. 70), bounded by twelve isosceles triangles each of which are equally inclined to two planes of symmetry. The indices are $\{210\}$, $\{41\bar{2}\}$, etc., or in general $\{hkl\}$ where $h-2k+l=0$.

Hexagonal prism of the first order $\{2\bar{1}\bar{1}\}$, consisting of six faces parallel to the principal axis and perpendicular to the planes of symmetry; the angles between (the normals to) the faces are 60°.

Hexagonal prism of the second order $\{10\bar{1}\}$, consisting of six faces parallel to the principal axis and parallel to the planes of symmetry. The faces of this prism are inclined to 30° to those of the last prism.

Dihexagonal prism, consisting of twelve faces parallel to the principal axis and inclined to the planes of symmetry. There are two sets of angles between the faces. The indices are $\{3\bar{2}\bar{1}\}$, $\{5\bar{3}\bar{2}\}$ . . . $\{h\bar{k}\bar{l}\}$, where $h+k+l=0$.

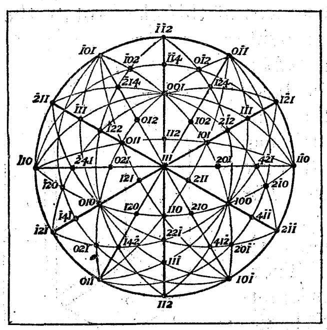

FIG. 72.—STEREOGRAPHIC PROJECTION OF A HOLOSYMMETRIC RHOMBOHEDRAL CRYSTAL

Basal pinacoid $\{111\}$ consisting of a pair of parallel faces perpendicular to the principal axis.

Fig. 71 shows a combination of a hexagonal prism (m) with the basal pinacoid (c). For figures of other combinations *see* CALCITE and CORUNDUM. The relation between rhombohedral forms and their indices are best studied with the aid of a stereographic projection (fig. 72); in this figure the thicker lines are the projections of the three planes of symmetry, and on these lie the poles of the rhombohedra (six of which are indicated).

Numerous substances, both natural and artificial, crystallize in this class; for example, calcite, chalybite, smithsonite, corundum (ruby and sapphire), haematite, chabazite; the elements arsenic, antimony, bismuth, selenium, tellurium and perhaps graphite; also ice, sodium nitrate, thymol, etc.

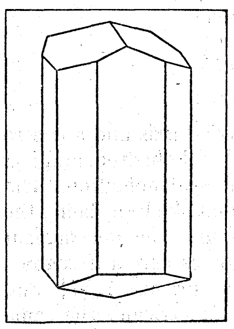

FIG. 73.—CRYSTAL OF TOURMALINE

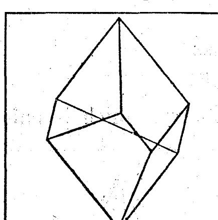
DITRIGONAL PYRAMIDAL CLASS

(Hemimorphic-hemihedral.)

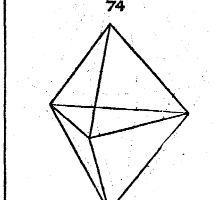
Here there are three similar planes of symmetry intersecting in the triad axis; there are no dyad axes and no centre of symmetry. The triad axis is uniterminal and polar, and the crystals are differently developed at the two ends; crystals of this class are therefore pyro-electric. The forms are all open forms:—

Trigonal pyramid $\{hkk\}$, consisting of three faces which correspond to the three upper or the three lower faces of a rhombohedron of the holosymmetric class.

Ditrigonal pyramid $\{hkl\}$, of six faces, corresponding to the six upper or lower faces of the scalenohedron.



74



75

FIG. 74.—TRIGONAL TRAPEZOHEDRON
FIG. 75.—TRIGONAL BIPYRAMID

Hexagonal pyramid $\{hkl\}$ (where $h-2k+l=0$), of six faces, corresponding to the six upper or lower faces of the hexagonal bipyramid.

Trigonal prism $\{2\bar{1}\bar{1}\}$ or $\{\bar{2}11\}$, two forms each consisting of three faces parallel to the principal axis and perpendicular to the planes of symmetry.

Hexagonal prism $\{10\bar{1}\}$ which is geometrically the same as in the last class.

Ditrigonal prism $\{h\bar{k}\bar{l}\}$, (where $h+k+l=0$), of six faces parallel to the principal axis, and with two sets of angles between them.

Basal pedion $\{111\}$ or $\{\bar{1}\bar{1}\bar{1}\}$, each consisting of a single plane perpendicular to the principal axis.

Fig. 73 represents a crystal of tourmaline with the trigonal prism $\{2\bar{1}\bar{1}\}$ hexagonal prism $\{10\bar{1}\}$ and a trigonal pyramid at each end. Other substances crystallizing in this class are pyrargyrite, proustite, iodyrite (AgI), greenockite, zincite, spangolite, sodium lithium sulphate, tolylphenylketone.

Trapezohedral Class

(Trapezohedral-hemihedral.)

Here there are three similar dyad axes inclined to one another at 60° and perpendicular to the triad axis. There are no planes or centre of symmetry. The dyad axes are uniterminal, and are pyroelectric axes. Crystals of most substances of this class rotate the plane of polarization of a beam of light.

In this class the rhombohedra $\{hkk\}$, the hexagonal prism $\{2\bar{1}\bar{1}\}$ and the basal pinacoid $\{111\}$ are geometrically the same as in the holosymmetric class; the trigonal prism $\{10\bar{1}\}$ and the ditrigonal prisms are as in the ditrigonal pyramidal class. The remaining simple forms are:—

Trigonal trapezohedron (fig. 74), bounded by six trapezoidal faces. There are two complementary and enantiomorphous trapezohedra, $\{hkl\}$ and $\{hlk\}$, derivable from the scalenohedron.

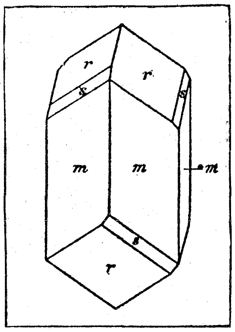


FIG. 76.—CRYSTAL OF DIOPTASE

Trigonal bipyramid (fig. 75), bounded by six isosceles triangles; the indices are $\{hkl\}$, where $h-2k+l=0$, as in the hexagonal bipyramid.

The only minerals crystallizing in this class are quartz (*q.v.*) and cinnabar, both of which rotate the plane of a beam of polarized light transmitted along the triad axis. Other examples are dithionates of lead ($PbS_2O_6{\cdot}4H_2O$), calcium and strontium, and of potassium ($K_2S_2O_6$), benzil, matico-stearoptene.

Rhombohedral Class

(Parallel-faced hemihedral.)

The only elements of symmetry are the triad axis and a centre of symmetry. The general form $\{hkl\}$ is a rhombohedron, and is a hemihedral form, with parallel faces, of the scalenohedron. The form $\{hkl\}$, where $h-2k+l=0$, is also a rhombohedron, being the hemihedral form of the hexagonal bipyramid. The dihexagonal prism $\{\bar{h}\bar{k}\bar{l}\}$ of the holosymmetric class becomes here a hexagonal prism. The rhombohedra $\{hkk\}$, hexagonal prisms $\{2\bar{1}\bar{1}\}$ and $\{101\}$, and the basal pinacoid $\{111\}$ are geometrically the same in this class as in the holosymmetric class.

Fig. 76 represents a crystal of dioptase with the fundamental rhombohedron r $\{100\}$ and the hexagonal prism of the second order m $\{10\bar{1}\}$ combined with the rhombohedron s $\{03\bar{1}\}$.

Examples of minerals which crystallize in this class are phenakite, dioptase, willemite, dolomite, ilmenite and pyrophanite: amongst artificial substances is ammonium diperiodate

$$((NH_4)_4I_2O_9{\cdot}3H_2O).$$

Trigonal Pyramidal Class

(Hemimorphic-tetartohedral.)

Here there is only the triad axis of symmetry, which is uniterminal. The general form $\{hkl\}$ is a trigonal pyramid consisting of three faces at one end of the crystal. All other forms, in which the faces are neither parallel nor perpendicular to the triad axis, are trigonal pyramids. All the prisms are trigonal prisms; and perpendicular to these are two pedions.

The only substance known to crystallize in this class is sodium periodate ($NaIO_4{\cdot}3H_2O$), the crystals of which are circularly polarizing.

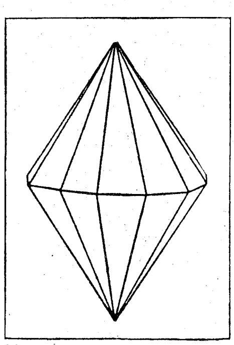

FIG. 77.—DIHEXAGONAL BIPYRAMID

Trigonal Bipyramidal Class

Here there is a plane of symmetry perpendicular to the triad axis. The trigonal pyramids of the last class are here trigonal bipyramids (fig. 75); the prisms are all trigonal prisms, and parallel to the plane of symmetry is the basal pinacoid. No example is known for this class.

Ditrigonal Bipyramidal Class

Here there are three similar planes of symmetry intersecting in the triad axis, and perpendicular to them is a fourth plane of symmetry; at the intersection of the three vertical planes with the horizontal plane are three similar dyad axes; there is no centre of symmetry.

The general form is bounded by twelve scalene triangles and is a ditrigonal bipyramid. Like the general form of the last class, this has two sets of indices $\{hkl, \bar{p}\bar{q}\bar{r}\}$, $\{hkl\}$ for faces above the equatorial plane of symmetry and $\{\bar{p}\bar{q}\bar{r}\}$ for faces below: with hexagonal axes there would be only one set of indices. The hexagonal bipyramids, the hexagonal prism $\{10\bar{1}\}$ and the basal pinacoid $\{111\}$ are geometrically the same in this class as in the holosymmetric class. The trigonal prism $\{2\bar{1}\bar{1}\}$ and ditrigonal prisms $\{\bar{h}\bar{k}\bar{l}\}$ are the same as in the ditrigonal pyramidal class.

The only representatives of this type of symmetry are the mineral benitoite (*q.v.*) and silver hydrogen phosphate, Ag_2HPO_4.

HEXAGONAL DIVISION

In crystals of this division of the hexagonal system the principal axis is a hexad axis of symmetry. Hexagonal axes of reference are used: if rhombohedral axes be used many of the simple forms will have two sets of indices.

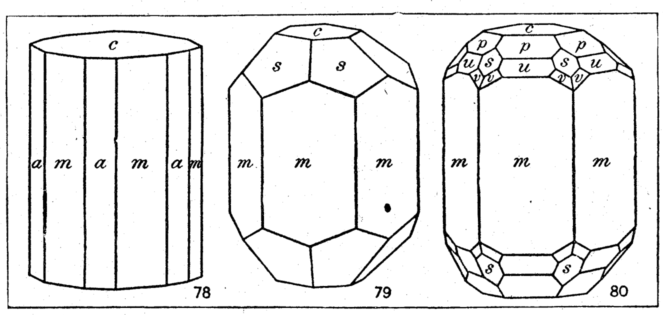
Holosymmetric Class

(Holohedral; Dihexagonal-bipyramidal.)

Intersecting in the hexad axis are six planes of symmetry of two kinds, and perpendicular to them is an equatorial plane of symmetry. Perpendicular to the hexad axis are six dyad axes of two kinds and each perpendicular to a vertical plane of symmetry. The seven simple forms are:—

Dihexagonal bipyramid, bounded by twenty-four scalene triangles (fig. 77; v in fig. 80). The indices are $\{21\bar{3}1\}$, etc., or in general $\{hikl\}$. This form may be considered as a combination of two scalenohedra, a direct and an inverse.

Hexagonal bipyramid of the first order, bounded by twelve isosceles triangles (fig. 70; p and u in fig. 80); indices $\{10\bar{1}1\}$, $\{20\bar{2}1\}$ . . . $\{h0\bar{h}l\}$. The hexagonal bipyramid so common in quartz is geometrically similar to this form, but it really is a combination of two rhombohedra, a direct and an inverse, the faces of which differ in surface characters and often also in size.



FIGS. 78, 79 AND 80.—COMBINATIONS OF HEXAGONAL FORMS

Hexagonal bipyramid of the second order, bounded by twelve faces (s in figs. 79 and 80); indices $\{11\bar{2}1\}$, $\{11\bar{2}2\}$ . . . $\{h.h.\bar{2h}.l\}$.

Dihexagonal prism, consisting of twelve faces parallel to the hexad axis and inclined to the vertical planes of symmetry; indices $\{hik0\}$.

Hexagonal prism of the first order $\{10\bar{1}0\}$, consisting of six faces parallel to the hexad axis and perpendicular to one set of three vertical planes of symmetry (m in figs. 71, 78–80).

Hexagonal prism of the second order $\{11\bar{2}0\}$, consisting of six faces also parallel to the hexad axis, but perpendicular to the other set of three vertical planes of symmetry (a in fig. 78).

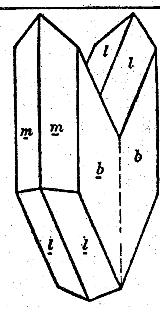
Basal pinacoid $\{0001\}$, consisting of a pair of parallel planes perpendicular to the hexad axis (c in figs. 71, 78–80).

Beryl (emerald), connellite, zinc, magnesium and beryllium crystallize in this class.

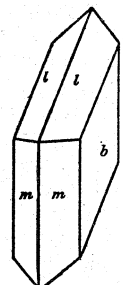
Bipyramidal Class
(Parallel-faced hemihedral.)

Here there is a plane of symmetry perpendicular to the hexad axis; there is also a centre of symmetry. All the closed forms are hexagonal bipyramids; the open forms are hexagonal prisms or the basal pinacoid. The general form $\{hikl\}$ is hemihedral with parallel faces with respect to the general form of the holosymmetric class.

Apatite (*q.v.*), pyromorphite, mimetite and vanadinite possess this degree of symmetry.



81



82

FIG. 81.—TWINNED CRYSTAL OF GYPSUM
FIG. 82.—SIMPLE CRYSTAL OF GYPSUM

Dihexagonal Pyramidal Class
(Hemimorphic-hemihedral.)

Six planes of symmetry of two kinds intersect in the hexad axis. The hexad axis is uniterminal and all the forms are open forms. The general form $\{hikl\}$ consists of twelve faces at one end of the crystal, and is a dihexagonal pyramid. The hexagonal pyramids $\{h0\bar{h}l\}$ and $\{h.h.\overline{2h}.l\}$ each consist of six faces at one end of the crystal. The prisms are geometrically the same as in the holo-symmetric class. Perpendicular to the hexad axis are the pedions $\{0001\}$ and $\{000\bar{1}\}$.

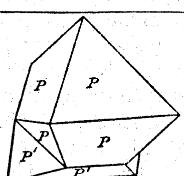
Iodyrite (AgI), greenockite (CdS), wurtzite (Zns) and zincite (ZnO) are often placed in this class, but they more probably belong to the hemimorphic-hemihedral class of the rhombohedral division of this system.

Trapezohedral Class
(Trapezohedral-hemihedral.)

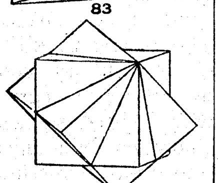
Six dyad axes of two kinds are perpendicular to the hexad axis. The general form $\{hikl\}$ is the hexagonal trapezohedron bounded by twelve trapezoidal faces. The other simple forms are geometrically the same as in the holosymmetric class. Quartz at temperatures above 575° C (and below 870° C)—β-quartz, barium-antimonyl dextro-tartrate+potassium nitrate $(Ba(SbO)_2\text{-}(C_4H_4O_6)_2\cdot KNO_3)$ and the corresponding lead salt crystallize in this class.

Hexagonal Pyramidal Class
(Hemimorphic-tetartohedral.)

No other element is here associated with the hexad axis, which is uniterminal. The pyramids all consist of six faces at one end of the crystal, and prisms are all hexagonal prisms; perpendicular to the hexad axis are the pedions.



83



84

FIG. 83.—SPINEL-TWIN
FIG. 84.—INTERPENETRATING TWINNED CUBES

Lithium potassium sulphate, strontium-antimonyl dextro-tartrate, and lead-antimonyl dextro-tartrate are examples of this type of symmetry. The mineral nepheline is placed in this class because of the absence of symmetry in the etched figures on the prism faces (fig. 92).

(*g*) *Regular Grouping of Crystals*

Crystals of the same kind when occurring together may sometimes be grouped in parallel position and so give rise to special structures, of which the dendritic (from δένδρον, a tree) or branch-like aggregations of native copper or of magnetite and the fibrous structures of many minerals furnish examples. Sometimes, owing to changes in the surrounding conditions, the crystal may continue its growth with a different external form or colour, *e.g.*, sceptre-quartz.

Regular intergrowths of crystals of totally different substances such as staurolite with kyanite, rutile with haematite, blende with chalcopyrite, calcite with sodium nitrate, are not uncommon. In these cases certain planes and edges of the two crystals are parallel. (*See* O. Mügge, "Die regelmässigen Verwachsungen von Mineralien verschiedener Art," *Neues Jahrbuch für Mineralogie*, 1903, vol. xvi. pp., 335–475.)

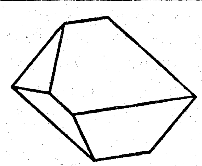
But by far the most important kind of regular conjunction of crystals is that known as "twinning." Here two crystals or individuals of the same kind have grown together in a certain symmetrical manner, such that one portion of the twin may be brought into the position of the other by reflection across a plane or by rotation about an axis. The plane of reflection is called the twin-plane, and is parallel to one of the faces, or to a possible face, of the crystal: the axis of rotation, called the twin-axis, is parallel to one of the edges or perpendicular to a face of the crystal.

In the twinned crystal of gypsum represented in fig. 81 the two portions are symmetrical with respect to a plane parallel to the ortho-pinacoid $\{100\}$, *i.e.*, a vertical plane perpendicular to the face *b*. Or we may consider the simple crystal (fig. 82) to be cut in half by this plane and one portion to be rotated through 180° about the normal to the same plane. Such a crystal (fig. 81) is therefore described as being twinned on the plane $\{100\}$.

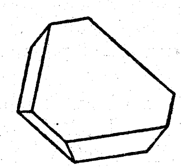
An octahedron (fig. 83) twinned on an octahedral face $\{111\}$ has the two portions symmetrical with respect to a plane parallel to this face (the large triangular face in the figure); and either portion may be brought into the position of the other by a rotation through 180° about the triad axis of symmetry which is perpendicular to this face. This kind of twinning is especially frequent in crystals of spinel, and is consequently often referred to as the "spinel twin-law."

In these two examples the surface of the union, or composition-plane, of the two portions is a regular surface coinciding with the twin-plane; such twins are called "juxtaposition-twins." In other juxtaposed twins the plane of composition is, however, not necessarily the twin-plane. Another type of twin is the "interpenetration twin," an example of which is shown in fig. 84. Here one cube may be brought into the position of the other by a rotation of 180° about a triad axis, or by reflection across the octahedral plane which is perpendicular to this axis; the twin-plane is therefore $\{111\}$.

Since in many cases twinned crystals may be explained by the rotation of one portion through two right angles, R. J. Haüy introduced the term "hemitrope" (half turn); the word "macle" had been earlier used by Romé d'Isle. There are, however, some rare types of twins which cannot be explained by rotation about an axis, but only by reflection across a plane; these are known as "symmetric twins," a good example of which is furnished by one of the twin-laws of chalcopyrite.



85



86

FIGS. 85 AND 86.—MISSHAPEN OCTAHEDRA

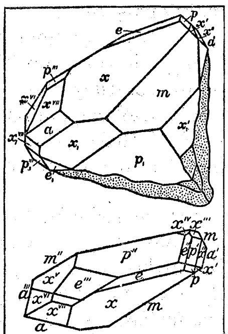
Twinned crystals may often be recognized by the presence of re-entrant angles between the faces of the two portions, as may be seen from the above figures. In some twinned crystals (*e.g.*, quartz) there are, however, no re-entrant angles. On the other hand, two crystals accidentally grown together without any symmetrical relation between them will usually show some re-entrant angles, but this must not be taken to indicate the presence of twinning.

Twinning may be several times repeated on the same plane or on other similar planes of the crystal, giving rise to triplets, quartets and other complex groupings. When often repeated on the same plane, the twinning is said to be "polysynthetic," and gives rise to a laminated structure in the crystal. Sometimes such a crystal (*e.g.*, of corundum or pyroxene) may be readily broken in this direction, which is thus a "plane of parting," often closely resembling a true cleavage in character. In calcite and some other substances this lamellar twinning may be produced artificially by pressure. (*See* below, Sec. II. [*a*], *Glide-plane.*)

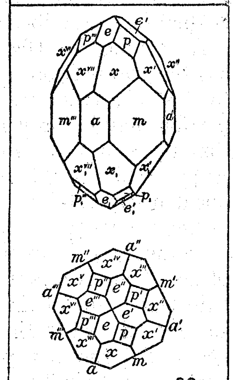
Another curious result of twinning is the production of forms which apparently display a higher degree of symmetry than that actually possessed by the substance. Twins of this kind are known as "mimetic twins" or "pseudo-symmetric twins." Two hemihedral or hemimorphic crystals (*e.g.*, of diamond or of hemimorphite) are often united in twinned position to produce a group with apparently the same degree of symmetry as the holosymmetric class of the same system. Or again, a substance crystallizing in, say, the orthorhombic system (*e.g.*, aragonite) may, by twinning, give rise to pseudo-hexagonal fórms: and pseudo-cubic forms often result by the complex twinning of crystals (*e.g.*, stannite, phillipsite, etc.) belonging to other systems. Many of the so-called "optical anomalies" of crystals may be explained by this pseudo-symmetric twinning.

(*h*) *Irregularities of Growth of Crystals; Character of Faces*

Only rarely do actual crystals present the symmetrical appearance shown in the figures given above, in which similar faces are all represented as of equal size. It frequently happens that the crystal is so placed with respect to the liquid in which it grows that there will be a more rapid deposition of material on one part than on another; for instance, if the crystal be attached to some other solid it cannot grow in that direction. Only when a crystal is freely suspended in the mother-liquid and material for growth is supplied at the same rate on all sides does an equably developed form result.



87



88

CRYSTAL OF ZIRCON (CLINOGRAPHIC DRAWINGS AND PLANS)
Fig. 87.—Actual crystal
Fig. 88.—Ideal development

Two misshapen or distorted octahedra are represented in figs. 85 and 86; the former is elongated in the direction of one of the edges of the octahedron, and the latter is flattened parallel to one pair of faces. It will be noticed in these figures that the edges in which the faces intersect have the same directions as before, though here there are additional edges not present in fig. 3. The angles (70° 32′ or 109° 28′) between the faces also remain the same; and the faces have the same inclinations to the axes and planes of symmetry as in the equably developed form. Although from a geometrical point of view these figures are no longer symmetrical with respect to the axes and planes of symmetry, yet crystallographically they are just as symmetrical as the ideally developed form, and, however much their irregularity of development, they still are regular (cubic) octahedra of crystallography. A remarkable case of irregular development is presented by the mineral cuprite, which is often found as well-developed cubes; but in the variety known as chalcotrichite it occurs as a matted aggregate of delicate hairs, each of which is an individual crystal enormously elongated in the direction of an edge of the cube.

The symmetry of actual crystals is sometimes so obscured by irregularities of growth that it can only be determined by measurement of the angles. An extreme case, where several of the planes have not been developed at all, is illustrated in fig. 87, which shows the actual shape of a crystal of zircon from Ceylon; the ideally developed form (fig. 88) is placed at the side for comparison, and the parallelism of the edges between corresponding faces will be noticed. This crystal is a combination of five simple forms, viz., two tetragonal prisms (*a* and *m*), two tetragonal bipyramids (*e* and *p*), and one ditetragonal bipyramid (*x*, with 16 faces).

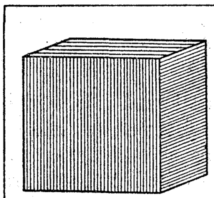
The actual form, or "habit," of crystals may vary widely in different crystals of the same substance, these differences depending largely on the conditions under which the growth has taken place. The material may have crystallized from a fused mass or from a solution; and in the latter case the solvent may be of different kinds and contain other substances in solution, or the temperature may vary. Calcite (*q.v.*) affords a good example of a substance crystallizing in widely different habits, but all crystals are referable to the same type of symmetry and may be reduced to the same fundamental form.

When crystals are aggregated together, and so interfere with each other's growth, special structures and external shapes often result, which are sometimes characteristic of certain substances, especially amongst minerals.

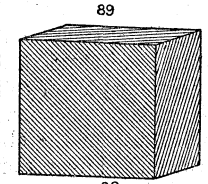
Incipient crystals, the development of which has been arrested owing to unfavourable conditions of growth, are known as crystallites (*q.v.*). They are met with in imperfectly crystallized substances and in glassy rocks (obsidian and pitchstone), or may be obtained artificially from a solution of sulphur in carbon disulphide rendered viscous by the addition of Canada-balsam. To the various forms H. Vogelsang gave, in 1875, the names "globulites," "margarites," "longulites," etc. At a more advanced stage of growth these bodies react on polarized light, thus possessing the internal structure of true crystals; they are then called "microlites." These have the form of minute rods, needles or hairs, and are aggregated into feathery and spherulitic forms or skeletal crystals. They are common constituents of microcrystalline igneous rocks, and often occur as inclusions in larger crystals of other substances.

Inclusions of foreign matter, accidentally caught up during growth, are frequently present in crystals. Inclusions of other minerals are specially frequent and conspicuous in crystals of quartz, and crystals of calcite may contain as much as 60% of included sand. Cavities, either with rounded boundaries or with the same shape ("negative crystals") as the surrounding crystal, are often to be seen; they may be empty or enclose a liquid with a movable bubble of gas.

The faces of crystals are rarely perfectly plane and smooth, but are usually striated, studded with small angular elevations, pitted or cavernous, and sometimes curved or twisted. These irregularities, however, conform with the symmetry of the crystal, and much may be learnt by their study. The parallel grooves or furrows, called "striae," are the result of oscillatory combination between adjacent faces, narrow strips of first one face and then another being alternately developed. Sometimes the striae on crystal-faces are due to repeated lamellar twinning, as in the plagioclase felspars. The directions of the striations are very characteristic features of many crystals: *e.g.*, the faces of the hexagonal prism of quartz are always striated horizontally, whilst in beryl they are striated vertically. Cubes of pyrites (fig. 89) are striated parallel to one edge, the striae on adjacent faces being at right angles, and due to oscillatory combination of the cube and the pentagonal dodecahedron (compare fig. 36); whilst cubes of blende (fig. 90) are striated parallel to one diagonal of each face, *i.e.*, parallel to the tetrahedron faces. (Compare fig. 31.) These striated cubes thus possess different degrees of symmetry and belong to different symmetry-classes. Oscillatory combination of faces gives rise also to curved surfaces. Crystals with twisted surfaces (*see* DOLOMITE) are, however, built up of smaller crystals arranged in nearly parallel position. Sometimes a face is entirely replaced by small faces of other forms, giving rise to a drusy surface; an example of this is shown by some octahedral crystals of fluorspar (fig. 2) which are built up of minute cubes.



89



90

FIG. 89.—STRIATED CUBE OF PYRITES
FIG. 90.—STRIATED CUBE OF BLENDE

The faces of crystals are sometimes partly or completely replaced by smooth bright surfaces inclined at only a few minutes of arc from the true position of the face; such surfaces are called "vicinal faces," and their indices can be expressed only by very high numbers. In apparently perfectly developed crystals of alum the octahedral face, with the simple indices {111} is usually replaced by faces of very low triakis-octahedra, with indices such as $\{251 \cdot 251 \cdot 250\}$; the angles measured on such crystals will therefore deviate slightly from the true octahedral angle. Vicinal faces of this character are formed during the growth of crystals, and have been studied by H. A. Miers (*Phil. Trans.*, 1903, Ser. A. vol. 202). Other faces with high indices, viz., "prerosion faces" and the minute faces forming the sides of etched figures (*see* below), as well as rounded edges and other surface irregularities, may, however, result from the corrosion of a crystal subsequent to its growth. The pitted and cavernous faces of artificially grown crystals of sodium chloride and of bismuth are, on the other hand, a result of rapid growth, more material being supplied at the edges and corners of the crystal than at the centres of the faces.

The internal structure of crystals has, since 1912, been worked out by the application of X-rays, and is now such an extensive and specialized subject that a separate article is devoted to it. (*See* X-RAYS AND CRYSTAL STRUCTURE.)

II. PHYSICAL PROPERTIES OF CRYSTALS

Many of the physical properties of crystals vary with the direction in the material, but are the same in certain directions; these directions obeying the same laws of symmetry as do the faces on the exterior of the crystal. The symmetry of the internal structure of crystals is thus the same as the symmetry of their external form.

(*a*) *Elasticity and Cohesion*

The elastic constants of crystals are determined by similar methods to those employed with amorphous substances, only the bars and plates experimented upon must be cut from the crystal with known orientations. The "elasticity surface" expressing the coefficients in various directions within the crystal has a configuration symmetrical with respect to the same planes and axes of symmetry as the crystal itself. In calcite, for instance, the figure has roughly the shape of a rounded rhombohedron with depressed faces and is symmetrical about three vertical planes. In the case of homogeneous elastic deformation, produced by pressure on all sides, the effect on the crystal is the same as that due to changes of temperature; and the surfaces expressing the compression coefficients in different directions have the same higher degree of symmetry, being either a sphere, spheroid or ellipsoid. When strained beyond the limits of elasticity, crystalline matter may suffer permanent deformation in one or other of two ways, or may be broken along cleavage surfaces or with an irregular fracture. In the case of plastic deformation, *e.g.*, in a crystal of ice, the crystalline particles are displaced but without any change in their orientation. Crystals of some substances (*e.g.*, para-azoxyanisol) have such a high degree of plasticity that they are deformed even by their surface tension, and the crystals take the form of drops of doubly refracting liquid which are known as "liquid crystals." (*See* O. Lehmann, *Flüssige Kristalle*, Leipzig, 1921.)

In the second, and more usual kind of permanent deformation without fracture, the particles glide along certain planes into a new (twinned) position of equilibrium. If a knife-blade be pressed into the edge of a cleavage rhombohedron of calcite (at *b*, fig. 91) the portion *abcde* of the crystal will take up the position *a′b′cde*. The obtuse solid angle at *a* becomes acute (*a′*), whilst the acute angle at *b* becomes obtuse (*b′*); and the new surface *a′ce* is as bright and smooth as before.

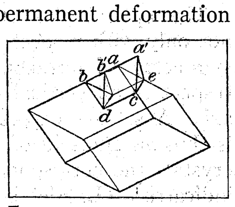


FIG. 91.—GLIDE-PLANE OF CALCITE

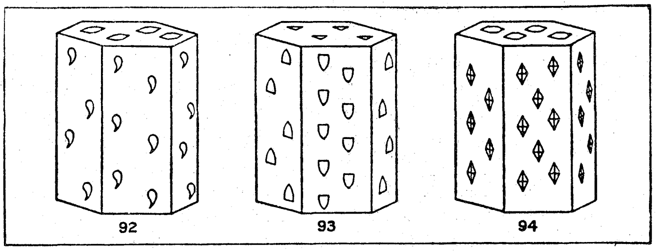
This result has been effected by the particles in successive layers gliding or rotating over each other, without separation, along planes parallel to *cde*. This plane, which truncates the edge of the rhombohedron and has the indices $\{1\bar{1}0\}$ is called a "glide-plane." The new portion is in twinned position with respect to the rest of the crystal, being a reflection of it across the plane *cde*, which is therefore a plane of twinning. This secondary twinning is often to be observed as a repeated lamination in the grains of calcite composing a crystalline limestone, or marble, which has been subjected to earth movements. Planes of gliding have been observed in many minerals (pyroxene, corundum, etc.) and their crystals may often be readily broken along these directions, which are thus "planes of parting" or "pseudo-cleavage." The characteristic transverse striae, invariably present on the cleavage surfaces of stibnite and kyanite are due to secondary twinning along glide-planes, and have resulted from the bending of the crystals.

One of the most important characters of crystals is that of "cleavage"; there being certain plane directions across which the cohesion is a minimum, and along which the crystal may be readily split or cleaved. These directions are always parallel to a possible face on the crystal and usually one prominently developed and with simple indices, it being a face in which the crystal molecules are most closely packed. The directions of cleavage are symmetrically repeated according to the degree of symmetry possessed by the crystal. Thus in the cubic system, crystals of salt and galena cleave in three directions parallel to the faces of the cube $\{100\}$, diamond and fluorspar cleave in four directions parallel to the octahedral faces $\{111\}$, and blende in six directions parallel to the faces of the rhombic dodecahedron $\{110\}$. In crystals of other systems there will be only a single direction of cleavage if this is parallel to the faces of a pinacoid; *e.g.*, the basal pinacoid in tetragonal (as in apophyllite) and hexagonal crystals; or parallel (as in gypsum) or perpendicular (as in mica and cane-sugar) to the plane of symmetry in monoclinic crystals. Calcite cleaves in three directions parallel to the faces of the primitive rhombohedron. Barytes, which crystallizes in the orthorhombic system, has two sets of cleavages, viz., a single cleavage parallel to the basal pinacoid $\{001\}$ and also two directions parallel to the faces of the prism $\{110\}$. In all of the examples just quoted the cleavage is described as perfect, since cleavage flakes with very smooth and bright surfaces may be readily detached from the crystals. Different substances, however, vary widely in their character of cleavage; in some it can only be described as good or distinct, whilst in others, *e.g.*, quartz and alum, there is little or no tendency to split along certain directions and the surfaces of fracture are very uneven. Cleavage is therefore a character of considerable determinative value, especially for the purpose of distinguishing different minerals.

Another result of the presence in crystals of directions of minimum cohesion are the "percussion figures," which are produced on a crystal-face when this is struck with a sharp point. A percussion figure consists of linear cracks radiating from the point of impact, which in their number and orientation agree with the symmetry of the face. Thus on a cube face of a crystal of salt the rays of the percussion figure are parallel to the diagonals of the face, whilst on an octahedral face a three-rayed star is developed. By pressing a blunt point into a crystal face a somewhat similar figure, known as a "pressure figure," is produced. Percussion and pressure figures are readily developed in cleavage sheets of mica (*q.v.*).

Closely allied to cohesion is the character of "hardness," which is often defined, and measured by, the resistance which a crystal face offers to scratching. That hardness is a character depending largely on crystalline structure is well illustrated by the two crystalline modifications of carbon: graphite is one of the softest of minerals, whilst diamond is the hardest of all. The hardness of crystals of different substances thus varies widely, and with minerals it is a character of considerable determinative value; for this purpose a scale of hardness is employed. (*See* MINERALOGY.) Various attempts have been made with the view of obtaining accurate determinations of degrees of hardness, but with varying results; an instrument used for this purpose is called a sclerometer (from σκληρός, hard). It may, however, be readily demonstrated that the degree of hardness on a crystal face varies with the direction, and that a curve expressing these relations possesses the same geometrical symmetry as the face itself. The mineral kyanite is remarkable in having widely different degrees of hardness on different faces of its crystals and in different directions on the same face.

Another result of the differences of cohesion in different directions is that crystals are corroded, or acted upon by chemical solvents, at different rates in different directions. This is strikingly shown when a sphere cut from a crystal, say of calcite or quartz, is immersed in acid; after some time the resulting form is bounded by surfaces approximating to crystal faces, and has the same symmetry as that of the crystal from which the sphere was cut. When a crystal bounded by faces is immersed in a



ETCHED FIGURES ON HEXAGONAL PRISMS. FIG. 92.—NEPHELINE. FIG. 93.—CALCITE. FIG. 94.—BERYL

solvent the edges and corners become rounded and "prerosion faces" developed in their place; the faces become marked all over with minute pits or shallow depressions, and as these are extended by further solution they give place to small elevations on the corroded face. The sides of the pits and elevations are bounded by small faces which have the character of vicinal faces. These markings are known as "etched figures" or "corrosion figures," and they are extremely important aids in determining the symmetry of crystals. Etched figures are sometimes beautifully developed on the faces of natural crystals, *e.g.,* of diamond, and they may be readily produced artificially with suitable solvents.

As an example, the etched figures on the faces of a hexagonal prism and the basal plane are illustrated in figs. 92–94 for three of the several symmetry-classes of the hexagonal system. The classes chosen are those in which nepheline, calcite and beryl (emerald) crystallize, and these minerals often have the simple form of crystal represented in the figures. In nepheline (fig. 92) the only element of symmetry is a hexad axis; the etched figures on the prism are therefore unsymmetrical, though similar on all the faces; the hexagonal markings on the basal plane have none of their edges parallel to the edges of the face; further the crystals being hemimorphic, the etched figures on the basal planes at the two ends will be different in character. The facial development of crystals of nepheline gives no indication of this type of symmetry, and the mineral has been referred to this class solely on the evidence afforded by the etched figures. In calcite there is a triad axis of symmetry parallel to the prism edges, three dyad axes each perpendicular to a pair of prism edges and three planes of symmetry perpendicular to the prism faces; the etched figures shown in fig. 93 will be seen to conform to all these elements of symmetry. There being in calcite also a centre of symmetry, the equilateral triangles on the basal plane at the lower end of the crystal will be the same in form as those at the top, but they will occupy a reversed position. In beryl, which crystallizes in the holosymmetric class of the hexagonal system, the etched figures (fig. 94) display the fullest possible degree of symmetry; those on the prism faces are all similar and are each symmetrical with respect to two lines, and the hexagonal markings on the basal planes at both ends of the crystal are symmetrically placed with respect to six lines. A detailed account of the etched figures of crystals is given by H. Baumhauer, *Die Resultate der Ätzmethode in der krystallographischen Forschung* (Leipzig, 1894).

(*b*) *Optical Properties*

The complex optical characters of crystals are not only of considerable interest theoretically, but are of the greatest practical importance. In the absence of external crystalline form, as with a faceted gem-stone, or with the minerals constituting a rock (thin, transparent sections of which are examined in the polarizing microscope), the mineral species may often be readily identified by the determination of some of the optical characters.

According to their action on transmitted plane-polarized light (*see* LIGHT) all crystals may be referred to one or other of the five groups enumerated below. These groups correspond with the six systems of crystallization (in the second group two systems being included together). The several symmetry-classes of each system are optically the same, except in the rare cases of substances which are circularly polarizing.

(1) Optically isotropic crystals—corresponding with the cubic system.

(2) Optically uniaxial crystals—corresponding with the tetragonal and hexagonal systems.

(3) Optically biaxial crystals in which the three principal optical directions coincide with the three crystallographic axes—corresponding with the orthorhombic system.

(4) Optically biaxial crystals in which only one of the three principal optical directions coincides with a crystallographic axis—corresponding with the monoclinic system.

(5) Optically biaxial crystals in which there is no fixed and definite relation between the optical and crystallographic directions—corresponding with the anorthic system.

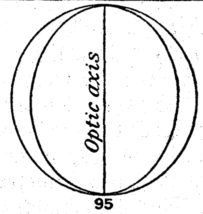
Optically Isotropic Crystals.—These belong to the cubic system, and like all other optically isotropic (from ἴσος, like, and τρόπος, character) bodies have only one index of refraction for light of each colour. They have no action on polarized light (except in crystals which are circularly polarizing); and when examined in the polariscope or polarizing microscope they remain dark between crossed nicols, and cannot therefore be distinguished optically from amorphous substances, such as glass and opal.

Optically Uniaxial Crystals.—These belong to the tetragonal and hexagonal (including rhombohedral) systems, and between crystals of these systems there is no optical distinction. Such crystals are anisotropic or doubly refracting (*see* LIGHT: *Refraction and Double Refraction*); but for light travelling through them in a certain, single direction they are singly refracting. This direction, which is called the optic axis, is the same for light of all colours and at all temperatures; it coincides in direction with the principal crystallographic axis, which in tetragonal crystals is a tetrad (or dyad) axis of symmetry, and in the hexagonal system a triad or hexad axis.

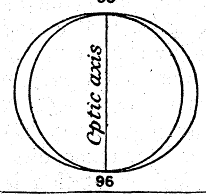
For light of each colour there are two indices of refraction; namely, the ordinary index (ω) corresponding with the ordinary ray, which vibrates perpendicular to the optic axis; and the extraordinary index (ϵ) corresponding with the extraordinary ray, which vibrates parallel to the optic axis. If the ordinary index of refraction be greater than the extraordinary index, the crystal is said to be optically negative, whilst if less the crystal is optically positive. The difference between the two indices is a measure of the strength of the double refraction or birefringence. Thus in calcite, for sodium (D) light, $\omega=1{\cdot}6585$ and $\epsilon=1{\cdot}4863$; hence this substance is optically negative with a relatively high double refraction of $\omega-\epsilon=0{\cdot}1722$. In quartz $\omega=1{\cdot}5442$, $\epsilon=1{\cdot}5533$ and $\epsilon-\omega=0{\cdot}0091$; this mineral is therefore optically positive with low double refraction. The indices of refraction vary, not only for light of different colours, but also slightly with the temperature.

The optical characters of uniaxial crystals are symmetrical not only with respect to the full number of planes and axes of symmetry of tetragonal and hexagonal crystals, but also with respect to all vertical planes, *i.e.,* all planes containing the optic axis. A surface expressing the optical relations of such crystals is thus an ellipsoid of revolution about the optic axis. (In cubic crystals the corresponding surface is a sphere.) In the "optical indicatrix" (L. Fletcher, *The Optical Indicatrix and the Transmission of Light in Crystals,* London, 1892), the length of the principal axis, or axis of rotation, is proportional to the index of refraction (*i.e.,* inversely proportional to the velocity) of the extraordinary rays, which vibrate along this axis and are transmitted in directions perpendicular thereto; the equatorial diameters are proportional to the index of refraction of the ordinary rays, which vibrate perpendicular to the optic axis. For positive uniaxial crystals the indicatrix is thus a prolate spheroid (egg-shaped), and for negative crystals an oblate spheroid (orange-shaped).

In "Fresnel's ellipsoid" the axis of rotation is proportional to the velocity of the extraordinary ray, and the equatorial diameters proportional to the velocity of the ordinary ray; it is therefore an oblate spheroid for positive crystals, and a prolate spheroid for negative crystals. The "ray-surface," or "wave-surface," which represents the distances traversed by the rays during a given interval of time in various directions from a point of origin within the crystal, consists in uniaxial crystals of two sheets; namely, a sphere, corresponding to the ordinary rays, and an ellipsoid of revolution, corresponding to the extraordinary rays. The difference in form of the ray-surface for positive and negative crystals is shown in figs. 95 and 96.



95



96

FIG. 95.—RAY-SURFACE SECTION OF A POSITIVE UNIAXIAL CRYSTAL
FIG. 96.—RAY-SURFACE SECTION OF A NEGATIVE UNIAXIAL CRYSTAL

When a uniaxial crystal is examined in a polariscope or polarizing microscope between crossed nicols (*i.e.*, with the principal planes of the polarizer or analyser at right angles, and so producing a dark field of view) its behaviour differs according to the direction in which the light travels through the crystal, to the position of the crystal with respect to the principal planes of the nicols, and further, whether convergent or parallel polarized light be employed. A tetragonal or hexagonal crystal viewed, in parallel light, through the basal plane, *i.e.*, along the principal axis, will remain dark as it is rotated between crossed nicols, and will thus not differ in its behaviour from a cubic crystal or other isotropic body. If, however, the crystal be viewed in any other direction, for example, through a prism face, it will, except in certain positions, have an action on the polarized light. A plane-polarized ray entering the crystal will be resolved into two polarized rays with the directions of vibration parallel to the vibration-directions in the crystal. These two rays on leaving the crystal will be combined again in the analyser, and a portion of the light transmitted through the instrument; the crystal will then show up brightly against the dark field. Further, owing to interference of these two rays in the analyser, the light will be brilliantly coloured, especially if the crystal be thin, or if a thin section of a crystal be examined. The particular colour seen will depend on the strength of the double refraction, the orientation of the crystal or section, and upon its thickness. If now, the crystal be rotated with the stage of the microscope, the nicols remaining fixed in position, the light transmitted through the instrument will vary in intensity, and in certain positions will be cut out altogether. The latter happens when the vibration-directions of the crystal are parallel to the vibration-directions of the nicols (these being indicated by cross-wires in the microscope). The crystal, now being dark, is said to be in position of extinction; and as it is turned through a complete rotation of 360° it will extinguish four times. If a prism face be viewed through, it will be seen that, when the crystal is in a position of extinction, the cross-wires of the microscope are parallel to the edges of the prism: the crystal is then said to give "straight extinction."

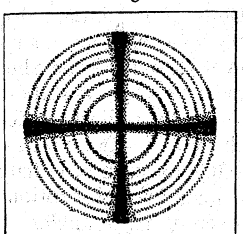


FIG. 97.—INTERFERENCE FIGURE OF A UNIAXIAL CRYSTAL

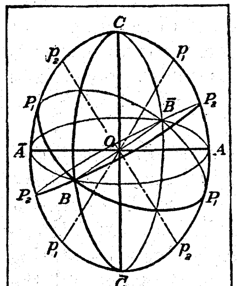
In convergent light, between crossed nicols, a very different phenomenon is to be observed when a uniaxial crystal, or section of such a crystal, is placed with its optic axis coincident with the axis of the microscope. The rays of light, being convergent, do not travel in the direction of the optic axis and are therefore doubly refracted in the crystal; in the analyser the vibrations will be reduced to the same plane and there will be interference of the two sets of rays. The result is an "interference figure" (fig. 97), which consists of a number of brilliantly coloured concentric rings, each showing the colours of the spectrum of white light; intersecting the rings is a black cross, the arms of which are parallel to the principal planes of the nicols. If monochromatic light be used instead of white light, the rings will be alternately light and dark. The number and distance apart of the rings depend on the strength of the double refraction and on the thickness of the crystal. By observing the effect produced on such a uniaxial interference figure when a "quarter undulation (or wave-length) mica-plate" is superposed on the crystal, it may be at once decided whether the crystal is optically positive or negative. Such a simple test may, for example, be applied for distinguishing certain faceted gem-stones: thus zircon and phenakite are optically positive, whilst corundum (ruby and sapphire) and beryl (emerald) are optically negative.

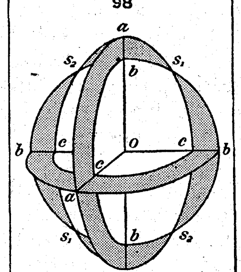
Optically Biaxial Crystals.—In these crystals there are three principal indices of refraction, denoted by α, β and γ; of these γ is the greatest and α the least ($\gamma>\beta>\alpha$). The three principal vibration-directions, corresponding to these indices, are at right angles to each other, and are the directions of the three rectangular axes of the optical indicatrix. The indicatrix (fig. 98) is an ellipsoid with the lengths of its axes proportional to the refractive indices; $OC=\gamma$, $OB=\beta$, $OA=\alpha$, where $OC>OB>OA$. The figure is symmetrical with respect to the principal planes OAB, OAC, OBC.

In Fresnel's ellipsoid the three rectangular axes are proportional to $1/\alpha$, $1/\beta$, and $1/\gamma$, and are usually denoted by $\mathfrak{a}$, $\mathfrak{b}$ and $\mathfrak{c}$ respectively, where $\mathfrak{a}>\mathfrak{b}>\mathfrak{c}$: these have often been called "axes of optical elasticity," a term now generally discarded.

The ray-surface (represented in fig. 99 by its sections in the three principal planes) is derived from the indicatrix in the following manner. A ray of light entering the crystal and travelling in the direction OA is resolved into polarized rays vibrating parallel to OB and OC, and therefore propagated with the velocities $1/\beta$ and $1/\gamma$ respectively: distances Ob and Oc (fig. 99) proportional to these velocities are marked off in the direction OA. Similarly, rays travelling along OC have the velocities $1/\alpha$ and $1/\beta$, and those along OB the velocities $1/\alpha$ and $1/\gamma$. In the two directions Op_1 and Op_2 (fig. 98), perpendicular to the two circular sections P_1P_1 and P_2P_2 of the indicatrix, the two rays will be transmitted with the same velocity $1/\beta$. These two directions are called the optic axes ("primary optic axis"), though they have not all the properties which are associated with the optic axis of a uniaxial crystal. They have very nearly the same direction as the lines Os_1 and Os_2 in fig. 99, which are distinguished as the "secondary optic axes." In most crystals the primary and secondary optic axes are inclined to each other at not more than a few minutes, so that for practical purposes there is no distinction between them.



98



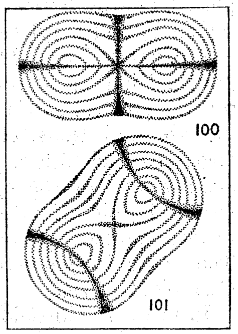
99

FIG. 98.—OPTICAL INDICATRIX OF A BIAXIAL CRYSTAL
FIG. 99.—RAY-SURFACE OF A BIAXIAL CRYSTAL

The angle between Op_1 and Op_2 is called the "optic axial angle"; and the plane OAC in which they lie is called the "optic axial plane." The angles between the optic axes are bisected by the vibration-directions OA and OC; the one which bisects the acute angle being called the "acute bisectrix" or "first mean line," and the other the "obtuse bisectrix" or "second mean line." When the acute bisectrix coincides with the greatest axis OC of the indicatrix, *i.e.*, the vibration-direction corresponding with the refractive index γ (as in figs. 98 and 99), the crystal is described as being optically positive; and when the acute bisectrix coincides with OA, the vibration-direction for the index α the crystal is negative. The distinction between positive and negative biaxial crystals thus depends on the relative magnitude of the three principal indices of refraction; in positive crystals β is nearer to α than to γ whilst in negative crystals the reverse is the case. Thus in topaz, which is optically positive, the refractive indices for sodium light are $\alpha=1{\cdot}6120$, $\beta=1{\cdot}6150$, $\gamma=1{\cdot}6224$; and for orthoclase which is optically negative, $\alpha=1{\cdot}5190$,

$\beta = 1{\cdot}5237$, $\gamma = 1{\cdot}5260$. The difference $\gamma - \alpha$ represents the strength of the double refraction.

Since the refractive indices vary both with the colour of the light and with the temperature, there will be for each colour and temperature slight differences in the form of both the indicatrix and the ray-surface; consequently there will be variations in the positions of the optic axes and in the size of the optic axial angle. This phenomenon is known as the "dispersion of the optic axes." When the axial angle is greater for red light than for blue the character of the dispersion is expressed by $\rho > v$, and when less by $\rho < v$. In some crystals, *e.g.*, brookite, the optic axes for red light and for blue light may be, at certain temperatures, in planes at right angles.



FIGS. 100 AND 101.—INTERFERENCE FIGURES OF A BIAXIAL CRYSTAL

The type of interference figure exhibited by a biaxial crystal in convergent polarized light between crossed nicols is represented in figs. 100 and 101. The crystal must be viewed along the acute bisectrix, and for this purpose it is often necessary to cut a plate from the crystal perpendicular to this direction: sometimes, however, as in mica and topaz, a cleavage flake will be perpendicular to the acute bisectrix. When seen in white light, there are around each optic axis a series of brilliantly coloured ovals, which at the centre join to form an 8-shaped loop, whilst farther from the centre the curvature of the rings is approximately that of lemniscates. In the position shown in fig. 100 the vibration-directions in the crystal are parallel to those of the nicols, and the figure is intersected by two black bands or "brushes" forming a cross. When, however, the crystal is rotated with the stage of the microscope the cross breaks up into the two branches of a hyperbola, and when the vibration-directions of the crystal are inclined at 45° to those of the nicols the figure is that shown in fig. 101. The points of emergence of the optic axes are at the middle of the hyperbolic brushes when the crystal is in the diagonal position: the size of the optic axial angle can therefore be directly measured with considerable accuracy.

In orthorhombic crystals the three principal vibration-directions coincide with the three crystallographic axes, and have therefore fixed positions in the crystal, which are the same for light of all colours and at all temperatures. The optical orientation of an orthorhombic crystal is completely defined by stating to which crystallographic planes the optic axial plane and the acute bisectrix are respectively parallel and perpendicular. Examined in parallel light between crossed nicols, such a crystal extinguishes parallel to the crystallographic axes, which are often parallel to the edges of a face or section; there is thus usually "straight extinction." The interference figure seen in convergent polarized light is symmetrical about two lines at right angles.

In monoclinic crystals only one vibration-direction has a fixed position within the crystal, being parallel to the ortho-axis (*i.e.*, perpendicular to the plane of symmetry or the plane $\{010\}$). The other two vibration-directions lie in the plane $\{010\}$, but they may vary in position for light of different colours and at different temperatures. In addition to dispersion of the optic axes there may thus, in crystals of this system, be also "dispersion of the bisectrices." The latter may be of one or other of three kinds, according to which of the three vibration-directions coincides with the ortho-axis of the crystal. When the acute bisectrix is fixed in position, the optic axial planes for different colours may be crossed, and the interference figure will then be symmetrical with respect to a point only ("crossed dispersion"). When the obtuse bisectrix is fixed, the axial planes may be inclined to one another, and the interference figure is symmetrical only about a line which is perpendicular to the axial planes ("horizontal dispersion"). Finally, when the vibration-direction corresponding to the refractive index β, or the "third mean line," has a fixed position, the optic axial plane lies in the plane $\{010\}$, but the acute bisectrix may vary in position in this plane; the interference figure will then be symmetrical only about a line joining the optic axes ("inclined dispersion"). Examples of substances exhibiting these three kinds of dispersion are borax, orthoclase and gypsum respectively. In orthoclase and gypsum, however, the optic axial angle gradually diminishes as the crystals are heated, and after passing through a uniaxial position they open out in a plane at right angles to the one they previously occupied; the character of the dispersion thus becomes reversed in the two examples quoted. When examined in parallel light between crossed nicols monoclinic crystals will give straight extinction only in faces and sections which are perpendicular to the plane of symmetry (or the plane $\{010\}$); in all other faces and sections the extinction-directions will be inclined to the edges of the crystal. The angles between these directions and edges are readily measured, and, being dependent on the optical orientation of the crystal, they are often characteristic constants of the substance. (See, *e.g.*, PLAGIOCLASE.)

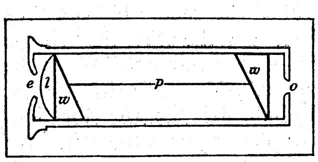


FIG. 102.—DICHROSCOPE

In anorthic crystals there is no relation between the optical and crystallographic directions, and the exact determination of the optical orientation is often a matter of considerable difficulty. The character of the dispersion of the bisectrices and optic axes is still more complex than in monoclinic crystals, and the interference figures are devoid of symmetry.

Absorption of Light in Crystals: Pleochroism.—In crystals other than those of the cubic system, rays of light with different vibration-directions will, as a rule, be differently absorbed; and the polarized rays on emerging from the crystal may be of different intensities and (if the observation be made in white light and the crystal is coloured) differently coloured. Thus, in tourmaline the ordinary ray, which vibrates perpendicular to the principal axis, is almost completely absorbed, whilst the extraordinary ray is allowed to pass through the crystal. A plate of tourmaline cut parallel to the principal axis may therefore be used for producing a beam of polarized light, and two such plates placed in crossed position form the polarizer or analyser of "tourmaline tongs," with the aid of which the interference figures of crystals may be simply shown. Uniaxial (tetragonal and hexagonal) crystals when showing perceptible differences in colour for the ordinary and extraordinary rays are said to be "dichroic." In biaxial (orthorhombic, monoclinic and anorthic) crystals, rays vibrating along each of the three principal vibration-directions may be differently absorbed, and, in coloured crystals, differently coloured; such crystals are therefore said to be "trichroic" or in general "pleochroic" (from πλέων, more, and χρώς, colour). The directions of maximum absorption in biaxial crystals have, however, no necessary relation with the axes of the indicatrix, unless these have fixed crystallographic directions, as in the orthorhombic system and the ortho-axis in the monoclinic. In epidote it has been shown that the two directions of maximum absorption which lie in the plane of symmetry are not even at right angles.

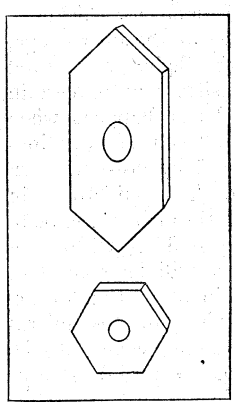

FIG. 103.—CONDUCTIVITY OF HEAT IN QUARTZ

The pleochroism of some crystals is so strong that when they are viewed through in different directions they exhibit marked differences in colour. Thus a crystal of the mineral cordierite (called also dichroite because of its strong pleochroism) will be seen to be dark blue, pale blue or pale yellow according to which of three perpendicular directions it is viewed. The "face colours" seen directly in this way result, however, from the mixture of two "axial colours" belonging to rays vibrating in two directions. In order to see the axial colours separately the crystal must be examined with a dichroscope, or in a polarizing microscope from which the analyser has been removed. The dichroscope, or dichroiscope (fig. 102), consists of a cleavage rhombohedron of calcite (Iceland-spar) p, on the ends of which glass prisms w are cemented: the lens l is focused on a small square aperture o in the tube of the instrument. The eye of the observer placed at e will see two images of the square aperture, and if a pleochroic crystal be placed in front of this aperture the two images will be differently coloured. On rotating this crystal with respect to the instrument the maximum difference in the colours will be obtained when the vibration-directions in the crystal coincide with those in the calcite. Such a simple instrument is especially useful for the examination of faceted gem-stones, even when they are mounted in their settings. A single glance suffices to distinguish between a ruby and a "spinel-ruby," since the former is dichroic and the latter isotropic and therefore not dichroic.

The characteristic absorption bands in the spectrum of white light which has been transmitted through certain crystals, particularly those of salts of the cerium metals, will, of course, be different according to the direction of vibration of the rays.

Circular Polarization in Crystals.—Like the solutions of certain optically active organic substances, such as sugar and tartaric acid, some optically isotropic and uniaxial crystals possess the property of rotating the plane of polarization of a beam of light. This property has also been proved, but much less easily, in certain biaxial crystals. In uniaxial (tetragonal and hexagonal) crystals it is only for light transmitted in the direction of the optic axis that there is rotatory action, but in isotropic (cubic) crystals all directions are the same in this respect. Examples of circularly polarizing cubic crystals are sodium chlorate, sodium bromate, and sodium uranyl acetate; amongst tetragonal crystals are strychnine sulphate and guanidine carbonate; amongst rhombohedral are quartz (*q.v.*) and cinnabar (*q.v.*) (these being the only two mineral substances in which the phenomenon has been observed), dithionates of potassium, lead, calcium and strontium, and sodium periodate; and amongst hexagonal crystals is potassium lithium sulphate. Crystals of all these substances belong to one or other of the several symmetry-classes in which there are neither planes nor centre of symmetry, but only axes of symmetry. They crystallize in two complementary hemihedral forms, which are respectively right-handed and left-handed, *i.e.,* enantiomorphous forms. Some other substances which crystallize in enantiomorphous forms are, however, only "optically active" when in solution (*e.g.,* sugar and tartaric acid); and there are many other substances presenting this peculiarity of crystalline form which are not circularly polarizing either when crystallized or when in solution. Further, in the examples quoted above, the rotatory power is lost when the crystals are dissolved (except in the case of strychnine sulphate, which is only feebly active in solution). The rotatory power is thus due to different causes in the two cases, in the one depending on a spiral arrangement of the crystal particles, and in the other on the structure of the molecules themselves.

The circular polarization of crystals may be imitated by a pile of mica plates, each plate being turned through a small angle on the one below, thus giving a spiral arrangement to the pile.

"Optical Anomalies" of Crystals.—When, in 1818, Sir David Brewster established the important relations existing between the optical properties of crystals and their external form, he at the same time noticed many apparent exceptions. For example, he observed that crystals of leucite and boracite, which are cubic in external form, are always doubly refracting and optically biaxial, but with a complex internal structure; and that cubic crystals of garnet and analcime sometimes exhibit the same phenomena. Also some tetragonal and hexagonal crystals, *e.g.,* apophyllite, idocrase, beryl, etc., which should normally be optically uniaxial, sometimes consist of several biaxial portions arranged in sectors or in a quite irregular manner. Such exceptions to the general rule have given rise to much discussion. They have often been considered to be due to internal strains in the crystals, set up as a result of cooling or by earth pressures, since similar phenomena are observed in chilled and compressed glasses and in dried gelatine. In many cases, however, as shown by E. Mallard, in 1876, the higher degree of symmetry exhibited by the external form of the crystals is the result of mimetic twinning, as in the pseudo-cubic crystals of leucite (*q.v.*) and boracite (*q.v.*). In other instances substances not usually regarded as cubic, *e.g.,* the monoclinic phillipsite (*q.v.*), may by repeated twinning give rise to pseudo-cubic forms. In some cases it is probable that the substance originally crystallized in one modification at a higher temperature, and when the temperature fell it became transformed into a dimorphous modification, though still preserving the external form of the original crystal. (*See* BORACITE.) A summary of the literature is given by R. Brauns, *Die optischen Anomalien der Krystalle* (Leipzig, 1891).

(C) THERMAL PROPERTIES

The thermal properties of crystals present certain points in common with the optical properties. Heat rays are transmitted and doubly refracted like light rays; and surfaces expressing the conductivity and dilatation in different directions possess the same degree of symmetry and are related in the same way to the crystallographic axes as the ellipsoids expressing the optical relations. That crystals conduct heat at different rates in different directions is well illustrated by the following experiment. Two plates (fig. 103) cut from a crystal of quartz, one parallel to the principal axis and the other perpendicular to it, are coated with a thin layer of wax, and a hot wire is applied to a point on the surface. On the transverse section the wax will be melted in a circle, and on the longitudinal section (or on the natural prism faces) in an ellipse. The isothermal surface in a uniaxial crystal is therefore a spheroid; in cubic crystals it is a sphere; and in biaxial crystals an ellipsoid, the three axes of which coincide, in orthorhombic crystals, with the crystallographic axes.

With change of temperature cubic crystals expand equally in all directions, and the angles between the faces are the same at all temperatures. In uniaxial crystals there are two principal coefficients of expansion; the one measured in the direction of the principal axis may be either greater or less than that measured in directions perpendicular to this axis. A sphere cut from a uniaxial crystal at one temperature will be a spheroid at another temperature. In biaxial crystals there are different coefficients of expansion along three rectangular axes, and a sphere at one temperature will be an ellipsoid at another. A result of this is that for all crystals, except those belonging to the cubic system, the angles between the faces will vary, though only slightly, with changes of temperature. E. Mitscherlich found that the rhombohedral angle of calcite decreases 8′ 37″ as the crystal is raised in temperature from 0° to 100° C.

As already mentioned, the optical properties of crystals vary considerably with the temperature. Such characters as specific heat and melting-point do not vary with the direction.

(D) MAGNETIC AND ELECTRICAL PROPERTIES

Crystals, like other bodies, are either paramagnetic or diamagnetic, *i.e.,* they are either attracted or repelled by the pole of a magnet. In crystals other than those belonging to the cubic system, however, the relative strength of the induced magnetization is different in different directions within the mass. A sphere cut from a tetragonal or hexagonal (uniaxial) crystal will if freely suspended in a magnetic field (between the poles of a strong electro-magnet) take up a position such that the principal axis of the crystal is either parallel or perpendicular to the lines of force, or to a line joining the two poles of the magnet. Which of these two directions is taken by the axis depends on whether the crystal is paramagnetic or diamagnetic, and on whether the principal axis is the direction of maximum or minimum magnetization. The surface expressing the magnetic character in different directions is in uniaxial crystals a spheroid; in cubic crystals it is a sphere. In orthorhombic, monoclinic and anorthic crystals there are three principal axes of magnetic induction, and the surface is an ellipsoid, which is related to the symmetry of the crystal in the same way as the ellipsoids expressing the thermal and optical properties.

Similarly, the dielectric constants of a non-conducting crystal may be expressed by a sphere, spheroid or ellipsoid. A sphere cut from a crystal will when suspended in an electro-magnetic field set itself so that the axis of maximum induction is parallel to the lines of force.

The electrical conductivity of crystals also varies with the direction, and bears the same relation to the symmetry as the thermal conductivity. In a rhombohedral crystal of haematite the electrical conductivity along the principal axis is only half as great as in directions perpendicular to this axis; whilst in a crystal of bismuth, which is also rhombohedral, the conductivities along and perpendicular to the axis are as 1·6:1.

Conducting crystals are thermo-electric: when placed against another conducting substance and the contact heated there will be a flow of electricity from one body to the other if the circuit be closed. The thermo-electric force depends not only on the nature of the substance, but also on the direction within the crystal, and may in general be expressed by an ellipsoid. A remarkable case is, however, presented by minerals of the pyrites group: some crystals of pyrites are more strongly thermo-electrically positive than antimony, and others more negative than bismuth, so that the two when placed together give a stronger thermo-electric couple than do antimony and bismuth. In the thermo-electrically positive crystals of pyrites the faces of the pentagonal dodecahedron are striated parallel to the cubic edges, whilst in the rarer negative crystals the faces are striated perpendicular to these edges. Sometimes both sets of striae are present on the same face, and the corresponding areas are then thermo-electrically positive and negative.

The most interesting relation between the symmetry of crystals and their electrical properties is that presented by the pyro-electrical phenomena of certain crystals. This is a phenomenon which may be readily observed, and one which often aids in the determination of the symmetry of crystals. It is exhibited by crystals in which there is no centre of symmetry, and the axes of symmetry are uniterminal or polar in character, being associated with different faces on the crystal at their two ends. When a non-conducting crystal possessing this hemimorphic type of symmetry is subjected to changes of temperature a charge of positive electricity will be developed on the faces in the region of one end of the uniterminal axis, whilst the faces at the opposite end will be negatively charged. With rising temperature the pole which becomes positively charged is called the "analogous pole," and that negatively charged the "antilogous pole": with falling temperature the charges are reversed. The phenomenon was first observed in crystals of tourmaline, the principal axis of which is a uniterminal triad axis of symmetry. In crystals of quartz there are three uniterminal dyad axes of symmetry perpendicular to the principal triad axis (which is here similar at its two ends): the dyad axes emerge at the edges of the hexagonal prism, alternate edges of which become positively and negatively charged on change of temperature. In boracite there are four uniterminal triad axes, and the faces of the two tetrahedra perpendicular to them will bear opposite charges. Other examples of pyro-electric crystals are the orthorhombic mineral hemimorphite (called also, for this reason, "electric calamine") and the monoclinic tartaric acid and cane-sugar, each of which possesses a uniterminal dyad axis of symmetry. In some exceptional cases, *e.g.*, axinite, prehnite, etc., there is no apparent relation between the distribution of the pyro-electric charges and the symmetry of the crystals.

The distribution of the electric charges may be made visible by the following simple method, which may be applied even with minute crystals observed under the microscope. A finely powdered mixture of red-lead and sulphur is dusted through a sieve over the cooling crystal. In passing through the sieve the particles of red-lead and sulphur become electrified by mutual friction, the former positively and the latter negatively. The red-lead is therefore attracted to the negatively charged parts of the crystal and the sulphur to those positively charged, and the distribution of the charges over the whole crystal becomes mapped out in the two colours red and yellow.

Since, when a crystal changes in temperature, it also expands or contracts, a similar distribution of "piezo-electric" (from πιέζειν, to press) charges are developed when a crystal is subjected to changes of pressure in the direction of a uniterminal axis of symmetry. Thus increasing pressure along the principal axis of a tourmaline crystal produces the same electric charges as decreasing temperature.

Crystals of various substances are extensively used as radio-detectors in wireless telephony, but no satisfactory explanation of their action has yet been given. An essential character of crystals is a variation of many of their physical properties with the direction within the crystal—in other words, such properties are vectorial.

III. RELATIONS BETWEEN CRYSTALLINE FORM AND CHEMICAL COMPOSITION

That the general and physical characters of a chemical substance are profoundly modified by crystalline structure is strikingly illustrated by the two crystalline modifications of the element carbon—namely, diamond and graphite. The former crystallizes in the cubic system, possesses four directions of perfect cleavage, is extremely hard and transparent, is a non-conductor of heat and electricity and has a specific gravity of 3·5; whilst graphite crystallizes in the hexagonal system, cleaves in a single direction, is very soft and opaque, is a good conductor of heat and electricity and has a specific gravity of 2·2. Such substances, which are identical in chemical composition, but different in crystalline form and consequently in their physical properties, are said to be "dimorphous." Numerous examples of dimorphous substances are known; for instance, calcium carbonate occurs in nature either as calcite or as aragonite, the former being rhombohedral and the latter orthorhombic; mercuric iodide crystallizes from solution as red tetragonal crystals, and by sublimation as yellow orthorhombic crystals. Some substances crystallize in three different modifications, and these are said to be "trimorphous"; for example, titanium dioxide is met with as the minerals rutile, anatase and brookite (*q.v.*). In general, or in cases where more than three crystalline modifications are known (*e.g.*, in sulphur no less than six have been described), the term "polymorphism" is applied.

On the other hand, substances which are chemically quite distinct may exhibit similarity of crystalline form. For example, the minerals iodyrite (AgI), greenockite (CdS) and zincite (ZnO) are practically identical in crystalline form; calcite ($CaCO_3$) and sodium nitrate ($NaNO_3$); celestine ($SrSO_4$) and marcasite (FeS_2); epidote and azurite; and many others, some of which are no doubt only accidental coincidences. Such substances are said to be "homoeomorphous" (Gr. ὅμοιος, like, and μορφή, form).

Similarity of crystalline form in substances which are chemically related is frequently met with and is a relation of much importance: such substances are described as being "isomorphous." Amongst minerals there are many examples of isomorphous groups, *e.g.*, the rhombohedral carbonates, garnet (*q.v.*), plagioclase (*q.v.*); and amongst crystals of artificially prepared salts isomorphism is equally common, *e.g.*, the sulphates and selenates of potassium, rubidium and caesium. The rhombohedral carbonates have the general formula $R''CO_3$, where R'' represents calcium, magnesium, iron, manganese, zinc, cobalt or lead, and the different minerals (calcite, ankerite, magnesite, chalybite, rhodochrosite and smithsonite [*q.v.*]) of the group are not only similar in crystalline form, cleavage, optical and other characters, but the angles between corresponding faces do not differ by more than 1° or 2°. Further, equivalent amounts of the different chemical elements represented by R'' are mutually replaceable, and two or more of these elements may be present together in the same crystal, which is then spoken of as a "mixed crystal" or isomorphous mixture.

In another isomorphous series of carbonates with the same general formula $R''CO_3$, where R'' represents calcium, strontium, barium, lead or zinc, the crystals are orthorhombic in form, and are thus dimorphous with those of the previous group (*e.g.*, calcite and aragonite, the other members being only represented by isomorphous replacements). Such a relation is known as "isodimorphism." An even better example of this is presented by the arsenic and antimony trioxides, each of which occurs as two distinct minerals:—

As_2O_3, Arsenolite (cubic); Claudetite (monoclinic).
Sb_2O_3, Senarmontite (cubic); Valentinite (orthorhombic).

Claudetite and valentinite though crystallizing in different systems have the same cleavages and very nearly the same angles, and are strictly isomorphous.

Substances which form isodimorphous groups also frequently crystallize as double salts. For instance, amongst the carbonates quoted above are the minerals dolomite ($CaMg(CO_3)_2$) and barytocalcite ($CaBa(CO_3)_2$). Crystals of barytocalcite (*q.v.*) are monoclinic; and those of dolomite (*q.v.*), though closely related to calcite in angles and cleavage, possess a different degree of symmetry, and the specific gravity is not such as would result by a simple isomorphous mixture of the two carbonates. A similar case is presented by artificial crystals of silver nitrate and potassium nitrate. Somewhat analogous to double salts are the molecular compounds formed by the introduction of "water of crystallization," "alcohol of crystallization," etc. Thus sodium sulphate may crystallize alone or with either seven or ten molecules of water, giving rise to three crystallographically distinct substances.

A relation of another kind is the alteration in crystalline form resulting from the replacement in the chemical molecule of one or more atoms by atoms or radicals of a different kind. This is known as a "morphotropic" relation (Gr. μορφή, form, τρόπος, habit). Thus when some of the hydrogen atoms of benzene are replaced by (OH) and (NO_2) groups the orthorhombic system of crystallization remains the same as before, and the crystallographic axis *a* is not much affected, but the axis *c* varies considerably:—

	a : *b* : *c*
Benzene, C_6H_6	0·891 : 1 : 0·799
Resorcin, $C_6H_4(OH)_2$	0·910 : 1 : 0·540
Picric acid, $C_6H_2(OH)(NO_2)_3$	0·937 : 1 : 0·974

A striking example of morphotropy is shown by the humite (*q.v.*) group of minerals: successive additions of the group Mg_2SiO_4 to the molecule produce successive increases in the length of the vertical crystallographic axis.

In some instances the replacement of one atom by another produces little or no influence on the crystalline form; this happens in complex molecules of high molecular weight, the "mass effect" of which has a controlling influence on the isomorphism. An example of this is seen in the replacement of sodium or potassium by lead in the alunite (*q.v.*) group of minerals, or again in such a complex mineral as tourmaline, which, though varying widely in chemical composition, exhibits no variation in crystalline form.

For the purpose of comparing the crystalline forms of isomorphous and morphotropic substances it is usual to quote the angles or the axial ratios of the crystal, as in the table of benzene derivatives quoted above. A more accurate comparison is, however, given by the "topic axes," which are calculated from the axial ratios and the molecular volume; they express the relative distances apart of the crystal molecules in the axial directions.

The two isomerides of substances, such as tartaric acid, which in solution rotate the plane of polarized light either to the right or to the left, crystallize in similar but enantiomorphous forms.

References.—An introduction to crystallography is given in most text-books of mineralogy, *e.g.*, those of H. A. Miers and of E. S. Dana. (*See* Mineralogy.) Standard works treating of the subject generally are A. E. H. Tutton, *Crystallography and practical crystal measurement* (2nd edit., 2 vols., London, 1922); P. Groth, *Physikalische Krystallographie* (4th ed., Leipzig, 1905). A popular book is A. E. H. Tutton, *The Natural History of Crystals* (London, 1924).

For geometrical crystallography, dealing exclusively with the external form of crystals, reference may be made to W. J. Lewis, *A Treatise on Crystallography* (Cambridge, 1899).

For optical crystallography, N. H. & A. N. Winchell, *Elements of Optical Mineralogy* (2nd ed., 2 vols., New York and London, 1927–28).

The physical properties of crystals are treated by T. Liebisch, *Physikalische Krystallographie* (Leipzig, 1891), and in a more elementary form in his *Grundriss der physikalischen Krystallographie* (Leipzig, 1896).

For an account of the relations between crystalline form and chemical composition, *see* P. Groth, *An Introduction to Chemical Crystallography*, translated by H. Marshall (London, 1906); A. E. H. Tutton, *Crystalline Form and Chemical Constitution* (London, 1926). Descriptive works giving the crystallographic constants of different substances: P. Groth, *Chemische Krystallographie* (5 vols., Leipzig, 1906–19); and of minerals the treatises of J. D. Dana and C. Hintze. A collection of thousands of drawings of crystals with critical lists of forms is given by V. Goldschmidt, *Atlas der Krystallformen* (9 vols. 4to, Heidelberg, 1913–23). (L. J. S.)

CRYSTALLOID is a substance which dialyses through a parchment membrane. Dialysis is a process for separating colloidal and crystalline substances. If a salt solution be placed in a drum provided with a parchment bottom, termed a "dialyser," and the drum and its contents placed in a larger vessel of water, the salt will pass through the membrane. If the salt solution is replaced by one of glue, it will be found that the membrane is impermeable. The salt solution is termed a "crystalloid" and the glue a "colloid." By adding hydrochloric acid to a container holding a solution of an alkaline silicate, no precipitate will fall, and the solution will contain hydrochloric acid, an alkaline chloride (*e.g.*, salt) and silicic acid. If the solution be transferred to a "dialyser," the hydrochloric acid and the alkaline chloride will pass through the parchment while the silicic acid will be retained.

CRYSTAL PALACE, a well-known English resort in the neighbourhood of Sydenham just outside the southern boundary of the county of London. The building, chiefly of iron and glass, was designed by Sir Joseph Paxton (*q.v.*), and was originally erected in Hyde Park for the 1851 Exhibition. It was enlarged and re-erected on high ground in its new site in 1854 and for a quarter century was very popular as an amusement centre and show place. After that it declined somewhat, but after the World War it was chosen because of its spaciousness to house the Imperial War Museum, which comprises a large collection of war relics, souvenirs, photographs and other records. There are accommodations in the grounds for many sports and games. On Nov. 30, 1936, the building was almost wholly destroyed by fire.

CSAKY, ALBIN, Count (1841–1912), Hungarian statesman, was born on April 18, 1841, at Krompach, in the county of Szepes, and studied law in Kassa (Daschau) and Budapest. In 1888 he was minister of education in the cabinet of Koloman Tisza. Together with Szilagyi, the minister of justice, Csaky was one of the most decided champions of obligatory civil marriage and of the rights of the Jews. He resigned in 1894, and in 1900 was appointed president of the house of Magnates, an office which he resigned on the fall of the Liberal party in 1906. Under the Khuen-Hédervåry Government he became on June 18, 1910, once more president of the house of Magnates. He died at Budapest on Dec. 15, 1912.

CSÁRDÁS or **CZÁRDÁS** (chardash), a national dance of Hungary, distinguished especially by its violent alternations of tempo, so that it is now wild and furious, now slow and restrained.

CSENGERY, ANTON (1822–1880), Hungarian publicist, and a historical writer of great influence on his time, was born at Nagyvárad on the 2nd of June 1822. He took, at an early date, a very active part in the literary and political movements immediately preceding the Hungarian Revolution of 1848. He and Baron Sigismund Kemény may be considered as the two founders of high-class Magyar journalism. After 1867 the greatest of modern Hungarian statesmen, Francis Deák, attached Csengery to his personal service, and many of the momentous state documents inspired or suggested by Deák were drawn up by Csengery. As a historical writer he excelled chiefly in brilliant and thoughtful essays on the leading political personalities of his time, such as Paul Nagy, Bertalan, Szemere and others. He died at Budapest on the 13th of July 1880.

CSIKY, GREGOR (1842–1891), Hungarian dramatist, was born on Dec. 8, 1842, at Pankota, in the county of Arad. He studied Roman Catholic theology at Pest and Vienna, and was professor in the Priest's College at Temesvár from 1870 to 1878. In the latter year, however, he joined the Evangelical Church, and took up literature. Beginning with novels and works on ecclesiastical history, which met with some recognition, he ultimately devoted himself to writing for the stage. Here his success was immediate. His play *Az ellenállhatatlan* ("L'Irrésistible"), which obtained a prize from the Hungarian academy, showed the distinctive features of his talent—directness, freshness, realistic vigour, and highly individual style. In rapid succession he enriched Magyar literature with realistic genre-pictures, such as *A Proletárok* ("Proletariat"), *Buborckok* ("Bubbles"), *Két szerelem* ("Two Loves"), *A szégyenlös* ("The Bashful"), *Athalia*, etc., in all of which he seized on some feature or type of modern life, dramatizing it with unusual intensity, qualified by chaste and well-balanced diction. Of the latter his classical studies may, no doubt, be taken as the inspiration, and his translation of Sophocles and Plantus will long rank with the most successful of Magyar translations of the ancient classics. Among the best known of his novels are *Arnold, Az Atlasz család* ("The Atlas Family"). He died at Budapest on Nov. 19, 1891.

CSOKONAI, MIHALY VITEZ (1773–1805), Hungarian poet, was born at Debrecen on Nov. 17, 1773, and died there on Jan. 28, 1805. Appointed professor of poetry in his native town he lost his position on account of his irregular life, and the rest of his short existence was spent in extreme poverty. He had real genius and some of the lyrical fire of Petöfi. His comedies and farces had some success, but his fame rests on his lyrics, inspired by the rich stores of Hungarian folk-song.

His collected works were edited in 1831 by Máxton; there are other editions, the latest (3 vols.) in 1924.

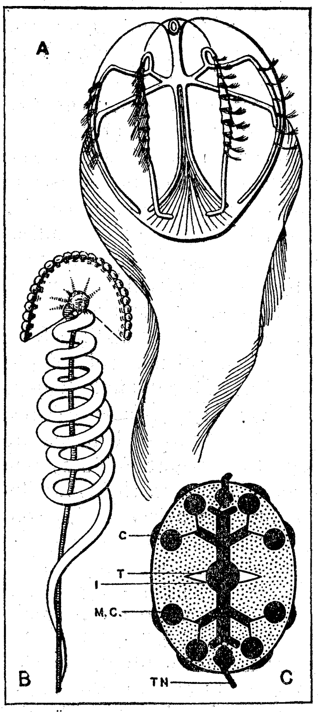
CSOMA DE KÖRÖS, ALEXANDER (1784–1842), or, as the name is written in Hungarian, KÖRÖSI CSOMA SANDOR, Hungarian traveller and philologist, born April 4, 1784, at Körös in Transylvania, belonged to a noble family which had sunk into poverty. He was educated at Nagy-Enyed and at Göttingen. In 1820, having received from a friend the promise of an annuity of 100 florins (about £10) to support him during his travels, he set out for the east to investigate the origin of the Magyars. He visited Egypt and then disguising himself as an Armenian he crossed central Asia to Tibet, where he spent four years in a Buddhist monastery studying the language and the Buddhist literature. To his intense disappointment he soon discovered that he could not thus obtain any assistance in his great object; but, having visited Bengal, his knowledge of Tibetan obtained him employment in the library of the Asiatic society there, which possessed more than 1,000 volumes in that language; and he was afterward supported by the government of Bengal while he published a Tibetan-English dictionary and grammar (both of which appeared at Calcutta in 1834). He also contributed several articles on the Tibetan language and literature to the *Journal of the Asiatic Society of Bengal,* and he published an analysis of the *Kah-Gyur,* the most important of the Buddhist sacred books. Meanwhile his fame had reached his native country and procured for him a pension from the government, which, with characteristic devotion to learning, he devoted to the purchase of books for Indian libraries. He spent some time in Calcutta studying Sanskrit and several other languages; but, early in 1842, he commenced his second attempt to discover the origin of the Magyars. He died at Darjeeling on April 11, 1842. An oration was delivered in his honour before the Hungarian academy by Jozsef Eötvös, the novelist.

See Duka, *Life and Travels of Alexander Csoma* (1886).

CTENOPHORA, a group of extremely curious marine animals, mostly pelagic, that is, frequenting the open sea. Their distribution is world-wide. They are jellyfish in the popular sense, but their structure is quite unlike that of the more familiar jellyfish belonging to the phylum of animals known as the Coelenterata (*q.v.,* and *cf.* HYDROZOA and SCYPHOZOA). The question of the relationship of the Ctenophora to the Coelenterata and other animals is discussed at the end of this article.

The Ctenophora are constructed on the same general plan as the Coelenterata, possessing a single internal cavity only, which opens to the exterior by one main aperture, the mouth. The body is composed of three layers of tissue. The outer layer (*ectoderm*), covering the surface of the body and lining the throat, is cellular in structure. The inner layer (*endoderm*), also cellular, lines the internal cavity and produces the sex cells. Between these layers is a third, the *mesoderm,* which is jellylike and contains cells and muscle fibres.

A common example of a ctenophore is *Pleurobrachia,* a "sea gooseberry" which under favourable conditions may be taken plentifully in a tow net in the English channel. It is an ovoid jellyfish half an inch or more in length, very soft and of glass-like transparency. It possesses two long feathered tentacles, each of which can be withdrawn into a pit in the substance of the body. The animal is an active swimmer, and swims not by repeated contractions of a bell-shaped body as do the coelenterate jellyfish, but by the action of a number of minute comblike plates which are attached to the body in eight vertically arranged series. These rows of combs are visible in the living animal as vertical stripes, in which a rippling movement, caused by the motion of successive combs, can be detected.



FROM KÜKENTHAL, "HANDBUCH DER ZOOLOGIE" (DE GRUYTER)

FIG. 1.—STRUCTURE OF A CTENOPHORE

A. General view, showing the two feathered tentacles; four of the 8 rows of comb plates; sense organ at upper end; and internal canals, visible because the body is transparent. B. An adhesive cell (colloblast). C. Diagram of transverse section: c. comb plate; i. infundibulum; m.c. meridional canal; t. throat; tn. tentacle

The general structure of the animal may be understood by reference to fig. 1. In the middle of the more pointed end of the ovoid body lies the mouth. This leads into a flattened throat extending some distance into the interior and opening in its turn into the central cavity of the animal, the *infundibulum.* This cavity is not large, but from it there radiate a number of canals which run to various parts of the body and mostly end blindly. All the space between the throat, central cavity and canals on the one hand and the skin on the other is filled in by jellylike mesoderm, which is so perfectly transparent that the whole system of internal organs is clearly visible from outside. The various canals are very definitely arranged, the most important being eight *meridional canals* which run longitudinally, one beneath each of the eight rows of combs. Each of these canals possesses, in the endoderm lining its outer wall, two concentrations of sex cells—a strip of egg-forming tissue beside a strip of cells which produce spermatozoa.

The other organs are constructed as follows: each of the tentacles is a long solid filament, bearing short lateral branches and composed of ectoderm covering a solid muscular core. At the base it is thickened and is attached to the wall of a deep pocket, lined by ectoderm, which penetrates the side of the animal. The tentacle bases lie one on each side of the throat in such a way that a line drawn from one to the other would intersect at right angles the longer diameter of the flattened throat. The ectoderm of the tentacles is crowded with cells of a unique description, known as *colloblasts.* Each colloblast (fig. 1) possesses a dome-like portion which is exposed at the surface of the ectoderm and adheres to any prey it touches, and also a spirally coiled contractile fibre descending into the substance of the ectoderm, whose function probably is to resist the strain put on the adhesive dome by the struggles of a prey and so prevent the tearing off of the dome. There is probably also poison connected with the capture of the prey.

Each of the rows of combs is situated along a meridian of the body and consists of a series of transverse strips of modified ectoderm cells which cross the meridian at right angles. Each strip bears a comblike plate whose teeth are made up of large stiff fused cilia; and the cells of one strip are in direct continuity with those of the next along the meridian. The comb as a whole can beat rapidly and repeatedly upward, and it works in unison with the others in its row.

The animal also possesses a complicated sense organ (fig. 2), situated in the middle of the aboral end of the body and consisting essentially of a small mass of minute calcareous particles (*statoliths*) supported on four legs composed of fused cilia. The whole structure is roofed in and protected by a little glasslike dome, and from the base of each of the four supporting legs there run out two narrow ciliated grooves, one to each row of combs; these grooves are underlain by special strands of the general nerve net.

Finally, the ctenophore possesses a diffuse nervous system like that of a coelenterate, consisting of a subepithelial network of nerve cells and fine fibrils. Its muscular system consists of muscle fibres traversing the mesoderm and concentrated as longitudinal muscle in the axes of the tentacles, and as sheets near the surface of the body and under the epithelium of the canals and throat.

The general functions of the ctenophore resemble those of a coelenterate. Respiration is performed by general surfaces, and whether there are definite excretory organs is as yet uncertain. There are neither blood nor blood vessels, and circulation in the true sense does not exist, the movements of fluid in the internal cavities being due to ciliary action. Food consists of fishes, their eggs and young, other ctenophores, crustacea, medusae and larvae of other animals which are found in the strata of the sea inhabited by the ctenophore. The prey is captured by the tentacles (assisted by their sticky cells) and swallowed by the throat. Digestion is a process involving first the breaking down of the food into particles and secondly the engulfing or ingestion of these particles by individual cells inside which the remaining processes of digestion occur. Both intra- and extra-cellular digestion appear to take place within the throat, which is not the case in the Coelenterata, and intra-cellular digestion also occurs in the endoderm of the canal system, assimilated products being apparently carried away by wandering cells. Indigestible waste is voided mainly through the mouth, partly also through pores lying below the apical sense organ.

The method of swimming in the Ctenophora is most interesting. A ctenophore of ordinary shape usually swims mouth forward and the motion is effected by the rows of combs. Each comb lashes sharply upward (*i.e.*, away from the mouth) and returns more slowly to its previous position; and the wave of motion affecting successive combs, which traverses the whole vertical row, passes from the aboral end downward. The beat of the combs was formerly believed to be controlled from the sense organ by the transmission of impulses along the epithelium of the ciliated grooves. Later it was shown, however, that special nervous tracts underlie the grooves and that the supporting tissues of the combs are richly innervated. The comb beat is under nervous control, and the sense organ is concerned in maintaining the co-ordination between the rows of combs, and with the ability of the animal to maintain its normal resting position.

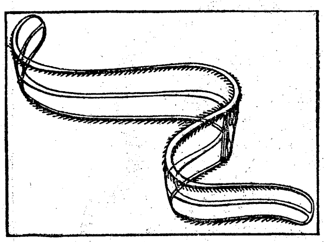
FIG. 2.—THE SENSE ORGAN OF A CTENOPHORE, SHOWING THE MASS OF STATOLITHS WITH ITS SUPPORTS. THE EIGHT CILIATED GROOVES ARE REPRESENTED AS DOTTED LINES. A. BELL; B. & C. EXCRETORY PORES; D. STATOLITHS; E. SPRING; F. POLAR PLATE; G. CILIATED GROOVE

Space forbids the detailed consideration here of the variations of form exhibited by the Ctenophora. Suffice it to say that although there is strong adherence throughout the greater part of the group to the fundamental principles of the type of structure described in *Pleurobrachia,* the general form of the body as a whole undergoes startling modification, the various organs and systems being distorted out of all spatial relationship to that state of affairs. The best example of this is provided by the genus *Cestus* (fig. 3), where the body has become a flattened translucent girdle, sometimes more than a yard in length, but in which nonetheless the fundamental ctenophoran structure is easily recognizable. Mention must also be made of a small series of aberrant but most interesting genera, the *Platyctenea,* in which the structure has become more radically modified. In *Coeloplana* (fig. 4), which will serve as an example, the animal has assumed a flattened, leaflike form, astonishingly similar at first sight to that of one of those flattened worms, the Turbellaria (*q.v.*). *Coeloplana* adheres to or creeps over the surface of alcyonarian colonies, seaweeds, etc., and although the adult form is so unlike a ctenophore, the larva is much like *Pleurobrachia* in structure.



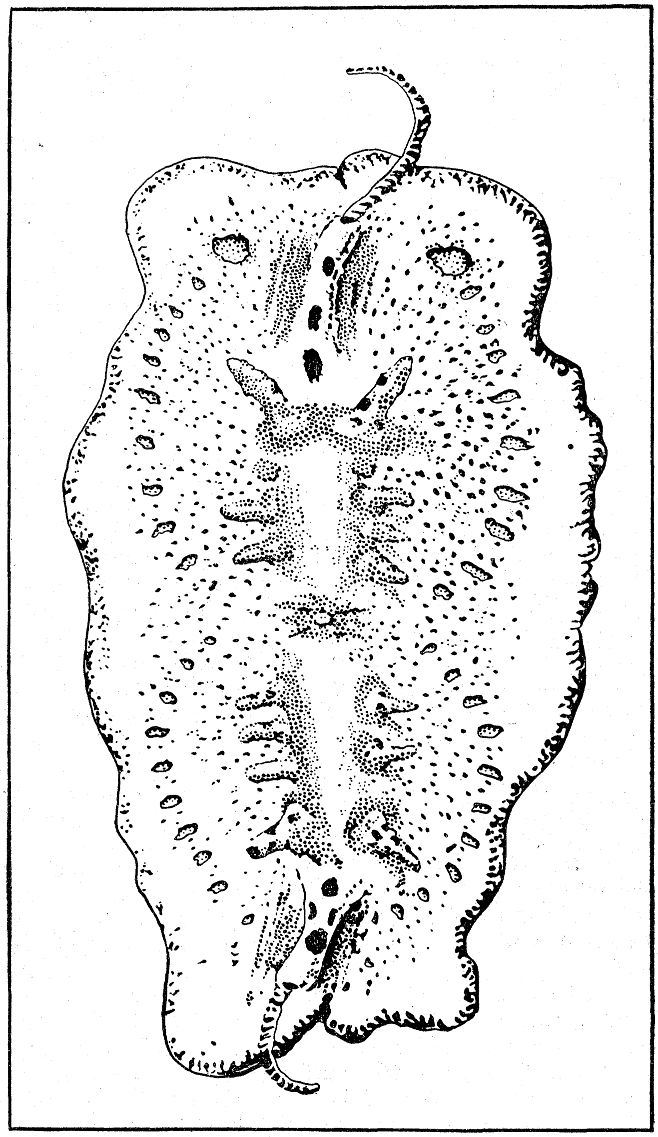
FROM CHUN, "CTENOPHORA" IN "FAUNA UND FLORA DES GOLFES VON NEAPEL"

FIG. 3.—GIRDLE OF VENUS, A TRANSLUCENT BELTLIKE CTENOPHORE

The development of the Ctenophora cannot be described here, but it is important to note that it is a process very different from that of a coelenterate egg. One result of the difference is that, if the two cells which result from the first cleavage be separated from one another, each of these may continue to develop, but it will form half a ctenophore only; on the other hand, cells similarly isolated in at least the simpler coelenterates will grow into perfect adults.

With these facts about the Ctenophora before us, discussion of their relationships becomes possible. First, the respects in which they resemble that group to which they are usually thought to be most closely allied, the Coelenterata, must be considered. The chief resemblance between the two groups lies in the fact that their general anatomical principle is the same; both possess a single internal cavity only, opening to the exterior by the mouth, and not comparable with the food canal of a higher animal (small pores of various kinds which exist in both Coelenterata and Ctenophora are obviously of no importance in this connection). In both the tissues are arranged in three layers, cellular ectoderm and endoderm with a jellylike layer between; in both the sex products originate in ectoderm or endoderm and are not formed by the intermediate layer even should they subsequently become embedded in it; and while neither possess true nerves both develop a subepithelial nerve net. The symmetry of the body is, however, not strictly comparable in the two groups; a typical coelenterate is either radially symmetrical or, if it is an anthozoan, has a bilateral symmetry underlying the radial. It will be seen from the description given above of *Pleurobrachia* (and by reference to fig. 1) that a ctenophore is radially symmetrical only as regards part of its structure, principally the rows of combs and the meridional canals. Regarded as a whole it can be divided into perfectly equivalent portions along two vertical planes only; *i.e.,* a ctenophore is bilaterally symmetrical about two vertical planes. In this it differs from an anthozoan, which is symmetrical about one plane only if its development be taken into account.

In several other respects a ctenophore differs from a coelenterate. First, the egg of a ctenophore, with its cleavage into cells each of which is destined to form only part of an adult, is markedly unlike the coelenterate egg, as has been mentioned. Second, a typical ctenophore swims by means of combs composed of cilia, muscular swimming motions coming into play on a large scale only in special cases; but in coelenterates swimming is essentially muscular save in larvae. Again the aboral end of a ctenophore produces an elaborate sense organ, that of a coelenterate being the least developed end. Furthermore, a coelenterate always possesses those explosive capsules known as *cnidae,*



FROM KÜKENTHAL, "HANDBUCH DER ZOOLOGIE" (DE GRUYTER)

FIG. 4.—COELOPLANA, A CTENOPHORE WHICH HAS BECOME FLATTENED AND LEAFLIKE IN FORM

whereas in the Ctenophora these are replaced by the colloblasts, with which cnidae are not directly comparable. The tentacles of a ctenophore, with their solid muscular axis, are also unlike those of a coelenterate. Capital has been made of the statement that in the development of a ctenophore there is a definite embryonic mesoderm, a set of cells cut off from the endoderm at an early stage and destined to form the axes of the tentacles and to provide most of the cells and muscle fibres of the adult mesoderm; whereas a coelenterate develops no such embryonic layer; these statements are, however, queried by certain authorities and cannot at present be regarded as decisive evidence. Epitheliomuscular cells (*see* COELENTERATA) do not occur among ctenophores.

There is last the question of the relationship of the Ctenophora to those animals which come next above them in the scale. Their nearest allies on the upgrade are generally considered to be some of the Turbellaria (*q.v.*), and much discussion has centred around their possible affinity with these. We know from the existence of *Coeloplana* that an animal in certain respects similar to a flatworm can arise from a ctenophore, and on a number of grounds it is possible reasonably to maintain that the Ctenophora and flatworms are allied, an idea that recent work on the comparative anatomy and development of the two groups has strengthened. This does not mean that *Coeloplana* is intermediate between a ctenophore and a flatworm; and, in fact, it has evolved along lines of its own; but it does mean that there may be ancestral connection between the two groups, though how far back in their evolution we cannot tell. In conclusion, although the Ctenophora resemble both the Coelenterata on the one hand and the Turbellaria on the other, the resemblance is not sufficient to warrant their inclusion in either group.

S.)

CTESIAS, of Cnidus in Caria, Greek physician and historian, flourished in the 5th century B.C. In early life he was physician to Artaxerxes Mnemon, whom he accompanied (401) on his expedition against his brother Cyrus the Younger. Ctesias was the author of treatises on rivers, and on the Persian revenues, of an account of India and of a history of Assyria and Persia in 23 books, called *Persica,* written in opposition to Herodotus in the Ionic dialect, and professedly founded on the Persian royal archives. The first six books treated of the history of Assyria and Babylon to the foundation of the Persian empire; the remaining 17 went down to the year 398. Of the two histories we possess abridgments by Photius, and fragments in Athenaeus, Plutarch, and especially Diodorus Siculus, whose second book is mainly from Ctesias.

As to the worth of the *Persica* there has been much controversy, both in ancient and modern times. Being based upon Persian authorities, it was naturally looked upon with suspicion by the Greeks and censured as untrustworthy.

For an estimate of Ctesias as a historian *see* G. Rawlinson's *Herodotus,* i, 71–74; or R. W. Macan's *Herodotus,* vol. ii. Appendix I §5; also the edition of the fragments of the *Persica* by J. Gilmore (1888, with introduction and notes and list of authorities).

CTESIPHON, an ancient city on the left bank of the Tigris in 33° N. and 45° E., and about 25 miles southeast of Baghdad. The site is famous for the remains of one of the most magnificent buildings in Mesopotamia, a great vaulted hall of the Sassanian period. It is first mentioned in the year 220 B.C. by Polybius v. 45, 4. When the Parthian Arsacids had conquered the land east of the Euphrates in 129 B.C., they established their winter residence in Ctesiphon. They dared not stay in Seleucia, on the opposite bank of the Tigris, as this city, the most populous town of western Asia, always maintained its Greek self-government and a strong feeling of independence, which made it incline to the west whenever a Roman army attacked the Parthians. The Arsacids also were afraid of destroying the wealth and commerce of Seleucia, if they entered it with their large retinue of barbarian officials and soldiers. From this time Ctesiphon increased in size, and many splendid buildings rose; it had the outward appearance of a large town, although it was by constitution only a village. Although for a short period in the 1st century A.D. Ctesiphon revolted from the Parthians, it remained as the eastern city, while Seleucia was western in its sympathies. After the destruction of Seleucia by Rome in A.D. 164 Hellenism died in Babylonia, and Ctesiphon, with the foundation of the Sassanian empire in the 2nd century, became the metropolis. It increased in size and various kings added new suburbs. After the battle of Qadisaya, Ctesiphon and the neighbouring towns were taken and plundered in 637 by the Arabs, who brought home an immense amount of booty.

The removal of the capital to Baghdad marks the definite recognition by the Abbasids of the shifting of the centre of power. From this time Ctesiphon was dead.

Ctesiphon, Battle of, Nov. 21, 1915. This denoted the highwater mark of the first British advance toward Baghdad in World War I. After successive victories, gained by skilful tactics rather than superior force, General Townshend reached Ctesiphon and there attacked the Turkish forces which were concentrating to cover the close approach to Baghdad. Townshend gained an initial advantage, but the arrival of Turkish reinforcements nullified much of his success, and three days later, Townshend was compelled to give the order for retreat, and to extricate his force from their dangerously isolated situation by falling back to Kut-al'-Amara (*q.v.*), where he was shortly besieged. For an account of these operations and the strategy which dictated them, *see* MESOPOTAMIA, OPERATIONS IN.

CUBA (the aboriginal name), a republic and a member of the League of Nations, the largest and most populous of the West Indian islands, included between the meridians of 74° 7′ and 84° 57′ W. long. and (roughly) the parallels of 19° 48′ and 23° 13′ N. lat. It divides the entrance to the Gulf of Mexico into two passages of nearly equal width—the Strait of Florida, about 112 mi. wide between Capes Hicacos in Cuba and Arenas in Florida (Key West being a little over 100 mi. from Havana [Habana]); and the Yucatan channel, about 130 mi. wide between Capes San Antonio and Catoche. On the northeast, east and southeast, narrower channels separate it from the Bahamas, Haiti (48 mi.) and Jamaica (87 mi.).

Physical Features.—The island of Cuba is long and narrow, somewhat in the form of an irregular crescent, convex toward the north. Its length from Cape Maisí to Cape San Antonio along a medial line is about 730 mi.; its breadth, which averages about 50 mi., ranges from a maximum of 160 mi. to a minimum of about 22 mi. The total area is estimated at 44,217 sq.mi. including the Isle of Pines (area about 1,182 sq.mi.). The coast line, including larger bays, but excluding reefs, islets, keys and all minute sinuosities, is about 2,175 mi. in length.

The north littoral, characterized by bluffs, becomes higher and higher toward the east, rising to 600 ft. at Cape Maisí. The bluffs are marked by distinct terraces. The southern coast near Cape Maisí is low and sandy. From Guantánamo to Santiago de Cuba it rises in high escarpments; westward, where the Sierra Maestra runs close to the sea, there is a very high abrupt shore. To the west of Manzanillo it sinks again, and throughout most of the remaining distance to Cape San Antonio is low, with a sandy or marshy littoral; at places sand hills fringe the shore; near Trinidad there are hills of considerable height; and the coast becomes high and rugged west of Point Fisga, in the province of Pinar del Río. On both the north and south sides of the island there are long chains of islets and reefs and coral keys (of which it is estimated there are 1,300), which limit access to probably half of the coast, and on the north, render navigation difficult and dangerous. On the south, they are covered with mangroves. A large part of the southern littoral is subject to overflow, and much more of it is permanently marshy. The Zapata swamp near Cienfuegos is 600 sq.mi. in area; other large swamps are the Majagüillar, east of Cárdenas, and the Ciénaga del Buey south of the Cauto river. A remarkable feature of the Cuban coast is the number of excellent anchorages, roadsteads and harbours. On the north shore, beginning at the west, Bahía Honda, Havana, Matanzas, Cárdenas, Nuevitas and Nipe; and on the south shore running westward Guantánamo, Santiago de Cuba and Cienfuegos are harbours of the first class, several of them among the best of the world. Mariel, Cabañas, Banes, Sagua la Grande and Baracoa on the north, and Manzanillo, Santa Cruz, Batabanó and Trinidad on the south are also excellent ports or anchorages. The peculiar pouch shape of almost all the harbours named (Matanzas being a marked exception) greatly increases their security and defensibility. The number of small bays that can be utilized for coast trade traffic is extraordinary.

In popular language the different portions of the island are distinguished as the Vuelta Abajo ("lower turn"), west of Havana; the Vuelta Arriba ("upper turn"), east of Havana to Cienfuegos—Vuelta Abajo and Vuelta Arriba are also used colloquially at any point in the island to mean "east" and "west"—Las Villas—*i.e.*, Villa Clara, Trinidad, Remedios, Cienfuegos and Sancti Spiritus—between Cienfuegos and Sancti Spiritus; and Tierra Adentro, referring to the region between Cienfuegos and Bayamo. These names are extremely common. The province and city of Puerto Príncipe are officially known as Camagüey, their original Indian name, which has supplanted the Spanish name in local usage.

Five topographic divisions of the island are fairly marked. Oriente province is high and mountainous, Camagüey is characterized by rolling, open plains, slightly broken, especially in the west, by low mountains. The east part of Las Villas (formerly Santa Clara) province is decidedly rough and broken. The west part, with the provinces of Matanzas and La Habana, is flat and rolling, with occasional hills a few hundred feet high. Finally, Pinar del Río is dominated by a prominent mountain range and by outlying piedmont hills and mesas. There are mountains in Cuba from one end of the island to the other, but they are not derived from any central mass and are not continuous. As just indicated there are three distinctively mountainous districts, various minor groups lying outside these. The three main systems are known in Cuba as the occidental, central and oriental. The first, the Organ mountains, in Pinar del Río, rises in a sandy, marshy region near Cape San Antonio. The crest runs near the north shore, leaving various flanking spurs and foothills, and a coastal plain which at its greatest breadth on the south is some 20 mi. wide. The plain on the north is narrower and higher. The southern slope is smooth, and abounds in creeks and rivers. The portion of the southern plain between the bays of Cortés and Majana is the most famous portion of the Vuelta Abajo tobacco region. The mountain range is capriciously broken at points, especially near Bejucal. The highest part is the Pan de Guajaibón, near Bahía Honda, at the west end of the chain; its altitude is 2,494 ft. The central system has two wings, one approaching the north coast, the other covering the island between Sancti Spiritus and Santa Clara. It comprehends a number of independent groups. The highest point, the Pico Potrerillo, is about 3,280 ft. in altitude. The summits are generally well rounded, while the lower slopes are often steep. Frequent broad intervals of low upland or low level plain extend from sea to sea between and around the mountains. Near the coast runs a continuous belt of plantations, while grazing, tobacco and general farm lands cover the lower slopes of the hills, and virgin forests much of the uplands and mountains.

The eastern mountain region includes the province of Oriente and a portion of Camagüey. In extent, in altitude, in mass, in complexity and in geological interest, it is much the most important of the three systems. Almost all the mountains are very bold. There are two main ranges, the Sierra Maestra, and a line of various groups along the north shore. The former runs from Cape Santa Cruz eastward along the coast some 125 mi. to beyond the river Baconao. The Sierra de Cobre, a part of the system in the vicinity of Santiago de Cuba, has a general elevation of about 3,000 ft. Pico Turquino, 6,400 ft. in altitude, is the highest peak of the island. Gran Piedra rises more than 4,900 ft., the Ojo del Toro about 3,300 ft., the Anvil de Baracoa is somewhat lower, and Pan de Matanzas is 1,315 ft. The western portions of the range rise abruptly from the ocean, forming a bold and beautiful coast. A multitude of ravines and gullies, filled with torrential streams or dry, according to the season of the year, and characterized by many beautiful cascades, seam the narrow coastal plain and the flanks of the mountains. The spurs of the central range are a highly intricate complex, covered with dense forests of superb woods. Many points are inaccessible, and the scenery is wild in the extreme. The mountains beyond Guantánamo are known locally by a variety of names, though topographically a continuation of the Sierra Maestra. The same is true of the chains that coalesce with those near Cape Maisí and diverge northwesterly along the north coast of the island. The general character of this northern marginal system is like that of the southern, save that the range is much less continuous. The range near Baracoa is extremely wild and broken. The region between the lines of the two coastal systems is a much dissected plateau, imperfectly explored. The Cauto river, the only one flowing east or west and the largest of Cuba, flows through it westward to the southern coast near Manzanillo. The scenery in the eastern portion of the island is very beautiful, with wild mountains and tropical forests. In the central part there are extensive prairies. In the west there are swelling hills and gentle valleys, with the royal palm the dominating tree.

A very peculiar feature is the abundance of caverns in the limestone beneath the surface. The caves of Cotilla near Havana, of Bellamar near Matanzas, of Monte Libano near Guantánamo, and those of San Juan de los Remedios are the best known. Many streams have part of their course through underground tunnels. Thus the Río San Antonio suddenly disappears near San Antonio de los Baños; the cascades of the Jatibónico del Norte disappear and reappear in a surprising manner; the Moa cascade (near Guantánamo) drops 300 ft. into a cavern and its waters later reissue from the earth; the Jojo river disappears in a great "sink" and later issues with violent current at the edge of the sea. The springs of fresh water that bubble up among the keys of the south coast are also supposedly the outlets of underground streams.

The number of rivers is very great, but almost without exception their courses are normal to the coast, and they are so short as to be of but slight importance. The Cauto river in Oriente province is exceptional; it is more than 155 mi. long, and navigable by small vessels for about 55 mi. Inside the bar at its mouth (formed by a storm in 1616) ships of 200 tons can still ascend to Cauto. In Camagüey province the Jatibónico del Sur; in Oriente the Salado, a branch of the Cauto; in Las Villas the Sagua la Grande (which is navigable for some 20 mi. and has an important traffic), and the Damuji; in Matanzas, the Canimar; and in Pinar del Río the Cuyaguateje are important streams. The water parting in the four central provinces is very indefinite. There are a few river valleys that are noteworthy—those of the Yumurí, the Trinidad and the Güines. At Guantánamo and Trinidad are other valleys, and between Mariel and Havana is the fine valley of Ariguanabo. Of lakes, there are a few on the coast, and a very few in the mountains. The finest is Lake Ariguanabo, near Havana, 6 sq.mi. in area. Of the almost innumerable river cascades, those of the Sierra Maestra mountains, and in particular the Moa cascade, have already been mentioned. The Guamá cascade in Oriente province and the Hanabanilla Fall near Cienfuegos (each more than 300 ft. high), the Rosario Fall in Pinar del Río, and the Almendares cascade near Havana, may also be mentioned.

Geology.—The foundation of the island is formed of metamorphic and igneous rocks, which appear in the Sierra Maestra and are exposed in other parts of the island wherever the comparatively thin covering of later beds has been worn away. A more or less continuous band of serpentine belonging to this series forms the principal watershed, although it nowhere rises to any great height. It is in this band that most of the minerals are found. These ancient rocks have hitherto yielded no fossils and their age is therefore uncertain, but they are probably pre-Cretaceous at least. Fossiliferous Cretaceous limestones containing *Rudistes* have been found, as at Santiago de los Baños, Las Villas province. At the base there is often an arkose, composed largely of fragments of serpentine and granite derived from the ancient floor. In Las Villas province bituminous plant-bearing beds occur beneath the Tertiary limestones, and at Baracoa a Radiolarian earth occupies a similar position. The latter, like the similar deposits in other West Indian islands, is probably of Oligocene age. Tertiary limestones are the predominant feature. Although they do not exceed 1,000 ft. in thickness, they probably at one time covered the whole island except the summits of the Sierra Maestra, where they have been observed, resting upon the older rocks, up to a height of 2,300 feet. They contain corals, but are not coral reefs. The shells which have been found in them indicate that they belong for the most part to the Oligocene period. They are frequently very much disturbed and often strongly folded. Around the coast there is a raised shelf of limestone which was undoubtedly a coral reef. But it is of recent date and does not attain an elevation of more than 40 or 50 feet.

Minerals are fairly abundant in number, but few are present in sufficient quantity to be industrially important. Oriente province is distinctively the mineral province of the island. Large copper deposits of peculiar richness occur in the Sierra de Cobre, and both iron and manganese are abundant. Besides the deposits in Oriente province, iron is known to exist in considerable amount in Camagüey and Las Villas, and copper in Camagüey and Pinar del Río provinces. The copper deposits are mainly in serpentine. Manganese occurs especially along the coast between Santiago de Cuba and Manzanillo. Chromium and other rare minerals exist, but not in commercially available quantities. Bituminous products of every grade, from clear translucent oils to lignite-like substances, occur in all parts of the island. Much of the bituminous deposits is on the dividing line between asphalt and coal. There is but little stone which is hard enough to be good for building material, the greatest part being a soft coralline limestone. There are extensive and valuable deposits of beautiful marbles in the Isle of Pines, and lesser ones near Santiago de Cuba. The Organ mountains contain a hard blue limestone; and sandstones occur on the north coast of Pinar del Río province. Clays of all qualities and colours abound. Mineral waters, though not yet important in trade, are extremely abundant, and a score of places in Cuba and the Isle of Pines are popular health resorts.

The soil of the island is mainly alluvial on the lowlands and disintegrated limestone on the uplands. In the original formation of the island, volcanic disturbances and coral growth played some part. Noteworthy earthquakes are rare. They have been most common in Oriente province. Those of 1776, 1842 and 1852 were particularly destructive, and of earlier ones those of 1551 and 1624 at Bayamo and of 1578 and 1678 at Santiago de Cuba. Every year there are light seismic disturbances, Santiago de Cuba being the point of most frequent visitation.

Flora.—The tropical heat and humidity of Cuba make possible a flora of splendid richness. All the characteristic species of the West Indies, the Central American and Mexican and southern Florida seaboard, and nearly all the large trees of the Mexican tropic belt, are embraced in it. The total number of native flowering species has been estimated at between 5,000 and 6,000. According to the census of 1919 wooded lands comprised 13,600,000 ac., but wasteful clearing after that time has reduced this area to less than 3,500,000 ac. (1940 est.). The woods are so dense over large districts as to be impenetrable, except by cutting a path foot by foot through the close network of vines and undergrowth. The jagüey (*Ficus* sp.), which stifles in its giant coils the greatest trees of the forest, and the copey (*Clusia rosea*) are remarkable parasitic lianas.

Of the palm there are more than 30 species. The royal palm is the most characteristic tree of Cuba. It attains a height of from 50 to 75 ft., and sometimes of more than 100 ft. Alone, or in groups, or in long aisles, towering above the plantations or its fellow trees of the forest, its beautiful crest dominates every landscape. Every portion, from its roots to its leaves, serves some useful purpose. The *corojo* palm (*Acrocomia crispa*) rivals the royal palm in beauty and utility; oil, sugar, drink and wood are derived from it. The *coco* palm (*Cocos nucifera*) is also put to varied uses. The mango is planted with the royal palm along the avenues of the plantations. The beautiful *ceiba* (*Bombax ceiba, Ceiba pentandra*) or silk-cotton tree is the giant of the Cuban forests; it often grows to a height of 100 to 150 ft. with enormous girth. The royal *piñón* (*Erythrina grisebachii*) is remarkable for the magnificent red flowers that cover it. The tamarind and banyan are also noteworthy. Utilitarian trees and plants are legion.

There are at least 40 choice cabinet and building woods. Of these, ebonies, mahogany, *cuyá* (or *cullá, Dipholis* spp.), *cocuyo* (*Bumelia* spp.), *ocuje* (also *ocuje macho, María, palo de María: Calophyllum antillanum*), *jigüe* (*Lysiloma sabicu*), *majagua* (*Hibiscus tiliaceus*), *granadillo* (*Brya ebenus*), and *icaquillo* (or *hicaquillo: Licania* sp.) are perhaps the most beautiful. Other woods, beautiful and precious, include *guayacán* (*Guaiacum sanctum*), *baría* (or *varía: Cordia gerascanthoides*), *quiebrahacha* (*Copaifera hymenaefolia*), which three are of wonderful lasting qualities; the *jiquí* (*Bumelia obovata*), *acana* (*Mimusops jaimiqui, Bassia albescens*), *caguirán* (or *caguairán: Pseudocopaiva hymenaefolia*), and the *dagame* (*Calycophyllum candidissimum*), which four, like the *cuyá*, are all wonderfully resistant to humidity; the *caimitillo* (*Chrysophyllum oliviforme*), the *yaya* (or *yayajabico, yayajabito: Erythalis fructicosa, Oxandra lanceolata, Mouriria acuta, Asimina rhombifolia*), a magnificent construction wood; the *maboa* (*Cameraria latifolia*) and the *jocuma* (jocum:

Sideroxylon mastichodendron, Dipholis salicifolia), all of individual beauties and qualities.

Many species are rich in gums and resins; others are oleaginous; and many are medicinal. There are also various dyewoods; rosewood, logwood (or campeachy wood), indigo, *manajú* (*Rheedia aristata*), brazilwood and saffron. Textile plants are extremely common. The *majagua* tree grows as high as 40 ft.; from its bark is made cordage of the finest quality. Strong, fine, glossy fibres are yielded by the exotic ramie (*Boehmeria nivea*); by the maya or rat pineapple (*Bromelia Pinguin*), and by the *daguilla* (*Lagetta lintearia, L. valenzuelana*), which like the maya yields a brilliant flexible product like silk; stronger cordage by the *corojo* palms, and various *henequén* plants, native and exotic (especially *Agave americana, A. cubensis*); and various plantains, the exotic *Sansevieria guinensis*, okra, jute, *Laportea*, various lianas, and a great variety of reeds, supply varied textile materials. The yuca is a source of starch. For building and miscellaneous purposes, in addition to the rare woods above named, there are cedars (used in great quantities for cigar boxes); the pine, found only in the west, where it gives its name to the Isle of Pines and the province of Pinar del Río; and various palms and oaks. Among economic plants are the coffee, cacao, citron, cinnamon, coconut and rubber tree. Wheat, Indian corn and many vegetables, especially tuberous, are important. Plantain in several varieties is a cheap and healthful substitute for bread, as is also the bitter cassava, after the poison is extracted. The sweet cassava yields tapioca. Bread trees are fairly common. White and sweet potatoes, yams, sweet and bitter yucas, sago and okra are raised.

The pineapple is the fruit most favoured by Cubans. The tamarind is everywhere. Bananas are grown particularly in the region about Nipe, Gibara and Baracoa, whence they are exported in large quantities. Mangoes, though exotic, are extremely common, and in the east grow wild in the forests. Oranges are little cultivated. Lemons yield continuously through the year, but like oranges, not much has yet been done with them commercially. Pomegranates are universally used, but figs and grapes degenerate. The coconut palm is most abundant in the vicinity of Baracoa. Among the common fruits are custard apples (*Anona cherimolia*), sweetsops (*A. squamosa*), soursops (*A. muricata*), mamons (*A. reticulata*), star apples (*Chrysophyllum cainito, C. pomiferum*), rose apples (*Eugenia jambos*), pawpaws, canistes (*Lucuma nervosa*), *jaguas* (*Genipa americana*), avocados (*Persea gratissima*), yellow mammees (*Mammea americana*), "red mammees" (*Achras zapota*) and limes.

Fauna.—The fauna, like the flora, is still imperfectly known. Collectively it shows long isolation from the other Antilles. Only two land mammals are known to be indigenous. One is the *jutía* (agouti) or Cuban rat, of which three species are known (*Capromys prehensiles, C. melanurus* and *C. pilorides*). It lives in the most solitary woods, especially in the eastern hills. The other is a peculiar insectivore (*Solenodon paradoxus*), the only other representatives of whose family are found in Madagascar. Various animals, apparently indigenous, that are described by the early historians of the conquest, have disappeared. An Antillean rabbit is very abundant. Bats in prodigious numbers, and some of them of extraordinary size, inhabit the many caves of the island; more than 20 species are known. Rats and mice, especially the *guayabito* (*Mus musculus*), an extremely destructive rodent, are very abundant. The manatee, or sea cow, frequents the mouths of rivers, the sargasso drifts and the regions of submarine fresh-water springs off the coast. Horses, asses, cows, deer, sheep, goats, swine, cats and dogs were introduced by the early Spaniards. The last three are common in a wild state. Deer are not native, and are very rare; a few live in the swamps.

Birds recorded in Cuba numbered, in 1928, 276 species. Two-thirds of these, including gulls, terns, ducks, waders, flycatchers, orioles, finches and warblers, are also found in the United States. The remaining third includes the Cuban crab hawk, snail kite, quail, rails, crane, blue-headed quail dove, macaw, paroquet, parrot, lizard cuckoo, bare-legged owl, tody, collared and palm swifts, fairy hummingbird, solitaire, cave swallow, blue-headed honey creeper and black finch. The earliest observations of Cuban birds were made by Columbus on his first voyage; the nightingales which charmed him were probably Cuban solitaires. See *The Birds of Cuba*, by Thomas Barbour, 1923.

Reptiles are numerous. Many tortoises are notable. The crocodile and cayman occur in the swampy littoral of the south. Of lizards the *iguana* (*Cyclura ciclura*) is noteworthy. Chameleons are common. Snakes are not numerous, and it is said that none is poisonous or vicious. There is one enormous boa, the *maja* (*Epicrates angulifer*), which feeds on pigs, goats and the like, but does not molest man.

Fishes are present in even greater variety than birds. Felipe Poey, in his *Ictiología Cubana*, listed 782 species of fish and crustaceans, of which 105 were doubtful; but more than one-half of the remainder were first described by Poey. The fish of Cuban waters are remarkable for their metallic colourings. The largest species are found off the northern coast. Food fishes are relatively not abundant, presumably because the deep sea escarpments of the north are unfavourable to their life. Shell fish are unimportant. Two species of blind fish, of extreme scientific interest, are found in the caves of the island. Of the "percoideos" there are many genera. Among the most important are the *robalo* (*Centropomus*), an exquisite food fish, the tunny, eel, Spanish sardine and *manjua*. Of the sharks the genus *Squalus* is represented by individuals that grow to a length of 26 to 30 feet. The hammerhead attains a weight at times of 600 lb. The sawfish is common. Of fresh-water fish the *liza, dogro, guajacón* and *biajaca* (*Parapetoenia tetracamtha*) are possibly the most noteworthy.

Molluscs are extraordinarily numerous; and many, both of water and land, are rarities among their kind for size and richness of colour. Of crustaceans, land crabs are remarkable for size and number. Arachnids are prodigiously numerous. Insect life is abundant and beautiful. The bite of the scorpion and of the numerous spiders produces no serious effects. The *nigua*, the Cuban jigger, is a pest of serious consequence, and the *mal de nigua* (jigger sickness) sometimes causes the death of lower animals and men. Sand flies and biting gnats are lesser nuisances. Lepidoptera are very brilliant in colouring. The *cucujo* or Cuban firefly (*Pyrophorus noctilucus*) gives out so strong a light that a few of them serve effectively as a lantern. The *Stegomyia* mosquito is the agent of yellow fever inoculation. Sponges grow in great variety.

Climate.—The climate of Cuba is typically that of islands in the trade wind belt, and distinctively insular in characteristics of humidity and equability. There are two distinct seasons: a "dry" season from November to April, and a hotter, "wet" season. About two-thirds of the total precipitation falls in the latter. Droughts, extensive in area and in duration, are by no means uncommon. At Havana the mean temperature is about 77° F., with a range between the means of the coldest and warmest months of 10° (71° to 81°), temperatures below 50° or above 90° being rare. The mean rainfall at Havana is about 44.9 in. (sometimes over 80), and the mean absolute humidity of different months ranges from 70% to 80%. These figures represent fairly well the conditions of much of the northern coast. The average rainfall is greatest in the northwestern part of the island. The heat of the day is relieved by the afternoon sea breezes. The trades are steady through the year, and in the dry season the western part enjoys cool "northers." Despite this the interior is somewhat cooler than the coast, and in the uplands frost is not uncommon. The southern littoral is also (except in sheltered points such as Santiago de Cuba, which is one of the hottest cities) somewhat cooler than the northern.

Eight or ten years rarely pass without tornadoes or hurricanes of local severity at least. Notably destructive ones occurred in 1768, 1774, 1842, 1844, 1846, 1865, 1870, 1882, 1888, 1894, 1896, 1906, 1910, 1912, 1915, 1917, 1924, 1926, 1932, 1935 and 1944. Those of 1842 and 1844 caused extreme distress. In 1846, 300 vessels and 2,000 houses were destroyed at Havana; in 1896 the banana groves of the northeast coast were ruined; and in 1926 Havana suffered severe damage. Such storms most frequently occur in September, October and November.

Health.—Convincing evidence is offered by the qualities of the Spanish people in Cuba that white men of temperate lands can be perfectly acclimatized in this tropical island. As for diseases, some common to Cuba and Europe are more frequent or severe in the island, others rarer or milder. There are the usual malarial, bilious and intermittent fevers, and liver, stomach and intestinal complaints prevalent in tropical countries and chiefly due to unhygienic living. Yellow fever (which first appeared in Cuba in 1647) was long the only epidemic disease, Havana being an endemic focus. The danger of an outbreak was never absent, until the work of the U.S. army in 1901–02 conclusively proved that this disease could be eradicated entirely by removing the possibility of inoculation by the *Stegomyia* mosquito. Since then yellow fever has ceased to be a scourge in Cuba. Smallpox was the cause of a greater mortality than yellow fever even before the means of combating the latter had been ascertained. The remarkable sanitary work begun during the American occupation and continued by the republic of Cuba, has shown that the ravages of this and other diseases can be greatly diminished. Leprosy is rather common, but seemingly only slightly contagious. Consumption is very prevalent. Malaria has been greatly reduced by the campaign against the anopheles mosquito, the carrier of the malady.

HISTORY

Cuba was discovered by Christopher Columbus in the course of his first voyage, on Oct. 27, 1492. In 1508 Sebastian de Ocampo circumnavigated it. In 1511 Diego Velázquez began the conquest of the island. Baracoa (the landing point), Bayamo, Santiago de Cuba, Puerto Príncipe, Sancti Spiritus, Trinidad and the original Havana were all founded by 1515. Velázquez's reputation and legends of wealth drew many immigrants to the island. From Cuba went the expeditions that discovered Yucatan (1517), and explored the shores of Mexico, Hernando Cortés's expedition for the invasion of Mexico, and de Soto's for the exploration of Florida. The last two had a pernicious effect on Cuba, draining it of horses, money and of men. At least as early as 1523 the African slave trade was begun. In 1544 the Indians, so far as they had not succumbed to the labour of the mines and fields to which they were put by the Spaniards, were proclaimed emancipated. The administration in the 16th century was loose and violent. The local authorities were divided among themselves by bitter feuds; brigandage, mutinies and internal struggles disturbed the peace. As a result of the transfer of Jamaica to England, the population of Cuba was augmented by Jamaican immigrants to about 30,000 in the middle of the 17th century.

The activity of English and French pirates began in the 16th, and reached its climax in the middle of the 17th century. So early also began dissatisfaction with economic regulations and even grave resistance to their enforcement. Illicit trade with privateers and foreign colonies had begun long before, and in the 17th and 18th centuries was the basis of the island's wealth. In 1762 Havana was captured after a long resistance by a British force under Admiral Sir George Pocock and the earl of Albemarle, with heavy loss to the besiegers. It was returned to Spain the next year in exchange for the Floridas. The British opened the port to commerce and the slave trade and revealed its possibilities. The government of Spain, beginning in 1764, made notable breaches in the old monopolistic system of colonial trade throughout America; and Cuba received special privileges. Spain paid increasing attention to the island, and in harmony with the policy of the Laws of the Indies many decrees intended to stimulate agriculture and commerce were issued by the crown, first in the form of monopolies, then with increased freedom and with bounties. Various colonial products and the slave trade were favoured in this way. After the cession of the Spanish portion of Santo Domingo to France, hundreds of Spanish families emigrated to Cuba, and many thousand more immigrants, mainly French, followed them during the revolution of the blacks. Most of them settled in Oriente province, where their names and blood are still apparent, and with their *cafetales* and sugar plantations converted that region from neglect and poverty to high prosperity.

Under a succession of liberal governors (especially Luis de las Casas, 1790–96, and the marqués de Someruelos, 1799–1813), at the end of the 18th century and the first part of the 19th, when the wars in Europe cut off Spain almost entirely from the colony, Cuba was practically independent. Trade was comparatively free, and worked a revolution in culture and material conditions. Gen. las Casas, in particular, left behind him in Cuba an undying memory of good efforts. Free commerce with foreigners—a fact after 1809—was definitely legalized in 1818 (confirmed in 1824). The state tobacco monopoly was abolished in 1817. The reported populations by the (untrustworthy) censuses of 1774, 1792 and 1817 were 161,670; 273,301 and 553,033. Something of political freedom was enjoyed during the two terms of Spanish constitutional government under the constitution of 1812. The sharp division between creoles and peninsulars (*i.e.*, between those born in Cuba and those born in Spain), the question of annexation to the United States or possibly to some other power, the plotting for independence, all go back to the early years of the century.

Misgovernment.—Partly owing to these political and social divisions, conspiracies being rife during 1820–30, and partly as preparation for the defense against Mexico and Colombia, who throughout these same years were threatening the island with invasion, the captains general, in 1825, received the powers above referred to, which became, as time passed, monstrously in discord with the general tendencies of colonial government and with increasing liberties in Spain, but continued to be the spiritual basis of Spanish rule in the island. Among the governors was Miguel Tacón (1834–39), a forceful and high-handed soldier; he ruled as a tyrant, made many reforms, and left Havana, in particular, full of municipal improvements. The good he did was limited to the spheres of public works and police; in other respects his rule was a pernicious influence for Cuba. Politically it was marked by the proclamation at Santiago in 1836, without his consent, of the Spanish constitution of 1834; he repressed the movement, and in 1837 the deputies of Cuba to the Cortes of Spain (to which they were admitted in the two earlier constitutional periods) were excluded from that body, and it was declared in the national constitution that Cuba (and Puerto Rico) should be governed by "special laws." The inapplicability of many laws passed for the peninsula was indeed notorious; and Cuban opinion had repeatedly, through official bodies, protested against laws thus imposed that worked injustice, and had pleaded for special consideration of colonial conditions. The promise of "special laws" based upon such consideration was therefore not, in itself, unjust, nor unwelcome. But as the colony had no voice in the Cortes, and the "special laws" were never passed, the arbitrary rule of the captains general remained quite supreme. The rule of Leopold O'Donnell was marked in 1844 by a bloody persecution of Negroes for a supposed plot against their masters; O'Donnell's actions being partly due to the inquietude that had prevailed for some years over the supposed machinations of English abolitionists and even of English official residents in the island, and also over the mutual jealousies and supposed annexation ambitions of Great Britain and the United States.

A Cuban international question had arisen before 1820. Spain, the United States, England, France, Colombia and Mexico were all fully involved in it, the first four continually. In the 1850s a strong proslavery interest in the United States advocated the acquisition of the island. One feature of this was the "Ostend Manifesto" (*see* BUCHANAN, JAMES), in which the ministers of the United States at London, Paris and Madrid declared that if Spain refused a money offer for the colony the United States should seize it. Their government gave this document publicity. The Cuban policy of Presidents Pierce and Buchanan (during 1853–61) was vainly directed to acquiring the island. From 1849 to 1851 there were three abortive filibustering expeditions from the United States, two being under a Spanish general, Narciso López (1798–1851). Domestic discontent had become acute by 1850, and from then on to 1868 there was conflict between liberal and reactionary sentiment, centring about the asserted connivance of the captains general in the illegal slave trade (declared illegal by the treaties of 1817 and 1835 between Great Britain and Spain), the notorious immorality and prodigal wastefulness of the government, and the selfish exploitation of the colony by Spaniards and the Spanish government. From early in the 19th century there had always been separatists, reformists and repressionists in the island, but they were individuals rather than groups. The last were peninsulars, the others mainly creoles, and among the wealthy classes of the latter the separatists gradually gained increasing support.

Civil Wars.—An ineffective and corrupt administration, a grave economic condition, new and heavy taxes, military repression, recurring heavy deficits in the budget, adding to a debt (about $150,000,000 in 1868) already very large and burdensome, and the complete fiasco of the *junta* of inquiry of Cuban and Puerto Rican representatives which met in Madrid in 1866–67—all were important influences favouring the outbreak of the Ten Years' War. Among those who waged the war some desired reforms; others annexation to the United States; others, independence. The reformists demanded action against slavery, assimilation of rights between peninsulars and creoles and the practical recognition of equality (*e.g.*, in the matter of officeholding) and guarantees of personal liberties. The separatists, headed by Carlos Manuel de Céspedes (1819–1874), a wealthy planter who proclaimed the revolution at Yara on Oct. 10, 1868, demanded the same reforms, including gradual emancipation of the slaves with indemnity to owners, and the grant of free and universal suffrage. War was confined throughout the ten years almost wholly to the east provinces. The policy of successive captains general was alternately uncompromisingly repressive and conciliatory. The Spanish volunteers committed horrible excesses in Havana and other places; the rebels also burned and killed indiscriminatingly, and the war became increasingly cruel and sanguinary. Intervention by the United States seemed probable, but did not come. Martínez Campos in Jan. 1878 secured the acceptance by the rebels of the convention of Zanjón, which promised amnesty, liberty to rebel slaves, the abolition of slavery, reforms in government and colonial autonomy. A small rising after peace (the "Little War" of 1879–80) was easily repressed. Gradual abolition of slavery was declared by a law of Feb. 13, 1880; definitive abolition in 1886; and in 1893 equal civil status of blacks and whites was proclaimed by Gen. Calleja. Coolie importation from China had been stopped in 1871.

The change from the old regime was only superficial. The Spanish constitution of 1876 was proclaimed in Cuba in 1881. In 1878–95 political parties had a complex development. The Liberals were becoming radical, the Union Constitutionalists, conservative; and after 1893 a Reformist party was launched that drew the compromisers and the waverers. The demands of the Liberals were as in 1868; those for personal and property rights were much more definitely stated, and among explicit reforms demanded were the separation of civil and military power, general recognition of administrative responsibility under a colonial autonomous constitutional regime; customs reforms and reciprocity with the United States were also demanded. As for the representation accorded Cuba in the Spanish Cortes, as a rule about a quarter of its deputies were Cuban-born, and the choice of only a few autonomists was allowed by those who controlled the Cuban elections. A reciprocity arrangement with the United States was in force from 1891 to 1894 and was found to be extremely beneficial to Cuba.

Discontent grew, and another war was prepared for. On Feb. 23, 1895, Gen. Calleja suspended the constitutional guarantees. The leading chiefs of the Ten Years' War took the field again —Máximo Gómez, Antonio Macéo, José Martí, Calixto García and others. This war was carried to the western provinces, and indeed was fiercest there. Among the military means adopted by the Spaniards to isolate their foe were entrenchments, barbwire fences, and lines of block-houses across the narrow parts of the island, and noncombatant detention camps. The latter measure produced extreme suffering and much starvation. In Oct. 1897 the Spanish premier, P. M. Sagasta, announced the policy of autonomy, and the new dispensation was proclaimed in Cuba in December. But again all final authority was reserved to the captain general. The system was never to have a practical trial, although a full government was quickly organized under it. President McKinley, while opposing recognition of the rebels, affirmed the possibility of intervention; Spain resented this attitude; and finally, in Feb. 1898, the United States battleship "Maine" was blown up—by whom will probably never be known—in the harbour of Havana.

American Occupation.—On April 20, the United States demanded the withdrawal of Spanish troops. War followed at once. A fine Spanish squadron seeking to escape from Santiago harbour was utterly destroyed by the American blockading force on July 3; Santiago was invested by land forces, and on July 5, surrendered. Other operations in Cuba were slight. By the treaty of Paris, signed on Dec. 10, Spain "relinquished" the island to the United States in trust for its inhabitants; the temporary character of American occupation being recognized throughout the treaty, in accord with the terms of the American declaration of war, in which the United States disclaimed any intention to control the island except for its pacification, and expressed the determination to leave the island thereupon to the control of its people. Spanish authority ceased on Jan. 1, 1899, and was followed by American "military" rule from Jan. 1, 1899 to May 20, 1902. During these three years the great majority of offices were filled by Cubans. Very much was done for public works, sanitation, the reform of administration, civil service and education. Most notable of all, yellow fever was eradicated where it had been endemic for centuries. A constitutional convention sat at Havana from Nov. 5, 1900 to Feb. 21, 1901. Certain definite conditions known as the Platt amendment were finally imposed by the United States, and accepted by Cuba (on June 12, 1901) as a part of its constitution. By these Cuba was bound not to incur debts its current revenues will not bear; to continue the sanitary administration undertaken by the military government of intervention; to lease naval stations to the United States; and finally, the right of the United States to intervene, if necessary, in the affairs of the island was explicitly affirmed. The status of the Isle of Pines was left an open question by the treaty of Paris, but a decision of the United States supreme court which recognized it as a part of Cuba was finally ratified by the United States senate on March 13, 1925.

The Republic.—The first Cuban congress met on May 5, 1902, and took over the government from the American military authorities on May 20; Tomás Estrada Palma (1835–1908) became the first president of the Republic. Material prosperity from 1902 to 1906 was very great; but various political, social and economic conditions led once more to revolution. Congress neglected to pass certain laws required by the constitution regarding municipal autonomy, independence of the judiciary, and congressional representation of minority parties. The preliminaries of the elections of Dec. 1905 and March 1906 being marked by frauds and injustice, the Liberals deserted the polls at those elections, and instead of appealing to judicial tribunals controlled by the Moderates, issued a manifesto of revolution on July 28, 1906. This insurrection rapidly assumed large proportions. The government was weak and lacked moral support in the whole island. After repeated petitions from President Palma for intervention by the United States, commissioners were sent from Washington to act as mediators.

All possible efforts to secure a compromise that would preserve the republic failed. The president resigned (on Sept. 28), congress dispersed without choosing a successor, and as an alternative to anarchy the United States was compelled to proclaim on Sept. 29, 1906, a provisional government,—to last "long enough to restore order and peace and public confidence," and hold new elections. The insurrectionists promptly disbanded. Government was maintained under the Cuban flag,—the diplomatic and consular relations with even the United States remained outwardly unchanged; and the regular constitutional forms were maintained so far as possible. No use was made of American military force save as a passive background to the government. The first effort was simply to hold the country together, without undertaking much that could divide public opinion; and later to establish a few fundamental laws which, when intervention ceased, should give greater simplicity, strength and stability to a new native government. These laws strictly defined the powers of the president; more clearly separated the executive departments, so as to lessen friction and jealousies; reformed the courts and administrative routine; and increased the strength of the provinces at the expense of the municipalities. On Jan. 28, 1909, the American administration ceased, and the republic was a second time inaugurated, with Gen. José Miguel Gómez (1858–1921) as president and Alfredo Zayas as vice-president. Both were Liberals. The last U.S. troops were withdrawn April 1, 1909.

Gómez remained in office until May 20, 1913. His term was marked by a return to the traditional political evils of the former Spanish colony; but though the government was corrupt the country prospered and public works were developed. Among a number of political disturbances the race war of 1912 was the most serious. This was a Negro uprising in Oriente which, however, was quickly suppressed; a body of U.S. marines was landed for the protection of foreign nationals and their property. Owing to friction within the Liberal party the Conservative candidate, Gen. Mario G. Menocal, was elected in 1912 and took office in 1913.

Charges of maladministration and dictatorial methods were persistently brought against Menocal's government, which was unable, furthermore, to show much in the way of positive achievement. Nevertheless, the first three years of his term were moderately successful. Menocal was again a candidate in 1916, and won the election by the employment of violence and other improper methods. In consequence there was a serious civil war under the leadership of Gómez in Feb. 1917, but Menocal was able to defeat his opponents and entered upon his second term. Meanwhile, Cuba had declared war on Germany on April 7, 1917. Great help was rendered through stimulating the production of sugar for sale to the Allies. In anticipation of the elections of 1920 Gen. Enoch H. Crowder of the U.S. army was invited in 1919 to draw up an election law. This he did, but the law was flagrantly disregarded in the ensuing elections. Alfredo Zayas, who had been the Liberal candidate in 1916, was now backed by Menocal in a Conservative-Popular alliance against Gómez, who was nominated by the Liberals. Zayas was successful but Gómez raised a protest, and new partial elections were called for at the suggestion of Gen. Crowder. Gómez withdrew before they could be completed, asserting that the government methods were unfair, and Zayas had an easy victory.

Meanwhile, Cuba had enjoyed phenomenal prosperity in 1919, but this was followed by a severe financial crisis in the depression of 1920–21. Despite a moratorium many banks and other business concerns became bankrupt. Because of the financial difficulties President Zayas, who went into office on May 20, 1921, was at first amenable to suggestions for reform made by the U.S. government. A loan of $50,000,000 was approved by the United States and floated in Jan. 1923, and finances rapidly improved. The Cuban war loan of $10,000,000 was liquidated and the year 1922–23 closed with a surplus. But with the return of prosperity in 1923 President Zayas broke away from his advisers, and his political improprieties led to the formation of the Veterans' and Patriots' association, whose reform movement was badly mismanaged and failed in the abortive revolution of April–May 1924. Zayas would not indulge in the violence of his predecessor, however, and when he was defeated by Menocal for the Conservative nomination, made a pact with Gen. Gerardo Machado, the Liberal candidate, to assist him against Menocal in the presidential election of 1924. Machado assumed office on May 20, 1925 and was re-elected on Nov. 1, 1928. Amendments voted by congress in June 1927, and approved by a constitutional convention on May 9, 1928, provided that the president's term be increased from four to six years and that he be ineligible for re-election; abolished the office of vice-president; increased the term of senators from six to nine years, and of representatives from two to six years, with national elections to be held every three years. The franchise was extended to all males over 21.

Political opposition, allayed by an adroit distribution of patronage in 1928, revived against President Machado as the economic depression deepened. The Chadbourne agreement of Dec. 1930 failed to stabilize the price of sugar and no substantial relief came from the public works program. Repressive measures, instead of silencing opposition, incited a violent outbreak and ruthless execution without civil trial was resorted to as the army maintained the government. At this point the good offices of the new United States ambassador, Sumner Welles, were accepted, a general amnesty was declared and constitutional and political reforms were undertaken. But the economic crisis would not wait and a general strike in Aug. 1933 forced Machado to flee the country.

A combination of parties named Dr. Carlos Manuel de Céspedes as provisional president and set aside the constitution of 1928. But the rank and file of the army revolted against its officers and joined with a radical group of Havana University students to set up a revolutionary Junta with Dr. Grau San Martín at its head.

After four months of intermittent and bloody strife, during which time the United States refused recognition of any government, Dr. Grau, deserted by some of the students and faced with renewed strikes, retired, and the Junta shortly thereafter, Jan. 17, 1934, surrendered power to Col. Carlos Mendieta, upon whom all parties agreed to confer the presidency. Recognition was promptly granted by the United States and other countries.

Disorder and strikes continued to prevail, but Mendieta and his chief of staff, Fulgencio Batista, asserted their dictatorial authority more frankly and postponed the election until Dec. 1935. As commander in chief of the army, Batista continued to rule Cuba through a succession of presidents (José Barnet, Dec. 1935–May 1936; Miguel Gómez, May 1936–Dec. 1936; Federico Laredo, Dec. 1936–Oct. 1940). In the presidential elections of July 14, 1940, Col. Fulgencio Batista Zaldivar, candidate of a Socialist-Democratic coalition of seven parties, defeated his opponent—ex-president Ramón Grau San Martín. With his inauguration on Oct. 10, 1940, Batista's administration co-operated closely with the U.S. The political scene has been dominated by problems associated with the war. Cuba declared war against Japan on Dec. 9, 1941, and against Germany and Italy on Dec. 11. The Declaration of the United Nations was signed by the Cuban ambassador to the United States on Jan. 1, 1942, and diplomatic relations were established with the soviet union in October of that year. (C. E. Ch.; G. M. McB.; R. W. Rd.)

Agriculture.—Cuba is predominantly an agricultural country: approximately 50% of the gainfully employed population is engaged in agriculture and more than 90% of the total exports are derived directly or indirectly from the soil. It is estimated (1940) that farm lands occupy slightly more than 55% of the total area, the cultivated area being 25% of the farms or 14% of the whole. Although the average size of a farm in 1930 was 188 ac., nearly one-third of the farms were less than one *caballería* ($33\frac{1}{3}$ ac.) and more than 70% were less than three *caballerías*. The greatest number of small farms is in the province of La Habana; the large cattle ranches and sugar centrals are most numerous in the province of Camagüey. It was estimated in 1940 that of the cultivated area 57% was devoted to sugar, 10% to bananas and plantains, more than 7% to corn, nearly 4% to coffee and slightly less than 3% to tobacco. About 14% of the total area of the island was classified as permanent pasture and wasteland. Of the 87,396 farms in Cuba reported in the census of 1930, 32,314 (32% of the cultivated farm acreage) were operated by owners, 44,284 (less than 29% of the cultivated acreage) were rented either on a cash or share basis, and 10,798 (nearly 40% of the cultivated acreage) were operated by administration, *i.e.*, hired managers and labourers.

Sugar has been the dominant crop in Cuba since the end of the 18th century. In addition to occupying more than one-half of the total land under cultivation, sugar and sugar products accounted for 75% of the value of all exports in 1940 and 82% of the export value of all agricultural products, including meat and hides. But dependence on one crop began to cause serious economic difficulties in Cuba as early as 1925, when world production of sugar began to exceed demands. After 1926 "Cuba has experimented with restricted production, delayed production, and market quotas; it has had pools and cartels, single sellers and a near valorization scheme; it has acted unilaterally and has sought international co-operation; and it has experienced spasms of complete laissez-faire." (*See* Foreign Policy Assoc., Commission on Cuban Affairs, *Problems of the New Cuba,* 1935). Under the United States quota system (Jones-Costigan act of 1934, superseded by the Sugar Quota law of 1937) and the adoption of flexible tariff provisions, the Cuban sugar industry, controlled by the Instituto Cubano de Estabilización del Azúcar, has enjoyed substantial benefits. During World War II the industry has been further benefited by increases in quotas and prices and the removal of tariffs. These are temporary measures, however, designed to help Cuba help itself; the success or failure of the United States policy with regard to Cuban sugar rests largely on Cuba's ability to revise and strengthen its economic, political and social structures. During and after the war of 1868–78, many families emigrated and were ruined; the ownership of plantations largely passed from Cubans to Spaniards. About 1885 began an immense development of centralization. Plantations have increased greatly in size (and also diminished in number), and extraction instead of being carried on on all plantations has been (after 1880) concentrated in comparatively few centrals. In 1941 there were 158 active sugar mills (16 inactive ones), 112 of which were in the provinces of Las Villas, Oriente and Camagüey. Of these more than 55% were owned or controlled by United States interests, slightly less than 22% Cuban, nearly 14% Spanish, and less than 5% Canadian. Prior to 1902 the production of sugar exceeded 1,000,000 tons only twice—in 1894 and 1895. Following the resuscitation of the industry after the Spanish-American War, the island's crop rose steadily from one-sixth to a full quarter of the total cane sugar output of the world. Of the total world production of nearly 40,000,000 tons in 1940, Cuba produced more than 3,000,000 tons, about four-fifths of which was exported to the United States. In 1941 Cuba produced (in addition to some 440,000,000 gal. of molasses and invert sirups, 34,600,000 gal. of alcohol and 7,700,000 gal. of cane brandy and rum) 2,695,827 tons of sugar.

Tobacco, the second most important export crop grown in Cuba, is noted throughout the world for its fine quality in the manufacture of cigars. The principal producing regions, identified according to the type of tobacco grown in each region, are Vuelta Abajo, in the province of Pinar del Río; Semi-Vuelta, adjoining the Vuelta Abajo on the east; Partido, mostly in La Habana province; Remedios, largely in Las Villas province but extending eastward into Camagüey province; and Oriente. Measured in terms of the number of farms, acreage, production and quality of the tobacco grown, the most important regions are Vuelta Abajo and Remedios, which together accounted for about 93% of the total tobacco produced in Cuba in 1941. In that year there were 4,435 tobacco farms (5,025 in 1940), ranging in area from 4 to 6 ac. per farm in the Partido region to about 26 ac. in the Remedios region. Practices with respect to the operation of farms vary considerably within and between regions. Farms in the Vuelta Abajo region are operated for the most part by owners, whereas in the Remedios region tenant farming on a share basis is the common practice. Farms are also owned by tobacco manufacturers and are operated by administration. Seedbeds are planted in August and September and transplanting begins toward the end of October. Harvesting, which begins as early as December, is usually completed in February. In order to produce mild tobacco, having a light colour and fine texture, much of the cigar wrapper leaf is grown under cloth. This is particularly true in certain districts in the Vuelta Abajo and throughout most of the Partido region. The use of commercial fertilizers and irrigation is confined to these same regions, and is closely correlated with the areas in which tobacco is grown under shade. Of the 56,219,000 lb. of tobacco produced in Cuba in 1940, 26,359,000 lb. of unmanufactured tobacco were exported, 383,000 lb. were used in the manufacture of cigars for export, and 21,971,000 lb. were reserved for domestic consumption. The total value of tobacco exports in 1940 was more than $12,000,000, or nearly 10% of Cuba's total exports. Approximately one-half the quantity or three-fourths the value of exports of unmanufactured tobacco is normally imported by the United States.

Coffeegrowing first attained prominence with the settlement in eastern Cuba, in the 18th century, of French immigrants from Santo Domingo. Coffee is grown in three widely separated regions in Cuba, but the mountainous districts of eastern and southern Oriente province are still of major importance, accounting for more than 85% of the total production. From 12% to 14% of Cuba's coffee is produced in the mountainous area between Cienfuegos and Trinidad in Las Villas province, and about 1% is grown in Pinar del Río province. Cuba's production of coffee is relatively small (59,256,000 lb. in 1941), but is sufficient to meet domestic needs and permits an average annual export (mostly to the United States) of more than 16,000,000 lb.

The production of fruit for export is Cuba's third largest agricultural industry, although it is small in comparison to that of sugar and tobacco. Among the fruits exported are bananas, pineapples (fresh and canned), grapefruit, avocados, guava products, plantains, papayas and limes. Of these, bananas and pineapples are the most important, together accounting for more than 80% of the value of the total fruit exports in 1940. These and many other tropical fruits, including coconuts, are grown widely for domestic consumption, but fruits grown for export are limited largely to accessible areas having suitable soils. Bananas for export are grown exclusively in two regions in the province of Oriente: the hill country surrounding Baracoa and the Nipe region on the north coast. Both of the fungus diseases (Panama disease and sigatoka) which are prevalent in most of the banana-producing areas in the Caribbean countries are affecting the plantations in Cuba. Although pineapples are grown in all the provinces, Pinar del Río province had, in 1939, nearly 60% of the total acreage and produced more than 55% of the crop. Other important producing regions are in the provinces of La Habana and Camagüey.

In addition to crops produced primarily or exclusively for domestic consumption, such as corn, rice, beans, peas, sweet potatoes, yams, white potatoes, onions, yuca, malanga, plantains and peanuts, Cuba produces appreciable quantities of winter vegetables for export to the United States. Crops normally grown for export include tomatoes, lima beans, eggplant, green peppers, okra and cucumbers. Exports of these and other fresh vegetables averaged $1,341,000 annually in the period 1936–40. Winter vegetables are grown chiefly in the western provinces and in the Isle of Pines.

From the earliest years of Spanish occupation until the Cuban War of Independence (1895) cattle breeding was a thriving industry. During the war the number of cattle was reduced from more than 3,000,000 head to about a quarter that number. Subsequent censuses, however, showed a steady recovery from this situation, there being more than 5,000,000 head of cattle in Cuba in 1940. Cattle are raised throughout the island, but are particularly numerous on the poorer lands in the east-central part. The climate permits pasturing the year round and cattle rarely get any feed other than pasture. Cuba produces sufficient quantities of beef and dairy products for its own needs and even has small surpluses for export. Oxen for draught purposes, horses, mules, and relatively insignificant numbers of hogs, sheep and goats are also raised.

Manufactures.—Only about 20% of all wage earners in Cuba are engaged in manufacturing and the mechanical trades. The leading manufactures are principally connected with the sugar and tobacco industries; nonagricultural industries employed about 32,000 people in 1939 and evaluated production at $64,000,000. The value of forest products (lumber, poles, posts, railroad ties, firewood and charcoal) in 1939 amounted to $4,402,000. Industrial products manufactured chiefly from raw materials produced in Cuba include sugar, molasses, sirups, rum, cane brandy, alcohol, cigars, cigarettes, cigar boxes, sponges, cement, cordage, salt, dressed hides, dairy products and canned goods. Scores of other products, such as paint, soap, shoes, hats, clothing, cotton cloth, burlap and cotton sacks, paper and matches, are made from domestic raw materials and imported raw and processed materials.

Mining.—Mining for precious metals ceased at a very early date, after rich discoveries were made on the continent. The mining of iron, copper, manganese and chromium, however, is of considerable importance, and the estimated reserves of these and other minerals, particularly petroleum, hold great promise for the future. Iron ore is particularly abundant and accessible, and is mined chiefly at Daiquiri (the most famous of Cuba's iron mines), Nipe and other places in Oriente province. Total Cuban reserves are estimated at 3,500,000,000 tons, 90% of which are held in reserve by United States steel interests. The Cobre copper mines near Santiago de Cuba were once the richest in the world, but the Matahambre mine on the north coast in Pinar del Río province has been more productive, producing more than $150,000,000 worth of ore in the period 1913–42. Cuba is the second largest producer of manganese in Latin America; this is mined mainly near La Maya and El Cristo in Oriente province. Following the outbreak of World War II mineral production in and exports of minerals from Cuba were changed somewhat to conform with the needs of the United Nations for strategic minerals. With virtually all exports going to the United States, Cuba exported 31,300 tons of copper, 80,350 tons of iron, 179,800 tons of chromium, 277,026 tons of manganese and more than 2½ tons of tungsten in 1941.

Commerce.—In 1904–08 exports and imports averaged $192,313,000 annually; in 1914–18, $491,744,000; in 1924–28, $589,799,000; in 1934–38, $243,408,000 and in 1941, $345,398,000. Sugar, tobacco and a few other farm products constitute almost all exports; imports are primarily manufactured products, although agricultural commodities constitute about one-fourth the average value of imports. After 1901 the balance of foreign trade has been in Cuba's favour, the value of imports averaging about 70% of the value of exports. Out of $211,507,591 worth of exports from Cuba in 1941, the United States took $181,220,419, while the United Kingdom was in second place with $16,759,757. The same year the United States furnished Cuba with $117,110,950 worth of imports out of a total of $133,890,137, while the United Kingdom was again placed second with $3,416,295. In 1936–40, United States trade with Cuba was greater than with any of the other American republics.

Communications.—No part of the island is far distant from some one of a great number of excellent harbours, the principal ones being Antilla, Banes, Baracoa, Caibarién, Cárdenas, Cienfuegos, General Peraza, Gibara, Guantánamo (location of U.S. naval base), Havana, Júcaro, Manzanillo, Mariel, Matanzas, Nueva Gerona, Nuevitas, Puerto Padre, Santa Cruz del Sur, Santiago de Cuba and Trinidad. All of these are connected with the interior either by railroads or roads, or both. In normal times all are visited regularly by foreign vessels; coastwise trade is carried on between these and a great number of lesser but serviceable harbours. In 1941, 8,158 vessels (30,310,114 gross tons) engaged in foreign trade entered and cleared all ports, while 7,774 vessels (1,967,252 gross tons) carried on coastwise traffic. In 1941 it was estimated that Cuba had more than 3,600 miles of roads, about 1,500 miles of which were only suitable for ox-drawn carts. The most notable road is the central highway (713 miles), extending from Pinar del Río to Santiago de Cuba and built by the government at a cost of $75,000,000. This was opened to traffic in 1931. The Cuban department of public works is planning an extensive road-building program which will provide sorely needed transportation facilities to many of the isolated rural regions.

Cuban railway history dates from 1834, in which year Ferdinand VII of Spain authorized the borrowing of 2,000,000 pesos from England for the purpose of building a railroad from Havana to Güines. The first section of this road (Havana to Bejucal) was opened in Nov. 1837. This was the beginning of what is the largest railroad in Cuba—the United Railways of Havana and Regla Warehouses, Ltd. (British-owned)—operating more than 46% of the common carrier trackage and serving all of the larger ports and cities in the provinces of Pinar del Río, La Habana, Matanzas and the western part of Las Villas. The second major development in rail transportation, designed to develop the eastern provinces, began in 1902 with the completion of a line from Santa Clara to Santiago de Cuba. A vast network of rails, representing about 35% of the common carrier trackage, and operated by the Consolidated Railways of Cuba (mostly owned by United States interests), covers large parts of the provinces of Las Villas, Camagüey and Oriente. At least 16 other common carrier railways, operating a total of about 700 mi. of track, are scattered throughout the six provinces. On June 30, 1940, the total length of common carrier trackage in Cuba was 3,152 mi., in addition to which there were about 700 mi. of yard track and sidings, some 5,000 mi. of private railways (mostly serving the larger sugar estates) and approximately 250 mi. of electric railways. Cuba is served by inter-regional air lines operated by Pan American Airways and Koninklijke Luchtvaart Maatschappij (Dutch); domestic service from Havana to Cienfuegos, Camagüey, Manzanillo, Santiago de Cuba, Guantánamo, Antilla, Preston, Cayo Mambí and Baracoa is maintained by the Compañía Nacional Cubana de Aviación, a subsidiary of Pan American Airways.

The telegraph (374 offices and 3,545 mi. of line in 1941) and telephone systems are owned by the government. Telephone service (59,870 telephones in Dec. 1940) reaches virtually every section of the country, and long-distance connection is possible with the United States and the United Kingdom. Cable service, too, is maintained between Cuba and the above countries. In 1941 there were seven radio-telephone stations operated by the government, in addition to which there were 84 commercial long-wave and 15 short-wave broadcasting stations. It was estimated in 1943 that there were more than 250,000 radio receiving sets in the republic.

Population.—The census of 1887 showed a population of 1,631,687; that of 1899 a population of 1,572,792 (decrease of 3.6% is explained by the intervening war); that of 1907, 2,048,980; that of 1919, 2,889,004; and that of 1931, 3,962,344. According to the general census of 1943, the population was 4,778,583. The average number of inhabitants per square mile in the six provinces is as follows: Camagüey, 47.9; Pinar del Río, 76.5; Oriente, 96.0; Matanzas, 110.8; Las Villas, 113.5; and La Habana (includes the Isle of Pines), 389.4. The average density of population for the entire country is 108.1 persons per square mile. The 1943 census lists 14 cities having a population of more than 25,000—Havana, 659,883; Marianao, 120,163; Santiago de Cuba, 118,266; Camagüey, 80,509; Matanzas, 54,844; Santa Clara, 53,981; Cienfuegos, 52,910; Guantánamo, 42,423; Cardenas, 37,059; Manzanillo, 36,295; Holguín, 35,865; Guanabacoa, 30,287, Sancti Spiritus, 28,262; Pinar del Rio, 26,241.

The aboriginal (Indian) population of Cuba was decimated so rapidly and completely during the first years of Spanish occupancy that a mestizo population never developed on the island. In the place of Indians and mestizos there is a large Negro and mulatto population, descendants for the most part of the hundreds of thousands of Negro slaves which were imported over a period of more than 350 years. Miscegenation of Negroes and whites was extremely common prior to the formal abolition of slavery in 1886. From the standpoint of racial composition and culture Cuba also differs from many of the other Latin American republics in that the number of Spaniards in relation to the total population is very large. The composition of the population, according to the census of 1931, was as follows: Cuban white and mulatto, 2,278,288; Cuban coloured, 925,297; Spaniards, 613,970; Haitians, 79,838; Jamaicans, 40,471; Chinese, 24,480—the latter being largely the descendants of contract labourers brought to Cuba in the early part of the 19th century. It is officially estimated at the present time (1944) that 75% of the population is white (approximately one-third of which is mulatto), 24% coloured, and 1% Mongoloid (mostly Chinese). In Dec. 1941 there were 334,033 unnaturalized foreigners registered in the republic. Of these, 187,183 were Spaniards, 64,988 Haitians, 29,444 Chinese, 27,602 British and 9,607 were citizens of the United States.

Constitution.—The constitution which was framed during United States military occupancy and accepted on June 12, 1901, was replaced by a new constitution on Oct. 10, 1940. Under the new constitution, the president of the republic, who is elected for a period of four years by the direct vote of the people, cannot succeed himself in office, and is ineligible for re-election for a period of eight years. The executive powers of the president are exercised with the assistance of a cabinet (*Consejo de Ministros*).

whose members the president appoints and removes freely, their number (17, including four without portfolio) being determined by law. The president sanctions, promulgates and executes the laws, and supplements them (partly co-ordinately with congress) by administrative regulations; holds veto and pardoning power; controls with the senate political appointments and removals; conducts foreign relations, submitting treaties to the senate for ratification; and is commander in chief of the armed forces of the republic. Congress consists of two houses. The senate contains nine members from each province, elected for four years by direct vote; candidates for the office are ineligible if they have been on active duty in the armed forces within two years of the date of their candidacy. The senate is the court of trial for the president, ministers of the government and provincial governors when accused of political offenses. It also acts jointly with the president in political appointments and treaty making. The house of representatives is composed of one member for every 35,000 inhabitants or fraction thereof in each of the provinces, the number being determined by the latest official national census. Members are elected by direct vote, one-half retiring every two years. The house of representatives has the special power of impeaching the president and ministers of government. Both houses hold regular sessions at the same time, twice a year, the first beginning the third Monday in September and the second commencing the third Monday in March. Each session of congress lasts not less than 60 days. The powers of congress are extensive, including, in addition to ordinary legislative powers, control of financial and foreign affairs and the power to declare war and approve treaties of peace.

The constitution of 1940 provides for a centralized republic of six provinces—Pinar del Río, La Habana, Matanzas, Las Villas, Camagüey and Oriente. Each has a provincial governor and assembly chosen directly by the people, generally charged with independent control of matters affecting the province; but the president may interfere against an abuse of power by either the governor or the assembly. Municipalities are administered by mayors (*alcaldes*) and assemblies elected by the people, and control strictly municipal affairs. The *término municipal* is the chief political and administrative civil division. It is an urban district together with contiguous rural territory. Its divisions are *barrios*. The president may interfere if necessary in the municipality as in the province; and so may the governor of the province. But all interference is subject to review of claims by the courts. Both provinces and municipalities are forbidden by the constitution to contract debts without a coincident provision of permanent revenue for their settlement.

The franchise is granted to all citizens of Cuba over 21 years of age not mentally incapacitated nor convicted of crime nor serving in the armed forces nor on the police force. A foreigner may become a naturalized citizen after five years of continuous residence, or he may gain citizenship in a shorter period of time by marrying a citizen of Cuba. The government may not subsidize any religion. Provisions regarding labour protection and social security are among the most advanced in Latin America.

Primary education is compulsory and supported by the state. All schools supported by the state, province or municipality, except universities and schools offering specialized pre-university studies, are free. Teachers in the primary schools must receive their training in one of the normal schools supported by the state, or from the "schools of pedagogy in the universities." Included in the school system of Cuba are kindergartens, lower primary schools (six years), higher primary schools (three years), secondary schools (four years), normal schools, various types of special rural, vocational and adult training centres, and the University of Havana. Data on enrolments and the number of schools in each category differ as a result of the arbitrary groupings which are frequently made. Ofelia Morales (see *Educational Yearbook of the International Institute of Teachers College*, Columbia University, 1942) cites the following statistics on schools and enrolments for an unspecified but presumably recent year: 565 urban kindergartens attended by about 31,000 children; 4,227 urban and semi-urban lower primary schools with an average attendance of 437,965 pupils; 37 urban higher primary schools with 7,741 pupils; 1,113 civic-rural lower primary schools with 57,050 pupils; 40 rural boarding schools for children (*hogares infantiles campesinos*—a type of higher primary school of prevocational character), each with 100 pupils; 24 secondary schools with 18,664 pupils; two schools for the preparation of kindergarten teachers with an enrolment of 475 students; and six normal schools with an enrolment of 3,087 students. In the field of vocational education there are four schools of arts and trades with 1,600 students; two technical industrial schools (one for boys with 331 students, and one for girls with 122 students); an unspecified number of schools of commerce attended by about 3,000 students; and six provincial schools of agriculture (*granjos agrícolas*). Adult education is given in 144 public night schools, while more than 40,000 adults in rural areas attend evening classes held twice a week in the civic-rural schools. The University of Havana (founded 1728), which enjoyed autonomy from 1937 on, had 13,949 students enrolled in 1941. (R. W. Rd.)

Finance.—In 1891–96 the average annual income was $20,738,930, the annual average expenditure $25,967,139. More than half of the revenue was derived from customs duties. Every Cuban paid about twice as heavy taxes as a Spaniard of the peninsula. Very little was spent on sanitation, roads, other public works and education. Lotteries, which were an important source of revenue under Spain, were abolished under the republic. The debt resting on the colony in 1895 (a large part of it as a result of the war of 1868–78, the entire cost of which was laid upon the island, but a part as the result of Spain's war adventures in Mexico and Santo Domingo, home loans, etc.) was $168,500,000. The attainment of independence freed the island from this debt, and from enormous contemplated additions to cover the expense incurred by Spain during the last insurrection. After that time the public finances have greatly improved, with enlarged income and all foreign expenditures eliminated. The consolidated public debt on June 30, 1942, exclusive of the floating debt, was $120,995,000, itemized as follows: foreign debt, $113,628,000, and domestic debt, $7,367,000. The following table shows the national revenue and expenditure for the years 1938–39 to 1943:—

	Revenue	*Expenditure*
1938–39	$83,250,000	$83,173,788
1940	75,670,000	79,238,000
1941	75,945,000	77,549,000
1942	89,960,000	89,956,000
1943	89,375,000	89,994,080

In 1939 the fiscal year was changed to coincide with the calendar year, but this change was reversed in Nov. 1941, and the fiscal year again runs from July 1 to June 30. United States and British investments, always important in the agriculture and manufactures of the island, greatly increased following 1898, and by 1940 amounted to $559,797,000 for the United States and (1942) £26,970,685 for the British. United States investments were $80,000,000 in 1901. While most of the United States money is in sugar, there are also large sums in tobacco, mining, fruit, railways, streetcar companies, docks, electric light and power companies, telephone companies, banks, hotels, steamship lines and Cuban bonds. Under a law of Nov. 7, 1914, a Cuban coinage system similar to that of the United States was introduced. Par value of the peso is $1 U.S. currency; the average exchange rate was 90 cents in 1940.

Bibliography.—E. Pechardo, *Geografía de le isla de Cuba* (Havana, 1854); M. Rodríguez-Ferrer, *Naturaleza y civilización de . . . Cuba*, vol. 1 (Madrid, 1876); United States Geological Survey, *22nd Annual Report* (1901); ibid., *Bulletin No. 192* (1902); R. T. Hill, *Cuba and Porto Rico with the other West Indies* (New York, 1898); E. M. Masse, *L'île de Cuba* (Paris, 1825); D. Turnbull, *Travels in the West* (London, 1840); R. R. Madden, *The Island of Cuba* (London, 1853); F. Matthews, *The New-Born Cuba* (New York, 1899); H. C. Brown, "Report on Mineral Resources of Cuba," *Civil Report of General Leonard Wood*, governor of Cuba (1902), vol. v.

Climate.—*Climatología. Secretaría de Hacienda* (Habana, 1937). Sanitation.—For conditions 1899–1902, see *Civil Reports* of American military governors. For conditions after 1902 consult the *Informe anual sanitario y demográfico*.

Agriculture.—Consult the *Revista de agricultura* and other publications of the *Secretaría de Agricultura;* also *Anuario Azucarero de*

Cuba (Habana), and P. G. Minneman, *The Agriculture of Cuba*, U.S.D.A., For. Agr. Bull., No. 2 (Washington, 1943).

INDUSTRIES, COMMERCE, COMMUNICATIONS.—For conditions about 1899 consult R. P. Porter (Special Commissioner of the United States government), *Industrial Cuba* (New York, 1899); W. J. Clark, *Commercial Cuba* (New York, 1898); reports of foreign consular agents in Cuba; and the statistical annuals of the *Secretaría de Comercio* and the *Secretaría de Hacienda* on foreign commerce and railways.

POPULATION.—The early censuses were extremely unreliable. Illuminating discussions of them can be found in Humboldt's *Essay*, Saco's *Papeles* and Pezuela's *Diccionario*. See *United States Department of War, Report on the Census of Cuba 1899* (Washington, 1899); *U.S. Bureau of the Census, Cuba: Population, History and Resources*, 1907 (1909) and *Información estadística de la población de la República de Cuba* (Habana, 1932).

EDUCATION.—See *Civil Reports* of the American military government, 1899–1902; United States commissioner of education, *Report, 1897–1898;* current reports in *Informe del superintendente de escuelas de Cuba . . .* (Havana, 1903–). On Letters and Culture.—E. Pechardo y Tapia, *Diccionario . . . de voces Cubanas* (Havana, 1836, 4th ed., 1875; all editions with many errors); Antonio Bachiller y Morales, *Apuntes para la historia de las letras y de la instrucción pública de Cuba* (3 tom., Havana, 1859–1861); J. M. Mestre, *De la filosofía en la Habana* (Havana, 1862); A. Mitjans, *Estudio sobre el movimiento científico y literario de Cuba* (Havana, 1890); biographies of Varela and Luz Caballero by Rodríguez (*see* below); files of *La Revista de Cuba* (16 vols., Havana, 1877–1884) and *La Revista Cubana* (21 vols., Havana, 1885–1895); *Educational Yearbook, 1942*, Columbia University (1942).

ADMINISTRATION.—Consult the literature of history and colonial reform given below. Also: Leandro García y Gragitena, *Guía del empleado de hacienda* (Havana, 1860), with very valuable historical data; Carlos de Sedano y Cruzat, *Cuba desde 1850 a 1873. Colección de informes, memorias, proyectos y antecedentes sobre el gobierno de la isla de Cuba* (Madrid, 1875); Vicente Vásquez Queipo, *Informe fiscal sobre fomento de la población blanca* (Madrid, 1845); *Información sobre reformas en Cuba y Puerto Rico celebrada en Madrid en 1866 y 67 por los representantes de ambas islas* (1st ed., New York, 1867; 2nd ed., New York, 1877); and the *Diccionario* of Pezuela. These, with the works of Saco, Sagra, Arango and Alexander von Humboldt's work, *Essai politique sur l'île de Cuba* (Paris, 1826; Spanish editions, 1 vol., Paris, 1827 and 1840; English translation by J. S. Thrasher with interpolations, New York, 1856), are indispensable. For conditions at the end of the 18th century, Fran. de Arango y Parreño, *Obras* (2 tom., Havana, 1888). For later conditions, E. Valdés Domínguez, *Los Antiguos Diputados de Cuba* (Havana, 1879); B. Huber, *Aperçu statistique de l'île de Cuba* (Paris, 1826); Humboldt; Sagra, vols. i–ii of the book cited above being the *Historia física y política*, and also the earlier work on which they are based, *Historia económica-política y estadística de . . . Cuba* (Havana, 1831); treatises on administrative law in Cuba by J. M. Morilla (Havana, 1847; 2nd ed., 1865) and A. Govin (Havana, 1882–83); A. S. Rowan and M. M. Ramsay, *The Island of Cuba* (New York, 1896); *Colección de reales órdenes, decretos y disposiciones* (Havana, serial, 1857–98); *Spanish Rule in Cuba. Laws Governing the Island. Reviews Published by the Colonial Office in Madrid . . .* (New York, for the Spanish legation, 1896); and compilations of Spanish colonial laws listed under article INDIES, LAWS OF THE. On the new Republican regime: *Gaceta Oficial* (Havana, 1903–); reports of departments of Government; M. Romero, Palafox, *Agenda de la República de Cuba* (Havana, 1905). *See* also the *Civil Reports* of the United States military governors, J. R. Brooke (1899; Havana and Washington, 1900), L. Wood (1900–02; Washington, 1901–02).

HISTORY.—The works (*see* above) of Sagra, Humboldt and Arango are indispensable; also those of Francisco Calcagno, *Diccionario biográfico Cubano* (ostensibly, New York, 1878); Vidal Morales y Morales, *Iniciadores y primeros mártires de la revolución Cubana* (Havana, 1901); José Ahumada y Centurión, *Memoria histórica política de . . . Cuba* (Havana, 1874); Jacobo de la Pezuela, *Diccionario geográfico-estadístico-histórico de . . . Cuba* (Madrid, 1863–66); *Historia de . . . Cuba* (4 tom., Madrid, 1868–78; supplanting his *Ensayo histórico de . . . Cuba, Madrid and New York* (1842); and José Antonio Saco, *Obras* (New York, 1853), *Papeles* (Paris, 1858–59), and *Colección póstuma de Papeles* (Havana, 1881). Also: Rodríguez Ferrer, *op. cit.* above, vol. 4 (Madrid, 1888); P. G. Guitéras, *Historia de . . . Cuba* (New York, 1865–66). Of great value is J. Zaragoza, *Las Insurrecciones en Cuba. Apuntes para la historia política* (Madrid, 1872–73); also J. I. Rodríguez, *Vida de . . . Félix Varela* (New York, 1878); *Vida de D. José de la Luz* (New York, 1874; 2nd ed., 1879), and C. H. A. Forbes-Lindsay, *Cuba and her People of To-day* (Boston, 1911). On early history see *Colección de documentos inéditos relativos al descubrimiento . . . de ultramar* (series 2, vols. i, iv, vi, Madrid, 1885–90). On archaeology, N. Fort y Roldan, *Cuba indígena* (Madrid, 1881); M. Rodríguez Ferrer (*see* above); and especially A. Bachiller y Morales, *Cuba primitiva* (Havana, 1883). For the history of the Cuban international problem consult José Ignacio Rodríguez, *Idea de la anexión de la isla de Cuba a los Estados Unidos de América* (Havana, 1900), and J. M. Callahan, *Cuba and International Relations* (Johns Hopkins University, Baltimore, 1898), which supplement each other. On the domestic reform problem there is an enormous literature, from which may be selected (*see* general histories above and works cited under § Administration of this bibliography): M. Torrente, *Bosquejo económico-político* (Madrid-Havana, 1852–53); D. A. Galiano, *Cuba en 1858* (Madrid, 1859); José de la Concha, twice captain general of Cuba, *Memorias sobre el estado político, gobierno y administración de . . . Cuba* (Madrid, 1853); A. López de Letona, *Isla de Cuba, reflexiones* (Madrid, 1856); F. A. Conte, *Aspiraciones del partido liberal de Cuba* (Havana, 1892); P. Valiente, *Réformes dans les îles de Cuba et de Porto Rico* (Paris, 1869); C. de Sedano, *Cuba: Estudios políticos* (Madrid, 1872); H. H. S. Aimes, *History of Slavery in Cuba, 1511–1868* (New York, 1907); F. Armas y Céspedes, *De la esclavitud en Cuba* (Madrid, 1866), and *Régimen político de las Antillas Españolas* (Palma, 1882); R. Cabrera, *Cuba y sus Jueces* (Havana, 1887; 9th ed., Philadelphia, 1895; 8th ed., in English, *Cuba and the Cubans*, Philadelphia, 1890); P. de Alzola y Minondo, *El Problema Cubano* (Bilbao, 1898); various works by R. M. de Labra, including *La Cuestión social en las Antillas Españolas* (Madrid, 1874); *Sistemas coloniales* (Madrid, 1874); R. Montoro, *Discursos . . . 1878–1893* (Philadelphia, 1894); Labra *et al.*, *El Problema colonial contemporánea* (Madrid, 1894); articles by Em. Castelar *et al.*, in Spanish reviews (1895–98); C. M. Pepper, *Tomorrow in Cuba* (New York, 1899); A. G. Robinson, *Cuba and the Intervention* (New York, 1905).

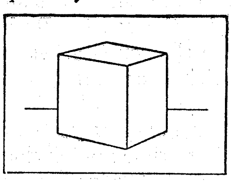
(C. E. CH.; G. M. MCB.; R. W. RD.)

CUBATURE: *see* QUADRATURE.

CUBE, a regular solid with six square faces; that is, a regular hexahedron. Since the volume of a cube is expressed, in terms of an edge, as e^3, in arithmetic and algebra the third power of a quantity is called the cube of that quantity. That is, 3^3, or 27, is the cube of 3; and x^3 is the cube of x.



A number of which a given number is the cube is called the cube root of the latter number; that is, since 27 is the cube of 3, 3 is the cube root of 27—symbolically, $3=\sqrt[3]{27}$. A number that is not a cube is said to have a cube root, the value being expressed approximately; that is, 4 is not a cube, but we speak of the cube root of 4, $\sqrt[3]{4}$, the approximate value being 1.587, because 1.587^3 is approximately 4. In Greek geometry the duplication of the cube was one of the most famous of the unsolved problems. It required the construction of a cube that should have twice the volume of a given cube. This has been proved to be impossible by the aid of the straight edge and compasses alone, but the Greeks were able to effect the construction by the use of higher curves, notably by the cissoid of Diocles (*see* CURVE). Hippocrates (*c.* 430 B.C.) showed that the problem reduced to that of finding two mean proportionals between a line segment and its double; that is algebraically, to that of finding x and y in the proportion $a:x=x:y=y:2a$, from which $x^3=2a^3$, and hence the cube with x as an edge has twice the volume of one with a as an edge.

CUBEBS, the fruit of several species of pepper (*Piper*), family Piperaceae. The cubebs of pharmacy are produced by *Piper Cubeba*, a climbing woody shrub indigenous to south Borneo, Sumatra, Prince of Wales island, and Java. The cubeb is cultivated in Java and Sumatra, the fruits are gathered before they are ripe, and carefully dried. Commercial cubebs consist of the dried berries, usually with their stalks attached; the pericarp is grayish-brown, or blackish and wrinkled; and the seed, when present, is hard, white and oily. The odour of cubebs is agreeable and aromatic; the taste, pungent, acrid, slightly bitter and persistent. About 15% of a volatile oil is obtained by distilling cubebs with water; after rectification with water, or on keeping, this deposits rhombic crystals of camphor of cubebs, $C_{15}H_{26}O$; cubebene, the liquid portion, has the formula $C_{15}H_{24}$. Cubebin, $CH_2[O]_2C_6H_3 \cdot CH : CH \cdot CH_2OH$, is crystalline and may be prepared from cubebene, or from the pulp left after the distillation of the oil. The drug, along with gum, fatty oils, and malates of magnesium and calcium, contains also about 1% of cubebic acid, and about 6% of a resin.

The volatile oil—oleum cubebae—is the form in which this drug is most commonly used, the dose being 5 to 20 minims, which may be suspended in mucilage or given after meals in a cachet. The drug has the typical actions of a volatile oil, but exerts some of them in an exceptional degree. Thus it is liable to cause a cutaneous erythema in the course of its excretion by the skin; it has a marked diuretic action; and is an efficient disinfectant of the urinary passages. Cubeb is often used in the form of cigarettes for asthma, chronic pharyngitis and hay-fever and in lozenges for use in bronchitis. It is also given in gonorrhoea, where its antiseptic action is of much value.

CUBE ROOT: *see* Root.

CUBIC CURVE: *see* Curve.

CUBICLE, a small chamber containing a couch or a bed. The rooms opening into the atrium of a Roman house are known as cubicula. In modern usage, a cubicle is one of the small separate bedrooms or cells into which a dormitory may be divided; or similarly separated space, as in a library, for private study.

CUBITT, THOMAS (1788–1855), English builder, was born at Buxton, near Norwich, on Feb. 25, 1788. He was responsible for many splendid ranges of London houses, such as Tavistock, Gordon, Belgrave and Lowndes squares and the district of South Belgravia, and was one of the originators of Battersea Park, the first of the people's parks. He died at Denbies, near Dorking, on Dec. 20, 1855.

CUBITT, SIR WILLIAM (1785–1861), English engineer, was born in 1785 at Dilham in Norfolk, where his father was a miller. Among his works were a number of canals, including drainage sluices, besides docks and coal drops, and the S.E. railway, of which he was chief engineer. He was consulted by foreign governments and municipalities, and reported on the construction of the Paris and Lyons railway. He was knighted for his services in connection with the buildings erected in Hyde Park for the exhibition of 1851. He died on Oct. 13, 1861.

CÚ CHULAINN, the chief hero of the second of the three cycles of ancient Irish mythology. He is closely associated with the warriors who centre in Conchobar mac Nessa, the Ultonian king; but although he is represented as being a son of Dechtire, the king's sister, he is racially distinct from them, for he is usually represented as short in stature and of dark complexion. According to one story, he was son of Sualtam, a minor warrior of the Conchobar cycle; according to another, he was a son and incarnation of the sun-god Lug. His first name, Setanta, can hardly be dissociated from that of the Setantii, a Brythonic people situated at the mouth of the Mersey. He joined the court of Conchobar at the age of six, and even then distinguished himself in deeds of prowess; he killed the watch-dog of the smith Culann, and acted as guard in its stead; whence his most familiar name, Cú Chulainn, "the Hound of Culann." He studied the art of the warrior with Scáthach, a she-warrior in Alba; married Emer, daughter of Forgall, and settled in Dún Delgan (Dundalk). The earthwork there called "Cú Chulainn's fort" is, however, merely a Norman motte. He was the foremost champion of Ulster in the great raid described in the tale *Táin Bó Cúalnge* ("The Cattle-raid of Cooley"), in which he single-handed held back the advancing hosts of Connacht. He was slain at the age of 27 by Lugaid, son of Cú-Roí mac Daire, warrior of Munster. But whatever may be the historical basis of the legend, practically all the details about Cú Chulainn transmitted to us must be regarded as mythical.

The chief tales about Cú Chulainn which have been preserved have been collected in translations by various hands by E. Hull, *The Cuchullin Saga* (1898). *See* also Windisch's edition (Leipzig, 1905) and Dunne's translation (1914) of *Táin Bó Cúalnge;* as well as the relevant sections of Thurneysen's *Die irische Helden und Königsage* (Halle, 1921). (R. A. S. M.)

CUCKOO, a well-known bird, distributed during the breeding season over most of Europe and Northern Asia; in many languages its name is derived from its frequently repeated call. Its abnormal breeding habits have made it the subject of much controversy among ornithologists. The fact that it was parasitic on other birds in the early stages of its life was known as far back as the time of Aelian, yet it is only within the last 50 years that the details have been gradually worked out and there are still some obscure points.

The common cuckoo, *Cuculus canorus,* Linn., winters in Africa south of the Sahara, India, the Malay Peninsula, south China and New Guinea. On the south coast of England it usually arrives about the second week of April. On the Continent many pass beyond the Arctic circle to the tree limit in north Finland. The bird itself is far oftener heard than seen. Its bluish colour, barred breast and long tail suggest a likeness to the sparrow-hawk (*Accipiter nisus*) and it is no uncommon sight to see it mobbed by small birds in the neighbourhood of a nest.

Breeding Habits.—On reaching its breeding grounds each female cuckoo asserts a claim over a definite territory, which varies in size with pressure from other competitors and the amount of food and fosterers' nests available. If another hen invades her domain, fighting takes place continually till one or the other is driven off. At least early in the season, each hen is usually attended by two or three cock birds. These also seem to return year after year to the same districts.

In the British Isles alone 60 species have been recorded as foster parents of the cuckoo and 120 on the Continent. Out of the dozen regular fosterers in England only about six are really common.

Variation in Eggs.—It is now definitely known that each hen cuckoo lays eggs of the same type throughout her life, but eggs from different individuals show much variation. A series from Europe and Asia not only shows astonishing variability but, as first pointed out by Baldamus (*Naumannia,* 1853), many eggs show a remarkable similarity to those of the fosterers in whose nests they are found. The theory of mimicry was at first hotly disputed by many English naturalists, mainly on the ground that many cuckoos' eggs deposited in the nests of the hedge sparrow (*Prunella modularis*) show no likeness whatever to the vivid blue eggs of the host. With other common English fosterers such as the robin or pied wagtail, often no great similarity is apparent, and the occasional instances of close mimicry might be dismissed as accidental if all the evidence were derived from south England alone.

A more comprehensive view, however, leads to different conclusions. In vast forested areas of north-eastern Europe the cuckoo is mainly parasitic on the redstart (*Phoenicurus phoenicurus*), and occasionally other species, all of which lay blue, or bluish-green eggs. Here practically all cuckoos' eggs are blue. In the great reed-beds round some Hungarian lakes the normal host is the great reed warbler (*Acrocephalus arundinaceus*) and a cuckoo's egg, boldly marked with grey and black, has been evolved which closely matches the host's. Many similar instances could be quoted, but it is evident that mimicry has become general because it is useful in reconciling the fosterer to the presence of the parasite's egg.

Any theory must take into account the fact that in some districts mimicry is only occasional. Statistics derived from series of cuckoos' eggs in museums and private collections are misleading, because nests of some species are much more readily found than others. In English collections cuckoos' eggs from nests of the reed warbler and hedge sparrow are common, while those from meadow pipits' nests are less frequently found. Yet the latter is the most numerous host over the greater part of Britain. From the study of the scanty material available we find that in the meadow pipit-cuckoos mimicry is very close, but in those districts where three or four species are victimized we often meet with a "mixed type" which shares in the characters of the various fosterers, and as regards the hedge sparrow mimicry is almost lacking.

Influence of Selection.—Dismissing this last species for a moment, it appears that the fosterers have allowed only those strains of cuckoo to survive which laid eggs harmonizing more or less closely with their own, by elimination (either through desertion of the nest or ejection of the egg) of all eggs in strong contrast with their own. This process has gone on uninterruptedly where the cuckoo is parasitic on one species only, or on two or three which lay similar eggs; but in districts where two or more fosterers which lay eggs of divergent types are victimized, interbreeding between the strains of cuckoo has produced the "mixed type" which passes muster with either, but avoids close mimicry. In the case of the hedge sparrow, experiment confirms the supposition that while other species resent the intrusion of strongly contrasting eggs, this species accepts them with indifference. The intensive study of the cuckoo by Dr. E. Rey and especially by V. Čapek has shown that where close mimicry has been thus obtained the percentage of rejections by the fosterer falls to 5%, but where the host is more exacting or mimicry is less perfect it may rise to 10, 30 or even 77%. Yet in all these cases the cuckoo has obtained a foothold and some proportion of young are reared annually. There are, however, a few cases in which the cuckoo is apparently struggling with little or no success to impose her eggs on an unwilling host. (Experimental research has been carried on in Germany by Dr. Rensch and in Africa by Swynnerton on these lines.)

Method of Egg Deposition.—The method by which the cuckoo inserts her egg in the fosterer's nest is still the subject of keen controversy. The careful work of E. P. Chance, supported by the evidence of films and photographs, has proved that in the case of ground-building species such as the meadow pipit, the cuckoo takes up her position on some commanding site near a selected nest, some time before laying is due. She glides down to the nest, picks up one of the eggs with her bill, settles on the nest for five or ten seconds, during which period the egg is laid, then backs out of the nest and flies away, taking the host's egg with her and usually devouring it. The same process also takes place in most open nests in trees or bushes. In the case of small birds which make domed nests with circular openings, or breed in holes of trees or rocks, this method seems at first impracticable, though we have good evidence that the cuckoo can squeeze into a very small opening, and domed nests often show traces of damage to their superstructure by the cuckoo when inserting her egg. Levaillant's suggestion that the egg is carried in the mouth and inserted by the bill provides such a simple explanation that it has been perhaps too hastily adopted, but most of the evidence fails to stand the test of close examination, and definite proof of its adoption is still lacking. The alternative suggestion is that the egg is laid direct into the nest hole while the bird is clinging with outspread wings to the side of the nest, and that a certain measure of direction can be imparted to the egg at the moment of laying by the extrusion of the lower walls of the oviduct. Occasional instances in which a cuckoo's egg has been found lying beneath the entrance to a wren's nest are more readily explained thus than if we accept the suggestion of insertion by the bill.

Rey was the first to assume that the eggs of the cuckoo are usually laid at intervals of about 48 hours, and Chance has proved this. By systematically removing the eggs as laid and providing a succession of fosterers' nests at the necessary intervals, Chance has also proved that a single hen may lay up to 25 eggs in a season. This was in 1922, the next highest being 21 from the same bird in 1920. Under natural conditions, nests are not always available and probably the average clutch of the cuckoo consists of five to seven eggs, laid on alternate days, followed by a pause and then by a further clutch of four or five.

Ejection of Foster-brothers.—The cuckoo's egg is relatively small, and the incubation period extends for just over 12 days, so that it is frequently hatched before the foster-brothers. The young bird, blind and naked, with long fore-limbs with which it feels its way, does not rest till it has worked itself underneath its companions one by one, and backing to the edge of the nest, has thrown them out over the rim. Burdet has filmed a case in which the young were thus ejected from under a brooding redstart. No notice is taken by the parents of their dead or dying young: all their efforts are devoted to satisfying the ravenous usurper. The young cuckoo remains in the nest about 20 days, keeping up a continual metallic chirp and opening its wide orange gape frequently. Even after leaving the nest a foster parent will often alight on the back of the young bird in order to deliver food into its gaping maw, and other species have also been known to respond to the stimulus of its food-appeal. The mortality among the young is heavy: out of 34 observed by J. H. Owen, 17 failed to survive. The old birds, whose impending departure is heralded by a change of note, begin to leave England in July, and have all gone by the end of August, but the juveniles may be seen even in September.

Economic Status.—Although Collinge estimates that 83% of the food of the cuckoo consists of injurious insects, especially hairy caterpillars, which are rejected by most birds, and regards it as extremely useful, it must be remembered that every cuckoo is reared at the expense of a brood of young insectivorous birds, and monopolizes the attentions of the old birds for some five weeks in the breeding season. Cuckoos also destroy nests with incubated eggs or young in order to force the parents to lay again.

Great-Spotted Cuckoo.—In another group of cuckoos, which includes the great-spotted (*Clamator glandarius*) and the crested cuckoos (*C. jacobinus*) inhabiting southern Europe, Asia and Africa, a different type of parasitism prevails. The former species is parasitic on magpies, crows or ravens, and its eggs show a striking resemblance to the Corvine type. When hatched the young parasites (sometimes as many as three to five in one nest) do not eject their foster-brothers, and the whole family lives in harmony. It has been pointed out by the writer that striking mimicry exists between the young cuckoos and their companions. This is also the case with the Indian koel (*Eudynanys scolopaceus*) which is parasitic in a similar way on crows. All cuckoos have not adopted the parasitic habit, for the two common species of North America, the black-billed and yellow-billed cuckoos (*Coccyzus erythrophthalmus*) and (*C. americanus*) both rear their own young, as also do the road runners (*Geococcyx*) and in the old world, the coucals. Two groups, however, deserve mention on account of their abnormal habits. The ani (*Crotophaga ani*) nests socially, several females combining to build a large nest, in which they deposit their eggs together and apparently incubate side by side. The Guira cuckoo (*Guira guira*), of Brazil, Paraguay and Argentina, lays extraordinary eggs, blue with a raised network of white chalky matter. The first nest of the season is so flimsy that the eggs fall to the ground and perish, but the second is more substantial.

See E. P. Chance, *The Cuckoo's Secret* (1922); F. B. Kirkman, *British Bird Book* (for less recent work); F. C. R. Jourdain, *Proc. Zool. Soc.* 1925 (Bibl.) (F. C. R. J.)

CUCKOO-PINT, called also lords-and-ladies and wake-robin (*Arum maculatum*), the only plant of the arum family (Araceae) indubitably native to the British Isles. It is common in woods and hedgerows in England, but probably not wild in Scotland. It grows from a whitish root-stock, which sends up in the spring a few long-stalked, arrow-shaped, polished green leaves, often marked with dark blotches. These are followed by the inflorescence, a fleshy spadix bearing in the lower part numerous crowded simple unisexual flowers and continued above into a purplish or yellowish appendage; the spadix is enveloped by a leafy spathe, constricted in the lower part to form a chamber, in which are the flowers. The mouth of this chamber is protected by a ring of hairs pointing downwards, which allow the entrance but prevent the escape of small flies; after fertilization of the pistils the hairs wither. Insects visit the plant, attracted by the foetid smell, and carry the pollen from one spathe to another. As the fruit ripens the spathe withers, and the brilliant red berries are exposed. This interesting aroid occurs in various parts of Europe and also in northern Africa. Its counterpart in eastern North America is the jack-in-the-pulpit. (*See* ARACEAE, ARUM, JACK-IN-THE-PULPIT.)

CUCKOO-SPIT, a frothy secretion found upon various plants and produced by the immature stages of insects known as froghoppers, pertaining to the family Cercopidae of the order Hemiptera. The origin and formation of the froth has been much discussed. It appears that juices of the plant imbibed by the insect, when voided from the alimentary canal, become mixed with the secretion of special abdominal glands, which enables the product to maintain its foamy coherence and hold the air-bubbles which are introduced through a special valve. Cuckoo-spit is believed to protect the insects from the attacks of enemies and also from desiccation. The common cuckoo-spit insect of Europe is *Cercopis spumaria* which also occurs in North America.

More than 2,000 species of this family have been described from various parts of the world. Most of the species are small insects, but in the tropical regions some of the species are medium sized; in Africa certain species occur in enormous numbers and secrete large amounts of honey dew, which drips from the branches like rain. Such trees are called rain trees. One species, the sugar cane froghopper, *Tomaspis saccharina,* is very destructive to sugar cane in Trinidad. Another species, *Aphrophora salicis,* has been imported from Europe to North America and is sometimes a serious pest of basket and ornamental willow. In Africa, India, the East Indian Islands and Australia there is a group of froghoppers which secrete small calcareous tubes of various shapes. The nymphs live inside these tubes in a mass of spittle. The tubes resemble small snail shells and curiously enough were described as species of snails by some of the earlier zoologists. (Z. P. M.)

CUCULIDAE: *see* Cuckoo; Road-runner.

CUCUMBER (*Cucumis sativus*), a creeping plant of the family Cucurbitaceae. It is widely cultivated for its fruit and originated probably in northern India. It is a tender annual with a rough, succulent trailing stem and stalked hairy leaves with three to five pointed lobes; the stem bears branched tendrils by which the plant can be trained to supports. The short-stalked, yellow, bell-shaped flowers are unisexual, but staminate and pistillate are borne on the same plant; the latter are recognized by the swollen warty green ovary below the rest of the flower. Pollination is dependent on an outside agency such as bees. Cucumbers grown in frames or a greenhouse may be pollinated by keeping a hive nearby or inside. In Great Britain and northern Europe the cucumber is extensively grown in frames or on trellises in greenhouses because the climate is so cool that few varieties are productive in out-of-door culture. Its heat requirement is one of the highest among the common vegetables. There are three groups of varieties, based on adaptability and use: (1) very large-fruited, strong-growing varieties adapted only to greenhouse or frame culture. Several English greenhouse varieties will form fruits without pollination and seed formation, and are generally much larger than those popular in the United States; (2) large-fruited varieties grown out-of-doors for slicing or raw salads, and generally having white spines; (3) small-fruited prolific varieties grown out-of-doors principally for making pickles, and having black spines. The food value of the cucumber is low but it is popular for salads and relishes. In the U.S. relatively few cucumbers are grown under glass but they are widely grown in the field. About 4,200,000 bu. were grown annually from 1930 to 1941 for marketing fresh; and about 5,600,000 bu. for preserving in brine for making pickles, together requiring about 128,000 ac. of land. They are extensively grown in home gardens. In the open, cucumbers are planted in "hills" about 5 ft. by 5 ft. apart, with two plants per hill; or with the plants spaced singly about 2 ft. apart in rows 5 ft. apart. An excess of seed, about 2 lb. to 3 lb. per acre, is sown, and the small plants are thinned to the number desired. The Sikkim cucumber, *C. sativus* var. *sikkimensis,* is a large-fruited form, reaching 15 in. long by 6 in. thick, grown in the Himalayas of Sikkim and Nepal. The West India gherkin, *Cucumis Anguria,* has small, slender vines, and abundant small ellipsoid green fruit covered with warts and spines. It is used for pickling. (V. R. B.)

A. Male flowers. B. Female flowers

CUCURBITACEAE, a botanical family of dicotyledons, containing 90 genera and about 750 species, found in the temperate and warmer parts of the earth but especially developed in the tropics. The plants are generally annual herbs, climbing by means of tendrils and having a rapid growth. The long-stalked leaves are arranged alternately, and are generally palmately lobed and veined. The flowers or inflorescences are borne in the leaf-axils, in which a vegetative bud is also found, and at the side of the leaf-stalk is a simple or branched tendril. There has been much difference of opinion as to what member or members the tendril represents; the one which seems most in accordance with facts regards the tendril as a shoot, the lower portion representing the stem, the upper twining portion a leaf. The flowers are unisexual, and markedly epigynous, the perianth and stamens being attached to a bell-shaped prolongation of the receptacle above the ovary. The five narrow pointed sepals are followed by five petals which are generally united to form a more or less bell-shaped corolla. There are five stamens in the male flowers; the anthers open toward the outside, are one-celled, with the pollen-sacs often elaborately twisted and variously united. The carpels, normally three in number, form an ovary with three thick, fleshy, bifid placentas bearing a large number of ovules on each side, and generally filling the interior of the ovary with a juicy mass. The short thick style has generally three branches, each bearing a fleshy, usually forked stigma. The fruit is a fleshy many-seeded berry with a tough rind (*pepo*), and often attains considerable size. The embryo completely fills the seed. The family is represented in Britain by bryony (*Bryonia dioica*), (fig. 1) a hedge-climber, perennial by means of large fleshy tubers which send up each year a number of slender angular stems. The leaves are heart-shaped with wavy margined lobes. The flowers are greenish, $\frac{1}{2}$ to $\frac{3}{4}$ in. in diameter; the fruit, a red several-seeded berry, is about $\frac{1}{4}$ in. in diameter. In North America the family is represented by a few genera comprising about 40 species, which occur chiefly in the southern parts of the United States and Mexico. Among these are the climbing wild cucumber or balsam apple (*Echinocystis lobata*) and the star-cucumber (*Sicyos angulatus*), of the eastern United States and Canada; the calabazilla or mock orange (*Cucurbita foetidissima*), of the southwestern U.S. and Mexico; and the man-root (*Echinocystis fabacea*), of California.

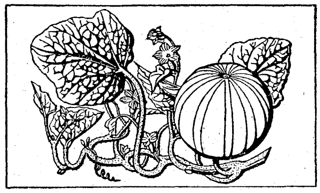

Fig. 2.—MELON, AN EDIBLE MEMBER OF THE GOURD FAMILY, SHOWING FLOWERS AND FRUIT (PEPO) AND GENERAL HABIT OF GROWTH

Many genera are of economic importance; *Cucumis* affords cucumber and muskmelon (*qq.v.*); *Cucurbita,* pumpkin, squash and marrow; *Citrullus vulgaris* is watermelon (*q.v.*), and *C. Colocynthis,* colocynth; *Ecballium Elaterium* (squirting cucumber), ejects its seeds, with a watery fluid, by the contraction of the wall of the fruit; *Sechium edule* (chocho), a tropical American species, is cultivated for its edible fruit; it contains one large seed which germinates *in situ. Lagenaria* is the gourd (*q.v.*). The fruits of *Luffa cylindrica* have closely netted vascular bundles in the pericarp, forming a kind of loose felt which supplies the well-known loofah or bath-sponge; its fruits are edible when not fully mature.

CUDAHY, an industrial city of Milwaukee county (Wis.), U.S.A., on Lake Michigan, 7 mi. S. of Milwaukee. It is served by the Chicago and North Western railway and the Pennsylvania-Central and Northwest air lines. Pop. (1940) 10,561. Its industries include a packing house, tannery and machine shops, and factories making drop forgings, bottling equipment and vinegar. Cudahy was founded in 1892 and incorporated in 1906.

CUDDALORE, a town of British India, the administrative headquarters of the South Arcot district of Madras, on the coast 125 mi. S. of Madras by the South Indian railway. Pop. (1941) 60,632. It lies low, but is regarded as exceptionally healthy. The principal exports are sugar, oilseeds and cake, and cotton goods. Trade is mostly coastal, and steamers lie 1 mi. offshore. The wharves, with a railway siding are on a backwater. Weaving and dyeing are carried on. There is a training school and an American mission. In the neighbourhood are the ruins of Fort St. David situated on the river Gadilam. As a small fort built by a Hindu merchant it fell into the hands of the Mahrattas after the capture of Gingi by Sivaji in 1677. From them it was purchased by the English in 1690, the purchase including not only the fort but the adjacent towns and villages "within ye randome shott of a piece of ordnance," and still spoken of as "cannon ball villages." The fortifications were greatly strengthened and in 1746 Fort St. David became the British headquarters for the south of India, and Dupleix' attack was successfully repulsed. Clive was appointed its governor in 1756. The French took it in 1758, abandoned it two years later, retook it, and withstood a British attack in 1783. In 1785 it finally passed into British possession.

CUDDAPAH, town and district, British India, in the Madras presidency. The town is 6 m. from the right bank of the river Pennar, and 161 m. by rail from Madras. Pop. (1941) 28,246. Once the capital of the Nawabs of Cuddapah, it is now a poor place. Hills rise on three sides, and it has a bad reputation from a health standpoint.

The district of Cuddapah has an area of 5,923 square miles. It is in shape an irregular parallelogram, divided into two nearly equal parts by the range of the Eastern Ghats, which intersects it throughout its entire length. The north, east and south-east is a low-lying plain; the other part, in the south and south-west, forms a high table-land from 1,500 to 2,500 ft. above sea-level. The chief river is the Pennar, which enters the district from Bellary on the west, and flows eastwards into Nellore. In the rains it contains a great volume of water but becomes an inconsiderable stream in the hot weather. The most interesting and ancient fort of Gurramkonda, which is supposed to have been built by the Golconda sultans, stands on a hill 500 ft. high, three sides of which consist of almost perpendicular precipices. The population of the district in 1941 was 1,056,507. The principal crops are millet, rice, other food grains, melons, groundnut and cotton. There are several factories for pressing cotton, and asbestos is worked. The district is served by lines of the Madras and the South Indian railways.

CUDWORTH, RALPH (1617–1688), English philosopher, was born at Aller, Somersetshire, the son of Dr. Ralph Cudworth (d. 1624), rector of Aller, formerly fellow of Emmanuel College, Cambridge. Cudworth was sent to his father's college, and was elected fellow in 1639. In 1642 he published *A Discourse concerning the true Notion of the Lord's Supper,* and a tract entitled *The Union of Christ and the Church.* In 1645 he was appointed master of Clare Hall and the same year was elected Regius professor of Hebrew. He was now recognized as a leader among the remarkable group known as the Cambridge Platonists (*q.v.*). The whole party were more or less in sympathy with the Commonwealth, and Cudworth was consulted by John Thurloe, Cromwell's secretary of state, in regard to university and government appointments. His sermons, such as that preached before the House of Commons on March 31, 1647, advocate principles of religious toleration and charity. In 1654 he was elected master of Christ's college, whereupon he married, and in the year 1662 he was presented to the rectory of Ashwell, Herts. In 1678 he completed and published *The True Intellectual System of the Universe: the first part, wherein all the reason and philosophy of atheism is confuted and its impossibility demonstrated* (imprimatur dated 1671). No more was published, perhaps because of the theological clamour raised against this first part. He died on June 26, 1688, and was buried in the chapel of Christ's. Much of Cudworth's work still remains in manuscript; *A Treatise concerning eternal and immutable Morality* was published in 1731; and *A Treatise of Freewill,* edited by John Allen, in 1838; both are connected with the design of his *magnum opus,* the *Intellectual System.*

The *Intellectual System* arose, so its author tells us, out of a discourse refuting "fatal necessity" or determinism. The immense fragment dealing with atheism is all that was published by its author. Cudworth criticizes two main forms of materialistic atheism, the atomic, adopted by Democritus, Epicurus and Hobbes; and the hylozoic, attributed to Strato, which explains everything by the supposition of an inward self-organizing life in matter. Atomic atheism is by far the more important, if only because Hobbes, the great antagonist whom Cudworth always has in view, is supposed to have held it. Atomism, in its purely physical application, is a theory that he fully accepts; he holds that it was taught by nearly all the ancient philosophers, and was only perverted to atheism by Democritus. It is only in conjunction with corporatism that it gives rise to atheism.

The only interest of the *Intellectual System* now is the light it throws upon the state of religious thought after the Restoration. As Bolingbroke said, Cudworth "read too much to think enough, and admired too much to think freely."

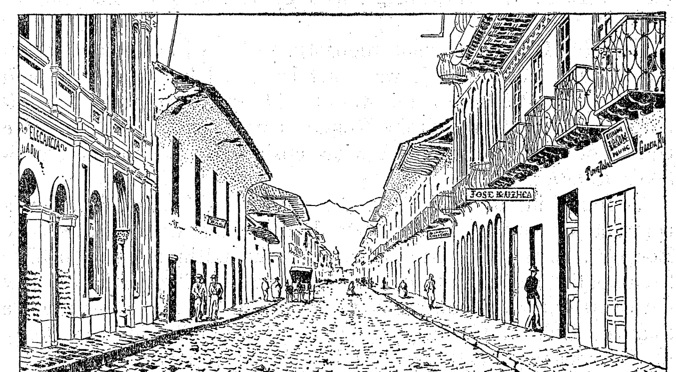
A much more favourable judgment must be given upon the short *Treatise concerning eternal and immutable Morality,* which deserves to be read by those interested in the development of British moral philosophy. It was an answer to Hobbes's famous doctrine that moral distinctions are created by the state, an answer from the standpoint of Platonism. Just as knowledge contains a permanent, intelligible element over and above the flux of sense-impressions, so there exist eternal and immutable ideas of morality. Cudworth's ideas, like Plato's, have "a constant and never-failing entity of their own," such as we see in geometrical figures; but, unlike Plato's, they exist in the mind of God, whence they are communicated to finite understandings. Hence "it is evident that wisdom, knowledge and understanding are eternal and self-subsistent things, superior to matter and all sensible beings, and independent upon them"; and so also are moral good and evil. The cardinal weakness of this form of intuitionism is its inability to give a list of the moral ideas that are self-evident like the axioms of geometry.

The *Intellectual System* was translated into Latin by J. L. Mosheim and furnished with notes and dissertations which were translated into English in J. Harrison's edition (1845). Our chief biographical authority is T. Birch's "Account," which appears in editions of the *Works.* There is a good chapter on Cudworth in J. Tulloch's *Rational Theology,* vol. ii. Consult also P. Janet's *Essai sur le médiateur plastique* (1860), W. R. Scott's *Introduction to Cudworth's "Treatise,"* and J. Martineau's *Types of Ethical Theory,* vol. ii. C. E. Lowrey, *The Philosophy of R. Cudworth* (1884).

CUENCA, a province in central Spain, part of the ancient kingdom of New Castile. It is bounded on the north by Guadalajara, north-east by Teruel, east by Valencia, south by Albacete, south-west by Ciudad Real, west by Toledo and north-west by Madrid. Pop. (1940) 333,335; area 6,588 sq. miles. The north-east districts of Cuenca are occupied by the rugged ridges and high plateaus of the Serranía de Cuenca, rising on the border of the province to the Cerro de san Felipe (5,932 ft.). Westward lie the Sierra de Altomira and broken country, sloping in the south-west to plains which form part of the district known as La Mancha. The province is drained by the upper streams of the Tagus in the north, and the Guadiana in the south-west and by the Júcar and its tributaries in the south-east. The climate is bleak and cold in the mountains and extreme on the plains, where summer heat is excessive. Prolonged droughts are common. The soil is fertile, where well watered, but the people are chiefly occupied in rearing sheep, goats, mules and asses. In the Alcarria region of the north, watered by the Guadiela, and near the rivers in La Mancha, olives, wine, cereals, saffron, wax, honey and silk are produced. The coniferous forests of the Serranía rival those of Soria. Owing to the scarcity of roads and railways the timber is exported almost entirely by river, much being floated down the Tagus to Madrid. Mineral output is confined to a little coal and salt, and the only industries, beyond saw-milling, are the making of rough cloth and pottery. Cuenca, the capital, pop. (1940) 23,038, is the terminus of the one railway line, a branch from Aranjuez which passes through Tarancón (6,673), the only other town with more than 6,000 inhabitants. The population is one of the scantiest and most illiterate in Spain. The province was held by Loyalists until the last stages of the civil war of 1936–39. (*See* also CASTILE.)

CUENCA, capital of Cuenca province, Spain; 125 mi. by rail S.E. of Madrid. Pop. (1940) 23,038 (mun., 24,702). The picturesque old town of Cuenca rises like a pyramid up a rugged height, crowned with a castle, which is separated from the surrounding Serranía de Cuenca by the deep gorges of the Júcar and Huecar rivers which unite at its foot. An iron bridge, built in 1906, replaces a 15th century structure across the Huecar gorge to the convent of San Pablo. The modern well-built quarter, with factories and the terminus of the Aranjuez railway, occupies flatter land below the Huecar. Cuenca, a Moorish fortress, was captured by Alphonso VIII of Castile in 1177. Shortly afterwards created an episcopal see, it became famous for its learning and industries, especially of wool and silver. Many of its convents and churches and the Gothic cathedral, celebrated for its sculpturing and for its beautifully carved 16th century wooden doorway, date from this period of prosperity. It was partially destroyed by Napoleonic troops, and later by Carlist rebels in 1874. Its chief trade is in timber from the pine forests; its industries are furniture, pottery, paper and leather manufacturing. Loyalists held it during the civil war of 1936–39.

CUENCA, a city and the capital of the province of Azuay, Ecuador, about 190 mi. S. of Quito and 70 mi. S.E. of Guayaquil. Pop. (1942 estimate) 49,569 (largely Indians), including the suburb of Ejido. Cuenca stands at the northern end of a broad valley, or basin, of the Andes, lying between the transverse ridges of Azuay and Loja, and is about 8,640 ft. above sea level. Near by is the hill of Tarqui which the French astronomers chose for their meridian in 1742. Communication with the coast is difficult. Cuenca is the third most important city of Ecuador, being the seat of a bishopric, and having a college, a university faculty, a cathedral and several churches, and a considerable industrial and commercial development. It manufactures sugar, woollen goods and pottery, and exports Peruvian bark (cinchona), hats, cereals,



BY COURTESY OF THE PAN-AMERICAN UNION

A STREET IN CUENCA, THE THIRD CITY OF ECUADOR, FOUNDED BY THE SPANIARDS IN 1557

cheese, hides, etc. It was founded in 1557 on the site of a native town called Tumibamba, and was made an episcopal see in 1786.

CUESTA, a name of Spanish origin principally used in New Mexico for low ridges of steep gradient on one side and gentle slope on the other. It has been suggested as a general term for any land form having a steep scarp or "strike" face, and gently inclined "dip" slope.

CUEVA, JUAN DE LA (1550?–1610?), Spanish dramatist and poet, was born at Seville. A precursor of Lope, he draws his inspiration from the national legend, historic tradition, and contemporary life, as in *Los siete Infantes de Lara, El saco de Roma,* and *El Infamador,* an anticipation of Don Juan. As an initiative force, Cueva is a figure of historical importance; his epic poem, *La Conquista de Bética* (1603) shows his weakness as an artist. In his *Ejemplar poético* (1606) he gave expression to his literary theories.

See E. Walberg, "Juan de la Cueva et son Exemplar poético," in *Acta Universitatis Lundensis,* xxxix (1904).

CUEVAS DE VERA, a city of southeast Spain on the right bank of the river Almanzora, in Almería province. Pop. (1940) 2,920 (mun., 9,530). It is isolated by the Sierra de los Filabres from the railway system of Almería. It is, however, the chief market for the cereals, fruit and vegetables, especially tomatoes, produced in the rich agricultural districts towards the south, and for the argentiferous lead and iron from mines in the mountains. In appearance it is modern, with an 18th century church in Doric style, but in reality the town is of considerable antiquity. One of the towers in the Moorish palace is probably of Roman origin. Also called Cuevas de Almanzora.

CUFF, the lower edge of a sleeve turned back to show an ornamental border, or with an addition of lace or trimming; now used chiefly of the stiff bands of linen worn under the coat sleeve either loose or attached to the shirt. "Cuff," meaning a blow with the hand either open or closed, has probably no connection with the above.

CUI, CÉSAR ANTONOVITCH (1835–1918), Russian composer, was born in Vilna on Jan. 18, 1835, the son of a French officer, who had been left behind in the retreat from Moscow in 1812, and was educated at Vilna and at the School of Military Engineering, St. Petersburg (Leningrad). He became a distinguished military engineer, and lectured at the Artillery school and the Staff college. He had little formal training in music, but in 1857 he met Balakirev, who gave him some guidance and criticism on his compositions. In 1858 he married the pianist, Mademoiselle Hamberg and next year produced privately his first operetta. From 1869 onward he produced a number of operatic works, most of them for French texts and all of them in the romantic style. The most important of these are *The Captive in the Caucasus* (1859), the libretto of which is based on Pushkin; *William Ratcliffe* (St. Petersburg, 1861), the libretto of which is drawn from Heine; *Angelo* (St. Petersburg, 1876) with the libretto drawn from Victor Hugo; and *The Captain's Daughter* (St. Petersburg, 1911). In addition Cui wrote a long series of songs, choral and orchestral works, chamber music and pianoforte pieces.

See Comtesse de Mercy-Argenteau, *César Cui* (1888).

CUIABÁ or CUYABÁ, capital of the inland state of Mato Grosso, Brazil, about 972 mi. N.W. of Rio de Janeiro, on the Cuiabá river, the principal Brazilian tributary of the Paraguay. Pop. of the *município* (1940) 54,770. Cuiabá has uninterrupted steamer communication with Montevideo, over 2,000 mi. distant, but has no rail or highway communication with the national capital. The climate is hot and malaria is prevalent. Cuiabá was founded in 1719 by Paulista gold hunters, and its gold washings, now apparently exhausted, yielded rich results in the 18th century. It is the centre of a cattle-raising area and headquarters of an important military district, having an arsenal and military barracks.

CUIRASS (Fr. *cuirasse,* Lat. *coriaceus,* made of leather, from *corium,* the original breastplate being of leather), the plate armour, formed of one or more pieces of metal or other rigid material which covers the front of the wearer's person (*see* ARMS AND ARMOUR). In a suit of armour it was generally worn in connection with a corresponding defense for the back and is understood to imply the complete body armour, described in the middle ages as a "pair of plates." The corselet (Fr. *corselet,* diminutive of the O.Fr. *cors,* body), a comparatively light cuirass, is more strictly a breastplate only. As parts of the military equipment of classic antiquity, cuirasses and corselets of bronze and of other rigid substances were common, but while some special kind of secondary protection for the breast had been worn in earlier times in addition to hauberks and studded "cotes" it was not until the 14th century that a regular body defense of plate was adopted. From that time the cuirass came into general use as well as plate coverings for the limbs, and by the end of the century had superseded the familiar chain mail. In the early 15th century entire plate armour began to be worn without any surcoat, but toward its end the short surcoat or "tabard" came into general use over the armour. At this time small plates of various shapes and sizes (and not always in matching pairs) were attached to the armour in front of the shoulders to defend these vulnerable points. In the middle of the century the breastplate of the cuirass was made in two parts, the lower overlapping the upper and contrived, by means of a strap or sliding rivet, to give flexibility. Later the cuirass was sometimes superseded by the "brigandine jacket," made generally of a rich textile lined throughout with overlapping metal scales riveted on with studs also of metal. In the 16th century the cuirass, with globular breast-plate, was reinforced by strong additional plates attached by rivets or screws. In about 1550 the breast-plate of the cuirass was characterized by a vertical central ridge, called the "tapul," having near its centre a projecting point; this projection, somewhat later, was lowered to the base of the plate and assumed the form which was known as the "peascod cuirass."

Corselets provided with both breast and back pieces were worn by foot-soldiers in the 17th century, while their mounted comrades were equipped with heavier and stronger cuirasses. These defences continued in use after the other pieces of armour had gradually been discarded, and their use has never altogether ceased. In modern armies mounted cuirassiers have in some degree perpetuated the character of the mediaeval body-armour although the steel-jacketed bullet of present-day warfare has demonstrated the futility of light metal-plate armour as a means of body protection.

CUIRASSIERS, a kind of heavy cavalry, originally developed out of the men-at-arms or gendarmerie forming the heavy cavalry of feudal armies. Their special characteristic was the wearing of full armour, which they retained long after other troops had abandoned it. Hence they became distinguished as cuirassiers. The first Austrian corps of *kyrissers* was formed in 1484 by the emperor Maximilian and was 100 strong. In 1705 Austria possessed 20 regiments of cuirassiers. After the war of 1866, however, the existing regiments were converted into dragoons. Russia likewise in modern times abolished all but a few guard regiments of cuirassiers. The Prussian cuirassiers were first so called under Frederick William I., and in the wars of his successor, Frederick the Great, they bore a conspicuous part. After the Seven Years' War they ceased to wear the cuirass on service, but after 1814 these were re-introduced, the spoils taken from the French cuirassiers being used to equip the troops. The cuirass is now worn only on ceremonial parades. In France the cuirassiers date from 1666, when a regiment was formed. During the First Empire many regiments were created, until in 1812 there were 14. The number was reduced after the fall of Napoleon, but was again increased in the period previous to the World War when the French regiments alone in Europe wore the cuirass on all parades and at manoeuvres.

CUISSES, plural of *cuisse,* French, meaning thigh and referring to the mediaeval plate armour worn on the front of the thighs. ("I saw young Harry, . . . with cuisses on his thighs, gallantly armed" Henry IV., pt. I.–iv. 1.)

CUJAS or CUJACIUS, **JACQUES** (or as he called himself, JACQUES DE CUJAS) (1520–1590), French jurisconsult, was born at Toulouse, where his father, whose name was Cujaus, was a fuller. Having taught himself Latin and Greek, he studied law under Arnoul Ferrier, then professor at Toulouse, and rapidly gained a great reputation as a lecturer on Justinian. In 1554 he was appointed professor of law at Cahors, and about a year after L'Hôpital called him to Bourges. Duaren, however, who also held a professorship at Bourges, stirred up the students against the new professor, and such was the disorder produced in consequence that Cujas yielded, and accepted an invitation he had received to the University of Valence. Recalled to Bourges at the death of Duaren in 1559, he remained there till 1567, when he returned to Valence. There he gained a European reputation, and collected students from all parts of the Continent, among whom were Joseph Scaliger and de Thou. In 1573 Charles IX. appointed Cujas counsellor to the *parlement* of Grenoble, and in the following year a pension was bestowed on him by Henry III. Margaret of Savoy induced him to remove to Turin; but after a few months (1575) he once more took his old place at Bourges. But the religious wars drove him thence. He was called by the king to Paris, and permission was granted him by the parlement to lecture on civil law in the university of the capital. A year after, however, he finally took up his residence at Bourges, where he remained till his death.

The life of Cujas was altogether that of a scholar and teacher. In the religious wars which filled all the thoughts of his contemporaries he steadily refused to take any part. *Nihil hoc ad edictum praetoris,* "This has nothing to do with the edict of the praetor," was his usual answer to those who spoke to him on the subject. His surpassing merit as a jurisconsult consisted in the fact that he turned from the ignorant commentators on Roman law to the Roman law itself. He collected more than 500 mss. but his library was broken up after his death and a great part lost. His emendations, of which a large number were published under the title of *Animadversiones et observationes,* were not confined to law books, but extended to many of the Latin and Greek classical authors. In jurisprudence his study was far from being devoted solely to Justinian; he recovered and gave to the world a part of the Theodosian Code, with explanations; and he procured the manuscript of the *Basilica,* a Greek abridgment of Justinian, afterwards published by Fabrot (*see* BASILICA). He also composed a commentary on the *Consuetudines Feudorum,* and on some books of the Decretals. In the *Paratitla,* or summaries which he made of the Digest, and particularly of the Code of Justinian, he condensed into short axioms the elementary principles of law, and gave definitions remarkable for their admirable clearness and precision. The edition of his works (Neville, 1577) is now very scarce. The edition of Colombet (1634) is incomplete. Fabrot, however, collected the whole in the edition which he published at Paris (1658), and which was reprinted at Naples (1722, 1727), and at Naples and Venice (1758), with an index forming an 11th volume.

CULDEES, an ancient monastic order with settlements in Ireland and Scotland. It was long imagined by Protestant and especially by Presbyterian writers that they had preserved primitive Christianity free from Roman corruptions in one remote corner of western Europe, a view enshrined in Thomas Campbell's *Reullura.*

As found in the Irish mss. the name is *Céle Dé, i.e.,* God's comrade or sworn ally. It was latinized as *Coli dei,* whence Boece's *culdei.* The term seems, like the Latin *vir dei,* to have been applied generally to monks and hermits. There are very few trustworthy ancient sources of information, but it seems probable that the Rule of Chrodegang (devised originally for the clergy of Chrodegang's cathedral, and largely an adaptation of St. Benedict's rule to secular clergy living in common), archbishop of Metz (d. 766), was brought by Irish monks to their native land from the monasteries of N.E. Gaul, and that Irish anchorites originally unfettered by the rules of the cloister bound themselves by it. In the course of the 9th century we find mention of nine places in Ireland (including Armagh, Clonmacnoise, Clones, Devenish and Sligo) where communities of these Culdees were established as a kind of annexe to the regular monastic institutions. They seem especially to have had the care of the poor and the sick, and were interested in the musical part of worship. Meanwhile in Scotland the Iona monks had been expelled by the Pictish king Nechtan in 717, and the vacancies thus caused were by no means filled by the Roman monks who thronged into the north from Northumbria. Into the gap, towards the end of the 8th century, came the Culdees from Ireland. The features of their life in Scotland, which is the most important epoch in the history of the order, seem to resemble closely those of the secular canons of England and the continent. From the outset they were more or less isolated, and, having no fixed forms or common head, tended to decay. In the 12th century the Celtic Church was completely metamorphosed on the Roman pattern, and in the process the Culdees also lost any distinctiveness they may formerly have had, being brought, like the secular clergy, under canonical rule. The pictures that we have of Culdee life in the 12th century vary considerably. The chief houses in Scotland were at St. Andrews, Dunkeld, Lochleven, Monymusk in Aberdeenshire, Abernethy and Brechin. Each was an independent establishment controlled entirely by its own abbot and apparently divided into two sections, one priestly and the other lay and even married. At St. Andrews about the year 1100 there were thirteen Culdees holding office by hereditary tenure and paying more regard to their own prosperity and aggrandizement than to the services of the church or the needs of the populace. A much-needed measure of reform, inaugurated by Queen Margaret, was carried through by her sons Alexander I and David I. Canons Regular were instituted and some of the Culdees joined the new order. Those who declined were allowed a life-rent of their revenues and lingered on as a separate but ever-dwindling body till the beginning of the 14th century, when they disappeared from history.

The Culdees of Lochleven lived on St. Serf's Inch, which had been given them by a Pictish prince, Brude, about 850. In 1093 they surrendered their island to the bishop of St. Andrews in return for perpetual food and clothing, but Robert, who was bishop in 1144, handed over all their vestments, books and other property, with the island, to the newly founded Canons Regular, in which probably the Culdees were incorporated. There is no trace of such partial independence as was experienced at St. Andrews itself, possibly because the bishop's grant was backed up by a royal charter. In the same fashion the Culdees of Monymusk, originally perhaps a colony from St. Andrews, became Canons Regular of the Augustinian order early in the 13th century, and those of Abernethy in 1273. At Brechin, famous like Abernethy for its round tower, the Culdee prior and his monks helped to form the chapter of the diocese founded by David I in 1145, though the name persisted for a generation or two. Similar absorptions no doubt account for the disappearance of the Culdees of York, a name borne by the canons of St. Peter about 925, and of Snowdon and Bardsey Island in Wales mentioned by Giraldus Cambrensis (*c.* 1190) in his *Speculum Ecclesiae* and *Itinerarium* respectively. The former community was, he says, sorely oppressed by the covetous Cistercians. These seem to be the only cases where the Culdees are found in England and Wales. In Ireland the Culdees of Armagh endured until the dissolution in 1541, and enjoyed a fleeting resurrection in 1627, soon after which their ancient property passed to the vicars choral of the cathedral.

See W. Reeves, *The Culdees of the British Islands* (Dublin, 1864), and in *Trans. Roy. Irish Acad.* vol. xxiv (1873); F. W. Skene, *Celtic Scotland* (1876–1880), especially vol. ii; Helen Zimmern, *Celtic Church* (1902); W. Beveridge, *Makers of the Scottish Church* (1908), and reff. given by T. J. Parry, art. "Culdees," Hastings' *Encyclopaedia of Religion and Ethics.*

CULEBRA, the smaller of two islands lying in the Virgin Passage immediately east of Puerto Rico and known as the *Islas de Passaje.* It is about 18 mi. distant from Cape San Juan and rises from the same submerged plateau with the larger islands of the Antilles. Its extreme dimensions are 3 by 6 mi., and its surface is low and comparatively uniform, which gives the prevailing winds an unbroken sweep across it. For this reason the rainfall is limited to a short season, and the population is compelled to store rainwater in cisterns for drinking purposes. Its soil is fertile, and cattle, poultry, vegetables and bananas are produced. The island has been a dependency of Puerto Rico since 1879, when its colonization was formally undertaken, and it is now in the municipality of Culebra. In 1902 the American naval authorities selected the Playa Sardinas harbour on the south side of Culebra as a rendezvous of the fleet and marine encampments were set up on shore. The strategic position of the island as a naval station has given it considerable importance. Pop. (1910) 1,315; (1920) 839; (1930) 847; (1940) 860.

CULIACÁN, or **CULIACÁN ROSALES,** capital of the state of Sinaloa on the west coast of Mexico. On the left bank of the Culiacán river and at the foot of the lofty Sierra Madre Occidental, this city of 22,025 population (1940) lies at an elevation of 175 ft. on a small coastal plain. The centre of the city is the *Plaza de la Constitución,* around which are grouped various municipal buildings and the cathedral. Along the river bank is the *Jardín Rosales* with many cultivated plants and a great variety of bird life. The climate is hot and semiarid. The average January temperature is 67° F., that of July, 84° F. The lowest temperature ever recorded is 38° F., the highest, 105° F. Summer is the rainy season, total precipitation, 24 in.; winter and spring are almost rainless. An elaborate system has been installed in the valley of the Culiacán river, making it possible to irrigate more than 100,000 ac. Only about 30,000 ac. are under cultivation, however. Great varieties of crops are grown for local subsistence and export, including maize, sugar cane, chick peas, beans, chile peppers, melons, potatoes, groundnuts and tobacco. Oranges, limes, bananas and grapes are the chief fruits. Swine, burros, horses, mules, sheep and goats make up the livestock. Mining is important in the hinterland. Although connected with the small port of Altata on the Pacific ocean by a branch railway 37 mi. long, Culiacán exports its surplus of tomatoes, beans, maize and cattle mostly via the Southern Pacific railway.

(S. N. D.)

CULIN, ROBERT STEWART (1858–1929), U.S. anthropologist, was born on July 13, 1858, in Philadelphia, Pa., and was educated at Nazareth hall, Pa. He studied archaeology until 1890, during which time he was also engaged in commercial enterprise, and two years later became director of the University of Pennsylvania Archaeological museum. In 1899 he left the university museum to become curator of American archaeology and general ethnology at the Free Museum of Science and Art and at the same time lectured in both subjects at the University of Pennsylvania. He went to New York in 1903, where he had been appointed curator in ethnology at the Museum of the Brooklyn Institute of Arts and Sciences, retaining that position for the remainder of his life. Culin founded the Oriental club in Philadelphia and was its secretary for 14 years. He was also one of the founders of the American Anthropological society and was a member of many scientific societies in the U.S., Spain, Sweden, Italy and Mexico. He held royal orders in Spain and Czechoslovakia.

During 1892–93 he was in Madrid as secretary to the U.S. commission sent to the Historical American exposition in that city. The following year, he was an assistant in the anthropological department at the Columbian exposition in Chicago. Culin travelled frequently, making studies of primitive games in Japan, Chosen, China and India, as well as among American Indians. His books include *Korean Games* (1896); *Chess and Playing Cards* (1896); and *American Indian Games* (1905). He died on April 8, 1929.

CULION RESERVATION is a municipality, not divided into barrios, on the island of Culion in the province of Palawan, Philippine Islands. Population (1939) 7,328, of whom 4,748 were males; only 11 of the total were whites. It is the leper colony (founded 1906) and its inhabitants are gathered from all parts of the archipelago and are kept at government expense. Excellent medical and hospital service are furnished free of charge, and many cures have been made. The local government is administered by the lepers themselves, who, so far as possible, live a normal village life.

CULLEN, PAUL (1803–1878), Irish cardinal and archbishop of Dublin, was born near Ballytore, Co. Kildare, and educated first at the Quaker school at Carlow and afterward at Rome, where he joined the Urban College of the Propaganda and, after passing a brilliant course, was ordained in 1829. He then became vice-rector, and afterward rector, of the Irish National college in Rome; and during the Mazzini revolution of 1848 he was rector of the Urban college, saving the property under the protection of the American flag. In 1849, on the strong recommendation of Archbishop John MacHale of Tuam, Cullen was nominated as successor to the primatial see of Armagh; and, on his return to Ireland, presided as papal delegate at the national council of Thurles in Aug. 1850. Taking a strong line on the educational question which was then agitating Ireland, he took a leading part in the National movement of 1850–52, and at first supported the Tenant Rights league. In May 1852 he was translated to Dublin, and soon a divergence of opinion broke out between him and the more ardent Nationalists under Archbishop MacHale. When the Irish university was started, with Cardinal

Newman, appointed by Cullen, at its head, the scheme was wrecked by the personal opposition to the archbishop of Dublin. As time went on, his distrust of the National movement grew deeper; and in 1853 he sternly forbade his clergy to take part publicly in politics, and for this he was denounced by the *Tablet* newspaper. His own political opinion had best be told in his own words. "For thirty years I have studied the revolution on the continent, and for nearly thirty years I have watched the Nationalist movement in Ireland. It is tainted at its sources with the revolutionary spirit. If any attempt is made to abridge the rights and liberties of the Catholic Church in Ireland, it will not be by the English government nor by a 'No Popery' cry in England, but by the revolutionary and irreligious Nationalists of Ireland" (Edward Purcell's *Life of Manning,* ii, 610). Cullen, therefore, while an ardent patriot, was consistently an opponent of Fenianism. He was made cardinal in 1866, being the first Irish cardinal. Energetic as an administrator, churches and schools rose throughout his diocese; the excellent Mater Misericordiae hospital and the Catholic University of Ireland are lasting memorials of his zeal. He took part in the Vatican council as an ardent infallibilist. In 1873 he was defendant in a libel action brought against him by the Rev. R. O'Keefe, parish priest of Callan, on account of two sentences of ecclesiastical censure pronounced by the cardinal as papal delegate. The damages were laid at £10,000. Three of the four judges allowed the defense of the cardinal to be valid; but it was held that the papal rescript upon which he relied for his extraordinary powers as delegate was illegal under statute; and the lord chief justice decided that the plaintiff could not renounce his natural and civil liberty. After several days' trial, during which Cullen was submitted to a very close examination the verdict was given for the plaintiff with $\frac{1}{4}d.$ damages. The cardinal died in Dublin on Oct. 24, 1878. (E. TA.)

CULLEN, WILLIAM (1710–1790), Scottish physician and medical teacher, was born at Hamilton, Lanarkshire, on April 15, 1710. He received his early education at the grammar school of Hamilton, and subsequently attended some classes at the University of Glasgow. He began his medical career as apprentice to John Paisley, a Glasgow surgeon, and after completing his apprenticeship he became surgeon to a merchant vessel trading between London and the West Indies. On his return to Scotland in 1732 he settled as a practitioner in the parish of Shotts, Lanarkshire, and in 1734–36 studied medicine at Edinburgh, where he was one of the founders of the Royal Medical society. In 1736 he began to practice in Hamilton, where he rapidly acquired a high reputation. From 1737–40 William Hunter was his resident pupil and at one time they proposed to enter into partnership. In 1740 Cullen took the degree of M.D. at Glasgow, where he removed in 1744. During his residence at Hamilton, besides the arduous duties of medical practice, he found time to devote to the study of the natural sciences, especially chemistry. On coming to Glasgow, he began to lecture in connection with the university, the medical school of which was as yet imperfectly organized. Besides the subjects of theory and practice of medicine, he lectured systematically on botany, materia medica and chemistry. His great abilities, enthusiasm and power of conveying instruction made him a successful and highly popular teacher, and his classes increased largely in numbers. At the same time he diligently pursued the practice of his profession. Chemistry was the subject which at this time seemed to have engaged the greatest share of his attention. He was himself a diligent investigator and experimenter, and he did much to encourage original research among his pupils, one of whom was Dr. Joseph Black. In 1751 he was appointed professor of medicine, but continued to lecture on chemistry; in 1756 he was elected joint professor of chemistry at Edinburgh along with Andrew Plummer, on whose death in the following year the sole appointment was conferred on Cullen. This chair he held for ten years—his classes always increasing in numbers. He also practised his profession as a physician with eminent success. From 1757 he delivered lectures on clinical medicine in the Royal Infirmary. This was a work for which his experience, habits of observation and scientific training peculiarly fitted him, and in which his popularity as a teacher, no less than his power as a practical physician, became more than ever conspicuous. On the death of Charles Alston in 1760, Cullen, at the request of the students, undertook to finish his course of lectures on materia medica; he delivered an entirely new course, which was published in an unauthorized edition in 1771, but which he rewrote and issued as *A Treatise on Materia Medica* in 1789.

On the death of Robert Whytt (1714–1766), the professor of the institutes of medicine, Cullen accepted the chair, at the same time resigning that of chemistry. In the same year, he had been an unsuccessful candidate for the professorship of the practice of physic, but subsequently an arrangement was made between him and John Gregory, who had gained the appointment, by which they agreed to deliver alternate courses on the theory and practice of physic. This arrangement proved eminently satisfactory, but it was brought to a close by the sudden death of Gregory in 1773. Cullen was then appointed sole professor of the practice of physic, and he continued in this office till a few months before his death, on Feb. 5, 1790.

As a lecturer Cullen stood unrivalled in his day. His clearness of statement and power of imparting interest to the most abstruse topics were the conspicuous features of his teaching, and in his various capacities as a scientific lecturer, a physiologist and a practical physician, he was ever surrounded with large and increasing classes of intelligent pupils, to whom his eminently suggestive mode of instruction was especially attractive. Living at the time he did, when the doctrines of the humoral pathologists were carried to an extreme, and witnessing the ravages which disease made on the solid structures of the body, it was not surprising that he should oppose a doctrine which appeared to him to lead to a false practice and to fatal results, and adopt one which attributed more to the agency of the solids and very little to that of the fluids of the body. His chief works were *First Lines of the Practice of Physic* (1774); *Institutions of Medicine* (1770); and *Synopsis Nosologicae Medicae* (1785), which contained his classification of diseases into (1) pyrexiae, or febrile diseases, as typhus fever; (2) neuroses, or nervous diseases, as epilepsy; (3) cachexiae, or diseases resulting from bad habit of body, as scurvy; and (4) locales, or local diseases, as cancer.

Cullen's eldest son Robert became a Scottish judge in 1796 under the title of Lord Cullen, and was known for his powers of mimicry.

See Dr. John Thomson, *Cullen's Life, Lectures and Writings* (1832), re-issued with the second volume by Dr. W. Thomson and Dr. D. Craigie in 1859; *Jour. of Psychological Medicine,* vol. xiii, p. 82 (1860).

CULLEN, royal and small burgh, Banffshire, Scotland. Pop. (est. 1938) 1,738. It is situated on Cullen bay, $11\frac{1}{2}$ mi. W. by N. of Banff and $66\frac{1}{2}$ mi. N.W. of Aberdeen by the L.N.E.R. Deskford Burn, after a course of $7\frac{1}{2}$ mi. enters the sea at Cullen, which it divides into two parts, Seatown, the older, and Newtown, dating only from 1822, the old town having been pulled down to extend the grounds of Cullen house. St. Mary's, the parish church, a cruciform structure, was founded by Robert Bruce, whose second wife died at Cullen. The harbour, constructed 1817–34, though artificial, is one of the best on this coast. Fish is exported. About 1 mi. to the S. is Cullen house, a seat of the earl of Seafield, which contains some fine works of art. To the west $1\frac{1}{2}$ mi. is the fishing village of Portknockie (pop. 1,657), a small burgh dating from 1912, with a deep-sea harbour built in 1891. On the cliffs, 2 mi. E., stands the ruins of Findlater castle, fortified in 1455.

CULLERA, a port of east Spain, in the province of Valencia, on the Mediterranean sea, at the mouth of the river Júcar, and the terminus of the Valencia-Silla-Cullera railway. Pop. (1940) 13,943 (mun., 15,005).

Cullera, at the foot of the Monte de las Zorras, which terminate eastward in Cape Cullera, and dominated by a ruined Moorish citadel, overlooks to the south a rich, irrigated plain producing cereals and fruit. The harbour consists of a roadstead from the mouth of the Júcar to Cape Cullera, where ships anchor and discharge into lighters, which alone can ascend the shallow river to the port.

Cullera is a fishing port but is chiefly engaged in exporting oranges, tomatoes and rice (ordinarily to Great Britain), and in importing artificial fertilizers, flour and timber.

CULLINAN, a town in the Transvaal, Union of South Africa, 25° 43′ S., 28° 34′ E., which grew up round the Premier diamond mine, and dates from 1903. It is connected by a branch railway (6 mi.) with Rayton, on the Pretoria-Delagoa bay line, and 24 mi. E. of Pretoria. Pop. (1936) 589; of which 395 were whites. There was discovered, in 1905, the Cullinan diamond, $3,024\frac{3}{4}$ carats, which was presented by the Transvaal government to King Edward VII, two stones cut from it being used for the British sceptre and crown. (*See* DIAMOND.)

CULLIS, CHARLES (1833–1892), U.S. physician, was born in Boston, Mass., on March 7, 1833. Between the ages of 16 and 19 he clerked in a mercantile establishment in Boston until serious ill-health forced him to leave. At about this time he was persuaded to study medicine, which he began on his recovery. It was through his medical work that the concept of a "consumptive's home" was born in him, out of which grew his life's work. His attention was drawn to the German orphanage founded by Herman Francke, and he read George Müller's *Life of Trust,* then newly published. They provided him with a working plan through which to consolidate his profound belief in the power of faith, and his compassion for incurables to whom the shelter of public hospitals was not open. His aim was to provide a home for such unfortunates which would be made possible through faith and prayer alone. His ideas were spread at first among friends, and later through meetings and published reports.

About 1865, with unsolicited public contributions ranging from pennies to hundreds of dollars, Cullis made his first purchase, for $4,000, of a house on Beacon Hill which became the Consumptives' Home. With later additions, including a church, this became the centre of the Faith-Cure movement. The home for consumptives was later moved to the place near Boston known as Oak Grove. There, on the 11 acres purchased, were constructed separate chapels for inmates and the public, 2 orphan homes, a spinal home, the Faith-Cure house and a deaconess' house which was a home for women workers. Churches and missions were established in Boston, and the movement spread to other states and abroad. Missions arose in Virginia, California, West Virginia, North Carolina and India, and there were tract repositories in New York, Boston and Philadelphia. Cullis died on June 18, 1892, and shortly afterward, for lack of funds and leadership, the movement for the most part died.

CULLMAN, a town in north central Alabama, U.S.A., the county seat of Cullman county. It is 34 mi. south of Decatur and about 5 mi. from the summit of Sand mountain. It is on U.S. highway 31, and is served by the Louisville and Nashville railroad. The land area is $2\frac{1}{2}$ sq.mi.; the altitude 802 ft. The population was 1,255 in 1900; 2,786 in 1930; and 5,074 by the census of 1940, of whom 4,966 were native white and 39 Negro.

The town owns and operates its own water works, electric generation and distribution system and sewage treatment plant. It is an industrial and agricultural centre, producing lumber, cotton, oil products, fertilizer and staves. It is in a rich strawberry growing region, and during the harvest season almost all farm labour is marshalled for picking. Cotton is also grown, and the town is an important shipping centre for the Sand mountain area. Cullman is administered by a mayor-council government elected by direct nonpartisan ballot, for four-year terms. Its assessed property value (1943) was $788,375 and its bonded debt (Sept. 30, 1943) $335,000. It publishes three weekly newspapers, each with a circulation of more than 2,000. A general hospital was established in 1939 and is under joint city-county management.

Cullman was founded by John G. Cullman, an immigrant from Bavaria, Germany. He purchased 349,000 acres of railroad-owned property in 1872, and planned the foundation of a German colony in the south. This was difficult at first, for the general line of migration was east to west, and not south. But by 1873, the first five families arrived from Cincinnati, Ohio, others following from Indiana and Illinois, and by 1876 a contemporary newspaper estimated a population of 800. Cullman was incorporated as a town in 1874.

CULLODEN, a tract of moorland in Inverness-shire, Scotland. It forms part of the northeast of Drummossie Muir, and is situated about 6 mi. by road east of Inverness, and $\frac{1}{2}$ mi. from Culloden Moor station on the L.M.S.R. from Aviemore to Inverness via Daviot. It is celebrated as the scene of the battle of April 16, 1746 (*see* below; also CUMBERLAND, WILLIAM AUGUSTUS, DUKE OF, and MURRAY, LORD GEORGE), by which the fate of the house of Stuart was decided. By Highlanders the battle is more generally described as the battle of Drummossie. Several memorials have been erected.

The *Culloden Papers,* a number of historical documents ranging from 1625 to 1748, were discovered in Culloden House in 1812 and published in 1815 by Duncan George Forbes. About 1 mi. to the south of the field, on the right bank of the Nairn, is the plain of Clava, containing several stone circles, monoliths, cairns and other prehistoric remains. The circles, some apparently never completed, vary in circumference from 12 yards to 140 yards.

Battle of Culloden.—For the course of the 1745 rebellion which was crushed at the battle of Culloden, *see* SCOTLAND. After a week's retreat, Charles Edward awaited the British on Drummossie Moor. Hearing, however, that Cumberland had halted at Nairn, eight miles away, to celebrate his 25th birthday, Charles decided to surprise his camp. The long night march over the moors, however, was too much for the tired and starving Highlanders and they returned to their old position, more exhausted and depressed than ever. Early on April 16, 1746, Cumberland obtained contact with the pretender's army. The Highlanders, about 7,000 strong, were drawn up in two widely separated lines, with a small reserve of horse, one flank resting on the park walls of Culloden House. The British, 9,000 strong, were also in two lines, at a distance of 50 paces, with cavalry on each flank and a reserve of Highland irregulars. The battle began with a duel between the nine Scottish and ten British guns; the latter, far better served, caused great distress to the Highlanders, who sought to escape their fire by attack. The British infantry awaited them in three ranks, the first kneeling, the second stooping, the third standing. Cumberland had trained each soldier to engage the man to his right front, so evading the Highlander's target and thrusting under his raised sword arm. On the British right the Highlanders only made feint attacks, trying to draw fire while still out of range; on the left they broke through at one point, but were taken in flank by supports from the second line, and thrown back in great confusion. Seeing this, the Scottish centre and left lost heart and retreated, the British following up and causing heavy losses with their musketry fire. At the same time the dragoons broke through the walls protecting the Scottish flanks and attacked the second line in rear. The Highlanders finding themselves surrounded, broke and fled, leaving 1,000 dead and many wounded and prisoners upon the field of battle, while 1,000 more fell in the subsequent pursuit. The British lost only 50 killed and 200 wounded.

CULLUM, GEORGE WASHINGTON (1809–1892), U.S. soldier and author, was born in New York city on Feb. 25, 1809. He entered the U.S. military academy at West Point in 1829 and after graduation in 1833 received a commission in the corps of engineers. He was promoted to captain in 1838, and during the Mexican War he superintended the engineering of sapper, miner, and pontoon trains for the use of the army in Mexico. From 1848 to 1855, he taught practical military engineering at West Point. In the years remaining before the outbreak of the Civil War, with the exception of two years spent abroad while on sick-leave, he was active in the supervision of fortifications and other public works, and served on several important boards and commissions. He was ordered to Washington in 1861 and in April became aide-de-camp to Gen. Winfield Scott, then commander in chief of the U.S. army. He was promoted to major of engineers in August, and on Nov. 19, 1861, became chief of staff and chief engineer to Gen. H. W. Halleck commanding the department of Missouri. Here he rendered invaluable service in supervising construction engineering on the western rivers, in preparation for the Union plan of separating the armies of the Confederacy. He also directed the engineering operations at the siege of Corinth, and elsewhere. Returning to Washington in 1862 with Gen. Halleck, now general in chief of the army, he served on the general's staff until Sept. 5, 1864, after which he became superintendent of the U.S. military academy. On March 13, 1865, he was brevetted colonel, brigadier general and major general in the regular army for meritorious service during the Civil War, and mustered out of the volunteer service the following year. For the next eight years, he served as military engineer in the vicinity of New York city and retired from active service in 1874. He spent the rest of his life in New York where he devoted himself to literary, scientific and military studies. He had already published (1863) his translation of Duparq's *Elements of Military Art and History,* and his own book *Systems of Military Bridges.* He also wrote *Campaigns of the War of 1812–15 against Great Britain sketched and criticized; with brief biographies of the American engineers* (1879) and numerous other military works, biographies, reviews and reports. But his most valuable literary achievement was the *Biographical Register of the Officers and Graduates of the U.S. Military Academy from 1802 to 1850.* A second edition was extended to cover 1867, and a third, in three volumes, 1890. This tremendous work included the military activities of all graduates of West Point from its foundation in 1802, as well as biographical sketches of many of its alumni, and a historical account of the academy itself. By the terms of Cullum's will, provisions were made for the continuance of the *Biographical Register,* and supplements were published in 1900, 1910 and 1920. Cullum also bequeathed to West Point more than $250,000 for the erection of a memorial hall. He died in New York city on Feb. 29, 1892.

CULMANN, KARL (1821–1881), German engineer, was born in Bergzabern, Germany on July 10, 1821, the son of a Bavarian clergyman. At 17 he matriculated in the engineering school of the Polytechnical institute in Karlsruhe. At the close of his studies, he entered the Bavarian civil service as an apprentice on the Hof railway section, where he remained until 1847. For the next three years he travelled in England, Ireland and North America, re-entering the civil service on his return. With an appointment to the faculty of the Polytechnical institute in Zurich, Switzerland (1855), he began a career of teaching and research. In 1864 he made a valuable report following his investigation of the wild mountain streams of Switzerland, the control of which was a seasonal problem. His most important work, however, was concerned with the problem of determining the distribution of stresses in structures. With the publication of *Die Graphische Statik* (1865, Zurich, vol. 1, no more published; 2nd ed. 1875), he presented a survey of all that had been done up to that point toward the solution of static problems by the graphic method, at the same time laying a foundation for its use as an exact science. The Culmann method of graphostatics has been used extensively in many problems of engineering and mechanics. In connection with this problem, he proved an interesting analogy with the mechanics of the human body. He demonstrated that the curves apparent in the thighbone, when the calcium phosphate has been dissolved, coincide with the ideal lines of main stress for minimum material, as determined by graphostatics. In 1880, Culmann was made honorary doctor of the faculty of philosophy at the University of Zurich. He died at Reisbach near Zurich on Dec. 9, 1881.

See Conrad Matschoss, *Männer der Technik* (Berlin, 1925); Wilhelm Ritter, *Anwendungen der graphischen statik, Nach Professor Dr. C. Culmann,* (Zurich, 1888–1906), 4 vols. in 2; Moritz Rühlmann, *Vorträge über die geschichte der technischen mechanik und theoretischen maschinenlehre* (Leipzig, 1885).

CULMINATION, the attainment of the highest point (from Lat. *culmen,* summit). In astronomy the term is given to the passage of a heavenly body over the meridian of a place. Two culminations take place in the course of the day, one above and the other below the pole. The first is called the upper, the second the lower. Either or both may occur below the horizon and therefore be invisible.

CULP, JULIA (1881–), Dutch mezzo-soprano, was born in Groningen, Holland on Oct. 1, 1881. Her musical training began with the violin and then turned to voice. At 15 she gave recitals at Groningen and at Amsterdam, but in 1897 she settled down to two years of study with Cornelia van Zanten at the Amsterdam conservatory. At 19, she went to Berlin, Germany, and although her concerts were successful, she gave them up to continue her studies with Etelka Gerster from whom, she wrote afterward, she learned all that she knew. Her formal debut was in 1901 in a joint recital with Ferruccio Busoni at Magdeburg, Germany. Success came early in her career, and not long after her debut there were invitations to almost every important European capital. In the years that followed she performed with Edvard Grieg, Charles Saint-Saëns, and Richard Strauss and sang with the principal European orchestras in Germany, Austria, the Netherlands, France, Spain and Russia. Her repertoire included the traditional Schubert, Schumann and Brahms. She also became impressed with the charm and intensity of Hugo Wolf's music and was among the first to bring his songs before the public. Wolf's close friend, Dr. Heinrich Potpeschnigg, was for some time her accompanist. *My Favorite Songs,* which she published in Boston, Mass., in 1916 also listed the music of Richard Strauss, C. A. P. Cornelius and Johann Karl Loewe (*qq.v.*) who wrote the ballad of the *Erlkönig.* With her reputation as an outstanding *lieder* singer established, Mme. Culp made her U.S. debut in New York on Jan. 10, 1913, winning immediate success and engagements for the remainder of the season with the major symphony orchestras throughout the country. She continued to visit the U.S. annually for many years. Reviews of her first New York concerts remarked on the happy blending in her voice of both the soprano and alto qualities, and of the sensitivity and understanding which she brought to her art. During World War I, she was occupied almost exclusively with hospital work among Allied sick and wounded. In 1937 she taught at the Vienna Music academy. Following the German invasion of the Sudetenland where she was living in 1938, she returned to her native land.

CULPEPER, a town in northern Virginia, U.S.A., and the county seat of Culpeper county. It is about 35 mi. northwest of Fredericksburg on U.S. highways 15 and 29 and state highway 3; and is served by the Chesapeake & Ohio and Southern railroads. The population was 1,819 in 1920; 2,379 in 1930; and 2,316 by the census of 1940, of whom 1,729 were native white and 538 Negro.

The town of Fairfax, as Culpeper was originally named, was laid out in 1759 on the property of Robert Coleman. During the American Revolution, the Culpeper minute men answered John Hancock's call to arms in 1775, bearing the flag whose legends read, "Don't Tread on Me" and "Liberty or Death." The minute men retained their identity as an organization, although they merged with regular regiments in the Civil and Spanish-American Wars. Located in the most contested area of the Civil War, it was occupied in the summer of 1862 by Union troops under Gen. John Pope. The Virginia hotel, where officers were billeted, was also the headquarters of General U. S. Grant during April 1864.

Culpeper is a trading centre for the surrounding agricultural area, and itself produces dairy products, livestock and apples. Manufactures include chairs and textiles; there are also silk, flour and lumber mills and a bottling works. It was incorporated Jan. 11, 1898, and a new charter was granted by act of legislature in 1936 with amendments in 1940. The town is administered by a mayor and council.

CULPEPER'S REBELLION (1677–79), one of the first popular uprisings in the American colonies against British authority. The northern, or Albemarle colony in Carolina consisted at that time of not more than 4,000 persons. They were engaged, mainly, in the raising of tobacco, which they traded for necessities with New England merchants. But enforcement of the navigation laws denied them a free market outside of England, and heavy duties placed on every pound of tobacco sold was directed at keeping the northern merchants from their harbour. Resentment was fostered by refugees from Virginia, where Nathaniel Bacon's rebellion had been put down with repressive measures, and by the New England men who were anxious to resume a profitable trade. All feelings of repression found an object in Gov. Miller, who in the absence of Governor Eastchurch was at once the governor, secretary and collector. The insurrection came to a head in 1677 with John Culpeper as its leader. Culpeper had emigrated to the southern or Clarendon colony at about 1670, where he was commissioned surveyor-general, and was active in political life. At the time of the insurrection, he was said to have been a refugee from Clarendon where he was wanted for inciting poor planters to riot. Under his leadership, the first act of the insurgent settlers was to imprison Gov. Miller and seven proprietary deputies, that is, the entire council except the president whose sympathies they had won. They also appropriated some £3,000 and all public records, established courts of justice, appointed judges and convoked a legislative assembly. On Dec. 3, 1677, they issued the first American manifesto entitled "Remonstrance of the inhabitants of Pasquetanke to all the rest of the county of Albemarle" and signed by 34 persons. In an outline of the grievances justifying their rebellion, they protested against excessive taxation, the denial of a freely elected assembly and interference with the regular channels of commerce. Miller had no military forces at his disposal and the settlers were virtually unopposed. For two years, with Culpeper as governor, they exercised all the powers and duties of government and functioned as an independent commonwealth. When Eastchurch arrived from England the following year, he was not accorded recognition, but before he could enlist military assistance from the governor of Virginia, he died of a fever. The settlers, hopeful of a just settlement, sent Culpeper and his assistant Holden to England, promising submission to proper authority. But Gov. Miller had in the meantime managed his escape and was in England to greet Culpeper with charges of treason and embezzlement. Culpeper submitted to trial, but requested that, if pardon was denied, he be allowed trial in Carolina, where the events charged had taken place. This was not necessary for he found support in the influential earl of Shaftesbury, himself a proprietor, who defended him claiming that no regular government existed in Albemarle and that Culpeper's actions were not treasonable. Culpeper returned to South Carolina in 1680 where he surveyed and laid out Charles Town (now Charleston).

CULPRIT, properly the prisoner at the bar; so one guilty of an offense. In origin the word is a combination of two Anglo-French legal words, *culpable,* guilty, and *prit* or *prist,* i.e., *prest,* O.Fr. for *prêt,* ready. On the prisoner at the bar pleading "not guilty," the clerk of the crown answered "culpable," and stated that he was ready (*prest*) to join issue. The words *cul. prist* (or *prit*) were then entered on the roll. When French law terms were discontinued the words were taken as forming one word addressed to the prisoner.

CULROSS (locally pronounced *Coo-rus*), a royal and small burgh, Fifeshire, Scotland, 6½ mi. southwest of Dunfermline. There is a station on the L.N.E.R. from Dunfermline to Kincardine, and another 2½ mi. away on the line from Dunfermline to Stirling. Pop. (est. 1938) 537. It is attractively situated on a hillside sloping gently to the Forth. There St. Serf founded a church and cemetery, and there he died and was buried. For centuries the townsfolk used to celebrate his day (July 1) by walking in procession bearing green boughs. Kentigern, the apostle to Cumbria and first bishop of Glasgow is said to have been born at Culross and to have been adopted by St. Serf as his son. These religious associations, coupled with the fertility of the soil, led to the founding of a Cistercian abbey in 1217. Of this structure the only remains are the western tower and the choir, which forms the parish church. It is supposed that a chapel of which some traces exist in the east end of the town was dedicated to Kentigern. James VI made Culross a royal burgh in 1588. In 1808 there was discovered in the abbey church, embalmed in a silver casket, still preserved there, bearing his name and arms, the heart of Edward, Lord Bruce of Kinloss, killed in 1613 near Bergen-op-Zoom in a duel with Sir Edward Sackville, afterward earl of Dorset.

Robert Pont (1524–1606), the Reformer, was born at Shirresmiln, or Shiresmill, a hamlet in Culross parish. Nearly all its old industries—the coal mines, salt works, linen manufacture, and the making of iron girdles—have disappeared, but its pleasant climate and picturesqueness make it a holiday resort.

Dunimarle Castle adjoins the site of the castle, where, according to tradition, Macbeth slew the wife and children of Macduff.

CULTIVATING MACHINERY: *see* AGRICULTURAL POWER AND MACHINERY; HARVESTING MACHINERY; TILLAGE MACHINERY.

CULTIVATION is the preparation of land for the reception of seed. Since the eradication of the natural vegetation either by burning or by laboriously removing trees and scrub with the axe is the first step in tillage, cultivation probably began on lands easiest to clear, such as the great Tigres-Euphrates or Nile river valleys where low rainfall precluded high vegetation except along the banks. The deep soils of these valleys, unleached by rains, were extremely fertile and easy to work with the crude implements of prehistoric man. The uniform temperatures and yearly inundations of flood water that supplied necessary moisture ensured successful crops. In time man learned to regulate the rivers so that the flood waters were stored and used for irrigation as needed. This made possible more extensive cultivation of adjoining lands.

At first only hoes and spades were used to turn the soil, but the antiquity of the plow shows that an elementary form was developed very early in conjunction with planting grains. From the evidence available, the plow probably originated in Mesopotamia, and spread east to the orient and west and north into the Mediterranean and central European countries, reaching the British Isles sometime before the Roman conquest. The early cylinder seals (*c.* 3500 B.C.) from Sumer, the paintings on Greek vases and the wall paintings of Egypt all portray plows made entirely of wood and pulled either by human or animal power, but plow points or soles of bronze and iron have been found among the artifacts of these peoples, indicating that metal was used to sheathe the parts receiving the greatest wear.

Because of the emphasis on irrigation the records from Mesopotamia and Egypt contain scant information on soil management. An Akkadian text (3200–2100 B.C.) refers to manuring, plowing and raking as essentials in preparing a seedbed, but similar details are lacking for Egypt of that date. A characteristic of primitive agriculture was the continued cropping of a field until the soil was exhausted; then fresh land was cleared and cropped and the old abandoned. However, where the silt-laden waters of a river yearly spread fresh sediment over a flood plain, soil depletion was negligible even without manuring.

As agriculture spread over the Mediterranean basin, new techniques of cultivation had to be developed to cope with the different soils, slopes and climatic conditions. On the eastern shores of the Mediterranean where there was little level land, the early Phoenicians were forced to till the mountainsides. Although their plows were primitive and inefficient, it was not long before the soils on their steep fields began to erode. Lack of rainfall during the growing season necessitated the development of some practice to husband the available moisture. The Phoenicians solved both problems by terracing and contour cultivation. Through their colonizing activities the Phoenicians carried their practices the length of the Mediterranean, and the tradition of the excellence of their agriculture was preserved in Roman literature.

The Greeks in turn left little written record of their system of cultivation. Many of their agricultural traditions are embodied in mythology; thus Zeus is credited with first harnessing oxen to the plow, and Hercules with river regulation and irrigation combined with manuring. Although alfalfa had been introduced, there is no indication of a definite crop rotation. Accounts from Hellenistic Egypt reveal that animals were pastured on the stubble following the harvest, and the government established a fixed rotation for the cleruchs and private individuals in which two years of grain were followed by one of rest or light cultivation (Glotz, *Le Travail dans le Grèce ancienne,* 1920).

Under the Romans, cultivation reached a fairly high state, and their agricultural literature records the progress of 300 years. Cato (234–149 B.C.) emphasized the importance of good plowing and manuring to provide a proper seedbed. The standard, however, was straight furrows rather than pulverization of the soil or regard for slope. Although Cato gave directions for making com-post of all farm wastes, he mentioned no rotation except the simple alternation of grain and fallow. By the time of Virgil (70–19 B.C.) alfalfa had been introduced into Italy, and a rotation of grain, legume and fallow was being practised. On level fields plowing and cross-plowing destroyed the weeds and formed a mulch to preserve moisture. Virgil described a hillside plow designed for contour plowing with two mouldboards. A Gallic plow of the same date was also equipped with wheels, but there is no proof that it was ever used in the Italian peninsula. Columella's *De re rustica* (1st century A.D.) summarized Roman knowledge and practice of soil management. The Romans were already describing and classifying soils according to structure, texture and acidity or alkalinity; and the necessity of fitting crop to soil type and of contour plowing on hilly fields was recognized generally. In addition to plowing fields two or three times to break up the clods and destroy weeds, green manures, dung and chalk or marl were used to add nutrients to the exhausted soils. Lowlands were drained by open and closed ditches and vineyards were terraced. The Romans made no great improvements in tillage implements. Handwork with mattocks preparatory to plowing was quite common, and a toothed harrow or a drag was frequently used after plowing to break up the lumps. From planting to harvest there was no further cultivation of a crop. Olive orchards and vineyards were exceptions, as they were cultivated several times during the growing season to remove weeds and aerate the soil.

There is evidence of grain culture in Britain as early as 2000 B.C., but there was no fixed field cultivation until the time of the Celts. They established a definite field pattern on the chalk hills and downs of southeastern England. Their rudimentary plow, similar perhaps to the modern caschrom, turned a furrow and gave their fields a square or rectangular shape. The introduction and spread of the two-oxen plow with its metal point or share increased the size of the field but did not alter its shape. Years of continued tillage caused the loosened soil to travel downhill and accumulate on the lower edge of the field forming in time a bank or lynchet. The large quantities of grain exported from Britain indicated that these fields may have been manured to keep up their fertility, if only by winter pasturing of cattle. Pliny referred to the marl pits and the use of chalk to counteract soil acidity, and potash in the form of wood ash may have been applied to the fields.

The Roman conquest of Britain did not affect the Celtic field system, but the subsequent Saxon invasions did. The Saxons cultivated the valleys with heavy eight-oxen plows and the Celtic square or rectangular fields gave way to the long, narrow acre-strips characteristic of the open fields. With the rise of the manors, cultivation settled into a fixed routine known as the three-field system, under which it stagnated until the 18th century. Although there were infinite variations over Europe, the usual pattern was the division of all the arable land of a manor into three parts, one for winter grains, one for spring grains and crops and one for fallow. To ensure a fair distribution, each serf was assigned acre-strips (the plowing unit) in all three fields. This excessive parcelling necessitated communal plowing, planting and harvesting. Bare fallow and lack of root crops and manure made crop yields extremely low. Peas and beans, the only legumes raised as field crops, were not used in rotations. No improvements were possible while the tillers of the soil were chained by custom to the inevitable alternation of crop and fallow. Only on the lands of the great monastic orders, whose adherents studied the Roman writers, were there any signs of improved cultivation.

In Spain where the Moors preserved the best agricultural traditions of the past, careful cultivation was the rule. Masters of irrigation and the use of composts, the Moors made up in thorough tillage what they lacked in efficient implements. The plowing cycle, or *qalib,* based on a knowledge of soil types, climatic conditions and on the use of a variety of legumes for rotations, called for a minimum of three plowings for each field before it was sown. Alfalfa, which the Moors introduced into Spain, was used largely as a fodder crop and not in rotations. By emphasizing thorough cultivation of the soil before and after planting, the Moors anticipated Jethro Tull (*q.v.*) by 500 years.

The secular lords of Christian Europe were introduced to Roman agricultural practices by Pietro de Crescenzi's *Opus ruralium commodorum* (1304), which marked the beginning of modern agricultural literature. Although there is evidence of a growing interest in agriculture and its improvement throughout the 16th and 17th centuries, Jethro Tull, an English farmer, was the first to emphasize the importance of thorough cultivation. From his observations of viticulture in France, he deduced that continuous stirring of the soil before and after sowing kept down weeds and permitted air, rain and dew to penetrate to the roots of the plants. As crops sown broadcast could not be cultivated, he invented a seed drill and, to eliminate hoeing by hand, a horse hoe or cultivator that could be drawn between the rows of the growing crop. Firmly convinced of the efficacy of tillage alone, he abolished fallows and made little use of barnyard manure. Although he planted turnips and sainfoin, he saw no need for rotations and, to prove his contentions, is said to have grown wheat on the same land for 13 successive years without fallow or manure and obtained heavier crops than his neighbours from one-third the seed. In spite of its fallacies, Tull's *New Horse-Houghing Husbandry* (1731) publicized the advantages of transferring the technique of garden cultivation to the cultivation of field crops. While most farmers continued the old routines, a few enlightened landowners applied his principles.

The continued improvement and cultivation did not depend upon tillage alone, but upon a recognition of the value of rotations and the use of manures to maintain soil fertility. The Dutch, long faced with the problem of insufficient land, early developed rotations to utilize every field every year for the production of food for man and beast. While a few English writers were cognizant of these practices, only in Norfolk, where the influx of Dutch had familiarized the local inhabitants with foreign crops and techniques, were they adopted to any extent. Here the cultivation of turnips for feed and the sowing of clover, sainfoin and alfalfa were fairly common before 1700. These importations resulted in a clearly defined system of cultivation peculiar to Norfolk and eminently suited to its climate and soils. Its most distinctive feature was the systematic rotation of crops, whereby grains were alternated with a cleaning or recuperative crop such as roots or clover. Thus the land was continuously occupied and bare fallow was eliminated. Because the rotation included feed crops, animal husbandry was coupled with crop cultivation to form the "new" or convertible husbandry. The fame of the Norfolk rotation, however, rested upon the prominence of men like Charles Townshend (1674–1738) and Thomas Coke (1752–1842), who practised it, and upon the widespread publicity Arthur Young gave it in his *Annals of Agriculture*. It was the Norfolk system combined with animal husbandry that established the supremacy of British agriculture.

The most important contributions of the 19th century to improved cultivation were the extension of drainage, the discovery of artificial fertilizers, the alliance of science with agriculture and the improvement of tillage implements. Once all land was occupied, farmers had to rely more and more upon intensive farming to increase production. The Norfolk system had pointed the way to full use of light sandy soils, but drainage was essential for intensive use of heavy clays. The relative merits of open, covered and deep drains had been discussed widely, but, until a machine to manufacture cheap tile was invented in 1845, not much capital was invested in drainage.

Meanwhile the appearance of artificial fertilizers widened the farmer's choice of manures, from vegetable and animal refuse produced on the farm, to superphosphates, nitrates, potash, etc., products of chemical research. The first Peruvian guano reached England in 1835, and nitrate of soda was introduced the same year, but commercial fertilizers did not appear on the market until the chemists had studied the chemical composition of soils and plant requirements. Although the first printed work on the subject (*Chemistry in its Applications to Agriculture and Physiology,* 1840) came from the German chemist, Justus von Liebig, Sir John Bennett Lawes, working independently, had already begun his experiments on the effects of various manures on different crops. Sir Joseph Henry Gilbert continued these experiments at Rothamsted for more than half a century. James Johnston and Augustus Voelcker popularized Liebig's ideas and aroused public interest in the value of artificial fertilizers. By analyzing the composition and value of fertilizing substances, preparing portable concentrates and experimenting on the time of growth at which they could be applied most profitably, these men provided farmers with a wide choice of fertilizers.

Symbolic of the times was the Royal Agricultural society's slogan, "Practice with Science." At first, agricultural science in the British Isles was largely a branch of chemistry. Through the work of the botanists on seed selection, the biologists on plant diseases and the entomologists on insect pests, agricultural leaders saw the value of a concerted attack upon agricultural problems, but comprehension of the interlocking roles of all the physical sciences for the solution of various phases of the same problem did not become general until after 1900.

Previous soil investigations carried out by geologists and chemists of various countries had emphasized kinds of soils, their relative fertility and types of crops suited to them, but the purely scientific study of soils was initiated by the Russians about 1870. V. V. Dokuchaiev advanced the theory that geographic location and climate determined the character of a soil rather than the parent rock. Because Russia contained vast areas of virgin soil with a wide variety of climatic and geographic factors, the Russians had an excellent opportunity to study the genesis and morphology of soils. K. D. Glinka, a pupil of Dokuchaiev, used this concept to build up a classification of soils based on their origin plus the climatic, geographic and vegetative factors contributing to their metamorphosis. Because their work was published in Russian it was not readily available until translations had been made into German and English and, consequently, remained unknown generally until the 20th century.

If the development of tillage implements had not kept pace with scientific advancement, farmers would have been unable to utilize these new techniques of cultivation. Light and efficient plows adapted to different types of soil had been patented. A wide range of harrows, scarifiers, digging tools and cultivators had come into general use. Seed drills were greatly improved and fertilizer attachments were developed. Rollers were used to consolidate the seedbed. Except for further refinements in the kinds of materials used, the type of motive power applied and more durable designs, the basic inventions of modern tillage equipment were already in use.

Cultivation in the 20th century has become increasingly scientific. Soil science has expanded from description and classification to the study of microorganisms essential to crop growth. The increased knowledge of plants and their requirements has led to specialization except in areas where agriculture is noncommercial and folkways persist. Weeds are controlled by clean seed and thorough tillage. Tractors have replaced animal power, and depth of plowing is determined by soil type and climate. Preparation of the seedbed is combined with fertilizing and sowing, so that a field is plowed, harrowed, fertilized, seeded and rolled in one operation. In England where ley farming superseded grain farming, the old rotations, like the Norfolk, were replaced by an alternation of a temporary ley of three or four years' duration followed by a short succession of cereals. Therefore, agricultural research has centred around the special plants, rotations and techniques of cultivation essential to pasture improvement. (*See* GRASS AND GRASSLAND.)

UNITED STATES

Before the European discovery of the Americas, the Indian tribes had achieved a stable agriculture based on corn (*Zea mays* and developed special techniques for cultivating it in accord with their environments. However, their agricultural tools were very primitive. The lack of draught animals prevented the development of the plow, so all tillage was done by hand. Only hoes with shell or stone blades, or hoes made of animal bones or horns, and planting sticks were used. Crop rotation was unknown, but fallowing and clean tillage were practised. Corn hills were frequently manured with fish, and where agriculture was intensive both human and animal manure were also utilized. In the semiarid and mountainous regions of Central and South America where there was little water or level land, the Indians built terraces to conserve soil and water. These structures varied from the Incan terraces and aqueducts skilfully faced with stone to the simple bench terraces and temporary diversion dams of the Hopi. Except for the technique of planting corn in hills, fertilizing it with fish and keeping it free of weeds, the Europeans did not adopt Indian practices, but rather attempted to introduce into the Americas the crops and techniques of their homelands. In the first century of European settlement, the struggle for existence and the difficulties of clearing virgin land and preparing it for crops, coupled with the lack of work stock and farming implements, prevented the colonists from utilizing at once the modes of cultivation current in Europe at the time of their migration.

Equipped only with spades, shovels, mattocks and hoes with which to prepare the land for sowing, the first farmers substituted corn for the European grains because it could be planted Indian fashion on fields not entirely cleared. As soon as draught animals were imported, plows began to be used wherever the condition of the land permitted. Although the seedbed was prepared by plowing, the colonists continued to use the Indian methods of planting. However, because of the scarcity of plows and animal power, many farmers had to rely on hand tools. In the southern colonies the adoption of the plow was retarded by the predominance of tobacco culture. The commercial importance of tobacco encouraged its rapid adoption as a cash crop. The spread of slavery ensured an adequate and unskilled labour supply, so there was little incentive to cut down on the manual labour involved in tillage. No attempt was made to maintain soil fertility for fresh land was abundant. Tobacco, however, was a soil-exhausting crop and clean tillage was a standard practice; consequently, fields were rapidly exhausted, eroded and abandoned. Thus, in spite of the care bestowed on the tobacco plant, its widespread cultivation led not to improved tillage but to soil wastage, an evil that was to harass the plantation system throughout its existence.

Throughout the 18th century, American agricultural practices continued to lag behind European practices. Difficulties of transportation and communication, lack of markets and isolation of the individual farmers offered little incentive for increasing production through improved cultivation. The apparently limitless supply of virgin land and its remarkable fertility encouraged profligate farming, for it was cheaper to clear new fields than to maintain the productivity of old ones. Usually, the same crops were grown year after year on poorly cultivated fields with little or no fertilizer and without systematic crop rotations. The growing crops received no cultivation except an occasional crossplowing to eradicate weeds. Cultivators, similar to Tull's horse hoe, were unknown generally, although a crude type may have been used between tobacco rows. Barnyard manure was regarded as a nuisance, and the widespread practice of letting cattle run at large prevented the accumulation of enough manure to be of real value. The rotation of crops was largely haphazard. Some farmers alternated cropland and pasture, maintaining each for four or more years; others alternated grain crops until the land was exhausted and then left it fallow for as long as 15 years before they thought it restored sufficiently to be planted again to grain. The fallow frequently was used as pasture as soon as volunteer weeds and bushes covered it.

Aside from slovenly practices, poor tillage implements thwarted any real efforts toward thorough cultivation. The first plows had to be imported, but by the 18th century most of them were fashioned by the farmers themselves or the village blacksmiths. These local products were not only poorly designed but also unwieldy. At best they merely skimmed the surface. The iron plating added to reinforce the mouldboard increased the friction, and the soft iron share was quickly dulled in heavy gravelly soils. While many farmers still used only the plow in preparing the seedbed, square and triangular harrows with wooden or iron teeth and crude wooden rollers were coming into more general use. Where the farmer lacked even these implements, he frequently made a drag of thick bushes or young trees with which to smooth the soil and cover the seed.

By the middle of the 18th century, the older areas of settlement were suffering from the extremely wasteful and destructive methods of tillage. A few farmers realized that the progressive mining of first one tract of soil and then another could not go on forever. This was an era of great improvement in England, and the work of Tull, Townshend and Coke was soon known to well-read individuals like Jared Eliot (1685–1763), author of the first American treatise on agriculture. While foreign observers were only critical, those directly concerned began to urge the adoption of improved English practices where fitting and careful experimentation with new crops, rotations and equipment, in an effort to raise the state of agriculture generally. Unfortunately, the isolated attempts that did meet with success had little effect upon the generality of farmers.

A few experiments were made with the introduction of potatoes and clover into rotations. Alfalfa was tried without much success. Some farmers alternated root, grain, and nitrogen-fixing crops in a six-year rotation, and wherever systematic rotations were practised the long fallow was reduced to one or two years. Another important innovation was sowing some kind of grass or clover on the fallow when it was to be pastured. English grasses and clovers had been introduced the previous century, but farmers did not fully realize their value or importance.

More attention was paid to manures and a variety of fertilizing substances was tried. In New England the farmers relied on fish and rockweed. In the middle colonies limestone and marl were used wherever local supplies were available. In the south a few farmers experimented with marl and cowpeas, but the reasons underlying their remedial qualities were not fully understood. Stock penning was a favourite device for securing manure for tobacco and other special crops. Swamp or creek mud was also advocated to ameliorate sandy soils. The most important fertilizing agent, however, was calcium sulphate popularly known as gypsum, plaster of Paris and land plaster. First used by the German farmers of Pennsylvania, it was tried by the agricultural leaders and extolled as a renovator of depleted soils. Where intensive agriculture prevailed, the refuse of potash manufactories, street sweepings and all other wastes were gathered up and used.

In the first half of the 19th century, improvement in cultivation techniques in the U.S. began to keep pace with European advancement. Progress along mechanical lines eventually surpassed that of Europe and, in the effort to cope with new problems arising from totally different physical and economic conditions, diverged from standard European practices. The major developments were better tillage implements, the introduction of commercial fertilizers and the beginning of scientific agriculture.

The first efforts toward better cultivation centred around improving plow designs so that they would answer the various uses expected of them. The rapid settlement of the west where the labour supply was inadequate intensified the need for more efficient equipment, and the necessity of increasing production on the poorer soils of the east also encouraged the adoption of improved implements. While some of the wealthy farmers had imported well-known European plows, U.S. designs dominated the scene because they were built in response to local requirements. The interest inventors took in designing new plow types to meet these needs is evident from the fact that more than 200 patents had been issued by 1850. As early as 1797 Charles Newbold had invented a cast-iron plow, but Jethro Wood's plow, first patented in 1814, embodying the concept of interchangeability of parts, set the pattern for subsequent plow manufacturers and marked the beginning of factory as distinct from hand production.

While the varieties of plows used throughout the U.S. had their European counterparts, the steel plow was a distinctly American contribution. Its importance in the agricultural development of the prairies cannot be overemphasized. When the settlers reached the prairies their first difficulty was in getting a plow strong enough to break up the tough sod and cut the matted root structure. After the sod disintegrated they discovered that the heavy iron breaking plows would not scour in prairie soils. Various remedies were tried without success until finally it was discovered that high grade steel would work admirably. According to Ardrey (*American Agricultural Implements,* p. 14), John Lane, in 1833, using a discarded steel saw blade made a plow that scoured satisfactorily. Other blacksmiths turned out plows using the same material, and in the '40s John Deere began the commercial production of steel plows. By 1850 the steel plow had largely displaced the cast-iron implement on the prairies, but where soil structure presented no problem cast iron continued to be used until the advent of the chilled iron plow.

Conterminous with the improvement of the plow was the development of cultivating machinery. The first cultivator was a shovel plow which served a variety of purposes besides stirring the soil between the rows of a growing crop. This was replaced in the '40s by a gang plow with two or more shovels, which in turn was superseded by the five- or six-tooth cultivator made of iron. The latter soon became the leading implement in the north and west. In the south the adoption of cultivating implements was extremely slow because the most important crops—corn, cotton and tobacco—continued to be cultivated by hand. The shovel plow replaced hand hoeing to some extent, and the cotton sweep, the skimmer and the scraper became the chief implements used for cultivating cotton after 1840.

There was little change in the thoroughness of cultivation 1800–50 in the west because extensive rather than intensive farming was the rule. In the east and south, soil erosion and exhaustion had become so pronounced that agricultural societies and periodicals endeavoured to awaken farmers to the importance of conserving the soil and maintaining its fertility through better tillage and crop practices. John Taylor (1753–1824) and later Edmund Ruffin (1794–1865), both leaders in agricultural improvement, urged farmers to use manures, legumes, green manures and rotations as remedies for depleted productivity. The erosion-control measures developed to hold the soil on sloping fields in areas of heavy rainfall included cover crops, strip cropping, hillside ditching, trenching and contour cultivation. The last three were especially designed to disperse and dispose of excess runoff. However, most of the farmers dismissed these painstaking practices in favour of the simpler, though expensive, expedient, commercial fertilizers. John Skinner of Baltimore, Md., had imported a few bushels of guano as early as 1824 and shipments had arrived in Boston, Mass., by 1830, but the guano craze did not become widespread until the '40s. The farmers, ever looking for a short-cut to increased production, tried Peruvian guano, Chilean nitrates, German potash and Carolina phosphates as each appeared on the market. While fertilizers seemed to increase productivity, they were not true remedies for soil deterioration caused by continuous cropping. The booming business in fertilizers led to many fraudulent practices, but, on the other hand, it encouraged some states to survey their natural resources in hopes of locating useful deposits and to appoint agricultural chemists to analyze fertilizers as well as soils.

The early development of agricultural science in the U.S. followed much the same pattern that it did in Europe. Actual field experiments on crops, plowing techniques and manures were largely carried on by individuals and supported by their private purses and enthusiasm. However, beginning in the 1830s, individual states allocated funds for agricultural and geological surveys in an effort to locate fertilizing deposits and to determine generally the land-use capabilities of the various types of soil. Although agricultural chemists were appointed to make soil and fertilizer analyses, no true soil investigations were undertaken. In the decade preceding the Civil War, the first agricultural colleges and experiment stations were organized, but co-ordinated attack upon agricultural problems was delayed for several decades.

The improvement of cultivation techniques and implements in the second half of the 19th century was affected by the Civil War and internal expansion. In the south the war completely disorganized systematic cultivation, but in the north it emphasized the value of improved tillage machinery in an expanding agriculture faced with an acute labour shortage. Because the south was predominantly agricultural, the disruption of the plantation system caused an economic depression that forestalled any major advance in cultivation until the 20th century. The lack of essential capital, equipment and labour in the 1870s further enmeshed the southern farmers in the vicious web of share cropping. With subsistence depending upon a cash crop, such as cotton, careful cultivation was impossible. A few far-sighted individuals realized that the south needed a complete revision of cropping techniques with more attention being paid to rotations and livestock, but the farmers continued to rely mainly on fertilizers to maintain soil fertility. As a result soil erosion continued to spread, laying waste thousands of acres. The one erosion-control practice that became quite common was terracing. In 1885, Priestly H. Mangum introduced the broad-base terrace whose chief advantage was that tillage operations could be performed over the entire structure. Plants like lespedeza that helped hold the soil were used on outlet channels to prevent cutting by storm water and for gully stabilization. For the most part tillage practices in the south lagged behind those of the other regions.

A new chapter in the western expansion of agriculture began after the Civil War, with the opening of the high plains, Rocky Mountain and intermountain regions to settlement through the homestead acts and the construction of transcontinental railways. Once again western migration became the popular panacea for agricultural ills in both the north and the south, and land abandonment in the older areas of cultivation continued throughout the 19th century.

This expansion of area under cultivation without a corresponding increase in farm labour supply forced the farmers to adopt farm machinery. The Oliver chilled-iron plow, patented in 1868, became a widespread favourite because of its adaptability and superiority in both material and design. Sulky and gang plows, rotary diggers and even steam tractors were invented and tried, but only the plows were of lasting importance. Seeding machines and cultivators, including harrows and rollers, were also improved, but the leading innovations were the spring-toothed and disk harrows first put on the market in 1877. Not until the 1890s, however, did the disk harrow become widespread.

In the rapid expansion of agriculture from the humid east to the semiarid west the farmers had no time to adjust their old techniques of cultivation to the new soils and climates that they encountered. As a result, a few prosperous years were followed by reversals. Gradually the farmers realized that diverse climatic, topographic and soil conditions were the factors complicating cultivation, and that new techniques would have to be developed to farm successfully the areas coming under the plow. West of the 100th meridian where the preservation of soil moisture was a major problem, dry farming was practised in an effort to conserve the scant rainfall. The subsurface packer invented by Hardy W. Campbell in 1885 enabled the farmer to establish a firm seedbed while leaving a dust mulch on the surface to entrap whatever rain there might be. As wheat was the main crop, turning plows were abandoned in favour of disk plows that cut up the old wheat stubble without exposing the light soils to wind erosion. Where irrigation farming prevailed, the effects of the irrigation water on soils presented still more problems. However, the farmers were not wrestling with their problems alone.

The public acceptance of the role of science in agriculture led to the establishment of institutions supported by state and federal funds. The federal department of agriculture was created as a separate agency in 1862, and the Land-Grant College act of the same year provided the basis for the founding of state agricultural colleges to educate and assist the farmer. The European concept of establishing experiment stations for agricultural research was introduced into the U.S. by Samuel W. Johnson, whose lectures and publications on soils, rotation of crops, fertilizers, methods of analysis, plant nutrition and food adulteration did much to popularize the experiment station as a research agency dealing with local problems. The passage of the Hatch act in 1887 secured the necessary funds for the establishment of agricultural experiment stations in each state. Through those institutions a co-ordinated attack was made upon U.S. problems that had no counterpart in European experience.

Cultivation in the 20th century became increasingly scientific and highly mechanized. The wide range of climatic and physiographic conditions under which the major crops were grown in the U.S. not only caused sharp regional differentiation in the methods of planting and tilling, but also delineated the number of variables governing successful tillage operations. The rapid development of the various agricultural sciences provided fresh approaches to tillage problems and the network of state and federal agencies provided the implementation, whereby the interrelations of climates, soils, methods of tillage, fertilizers, crops and rotations were investigated throughout the country.

The shift from horses and mules to tractors gave fresh impetus to mechanized farming. The clumsy tractor of 1910 gradually was replaced by lighter and more adaptable designs. Because tractors were capable of drawing heavier equipment, farmers were able to combine operations by using tandem arrangements of plows, harrows, rollers and seed and fertilizer drills. The use of tractors in turn led to further refinements in tillage implements, so that they would be more flexible. Research on tillage machinery was limited to determining what types of turning plows and disks were suited to southern crops and soils, the proper set and speed of operation of existing equipment and to developing special machinery to cultivate terraced land and to turn winter-legume cover crops.

However, plowing as a method of tillage was challenged by Edward H. Faulkner in his *Plowman's Folly* (1943). Viewing the plow as the root of all soil ills, Faulkner maintained that disking in a green cover crop or other crop residue would prevent soil erosion, increase soil moisture and provide organic matter in sufficient quantities so that fertilizing would be unnecessary. The ensuing controversy brought out that no one set of practices is equally applicable to all the crop regions of the U.S.; that disking and stubbling in have been practised in dry-farming areas for many years; that discarding the plow does not mean the soil is untilled; and that, far from destroying insect pests, in some instances mulching actually encouraged their increase. The contentions, however, focused public attention on the basic problems of soil management just as the dust storms of 1934–35 demonstrated the havoc resulting from improper tillage.

Soil erosion was not new, but until the dust storms blanketed the eastern cities, little interest was displayed even by the farmer in the amount of soil lost by improper tillage. The full effects of plowing vast acreages of submarginal land in the high plains to sow wheat were not felt until the early 1930s, when a series of dry years left the farmers nothing but a harvest of dust. A nation-wide survey revealed that some form of erosion was affecting all the agricultural regions from the citrus groves of California to the potato fields of Maine. The soil conservation service, established in 1935, set up demonstration areas and tested cropping and cultivating techniques to determine what practices would enable farmers not only to maintain soil fertility, but also to stabilize soils so that they would not erode beyond the geologic norm. The leading conservation practices included terracing, strip cropping, contouring, basin listing, cover crops, rotations and, where necessary, retiring land from cultivation. Where regular equipment was inadequate, new machines, such as the duck-foot cultivator, rod weeder, basin, or damming lister, and terracing machine, were developed. The funds available for research, the magnitude of the conservation program and the rapid acceptance of the program by the farming public deeply interested foreign countries in the soil conservation work of the U.S.

CULVERIN, an early form of light gun, constructed of leather or bronze (from Fr. *couleuvre,* a serpent). Culverins were classified into the grand culverin, weight about 40cwt., bore about $5\frac{1}{2}$in., and throwing a shot of about 18 lb.; bastard culverin, weight 30cwt., bore 5in., weight of shot 10 lb.; and medium culverin, weight 15cwt., bore 4in., weight of shot 2lb. The name disappeared about 1732.

CULVERT. It is frequently necessary to make a passage for water under roads, railways, banks, canals, etc. The drain made to carry the water in such cases is called a culvert. It may be either flat or arched, and is usually built strongly of masonry or brickwork. The introduction of ferro-concrete affords a ready means of constructing culverts strongly and economically; a concrete arch for such work is sometimes made with reinforcing rods laid in spiral form. The derivation of the word is apparently from Fr. *couloir*, a water-way.

CUMAE, an ancient city on the west coast of Campania, Italy, about 12 m. W. of Neapolis, on a volcanic eminence, overlooking the plain traversed by the Volturno.

Strabo calls it (Gr. Κύμη) the oldest of the Greek colonies on the mainland of Italy or in Sicily. We find it in 721 B.C. founding Zancle (Messina) in Sicily, jointly with Chalcis; and it extended its power gradually over the coast of the gulf of Puteoli and the harbours of the promontory of Misenum. Puteoli itself (under the name Dicaearchia) was probably founded by Cumae. In the seventh century, according to the legends, Parthenope, whither the demos of Cumae had taken refuge after an unsuccessful rising against the aristocracy, was attacked by the latter and destroyed, but soon rebuilt under the name of Neapolis (New City, the present Naples) (*q.v.*). The most fertile portion of the Campanian plain was also under its dominion; the name "fossa Graeca" still lingered on in 205 B.C. to testify to its ancient limits. Cumae was now at the height of its power, and many fine coins testify to its prosperity. In 524 B.C. it was the object of a joint but unsuccessful attack by the Etruscans of Capua, the Daunians of the district of Nola, and the Aurunci of the Mons Massicus. A renewed Etruscan attack was repelled with the help of Hiero of Syracuse, who in the battle of Cumae of 474 B.C. drove the Etruscan fleet from the sea, and broke their power in Campania. The Samnites finally destroyed the Etruscan supremacy by the capture of Capua in the latter half of the fifth century (*see* CAPUA; CAMPANIA), and the Greeks of Cumae were overwhelmed by the same invasion. The beautiful series of Greek coins from the town now ended, and Oscan became its language (though in many respects the Greek character of the town survived) until about 180 B.C. when the Cumaeans addressed to Rome a request that they might be allowed to use Latin for public purposes. Cumae had already come under the supremacy of Rome, about 340, as Capua did, and was governed after 318 by the *praefecti Capuam Cumas*. In the Hannibalic wars it remained faithful to Rome. Under the empire it was a quiet country town, in contrast to the gay and fashionable Baiae, which, however, with the *lacus Avernus* and *lacus Lucrinus,* formed a part of its territory. Cicero's villa on the east bank of the latter, for example, which he called the *Academia,* was also known as Cumanum. In the Gothic wars the acropolis of Cumae was, except for Naples, the only fortified town in Campania, and it retained its military importance until it was destroyed by the Neapolitans in 1205, since which time it has been deserted.

The acropolis hill (269 ft. above sea-level), a mass of trachyte which has broken through the surrounding tufa, lies hardly 100 yd. from the low sandy shore. It is traversed by caves, which are famous in legend as the seat of the oracle of the Cumaean Sibyl, and a vaulted corridor leading to a large rectangular forecourt has been found, from which the oracular cave itself will no doubt be reached when the excavations are completed. The acropolis has only one approach, on the south-east; on all other sides it falls away steeply. Remains of fortifications of all ages run round the edge of the hill; some of the original Greek work, in finely hewn rectangular tufa blocks, exists on the east. The mediaeval line follows the ancient, except on the north-east, where it takes in a larger area. Within the acropolis stood the temple of Apollo, the remains of which, restored in Roman times, stand on the eastern and lower summit.

There are also various remains of buildings of the imperial period, and these are far more frequent on the site of the lower town (now occupied by vineyards) which lies below the acropolis to the south. The line of the city walls can be traced both on the east and on the west, though the remains on the east are insignificant, and on the west (the seaward side) only the scarping of the hill remains. To the south of the town, just outside the wall, is the amphitheatre. To the north of it is the point where the roads from Liternum (the Via Domitiana running along the sandy coast), Capua (a branch of the Via Campana), Misenum and Puteoli meet. The last passes through the Arco Felice, an arch of brick-faced concrete 63 ft. high which spans a cutting through the Monte Grillo, made by Domitian to shorten the course of the road, which had hitherto run farther north. The Grotto della Pace leads to the shores of Avernus. On the east side of Cumae are considerable remains of the Roman period. The cemeteries of Cumae extended on all sides of the ancient city, except towards the sea, but the most important lay on the north, between this temple and the Lago di Licola. Pre-Hellenic (ninth to eighth centuries B.C.) Greek, Samnite and Roman graves have produced many important objects, now in various museums.

See D. Randall MacIver, *The Iron Age in Italy* (Oxford, 1927), 160 *sqq.* (especially for the geometric pottery found here).

CUMANÁ, a city and port of Venezuela, capital of the State of Sucre, situated on the Manzanares river about 1m. above its mouth, 52ft. above sea-level and 180m. E of Carácas. It is the oldest existing European settlement on the South American continent, having been founded by Diego Castellon in 1523 under the name of Nueva Toledo. The city was almost totally destroyed by an earthquake in 1766, and also in 1797 and 1929; shocks were experienced in 1812 and 1853, when little remained of the original structures of the town. Slight shocks are very frequent, some of them severe enough to cause considerable damage to the buildings. The mean annual temperature is 83° and the climate is enervating. In colonial times the city was rich and prosperous and enjoyed a lucrative trade with the mother country Spain. Pop. (1941) 25,893. The products consist of coffee, cacao, brown sugar ("papelon"), tobacco, rum, coco-nut oil, divi-divi, fruits, cotton goods, dried fish, and furniture made from the fine native woods. There is excellent tobacco and cotton land along the shores of the bay and there are a good many settlements and small towns along the southern shore. The district is one of considerable promise for the future if the labour problem can be solved. A tramway connects the city with its port at the mouth of the Manzanares. In recent years several manufacturing enterprises have been established, among which are a coco-nut oil extraction plant, a textile factory, electric light plant and other utilities.

CUMANS or **COMANS,** one of the most important of the old Turkish races. Their origin is uncertain; they were probably closely akin to the Seljuk Turks, and perhaps identical with the Qun of Arabic chroniclers; in which case they were the western neighbours of the Seljuks, and preceded their westward march by a few years. They must have arrived on the confines of Europe about A.D. 1030. About 1050 they attacked the Ghuz, who were then living in the old lands of the Petchenegs (*q.v.*) between the Ural and the Volga. These they subdued and made their vassals. After 1120 they further combined with the Kipchak

State which had now come under a Mongolian dynasty. The new federation was known henceforth to Arabic and Chinese sources as Kipchak; to the Russians as Polovtsi; to the Greeks as Cumani, and to the Germans as Walwen, or Falven, these being attempts to reproduce the Slavonic name, which means "dwellers in the plains"; for the Cumans were not of pure Turkish race.

The Cuman federation destroyed the last remains of the Khasar State and took their lands. After the defeat of the Petchenegs by Jaroslav of Kiev, they extended their empire yet further westward, reaching the Dnieper in 1055. Soon their frontiers reached from the Volga to the Danube. For the next century, the history of Kiev is practically one of continual Cuman wars. Sometimes treaties, and even marriage alliances were concluded; but the Cumans seem to have taken these treaties lightly, and bands of them constantly harassed the Slavonic peasants. At this time the Cumans were partly Mohammedan, but still largely pagan. "We worship one God, who is in the sky," they told the first missionaries to them, "and beyond that we know nothing; for the rest, we have abominable habits." As to these, the "Chronicle of Nestor" states: "Our Polovtsi too have their own habits; they love to shed blood, and boast that they eat carrion and the flesh of unclean beasts, such as the civet and the hamster; they marry their mothers-in-law and daughters-in-law, and imitate in all things the example of their fathers." These Cumans wore short kaftans, and shaved their heads, except for two long plaits. They seem to have been purely hunters and warriors, leaving the cultivation of the soil to their subject tribes of Slavs. Cumania, as south Russia was called, possessed thriving towns, and traded in slaves, furs and other products; but the trade was probably in the hands of Greeks and Genoese; the funeral monuments attributed to the Cumans (pyramids or pillars, each surmounted by a male figure bearing in his hand a drinking-cup) were probably not their work. The early westward raids of the Cumans, as when they invaded Hungary in 1071–72 and Byzantine territory in 1086 and 1094, allied with the Petchenegs, were not made in force, and were defeated. After the break-up of Kiev they grew stronger; at the opening of the 12th century they were the allies of the terrible Bulgarian Tsar Kalojan, whose wife was a Cuman. With him they were engaged in annual wars against Byzantium and against the Crusaders, although the alliance had to be renewed annually, for at the approach of summer the Cumans always retired to their own steppes to enjoy their booty. The growing power of Hungary was already a danger to them; the King of Hungary made several campaigns into Moldavia and Wallachia from 1223 on, coupling these wars with the more pacific methods of Catholic propaganda. By 1228 he already had enough converts to found a bishopric in Moldavia.

Break-up of the Cuman Empire.—The conquerors of the Cumans were to come, however, from the East. In 1228 the Mongols attacked them on the Volga, destroying many and driving others into Georgia, where they were attacked and wiped out. In 1238 they were crushingly defeated near Astrakhan. Many of them were slain, many more absorbed in the conquerors' hordes. Some, who were sold as slaves to the Sultan Malek-el-Saleb, became the founders of the Boharib dynasty of Mameluke sultans in Egypt, and subsequently avenged their earlier defeat, and inflicted on the Mongols their first check. Large numbers of Cumans crossed the Danube in leather boats, and took refuge in Bulgaria. Their army is still heard of as a separate force here in 1256, and the Cumans played a very large, if not a preponderating part in Bulgarian history up to the Turkish conquest. The two chief Bulgarian dynasties of this period, the Terterovske and the Sismanovske, were Cuman, and much of the population of north Bulgaria must also have been Cuman. Jireček believes the so-called "Gagauz" of north-east Bulgaria, the Dobruja and Bessarabia (Turkish-speaking orthodox Christians) to be descendants of the Cumans. The Gagauz are being rapidly Bulgarized to-day.

Another group of Cumans, consisting of 40,000 warriors with their families, or at least 200,000 souls in all, under their Khan Kuthen, took refuge in Hungary in 1239, promising to adopt Christianity in return for protection. This protection was the occasion of the declaration of war on Hungary by the Mongols who claimed the Cumans as their vassals. They were received with honour by King Bela of Hungary, and a commission was appointed to settle with them. There was, however, much friction between the Cumans and the Magyars. The former, who were still nomad tent-dwellers, felt cramped in their new life; the latter complained of depredations against their fields and their women. The Cuman women, on the other hand, were too ugly to attract the Magyars. The Cumans were eventually settled in the most fruitful parts of the Alföld, between the Danube and the Theiss, in the districts henceforward known as Greater and Lesser Cumania. When the Mongols invaded Hungary, they drove before them many Cuman prisoners as their vanguard. This caused the belief that the Cumans of Hungary had turned against their hosts, and a mob of infuriated Magyars broke into the royal palace and murdered Kuthen. His followers, who were assembling loyally enough to fight the Mongols, thereupon turned on the Magyars, and a party of them after devastating much of south Hungary and Styria, retired with their booty to the Balkans. Some of his followers settled in the district of south Serbia where a village still bears the name of Cumanovo; others rejoined their compatriots in Bulgaria.

King Bela married his son to a Cuman woman, and King Ladislaus of Hungary (1272-90) was known as the Cumanian. He favoured the Kunok (as the Cumans were known in Hungary) to such an extent that there appeared a danger that the land might relapse into heathendom, and a crusade was preached against them; but after his death their importance diminished. Many of them were created nobles, the rest remained free peasants, enjoying special privileges and immunities. Until 1715 they did military service in lieu of all taxation, and had the right of migrating at will. They retained their individuality until late in the 18th century, when they were completely Magyarized. The last speaker of Cuman as a living language died in 1770. Many Cumans doubtless left Hungary with the Turks.

The Cumans were notoriously prolific, and it certainly cannot be doubted that they form a much larger element of the population of Hungary and Bulgaria, perhaps also Rumania, than is generally recognized. They were a talented race. They produced a dynasty in Egypt and two in Bulgaria, and intermarried with the kings and princes of Kiev, Serbia and Hungary. Matthias Corvinus himself is said by some authorities to have been of Cuman origin.

Their language has been preserved in the so-called *Codex Cumanicus,* which was once in the possession of Petrarch, and is now in the library of St. Mark in Venice. This interesting 14th century document contains an imperfect Cuman lexicon, a number of hymns, and a collection of riddles in Cuman. The language is clearly an east Turkish dialect.

(C. A. M.)

CUMBERLAND, DUKES AND EARLS OF. The earldom of Cumberland was held by the family of Clifford (*q.v.*) from 1525 to 1643, when it became extinct by the death of Henry, the 5th earl. The 1st earl of Cumberland was Henry, 11th Lord Clifford (1493–1542), a son of Henry, 10th Lord Clifford (*c.* 1454–1523). Created an earl by Henry VIII. in 1525, Henry remained loyal during the great rising in the north of England in 1536, and died on April 22, 1542. His son and successor, Henry, the 2nd earl (*c.* 1517–70), married Eleanor (d. 1547), a daughter of Charles Brandon, duke of Suffolk, and Mary, daughter of King Henry VII.; he had the tastes of a scholar rather than a soldier, and died early in 1570. By his first wife, Eleanor, he left an only daughter, Margaret (1540–96), who married Henry Stanley, 4th earl of Derby, and who in 1557 was regarded by many as the rightful heiress to the English throne. By his second wife he left two sons and a daughter; his elder son George succeeding to the earldom in 1570, and his younger son Francis succeeding his brother in 1605. George, 3rd earl of Cumberland (1558–1605), was born on Aug. 8, 1558, and married Margaret (*c.* 1560–1616), daughter of his guardian, Francis, 2nd earl of Bedford. He commanded the "Bonaventure" against the Spanish Armada, and from this time until his death on Oct. 30, 1605, was mainly engaged in fitting out and leading plundering expeditions, some of which, especially the one undertaken in 1589, gained a large amount of booty. The earl left no sons, and his barony was claimed by his only daughter Anne (1590–1676), the wife successively of Richard Sackville, 3rd earl of Dorset, and of Philip Herbert, 4th earl of Pembroke and Montgomery; while his earldom was inherited by his brother Francis (1559–1641). A long law-suit between the new earl and the countess Anne over the possession of the family estates was settled in 1617. The 5th earl was Francis's only son Henry (1591–1643), who was born on Feb. 28, 1591, and was educated at Christ Church, Oxford. He was a supporter of Charles I. during his two short wars with the Scots, and also during the Civil War until his death on Dec. 11, 1643. He left no sons; his earldom became extinct; his new barony of Clifford, created in 1628, passed to his daughter Elizabeth (1618–91), wife of Richard Boyle, earl of Cork and Burlington; and the Cumberland estates to his cousin Anne, countess of Dorset and Pembroke.

In 1644 the English title of duke of Cumberland was created in favour of Rupert, son of Frederick V., elector palatine of the Rhine, and nephew of Charles I. Having lapsed on Rupert's death without legitimate issue in 1682, it was created again in 1689 to give an English title to George, prince of Denmark, who had married the lady who afterwards became Queen Anne. It again became extinct when George died in 1708, but was revived in 1726 in favour of William Augustus (1721–65) third son of George II. As this duke was never married the title lapsed on his death in 1765, but was revived in the following year in favour of Henry Frederick (1745–90), son of Frederick, prince of Wales, and brother of George III. Having again become extinct on Henry Frederick's death, the title of duke of Cumberland was created for the fifth time in favour of Ernest Augustus, who was made duke of Cumberland and Teviotdale in 1799. In 1837 Ernest became king of Hanover, and on his death in 1851 the title descended with the kingdom of Hanover to his son King George V., and on George's death in 1878 to his grandson, Ernest Augustus (b. 1845). In 1866 Hanover was annexed by Prussia, but King George died without renouncing his rights. His son, Ernest (1845–1923), was known as the duke of Cumberland. He married Princess Thyra of Denmark, and inherited the duchy of Brunswick-Lüneburg in 1884, but was prevented from becoming reigning duke by a federal decision, inspired by Prussia in 1885, and repeated and strengthened in 1907, when it was decreed that no member of the house should assume the throne of Brunswick-Lüneburg. The duke never formally renounced the throne of Hanover, and the hostility between his family and the Hohenzollerns continued until reconciliation was accomplished by the marriage of his son, Ernest Augustus, to Princess Victoria Louisa of Prussia, daughter of the emperor William II. The old duke had resigned (1906) his rights in favour of his son. The son was permitted on his marriage to succeed to the duchy of Brunswick, but in 1918 was compelled, with other German princes, to abdicate.

CUMBERLAND, RICHARD (1631–1718), English philosopher and bishop of Peterborough, the son of a citizen of London, was born in London on July 15, 1631. He was educated in St. Paul's school, and at Magdalene college, Cambridge, and in 1667 was presented to the rectory of Allhallows at Stamford.

At the age of 40 he published his earliest work, entitled *De legibus naturae disquisitio philosophica, in qua earum forma, summa capita, ordo, promulgatio, et obligatio e rerum natura investigantur; quin etiam elementa philosophiae Hobbianae, cum moralis tum civilis, considerantur et refutantur* (1672). It appeared during the same year as Pufendorf's *De jure naturae et gentium,* and was highly commended in a subsequent publication by Pufendorf, whose approbation must have had the effect of making it known on the continent. Having thus established a solid reputation, Cumberland next prepared a work on a very different subject—*An Essay towards the Recovery of the Jewish Measures and Weights, comprehending their Monies; by help of ancient standards, compared with ours of England* (1686).

In 1691 he became bishop of Peterborough. He died on Oct. 9, 1718.

The philosophy of Cumberland is expounded in the treatise *De legibus naturae.* Its main design is to combat the principles of Hobbes.

He defines the laws of nature as "immutably true propositions regulative of voluntary actions as to the choice of good and the avoidance of evil, and which carry with them an obligation to outward acts of obedience, even apart from civil laws and from any considerations of compacts constituting government." This definition, he says, will be admitted by all parties. Some deny that such laws exist, but they will grant that this is what ought to be understood by them. There is thus common ground for the two opposing schools of moralists to join issue.

The existence of such laws may, according to Cumberland, be established in two ways. The inquirer may start either from effects or from causes. Cumberland prefers that from causes to effects, as showing more convincingly that the laws of nature carry with them a divine obligation. In the prosecution of this method he expressly declines to have recourse to what he calls "the short and easy expedient of the Platonists," the assumption of innate ideas of the laws of nature. He cannot assume, he says, that such ideas existed from eternity in the divine mind, but must start from the data of sense and experience, and thence by search into the nature of things discover their laws. It is only through nature that we can rise to nature's God. His attributes are not to be known by direct intuition. But the Cambridge Platonists have his support in their battle with Hobbes, and he grants that ideas might be both born with us and afterwards impressed from without.

Cumberland's ethical theory (*see* ETHICS, HISTORY OF) is summed up in his principle of universal Benevolence, the one source of moral good. "No action can be morally good which does not in its own nature contribute somewhat to the happiness of men." The theory is important in comparison (1) with that of Hobbes, and (2) with modern utilitarianism.

1. Cumberland's Benevolence is, deliberately, the precise antithesis to the Egoism of Hobbes. His method was the deduction of the propriety of certain actions from the consideration of the character and position of rational agents in the universe. He argues that all that we see in nature is framed so as to avoid and reject what is dangerous to the integrity of its constitution; that benevolence of all to all is what in a rational view of the creation is alone accordant with its general plan; that both man's body and his mind show him to be designed for the pursuit of common good rather than his own private advantage. The whole course of his reasoning proceeds on, and is pervaded by, the principle of final causes.

2. To the question, What is the foundation of rectitude? he replies, the greatest good of the universe of rational beings. He may be regarded as the founder of English utilitarianism, but his system goes to the opposite extreme from what is known as the selfish system, by absorbing individual in universal good.

Nor did he restrict good to the pleasures of sense; a point in which his views were abandoned by the utilitarians, but revived later by Mill. The doctrine of right reason, regarded as a purely derivative function of the mind which lies only in germ in Cumberland, will be found in full flower in Hartley, Mackintosh and later associationists.

BIBLIOGRAPHY.—The care of Cumberland's posthumous publications devolved upon his domestic chaplain and son-in-law, Squier Payne, who soon after the bishop's death edited *"Sanchoniato's Phoenician History,* translated from the first book of Eusebius, *De praeparatione evangelica:* with a continuation of Sanchoniato's history of Eratosthenes Cyrenaeus's Canon, which Dicaearchus connects with the first Olympiad. These authors are illustrated with many historical and chronological remarks" (1720). The preface, moreover, contains an account of the life, character and writings of the author, which was likewise published in a separate form. The sequel to the work was likewise published by Payne—*Origines gentium antiquissimae; or Attempts for discovering the Times of the First Planting of Nations: in*

several Tracts (1724). Editions of the *De legibus naturae* (Lübeck, 1683 and 1694); English versions by J. Maxwell (1727) and John Towers (1750); French translation by Jean Barbeyrac (1744); James Tyrrell (1642–1718), grandson of Archbishop Ussher, published an abridgment of Cumberland's views in *A Brief Disquisition of the Laws of Nature according to the Principles laid down in the Rev. Dr. Cumberland's Latin Treatise* (1692; ed. 1701). For biographical details *see* also Cumberland's *Memoirs* (1807), i. 3–6; *Pepys' Diary*. For his philosophy, *see* E. Albee, *Philosophical Review*, iv. 3 (1895), pp. 264 and 371; F. E. Spaulding, *R. Cumberland als Begründer der englischen Ethik* (1894); and text-books on ethics.

CUMBERLAND, RICHARD (1732–1811), English dramatist, was born in the master's lodge of Trinity college, Cambridge, on Feb. 19, 1732. He was the great-grandson of the bishop of Peterborough; and his father, Dr. Denison Cumberland, became successively bishop of Clonfert and of Kilmore. His mother was Joanna, the youngest daughter of the great scholar Richard Bentley, and the heroine of John Byrom's once popular little eclogue, *Colin and Phoebe*. Cumberland was educated at Westminster School and Trinity College, Cambridge, where he took his degree as tenth wrangler in 1750. He had just begun to read for his fellowship, when he was offered, and accepted, the post of private secretary to the earl of Halifax, first lord of trade and plantations in the duke of Newcastle's ministry. In 1761 he accompanied his patron (who had been appointed lord-lieutenant) to Ireland as Ulster secretary and subsequently held other Government positions. In 1780 he was sent on a confidential mission to Spain, the expenses of which he strove in vain to recover, and soon after retired on an allowance of less than half-pay. He died in London on May 7, 1811.

Cumberland is remembered by his plays, and, to some extent, by his *Memoirs* (1806–07), which include a long account of his Spanish mission and reminiscences of politicians and of Garrick, Foote and Goldsmith. Cumberland was a good observer of men and manners; but the uneasy self-absorption which Sheridan immortalized in the character of Sir Fretful Plagiary in *The Critic* is apparent enough in this autobiography.

Cumberland's plays, published and unpublished, have been computed to amount to fifty-four. About 35 of these are regular plays, to which have been added 4 operas and a farce; and about half of the whole list are comedies. The best known of them belong to sentimental comedy. He first essayed sentimental comedy in *The Brothers* (1769). The theme of this comedy is inspired by Fielding's *Tom Jones;* its comic characters are the jolly old tar Captain Ironsides, and the henpecked husband Sir Benjamin Dove. The epilogue paid a compliment to Garrick, who helped the production of Cumberland's second comedy *The West-Indian* (1771), which was afterwards translated into German by Boden; Goethe acted in it at the Weimar court. *The Fashionable Lover* (1772) is a sentimental comedy of the most pronounced type.

Among his later plays may be mentioned *The Natural Son* (1785), *The Imposters* (1789), a comedy of intrigue; *The Jew* (1794), a serious play; *The Wheel of Fortune* (1795), in which John Kemble found a famous part in the misanthropist Penruddock, who cannot forget but learns to forgive (a character declared by Kotzebue to have been stolen from his *Menschenhass und Reue*), and a *Hint to Husbands* (1806), which, unlike the rest, is in blank verse. *The Carmelite* (1784), a romantic domestic drama in blank verse, in the style of Home's *Douglas,* furnished some effective scenes for Mrs. Siddons and John Kemble as mother and son. His posthumously printed plays (published in 2 vols. 1813) include *Brutus* (afterwards amalgamated with other plays on the subject into a very successful tragedy for Edmund Kean by Payne); *Tiberius in Capreae;* and *The False Demetrius* (on a theme which attracted Schiller). Cumberland translated the *Clouds* of Aristophanes (1797), and altered for the stage Shakespeare's *Timon of Athens* (1771), Massinger's *The Bondman* and *The Duke of Milan* (both 1779). Cumberland's novel, *Henry,* was printed in Ballantyne's Novelists' Library (1821), with a prefatory notice of the author by Sir Walter Scott.

A so-called *Critical Examination* of Cumberland's works and a memoir of the author based on his autobiography, by William Madford, appeared in 1812. An excellent account of Cumberland is included in "George Paston's" *Little Memoirs of the Eighteenth Century* (1901). Hettner well characterizes Cumberland's position in the history of the English drama in *Litteraturgesch. d. 18 Jahrhunderts* (2nd ed., 1865), i. 520. Cumberland's portrait by Romney (whose talent he was one of the first to encourage) is in the National Portrait Gallery.

CUMBERLAND, WILLIAM AUGUSTUS, Duke of (1721–1765), son of King George II. and Queen Caroline, was born on April 15, 1721, and when five years of age was created duke of Cumberland. After an unsuccessful attempt at a naval career, he joined the army in 1742, becoming a major-general in December. In 1743, he shared in the glory of Dettingen (June 27), and after the battle was made lieutenant-general. In 1745, having been made captain-general of the British land forces at home and in the field, the duke was again in Flanders as commander-in-chief of the allied British, Hanoverian, Austrian and Dutch troops. Advancing to the relief of Tournai, which was besieged by Marshal Saxe, he unsuccessfully engaged that great general in the battle of Fontenoy (*q.v.*) on May 11.

He was recalled from Flanders to quell the Jacobite rising headed by Prince Charles Edward (1745–46). Carlisle having been retaken, Cumberland retired to London, till the news of the defeat of Hawley at Falkirk roused fresh fears. The duke was appointed commander of the forces in Scotland, and proceeded to Aberdeen to prepare his army. On April 15, 1746 he fought the decisive battle of Culloden. His stern measures for the suppression of Jacobitism which followed earned him his title of "Butcher" Cumberland.

He was rewarded by being voted an income of £40,000 per annum in addition to his revenue as a prince of the royal house. In 1747 he again opposed the still victorious Marshal Saxe in Flanders, and received a heavy defeat at the battle of Lauffeld, or Val, near Maestricht (July 1747). When war broke out afresh in 1757 Cumberland was placed at the head of a motley army of allies to defend Hanover. At Hastenbeck, near Hameln, on July 26, 1757, he was defeated by the superior forces of D'Estrées (*see* Seven Years War), and finally, in September, capitulated at Klosterzeven, agreeing to disband his army and to evacuate Hanover. His disgrace was completed on his return to England by the king's refusal to be bound by the terms of the duke's agreement. Retiring into private life, the duke did much to displace the Bute ministry and that of Grenville, and endeavoured to restore Pitt to office. Public opinion, which had originally turned against him after his harsh treatment of the Scotch, now set in his favour, and he became almost as popular as he had been in his youth. He died on Oct. 31, 1765.

See A. N. Campbell Maclachlan: *William Augustus, Duke of Cumberland* (1876); E. Charteris: *William Augustus . . . his early life and times* (1913); *William Augustus . . . and the Seven Years War* (1925); and Cumberland: Dukes and Earls of.

CUMBERLAND. The north-westernmost county of England, bounded north by Scotland, with the boundary deflected north of the Esk-Liddell streams so as to include Solway Moss in England, east by Durham and Northumberland leaving the pass between Pennines and the Cheviots in the latter county, south-east by Westmorland giving the upper Eden to that county, south by Lancashire, which possesses the southward-opening Coniston and Windermere areas of the English Lake District, and west by the Irish Sea. It thus consists essentially of the Carlisle plain and those portions of the Lake District which focus upon it or upon the west coastal strip. Area 1,520.5 sq.mi.

Physical and Geological Features.—The great physical and geological feature is the famous mountain dome with its radial lakes and this will be described briefly here though it extends into Westmorland eastwards and Lancashire southwards. The geological history has analogies with that of North Wales. Ordovician deposits were overlaid by lava and ashes and these in turn were covered by Silurian rocks. The area was folded in a north-north-west direction during the Caledonian mountain-building period, was reduced and acquired a girdle and probably a cover of Carboniferous rocks, was depressed again, acquired a girdle of New Red Sandstone, and, Marr suggests, a covering of Chalk-period deposits. Later, probably during the Alpine mountain-building period, the present dome was uplifted with a drainage scheme first developed on a now vanished cover. The Saddleback (2,847 ft.), Skiddaw (3,053 ft.), Bassenthwaite, Crummock Water, and the West Ennerdale area shows the smoothed surface of Ordovician rocks typically pressed into slates. To the south of a great fault the volcanic rocks or Borrowdale series give rugged features; they lagged behind the slates in the northward Caledonian folding Sca Fell Pike (3,210 ft.) and Helvellyn (3,118 ft.) are the most outstanding masses. The two sections are separated broadly by the Penrith-Keswick road and a line continuing this westward. There are some volcanic rocks (Carrock Fell) northeast of Skiddaw. The volcanic series gives place southward to Silurian rocks along a line from the lower Duddon across the upper part of Windermere to the vicinity of Shap in Westmorland. The scenery to the south becomes smoother and the transition is, in the west, not far from the county boundary. The volcanic series contains intrusive igneous rocks in the west, and at Shap. The dome has been radially eroded and fault lines have added complexities as also have the glaciers of the Pleistocene Ice Age. The Derwent, Caldew, Eamont, Lowther, Kent, Leven, Crake, Duddon, Esk, Irt and Ehen spread like the spokes of a wheel, mostly from the central volcanic zone and their valleys contain the many long lakes, usually with morainic dams, that name the district. Derwentwater, Bassenthwaite, Buttermere, Crummock Water, Ennerdale and Wastwater are the largest in Cumberland, with Ullswater on the Westmorland border. As in north Wales there are also high tarns at the heads of valleys.

A fault running east-northeast from Maryport cuts off the dome from the Carlisle plain which has many faults around it and possesses a floor of Permian, Triassic and Liassic rocks. The Pennine fault runs along the east side of the Eden valley and throws up Carboniferous limestone and other rocks of that period to form the high ground on the north and northeast of the county. Cross Fell (2,930 ft.) is outstanding and the volcanic intrusion of the Whinsill may be traced northward from it.

The west coast strip exposes Carboniferous limestone, with remnants of scarps facing towards the dome, followed by coal measures some of which are worked under the sea. Ironstone also occurs. To the southwest Triassic sandstones form the frame of the dome. The present dips of these rocks are sufficient to carry them on over the whole dome and Marr thinks they once covered it. Like northwest Wales, Cumberland was affected in the Pleistocene Ice Age not only by local ice sheets but also by ice sheets spreading down the Irish sea from Scotland. A moraine with south Scottish rocks can be traced at S. Bee's Head, in the Isle of Man, and in north Ireland.

Early Settlement.—The great circles of unhewn stone are a feature of Cumberland. That at Swineside, near Millom, still has 22 stones standing, its diameter is about 25 yards. Another, $1\frac{1}{2}$ mi. from Keswick on the old Penrith road, retains 38 stones and is about 38 yards in diameter; it encloses a group of 10 stones one of which is 7 ft. high. Long Meg and her Daughters, near Addingham church, has 67 stones and a diameter of more than 100 yards. Near the enclosure is a stone 18 ft. high. Tumuli have been found on many of the lower hills, notably near Heskfell (south), Penrith and Bewcastle Fells (north). A number of bronze-age finds have been made.

The district was conquered by Agricola in A.D. 80 and he built a wall from Solway to Tyne. This was superseded by the great wall of Hadrian built A.D. 121 from Wallsend in Northumberland to Bowness-on-Solway in Cumberland, a distance of $73\frac{1}{2}$ mi. In post-Roman times the county shared in the activities of Celtic Christianity which had its centre in the northwestern islands. Crosses with Celtic and Scandinavian characteristics occur at Gosforth, Bewcastle and elsewhere. The battle of Ardderyd (573) resulted in the consolidation of Cumberland with the kingdom of Strathclyde. About 670–680 the Angles of Northumbria conquered the district between the Solway and the Mersey and kept it until the Danish invasion of the 9th century. In 875 the kingdom of the Cumbri is referred to, but without any indication of its extent, and the first mention of Cumberland to denote a geographical area occurs in 945, when it was ceded by Edmund to Malcolm of Scotland. At this date it included the territory north and south of the Solway from the Firth of Forth to the Duddon. In 1000 it was once more a stronghold of the Danes, whose influence is clearly traceable in place names, the Scandinavian names being mostly on the higher ground and the Saxon names in the lowlands. At the time of the Norman invasion Cumberland was a dependency of the earldom of Northumbria, but its history at this period is very obscure, and no notice of it occurs in Domesday. In 1092 William Rufus captured Carlisle, repaired the city, built the castle, sent Englishmen to till the land and placed the district under the lordship of Ranulf Meschines. The district was again captured by the Scots in the reign of Stephen, and on its recovery in 1157 was made to include the great barony of Coupland. At this date the district was described as the county of Carlisle, and the designation county of Cumberland is not adopted in the sheriff's accounts until 1177. The administrative divisions were known as bailiwicks, in 1278.

Border warfare was a feature of Cumbrian life until, and even after, the union of England and Scotland. Families like the Tilliols, the Lucies, the Greystokes and the Dacres were famous on the English side. Many of the parish churches have towers for defense, as the church at Burgh-on-the-Sands near Carlisle. Carlisle was the headquarters of the English army under Edward I. In the Wars of the Roses the prevailing sympathy was with the Lancastrian cause. In 1542 the Scots suffered a disastrous defeat at Solway Moss. After the union of the crowns of England and Scotland in 1603, the countries hitherto known as "the Borders" were called "the Middle Shires." On the outbreak of the Civil War of the 17th century the northern counties rose for the king. In 1645 Carlisle was captured by the parliamentary forces, but in April 1648 it was retaken and did not finally surrender until the autumn of 1648. Cumberland was one of the first counties to welcome Charles II; in 1715 it was associated with the rising, and Carlisle was the chief seat of operations in 1745. With the Romantic revival in English poetry, the Lake district became a centre of literary interest gathering around the names of Wordsworth, Coleridge, Southey, Ruskin and others.

Industries and Occupations.—About $52\frac{2}{3}\%$ of the total area of the county (1,503 sq.mi., excluding water) was under cultivation in 1939, and over one-third was in rough grazings. Stock farming, especially for sheep, of which 749,622 were raised in 1939, is the main rural occupation, though cattle are important, with a total of 199,496 in the same year. The principal crop is oats (43,110 ac.), followed by turnips and swedes (15,806 ac.) and potatoes (4,812 ac.). Rough Fell sheep are favoured in the hills and they are crossed with larger ones in the lowlands. Long after the Norman conquest Cumberland remained one of the most densely forested regions of England, and much of the low-lying land is still well wooded. The oak, ash and birch are the principal natural trees, while sycamores have been planted for shelter round many farmsteads. Plantations of larch are numerous, and extensive afforestation has been carried out. Much land was formerly held by "statesmen" *i.e.*, "estatesmen," a class of sturdy small holders. The National Trust owned 14.1 sq.mi. in Cumberland in 1942, including the principal peaks and the Derwentwater.

The industries of Cumberland have been from earliest times connected with its fisheries and mineral wealth. The mines of Alston and the iron mines about Egremont were worked in the 12th century. The Keswick copper mines were worked in the reign of Henry III, and the black-lead mine in the 18th century. Coal mining is referred to in the 15th century and, after the revival of the mining industries in the 16th century, rose to great importance. The saltpans about the estuaries of the Esk and the Eden were a source of revenue in the 12th century. In modern times the iron and steel manufacture has centred in Workington, pig iron is produced mainly at Millom, and coal is mined about Whitehaven, Workington, Maryport, Aspatria and Cockermouth. Iron ore is raised at Cleator Moor, though on a larger scale in the south around Millom. Pencils are made at Keswick, gypsum is worked at Hesket and exists in quantity at Whitehaven, while cobalt, antimony and manganese are sometimes obtained. Granite and limestone are extensively quarried. Cotton is manufactured at Carlisle.

The decline in the iron, steel and coal industries, due to the fall in home demand and the loss of foreign markets following World War I, combined with an absence of other industries, led to severe depression in the West Cumberland industrial region in the 1930s. A government investigation showed that in mid-1934, out of an insured male population of 33,800, there were 10,500 unemployed. In intensity, unemployment ranged from 28.2% in Harrington to 61.2% in Maryport. Cleator Moor and Maryport became partially derelict and the condition of several other towns was serious. Industrially West Cumberland's main activities revealed a remarkable interdependence, but, since the iron ore mining was unlikely to afford more employment in the future and the iron and steel industry could offer no prospect of absorbing its unemployed, the outlook was far from promising. Accordingly, the whole area—consisting of the towns of Alston, Aspatria, Cleator Moor, Cockermouth, Haltwhistle (Northumberland), Harrington, Maryport, Millom, Whitehaven and Workington—was scheduled for assistance under the Special Areas act of 1934.

Steps taken towards economic recovery and stability followed policy for the Special areas as a whole The Cumberland Development council was formed in late 1935 to promote particularly the area's industrial potentialities and its great possibilities as a tourist centre. Under the council an industrial survey was completed in 1938, and a comprehensive publicity campaign was undertaken. Rapid results were hindered, however, by the inaccessibility of the area, though its small size made it susceptible to measures which in larger regions would scarcely have been adequate. Thus, though a trading estate was impracticable, the West Cumberland Industrial Development company, which was formed instead in Aug. 1937, with powers similar to those of the trading estate companies, met with considerable success in its efforts to attract new industry. By the end of Sept. 1938, two new factories had been completed at Maryport and a third was being built; extensive factory space had been newly equipped at Cleator Moor; a large leather factory was almost completed at Millom; and at Whitehaven the erection of a factory for silk weaving and finishing had been begun. In addition, plans had been formulated for improving the amenities of the area. Of 15 undertakings which had been granted financial assistance by the Special Areas commissioner at the same date, eight had received it in the form of "inducements" under the Amending act of 1937, and of these, five were to occupy factories provided by the development company.

Apart from purely industrial measures, the most important works, which were finally undertaken after severe initial setbacks, were in connection with the improvement of Whitehaven and Maryport harbours, but the factor of supreme importance to the future of the area as a whole, *i.e.*, greatly improved transport facilities, particularly by road, was still under discussion, mainly because of the extent and cost of the necessary works.

Unemployment was directly relieved by the transference of workers to more prosperous localities through the ministry of labour—about 4,000 had been transferred by Sept. 30, 1938—by settlement schemes, administered by the Land Settlement association, and by the provision of "sub-economic" employment in the shape of group holdings (under the same association) and allotments. The progress of group holdings was slow because of the difficulty of obtaining suitable properties, and by Sept. 30, 1938, only 15 groups with 155 holdings were in operation. Land settlement suffered similarly at first, but eventually four estates aggregating 2,136 ac. were acquired in the county (the largest two near Carlisle) with accommodation for 224 families, and at the end of Sept. 1938, 115 families, or 551 persons had been settled on them. Public works undertaken by the local authorities, aided by grants from the commissioner, provided additional employment. The placing of government contracts in the area and the reopening of some works also contributed to the fall in the number of wholly unemployed men to 6,860 in mid-September 1938, the total number of unemployed persons in the area at that time being 9,933 or 28.8% of the insured population. (*See* also GLAMORGANSHIRE.)

The chief ports are Whitehaven, Workington and Maryport. The L.M.S.R. enters the county near Penrith and passes through Carlisle. This is the western route to Scotland. There are branch lines with connections to Maryport, Cockermouth, Keswick, Egremont, Chester and Workington. The L.N.E.R. connects Carlisle with Newcastle. Motorbus traffic has facilitated travel. There were 2,350 miles of roads in the county in 1943.

Population and Administration.—The area of the administrative county is 1,513.4 sq.mi. with an estimated pop. of 194,900 in 1938. However, the suitability of the county as a reception area for evacuees in World War II had the effect of raising the population 11% between Sept. 1939 and Feb. 1941. The county contains five wards, corresponding to hundreds, and the Derwent division. The county town is the city of Carlisle, a county borough. The municipal boroughs are Whitehaven and Workington and the urban districts Cockermouth, Keswick, Maryport and Penrith. Cumberland is in the northern circuit, and assizes are held at Carlisle. It has one court of quarter sessions and 12 petty sessional divisions. Carlisle has a separate commission of the peace and court of quarter sessions. Cumberland returned three members for the county to the parliament of 1290, and in 1295 returned in addition two members for the city of Carlisle and two members each for the boroughs of Cockermouth and Egremont. Carlisle now returns one member and four others are returned respectively by the Northern, Penrith and Cockermouth, Whitehaven and Workington divisions of the county.

In 685 Carlisle and district were annexed by Egfrith of Northumbria to the diocese of Lindisfarne, to which it continued subject, until the Danish invasion of the 9th century. In 1133 Henry I created Carlisle (*q.v.*) a bishopric. In 1856 the diocese was extended so as to include the whole of Cumberland except the parish of Alston (in the diocese of Newcastle), the whole of Westmorland and the Furness district of Lancashire. The parish of Firbank, in Westmorland, is in the diocese of Bradford.

CUMBERLAND, the second largest city of Maryland, U.S.A., on the Potomac river, in the north-western part of the State; the county seat of Allegheny county. It is on Federal highways 40 and 220; has an aeroplane landing field, Mexico Farms; and is served by the Baltimore and Ohio, the Cumberland and Pennsylvania, the Pennsylvania, and the Western Maryland railways. The population in 1930 was 37,747 (91% native white), and was 39,483 (97.3% native white) in 1940, federal census. The city is 635 ft. above sea-level, and is surrounded on three sides by mountain scenery. A deep gorge of great beauty, called "The Narrows," forms a natural gateway to the west. Cumberland has a large trade in coal, of which the county mines about 1,500,000 tons a year. The manufacturing industries include artificial silk, rubber tires, glassware, groundshafting, firebrick, lumber products and beer. The railroad shops in Cumberland are capable of repairing and building all types of equipment. Cumberland is a retail and wholesale centre for western Maryland and large sections of West Virginia and Pennsylvania. The first settlement here was made in 1750, and in 1754 Col. James Imes built Ft. Cumberland at Wills creek as a defence against the French and their Indian allies. From this fort Gen. Braddock started on his disastrous expedition of July 9, 1775. A town was laid out in 1763 and incorporated in 1815. In 1850, when the population was 6,073, it was chartered as a city, and in 1910 a commission form of government was adopted.

CUMBERLAND, a town in Providence county, Rhode Island, U.S.A., in the northeastern part of the state, on the Blackstone river and served by the New York, New Haven and Hartford railroad. The population in 1940 (federal census) was 10,625. Within its borders are nine villages, which manufacture cotton goods and silk. At Lonsdale, a village on the river, William Blackstone, the first permanent white settler in Rhode Island, built his residence "Study Hall" about 1635. Cumberland was originally part of Rehoboth, and then of Attleboro (Mass.). In 1747, by royal decree, it was annexed to Rhode Island and the town was incorporated. Because of the variety of minerals within its borders it was named after Cumberland, England. In 1867 part of it was set off as the town of Woonsocket.

CUMBERLAND GAP, a pass in the Cumberland mountains on the border between the States of Kentucky and Tennessee, U.S.A., about 45 m. north-east of the city of Knoxville, Tennessee. The altitude of the pass, which was an important strategic point in the Civil War, is 1,648 feet.

CUMBERLAND MOUNTAINS, the westernmost of the three great divisions of the Appalachian uplift in the United States, composed of many small ranges of mountains (of which Cumberland mountain in eastern Kentucky is one). It extends from Pennsylvania to Alabama, attaining its greatest height (about 4,000ft.) in Virginia. The plateau is rich in a variety of mineral products, of which coal is the most abundant; beautiful marbles are also quarried in this region. The plateau has an abrupt descent, almost an escarpment, into the great Appalachian valley on its east, while the west slope is deeply and roughly broken. The whole mass is eroded in Virginia into a maze of ridges. Cumberland mountain parts the waters of the Cumberland and Tennessee rivers. This range and the other ranges about it are perhaps the loveliest portion of the whole plateau. The peaks here and in the Blue Ridge to the east are the highest of the Appalachian system. The Cumberland range is noted for its immense caverns and subterranean streams. Cumberland gap, crossing the ridge at 1,648ft. above sea level, where Kentucky, Virginia, and Tennessee meet, is a gorge about 500ft. deep. The mountains, river, and gap were all discovered by a party of Virginians in 1748, and named in honour of the victor of Culloden, William, duke of Cumberland. Afterwards the gap gained a place in American history as one of the main pathways by which emigrants crossed the mountains to Kentucky and Tennessee. During the Civil War it was a position of great strategic importance, as it afforded an entrance to eastern and central Tennessee from Kentucky, which was held by the Union arms; and it was repeatedly occupied in alternation by the opposing forces throughout the struggle.

CUMBERLAND RIVER, a large southern branch of the Ohio river, U.S.A., rising in the highest part of the Cumberland plateau in southeast Kentucky, and emptying into the Ohio in Kentucky (near Smithland) after a devious course of 688 mi. through that state and Tennessee. It drains a basin of somewhat more than 18,000 sq.mi. At the Great Falls, in Whitley county, (Ky.), it drops precipitously 63 ft. Above the falls it is a mountain stream, of little volume in the dry months. It descends rapidly at its head to the highland bench below the mountains and traverses this to the falls, then flows in rapids (the Great Shoals) for about 10 mi. through a fine gorge with cliffs 300–400 ft. high and descends between bluffs of decreasing height and beauty into its lower level. Save in the mountains its gradient is slight, and below the falls, except for a number of small rapids, the flow of the stream is equable. Timbered ravines lend charm to much of its shores, and in the mountains the scenery is most beautiful.

Below Nashville the stream is about 400 to 500 ft. wide, and its high banks are for the most part of alluvium, with rocky bluffs at intervals. At the mouth of the river lies Cumberland island, in the Ohio. During low water of the Ohio the Cumberland discharges around both ends of the island, but in high water of the Ohio the gradient of the Cumberland is so slight that its waters are held back, forming a deep quiet pool that extends about 20 mi. up the river. Commerce on the Cumberland was once of great importance, it being navigable for light-draught boats through about 500 mi. under favourable conditions—Burnside, Pulaski county, 518 mi. from the mouth, being the head of navigation. A system of locks and dams below Nashville was planned in 1846 by a private company, which accomplished practically nothing. Since 1832 the federal government has expended more than $6,000,000 on canalization and open channel projects. During the Civil War, Fort Donelson on the Cumberland, and Fort Henry near by on the Tennessee were erected by the Confederates, and their capture by Flag-officer A. H. Foote and Gen. Grant (Feb. 1862) was one of the decisive events of the war.

CUMBERLAND ROAD: *see* NATIONAL OLD TRAILS ROAD.

CUMBRAES, THE, two islands forming a parish and part of the county of Bute, Scotland, lying in the Firth of Clyde, between the southern shores of Bute and the coast of Ayrshire. Great Cumbrae island, about 1½ mi. W.S.W. of Largs, is 3¾ mi. long and 2 mi. broad, and has a circumference of 10 mi. and an area of 3,200 ac. or 5 sq.mi. Its highest point is 417 ft. above the sea. There is some fishing and a little farming, but the mainstay of the inhabitants is the custom of the visitors who crowd every summer to Millport, which is reached by steamer from Largs, and from Fairlie in the summer. This town (pop. 1938, 1,508) is well situated at the head of a fine bay and has a climate that is both warm and bracing. Its chief public buildings include the cathedral, erected in Gothic style on rising ground behind the town, the college connected with it (not now used as such), a picturesque seat belonging to the marquess of Bute, who owns the island, and a marine biological station. The cathedral, originally the collegiate church, was founded in 1849 by the earl of Glasgow and opened in 1851. In 1876 it was constituted the cathedral of Argyll and the Isles. Millport enjoys exceptional facilities for boating and bathing, and there are also two good golf courses. Little Cumbrae island lies to the south, separated by the Tan, a strait half a mile wide. It is 1¾ mi. long, barely 1 mi. broad, and has an area of almost a square mile. Its highest point is 409 ft. above sea level. On the bold cliffs of the west coast stands a lighthouse. Robert II is said to have built a castle on an islet off the east shore, which was demolished by Cromwell's soldiers in 1653. The remains of the tower can be seen. The population of the two islands, omitting Millport, was 82 in 1931.

CUM DIVIDEND: *see* DIVIDENDS.

CUMIN or **CUMMIN** (*Cuminum Cyminum*), an annual herbaceous plant of the family Umbelliferae, probably a native of western Asia, but scarcely known at the present time in a wild state. It was early cultivated in Arabia, India and China, and in the countries bordering the Mediterranean. Its stem is slender and branching, and about a foot in height; the leaves are deeply cut, with filiform segments; the flowers are small and white. The fruits, the so-called seeds, which constitute the cumin of pharmacy, are fusiform or ovoid in shape and compressed laterally; they are two lines (one-sixth inch) long, are hotter to the taste, lighter in colour, and larger than caraway seeds, and have on each half nine fine ridges, overlying as many oil-channels or vittae. Their strong aromatic smell and warm bitterish taste are due to the presence of an oil. Total annual world production is about 2,000 tons. Principal use is in spice manufactures. The drug is used in veterinary practice. Cumin is exported from Algiers, Morocco, India, Malta, Syria and Mexico.

CUMMERBUND, a girdle or waistbelt (Hindostani *kamarband,* a loin-band). In the east the principle of health is to keep the head cool and the stomach warm; the turban protects the one from the sun, and the cummerbund ensures the other against changes of temperature. In India the cummerbund consists of many folds of muslin or bright-coloured cloth.

CUMMING, JOSEPH GEORGE (1912–1868), English geologist and archaeologist, was born at Matlock in Derbyshire on Feb. 15, 1812. He was educated at Oakham grammar school, and Emmanuel college, Cambridge, taking the degree of M.A., and entering holy orders in 1835.

In 1841 he was appointed vice-principal of King William's college, Castletown, in the Isle of Man, and this position he held until 1856. During this period his leisure time was devoted to a study of the geology and archaeology of the island. The results were published in a classic volume, *The Isle of Man; its History, Physical, Ecclesiastical, Civil and Legendary* (1848). He was vicar of St. John's Bethnal Green, London, at the time of his death on Sept. 21, 1868.

CUMMINGS, BRUCE FREDERICK: *see* BARBELLION, W. N. P.

CUMMINS, ALBERT BAIRD (1850–1926), American politician, was born at Carmichaels, Pa., on Feb. 15, 1850. He was educated at Waynesburg (Pa.) college, studied surveying, and was at first engaged in railway work. He then took up law, was admitted to the bar of Illinois in 1875, and for three years practised in Chicago. In 1878 he went to Des Moines, where he attained great distinction in his profession, and ten years later was a member of the Iowa house of representatives. He was chairman of the Republican State committee (1892–96), candidate for the U.S. senate in 1894 and 1900, member of the Republican National committee (1896–1900) and a delegate to the Republican National convention on four occasions. He was elected governor of Iowa in 1902 and re-elected for two succeeding terms. In 1908 he was elected to the U.S. senate to fill the unexpired term of Senator Allison, and was re-elected three times, serving continuously for 18 years until his death, which occurred at Des Moines, on July 30, 1926. He opposed the nomination of Taft in 1912, but did not leave his party. He was specially identified with measures concerning trusts and railways, and took a leading part in drafting the Esch-Cummins act, under which the government in 1920 returned to private control the railways of the United States. When Vice-President Calvin Coolidge succeeded to the presidency in 1923 Cummins served as president of the senate until the succeeding vice-president, C. G. Dawes, assumed office in 1924.

CUMNOCK AND HOLMHEAD, small burgh, Ayrshire, Scotland, on the Lugar, 33¾ mi. S. of Glasgow by road, with two stations (Cumnock and Old Cumnock) on the L.M.S.R. Pop. (est. 1938) 4,053. Area, .26 sq.mi. It is in the parish of Old Cumnock (1931 pop. 5,637). Coal and ironstone are extensively mined in the neighbourhood, and the industries include iron works and the manufacture of electrical switchgear. When Alexander Peden (1626–1686), the persecuted Covenanter, died, he was buried in the Boswell aisle of Auchinleck church; but his corpse was borne thence by a company of dragoons to the foot of the gallows at Cumnock, where they buried it. After the Revolution the inhabitants out of respect for the "Prophet's" memory abandoned their then burying ground and turned the old place of execution into the present cemetery. A monument was erected in his memory. Five miles southeast lies the civil parish of New Cumnock (pop. 6,420) at the confluence of Afton Water and the Nith, with a station on the L.M.S.R. Two miles northwest of Cumnock is Auchinleck (pronounced Affleck), with a station on the same railway. Coal and iron mining and stone quarrying are carried on. It is the seat of the Boswell family, three of whom are well known—Lord Auchinleck, the judge (who dubbed Dr. Johnson "Ursa Major"), his son James, the biographer, and his grandson Sir Alexander, the author of "Gude nicht and joy be wi' you a'," "Jenny's Bawbee," "Jenny dang the weaver," and other songs and poems, who perished in a duel. Pop. of Auchinleck civil parish (1931) 6,626.

CUMONT, FRANZ VALÉRY MARIE (1868–), Belgian historian of religion, was born on Jan. 3, 1868, at Alost. After studying at Ghent, Bonn, Berlin, Vienna and Paris, he was from 1892 to 1910 professor in Ghent university, and from 1899 to 1912 curator of the Brussels Royal museum.

His chief publications are: editions of Philo's *De aeternitate mundi* (1891) and of the *Acts of S. Dasius* (1897); *Textes et monuments relatifs aux mystères Mithra* (1894–1901, Eng. trans. 1903); *Les Réligions orientales dans le paganisme romain* (1906, Eng. trans. 1911); *Recherches sur le manichéisme* (1908–12); *Astrology and Religion among the Greeks and Romans* (1912); *Études syriennes* (1917); *After Life in Roman Paganism* (1922); *Imp. Caesaris F. C. Iuliani Epistulae, Leges, Poematia, Fragmenta varia* (with Bidez 1922); and *Fouilles de Doura Europos, 1922–23*, etc. (2 pts. 1926).

CUMULATIVE PREFERENCE SHARE, a share which carries with it the right, not only to a preferential dividend, but to a lien upon future profits for any or all arrears of deferred or unpaid preferential dividend. That is to say, if the cumulative preference dividend for any period cannot be paid, the unpaid dividend accumulates to the credit of the holder of the share, and must be paid before any other dividend is paid in any succeeding year. The equivalent term in the United States is cumulative preferred stock.

CUNARD, SIR SAMUEL, Bart. (1787–1865), British civil engineer, founder of the Cunard line of steamships, was born at Halifax, Nova Scotia, on Nov. 21, 1787. In conjunction with Messrs. Burns of Glasgow and Messrs. MacIver of Liverpool, proprietors of rival lines of coasting steamers between Glasgow and Liverpool, he formed a company to carry out the British government's proposal to substitute steam- for sailing-vessels in the trans-Atlantic mail service. The first voyage of a Cunard steamship was successfully made by the "Britannia" from Liverpool to Boston, U.S.A., between July 4, and 19, 1840. Cunard was created a baronet in 1859. He died on April 28, 1865.

CUNARD WHITE STAR LINE. This British steamship company takes its name from Samuel Cunard (*q.v.*) who, in 1839, secured the contract from the British admiralty for the carriage of mails by steamship to Canada and the United States.

The Cunard Atlantic service was inaugurated on July 4, 1840, when the "Britannia," a wooden paddle-wheel steamer, sailed from Liverpool for Halifax, N.S., and Boston, completing the passage in 14 days 8 hours at an average speed of $8\frac{1}{2}$ knots.

In the first 43 years of the company's existence noteworthy links in the chain of development were the "Persia" (1856), the first iron Cunard liner, the "Scotia," 3,871 tons (1862), in her day the largest steamer in the world; the "Gallia," 4,800 tons (1879), regarded as the grandparent of the modern liner; the "Servia," 7,392 tons (1881), the first steel Cunard liner and larger and faster than any boat then in commission, and the "Aurania" (1883), the first liner to be fitted with suites of rooms.

From 1884 onwards, the rate of progress made was more rapid than ever. The "Umbria" and "Etruria" launched in that year were sister ships of more than 8,000 tons and an instantaneous success.

The achievements of the "Umbria" and "Etruria" were eclipsed by the commissioning of the first Cunard twin-screw steamers "Campania" and "Lucania" (1893) whose speed of 22 knots made them the ships of the day. The "Caronia" (19,687 tons) and the "Carmania" (19,524 tons) were added to the fleet in 1905. The latter was the first Cunard liner to have turbine engines.

The "Lusitania" (31,550 tons) and "Mauretania" (31,937 tons) were commissioned in 1907. Their construction followed the signing of an agreement in 1903 between the Cunard company and the government to meet the competition of the recently formed International Mercantile Marine Company of America.

In 1909 the company strengthened its Mediterranean freight services by the purchase of three steamers. In 1939 these services were maintained by four 2,400-ton steamers, "Bactria," "Bantria," "Bosnia" and "Bothnia."

An important development took place in 1911 when the company re-entered the Canadian trade by acquiring the Thomson Line. In addition three new vessels for this service were ordered.

The "Aquitania" (44,768 tons) was commissioned in May 1914.

Immediately after the Armistice the company ordered 13 new vessels amounting to a gross tonnage of 214,000 tons. This new fleet included five 20,000 ton liners for the New York service and six 14,000 ton vessels for the Canadian trade. The express service was transferred to Southampton and maintained by the "Berengaria" (ex "Imperator"), "Aquitania" and "Mauretania."

The company had also acquired other interests, the chief of which were the Commonwealth & Dominion Line (Port Line) engaged in the Australian and New Zealand trade and Thos. & Jno. Brocklebank engaged in the Indian trade.

In 1930 the construction of the "Queen Mary" (81,235 tons) was begun at Clydebank. The ordering of this vessel was due to the rapid progress in naval architecture and marine engineering which made it possible for two ships of sufficient size and speed to maintain the company's express service to New York instead of three ships hitherto found necessary. In Dec. 1931, owing to the world-wide economic depression, work on the "Queen Mary" was suspended and it was not until April 1934 that it was restarted.

In Feb. 1934 the agreement between the Cunard Steamship company, White Star Line (*q.v.*) and the government was reached. As a result of this agreement the North Atlantic assets of the Cunard and White Star companies were merged while the government agreed to advance to the merger company £9,500,000 to enable the "Queen Mary" to be completed and a sister ship constructed.

The "Queen Mary" was launched by Her Majesty Queen Mary on Sept. 26, 1934, and made her first voyage to New York on May 27, 1936. In the same year construction of the second ship (the "Queen Elizabeth") began at Clydebank.

An important development in the company's services took place in 1937 when work was begun at Birkenhead on the construction of a new 35,000-ton liner.

Designed for the company's intermediate services and to supplement when necessary the express service, this new vessel was launched on July 28, 1938, and named "Mauretania," in this way perpetuating the name of her famous predecessor which had been sold for breaking up in 1935.

The new "Mauretania" was commissioned in 1939 and made her maiden voyage from Liverpool to New York on June 17.

The launching of the "Queen Elizabeth" by Her Majesty the Queen took place on Sept. 27, 1938.

This great vessel—more than 1,030 ft. in length and with a gross tonnage of 85,000 tons—made a successful maiden voyage to New York city in March 1940, secretly and without passengers, to evade the German submarines.

CUNAXA, BATTLE OF, 401 B.C. This battle is more famous in its sequel—The "Retreat of the Ten Thousand" under Xenophon—than in itself. Cyrus the Younger, seeking to seize the Persian throne from his brother Artaxerxes, had advanced from Sardis and at Cunaxa, beside the Euphrates, he met his brother's army. Cyrus' force was leavened with some 12,800 Greek mercenaries, under Clearchus. These he placed on his right, the post of honour, next the river. On the other side Artaxerxes with his personal guard cavalry was, according to custom, in the centre, where also the cavalry of the satrap Tissaphernes were placed. On either flank of this cavalry centre stood Artaxerxes' infantry and beyond them again on the two wings were the troops of the other two satraps who were present. The right extended beyond the flank of Cyrus' left. But Cyrus appears to have had an acute grasp of the fact, abundantly attested later in Alexander's invasion, that the resisting power of a Persian army lay in its royal link. For this reason Cyrus wished Clearchus with his Greeks to advance obliquely against the enemy's centre, where Artaxerxes was, for, "if we are victorious in that quarter, our object is fully achieved." As events proved, such a move would probably have decided the battle and a throne. But Clearchus demurred, on the ground that by such a lateral march he would expose his flank, at present protected by the river. The Greeks, therefore, advanced straight to their front and their superior training and armour enabled them easily to rout the opposing Persian left. Unhappily, instead of turning inwards to roll up the enemy's line they pressed straight on in pursuit of their immediate opponents. Meanwhile on the other flank, Artaxerxes' more extended right had naturally lapped round Cyrus' left. Cyrus, however, in default of Clearchus' help, put his conception into execution by charging with 600 cavalry at the enemy's centre. He is said to have penetrated far enough to wound Artaxerxes with his own hand, but was then himself slain. On his fall his own army proved his insight right by dispersing—all save the Greeks. These returned from the pursuit to a battle they believed won and found lost, but even then, a handful adrift among enemy masses in a strange land, they were too formidable for Artaxerxes to dare an attack, except by the subsequent treachery which led to the murder of their leaders and Xenophon's (*q.v.*) opportunity to earn immortal fame.

See Xenophon, *Anabasis.*

CUNDINAMARCA, a department of the eastern plateau of Colombia, South America, pop. (1938) 1,174,607, composed chiefly of Indians and mestizos. A considerable part of its area consists of plateaus from 8,000 to 9,000 ft. above sea level, enjoying a temperate climate and producing the fruits and cereals of the temperate zone, and another important part lies in the valley of the Magdalena and is tropical in character. The slopes between these two regions are celebrated for the excellence of their coffee.

The capital of the department, Bogotá, population (1938 est.) 325,658, is also capital of the republic. Other important towns are Facatativá, pop. (1938) 9,779, situated on the western margin of the *sabana* of Bogotá, 25 mi. N.W. from the capital by rail; and Girardot, pop. (1938) 22,557, connected by rail and a section of the Pan-American highway with the capital.

CUNEIFORM. This name was first applied by Engelbert Kämpfer, at the beginning of the 18th century, to those rock inscriptions from Persia, and to inscriptions on brick and stone from Babylon, which are distinguished by the use of characters made up of triangles or wedge-shaped incisions. This kind of writing was still practised in Babylonia in the first century B.C. Copies accurate enough to allow of study, were used by Karsten Niebuhr in 1774–78, who distinguished three kinds of cuneiform writing, found in three columns in the inscriptions, and divined that one was alphabetic in character. It has since been proved that some of the consonants include the value of a short vowel.

DECIPHERMENT

Old Persian.—Niebuhr drew up an alphabet of one class of inscriptions (that contained in the first column), consisting of 42 characters (whereas there are in fact only 32), and considered this kind of writing Persian.

The number of correct values assigned was gradually increased, many names were correctly ascertained, and the division of words rendered certain by the recognition of the fact that a diagonal wedge was used as a word-divider. In 1837, Rawlinson sent his decipherments of the Persian rock-inscriptions at Elvend and Bisitun (Behistun) to the Royal Asiatic society, and, with the final revision of his work in 1846, the main part of the Old Persian inscriptions of the Achaemenian period became intelligible and the period of decipherment in that branch ended.

Elamite.—The sense of the inscriptions in the two languages that precede Old Persian in these trilingual inscriptions was known from the decipherment of the Old Persian; and it was not difficult to identify certain series of characters in them with the proper names given in the Old Persian. The simpler writing of the two was that in the second column. This writing is not alphabetic, but the majority of the signs are syllabic; thus there are signs representing *sha, shi, shu,* and *ish* which represent the series of simple syllables composed of the consonant *sh* and a vowel, while other signs represent syllables compounded of two consonants and a vowel; *e.g., man, pan, par.* A few signs signify words in themselves and are therefore called ideograms; divine names are marked by prefixing a sign not intended to be sounded; and a perpendicular or a horizontal stroke marks nouns of different kinds. The second column inscriptions were not therefore difficult to arrange into words, and the sense of the words was accurately known in most cases. Rawlinson with his translation of the Old Persian version of the Bisitun inscription was able to supply certain passages broken in the third column, from the intact second column. By 1890 the main ascertainable facts were finally decided. The inscriptions found at Susa during spasmodic excavations, and afterwards by the great French expedition, finally proved that the language of the second column of the Achaemenian inscription was the latest form of the tongue spoken by the people of Elam, and in 1897, Hüsing gave it the name New Elamite. The history of the language covers some 2,000 years, and the decipherment of the earlier stages is mainly due to the text publications of the French expedition by Father Scheil. Unfortunately the sense of these earlier inscriptions can only be approximately decided. The language is classed in the amorphous group generally called "Caucasian."

Babylonian.—The language of the third column of the Achaemenian inscriptions was Babylonian; the characters employed being those on bricks and other objects from the site of Babylon. The decipherment of this language was accomplished when in 1851 Rawlinson published 112 lines of the Babylonian version of the Bisitun inscription, with a transcription, and a nearly complete translation. In this memoir 150 signs were assigned values, and certain of these had more than one phonetic value. The language was unquestionably Semitic, and the words could be frequently compared with Hebrew and Arabic; the characters were in part ideograms, in part syllables (individual signs being occasionally polyphonous), and in part used to denote the character of a word, such as a personal name, a profession, a bird and so forth. The language was called by universal consent, Assyrian, since the bulk of the inscriptions then published came from Assyria. Subsequent studies have resulted in a slight change in the nomenclature. Most of the Assyrian royal inscriptions use, as a literary language, the classical Babylonian Semitic language, called by themselves Akkadian. But the Assyrians spoke, and sometimes wrote a language distinct from, but closely related to, Akkadian, and the term Assyrian is now best reserved for that distinctive language, while the Babylonian tongue is termed Akkadian.

Sumerian.—A certain number of inscriptions from Babylonia, especially those of early date, proved to be in a language which was not a Semitic language, to which the name Sumerian is now given. Cuneiform writing was actually invented by the people who spoke Sumerian. The decipherment of this language offered no particular difficulties so far as the characters and phonetic values were concerned, as these were obtained from the Semitic texts and vocabularies. But the language itself is peculiar in structure and cannot at present be allocated to any known family with certainty; the interpretation of unilingual texts from Babylonia in the early period is not often in doubt so far as the main sense goes, but in detail there are still considerable uncertainties.

Urartaean.—Cuneiform inscriptions exist in Armenia in the neighbourhood of Lake Wān and over a very wide area, from Erzerum in the north to the neighbourhood of Lake Urmia in the south. These inscriptions are not all in the Akkadian employed by Assyrian kings, but in another language, which had a nominative case that ended in—*s,* and an accusative in—*n;* the kings' names were in certain cases unquestionably those given by Assyrian inscriptions as kings of Urartu. For the most part the texts are records of buildings and of the construction of canals and other means of irrigation. Modern scholars are inclined to consider this language one of a group known as "Caucasian" to which family Georgian belongs. Various names have been applied to it: "Vannic," since the kingdom in which it was spoken centred round Lake Wān or Van, "Chaldian," because the mention of "Chaldian gods" in the inscriptions may show that the people called themselves "Chaldians," and the Greek writers mention Χαλδιοί in this area, and "Urartaean" because the kingdom was called Urartu by the Assyrians.

Hittite.—The fragments of clay tablets found at various sites in the neighbourhood of Boghaz Keui at the end of the 19th century bore texts in a language clearly similar to, or the same as, that in which a king of Arzawa wrote about 1380 B.C. to the Pharaoh of Egypt, Amenhotep IV, the heretic Ikhnaton. At Boghaz Keui in 1907 a great archive of tablets was unearthed written in various languages, including Akkadian. These Akkadian documents made it clear that Boghaz Keui was the capital of those kings of the Hittites who were engaged in great wars with Egypt in the 14th and 13th centuries B.C.; the library discovered included a certain number of vocabularies, which gave the meaning of the native "Hittite" words in Akkadian. This basis would not have been sufficient to decipher the language, had not the scribes who wrote Hittite texts used both Sumerian and Akkadian words as "ideograms"; that is, they wrote foreign words in cuneiform, but pronounced them in their own language. The meaning of sentences being approximately certain, words in the Hittite language can be ascertained to have certain approximate senses. Hrozny showed that in certain remarkable respects the verb conjugations and the noun declensions corresponded to the *centum* languages of the Indo-European group. But the vocabulary of the Hittites has for the most part no relation to Indo-European; only a few roots can be equated with Indo-Germanic. Whether the Hittite written in cuneiform is the same language as that expressed in pictographic script commonly called "Hittite" because it also was used at Boghaz Keui, is not known.

Other Languages.—Cuneiform was widely employed all over western Asia in the second millennium B.C. Palestinian, Syrian and Phoenician princes wrote to their Egyptian overlord on cuneiform tablets, and sometimes explained isolated Babylonian words by the native "Canaanite" words, which are closely related to Hebrew. One tablet contains Egyptian words spelled phonetically and explained by Babylonian words. On Hittite tablets of a magical and religious character incantations and spells are often given in languages of Asia Minor other than Hittite, designated as the "Luvian," "Bala" and other unknown names. One of these languages is called "Hurrian," and was spoken by a people whose political power centred about the valley of the Khabur. This language is only dialectically distinguishable from that in which the letter of Dushratta, the king of Mitanni, to the Pharaoh Amenhotep IV is couched. Now this language was probably the speech of the Subaraeans, for the names of men called "Subaraean" demonstrably contain the same elements. The exact interpretation of the Subaraean and Hurrian languages is not yet possible owing to the paucity of material.

History of Cuneiform Writing.—The earliest was pictographic, and the simplest objects were truly drawn; a head, foot, sledge, man in a hut, various kinds of pots, reeds, can all be clearly distinguished. The only extant tablet with the pictographic signs upon it is made of stone, which offers no difficulty for drawing such pictures, and may date from about 3,500 B.C. on an approximate estimate. The only other writing material in Babylonia, where this pictographic writing seems to have originated, is clay. The clay was specially selected, and the shape made in the earliest times resembled that of a square cushion with rounded corners. Though wet clay will take lines from a fine point, it is impossible to draw objects in full detail successfully, and clay tablets inscribed shortly after the date of the pictographic tablet show conventional linear forms of the signs which sometimes leave the nature of the original picture in doubt. These linear forms were immediately adopted for use on stone; but they cannot have been in use long on clay because an easier method was at hand. Instead of drawing the point of the stilus across the surface, the point was pressed in, and a sharp edge depressed in the required direction, with the effect that the head of the line assumed a slightly triangular shape, so that | became ▼ and — became ►—. This characteristic, the wedge-shape, from which the writing received its name cuneiform, became inseparable from the writing and was copied by the masons in stone inscriptions. Hence through this development the human foot  came to be represented by .

The earliest writing was in columns read downwards, and from right to left, and this custom was retained in certain cases till the reign of Hammurabi; but the custom of writing horizontally from left to right, which entailed turning the signs on one side, was introduced before 2600 B.C., and was universal later. This resulted in the picture of a man's head facing right  becoming a recumbent head .

The exact method of the scribes in writing on clay tablets is not known, and the explanation which follows is conjectural. In shaping the clay the thumb and fingers were used on less important documents, but marks were never left on finely made tablets. The shape of the tablets varied in different periods, the square tablets being succeeded by long rectangular shapes; the large tablets used in the third millennium were abandoned for general use, but are occasionally found in use for long literary texts. The building inscriptions which were placed as records in the foundations of temples and palaces by kings were generally written on hollow barrel cylinders. The Assyrians who added to the account of the building a long preamble containing the military exploits of the reign, also used a prism shape, with four to ten sides, which was inscribed down the length. These cylinders and prisms always had a fine clay surface put over a rough core.

The stilus was in general made of a reed, and the fibre marks may be seen in roughly written business documents. It has been claimed that a very early bone object found at Kish is a stilus. In the very finest writing some hard material must have been employed, possibly even metal. The point of the instrument was perhaps formed by cutting a square stem obliquely. The stilus was held in the right hand, and the kinds of wedges required, ▼, ►—, ◣, ►——, ◀, were obtained by a manipulation with the fingers, the different edges being used. The blunt edge of the stilus was round, and in the earliest times circles and semi-circles were made by it to indicate numerals. An unexplained difficulty is that tablets are inscribed on obverse and reverse. When the tablet was turned, in such a way that the bottom of the obverse became the top of the reverse, the inscribed surface, still wet, would be likely to suffer from any pressure, but this was avoided by some unknown means. Some of the finest tablets from Ashurbanipal's library, and some prisms, are pierced with round holes; the exact purpose is not known.

The development in power of expression accompanied the change in methods of writing. The pictograph, besides denoting the object depicted, had indicated allied ideas; thus the picture of the human foot could also mean "to stand" or "to go" and other verbs of motion. The sign thus came to have the sound of these words associated with it. These sounds were later used as syllabic values, and used to write words not capable of being expressed by a single sign. Another development was the use of compound signs; "food" in "mouth" formed the picture sign "to eat." The polyphony of the signs was both increased and reduced by the assumption of a single form by signs originally distinct, and by the distinction into different forms of a single sign. When the cuneiform signs were adopted for the expression of the Semitic language, still more syllabic values were added to various signs, since the Semitic words for various picture signs were sometimes treated as syllabic values. Even so it is not possible to give a full account of the origin of all values.

The syllabary evolved by this process consisted of some thousands of signs, but in practice the number necessary could be, and was very considerably reduced. The almost endless "ideograms" were used by the learned scribes for writing documents only intended for their own eyes; to simplify the reading of them an elaborate system of phonetic complements was introduced. Commercial documents and more especially letters, were written with simple syllables, and for this purpose about 150 common signs and ideograms sufficed. In this form the writing was borrowed by other countries.

The two main schools of cuneiform were both derived from the particular style of writing of the Sumerian scribes of the 3rd dynasty of Ur about 2300–2150 B.C. At that time the writing was introduced into Assyria. In the north, a tendency to make the signs square in appearance developed about 2000 B.C., and thenceforward the Assyrian forms of signs are markedly different in many cases from the Babylonian. In both cases simplification took place, but the Babylonian preferred a cursive form.

In Elam, cuneiform was adopted at a very early period and was used at the same time as an indigenous form of writing in the third millennium. In the second millennium cuneiform signs were written in cursive forms peculiar to the country; when exactly the peculiar forms and limited number of signs used in the second column of the Achaemenian inscriptions were adopted is not known, the date may approximately be the 7th or early 6th century. The Persian cuneiform was a separate invention, based only on the use of wedges. Some scholars affirm that the Persian alphabet must have been known before the time of Darius I, the Great, but there is no definite proof of this. All the inscriptions in this cuneiform alphabet extant are royal, and there is no literary or commercial document so written extant; it is to be doubted whether it was ever used except for monumental purposes. The one example of a clay tablet was intended for the use of masons.

Spread of Cuneiform Writing.—The objects delineated in the early pictographic script prove that its originators were inhabitants of the marsh lands at the head of the Persian gulf. From there it spread to Elam at the end of the 4th millennium. It was first used to express a Semitic language at some time after 3000 B.C., and was regularly so used from 2500 B.C. onwards. It was introduced into Assyria and Asia Minor about 2300 B.C. Between 1500–1200 B.C. there were cuneiform scribes in several Hittite towns in Asia Minor, in nearly every important city in Syria and Palestine and at the Egyptian court. About the same time the Assyrians introduced it into their provinces east of the Tigris, at such places as Arrapha, for ordinary use; the earlier examples of cuneiform writing in the Zagros range, which date from about 2800 B.C., onwards, are confined to royal monumental inscriptions. The kings of Van borrowed Assyrian cuneiform about the 9th century B.C. for their own monuments and clay tablets prove that it was in ordinary use. In the time of the Assyrian empire, 800–600 B.C., cuneiform was used in all the provinces of western Asia. The Achaemenian kings continued and developed the practice of writing in their home lands, and the Seleucid dynasty which followed them had royal inscriptions written in it, and encouraged Greeks to study early cuneiform documents, for there are tablets which give translations of the cuneiform signs into Greek characters.

BIBLIOGRAPHY.—Rogers, *History of Babylonia and Assyria*, 6th ed., vol. I (1915); E. A. W. Budge, *Rise and Progress of Assyriology*, 1925.

CUNEO, a town and episcopal see of Piedmont, Italy, the capital of the province of Cuneo, 55 mi. by rail south of Turin, 1,722 ft. above sea level. Cuneo lies on the railway from Turin to S. Dalmazzo di Tenda, whence the road goes on to Airole which is 8 mi. N. of Ventimiglia by rail. In 1937 it became a station on the new direct railroad from Turin to Nice. It is also a junction for Mondovi and Saluzzo, and has steam tramways to Borgo S. Dalmazzo, Boves, Saluzzo and Dronero. Pop. (1936) 18,852 (town); 35,321 (commune). Its name ("wedge") is due to its position on a hill between two streams, the Stura and the Gesso. Cuneo was founded about 1120 by refugees from local baronial tyranny, who, after the destruction of Milan by Barbarossa, were joined by Lombards. In 1382 it swore fealty to Amadeus VI, duke of Savoy. It was a fortress, and was ceded by the treaty of Cherasco (1796), with Ceva and Tortona, to the French. In 1799 it was taken by the Austrian and Russian armies, and, in 1800, after the victory of Marengo, the French demolished the fortifications.

CUNIBERT, SAINT (*c.* 590–663), bishop of Cologne, was educated at Trèves, where he became archdeacon. After becoming bishop of Cologne in 623, he assisted at the synods of Reims (625) and of Clichy (626). At the court of the Merovingians, especially under Sigebert III (d. 656), he exercised great political influence. He encouraged missions to the Frisians.

CUNITZ, MARIA (*c.* 1610–1664), Silesian astronomer, was the eldest daughter of Dr. Heinrich Cunitz of Schweinitz, and the wife (1630) of Dr. Elias von Löven, of Pitschen in Silesia—both of them men of learning and distinction. From her universal accomplishments she was called the "Silesian Pallas," and the publication of her work, *Urania propitia* (Oels, 1650), a simplification of the Rudolphine tables, gained her a European reputation. It was composed at the village of Lugnitz, close by the convent of Olobok (Posen), where, with her husband, she had taken refuge at the outbreak of the Thirty Years' War, and was dedicated to the emperor Frederick III. She died at Pitschen on Aug. 24, 1664.

CUNLIFFE, WALTER, 1ST BARON (1855–1920) English banker, was born in London on Dec. 4, 1855, the son of Roger Cunliffe, a banker of the City of London. He was educated at Harrow and Trinity college, Cambridge, and became a banker in the City in 1880, establishing in 1890 the merchant banking business of Cunliffe Bros. He became a director of the Bank of England in 1895, deputy-governor in 1911, and governor in 1913, an office which he held until 1918. He was raised to the peerage as Baron Cunliffe of Headley in Dec. 1914. Lord Cunliffe was associated with the working out of all the chief financial problems during World War I, and in 1917 accompanied A. J. Balfour on his financial mission to the United States. He died at Epsom on Jan. 6, 1920.

CUNLIFFE-LISTER, SIR PHILIP (1884–), British statesman, was born on May 1, 1884, at Ayton, Yorkshire. The youngest son of Lt.-Col. Yarburgh G. Lloyd Greame, he assumed by royal warrant the name of Cunliffe-Lister in Dec. 1924. He was educated at Winchester and University college, Oxford, and was called to the bar in 1908. During World War I he served with the King's Royal Rifle corps, attaining the rank of major. Elected Conservative member for Hendon in 1918, he was chairman of the labour committee of the war cabinet, and served on other important government committees. He was parliamentary secretary to the Board of Trade and of the Overseas Trade department in the Lloyd George Coalition government; was president of the Board of Trade 1922–23, 1924–29 and 1931; and colonial secretary 1931–35; and secretary of state for air 1935–38. He was created Viscount Swinton in Nov. 1935.

CUNNINGHAM, ALEXANDER (*c.* 1655–1730), Scottish classical scholar and critic, was born in Ayrshire. It is probable that he completed his education at Leyden or Utrecht. He was tutor to the son of the first duke of Queensberry, through whose influence he was appointed professor of civil law in the University of Edinburgh until 1710, when he left England for The Hague, where he resided until his death. He is chiefly known for his edition of Horace (1721) with notes, mostly critical, which included a volume of *Animadversiones* upon Richard Bentley's notes and emendations. Cunningham also edited the works of Virgil and Phaedrus (together with the *Sententiae* of Publilius Syrus and others).

Life by D. Irving in *Lives of Scottish Writers* (1839).

The above must not be confused with ALEXANDER CUNNINGHAM, British minister to Venice (1715–1720), a learned historian and author of *The History of Great Britain* (from 1688 to the accession of George I), originally written in Latin and published in an English translation after his death.

CUNNINGHAM, ALLAN (1784–1842), Scottish poet and man of letters, was born at Keir, Dumfriesshire, on Dec. 7, 1784, and died on Oct. 30, 1842. He began life as a stone mason's apprentice. His father was a neighbour of Burns at Ellisland, and Allan with his brother James visited James Hogg, the Ettrick Shepherd, who became a friend to both. Cunningham contributed some songs to Roche's *Literary Recreations* in 1807, and in 1809 he collected old ballads for Robert Hartley Cromek's *Remains* *of Nithsdale and Galloway Song;* he sent in, however, poems of his own, which the editor inserted, even though he may have suspected their real authorship. In 1810 Cunningham went to London and in 1814 became clerk of the works in the studio of Francis Chantrey, retaining this employment till the sculptor's death in 1841. Some of Cunningham's songs hold a high place among British lyrics. "A Wet Sheet and a Flowing Sea" is a famous sea-song although written by a landsman; and many other of his songs will bear comparison with it.

Cunningham had five sons and one daughter. JOSEPH DAVEY CUNNINGHAM (1812–1851) entered the Bengal Engineers, and is known by his *History of the Sikhs* (1849). SIR ALEXANDER CUNNINGHAM (1814–1893) also entered the Bengal Engineers; attaining the rank of major-general; he was director general of the Indian Archaeological survey (1870–85), and wrote an *Ancient Geography of India* (1871) and *Coins of Medieval India* (1894). PETER CUNNINGHAM (1816–1869) published several topographical and biographical studies, of which the most important are his *Handbook of London* (1849) and *The Life of Drummond of Hawthornden* (1833). FRANCIS CUNNINGHAM (1820–1875) joined the Indian army, and published editions of Ben Jonson (1871), Marlowe (1870) and Massinger (1871).

The works of Allan Cunningham include *Lives of the Most Eminent British Painters, Sculptors and Architects* (1829–33); *Traditionary Tales of the Peasantry* (1822); the *Songs of Scotland, Ancient and Modern* (1825); *Biographical and Critical History of the Literature of the Last Fifty Years* (1833); an edition of *The Works of Robert Burns,* with notes and a life containing a good deal of new material (1834); and *Life, Journals and Correspondence of Sir David Wilkie,* published in 1843. An edition of his *Poems and Songs* was issued by his son, Peter Cunningham, in 1847.

CUNNINGHAM, WILLIAM (1805–1861), Scottish theologian and ecclesiastic, was born at Hamilton, Lanarkshire, on Oct. 2, 1805, and educated at the University of Edinburgh. In 1834 he received the charge of Trinity college parish, Edinburgh. In the stormy discussions which preceded the Disruption, he was a powerful advocate of the cause of the Free Church. On its formation in 1843 Cunningham was appointed professor of Church history and divinity in the New college, Edinburgh, of which he became principal in 1847 in succession to Thomas Chalmers. In 1859 he was appointed moderator of the General Assembly. He died on Dec. 14, 1861. He was one of the founders of the Evangelical Alliance. The Cunningham theological lectureship at the New college, Edinburgh, was endowed in 1862.

See Rainy and Mackenzie, *Life of Cunningham* (1871).

CUNNINGHAM, WILLIAM (1849–1919), British economist, was born at Edinburgh on Dec. 29, 1849. He was educated at Edinburgh, Tübingen and Cambridge. He was university lecturer in history from 1884 to 1891, when he was named professor of economics at King's college, London, a post which he held until 1897. He was lecturer in economic history at Harvard university (1899), and Hulsean lecturer at Cambridge (1885). He became vicar of Great St. Mary's, Cambridge, in 1887, and was made a fellow of the British academy. In 1906 he was appointed archdeacon of Ely. He died at Cambridge on June 10, 1919. Dr. Cunningham's *Growth of English Industry and Commerce during the Early and Middle Ages* (1890) and *Growth of English Industry and Commerce in Modern Times* (1882; 3rd ed., 1903) are standard works of reference on the industrial history of England. He also wrote *The Use and Abuse of Money* (1891); *Alien Immigration* (1897); *Western Civilization in its Economic Aspect in Ancient Times* (1898), and *in Modern Times* (1900); and *The Case against Free Trade* (1910), written in support of Joseph Chamberlain's tariff policy. Cunningham's work on the historical side of economics marked the beginnings of a new tendency. A bibliography of his work will be found in his *Progress of Capitalism in England* (1916).

CUNNINGHAME GRAHAM, ROBERT BONTINE (1852–1936), Scottish writer, eldest son of William Cunninghame Graham of Ardoch and Gartmore, was educated at Harrow. He spent much of his youth cattle-farming in the Argentine, and travelled widely in Paraguay, Mexico, Spain and Morocco. A Spanish grandmother made the Spanish language and national temperament singularly congenial, and his writings are throughout coloured by these early experiences. Cunninghame Graham sat as M.P. for North Lanarkshire from 1886–92, and took an active part in Labour politics, being closely associated with John Burns and Keir Hardie in their early days, and in 1928, as an ardent nationalist, identified himself with the Scottish national movement.

Characteristic of his varied writings, essays, travel notes, biography and stories, all of which are original in matter and brilliant in expression, are these: *Mogreb-el-Acksa* (1898); *A Vanished Arcadia* (1901); *Success* (1902); *Hernando de Soto* (1903); *Faith* (1909); *A Brazilian Mystic,* a life of Antonio Conselheiro (1920); and a biography of his ancestor, *Doughty Deeds of Robert Graham, 1735–97* (1925); *Pedro de Valdivia, Conqueror of Chile* (1926). *See* also L. Chaundy, *A Bibliography of the First Editions of the Works of Robert Bontine Cunninghame Graham.*

CUNO, WILHELM (1876–1933), German statesman, was born on July 2, 1876, at Suhl. He entered the civil service and was employed from 1907 in the treasury. During World War I he was in charge of the imperial grain office until July 1916; he was then Batocki's chief assistant in the food department until Nov. 1917, when he became a director of the Hamburg-Amerika line. At the end of 1918 he succeeded Ballin as president and general director. Dr. Cuno always took an active part in national politics, although he never stood for parliament. As a result of the murder of Erzberger on Aug. 26, 1921, and of Rathenau on June 24, 1922, which had shaken national confidence, a ministerial crisis, inspired by the socialist distrust of Herr Stinnes, resulted in the resignation of the Wirth government on Nov. 14. Dr. Cuno then formed a non-party cabinet, in which there were no social democrats, with Dr. von Rosenberg as foreign minister, the chief task being the direction of national opposition to the French in the Ruhr. A financial crisis following the disastrous fall of the mark obliged Dr. Cuno to resign on Aug. 12, 1923, and he then returned to the presidency of the Hamburg-Amerika shipping company. It is perhaps worth noting that the idea of a pact, which eventually developed under Dr. Cuno's successors into the Locarno Pact, was already mooted by him during his chancellorship (*see* E. C. Reventlow, *Minister Stresemann als Staatsmann, etc.* [1925]).

CUP, a drinking vessel, usually in the form of a half sphere, with or without a foot or handles. The footless type with a single handle is preserved in the ordinary tea-cup. The cup on a stem with a base is the usual form used in the celebration of the eucharist, to which the name "chalice" is generally given. (*See* DRINKING VESSELS.)

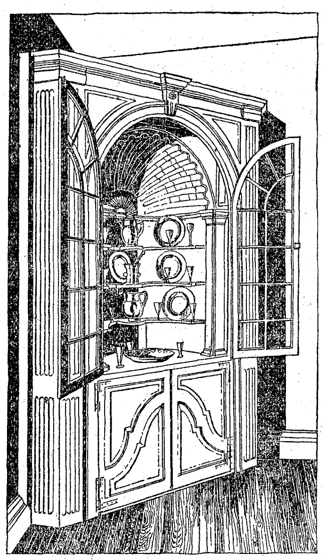
CUPAR, a royal and small burgh, and the capital of the county, Fifeshire, Scotland, 11 mi. W. by S. of St. Andrews by the L.N.E. railway. Pop. (est. 1938) 5,004. It is situated on the left bank of the Eden, in the east of the Howe (Hollow) of Fife, and is sometimes termed Cupar-Fife to distinguish it from Coupar-Angus in Perthshire. The Mercat cross stands at "the Cross" in the main street, where it was set up in 1897, having been removed from Hilltarvit, an eminence in the neighbourhood of Cupar, on the western slope of which, at Garliebank, the truce was signed between Mary of Guise and the lords of the Congregation. The town received its charter in 1356 from David II, and being situated between Falkland and St. Andrews was constantly visited by Scottish sovereigns, James VI holding his court there for some time in 1583. The site of the 12th-century castle, one of the strongholds of the Macduffs, thanes or earls of Fife, is occupied by a public school. On the esplanade in front of Macduff castle, still called the Playfield, took place in 1552 one of the first recorded performances of Sir David Lindsay's *Ane Satyre of the Three Estaits* (1540); his *Tragedy of the Cardinal* (1547), referring to the murder of Beaton, being also performed there.

The chief industry is the manufacture of linen, and tanning and coach-building are carried on. There is a beet-sugar factory. The town has some repute for its fine printing.

To the northeast is the parish of Dairsie, where one of the few parliaments that ever met in Fife assembled in 1335. The castle in which the senate sat was also the residence for a period of

Archbishop Spottiswood, who founded the parish church in 1621. Two miles and a half north of Dairsie is situated Kilmany, which was the first charge (1803–15) of Thomas Chalmers. David Hackston, the Covenanter, who was a passive assister at the assassination of Archbishop Sharp, belonged to this parish, his place being named Rathillet. After his execution at Edinburgh (1680) one of his hands was buried at Cupar, where an inscription records his death. To the west of Kilmany lies Creich, where Alexander Henderson (1583–1646), the Covenanting divine and diplomatist, and John Sage (1652–1711), the non-juring archbishop of Glasgow, were born. In the upper Old Red Sandstone of Dura Den, a ravine on Ceres burn, 2½ mi. E. of Cupar, have been found great quantities of fossils of ganoid fishes.

CUPBOARD, a fixed or movable closet usually with shelves. As the name suggests, it is a descendant of the credence or buffet, the characteristic of which was a series of open shelves for the reception of drinking vessels and table requisites. After the word lost its original meaning—and down to the end of the 16th century we still find the expression "on the cupboard"—this piece of furniture was, as it to some extent remains, movable, but it is now most frequently a fixture designed to fill a corner or recess. With the exception of a very few examples of fine ecclesiastical cupboards which partook chiefly of the nature of the armoire in that they were intended for the storage of vestments, the so-called court-cupboard is perhaps the oldest form of the contrivance. The derivation of the expression is somewhat obscure, but it is generally taken to refer to the French word *court,* short. This particular type was much used from the Elizabethan to the end of the Carolinian period. It was really a sideboard with small square doors below, and a recessed superstructure supported upon balusters. Of these many examples remain. Less frequent is the livery cupboard, which appears usually to have been placed in bedrooms, so that a supply of food and drink was readily available when a very long interval separated the last meal of the evening from the first in the morning. The livery cupboard was often small enough to stand upon a sideboard or cabinet and had an open front with a series of turned balusters. It was often used in churches to contain the loaves of bread doled out to poor persons under the terms of ancient charities. They were then called dole cupboards; there are two large and excellent examples in St. Alban's abbey, Hertfordshire. The butter, or bread and cheese cupboard, was a more ordinary form, with the back and sides bored with holes, sometimes in a geometrical pattern, for the admission of air to the food within. The corner cupboard, which is in many ways the most pleasing and artistic form of this piece of furniture, originated in the 18th century, which, as we have seen, was the golden age of the cupboard. It was often of oak, but more frequently of mahogany, and had either a solid or a glass front. The older solid-fronted pieces are fixed to the wall half-way up, but those of the somewhat more modern type, in which there is much glass, usually have a wooden base with glazed superstructure. Most corner cupboards are attractive in form and treatment, and many of them, inlaid with satinwood, ebony, holly or box, are extremely elegant.

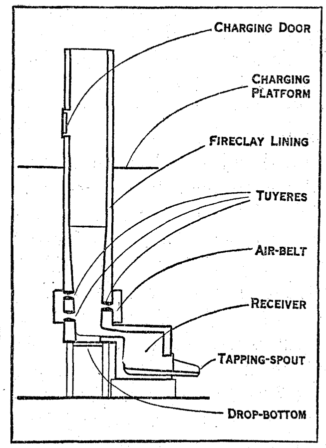


BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

18TH-CENTURY CORNER CUPBOARD

CUPID, the Latin name for the god of love, Eros (*q.v.*). Cupid is generally identical with Amor (*Cupido,* "desire"). The idea of the god of love in Roman poetry is due to the influence of Alexandrian poets and artists, in whose hands he became a mischievous boy with essentially human characteristics. His usual attribute is the bow. For the story of Cupid and Psyche, *see* PSYCHE.

CUPOLA, in metallurgy, a tall tubular structure built of steel plates and lined with firebrick. It is employed in iron foundries to melt pig and scrap for the castings, or pig-iron in steel works for the Bessemer converter. Dwarf cupolas for small requirements are about 2 ft. 6 in. in diameter and 10 ft. high, melting from 10 to 15 cwt. per hour, while on a large scale the dimensions may reach 9 ft. and over 40 ft. respectively, having a capacity of 30 tons per hour. A bed charge of coke is first laid at the bottom and then alternate layers of iron and coke, which are thrown through the charging-door, the furnacemen standing on the charging-platform. Supplies are brought up by a crane or a cupola-hoist. Blast to furnish means for increasing the combustion is sent in from a fan or blower, through tuyeres communicating with the interior of the furnace, these being made with flaring mouths to soften the force. An air-belt generally surrounds the tuyere zone, so as to conduct the air to the tuyeres in an adequate amount at uniform pressure. The molten metal is either tapped directly from the cupola, or flows into a receiver, which keeps it hot, and ready for drawing off supplies as required. This is the type shown in the diagram. Some cupolas are solidly built at the bottom, but a better style is with drop-bottom, which has hinged doors kept up by a catch. At the end of the melting process the catch is released, from a safe distance, and the doors fall and with them the slag, residue of iron and unburned coke, the two latter items being put in again at the next blow. A spark-arrester is fitted on the top of a cupola when there is risk of fire to adjacent buildings, or the flying grit is objectionable. A large cupola is more economical to work than a small one, hence the consumption of coke varies in different cases, from 1¼ cwt. to 4 cwt. per ton of iron melted; this relation is termed the melting-ratio. (*See* IRON AND STEEL.)



THE CUPOLA FURNACE, EMPLOYED IN IRON FOUNDRIES TO MELT PIG AND SCRAP FOR CASTINGS, OR PIG IRON. IN STEEL WORKS, FOR THE BESSEMER CONVERTER

In architecture, cupola is primarily a dome-shaped covering for a building or room, especially when the curvature is slight; thus, in fortifications, a low, flat turret resembling an overturned saucer, in which guns are mounted. By extension the term has come to mean a lantern (*q.v.*) crowning a dome as well as the dome itself, and hence any small, lantern-like form, projecting above the roof of a building.

CUPPING, a method, now obsolete, whereby blood was drawn to some cutaneous region by the partial vacuum within a heated cupping glass (dry cupping). In wet cupping the skin was incised. In both instances, as in the action of leeches, there was local abstraction of a small quantity of blood which was held to relieve subjacent inflammation.

CUPRA, the name of two ancient Italian *municipia* in Picenum.

(1) Cupra Maritima (Civita di Marano near the modern Cupra Marittima), on the Adriatic coast, 48 mi. S.S.E. of Ancona, erected in the neighbourhood of an ancient temple of the Sabine goddess Cupra, which was restored by Hadrian in A.D. 127. The remains of what was probably the forum of the town were discovered. The nature of the forum was indicated by the fragments of a calendar and of a statue of Hadrian which were unearthed. Some statuettes of Juno were also among the finds, as well as an inscription of a water reservoir erected in 7 B.C. The more ancient Picene town appears to have been situated near the hill of S. Andrea, a little to the south, where pre-Roman tombs were discovered.

(2) Cupra Montana, 10 mi. by road S.W. of Aesis (mod. Jesi). The village, formerly called Massaccio, has resumed the

ancient name. Ruins, perhaps of baths, and remains of subterranean aqueducts have been discovered near the church of S. Eleuterio.

CUPRESSACEAE: *see* GYMNOSPERMS.

CUPRITE, a mineral consisting of cuprous oxide, Cu_2O, crystallizing in the cubic system, and forming an important ore of copper, of which it contains 88.8%. The name cuprite (from Lat. *cuprum,* copper) was given by W. Haidinger in 1845; earlier names are red copper ore and ruby copper, which at once distinguish this mineral from the other native copper oxide—cupric oxide—known as black copper ore or melaconite. Well-developed crystals are of common occurrence; they usually have the form of the regular octahedron, sometimes in combination with the cube and the rhombic dodecahedron. The colour is cochineal-red, and the lustre brilliant and adamantine to submetallic in character; crystals are often translucent, and show a crimson red colour which on prolonged exposure to light becomes dull and opaque. The streak is brownish red. Hardness $3\frac{1}{2}$; specific gravity 6.0; refractive index 2.85.

Compact to granular masses also occur, and there are two curious varieties—chalcotrichite and tile-ore—which require special mention. Chalcotrichite (from Gr. χαλκός, copper, and θρίξ, τριχός hair) or "plush copper ore," is a capillary form with a rich carmine colour, and silky lustre: the delicate hairs are loosely matted together, and each one is an individual crystal enormously elongated in the direction of the edge of the cube. Tile-ore (Ger. *Ziegelerz*) is a soft earthy variety of a brick-red to brownish-red colour; it contains admixed limonite, and has been formed by the alteration of chalcopyrite (copper and iron sulphide).

Cuprite occurs in the reduction zone of copper bearing lodes; and is of secondary origin.

Beautifully crystallized specimens were formerly found in Cornwall; they also occur in the copper mines of the Urals, in Arizona and elsewhere. (L. J. S.)

CURAÇAO or **CURAÇOA,** a Dutch West Indian island 40 mi. from the north coast of Venezuela, in 12° N. and 69° W., 40 mi. long from northwest to southeast; average width 10 mi.; area 210 sq.mi. It is flat, with southwest hills rising to 1,200 ft. There are deeply indented natural harbours, the chief of which is that of St. Anna on the southwest coast. Curaçao consists chiefly of diorite and diabase, and is surrounded by coral reefs. Streams are few and rainfall scanty, averaging only 16 in. per annum. The plains are largely arid but glens produce maize, beans, pulse, etc. Salt, phosphates and cattle are exported. The commerce is with U.S.A. and Venezuela. Curaçao liqueur was originally made on the island from an orange, *Citrus Aurantium curassuviensis.* Willemstad (pop. [1939] 31,264), on the harbour of St. Anna, has houses in the Amsterdam style, and the narrow channel separating it from its western suburb of Overzijde and the waters of the Waigat, which intersect it, recall the Dutch canals. The entrance of the Schottegat or Inner harbour is protected by forts. The Negroes speak *Papaimento,* composed of Spanish, Dutch, English and native words. Curaçao gives its name to the government of the Dutch West Indies, which include Aruba, west of Curaçao, area 69 sq.mi. and pop. (1941) 31,522; Buen Ayre, 20 mi. N.E., area 95 sq.mi. and population (1941) 5,556; St. Eustatius, Saba and part of St. Martin. The governor is assisted by a council of four, and a colonial council of 13. Curaçao island had a population (estimated Dec. 31, 1941) of 68,217 and the entire colony of Curaçao had 109,592 inhabitants.

PANAMA-HAT WEAVING, AN IMPORTANT INDUSTRY IN CURAÇAO

The chief industry is oil refining, the crude petroleum being imported from oil fields of the Lake Maracaibo basin of Venezuela.

Imports of Curaçao and the other islands (1936), 197,012,376 guilders; exports, 201,512,618 guilders.

Curaçao was discovered by Hojeda about 1499 and occupied by the Spaniards in 1527. The Dutch have held it since 1634, except during 1798 and from 1806 to 1814, when it was held by Great Britain. In 1940 it was occupied by Allied troops.

See Wynmalen, "Les Colonies néerlandaises dans les Antilles," *Revue Colon. Internat.* ii., p. 391 (1887); K. Martin, *West-Indische Skizzen* (Leyden, 1887); De Veer, *La Colonie de Curaçoa* (Les Pays Bas, 1898). Also several articles on all the islands in *Tijdschrift v.h. Ned. Aardr. Genootschap; Encyclopaedie van Nederlandsch-Indië* (1914–17).

CURAÇAO, a delicate fruit liqueur; it was originally made in the Dutch West India island of Curaçao—hence its name. At first it enjoyed a great vogue because of its distinctive flavour, being made from the peel of a special variety of orange known as the Curaçao orange—*Citrus Aurantium curassuviensis.* Later, when the manufacture of the liqueur had extended to Holland as an industry, the ordinary variety of oranges were used. The orange peel is well soaked in water and then distilled with spirit and water, sweetened, and flavoured with Jamaica rum. The alcoholic strength of Curaçao ranges from 36 degrees to 40 degrees. There are two kinds, the dry and the sweet, the former being the stronger of the two. Epicures regard a liqueur glass of *Curaçao sec* as a most agreeable digestive after a substantial repast. There are now many brands of Curaçao on the market, and no longer is the industry confined to Holland. Pommeranzen is a variety of Curaçao made at Riga. The well-known "Grand Marnier" is another variety of Curaçao made with fine brandy. (J. V. M.)

CURARE (obsoletely and/or primitively: curari, wourara, wourari, wourali, urari, curara, urirarery, etc.), a non-specific term used by certain South American Indians to designate a group of varying but related arrow-poisons; in pharmacognosy and medicine specifically a form of curare like that discovered by Gill, 1938, used in human beings. The crude drug is a resinous appearing, dark-brown to black mass of a sticky to hard consistency and has an aromatic, tarry odour. It is frequently prepared, primitively, as a decoction (though often, also, as a cold concoction). The types of curare most often studied have each contained several ingredients, variously grouped, from: A. (of primary importance) Loganiaceae (Strychnos *spp.*); Menispermaceae (Chondodendron, Cissampelos, Sciadotenia, Telitoxicum, Elissarrhena, Anomospermum *spp.,* etc.) and B. (of secondary, and even rare, use) Piperaceae (Piper *spp.*); Annonaceae (Annona); Leguminosae (Lonchocarpus); Rutaceae (Erythrochiton); Moraceae (Ficus); Rubiaceae (Psychotria); Solanaceae (Capsicum); Aristolochiaceae (Aristolochia *spp.*).

Different curares contain one or more of the following complex basic alkaloids: curin(e), curarine, tubo-curarine, paracurarine, protocurarine, the recently isolated phenolic alkaloids, protocuradine and neo-protocuradine (King), and others.

Curare is used for the artificial induction of flaccidity in striated muscles; by refinements in the drug and a carefully controlled technique of administration, attempts are made to avoid respiratory embarrassment or other unwanted side-reactions. This curarization is now employed for relief of spastic paralysis (by reducing to normal the tonus of hyperinnervated muscles), in the reduction of fractures and dislocations (by eliminating muscle pull during setting or reduction), and in other fields where a state of profound muscular relaxation or even immobility is desirable. Another of its most publicized uses is as an adjunct in the shock-therapy treatment and cure of schizophrenia (dementia praecox), and various affective mental disorders, the manic-depressive psychoses, especially involutional melancholia (Bennett, Menninger, Woolley, Stewart, etc.). The standardized curare is claimed to lessen incidence of vertebral fractures.

However, with curare's federal acceptance, the drug is most widely used as an adjuvant in general inhalation anaesthesia (Griffith, Cullen, Smith, Cole, Baird, etc.), especially in abdominal surgery, in which field, frequently combined with cyclopropane gas, it is becoming the method of choice because it produces profound surgical relaxation (comparable only to that seen in spinal anaesthesia) with only a minimal concentration of anaesthetic agent. From this there is prompt post-anaesthetic recovery and a radical reduction of the possibilities of post-operative pneumonias and other complications. S. M. Smith observes that "curare . . . appears to be one of the greatest aids introduced into the field of anaesthesiology." The drug is also being successfully employed as a needed relaxant in oral intubation, general endoscopy (oral, rectal, etc.), various tetanic seizures, lumbar and sacro-iliac manipulations, and, latterly, owing to its quickly reversible action, as a definite diagnostic sign in myasthenia gravis.

CURASSOW, a group of gallinaceous birds forming one of the subfamilies of *Cracidae* (*Cracinae*), which includes the finest game birds of S. America. They are large heavy birds, with short wings, long broad tail and strong bill. The hind toe is placed on a level with the others, unlike the majority of gallinaceous birds. With the exception of one species found north of Panama, the curassows are confined to S. America, east of the Andes, and not extending south of Paraguay. They live in small flocks, and are arboreal. Their nests are neat structures, made of slender branches interlaced with blades of grass, and lined with leaves. They feed on fruits, seeds and insects. They are often tamed but have never been thoroughly domesticated. Their flesh is white and delicate.

Crax globicera, found in Mexico, is about 3 ft. in length, of a glossy black except for the white abdomen and tail coverts. In common with the other species its head bears a crest of feathers curled forward at the tips, which can be raised or depressed at will. The female is reddish brown. In one species (*C. incommoda*) the greater part of the black plumage is beautifully varied with narrow bars of white. The galeated curassow (*Pauxi galeata*) has a large blue tubercle, resembling a hen's egg in size and shape, situated at the base of the bill, and much larger in the male.

CURATE, properly a presbyter who has the cure of souls within a parish (from the Lat. *curare*, to take care of). The term is used in this general sense in the English Book of Common Prayer; and in continental Europe the cognate term (Fr. *curé*, Ital. *curato*, Span. *cura*, etc.) is applied to parish priests.

The term is now used almost exclusively, in English-speaking countries, to signify an unbeneficed clergyman who is assistant to a parish priest. This usage, which hardly goes back further than the early 19th century, was at first restricted to the Church of England, and to the Roman Catholic Church in Ireland; but has now become general in both churches, though the more exact title "assistant curate" is used by Anglican bishops in licensing such persons. The term "perpetual curate" denotes, in the Church of England, the incumbent of a parish where the tithes are impropriate (*i.e.*, transferred to lay hands) and no vicarage has been endowed; but an act of parliament was passed in 1868, authorizing perpetual curates to style themselves vicars (*see* VICAR), and the former name has fallen into desuetude.

CURATOR, in Roman law the "caretaker" or guardian of a spendthrift (*prodigus*) or of a person of unsound mind (*furiosus*), and, more particularly, one who takes charge of the estate of an *adolescens*, *i.e.*, of a person *sui juris*, above the age of a *pupillus*, 14 or 12 years, according to sex, and below the full age of 25. Such persons were known as "minors," *i.e.*, *minores viginti quinque annis*. While the tutor, the guardian of the *pupillus*, was said to be appointed for the care of the person, the curator took charge of the property. The term survives in Scots law for the guardian of one in the second stage of minority, *i.e.*, below 21, and above 14, if a male, and 12 if a female. Under the Roman empire the title of curator was given to several officials who were in charge of departments of public administration. In modern usage "curator" is applied chiefly to the keeper of a museum, art collection, public gallery, etc., but in many universities to an official or member of a board having a general control over the university, or with the power of electing to professorships. In the University of Oxford "curators" are nominated to administer certain departments, such as the University chest.

CURB MARKET or **STREET MARKET,** a name given to any stock market which either now transacts or originally transacted its business in the open, presumably in the streets or upon the curbs. At the outset, the curb markets of the various cities were entirely unorganized and operated only through the custom of a number of brokers meeting at certain places. Now they are well organized exchanges, most of them well housed.

The London Street Market operated in 'Change alley for almost a century. It is known that a street market existed in Paris in 1720, for records show that a part of the rue Quincampoix was roped off at the time of the Mississippi Bubble to protect the street traders from the general public. In Boston the curb market operated in Exchange place for years before going into its present building.

New York Curb Exchange had its origin before the Civil War when its meeting place was located in Wall street, near Hanover street. During the war it functioned in William street, between Exchange place and Beaver street. In those days trading began at 8 A.M. and continued until 6 P.M. or later and, at night, was carried on in the corridors of uptown hotels. From 1880 to 1900, it was carried on at all hours in front of the Mills building in Broad street, but after 1900 was reduced to a regular session from 10 A.M. to 3 P.M. Later the open air traders located opposite 44 Broad street, just south of Exchange place. A more closely knit organization was formed in 1908, known as "The New York Curb Agency."

The present Exchange, under the name of the "New York Curb Market," or "Market Association," was organized as a voluntary association in 1911. The official title was changed to "New York Curb Exchange" in 1929. Main functions of the Curb Exchange are:

(a) To provide a primary market for introducing the securities of such industrial, metal, oil, public utilities or other corporations as are eligible for listing under the listing requirements of the exchange.

(b) To furnish a temporary primary market for the preliminary issue of securities of well known established companies which are being reorganized or are issuing additional stock, usually represented by "rights."

(c) To provide a market for issues in the formative or growth period of their corporate existence.

(d) To provide a market for such active stocks or bonds which, for various reasons, are not listed on any other exchange.

The Exchange is governed by a Board composed of 32 Governors, classified as follows:

Class A: to be composed of 15 regular members of the Exchange.

Class B: to be composed of 12 associate member partners or non-member partners of regular or associate member firms doing business for the public.

Class C: to be composed of three representatives of the public not engaged in the securities business.

Class D: to be composed of the Chairman of the Board and the President of the Exchange.

In addition to regular memberships, there are associate memberships available to members of the New York Stock Exchange and to members of firms, or executive officers of corporations, engaged in the business of buying and selling securities as brokers or dealers.

The New York Curb Exchange does not deal in, or quote any securities listed on the New York Stock exchange, though many securities originally traded in on the Curb are later "graduated" and admitted to the New York Stock Exchange. Approximately 50% of the stocks listed on the New York Stock Exchange today were formerly dealt in on the New York Curb Exchange. In 1939 there were about 1,100 stock issues and 350 bond issues dealt in on the Curb Exchange, which is a large factor in the financial activities of the "Street." It is housed in its own building at 86 Trinity place.

CURCI, CARLO MARIA (1810–1891), Italian theologian, was born at Naples. He joined the Jesuits in 1826, and became one of the first editors of their *Civiltà Cattolica.* He wrote a preface to Gioberti's *Primato* (1843), but dissented from his *Prolegomena.* After the events of 1870, Curci, at Florence, delivered a course on Christian philosophy, and in 1874 began to publish several scriptural works. In his edition of the New Testament (1879–80) he criticizes the Italian clergy for their neglect of the Scriptures. He attacked the political action of the Vatican, and in his *Il Moderno Dissidio tra la Chiesa e l'Italia* (1878) advocated an understanding between the Church and State. This was followed by *La Nuova Italia ed i Vecchi Zelanti* (1881), another attack on the Vatican policy, and by his *Vaticano Regio* (1883), in which he accuses the Vatican of trafficking in holy things and of worldliness. His early work among the poor and prisoners at Naples drew him also in the direction of Christian Socialism.

He was condemned at Rome and cast out of the Jesuits, but finally he accepted the decrees against him and retracted "all that he said contrary to the faith, morals and discipline of the Church."

Shortly before his death, on June 8, 1891, he was readmitted to the Society of Jesus.

CURECANTI NEEDLE, a natural pyramid of granite in southwestern Colorado, in the Black Canyon area; some 800 or 900ft. high, at the mouth of Blue creek, a small stream that joins the Gunnison from the south.

CUREL, FRANÇOIS, Vicomte de (1854–1928), French dramatist and academician, was born in the city of Metz on June 10, 1854.

He was educated at the École Centrale as a civil engineer, the family wealth being derived from smelting works. But for the war of 1870 and the consequent separation of Lorraine from France, Curel might have become an ironmaster. As it was, he turned to literature. His first publications were, *L'Été des fruits secs* (1885) and *Le Sauvetage du grand duc* (1889). In 1891 three pieces were accepted by Antoine for the Théâtre Libre. The list of his plays includes *L'Envers d'une sainte* (1892); *Les Fossiles* (1892), a picture of the prejudices of the provincial nobility; *L'Invitée* (1893), the story of a mother who returns to her children after 20 years' separation; *L'Amour brode* (1893), which was withdrawn by the author from the Théâtre Français after the second representation; *La Figurante* (1896); *Le Repas du lion* (1898), dealing with the relations between capital and labour; *La Fille sauvage* (1902), the history of the development of the religious idea; *La Nouvelle Idole* (1899), dealing with the worship of science; and *Le Coup d'aile* (1906). In a collected edition of his works (1914) he explains his literary creed. He succeeded Paul Hervieu at the Academy in 1918. He had already broken his silence in 1914 with *La Danse devant le Miroir,* and after the World War he wrote two dramas treating the moral and psychological conditions arising out of the war and post-war conditions: *Terre inhumaine* (1923; Eng. vers. *No Man's Land*), and *La Viveuse et le Moribond* (1926). Curel died on April 26, 1928.

See P. Blanchart, *F. de Curel: son oeuvre* (1924).

CURES, a Sabine town between the left bank of the Tiber and the Via Salaria, about 26m. from Rome. According to the legend, it was from Cures that Titus Tatius led to the Quirinal the Sabine settlers, from whom the whole Roman people took the name Quirites. It was also renowned as the birthplace of Numa. It appears as the seat of a bishop in the fifth century, but seems to have been destroyed by the Lombards in A.D. 589. The site consists of a hill with two summits, round the base of which runs the Fosso Corese: the western summit was occupied by the necropolis, the eastern by the citadel, and the lower ground between the two by the city itself. A temple, the forum, the baths (second century, A.D.) etc., were excavated in 1874–77, but nothing is now visible on the site.

CURETES is said to mean "young men" (Gr. Κουρῆτες Κούρητες). (1) A people who fight the Calydonians in the quarrel arising out of the boar-hunt. (*See* Meleager.) Later writers placed them in Aetolia, Acarnania, or Chalcis. (*See* Homer, *Iliad,* ix., 529 ff.; Strabo, x., 3, 1; schol. Hom., *loc. cit.*)

(2) Certain daimones connected with the cult of Rhea and regularly conceived as the attendant band (*thiasos*) of the infant Zeus. In historical times they had a certain amount of cult in various parts of the Greek world, which comprised Pyrrhic dances (*i.e.,* war-dances in armour). In cult, art and literature they are frequently confused with the Corybantes (*q.v.*), but their proper home is Crete, and their proper function attendance on Zeus and his mother Rhea. Names of several of them point to these facts, as *Kres* (Cretan), *Labrandos* (he of the double axe, *labrus,* a very old Cretan and Asiatic sacred symbol, *cf.* the Carian *Zeus Labrandeus*). The legend states that when Zeus was born in, or conveyed in infancy to, Crete, they danced and clashed their weapons to drown his cries (*see* Zeus). A highly interesting hymn in their honour has been discovered at Palaikastro in Crete; the worshippers call on Ζεὺς Κοῦρος and his attendants to bring all manner of fertility.

It is a not improbable supposition that the original Curetes were the human worshippers of Ζεὺς Κοῦρος *i.e.,* that the κοῦροι (adolescent lads) worshipped a god supposed to be of their own age, a variant of the "infant" Zeus of Crete; that the object of their worship was the increase of fertility, vegetable and animal; and that, although the hymn is of Hellenistic date, the rite itself may go back to Minoan times. (For further speculations *see* Miss Harrison's *Themis.*) It is also possible that the *Curetes* who fight the Calydonians are in their origin nothing but the young warriors of the neighbouring states. The text of the hymn is best given in Powell, *Collectanea Alexandrina* p. 160 (1925); other texts are cited in Immisch.

CURETON, WILLIAM (1808–1864), English orientalist, was born at Westbury, Shropshire. Educated at the free grammar school of Newport, and at Christ Church, Oxford, he took orders in 1832, became chaplain of Christ Church, sub-librarian of the Bodleian, and, in 1837, assistant keeper of mss. in the British Museum. He was afterwards appointed select preacher to the university of Oxford, chaplain in ordinary to the Queen, rector of St. Margaret's, Westminster, and canon of Westminster. He was elected F.R.S. and a trustee of the British Museum, and was also honoured by several Continental societies. He died on June 17, 1864.

Cureton edited, with notes, an English translation of the Epistles of Ignatius to Polycarp, the Ephesians and the Romans, from a Syriac ms. that had been found in the monastery of St. Mary Deipara, in the desert of Nitria, near Cairo, and other important Syriac mss.

See an introduction by Dr. W. Wright to *Ancient Syriac Documents relative to the earliest Establishment of Christianity in Edessa, etc.* (1864).

CURETUS, a tribe of South American Indians, inhabiting the country between the rivers of Japura and Uaupés, northwestern Brazil.

CURFEW, Curfeu or Couvre-feu, a signal, as by tolling a bell, to warn the inhabitants of a town to extinguish their lights and fires or cover them up and retire to rest. This was a common practice throughout Europe during the middle ages. In mediaeval Venice the Barbers' Quarter was exempt, doubtless because they were also surgeons and their services might be needed during the night. The curfew originated in the fear of fire when most cities were built of timber. Its use is obvious, as the household fire was usually made in a hole in the middle of the floor, under an opening in the roof through which the smoke escaped. The custom is said to have been introduced into England by

William the Conqueror; but as there is good reason to believe that the curfew-bell was rung each night at Carfax, Oxford (*see* Peshall, *Hist. of Oxford*), in the reign of Alfred the Great, it would seem that all William did was to enforce more strictly an existing regulation. The absolute prohibition of lights after the ringing of the curfew-bell was abolished by Henry I. in 1100. The practice of tolling a bell at a fixed hour in the evening, still extant in many places, is a survival of the ancient curfew. In 1848 the curfew was still rung at Hastings, Sussex, from Michaelmas to Lady-Day, and this was the custom too at Wrexham, North Wales.

On April 2, 1918, the British Board of Trade with a view to economy in the consumption of coal, introduced the "Curfew Order," by which all restaurants, etc., had to extinguish their lights at 10 P.M.; no lighting was to be used in theatres after 10.30 P.M., and no shop fronts were to be lighted. This order was rescinded on Dec. 23, 1918.

On Aug. 31, 1920, in consequence of the prevailing disorder, the military authorities in Belfast instituted the Curfew law, by which all citizens were required to remain within doors from 10.30 P.M. to 5 A.M. This order, save for two brief intervals, remained in force throughout Northern Ireland until Dec. 1924.

CURIA, a section of the Roman people, an ancient division traditionally ascribed to Romulus, who divided the people into three tribes, and subdivided each of these into ten *curiae,* each of which contained a number of families (*gentes*). It is more probable that the *curiae* were not artificial creations but natural associations of families, artificially regulated to serve a political purpose. The names of *curiae* suggest a local origin for the groups; but, as membership was hereditary, the local tie grew weak with successive generations. Each *curia* was organized as a political and religious unit. Politically it had no activities beyond a vote in the *Comitia Curiata* (*see* COMITIA), determined by a majority of the members (*curiales*). But as a religious unit the *curia* had more individual activity. There were sacrifices performed in common, but each *curia* had its own *sacra,* conducted by a *curio* assisted by a *flamen curialis.*

The thirty *curiae* comprised the whole Roman people; for citizenship depended on membership of a *gens* (*gentilitas*) and every member of a *gens* was *ipso facto* attached to a *curia.* They therefore included plebeians as well as patricians (*q.v.*) from the date at which plebeians were recognized as citizens. But, just as the full rights of *gentilitas* were only gradually granted to plebeians, so it is probable that a plebeian did not immediately exercise all the rights of a *curialis.* It is unlikely that plebeians voted in the *Comitia Curiata* till early in the republican period; it is certain that they did so in Cicero's time. A plebeian was first elected *curio maximus* in 209 B.C. The curia soon ceased to have any political importance, but its religious importance survived during the principate.

The term *curia* was applied to the common shrine of the *curiales,* and then to other places of assembly. Hence the ancient senate house at Rome was known as the Curia Hostilia. The *curia* was adopted as a state division in municipal towns; and the term was often applied to their senates (*see* DECURIO).

BIBLIOGRAPHY.—Mommsen, *Römisches Staatsrecht,* (1887); for local names of *curiae,* Pauly-Wissowa, *Realencyklopädie,* (1893). *See* also G. W. Botsford, *Roman Assemblies* (1909).

In mediaeval Latin the word *curia* was used in the general sense of "court." It was used of "courts" in the sense of solemn assemblies summoned by the king (*curiae solennes*); of courts of law, whether developed out of the imperial or royal *curia* (*see* HOUSEHOLD, THE ROYAL) or not. Sometimes *curia* means jurisdiction, or the territory over which jurisdiction is exercised; whence its use for the court-yard of a house, or for the house itself; *e.g.,* Hampton Court. The word Curia is now only used of the papal court of Rome (*see* CURIA ROMANA).

Sandys, *Companion to Latin Studies* (1921), with useful bibliography. H. F. Pelham, *Essays on Roman History* (Oxford, 1911), pp. 1–15 "The Roman Curiae."

CURIA REGIS: *see* HOUSEHOLD, THE ROYAL.

CURIA ROMANA, in the strict canonical sense, the group of departments and persons used by the Roman pontiff in the exercise of his supreme and universal power over the Catholic Church; in this sense it consists of the Roman congregations, the tribunals of the Roman Curia, and the offices of the Roman Curia. These departments, which act in the name and by the authority of the pope, are collectively known as the Apostolic (or Holy) See. In a wider sense, the Roman Curia is understood also to embrace the whole body of dignitaries and officials who are attached to the person of the pope. It includes, therefore, both the *famiglia pontificia* (headed by the two palatine cardinals, the cardinal datary and the cardinal secretary of state) and the *cappella pontificia* (the entourage of the pope at solemn liturgical functions).

In pre-Constantine times the pope was chiefly assisted by the Roman clergy and by neighbouring bishops; for instance, the seven Roman deacons were entrusted with the care of the poor. From Constantine up into the middle ages important and difficult affairs were handled by the Roman synods, either provincial or (later) general. In the mediaeval period the popes began increasingly to avail themselves of the assistance of the cardinals; the deliberative functions of the synods were taken over by the papal consistory, an assemblage of cardinals presided over by the pope; individual cardinals were set over particular spheres of business; for instance, the cardinal chancellor and the cardinal camerlengo, and with them were associated other cardinals. The first, however, authoritatively to organize a permanent system of agencies for the dispatch of all ecclesiastical business was Sixtus V, by the constitution *Immensa* on January 22, 1587 (1588). He established fifteen congregations, most of them designed to assist the pope in the spiritual affairs of the Church, but a few for the administration of the papal states. His organizational pattern, retouched by Clement VIII, Gregory XV, Urban VIII, Clement IX and Pius VII, remained substantially in existence up to the 20th century. But it had gradually become an unwieldy, confused, and inefficient structure.

Consequently, Pius X, by the constitution *Sapienti Consilio* of June 29, 1908, proceeded to a general reorganization of the Roman Curia—congregations, tribunals and offices. In this constitution he declared that the competency of these various organs was not always clear, and that their functions were badly arranged; that certain of them had only a small amount of business to deal with, while others were overworked; that strictly judicial affairs, with which the congregations had not to deal originally, had developed to an excessive extent, while the tribunals, the Rota and the Signatura, had nothing to do. He consequently withdrew all judicial affairs from the congregations, and handed them over to the two tribunals, now revived, of the Rota and the papal Signatura. All affairs concerning the discipline of the sacraments were entrusted to a new congregation of that name. The competency of the remaining congregations was modified, according to the nature of the affairs with which they deal, and certain of them were amalgamated with others; general rules were laid down for the expedition of business and regarding personnel; in short, the work of Sixtus V was adapted to later conditions. The ordinations of the *Sapienti Consilio,* and of its annexed *Ordo servandus in ss. congregationibus, tribunalibus et officiis romanae curiae,* were received, with some small changes, into the *Code of Canon Law,* promulgated on Sept. 15, 1917.

The Roman Congregations.—There are eleven: the Holy Office, the Consistorial Congregation, the Congregations of the Sacraments, of the Council, of Religious, for the Propagation of the Faith, of Sacred Rites, of Ceremonies, of Extraordinary Ecclesiastical Affairs, of Seminaries and Universities, for the Oriental Church. A twelfth, the Congregation of the Basilica of St. Peter, is not considered as such by the code.

Each congregation is headed by a prefect. The pope himself holds the prefecture of three: the Holy Office, the Consistorial Congregation, and the Congregation for the Oriental Church. These are actually directed by a cardinal secretary, who is assisted by a prelate called the *adsessor.* The prefects of the remaining congregations are cardinals, and each is assisted by a secretary, a prelate, often a titular archbishop. Only cardinals are members of the congregations themselves; but there are a number of major and minor officials, and each congregation also has its "consultors." The competence of the congregations is administrative and disciplinary. They have no judicial power, but must send cases requiring judicial decision to the competent tribunal; nor have they any strict legislative power, which is reserved to the pope. The functions of each are defined by the code (canons 247–57); collectively, they extend to: care for the faithful observance of the laws of the Church, the issuance of instructions to clarify, explain, or confirm the law, the practical application of legal prescriptions to particular cases, the concession of faculties *secundum vel praeter ius,* the granting of dispensations, the application of disciplinary measures, the resolution of doubts, questions and controversies in disciplinary (nonjudicial) form. The authority of the congregations, within the limits of their own competence, is supreme and universal; it is also ordinary, but vicarious (it is possessed by the congregation in virtue of law, but exercised by it in the name and by the authority of the pope). They do not, however, share in the fullness of the papal power nor in the pope's infallibility; their acts as such are their own, and are by nature reformable, unless they have been confirmed in specific form by the pope.

Tribunals and Offices of the Roman Curia.—The tribunals are assemblies of cardinals and prelates, which deal with judicial cases. There are three: the Sacred Penitentiary, the Roman Rota, and the Apostolic Signatura. The offices of the Roman Curia are five in number: the Apostolic Chancery, the Apostolic Datary, the Apostolic Camera, the Secretariate of State, and the Secretariate of Briefs and Latin Letters. Their functions are rather ministerial.

Permanent Papal Commissions.—Though not strictly elements of the Roman Curia, these may be mentioned here. They are eight in number. The chief ones are the Commission for Biblical Studies, established by Leo XIII, and the Commission for the Authentic Interpretation of the Code of Canon Law, established by Benedict XV.

CURICÓ, a province of central Chile, lying between the provinces of Colchagua and Talca and extending from the Pacific to the Argentine frontier. Area 2,215 sq.mi.; population (1940) 81,185.

The eastern and western sections are mountainous and are separated by the fertile valley of central Chile. The mineral resources, though undeveloped, are said to include copper, gold and silver.

Cattle, wheat and wine are the principal products, but Indian corn and fruit also are produced. On the coast are important salt-producing industries.

The climate is mild and the rainfall more abundant than in the northern part of the valley, and the effects of this are to be seen in the better pasturage. Irrigation is used to a large extent.

The principal city, Curicó, is on the Mataquito river, 114 mi. S. of Santiago by the Chilean Central railway, which crosses the department. The city stands on the great central plain, 748 ft. above sea level, and in the midst of a comparatively well-cultivated district. It was founded in 1742 by José de Manso and is one of the more cultured and progressive provincial towns of Chile. Pop. (1940) 19,532.

CURIE, PIERRE (1859–1906) and **MARIE** (1867–1934), French physicists. Pierre Curie was born in Paris on May 15, 1859, and educated at the Sorbonne, where he later became professor of physics. His early researches were on piezo-electricity, the magnetic properties of bodies at different temperatures and other topics. He was chiefly known for his work on radio-activity carried out jointly with his wife, Marie Sklodowska, to whom he was married in 1895. Marie Sklodowska was born in Warsaw on Nov. 7, 1867, and received her early scientific training from her father, Dr. Sklodowski. She became involved in the students' revolutionary organization and found it advisable to leave Warsaw. Mlle. Sklodowska went first to Cracow, then under Austrian rule, and later to Paris, where she took a science degree at the university.

After the discovery of the radio-active properties of uranium by Henri Becquerel in 1896 M. and Mme. Curie began their researches into radio-activity (*q.v.*) and in 1898 obtained polonium and radium from pitchblende which they had subjected to a very laborious process of fractionation. In subsequent years they did much to elucidate the properties of radium and its transformation products. In 1903 they were awarded the Davy medal of the Royal Society and in the same year the Nobel prize for physics was divided between them and Henri Becquerel. The same year Mme. Curie submitted the results of her researches in her doctorate thesis presented to the university. She then became *chef de travaux* in the laboratory at the department of the Sorbonne created for her husband. Prof. Curie, who was elected to the Academy of Sciences in 1905, was run over by a dray and killed instantly in Paris on April 19, 1906. His widow succeeded him as professor at the Paris university and in 1911 was awarded the Nobel prize for chemistry. Her classic *Traité de Radioactivité* was published in 1910. Mme. Curie did much to help the establishment of the radio-activity laboratory in her native city. In 1921 President Harding, on behalf of the women of the United States, presented her with a gramme of radium in recognition of her services to science. On a second visit to the United States, in 1929, Mme. Curie received from the hands of President Hoover a gift of $50,000 from American friends of science to purchase radium for the use of the laboratory in Warsaw.

CURIE, a unit of measurement for radium emanation. It is named in honour of Marie Curie, the discoverer of radium. It is defined as the quantity of radium emanation, known also as radon, in equilibrium with one gram of radium. This unit is subdivided into the millicurie and the microcurie, representing the amounts of emanation in equilibrium with a milligram and a microgram of radium respectively. These units are used in measuring the dosage in the therapeutic use of radium.

CURIO, GAIUS SCRIBONIUS, Roman statesman and orator, son of a distinguished orator of the same name, flourished during the 1st century B.C. He was tribune in 90 B.C., and served in Sulla's army in Greece against Archelaus, general of Mithridates, and as his legate in Asia, where he was commissioned to restore order in the kingdoms abandoned by Mithridates. In 76 he was consul, and as governor of Macedonia (75–73), defeated the Dardanians, being the first Roman general to penetrate as far as the Danube. On his return he was granted a triumph. During the discussion as to the punishment of the Catilinarian conspirators he supported Cicero, but he spoke in favour of P. Clodius (*q.v.*) at his trial for sacrilege (61). This led to a violent attack on the part of Cicero, but it does not appear to have interfered with their friendship. Curio was a vehement opponent of Caesar. He was pontifex maximus in 57, and died in 53.

See Orelli, *Onomasticon* to Cicero; Florus iii. 4; Eutropius, vi. 2; Val. Max. ix. 14, 5; Quintilian, *Instit.*, vi. 3, 76; Dio Cassius, xxxviii. 16.

His son, GAIUS SCRIBONIUS CURIO, was first a supporter of Pompey, but after his tribuneship (50 B.C.) went over to Caesar, by whom he was said to have been bribed. When it was demanded that Caesar should lay down his imperium before entering Rome, Curio proposed that Pompey should do the same, adding that, if the rivals refused to do so, they ought both to be declared public enemies. His proposal was carried by a large majority, but a report having spread that Caesar was on the way to attack Rome, the consuls called upon Pompey to undertake the command of all the troops stationed in Italy. Curio's protest to the people was disregarded, whereupon he fled to Ravenna to Caesar. He was commissioned by Caesar to take a message to the senate, but met with so hostile a reception that he hurried back by night to Caesar. It was now obvious that civil war would break out. Curio collected troops in Umbria and Etruria for Caesar, who sent him to Sicily as propraetor in 49. After some successes against the Pompeians, Curio crossed over to Africa, where he was defeated and slain by Juba, king of Numidia. Curio possessed great ability; Cicero, as an old friend of his father, took an interest in him and seven of Cicero's letters (*Ad. Fam.* ii. 1–7) are addressed to him.

See Orelli, *Onomasticon* to Cicero; Livy, *Epit.* 109, 110; Caesar, *Bell. Civ.* ii. 23, for Curio's African campaign; Appian, *Bell. Civ.*, ii. 26–44; Vell. Pat. ii. 48. *See* also Rice Holmes, *The Roman Republic* (1923) chaps. xii. and xviii. and vol. iii. Part ii. pp. 421–28.

CURITIBA (also CURITYBA and CORITYBA), capital of the state of Paraná, Brazil, on an elevated plateau (3,120 ft. above sea level) 65 mi. west of its seaport Paranaguá, with which it is connected by a railway, remarkable for the engineering difficulties overcome and for the beautiful scenery through which it passes. Pop. (1940) 101,204; *municipio* 142,873. There is a large foreign element in the population, Germans preponderating. The city has a temperate, healthy climate, and is surrounded by a region which produces maté, coffee, timber, sugar and fruits. Maté is the principal export.

CURLEW, the name given to several birds allied to the snipes, sandpipers and plovers.

The common curlew (*Numenius arquata*) of the snipe family, *Charadriidae,* is about 2 ft. long, drab coloured above, mottled with dark brown, and white beneath. The bill is 5 to 7 ins. long and is curved; the legs are long and the build of the bird slender and graceful. It inhabits most of Europe, breeding on heaths and moors and haunting the mud flats of the sea-shore and estuaries in winter. In Scotland it is called the "whaup." The eggs are laid in a rough nest on the ground; they are usually four in number and brownish-green with cinnamon markings. The food consists of worms, crustaceans, small molluscs, insects and also berries.

The lesser curlew or whimbrel (*N. phaeopus*) resembles the last in habits and appearance, but is smaller. Three American species, *N. longirostris, N. hudsonicus* and *N. borealis* (the last now extinct) are extremely similar but distinguished by the rufous colouring of the axillary feathers—a feature also characterizing the American godwits (*Limosa*). The genus *Numenius* is almost cosmopolitan.

The stone curlew, Norfolk plover or thick-knee (*Oedicnemus crepitans*) has a sweeter voice. It is a summer visitor to England, where it occurs mainly in the "Breck" country of Norfolk and Suffolk. On the mainland it extends across Europe to N. Africa and India, keeping mainly to the open chalk-country. It is the largest of the plovers and lays its two stone-coloured eggs on the ground. The bill is short, the legs long and thickened on the upper part of the tarsus. The eye is very large. The hind toe is absent, the plumage drab, rendering the bird invisible at a short distance. It feeds on snails, insects, worms, frogs and other small animals. Like its namesake, it is exceedingly wary. Other species are found in Africa, Australia and America. It has a peculiar form of courtship, and strange social dances in autumn. *See* COURTSHIP OF ANIMALS.

CURLING, a game in which the players propel large rounded stones upon a rink or sheet of ice, towards a mark called the tee. Where the game originated is not precisely known; but it has been popular in Scotland for three centuries at least. Some writers, looking to the name and technical terms of the game, trace its invention to the Netherlands. Curling was called "kuting" in some parts of Lanarkshire and Ayrshire. Cornelis Kilian (1528–1607) in his *Teutonic Dictionary* gives the term *khuyten* as meaning a pastime in which large globes of stone like the quoit or discus are thrown upon ice. Camden, when describing the Orkney Islands in 1607, tells us that one of them supplies "plenty of excellent stones for the game called curling"; and incidental references to it as a game played in Scotland are made by several authors during the first half of the same century.

If the game be not indigenous to Scotland it certainly owes its development to that country, and in the course of time it has come to be the national sport. It was played at first with very rude engines—random whin boulders fashioned by nature alone, bored through to let in the thumb of the player, having been the primitive channel stones. In course of years the rough block was superseded by a symmetrical object usually made of whinstone or granite, beautifully rounded, brilliantly polished, and supplied with a convenient handle.

Although curling boasts a literature of its own and songs innumerable, yet it has received but the scantiest notice from such important Scottish writers as Scott and Burns, or from contemporary literature in general. In 1834 an "Amateur Curling Club of Scotland" was formed but came to nothing. The "Grand Caledonian Curling Club," which began its existence on Nov. 15, 1838, and which, under its present title of "The Royal Caledonian Curling Club," is regarded in all parts of the world as the mother-club and legislative body, even in Canada, where, however, curling conditions differ widely from those of Scotland. Special rules have been made to suit local conditions. Starting with 28 allied clubs the Royal Club grew so rapidly that there were 500 such in 1880 and 720 in 1903. It was under the auspices of the Royal Caledonian that a body of Scottish curlers visited Canada and the United States in the winter of 1902–1903, and, while victory remained with the home players under their own climatic conditions, the visit did much to bring together the lovers of the game on both sides of the Atlantic. The assumption of the title "Royal" in place of "Grand" was due to the visit of Queen Victoria and the prince consort to Scotland in 1842, on which occasion they were initiated into the mysteries of the game on the polished floor of the drawing-room in the Palace of Scone; and the prince consort, who was presented with a pair of curling-stones, consented to become patron of the club. Subsequent patrons of the club have been Edward VII (as prince of Wales and as King), George V, Edward VIII who, as prince of Wales, had in 1925–26 been president of the club, and George VI. The club's main duties are to further the interests of the game, to revise the laws and to arrange the important matches, especially the grand match, played annually between the Scottish clubs north of the Forth and Clyde canal and those south of it. In the first of these matches (1847) only 24 rinks took part (a rink is composed of four players); in 1903 there were 386. In 1927 there was an entry of 600 clubs.

Glossary.—Baugh ice, rough or soft ice. *Bonspiel,* a match between several clubs. *Burn,* see *Mar. Chap and Lie,* to strike out a stone and lie in or near its place. *Chipping,* striking a stone of which a small part can be seen. *Crack an egg on a stone,* touch it very slightly. *Crampit,* an iron plate fitted with spikes which the player stands upon to deliver the stone. *Draw,* to play gently to a certain spot. *Drive,* to strike. *Drug ice,* soft bad ice. *Fill the port,* to block the interval between two stones. *Guard,* a stone that covers and protects another. *Hack,* a hollow cut in the ice for the player's foot, used in place of a crampit. *Hog,* a stone that stops short of the *hog-score,* a line drawn one-sixth of the length of the rink from the tee. *Head,* an innings, both sides delivering all their stones once. *House* (also boardhead or parish), the large circle round the tee. *In-wick,* gaining a good position by rebounding off another stone. *In-turn,* to make one turn to the right. *Lie shot,* the stone resting nearest the tee. *Mar,* to interfere with a stone while running. *Out-turn,* to make the stone twist to the left if a right-hand player; if left-handed it is the reverse. *Out-wick,* to strike a stone on the edge so as to drive it towards the tee. *Pat-lid,* a stone that lies on the tee. *Peels,* equal scores. *Raise,* to promote a "friendly" stone nearer the tee. *Rink,* the space in which the game is played; also the members of a side. *Running Shot,* to deliver the stone with great force, so as to scatter the stones. *Sole,* is the part of the stone in contact with the ice and on which it runs; also to deliver the stone. *Soop,* to sweep. *Spiel,* a match between members of the same club. *Tee,* the mark in the centre of the house or rings, against which it is the curler's object to lay the stone. The tee may be any kind of mark; a small iron plate with a spike in it is often used.

The Rink and Implements.—The rink is marked out in the ice, which should be very hard and smooth; in curling language "keen and clear." To keep it swept every curler carries a broom. Good "sooping," or sweeping, is part of the curler's art, and is performed subject to strict rules and under the direction of the skip, or captain; its importance lying in the fact that the progress of a stone is retarded by the ice-dust caused by the play or thin snow. Apart from the broom and the crampit, which replaces the hack, the game requires no further implement than the stone. The two flat sides, or soles, are so shaped that one is serviceable for keen ice and the other for ice that is soft, rough or "baugh." The handle can be fitted to either side, as the case demands. The cost of a pair of stones is not less than £3, generally more. In the intense cold of Canada and the United States iron is considered by some players as serviceable as stone. "Irons" are not used much in Canada now, except in Quebec, Montreal and eastern Ontario. Even these are light compared with the earlier rough boulder-stones, some of which weighed over 115 lb., although the very early ones were much lighter. The modern stone took shape at the beginning of the 19th century. The ancient stones had no handles, but notches were hewn in them for finger and thumb, and, as their weight varied from 5 to 25 lb., it is probable that they were thrown after the manner of quoits. Channel-stones, stones rounded by the action of water in a river bed, were the favourites, while the shape was a matter of individual taste, oblong and triangular stones having been common. The soles were artificially flattened. During the next period we find the heavy boulder-stones, unhewn blocks fitted with handles and probably used at shorter distances, 70 or 80 lb. being no uncommon weight. The rounded stone, made on scientific principles, did not appear until about 1800. Even then it was of all shapes and sizes, with and without handles, and not uncommonly made of wood. The stones of today are named after the places in which they are quarried, Ailsa Craigs, Burnocks, Carsphairn Reds and Crawfordjohns being some of the best-known varieties. The stones are quarried and never blasted, as the shock of the explosion is apt to strain or split the rock.

The Game.—Curling is practically bowls played on the ice, the place of the "jack" being taken by a fixed mark, as at quoits, called the tee, to which the curler aims his stone; every stone that finally lies nearer than any of the opposing stones counting a point or "shot." As each side has four players, each playing two stones, it is possible for one side to score eight points at a "head" or innings; but in practice it is found wiser, when a good shot has been made, to play some or all following stones to such positions as will prevent opposing stones from disturbing the stone lying near the tee. Stones thus placed are called "guards." Strategic matters like this are decided by the skip, or captain, of the rink, who plays last, and whose will is law. The "lead," or first player, is expected to play quietly up the rink, leaving his stone as close to the tee as possible, but on no account beyond it. He is followed by the "lead" of the other side, who, instructed by his skip, will either try to drive away the first stone, if well placed, or put his own stone in a better position. When the skip's turn comes he is "skipped," or directed, by another player, appointed by himself, usually the third player. When all sixteen stones have been delivered the players cross over, the scores are counted, and the game proceeds from the other end of the rink. If a stone fails to cross the "hog-score" it is a "hog" and is removed from the rink, unless it has struck another stone in position. Stones that pass the back-score or touch the swept snow on either side are also removed. By a cleverly imparted twist a stone may be made to curve round a guard and either drive away an opposing winner or find a favourable lie for itself. This, the equivalent of "bias" in the game of bowls, is the height of scientific play. If the situation seems desperate a very hard throw, a "thunderin' cast," may succeed in clearing away the opponents' stones from the neighbourhood of the tee. Different methods are adopted in delivering the stone, but in all of them a firm stand should be taken in the hack or on the crampit, and the stone swung, either quietly, or, if the skip calls for a "thunderin' cast," vigorously; but care must be taken to avoid striking the ice with the stone so as to crack or "star" the ice. A smooth gliding delivery is preferable.

Abridged Rules.—Tees shall be 38 yd. apart, and with the tee as centre a circle having a radius of 7 ft. shall be drawn. In alignment with the tees, lines, to be called *central lines,* are drawn from the tees to points 4 yd. behind each tee, and at these points *foot scores* 18 in. long shall be drawn at right angles, on which, at 6 in. from central line, the heel of the crampit shall be placed. All matches shall be of a certain number of heads, or shots, or by time, as agreed. Every rink of players shall be composed of four a side. No shoes likely to break the ice may be worn.

The skips opposing each other shall settle by lot, or in any other way they may agree upon, which party shall lead at the first head, after which the 4 side which has won the last head shall lead.

All curling stones shall be of a circular shape. No stone shall be of a greater weight than 44 lb. imperial, or of greater circumference than 36 in., or of less height than one-eighth part of its greatest circumference.

No stone shall be substituted for another, except under rules 10 (in case of a stone being broken) and 14 (a wrong stone being played shall be replaced by the stone which ought to have been played) after a match has begun, but the sole of a stone may be reversed at any time during a match.

Should a stone happen to be broken, the largest fragment shall be considered in the game for that end—the player being entitled afterwards to use another stone or another pair.

If a played stone rolls over, or stops, on its side or top, it shall be put off the ice. Should the handle quit the stone in delivery, the player must keep hold of it, otherwise he shall not be entitled to replay the shot.

Players, during the course of each end, to be arranged along the sides of the rink, anywhere skips may direct; and no party, except when sweeping according to rule, shall go upon the middle of the rink, or cross it, under any pretense whatever. Skips alone to stand at or about the tee—that of the playing party having the choice of place, and not to be obstructed by the other.

If a player should play out of turn, the stone so played may be stopped in its progress, and returned to the player. Should the mistake not be discovered till the stone be at rest, or has struck another stone, the opposite skip shall have the option of adding one to his score, allowing the game to proceed, or declaring the end null and void. But if another stone be played before the mistake has been discovered, the head must be finished as if it had been properly played from the beginning.

The sweeping shall be under the direction and control of the skips. The player's party may sweep the ice anywhere from the hog-score to the tee, and behind it—the adverse party having liberty to sweep behind the tee, and in front of any of their own stones when moved by another, and till at rest. When snow is falling or drifting, the player's party may sweep the ice from tee to tee. Skips to have full liberty to clean and sweep the ice behind the tee at any time, except when a player is being directed by his skip.

If in sweeping or otherwise, a *running* stone be marred by any of the party to which it belongs, it may, at the option of the opposite skip, be put off the ice; if by any of the adverse party, it may be placed where the skip of the party to which it belongs shall direct. If otherwise marred, it shall be replayed.

Every player to be ready to play when his turn comes, and not to take more than a reasonable time to play. Should a player play a wrong stone the stone which ought to have been played shall be put in its place.

No measuring of shots allowable previous to the termination of the end. Disputed shots to be determined by the skips, or, if they disagree, by the umpire, or, when there is no umpire, by some neutral person chosen by the skips. All measurements to be taken from the centre of the tee, to that part of the stone which is nearest it. No stone shall be considered without a circle, or over a line, unless it clear it;—and in every case, this is to be determined by placing a square on the ice, at the circle or line.

Skips shall have the exclusive regulation and direction of the game for their respective parties, and may play last stone, or in what part of it they please; and, when their turn to play comes, they may name one of their party to take charge for them.

If any player shall speak to, taunt or interrupt another, not being of his own party, while in the act of delivering his stone, one shot shall be added to the score of the party so interrupted.

If from any change of weather after a match has been begun, or from any other reasonable cause, one party shall desire to shorten the rink, or to change to another one, and, if the two skips cannot agree, the umpire shall, after seeing one end played, determine whether the rink shall be shortened, and how much or whether it shall be changed, and his decision shall be final. Should there be no acting umpire, the two skips may call in any neutral curler to decide, and his powers shall be equal with those of the umpire.

See *Annual* of the Royal Caledonian Curling club, Edinburgh.

The United States as compared with Scotland has few curling organizations and these originally were found where a group of Scotsmen had gathered. In 1924 an indoor artificial ice rink for curling was built at Boston and in the same year, another artificial ice plant was installed at Detroit. Curling has been played for about a century. Though it does not receive the enthusiasm it enjoys in Canada, winter carnivals in Minnesota, New Hampshire and Maine usually include a curling event in their sporting programs. The game is played with the same general rules as apply in Scotland. In the last 15 years, an organization of curling teams consisting of members of golf clubs such as St. Andrews in Yonkers, N.Y., Brookline, Mass. and clubs of other communities have been active in holding annual curling tournaments each winter.

Canada in 1943 had over 30,000 registered curlers. In 1807 curling was first played in Quebec City, the birthplace of curling on the North American continent. Some early settlers from Scotland brought curling stones with them but found additional stones unobtainable; this led to the substitution of "irons," weighing say 60 lb., still used in Montreal, Quebec and eastern Ontario. Elsewhere "stones" are in general use. In 1925 artificial ice indoor rinks were found practical in Ontario and in 1936 matched stones of uniform weight, 40 lb., with black and white handles for the opposing teams; these usually are the property of the club. This is a great boon to the game which can be played from November to April. An indoor rink with five sheets of artificial ice requires about 30,000 ft. of $1\frac{1}{4}$ in. pipe. In 1927 an annual competition for the Canadian championship was inaugurated with teams from the nine provinces. Some contestants travelled more than 2,500 miles to Toronto, the competitive point. Manitoba has been the most successful. There are many women's curling clubs. (T. Re.)

CURLL, EDMUND (1675–1747), London bookseller, is remembered for his long quarrel with Pope over the anonymously published *Court Poems* (1716). Pope took his revenge by immortalizing Curll in the *Dunciad.* Curll became notorious for his indecent publications, so much so that "Curlicism" was regarded as a synonym for literary indecency. In 1716 and again in 1721 he had to appear at the bar of the house of lords for publishing matter concerning its members. In 1725 he was convicted of publishing obscene books, and fined in 1728 for publishing *The Nun in her Smock* and *De Usu Flagrorum,* while his *Memories of John Ker of Kersland* cost him an hour in the pillory. When Curll in 1735 announced the forthcoming publication of *Mr. Pope's Literary Correspondence,* his stock, at Pope's instigation, was seized. It has since been proved that the publication was really instigated by Pope, who wanted an excuse to print his letters, as he actually did (1737–41). In his 40 years of business Curll published a great variety of books; a list of his publications contains 167 standard works. He died Dec. 11, 1747. *See* the *Life of Pope,* by Sir Leslie Stephen, and R. Straus, *The Unspeakable Curll* (1927).

CURRAGH, an open level stretch of ancient crown land, area over 4,800 acres, Co. Kildare, Eire. The right of pasturage is possessed by the landowners of the district. The *Liber Hymnorum* (10th century) says the king of Leinster granted it to St. Bridget, who is credited with having made it a common. The downs of Kildare seem to have been a meeting place from time immemorial. *Cuirrech* (lat. *cursus*) means race course and it is said that races occurred there as early as the 1st century A.D. Aenach Colmain (Curragh fair) or Aenach Life (fair on the Liffey plain) is often mentioned in the Irish Annals. It has seen many fights and gatherings of troops and has long had a military training camp; it is the principal horse-racing ground in Ireland. At the camp, on March 20, 1914, Gen. Hubert Gough and other officers offered their resignations as a protest against being sent to enforce the acceptance of Home Rule by Northeast Ulster.

CURRAN, JOHN PHILPOT (1750–1817), Irish politician and judge, was born on July 24, 1750, at Newmarket, Cork, where his father, a descendant of one of Cromwell's soldiers, was seneschal to the manor-court. He was educated at Middleton, and Trinity college, Dublin; and in 1773, having taken his M.A. degree, he entered the Middle Temple. In 1774 he married; but the marriage proved unhappy, and Mrs. Curran finally eloped. In 1783 Curran was appointed king's counsel; and in the same year he was presented to a seat in the Irish house of commons. But finding that he differed radically in politics from the gentleman from whom he had received his seat, he expended £1,500 in buying another to replace that which he occupied. He spoke vigorously on behalf of Catholic emancipation, and strenuously attacked the ministerial bribery which prevailed. This led him into two duels, one with the attorney general, the other with the secretary of state, Maj. Hobart. The union caused him the bitterest disappointment; he even talked of leaving Ireland, either for America or for England.

Curran's fame rests most of all upon his speeches on behalf of the accused in the state trials between 1794 and 1803, the most notable being those in defense of Hamilton Rowan, Lord Edward Fitzgerald and Wolfe Tone. Curran came under suspicion on the arrest of Robert Emmet, but on examination before the privy council was acquitted. In 1806, on the death of Pitt and the formation of the Fox ministry, Curran received the post of master of the rolls, with a seal in the privy council, though he had desired a position of greater political influence. For eight years, however, he held this office. He then retired on a pension of £3,000, and the three remaining years of his life were spent in London, where he became one of the most brilliant members of the society which included Sheridan, Erskine, Thomas Moore and William Godwin. He died at his house in Brompton on Oct. 14, 1817.

See *Curran and His Contemporaries,* a most entertaining work, by Charles Phillips, a personal friend of Curran (1818), and the *Life of Curran,* by his son, W. H. Curran (1819; with additions by Dr. Shelton Mackenzie, New York, 1855). *See* also *Curran's Speeches* (1805, 1808, 1845); Wm. O'Regan, *Memoirs of Curran* (1817); Letters to Rev. H. Weston (1819); and T. Moore's *Memoirs* (1853).

CURRANT. The currants of northern Europe and America —so-called from a resemblance of dried black currants to the fruit of one variety of the grapevine, *Vitis vinifera,* cultivated chiefly in Greece and California (*see* GRAPE)—are derived from *Ribes sativum, R. rubrum* and *R. petraeum,* deciduous shrubs of the family Saxifragaceae and indigenous to Britain, northern and central Europe and Siberia. There are at least 100 species of currants. The Rocky mountains in North America are especially rich in species. The common black currants of Europe are all derived from *Ribes nigrum,* a native of northern Europe and of northern and central Asia. A few relatively unimportant black currants of America are derived from *R. americanum* and *R. odoratum,* natives of North America. *Ribes sanguineum,* a native of the western coast of North America, is the flowering currant of northern Europe and *R. aureum* is the chief American flowering currant. The currant seems to have been cultivated first sometime before 1600 in the Netherlands, Denmark, and around the Baltic sea. Bushes were taken to settlements in America early in the 17th century. Most varieties growing in America originated in America. Fay, Wilder, Red Cross, Diploma, Perfection, London Market and Victoria are the chief red varieties. Red Lake and Cascade are promising new sorts. Important red currant varieties of England are Earliest of Fourlands, Laxtons Perfection, Fay, Rivers Late, Houghton Castle and Prince Albert. The black currant is extensively cultivated in Europe and to a lesser extent in Canada. Important black currant varieties of England are Baldwin, Boskoop, Seabrook, Laxton and Daniels September, and of Canada Climax, Kerry, Elipse, Clipper and Saunders. Both red and black currants are used for making tarts, pies, jams, jellies, etc. Black currants are also used in lozenges, for flavouring, and are occasionally fermented. It is extremely high in vitamins C and P. In 1934 the acreage in England of black currants was reported as 9,500 ac., and of red and white as 3,100 ac. In 1939 the acreage in the United States was 2,300 ac., nearly all red currants with a crop value of $334,000.

Currants succeed best in cool, moist northern climates. They are cultivated from Maryland to Kansas northward and are hardy far north in Canada, northern Scandinavia and the U.S.S.R.

Two leaf diseases, cane blight and anthracnose limit the culture of currants south of Maryland and Kansas.

Clay and silt soils are preferred for growing currants. They are propagated almost entirely by means of cuttings made from vigorous shoots of the current season's growth. The cuttings, 8 to 12 in. long, are usually taken in the autumn and set in the nursery immediately or buried in sand till spring and then set 3 to 6 in. apart with not over two buds left above ground. In the plantation they are set 4 to 5 ft. apart in rows 6 to 8 ft. distant. Under intensive cropping currants are planted under grapes, peaches, cherries, apples and pears because they stand shade better than do most plants.

The currants and gooseberries are the chief agencies in the spread of the white-pine blister rust, a destructive disease of the five-leaved pines in Europe and America. The common garden black currant is the favourite host of the blister rust. Because the white pine is one of the most valuable timber trees of the United States the black currant has been declared a menace and is not grown in most of the United States. Furthermore, the culture of all currants and gooseberries has been prohibited in many sections of the United States. The Viking red currant (called Red Dutch in Norway) is a vigorous variety immune to the blister rust and has been tested in northern United States for its horticultural value. The Red Holland variety of Germany is also immune to this disease. In 1943 good-fruited immune hybrids between a blister rust-immune species from Siberia and the common black currant were reported by the Canadian Experiment station at Ottawa. The currant maggot, for which there is no known control, infects the fruit so badly in parts of western North America that this fruit is not grown. The attacks of the currant worm may defoliate the plants in the spring unless controlled by using powdered hellebore, diluted 5 to 12 times with flour or air-slaked lime, or as a spray, with 1 oz. to 1 gal. of water.

The black currant is subject to the attacks of a mite, *Phytoptus ribis,* which destroys the unopened buds. The infested buds, recognized by their swollen appearance, should be picked off and burned. Reversion has been found to be a virus disease and is controlled by destroying affected plants. (G. M. D.)

CURRENCY. The term "currency" has no generally accepted meaning. It has been used variously to designate a part or the whole of the circulating medium or money of a country. Hugh Vance, one of the first writers to use the term, asserted in 1740 that the word was in common use in the colonies. He stated that it included silver, paper money, tobacco in Virginia and sugar in the West Indies; that it was "more especially that most general commodity, for which contracts are usually made." By the end of the 18th century the word was frequently used in both Great Britain and the United States, and it is clear that writers were thereby referring to all forms of hand-to-hand circulating media, more particularly to coins and bank notes. Adam Smith often used the term "common currency" in *The Wealth of Nations* (1776) evidently with this meaning in mind. During the first third of the 19th century the term was used in this sense, but with the additional inclusion of government paper money.

Most writers have not stated explicitly whether they use the term "currency" synonymously with "money"; but one may infer that many do. Samuel Jones Loyd (later Lord Overstone) and George Warde Norman asserted (1840) that they did so use the terms. A few have made it clear that they do not. Thus George Guthrie asserted (1860) that "bank-notes are not money more than cheques or bank-bills are. . . . . The only real money or cash in this country is gold." Nevertheless, he included bank notes as part of the currency. Similarly J. F. Johnson stated (1905) that "in the United States gold alone is money"; but included United States notes, bank notes, silver dollars and subsidiary coins as part of the stock of currency, and apparently, also demand deposits.

During the 1830s it was recognized by numerous writers, both British and U.S., that demand deposits, against which cheques might be drawn, serve the same purposes, and have the same relationship to the price level, as hand-to-hand money. Many of these men, therefore, included demand deposits as a part of the currency. Robert Torrens wrote (1837) that "the currency, or general medium of exchange, is composed of two distinct and different elements, namely:—of the circulating money, consisting of coin and bank notes; and of the credit money, consisting of all those deposits and credits which stand in the books of the bankers, and which are available in effecting purchases and payments." Similarly Irving Fisher wrote (1911) as follows: "Currency includes any type of property right which, whether generally acceptable or not, does actually, for its chief purpose and use, serve as a means of exchange. Circulating media are of two chief classes: (1) money; (2) bank deposits. But while a bank deposit transferable by cheque is included as circulating media, it is not money. A bank note, on the other hand, is both circulating medium and money." A further extension of the meaning of the term "currency" is sometimes encountered. Thomas Tooke asserted (1826) that "currency is that medium, whether consisting of gold, notes, bills, or credit, by which the purchase of commodities is effected." While a number of other writers have also taken the position that bills and credit in all forms have the same significance as coin and bank notes, few have explicitly included them in the term "currency."

While there was some reason for Tooke's position at the time he wrote, since bills were actually used as a means of payment in Lancashire, it would not be justified to include credit instruments as a part of the currency today. Nevertheless, they have an important monetary significance. Such "near moneys" as government short-term securities (treasury bills), mercantile bills, and in fact all high-grade liquid securities are in demand as a substitute for cash in "cash" balances of the public, since they can be converted into cash quickly if the latter is needed, and they yield an income which is not obtained if cash itself is held. This tendency to substitute securities for cash increases the velocity of circulation of money, which has the same effect as an increase in its quantity. It is manifest from what has been said above that past and current usage will support about equally well the use of the term "currency" to include all of the hand-to-hand circulating media, such as coins, bank notes and government paper money, but excluding bank deposits, or, to include deposits as well. In what follows it will be used in the first of these two senses, and the terms "money" and "circulating medium" will be used in the latter sense.

History.—Historically the constituent elements of the currency have varied greatly in both the United States and Great Britain. Before the advent of commercial banking in the latter country in the 17th century, the currency consisted exclusively of coins. In the American colonies, however, numerous experiments were made with various types of paper money, so that the actual currency consisted of coins and paper, with, in the early days, some use of tobacco in the south. Following the development of banking in Great Britain, and consequent upon the establishment of the first commercial bank in the United States in 1782, bank notes became an important element in the currency of both countries.

From about 1830 to 1844 there was much controversy in Great Britain between the so-called currency and banking schools. The former group of writers held that the existing mixed metallic and paper (bank-note) currency should vary with exports and imports of gold precisely as would a purely metallic currency. By this they meant that an outflow of gold should immediately cause a contraction of the currency and thus reduce prices, or contrariwise with an inflow. Thus international equilibrium would be automatically restored. Failure so to control the stock of currency, they asserted, would permit the banks to continue to expand their loans and the quantity of circulating medium after an outflow of gold had set in. This development, they believed, would eventually lead to an undermining of the reserve position of the banks, and therefore to a violent contraction and commercial "revulsion." Most of these writers either ignored or greatly underestimated the importance of deposits as an element in the stock of money.

The banking school saw better the influence of deposits, and contended that to control the currency alone would not achieve the result desired by their opponents. But in addition they denied that an immediate contraction of the stock of money was to be desired upon the beginning of an outflow of gold. International gold movements frequently were due, they asserted, to the requirement of making some specific and limited payment, rather than to a fundamental condition of disequilibrium. To contract the currency, therefore, they claimed, would be unnecessary in these cases and would needlessly worsen domestic business conditions. Moreover, they held that the banks could not unduly expand the quantity of money—that they were controlled by the "needs of business." This latter doctrine is still debated but appeared to have no foundation in theory or history.

In the political field the currency school won the argument; and the note-issuing privilege of the banks was severely limited by Peel's Act of 1844. In its economic aspects, however, the difference of opinion has not yet been satisfactorily resolved. There is in truth a difficult problem of public policy presented when an outflow or inflow of an international money takes place. It may or may not be the consequence of a fundamental condition of disequilibrium; but, if it is, the international position then requires a change in the domestic price level and a shift of production from domestic to international commodities, or the contrary, depending upon the direction of the gold flow. In any case the change in the stock of money causes an unwelcome disturbance of domestic economic affairs. If it involves a reduction in domestic prices, as will be the case when the flow of gold is outward, there may develop a considerable amount of unemployment.

In the United States there arose contemporaneously a point of view quite similar to that of the currency school in England. Many writers contended that the currency should consist only of "hard" money, that is, coin. Nevertheless, partly because the federal government was then supposed not to have the constitutional authority to interfere with the issuance of notes by state-incorporated banks, no legislation comparable with Peel's act was passed in the United States. However, the Independent Treasury Act of 1846 provided for maintaining governmental sub-treasuries for keeping the funds which formerly had been deposited in various banks. This act also required the treasurer to accept and to pay out only coin. In this way it was believed that the proportion of "hard" money to bank notes would be increased. The act may have had some slight influence in this direction.

No important legal limitation of the privilege of note issue was instituted in the United States until the passage of the National Bank act in 1863, and of the act of 1865. The former act provided for incorporation of national banks which might issue notes, but only against the security of federal government bonds. The latter act levied a tax of 10% per annum on the note issues of state-incorporated banks. The intent and effect of this tax was to eliminate entirely the notes of state banks.

The currency of the United States was made yet more complicated by the issuance of United States notes (greenbacks) during the Civil War, and of gold and silver certificates, the former appearing in 1866, and the latter in 1880. Federal reserve notes were provided for in the act of 1913 and after that date they became the major form of currency. The general circulation of gold coin and certificates was discontinued in 1934, while the quantity of silver certificates greatly increased after that date in consequence of the Silver Purchase act of that year. The privilege of issuing notes by the national banks was discontinued in 1935.

In Great Britain the composition of the currency also changed after 1914, although it was not so complicated as in the United States. The issuance of currency notes by the treasury was authorized at the outbreak of World War I, and the volume of these notes rose rapidly to a maximum of approximately £320,000,000 in Dec. 1920. Gold coins disappeared from circulation. The issues of the Bank of England also increased during these years, but their quantity did not become so great as that of the currency notes. The return to gold in 1925 did not affect the composition of the currency, since the Gold Standard act permitted the Bank of England to redeem its obligations in bullion rather than coin.

The Currency and Bank Notes Act of 1928 amalgamated the currency notes and the Bank of England issues by making the outstanding currency notes an obligation of the bank, and transferring to the latter an equal amount of assets. This act increased the note issues of the bank from approximately £180,000,000 to £419,000,000 and the uncovered or fiduciary issues from about £20,000,000 to £260,000,000. The suspension of the gold standard in 1931 likewise did not affect the composition of the currency, because gold coins had not been in circulation since 1914.

Quantity.—In the absence of commercial banking, the determination of the quantity of currency under a purely metallic standard would be a relatively simple matter. The volume of currency and the price level would be simultaneously determined by the richness of ore reserves, the technology of mining and of ore reduction, the industrial demand for the money metal, the volume of transactions requiring payment in money, and the velocity of circulation of the currency. In a country in which fractional-reserve banking obtains, the problem is much more complicated. If the reserves of the banks consisted of currency the preceding factors would be partial determinants under a metallic standard; but, in addition, the relative demand of the public for currency and for deposits, and the reserve ratio of the banks would become important determinants. If, for example, the public desired to hold the same amount of cash in the form of currency as in deposits, if the reserve ratio of the banks were 25%, and if the amount of currency (consisting of coin only) were 100 units, then the currency in the hands of the public would be 80 units, and that in the reserves of the banks 20 units. Deposits would then be four times the amount of reserves, or 80 units, that is, they would be equal to the amount of currency in the hands of the non-banking public. The total quantity of money in the cash balances of the public would therefore be 160 units.

If we assume all the above conditions to be the same except that the demand of the public for currency is one-sixth of its demand for deposits, then the currency outside the banks will be 40 units, and the reserves of the banks 60 units. Thus there will be 240 units of deposits, or six times the amount of currency in the hands of the public. However, in this second case the total amount of money (280 units) will be much larger than in the first case. This will cause the price level to be higher, and mining of the money metal to be more costly, since higher prices will mean higher wage rates for miners and higher costs of mining materials. Thus the output of the money metal will be actually lower than in the first case, so that if 100 units of coined money would be provided in the first case, mining would be so much curtailed in the second that, in fact, less than 100 units would be provided. The consequence would be that the price level would be higher than in the first case, the total quantity of money greater and the quantity of currency in the hands of the non-banking public smaller; but the price level would not be so high, or the quantity of money and of currency so great, as we have assumed in the arithmetic example in the second case. Equilibrium would be reached at some level which cannot be determined without making precise assumptions as to ore reserves, volume of transactions, and the other relevant factors.

If we vary our second case by assuming that the reserve ratio is 10% instead of 25%, while the demand for currency continues to be equal to the demand for deposits, then the amount of currency in the hands of the general public will be 90.9 units, while the reserves of the banks will be 9.09 units. We shall therefore have 90.9 units of deposits, and the total amount of money in the cash balances of the public (currency plus deposits) will be 181.8. This is a larger amount of money than the 160 units of the first case, and consequently the statements concerning our second case also apply here. If a country is not on a metallic standard the quantity of currency and of money in the final analysis will depend upon action by the legislature. In this case, however, the legislature will need some guide to its action. Various such guides have been suggested, such as a constant quantity of money, a constant product of the quantity of money and its velocity per capita, and a stable price level. While there is no unanimity of opinion on this subject, a stable price level probably comes nearest to general acceptance. It will still be true, however, that all of the above determinants, except the conditions of mining, will be factors in determining how much currency the legislature can provide consistently with its announced policy.

A further complication arises if the reserves of the banks consist not of currency, but of deposits with a central bank. This, in fact, is the usual condition in industrial nations. If a nation is on the gold standard there will still be a relationship between the quantity of currency and of money, the output of gold, and the price level; but it will be tenuous and uncertain. The action of the central bank in increasing or decreasing the reserves of the "member" banks by means of open-market operations will be an important consideration. This factor has not in the past been so predictable and reliable as is to be desired. If the central bank is itself not required to redeem its obligations in gold or other legal tender, the uncertainty in monetary policy may in fact not be significantly greater than it will be under the gold standard and the absence of an established monetary policy. Moreover, it is at least conceivable that monetary policy could be more definite without than with a gold standard, since there would be no danger that the exhaustion of reserves would intervene to put a stop to an expansion that was desirable. However, the relative merits of a gold and a paper standard is a much debated question.

It should not be inferred from the preceding statements that the velocity of circulation of currency is stable. It is, in fact, notoriously unstable, and the consequence is that there has been witnessed in the past marked fluctuations in the price level for this reason as well as because of variations in the quantity of money, and therefore also fluctuations in the volume of employment and production. A definite monetary policy of offsetting changes in velocity by changes in the opposite direction in the quantity of money should do much to stabilize the price level and employment; but no nation has as yet adopted a policy of this kind. Such data as are available indicate that prior to about 1850 the volume of currency exceeded that of deposits in the United States; and, while the data are less conclusive for Great Britain, the same relationship probably obtained in the latter country. This ratio fell during the second half of the 19th century, but rose again somewhat during the 1930s. In 1944 it stood, very roughly, at about one to five in both Great Britain and the U.S., if both time and demand deposits are included.

The fact that the volume of currency exceeded that of deposits before 1850, and the failure to understand fully the significance of deposits, doubtless explain the central place assigned to the currency in the currency-banking school controversy in Great Britain, and the demand for a "hard" money in the United States. In recent years, but particularly after about 1920, the tendency has been to put more emphasis on the need for controlling the volume of deposits, and to consider, rightly, the volume of currency as a matter of secondary importance—except in so far as it may influence, by way of bank reserves, the volume of deposits. (*See* also the articles on MONEY; QUANTITY THEORY OF MONEY; BANKING AND CREDIT; INFLATION AND DEFLATION; and GREENBACKS.)

CURRENCY, PRIMITIVE. Among peoples of primitive culture is found a strange diversity of objects commonly termed "money" or "currency." These are of two main kinds, one comprising articles of practical use, the other those of which the primary purpose is ornament. The rock salt of Abyssinia, the hoes of the Dinka and Shilluk of the upper Nile, the iron and cloth of central and west Africa, the brilliant red feather bands of Santa Cruz, the dentalium shell strings of California and British Columbia, the wampum of the eastern American tribes, the tridacna-shell armlets and large stone axe blades of eastern New Guinea, the sperm-whale teeth of Fiji and the *fê* or "millstone money" of the Caroline islands have all been termed "money." Certain of these things are currency in the true economic sense; others have been dubbed so through loose definition of terms and use.

Well known among "native money" are the strings of shell disks so characteristic of the Melanesian islands, as the *diwara* of New Britain, the *rongo* of Malaita or the *sapisapi* of east New Guinea. Much work is involved in their manufacture, and their value varies according to their length and colour. Red disks are worth more than white, the shell from which they are obtained being more rare. These strings, whether in coils or made up into necklaces, form most important items of wealth to the native, and pass freely from hand to hand in settlement of social obligations.

But according to precise terminology such objects can hardly be correctly described as currency or money. In any economic system, however primitive, an article can only be regarded as true money when it acts as a definite and common medium of exchange, as a convenient stepping-stone in obtaining one type of goods for another. Moreover, in so doing it serves as a measure of values, allowing the worth of all other articles to be expressed in terms of itself. Again, it is a standard of value with reference to past or future payments, while as a store of value it allows wealth to be condensed and held in reserve. Strings of shell disks and similar articles are certainly a form of condensed wealth, and act as a store of value. But they do not consistently perform any other function of money. They may pay for canoes or be traded against one another, but they do not facilitate every-day exchanges, as those of food or implements, nor are market values of other commodities expressed in them. The use of such articles is largely ceremonial; individual pieces often have names and unique histories, and are connected with the fortune of special persons and clans. In general, the economic system of the Pacific island native, considered apart from the effects of white contact, has not been shown capable of accommodating and utilizing a fully-fledged circulating medium in its system of production and exchange; references to native "money" or "currency" therefore cannot be accepted at face value.

With African tribes the case is different. The use of hoes or cattle as true money is dubious, but it is clear that such objects as iron bars (often in the form of conventionalized spear-heads or knives), cowrie shells, salt and cloth serve as definite media of exchange and as common measures, standards and stores of value. This may be due to external influence, particularly to that of Arab traders. The cowrie (*Cypraea moneta*) is one of the most striking forms of native currency. Ranging in west Africa from the Sahara to the Gulf of Benin, taking in the whole basin of the Niger-Benue, and including also the upper Congo-Lualaba area, its economic sphere centres especially in Timbuktu, the district of the middle Niger, and the country around Lake Tchad. Sometimes the shells are strung on a cord, sometimes kept loose in a leather bag, and transactions of all kinds, from simple village marketing to buying and selling on a large scale, are accomplished through this medium. In recent times the cowrie has often served as the small change for a European currency. With the change in economic conditions and ideas consequent upon the arrival of the white man, objects previously not employed as actual currency may begin to extend their function and assume that position.

CURRENT ASSETS, also known as *liquid, quick, working* or *floating assets,* are assets consisting of cash and other items which can readily be converted into cash without serious depreciation in values. Ordinarily this group of assets includes cash, accounts receivable, notes receivable, accrued interest receivable and merchandise inventories. It is generally assumed that current assets will be converted into cash during the current operations of the business. Usually this will occur within from three months to six months following the date of the accounts, although in some cases an entire year might be required. While some concerns, notably those that manufacture repair parts, have a sufficient stock of such parts to last for a three to five year period, it is customary even in such instances to include these valuations in the inventory accounts. The amount involved in the inventory of the repair parts is usually small as compared with the inventories of finished products, work in process and raw materials. In the preparation of the balance sheet of an organization, current assets are usually listed first. It is to these assets that current creditors of the business must look for satisfaction of claims. If the balance sheet is to be used for credit purposes, the prospective creditor will be most interested in this group of assets so that he may reasonably determine the ability of the debtor to discharge his obligation at maturity. *Net current assets* is a term used to signify the excess of current assets over current liabilities. (G. L. C.)

CURRENT BALANCE. A current balance, or current weigher, measures an electric current by balancing the force of attraction or repulsion between two or more coils which carry the current against the force of gravity on a known mass. In the current balance described by Lord Rayleigh in 1882 a coil suspended from one pan of a balance and carrying the current in a clockwise direction is repelled by the upper fixed coil in which the current is counter-clockwise and attracted by the lower coil in which the current is clockwise. The resulting force on the moving coil is balanced by adding a small weight to the opposite pan. The current in absolute amperes is computed from the force on this weight, the number of turns of wire on the coils, their radii, and their distance apart.

The current balance is now used only by national standardizing laboratories for determining the ratio between the absolute ampere and the international ampere, the latter being the unit in which instruments for measuring electric current are certified. In 1940 in both England and the United States, 1 international ampere = 0.99985 absolute ampere. (*See* INSTRUMENTS, ELECTRICAL.)

(H. L. Cs.)

CURRENT LIABILITIES, a financial and accounting term used to designate short-term obligations; *i.e.*, obligations which mature within a period of one year. This classification of accounts normally includes such items as accounts payable, notes payable, acceptances payable, accrued interest payable, salaries and wages accrued, and other items of like character. In the preparation of a balance sheet, it is customary to segregate current liabilities and list them first in the liability section so that prospective creditors may more readily determine the relation of current liabilities to current assets (*q.v.*).

CURRIE, SIR ARTHUR WILLIAM (1875–1933), Canadian soldier and administrator, was born at Napperton, Ont., on Dec. 5, 1875, commanded the 1st Canadian Division, 1914–17, and the Canadian Corps in France, 1917–18. Currie was given the C.B. in 1915, K.C.M.G. 1917, K.C.B. 1918 and G.C.M.G. 1919; he also received French and Belgian decorations. In 1920 Sir Arthur Currie became principal of McGill university, Montreal.

CURRIE, SIR DONALD (1825–1909), British shipowner, was born at Greenock on Sept. 17, 1825. By a fortunate chance he attracted the notice of the chief partner in the newly-started Cunard steamship line, who found him a post in that company. In 1849 the Cunard company started a service between Havre and Liverpool to connect with their trans-Atlantic service. Currie was appointed Cunard agent at Havre and Paris, and secured for his firm a large share of the freight traffic between France and the United States. About 1856 he returned to Liverpool, where till 1862 he held an important position at the Cunard company's headquarters. In 1862 he established the Castle line of sailing-ships between Liverpool and Calcutta. In 1864 Currie found it profitable to substitute London for Liverpool as the home port of his vessels, and himself settled in London. In 1872 he started the Castle Line of steamers between England and South Africa, which after 1876 divided the South African mail contract with the older Union Line, and was finally amalgamated with the latter under the title Union Castle Line in 1900. Currie's intimate knowledge of South African conditions caused him to be entrusted by the home Government with the negotiations in the dispute concerning the ownership of the Kimberly diamond-fields. He introduced the two Transvaal deputations which came to England in 1877 and 1878 to protest against annexation, and though his suggestions for a settlement were disregarded by the Government of the day, the terms on which the Transvaal was subsequently restored to the Boers agreed, in essentials, with those he had advised. Entering politics, he was returned to parliament in 1880 as Liberal member for Perthshire, but, though a strong personal friend of Gladstone, he disagreed with him on the Home Rule question, and from 1885 to 1900 represented West Perthshire as a Unionist. In 1881 he was knighted, and in 1897 was created G.C.M.G. He died at Sidmouth on April 13, 1909.

CURRIE, JAMES (1756–1805), Scottish physician and editor of Burns, son of the minister of Kirkpatrick-Fleming, in Dumfriesshire, was born there on May 31, 1756, and died at Sidmouth on Aug. 31, 1805. He spent some years in America before he studied medicine and became physician (1783) of Liverpool infirmary. Among other pamphlets Currie wrote *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Fevers and Febrile Diseases* (1797), which had some influence in promoting the use of cold water affusion, and contains the first systematic record in English of clinical observations with the thermometer. But he is best known for his edition (1800), long regarded as the standard, of Robert Burns.

CURRIER. One who dresses and prepares leather already tanned. The currier pares off roughness and inequalities, makes the leather soft and pliable, and gives it the necessary surface and colour. It is of interest to note that the word "curry," which describes the work of the currier, also means to dress a horse by grooming with a comb.

The word curry crops up in many telling phrases. The saying "to curry favour," to flatter or cajole, is a 16th century corruption of "to curry favel," *i.e.* a chestnut horse. A chestnut or fallow horse seems to have been taken as typical of deceit.

CURRIER & IVES, American lithographers whose prints of events and scenes in the United States of the middle and latter part of the 19th century are much sought after. NATHANIEL CURRIER (1813–1888) was born in Roxbury, Mass., was apprenticed to a lithographer at 15 and at the age of 22 set up for himself, first at Philadelphia and then in New York. In 1835 a disastrous fire swept lower New York. Four days later Currier produced a lithograph entitled "Ruins of the Merchants' Exchange" which the public bought eagerly. A few years later the steamship "Lexington" was burned in Long Island Sound with the loss of 100 lives. Within three days Currier had lithographed the burning ship, supplying a full description of the catastrophe. The success of the lithograph was instant. JAMES MERRITT IVES (1824–1895), an artist, was employed by Currier, at first as a bookkeeper; but later he became a partner. For over a generation Currier & Ives turned out lithographs, which the public eagerly bought, on the events of the day, disasters on land and sea, death beds, Indian and frontier scenes, Biblical scenes, and social caricatures. In the later years of the 19th century the newspapers and the photograph supplanted lithographs, and the prints were no longer made. Years later they began to be in demand by collectors, and prints that originally sold for a dollar or two each were bought for hundreds or even thousands of dollars.

CURSOR, LUCIUS PAPIRIUS, Roman general, five times consul and twice dictator. In 325 B.C. he was appointed dictator to carry on the second Samnite War. After the disaster of the Caudine Forks (*q.v.* 321 B.C.) Cursor to some extent wiped out the disgrace by compelling Luceria (which had revolted) to surrender. In 309, when the Samnites again rose, Cursor was appointed dictator for the second time, and gained a decisive victory at Longula. His son of the same name, also a distinguished general, completed the subjection of Samnium (272).

CURSOR MUNDI, an English poem in the northern dialect dating from the early 14th century. It is a religious epic of 24,000 lines "over-running" the history of the world as related in the Old and New Testaments. The author explains his reason for undertaking the work. Men desire to read old romances of Alexander, Julius Caesar, Greece, Troy, Brut, Arthur, and others. But better than tales of love is the story of the Virgin; therefore in her honour he will write this book. He writes in English so that those who know no French may understand. The history is treated under seven ages. The first four include the period from the creation of the world to the successors of Solomon; the fifth deals with Mary and the birth and childhood of Jesus; the sixth with the lives of Christ and the chief apostles, and with the finding of the holy cross; and the seventh with Doomsday. Four short poems follow, more in some mss. The bulk of the poem is written in rhyming couplets of short lines of four accents, and maintains a fair level throughout. The narrative is enlivened by many legends; and the numerous transcripts of it prove that it was able to hold its own against profane romance.

Of the author nothing is known. The date of the book was placed by Dr. J. A. H. Murray (*The Dialect of the Southern Counties of Scotland*, 1873, p. 30) in the last quarter of the 13th century, and the place of writing near Durham.

Cursor mundi was edited for the Early English Text Society in 1874–93 by Dr. R. Morris in parallel columns from four mss.

CURTAIN, a screen of any textile material, running by means of rings fixed to a rod or pole. Curtains are now used chiefly to cover windows and doors, but for many centuries every bed of importance was surrounded by them, and sometimes, as in France, the space thus screened off was much larger than the actual bed and was called the *ruelle*. The curtain is very ancient—indeed the absence of glass and ill-fitting windows long made it a necessity. Originally single curtains were used; it would appear that it was not until the 17th century that they were employed in pairs. Curtains are made in an infinite variety of materials and styles; when placed over a door they are usually called *portières*. In fortification the "curtain" is that part of the enceinte which lies between two bastions, towers, gates, etc.

CURTAIN FIRE, a barrier of shells fired so as to burst along a certain line just in front of one's own infantry to protect them from enemy attack, or in rear of the hostile infantry to prevent their retreat or the arrival of reinforcements (from O.Fr. *courtine*). Curtain fire is alternatively termed "barrage fire" (from Fr. *barrage*, a barrier).

CURTANA, the pointless sword of mercy, known also as Edward the Confessor's sword, borne at the coronation of the kings of England between the two pointed swords of temporal and spiritual justice.

CURTEA DE ARGEŞ, an old city in the department of Argeş, Rumania, on the right bank of the Argeş, where it flows through a valley of the lower Carpathians, terminus of a branch railway from Piteşti. Pop. (1930) 6,831. Tradition says it was founded early in the 14th century by Prince Radu Negru, succeeding Câmpulung as capital of Walachia. Hence its name *Curtea*, "the court." It contains a few ancient churches, and was created a bishopric at the close of the 18th century.

The cathedral, the most famous Rumanian building, stands in monastery grounds 1½ mi. north of the city. Mausoleum-like, it is built in Byzantine style, with Moorish arabesques; it is oblong, with a many-sided annex at the back. A central dome is fronted by two smaller cupolas; while a broader and loftier secondary dome springs from the annex.

The archives of the cathedral were plundered by Magyars and Muslims, but several inscriptions, Greek, Slav and Rumanian, were left. One tablet names the founder, Prince Neagoe Bassarab (1512–21); another says Prince John Radu completed the work in 1526; a third describes repairs executed in 1681 by Prince Şerban Cantacuzino; a fourth, the restoration in 1804, by Joseph, the first bishop. The cathedral was reconstructed 1875–85, and reconsecrated in 1886.

CURTESY: *see* COURTESY.

CURTILAGE, the area of land which immediately surrounds a dwelling-house and its yard and outbuildings. In feudal times every castle with its dependent buildings was protected by a surrounding wall, and all the land within the wall was termed the curtilage; but the modern legal interpretation of the word, *i.e.*, what area is enclosed by the curtilage, depends upon the circumstances of each individual case, such as the terms of the grant or deed which passes the property, or upon what is held to be the amount of land usual or necessary for the site of the house, etc. The importance of the word in modern law depends on the fact that the curtilage marks the limit of the premises in which housebreaking can be committed.

CURTIN, ANDREW GREGG (1817–1894), American political leader, was born at Bellefonte, Centre county, Pa., on April 22, 1817. He graduated from the law department of Dickinson college in 1837 and was admitted to the bar in 1839. Entering politics as a Whig, he was chairman of the Whig State central committee in 1854, and from 1855 to 1858 was secretary of the commonwealth. In Oct. 1860 he was elected governor of Pennsylvania on the Republican ticket.

During the Civil War he was one of the closest advisers of President Lincoln, and one of the most efficient, energetic and patriotic of the "war governors" of the north. He organized the famous "Pennsylvania Reserves," by means of which the state was always able to fill at once its required quota after each successive call. In equipping and supplying troops he showed great resourcefulness, and his arrangements for caring for the widows and children of Pennsylvania soldiers killed in battle and for the sick and wounded were copied throughout the north. He was re-elected governor in 1863 and served until Jan. 1867. He was U.S. minister to Russia from 1869 until 1872. He returned to America and took part in the Liberal Republican revolt against President U. S. Grant. Later he joined the Democratic party and was a representative in congress from 1881 to 1887. He died at his birthplace, Bellefonte, Pa. on Oct. 7, 1894.

See William H. Egle, *Life and Times of Andrew Gregg Curtin* (Philadelphia, 1896), which contains chapters written by A. K. McClure, Jno. Russell Young, Wayne MacVeagh, Fitz John Porter and others; and Oberholtzer, *Since the Civil War*.

CURTIS, CHARLES (1860–1936), American politician, was born in North Topeka, Kan., on Jan. 25, 1860. He received a common school education, studied law, was admitted to the bar in 1881, began practice in Topeka, and in 1884–88 served as county attorney. Entering politics, he was elected in 1893 Republican representative in congress, and was re-elected continuously until 1907, when he was chosen United States senator, serving until 1913. He was again elected senator for the terms 1915–21, 1921–27 and 1927–33. At the Republican national convention in 1928 he was nominated for the vice-presidency. On Nov. 6, 1928, he, with Herbert Hoover, was elected by the overwhelming majority of 444 to 87 electoral votes, but four years later he was defeated even more decisively. He died Feb. 8, 1936.

CURTIS, CHARLES GORDON (1860–), American inventor, was born at Boston, Mass., April 20, 1860. He was educated at Columbia university (C.E., 1881; LL.B., 1883; M.S., 1907), and practised as a patent lawyer for eight years. He organized the C. and C. Electric Motor Co., and also the Curtis Electric Manufacturing Co., of which latter concern he was president. He invented the Curtis steam turbine, of high efficiency with a new method of controlling speed, the land rights of which he sold to the General Electric Co.

CURTIS, CYRUS HERMANN KOTZSCHMAR (1850–1933), U.S. philanthropist and publisher, was born in Portland, Me., June 18, 1850, the son of Cyrus Libby Curtis and Salome Ann Cummings Curtis. As early as 1863, he began publishing in Portland a local weekly called *Young America*. When fire destroyed his plant, he moved to Boston, where he worked as a messenger, an advertising solicitor and as publisher of *The People's Ledger*, a magazine. He moved to Philadelphia in 1876 and continued there the publication of the magazine. In 1879 he founded *The Tribune and Farmer*, from the women's section of which he formed a new magazine, *The Ladies' Home Journal*. In 1890, Curtis organized the Curtis Publishing company. Seven years later he purchased *The Saturday Evening Post* and in 1911 *The Country Gentleman*. In 1913, he purchased the *Philadelphia Public Ledger* and a year later began publication of the *Evening Public Ledger*. He bought the *Evening Telegraph* for its Associated Press membership, which he transferred to the *Evening Public Ledger*. Later he purchased the *Philadelphia Press* and the *North American*, both morning newspapers, and merged them with the Curtis papers. In 1924, he obtained possession of the *New York Evening Post*; in 1930, the *Philadelphia Inquirer*. He died June 7, 1933.

CURTIS, GEORGE TICKNOR (1812–1894), American lawyer, legal writer and constitutional historian, was born in Watertown, Mass., on Nov. 28, 1812. He graduated at Harvard in 1832, was admitted to the bar in 1836, and practised in Worcester, Boston, New York and Washington, appearing before the U.S. supreme court in many important cases, including the Dred Scott case, and the "legal tender" cases. In Boston he was for many years the U.S. commissioner, and in this capacity, despite his own opposition to slavery, ordered the return to his owner of the famous fugitive slave, Thomas Sims, in 1852. He was the nephew of George Ticknor, the historian of Spanish literature, and his association with his uncle was influential in developing his scholarly tastes. He is best known as the author of *A History of the Origin, Formation and Adoption of the Constitution of the United States, with Notices of its Principal Framers* (1854), republished, with many additions, as *The Constitutional History of the United States from their Declaration of Independence to the Close of their Civil War* (1889–96). This history may be said to present the old Federalist or "Webster-Whig" view of the formation and powers of the Constitution; and it was natural that Curtis should follow it with a voluminous *Life of Daniel Webster* (1870), a most valuable biography of that statesman. In his later years Curtis, like so many of the followers of Webster, turned towards the Democratic Party; and he wrote, among other works of minor importance, an exculpatory life of President James Buchanan (1883) and two vindications of Gen. George B. McClellan's career (1886 and 1887). He died in New York on March 28, 1894.

In addition to the works above mentioned he published: *Digest of the English and American Admiralty Decisions* (1839); *Rights and Duties of Merchant Seamen* (1841); *Law of Patents* (1849); *Equity Precedents* (1850); *Commentaries on the Jurisprudence, Practice and Peculiar Jurisdiction of the Courts of the United States* (1854–58); *Creation or Evolution* (1887); and a novel, *John Chambers* (1889).

His brother, BENJAMIN ROBBINS CURTIS (1809–1874), also an eminent jurist, was born on Nov. 4, 1809, in Watertown, Mass., graduated at Harvard in 1829, studied law at Cambridge and at Northfield, Mass., where, after his admission to the bar in 1832, he practised law for two years, and then in Boston in 1834–51. In 1851 he was appointed to the Supreme Court of the United States, where he gained his greatest fame by his dissenting opinion in the Dred Scott case, in which he argued that the Missouri Compromise was constitutional, and that negroes could become citizens. His argument was immediately published as an anti-slavery document. In 1857 he resigned from the Supreme Court and resumed his private practice. In 1868 he was one of the counsel for President Andrew Johnson in his impeachment trial. He died at Newport R.I., on Sept. 15, 1874. He prepared *Decisions of the Supreme Court* and a *Digest* of its decisions down to 1854.

A Memoir of Benjamin Robbins Curtis, with Some of his Professional and Miscellaneous Papers, edited by his son, Benjamin R. Curtis, was published at Boston in 1879, the *Memoir* being by George Ticknor Curtis.

CURTIS, GEORGE WILLIAM (1824–1892), American man of letters, was born in Providence, R.I., U.S.A., Feb. 24 1824, of old New England stock. The most significant factor in his early life was his two years' stay with his brother James as a boarder at the Brook Farm community and school. Then came two years, passed partly in New York, partly in Concord in order to be near Emerson and to combine intellectual with outdoor occupation. After four years spent in Europe, Egypt and Palestine, Curtis returned to America in 1850, handsome, attractive, accomplished, ambitious of literary distinction. He joined the staff of the New York *Tribune,* to which, as to the *Courier and Enquirer,* he had sent some letters from Europe. He became a popular lecturer. He set himself to work on a volume published in the spring of 1851 under the title of *Nile Notes of a Howadji,* which was followed in 1852 by *The Howadji in Syria.* He wrote much for *Putnam's Magazine,* of which he was an associate editor; and a number of volumes, composed of charming essays written for that publication, for his department, "The Lounger," in *Harper's Weekly,* and for *Harper's Monthly,* where he was long associated with "The Easy Chair," came in rapid succession from his pen. The chief of these were the *Potiphar Papers* (1853), a satire on the fashionable society of the day; and *Prue and I* (1856), a fancifully tender and humorous study of life. These, the Howadji books and *Lotus Eating* (1852) appeared in a uniform edition in 1856. In 1856 Curtis married Miss Anna Shaw. For years he was obliged to sacrifice much of his home life that he might, by lecturing, pay off the debts he had assumed voluntarily after the failure of *Putnam's Magazine.*

In the period just preceding the Civil War other interests were subordinated to those of national concern. He made his first important speech on current questions at Wesleyan university in 1856. He engaged actively in the presidential campaign of that year, and was soon recognized not only as an effective public speaker but as one of the ablest and most trustworthy leaders of public opinion. In 1863 he became political editor of *Harper's Weekly,* and as such his writing was clear, direct and forcible. Although he never became a mere partisan, his service to the Republican Party was such that he was offered nominations of distinction and was given his choice of the chief missions under President Hayes. He refused them all, feeling that he could be of more service to the country as editor and public speaker. In 1871 he was appointed by President Grant chairman of the commission on civil service reform. From then until his death, he led this movement, and to his sound judgment, his vigorous presentation of the evils of the corrupt political patronage system and his untiring efforts, progress in the reform is mainly due. He was president of the National Civil Service Reform League and of the New York Civil Service Reform Association. In 1884 in refusing to support the nomination of James G. Blaine as candidate for the Presidency, he broke with the Republican Party, and became the typical Independent in politics. In 1890 he was made chancellor of the University of New York, having been a member of the board of regents from 1864. He died at New Brighton, Staten Island, N.Y., Aug. 31, 1892. (C. E. N.)

BIBLIOGRAPHY.—See *George William Curtis,* by Edward Cary, in the "American Men of Letters" series (1894), an excellent biography; "An Epistle to George William Curtis, 1874" and "Postscript, 1887" in James Russell Lowell's *Complete Poetical Works; George William Curtis,* a commemorative address delivered before the Century Association, Dec. 17, 1892, by Parke Godwin (1893); *Orations and Addresses by George William Curtis,* edited by Charles Eliot Norton (1894), and *Early Letters of George Wm. Curtis to John S. Dwight, Brook Farm and Concord,* edited by G. W. Cooke (1898). A number of his literary and social essays were published in book form posthumously. W. M. Payne refers to him in his *Leading American Essayists* (1910).

CURTIS PUBLISHING COMPANY, THE, an American publishing company with headquarters in Philadelphia. Its publications consist of *The Saturday Evening Post* (general-weekly), the *Ladies' Home Journal* (women's monthly), the *Country Gentleman* (agriculture-monthly), and *Jack and Jill* (young children-monthly). *The Saturday Evening Post* was founded in 1728 by Benjamin Franklin, under the name of the *Pennsylvania Gazette,* and has been published continuously since that time, except for a few weeks during the British occupancy of Philadelphia during the Revolutionary War. The *Ladies' Home Journal* was founded by Cyrus H. K. Curtis in 1883. The *Country Gentleman* is the oldest agricultural periodical in America, and was established in the year 1831. *Jack and Jill* was established in Nov. 1938. The net paid circulation of all four magazines in 1939 was the highest in their history, the average circulation of the *Post,* during the first six months of that year, being 3,117,805, the *Journal* 3,185,376, the *Gentleman* 2,054,292, and *Jack and Jill* 125,845.

The Curtis Publishing Company has been the originator of many innovations in the publishing business. It developed the first organized research into commercial problems; it developed the four-colour wet printing process; invented and developed the parallel folder in magazine work, and developed, for the first time practically, the almost instantaneous drying of printing inks in fine quality work. It originated the first magazine circulation department, and has been a pioneer in many forms of modern management. Its buildings in Philadelphia are open for public inspection. (W. D. F.)

CURTIUS, ERNST (1814–1896), German archaeologist and historian, was born at Lübeck on Sept. 2, 1814. After travelling in Greece he became, in 1844, an extraordinary professor at the University of Berlin, and in the same year was appointed tutor to Prince Frederick William (afterwards the Emperor Frederick III.)—a post which he held till 1850. In 1874 he concluded an agreement by which the excavations at Olympia (*q.v.*) were entrusted exclusively to Germany. Curtius died at Berlin on July 11, 1896.

His best-known work is his *History of Greece* (1857–67, 6th ed. 1887–88; Eng. tran. by A. W. Ward, 1868–73) now superseded (*see* GREECE: *History, Ancient,* § Bibliography). His other writings are chiefly archaeological. The most important are: *Die Akropolis von Athen* (1844); *Naxos* (1846); *Peloponnesos, eine historisch-geographische Beschreibung der Halbinsel* (1851); *Olympia* (1852); *Die Ionier vor der ionischen Wanderung* (1855); *Attische Studien* (1862–65); *Ephesos* (1874). His collected speeches and lectures were published under the title of *Altertum und Gegenwart* (5th ed. 1903 *et seq.*).

A full list of his writings will be found in L. Gurlitt, *Erinnerungen an Ernst Curtius* (1902); *see* also article by O. Kern in *Allgemeine deutsche Biographie,* xlvii. (1903), to which may be added F. Curtius, *Ernst Curtius, ein Lebensbild in Briefen* (1903); T. Hodgkin, *Ernst Curtius* (1905).

His brother, GEORG CURTIUS (1820–1885), philologist, was born at Lübeck on April 16, 1820. He held philological appointments at Prague, Kiel and Leipzig. He died at Hermsdorf on Aug. 12, 1885. His philological theories exercised a widespread influence. The more important of his publications are: *Die Sprachvergleichung in ihrem Verhältniss zur classischen Philologie* (1845; Eng. tran. by F. H. Trithen, 1851); *Sprachvergleichende Beiträge zur griechischen und lateinischen Grammatik* (1846); *Grundzüge der griechischen Etymologie* (1858–62, 5th ed. 1879); *Das Verbum der griechischen Sprache* (1873). The last two works have been translated into English by A. S. Wilkins and E. B. England. From 1878 till his death Curtius was general editor of the *Leipziger Studien zur classischen Philologie.* His *Griechische Schulgrammatik,* first published in 1852, has passed through more than 20 editions, and has been edited in English. In his last work, *Zur Kritik der neuesten Sprachforschung* (1885), he attacks the views of the "new" school of philology.

Opuscula of Georg Curtius was edited after his death by E. Windisch (*Kleine Schriften,* 1886–87). For further information consult articles by R. Meister in *Allgemeine deutsche Biographie,* xlvii. (1903), and by E. Windisch in C. Bursian's *Biographisches Jahrbuch für Alterthumskunde* (1886).

CURTIUS, ERNST ROBERT (1886–), German scholar, was born at Thann, Alsace, on April 14, 1886. From 1913–19 he taught at the University of Bonn, from 1920–24 at Marburg, was professor of French history and romance philology at Heidelberg from 1924 to 1929, when he returned to Bonn.

Among his works are: *Die literarischen Wegbereiter des neuen Frankreichs* (1919); *Maurice Barrès und die geistigen Grundlagen des französischen Nationalismus* (Bonn, 1921); *Balzac* (Bonn, 1923); *Französischer Geist im neuen Europa* (1925); *Die Literarästhetik des Mittelalters,* in *Zeitschrift f. rom. Philologie* (1938).

CURTIUS, MARCUS, a legendary hero of ancient Rome. It is said that in 362 B.C. a deep gulf opened in the forum, which the seers declared would never close until Rome's most valuable possession was thrown into it. Then Curtius, recognizing that nothing was more precious than a brave citizen, leaped, fully armed and on horseback, into the chasm, which immediately closed. The spot was afterwards covered by a marsh called the Lacus Curtius. Two other explanations of the name Lacus Curtius are given: (1) a Sabine general, Mettius Curtius, hard pressed by Romulus, leaped into a swamp which covered the valley afterwards occupied by the forum; (2) in 445 B.C. the spot was struck by lightning, and enclosed as sacred by the consul, Gaius Curtius.

BIBLIOGRAPHY.—*See* Livy i. 12, vii. 6; Dion Halic. ii. 42; Varro, *De lingua Latina,* v. 148; Ch. Hülsen, *The Roman Forum* (Eng. trans. of 2nd. ed., J. B. Carter, 1906); O. Gilbert, *Geschichte und Topographie der Stadt Rom im Altertum,* i. (1883), 334–38.

CURTIUS RUFUS, QUINTUS, biographer of Alexander the Great. Modern authorities regard him as a rhetorician who flourished during the reign of Claudius (A.D. 41–54). His work (*De rebus gestis Alexandri magni*) originally consisted of ten books, of which the first two are entirely lost, and the remaining eight are incomplete. The work is uncritical, and shows ignorance of geography, chronology and military matters.

There are numerous editions and an English translation by P. Pratt (1821).

CURUCANECAN, a tribe or small group of tribes of South American Indians, regarded on very insufficient evidence as constituting an independent linguistic stock. They have been extinct since the early part of the 19th century. The Curucanecas lived in the extreme north-east corner of the present province of Chiquitos in eastern Bolivia, in about 16° S. lat. They appear to have been similar to and may have been linguistically related to the Corabecas (*see* CORABECAN), Coravecas, Curuminacas and other nomad hunting tribes of this region.

See A. D'Orbigny, *L'Homme Americain* (Paris, 1839).

CURULE, the epithet applied in Rome to the chair of office, *sella curulis* (Lat. *currus,* "chariot"), used by the "curule" or higher magistrates, and by the emperors. This chair seems to have been originally placed in the magistrate's chariot. It was inlaid with ivory or made of it, had curved legs but no back, and could be folded up like a camp-stool. (*See* CONSUL, PRAETOR and AEDILES.)

CURVE. A curve is most easily thought of as the path of a point moving continuously as to both position and direction, except at special points where discontinuities of any kind may occur. Formerly the word *line* was used to include both curves and straight lines; in modern use it always means a straight line, and is a particular case of the more general term *curve.*

A curve may also be thought of as given in its entirety, a single infinity of points. This point of view is the one adopted by mathematicians in the study of continuous curves. (*See* TOPOLOGY.)

In either case, the idea becomes more definite when we regard all the points of the curve, whether given successively or simultaneously, as obeying some sort of *law.* If we adopt the device of co-ordinates (*see* ANALYTIC GEOMETRY), the law is expressed by one or more equations between the co-ordinates, involving certain functions of them which vanish. The curve is said to be *algebraic* or *transcendental* according to the nature of its equations in Cartesian co-ordinates. If it is algebraic, it has only a finite number of exceptional points, but a transcendental curve can have an infinite number (for an example, *see* article CURVES, SPECIAL) and if its equation involves one of the highly discontinuous functions known to modern analysis it may lose all or nearly all of the properties usually associated with the idea of curve.

If P is an ordinary point of a plane curve, and Q is a neighbouring point, then as Q moves up to P, the chord PQ tends to a definite limit called the *tangent* at P. The line through P perpendicular to the tangent is the *normal.* Three points P,Q,R of the curve determine a circle, whose limit as Q and R tend to P is the *circle of curvature* at P. The more sharply the curve bends, the smaller is this circle, and the reciprocal of its radius is the *curvature* at P, and is equal to the rate of rotation of the tangent (or normal) per unit length of arc described by P. The centre of curvature is also the limit of the intersection of adjacent normals.

In the immediate neighbourhood of P, to a first approximation the curve can be replaced by the tangent, and to a second approximation by the circle of curvature.

By the principle of duality (*q.v.*) a curve can also be regarded as the envelope of its tangents; we may think of the tangent as a line moving continuously in one plane according to some law; its intersection with a neighbouring tangent has a definite limit, which is the point of contact. Thus the tangent replaces the point as the element which generates the curve, and the point of contact replaces the tangent.

Curves in Space.—A *twisted curve* is one which does not lie wholly in one plane. If P,Q,R,S are four neighbouring points of the curve, the planes PQR, QRS are in general distinct. The limit of PQR as Q and R tend to P is the *osculating plane* at P. The normal is the perpendicular to the tangent in the osculating plane, and the common perpendicular to the tangent and normal is the *binormal.* The circle of curvature, limit of the circle PQR, lies in the osculating plane; but its centre is not the limit of intersection of adjacent normals, for these, lying in different osculating planes, do not meet in general. The four points P,Q,R,S determine a sphere through the circles PQR, QRS, the limit of whose centre is the *centre of spherical curvature* at P.

It is useful to think of the tangent, normal and binormal as a rigid frame of rectangular axes, with P as origin, moving forward and rotating as P describes the curve with unit velocity. At any moment, the angular velocity of the frame about the binormal is the curvature, and that about the tangent is the *torsion;* there is no instantaneous rotation about the normal.

The *degree* of an algebraic plane curve is that of its equation, and is the number of its intersections with a general line of the plane; and its *class* is the number of its tangents through a general point. The degree of an algebraic twisted curve is the number of its points that lie in a general plane; and its class is the number of its osculating planes through a given point, and it has another important characteristic, the *rank,* which is the number of its tangent lines that meet a general line.

In space, the figure dual to a curve locus is a singly infinite set of planes obeying some given law. These form a *developable* surface. Any plane of the set with any other one determines a line, and with any other two it determines a point. As the second and third planes tend to coincide with the first, this point has a definite limit, whose locus is a curve associated with the developable surface, called its *edge of regression.* The limit of the line is its tangent, and the original plane is its osculating plane. Conversely, the osculating planes of a given curve form the associated developable, of which the curve is the edge of regression.

For the equation of a transcendental curve, there is often a simple expression in polar or other co-ordinates (for example, *see* article CURVES, SPECIAL: *Euler's Spiral, Cardioid, Trisectrix of Maclaurin*). In other cases (see *Cycloid* in the same article), the simplest form gives each co-ordinate in terms of a common parameter. The parametric expression is often useful for algebraic curves also. For example, by a proper choice of a system of homogeneous co-ordinates (*see* CO-ORDINATES) any twisted cubic can be represented by $x:y:z:w = 1:t:t^2:t^3$.

Yet another form of expression is in terms of the length of any arc and the angle between the tangents at its extremities; this is called the *intrinsic equation,* since it depends on no frame of reference unconnected with the curve (see *Catenary,* in the article CURVES, SPECIAL).

Degenerations and Intersections.—The equation of a plane algebraic curve k of degree n in Cartesian or homogeneous co-ordinates contains $\frac{1}{2}(n+1)(n+2)$ coefficients, whose $\frac{1}{2}n(n+3)$ ratios are the independent parameters of the curve, regarded as a member of the whole plane family of curves of degree n. Any special type can be obtained by making restrictions on these parameters, *e.g.,* the conditions for the three types of conic. (*See* CONIC SECTION.)

For certain sets of values of the parameters, the left-hand side of the equation falls into factors, each of which by itself gives a separate curve. The product vanishes whenever any factor vanishes by itself, and the equation is satisfied by the co-ordinates of a point on any one of these curves, and so represents their aggregate. In many cases it is convenient still to regard this as a single curve, which is then said to be *degenerate.* Thus a pair of intersecting lines is a degenerate conic. A curve which does not break up is said to be *proper.*

In the plane, any aggregate of curves can be regarded as a degenerate curve, of degree equal to the sum of their separate degrees. In space this is not so unless the components satisfy certain conditions of incidence: a pair of skew lines is not a degenerate conic.

A conic and a line meeting it twice, and therefore lying in its plane, form a degenerate plane cubic; a conic and a line, not in its plane, but meeting it once, form a degenerate twisted cubic; a conic and a line not meeting it, but meeting its plane in a point not lying on the conic, cannot be regarded as a single degenerate curve.

The common points of two curves of degrees n_1, n_2 are those whose co-ordinates satisfy both equations, and their number is n_1n_2, equal to that of the solutions of the eliminant. This continues to hold if one or both of the curves break up. In any case, we must reckon imaginary and infinite solutions as corresponding to intersections of the same natures. The points at infinity of the plane must be considered to lie on a line with which the curve k has n intersections, real or imaginary.

A point of k at infinity lies on a branch stretching to infinity; the tangent at a point retreating along this branch may tend to a limiting position not wholly at infinity, its one point at infinity being that point through which the branch of k passes. Such a tangent is called an *asymptote* (*q.v.*), and k has in general n of them; their directions are given by the terms of highest degree in its Cartesian equation. But it may happen that the limit of the tangent is the line at infinity itself; then there is no corresponding linear asymptote.

Now an asymptote has only one point at infinity, the same towards whichever end of the line we retreat; thus a curve approaches its asymptote at both ends, and in general on opposite sides, as viewed from the finite part of the plane. This appears strange at first sight; but two parallel lines have a simple intersection at infinity, and the second lies on the same side of the first at both ends. A curve touches its asymptote at infinity, having two intersections with it there; so if it and a given parallel to the asymptote lie on the same side of the asymptote at one end, they must lie on opposite sides at the other.

Singularities.—The interest of any curve depends largely on its exceptional points, where the ordinary properties fail. A *singular point* of a curve k is one where there is not a unique, definite tangent. The simplest is an ordinary *double point* or *node* O, where two separate branches of k cross without touching. Here there is not one definite tangent, but two, one belonging to each branch. A moving point describing k comes to O twice, on different occasions and in different directions. A general line l, passing near O but not through it, meets k in two points near O, one on each branch, both of which tend to O when l moves so as to pass through O. If l is ultimately one of the tangents at O, three such intersections are absorbed, two on the branch touched, and one on the other.

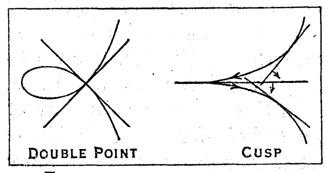

FIG. 1.—SINGULAR POINTS

In general, the *multiplicity* s of a singular point O is the number of intersections with a general line absorbed there. Through O there are always s lines, distinct or coincident, on which more than s intersections are absorbed, and which are the tangents at O. If the s tangents are distinct, the multiple point O is *ordinary.* If O is s_1-fold on one curve and s_2-fold on another, it absorbs just s_1s_2 of their points of intersection if they have no common tangent at O; if they touch, it may absorb any greater number.

If any of the s tangents coincide, O is an *extraordinary* singularity. The simplest is a *cusp* of first species, a variety of double point, which may be thought of as the limit of a loop drawn together to its node.

There is only one branch of k at O, and one distinct tangent meeting k in three coincident points at O. A point P describing k continuously comes to rest at O and reverses its direction of motion; for this reason a cusp is often called a *stationary point.* The tangent at P rotates in the same sense without reversal.

A cusp is something like the path of an engine running past catch-points to rest, and backing on to another pair of rails; that is, running down on one branch of a Y and backing up on the other.

A set of different but corresponding singularities presents itself when a curve is regarded as an envelope. A *singular tangent* is one which has not a unique, definite point of contact. The line singularity which answers to an ordinary double point is a *double tangent,* with two distinct, definite points of contact, each a simple point of the curve. That which answers to a cusp is an *inflexion,* when the two points of contact coincide, and the tangent meets the curve in three coincident points. A tangent describing the envelope comes to rest and reverses its direction of rotation, but a point describing the curve goes on without reversing, for the inflexion is a simple point of the curve.

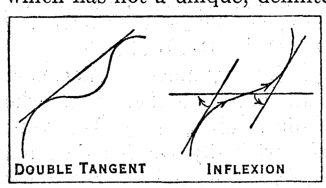

FIG. 2.—SINGULAR TANGENTS

Every singularity of a curve, which is of higher multiplicity or more complicated nature than the four elementary kinds described above, is, from a great many points of view, equivalent to a certain set of distinct double points, cusps, double tangents and inflexions, and can usually be regarded as the limit of this set when certain points and lines come to coincide. Thus a triple point can arise from three double points.

Transformations; Genus.—Two curves, whether plane or twisted, are said to be *in 1, 1 correspondence,* or *transformations* of each other, or *represented upon* each other, if each ordinary point of either corresponds to one and only one point of the other. If the co-ordinates of the first point are given, those of the second are one-valued and therefore rational functions of these, and the equations expressing this are rationally reversible, so that the co-ordinates of the first point are also expressible as rational functions of those of the second. Any curve can be thus transformed into a plane curve having no multiple points except ordinary double points, or into a twisted curve having no singular points at all.

A plane curve of given degree n cannot have more double points or cusps than $\frac{1}{2}(n-1)(n-2)$, or their equivalent, without breaking up. Thus the only nodal conic is a pair of lines. A proper cubic can have one node; if it had two, the line joining them would have four intersections with the cubic, which is impossible: the curve would break up into the line and a conic through the two points. The number

$$\rho=\tfrac{1}{2}(n-1)(n-2)-\delta-\kappa$$

by which the equivalent number $\delta+\kappa$ of double points and cusps falls short of this maximum is called its *deficiency* or more usually its *genus*. The fundamental property of the genus is that it is unaltered by any 1, 1 transformation of the curve.

If $\rho=0$, the curve is *rational* or *unicursal*, and can be transformed into a line. The co-ordinates of its general point can be expressed as rational functions of a single parameter, the coordinate of the corresponding point on the line.

A 1, 1 correspondence is set up between a twisted curve k and its projection k' from any vertex V upon any plane. The singularities of k' are the projections of those of k, and, in addition, a certain number of ordinary double points lying on rays through V which meet k in two distinct points. These are called *apparent double points* of k, and their number is one of its essential characteristics, for it reduces the genus, being an additional number of singularities of k', whose genus is the same as that of k.

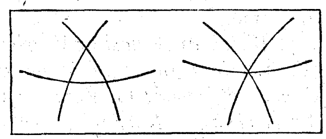

FIG. 3.—TRIPLE POINT AS LIMIT OF THREE DOUBLE POINTS

Plucker's Equations.—All plane curves other than lines and conics possess singularities of some sort. If they are free from multiple points, they are bound to have definite numbers of double tangents and inflexions, or their equivalent in higher singular tangents. If multiple points are present, the numbers of multiple tangents are reduced. Between the degree n, class n', and the equivalent numbers δ, κ, δ', κ' of double points, cusps, double tangents and inflexions there exists a remarkable set of relations known as *Plücker's equations*, by which any three of the six numbers can be calculated in terms of the other three:

$$n'=n(n-1)-2\delta-3\kappa$$
$$\kappa'-\kappa=3(n'-n)$$
$$2(\delta'-\delta)=(n'-n)(n'+n-9)$$

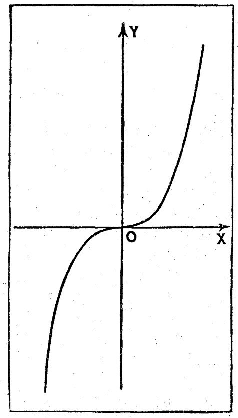
Thus the cubic with no node is of class 6 and has no double tangents and 9 inflexions; the nodal cubic is of class 4 with 3 inflexions; and the cuspidal cubic is of class 3 with one inflexion. The quartic with no singular points has 28 double tangents and 24 inflexions.

The points of contact of the n' tangents which can be drawn to k from any point P of the plane are the intersections, other than the multiple points of k, with a certain derived curve of degree $n-1$, called the *first polar* of P with regard to k. This passes through each double point of k, meeting it in two points there, and touches k at each cusp, meeting it in three points there. The first of Plücker's equations expresses that the total number of intersections of k with the first polar is $n(n-1)$.

BIBLIOGRAPHY.—The best-known English text-book is G. Salmon's *Treatise on the Higher Plane Curves* (translated into German and French). Full references are given in the *Encyklopädie der mathematischen Wissenschaften*, Band iii. (H. P. HU.)

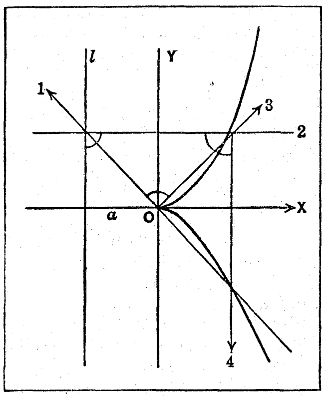
CURVES, SPECIAL. Partly due to the studies of the Greeks in pure geometry, but largely to the influence of analytic geometry (*q.v.*), there have been developed a large number of special curves which have received names which are more or less generally recognized. Such curves may be classified in various ways—curves in a plane or in a space of three dimensions; algebraic and non-algebraic; alphabetically; chronologically; etc. For reference purposes, however, it has seemed best to give an initial alphabetical list with references to the numbers of the sections, and then to arrange the sections roughly in the order: plane algebraic curves according to degree followed by plane transcendental curves, general classes of curves, and curves of double curvature, inserting figures to show the general shapes of the most important plane curves considered.

1. *Cubical Parabola* (F. *Parabole Cubique;* G. *Kubische Parabel*), $y=ax^3+bx^2+cx+d$, or $y=ax^2(x-e)$, one of the canonical forms of cubics studied by Newton and a particular case of the *Pearls of Sluze.* The name is usually applied to the special case $y=ax^3$ (*see* fig.) which was first discussed by Leibniz (1675) who sought that curve for which the subnormal is always inversely proportional to the ordinate. It was used ($a=1$) by Monge (1815) to solve every equation of the form $x^3-px-q=0$.



Cubical Parabola (Sec. 1)

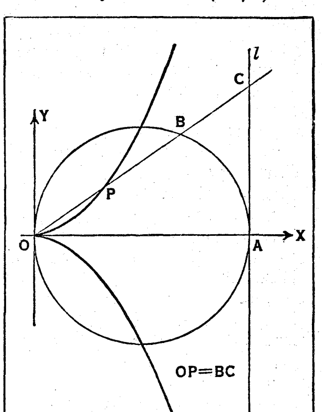
2. *Semi-cubical Parabola* or *Neil's Parabola* (F. *Parabole Sémi-cubique* or *Parabole de Neil;* G. *Semi-kubische Parabel*), $x^3=ay^2$, was the first algebraic curve rectified (Neil, 1659). It is the evolute of a parabola. Evolutes of parabolas and the lines of curvature of Enneper's minimal surface are the only cubics algebraically rectifiable (Raffy, *L'Interm. d. Math.*, 1894, p. 106). In 1687 Leibniz proposed the problem to find the plane curve down which a particle may descend under the action of gravity so as to describe equal vertical spaces in equal times, the initial velocity of the particle not being zero. Huygens found the curve at once to be a semi-cubical parabola, cuspidal tangent vertical, and thus it is called an *Isochrone* or *Isochronous Curve* (F. *Courbe* [or *Ligne*] *Isochrone;* G. *Isochrone* or *Gleichzeitenkurve*), that is a curve down which a particle may descend under the action of any assigned forces so as to describe equal vertical spaces in equal times. For construction of points of the curve *see* figure.



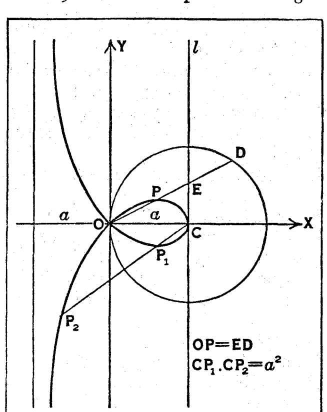
Semi-cubical Parabola (Sec. 2)

3. *Cissoid of Diocles* (F. *Cissoïde de Diocles;* G. *Kissoide des Diokles*), $y^2=x^3/(2a-x)$, or $r=2a\tan\theta\sin\theta$, a curve invented by Diocles (*c.* 100 B.C.) to solve the problem of the duplication of the cube. The area between the curve and its asymptote is three times that of the generating circle. Its polar reciprocal with respect to a circle with centre at its cusp is a *semi-cubical parabola.* $OP=BC$, $OA=2a$; *see* fig.

4. *Strophoid* (F. *Strophoïde;* G. *Strophoid*), if *oblique* (F. *oblique;* G. *skräge*), $r=a\sin(\alpha-2\theta)/\sin(\alpha-\theta)$, was first considered by Barrow (1670). When $\alpha=90°$ the strophoid is *right*



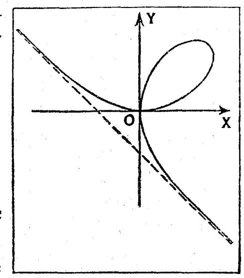
Cissoid of Diocles (Sec. 3)



Strophoid (Sec. 4)

(F. *droite;* G. *gerade*), $r=a\cos 2\theta/\cos\theta$ or $y^2=x^2(a-x)/(a+x)$ (*see* fig.). Let g be the generator of a circular cone and t a tangent perpendicular to this generator. Any plane, p, through t will intersect the cone in a conic. The locus of the foci of the conics as p rotates about t, is a strophoid (Casali, 1757); if a cylinder replaces the cone we get a *right strophoid.*

5. *Folium of Descartes* (F. *Folium de Descartes;* G. *Cartesisches Blatt* or *Descartessches Blatt*), $x^3+y^3=3axy$, a curve with asymptote $x+y+a=0$, first discussed by Descartes in 1638 (*see* fig.). The *Hessian Curve* of a folium of Descartes is another folium of Descartes.

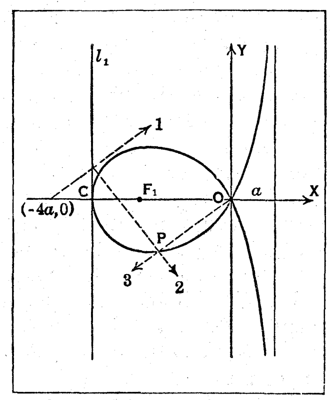


Folium of Descartes (5)

6. *Trisectrix of Maclaurin* (F. *Trisectrice de Maclaurin;* G. *Maclaurins Trisektrix*),

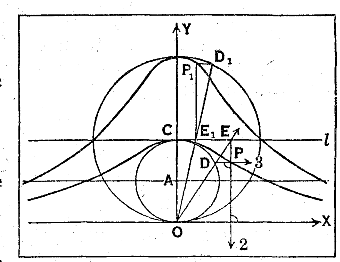
$$x(x^2+y^2)=a(y^2-3x^2), \text{ or}$$
$$y^2=x^2(3a+x)/(a-x),$$

or $r=a\sec\theta-4a\cos\theta=2a\sin 3\theta/\sin 2\theta$ (*see* fig.), first studied by Maclaurin (1742) who showed that it could be used to solve the problem of trisection of an angle. Referred to the focus $(-2a, 0)$ as origin the polar equation of the trisectrix may be written $r=a/\cos(\theta/3)$. Maclaurin noted that the curve goes over into a *folium of Descartes* by an affine transformation, showing that the general shape of the two curves is the same.



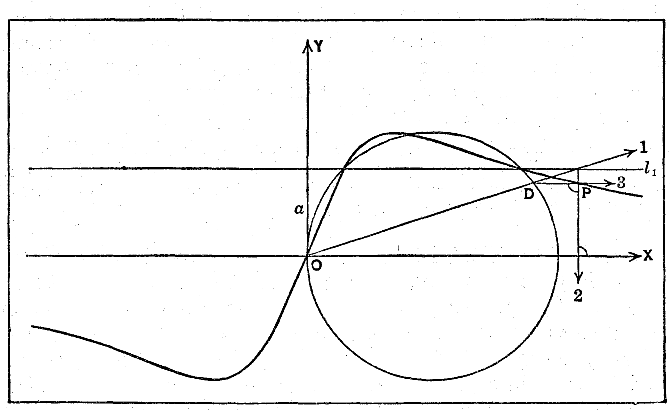
Trisectrix of Maclaurin (Sec. 6)

7. *Witch of Agnesi* or *Versiera* (F. *Versiera* or *Agnésienne* or *Courbe d'Agnesi;* G. *Versiera* or *Agnesische Kurve*), $yx^2=a^2(a-y)$, discussed, and named versiera, by Maria Agnesi (1748), but earlier treated by Fermat (before 1666), and Grandi (1703) who also named it versiera. The area between the curve and its asymptote $y=0$ is four times that of the generating circle. If each of the ordinates of the versiera be doubled, we get the *Pseudo Versiera* (locus of P_1), $yx^2=a^2(2a-y)$ first treated by J. Gregory (1658), and later discussed by Leibniz (1674) in deriving his formula $\pi/4=1-1/3+1/5+1/7+ \ldots$ (*See* the figure.)



Witch of Agnesi or Versiera (Sec. 7)

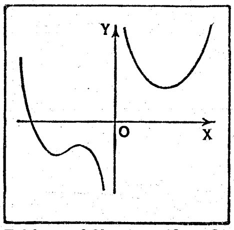
8. *Serpentine* (F. *Sérpentine* or *anguinée;* G. *Serpentine* or *Schlangenkurve*) $x^2y+aby-a^2x=0(ab>0)$ (*see* fig.), associated with the name of Newton (1701) who called it *anguinea.* L'Hospital and Huygens recognized (1692) that the serpentine could be used as an auxiliary for rectification of the *logarithmic curve.* Consider the intersection of a cylinder of revolution and a hyperbolic paraboloid with a common tangent plane intersecting the hyperbolic paraboloid in



Serpentine (Sec. 8)

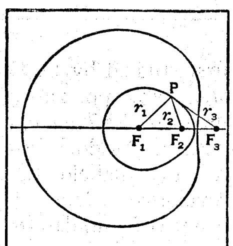
two lines (one of them a generator of the cylinder) making an angle of 45° with one another at the point where the intersection of the planes of symmetry of the surface meets it. The curve of section is a *horopter* (F. *Horoptère;* G. *Horopterkurve*) discovered in his studies in physiological optics by Helmholtz (1867, Eng. trans. vol. 3, 1925) and whose projection on the tangent plane is a *versiera,* and on a plane of symmetry through the axis perpendicular to this plane is a serpentine. The tangents to the horopter intersect the plane, through the point of contact of the tangent, perpendicular to the axis, in a *cardioid.*

9. *Trident of Newton* or *Parabola of Descartes* (F. *Trident de Newton* or *Parabole de Descartes;* G. *Newton's Tridens* or *Cartesische Parabel*). Trident is the name applied by Newton (1701) to the cubic curve $xy=cx^3+dx^2+ex+f$ one form of which is indicated in the figure. Newton observed that exactly this curve was used by Descartes (1637) to construct a curve of the sixth degree; hence the name *Parabola of Descartes.*



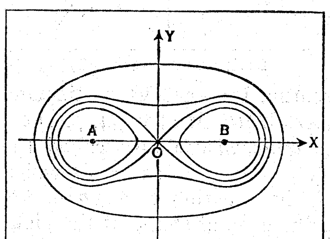
Trident of Newton (Sec. 9)

10. *Cartesian* or *Cartesian Ovals* (F. *Cartésienne* or *Ovales de Descartes;* G. *Cartesische Kurve* or *Cartesische Ovalen*) have been studied by many mathematicians such as Descartes (1637), Newton, Quetelet, Chasles, Cayley, Darboux (for bibliography see *Bull. Sc. Math.* (2) v. 6, 1882, pp. 40–49 and *L'Interm. d. Math.,* v. 3, 1896, p. 239). The Cartesian is the locus, two ovals, of points, *P,* whose distances from two fixed points (foci, distance *c* between them) satisfy a linear non-homogeneous relation $r_1+mr_2^2=a$, or a linear homogeneous relation $r_1 \pm m_2r_2 \pm m_3r_3=0$, where r_3 is the distance of *P* to a third focus collinear with the other two (Chasles, 1837). Hence the equation in rectangular co-ordinates may be written: $[(x^2+y^2)\cdot(1-m^2)+2m^2cx+a^2-m^2x^2]=4a^2(x^2+y^2)$. When $m=\pm 1$ the locus becomes an ellipse or hyperbola as it should; when $m=a/c$ we get the *Limaçon of Pascal* for which two foci coalesce at the node. For different forms of cartesians *see* Cayley, *Coll. Math. Papers,* v. 2, pp. 369, 374.



Cartesian Ovals (Sec. 10)

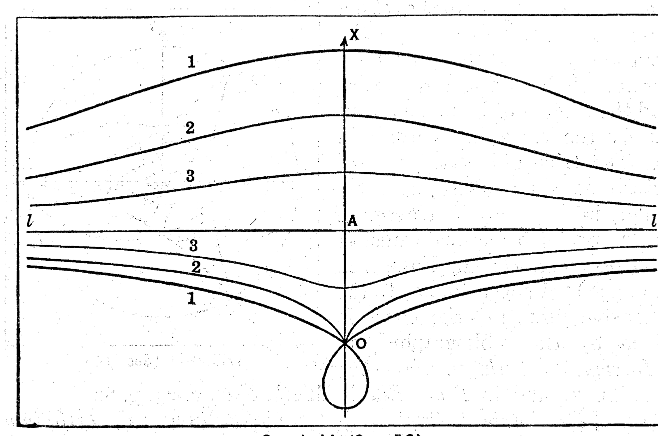
11. *Cassinian* or *Cassinian Ovals* or *Cassinian Ellipse* (F. *Cassinienne* or *Cassinoide* or *Ellipse de Cassini;* G. *Cassinische Kurve*), first conceived by Giovanni Domenico Cassini (1680) in connection with a study of the relative motions of the earth and sun, is the locus of a point moving such that the product of its distances from two fixed points *A* and *B* (*see* fig.) is a constant, c^2. Hence the equation $(x^2+y^2)^2-2a^2(x^2-y^2)+a^4-c^4=0$. When $c>a$ the curve consists of two loops; when $c=a$ the cassinian becomes the *lemniscate of Bernoulli;* these, as well as two cases of $c<a$ are illustrated in the figure. The section of an anchor ring by a plane parallel to the axis (*spiric lines of Perseus,* no. 58) and at a distance from it equal to the radius of the generating circle is a cassinian, the form of which varies with the ratio of the distance of the centre of the generating circle from the axis to the radius of the generating circle (Comte, 1843, in part). When this ratio is 2 the section is the *lemniscate of Bernoulli.*



Cassinian Ovals (Sec. 11)

12. *Lemniscate of Bernoulli* (F. *Lemniscate de B.;* G. *Bernoulli'sche Lemniskate*) sometimes called, because of its connections with the hyperbola a *hyperbolic lemniscate,* has for equation $(x^2+y^2)^2=a^2(x^2-y^2)$ or, in polar form, $r^2=a^2\cos 2\theta$. The curve was first imagined by Jacques Bernoulli (1694). It may be found (on eliminating *z*) as an orthogonal projection of the curve of section of the paraboloid $2(x^2+y^2)=a^2-2\sqrt{2az}$, and the cylinder $8(y^2+z^2)=a^2$.

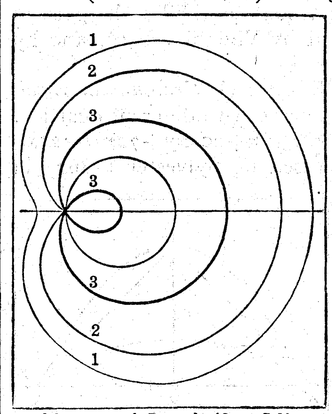
13. *Conchoid* [from the Greek meaning shell form] (F. *Conchoïde;* G. *Konchoide* or *Muschellinie*) was a curve invented by a Greek mathematician, Nicomedes (*fl.* about 225 B.C.), who devised for it a mechanical construction and applied it to find two mean proportionals between two line segments, and hence to solve the famous problem of the duplication of a cube. The curve may also be used to solve the problem of the Trisection of an Angle, since both problems can be reduced to a νεῦσις (Heath, *Hist. Gr. Math.,* v. 1, p. 235). Pappus (*c.* 300) called the conchoid of Nicomedes the *Cochloid,* its original name, but Proclus (*c.* 460) employs the term conchoid. It is generated as follows: Let *O* be a fixed



Conchoid (Sec. 13)

point (*see* fig.), called the pole, on the line *OX* perpendicular at *A* to the fixed straight line, or base, *l.* Let any line through the pole meet *l* in *B,* on this line mark off $BP=BP'=a$, a constant. The locus of *P* and *P'* is the conchoid. Its equation may be written (if $OA=b$): $r=a+b\sec\theta$; the corresponding rectangular equation is $(x-b)^2(x^2+y^2)-a^2x^2=0$. The three types of the curve illustrated in the figure seem to have been recognized by Nicomedes. This curve is sometimes called the *conchoid of a line.*

14. *Limaçon of Pascal* (F. *Limaçon de Pascal;* G. *Pascal'sche Schneckenlinie* or *Kreiskonchoide*) named by Roberval, Étienne Pascal (father of Blaise) having discovered it. The reason for the other part of the name is that one half the curve with a loop (the form first discussed) has a fancied resemblance to a snail. The curve was discussed by Roberval as early as 1650 when it was considered as a *conchoid of a circle;* if a rod (length $2b$) is constrained so to move that its middle point described the circle (diameter $2a$) while it is always directed to a fixed point on the circle the ends of the rod will trace out a limaçon whose equation may be written: $(x^2+y^2-2ax)^2=b^2(x^2+y^2)$, or $r=b+2a\cos\theta$. Three forms of the curve are shown in the figure: (1) $b>2a$, (2) $b=2a$; a *cardioid;* (3) $b=a$, which Roberval showed might be used for trisecting an angle.

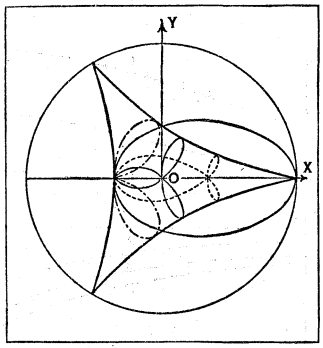


Limaçon of Pascal (Sec. 14)

15. *Cardioid* (F. *Cardioïde;* G. *Kardioide* or *Herzlinie*) is an *epicycloid* traced by a point on a circle rolling on an equal fixed circle (*see* fig. Sec. 14), or by a point on the circumference of a circle double the size of the fixed circle and rolling on it with internal contact (*see* fig. Sec. 25). It was first conceived, in part, as a *conchoid of a circle,* with respect to a point on its circumference as pole, by a Dutch mathematician J. Koërsma (*Bibl. Univ. et Hist.,* v. 12, 1689); and completely by Ozanam (1691) as an epicycloid. Its present English name originated with Castillon (1741). Its cartesian, polar, and Cesàro intrinsic equations are: $(x^2+y^2-2ax)^2=4a^2(x^2+y^2)$; $r=2a(1+\cos\theta)$; $s^2+9R^2=(8a)^2$. Referred to the centre of the fixed circle as origin, the parametric equations of the curve may be written: $x=a(2\cos\theta-\cos 2\theta)$, $y=a(2\sin\theta-\sin 2\theta)$; and since it has three cusps (two imaginary) its trilinear equation may be written $X^{-\frac{1}{2}}+Y^{-\frac{1}{2}}+Z^{-\frac{1}{2}}=0$, which is the same for all tricuspidal quartics, for example, the *tricuspid,*

into which the cardioid may be projected by a real bilinear transformation (*Annals of Math.*, s.2, v. 4, p. 97).

16. *Tricuspid* (F. *Tricuspide* or *Hypocycloïde à Trois Rebroussements* or *Hypocycloïde de Steiner;* G. *Hypozykloide mit* 3 *Rückkehrpunkten* or *Steiner'sche Kurve*), generated by a point on the circumference of a circle rolling inside a fixed circle three times as large, has equations: $x=a(2\cos\theta+\cos 2\theta)$, $y=a(2\sin\theta-\sin 2\theta)$; or $(x^2+y^2-12ax+9a^2)^2+4a(2x-3a)^2=0$; and $9s^2+R^2=64a^2$ where a is the radius of the rolling circle. (*See* fig.) The area of the tricuspid is twice that of its inscribed circle; its length is $16a$; and the lengths of its tangents cut off by the curve are constantly $4a$. The tricuspid was first conceived, as a unicursal quartic by Euler, in 1745, in the treatment of a problem in catacaustics (*Correspondance*, ed. Fuss, vol. 1, p. 352). A suggestion as to the extensive literature the curve is given by the bibliographies in *L'Interm. d. Math.*, v. 3, p. 166; v. 4, p. 7; and in *Proc. Edinb. Math. Soc.*, v. 23, p. 80.

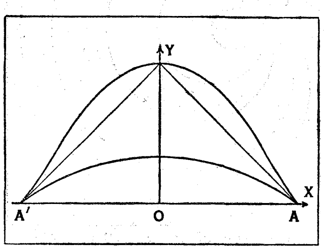


Tricuspid (Sec. 16)

17. [1] *Simple Folium,* [2] *Double Folium,* [3] *Trifolium* (F. [1] *Folium simple* or *Courbe ovoïde,* [2] *Folium Double,* [3] *Trifolium;* G, [1] *Einfaches Folium* or *Einblatt,* [2] *Doppelte Blatt Kurve* or *Zweiblatt,* [3] *Dreiblatt*). The *pedal* of the *tricuspid* (*see* fig. sec. 16) with respect to a point $(b, 0)$ on the X-axis has for its equation, if the origin is at the vertex,

$[(x-b)^2+y^2]\,[y^2+x(x-b)]=4a(x-b)y^2$, which on transferring to the origin to $(b,0)$, becomes: $(x^2+y^2)\,[y^2+x(x+b)]=4axy^2$; or in polar coordinates, $r=-b\cos\theta+4a\cos\theta\sin^2\theta$. When $b=4a$ we have the *simple folium* $r=-4a\cos^3\theta$; when $b=0$, the *double folium,* $r=4a\cos\theta\sin^2\theta$; when $b=a$, the *trifolium,* $r=a\cos\theta(4\sin^2\theta-1)$, or $r=-a\cos 3\theta$ if the origin is transferred to O. When $b=2a$ we have the *trifolium* $r=-2a\cos\theta\cos 2\theta$. The *simple folium* was used by Kepler (1609) to exhibit the path of the planet Mars and was discussed by Viviani (1647), and by Maclaurin (1720).

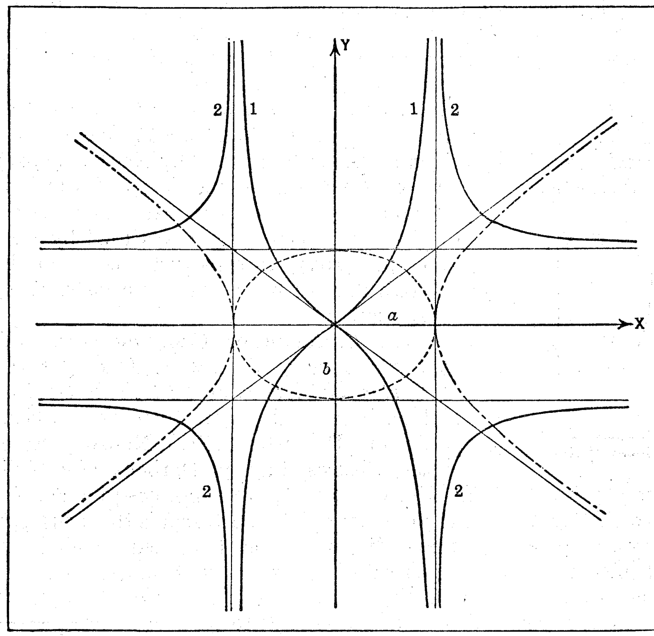
18. *Bicorn* or *Cocked Hat* (F. *Bicorne;* G. *Kremhut* or *Zweihornkurve*). This term has been applied to two different quartics: (1) To $2y^4-9y^3-17y^2+125y-xy^3-29xy^2+205xy+72x^2y-27x^3-25x^2=0$ named bicorn, and discussed by Sylvester (1864) in his treatment of Newton's rule for the discovery of imaginary roots. Cayley discussed it also at length in his eighth memoir on quantics (1867). The curve has an ordinary cusp $(-76\tfrac{23}{27}, -41\tfrac{2}{3})$, and a node-cusp $(-1, 1)$. (2) To $(x^2+2ay-a^2)^2=y^2(a^2-x^2)$ or $y=(a^2-x^2)/[2a\pm(a^2-x^2)^{\frac{1}{2}}]$, referred to as a *cocked hat* in *Educational Times,* Feb. 1896. This is a curve of the sixth class with three distinct nodes, two of them cusps $(\pm a, 0)$, and hence deducible by a cremona transformation from a conic. The curve (*see* fig.) is symmetrical to the Y-axis, and meets it at $(0, a/3)$, $(0, a)$. For a neat construction of points on the curve see *L'Interm. d. Math.*, v. 3.



Bicorn or Cocked Hat (Sec. 18)

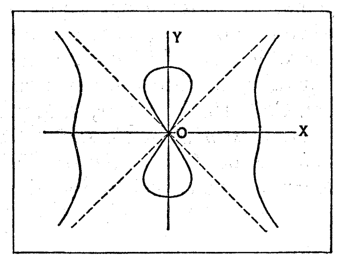
19. *Bullet-Nose Curve* (F. *Puntiforme;* G. *Kohlenspitzenkurve*) a unicursal quartic curve with three points of inflexion, discussed by P. H. Schoute (1885). Through the points of intersection of a tangent to a hyperbola $(x^2/a^2-y^2/b^2=1)$ with the axes, parallels to the axes are drawn. The locus of their point of intersection, P, is the curve $a^2/x^2-b^2/y^2=1$ which, for want of an English name, has been called *bullet-nose curve.* The six points of contact of tangents drawn to the *bullet-nose curve* from any point not on the curve is a conic, a result true also for the unicursal *Cross Curve* (F. *Cruciforme;* G. *Kreuzkurve*), $a^2/x^2+b^2/y^2=1$, derived from the ellipse $x^2/a^2+y^2/b^2=1$ in exactly the same way as the bullet-nose curve was derived from the hyperbola. It has an isolated point at the origin, and it is the polar reciprocal of the *evolute* of the ellipse with respect to the circle $x^2+y^2=a^2-b^2$.

20. *Devil's Curve* (F. *Courbe du diable;* G. *Teufelkurve*) is one name which has been applied to the curve $y^4+my^2-x^4+nx^2=0$,



Bullet-Nose Curve (Sec. 19)

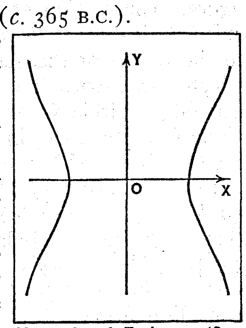
first studied by G. Cramer (*Introd. a l'analyse d. lignes courbes alg.*, 1750, pp. 19–25), for the case $m=-96$, $n=100$. Another name is *devil on two sticks* (*Amer. Math. Mo.*, v. 1, p. 275); both names doubtless originated from the fact that a section of the toy diabolo (a surface of revolution, long popular in France) is similar to the central portion of the curve (*Amer. Math. Mo.*, v. 34, p. 365). The form of the equation usually discussed is that in which $m=-96a$, $n=100a^2$. With special reference to the case $m=-1$, $n=2$ (*see* fig.) it has been shown that the curve is an excellent example for use in presenting the theory of Riemann surfaces and Abelian integrals (*Amer. Math. Mo.*, v. 34, p. 199).



Devil's Curve (Sec. 20)

21. *Eight Curve* (F. *Huit;* G. *Achterkurve*) also called the *Lemniscate of Gerono,* $x^4=a^2(x^2-y^2)$, or $r^2=a^2\cos 2\theta\cos^4\theta$ which may be compared with $r^2=a^2\cos 2\theta$, the equation of a *lemniscate of Bernoulli,* in order to determine the general shape of the eight curve. It is a particular case of *Virtual Parabolas* studied by *Grégoire St. Vincent* (1647) and of the *Besace* (wallet) of Cramer (1750). It may also be found as a projection of *Viviani's windows* (1692) or of the *horse fetter* of Eudoxus (*c.* 365 B.C.).

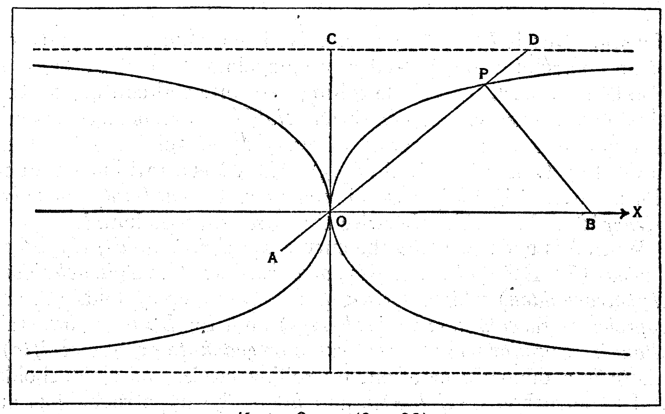
22. *Kampyle of Eudoxus* (F. *Kampyle d'Eudoxe;* G. *Kampyla* [*Kurve*] *des Eudoxus*), $a^2x^4=b^4(x^2+y^2)$ or $ar\cos^2\theta=b^2$ (*see* fig.). This equation together with that of the circle $r=a\cos\theta$ enables one to find two mean proportionals between a and b and hence to solve the problem of the duplication of the cube. The most remarkable of all ancient solutions of this problem was that of Archytas of Taras (*c.* 380 B.C.) who found these mean proportionals from the intersection of three surfaces of revolution: the anchor ring $x^2+y^2+z^2=a(x^2+y^2)^{\frac{1}{2}}$, the cylinder $x^2+y^2=ax$, and the cone $x^2+y^2+z^2=a^2x^2/b^2$ $(a>b)$. The first and last of these surfaces intersect in a curve called the *Curve of Archytas* whose projection on the XY-plane is the one whose equation has been given above. It is by no means certain



Kampyle of Eudoxus (Sec. 22)

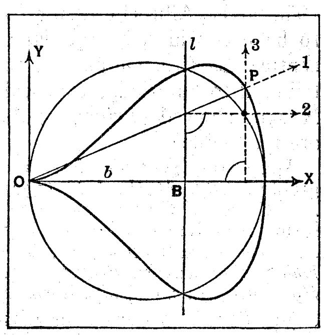
that Eudoxus (a pupil of Archytas) used the curve here associated with his name; we know that he solved the problem by means of lines of a "curved or bent form"; kampyle is an adaptation of the Greek word for "curved" (*cf.* Heath. *Hist. Greek Math.*, v. 1, pp. 249–251).

23. *Kappa Curve* (F. *Cappa;* G. *Kappa Kurve*) also known as *Gutschoven's curve* was conceived by G. van Gütschoven, a pupil



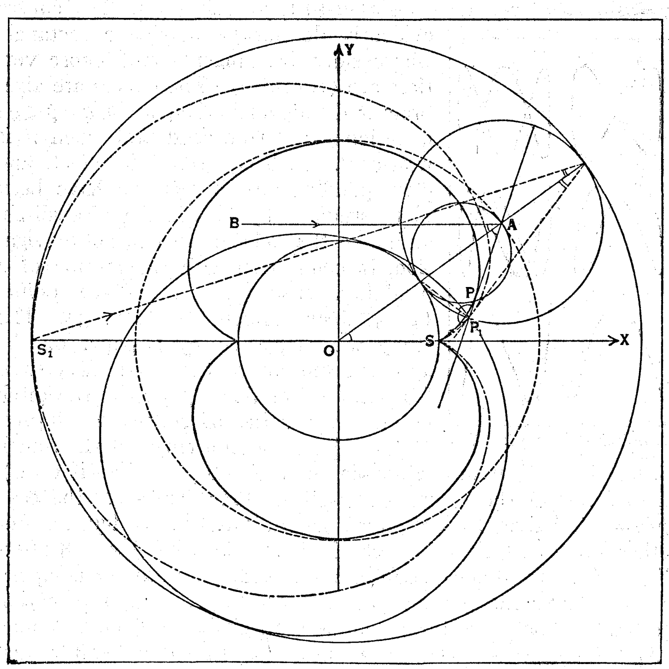
Kappa Curve (Sec. 23)

of Descartes, at least as early as 1662. To take a line l meeting the Y-axis in C, and parallel to the X-axis (*see* fig.) and at a distance a from it. From the origin O, draw any line to meet l in D. On OD mark off $OP=CD$. The locus of P is the Kappa curve (Barrow, 1670). Let the perpendicular to OP at P meet OX in B, then PB is always equal to a. Hence the curve may also be thought of as a *glissette*, the locus of the vertex of a right angle OPB, B sliding on OX, $PB=a$, and PA always passing through O (Gutschoven and Newton). Hence the equations of the curve may be written: $r=a\cot\theta$; or $y^2(x^2+y^2)=a^2x^2$. Other constructions include one by Jean Bernoulli.



Pear-shaped quartic (Sec. 24)

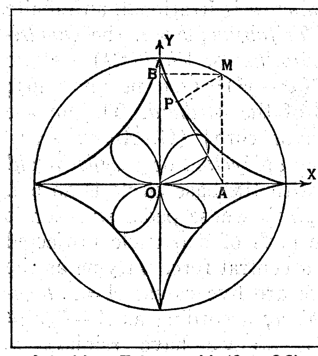
24. *Pear-shaped quartic* (F. *Quartique piriforme* or *Piriforme* or *Toupie;* G. *Birnförmige Kurve 4. O.*), $b^2y^2=x^3(a-x)$, was studied by De Longchamps (1886). Since it is a projection (stretch) of the special case, $a=b=1$, of Bonnet (1844), whose area is equal to one-half that of the generating circle, diameter equal to a, its area is readily found to be $\pi a^3/8b$ where $OB=b$ (*see* fig.).



Nephroid (kidney-shaped) (Sec. 25)

25. *Nephroid* (*kidney-shaped*) F. *Néphroïde* or *Épicycloïde de Huygens;* G. *Nierenkurve* or *Nephroide*), an epicycloid traced by a point on the circumference of a circle rolling on a fixed circle of double its radius, has equations: $x=a(3\cos\alpha-\cos 3\alpha)$, $y=a(3\sin\alpha-\sin 3\alpha)$, or $(x^2+y^2-4a^2)^3=108a^4y^2$, or: $(r/2a)^{\frac{2}{3}}=(\sin\frac{1}{2}\theta)^{\frac{2}{3}}+(\cos\frac{1}{2}\theta)^{\frac{2}{3}}$. The curve was studied and imagined in its completeness, as a catacaustic of a circle for parallel rays, by Huygens and Tschirnhausen (1678–90). Jacques Bernoulli showed (1692) that the nephroid is a cardioid *catacaustic* for a luminous cusp (*see* fig.); indeed this nephroid is generated as an envelope of a diameter of the circle generating the *cardioid* (*see* fig.). The name nephroid has been also applied (*Proc. Lond. Math. Soc.*, v. 10, p. 228) to the curve $r=a(1+2\sin\frac{1}{2}\theta)$, which was used to describe a regular heptagon.

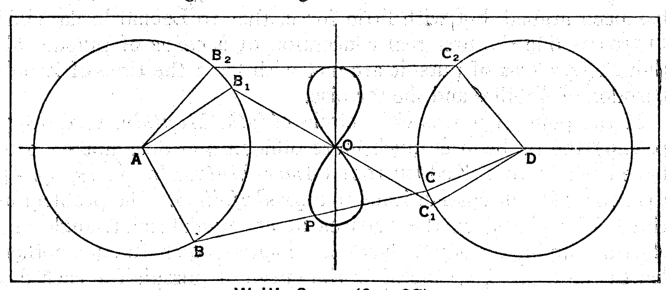
26. *Astroid* or *Tetracuspid* (F. *Astroïde;* G. *Astroide* or *Vierspitzige Hypokykloide*), the curve generated by a point on the circumference of a circle rolling inside a fixed circle four times as large, is of the sixth degree and fourth class, and with four cusps. Its equation may be written $(x^2+y^2-a^2)^3+27a^2x^2y^2=0$ or $x^{\frac{2}{3}}+y^{\frac{2}{3}}=a^{\frac{2}{3}}$ (Hermann, 1715), and $4(R^2+4s^2)=9a^2$. The curve was first discussed, by Jean Bernoulli (1691–92, *Opera Omnia*, v. 3, p. 449), who found its equation and its length between two cusps ($3a/2$), by considering the curve as the envelope of a line segment ($AB=a$) sliding with its ends (*see* fig.) on the co-ordinate axes. Let parallels to the axes, through A and B, meet in M; the perpendicular from M on AB meets it in P, on the astroid.



Astroid or Tetracuspid (Sec. 26)

27. *Cayley's Sextic* (F. *Sextique de Cayley;* G. *Cayley's Sextik*), $4(x^2+y^2-ax)^3=27a^2(x^2+y^2)^2$ or $r=4a\cos^3(\theta/3)$, first found by Maclaurin (1718), and indeed as a cardioid pedal, was so named because a detailed study of the curve was first given by Cayley.

28. *Watt's Curve* (F. *Courbe de Watt;* G. *Watt'sche Kurve*) is the sextic curve generated by a point P of the side BC of a three-bar linkage AB, BC, CD, the points A and B remaining fixed while the others vary (*see* fig.). If O is the middle point of AD, and $AO=a$, $AB=CD=b$, $BP=PC=c$, the polar equation of the locus of P is $r^2=b^2-[a\sin\theta\pm(c^2-a^2\cos^2\theta)^{\frac{1}{2}}]^2$, θ varying from 0 to π. If the end of a piston rod is fastened at P to the bar BC it will move up and down approximately in a straight line ("parallel motion") while B and C describe circles. In 1784 this device was patented by James Watt, the inventor of the modern condensing steam-engine. Watt's curve becomes a *lemniscate of Bernoulli* when $c=a$, and $b=\sqrt{2^a}$, For references to the extensive literature of Watt's curve see *L'Interm. d. Math.*, v. 4, p. 184 *seq.*, and *Bull. d. Sc. Math.*, 1883, p. 145 *seq.*



Watt's Curve (Sec. 28)

29. *Pearls of Sluze* (F. *Perles de Sluze;* G. *Perlkurven*). Pearls is the name (due to Pascal) of the curves studied by Sluze (1657–58) and defined by the equation $y^n=k(a-x)^px^m$, where m, n, and p are positive integers. The *cubical parabola* and the *pear-shaped quartic* are special cases considered by Sluze and Huygens

in the course of considerable correspondence connected with pearls of Sluze.

30. *Lamé Curves* (F. *Courbes de Lamé* or *Storoïdes;* G. *Lamé'sche Kurven*) is the name applied to the family $(x/a)^n+(y/b)^n=1$, discussed by G. Lamé (1818), which are algebraic when n is rational, and transcendental otherwise. Particular cases are: parabola ($n=\frac{1}{2}$), *cross curve* ($n=-2$), *evolute* of a central conic ($n=\frac{2}{3}$), and *astroid* ($n=\frac{2}{3}$, $a=b$). Lamé curves with the same exponent, n, and tangent to one another at the same point P, have the same radius of curvature at P (Fouret, 1890). A number of other general results have been found, and many varieties of the curves considered.

31. *Rhodoneae* (F. *Rhodonacées* or *rhodonées* or *rosaces;* G. *Rosenkurven*), curves $r=a\cos k\,\theta$ or $r=a\sin k\theta$, so named by Guido Grandi (1723, 1728) because of their fancied resemblance to roses. They are epitrochoids generated by a circle of radius $(k-1)a/2(k+1)$ rolling on a circle of radius $ka/(k+1)$, the generating point of the rolling circle being distant a from its centre. When k is an integer there are k or $2k$ petals of the rose-curves according as k is odd or even. When k is rational there are a finite number of petals, and when k is irrational, an infinite number. When $k=3$ we have the *Trifolium;* $k=2$, the *Quadrifolium* (F. *Quadrifolium;* G. *Quadrifolium* or *Vierblatt*) a sextic curve $r=a\cos 2\theta$, or $(x^2+y^2)^3=a^2(x^2-y^2)^2$ (*see* fig. no. 26); $k=\frac{1}{3}$, the first positive focal *pedal* of the *cardioid.* The inverse of a Rhodonea is an *Épi* [ear, as of corn] (G. *Ährenkurve*) $r\cos k\theta=a$. The polar reciprocal of an *epicycloid* or a *hypocycloid* with respect to a circle concentric with the base circle is an épi. This curve is also one of *Cotes's Spirals* whose pedal equation is $1/p^2=A+B/r^2$, which occur as the path of a particle projected in any manner under the action of a central force varying as the inverse cube of the distance. There are five cases: $A=0$, *logarithmic spiral;* $B=1$, *hyperbolic spiral;* according as $A+B/r^2=n^2(1/a^2)\pm(1/r^2)$, $n^2(1/r^2)-(1/a^2)$, do we have $r\sinh n\,\theta=a$, $r\cosh n\,\theta=a$. These five cases are discussed by Cotes in his *Harmonia Mensurarum,* 1722, pp. 30–35. But $r\cosh n\,\theta=a$ defines what is usually known as *Poinsot's Spiral* (F. *Spirale de Poinsot;* G. *Poinsot'sche Spirale*) which is mentioned by this eminent geometer as a *herpolhode* in his celebrated "new theory," 1834–51, of the rotation of bodies.

32. *Curve of Pursuit* (F. *Courbe* [or *Ligne*] *de Poursuite* or *Courbe du Chien;* G. *Verfolgungskurve* or *Hundekurve*). If a point A describes a known curve, the curve described by a point P, the motion of which is always directed towards A, A and P moving with uniform velocities, is a curve of pursuit. If A moves along a straight line, which may be taken, as the Y-axis, the equation of the locus of P is found to be of the form $y=\frac{1}{2}[cx^{m+1}/(m+1)+1/(m-1)(cx^{m-1})]$ if $m>1$ or $m<1$; and $y=\frac{1}{2}[(cx^2/2)-\frac{1}{2}\log x]$, if $m=1$. Various forms of these curves are given in Teixeira's work mentioned below, and in J. Luterbacher, *Diss.* Bern, 1900. The problem of the curve of pursuit first formulated and solved by Bouguer in 1732, was as here. It has been argued, but with little force, that to Leonardo da Vinci (1510) is due the first real conception of a *curve* of pursuit, although *problems* of pursuit are met with **from the time** of Zeno's parodox of Achilles and the tortoise.

If the point A moves on a circle (*Math. Monthly,* v. 1, 1859, p. 249) the problem is much more difficult and does not seem to have been finally solved till 1921 (*Amer. Math. Mo.,* v. 28, pp. 54, 91, 278). The discussion leads to a *quadrifolium.* The problem of three dogs placed at the vertices of an equilateral triangle and starting simultaneously with equal velocities, to chase one another, led to the *logarithmic spiral* as the curve of pursuit for each dog (*Nouv. Corresp. Math.* v. 3, 1877, pp. 175, 280). This problem is generalized in *Johns Hopkins Univ. Circ.,* 1908, p. 135.

33. *Epicycloid, Hypocycloid* (F. *Épicycloïde, Hypocycloïde;* G. *Epizykloide, Hypozykloide*). The epicycloid (hypocycloid) is the curve traced out by a point on the circumference of a circle which rolls without slipping on the exterior (interior) of a fixed circle. If a is the radius of the fixed circle, b the radius of the rolling circle, and h the distance from its centre of the tracing point, the equations of the epicycloid may be written (if h is set equal to b):

$$x=(a+b)\cos\phi-h\cos[(a+b)\phi/b],\quad y=(a+b)\sin\phi-h\sin[(a+b)\phi/b] \qquad (1);$$

and of the hypocycloid:

$$x=(a-b)\cos\phi+h\cos[(a-b)\phi/b],\quad y=(a-b)\sin\phi-h\sin[(a-b)\phi/b],$$

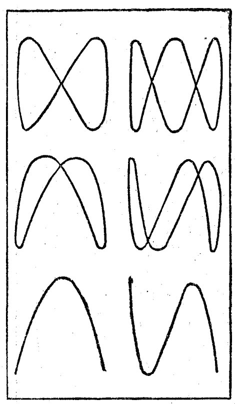
if $b<a$. But if $b>a$, they correspond once more to equations of an epicycloid; and indeed any epicycloid defined by (1) can also be generated by a circle rolling with internal contact on the outside of a fixed circle, *e.g.,* the *cardioid* (*see* fig., no. 25). There is a similar double generation of every hypocycloid, a fact first noticed by Daniel Bernoulli (1725). If $a:b$ is a rational number the curves are algebraic and unicursal, *e.g.,* the *cardioid, nephroid, tricuspid* and *astroid;* otherwise they are transcendental.

When h is not equal to b the curves are *Epitrochoids, Hypotrochoids* (F. *Épitrochoïdes, Hypotrochoïdes;* G. *Epitrochoiden, Hypotrochoiden*) which, for $h<b$, are *curtate* epicycloids (F. *accourcies* or *raccourcies;* G. *verkürzte*) and, for $h>b$, *prolate* (F. *allongées* or *rallongées;* G. *gestreckte* or *gedehnte* or *geschweifte*). There is a double generation, by rolling circles, of epitrochoids and hypotrochoids. If $b=\frac{1}{2}a$, and $h\neq b$, the hypotrochoid is an ellipse (W. Wallace, 1839); when $h=b$, the point traces out the diameter of the fixed circle (Nasîr Eddin, about 1250), a result of importance in connection with certain machines. The *limaçon of Pascal* is an example of both a curtate and prolate epitrochoid. When in (1) $h=a+b$ we get the equation of a *rhodonea,* which is always an epitrochoid or hypotrochoid (Suardi, 1752; Ridolfi, 1844).

The artist Albrecht Dürer seems to have been the first (1525) to have considered a special case of an epicycloid. In the 17th century LaHire, Desargues, Leibniz, Réaumur and Newton contributed to knowledge concerning the curves; among other things Newton showed (*Principia*) that all epicycloids and hypocycloids are rectifiable.

Apart from general references given below *see* E. Wölffing's bibliography, *Bibl. Math.* (2), (1901) and R. A. Proctor, *Cycloid and . . . Cycloidal Curves* (London, 1878); and for many other beautiful forms of cyclic curves *see* C. Taylor, *Curves Formed by the Action of . . . Geometric Chucks,* 2 vols. (London, 1874, 1875); T. S. Bazley, *Epicycloidal Cutting Frame* (London, 1872); and R. E. Moritz, *Cyclic-Harmonic Curves* (*Univ. Wash. Publs. in Math.,* 1923).

34. *Bowditch Curves* or *Lissajous Curves* (F. *Courbes* [or *Figures*] *de Lissajous;* G. *Lissajous-Kurven* or *Lissajoussche Kurven*). These are curves defined by the equations $x=a\sin(m_1u+n_1)$, $y=b\sin(m_2u+n_2)$, or $x=a\sin(nt+c)$, $y=b\sin t$ (1). The curves evidently do not lie outside a rectangle whose sides are tangents and whose vertices are ($\pm a$, $\pm b$). The curves are algebraic and unicursal when $n=p/q$ ($p<q$) is rational and transcendental when n is irrational. Such equations, in effect, and corresponding curves seem to have been first studied by Nathaniel Bowditch, author of the well-known book on navigation, in connection with the motion of a pendulum suspended from two points (1815, *Mem. Amer. Acad.,* v. 3). The study was suggested by a paper on the apparent motion of the earth as viewed from the moon. When $p=q$ the Bowditch curves are a series of concentric ellipses. If $p/q=\frac{1}{2}$ we obtain a curve of the fourth order (if $c\neq 0$) with one double point, and a parabola (if $c=0$). Two forms of these curves as well as three forms for the case $p/q=\frac{1}{3}$ (all given by Bowditch) are indicated in the figures. For other forms *see* Geiger and Scheel, *Handbuch d. Physik,* v. 8 (Berlin, 1927) and Melde, *Lehre von d. Schwingungskurven* (Leipzig, 1864). These curves are also met in acoustics; an approximation to some of the curve forms having been given by Thomas Young (*Phil. Trans.,* 1800). They were, however, studied in detail by Lissajous (1857–58) whose name was consequently connected with



Bowditch Curves (Sec. 34)

them. They occur, thirdly, in discussion of *geodesic lines* on Liouville surfaces (*Enzyk. d. Math. Wiss.*, v. 3, pt. 3, 1927). And finally they are members of a group of curves studied by W. F. Rigge (*Harmonic Curves,* Omaha, Neb., 1926, the Hagen pendulum illustrations being especially interesting). If with equations (1) we consider $z=b\cos t$ we have that every Bowditch curve is the orthogonal projection of a *sine curve* developed on a right circular cylinder (see *Handbuch,* l.c.). For Lissajous curves in space *see* Melde (l.c.), E. H. Comstock and C. S. Slichter (*Trans. Wisconsin Acad.*, v. 11, [1898]), and Zambiasi, *Le figure di Lissajous* (1903).

35. *Sinusoidal Spirals* (F. *Spirales Sinusoïdes;* G. *Sinus-spiralen*), $r^n=a^n\cos n\theta$, where n is a positive or negative rational number. Particular cases are: line ($n=-1$), circle ($n=1$), parabola ($n=-\frac{1}{2}$), equilateral hyperbola ($n=-2$), *lemniscate of Bernoulli* ($n=2$), *cardioid* ($n=\frac{1}{2}$), *logarithmic spiral* ($n=0$, Haton de la Goupillière, 1857), *Cayley's sextic* ($n=\frac{1}{3}$), and *Tschirnhausen's cubic* ($n=-\frac{1}{3}$) first shown by Tschirnhausen (1690) to be a *catacaustic* of a parabola for rays perpendicular to its axis of symmetry. This curve has also been called *cubique de l'Hôpital,* and *Trisektrix von Catalan.* The equation of this curve as well as those of all other nodal cubics such as the *strophoid, trisectrix of Maclaurin,* and *folium of Descartes,* can be expressed in the form $X^{\frac{1}{3}}+Y^{\frac{1}{3}}+Z^{\frac{1}{3}}=0$, where X, Y, Z are linear functions of x and y which when set equal to zero are the equations of tangents at the points of inflection of the cubic. Sinusoidal spirals were first studied by Maclaurin (1718, 1720) who showed: (*a*) that their positive and negative *pedals* are again sinusoidal spirals; (*b*) that a body will trace out a sinusoidal spiral if acted on only by a force, in the direction of the pole, inversely proportional to the power $2n+3$ of its distance from the pole. For example, the *lemniscate of Bernoulli* is traversed by a body acted on by force directed to the double point and inversely proportional to the seventh power of the distance of this point from the moving body.

36. *Cycloid* (F. *Cycloïde;* G. *Cykloide* or *Zykloide* or *Radlinie*), $x=a(\phi-\sin\phi)$, $y=a(1-\cos\phi)$, one of the most celebrated of all special curves, is the locus of a point on the circumference of a circle rolling along a straight line (*see* fig. A). Its Cesàro intrinsic equation is $R^2+s^2=16a^2$, where a is the radius of the rolling circle. Sir Christopher Wren discovered (1658) that the length of a single arch is four times the diameter of the generating circle. Its area above the base line is three times that of the generating circle, a result approximated by Galileo Galilei (*c.* 1599) on weighing pieces of paper cut in the forms of the circle and cycloid (a name given by Galilei). But the first exact derivation of the area was due to Roberval (1634). The discovery by Huygens (1673) that the evolute of a cycloid is an equal cycloid led to his construction of the *isochronal* pendulum (*see* no. 2) generally known as the cycloidal pendulum. The cycloid is a *tautochrone* (Huygens, 1673) and a *brachistochrone* (Jean Bernoulli, 1696, *see* nos. 48, 56). In 1639 Galilei recommended the form of the cycloid for arches of bridges.

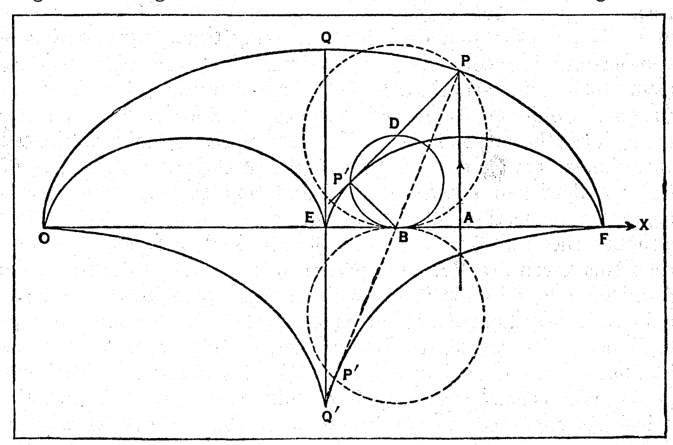


Fig. A.—Cycloid (Sec. 36)

If the tracing point P_1 of the rolling circle generating the cycloid be not on the circumference but at a distance h from the centre of the rolling circle the equations of the locus are: $x=a\theta+h\sin\theta$, $y=a-h\cos\theta$, which define *Trochoids* which are ($h<a$) *curtate,* or *curtate cycloids,* or ($h>a$) *prolate,* or *prolate cycloids* (*see* fig. *b*). Roberval found (1634) the area of such curves, and Descartes, Pascal, Wallis and Jean Bernoulli derived other results. The parallel projection of a *helix* on a plane perpendicular to its axis is a cycloid (ordinary, curtate or prolate) according as the inclination of the projecting rays is equal to, less than, or greater than the pitch of the helix (Guillery, 1847; Montcula found the result for the ordinary cycloid, 1799).

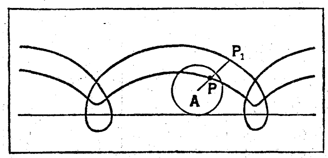

Fig. B.—Cycloid (Sec. 36)

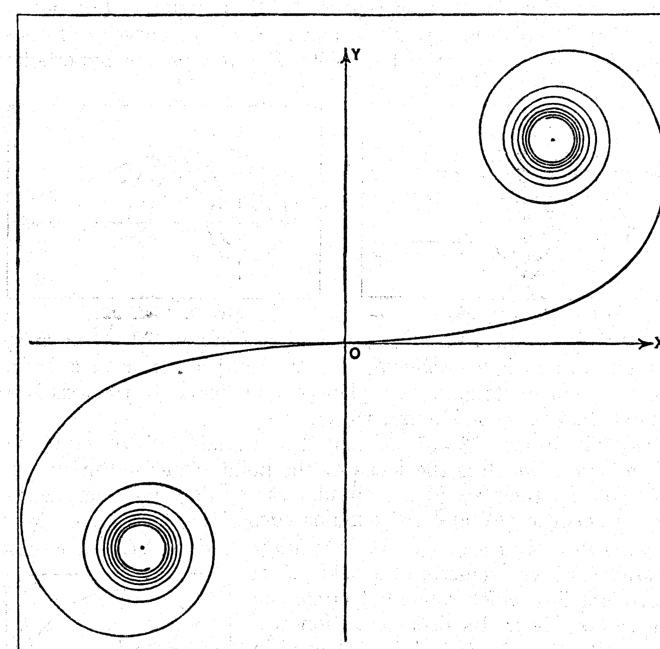
For a bibliography of the literature of cyclic curves *see* E. Wölffing, *Bibl. Math.* (3), v. 2, p. 235 *seq.*, and S. Günther *Bibl. Math.* (2), v. 1, p. 8, *seq.; see* also general references.

37. *Euler's Spiral* or *Clothoid* or *Cornu's Spiral* (F. *Clothoïde* or *Spirale de Cornu* or *Spirale de Fresnel;* G. *Klothoide*) is the curve defined by the equations

$$x=\frac{a}{2^{\frac{1}{2}}}\int_0^v\frac{\sin v\,dv}{v^{\frac{1}{2}}},\quad y=\frac{a}{2^{\frac{1}{2}}}\int_0^v\frac{\cos v\,dv}{v^{\frac{1}{2}}}$$

with asymptotic points at $(\pm a\pi^{\frac{1}{2}}/2^{\frac{3}{2}}, \pm a\pi^{\frac{1}{2}}/2^{\frac{3}{2}})$, and hence the name clothoid suggesting the spinner among the Fates (*see* fig.). The intrinsic equation of the curve is $Rs=a^2$, showing that the radius of curvature of any point of the curve is inversely proportional to the length of arc to that point from some point of reference. All of these results (for half the curve) were found by Euler in his *Methodus inveniendi lineas curvas* . . . , (1744) and in a paper presented to the Academy at St. Petersburg in 1781 wherein he determined the asymptotic points. The curve originated in the consideration of an elastic spring. The similar problem of an elastic lamina was considered earlier (1694) by Jacques Bernoulli but there is no indication that he had any conception, as Euler had, of the real form of the curve. In the 19th century, through discoveries by Fresnel in connection with the diffraction of light, Euler's spiral, and integrals (for which there are many tables) became of special interest.



Euler's Spiral or Clothoid or Cornu's Spiral (Sec. 37)

Euler's spiral is advocated by many writers as a *Transition Curve* for railways; *see,* for example, A. L. Higgins, *The Transition Spiral* (London, 1921). For different values of m the intrinsic equation $Rs^m=a^2$, represents a *clothoid,* a *logarithmic spiral,* the *involute of a circle,* and a straight line. For a bibliography of Euler's spiral see *Amer. Math. Mo.*, v. 25, pp. 276–282.

38. The family of curves $r^m=a^m\theta$, for which the pedal equation is $p^2(m^2r^{2m}+a^{2m})=m^2r^{2m+2}$ (Sacchi, 1854) includes four notable curves: (*a*) *Spiral of Archimedes* ($m=1$) (F. *Spirale d'Archimède;* G. *Archimedische Spirale*); (*b*) *Fermat's Spiral* ($m=2$); (*c*) *Hyperbolic* [or *Reciprocal*] *Spiral* ($m=-1$) (F. *Spirale Hyperbolique;* G. *Hyperbolische Spirale*); (*d*) *Lituus* ($m=-2$) (F. *Lituus* or *Trombe;* G. *Lituus* or *Krummstab*).

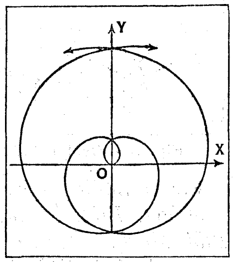


Fig. A. (Sec. 38)

(*a*) This spiral, $r=a\theta$, in which the length of the radius vector is proportional to the angle, is discussed at length in the book on spirals by Archimedes (*c.* 225 B.C.) and it seems that it was used by him to solve the problem of squaring the circle. The subnormal of the spiral is always equal to *a*. Archimedes gave, in effect, the quadrature of the curve, as $a^2\theta/6$ (*see* fig.). The spiral is the pedal of the *involute of a circle* with respect to its centre (Maxwell, 1849). The orthogonal projection of the line of section of a helicoid and a cone of revolution with coincident axes, on a plane perpendicular to the axis, consists of two equal spirals of Archimedes (Pappus, *c.* 330; *see* F.G.M., *Exercices de Géom. Descr.,* 4th ed., Tours, 1909, p. 811, *seq.*).

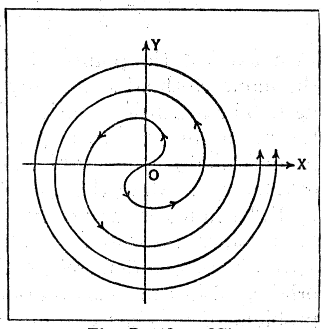

Fig. B. (Sec. 38)

(*b*) The spiral $r^2=a^2\theta$ was discussed by Fermat (1636) and has the form in the figure. Its inverse with respect to its pole is a *lituus.*

(*c*) The hyperbolic spiral, $r\theta=a$, the consideration of which originated with Varignon (1704), was also studied in the 18th century by Jean Bernoulli (1710–13) and Roger Cotes (1722). The subtangent of the curve is of constant length, *a.* If through a point P (r,θ) of the hyperbolic spiral $r\theta=a$, a line PP_1, of length r, be drawn parallel to the axis, the locus of P_1 is a *cochleoid.* The conical projection of a *helix,* from a point of its axis, on a plane perpendicular to the axis is a hyperbolic spiral (T. Olivier, 1833).

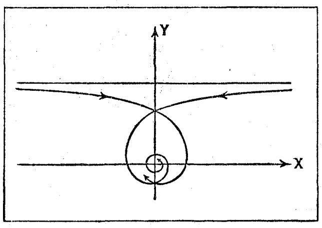

Fig. C. (Sec. 38)

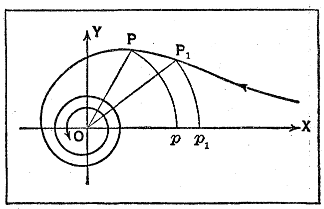

Fig. D. (Sec. 38)

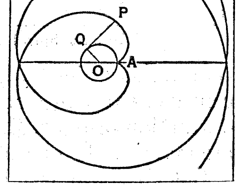
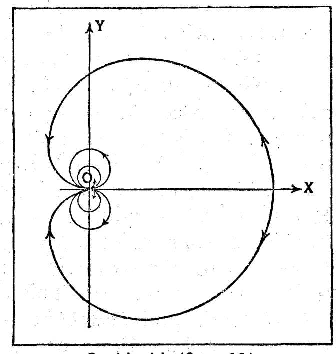
(*d*) The lituus, $r^2\theta=a^2$, originated in a study by Cotes (1722) of the curve which is the locus of the point P moving in such a manner that the area of the circular sector POp (*see* fig.) comprised between OX and OP remains constant.

39. *Involute of a Circle* (F. *Développante du cercle;* G. *Kreisevolvente*) is the roulette of a point, P, on a straight line which rolls on a circle centre O (*see* fig.). Its pedal equation with respect to O is $r^2=p^2+a^2$, its Whewell intrinsic equation $2s=a\psi^2$ and its Cesàro intrinsic equation $R^2=2as$. Its parametric equations are $x=a(\cos\phi+\phi\sin\phi)$, $y=a(\sin\phi-\phi\cos\phi)$. The involute of a circle is the locus of the pole of a *logarithmic spiral* rolling on a concentric circle (Maxwell, 1849). The involute of a circle seems to have been conceived in 1693, when Huygens was considering clocks without pendulums which might be of service on sea-going vessels (Huygens, *Oeuvres,* v. 10, 1905, p. 514). In this connection he originated an apparatus in which the involute plays an essential rôle. In 1891 it became desirable to enlarge the dome of the Royal Observatory at Greenwich; for various reasons the new dome was made, for the most part, in the form of a surface generated by the revolution of an arc of an involute of a circle (*Mo. No. R. Astr. So.,* v. 51).



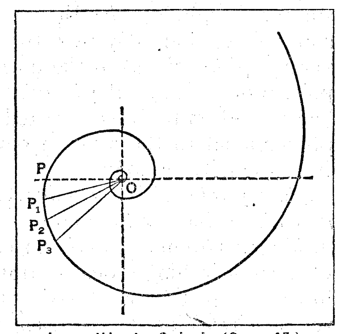
Involute of a circle (Sec. 39)

40. Cochleoid [snail form] (F. *Cochléoïde;* G. *Kochleoide* or *Schneckenhauslinie* or *Schraubenkurve*), $r=a(\sin\theta)/\theta$ (*see* fig.), was first considered as a quadratrix of a circle in an anonymous paper in the *Phil. Trans.* (1700). The curve was considered again in correspondence of Goldbach and Daniel Bernoulli (1726) as the locus of the ends of equal arcs measured from the common point of contact of a series of tangent circles. The points of contact of parallel tangents to the cochleoid lie on a *strophoid* having the pole for double point (Teixeira, 1909). The projection of a cylindrical *helix* from one of its points on a plane perpendicular to its axis is a cochleoid.



Cochleoid (Sec. 40)

41. *Logarithmic* [or *Equiangular* or *Logistic*] *Spiral* (F. *Spirale Logarithmique* [or *Équiangle* or *Logistique*]; G. *Logarithmische Spirale*) was first discussed by Descartes (1638), in connection with a problem in dynamics, as the curve cutting radii vectores from a fixed point O under a constant angle ϕ. If P (r,θ) is any point on the curve and s is its length from O to P, Descartes observed that $s=r$const., and hence rectified a curve for the first time (*see* no. 2). Loria claims this honour for Torricelli (*Accad. d. Lincei, Rendiconti cl. d. sc. fisiche, matem. e nat.* v. 6 (2), 1897, p. 318). The intrinsic pedal and polar equations of the curve are: $R=as$, $p=r\sin\phi$, and $r=ke^{c\theta}$ (1) where $c=\cot\phi$. The form of the curve depends on c and is wholly independent of k. The lengths of radii vectores making equal angles with one another are in geometric progression. That the pole was an asymptotic point seems to have been first noticed by Torricelli (1646). Collins (1675), and Jacques Bernoulli, to whom the name logarithmic spiral is due ("equiangular spiral" originated with Cotes, 1714), noticed (1691) the analogous generations of this spiral and of the *loxodrome,* and that the latter is a stereographic projection of the former seems also due to Collins, although the result was first published by Halley (1696). Among theorems given by Bernoulli (1691–93) are the following: the *pedal* of a logarithmic spiral with respect to its pole is a logarithmic spiral; its *evolute* is an equal spiral with the same asymptotic point; its *catacaustic* for rays emanating from the pole as luminous point is an equal spiral. The discovery of such "perpetual renascence" delighted Bernoulli, who requested that the spiral be engraved on his tomb with the inscription *Eadem mutata resurgo.* That an attempt was made to grant the request may be seen at his tomb in the cloister of the cathedral at Basle. If the surface generated by the revolution of a *logarithmic curve* about its asymptote intersect a helicoid with the asymptote as axis the orthogonal projection of the curve of section of the surface on a plane perpendicular to the axis is a logarithmic spiral (Chasles, 1837). Sir John Leslie seems to have been the first (1821) to suggest, what was later established, that the septa of the nautilus are in form logarithmic spirals. The curve has also been discussed in connection with arrangements of florets in sun-flowers, pine cones and other growths. The most complete historical summary of the extensive literature of the logarithmic spiral is given by R. C. Archibald in an appendix to J. Hambidge, *Dynamic Symmetry* (New Haven, 1920).

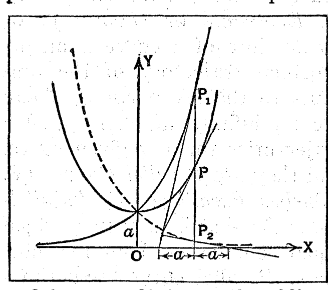


Logarithmic Spiral (Sec. 41)

42. *Frequency Curve* or *Probability Curve* or *Normal Curve of Errors* (F. *Courbe de Probabilité* or *Courbe de Possibilité;* G. *Wahrscheinlichkeitskurve* or *Fehlerkurve*) is the name usually applied to the bell-shaped curve whose cartesian equation is $y=(a/\sqrt{\pi})e^{-mx^2}$ (1). This curve originated, in essence, with DeMoivre (1733, see *Isis,* v. 8, p. 671 *seq.,* and *Biometrika,* v. 16, p. 402 and v. 17, p. 201), although it has been connected more particularly with the names of Laplace and Gauss (see *Trans. Connecticut Acad.,* v. 4). The equation has been developed on various hypotheses the statement of which may be found in works on probability and statistics. Among many tables giving the area, ordinate, and other information, for such curves as the particular case of (1), when $a=\frac{1}{2}^{\frac{1}{2}}$, $m=\frac{1}{2}$, are J. W. Glover's, *Tables of Appl. Math.* (1923). The term *Frequency Curves* is applied to a great variety of curves; *see,* for example, W. P. Elderton, *Frequency Curves and Correlation,* 2nd ed. (1927).

43. *Logarithmic* [or *Logistic*] *Curve* (F. *Logarithmique* or *Logistique;* G. *Logarithmische Kurve* [or *Linie*] or *Exponentialkurve,* or *Logistika*) is the curve defined by the equation $x=a\log(y/m)$ or $y=me^{x/a}$ and consisting of a single branch (for a summary of considerable discussion in this regard *see* Salmon, *Higher Plane Curves,* 3rd ed., p. 286) with the axis of X as asymptote (*see* fig. in no. 44, locus of P_1, where $m=a$). The curve originated with a problem and discussion about 1640 and then and later in the 17th century (that of the discovery of logarithms) in connection with the names of Torricelli, James Gregory, Craig, Huygens and others. The characteristic property of the curve as then found was: whatever m may be, the subtangent is constantly equal to a (*see* fig.). The area between the curve, the asymptote and an ordinate is equal to that of a rectangle with sides respectively equal to the abscissa and subtangent (Torricelli, Huygens).

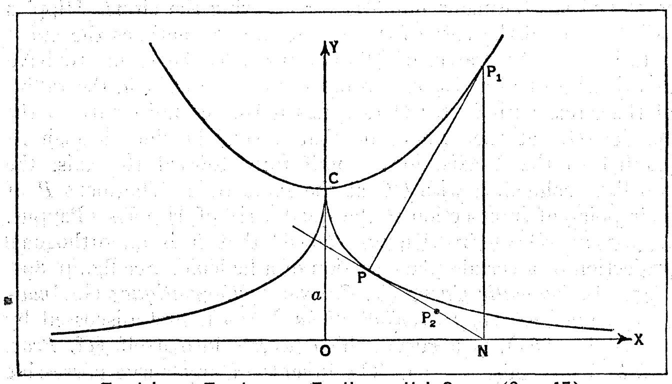
44. *Catenary* or *Chainette* (F. *Chaînette;* G. *Kettenlinie*) is the form (Galilei thought it a parabola) which a perfectly flexible, inextensible chain will assume when suspended by its ends and acted upon by gravity alone. Its equation, determined in 1691 by such mathematicians as Huygens and Leibniz, can be written $y=\frac{1}{2}a(e^{x/a}+e^{-x/a})=a\cosh(x/a)$. Points on the curve may be readily determined from logarithmic curves (*see* fig.). The tangents at P, P_1, P_2 are concurrent. If s represents the length of the catenary measured from its vertex on the Y-axis to any point P, $y^2=s^2+a^2$, and $s=a\sinh(x/a)$. The Cesàro intrinsic equation is $aR=s^2+a^2$, which is a particular case of the equation $aR=s^2+c^2$ which defines curves named by Cesàro (1886) *Alysoid* (F. *Alysoïde;* G. *Alyseiden*). If two opposite edges of a thin inextensible and perfectly flexible rectangular piece of cloth are fixed parallel to each other, and the cloth is exposed to a uniform current of air moving at right angles to the plane which contains the two fixed edges of the cloth the form of equilibrium of the cloth (which is the form of the cross section of a sail filled by wind) is a catenary, or, as Jean and Jacques Bernoulli (1692–95) called it a *Velaria* (sail curve, G. *Segelkurve* or *Seilkurve*). If the catenary is revolved about the X-axis we obtain a catenoid, which is the only minimal surface of revolution, a surface discussed by Euler as early as 1744, and illustrating important principles in the calculus of variations.



Catenary or Chainette (Sec. 44)

Since a catenary may be regarded as a roulette of the focus of a parabola rolling along a straight line, it has been called also a *parabolic catenary.* Similar roulettes of an ellipse and of a hyperbola lead to an *elliptic catenary* and a *hyperbolic catenary.* The corresponding surfaces of revolution are called respectively *Unduloid* and *Nodoid* (*see* A. G. Greenhill, *Elliptic Functions,* 1892). Delaunay showed (1891) that surfaces of revolution of constant mean curvature are of the three types here mentioned.

45. *Tractrix* or *Tractory* or *Equitangential Curve* (F. *Tractrice* or *Tractoire* or *Courbes aux Tangents Égales;* G. *Zuglinie* or *Traktrix* or *Traktorie*) being equitangential (PN$=a$, *see* fig.) is defined by the equations $y(1+y'^2)=a^2y'^2$ or $x=a(\cos u+\log\tan[u/2])$ and $y=a\sin u$; and $R^2+a^2=a^2e^{2s}/a$. In 1692 Huygens considered this curve in detail and hence the name *Traktorie von Huygens* has been used; it was later studied,



Tractrix or Tractory or Equitangential Curve (Sec. 45)

among others, by Leibniz and Jean Bernoulli. The tractrix (*see* fig.) is the orthogonal trajectory of circles of radius a with centres on the X-axis (Liouville, 1850). The evolute of the tractrix (locus of P), is the catenary (locus of P_1)

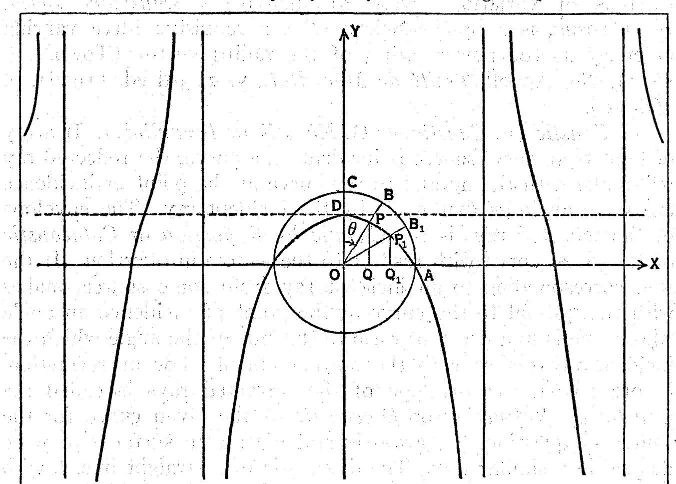
$$y=(a/2)(e^{x/a}+e^{-x/a}).$$

The projection N, of P_1, on the X-axis is the end of the tangent PN, which is constantly equal to a. The intersecting surface of constant negative curvature generated by revolving the tractrix about its asymptote is called a pseudosphere (Beltrami, 1865), and its volume is one half that of the sphere of radius $OC=a$ (Huygens, 1692). The "surface of Dini" is a helicoid with the tractrix as meridian curve (Dini, 1865).

If on the tangent PN to the tractrix a point P_2 is taken (*see* fig.) such that $NP_2=b$, a constant, the locus of P_2 as P traces out the tractrix is the *Syntractrix* (F. *Syntractrice;* G. *Syntraktrix*) defined by $x+(b^2-y^2)^{\frac{1}{2}}=a\log\{[b+(b^2-y^2)^{\frac{1}{2}}]/y\}$, and whose intrinsic equation, when $b=2a$, may be written

$$R=(a/4)(e^{s/a}+e^{-s/a}).$$

This equation differs but slightly from $R=(a/2)(e^{s/a}+e^{-s/a})$ which defines a *Catenary of uniform strength* (F. *Chaînette*



Quadratrix of Hippias (Sec. 46)

d'Égale Résistance; G. *Kettenlinie gleichen Wiederstandes* or *Longitudinale*). Thomson and Tait give the equation of this curve (*Nat. Phil.,* §573; also Coriolis, 1836), in which linear density or cross section is so arranged as to be proportional to the tension, as $e^{y/a}=\sec(x/a)$, which may be written $\tanh\frac{1}{2}(y/a)=\tan^2\frac{1}{2}(x/a)$. The curve was first discussed by Gilbert (1826) in his memoir on suspension bridges. It is the curve which with its *catacaustic,* for parallel rays, encloses the minimum area (Dunkel, *Washington Univ. Studies,* v. 8, 1921).

46. *Quadratrix of Hippias* (F. *Quadratrice de Dinostrate;* G. *Quadratrix des Dinostratus*), $y=x\cot(\pi x/2a)$, $r\sin\theta=(2a/\pi)\theta$, a curve invented by Hippias of Elis (*c.* 430 B.C.) and used (by him, apparently) for trisecting an angle (it may be used for dividing an angle into any number of equal parts), but also employed (as the name implies) for squaring the circle. Hippias may have used the curve for this purpose. Sometimes the curve is called the Quadratrix of Dinostratus since he seems to have used it as a quadratrix (*c.* 350 B.C.). Suppose $OA=a$, the radius of the circle with center O (*see* figs.), rotates uniformly to the position OC at the same time that a straight line through A, parallel to the Y-axis, moves uniformly toward the axis, the two lines coinciding with OC at the same time. The locus P of their point of intersection is the quadratrix of Hippias (Pappus, *c.* 300); $OD=2a/\pi$. Pappus showed that it is an orthogonal projection of a certain plane section of a helicoid. *See* fig., p. 895.

47. *Anallagmatic Curve* (F. *Courbe anallagmatique;* G. *Anallagamatische Kurve, Unveränderliche Kurve*), first discussed by Moutard (1864), is a curve which inverts into itself (cf. *Proc. Edinb. Math. Soc.,* v. 20). The inverse of any curve possessing a line of symmetry is, in general, anallagmatic. Since bicircular quartics (which include the *limaçon, cardioid, cartesian, cassinian*), as well as the *strophoid,* the *trisectrix of Maclaurin* and the *cissoid,* are the inverses of conics, they are thus anallagmatic. In particular, the cartesian is anallagmatic with respect to any of its foci, the power of inversion being the product of the distances of this focus to the other two foci; for the *strophoid* its vertex is the centre of inversion, and the power of inversion is the square of the distance of the vertex to the double point; so also for the *trisectrix of Maclaurin.* The inverse of an anallagmatic curve is anallagmatic.

48. *Brachistochrone* (F. *Brachistochrone* or *Brachystochrone;* G. *Brachistochrone* or *Linie schnellsten Falles*) is the curve along which a body moves from one point A to another B, under the action of an assigned accelerating force, in the least time possible. The problem when gravity was the accelerating force was proposed by Jean Bernoulli (1696) as a challenge to mathematicians. Leibniz, Newton, Jacques Bernoulli, and L'Hospital responded with solutions, that the curve was a *cycloid.* That there is one and only one cycloid arc with the required property was not shown till the 19th century, when an important necessary condition, unstated by Bernoulli, and other things in the theory of the calculus of variations, were formulated. A *sinusoidal spiral,* $r^n=a^n\cos n\theta$, is a brachistochrone for a repulsive force varying inversely as the power $2n+3$ of the radius vector (Townsend, 1875). *See* Appell, *Traité de Méc. Rat.,* v. 2, 3rd ed. (1909), p. 460, *seq.*

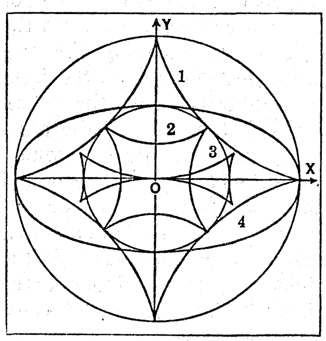
49. *Caustic* (F. *Caustique;* G. *Kaustik* or *Brennlinie*). If a ray of light from some source is incident on a curve, the reflected ray will make with the normal to the curve at the point of incidence the same angle as that made by the incident ray. The envelope of the reflected rays is the *Caustic by Reflection* or *Catacaustic* of the given curve with respect to the source in question. If the ray, corresponding to an incident ray from some source, makes with the normal to the curve at the point of incidence an angle whose sine is in a constant ratio to the sine of the angle which the incident ray makes with the normal (Snell's law of refraction, before 1626), the envelope of the refracted rays is called the *Caustic by Refraction* or *Diacaustic* of the given curve for the source in question. Catacaustic and diacaustic surfaces may be defined in a similar way. The diacaustic of a straight line, l, with respect to a source, S, is the evolute of an ellipse with foci at S and the reflection of S in l (Gergonne, 1820). The diacaustic of a circle is, in general, the evolute of a *cartesian* (Sturm, 1824). If the source is at an infinite distance the incident rays are parallel. The idea of caustic curves originated with Huygens and Tschirnhausen about 1678 and was developed, among others, by Jean and Jacques Bernoulli and by L'Hospital before the end of the century. About 1822 it was discovered by Quetelet that the caustic (C'), of a given curve (C), for a finite source S, is the evolute of a curve (C''), called *Secondary Caustic,* which is the envelope of the circles with centres on (C) and passing through S; or the evolute of a curve (C''), which is similar to the *pedal* of (C) with respect to S, but of double its linear dimensions. Some samples of special curves as catacaustics are as follows:

Curve	Source of rays	Catacaustic
Circle . . .	pt. on circumference	*Cardioid* (Jean and Jacques Bernoulli, 1692, *see* fig. no. 25).
Circle . . .	pt. not on circumference	*Limaçon* (St. Laurent, 1826).
Tschirnhausen's cubic . .	focus	*Semi-cubical parabola* (Archibald, 1900).
Cardioid . .	cusp	*Nephroid* (Huygens, 1678, *see* fig. no. 25).
Cissoid . .	ordinary focus	*Cardioid* (T. Lemoyne, 1919).
Quadrifolium .	centre	*Astroid* (Brocard, 1919).
Logarithmic spiral	pole	*Logarithmic spiral* (Jacques Bernoulli, 1692).
Circle . . .	parallel	*Nephroid* (Huygens, 1678, *see* fig. no. 25).
Parabola . .	rays perp. to axis	*Tschirnhausen's cubic* (Tschirnhausen, 1690).
Cycloid arch .	rays perp. to base	Two *cycloid* arches (Jean Bernoulli, 1692, *see* fig. no. 36[a]).
Tricuspid . .	parallel rays	*Astroid* (Köstlin, 1888).
Logarithmic curve $y=a\log x$. .	rays parallel to X-axis	*Catenary* (R. Heath, 1887).

See F. Bösser, *Zeit. f. Math. u. Phys.,* v. 15, pp. 170–206; Geiger and Scheel, *Handbuch d. Physik,* v. 18 (1927); R S. Heath, *Treatise on Geometrical Optics* (1887); Brocard and Lemoyne's work mentioned below; G. F. Childe, *Reflected Ray Surfaces* . . . (Cape Town, 1857); bibliography in *L'Intermed. d. Math.* (1894), p. 190, and (1895), pp. 208, 321.

50. *Evolute* (F. *Développée;* G. *Evolute* or *Krümmungsmittelpunktslinie* or *-kurve*). This is the envelope of all the normals to a curve of the locus of the curve's centres of curvature. A curve and its evolute have the same foci. The deficiency of the evolute is the same as that of the primitive curve. For other general properties of such curves *see* Salmon, *Higher Plane Curves,* 3rd ed., 1879, p. 82 *seq.* Evolutes of *Epicycloids* and *Hypocycloids* (e.g., *cardioid, nephroid, tricuspid, astroid*) are curves of the same type. So also for the *cycloid* and *logarithmic spiral,* but the evolute of a parabola is a *semi-cubical parabola;* of a *tractrix,* a *catenary;* of a *Cayley's Sextic,* a *nephroid.*

If the evolute be regarded as the original curve, a curve of which it is the evolute is called an *Involute* (F. *Développante;* G. *Evolvente* or *Involute*); or an involute of a curve is an orthogonal trajectory of the tangents to the given curve. There are an infinite number of such trajectories for any given curve, and they are *Parallel Curves* (F. *Courbes Parallèles;* G. *Parallelkurven*); that is, any two cut off equal lengths on common normals. Parallel curves sometimes have a very different appearance, for example, *Cayley's Sextic* and the *nephroid.* The accompanying figure shows: (*a*) two parallel curves, 3, 4, of an *astroid,* 2, one of them an oval, and also (*b*) the evolute, 1, of this astroid.



Evolute (Sec. 50)

The conception of evolutes and involutes originated with Huygens in his celebrated *Horlogium Oscillatorium* (1673). The principles underlying the determination of such envelopes, as well as those connected with caustics by Tschirnhausen (1682), were developed into a theory by Leibniz (1692–94), who was the first to consider parallel curves.

51. *Inverse Curves* (F. *Courbes Inverses;* G. *Inverse Kurven*).

If through a point O, called the centre of inversion, a line is drawn to any point P_1, of a curve C_1, and on OP_1, a point P_2 is taken such that $OP_1 \cdot OP_2 = k^2$, a constant, P_1 and P_2 are inverse points. As P_1 traces the curve C_1, P_2 traces its inverse curve C_2. If the power is $-k^2$ the points P_1 and P_2 are on opposite sides of O. The first examples of this transformation were given by Quetelet (1825). (*See* also no. 47.) Some examples of curves and their inverses are as follows:

Curve	Pole	Inverse
Central conic	focus	*Limaçon*
Central conic	centre	*Cassinian*
Hyperbola, rectangular	centre	*Lemniscate of Bernoulli*
Hyperbola, rectangular	vertex	*Strophoid*
Trisectrix of Maclaurin	double point	Hyperbola
Trisectrix of Maclaurin	focus	*Tschirnhausen cubic*
Strophoid	double point	Hyperbola
Cissoid	cusp	Parabola
Parabola	focus	*Cardioid*
Spiral of Archimedes	pole	*Hyperbolic spiral*
Logarithmic spiral	pole	*Logarithmic spiral*
Cochleoid	pole	*Quadratrix of Hippias*
Lituus	pole	*Fermat's spiral*
Rhodonea	pole	*Épi* or *Cotes's spiral*

52. *Isoptic Curve* (F. *Courbe isoptique* or *Ligne isoptique;* G. *Isoptische Kurve* or *Kurve gleichen Gesichtswinkels*). The locus of the points of intersection of tangents to a given curve (or a pair of curves) meeting at a constant angle is an isoptic curve of the given curve, or curves. When the constant angle is right the isoptic curve is said to be the *Orthoptic Curve* (F. *Courbe Orthoptique;* G. *Orthoptische Kurve*). The isoptic curve of an epicycloid is an epitrochoid (Chasles, 1837); of a *cycloid* a curtate or prolate cycloid (LaHire, 1704); of a *sinusoidal spiral* another sinusoidal spiral. The orthoptic curve of a *tricuspid* is a circle; of an *astroid,* a *quadrifolium;* and of a *cardioid,* a circle and a *Limaçon of Pascal,* which suggests that the isoptic curve of Chasles's theorem should be one or more *epitrochoids;* indeed the number of such epitrochoids is only finite if the radius of the base of the given epicycloid is commensurable with that of the rolling circle (Duporcq, *L'Interm. d. Math.,* 1896, p. 291). The orthoptic curve of two confocal conics is a concentric circle (Chasles).

53. *Pedal* or *Pedal Curve* (F. *Courbe pédale* or *Podaire;* G. *Fusspunktkurve*). The pedal (C_1) of a curve (C), with respect to a point O, is the locus of the feet of the perpendiculars from O on the tangents to (C). Maclaurin first introduced (1718) the idea of positive and negative pedals of a curve with respect to a point; (C_1) is the pedal or first positive pedal of (C), or (C) is the first negative pedal of (C_1). If (C_2) is, with respect to the same point, the first positive pedal of (C_1), it is the second positive pedal of (C); and so on. Some examples of pedals are as follows:

Curve	Point	Pedal
Circle	any point in plane	*Limaçon*
Circle	point on the circumference	*Cardioid*
Parabola	foot of directrix	*Right strophoid*
Parabola	any point of directrix	*Strophoid*
Parabola	reflexion of focus in directrix	*Trisectrix of Maclaurin*
Parabola	vertex	*Cissoid*
Equilateral hyperbola	centre	*Lemniscate of Bernoulli*
Cissoid	ordinary focus	*Cardioid*
Epicycloid, Hypocycloid	centre	*Rhodonea*
Cardioid	cusp	*Cayley's sextic*
Tricuspid	cusp	*Simple folium*
Tricuspid	vertex	*Double folium*
Tricuspid	centre	*Trifolium*
Astroid	centre	*Quadrifolium*
Logarithmic spiral	pole	*Logarithmic spiral*
Involute of circle	centre of circle	*Spiral of Archimedes*

For the *sinusoidal spirals* $r^n = a^n \cos n\theta$ the k^{th} pedal, positive or negative, with respect to the pole, is

$$r^{n/(1+kn)} = a^{n/(1+kn)} \cos\theta n/(1+kn).$$

From this, many results can be stated; for example: the fifth negative pedal of a *cardioid* is a *Tschirnhausen cubic;* the fourth positive pedal of a parabola is a *cardioid.* The term *tangential pedal curve* is sometimes used to distinguish it from *normal pedal curve* where normals play the same rôle as tangents in the above discussion.

54. *Radial* or *Radial Curve* (F. *Courbe radiale;* G. *Radiale*). From a fixed point lines are drawn equal and parallel to the radii of curvature at successive points of a given curve; the locus of the extremities of these lines is the radial curve corresponding to the given curve (Tucker, 1864). The degree of the radial of an algebraic curve is that of the curve's *evolute.* The following are some examples (c=curve, r=radial): c—*catenary,* r—*kampyle of Eudoxus;* c—*catenary of uniform strength,* r—a straight line; c—*tractrix,* r—*kappa curve;* c—*cycloid,* r—circle, c—*epicycloid* of n cusps, r—*rhodonea* of n petals; c—*tricuspid,* r—*trifolium;* c—*astroid,* r—*quadrifolium.*

55. *Roulette* (F. *Roulette;* G. *Rollkurve* or *Roulette*). When a curve rolls, without slipping, on a fixed curve or straight line, any fixed point, P, in the plane of the rolling curve describes a curve called a roulette. The term is also sometimes applied (still limiting motion to that in a plane) to: (*a*) the envelope of a fixed line in the plane of the rolling curve; (*b*) the locus of a variable point, such as the centre of curvature of the point of contact of the rolling curve. If O is the point of contact of rolling and fixed curves, OP is normal at P (P, fixed) to the curve traced by P (Descartes). If any curve roll on an equal curve, corresponding points of the curves being in contact, the roulette of any point is a curve similar to a certain pedal of the fixed curve and of double its linear dimensions (Maclaurin, 1720); in particular *Cayley's Sextic* is generated by the cusp of a *cardioid* rolling, with corresponding points in contact, on an equal cardioid (Maclaurin). The roulette of the vertex of a parabola rolling on a fixed equal parabola is a *cissoid of Diocles.* The *cycloid, epicycloids, epitrochoids* and *hypocycloids* are examples of roulettes. Every *rhodonea* can be generated as the roulette of a circle on a circle (Suardi, 1752, and Ridolfi, 1844). The *hyperbolic spiral* whose equation is $r=a/\theta$ rolled on a *logarithmic curve* whose equation is $y=a\log(x/a)$ traces the axis of y or the asymptote (Maxwell, 1849). The pole of a *hyperbolic spiral* rolling on a straight line traces out a *tractrix* (Demoulin, 1891). A *helix* rolls on a straight line to which it is always tangent while its axis moves in a plane; any point of the helix traces out a cycloid (Besant, 1870). References may be given to J. C. Maxwell's second published paper in 1849 (*Scientific Papers,* vol. i.) and to W. H. Besant's *Notes on Roulettes and Glissettes* (2nd ed., Cambridge, 1890). Among *Glissettes* (F. *Glissettes;* G. *Gleitkurven*) are the curves: (*a*) traced out by points, (*b*) enveloped by a fixed line, in the plane of a curve which is made to slide between given points, or straight lines, or curves, or to glide so as always to be tangent to a line at a fixed point. The envelope-glissette of a given line segment sliding between lines at right angles is an *astroid.* The point glissette of the focus of a parabola sliding between two lines at right angles is an *épi* or *Cotes's spiral* whose equation may be written $r\sin 2\theta = a$. An *involute of a circle* slides on a straight line, always touching it at the same point; the glissettes of a point and a straight line are respectively a *trochoid* and an involute of a *cycloid* (Besant).

56. *Tautochrone* (F. *Tautochrone* or *Courbe Tautochrone;* G. *Tautochrone* or *Gleichzeitkurve*). This is a curve along which a particle acted on by assigned forces will arrive in the same time at a given point whatever initial point is taken on the curve. When gravity is the accelerating force Huygens showed (*Horlogium Oscillatorium,* 1673) that the inverted *cycloid* with axis vertical was the tautochrone. The converse problem was solved by Newton (*Principia,* 1687, bk. 3, sec. 10). The problem of the tautochrone was notably discussed by Jean Bernoulli (1718), and Euler (1726–72), and Lagrange (1767, *Oeuvres,* v. 2, 1868, p. 317). The *astroid* is a tautochrone for a force perpendicular to a line and proportional to the cube root of the distance to this line (Jullien, 1855). The *cardioid* is a tautochrone for a repulsive force varying as the distance, situated on the axis at one-quarter

of the distance from the focus to the vertex (Purkiss, 1864). A similar result holds for all *epicycloids* (Purkiss). (*See* C. Ohrtmann, *Das Problem der Tautochronen; ein historischer Versuch.*)

57. *Clélies* (F. *Clélies;* G. *Cleliakurven* or *Clelien*). Let ϕ be the longitude, and θ the colatitude, of any point P on a sphere of radius a. If this point is moved such that $\theta=m\phi$, m being a constant, the locus described by P is a clélie, discussed by Guido Grandi (1728). When $m=1$ we have *Viviani's Windows.* In cartesian co-ordinates the equations may be written

$$x=a\sin m\phi\cos\phi,\quad y=a\sin m\phi\sin\phi,\quad z=a\cos m\phi.$$

The projection of this curve on the XY-plane is the *rhodonea,* $r=a\sin m\phi$.

Grandi applied the name clélies also to curves defined by the equations $a\sin\theta=b\sin m\phi$, $a\sin\theta=a-b\sin m\phi$. The projection of the first curve on the XY-plane is $r=b\sin m\phi$ again a rhodonea. The projection of the second curve on the XY-plane is represented by the equation $r=a-b\sin m\phi$ which is a *conchoid* of the same rhodonea.

58. *Horse Fetter* or *Hippopede* (F. *Hippopède;* G. *Hippopede* or *Pferdefessel*) is a term applied to two different curves discussed by the Greeks (*cf.* Heath, *Hist. Greek Math.*, v. 1, pp. 332–334; v. 2, pp. 204–206). (*a*) The horse-fetter of Eudoxus (fl. *c.* 365 B.C.) is the curve described by a planet about the zodiac circle in his theory of concentric spheres, and it is the curve of section of a circular cylinder and tangent sphere (Schiaparelli, *Scritti s. storia d. Astronomica Antica,* part 1, t. 2, p. 40 *seq.*). Let the centre, O, of the sphere, of radius, a, be the origin; the axis of y the line through O and B, the point of contact of cylinder and sphere; the axis of z parallel to the generator of the cylinder, then the equations of the horse-fetter are: $x^2+y^2+z^2=a^2$, $x^2+(y-b)^2=(a-b)^2$, where b is the distance of the axis of the cylinder from O. Because of its form, the curve has been called a *spherical lemniscate.* Its projection in the YZ-plane is part of the parabola $z^2+2by-2ab=0$. The YZ-plane and XY-plane are planes of symmetry and B is a double point. The stereographic projection of the horse-fetter with respect to the point $(0, a, 0)$ is the hyperbola $(a-b)z^2-bx^2=ab^2$. When $b=a/2$ the horse-fetter, which Eudoxus introduced into geometrical discussion, becomes part of *Viviani's curve.*

(*b*) The plane curve hippopede, referred to by Proclus, appears to be one of the *spiric lines of Perseus* (*c.* 75 B.C.), that is one of the curves formed by a plane section of an anchor ring parallel to its axis. When the plane is tangent to the anchor ring internally, the section is a hippopede whose equation is

$$(x^2+y^2)^2+4c(c-a)(x^2+y^2)=4c^2x^2.$$

If the distance of the plane from the axis is equal to the radius of the generating circle of the ring ($c=2a$) the hippopede is a *lemniscate of Bernoulli.*

59. *Loxodrome* or *Rhumb Line* or *Spherical Helix* (F. *Loxodromie;* G. *Loxodrome* or *Rhumblinie*) is usually defined as the curve cutting the meridian of a sphere at a constant angle; it is a double spiral having the north and south poles for asymptotic points. The curve was first conceived by Pedro Nunes (1550). If the constant angle is β, ϕ is the longitude and θ the colatitude of a point on the loxodrome its equation may be written

$$x=\sin\phi\cos\theta,\qquad y=\sin\phi\sin\theta,\qquad z=\cos\phi,$$

where $\theta=-\tan\beta\log\tan(\phi/2)$. The orthogonal projection of this curve on the XY-plane is $r(e^{h\theta}+e^{-h\theta})=2$ or $r\cosh h\theta=1$, where $h=\cot\beta$, *Poinsot's Spiral* (*see* no. 31). The stereographic projection of a loxodrome from one of its poles on the plane of the equator is a *logarithmic spiral.* Nunes had the idea (not yet dead) that a loxodrome joining two points on a sphere was the shortest distance on the sphere between those points. Support of this view may have been found by some in the fact that on Mercator charts (1569) the spherical loxodrome becomes a straight line. In the 19th century intelligent mariners realized that great-circle sailing should replace loxodromic paths for shortest distances. The most notable history of the loxodromic line is that of S. Günther, *Studien z. Gesch. d. Math. u. Phy. Geographie,* pt. 6 (Halle, 1879).

The general question of loxodromes on any surface of revolution was studied for the first time by J. G. Walz in 1741. But Scheffers introduced the idea (1902) of a loxodrome as a space curve and not a surface curve, a curve which cuts all planes of a pencil under a constant angle. Loxodromes are space W-curves of Klein and Lie (1870); see *Enzykl. d. Math. Wiss.*, v. 3, p. 247.

60. *Spherical Catenary* (F. *Chaînette Sphérique* or *Caténaire Sphérique;* G. *Sphärische Kettenlinie*). (*a*) This is the form of a curve assumed under gravity by a heavy, homogeneous, flexible, inextensible cord placed with its two ends fixed on the perfectly smooth surface of a sphere. Taking the centre of the sphere as origin and the axis of z vertical we find (as in Appell, *Traité de Méc. Rat.*, v. 1, 3rd ed., 1909, p. 207) for the equations of curve

$$r^2=a^2-z^2 \text{ and } d\theta=Aadz/(a^2-z^2)Z,$$

where $Z=(h-z)^2(a^2-z^2)-A^2$, A and h being constants. Hence θ is, in general, an elliptic transcendent. Discussion of various possibilities in connection with the constants, and the roots of the equation $Z=0$, has been the subject for numerous monographs and dissertations. Greenhill found (1895), for example, that under certain circumstances the spherical catenary becomes a closed algebraic curve. The problem of a surface catenary was first discussed by Bobillier (1829) for any surface.

(*b*) Gudermann defined a spherical catenary by the equation $\tan\theta=\cosh m\phi$, without any reference to mechanics but simply from analogy with the equation of the plane catenary curve (*Grundriss d. analyt. Sphärik,* 1830 and Crelle's *Journal,* v. 11, 1834). He showed that this catenary is an *evolute* of the *spherical loxodrome* (1834).

61. *Spherical Epicycloid* (F. *Épicycloïde Sphérique;* G. *Sphärische Epizykloide*). This curve is the locus of a point on the circumference of a circle which rolls on the circumference of a fixed circle, the plane of the rolling circle always making with that of the fixed circle a constant angle, ω. These curves were first studied by Hermann (1728) as a result of a problem proposed in 1718 by Offenbourg: To construct on the surface of the sphere a window with contour algebraically rectifiable. (It would seem as if the problem had been suggested by that of *Viviani's windows,* no. 62.) Hermann's mistake in imagining all such curves rectifiable was pointed out by Jean Bernoulli (1742) and the only possible case for this was indicated. Clairaut, Gudermann and Lexell were other workers in this field. (*See* H. M. Jeffrey, *Quart. Journ. Math.*, v. 19, 1883, p. 44 *seq.*) The equations of such curves may be written

$$x=a\cos\theta-b[1-\cos(a\theta/b)]\cos\omega\cos\theta+a\sin(a\theta/b)\sin\theta,$$
$$y=a\sin\theta-b[1-\cos(a\theta/b)]\cos\omega\sin\theta-a\sin(a\theta/b)\cos\theta,$$
$$z=a[1-\cos(a\theta/b)]\sin\omega,$$

and define spherical curves, algebraic and unicursal if a/b is rational, and transcendental if a/b is irrational. If $a=b$ and $\omega=\pi/2$, we have a *Spherical Cardioid* whose orthogonal projections are (J. Schreiner, *Gymn. Progr.*, Kempten, 1896): (i.) on the XY-plane a *cardioid;* (ii.) on the YZ-plane a *pear-shaped quartic;* (iii.) on the XZ-plane part of a parabola.

62. *Viviani's Curve* or *Viviani's Windows* (F. *Vivianienne* or *Courbe de Viviani* or *Fenêtre de Viviani;* G. *Viviani'sche Kurve*) results from the solution of the following problem proposed for solution in 1692 by Viviani, a pupil of Galilei: On a hemispherical dome construct four equal similarly shaped windows such that the rest of the surface of the dome is exactly rectifiable. Among others, Leibniz, Jacques Bernoulli and Wallis solved the problem. The equations of the curve are, in part:

$$x^2+y^2+z^2=a^2, \text{ and } x^2+y^2-ay=0,\ x>0,$$

where a is the radius of the sphere; or $x=a\sin\phi\cos\phi$, $y=a\cos^2\phi$, and $z=a\sin\phi$; or, if $t=\tan(\phi/2)$,

$$x=2at\frac{1-t^2}{(1+t^2)^2},\quad y=a\frac{(1-t^2)^2}{(1+t^2)^2},\quad\text{and } z=a\frac{2t}{1+t^2}.$$

This curve corresponds to the curved boundary of two windows [the YZ-plane is here the base of the dome considered by Viviani]; here would be two corresponding windows on the other side of the hemispheres. The area of the hemisphere left is $8a^2$. The orthogonal projection of Viviani's curve on the XZ-plane is half of the *eight curve*, $z^4=a^2(z^2-x^2)$, and on the YZ-plane is a portion of the parabola $z^2=a(a-y)$. The stereographic projection of Viviani's curve on: (1) the XZ-plane and with the point (0, a, 0) as pole is half of the equilateral hyperbola $z^2-x^2=a^2$; (2) on the XZ-plane with the point (0, $-a$, 0) as pole is half of the *lemniscate* of *Bernoulli* $(x^2+z^2)^2=a^2(z^2-x^2)$; (3) on the XY-plane with the point (0, 0, a) as pole is part of the *strophoid*

$$y(x^2+y^2)-2a(x^2+y^2)+a^2y=0$$

with double point at (0, a, 0). The projection of Viviani's curve from (0, 0, 0) on the plane $z=a$ is part of the *kappa curve* $y^2(x^2+y^2)=a^2x^2$. (*See* T. Huber, *Diss.* Bern, 1916.)

63. *Helix* (F. *Hélice;* G. *Helix*, or *Schraublinie*). This is the curve cutting the generators of a right circular cylinder under a constant angle, β. Then the equations of the curve are $x=a\cos\theta$, $y=a\sin\theta$, and $z=a\theta\cot\beta$; $s=a\theta\operatorname{cosec}\beta$. The helix is mentioned by Geminus (*c.* 70 B.C.) and a passage in Proclus (*c.* 460) suggests that it was known to Apollonius (*c.* 225 B.C.). It was used by Pappus (*c.* 300) for producing the *quadratrix of Hippias* and we have seen that by projecting it in various ways we get a *cycloid* a *trochoid*, a *cochleoid* and a *hyperbolic spiral*. Its orthogonal projection on a plane parallel to the axis of the cylinder is a *sine curve* (Pitot, 1724). The ratio of the radii of curvature and torsion of the helix is constant (Lancret, 1802). Puiseux found (1842) that the only curve for which the radii of curvature and torsion are constant is the right circular helix. The helix is a special case of *Bertrand Curves* for which a linear relation between curvature and torsion exists. A moving straight line always meeting a helix and intersecting its axis orthogonally traces out a right circular helicoid which is the only real minimal ruled surface (Catalan, 1842).

The curve which cuts the generators of a cone of revolution under a constant angle is a *Cylindro-Conical Helix* or *Conica Loxodrome* (F. *Hélice cylindro-conique* or *Spirale logarithmique conique;* G. *Zylinderkegelschraubenlinie*) and was first discussed by Guido Grandi (1701). Its equation may be written

$$x=he^{a\theta}\cos\theta,\quad y=he^{a\theta}\sin\theta,\quad z=he^{a\theta}\cot\beta.$$

Grandi noted that this helix cuts also under a constant angle the generators of a cylinder of which one generator coincides with the axis of the cone and whose base is a *logarithmic spiral* having its pole on this axis. A certain logarithmic spiral on the XY-plane, and with pole at the origin, is an *involute* of Grandi's helix (1826).

64. *Cubical Conic Sections* (F. *Coniques Cubiques;* G. *Kubische Kegelschnitte*), which may be obtained as the line of intersection of two cones of the second order, or of two hyperboloids of one sheet, with a common generator, was first discussed by Möbius in his *Der barycentrische Calcul* (Leipzig, 1827), and later studied by Chasles (1837), Cayley (1845), Cremona (1862) and others. Möbius showed that a moving tangent to such a cubic traces out a conic on a fixed osculating plane. Seydewitz classified the cubics (1847) according to the nature of their infinitely distant points: (a) The *Cubical Ellipse* which has one real, and two conjugate points at infinity; this curve has one real asymptote. (b) The *Cubical Hyperbola* which has three real distinct points at infinity; three real distinct asymptotes. (c) The *Cubical Parabolic Hyperbola* with three real points at infinity but two of them coincident; three real asymptotes, two coincident. (d) The *Cubical Parabola* with three coincident points at infinity; the plane at infinity is an osculating plane and the curve has no asymptote. Through six given points in space a gauche cubic curve can be passed. The locus of the vertices of the cones of the second degree which all pass through the six given points in space is the cubic of the third degree determined by these six points (Chasles, 1837). If a gauche cubic with six points in common with a quadric has also a seventh point in common it lies wholly on the surface (Chasles, 1857). The quadrics through the cubic form a pencil. An elliptic cylinder passes through a gauche ellipse; three hyperbolic cylinders through a gauche hyperbola; a hyperbolic and a parabolic cylinder through the gauche parabolic hyperbola; and a parabolic cylinder through the gauche parabola. The numerous results found for such cubics are summarized in *Ency. d. Sc. Mathém.*, t. 4 v. 4, pt. 1, Paris, 1914, p. 119 *seq. See* also O. Staude, *Kubische Kegelschnitte* (Leipzig, 1913), and P. W. Wood, *The Twisted Cubic with some account of the Metrical Properties of the Cubical Hyperbola* (1913). Interpretations of the invariants and covariants of a binary cubic in terms of the geometry of a twisted cubic are given in Grace and Young, *Algebra of Invariants* (1903).

CURVILINEAR, in architecture, any form with curved or flowing lines. The term is used especially to designate the flowing tracery (*q.v.*) employed in the later decorated style (*see* DECORATED PERIOD) of English Gothic and of the French Flamboyant (*see* FLAMBOYANT STYLE), and similar styles (*see* GOTHIC ARCHITECTURE).

CURWEN, JOHN (1816–1880), English Nonconformist minister and founder of the tonic sol-fa system of musical teaching, was born at Heckmondwike, Yorkshire, of an old Cumberland family, and died at Manchester on May 26, 1880. His father was a Nonconformist minister, and he himself adopted this calling, which he practised until 1864, when he gave it up in order to devote himself to his new method of musical nomenclature, designed to avoid the use of the stave with its lines and spaces. He adapted it from that of Miss Sarah Ann Glover (1785–1867) of Norwich, whose sol-fa system was based on the ancient gamut. Curwen was led to feel the importance of a simple way of teaching how to sing by note by his experiences among Sunday-school teachers. Apart from Miss Glover, the same idea had been elaborated in France since J. J. Rousseau's time, by Pierre Galin (1786–1821), Aimé Paris (1798–1866) and Emile Chevé (1804–1864), whose method of teaching how to read at sight also depended on the principle of "tonic relationship" being inculcated by the reference of every sound to its tonic, by the use of a *numeral* notation. Curwen brought out his *Grammar of Vocal Music* in 1843, and in 1853 started the Tonic Sol-Fa Association; in 1879, the Tonic Sol-Fa college was opened. Curwen also took to publishing, and brought out a periodical called the *Tonic Sol-Fa Reporter*, and in his later life was occupied in directing the spreading organization of his system. His son, JOHN SPENCER CURWEN (1847–1916), who became principal of the Tonic Sol-Fa college, continued the promulgation and popularization of the Sol-Fa gospel, with the able co-operation of his wife, whose numerous teaching works are deservedly held in high repute.

CURZOLA (Serbo-Croatian, *Korčula* or *Karkar*), an island in the Adriatic, forming part of Dalmatia, Yugoslavia. Pop. (1931) of island 28,492; of capital (same name) 6,563. Length about 38m., breadth (average) 5 miles. The island lies 2m. W. of Sabioncello promontory. The hilly interior has prehistoric grave mounds, and Phoenicians may have colonized here. Greeks did so in the 4th century B.C., and the name may be corrupted from Κέρκυρα Μέλαινα, perhaps referring to the dark pines that still partly cover the island. It first became Venetian in A.D. 998, was ruled by Hungary and Genoa in turn in the 12th century, became independent for a while, and then its counts submitted to Venice (1255). Marco Polo was taken prisoner by the Genoese in a sea-fight near by. Curzola became Hungarian in 1358, was bought by Ragusa (1413–17), and again submitted to Venice in 1420. The capital is on a rocky foreland and contains the *loggia* (council chambers) and palace of the Venetian governors, a fine Gothic cloister in a 15th century Franciscan friary, walls and towers of the citadel (1420) on the hill crown, and a church (12th–13th century), formerly a cathedral. It was a see from 1301 to 1806.

The resistance of Curzola to the Turks in 1571 earned for it the title *fidelissima.* In 1776–97 it was a Venetian arsenal, succeeding Lesina. In the Napoleonic wars it passed through Russian, French and British to Austrian hands (1815), and it became Yugoslav in 1918. The people are sailors and fishermen, build boats, grow vines, olives and corn, breed mules, and quarry slate, stone and marble. They cling to old ways and dance the "Moreska." Italy occupied Curzola in World War II.

CURZON OF KEDLESTON, GEORGE NATHANIEL, 1st Marquess (1859–1925), English statesman, eldest son of the 4th baron Scarsdale, rector of Kedleston, Derbyshire, was born on Jan. 11, 1859, and was educated at Eton and Balliol college, Oxford. At Oxford he was president of the Union (1880), and was elected a fellow of All Souls college in 1883. He became assistant private secretary to Lord Salisbury in 1885, and in 1886 entered parliament as member for the Southport division. He was appointed under-secretary for India in 1891–1892 and for foreign affairs in 1895–1898. As under-secretary he created the impression that his career might rise to any height. Meantime he had travelled in Central Asia, Persia, Afghanistan, the Pamirs, Siam, Indo-China and Korea, and published three important books: *Russia in Central Asia* (1889), *Persia and the Persian Question* (1892) and *Problems of the Far East* (1894). In 1895 he married Mary Victoria Leiter (d. 1906), daughter of a Chicago millionaire.

In Jan. 1899 he was appointed governor-general of India. On his appointment he chose an Irish peerage, which would leave him free to re-enter the House of Commons on his return. Reaching India shortly after the suppression of the frontier risings of 1897–98, he paid special attention to the independent tribes of the north-west frontier, inaugurated a new province called the North West Frontier province, and carried out a policy of conciliation mingled with firmness of control. The only trouble on this frontier during the period of his administration was the Mahsud Waziri campaign of 1901. He exerted himself to encourage British trade in Persia, paying a visit to the Persian gulf in 1903; while on the north-east frontier he anticipated a possible Russian advance by the Tibet mission of 1903, which rendered necessary the employment of military force for the protection of the British envoys. The mission, which had the ostensible support of China as suzerain of Tibet, penetrated to Lhasa, where a treaty was signed in Sept. 1904. Curzon appointed a number of commissions to inquire into Indian education, irrigation, police and other branches of administration, and he placed on a stable basis the financial relations between the provinces and the Government of India. He established the Imperial Cadet corps, settled the question of Berar with the nizam of Hyderabad, reduced the salt tax, and gave relief to the smaller income-tax payers. He created the new department of commerce and industry. In Jan. 1903 he presided at the durbar which was held at Delhi in honour of the coronation of King Edward VII. On the expiration of the customary five years of office, Lord Curzon was reappointed governor-general and was thus able to supervise the execution of the reforms based on the exhaustive inquiries made during his first term. Of these the partition of Bengal, not actually carried out until after he had left India, roused bitter opposition, and was practically reversed in 1911. A difference of opinion with the commander-in-chief, Lord Kitchener, regarding the position of the military member of council in India, led to a controversy in which Lord Curzon was not supported by the home government. He resigned (1905) and returned to England. After his return he became warden of the Cinque Ports. In 1906 Lady Curzon died of heart failure. Curzon succeeded Goschen in 1907 as chancellor of the University of Oxford. He took his duties very seriously, and inaugurated several important changes in the constitution of the university. He now gave up the idea of returning to the House of Commons, and took his seat in the House of Lords as an Irish representative peer.

Lord Curzon received an earldom, along with the viscountcy of Scarsdale and the barony of Ravensdale, as a coronation honour in 1911. He was a strong opponent of the Parliament bill. Nevertheless, when the crisis came, he stood by Lord Lansdowne in persuading the bulk of the Conservative peers to abstain from voting, and so to permit the bill to pass and avoid a constitutional crisis.

During the vehement party conflicts of the years before the World War he was the chief lieutenant of Lord Lansdowne in the Lords. But much of his time and attention was given to the affairs of Oxford university. He had, moreover, a scholarly love for antiquities, and bought and preserved from further ruin the ancient castles of Tattershall in Lincolnshire and Bodiam in Sussex, and eventually presented them to the nation.

He joined Asquith's Coalition Cabinet in the summer of 1915, as lord privy seal; he introduced the bill constituting the new Ministry of Munitions, and took charge in the Lords of the Munitions of War bill. He became president of the Air Board in May 1916 and in July became a permanent member of the War Committee of the cabinet. When Lloyd George formed his ministry in December, Lansdowne and Crewe—the two leaders of parties in the Lords—both retired from office, and Curzon became the leader of the House with the office of lord president. He was also one of the four ministers who constituted the war cabinet, and were charged with the permanent daily conduct of the war. After the Paris conference he took over the Foreign Office from A. J. Balfour, retaining his leadership of the party in the House of Lords.

His lifelong study of foreign politics, and his first hand knowledge of Asiatic problems fitted him admirably for the foreign office. But foreign affairs in the years immediately following the war were still dominated by the prime minister and the Supreme Council; and it was at meetings of the latter, which Lloyd George attended—at Paris, San Remo, Spa, Lympne and London—that a settlement, or at least a temporary salve, was found for recurrent difficulties. Lord Curzon's reputation was a rather formidable one He had the grand manner, and none but his few intimates knew the witty, friendly and even modest personality behind the façade. His autocratic method in India and the conflict with Lord Kitchener there led people to expect that he would be a masterful foreign secretary. But to the general surprise he accepted the position imposed by Lloyd George's assumption of the main work of diplomacy, and never showed any resentment. It was not until after the fall of the coalition (Oct. 1922) that Curzon had the full powers associated with the position of foreign secretary. He retained office under Bonar Law and Baldwin until 1924.

During this period he had first to straighten out British relations with the Nationalist Turks, who, disregarding the Treaty of Sèvres, had driven the Greeks out of Thrace and Asia Minor by force of arms. In the winter of 1922–3 he presided over a European conference at Lausanne, where he employed all his resources of knowledge, skill, patience and courtesy in the vain endeavour to win Turkish consent to a satisfactory settlement. Ultimately Turkey was allowed to retain all she had regained. Relations with Russia also presented great difficulties. By remonstrances in the spring and summer of 1923, he obtained from the Russian Government the suspension of anti-British action and propaganda, and the removal of their incriminated officials at Kabul and Teheran.

But his principal preoccupation was the relations of England, France and Germany. Poincaré, the French prime minister, in spite of serious British protests, embarked in the winter of 1922–23 on the Ruhr expedition to exact reparations from Germany; and he continued and intensified the pressure throughout the year, accompanying it with the policy of encouraging Separatist movements in the Rhineland. Curzon, who had begun by merely dissociating Britain from French action, gradually took up a position of decided antagonism; and finally in August issued a note of severe condemnation, asserting the total illegality of the French movement. It is fair to say that this note was drafted in the prime minister's department, and that the most that can be alleged against the foreign office is that they did not modify its terms so as to make it more acceptable. In any case the remonstrance merely exacerbated the situation. Meanwhile Curzon had encouraged Germany to make, in regard to reparation, offers of her own, which eventually became sufficient to afford a basis for negotiation. Before he left office he had secured the consent of

France and Belgium to an advisory committee of experts (in which the United States had decided to co-operate) to be appointed by the Reparations Commission. This developed under Ramsay MacDonald into the Dawes committee, from whose report dated the improvement of European relations.

Curzon had two serious disappointments in his last years, both of which he bore with dignity. The first of these was when, on Bonar Law's resignation in May 1923, Baldwin was chosen prime minister, mainly because it was only in the House of Commons that the real opposition, the Labour party, could be encountered. The other was when Baldwin formed his second cabinet in the autumn of 1924, and passed over Curzon's claims to return to the Foreign Office in favour of Austen Chamberlain. On the first occasion, Lord Curzon consented to take the chair at the conservative party meeting which elected Baldwin to the leadership; on the second, he accepted the presidency of the council, retaining, of course, the leadership in the Lords.

The first Lady Curzon, by whom he had three daughters, died in 1906, and in 1917 he married, as his second wife, Grace Elvina, widow of Alfred Duggan, of Buenos Aires, and daughter of J. Munroe Hinds, United States consul, Rio, Brazil. He succeeded to the barony of Scarsdale on his father's death in 1916 and became a K.G. in the same year. He was created a marquess on the king's birthday in 1921. In 1925 he received the gold medal of the Royal Geographical Society.

Curzon's life was one of unremitting industry. He followed a strict *régime,* was always working and always writing. In spite of a serious weakness, curvature of the spine, which he developed in his early days at Oxford, he took violent physical exercise, and during his eastern travels, rode many hundreds of of miles. He had forced himself by sheer will-power, to do day by day more than a strong man's work; and in the early spring of 1925, his health suddenly broke down, and after a fortnight's illness he died in London on March 20. As he left no son, the marquessate and earldom became extinct; the viscountcy and barony of Scarsdale passed, with Kedleston, to his nephew; and his eldest daughter, Lady Irene Curzon, inherited the barony of Ravensdale.

His *British Government in India* (2 vols.), on the proofs of which he was engaged during his last illness, appeared in 1925. To his later years also belongs the *Tales of Travel* (1923).

The official *Life of Lord Curzon,* in three volumes, by Lord Ronaldshay, appeared in 1928.

CUSANUS, NICOLAUS (Nicholas of Cusa) (1401–1464), cardinal, theologian and scholar, the son of a boatman named Krypffs or Krebs, derived his name from his birthplace, Kues or Cusa, on the Moselle. He took his doctor's degree in law at Padua in 1423, and after studying theology at Cologne became archdeacon of Liége. He was a member of the council of Basel (1437), and dedicated to the assembly his *De concordantia Catholica,* in which he maintained the superiority of councils over popes, and assailed the genuineness of the False Decretals and the Donation of Constantine. Later, he zealously defended the supremacy of the pope. He was entrusted with various missions by the pope, being sent to Constantinople to bring about a union of the Eastern and Western churches. From 1440 he was in Germany, as papal legate at the diets of 1441, 1442, 1445 and 1446. In 1448, in recognition of his services, Nicholas V. raised him to the cardinalate, and in 1450 he was appointed bishop of Brixen. In 1451 he was sent to Germany and the Netherlands to check ecclesiastical abuses, to purify monastic life and to promote the crusade. He died Aug. 11, 1464.

Apart from his religious reforms, Cusanus is notable for his emphasis on the less predominant tendencies of mediaeval thought. Thus, like the early Oxford Franciscans, he exalts mathematics and experiment and objects to an excessive devotion to Aristotle. In his *Reparatio Calendarii,* presented to the council of Basel, he proposed the reform of the calendar after a method resembling that adopted by Gregory. In his *De Quadratura Circuli* he professed to have solved the problem; and in his *Coniectura de novissimis diebus* he prophesied the end of the world in 1734. He anticipated Copernicus by maintaining a universal movement in which the earth, which is not the centre of the universe, is involved. Celestial bodies are neither strictly circular in form nor in movement. In his principal work, *De docta ignorantia* (1440), supplemented by *De Coniecturis libri duo* (1440) he maintains that, because no two things are alike, all human knowledge is mere conjecture, and man's wisdom is to recognize his ignorance. From scepticism he escapes by holding that God (the reality in which things participate and in which contradictions vanish) can be apprehended by intuition; hence the universe and man, who return to God by their love of unity, are called the contracted maximum. He thus laid himself open to the charge of pantheism brought against him in his day. His chief philosophical doctrine was taken up by Giordano Bruno, who calls him the divine Cusanus.

The works of Cusanus were published at Basel, 1565. There are Eng. translations of *The Idiot* (1650), *Coniectura de Ultimis diebus* (1696), *De Visione Dei* (1646) and ch. 2. of Bk. 3. of *De cord. Cath.* dealing with the Donation of Constantine. *See* F. A. Scharpff's *Der Kardinal und Bischof Nikolaus von Cusa als Reformator in Kirche, Reich und Philos. des 15 Jahrhund.* (Tübingen, 1871); J. M. Düx, *Der deutsche Kard. Nicolaus von Cusa und die Kirche seiner Zeit.* (Regensburg, 1848); F. J. Clemens, *Giordano Bruno und Nikolaus Cusanus* (Bonn, 1847); E. van Steenberghe, *Le Cardinal N. de Cusa* (1920).

CUSCO, Peru: *see* CUZCO.

CUSH, the eldest son of Ham, in the Bible, from whom seems to have been derived the name of the "Land of Cush," commonly rendered "Ethiopia" by the Septuagint and the Vulgate. The exact territory thus designated is uncertain, some maintaining that it lies in Africa, in which case it will be the country to the south of Assouan, others that it is in Arabia, whilst a third view again associates the name with the "Kassites," who for some centuries dominated Babylonia. The various references suggest that the term may have been applied to districts in all three regions.

CUSHENDUN, 1st Baron (the Rt. Hon. Ronald John M'Neill, P.C.) (1861–1934), British politician, was born April 3, 1861, the son of an Ulster landowner, Edmund M'Neill, and educated at Harrow and Christ Church, Oxford. He became a barrister, but found a career in journalism. In 1899 he became assistant editor of *The St. James's Gazette,* and was editor of the same journal 1900–04. From 1906–10 he assisted Mr. Hugh Chisholm in the preparation of the 11th edition of *The Encyclopædia Britannica.* Having made several unsuccessful attempts to enter parliament, he was, in 1911, returned as Conservative M.P. for the St. Augustine (in 1918 for the Canterbury) division of Kent. As a politician he was for some years associated with Sir Edward Carson and the more strenuous opponents of Home Rule. When Baldwin formed his first ministry in 1922, M'Neill was appointed Under-secretary for Foreign Affairs; he held that office until early in 1924 and returned to it in Nov. of the same year again under Baldwin. From 1925–27 he was financial secretary to the Treasury. In 1927 he was appointed Chancellor of the Duchy of Lancaster, and raised to the peerage in the same year, taking the title Baron Cushendun from one of his family estates. When Sir Austen Chamberlain was obliged by ill-health to relinquish the conduct of the Foreign Office in the summer of 1928, Lord Cushendun took his place. He was signatory for Great Britain of the Kellogg Peace Pact, Aug. 27, 1928.

CUSHING, CALEB (1800–1879), American statesman and lawyer, was born in Salisbury, Mass., on Jan. 17, 1800. He graduated at Harvard in 1817, was tutor in mathematics there in 1820–21, was admitted to the Massachusetts bar in Dec. 1821, and began the practice of law in Newburyport, Mass., in 1824. After serving, as a Democratic-Republican, in the State house of representatives in 1825, in the State senate in 1826, and in the house again in 1828, he spent two years in Europe. He again served in the State house of representatives in 1833–34, and in the latter year was elected by the Whigs as a representative in Congress. He served in this body from 1835 until 1843, but during this period he was forced out of the Whig Party by his support of Tyler's vetoes of certain Whig measures. In 1843 President Tyler nominated him for secretary of the treasury, but the Senate refused to confirm him for this office. He was appointed later in the same year U.S. commissioner to China, where he negotiated the first treaty between China and the United States (1844);

in it was outlined the principle of exterritoriality. During the Mexican War he raised the funds necessary to equip a regiment and served with it first as colonel and afterwards as brigadier-general of volunteers. In 1847 and again in 1848 the Democrats nominated him for governor of Massachusetts, but each time he failed to be elected. After serving in the State legislature in 1851, he became an associate justice of the Massachusetts supreme court in 1852, and during the administration (1853–57) of President Pierce, was U.S. attorney general. In 1860 he presided over the Democratic national convention which met first at Charleston and later at Baltimore; when the split in the party came, he presided over the seceders, who nominated Breckinridge. During the Civil War he supported loyally the Union and served the Administration in various minor positions. At the Geneva conference for the settlement of the "Alabama" claims in 1871–72 he was one of the counsel for the United States. In 1873 President Grant nominated him for chief justice of the United States, but vigorous opposition in the Senate caused his name to be withdrawn. From 1874 to 1877 Cushing was U.S. minister to Spain. He died at Newburyport, Mass., on Jan. 2, 1879. He published *History and Present State of the Town of Newburyport, Mass.* (1826); *Review of the Late Revolution in France* (1833); *Reminiscences of Spain* (1833); *Orations on the Growth and Territorial Progress of the United States* (1839); *Life and Public Services of William H. Harrison* (1840); and *The Treaty of Washington* (1873).

See C. M. Fuess, *The Life of Caleb Cushing* (1923).

CUSHING, HARVEY (1869–1939), American surgeon, fourth in direct line of a family of physicians, was born at Cleveland (O.), on April 8, 1869. He graduated from Yale university in 1891 and from the Harvard medical school in 1895. After four years at Johns Hopkins hospital he studied abroad under Kocher at Berne, and Sherrington at Liverpool. On his return to Baltimore he held various positions in the department of surgery at Johns Hopkins university, becoming associate professor in charge of cases of surgery of the central nervous system. He wrote numerous monographs on the surgery of the brain and developed the method of operating with local anaesthesia. His work on the pituitary body (1912) gave him an international reputation. He also made important contributions to the study of blood pressure in surgery, and to the classification of brain tumours. From 1912 to 1932 he was professor of surgery in the Harvard medical school and surgeon-in-chief at the Peter Bent Brigham hospital in Boston. From 1917–19 he was director of U.S. base hospital No. 5 attached to the B.E.F. in France. In 1918 he was made senior consultant in neurological surgery for the A.E.F. He wrote a *Life of Sir William Osler* (1925) which received the Pulitzer Prize for Biography. In 1933 he became Sterling professor of neurology at Yale university.

CUSHING, WILLIAM BARKER (1842–1874), American naval officer, was born in Delafield, Wis., on Nov. 4, 1842. His father's early death forced him and his two brothers, who later displayed great gallantry in the army, to assist their mother. He was for a time a congressional page, but in 1857 received an appointment to the naval academy, from which he was obliged to resign in 1861 as the result of a prank played on one of his professors. The outbreak of the Civil War gave him, however, an opportunity to redeem himself, of which the self-styled "ex-midshipman, ex-master's mate, hare-brained scapegrace" took the fullest advantage. Coolness, daring, exceptional resourcefulness and a good fortune which caused the more superstitious of the sailors to believe him invulnerable made him the hero of a series of most spectacular feats. Foremost among them was the destruction of the Confederate ironclad "Albemarle" in the Roanoke river on Oct. 27, 1864. This vessel, which had done much damage to the Federal naval forces, was at anchor when Lieutenant Cushing in a steam launch succeeded in eluding the Confederate look-out and in exploding against her a spar-torpedo with such success that she sank. Cushing's own launch was destroyed and the crew compelled to take to the water, only he and one other man escaping capture or death. For this achievement he was thanked by Congress and made lieutenant-commander. He was promoted commander at the exceptionally early age of 30. He died at Washington, D.C., of brain fever on Dec. 17, 1874.

See a sketch by C. F. Stewart, which contains autobiographical material, in U.S. Naval Instit., *Proceedings*, vol. xxxviii., pp. 425–491, 913–991 (1912); T. W. Haight, *Three Wisconsin Cushings* (1910).

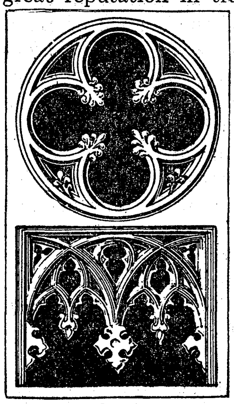
CUSHING, a city of Payne county, Oklahoma, U.S.A., 70m. N.E. of Oklahoma City, near the Cimarron river. It is served by the Missouri-Kansas-Texas and the Santa Fe railways. In 1900 the population was 826; in 1930, 9,301; and it was 7,703 in 1940 by the federal census. Cushing is in the oil, gas and cotton belt of Oklahoma. It has cotton gins, compresses, lumber yards, two refineries and three pump stations. It was settled about 1892, and incorporated in 1894.

CUSHION, a soft bag of some ornamental material, stuffed with wool, hair, feathers or even paper torn into fragments. It may be used for sitting or kneeling upon, or to soften the hardness of a chair or couch. It is a very ancient article of furniture, the inventories of the contents of palaces and great houses in the early middle ages constantly making mention of it. It was then often of great size, covered with leather, and firm enough to serve as a seat, but the tendency of all furniture has been to grow smaller. It was, indeed, used as a seat, at all events in France and Spain, at a very much later period, and in Saint-Simon's time we find that at the Spanish court it was still regarded as a peculiarly honourable substitute for a chair. In France the right to kneel upon a cushion in church behind the king was jealously guarded and strictly regulated, as we may learn again from Saint-Simon. This type of cushion was called a *carreau* or square.

The term "cushion" is given in architecture to the sides of the Ionic capital. It is also applied to an early and simple form of the Romanesque capitals of Germany and England, which consist of cubical masses, square at the top and rounded off at the four corners, so as to reduce the lower diameter to a circle of the same size as the shaft.

CUSHITE LANGUAGES, the name given to a group of Hamitic languages spoken from the Red Sea littoral to the area south of the Horn of Africa. (*See* HAMITIC LANGUAGES.)

CUSHMAN, CHARLOTTE SAUNDERS (1816–1876), American actress, was born in Boston, Mass., on July 23, 1816. Her father, a West India merchant, left his family in straitened circumstances, and Charlotte, who had a fine contralto voice, went on the operatic stage. In 1835 she successfully appeared at the Tremont theatre as the Countess Almaviva in *The Marriage of Figaro*. But her singing voice failing her she entered the drama, and played Lady Macbeth in the same year. In 1842 she managed and played in the Walnut street theatre in Philadelphia. She accompanied Macready on an extensive American tour, winning a great reputation in tragedy. In 1845 and again in 1854–55 she fulfilled successful engagements in London.



CUSP

Top: Early English, Lichfield Cathedral. Bottom: Gothic

She was a keen student, and acquired a large range of classic rôles. Her best parts were Lady Macbeth and Queen Katherine, her most popular, Meg Merrilies, in a dramatization of Scott's *Guy Mannering*. Her commanding figure and her animated vigorous temperament enabled her to play with success such male parts as Romeo and Cardinal Wolsey. Her last stage appearance was at the Globe theatre, Boston (May 15, 1875). She died in Boston Feb. 18, 1876.

See Emma Stebbins' *Charlotte Cushman, her Letters and Memories of her Life* (1878); H. A. Clapp, *Reminiscences of a Dramatic Critic* (1902); and W. T. Price, *A Life of Charlotte Cushman* (1894).

CUSP, technically, the intersection of two curves; hence, in architecture, the intersections of lobed or scalloped forms, particularly in arches (cusped arches) and tracery. Thus the three lobes of a trefoil (clover leaf form) are separated by three cusps. Cusped forms appear commonly in early Mohammedan work (*see* Mohammedan Architecture), as in the mosque of Ibn Touloun at Cairo (*c.* 875), and were especially frequent in the Moorish work of Algiers and Spain. The cusp is found occasionally in the Romanesque work (*see* Byzantine and Romanesque Architecture) of France, as in the chapel of St. Michel de l'Aiguille at Le Puy en Velay (probably late 11th century), due perhaps to influence from Spain, but it did not become popular until the Gothic period (*see* Gothic Architecture), during which it was used universally and frequently enriched with leaves, flowers or even human heads at the tip.

CUST, HENRY JOHN COCKAYNE (1861–1917), English journalist, was born in London on Oct. 10, 1861, and educated at Eton and Trinity college, Cambridge. He was Unionist member for Stamford from 1890 to 1895, and for Bermondsey from 1900 to 1906. From 1892 to 1896 he was editor of the *Pall Mall Gazette.* In Aug. 1914, he founded the Central Committee for National Patriotic Organizations, and a Cust annual lecture "on some important current topic relating to the British empire" was endowed in Nottingham university to commemorate his work. His *Occasional Poems* appeared in 1918, printed in Jerusalem. He died in London on March 2, 1917.

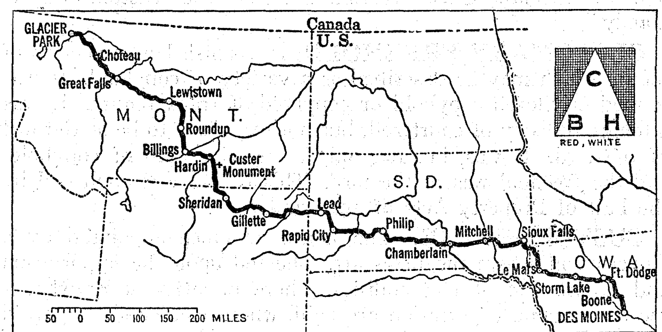
CUSTARD APPLE, a name applied to the fruit of various species of the genus *Annona* (family Annonaceae). The members of this genus are shrubs or small trees having alternate, exstipulate leaves, and flowers with three small sepals, six petals arranged in a double row and numerous stamens. The fruit of *A. reticulata,* the common custard apple, or "bullock's heart" of the West Indies, is dark brown in colour, and marked with depressions, which give it a quilted appearance; its pulp is reddish-yellow, sweetish and very soft (whence the name); the kernels of the seeds are said to be poisonous. The sour-sop (*q.v.*) is the fruit of *A. muricata,* native of the West Indies. The sweet-sop (*q.v.*) is produced by *A. squamosa,* a native of tropical America and widely cultivated in the tropics. *A. cherimola* yields the Peruvian cherimoya, which is a much esteemed fruit of superior flavour. *A. palustris,* alligator-apple or cork-wood, a native of South America and the West Indies, is valued for its wood, which serves the same purposes as cork; the fruit, commonly known as the alligator-apple, is not eaten, being reputed poisonous. (*See* Annonaceae; Cherimoya.)

CUSTER, GEORGE ARMSTRONG (1839–1876), American cavalry soldier, was born in New Rumley, Ohio. He graduated from West Point in 1861, and was sent at once to the theatre of war in Virginia, joining his regiment as it was going into the first battle of Bull Run. He served afterwards on the staff of Gen. Kearny, and later a daring reconnaissance on the Chickahominy river brought him to the notice of Gen. McClellan, the commander-in-chief, to whose staff he was promptly attached. When McClellan was relieved of his command, Custer returned to his regiment, but early in 1863 was selected as an aide-de-camp by Gen. Pleasonton who promoted him to the rank of brigadier general of volunteers. Custer distinguished himself at the head of the Michigan cavalry brigade in the battle of Gettysburg and served brilliantly through the remaining operations of the campaign of 1863. When the cavalry corps of the Army of the Potomac was reorganized under Sheridan in 1864, Custer retained his command and took part in the various actions of the cavalry in the Wilderness and Shenandoah campaigns. He led a division in the brilliant cavalry action called the battle of Woodstock, and took a most conspicuous part in the decisive battle of Cedar creek. In 1865 he accompanied Sheridan on his last great cavalry raid, won the action of Waynesboro, fought bravely at Five Forks, and led the final cavalry charge at Appomattox court house. He emerged as one of the most brilliant cavalry leaders of the Civil War.

In 1866 Custer was made lieutenant colonel of the 7th U.S. cavalry and ordered to Kansas to take part under Gen. Hancock in an expedition against the Cheyenne Indians. A crushing defeat was inflicted upon them at Washita river in November, 1868. After five more leisurely years during which time he wrote *My Life on the Plains* (1874) Custer and the 7th regiment were ordered against the Sioux in Dakota and Montana. As the advance guard of the troops under Gen. Terry, Custer's force arrived at the junction of Big Horn and Little Big Horn rivers, Montana territory, June 24, 1876; the main body was due to join him on the 26th. Unfortunately, the presence of what was judged to be a small force of Indians was reported to the general, and dividing his regiment into three parties he moved forward on the 25th to surround this force. But instead of meeting only a small force of Indians, the regiment was promptly attacked by the full force of the enemy. The flanking columns maintained themselves with difficulty until Terry came up. Custer and 264 men of the centre column rode into the midst of the enemy, and were slaughtered.

Bibliography.—Besides Custer's own book, consult those of his wife, Elizabeth Bacon Custer, *Boots and Saddles* (1885), *Tenting on the Plains* (1887), and *Following the Guidon* (1891). *See* F. W. Whittaker, *Life of General George A. Custer* (1876); F. S. Dellenbaugh, *George Armstrong Custer* (1917); P. E. Byrne, *Soldiers of the Plains* (1926); and W. A. Graham, *The Story of the Little Big Horn* (1926).

CUSTER BATTLEFIELD HIGHWAY extends from Des Moines, Iowa, to Glacier National park, Montana, a distance of about 1,500 miles. It includes along its course six national



CUSTER BATTLEFIELD HIGHWAY

forests, three national monuments, two national parks, two Indian reservations and a region adapted to camping, hunting and fishing. The Custer Battlefield national cemetery, which is replete with historic memories of the early West; the Bad Lands of South Dakota; the Black Hills; the Roosevelt monument at Deadwood; the "Devil's Tower"—are the outstanding landmarks of this interesting route. Ft. Dodge, Sioux Falls, Deadwood, Billings, Roundup, Lewiston and Great Falls are among the cities along the way.

CUSTINE, ADAM PHILIPPE, Comte de (1740–1793), French general, was born in Metz on Feb. 4, 1740, and began his military career in the Seven Years' War. He next served against the English in the War of American Independence. In 1789 he was elected to the States General by the *bailliage* of Metz. In Oct. 1791 he again joined the army, with the rank of lieutenant-general and became popular with the soldiers, amongst whom he was known as *Général Moustache.* General-in-chief of the army of the Vosges, he took Speyer, Worms, Mainz and Frankfurt in September and October 1792. During the winter a Prussian army forced him to evacuate Frankfurt, re-cross the Rhine and fall back upon Landau. He was accused of treason, defended by Robespierre, and sent back to the army of the north. But he dared not take the offensive, and did nothing to save Condé, which the Austrians were besieging. Sent to Paris to justify himself, he was found guilty by the revolutionary tribunal of having intrigued with the enemies of the republic, and guillotined on Aug. 28, 1793. (*See* French Revolutionary Wars.)

CUSTOM, in general, a habit or practice. Thus a tradesman calls those who deal with him his "customers," and the trade resulting as their "custom." The word is also used for a toll or tax levied upon goods (*see* Customs).

In law, such long-continued usage as has by common consent become a rule of conduct is termed custom. The adoption of local customs by the judiciary has undoubtedly been the origin of a great portion of the English common law. Blackstone divides custom into (1) general, which is the common law properly so called, and (2) particular, which affects only the inhabitants of particular districts. The requisites necessary to make a particular custom good are: (1) It must have been used so long that the memory of man runneth not to the contrary; (2) it must have been continued, and (3) enjoyed peaceably; (4) it must be reasonable, and (5) certain; (6) it must be compulsory, and not left to the option of every man whether he will use it or not; (7) it must be consistent with other customs, for one custom cannot be set up in opposition to another. Customs may be of various kinds, for example, customs of merchants, customs of a certain district (such as gavelkind and borough English), customs of a particular manor, etc. The word custom is also generally employed for the *usage* of a particular trade or market; for a trade custom to be established to the satisfaction of the law it must be a uniform and universal practice so well defined and recognized that contracting parties must be assumed to have had it in their minds when they contracted.

In the history of France the term "custom" was given to those special usages of different districts which had grown up into a body of local law, as the "custom of Paris," the "custom of Normandy."

CUSTOMARY FREEHOLD, in English law, a species of tenure which may be described as a variety of copyhold. It was termed privileged copyhold or copyhold of frank tenure. It was a tenure by copy of court roll, but not expressed to be at the will of the lord. It was, in fact, only a superior kind of copyhold, and the freehold was in the lord. This tenure was abolished by the Law of Property Acts of 1922 and 1925.

CUSTOM HOUSE. The house or office appointed by a Government where the taxes are collected upon the importation and exportation of commodities, where bounties or drawbacks receivable upon exportation are paid, where free goods imported or exported are declared, and where vessels are entered and cleared. The term "Custom House" has passed into all English-speaking countries.

Collection of Customs.—In early days it was the regular practice to farm the customs revenue for lengthy periods, generally of three years. In the middle of the 17th century this system was found to be very cumbersome and the revenue was therefore supplemented by the establishment of the excise, which included duties on many imported articles, differing from the customs duties only in that they were collected by commissioners of excise under the direct control of the crown. The farming system finally collapsed after the Restoration owing, chiefly, to its inconvenience, but also to the fact that the farmers were bankrupt through the country having been in quarantine for nearly a year during the Great Plague. Thereafter the collection of the customs revenue remained in the hands of the government. The collection and management of duties of customs and excise were after 1909 the responsibility of the customs and excise department, under the direction of the commissioners of customs and excise who are subject to the control of the treasury.

From the earliest times the British custom house was used for purposes other than the collection of the customs revenue. Formerly the customs officials were responsible for the collection of the light dues on behalf of the various lighthouse proprietors, and transacted all business concerning the measurement, registration and transfer of shipping, while until 1896 the customs department was also responsible for the enforcement of the quarantine regulations.

The customs and excise department assists in controlling for other departments the traffic in many nondutiable goods which, on various grounds of public policy (*e.g.*, for the protection of health), are subject to prohibition or special regulation. (*See* Customs Collector.) **(W. D. C.)**

CUSTOMS (*see* also Tariffs). The use of the British term "Customs" is of early origin, and arose as an abbreviated form of "customary" dues. It was anciently used to describe any customary payment, whether to king or church, but in process of time it came to be restricted to taxes on the import or export of commodities. As early as the reign of Richard I a tax called prise was levied on wine imports. In the Exchequer Statute of 1266 we find reference made to the yield of the customs duty on wool. The ancient customs were three. There was the grant by Parliament to the Throne of export duties on wool and leather. Then there were the import duties on wine at so much a ton—"tonnage," and at so much a pound on the value of all other goods—"poundage." Poundage at 1/- the pound, or 5%, became customary for a long period. In 1303 a charter of Edward I to alien merchants granted them liberty of trading on payment of certain duties on wine, wool, hides, cloth, etc., known variously as "new customs," "butlerage," "alien duty," or "petty custom."

The first complete legal grant of tonnage and poundage imposed by Parliament, extending to English citizens, was in 1373, in the reign of Edward III. This was called, as indeed it was, a "subsidy" to the sovereign, and after 1373 Parliament renewed the subsidy to each sovereign at the beginning of his reign. Much later we find the Act of Tonnage and Poundage of 1660 (Charles II) setting out certain scheduled rates of duty—the book of rates—as the figures at which the *ad valorem* poundage duties were to be assessed.

Growth of Customs Complexity.—In the reign of William III. the system began of mortgaging the customs yield in return for war loans, and many complicated additional dues were exacted; thus in 1698 there was an additional levy on Scottish and coastwise coals. So, in 1702, the yield of the customs rose to £1,285,605. Further heavy additions were made under Queen Anne, and in 1714 the yield was £1,779,696. In 1751, in the reign of George II., a competent authority, quoted by Pittar in his history of the Customs Tariffs, wrote: "What a maze our merchants must be in . . . Can we wonder at the decay of our commerce . . . should we not wonder that we have any left?" In 1784 the complexities had become so great that a consignment of 2,000 ells of Russian linen paid duty under ten different heads to the tune of £69 17s. od., and this sum was earmarked in detail and painfully divided up amongst many different public funds. In 1785 a committee of public accounts investigated 68 cumbrous heads of customs, in addition to five plantation duties, and directed attention to "the intricacy and perplexity that involve the collection of accounts." As a result Pitt, in 1787, consolidated the customs into single rates for each article, and enacted that all their produce should be paid into a single account to be called the "Consolidated Fund." Nevertheless, the Customs Rate Book of 1787 was a formidable compilation, and the regulations remained numerous and complicated; a shipmaster could not tackle them without expert aid. In 1793 came the war with France and heavy customs increases, and in 1798 convoy duties were enacted to pay for naval protection. Until the unions with Scotland and Ireland, there were vexatious customs duties against Scottish and Irish imports which greatly impaired trade with those countries; William III., for example, was moved to use the customs to discourage the Irish in the woollen manufacture while permitting them to trade with England in linens. Ireland, although a pastoral country, might not export her cattle or produce to England.

The Coming of Free Trade.—In 1801, the United Kingdom had no less than 1,500 specific rates of customs duty, and each article imported bore four different rates; a hundredweight of copper had to pay £2 5s. 8d. on importation. In 1826, and again in 1833, there were codifications, but excessive restrictions and prohibitions remained until 1842, when Sir Robert Peel began his great reforms, sweeping away many imposts and simplifying others. The customs tariff of 1842 reduced the import taxes on raw materials to rates not exceeding 5%, and those on manufactures to rates not exceeding 20%. Then followed the Free Trade Acts of 1845 and 1846, which cancelled hundreds of duties, virtually repealed the Corn Laws, and gave free entry to animals, meat and vegetables. By his budget of 1860, Mr. Gladstone reduced the customs tariff, for practical purposes, to a revenue tariff on a few articles not produced in the United Kingdom, and the customs duties thus ceased to have any protective effect. The duties were reduced to 26 denominations, of which ten, viz., those on beer, cards, chicory, dice, spruce, hops, malt, paper, vinegar and plate were solely imposed as countervailing duties to balance excise revenue taxes on the like articles produced at home.

Tariff Revival After War.—Thus the British customs system became a very simple one, used for revenue purposes, and so it remained until the World War, when (1915–16) import duties were imposed on a few imported luxuries, which, not being countervailed by excise duties, had a certain protective effect. Mr. McKenna, the chancellor of the exchequer who imposed these duties, chose cinematograph films, clocks and watches, pleasure motor-vehicles, and musical instruments for his purpose as proper articles upon which to levy sumptuary taxes, and these war time customs duties came to be called the "McKenna duties." In 1924, the Labour Government, in its brief tenure of office, repealed these duties, notwithstanding their incidence upon wealth, in the cause of Free Trade, but Mr. Churchill reimposed them in 1925, and in addition imposed a sumptuary customs duty on silk and artificial silk largely countervailed by an excise duty. The policy of safeguarding "key" and other industries also led, after the war, to the enactment of the safeguarding of industries act, 1921, which scheduled certain groups of articles as "key" or indispensable industries to be chargeable to customs duty at $33\frac{1}{3}\%$ *ad valorem;* these were optical glass, optical instruments, scientific glassware, laboratory porcelain, scientific instruments, measuring instruments of precision, certain compounds (not ores or minerals) of the rare metals, and certain chemicals. Few as these classifications seem, they cover in practice thousands of articles, and fill an official book of 68 pages. The safeguarding of industries act also made dutiable competing imports in cases in which it could be demonstrated by official enquiry that home industries were unfairly competed with through foreign currency depreciation, subsidies, or inferior labour conditions. Under this provision, lace, embroidery, gas mantles, leather and fabric gloves, cutlery, packing and wrapping paper, tableware and translucent pottery were made dutiable. So the British import duties grew again, but by far the greater part of the British customs tariff in 1928 was levied for revenue purposes only. (*See* FREE TRADE, PROTECTION, and SAFEGUARDING OF INDUSTRY.)

BIBLIOGRAPHY:—Pittar's *Customs Tariffs of the United Kingdom* (Blue Book G 8706 of 1897), is the best detailed account of customs history to that date; for the years after 1897 it is necessary to consult the *Statistical Abstract* of the United Kingdom, and the lists published by the British Stationery Office under the safeguarding of industries act.

BRITISH STATISTICS

The chief heads under which these duties are imposed in Great Britain are: oil, spirits, beer, tobacco, tea, sugar, wine, silk and artificial silk, cocoa, matches, beef and veal, motor vehicles, entertainments and liquor and other licences. Spirits, beer, artificial silk, sugar, matches and mechanical lighters are subject to both customs and excise duties. Tobacco, tea, silk, cocoa, oil, beef and veal, and clocks are subject to customs duties only. Entertainments are subject only to excise duties.

Items	1937–38		1926–27	
	Customs	Excise	Customs	Excise
	£	£	£	£
Cocoa, etc.	871,765		753,905	
Beer	4,498,816	61,241,404	5,432,875	78,763,480
Dried fruit	649,944		588,109	
Spirits	4,813,872	31,092,200	6,494,279	37,058,506
Sugar, etc.	9,807,635	2,065,781	17,429,320	1,354,188
Tobacco	82,951,392		53,857,530	1,831
Wine	4,996,611	498,521	4,328,908	
Tea	7,352,116		5,952,668	
Beef and veal	3,563,398			
Clocks, watches	733,342			
Motor vehicles	1,693,375			
Oil	50,258,914			
Matches	2,128,495	2,120,587	2,122,947	1,455,895

Imports Duty Act, 1932	29,712,341			
Key industry goods	1,012,386			
Eire imports	4,182,011			
Ottawa duties	8,096,993			
Liquor licenses		4,305,194		4,246,743
Entertainments		7,985,071		5,729,054
Patent medicine labels		732,699		1,295,139
McKenna duties			2,711,767	

The yield from the combined customs and excise duties was as follows: 1913–14, £75,226,538; 1917–18, £109,467,421; 1918–19, £163,129,231; 1919–20, £283,335,635; 1920–21, £333,813,420; 1921–22, £323,354,993; 1922–23 (in and after which year the figures apply to Great Britain and Northern Ireland, the Irish Free State having come into existence), £279,733,257; 1923–24, £267,730,836; 1924–25, £235,006,811; 1925–26, £237,758,442; 1933–34, £286,884,014; 1937–38, £336,116,854.

UNITED STATES

Customs or import duties in the United States are collected at certain specified ports of entry according to the schedules of the tariff act then in effect (*see* TARIFFS). However, according to the Tariff Act of 1922, the president may alter rates of duty by proclamation whenever, upon investigation, it is found that the duties fixed in the act do not equalize the differences in the costs of production of articles that are the growth or product of the United States, and of like or similar articles the growth or product of competing foreign countries. The right to change any rate or duty is restricted to a total increase or decrease of 50% of the rate specified in the act. Customs in the United States are confined to imports only, as the Constitution prohibits both export and inter-State duties. Some rates are specific, *i.e.,* based upon count, volume or weight irrespective of value; while others are *ad valorem, i.e.,* based upon value alone. The imports of the United States for the calendar year 1926 were valued at $4,408,076,000, of which $1,499,969,000 worth were dutiable, assessed $590,045,000 or an *ad valorem* of 39·34%. The world wide depression cut these figures by 1933 to: imports $1,433,013,000, dutiable $529,466,000, duty $283,681,000, equalling an *ad valorem* of 53·58%.

In 1937 imports were $3,084,061,000. The actual customs collections reported for years ending June 30 fell from the all time peak of $605,500,000 in 1926–27 to $250,750,000 in 1932–33. In 1937–38 the amount was $359,187,249.

Customs claims for the return of money illegally exacted by the administrative customs official are brought before the U.S. customs court. If the valuation by the local appraiser of imported merchandise upon which an *ad valorem* duty is assessed is disputed by the importer he may appeal for revaluation within ten days after the personal delivery or mailing of the written notice of appraisement by the local appraiser. If the importer is dissatisfied with the classification by the collector of customs at the port of entry, he may file a protest in writing within 60 days with such collector, who thereupon must forward the papers to the court, and the case is regularly docketed. There are within the United States and its Territories 47 customs districts, and, at 11 of these, regular dockets for the trial of such cases are held.

CUSTOMS COLLECTOR, the official of the U.S. Treasury Department who is the head of the customs office in a port of entry. The collectors at the principal ports are named by the president with the advice and consent of the Senate, and the major appointments are awarded to active party workers. Collectors at minor ports are named under the civil service regulations. At the principal ports the collector is assisted by an appraiser, a comptroller, a surveyor and a corps of inspectors and clerks.

CUSTOMS UNION. The idea denoted by the term is almost more familiar in its German form of "Zollverein." Strictly speaking, it means any agreement or union of a number of separate states affecting their arrangements with regard to tariffs, either among themselves or against the outside world. The classic instance was the treaty of March 1833, under which the Prussians agreed with various independent German states (at first Hesse Cassel, Hesse Darmstadt, Bavaria and Württemberg) to impose no tariffs whatever against each other and to adopt a uniform tariff against the rest of the world. This became later the germ of the idea of the Federation of the German States.

In other cases the customs union has been the means by which a small state has brought itself within the tariff system of a larger adjoining state while theoretically retaining its political independence in other ways, *e.g.* San Marino with Italy by the treaty of 1862, Monaco with France, 1865, Liechtenstein with Austria, 1875, and Portuguese India with British India, 1878. The union in this case may be very unequal, and is practically a recognition of the dominance of the adjoining greater power in commercial affairs, making the preservation of fiscal independence really not feasible.

In 1889 Cape Colony entered into a customs union with the Orange Free State, and this was afterwards extended by the adhesion of British Bechuanaland, Basutoland, the British Bechuanaland Protectorate, Natal and, after the Boer War, the Transvaal. Southern Rhodesia also joined in 1903, Swaziland in 1904 and Northern Rhodesia in 1905. The formation of the Union of South Africa in 1910 of course superseded this arrangement for the most part, but the Union does not include Rhodesia.

In the British fiscal controversy begun by Joseph Chamberlain in 1903 the idea of the Zollverein was frequently put forward as the ideal for the British empire, but any real customs union throughout the empire as a whole was never seriously discussed, because most of the constituent colonies were already committed to a system of protective tariffs, and while they were prepared to discuss preferential treatment with Great Britain, few went so far as to suggest that they should adopt free trade within the empire. (*See* IMPERIAL PREFERENCE.)

See T. E. Gregory, *Tariffs; a study in method,* 1921. (J. A. T.)

CUSTOS ROTULORUM, one of the justices selected to keep the rolls of the peace on the county. He is appointed by the Crown and is usually a person of rank, most frequently the lord-lieutenant of the county. In practice the records are in the custody of the clerk of the peace. This latter was appointed by the *custos rotulorum,* but since the passing of the Local Government Act, 1888, the appointment is made by the standing joint-committee of the county council.

CUSTOZZA, a village of Italy, 11 m. S.W. of Verona, famous as the scene of two battles between the Austrians and the Italians in the struggle for Italian unity. The first battle of Custozza was fought in 1848, the Austrians being victorious. The second battle was fought in 1866, and resulted in the victory of the Austrians. (*See* ITALIAN WARS.) Pop. (1936) 320 (town); 869 (commune).

CÜSTRIN (Küstrin), a fortified town of Germany, in the Prussian province of Brandenburg, at the confluence of the Oder and Warthe, 18 mi. N.E. from Frankfort-on-Oder and 51 mi. N.E. of Berlin by rail. Pop. (1939) 23,788.

About 1250 a town was erected on the site of Cüstrin, where a fishing village originally stood. From 1535 till 1571 it was the residence of John, margrave of Brandenburg-Cüstrin, who died without male heirs in 1571. It consists of the town proper within the fortifications, a suburb on the left bank of the Oder, and one on the right bank of the Warthe. It has manufactories of machinery, furniture, cigars, etc., and there is a considerable river trade.

CUTANEOUS SENSATION: *see* SKIN, SENSORY FUNCTIONS OF.

CUTCH, a native state of India, in the Western Indian States agency, with an area of 8,461 sq.mi. It is a peninsular tract of land, enclosed towards the west by the eastern branch of the Indus, on the south by the Indian ocean and the gulf of Cutch, and on the north and east towards the interior, by the great northern Rann, a salt morass or lake. The interior of Cutch is studded with hills and a range of mountains runs through it from east to west, many of them of fantastic shapes scattered with large isolated masses of rock. The greater part of Cutch is rocky and wild; the ground is cold, poor and sterile; and the whole face of the country bears marks of volcanic action. With the exception of a few fields near the villages, the country is a rocky and sandy waste. Wheat, barley, millet, pulse and cotton are grown. Water is scarce and brackish, and is chiefly found at the bottom of the low ranges of hills; and the inhabitants of the extensive sandy tracts suffer greatly from the want of it. Owing to the uncertainty of the periodical rains in Cutch, the country is liable to famines, and it has suffered greatly from plague.

The temperature of Cutch during the hot season is high, the thermometer frequently rising to 100° or 105° F; and in the months of April and May there are frequent storms, with clouds of dust and sand. The influence of the monsoon is greatly moderated before it reaches this region, and the rains sometimes fail. Bhuj, the capital of the state, is situated inland, and is surrounded by hills. The detached hill of Bhuja, on which the fort is situated, rises to the height of 500 ft. in the middle of the plain. There are many mountain-streams, almost dry except in the rainy season, when they are very full and rapid, and discharge themselves into the Rann, all along the coast of which the wells and springs are saline.

Famine, pestilence and tyranny have contributed in the past to thin the population of Cutch. The inhabitants numbered 500,800 in 1941. One quarter are Mohammedans and the remainder Hindus of various castes. The Jadeja Rajputs form a particular class, being the aristocracy of the country; they are all more or less connected with the family of the rao or prince, and claim their descent from a prince who reigned in Sind about 1,000 years ago. From him also the reigning sovereign is lineally descended, and he is the liege-lord of whom all the chiefs or nobles hold their lands in feu. They are all termed the brotherhood of the rao or Bhayad, and supposed to be his hereditary advisers, and their possessions are divided among their male children. To prevent the breaking down of their properties the necessary consequence of this law of inheritance, infanticide was common, but it has been put down. The Jadejas have a tradition that when they entered Cutch they were Mohammedans, but that they afterwards adopted the customs and religion of the Hindus. It is certain, indeed, that they still retain many Mohammedan customs. The natives are in general intelligent and more strongly built and handsome than those of western India. The artisans are celebrated for their ingenuity. The palace at Mandvi and a tomb of one of their princes at Bhuj, are fair specimens of their architectural skill. There are special manufactures of silver-work, silk and cotton and embroidery. The maritime population supplies good sailors. Since the withdrawal of British military forces, £5,484 is paid in tribute. There is a railway from Bhuj to Tuna, a distance of 37 miles.

History.—Cutch was invaded about the 13th century by Mohammedans of the Summa tribe, under whose sway it continued tranquil for many years. The succession continued in the same line from Prince Khengayi until 1697, when Pragji murdered his elder brother and usurped the sovereignty. This line of princes continued till 1760 without any remarkable event, when, in the reign of Rao Ghodji, the country was invaded four times by the Sinds. Fateh Mohammed, a native of Sind, continued to rule the country until his death in 1813. It was in the reign of Fateh Mohammed that communication was first made with the British Government. During the contests for the sovereignty between the usurper and the legal heir, the leader of the royal party, Hansraj, the governor of Mandvi, sought the aid of the British.

Fateh Mohammed left several sons by different wives, who were competitors for the vacant throne. Husain Miyan succeeded to a considerable portion of his father's property and power. Jugjevan, a Brahman, the late minister of Fateh Mohammed, also received a considerable share of influence; and the hatred of these two factions was embittered by religious animosities, the one being Hindu and the other Mohammedan.

The administration of affairs was nominally in the hands of Husain Miyan and his brother Ibrahim Miyan; Jugjevan was murdered and the executive authority was much weakened by the usurpations of the Arabs and other chiefs. In the meantime Ibrahim Miyan was assassinated; and after various other scenes of anarchy, the rao Bharmulji assumed the chief power. His hostility to the British became evident, and accordingly a force of 10,500 men crossed the Runn in November, 1815, and were within five miles of Bhuj, the capital of the country, when a treaty was concluded, by which the rao Bharmulji was confirmed in his title to the throne, on agreeing among other stipulations to cede Anjar and its dependencies in perpetuity to the British. Failing to fulfill the terms of the treaty, he was deposed on his surrender to the British forces and his infant son, Desalji II. was enthroned (1819.)

In 1822 the relations subsisting between the ruler of Cutch and the British were modified by a new treaty, under which the territorial cessions made by the rao in 1816 were restored in consideration of an annual payment.

Rao Desalji II. did much to suppress infanticide, suttee and the slave trade in his state. His successor Maharao Pragmalji, an excellent administrator, built harbour works at Mandvi and a reservoir. In 1876 he was succeeded by Maharaja Rao Khengarji III. the present ruler, who is also a keen advocate for education. In 1924, Cutch with Kathiawar and Palanpur (formerly under the Government of Bombay) were put in direct relation with the Government of India, through an agent to the Governor-General in the States of Western India. *See* INDIA.

CUTCH, GULF OF, an inlet on the west coast of India heading in the Runn of Cutch. The recent completion of a safe ocean port at Okha at its entry, and half way between Karachi and Bombay, is noteworthy.

CUTCH, RUNN OF or **RANN OF KACHH** (*see* INDIAN DESERT). A salt-impregnated tract in the State of Cutch. It represents the seaward margin of the Indian desert.

CUTHA, an ancient city in Mesopotamia, mentioned in the Bible but not certainly identified with any site. Sir Henry Rawlinson identified it with the mound Tell Ibrahim, 20 m. N. of Kish and 35 m. S.E. of Sippar. The mound is 60 ft. high and two miles in circumference. Cutha was devoted to the cult of Nergal, the god of the lower world. This deity was worshipped in every Sumerian city, and Cutha, because of its sanctity, seems to have been kept in repair by all Sumerian and Semitic rulers down to the last few centuries before the Christian era.

See S. Langdon, *Cambridge Ancient History* vol. i. (1923).

CUTHBERT, SAINT (d. 687), bishop of Lindisfarne, was probably a Northumbrian by birth. He entered the monastery of Melrose in 651, where, after having spent a short time in the monastery of Ripon, he succeeded Boisel as prior in 661. Three years later he became prior at Lindisfarne, retiring in 676 to the island of Farne. In 684 at the council of Twyford in Northumberland, Egfrith, king of Northumbria, induced him to become bishop of Hexham, a see which he afterwards exchanged with Eata, abbot of Melrose, for that of Lindisfarne. In 687 Cuthbert again retired to Farne, where he died on March 20, 687. His remains were removed to Durham. Another Cuthbert (or Cuthbeorht) was bishop of Hereford (736–40) and archbishop of Canterbury from 740 until his death in Oct. 760.

The best life of Cuthbert is by Bede, published in Bede's *Opera*, ed. J. Stevenson (1841). *See* also C. Eyre, *The History of St. Cuthbert* (1887); and J. Raine, *St. Cuthbert* (1828).

CUTLASS, a curved, basket-hilted sword, used at sea.

CUTLER, MANASSEH (1742–1823), American clergyman, was born in Killingly, Conn., on May 13, 1742. He graduated at Yale college in 1765, and after being a school teacher and a merchant, and occasionally appearing in the courts as a lawyer, he decided to enter the ministry. From 1771 he was pastor of the Congregational church at what is now Hamilton, Massachusetts. In the American Revolution he served as chaplain, thereafter supplementing his ministry by the practice of medicine and the conduct of a private boarding-school. In 1786 he became interested in the settlement of Western lands, and in the following year, as agent of the Ohio Company (*q.v.*), which he had taken a prominent part in organizing, he made a contract with Congress whereby his associates, former soldiers in the Revolutionary War and business men, might purchase 1,500,000ac. of land in the region north of the Ohio at the mouth of the Muskingum river. He also took a leading part in drafting the famous Ordinance of 1787 for the government of the North-west Territory. From 1801 to 1805 he was a Federalist representative in Congress. A versatile man, Cutler conducted painstaking astronomical and meteorological investigations, and made researches of scientific value in botany. He died in Hamilton, Mass., July 28, 1823.

See W. P. and Julia P. Cutler, *The Life, Journals, and Correspondence of Manasseh Cutler* (1888); and *Records of the Original Proceedings of the Ohio Company,* ed. A. B. Hulbert ("Marietta College Hist. Coll." vol. i.–ii., 1917).

CUTLERY, the name given to the various types of knives and cutting instruments used for domestic purposes. It also includes razors, scissors, carving forks and steels used for sharpening knives. Table forks which were formerly made from steel have been generally superseded by the nickel-silver article, which along with spoons form another trade.

Among primitive tribes in pre-historic times, cutting tools and weapons used in hunting and defence were made from stones and flint. Later, with the coming of a knowledge of the use of metals, cutting tools were made of bronze and iron. The Romans taught the early Britons much concerning the working of iron, and the Norman invaders are said to have brought over many smiths and skilled workers in metal. Some of the early knives and weapons acquired a high reputation for perfection and skill of production, and examples of Toledo and Damascus blades remind us of the high quality of these productions.

The production of cutlery is centred and localised in definite towns in England, the United States, France and Germany where the bulk of the world's cutlery is produced. In Europe, this localisation has been largely due to the natural resources of Sheffield, Thiers and Solingen respectively. Each of these towns is situated in a district plentifully supplied with mountain streams, the energy of which has been utilized from early times to drive water-wheels and thereby to provide the power required for manufacturing purposes. In Chaucer's time (1328-1400) the name of Sheffield was especially associated with cutlery, as when in writing of the miller, he says: "A Sheffield thwitel baar he in his hose."

In the United States now there are important centres of cutlery manufacture, especially in the New England states. The workmen employed there are largely immigrants from Sheffield and Solingen. According to the latest United States Census of Manufactures, there were then 211 American establishments under the classification "Cutlery and Edge Tools," employing 16,400 persons, with a product valued at $80,260,000. The interesting feature of American cutlery production is the growing adoption of machine processes and the passing of certain branches of the industry into the hands of some of the leading American engineering firms. A similar movement in the direction of the extended employment of machine methods is also at work in Sheffield, Solingen and Thiers.

Types of Cutlery.—There are many types of cutlery, each having distinctive uses. They vary from a small wafer blade used in the safety razor to such larger cutting instruments as the carving knife or tailor's shears, and they may be divided into the following classes: table knives, butcher and kitchen knives, pocket knives, scissors, razors, safety razors, and miscellaneous cutting tools. In all these types the blade is the fundamental part which determines the value and quality of the tool or instrument. Blades are made from steel and the quality of the article is largely a question of the quality of the steel employed in its production, and of the skill with which it is manipulated during manufacture.

In the early days of the manufacture of high-grade cutlery both cast steel and shear steel were used, and the cutlery made from these steels is specially noted for the quality of its cutting edge, and for its ability to maintain it. Later, open-hearth steel has been used for table-knives and scissors. But the introduction of steel known as "stainless" steel for cutlery has been revolutionary in its effects, and much of the steel hitherto used has been superseded by the new material, particularly in Sheffield.

The use of the word "stainless" is not a strictly accurate description of the steel, though it does resist corrosion from domestic acids to a remarkable extent. The stainless quality of the blade depends upon its having been produced in a properly hardened condition.

TABLE CUTLERY

The production of blades for table cutlery is accomplished in three successive stages: the first consisting of forging the steel into the desired shape, the second in grinding the steel to a cutting edge and imparting a polish to the steel, and the third in finishing the blade and fitting the handle.

Forging.—The better quality of knives are hammered by machinery from short, square bars of good steel. The blade receives many hundreds of blows in being forged down to the desired pattern. This hammering, like the old hand-forging, it is claimed, imparts to the blade the valuable quality of resisting wear and retaining a sharp cutting edge.

A shoulder or "bolster" is usually forged, or rolled, at the handle end of the blade, and the forging is continued below the bolster to form the "tang" or prolongation of the blade for insertion into the handle.

The introduction of machinery into the forging processes involved in table-knife forging has had the effect of creating in Sheffield a new subsidiary trade called "the goffing trade."

Hardening and Tempering.—After the blades are forged or cut out they are hardened by heating in a suitable furnace to the correct temperature and then quenched, that is, immersed in a cooling liquid. The temperature of heating required for the "stainless" steel is higher than that required in the case of other steels, the temperature of heating being in the one case 1740° F and in the other 1400° F before quenching. Various mediums are used for quenching purposes, water being the one most commonly adopted. After hardening, the blades are very brittle and are much too hard for regular use. They are then tempered by reheating to a low temperature (390° F) and again quenched. This latter treatment gives the blades the right amount of toughness combined with hardness.

A number of interesting instruments for obtaining the exact measure of hardness of the material have been introduced.

Grinding.—The blade is now subjected to the next stage, that of grinding. Machinery has largely superseded craftsmen in the grinding of table-knives; there are, however, many hand-grinders employed in Sheffield, Solingen and Thiers. In a few cases they use the same equipment driven by a water-wheel, which was in use more than a century ago. Prior to 1914 the grinders used exclusively a sandstone grinding-wheel for grinding down the forged blade to a knife blade having an even, fine cutting edge, and having a back of increasing thickness from the point of the blade to the handle. This caused a fine dust from the grindstone, and although in most cases it was saturated with water it was extremely injurious to the lungs of the grinder and resulted in a disease known as "silicosis." This injurious effect upon the health of the workman is recognized by the British Government, which requires the payment by the employer of compensation under certain conditions.

The grindstones from 5ft. to 6ft. in diameter, when new, are made to revolve in a trough containing sufficient water to wet the surface of the grindstone. In some cases the sandstone has been replaced by an artificial abrasive wheel which has the advantage of being a "healthy" wheel, but the cost unfortunately is many times the cost of the sandstone.

The grinders use the wheels differently in various centres. In Sheffield they sit on a "horsing" which is mounted over the wheel, and the men exert a pressure of the work on the wheel by standing up slightly and putting the weight of the body on the work. In Solingen the wheel is made to revolve in front of the grinder, whilst in Thiers the men lie flat on boards placed over and behind the grinding wheels. In all cases the wheels revolve so that the periphery moves away from the worker and not towards him.

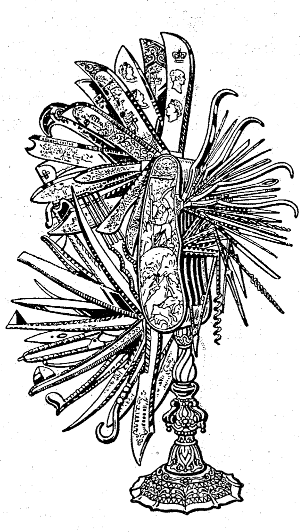
After the grinding operation has been completed the blades are fitted with handles. A wide range of material is used for the handles, varying from ivory or silver in the most expensive knives to wood in the very cheap knives. The material which is most popular in Europe is celluloid, whereas in the United States preference is given to the solid steel handle.

Carvers are made up in sets consisting of knife, fork and steel for sharpening the knife. The carving fork is the sole remaining example of the old steel forks used formerly with the table knives. The fork is provided with a guard made in various designs to prevent the blade from cutting the hand during use.

Another form of kitchen knife is the "bread knife." Some of these knives are made with a wavy edge, others are made with saw teeth cut into the finished knife, the object being to be able to cut newly-baked bread.

Table cutlery has been recently extended to include a small knife, generally made in fancy patterns with coloured handles, called a "tea knife." It is popular in cafés, where it is frequently used when eating pastries.

Pocket Knives.—The production of pocket knives commenced with the "Jack" knife, and at first was confined to heavy knives containing one blade which would open and close into a groove in the handle. Later a spring was used to secure the blade in both positions. Pocket knife manufacture is therefore known as "spring knife" cutlery. Then other blades were introduced, and the knife containing a small blade at one end and a larger blade at the other end became known as the "pen knife," due to the use of the smaller blade for sharpening quill pens.



BY COURTESY OF JOSEPH RODGERS AND SONS LTD.

THE NORFOLK SPORTSMAN'S KNIFE
Made by Joseph Rodgers & Sons Ltd., of Sheffield, for the Exhibition of 1851; this knife has 75 blades, most of which are etched or chased, and took two years to manufacture

Pocket knives are made in a great variety of patterns, some firms alone offering them in a thousand different forms. The more expensive are finished by jewellers, the cutlers supplying the skeleton knife without the covering. The jeweller then completes the knife by fitting gold scales, and some of these are even inlaid with precious stones.

The fitting of the spring knife calls for highly skilled work, as the slightest variation in the length of the spring, or the joints, will affect the correct position of the blade when open or shut.

The blades of pocket knives are made from high-grade steel, and they are tempered slightly harder than table knives, this operation calling for much skill.

The pocket knife which is fitted with a variety of articles, such as corkscrew, pricker, scissors, etc., is known as a "sporting knife." This type of knife lends itself to many extreme uses, for example a pocket knife made for an engineer includes a foot folding rule, calipers and screw-driver, in addition to the blades.

Razors.—Razors are of very remote origin, and their manufacture is carried on in most cutlery centres. The finest steel is used for the blades, which are most accurately ground and carefully whetted to produce the fine shaving edge. The hollow-ground razor is made in various patterns known as "full hollow," "three-quarter hollow," and "half hollow." The full-hollow razor is ground to an extremely thin part about the middle of the blade and is increased in thickness towards the edge, finally tapering off to the cutting edge. The essential qualities of the blade are its proper hardness and its extremely fine cutting edge.

Many attempts have been made in the past to introduce safety devices for razors, but it was not until the advent of the "Gillette" razor that this problem was satisfactorily solved, and later other types have been successfully introduced.

The safety razor consists of a small blade secured by a holder and to which is fitted a guard. The guard keeps the edge of the blade from coming into actual contact with the skin. It is, however, possible for a careless individual to cut himself even with this precaution, especially if he tries to use it at a wrong angle or uses the corner of the blade. The safety blade is of simple form; straight of edge, and lends itself to production by machine methods, eliminating most of the grinding required for ordinary hollow-ground razors. On the other hand, the safety blade in use must be kept clean. The blades, unless exceptional care is taken, require renewing frequently. To avoid this expense a stropping device is included in some patterns.

The principle of fitting a guard has been extended and applied

FINAL STEPS IN THE MANUFACTURE OF FORKS AND SPOONS

1. Striking the design of the handle, on a drop press
2. Cutting out the narrow strips of metal left on the end of the fork blank, thus forming the tines of the fork
3. Belting the tines of the fork to give a smooth finish to the surfaces between
4. Sand-buffing spoons before silver-plating
5. Silver-plated spoons after removal from the plating machine
6. Buffing to provide the final finish

to the ordinary hollow-ground razor, thus converting the plain razor into a safety razor. Another pattern of safety razor adopts the hollow-ground blade of the ordinary razor using a small section of this blade.

Scissors.—Scissors are largely produced by forging the two parts in drop stamps from a milder quality of steel than is used for razors or pocket knives. The parts are "dressed up" and "put together," and, in order to prevent the scissors from working loose, the screw which holds them together is tightly fitted and made from hard steel. There are two interesting features of fitting scissors, the first is that the blades are slightly bent towards each other, so that they make a close contact on the cutting edge, and in addition there is provision made in the joints for ensuring this contact.

Scissors are sometimes made with shaped bows so that the thumb and fingers can operate with more ease. These shaped scissors are sometimes produced from malleable castings and the blades made from steel are later fitted to the castings. Another process is to die-cast the parts in aluminium and fit steel blades to them, the latter possessing the advantage of being very light and of having an attractive appearance. There are many types of household scissors in addition to dressmaking, embroidery and manicure patterns, whilst for trade purposes there are scissors made for tailors, weavers, gardeners, cattle marking and many others. Many forms of cutting instruments cannot be strictly defined as domestic articles, such as knives for kitchen purposes, paper knives, and knives for shoe-makers, painters, and many other trades.

The Craftsman.—One of the most interesting features of the cutlery trade is the survival of some of the old guild conditions, particularly in Sheffield. The practice of dividing the trade into three sections of forging, grinding and finishing still continues.

It is in the grinding section particularly that many old customs are maintained. The workmen in some cases work at communal factories, called tenement factories, or "wheels," which are put up for the purpose of obtaining rents from any grinder who desires accommodation. The grinder pays rent and he obtains a trough in which he fits his grinding wheel, and in addition he is supplied with power to drive it and light. In some factories a small weekly charge is made for light.

BY COURTESY OF JOSEPH RODGERS AND SONS LTD.

GRINDING KNIFE BLADES
The blade is hand-held in a frame against power-driven grinding wheels, the workman gauging, by experience, the degree of grinding necessary

The craftsmen are in many cases free to go and return from work at any time to suit their own convenience. They work for any employer who will provide them with work, but as there is no contract of service they are prevented from coming within the provisions of certain factory legislation, such as the Workmen's Compensation Act.

In the early days of cutlery manufacture, both in England and on the Continent, guilds or companies of cutlers were established, the object being to protect the trade, maintain the quality of production and regulate the conditions under which the trade was carried on, including the number and training of apprentices. Some of these companies became very powerful and exerted considerable influence over the welfare of the trades.

THE CARE OF CUTLERY

The universal use of cutlery makes it desirable that some information should be given on its care and maintenance. An important precaution to take with table cutlery is to avoid washing the blades in water which is too hot. The white handles become plastic when hot and begin to leave the blades at the shoulder or bolster, displaying an ugly, narrow gap.

It is often complained that the "stainless" table knife is not stainless, and that it fails to maintain its edge. In order to test a "stainless" knife, two or three drops of malt vinegar should be allowed to dry on the blade. The blade should then be washed in hot water, and if stained there would be just cause for complaint. The failure to keep a sharp edge is a further frequent criticism, but it should be remembered that there has been a great change in practice on the part of the householder. As the "stainless" knives require no cleaning like the ordinary knives they do not receive that rubbing which helps to maintain the sharp edge in the ordinary blade. The user of stainless cutlery should keep a sharpening appliance made for stainless blades, or a small stick of fine carborundum to be used like a steel, but very sparingly.

Pocket knives require attention, particularly in the joints, which should be kept well oiled. The pocket knife blade can also be sharpened on the carborundum stick (purchased from any ironmonger) by drawing the blade slightly inclined across the stick.

Another necessary precaution both for table knives and pocket knives is not to use them for screwdrivers or for levers. The blades are made from special steels, hardened and tempered to maintain a cutting edge and not for withstanding bending strains.

Razors will maintain their cutting quality if care is taken to prevent corrosion of the extremely fine edge. After use they should be stropped and if the strop is kept in good condition, by applying a little castor oil occasionally, it will put a thin film of oil over the cutting edge, thus preventing the action of moisture upon it. This procedure is equally successful in maintaining a sharp edge on safety-razor blades.

Scissors require attention at the joints; they should be quite free but not allowed to become slack. There is a tendency in most screw joints for the blades to unscrew the rivet and so bring about slackness in the blades. The edges of the blades do not require sharpening except at long intervals, and the carborundum stick will be found a very suitable tool for this operation.

See G. I. H. Lloyd, *The Cutlery Trades;* E. Page, *La Coutellerie.* (W. R.)

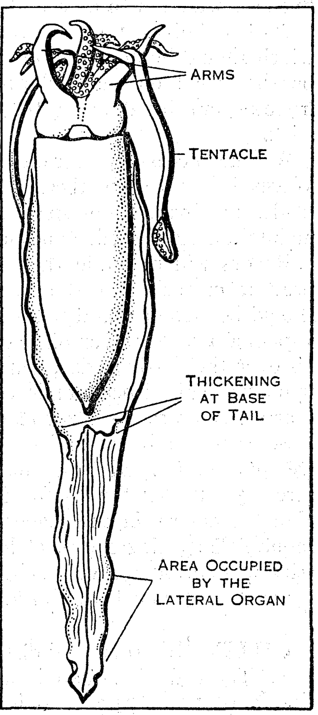
CUTTACK, town and district of British India in Orissa province. The town is situated on the river Mahanadi. The population in 1941 was 74,291. It is the centre of the Orissa canal system, and a station on the Bengal Nagpur railway from Madras to Calcutta.

It contains a government college and girls' high school, named after Ravenshaw, a former commissioner, a training college, a school of engineering and a medical school. The principal industries are silver filigree work of fine quality and tanning.

Formerly the capital of the Hindu kings of Orissa, Cuttack was the capital of the Mogul and, after them, of the Maratha governors of Orissa till its capture by the British in 1803. Some remains are still left of the Barahbati fort, which dates back to the 16th century.

The district of Cuttack forms the delta of the Mahanadi and Brahmani, together with a hilly tract inland. It has an area of 4,571 sq.mi. and a population of (1941) 2,431,427. It consists of three physical divisions: first, a marshy salt-impregnated strip along the coast, from 3 to 30 mi. in breadth; second, an intermediate stretch of alluvial plain; third, a broken hilly region, which forms the western boundary of the district. Cultivation does not begin till the limits of the salt tract are passed. The rice plain stretches inland for about 40 mi., and is a fertile region with an extensive system of irrigation. The hilly frontier separates the delta from the feudatory states. It consists of a series of ranges, 10–15 mi. in length, running nearly due east and west, with wooded slopes and valleys between. The highest hill is Assiagiri, 2,500 ft. The district is intersected by three large rivers, the Baitarani, Brahmani and Mahanadi, which after numerous bifurcations find their way into the sea by three principal mouths. Silt-banks and surf-washed bars render the entrance to these rivers perilous. The rivers having, by the silt of ages, gradually raised their beds, now run along high levels, and during floods pour over their banks and sometimes destroy the crops. Numerous interlacing channels establish communication between the main streams. Rice forms the staple product of the district; its three chief varieties are *biali* or early rice, *sarad* or winter rice, and *dalua* or spring rice. Cuttack is one of the few districts in the province in which jute is largely grown. The Orissa canal system, which lies within Cuttack district, is used both for irrigation and transport purposes. Interesting archaeological remains are found at the subdivisional town of Jajpur (*q.v.*) and at Dhauli is an inscription of the edicts which express Asoka's remorse for the suffering he inflicted in his conquest of Kalinga.

CUTTLEFISH, a marine invertebrate animal related to the octopus and placed in the molluscan class Cephalopoda (*q.v.*). The name has been regularly given to members of the family Sepiidae; but it has also been applied to other cephalopods, *e.g.*, to various kinds of squid. It is considered to be more desirable, however, to maintain the more precise usage, when possible, and to avoid confusing the cuttlefish (Sepiidae) with squids. The most characteristic feature of the cuttlefish is the internal calcified shell or "cuttle-bone," and it is this structure which affords the best means of distinguishing the cuttlefish from other forms, which on account of certain structural resemblances, are associated with it in the suborder Sepioidea of ten-armed Cephalopoda. These forms (e.g., *Sepiola, Rossia,* etc.) have a horny "shell." The interesting genus *Spirula* is regarded by some zoologists as allied to the cuttlefish; but the shell of *Spirula* is not wholly internal and its structure is not comparable with that of the Sepiidae. The sepiids include the widely distributed genus *Sepia,* in which the common European cuttlefish (*Sepia officinalis*) *Sepiella, Hemisepius,* and a few other genera are placed. These animals have a somewhat flattened body (visceral mass) edged by a pair of rather narrow fins. In the common cuttlefish the body is ornamented with a number of zebra-like stripes. The remarkable *Sepiella ornata* has a series of longitudinal patches (ocelli) down each side. Five pairs of arms encircle the mouth in all cuttlefish. One pair of these is specialized for capturing prey. These are longer than the rest and can be withdrawn into two pouches. The suckers of the shorter arms are arranged in transverse rows of four suckers each down the entire length of the arms, except on one of the ventral arms of the male (hectocotylized arm), from which they are absent towards the base. On the tentacles the suckers are restricted to an expanded pad (the "hand") at the tip of the arm. (For the general anatomy of these animals *see* CEPHALOPODA.)



FROM "ANNALS AND MAGAZINE OF NATURAL HISTORY" (TAYLOR & FRANCIS)

SQUID-LIKE CUTTLEFISH (DORATOSEPION CONFUSUM)

The male of this species has its fins prolonged backwards and provided with two lateral organs of unknown function

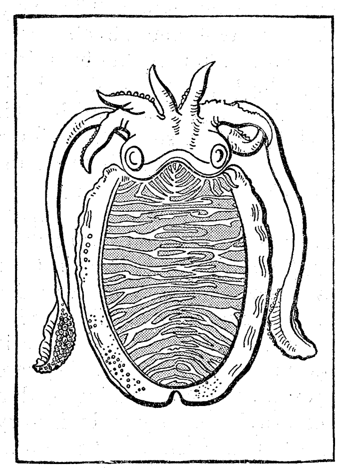
The cuttlefish are active muscular animals. They swim usually by means of the fins, which perform undulating movements; but on being alarmed or attacked the animal can dart violently backwards by expelling a jet of water from the mantle-cavity through its funnel (*q.v.* in article CEPHALOPODA). In common with the majority of the Cephalopoda the cuttlefish secretes a dark substance ("ink"), the value of which as a means of protection is discussed in the general article on the Cephalopoda.

About 100 species of cuttlefish are known. They are found in most tropical and temperate seas, but only rarely in high latitudes. According to G. Grimpe the European species are not found farther north than the Skager Rak. Among the more noteworthy species are *Sepia rouxii* and *Sepia hierreda,* which are found in the Indian ocean and the Atlantic respectively and attain a length of over 2 ft.; *Sepiella ornata* from West Africa, the colouring of which has been already alluded to, and the squid-like members of the subgenus *Doratosepion.* One of these, *Doratosepion confusum,* has its fins prolonged backwards in two long "streamers" in the male and furnished with two organs of unique structure and unknown function. The cuttlefish are mainly inhabitants of shallow coastal waters. Certain species (*e.g.,* the common European *Sepia officinalis*) seem, however, to perform regular migrations into deeper water during part of the year, and there is not much doubt that these movements, as in the case of some other marine animals, are related to various phases in the reproductive cycle. From Cuénot's account of the migrations of *S. officinalis* it seems certain that this cuttlefish enters the Bassin d'Arcachon (Bay of Biscay) during the spring, summer, and autumn for the purpose of breeding and egg-laying, and that all the individuals, young and old, depart for deeper off-shore water in the winter. Grimpe, however, has observed an additional periodicity in the occurrence of *S. officinalis* in the North sea, for there are apparently years in which this cuttlefish is far more frequent in that area than at other times. Grimpe and L. Cuénot have likewise recorded the occurrence of seasonal dimorphism in *S. officinalis.* The former states that a plump summer form ("*S. fillouxii*") replaces the slender ("*S. officinalis*") winter form in the North Sea.

The pear-shaped eggs of *Sepia* are enclosed in tough capsules and are dark in colour. They are deposited in clusters on fragments of coral, the tubes of marine worms and the stems of plants. Lo Bianco observed that in the Gulf of Naples *Sepia officinalis* prefers submerged land plants, such as *Pistacia,* for this purpose.

The breeding habits of the common cuttlefish have been recently studied by Grimpe, who records that, at least in captivity, the animal is monogamous.

The food of *Sepia* mainly consists of crustacea, though fishes are also eaten by it. J. T. Cunningham has described the capture of prawns by *S. officinalis* in the aquarium of the Marine Biological station at Plymouth. The cuttlefish marks down a prawn that is poised on a projecting ledge of rock and stalks it with great caution. When it is within striking distance the cuttlefish shoots out its tentacles and drags the prawn into the circlet of shorter arms, by which it is held as it is dismembered by the "beaks" or horny jaws of its captor. In all probability the enemies of the cuttlefish are large fishes; but exact observations on the special enemies of these animals are wanting.



COMMON EUROPEAN CUTTLEFISH

This species, distinguished by zebra-like stripes on the flattened body, is found in coastal waters. The long arms are used for catching prey. About one-quarter natural size

Cuttlefish are eaten by men in various parts of the world, *e.g.,* in Italy, Greece, India and Japan. In the Gulf of Naples *Sepia officinalis* is caught with various kinds of tackle, and the Neapolitan fishermen in the breeding season of this animal sometimes tow a female *Sepia* behind their boats and catch the males which invariably follow her. It has been found that some species of *Sepia* which are partly nocturnal in their habits are attracted by light, and in various countries fishermen lure them into their nets by torches or lanterns. In Naples the flesh of *Sepia* is not so much esteemed as that of *Octopus* and *Loligo;* but it is obtained and sold in great quantities in the Gulf of Naples and additional supplies are obtained from the Adriatic and Gulf of Manfredonia.

The "ink" secreted by these animals is used as the well-known brown pigment "sepia." It is made by cutting out the ink sac (*q.v.* in article CEPHALOPODA), dissolving its dried contents in a dilute alkaline solution, precipitating with a weak mineral acid, such as hydrochloric acid, and then adding gum arabic. The "cuttlebone" or internal shell has been used, either powdered or whole, as a dentifrice, for fine polishing, for taking casts in metalwork, as an agricultural fertilizer, for "pouncing" (dusting unsized paper to prevent ink spreading on it) and for feeding cage-birds. It was also used as a cosmetic by Roman women of fashion.

The modern cuttlefish make their appearance in the Miocene period. They are undoubtedly derived from a Belemnite-like ancestor, *Belosepia,* which lived in the Eocene seas and is found in a fossil state in the London clay.

CUTTS OF GOWRAN, JOHN CUTTS, Baron (1661–1707), British soldier, was educated at Catherine Hall, Cambridge. In 1686 he served under Charles of Lorraine in Hungary, and in 1688 as lieutenant-colonel in Holland. He fought for William in the English revolution of 1688, and in 1690, as commander of a regiment of foot, distinguished himself at the battle of the Boyne and at the siege of Limerick, for which William created him Baron Cutts of Gowran in the kingdom of Ireland. Later he served under Marlborough in the opening campaign of the War of the Spanish Succession, later being third in command at Blenheim. Cutts sat in five parliaments for the county of Cambridge, and under Anne was returned for Newport in the Isle of Wight.

CUVIER, GEORGES LÉOPOLD CHRÉTIEN FRÉDÉRIC DAGOBERT, Baron (1769–1832), French naturalist, was born on Aug. 23, 1769, at Montbéliard. After spending four years at the Academy of Stuttgart, he became tutor in the family of the Comte d'Héricy, who was in the habit of spending the summer near Fécamp. There he made the acquaintance of the agriculturist, A. H. Tessier, who secured for him in 1795 the post of assistant to the professor of comparative anatomy at the Muséum d'Histoire Naturelle. In 1796 he began to lecture at the École Centrale du Panthéon, and at the opening of the National Institute in April, he read his first palaeontological paper, which was subsequently published in 1800 under the title *Mémoires sur les espèces d'éléphants vivants et fossiles.* In 1798 appeared his first separate work, the *Tableau élémentaire de l'histoire naturelle des animaux,* which was an abridgment of his course of lectures at the École du Panthéon, and may be regarded as the foundation and first and general statement of his natural classification of the animal kingdom.

In 1799 he succeeded L. J. M. Daubenton as professor of natural history in the Collège de France, and in the following year he published the *Leçons d'anatomie comparée,* a classical work, in the production of which he was assisted by A. M. C. Dumeril in the first two volumes, and by G. L. Duvernoy in three later ones. In 1802 Cuvier became titular professor at the Jardin des Plantes; and in the same year he was appointed commissary of the Institute to accompany the inspectors-general of public instruction. In this latter capacity he visited the south of France; but he was in the early part of 1803 chosen perpetual secretary of the National Institute in the department of the physical and natural sciences.

He now devoted himself more especially to three lines of inquiry—one dealing with the structure and classification of the mollusca, the second with the comparative anatomy and systematic arrangement of the fishes, and the third with fossil mammals and reptiles primarily, and secondarily with the osteology of living forms of those groups. The results of Cuvier's principal palaeontological and geographical investigations were ultimately given to the world in his *Recherches sur les ossements fossiles de quadrupèdes* (1812, later editions 1821 and 1825) and in *Discours sur les révolutions de la surface du globe* (1825). In his *Règne animal distribué d'après son organisation* (4 vols. 1817; 2nd ed. 5 vols. 1829–30) Cuvier embodied the results of the whole of his previous researches on the structure of living and fossil animals. In 1808 Napoleon named him to the council of the Imperial University, and in this capacity he presided (in the years 1809, 1811 and 1813) over commissions charged to examine the state of the higher educational establishments in the districts beyond the Alps and the Rhine which had been annexed to France, and to report upon their affiliation with the central university. Before the fall of Napoleon (1814) he had been admitted to the council of state, and retained his position under the Bourbons. He was also elected chancellor of the university. In 1819 he was appointed president of the committee of the interior. In 1826 he was made grand officer of the Legion of Honour; and in 1831 he was raised by Louis Philippe to the rank of peer of France, and was subsequently appointed president of the council of state. In the beginning of 1832 he was nominated to the ministry of the interior, but on May 13 he died in Paris after a brief illness.

CUVILLES, FRANÇOIS DE (1698–1767), French architect and engraver. He helped to carry the French rococo taste to Germany—he was summoned about 1720 to Cologne by the elector James Clement; in 1738 he became architect to the elector of Bavaria, and afterwards occupied the same position towards the emperor Charles VII. His style, while essentially thin, is elaborate and bizarre. His son, François de Cuvilles the younger, succeeded his father at the court of Munich.

CUXHAVEN or **KUXHAVEN,** a seaport of Germany, in the Prussian province of Hanover, on the west side of the Elbe, 71 mi. by rail N.W. of Hamburg. Pop. (1939) 33,365. The town dates only from 1873, having been formed by uniting the villages of Ritzebüttel and Cuxhaven, which had belonged to Hamburg since 1394. The harbour is good and secure. A new harbour was made in 1891–1896 and became the seat of the German-American traffic. There is a fishing fleet, for which a new harbour was opened in 1892, and some ship-building is carried on. It was frequently bombed by the British in World War II.

CUYAHOGA FALLS, a city of Summit county, Ohio, U.S.A. on the Cuyahoga river, 5 mi. N.E. of Akron. It is served by the Baltimore and Ohio and the Pennsylvania railways. The population was 10,200 in 1920 (91.8% native white), and was 19,797 in 1930 and 20,546 in 1940 by the federal census. It has important manufactures (chiefly of iron and rubber goods), with an output in 1937 valued at $3,665,020; there were 22 industrial establishments in that year with 555 workers who received $807,513 in wages. It is a growing residential suburb of Akron. The city has a planning commission. Cuyahoga Falls was founded in 1812, incorporated as a village in 1868, and chartered as a city in 1921.

CUYAPO, a municipality (with administrative centre and 39 *barrios* or districts) of the province of Nueva Ecija, Luzon, Philippine Islands, 28 mi. N.N.W. of San Isidro, the provincial capital. Rice is the principal product. Pop. (1939) 24,570, of whom 12,288 were males. Of those aged 6 to 19, inclusive, 37.6% in 1939 attended school and of those 10 years old and over 51.2% were literate. Pampango is the vernacular.

CUYP, the name of a Dutch family which produced two generations of painters. The Cuyps were long settled at Dordrecht, in the neighbourhood of which they had a country house, where Albert Cuyp (the most famous) was born.

The eldest member of the family who acquired fame was Jacob Gerritsz Cuyp, born at Dordrecht Dec. 1594, and taught by Abraham Bloemaert of Utrecht. He is known to have been alive in 1649, and the date of his death was probably 1651 or 1652. J. G. Cuyp's pictures are little known. But he produced portraits in various forms, as busts and half-lengths thrown upon plain backgrounds, or groups in rooms, landscapes and gardens. Of portrait busts there are signed examples dated 1624, 1644, 1646 and 1649, in the museums of Berlin, Rotterdam, Marseilles, Vienna and Metz. In a family scene at the Amsterdam museum there are likenesses of men, women, boys and girls with a cottage and park.

Benjamin Cuyp (1612–1652) another painter of this family, was born Dec. 1612 and is supposed to have been a nephew of Jacob Gerritsz and to have resided principally at Dordrecht. He painted in the style of Rembrandt. He died in Aug. 1652.

Albert Cuyp (1620–1691), the son of Jacob Gerritsz by Grietche Dierichsdochter (Dierich's daughter), was born at Dordrecht in Oct. 1620, and married in 1658 Cornelia Bosman. By right of his possessions at Dordwyck, Cuyp was privileged to sit in the high court of the province. As a citizen he was sufficiently well known to be placed on the list of those from whom William III, stadtholder of the Netherlands, chose the regency of Dordrecht in 1672. His death, and his burial on Nov. 7, 1691 in the church of the Augustines of Dordrecht, are historically proved. He seldom dates his pictures, but it appears probable that he ceased to paint about 1675. That he was a pupil of van Goyen has been surmised on the strength of his early style. His works are supposed to be divisible into such as bear the distinctive marks C. or A. C. in cursive characters, the letters A. C. in Roman capitals, and the name "A. Cuyp" in full, but spurious examples exist. Generally speaking, the finished examples of Cuyp's middle and final period all bear his full signature.

Familiar subjects of the master's earlier period are stables with cattle and horses (Rotterdam, Amsterdam, Leningrad and Brussels museums). Occasionally he painted portraits in the bust form familiar to his father, one of which, dated 1649, is in the National gallery, London. More frequently he produced portraits of ladies and gentlemen on horseback, in which the life and dress of the period and the forms of horses are most vividly represented (Buckingham palace, Bridgewater gallery, Louvre and Dresden museums). Later on we find him fondest of expansive scenery with meadows and cattle and flocks, or rivers and barges in the foreground, and distances showing the towers and steeples of Dordrecht. Cuyp is to the river and its banks what Willem Vandevelde is to calm seas and Hobbema to woods. In his best period from about 1655–70, his landscapes are saturated with golden light and masterpieces of an acknowledged beauty, the "Riders with the Boy and Herdsman" in the National gallery, London, the Meuse, with Dordrecht in the distance, in three or four varieties, in the Bridgewater, Grosvenor, and Brownlow collections, the "Piper with Cows," in the Louvre attest his power.

John Smith's *Catalogue raisonné* of the Dutch and Flemish painters, in 9 vols. (1840), enumerated 335 of Albert Cuyp's works, of which in 1877 Sir J. A. Crowe wrote in this encyclopaedia that "it would be difficult now to find more than a third of them." In C. Hofstede de Groot's *Catalogue raisonné,* vol. ii (1909), revising Smith's, the number is extended to nearly 850, but he accepts too readily the attributions of sale catalogues; the work is, however, the best modern authority on the painter.

CUYPERS, PETRUS JOSEPHUS HUBERTUS (1827–1921), Dutch architect, was born on May 16, 1827, at Roermond, Holland. He studied under Viollet-le-Duc, and was inspired both by the Gothic and the Netherland style of the 16th century in building the Rijks museum at Amsterdam (1877–85) and in restoring and rebuilding many Roman Catholic churches, town halls and other buildings. His chief merit, however, was that he awakened the interest of his countrymen in architecture and the decorative arts, and so prepared the way for Berlage, de Bazel and others, who created the modern Dutch style of architecture. Cuypers received honorary degrees from the universities of Utrecht and Delft. He died on March 3, 1921.

CUYUNA RANGE, an area in Minnesota, U.S.A., containing extensive iron ore deposits. It was the last of the three large iron ranges in Minnesota to be opened, the first ore being shipped in 1911. The other two iron ranges in the state are the Vermilion range and the Mesabi range, both located farther to the north. There is no surface ridge or outcropping distinguishing the Cuyuna range, and the existence of the ore deposits was discovered with a drift needle. The ore lies in vertical lenses, and is covered with glacial drift which varies from 80 to 350 ft. thick, making underground mining necessary. The ore of the Cuyuna range is distinguished from that of the other two ranges in that it contains a notable amount of manganese, which is important in steelmaking.

CUZA or **COUZA, ALEXANDER JOHN** (Alexandru Joan) (1820–1873), first prince of Rumania, was born on March 20, 1820, at Galatz in Moldavia, of an ancient *boiar* or noble family. He was educated at Jassy, Pavia, Bologna, Athens and Paris. In 1845 he married Elena Rosetti. Cuza was expelled from Moldavia by Prince Sturdza for taking part in the Rumanian revolution of 1848 and took refuge in Vienna. On his return, in 1850, he was appointed president of tribunal and, later, prefect of Galatz. In 1857 he rejoined the army and within a few months rose to the rank of colonel. He became minister of war in 1858 and represented Galatz in the assembly which was elected in the same year to nominate a prince for Moldavia. In default of a foreign prince, he was himself elected prince of Moldavia by the assembly at Jassy (Jan. 5–17, 1859), and prince of Walachia by the assembly at Bucharest (Jan. 24–Feb. 5). He thus became ruler of the united principalities, with the title Prince Alexander John I; but as the Convention of Paris (Aug. 19, 1858) had intended and provided for the continued separation of the two principalities his authority was not recognized by his suzerain, the sultan of Turkey, until Dec. 11–23, 1861, when the union of the principalities under the name of Rumania was formally proclaimed. For a full account of Cuza's reign, *see* Rumania. The drastic and unconstitutional reforms which he imposed on all classes alienated his subjects, and the popular discontent culminated in revolution. At four o'clock on the morning of Feb. 23, 1866, a band of military conspirators broke into the palace and compelled the prince to sign his abdication and to leave the country. He died in Heidelberg on May 15, 1873.

CUZCO (preferably Cusco), an inland department and city of southern Peru; bounded by those of Apurimac, Ayacucho, Junín, Loreto, Madre de Dios, Puno and Arequipa and touching Brazil (area 55,717 sq.mi.). It consists of mountains, a network of high valleys tributary to great rivers, Apurimac and Urubamba, and low, jungle-covered plains. Within the summer-rain zone, the climate changes with altitude, ranging from tropical to frigid. Sugar, cacao, coca, coffee and tobacco are raised in the lower valleys, maize, cereals, alfalfa, potatoes and barley above. The amount of cultivation depends upon markets, *i.e.*, transportation. Cattle are raised in northern valleys, sheep and alpacas in the southern provinces. Though the department is rich in minerals (gold, silver, copper, iron, lead, coal, salt and others), few mines are in operation, also for lack of transportation. There are many miles of finished roads in the highland portions of the department, but none in the lowlands. One can travel by car from Cusco to Puno on the shores of Lake Titicaca, and to Lima (600 mi.). The Mollendo-Cusco railway extends beyond Cusco to Macchu and Urubamba, both in the upper Urubamba valley. Manufacturing is still in embryo. The population (565,458 in 1940) is largely composed of Indians who speak their native tongue (Quechua). The department abounds in ruins, of which the most famous are in the Urubamba valley at Pisac (Intihuatana), Ollantaitambo and Macchu Picchu (*see* Inca).

Cusco, capital of the department (13° 31′ S., 72° W.), lies in a small valley (Huatanay) tributary to the Urubamba, at a height of 11,380 ft. It is protected by lofty mountains and surrounded by orchards, gardens and cultivated fields. The population (1940, 45,158) is mostly Indian and mestizo. Founded in the 11th century by Manco Capac, first of the Incas, it has legendary prestige as capital of that vast empire. It is a strange mixture of massive Inca stone walls, early Spanish colonial architecture—of which the Renaissance cathedral (1560–1654) is a superb example—and crude adobe buildings of the present day. The houses are often built upon a foundation of Inca stonework, the modern superstructure roofed with red tile. The narrow, irregular streets are roughly paved, the wide plazas, surrounded by arcades, the site of busy markets and weekly fairs. Cusco is still in many respects a primitive Indian city, the pure, transparent air compensating for lack of sanitation. The climate is chilly (mean annual temperature 53°–59° F.), the nights cold, with rains from November to March. The cyclopean fortress of Sachsaihuaman dominates the city on the north. Among the principal buildings are the cathedral, the convent of Santo Domingo, incorporating in its walls part of the Inca temple of the sun (Coricancha), the prefecture (palace of Francisco Pizarro, who took the city in 1533), the university (founded in 1598, secularized in 1828), hospitals, library and museum of pre-Columbian Peruvian antiquities. It is the seat of a bishopric and superior court, has many monasteries and convents and more than 20 churches. The university, with four faculties (jurisprudence, political science, letters and physical science), has about 150 students. There are two *colegios nacionales* and many elementary schools. Though ancient industries such as gold and silver work are fast disappearing, there are several small manufactories such as breweries, tanneries, sugar and chocolate mills. One cotton mill produces 1,000,000 yd. annually. Cusco is the trade hub of a vast region but commerce is limited on account of transportation costs. The railway to Mollendo, more than 500 mi. distant, is the only rail outlet to the coast. There are a few modern conveniences in this venerable city, including electric lights (power furnished by a hydro-electric station 10 mi. distant), a mule-drawn tram, a telephone system and, since 1925, a new water-supply. This involved bringing in additional sources of supply, building storage reservoirs, and laying pipe-lines in the narrow, cobblestone streets, 104,800 ft. in all. It was necessary to build a motor-road 9 mi. long to permit delivery of cement pipe along the route, manufacturing it in a plant set up on the spot. (M. T. Bi; X.)

CYANAMIDE forms white crystals, melting at 40° C. and readily soluble in water, alcohol and ether. It is the amide of normal cyanic acid, NC·OH, having the formula $NC{\cdot}NH_2$. It is obtained by acting on cyanogen chloride, bromide or iodide with ammonia, or generally by desulphurizing thio-urea with mercuric oxide. Heated above its melting point cyanamide polymerizes to di-cyandiamide $(CN_2H_2)_2$, which at 150°C. is transformed into the polymer *n*-tri-cyantriamide or melamine $(CN_2H_2)_3$, the mass solidifying. Nascent hydrogen reduces cyanamide to ammonia and methylamine. It gives mono-metallic salts of the type NC·NHM when treated with aqueous or alcoholic solutions of alkalis. Di-metallic salts are obtained by heating cyanates alone, *e.g.,* calcium, or cyanides in a current of nitrogen, *e.g.,* barium.

Calcium cyanamide has assumed importance in agriculture since the discovery of its economic production in the electric furnace (*see* below). It may also be produced by heating lime or chalk with charcoal to 2,000° in a current of air. It appears that with soils which are not rich in humus or not deficient in lime, calcium cyanamide is almost as good, nitrogen for nitrogen, as ammonium sulphate or sodium nitrate; but it is of doubtful value with peaty soils or soils containing little lime, nor is it usefully available as a top-dressing or for storing.

The metallic cyanamides, of which calcium cyanamide, $CaCN_2$, is the only one of technical importance, are derivatives of cyanamide, H_2CN_2. In practice, calcium cyanamide is always formed by the action of nitrogen on calcium carbide. In 1892 Moissan showed that calcium carbide could be prepared easily and in quantity in the electric furnace, and in 1895 A. Frank and N. Caro began investigations on the absorption of nitrogen by metallic carbides which have led to the establishment of the modern cyanamide industry. Although pure calcium carbide does not absorb nitrogen even at 1,200° C. (Moissan), Frank and Caro found that technical carbides did so readily at much lower temperatures, probably owing to their impurities.

Formation of Cyanamides by Nitrogen.—By the action of nitrogen on metallic carbides, mixtures of cyanamides and cyanides are obtained, the proportions depending on the metal and on the temperature. The general type of the reaction may be illustrated by the case of calcium carbide.

$$\begin{aligned} CaC_2+N_2&=CaCN_2+C \\ CaCN_2+C&=Ca(CN)_2 \end{aligned} \quad \cdots \quad (1)$$

With alkali carbides, cyanide preponderates largely. With barium carbide about 30% cyanide and 70% cyanamide are obtained at 700°–800°C., whilst with calcium carbide cyanamide is practically the only product up to 1,100°C. In all cases the proportion of cyanide increases with the temperature. These facts explain the formation of cyanide by fusing calcium cyanamide and carbon with sodium chloride. The mechanism of the production of calcium cyanamide is by no means clear, in spite of numerous investigations. The chief difficulty in interpreting the results is the effect of impurities, always present in commercial carbide.

Absorption of Nitrogen.—The rate of absorption of nitrogen by carbide has been much studied. Pure calcium carbide does not absorb nitrogen at 1,200°C. With commercial carbide (containing about 10% lime) absorption is rapid and complete at 1,050°–1,100°C. Below 1,000°C. the absorption is less rapid and is incomplete, the nitrogen absorbed tending to a limiting value, which is lower the lower the temperature. These limiting values do not represent true equilibria (Foerster and Jacoby). Pollacci found that the velocity of absorption is proportional to the nitrogen pressure up to two atmospheres, but that further increase of pressure makes little difference.

Many substances when added to calcium carbide lower the temperature at which nitrogen absorption begins and increase the velocity of absorption for a given temperature. The most important of these substances are calcium chloride (Polzenius) and calcium fluoride (Carlson). Many other substances, including lime, act similarly, and this explains the action of commercial carbide. The rôle of these additions has been investigated by G. Bredig, W. Fraenkel and E. Wilke, F. Foerster and H. Jacoby, Rudolphi, G. Pollacci and others, and has been connected with the lowering of the melting-point of the mass which they cause; but how this increases the velocity of absorption, whether by removing protecting layers of reaction products from the carbide, by allowing the nitrogen to dissolve in the liquid mass, or by other means, has not been settled. Reaction (1) is strongly exothermic. The heat of reaction is about 77,800 calories at 25°C.

Technical Production.—On the commercial scale a mixture of calcium cyanamide and carbon ($CaCN_2+C$) is produced by heating ground calcium carbide in an atmosphere of nitrogen to about 1,000°–1,100°C. The nitrogen is generally prepared by the fractional distillation of liquid air by the Linde or Claude process, and should be as free as possible from moisture, oxides of carbon and especially oxygen, as these act on either the carbide or cyanamide and diminish the nitrogen content of the final product.

Discontinuous Process.—In the discontinuous process a vertical steel drum lined with firebrick is fitted loosely with a thick paper or thin, perforated, sheet-iron cylinder. Down the centre of the retort passes a carbon rod contained in a cardboard tube to separate it from the carbide. This rod is connected to an alternating current supply and is used as a heating resistance to start the reaction. The ground carbide is packed between the inner tube and the outer cylinder. The lid is luted on airtight. Nitrogen is admitted by a pipe through the outer casing. The charge consists of 300–800 kilos of carbide. A battery of such units is connected to the current supply. The heated carbon resistor starts the reaction at the centre. After a time the current is cut off as the reaction produces sufficient heat to maintain the charge at about 1,000°C. and so complete the reaction. The drums are allowed to cool, the contents ground and treated with sufficient water to slake the lime and decompose any uncombined carbide. The ground product is sometimes mixed with a little oil to render it dustless before packing in bags. The crude cyanamide, known as "nitrolim," "lime nitrogen," "kalkstickstoff" or "stickstoffkalk," contains 20–22% of nitrogen, corresponding to 57–63% of $CaCN_2$ and about 20% lime, 7–8% silica, iron oxide and alumina and 14% of graphitic carbon.

Continuous Process.—In one type of continuous furnace the carbide is packed in perforated metal boxes which are sent through a tunnel filled with nitrogen and heated, electrically or by external gas firing, to the necessary reaction temperature. Another common type is a vertical iron shaft lined with firebrick and divided internally into sections by shelves. The carbide is fed in at the top and heated by arcs between carbon electrodes. It meets an ascending stream of nitrogen and is made to fall slowly from shelf to shelf by scrapers until it is discharged at the bottom. In the Carlson process calcium fluoride is added to the carbide to increase the velocity of absorption and to lower the reaction temperature.

Uses of Nitrolim.—Nitrolim may be used directly on most soils as a nitrogenous fertilizer. When treated with water or steam under pressure it gives up practically the whole of its nitrogen as ammonia (*q.v.*):—

$$CaCN_2+3H_2O=CaCO_3+2NH_3.$$

The addition of alkali increases the yield of ammonia by lessening the formation of polymerides of cyanamide. By fusing a mixture of nitrolim, common salt and calcium carbide in an arc furnace, sodium cyanide is a product of the reaction. By rapidly cooling the melt the reverse reaction is prevented and the cyanide preserved. By suitable treatment numerous organic compounds (urea, dicyandiamide, guanidine, etc.) may be prepared from cyanamide. It also forms the basis of "ferrodur," used for case-hardening iron.

CYANIC ACID AND CYANATES. Cyanic acid, HO.CN, was discovered by F. Wöhler in 1824. The acid is best prepared by distilling its polymeride, cyanuric acid, in a current of carbon dioxide (F. Wöhler and J. v. Liebig, 1827), the vapours distilling over being condensed in a freezing mixture. It is a very volatile liquid of strong acid reaction, and is stable only below 0°C. It has a smell resembling that of acetic acid. At 0°C. it is rapidly converted into a mixture of cyanuric acid, $C_3N_3O_3H_3$, and another polymeride cyamelide $(CNOH)_x$, a white amorphous powder, insoluble in water. Cyanogen chloride, CNCl, which may be regarded as the chloride of cyanic acid, is prepared by the action of chlorine on hydrocyanic acid or on mercuric cyanide. It is a very poisonous volatile liquid, which boils at 15.5°C. (*See* CHEMICAL WARFARE.)

The salts of cyanic acid are known as the cyanates, the two most important being potassium cyanate (KOCN) and ammonium cyanate (NH_4OCN). Potassium cyanate may be prepared by heating potassium cyanide with an oxidizing agent, or by heating potassium ferrocyanide with manganese dioxide, potassium dichromate or a mixture of potassium carbonate and minium. It crystallizes in flat plates and is readily soluble in alcohol or cold water. It is a somewhat important reagent, and has been used by Emil Fischer in various syntheses in the uric acid group. (*See* PURINES.) J. Walker and J. K. Wood (1900) prepared pure ammonium cyanate by the union of gaseous ammonia and cyanic acid, special precautions being taken to keep the temperature below the point at which the salt is transformed into urea. It crystallizes in fine needles, which melt suddenly at about 80°C., then resolidify, and melt again at about 128° to 130°C. (this temperature being the melting point of urea).

Esters of normal cyanic acid are not known, but those of isocyanic acid (HN:CO) may be prepared by the action of alkyl halides on silver cyanate, by oxidizing the isonitriles with mercuric oxide, or, more conveniently, by rearrangement of the amide or azide of a carboxylic acid, by rearrangement of a hydroxamic acid, or by the action of phosgene upon the hydrochloride of an aromatic primary amine. They are volatile liquids which boil without decomposition, and possess a disagreeable odour. When hydrolyzed with caustic alkalis, they yield primary amines (this reaction determines their constitution): $C_2H_5NCO+2NaOH=C_2H_5NH_2+Na_2CO_3$. With alcohols they give urethanes, and with amines they give substituted ureas. The sulphur analogues of these esters, the isothiocyanates, are known as mustard oils (*q.v.*).

Ethyl isocyanate, C_2H_5NCO, a colourless liquid (b.p. 60°C.) was first prepared by A. Wurtz (1854) by distilling a mixture of potassium ethyl sulphate and potassium cyanate.

Cyanuric acid, $H_3C_3N_3O_3$, was obtained by Wöhler and Liebig by heating urea, and by A. Wurtz by passing chlorine into melting urea. It forms white efflorescent crystals. Treatment with phosphorus pentachloride gives cyanuric chloride, $C_3N_3Cl_3$, which is also formed by the combination of anhydrous chlorine and hydrocyanic acid in the presence of sunlight. These substances contain a ring of three carbon and three nitrogen atoms.

CYANIDE, in chemistry, a salt of prussic or hydrocyanic acid, the name being more usually restricted to inorganic salts, *i.e.,* the salts of the metals; the organic salts (or esters) being termed nitriles. The properties of cyanides are treated in the article PRUSSIC ACID; reference should also be made to the articles on the particular metals. The most important cyanide commercially is sodium cyanide, which receives application in the "cyanide process" of gold extraction (*see* GOLD), as an insecticide, in case-hardening, electroplating, in the separation of minerals by flotation, and in organic syntheses.

Sodium Cyanide, NaCN, is manufactured by six methods.

(1) *Sodium Process.*—Metallic sodium is melted with charcoal in a steel vessel, and dry ammonia gas blown into the liquid at a dull red heat (600°C.); the sodium and carbon combine with the nitrogen of the ammonia, yielding sodium cyanide which is liquid at this temperature. The combination really takes place in three stages; sodamide is first formed, $Na+NH_3=NaNH_2+H$, but it has only a momentary existence, reacting at once either with charcoal or with sodium cyanide, to form sodium cyanamide ($2NaNH_2+C=Na_2CN_2+2H_2$, or $NaNH_2+NaCN=Na_2CN_2+H_2$), which then takes up carbon more slowly, yielding sodium cyanide, $NaCN_2+C=2NaCN$. To complete this last reaction the temperature is raised finally to about 850°C. After cooling, but while still molten, the finished cyanide is filtered through iron turnings into moulds of convenient size. The product is a pure white crystalline material containing 97.5% of sodium cyanide.

(2) *Formamide Process.*—When the vapour of formamide is passed over a catalyst at a moderately high temperature, *e.g.,* 600°C., it decomposes almost completely into hydrocyanic acid and water, $H{\cdot}CO{\cdot}NH_2=HCN+H_2O$. The former is absorbed in caustic soda and the resulting solution of sodium cyanide is evaporated to dryness in a vacuum. The briquetted product contains about 90% of sodium cyanide. This process has been made economically possible by the development of the high-pressure technique of chemical industry; the necessary formamide is obtained by the direct combination of carbon monoxide and ammonia at 80° to 90° under a pressure of 200 atmospheres. The reaction takes place most readily in presence of sodium methoxide, obtained by dissolving sodium in methanol (methyl alcohol).

(3) *"Schlempe" Process.*—The juice of the sugar beet contains, in addition to sugar, certain nitrogenous compounds. After the sugar has been removed as completely as possible, there remains a dark brown syrup, known in Germany as "Schlempe," which contains a large part of these constituents. This is dried and then distilled in retorts resembling those used in coal-gas manufacture. The gas evolved contains, among other things, ammonia and the three methylamines; when heated to 1,000°C. the latter decompose, yielding hydrocyanic acid. On leaving the heating stoves the gases contain ammonia, hydrocyanic acid and carbon dioxide; the ammonia is recovered by treatment with sulphuric acid after which the hydrocyanic acid is washed out with water, the dilute solution produced (about 2% HCN) is distilled and the hydrocyanic acid absorbed in caustic soda. This product resembles that of the formamide process.

(4) *The Cyanamide Process* begins with calcium cyanamide (*q.v.*), which is manufactured in large quantities by the direct union of atmospheric nitrogen with calcium carbide. A mixture of calcium cyanamide, common salt, and a little calcium carbide is fed into an electric furnace, consisting of a vertical shaft with carbon bottom and a single, suspended carbon electrode. Alternating current passes between the electrode and the charge, heating it to 1,200°–1,400°C. The fused furnace charge is run off almost continuously on to a rotating, water-cooled, steel drum which cools it rapidly. The product is obtained in the form of thin, grey flakes and contains cyanide equivalent to 48 to 50% of sodium cyanide. The formation of cyanide in this process is due to the combination of calcium cyanamide with carbon, $CaCN_2+C=Ca(CN)_2$. A part of the necessary carbon is already present in the calcium cyanamide owing to its method of formation, $CaC_2+N_2=CaCN_2+C$; the addition of calcium carbide to the charge furnishes a further quantity in a more chemically active form. Rapid cooling of the melt is necessary to prevent the decomposition of calcium cyanide which takes place between 700° and 400°C.

(5) *The Carbonate Process,* historically the oldest of those in use, was first described by L. Thompson in 1838. An intimate

mixture of sodium carbonate, carbon and iron is heated at 950°C. in a nichrome retort lined with steel with a current of nitrogen employed in excess: $Na_2CO_3+4C+N_2=2NaCN+3CO$, the iron acting as a catalyst. This process presents many difficulties, but has nevertheless obtained a measure of success as a producer of hydrocyanic acid.

(6) *Arc Process.*—When a mixture of methane and nitrogen, diluted with hydrogen, is passed through a high-tension electric arc, hydrocyanic acid is formed, $2CH_4+N_2=2HCN+3H_2$.

Control of Insect and Other Pests.—The value of hydrocyanic acid as an insecticide was first recognized in 1886 by D. W. Coquillett, who used it in the control of scale insects on citrus trees in California. The methods of work were standardized by the investigations of R. S. Woglum in 1907–10, and the method spread to most of the fruit-growing countries of the world. Hydrocyanic acid was first used for the destruction of vermin in the sleeping carriages of the Cape Government Railway in 1898, and its use for similar purposes spread so rapidly that the town council of Johannesburg found it necessary, in 1916, to draw up by-laws for the licensing of fumigators and for regulating the practice. Hydrocyanic acid was authorized as a fumigant in the United States Quarantine Regulations of 1910, but was first used on a large scale for killing rats in ships at New Orleans in 1914.

In the fumigation of plants it is important to secure a concentration of hydrocyanic acid which will kill the insect pest without injury to the plant; since these are more susceptible to injury in sunlight than in the dark, fumigation is done at night and at 38°–65°F. Some plants are more easily damaged than others.

In order to confine the gas, plants growing in the open are covered with a tent of closely-woven cotton cloth, measuring usually from 36 to 45ft. across, which hangs down, touching the ground all round. The distance round the bottom of this tent is then measured and the distance over the top of the tree read off from a scale which is painted on the cloth itself; the quantity of cyanide required for the enclosure is then read off from tables constructed by Woglum and based on the use of 1 oz. of potassium cyanide (or $\frac{3}{4}$ oz. of sodium cyanide) for 100 cu.ft. of enclosed space; allowances are made for the size of tree and the nature of the insect to be dealt with. The exposure to the gas is usually one hour. The hydrocyanic acid is generated by mixing together sodium cyanide (1 oz.), concentrated sulphuric acid ($1\frac{1}{2}$ fluid oz.) and water (2 oz.). The water is placed in a 2 to 3gal. stoneware jug, the sulphuric acid added, the charge of cyanide is thrown in, and the tent closed at once. In more gas-tight enclosures, such as greenhouses, a smaller dosage is sufficient; in some cases a repetition of the treatment after a suitable interval may be needful, eggs and pupae being more resistant than the larvae and mature insects; most scale insects require about $2\frac{1}{2}$ oz. per 1,000 cubic feet.

In the fumigation of ships and mills, modifications of the procedure are necessary owing to the larger quantity of gas required and the difficulty of protecting the operator from danger, several hours being allowed for the gas to escape.

The necessity of handling strong sulphuric acid and difficulties in disposal of the poisonous acid residues have led to the introduction of pure liquid hydrocyanic acid. This was first manufactured commercially in California in 1917 and in South Africa in 1920. In California, the liquid, which contains 2 to 4% water, is supplied in iron drums holding 100 lb. each. It is applied by means of a portable vessel containing 17 to 21 lb. with attached hand pump; each stroke of the pump delivers a measured quantity of the liquid to a spraying nozzle which is pushed into the tent; 22c.c. of the liquid acid are equivalent to 1 oz. of sodium cyanide.

Liquid hydrocyanic acid is unstable and may even explode. For this reason its use was restricted to districts in which distribution by motor transport from a local factory was possible. The instability is principally due to the presence of traces of ammonia gradually formed by the action of water on the acid itself. Small quantities of a strong acid neutralize the ammonia and therefore confer temporary stability; larger quantities are useless because they accelerate the formation of ammonia. Recently many other substances which neutralize ammonia have been proposed; among these, substances which also act as detectors are especially interesting. Owing to its faint smell the presence of a dangerous quantity of hydrocyanic acid may easily escape notice (the smell is much more perceptible when one is smoking). The addition of 2 or 3% of such violently lachrymatory substances as cyanogen chloride, ethyl chlorocarbonate or ethyl bromoacetate is said to stabilize the acid and also give unmistakable warning of its presence in the air. Stabilized, liquid hydrocyanic acid, absorbed in granular diatomite, is marketed under the name of *Cyclon.*

The impure calcium cyanide produced by the cyanamide process gives off hydrocyanic acid by mere contact with moist air. Where the residue of lime is harmless the powdered material may therefore be used instead of hydrocyanic acid; for example, it has been used for killing rabbits by blowing the dust into their burrows.

Case Hardening.—Since 1910 case hardening by immersion in fused sodium cyanide has come into use more especially in the United States and Canada. Mild steel absorbs carbon from fused sodium cyanide and is so converted, superficially, into steel which can be hardened by rapid cooling. The articles to be treated are suspended in a bath of fused sodium cyanide at 850°C. preferably diluted with sodium chloride or carbonate to contain about 50% of NaCN. The rate of penetration of carbon into mild steel is $\frac{1}{100}$th in. (0·25mm.) per hour, or about 50% more when 3% nickel steel is used. The rate of penetration is independent of the percentage of cyanide in the bath, but the carbon content, and therefore the hardness after quenching, increases with it; an immersion of 10 to 15 min. is sufficient in some instances.

Electroplating.—The use of cyanide solutions for plating with silver was discovered in 1840. A plating solution is prepared by dissolving a silver salt (*e.g.,* the cyanide or carbonate) in a solution of potassium cyanide. The article to be plated, of which the surface has been carefully cleaned, and a sheet of silver of about the same size are suspended a few inches apart in the solution and a current of electricity is passed through the bath from the silver to the article. The silver dissolves and an equal quantity is deposited, so that the composition of the bath remains unchanged except for a slight decomposition of the cyanide by the action of atmospheric carbon dioxide. The quality of the deposit improves with the age of the bath: solutions are to be found which have been in use for more than 50 years. The composition of the bath varies, but from 2 to 4 oz. of silver per imperial gallon, with about double the minimum quantity of cyanide required to dissolve it, is usually satisfactory. The improvement with age is probably due to the higher electrical conductivity of the solutions containing accumulated impurities, principally potassium carbonate. The current generally used is 3 amp. per sq.ft. of surface. Plating with gold, gold–silver or gold–copper alloys is done in a similar way. Cyanide solutions are also used in the deposition of copper, zinc, brass and cadmium, more especially on iron.

Flotation.—Intimate mixtures of the sulphides of lead, zinc, copper and iron with gangue often occur in nature. The separation of the minerals is effected by agitating a mixture of the powdered ore, water and a little oil with air. A froth is formed in which the minerals predominate. G. E. Sheridan and G. G. Griswold (U.S. Patents 1,421,583 and 1,427,235 of 1922) have found that the addition of a small quantity of sodium cyanide and, preferably, zinc sulphate to the liquid, previously made faintly alkaline with soda ash, prevents the flotation of zinc sulphide and of iron pyrites without affecting that of the sulphides of lead or copper. The iron and zinc may be separated by a second treatment in more strongly alkaline solution, the zinc alone floating. The process is in use at several mines in North America.

CYANIDE PROCESS. When the cyanide process was invented in 1887 there was pressing need for improvement in the treatment of gold ores. The industry, after languishing for many years, had received a fillip from the discovery of the Rand goldfield and was attracting great attention. The mining of ores was by no means inefficient, but extraction of the gold from them was poor and behind the times. The old amalgamation (*q.v.*) process was cheap but in general could only extract some 60% of the values, and most of the finely divided gold, as well as the gold contained in minerals such as pyrites and other sulphides, escaped in the tailings. Many ores had been discovered which could not be treated by amalgamation or were too poor to pay for working. Smelting, although effective, was costly and required the supply of large quantities of rich ore, together with lead ore and cheap fuel at no great distance from the gold mines. Metallurgists were busily engaged in the search for new methods and almost any proposal was eagerly seized upon and tested. It was the paradise of the bogus process-monger. Many new processes, including novelties in amalgamation, were found to be worthless or of limited scope.

The proposal to use cyanide of potassium as a solvent for gold in ores is almost the only instance on record of an invention of vital importance to an industry being made to order. It was put forward by J. S. MacArthur and R. W. and W. Forrest and was received at first with derision, partly because the chemical was rare and had been little studied. Cyanide was best known at the time as a deadly poison, although small quantities were used in electro-plating and in photography.

However, it was soon found that the proposal was a sound one. It was tried in New Zealand in 1889 and in South Africa in 1890 and before long was recognized as the new process for which everyone had been seeking. At first it was used mainly on the tailings from amalgamation in the Transvaal, but it was applied later to both gold and silver ores without previous amalgamation, and this practice had become the general rule by 1925.

In the process, pulverized gold ores or the tailings from amalgamation are mixed with a dilute solution of potassium cyanide (KCy) or sodium cyanide (NaCy) in water. The gold and silver are dissolved and the solution is separated from the ore by filtration. The clear solution then flows through a mass of zinc shavings, when the gold and silver are precipitated and appear on the surface of the zinc as a black slime, while some zinc is dissolved. The black slime is purified, melted down and cast into bars of gold and silver. In modern practice the zinc shavings are replaced by zinc dust.

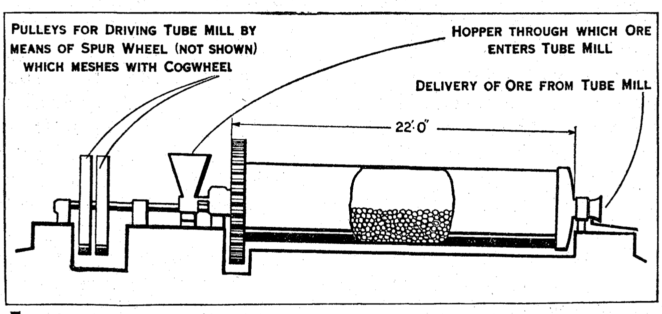

FIG. 1.—SECTION OF TUBE MILL SHOWING HOW THE BROKEN GOLD ORE, SCREENED TO A MAXIMUM SIZE OF ½ IN., IS GROUND WITH PEBBLES OR UNBROKEN ORE TO A MIXTURE OF SAND AND SLIME

The chemical action is complicated but need not be discussed here at length. The gold is not dissolved without chemical change, as sugar is dissolved in water. It is converted into cyanide of gold and is dissolved as a double cyanide of gold and potassium. When chemical symbols are used, the dissolving of the gold is represented by the following equation:—

$$4\,Au+8\,KCy+O_2+2\,H_2O=4\,KAu\,Cy_2+4\,KHO$$

Among the involved chemical actions which take place there is one which should be borne in mind, and that is the part played by air in dissolving the gold. It is necessary to ensure the continuous presence of oxygen at the surface of the particles of gold or the action stops altogether.

Crushing and Cyaniding the Ore.—Gold ores are generally crushed in cyanide solution instead of water. The result is that the gold begins to be dissolved at once, and the dissolving continues throughout the succeeding stages until filtering is completed. A variety of machines are used for crushing, among which may be mentioned the stamp battery (*see* AMALGAMATION). When the ore has been reduced to a maximum size of about ½in. in diameter it is delivered into tube mills (fig. 1), for further grinding. A tube mill is a long iron cylinder placed in a horizontal position and made to revolve on its own axis. It is half filled with flint pebbles or pieces of unbroken ore, which roll over each other as the mill revolves and grind the ore to a mixture of sand and slime. It is continuous in action. The ore enters ceaselessly at one end and passes out at the other.

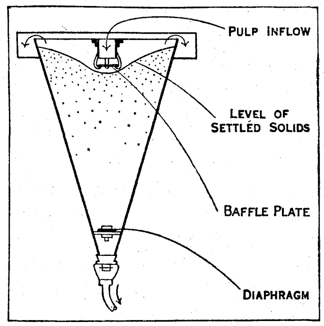

FIG. 2.—CONE CLASSIFIER
The product of the tube mill passes into this apparatus which separates the coarse sand from the slime

The product of the tube mill is next "classified" or separated nto sand and slime. One type of classifying machine much used in South Africa is the Cone Classifier (fig. 2). This is kept full of water and the pulp is run in at the top. The coarse sand settles and passes through a nozzle at the bottom; the fine slime overflows at the top with most of the water. The coarse sand is returned to the tube mill to be ground again and the product is fed once more into the classifier. The ore is thus all ground to slime in the end, as the only part which goes forward to other machines is the overflow from the classifier (fig. 3). This method of work is called "all-sliming."

At this stage of the operations the dissolving of the gold is assisted by the use of agitating vats. One of the most ingenious of these is the Pachuca tank (fig. 4), so called because of its use on silver ores at Pachuca in Mexico. Air is forced into the central tube A at the bottom and bubbles up the tube, carrying the slimed ore with it. The slime overflows at the top of the tube and, passing down in the tank outside, enters the tube at the bottom and is carried up again. Aeration and mixing continue until the gold is dissolved.

Filtration and Gold Recovery.—After the gold has been dissolved in the agitators the mixture is pumped into a filtering tank and the solution is separated from the residue by means of leaf filters. A single filter leaf (fig. 5) is a canvas bag, wide and deep but nearly flat. It may be pictured as an empty sack. In the Butters leaf a vacuum is created inside the bag so that the clear liquid is sucked through the canvas into it. The solids form layers or cakes of slime on the outside surfaces. When the cakes have grown to about 1in. thick, they are detached and the filtering is renewed. A large number of filter leaves are clamped near together in a parallel position and the whole frame of filter leaves, or "basket" as it is called, is immersed in the pulp to be filtered. In some other leaf filters the pulp is forced under pressure into the interior of the leaf or bag and the clear liquid passes through the canvas to the outside, leaving the solids inside. This variety of filtering is called "filter-pressing."

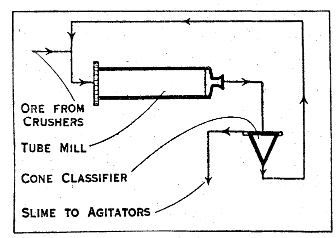

FIG. 3.—"ALL-SLIMING" PROCESS
The ore, ground to slime, passes on to the agitators, while the sand is returned to the tube mill

An alternative and older method of separating the gold-cyanide solution from the ore-slime is by decantation. The mixture is allowed to settle in large vats and the clear liquid is drawn off from the top. Lime is added to the charge to hasten the settling. An improvement consists in continuously introducing a slow current of clear water at the bottom and allowing it to overflow at the top (counter-current decantation). In this way the ore-slime never settles but remains in suspension in the water in the vat and is gradually washed clean.

For the recovery of the gold from the cyanide the dissolved air is first removed from the clear solution by applying a vacuum to thin streams of the liquid (Crowe process). The solution is then mixed with zinc dust and the gold precipitated as black slime (not to be confused with the ore-slime mentioned previously), while most of the zinc is dissolved. The gold-slime is then filter-pressed in leaf filters and the clear cyanide solution separated in them is conveyed to a storage tank for use again after it has been re-aerated. The gold-slime is purified by furnace methods and is finally melted and cast into bars.

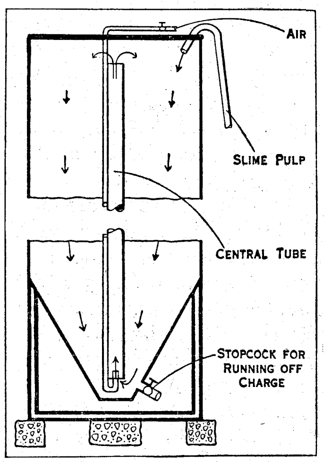

FIG. 4.—SECTION (INCOMPLETE) OF A PACHUCA AGITATING TANK
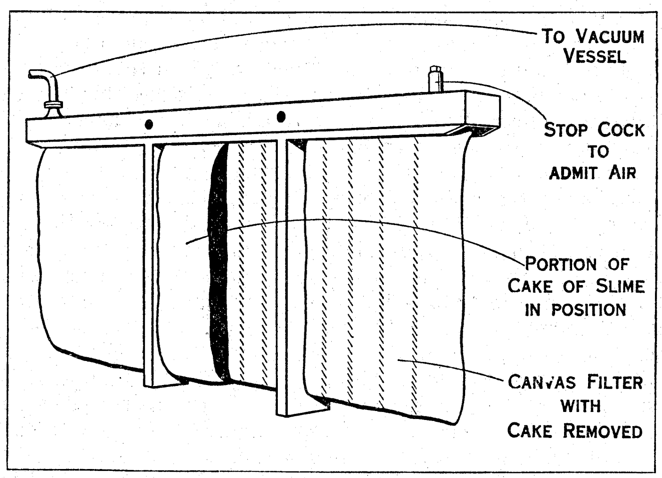
Here, the slimed ore is charged with air while the gold is being dissolved. Aeration is an important factor in the solution of gold by the cyanide process

One of the most striking features in the cyanide process is the extreme dilution of the solutions. In South Africa the cyanide solutions are kept as far as possible at a strength of only 0·027% (0·54 lb. per ton), and in 1922 the consumption of cyanide was only about 0·27 lb. per ton of ore. The total cost of treatment by a modern plant is 3s. 6d. per ton. This is remarkably low considering the complexity of the process, which can hardly be realized from the incomplete outline presented here. About 98% of the gold is extracted.

Silver ores are treated similarly to gold ores, but the solutions are stronger, generally containing from 0·1% to 0·5% of cyanide.

In places where the amalgamation process still lingers, as in India, gold ores are crushed in water, not cyanide solution. The all-sliming method is not used, but instead the sands and slimes are cyanided separately. The sands are charged into large circular vats. Cyanide solution is pumped on to the top and sinks downwards through the sand, dissolving the gold as it passes. It runs out at the bottom through a filter bed of coarse sand covered with canvas. The oxygen is supplied from that dissolved in the solution and from the air held in the porous ore. The air supply may be renewed by draining the charge dry. Similar methods were in use in South Africa before 1925.



FROM GOWLAND "METALLURGY OF THE NON-FERROUS METALS" (FRASER & CHALMERS)

FIG. 5.—BUTTERS' LEAF FILTER, BY WHICH THE PULP FROM THE AGITATORS IS SEPARATED INTO RESIDUE AND LIQUID. THE CLEAR SOLUTION IS SUCKED INTO THE LEAF FILTERS, WHILE THE RESIDUE CAKES ON THE OUTSIDE SURFACES

In conclusion it may be observed that the cyanide process was responsible for a very large proportion of the world's production of gold and silver in recent years, and that the mining industry is well satisfied with its results.

Rose, *The Metallurgy of Gold* (1915, bibl.); H. A. White, *Trans. Instn. of Mining and Metallurgy*, vol. xxxiv. part 2, p. 222 (1925); *Mineral Industry for 1925*, p. 356 (New York, 1926). (T. K. R.)

CYANIN is the pigment of cornflowers and occurs also in deep red dahlias.

(*See* ANTHOCYANINS AND ANTHOXANTHINS.)

CYANITE: *see* KYANITE.

CYANOGEN, a gas composed of carbon and nitrogen. The name was suggested by Prussian blue (Gr. κύανος, blue), its earliest known compound. Cyanogen (C_2N_2) was first isolated in 1815 by J. Gay-Lussac, who obtained it by heating mercury or silver cyanide; this discovery is of considerable historical importance, since it recorded the isolation of a "compound radical." It may also be prepared by heating ammonium oxalate or by the addition of a concentrated solution of potassium cyanide to one of copper sulphate, the mixed solutions being then heated. It also occurs in blast-furnace gases. When cyanogen is prepared by heating mercuric cyanide, a brown residue known as paracyanogen $(CN)_x$ is left; this is to be regarded as a polymeride of cyanogen.

Cyanogen is a colourless gas, possessing a peculiar characteristic smell, and is very poisonous. It burns with a purple flame, forming carbon dioxide and nitrogen; and may be condensed (by cooling to −20° C.) to a colourless liquid, and further to a solid, which melts at −34.4° C. (M. Faraday, 1845). It dissolves readily in water and the aqueous solution decomposes on standing; a dark-brown flocculent precipitate of azulmic acid, $C_4H_5N_5O$, separating, while ammonium oxalate, urea and hydrocyanic acid are found in the solution.

In many respects it resembles chlorine in its chemical behaviour, a circumstance noted by Gay-Lussac; it combines directly with hydrogen (at 500° to 550° C.) to form hydrocyanic acid, and with chlorine, bromine, iodine and sulphur, to form cyanogen chloride, etc.; it also combines directly with zinc, cadmium and iron to form cyanides of these metals. Concentrated hydrochloric acid converts it into oxamide.

A dilute solution of potassium hydroxide converts it into a mixture of potassium cyanide and cyanate. With tin and hydrochloric acid it yields ethylene-diamine.

CYAXARES (Sī-ăks′-ah-rēz), king of Media, reigned, according to Herodotus (i. 107), 40 years, about 624–584 B.C. That he was the real founder of the Median empire is proved by the fact that in Darius's time a Median usurper, Fravartish, pretended to be his offspring (Behistun inscr. 2. 43). Herodotus narrates (i. 103 *et seq.*) that he renewed the war against the Assyrians and, while he besieged Nineveh, was attacked by a great Scythian army under Madyas. The Scythians defeated Cyaxares and ruled 28 years, till at last they were made drunk and slain by him at a banquet (*cf.* also Herod. i. 73).

We know from Jeremiah and Zephaniah that Syria and Palestine were really invaded by northern barbarians in 626 B.C., and it is probable that this invasion was the principal cause of the downfall of the Assyrian empire. (*See* MEDIA and PERSIA: *Ancient History.*)

Cyaxares now renewed his attack on Assyria, and in 606 B.C. destroyed Nineveh and the other capitals of the empire (Herod. i. 106). The countries north and east of the Tigris, the northern part of Mesopotamia, Armenia and Cappadocia were likewise subdued. The attempt to advance farther into Asia Minor led to a war with Alyattes of Lydia, in which Syennesis of Cilicia and Nebuchadrezzar (in Herodotus "Labynetus") of Babylon interceded and effected a peace, whereby the Halys was fixed as frontier between the two empires. Cyaxares died shortly afterwards.

CYBELE, a goddess native to Asia Minor, known to the Romans most commonly as the GREAT MOTHER OF THE GODS. (*q.v.*).

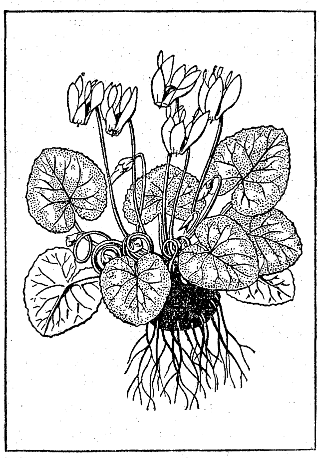
CYCADALES: *see* GYMNOSPERMS.

CYCADS: *see* Gymnosperms.

CYCLADES, islands in the Greek Archipelago, around the island of Syra (Syros), the principal town of which, Hermoupolis, is the capital of a department. The islands are interesting and picturesque; their inhabitants present the best type of Greek, and many islands bear traces of the feudal rule of Venetian families. Delos (*q.v.*), was a great centre of ancient religious, political and commercial life, and has been thoroughly excavated by French archaeologists; Melos (*q.v.*), has Hellenic and Roman remains, and the prehistoric town of Phylakopi has been excavated by the British school at Athens. In the volcanic Thera (*see* Santorin), the ancient capital has been explored by Baron Hiller von Gärtringen. Naxos, largest and most fertile, contains the highest mountain (Zia, 3,290 ft.), and exports emery, a state monopoly hypothecated to the foreign debt. Ceos (*q.v.*) or Zeá and Ios furnish valonia. Kimolos produces fuller's-earth. The marble of Paros has been practically abandoned; that of Tenos is worked by a British syndicate; iron ore is exported from Seriphos, manganese and sulphur from Melos, and pumice for cement (*pozzolana*) from Santorin. But the mineral wealth of the Cyclades is ill-exploited as yet. Though of rugged and barren aspect, they export wines, brandy, tobacco and hides. Cythnos, Melos and other islands possess hot medicinal springs. Tenos has a pilgrim-church, modern but famous throughout Greece.

Population of the Cyclades (1928, last census before World War II) 129,702. The islands were occupied by Germany in 1941.

CYCLAMEN, in botany, a genus belonging to the family Primulaceae, containing 20 species native in the mountains of central Europe and the Mediterranean region. *C. europaeum* (sow-bread) is found as an introduced plant in copses in Kent and Sussex. The plants are low-growing herbs with large tuberous rootstocks, from the surface of which spring a number of broad, generally heart-shaped or kidney-shaped, long-stalked leaves, which in cultivated forms are often beautifully marbled, ribbed or splashed. The flowers are nodding, and white, pink, lilac or crimson in colour. The corolla has a short tube and five large reflexed lobes. After flowering the stalk becomes spirally coiled, drawing the fruit down to the soil. Cyclamen is a favourite flower, and *C. persicum* is the sort most grown by florists as a pot plant. It is a small-growing kind bearing medium-sized leaves and numerous flowers. *C. persicum giganteum* is a large, strong-growing variety, not quite so free flowering as *C. persicum* but in all other respects superior to it when well grown. *C. persicum papilio* differs in the fringed character of the petals. There is also a beautiful crested race. (N. Tr.)



FROM A. JORDAN "ICONES AD FLORAM EUROPAE"

WILD CYCLAMEN (CYCLAMEN EUROPAEUM), A STEMLESS PLANT, SOMETIMES CALLED "SOW BREAD" BECAUSE ITS TUBERS ARE RELISHED BY SWINE

CYCLE, in astronomy, a period of time at the end of which some aspect or relation of the heavenly bodies recurs. (Gr. κύκλος, a circle.) (*See* Calendar and Eclipse.) In physics, the term is applied to a series of operations which, performed upon a system, brings it back to its original state; "Carnot's Cycle" is an example (*see* Thermodynamics). The word is used loosely of any long period of time. From the phrase ὁ ἐπικὸς κύκλος, the epic cycle (*see* below), comes the application of the term "cycle" to a series of prose or poetical romances which have for a centre one subject, whether a person, as in the Alexander, Arthurian or Charlemagne cycles, or an object, such as the ring of the Nibelungenlied. In music "Song-cycle" (Ger. *Liederkreis*) is similarly used of a series of songs written round one subject or set to poems by the same author. Beethoven's *An die ferne Geliebte* (Op. 98), published in 1816, is the earliest instance. For the epic cycle, or cyclic poems, of Greece *see* Homeric Poems.

CYCLE OF TRADE: *see* Trade Cycle.

CYCLING, the clipped term now given comprehensively to the sport or exercise of riding a bicycle (*q.v.*) or tricycle (*q.v.*).

History.—Suggestions of vehicles having two or more wheels and propelled by the muscular effort of the rider or riders are to be found in very early times, even on the bas-reliefs of Egypt and Babylon and the frescoes of Pompeii; but though sporadic examples of such contrivances are recorded in the 17th and 18th centuries, it was apparently not till the beginning of the 19th century that they were used to any considerable extent. A "velocipede" invented by Blanchard and Magurier, and described in the *Journal de Paris* on July 27, 1779, differed little from the *célérifère* proposed by another Frenchman, de Sivrac, in 1690; it consisted of a wooden bar rigidly connecting two wheels placed one in front of the other, and was propelled by the rider, seated astride the bar, pushing against the ground with his feet. The next advance was made in the *draisine* of Freiherr Karl Drais von Sauerbronn (1785–1851), described in his *Abbildung und Beschreibung seiner neu erfundenen Laufmaschine* (Nuremberg, 1817). In this the front wheel was pivoted on the frame so that it could be turned sideways by a handle, thus serving to steer the machine. A similar machine, known by the name "celeripede," also with a movable front wheel, is said to have been ridden by J. N. Niepce in Paris some years before. In England the draisine achieved a great, though temporary, vogue under various names such as velocipede, patent accelerator, bivector, bicipedes, pedestrian curricle (patented by Dennis Johnson in 1818), dandy horse, hobby horse, etc., and for a time it was popular in America also. The propulsion of the draisine by pushing with the feet being alleged to give rise to diseases of the legs, arrangements were soon suggested, as by Louis Gompertz in England in 1821, by which the front wheel could be rotated by the hands with the aid of a system of gearing, but the idea of providing mechanical connections between the feet and the wheels was apparently not thought of till later. Pedals with connecting rods working on the rear axle are said to have been applied to a tricycle in 1834 by Kirkpatrick McMillan, a Scottish blacksmith of Keir, Dumfriesshire, and to a draisine by him in 1840, and by a Scottish cooper, Gavin Dalzell, of Lesmahagow, Lanarkshire, about 1845. The draisine thus fitted had wooden wheels, with iron tires, the leading one about 30 in. in diameter and the driving one about 40 in., and thus it formed the prototype, though not the ancestor, of the modern rear-driven safety bicycle.

For the next 20 years little was done, and then began the evolution of the high "ordinary" bicycle, with a large driving wheel in front and a small trailing one behind. Rubber tires, in place of iron ones, appeared in 1868, and in two or three years were made an inch or an inch and a half in width. Suspension wheels, with wire spokes in tension, were seen at the Crystal Palace, London, on the "Phantom" of W. F. Reynolds and J. A. Mays in 1869, and early in the same year the manufacture of bicycles, at first for export to France, was begun in England by the Coventry Sewing Machine company, till then makers of sewing machines. There was a rapid growth in the size of the front wheel with a corresponding shrinkage in the rear wheel until by 1874, the date of the invention of the tangent wheel by James Starley, 54 in. wheels were being made. It is important (historically) to remember that James Starley died before John Kemp Starley (his nephew) began work. The high bicycle was now fairly established in form and very fast times were made with it both on the road and on the racing path. In 1882 H. L. Cortis rode 20 mi. 300 yd. in one hour, and in April 1884 Thomas Stevens started from San Francisco to ride round the world, a feat which he accomplished in Dec. 1886.

The improvement of the high bicycle was attempted in two directions. On the one hand it was modified by placing the rider farther back, his position "over his work" being ensured by arranging the pedals immediately below him and connecting them to the front wheel, which was usually reduced in size, by levers and cranks or by chain-gearing, often with a multiplying action.

On the other, the rear wheel was enlarged and made the driving wheel. This latter developed into the modern rear-driven safety. There are numerous claimants for the invention—or rather the reinvention—of this type, but it appears that the credit for its practical and commercial introduction in substantially its present form is due to J. K. Starley in England. His "Rover," brought out early in 1885, had two nearly equal wheels, the driving wheel 30 in. in diameter and the steering 32 in., and the rider sat so far back that he could not be thrown forward over the handles. The motion imparted by the pedals to a sprocket wheel mounted between the wheels was transmitted by an endless chain to the rear wheel, and by sufficiently increasing the size of this sprocket wheel the machine could be made to travel as far or farther than the "ordinary" for each complete revolution of the pedals. From about 1890 the "safety" monopolized the field. At first it was fitted with the narrow rubber tires customary at the time, but these gave way to pneumatic tires, invented in 1888 by J. B. Dunlop, a Scotsman practising as a veterinary surgeon in Belfast, whose idea, however, had been anticipated in the English patent No. 10,990 taken out by R. W. Thomson in 1845. The result was a great gain in comfort, due to reduction of vibration, and a remarkable increase of speed or, alternatively, decrease of exertion. The beginning of the 20th century saw the introduction of two innovations: one was the "free-wheel," a device which allows the driving wheel to rotate independently of the chain and pedals, so that the rider, controlling his speed with powerful brakes, can "coast" down a hill using the stationary pedals as footrests; and the other was the motorcycle, in which a gasoline-engine relieves him, except at starting, from all personal exertion, though at the cost of considerable vibration.

The safety bicycle, with pneumatic tires, rendered cycling universally popular, not merely as a pastime but as a convenient means of locomotion for everyday use. Made with a drop-frame, it also enabled women to cycle without being confined to a heavy tricycle or compelled to assume "rational dress." In consequence there was an enormous expansion in the cycle industry. In Britain the demand for machines had become so great by 1895 that the makers were unable to cope with it. Numbers of new factories were started, small shops grew into large companies, and the capital invested advanced by millions of pounds. The makers who had devoted their mechanical skill to perfecting the methods of cycle-construction were swallowed up by company promoters and adventurers, bent simply upon filling their own pockets. In America the manufacture of bicycles was not begun until about 1878, when it was introduced by A. A. Pope (1843–1909), and even by 1890 the value of the products barely exceeded $2,500,000, while for several years later much of the steel tubing required for bicycle manufacture continued to be imported from Great Britain. The industry, however, thanks to automatic machinery and perfect organization grew rapidly, and in 1900 the value of its products was nearly $32,000,000. In the two years 1897 and 1898 the exports of cycles and cycle parts alone were worth nearly $14,000,000, though they fell off in subsequent years, and British makers had to contend with an American invasion in addition to their domestic troubles. But the competition was short-lived. The American makers sent over machines with single tube tires and wooden rims, which did not secure the approval of the British purchaser, and so they too lost their hold. In the opening years of the 20th century the industry in Great Britain gradually recovered itself. More attention was paid to the production of cheap machines which were sound and trustworthy, and sales were further stimulated by the introduction of systems of deferred payments. In 1905 about 600,000 machines were made in Great Britain, and 47,604 were exported, the total value of the home market for cycles and their parts being about £3,500,000 sterling, and of the export trade about £1,000,000. In the same year the number of machine imported was only 2,345.

Touring Clubs.—Cycle tours were taken and cycling clubs established almost as soon as the cycle appeared, the Pickwick Bicycle club in London, founded in 1870, being the oldest in the world. The organization of these clubs was chiefly of a social character, and few possessed well-appointed clubhouses. To a great extent they have been superseded by the large touring organizations. The Cyclists' Touring club, organized in 1878 as the Bicycle Touring club, has members scattered through Europe, America and even the east. Many other countries possessed national clubs, as for instance the now extinct original League of American Wheelmen organized in 1880; Touring Club de France, founded in 1895, of whose objects cycling is only one, though the chief. The aim of these national associations, which have formed an international touring league, is the promotion of cycle touring. To this end they publish roadbooks, maps and journals; they recommend hotels, with fixed tariffs, in their own and other countries; they appoint representatives to aid their members when touring; and they have succeeded in inducing most governments to allow their members to travel freely across frontiers without paying duty on their machines. In all countries they have erected warning-boards at dangerous places; in France the best route is suggested by a signpost, and cyclists who meet with accidents in lonely places find repair outfits provided for their free use. Another important part of the work of these clubs, either directly or indirectly, is the improvement of the roads. France has done more for the cyclist than any other country, owing to the fact that she possesses the best roads, kept up to a certain extent by the cycle tax, whereby the cyclist acquires a certain official position and right; moreover cycles accompanied by their owners are conveyed without extra charge on the railways, and aid is given to the sport and pastime from public funds. In Belgium the cycle has worked a veritable revolution in the national life. The surface of the greater part of the country being loose and sandy, the roads have been paved, and this paving is so bad as to be impossible for light traffic. The cycle tax has consequently been devoted, first, to the construction of paths on which cyclists have equal rights with pedestrians, and secondly to the replacing of the paving by macadam. In this way alone cycling has proved of inestimable benefit to Belgium and Luxembourg. In the United States measures for securing good roads and side paths have been introduced in various states, mainly at the instigation first of cyclists and then of motorists, and in Great Britain the Roads Improvement association has worked for the same end.

Racing.—Each country also possesses an organization for the government of cycle racing; and although these unions, one object of which—usually the main one—is the encouragement of cycle racing and cycle legislation, boast an enormous membership, their membership is often composed of clubs and not individuals. Among the most important are the National Cycling association, which controls professional track racing, and the Amateur Bicycle League of America, in the U.S.A.; the Canadian Wheelmen's Association in Canada, the National Cyclists' Union of England and the Union Vélocipédique of France. These bodies, with the exception of the A.B.L. of A. are also bound together by the Union Cycliste Internationale which is devoted mainly to the promotion of racing and legislation connected with it all over the world. The National Cyclists' Union, originally the Bicycle Union, which was the parent body of all, formed in Feb. 1878, was the first to put up danger-boards, and also was early instrumental, alone and with the C.T.C., in framing or suggesting laws for the proper government and regulation of cycle traffic, notably in establishing its position as a vehicle in securing universal rights, in endeavouring, again in conjunction with the C.T.C., to increase facilities for the carriage of cycles on the railways, in securing the opening of parks, and in promoting many other equally praiseworthy objects. For a number of years, however, it has been more prominent as the ruling race-governing body. But cycle racing in England fell upon evil days. At one time cycle racing attracted a large number of spectators, but gradually it lost the public favour, or rather was ignored by the public because it became mainly an advertisement for cycle makers. The presence of the man, directly or indirectly, in the employ of, or aided by a maker, and the consequent mixing up of trade and sport, lowered racing not only in the public estimation, but in that of all genuine amateurs. There have always been a few amateurs who have raced for the love of the sport, but the greater number of prominent racing men have raced for the benefit of a firm, so much so that, at one time, an entire section of racing men were classed as "makers' amateurs." They did not confine themselves to the race track, but appropriated the public roads until they became a danger and a nuisance, and road-racing, on the old lines, finally was abolished, though record rides, as they are called, are still indulged in, claims being checked and adjudicated upon by a strong organization, known as the Road Records association, founded in 1888. The makers' amateurs at least rode to win and to make the best time possible. But the scandal was so great that a system of licensing riders was adopted by the N.C.U., and if this did not effectively kill the sport, the introduction of waiting races did.

In the United States the National Cycling association controls professional cycle racing. This body succeeded the League of American Wheelmen. All six-day races are held under N.C.A. sanction. The Amateur Bicycle League of America controls all amateur racing, on the road, dirt or board tracks, also encourages touring and record making attempts. In 1940 Raymond Bryan rode from New York city to San Francisco, a distance of 3,149 miles, in 27 days 11 hours.

The A.B.L. of A. is composed of 80 clubs from 36 states and Hawaii. National championships are held yearly. They have taken place in Washington; Atlantic City; Chicago; Buffalo; Philadelphia; Kenosha, Wis.; Columbus, O.; Detroit; Pasadena, Calif.; Louisville, Ky.; St. Louis and Newark. The A.B.L. of A. is affiliated with the Amateur Athletic union and the United States of America Sports federation. The U.S.A.S.F. is the body into which the American Olympic Games and the Pan-American Games committees were combined. In America (*see* below) the system of proving the capacity of racing machines was carried so far that in 1899 a board track was laid down on the Long Island railway for about 2 mi. between the rails and a cyclist named Charles M. Murphy, followed a train, and protected by enormous wind-shields, succeeded in covering a mile in $57\frac{4}{5}$ seconds. This gave birth to the expression "a mile a minute." Other cyclists have devoted themselves, at the instigation of makers, to the riding of 100 mi. a day every day for a year. It would be difficult to say what advantage there is in these trials and contests. They are not convincing records, and only prove that some people are willing to take great personal risks for the benefit of their employers. E. Hale, during 1899–1900, covered 32,496 mi. in 313 days. For many years also long-distance races, mostly of six days' duration, have been promoted on covered tracks, and though condemned by all cycling organizations, they find a great deal of pecuniary support. In 1941 Alf Letourner, professional rider, travelled at the rate of 108.92 miles per hour behind a midget auto racing car on a California state highway. Letourner was officially timed by an American Automobile association representative.

Military.—The cycle has also been taken up for military purposes. For this idea the British army is indebted to Colonel A. R. Savile, who in 1887 organized the first series of cycle manoeuvres in Britain. Thereafter military cycling underwent a great development, not only in the country of its origin but in most others.

Recent Developments.—During the period following 1910 the evolution of the bicycle was not maintained, mechanical changes being less frequent and not so drastic as had been the case during the early pneumatic era. After 1918 interest in every branch of cycling increased to a marked extent, and this had its origin in the attitude taken up by the big cycle makers, who, desiring the freedom from trouble which mass production provides, discouraged development and allowed design to stagnate.

Thus an opportunity arose for the assembler or small maker, generally an active cyclist himself, and invariably a working mechanic. Numbers of such men started in business, making a specialty of bicycles built to order and complying with the customer's own specification. These assemblers purchased parts from the various houses specializing in the production of fittings for the trade and built them up into complete machines. Under their aegis, supported by a growing demand from the large number of club riders of both sexes, the light roadster bicycle was evolved, a type which the large manufacturer had persistently ignored for more than a generation.

In addition to reducing the weight of his product, the small maker incorporated certain improvements which hard riders were quick to appreciate; among these were the drop-out rear wheel and the caliper brake, both of which, it is worth noting, were old ideas, the advantages of which had not been realized when they originally appeared on the market. The light-weight bicycle with small (26 in.) wheels gave cycling a new lease of life; contemporaneously with its advent came a movement to popularize rational dress among lady cyclists. The fashion of wearing short skirts, aided by the adoption of breeches, by the many women who took up agricultural work during World War I enabled the bifurcated garment to overcome prejudice and to score an almost complete triumph over the skirt. In 1944 nearly 90% of club women and keen riders in England wore rationals for their more serious cycling, though skirts were retained for shopping expeditions and short journeys. Many wearers of rational dress used diamond-framed machines. But in the United States most women wore shorts, slacks or culottes.

Officials of the big factories were somewhat slow to note the tendency of demand, and allowed the small makers to obtain a long lead in the production of light bicycles. Ultimately they began to realize the position, and many of them designed light and speedy models to compete with the locally built machines. These may be procured from most of the large manufacturers, but the small assembler enjoys the great advantage of being able to comply with the whims of his client, and the ability to build "to order" without undue interruption of his works routine. Another feature of the period after World War I was the revival of interest in tandem riding. This, again, was fostered by the little maker with the encouragement of club riders.

Road racing flourished exceedingly. In Europe, America and Australia competitions are run on ordinary racing lines, the riders starting together, or, in the case of handicaps, in the order of their time allowance, the first man to finish being the winner. In Great Britain and Ireland the time trial system is in vogue, and has proved an extraordinary success. So great has the number of events become that, in 1922, the most prominent cycling clubs came together and formed the Road Racing council, to which 80 clubs are affiliated, and which has compiled regulations for the conduct of road trials. Two years before, the Amateur Bicycle League of America was formed for the same purpose. The most popular distances are 25, 50 and 100 mi., while several races at 12 and 24 hours are organized each year. One of the best things the R.R.C. has done for the sport has been to limit the number of entrants for any race run under its jurisdiction, and in the more important events not more than 100 riders may take part.

The Road Racing council has managed to cope successfully with that age-old problem, the "trade-assisted amateur" by decreeing that a rider whose performances have been advertised shall not compete in a speed trial promoted by any of its adherent clubs. The National Cyclists' union does not go as far as this in its efforts to discourage the association of the trade with the sport, but it requests cycle and accessory manufacturers to refrain from quoting the names of riders in their announcements. The legislative bodies of Great Britain are unique in their desire to prevent the exploitation of wins by amateurs for trade purposes. In every other country where cycle racing flourishes makers are allowed to advertise the exploits of racing amateurs. This is not the only detail in which Britain is peculiar. Whereas professional cycling thrives in every other civilized country, Britain has few professional racing men, but Australia produced some of the world's outstanding racing cyclists.

Track racing continues to enjoy great popularity in France, Germany, Belgium, Switzerland, Holland, Denmark, America, Italy and Australia, but in Great Britain, Spain, Norway, South Africa and certain other countries, the scarcity of up-to-date tracks prevents the development of this branch of the sport. One of the finest tracks in the world is the one in Casablanca. The annual races for the championships of the world have been continued, the Union Cycliste Internationale having taken over the series which were inaugurated by its predecessor, the International Cyclists' association. They were, of course, interrupted by World War II. In 1921 the motor-paced race for the amateur title was dropped, and its place as a distance test was taken by a road race the distance of which is usually 100–120 mi.

Important influences in the development of cycling can be traced to the periodical exhibitions which have been a regular feature since they were first inaugurated by the Stanley Bicycle club in London in 1878. Since that year London has seen at least one cycle show each season, and the idea has been copied and expanded in every country throughout the world. The annual "show" which cyclists and cycle makers originated has been imitated by the newer industry which caters for motoring, and nowadays motor exhibitions are held in every important capital. The yearly show serves a dual purpose; it encourages manufacturers to improve their products, each striving to evolve something better than his rivals; thus is mechanical advancement fostered. Secondly, the exhibitors provide the public with frequent opportunities for inspecting the latest models, with the obvious incentive to purchase the newest types. (H. W. B.; W. Ra.)

Bicycle racing, after many vicissitudes, became in the United States one of the nation's major sports. A troupe of English professionals inaugurated it in the U.S. about 1870 when they introduced the high wheel. The dirt tracks used for trotting races served for the first set of cycling events, staged near Springfield, Massachusetts. With the invention of the safety-wheel about 1889, there came also the board tracks. Americans then took the lead in the sport that they have since maintained. Formerly cycling was extremely popular all over the country. There were tracks from Manhattan Beach to California. Manufacturers of bicycles and accessories kept the sport alive by organizing competing racing teams. With the coming of the automobile about 1895, cycling, as a utility, died out, only to return later as a sport. It prospered in Salt Lake City, then spread back to the east, with Newark, N.J., as the centre. While there were not in 1928 as many bicycle tracks in America as there were in the old days, the sport was increasing in popularity where tracks were located. Outdoor tracks for summer racing were in New York; Philadelphia; Newark;

Chicago; San Jose, Calif.; Detroit; Boston; Providence, R.I.; Hartford, Conn. and other cities. The track in Chicago, a cement bowl in Humboldt park, is owned by the city. The six-day racing branch of cycling for many years attracted people by the thousands to Madison Square Garden in New York and to the Coliseum in Chicago, the largest amphitheatres in those cities. In 1927 Detroit, with the completion of its new Olympia holding 17,000 people, saw its first six-day race, and that city became permanently in the six-day circuit. In New York six-day bicycle racing was witnessed by sport enthusiasts twice a year, in December and March, while Chicago had its two races in October and February.

Six-day racing in the U.S. spread from New York to San Francisco and Los Angeles, from New Orleans to Montreal and Toronto. But almost as rapidly as the sport grew, the interest waned, and by 1938 the average weekly attendance at New York races had dropped from over 100,000 to about half. As a result Madison Square Garden dropped six-day bicycle racing from its sports calendar after the Nov. 1939 race, and Chicago and other cities followed.

Government war regulations in the U.S. restricted bicycle production to 750,000 in 1942, whereas in 1941 the eight leading factories in the country turned out 1,800,000. In 1940 the output was 1,500,000. From 1935 to 1941 the average output was 1,000,000 yearly. As a result, bicycles soon were difficult to get. About 12,000,000 were in use in the U.S. in 1944. (W. Ra).

CYCLOID: *see* Curves, Special.

CYCLONE. A name variously applied to rotating wind systems of a stormy character. In meteorology the term is applied to an area of relatively low pressure usually 50 to 1,000 mi. in diam. together with its revolving wind circulation. Popularly, this name is sometimes given to the small, extremely violent, twisting cloud appendage which is more properly called a *tornado* (*q.v.*). Meteorologists classify cyclones as (1) tropical cyclones and (2) extratropical cyclones. The first are called typhoons in the far east and hurricanes or cyclones elsewhere. For a complete discussion of them, see Tropical Revolving Storms. The second type, the extratropical cyclone, is the common rain and snow-producing disturbance of middle and high latitudes. In England this type is commonly called a depression. Both types have a counterclockwise wind circulation in the northern hemisphere and a clockwise rotation in the southern hemisphere. The areas of low pressure appear on weather charts as oblong or nearly circular systems of isobars which stand out in sharp contrast with the areas of high pressure or anticyclones (*q.v.*).

The extratropical cyclones generally move from west to east with the prevailing winds of their latitude, producing large areas of precipitation and relatively strong winds. The approach of an extratropical cyclone is recognized by an increase in the wind from a direction between southwest and northeast through southeast, accompanied by falling pressure, increasing cloudiness and precipitation. As the centre moves eastward away from the observer, the pressure rises and the wind comes in from a direction between southwest and north. In most cases, the weather then improves, although rain and snow of the shower type and general cloudiness may prevail. Warm air usually precedes the cyclone and cold air moves in somewhat suddenly behind. There is a typical pattern of these warm and cold air currents having distinct boundaries between them, known as fronts. It is in these contrasting temperatures that an extratropical cyclone is most clearly differentiated from a tropical cyclone, which contains horizontally homogeneous air.

On climatic charts as well as on most weather maps cyclonic centres are found in the northern Atlantic and Pacific oceans, known respectively as the Icelandic and Aleutian "lows." In summer, semipermanent low-pressure centres exist over warm continental regions. They are in some places belts of low pressure, such as that which extends from the Sahara desert through the Red sea and Asia Minor to the Persian gulf, northern India and Burma. A belt of low pressure also is found near the equator between the circulations of the oceanic anticyclones of the northern and southern hemispheres. (*See* Meteorology; Wind.) (H. R. B.)

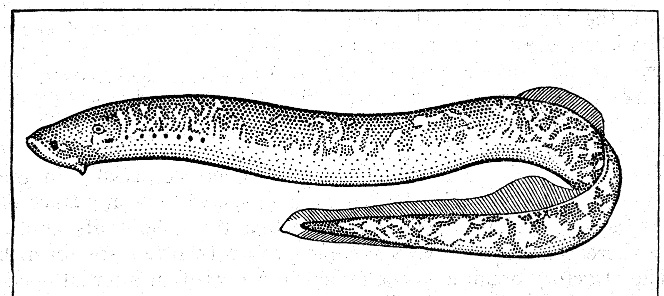
CYCLOPEAN MASONRY, a term in architecture, used in conjunction with Pelasgic, to define the rude polygonal masonry employed by the Greeks, the Etruscans and other primitive peoples (from the Cyclopes, the supposed builders of the walls of Mycenae). In the earliest examples it consists only of huge masses of rock, of irregular shape, piled one on the other and depending on their great size and weight for cohesion; sometimes smaller pieces of rock filled up the interstices. The walls and gates of Tiryns and Mycenae were thus constructed. Later, these blocks were shaped to fit one another. The date cannot always be determined by the type of construction; where stratified rocks were obtainable horizontal coursing may in some cases have been early adopted; in fact, there are instances in Greece of a later wall of cyclopean construction being built over one with horizontal courses.

CYCLOPES. (1) In Homer the Cyclopes are one-eyed cannibal giants (Κύκλωψ, Round-eye), living a rude pastoral life in a distant land (traditionally identified with Sicily), having no social unit larger than the family (*see* Acis; Polyphemus). (2) In Hesiod they are sons of Heaven and Earth, three in number—Arges, Brontes and Steropes (Bright, Thunderous, Lightener)—who forge the thunderbolts of Zeus; later authors say Apollo killed them for making the thunderbolt which slew Asclepius, and make them the workmen of Hephaestus (*q.v.*). (3) The walls of several ancient cities, *e.g.*, Tiryns, of Mycenaean architecture, are sometimes said to have been built by Cyclopes, perhaps the same as (2). Hence in modern archaeology the term *Cyclopean* applied to walling of which the stones are not squared.

See Roscher's *Lexikon, art.* "Kyklopen" (bibl.)

CYCLOSTOMATA or **MARSIPOBRANCHII,** a group of vertebrate animals, generally regarded as a class, comprising the lampreys (fig. 1) and the borers (*q.v.*). There are two types of borers, the hagfishes (fig. 2) and the slime-eels or *Myxine* (*q.v.*).

These are all aquatic creatures, smooth, slimy, scaleless and shaped like eels. The known species—about 50—inhabit the waters of the temperate zones. Most are marine, but a few lampreys are confined to lakes and streams and the sea lampreys spawn in fresh waters. The maximum size ranges from less than 6 in. to about 3 ft.



FROM JORDAN, "FISHES" (D. APPLETON-CENTURY CO.)

FIG. 1.—SEA LAMPREY, AN INHABITANT OF ATLANTIC COAST WATERS OF EUROPE AND NORTH AMERICA. IT ENTERS RIVERS TO BREED

Importance.—Most of the cyclostomes are regarded as harmful to man because they destroy food and game fishes. The larger lampreys attach themselves to fishes and drain their blood. In the Great Lakes considerable damage is thus done by the sea lamprey (fig. 1), which entered these waters by way of a canal and soon became very abundant, feeding extensively on lake trout and spawning in the lake tributaries. Efforts are made to control the increase of these lampreys by destroying the mature adults which are caught in a weir placed in the spawning stream. Marine food fishes are bled by seagoing lampreys, but suffer greater damage from the attacks of the borers. Both the hagfishes and the slime-eels eat their way into and through the flesh of food fishes. Large numbers of valuable fish are thus destroyed. Fish that are caught in nets or on set-lines are particularly subject to such loss. On the other hand lampreys are esteemed as food in many places and their larvae are extensively used as bait by fresh-water anglers. Adult brook lampreys, which are harmless because they do not feed, furnish, along with the larvae of all lampreys, considerable natural food for trout and other game fishes.

Scientifically the cyclostomes are of great significance, because they are the most primitive of the living vertebrates. The lamprey larva or ammocoete (fig. 4) in particular is regarded as providing the closest facsimile of the ancestor of the backboned animals. For this reason the ammocoete is recommended as one of the types to be studied in comparative anatomy courses. Adult lampreys and the borers depart from the ancestral form because they are specialized for parasitic existence.

Distinctive Characters.—The cyclostomes (or marsipobranchs) differ from all other living vertebrates in many important respects. None of their gill-arches have been converted into jaws, for which reason they are classified among the jawless vertebrates or Agnatha (a group which contrasts with the jaw-bearing vertebrates or Gnathostomata). The cyclostomes are also devoid of any trace of the paired fins (pectorals and pelvics), which, except for occasional loss through degeneration, are present in all other fishes and, in the form of limbs, are represented in all higher vertebrates. The muscular, protrusible tongue in all cyclostome fishes, and in the adult lampreys the buccal disc or funnel (figs. 3 and 5) as well, bear teeth which are composed of thin horny tissue rather than dentine or enamel. Instead of forming partitions between slits, the gills lie in spherical pouches which connect with the pharynx and with the exterior through tubes. The internal ear has only one or two semicircular canals, not three as in typical vertebrates (the horizontal canal is missing). The brain is small, primitive and distinctive, and the brain case is incomplete, especially in the borers. The skeleton is wholly cartilaginous, without any trace of calcification. The notochord is persistent throughout life and is nowhere constricted. No vertebrae proper (centra) are formed. The olfactory organ is a single median sac with an internal opening into the cavity of the pituitary and an external opening that lies on the midline either on the top or at the front of the head. On the basis of the narial structure some authorities classify the cyclostomes, along with certain extinct groups discussed below as the Monorhini. All other vertebrates are said to be diplorhine, for they have paired nostrils, with one sac on each side of the head.

FIG. 2.—FOUR HAGFISHES AND A SLIME-EEL

A. *Polistotrema stouti,* California; B-C. Japanese species of *Eptatretus;* D. *Paramyxine,* from Japan; E. *Myxine garmani,* Japan

Classification.—The Cyclostomata are divided into two subgroups, which are very different in anatomy, appearance and habits:

	Hyperoartii (lampreys)[1]	*Hyperotreti* (borers)
Nasal opening	On top of head	At front of head
Pituitary canal	Closed internally	Opening into pharynx
Cartilaginous rings around this canal	Lacking	Developed
Pineal eyes	Easily visible	Degenerate
Eyes	Well developed	Vestigial
Oral funnel	Developed	Not present
Teeth	On disc also	Only on tongue
Tentacles about mouth and nostril	Lacking	Six, supported by cartilage
Number of gills	Always seven	5 to 14
Gill-openings	Close to head	Remote from head
Internal gill tubes	United	Separate
Duct on left side, pharynx to exterior	Lacking	Developed
Branchial skeleton	A conspicuous basket-work	Greatly reduced
Dorsal fin	One or two well developed	None or only a trace
Neural arches	Present	Lacking
Dorsal and ventral roots of spinal nerves	Distinct	United
Kidneys	Compact organ	Separate
Eggs	Minute, without horny shell	Very large, with horny shell
Development	With larva and metamorphosis	Direct (young much like adult)
Spawning place	Gravel in streams	Ocean floor
Feeding on	Fish blood	Fish flesh
Type of parasitism	External	Internal

[1]The characters are those of adult lampreys. In several respects the lamprey larvae agree with the Hyperotreti.

The differences between the lampreys and the borers are so extensive and so fundamental as to lead some authorities to think that the two groups are unrelated. They appear, however, to have had a common ancestor.

The Hyperoartii or lampreys may be classified into three families. The chief family, Petromyzonidae, comprises all the northern hemisphere species. The well-known sea lamprey, *Petromyzon marinus* (fig. 1), occurs on both sides of the Atlantic. Three related genera, *Eudontomyzon, Entosphenus* (figs. 3-5) and *Lampetra,* occur in Eurasia as well as in North America. The primitive genus *Ichthyomyzon,* with more species than any other, inhabits only the fresh-waters of eastern North America. *Caspiomyzon* is confined to the Caspian sea basin. About half the species of Petromyzonidae are of the dwarfed nonparasitic brook type, with weak teeth (fig. 5). Nearly all of these have arisen through degeneration from different parasitic kinds, and hence they are named as distinct species (in the genera *Ichthyomyzon, Eudontomyzon, Entosphenus* and *Lampetra*). The distinctive lampreys of the southern hemisphere are placed in two families, Geotriidae and Mordaciidae, each with a single genus (*Geotria* and *Mordacia*). These southern genera live along the coasts of Chile, New Zealand and Australia. Like all lampreys they spawn in fresh water.

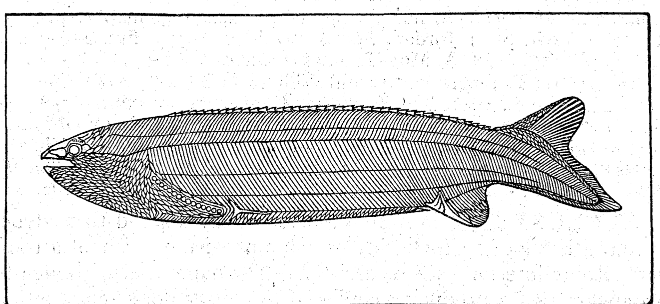
FIG. 5.—BUCCAL DISC AND TEETH OF THE NONPARASITIC AMERICAN BROOK LAMPREY (ENTOSPHENUS LAMOTTENII)

The Hyperotreti or borers comprise the Eptatretidae, or hagfishes, with the genera *Eptatretus, Polistotrema* and *Paramyxine,* and the Myxinidae or slime-eels, with the one genus *Myxine* (fig. 2). That genus is characterized by the single external gill-opening on each side. It is approached by *Paramyxine,* which has the gill-openings closely approximated (fig. 2). For this reason some authors prefer to unite the Eptatretidae with the Myxinidae. All members of both groups are marine. One species of *Myxine* occurs in deep water off Panamá but all other known Hyperotreti are inhabitants of temperate waters—in western North America, Japan, New Zealand, Chile, Patagonia and South Africa. Fewer than 24 species are recognized.

Life History.—All lampreys spawn in the spring on gravel beds in streams. The marine species migrate into the streams to breed, passing over dams and other obstructions by inching their way up the vertical walls, to which they adhere by their sucking mouth disc. The males arrive first on the spawning grounds and start to prepare the nest. By adhering to and tugging out pebbles a depression is formed. The female then maintains a hold on a stone while the male clamps onto the female and twists around her as the eggs are extruded and fertilized. Then by further tugging the pebbles above the depression are loosened, so that they are carried down to surround and cover the eggs. By the time the spawning act is completed the adults are emaciated. They never recover, but invariably die.



KIAER, "THE DOWNTONIAN FAUNA OF NORWAY"

FIG. 6.—PHARYNGOLEPIS OBLONGUS, AN ANASPID FROM THE UPPER-SILURIAN OF NORWAY. THERE WAS A SERIES OF SMALL GILL-OPENINGS BEHIND THE HEAD, AS IN THE LAMPREYS

After about two weeks the eggs hatch and the larval or ammocoete life, that lasts several years, begins. The several size groups, each resulting from one year's spawning, prove this point. The wormlike, toothless, nearly blind larvae (fig. 4) live in burrows in the bottom of mixed sand and mud, coming out at night to feed on the organic ooze which is strained through the thick cirri in the hoodlike mouth.

After at least three years of such life the ammocoete rapidly transforms in late summer and fall into the adult form. The eye becomes much larger and better developed, the hood is replaced by the disc and the cirri by teeth, the nostril opening moves from the front to the top of the head, and many other changes take place simultaneously. The body becomes rounder in cross-section, the flesh firmer and the colour brighter. During this transformation or metamorphosis the lamprey shrinks considerably in length.

Soon after metamorphosis the sea lampreys become silvery and large-eyed in preparation for life in the ocean, to which they promptly migrate. Some of the nonparasitic brook lampreys pass through this same stage, known as the macrophthalmia, as though in racial remembrance of the former seaward journey, though this trip has been abandoned for millenia.

FIG. 7.—A COMPARISON OF THE HEADS, SEEN ABOVE, OF THE LIVING LAMPREY (PETROMYZON) AND THE SILURIAN FOSSIL ANASPIDA (RHYNCHOLEPIS), SHOWING ESSENTIAL SIMILARITY

All parasitic lampreys feed and grow rapidly on their nutritious diet of fish blood. Those that remain in fresh water live thus for a year. A larger size is reached in the sea but it is not known how long the marine forms live as adults, for they are seldom encountered. After their growth has been attained and the sex products ripened the parasitic species spawn once and then die, to complete the life cycle.

The nonparasitic species metamorphose at a size at least as large as do their parasitic relatives, but the teeth are poorly developed and the gut shrinks to a solid strand. Without taking any food they complete, over-winter, the ripening of the sex products that had begun before the metamorphosis. Like the parasitic species they then spawn and die.

The hagfishes and slime-eels (fig. 2) deposit a large, yolk-filled egg. This is enclosed in a protective horny shell and is attached to the bottom of the sea by threadlike tendrils. The development is slower than in lampreys and the young are much larger when hatched. They look much like the adults, into which they gradually develop without a metamorphosis. Thus in life history as well as in structure the Hyperotreti are very unlike the Hyperoartii.

Evolutionary History.—The fossil record as well as the evidence from comparative anatomy indicates that the Cyclostomata are cousins of the earliest and lowest vertebrates. The oldest fossilized remains of vertebrate animals, found in the Silurian deposits with traces in the yet more ancient Ordovician rocks, prove on close study to be similar in many respects to lampreys and borers. Superficially the fossils (figs. 6-12) bear little resemblance to their modern relatives, which, in correlation with their parasitic habits, are highly specialized in some respects and in other ways much degenerated. In fundamental anatomy, however, they were much alike. Thus the extinct forms resembled the cyclostomes in lacking jaws, for the anterior gill arches remain unaltered. They appear also to have lacked true paired fins, though in some species flipperlike flaps were developed in place of pectoral fins. The extinct forms agreed further with the cyclostomes in gill structure and in having had only two semicircular canals in the internal ear. Some of the extinct groups had, like the cyclostomes, a single median nostril.

FIGS. 8 AND 9.—FOSSIL AGNATHA

Above: *Thelodus scoticus*, one of the Coelolepida from the Silurian of Lanarkshire. Below: *Cephalaspis murchisoni*, from the Devonian of Herefordshire. It was covered with bony plates

Most of these early fishes, and naturally those that are best known because most thoroughly preserved, were heavily armoured with dermal bone—hence the group name Ostracodermi that has often been applied to them as a whole. On these grounds many paleontologists have regarded the bizarre armoured fishes as the direct ancestors of the more ordinary modern types. It is more logical to assume, however, that both the armoured and the progressive types were derived from unarmoured fishes with the usual fish form. The highly specialized mailed kinds were probably evolved to provide protection from such enemies as the gigantic "water scorpions" of early times. Furthermore such types had a much greater chance than their slender, soft-bodied and probably free-swimming ancestors to be fossilized and well preserved in the rocks. The more highly evolved, heavily armoured types persisted throughout late Silurian time and all of the Devonian, along with the earlier jawed or gnathostome fishes which are classified as the Placodermi. None of the Ostracodermi are known to have survived beyond the end of the Devonian, but some primitive member of the Agnatha must have persisted, to give rise to the living group with which we are dealing. In conformity with an evolutionary rule the highly specialized group died out, while some generalized relative lived on.

Fossil Relatives.—Since the cyclostomes are the only living Agnatha or jawless vertebrates their relatives are to be sought exclusively among the extinct fishes. Five groups, commonly treated as orders, all Paleozoic and none persisting beyond the Devonian, show evidence of relationship with the lampreys and borers.

(1) In some ways the most lampreylike of the fossils were the Anaspida (fig. 6). These Silurian and Devonian creatures seem primitive because of their small size (none exceeding 10 in.), their almost ordinary fish form and their small scales, which apparently

overlaid the muscle segments. These characters and more particularly the rather straight contour of the back, the terminal rather than inferior mouth and the hypocercal or reversed heterocercal tail (with the body axis extended into the long lower caudal lobe), indicate that they escaped their enemies by swimming at the surface of the water. As in the cyclostomes, they had the eyes lateral and a single nostril in front of the third or pineal eye (fig. 7); and the gill-openings formed a row of pores on each side.

(2) The Cephalaspida (or Osteostraci) also had a median, superior nostril and a row of porelike gill-openings, but differed from the Anaspida (and from the cyclostomes) in having the head enclosed in a flat bony shield (fig. 9). The tail was heterocercal (with the body axis extending into the long upper lobe of the caudal fin) and the eyes were set close together on the top of the head. All these characters indicate that these armoured fishes lived on the bottom. They varied in length from a few inches to about 2 ft.

(3) The Coelolepida (fig. 8) were small to medium-sized and were completely covered with minute scales (denticles) that did not overlap. Structurally these fishes are poorly known, but from superficial resemblances they are thought to have been related to the Pteraspida. Indeed they may have belonged to that group and by some authorities they have been so classified. Or they may have been ancestral to the Pteraspida. Denticles thought to have belonged to one of the Coelolepida are known from the Ordovician.

FIG. 12.—PALAEOSPONDYLUS GUNNI, TWICE NATURAL SIZE, FROM THE SILURIAN OF SCOTLAND

(4) The Pteraspida (or Heterostraci) were armoured fishes (figs. 10-11) that closely resembled the Cephalaspida. Both groups were abundant in late Silurian and early Devonian times and disappeared completely by the end of the Devonian. Some of the very earliest known vertebrates, fragments of dermal plates from the Ordovician rocks, are thought to have been pteraspidans, because of the microscopic structure. In this group the armour lacks the bone cells that were characteristic of the Cephalaspida. The paired eyes were far apart and there was no dorsal nostril. The olfactory organs, which were close together but paired, are supposed to have opened into the mouth cavity. Like the anaspids the typical pteraspidans had a straightish dorsal contour, a reversed heterocereal tail and little depressed bodies—all indicative of surface-swimming habits. None exceeded 1 ft. in length.

(5) The Devonian group known as Cycliae or Palaeospondyloidea is recognized for one of the most problematical of the fossil vertebrates, Palaeospondylus (fig. 12), which by some has been thought to be an ancient lamprey or lampreylike animal. If so, the living lampreys must be very degenerate, for they lack the vertebral centa that are well developed in the fossil. Other zoologists regarded it as a larval arthrodire. The remains of this 1 to 2 in. fishlet abound in one quarry in Scotland and have been very thoroughly studied. Nevertheless, its relationships remain uncertain. Opinions differ as to whether or not it had gills or paired fins.

CYCLOSTYLE, in architecture, a term applied to a structure consisting of a simple ring of columns with or without a roof, but with no interior walls or divisions. The name is also applied to an apparatus for producing copies of letters or documents, either written or typewritten. This is effected on the principle of a stencil (*q.v.*) by means of a prepared paper. The pen or type perforates the paper and when an inked roller is passed over it the written matter is transferred to a sheet of paper placed beneath it.

CYCLOTRON. The cyclotron is a device for accelerating nuclear particles to very high speeds. These high-speed particles are used by physicists to investigate the properties of atomic nucleii and to produce nuclear transmutation and artificial radioactive substances. The cyclotron was invented in 1930 by a U.S. physicist, Ernest O. Lawrence.

Why Build a Cyclotron?—To appreciate the problem involved, it must be remembered that man is midway in the scale of size between the solar system and the atom. Thus an atom is 10 to 100,000,000,000 times smaller than a man. And yet like the solar system the atom is mostly empty space with practically all of its mass concentrated in the positively charged nucleus, which is in turn 10,000 times smaller than the atom itself. It may at first seem strange that man should consider it necessary to construct an instrument weighing thousands of tons in order to investigate such a particle!

The atom's nucleus is built up of protons and neutrons. These fundamental building blocks are almost equal in mass but the proton is positively charged while the neutron is neutral. The particles are held together in the nucleus by very strong short-range forces acting only when the particles are in contact. (Small particles covered with a thick coating of glue would be an analogy.) The ordinary hydrogen nucleus consists of one proton while the nucleus of the heavier isotope of hydrogen (deuterium) consists of one proton and one neutron and is called the deuteron. The helium nucleus (alpha particle) is built up of two protons and two neutrons, and the complexity increases as one goes up the periodic table to uranium, most of whose nucleii consist of 92 protons and 146 neutrons giving a total mass of 238.

Since the nucleus was so small, the best way of determining its properties was to shoot particles of similar size and mass at it and then investigate the results of the collision. However, the nucleus is positively charged and the available shooting particles were also positively charged so that (by the inverse square law of repulsion between those like electric charges) it was necessary to give the shooting particles very high speed (or energy) in order that they could get close enough to the nucleus to be captured by it. Once this was done the short-range forces mentioned above became operative on the intruding particle and the various sequels became the field for many exciting discoveries in nuclear physics.

The first artificially produced nuclear transmutation was made by Ernest Rutherford in 1919. He used the energetic alpha particles emitted by a natural radioactive element to bombard nitrogen and produce a few atoms of oxygen. Similar experiments were done on other light nucleii during the following decade, but in general the alpha particles were not sufficiently energetic to overcome the repulsive force on their two units of positive

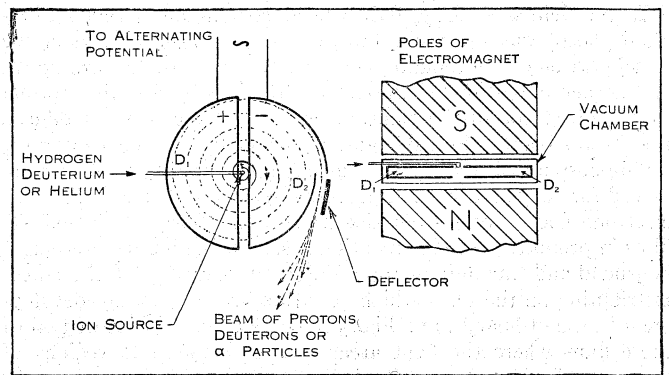
THE CYCLOTRON AND ITS APPLICATION

1. A 60-in. cyclotron showing the vacuum chamber between the poles of the electromagnet. The target chamber where the nuclear transmutations take place is shown as an extension of this side of the vacuum chamber between the coils of the magnet. The cylindrical tank on top of the magnet is the voltage supply for the deflector
2. View of the opposite side of the 60-in. cyclotron, showing the Dee-support housings. The Dee supports form a quarter wave resonant line with the Dees at the high voltage end
3. View between the magnet coil tanks of the 60-in. cyclotron showing the beam of 15 Mev deuterons when it is allowed to emerge from the target chamber on the right. The beam is about 5 ft. long and becomes more diffuse at the end because the deuterons as they slow down are more easily scattered by air molecules
4. View of the giant 184-in. cyclotron magnet in process of construction (Berkeley, Calif.). 300 tons of copper were used in the coils later placed around the pole cores.
5. The importance of the cyclotron to the biological sciences rests largely upon its production of radioactive isotopes of the biologically important elements. The radiation from these radioactive tracers (as they are called) can be detected in very minute quantities; thus the tracer can be administered to the biological specimen so as not to affect the physiological equilibrium of the specimen. In the field of botany, for instance, it has been demonstrated that assimilated phosphorus can move downward as well as upward in the aerial portion of the tomato plant. Tracer phosphorus introduced at side roots grown on a tomato plant was found to be present in the upper leaves in sufficient quantity to give a bright picture after 6 hours' exposure of film, while in the lower leaves it required 108 hours' exposure to show on the radio-autograph. This proved that although minerals travel upward with the greatest facility they do also move downward in plants



On the right is a vertical section through the magnet poles of the cyclotron showing the vacuum chamber and the two hollow semicircular insulated electrodes D_1 and D_2. The horizontal section on the left shows the spiral path taken by the positive ions as they receive repeated accelerations across the gap between D_1 and D_2 until they finally are attracted by the deflector and emerge as a beam of high-speed particles. The ions are produced from the gas admitted to the ion source; protons from hydrogen, deuterons from deuterium, or alpha particles from helium

charge.

Description of the Cyclotron.—About 1930, physicists began to develop devices for accelerating singly charged protons (hydrogen nucleii) and other particles to high speeds. The most successful of these was the cyclotron invented by Ernest O. Lawrence of the University of California. The success of this scheme lay in its subtlety. Instead of trying to attain a direct potential difference between two parts of the apparatus sufficiently great to give a particle all of its energy in one push, a much lower potential difference was used to give the particle a series of pushes. In addition, the charged particles (positive ions) were bent around in a magnetic field so that the same electrodes could be used over and over again to give the series of pushes.

At first glance, the most prominent feature of the cyclotron is the large electromagnet which produces the magnetic field. A vacuum chamber is placed between the poles of the electromagnet (*see* diagram) and in it are suspended two hollow semicircular electrodes or Dees (so named because of their shape). This hollow circular electrode system is shaped like a shallow drum which has been cut along a diameter and the two parts separated slightly. The positive ions to be accelerated are introduced at the centre of the Dee system where they are repelled by the positive D_1 and attracted by the negative D_2. Thus the ions are accelerated across the gap between the Dees and pass into the electric field-free region within the interior of D_2 where they are unaffected by subsequent changes in the voltage between the Dees. However, the magnetic field forces the ions to trace out a semicircular path within D_2 so that they eventually emerge again into the gap between the Dees. If the electric field between the Dees had still the same direction as before, the ions would be slowed down to rest. However, by reversing the electric potential while the ions are in D_2 so that now D_1 is negative and D_2 is positive, the ions are given another acceleration and pass into D_1. Then the electric potential is reversed again to its original direction and the ions receive a further acceleration in passing from D_1 into D_2. This process was usually repeated about 100 times so that if, for example, the potential difference between the Dees is 200,000 volts the ions will eventually gain an energy equivalent to that which they would have after falling through a drop in potential of 20,000,000 volts. Since the difficulties attendant upon the maintenance of steady direct potentials above 3,000,000 or 4,000,000 volts were found to be very great, the advantages of Lawrence's method are clearly indicated.

There is a physical law which makes the cyclotron relatively simple. Thus a uniform magnetic field constrains a moving ion to follow a circular path, and the law states that the time required for the ion to traverse the circle is a constant for a given ion and magnetic field and does not depend upon the speed of the ion. This is true also for half a circle, so that in the cyclotron as the ion gains speed it goes around in larger and larger semicircles such that the length of path increases in correct proportion to keep the time of travel constant between accelerations. This means that a potential source of constant frequency can be used to make the Dees alternately plus and minus. The frequency turns out to be in a convenient range (10–20 mc. per sec. for accelerating protons, for example).

When the ions have spiraled out to the outer diameter of the Dee system, they have received as much energy as they can get from the system and they are then attracted out of their circular path by a negatively charged plate. This deflector, as it is called, deflects the now high-speed ions away to bombard an external target, where the various nuclear transmutations, etc., are carried out. The maximum ion energy available clearly depends upon the diameter of the Dee system for a given maximum magnetic field. In order to prevent the ions from being lost by collision with gas molecules, the pressure in the vacuum chamber must be kept down to about one ten millionth of an atmosphere.

Development.—The energy of nuclear particles is usually expressed in terms of a unit called the electron-volt. This is the kinetic energy gained by an electron in falling through a potential difference of one volt. Thus if an alpha particle has an energy of 30,000,000 electron volts (Mev) it means that it has the same energy that an electron would gain in falling through a potential difference of 30,000,000 volts. However, since the alpha particle has an electric charge equal in magnitude to two electrons (although plus instead of minus) it would only have to fall through a potential difference of 15,000,000 volts in order to gain 30 Mev of energy.

The first ions accelerated by a preliminary 4-inch model of the cyclotron in 1930 had an energy of only 80,000 electron volts. This was soon followed, however, by the first real cyclotron using a magnet with 11-inch pole faces to accelerate protons to an energy somewhat in excess of 1,000,000 electron-volts. These particles were used to produce nuclear transmutation in 1932. During that same year an 80-ton magnet was converted to cyclotron use with 27-inch pole faces and immediately 1.8 Mev protons were obtained, then shortly afterward the energy was raised to 2.4 Mev. In 1934, heavy water was available in sufficient quantities so that deuterium ions (deuterons) could be accelerated, and in 1935 the 27-inch cyclotron was accelerating deuterons to energies of 4 Mev. It was soon found that the deuteron was a particularly effective particle at producing nuclear transmutation, partly because of the loosely bound neutron it contains. In 1937 the pole-face diameter was increased to 37 in. and shortly thereafter deuterons of 8 Mev energy were obtained and used regularly for physical and biological experimentation.

The success of the cyclotron was so spectacular by that time that many laboratories throughout the world had built or were building cyclotrons. In the decade following its invention, more than 40 cyclotrons were built or being built, about 30 in the United States, three in Great Britain, one in Canada and one or more in five other countries. The design and construction of almost every new cyclotron has added some improvement or alternative, large or small, to the general cyclotron technique. It is beyond the scope of this article to list the source of even the major improvements made by the various laboratories and later adopted as standard cyclotron design.

By 1937 the biological experiments looked so promising that construction was started in Lawrence's laboratory at Berkeley, Calif., on a new 60-inch cyclotron to be used especially for biological and medical work. The completion of this instrument in 1939 made available deuterons of energy 14.5 Mev and alpha particles of energy 29 Mev, which were immediately applied to biological, medical and physical problems. Photograph 1 in the Plate shows this instrument and its 220-ton magnet with the evacuated accelerating chamber between the pole faces. Fig. 2 in the Plate shows the opposite side of the magnet with the large cylindrical tubes which act as leads for the alternating potential to be applied to the Dee electrodes. The useful length of these horizontal tubes is adjusted so that they act as a coaxial quarter wave line resonant at the desired frequency. The Dees form the high voltage end of this line, and with 75 KW of radio frequency power the potential between them rises somewhat in excess of

200,000 volts. The deflector potential is about −100,000 volts. Fig. 3 in the Plate shows the beam of 15 Mev deuterons when it is allowed to emerge into the atmosphere instead of (as is usual) producing nuclear transmutations by striking a target inside the evacuated chamber. Such beams average about one ten thousandth of an ampere, which means that there are 600,000,000,000,000,000 deuterons per second accelerated to a speed of 25,000 mi. per sec. In order to produce an equivalent number of particles from naturally radioactive substances over 30 lb. of pure radium would be required, at $11,000,000 per lb. In 1945 this cyclotron was rebuilt to produce deuterons of over 22 Mev energy. No attempt will be made to summarize the many fundamental discoveries made and research problems attacked with the cyclotron. Hundreds of papers on nuclear physics alone have been published using it as a tool.

The winter of 1939–40 brought two great honours to the cyclotron and its inventor. Lawrence was awarded the Nobel prize in physics for the invention and development of the cyclotron, and the Rockefeller foundation made a large grant for the construction of a giant cyclotron at Berkeley, Calif. The plans for this cyclotron called for a magnet weighing over 4,000 tons and with a pole face diameter of 184 in. The yoke of the magnet was made 59 ft. long, 30 ft. high and 184 in. wide.

By the end of 1941, scientists were working on the use of uranium 235 in the atomic bomb. First, however, this material had to be separated from its 140 times more abundant isotope, uranium 238. To attack this problem Lawrence rushed the giant magnet to completion in May, 1942, and used it in the development of the electromagnetic or "Calutron" (California University Cyclotron) method of isotope separation which was later embodied in the huge electromagnetic separation plant at Oak Ridge, Tenn. After the end of World War II the giant magnet was used for its original purpose—as a cyclotron to accelerate deuterons to the terrific energy of 200 Mev.

Applications of the Cyclotron.—A discussion of the cyclotron would be incomplete without mentioning some of its many important biological and medical applications. The importance of the cyclotron to the biological sciences rests largely upon its production of radioactive isotopes of the biologically important elements. These artificially produced isotopes differ from the stable form of the same element only in their nuclear properties such as radioactivity. The extra-nuclear components of the two atomic forms are practically identical, which means that the chemical and physiological properties of the two forms are identical. The radiations from the radioactive isotopes as used in this application are kept far below the intensity at which they would cause physiological changes.

The radiations from these radioactive tracers (as they are called) can be detected in very minute quantities by such instruments as the Geiger counter (which can detect under favourable conditions the radioactivity of a single atom). Thus the tracer can be administered to the biological specimen in a quantity sufficiently small so as not to affect the physiological equilibrium of the specimen, and yet its subsequent presence in different parts of the specimen can be readily detected. Important work of this kind has been done using radioactive phosphorus in studying the uptake and distribution of phosphorus in plants, animals and man. In the case of mice, for example, the distribution and speed of assimilation of phosphorus in the muscle, bone, liver, lymph node and spleen has been investigated, both for normal animals and those with leukaemia. This was done by administering a single dose of tracer phosphorus to each of a large group of normal and leukaemic mice, then sacrificing them at varying intervals and determining the content of both total and radioactive phosphorus in the tissues. Considerably larger uptake of the tracer was found in the lymph node and spleen of leukaemic than in normal mice. In addition it was demonstrated that in human leukaemia radiophosphorus was selectively accumulated in the leukocytes (malignant white blood cells) rather than in the red blood cells or plasma. These demonstrations, together with many other careful experiments, led to extensive trials of the therapeutic application of radio-phosphorus in the treatment of human leukaemia.

In the field of botany, it has been demonstrated that assimilated phosphorus can move downward as well as upward in the aerial portion of the tomato plant. To show this roots were grown on the aerial portion of the stem midway between the normal roots and the top of the plant. These roots were then introduced for several hours into a di-sodium phosphate solution containing radio-phosphorus. Finally the various portions of the plant were placed for varying times flat against photographic films. The fast electrons (beta rays) from the tracer phosphorus darkened the films in proportion to the tracer's density in the immediate neighbourhood and thus left pictures (radio-autographs) of the tracer distribution on the films which could be brought out by development in the ordinary way. Fig. 5 in the Plate is a print of two of these films where the light areas now correspond to regions of greater radio-phosphorus (tracer) density. It is seen that the phosphorus carrying with it the chemically identical tracer has passed up the stem and thence through the conduction system of the leaves with great facility. However, the lower film shows that a much smaller fraction of the phosphorus has also moved *down* the stem and so to leaves below the side roots. It was even found that some radio-phosphorus (and therefore also normal phosphorus) had penetrated to the normal root structure. A conclusive demonstration of this downward movement of minerals in plants would be quite difficult by any other method.

Another method of using radioactive tracers as produced by the cyclotron is illustrated by the applications of radio-iodine. The isotope of iodine which is usually used emits gamma rays sufficiently penetrating to be detected through many layers of tissue. Thus the uptake of iodine, particularly by the thyroid gland, can be investigated by first orally administering a sample of radioiodine to the human subject and then placing a Geiger counter at the neck to detect the gamma rays from the tracer as it is taken up by the thyroid. A comparison of this uptake for normal controls and patients suffering from different types of hyperthyroidism has lead to many informative conclusions. An interesting sidelight on this problem was an experiment in administering element 85. This element is not found in nature but was first produced by the cyclotron from bismuth and was found to be radioactive. Since this element according to the periodic table should be very similar to iodine in its chemical properties it was injected into guinea pigs. It was found to be concentrated by the thyroid gland in a manner very similar to iodine.

Radioactive tracers have also been used extensively in medical diagnosis. An example of this is the use of radioactive sodium in the diagnosis of cases of peripheral vascular diseases (which involve poor circulation of the blood). The blood circulation time can be determined by using a Geiger counter to indicate when the tracer arrives in the member concerned after intravenous injection elsewhere in the body. The competency of the circulation at different points will then indicate the type and best site for surgery. Also the efficiency of therapeutic measures can be tested by this means.

Mention should be made of the results obtained using radioactive carbon. This element is extremely important because it is so basic to all life. Using tracer carbon, results were early obtained showing that in photosynthesis carbon dioxide is attached to a complicated molecule prior to its photochemical reduction.

The investigations mentioned here are only a small sample of the work which was done during the first decade while the biologists were learning to apply to the solution of their problems the new tools furnished by the cyclotron. The research which remained to be done was almost unlimited in scope. The perfection of the uranium pile by 1945 made it possible to produce much larger quantities of some of the biologically important radioactive isotopes although for others the cyclotron remained the only source.

The radioactive isotopes of the known elements are useful in chemistry because of the same properties that have made them such an important tool in biology. Of the some 90 elements which occur in nature there are about 390 naturally occurring isotopes. Less than 10% of these are radioactive and they are generally at the heavy end of the periodic table. In the decade before 1942 some 350 radioactive isotopes were artificially produced, and over two-thirds of them were discovered by means of cyclotrons throughout the world. These isotopes are generally distributed throughout the periodic table so that they will undoubtedly be of great value in future chemical investigations.

Of particular interest to chemists is the production of new elements which do not occur in nature and the subsequent investigation of their chemical properties. One of these first produced by the cyclotron has already been mentioned (element 85). In addition, element 43 was produced and in 1940 the cyclotron first produced minute amounts of elements 93 (neptunium) and 94 (plutonium). These new elements were of great importance in the atomic bomb program and were produced by the cyclotron in sufficient quantities to determine all their chemical properties using microchemical methods. Neptunium and plutonium were later produced in larger quantities, by means of uranium "piles," in the plant at Hanford, Wash. In 1945, minute quantities of elements 95 and 96 were produced by the cyclotron and their chemical properties were determined, indicating the possible existence of a new "rare earth" series starting with uranium.

Ion Paths in the Cyclotron.—In explaining qualitatively the action of the cyclotron the fact was brought forward that the time required for an ion to traverse a complete circle (or semicircle) in the magnetic field was independent of its velocity. This can easily be demonstrated by an ion of charge e moving in a plane perpendicular to the magnetic field H with a velocity v in a space which is free from electric field (inside one of the Dees, for example). The magnetic field will exert a force equal to Hev on the moving ion perpendicular both to its direction of motion and to the magnetic field. Thus the ion is forced to move in a circle like a ball on the end of a string. Applying Newton's Second Law we have:

$$Hev = \frac{mv^2}{r} \tag{1}$$

where m is the mass of the ion and r is the radius of the circular path.

Solving $v = \frac{eHr}{m}$, and so the time required to traverse a full circle would be

$$T = \frac{2\pi r}{v} = \frac{2\pi m}{eH} \tag{2}$$

which is independent of the velocity of the ion. Also the frequency (f) of the alternating potential required for the Dees would be

$$f = \frac{1}{T} = \frac{e}{m} \cdot \frac{H}{2\pi} \tag{3}$$

The kinetic energy gained by the ions when they have reached the exit slit at radius R can be expressed in terms of the equivalent voltage V which would give them the same energy.

$$Ve = \tfrac{1}{2}mv^2 = \frac{e^2 H^2 R^2}{2m}$$

or

$$V = \frac{e}{m} \frac{H^2 R^2}{2} \tag{4}$$

So the kinetic energy of the ions measured in electron-volts would be

$$W = \frac{Z^2}{A} H^2 R^2 (4.8 \times 10^{-5}) \text{ electron-volts} \tag{5}$$

where Z is the number of electronic charges on the ion ($Z = 1$ for protons, deuterons and 2 for alpha particles) and A is its atomic number ($A = 1$ for protons, 2 for deuterons, 4 for alpha particles) H is in oersteds, R in cm. Similarly, for the frequency:

$$f = \frac{Z}{A} H (1.53 \times 10^3) \text{ cycles per second} \tag{6}$$

Equations (5) and (6) are the fundamental design formulae of the cyclotron. The magnetic field H is limited by saturation in the iron of the magnet to about 20,000 oersteds so that in order to increase the energy W one must increase the exit radius R. However, the relationship is quite favourable—doubling the pole face diameter, for example, will give four times the energy W. For the 60-inch cyclotron prior to 1945, the exit radius R was 63 cm. and $H = 13{,}000$ oersteds. Substituting in equation (5) we obtain for deuterons $W = 16$ Mev and for alpha particles $W = 32$ Mev. Similarly from (6) we obtain $f = 10$ mc. which is equivalent to a wave length of 30 m. for the radio-frequency power supplied to the Dees.

The ions in the cyclotron are kept near the horizontal median plane of the Dees by several focusing actions. In the initial stages of acceleration when the ions are moving comparatively slowly there is some focusing action produced by the electric lens effect of the gap between the Dees, although under some circumstances this action is defocusing. When the ions are moving faster the focusing due to the magnetic field becomes predominant, since as in equation (1) the force exerted by the magnetic field is proportional to the velocity of the ions. This focusing force is due to the radial decrease of the magnetic field as one approaches the edge of the pole face. This corresponds to the bending of the magnetic lines of force in such a way as to exert a restoring force on any ions which stray from the horizontal median plane. A magnetic field which increases with the radius, on the other hand, causes defocusing so that the ions are lost before they are accelerated to full energy.

In the discussion so far we have neglected the increase of mass with velocity which was predicted by the theory of relativity:

$$m = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}} \tag{7}$$

where m_0 is the mass of the particle when at rest and c is the velocity of light. Combining this expression with equation (3) we see that in order to keep the frequency constant as the velocity increases (in other words, to maintain the resonance condition) the magnetic field H should increase proportionately with the mass m. But we have just seen that it would cause defocusing and loss of the ions for the magnetic field to increase when the radius increased.

There have been several promising suggestions for avoiding this dilemma, which sets a limit to the highest available energy. The most straightforward solution was to raise the voltage on the Dees so that the ions had to make fewer revolutions to attain their final energy and thus making the resonance condition less stringent. Calculations indicated that a Dee voltage of 1,200,000 volts would give a beam of 100 Mev deuterons from the giant 184-inch magnet. Other suggestions were the placing of grids or foils along the interface of the Dees to give larger electrical focusing, or the periodic modulation of the frequency proportional to the mass increase in (7), which would bring the ions out in bursts. In any case, it seemed clear as of 1945 that experimental ingenuity could deal with the relativistic mass increase and that cyclotrons could go on to the acceleration of particles to higher and higher energy. CYDER: *see* CIDER.

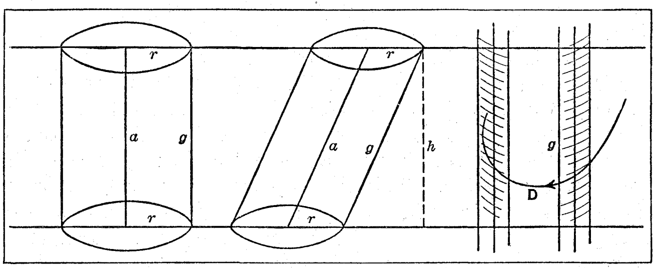
CYGNUS ("the swan"), in astronomy, a constellation of the northern hemisphere fabled by the Greeks to be the swan in the form of which Zeus seduced Leda. In this constellation β Cygni is a fine coloured double star, consisting of a yellow star, 3 mag., and a blue star, $5\frac{1}{2}$ mag. A wide double star 61 Cygni was, on account of its large proper motion of 5″ per annum, singled out by Bessel for the first successful attempt to measure stellar parallax. The parallax is about 0.31″. The constellation includes one of the most interesting regions of the Milky Way for astronomical research.

CYLINDER. In its oldest mathematical sense, the space swept out by a rectangle (fig. 1) rotating round one side as axis. It is from the Greek *kylindros*, roller, from *kylindein*, to roll. The side (called *generatrix*, g) parallel to the axis (a) traces the curved *cylindric surface;* the other two (each equal to r) trace the circular *bases* of such a right *circular cylinder*. The nearest-lying generalization supposes g not perpendicular to the parallel base-planes, but oblique, inclined at a fixed angle (like a pencil in writing), and tracing in the planes equal circles about the ends of the oblique axis as centres (fig. 2).

Measurement.—The perpendicular distance between the planes is called the cylinder's *altitude* (h). The area of each base



FIGS. 1, 2 AND 3

is clearly πr^2; the product of base and altitude (h) is the cylinder's volume $\pi r^2 h$; its curved surface (which suppose rolled out on a tangent plane) is the parallelogram of its edge (g) and the circumference of its base, *i.e.,* $2\pi rh$. A sector of the cylinder has a volume and curved surface proportional to the sector's angle. Subtracting from this volume that of the triangular prism of the axial sector-planes and the plane through parallel chords of the sector in the two bases, we obtain the volume of the cylinder segment cut off by a plane parallel to the axis, the formula being easily found by trigonometry.

Archimedes.—The metrical relations of cone, hemisphere and cylinder of the same base and height were especially studied by Archimedes of Syracuse (*c.* 225 B.C.), who showed (in Book I of his *Sphere and Cylinder*) their volumes to be as 1: 2: 3; and the surface of the sphere to equal the curved surface of the (right) circumscribing cylinder; *i.e.,* two-thirds of its whole surface. These relations were deemed by Archimedes so important and beautiful that he expressed the wish that the sphere-cylinder figure be engraved on his tomb, a wish fulfilled at command of Marcellus and furnishing a mark by which the quaestor Cicero identified it in 75 B.C., after nearly a century and a half.

Later View.—The more modern mind regards rather the cylindric surface as the cylinder itself (compare the cone, *q.v.*), and defines it in full generality as the path of a right line (g) moving without turning, *i.e.,* always parallel to itself or some fixed line or direction. To make such a surface definite, we must prescribe some *directrix* (d), generally a curve which the generatrix (g) shall describe passing through its points (fig. 3). Obviously such a surface is *developable*; that is, it may be imagined as flattened or rolled out smooth, without stretching, tearing or crinkling, on a tangent plane which evidently touches the surface full length along an element in any one of its positions. In case the directrix be an ellipse, the surface has been called "cylindroid," and may be defined as the path of an ellipse moving always parallel to itself, its centre always on a fixed line or axis. The same name is also applied to Cayley's conoidal cubic surface traced by the intersection of two moving planes $y=x \tan\theta$, $z=m \sin 2\theta$, whence, on eliminating the parameter θ, there results the equation of the surface, $z(x^2+y^2)=2mxy$. Plainly any cylindric surface may be vividly conceived as a straight tube traced by a directrix moving always straight and keeping always parallel to itself.

Sections.—If any directrix has a centre, the line through it, along which the centre moves parallel to g, is called the *axis*. Any plane through the axis makes a "principal section," namely, two opposite parallels, elements of the surface, which, with two parallel sections of this plane by two parallel planes through the cylinder, form a parallelogram. This parallelogram becomes a rectangle if the two planes be perpendicular to the generatrix g. In a right circular cylinder such a perpendicular plane cuts it in a circle, but any plane oblique to the axis, in an ellipse, which is thus seen to be the parallel projection of a circle on an inclined plane, a fact leading directly to many properties of that curve (*see* ELLIPSE). If the circular cylinder be not right but oblique, then the plane sections across it are in general elliptic, but become circular for planes parallel to the directrix circle, and also in sections "subcontrary," *i.e.,* of planes perpendicular to the principal section and inclined to the axis equally, but oppositely, to the directrix plane. The same condition occurs in oblique cones (*see* CONE).

A Limiting Case of the Cone.—The cylinder may be regarded as a cone whose vertex has withdrawn to infinity (Desargues, 1639). Accordingly all oblique sections of the right circular cylinder yield ellipses, but those parallel to an element (g) or the axis yield a pair of parallels, a limiting case of the parabola. Still further turned, the plane again cuts through, giving ellipses. But the same two parallels may be held for a limiting case of the hyperbola $\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$, which for $b=\infty$ becomes $x=\pm a$, an hyperbola straightened out into a pair of right lines tangent at the vertices. The conjugate, hyperbola, $\frac{x^2}{a^2}-\frac{y^2}{b^2}=-1$, on the same supposition ($b=\infty$) becomes a pair of imaginary lines, $x=\pm a\sqrt{1}$. (*See* CONIC SECTIONS and CO-ORDINATES.) (W. B. SM.)

CYLINDER IN ENGINEERING

The cylinder is one of the primary mechanical elements used in numerous kinds of prime movers, compressors, pumps, and pneumatic and hydraulic appliances. The earliest cylinders were employed in what were termed fire-engines, which operated by the production of a partial vacuum beneath a piston. Huygens in 1678 exploded gunpowder below the piston; with the expulsion of the gaseous products and the cooling of the remainder a vacuum was produced for the piston to descend by atmospheric pressure. Papin in 1690 applied steam in a crude fashion, and Savery and Newcomen carried developments further (*see* CONDENSER), but

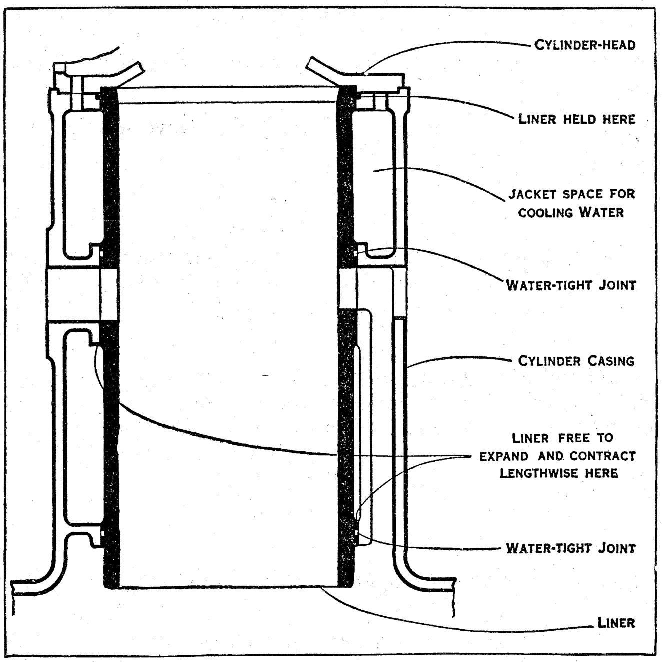


FIG. 4.—SECTION OF AN OIL-ENGINE CYLINDER FITTED WITH LINER
A renewable liner of hard-wearing metal is fitted into the cylinders of many kinds of engines. After a period of service it can be replaced by a new liner; which is a more satisfactory procedure than that of re-boring a cylinder

Watt initiated the era of practical steam-engine construction, making double-acting cylinders in which steam drove the piston to and fro, the principle remaining unchanged to-day. Later improvements involved better methods of manufacture, the use of higher steam pressures and superheated steam, as well as of the expansive energy in successive cylinders, in compound, triple-expansion, and quadruple-expansion engines. Now these multi-cylinder types are challenged by a single-cylinder engine, the "Uniflow," with its method of exhausting through central ports instead of at the ends of the cylinder as usual. Great efficiency results from the fact that condensation losses are reduced by the absence of alternate rushes of hot live steam and cooled exhaust steam over the cylinder surfaces.

Steam cylinders must be kept warm by lagging with non-conducting substances packed around the exterior, or by passing live steam around in a jacket. In internal-combustion engines and compressors the opposite need must be satisfied. The temperature must be kept down in order that the lubricating oil may keep in a working condition, and the parts maintain their shape. Air or water cooling systems deal with this problem (*see* COOLING SYSTEMS). But in any class of cylinder the risk of distortion must be guarded against by careful design; no very thick parts must be adjacent to thin ones, or expansions and contractions will be unequal, and leakages of steam or gas or vapour will occur. The strongest construction is in the Diesel engines, which have to act as powerful air-compressors, and then withstand the ensuing strong power stroke. The *liner* is an important constructional feature in great numbers of cylinders; it is a very plain tube of close-grained, hard-wearing, iron or steel, fitted into the cylinder, and often held at one end only, leaving the remainder of the length to expand longitudinally (fig. 4). When much worn the liner can be taken out and a new one inserted. It is also convenient when employing aluminium cylinders for lightness, steel liners taking the wear of the piston. Liners of gun-metal or phosphor-bronze are fitted in some kinds of hydraulic machinery (*e.g.* pumps) to prevent rusting, and the rams may be of stainless steel for the same reason. When cast-iron does not afford sufficient strength, cast-steel is chosen, particularly in hydraulic work, while if pressures are very high, as in some pumps, the cylinder bodies are bored out of solid blocks of forged steel.

Thicknesses range between remarkable extremes; on the one hand are the $\frac{3}{16}$ in. walls of aero-engines, and on the other the 9in. cast-steel walls of a Davy 12,000 ton armour-plate press. Sound metal is particularly important in cylinders, and careful selection and casting of the metal are imperative. Many steam cylinders and others including those for hydraulic presses, are cast with a large extra lump of metal at the top, termed head-metal, the dross and scoriae rising into this. When the casting is taken from the mould, this lump is cut off, leaving pure sound metal throughout the cylinder.

Multi-cylinders are used to a great degree in steam-engines, compressors, pumps, and motor and aero work. They are either

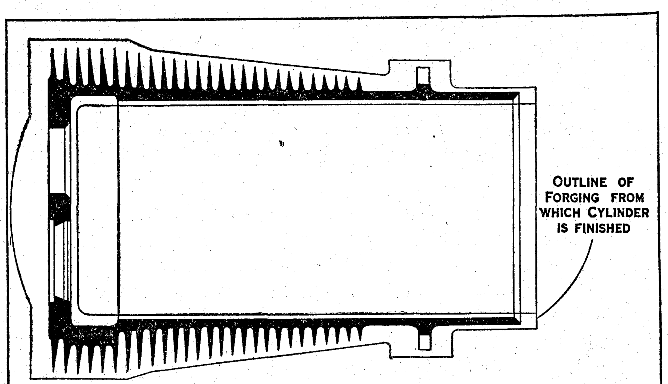

FIG. 5.—SECTIONAL DRAWING OF BRISTOL "JUPITER" RADIAL AERO-ENGINE CYLINDER
The method of producing these cylinders affords an example of the best practice to secure absolutely flawless metal. A steel forging weighing 86 lb. is bored, and turned to make the finished outline shown in black, weighing then only 18 pounds

built up by bolting together, or cast *en bloc,* the latter method being preferable from the point of view of rigidity and compactness. Aero-cylinders are sometimes cast, sometimes bored and turned from solid blocks of forged steel, so as to ensure sound metal throughout. Or a heavy forging is prepared, as in the Bristol "Jupiter" radial engines, and the cylinder machined out of this, removing a large amount of metal. This appears in fig. 5, the outline of the forging being shown by thin lines. The forging weighs 86 lb., the finished piece only 18 lb.

The importance of making a truly circular and parallel bore need scarcely be emphasized; without this, wasteful leakages occur in any sort of cylinder, and the compression cannot be properly obtained in an internal-combustion engine. The methods of finishing a bore from the casting or forging include boring, reaming, and grinding. The first-named process is often followed by the second to obtain superior finish and accuracy. Grinding gives a high

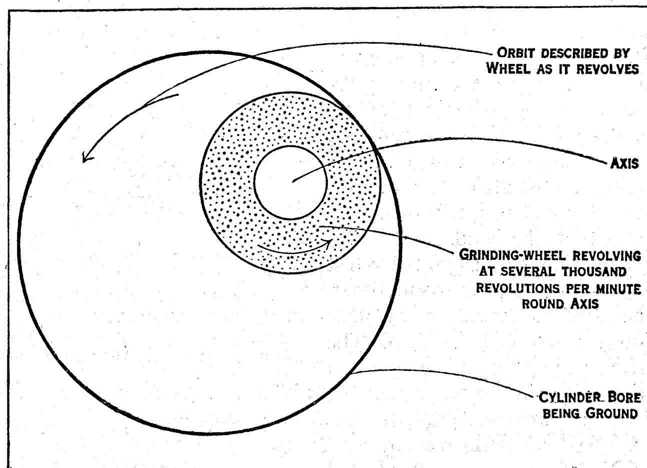

FIG. 6.—A DIAGRAM SHOWING ACTION OF PLANETARY GRINDING OF CYLINDER BORES
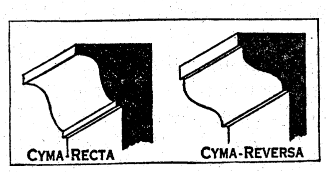
The peculiar planetary motion of the grinding-wheel spindle is necessary in order to grind the bores of cylinders while held in a fixed position on the table of the grinding-machine. Cylinder blocks, being bulky and unbalanced, cannot be conveniently revolved by a chuck, as is usual with other classes of work requiring to be ground internally

mirror-finish, and by reason of the nature of the operation, which removes a mere film of metal, it tends to avoid distortion of the cylinder by pressure and heat. A number of machines have been developed for these operations, including single-spindle and multi-spindle boring and reaming machines, for units and block castings. The grinding machines are specially designed for the purpose, having a planetary action to the wheel-spindle which can be moved round in a circle of lesser or greater diameter as required, while the spindle is turning on its own axis at 5,000 or 6,000 revolutions per minute (fig. 6). This peculiar action is necessary because the cylinders cannot be conveniently revolved, but must be clamped to a fixed table. Honing is a newer finishing process, a revolving and reciprocating spindle moving a circle of carborundum cylinders round the bore and up and down. (*See* STEAM ENGINE; INTERNAL COMBUSTION ENGINE; DIESEL ENGINE.) (F. H.).

CYLLENE (1) a mountain in Greece, in the north-east of Arcadia, mod. *Ziria,* 7,789 ft. It was sacred to Hermes, who was born in a cave on the mountain, and had a temple and an ancient statue on its summit.

(2) An ancient port in Elis doubtfully identified with (3) the modern port at Glarentza, with mineral baths a little to the south.

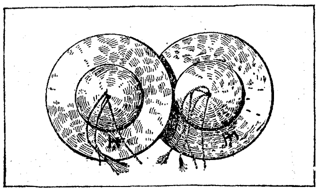


CYMA, in architecture, a moulding of double curvature, whose profile is concave at one end, convex at the other. When the more projecting portion is concave, it is known as a *cyma recta,* when convex as a *cyma reversa.* (Gr. *kuma,* wave.) (*See* MOULDING.)

CYMATIUM, the uppermost member of a classic cornice (*q.v.*), usually consisting of a projecting moulding. In the Greek Doric the cymatium occurs only upon the pediment cornices, returning along the sides only the depth of the pediment coping which it decorates. It is in the form of an ovolo or projecting convex moulding. The cymatium also takes an ovolo form in the Tuscan order, a cavetto, or concave, form in the Roman Doric and a cyma recta form, or moulding of double curvature, elsewhere. (*See* MOULDING; ORDER.)

CYMBALS, a modern instrument of percussion of indefinite musical pitch, whereas the small ancient cup-shaped cymbals sounded a definite note. Cymbals consist of two thin round plates of an alloy containing eight parts of copper to two of tin, and the sound is obtained by clashing and rubbing them against each other. Although cymbals are not often required they form part of every orchestra. They are specially suited for suggesting frenzy, fury or bacchanalian revels, as in the Venusberg music in Wagner's *Tannhäuser* and Grieg's *Peer Gynt* suite.

The *timbre* of the ancient cymbals is entirely different, more like that of small hand-bells or of the notes of the keyed harmonica. They are not struck full against each other, but by one of their edges, and the note given out by them is higher in proportion as they are thicker and smaller. Berlioz in *Romeo and Juliet* scored for two pairs of cymbals, modelled on some ancient Pompeian instruments no larger than the hand.



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

CHINESE BRONZE CYMBALS MARKED WITH THE CHARACTER "JEWEL"

The cords of the Chinese instrument are usually red, symbolizing happiness

The origin of the cymbals must be referred to prehistoric times. The ancient Egyptian cymbals closely resembled our own. The British Museum possesses two pairs, $5\frac{1}{3}$in. in diameter, one of which was found in the coffin of the mummy of Ankhhapē, a sacred musician.

CYMBALUM: *see* CHIME-BELLS.

CYME, the name given in botany to an arrangement of flowers (inflorescence) in which each successive branch of the flowering axis ends in a flower after bearing one or more bracteoles in whose axils the branching is continuous. Cymes are subdivided according to the number of these branches. (*See* FLOWER.)

CYNEGILS (d. 643), king of the West Saxons, succeeded his uncle King Ceolwulf in 611. With his son Cwichelm (d. 636), he defeated the advancing Britons at Bampton, Oxfordshire, in 614, and Cwichelm sought to arrest the growing power of the Northumbrian king Eadwine by procuring his assassination; the attempt failed, and in 626 the West Saxons were forced to own Eadwine's supremacy. Cynegils' next struggle was with Penda of Mercia, who defeated him in 628 at Cirencester. Cynegils was converted to Christianity by Birinus, and was baptized in 635 at Dorchester, Oxfordshire, where he founded a bishopric. His son Cenwalh succeeded him.

CYNEWULF (d. 785), king of Wessex, succeeded to the throne in 757 on the deposition of Sigebert. He was constantly at war with the Welsh. In 779 Offa of Mercia defeated him and took Bensington. In 785 he was surprised and killed at Marten, Wilts (Merantune), by Cyneheard, brother of Sigebert.

See J. Earle and C. Plummer's edition of the *Anglo-Saxon Chronicle,* 755, 779 (Oxford, 1892).

CYNEWULF, the only Old English vernacular poet, known by name, of whom any undisputed writings are extant. He is the author of four poems preserved in two mss., the *Exeter Book* and the *Vercelli Book,* both of the early 11th century. An epilogue to each poem contains the runic characters answering to the letters *c, y, n* (*e*), *w, u, l, f*. The runes are to be read as the words that served as their names; these words enter into the metre of the verse, and (except in one poem) are significant in their context.

In *Juliana* and *Elene* the name is spelt Cynewulf; in *The Ascension* the form is Cynwulf. In *The Fates of the Apostles* the page is defaced, but the spelling Cynwulf is almost certain. The absence of the E in *The Ascension* can hardly be due to a scribal omission, for the name of this letter (meaning "horse") would not suit the context; this was perhaps the motive for the choice of the shorter form. The orthography (authenticated as the poet's own by the nature of his device) has chronological significance. If the poems had been written before 740, the spelling would almost certainly have been Cyniwulf. From the scanty extant evidence we should conclude that the form Cynwulf came in about 800, and the four works may therefore be referred provisionally to the beginning of the 9th century, any lower date being for linguistic and metrical reasons improbable. The mss. of the poems are in the West-Saxon dialect, but Prof. E. Sievers's arguments for a Northumbrian original have considerable weight.

Cynewulf's unquestioned poems show that he was a scholar, familiar with Latin and with religious literature, and they display much metrical skill and felicity in the use of traditional poetic language; but of the higher qualities of poetry they give little evidence. There are pleasing passages in *Elene,* but the clumsy and tasteless narration of the Latin original is faithfully reproduced, and the added descriptions of battles and voyages are strings of conventional phrases, with no real imagination. In *The Ascension* the genuine religious fervour imparts a higher tone to the poetry; the piece has real but not extraordinary merit. Of the other two poems no critic has much to say in praise.

Until recently it was commonly thought that Cynewulf's authorship of the Riddles in the *Exeter Book* (*q.v.*) was beyond dispute. Some of the Riddles have been shown by Prof. E. Sievers to be older than Cynewulf's time; that he may have written some of the rest remains a bare possibility. The similarity of tone in the three poems known as the *Christ* affords some presumption of common authorship. Both *The Incarnation* and *The Last Judgment* contain many passages of remarkable power and beauty. The *Christ* is followed in the ms. by two poems on *Saint Guthlac,* the second of which is generally, and with much probability, assigned to Cynewulf. The first Guthlac poem is almost universally believed to be by another hand. Cynewulf's reputation can gain little by the attribution to him of *Guthlac.* Very different would be the effect of the establishment of his much disputed claim to *Andreas,* a picturesque version of the legend of the Apostle Andrew. The poem abounds to an astonishing extent in "Cynewulfian" phrases, but it is contended that these are due to imitation. If the author of *Andreas* imitated *Elene* and *Juliana,* he bettered his model. Cynewulf's authorship has been asserted by some scholars for *The Dream of the Rood,* the noblest example of Old English religious poetry. But an extract from this poem is carved on the Ruthwell Cross; and, notwithstanding the arguments of Prof. A. S. Cook, the language of the inscription seems too early for Cynewulf's date. The similarities between the *Dream* and *Elene* are therefore probably due to Cynewulf's acquaintance with the older poem. The only remaining attribution that deserves notice is that of the *Phoenix.* The author of this fine poem was, like Cynewulf, a scholar, and uses many of his turns of expression, but he was a man of greater genius than is shown in Cynewulf's signed compositions.

For the older literature relating to Cynewulf, *see* R. Wülker, *Grundriss der angelsächsischen Litteratur* (1885). References to the most important later discussions will be found in M. Trautmann, *Kynewulf, der Bischof und Dichter* (1898), and the introductions and notes to the editions of *Cynewulf's Christ,* by I. Gollancz (1892) and A. S. Cook (1900). For the arguments for Cynewulf's authorship of *Andreas, see* F. Ramhorst, *Andreas und Cynewulf* (1885). *See* also C. W. Kennedy, the *Poems of Cynewulf Translated into English Prose* (1910); A. S. Cook, "Cynewulf's Part in our Beouwulf," *Conn. Ac. Arts and Sci.* xxvii. (1925).

CYNICS, a small but influential school of ancient philosophers. Their name is variously derived from the building in Athens called Cynosarges, the earliest home of the school, and from the Greek word for a dog (κύων), in contemptuous allusion to the uncouth and aggressive manners adopted by the members of the school. Whichever of these explanations is correct, it is noticeable that the Cynics agreed in taking a dog as their common badge or symbol (*see* DIOGENES). From a popular conception of the intellectual characteristics of the school comes the modern sense of "cynic," implying a sneering disposition to disbelieve in the goodness of human motives and a contemptuous feeling of superiority.

As regards the members of the school, the separate articles on ANTISTHENES, CRATES, DIOGENES and DEMETRIUS contain all biographical information. We are here concerned only to examine the general principles of the school in its internal and external relations as forming a definite philosophic unit. The importance of these principles lies not only in their intrinsic value as an ethical system, but also in the fact that they form the link between Socrates and the Stoics, between the essentially Greek philosophy of the 4th century B.C. and a system of thought which has exercised a profound and far-reaching influence on mediaeval and modern ethics. From the time of Socrates in unbroken succession up to the reign of Hadrian, the school was represented by men of strong individuality. The leading earlier Cynics were Antisthenes, Diogenes of Sinope, Crates of Thebes, and Zeno; in the later Roman period, the chief names are Demetrius (the friend of Seneca), Oenomaus and Demonax. All these men adhered steadfastly to the principles laid down by Antisthenes.

Antisthenes was a pupil of Socrates, from whom he imbibed the fundamental ethical precept that virtue, not pleasure, is the end of existence. He was, therefore, in the forefront of that intellectual revolution in the course of which speculation ceased to move in the realms of the physical (*see* IONIAN SCHOOL OF PHILOSOPHY) and focused itself upon human reason in its application to the practical conduct of life. "Virtue," says Socrates, "is knowledge": in the ultimate harmony of morality with reason is to be found the only true existence of man. Antisthenes adopted this principle in its most literal sense, and proceeded to explain "knowledge" in the narrowest terms of practical action and decision, excluding from the conception everything except the problem of individual will realizing itself in the sphere of ordinary existence. Just as in logic the inevitable result was the purest nominalism, so in ethics he was driven to individualism, to the denial of social and national relations, to the exclusion of scientific study and of almost all that the Greeks understood by education. This individualism he and his followers carried to its logical conclusion. The ordinary pleasures of life were for them not merely negligible but positively harmful inasmuch as they interrupted the operation of the will. Wealth, popularity and power tend to dethrone the authority of reason and to pervert the soul from the natural to the artificial. Man exists for and in himself alone; his highest end is self-knowledge and self-realization in conformity with the dictates of his reason, apart altogether from the State and society. For this end, disrepute and poverty are advantageous, in so far as they drive back the man upon himself, increasing his self-control and purifying his intellect from the dross of the external. The good man (*i.e.* the wise man) wants nothing: like the gods, he is αὐταρκής (self-sufficing); "let men gain wisdom—or buy a rope"; he is a citizen of the world, not of a particular country (*cf.* Diogenes Laërtius vi. 2).

It is not surprising that the pioneers of such a system were criticized and ridiculed by their fellows, and this by no means unjustly. We learn that Diogenes and Crates sought to force their principles upon their fellows in an obtrusive, tactless manner. The very essence of their philosophy was the negation of the graces of social courtesy; it was impossible to "return to nature" in the midst of a society clothed in the accumulated artificiality of evolved convention without shocking the ingrained sensibilities of its members. Nor is it unjust to infer that the sense of opposition provoked some of the Cynics to an overweening display of superiority. At the same time, it is absurd to regard the eccentricities of a few as the characteristics of the school, still more as a condemnation of the views which they held.

In logic Antisthenes was troubled by the problem of the One and the Many. A nominalist to the core, he held that definition and predication are either false or tautological. Ideas do not exist save for the consciousness which thinks them. "A horse," said Antisthenes, "I can see, but horsehood I cannot see." Definition is merely a circuitous method of stating an identity: "a tree is a vegetable growth" is logically no more than "a tree is a tree."

Cynicism appears to have had a considerable vogue in Rome in the 1st and 2nd centuries A.D. Demetrius (*q.v.*) and Demonax are highly eulogized by Seneca and Lucian respectively. It is probable that these later Cynics adapted themselves somewhat to the times in which they lived and avoided the crude extravagance of Diogenes and others. But they undoubtedly maintained the spirit of Antisthenes unimpaired and held an honourable place in Roman thought. This very popularity had the effect of attracting into their ranks charlatans of the worst type. So that in Rome also Cynicism was partly the butt of the satirist and partly the ideal of the thinker.

Disregarding all the accidental excrescences of the doctrine Cynicism must be regarded as a most valuable development and as a real asset in the sum of ethical speculation. With all its defective psychology, its barren logic, its immature technique it emphasized two great and necessary truths; firstly, the absolute responsibility of the individual as the moral unit, and, secondly, the autocracy of the will. These two principles are sufficient ground for our gratitude to these "athletes of righteousness" (as Epictetus calls them). Furthermore they are profoundly important as the precursors of Stoicism. The closeness of the connection is illustrated by Juvenal's epigram that a Cynic differed from a Stoic only by his cloak. Zeno was a pupil of Crates, from whom he learned the moral worth of self-control and indifference to sensual indulgence (*see* STOICS).

Finally it is necessary to point out two flaws in the Cynic philosophy. In the first place, the content of the word "knowledge" is never properly developed. "Virtue is knowledge"; knowledge of what? and how is that knowledge related to the will? These questions were never properly answered by them. Secondly they fell into the natural error of emphasizing the purely animal side of the "nature" which was their ethical criterion. Avoiding the artificial restraints of civilization, they were prone to fall back into animalism pure and simple. Many of them upheld the principle of community of wives (*see* Diogenes Laërtius vi. 2); some of them are said to have outraged the dictates of public decency. It was left to the Stoics to separate the wheat from the chaff, and to assign to the words "knowledge" and "nature" a saner and more comprehensive meaning. For relation of Cynicism to contemporary thought, *cf.* CYRENAICS, MEGARIAN SCHOOL OF PHILOSOPHY. (*See* also ASCETICISM.)

CYNOCEPHALUS (or GALEOPITHECUS), the scientific names of the species of Colugo or Cobego, commonly known as flying lemurs (*q.v.*) and alone representing the family Cynocephalidae of the order Dermoptera. The family characters are as follows: Herbivorous, climbing, clawed mammals, provided with a very extensive gliding membrane, and having the dental formula $i. \frac{2}{2}$, $c. \frac{0}{1}$, $p. \frac{3}{3}$, $m. \frac{3}{3}$, total 34. The lower incisors are directed forwards and have a comb-like structure of their crowns, while the outermost of these teeth and the canines are double-rooted, being in these respects, taken together, quite unlike those of all other mammals; the cheek-teeth have numerous sharp cusps; and there is the normal replacement of milk-molars by premolars. In the skull the orbit is surrounded by bone, and the tympanic has a bulla and an ossified external meatus. The ulna and fibula are to some extent inclined backwards; the carpus has a scapho-lunar; and the feet are five-toed. The hemispheres of the brain are short and but slightly convoluted; the stomach is simple; there is a large caecum; the testes are received into inguinal pouches; the uterus is two-horned; the placenta is discoidal; and there are two pairs of pectoral teats. A single offspring is produced at a birth. (*See* INSECTIVORA.)

There are two well-marked species, *Cynocephalus temminckii,* ranging from Burma, Thailand and the Malay Peninsula to Borneo, Sumatra and Java, and *Cynocephalus volans,* of the Philippine group. The former, which is nearly 2 ft. in total length, is distinguished by its larger upper incisors, shorter ears and smaller skull. In both species not only are the long and slender limbs connected by a broad integumentary expansion extending outwards from the sides of the neck and body, but there is also a web between the fingers and toes reaching as far as the base of the claws; and the hind-limbs are further connected by a similar expansion passing outwards along the back of the feet to the base of the claws, and, inwardly, involving the long tail to the tip, forming a true interfemoral membrane, as in bats.

CYNOSCEPHALAE, BATTLE OF (197 B.C.). Once the Hannibalic War (*see* PUNIC WARS) was concluded Roman expansion began. Expansion eastwards soon brought the Republic into contact with the fragments of the Alexandrian Empire, and between the years 200 and 197 B.C. the Second Macedonian War took place culminating in the decisive victory of Quinctius Flamininus, the Roman Consul, over Philip, King of Macedon, at Cynoscephalae in Thessaly. Both armies numbered about 26,000 men, the Macedonian being organized in a phalanx of two divisions of 8,000 men each, about 7,000 light troops and 2,000 horse. Flamininus had the same number of heavy foot, but was considerably the stronger in cavalry as the Aetolian horsemen had joined him; he also possessed a force of war elephants.

When the king arrived at Larissa he learnt that Flamininus was approaching Pherae, and immediately pushed forward to that place. Finding the ground there "thickly wooded and full of walls and gardens and consequently unsuited to the movements of his phalanx" he fell back to Scotussa, a corn-growing district which offered him not only moderately level ground but ample supplies and forage.

Learning of his withdrawal, Flamininus followed him, and quite unknown to each other both armies encamped on the opposite sides of a low range of hills called from their appearance Cynoscephalae, or "the Dogs'-heads."

The next day both generals sent out reconnoitring parties to occupy the ridge; a dense fog covered the ground; in it the two forces of light infantry met unexpectedly, and the Romans being the weaker were driven back, then being reinforced they advanced, were once again heavily attacked by the Macedonians who would have cut them up had not they been held back by the Aetolian cavalry.

Flamininus now, the fog having cleared, drew out his legions. Ordering his right wing to remain where it was with the elephants in front of it, he advanced at the head of the left wing covered on its left by light troops, to support his advanced guard. Philip was a sound but weak general. At first he had no intention of entangling his columns in the hilly ground, but finally was persuaded by his subordinates to advance. Placing himself at the head of the right division of the phalanx he was soon compelled to form it into a heavy column in order to cross the broken ground.

Meanwhile Nicanor who was in command of the left division of the phalanx was instructed to follow the right division as soon as possible. This over-haste to support the Macedonian advanced guard resulted in Philip's army being beaten in detail.

On approaching Flamininus, Philip threw out his light infantry on his right flank and sounded the charge. The sarissas (pikes) were lowered, and the Roman left wing driven down the hill. Flamininus, seeing that it was not possible to prevent his men falling back, and perceiving that the Macedonian wings were separated, Nicanor being still a considerable distance in rear, galloped over to his right wing and ordered it to advance against the Macedonian left, which caught in column of march was thrown into confusion by the elephants, and at once broke and fled, being pursued by the Roman right wing. One of the tribunes, a man of quick tactical insight, seeing that the Roman left was hard pressed, broke away from the pursuit and wheeling round some 20 maniples moved rapidly towards the Macedonian right wing, and charged it in rear. The nature of the phalanx being such that it was most difficult for the men to face round singly and defend themselves, confusion at once resulted. Under cover of this confusion the Roman left wing reformed its ranks and attacked the Macedonians in front. This dual attack in rear and front proved decisive.

Philip left the field with a small party of men, his right wing was cut to pieces, his losses being 8,000 killed and 5,000 prisoners; the Romans lost 700.

Tactically the battle of Cynoscephalae is an interesting one. Both armies attacked and were attacked in detail. In the actual charge the sarissa proved once again all-powerful, but the legionary organization being the more flexible enabled a clear-sighted subordinate quickly to break off a small party of men and manoeuvre towards the decisive point—the rear of the victorious Macedonian right. *See* also ROME: *Ancient History.*

CYNOSURE, the name given by the Greeks and Romans to the constellation of the Little Bear, Ursa Minor. (Lat. *cynosura,* Gr. *κυνόσουρα,* from *κυνός,* genitive of *κύων,* a dog, and *οὐρά* tail.) The word is applied in English to the pole-star which appears in that constellation, and hence to something bright which, like a "guiding-star," draws all attention to it, as in Milton's "cynosure of neighbouring eyes."

CYNOTHERAPY, the practice of healing by means of dogs, is of great antiquity and almost world-wide distribution. In it the use of the dog may be merely magical or ceremonial, or the parts of the dog itself may be used as medicine or as ingredients therein. Primitive thought does not clearly distinguish between what is magical and what is medicinal. The domestication of the dog dates from the Mesolithic age, and its use as food is widespread and has generally some ceremonial significance, a significance perhaps due to the great value of the dog to the ancient hunter or shepherd. Thus in the Nicobar islands, where the dog is apparently a tribal token, it is sacrificed, then cooked and eaten. The Lhota Nagas of Assam sacrifice (and eat) dogs at a propitiatory ceremony because the dog, being the cleverest of all animals, is therefore the most gratifying to the spirits. Among the Igorot of Luzon the dog is used as a ceremonial food, and in mediaeval Europe it was a favourite animal in offerings to the devil. In Argos the dog was sacrificed to a fertility god, and in Sparta and Caria to the god of war; the Macedonians and Boeotians sacrificed dogs in purification rites and so apparently did the Romans, for Pliny mentions that live dogs were fastened in a wooden fork (*Nat. Hist.* xxix., iv.), much as a Kuki or Naga of Assam impales them on a bamboo spike at this day. The dog also appears to have been eaten as food in Rome. In 813 the Bulgar leader, Krum, sacrificed dogs before Constantinople. The Sema Nagas mark a boundary by burning a live puppy, and a similar use of dogs as sacrifices on important occasions such as in peace-makings, in cementing friendships, in taking oaths and even in rain-making is common.

But though these uses of the dog may be merely the outcome of a vague feeling of reverence, caused by its sagacity and valuable qualities, of such a feeling as that recorded of the Kenyahs of Borneo, there seems to be more than this at the bottom of its use as medicine, and it may be that there is, or has been, an idea that the soul matter of human beings and of dogs is of similar quality (*see* METEMPSYCHOSIS; LYCANTHROPY; HEAD-HUNTING), and that the latter can usefully be substituted for the former for that reason. It has been suggested—Carveth Read, *Origin of Man* (1925)—that the sympathy between man and dogs is due to the fact that both are descended from ancestors that hunted in packs. In any case hunting dogs are often treated as human beings; if an Angami Naga kills one, he must leave the village for five days, that of his departure and return being kept as communal tabu days, as if he had committed homicide on a small scale. Hunting dogs were crowned in ancient Italy, are buried with particular respect by the Naga tribes of Assam, and are allotted a definite share of the game killed by the Oraons of Chhota Nagpur in India, by the Khasis and the Naga tribes in Assam, and by the Tinguians of the Philippine Islands. So, too, canine have been substituted for human victims in sacrifice on the Nile, in Hawaii, in the Naga hills, and perhaps in Ireland; and the same idea is no doubt present in the use of dogs for sacrifice in illness by the Koryaks of Siberia, in New Guinea, in Hawaii, and by the Kuki tribes of Assam and Burma, the dog being the sacrifice *par excellence* in illness among the Thado, Lushei, and Chins. The Buru and Aru islanders of Indonesia eat dogs to acquire bravery, as do the Kansas Indians of the U.S.A. The Romans sacrificed dogs to the Bona Dea and at the Lupercalia. The Huancas of Peru had the same idea and ate dogs at their greatest festival, while the Angami Nagas also make a practice of eating dog at their important annual festival, the Sekrengi, which is intended to secure the health of the community during the ensuing year. The Naga tribes all regard dog's flesh as a valuable tonic and as generally health-giving, while the flesh, blood, or fat of dogs has long been regarded as medicinal in Europe. Hippocrates advocated a diet of dog flesh in certain illnesses, as consumption, and Pliny remarks "that sucking puppies were held fit for food." Culpeper, in his *Pharmacopoeia Londiniensis* (1659), recommends newly-whelped puppy as an ingredient in liniment for bruised or wounded limbs, and the *Pharmacopée Universelle* (1763) gives directions for the preparations of ointment, oil, and liniment from dogs for use in rheumatism, while a remedy called "dog oil" is still used in the north of

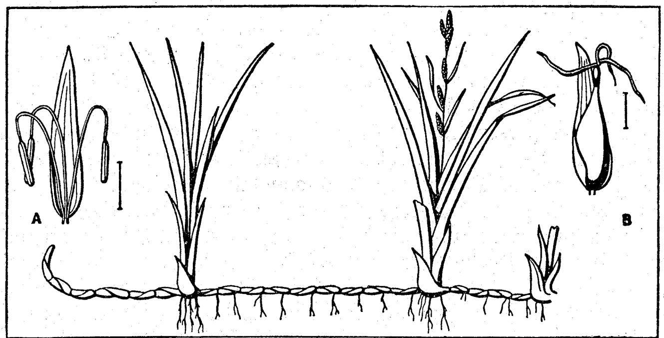

FIG. 1.—CAREX RIPARIA, THE LARGEST BRITISH SEDGE, FROM 3 TO 5 FT. HIGH

England for arthritis. Dog, too, is a common nostrum against poison; "nothing is more potent against poison than dog's blood," says Pliny again (*Loc. cit.*), and in Ireland "the blood of many dogs" forms part of a charm against poisoning, while the Angami Naga antidote is the eyes of a living dog, plucked out and swallowed. The hair of the dog that bit you is a remedy for dog-bite in Assam as well as in Great Britain, while in China there is medicinal virtue in the hair of any dog.

Of course the belief in the virtue of dog flesh may be due, or partly due, to the observations of the healing effects of a dog's licking its own wounds. *Langue de chien sert de médécine* says the French proverb, while the scriptural case of Lazarus seems to contain that idea. Cures were effected at Epidaurus in the 4th century B.C. by the licking of the patient by dogs sacred to Aesculapius (*q.v.*), to which dogs the Athenians actually offered sacrifices. The idea is still current, for a whole family in Co. Durham in 1921 attributed their recovery from scabies to the licking of a pet dog (*The Lancet*, Nov. 1921). (J. H. H.)

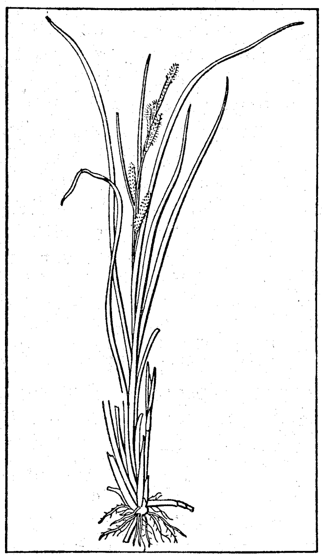

FIG. 1A.—CAREX AMPULLACEA, WHICH GROWS FROM 1 TO 3 FT. HIGH, IN BOGS AND MARSHES IN PARTS OF EUROPE, ASIA AND NORTH AMERICA

CYPERACEAE, in botany, a family of monocotyledons. They are grass-like herbs, sometimes annual, but more often persisting by means of an underground stem, from which spring erect solitary or clustered, generally three-sided aerial stems, with leaves in three rows. The minute flowers are arranged in spikelets somewhat as in grasses, and these again in larger spike-like or panicled inflorescences. The flower has in rare cases a perianth of six scale-like leaves arranged in two whorls, and thus conforming to the common monocotyledonous type of flower. Generally the perianth is represented by hairs, bristles or similar developments, often indefinite in number; in the two largest genera, *Cyperus,* and *Carex* the flowers are naked. In a few cases there are two whorls of stamens, with three members in each; but generally only three are present; the pistil consists of two or three carpels, united to form an ovary bearing a corresponding number of styles and containing one ovule. The flowers, often unisexual, are wind-pollinated. The fruit is one-seeded, with a tough, leathery or hard wall. There are 85 genera containing about 3,200 species and widely distributed throughout the earth, chiefly as marsh-plants. In the arctic zone they form 10% of the flora. They will flourish in soils rich in humus which are too acid to support grasses. The large genus *Cyperus* contains about 600 species, chiefly in the warmer parts of the earth; *C. papyrus*

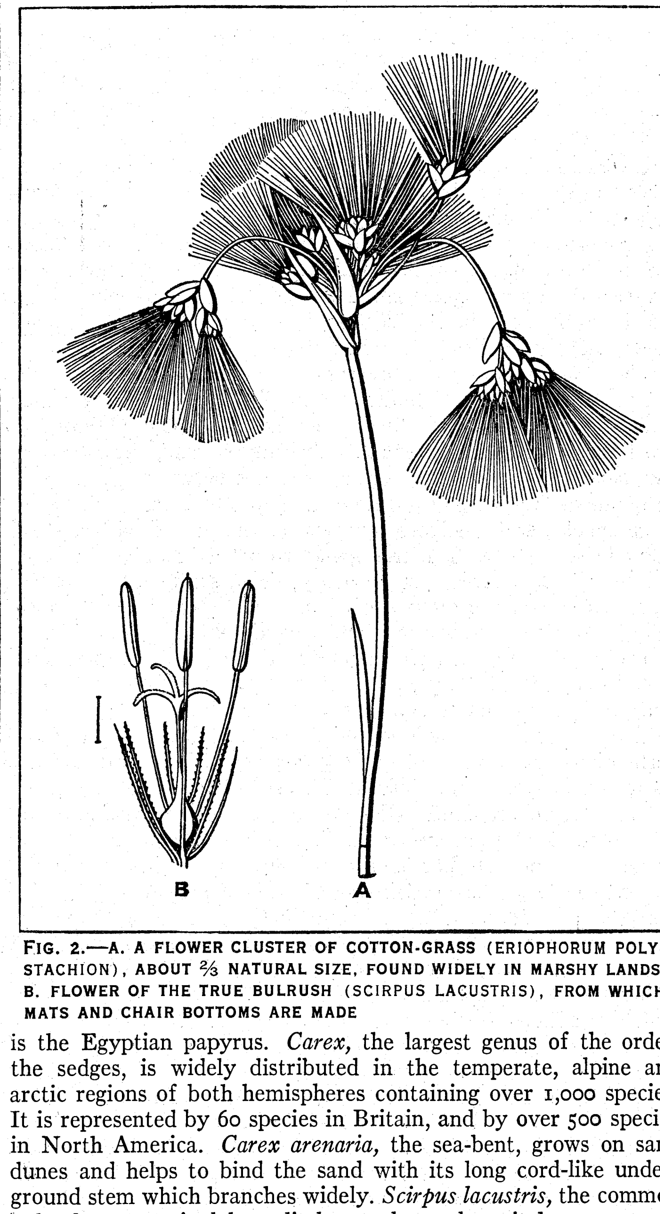

FIG. 2.—A. A FLOWER CLUSTER OF COTTON-GRASS (ERIOPHORUM POLYSTACHION), ABOUT ⅔ NATURAL SIZE, FOUND WIDELY IN MARSHY LANDS. B. FLOWER OF THE TRUE BULRUSH (SCIRPUS LACUSTRIS), FROM WHICH MATS AND CHAIR BOTTOMS ARE MADE

is the Egyptian papyrus. *Carex,* the largest genus of the order, the sedges, is widely distributed in the temperate, alpine and arctic regions of both hemispheres containing over 1,000 species. It is represented by 60 species in Britain, and by over 500 species in North America. *Carex arenaria,* the sea-bent, grows on sand dunes and helps to bind the sand with its long cord-like underground stem which branches widely. *Scirpus lacustris,* the common bulrush, occurs in lakes, ditches and marshes; it has a spongy, green, cylindrical stem, reaching nearly an inch in thickness and 1 to 8ft. high, which is usually leafless with a terminal branched inflorescence. *Eriophorum,* cotton grass, is represented in Britain by several species in boggy land. They are small tufted herbs with cottony heads due to the numerous hair-like bristles which take the place of the perianth and become much elongated in the fruiting stage.

In North America, some species of *Carex* grow on dry land, but the largest ones occur in low grounds. They cover great areas of marsh land in the Upper Mississippi region, and are employed in the manufacture of "grass carpets."

CY-PRÈS, in English law, a principle adopted by the court of chancery in dealing with trusts for charitable purposes. When the charitable purpose intended by a testator cannot be carried into effect, but the general charitable intent is clear, the court will apply the funds to some other purpose, as near the original as possible (whence the name).

In the United States, charitable trusts have become more frequent as the wealth of the country has progressed, and are regarded with increasing favour by the courts. The *cy-près* doctrine has been either expressly or virtually applied to uphold them in several of the States, and in some there has been legislation in the same direction. In others the doctrine has been repudiated; *e.g.*, in Michigan, Tennessee, Indiana and Virginia. For many years the New York courts held that this doctrine was not in force there, but in 1893 the legislature repealed the provisions of the revised statutes on which these decisions rested and restored the ancient law. Statutes passed in Pennsylvania have established the doctrine there, and dissolved any doubt as to its being in force in that state.

CYPRESS, the name given to several evergreen, aromatic trees and shrubs belonging to the genera *Cupressus* and *Chamaecyparis* of the coniferous family Cupressaceae. The cypresses, which are indigenous to southern Europe, Asia and North America, feature scale-like overlapping leaves, usually in four ranks; few-scaled catkins; cones consisting of from six to ten peltate, woody, terminally bossed scales; and numerous small, winged seeds. All species exude a resin but no turpentine.

The Italian cypress (*Cupressus sempervirens*) has been well-known throughout the Mediterranean region since classic times. It is a tapering tree resembling the Lombardy poplar; its branches are thickly covered with small, imbricate, shining, green leaves; the male catkins are minute; the cones are between 1 and 1½ in. in diameter, sessile, and generally in pairs, and are made up of large angular scales, slightly convex exteriorly, and with a sharp point in the centre. The tree grows to a height of 90 ft. in its native soil. It thrives best on a dry, deep, sandy loam, on airy sheltered sites at no great elevation. The timber is hard, close-grained, of a fine reddish hue, and very durable.

The cypress, which is incapable of developing stump sprouts once the tree is cut down, was regarded as a symbol of the dead, and perhaps for that reason was sacred to Pluto.

The tree grows straight, or nearly so, and has a gloomy and forbidding, but wonderfully stately aspect. With advancing age its foliage becomes almost black. Its origin is doubtful.

The Port Orford white-cedar (*Chamaecyparis lawsoniana*), native to south Oregon and north California, is commonly known as Lawson cypress to horticulturists. The finest representative of the genus *Cupressus* in California is the Monterey cypress (*C. macrocarpa*). It is a tree of beautiful symmetry, becoming 150 ft. in height, with a trunk 8 ft. to 10 ft. in circumference. It grows rapidly, even on poor soils, and thrives best near the sea. Other Californian species are *C. goveniana* and *C. macnabiana,* which are much smaller trees than the Monterey cypress. *C. funebris* is a native of the north of China, where it is planted near pagodas. *Chamaecyparis nootkatensis,* the Nootka sound cypress or Alaska-cedar, is a hardy species, reaching a height of from 80 ft. to 100 ft. *C. obtusa* of Japan is a tall tree reaching 100 ft. in height, and widely planted by the Japanese for its timber—one of the best for interior construction. It is also cultivated by them in a dwarf form not exceeding a foot in height.

The baldcypress, *Taxodium distichum,* a deciduous conifer, is a member of the family (Taxodiaceae), a native of the southern United States and Mexico. It is a lofty tree reaching a height of about 170 ft., with a massive trunk 15 ft. or more in diameter, growing in or near water. The lower part of the trunk bears huge buttresses, each of which ends in a long branching far-spreading root, from the branches of which arise the peculiar knees above the level of the water. The knees are of a soft spongy texture and have been thought to act as breathing organs, supplying the roots with air. Some authorities assert that their function is largely mechanical and they give greater stability to the standing tree. The stout, horizontally spreading branches give a cedar-like appearance; the foliage is light and feathery; the leaves and the slender shoots which bear them fall in the autumn.

The cones, about the size of a small walnut, bear spirally-arranged imbricated peltate scales which subtend the three-angled, winged seeds. The wood is light, soft, straight-grained and easily worked; it is very durable in contact with the soil, and is used for railway-ties, posts, fencing and for construction.

The baldcypress is very extensively developed in Mexico, as one of the important assets of that country, furnishing valuable timber for many purposes. Its durability and resistance to water are remarkable. The geological history of cypress dates back to the Upper Cretaceous, the evidence being that the group was derived from the pine group during the Mesozoic. (E. S. Hr.)

CYPRIAN, SAINT (*Caecilius Cyprianus,* called Thascius) (*c.* 200–258), the illustrious bishop of Carthage, was born of a wealthy patrician family at Carthage, where he became a teacher of rhetoric. About 246 he was converted by the priest Caecilianus. His enthusiasm and ability, together with his devotion of his wealth to the relief of the poor and other pious uses, led to his being made head of the church in Carthage *c.* 248. During the persecution of Decius (250), Cyprian had to seek safety in retreat, but he returned when it relaxed under Gallus, the successor of Decius. Several councils were held to discuss such questions as heretical dissensions from the belief in the divine authorship of the episcopal order and the unity of Christendom, baptism by heretics and the readmission into the church of those who had lapsed during persecution. Though tolerant towards the lapsed, Cyprian was strict in the matter of baptism, and only escaped conflict with the Roman bishop Stephen through the new persecution under the Emperor Valerian. Stephen was martyred in Aug. 257, and Cyprian was banished to Curubis. He was recalled and beheaded on Sept. 14, 258, the first African bishop to obtain the martyr's crown.

Cyprian's works, written in a smooth, persuasive style reflecting his practical mind, are concerned, like Tertullian's, and often in imitation of them, with apologetic, dogmatic and pastoral themes. The best known is the *De Unitate Catholicae Ecclesiae* called forth in A.D. 251 by the schism at Carthage and the Novatian schism at Rome. It proclaims the doctrine of one church founded upon Peter, whose "tangible bond is her one united episcopate, an apostleship universal yet only one—the authority of every bishop perfect in itself and independent, yet not forming with all the others a mere agglomeration of powers, but being a tenure upon a totality like that of a shareholder in some joint property." The *Ad Donatum* (*De Gratia Dei*) contrasts the regenerated life with the moral degradation of the heathen; the *De Opere et eleemosynis* presents the Tertullian conception of merit and satisfaction; and the *Letters,* only 66 of the present collection being genuine, are important for church history and ecclesiastical law. Cyprian, who "set his seal on Episcopalianism" and stressed infant baptism and penance as means of grace, was of unparalleled authority in the West, especially for Augustine.

See his works by W. von Hartel in *Corpus Scriptorum Ecclesiasticorum* (Eng. trans. in the *Oxford Library of the Fathers*). *See* also E. W. Benson, *Cyprian, his life, his times, his works* (1897); A. Harnack, *Hist. of Dogma* ii and v; O. Bardenhewer, *Gesch. der Altkirchl. Lit.* II; Joseph H. Fichter, *Saint Cecil Cyprian* (1942).

CYPRINODONTS, a family of fishes, soft-rayed and with abdominal pelvic fins, but without a duct to the air-bladder. The head is flat-topped, the mouth generally small and protractile, with bands of small teeth in the jaws, the scales usually large. About 400 species are known, none of which exceeds a foot in length; they are found in all warm countries, but are especially abundant in America; many species are marine, but these especially frequent lagoons and estuaries; others are confined to fresh water. The Cyprinodonts are much appreciated as aquarium fishes, on account of their small size, pretty colours, and lively habits. Courtship and pairing are general throughout the group, and in many species the sexes are very dissimilar, the males being brilliantly coloured and having large and beautifully ornamented fins. *Cynolebias* of South America is unique among fishes, the dorsal fin of the male being not only much larger than that of the female, but having many more rays. There are seven subfamilies, of which the *Fundulinae* and *Cyprinodontinae* are oviparous and occur in Africa, southern Europe, and Asia, as well as in America. In the extraordinary *Phallostethinae,* from Johore and the Philippines, pelvic fins are absent and the male has a large muscular appendage under the head. The other viviparous groups, four in number, are American, and in them the anal fin of the male is modified into an intromittent organ. *Lebistes reticulatus,* the "Millions" fish of the West Indies, devours mosquito larvae and so helps to prevent malaria. *Xiphophorus helleri* of Mexico, named "sword-tail" because the lower half of the caudal fin of the male is produced into a long pointed process, is remarkable for "sex inversion," about half the females becoming converted into males before they reach an inch in length. One of the most curious types is the "four-eyed fish" (*Anableps*) of Central and South America, in which the eyes project above the top of the head, and are divided by a black horizontal band into an upper part for vision in the air and a lower for vision in the water. Spermatophores have been described in the *Phallostethinae* and *Poeciliinae,* and may be characteristic of the group. The *Amblyopsidae,* which include the blind cave fishes of North America, are a related family. (C. T. R.)

CYPRUS, one of the largest islands in the Mediterranean, after 1914 a British Crown colony, at roughly equal distance from the coasts of Asia Minor to the north and of Syria to the east. The headland of Cape Kormakiti in Cyprus is distant 44 m. from Cape Anamur in Asia Minor, and its north-east point, Cape St. Andrea, is 69 m. from Latakieh in Syria. It lies between 34° 33′ and 35° 41′ N., and between 32° 20′ and 34° 35′ E. Its greatest length is about 141 m., from Cape Drepano in the west to Cape St. Andrea in the north-east, and its greatest breadth, from Cape Gata in the south to Cape Kormakiti in the north, reaches 60 m.; while it retains an average width of from 35 to 50 m. through the greater part of its extent, but narrows suddenly to less than 10 m. about 34° E., and from thence sends out a long narrow tongue of land towards the E.N.E. for a distance of 46 m., terminating in Cape St. Andrea. The coast-line measures 486 m., the area is 3,572 sq.mi., or a little more than the area of Norfolk and Suffolk. Cyprus is the largest island in the Mediterranean after Sicily and Sardinia.

Mountains.—A great part of the island is occupied by two mountain ranges, both having a general direction from west to east. Of these, the most extensive and lofty fills almost the whole southern portion of the island, and is generally designated as Mt. Olympus. The highest summit, Mt. Troödos, attains 6,406 feet. Subordinate spurs diverge on all sides; one extends to Cape Arnauti (the ancient Acamas), which forms the north-west extremity of the island; others descend to the northern and southern coasts. South-east of the summit are governmental and military summer quarters. The main range is continued eastward by Mt. Adelphi (5,305 ft.), Papoutsa (5,124) and Machaira or Chionia (4,674), and ends in the isolated Hill of the Holy Cross (2,260 ft.), Santa Croce, Stavrovouni or Oros Stavro, a conspicuous object from Larnaca, only 12 m. distant, and a place of pilgrimage. The northern range, a narrow but rugged and rocky ridge, begins at Cape Kormakiti (the ancient Crommyon) and is continued unbroken to the eastern Cape St. Andrea, a distance of more than 100 miles. It has no collective name; its western part is the Kyrenia mountains, the remainder Carpas. Its highest summit (Buffavento) attains only 3,135 feet. It descends abruptly to the south into the great plain of Lefkosia, and to the north to a narrow plain bordering the coast.

The Mesaoria.—Between the two mountain ranges lies a broad plain, extending across the island from the bay of Famagusta to that of Morphou on the west, a distance of nearly 60 m., with a breadth varying from 10 to 20 miles. It is known by the name of the Mesaoria or Messaria. The chief streams are the Pedias and the Yalias, which follow roughly parallel courses eastward. The greater part consists of open, uncultivated downs; but corn is grown in the northern portions. Though Cyprus was celebrated in antiquity for its forests, the whole Mesaoria is now treeless. The disappearance of the forests (which is being artificially remedied) has reduced the rivers to mere torrents, dry in summer. Even the Pedias (ancient *Pediaeus*) does not reach the sea in summer, and forms unhealthy marshes. The mean annual temperature in Cyprus is about 69° F (mean maximum 78° and minimum 57°). The mean annual rainfall is about 19 inches. October to March is the cool, wet season. Earthquakes are not uncommon.

Geology.—Cyprus lies in the continuation of the folded belt of the Anti-taurus. The northern coast range is formed by the oldest rocks in the island, consisting chiefly of limestones and marbles with occasional masses of igneous rock. These are supposed to be of Cretaceous age, but no fossils have been found in them. On both sides the range is flanked by sandstones and shales (the Kythraean series), supposed to be of Upper Eocene age; and similar rocks occur around the southern mountain mass. The Oligocene consists of grey and white marls (known as the Idalian series), which are distributed all over the island and attain their greatest development on the south side of the Troödos. All these rocks have been folded, and take part in the formation of the mountains. The great igneous masses of Troödos, etc., consisting of diabase, basalt and serpentine, are of later date. Pliocene and later beds cover the central plain and occur at intervals along the coast. The Pliocene is of marine origin, and rests unconformably upon all the older beds, including the Post-oligocene igneous rocks, thus proving that the final folding and the last volcanic outbursts were approximately of Miocene age. The caves of the Kyrenian range contain a Pleistocene mammalian fauna.

Population.—The estimated population of Cyprus in 1944 was 424,656, of whom somewhat less than one-fifth were Mohammedans; it was 347,959 by the census of 1931. The people are mainly Greeks and Turks, though there is also an Armenian colony and a distinct, though not numerous, Latin colony. The bulk of the inhabitants are Christians of the Independent Cypriote Church, a branch of, and in communion with, the Orthodox Eastern Church, though "autocephalous" (*i.e.,* independent, with the right of electing its own archbishop). The chief towns, with 1944 populations, are Nicosia (pop. 28,126), the capital, in the north central part of the island, Limasol (17,825) and Larnaca (13,043) on the southeastern coast. The other capitals of districts are Famagusta, on the east coast, Kyrenia, on the north, and Ktima, capital of Paphos, on the southwest.

Agriculture and Minerals.—The most important species of trees are the Aleppo pine, the *Pinus laricio,* cypress, cedar, carob, olive and *Quercus alnifolia.* Forest land occupies about 19% of the total area of the island. Under the terms of the Colonial Development and Welfare act, 1940, the British government provided over £200,000 for reclamation and reafforestation of forest areas. The principal crops are grain, fruit (including carob), olive, mulberry, cotton, vegetables and oilseeds. The government regulates the grading and packing of agricultural produce for export, prohibits the export of inferior wines and ensures the high standard of tobacco and cotton production. Considerable works of irrigation were undertaken at the expense of the British treasury.

The rearing of livestock, especially mules, is important. Arab stallions and good breeds of cattle and pigs have been imported by the government, which maintains a stock farm at Athalassa. Sponge fishery is important.

Arazi land is held by title deed issued by the Land Registry office; there are special categories of wasteland and trust-lands for public, religious or charitable purposes. *Mulk* includes all buildings, gardens, planted land and grafted trees and is inscribed at the land registry. All minerals belong to the state; permission is necessary for erection of buildings; and any kind may be expropriated for public purposes.

Cyprus was celebrated among the ancients for its mineral wealth, especially for its mines of copper. In modern times cupreous pyrites is by far the most important mineral produced in the island, principally from the Skouriotissa, Mavrovouni, Kalavasos and Lymni mines. The asbestos-bearing rock on Mount Troödos is quarried at Amiandos, and the chrome iron ore obtained in the Troödos area is concentrated near Kakopetria. Auriferous deposits are worked in the Nicosia and Larnaca districts, and terra umbra in the latter district, while gypsum is produced by quarrying at many localities.

Communications.—Cyprus lacks natural harbours. That at Famagusta, enlarged in 1932–33, is the only one suitable for large vessels. The ports of Larnaca and Limasol have only open roadsteads, and there are small harbours at Kyrenia and Paphos. A government-owned railway, of 2 ft. 6 in. gauge, runs from Famagusta through Nicosia and Morphou to Kalokhorio, 71 mi. distant; the only section open to regular passenger traffic in 1943 was that between Famagusta and Nicosia, 37 mi. Cable and Wireless, Limited, operates land telegraphs between the six principal towns, cables to Egypt and Palestine and also a wireless station. In 1943 there were 886 mi. of main and 1,716 mi. of secondary roads. There are mail-steamer and air services.

Administration.—The governor has the assistance of an executive council consisting of four official and three non-official nominated members. For many years Greek-speaking Cypriotes clamoured for the island to be united to Greece, and in 1931 the agitation resulted in rioting and the destruction of the governor's residence. In consequence the legislative council, which had existed since 1882, was deprived of its functions and power to legislate was vested in the governor. An advisory council was established in 1933 to represent the views of the Cypriotes; this body comprised 4 official members and 10 others annually selected from the unofficial community. District commissioners represent the government in each of the six districts of the island, namely —Nicosia, Larnaca, Limasol, Famagusta, Kyrenia and Paphos. Courts of Justice laws, 1935 and 1938, provided for a supreme court, and in each district an assize court and a district court. The courts apply local legislation and certain Ottoman legislation specified in the 1935 Courts of Justice law. The family law of the various religious communities which had received recognition under Turkish rule was preserved; and three *Sheri* courts administer the Moslem religious law.

Finance and Trade.—The principal sources of revenue are from immovable property and animal taxes; an excise on tobacco; stamps, court fees, royalties and licences; the salt monopoly; import duties and shipping and wharfage dues. The Cyprus pound, divided into 180 piastres, is equal to the pound sterling; there are also government currency notes. The Bank of Cyprus has its head office in Nicosia, and banking institutions with branches in the island include the Ottoman bank, the Bank of Athens and Barclays bank (Dominion, Colonial and Overseas). The chief exports are cupreous concentrates, cupreous pyrites, carobs, citrus fruit, asbestos, wines and potatoes. Chief imports are wheaten flour, cotton manufactures, machinery, iron and steel, timber and woollens. Turkish weights and measures are used.

Education.—The government assumed direct control of elementary education in 1933. Education is voluntary (though the government obtained compulsory powers in 1931) and free for all children from the age of six up to the end of the teaching year preceding their 14th birthday. Each religious community has an entirely separate system of schools. Orthodox-Christian and Maronite schools are taught in Greek, Moslem schools in Turkish, though English is included in the curriculum of all the larger schools. The Secondary Education law, 1935, provided for the registration and inspection of all secondary schools by the government, which made grants-in-aid. Most secondary schools are under the management of the various religious communities, though three are undenominational—the English school, Nicosia (which came under government control in 1936) and two American academies (co-educational at Larnaca and for girls at Nicosia). (J. L. My.; W. B. Pn.)

ANCIENT HISTORY AND ARCHAEOLOGY

The Stone age has left but few traces in Cyprus. The "megalithic" monument of Halá Sultán Teké near Larnaca may perhaps be early, but the vaulted chamber of Agia Katrína near Enkomi is Roman, and the chapel of Agia Phareromeni at Larnaca is a tomb of similar late date. The perforated monoliths at Ktima seem to belong to oil presses of uncertain date. A neolithic settlement is reported at Frenaros.

The Bronze age, on the other hand, is of peculiar importance since Cyprus was one of the chief early sources of copper. Throughout this period, which began probably before 3000 B.C. and ended about 1200 B.C., Cyprus evidently maintained a large population, and distinct art and culture. This culture falls into three main stages. In the first, the implements are of copper, the pottery is hand-made, with a red burnished surface, gourd-like forms and incised patterns; zoomorphic art is rare, and imported objects are unknown. In the second stage, implements of bronze (9 to 10% tin) became common; pottery of buff clay with painted geometrical patterns appears alongside the red-ware; and foreign imports occur, such as Egyptian blue-glazed beads.

In the third stage, Aegean colonists introduced the Mycenaean culture and industries; with new types of weapons, wheel-made pottery, a naturalistic art which rapidly becomes conventional; gold, ivory, glass and enamels. Intercourse with Syria, Palestine and Egypt brought other types of pottery, jewellery, etc. There is, however, nothing in this period which can be ascribed to specifically "Phoenician" influence; the only traces of writing are in a variety of the Aegean script (British Museum, *Excavations in Cyprus*, 1900). It is in this third stage that Cyprus first appears in history, under the name *Asi*, as a conquest of Tethmosis (Thothmes) III. of Egypt (18th dynasty, *c.* 1500 B.C.) (E. Oberhummer, *Die Insel Cypern,* Munich, 1903, i., pp. 1–3). It was still in Egyptian hands under Seti I., and Rameses III. *Alasya,* sometimes identified with Cyprus, is probably in north Syria.

The Early Iron age which succeeds is a period of obscurity and relapse. The introduction of iron was accompanied, as in the Aegean, by economic and political changes, which broke up the Mycenaean colonies. Foreign imports almost cease; cylinders and scarabs are replaced by conical seals like those of Asia Minor, and dress-pins by brooches (*fibulae*). Representative art languishes; decorative art becomes purely geometrical. Lingering thus, Mycenaean traditions met new oriental influences from the Syrian coast. But there is no clear proof of Phoenician or other Semitic activity in Cyprus till the end of the 8th century.

No reference to Cyprus has been found in Babylonian or Assyrian records before the reign of Sargon II. (end of 8th century B.C.). The Hebrew geographers of this and the next century reckoned it as predominantly Greek. Sargon's campaigns in north Syria, Cilicia and south-east Asia Minor (721–711) provoked first attacks, then an embassy and submission in 709, from seven kings of *Yatnana* (the Assyrian name for Cyprus); and an inscription of Sargon himself, found at Citium, proves an Assyrian protectorate. Under Sennacherib's rule, *Yatnana* figures (as in Isaiah) as the refuge of a disloyal Sidonian in 702; but in 668 ten kings of Cypriote cities joined Assur-bani-pal's expedition to Egypt. Citium does not appear by name; but is recognized in the list under its Phoenician title *Karti-ḥadasti,* "new town."

Thus before the middle of the 7th century Cyprus reappears in history divided among at least ten cities, of which some are certainly Greek, and one at least certainly Phoenician. With this, Greek tradition agrees[1]. The settlements at Paphos and Salamis, and probably at Curium, were believed to date from the period of the Trojan War. Late Mycenaean settlements were discovered on these sites. The Greek dialect of Cyprus shows marked resemblances to that of Arcadia from which it must have been separated not later than the 12th century. Further evidence of continuity is the peculiar Cypriote script, a syllabary related to the linear scripts of Crete and the south Aegean, and traceable in Cyprus to the Mycenaean age[2]. It remained in regular use for Greek records until the 4th century at least; before that time the Greek alphabet occurs in Cyprus only in a few inscriptions erected for visitors[3]. A few inscriptions in the syllabary preserve another language which has not yet been identified. In Citium and Idalium, a Phoenician dialect and alphabet were in use from the time of Sargon onward[4]. Sargon's inscription at Citium is cuneiform[5].

VIEWS OF MODERN CYPRUS

1. The waterfront at Larnaca, a seaport on the southeast coast of Cyprus
2. Famagusta, view showing (on the left) the ruined church of St. George of the Greeks, and (right) the mosque of St. Sophia, once the cathedral of St. Nicholas
3. Kyrenia, showing Virgin castle, built *c.* 1200, which has remained impregnable throughout the history of Cyprus
4. A closer view of the mosque of St. Sophia

The culture and art of Cyprus in this Graeco-Phoenician period are well represented, the earlier phases at Lapathus, Soli, Paphos and Citium; the later Hellenization at Amathus and Marion-Arsinoë. Three distinct foreign influences may be distinguished, originating in Egypt, in Assyria and in the Aegean. Their effects are best seen in sculpture and in metal work, though it remains doubtful whether the best examples of the latter were made in Cyprus or on the mainland[1]. The first two merged in a mixed art which, from its intermediate position between the art of Phoenicia and its western colonies and the earliest Hellenic art in the Aegean, has been called Graeco-Phoenician. Pottery-painting for the most part remains geometrical. Those Aegean influences, however, which had predominated in the later Bronze age, and had never wholly ceased, revived, as Hellenism matured and spread, and slowly repelled the mixed Phoenician orientalism. Early in the 6th century appear the specific influences of Ionia and of Naucratis. The revival of Egypt as a phil-Hellene state under the 26th dynasty, admitted strong Graeco-Egyptian influences in industry and art, and led, about 560 B.C., to the conquest of Cyprus by Amasis (Ahmosi)II.[2]

The annexation of Egypt by Cambyses of Persia in 525 B.C. was preceded by the voluntary surrender of Cyprus, which formed part of Darius's "fifth satrapy."[3] The Greek cities joined the Ionic revolt in 500 B.C.[4]; but the Phoenician States, Citium and Amathus, remained loyal to Persia; the rising was soon put down; in 480 Cyprus furnished 150 ships to the fleet of Xerxes[5]; and remained subject to Persia during the 5th century[6]. But the Greek cities retained monarchical government throughout, and domestic arts and religious cults remained almost unaltered. The principal Greek cities were now Salamis, Curium, Paphos, Marion, Soli, Kyrenia and Chytri. Phoenicians held Citium and Amathus on the south coast, Tamassus and Idalium in the interior. At the end of the 5th century a fresh Salaminian League was formed by Evagoras (*q.v.*), who became king in 410, aided by the Athenian Conon after the fall of Athens in 404, and revolted openly from Persia in 386, after the peace of Antalcidas. Athens again sent help. But the Phoenician states supported Persia as before, the Greeks were divided by feuds, and in 380 the attempt failed; Evagoras was assassinated in 374, and his son Nicocles died soon after. After the victory of Alexander at Issus in 333 all the states of Cyprus welcomed him.

After Alexander's death in 323 Cyprus passed, after several rapid changes, to Ptolemy I., king of Egypt. In 306 B.C. Demetrius Poliorcetes of Macedon overran the whole island, but Ptolemy recovered it in 295 B.C. Under Ptolemaic rule Cyprus was usually governed by a viceroy of the royal line, but it gained a brief independence under Ptolemy Lathyrus (107–89 B.C.), and under a brother of Ptolemy Auletes in 58 B.C. The great sanctuaries of Paphos and Idalium, and the public buildings of Salamis, which were wholly remodelled in this period, have produced but few works of art. It is in this period that we first hear of Jewish settlements[7] which later become populous.

In 58 B.C. Rome, which had made large unsecured loans to Ptolemy Auletes, sent M. Porcius Cato to annex the island. Under Rome, Cyprus was at first appended to the province of Cilicia; after Actium (31 B.C.) it became a separate province, which remained in the hands of Augustus and was governed by a *legatus Caesaris pro praetore* as long as danger was feared from the East. No monuments remain of this period. In 22 B.C., however, it was transferred to the senate[8], so that Sergius Paulus, who was governor in A.D. 46, is rightly called proconsul[9]. Of Paulus no coins are known, but an inscription exists[10]. Other proconsuls are Julius Cordus and L. Annius Bassus who succeeded him in A.D. 52[1]. The persecution of Christians on the mainland after the death of Stephen drove converts as far as Cyprus; and soon after converted Cypriote Jews such as Joses the Levite (better known as Barnabas), were preaching in Antioch. The latter revisited Cyprus twice, first with Paul on his "first journey" in A.D. 46 and later with Mark[2]. In 116–117 the Jews of Cyprus, with those of Egypt and Cyrene, revolted, massacred 240,000 persons, and destroyed a large part of Salamis. Hadrian, afterwards emperor, suppressed them, and expelled all Jews from Cyprus.

For the culture of the Roman period there is abundant evidence from Salamis and Paphos, and from tombs everywhere, for the glass vessels which almost wholly supersede pottery in tombs are much sought for their (quite accidental) iridescence.

The Christian Church of Cyprus was divided into 13 bishoprics. It was made autonomous in the 5th century, in recognition of the supposed discovery of the original of St. Matthew's Gospel in a "tomb of Barnabas," still shown at Salamis; and the patriarch has the right to sign his name in red ink. A council of Cyprus, summoned by Theophilus of Alexandria in A.D. 401, prohibited the reading of the works of Origen (*see* CYPRUS, CHURCH OF).

Of the Byzantine period little remains but the ruins of the castles of St. Hilarion, Buffavento and Kantára; and a series of gold ornaments and silver plate, found at Lapithus in 1883 and 1897 respectively. The Frank conquest is represented by the "Crusaders' Tower" at Kolossi, and the church of St. Nicholas at Nicosia; and, later, by masterpieces of a French Gothic style, such as the church (mosque) of St. Sophia, and other churches at Nicosia; the cathedral (mosque) and others at Famagusta (*q.v.*), and the monastery at Bella Pais; as well as by domestic architecture at Nicosia; and by forts at Kyrenia, Limasol, etc.

(J. L. MY.)

MODERN HISTORY

After the division of the Roman empire (A.D. 395) Cyprus passed into the hands of the eastern emperors, to whom it continued subject, with brief intervals, for more than seven centuries. It was administered as a pro-consulship by an official appointed from Antioch, the capital being transferred from Paphos to Salamis (then known as Constantia). Until 632 the island was exceedingly prosperous, but in that year began the period of Arab invasions, which continued intermittently for three centuries. In 647 the Arabs under the caliph Othman made themselves masters of the island, and destroyed Salamis, but were driven out by the emperor only two years later.

Again conquered by the Arabs in the reign of Harun al-Rashid (802), Cyprus was finally restored to the Byzantine empire under Nicephorus Phocas (963–969). Its princes became practically independent, and tyrannized the island, until, in 1191, Isaac Commenus, who in 1184 had assumed the title of Despot of Cyprus, provoked the wrath of Richard I, king of England, by wantonly ill-treating his crusaders. Richard thereupon wrested the island from Isaac, whom he took captive. He then sold Cyprus to the Knights Templars, who resold it to Guy de Lusignan, titular king of Jerusalem.

Guy ruled from 1192 till his death in 1194; his brother Amaury took the title of king, and from this time Cyprus was governed for nearly three centuries by a succession of kings of the same dynasty, who introduced into the island the feudal system and other institutions of western Europe. Their court was a brilliant one, and the kings of Cyprus in addition often bore the title of kings of Jerusalem, and after 1393, of Armenia also. In 1372, indeed, following a quarrel between the Venetian and Genoese consuls, the Genoese took Famagusta, which had become the chief commercial city in Cyprus, and held it till 1464; but it was recovered by King James II, and the whole island was reunited under his rule.

His marriage with Caterina Cornaro, a Venetian lady of rank, was designed to secure the support of the powerful republic of

Venice, but had the effect, after his own death and that of his son James III, of transferring the sovereignty of the island to his new allies.

Caterina, feeling herself unable to contend alone with the increasing power of the Turks, abdicated the sovereign power in favour of the Venetian republic, which at once entered into full possession of the island (1489).

The Venetians retained their acquisition for 82 years, notwithstanding the neighbourhood of the Turks. Cyprus was now harshly governed by a lieutenant, and the condition of the natives, who had been much oppressed under the Lusignan dynasty, became worse. In 1570 the Turks, under Selim II, made a serious attempt to conquer the island, in which they landed an army of 60,000 men. The greater part of the island was reduced with little difficulty; Nicosia, the capital, was taken after a siege of 45 days, and 20,000 of its inhabitants put to the sword. Famagusta alone made a gallant and protracted resistance, and only capitulated after a siege of nearly a year (Aug. 6, 1571). The terms of the capitulation were shamefully violated by the Turks, who put to death the governor Marcantonio Bragadino with cruel torments.

On March 7, 1573, Venice recognized the sultan's sovereignty over Cyprus. The period of Turkish administration lasted for 200 years. At first comparatively mild (serfdom was abolished, the Orthodox archbishopric restored, and the Christian population granted a large measure of autonomy), it became increasingly oppressive.

There were serious risings in 1764, 1804 and 1821. In 1838 and 1839 attempts were made to introduce reforms and some self-government, with a local Divan. On June 4, 1878, Great Britain, by treaty with the sultan, took over the occupation and administration of Cyprus, the Porte remained nominal sovereigns, and received an annual "tribute" of £92,800 a year.

Annexation by Great Britain.—On the outbreak of war with Turkey Nov. 5, 1914, Cyprus was annexed to the British crown. The British government offered the island to Greece 12 months later, conditionally upon the latter aiding Serbia, then invaded by Bulgaria. The offer lapsed when Greece declined it. British annexation was formally recognized by Turkey under the Treaty of Lausanne, ratified in 1924.

The annual Turkish "tribute" continued to be borne by the island's revenue, which was supplemented by grants-in-aid from the British government. The amounts varied from year to year until 1911, when the British contribution toward the finances of Cyprus became a fixed sum of £50,000 annually. In 1928 that figure was raised to £92,800 per year, the full amount of the "tribute" payable to Turkey by Cyprus.

Cyprus in World War II.—A pack transport (mule) company from Cyprus arrived in France in 1940, being the first unit of British colonial troops to reach that theatre of war. The Cyprus regiment, formed in 1940, took part in the campaigns in Libya in that and the succeeding year, and other Cypriote units fought in east Africa, Crete, Greece and Syria. During 1943 municipal government was introduced in Cyprus on the basis of adult suffrage, and the British government announced that restoration of self-government in the island was contemplated following conclusion of hostilities.

History of Excavation.—Many archaeological discoveries were made in Cyprus after British occupation of the island in 1878. T. B. Sandwith, British consul, 1865–69, laid the foundations of a sound knowledge of Cypriote pottery (see *Archaeologia*, xlv, 1877); his successor, R. H. Lang, 1870–72, excavated a sanctuary of Aphrodite at Dali (see *Trans. Roy. Soc. Literature*, 2nd ser. xi, 1878); and Luigi P. di Cesnola, U.S. consul, explored sites and tombs in all parts of the island during 1865–77. His collection, in the Metropolitan museum of New York, represented the largest series of Cypriote antiquities in the world.

The Ottoman law of 1874 in regard to antiquities was retained in force after the British occupation. Excavation was permitted under government supervision; and the finds were apportioned in thirds, between the excavator, the landowner (usually bought out by the former) and the government. The most important excavations made late in the 19th century were those conducted by Ohnefalsch Richter at Idalium and Tamassus; by the Cyprus Exploration fund at Paphos, Marion and Salamis; and by the British museum at Amathus, Salamis and Curium. Restrictions imposed in 1905 had the effect of stopping scientific excavation by foreigners, but the law was amended in 1927 to permit the export of antiquities with the permission of the governor in consultation with the authorities concerned.

The Cyprus museum, at Nicosia, organized in 1897 as a memorial to Queen Victoria, contained a representative collection of Cypriote art of all periods. Funds from the Carnegie corporation and other sources made possible a complete reorganization of the museum in 1936–37.

In 1935, by the establishment of an Antiquities department and the enactment of a new Antiquities law, the government inaugurated a policy of closer supervision and protection of the antiquities and historic monuments in the island. Monuments protected under the law numbered 182 in 1943, of which 77 were the property of the government.

Resident custodians were appointed to supervise certain of the declared "ancient monuments," entrance fees being charged to visitors from outside the island.

Excavation at Khirokitia by the Antiquities department in 1936 brought to light a settlement of the Neolithic period, with burials which contained the earliest human remains found in Cyprus down to that time. In 1937–38 the department also excavated early Christian remains surrounding the Church of Ayios Philon, near Rizokarpaso, and a number of Hellenistic tombs in the neighbourhood were investigated with the aid of a grant from the Ashmolean museum at Oxford. Among minor excavations in 1938, a mining settlement of the late bronze age was discovered in Nicosia district by the department.

In the late 1930s an expedition of the museum of the University of Pennsylvania excavated the site of the Sanctuary of Apollo at Curium, as well as a settlement of the late bronze age to the east of the village of Episkopi; a large part of Curium hill was acquired by the government with the aid of a grant from the expedition. On behalf of the British school at Athens, a number of tombs in various parts of the early bronze age cemetery at Vounous, near Bellapais, were excavated during 1937–38 by J. R. Stewart.

The government possessed power to control the height and style of buildings adjoining ancient monuments in certain areas in Kyrenia and Nicosia, and throughout the whole of the old town and fortifications of Famagusta. In 1938, for the first time, funds were made available for the purchase of private properties to secure ancient monuments from the encroachment of undesirable modern buildings and for the demolition of others. This made possible the isolation of the Churches of St. George of the Greeks and Sts. Peter and Paul in Famagusta, and the acquisition of open sites near the Martinengo bastion. Much repair work was also done, notably at Kyrenia castle and, at Famagusta, the Venetian fortifications and the Church of St. George of the Latins.

Over 26,000 visits to museums and monuments were recorded, representing an increase on the figures for 1937 of 64% for residents and 22% for visitors from abroad.

CYPRUS, CHURCH OF. The Church of Cyprus is in communion and in doctrinal agreement with the other Orthodox Churches of the East (*see* Orthodox Eastern Church), but is independent and subject to no patriarch. This position it has always claimed. At any rate, its independence "by ancient custom" was recognized, as against the claims of the patriarch of Antioch, by the council of Ephesus, A.D. 431, by an edict of the emperor Zeno (to whom the church had sent a cogent argument on its own behalf, the alleged body of its reputed founder St. Barnabas, then just discovered at Salamis), and by the Trullan Council in 692. Attempts have been made subsequently by the patriarchs of Antioch to claim authority over it, the last as recently as 1600; but they came to nothing. And excepting for the period during which Cyprus was in the hands of the Lusignans and the Venetian Republic (1193–1571), the Church has never lost its independence. This period of bondage ceased at the conquest of the island by the Turks: the Latin hierarchy disappeared (the cathedral at Nicosia is now used as a mosque), and the native church emerged into comparative freedom. In 1821, it is true, all the bishops and many of their flock were put to death by way of discouraging sympathies with the Greeks; but successors were soon consecrated, by bishops sent from Antioch at the request of the patriarch of Constantinople, and on the whole the Church has prospered. The bishops-elect required the *berat* of the sultan; but having received this, they enjoyed no little civil importance. Since 1878 the *berat* has not been given, and the bishops are less influential. There are now four bishoprics, Nicosia, Paphos, Kition and Kyrenia, the bishop of the first named being archbishop primate.

CYPSELUS, tyrant of Corinth from *c.* 657 to 627 B.C. was the son of Aeëtion and Labda, daughter of Amphion, a member of the ruling family, the Bacchiadae. He is said to have derived his name from the fact that when the Bacchiadae, warned that he would prove their ruin, sent emissaries to kill him in his cradle, his mother saved him by concealing him in a chest (Gr. *κυψέλη*). When he was grown up, Cypselus drove out the Bacchiadae, and made himself master of Corinth. In the words of Aristotle he made his way through demagogy to tyranny. Herodotus, with the prejudice of the 5th century Greek against tyrants, says he ruled harshly, but he is generally represented as beneficent and popular. He pursued an energetic commercial and colonial policy (*see* Corinth), and thus laid the foundations of Corinthian prosperity. He laid out the large sums thus derived on the construction of buildings and works of art. At the same time he strove to gain the good will of the powerful priesthoods of Delphi and Olympia. At Delphi he built a treasure-house for Corinthian votive offerings; at Olympia he dedicated a colossal statue of Zeus and the famous "Chest of Cypselus," described by Pausanias (v. 17–19). Cypselus was succeeded by his son Periander (*q.v.*).

CYRANO DE BERGERAC, SAVINIEN (1620–1655), French romance-writer and dramatist, son of Abel de Cyrano, seigneur de Mauvières et de Bergerac, was born in Paris on March 6, 1620. He studied with a country priest, and had for a fellow pupil his friend and future biographer, Henri Lebret. He then studied in Paris at the collège de Beauvais, where he had for master Jean Grangier, whom he afterwards ridiculed in his comedy *Le Pédant joué* (1654). At the age of 19 he entered a corps of the guards, serving in the campaigns of 1639 and 1640, and began the series of exploits that were to make him a hero of romance. The story of his adventure single-handed against 100 enemies is vouched for by Lebret as the simple truth. After two years of this life Cyrano left the service and began to write tragedies cast in the orthodox classical mode. He was, however, as a pupil of Gassendi, suspected of thinking too freely, and in the *Mort d' Agrippine* (1654) his enemies even found blasphemy. But his most famous works are the two romances *L'Histoire comique des états du soleil* (1662) and *L'Histoire comique des états de la lune* (1656?). Cyrano's ingenious mixture of science and romance furnished a model for many writers, such as Swift and Poe. Cyrano spent a stormy existence in Paris and was involved in many duels, and in quarrels with the comedian Montfleury, with Scarron and others. In 1654 he was injured by a falling timber in the house of the duc d' Arpajon, his patron. His reputation as a free-thinker later forced him to seek refuge with friends in Paris, where he died in Sept. 1655.

M. Edmond Rostand's romantic play *Cyrano de Bergerac* (1897) revived interest in the author of the *Histoires comiques.* A modern edition of his *Oeuvres* (2 vols.), by P. L. Jacob (Paul Lacroix), appeared in 1858 (new ed. 1900), with the preface by H. Lebret originally prefixed to the *Histoire comique des états de la lune* (1656?). *See* also P. A. Brun, *Savinien de Cyrano Bergerac* (1894); F. Lachèvre, *Cyrano de Bergerac* (1920). Other studies of Cyrano are those of Charles Nodier (1841), F. Merilhon (Périgueux, 1856), Fourgeaud-Lagrèze (in *Le Périgord littéraire,* 1875) and Théophile Gautier, in his *Grotesques.*

CYRENAICA, in ancient geography, a district of the North African coast, lying between the Syrtis Major and Marmarica. The northern half of the district was known as Pentapolis, from its possession of five considerable cities (1) Hesperides-Berenice (Bengasi), (2) Barca (Merj), (3) Cyrene (Ain Shahat-Grenna), (4) Apollonia (Marsa Susa), (5) Teucheira-Arsinoë (Tocra). In later times two more towns rose to importance, Ptolemais (Tolmeita) and Darnis-Zarine (Derna). These all lay on the coast, with the exception of Barca and Cyrene (*q.v.*), which were situated on the highland now called Jebel Akhdar, a few miles inland. For about 500 years this district enjoyed great prosperity, owing partly to its natural products, more to trade with interior Africa.

Under the Ptolemies, the inland cities declined and the Cyrenaica began to feel the commercial competition of Egypt and Carthage, whence easier roads led into the continent. After all north Africa had passed to Rome, and Cyrenaica itself, bequeathed by Apion, the last Ptolemaic sovereign, had become (in combination with Crete) a Roman province (after 96 B.C.), this competition told more severely, and the Greek colonists, grown weaker, found themselves less able to hold their own against the Libyan population. A great revolt of the Jewish settlers (A.D. 115–116) settled the fate of Cyrene and Barca. Henceforward till the Arab invasion (A.D. 641) Apollonia was the chief city, with Berenice and Ptolemais next in order. After the conquest by Amir ibn el'Asi, inland Cyrenaica regained importance, lying as it did on the direct route between Alexandria and Qairwan, and Barca became its chief place. But with the substitution of Ottoman for Arab empire, resulting in the virtual independence of both Egypt and Tripoli, the district between them relapsed to anarchy, which continued after Mahmud II had resumed direct control over Tripoli (1835), and in the middle of the 19th century Cyrenaica was still so free of the Turks that Sheik Ali bin-Senussi chose it as headquarters of his nascent dervish order.

Modern Cyrenaica became a somewhat larger district than of old, and included ancient Marmarica up to the head of the Gulf of Sollum (Catabathmus Magnus), while the western boundary (toward Tripolitania) was at Gasr El Machtar. The whole area was about 212,000 sq.mi., mostly barren desert, and had in 1931 a population of 165,000 inclusive of 19,000 Europeans, mainly Italians. On Jan. 1, 1934, Cyrenaica, along with Tripolitania (*q.v.*), became part of modern Libya (*q.v.*). The capital and chief seaport is Bengasi. When in 1912 Italy succeeded Turkey in the sovereignty of the vilayet of Bengasi, it was officially styled Cyrenaica. It was made a colony distinct from the adjoining vilayet of Tripoli (Tripolitania), but up to 1914, owing mainly to the opposition of the Senussi, the Italians had occupied little more than the coast region. During World War I Italian occupation was reduced to the ports of Bengasi and Derna and a few other places on the Mediterranean, but from 1919 onward Italian authority was extended. By an agreement, concluded in Dec. 1925, Egypt ceded to Italy the oasis of Jaghbub, which the Italians occupied in Feb. 1926. This enabled them to strengthen their hold on the hinterland, as it is a centre of several important caravan routes, while in 1928 the whole of the coast as far as the Tripoli frontier was subjugated.

The people—Arabs and Berbers—rear large numbers of cattle, sheep and camels, and there is considerable trade in livestock with Egypt. Excellent barley is grown and is usually exported to Great Britain. There are also fisheries. Salt production in 1931 was 25,000 tons. In 1932 imports were valued at $6,550,000 while exports totalled only $538,000. Chief exports were sponges, $80,000; hides and skins, $33,600; wool, $52,800; cattle, $2,100 and carpets, $6,590.

Railway lines extend from Bengasi to Barce (66 mi.) and from Bengasi to Solúch (34 mi.). (*See* SENUSSI.)

Bengasi and Derna are connected by a motor road which leads through Cyrene; and the road to Jaghbub (Giarabub) and Siwa is also possible for vehicles.

The main caravan route to the Wadai runs through the Augila and Kufra oases, but has lost much of its importance since the construction of the railway to Khartoum.

In 1931, 1,170 vessels of 1,075,981 tons entered, and 1,153 vessels of 1,072,900 tons cleared the ports.

Geologically and structurally Cyrenaica is a mass of Miocene limestone. This mass is divided into two blocks, the higher being the western Jebel Akhdar, on which Cyrene was built (about 1,800 ft.): the lower, the eastern Jebel el-Akabah, the ancient Marmaric highlands (700 ft.). There is no continuous littoral plain, the longest strip running from the recess of the Syrtis round past Bengasi to Tolmeita. Thereafter, except for deltaic patches at Marsa Susa and Derna, the shore is precipitous. Jebel Akhdar, being without "faults," has no deep internal valleys, and presents the appearance of downs; but its seaward face is very deeply eroded, and deep circular sinkings (swallow-holes) are common. There is much forest on its northward slopes, and good red earth on the higher parts, which bears abundant crops of barley, much desired by European maltsters. Plenty of springs issue on the highlands. Here the Bedouins (mostly Beni Hassa) pasture flocks and herds, amounting to several million head. The climate is temperate and the rainfall usually adequate, but one year in five is expected to be droughty. The southward slopes fall through ever-thinning pasture lands to sheer desert about 80 m. inland.

Jebel el-Akabah is much more barren than Jebel Akhdar, and the desert comes right down to the sea in Marmarica. In the west of Cyrenaica is the remarkable chain of low-lying oases, which, from the chief member of the group, is commonly called the Augila depression.

Collectively the oases present the aspect of a long winding valley, extending from the Wadi el-Fareg near the Gulf of Sidra, through the Bir Rassam, Augila Jalo, Faredgha, and Siwa oases, to the Natron lakes and the dried-up branch of the Nile delta known as the Bahr bilā-Mā (waterless river). The whole region appears as a silted up marine inlet which, perhaps, in Pliocene times, penetrated some 300 m. S.E. in the direction of the Nile. Nearly all the fossil shells found in its sands belong to the fauna now living in the Mediterranean, and Siwa is 98 ft. below sea-level. This is true also of its eastern extensions, Sittra (80) and the Birket el-Kerun in the Fayum (141). But Augila and Jalo stand 130 and 296 ft. respectively above sea-level. They have considerable variations of temperature (as much as 75° in one day was registered at Augila in Dec. 1921, from 113° to 38° F), strong winds, but very little rain. The population of Augila and Jalo is about 4,500. The production of dates is considerable.

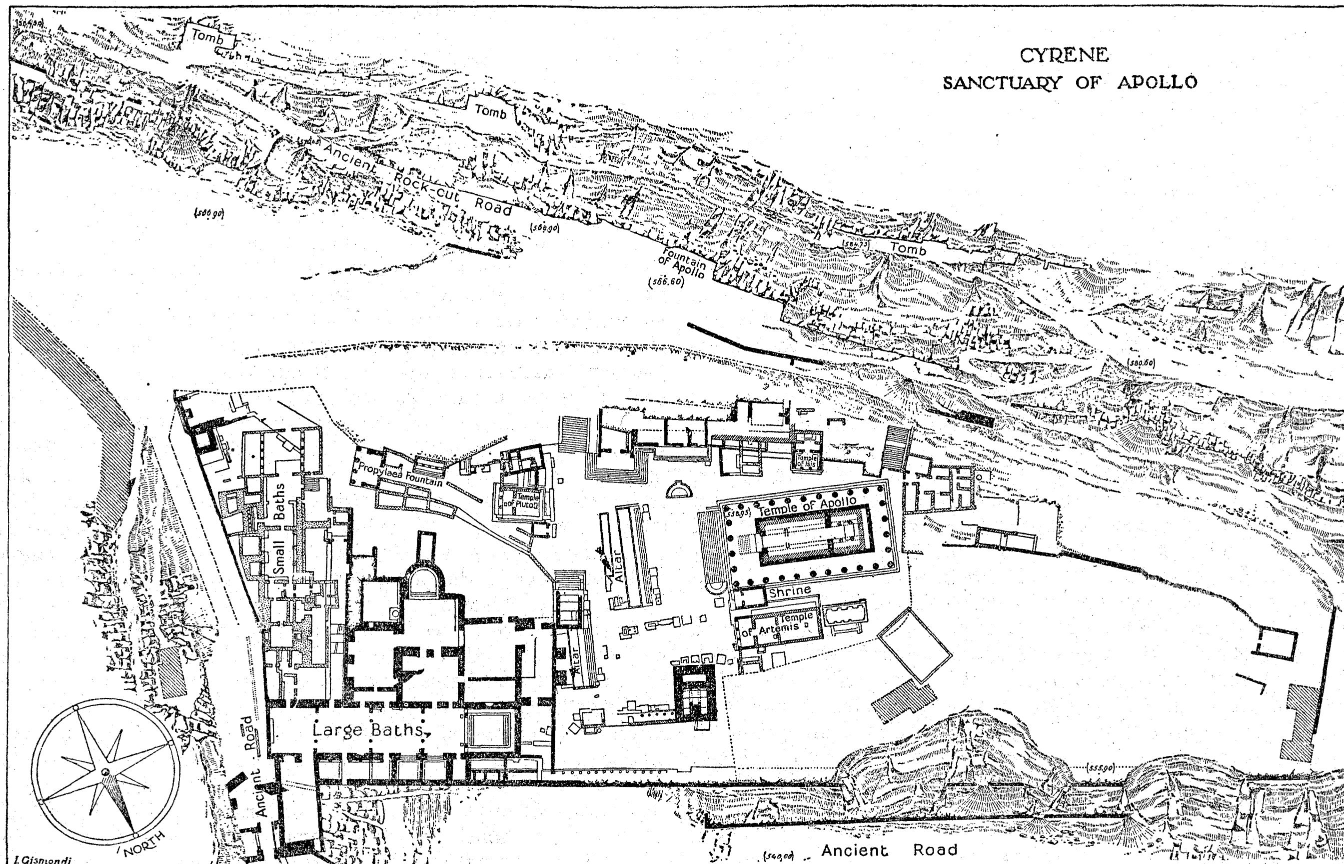
South of the Augila depression the land rises steadily to nearly 1,200 ft. in the *Kufra* oases, which lie between 21° and 24° E., north of the Tropic of Cancer and due east of Fezzan. The group consists of five distinct oases in the heart of the Libyan desert—Taizerbo, Zighen, Bu-Zeima, Erbena and Kebabo—which extend for a distance of 200 m. N.W. and S.E., and have a collective area of 7,000 sq.m., and a population of 6,000 or 7,000 Arabo-Berber nomads. Good water is obtained in abundance from the underground reservoirs, which lie within a few feet of the surface, and support over a million date-palms. Kufra is a centre of the Senūssite brotherhood, with an important *'zawya* (convent) at Jof, in Kebábo. Kufra was visited during 1920–23 by the travellers, Mrs. Forbes, Hassanien Bey and Bruneau de Laborie. Hassanien Bey in his second independent journey (1923), explored the mountain regions of Archenu and el-Avenal (both in Italian territory on the 22nd parallel) pushed on to Erdi, crossed the eastern Ennèdi, and then turned eastwards into the Sudan, finally reaching Darfai. He discovered the presence of a great mass of granitic rock, considerably earlier than the sedimentary calcareous rock of which alone the Libyan desert had been thought to be composed. Bruneau de Laborie, starting from Duàla, on the Gulf of Guinea, came up through the Cameroons, Wadai and Bòrai, and so by the caravan route (which he was the first European to follow) to Tècro, es-Sàrra and Bésciara (all of them waterpoints within Italian territory) and so up to Kufra. (*See* Rosita Forbes, *The Secret of Sahara:* Kufra, 1921; Hassanien Bey, *The Lost Oases,* 1925, and the accounts of both journeys in the *Geographical Journal;* Bruneau de Laborie, *Du Cameronn au Caire par le désert de Libye,* 1924.)

Successful military operations during the spring of 1928 by troops moving simultaneously from Tripolitania and Cyrenaica, led to the decisive victory at the wells of Tegrift and the clearing of the whole district from the 29th parallel northwards, as far south, that is, as Giarabub (which lies immediately west of the oasis of Siwa, which is in Egyptian territory), Augila, Giala, Marada and Zella. Senussi power was thus definitely destroyed. Much may be made of Cyrenaica by judicious colonization. All kinds of trees grow well, from the date palm, numbering 500,000, to the oak; and there are over 200,000 wild olives. There are forests of laitisk and juniper. Conditions in general are like those of Sicily and Apulia, and there is ample room for new settlers in the fertile coast zone, where water is easily found.

BIBLIOGRAPHY.—E. Roberts, *Catalogue of the Greek Coins of Cyrenaica* (1927); and a number of publications by the Ufficio Studi of the Government of Cyrenaica, including an excellent summary of the work of previous explorers by A. Mari (*L'esplorasione geografica della Libia: Rapportie Monografie Coloniali,* Series 2, No. 5, 1926). A map of Cyrenaica, on the scale of 1: 100,000 (some of the coastal districts 1: 50,000) is in active preparation.

The accounts of earlier travellers and especially those of Beechey and of Smith and Porcher, are of great value to the archaeologist owing to the continual destruction that has been going on there until Italy came into possession. For the archaeology of Cyrenaica in general see *Ministero delle Colonie: Notiziario Archeologico* i. 67–239 (1915).

CYRENAICS, a Greek school of philosophy, so called from Cyrene, the birthplace of the founder, Aristippus (*q.v*). It was one of the two earliest Socratic schools, and emphasized one side only of the Socratic teaching (*cf.* CYNICS). Socrates, although he held that virtue was the only human good, admitted to a certain extent the importance of its utilitarian side, making happiness at least a subsidiary end of moral action (*see* ETHICS). Aristippus and his followers seized upon this, and made it the prime factor in existence, denying to virtue any intrinsic value. Logic and physical science they held to be useless, for all knowledge is immediate sensation (*see* PROTAGORAS). These sensations are motions (κινήσεις) which (1) are purely subjective, and (2) are painful, indifferent or pleasant, according as they are violent, tranquil or gentle. Further they are entirely individual, and can in no way be described as constituting absolute objective knowledge. Feeling, therefore, is the only possible criterion alike of knowledge and of conduct. "Our modes of being affected (πάθη) alone are knowable." Thus Cyrenaicism goes beyond the critical scepticism of the Sophists and deduces a single, universal aim for all men, namely pleasure. Furthermore, all feeling is momentary and homogeneous. It follows (1) that past and future pleasure have no real existence for us, and (2) that among present



AFTER THE PLAN BY GISMONDI, REPRODUCED BY COURTESY OF DR. G. OLIVERIO, DIRECTOR OF ANTIQUITIES FOR CYRENAICA

pleasures there is no distinction of kind, but only of intensity. Socrates had spoken of the higher pleasures of the intellect; the Cyrenaics denied the validity of this distinction and said that bodily pleasures as being more simple and more intense are to be preferred. Momentary pleasure (*μονόχρονος ἡδονή*), preferably of a carnal kind, is the only good for man. Yet Aristippus was compelled to admit that some actions which give immediate pleasure entail more than their equivalent of pain. This fact was to him the basis of the conventional distinction of right and wrong, and in this sense he held that regard should be paid to law and custom. It is of the utmost importance that this development of Cyrenaic hedonism should be fully realized. To overlook the Cyrenaic recognition of social obligation and the hedonistic value of altruistic emotion is a very common expedient of those who are opposed to all hedonistic theories of life. Like many of the leading modern utilitarians, they combined with their psychological distrust of popular judgments of right and wrong, and their firm conviction that all such distinctions are based solely on law and convention, the equally unwavering principle, that the wise man who would pursue pleasure logically must abstain from that which is usually denominated "wrong" or "unjust." This idea, which occupies a prominent position in systems like those of Bentham, Volney, and even Paley, was evidently of prime importance, at all events to the later Cyrenaics.

Developing from this is a new point of practical importance to the hedonism of the Cyrenaics. Aristippus, both in theory and in practice, insisted that true pleasure belongs only to him who is self-controlled and master of himself. The truly happy man must have *φρόνησις* (prudence), which alone can save him from falling a prey to mere passion. Thus, in the end, Aristippus, the founder of the purest hedonism in the history of thought, comes very near not only to the Cynics, but to the more cultured hedonism of Epicurus and modern thinkers. Theodorus held even more strongly that passing pleasure may be a delusion, and that permanent tranquillity is a truer end of conduct. Hegesias denied the possibility of real pleasure and advocated suicide as ensuring at least the absence of pain. Anniceris, in whose thought the school reached its highest perfection, declared that true pleasure consists sometimes in self-sacrifice and that sympathy in enjoyment is a real source of happiness.

CYRENE, the original capital of ancient Cyrenaica (*q.v.*), and one of the greatest of Greek colonies. The Theraean story of its foundation, as told by Herodotus, runs thus: Battus was bidden by the Delphic oracle to lead a portion of the citizens to Libya and build a city in a "place between waters." By this he understood an island, and therefore established his followers on the barren islet of Platea in the Gulf of Bomba. The colony being unsuccessful made further application to the oracle and was bidden to transfer itself to the mainland. The Libyan barbarians were induced to act as guides, and brought the Greeks to high ground from various points of which issued springs, and Battus, recognizing "a place between waters," began to build. This was in the middle of the 7th century B.C.

History.—The result was Cyrene, so called from a local nymph, the mother of Aristaeus by Apollo, really a nature goddess. The point first occupied was the hill above the fountain of Apollo, on the south-west, afterwards the Acropolis, and there was erected the fortress-palace of the Battiadae, who continued to rule the colony for eight generations. Battus I. reigned *c.* 630 to 590 B.C., and was succeeded by his son Arcesilaus (*c.* 590–574). The kings henceforth bore alternately the names Battus and Arcesilaus. Under Battus II. (570 B.C.?) a fresh band of settlers was invited from Greece, and the colony tended to become henceforth more maritime and democratic. Its port, Apollonia (Marsa Susa), now rose to importance; and a second (winter) port was created at Naustathmos (Marsa Hilal) about 15 m. E., behind a sheltering cape. Fine roads were cut through the rock connecting these harbours with the capital. The Libyans, robbed in favour of the new settlers, called in Egyptian help; but the force sent by Apries was defeated near the spring of Theste, and presently Amasis of Egypt made peace and took a Battiad princess to wife. Under Arcesilaus II. (*c.* 560–550) domestic dissensions and Libyan revolt led to the founding of a rival inland city, Barca, and a severe defeat and massacre. This, with the fact that Battus III. was thought to have disgraced the house by his lameness, prompted the Cyrenaeans to send to Delphi for more advice, and as a result Demonax of Mantinea arrived as arbitrator and framed a Constitution limiting the monarchy and dividing the citizens tribally. Further attempts of the Battiadae (*e.g.*, of Pheretima, wife of Battus III., and Arcesilaus his son), to annul this Constitution, and family dissensions, brought about a Persian invasion, and finally the extinction of the dynasty about 450 B.C.

A republic succeeded, but it was often interrupted by tyrannies; and having made submission by embassy to Alexander in 331, Cyrene passed under Ptolemaic domination ten years later. From this epoch dates a decline which was due to economic causes. Apollonia and Berenice gradually superseded Cyrene and Barca respectively, but Cyrene continued to be a great city after it had passed to Rome (96 B.C.) by the will of Ptolemy Apion, its last king. The Romans took over only his personal property. Three boundary stones of the time of Vespasian have been discovered. In the last years of the reign of Trajan, a Jewish revolt and the repressive measures taken by the Imperial Government (A.D. 115–116), dealt it an irreparable blow, and it is described as deserted in the 4th century, and in the 5th as a vast ruin. Henceforward, to the epoch of Arab conquest (A.D. 641) its Greek life gradually deserted it for Apollonia. At its acme Cyrene is said to have had over 100,000 inhabitants. It was noted among the ancients for its intellectual life. Its medical school was famous, and it numbered among its celebrities Callimachus the poet, Carneades, the founder of the New Academy at Athens, Aristippus, a pupil of Socrates and the founder of the so-called Cyrenaics (*q.v.*), Eratosthenes the polyhistor and Synesius, one of the most elegant of the ancient Christian writers.

Archaeology.—The site lies on the crest of the highland of Jebel Akhdar (about 1,800 ft.) and 17 m. from the sea. The ground slopes very gradually south, and being entirely denuded of trees, makes good corn land. The northward slope falls more steeply in a succession of shelves, covered here and there with forest. Ravines surround the site on three sides, and of the springs in its area, one, having great volume, has been at all times the attraction and focus of the place. This is the so-called "Fount of Apollo," which issues from a tunnel artificially enlarged, and once faced with a portico. The channel is about 300 yd. long, and extremely tortuous. Here are numerous inscriptions of ancient visitors, including a dedication to good fortune *σὺν θεοφανεία, ie.,* with a vision, which it was hoped would be granted. The acropolis was immediately above this on the west, and the main entrance of the city, through which came the sacred processions, passed it. The remains of Cyrene itself are enclosed by a wall having a circuit of about 4 m., of which little remains, but tombs and isolated structures extend far outside this area. The walls date from not before the 5th century B.C., and the large temples lie outside them.

The acropolis, on the south-western of the two hills, into which the site is divided by a valley, had separate fortifications especially conspicuous on the east, where a gate and a long stretch of wall on each side of it are preserved. Excavations made on the summit of the acropolis in 1910–11 (described in *Bulletin of the Archaeological Institute of America,* ii., 1911, R. Norton and others), led to the discovery of a building of the 3rd century B.C. arranged round a colonnade with a series of rooms on the south, and wings on the east and west running north. Another building, with an apse, showed traces of protracted occupation. A number of sculptures, including a fine head of Athena, were found, and, on the north-west slope, a quantity of terracotta objects.

These excavations were suspended when Cyrenaica became Italian, and have not been resumed, attention having been devoted to other parts of the town, where results of the highest importance have been obtained, and work is still (1928) in progress. On the north-east of the slope of the acropolis a small sanctuary of the divinities of Alexandria was found; the numerous works of art include a fine portrait head of Berenice II.

The temple of Apollo occupied the centre of a large level space below the Acropolis on the north. Here Smith and Porcher had already found a number of sculptures, now, with the rest of their discoveries, in the British Museum. Remains of the original temple, erected by Battus, have come to light; it had six columns in front, 11 on the sides, and two internal rows of columns in two stories (*cf.* Paestum). Fragments of its terracotta decoration were found, and also an enormous marble *acroterion* (gable decoration) with a Gorgon's head. In the time of Augustus it was reconstructed on the same plan; but later (perhaps under Hadrian) the interior was divided into three compartments, one behind the other, the older columns being used as material for the foundations. In front of the temple was a huge altar, 25 yards long. To the north of it is the temple of Artemis (beginning of 6th century B.C.) with an altar in front of it, and between the two is a small shrine of the Roman period. The temple was later surrounded by a sacred precinct, entered by propylaea erected in Roman times, in front of which is a temple of Pluto; while in the precinct are some smaller temples, including one of Isis (Iseum) and others dedicated to Apollo.

At the western extremity of the open space is a theatre (not well preserved) and at the eastern the Roman thermae, restored by Hadrian (large baths) and again in the 3rd and 4th centuries A.D. (small baths) cutting off part of the area; they are well preserved and contained numerous works of art, including two marble groups of the Three Graces and (probably) the fine Aphrodite Anadyomene (now in the Museo delle Terme at Rome) which was laid bare by a heavy rainstorm close by. The whole forms a most imposing group of remains; the valley is barred by a large supporting wall on the north, while to the south are the cliffs from which issues the Fountain of Apollo.

To the east of the Acropolis lay the Agora, and away to the north-east, on the eastern hill, the so-called Great Temple, with the stadium to the east of it again. In the centre of the Agora are two archaic round monuments—the heroon and the tomb of Battus. A portico surrounds it, with temples of Zeus Soter (the Saviour) and Rome and Augustus; while a late enlargement produced the temple of Demeter. To the south of the main road is the Capitolium, or temple of Jupiter, Juno and Minerva. The statues of these three deities were presented by Hadrian and Antoninus Pius in A.D. 138. The statue of Jupiter (*Zeus Aigiochos, i.e.,* Zeus holding the aegis) was found in 1915, while the other two, discovered by Smith and Porcher, have recently been identified at the British Museum.

The temples attributed to Bacchus and Venus by Smith and Porcher, which yielded them numerous sculptures, have not yet been re-excavated. The great temple on the eastern hill was, as an inscription of the Roman period shows, dedicated to the Olympian Zeus. Smith and Porcher, in their hasty investigations, had found only fragments of sculpture there; but a fine head of Zeus of Pheidian type, with traces of gilding on the hair and beard, and belonging to an acrolithic statue, has recently been found there, as well as a head of Poseidon, probably belonging to a statue forming a "pendant" to it. To the north was a smaller temple, in which a colossal male head and two statuettes were found by Smith and Porcher; while to the east was the Stadium, and some way to the south of that a basilica of the Byzantine period. Further to the south again, at the south-east angle of the site are some very large reservoirs.

From a study of the numerous sculptures found, especially in the thermae, it is clear that in the archaic period Cyrene was influenced artistically by the Greek islands, and in the 5th century B.C. by Olympia. Some inscriptions of great importance have come to light. The great spectacle, however, which distinguishes the site of Cyrene, is provided by its cemeteries. There is one along each of the approaches to the main gates, but the largest and most splendid lies by the Apollonian road, which winds by easy curves up the northern buttresses of the plateau.

Here the sepulchres rise in tiers one above the other along fully a mile of the way. The most important have pillared façades. Within, they open out either into large halls, leading one out of another with graves in recesses and pits in the floor; or into rock corridors lined with *loculi,* disposed one above another like pigeon holes. Most of the wall paintings have perished; but one tomb still retains its decoration. The scenes are agonistic, *i.e.,* represent funeral games, in which both white and black persons take part, the latter doubtless Libyan *perioeci*: but all wear Greek garments. Several tombs are inscribed and on some external paintings are still faintly visible. The commonest type of grave is a simple pit covered by a gabled lid. These occur by hundreds. But not all the sepulchres are rock-cut: altar tombs and other forms of *heroa* are found built upon plinths of rock.

The harbour of Cyrene was called Apollonia, after the tutelary deity of the city. It is the modern Marsa Susa, 12 m. to the N.E. of it; and scanty remains of the mole are still to be seen. Its fortifications have been largely destroyed by an earthquake, and the same has happened to its other buildings, which suffered further damage from quarrying for material for modern houses within the last hundred years, so that the descriptions given by earlier travellers, such as Beechey and Smith and Porcher are of considerable value here as elsewhere. Remains of a Christian basilica, of tombs, of reservoirs and of an aqueduct may be recognized; but the theatre is better preserved. Remains of the road leading down to it from Cyrene may be traced through the necroplis. Two milestones erected by Trajan in A.D. 100 have been found along its course, and another of Hadrian set up in A.D. 118–119; and remains of several forts may be seen near it.

CYRIL, SAINT (376–444), made bishop of Alexandria *c.* 412. He had hardly entered upon his office when he closed and plundered the churches of the Novatians, and drove the Jews in thousands from the city. The prefect of Egypt, Orestes, who endeavoured to withstand his furious zeal, was denounced, and the illustrious Hypatia, his friend and the advocate of Neo-Platonism, was murdered in one of the frequent riots. Cyril's antagonism to the Antiochene school is shown in his opposition to Chrysostom, whose name he for some time refused to allow into the lists of martyrs and bishops mentioned in the prayers of his church, and to the apologist, Theodoret. The story of his opposition to Nestorius at the council of Ephesus in 431 is told elsewhere (*see* NESTORIUS). He himself incurred the charge of heresy from the oriental bishops. Satisfied, however, with the deprivation and exile of his opponent, he returned to Alexandria in triumph as the great champion of the faith. Cyril is important for the history of Christology. He taught the personal or hypostatic union of the two natures in Christ, but tended to allow that after the union the Word, which replaces the rational soul, forms but one nature with the body, hence he inclined to Monophysitism. In his Trinitarian expositions, he does expressly affirm the procession of the Holy Ghost *ex Filio.* He introduces an allegorical interpretation of the Bible and appeals often to the Fathers.

In addition to his *Twelve Anathematisms* and the defence of the same, he produced five other books against Nestorius, *Thesaurus*—a treatise in dialogue form on the Trinity, a book *On the Right Way* and another *On the Incarnation.* His letters and sermons are valuable sources of the Nestorian controversy.

BIBLIOGRAPHY.—The collected edition by J. Aubert (Paris, 1638) was reprinted in Migne, *Patr. Graec,* vols. 68–77; Eng. trans. in the *Oxford Library of the Fathers. See* also A. Largent's *Études d'hist. ecclés.; St Cyrille d'Alexandrie et le concile d'Éphèse* (1892); H. Rehrmann, *Die Christologie des hl. C. von Alexandrien* (Hildesheim, 1902); A. Harnack, *Hist. of Dogma,* vol. 4; J. Tixeront, *Hist. of Dogma,* vol. 3; Brightman, *The Age of the Fathers,* vol. 2 (1903); E. Weigl, *Die Heilslehre des hl. C. von Alexandrien* (1905).

CYRIL, SAINT (*c.* 315–386), bishop of Jerusalem, where probably he was born, was ordained a presbyter in 345. In 350 he was elevated to the see of Jerusalem. His metropolitan, Acacius of Caesarea, inclined to Arianism, while Cyril espoused the Nicene creed and was, in consequence, deposed, till the accession of Theodosius permitted him to return in 379. He attended the second council of Constantinople in 381, where he was welcomed for his defence of orthodoxy. Cyril's ability as a pastor is seen in his one important work—his 23 addresses to catechumens delivered in A.D. 348. These lectures, said to be the first example of a popular exposition of Christian doctrine, give us insight into the creed forms and the ceremonies of baptism of the early Church. As regards the Eucharist, Cyril holds the Real Presence and makes the change due to the invocation of the Holy Spirit upon the offerings. He does not explicitly use the Nicene formula of the Trinity.

CYRIL (827–869), apostle of the Slavs, amongst whom he worked in conjunction with his elder brother Methodius (*q.v.*). Tradition says that while in the Khazar country (where he combated Jewish and Mohammedan influence) he found at Kherson the remains of Clement of Rome, which he bore with him wherever he went, finally depositing them at Rome in 867. His name is associated with the invention of the modified (Cyrillic) form of the Greek alphabet, which largely superseded the ancient Slavonic characters.

CYRILLIC ALPHABET: *see* ALPHABET, OLD SLAVONIC, SLAVONIC LANGUAGES, SLAVS.

CYRILLUS, Greek jurist of the 5th century, was professor in the ancient law college of Berytus, and one of the founders of the oecumenical school of jurists (τῆς οἰκουμένης διδάσκαλοι) which preceded the succession of Anastasius to the Eastern empire (A.D. 491), and paved the way for Justinian's legislation.

CYRTO-STYLE, in architecture, a semi-circular projecting portico with columns.

CYRUS, the Latinized form of a Persian name borne by two prominent members of the Achaemenid house (Gr. Κῦρος; Pers. *Kuru-sh;* Babyl. *Kurash;* Hebr. *Kōresh*).

1. CYRUS THE GREAT, the founder of the Persian empire, was the son of Cambyses I. of the clan of the Achaemenidae, the principal clan of the Persian tribe of the Pasargadae (*q.v.*). In his proclamation to the Babylonians Cyrus calls his ancestors, Teispes, Cyrus I. and Cambyses I., "kings of Anshan." But, as we know from Jer. xlix. 34 ff. (*cf.* Ezek. xxxii. 24 ff.), Elam, of which Anshan is a district, suffered a heavy defeat in 596 B.C., and it is probable that the Pasargadian dynast Teispes conquered Anshan in this year.

The Pasargadian kings of Anshan were vassals of the Median empire until the rebellion of Cyrus (who seems to have become king in 558 B.C., as Herod. i. 214 gives him a reign of 29 years) which began in 553 B.C. and ended with Astyages being taken prisoner and Ecbatana plundered. From then Cyrus called himself "king of the Persians."

The history of Cyrus soon became overgrown with legends. Herodotus (i. 95) gives four traditions about him. One makes him the son of Mandane, a daughter of Astyages (originally evidently by a god), who is exposed in the mountains, suckled by a dog and educated by a shepherd. At the same time, the rule of Cyrus and the Persians is legitimated by his family connection with Astyages. This account partly preserved in Justin i. 4. 10 (probably from Charon of Lampsacus) and in Aelian, *Var. Hist.* xiv. 42, is alluded to by Herodotus i. 95 and 122. The second account, which Herodotus follows, rationalizes the first by changing the dog into a shepherd's wife. In the later part of his story Herodotus uses the family traditions of the Median general Harpagus, whose treason is justified by the cruelty of Astyages. Harpagus afterwards stood in high favour with Cyrus, and commanded the army which subdued the coasts of Asia Minor. In a third version, preserved from Ctesias in Nicolaus Damasc., p. 66 (*cf.* Dinon *ap.* Athen. xiv. 633 C), Cyrus is the son of a poor Mardian bandit Atradates (the Mardians are a nomadic Persian tribe, Herod. i. 125), who later, as a servant, found favour with Astyages. After a Chaldaean sage prophesied his future greatness, he fled to Persia and began the rebellion. Parts of this story are preserved also in Strabo xv., p. 729, and Justin i. 6. 1–3; 7. 1; *cf.* Ctesias *ap.* Photium 2–7. With this version Ctesias and Nicolaus have connected another, in which Cyrus is the son of a Persian shepherd of Pasargadae where he fights the decisive battle. The didactic novel of Xenophon, the *Cyropaedia,* is an invention based upon the account of Herodotus and occasionally influenced by Ctesias, without any independent tradition. The account of Aeschylus, *Pers.* 765 ff., combines Greek traditions and a few oriental elements; here the first king is Medos (the Median empire); his nameless son is succeeded by Cyrus, a blessed ruler, who conquered Lydia, Phrygia, Ionia.

The principal events of the later history of Cyrus are in the main correctly stated by Herodotus. The short excerpt from Ctesias, preserved by Photius, contains useful information, and there is a brief notice in the fragments of Berossus and another in the Old Testament. The original sources are scanty; besides the cylinder containing his proclamation to the Babylonians we possess only a number of dated private documents from Babylon. These serve to fix the chronology, which agrees with the dates of the canon of Ptolemy.

Soon after the conquest of the Median empire, Cyrus was attacked by a coalition of Babylon, Egypt and Lydia, joined by Sparta, the greatest military power of Greece. But in 546, he took Sardis, thereby making the Lydian kingdom a Persian province. During the next years the Persians under Harpagus suppressed a rebellion of the Lydians under Pactyas, and subjugated the Ionian cities, the Carians and the Lycians. The king of Cilicia (Syennesis) voluntarily acknowledged the Persian supremacy. When Cyrus defeated the army of Nabonidus, Babylon itself surrendered, in Oct. 539, to the Persian general Gobryas.

From the beginning of 538 Cyrus dates his years as "king of Babylon and king of the countries" (*i.e.,* of the world). With the capital, the Babylonian provinces in Syria fell to the Persians; in 538 Cyrus granted to the Jews, whom Nebuchadrezzar had transported to Babylonia, the return to Palestine and the rebuilding of Jerusalem and its temple. (*See* JEWS, § 14.) According to Ctesias he defeated the Bactrians and the Sacae; and the historians of Alexander mention a march through Gedrosia, where he lost his whole army but seven men (Arrian vi. 24. 2; Strabo xv. 722), a tribe Ariaspae on the Etymandros (in Sijistan), who on account of their support against the Scythians, were called Euergetae (Arrian iii. 27. 4; Diod. xvii. 81; Curt. vii. 3. 1), and a town, Cyropolis, founded by him on the Jaxartes (Arrian iv. 2. 3; Curt. vii. 6. 16; Strabo xi. 517, called Cyreskhata by Ptolem. vi. 12. 5). In 530, having appointed his son Cambyses king of Babel, he set out for a new expedition against the East. In this war he was killed (Herod.) or mortally wounded (Ctesias) in 528 B.C.

In his native district Cyrus built a city with a palace, called after his tribe Pasargadae (now Murghab), and here he was buried. (*See* PASARGADAE.) In a short time he, the petty prince of an almost unknown tribe, had founded a mighty empire, which extended from the Indus and Jaxartes to the Aegaean and the borders of Egypt. Cyrus was a great warrior and statesman, humane in his treatment of the vanquished, in Babylonia behaving like a constitutional monarch. By the Persians his memory was cherished as "the father of the people" (Herod. iii. 89), and the Greek tradition preserved by Aeschylus (*cf.* above) shows that his greatness was acknowledged also by his enemies.

2. CYRUS THE YOUNGER, son of Darius II. and Parysatis, was born after the accession of his father in 424. When, after the victories of Alcibiades, Darius II. decided to continue the war against Athens and give support to the Spartans, he sent, in 408, the young prince into Asia Minor, as satrap of Lydia and Phrygia Major with Cappadocia, and commander of the Persian troops. He gave strenuous support to the Spartans in the hope that their general, Lysander, would help him to gain the throne against his elder brother, Artaxerxes. He assisted Lysander in the Peloponnesian war, and by exerting his influence in Sparta he brought it about that, after the battle of Arginusae, Lysander was sent out a second time as the real commander (though under a nominal chief) of the Spartan fleet in 405 (Xen. *Hell.* ii. 1. 14). After the accession of Artaxerxes II. in 404, Tissaphernes denounced the plans of Cyrus against his brother (*cf.* Plut. *Artax.* 3); but by the intercession of Parysatis he was pardoned and sent back to his satrapy. Meanwhile Lysander by the victories of Aegospotami and Sparta was supreme in the Greek world. Cyrus managed to gather a large army by beginning a quarrel with Tissaphernes, satrap of Caira, about the Ionian towns, and pretended to prepare an expedition against the Pisidians, a troublesome mountainous tribe in the Taurus. In the spring of 401, Cyrus started from Sardis with his forces and, joining with the Spartans, advanced into Babylonia where he met the army of Artaxerxes. Here ensued, in Oct. 401, the battle of Cunaxa in which Cyrus was slain. Afterwards Artaxerxes pretended to have killed the rebel himself, with the result that Parysatis took cruel vengeance upon the slayer of her favourite son. The Persian troops dared not attack the Greeks, but decoyed them into the interior, beyond the Tigris, and tried to annihilate them by treachery. But after their commanders had been taken prisoners the Greeks forced their way to the Black sea. By this achievement they had demonstrated the internal weakness of the Persian empire and the absolute superiority of the Greek arms.

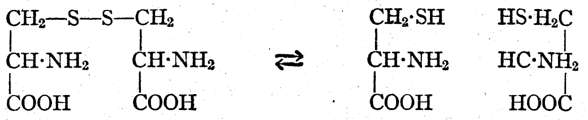
The history of Cyrus and of the Greek retreat is told by Xenophon in his *Anabasis* (where he tries to veil the actual participation of the Spartans). Another account, probably from Sophaenetus of Stymphalus, was used by Ephorus, and is preserved in Diodor. xiv. 19 ff. *See* also the excerpts from Ctesias by Photius, and Plutarch's life of Artaxerxes. Cyrus is highly praised by the ancients, especially by Xenophon (*cf.* also his *Oeconomics,* c. iv.); and certainly as a general and statesman he was much superior to his weak brother, under whom the empire decayed. (*See* also PERSIA: *Ancient History.*)

See E. Meyer, *Gesch. des Altertums,* 3rd ed. (Berlin, 1921); J. D. Prásek, *Gesch. der Meder und Perser* (Gotha, 1906) and "Kyros der Grosse" in *Der Alte Orient* (1912).

CYSTINE is one of some twenty substances (amino-acids) which are produced when the proteins of food are digested in the alimentary canal. Together with its congeners it is liberated from proteins by any process which involves hydrolysis, and it is obtained when any typical protein is boiled with mineral acids (*see* PROTEINS). It differs from all but one other among the constituent amino-acids of protein in that it contains sulphur, that element being present in relatively unstable combination.

Cystine is almost insoluble in neutral aqueous media, a circumstance which led to its discovery and affects its behaviour in the animal body. Long before it had been shown to be derived from protein, it was discovered as the main constituent of a urinary calculus removed from a human subject (Wollaston, 1810), and although relatively rare, calculi composed of cystine have since been many times observed. It is occasionally found in human urine when it tends to form a white crystalline deposit. In such cases a highly interesting anomaly of metabolism exists. While the body of a normal individual is capable of completely oxidizing all the amino-acids to which the breakdown of protein gives rise, there are rare cases in which this power is deficient. The failure applies especially to the oxidation of cystine. As a result considerable amounts of this substance appear unaltered in the urine. Because of its low solubility it may be deposited in the tissues or as calculi. Those who display this condition suffer from a definite deficiency in the chemical make-up of their bodies. A specific oxidizing mechanism fully active in normal people is in their case imperfectly developed. This is a congenital anomaly commonly transmitted (perhaps on Mendelian lines) from parents to children.

The amount of cystine contained in individual proteins varies from less than 1% to more than 3%. A due supply of cystine in the diet is essential to nutrition. Proteins deficient in this constituent may show a relatively low nutritive value. Keratin, a much modified protein, which is the basal constituent of horn and hairs, is characteristically rich in cystine, containing 8% and upwards. Natural cystine when pure is a snow-white substance consisting of highly characteristic microscopic crystals in the form of hexagonal plates. It has an exceptionally high rotatory power on polarized light $[\alpha]_D = -222°$ in normal hydrochloric acid. The structural formula and that of the related *cysteine* are as follows:



Cystine Cysteine (two molecules)

It is characteristic of compounds containing a disulphide grouping to yield upon reduction two molecules of the corresponding compound containing the thiol or —SH group. These relations are displayed in the biological behaviour of cystine (*see* GLUTATHIONE).

See A. E. Garrod, *Inborn Errors of Metabolism* (1923).

(F. G. H.)

CYSTOLITH, a botanical term for the inorganic concretions, usually of calcium carbonate, formed in a cellulose matrix in special cells, generally in the leaf of plants of certain families, *e.g., Ficus elastica,* the india-rubber plant.

CYTHERA, an island (mod. *Cerigo,* but officially *Cythera*), situated about 8 mi. from Cape Malea, the southern promontory of Greece. From north to south it is nearly 20 mi. long and its greatest breadth is about 12 mi. It is rocky, but streams abound, and there are fertile districts. Two great caves with stalactites are among its natural peculiarities. Much land is pasture, but wine and corn are produced, and the olive oil is good. The honey is highly prized, as in antiquity, and goat cheese, salt, flax, cotton and currants are exported. The people are industrious, and find employment as labourers in the Morea and Asia Minor. There is no regular harbour; sea currents are strong, and storms frequent. The best anchorage is at San Nicolo, on the eastern side. The principal village, Capsali, at the southern extremity, has a bishop, and several convents and churches.

There are few traces of antiquity. The ancient capital was at Paleo-Kastro. In the church of St. Kosmas are preserved archaic Doric columns of the famous temple of Aphrodite of Cythera, who was supposed to have emerged there from the sea. Cythera was the seat of a purple fishery; hence its poetical name Porphyris and tradition of a Phoenician settlement. For a time dependent on Argos, it belonged later to the Spartans. In the Peloponnesian war, it was occupied by Athens, but in 421 it was recovered by Sparta. In mediaeval and modern history Cythera ranks as one of the Ionian Islands and shares their history; but it was subject to Venice only from 1717 to 1797.

See the works referred to under CEPHALONIA, and also Weil, in *Mittheil. d. deutsch. Inst. zu Athen* (1880), pp. 224–243.

CYTOLOGY. One of the most remarkable and fundamental facts of biology is that all living things have a common unit of structure, the cell, and are made up of the same general kind of basic substance, protoplasm. Cytology is the branch of biology which deals with these cells and this substance. Many organisms, such as the Protozoa, mostly of microscopic size, consist of single cells; but most of those which are large enough to be seen with the naked eye, including the animals and plants familiar to all of us, are multicellular, made up of millions of microscopic cell units. Although originally seen as minute empty spaces in dead plant tissue, such as cork, and consequently misnamed "cells" by their discoverers (Robert Hooke and Nehemiah Grew, 1665), cells are actually full of living protoplasm and are very complex bodies in which a multitude of delicate chemical and physiological processes take place. This means, of course, that protoplasm is not a simple substance, but is a highly organized one containing many kinds of materials and minute structures. Most biologists believe that protoplasm owes its living nature to its *organization* rather than to the possession of some one vital element. This is an important point and should be continually kept in mind. The purpose of this account is to give some idea of what the structures are like that go to make up cells, how they vary in different kinds of cells, what roles they play in some of the more important living processes and how they determine the nature of different organisms, including man himself. We are far from having a full understanding of these subjects, of course, but a great deal has been learned and our knowledge is growing at an ever increasing rate.

Cytology is one of the youngest of the biological sciences. Nevertheless, it merits special attention because it provides a common meeting ground for several other branches of biology. Our later discussion will be made easier if we first get a picture of this relationship. As is known, almost any ordinary animal starts out as a fertilized egg, from which an embryo and later the adult animal develops. This fertilized egg is a cell. It results from the union of two cells—the unfertilized egg and the sperm. It does not simply grow into an embryo. Instead, it divides into two cells, these into four, these four into eight and so on until great numbers are produced. This divisional process is known as cell division, or more technically, *mitosis.* For the most part the new cells formed at each division grow to the size of their parent cells before they, in turn, divide. Thus cell growth and cell division are ordinarily both involved in the development of an embryo from a fertilized egg. In the case of many large eggs, such as those of birds, most of the egg consists simply of food material and division involves only the cell proper, which is very small; but otherwise the process of development is essentially the same, the food material being gradually absorbed by the cells as they multiply. In either case, as the embryo is produced it comes to be made up of different tissues and organs (*e.g.,* muscles, nerves, fat, skin, glands, etc.) and the cells in these various tissues often come to differ strikingly. Study of the processes of development and differentiation reveals a close relationship between cytology and embryology.

An equally close relationship exists between cytology and the study of heredity, known as genetics. As previously stated, the sperm and the egg, which unite at fertilization to produce a new individual, are both cells. Each carries within it the hereditary materials from one parent. Combined, the two sets of materials determine the hereditary potentialities of the animal or plant which develops from the fertilized egg. Identifying the individual cell components which carry the hereditary "determiners" and

discovering the laws underlying their transmission from generation to generation was one of the major tasks in cytology, especially during the period from about 1870 to about 1925. Combined with breeding experiments, such studies have now been elevated to the rank of a semi-independent branch of biology known as cytogenetics which will be discussed presently. Similarly, in the study of the structure and functions of different tissues and organs (anatomy and physiology, respectively) and in the study of the relationship between different species (taxonomy) as well as in the study of the evolution of species, cytology plays an important part. In the words of E. B. Wilson (1925): "Long ago it became evident that the key to every biological problem must finally be sought in the cell; for every living organism is, or at some time has been, a cell."[1]

Subsequent discussion will be further simplified if we get another picture in mind at this point: Cells, like the animals and plants in which they are found, are the products of long evolutionary development and owe their present characteristics to this fact. In the earliest forms of life protoplasm was presumably a relatively simple substance, not organized into cells as we know them today, and the process of mitosis did not exist in its present form. As evolution proceeded, cells came into existence and different species of organisms arose. These species differed because of differences in their cells. In other words, evolutionary changes occur within individual cells (*see* below). It is to be expected, therefore, that although all are similar in certain respects, cells of many kinds will be found in the highly complex animals and plants now living. And so they are. Furthermore, nearly all the different structures and processes found in cells have undergone change in the course of evolution, leading to the great variety of conditions found today. One of the products of evolutionary change is the present highly complex process of mitosis, the importance of which will be brought out below.

THE CELL

There is no very satisfactory definition of the term "cell" in biology, so we may begin our account with a description rather than a definition. During the early stages in the development of an ordinary animal there is a period when all the cells are very much alike and all behave in much the same manner. It is a period of relatively rapid multiplication of cells. Following division, each cell goes through a typical series of internal changes, including growth, before it divides again. The span from one division to the next is a cell generation. It represents the life cycle of an individual cell. Since these cells are much alike and are much like those found at corresponding stages in other animals, and even in plants, they may be called "typical" cells. Most general descriptions of cells apply especially to cells of this kind. Such cells are usually found wherever growth and cell multiplication are taking place. The more highly specialized cells arise, of course, from typical cells when the time for differentiation occurs. And it is interesting to note that in the case of many kinds of specialized cells the power of cell division appears to be lost as soon as the cell becomes specialized.

Any ordinary cell consists fundamentally of two parts—a central *nucleus* and the protoplasm surrounding it. The latter is called *cytoplasm* to distinguish it from the protoplasm of the nucleus (fig. 6). This distinction is amply warranted, for studies have shown that the components of the cytoplasm differ in nature, behaviour and function from those of the nucleus. There has been discussion about which is more important, but this misplaces the emphasis. Nucleus and cytoplasm are both essential to the life of the organism; the difference is in their respective roles. The nuclear components play a primary role in heredity and in directing the course of embryonic development, while the components of the cytoplasm appear to function mainly in such processes as respiration, growth, differentiation, secretion, transmission of nerve impulses, locomotion of free moving cells (such as some of the blood cells) and contraction of muscles.

The generalized diagram of a cell shown in fig. 6 represents a typical animal cell shortly before mitosis takes place. The diagram includes most of the components found in animal cells; but it does not give any clear conception of the cell as a living structure. To get such a conception we must think of the cell not only as highly complex, but as highly active in a physiological sense. Under ordinary conditions complicated chemical processes are almost certainly taking place in it continually. In typical cells these are accompanied by, and presumably correlated with, various movements and changes in form or structure of the different cell components. Consequently, when we describe these components our description may apply only to the stage under consideration, and we may have to follow them through the whole life of the cell in order to see what they are really like. The preliminary description given below is simplified as much as possible in order to give a general picture, the details of which will be filled in later. As will be seen, some components are found in the cells of nearly all animals and plants, others are found mainly or exclusively in animals, others in plants and others only in certain groups of animals or plants. These variations or restrictions are among the factors which make it difficult to give a brief and satisfactory definition of a cell.

FIG. 6.—GENERALIZED DIAGRAM OF AN ANIMAL CELL SHOWING MAIN COMPONENTS

Our knowledge of the internal organization of cells came from various kinds of studies. Its advance depended primarily on the development of the microscope, but was also greatly affected by other developments, such as those in illumination with high power electric lamps and in photography (photomicrography), including that with ultra-violet light (Pl., fig. 8). Much information came from direct observation of living cells under the microscope, a method which is being used to an increasing extent. Much also came from a study of moving pictures of living cells, taken through the microscope. Most of it, however, was secured through study of material that was "fixed and stained" and mounted on glass microscope slides. Many different procedures are used for the latter purpose, but most of them involve killing and hardening the tissue with chemicals, such as acids, formalin, alcohol, etc., then cutting it into very thin sections of a few thousandths of a millimetre thickness, mounting these sections on slides under very thin glass cover slips and staining them with various dyes. Since different structures in the cell differ chemically, as well as in form, individual kinds may be revealed in sharp contrast to one another or to the rest of the protoplasm through proper selection of fixing agents and stains. This permits a much more refined analysis than would otherwise be possible. It brings out clearly numerous structures which often cannot be seen at all, or can be seen only vaguely, in the living cell, where the optical properties of nearly all the components tend to be much alike.

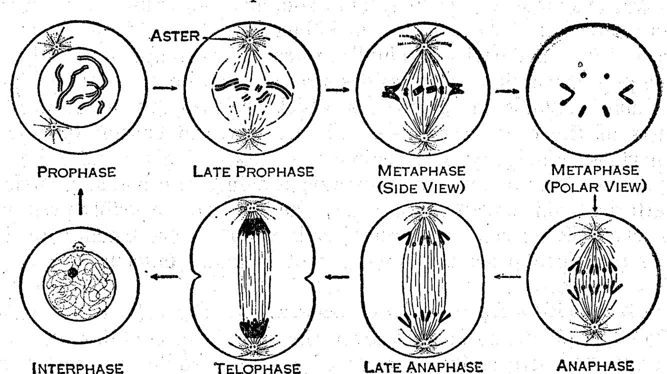
General Description of a Cell.—We will first describe a typical animal cell when it is just getting ready to divide (prophase); then we will follow it through the succeeding stages of one cell generation. **Prophase:** At the periphery of the cell (fig. 6) we find the *cell wall* or outer membrane, usually a conspicuous and resistant structure. Just beneath this is the *plasma membrane,* which is very thin and often not detectable under the microscope. Next comes the *cytoplasm* proper consisting of a basic and apparently structureless, jelly-like *ground substance* in which are found various distinct kinds of bodies or materials. Three of the latter call for special attention. They are the *chondriosomes* or mitochondria, the *Golgi bodies* and the *centrioles* or central bodies. These three types differ from one another in their chemical properties, behaviour and function and will be discussed

[1]From E. B. Wilson, *The Cell in Development and Heredity.* By permission of the Macmillan Co., publishers.

more in detail below. We need only note here that the chondriosomes and also the Golgi bodies may differ much in size and shape in different cells or even in different stages in the life of one cell. Besides these three kinds there may be other bodies or materials present, such as fat droplets, yolk spheres, granules and vacuoles of watery substance. The former two, at least, seem to be primarily food materials. In plant cells, other structures are often present, such as starch grains and the chloroplasts responsible for leaf and stem colour. Near the centre of the cell is the spherical *nucleus*. It consists of an outer *membrane*, a clear, jelly-like ground substance called *nucleoplasm* or nuclear sap, and two kinds of enclosed bodies—the *chromosomes* and the *nucleoli*. The chromosomes are relatively long and more or less thread-like, while the nucleoli are typically globular.

The preceding description applies to the early part of the prophase stage. In later prophase, conditions change rapidly, leading to mitosis (fig. 7)—one of the most remarkable and significant processes found anywhere in nature. As the process begins, the nuclear membrane is dissolved and disappears. The nucleolus also disappears. In the cytoplasm the centrioles, two in number, move to opposite sides of the cell, if they have not already done so, and between them is formed the *mitotic spindle* (figs. 4, 7, 9 and Pl., fig. 3). This consists of a spindle-shaped system of rays, at the two ends or "poles" of which lie the centrioles. Usually similar rays also radiate out in other directions from the poles, forming *asters*. The nucleus ordinarily lies between the two asters and often the nuclear membrane disappears while the spindle is forming. In some cells, however, the spindle forms in the cytoplasm at one side of the nucleus and the two later move together. In either case the chromosomes, which are steadily becoming shorter and more dense in appearance, become "attached" to rays of the spindle and gradually move into the equator as if pulled by the rays. The rays are technically called *spindle fibres*.

Metaphase (figs. 4, 7 and Pl., figs. 2 & 3): When the chromosomes come to lie at the equator of the spindle, forming the *equatorial plate*, the metaphase stage is reached. By this time, and often much earlier, each chromosome is seen to be double, the result of a preceding split from end to end. In other words, each chromosome is duplicated in an accurate manner so that



BY COURTESY OF C. W. METZ

FIG. 7.—DIAGRAMS SHOWING CHROMOSOME BEHAVIOUR AT SUCCESSIVE STAGES IN THE LIFE CYCLE OF A TYPICAL ANIMAL CELL (ARROWS INDICATE SEQUENCE)

each daughter chromosome becomes a replica of the original. This fact has great significance for, as pointed out by Wilhelm Roux in 1883, it indicates that a chromosome is not a simple, homogeneous body, but contains a linear series of qualitatively different materials, each one of which is essential and must be passed on to each daughter cell. These materials are now identified as the hereditary units or genes, and mitosis shows how they are perpetuated, as will be seen later.

Anaphase (figs. 7, 9 and Pl., figs. 4 & 5): On the metaphase plate each double chromosome is oriented so that one member lies nearer one pole and the other nearer the opposite pole (fig. 7). Then the two sister members gradually separate and move slowly toward the respective poles, as indicated in figs. 7, 9 and Pl., fig. 5. This marks the anaphase stage, which ends when the poles are reached. As a result of the chromosome division, followed by the anaphase movements of the daughter halves, the two chromosome groups at the poles are exact and complete duplicates of the original group. Thus each of the two daughter cells, to be formed shortly, will receive such a group.

Telophase (fig. 7 and Pl., fig. 6): After the two daughter chromosome groups reach the poles each chromosome gradually takes on the appearance of a delicate, coiled thread, which subsequently uncoils and extends until it is scarcely distinguishable. This thread was present all the time (fig. 17). It is the *chromonema* (coloured thread) and represents the true, permanent part of the chromosome, including the hereditary materials. As the uncoiling takes place the chromosomes in each group become clumped and around them a new nuclear membrane is formed. These transformations mark the telophase. By the time they are completed, or soon thereafter, the cell itself begins to divide, giving rise to two separate and complete daughter cells (Pl., fig. 6). During division the cytoplasm is apportioned more or less equally by a process of pinching in two and the two parts carry with them the chondriosomes, Golgi bodies and other inclusions which they contain (figs. 9, 12). Thus the cytoplasmic structures (except the centrioles) are transmitted to the daughter cells in a very inexact manner as compared with the chromosomes. Here again we see a fact of special significance in connection with the function of different cellular elements, to be considered later.

Interphase or resting stage (fig. 7): Mitosis has now been completed and the daughter cells have entered a long interphase period which will extend to the next mitosis. This period is usually called the resting stage because no very conspicuous activities seem to be going on. Like the term "cell," however, the name is misleading, for actually a period of high activity is represented, but it is metabolic (physiological) activity, not movement. The cell is at first just half the size of the preceding one and must now grow back to full stature. Likewise, the chromosomes and all the cytoplasmic structures must be restored to the proper condition. How this is done is not known, except in very crude outline. The microscopically visible changes which occur are relatively simple. The chromosomes become delicate threads, coiled about in the nucleus, and often cannot be distinguished individually. One or more nucleoli appear. The nuclear volume increases as does that of the cytoplasm and the cell as a whole. The centriole divides into two, if it has not already done so. And the various other cytoplasmic bodies (chondriosomes, Golgi bodies, etc.) become more numerous. The basic living processes are going on. Food is being taken up and transformed into living matter in the form of known structures and apparently structureless ground substance. But we are relatively ignorant of the manner in which the transformation takes place. The latter falls within the province of the cell physiologist.

By the time the interphase or growth stage is completed, the two daughter cells have ordinarily become fully restored to the condition seen in the cell which divided to produce them. Then they in turn are ready to undergo mitosis. An entire cell cycle has been completed. If we omit bacteria and the blue-green algae, we may say that, with minor modifications, the process just described is found in almost all animals and plants. The significance of this fact can hardly be exaggerated. The original discovery that every cell comes from a pre-existing cell (*omnis cellula e cellula,* Rudolf Virchow, 1858) marked one of the milestones in biology's progress. And the further realization that cell division involves such an accurate distribution of materials, especially chromosomes, brought a flood of light into the previously obscure realm of heredity and evolution. This latter realization came about gradually through the researches of many investigators, beginning around 1870 and continuing to about 1920, by which time breeding experiments securely established the fact that hereditary units (genes) are in the chromosomes and are themselves duplicated and accurately passed on from cell to cell through mitosis.

With this picture in mind it is now possible to explore further. Several questions arise immediately. For example, what is the relative importance and significance of the various cell components just described? And what, more specifically, is the relation just mentioned between the chromosomes and heredity? These and related topics will be treated below, either separately or in connection with more detailed descriptions of the different structures. The reader will observe that a large part of the account is devoted to the chromosomes. This is not only because of the great importance of these structures, but because our knowledge of them is much more clear-cut and significant than in the case of the cytoplasmic constituents.

Importance and Significance of Different Cell Components.—One of the simplest ways to throw light on the relative importance and significance of the different cell components is to answer the following questions about each one: (1) How widely is the constituent distributed in nature? If it is found in all cells of animals and plants it surely is important, for nature does not perpetuate unimportant structures to that extent. If it is found in some, but not all, species it is presumably essential to the welfare of these species, but its general significance is restricted. (2) Does the constituent or its units show a significant constancy in form and number? (3) Is it self-reproducing? Constancy combined with the power of reproduction is especially significant. (4) Is it transmitted from cell to cell, and if so, how? If it is transmitted in an accurate manner we may be reasonably sure that a special mechanism is operating, and such a mechanism could hardly have evolved if the structure were not important. (5) Is the constituent susceptible to experimental modification without serious damage? This latter test is valuable at least for determining how highly organized the structure is. These criteria should be kept in mind as we give further consideration to the components listed above.

Nucleus *v.* Cytoplasm.—Although neither the nucleus nor the cytoplasm is a single constituent, a fact of broad significance may be revealed by comparing their susceptibilities to experimental modification. Many cells recover readily if part of their cytoplasm has been removed or injured. In contrast, the nucleus is unable to repair damage except within very restricted limits. Generally speaking, this means that in the nucleus each individual unit of structure is essential and self-reproducing; once lost it cannot be replaced. In the cytoplasm, on the other hand, the units making up any class of structures (chondriosomes, etc.) seem to be alike and interchangeable; if some are lost they may be replaced by their counterparts or formed anew, with the possible exception of the centrioles. This distinction between the nucleus and cytoplasm is far-reaching in its implications and will become clearer as we proceed.

CYTOPLASM

The ground substance of cytoplasm is universal in cells of all kinds and is of fundamental importance. In spite of the fact that it looks like a simple, clear or alveolar jelly under the microscope, experiments and biochemical studies all indicate that it is chemically complex and includes complex proteins of various kinds. Although having general properties in common throughout all organisms, the exact chemical nature of this material in any one species seems (at least in animals) to be different from that in every other species. Sometimes the difference apparently extends down to strains or families or even individual animals. For example, the immunity of an individual person to disease is presumably because of the particular chemical characteristics of this substance (although the characteristics may in turn be determined by genes in the chromosomes). The ground substance appears to be homogeneous and ordinarily it is simply divided into two portions by mass division at mitosis. This would indicate that usually all parts of it are alike in any one cell. In some cases, however, experiments have shown that different regions of the cell apparently contain different kinds of ground substance, even though no difference is visible under the microscope.

Vacuoles and Cell Sap.—In connection with the ground substance of the cytoplasm we may profitably consider the vacuoles and cell sap of plant cells. Vacuoles are not only common and widespread in plants, but they often become so extensive as to occupy most of the cell volume (fig. 8). They represent the seat of much metabolic activity, made possible in part by the fact that they are separated from the rest of the cell by semipermeable membranes. Their content, the cell sap, is often deceptively clear and simple in appearance but may be chemically complex. In other cases it may contain dissolved pigments which give colour to the flowers or other parts, especially the blue, purple and red colours. Or it may contain special materials which give rise to such products as gums, resins and rubber. Since this material is

derived mainly from the surrounding cytoplasm, its composition gives a further indication of the make-up of the latter. According to E. C. Miller (1938) the composition varies widely in different plants and under different conditions but the following materials have all been found in vacuoles: water up to 98%; inorganic salts of various kinds, especially salts of sodium, potassium, magnesium and calcium; carbohydrates, including cane sugar, maltose, glucose, fructose, dextrins and inulin; nitrogenous compounds, including proteins, amino acids, amides, proteoses and peptones; various soluble alkaloids and glucosides, which are probably waste products of the cell; gases, especially oxygen and carbon dioxide; enzymes, principally diastase, invertase, lipase, inulase and proteolytic enzymes; organic acids, including mainly oxalic, malic, citric, tartaric, tannic, acetic and formic—the last two "probably present in every living cell." In animal cells vacuoles are usually much less prominent than in plants, except in many unicellular forms (*see* PROTOZOA).

Chondriosomes or Mitochondria.—In the cells of all animals and plants, so far as known, the cytoplasm contains numerous tiny structures in the form of granules, rodlets, globules or filaments. These structures include the chondriosomes or, as they are often called, the mitochondria. But they may also include other structures, such as the plastids or proplastids in the case of plant cells, or the Golgi bodies in animal cells, or granular materials of various kinds. The accurate differentiation and identification of such structures and the study of their origin, organization, chemical constitution and function has presented a peculiarly difficult problem to the cytologist. Consequently, there is still much difference of opinion on the points mentioned. The granules or rodlets often grade in size down to, and presumably beyond, the limits of vision with the highest powers of the microscope. The globules, on the other hand, may sometimes be as large as the chromosomes, and the filaments as long. Examples of chondriosomes are shown in figs. 9, 11, 12. Chondriosomes are lipid in nature, resembling phospholipins and albumens in chemical tests. They are readily dissolved in some of the organic acids, such as acetic, and may readily be stained in the living condition with Janus green B. These characteristics, combined with those of behaviour, are usually sufficient to identify the chondriosomes when

Lucas); (9-15) giant salivary gland chromosomes from fly larvae, all from cells which have been crushed and flattened out; (9) entire chromosome group of four pairs, with homologues closely united, from a fungus fly (arrow at lower right indicates the ordinary chromosomes of same fly at same magnification, for comparison); (10-12) parts of individual salivary gland chromosome pairs (11-12) show differences in homologues; (13) part of a pair of chromosomes in a species hybrid; (14-15) chromosome rearrangements induced by X-ray treatment (15, courtesy H. V. Crouse). Magnification: (1-6) 780 times; (7) 1,134 times; (8) 1,200 times; (9) 540 times; (10) 1,700 times; (11) 1,200 times; (12, 13) 1,700 times

they are in the form of filaments or vesicles. To determine which among the smallest granules are mitochondria, however, is often impossible.

In some cases, at least, it is clear that chondriosomes, or bodies made up of chondriosome material, divide; but whether the individual elements regularly reproduce and never arise *de novo* is not clear. Some observers maintain that they are not permanent cell organs and do arise *de novo* in the form of minute granules in the cytoplasm. A similar disagreement exists regarding the function of chondriosomes. Among the functions attributed to them are those of: giving rise to yolk spheres in some eggs; production of fatty droplets in some gland cells; development into plastids which produce starch and various pigments in plant cells; and possibly the formation of certain types of fibrils, such as nerve fibrils, during differentiation of specialized cells. Other observers, however, maintain that they are the products rather than the agents of metabolic activity. In the formation of the animal sperm they go through a series of remarkable transformations which culminate in the production of an elaborate structure in the "middle piece" of the tail (fig. 5).

As implied by the above, chondriosomes readily undergo wide changes in size and form in many cells. Likewise, they appear to change radically in number, even in individual cells. Small chondriosomes may unite to form larger ones, or may apparently multiply rapidly to form greatly increased numbers. As cells become specialized during development the number often becomes greatly reduced. Such characteristics add to the difficulty of getting a real understanding of the nature and function of these structures. The evidence leads to the conclusion, however, that the individual chondriosomes in a cell are essentially alike in composition and that the precise number is not important. In other words, they are all made of the same stuff and presumably it is merely necessary to have enough of this material present.

Plastids.—Related to chondriosomes, and possibly arising from them, are the plastids (fig. 8). These structures are characteristic of plant cells, but not animal cells. Whether plastids are permanent, self-reproducing cell structures is difficult to determine, but there is an increasing volume of evidence to indicate that they are and that they regularly multiply by division. The green plastids, containing chlorophyll, in which photosynthesis takes place, are responsible for most of the food that main-

tains animal life, as well as plant life, on the earth. It is in these green *chloroplasts* that carbon and oxygen from the carbon dioxide in the air are combined with hydrogen from water to produce sugar. Although photosynthesis is still not fully understood by physicists and chemists, it is clear that the green pigment, chlorophyll, has the ability to take up energy from sunlight and utilize this energy to bring about the chemical process just mentioned (*see* PHOTOSYNTHESIS). Other chloroplasts (coloured plastids) produce other colours in plants, such as the yellows and browns seen in leaves, and some of the reds. Like the chondriosomes, plastids undergo wide changes in size, form and number. Their chemical composition is not adequately known, but they appear to be relatively rich in protein and lipid materials. In addition to chloroplasts several kinds of colourless plastids, known as leucoplasts, are found, including those which produce starch grains.

Golgi Materials or Golgi Bodies (figs. 9, 10).—In animal cells a type of fatty material is known which blackens in osmic acid, is readily impregnated with silver and exists in a wide variety of morphological conditions—fibrils, canals, networks, crescents, globules, etc. This is known as the Golgi material, named after its discoverer, who first observed it (1898) in nerve cells. Its prominence in gland cells, its association with secretion droplets and its lipid nature indicate that its function is probably secretory; although just how it functions is unknown. Such a function helps to explain its widely different appearance in different types of cells. In nerve and gland cells, *e.g.,* it often forms a "reticular apparatus" of fibres or canals (fig. 10) whereas in insect spermatocytes it is represented by small, separate bodies known as Golgi bodies or dictyosomes (fig. 9) which are usually composed of two portions having unlike staining qualities. Some authors maintain that the dictyosomes should not be classed with Golgi material.

Notwithstanding the fact that in some cells the Golgi bodies resemble chondriosomes in appearance, the two types of constituents are clearly distinct in so many cases that they must, in general, be put in different categories. This is shown by behaviour as well as by physical and chemical characteristics (specific gravity, staining reactions, etc.). For example, in animal sperms the Golgi material forms the acrosome or perforatorium at the tip of the sperm head, while, as just noted, the chondriosomes form most of the "middle piece" of the tail (fig. 5).

The Golgi material is not known to be regularly self-reproducing, and at mitosis it is distributed in a random rather than an accurate manner to the two daughter cells. Some authors have maintained that Golgi material in animal cells is represented in plants by the vacuoles (considered above) but there is no general agreement on the subject. Taking the evidence all together, therefore, it would appear that the Golgi bodies have more limited significance than the chondriosomes. Likewise, it seems probable that they are involved in activities that do not occur in plant cells or are carried on there by other agents, such as the vacuoles.

Centrioles (figs. 7, 9 and Pl., figs. 3 and 4).—These structures are prominent in many animal cells and appear to be lacking for the most part in plants. They are usually dot-like in appearance and often difficult to distinguish from granules in the cytoplasm; but in some cases they are in the form of rods or filaments, or are V-shaped or dumbbell shaped (fig. 9). It is too early to determine their full significance, partly because their nature is in dispute and partly because we are not sure that they are lacking where they are not seen (as in most plant cells). There is some reason to believe that in the latter cases they are submicroscopic and possibly multiple (*see* Franz Schrader, 1944). Where evident, they show a constancy in number (usually one at each pole of the mitotic spindle) and they divide regularly and are distributed accurately at mitosis. The latter are important and significant attributes, paralleled only in the chromosomes. If it should ultimately be found that centrioles are present in essentially all cells, therefore, as suggested above, there can be little doubt of their importance. Their significance is clear, in a general sense, for they are obviously a part of the mitotic apparatus and appear to be involved somehow in the mitotic movements of chromosomes. But when we attempt to explain how they function in this latter activity we meet conflicting data and ideas, which cannot be summarized here (*see* Schrader, 1944). One interesting recent suggestion is that the centriole is the counterpart of the kinetochore, a structure found in each chromosome at the point where the spindle fibre is attached. **Other Cytoplasmic Bodies:** In addition to the kinds of structures listed above, the cytoplasm may contain various other bodies such as oil droplets and yolk spheres (fig. 4), crystals and tiny granules of unknown nature. Mention may also be made of such cell products as the cellulose walls of plant cells and the cartilage and bone produced by animal cells.

Cell Wall.—This component is placed at the end of the list because it presents a special problem. Most cells possess cell walls, and there is no question about the general importance of the structure. But whether or not we say that all cells have cell walls depends in part on how we define a cell. There are some organisms, such as the slime moulds, which do not have cell walls in the ordinary sense. And in some other organisms there may be regions or parts in which cell walls are lacking or there may be stages in development during which cell walls are absent. For example, during the early development of many insect eggs, after fertilization, mitoses occur until many nuclei are present, each surrounded by an area of cytoplasm but without a cell wall. These areas or islands move about through the yolk and other materials until they get into the right places and then a cell wall forms around each one, making a typical cell. Is such a structure a cell before the wall is formed, or not until afterward? Opinions differ. Some authors regard the entire egg as a single multinucleate cell until the walls are formed, and likewise regard the slime mould as a multinucleate but single-celled organism, even though it shows specialization of parts. Correspondingly, two different definitions of a cell are given.

According to some authors a cell consists of a mass of protoplasm enclosing a nucleus; according to others it is a mass of protoplasm surrounded by a cell membrane or cell wall and enclosing one or more nuclei.

NUCLEUS

Since the nuclear membrane disappears during each cell division, the nucleus as a separate body is not a permanent cell organ. Likewise, it does not appear to exist in the bacteria. But the constituent which gives significance to the nucleus, namely the chromosome material, or chromatin, is apparently universally distributed and essential. **Nucleoplasm or Nuclear Sap:** This material is ordinarily clear and structureless in appearance and seems to be homogeneous. It differs to some extent, at least, from the ground substance of the cytoplasm, for chemical tests show it to be more acid than the latter. **Nucleoli:** Ordinarily, two kinds of nucleoli are recognized, the so-called chromosome nucleoli or *karyosomes* and the "true" nucleoli or *plasmosomes*. The former are simply dense, deeply staining parts of chromosomes and need no special treatment here. We may confine our attention, therefore, to the plasmosomes. Long listed among the least understood of cell constituents, the so-called true nucleoli are now reasonably well known, at least as regards their origin and fate. Barbara McClintock, who made major contributions in the field (1934), was able to demonstrate that in maize each nucleolus is produced in some manner by a chromosome through the agency of a "nucleolus-forming region" which occupies a specific place in the chromosome. The nucleolus arises in the form of a bleb from the nucleolus-forming region (Pl., fig. 7). The fact that the nucleoli ordinarily appear during telophase, as the chromosomes become indistinct, and then disappear in prophase as the chromosomes become condensed and deeply staining, is considered an indication of exchange of material between chromosomes and nucleoli.

Chromosomes.—The relation of chromosomes to heredity was previously mentioned. But to appreciate the chromosomes fully we must also consider them from another viewpoint, and it will be advantageous to examine that aspect first. Cytologists have long been searching for more and more exact knowledge as to what makes the cell a living unit and as to whether any of the structures it contains may in turn be regarded as living units. From this standpoint the chromosomes stand out as the most significant and remarkable. They are highly organized bodies which possess the three living properties of growth, accurate reproduction and movement characteristic of the cell itself. There is also some evidence that they possess irritability. We are concerned, therefore, with anything which will throw light on the nature of chromosomes. Practically, this means studying their form, structure, chemical make-up and behaviour as well as their role in heredity.

Chromosome Number, Size and Shape.—When the chromosomes are arranged at the equator of the spindle during mitosis it is possible, in favourable material, to see each member clearly, so the total number in the cell may be counted and the sizes and shapes of the different members observed (figs. 13-15 and Pl., fig. 2). The set as a whole is referred to as the "chromosome group" of that cell. By comparing such groups, from cell to cell, individual to individual and species to species, highly significant facts about chromosomes have been revealed. Most of these were discovered during the last quarter of the 19th century through the studies of the group of men referred to below. The following principles, laid down then, have become firmly established. Where exceptions occur they serve to throw additional light on some of the problems involved, but do not disturb the principles themselves. In the first place, as would be expected from the nature of the mitotic process already described, the chromosome group in the fertilized egg is handed on intact to all the cells during development, so all cells in the adult have the same group. Secondly, the chromosome group is constant for all the individuals of any one species of animal or plant, but differs greatly between different species. In the third place, the individual chromosomes in a chromosome group often are not all alike in size and shape; they may differ widely from one another, as seen in figs. 14, 15 and 23. Studies on such cases have shown that there are two chromosomes of each kind in each group. In other words, the chromosomes are in pairs (fig. 16). And it is known that one member of each pair comes from the mother and the other from the father. That is, the unfertilized egg has one chromosome of each kind, and the sperm brings in at fertilization the other member of each kind (fig. 16 and Pl., fig. 1). Thus, in inheritance the two parents contribute equally. Such evidence led Theodor Boveri and others to enunciate the now well established principle of the *individuality* and *continuity* of chromosomes. According to this principle the two members of each pair of chromosomes are qualitatively alike, but they differ in composition from the members of all the other pairs of the group. And each chromosome retains its identity from generation to generation in spite of the fact that it changes its form at different stages in the cell cycle and is usually lost to view when the chromonema uncoils into a delicate thread during the interphase. In terms of hereditary materials, then, we may say that each kind of chromosome in the group contains a different set of hereditary units and that therefore each kind of chromosome must be present in order to have a full complement of hereditary materials (genes). Furthermore, it is evident that each germ cell (egg and sperm) carries a full set of genes before fertilization and that the fertilized egg, which results from their union, and the cells descending from it, carry a double set of genes (fig. 16). This fact forms one of the cornerstones in the foundation of the science of genetics, as will be seen in more detail later.

Another cornerstone is provided by certain events which occur when the eggs and sperms are themselves formed. Recalling the principle that during the development of an animal or plant all the cells have the double set of chromosomes, it is evident that if these chromosomes all went into each egg and sperm, fertilization would result in again doubling the number. So unless some regulating process intervened each animal or plant would have twice as many chromosomes as its parents. Such a process does intervene, however; it occurs during what is called *meiosis*, or maturation of the germ cells, the general outline of which is shown in fig. 16. The details will concern us later. During meiosis the chromosomes undergo a *reduction* in number, such that each egg or sperm receives only one member of each pair of chromosomes—*i.e.*, one chromosome of each kind, as shown in fig. 16. This counterbalances the union of two sets of chromosomes at fertilization and keeps the number constant from generation to generation.

Like other characteristics of present day animals and plants the numbers, sizes and shapes of the chromosomes came about through evolutionary changes. Some groups of organisms tend to have certain distinctive kinds of chromosome groups. For example, in moths and butterflies (Lepidoptera) there is usually a large number of very small spherical chromosomes, such as shown in fig. 13. In man (fig. 14), in monkeys, in many birds and some other groups of vertebrates the number of chromosomes is smaller, and various sizes and shapes are represented in individual chromosome groups. In the salamanders (fig. 15) most of the chromosomes are very large and long. From the evolutionary point of view the main fact that stands out is that there was no single trend, such as that from small to large chromosomes or few to many chromosomes. Various kinds of changes evidently took place independently in different lines of descent among different groups of animals and plants. How some of these changes may have occurred will be suggested later.

Structure and Chemical Nature of Chromosomes.—In favourable material it is possible to see that during mitosis, when the chromosomes are condensed, each has somewhat the appearance represented schematically in fig. 17. It consists of a closely coiled thread, the *chromonema,* which may be double, embedded in a jelly-like *matrix.* Although important in some respects, the matrix does not appear to be a permanent part of the chromosome and may be ignored here. The chromonema is the essential part. Its structure is best revealed when it is uncoiled and extended. Then it appears (in "fixed" preparations) as a series of many tiny, deeply staining granules, called *chromomeres* (Pl., fig. 7), connected by a delicate strand of so-called linin material which may be chemically different from the material in the granules. In most chromosomes there is also a differentiated structure at the point where the chromosome is attached to its spindle fibre at mitosis. This structure

FIG. 16.—DIAGRAMS SHOWING THE HISTORY OF THE CHROMOSOMES FROM FERTILIZATION OF THE EGG, THROUGH EMBRYONIC DEVELOPMENT (WHERE ALL CHROMOSOMES DIVIDE AT EACH CELL DIVISION, OR MITOSIS) AND FORMATION OF THE GERM CELLS (MEIOSIS), WHERE THE CHROMOSOME NUMBER IS REDUCED

is given various names, such as spindle fibre attachment, kinetochore and centromere. It usually has the appearance of a small, nonstaining vesicle as shown in the diagram (fig. 17) and at K in the photomicrograph of maize chromosomes (Pl., figs. 7 and 8). The body appears to take an active part in chromosome movement during mitosis; but how it functions is unknown. In some animals, such as most of the true bugs (Hemiptera), each chomosome has many minute kinetochores and a corresponding number of spindle fibres, instead of the usual single one.

The granules or chromomeres in the chromosome appear to be composed largely of nucleoproteins rich in nucleic acid, which accounts for their staining properties and their selective absorption of ultra-violet light. The exact nature of these granules is of great interest because they probably contain the units (genes) responsible for Mendelian heredity. The linin matherial, on the other hand, is less deeply staining and appears to react differently in chemical tests, indicating that it contains proteins, but perhaps not nucleoproteins (*see* below).

Especially noteworthy advances have been made in the study of chromosome structure since 1934 when the long known, but misinterpreted, bodies in the salivary gland nuclei of fly larvae, were recognized as true chromosomes (by E. Heitz and Hans Bauer, by T. S. Painter, and by R. L. King and H. W. Beams). These giant chromosomes call for special consideration, both here and in later paragraphs. They are found only in the salivary glands and other glands of the larvae of Diptera (two-winged flies.) The maggots of ordinary houseflies, blowflies, or fruit flies are good examples of such larvae. The salivary gland cells here grow to a relatively enormous size, and their nuclei and chromosomes become proportionately enlarged (Pl., figs. 9–15). When fully developed, in the full grown larva, these chromosomes are about 100 times as long and probably at least 2000 times as great in volume as they were originally or as the chromosomes are in the ordinary cells. Just how or why they undergo such enlargement is not yet clear. Neither is it certain that they do not become altered in other respects during enlargement, for the cells in which they are found become highly specialized and disintegrate without undergoing another division. Nevertheless, observations and experiments have shown that these chromosomes reflect to a high degree the true conditions in ordinary chromosomes and that evidence obtained from them is mostly applicable to the latter.

FIG. 17. — SIMPLIFIED DIAGRAM OF A CHROMOSOME IN THE CONDENSED STAGE (AT TIME OF MITOSIS); ACTUALLY THE CHROMONEMA IS USUALLY DOUBLE

Pl. figs. 8 and 9 show a photomicrograph of the salivary gland chromosomes from a fungus fly, together with a photomicrograph (indicated by arrow at the lower right), of the chromosomes from an ordinary cell of the same fly, both taken at the same magnification. Aside from the enormous size difference, the first thing to strike the eye here is the pattern of deeply staining cross bands or disks in the giant chromosomes. This at once reveals in a convincing manner the linear differentiation postulated long ago by Roux and required by the subsequent findings of geneticists in their breeding experiments. Not only is the chromosome made up of a series of alternating deeply staining and nonstaining disks, like coins in a tube, but the pattern is highly complex and specific. No two parts of a chromosome, or of different chromosomes, have the same pattern (except a few short regions which are actual duplicates of one another and are especially interesting on that account). Evidence secured after 1934, especially from the fruit fly *Drosophila* on which so much breeding work has been done, leaves little question that the deeply staining disks contain the genes responsible for heredity. Even the exact disk which contains a given gene is known in some cases. It is not yet certain, however, whether only one gene is located in the spot occupied by one disk, or whether the total number of genes in a chromosome exceeds the number of disks and the disks are themselves compound in the linear direction. The latter possibility is suggested by the fact that when a chromosome is stretched, as often happens in the process of preparing a slide for study, some of the thicker disks are seen to be made up of two or more thinner ones.

Numerous attempts have been made to study the chemical structure of the chromosomes, from the time of F. Miescher who (in the 1870s) identified the main constituent of sperm heads as substances now known as nucleoproteins. All such attempts meet the obvious difficulties of intracellular chemistry. Methods are required for separating the desired structures from other cellular components, to permit analysis by standard chemical techniques. Likewise, the results must be supported by microchemical identification of substances in the structures themselves in the microscopic preparations. Study of sperm heads, which are composed almost entirely of chromosomes, was extended to other types of nuclei, partly through the use, after 1930, of new techniques. The nucleic acid of the chromosome has a remarkably uniform composition. It is made up of units (nucleotides) composed of a purine or pyrimidine base, combined with the phosphoric acid ester of a pentose sugar, desoxyribose (known only in chromosomes). Nucleic acids with another type of sugar (ribose) likewise occur, but they are mainly in the cytoplasm. In combination with the nucleic acids are various proteins, differing somewhat in different organisms; these include protamines, histones and others not yet identified. In ultra-violet light the chromosomes show a characteristic absorption spectrum, corresponding to that of the nucleoproteins. Among the microchemical tests are: the Feulgen reaction, which shows that desoxyribose nucleic acid is located only in chromosomes; staining tests of various kinds; and digestion with various enzymes which remove the nucleic acid and leave the underlying fibrous protein structure intact. Such studies led to the suggestion that a chromosome may be composed of nucleoprotein units, the genes, connected by, or attached to, a fibrous protein thread.

Chromosomes and Heredity—Cytogenetics.—The fact that hereditary materials are in chromosomes came to light somewhat gradually as early investigators saw more and more clearly the parallelism between the behaviour of the chromosomes and the behaviour of inherited characters. The chromosome evidence appeared largely during the period from 1870 to 1900, when cytology was advancing at a rapid rate through the labours of such investigators as H. Fol, Otto Buetschli, Boveri, O. Hertwig, W. Flemming, E. Van Beneden, Eduard Strasburger, J. B. Carnoy, C. O. Whitman and Wilson. The chromosomal mechanism was at hand, therefore, on which to base an interpretation of heredity when the Mendelian principles of inheritance were rediscovered in 1900. An account of Mendel's work and of Mendelian inheritance will be found in the article on heredity and so only the general aspects necessary for present purposes will be outlined here. These aspects apply to animals and plants alike, although subject to various modifications in special cases where the chromosome mechanism is correspondingly modified.

The chromosome mechanism with which we are concerned is the one already mentioned in connection with reduction of the chromosome number during the formation of the germ cells. It operates during meiosis. Superficially, what happens is relatively simple, as may be seen from the following outline, which treats first the history of the cells and then that of the chromosomes. Early in the embryonic development of many animals certain cells may be distinguished as the ones whose descendants will produce the eggs or sperms. These are the cells of the germ line, called *oogonia* or *spermatogonia* as the case may be. They take part in the formation of the ovaries or testes. After multiplying sufficiently by mitosis, as shown in fig. 16, they suddenly stop dividing and enter a long "growth stage." This takes the place of the ordinary resting stage or interphase. They are now called *primary oocytes,* in the ovary, and *primary spermatocytes,* in the testis. Later these divide to produce the *secondary* oocytes or spermatocytes, which in turn divide to produce the final eggs and sperms, as shown in fig. 16. The process is somewhat different in the two sexes, for in the male each primary spermatocyte gives rise to four sperms, whereas in the female the divisions are unequal as regards the cytoplasm and only one of the four cells from each primary oocyte actually gets enough cytoplasm to function as an egg. The latter result has the beneficial effect of providing the fertilized egg with a relatively large amount of cytoplasmic food material with which to begin its development.

The chromosome behaviour is essentially the same in both sexes (and in plants). For the sake of simplicity we will consider only animal spermatogenesis (meiosis), as outlined in fig. 16. In the primary spermatocyte homologous chromosomes come together side by side in pairs—a process called *synapsis.* They also divide, if they have not already done so, and each pair of chromosomes becomes a tetrad of four members (figs. 16, 20). Then two cell divisions occur without any further division of the chromosomes. These are the primary and secondary spermatocyte divisions just mentioned. They are called *meiotic* divisions to distinguish them from the ordinary mitotic divisions in preceding cell generations. At the first meiotic division two of the four members of each tetrad go to one pole, and thus into one secondary spermatocyte, and the other two go to the other. Then at the second division the two members which remained together separate and go to opposite poles. As a result of these two meiotic divisions the four sperms derived from each primary spermatocyte get just one chromosome of each kind.

By referring to the article on heredity it will be seen that the units responsible for hereditary characters show the same kind of assortment and distribution as that just described for the chromosomes.

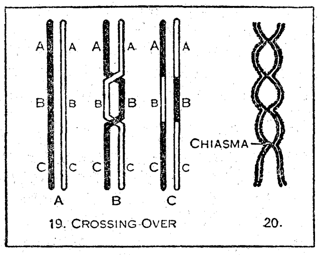
FIG. 18.—DIAGRAM ILLUSTRATING THE BEHAVIOUR OF A PAIR OF HEREDITARY GENES (MENDELIAN INHERITANCE)

A, gene for gray colour; a, gene for albino (white). This behaviour parallels that of the chromosomes. P_1, parents; F_1, first hybrid generation; F_2, second generation

Each hereditary character results from a unit, the *gene.* The genes, like the chromosomes in which they lie, are in pairs and at meiosis the two members of a pair separate and go into different germ cells. This is the mechanism responsible for the 3:1 ratio characteristic of Mendelian inheritance. For example, suppose an ordinary gray rabbit is crossed with an albino (white) rabbit. We may represent the gene for gray by A and that for albino by a. The wild-type, or gray, rabbit would have the constitution AA and the albino aa, as indicated in fig. 18 (P_1). Each germ cell of the former would receive one A gene, and correspondingly each germ cell of the albino would receive one a gene. The hybrids (F_1) then would all be Aa in constitution. Since A is dominant over a the hybrids would all be gray. When they formed germ cells, approximately half the eggs would receive A and half a, and similarly half the sperms would receive A and half a. Random combination at fertilization, therefore, would give the following gene combinations in the offspring (F_2), in the proportion indicated: 1 AA, 2 Aa, 1 aa. Three of the four cases include the dominant A gene; they would result in gray rabbits, and only the aa would be albino. Thus the ratio in this generation would be 3 gray:1 albino. This parallelism between the behaviour of chromosomes and genes was first pointed out clearly by W. S. Sutton in 1902. Sutton likewise called attention to the corresponding parallelism observed when the inheritance of two independent pairs of characters is studied and the typical Mendelian ratio of 9:3:3:1 is found in the second (F_2) generation. This ratio is obtained when the two pairs of genes are in separate pairs of chromosomes. The members of the two pairs of chromosomes, like the genes, segregate independently of one another in the hybrid. That is, the two from the mother do not regularly go into one germ cell and the two from the father into another. They are just as apt to assort so that one from the mother goes with one from the father. Thus, four types of germ cells are formed in equal numbers and sixteen combinations are produced in the F_2 generation, giving the 9:3:3:1 ratio.

But now, we may ask, what happens if two pairs of genes are in one pair of chromosomes instead of separate pairs? When this condition is found we get what is known as gene *linkage.* That is, the two genes in a chromosome tend to remain together in subsequent generations. They are said to be *linked*. But they may separate from one another occasionally, or frequently, by means of a process called *crossing over* (T. H. Morgan, 1911). As Morgan pointed out, if the genes are arranged in linear series in the chromosomes the two homologous chromosomes, making a pair, would have similar or identical series of genes, and if these chromosomes exchanged segments crossing over of genes would result, as shown schematically in fig. 19. Furthermore, since crossing over can occur at any point on the chromosome, the amount or frequency of crossing over between two genes that are far apart in the chromosome should be greater than that between two genes close together. Sturtevant (1913) found by experimental tests that definite and consistent amounts of crossing over are obtained between any two linked genes and that on this basis the actual serial order of the genes can be determined, as well as their relative distances apart.



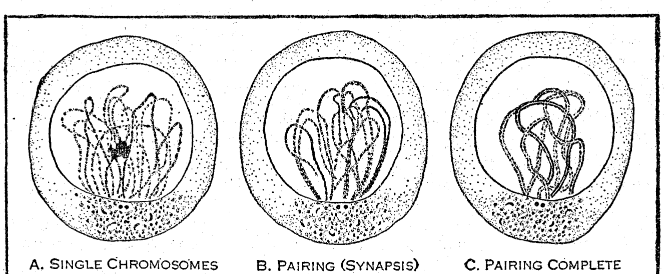
BY COURTESY OF C. W. METZ

FIGS. 19-20.—DIAGRAMS OF CROSSING OVER, OR SEGMENTAL INTERCHANGE, BETWEEN HOMOLOGOUS CHROMOSOMES, EFFECTING EXCHANGES OF GENES

In (19), the gene series ABC and abc become changed to AbC and aBc. For the sake of simplicity only the two crossover strands are shown here. Exchanges are believed to occur at the chiasma points, when the chromosomes are in the four-strand tetrad condition shown in (20)

The discovery of the phenomena of linkage and crossing over in the banana fly, *Drosophila melanogaster*, by Morgan, and the exploration of the field by Morgan, A. H. Sturtevant, H. J. Muller, C. B. Bridges and subsequent workers, was epoch-making, in the field of cytology as well as genetics. It made possible a much more refined analysis of chromosome organization than any based on cytological observations alone. And it provides an excellent illustration of the integration which came about between cytology and genetics. Although investigations were carried further in the banana fly than in any other material, similar phenomena became well known after 1911 in numerous other organisms, several of which, such as maize, made valuable contributions to the subject. To understand these phenomena we must examine meiosis in detail.

We are especially concerned with what takes place in the primary spermatocytes or oocytes during the relatively long meiotic growth period, which involves a series of events not found in any other cell generation. Making allowance, as usual, for many minor differences in different species, and also for some major ones which cannot be treated here, we may say that in most higher animals and plants the basic pattern of events is as follows. Early in the growth period the coiled *chromonema* in each chromosome becomes fully extended into a *leptotene thread*, which may be double through previous division. Often the threads form loops marking a *bouquet stage*, as shown in figure 21A, with the ends all pointing toward a cluster of cytoplasmic bodies, called the idiozome, outside the nucleus. Then homologous threads, representing the two members of each pair of chromosomes, gradually come together side by side in an intimate synaptic union, usually beginning at the ends and progressing toward the middle of the loops (fig. 21B). When completed, this gives rise to the *pachytene* stage (fig. 21C), in which the two homologous chromosomes are often so intimately united as to look like a single structure, under the microscope. The intimate union is especially significant, for much evidence indicates that it marks the stage, or the beginning of the stage, at which an exchange of segments occurs between homologous chromosome threads. Synapsis, together with doubling of each of the two threads, produces the tetrad condition already mentioned. There has been considerable difference of opinion as to whether doubling of the threads precedes or follows synapsis. In a good many organisms, at



BY COURTESY OF C. W. METZ

FIG. 21.—BEHAVIOUR OF THE CHROMOSOMES (SEMIDIAGRAMMATIC) AT THE TIME OF SYNAPSIS, WHICH LEADS TO CROSSING OVER

least, it seems clearly to precede. In any event, genetic studies show that segmental interchange (crossing over) occurs when the structure is a tetrad, and that an exchange occurs between only two of the four threads at any one place. Numerous theories have been advanced as to the nature of crossing over and the mechanism which brings it about, but there is as yet no direct evidence and little agreement on the critical aspects. Following the pachytene stage, the threads of the tetrad become less intimately associated and often show that they are looped or twisted about one another in various ways. As they do this they usually remain associated in twos, and often cross connections in the form of an X are evident here and there as represented in fig. 20. Such a double connection is called a *chiasma* and its original position is believed to be the place where an interchange has taken place or will take place (depending on which hypothesis of crossing over one advocates). It is unfortunate that so far these finer details of chromosome behaviour have eluded direct observation, for they hold the key to some of the most important problems concerning the organization of the chromosomes and the nature of genes.

At present we do not know whether the chromosome threads fuse at the points of interchange before the exchange of partners occurs, or whether they break and the free ends unite in new combinations, or whether, as on another view, the new combinations are brought about during reproduction of the chromosomes, without either fusion or breakage.

If we combine the findings of genetics and cytology we may make the following statements with reasonable assurance: (1) In crossing over the exchange is so exact that it ordinarily involves precisely the same series of genes in the two chromosomes; and so it requires an accurate pairing of the threads gene for gene. (2) In most organisms such an accurate alignment occurs only during synapsis; thus the synaptic union provides not only an excellent opportunity, but the only satisfactory one, for such an exchange. (3) Direct cytological observations, on suitable material, have shown that segmental interchange actually does occur during meiosis. (4) Genetic crossing over has been shown to occur at a time when four threads are present (tetrad condition); but only two threads undergo exchange at any one place. (5) The formation of chiasmas and the configuration of the chromosomes following synapsis conform to what would be expected on the basis just outlined; therefore they are believed to reflect the actual segmental interchanges.

The Sex Chromosomes.—From ancient times people were puzzled by the fact that in man, and most of the common animals with which he is familiar, males and females are produced in approximately equal numbers. Many fanciful ideas were suggested centuries ago to account for the phenomenon; but the real answer had to wait until the rapid strides of cytology (about 1880 to 1900) focused attention on the chromosomes as probable agents in heredity. As already indicated, it was found in this period that chromosomes are ordinarily present in pairs, one member from each parent. Then it was noted that in some species one of the chromosomes in the male has no mate, whereas all the chromosomes in the female are in pairs, as indicated in fig. 22A and B. And it was found that as a result of the reduction division during meiosis in the males (fig. 22C) half the sperms receive the odd chromosome and the other half lack such a chromosome entirely. In other words, two different kinds of sperms are formed in equal numbers. This led C. E. McClung to suggest in 1902 that one of these kinds of sperms is male-determining and the other female-determining and that the odd chromosome is responsible for sex determination. Subsequent evidence supported and amplified this interpretation and led to the recognition of sex chromosomes in a wide range of animals and also in numerous dioecious plants (plants in which the sexes are separate).

In the condition just described, the male has one X chromosome and the female two. The other chromosomes, designated autosomes, are alike in both sexes. It is evident, therefore, that sex determination rests on a quantitative basis. One X gives a male, two X's a female.

The sex chromosome conditions just described, however, are found in relatively few species. In most animals the situation is different, and at first sight the difference appears to be great. In many animals the male, instead of having an unpaired X chromosome, has two sex chromosomes one of which is an X like the two in the female, but the other a different chromosome, referred to as a Y chromosome (fig. 23). In a large number of animals the Y is much smaller than the X and so is conspicuously different from it. This is true, for example, in man (fig. 24). In others there is no difference in appearance between the two. In all cases, however, there is a qualitative difference. The Y chromosome may lack most of the hereditary materials (genes) found in the X and in any event appears to lack the main materials of the X which influence sex. So far as sex-determining genes are concerned, therefore, a male with an X and a Y chromosome is equivalent to one having only an X. Two types of sperms are produced here, one bearing an X, the other a Y. The former is "female-determining" as before, and the latter is "male-determining," like the kind having no X.

In contrast to the mechanism just described, where the male produces two kinds of sperms, we find in some groups of animals just the reverse condition. Here the male produces only one kind of sperm, but the female produces two kinds of eggs. The chromosome conditions are correspondingly modified. The male possesses a pair of sex chromosomes, both alike; the female possesses a sex chromosome of this same kind, and in addition a different one, corresponding to the Y in the male in the cases mentioned above. Such a condition is found, *e.g.,* in birds and in the group of insects (Lepidoptera) which includes the moths and butterflies. To distinguish this type of condition from the preceding one the symbols W and Z are sometimes used instead of X and Y, so that WW represents the male and WZ the female.

The sex chromosome mechanism just considered is only found in species in which the two sexes are represented by separate individuals and the eggs have to be fertilized before they will develop. The situation may be different where the eggs and sperms (or, in plants, ovules and pollen grains) are produced by one individual (*see* HERMAPHRODITE) and also where the eggs are able to develop without fertilization (*see* PARTHENOGENESIS).

Chromosome Changes, Spontaneous and Induced.—The mounting evidence that evolutionary changes, for the most part, originate in chromosomes, led to intensive studies on chromosome alteration. Comparative studies revealed the kinds of modifications which

(22) from a bug, showing the complete chromosome group of a male and that of a female, together with the process of reduction during meiosis in the male as a result of which half the sperms receive the X chromosome and half get no sex chromosome at all (after Wilson 1911); (23) diagram, entire chromosome groups of a fruit fly, *Drosophila pseudoobscura,* in which the male has unlike sex chromosomes (X and Y); (24) reduction division in a spermatocyte of man, showing the segregation of the two unlike sex chromosomes, X and Y (after Painter, 1923), x 1700

occur and persist in nature, and experimental treatments, especially with X-rays and other forms of irradiation, have shown that the same kinds may be induced artificially. A great impetus was provided by Muller's discovery, in 1928, that mutations resulting in new inherited characters may be induced with X-rays. Subsequently it was found that irradiation also induces gross chromosome alterations; indeed, one type was detected by J. W. Mavor as early as 1921. Spontaneous, and also induced, changes are mainly of three types (omitting those whose effects are too small to be detected under the microscope). One involves change in chromosome number, through addition or loss of one or more whole chromosomes. This includes doubling of the chromosome group (tetraploidy) which is found especially in plants, seldom in animals. Another involves *deletion* (loss) or *duplication* (addition) of portions of individual chromosomes. These latter types are studied to best advantage in the giant salivary gland chromosomes of flies, because here a modified chromosome from one parent may be brought together with an unmodified one from the other parent, so as to reveal the modification clearly. Examples of spontaneous alterations which appear to include deficiencies and duplications are shown in Pl., figs. 11–13. The first two are from specimens within one species. The last (Pl., fig. 13) is from a species hybrid. Here the two homologous chromosomes from the two parent species lie side by side, permitting a detailed comparison of the chromosome structure. From such hybrid material it is possible to determine what changes occurred during the evolutionary divergence of the two species from a common ancestor (*see* Theodosius Dobzhansky 1941). The third type of change involves rearrangement of chromosome materials, without addition or loss. This type includes mainly *inversions* and *translocations.* In an inversion a piece of chromosome loses its connections and becomes reconnected in an inverted position. An example is shown in Pl., fig. 14, where a chromosome with an inverted section (*c-g* in the diagram) is paired side by side with a normal one, forming a loop with cross connections. A translocation involves the shifting of a piece of chromosome to an entirely new position, usually into another chromosome, and often involves a reciprocal exchange of parts between nonhomologous chromosomes. An example of the latter is shown in Pl., fig. 15, where the two modified chromosomes from one parent are paired with the corresponding parts of their normal homologues from the other parent, forming a cross figure having the constitution indicated in the inserted diagram (at upper left). In this diagram the two normal, nonhomologous chromosomes from the one parent are represented in solid black and solid white, respectively. The other two are the ones which previously exchanged segments—a short terminal portion of the white chromosome having been exchanged for a somewhat longer piece of the black one.

Aside from their more obvious role of bringing about evolutionary changes of a morphological nature, chromosome rearrangements are important in other respects. For example, they sometimes produce what is known as "position effect." The latter results in a new, inherited character believed to be the result of the changed association of the genes. In other words, the phenomenon indicates that the activity of a gene is influenced by its neighbours and may change when the gene is put into association with new neighbours.

Although cytogenetics represents one of the most recent developments in cytology it has already made rapid strides; and it holds even greater promise for the future, through extension of studies on evolutionary change and through further application of physical and chemical methods to analysis of the make-up and function of chromosomes and genes.

Other branches of cytology likewise hold great potentialities, especially where they overlap the fields of cell physiology and medecine (see *e.g.,* Lewis Heilbrunn, 1943). Indeed this ramification of cytology into the various other branches of biology ensures it a varied and ever changing future.

CYTOLOGY OF PLANTS: *see* CYTOLOGY; PLANTS AND PLANT SCIENCE: *Anatomy of Plants.*

CYTOPLASM, the term used in biology to denote all the living contents of the cell (protoplasm) other than the nucleus (*q.v.*). (*See* CYTOLOGY, PROTOPLASM, CELL.)

CYZICENUS, an architectural term used by Vitruvius for certain large halls, facing north, in Greek houses. Such halls usually overlooked gardens and had large, low windows in order to give the widest possible view.

CYZICUS, an ancient town of Mysia in Asia Minor, situated on the shoreward side of Arctonnesus, which is said to have been originally an island in the Sea of Marmora, and to have been artificially connected with the mainland in historic times. It was, according to tradition, occupied by Thessalian settlers at the coming of the Argonauts, and in 756 B.C. the town was founded by Greeks from Miletus. Owing to its advantageous position it speedily acquired commercial importance, and the gold *staters* of Cyzicus were a staple currency in the ancient world till they were superseded by those of Philip of Macedon. During the Peloponnesian War (431–404 B.C.) Cyzicus was subject to the Athenians and Lacedaemonians alternately, and at the peace of Antalcidas (387 B.C), like the other Greek cities in Asia, it was made over to Persia. The history of the town in Hellenistic times is closely connected with that of the dynasts of Pergamum, with whose extinction it came into direct relations with Rome. Cyzicus was held for the Romans against Mithridates in 74 B.C. till the siege was raised by Lucullus: the loyalty of the city was rewarded by an extension of territory and other privileges. Still a flourishing centre in Imperial times, the place appears to have been ruined by a series of earthquakes. The principal extant ruins are:—the walls, which are traceable for nearly their whole extent, a picturesque amphitheatre intersected by a stream, and the substructures of the temple of Hadrian. Of this magnificent building, sometimes ranked among the seven wonders of the ancient world, thirty-one immense columns still stood erect in 1444.

See J. Marquardt, *Cyzicus* (Berlin, 1830); G. Perrot, *Exploration de la Galatie* (Paris, 1862); F. W. Hasluck, *Cyzicus* (1910).

CZARNIECKI, STEPHEN (1599–1665), Polish general, fought in the Prussian campaigns against Gustavus Adolphus (1626–29), and under Wladislaus IV. in the Muscovite campaign of 1633. In the invasion of Poland by Charles X. of Sweden (1655), a national army under Czarniecki ultimately drove out the Swedes, and after the Peace of Oliva (1660) also penetrated into Muscovy, winning victories at Polonka and Lachowicza. He died in 1665 just after he had been appointed Polish commander-in-chief.

(Cracow, 1859).

CZARTORYSKI, ADAM GEORGE, Prince (1770–1861), Polish statesman, was the son of Prince Adam Casimir Czartoryski and Isabella Fleming. After a careful education at home under tutors, one of whom was Dupont de Nemours, he first went abroad in 1786. At Gotha he heard Goethe read his *Iphigenie auf Tauris,* and met Herder and Wieland. In 1789, and again in 1793, he visited England, and made many acquaintances among the English aristocracy and studied the British constitution. In the interval between these visits he fought for his country during the war of the second partition, and would subsequently have served under Kosciuszko also had he not been arrested on his way to Poland at Brussels by the Austrian government. After the third partition the estates of the Czartoryskis were confiscated, and in May 1795 Adam and his younger brother Constantine were summoned to St. Petersburg (Leningrad), and presently ordered to enter the Russian service. Catherine restored part of their estates, and in the beginning of 1796 made them gentlemen in waiting. Adam had already met the grand duke Alexander and the youths at once conceived a strong "intellectual friendship" for each other after the accession of Alexander to the throne. As adjunct of foreign affairs, he had the practical control of Russian diplomacy. His first act was to protest energetically against the murder of the duc d'Enghien (March 20, 1804), and insist on an immediate rupture with France. On June 7 the French minister Hédouville quitted St. Petersburg; and on Aug. 11 a note dictated by Czartoryski to Alexander was sent to the Russian minister in London, urging the formation of an anti-French coalition. It was Czartoryski also who framed the Convention of Nov. 6, 1804, whereby Russia agreed to put 115,000 and Austria 235,000 men in the field against Napoleon. Finally, on April 11, 1805, he signed an offensive-defensive alliance with England. A memorial written by him in 1805, but otherwise undated, aimed at transforming the whole map of Europe. Austria and Prussia were to divide Germany between them. Russia was to acquire the Dardanelles, the Sea of Marmora, the Bosporus with Constantinople, and Corfu. Austria was to have Bosnia, Wallachia and Ragusa. Montenegro, enlarged by Mostar and the Ionian islands, was to form a separate state. England and Russia together were to maintain the equilibrium of the world. In return for their acquisitions in Germany, Austria and Prussia were to consent to the erection of an autonomous Polish State extending from Danzig to the sources of the Vistula, under the protection of Russia. But in the meantime Austria had come to an understanding with England as to subsidies, and war had begun.

In 1805 Czartoryski accompanied Alexander both to Berlin and Olmütz as chief minister. He regarded the Berlin visit as a blunder, chiefly owing to his profound distrust of Prussia; but Alexander ignored his representations and in February 1807 he lost favour and was superseded by A. E. Budberg, but continued to enjoy Alexander's confidence in private. In 1810 Czartoryski quitted St. Petersburg for ever; but the personal relations between him and Alexander were never better. The friends met again at Kalisch shortly before the signature of the Russo-Prussian alliance of Feb. 20, 1813, and Czartoryski was in the emperor's suite at Paris in 1814, and rendered his sovereign material services at the congress of Vienna.

On the erection of the congressional kingdom of Poland Czartoryski contented himself with the title of senator-palatine and a share in the administration. In 1817 the prince married Anna Sapiezanko, the wedding leading to a duel with his rival Pac. In 1823 he retired to his ancestral castle at Pulawy; but at the Revolution of 1830 he became president of the provisional government, and summoned (Dec. 18, 1830) the diet of 1831. After the termination of Chlopicki's dictatorship he was elected chief of the supreme council by 121 out of 138 votes (Jan. 30). On Sept. 16 he left the government after sacrificing half his fortune to the national cause. On Aug. 23 he joined Girolano Ramorino's army corps as a volunteer, and subsequently formed a confederation of the three southern provinces of Kalisch, Sandomir and Cracow. At the end of the war he emigrated to France, where were spent the last 30 years of his life. He died at Montfermeil, near Meaux, on July 15, 1861. He left two sons, Witold (1824–65), and Wladyslaus (1828–94), and a daughter Isabella, who married Jan Dzialynski in 1857.

The principal works of Czartoryski are *Essai sur la diplomatie* (Marseilles, 1830); *Life of J. U. Niemcewiez* (Pol.) (Paris, 1860); *Alexander I. et Czartoryski: correspondance . . . et conversations* (1801–1823) (1865); *Mémoires et correspondance avec Alex. I.,* with preface by C. de Mazade (1887); an English trans. *Memoirs of Czartoryski, etc.,* edited by A. Gielgud, with documents relating to his negotiations with Pitt, and conversations with Palmerston in 1832 (London, 1888).

See also Bronislaw Zaleski, *Life of Adam Czartoryski* (Pol.) (Paris, 1881); Lubomir Gadon, *Prince Adam Czartoryski* (Pol.) (Cracow, 1892); Ludovik Debicki, *Pulawy,* vol. iv.; Lubomir Gadon, *Prince Adam Czartoryski during the Insurrection of November* (Pol.) (Cracow, 1900).

CZARTORYSKI, FRYDERYK MICHAL, Prince (1696–1775), Polish statesman, completed his education at Paris, Florence and Rome; he then attached himself to the court of Dresden and obtained the vice-chancellorship of Lithuania. Czartoryski was one of the nobles who, on the illness of Augustus II. in 1727, signed the secret guarantee of the Polish succession to his son; but he supported Stanislaus Leszczynski when he was placed upon the throne by the influence of France in 1733. When Stanislaus abdicated in 1735 Czartoryski voted for Augustus III. (of Saxony), who employed him and his family against the Potockis. For the next 40 years Czartoryski was the leading Polish statesman. In foreign affairs he was the first to favour an alliance with Russia, Austria and England, as opposed to France and Prussia—a system difficult to sustain and not always beneficial to Poland or Saxony. In Poland Czartoryski stood for reform. Promising young men were educated at his palace. He aimed at the restoration of the royal prerogative and the abolition of the *liberum veto* which made any durable improvement impossible. The Czartoryskis were therefore unpopular with the ignorant *szlachta,* but for many years they had the firm support of the Saxon court, especially after Brühl succeeded Fleming.

Czartoryski reached the height of his power in 1752 when he was entrusted with the great seal of Lithuania; but after that his rival, Mniszek, began to prevail at Dresden, whereupon Czartoryski sought a reconciliation with his opponents at home and foreign support in England and Russia, in the latter country unsuccessfully. Czartoryski's philo-Russian policy had estranged Brühl, but he frustrated the Saxon court by dissolving the diets of 1760, 1761 and 1762. In 1763 he proposed the dethronement of Augustus III., who died the same year. To his disgust his incompetent nephew, Stanislaus, was elected king in 1765 after an interregnum occupied by constitutional discussions. Czartoryski's foreign policy was very vacillating, and he changed his "system" more frequently perhaps than any contemporary diplomatist. But he was an able and patriotic statesman.

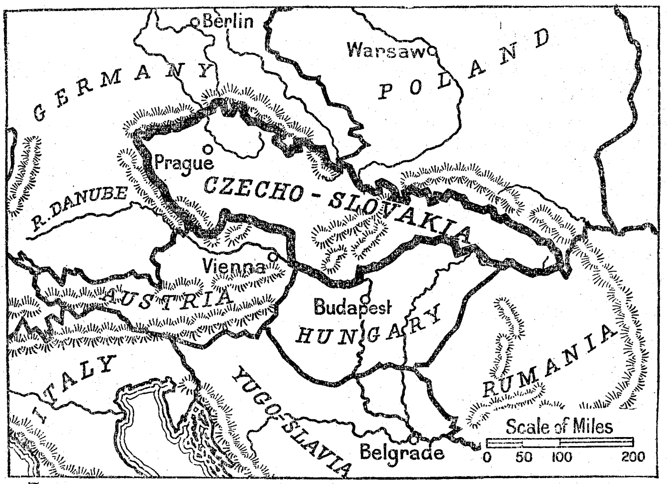
CZECH (Čech), a name signifying an inhabitant of "Čechy," the native name for Bohemia, but in use confined to the native Slavonic inhabitants of that country and of Moravia. The Czechs, with the Lusatians, Poles and Slovaks, form the western group of the Slav family; for their ethnographical position within that family, and their language, *see* Europe: *Races and Peoples.* The native home of the Czechs to-day lies in the Czechoslovak republic (*see* Czechoslovakia), in which they are the dominating race, occupying about two-thirds of Bohemia, four-fifths of Moravia, and the districts which formerly were known as Austrian Silesia. North-west, west and south they are neighbours with a Germanic population; to the north-east, in the district of Teschen (*q.v.*) they border on the Poles, the ethnographical dividing line being difficult to draw in this region. East, the Czechs have for neighbours the Slovaks, a race closely akin to them, who inhabit the southern slopes of the northern Carpathians, in what until 1918 was northern Hungary. While dogmatic statement is difficult, there was probably no real distinction between the original "Czechs" and "Slovaks." The accident of history, the former forming, first an independent state, and later a part of Austria, while the latter remained for a thousand years under Hungarian rule, led to separate development, which was accentuated by religious differences. The Slovaks contributed some of the most prominent Panslavist and Czech national apostles of the late 18th and early 19th centuries. Political considerations, however, led some of them to crystallize Slovak into a literary language, distinct from Czech, and this feeling of Slovak individuality afterwards became a confusing political factor, some of the Slovaks being prepared to sink their differences in their community with the Czechs, even at the cost of some sacrifices, while others considered that the Czechoslovak republic, in which the two nations were united, should have made much greater allowance for the differences between them.

The early history of the Czechs is very obscure, and cannot be discussed apart from that of the Slavs in general. Czech legend, as preserved by the chronicler Cosmas of Prague, relates that Čech, a noble of Croatia (probably White Croatia, or Galicia), having committed homicide, fled with his followers to Bohemia, and first settled on the Řip mountain, near Roudnice. The youngest of Krok's three daughters, Libuša, became ruler of Bohemia, founded Prague, and married a ploughman, who became the founder of the Přemyslides, or first native Bohemian dynasty.

It is probable that the Slavs arrived in Bohemia, which was then tenanted by Germanic tribes, not later than the 7th century A.D., perhaps earlier. They are first mentioned unmistakably in A.D. 805 and the first certain historical state in these provinces is the kingdom of Great Moravia (*see* MORAVIA), destroyed by the Magyars in 904–905. While Slovakia now passed under Magyar rule, the Czechs founded the kingdom of Bohemia (*q.v.*), which for centuries was among the most powerful and glorious in Europe. During this early period the religious movement among the Czechs (*see* HUSSITES) influenced all Europe. The Czechs were always in close contact with the Germans who with them inhabited Bohemia, and Germanic influence undoubtedly accounted for their cultural development, which in many ways was far in advance of that of any other Slavonic race. Under the Habsburgs, however, and especially in the days of the Counter-Reformation, the Czech national life and language were almost eliminated. The national revival began in the 18th century, and its manifestations



THE FRONTIERS OF CZECHOSLOVAKIA AS ESTABLISHED JUNE 12, 1919

filled much of the public life of Austria-Hungary in the 19th century (*see* AUSTRIA). At last the nation achieved independence, with the Slovaks, in 1918 (*see* CZECHOSLOVAKIA).

According to the official census of 1918, the Czechs and Slovaks of Czechoslovakia numbered 8,760,937, or 65.5% of the population of that state. There were also considerable colonies in Canada, the United States of America, and other countries, a large Czech colony in Vienna, and many Slovak settlements in Hungary. Czechs supplied a very high proportion of the domestic servants and of the tailors in Central Europe, Czech tailors, in particular, thriving even in England. The romantic national calling of the Slovaks was that of itinerant broom-binders. Besides this, however, Czechs supplied a high proportion of distinguished names in the history of the Austrian empire. They have a fine national literature (*see* CZECH LANGUAGE AND LITERATURE) and art, while in music they are particularly distinguished. It is sufficient to mention the names of the Czech composers Dvořák and Smetana. Business in Bohemia and Moravia was largely in the hands of Germans or Jews until the 20th century, when the Czechs began to make rapid progress in this field also.

(C. A. M.)

CZECHOSLOVAKIA is an independent republic in Central Europe, proclaimed on Oct. 28, 1918, and confirmed by the peace treaties after World War I. It comprised Bohemia (*q.v.*), Slovakia (*q.v.*) and Ruthenia (*q.v.*) In Oct. 1938, the Germans, Hungarians and Poles annexed about one-third of the country's territory and the nation was transformed into a federated state of Czechs, Slovaks and Ruthenians. This state ceased to exist in March 1939, the Germans annexing the lands of Bohemia, Slovakia becoming nominally independent and Hungary seizing Ruthenia. After Germany's defeat in May 1945, the Czechoslovak republic was reborn. Ruthenia was ceded to the U.S.S.R.

The republic of Czechoslovakia occupies a position of greatest strategic and political importance in the heart of Europe. The territory it occupies lies athwart a maze of frequented routes and forms a zone of contact between the Germanic and Slav worlds. It comprises two highly contrasted types of land form, each having a characteristic natural endowment. One, the old resistant upland region including Bohemia and parts of Moravia and Silesia, on account of the surrounding mountain ranges a natural bastion in Central Europe, gravitates mainly towards the North sea, is rich in mineral wealth and has deeply experienced the force of French and Germanic cultural influences, which are reflected in its advanced agriculture and industrialization, dense population and network of communications, and the modernism of its outlook which is definitely Western, progressive and democratic. The other, the folded ranges of the Carpathians (*q.v.*), has been naturally and politically drawn toward the Danube and the less progressive pastoral and agricultural region of Europe. Here, a sparse and disseminated population still clings to the old customs and primitive methods which are fostered by an isolation in mountain-girt basins. The administrative problem, faced by Czechoslovakia, of reconciling the divergent interests within the country was difficult, and the shape and physical structure of the country combined to increase the severity of the task. The W.-E. length amounted to 594mi., whereas the breadth varied from 175mi., to less than 45 miles. The capital, Prague (*q.v.*), had a peripheral location and was difficult of access from the remote and self-contained eastern districts with which it had originally few affinities and whose wider contacts had been traditionally established in the direction of the middle Danube. In spite of these difficulties Czechoslovakia succeeded in building up a modern and progressive state based upon an appreciation of the demands arising from diversity of natural endowment and historical experience and of the necessity of combining regional autonomy with the needs of a common protection of progressive standards of democracy and national development.

Climate and geographic formation are equally advantageous for agriculture. Climatically the country is transitional from oceanic to continental, as the following table shows:

Place	Long.	Height in ft.	Average temp. in Fahr. deg.			Rain-fall in inches
			Jan.	July	Year	
Prague . . .	14°25′E.	650	29.6	66.2	48.2	19.6
Prešov . . .	21°10′E.	850	25.7	66.6	46.8	25.6

Variations in altitude and exposure, however, prevent uniformity and are important in agriculture. Thus, in the sheltered parts of the valleys of the Morava and Elbe and in the basins of the Carpathians that open southward the vine appears, while fruits and

maize ripen and the lower slopes and plains offer striking contrasts to the raw and rainy highlands. As in the Eastern Alps enclosed basins suffer from inversions of temperature, but settlement and cultivation here rise to a height fully 600ft. above the limit in the former region. Precipitation is distributed advantageously for agriculture, fully two-thirds of the annual total falling in the spring and summer months. Heavy winter snowfalls are common in the highland regions and navigation on both Elbe and Danube is usually interrupted by ice for six to eight weeks.

Relief and climate combine to make Czechoslovakia one of the richest forest lands in Europe; conifers cover 55% of the forested area, deciduous growth 30%, the remainder being mixed woodland. The limit of tree growth varies from 5,000ft. in the Tatra mountains to 4,000ft. in the East Carpathians.

Population, Religion and Settlement.—The population of the republic at the 1930 census was 14,729,536, of whom 249,971 were foreigners. The following table shows the distribution of the native population according to provinces, together with the percentage figures for the principal nationalities represented:—

Province	Population (citizens)	Nationality					
		Czecho-slovak	German	Magyar	Ruthene	Jew	Pole
Bohemia	7,109,376	67·1	32·3	0·1	0·1	0·18	....
Moravia & Silesia	3,565,010	74·1	22·8	0·1	0·1	0·5	2·3
Slovakia	3,329,793	72·0	4·5	17·5	2·8	2·0	....
Carpathian Ruthenia	725,357	4·8	1·9	15·4	63·0	12·9	....
Czechoslovakia	14,729,536	66·9	22·3	4·8	3·8	1·3	0·6

This ethnic variety of the population presented a great difficulty for Czechoslovakia. The young state, however, succeeded gradually in overcoming these difficulties by a strict application of its democratic constitution and of the principle of the equality of all citizens before the law, by providing all the minorities as amply with schools and cultural institutions in their own languages as the Czechoslovaks themselves enjoyed, and by trying to draw the minorities into active and constructive participation in the administration. Nevertheless the large German minority which lived mostly in compact blocks along the north-western and south-western frontiers in the most highly industrialized zones of the country, and the Magyar minority living compactly in the southern plains of Slovakia contiguous with Hungary, continued to demand the grant of more extensive autonomy.

A similar demand for autonomy was also raised by part of the Slovak population which amounted to some 25% of the 9,688,770 persons classified as Czechoslovaks. The Slovaks, although racially and linguistically most closely related to the Czechs, nevertheless had been separated from them politically for many centuries and for historical as well as economic reasons their cultural level was in general much lower than that of the Czechs. In fact, passage eastward through the country marks a decrease in density of population consequent upon the change from industry to agriculture, a change from Roman to Greek form of religion, the appearance of more primitive house-types and a rapid increase in the proportion of illiterates. The house-types and village-forms reflect the differences of peoples and occupations as well as the physical contrasts from region to region. The modern ferro-concrete buildings of the industrialized western towns scale down to the rude wooden hutments of pastoral Ruthenia; the solid four-square form of the German varies only in the height and nature of its roof according to local climatic conditions and is an informative contrast to the smaller half-timbered house of the Czech and the thatched wooden structures of the Slovak. Correspondingly customs, social organization and dress vary considerably from those of advanced civilization to others that have scarcely altered through the centuries and recall vividly patriarchal times.

According to the census of 1930, 10% of the population lived in the five cities of over 100,000 inhabitants and 69·9% of the population lived in rural or small urban communities of less than 5,000 inhabitants. Of the whole population of the country 7,143,116 were men, 7,586,420 were women. The population had shown a considerable natural increase in the decade from 1920 to 1930. This natural increase amounted for the whole republic to 9·67%. Characteristically it was lowest in the most western part of Czechoslovakia, in the province of Bohemia, where it amounted only to 6·11%. And it rose from there until it reached 22·50% in the most eastern part of the republic, in Ruthenia.

The dominant religion was Roman Catholicism which was professed in 1930 by 73·54% of the population. Of the other Christian denominations the Protestants numbered 7·67%, the Czechoslovak Church 5·39% and the Greek Catholic Church 3·97%. The number of Jews amounted to 2·42%. Their percentage was lowest in Bohemia with 1·07%, higher in Slovakia with 4·11% and highest in Ruthenia with 14·14%. (W. S. L.; H. Ko.; X.)

FINANCE AND CURRENCY

In no other department of the state activities was there so energetic an endeavour to ensure the independent existence of the new republic as in that of finance and currency. In this respect there was a twofold aim: to achieve an equilibrium of the state finances and establish a stable currency. In both respects the administration was highly successful.

The budget estimates for the four years 1935–38 amounted in millions of crowns:

	1935	1936	1937	1938
Revenue	7,985	8,033	8,456	10,120
Expenditure	7,983	8,032	8,454	10,117

The total national debt amounted in 1938 to 47,094 million crowns as against 37,969 million crowns in the year 1933. Of this debt 36,843 million were internal debts, 8,251 million foreign debt, and 2,000 million note debt as a result of the monetary reform.

Currency.—One of the most important acts of the first Government of Czechoslovakia was the establishment of an independent currency early in 1919. For this purpose it was decided to collect and stamp all the bank-notes of the Austro-Hungarian Bank, which were then circulating upon Czechoslovak territory, as well as the deposit accounts in Czechoslovak branches of the Austro-Hungarian Bank, totalling about 10 milliard crowns. During the process of stamping, about 2.7 milliard crowns were retained as a compulsory state loan in order to reduce the amount of paper money in circulation, and the stamped bank-notes were declared to be state notes with a face value in Czechoslovak crowns. At the same time a temporary bank of issue was established under the title of "Banking Office of the Finance Ministry." The stamped bank-notes were later replaced by independent state notes in equal proportion. In order to defray the value of the uncovered state notes and the deposit accounts taken over from the Austro-Hungarian Bank, a tax on capital was levied, the estimated yield of which was 7.5 milliard crowns. Of this sum nearly 5½ milliards had been paid off by the end of 1927, leaving a remainder of the "State Notes Debt" of about 4½ milliard Czechoslovak crowns. Neither was the Banking Office, managed by a board of directors appointed by the finance minister, nor was the National Bank of Czechoslovakia, which took over the former's functions on April 1, 1926, permitted to grant the state any loan, either direct or indirect.

The financial and economic difficulties after the World War, the chaos prevailing in the currencies in the neighbouring states, and the comparative ignorance of Czechoslovakia abroad caused the exchange rate of the Czechoslovak crown to fluctuate up to 1922, although the financial administration continued to pursue sound principles. From the year 1922, however, the exchange rate of the crown was stabilized at about 100 crowns to $3 (U.S.). Thus, as a result of the energetic and judicious currency policy inaugurated by Dr. Rašín, the Czechoslovak crown maintained its stability and its relatively high exchange value at a period when the currencies of the neighbouring states were hopelessly unstable and depreciated. This caused Czechoslovakia to be described as "an island in a sea of inflation."

The National Bank of Czechoslovakia was set up in 1926 with a share capital of originally $12,000,000 which was, however, changed in 1934 to 405,000,000 crowns. The bank was under legal obligation to maintain the currency at the exchange level of 100 crowns to $2.90–$3.03 on the New York Stock Exchange. Thus Czechoslovakia was brought into line with the countries possessing a gold exchange standard. The gold and gold exchange cover ratio to the bank-note circulation and sight liabilities amounted to 42% on Dec. 31, 1926. In Oct. 1929 the final aim of the administration, to establish an effective gold standard currency, was realized and the value of the crown was fixed at 44·58 milligrams of fine gold. The gold content was, however, reduced in Feb. 1934 to 37·15 milligrams, and was further reduced in Oct. 1936 to between 30·21 and 32·21 milligrams. The cover of notes was reduced legally in 1934 to 25%, to consist only of gold.

Banking and Credit.—Among the oldest financial institutions existing upon the territory of the former republic were the communal savings banks. As a result of the development of industry, notably about the middle of the 19th century, these were followed by deposit banks, and as agriculture continued to progress a number of co-operative institutions were established in the rural districts. At the end of 1935 the savings banks, the activities of which were strictly defined by special regulations, numbered 356, their total book deposits amounted to 18,810 million crowns, as against 5,326 million crowns at the end of 1919. There were also in 1935, 174 district agricultural deposit banks in Bohemia and more than 7,000 co-operative credit banks in existence.

In 1937 Czechoslovakia contained 23 joint-stock banks with a total paid-up share capital of 1,274 million crowns and 55 smaller establishments in the eastern part of the republic with a share capital of 252 million crowns. The financial and credit organization of Czechoslovakia was supplemented by a State-managed postal cheque office in Prague, which was complemented by a postal savings bank.

Czechoslovakia had a highly developed system of public social insurance. On July 1, 1926, the Central Social Insurance Institution started its operations based on the capital scheme. This insurance covered accident, sickness, disability, old age and death. In view of the complex character the social insurance was not uniformly regulated. In the year 1935 the number of persons insured against sickness amounted to 3,051,000, those insured against disability and old age to 2,201,000. In taking into account their families, the number of persons covered by social insurance in Czechoslovakia amounted to about 8,000,000. The total sum spent by institutions of social insurance in the year 1935 for their members amounted to 2,450 million crowns, their total capital to 14,540 million crowns. (V. P.; H. Ko.)

DEFENCE

Compulsory service in Czechoslovakia was introduced by a law of 1920 and was universal for all male citizens. A French military mission was established in 1919, to remain for ten years, and to this mission a high standard of military efficiency can be attributed. Liability to service lasted from the age of 17 to 60, but began normally at the age of 20. The president of the republic was the supreme head of the army under the constitution. The army was organized into 4 military areas and comprised 12 infantry divisions and a number of special brigades and troops. Particular attention was devoted to military education. The Czechoslovak army was regarded as one of the finest in Europe, both as regards training and equipment. The average strength of the army in 1937 was 10,059 officers and 153,356 other ranks, in addition to 12,647 gendarmerie. There were 6 regiments in the air force, having 566 aeroplanes. There was a small force of armed motor boats for river service on the Danube. (H. Ko.)

ECONOMICS AND TRADE

Occupations.—According to the census of 1930, 34·64% of the population of Czechoslovakia were occupied in agriculture, 34·94% in industry, 7·43% in commerce, 5·53% in transportation and 4·86% in public service and the professions. These figures compare with 45·97%, 32·13%, 5·35%, 3·03% and 3·71% respectively, according to the census of 1900. In Bohemia 24·06% were occupied in agriculture as against 56·82% in Slovakia, and 41·78% in industry as against 19·07% in Slovakia.

According to the data of 1936 the total area of the country comprised 5,855,000 hectares of arable land, 1,268,401 hectares of permanent meadows, 102,735 hectares of vegetable gardens, 25,090 hectares of vineyards, 1,066,000 hectares of pastures and 4,587,393 hectares of forests.

Sugar beet, corn and high-grade barley for beer-brewing are cultivated in the low-lying areas, while in the more elevated regions the cultivation of potatoes, rye and oats predominates; the high lands, except those covered by forests, are used for growing fodder crops or for grazing.

The productivity of the soil varies considerably. Thus, in the west, where there is a high technical standard in agriculture, the productivity often exceeds the general maximum figures for Europe as a whole. But in the eastern areas (Slovakia and Carpathian Ruthenia) the productivity is much lower.

The distribution of cattle, which forms 75% of the total number of animals, exhibits similar variations. Productivity decreases from west to east, and while in the western regions there are 62 head of cattle per sq.km. a figure surpassed in Europe only by Denmark, Belgium and Holland, the number per sq.km. in the eastern areas is considerably less; the average for the whole republic is 52 head per square kilometre.

The prominent position occupied by Czechoslovakia among the most progressive agricultural states is due to the high standard of Czechoslovak agriculture.

Agrarian Reform.—The Act of Parliament of April 16, 1919 gave the State the right to take over for partition estates in so far as they exceeded 150 hectares of arable land, or 250 hectares of land of any other category, indemnification being based on the average value between 1913–17. The total area affected by this Act was 926,817 hectares. By the end of 1924, 654,710 hectares had been taken over and redistributed. Of the agricultural land, 52% was allotted to small farmers and 25% to landless peasants. During 1925 a further 253,000 hectares were distributed.

Minerals and Mines.—The mineral wealth of Czechoslovakia was of great importance. The most important items are pit coal and lignite. The former has its chief centres in the Ostrava-Karvinná coal-field, which is connected with the German and Polish coal-fields of Upper Silesia. In addition, there are the coal-fields of Kladno and Plzeň. Other important coal-fields are near Brüx, Komotau and Falkenau. The coal production amounted in 1937 to 16,777,000 tons of hard coal and 17,895,000 tons lignite. Coal was an important article of export. Besides coal there are to be found iron, graphite, silver, copper, lead and rock salt in Czechoslovakia. Native iron ore was, however, inadequate for the native iron industry, and accordingly much had to be imported.

The abundance of excellent porcelain raw materials, particularly of kaolin, is of great importance both for home industry and for export purposes. The annual yield is about 400,000 tons, obtained chiefly from western Bohemia and southern Moravia. Systematic attention is being devoted to the exploitation of water-power resources, together with a systematic process of electrification, and large steam-driven central power stations have been erected.

(V. B.; H. Ko.)

Industry.—It has already been pointed out that the agricultural products of Czechoslovakia provide the raw materials for important agricultural industries. The most important of these is the old-established sugar industry, which is carried on in some 119 sugar factories. The beer-brewing industry had attained a world-wide reputation by reason of the excellent quality of its products. The agricultural industries include also flourishing spirit, malt and foodstuffs industries. Czechoslovakia's smoked-meat products, especially hams, are of world-wide reputation. In 1935 there were 403 breweries producing 7,744,444 hectolitres of beer.

The abundance of coal and the presence of iron-ore provided the necessary conditions for the development of the metallurgical industries. The output of pig-iron in 1937 was 1,675,064 metric tons and that of raw steel 2,317,634 tons. The glass, porcelain and pottery industries also depended mainly upon the home supply of raw materials. All kinds of glass goods were produced; in addition there were about 70,000 workers, who in their own homes made glass jewellery and beads which are known under the generic name of Gablonz ware. Crystal, ground and coloured Bohemian glass, all of high-grade quality, was largely exported to all parts of the world. The manufacture of porcelain was concentrated mainly in western Bohemia. The large forest areas provided the raw material for the flourishing timber, paper and cellulose industries. A great part of the output was exported.

Similarly highly developed were the textile industries which occupied in 1930 more than 360,000 workers and the shoe industry of which the most famous establishment was the Bat'a works in Zlin. The textile industries comprised cotton, wool, flax and jute production. The leather industry was making great progress.

Communications and Transport.—In 1935 there were 69,903km. of roads in Czechoslovakia; the number of automobiles amounted to 91,797 passenger cars, 29,616 trucks and 3,943 buses. There were 15,506km. of railway of which 12,385 were owned by the State. These railways formed a direct connection between the systems of Western and Eastern Europe and made Czechoslovakia an important centre of communication. This was as true of the highly developed air service. There were 13 lines operated in the national service and 21 in the international service.

The peace treaties had internationalized the most important waterways. The Vltava and the Elbe (Labe) connected Bohemia with the North sea, and Czechoslovakia had the right to use certain wharves in the ports of Hamburg on the North sea and of Stettin on the Baltic sea. The Danube, where Bratislava was the chief port, connected Czechoslovakia with the Black sea. The total length of navigable waterways amounted to 418km., of which 206km. were represented by the Elbe and Vltava, and 172km. by the Danube. In 1935 the traffic on the Danube amounted to 627,326 tons, on the Vltava and Elbe to 1,905,110 tons.

The number of post offices amounted in 1937 to 4,591, that of the telegraphic offices to 4,784; in the same year there were 157,079 telephone stations and 683,822mi. of telephone wire.

Foreign Trade.—The large export and import trade of Czechoslovakia required it to build up a system of commercial treaties with foreign powers. The guiding principle of Czechoslovak trade policy was that of the most-favoured-nation clause. Upon this principle it constructed its whole system of agreements, which it supplemented by means of tariff conventions for customs purposes. A customs tariff of the former Austro-Hungarian empire, drawn up in 1906, was adapted to the changed economic conditions by means of a system of co-efficients and became the basis of Czechoslovak customs policy as far as not replaced by any new items. The tariff agreements concluded with France, Italy, Austria, Poland, Greece, Spain, Belgium and Hungary led to a reduction of from 50% upwards in the customs rates applicable to more than two-thirds of the industrial products which formed the subject of trade.

Imports and exports amounted in millions of crowns to:

	1922	1929	1932	1935	1937
Imports . . .	12,696	19,987	8,155	6,738	10,981
Exports . . .	18,086	20,498	7,399	7,418	11,982

Principal articles of import in 1937 were cottons, woollen goods, iron and steel, fruit and vegetables, fats and oils; principal articles of export were iron and steel, woollen goods, cotton goods, coal, glass-ware, sugar, cereals, timber and leather. Of the countries of origin the most important were the following, arranged according to their importance in 1937: Germany, United States of America, Great Britain, France, Rumania, Austria, The Netherlands and Yugoslavia. Of the countries of destination the most important arranged in the same way were: Germany, United States of America, Great Britain, Austria, Rumania, Yugoslavia, The Netherlands, Switzerland and France. (J. D.; H. Ko.)

CONSTITUTION

Czechoslovakia was a democratic republic. Legislative authority was exercised by parliament elected by universal, equal, secret and compulsory suffrage, based on the principle of proportional representation, and consisting of two chambers: a chamber of deputies of 300 members, elected for six years, and a senate of 150 members, elected for eight years. The franchise was open to all citizens without distinction of sex who were over 21 or 26 years respectively. Cabinet ministers, who did not need to be members of parliament, were responsible to the chamber of deputies which by a vote of non-confidence could compel the resignation of the Government. A measure passed by the chamber of deputies became law despite an adverse decision of the senate if the chamber of deputies adhered to the original decision by an absolute majority of all its members.

The president of the republic was elected in a joint session of the chambers for a period of seven years. He could be re-elected immediately for a second period; for a third term, however, only after the expiration of seven years after the end of his second term. This restriction did not apply to President Masaryk. The president signed all laws enacted by parliament and had the right to return with his comments any measure enacted by it; such a measure could become law only if repassed by an absolute majority of members of each of the two houses, or by three-fifths of all the members of the chamber of deputies.

The judiciary was separated from and independent of the administration. The judges were appointed permanently and could not be recalled. The constitution guaranteed all citizens of the republic full equality before the law and equal civil and political rights, whatever be their race, language or religion, full personal freedom, inviolability of domestic rights and of the mails, freedom of the press, the right of free assembly and of association, and of the expression of opinion by word, writing or print, freedom of scientific research, of instruction, of conscience and religious creed. All religions were equal before the law. Wedlock, family and motherhood were placed under special protection; and special provisions of the constitution protected the rights of all minorities of language, religion or race, guaranteed to them the public maintenance of their schools, and forbad every manner of forcible denationalization. All these guarantees and rights were protected by the supreme administration court; a constitutional court decided whether laws promulgated by parliament were in harmony with the character of the constitution.

HISTORY

THE RISE OF THE REPUBLIC

Czechs and Slovaks in the Dual Monarchy.—During the 19th century the problem of nationality in central Europe, and particularly in Austria-Hungary, became more and more acute as the process of national revival advanced, notably in the revolutionary period of 1848. The Poles and Czechs awoke to the knowledge of historical state rights, and all nationalities felt the right to self-determination.

The leading German circles in Austria endeavoured to maintain their hegemony over the non-German nations in the empire and neglected the possibility of solving the nationality problem in the spirit of federalism with equal justice for all. The Czech nation, though possessed of a political consciousness, and with it also the other central European nations, entered the 20th century subjected to a foreign regime, the domination of the Germans, the German-Austrians and the Magyars.

It was partly the wars of liberation in the Balkans, but especially the World War, which brought about a radical improvement in this state of affairs, bringing the political aspect of Europe more in accordance with its ethnographical aspect.

The Outbreak of War, 1914.—The Czech nation, which in consequence of the Thirty Years' War had been deprived of its political independence, had never abandoned the idea of recovering it, and in the 19th century did much to remove the far-reaching traces which the severe anti-reformation regime of the Habsburgs had left in its organism. Having successfully withstood the absolutist pressure of Germanization in Bohemia, Moravia and

Silesia, while its Slovak kindred were slowly succumbing to the Magyarizing endeavours of the Hungarian state, it clearly saw that the outcome of the World War would have a decisive effect upon its existence. By its traditions, its sympathies and its whole political outlook the Czech nation was on the side of western European democracy and Slavonic Russia and Serbia against the central autocracies for whom the Czechs were called to fight. The opposition of the Czech nation to its political oppressors assumed the form of passive resistance, the passing over of Czech troops in great numbers to the Allies, and secret organizations, the purpose of which was to prepare for the decisive moment. The brunt of the Czechoslovak revolutionary movement was, however, borne by the political exiles who, having escaped abroad at the beginning of the World War, began to carry on in the Allied and neutral countries an extensive anti-Austrian action of a diplomatic, propagandist and military character, which aimed at achieving independence for the Czech and Slovak territories.

Organization Outside Austria-Hungary.—The necessity for systematic action abroad, and mainly in western Europe, was soon realized by Prof. Masaryk, the leader of the small Realist Party, who, as a member of parliament and of the Austro-Hungarian delegations, had for many years past—especially during the Bosnian annexationist crisis—been an opponent of reactionary Austria and especially of its provocative and dishonourable foreign policy. As early as the autumn of 1914 it was clear to him that the World War would not be decided on the Russian front, but in the west, and that it would last longer than was imagined by those who, guided by Slavonic sympathies, relied mainly on the strength of Russia. Being warned, on returning by way of Switzerland from an informative journey to Italy in Dec. 1914, that the Austrian police had orders to arrest him on his return, Masaryk decided to remain abroad and to organize the Czech campaign against Austria-Hungary, keeping, as far as possible, in continual touch with the underground activities of his friends at home to make the Czechoslovak question a subject of diplomatic negotiations on the part of the competent official circles of the Entente, which would effect its solution on international lines. For this purpose Masaryk proceeded to organize Czechoslovak settlers or residents abroad in order to make use of their resources and their influence in favour of his program. When the Czechoslovaks abroad were joined by a large number of Czechoslovak soldiers who crossed over to the Allied side, it was possible to consider the formation of special military units and a separate Czechoslovak army within the framework of the Allied armies. In all the Entente States there were spontaneous organizations of Czechs and Slovaks for the purpose of actively supporting the Allies in the struggle against the Central Powers. Czechs and Slovaks in the United States of America soon had an opportunity of doing important work, particularly in taking upon themselves the major part of the financial burden of the campaign.

In the political public opinion of western Europe Austria-Hungary was regarded as an element in the maintenance of European equilibrium. The Czechoslovak problem was looked upon as being an internal problem of the dual monarchy, which certain circles in the Entente were unwilling to alienate by formulating the final and extreme war aims, endeavouring rather to isolate Austria-Hungary from Germany and thus weaken the latter, who was regarded as the sole culprit in bringing about the world catastrophe. Up to the moment when Austria-Hungary collapsed it was necessary to fight against Austrophilism, which was powerful both in the neutral states as well as in the Allied countries and Russia. It was also necessary to struggle against the intensive Austrophile propaganda, by revealing the pseudo-constitutionalism and minority rule which were the true foundations of Austria-Hungary.

The Formation of Foreign Committees.—The year 1915 resulted in a mobilization of resources and the distribution of work for the Czechoslovak movement abroad, rather than in any positive successes. Up to the arrival of Dr. Beneš (*q.v.*) in the autumn of 1915 the headquarters of this work were in Switzerland, but after his arrival Masaryk chose London as his seat of action, while Beneš, as secretary of the Central Foreign Committee, proceeded to Paris with Štefánik, the Slovak scientist, who served as an aviator in the French army. Durich, a Czech agrarian deputy, was entrusted with the task of concentrating the work that had hitherto been accomplished in Russia by means of a unified Czech committee.

Steps were very soon taken to form a Czechoslovak foreign committee for the purpose of carrying on a united struggle against Austria. On Nov. 14, 1915 a manifesto was issued, signed by Masaryk and Durich, by the leaders of the Czech colonies in the Entente states and notably also by the Czechs and Slovaks in America. This was the first official pronouncement by the Czechs abroad against Austria-Hungary, in favour of the Entente, and of the independence of the Czechoslovak state. At the beginning of Jan. 1916 the Foreign Committee was transformed into a National Czech Council, the president of which was Masaryk, the vice-president Josef Durich, and the general secretary Dr. Beneš. The Slovaks were represented on this Council by Gen. Štefánik.

The Czechoslovak Legions.—Considerable success and marked progress were achieved by the Czechoslovak movement in Jan. 1917, when the Allies in their reply to President Wilson's note on the peace conditions included the liberation of the Czechoslovaks from foreign rule among their chief war aims. In Russia a Czech brigade had in the meantime made further developments, and in June 1916 the tsar consented to the release of the Slav prisoners of war, but at the instigation of Stürmer, supported by the tsaritsa, the consent was withdrawn at the beginning of August. In October an independent Czechoslovak division in the Russian army was sanctioned, but scarcely a month later this concession was also withdrawn. The Russian revolution of March 1917 did not bring any immediate advantage to the Czechoslovak movement there. It was not until the Czech regiments distinguished themselves at Zborov on July 2, 1917 that Kerensky was induced to allow additional troops to be recruited from among the Czech prisoners of war. Unfortunately the Russian army was already in a state of collapse and the Government of the March revolution was only short-lived. An agreement was concluded between the French Government and the Czechoslovak National Council to transport Czech troops to France, and by a decree signed by President Poincaré on Dec. 19, 1917 an independent Czechoslovak army was established in France.

In Russia, where in the meantime Masaryk had taken charge of the Czechoslovak movement, having left England in May 1917, the establishment of the first independent Czechoslovak body was reached during the interim Government in Oct. 1917.

Developments Within the Dual Monarchy.—In Bohemia in 1916 the Austrian persecution reached its culminating point. Under the military and police pressure no public political life was possible there. Conditions improved, however, after the death of Francis Joseph and the outbreak of the Russian revolution in March 1917. The May manifesto of the Czech authors and the proclamation of the Czech deputies on May 30, at the first meeting of the Reichsrat in Vienna, demanding the transformation of the Austro-Hungarian monarchy into a federative state with equal rights for the various nationalities, were the first signs of the coming spring. The representatives of the Czech Social Democrats at the Socialist Peace Congress at Stockholm in June 1917 advocated the right of self-determination and a demand for a sovereign Czechoslovak state within a Danubian federation.

The Czech Legions in Siberia.—The autumn Bolshevik revolution complicated the situation of the recognized Czechoslovak units of the Russian army. Masaryk had already announced the Czechoslovak policy there as one of neutrality and non-intervention in Russian affairs. On the principle of armed neutrality it was arranged with the Bolsheviks that the Czechoslovak troops should be transported via Vladivostok to France and the first detachment was dispatched at the beginning of November. In France, in Feb. 1918, the National Council had organized among the Czechoslovaks there a system of general conscription for the Czechoslovak legions. At the same time, the representatives of the Czechoslovak armies left France for Italy, where in April 1918 an agreement was reached between Orlando and Gen. Štefánik for organizing legions among the numerous Czechoslovak fugitives there on the Russian model.

The clear relationship between the Czechoslovak command and the Bolsheviks, conditioned by the rejection of any plans aiming at intervention against the Bolsheviks, was complicated by the lack of loyalty shown by the Bolshevik Government, which during the transport of the Czechoslovak divisions demanded their disarmament. The incident at Chelyabinsk with the local Soviet in the second half of May 1918, led to the internment of the representatives of the National Council at Moscow and the instruction issued by the Soviet authorities and Trotsky for the forcible disarmament of the Czechs. At the end of May hostilities began between the Czechoslovak troops and the Bolsheviks, during which the Czechoslovaks occupied the whole of the railway line as far as Irkutsk and gained possession of the Baikal and Chita railway, 5,000mi. in length.

Masaryk, who in March 1918 left Russia and arrived in May in America, opposed all idea of armed intervention in Russian affairs, but when the Bolsheviks provoked an armed conflict with the Czechoslovak troops in Siberia, he asked America and the rest of the Allies for military and material help for the Siberian legions, who were suffering especially from lack of equipment. The Allied Governments decided at Washington, notably by an American-Japanese agreement, to grant the military and material assistance asked for (Aug. 3). The military help promised by the Entente was not forthcoming, with the exception of a small Japanese contingent, but abundant quantities of supplies and equipment were given. The victory of the Czechoslovak troops on the Volga and in Siberia caused a sensation in the Allied states, so that the Czech success had a considerable moral significance and denoted the strengthening of the Czech cause. What made the Czech achievement particularly valuable was that it had prevented the Soviet Government, and thus also Germany, from obtaining the keenly desired contact with the Siberian supplies of raw materials and foodstuffs, and also that the vast numbers of German prisoners of war in the Siberian camps could not be used for strengthening the German army. Lloyd George (Sept. 11, 1918) thanked the National Council in a telegram for the inestimable services rendered by the legions to the Allies.

Recognition by the Powers.—Great Britain had previously, in a pronouncement of Lord Robert (Viscount) Cecil on May 22, 1918, officially recognized the right of the Czechoslovak nation to complete independence. When on May 29, 1918 the Government of the United States approved the anti-Austrian resolution passed by the Congress of Oppressed Nations in Rome, which had been organized in April of that year by Dr. Beneš on the initiative of Professor Denis, the War Council at Versailles associated itself with this American proclamation, while the prime ministers of France, Britain and Italy, and indeed of all the Allied nations, declared their sympathies with the Czechoslovak and Yugoslav aims for liberation. At the same time, the British Government announced its willingness to recognize the National Council as the leading body of the Czechoslovak movement and also of the army that was fighting on the side of the Entente. The first country to grant actual recognition in this sense was France (June 29, 1918). On June 30 President Poincaré, with the representatives of the French cabinet, handed over the colours to the 21st Czechoslovak regiment at Darney, and on the following day the British Government expressed its agreement with the speech made by President Poincaré on this occasion.

About the same time a second, supplementary agreement was reached with Italy concerning a Czechoslovak army within the framework of the Italian army, and the Government of the United States in its pronouncement identified itself with the complete liberation of all branches of the Slav race under German and Austrian domination. About 50,000 Czechs and Slovaks then offered themselves as volunteers for the army of the United States, apart from those in the Canadian army and in France. By a declaration on Aug. 9 the Government of Great Britain recognized the Czechoslovaks as an Allied nation, the three Czechoslovak armies as a single Allied army carrying on regular warfare against Austria-Hungary and Germany, and the National Council as the supreme body controlling national interests. On Sept. 3, 1918 the British Government recognized the future Czechoslovak Government upon the basis of the National Council and negotiated a convention with the National Council concerning an army and diplomatic relationships on the basis of the analogous international position of Serbia and Belgium. On the same day a similar recognition was obtained from the United States Government, and on Sept. 9, 1918 the recognition of the Japanese Government in the same sense was obtained.

The success of this intensive diplomatic struggle for independence, carried on partly from Paris by the headquarters of the National Council, partly by Masaryk at Washington, and achieved to a considerable extent through the merits of the Czechoslovak legions, was promoted in no small degree by the resolute action of the Czech political leaders in Austria-Hungary itself. Important in this respect are the manifestos of the Czech deputies of Jan. 6, 1918, the vow made by representatives of all sections of the nation on April 13, 1918 that the struggle for Czech independence should not cease until the final victory, and the May celebrations of the National theatre at Prague, which were attended by representatives of other oppressed nations in Austria, especially the Yugoslavs, Poles and Italians—all this enhanced the movement abroad, which in the autumn of 1918 was reaching its final goal.

Declaration of Independence.—Finally, on Oct. 14 Dr. Beneš notified the Entente states of the establishment of an interim Czechoslovak Government in Paris in accordance with the decision of the president of the National Council on Sept. 26, and Dr. Beneš as minister for foreign affairs was appointed the first Czechoslovak minister to the Entente states. This interim Czechoslovak Government was recognized by the French Government on Oct. 15, and by the Italian Government on Oct. 24, while on Oct. 18, 1918 the interim Government itself proclaimed the independence of the Czechoslovak nation by a declaration dated at Washington. On the same day President Wilson rejected the Austro-Hungarian peace offer of Oct. 7 on the ground that since the issue of his Fourteen Points (*q.v.*) on Jan. 8, 1918 the Government of the United States had recognized a state of war between the Czechoslovaks and Austria-Hungary, and intimated to the Austrian Government that it should apply to the National Council which had already been recognized as the *de facto* Government of the Czechoslovak nation.

In Bohemia the socialist parties, especially in the rural districts, had attempted to proclaim a republic on Oct. 14. Wilson's reply, rejecting a peace offer by the Emperor Charles, was published in Austria-Hungary on Oct. 21, and within a week, notably through the collapse of the army, all the conditions were furnished for the capitulation of Austria-Hungary, which took place in the night between Oct. 27 and 28. On Oct. 24 the Czech deputies had already obtained permission from the emperor to proceed to Geneva for the purpose of conferring with Beneš there. The National Committee at Prague, however, did not await their arrival but drew its own conclusions from the Austrian capitulation, and on Oct. 28, by its first law, proclaimed the independence of the Czechoslovak state, taking into its hands the administration of the Czech territories without encountering any considerable opposition from the army or from the authorities. Two days later, on Oct. 30, by a manifesto of the Slovak National Council at Turčanský Sv. Martin, Slovakia pronounced itself in favour of Czechoslovak unity.

Oct. 28 remains the symbol of the national liberation from the centuries of Habsburg bondage, although the actual transformation was carried out early in the subsequent days by an agreement between the Government of the Czechoslovak state in Paris and the National Committee, which took over all the commitments of the former. The conferences at Geneva also gave the renewed state its definite form of a democratic republic. On Nov. 13 the National Committee issued an interim constitution and a day later there was a meeting of the Czechoslovak National Assembly constituted in accordance with the proportional numerical strength of the individual political parties, containing 256 (later 270) members, of which 44 were Slovaks. There were no Germans among them, the German representatives having refused participation. At this first meeting of the National Assembly Masaryk was unanimously elected the first president of the Czechoslovak republic, and on the basis of the interim constitution the National Assembly elected its first Government. The prime minister was Kramář, the foreign minister Beneš, and the minister for war Gen. Štefánik. On Dec. 21 the president returned to Prague, and his inaugural message, pronounced in the National Assembly on the following day and containing a concise survey of the Czechoslovak movement for independence abroad and a plan for the further consolidation of the republic, concludes the revolutionary period and begins the constructive period of the state. The Peace Conference had yet to define only a few details of the relations of Czechoslovakia to its neighbours and to the other members of the comity of nations. (T. G. M.)

1918–1935

The Kramář Ministry.—The first ("Revolutionary") Czechoslovak ministry consisted of four Agrarians, three Czechoslovak (national) Socialists, three Social Democrats, three National Democrats, one People's Party and one Slovak member. Beneš and Štefánik were non-party. During its eight months of office the Government had to maintain the integrity of the national territory, to keep the administration working and to defend the interests of the country at the Peace Conference. Further, it had to face the problems arising out of the economic difficulties of the period, especially as regards provisioning, and out of the international situation of the new state. It dealt with all these tasks successfully.

First, it put down the attempted insurrections in the German-speaking districts of Bohemia and Moravia, which had attempted to unite with Austria. In Slovakia there were grave difficulties owing to the departure of most of the Hungarian bureaucrats, the hostility of the Magyar and Magyarophile elements of the population and to the fact that the frontiers were not yet regulated. On Feb. 1, 1919 the Slovak Government was formally installed at Bratislava. After the Communist Party came to power in Hungary there were further grave complications. The Hungarian communist troops invaded Slovakia, which Czech troops were occupying. They were repelled with the help of the Allies, who, as a result of this episode, fixed a provisional line of demarcation which was maintained without great change when the frontier was finally traced on June 12, 1919. Similarly in Teschen (Těšín) the situation was grave owing to the conflict with the Poles, who had occupied part of this territory. The Czech Government in its turn occupied Teschen and there were conflicts attended by bloodshed. The Peace Conference had to intervene. An armistice was concluded on Feb. 19 and the dispute was referred to diplomatic negotiations (*see* TESCHEN).

This Government carried through much important financial and social legislation. It effected the financial and economic separation of Czechoslovakia from Austria (notably by Rašín's legislative measures of Feb. 1919), secured the food supply, temporarily threatened by the effects of the World War, through purchases from abroad, and laid the foundations of political and economic democracy. The chief measures included the new communal suffrage, the eight-hour day, and the commencement of the land reform; measures which both realized the ideals held by the nation and averted the danger of an extremist social movement.

The First Tusar Cabinet.—The municipal elections of June 15, 1919 clearly showed that the composition of the Government and of the National Assembly did not correspond with the real numerical importance of the different parties. The cabinet accordingly resigned, and on July 8, 1919 President Masaryk appointed a second cabinet under Tusar, a leader of the Social Democrats. The new Government represented a coalition of the parties which had been most successful in the elections. Besides Tusar (minister president) it included three other Social Democrats, four Czechoslovak Socialists, four Agrarians and two Slovaks, Beneš retaining his portfolio.

During the period of office of Tusar's cabinet Czechoslovakia consolidated her international situation. The interests of the country were successfully defended at the Peace Conference. On Sept. 10, 1919 the Treaty of St. Germain with Austria had been signed and on the same day the so-called "little treaty" of St. Germain, which guaranteed the rights of minorities in Czechoslovakia. Under the guidance of Beneš commercial relations were developed between Czechoslovakia and her neighbours. The relations between Austria and Czechoslovakia soon became friendly and the ground was prepared for future political agreements.

In its financial and social policy this Government continued the work of its predecessor. A number of foreign loans were raised to meet urgent requirements, a fiscal reform was carried through and an extraordinary levy on capital imposed. The chief social measures were the Works Councils Act and the act establishing profit-sharing in the mining industry. The most important task of Tusar's cabinet was the elaboration of the constitution. In view of the attitude adopted by most of the German population it was resolved that this should be voted by the revolutionary National Assembly rather than by a nationally elected parliament. A special commission elaborated its general principles and its text. Several points—the question of a second chamber, of the separation of church and state, of the system of military organization, and especially of the incorporation of the language laws in the constitution—gave rise to vehement debate before the constitution was finally adopted on Feb. 29, 1920.

The Second Tusar Cabinet.—The general elections were held in April 1920. The result showed that the Czechoslovak Socialists and Agrarians commanded a majority in the country. Tusar therefore formed a second cabinet, in which Beneš again held the portfolio of foreign affairs.

Assembling in May, the new National Assembly, in joint session of both chambers, re-elected M. Masaryk as president of the republic by 284 votes out of 411. On June 1 the new cabinet read its program, which envisaged an advanced democratic and social policy. Appealing to the German representatives, Tusar declared that if the two nations had hitherto failed to co-operate, this was not due to the fault or the wishes of the Czechoslovak majority but to the attitude of the Germans themselves. The reply of the German bourgeois parties, however, which was repeated in a modified form by the German Socialists, showed their intention of persisting in their negative policy towards the republic. The German problem remained as far as ever from a solution.

A split in the Social Democratic Party, with the left wing joining the Third International, forced the resignation of the cabinet in Sept. 1920. It was replaced by a cabinet under Černý, made up largely of high public officials. The new situation paved the way for a coalition of five Czechoslovak parties, the Social Democrats, the Czechoslovak Socialists, the National Democrats, the Agrarians and the People's Party. These five parties formed a Council of Five, the so-called Pětka, to insure contact and organized collaboration between the Government and the majority. This paved the way for the formation of a new parliamentary Government.

The Beneš Cabinet.—As soon as the Social Democrat Party had reconsolidated itself after its break with the Communists, it expressed its readiness to re-enter the Government. The cabinet of officials was accordingly replaced by a new parliamentary Government in the shape of the Beneš cabinet, which was constructed on Sept. 27, 1921. The Government majority included the five great Czechoslovak parties, and also enjoyed the support of the minor Czechoslovak parliamentary groups, so that it could thus command a secure majority of 180 votes in the chamber against the 78 of the national minorities and the 25 Communists. Beneš became premier, his cabinet included three Social Democrats, three Agrarians, two Czechoslovak Socialists and one National Democrat. The premier, who also acted as foreign minister, and the ministers of finance, the interior and Slovakia, were non-party men. Beneš' appointment was in general well received; the German press and deputies regarded it as a hopeful symptom.

The Government remained in office from Sept. 26, 1921 to Oct. 7, 1922. The foreign situation during this year was particularly full of incident, including the second attempt at restoration (Oct. 20, 1921) of the ex-King Charles in Hungary, as a result of which Czechoslovakia commenced mobilization, the conclusion of a political convention with Poland (Nov. 6, 1921), which, however, remained unratified (*see* LITTLE ENTENTE), of a treaty of guarantee and arbitration concluded on Dec. 16, 1921 at Lány (Lana) with Austria, the Conference of Genoa in March and April 1922, the negotiations for the expansion and strengthening of the Little Entente and the difficulties arising out of the fresh financial collapse in Austria in 1922. These questions preoccupied the attention of the Government somewhat to the exclusion of internal affairs. The internal economic situation was difficult and the cost of living high, both for general reasons and owing to the sudden rise of the Czech crown. There were serious labour troubles, such as the miners' strike of Feb. 1922 and the strike in the metal industry in May 1922.

The history of the Beneš cabinet so conclusively proved the feasibility of a concentration cabinet that when it resigned, on Oct. 5, 1922, the system was maintained on an even broader basis. The new ministry was formed on Oct. 7, its head being Švehla, leader of the Agrarian Party and one of the most influential members of the Pětka.

The Švehla Cabinet.—The new cabinet consisted of five Agrarians (including the premier), five Social Democrats, three Czechoslovak Socialists (including Beneš, who retained the portfolio of foreign affairs), two members of the People's Party and two National Democrats (including Rašín, who again took the ministry of finance). Its program was presented on Oct. 24 in the form of three exposés by Švehla, Beneš and Rašín respectively. This Government was successful in decreasing the coal tax and the tax on property, to the benefit of industry and agriculture, and it was also able to maintain the stability of the exchange and to carry through the important measure of social insurance of both workmen and independent persons. It failed, however, to solve by inter-party agreement the question of agricultural tariffs, a point on which Agrarian interests, and especially the Agrarian Party, laid the greatest stress. In June 1925 a temporary solution was reached by the introduction of the so-called sliding customs tariff; yet this expedient, while representing the maximum of concessions which the Socialists were willing to grant, was not permanently satisfactory to the Agrarians. The result was a permanent discord, which was even increased by the events of July 1925.

The chamber met on Sept. 18 to discuss the budget estimates, which, for the first time, provided for a surplus of revenue. The budget was passed (the Germans abstaining), but the chamber was unable to carry through a bill which introduced a slight amendment in the electoral system (dividing Prague into two constituencies). It was obliged to abandon the rest of its program. The two chambers were dissolved on Oct. 16, and new elections for both fixed for Nov. 15.

Second Švehla Cabinet and Second Cabinet of Officials.—The results of the elections brought about a considerable rearrangement of the strength of the parties of the coalition. The People's Party gained greatly, the Agrarians to a lesser extent, the Social Democrats were weakened, mainly because Communist candidates split the labour vote. The National Democratic Party was also weakened. In general, however, the five coalition parties did not lose their ability for government, especially as they were joined by the Traders' Party as a sixth member, which almost made up for the losses which they had sustained.

On Dec. 9 Švehla's second cabinet was formed, its constitution being as follows: Agrarians four, Social Democrats three, Czechoslovak Socialists three, Czechoslovak People's Party three, Traders' Party one, National Democrats one. Two places were occupied by non-party ministers, one of these being Engliš, the minister of finance. The position of the socialist parties in this Government was much weaker, and their collaboration with the non-socialists more difficult. After the Government had passed the decree of Feb. 1926 for the enforcement of the Minorities law, the growing tension led to its resignation.

It was succeeded by a fresh Government of officials under Dr. Jan Černý, only Beneš, Engliš and Kállay being included from the former Government. The Czechoslovak bourgeois parties, the Czechoslovak-German Farmers' Party and the Christian Socialists formed the Government coalition, all socialist parties being in the opposition. The customs Tariff bill was approved, after a heated struggle, on June 12, 1926, being followed by the State Employment bill, the Congrua bill (ministerial salaries) and the "refunding bills" (sugar tax and increase of the tax on alcohol).

(K. SE.; H. KO.)

The Development after 1927.—On Oct. 12, 1926 a new parliamentary Government was appointed, which for the first time was based on the collaboration of Czech and German bourgeois parties. Two Germans, representing the German Catholic Party and the German Agrarians, participated in the cabinet, the head of which was again Švehla. The adherence of the Germans, who from 1926 until 1938 participated actively in the administration of the country, seemed to bring the solution of the German minority problem nearer. The Slovak Peasant Party which was autonomist and clerical in its outlook, also joined the Government in Jan. 1927 and as one of its representatives Josef Tiso entered the cabinet. On July 1, 1927 the republic was divided for administrative purposes into four parts, Bohemia, Moravia and Silesia, Slovakia, Carpathian Ruthenia. This division allowed the granting of larger regional autonomy, thus trying to fulfil the wishes of the Slovak autonomists.

The good relations with the Slovak Popular Party were, however, disturbed, when in 1929 one of its leaders, Dr. Tuka, was tried for separatist agitation and treasonable relations with Hungary, and was condemned to fifteen years of imprisonment. New elections on Oct. 31, 1929, changed the composition of the parliament, and on Dec. 8, 1929, a new cabinet was appointed under Udržal, a Czech Agrarian as prime minister, and with the participation of Czech and German bourgeois and socialist parties. The number of German representatives in the cabinet remained at two, a Social Democrat and an Agrarian, but was later raised to three by the inclusion of a German clerical. President Masaryk had been re-elected on May 27, 1927 for a second period of seven years. The Government of Mr. Udržal was followed by a cabinet under Malypetr, a Czech Agrarian himself, and the composition of the cabinet did not fundamentally differ from the preceding one. It had been appointed on Oct. 30, 1932, and was re-appointed with a somewhat changed personnel on Feb. 14, 1934.

New elections were held on May 19, 1935. These elections were held largely in the shadow of the changed international situation. The problem of the German minority in Czechoslovakia was transformed from a problem of internal policy which was well on its way toward solution, into a problem of international policy and was made subservient to the German attempt at expansion and domination over central Europe.

FROM 1935 TO THE END OF WORLD WAR II

The New President.—The remarkable stability of Czechoslovak democracy expressed itself also in the unbroken continuity of the leadership of the republic. The first president, Thomas G. Masaryk, the president liberator, remained the head of the state he had done so much to create and to shape, from the fall of 1918 until Dec. 1935. When he had to resign on account of his advanced age (he was then in his 86th year) he was succeeded by Dr. Eduard Beneš, who was elected by a large majority on Dec. 18, 1935 for the presidential term of seven years. Dr. Beneš had been the closest disciple and collaborator of Masaryk for more than twenty years, and had since 1918 been minister of foreign affairs of Czechoslovakia. As a statesman, as a sociologist and as a student of ethics, Beneš followed closely the line of his predecessor. Masaryk, although in failing health, lived on for two more years; his death on Sept. 14, 1937 united the whole nation in an impressive demonstration for the great humanitarian democrat. On Nov. 5, 1935, Dr. Milan Hodža, a member of the Agrarian Party and a Slovak, became prime minister. Dr. Kamil Krofta, a distinguished historian, took over the foreign office on March 1, 1936. Both continued in office until the September crisis of 1938.

The Rise of National Socialism.—The accession to power of the National Socialist Party in Germany, the growing strength of

Nazi Germany in international relations, the spread of fascist influence and of a chauvinistic and exaggerated nationalism throughout central Europe, the weakening of the League of Nations and of the ideals for which it stood, all that was reflected in the attitude of the German minority in Czechoslovakia. Since 1926 German ministers had participated in Czechoslovak cabinets. This rapprochement between the two races coincided with a general improvement created by the Locarno Pact. But the German minority continued to feel themselves treated as second-rate citizens. Undoubtedly some of their grievances were legitimate. Czech influence and numbers were constantly growing in predominantly German districts. The Czech language was given a prominent place, Czech officials and police were employed in German cities and districts. In economic enterprises, financed by the Government, Czech employers and workers were given preference in German territory. But viewed in the light of the position of minorities generally throughout central and south-eastern Europe there is no doubt that the situation of the German minority in Czechoslovakia was relatively good, and that the democratic liberties were shared equally by the Germans with all the other nationalities of Czechoslovakia. The discontent of the Germans was aggravated by the general economic crisis which hit the predominantly industrial and less fertile parts of Czechoslovakia, inhabited by the Germans, much more heavily than the more agrarian districts.

The Czechoslovak Government dissolved on Oct. 4, 1933 the two extremist German nationalistic parties, the Nationalists and the National Socialists. A few days later a young teacher of gymnastics, Konrad Henlein, formed a new party, the Sudetendeutsche Heimatfront, later called the Sudetendeutsche Partei, or Sudetic German Party (the Sudeten is the name for the mountains separating Bohemia from Germany). The new party professed loyalty to the Czechoslovak state, but imitated the German National Socialist Party in its authoritarian totalitarianism, in its racial interpretation of history and in its fight against liberalism and socialism. This party became at the parliamentary elections of May 1935 the strongest German party, gaining about two-thirds of the German vote. The other three German parties, the Agrarian Party, the Clerical Christian Social Party and the Social Democrats, co-operated with the Government and entered a coalition cabinet with the Czech parties. The Sudeten Party demanded the autonomy of the Sudetenland and above all a complete change in Czechoslovakia's foreign policy and her re-orientation into the German orbit. These demands of the Sudeten Party were supported by the German press in the Reich which launched from time to time vehement attacks against Czechoslovakia.

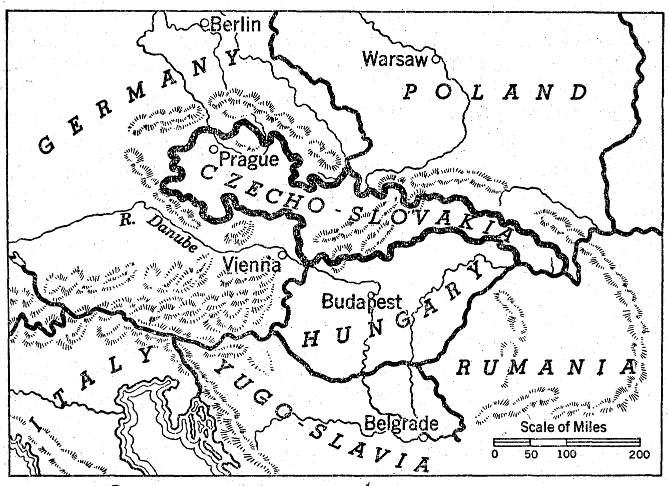
International Policy.—By her geographic position Czechoslovakia was the pivotal point in the struggle for a balance of power in Europe and in the efforts to maintain democracy in central Europe. This strategic position of Czechoslovakia grew in importance, as Germany resumed her expansion eastward in an effort to establish her control over the Danubian basin, to strengthen her *potentiel de guerre* by the economic resources of central and south-eastern Europe and by helping fascism to become the dominating political philosophy in all the countries which would fall under her influence. Against this drive for the expansion of Germany's strategic and economic power Czechoslovakia relied upon the League of Nations to which she always had faithfully adhered, and made her relations with the other members of the Little Entente, Yugoslavia and Rumania, closer by the pact of Feb. 16, 1933. The alliance with France, which had been a cornerstone of Czechoslovak policy since her foundation, became more intimate and was reaffirmed in a number of solemn declarations. Under the influence of France Czechoslovakia altered also her attitude toward the Soviet Union, being one of the last states to extend recognition. After France had concluded a defensive pact of mutual assistance with the Soviets, Czechoslovakia followed suit on May 16, 1935.

At the same time the Czech Government concentrated its attention on strengthening its army which was raised to a very high standard and was in training, equipment and efficiency equal to the best armies of Europe. A line of most modern fortifications, a second "Maginot" line, was built along the German frontier to protect the country against any surprise attack. The armament works of Czechoslovakia, especially the famous Skoda Works in Pilsen, were world renowned. In addition to her reliance upon world democracy, upon her friends and upon her army, Czechoslovakia pursued an active policy for improving her relations with her neighbours. The Czechs tried to promote the ideal of an economic and a diplomatic co-operation between the states of central Europe for the maintenance of their independence and their traditions. The relations with Austria became more cordial, and better relations with Hungary were established than there had existed since the end of the World War. Definite prospects of a peaceful consolidation and development of the central European situation appeared toward the end of 1937.

Efforts at Czech-German Conciliation.—To lessen the prevailing tension the Government of Dr. Hodža started negotiations with the three German parties who were co-operating with the Government. Only three major parties remained outside the coalition, the Sudeten German Party, the Communist Party and the Slovak People's Party, the latter a reactionary clerical party with fascist tendencies under the leadership of Father Andreus Hlinka. On Feb. 18, 1937 an agreement was concluded between the Government and the three German parties within, whereby the Germans were promised their just share in public economic enterprises, their due representation in civil service and certain improvements in the thorny question of the inequality of the Czech and German languages. Certain steps were taken toward satisfying the demands of the Slovaks and of the Carpatho-Russians for autonomy. But all these measures were carried out only slowly and did not keep pace with the rapidly changing international situation where Germany was striding fast to attain her ends.

After the Annexation of Austria.—Chancellor Hitler in his speech on Feb. 20, 1938 had declared that the German minority in Czechoslovakia as well as the Germans in Austria should feel confident of the Reich's support. Nine days later Field Marshal Göring warned that "since the Fuehrer made the proud statement that we would no longer tolerate that ten million of our German brothers across the frontier should be oppressed," the soldiers of the German air force knew that they must "stand for this word of the Fuehrer until the end." Ten days later German aeroplanes and troops moved into Austria and the country was annexed. This fact rendered the situation of Czechoslovakia even more precarious. It aroused in the German minority the definite expectation that within a brief time Chancellor Hitler would "liberate" them. In this mood many Germans joined the Nazi Party. Of the three German parties co-operating with the Government, the Agrarians and the Christian Social Party dissolved and joined the Sudeten Party, the German Social Democrats also withdrew from the cabinet. The demand of the Sudeten Germans for autonomy was now taken up by the Hungarian and Polish minorities and by the Slovak People's Party. The Czech Government promised to grant further concessions to the German minority, but the eight demands laid down by Henlein in a speech at Carlsbad on April 24, proved unacceptable, because they included not only a complete autonomy for the Germans, but an insistence upon the acceptance of the totalitarian Nazi philosophy, incompatible with the democratic character of Czechoslovakia. The Sudeten German Party, which on May 13 created its own uniformed storm troopers, became more and more insistent, frequent incidents resulted, governmental authority in the Sudeten districts was undermined, the followers of Henlein terrorized the German Socialists and Democrats. A general feeling prevailed that on May 21 German troops would move into the Sudetenland to support a Sudeten revolt. A quick mobilization of part of the Czech army, carried through with greatest preciseness and efficiency, forestalled, at least for the time being, any such move. But the German Government ordered on May 29 a sharp increase in the German army which was raised during the early summer to the strength of 1,500,000 men under arms, and concentrated about 500,000 conscripted labour upon the rapid construction of impregnable fortifications on Germany's western front.

Meanwhile negotiations continued between the Czech Government and the different minorities, especially the Sudeten Germans, about a general revision of the status of the minorities in Czechoslovakia. These negotiations were hindered by the violent campaign of abuse and hatred carried on by the German press and radio against Czechoslovakia. Under these circumstances and with Germany's threat of war against Czechoslovakia more and more imminent, the British Government sent, at the end of July, Lord Runciman to mediate between the Czechs and the Sudeten Germans. The Czech Government submitted proposals for far-reaching concessions to the Sudeten Germans, embodying most of their demands for self-government. But the Sudeten Germans refused, under the pretext of minor incidents, to negotiate. At the same time Chancellor Hitler in his speeches during the month of September sounded a more and more warlike note. With the danger of armed conflict rapidly growing the British and French Governments started negotiations with Germany. As the result of these negotiations they forced Czechoslovakia to accept the German demands for a dismemberment of Czechoslovakia. The Czech Government had not even been consulted during these negotiations. Finding itself forsaken by its allies, it had no other choice than to become resigned to the establishment of German undisputed hegemony in central Europe at the expense of Czechoslovakia, but also at the expense of democracy, of the prestige and position of Great Britain and France, and of the League of Nations.



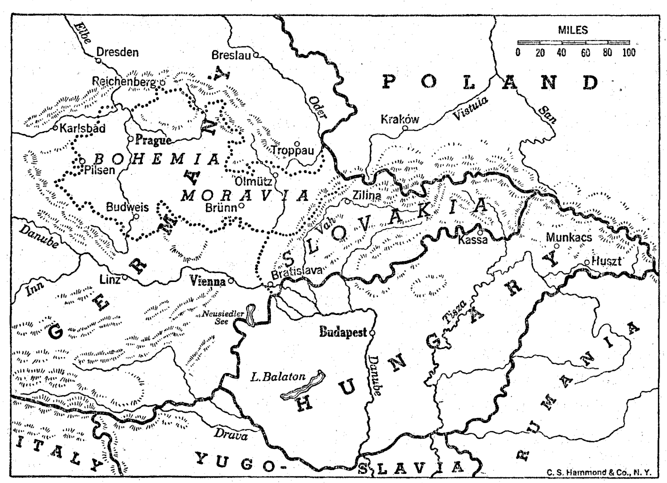
CZECHO-SLOVAKIA AFTER THE MUNICH PACT, 1938

After the Pact of Munich.—The accord of Munich of Sept. 30, 1938 sealed the fate of Czechoslovakia. On September 22 the Government of Dr. Hodža had resigned and General Jan Syrovy, the inspector general of the army, had formed a new cabinet. This cabinet was now faced with the task of carrying through the cession of all the territory inhabited, according to the census of 1910, by a German majority, to Germany, and to face similar claims on the part of Poland and Hungary. The Polish claims were fully granted, those of Hungary, after long negotiations, were settled on November 2 by a judgment of the German and Italian foreign ministers who acted as arbiters. Meanwhile, on October 5, Dr. Beneš resigned as president of the republic, a second cabinet of General Syrovy's was formed with Dr. František Chvalkovský as foreign minister, who was well known for his sympathetic attitude toward Germany and Italy. This cabinet carried through the difficult transition from a democratic Czechoslovakia, relying upon the League of Nations and the western democracies, to a new federative state Czecho-Slovakia, with fascist tendencies and entering entirely the political, economic, strategic and cultural orbit of Germany. Thus the First Czechoslovak Republic created by Masaryk was followed by a Second Republic the tendencies and ways of life of which differed fundamentally from its predecessor.

The Second Czecho-Slovak Republic.—Czechoslovakia lost 28,680 sq.km. to Germany, 11,830 to Hungary, and 1,086 to Poland. Her area after the Pact amounted to 98,912 square kilometres. Of her population she lost 3,576,719 to Germany, 992,496 to Hungary and 230,282 to Poland. Among this population lost there were about 1,202,000 of Czech and Slovak nationality who now formed minorities in Germany, Hungary and Poland. The total population of the new Czecho-Slovakia amounted to 9,807,096 or two-thirds of the original population.

The new Czecho-Slovakia was a federal state consisting of Bohemia and Moravia with 49,362 sq.km., Slovakia 38,456 and Ruthenia 11,094. Bohemia and Moravia contained more than two-thirds of the present population, namely 6,804,876. The three federated Slav nationalities, the Czechs (6,453,857), the Slovaks (2,055,802) and the Ruthenes (512,289), formed together 93·4% of the whole population. The remaining national minorities, the Germans, Hungarians, Jews and Poles, were numerically insignificant.

The relations between the Czechs and the Slovaks were regulated in a way similar to that existing in the Dual Monarchy of the Habsburgs after 1867. Although numerically much inferior, the Slovaks set the pace of the development of the Second Republic and led the distinct swing to right-wing fascism which became characteristic of the Second Republic. The Slovak Government under Monsignor Josef Tiso, the successor of Father Hlinka who had died in Aug. 1938, established a one-party rule, created a fascist militia, and started a violent anti-Semitic campaign copying the German example. The development in the western part of the country went in the same direction although much slower and under preservation of certain features of an "authoritarian" democracy. The Czechs knew that they depended for their survival entirely upon the goodwill of Nazi Germany. They had therefore to adapt their whole economic, political and cultural life to this new situation. The Czech parties were dissolved, the Communist Party outlawed, anti-Semitism grew rapidly under German propaganda. The democratic period of Czechoslovakia, the memory of Masaryk, the personality of Beneš, were violently attacked by the new forces which had come to the fore among the Czechs. The Czech Conservative parties formed a party of National Unity which became the majority party in the Czech parliament, opposed by a Czech labour party which tried to maintain, as far as it was possible in the new situation, certain traditions of the democratic past.



DIVISION OF CZECHO-SLOVAKIA AFTER AUG. 1939

The Czecho-Slovak parliament accepted on Nov. 22, 1938 the autonomy statute for Slovakia. On Nov. 30 it elected Dr. Emil Hacha, the president of the supreme administrative court, president of the new republic. A new cabinet was appointed under Rudolf Beran, who had been for many years an advocate of a Germanophile policy. The new Government sanctioned the building of a German corridor across Czecho-Slovakia, to connect German Silesia with Vienna. This corridor was to be regarded as part of the German political and customs territory, and to be under German sovereignty. In addition to this road a canal was to be built by Germany across Czecho-Slovakia, connecting the Danube with the Oder, and thus to bring the countries of central and south-eastern Europe into the German economic and political orbit.

German influence made itself also heavily felt in Carpatho-Ruthenia which was, under the new premier, Monsignor August Vološin, transformed into the spear-head for the "liberation" of all Ukrainians, living in Poland and the Soviet Union, by Germany.

The whole Second Republic tried to adapt herself rapidly to the changed situation. She tried, too, to maintain against increasing demands on the part of Germany and of the numerically insignificant German minority still in the country, at least a semblance of independence. In spite of the fascist character and the subservience of the new Czecho-Slovak Government, the German Government did not accept the situation created by the Pact of Munich. Internal disputes arose between the Government in Prague and the autonomists in Slovakia and Ruthenia, who had been encouraged by Germany to an attitude irreconcilable with the maintenance of even a formal union between the three parts, and were supported by Germany in their open defiance of the Central Government. With German help Slovakia proclaimed her independence on March 14, and charging that Germans had been mishandled, German troops entered Bohemia and Moravia, dissolved the Czecho-Slovak Republic and put an end to Czech independence. The British and French, who had undertaken at Munich to guarantee the new frontiers of Czecho-Slovakia, refused to act at this violation of the Pact of Munich. The Czech president, Dr. Hacha, was forced in Berlin to demand the protection of the German Government for Bohemia and Moravia. At that time, on March 15, 1939, German troops were already on the march towards Prague and on the evening of the same day Chancellor Hitler in person came to Prague and stayed in the historic castle of Hradčany. Bohemia and Moravia were incorporated into the German Reich as "autonomous protectorates." The Czech army was disbanded, the Reich took over the conduct of the foreign affairs of Czecho-Slovakia, and acquired the great military equipment, economic wealth, resources and productive potentialities of the former republic. Baron Constantin von Neurath was named protector of the new protectorate, and one of the leaders of the former Sudeten German Party, H. K. Frank, was named secretary of the protectorate.

Subsequently, it became clear that the Germans intended to restrict even further the remnant of authority left to the Czechoslovaks. A German decree, issued in June 1939, empowered the protector to modify the existing autonomy without any reference to the Czechoslovak authorities. Under these circumstances, the resistance of the Czechs to the new regime increased. During World War II, German rule became more severe and the Czechs, because of their Slavic origin, were treated as "second-class" citizens. In 1944–45, Russian armies liberated first Ruthenia, then Slovakia and finally Bohemia from the reich grip. Several days after Germany's surrender (May 8, 1945), President Beneš and his government returned to Prague. The new prime minister, Zdenek Fierlinger, outlined a radical program of social reforms, which included state control of monopolies and the large banks. In foreign policy, Fierlinger adhered to the alliance with the soviet union. It was announced on June 29, 1945, that Czechoslovakia had agreed to cede Ruthenia (or the Carpatho-Ukraine) to the soviet union. (*See* WORLD WAR II.)

(H. Ko.)

CZECH LANGUAGE AND LITERATURE. The name Czech has always been used by the Slavs themselves and by their eastern neighbours. In Western countries derivations of the Latin name of their chief land, Bohemia (Čechy), were in use until recently. To avoid associations with "Bohemianism" the native form Czech and, since the World War, Czechoslovak has been almost universally adopted. The former word is properly spelt *Čech* (*ch* as in Scottish *loch*). The spelling *cz* which has prevailed in English is found in Latin, old Czech, Polish and occasionally in German. The origin of the name is obscure. Tradition records it as the name of the chief who led the Slavs into Bohemia. It is usually considered an abbreviation of a personal name (Česlav?). The latter form—*československý jazyk,* in Latin *bohemoslavica*—has been current for the language since the beginning of the eighteenth century, especially in Slovakia. Up to the thirteenth century the Bohemian Slavs called their language *slověnský,* a name preserved among the Slovaks. The political prestige of the central tribe established a supremacy over the whole of Bohemia towards the close of the tenth century and the name Czech became a generic term. The Slovaks are called *natio Slavica seu bohemica* in old records (*cf.* Verbötzi, 1609 etc.). The expression Moravian language (*moravský*) is common among the Czechs who came under Prussian rule in 1742.

Affinities and Structure.—Czech is a member of the western group of the Slavonic branch of the Indo-European family of languages (*q.v.*). It has preserved the archaic characteristics of an inflectional tongue. It has no article; there are three grammatical genders and seven cases. Instead of an elaborate system of tenses there are verbal aspects (perfective and imperfective) to express complete and incomplete action (*e.g. padati*—to be falling, to fall repeatedly; *padnouti*—to fall once; *psáti*—to write; *napsati*—to write down). There is no subjunctive. Czech forms the passive, whenever possible, by the aid of a reflexive (*Jmenuje se Jan*—He is called John). It is syntactically akin to the ancient Aryan languages, though less conservative than Russian. The word-order is free (except for unstressed words like *by, se, mi*). The principles of derivation are essentially the same as in other Slavonic languages. Compounds are comparatively rare.

The old dual number and the aorist and imperfect, which survive in Wendish and Southern Slavonic, were lost; the simple tenses were replaced throughout in the 16th century by the compound l-preterite, which distinguishes gender.

Phonetics.—Czech exhibits the specific features of Western Slavonic: *c* and (*d*)*z* for *tj* and *dj* (*placen* from *platiti,* to pay; *mezi,* amid); the group *dl* (*mýdlo,* soap *cf.* Russian, *mylo*); *š* for *ś* (*vše*—all). As in Polish, the two primitive semi-vowels (*jer*) became *e,* or were dropped (*pes,* dog, gen. *psa*); the initial *i* was dropped in *z* (out *cf.* Latin *ex*), *míti* (to have). *Co,* from *česo,*—what. The declension of animate and inanimate masculines is differentiated. Nasal vowels, however, have been lost in Czech (*Venceslaus,* a 10th-century Latinized form, is now *Václav*).

It agrees with Southern Slavonic in the treatment of the groups *or, er, ol, el.* (*král*—king, from *karl*); *břeh*—bank (*cf.* German *Berg*); *hlava*—head (*cf.* Lithuanian *galvā*); *mlíti*—to grind (from **mel-ti*). As in Little Russian, *g* became voiced *h.* (*hora* cf. Sanskrit *girịḥ*—mountain). As in Upper Wendish, its nearest relative, the principal accent falls on the first syllable.

The characteristic distinction of literary Czech as compared with the original form of the language and with its more conservative eastern dialects is mutation and other vowel changes, through which the dialects of Bohemia passed between the 12th and 16th centuries. *Duša* became *duše* (12th c.); *dušu* became *duši* (14th c.); *viera* gradually became *víra; ó* became *uo* and later *ů* (*sůl*—salt); *ú* was diphthongized into *au,* later *ou* (*moucha,* fly).

The most characteristic features of modern Czech phonology are; clear, somewhat staccato pronunciation without obscuration of the unstressed syllables; a simple vowel system; rigorous preservation of the marked distinction between long and short vowels (*páni*—gentlemen; *paní*, ladies); the vowel-like *r* and *l*, capable of assuming syllabic functions (as in Sanskrit, but never initially), even in stressed syllables (*trn*-thorn, *Vltava;* but *černý*, black, where Serb. has *crn, dlouhý*, long, not *dlhý* as in Slovak); *r* is rolled, the peculiar soft sound of *ř* is voiced or voiceless (*Řehoř*—Gregory). The difficult sounds *ł* and *y*, preserved in Polish, have been long discarded (*y* is pronounced as *i*). The difference between hard and soft consonants, which makes Polish phonetics so difficult, has practically disappeared (except in soft *d', t', ň*). *P, t* and *k* are never aspirated. In colloquial Czech *ý* is pronounced *ej*, initial *o*—*vo* (*oko*, eye, becomes *voko*).

Czech spelling is phonetic. A form of Latin alphabet modified by means of diacritics is used. Vowels are sounded as in Italian; vowel-length is represented by an acute accent, and in the case of long *ú* (medially and finally) by *ů* (*Bůh*, pron. *búch*—god). The sign ˇ placed over *e* softens it (*věk*—*vyek*—age). *Ou* as in soul. Most consonants have a similar sound value as in English. The following letters require special attention: *C*—ts (wi*ts*); *h* voiced (per*h*aps); *j* (hallelu*j*ah); *g* (in foreign words) always guttural (get); digraph *ch* as in loch; *š*—sh; *ž*—z in azure; *ř* like *rš* or *rž*; *č*—tš (church); *d', t', ň*, soft as in dew, tube, new. The same sound is heard in *di, ti, ni, dě, tě, ně*.

The position of the original free stress left its traces in the vowel quantity. Another source of long vowels is the primitive intonation (*bláto* Russ. *bolóto*), contraction (*státi* from *stojati*) or the nature of the following consonant (*můj* from *moj*).

Vocabulary.—The Czech vocabulary is homogeneous. Common words like *bratr* (brother), *myš* (mouse), *tři* (three), *nový* (new), *peku* (bake), throw light on the Aryan affinities of Czech. As a result of contact with the Teutonic race certain words of German origin are found (*barva*, Ger. *Farbe; hejtman*, Ger. *Hauptmann*), besides such early common Slavonic loan-words as *kněz*—priest (etym. related to Eng. *king*), *chléb*—bread (*cf.* loaf). Western Christianity brought in many Latin words such as *oltář*—altar, *řehole*—regula, while only a few traces remained of the original Slavonic liturgy (*církev*—church, *blahoslaviti*—to bless, *prorok*—prophet). In modern times international terminology is freely used; *republika, objektivnost, politický, telefonovati.* Slang is mainly derived from German: *kumšt, fotr.* Czech additions to the Western vocabulary are: pistol (from *pišťala*), howitzer (from *houfnice*), polka, robot. Czech style and structure of the sentences suffered through the imitation of German models in the period of decline but the racy idiomatic language has survived on the lips of the people and in good writers.

Dialectical Divisions.—The Czech dialects are broadly divided into four main territorial groups. Bohemia is almost unified in speech. Her most interesting dialect is *Chodský*, near Domažlice, in the southwest (*bul* for *byl*—he was). The "Doric" of Central Moravia, *Hanácký*, is distinguished by its broad vowel sounds (*bel* for *byl, lóka* for *louka*—meadow). The Silesian dialect is a transition to Polish (*był*, no long vowels, accent on the penult). The Slovak group, by far the most important, is spoken in E. Moravia and in Slovakia proper, where there is an extraordinary richness of dialectical types (28 expressions for potato). Its distinctive feature is the absence of *ř* (*reka* for *řeka*—river), and the generalization of the ending *m* in the 1st person of verbs. The melodious Central dialect (*bol* for *byl*) has been standardized for literary use (1852); but Czech has retained its traditional prestige among the Slovak Protestants. The Slovak vernacular is merely a dialect of Czech, and is easily understood by the Czechs. An attempt (about 1835) to form a Moravian language artificially out of local dialects was thwarted by F. Palacký, the well-known historian.

LITERATURE

In Czechoslovakian, which is the oldest of Slavonic literatures, literary monuments exist from the beginning of the 14th century. Before that time Czech literature consisted of glosses of religious texts and religious songs. Czechoslovakian literature had its beginnings in rhymed legends, the products of priestly culture, but for a time West-European chivalry of Franco-German origin, modified to suit Czech conditions, prevailed throughout the country. This state of affairs is reflected in the verse translation of the Latin *Alexandreid*, written about 1310; in a rhyming chronicle of about 1310, erroneously known as *Dalimil's Chronicle*, which was patriotic and anti-German in spirit; and in the witty satires of the noble Smil Flaška of Pardubice (1349–1403). In the Easter mysteries and farces, and in short lyrics, frolicsome priests and university students found self-expression. The prose of the period is remarkable, both for its religious and educative qualities, and, in the *Kniha Rožmberská* and in the work of Ondřej of Dubá, for the records it has preserved of the earliest known Czech laws. Foreign culture was, however, already dissolving the national traditions of Czech literature during the reign of Charles IV. of the Lucemburg family.

The Reformation and the Renaissance.—By the end of the 14th century, Czech literature had grown richer in form and variety, and two aspects of the Czech soul became more pronounced and found manifold expression. The first was that of meditation on religion, and discontent with the contemporary scholastic system: the second was the revolt against feudalism, and the moral enthusiasm which permeated the public mind in its efforts to find a juster social order. From these two roots, watered by Waldensian teaching and by Wyclif's theology, there grew up the Czech Reformation, known at first as the Hussite movement, and later identified with the Bohemian Brethren. Its forerunners were the learned theologian and reformer Matěj of Janov (b. 1393) who wrote in Latin, and the squire Tomáš of Štítné (1331–1401), a popularizer of learning and the founder of Czech philosophical prose. The influences of these two men were later embodied in the personality of Jan Hus who elaborated their teachings, and set the seal on them by his martyrdom in 1415. He was an able writer, both in Czech and Latin, and by his eloquence as academical orator and popular preacher he made Wyclif's teachings widely known. By shunning archaisms he adapted the language to the needs of the day, and placed the love of religion in the forefront of all literary activities. For a time it seemed that secular literature had disappeared from Bohemia. Religious inspiration, however, produced powerful spiritual and warlike lyrics, of which the battle hymn "Kdož jste boží bojovníci" acquired great fame, and made a deep impression on the mind of a disciple of Hus, Peter Chelčický (1390–1460). This Gothic spirit from the people was a radical critic, not only of the church, but of the whole social and cultural system. Spiritually he was akin to Rousseau and Tolstoy, and from his ideal of a restored Apostolic Church and the foundation of the Kingdom of God on earth sprang the wonderful Union of Bohemian Brethren. The Brethren were given a stable constitution by Brother Lukáš at the end of the 15th century, and a primitive and anarchistic chiliasm was thus reconciled with the realities of life. The Union of Brethren then began to cultivate literature and science; mastered the art of printing; studied educational methods; pursued historical researches; and cherished and developed the mother-tongue.

The influences of the Renaissance are now discernible, but the humanities which penetrated into Bohemia from Italy seemed at first to be the privilege of the Roman Catholic nobility, of the emperor's diplomats and foreign officials, and resulted in a further latinization of the literature. That a happy compromise was eventually reached between Latin and Czech culture may be seen from the masterly prose of Viktorin Kornel of Všehrdy, who codified the ancient Czech laws. In Moravia at the same time Ctibor Tovačovský of Cimburk was engaged on similar work. In the Union of Bohemian Brethren the reconciliation of Christianity and Humanism was achieved by the pious and scholarly Jan Blahoslav (1523–71), who was an historian, grammarian, musical theorist and sacred poet. With his name is connected the Brethren's greatest literary work, a masterly translation of the Scriptures, known as the *Bible of Kralice,* which was completed in 1588 and remains a perfect example of classical Czech.

In the 16th and 17th centuries the influence of the Renaissance spread through the nation, and Daniel Adam of Veleslavín (1545–99), famous as a printer, literary man, orator, philologist and historian, may be mentioned as typical. During this age didactic prose flourished, and in addition to books of travel, historical works of all kinds abounded. These extended from the popular chronicle of Václav Hájek of Libočany to the psychological and pragmatic art of Bartoš Písař. Even during the period of decline two emigrants Pavel Skála of Zhoře and Pavel Stránský maintained the old tradition. Drama, poetry and the novel were, however, utterly neglected.

In 1620, with the defeat on the White Hill of the rebellion against the emperor, the national schism was complete. On one side stood the victorious Roman Catholics; on the other, the defeated Protestants. The latter soon emigrated and carried with them nearly the whole of Czech literary and scholastic culture. Among the emigrants was the last bishop of the Union of Brethren, Jan Amos Komenský (Comenius, 1592–1670), the great pedagogical reformer and language teacher. He was a devout Christian and a loyal Czech, as well as an ardent pansophist and a forerunner of the encyclopaedists. Like Hus, he was a great writer both in Czech and Latin, while his works, which show a strong foreign influence, reveal him as not only a philosopher and philologist, but as a poet. At the time of the Roman Catholic baroque Reformation a decline set in both in literature and language, which the efforts of the noble-minded clerical patriots, Bohuslav Balbín (1621–88), the learned historian, and Václav Šteyer (1630–92), the popular teacher, were unable to stay.

Revival in the 18th and 19th Centuries.—Towards the end of the 18th century, when the Austrian Government suspended the rights of the Czech State and by decree abolished the national language, it seemed that the gradual decline would become absolute ruin. A powerful revival set in, however, and the economic and social liberation of the country people gave new strength to the nation, while the enlightenment of Western Europe which penetrated into Bohemia strengthened this unexpected re-awakening. The nobility now began to defend their own rights and those of the Czech State against the centralizing influence of Vienna, and the clergy resumed the efforts of their patriotic predecessors of the previous century. The historical and philological studies which scholars, trained by new methods, were now pursuing were soon used as weapons against the Germanizing efforts of the Government, and against the prevailing ignorance of the masses. Scholars and writers, who themselves had sprung from common stock, roused the people from their apathy, while Western science, coupled with Slavonic enthusiasm, developed in the Czech mind the sense of unity with the whole Slav race. The first stage of this collective movement, known as the National Awakening or Revival, which was contemporary with the enlightenment of France and Germany, belongs to the 18th century and is extremely modest. Apart from scientific works, in Latin and German, it consisted of efforts to publish literature and periodicals for the people. Josef Dobrovský (1753–1829), a systematic philologist and historian, and founder of Slavonic studies, wielded the greatest influence, and his study of past literature, of the philological kinship of the language with the other Slav tongues, and of the laws of prose and verse, revealed an enlightened mind. His influence was very considerable, and bore fruit in the journalistic work of Václav Matěj Kramerius, and in that of Antonín Jaroslav Puchmajer, the first Czech poet.

Influence of Romantic Movement.—It was, however, the Romantic movement in Europe at the beginning of the 19th century, following upon the French Revolution and the Napoleonic wars, which set free the latent powers of the country and made the victory of the Czechoslovakian national revival complete. The importance of the national language was by now fully realized, and there was a general movement toward the serious cultivation of Czech science and poetry. A sense of history and tradition entered into the soul of the people, and an appreciation of nature, together with a growing emancipation of imagination and feeling, led to literature and poetry throwing off the chains of didacticism and entering the field of artistic creation. Three great historians and philologists, inspired by philosophy and love of poetry, were the leaders of this intellectual revolt, and their legacy remains the foundation of the culture of Czechoslovakia. The oldest of them, Josef Jungmann (1773–1847), the patriarch of Czech literature, who came from central Bohemia, is famous as a lexicographer, literary historian and critic of poetry, while his followers Pavel Josef Šafařík (1795–1861) and František Palacký (1798–1876) introduced new elements of Slovakian thought. The former elaborated Dobrovsky's studies in the sphere of Slavonic history and ethnography; the latter, who rightly bears the name of "Father of the Nation," wrote popular philosophical works on Czech history, in which he presented an inspiring picture of the past, and also laid foundations for the political development that was to follow. Their common ideal of Czech classical poetry being recognized at its true worth was not for many years to be realized, but a body of enthusiasts with Václav Hanka at their head resolved to follow "Ossian" Macpherson's example and manufacture such poetry. Thus did the famous literary forgeries *Rukopis Královédvorský* and *Zelenohorský* originate, and though the imitation of the language was poor, the poems were rich in feeling for the ancient heroic period of the nation. Real poets were soon forthcoming. The conception of Slavonic brotherhood was eloquently expressed by Jan Kollár (1793–1852), a rhetorician, classical in style, who hailed from Slovakia, in the poetic allegory *Slávy dcera.* In his footsteps followed Jan Hollý (1793–1844), an epic poet alive to the grandeur of the past. Next came František Ladislav Čelakovský (1799–1852), a clever imitator of Czech and Russian native poetry, and Karel Jaromír Erben (1811–70), the writer of tragic moral ballads which, though more restricted in scope, were more intense in feeling. Karel Hynek Mácha (1810–36), an imaginative poet whose verses are charmingly melodious, followed a new romanticist path, leading to the metaphysical conflicts of modern man, but he did not live to maturity. The novel and the drama, which were still largely historical, cannot compare in interest with this poetry, and even Josef Kajetán Tyl, the author of the national anthem, and Václav Kliment Klicpera were but popular writers of the day.

The Beginnings of Literary Realism.—In the '40s of the 19th century, the romantic era in Czech literature gradually drew to an end and was replaced by a period in which attempts were made to reproduce realistically the problems of contemporary public and social life. Literature now began consciously to attempt to influence society. This general movement was connected with the increasing political activity which occurred about the year 1848; with the democratic ideas of the age; and with the progress of journalism. National culture was, however, handicapped by the separation of the "dialect" Slovak literature, which had been effected in 1844–46 by the ardent Slovak leader Ludevít Štúr. These new tendencies were personified in the classic Czech journalist, Karel Havlíček-Borovský (1821–56), who was an excellent satirist, epigrammatist and critic; in the sphere of the novel, Božena Němcová (1820–62), a master of idyllic narrative, played a similar part. It was not, however, until about the year 1860, which brought its measure of political freedom, that a young literary school, called the school of Máj, revolutionized Czech poetry, conforming it to the new spirit of realism and social and moral reform. Leader of the group was Vítězslav Hálek (1835–74), the brilliant peasant-type psychologist and the author of love and nature poems. His friend Jan Neruda (1834–91) was a prolific journalist, a melancholy lyric poet, a clever critic and a brilliant *feuilleton* writer, who with his keen gift for observation, his love of truth, his deep humanity and original style, laid the foundations of modern Czech literature. His inspiration is still alive to-day while the work of his intimate companion, Adolf Heyduk, is forgotten. Jan Neruda in his critical capacity directed special attention to that branch of the novel and the drama which concerns itself with social problems. His action was fruitful. Karolina Světlá (1830–99), the idealist thinker and tragic authoress, dealt with moral problems in the novel, and her literary *confrères,* Gustav Pfleger Moravský (1835–75), Jakub Arbes (1840–1914) and Antal Stašek (1843–1931), studied the life and environment of the working classes, and the problem of the discord between capital and labour. In originality of character drawing and effectiveness of style these, however, were all surpassed by Alois Vojtěch Šmilovský (1837–83), the psychologist of the country town. In the world of drama, Emanuel Bozděch (1841–89) failed to emancipate himself from his French models, and continued to write witty comedies of intrigue, but František Věnceslav Jeřábek (1838–93) made good use of the realities of his native soil and produced impressive works.

National Tendencies and Artistic Aims.—In the '70s and '80s of the last century there appeared two independent literary groups of the schools of Neruda and Hálek. One, named after the periodical *Ruch,* supported the tendency in contemporary politics to strengthen nationalist feeling, to recover old rights, and to foster friendly relations with the rest of the Slav race. The other, contributing to the magazine *Lumir,* worked for the ideal of literature for its own sake, and demanded the incorporation of the thought and creative art of Western Europe in Czech literature. Both schools introduced into rhetorical poetry the element of meditation, both sacrificed sound to literary images, and led literature from popular simplicity to learned artificiality, which was popular among the educated classes.

Svatopluk Čech (1846–1908), a follower of Byron and the Slav Byronic poets, an epic poet rich in colour and varied in music, master of the political song and eloquent preacher on poetic themes, was the most famous poet of the period. The poetess and critic Eliška Krásnohorská (1847–1926), the leader of Czech feminists, though inferior as a poet, was his equal in patriotic fervour. The depths of the Czech soul were plumbed by the lyric poet, Josef V. Sládek (1845–1912), who is famous as the translator of Shakespeare and of other English and American poets: master both of lyric and contemplative poetry, he wrote of love, faithfulness, death and eternity, for the most part in simple classical form. Though every manifestation of national life was persecuted by the Magyar Government, Slovakia possessed two ardent patriotic poets. The first, Svetozar Hurban Vajanský (1847–1916), the more vehement and less profound, wrote chiefly lyrical songs, while Hviezdoslav (Pavel Országh), an original thinker, wrote broad epics of the history of the race.

The historical novel, based on thorough historical research and devoted to the cultivation of patriotism, was by far the most popular product of the National school. Its pioneers were the elegiac and pathetic Václav Beneš Třebízský (1849–84) and Alois Jirásek (1851–1930) whose studies of the Hussite Wars, of the national decline, and of the Revival period, all greatly detailed and yet wide in vision, are dear to every Czech from childhood. Nevertheless, in artistic force and delicacy of treatment, he was surpassed by the archaic and pithy Zigmund Winter (1846–1912).

That the members of the other group, whom their opponents dubbed cosmopolitans by way of reproach, advocated the principle of "art for art's sake" was only a temporary self-deception; that by their predilections for the cultures of France, Italy and England they liberated Czech literature from the long tutelage of German influences was an undeniable service; that they extended the scope of subjects, ideas and imagery was a token of their artistic powers. They derived new inspiration from the sea, from the fine arts, from feminine beauty; they learned to absorb the cultures of foreign countries and of bygone ages and to imitate the metrical forms employed by them; they enriched the Czech poetical style with unprecedented verbal resources and obtained musical effects which had not hitherto been achieved in Czech verse.

Julius Zeyer (1841–1901), the elder of the two leaders of this group, was permeated by the Gothic spirit of the English pre-Raphaelites. In novels, short stories, epics and dramas, he evoked the exotic colours of the East and the romantic tales of the middle ages. His younger companion, Jaroslav Vrchlický (Emil Frida, 1853–1912), occupied two positions of equal significance in the literature of his nation. As a literary scholar of unrivalled erudition and as an adept at translation, this tireless worker made accessible to the Czechs all the chief products of Romance poetry from the time of the Renaissance onwards. As a poet with the prolific qualities of a Lope de Vega, he was the author of a whole library of lyrics and epics as well as of dramas and stories. By nature he was a hedonist with predilections for classical antiquity and the Renaissance, but life awakened in him an instinct for suffering, sorrow and the Christian scale of values. As a pupil of Victor Hugo he dreamed of a huge epic of humanity, conceived on evolutionary and humanitarian lines, half picturesque, half rhetorical in style, but this gigantic task was carried out only in fragments and in feverish haste, its progress having been interrupted by his lyric compositions, the melodious utterances from the depths of a spirit overwhelmed but also purified by the visitations of destiny. The incisive influence of Vrchlický left its traces on the whole of Czech poetry during the '80s and '90s of the 19th century and his followers were numerous. Of them may be mentioned Jaroslav Kvapil (b. 1868), a master of stagecraft, who as a poet is distinguished by beauty of form.

Realism and the Reaction.—A violent reaction from Vrchlický is represented in the early works of scholarship and criticism produced by T. G. Masaryk, who later devoted himself wholly to politics. The new tendency was given the not altogether appropriate name of realism. Against the cult of personality it placed the social consciousness, against the charm of art the serious occupation with public questions, against the interest in form the exclusive criteria of ideas and subject matter. It continued the process of emancipation from German influences, but it preferred the English and the Russians to the French. It disregarded the Renaissance and identified itself with the religious Reformation. It imposed upon authors the duty of studying the life around them, not merely on the surface, but in accordance with the ideas underlying it and of expressing the results of their observations in plain, concise language without adornment or rhetoric.

The chief poet who followed these principles was Jan Svatopluk Machar (b. 1864). He began with love poetry and political or social verses, the pitilessly analytical spirit of which is provocative rather than satisfying. His striving after an objective attitude led him to a versified epic of mankind. This consists of fragmentary poems, the best of which are concise and graphic, but the general tone of the work is dry and didactic. To his influence can be traced the work of a great political poet, Petr Bezruč (Vladimír Vašek, b. 1867), the author of only one book, the fiery spokesman of the Silesian miners, who is equally sincere whether enunciating the anguish of a dying race or rallying the victims of social injustice to defiance.

Realism in Czech prose was satisfied mostly with the search for human documents and with the depicting of remarkable types.

More rarely it illuminates the complex questions affecting the social structure. This applies particularly to the village novel, which was then much in vogue. Two writers of the older generation must be mentioned here. The Slavophil author Josef Holeček (1853–1929) returned, by way of his interest in the Yugoslav heroic legends and Russian orthodoxy, back to the Czech peasant, from whose stock he was descended. In a novel which consisted of several volumes and which was written with great verbal skill, he depicted the old Czech peasant virtues in an idealistic light. Teréza Nováková (1853–1912), a very complex feminine personality, achieved an understanding of the spirit of the people slowly, but she then discovered that the moody highland peasants, whom she knew, were, at bottom, animated by a moral and religious fervour which attained an almost tragic intensity. In her stories the idealism of the conception is coupled with a realism of treatment.

Jan Herben (b. 1857) and Alois Mrštík (1861–1924) wrote chronicle-like narratives, rich in incident, from which an invaluable knowledge of Moravia can be obtained, and the racy tales of Martin Kukučín (M. Bencúr, 1860–1928) render the same service for Slovakia. They are surpassed by Karel V. Rais (1859–1926) whose sensitive sketches from the Krkonoše (Giant Mountains) district are distinguished by the economy of their structure. Considerable success was attained by the novel of city life, notably with a Prague setting. Ignát Hermann (b. 1854) revealed a richly humorous vein in his descriptions of lower middle-class life in Prague. M. A. Šimáček (1860–1913) gave first-hand accounts of factory-life, for the sociological aspect of which he showed a sound instinct. F. X. Svoboda (b. 1860), who was of rural origin, but became acclimatized to Prague, handled feminine psychology with poetical understanding, and his novels, written with an abundance of impressionistic imagery, generally centre upon some phase of moral or family tradition. All these authors, however, were thrown into the shade by the crude naturalist K. M. Čapek-Chod (1860–1927). With an unbridled instinct for grotesque effects and pessimistic mockery, he portrays present-day Prague in a wealth of ruthless but faithful detail.

From the beginning of the 20th century there was a manifest decline in realism. This transition to a more spiritualized art is associated with the name of F. X. Šalda (1867–1937), creator of modern Czech criticism and a scholar who was, fundamentally, a poet. The change was first exhibited in lyric poetry which has always formed the leading feature of Czech literature. In the case of Antonín Sova (1864–1928), a master of melody and metaphor, his whole work reflects the reactions of an altogether unusually sensitive temperament to the solitude of nature, to its own emotions and to the many-sided social phenomena of modern life.

This sensitive reaction to the internal and external world is found also in the work of such diverse poets as Jiří Karásek ze Lvovic (b. 1871), who has written elegiac verses of impeccable form and decadent subject-matter, Stanislav K. Neumann (b. 1875), eloquent and barbaric in his advocacy of unfettered instincts, who extols rustling forests, flowing waters, amorous women and turbulent multitudes, and Karel Toman (Antonín Bernášek, b. 1877), admirably concise and suggestive in his melodious, profoundly emotional verses. This sensitiveness forms only one of the elements in the personality of Ottokar Březina (Václav Jebavý, 1868–1929), whose lyric poetry was prompted by a cosmic consciousness and exhibits a unique inventiveness of metaphor. In hymn-like poems, which are remarkable on account of their elaborate design and brilliant imagery, the poet, whose life was spent in philosophical seclusion, extols the flight of the soul through the universe to God and its return thence to the everyday world, clutched by myriads of praying and toiling hands. His influence is seen in the work of Otakar Theer (1880–1917), who in the end subordinated his sensual temperament to fertile ideas concerning will and suffering, eternity and God, patriotism and moral liberty. Viktor Dyk (1877–1931), a poet who occupies a place apart, was closely attached to his nation as a living entity which uplifted him from nihilism and imparted a fervid charm to his simple and epigrammatic diction.

Novel and Drama.—In prose fiction the new sensitiveness made its appearance as a strengthening of the picturesque element, and later as an enhanced feeling for the subtleties of psychology, together with a close and sometimes exaggerated cultivation of style. It was on such lines as these that Vilem Mrštík (1863–1912) dealt with the unfettered destinies of youth, Růžena Svobodová (1868–1920) with the sorrows, yearnings and dreams of modern women, Karel Sezima (Karel Kolář, 1876–   ), with the tragic aspect of everyday life in small towns. Here also a reference should be made to Fráňa Šrámek (1877–   ), ecstatically revelling in the beauty of the world and celebrating in luminous prose and also in melodious lyric poems the grief and enchantment of youth. More recently, however, the tendency of the Czech novel has been towards a simplification as regards style and emotional content, and it shows signs of becoming richer in ideas. Inspiration is also being derived from the facts of science, and there is an obvious return towards realism. Thus, Anna Maria Tilschová (1873–   ) is remarkably precise in analysing the decadence of urban society, while Karel Čapek (1890–1938), a whimsical philosopher of the commonplace, combined phantasy with warmth and delicacy of sentiment.

Although the drama has always formed the height of Czech literary ambitions and although the handsome National Theatre, ever since its establishment in 1883, has been regarded as the supreme artistic institution, Czech drama did not thrive in the desired manner. Several of the authors who have already been mentioned tried their hands at writing for the stage. Vrchlický and Zeyer produced scenic poems, the subject-matter of which was derived from myths and history; Ladislav Stroupenický (1850–92) applied the method of realistic *genre* in rural comedies and historical miniatures; Jirásek wrote dramatic chronicle-plays from Czech history or based upon legends and village life; F. X. Svoboda realistic dramas from the life of the contemporary bourgeoisie. But it is only quite recently that the Czech drama has developed greater briskness and a sense of reality, both as regards the problems chosen and the language in which they are treated. Jaroslav Hilbert (b. 1871) and František Langer (b. 1882) are skilful psychologists in the modified realistic manner. Arnošt Dvořák (1881–1932) handled historical subjects with picturesque elaboration; Karel Čapek, beneath whose satirical grimace was concealed the heart of an humanitarian, was a bold contriver of scenic utopias.

Scholarship.—Czech scholarship in the fields of history and linguistics kept close touch with literature from the beginning of the National Revival, and the work of Palacký and Jungmann exercised considerable influence. A direct follower of Palacký was Václav V. Tomek (1818–1905), the historian of the city of Prague, a tireless political historian and founder of the so-called Austrian history. With him was Josef Kalousek (1838–1913), the expert in Czech common law. In the '70s and '80s, Jaroslav Goll (1848–1929), an expert in critical method and the author of valuable studies on the Bohemian Brethren, gave a new direction to Czech historical research, and was responsible for the training of three distinguished scholars: Josef Pekař (1870–1937), shown to be a man of originality of mind by his researches into economic history, popular legends, the National Revival, and the Hussite Wars; Josef Šusta (1874–   ), who has outlined the development of the Czechs against the hitherto neglected background of the history of Western Europe; and finally Václav Novotný (1860–1932), a student of the religious Reformation. Slavonic archaeology has been enriched by the studies of Lubor Niederle (b. 1865). The grammatical studies of Dobrovský and Šafařík were superseded by those of Jan Gebauer (1838–1907) who constructed a logical and systematic history of the Czech language upon the basis of the extensive material he had collected. This was later supplemented by the work of František Bartoš (1837–1906), a Moravian who recorded and analysed the Moravian dialects. Philology and history were united in the work of Jaroslav Vlček (1860–1930), the founder of modern literary history and an exponent of the ideas underlying the age of enlightenment. New light was thrown on the literature of the National Revival by Jan Jakubec (b. 1862), and Václav Flajšhans

(b. 1866) is famous for his studies on the life and work of Jan Hus.

See Count Lützow, *A History of Bohemian Literature* (1899); W. R. Morfill, *Slavonic Literature* (1883); F. Chudoba, *A Short Survey of Czech Literature* (1924); H. Jelínek, *La Littérature tchèque contemporaine* (1912); J. Jakubec and Arne Novák, *Geschichte der Čechischen Literatur* (1913). There are modern histories of Czechoslovakian literature written in the national language by Jar. Vlček, Jan Jakubec and Arne Novák. (A. No.)

CZERNIN, OTTOKAR, COUNT (1872–1932), Austro-Hungarian statesman, was born on Sept. 27, 1872, and became in Feb. 1912 a member of the Austrian upper house, attaching himself to the Constitutional party.

In Oct. 1912 he went as Austro-Hungarian minister to Bucharest. Even at that time he was convinced that, despite the treaty signed by the king with the Triple Alliance, Rumania would not support the Central powers in the event of war except at a price; and on the outbreak of World War I he attempted to persuade his government to pay such a price. He was unsuccessful, but kept Rumania neutral for a long time. At the end of 1916 Czernin succeeded Burian as minister of foreign affairs, and from the first endeavoured to persuade the German emperor and high command to seek the conclusion of a peace which should preserve Germany and Austria-Hungary as great powers, even though Germany must make sacrifices in Alsace-Lorraine and Belgium, for which he suggested that she should receive compensation in the east, chiefly by the acquisition of Polish territory. He was cognizant and approved of the peace negotiations which the emperor, Charles, opened with Britain and France through his brother-in-law, Prince Sixtus of Parma, although he knew nothing of the wording of the letter of March 24, 1917, in which the emperor, Charles, spoke of his willingness to support the "just demand" of France for the return of Alsace-Lorraine by any means and by the use of his whole personal influence with his ally.

During the negotiations at Brest-Litovsk from Dec. 1917 to March 1918 the opposition between the views of the Austro-Hungarian delegation, led by Czernin, and the German delegation became strikingly manifest. In the negotiations leading up to the convention between Russia and the Quadruple Alliance, signed on March 3, 1918, Czernin took a conspicuous part. A few weeks earlier peace had been concluded at Brest-Litovsk with the newly founded republic of the Ukraine. The fact that Czernin, in order to secure this "bread peace," had ceded to Ukraine the district of Chelm, to which the Poles laid claim, aroused the most violent resentment among the latter, and led to unsparing attacks upon him by the Austrian Poles. In the beginning of April 1918 his position was no longer tenable. The immediate cause of his resignation on April 15, 1918, was the conflict between him and the emperor, Charles, over the "Sixtus letter."

BIBLIOGRAPHY.—For Czernin's activity in Bucharest and in the World War *see* his *Im Weltkriege* (1919). His despatches from Bucharest are printed in the Austro-Hungarian "Red Book," *Diplomatische Aktenstücke betreffend die Beziehungen Oesterreich-Ungarns zu Rumänien, 22 Juli 1914 bis 27 August 1916.* A favourable view of Czernin's attitude in the "Sixtus affair" is taken by Count August Demblin in *Czernin und die Sixtus Affaire* (1920); the standpoint of Prince Sixtus is represented in *Prince Sixt de Bourbon, L'offre de la paix séparée de l'Autriche* (1920).

CZERNOWITZ (Rum. *Cernăuti*), a city of Rumania, capital of the Bukovina (*q.v.*), and situated on the main Lemberg-Bucharest railway. Pop. (1930) 111,122; (est. 1939) 109,698. Czernowitz lies on an eminence on the right bank of the Pruth. Its most conspicuous building is the archiepiscopal palace of the Greek orthodox metropolitan of the Bukovina—a notably ugly erection in the Byzantine style. The Orthodox cathedral, completed in 1864, is modelled on the church of St. Isaac in Leningrad. The Armenian church, in mixed Gothic and Renaissance style, was consecrated in 1875. The university, opened in 1875, was formerly a brilliant outpost of Germanic culture in the extreme east of the Austrian empire. The language of instruction is now Rumanian. The main Austrian monument, a statute of Maria Theresa, was wrecked in 1918. An active trade is carried on in agricultural produce, wood, wool, cattle and spirits. The marketplace, with its Ruthenian peasantry, is a very picturesque sight.

At the time of the Austrian occupation (1775), Czernowitz was an unimportant village, but the Austrian colonization of the Bukovina made of it a centre of some importance. It was created a town in 1786. With Bukovina, it was ceded by Rumania to the U.S.S.R. in June 1940 but was regained during the campaign against Russia the following year.

CZERNY, KARL (1791–1857), Austrian pianist and composer, was born at Vienna, where he remained throughout his life. His father, who was a teacher of the piano, trained him for that instrument from an early age with such success that he performed in public at the age of nine, and commenced his own career as a teacher at fourteen. He was brought under the notice of Beethoven, and was his pupil in the sense in which that great master had pupils. He became famous as a teacher of the piano, and among his pupils he numbered Liszt, Theodor Döhler (1814–43) and many others who afterwards became famous. His works, which include every class of composition number nearly a thousand, but none are as well known as those to which he probably attached least importance, namely his admirable educational studies and exercises which still hold their own with the best.

CZESTOCHOWA, a town of Poland, in the province of Kielce, on the left bank of the Warta, 143 mi. S.W. of Warsaw, on the railway between that city and Cracow. Pop. (1931) 117,588; (est. 1939) 138,000. Here is a celebrated monastery on the steep eminence called Jasna Gora. It was founded by King Wladyslaw of the Jagiello dynasty and was at one time fabulously wealthy. In 1430 it was attacked and plundered by the Hussites; in 1655, and again in 1705, it bravely resisted the Swedes; but in 1772 it was forced to capitulate to the Russians and in 1793 to the Prussians. This monastery, which is occupied by monks of the order of Paul the Hermit, contains over the altar in its church a painted image of the Virgin, traditionally believed to have been painted by St. Luke, and visited annually by throngs of pilgrims. The town manufactures cotton, cloth and paper, and does a lively business in rosaries, images, scapularies and so forth. It fell to German troops in the first week of World War II.

D

THIS letter has retained the fourth place in the alphabet from the earliest point at which it appears in history. It corresponds to Semitic ◁ (*daleth*) and Greek Δ (*delta*). The rounded form D occurs in the Chalcidic alphabet, from which it passed into the Latin, as well as in the Etruscan. The Umbrian and Oscan forms, written from right to left, are respectively ꟼ and Я. The letter has retained the rounded form that it had in the Latin alphabet until the present day.

Latin cursive forms were ∂ (5th century) and ɑ (6th century.) In these the right-hand rounded line of the majuscule letter is carried far above the level of its junction with the stroke. From these forms and from uncial arose the Carolingian ∂ and our own miniscule *d*.

The sound consistently represented by the letter in Semitic, Greek, Latin and the modern languages of Europe is the voiced

DEVELOPMENT OF THE LETTER "D" FROM THE PHOENICIAN THROUGH CLASSICAL GREEK AND LATIN TO THE PRESENT TIME

dental stop. In English this sound, as well as the unvoiced sound represented by *t*, has become alveolar, that is to say, is pronounced by the pressure of the tongue upon the gums rather than upon the teeth.

In music, D is the fourth note of the musical alphabet and the second note of the scale of C. In former times it gave its name also to one of two or three clefs which are now no longer in use. (*See* CLEF.) Used as an abbreviation, D has several meanings, e.g., *m.d.*=*main droite; d.c.*=*da capo; d.s.*=*dal segno.*

DAB (*Limanda limanda*), a species of flat-fish belonging to the family Pleuronectidae and distinguishable from plaice and flounder by the distinct arch in the lateral line at the anterior end. It is of a brown or ashen gray colour with irregular dark markings and close-set scales, and is to be found on sandy shores in the north of Europe, the length attained being 12 in. Another species is the sand dab or rusty dab (*L. ferruginea*) found on the coasts of North America. *See* also FLAT-FISH.

DABCHICK, the popular name of the little grebe (*Podiceps fluviatilis*) a member of the family Podicipedidae. It has a wide range in the Old World. *See* GREBE.

D'ABERNON, EDGAR VINCENT, 1ST VISCOUNT (1857–1941), British diplomat, was born at Slinfold, Sussex, on Aug. 19, 1857, the youngest son of Sir Frederick Vincent, 11th Bart., of Stoke D'Abernon, Surrey. He was educated at Eton. In 1882 he was sent to Constantinople as the representative of Great Britain, Holland and Belgium on the council of the Ottoman public debt, of which in 1883 he became president. In 1883 he went to Cairo as financial adviser to the Egyptian government, remaining there until 1889, when he returned to Constantinople as governor of the Imperial Ottoman bank, a post which he resigned in 1897. He entered parliament in 1899 as Conservative member for Exeter, but lost this seat in 1906. In 1914 he was raised to the peerage as Baron d'Abernon. From 1920 to 1926 he was ambassador to Germany. His own financial experience helped the temporary settlement of the debt question under the Dawes plan. His works include *The Economic Crisis—Its Causes and the Cure* (1931) and *Portraits and Appreciations* (1931). In Jan. 1926 he was made a viscount. He died at Hove, Sussex, Nov. 1, 1941.

D'ABRANTÈS, DUCHESSE: *see* JUNOT, LAURE.

DABROWA, a Polish town in the province of Kielce and centre of the coal basin bearing its name. It combines with the basins of Cracow and Polish Silesia to form one of the greatest coalfields of Europe. Pop. (1931) 36,987. The Dabrowa basin, 200 sq.km., produced 6,738,348 tons of coal in 1938. Germany occupied Dabrowa in Sept. 1939.

DA CAPO (It.) or d.c., "from the beginning," a direction used in musical scores to indicate that the first part of a composition is to be repeated. A similar direction, equally often employed, is *dal segno* (or *d.s.*), meaning "from the sign," indicating the return to a 𝄋, or some similar character, placed either at the beginning or at some other point in the piece.

DACCA, a city of British India, giving its name to a district and division of Bengal situated on the Buri-Ganga river with a railway station, 10 mi. from the terminus of the river steamers at Narayanganj. Pop. (1941) 213,218. Dacca has twice been a provincial capital. In 1608 Islam Khan, nawab of Bengal, removed his capital there from Rajmahal and it continued to be the capital till 1704. It was also the capital of the short-lived government of Eastern Bengal and Assam (1905–12). The principal Mohammedan public buildings are the Bara Katra and the Lal-bagh fort. The Lal-bagh ("beautiful garden") fort was begun by Azam Shah, the third son of the emperor Aurangzeb, but it appears never to have been completed; and when Tavernier visited Dacca (*c.* 1666) the nawab was residing in a temporary wooden building in its court. Other buildings of the Mogul period are the Chota Katra (1663), Husaini Dalan (1642) and several mosques. Except for these there are few buildings of any great age and interest: even in Tavernier's time the houses were "no more than paltry huts built up with bamboos and daubed over with fat earth." The English established a factory in the city in the 17th century, but it was pulled down in 1829 or 1830. The French and Dutch factories have also disappeared. Of modern buildings the finest are those built during the years when Dacca was the capital of Eastern Bengal and Assam; these are grouped round a large park called the Ramna, a mile from the centre of the city. Some, such as the residence of the lieutenant-governor and the secretariat, have been appropriated to the use of the University of Dacca. The university was established in 1921 and had 1,325 full-time students in 1925: the students reside in halls and hostels, such as the Curzon hall, Dacca hall and Jagannath hall. Among other institutions may be mentioned the Mitford hospital and Dacca medical school. There are four Christian churches, Anglican, Roman Catholic, Greek and Armenian, a Sikh temple and many Hindu temples, of which the most notable is that of Dhaleswari. The famous manufacture of fine muslins, which was the chief article of local trade, is almost extinct, but the carving of shells, carried on from ancient times, is an important industry.

The District of Dacca has an area of 2,738 sq.mi. and a population of (1941) 4,222,143. The district consists of a level plain bounded on three sides by the Meghna, the Ganges or Padma, and the Jamuna, or main stream of the Brahmaputra, and watered by a network of rivers and streams, such as the Dhaleswari, the Buriganga and the Lakshya. About 20 mi. N. of Dacca city, small ridges are met with in the Madhupur jungle, stretching into Mymensingh district. These ridges, however, are mere mounds not over 50 ft. to 60 ft. high, composed of red soil containing a considerable quantity of iron ore; and the whole tract is for the most part unproductive. The country lying to the south of the Dhaleswari is the most fertile part of the district. It consists entirely of rich alluvial soil, annually inundated to a depth varying from 2 to 14 ft. of water. Villages here are built on artificial mounds of earth, so as to raise them above the flood level.

Rice is the principal crop, followed by jute. The industries consist of jute pressing, weaving, embroidery, gold and silver work and shell-carving; soaps, mother-of-pearl buttons and horn combs are also made locally, and some oil mills have been started. The weaving industry and the manufacture of fine Dacca muslins have greatly fallen off, owing to the competition of European piece goods. The manufacture of Kasidas, *i.e.*, muslins embroidered with silk, which used to be exported to Turkey, has also been declining since World War I. Narayanganj is the centre of the jute trade.

The Division of Dacca lies in the east of Bengal within the delta formed by the Brahmaputra and the Ganges. It consists of the four districts of Dacca, Mymensingh, Faridpur and Bakarganj. Its area is 15,498 sq. miles. Its population in 1941 was 16,683,714.

University of Dacca.—The creation of the University of Dacca was brought about owing to the Government of India's wish to provide increased educational facilities for the Muslims of eastern Bengal, to set up a new residential and teaching type of university and to relieve the congestion of the (affiliating) University of Calcutta. After reports from a special committee in 1912 and the Calcutta University Commission in 1919, it was opened on July 1, 1921. The university has fine buildings, and an estate of nearly a square mile, with large playing fields, three residential halls, well equipped chemical and physical laboratories, and residences for the staff. The constitution is similar to that of the English provincial universities, but on the residential side it is more akin to Oxford and Cambridge. Research is carried on in all departments. The library contains about 44,000 volumes.

DACE, DARE or **DART** (*Leuciscus leuciscus*), a Cyprinid fish of the rivers of Siberia, Europe north of the Alps and Pyrenees, and England. It is closely related to the chub, but has a smaller head and smaller mouth. It is a graceful fish, silvery in coloration, and an active swimmer; it rarely reaches a length of more than 12 in. In America the name is given to other Cyprinidae, *e.g.*, the Horned Dace (*Semotilus atromaculatus*).

DACH, SIMON (1605–1659), German lyrical poet, was born at Memel in East Prussia on July 29, 1605. Educated in the classical schools of Königsberg, Wittenberg and Magdeburg, he entered the university of Königsberg in 1626 as a student of theology and philosophy. He was professor of poetry at Königsberg from 1639 until his death on April 15, 1659. At Königsberg he formed with Heinrich Albert (1604–51), Robert Roberthin (1600–48) and Sibylla Schwarz (1621–38), the so-called *Königsberger Dichtergruppe.* He sang the praises of the house of the electors of Brandenburg in a collection of poems entitled *Kurbrandenburgische Rose, Adler, Löwe und Scepter* (1661), wrote excellent hymns, and also produced many occasional poems; the most famous of them is *Anke von Tharaw öss, de my geföllt* (rendered by Herder into modern German as *Ännchen von Tharau*).

DACHAU, a town in Upper Bavaria, Germany, 8 mi. N.W. of Munich on the railway from Munich to Ingolstadt. Pop. (1939) 17,594. It has extensive fortifications, a castle and a museum of antiquities, and makes paper, sawmill machinery and beer. It formerly had a colony of artists. After 1933 one of the most notorious of the nazi concentration camps was located there.

DACIA, a large district of central Europe, bounded on the north by the Carpathians, on the south by the Danube, on the west by the Pathissus (Theiss) and on the east by the Tyras (Dniester), thus corresponding in the main to the modern Rumania and Transylvania. The inhabitants of this district were a Thracian stock, originally called Δᾶοι (after the 4th century B.C., Δακοί). The Getae (*q.v.*) were most akin to them in language and manners; by the Greeks the Dacians were usually called Getae, by the Romans Daci. Δᾶος and Γέτα (Davus, Geta) were common as names of slaves in Attic comedy and in the adaptations of Plautus and Terence. The Dacians had attained a considerable degree of civilization when they first became known to the Romans. They believed in the immortality of the soul, and regarded death as merely a change of country. They were divided into two classes —an aristocracy and a proletariat. The first alone had the right to cover their heads and wore a felt hat (*pilleus,* hence *tarabostesei*= πιλοφόροι *pilleati*), the second class, who comprised the rank and file of the army, the peasants and artisans, wore their hair long (κομηταί, *capillati*). Their chief occupations were agriculture and cattle breeding; horses were mainly used as draught animals. They also worked the gold and silver mines of Transylvania, and carried on a considerable outside trade.

A kingdom of Dacia was in existence at least as early as the beginning of the 2nd century B.C. under a king Oroles. Conflicts with the Bastarnae and the Romans (112–109, 74), had greatly weakened the resources of the Dacians. Under Burbista (Boerebista), who thoroughly reorganized the army, the limits of the kingdom were extended; indeed the Dacians appeared so formidable that Caesar contemplated an expedition against them, which was prevented by his death. About the same time Burbista was murdered, and the kingdom was divided under separate rulers. One of these was Cotiso, to whom Augustus betrothed his five-year-old daughter Julia. The Dacians are often mentioned under Augustus, according to whom they were compelled to recognize the Roman supremacy. But they were by no means subdued, and seized every opportunity of crossing the frozen Danube and ravaging the province of Moesia. From A.D. 85 to 89 the Dacians were engaged in two wars with the Romans, under Duras and Decebalus. After reverses, the Romans gained the advantage, but were obliged to make peace owing to the defeat of Domitian by the Marcomanni. Decebalus received the crown from Domitian's hands, an apparent acknowledgment of Roman suzerainty. But the Dacians were really left independent, as is shown by the fact that Domitian agreed to purchase immunity from further Dacian inroads by the payment of an annual tribute.

To put an end to this disgraceful arrangement, Trajan resolved to crush the Dacians once and for all. The result of his first campaign (A.D. 101–102) was the occupation of the Dacian capital Sarmizegethusa, of the second (105–107), the conquest of the whole kingdom and its conversion into a Roman province. It was under a governor of praetorian rank, and the legio xiii. *gemina* with numerous auxiliaries had its fixed quarters in the province. To make up for the ravages caused by the recent wars colonists were imported to cultivate the land and work the mines, and the old inhabitants gradually returned. Forts were built as a protection against the incursions of the surrounding barbarians, and three great military roads were constructed to unite the chief towns, while a fourth, named after Trajan, traversed the Carpathians and entered Transylvania by the Roteturm pass. The two chief towns were Sarmizegethusa (afterwards Ulpia Traiana) and Apulum (Karlsburg).

In A.D. 129, under Hadrian, Dacia was divided into Dacia *Superior* and *Inferior,* the former comprising Transylvania, the latter Little Walachia, with procurators, both under the same praetorian legate. Marcus Aurelius redivided it into three (*tres Daciae*), Porolissensis, Apulensis and Maluensis. The *tres Daciae* had a common capital, Sarmizegethusa, and a common diet, which discussed provincial affairs, formulated complaints and adjusted the incidence of taxation; but in other respects they were independent provinces, each under a procurator, subordinate to a governor of consular rank.

The Roman hold on the country was, however, still precarious. Hadrian contemplated its abandonment and was only deterred by consideration for the safety of the numerous Roman settlers. In A.D. 256 the Goths crossed the Carpathians and drove the Romans from Dacia, with the exception of a few fortified places. Aurelian (A.D. 270–275) withdrew the troops altogether and settled the Roman colonists on the south of the Danube, in Moesia, where he created the province Dacia Aureliani. (*See* also Vlachs.)

DACIER, ANDRÉ (1651–1722), French classical scholar, was born at Castres in upper Languedoc. In 1672 he went to Paris, and was appointed one of the editors of the Delphin series of the classics. In 1683 he married Anne Lefèvre, the daughter of his old tutor (*see* below). As payment for his share in the "medallic" history of the king's reign, he was appointed keeper of the library of the Louvre. The most important of his works were his editions of Pompeius Festus and Verrius Flaccus, and his translations of Horace (with notes), Aristotle's *Poetics,* the *Electra* and *Oedipus Coloneus* of Sophocles, Epictetus, Hippocrates and Plutarch's *Lives.*

His wife, Anne Lefevre (1654–1720), French scholar and translator from the classics, was born at Saumur. On her father's death in 1672 she removed to Paris, carrying with her part of an edition of Callimachus, which she afterwards published. She was engaged as one of the editors of the Delphin series of classical authors, in which she edited Florus, Dictys Cretensis, Aurelius Victor and Eutropius. In 1681 appeared her prose version of Anacreon and Sappho; in the next few years she published prose versions of Terence and some of the plays of Plautus and Aristophanes. In 1684 she and her husband retired to Castres to devote themselves to theological studies, and in 1685 they became Roman Catholics. In 1699 appeared the prose translation of the *Iliad* (followed nine years later by a similar translation of the *Odyssey*), which gained for her the position she occupies in French literature. The appearance of this version, which made Homer known for the first time to many French men of letters, gave rise to a famous controversy with A. Houdar de la Motte and others on whether so ancient a poet still retained merit.

Sainte-Beuve, *Causeries du lundi,* vol. ix.

DACITE (from Dacia, mod. Transylvania), in petrology, volcanic rocks which may be considered a quartz-bearing variety of andesite. Like the latter they consist for the most part of plagioclase felspar with biotite, hornblende, augite or enstatite, and have generally a porphyritic structure, but they contain also quartz as rounded, corroded phenocrysts, or as an element of the ground-mass. Their felspar ranges from oligoclase to andesite and labradorite; sanidine occurs also in some dacites, and when abundant gives rise to rocks which form transitions to the rhyolites. From this list of minerals it is readily seen that the dacites are the volcanic equivalent of the plutonic tonalites. Many of the hornblende- and biotite-dacites are grey or pale brown and yellow rocks with white felspars and black crystals of biotite and hornblende; others, especially augite- and enstatite-dacites, are darker coloured. The rocks of this group occur in Hungary, Almeria (Spain), Argyllshire and other parts of Scotland, Victoria, New Zealand, the Andes, Martinique, Nevada and other districts of western North America, Greece, etc. They are mostly associated with andesites and trachytes, and form lava flows, dikes and in some cases massive intrusions in the centres of old volcanoes. Among continental petrographers the older dacites (Carboniferous, etc.) are often known as "porphyrites."

DACOIT, a term used in India for a robber belonging to an armed gang. The word is derived from the Hindustani *dakait,* and being current in Bengal got into the Indian penal code. By law, to constitute *dacoity,* there must be five or more in the gang committing the crime. In Burma also the word dacoit came to be applied in a special sense to the armed gangs which maintained a state of guerilla warfare for several years after the defeat of King Thibaw in Nov. 1885. (*See* Burmese Wars.)

DA COSTA, ISAAK (1798–1860), Dutch poet and theologian, was born at Amsterdam on Jan. 14, 1798. His father was a Jew of Portuguese descent, and claimed kindred with the celebrated Uriel D'Acosta. He studied at Amsterdam and at Leiden, where he took his doctor's degree in law in 1818, and in literature in 1821. In 1814 he wrote *De Verlossing van Nederland,* a patriotic poem, which placed him in line with the contemporary national romantic poets in Germany and in France. His *Poëzy* (2 vols., 1821–22) revealed his emancipation from the Bilderdijk tradition, and the oriental colouring of his poems, his hymn to Lamartine, and his translation of part of Byron's *Cain,* establish his claim to be considered as the earliest of the Dutch romantic poets. In 1822 he became a convert to Christianity, and towards the close of his life was a director of the seminary established in Amsterdam in connection with the mission of the Free Church of Scotland. He died at Amsterdam on April 28, 1860. Da Costa ranked first among the poets of Holland after the death of Bilderdijk. His principal poetical works were: *Alphonsus I.* (1818), a tragedy; *Poëzy* (Leyden, 1821); *God met ons* (1826); *Festliedern* (1828); *Vijf-en-twintig jaren* (1840); *Hagar* (1852); *De Slag bij Nieuwpoort* (1857). He also translated *The Persians* (1816) and the *Prometheus* (1818) of Aeschylus, and edited the poetical works of Bilderdijk.

His complete poetical works were edited by J. P. Hasebroek (3 vols., Haarlem, 1861–62). *See* G. Groen van Prinsterer, *Brieven van Mr I. da Costa, 1830–1849* (1872), and J. ten Brink, *Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw* (vol. i., 1888, bibl.).

DACTYL, in prosody, a long syllable followed by two short (Gr. δάκτυλος "a finger"). (*See* Verse.)

DADO, a decorative band running horizontally along the lower portion of a wall above the base; a wainscot that does not cover the entire height of the wall. The dado is frequently separated from the rest of the wall by a moulding known as a chair rail or surbase.

DADU PANTHIS. The Dadu Panthi sect of western India (following Dadu's path) founded by Dadu about the year 1600, has many followers in Ajmir and Marwar, one section of whom, the Nagas, engage largely in military service, while the others are either householders or mendicants. The followers of this creed wear no distinctive sectarial mark or badge except a skull-cap; nor do they worship the visible image of any deity, the repetition (*japa*) of the name of Rama being the only kind of adoration practised by them.

DAEDALUS, a mythical Greek architect and sculptor, who was said to have built the labyrinth for Minos of Crete, to have made a wooden cow for Pasiphaë and a bronze man who repelled the Argonauts. Falling under the displeasure of Minos, he fashioned wings for himself and his son Icarus and escaped to Sicily. These legends seem primarily to belong to Crete, and the Athenian element, which connected Daedalus with the royal house of Erechtheus, is a later fabrication. To Daedalus the Greeks of the historic age were in the habit of attributing buildings and statues the origin of which was lost in the past. In many cities of Greece there were rude wooden statues, said to be by him. Later critics ascribed to Daedalus such improvements as separating the legs of statues and opening their eyes. In fact, the name Daedalus is a mere symbol, standing for a particular phase of early Greek art, when wood was the chief material and other substances were let

into it for variety. In a later verse in the *Iliad* he is mentioned as the maker of a dancing-place in Crete.

This Daedalus must not be confused with Daedalus of Sicyon, a great sculptor of the early part of the 4th century B.C., none of whose works is extant.

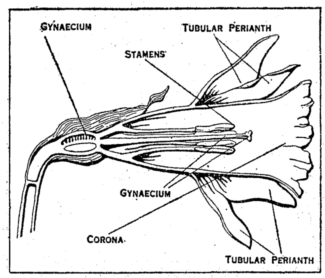
DAENDELS, HERMAN WILLEM (1762–1818), Dutch general, was born on Oct. 21, 1762, at Hattem in Gelderland. He began his career as a solicitor, but during the revolution of 1787 went to France, and fought against Holland in 1793. When the Batavian republic was proclaimed three years later Daendels was made a lieutenant-general. He fought against the English and Russians in north Holland in 1799, and for his conquest of East Friesland and Westphalia in 1806 was made a marshal. He was governor-general of Dutch East India from 1807 to 1811. He defended Modlin in the Russian campaign of 1812–13. From 1815 Daendels administered the Dutch possessions on the Gold Coast, dying at Saint George del Mina on May 2, 1818.

Daendels published a 4-volume work on his administration of Java in 1814.

DAET, a municipality (with administration centre and 30 *barrios* or districts) and capital of the province of Camarines Norte, Luzon, Philippine islands, situated in the northeast part of the province near the coast. It is the chief commercial place in the province and does most of its business direct with Manila. Pop. (1939), 20,066, of whom only 19 were whites. Of the 10 schools, 5 were public. According to the census of 1939, 19,457 persons speak Bikolano, 11,211 speak Tagalog, 7,829 speak English, and 675 speak Spanish.

A Franciscan convent was established there early in the 17th century.

DAFFODIL, the common name of a group of plants of the genus *Narcissus*, of the family Amaryllidaceae (*see* NARCISSUS). The common daffodil, *N. pseudo-narcissus*, is frequent in woods and thickets in most parts of northern Europe, but is rare in Scotland. It is sparingly naturalized in the eastern United States as an escape from cultivation. Its leaves are five or six in number, are about a foot in length and an inch in breadth, and have a blunt keel and flat edges. The flower stalk is about 18 in. long, the spathe single-flowered. The flowers are large, yellow, scented and a little drooping, with a corolla deeply cleft into six lobes, and a central bell-shaped nectary, which is crisped at the margin. They appear early in the year. The stamens are shorter than the cup, the anthers oblong and converging; the ovary is globose, and has three furrows; the seeds are roundish and black. Many horticultural varieties, some with double flowers, are cultivated in gardens. The bulbs are large and orbicular, and have a blackish coat.



FROM GROOM'S "ELEMENTARY BOTANY" (G. BELL & SONS LTD.)

DAFFODIL (NARCISSUS PSEUDO-NARCISSUS), DIAGRAM OF SECTION OF THE FLOWER

The daffodil is a native of England and is widely cultivated in America. Each stem has one yellow trumpet-shaped blossom

The Peruvian daffodil and the sea daffodil are species of the genera *Hymenocallis* and *Pancratium*.

DAFLA HILLS, a tract of hilly country on the border of Assam, occupied by an independent tribe called Dafla. It forms part of the sub-Himalayan hills to the north of the Darrang and Lakhimpur districts, and is bounded on the west by the Bhareli river and on the east by the Ranganadi river. The Daflas are akin to both the hill Miris and the Abors. They are divided into exogamous clans claiming descent from the moon ♂ and sun ♀ extremely democratic in polity, but slave owners; burying their dead, whose spirits go to an underground world except in the case of unnatural deaths when they ascend to the sky. They use cane helmets, hide armour, long sword, spear and arrows poisoned with aconite.

In 1872 the Daflas attacked a colony of their own tribesmen in British territory, which led in 1874 to a punitive expedition. Several small expeditions have since been made. The Daflas continually raid one another; occasional petty forays in the plains are made by malcontents and escaped slaves.

See Nevill, *The Daflas; Assam Census Report* (1921) I., Apdx. B. i.

DAFYDD AB GWILYM (14th century), Welsh poet, a contemporary of Chaucer, was born at Bro Gynin, Cardiganshire, about 1340, and died about 1400. He was elected chief bard of Glamorgan, and was household bard to his kinsman, Ivor Hael of Maesaleg.

After an unsuccessful attempt to elope with Morfudd Lawgam, to whom he addressed 147 odes, he was imprisoned, but was ransomed by his friends in Glamorgan. He wrote nature poems, the best of which are: "The Lark," "The Wind" and "The Mist." George Borrow, who called him the Horace of Wales, translated some of his verses, most of which were written in the *cywydd* form; *i.e.*, a short ode not divided into stanzas, each line having the same number of syllables.

DAGENHAM, a municipal borough in the Romford parliamentary division of Essex, England, 12 mi. from Whitechapel (London) church and served by the London Passenger Transport board and the L.M.S.R. Pop. (est. 1938) 107,400. Area, 10.51 sq.mi. The rapidity of Dagenham's growth is unique in Britain. In the period 1926–38 it rose from parish council to municipal borough, and in 1921 its population was only 9,127. This phenomenal rise was partly due to the building of the London County council's housing estate at Becontree, 15,000 houses being in Dagenham, the opening of the Ford Motor company's factory in the parish on the north bank of the Thames in Nov. 1931 (factory completed 1932) and subsequent extensive private development.

DAGGER, a hand weapon with a short blade. The derivation is obscure (*cf.* Fr. *dague* and Ger. *Degen*), but the word is related to *dag,* a long pointed jag such as would be made in deeply nicking the edge of a garment. The war knife in various forms and under many names has of course been in use in all ages and amongst all races. But the dagger as generally understood was not a short sword, but a special stabbing weapon which could be used

TYPES OF DAGGERS FROM THE 16TH. TO THE 19TH. CENTURY
A. Italian or French dagger, 16th century. B. Italian stiletto, 17th century. C. Italian dagger, late 15th century. D. Scottish dirk, with scabbard, knife and fork, early 19th century. E. Malay kris, 18th–19th centuries

along with the sword. The distinction is often difficult to establish in a given case owing to the variations in the length of the weapon. The principal mediaeval dagger was the *miséricorde,* which from the end of the 12th century was used to penetrate the joints of the armour of an unhorsed adversary (hence Ger. *Panzerbrecher,* armour-breaker). It was so called either because the threat of it caused the vanquished to surrender "at mercy," or from its use in giving what was called the *coup de grâce.* From about 1330 till the end of the succeeding century, in many knightly effigies it is often represented as attached on the right side by a cord or a chain to the sword-belt. This weapon and its sheath were often elaborately adorned. It was customary to secure it from accidental loss by a guard-chain fastened to the breast-armour. Occasionally the *miséricorde* was fixed to the body-armour by a staple; or, more rarely, it was connected with a *gypcière* or pouch. The *miséricorde* may be called a poniard. The distinction between the dagger and the poniard is arbitrary, and in ordinary language the latter is taken as being the shorter and as having less resemblance to a short sword or cutlass. A weapon, with a longer blade than the *miséricorde,* was habitually worn by civilians, including judges, during the middle ages; such weapons bore the name of *anlace* (from *annulus,* as it was fastened by a ring), *basilarde* or *langue de bœuf,* the last from the broad ox-tongue shape of the blade. This had often a small knife fixed on the scabbard, like a Highland officer's dirk of the present day. By nobles and knights the dagger or poniard was worn when they had exchanged their armour for the costume of peace. It is recorded besides that when they appeared at a tournament and on some other occasions, ladies at that time wore daggers depending, with their *gypcières,* from their girdles. Thus, writing of the year 1348, Knighton speaks of certain ladies who were present at jousts as "habentes cultellos, quos *daggerios* vulgariter dicunt, in powchiis desuper impositis." A longer and heavier dagger with a broad blade (Italian) is called *cinquedea.* The Scottish "dirk" was a long dagger, and survives in name in the dirk worn by midshipmen of the royal navy, and in fact in that worn by officers of Highland regiments. In the 15th and 16th centuries the infantry soldiers (Swiss or *landsknecht*) carried a heavy poniard or dagger. This and the earlier Spanish dagger with a thumb-ring were distinctively the weapons of professional soldiers. The rise of duelling produced another type, called the *main gauche,* which was a parrying weapon and often had a toothed edge on which the adversary's sword was caught and broken. One form of this dagger had a blade which expanded into a triple fork on pressing a spring; this served the same purpose. The satellites of the *Vehmgericht* had a similar weapon, in order, it is suggested, that their acts should be done in the name of the Trinity. The smaller poniards are generally called "stilettos." Much ingenuity and skill have been lavished on the adornment of daggers, and in rendering the blades more capable of inflicting severe wounds. Daggers also were sometimes made to poison as well as to wound. Of oriental daggers may be mentioned the Malay "crease" or "kris," which has a long waxed blade; the Gurkha "kukri," a short curved knife, broadest and heaviest towards the point; and the Hindu "khuttar," which has a flat triangular-shaped blade, and a hilt of H-shape, the cross-bar forming the grip and the sides the guard.

DAGHESTAN (Dagestan), an autonomous S.S.R. in the Russian Soviet Federated Socialist Republic. Area 13,124 sq.mi. Pop. (1939) 930,527, urban 196,480, rural 734,047. Its boundaries are:—north, Orjonikidze territory; east, the Caspian Sea; south, the Azerbaijan S.S.R.; west, the Checheno-Ingushetia A.S.S.R. and the Georgian S.S.R. It was created in January, 1921, and then included mainly the former Daghestan province, a mountainous area, with a narrow coastal strip. But later, in view of the need for winter pasture for the *transhuman* hill shepherds, the Kizlyar and Kara-Nogai steppes were incorporated in the republic. The republic falls into four structural divisions.

The Plains.—North of the Terek river lies an area of continuous salty sands, sparsely peopled, and of use mainly as winter pasture for the hill sheep and goats. The delta of the Terek consists of salt marshes, while from the right bank to the hills is a stretch of chestnut coloured soil, favourable for agriculture, fruit and vine culture if irrigation supplements the too scanty rainfall. In its lower course the river deposits much alluvium and its bed is high above the neighbouring fields—at Kizlyar it is on a level with the spire of the church. Consequently, when the hill snows melt in spring, the river frequently overflows its banks and the area is subjected to devastating floods. From Makhach-Kala (Petrovsk) to the Samur river is a coastal strip of sandy, clayey, or salty grey earth. The alluvial patches are fertile and rice is grown in the river deltas, while in the southern sub-tropical area the vine, almond, peach, apricot and other fruits grow well. Cotton is cultivated, an early kind near Makhach-Kala and a later kind near Derbent. The only forested area is on the damp bog soil of the Samur area.

The Foothills.—This zone consists of the lower ridges 1,300 to 3,300 ft. and the valleys and basins between them, and is about 14 to 27 miles in width. The climate is milder than that of the plains or mountains, and has a greater rainfall, mainly in autumn. Its milder, wetter winter and dry hot summer make it favourable to vineyard, fruit and garden produce, and it contains the greatest forest wealth of Daghestan.

The Mountain Zone.—A belt from 26 to 33 m. in width, running in a south easterly direction, and consisting mainly of limestone. Its climate is very dry, with a maximum rainfall in summer and a sharp, cold winter with little snow. There is, however, a marked contrast between the damp, cool summer of the heights and the hot, dry summer of the valleys. These inland mountains of Daghestan are wild and sterile, but the hill people, with enormous labour, have cultivated tiny irrigated patches on rocky ledges. In autumn, after the harvest, the younger men stream out into the surrounding areas, especially the Baku industrial region, to try to find work to supplement their tiny harvest, while the women work at *koustar* (peasant) industries, thread, cloth, carpets, gold and silver embroidery and the older men at metal, wood and leather. This system inevitably has bad social results, and the diseases of the industrial areas have spread with devastating rapidity through the hill country.

The High Mountain Area.—The border between the limestone hills and the slate outcrop is very sharp: steep rocky walls lying on a base of black, clayey slate rise above the limestone dolomite mass. Glaciers and perpetual snow cover their summits, and the climate is very severe, with a long, cold winter and a short, cool summer. The valleys and lower slopes are more richly forested than those of the limestone area, while the treeless alpine meadows of the south east provide rich summer pasture for the nomadic herdsmen. The ancient glacial valleys, with their wide flat bottoms, are favourable for cultivation and cattle rearing.

The main features of Daghestan are that inaccessible mountains occupy four-fifths of its area and that, of the remaining plain, much is salt or marsh. Pasture and hayfields occupy most of the republic which is not bare, stony or sandy, forests come next, and the small remaining area suitable for crops and fruit cultivation is liable to drought and needs careful irrigation.

During the Civil War Daghestan probably suffered more severely than any other part of Russia. Various political parties exploited the fierce love of liberty of the illiterate hill folk and their passionate devotion to Islam. Their fighting powers were well known and they were enlisted by the National Independents, by the Denikin group, by the Georgian Menshevists, by the Pan-Islam and Pan-Turk leaders, and for a short time an emirate of the North Caucasus under the Sultan of Turkey existed. The Bolshevists, like the Imperial government, attached great importance to the area because of its links with Baku and finally succeeded in conquering its wild peoples. But the cost was terrible; roads, bridges, primitive irrigation schemes and the simple implements of peasant industry were completely destroyed. Of 60 villages and one town, Khasav-Yurt, not a trace was left, while in other towns, notably Derbent, more than three quarters of the buildings were destroyed. The impossibility of moving the herds to winter pasture led to the starvation of more than 75% of them, and an equal proportion of vineyards and fruit orchards was ruined by the destruction of irrigation works. The famine of 1921–2 was specially severe in Daghestan, cattle plague broke out among the remnants of the herds in 1922 and locusts and field mice, enormously increased by the lack of vigilance in the troubled years, injured the crops in 1923, while the hurricanes and hailstorms of that year completed their ruin. The partial drought of 1924 was severe in Daghestan. Typhus, famine diseases, malaria and social diseases have wrought havoc among the survivors of these terrible times. The unemployed workers from the ruined towns fled to the hills to swell the numbers of land-less and cattle-less, half-starved hill peasants.

The new republic thus starts its existence under heavy handicaps. Capital is needed, but is not yet forthcoming, to provide new irrigation works, to replace the destroyed sheep and cattle, to rebuild the ruined towns, villages, roads and bridges and to provide seeds and implements for the poverty stricken cultivators; while the shattered *morale* and physique of the natives are added disabilities. A problem of much longer standing is the fact that among the bleak uplands of Daghestan, isolated by deep gorges and arid ridges, more than thirty nationalities, speaking different languages, some bearing historic names, *e.g.*, Avars and Huns, have survived to modern times, and thus difficulties of linguistic communication are added. Attempts are being made to introduce Azerbaijan Turkish, which seems easiest for most of these nationalities to assimilate, into the schools, but under present conditions education is difficult and many children receive no school education. Relief works include the construction of the October canal, supplying 15 villages with the means of irrigation, the making of irrigation canals in the Kara-Nogai steppe, the regulation of the Terek river and draining of the Sulak marsh, while cotton, maize and sun-flower seed cultivation is reviving, and the cotton factories at Tagier and Makhach-Kala have been reopened. A scheme of electrification for the latter town and the railway to the Sulak river is planned, and small cotton, glass, leather, food-preserving and nail factories are working there, and oil refineries are being constructed. The fishing industry has been financed by credit banks and is reviving rapidly. Co-operative movements are attempting to finance the scattered peasant cultivators and their home industries of silver and tin working, bootmaking, cloth, felt and carpet making; the latter were temporarily ruined by the destruction of sheep and consequent lack of wool supply. Possible future sources of revenue may be the establishment of health resorts and the working of the great mineral wealth, but this needs capital. In pre-war times French capital was working the sulphur, and English capital the quicksilver and cinnabar mines, while the Nobel firm worked the naphtha and natural gas. The coastal railway forms part of the line linking Baku with the Black Sea, but turns westward at Makhach-Kala; a branch from Shakhmaya, just north of Makhach-Kala goes south-west to Buinaksk (Temir-Khan-Shura), situated on the north to south road, while another branch from the inland town of Cherelennaya on the Terek goes north-east as far as Kizlyar, at the head of the Terek delta. The administrative centre is Makhach-Kala (Petrovsk), pop. (1939) 86,847, a port on the Caspian through which naphtha from Grozny is exported to the Volga. The town has cold storage facilities, a lighthouse, and routes to various Caspian ports. It has small manufactures (*see* above) and recently a factory for extracting soda from Glauber salts has been established, and sulphur extraction has re-commenced. South of it is a health resort with sulphur springs. Derbent, also a port on the Caspian, has wool spinning mills, and like Makhach-Kala, is a centre for the fishing industry. Kizlyar, at the head of the Terek delta, is a centre for the vine and fruit of the district and should increase in importance if the plans for irrigating the area and settling the poverty stricken hill-peasants in the surrounding district are successful. An electric station was established at Akhty, in the heart of the mountains, on the Samur and efforts were being made to drain the Samur delta marshes, while another electric station was established near Gunib in the central mountain area. Buinaksk (Temir-Khan-Shura) is increasing in importance owing to the establishment of fruit preserving works, the products of which can be sent by rail to Makhach-Kala.

DAGIS: *see* Caste.

DAGNAN-BOUVERET, PASCAL ADOLPHE JEAN (1852–1929), French painter, born in Paris on Feb. 7, 1852. He studied under Gérome at the École des Beaux Arts, and first attracted notice by his picture "A Wedding at the Photographers" in the Salon of 1879. He joined the movement, initiated by Bastien-Lepage in France, which took up the study of contemporary life. From 1880 onwards he made Brittany with its rustic types his special sphere of study. A harmonious green tone pervades his open-air effects. He is a fine draughtsman and also practises lithography. For the Sorbonne he painted a large panel representing Apollo and the Muses.

DAGO, a name given somewhat contemptuously to Spanish, Portuguese and Italian sailors. In America the word is generally confined in its use to designate the poorer class of Italian immigrants. The word is apparently a corruption of the common Spanish and Portuguese Christian name "Diego."

DAGOBERT I. (d. 639), king of the Franks, was the son of Clotaire II. In 623 his father established him as king of the region east of the Ardennes, and in 626 revived for him the ancient kingdom of Austrasia, *minus* Aquitaine and Provence. As Dagobert was yet but a child, he was placed under the authority of the mayor of the palace, Pepin and Arnulf, bishop of Metz. At the death of Clotaire II. in 629, Dagobert wished to re-establish unity in the Frankish realm, and in 629 and 630 made expeditions into Neustria and Burgundy, where he succeeded on the whole in securing the recognition of his authority. In Aquitaine he gave his brother Caribert the administration of the counties of Toulouse, Cahors, Agen, Périgueux and Saintes; but at Caribert's death in 632 Dagobert became sole ruler of the whole of the Frankish territories south of the Loire. Under him the Merovingian monarchy attained its culminating point. He restored to the royal domain the lands that had been usurped by the great nobles and by the Church; he maintained at Paris a luxurious, though, from the example he himself set, a disorderly court; he was a patron of the arts and delighted in the exquisite craftsmanship of his treasurer, the goldsmith St. Eloi. His authority was recognized through the length and breadth of the realm. The duke of the Basques came to his court to swear fidelity, and at his *villa* at Clichy the chief of the Bretons of Domnoné promised obedience. He intervened in the affairs of the Visigoths of Spain and the Lombards of Italy, and was heard with deference. Indeed, as a sovereign, Dagobert was reckoned superior to the other barbarian kings. He entered into relations with the eastern empire, and swore a "perpetual peace" with the emperor Heraclius; and it is probable that the two sovereigns took common measures against the Slav and Bulgarian tribes, which ravaged in turn the Byzantine state and the German territories subject to the Franks. Dagobert protected the Church and placed illustrious prelates at the head of the bishoprics—Eloi (Eligius) at Noyon, Ouen (Audoenus) at Rouen, and Didier (Desiderius) at Cahors. His reign is also marked by the creation of numerous monasteries and by renewed missionary activity in Flanders and among the Basques. He died on Jan. 9, 639, and was buried at St. Denis. After his death the Frankish monarchy was again divided. In 634 he had been obliged to give the Austrasians a special king in the person of his eldest son Sigebert, and at the birth of a second son, Clovis, in 635 the Neustrians had immediately claimed him as king. Thus the unification of the realm, which Dagobert had re-established with so much pains, was annulled.

See the *Chronicon* of Fredegarius; "Gesta Dagoberti I. regis Francorum" in *Mon. Germ. hist. Script. rer. Meroving.* vol. ii. edited by B. Krusch; J. H. Albers, *König Dagobert in Gesch., Legende, und Sage* (2nd ed. Kaiserslautern, 1884); E. Vacandard, *Vie de Saint Ouen, évêque de Rouen* (Paris, 1901); and H. E. Bonnell, *Die Anfänge des karoling, Hauses* (Berlin, 1866). (C. Pf.)

DAGOMBA, the Hausa name of the Dagbamba in the Dagong district of Tamale and Yendi in the northern parts of the Gold Coast, probably parent stock of the Mossi, having the same physical, linguistic and social characters; once a powerful kingdom which in the 18th century fought against the Ashanti and placed the Gondja and Bassari in subjection. They are warriors and cultivators; engaged in cattle-raising and trade, and remain animists, with a certain proportion of Muslims.

See Graf, von Zech, "Land und Leute an der Nord-West Grenze von Togo," *Mitt. der deutsch. Schutzgebiete* (1904).

DAGON, a native Semitic deity, adopted by the Philistines after their settlement in Canaan (Judg. xvi. 21, 23; 1 Sam. v. 1; *cf.* Josh. xv. 41, 1 Chron. x. 10, 1 Macc. x. 83, 84, xi. 4). Identical with the Babylonian god Dagan. The name popularly connected with the Hebrew word *dag,* "fish," more closely resembles *dagan,* "corn," and either the name of the deity came to be used to denote "corn," or it has the more general meaning of "food." *See* Robertson Smith, *Rel. of the Semites,* 3rd ed. p. 578. Little is known of the cult of this god.

DAGUERRE, LOUIS JACQUES MANDE (1789–1851) French painter and physicist, inventor of the daguerreotype, was born at Cormeilles, in the department of Seine-et-Oise, and died on July 12, 1851, at Petit-Brie-sur-Marne, near Paris. He was at first an inland revenue officer and then a scene-painter for the opera. In 1822, in conjunction with Bouton, he opened at Paris the Diorama, an exhibition of pictorial views, the effect of which was heightened by changes in the light thrown upon them. A similar establishment was opened by Daguerre in Regent's Park, London; it was destroyed by fire on March 3, 1839. This reverse was more than compensated by the success of his daguerreotype photographic process. J. Nicéphore Niepce, who since 1814 had been seeking to obtain permanent pictures by the action of sunlight, learned in 1826 that Daguerre was similarly occupied. The two investigators worked together on their "heliographic pictures" from 1829 until the death of Niepce in 1833. Daguerre, continuing his experiments, discovered eventually the process connected with his name. On Jan. 9, 1839, at a meeting of the Academy of Sciences, Arago emphasized the importance of the discovery; and Daguerre was appointed an officer of the Legion of Honour. A law of 1839 assigned to Daguerre and the heir of Niepce annuities of 6,000 and 4,000 francs respectively, on condition that their process should be communicated to the Academy. Daguerre's process, together with his system of transparent and opaque painting, was accordingly published by the government (*see* Photography).

Daguerre's works are *Historique et description des procédés du daguerréotype et du diorama* (1839); and *Nouveau moyen de préparer la couche sensible des plaques destinées à recevoir les images photographiques* (1844).

DAGUPAN, a municipality (with administrative centre and 20 *barrios* or districts), and the most important commercial centre of the province of Pangasinan, Luzon, Philippine islands, on a branch of the Agno river near its entrance into the gulf of Lingayen, 125 mi. by rail N.N.W. of Manila. Pop. (1939) 32,602, of whom only 54 were whites. It is served by the Manila and Dagupan railway. Salt is manufactured in the marshes along the coast where also alcoholic liquors are distilled from the nipa palms which grow in abundance. Besides these products there are extensive exports of sugar, maize (corn), palay (rice) and copra, which are produced abundantly in the fertile region of which Dagupan is the chief port. It is also a point of transfer from rail to automobile en route to Baguio, and has a meteorological station. Of those inhabitants aged 6 to 19, inclusive, 48·4% were reported in 1939 as attending school, while of those ten years old and over, 61·7% were reported as literate. The Pangasinan language is the vernacular.

DAHABEAH, an Arabic word for a passenger boat used by natives on the Nile. The typical form is that of a barge-like house-boat provided with sails, resembling the painted galleys represented on the tombs of the Pharaohs. Similar state barges were used by the Mohammedan rulers of Egypt, and to the circumstance that these vessels were ornamented with gilding is attributed the usual derivation of the name from gold. Before the introduction of steamers, dahabeahs were generally used by travellers ascending the Nile, and they are still the favourite mode of travelling for the leisured and wealthy classes. The modern dahabeah is often made of iron, draws about 2ft. of water, and is provided with one very large and one small sail. According to size it provides accommodation for from two to a dozen passengers. Steam dahabeahs are also built to meet the requirements of tourists.

DAHL, HANS (1849–1910), Norwegian painter, was born at Hardanger on Feb. 19, 1849. After serving in the Swedish army he studied art at Karlsruhe and at Düsseldorf in Germany, being a notable painter especially of landscape and *genre.* In 1889 he settled in Berlin. His work had considerable humour, but his colouring was hard and rather crude. His pictures were very popular in Norway.

DAHL, JOHANN KRISTEN CLAUSEN (1788–1857), Norwegian landscape painter, was born in Bergen on Feb. 24, 1788, and died in Dresden on Oct. 14, 1857. He settled in Dresden in 1818. Dahl is usually included in the German school, although he was nearly 40 when he finally took up his abode in Dresden, where he became professor. At Dresden may be seen many of his works, notably a large picture called "Norway" and a "Storm at Sea."

See A. Aubert, *Maleren Professor Dahl* (1788–1857).

DAHL, MICHAEL (1656–1743), Swedish portrait painter, was born at Stockholm. In 1688 he settled in England, and became for some years a dangerous rival to Kneller. He painted portraits of Princess Anne (afterwards queen), Prince George of Denmark and others. Through Prince George, he obtained a commission to paint the portraits of many naval officers for Greenwich Hospital. Much of his best work is at Hampton Court and at Petworth. He died in London on Oct. 20, 1743, having out-lived his great popularity.

See W. Nisser, *Michael Dahl and the Contemporary School of Painting in England* (1928).

DAHLAK ISLANDS, an Archipelago consisting of a group of islands off the Bay of Massawa forming part of the Italian colony of Eritrea. They are chiefly of coral formation, three islands only being inhabited. A trade in pearl and sponge fishing has been conducted since Roman times. *See* also Eritrea.

DAHLBERG (Dahlbergh), **ERIK JOHANSEN,** Count (1625–1703), Swedish soldier and engineer, was born at Stockholm on Oct. 20, 1625. As adjutant-general and engineer adviser to Charles X. (Gustavus) he had a great share in the famous crossing of the frozen Belts, and at the sieges of Copenhagen and Kronborg he directed the engineers. In spite of these distinguished services, Dahlberg remained an obscure lieutenant-colonel for many years. In 1676 he became director-general of fortifications, and in the wars of the next 25 years he rendered distinguished service, alike in attack (as at Helsingborg in 1677, and Dünamünde in 1700) and defence (as in the two sieges of Riga in 1700), and his work in repairing the fortresses of his own country, not less important, earned for him the title of the "Vauban of Sweden." He retired as field-marshal in 1702, and died at Stockholm on Jan. 26, 1703.

See H. Heden, *Erik Dahlberg* (1900).

DAHLGREN, JOHN ADOLF (1809–1870), admiral in the U.S. navy, was the son of the Swedish consul at Philadelphia, Pa., and was born in that city on Nov. 13, 1809. He entered the navy in 1826, and saw some service in the Civil War in command of the South Atlantic blockading squadron, but was chiefly notable as a scientific officer. His knowledge of mathematics caused him to be employed on the coast survey in 1834. In 1847 he was transferred to the ordnance department. In this post he applied himself to the improvement of the guns of the navy. He was the inventor of the smooth bore gun which bore his name, but was from its shape familiarly known as "the soda water bottle." It was used in the Civil War, and for several years afterwards in the U.S. navy. Dahlgren's guns were first mounted in a vessel named the "Experiment," which cruised under his command from 1857 till 1859. They were "the first practical application of results obtained by experimental determinations of pressure at different points along the bore, by Colonel Bomford's tests—that is by boring holes in the walls of the gun, through which the pressure acts upon other bodies, such as pistol balls, pistons, etc." When the Civil War broke out, he was on ordnance duty in the Washington navy yard, and he was one of the three officers who did not resign from Confederate sympathies. His rank at the time was commander, and the command could be held only by a captain. President Lincoln insisted on retaining Commander Dahlgren, and he was qualified to keep the post by special act of Congress. He became post-captain in 1862, rear-admiral in 1863, and was in command of the Washington navy yard when he died on July 12, 1870.

A memoir of Admiral Dahlgren by his widow was published at Boston in 1882. (D. H.)

DAHLGREN, KARL FREDRIK (1791–1844), Swedish poet, was born at Stensbruk in Östergötland on June 20, 1791. At a time when literary partisanship ran high in Sweden, and the writers divided themselves into "Goths" and "Phosphorists," Dahlgren made himself indispensable to the Phosphorists by his polemical activity. In the mock-heroic poem of *Markalls sömnlösa nätter* (Markall's Sleepless Nights), in which the Phosphorists ridiculed the academician Per Adam Wallmark and others, Dahlgren, who was a genuine humorist, took a prominent part. In 1825 he published *Babels Torn* (The Tower of Babel), a satire, and a comedy, *Argus in Olympen;* and in 1828 two volumes of poems. In 1829 he was appointed to an ecclesiastical post in Stockholm, which he held until his death. In a series of odes and dithyrambic pieces, entitled *Mollbergs Epistlar* (1819, 1820), he strove to emulate the wonderful lyric genius of K. M. Bellman, of whom he was a student and follower. From 1825 to 1827 he edited a critical journal entitled *Kometen* (The Comet), and in company with Almqvist he founded the *Manhemsförbund,* a short-lived society of agricultural socialists. In 1834 he collected his poems in one volume; and in 1837 appeared his last book, *Angbåts-Sånger* (Steamboat Songs). He died at Stockholm on May 1, 1844. Dahlgren is one of the best humorous writers that Sweden has produced; but he was perhaps at his best in realistic and idyllic description. His little poem, *Zephyr and the Girl,* which is to be found in every selection from Swedish poetry, is a good example of his sensuous and ornamented style.

His works were collected and published after his death by A. J. Arwidsson (5 vols., Stockholm, 1847–52).

DAHLIA, a genus of tuberous-rooted herbs of the family Compositae (*q.v.*), containing 12 species indigenous to the high plateaus of Mexico and Central America. The dahlia was first introduced into Britain from Spain in 1789 by the marchioness of Bute. The species was probably *D. pinnata,* from which many of the forms now common have originated. The cactus dahlias, however, are derived from *D. Juarezi,* a species from Mexico and Guatemala, or from *D. popenovi.* The flowers, at the time of the first introduction of the plant, were single, with a yellow disk and dull scarlet rays; under cultivation, flowers of numerous brilliant hues have been produced. The flower has been modified also from a flat to a globular shape, and the arrangement of the florets has been rendered quite distinct in the peony and anemone-like kinds.

The ordinary natural height of the dahlia is about 7 or 8 ft., but one of the dwarf races grows to only 18 in. With changes in the flower, changes in habit have been brought about by cultivation; varieties of the plant have been produced which require more moisture than others; and the period of flowering has been much extended.

FROM CURTIS BOTANICAL MAGAZINE
DAHLIA (DAHLIA PINNATA), A NATIVE OF MEXICO NAMED IN HONOUR OF THE SWEDISH BOTANIST DAHL AND THE ORIGIN OF MANY GARDEN FORMS

The hundreds of varieties are classed under 13 different types, of which the best known are: (1) *Single dahlias.* These have been derived from *D. coccinea;* they have a disk of tubular florets surrounded by the large showy ray florets. (2) *Show dahlias,* large and double, quilled flowers self-coloured or pale-coloured and edged or tipped with a darker colour. (3) *Fancy dahlias,* resembling the show but having the florets striped or tipped with a second tint. (4) *Bouquet* or *Pompon dahlias,* with much smaller double, quilled flowers of various colours. (5) *Cactus dahlias,* probably derived from *D. Juarezi,* a form which has given rise to a beautiful race with pointed starry flowers. (6) *Peony-flowered dahlias,* a race with large, floppy heads, broad florets and several disk florets in centre.

New varieties are procured from seed, which should be sown indoors in pots or pans towards the end of March, or placed in a hotbed or propagating pit, the young plants being pricked off into pots or boxes, and gradually hardened off for planting out in June; they will flower the same season if the summer is genial. The older varieties are propagated by dividing the large tuberous roots, in doing which care must be taken to leave an eye to each portion of tuber, otherwise it will not grow. Valuable varieties are sometimes grafted on the roots of others. Another mode of propagation is by cuttings, to obtain which, young non-flowering shoots are taken off with a heel, and planted singly in small pots filled with fine sandy soil. They root speedily, and are then transferred to larger pots in light rich soil, and their growth encouraged until the planting-out season arrives, about the middle of June, when the pots are plunged. In the fall the pots are dug and stored in a frost-free place. The tubers are then ready for growth the following spring. Dahlias succeed best in an open situation, and in rich deep loam, but there is scarcely any garden soil in which they will not thrive, if it is manured. Dahlias flower on till they are interrupted by frost in autumn. The tubers are then taken up, dried, and stored in some place where they may be secure from frost and moisture. Earwigs are very destructive, eating out the young buds and florets. Small flowerpots half-filled with dry moss and inverted on stakes placed among the branches form a useful trap. The tarnished plant bug, sometimes a troublesome pest, can be controlled by arsenical sprays.

DAHLMANN, FRIEDRICH CHRISTOPH (1785–1860), German historian and politician, was born at Wismar on May 13, 1785; he came of an old Hanseatic family of Wismar, which then belonged to Sweden. He studied classical philology at Copenhagen and Halle, and again at Copenhagen. After finishing his studies, he translated some of the Greek tragic poets, and the *Clouds* of Aristophanes. But he was also interested in modern literature and philosophy, and in the political developments of his time. In 1809, on the news of the outbreak of war in Austria, Dahlmann, together with the poet Heinrich von Kleist, whom he had met in Dresden, went to Bohemia, and was afterwards with the Imperial army until the battle of Aspern. After taking his doctor's degree at Wittenberg (1810) he qualified at Copenhagen in 1811 as a lecturer on ancient literature and history, on which he delivered lectures in Latin. In 1812 he received a chair at Kiel university.

From 1815 onwards, as secretary to the perpetual deputation of the estates of Schleswig-Holstein, he began in memoirs, or articles in the *Kieler Blätter,* which he founded himself, to advocate the half-forgotten rights of the Elbe duchies, as against Denmark. The Danes afterwards accused him of having invented the Schleswig-Holstein question (*q.v.*). After his transference to the chair of history at Göttingen in 1829, he had a share in framing the Hanoverian constitution of 1833; and when in 1837 the new king Ernest Augustus declared the constitution invalid, Dahlmann inspired the famous protest of the seven professors of Göttingen. He was deprived of his position and banished, but German national feeling had been stimulated by his action.

After some years spent in Leipzig and Jena, King Frederick William IV. appointed him in Oct. 1842 to a professorship at Bonn. His *Politik* (1835) had already made him a great name as a writer; he now published his *Dänische Geschichte* (1840–43), a historical work of the first rank; and this was soon followed by histories of the English and French revolutions, which advocated constitutional monarchy. After the revolution of 1848 broke out, the "father of German nationality" was appointed one of the committee of 17 nominated to draw up a draft constitution for submission to the national assembly summoned at Frankfurt. Dahlmann represented Prussia on this committee, and with the jurist Albrecht drafted a scheme. (*See* also GERMANY.) Dahlmann was also a member of the parliament. His object was to make Germany as far as possible a united constitutional monarchy, with the exclusion of the non-German Austrian dominions. Prussia was to provide the emperor, but at the same time—and in this lay the doctrinaire weakness of the system—was to give up its separate existence, consecrated by history, in the same way as the other States. When Frederick William IV. was elected hereditary emperor (March 28, 1849), Dahlmann was one of the deputation which offered the crown to the king in Berlin. The king's refusal was less of a surprise to him than to most of his colleagues. He counted on being able to compel recognition of the constitution by the moral pressure of the consent of the people. It was only when the attitude of the Radicals made it clear to him that this course would lead to a revolution, that he decided, after a long struggle, to retire from the national parliament (May 21). He was still, however, one of the chief promoters of the conference of the imperial party at Gotha; and he took part in the sessions of the first Prussian chamber (1849–50) and of the parliament of Erfurt (1850). But finally, convinced that for the moment all efforts towards the unity of Germany were unavailing, he retired from political life and again took up his work of teaching at Bonn. His last years were, however, saddened by illness, bereavement and continual friction with his colleagues. He died on Dec. 5, 1860.

Dahlmann's chief works were:—*Quellenkunde der deutschen Geschichte nach der Folge der Begebenheiten geordnet* (1830, 7th edition of Dahlmann-Waitz, *Quellenkunde,* Leipzig, 1906); *Politik, auf den Grund und das Mass der gegebenen Zustände zurückgeführt* (1835); *Geschichte Dänemarks* (3 vols., 1840–43); *Geschichte der englischen Revolution* (1844); *Geschichte der französischen Revolution* (1845).

See A. Springer, *Friedrich Christoph Dahlmann* (2 vols., 1870–72); and H. v. Treitschke, *Histor. und polit. Aufsätze,* i. 365 *et seq.;* Christern, *F. C. Dahlmann's politische Entwicklung bis 1848* (1921).

DAHLSTJERNA, GUNNO (1661–1709), Swedish poet, whose original surname was Eurelius, was born at Öhr, Dalsland, where his father was rector. He studied at Uppsala, became a land-surveyor, and in 1681 was sent on professional business to Livonia, then under Swedish rule. Returning to Sweden he became in 1699, head of the land survey department. In 1702 he was ennobled under the name of Dahlstjerna. His death, which took place in Pomerania, is said to have been hastened by the disastrous news of the battle of Poltava. Dahlstjerna's patriotism was touching in its pathos and intensity, and during his long periods of professional exile he comforted himself by the composition of songs to his beloved Sweden. At his best he easily surpasses all the Swedish poets of his time. His best-known original work is *Kungaskald* (Stettin, 1697), an elegy on the death of Charles XI. It is written in alexandrines, arranged in *ottava rima,* and contains many passages full of melody. Dahlstjerna was a reformer in language, and it has been well said by Atterbom that in this poem "he treats the Swedish speech just as dictatorially as Charles XI. and Charles XII. treated the Swedish nation." In 1690 was printed at Stettin his paraphrase of the *Pastor Fido* of Guarini. His most popular work is his *Götha kämpavisa om Konungen och Herr Peder* (The Goth's Battle Song, concerning the King and Master Peter; Stockholm, 1701). The king is Charles XII. and Master Peter is the tsar of Russia. This spirited ballad lived almost until our own days on the lips of the people as a folk-song.

The works of Dahlstjerna have been collected by P. Hanselli, in the *Samlade Vitterhetsarbeten af svenska Författare från Stjernhjelm till Dalin* (Uppsala, 1856, etc.).

DAHN, JULIUS SOPHUS FELIX (1834–1912), German historian, jurist and poet, was born on Feb. 9, 1834, in Hamburg, where his father, Friedrich Dahn (1811–89), was a leading actor at the city theatre. His mother, Constance Dahn, *née* Le Gay, was a noted actress. In 1834 the family moved to Munich. Felix Dahn studied law and philosophy in Munich and Berlin from 1849 to 1853. His first works were in jurisprudence, *Uber die Wirkung der Klagverjährung bei Obligationen* (Munich, 1855), and *Studien zur Geschichte der germanischen Gottesurteile* (Munich, 1857). In 1857 he became *docent* in German law at Munich university, and in 1862 professor-extraordinary, but in 1863 was called to Würzburg to a full professorship. In 1872 he removed to the University of Königsberg, and in 1888 settled at Breslau, becoming rector of the university in 1895. Meanwhile in addition to many legal works of high standing, he had begun the publication of a long series of histories and historical romances. His chief histories, besides many monographs and shorter works, were *Die Könige der Germanen* (vols. i.–vi., Munich and Würzburg, 1861–70, vols. vii.–xi., Leipzig, 1894–1908); *Die Urgeschichte der germanischen und romanischen Völker* (1881–90) and *Geschichte der deutschen Urzeit* (Gotha, 1883–88), all of which combine a wealth of learning and critical skill with great imaginative insight. Many of his essays were collected in the series of *Bausteine* (6 vols., 1879–84). His historical romances, although immensely popular, have less enduring value. The best known are *Ein Kampf um Rom.* (4 vols., 1876); *Odhins Trost* (1880); *Die Kreuzfahrer* (1884); *Bis zum Tode getreu* (1887); *Odhins Rache* (1891); *Julian der Abtrünnige* (1894). Dahn also published some poetry. His wife Therese, *née* Freiin von Droste-Hülshoff, was joint-author with him of *Walhall, Germanische Götter und Heldensagen* (Leipzig, 1898). Dahn's fictional work, prose and verse, was published in a collected edition (21 vols., 1898 and 1901). Dahn also published four volumes of memoirs, *Erinnerungen* (Leipzig, 1890–95).

DAHOMEEN, a people living in Dahomey in the Abomey—Allada—Wida district of Africa. The hierarchical monarchy formerly comprised king, ministers and high court functionaries, an organized standing army comprising several regiments including one composed of women (Amazons), with distinct social ranks of princes, high dignitaries, people and slaves. The extended patrilineal family group (*hennu*) had property in common under the headship of the patriarch (*Hennu-daho*), with individual ownership of personal possessions. Marriage was prohibited between members of the same family. Succession passed to the son, thence to the brother, afterwards to the nephew. They practised husbandry, arboriculture and trade. They were animists, who long practised human sacrifice and there are traces of totemism (leopard and serpent cults). Secret societies and male and female sacerdotal organization existed.

See Le Hérissé, *L'Ancien Royaume du Dahomey* (1911).

DAHOMEY, one of the colonies of French West Africa. Dahomey is bounded south by the Gulf of Guinea, east by Nigeria (British), north by Niger, and on the west by Togo, the eastern portion of which was placed under French mandate by an Anglo-French agreement of July 10, 1919. With a coast line of only 75 mi. (1° 38′ E. to 2° 42′ 30″ E., from the vicinity of Anecho to the longitude of the mouth of the Ajara [Adjara] river), the area of the colony is 46,300 sq.mi. and the population 1,424,220 (1941), of whom 1,150 are European. As far as 9° N. the width of the colony is no greater than the coast line. From this point, the colony broadens out both eastward and westward, attaining a maximum width of 200 mi. It includes the western part of Borgu (*q.v.*), and reaches the Niger at a spot a little above Illo. Its greatest length north to south is 430 mi.

Physical Features.—The littoral, part of the old Slave Coast (*see* GUINEA), is very low, sandy and obstructed by a bar. Behind the seashore is a line of lagoons, where small steamers can ply; east to west they are those of Porto Novo (or Lake Nokoué), Ouidah and Grand Popo. The Ouémé (300 mi. long), the most important river running south, drains the colony from the Bariba country to Porto Novo, entering the lagoon so named. The Zon is a western affluent of the Ouémé. Farther west is the Couffo (150 mi. long), which, before entering the Ouidah lagoon, broadens out into a lake or lagoon called Ahémé, 20 mi. long by 5 mi. broad. The Niger forms the northeast frontier of the colony (*see* NIGER).

For some 50 mi. inland the country is flat, and, after the first mile or two of sandy waste is passed, covered with dense vegetation. At this distance (50 mi.) from the coast is a great swamp known as the Lama marsh. It extends east to west some 25 mi. and north to south 6 to 9 miles. North of the swamp the land rises by regular stages to about 1,650 ft., the high plateau falling again to the basin of the Niger. In the northwest a range of hills known as the Atacora forms a watershed between the basins of the Ouémé, the Niger and the Volta. A large part of the interior consists of undulating country, rather barren with occasional patches of forest. The forests contain the baobab, the coconut palm and the oil palm. The fauna resembles that of other parts of the west coast, but the larger wild animals, such as the elephant and hippopotamus, are rare.

Climate.—The climate of the coast regions is very hot and moist. Four seasons are well marked: the harmattan or long dry season, from Dec. 1 to March 15; the season of the great rains, from March 15 to July 15; the short dry season, from July 15 to Sept. 15; and the "little rains," from Sept. 15 to Dec. 1. Near the sea the average temperature is about 80° F. The harmattan prevails for several days in succession, and alternates with winds from the south and southwest. During its continuance the thermometer falls about 10°, there is not the slightest moisture in the atmosphere, vegetation dries up or droops, the skin parches and peels, and all woodwork is liable to warp and crack with a loud report. Tornadoes occur occasionally. During nine months of the year the climate is tempered by a sea breeze, which is felt as far inland as Abomey (60 mi.). It generally begins in the morning, and in the summer it often increases to a stiff gale at sundown. In the interior there are but two seasons: the dry season (November to May) and the rainy season (June to October). The rains are more scanty and diminish considerably in the northern regions.

Inhabitants.—The inhabitants of the coast region are of pure Negro stock. The Dahomeyans (Dahomi), who inhabit the central part of the colony, form one of 18 closely allied clans occupying the country between the Volta and Porto Novo, and share a common tongue with the Ewe-speaking tribes. In their own tongue Dahomeyans are called Fons or Djedjés. They are tall and well formed, proud, reserved, polite in their intercourse with strangers, warlike and keen traders. The Mina, who occupy the district of the Popos, are noted for their skill as surf men, which has gained for them the title of the Krumen of Dahomey. Porto Novo is inhabited by a tribe called Nago, which has an admixture of Yoruba blood and speaks a Yoruba dialect. The Nago are a peaceful tribe and even keener traders than the Dahomi. In Ouidah and other coast towns are many mulattos, speaking Portuguese and bearing high-sounding Portuguese names. In the north the inhabitants—Mahi, Bariba, Gurmai—are also of Negro stock, but scarcely so civilized as the coast tribes. Settled among them are communities of Peulhs and Hausas. There are many converts to Islam in the northern districts, but the Mahi and Dahomeyans proper are nearly all fetish worshippers.

The chief port is Cotonou (1936 pop. 5,500), the starting point of a railway to the Niger completed as far as Parakou (272 mi.). An iron pier, which extends well beyond the surf, affords facilities for shipping. Cotonou was originally a small village which served as the seaport of Porto Novo and was burned to the ground in 1890. It has consequently the advantage of being a town laid out by Europeans on a definite plan. Situated on the beach between the sea and the lagoon of Porto Novo, the soil consists of heavy sand. Good dirt roads have been made. Owing to an almost continuous, cool, westerly sea breeze, Cotonou is, in comparison with the other coast towns, decidedly healthy for white men. Porto Novo (1936 pop. 23,500), the seat of government and chief business centre, is on the northern side of the lagoon of the same name and 19 mi. northeast of Cotonou by road. The town has had many names, and that by which it is known to Europeans was given by the Portuguese in the 17th century. It contains numerous churches and mosques, public buildings and merchants' residences. Ouidah, 28 mi. west of Cotonou, is an old and formerly thickly populated town. Its population was 10,500 in 1936. It is built on the north bank of the coast lagoon about 2 mi. from the sea. There is no harbour at the beach, and landing is effected in boats made expressly to pass through the surf, particularly heavy there. In consequence of the thousands of orange and citron trees which adorn it, Ouidah is called "the garden of Dahomey." West of Ouidah, on the coast and near the frontier of Togoland, is the trading town of Grand Popo. Inland in Dahomey proper are Abomey (*q.v.*), the ancient capital, Allada, Kana (formerly the country residence and burial place of the kings of Dahomey) and Dogba. In the hinterland are Savalou (1936 pop. 20,200), Nikki and Parakou, Borgu towns, and Kandi, on the road leading north to the Niger.

Agriculture and Trade.—The agriculture, trade and commerce of Dahomey proper are essentially different from that of the hinterland (*Haut Dahomey*). The soil of Dahomey proper is naturally fertile and is capable of being highly cultivated. It consists of a rich clay of a deep red colour. Finely powdered quartz and yellow mica are met with, denoting the deposit of disintegrated granite from the interior. The principal exports in order of their value are palm kernels, palm oil, peanuts, corn, cotton and shea nuts. The district of Toffo is particularly noted for its oil palms. Palm wine is also made, but the manufacture is discouraged as the process destroys the tree. Next to palm oil the principal vegetable products are maize, guinea-corn, cassava, yams, sweet potatoes, plantains, coconuts, oranges, limes and the African apple, which grows almost wild. The country also produces coffee, castor beans, kola nuts, pineapples, guavas, spices of many kinds, ginger, okras, sugar cane, onions, tomatoes and papayas. Cattle, sheep, goats and fowl are scarce in the coastal region. There is a large fishing industry in the lagoons. Around the villages, and here and there in the forest, are clearings which are cultivated in places, but agriculture is in a backward condition. In the grassy uplands of the interior cattle and horses thrive, and cotton is grown by the inhabitants. The prosperity of the country depends chiefly on the export of palm oil and palm kernels. Copra, kola nuts and dried fish are also exported, the fish going to Lagos. Trade is mainly with France and Great Britain. Cotton goods (chiefly from Great Britain), machinery and metals, tobacco and petroleum products are the chief imports.

Communications.—The Dahomey railway from Cotonou to Parakou (272 mi.) is of metre gauge (3.28 ft.). This line is to be carried on as far as the Niger. A branch railway from the main line serves the western part of the colony. It goes via Ouidah to Segboroué on Lake Ahémé, whence a 1.97 ft. line continues to Adjaha and Athiémé. Another line (66 mi.) runs from Cotonou to Porto Novo and through the market town of Adjara to Pobé, close to the British frontier. A branch connects Lagbé and Sakété. This line serves a belt of country rich in oil palms. At Bohicon one branch line goes to Abomey and the other to Zagnanado. Cotonou is a regular port of call for steamers from

Europe to the west coast, and there is also regular communication along the lagoons between Porto Novo and Lagos. Cotonou is an important cable station. Telegraph, telephone and radio communications are government owned and operated. Air services link the colony with main lines serving the continent of Africa.

Administration.—The colony is administered by a governor (responsible to the governor-general at Dakar), assisted by a secretary-general and a council composed of official and unofficial members. It is divided into eight circles or provinces. Over each circle is an administrator with extensive powers. Native laws and customs are as far as possible retained. Natives, however, may place themselves under the jurisdiction of the French law. In general the administrative system is the same as that for all the colonies of French West Africa (*q.v.*). The chief source of revenue is the customs, while the capitation tax contributes most to the local budget.

HISTORY

The recorded history of Dahomey begins about the commencement of the 17th century. At that period the country now known as Dahomey was included in the extensive kingdom of Allada or Ardrah, of which the capital was the present town of Allada, on the road from Ouidah to Abomey. Allada became dismembered on the death of a reigning sovereign, and three separate kingdoms were constituted under his three sons. One state was formed by one brother round the old capital of Allada, and retained the name of Allada or Ardrah; another brother migrated to the east and formed a state known under the name of Porto Novo; while the third brother, Tacodonou, travelled northward, and after some vicissitudes established the kingdom of Dahomey. About 1724–28 Dahomey, having become a powerful state, invaded and conquered successively Allada and Ouidah.

The name Dahomey (Dan-homey—stomach of Dan) supposedly commemorates the slaying of Dan, king of the Fons, in accordance with a legend that Aho Tacodonou continually harassed Dan with demands, and the latter, enraged, finally demanded of Aho "if he did not wish to set himself up on his stomach." Aho then attacked and overcame Dan and, after carrying him prisoner to Agbome, decapitated him and threw his body into the foundations of the palace which he was building, whereupon Aho was proclaimed king of the Fons, and it was one of his descendants whom the French found on the throne of Abomey at the time of the conquest.

King Gezo ascended the throne about the year 1818, and during a reign of 40 years raised the power of Dahomey to its highest pitch, extending greatly the border of his kingdom to the north. He boasted of having first organized the Amazons, a force of women to whom he attributed his successes. The Amazons, however, were state soldiery long before Gezo's reign, and what he really did was to reorganize and strengthen the force.

European Rivalry.—In 1851 Gezo attacked Abeokuta in the Yoruba country and the centre of the Egba power, but was beaten back. In the same year the king signed a commercial treaty with France, and undertook to preserve "the integrity of the territory belonging to the French fort" at Ouidah. The fort was one built in the 17th century, and in 1842 made over to a French mercantile house. England, Portugal and Brazil also had "forts" at Ouidah—all in a ruinous condition and ungarrisoned—and when in 1852 England, to prevent the slave-trade, blockaded the Dahomeyan coast, energetic protests were made by Portugal and France, based on the existence of these "forts." In 1858 Gezo died. He had greatly reduced the custom of human sacrifice, and left instructions that after his death there was to be no general sacrifice of the palace women. Gezo was succeeded by his son Gléglé (or Gélélé), whose attacks on neighbouring states, persecution of native Christians, and encouragement of the slave-trade involved him in difficulties with Great Britain and France. It was, as Lord Russell said, to check "the aggressive spirit of the king of Dahomey" that England in 1861 annexed the island of Lagos. Nevertheless, in the following year Gléglé captured Ishagga and in 1864 unsuccessfully attacked Abeokuta, both towns in the Lagos hinterland. In 1863 a step was taken by France which was the counterpart of the British annexation of Lagos. The kingdom of Porto Novo accepted a French protectorate, and an Anglo-French agreement of 1864 fixed its boundaries. This protectorate was soon afterwards abandoned by Napoleon III, but was re-established in 1882. At this period the rivalry of European powers for possessions in Africa was becoming acute, and German agents appeared on the Dahomeyan coast. However, by an arrangement concluded in 1885, the German protectorate in Guinea was confined to Togo, save for the town of Little Popo at the western end of the lagoon of Grand Popo. In Jan. 1886 Portugal—in virtue of her ancient rights at Ouidah—announced that she had assumed a protectorate over the Dahomeyan coast, but she was induced by France to withdraw her protectorate in Dec. 1887. Finally, the last international difficulty in the way of France was removed by the Anglo-French agreement of 1889, whereby Cotonou was surrendered by Great Britain. France claimed rights at Cotonou in virtue of treaties concluded with Gléglé in 1868 and 1878, but the chiefs of the town had placed themselves under the protection of the British at Lagos.

French Conquests.—With the arrangements between the European Powers the Dahomeyans had little to do, and in 1889, the year in which the Anglo-French agreement was signed, trouble arose between Dahomey and the French. A French force was landed at Cotonou, and severe fighting followed, in which the Amazons played a conspicuous part. In Oct. 1890 a treaty was signed which secured to France Porto Novo and Cotonou, and to the king of Dahomey an annual pension of £800. It was unlikely that peace on such terms would prove lasting, and the slave-raiding expeditions of Behanzin, Glégle's son, who succeeded in 1889, led in 1892 to a new war with France. General Dodds was placed in command of a strong force of Europeans and Senegalese, and after a sharp campaign during September and October completely defeated the Dahomeyan troops. Behanzin set fire to Abomey (entered by the French troops on Nov. 17) and fled north. Pursued by the enemy, abandoned by his people, he surrendered unconditionally on Jan. 25, 1894. Thus ended the independent existence of Dahomey. The French divided it into two parts—Abomey and Allada—placing on the throne of Abomey a brother of the exiled monarch. Ouidah and the adjacent territory were annexed to France on Dec. 3, 1892, and the rest of Dahomey placed under a French protectorate at the same time. The prince who had been made king of Abomey was found intriguing against the French, and in 1900 was exiled by them to the Congo.

Dahomey conquered, the French at once set to work to secure as much of the hinterland as possible. On the north they penetrated to the Niger, on the east they entered Borgu (a country claimed by the Royal Niger company for Great Britain), on the west they overlapped the territory claimed by Germany as the hinterland of Togo. The struggle with Great Britain and Germany for supremacy in this region forms one of the most interesting chapters in the story of the partition of Africa. In the result France succeeded in securing a junction between Dahomey and her other possessions in West Africa, but failed to secure any part of the Niger navigable from the sea. (*See* Africa: *History,* and Nigeria.) A Franco-German convention of 1897 settled the boundary on the west, and the Anglo-French convention of 1898 defined the frontier on the east. In 1899, on the disintegration of the French Sudan, the districts of Fada N'Gurma and Say, lying north of Borgu, were added to Dahomey, but in 1907 they were transferred to Upper Senegal-Niger, with which colony they were closely connected both geographically and ethnologically. From 1894 onward the French devoted great attention to the development of the material resources of the country. In 1911 they deposed the chief, a member of the old royal family, whom they had installed at Abomey. His territory was divided among petty chiefs under the direct control of the French resident, and the whole country became the colony of Dahomey and dependencies. In 1912 a Franco-German convention delimited the Dahomey-Togo boundary; but two years later Togo was invaded and conquered by the French and British.

The "Customs."—The Dahomey "customs," no longer practised, have given the country an infamous notoriety. They appear to date from the middle of the 17th century, and were of two kinds: the grand customs performed on the death of a king; and the minor customs, held twice a year. The horrors of these saturnalia of bloodshed were attributable not to a love of cruelty but to filial piety. Upon the death of a king human victims were sacrificed at his grave to supply him with wives, attendants, etc., in the spirit world. The grand customs surpassed the annual rites in splendour and bloodshed. At those held in 1791 during January, February and March, it is stated that no fewer than 500 men, women and children were put to death. The minor customs were first heard of in Europe in the early years of the 18th century. They formed continuations of the grand customs, and "periodically supplied the departed monarch with fresh attendants in the shadowy world." The actual slaughter was preluded by dancing, feasting, speechmaking and elaborate ceremonial. The victims, chiefly prisoners of war, were dressed in calico shirts decorated round the neck and down the sleeves with red bindings, and with a crimson patch on the left breast, and wore long white night caps with spirals of blue ribbon sewn on. Some of them, tied in baskets, were at one stage of the proceedings taken to the top of a high platform, together with an alligator, a cat and a hawk in similar baskets, and paraded on the heads of the Amazons. The king then made a speech explaining that the victims were sent to testify to his greatness in spiritland, the men and the animals each to their kind. They were then hurled down into the middle of a surging crowd of natives, and butchered. At another stage of the festival human sacrifices were offered at the shrine of the king's ancestors, and the blood was sprinkled on their graves. This was known as *Zan Nyanyana* or "evil night," the king going in procession with his wives and officials and himself executing the doomed. These semi-public massacres formed only a part of the slaughter, for many women, eunuchs and others within the palace were done to death privately. The skulls were used to adorn the palace walls, and the king's sleeping chamber was paved with the heads of his enemies. The skulls of the conquered kings were turned into royal drinking cups, their conversion to this use being esteemed an honour. Sir Richard Burton insists (*A Mission to Gelele, King of Dahome*) that the horrors of these rites were greatly exaggerated. He denies that the king floated a canoe in a tank of human blood or that the victims were tortured, and affirms that, on the contrary, they were treated humanely, and in many cases even acquiesced in their fate. It seems that cannibalism was a sequel of the customs, the bodies of the slaughtered being roasted and devoured smoking hot. On the death of the king the wives, after the most extravagant demonstrations of grief, broke and destroyed everything within their reach, and attacked and murdered each other, the uproar continuing until order was restored by the new sovereign.

Amazonian Army.—The training of women as soldiers was the most singular Dahomeyan institution. About one-fourth of the whole female population were said to be "married to the fetich," many even before their birth, and the remainder were entirely at the disposal of the king. The most favoured were selected as his own wives or enlisted into the regiments of Amazons, and then the chief men were liberally supplied. Of the female captives the most promising were drafted into the ranks as soldiers, and the rest became Amazonian camp followers and slaves in the royal households. These female levies formed the flower of the Dahomeyan army. They were marshalled in regiments, each with its distinctive uniform and badges, and they took the post of honour in all battles. Their number has been variously stated. Sir R. F. Burton, who, in 1862, saw the army marching out of Kana on an expedition, computed the whole force of female troops at 2,500, of whom one-third were unarmed or only half-armed. Their weapons were blunderbusses, flint muskets, and bows and arrows. A later writer estimated the number of Amazons at 1,000, and the male soldiers at 10,000. The system of warfare was one of surprise. The army marched out, and when within a few days' journey of the town to be attacked, silence was enjoined and no fires permitted. The highways were avoided, and the advance was by a road specially cut through the bush. The town was surrounded at night, and just before daybreak a rush was made and every soul captured if possible; none were killed except in self-defense, as the first object was to capture, not to kill. The season usually selected for expeditions was from January to March, or immediately after the annual "customs." The Amazons were carefully trained, and the king was in the habit of holding "autumn manoeuvres" for the benefit of foreigners. Many Europeans have witnessed a mimic assault, and agree in ascribing a marvellous power of endurance to the women. Lines of thorny acacia were piled up one behind the other to represent defenses, and at a given signal the Amazons, barefooted and without special protection, charged and disappeared from sight. Presently they emerged within the lines torn and bleeding, but apparently insensible to pain, and the parade closed with a march past, each warrior leading a pretended captive bound with a rope.

BIBLIOGRAPHY.—*Dahomey*, a British Foreign Office handbook (1920). Religion, laws and language are specially dealt with in *Ewe-Speaking Peoples of the Slave Coast*, by A. B. Ellis (1890), and in *La Côte des Esclaves et le Dahomey*, by P. Bouche (1885). Much historical matter, with particular notices of the Amazons and the "Customs," is contained in *A Mission to Gelele*, by Sir R. Burton (1864). The story of the French conquest is told in *Compagne du Dahomey*, by Jules Poirier (1895). The standard authority on the early history is *The History of Dahomey*, by Archibald Dalzel (sometime governor of the English fort at Ouidah) (1793); *Annuaire statistique de l'Afrique occidentale française* by Agence Economique (Paris, 1939) contains the latest official statistics for the federation. *Dahomey*, published by the government general of French West Africa (Paris, 1931) contains a comprehensive survey of the colony's economy. *Dahomey, an ancient West African kingdom*, 2 vols., by Melville J. Herskovitz (1938) is an excellent anthropological monograph of one of the most advanced peoples in West Africa. (T. C. WN.)

DÁIL EIREANN: *see* IRISH FREE STATE.

DAILLE (DALLAEUS), **JEAN** (1594–1670), French Protestant divine, was born at Châtellerault and educated at Poitiers and Saumur. In 1625 he became minister of the church of Saumur, and in 1626 of the church of Charenton. Of his works the best known is the treatise *Du vrai emploi des Pères* (1631), translated into English by Thomas Smith under the title *A Treatise concerning the right use of the Fathers* (1651). He was president of the last national synod held in France, which met at Loudun in 1659 (H. M. Baird, *The Huguenots and the Revocation of the Edict of Nantes*, 1895, i. pp. 412 ff.), when he defended the universalism of Moses Amyraut.

DAINGERFIELD, ELLIOTT (1859–1932), American painter, was born at Harper's Ferry, Va. (now W.Va.), March 26, 1859. He received his early education at Fayetteville, N.C., and went to New York city in 1880 to study art. He exhibited first at the National Academy of Design in 1880. Among his best-known pictures are "Christ Stilling the Tempest" and "Slumbering Fog," in the Metropolitan museum, New York city; "Storm Breaking Up," in the Toledo museum; "The Child of Mary," in the National gallery, Washington; "The Midnight Moon," in the Brooklyn museum; "The Valley of the Dragon," in the Chicago Art institute. He executed the beautiful mural decorations in the Lady Chapel of the Church of St. Mary the Virgin, New York city. He won the Clarke prize of the National Academy of Design, 1902. He was the author of monographs on George Inness (1911), and on R. A. Blakelock (1914). He died Oct. 22, 1932.

DAIREN, the port of the Kwantung peninsula, which is the southern end of the Liaotung peninsula in south Manchuria. Its name is the Japanese version, as Dalny was the Russian, of the Chinese name Ta-lien. The Kwantung Leased Territory is that region of Manchuria leased by China to Russia in 1898 and assigned by transfer to Japan after the Russo-Japanese War. The seat of government, formerly at Port Arthur, was transferred to Dairen in 1937 after a series of administrative changes following upon the formation of "Manchoukuo" and culminating in the transfer of extra-territorial rights by Japan to that state. Dairen after 1907 was a free port, duties being collected by an office of the Chinese maritime customs there upon only those imports leaving the free zone, until the formation of "Manchoukuo" which operates (1944) the customs office. The port has 36 ft. of water at the entrance, and has been well equipped under Japanese administration with wharves, dry docks, warehouses and special loading facilities for coal and oil. It has extensive storage facilities for soybeans, the principal export, and has since 1931 gained special importance as a port of entry for military supplies for the Japanese forces in Manchuria and for material for the intensive industrialization of that region. It was until recently the headquarters of the South Manchuria railway and remains the site of important industrial enterprises, notably the manufacture of rolling stock.

The population in 1938 was 515,743 of whom 351,919 were Manchurians, 158,223 Japanese and 3,900 Koreans.

DAIRY FARMING. History reveals that many species of mammals have been used as a source of milk for human consumption. The most common references to sources other than that of the human mother were to the cow, ewe, goat, and the mare. Today the ewe and the goat are extensively used in many countries. In France Roquefort cheese is produced from ewe's milk. In Italy many varieties of cheese are produced from goat's milk. Almost every city in the United States has a limited supply of goat's milk, the result of a demand created by physicians who recommend its use for those who cannot assimilate cow's milk. When milk is mentioned, however, the reference is to cow's milk unless otherwise specified.

Meat and milk products have been used abundantly by most of the European countries. Butter and cheese are mentioned in the earliest recorded references to human food products. The animals used as a source of meat and milk by the people of the old world were as varied as the history of the people themselves. The influence of immigration, conquest, and environmental conditions such as climate, topography, and fertility of the land has resulted in the development of a large number of types of animals of the same species. Up to the 17th century little attention had been paid to the improvement of livestock or to the development of breeds for special uses. The year 1770 is mentioned as the beginning of livestock improvement. It was around this time that interest was aroused in Great Britain in the improvement of cattle and other domestic animals. The demonstrations of improvement by selection of livestock were so striking that the movement spread rapidly throughout the world and formed the beginning of improved breeds of livestock. This interest in improving livestock was timed to be of greatest benefit to livestock development in the United States. It made possible improved and specialized breeds of livestock for this new market. The early colonists had brought some livestock with them, but few of these survived. The foundations of most of the American breeds of livestock were brought to the United States early in the 18th century from Europe.

It can be said for dairy farming that when properly managed it will maintain or increase fertility to a greater extent than most systems of livestock farming. It is for this reason that dairy farming is followed on some of the oldest and highest priced land in the world. The dairy farmer not only feeds most of the crops produced on his farm, but he also purchases feeds which are high in protein and thus enriches the manure produced by his animals. A dairy cow fed properly will produce about 12 tons of solid and liquid manure in a year. This manure when properly handled will increase farm crop yields sufficiently so that a farmer can realize from $2 to $6 per ton for manure. A dairy farmer by feeding his crops to his cows sells less fertility from his farm than when he sells crops. The value of fertilizing elements—nitrogen, potash, and phosphoric acid—in a ton of butter is about 32 cents and in a ton of milk $1.46. In a ton of alfalfa hay the value of fertilizing elements is $6.68, in a ton of corn $4.88, and in a ton of wheat $6.16. This is based on a price of 10 cents per pound for nitrogen, 6 cents for phosphoric acid, and 5 cents for potash. Dairy farmers in recent years have taken advantage of research in crop improvement and are using high yielding clovers and alfalfa to the exclusion of non-legumes. This plan also is conducive to maintaining soil fertility and reduces the need of purchasing protein supplements to feed their animals.

The dairy cow has an advantage over some types of livestock in her ability to consume large amounts of roughage. High producing cows are generally fed all the roughage they will consume and grain supplements to make up the nutrients required. In the European dairy countries the dairy cows are fed mostly on hay and pasture, while in the United States dairy cows are fed more liberally on farm-grown grains. An efficient dairy cow will return more edible food nutrients from food eaten than will other classes of livestock. For each 100 pounds of digestible nutrients in her feed she will return 18 pounds of edible milk solids.

In spite of the many factors favourable to dairy farming, the amount of labour and the daily routine of painstaking labour involved are objectionable to many farmers. Perhaps this condition is an advantage in that it limits the number of dairy farmers. The milking machine and labour saving barns and equipment have made dairy farm labour less irksome on many farms. Because dairy farming is a year round job, labour is utilized to better advantage than on some other types of farms. Dairy farming is generally a safer type of farming because it means a daily income for the farmer. On most dairy farms the world over the labour involved in handling dairy cattle becomes a family enterprise, and labour may be used that would not otherwise be used to advantage. The extent to which dairy farming is followed in the United States may be indicated by the fact that, of a total of 6,096,799 farms in 1940, 4,663,431 reported cows were kept for milk production. Almost every farmer keeps a few cows. When their production becomes more than the needs of the family, the surplus is sold. The United States census defines a dairy farm as one where more than 40% of the income is from dairy cattle. This reduces the number of specialized dairy farms to about 600,000 in the United States. The leading states in total milk production in the United States are Wisconsin, Minnesota, New York, and Iowa.

The Dairy Herd.—The dairy cattle population of the United States has increased rapidly since 1940 as a result of the demand for dairy products resulting from the war. The same can be said for cattle kept for the production of beef. In 1944, there were approximately 27,000,000 dairy cows in production. The number of cattle of all breeds and ages was 82,000,000. Of this number, approximately 44,000,000 were dairy cattle and 38,000,000 were beef cattle.

The term "dairy cows" refers to dairy cows two years old or over kept for milk production. By "dairy cattle" is meant dairy animals of all ages and both sexes. The term "pure bred cattle" refers to animals whose ancestry came from the original home of the breed mentioned and whose record of descent has been recorded in the herd books of the breed.

A grade or unregistered animal may show the characteristics of one of the breeds, but its ancestry has been mixed with unregistered animals or for other reasons it cannot be registered. Most of the dairy animals in the United States are classed as grades. Less than 4% of dairy cattle are pure bred.

Pure bred dairy cattle registered in the United States during 1942 were: Ayrshire 17,713; Guernsey 63,674; Holstein-Friesian 106,624; Jersey 71,821; Brown Swiss 14,019.

In the United States more than one-fifth of the total annual agricultural income comes from dairy cows. A big proportion of our farms not only keep cows for milk production but they sell dairy products. The degree to which a farmer engages in dairy farming is subject to a large number of ever changing conditions. It is common knowledge that the most productive type of farming over a long period of time is the type that utilizes most of the crops produced on the farm in producing livestock or livestock products. The type of livestock used will depend upon the operator. The specialized dairy farmer will probably keep either grade or pure bred cattle of one of the special breeds of cattle. Even the general farmer may have dairy cattle, the number depending upon the extent to which he engages in dairy farming.

Some factors that may determine the extent to which a farmer engages in dairying are: nearness to special markets; the size of his farm; the kind of land; availability of labour; and type of farming in the locality.

A dairy farmer generally chooses one of the following markets: (1) sell to a pasteurizing plant for use as fluid milk; (2) bottle and sell his own milk either raw or pasteurized; (3) sell milk to a condensery, cheese factory, or creamery; (4) separate the milk and sell the cream to a creamery or other dairy plant; (5) churn the cream and sell butter in a nearby town.

Most of the specialized dairy farmers have a special market for their products. By far the greatest amount of cream for butter is produced by the farmer who separates his milk on the farm and sells cream. This leaves the skimmed milk, nutritionally the most valuable part of the milk, for feeding livestock on the farm. To utilize the skimmed milk to advantage, a farmer should have some hogs and chickens, in addition to the calves he raises for replacements, to consume this by-product. It is this type of dairy farming that encourages a diversified system of farming and has made pork production and poultry raising a valuable adjunct to dairy farming. It is for this reason that dairy farming is so generally followed in the agricultural section of the United States. The dairy stock may consist of 12–15 cows in milk, 5–6 heifers, a herd sire, and a few young calves. To house these cattle a rectangular barn with a cement floor and stalls for the cows in milk is desirable. The hay is commonly stored in a mow above the cattle, and a silo is located near the barn for convenience in feeding. On the specialized dairy farms certain requirements must be met in housing the animals and handling the milk. It is common to build a milk house near, or under certain specifications a part of the milking barn, with facilities for cooling the milk and washing utensils. Regulations covering the production of milk for the fluid milk market are formulated by state laws, city ordinances and special conditions specified by the purchaser. In the case of the producer of cream, the regulations are less rigid but it is desirable that he too have a milk room for separating the milk, cooling the cream, and washing the utensils. The cream should be kept cool and delivered to the creamery sweet or only slightly sour. Cream is generally delivered or picked up by trucks at the farmer's door, twice a week in winter and every other day in the summer.

The cream is paid for on the basis of its butterfat content as determined by the Babcock method. Cream testing 30–35% butterfat is desired. Each delivery of cream is tested for butterfat and in some states laws specify that a differential in price will be paid for cream of different grades of quality. Low grade cream is rejected. One hundred pounds of milk when separated will produce between 82–85 lb. of skimmed milk and 15–18 lb. of cream, depending upon the per cent of fat in the milk and the per cent of fat in the cream. A comparison of normal milk and skimmed milk is given below:

Table I.

	Normal milk	Skimmed milk
Water	87.1%	90.5%
Butterfat	3.9	0.1
Proteins	3.4	3.57
Milk sugar	4.75	4.95
Ash	0.75	0.78

Not only is most of the protein of milk left in the skimmed milk, but this protein is of the highest quality for human or livestock feeding.

The butterfat removed from the milk is valuable commercially, but as a feed for livestock it can be replaced by corn at a material saving. In feeding calves between one month and six months of age, two pounds of corn are equal to a pound of butterfat as a source of energy. Skimmed milk is a valuable food for human consumption since it contains everything in milk except the butterfat and the accessory elements in the butterfat. Skimmed milk becomes valuable commercially only when it is dried. The development and use of dried skim milk may eventually cause more milk to be delivered to creameries where the milk can be separated and dried. The utilization of skimmed milk on a general dairy farm may determine the profit or loss of the dairy herd. The management of the dairy herd has an important bearing on the production of the herd, the use of labour, and the success of the entire venture. In most of the dairy states in the United States outside of the milk shed, the cows are bred to freshen in the fall of the year. This means that the cows will produce best during the winter months when butterfat is highest in price and when the farmer has more time to spend with the herd. This also means that many of the cows will be dry during the busy crop season. This plan of winter dairying is not suitable when milk is sold and a constant supply throughout the year is necessary. It is common knowledge that fall freshening cows turned to grass in the spring will produce more in the year than spring freshening cows.

The specialized breeds of dairy cattle in the United States are: Jersey, Guernsey, Ayrshire, Holstein-Friesian, and Brown Swiss. The Milking Shorthorn, Red Polls, and Polled Durhams are listed as dual purpose or milk and beef breeds. In England and in some herds in the United States, the Milking Shorthorns have all the characteristics of the special dairy breeds. The advantage a dairy farmer has in using a specialized dairy breed is that he gets the benefits of years of selection for the characteristics of a special dairy animal. There is no one breed that is especially better than another in efficiency of production. The breeds vary in colour, size, per cent of butterfat, and amount of milk produced. When it comes to efficiency of production, it is a matter of individual animals.

The only sure way to measure a cow's ability is to use some means of estimating the amount of milk she produces and the amount of feed eaten. This may be done by weighing the milk from each milking or by weighing the milk one day of each month and using this as a basis for estimating the milk for the period. The feed eaten may be estimated in a like manner. This may be done by the owner, by a representative of the cow testing association, or by a representative of the breed association.

In the United States at the present time less than 3% of the cows have any records of production, and records were kept on more cows in 1942 than for any year to date. In Denmark, prior to the war, some districts had as many as 50% of their cows in cow testing associations.

A cow testing association, or dairy herd improvement association, as used by the United States department of agriculture is an organization of dairy farmers, 25 or 26 in number, who employ a man to spend one day of each month with each herd. While at the farm he estimates the milk produced by each cow and the feed consumed during the same period. A sample of each cow's milk is tested for butterfat by the Babcock method. Using this day's production as the average for the month, the estimate for the month can be determined by multiplying by the number of days in the month. At the end of a year a summary may be made on each cow. The tester also helps the farmer with his feeding and management problems. Cow testing associations originated in Denmark and are very common in all dairy countries. In the United States each dairy breed association, in addition to recording the ancestry and issuing registration certificates on pure bred animals, has a system of advanced registry for supervising and recording records of production. The records are supervised in co-operation with the agricultural college in each state at the request and expense of the breeder.

Some exceptionally high records have been made by representatives of each breed. These records are important to the end that they show the possibilities of maximum production without regard to economy of production. The cows are liberally fed, milked three or four times a day, and handled to produce to the maximum. The records in Table II were made under the uniform rules adopted by the breed associations in the United States. Two of the records were made in Canada, but under supervision similar to that in the United States.

The average butterfat production of the cows kept for dairy purposes in the United States was 188 lb. of butterfat in 1942. It is generally assumed in the United States that a cow should produce 200 lb. of butterfat in a year to pay for her feed. United States cows in co-operative cow testing associations in 1942 produced an average of 8,323 lb. of milk and 339 lb. of butterfat. In unselected herds of dairy cows in the United States, or in most any state of the United States, one-third of the dairy cows are kept at a loss, another one-third will about pay for their feed, and the remaining third will produce profitably if properly fed and cared for.

TABLE II.—*High Cow for Mature Butterfat Production in Each of the Dairy Breeds, 1944. (365-day division)*

	Lb. Milk	Lb. Butterfat	Test
Holstein—Carnation Ormsby Butter King 1165152	38606.6	1402.0	3.6%
Ayrshire—Ardgowan Valda	31156	1356	4.35
Jersey—Brampton Basilua 48490	19012	1312.8	6.9
Guernsey—Cathedral Rosalie 33499	23714	1213	5.12
Brown Swiss—Illini Nellie 26578	29589	1200	4.07

A dairy cow should be bred in the third month after calving. This will permit her to milk ten months and be dry two months before giving birth to a calf. During this ten-months' period, a cow should produce at least a pound of butterfat per day to pay for her feed, labour, and overhead costs. It cost about $78 per year to feed the average cow testing association cow in 1942; this is only one-half of the total cost of keeping a cow.

The chances of getting high producing animals can be increased by carefully selecting the ancestors of our cows. The ability of a herd sire is reflected in the progeny of every cow in the herd.

Here again we cannot measure a sire's ability until his daughters have freshened. In a study of 3,100 pure bred bulls proved in United States cow testing associations in 1943, the results demonstrated that with cows averaging 375 lb. of butterfat, approximately half of the bulls sired heifers that produced as much as their dams.

With the present plan of handling dairy sires, only one sire out of five is alive when his value is known.

The method of measuring a bull's ability is to compare the records of at least five of the bull's daughters with the records of their dams.

The average production of a bull's daughters may be used as a basis for an index of the bull's ability. As yet, record keeping in dairy herds is not common enough to make mass selection possible.

The control of disease in dairy herds is one of the problems of management. In the United States, federal and state funds have provided funds for payment of farmers for animals known to be tubercular. As a result of an intensive campaign in all of the states, this disease has been practically eliminated. A similar campaign is about to be launched to combat Bang's disease.

Mastitis, or garget, is another disease that is troubling dairy farmers.

A typical daily ration for a 1,000-lb. dairy cow giving 25 lb. of 5% milk would be 10 lb. alfalfa hay, 30 lb. of corn silage, and 6–8 lb. of a mixture of farm-grown grains.

As the cow's production is decreased the grain may be eliminated until at 12 lb. of milk daily the hay and silage will be sufficient.

The Utilization of Milk.—In the United States in 1940, the entire volume of milk produced was used as follows: factory dairy products 48.6%; fluid consumption 30.9%; other uses on the farm 13.2%; farm butter 7.3%. The use of milk for factory dairy products was as follows: creamery butter 66.2%; cheese 13.4%; evaporated and condensed 10.2%; ice cream 6.9%; minor uses 3.3%.

The utilization of milk in the United States was changed by World War II demands of the armed services, lend-lease and the civilian population. In 1943, the United States produced 118,000,000,000 pounds of milk. This was an increase of 14,000,000,000 pounds of milk above the average annual production for the ten years prior to 1940. In spite of this increase, rationing and other regulations were necessary to assist in making a fair allocation of the supply of dairy products. The increased buying power of the civilian population and wartime restrictions on foods caused an increase in fluid milk consumption. The production of concentrated milks and cheese was increased and butter production reduced. Dried skim milk, currently called "nonfat dry milk solids," was in great demand for human food with a corresponding reduction in its use for animals. The same can be said for dried buttermilk. The facilities for producing dried whole milk, dried skim milk, and dried buttermilk were greatly expanded in the butter producing sections of the United States.

To stress the wholesomeness of dairy products it has been necessary to carefully regulate the conditions under which milk and dairy products are produced. Two important factors in the production of high quality dairy products are (1) to produce them under clean conditions and (2) hold in clean cold rooms.

Dairy products are generally sold on the wholesale market on the basis of a score that will give the trade a guide as to quality. In the case of butter the score is determined by flavour, body and texture, colour and package.

Milk is now commonly sold on grade. The grade is determined by the requirements met as indicated by its bacterial content and delivery temperature and the farm conditions where the milk originated. In the sale of milk, rapid strides have been made in the United States in uniform laws and regulations covering the production, processing, and distribution of milk. The United States public health code is used as a guide. More than half of the cities over 100,000 in population have between 90 and 100% of the milk pasteurized. In some cities all milk is required to be pasteurized except certified or grade A milk. Pasteurized milk as defined on most markets is milk that has been heated to 143° F. and held at this temperature for 30 minutes and then cooled, or milk that has been heated to 160° F. for 15 seconds and then cooled. These are the minimum temperatures required to kill disease-producing bacteria.

Certified milk is milk produced and handled under conditions specified by the American Association of Medical Milk Commissions. This is the highest quality of raw milk offered for sale. In 1937 the pasteurization of certified milk was approved. The high price of certified milk and the abundance of high quality grade A raw and grade A pasteurized milk at a much lower price has minimized the importance of certified milk. Grade A raw milk, as defined on most markets, complies with most of the requirements of certified milk but some of the more elaborate requirements have been eliminated to reduce the price to somewhat near the regular market milk. Usually the market requires grade A raw milk to contain less than 50,000 bacteria per c.c. Grade A pasteurized milk has about the same requirements as grade A raw except that after pasteurization it must have a bacterial content of less than 30,000 per c.c.

Other market grades are used, but they are so variable that they cannot be discussed here. A few definitions of different kinds of milk as given in the U.S. public health code follow:

Milk.—Milk is hereby defined to be the lacteal secretion obtained by the complete milking of one or more healthy cows, excluding that obtained within 15 days before and 5 days after calving, or such longer period as may be necessary to render the milk practically colostrum free; which contains not less than 8% of milk solids not fat, and not less than 3¼% of milk fat.

Cream and sour cream.—Cream is a portion of milk which contains not less than 18% milk fat. Sour cream is cream the acidity of which is more than 0.20%, expressed as lactic acid.

Skimmed milk.—Skimmed milk is milk from which a sufficient portion of milk fat has been removed to reduce its milk-fat percentage to less than 3¼%.

Buttermilk.—Buttermilk is a product resulting from the churning of milk or cream, or from the souring or treatment by a lactic acid or other culture of milk, skimmed milk, reconstituted skimmed milk, evaporated or condensed milk or skimmed milk, or milk or skimmed-milk powder. It contains not less than 8% of milk solids not fat.

Homogenized milk.—Homogenized milk is milk which has been treated in such manner that after a storage period of 48 hours tests of the 100-cc. portion decanted from the top of a quart bottle of milk will not show a difference in fat content over tests of the remainder of the milk after thorough mixing exceeding 5% of the total fat content. For example, on 4% milk the difference shall not exceed 0.2%. In homogenized milk the globules of butterfat are more finely dispersed than in normal milk. This condition is brought about by forcing the milk under high pressure through a specially designed homogenizer valve.

Vitamin D milk is milk in which the vitamin D content has been increased. Three methods are commonly used: (1) by direct irradiation of the milk, (2) by feeding irradiated yeast to the cows, (3) by the addition of vitamin D concentrates. The amount desired is 400 U.S.P. units of vitamin D per quart of milk.

Colostrum milk is the milk secreted by a cow during the first three or four days after calving. It is especially designed for the use of the

PREPARATION OF DAIRY PRODUCTS FOR MARKET

1. Receiving and weighing milk from dairy farms
2. Power-driven separators which separate milk and cream
3. Milk bottles are washed and sterilized mechanically. An employee inspects the bottles for flaws and cracks as they pass along conveyors
4. After pasteurizing, the milk flows over a cooler (shown with sides open) and is cooled rapidly to 40° F. or lower
5. Filling and capping machines which automatically fill any size milk bottle without spilling a drop and place the sealing cap or cover on each bottle
6. Combined churns and butterworkers which deliver 1,000 lb. of butter with each churning

young calf. It is high in vitamin A and contains more than twice the amount of total solids found in whole milk. This difference is due in a large part to the increased amount of globulin in the colostrum milk.

In recent years the dairy breed associations have exploited the milk from their cattle. For example, we have the following trade-marked breed milks: (1) Golden Guernsey milk produced from herds of which at least one-half are pure bred Guernsey cattle and which meets the local requirements for raw milk; (2) Jersey Creamline milk produced by pure bred Jersey cattle and which also meets the local ordinance for raw milk; (3) Ayrshire Health milk produced by pure bred Ayrshire cattle and which also meets the local requirements.

DAIRY MACHINERY AND EQUIPMENT. The development of modern dairy machinery has been influenced by several factors, a few of which are: (1) expansion in the use of dairy products and dairy by-products; (2) the urge to save labour; (3) development of large volume production and distribution agencies; (4) greater use of pasteurization; (5) use of stainless steel; (6) the development of larger dairy farm units; (7) greater use of the milking machine on the farm; (8) changes in transportation resulting from better roads and the use of trucks.

The above factors have influenced the extent and use of dairy machinery in all countries of the world where dairying is a major enterprise. The greatest changes, however, have taken place in the United States where the industry is relatively new.

Milking Machines.—The shortage and the high price of desirable labour for milking cows has extended the use of milking machines. It is difficult to estimate the proportion of cows milked by machine but estimates from men selling milking machines in the United States varied from 25 to 30% in 1944.

The milking machine has been developed to imitate the suction of the calf on the cow's teat. There have been many refinements in the machines that have not only made them more efficient, but more easily cleaned and more durable. When properly operated a milking machine will milk as efficiently as the average hand milker.

The cows are usually stripped by hand after the machine is removed, but many milkers strip with the machine.

The usual type of milking machine has a central suction pump and the vacuum line is piped throughout the barn where the cows are housed. The milker unit may be attached any place in the suction line. The milking unit consists of a metal bucket with the pulsator on the cover. A rubber tube runs from the pulsator to the suction line. Another tube runs from the pulsator to the cow's udder where it ends in four teat cups. The suction is applied, then released.

The rapidity of the pulsation is controlled by the operator. Portable suction pumps using electric motors or small gasoline engines have been developed which are pushed through the barn and become a part of the milker unit.

This type of milker reduces the cost of installation by eliminating the suction line.

The success of the milking machine on a dairy farm depends to a great extent on the ability of the operator to adjust the machine to the individual cow so that she will give her maximum production and at the same time save enough time and labour with the machine to justify the expense of the machine.

Milk Coolers.—When milk comes from the cow it is about 100° F. It is important that this milk be cooled immediately to a point below that at which bacteria grow rapidly. It is desirable to cool to 50° F. as soon as possible. On the dairy farm this is usually accomplished by allowing the milk to run in a thin film over a cooled metal surface where it is cooled and aerated. Most coolers consist of a series of tubes through which cold water is passing. In some cases the milk may first contact water-cooled tubes and in the lower half tubes cooled with brine. The thin film of milk may also cause undesirable odours to pass out of the milk.

When the milk is held on the farm before delivery, it is placed in 8- or 10-gallon cans and put into a tank of water with some provision for holding the temperature at a desirable level. When the milk is separated at the farm it is best to separate it soon after milking and without cooling.

Milk is skimmed more efficiently by a centrifugal separator at about 90° F., and the skim milk at this temperature is about right for feeding calves.

The Cream Separator.—The centrifugal separator has replaced the gravity systems of separation of cream from the rest of the milk. The separation of milk by centrifugal force is based on the fact that the butterfat in milk is in the form of small globules which are lighter than the rest of the milk. The specific gravity of milk is 1.032 and of butterfat is .93 at 60° F. (15.5° C.). In the early development of the separator the cost of separators was high, and as a result whole milk was hauled to skimming stations or to creameries where it was skimmed and each farmer was given a proportionate amount of skimmed milk. In 1890 the hand separator was put on the market. This changed the type of creameries from whole milk to gathered cream creameries, reduced the hauling of milk and made skimmed milk more easily available. In all parts of the world the separator is an essential item of equipment where cream is sold. Even on the farms where whole milk is sold it is necessary to separate some milk for raising calves.

The essential feature of the centrifugal cream separator is a rapidly revolving bowl which contains a series of discs. The bowl is mounted on a spindle under a supply can holding the milk. Openings at different locations at the top of the bowl permit the milk to enter, and the cream to come out one outlet and the skimmed milk another in a continuous flow. The bowl of a hand separator revolves between 6,000–8,000 r.p.m. The discs divide the milk into thin layers, and the centrifugal force developed in the rapidly revolving bowl causes the heavier part of the milk to be forced to the outside of the bowl and out of the skim milk outlet. The butterfat, being lighter than the rest of the milk, comes to the centre and is moved out of the cream outlet. The richness of the cream may be regulated by the position of the cream outlet. As previously stated, cream testing 30–35% butterfat is desirable. When properly handled, the skimmed milk should not contain more than .1% butterfat.

The Milk Clarifier.—It is common knowledge to users of the centrifugal separator that the inside of the bowl frequently gathers foreign particles from the milk. This fact formed the basis for the construction of the centrifugal clarifier, for removing foreign material from market milk. The clarifier resembles the separator with the exception that the bowl is constructed so there will be no separation in the milk and there is more room between the discs and the inside of the bowl. The milk flows through the rapidly revolving bowl and out a single outlet.

Pasteurizers are used in milk plants or creameries where large volumes of milk and cream are pasteurized for market milk or for some operation in processing milk or cream. The type of pasteurizer and cooling equipment will depend upon whether the holding method (143° for 30 min.) or the flash method (160° for 15 sec.) of pasteurization is used. A commonly used pasteurizer is a rectangular insulated vat made of stainless steel with a tight cover of the same material. Some device for slow agitation is mounted in the vat. The vat is equipped so that hot water may be applied to heat the milk to the proper temperature. After this, water or brine may be turned into the vat for cooling, or the warm milk may be pumped over a tubular cooler. A recording thermometer may record the temperature cycle. In the case of high temperature pasteurization, special machinery is necessary to apply heat at a higher temperature for a short period.

Bottle Fillers.—The bottling of milk may be the final plant operation in a system of pasteurization of milk where the warm milk flows over a tubular cooler into an automatic bottle filler and capper. The inspected bottles are fed onto a revolving table where the bottles are filled and capped at the end of the revolution. The capping of bottles by hand is a source of contamination prohibited on most markets. In addition to the usual paraffined cap some grades of milk require a paper or metal cover to protect the top of the bottle. In this event this is made another operation of the machine. Hand operated filling and capping machines are available for small dairies. In 1943 many milk distributors were using single service paper bottles.

Creamery Machines.—Shortly after the adoption of the hand separator the butter factory in the United States changed from receiving whole milk to handling cream for churning. Creameries were built to handle cream from farmers who delivered their own cream in an area having 1,000 or more cows. Now automobiles and all-weather roads have extended the area available to any one creamery. In the state of Minnesota in 1943 there were 778 creameries. Of this number 601 were co-operative creameries.

For each 100 lb. of 35% cream delivered to a creamery there are approximately 57 lb. of buttermilk that is sold to nearby farmers for feeding to animals or may be trucked to a central drying plant.

Dried buttermilk or partially dried buttermilk, known as semisolid buttermilk, may be used for feeding animals. Dried buttermilk, meeting specified sanitary requirements, is used for human food when milk solids are scarce. In many plants the drying equipment is used for producing both dried buttermilk and dried skimmed milk.

The churning of cream into butter depends on the fact that the butterfat in cream is in the form of small globules. At the proper temperature (around 50° F.) and with sufficient agitation, the butter will gather together in the form of granules and separate from the buttermilk. When the butter particles reach the size of a kernel of corn, the buttermilk can be drawn off without an appreciable loss of butterfat. The butter is then washed with water of about the same temperature as the buttermilk. After the wash water is removed, salt may be added if desired and the butter worked. During working, the butter is kneaded into a compact mass, the salt incorporated and the moisture content standardized. In the United States, butter must contain 80% of butterfat by weight.

In a creamery the cream is churned in a barrel-like combined churn and worker that will handle approximately 1,000 lb. of finished butter. The churn is commonly made of wood and is mounted so that it will revolve.

The butter is washed, salted and worked in the churn, and is ready for packing into tubs or for printing when taken from the churn. The upright dasher churns so common on farms in the past have been eliminated in favour of some kind of revolving barrel churn.

The making of butter on the farm is gradually being eliminated due to the ease of trading butter fat for butter at the dairy plant and for the reason that farm-made butter is generally inferior in quality to creamery butter.

Cheesemaking.—In the making of cheddar cheese, whole milk is coagulated with rennet. The liquid portion or whey is removed and the curd is heated and allowed to drain. The curd is then cut, salted and packed in cloth-lined hoops, and placed in a press for about 24 hours to mould the cheese into the desired shape. The cheese is then moved to a curing room where a desirable temperature for curing may be maintained. This may vary from 40° F. to 60° F. The length of time and temperature determine the ripeness of the cheese. Usually 6–8 months are required to insure satisfactory ripening. The equipment for cheesemaking is more simple than that required for other dairy products. Rectangular vats for holding the milk, presses and a curing room are the most essential items. The development of process cheese has stimulated the cheese industry in the United States. In making process cheese the rind is removed and the cheese is ground, heated and packaged when hot. Cheese of various ages and types are blended to secure the desired flavour and body. In the United States a large amount of cheddar cheese is made from pasteurized milk.

Ice Cream Making.—Ice cream has changed from a luxury to a delicious food product universally used. Centralized methods of manufacture and distribution have extended the use of ice cream at a price within the reach of all. The tub freezer requiring ice has been replaced by the continuous freezer made of stainless steel and using brine or ammonia as a refrigerant. The ice cream mix is partially frozen and whipped in the freezer and then placed in a low temperature room (below −10° F.) to harden. The very general adoption of electrical refrigerators in the home has made it possible to carry a supply of ice cream in the home. Refrigerated trucks and the use of dry ice have facilitated the distribution of ice cream.

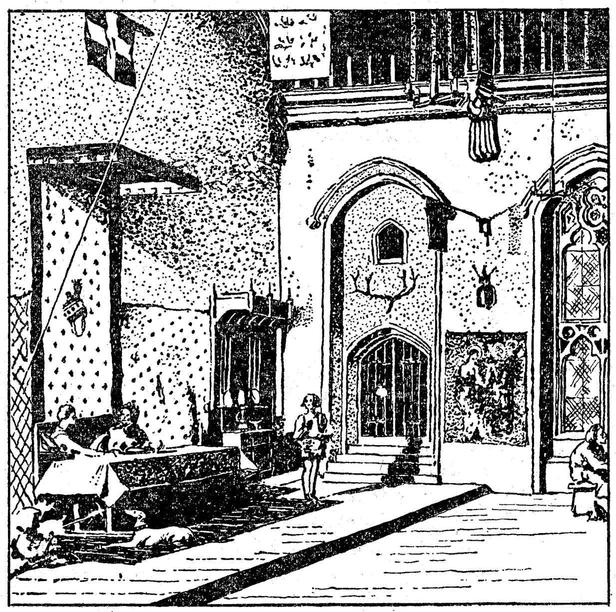
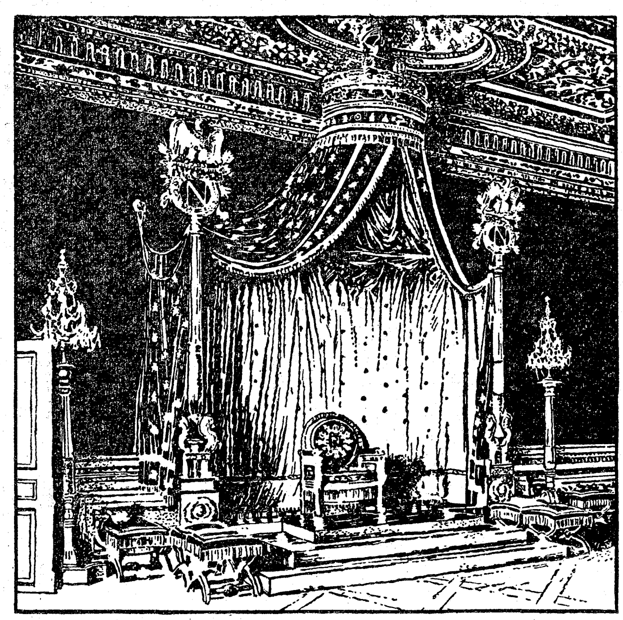
DAIS, originally the raised part of the floor at the end of a mediaeval hall. On this the lord of the mansion dined with his



English Gothic, 14th Century



French Empire, Early 19th Century
Napoleon's Throne Room
Fontainebleau Chateau

Top: after a model by Dwight Franklin, in the Metropolitan Museum of a Mediaeval Hall, England friends at the high table, apart from the retainers and servants. There was generally a deep-recessed bay window at one or at each end of the dais to give greater privacy than the open hall could afford. In France the word is understood as a canopy or hanging over a seat, probably from the fact that the seats of great men were often surmounted by such a feature. In ordinary usage the term means any raised platform in a room, for ceremonial use (*see* CANOPY).

DAISY, the name applied to many plants with showy rays, and in England practically restricted to the genus *Bellis,* of the family Compositae. The word is derived from the Anglo-Saxon and means day's eye. The genus contains ten species found in Europe and the Mediterranean region. The common daisy, *B. perennis,* is the only representative of the genus in the British Isles. It is a perennial, abundant everywhere in pastures, lawns and on banks in Europe, except in the most northerly regions and in Asia Minor, and occurs sparingly as an introduced plant in North America where it is always called English daisy or bachelor's-button. The stem is short; the leaves, which are numerous and form a rosette, are slightly hairy, obovate-spatulate in shape, with rounded teeth on the margin in the upper part; and the rootstock is creeping and of a brownish colour. The flowers are to be found from March to November, and occasionally in the winter months. The heads of flowers are solitary, the outer or ray florets pink or white, the disk florets bright yellow. The size and luxuriance of the plant are much affected by the nature of the soil in which it grows. The cultivated varieties bear finely-coloured flowers, and make very effective borders for walks. What is known as the "hen-and-chicken" daisy has the main head surrounded by a brood of sometimes as many as ten or twelve small heads, *i.e.,* proliferous. The ray florets curve inwards and "close" the flower head in dull weather and towards evening.

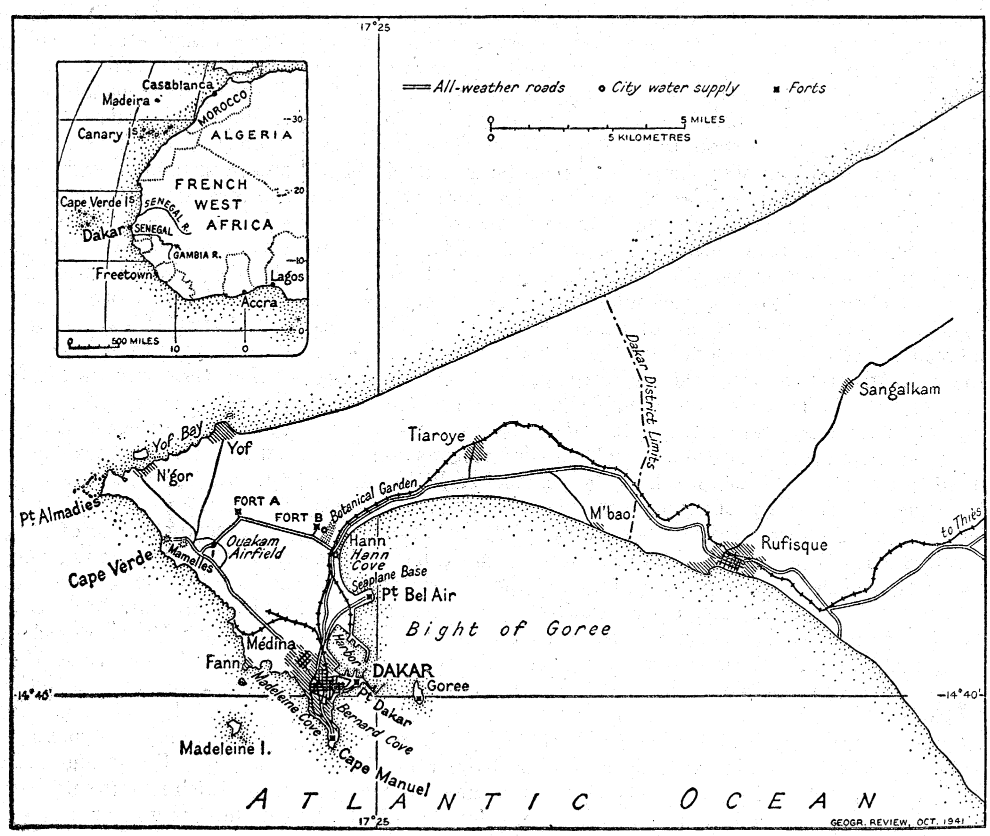
In French the daisy is termed *la marguerite,* and "herb margaret" is stated to be an old English appellation for it. In Scotland it is popularly called the gowan, and in Yorkshire it is the bairnwort, or flower beloved by children.

The Christmas and Michaelmas daisies are species of *Aster;* the ox-eye daisy is *Chrysanthemum leucanthemum,* a common weed. *B. perennis floreplenо,* the double daisy, consists of dwarf, showy, 3 to 4 in. plants, flowering freely in spring if grown in rich light soil.

DAKAR, capital of French West Africa (*q.v.*), chief seaport of Senegal (*q.v.*), port of call for ships and aeroplanes, and a fortified naval and air base. It stands on Cape Verde peninsula, westernmost extension of the African continent (*see* map). Being in the part of the old world nearest to South America, it became and remains the eastern terminus of the first transatlantic air route. Not far offshore lies the fork in the ocean routes connecting Europe with Brazil-Argentina, and with Africa and the Indian ocean. The peninsula includes the bit of coast most readily improved with large-scale harbour works anywhere in West Africa. It lies between the Senegal and the Gambia, the two rivers by way of which the western Sudan was opened to European occupation, and was made the ocean terminal of the railroads which have inherited most of the river-borne trade. Fanned by ocean breezes, it is the most comfortable spot on the coast of French West Africa, and almost the nearest to Europe of suitable sites for a large city; France chose it for the colonial capital. Its bold cliffs warranted fortification and gave it the sobriquet "The African Gibraltar."

In appearance and character Dakar is more like a European city than any other in West Africa, and its European population is the largest—*c.* 10,000 of the total 92,634 in 1936, and perhaps 15,000 of more than 100,000 during World War II. Seasonal migration of both Europeans and Africans swells these figures during the dry season. In spite of its natural advantages and their ultimate fulfillment, the only settlements on the peninsula were native villages subsisting meagerly on sandy soil and seafish, until after French conquest of the western Sudan made the mainland safe for permanent European settlement. In 1857 the French government took possession and built a fort on Dakar point, thereby safeguarding the interests of merchants who had been settling there for 20 years and of residents of the nearby island of Goree, who had depended upon the mainland for water, firewood and some of their food. By 1862 a short breakwater had been built in the lee of the point and a town laid out on the low limestone platform behind the curve of sandy beach. Another generation elapsed, however, before Dakar established its supremacy over rival Cape Verde settlements.

Predecessors and Rivals.—The earliest European foothold in the vicinity was Goree, on a waterless island in the lee of the peninsula. Protected from depredations of the indigenes by $1\frac{1}{4}$ mi. of water and favoured with a tiny natural harbour, Goree had been occupied by the Dutch in 1588. It was seized by the French in 1677 and thenceforth held by them except for four terms of British military occupation, three of them during the 18th century struggle for colonial supremacy. Until the abolition of slavery in 1848, its chief activity was the slave trade, but it also housed all the other establishments doing business on the Petite Côte, the low-lying coast threaded with broad estuaries and short streams that lies between Cape Verde and the Gambia river. At times it administered the Petite Côte, and from 1903–08 it



COURTESY OF THE GEOGRAPHICAL REVIEW

THE CAPE VERDE PENINSULA: SCALE APPROXIMATELY 1:300,000. BASED ON THE 1:100,000 MAP OF THE SERVICE GÉOGRAPHIQUE DE L'AFRIQUE OCCIDENTALE FRANÇAISE À DAKAR, 1928.

was the temporary residence of the governor-general of French West Africa. Removal of the government to the peninsula had been preceded by departure of the business houses, and left only a garrison and a few minor government departments. After having been a commune since 1872, Goree was absorbed by Dakar in 1929. Its significance, apart from its historic role, is conversion of the island into a modern fort during World War II. For this purpose its cliffed southern half, facing the seaward approach to Dakar, is eminently suited.

Dakar's rise was further retarded by the commercial rivalry of Rufisque, 13 mi. along the coast of the peninsula and only 6 mi. from the African mainland. The Portuguese had discovered its stream of fresh water in the 15th century, naming it Rio Fresco. In 1849 the first African-grown groundnuts (peanuts) were shipped from this neighbourhood, and the place became a lighterage port with piers projecting beyond the surf. Peanuts spread inland and soon became the chief export business of West Africa. Commercial houses deserted Goree for Rufisque, which monopolized the peanut trade and was made a commune in 1880. Its decline began when, in 1885, Dakar's superior harbour was connected with the Senegal river. A score of years later, further improvements in Dakar's port facilities withdrew more traffic and started a transfer of business houses from Rufisque. After 1923, when railroad extensions through the heart of the peanut country tapped the upper Niger basin, Rufisque became moribund. Ports of the more distant Petite Côte, however, have prospered on increased groundnut shipments. Among them, Kaolack (pop. [1936] 40,000, 650 being Europeans) is the second city in French West Africa.

The Port.—Until about 1900, Dakar's chief function was to serve as a port of call for ocean shipping otherwise unconnected with West Africa. The first jetty adequate to protect the anchorage from the surf and to withstand the tempests of the rainy seasons was finished in 1866. Thenceforth the Messageries Maritimes used Dakar as port of call for its liners instead of St. Vincent on the Cape Verde Islands. Between 1898 and 1912 this jetty was extended to 2,740 ft. Beyond an entrance 820 ft. wide a new breakwater was built to the opposite shore of the bay, the shoreward half being awash. The harbour so formed comprises 555 ac. In addition to lighterage, two piers with warehouses were built to accommodate commercial shipping. The naval installations consisted of a marine arsenal and repair yard, a drydock serving ships up to 10,000 tons, and a basin for destroyers. Further improvements were begun in the 1930s, and amplified in the early years of World War II. Both jetties were widened to serve as quays, and four or five new commercial piers were built. Just within the harbour entrance an anchorage has been dredged to 33 ft. to accommodate warships and other vessels refueling with petroleum. A coaling pier is adjacent. A 28-foot channel runs to the navy yard. Depth of water along some of the commercial wharfs is 23 ft., alongside others 28 ft. Spur tracks from the railroad terminal serve the entire quayage. A new jetty was built outside the harbour from Point Dakar toward Goree, forming an outer road and further protecting the entrance to the harbour. From it a boom to ward off submarines was run eastward to Goree, and thence north to the peninsula a little west of Rufisque. For further protection paired batteries of 240-mm. guns were emplaced on the highest surroundings of the city: Goree, a basalt cliff 145 ft. high; Cape Manuel, another, 130 ft. high, which forms the south tip of the peninsula; and the Cape Verde hill itself, 345 ft. high. All round the headland are lesser batteries (5 of 155 mm. and 9 of 75 mm.), those on the low north shore being mobile units. An aerodrome, a seaplane airport, and radio sending stations complete the fortification of the "African Gibraltar."

Ships of nearly all lines trading to West Africa call at Dakar, as do also many in the South African and South American trade. The port handles 75–80% of the total overseas trade of Senegal and French Sudan, except the export of groundnuts, which it shares with river ports of the Petite Côte. By volume of traffic it ranks next after Havre and Marseilles in the entire French empire but most of this is accounted for by groundnut exports and the importation of coal and petroleum, used mainly for servicing passing ships. Import commodities absorbed by Africa fall far short of exports in value, and still farther in tonnage.

The Town.—The business centre of the city stands some 25 ft. above the harbour, on gently undulating ground. Southward the land rises in a long slope and the cape narrows. There stand most of the government offices, including the governor's palace, most conspicuous structure in town, on a bluff 100 ft. above the Bight of Goree. The spacious official section and the associated European residential quarter are laid out to take advantage of whatever breeze may blow. Nearby is the imposing domed Roman Catholic cathedral. Some 20,000 Africans live scattered about the city, but more than half the total population of Dakar now dwells in the suburb Médina, regularly laid out as an African settlement on flat land northwest of the business centre.

Between the harbour and Médina, business houses run by, and catering to, Europeans give way to a quarter in which business catering to Africans is in the hands of "Syrians" from North Africa and the Levant. In Médina itself Africans chaffer in open-air markets. Manufacturing, other than repairing, is confined to making perishable goods sold locally, except for an oil and soap factory and the naval base. Handicrafts are more wide-spread—chiefly garment making with the aid of foot-power sewing machines, cabinet work, and jewellery. In the country, beyond Médina, most of the arable land is devoted to market gardens. Ancient fishing villages on the Atlantic coast send their catch to the new metropolis.

Services.—Safeguards to public health are paramount in the layout and operation of the city. Potable water is brought from several groups of sanddunes as far as 12 mi. from town. Seawater is used to flush the streets frequently, to keep them clean and also free from the larvae of mosquitoes. Public shower baths and latrines are distributed through the city. Marshes have been drained, so as to reduce the number of mosquitoes, to a line 12 mi. out.

The medical centre is the largest in middle Africa. It includes hospitals for Europeans and Africans, an out-patient clinic for Africans, and a school granting certificates for assistants in the medical service of the colony. Other advanced schools: administration and teaching (especially for urban teachers); marine engineering (for naval service); a secondary school granting a certificate equivalent to the *baccalauréat* of France.

Besides shipping lines Dakar is linked to Paris, Natal (Brazil) and Khartoum (Anglo-Egyptian Sudan) by air routes. Cables run to Brest, Pernambuco (Brazil) and the other French African colonies. Besides railroads, dry-season motor roads ramify throughout Senegal and connect Dakar with all the eight subcolonies which it governs. Telegraph lines reach every centre of French West Africa.

Political Status.—In 1887 Dakar was made one of three communes in French Africa south of the Sahara. All persons born within the commune before 1906 and their descendants are French citizens. Other adult Africans may become citizens under specified conditions that prove adherence to the European manner of life. Adult male citizens elect a commune council in which Africans form the majority, but which has limited functions (as is also the case in France). Citizens may vote for a member of the French chamber of deputies, elected jointly by the three communes. After 1932 this body of citizens lived under a special civil code and was exempt from French laws that apply only to natives. Citizens who are Moslems are also subject to local Moslem law.

In 1902 Dakar was designated capital of the seven-year-old colony of French West Africa, in succession to Saint-Louis (*q.v.*). Offices were removed thither or to Goree shortly thereafter, and by 1908 the entire government was housed on the peninsula, largely in buildings constructed for the purpose.

In 1924 Dakar and neighbouring villages, including the area from which it draws its water supply, were withdrawn from Senegal, and set up as a district (*Circonscription*) administered by a governor. The boundary crosses the peninsula a little west of Rufisque. The functions of the government-general of West Africa which are located at Dakar include all the usual executive offices, the high court of appeal, and the African headquarters of the Bank of French West Africa, which issues banknotes. The city is the seat of a Roman Catholic bishop. Because of undeniable natural advantages, the natural handicaps of Dakar have been reduced or converted into assets. After World War I it was one of the key points in the French empire. World War II made evident its significance as a major world focus.

Lengyel, *Dakar* (1943). (D. WH.)

DAKIN'S SOLUTION or **CARREL-DAKIN SOLUTION** is an antiseptic containing free chlorine and designed for the treatment of infected wounds. First used during World War I, it was the product of long study by Henry Drysdale Dakin and Alexis Carrel in search of the ideal wound antiseptic. The stronger germicidal solutions, such as carbolic acid and iodine, damage living cells, or lose their potency in the presence of blood serum. Dakin's solution avoids both these defects and in addition has a solvent action on dead tissue which hastens its separation from living tissue. By combination between the slowly liberated chlorine and the tissue proteins, Dakin believes that a chloramine is formed, to which is due the extraordinary antiseptic power exhibited by Dakin's solution *in vivo*. The solution now commonly used is a modification proposed by Dufresne and embodied in the U.S. Pharmacopoeia as *Liquor Sodae Chlorinatae Chirurgicalis*. It is prepared from bleaching powder and the carbonate and bicarbonate of soda, and must contain 0.45 to 0.50% of sodium hypochlorite and no free alkali. It is unstable and will not keep more than a few days. The Carrel-Dakin treatment consists in flooding the entire wound surface every two hours, by means of small tubes connected with a reservoir. Used in this way, Dakin's solution is the best preparation now known for controlling infection in wounds and abscess cavities.

DAKOTA, a tribe, or confederated aggregation of tribes, of Siouan family in the northern plains of the United States. The name, now applied to two States, means "allies"; the popular designation is Sioux, abbreviated from Nadowessioux, from Ojibwa via French. As the largest group in the Siouan family, the Dakota have given their name to this. They number in the aggregate some 25,000, not much less than at first white contact, probably. There are three main divisions: Santee, Yankton, Teton, calling themselves respectively Dakota, Nakota and Lakota. The Santee comprise the Mdewakanton, Wahpeton, Wahpekute, Sisseton; the Yankton includes the Yankton and the Yanktonai. This makes seven divisions, recognized by the Dakota themselves as "seven council fires"; but the Teton outnumber the other six combined.

First encountered by the whites in Minnesota, the Dakota have drifted westward, under pressure first from the Ojibwa, who were early armed with French guns, and later from the whites. During the latter half of the 18th century the Teton established themselves west of the Missouri river. They are now on ten reservations in several States. The Dakota have always been a spirited, brave, somewhat turbulent people, upstanding and outright in character. Tall in stature and picturesque in costume, they have in recent generations impressed civilized imagination perhaps more than any other American tribe. All the Teton and part of the other divisions adhered to the plains Indian type of life: buffalo hunting, tepee dwelling, nomadic, non-agricultural, raiding, and proud of their war exploits. Their greatest ceremony was the so-called sun dance. (A. L. K.)

DALADIER, EDOUARD (1884–), French politician, who was a school teacher in early life, was elected Radical-Socialist deputy for Vaucluse in 1919. After holding several cabinet posts, he became premier in 1933; he also headed the short-lived government that was toppled by the Stavisky scandal in 1934.

Daladier became premier again in 1938, and in September of that year he returned from Munich with high hopes for peace. But a year later, Hitler invaded Poland and destroyed his illusions. After declaring war on Germany, Daladier formed a war cabinet Sept. 13, 1939; but his vacillating policy led to his downfall March 20, 1940. He was minister of defense and war in the Reynaud cabinet but was dropped June 6. Daladier was arrested Nov. 17, 1940, stood trial at the Riom war-guilt hearings Feb. 1942, and together with Leon Blum, led a vigorous attack on the Pétain regime. After the trials were suspended April 1942, Daladier was placed under house arrest.

DALAGUETE, a municipality (with administrative centre and 23 *barrios* or districts) of the province and island of Cebu, Philippine islands, at the mouth of the Tapón river on the east coast, 50 mi. S.S.W. of Cebu, the provincial capital. Pop. (1939) 27,284, of whom only one was white. The climate is healthy, the coolest months being those of November to February, inclusive. Abacá, corn, coffee, sibucao, cacao, coco-nuts and sugar are the principal agricultural products. Manufactures include rough fabrics, clay pots and jars, salt, soap and tuba wine. Fisheries afford a leading source of livelihood for the inhabitants, of whom 20.8% of those aged 6 to 19, inclusive, were reported in school and 31.9% of those ten years old and over were reported literate. The vernacular is Cebuano.

DALBEATTIE, a small burgh, Kirkcudbrightshire, Scotland. Pop. (est. 1938) 3,160. It lies on Dalbeattie burn, 14½ mi. S.W. of Dumfries by the L.M.S.R. The town dates from 1780 and owes its rise to the granite quarries at Craignair and elsewhere in the vicinity, from which was derived stone used for the Thames embankment, docks at Odessa and Liverpool and other works. Besides quarrying, the industries include concrete (crushed granite) works, paper, bobbin, corn and timber mills, brickmaking and glove manufacture. The estuary of the Urr, known as Rough firth, is navigable by ships of 150 tons, and small vessels can ascend as far as the mouth of Dalbeattie burn, within a mile of the town. The Mote of Urr, 3 mi. N., is the most notable Anglo-Norman earthwork in Scotland. It is on a natural circular hillock, cone-shaped, with an encircling trench and is situated at one end of a base court, or bailey. It was once a river island.

DALBERG, the name of an ancient and distinguished German noble family, derived from the hamlet and castle (now in ruins) of Dalberg or Dalburg near Kreuznach. In the 14th century, the original house of Dalberg became extinct in the male line, the fiefs passing to Johann Gerhard, chamberlain of the see of Worms, who married the heiress of his cousin, Anton of Dalberg, about 1330. His own family was of great antiquity, his ancestors having been hereditary ministerials of the bishop of Worms since the time of Ekbert the chamberlain, who founded in 1119 the Augustinian monastery of Frankenthal and died in 1132. By the close of the 15th century the Dalberg family had grown to be of such importance that, in 1494, the German King Maximilian I granted them the honour of being the first to receive knighthood at the coronation; this part of the ceremonies being opened by the herald asking in a loud voice "Is no Dalberg present?" (*Ist kein Dalberg da?*). This picturesque privilege the family enjoyed till the end of the Holy Roman Empire. The elder line of the family of Dalberg-Dalberg became extinct in 1848, the younger, that of Dalberg-Herrnsheim, in 1833. The male line of the Dalbergs was then represented only by the family of Hessloch, descended from Gerhard of Dalberg (*c.* 1239), which in 1809 succeeded to the title and estates in Moravia and Bohemia of the extinct counts of Ostein. The following are the most noteworthy of the family:

1. JOHANN VON DALBERG (1445–1503), chamberlain and afterwards bishop of Worms, son of Wolfgang von Dalberg. He studied at Erfurt and in Italy, where he took his degree of doctor *utriusque juris* at Ferrara and devoted himself more especially to the study of Greek. Returning to Germany, he became privy councillor to the elector palatine Philip, whom he assisted in bringing the university of Heidelberg to the height of its fame. He was instrumental in founding the first chair of Greek, which was filled by his friend Rudolph Agricola, and he also established the university library and a college for students of civil law. He was an ardent humanist, was president of the *Sodalitas Celtica* founded by the poet Konrad Celtes (*q.v.*), and corresponded with many of the leading scholars of his day, to whom he showed himself a

veritable Maecenas.

2. Karl Theodor Anton Maria Von Dalberg (1744–1817), archbishop-elector of Mainz, arch-chancellor of the Holy Roman empire, and afterwards primate of the Confederation of the Rhine and grand-duke of Frankfurt. Karl had devoted himself to the study of canon law, and entered the Church. He was made governor of Erfurt (1772), elected coadjutor of Mainz and of Worms (1787) and of Constance (1800); in 1802 he became archbishop-elector of Mainz and arch-chancellor of the empire. Dalberg tried to galvanize the atrophied machinery of the empire into some sort of effective central government of Germany. Failing in this, he turned to the rising star of Napoleon, believing that he had found in him the only force strong enough to save Germany from dissolution. On the dissolution of the empire in 1806 he was appointed by Napoleon prince primate of the Confederation of the Rhine. In 1810, after the peace of Vienna (Schönbrunn), the grand-duchy of Frankfurt was created for his benefit out of his territories, which in spite of the cession of Regensburg to Bavaria were greatly augmented. Dalberg's fortunes fell with those of Napoleon, and, when he died on Feb. 10, 1817, of all his dignities he was in possession only of the archbishopric of Regensburg. He was a notable patron of letters, and was the friend of Goethe, Schiller and Wieland.

See Karl v. Beaulieu-Marconnay, *Karl von Dalberg und seine Zeit* (Weimar, 1879).

3. Wolfgang Heribert Von Dalberg (1750–1806), brother of the above, was intendant of the theatre at Mannheim, and was the first to stage Schiller's earlier dramas. The poet's *Briefe an den Freiherrn von Dalberg* (Karlsruhe, 1819) are addressed to him. He himself wrote several plays, including adaptations of Shakespeare. His brother, Johann Friedrich Hugo von Dalberg (1752–1812), canon of Trier, Worms and Spires, was a composer and writer on musical subjects.

See Alafberg, *Von Dalberg als Bühnenleiter und Dramatiker* (1907).

4. Emmerich Joseph, Duc de Dalberg (1773–1833), son of Baron Wolfgang Heribert, was born at Mainz on May 30, 1773. In 1803 he entered the service of Baden, which he represented as envoy in Paris. After the peace of Schönbrunn (1809) he entered the service of Napoleon, who, in 1810, created him a duke and councillor of state. In 1814 he was a member of the provisional Government by whom the Bourbons were recalled, and he attended the congress of Vienna, with Talleyrand, as minister plenipotentiary. At the second restoration he became a minister of state and a peer of France. In 1816 he was sent as ambassador to Turin. He died at Herrnsheim on April 27, 1833.

The duc de Dalberg had inherited the family property of Herrnsheim from his uncle the arch-chancellor Karl von Dalberg, and this estate passed, through his daughter and heiress, Marie Louise Pelline de Dalberg, by her marriage with Sir R. E. Acton, 7th baronet (who assumed the additional name of Dalberg), to her son the historian, John Emerich Edward Dalberg-Acton (1834–1902), 1st Baron Acton (*q.v.*).

D'ALBERT, EUGEN FRANCIS CHARLES (1864–1932), Anglo-French pianist and composer, was born in Glasgow, April 10, 1864, being the son of Charles Louis Napoleon d'Albert, whose dance music enjoyed great popularity in its day. D'Albert studied at the National Training school, London (later the Royal College of Music), eventually winning the Mendelssohn scholarship and going to Vienna to continue his studies. He succeeded Joachim as director of the Hochschule in Berlin in 1907. As pianist d'Albert excelled in the interpretation of Beethoven; as composer he composed chiefly operas, *Tiefland* being the best known of his many works in this form.

DALE, DAVID (1739–1806), Scottish manufacturer and philanthropist, was born at Stewarton on Jan. 6, 1739, the son of a grocer. He began business by buying up homespun linen and yarn, and then imported French and Dutch yarn. Together with Arkwright in 1785 he opened a cotton mill at New Lanark near the Falls of Clyde, but the partnership was dissolved in the same year. The enterprise, however, was so successful that Dale built a village for the workers. The mill was afterwards sold to a Manchester firm who appointed Robert Owen as manager. About 1770 Dale organized the "Old Independents," a religious community on Congregational lines, of which he was chief minister. He died in Glasgow on March 17, 1806.

DALE, RICHARD (1756–1826), United States naval officer, was born in Norfolk county, Virginia, Nov. 6, 1756, and went to sea at the age of 12. During the early months of the American Revolution, he led a checkered career as a lieutenant in the Virginia provincial navy, a prisoner of war on Governor Dunmore's British fleet in the Chesapeake, and a mate in a Tory brig. The brig was taken by John Barry on July 27, 1776, and that same day Dale entered on board Barry's Continental brig "Lexington" as a master's mate. He served on the "Lexington" under three captains, and went to Mill prison, Plymouth, England, along with the rest of the crew when the brig was taken by the British cutter "Alert" in the English Channel on Sept. 19, 1777. Escaping to France more than a year later, Dale entered on board the "Bon Homme Richard," Captain John Paul Jones commanding, and as first lieutenant of that famous ship distinguished himself at the taking of the "Serapis" off Scarborough in Sept. 1779. He followed Jones's fortunes as first lieutenant on the "Alliance" and the "Ariel," and, in Aug. 1781 was on board the "Trumbull" when that frigate was captured by two British ships. After the war, Dale engaged as a shipmaster in the London and East Indies trades until he was appointed fourth ranking captain in the United States navy in 1794. Later, in a dispute over rank, he secured a leave of absence and went back to the merchant marine. In May 1801 he was recalled to duty and appointed to the command of a squadron of observation sent to the Mediterranean. With limited powers and a small force, Dale maintained a successful blockade of Tripoli, and prevented the piratical depredations of the Barbary powers for a period of six months. He returned to the United States in 1802. That same year he refused to take out a second squadron, when the navy department would not allow him a captain for the frigate "President" upon which he was to hoist his broad pennant, and resigned from the navy on Dec. 17, 1802. Dale lived in retirement in Philadelphia until his death on Feb. 26, 1826.

See "Biographical Memoir of Richard Dale," *The Port Folio* (June 1814); *Quasi-War with France and Barbary War Documents,* 11 vols. (Washington, 1935–42). (W. B. Ck.)

DALE, SIR THOMAS (d. 1619), British naval commander and colonial deputy-governor of Virginia. From about 1588 to 1609 he was in the Netherlands with the English army originally under Robert Dudley, earl of Leicester; in 1606 he was knighted by James I.; from 1611 to 1616 he was actually though not always nominally in chief control of the colony of Virginia either as deputy-governor or as "high marshall," and he is best remembered for the energy and the extreme rigour of his administration there, which established order and in various ways seems to have benefited the colony. Under him began the first real expansion of the colony with the establishment of the settlement of Henrico on and about what was later known as Farrar's Island; about 1614 he took the first step toward abolishing the communal system by the introduction of private holdings, and it was during his administration that the first code of laws of Virginia was effectively tested. This code, entitled "Articles, Lawes, and Orders—Divine, Politique, and Martiall," but popularly known as Dale's Code, was notable for its pitiless severity, and seems to have been prepared in large part by Dale himself. He left Virginia in 1616 and shortly after his return to England was given command of a fleet sent against the Dutch, defeated the enemy near Batavia in the East Indies late in the year 1618, arrived at Masulipatam in July 1619, and died there on Aug. 9, following.

An account of Dale's career in Virginia is given in Alexander Brown's *The First Republic in America* (1898); a scholarly discussion of "Dale's Code" by W. F. Prince may be found in vol. i. of the *Annual Report of the American Historical Association* for 1899 (1900), and the code itself is reprinted in Peter Force's *Historical Tracts,* vol. iii., No. 11.

DALECARLIA (*Dalarne,* "the Dales"), a west midland region of Sweden, extending from the mountains of the Norwegian frontier to within 25 m. of Gefle on the Baltic coast. It is a region of historical associations and local peculiarities. The Dalecarlians have their own dialect and colourful costumes. In 1434, led by Engelbrecht, they rose against the tyranny of Eric XIV. of Denmark, and in 1519–1523 they strongly supported Gustavus Vasa in freeing Sweden from the Danes. The districts around Lakes Runn and Siljan ("the Eye of the Dales"), are consequently classic ground. The people are for the most part small peasant proprietors. They eke out their scanty existence based on agriculture by a variety of home industries, such as making scythes, saws, bells, wooden wares, hair goods, etc. About three-quarters of the whole district is covered with forest. Besides the wealth of the forests, Dalarne contains some of the largest iron mines in Sweden, notably those of Grängesberg. Copper has been mined since the 13th century at Falun (*q.v.*), and other minerals have been found. Much of the area is consequently industrial.

DALÉN, GUSTAF (1869–1937), Swedish inventor, was born at Stenstorp Nov. 30, 1869. After passing his examination as an engineer at Göteborg in 1896 he completed his studies at Zürich. On his return home he invented hot-air turbines, milking and other machines. In 1906 he became chief engineer to the Gas Accumulator Co., which was exploiting in Sweden the French invention of dissolved acetylene. In 1909 he was appointed managing director of this company and then succeeded in composing a product called "Agamassan" which has the property of absorbing acetylene without any danger of explosion. Dalén's cleverest invention was what is called Solventil, which when placed in a fire kindles it automatically when twilight sets in and extinguishes it at daybreak. In 1912 he was awarded the Nobel Prize for physics. During an experiment in 1913 he became blind in consequence of an explosion, but nevertheless he continued to conduct his experiments until his death at Stockholm Dec. 9, 1937.

DALGAIRNS, JOHN DOBREE (1818–1876), English Roman Catholic priest, was born in Guernsey on Oct. 21, 1818, and educated at Exeter college, Oxford. Dalgairns became a Roman Catholic in 1845, and with Newman became a member of the Congregation of the Oratory at Rome. On his return to England in 1848 he was attached to the London Oratory, becoming superior on Fr. Faber's death in Sept. 1863. Dalgairns was a prominent member of the well-known "Metaphysical Society." He died on April 6, 1876. His chief works are *The Devotion to the Sacred Heart of Jesus, with an Introduction on the History of Jansenism* (1853); *The German Mystics of the Fourteenth Century* (1858); *The Holy Communion, its Philosophy, Theology and Practice* (Dublin, 1861).

See J. Gillow's *Bibliog. Dict. of English Catholics.*

DALGARNO, GEORGE (*c.* 1626–1687), British writer, was born at Old Aberdeen. For 30 years a schoolmaster at Oxford and at Elizabeth school, Guernsey, he wrote *Ars Signorum* (1661), an attempt to formulate a philosophical language in which ideas were represented by letters of the alphabet, and *Didascalocophus* (1680), the first explanation of the deaf and dumb alphabet. His chief works were reprinted for the Maitland Club in 1834.

DALHOUSIE, FOX MAULE RAMSAY, 11TH EARL OF (1801–1874), was the eldest son of William Ramsay Maule, 1st Baron Panmure (1771–1852), and a grandson of George, 8th earl of Dalhousie. Born on April 22, 1801, and christened Fox as a compliment to the great Whig, he served for a term in the army, and then in 1835 entered the House of Commons as member for Perthshire. In Lord Melbourne's ministry (1835–41) Maule was under-secretary for home affairs, and under Lord John Russell he was secretary-at-war from July 1846 to Jan. 1852, when for two or three weeks he was president of the board of control. In April 1852 he became the 2nd Baron Panmure, and was secretary of State for war from 1854–58, being at the war office during the concluding period of the Crimean War and having to meet a good deal of criticism, both just and unjust. In Dec. 1860 he succeeded his kinsman, the marquess of Dalhousie, as 11th earl of Dalhousie, and died childless on July 6, 1874. On his death the barony became extinct, but his earldom passed to his cousin, George Ramsay (1806–80), an admiral who, in 1875, was created a peer of the United Kingdom as Baron Ramsay.

See the *Panmure Papers,* a selection from Panmure's correspondence, edited in two vols. (1908), by Sir G. Douglas and Sir G. D. Ramsay. These letters throw much light on the concluding stage of the Crimean War.

DALHOUSIE, JAMES ANDREW BROUN RAMSAY, 1ST MARQUESS and 10TH EARL OF (1812–1860), British statesman and Indian administrator, was born at Dalhousie Castle, Scotland, on April 22, 1812. He was the third son of George Ramsay, 9th earl of Dalhousie (1770–1838), one of Wellington's generals, who, after holding the highest offices in Canada, became commander-in-chief in India. Several years of his early boyhood were spent with his father and mother in Canada. After two years (1825–27) at Harrow, he was placed under a tutor, and in 1829 entered Christ Church, Oxford. On leaving Oxford in 1833 he spent some time abroad. He married in 1836 Lady Susan Hay, daughter of the marquess of Tweeddale, and in 1837 entered the House of Commons as member for East Lothian.

He succeeded to the peerage in 1838, and made his mark in the House of Lords by a clever defence (June 16, 1840) of Lord Aberdeen's Church of Scotland Benefices Bill. In May 1843 he became vice-president of the board of trade, succeeding Gladstone as president in 1845. In the struggle over the corn laws he ranged himself with Peel, and after the failure of Lord John Russell to form a ministry he resumed his post at the board of trade, entering the cabinet on the retirement of Lord Stanley. When Peel resigned office in June 1846, Lord John offered Dalhousie a seat in the cabinet, an offer which he declined. But in 1847 he accepted the post of governor-general of India in succession to Lord Hardinge, on the understanding that he was to be left in "entire and unquestioned possession" of his own "personal independence with reference to party politics."

Governor-General of India.—Dalhousie assumed charge as governor-general of India and governor of Bengal on Jan. 12, 1848. In writing to the president of the board of control, Sir John Hobhouse, he assured him that everything was quiet. This statement, however, was to be falsified by events almost before it could reach England. For on April 19 Vans Agnew of the civil service and Lieutenant Anderson of the Bombay European regiment, having been sent to take charge of Multan from Diwan Mulraj, were murdered there, and within a short time the Sikh troops and sardars joined in open rebellion. Dalhousie agreed with Sir Hugh Gough, the commander-in-chief, that the Company's military forces were not prepared to take the field immediately. He also foresaw the spread of the rebellion, and the eventual necessity, not merely for the capture of Multan, but also for the entire subjugation of the Punjab. He therefore organized a strong army for operations in November. For the course of the second Sikh War and Gough's victory at Gujrat *see* INDIA: *History.* For his services the earl of Dalhousie received the thanks of parliament and a step in the peerage, as marquess.

The Punjab and Burma.—Dalhousie, now, without waiting for instructions from home, annexed the Punjab, and made provision for the custody and education of the infant maharaja. The province was temporarily administered by a triumvirate under the personal supervision of the governor-general, and later, a place having been found for Henry Lawrence in Rajputana, by John Lawrence as sole commissioner. Twice Dalhousie toured the province, settling on the spot all matters of importance, and when he left India no province could show a better record of progress.

Another addition to the British possessions was made by conquest. The Burmese court at Ava was bound by the treaty of Yandabo, 1826, to protect British ships in Burmese waters, but the outrageous conduct of the governor of Rangoon towards the masters of the "Monarch" and "Champion" met with no redress from the king. Dalhousie tried to settle the dispute by diplomacy. When that failed he made vigorous preparation for the campaign to be undertaken in the autumn, which he placed in charge of General Godwin. Martaban was taken on April 5, 1852, and Rangoon and Bassein shortly afterwards. A second campaign opened in October, and after the capture of Prome and Pegu the annexation of the province of Pegu was declared by a proclamation dated Dec. 20, 1853. To any further invasion of the Burmese empire Dalhousie was firmly opposed, being content to "consolidate" the Company's possessions by uniting Arakan to Tenasserim. By his wise policy he pacified the new province, placing Colonel Arthur Phayre in sole charge of it, personally visiting it, and establishing a complete system of telegraphs and communications.

Reforms.—These military operations added force to the conviction which Dalhousie had formed of the need of consolidating the Company's ill-knit possessions, and as a step in that direction he decided to apply the doctrine of "lapse," and annex any Hindu native states, created or revived by the grants of the British government, in which there was a failure of male lineal descendants, reserving for consideration the policy of permitting adoptions in other Hindu chiefships tributary and subordinate to the British government as paramount. Under the first head he recommended the annexation of Satara in Jan. 1849, of Jaitpur and Sambalpur in the same year, and of Jhansi and Nagpur in 1853. In these cases his action was approved by the home authorities, but his proposal to annex Karauli in 1849 was disallowed, while Baghat and the petty estate of Udaipur, which he had annexed in 1851 and 1852 respectively, were afterwards restored to native rule.

Other measures with the same object were carried out in the Company's own territories. Bengal, too long ruled by the governor-general or his delegate, was placed under a separate lieutenant-governor in May 1854; a department of public works was established in each presidency, and engineering colleges were provided. An imperial system of telegraphs followed; the first link of railway communication was completed in 1855; well-considered plans mapped out the course of other lines and their method of administration; the Ganges canal, which then exceeded "all the irrigation lines of Lombardy and Egypt together," was completed; and despite the cost of wars in the Punjab and Burma, liberal provision was made for metalled roads and bridges. The useless military boards were swept away; selection took the place of seniority in the higher commands; an army clothing and a stud department were created, and the medical service underwent complete reorganization. "Unity of authority coupled with direct responsibility" was the keynote of his policy. In nine masterly minutes he suggested means for strengthening the Company's European forces, calling attention to the dangers that threatened the English community, "a handful of scattered strangers"; but beyond the additional powers of recruitment which at his entreaty were granted in the last charter act of 1853, his proposals were shelved by the home authorities, who scented no danger and wished to avoid expense. In his administration Dalhousie vigorously asserted the control of the civil government over military affairs, and his insistence on this point caused the resignation of General Charles Napier.

Dalhousie created an imperial system of post-offices, reduced the rates of carrying letters and introduced postage stamps. To him India owes the first department of public instruction; it was he who placed the gaols under proper inspection, abolishing the practice of branding convicts; put down the crime of *meriahs* or human sacrifices; freed converts to other religions from the loss of their civil rights; inaugurated the system of administrative reports; and enlarged and dignified the legislative council of India. His wide interest in everything that concerned the welfare of the country was shown in the encouragement he gave to the culture of tea, in his protection of forests, in the preservation of ancient and historic monuments. He closed the useless college in Calcutta for the education of young civilians, establishing in its place a proper system of training them in technical (*mufasal*) stations, and subjecting them to departmental examinations. He provided the European soldier with healthy recreations and public gardens. To the civil service he gave improved leave and pension rules, while he purified its *moral* by forbidding all share in trading concerns, by vigorously punishing insolvents, and by his personal example of careful selection in the matter of patronage. The high standard thus set became a settled tradition.

Foreign Policy.—His foreign policy was guided by a desire to recognize the "independence" of the larger native states, and to avoid extending the political relations of his government with foreign powers outside India. Pressed to intervene in Hyderabad, he refused to do so, laying down the doctrine that interference was only justified "if the administration of native princes tends unquestionably to the injury of the subjects or of the allies of the British government." Protection in his view carried no right of interference in the affairs of what he called "independent" states. In this spirit he negotiated in 1853 a treaty with the nizam, which provided funds for the maintenance of the contingent kept up by the British in support of that prince's authority, by the assignment of the Berars in lieu of annual payments of the cost.

The same spirit induced him to tolerate a war of succession in Bahawalpur, so long as the contending candidates did not violate British territory. This reluctance to increase his responsibilities further caused him to refrain from punishing Dost Mohammed for the part he had taken in the Sikh War, and resolutely to refuse to enter upon any negotiations until the amir himself came forward. Then he steered a middle course between the proposals of his own agent, Herbert Edwardes, who advocated an offensive alliance, and those of John Lawrence, who would have avoided any sort of engagement. He himself drafted the short treaty of peace and friendship which Lawrence signed in 1855, that officer receiving in 1856 the order of K.C.B. in acknowledgment of his services in the matter. While, however, Dalhousie was content with a mutual engagement with the Afghan chief, binding each party to respect the territories of the other, he saw that a larger measure of interference was needed in Baluchistan, and with the khan of Kalat he authorized Major Jacob to negotiate a treaty of subordinate co-operation on May 14, 1854. The khan was guaranteed an annual subsidy of Rs. 50,000, in return for the treaty which "bound him to us wholly and exclusively." To this the home authorities demurred, but the engagement was duly ratified, and the subsidy was largely increased by Dalhousie's successors. On the other hand, he insisted on leaving all matters concerning Persia and Central Asia to the decision of the queen's advisers. The frontier tribesmen it was obviously necessary to coerce into good behaviour after the annexation of the Punjab. "The hillmen," he wrote, "regard the plains as their food and prey," and the Afridis, Mohmands, Black Mountain tribes, Waziris and others had to be taught that their new neighbours would not tolerate outrages. But he proclaimed to one and all his desire for peace, and urged upon them the duty of tribal responsibility.

Oudh.—The settlement of the Oudh question was reserved to the last. In 1854 Dalhousie appointed Outram as resident at the court of Lucknow; the latter reported on the condition of the province in March 1855. But in spite of the revelation of disorder and misrule, Dalhousie, looking at the treaty of 1801, considered that he was bound to proceed in the matter of reform with the king's consent. He proposed the transfer to the Company of the entire administration, the king merely retaining his royal rank, certain privileges in the courts and a liberal allowance. A general rising was almost certain to follow refusal and then the British Government would of necessity intervene on its own terms. On Nov. 21, 1855 the court of directors instructed Dalhousie to assume the powers essential to the permanence of good government in Oudh, and to give the king no option unless he was sure that he would surrender the administration rather than risk a revolution. Dalhousie was in wretched health and on the eve of retirement when the belated orders reached him; but he laid down instructions for Outram in every detail, moved up troops, and elaborated a scheme of government with particular orders as to conciliating local opinion. The king refused to sign the treaty put before him, and a proclamation annexing the province was therefore issued on Feb. 13, 1856. Only one important matter now remained to him before quitting office. The insurrection of the half-civilized Kolarian Santals of Bengal against the extortions of landlords and money-lenders had been severely repressed, but the causes of the insurrection had still to be remedied. By removing the tract of country from the ordinary regulations, enforcing the residence of British officers there, and employing the Santal headmen in a local police, he ensured a system of administration which proved successful. For a criticism of Dalhousie's policy of annexation *see* INDIA: *History*.

Bengal.—After seven years of strenuous labour, Dalhousie, on March 6, 1856, set sail for England reaching Spithead, on May

13. The outbreak of the mutiny led to bitter attacks at home upon his policy, and to strange misrepresentation of his public acts, while on the other hand John Lawrence invoked his counsel and influence, and those who really knew his work in India cried out, "Oh, for a dictator," and his return "for one hour!" To all these cries he turned a deaf ear, refusing to embarrass those who were responsible by any expressions of opinion, declining to undertake his own defence or to assist in his vindication through the public press, and by his last directions sealing up his private journal and papers of personal interest against publication until 50 years after his death. Dalhousie died at Dalhousie Castle on Dec. 19, 1860; he was buried in the old churchyard of Cockpen. Dalhousie had two daughters, and the marquessate became extinct at his death.

DALIN, OLOF VON (1708–1763), Swedish poet, was born in the parish of Vinberg in Halland, where his father was the minister. He was nearly related to Rydelius, the philosophical bishop of Lund and was sent at a very early age to be instructed by him, Linnaeus being one of his fellow-pupils. While studying at Lund, Dalin had visited Stockholm in the year 1723, and in 1726 entered one of the public offices there. In 1733 he started the weekly *Svenska Argus,* on the model of Addison's *Spectator,* writing anonymously till 1736. His next work was *Tänkar öfver Critiquer* (Thoughts about Critics, 1736). With the avowed purpose of enlarging the horizon of his cultivation and tastes, Dalin set off, in company with his pupil, Baron Rålamb's son, on a tour through Germany and France, in 1739–40. On his return the shifting of political life at home caused him to write his famous satiric allegories of *The Story of the Horse* and *Aprilverk* (1738), which provoked countless imitations. His didactic epos of *Svenska Friheten* (Swedish Liberty) appeared in 1742. Hitherto Addison and Pope had been his models; in this work he draws his inspiration from Thomson, whose poem of *Liberty* is emulated. On the accession of Adolphus Frederick in 1751 Dalin received the post of tutor to the crown prince, afterwards Gustavus III. Queen Louisa Ulrika made him secretary of the Swedish academy of literature, founded by her in 1753. He held the post of tutor to the crown prince until 1756, when he was arrested on suspicion of having taken part in the attempted *coup d'état* of that year, and was tried for his life before the diet. He was exiled from Court, and spent his leisure in preparing the third volume of his great historical work, the *Svea Rikes historia* (History of the Swedish Kingdom), which came down to the death of Charles IX. in 1611. The first two volumes appeared in 1746–50; the third, in two parts, in 1760–62. Dalin had been ennobled in 1751, and made privy councillor in 1753; and in 1761 he once more took his place at court. On Aug. 12, 1763 he died at his house in Drottningholm. In the year 1767 his writings in *belles lettres* were issued in six volumes, edited by J. C. Bökman, his half-brother. During the early part of his life he was universally admitted to be *facile princeps* among the Swedish poets of his time.

See K. Warburg, "Olof von Dalin," in the *Handlingar* (vol. lix., 1884) of the Swedish Academy. A selection of his works was edited by E. V. Lindblad (Örebro, 1872).

DALKEITH, a small burgh, Midlothian, Scotland, between the North and South Esk, 7 mi. S.E. of Edinburgh, by the L.N.E.R. Pop. (1938) 7,658. It is an agricultural centre, and one of the largest grain markets in Scotland. The county is famous for its oatmeal, and Dalkeith is a milling centre. Other industries are brewing, the making of carpets and brushes and brass founding. Near Eskbank, a residential quarter with a railway station, coal mining is carried on. Market gardening, owing to the proximity of the capital, flourishes. The parish church was originally the castle chapel, and was restored in 1852. A park was presented by the duke of Buccleuch in 1909. Dalkeith palace, designed by Sir John Vanbrugh in 1700, has been the residence, during visits to Edinburgh, of George IV., Victoria and Edward VII. The picture gallery, gardens and park are famous. About 1 m. south is Newbattle abbey, seat of the marquess of Lothian, on the site of an abbey founded by David I., the ancient crypt being incorporated in the mansion. Two miles farther south lie Cockpen, immortalized by Baroness Nairne and Dalhousie castle, partly ancient and partly modern. About 6 m. south-east of Dalkeith are Crichton and Borthwick castles, 1 m. apart. The former is in ruins; the latter has been restored—Queen Mary spent three weeks in Borthwick castle after her marriage with Bothwell, and fled from it to Dunbar in the guise of a page. The castle, a double tower, was besieged by Cromwell.

DALKEY, a small port and watering place of Co. Dublin, Eire, 9 mi. southeast of Dublin by rail. It was assimilated, with several other urban districts, into the borough of Dun Laoghaire. It is situated on and about Sorrento point, the southern horn of Dublin bay. The 15th century castle has been restored for use as offices. There are ruins of an old church dedicated to St. Begnet, perhaps a diminutive form of Bega, but the identity is not clear. The harbour was once a landing-place of some importance.

DALLAS, ALEXANDER JAMES (1759–1817), an American lawyer, financier, and statesman who as secretary of the United States Treasury during the difficult years 1814–16 rendered great service in the restoration of a national bank and a national currency and in the formulation of the tariff of 1816, was the son of a Scottish physician of good family and good English connections. The father, Robert Charles Dallas, was resident in Jamaica when the son was born, but returned to Britain for the education of his children. Alexander attended school in Edinburgh and at Kensington in London attracting the attention of Dr. Benjamin Franklin and Dr. Samuel Johnson. The father's untimely death cut short the boy's plans for a legal education in the Temple; and young Alexander James Dallas earned a living in a counting-house for two years. His mother's second marriage enabled him to join the family in Devonshire and resume his studies. In 1780, at the age of 21, he married Arabella Maria, the 16-year-old daughter of Major George Smith, and proceeded with her to Jamaica, whither his mother had gone, and where Major Smith was on military duty. There he became acquainted with Lewis Hallam, who induced him to go to Philadelphia. In this move one may possibly discern the influence of young Dallas' former association with Dr. Benjamin Franklin. Dallas immediately took up the study of law, and gained admission to practice in 1785. With Hallam he indulged his literary and theatrical inclinations, editing the *Columbian Magazine* from 1787 to 1789 and helping Hallam in the establishment of the theatre in Philadelphia.

Possibly during these eventful years, young Dallas developed those abilities and powers which enabled him to render great service to his adopted country in the last two or three years of his life. However this may be, the formation of "a more perfect Union" through the adoption of the Constitution of 1789, and the consequent development of political parties, appear to have stimulated his legal practice and to have drawn his attention to politics and the public service. In 1795 he gained much influence in the Democratic-Republican Party by the publication of an able pamphlet against the Jay Treaty; and when Jefferson became president in 1801, Dallas was appointed United States attorney for the eastern district of Pennsylvania, a position which he held continuously until Madison called him to be secretary of the United States Treasury in 1814. During this quarter century, 1789–1814, at the beginning of which Dallas was about 30 years old, he belonged to the McKean-Gallatin branch of the Republicans and opposed the Leib-Duane combination, but he was not on that account any more acceptable to the Federalist element, who naturally feared the ability of the men of the Gallatin school. Although biography has failed to explain satisfactorily A. J. Dallas's development, it is certain that by 1814 he possessed the constructive abilities and powers which were so much needed in the United States Treasury at that time. Within a fortnight after he had entered upon the duties of that post, he wrote a letter to the committee on ways and means recommending the establishment of a national bank. The resulting bill was amended, however, so that it became unacceptable; and Dallas sent another outline in a letter to John C. Calhoun, chairman of the committee on the currency, who was able to carry a bill embodying Dallas's recommendations. Consequently, the second bank of the United States went into operation in Jan., 1817, and resumption of specie payments followed shortly. Meanwhile, he had made recommendations regarding the tariff and a system of protection which became the basis of the Tariff Act of 1816. He left the Treasury, in March 1816, with a surplus of $20,000,000.

See G. M. Dallas, *Life and Writings of Alexander James Dallas* (1871); *The Nation* (New York), Sept. 14, 1871; and Henry Adams, *History of the United States.*

DALLAS, GEORGE MIFFLIN (1792–1864), an American statesman and diplomat, was United States minister to England (1856–61) on the eve and at the outbreak of the American Civil War, and the immediate predecessor of Charles Francis Adams. He was the son of Alexander James Dallas (*q.v.*). In 1813, just after he was admitted to the bar, he went abroad as the private secretary to Albert Gallatin and brought back from Ghent important despatches from the American peace commissioners. For the next 20 years he played a prominent and fairly successful rôle as a Democrat in Pennsylvania politics and in the United States Senate; and from 1835 to 1839 was United States minister to Russia. When he returned from Russia, he entered upon a long struggle with James Buchanan for the party leadership in Pennsylvania. As candidate for vice-president on the ticket with James K. Polk (*q.v.*), he helped to win the Democratic victory in 1844; but the appointment of Buchanan as secretary of state deprived him of a most important share of party patronage and influence in the Polk administration. Consequently he became the leader of a distinct body of conservative Democrats who were not in all respects in harmony with the administration, but he did not go so far as to oppose territorial expansion. Indeed, he sacrificed his influence with protectionists in Pennsylvania by casting his vote at a critical time in the Senate in favour of the Walker Tariff bill of 1846. He returned to the practice of law in 1849, and became associated with Robert James Walker (*q.v.*), his relative by marriage, in promoting in England the financial interests of the Illinois Central railroad.

In 1853 President Pierce was urged to appoint Dallas minister to England; and in 1856 the President did so, sending him to succeed his old political rival, James Buchanan, who returned to the United States and made a successful campaign for the presidency. Buchanan retained Dallas at the London post throughout the whole of his administration. Dallas's earlier contacts with the friends of the United States in Great Britain, through the promotion of American business interests there, appear to have served him well in the solution of difficulties which faced him from the beginning of his residence as minister. Friction over the various interpretations of the ill-starred Clayton-Bulwer Treaty of 1850 and the serious crisis over British enlistments in the United States during the Crimean War, which was drawing to a close, made war imminent between Great Britain and the United States; but Cobden, Gladstone and others forced their Government to publish papers of a damaging character, while in America the failure of the Cincinnati Convention to nominate President Pierce for a second term had a pacific effect. In Great Britain the nomination of Buchanan was regarded by some as a stiffening of the American attitude. In October, Dallas and Lord Clarendon succeeded in drawing up the project for a treaty which later became the basis of an adjustment. By the close of 1860, official Anglo-American relations were to all appearances composed.

There is no satisfactory biography of George Mifflin Dallas; but *see* his *Letters from London, 1856–1860* (1871); his *Diary* (1892); and J. B. Moore (ed.), *The Works of James Buchanan.* (T. P. MA.)

DALLAS, the largest city of northern Texas, U.S.A., on the Trinity river, 30 mi. E. of Fort Worth and 75 mi. from the Oklahoma state line; the county seat of Dallas county, a port of entry in the Galveston customs district and an important financial and commercial centre. It is on four transcontinental highways (Bankhead, King of Trails, Dallas-Canadian-Denver and Dixie Overland), is served by the Ft. Worth & Denver City, the Frisco, the Missouri-Kansas-Texas, the Rock Island, the St. Louis Southwestern, the Santa Fe, the Southern Pacific and the Texas and Pacific railways, is a commercial aviation centre and has air-mail service.

The land area is 40.6 sq.mi. The population was 158,976 in 1920, of whom 24,023 were Negroes and 8,730 were foreign-born white, and had increased to 294,734 in 1940 by the federal census. There is a Union station (opened 1916) where more than 100 passenger trains arrive and depart daily. Interurban electric lines operate upwards of 250 passenger and freight trains daily from an interurban terminal. The municipal airport, Love field, covers 173 ac. General offices of the Texas and Pacific railway, Texas headquarters of the Missouri-Kansas-Texas lines, southwestern headquarters of the American Railway Express and headquarters of the telegraph and telephone systems of the southwest, are in Dallas.

The freight, express and parcel-post business coming into Dallas over all the above-mentioned lines aggregates 8,000,000,000 lb. in a year.

Since the World War of 1914–18 many skyscraper business buildings, large warehouses and factories, hotels and apartment houses have been erected. The hotels, representing an investment of $40,000,000, furnish accommodations for 20,000 guests. The assessed valuation of property in 1940 was $251,191,475. The water supply from Lake Dallas is sufficient for a population of 1,000,000.

Lake Dallas, covering 10,444 ac., with a shore line of 65 mi., was completed in 1928.

Since 1915 natural gas and fuel oil have been available from fields in the neighbourhood. The municipality has 50 parks, covering 4,134 acres. There are six high and 45 elementary public schools, employing about 1,100 teachers, and 80 private schools of various kinds. Southern Methodist university, established there in 1911 and opened in 1915, has an enrolment of more than 3,000.

Its campus (132 ac.) is in the separately incorporated suburb of University Park, north of the city. The schools of nursing and dentistry of Baylor university (at Waco) are located there. Dallas has a manager-council form of government.

The economic life of Dallas is based on the agricultural and mineral wealth of the surrounding region. It is the largest inland cotton market in the country, and is the southwestern headquarters of large oil companies. Dallas ranks fifteenth in the total amount of its jobbing business, fifth as a distributor of dry goods, third of farm implements and first of cotton-seed products, saddlery and harness. There are 500 wholesale houses in the city.

Wholesale transactions are estimated at $800,000,000 annually; retail business at $250,000,000. The cotton firms handle about 3,000,000 bales a year.

Dallas is the seat of the federal reserve bank of the Eleventh district. In postal receipts it stands high, with a total of $4,597,769 in 1940; as an insurance centre it ranks fifth, containing the home offices of more than 20 companies and the agencies of more than 170 other insurance firms. The approximately 500 establishments situated in Dallas county produce goods valued at $125,000,000 annually. The numerous groups of manufactures are widely diversified. Nearly half the cotton gins used in the world are made in Dallas. There are petroleum refineries and plants making machinery and supplies for the oil fields. Printing and publishing is an important industry. The 72 periodicals issued include three daily newspapers and numerous trade and religious magazines. Other manufactures of importance are aeroplanes, automobile accessories, awnings and tents, bagging, candy, clothing, cement, flour, mixed feed, iron and steel products, textiles, store fixtures and packing-house products.

The bank deposits were (1940) $3,160,201,000; (1930) $2,640,868,000. The postal receipts were (1940) $4,597,769; (1930) $3,797,916. Dallas had 122,786 motor vehicles in 1940 as against 89,101 in 1930.

There were 101,071 telephones in 1940 and 69,732 in 1930. The Texas state fair, the largest annual fair in the United States, drawing an attendance of 1,000,000, has been held at Dallas since 1886.

Fair park contains about 150 ac. and has a stadium seating 40,000.

A log hut built in 1841 on the bank of the Trinity river by John Neely Bryan was the nucleus of a village called Peter's Colony, which in 1845 adopted the name of the newly inaugurated vice-president, George Mifflin Dallas, of Philadelphia. It was incorporated as a city in 1871, when the population was about 5,000. In 1890, with a population of 38,067, it was the largest city in the state; in 1900, with 42,638, it ranked third; and in 1910 and 1920 it stood a very close second to San Antonio. The total area within the corporate limits was increased from 7.5 sq.mi. in 1900 to 41.8 in 1940.

DALLE, a rapid falling over flat smooth rock surfaces in a river bed, especially in rivers flowing between basaltic rocks (Fr. for a flag-stone or flat tile).

The name is common in North America, and came into use through the French employés of the Hudson's Bay Company. Well-known "dalles" are on the St. Louis, St. Croix and Wisconsin rivers.

The "dalles" of the Columbia river are very beautiful, and have given its name to The Dalles (*q.v.*), county-seat of Wasco county, Oregon.

DALLES, THE, a city of northern Oregon, U.S.A., on the Columbia river, 93 mi. E. of Portland; the county seat of Wasco county. It is on the Columbia river highway and is served by the Union Pacific railroad. Pop. (1930) 5,883 (99% native white) and in 1940, 6,266.

A few miles above the city the entire Columbia river plunges over a rocky barrier of basalt in the Celilo falls, and just below the falls it is confined into a narrow chasm 130–200 ft. wide.

An $8\frac{1}{2}$-mi. navigation canal with locks enables inland river craft to pass these obstacles. These craft carry a heavy traffic of petroleum products upstream and agricultural products downstream.

The Dalles is the distributing point for much of the wheat and wool produced on the great plateaus of eastern Oregon. It has fruit-processing plants, a salmon cannery, flour mills, a wood-preserving plant and terminals for ocean carriers now navigating the new seaway. The city was founded in 1847 and incorporated in 1857.

DALLIN, CYRUS EDWIN (1861–1944), U.S. sculptor, was born at Springville, Utah, on Nov. 22, 1861. He was a pupil of Truman H. Bartlett in Boston, of the École des Beaux-Arts, the Académie Julien and the sculptors Henri M. Chapu and Jean Dampt (1858–1945), in Paris, and on his return to America became instructor in modelling in the state normal art school in Boston. He is best known for his plastic representations of the North American Indian—especially for "The Signal of Peace" in Lincoln park, Chicago, "The Medicine Man," in Fairmount park, Philadelphia, and "The Appeal to the Great Spirit" in the Museum of Fine Arts, Boston. His statue of Massasoit, the Indian chief, at Plymouth, Mass., was completed in 1921. As a boy he had lived among the Indians in the far west and had learned their language. His later works include "Pioneer Monument," Salt Lake City; "Sir Isaac Newton," Library of Congress; and "Don Quixote." He won a silver medal at the Paris Exposition, 1900, and in 1906 the first prize in the competition for the soldiers' and sailors' monument at Syracuse, New York. He died Nov. 14, 1944.

DALLING AND BULWER, WILLIAM HENRY LYTTON EARLE BULWER, BARON (1801–1872), known as Sir Henry Bulwer, English diplomatist and author, the son of General William Earle Bulwer and his wife Elizabeth Barbara Lytton was born in London on Feb. 13, 1801. His younger brother Edward Bulwer, Baron Lytton, is separately noticed.

Henry Bulwer was educated at Harrow, under Dr. George Butler, and at Trinity and Downing Colleges, Cambridge. In 1824 he went to the Morea, as emissary of the Greek committee then sitting in London, with £80,000 sterling for the use of Prince Mavrocordato and his colleagues. This he describes in *An Autumn in Greece* (1826). In the meantime he had, on Oct. 19, 1825, been gazetted as a cornet in the 2nd Life Guards, but finally left the army for the diplomatic service (Jan. 1, 1829). His first diplomatic appointment was as attaché in Berlin, and he held later similar posts in Vienna (1830), and The Hague (1831). At the beginning of the Belgian revolution (August to October 1830) Bulwer was despatched to Belgium to watch and report on events, and sent home a series of despatches for which he received the congratulations of the cabinet. Shortly before the carrying of the first Reform Bill Bulwer was returned to parliament for Wilton, and later, in 1831 and 1832 as M.P. for Coventry. After two years' absence he was again returned in 1834 as member for Marylebone, and won considerable distinction as a debater. At this time he published *France—Literary, Social and Political* (2 vols. 1834), a work completed in 1836 by two further volumes entitled *The Monarchy of the Middle Classes.*

While on one of his many visits to Paris from Brussels, he obtained his nomination as secretary of embassy at Constantinople. The first task entrusted to him by Lord Ponsonby was the negotiation of a commercial treaty, which had the double object of removing the intolerable conditions which hampered British trade with Turkey, and of dealing a blow at the power of Mehemet Ali, pasha of Egypt, by shattering the system of monopolies on which it was largely based. In this difficult task Bulwer was helped by the hatred of Sultan Mahmed II. for Mehemet Ali, but the treaty was none the less a remarkable proof of his diplomatic skill. Shortly afterwards Bulwer was nominated secretary of embassy at St. Petersburg, but, before he could take up the appointment, was nominated to Paris in the same capacity (June, 1839).

On Nov. 14, 1843 he was appointed ambassador at the court of the young Spanish queen Isabella II. Upon his arrival at Madrid he was chosen arbitrator between Spain and Morocco, and his mediation led to the signature of the treaty of 1844. In 1846 a much more formidable difficulty arose over the question of the "Spanish Marriages," the dynastic intrigue which led up to the February revolution in Paris. The explosion which took place at Paris was answered a month later at Madrid by a similar outbreak. Marshal Narvaez thereupon assumed the dictatorship and wreaked upon the insurgents a series of reprisals whose excessive severities the British ambassador did his utmost to mitigate. When at last Narvaez summarily suppressed the constitutional guarantees Bulwer sent a formal protest in the name of England. Narvaez's counterstroke was the denunciation of the English ambassador as an accomplice in the conspiracies of the Progressistas, and in spite of Bulwer's diplomatic position he was, on June 12, summarily required to quit Madrid within twenty-four hours. Two days later M. Isturitz, the Spanish ambassador in London returned to Madrid. Diplomatic relations were not restored between the two countries until a formal apology, dictated by Lord Palmerston, had been signed by the prime minister of Queen Isabella. Bulwer was gazetted a K.C.B., and received the formal approbation of the ministry and the thanks of both houses of parliament.

Within a year of his return Sir Henry Bulwer married the Hon. Georgiana Charlotte Mary Wellesley, youngest daughter of the 1st Baron Cowley. On April 27, 1849 he was nominated ambassador at Washington. There his principal success was the compact known as the Clayton-Bulwer Treaty (*q.v.*), ratified in May 1850, pledging the contracting governments to respect the neutrality of the meditated ship canal through Central America. After three years in Washington, Bulwer spent three years (1852–55) as minister plenipotentiary at the court of the grand duke of Tuscany at Florence. From May 1858 to Aug. 1865 he was ambassador extraordinary to the Ottoman Porte at Constantinople. He returned to England in 1865 and retired with a pension.

On Nov. 17, 1868 he was elected M.P. for Tamworth, and retained his seat until he was raised to the peerage on March 21, 1871, with the title of Baron Dalling and Bulwer of Wood Dalling in the country of Norfolk. He died on May 23, 1872.

DALLMEYER, JOHN HENRY (1830–1883), Anglo-German optician, was born on Sept. 6, 1830 at Loxten, Westphalia, the son of a landowner. On leaving school at the age of 16, he was apprenticed to an Osnabrück optician, and in 1851 he came to London, where he obtained work with an optician and later with Andrew Ross, a lens and telescope manufacturer. After a year spent in a commercial post, he was re-engaged by Ross as scientific adviser. He married Ross's second daughter, Hannah, and inherited, at Ross's death (1859), a third of his employer's large fortune and the telescope-manufacturing portion of the business. Turning to the making of photographic lenses (*see* PHOTOGRAPHY), he introduced improvements in both portrait and landscape lenses, in object-glasses for the miscroscope and in condensers for the optical lantern. In connection with celestial photography he constructed photo-heliographs for the Wilna observatory in 1863, for the Harvard college observatory in 1864, and, in 1873, several for the British Government. Dallmeyer's instruments took the highest awards at various international exhibitions, and he received many honours from governments and learned societies. He died on board ship, off the coast of New Zealand, on Dec. 30, 1883.

His second son, THOMAS RUDOLPHUS DALLMEYER (1859–1906), introduced telephotographic lenses into ordinary practice (patented 1891), and wrote a standard book on the subject (*Telephotography,* 1899).

DALL' ONGARO, FRANCESCO (1808–1873), Italian writer, born in Friuli, was educated for the priesthood, but abandoned his orders, and founded the *Favilla* at Trieste in the Liberal interest. In 1848 he enlisted under Garibaldi, and next year was a member of the assembly which proclaimed the republic in Rome, being given by Mazzini the direction of the *Monitore ufficiale.* On the downfall of the republic he fled to Switzerland, then to Belgium and later to France, taking a prominent part in revolutionary journalism. In 1860 he returned to Italy, and was professor of dramatic literature at Florence, and then at Naples, where he died on Jan. 10, 1873. His patriotic poems, *Stornelli,* composed in early life and published in 1863, had a great popular success; and he produced a number of plays, notably *Fornaretto, Bianco Capello, Fasma* and *Il Tesoro.* His collected *Fantasie drammatiche e liriche* were published in his lifetime.

See A. De Gubernatis, *Francesco dall' Ongaro* (1875).

DALMAN, GUSTAF (1855–), German theologian and orientalist, was born at Niesky, Silesia, on June 9, 1855. He became professor at Leipzig in 1895 and at Halle in 1900. From 1902 to 1917 he was director of the German Evangelical Institute for Archaeology in Jerusalem, and for the next five years professor at Greifswald. His chief publications are *Christus im Thalmud* (1891, Eng. trans. 1893); *Grammatik des jüdisch-palästinischen Aramäisch* (1894); *Aramäisch-neuhebräisches Wörterbuch* (1897–1901); *Worte Jesu* (1898, Eng. trans. 1902); *Petra u. seine Felsheiligtümer* (1908); *Orte u. Wege Jesu* (1919); *Jesu-Jeschua, Die Drei Sprachen Jesu,* etc. (1922).

DALMATIA, formerly a kingdom and crownland of the Austro-Hungarian empire, in the north west of the Balkan Peninsula, and on the Adriatic Sea. It comprised an area of 4,923 sq.mi.: was 210 mi. long and in breadth 35 mi. After 1918, however, Dalmatia formed a part of the Serb, Croat and Slovene state. (*See* YUGOSLAVIA and BALKAN PENINSULA.)

Ancient and Mediaeval History.—Dalmatia originally belonged to the Illyrian kingdom, which was conquered in 168 B.C. by the Romans, but it was not till A.D. 12 that Tiberius quelled the last of many insurrections. Its capital Delminium was probably Durno in Hercegovina. Already in the 4th century B.C. Greek colonies were established at Issa (Lissa, Vis), Pharia (Lesina, Hvar), Corcyra Nigra (Curzola, Korčula), etc., and these and other towns became flourishing Roman municipalities. Iadera and Salona were the chief towns. Various Illyrian generals became emperor, notably Diocletian, who on his abdication retired to his native province and built the famous palace which still forms the centre of the town of Spalato (Split). Spalato and Epidaurum (Ragusa) were founded after the annihilation of Salona in 639 by the Avars (*q.v.*). The Avars were soon followed by the Croats and Serbs, who established themselves along the coast during the 7th and 8th centuries. The first Croat dukes (*see* CROATIA-SLAVONIA) resided mainly at Bihač near Traù (Trogir) and at Knin, but the towns preserved their autonomy and Byzantine suzerainty was little more than nominal. In 879 Duke Branimir acknowledged the Pope, and henceforth the Croats held with Rome, the archbishop of Spalato becoming metropolitan of the littoral from the Arsa to Cattaro (Kotor). After two centuries of struggle the Slav liturgy (the so-called Glagolitic rite) was sanctioned by a church council at Spalato in 1076. Dalmatia formed part of the Croatian kingdom till its union with Hungary in 1102, and already was involved in conflicts with the rising power of Venice. King Koloman almost at once conceded special autonomy to the Dalmatian towns, the charter of Traù (1107) serving as a model for others. Between 1115 and 1420 there were 21 wars between Hungary-Croatia and Venice; in that of 1202, the republic diverted the Fourth Crusade to the conquest of Zara (Zadar). During the Mongol invasions King Béla IV. took refuge in Dalmatia, but the crown's hold upon it was by now slight, and power was divided between the Venetians and a few great Croat nobles, such as the counts of Bribir, while south of the Narenta (Neretva) river the Serbian rulers held sway. In 1220 Stephen "the First-crowned," having married a niece of Enrico Dandolo, assumed the style *"Totius Serviae Diocliae Tribuniae Dalmatiae atque Chlumiae Rex coronatus":* and over a century later his descendant Tsar Dušan invaded and held southern Dalmatia (1350–6). His death was followed by a successful war of Louis the Great against Venice, who in 1358 ceded to Hungary the whole coast from the Quarnero to Durazzo, though Ragusa (Dubrovnik) maintained its independence. Louis died in 1382 and in 1390 King Tvrtko of Bosnia (*q.v.*) seized most of the coast towns and took the title of king of Croatia and Dalmatia, but died a year later. The disputed succession in Hungary gave Venice a new opportunity: in 1409 Ladislas of Naples, to finance the campaign against his cousin Mary and her husband Sigismund, sold Dalmatia to Venice for 100,000 ducats: and in 1420 Sigismund had to ratify the cession.

Venetian Rule.—Thus from 1420 to 1797 Venice held the coast from the Zrmanja to the Neretva (including Zara, Sebenico, Traù, Spalato and the North and Central islands) and then again (south of Ragusan territory) Cattaro and the Albanian ports. In 1537 Clissa, near Spalato, was captured by the Turks, who gained a further foothold at the mouth of the Neretva. In the second half of the 16th century the Uzkoks established an almost independent corsair community round Almissa (Omiš) and the Neretva, and gave both Venice and Turkey much trouble. In 1635 Venice obtained from the Turks the cession of the "Nani line," as far as the watershed of the Dinaric Alps: by the Treaty of Karlowitz (1699) she obtained the Nuovo Acquisto (Knin and Sinj) and in 1718 the Nuovissimo Acquisto (district of Imotski). Dalmatia supplied numerous levies to the Venetian fleet and army, but was treated in stepmotherly fashion and regarded as a strategic outpost to protect the Adriatic trade route. Sarpi's advice—"If you want the Dalmatians to be faithful, keep them ignorant"—was closely followed: there were scarcely any schools and the first printing press was erected at Zara in 1796. Taxes were heavy; there was an oppressive salt monopoly; the forests were felled and not replanted. Dalmatia had produced real architectural and artistic masterpieces in the 15th and 16th centuries, but then fell into neglect and isolation. Ragusa alone remained an intellectual centre, and produced a brilliant galaxy of poets and writers, notably Ivan Gundulić in the first half of the 17th century. Later still it produced the mathematician Bošković.

Napoleonic Period.—On the fall of Venice in 1797, Dalmatia was assigned to Austria by the Treaty of Campo Formio. In 1805, however, it was united with Napoleon's vassal Italian kingdom. For a time, combined Russian and Montenegrin forces held the French at bay in the Bocche di Cattaro, but eventually the latter occupied Dalmatia, and suppressed the Ragusan republic and even the tiny peasant republic of Poljica (near Split). In 1808 the Russians evacuated, but the British fleet held Vis (Lissa) and under Hoste inflicted on March 12, 1812, a severe naval defeat upon the French. Several islands remained in British occupation till the end of the war. The rest of Dalmatia formed from 1809 to 1814 part of the French province of Illyria, under Marshal Marmont, whose short rule was marked by the building of roads, schools and public institutions. The Austrians under the Croat general Milutinović captured Ragusa from the French in January 1814 and Cattaro in June. The province was definitely assigned to Austria at the peace of 1815 and reorganized in four districts, one consisting of former Ragusan territory.

Austrian Rule.—For the next generation Dalmatia lived its own life, almost forgotten by the rest of Austria and only accessible by sea. Its population was overwhelmingly Slav, but the small educated class, knowing Italian often better than Croat, formed a useful recruiting ground for the Austrian bureaucracy in Lombardy and Venetia, and there was a very close connection with Padua University, where the Yugoslav poet Orsat Počić (Pozza) was specially active. The greatest Dalmatian of this period was Niccolò Tommaseo, who was in close touch with the Illyrian movement before he became a minister in Manin's revolutionary government at Venice in 1848, and provided a synthesis between Italian and Slav aspirations on the Adriatic. In 1836 a Slav review, and in 1849 a Slav literary society, was founded in Zara; but during the fifties all such tendencies were rigorously repressed. National life first really became vocal in 1861 when Dalmatia, like other Austrian provinces, received a diet. Under the narrow franchise 15,600 Italians elected 26 deputies and 140,000 Serbo-Croats only 15. The struggle lay between the Autonomist Party, with its organ *Il Dalmata,* and the Croat National Party, which desired Dalmatia's union with Croatia. The former found a remarkable leader in Bajamonti, mayor of Split, whose motto was "Slavo sempre, Croato giammai" (Slav ever, Croat never), but his successors gave the party more and more an exclusively Italian character. Vienna steadily promoted discord between Italian and Slav, and also between Croat and Serb. Already in 1870 the Slavs won a majority in the diet, and in the eighties stormed the municipalities one by one, till only Zara remained mainly Italian, while Serbo-Croat asserted itself in administration, justice and education. In 1897 a compromise between the Croats and the Serbs reduced the Italians to such a tiny minority, that they lost all representation in the Vienna *Reichsrat* even before the advent of universal suffrage. The events of 1903 in Croatia caused intense excitement in Dalmatia, whose deputies vainly petitioned Francis Joseph on behalf of their kinsmen. The Dalmatian leaders Trumbić, Supilo and Smodlaka played a leading part in drafting the Resolutions of Fiume and Zara (Oct. 1905), and thus effecting a firm Serb-Croat coalition against Budapest and Vienna. With the coming of universal suffrage for the *Reichsrat* (1907) the Dalmatian deputies became more vocal in Vienna, allied themselves with the Slovenes and Czechs, and by constant interpellations drew attention to the scandalous conditions in Croatia (*q.v.*). During the same period publicity was thrown upon the backward economic conditions of Dalmatia, which owing to political jealousies between Budapest and Vienna remained without railway connections northwards. It was very inadequately supplied with primary schools, and had been injured in its fishing and wine trade by Vienna's customs concessions to Italy. Emigration was high, and though the population was only 635,000 in 1910, no fewer than 67,000 persons had left Dalmatia in the previous thirty years, mostly for South America, the United States and New Zealand. Pop. (1930) 650,139.

In 1912 lively demonstrations in Dalmatia in favour of the Balkan allies led to press confiscations and the dissolution of the municipalities of Split and Šibenik (Sebenico). By 1914 in Croatia and Bosnia also the Yugoslav idea made rapid progress.

On the outbreak of World War I, the leading Yugoslav intellectuals were arrested and interned, and all municipal councils (except Zara, which had an Italian majority) were early dissolved. In the winter of 1917–18 an underground revolutionary movement steadily gained strength.

Union with Yugoslavia.—On Feb. 1, 1918, a mutiny placed the fleet and most of the strategic points in the Bocche di Cattaro for three days at the mercy of a revolutionary committee. The leader, Antun Sesan, flew to Italy for help, but was held in arrest, and Austrian ships from Pola suppressed the movement. Early in October, however, a still wider plot was prepared, and its spokesmen, the Czech Štěpánek and the Croat Giunio, crossed the Adriatic in a sailing boat with instructions to communicate with Marshal Foch and arrange with him the date for an insurrection. Had not they in their turn been held in custody for over three weeks by the Italians, and debarred from all intercourse with the Czech and Yugoslav national committees, the Allied fleets might have been in control of Dalmatia a fortnight before the Italian offensive was actually launched. At the close of October a national committee was formed in Split which recognized the supreme authority of the Yugoslav national council in Zagreb, but made itself responsible for local order in the province and disarmed the Austrian and Hungarian troops as they retired northwards from the Albanian front. A very dangerous situation arose when Italian naval forces occupied northern Dalmatia and the islands, and some of D'Annunzio's followers tried to execute a raid upon Trogir (Traù) and Split. A conflict was averted very largely by the tact of the American admiral. By the Treaty of Rapallo between Italy and Yugoslavia (Nov. 12, 1920) the whole of Dalmatia was assigned to the latter, save for Zara and a small enclave round it. (*See* YUGOSLAVIA.)

After Hitler's invasion and dismemberment of Yugoslavia in April 1941, Mussolini, by an agreement of May 18, was allowed to annex Šušak, Spalato and the Dalmatian coast north to Zara; Cattaro and the Adriatic coast south to Albania; and all but three of the former Yugoslav islands in the Adriatic. In August he occupied the whole Dalmatian territory from Fiume in the north to Montenegro in the south. The resulting Italian province of Dalmatia was placed under the administration of Giuseppe Bastianini, former Italian ambassador to Great Britain. Italy thus obtained the Adriatic territory which she had sought but failed to gain at Paris in 1919.

DALMATIC, a liturgical vestment of the western church, proper to deacons, as the tunicle (*tunicella*) is to subdeacons. Dalmatic and tunicle are now, however, practically identical in shape and size; though, strictly, the latter should be somewhat smaller and with narrower arms. In most countries, *e.g.,* England, France, Spain and Germany, dalmatic and tunicle are now no longer tunics, but scapular-like cloaks, with an opening for the head to pass through and square lappets falling from the shoulder over the upper part of the arm; in Italy, on the other hand, though open up the side, they still have regular sleeves and are essentially tunics. The most characteristic ornament of the dalmatic and tunicle is the vertical stripes running from the shoulder to the lower hem, these being connected by a cross-band, the position of which differs in various countries.

The *dalmatica,* which originated (as its name implies) in Dalmatia, came into fashion in the Roman world in the 2nd century A.D. It was a loose tunic with very wide sleeves, and was worn over the *tunica alba,* which was simply a long white shirt, by most of the better class of citizens. According to the *Liber pontificalis* (ed. Duchesne, I. 171) the dalmatic was first introduced as a vestment in public worship by Pope Sylvester I. (314–335), who ordered it to be worn by the deacons; but Braun (*Liturg. Gewandung,* p. 250) thinks that it was probably in use by the Popes themselves as early as the 3rd century, since St. Cyprian (d. 258) is mentioned as wearing it when he went to his death.

If this be so, it was probably given to the Roman deacons to distinguish them from the other clergy and to mark their special relations to the Pope. However this may be, the dalmatic remained for centuries the vestment distinctive of the Pope and his deacons, and (according at least to the view held at Rome) could be worn by other clergy only by special concession of the Pope. The dalmatic was in general use at the beginning of the 9th century, partly as a result of the Carolingian reforms, which established the Roman model in western Europe; but it continued to be granted by the Popes to distinguish ecclesiastics not otherwise entitled to wear it, *e.g.,* to abbots or to the cardinal priests of important cathedrals. Dalmatic and tunicle are never worn by priests, except when officiating as deacons, *e.g.,* as deacon and subdeacon assisting at mass, but both are worn by bishops under the chasuble (never under the cope).

In England at the Reformation the dalmatic or tunicle, though prescribed in the first prayer-book of Edward VI., ultimately shared the fate of the other mass vestments. (*See* VESTMENTS.)

In the eastern churches the only vestment that has any true analogy with the dalmatic is the *sakkos.* This, which, as a liturgical vestment, first appears in the 12th century as peculiar to patriarchs, is now very similar to the modern dalmatic. Its origin is almost certainly the richly embroidered dalmatic that formed part of the consular insignia, which under the name of *sakkos* became a robe of state special to the emperors. Braun suggests that its use was granted to the patriarchs, after the completion of the schism of east and west, in order "in some sort to give them the character, in outward appearance as well, of Popes of the east." Its use is confined to the Greek rite. In the Greek-Melchite churches it is confined to the patriarchs and metropolitans; in the Russian, Ruthenian and Bulgarian churches it is worn by all bishops. Contrary to the practice of the Latin church, it is not worn under, but has replaced, the phelonion (chasuble).

A silk dalmatic forms one (the undermost) of the English coronation robes. Its use seems to have been borrowed, not from the robes of the eastern emperors, but from the church, and to symbolize with the other robes the quasi-sacerdotal character of the kingship (*see* CORONATION). The magnificent so-called dalmatic of Charlemagne, preserved at Rome, is really a Greek *sakkos.*

DALMELLINGTON, a civil parish, Ayrshire, Scotland, 15 mi. S.E. of Ayr by a branch line, of which it is the terminus, of the L.M.S. railway. Pop. (1931) 6,151. The district is rich in coal, ironstone, sandstone and limestone. Though the place is very old, a Roman road running near it, few remains exist. It was, however, a centre of activity in Covenanting times.

DALOU, JULES (1838–1902), French sculptor, was born in Paris, and died there on April 15, 1902. He was a pupil of Carpeaux and Duret and combined the vivacity and richness of the one with the academic purity and scholarship of the other. He was one of the most brilliant virtuosi of the French school. He first exhibited at the Salon in 1867, but took refuge in England in 1871 and began to teach at South Kensington. A bronze version of his "French Peasant Woman," under the title of "Maternity," was erected outside the Royal Exchange, London. He returned to France in 1879. For the city of Paris he executed his most elaborate and splendid achievement, the vast monument, "The Triumph of the Republic," erected, after twenty years' work, in the Place de la Nation, showing a symbolical figure of the Republic, aloft on her car, drawn by lions led by Liberty, attended by Labour and Justice, and followed by Peace. It is somewhat in the taste of the Louis XIV. period, ornate, but exquisite in every detail. Dalou, who gained the *Grand Prix* of the International exhibition of 1889 and was an officer of the Legion of Honour, was one of the founders of the New Salon (*Société Nationale des Beaux-Arts*) and the first president of the sculpture section.

DALRIADA, the name of two ancient Gaelic kingdoms, one in Ireland and the other in Scotland. Irish Dalriada was the district which now forms the northern part of county Antrim, and from which about A.D. 500 some emigrants crossed over to Scotland, and founded in Argyllshire the Scottish kingdom of Dalriada. For a time Scottish Dalriada appears to have been dependent upon Irish Dalriada, but about 575 King Aidan secured its independence.

One of Aidan's successors, Kenneth, became king of the Picts about 843, and gradually the name Dalriada both in Ireland and Scotland fell into disuse.

See W. F. Skene, *Celtic Scotland* (Edinburgh, 1876–80).

DALRY, mining and manufacturing town and civil parish, Ayrshire, Scotland, on the Garnock, 23¼ mi. S.W. of Glasgow, by the L.M.S.R. (Gaelic, "the field of the king"). Pop. (1931) 6,827.

The industries consist of woollen factories, worsted spinning, brickmaking, dyeing, machine-knitting, and iron and steel works. In the vicinity is a curious stalactite cave, known as Elf House, 30 ft. high and about 200 ft. long, offering some resemblance to a pointed aisle. Blair house, an ancient mansion, has a tower said to date from 1130.

DALRYMPLE, ALEXANDER (1737–1808), British hydrographer, was born on July 24, 1737, at New Hailes, near Edinburgh.

In 1752 he sailed for Madras in the service of the East India company. After a voyage of observation to the Eastern Islands in 1759 he attempted unsuccessfully to open up trade with Sulu and Canton.

His activities during these years are indicated by the titles of his publications: *An Account of the Discoveries in the South Pacific Ocean Before 1764* (1767); *Historical Collection of South Sea Voyages* (2 vols., 1770); *Collection of Charts* (1772); *Historical Relation of the Several Expeditions from Fort Marlborough to the islands off the West Coast of Sumatra* (1775). In 1779 Dalrymple became hydrographer to the East India company, and from 1795 to 1808 held the same office to the admiralty.

He died in London on June 19, 1808.

DAL SEGNO: *see* DA CAPO.

DALTON, JOHN (1766–1844), English chemist and physicist, was born about Sept. 6, 1766, at Eaglesfield, near Cockermouth in Cumberland. His father, Joseph Dalton, was a weaver in poor circumstances, who belonged to the Society of Friends. John received his early education from his father and from John Fletcher, teacher of the Quakers' school at Eaglesfield, on whose retirement in 1778 he himself started teaching. But he earned only about five shillings a week, and after two years he took to farm work.

He received some help in his mathematical studies from a distant relative, Elihu Robinson. In 1781, he left his native village to become assistant to his cousin George Bewley who kept a school at Kendal. There he passed the next 12 years, becoming in 1785, through the retirement of his cousin, joint manager of the school with his elder brother Jonathan. He remained at Kendal till, in the spring of 1793, he moved to Manchester, where he spent the rest of his life. Mainly through John Gough (1757–1825), a blind philosopher who was a good classical and mathematical scholar, he was appointed teacher of mathematics and natural philosophy at the New College in Moseley Street (in 1889 transferred to Manchester College, Oxford), and that position he retained until the removal of the college to York in 1799, when he became a "public and private teacher of mathematics and chemistry."

Encouraged by Gough, Dalton had, while he was at Kendal, contributed solutions of problems and questions on various subjects to the *Gentlemen's* and *Ladies' Diaries,* and in 1787 he began to keep a meteorological diary in which during the succeeding 57 years he entered more than 200,000 observations. He made his own instruments. His first separate publication was *Meteorological Observations and Essays* (1793), which contained the germs of several of his later discoveries; but in spite of the originality of its matter, the book met with only a limited sale. BY COURTESY OF (1, 2, 4) THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM; PHOTOGRAPH (3) ALINARI

PERSIAN, SPANISH, FLEMISH AND BYZANTINE DALMATICS

1. Persian dalmatic (sakkos) of brocade in coloured silks and silver-gilt thread, on ground of silver thread. Roses, irises, tulips, narcissi and other flowers, with wisps of cloud, form the design. Fastened by loops and silver buttons. Persian work of late 17th or early 18th century
2. Spanish dalmatic, 15th century, of silk velvet. Apparels and orphreys of 16th century appliqué work, the former bearing shields charged with the Five Wounds
3. Dalmatic of Charlemagne, in the sacristy of St. Peter's, Rome, an example of Byzantine work, originally ascribed to 8th–10th century, but now generally attributed to the 12th century or later. Front shows Christ as judge of the world; the back, shown here, depicts the Transfiguration
4. Flemish dalmatic of late 15th century, in Waterford cathedral, Ireland. Cut green silk velvet with cloth of gold ground; orphreys embroidered with figures of saints in gold and colours

1794 he was elected a member of the Manchester Literary and Philosophical Society, and a few weeks after election he communicated his first paper on "Extraordinary facts relating to the vision of colours," in which he gave the earliest account of the optical peculiarity known as Daltonism or colour-blindness, and summed up its characteristics as observed in himself and others. This paper was followed by many others on diverse topics. In 1803 he published a paper on the "Absorption of gases by water and other liquids"; containing his "Law of partial pressures."

Dalton was a crude experimenter, a good many of his results have since been disproved and none of his investigations compares with those concerned with the Atomic Theory, with which his name is inseparably associated. It is clear from the notes prepared for his lectures that in his long series of meteorological experiments he was feeling his way towards the Atomic Theory. A study of these papers by Roscoe and Harden (*A New View of the Origin of Dalton's Atomic Theory,* 1896) shows that the idea of atomic structure arose in his mind as a purely physical conception, forced upon him by study of the physical properties of the atmosphere and other gases. The first published indications of this idea are to be found at the end of his paper on the "Absorption of gases" (Oct. 21, 1803) published in 1805. Here he says: "Why does not water admit its bulk of every kind of gas alike? This question I have duly considered, and though I am not able to satisfy myself completely I am nearly persuaded that the circumstance depends on the weight and number of the ultimate particles of the several gases." He proceeds to give what has been quoted as his first table of atomic weights, but on p. 248 of his laboratory notebooks for 1802–04, under the date Sept. 6, 1803, there is an earlier one in which he sets forth the relative weights of the ultimate atoms of a number of substances, derived from analysis of water, ammonia, carbon dioxide, etc., by chemists of the time. Confronted with the "problem of ascertaining the relative diameter of the particles of which, he was convinced, all gases were made up, he had recourse to the results of chemical analysis. He thus arrived at the idea that chemical combination takes place between particles of different weights, and this differentiated his theory from the historic speculations of the Greeks. The extension of this idea to substances in general necessarily led him to the law of combination in multiple proportions, and the comparison with experiment brilliantly confirmed the truth of his deduction" (*A New View, etc.,* pp. 50, 51). Dalton communicated his atomic theory to Dr. Thomas Thomson of Glasgow university, who by consent included an outline of it in the third edition of his *System of Chemistry* (1807), and Dalton gave a further account of it in the first part of the first volume (1808) of his *New System of Chemical Philosophy.*

In 1804 Dalton was chosen to give a course of lectures at the Royal Institution, London, where he delivered another course in 1809–10; and in 1822 he became F.R.S. He was a corresponding member of the French Academy of Sciences, and in 1830 he was elected as one of its eight foreign associates in place of Davy. In 1833 Lord Grey's government conferred on him a pension of £150, raised in 1836 to £300. He lived for more than a quarter of a century with his friend the Rev. W. Johns (1771–1845), in George Street, Manchester, where his daily round of laboratory work and tuition was broken only by annual excursions to the Lake district and occasional visits to London, "a surprising place and well worth one's while to see once, but the most disagreeable place on earth for one of a contemplative turn to reside in constantly." In 1822 he paid a short visit to Paris, where he met many of the distinguished men of science then living in the French capital, and he attended several of the earlier meetings of the British Association at York, Oxford, Dublin and Bristol. Into society he rarely went, and his only amusement was a game of bowls on Thursday afternoons. He died in Manchester on July 27, 1844.

See Henry, *Life of Dalton,* Cavendish Society (1854); Angus Smith, *Memoir of John Dalton and History of the Atomic Theory* (1856), which on pp. 253–263 gives a list of Dalton's publications; and Roscoe and Harden, *A New View of the Origin of Dalton's Atomic Theory* (1896); an essay by Sir William A. Tilden in his *Famous Chemists* (1921); also ATOM.

DALTON, a city of north-western Georgia, U.S.A., 34 mi. S.E. of Chattanooga; the county seat of Whitfield county. It is on federal highway 41, and is served by the Nashville, Chattanooga and St. Louis and the Southern railways. The population was 8,160 in 1930 and 10,448 in 1940 by the federal census. It is a shipping point for cotton, cattle, grain and fruit, and has various manufacturing industries, including four textile mills, hosiery mill, chair factory, brick plant and more than 30 chenille bedspread plants. The tufted bedspread industry originated in Whitfield county and has developed into the largest industry in the county in value of product and number of employees. The city was founded about 1844 and was incorporated in 1847. In Nov. 1863, after Gen. Bragg's defeat at Chattanooga, he retreated to Dalton, and this became the headquarters of the Confederate army in northern Georgia through the winter. Three weeks afterwards, Bragg was replaced by General Joseph E. Johnston who, with his force of 54,000, adopted defensive tactics to meet Sherman's invasion of Georgia, with his 99,000 or 100,000 men in the army of the Cumberland (60,000) under General G. H. Thomas, the army of the Tennessee (25,000) under General J. B. McPherson, and the Army of the Ohio (14,000) under General J. M. Schofield. The city was evacuated the following spring during the retreat toward Atlanta before the advance of Sherman's federal forces.

DALTON-IN-FURNESS, urban district and market town of Lancashire, England, 4 mi. N.E. of Barrow-in-Furness. Pop. (est. 1938) 10,440. Area, 12.5 sq.mi. St. Mary's church retains ancient fragments and a font believed to have belonged to Furness abbey, 3 mi. south (*see* FURNESS). Of Dalton castle, where the manorial court of Furness abbey was held, there remains a square tower showing decorated windows. There are iron-ore mines in the parish. A canal 3½ mi. long communicates with the sea.

DALTON'S LAW states that *the total pressure of a mixture of gases is equal to the sum of the partial pressures of the individual constituent gases.* The partial pressure is the pressure which each gas would exert if it alone occupied the same total volume of the mixture at the same temperature. This law is true only for perfect or ideal gases. (*See* KINETIC THEORY OF MATTER.) (J. B. Ps.)

DALTON SYSTEM: *see* EDUCATION: *Educational Experiments.*

D'ALVIELLA, COUNT GOBLET (1846–1925), Belgian legislator and writer, was born on Aug. 10, 1846, at Brussels. He sat in parliament from 1874 to 1878; from 1874 to 1890 he directed the *Revue de Belgique;* from 1892 to 1894 he was Liberal leader in the senate, and then became professor of the history of religion in Brussels. His chief publications were *The Sahara and Lapland* (Eng. trans. 1874); *Inde et Himalaya* (1877); *The Contemporary Evolution of Religious Thought in England, America and India* (Eng. trans. 1885); *The Origin and Growth of the Conception of God* (Hibbert Lectures 1892); *La Migration des Symboles* (1891, Eng. trans. 1894); *La Représentation proportionelle en Belgique* (1900); *Souvenirs des États-Unis* (1906); *Croyances, Rites, Institutions,* 3 vols. (1911).

DALY, AUGUSTIN (1838–1899), American theatrical manager and playwright, was born in Plymouth (N.C.), July 20, 1838. He was dramatic critic for several New York papers from 1859, and he adapted or wrote a number of plays, *Under the Gaslight* (1867) being his first success. In 1869 he was the manager of the Fifth Avenue theatre, and in 1879 he built and opened Daly's theatre in New York, and in 1893, Daly's theatre in London. At the former he gathered a company of players, headed by Miss Ada Rehan, which made for it a high reputation, and for them he adapted plays from foreign sources, and revived Shakespearean comedies in a manner before unknown in America. He took his entire company on tour, visiting England, Germany, and France.

Some of the best actors on the American stage have owed their training and first successes to him; among them Clara Morris, Sara Jewett, John Drew, Fanny Davenport, Maude Adams, and Mrs. Gilbert. Daly was a great book-lover; his valuable library was dispersed by auction after his death, in Paris, June 7, 1899.

Besides plays, original and adapted, he wrote *Woffington: a Tribute to the Actress and the Woman* (1888).

DALYELL (or DALZIELL or DALZELL), **THOMAS** (d. 1685), British soldier, was the son of Thomas Dalyell of Binns, Linlithgowshire. He was present at the battle of Worcester (Sept. 3, 1651), where his men surrendered, and he himself was captured and imprisoned in the Tower. In May he escaped abroad, and in 1654 took part in the Highland rebellion and was excepted from Cromwell's act of grace, a reward of £200 being offered for his capture, dead or alive. The king's cause being now for the time hopeless, Dalyell entered the service of the tsar of Russia, and fought in the wars against the Turks and Tatars. He returned to Charles in 1665, and on July 19, 1666, he was appointed commander-in-chief in Scotland to subdue the Covenanters. He defeated them at Rullion Green and exercised his powers with great cruelty, his name becoming a terror to the peasants. He obtained several of the forfeited estates. On Jan. 3, 1667, he was made a privy councillor, and from 1678 till his death represented Linlithgow in the Scottish parliament. He was incensed by the choice of the duke of Monmouth as commander-in-chief in June 1679, and was confirmed in his original appointment by Charles, but in consequence did not appear at Bothwell Bridge till after the close of the engagement. On Nov. 25, 1681, a commission was issued authorizing him to enrol the regiment afterwards known as the Scots Greys. He was continued in his appointment by James II., but died soon after the latter's accession in Aug. 1685.

DAMAGES, the sum of money claimed or adjudged to be paid in compensation for loss or injury inflicted by a wrongdoer. Compensation first appears in law as a substitute for retaliation. Primitive systems appear universally to have had detailed scales of compensation for each particular form of personal injury, like the ποινή of the *Iliad* and the Anglo-Saxon *wer-gild*. Punishment and compensation were not distinguished. In modern systems criminal and civil remedies are clearly separated, although in France and many foreign countries they are often administered in the same proceeding. In countries following the common law and in Scotland, the proceedings, with few exceptions, are kept separate.

Assessment of Damages.—Courts of common law had no other remedy than damages, and consequently rules had to be evolved for assessing in money losses which often could not be so assessed with any degree of accuracy. Where, as in breaches of contract, the loss could be accurately estimated, the measure of damages was governed by strict rules; in other cases, the jury, or a judge, arbitrator or referee acting as a jury, was left to fix a reasonable sum in view of all the circumstances. In such cases, unless substantial injustice has been caused by the judge's misdirection or by the improper admission or rejection of evidence, a court of appeal will not interfere with the assessment if a jury could reasonably have so fixed the amount. The damages, however, must be assessed once and for all in one lump sum. If unexpected damage occurs after assessment, in the absence of a new cause of action, the plaintiff cannot obtain a reassessment, nor, if possibilities which do not in fact occur induce the jury to award heavy damages, can the defendant, when the event is ascertained, have the assessment reduced. Thus in an action for personal injuries permanently incapacitating the plaintiff, the jury cannot award an annuity, but, with reasonable regard to the probabilities, must award a sum which will stand unaltered whether the plaintiff survive for one year or for 20. If, however, the occurrence of future damage would constitute a new cause of action, damages are assessed up to the time when the assessment takes place, but no account is taken of future damage, however probable.

Courts of equity had, until 1858 (Cairn's Act), no jurisdiction to award damages, but could order specific performance of certain contracts and could interfere by injunction to prevent a threatened wrong. These powers were not exercised if the damages which could be obtained from a court of common law were an adequate remedy, but since 1858 courts of equity have been empowered to award damages, if they deem fit, in lieu of an injunction or a decree of specific performance. This power enables the court to award damages where the injury is only threatened (*Leeds Industrial Co-operative Society, Ltd.*, v. *Slack*, 1924, A.C. 851). Apart from this special case, however, damages can only be awarded by any court when a legal wrong has already been committed. Trade competition, revelation of the true character of an impostor, the making of works authorized by statute and countless other acts may inflict serious injury, yet damages cannot be recovered. A cause of action must be proved. If a cause of action is proved, however, damages will be awarded. The amount will be nominal (from 40 shillings to one shilling or even a farthing) if no proof of actual injury is given; but the award is important as establishing a right and as a "peg on which to hang costs." Such nominal damages are to be distinguished from contemptuous damages, by awarding which the jury express their view that the plaintiff although alleging substantial injury, has not in fact suffered any, and should not have brought an action. The award of contemptuous damages seldom occurs in practice except in actions for defamation and can only occur where there is no settled measure of damages. Such an award is a material fact for the judge to consider if he is asked to deprive a successful plaintiff of costs, but it is not a conclusive fact.

If a plaintiff is entitled to more than nominal damages, the object of the common law is to place him, so far as money can do so, in the same position as if the wrong had not occurred. But that principle does not entitle the plaintiff to compensation which flows from some other cause than the defendant's wrong. The damages must not be too remote; but the rules on remoteness of damage are complicated and the subject of much debate. At one time a single test was applied: Was the damage the natural and probable result of the wrong? But the test was of little value unless supplemented by a mass of case law. Of recent years judges have preferred to ask if the damage is the direct result of the wrong. If so, compensation is recoverable, however improbable was the result (*In re Polemis*, 1921, 3 K.B. 560). But the question remains open when the test is applied, whether the defendant's wrong was the true cause of the damage. Thus where a person entrusted with a libellous letter wrongfully left it where it was seen by others and the writer was thereupon successfully sued for libel, the damage which the writer thus suffered was held not to flow from the wrongful exposure of the letter, but from the writer's own libel (*Weld-Blundell* v. *Stephens*, 1920, A.C. 956). Similarly where a maintained action has been successful, the damages and costs in which the defendant is condemned flow from his own wrong and cannot be recovered in an action for maintenance (*Neville* v. *London Express Newspaper Ltd.*, 1919, A.C. 368). The intervention of another person's act between the wrong and the damage also prevents the damage from being the direct result of the wrong.

Contemplated Result.—Nevertheless, in many cases a wrongdoer is responsible for damage, although the intervention of others has broken the direct chain of causation. If the wrongdoer actually contemplated or ought to have contemplated or was under a duty to guard against the particular kind of damage which followed from his act, he is liable unless, as in the cases above cited, the plaintiff is seeking indemnity from his own wrong. Common illustrations are the republication, in pursuance of a legal or moral duty or by wrongdoer's authority, of defamatory words, and the instinctive acts of persons put in peril by the defendant's wrong. Thus in a famous case (*Scott* v. *Shepherd*, 1773, 2 W.Bl. 892) the plaintiff, injured by the explosion of a lighted squib thrown from hand to hand, was entitled to recover in trespass from the original thrower as if he had directly thrown the squib into his eye. Similarly if a customer draws a cheque with blank spaces which facilitate forgery, he must bear the loss if his bank pays the amount as fraudulently altered (*London Joint Stock Bank Ltd.* v. *Macmillan*, 1918, A.C. 777). The intervening criminal act is an act against which the customer is bound to guard. More difficult questions arise when the intervening acts are of children. Persons who know of the presence or probable presence of children ought to contemplate their getting into mischief and their acts "in the wantonness of infancy" will be mere links in the chain of causation. But if the childish acts are such as would not reasonably be contemplated, the chain of causation will be broken (*McDowall*

v. *Great Western Ry. Co.*, 1903, 2 K.B. 331).

The same principles apply to breaches of contract. Very often damage follows a breach of contract, but the true cause is to be found in circumstances outside the contract. If so damages are only recoverable if the circumstances were or ought to have been in the contemplation of the parties. Mere knowledge is not enough: the circumstances must be in their contemplation as affecting their contractual obligations. In the leading case on the subject (*Hadley* v. *Baxendale*, 1854, 9 Ex. 341), a carrier who negligently delayed a mill shaft sent for repair was held not responsible for the stoppage of the mill owing to there being no spare shaft. The commonest illustration, however, arises where in an action for default in delivering goods claim is made for loss of profit on a resale. If the default makes delivery under the contract of resale impossible the loss of profit will be recoverable if, and only if, resale was in the contemplation of the parties. The same test determines the recovery of damages and costs payable to third parties.

Even when damages are not too remote they may, however, be irrecoverable because the plaintiff has neglected the duty which lies on him to act reasonably in order to mitigate his damages. If, after the cause of action has arisen, the plaintiff can reduce the loss by reasonable steps, he cannot recover compensation for any part of the damage which is due to his neglect to take such steps; and if from the steps he takes he derives a benefit which he would not have secured if the wrong had not been committed, such benefit will be considered in assessing the damages (*British Westinghouse Ltd.* v. *Underground Rys. Ltd.*, 1912, A.C. 673).

Liquidated Damages.—In contracts it is not uncommon to specify the amount to be paid in the event of breach. If the amount, whatever the parties call it, is a penalty, the courts will ignore the provision. If, however, looking at all the circumstances, the court is of opinion that the parties made a genuine attempt to pre-estimate the loss which would result from breach, the amount will be liquidated damages and the court, without independent assessment, will award such amount to the party wronged. Ordinarily he can recover no greater damages; but if he is able to show special damage flowing from circumstances which were entirely outside the contemplation of the parties when the liquidated damages were agreed, and such damage is not too remote, it may be recovered over and beyond the liquidated damages (*Aktieselskabet Reidar* v. *Arcos Ltd.*, 1927, 1 K.B. 352).

If damages are proved in foreign currency, they are converted into legal tender at the rate of exchange prevailing when the cause of action arose, and subsequent fluctuations in the rate of exchange are immaterial.

Interest is only recoverable as damages in exceptional circumstances. (*See* MONEY LENDING.)

Although difficult questions on remoteness often arise, damages for breach of contract can usually be assessed with accuracy since the cost of putting the injured party in the position he would have been in but for the breach can be ascertained by proving the cost of making a contract which will secure to him the like advantages. In some cases by custom or practice of the courts a definite measure of damages which differs, or may differ in result from the application of general principles, has been adopted for convenience of assessment in cases which otherwise would be very complicated. Thus where an insured ship is repaired and the owner derives benefit from the substitution of new materials for old, one-third of the cost of the repairs is deducted for this benefit. Similarly, where a domestic servant is wrongfully dismissed, by custom the damages are a month's wages without any allowance for board and lodging during the month. Sometimes, however, the damage from a breach of contract may be difficult of assessment because of the peculiar character of the plaintiff's loss, as where he is deprived of a chance of losing a prize, or of the enhanced reputation which an actor or actress may gain, in the contemplation of both parties, by appearing in an important part or in a well-known theatre. Difficulty in assessing damages, however, is no reason for refusing to award them or for awarding only nominal damages. The damages for breach of one form of contract—a contract to marry—are peculiarly at large, and the jury may give exemplary damages to mark their disapproval of the defendant's conduct. Generally, however, in contract the common law is concerned only with the loss which the plaintiff has suffered and is uninfluenced by the motive or good faith of the defendant. Roman law, on the other hand, applied quite a different measure of damages when the defendant acted in good faith and when he acted fraudulently. Thus the vendor of a defective article, if he did not know of the defect, was liable only for the difference between the price he received and the price which the buyer would have given if he had known of the defect. If the vendor knew of the defect, however, he would be liable for all injury flowing from the use of the article in its defective condition. Accordingly the Roman and the common law would apply startlingly different measures of damages in cases such as *Pinnock Brothers* v. *Lewis and Peat Ltd.*, 1923, 1 K.B. 690, where copra cake innocently supplied for the manufacture of cattle food contained poisonous castor bean, causing the death of many cattle to which the food was ultimately given. In general, however, the rules governing damages for breach of contract are very similar under all legal systems. Continental systems differ from the common law chiefly in their readiness to enforce an agreed measure of damages, whether or not the stipulated damages are a genuine pre-estimate of the probable loss. Scots law follows English law, as it also does in the sale of goods, the Sale of Goods Act, 1893, forming a common code. The Indian contracts code also adopts, in effect, the English rules.

Exemplary Damages.—In some actions for tort, damages can be calculated with exactness as in contract, *e.g.*, in cases of injury to property. Thus, in conversion, the measure of damages is almost always the value of the article converted at the time of the conversion. Where, however, the injury is to the person or reputation, only actual expenses and loss of income caused by the wrong can be proved with exactitude, and the bulk of the damages are at large and consequently within the reasonable discretion of the jury. Consequently the motives and conduct of the defendant may greatly affect the damages awarded. The chief cases where great latitude is allowed are: (1) in actions for defamation; (2) in actions for malicious prosecution and false imprisonment; (3) in cases of outrageous trespass on land; (4) in seduction and breach of promise of marriage; and (5) for adultery. The divorce court has peculiar powers over the application of damages for adultery, however, and may ensure provision for the maintenance and education of children of the marriage or the maintenance of the guilty wife. In assessing damages the jury are often asked to have regard to the means and position of the adulterer. Whether this was proper was much debated, and the grounds for allowing it, as well as the other principles governing damages for adultery were stated, after a review of the authorities, by Mr. Justice McCardie in *Butterworth* v. *Butterworth*, 1920, p. 126, to which reference should be made.

In cases of collisions at sea where both ships are to blame, the Admiralty rule is to apportion blame and to make the ships bear the total loss in the proportion of their fault. But this rule does not apply to claims for personal injuries brought in the admiralty court.

Although English law gives compensation for physical injury caused by shock, and for pain and suffering, no allowance is made for wounded feelings as a general rule. In Scots law a *solatium* for wounded feeling may be allowed. Probably the greatest difference between the two systems, however, is the recognition in English law, but not in Scots law, of the maxim *actio personalis moritur cum persona*. In English law, as a general rule, a right to recover damages for a tort did not survive the death of either the wrongdoer or his victim, and no right of action could be based on the death of a human being. Limited statutory exceptions to the former principle were made as early as Edward III.'s reign and greatly extended in 1833 (3 and 4 Will. IV., c. 42), but the exceptions only applied where real or personal property was affected by the tort. The rule continues in cases of defamation and other personal torts. By the Fatal Accidents Act, 1846 (Lord Campbell's Act) personal representatives of a person killed or fatally injured by a wrongful act have a statutory right of action, if the deceased would himself have had a cause of action, for the benefit of the husband, wife, parent or legitimate child, grandchild or step-child of the deceased. But the damages recoverable are limited to financial loss from the death, and account must be taken of all benefit resulting from the death (*Carling* v. *Lebbon,* 1927, 2 K.B. 108) such as a widow's or orphan's pension from the Government. By statute passed in 1908, however, sums payable under policies of insurance do not reduce the damages. Regard may be had, moreover, to the reasonable expectation of pecuniary benefit in the future if the deceased had lived, but the courts will ignore a mere speculative possibility (*Barnett* v. *Cohen,* 1921, 2 K.B. 461). Strangers, such as a master deprived by the death of a valuable servant, cannot, however, recover any damages.

In the United States the law of England on damages is generally followed, modified, however, in some particulars by statute. Thus, the law in England that a tenant who commits wilful waste on the premises shall pay thrice the amount of the damages is not the law in all States. Likewise the law in England that a tenant who refuses to quit after due notice shall thereafter pay his landlord double rent is not the law in all jurisdictions in the United States.

See T. Sedgwick, *Treatise on the Measure of Damages* (6th ed., 1874); G. J. Bell, *Principles of Law of Scotland* (10th ed., 1899); J. D. Mayne, *Treatise on Damages* (10th ed. by F. Gahan, 1927). (F. G.)

DAMANHŪR, a town of Lower Egypt, 38 mi. E.S.E. of Alexandria by rail, capital of the richly-cultivated province of Bahera. It is the ancient Timenhōr, "town of Horus," which in Ptolemaic times was capital of a nome and lay on the Canopic branch of the Nile. Its name and other circumstances imply that Horus (Apollo) was worshipped there in the same form as at Edfu, though its Roman name, Hermopolis Parva, should indicate Thoth as the local god. A much frequented fair is held at Damanhūr three times a year, and there are several cotton manufactories. Pop. (1937), 61,962; area 2.3 sq.mi.

DAMAO or **DAMAN,** town, Portuguese India, capital of the settlement of Damão, on the east side of the entrance of the Gulf of Cambay within the Bombay Presidency with a station on the Bombay, Baroda and Central India railway. Pop. (1940) 23,080. The settlement, which has an area of 134 sq.mi. and a population of 63,521, is subject to the Governor General of Goa. It is divided into two parts, Damão proper, and the larger *pargana* of Nagar Havili, the two being separated by a narrow strip of British territory. The soil is fertile though only a small proportion is cultivated for rice, wheat and tobacco. The teak forests are valuable. Weaving is less important than formerly; mats and baskets are made. Deep-sea fishing and shipbuilding are important. There is no foreign trade.

Damão town was sacked and burnt by the Portuguese in 1531. It was subsequently rebuilt, and in 1558 was again taken by the Portuguese, who made a permanent settlement and have held it since. The territory of Damão proper was conquered by the Portuguese in 1559; that of Nagar Havili was ceded to them by the Mahrattas in 1780 in indemnification for piracy.

DAMARALAND, a region of south-western Africa, bounded west by the Atlantic, east by the Kalahari, north by Ovampoland, and south by Great Namaqualand. It forms the central portion of South-West Africa. Damaraland is alternatively known as Hereroland, both names being derived from the tribes inhabiting the region. The so-called Damara consist of two probably distinct peoples. They are known respectively as "the Hill Damara" and "the Cattle Damara," *i.e.,* those who breed cattle in the plains. The Hill Damara are negroes with perhaps some Hottentot blood, and have adopted the Hottentot tongue, while the Cattle Damara are of distinct Bantu-Negro descent and speak a Bantu language. The term Damara ("Two Dama Women") is of Hottentot origin, and is not used by the people, who call themselves Ova-herero, "the Merry People" (*see* HOTTENTOTS and HERERO).

DAMASCENING or **DAMASKEENING,** a term sometimes applied to the production of damask steel, but properly the art of incrusting wire of gold (and sometimes of silver or copper) on the surface of iron, steel or bronze. The surface upon which the pattern is to be traced is finely undercut with a sharp instrument. The gold thread is forced into the minute furrows of the cut surface by hammering and is securely held. This system of ornamentation is peculiarly Oriental, having been much practised by the early goldsmiths of Damascus; it is still eminently characteristic of Persian metal work.

DAMASCENUS, JOHN: *see* JOHN OF DAMASCUS.

DAMASCENUS, NICOLAUS: *see* NICOLAUS DAMASCENUS.

DAMASCIUS, the last of the Neoplatonists, was born in Damascus about A.D. 480. In his early youth he went to Alexandria, where he studied rhetoric, philosophy and science and was a professor of rhetoric. Later on in life he migrated to Athens. He became a close friend of Isidore the dialectician, succeeded him as head of the school in Athens, and wrote his biography, part of which is preserved in the *Bibliotheca* of Photius (*see* appendix to the Didot edition of Diogenes Laërtius and a German translation by R. Asmun of the fragments preserved in vol. cxxv. of Phil. Bibliothek, Leipzig, 1911). In 529 Justinian closed the school, and Damascius, with six of his colleagues, went to the court of Chosroes I., king of Persia. In 533, in a treaty between Justinian and Chosroes, it was provided that they should be allowed to return. The date of his death is not known.

His chief treatise is entitled *Difficulties and Solutions of First Principles* (Ἀπορίαι καὶ χύσεις περὶ τῶν πρώτων ἀρχῶν). It examines into the nature and attributes of God and the human soul. This examination is, in two respects, in striking contrast to that of certain other Neoplatonist writers. It is conspicuously free from Oriental mysticism, and it contains no polemic against Christianity, to the doctrines of which, in fact, there is no allusion. His main result is that God is infinite, and as such incomprehensible; that his attributes of goodness, knowledge and power are credited to him only by inference from their effects; that this inference is logically valid and sufficient for human thought.

Interesting as Damascius is in himself, he is still more interesting as the last in the long succession of Greek philosophers. (*See* NEOPLATONISM.)

His work *Difficulties* was edited in part by J. Kopp (1826), and in full by C. E. Ruelle (1889). French trans. by Chaignet (1898). *See* E. Zeller, *History of Greek Philosophy;* C. E. Ruelle, *Le Philosophe Damascius* (1861); Ch. Levêque, "Damascius" (*Journal des savants,* Feb. 1891); T. Whittaker, *The Neoplatonists* (1901). *See* also works quoted under NEOPLATONISM and ALEXANDRIAN SCHOOL.
