Population and Administration.—The area of the county is 1,356.5 sq.mi., including the 6 sq.mi. of the Scilly Isles. The population was estimated in 1938 at 309,900, excluding the islands. In 1861 the population was 369,390, and had shown an increase up to that census. The county was an ideal one as a reception area for evacuees in World War II; immigration caused an increase of 17% in the population between Sept. 1939 and Feb. 1941. Of the 12 municipal boroughs the chief are Bodmin, Falmouth, Penzance, St. Ives and the city of Truro. There are eight urban districts and ten rural districts. Cornwall is divided into 17 petty sessional divisions. The boroughs of Bodmin, Falmouth, Helston, Launceston, Liskeard, Penryn, Penzance, St. Ives and Truro have separate commissions of the peace and Penzance has a separate court of quarter sessions. The Scilly Isles are administered by a separate council and form one of the petty sessional divisions. The county boundary was doubtless roughly determined by Aethelstan's day. In 1386 disputes arose and a commission was appointed to determine the Cornish border between North Tamerton and Homacot. Traces of jurisdictional differentiation anterior to Domesday survive in the names of at least five of the hundreds. At the time of the *Inquisitio Geldi* they were as follows: Straton, Fawiton, Panton, Tibeste, Wineton, Conarditon and Rileston. The shire court was held at Launceston except from about 1260 to 1386, when it was held at Lostwithiel. In 1716 the summer assize was transferred to Bodmin. After 1836 both assizes were held at Bodmin. Cornwall had its own bishops from the middle of the 9th century until 1018. In 1049 the see of the united dioceses of Devon and Cornwall was fixed at Exeter. Cornwall was formed into an archdeaconry soon after, and, as such, continued until 1877, when it was reconstituted a diocese with its see at Truro. The parishes of St. Giles-in-the-Heath, North Petherwyn and Werrington, wholly in Devon, and Boyton, partly in Devon and partly in Cornwall, which were portions of the ancient archdeaconry, and also the parishes of Broadwood-Widger and Virginstow, both in Devon, which had been added to it in 1875, thus came to be included in the Truro diocese. Of these, Broadwood-Widger was transferred to Exeter and Virginstow became associated with St. Giles-in-the-Heath. The county has 240 civil parishes, of which 5 are in the Scilly Isles. Two members for the county were summoned by Edward I to the parliament of 1295, and two continued to be the number of county members until 1832. Six boroughs were granted the like privilege by the same sovereign. To strengthen and augment the power of the crown as against the commons, between 1547 and 1584, 15 additional towns and villages received the franchise, with the result that, between the latter date and 1821, Cornwall sent no less than 44 members to parliament, and became notorious for the number of its rotten boroughs. The allocation of members proportionately to the population continued irregular until 1885. The parliamentary divisions are five, Bodmin, Camborne, Northern, Penryn and Falmouth, and St. Ives. In 1937 the East Cornwall Joint Planning committee was formed to prepare a planning scheme for nearly all East Cornwall. The area covered was about 637 sq.mi.

Communications.—The principal ports are Falmouth and Penzance. The G.W.R. main line passes through the county and terminates at Penzance. Fowey, Penryn and Falmouth, and Helston on the south, Newquay and St. Ives in the north are served by branch lines. The northeastern parts of the county, Launceston, Bude, Bodmin, Wadebridge and Padstow are served by the S.R. Motorbus traffic has greatly improved communications in the rural areas. In 1943 there were 3,850 mi. of roads in the county. Many of the small seaside towns have become favourite holiday resorts, such as Bude, Newquay and St. Ives.

CORNWALL, founded as New Johnstown by United Empire Loyalists in 1784, incorporated in 1834, and now the capital of the united counties of Stormont, Dundas and Glengarry, Ontario, Canada, 67 mi. southwest of Montreal, on the left bank of the St. Lawrence river. Pop. (1941) 14,117. It is an important station on the Canadian National, Canadian Pacific, and New York Central railways, is a port of call for all steamers between Montreal and Lake Ontario ports, and is connected by an inter-nation bridge with the United States.

The surplus from the Cornwall canal furnishes excellent water privileges for its factories, which include cotton and woollen mills and grist and saw mills.

CORNWALLIS, CHARLES CORNWALLIS, 1st Marquess (1738–1805), eldest son of Charles, 1st Earl Cornwallis (1700–62), was born on Dec. 31, 1738, and educated at Eton and Clare college, Cambridge. He entered the army, and served in Germany in 1761. Succeeding to the earldom in 1762, in 1765 he was made aide-de-camp to the king and gentleman of the bedchamber, and in 1770 was appointed governor of the Tower. He served as major-general in the American War of Independence, and in 1780 commanded the British forces in South Carolina; in 1781 he defeated Greene at Guildford Court House, and raided Virginia, but was besieged at Yorktown by the French and American armies, and was forced to capitulate on Oct. 19, 1781. With him fell the English cause in the United States. Appointed governor-general of India and commander-in-chief of Bengal in 1786, he was interrupted in his administrative reforms by the quarrel with Tippoo Sahib. After capturing Bangalore (1791) and laying siege to Seringapatam, he concluded a treaty which stripped Tippoo Sahib of half his realm. The settlement of the land revenue under his administration is frequently called the Cornwallis code. Cornwallis returned to England in 1793, received a marquessate, and was made master-general of the ordnance. As viceroy of Ireland (June, 1798–1801) he gained the goodwill of both Roman Catholics and Orangemen, and a few weeks after a general amnesty had been proclaimed (July 17, 1798) the French army under Humbert was forced to surrender. In 1802 Cornwallis was appointed plenipotentiary to negotiate the treaty of Amiens. In 1805 he was again sent to India as governor-general, to replace Lord Wellesley, whose policy was too advanced for the directors of the East India company, but he died on Oct. 5, 1805, on his way up country to assume command of the troops. He was succeeded as 2nd marquess by his only son, Charles (1774–1823). On his death the marquessate became extinct, but the title Earl Cornwallis passed to his uncle, James (1743–1824), bishop of Lichfield. In 1852, on the death of his son and successor, James, the 5th earl, the Cornwallis titles became extinct.

See W. S. Seton-Karr, *The Marquess Cornwallis,* "Rulers of India" series (1890).

CORNWALLIS, SIR WILLIAM (1744–1819), British admiral, was the brother of the 1st Marquess Cornwallis, governor-general of India. He was born on Feb. 20, 1744, entered the navy as a boy of 11, and had reached post-rank when he was 22. In 1779 he commanded the "Lion" in the fleet of Admiral Byron. The "Lion" was very roughly handled in the battle off Grenada on July 6, 1779, and had to make her way alone to Jamaica. In March 1780 he fought an action in company with two other vessels against a much superior French force off Monti Cristi, and had another encounter with them near Bermuda in June. The force he engaged was the fleet carrying the troops of Rochambeau to North America, and was too strong for his squadron of two small liners, two 50-gun ships and a frigate. After taking part in the second relief of Gibraltar, he returned to North America, and served with Hood in the actions at the Basse Terre of St. Kitts, and with Rodney in the battle of Dominica on April 12, 1782. Some very rough verses which he wrote on the action have been printed in Leyland's *Brest-Papers,* published for the Navy Record Society, and show that he thought very ill of Rodney's conduct of the battle. Cornwallis's papers on this and other actions are valuable in the history of the British navy. In 1788 he went to the East Indies as commodore, and had some share in the war with Tippoo Sahib, and helped to reduce Pondicherry. His promotion to rear-admiral dates from Feb. 1, 1793, and on July 4, 1794, he became vice-admiral.

In the Revolutionary War his services were in the Channel. The most signal of them was performed on June 16, 1795, when he carried out what was always spoken of with respect as "the retreat of Cornwallis." He was cruising near Brest with four sail of the line and two frigates, when he was sighted by a French fleet of 12 sail of the line, and many large frigates commanded by Villaret Joyeuse. The odds being very great he was compelled to make off. But two of his ships were heavy sailers and fell behind. He was consequently overtaken, and attacked on both sides. The rearmost ship, the "Mars" (74), suffered severely in her rigging and was in danger of being surrounded by the French. Cornwallis turned to support her, and the enemy, impressed by a conviction that he must be relying on help within easy reach, gave up the pursuit. In 1796 he incurred a court-martial, but was practically acquitted. The substance of the case was that he demurred on the ground of health at being called upon to go to the West Indies, in a small frigate, and without "comfort." He became full admiral in 1799, and held the Channel command for a short interval in 1801 and from 1803 to 1806, but saw no further service. He was made a G.C.B. in 1815, and died on July 5, 1819.

See G. Cornwallis-West, *The Life and Letters of Admiral Cornwallis* (1927).

CORO, a small city and the capital of the State of Falcón, Venezuela, 7m. W. of La Vela de Coro (its port on the Caribbean coast), with which it is connected by rail, and 199m. W.N.W. of Carácas. Pop. (1940) 18,962. Coro stands on a sandy plain between the Caribbean and the Gulf of Venezuela, and near the isthmus connecting the peninsula of Paraguaná with the mainland. Its elevation above sea-level is only 105ft., and its climate is hot but not unhealthy. It is the commercial centre for an extensive district on the east side of Lake Maracaibo and the Gulf of Venezuela, which exports large quantities of goat-skins, an excellent quality of tobacco, and some coffee, cacao, castor beans, timber and dye-woods. American and British oil companies have taken up oil-land concessions throughout this coastal region and are exploring for petroleum both west and east of Coro. There are salt deposits and coal mines worked by the government in the vicinity. It was founded in 1527 by Juan de Ampués, who gave to it the name of Santa Ana de Coriana (afterwards corrupted to Santa Ana de Coro) in honour of the day and of the tribe of Indians inhabiting this locality. It was also called Venezuela (little Venice) because of an Indian village on the gulf coast built on piles over the shallow water; this name was afterwards bestowed upon the province of which Coro was the capital. Coro was also made the chief factory of the Welsers, the German banking house to which Charles V. mortgaged this part of his colonial possessions, and it was the starting-point for many exploring and colonizing expeditions into the interior. It was made a bishopric in 1536, and for a time Coro was one of the three most important towns on the northern coast. The seat of government was removed to Caracas in 1578 and the bishopric five years later. Coro is celebrated in Venezuelan history as the scene of Miranda's first attempt to free his country from Spanish rule.

COROLLARY, a proposition, geometric or not, incidentally proved in the demonstration of another proposition, and therefore following from it without further proof. Hence the significance of the word, from late Latin *corollarium,* a gift, money paid for a *corolla,* a garland. Euclid gave no corollaries, the modern examples having been added by commentators on, or editors of, the *Elements.*

COROMANDEL COAST, a name formerly applied officially to the eastern seaboard of India approximately between Cape Calimere, in 10° 17′ N., 79° 56′ E., and the mouths of the Kistna river. The shore, which is low, is without a single good natural harbour, and is at all times beaten by a heavy sea. The north-east monsoon, which lasts from October till April, is violent for the first months. From April till October hot southerly winds blow by day; at night the heat is tempered by sea-breezes. The principal places frequented by shipping are Pulicat, Madras, Sadras, Pondicherry, Cuddalore, Tranquebar, Nagore and Negapatam. The name Coromandel is said to be derived from *Cholamandal,* the mandal or region of the ancient dynasty of the Chola.

CORONA, a city of Riverside county, California, U.S.A., 45m. E.S.E. of Los Angeles, on Temescal creek, and served by the Santa Fe Railway. The population was 8,764 in 1940. There are mineral springs and quarries (cement, lime, clay and porphyry) in the vicinity. Natural gas is used. The city ships oranges, lemons and other fruits, beets and alfalfa, and manufactures lemon products, boxes, sewer pipe, terra-cotta, pressed brick and chemicals.

CORONA. During the period of totality of an eclipse of the sun there is seen surrounding it a halo, pearly-white in colour, of irregular shape, but roughly circular in form, about twice the size of the sun, with faint streamers extending several diameters from the limb of the sun. This is termed the Solar Corona. It was long uncertain whether the corona belonged to the sun or to the moon, or if it arose in the earth's atmosphere. It cannot originate in the atmosphere since it presents the same appearance when seen from widely separated positions on the earth's surface, and photographs show that the dark moon moves across the background formed by the corona, so that it cannot belong to the moon. It will be obvious that many of the phenomena that will now be described are inconsistent with any but a solar origin.

Phenomena.—The plate gives a good idea of typical coronae. There is an approximately circular, and not very large, bright inner corona around which are more or less extensive streamers proceeding in a roughly radial direction mainly from the neighbourhood of the solar equator; and there are curved rays (the "polar brushes") proceeding from the north and south poles of the sun. The forms observed can be classified into two main types occurring alternately, at regular intervals, with intermediate forms between. At times of minimum sun-spot activity the polar brushes are short, and the equatorial streamers long; at times of maximum sun-spot activity the polar rays are longer, the equatorial streamers shorter and the corona is more circular in form. Near prominences the corona is brighter and shows an arched structure. It is uncertain how long the different forms endure, since observations are possible only during a total eclipse; thus there was a sun-spot maximum in Aug. 1917, but the corona of June 1918 was not a typical maximum type. In general after a maximum the streamers draw away from the poles and the longest rays are found in the sun-spot zones, making the corona rectangular in appearance. The extent of the corona varies greatly. Streamers have been followed out to the enormous distance of twelve solar diameters, *i.e.,* over 10,000,000m. from the surface of the sun, but commonly three or four diameters is its extent.

Coronae near sun-spot maximum are found to differ more than those occurring near a sun-spot minimum. It is definitely established that changes occur and that the broad features may be correlated with sun-spot activity. It remains at present undecided whether any changes occur during the short periods of time for which the corona can be observed at any one eclipse. Certainly no changes have been found during the time of totality at any one station, which is necessarily less than about seven and a half minutes. The interval of time between totality at different points of the earth's surface lying within the zone of totality may, however, be several hours, and it is of interest to compare observations of the corona made at widely separated stations. The evidence is on the whole in favour of changes taking place. In 1905 plates taken in Egypt and in Spain with an interval of 70min. showed no movement, but in 1918 stations 26min. apart showed changes in the coronal arches, indicating that they were receding from the sun with a velocity of about 16km. per sec., and Prof. Horn d'Arturo, comparing photographs of the corona of Jan. 14, 1926, taken in East Africa and in Sumatra, with an interval of 150min., finds considerable changes and velocities of recession of the coronal material of the order of 1km. per sec. Of course, rapid motions along the lines of the streamers might exist and escape detection.

The Radiation from the Corona.—The greater part of the light from the corona shows a continuous spectrum; a number of bright emission lines are present, and also the Fraunhofer spectrum (the ordinary solar spectrum). The spectrum of the inner corona (from 8 to 10min. of arc from the limb of the sun, the diameter of which is about 30min.) is mainly continuous and the bright lines are strongest here; farther out, in the middle and outer corona, the Fraunhofer lines are visible. It is important to know if, and how, the radiation from the corona is polarized. It is found that the bright-line spectrum is unpolarized, but the continuous radiation shows strong radial polarization. The polarization rises rather rapidly to a maximum of about 11% in the visible region of the spectrum, at 5 or 6min. from the limb, and thereafter decreases more slowly. Unfortunately little or nothing is known about the way in which the polarization varies over the spectrum. H. F. Newall found that there came from the veil of illuminated sky between the observer and the corona as much polarized light as from the corona itself at 3–4° from its centre.

The Distribution of Intensity. The older measurements are quite inconsistent. More recent measurements agree more or less with the law found by Bergstrand in 1914. He found that the intensities near the solar equator differ greatly from those near the poles at the same distance from the centre of the sun. The equatorial rays are three times as intense as the polar rays. He suggested that we regard the corona as the superposition of an interior corona existing only in the equatorial zone, and a general outer corona. In both the intensity decreases as the inverse square of the distance from the edge of the sun, but the intensity of the equatorial corona is double that of the outer corona. However, on account of the complex detailed structure of the corona, any attempt to derive a law of intensity distribution of the kind just examined, which ignores variation round the sun and treats the corona as if it were a disc whose brightness varies only along a radius, is foredoomed to failure if regarded as anything but a rough approximation.

The Total Radiation from the Corona. In view of the great uncertainty of the older measurements and the paucity of modern ones, caution must be used in giving any figures for the total radiation, but it seems fairly clear that the total energy radiated is from about a quarter to a half that received by us from the full moon, and that it is not constant but varies from one eclipse to another, the measures indicating, for example, that it was 40% greater in 1926 than in 1925.

The Continuous Spectrum of the Corona.—The eclipse of 1922 showed that the Fraunhofer spectrum of the corona does not come from terrestrial scattering of direct sunlight, since no trace of it was found beyond the limits of the coronal spectrum on the plates. It is found that the continuous spectrum and the Fraunhofer lines are strong, and the coronal green emission lines are weak, near a time of sun-spot minimum and this, on the whole, indicated that the coronal radiation is richer in red and infra-red rays than is direct sunlight, but the amount of the difference is small and uncertain. There seems to be no appreciable radiation from the corona in the infra-red region beyond about 55,000 A.U.

The Bright-line Spectrum of the Corona.—A number of bright lines are found in the spectrum of the corona, which are definitely not due to the higher regions of the chromosphere. None of them is very bright, and the older measures are very inaccurate. The table gives a summary of the most accurate measures available of lines definitely believed to belong to the corona. None of them is identified with any known line in the spectrum of an element observed in the laboratory, and when they were first discovered the name "Coronium" was proposed for the hypothetical element to which they were supposed to owe their origin. Their behaviour, however, seems hard to reconcile with the idea that they have a common origin. Thus the structure of the monochromatic images of the inner corona obtained by use of a prismatic camera, indicates that the lines can be grouped in pairs, such as 3454 and 3643 and 3601 and 4086.

The Bright Line Spectrum of the Corona

Wave-lengths in international Angstrom units	Intensities	Wave-lengths in international Angstrom units	Intensities
3387·96	20	4311	2
3454·13	5	4359	4
3600·97	9	4567	6
3642·87	3	4586	4
3800·77	4	5118	2
3986·88	10	5302·80	20
4086·0	8	5536	2
4231·4	10	6374·8	5

Of these lines 4231 and 4586 are near strong lines due to ionized iron, and 5536 is near a strong iron line and near a strong line due to ionized strontium. These lines are, however, possibly coronal in origin. Three lines in the far ultra-violet (3164, 3170 and 3237) have been observed by Deslandres once only, and are probably of chromospheric origin due to TiII. A few other very doubtful lines are 3461, 4241, 4245, 4398, 4533 and 4567. *See* C. R. Davidson and F. J. M. Stratton, *Mem. Roy. Ast. Soc.*, 64, 142 (1927).

The distribution of intensity of the lines across the corona groups these same pairs together, and also 3388 and 3987; the line 5303 appears to belong to the 3601 group and 6374 resembles 3388 and 3987 but not very closely.

A remarkable relation between the wave-lengths of certain coronal lines discovered in 1911 by J. W. Nicholson (resembling the relation between nebular lines also discovered by him), and accounted for in terms of a dynamical theory of a hypothetical atom, seems not to have stood the test of time. He found that most of the lines then classed as coronal lines could be fitted to a formula of the type $\lambda = a(n+\mu)^3$ where n is an integer. Increasing accuracy of measurement has not improved the fit of this formula, moreover some of the lines used by him are of very doubtful coronal origin or even existence, and some have been identified as chromospheric lines due to ionized iron or titanium.

Rotation of the Corona.—It is generally assumed that the corona close to the sun rotates with it, but there is no definite evidence of any motions in it that could be interpreted as rotational. We do not know independently the wave-lengths of any of the coronal lines, so we cannot say from the observed wave-lengths if there is any displacement that could be interpreted as due to motion toward or away from the observer in the line of sight. Attempts have been made to discover rotational effects by comparing the wave-lengths of a coronal line at two ends of a solar diameter. They have been unsuccessful on account of the great weakness of the lines at any appreciable distance from the sun's limb. It has been observed, though confirmation of this is desirable, that the Fraunhofer lines in the coronal spectrum are slightly displaced. This might indicate rotational movement but might, on the other hand, be due to the reflection of sunlight from particles moving radially from the surface of the sun, as suggested by H. N. Russell.

Theories of the Corona.—The presence of the Fraunhofer lines in the spectrum of the corona suggests strongly that there is an atmosphere of dust particles or a gaseous envelope scattering the solar radiation, as does also the polarization of the coronal light. The density of the coronal material must be very low since there is no appreciable refraction produced by it, nor do comets, which sometimes almost graze the solar surface, suffer any detectable perturbations in passing through the corona. One of the oldest theories of the corona is that it consists of a swarm of meteoric particles revolving round the sun. This theory has the disadvantage of explaining none of the observations, and was probably only put forward because this was the only known means, at the time, of maintaining any kind of atmosphere against the force of gravitation. Various so-called mechanical theories have been put forward from time to time, based on the original one of Schaeberle. According to these the corona is due to light emitted and reflected from streams of matter, which are ejected from the sun by forces acting along lines roughly normal to the solar surface and localized chiefly in sun-spot zones (to account for the correlation with sun-spot activity). The main difficulty in these theories has been that of providing a suitable expelling agency;

CORONAE AT VARIOUS STAGES OF SUN-SPOT ACTIVITY

1. Corona, May 18, 1901, near time of minimum sun-spot activity. Characteristic sun-spot minimum with short polar brushes and long equatorial streamers

2. Corona, Aug. 30, 1905, near time of maximum sun-spot activity. The circular corona characteristic of a sun-spot-maximum period and the long equatorial streamers which give it its typical form are here visible

3. Corona during total eclipse of June 8, 1937, characteristic of maximum sun-spot activity. Photograph taken at Canton island

4. Solar corona, Alhambra, Spain, Aug. 31, 1905. Photograph taken with 40-ft. telescope; exposure time 25 seconds

NOTE: THE RANGE OF BRIGHTNESS IN THE CORONA IS SO GREAT THAT ANY ONE PHOTOGRAPH CAN SHOW DETAIL EITHER OF THE INNER OR OUTER CORONA ONLY. FIGS. 1 AND 2 ARE FROM COMPOSITE DRAWINGS MADE FROM ORIGINAL NEGATIVES, WITH CONTRAST REDUCED

moreover the explanation of the continuous spectrum is not thereby completed, and the problem of the bright line spectrum is left quite unsolved.

Probably the view to take at the present time is something like this. We have a satisfactory theory of the chromosphere, whereby it turns out to be a gaseous atmosphere consisting largely of electrons and ionized atoms supported by radiation pressure (the competent force lacking in older theories). At the top of the chromosphere the density is very low, pressure is of the order of 10–12 atmospheres, and since we can scarcely suppose the density to increase outwards from the sun, there is no difficulty in fitting on to it a tenuous coronal envelope. The mechanism of the radiation pressure supporting the atoms is that of line absorption, which is very different from that of pressure on small particles. In particular it is selective in its action. Only those atoms are capable of existing in such an atmosphere that are ionized to the appropriate degree under the existing conditions of temperature and pressure, so that they can absorb the requisite amount of radiation from the supply provided, which last is determined by the surface temperature of the sun. This is quite welcome, however, for since we have to account for the coronal lines we must suppose them due to some atoms, and since there are not many of them only a few atoms should be concerned in their production. The coronal region must consist of gases in a rather higher degree of ionization than in the chromosphere, since the pressure is so much lower, and though there may not be possible a static equilibrium for such an atmosphere, yet, owing to recombination of ions (allowing suitably powerful absorption to occur from time to time) there may be a dynamical equilibrium. We do not require to suppose the corona quiescent. If we regard coronal material as shot up from below, owing to excessive radiation pressure, we have a good reason for the observed connection between coronal arches and streamers and prominences, since, near prominences and sun-spots, locally superheated regions of the solar surface are found to occur; moreover the connection with sun-spot activity is no longer mysterious. There will be present a considerable proportion of free electrons; these can scatter light and, it turns out, would do so in the right kind of way, so far as observation is possible; and the scattering by atoms present is not inconsistent with observation.

Finally with regard to the origin of the coronal lines, it seems most likely that they are to be explained in the same way as the nebular lines, *i.e.*, as due to known atoms in circumstances which cannot so far be imitated in the laboratory; so that transitions can occur sufficiently often under the conditions of low density (*i.e.*, long undisturbed life of the individual atoms) and appropriate stimulation, so as to produce "forbidden" lines of appreciable intensity and to suppress the ordinary lines. The atoms involved would presumably be those capable of existing (possibly at a lower stage of ionization) in the high chromosphere, and indeed doubly ionized calcium has been suggested as the source of these lines, with some plausibility, but so far it is not more than a suggestion; ionized titanium seems also very likely to be involved.

(J. A. CA.)

CORONA, in architecture the central division of a classic cornice, usually consisting of a projecting block, with its under side approximately flat, and its outer face vertical, and forming a simple, continuous band along the length of the cornice. (*See* ORDER.)

CORONACH, the lamentation or dirge for the dead which accompanied funerals in the Highlands of Scotland and in Ireland. (A Gaelic word, from *comh,* with, and *ranach,* wailing.) The more usual term in Ireland is "keen," "caoine" or "keening."

CORONADO, FRANCISCO VASQUEZ DE (*c.* 1500–1554), Spanish explorer of the American southwest, accompanied Antonio de Mendoza to New Spain in 1535, and became a leading grandee. In 1538 he was chosen a *regidor,* or member of the town council, of Mexico City, and in 1539 was appointed governor of the province of New Galicia. In the same year Melchior Díaz reaffirmed the fabulous report of Fray Marcos de Niza concerning the "seven cities of Cibola" (now identified almost certainly with the Zuñi pueblos of New Mexico), and in February of 1540 Coronado left Compostela, at the head of an expedition of 250 horsemen, 70 Spanish footmen, and several hundred friendly Indians with baggage animals and herds of cattle, for their exploration and conquest. Coronado with a part of his force captured the "seven cities" in July. The fabled wealth, however, was not there, and he moved westward, to the Rio Grande, where in the autumn (1540) he was joined by the rest of his force. Exploring parties visited Tusayan (the Hopi or Moqui country of northeastern Arizona), the Grand Canyon of the Colorado, and the Rio Grande (Tuguez). Having wintered here, the expedition, reinspirited by stories of an Eldorado called "Quivira" far to the northeast, advanced onto the plains of Texas in April, 1541. Finding nothing but prairie and bison, most of them retraced their steps, but Coronado with about 30 horsemen penetrated to the central part of Kansas, explored the misnamed Eldorado—a village of Wichita tepees—and in October rejoined his forces on the Rio Grande. In the spring of 1542 he led a tattered remnant of his army home, to taste the bitter cup of incompetence and failure. He nevertheless continued in his capacity of governor of New Galicia until 1544, when his *residencia* was taken and he was convicted of "general neglect of duty . . . rank favoritism and numerous irregularities," was fined and for a short time was actually imprisoned. He retired to Mexico City where he still held the post of *regidor,* and rose to petty prominence in the municipal routine. In 1549 he received a small *encomienda* (a grant of land and the Indians residing on it) in recognition of "meritorious services in discovery and conquest," but his health began to give way, and sometime about the first of November, 1554, he died. Though Coronado is one of the least of the conquistadors, his march looms up as one of the feats of the Spanish conquest in America, both on its own merits and by its consequences a tribute to the genius of Antonio de Mendoza. In connection with it, Hernando de Alarcon in 1540 ascended the Gulf of California to its head, and the Colorado river for a long distance above its mouth.

See G. P. Winship, "The Coronado Expedition" in the 14th *Report* of the U.S. Bureau of Ethnology (1896). (W. B. P.)

CORONATION, a solemnity whereby sovereigns are inaugurated in office. In pre-Christian times in Europe the king or ruler, upon his election, was raised on a shield, and, standing upon it, was borne on the shoulders of certain of the chief men of the tribe, or nation, round the assembled people. This was called the *gyratio,* and it was usually performed three times. At its conclusion a spear was placed in the king's hand, and the diadem, a richly wrought band of silk or linen, which must not be confused with the crown (*see* CROWN AND CORONET), was bound around his forehead. When Europe became Christian, a religious service of benediction was added to the older form, which, however, was not abandoned. Derived from the Teutons, the Franks continued the *gyratio,* and Clovis, Sigebert, Pippin and others were thus elevated to the royal estate. From a combination of the old custom with the religious service the later ceremonies were developed. In the procession of the English king from the Tower to Westminster (first abandoned at the coronation of James II.), in the subsequent elevation of the king into what was known as the marble chair in Westminster Hall, and in the showing of the king of France to the people, as also in the universal practice of delivering a sceptre to the new ruler, traces, it is thought, may be detected of the original function.

The added religious service was naturally derived from the Bible, where mention is frequently made, in the Old Testament, of the anointing and crowning of kings. The anointing of the king soon came to be regarded as the most important, if not essential, feature of the service. By virtue of the unction which he received, the sovereign was regarded, in the middle ages, as a *mixta persona,* in part a priest and in part a layman. It was a strange theory, and Lyndwode, the great English canonist, is cautious as to it, and was content to say that it was the opinion of some people. It gained wide acceptance, and the anointed sovereign was generally regarded as, in some degree, possessed of the priestly character. By virtue of the unction he had received, the emperor was made a canon of St. John Lateran and of St. Peter at Rome, and also of the collegiate church of Aachen, while the king of France was *premier chanoine* of the primatial church of Lyons, and held canonries at Embrun, Le Mans, Montpellier, St. Pol-de-Léon, Lodève, and other cathedral churches in France. There are, moreover, trustworthy records that, on more than one occasion, a king of France, habited in a surplice and choir robes, took part with the clergy in the services of some of those churches. Martène quotes an order, which directs that at the imperial coronation at Rome, the pope ought to sing the mass, the emperor read the gospel, and the king of Sicily, or, if present, the king of France, the epistle. Nothing like this was known in England, and a theory, which has prevailed of late, that the English sovereign is, in a personal sense, canon of St. David's, is based on a misconception. The canonry in question was attached to St. Mary's College at St. David's before the Reformation, and, at the dissolution of the college, became crown property; but the king of England is not, and never was personally, a canon of St. David's, nor did he ever perform any quasi-clerical function.

At first a single anointing on the head was the practice, but afterwards other parts of the body, as the breast, arms, shoulders and hands received the unction. From a very early period in the West three kinds of oil have been blessed each year on Maundy Thursday, the oil of the catechumens, the oil of the sick, and the chrism. The last, of olive oil and balsam, is only used for the most sacred purposes, and the oil of the catechumens was that used for the unction of kings. In France, however, a legend gained credence that the Holy Dove had descended from heaven, bearing a vessel (afterwards called the Sainte Ampoule), containing holy oil, and had placed it on the altar for the coronation of Clovis. A drop of oil from the Sainte Ampoule mixed with chrism was afterwards used for anointing the kings of France. Similarly the chrism was introduced into English coronations, for the first time probably at the coronation of Edward II. To rival the French story another miracle was related that the Virgin Mary had appeared to Thomas Becket, and had given him a vessel with holy oil, which at some future period was to be used for the sacring of the English king. A full account of this miracle, and the subsequent finding of the vessel, is contained in a letter written in 1318 by Pope John XXII. to Edward II. The chrism was used in addition to the holy oil. The king was first anointed with the oil, and then signed on the head with the chrism. In all other countries the oil of the catechumens was alone used. In consequence of the use of chrism the kings of England and France were thought to be able to cure scrofula by the imposition of their hands, and hence arose the practice in those countries of touching for the king's evil, as it was called. In England the chrism disappeared at the Reformation, but touching for the evil was continued till the accession of the house of Hanover in 1714.

The oldest existing ritual for the coronation of a king is contained in what is known as the Pontifical of Egbert, who was archbishop of York in the middle of the 8th century. The coronation service in it is entitled *Missa pro rege in die benedictionis ejus,* and the coronation ceremony is interpolated in the middle of the mass. After the Gospel the officiant recites some prayers of benediction and then pours oil from a horn on the king's head, while the anthem "Zadok the priest," etc., is sung. After this the assembled bishops and nobles place a sceptre in the king's hands, while a form of intercessory benediction is recited. Then the staff (*baculus*) is delivered to him, and finally a helmet (*galea*) is set upon his head, the whole assembly repeating thrice "May King N. live for ever. Amen. Amen. Amen." The enthronement follows, with the kisses of homage and of fealty, and the mass, with special prayers, is concluded.

Another service of Anglo-Saxon date bearing, but with no good reason, the name of Aethelred II., has also been preserved, and is of importance as it spread from England to the Continent, and was used for the coronations of the kings of France. It differs from the Egbert form as the coronation precedes the mass, while the use of a ring, and the definite allusion to a crown (*corona* not *galea*) occur in it. Joined to it is the form for the coronation of a queen consort. It may have been used for the crowning of Harold and of William the Conqueror.

A third English coronation form, of the 12th century, bears the name of Henry I., but also without good reason. The ceremonial is more fully developed, and the king is anointed on the head, breast, shoulders, and elbows. The royal mantle appears for the first time, as does the sceptre. The queen consort is to be crowned *secundum ordinem Romanum,* and the whole function precedes the mass.

The fourth and most important of all English coronation services is that of the *Liber Regalis,* a manuscript still in the keeping of the dean of Westminster. It was introduced in 1307, and continued in use till the Reformation, and, in an English translation and with the Communion service substituted for the Latin mass, it was used for the coronation of James I. In it the English coronation ceremonies reached their fullest development. The following is a bare outline of its main features:—

The ceremonies began the day before the coronation, the king being conducted in a procession from the Tower of London to Westminster. There he reposed for the night, and was instructed by the abbot as to the solemn obligations of the kingly office. Early next morning he went to Westminster Hall, and there, among other ceremonies, as *rex regnaturus* was elevated into a richly adorned seat on the king's bench, called the Marble Chair. Then a procession with the regalia was marshalled and led into the abbey church, the king wearing a cap of estate on his head, and supported by the bishops of Bath and Durham. A platform with thrones, etc., having been previously prepared under the crossing, the king ascended it, and, all being in order, the archbishop of Canterbury called for the Recognition, after which the king, approaching the high altar, offered a pall to cover it, and a pound of gold. Then a sermon appropriate to the occasion was preached by one of the bishops, the oath was administered by the archbishop, and the *Veni Creator* and a litany were sung. Then the king was anointed with oil on his hands, breast, between the shoulders, on the shoulders, on the elbows, and on the head; finally he was anointed with the chrism on his head. Thus blessed and anointed, the king was vested, first with a silk dalmatic, called the *colobium sindonis,* then a long tunic, reaching to the ankles and woven with great golden images before and behind, was put upon him. He then received the buskins, the sandals, and spurs, then the sword and its girdle; after this the stole, and finally the royal mantle, four-square in shape and woven throughout with golden eagles. Thus vested, the crown of St. Edward was set on his head, the ring placed on his wedding finger, the gloves drawn over his hands, and the golden sceptre, in form of an orb and cross, delivered to him. Lastly, the golden rod with the dove at the top was placed in the king's left hand. Thus consecrated, vested and crowned the king kissed the bishops who, assisted by the nobles, enthroned him, while the *Te Deum* was sung. When a queen consort was also crowned, that ceremony immediately followed, and the mass with special collect, epistle, gospel, and preface was said, and during it both king and queen received the sacrament in one kind. At the conclusion the king retired to a convenient place, surrounded with curtains, where the great chamberlain took off certain of the robes, and substituted others for them, and the archbishop, still wearing his mass vestments, set other crowns on the heads of the king and queen, and with these they left the church.

This service, in English, was used at the coronation of James I., Elizabeth having been crowned with the Latin service. Little change was made till 1685, when it was considerably altered for the coronation of James II. The Communion was necessarily omitted in the case of a Roman Catholic, but other changes were introduced quite needlessly by Archbishop Sancroft, and four years later the old order was still more seriously changed, with the result that the revisions of 1685 and 1689 have grievously mutilated the service by confusing the order of its different sections, while the meaning of the prayers has been completely changed for no apparent reason. Alterations since then have been verbal rather than essential, but at each subsequent coronation some feature has disappeared, the proper preface having been abandoned at the coronation of Edward VII.

In connection with the English coronation a number of claims to do certain services have sprung up, and before each coronation a court of claims is constituted, which investigates and adjudicates on the claims that are made. The most striking of all these services is that of the challenge made by the king's champion, a service in grand serjeantry attached to the manor of Scrivelsby for many centuries. Immediately following the service in the church a banquet was held in Westminster Hall, during the first course of which the champion entered the hall on horseback, armed *cap-à-pie,* with red, white, and blue feathers in his helmet. He was supported by the high constable on his right, and the earl marshal on his left, both of whom were also mounted. On his appearance in the hall a herald in front of him read the challenge, the words of which have not materially varied at any period, as follows: "If any person, of what degree soever, high or low, shall deny or gainsay our sovereign lord . . . , king of the United Kingdom of Great Britain and Ireland, defender of the faith, (son and) next heir unto our sovereign lord the last king deceased, to be the right heir to the imperial crown of this realm of Great Britain and Ireland, or that he ought not to enjoy the same; here is his champion, who saith that he lieth, and is a false traitor, being ready in person to combat with him; and in this quarrel will adventure his life against him, on what day soever he shall be appointed." The champion then threw down the gauntlet. The challenge was again made in the centre of the hall, and a third time before the high table, at which the king was seated. The king then drank to the champion out of a silver-gilt cup, with a cover, which he handed to him as his fee. The banquet was last held, and the challenge made, at the coronation of George IV. in 1821. The champion's claim was admitted in 1902, but as there was no banquet the duty of bearing the standard of England was assigned to him. There is no record of the challenge ever having been accepted.

The coronation form in France bore much resemblance, in its general features, to the English coronation, and was, it is believed, originally based on the English form. The unction was given, first on the top of the head in the form of a cross, on the breast, between the shoulders, and at the bending and joints of both arms. Then, standing up, the king was vested in the dalmatic, tunic, and royal robe, all of purple velvet sprinkled with fleurs-de-lys of gold, and representing, it was said, the three orders of subdeacon, deacon, and priest. Then, kneeling again, he was anointed in the palms of the hands, after which the gloves, ring, and sceptre were delivered. Then the peers were summoned by name to come near and assist, and the archbishop of Reims, taking the crown of Charlemagne from the altar, set it on the king's head. After which the enthronement and showing of the king to the people took place. All the unctions were made with the chrism, mixed with a drop of oil from the Sainte Ampoule. After the enthronement mass was said, and at its conclusion the king communicated in both kinds. The third day after the coronation the king touched for the evil.

On the "11 Frimaire, an 13," Napoleon and Josephine were jointly crowned at Paris by the pope. Napoleon entered Notre-Dame wearing a crown, and before him were carried the imperial ornaments, to wit: *"la couronne de l'empereur, l'épée, la main de justice, le sceptre, le manteau de l'empereur, son anneau, son collier, le globe impérial, la couronne de l'impératrice, son manteau, son anneau."* Each of these was blessed, and delivered with a benediction to the emperor and empress, kneeling side by side, to receive them, both having previously received the unction on the head and on each hand. Napoleon placed the crown on his head himself. Mass with special prayers followed.

In Spain the coronation ceremony never assumed the fullness or magnificence that might have been expected. It was usually performed at Toledo, or in the church of St. Jerome at Madrid, the king being anointed by the archbishop of Toledo. The royal ornaments were the sword, sceptre, crown of gold, and the apple of gold, which the king himself assumed after the unction. In recent years the unction and coronation have been disused.

In Sweden the king was anointed and crowned at Uppsala by the archbishop. The ceremony is now performed in the Storkyrka, at Stockholm, where the archbishop of Uppsala anoints the king on the breast, temples, forehead, and palms of both hands. The crown is placed on the king's head by the archbishop and the minister of justice jointly, whereupon the State marshal proclaims: "Now is crowned king of the Swedes, Goths and Wends, he and no other." When there is a queen consort she is then anointed, crowned, and proclaimed in the same manner.

In Norway, according to the law of 1814, the coronation is performed in the cathedral at Trondhjem, when the Lutheran superintendent, or bishop, anoints the king. The crown is placed on the king's head jointly by the bishop and the prime minister.

In Russia the coronation, celebrated at Moscow, was full of religious significance. The tsar was anointed by the metropolitan, but placed the crown on his head himself. He received the sacrament among the clergy, the priestly theory of his office being recognized. The coronation ceremony was also performed with much significant ritual in Austria and Hungary. In other countries, as Prussia, it was retained in a modified form; but in the remaining States such as Denmark, Belgium, Italy, etc., it has been abandoned, or never introduced.

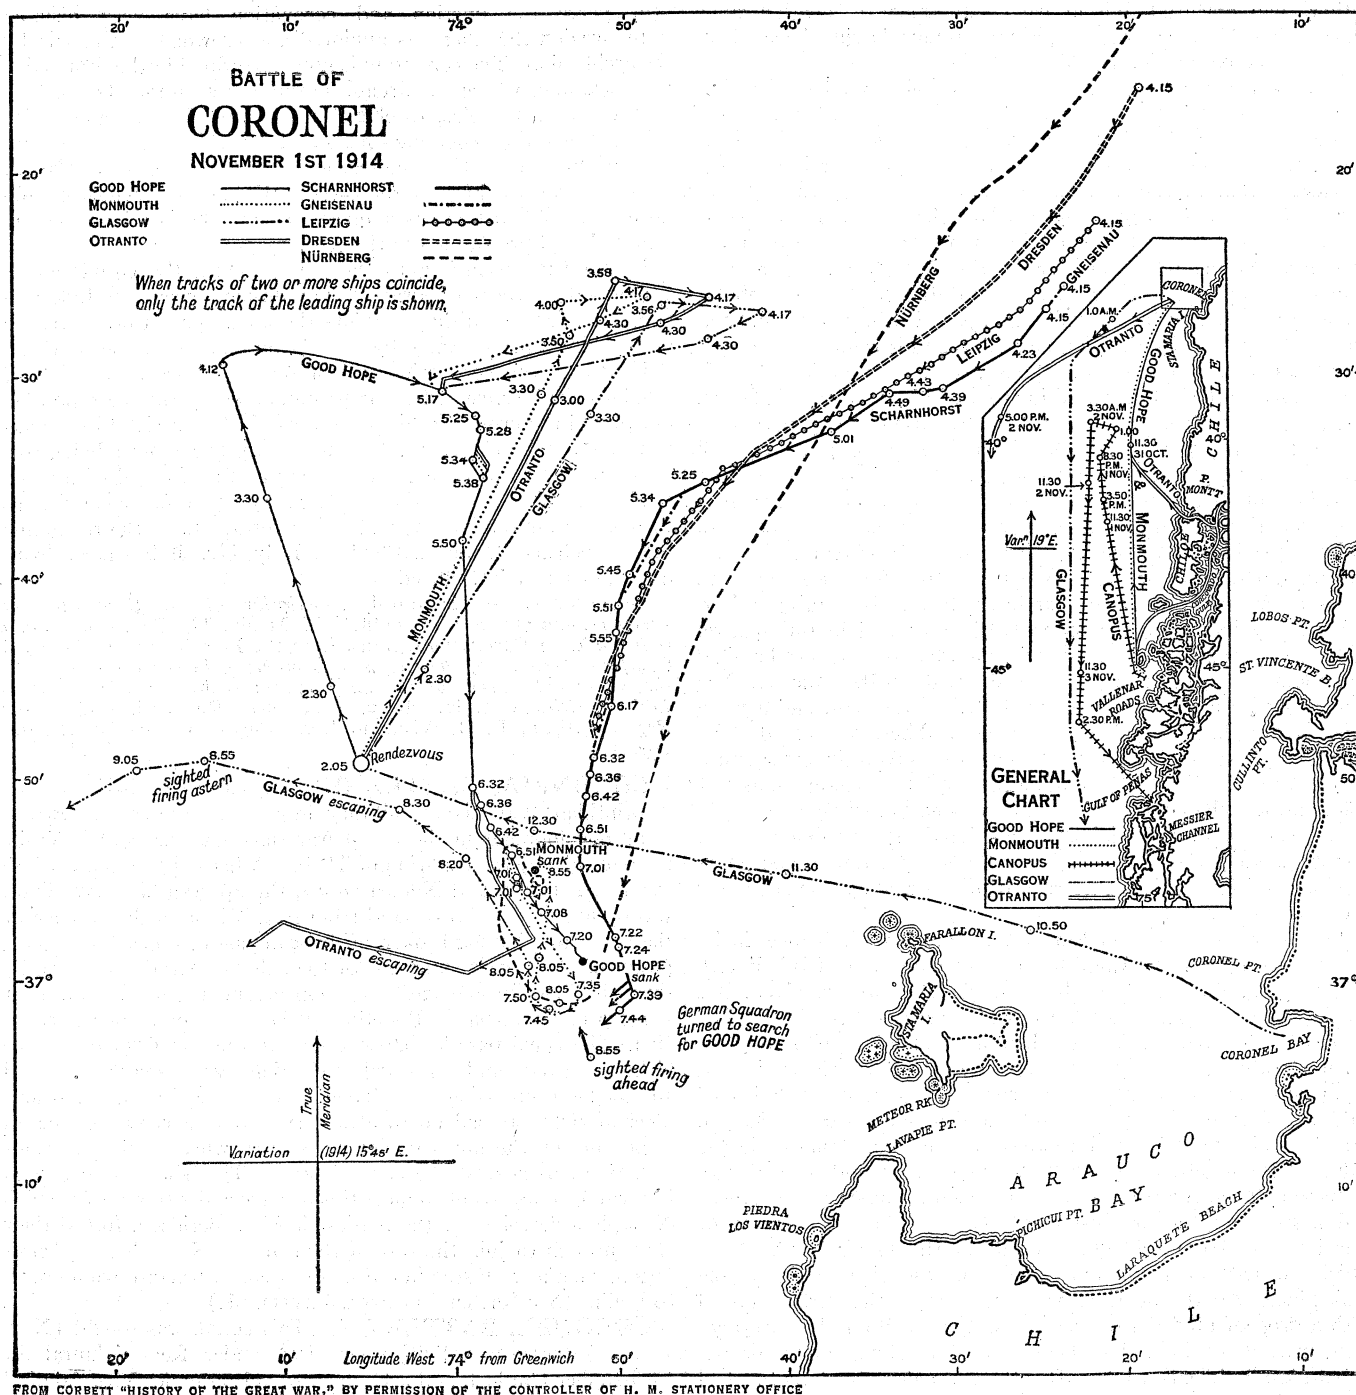
CORONEIA, BATTLE OF, 394 B.C. This battle of the "Corinthian War" is of military interest as showing a further small development in the art of war since Cunaxa (*q.v.*). While the offensive by the coalition of Thebes, Athens, Argos and Corinth was being stemmed at Nemea (*q.v.*), the Spartan king, Agesilaus, was on his way back overland from Asia Minor to the defence of the homeland, having broken off his campaign against the Persian power on the urgent summons of the ephors. After passing safely through Thessaly and gathering reinforcements, he was faced at the gap of Coroneia, in Boeotia, by the main forces of the coalition. The usual parallel battle followed, the usual "drift" to the right occurred, and as usual each right wing overlapped and smashed the opposing left. Then, however, while the victorious Theban right pressed on to attack the Spartan camp, Agesilaus, improving on the novel device of Nemea, wheeled his victorious right inwards against the enemy centre. The Thebans succeeded in forming a new front to meet this menace and, after a fight which Xenophon describes as the hardest in his experience, forced their way through to join the rest of their army. Nevertheless, Agesilaus had cut a fresh step in the steep ascent of warfare from brawn to brain. (*See* further LEUCTRA, BATTLE OF.)

CORONEL, BATTLE OF. This action was fought (Nov. 1, 1914) between a British squadron under Rear Admiral Sir Christopher Cradock and a German squadron under Vice Admiral Graf von Spee. Actually it took place in a position 41m. to the west of Coronel in Chile. The result was a severe defeat of the British forces, the flagship "Good Hope" and the cruiser "Monmouth" being sunk; while the two remaining ships escaped in the dark. The German ships were comparatively little damaged.

The causes which led up to the British defeat can be directly traced to a faulty appreciation by the Admiralty of the whole situation of Cradock *vis-à-vis* von Spee. In consequence of this Cradock had not been reinforced by a powerful modern cruiser for which he had urgently applied, while the instructions sent him were ambiguous, although their general tone was such that he could not have done otherwise than set out in search of an enemy which proved to be superior in every respect to his fighting strength. It has been argued that, having found the enemy, he should have avoided action, but he had specific orders "to be prepared to meet them" and "to protect trade." It has also been argued that he would have been safe if he had not pressed on without the old battleship "Canopus" and that he had been speci-



FROM CORBETT "HISTORY OF THE GREAT WAR," BY PERMISSION OF THE CONTROLLER OF H. M. STATIONERY OFFICE

FEELING COMPELLED BY HIS ORDERS TO FIGHT, DESPITE INFERIORITY IN GUN POWER, SPEED, AND TRAINED PERSONNEL, THE BRITISH ADMIRAL CLOSED, ON SIGHTING THE ENEMY, AND BY 6:25 P.M. THE ACTION HAD BEGUN. TACTICAL ADVANTAGE LAY WITH THE GERMANS. A HEAVY SEA RENDERED THE MAIN DECK GUNS OF THE ALMOST OBSOLETE BRITISH CRUISERS INEFFECTIVE, AND, SILHOUETTED AGAINST THE SETTING SUN, THEY PRESENTED EASY TARGETS FOR THE HEAVIER ARMAMENT OF THE GERMAN "GNEISENAU" AND "SCHARNHORST." THE "GOOD HOPE" WAS BLOWN IN TWO AT 7:20 P.M., AND THE "MONMOUTH" WAS SUNK AT 800 YARDS' RANGE AT 8:55 P.M. NOT A MAN WAS SAVED. THE "OTRANTO" AND "GLASGOW" ESCAPED

fically warned by the Admiralty that "'Canopus' should accompany 'Glasgow,' 'Monmouth' and 'Otranto'." To these latter instructions Admiral Cradock had, not unnaturally, replied that it was impossible to find and destroy the enemy's fast squadron with a ship of such slow speed as the "Canopus" in company. Moreover, the idea that this ship, because she was classed as a battleship, was something in the nature of an impregnable fortress, under whose shelter he could not come to any harm, was based on a complete fallacy as to her fighting efficiency. Her four old 12in. guns could have been out-ranged by the more modern 8in. guns of the German "Gneisenau" and "Scharnhorst." Her armoured belt was no thicker than that of the "Good Hope," while her crew was very largely untrained, whereas von Spee's two principal ships were the crack gunnery ships of the German Fleet in the eastern waters. There can be very little doubt that had the "Canopus" been present in the battle she would have been sunk as surely as were the "Good Hope" and "Monmouth."

Events Leading Up to the Action.—On Oct. 22 Admiral Cradock left Port Stanley in the Falkland islands by the route round the Horn. The "Canopus," which had just arrived at the Falklands, was told to follow immediately and meet him on the other side of the Straits of Magellan. He had sent instructions for the armoured cruiser "Defence" to join him, but these were cancelled by the Admiralty, who informed him that she was to

Ships engaged:

Ship.	Displacement.	Completed.	Guns.	Armour.	Max. speed.
British					
Good Hope (Flag)	14,100 tons	1902	2 9·2in. 16 6in.	6-in. belt, 5–6-in. on turrets	23·5kts.
Monmouth	9,800 tons	1903	14 6in.	4-in. belt, 6-in. on turrets	23kts.
Glasgow	4,800 tons	1911	2 6in. 10 4in.	Light protection only	25kts.
Otranto	Armed Merchant	Cruiser	4 4·7in.	Nil	16kts.
German					
Scharnhorst (Flag)	11,600 tons	1907	8 8·2in. 6 5·9in.	6-in. belt, 6–6¾-in. on turrets	24kts.
Gneisenau	do.	do.	do.	do.	22·5kts.
Leipzig	3,250 tons	1906	10 4·1in.	Light protection only	22 kts.
Nürnberg	3,450 tons	1908	10 4·1in.	do.	23·5kts.
Dresden	3,600 tons	1909	10 4·1in.	do.	24·5kts.

remain on the east coast of South America under Admiral Stoddart's orders. The "Glasgow" and "Monmouth" were already in the South Pacific, working from a secret base in the Chonos archipelago (lat. 45°24′ S., long. 74°18′ W.), where the "Good Hope" joined them on Oct. 26th. Here, too, was the armed merchant cruiser "Otranto."

At this time, Cradock had no very definite intelligence of the enemy on which to act. He therefore, on Oct. 27, despatched the "Glasgow" to Coronel to pick up what news she could and to cable to the Admiralty his dispositions and intention to move northward. These, his last messages, were duly despatched on Oct. 31 and reached the Admiralty just after Lord Fisher had been installed as the new first sea lord. The latter at once perceived the grave danger in which Cradock might find himself. He reversed the previous decision and gave immediate orders for the "Defence" to join him, while Cradock was instructed to keep his squadron concentrated and to effect a junction with the "Defence" at the earliest possible moment, but unhappily these orders never reached him. Meanwhile the "Glasgow" had reported wireless indications of the close proximity of German warships. On Oct. 30, therefore, Cradock set out from his base, leaving the "Canopus" behind to make good engine defects. His squadron consisted of the "Good Hope," "Monmouth" and "Otranto." The "Glasgow" met him at 1:30 P.M. on Nov 1.[1]

Von Spee, coming from the Far East, had crossed the Pacific and his last port of call had been Mas-a-Fuera. On Oct. 30 he had sent an armed merchantman, the "Prinz Eitel Friedrich," into Valparaiso and was cruising with the remainder of his squadron just out of sight of land. From this ship he learnt of the "Glasgow's" visit on Oct. 31. He therefore stood south with the object of finding her.

Meanwhile Cradock had ordered his ships to spread 15m. apart on a line of bearing north-east by east in the order "Good Hope," "Monmouth," "Otranto," "Glasgow"; "Good Hope" being to the westward, while a course was set north-west by north in the direction in which he expected to find the enemy. Before the ships could get into their stations, the "Glasgow" and "Otranto" sighted the smoke of von Spee's squadron, and by 4:10 P.M. the former ship sighted and reported the "Scharnhorst," "Gneisenau," and a light cruiser. The British ships at once closed on the "Good Hope." Three hundred miles to the southward the "Canopus" had just left harbour and was plodding along, escorting her colliers. Von Spee, on sighting the "Glasgow" to the westward, turned and worked his squadron up to full speed. It was blowing hard from the southward and there was a heavy sea running. Under such conditions it would have been impossible for the main deck guns of the "Good Hope" and "Monmouth" to have been fought, and the combined broadside of these ships was therefore reduced from two 9·2in. and 15 6in. to two 9·2in. and seven 6in. The 12 8in. guns, which formed the combined broadside of the two German armoured cruisers, were mounted on the upper deck, thus securing them an additional advantage in such weather.

By 5:20 P.M. the British squadron was on an easterly course, the "Good Hope" leading, followed by "Monmouth," Glasgow" and "Otranto," and heading direct for the enemy. About 5:25 Cradock altered to the southward, which brought him on a converging course to that of von Spee, who was then about 11m. on his bow, steering to the south-west. The British admiral was evidently determined to fight, and desired to close the range and to take full advantage of the sun while it was high enough to dazzle the enemy. But von Spee was no less determined not to be rushed and to fight under his own conditions. He therefore turned away when Cradock attempted to close. At 6:20, however, the sun having begun to dip below the horizon, he decided that his time had come. The British ships stood out, silhouetted against the red glow, while those of the German squadron were becoming more and more difficult to see against the approaching darkness to the eastward. A few minutes later the "Scharnhorst" opened fire at just over 11,000 yards. The third salvo hit the "Good Hope" between the conning tower and her fore-turret, starting a fire. Now the rest of the German ships joined in, the "Gneisenau" taking on the "Monmouth," the "Leipzig" the "Glasgow," and the "Dresden" the "Otranto." The "Good Hope" replied, but under the difficult conditions of light it is evident that her fire was very ineffective.

Cradock determined to close still further, and by 6:53 the range was down to 6,600 yards. The "Monmouth" was firing furiously, but the heavier German shells were finding their mark, and by 7 o'clock both the British ships were in great distress. The "Monmouth's" fore-turret, having been struck by a shell, caught fire and exploded, the gun-house being blown overboard. The "Good Hope" was badly hit and on fire. A quarter of an hour later, with the range down to only 5,000yd., she was rapidly losing speed, and about 7:20 a shell struck her amidships and a moment later a huge column of fire shot up. Firing a few last desperate shots, she disappeared, having been practically blown in two and gutted. At 7:20 the "Monmouth" ceased fire and proceeded to try and get her fires under, but already she was badly down by the bows and had a heavy list. She made vain efforts to work to the westward and get her stern to the sea. The "Glasgow" did what was possible to support her, but could only have offered a useless sacrifice by remaining. The "Otranto," wisely, had already made off.

By the light of the moon the "Nürnberg," which had been making great efforts to catch up and join in the fight, sighted the now almost completely crippled "Monmouth." She attacked her with a torpedo, but missed, and then opened fire with her guns at only 800yd. range. At 8:58 P.M. the "Monmouth," heeling over more and more, went down with her ensign still flying. Not a soul was saved from either her or the "Good Hope." The "Glasgow" eventually joined up with the "Canopus" and worked back to the Falkland islands via the Magellan straits, the "Otranto" taking the passage round the Horn.

The effect of the defeat at Coronel was for the time being most disconcerting to British trade and interests in South American waters. But von Spee, in the midst of the rejoicing by the German community at Valparaiso, had no illusions as to his ultimate fate and in fact retribution swift and complete was already being organized, and there was something of poetic justice in the selection of Rear Admiral Sturdee, the chief of the Naval staff at the time of the Coronel disaster, for the command of the squadron which was to avenge Cradock in the battle of the Falklands. (E. A.)

CORONER, an ancient office first referred to, as *custos placitorum*, in s. 20 of the Articles of Eyre (1194), though it was probably instituted before that date; possibly by Henry I. (1100–31). The coroner appears as a check on the sheriff in the royal

[1]Chilean time. 5 hours slow on Greenwich.

interest. Magna Carta (1215) prohibits both sheriff and coroner from holding pleas of the Crown. The king had a pecuniary interest if, for example, a dead man's Englishry (*q.v.*) could not be proved; in the deodand (*q.v.*), and in forfeiture (*q.v.*). Little is left of those duties which made the mediaeval coroner a considerable figure. The Eyre (*see* ASSIZE), the criminal appeal (*q.v.*), outlawry (*q.v.*), sanctuary (*q.v.*), abjuration (*q.v.*) are hardly more than names to us. Other powers already obsolescent were expressly taken away by the Coroners Act of 1887, s. 44, which section, interestingly enough, re-enacts the provision of Magna Carta above referred to.

The office was always elective, the appointment being made by the freeholders of the county assembled in the county court. The first statute of Westminster enacted that none but lawful and discreet knights should be chosen as coroners. Lands to the value of £20 per annum (the qualification for knighthood) were afterwards deemed sufficient. Blackstone complains that "through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute and get into low and indigent hands."

The Coroners Amendment Act, 1926, requires that a coroner shall be a barrister, solicitor or legally qualified medical practitioner of not less than five years' standing in his profession, no property qualification being required. The practice of the London County Council is to appoint gentlemen possessing both legal and medical qualifications.

The judges of the high court are *ex officio* sovereign coroners: they may (but, in fact, do not) exercise their jurisdiction in any part of the realm.

The duties of a coroner are now limited to an enquiry (inquest) *super visum corporis* into the cause of all deaths occurring within his district by violent or unnatural means or from some unknown cause, or on anyone who has died in prison or in such place or under such circumstances as to require an inquest in pursuance of any act. The coroner must view the body, but since the Act of 1926 the jury need not. Evidence is given upon oath, but the procedure is somewhat informal, seeing that the proceedings are in the nature of an enquiry and not of a trial. If any person is found guilty of murder, manslaughter or infanticide, the coroner commits him for trial, but in practice since the Act of 1926 he seldom has to do this, as it is provided by s. 20 (1) that if the coroner is informed before the jury have given their verdict that some person has been charged with any of these crimes he shall adjourn the inquest until after the conclusion of the criminal proceedings. By the City of London Fire Inquests Act, 1888, the coroner for the City holds inquests in cases of loss or injury by fire in the City of London and the liberties thereof situated in the county of Middlesex. In Scotland the duties of a coroner are performed by an officer called a procurator-fiscal.

In the United States, coroners are generally elected by the qualified voters of the county. In some states they are appointed by the executive. No property qualification exists as to eligibility for the office; instead a bond with adequate sureties must be filed by the coroner on assuming office. The coroner's duties extend to the holding of an inquest *super visum corporis* whenever there is a reasonable suspicion attending the circumstances of death. Refusal by a physician of a death certificate requires the holding of an inquest. Autopsies are performable upon the coroner's order. The finding of the coroner's jury does not operate as an indictment but may lead to the procurement of an indictment, though in many states the finding itself is equivalent to an information upon which the magistrate may issue his summons.

See *Jervis on Coroners* (7th ed. by Danford Thomas, 1927); W. S. Holdsworth, *Hist. Eng. Law;* H. Gerland, *Die Englische Gerichtsverfassung* (1910). (F. T. G.)

CORONIUM, that constituent (otherwise unknown) of the sun's corona which emits the characteristic green coronal ray, of which the wave-length is 5303. It was first observed by Young in 1869.

COROT, JEAN-BAPTISTE CAMILLE (1796–1875), French landscape painter, was born in Paris, in a house on the Quai by the rue du Bac, now demolished, on July 16, 1796. His parents kept a successful millinery establishment, and under Napoleon I. Madame Corot was court modiste. Thus, he never, throughout his life, felt the want of money. He was educated at Rouen and was afterwards apprenticed to a draper, but hated commercial life. He remained in it, however, until he was 26, when his father at last consented to his adopting the profession of art. With Victor Bertin as teacher, he was trained in the classicist tradition. He visited Italy on three occasions: in 1825, 1835 and 1843. On his return from his third journey he came under the influence of the Barbizon school and his eyes were opened to the beauty of French landscape. He was a regular contributor to the Salon during his lifetime, and in 1846 was "decorated" with the cross of the Legion of Honour. He was promoted to be officer in 1867. His many friends in 1874, only a short time before his death, presented him with a gold medal. He died in Paris on Feb. 22, 1875, and was buried at Père Lachaise.

Of the painters classed in the Barbizon (*q.v.*) school Corot is the least realistic. He often painted landscapes from memory in his studio; his compositions are poems in tone-values. He preferred to paint in the hour of twilight, when all colours are merged into harmony.

Corot's works are somewhat arbitrarily divided into periods but the point of division is never certain, as he often completed a picture years after it had been begun. In his first style he painted with an eye to form and arrangement; he is reported to have said: *"Il ne faut laisser d'indecision dans aucune chose."* ("Vue du Colosée," 1825; "Le pont de Narni," 1827; "Chartres cathedral," 1830). After his 50th year his methods changed to breadth of tone and an approach to poetic power ("Dance of the Nymphs," 1849), and about 20 years later, say from 1865 onwards, his manner of painting became full of "mystery" and poetry ("Le beffroi de Douai," 1871). In the last ten years of his life he became the Père Corot of the artistic circles of Paris, in which he was regarded with personal affection. He earned large sums by his pictures, which became greatly sought after. In 1871 he gave £2,000 for the poor of Paris (where he remained during the siege), and his continued charity was long the subject of remark. Besides landscapes, of which he painted several hundred, Corot produced a number of figure pictures. These are mostly studio pieces. In his later work of this kind, which is now highly prized, he combined the simplified classical conception of form with a Rembrandtesque rendering of planes in colour remarkable for its strength and purity ("Femme à la Perle", 1870). Corot also executed a few etchings and pencil sketches. He also painted some decorative panels in the houses of his friends. At Mantes he composed six Italian landscapes for a small bathroom; at Ville d'Avray a similar decoration for a pavilion (1847). Here he also painted four frescoes for the church (1855). "The Baptism of Christ" in the church of St. Nicolas du Chardonnet at Paris (1844) is one of the few figure compositions of this master.

The works of Corot are scattered over France and the Netherlands, Great Britain and America. The following may be considered as the first half-dozen: "Une Matinée" (1850), in the Louvre, Paris; "Macbeth" (1859), in the Wallace collection, London; "Le Lac" (1861); "L'Arbre brisé" (1865); "Pastorale-Souvenir d'Italie" (1873), in the Glasgow Corporation Art Gallery; "Biblis" (1875). Corot had a number of followers who called themselves his pupils. The best known are Boudin, Lepine, Chintreuil, Français and Le Roux.

CORPORAL. 1. An adjective used in such expressions as "corporal punishment" (*see* FLOGGING), "corporal works of mercy," acts of bodily kindness, such as feeding the hungry or clothing the naked, rescuing captives (Lat. *corporalis,* to the body). A "corporal oath" (one ratified by touching a sacred object, *see* OATH).

2. (Lat. *corporale* or *palla corporalis*), in the Roman Catholic Church, a small square linen cloth, on which the chalice and paten are placed on the altar at mass.

3. (Of uncertain derivation; the French form *caporal*, and Ital. *caporale*, point to an origin from *capo*, Italian for head; the *New English Dictionary*, however, favours the derivation from Lat. *corpus*, Ital. *corpo*, body), a non-commissioned officer of infantry, cavalry and artillery, ranking below a sergeant. This rank is almost universal in armies. In the 16th and 17th centuries there were corporals but no sergeants in the cavalry, and this custom is preserved in the three regiments of British household cavalry, the rank of sergeant being replaced by that of "corporal of horse," and that of sergeant-major by "corporal-major." In the 16th and early 17th centuries the title "corporal of the field" was often given to a superior officer who acted as a staff-officer to the sergeant-major-general. In the British navy a "ship's corporal" was formerly a semi-military instructor to the crew, but later became a petty officer charged with assisting the master-at-arms in police duties on board ship. The rating of Regulating Petty Officer has now superseded that of Ship's Corporal.

In the combat organizations of the United States Army the Corporal is the leader of the squad (Infantry and Cavalry) which operates in battle as a combat group. He is the gunner of the gun squad (Artillery) which operates the piece. He is responsible for the training and equipment of his unit and is appointed by the regimental commander who signs the warrant. The insignia of rank of the Corporal is a chevron of two stripes worn on the sleeves of the uniform.

CORPORAL PUNISHMENT: *see* FLOGGING.

CORPORATION, in English law, an association of persons which is treated in many respects as if it were itself a person. It has rights and duties of its own which are not the rights and duties of the individual members thereof. Thus a corporation may own land, but the individual members of the corporation have no rights therein. A corporation may owe money, but the corporators as individuals are under no obligation to pay the debt. The rights and duties descend to the successive members of the corporation. This capacity of perpetual succession is regarded as the distinguishing feature of corporations as compared with other societies. A corporation differs from a partnership (*q.v.*) in that it is a legal person distinct from the sum of its members and in that the members can escape personal liability.

Many of the legal attributes of an English corporation are to be found in the *universitas* and *collegium* of the law of Rome. In the later Roman law the distinction of corporations into civil and ecclesiastical, into lay and eleemosynary, is recognized. English law has invented another classification—corporations aggregate and sole. The normal corporation is aggregate, *i.e.*, it consists of several persons united in one society maintained by perpetual succession. Corporations sole consist of one person only and his successors; if a public officer in English law is a corporation sole, the rights acquired by him in that capacity devolve upon his successor in office, and not upon his ordinary legal representative. The best known instances of corporation sole are the king and the parson of a parish. The conception of the king as a corporation is the key to many of his paradoxical attributes in constitutional theory—his invisibility, immortality, etc. Parliament has found it convenient to confer the character of a corporation sole upon the official heads of departments which have rights and property—*e.g.*, the postmaster-general, the Ministries of Agriculture, Health and Transport, the Treasury solicitor and the public trustee.

The corporations known to the earlier English law were mainly the municipal, the ecclesiastical, and the educational and eleemosynary. To all of these the same principles, borrowed from Roman jurisprudence, were applied. The different purposes of these institutions brought about in course of time differences in the rules of the law applicable to each. In particular, the development of trading companies, checked by parliament after the South Sea Bubble crisis, produced in the 19th century a new class of special statutory corporations, differing widely from those formerly known to the law. The reform of municipal corporations, as well as the statutory incorporation of many units of local government, has also restricted the operation of the principles of the older corporation law. These principles, however, still apply when special statutes have not intervened.

The legal origin of corporation is usually ascribed to five sources, viz., common law, prescription, act of parliament, charter and implication. Prescription in legal theory implies a grant, so that corporations by prescription would be reducible to the class of chartered or statutory corporations. A corporation is said to exist by implication when the purposes of a legally constituted society cannot be carried out without corporate powers. Corporations are thus ultimately traceable to the authority of charters and acts of parliament. The power of creating corporations by charter is a prerogative of the Crown, nowadays exercised of course upon the advice of ministers responsible to parliament. The power of chartering corporations belonged also to subjects who had *jura regalia; e.g.*, the bishops of Durham granted a charter of incorporation to the city of Durham in 1565, 1602 and 1780. The charter of a corporation is regarded as being of the nature of a contract between the king and the corporation. It will be construed more favourably for the Crown, and more strictly as against the grantee. It cannot alter the law of the land, and it may be surrendered, so that, if the surrender is accepted by the Crown and enrolled in chancery, the corporation is thereby dissolved. Great use was made of this power of the Crown in the reigns of Charles II. and James II. (*See* CHARTER and CHARTERED COMPANIES.)

Every corporation, it is said, must have a name, and it may have more names than one, but two corporations cannot have the same name. And corporations cannot change their names save by charter or some equivalent authority.

The possession of a common seal, though not conclusive of the corporate character, is an incident of every corporation aggregate. The inns of courts (*q.v.*) have common seals, but they are only voluntary societies. Generally speaking, all corporate acts affecting strangers must be performed under the common seal; acts of internal administration affecting only the corporators, need not be under seal. The rule has been defended as following necessarily from the impersonal character of a corporation; either a seal or something equivalent must be fixed upon so that the act of the corporation may be recognized by all.

A corporation may be abolished by statute, but not by the mere authority of the Crown. It may also become extinct by the disappearance of all its members or of any integral part by surrender of charter if it is a chartered society, by process of law or by forfeiture of privileges.

The power of the majority to bind the society is one of the first principles of corporation law, even in cases where the corporation has a head. It is even said that only by an act of parliament can this rule be avoided. The binding majority is that of the number present at a corporate meeting duly summoned.

In corporations which have a head (*e.g.*, mayor and commonalty or dean and chapter), although the head cannot veto the resolution of the majority, he has been deemed an integral part of the society; his death was thought to suspend its existence, so that a head could not devise or bequeath to the corporation, nor could a grant be made to a corporation during vacancy of the headship. Doubts as to the effect of such a vacancy, or of a vacancy in the office of a corporation sole, are set at rest by sec. 180 of the Law of Property Act, 1925.

A corporation has power to make such regulations (by-laws) as are necessary for carrying out its purposes, and these are binding on its members and on persons within its local jurisdiction if it has any.

The power to acquire and hold land was incident to a corporation at common law, but its restriction by the statutes of mortmain (*q.v.*) dates from a very early period. The law was consolidated by the Mortmain and Charitable Uses Act, 1888, and the result is simply that corporations cannot take land for any purpose without a licence, and no licence in mortmain is granted by the Crown, except in certain statutory cases in the interests of religion, charity or other definite public object. The first statutes of mortmain were prompted by the vast increase in his lands of ecclesiastical corporations.

The power of corporations at common law to alienate their property is usually restricted, as is their power to lease it for more than a certain number of years, except by sanction of a public authority. The more important classes of corporations, however, are now governed by special statutes which exclude or modify the operation of the common law principles. The most considerable class of societies still unaffected by such special legislation are the livery companies (*q.v.*). Under COMPANY will be found an account of the important enactments regulating joint-stock companies.

Corporations, brought into being for definite purposes, are restricted to actions concerned in furthering those purposes; actions outside that field are *ultra vires* and can be restrained and declared void. This rule is most rigid when the purposes are defined in a memorandum of association under the Companies Acts (*see* COMPANY); it is based on public policy as well as on the protection of corporations themselves and those who deal with or belong to them.

The general capacity of a corporation has sometimes been enlarged by statute; thus a corporation can now be an executor and administrator. Mention may here be made of "trust corporations," an expression which appears in the Law of Property legislation of 1925. Though the Trustee Act of that year required that for many trust purposes there should be at least two trustees, an exception was made for "trust corporations," which are allowed to act alone. This expression (enlarged by statute in 1926) includes trustees in bankruptcy, the public trustee and other approved bodies and officials.

In its treatment of corporations, as elsewhere, English law has been inspired by convenience rather than dogma. Even the fundamental principle that a corporation is a person distinct from its members was somewhat shaken when in 1915 the national danger made the law-courts willing in the *Daimler* case to look through the screen of corporateness at the members behind it. The abstract nature of corporate personality has been discussed by Gierke, Maitland and others. To some the corporation is a fiction, a thing which cannot exist till the State creates it; to others it is a real person, a group-unit with a group-will, capable of existence even if the State does not concede life to it. Unconcerned with metaphysical speculation, English law has treated the corporate person as much as possible like an individual. The treatment is consonant with popular ideas and speech wherein corporate bodies are freely personified. The Interpretation Act of 1889 frankly declares that in any subsequent statute the word "person" shall, unless the contrary intention appears, include corporations. Plainly the assimilation of corporate and individual personality, however convenient and acceptable, has its limits; a corporation cannot marry or commit murder or be imprisoned or hanged. In 1245 the pope had said that it could not be excommunicated; having neither mind nor soul, it could not sin. But English law, by a simple extension of the legal principles of agency, has managed to hold a corporation liable for the wrongs committed by its servants—trespass, assault, negligence, false imprisonment and even libel and malicious prosecution. Criminal liability presented less difficulty because corporations had long been held indictable for non-repair of highways and bridges and because there are certain offences in which the existence of criminal intent is not an essential element. Difficulties of procedure and of punishment may be inevitable; the former were lightened in England by sec. 33 of the Criminal Justice Act of 1925; the latter are sometimes met (for example in the Official Secrets Act of 1920) by providing that, if a corporation is guilty of an offence under a particular statute, each of its directors and officers shall be deemed guilty unless he proves that the offence was committed without his knowledge or consent.

As corporate bodies escape death duties, an equivalent duty was imposed upon their property by the Customs and Inland Revenue Act of 1885. This must not be confused with the Wartime "corporation profits tax" imposed by the Finance Act of 1920 and terminated by that of 1924. (C. T. C.)

UNITED STATES

Corporation, in the law of the United States, has two accepted meanings. The term is used in a generic sense to indicate any body of persons treated in law as a unit; more commonly a company organized for profit, corresponding to the English joint-stock company. Corporations organized for profit are often referred to as stock corporations, because the interest of the shareholder is represented by shares of stock. Again, they are private corporations, since their object is gain for the individual as distinguished from the public corporation whose object is to serve the community. As in English law the corporation derives its existence from authority granted by the sovereign and may not exist without such authority. Sovereignty in this respect rests in the United States with the several States, though within a limited field the Federal Government may create corporations. This right was early exercised by Congress in the creation of the Bank of the United States. After the Civil War, many railroads sought Federal charters, some of which are still retained. More recent instances are the creation by Congress during the World War of the War Finance Corporation and the Emergency Fleet Corporation.

The State of New York was the pioneer in enacting a general corporation law eliminating the necessity of passing an act of the legislature for each new corporation. This act of 1811 antedates similar legislation in England. The method was rapidly adopted by the other States. Later, abuses in granting special charters led to amendments to the State Constitutions forbidding such charters except where the objects of the corporation could not be attained under the general law. Each State has its own corporation act and these often differ in many essentials. In general the law governing incorporation, promoters, directors, shares, allotment of shares, meetings of stockholders, payment for shares, and dividends is the same as for the English joint-stock company. The transfer of shares is regulated in an increasing number of States by the Uniform Stock Transfer Act. One of the most noteworthy provisions of this act is that one who has purchased shares without knowledge that the seller obtained them by fraud, may keep them as against the defrauded party. Recognition is thus given to the fact that in practice shares are freely traded in without inquiry as to the circumstances under which they were acquired by the seller.

The liability of the shareholder is ordinarily limited to the amount which he agreed to pay for the shares subscribed for by him. It is illegal, however, for a corporation to issue shares for less than par; *i.e.;* to issue a \$100 share for less than that sum or its equivalent in property. This requirement is often evaded by overvaluing contributions of property. Minnesota and California have unusual laws respecting shareholders' liability. In many of the other States the liability of shareholders of banking and insurance companies is not limited to the par value of the shares. Perhaps the most marked difference between the corporation laws of the United States and other countries is the share without par value. Although a share of stock is merely an aliquot part of the capital of a corporation the certificate issued by the corporation to the shareholder does not indicate that fact. The certificate states that the person named therein is the owner of so many \$100 shares or £5 shares or whatever unit may have been adopted by the company. The amount of money stated or the par value, represents the least amount which the law requires the shareholder to pay to the company. But the retention of this figure despite subsequent changes in the financial condition of the company makes possible the deception of future purchasers. To avoid this danger the share without par value was devised. Instead of stating that it represents an investment of so much money it states that it represents so many shares of the corporation out of a fixed total of shares which the corporation is authorized to issue. The laws of a majority of the States now allow the issuance of no par value shares. In most cases both ordinary shares and shares entitled to preferences may be without par value. In the case of preferred shares the dividend preference is expressed in a stated number of dollars rather than the percentage customary with par value shares. The price at which such shares may be issued is determined by the stockholders, though they may in most cases delegate the determination of the price to the directors.

As a rule the statutes do not require that a company issuing shares publish a prospectus. In practice, however, it is almost invariably the case that the bankers who underwrite the issue publish a statement giving the outstanding facts concerning the corporation's property and business. In doing so the bankers assume the grave risk that they may be held liable in case the statements are untrue. The bankers often seek to protect themselves by declaring that the representations made are believed by them but are not guaranteed, but the courts in recent decisions have shown an inclination to hold the bankers liable where they have been negligent in ascertaining the truth of the statements which they publish.

Because of the great diversity in the provisions of the various State laws regarding corporations there is a proposal that a uniform act be adopted by all the States. In the analogous fields of partnerships and limited partnerships such acts have been framed by the National Conference of Commissioners on Uniform Laws and have been adopted by numerous States. This Conference is now engaged (1928) in the preparation of a Uniform Business Corporation Act and has tentatively approved a draft which if finally accepted will be presented to the legislatures of the States for their adoption. It is likely that in the course of time uniform legislation on the subject may be secured. This is especially important since so many of the corporations do business in States other than those in which they are incorporated, often having their principal place of business elsewhere. In recent years a number of States have adopted liberal and what are supposed more desirable provisions for the regulation of corporations, and there is a widespread practice for promoters to select some such State as the place to incorporate, although the corporation to be formed is to transact no business there. The great weight attached to such laws is indicated by the fact that many corporations, hitherto organized elsewhere, have abandoned their charters and incorporated anew in one of the more liberal states, such as Delaware, Maryland and Maine. This movement is comparable to the organization of the "trusts" such as the United States Steel Corporation at the end of the last and beginning of the present century. At that time the State of New Jersey was almost invariably chosen as a domicile. However, the passage of more stringent laws in that State in 1913 has directed attention elsewhere.

In most States separate acts have been enacted to deal with companies organized not for profit and other acts to deal with transportation, insurance, banking corporations, and other special types. Corporations organized not for profit are frequently referred to as membership corporations because shares are dispensed with and the participants merely become members. In the case of membership corporations, as well as the other types covered by separate acts, special permission of some judicial or administrative authority is frequently required before incorporation is allowed. (J. L. WE.)

CORPORATION PROFITS TAX. A tax on the profits of companies enjoying limited liability was introduced in the British Parliament in the Finance bill, 1920, and was passed into law in the Finance Act of that year. It met with slight opposition, partly because of the modesty of the rate, but the arguments advanced in support of the proposals were not limited to their effect in the production of revenue. It was pointed out that as the State conferred certain privileges upon companies with limited liability, such companies could properly be called upon to pay something to the State in return. It was also indicated that the tax would act to some extent as a corrective of the practice of the evasion of the super tax (a tax payable only by individuals) by the placing by private companies of their profits to reserve, instead of distributing them. The tax, therefore, was levied solely upon limited liability companies; it was levied without reference to pre-war profits, and it was levied upon the profits whether those profits were distributed or not.

The provisions relating to the tax were contained in part V. of the Finance Act, 1920. The tax was charged as from Jan. 1, 1920, at the rate of *1s.* in the £ on the profits arising in any accounting period, of a British company carrying on any trade or business or any undertaking of a similar character, including the holding of investments. The tax was also imposed on the profits of foreign companies carrying on in the United Kingdom any trade or business, or any undertaking of a similar character, so far as those profits arose in the United Kingdom. The expression "company" was defined as "any body corporate so constituted that the liability of its members is limited," but was not to include a company formed before the commencement of the Act whose assets consisted wholly of securities issued by a public authority, and formerly held by the persons by whom the company was formed. No tax was charged on the first £500 a year of the profits. Mutual trading concerns, whose activities had not given rise to liability to income tax, were brought within the charge, but their taxable profits were to be ascertained on a special basis. Exemption for three years was given to building societies as well as to companies carrying on wholly in the United Kingdom gas, water, electricity, tramway, hydraulic power, docks, canal or railway undertakings, whose charges and dividends were limited by Act of Parliament. The amount of tax charged on any company was not to exceed *2s.* in the £ on what remained after deducting from the profit the amount paid out in interest or dividends on debentures, preference shares, or permanent loans secured by mortgage or debentures, and repayable at not less than three months' notice. No company was assessable on income received from another company liable to be assessed in respect of that income, and a company holding all the share capital of another company might elect to have the profits of the two companies assessed together.

Assessment.—Generally speaking, the profits for assessment were to be calculated on the same basis as that adopted for income tax, but the profits charged in each accounting period were to be the actual profits, and not the profits computed on an average of the previous three years, or on any other basis.

The Act made provision for certain deductions in arriving at the assessable profits, and also forbade certain deductions. Thus, interest on money borrowed for the business (except permanent loans and money borrowed from a person having a controlling interest in the company), rent of premises, royalties paid to a person who had not a controlling interest, shares of profits distributed to employees under a profit-sharing scheme, and not in respect to shares purchased by them, wear and tear, excess profits and mineral rights duty, and foreign and colonial taxes, were allowed as deductions. Royalties paid to a person having a controlling interest, interest on money borrowed from such a person, interest on permanent loans, dividends on distribution of profits, and remuneration in excess of £1,000 a year of directors and managers who had a controlling interest in the company, were not allowed as deductions, and no deduction could be made in respect of any transaction which artificially reduced the amount of the taxable profits. The penalty for entering into fictitious or artificial transactions with a view to evading the tax, was a fine not exceeding £500.

Unlike the income tax, which is assessed by bodies of local commissioners in the various districts throughout Great Britain, the Corporation Profits Tax was assessed by the commissioners of Inland Revenue, who were empowered, in the absence of a satisfactory return or information from the company, to make an assessment according to the best of their judgment. An appeal could be made against the amount of an assessment to the general or the special commissioners of income tax, at the option of the company assessed, and an appeal from the decision of the commissioners could be taken to the courts on a point of law. Where a company was being wound up, the liquidator was prohibited from distributing the assets until he had satisfied the commissioners of Inland Revenue that he had provided for the payment of any tax for which the company might be liable.

These provisions, like all revenue provisions, gave rise to legal questions as to the true construction of the words of the Act by which the charge was imposed, and the courts were called upon to give decisions on many points, notably as to whether certain companies were carrying on trade or business, or any undertaking of a similar character. But the tax had a short life. By section 36 of the Finance Act, 1923, the rate of tax was reduced to $2\frac{1}{2}\%$, and by section 34 of the Finance Act, 1924, the tax was brought to an end at June 30, 1924. (R. N.)

CORPS (pronounced *cor* as in French, from which it is taken, being a late spelling from Lat. *corpus,* a body; *cf.* "corpse"), a word in very general use since the 17th century to denote a body of troops, varying from a few hundred to the greater part of an army. In a special sense "corps" is used as synonymous with "army corps" (*corps d'armée*) a grouping of several divisions. (*See* ARMY.) The word is applied to any organized body, as in *corps diplomatique,* the general body of foreign diplomatic agents accredited to any government (*see* DIPLOMACY) or *corps de ballet,* the members of a troupe of dancers at a theatre; so in *esprit de corps,* the common spirit of loyalty which animates any body of associated persons.

CORPSE, a dead human body. By the common law of England a corpse is not the subject of property nor capable of holding property. It is not, therefore, larceny to steal a corpse, but any removal of the coffin or grave-cloths is otherwise, such remaining the property of the executors or administrators or of the persons who buried the body. It is a misdemeanour to expose a naked corpse to public view, to prevent the burial of a dead body, or to disinter it without authority; also to bury or otherwise dispose of a dead body on which an inquest ought to be held, without giving notice to a coroner. It is a like offence to remove unlawfully a corpse from a grave. Anyone who, having the means, neglects to bury a dead body which he is legally bound to bury, is guilty of a misdemeanour, but no one is bound to incur a debt for such a purpose. It is incumbent on the relatives and friends of a deceased person to provide Christian burial for him; failing relatives and friends, the duty devolves upon the parish. The burning of any human remains is dealt with by the Cremation Act 1902, and a breach of the regulations may be dealt with summarily. If the burning is to conceal an offence, it is indictable. (*See* further BODY-SNATCHING, and BURIAL.)

CORPULENCE or OBESITY, the over-accumulation of fat under the skin and around and throughout certain of the internal organs. The most celebrated case is that of Daniel Lambert (*q.v.*) who died in 1809 in his 40th year. He is said to have been the heaviest man that ever lived, his weight being 739lb. (52st 11lb.). Health cannot be long maintained under excessive obesity, for exercise is difficult and the thoracic and abdominal organs are embarrassed in their functions. Often mental activity is impaired.

Various factors operate in the production of corpulence. Sometimes it is an hereditary tendency, which no precautions as to living appear capable of averting. But certain habits favour its occurrence. Predisposing causes are a luxurious, inactive or sedentary life, with over-indulgence in sleep and absence of mental occupation, over-feeding (esp. carbohydrates and fats) and the large use of fluids (esp. beer and sweet wines). Its frequent occurrence in eunuchs and cretins, and in women after the menopause, suggests the importance of endocrine secretions; and the value of thyroid extract in reducing weight indicates that this gland is implicated. (*See* ENDOCRINOLOGY; METABOLIC DISEASES; NUTRITION.)

CORPUS CHRISTI, a city in southeastern Texas, U.S.A., on Corpus Christi bay, near the mouth of the Nueces river; a port of entry and the county seat of Nueces county. It is the southern terminus of federal highway 181; is served by the Missouri Pacific, the Southern Pacific, and the Texas-Mexican railways; is a modern deepwater port which in 1940 handled 6,794,887 tons of cargo, and is connected to the Gulf of Mexico by a 21-mi. channel, 200 ft. wide, 32 ft. deep. There is a municipal airport, with passenger and mail service. The population grew from 27,741 in 1930 to 57,301 in 1940. The U.S. navy air station, costing over $40,000,000, is there. Large crops of cotton, winter vegetables and livestock are grown in the county. In the county were more than 1,100 oil wells in 1940. Building permits in 1940 totalled more than $8,000,000. A two-mile sea wall, a bay front boulevard and three yacht basins were completed in 1941. There was a small Spanish settlement here at an early date, and from this base Gen. Zachary Taylor made his forward movement to the Rio Grande in 1846. After the Mexican War an American town grew up, which was chartered as a city in 1876.

CORPUS CHRISTI, FEAST OF, a festival of the Roman Catholic Church in honour of the Real Presence of Christ in the Eucharist, observed on the Thursday after Trinity Sunday (Lat. *festum corporis Christi,* Fr. *fête-Dieu* or *fête du saint-sacrement,* Ger. *Fronleichnamsfest*).

The institution of this feast is due to St. Juliana, prioress of Mont Cornillon near Liége (1222–58), whose veneration for the Blessed Sacrament was intensified by a vision, and who persuaded Robert de Torote, bishop of Liége, to order the festival for his diocese in 1246. It did not spread, however, until in 1261 Jacques Pantaléon, formerly archdeacon of Liége, became pope as Urban IV.

In 1264 Urban ordered the whole Church to observe the feast, for which a new office (still in use) was written by St. Thomas Aquinas; but the well-known story of the miracle of Bolsena, which is supposed to have hastened the pope's decision, is not supported by contemporary evidence, and is probably a later adaptation of a type of legend which occurs at least as early as the 12th century. Owing perhaps to Urban's death soon afterwards (Oct. 2, 1264), his order was ignored in most countries until after its confirmation by Clement V. at the council of Vienna in 1311.

By the middle of the 14th century the festival had found general acceptance; and in the 15th century it became in effect the principal feast of the Church.

The procession of the Host, its most prominent feature (though not part of the original ritual), became a gorgeous pageant in which sovereigns and princes took part, as well as magistrates and members of trade and craft gilds, and was followed by miracle plays and mysteries performed by members of the gilds.

The rejection of the doctrine of transubstantiation at the Reformation naturally involved the suppression of the festival, as a religious observance, in the reformed Churches; but the mystery plays survived for a time in places.

CORPUSCULAR THEORY OF LIGHT, the earliest theory of the nature of light (*q.v.*), also known as the *emission theory,* according to which luminous bodies emit minute particles capable of passing through transparent substances and producing the sensation of light.

CORRAL, a word used chiefly in Spanish America and the United States for an enclosure for cattle and horses, and also for a defensive circle (Sp. *corro,* a circle) formed of wagons against attacks from Indians. It is also used as a verb, meaning to drive into a corral, and so figuratively to enclose, hem in. The word is probably connected with the South African Dutch word *kraal* (*q.v.*).

In Ceylon it is especially used for an enclosure meant for the capture of wild elephants. The corresponding term in India is *keddah* (*q.v.*).

CORREA DA SERRA, JOSÉ FRANCISCO (1750–1823), Portuguese politician and man of science, was one of the founders of the Portuguese Academy of Sciences, of which he was named perpetual secretary.

Correa da Serra came into conflict with the Holy Office and had to leave the country, taking refuge in Paris, London and finally New York.

In 1816 he was made Portuguese minister-plenipotentiary at Washington, and in 1820 he was recalled home, appointed a member of the financial council and elected to a seat in the *cortes.*

Correa da Serra was a good botanist, but his principal claim to fame is the *Colecção de livros ineditos da historia Portugueza* (4 vols., 1790–1816), an invaluable selection of documents, exceedingly well edited.

CORREA GARÇÃO, PEDRO ANTONIO JOAQUIM (1724–1772), Portuguese lyric poet, was the son of a foreign office official; his mother was of French descent. The poet studied law at Coimbra. He took his degree in 1748, and two years later was created a knight of the Order of Christ. In 1751 his marriage with D. Maria Salema brought him a rich dower, but in later years a law-suit reduced him to poverty. From 1760 to 1762 he edited the *Lisbon Gazette*. In 1756, in conjunction with Cruz e Silva and others, he founded the *Arcadia Lusitana* to rid Portuguese literature of the affectations of *Seicentismo*, which delighted in conceits, windy words and rhetorical phrases. He was the chief contributor to its proceedings, bearing the name of "Corydon Erimantheo." He is supposed to have conceived a passion for an English married lady which completely absorbed him and contributed to his ruin. He was arrested on the night of April 9, 1771, and committed to prison by Pombal, whose displeasure he had incurred. The immediate cause seems to have been his connection with a love intrigue, but he was never brought to trial. He was released on Nov. 10, 1772, but died that very day.

Taking Horace as his model, and aided by sound judgment, scholarship and wide reading, Correa Garção adopted a classical simplicity of form and expression. His sonnets *ad sodales* show a charming personality; his odes and epistles are sententious in tone and reveal an inspired poet and a man chastened by suffering. His two comedies in hendecasyllables, the *Theatro Novo* (played in Jan. 1766) and the *Assemblêa,* are excellent satires on the social life of the capital; and in the *Cantata de Dido,* included in the latter piece, the spirit of Greek art is allied to perfection of form, making this composition perhaps the gem of Portuguese 18th century poetry.

His works were published posthumously in 1778, and the most complete and accessible edition is that of J. A. de Azevedo Castro (Rome, 1888). An English version of the *Cantata de Dido* appeared in the *Academy* (Jan. 19, 1895). *See* Innocencio da Silva, *Diccionario bibliographico Portuguez,* vol. vi. pp. 386–393, and vol. xvii. pp. 182–184; also Dr. Theophilo Braga, *A Arcadia Lusitana* (Oporto, 1899).

CORREGGIO or **COREGGIO,** the name given to Antonio Allegri (1494–1534), Italian painter, one of the most vivid and impulsive inventors in expression and pose and the most consummate executants. His father was Pellegrino Allegri of Correggio, a small city in the territory of Modena; his mother Bernardina Piazzoli degli Aromani. Antonio was born in Correggio. He studied anatomy under Dr. Giovanni Battista Lombardi, whom he is believed to have represented in the portrait currently named "Il Medico del Correggio" (Correggio's physician). It is concluded that he learned the first elements of design from his uncle, Lorenzo Allegri, at Correggio, and from Antonio Bartolotti, named Tognino, and that he afterwards went to the school of Francesco Ferrari Bianchi (named Frarè), and perhaps to that of the successors of Andrea Mantegna in Mantua. He is said to have learned modelling along with the celebrated Begarelli at Parma.

One of his early pictures, painted in 1514 when he was 19 or 20 years old, is a large altar-piece commissioned for the Franciscan convent at Carpi, representing the Virgin enthroned, with saints; it indicates a predilection for the style of Leonardo da Vinci. This picture is now in the Dresden gallery. Another painting of Correggio's youth is the "Arrest of Christ." A third is an Ancona (or triple altar-piece—the "Repose in Egypt, with Sts. Bartholomew and John") in the church of the Conventuali at Correggio, showing the transition from the painter's first to his second style. In 1521 he began his famous fresco of the "Ascension of Christ," on the cupola of the Benedictine church of San Giovanni in Parma. This he finished in 1524, and soon afterwards undertook his still vaster work on another cupola, that of the cathedral of the same city, presenting the "Assumption of the Virgin," which occupied him up to 1530. He was the first Italian artist who ever undertook the painting of a large cupola and went at once to the extreme of what can be adventured in fore-shortening, even forestalling in this attempt the mightiest geniuses of an older generation—the "Last Judgment" of Michelangelo, for instance, not having been begun earlier than 1533 (although the ceiling of the Sistine chapel, in which fore-shortening plays a comparatively small part, dates from 1508 to 1512).

Other leading works by Correggio are: the frescoes in the Camera di San Paolo (the abbess's salon) in the monastery of St. Lodovico at Parma, painted towards 1519 in fresco—"Diana returning from the Chase," with auxiliary groups of lovely and vivacious boys of more than life size, in 16 oval compartments. In the National Gallery, London, the "Ecce Homo," painted probably towards 1520, and "Cupid, Mercury and Venus," the latter a fine example. The oil-painting of the Nativity named "Night" ("La Notte"), undertaken at Reggio in 1522 for Alberto Pratoneris, now in the Dresden gallery. The oil-painting of St. Jerome, termed also "Day" ("Il Giorno"), as contrasting with the above-named "Night." Jerome is here with the Madonna and Child, the Magdalene, and two angels. This was painted for Briseida Bergonzi from 1527 onwards, and is now in the gallery at Parma. The "Magdalene lying at the entrance of her Cavern": this small picture (only 18in. wide) was bought by Augustus III. of Saxony for 6,000 louis d'or, and is in Dresden. In the same gallery, the two works designated "St. George" (painted towards 1532) and "St. Sebastian." In the Parma gallery, the Madonna named "della Scala," a fresco which was originally in a recess of the Porta Romana, Parma; also the Madonna "della Scodella" (of the bowl, which is held by the Virgin—the subject being the Repose in Egypt): it was executed for the church of San Sepolcro. Both these works date towards 1526. In the church of the Annunciation, Parma, a fresco of the Annunciation. Five celebrated pictures painted or begun in 1532—"Venus," "Leda," "Danaë," "Vice," and "Virtue": the "Leda," with figures of charming girls bathing, is now in the Berlin gallery. In the Louvre, "Jupiter and Antiope," and the "Mystic Marriage of St. Catharine." In the Naples museum, the "Madonna Reposing," commonly named "La Zingarella," or the "Madonna del Coniglio" (Gipsy-girl, or Madonna of the Rabbit). On some of his pictures Correggio signed "Lieto," as a synonym of "Allegri." About 40 works can be confidently assigned to him, apart from a multitude of others probably or manifestly spurious.

In 1520 Correggio married Girolama Merlino of Mantua. She was but 16 years of age and is said by tradition to have been the model of his Zingarella. They had four children; she died in 1529. Correggio died at his native place on March 5, 1534, and was buried with some pomp in the Arrivabene chapel, in the cloister of the Franciscan church at Correggio.

Correggio was the head of the school of painting of Parma, which forms one main division of the Lombardic school. Of his pupils one can name with certainty only his son Pomponio, who was born in 1521 and died at an advanced age; Francesco Capelli; Giovanni Giarola; Antonio Bernieri (who, being also a native of the town of Correggio, has sometimes been confounded with Allegri); and Bernardo Gatti, who ranks as the best of all.

Bibliography.—*See* Pungileoni *Memorie storiche di Antonio Allegri* (1817); Colnaghi *Correggio Frescoes at Parma* (1845); Fagan *Works of Correggio* (1873); Julius Meyer *Antonio Allegri* (1870, Eng. trans. 1876); Conrado Ricci *Life and Times of Correggio* (1896); H. Thode *Correggio* (1898); T. Sturge Moore *Correggio* (1906), which includes some adverse criticism on the views of Bernhard Berenson in his *Study of Italian Art,* and elsewhere.

CORRELATIVE generally denotes the terms or partners of a relationship. A relationship requires at least two terms between which it holds, and they are said to be correlative terms. Thus, *e.g.,* "cause" and "effect" exemplify one kind of relationship, "teacher" and "pupil" another, "north" and "south" yet another relationship. The terms in each of these pairs are accordingly called, in logic, "correlative" terms. The expression has also been extended to propositions which express the same relationship from different points of view. Thus, *e.g., S is North of P* implies *P is South of S.* They are simply correlative propositions.

See A. Wolf; *Essentials of Logic* (1926).

CORRENTI, CESARE (1815–1888), Italian revolutionist and pamphleteer, was born at Milan on Jan. 3, 1815, and made his name by writing revolutionary pamphlets exciting the people against the Austrian rule. He took a prominent part in the insurrection of the Five Days, and in 1849 became a deputy. He supported Cavour, and in 1860 became a councillor of state. Later he became less radical in his opinions, and in 1867 and 1869 was minister for education. He helped to draft the Law of Guarantees, and played a conspicuous part in the occupation of Rome. His return to the Radical fold in 1876 assured the advent to power of the Left, and he was Depretis's chief adviser until the latter's death. Although he frequently refused ministerial office, he accepted in 1877 the lucrative post of secretary of the order of Saints Maurice and Lazarus, and in 1886 he was made a senator. He died at Rome on Oct. 4, 1888.

BIBLIOGRAPHY.—L. Carpi, *Il Risorgimento italiano,* vol. iv. (Milan, 1888); E. Massarani, *Cesare Correnti nella vita e nelle opere* (1890), and a collection of his writings entitled *Pensieri di Cesare Correnti, etc.,* (Milan, 1915).

CORRESPONDENCE, a mutual agreement or fitness of parts or character (Lat. *cum,* with, *respondere,* to answer; *cf.* Fr. *correspondance*). In the 17th and 18th centuries the word was applied to relations and communications between states. It is now chiefly used of the interchange of communications by letter or of the letters themselves. The "doctrine of correspondence or correspondences," one of the leading tenets of Swedenborgianism, is that every natural object corresponds to and typifies some spiritual principle or truth, this being the only key to the true interpretation of Scripture. In mathematics (*see* MATHEMATICS, NATURE OF) "correspondence" denotes the relation between members of two groups of objects. (*See* CURVE.)

CORRESPONDENCE SCHOOLS. Correspondence instruction in its modern form originated in the last quarter of the 19th century. In 1856 Toussaint and Langenscheidt founded a school in Berlin to teach languages by correspondence. In 1868 the University Extension movement in England introduced correspondence instruction, but its development was left largely to American initiative. The "Society to Encourage Study at Home" was organized at Boston in 1873, but the first formal American attempt in this field was launched at Ithaca, N.Y., by the "Correspondence university" in 1883. Its purpose was to supplement the work of other educational institutions. In 1892 William Rainey Harper became president of the new University of Chicago and established a correspondence department therein. This venture proved successful and during the following two decades spread to a number of other universities throughout the country. In 1928 there were 154 resident institutions of higher learning offering correspondence instruction and enrolling annually 45,000 students. The correspondence courses offered by these institutions, for the most part, presuppose that the student has an educational background comparable to that of the college student. The granting and exchange of credit for correspondence work have not been standardized.

There is another distinct source of the modern correspondence school. In the '80's an editor of a Pennsylvania newspaper began to publish questions and answers concerning coal mining. In 1891 he prepared a course covering this field to be offered by the correspondence method. Other cognate courses were soon added and within a decade this organization grew into the International Correspondence Schools, offering about 300 courses and enrolling approximately 100,000 students annually. Many private ventures in the field of correspondence instruction rapidly followed, until in 1928 there were 498 private correspondence schools in the United States, enrolling annually more than 1,500,000 students. In many instances these schools uphold high educational standards, while others are little more than book selling concerns. The courses offered are, for the most part, vocational and technical, the texts being written in non-technical language with copious illustrations and drawings, to enable the average adult worker to comprehend readily. Some of the best vocational literature in the English language is found in these correspondence school texts, but since there was no accrediting agency in the correspondence school field during the first 35 years of its existence, a certain amount of mediocre educational material and unethical practices became current. To meet this situation the National Home Study council, Washington, D.C., was organized in 1926 to serve as an inspecting and accrediting agency for the proprietary home study schools.

The U.S. Government endorsed the value of correspondence instruction when in 1920 the U.S. Marine Corps institute offered 225 courses to members of the Marine Corps. There were 36,700 students enrolling for these courses in 1928. In 1921 the U.S. department of war established 342 correspondence courses in military tactics for reserve officers.

Other ventures in this field are as follows:

1. The insular department of education in Porto Rico offers free correspondence instruction in high school subjects.
2. Several communities in Michigan are supplementing high school work by enrolling vocational students in private correspondence schools.
3. In sparsely settled provinces of western Canada children are being taught elementary school subjects by correspondence.

Students and Courses.—More than 85% of the 1,500,000 correspondence students enrolled annually in the United States pursue vocational courses, of which 60% are in the field of "job-improvement." The typical correspondence school student may be described as an adult 26 years old. He has had two years in high school and ten years' experience in the semi-skilled trades or vocations, and lives in a community of less than 100,000 population, where vocational training looking toward job-improvement is available for adults only through home study. Since three-fourths of the population of the United States live in smaller communities, it is evident that the correspondence schools fill a definite need in American life. Many correspondence schools have invested as much as $100,000 in perfecting the teaching technique, etc., of single courses. The correspondence school movement is rapidly reaching a recognized stage of permanency and is forming a valuable supplement to the public educational system. (J. S. No.)

CORRESPONDING STATES, LAW OF: *see* LIQUEFACTION OF GASES.

CORRÈZE, a department of south-central France, formed from the southern portion of the old province of Limousin, bounded north by the departments of Haute-Vienne and Creuse, east by Puy-de-Dôme, south-east by Cantal, south by Lot, and west by Dordogne. Area, 2,273 square miles. Pop. (1936) 262,770. It is situated on the western fringe of the Plateau Central and consists largely of high tracts of crystalline schists and granitic intrusions. The highest points, many over 3,000 ft., are found in the north, where the Plateau de Millevaches, separating the basins of the Loire and the Garonne, provides good sheep-pasture. Except for a small district in the extreme north drained by the Vienne, Corrèze has rivers flowing south-westwards to the basin of the Garonne. The Dordogne drains the south-eastern portion and the Corrèze joins the Vézère to the west of Brive. These river valleys and the lower land of the south-west are given over to agriculture. Rye, buckwheat and wheat are the chief cereals and hemp, flax and tobacco are also grown. Pigs and goats are reared on the valley slopes and poultry-farming and cheese-making are much practised. The vineyards around Brive produce wine of medium quality. Chestnuts, largely used as an article of food, walnuts and cider-apples are the chief fruits.

Coal in small quantities, slate, building-stone and pottery clay are worked. The government manufactory of fire-arms is at Tulle. There are flour-mills, oil-works, saw-mills and dye-works; and hats (Bort), coarse woollens, silk, preserved foods, wooden shoes, chairs, paper and leather are manufactured. Coal and raw materials for textile industries are leading imports; live stock and agricultural products are the chief exports.

The department is served by the Orléans railway, and the Dordogne is navigable. It is divided into the arrondissements of Tulle and Brive, containing 29 cantons and 289 communes. It belongs to the archdiocese of Bourges, the region of the XII. army corps, and the *Académie* (educational division) of Clermont-Ferrand. Its court of appeal is at Limoges. Tulle, the capital, and Brive are the principal towns. Uzerche, on the Vézère, has a Romanesque church and remains of mediaeval fortifications. There are Romanesque churches at Aubazine (or Obazine), Beaulieu, Meymac and Vigeois. Treignac, with its church, bridge and ramparts of the 15th century, and Turenne, dominated by the ruins of its castle, are interesting towns. The dolmen at Espartignac and the cromlech of Aubazine are the chief megalithic remains in the department. A Roman eagle and other antiquities were found close to Ussel, which became the centre of the duchy of Ventadour at the end of the 16th century.

CORRIB, LOUGH, a lake of western Ireland, in the counties Galway and Mayo. It lies north-west and south-east and is

27 mi. long. The extreme breadth is 7 mi., but the lough narrows near the centre to a few hundred yards. Lough Corrib hardly exceeds 30 ft. in depth at any point, and is dotted with islands. It lies 29 ft. above sea level and drains by the short river Corrib to Galway bay. Lough Mask lies to its north and is connected with it by a partly subterranean channel.

CORRIDOR, a main passage in a large building, on which various apartments open (Med. Lat. *corridorium,* a "running-place," from *currere,* to run). In public offices, prisons, hospitals, etc., the corridors are usually of severe simplicity; but in mansions and palaces large corridors (galleries) are often adorned with works of art, whence comes the term "picture gallery." The term "corridor carriage" is applied to the modern European style of railway carriage in which a narrow passage connects the separate compartments.

CORRIE, a term used in the highlands of Scotland and elsewhere for a steep-sided, rounded hollow in a mountainside, from the lower part of which a stream usually issues as the outlet of a small lake ponded by glacial debris. It is from Gaelic *coire,* cauldron; hence whirlpool, or circular hollow. (*See* CIRQUE.)

CORRIENTES, a northeastern province of the Argentine republic situated between 27° and 31° S. lat. and 56° and 60° W. longitude. It is bounded north and west by the Paraná river which separates it from Paraguay in the north and from the territory of the Chaco and the province of Santa Fé in the west; in the northeast by the territory Misiones; east by the river Uruguay, which separates it from Brazil and Uruguay; and south by the province of Entre Ríos. Its area is about 34,500 sq.mi., of which at least one-eighth is water surface. Pop. (1943 est.) 553,013.

The surface of the province, broadly speaking, is an extensive plain covered by swamps and lagoons in the north, undulating in the south and broken by ranges of hills in the northeast. The low-lying areas about the lagoons are practically unfit for permanent settlement unless drained. The southern districts of the province are high and rolling with woods alternating with natural pasture lands, and are admirably adapted to grazing and agriculture. The northeastern corner is also high, some of the hills reaching an elevation of 650 ft., and is heavily forested, like the adjacent territory of Misiones. The province is divided into two water sheds, those of the Paraná and the Uruguay. The principal lagoons, which are the sources for several of the rivers, are the Iberá in the central and northeastern section and the Maloya in the northwestern section. The climate on the higher plains is sub-tropical, but in the northern swamps it is exceedingly humid and hot. Its annual mean temperature of about 71° F. makes Corrientes the hottest province of Argentina.

The principal industry of Corrientes is the raising of livestock. In 1940 there were within the province 3,279,859 cattle, 2,396,842 sheep and 48,355 swine. Agriculture is also of great importance; however, it has not been developed as extensively as conditions would permit. The chief crops are Indian corn (maize), cotton, rice, tobacco, sugar cane, yerba maté, sweet potatoes, manioc, peanuts, fruits and melons. The province is especially noted for its citrus fruits. The area sown in crops in 1940, exclusive of the area devoted to fruits, was 422,389 ac. The forest lands, estimated at 5,000,000 ac., are covered chiefly with hardwoods, many of which are suitable for cabinetwork. In 1939 there were 623 manufacturing establishments in the province, a large number of which were sawmills, tanneries and sugar mills. The exports include cattle, horses, hides, forest products, yerba maté, cereals, tapioca, oranges and quarried stone.

The principal cities are Corrientes, capital (pop., 1941 est., 59,323), on the left bank of the Paraná and an important port of call for steamers trading between Buenos Aires and the upper reaches of the Paraná; Goya (1941 est., 23,170), a flourishing commercial centre on a side channel of the Paraná, handling agricultural and pastoral products; Mercedes (1940 est., 15,000) and Curuzú-Cuatiá (15,000), inland towns; Bella Vista, on the Paraná, the commercial centre of a large district; Esquina on the Paraná at the mouth of the Corrientes river, which exports timber and firewood; Empedrado, also on the Paraná; and Monte Caseros, Paso de los Libres and Santo Tomé, all ports on the Uruguay. Although rivers continue to provide the principal means of communication, there are about 750 mi. of railway and nearly 650 mi. of road in the province. The *Nordeste Argentino* railway (596 mi.) crosses the province in a S.E. direction from Corrientes to Monte Caseros, its junction with the branch that leads south to Entre Ríos and north to Posadas, Misiones. The *Económico Correntino* railway of the *Compañía General de Ferrocarriles Económicos* (155 mi.) connects the city of Corrientes with Lomas de Vallejos, from which point a branch line leads to General Paz and another to Mburucuyá, all located in one of the most fertile and productive regions of the province. Between 1933, the year in which the *Dirección Nacional de Vialidad* was created, and 1940, 637 mi. of road were built in Corrientes.

CORRIENTES. A city and river port, and the capital of the province of the same name, in the north of the Argentine republic, on the left bank of the Paraná river, 25 mi. below the junction of the upper Paraná and Paraguay, and 667 mi. by rail N. of Buenos Aires. Pop. (1941 est.) 59,323. The city was founded in 1588 by Torres de Vera who built a fort bearing the name of *San Juan de Vera de las Siete Corrientes* (seven currents) for the seven rapids in the river just above the town. The commercial importance of Corrientes results from its unusually favourable situation near the confluence of the Upper Paraná and Paraguay, and a short distance below the mouth of the Bermejo. The navigation of the Upper Paraná and Bermejo rivers begins there, and freight for the Upper Paraná and Chaco rivers is transshipped at Corrientes, which practically controls the trade of the extensive regions tributary to them. Corrientes is the western terminus of the *Nordeste Argentino* railway, which crosses the province southeast to Monte Caseros, where it connects with the line running south to Entre Ríos and north to Posadas. The *Económico Correntino* railway connects Corrientes with Lomas de Vallejos, General Paz, Mburucuyá and other centres in the fertile and highly productive region to the east of the city. The principal exports are beef, hides, cereals, yerba maté, sugar, rice, tobacco, citrus fruits, quebracho and timber. The city has four churches, a national college, normal school, library, three hospitals, a fine government palace, several plazas and a beautiful park overlooking the river.

CORRIGAN, MICHAEL AUGUSTINE (1839–1902), American prelate, was born in Newark, N.J., on Aug. 13, 1839. In 1859 he graduated at Mount St. Mary's college, Emmittsburg, Md., and began his studies for the priesthood at the American college in Rome. After his return to the U.S., he was successively professor of dogmatic theology and sacred scripture, and director of the ecclesiastical seminary of Seton Hall college at South Orange, N.J., vice-president of the institution and president (1868–76). In Oct. 1868, Corrigan became vicar general of Newark, and in 1873 bishop. In 1880 he was made coadjutor, with the right of succession, to Cardinal McCloskey, archbishop of New York, and on the cardinal's death in 1885 he became metropolitan of New York. He died May 5, 1902. He was a scholar with great power of administrative organization, simple, generous and kindly.

CORROSION AND RUSTING. Many metals of industrial importance undergo a chemical change when exposed to the action of air and water or salt solutions. This change often results in the production of spots of differently coloured material scattered over the surface of the metal, *e.g.,* brown rust on iron and steel, white specks on aluminum, and blue or green layers on copper. The change not only spoils the appearance of the metal but sometimes penetrates so deeply into it that its mechanical properties are seriously impaired. Recent calculations of Sir Robert Hadfield suggest that the world-loss of iron and steel alone, due to corrosion, must be valued at many millions of pounds sterling every year.

Corrosion is essentially a process of oxidation. Metals are usually found in nature in an oxidized state as ores, and in order to fit them for industrial use they must be "reduced" from the ore, *i.e.,* oxygen, water and other substances must be separated from the metal by chemical and physical processes. But when the metal has been so obtained it will tend to reassociate with oxygen and other substances whenever it comes into contact with them in suitable conditions: thus, iron tends to react with water and oxygen to form rust which is similar in composition to certain kinds of iron ore. The rusting of iron is a typical example of the process of corrosion whereby metals tend to return to an oxidized condition.

The process of oxidation was formerly thought to be usually a direct union between the metal, oxygen gas and sometimes traces of sulphur compounds occurring in the atmosphere. It is probable that this kind of action does take place in certain cases, such as atmospheric corrosion which can occur in the presence of mere traces or very thin films of moisture—the tarnishing of silver is an example. But it is not usually this kind of action which results in the formation of rust and the other conspicuous corrosion products mentioned above on metals immersed in liquids.

When a "base" metal is placed in water or in a salt solution, which can conduct electricity, it tends to dissolve as electrically charged metal atoms or "ions," displacing a proportionate number of charged hydrogen atoms which are constituents of water. With some metals, such as sodium, the hydrogen may appear as gas bubbles; with other metals, such as iron and copper, little or no gas appears; nevertheless the hydrogen is present as an invisible, probably atomic, film at the surface of the metal, and may completely cover it. Unless this film is removed the corrosion process is greatly retarded at this stage and no change may be visible; this may happen in the absence of oxygen; but oxygen has the property of uniting with hydrogen to form water, and so destroying the interfering film of hydrogen. Hence in the presence of air, which contains oxygen, a gas soluble in water, the process can continue, *i.e.*, more hydrogen can be displaced by metal to replace that which has been oxidized. Thus the action of oxygen in corrosion is usually indirect: it unites with hydrogen, the metal reacts with the water. This may be expressed in equations thus (neglecting electrical effects for the present):

$$(1)\quad \underset{\text{(Metal)}}{M} + \underset{\text{(Water)}}{HOH} \text{ yields } \underset{\substack{\text{(Metallic}\\ \text{hydroxide)}}}{MOH} + \underset{\substack{\text{(Hydrogen atom, called}\\ \text{an ion when in solution)}}}{H^{\cdot}}$$

$$(2)\ (a)\quad \underset{\substack{\text{(2 Hydrogen}\\ \text{atoms)}}}{2H^{\cdot}} + \underset{\substack{\text{(Oxygen}\\ \text{atom)}}}{O} \text{ yield } \underset{\substack{\text{(Water}\\ \text{molecule)}}}{HOH}$$

$$(2)\ (b)\quad 2\,H\ \text{(atomic)} = H_2\ \text{(molecular gas)}$$

It will be seen that the result of these reactions is the conversion of the metal into an oxidized product, called an hydroxide. Metallic hydroxide is a typical product of corrosion, but it may undergo further changes, *e.g.*, it may react with carbon dioxide from the atmosphere and finally form a complicated body; such a body is rust which usually contains ferrous and ferric hydroxide and carbonate and is practically insoluble in water. Some hydroxides, such as those of calcium and sodium, are soluble in water, in which case little or no solid corrosion product will appear till the water becomes saturated after long periods of corrosion.

If corrosion occurs in a solution of a salt such as sodium chloride the reactions are a little more complicated and may be summarized thus:

$$(3)\quad \underset{\text{(Metal)}}{M} + \underset{\text{(Water)}}{HOH} + \underset{\substack{\text{(Sodium}\\ \text{chloride)}}}{Na\,Cl} \text{ yields } \underset{\substack{\text{(Metal}\\ \text{chloride)}}}{MCl} + \underset{\text{(Hydrogen)}}{H^{\cdot}} + \underset{\substack{\text{(Sodium}\\ \text{hydroxide)}}}{Na\,OH}$$

$$(4)\quad \underset{\substack{\text{(Metal chlor-}\\ \text{ide)}}}{MCl} + NaOH \text{ yields } \underset{\substack{\text{(Metal hy-}\\ \text{droxide)}}}{MOH} + \underset{\substack{\text{(Sodium}\\ \text{chloride)}}}{Na\,Cl}$$

The hydrogen will react with oxygen as before. It will be noticed that the corrosion product is a metallic hydroxide, as in the case of water, but formed indirectly, and that the sodium chloride is regenerated—not always completely for it may be partly carried out of solution as a complex compound such as a so-called "oxychloride."

A remarkable feature of corrosion in water and salt solutions is its concentration at certain isolated spots or areas at which the metal is sometimes deeply pitted, the surrounding metal being scarcely attacked at all. This is due to the fact that such corrosion is mainly a "galvanic" or electrolytic action and is concentrated on areas representing the negative, anodic or zinc pole of a primary battery, such as is used for electric bells; the surrounding, relatively slightly attacked, areas correspond to the positive or carbon pole; ordinary water and salt solutions, which are electrolytes, and therefore conduct electricity, correspond to the sal ammoniac solution in the battery.

A primary battery operates largely because there is an electrical difference, a difference of potential, between the zinc and carbon when plunged in the same electrolyte. If the analogy be trustworthy, the conclusion is reached that there must be differences of electric potential between different parts of the same piece of metal when localized corrosion takes place. Such differences may be due to actual physical or chemical variations in the metal itself which are not readily discernible (such as local strains, segregation of impurities, or presence of second metals or "phases" such as carbon in cast iron), or more often to variations in the conditions external to the metal, such as differences of oxygen or metal-ion concentration. Differences of oxygen concentration are particularly important and may be due to convection currents in the liquid, or to pores in the metal into which dissolved oxygen cannot easily penetrate; in all cases the metal forms a negative pole, and is corroded, where the oxygen concentration is *least*; where the oxygen concentration is greatest the hydrogen will be most rapidly removed according to equation (2) given above, which together with (4) states the typical reactions at a positive pole. Thus metals tend to be corroded most at crevices of all kinds.

The actual rate of corrosion in any particular case is determined by more than a dozen factors the interaction of which makes the subject exceedingly complicated. Some of these factors are tabulated below.

Factors which influence the Rate of Corrosion

Relating to the metal	*Relating to external conditions*
1. Electrode potential.	8. Temperature.
2. State of aggregation.	9. Pressure of oxygen.
3. Presence of internal stresses.	10. Rate of supply and distribution of oxygen.
4. Overpotential.	11. Hydrogen-ion concentration.
5. Nature and concentration of metals in solid solution.	12. Nature and distribution of corrosion products.
6. Nature, amount and distribution of second phases.	13. Conductivity of the liquid.
7. Chemical reactivity.	14. Metal-ion concentration.
	15. Specific nature of the ions present.

In many industrial waters and salt solutions, factor no. 12 becomes very important since films and mounds of corrosion products may form at the metal surface and affect other factors in a complicated manner.

For a detailed account of the way these factors operate, and for many other important aspects of corrosion, the reader should consult U. R. Evans, *The Corrosion of Metals* (1926); F. N. Speller, *Corrosion: Causes and Prevention* (1926), McGraw-Hill Book Co., New York. (G. D. B.)

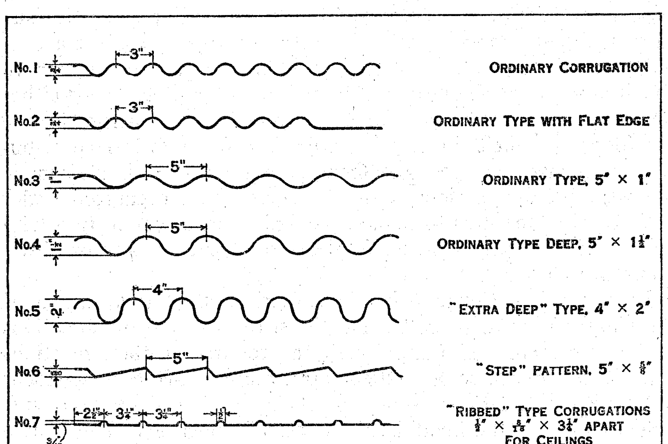
CORROSIVE SUBLIMATE, a white solid, melting at 288° C and boiling at 303° C. It is sparingly soluble in cold, and more so in hot water, and very soluble in alcohol and ether. Chemically it is mercuric chloride (perchloride of mercury), $HgCl_2$, and it is obtained by the action of chlorine on mercury or calomel (*q.v.*), by the addition of hydrochloric acid to a hot, strong solution of $Hg_2(NO_3)_2 + 4HCl = 2HgCl_2 + 2H_2O + 2NO_2$, mercurous nitrate, and, commercially, by heating a mixture of mercuric sulphate and common salt, the mercuric chloride subliming and being condensed in the form of small rhombic crystals. When treated with hydrochloric acid, it dissolves and forms compounds such as $HgCl_2 \cdot 2HCl$, $3HgCl_2 \cdot 4HCl$, $2HgCl_2 \cdot HCl$, according to the temperature and concentration; it also forms double salts with many chlorides; *sal alembroth,* $2NH_4Cl, HgCl_2, H_2O$, is the compound with ammonium chloride. It absorbs ammonia to form $HgCl_2, NH_3$, which may be distilled without decomposition. Various oxychlorides are formed by digesting corrosive sublimate with mercuric oxide. Corrosive sublimate has important applications in medicine—as an astringent, stimulant, caustic and antiseptic (*see* MERCURY).

CORRUGATED IRON. Although many millions of galvanized corrugated sheets are now in use all over the world, this industry is less than 100 years old. British makers were the pioneers. At first the sheets were made from wrought or puddled iron (not steel), and corrugated in the black, then galvanized by hand dipping in an open bath of molten zinc. The output naturally was small, and the cost high, but the quality was excellent, so much so that galvanized corrugated iron sheets are known to be still in use although they were fixed in position 50 years ago.

After the steel making process became a commercial proposition about 1860, steel sheets were produced in the heavier gauges but it was not until about 30 years later that they were made successfully in the lighter gauges. The output per shift was so much larger and the cost so much lower than iron, that steel sheets very quickly ousted the old-fashioned iron sheets. But it must be admitted that the life of ordinary quality galvanized corrugated steel sheets is only about 25% that of the original iron sheets. Iron sheets, of higher purity than ever, are being made not only in Great Britain but on the Continent and in America, for those who see the wisdom of paying a higher price for an article of longer life, but 95% of the so called "corrugated iron" is really steel. The corrugating process enables much lighter gauges of sheets to be used because it makes them very rigid and portable.

The Object of Galvanizing.—The galvanizing or zincing process is to prevent corrosion or rusting, and if the sheet is properly coated it adds very considerably to its life. With the use of machinery, outputs have been tremendously increased and costs very much lowered. The demand for cheaper goods leads to the zinc coating, which can be regulated by mechanical rollers, being sometimes brought down to a dangerously low limit. The life of a galvanized sheet depends upon its zinc coating. An imperfectly or insufficiently coated sheet is worse than a black or ungalvanized sheet. Leading consulting engineers know the importance of this, and many of them in their specifications call for a coating of from 2oz. to $2\frac{1}{2}$oz. per square foot which is considerably higher than the ordinary merchant quality.

Production in Great Britain.—The British corrugated sheet industry had small beginnings, but by 1891 the total production



BY COURTESY OF FREDERICK BRABY & CO., LTD.

SHAPES AND MEASUREMENTS OF PATTERNS OF CORRUGATED STEEL SHEETS

exceeded 200,000 tons and by 1927 the production was nearly 1,000,000 tons. Only about 25% of the sheets are used in Great Britain, while fully 75% are exported to India, Australia, New Zealand, Canada, South Africa, Japan, Argentina and other parts of the world. These British exports have been steadily expanding. In 1901 the quantity shipped was 250,287 tons, and in 1910 it was 596,949 tons, while in 1913 it rose to 762,075 tons. During the war period and up till 1924 the shipments naturally declined, but in 1927 they again reached the 1913 standard and the figures are growing monthly.

Production in America.—The production of galvanized sheets in America reached a total of 881,720 tons in 1913, but has since declined slightly. The American exports during 1915–27 averaged about 120,000 tons per annum. The general steel production in America reached the enormous total of 45,000,000 tons in 1927, but less than 2% of this consisted of galvanized corrugated sheets.

Exact figures of output of corrugated sheets in other countries are not obtainable, but the tonnage as yet is comparatively small. A few years ago Germany was exporting 3,000 to 4,000 tons monthly but in 1927 this had fallen to about 500 tons monthly. Belgium, however, since she entered the corrugated sheet business has made fairly rapid progress, and in 1928 was producing at the rate of 75,000 tons per annum. Japan, which formerly bought her galvanized corrugated sheets principally from Great Britain, is now buying the bulk of her sheets in the black condition from Britain and America and doing the galvanizing and corrugating in Japan. These sheets are specially light, namely 28 to 31 gauge, which is only about half the thickness used in other countries.

Galvanizing and Corrugating.—The black sheets are first put through the pickling process. This is done in a stone or timber tank which is filled either with sulphuric or hydrochloric acid to remove all scale, oxide or rust. This operation can be carried out either by hand pokers or by an automatic pickling machine. After being cleansed in a water tank, the flat sheets are then fed into the galvanizing bath either by hand or by an automatic feeder, one at a time. The galvanizing bath is made of steel plates from 1in. to $1\frac{1}{2}$in. thick and of a size to suit the width of sheets to be treated. Inside the bath there is the galvanizing machine with rollers which revolve in the molten spelter or zinc which is heated to 850° F. The sheets pass rapidly through the zinc and emerge at the other side of the bath through two exit rollers; these rollers, together with the speed of the machine and temperature of the bath, regulate the quantity of zinc covering, viz., from $1\frac{1}{4}$ to $2\frac{1}{2}$oz. per square foot. A flux is used in the process made from muriate of ammonia and this causes the zinc to flow freely and gives the sheet a smooth surface. When sheets are wanted with a bright flowery spangle, it is necessary to add a small proportion of tin to mix with the zinc. The sheets automatically pass through a tank of hot water to wash off any flux stains and then they pass on to a drying fire and finally they are examined by inspectors.

The sheets then pass to the corrugating department. The galvanized flat sheets are here corrugated to the size of corrugation required, either by powerful presses when several sheets are corrugated at a time or in rotary corrugated rollers usually doing one sheet at a time. In either case the process is rapid and a large tonnage is obtained. The corrugated sheets are then weighed up, bundled or packed for shipment; or they are put into store in their various sizes and gauges.

Laying Corrugated Sheets.—For roofs the sheets should have end laps of not less than 6in. The usual side lap for ordinary purposes is half a corrugation, that is to say, the last corrugation in each sheet overlaps. This is known as "single side lap." For special purposes such as stores, warehouses and dwelling-houses, the last two corrugations in each sheet should be overlapped, otherwise termed "double side laps." Sheets for sides of buildings can be laid with 3 or 4in. end laps, and half corrugation or single side laps.

Bolts, nails or screws should always be placed in the top corrugation. Wood screws or nails should be placed 6in. apart. Bolts for fixing sheets together should be about 15in. apart along the side corrugation. Hook bolts for iron framed buildings should be about 12in. apart. All screws and sheet bolts should have at least one iron or lead washer under the head; one of each is recommended. Hook bolts should have curved washers, either round or diamond shaped. In laying sheets the workman should begin at the bottom row, and work towards the ridge of roof.

Galvanized sheets should be stored very carefully in a dry, well-ventilated place, and any sheets which have become damp or wet in transit should be wiped thoroughly dry before storing. On no account should they be stored in bundles in a damp atmosphere. If sheets must be stored in the open air or under poor conditions, they should be stacked in such a manner as to allow a good air space between them. (*See* also GALVANIZED IRON AND STEEL.) (D. McM.)

CORRUPT PRACTICES is a general term including bribery (*q.v.*), undue influence, etc., but has specific reference to electoral systems (*q.v.*); in England, as defined by the Corrupt and Illegal Practices Prevention Act, 1883, and the Representation of the People Act, 1918, the object of which is to prevent improper interference with the freedom of elections and in certain cases to avoid the election in question.

UNITED STATES

While all of the American States and Territories have, from the time of their creation, had laws against bribery in elections, corrupt practices legislation was not enacted until after England set the example. The States first sought to control nominating conventions, direct primaries and elections. In this they were followed later by Congress.

Colorado and Michigan enacted corrupt practices laws in 1891, and Massachusetts and New York in 1892, the last-named State having defined corrupt practices in 1890. Since that time, all of the States except Illinois, Mississippi, Rhode Island, South Carolina and Tennessee have adopted such laws. These laws define numerous election offences, including bribery, coercion, intimidation and treating, and generally set forth in detail purposes for which money may be legally expended in campaigns by candidates, their agents and political committees. Such expenditures permitted in State, district, county and municipal campaigns ordinarily include those for travelling, telegraph, telephone, postage, messenger service, halls and rooms, payment of speakers and musicians, lists of candidates and sample ballots, pamphlets, newspapers, cards, polling lists, canvassing and challenging, stationery, clerical hire, literature and advertising. In some States the furnishing of conveyances for carrying other than the aged and infirm to the polls is prohibited, and others prohibit salaries for speakers. Candidates and committees are often limited in the amounts of expenditures. Such amounts are restricted to one of three limitations, as the statute may provide; a percentage of the salary of the office involved, a sum proportionate to the number of voters in the area in which the candidacy is made, or an arbitrary amount named. Candidates, agents and committee treasurers are required to file with officers designated by law sworn statements of campaign receipts and expenditures, including amounts, names and addresses and purposes, in all cases after the nominating convention or direct primary or election, and in some at a specified time before the campaign closes. Corporations are prohibited from contributing to campaign funds. As a means of protection to candidates, they may not contribute or be requested to contribute to organizations of a religious, charitable or educational character, unless they have regularly aided such institutions; likewise they may not contribute toward the expenses of entertainments, balls, picnics or other outings. The circulation of untruths concerning candidates is prohibited in many States. The penalty for violation of the statutes may be fine or imprisonment or both or, where the successful candidate has profited from the illegality, invalidation of the nomination or election.

Federal action came in 1907 when Congress prohibited national banks and corporations organized by authority of Congress from contributing to political campaigns, and also prohibited any other corporations from contributing in campaigns where presidential electors and representatives in Congress were chosen and when U.S. senators were chosen by the legislatures. Federal officials were prohibited in 1909 from soliciting campaign funds from any officer, clerk or employé of the Government. The publication of campaign expenditures after the election by political committees with activities in more than two States at elections in which representatives in Congress were chosen was required in 1910. An amendment was adopted in 1911 by which publication of campaign expenditures both before and after the election was required, and candidates for representative and senator in Congress were similarly required to file statements of expenditures, both before and after the nominating agencies and the elections. Such statements were required by a law of 1912 to be under oath and sent by registered mail to officials of Congress. Promises and offers for votes and the withholding of votes on behalf of candidates for both houses of Congress were prohibited in 1918, both as regards direct primaries and elections.

Act of 1925.—In 1925 Congress passed a new Corrupt Practices Act in which no attempt was made to control direct primaries or nominating conventions. It specifically repealed all the previous Federal laws, but provided in general: (1) That the treasurer of every political committee having activities in two or more States must file with the clerk of the House of Representatives between the 1st and 10th days of March, June and September in each year, and also between the 10th and 15th days and on the 5th day next preceding the date on which a general election is to be held at which candidates are to be elected in two or more States, and also on the 1st day of January following, sworn statements showing the names and addresses of contributors of $100 or more, together with amounts and dates, and the total sum of other and all contributions, as well as the names and addresses of persons to whom expenditures of $10 or more are paid, with amounts, dates and purposes, and the total sum of other and all payments. Every person likewise expending money other than through contributions to political committees in two or more States must file similar statements. (2) That every candidate for senator must file with the secretary of the Senate, and every candidate for representative, delegate or resident commissioner must file with the clerk of the House, not less than ten nor more than 15 days before and also within 30 days after the election, itemized sworn statements of all contributions to his campaign and expenditures in his behalf, as well as promises or pledges made by him and in his behalf.

If a State prescribes a maximum amount to be expended by the candidate, this must be observed, unless it is more than the amount fixed by the act, viz., $10,000 by a candidate for the Senate, $2,500 by a candidate for the House, or an amount equal to the amount obtained by multiplying three cents by the total number of votes cast at the last general election for the office the candidate seeks, but in no event exceeding $25,000 for the Senate or $10,000 for the House. The act makes it unlawful to pledge appointment or employment for the purpose of procuring support and for any person to make an expenditure or cause one to be made or offered to any person to vote for or against a candidate or to withhold his vote, and likewise for any person to solicit any such expenditure. Members of or candidates for either house or any other officer or employé of the Government are forbidden to solicit directly or indirectly any political contribution from any such person, officer or employé. It is also made unlawful for any national bank or corporation organized under authority of Congress to make a contribution in connection with any election at which presidential electors or members of either house are chosen.

Each house of Congress is empowered under Article i., s. 4 of the Constitution to judge the elections, returns and qualifications of its own members, and through the reports of their elections committees they have defined corrupt practices, often independent of statutory violations, which in their opinion have been sufficient cause for the invalidation of certain elections. The Senate has established the precedent of considering corrupt practices in direct primaries, even where there has been no charge of statutory violation.

CORRY, a city of Erie county, Pennsylvania, U.S.A., in the northwest part of the state, 25 mi. from Lake Erie, at an elevation of 1,431 ft. It is on federal highway 6, and is served by the Erie and the Pennsylvania railways. Pop. in 1940 was 6,935. It is the centre of a farming and industrial district, producing machine and motor vehicle parts, springs, steel cabinets and oil-drilling engines. Natural gas is used. One mile west is a state fish hatchery, and there are fine trout streams in the neighbourhood.

Corry was settled about 1860, soon after oil was discovered in this region, and was named after Hiram Corry, through whose influence a railroad was built to the town.

Corry was incorporated as a city in 1866.

CORSAIR, the name given by the Mediterranean peoples to the privateers of the Barbary coast who plundered the shipping of Christian nations. (*See* PIRATE AND PIRACY; BARBARY PIRATES.)

CORSELET. Ancient and mediaeval body armour. Originally the term referred to the armour which covered the whole body (from Latin *corpus* and O.Fr. *cors,* body) but later it was restricted to that which covered the body between the neck and the thighs.

The ancient Egyptians and Persians had corselets of linen. In the middle ages the corselet was made of metal, and was distinguishable from the cuirass in that the former had a back-plate as well as a breast-plate.

Corselets were worn by infantry during the 17th century.

CORSICA, an island in the Mediterranean sea, forming a department of France. The island lies between 41° 20′ and 43° N. latitude and between 8° 30′ and 9° 30′ E. longitude. It has a north-south length of 110 mi. and a maximum width of 50 mi. Area 3,367 sq.mi. Pop. (1936) 322,854. Directly N. of Sardinia, from which it is separated by the 7 mi.-wide Strait of Bonifacio, Corsica lies 55 mi. S.W. of Livorno (Leghorn), Italy and 115 mi. E.S.E. of Nice, France.

Corsica is shaped roughly like an oval, on the N.E. side of which a massive, rectangular peninsula points toward the mainland to the N. The framework of the island is formed by two mountain ranges. One extends from N.N.W. to S.S.E. across the island; the other lies to the E. of the first range and juts northward 20 mi. beyond the main body of the island to end in Cape Corse, northernmost point of Corsica. The highest elevation is attained in the western range about 10 mi. inland and at the northern end, where Mt. Cinto rises to 8,881 ft. Several other peaks exceed 7,500 ft. On the western flank, secondary ridges reach out to the sea, ending in precipitously sloped promontories and thus forming a series of gulfs along the western shore. The four most prominent (from N. to S., Porto, Sagone, Ajaccio and Valinco) are deep enough so that the largest vessels can come close inshore. The eastern flank is less broken and descends over steep slopes directly to the sea at the S.E. Between the two main ranges, a zone of relatively low mountain-fringed basins stretches diagonally from the central E. coast to the central N. coast, forming a nearly continuous furrow across the island. Along the central part of the E. coast for 40 mi. the marshy, lagoon-fringed plain of Aleria, varying in width up to 8 mi., forms the most extensive lowland. This plain has been formed by the deposits of the two largest rivers, the Golo in the N. and the Tavignano farther S., and by those of numerous secondary streams which flow down the eastern mountain sides. The upper courses of most of the rivers are flat-floored, high basins just below the mountain crests. From them the streams descend their rapid-filled middle courses through gorges. On the W., they flow to the heads of the gulfs where they have formed small, isolated plains at the sea's edge, each one separated from that at the mouth of the next stream by cliffed promontories.

The climate of Corsica varies with elevation and exposure. Near the coast, summers are hot and dry while winters are very mild and rainy. The average temperature of the warmest month is about 75° F. while that of the coldest month approximates 50° F. Rainfall is somewhat higher on the W. than on the E., and in the mountains than along the coasts. Lower temperatures, especially in winter, occur inland. The peaks are snow-covered for more than half the year. The lower uncultivated slopes are mantled with a thick brush growth, known as *maquis,* which includes such plants as scrub oak, myrtle, broom, honeysuckle, thyme and rosemary. On some of the poorer soils, a thinner cover with scattered grassy plants is common.

The *maquis* gives way to forests of chestnut, oak and beech on the intermediate slopes and in the mountain basins, and to fir still higher. Above the forests, grassy areas extend to the bare surface of the higher mountain peaks.

Population is not evenly spread over the island. It is concentrated in the less marshy lowlands with their fringing slopes and in the mountain basins. Because it is malarial, the plain of Aleria is only sparsely populated. The zone of basins between the main mountain ranges is more densely peopled than most parts of the island.

The ties between the coastal and interior settlements are still weak, for there are few good roads. A motorable road completely encircling the island connects the coastal towns; a narrow-gauge railroad follows a tortuous route across the island from Ajaccio in the S.W. to Bastia in the N.E. with one branch to Île Rousse and Calvi on the N. coast and another to Ghisonaccia on the E. coast. Otherwise, communications are poorly developed; roads are little more than trails.

Agriculture suffers from lack of cultivable land, of labour and of capital. Because of the summer drought and the consequent difficulty of obtaining water for some of the crops, much of the farming is pastoral. Cereal cultivation is neglected despite the suitability of the climate and the fertility of much of the soil.

The culture of the vine, citrons and olives, of vegetables and tobacco, and the rearing of sheep and goats are the main rural industries. To these may be added the rearing of silkworms. The chestnut forests provide both a food for the inhabitants and an item of export.

Most of the inhabitants are proprietors of land. Holdings are scattered to include vineyard or olive grove, cultivable land on one of the plains, and a chestnut woods in the interior. Game and freshwater fish are abundant.

The moufflon, a wild sheep, inhabits the less accessible parts of the mountains.

Industries include the extraction of gallic acid from chestnut bark, the preservation of citrons, the preparation of macaroni and similar foods, and the manufacture of cigars. There are mines of anthracite, antimony and copper; granite, marble and asbestos are quarried; and there are salt marshes and mineral springs.

In general, lack of means of communication as well as of capital is a barrier to commercial activity. The coastal towns, of which Bastia, Ajaccio, Île Rousse, Calvi and Bonifacio are the most important, export early vegetables, fresh and preserved fruits, olive oil, wood, charcoal, tanning bark, gallic acid, mineral waters, game, fish, skins and cheese. The main interior production centres are Corte, Venaco, Vezzani and Sartène. (H. M. KL.)

ARCHAEOLOGY

Although as an archaeological field Corsica is little explored, the excavations of C. J. Forsyth Major, E. Passemard and H. Obermaier have been sufficiently thorough to demonstrate that it is in a high degree improbable that man existed in Corsica before the late Stone Age (neolithic) or even the beginning of the Metal Era. The first civilization that can be recognized has marked Ligurian affinities and was probably derived from across the Gulf of Genoa. It is represented by a meagre outfit of small stone tools (including some of jasper and obsidian), ornaments of stone, shell and bone, and occasional bronze weapons and trinkets. Finds of this nature occur, although rarely, in rock-shelters and caves; thus, near Bonifacio contracted skeletons with a stone slab over the head only (a Ligurian burial-fashion) were accompanied by obsidian scrapers and potsherds. Probably the megalithic burial-places (*stazzone*), rectangular stone cists about 10 ft. in length and roofed by a single slab, belong to this same culture; but although about 15 are known and although stone implements have been picked up near them, their exact chronological position is unknown. These cists are all ruined; one is situated a little to the west of Corte, but the remainder are grouped either in the extreme north, or in the south-west, of the island. A large number (over 40) of menhirs (*stantari*), sometimes grouped in alignments, are also found in the same districts as the cists, and are probably contemporary with the tombs. A "camp" with a massive stone rampart is also recorded at Ficciaggola near Ajaccio; but its date is uncertain.

The sculptured menhirs, of which four or five are known, are of considerable interest. They are distinguished from the French series of statue-menhirs by the fact that the head, chin, and neck, are shaped, though often very roughly. The best known is the Statue d' Apricciani, which has been called Phoenician; but the most interesting is the Statue of Petra-Pinzuta, for this shows a version of the girdle and baldrick common in the French carvings.

The Ligurian civilization was probably long-lived. There is evidence, however, of the altered Iron Age (Hallstatt) fashions in the important Gravona hoard of bronzes, and in the Cagnano cemetery near Luri that probably dates from 700–600 B.C. Moreover, about 560 B.C. the Phocaean Greeks founded a colony at Alalia; but the Greek occupation was not a long one, and after the naval battle in 535 between the Greeks and the allied fleets of Carthage and Etruria, the colony was abandoned. Some red-figure pottery found in the island may date from the Greek settlement; there is also enough Etruscan ware to suggest that after the Greeks left Alalia the Etruscans to a certain extent took their place, though Carthage thenceforward claimed the island until it was ceded to Rome in the early part of the 3rd century B.C. The Roman occupation had doubtless a larger general effect on native life, and a number of Roman buildings are still to be seen, particularly at Aleria.

HISTORY

The earliest inhabitants of Corsica were probably Ligurian, but the Phocaeans of Ionia were the first civilized people to establish settlements. About 560 B.C. they landed on the island and founded the town of Alalia. Their power soon dwindled before that of the Etruscans, who were in their turn driven out by the Carthaginians. The latter were followed by the Romans, who gained a footing in the island at the time of the First Punic War, but did not establish themselves there till the middle of the 2nd century B.C. In the early centuries of the Christian era Corsica formed one of the senatorial provinces of the empire, and was used as a place of banishment for political offenders. One of the most distinguished of those was the younger Seneca, who spent in exile there the eight years ending A.D. 49.

During the break-up of the Roman empire in the West, Corsica was disputed between the Vandals and the Gothic allies of the Roman emperors, until in 469 Gaiseric finally made himself master of the island. For 65 years the Vandals maintained their domination, the Corsican forests supplying the wood for the fleets with which they terrorized the Mediterranean. After the destruction of the Vandal power Corsica became part of the East Roman empire. Thereafter Goths and Lombards in turn ravaged the island, the rule of the Byzantines being effective only in grinding excessive taxes out of the wretched population; to crown all, in 713 the Muslims from the northern coast of Africa made their first descent. Corsica remained nominally attached to the East Roman empire until Charlemagne conquered it. Moorish incursions from Spain soon followed, and in 810 the Moors gained temporary possession. Though expelled they returned again and again, and in 828 the defence of Corsica was entrusted to Boniface II., count of the Tuscan march. He built a fortress in the south of the island which formed the nucleus of the town (Bonifacio) that bears his name. Boniface's war against the Saracens was continued by his son, but the Muslims seem to have remained in possession of part of the island until about 930.

Terra di Comune.—Later the period of feudal anarchy began, a general conflict of petty lords each eager to expand his domain. The counts of Cinarca (to the north-east of Ajaccio), especially aimed at establishing their supremacy over the whole island. To counteract this and similar ambitions, in the 11th century, a sort of national diet was held, and Sambucuccio, lord of Alando, put himself at the head of a movement which resulted in confining the feudal lords to the southern part of the island and in establishing in the rest, henceforth known as the Terra di Comune, a sort of republic composed of autonomous parishes. Each parish or commune nominated a certain number of councillors who, under the name of "fathers of the commune," were charged with the administration of justice under the direction of a *podestà,* who was as it were their president. The podestas of each of the States or enfranchised districts chose a member of the supreme council charged with the making of laws and regulations for the Terra di Comune. This council or magistracy was called the Twelve, from the number of districts taking a share in its nomination. In each district the fathers of the commune elected a magistrate who, under the name of *caporale,* was entrusted with the defense of the interests of the poor and weak. The constitution thus established has never lost its hold on the affections of the people.

Ecclesiastical Jurisdiction.—Meanwhile the south remained under the sway of the counts of Cinarca, while in the north feudal barons maintained their independence in the promontory of Cape Corso. Towards the end of the century the popes laid claim to the island; the Corsican clergy supported the claim, and in 1077 the Corsicans declared themselves subjects of the Holy See in the presence of the apostolic legate Landolfo, bishop of Pisa. Pope Gregory VII. thereupon invested the bishop and his successors with the island and the Pisans took solemn possession, their "grand judges" (*judices*) replacing the papal legates. Corsica, valued by the Pisans as by the Vandals as an inexhaustible storehouse of materials for their fleet, flourished exceedingly under the enlightened rule of the great commercial republic. Causes of dissension, however, remained abundant. The Corsican bishops repented their subjection to the Pisan archbishop; the Genoese intrigued at Rome to obtain a reversal of the papal gift to the rivals with whom they were disputing the supremacy of the seas. In 1138 Innocent II. divided the ecclesiastical jurisdiction of the island between the archbishops of Pisa and Genoa. This gave the Genoese great influence in Corsica, and the contest between the Pisans and Genoese began. It was not, however, till 1195 that the Genoese, by capturing Bonifacio—a nest of pirates preying on the commerce of both republics—actually gained a footing in the country.

Throughout the 13th century the struggle between Pisans and Genoese continued, reproducing in the island the feud of Ghibellines and Guelphs that was desolating Italy. Pope Boniface VIII. added to the complication by investing King James of Aragon with the sovereignty of Corsica and of Sardinia. In 1325 the Aragonese attacked and reduced Sardinia, with the result that the Pisans, their sea-power shattered, were unable to hold their own in Corsica. A fresh period of anarchy followed until, in 1347, a great assembly of *caporali* and barons decided to offer the sovereignty of the island to Genoa. A regular tribute was to be paid to the republic; the Corsicans were to preserve their laws and customs, under the Council of Twelve in the north and a Council of Six in the south; Corsican interests were to be represented at Genoa by an *orator.*

Genoese Domination.—The Genoese domination thus inaugurated began under evil auspices—for the Black Death killed off some two-thirds of the population—and was not destined to

THE CITIES OF CORSICA

1. The harbour of Bastia, largest city and former capital of Corsica. The towers are those of the church of San Giovanni Battista
2. A narrow street in Ajaccio. Buttresses support the buildings on both sides
3. View from the walls of the old fort of Calvi
4. General view of Ajaccio, the capital, and its harbour, which is accessible to the largest ships
5. The water front at Calvi, on the north-west coast

bring peace. The feudal barons of the south and the hereditary *caporali* of the north alike resisted the authority of the Genoese governors; and King Peter of Aragon took advantage of their feuds to reassert his claims. Among the events of a confused and troubled period may be mentioned the founding of Bastia, in 1383, by Leonello Lomellino, a Genoese governor and count of Corsica. This, with other coastal strong places, such as Calvi and Bonifacio, was a bulwark of Genoese power, though it was lost to the Aragonese at times. By 1447 the position was that the Genoese were masters of the strongholds, the lords of Cinarca held the lands in the south, under the nominal suzerainty of Aragon, and Galeazzo da Campo Fregoso, a member of a powerful Genoese family, was supreme in the Terra di Comune.

The Bank of San Giorgio.—An assembly of the chiefs of the Terra di Comune decided to offer the government of the island to the Company or Bank of San Giorgio, a powerful commercial corporation established at Genoa in the 14th century. The bank accepted; the Spaniards were driven from the country; and a government was organized. Further trouble soon broke out, however, with conflicts between rival lords, and it was not till 1511 that the bank could consider itself in secure possession of the island.

If the character of the Corsicans has been distinguished in modern times for a certain wild intractableness and ferocity, the cause lies in their unhappy past, and not least in the character of the rule established by the Bank of San Giorgio. The power which the bank had won by ruthless cruelty, it exercised in the spirit of the narrowest and most short-sighted selfishness. Only a shadow of the native institutions was suffered to survive, and no adequate system of administration was set up in the place of that which had been suppressed. In the absence of justice the blood-feud or *vendetta* grew and took root in Corsica just at the time when, elsewhere in Europe, the progress of civilization was making an end of private war. The agents of the bank, so far from discouraging these internecine quarrels, looked on them as the surest means for preventing a general rising. Concerned, moreover, only with squeezing taxes out of a recalcitrant population, they neglected the defence of the coast, along which the Barbary pirates harried and looted at will; and to all these woes were added, in the 16th century, pestilences and disastrous floods, which tended still further to impoverish and barbarize the country.

In these circumstances King Henry II. of France conceived the project of conquering the island. Three years' confused fighting from 1553 to 1556 ended in the conclusion of a truce which left Corsica—with the exception of Bastia—in the hands of the French, who proceeded to set up a tolerable government. In 1559, however, the island was restored to the Bank of San Giorgio, from which it was at once taken over by the Genoese republic.

Genoese Rule Restored.—Trouble at once began again. The Genoese attempted to levy a tax which the Corsicans refused to pay; and in violation of the terms of the treaty they confiscated the property of Sampiero da Bastelica, the Corsican national hero, who had put himself at the head of the national movement. The suzerainty of the Turk seemed preferable to that of Genoa, and, with letters from the king of France, Sampiero went to Constantinople to ask the aid of a fleet for the purpose of reducing Corsica to the status of an Ottoman province. All his efforts to secure foreign help were, however, vain: he determined to act alone, and in June 1564 landed at Valinco with only 50 followers. His success was at first extraordinary, and he was soon at the head of 8,000 men; but ultimate victory was rendered impossible by the internecine feuds of which the Genoese well knew how to take advantage. For over two years a war was waged in which quarter was given on neither side; but after the assassination of Sampiero in 1567 the spirit of the insurgents was broken, and peace was declared in 1568.

From this time until 1729 Corsica remained under the government of Genoa, in a peace due to lassitude and despair rather than contentment. The settlement of 1568 had reserved a large measure of autonomy to the Corsicans; during the years that followed this was withdrawn piecemeal, until, disarmed and powerless, they were excluded from every office in the Administration. The *vendetta* increased; in the absence of effective protection the sea-board was exposed to the ravages of the Barbary pirates, so that the coastal villages and towns were abandoned and the inhabitants withdrew into the interior, leaving the most fertile part of the country to fall into the condition of a malarious waste. To add to all this, in 1576 the population had been decimated by a pestilence. Emigration *en masse* continued, and an attempt to remedy this by introducing a colony of Greeks in 1688 only added one more element of discord to the luckless island. To the Genoese Corsica continued to be merely an area to be exploited for their profit; they monopolized its trade; they taxed it up to and beyond its capacity; they made the issue of licences to carry firearms a source of revenue, and therefore studiously avoided interfering with the custom of the *vendetta.*

King Theodore of Corsica.—In 1729 the Corsicans, irritated by a new hearth-tax, rose in revolt. As usual, the Genoese were soon confined to a few coast towns; but the intervention of the emperor Charles VI. and the despatch of a large force of German mercenaries turned the tide of war, and the authority of Genoa was temporarily re-established. A fresh outbreak soon took place, but lack of arms and provisions made any decisive success of the insurgents impossible, and when, on March 12, 1736, the German adventurer Baron Theodor von Neuhof arrived with a shipload of muskets and stores and the assurance of further help to come, leaders and people were glad to accept his aid on his own conditions, namely that he should be acknowledged as king of Corsica. The new king's reign was not fated to last long. The *opéra bouffe* nature of his entry on the stage—he was clad in a scarlet caftan, Turkish trousers and a Spanish hat and feather, and girt with a scimitar—did not, indeed, offend the unsophisticated islanders; they were even ready to take seriously his lavish bestowal of titles and his knightly order "della Liberazione"; they appreciated his personal bravery; and the fact that the Genoese Government denounced him as an impostor and set a price on his head only confirmed him in their affection. But it was otherwise when the European help that he had promised failed to arrive, and, the Governments with which he had boasted his influence disclaimed him. In November he left the island, never to return. The Corsicans, weary of the war, opened negotiations with the Genoese; but the refusal of the latter to regard the islanders as other than rebels made a mutual agreement impossible. Finally Genoa decided to seek the aid of France.

Sardinian and British Intervention, 1746.—The object of the French in assisting the Genoese was not the acquisition of the island for themselves so much as to obviate the danger, of which they had long been aware, of its falling into the hands of another Power, notably Great Britain. The Corsicans, on the other hand, though ready enough to come to terms with the French king, refused to acknowledge the sovereignty of Genoa even when backed by the power of France. The French did, however, succeed in restoring order. But this depended on the presence of their troops which were withdrawn in 1740, leaving the Genoese and Corsicans to begin the perennial struggle anew.

The Corsicans made a vigorous onslaught on the Genoese strongholds, helped by the sympathy and active aid of European Powers. In 1746 Count Domenico Rivarola, a Corsican in Sardinian service, succeeded in capturing Bastia and San Fiorenzo with the aid of a British squadron and Sardinian troops. The factious spirit of the Corsicans themselves was, however, their worst enemy. The British commander judged it inexpedient to intervene in the affairs of a country of which the leaders were at loggerheads; Rivarola, left to himself, was unable to hold Bastia—a place of Genoese sympathies—and in spite of the collapse of Genoa itself, now in Austrian hands, the Genoese governor succeeded in maintaining himself in the island. By the time of the signature of the Peace of Aix-la-Chapelle, in 1748, the situation of the island had again changed. Owing to a report that the king of Sardinia was meditating a fresh attempt to conquer the island, a strong French expedition had, at the request of the republic, occupied Calvi, Bonifacio, Ajaccio and Bastia. By the terms of the treaty Corsica was once more assigned to Genoa, but the French garrison remained, pending a settlement between the republic and the islanders. In view of the intractable temper of the two parties no agreement could be reached, and the withdrawal of the French troops was the signal for a fresh rising. The usual faction disputes followed till, in 1755, the Corsican hero Pasquale Paoli was invited to come from Naples and assume the command.

Pasquale Paoli.—The first task of Paoli, elected general in April at an assembly at San Antonio della Casabianca, was to suppress a rival faction. By the spring of 1756 this was done, and the Corsicans were able to turn a united front against the Genoese. At this juncture the French, alarmed by a supposed understanding between Paoli and the British, once more intervened, and occupied Calvi, Ajaccio and San Fiorenzo until 1757. In 1758 Paoli renewed the attack on the Genoese, founding the new port of Isola Rossa as a centre whence the Corsican ships could attack the trading vessels of Genoa. The republic, indeed, was now too weak to attempt seriously to reassert its sway over the island, which, with the exception of the coast towns, Paoli ruled with absolute authority and with conspicuous wisdom. In the intervals of fighting he was occupied in reducing Corsican anarchy into some sort of civilized order. The *vendetta* was put down, partly by religious influence, partly with a stern hand; the surviving oppressive rights of the feudal lords were abolished; and the traditional institutions of the Terra di Comune were made the basis of a democratic constitution for the whole island.

All now depended on the attitude of France to which Power both Paoli and the republic made overtures. In 1764 a French expedition arrived, and garrisoned three of the Genoese fortresses. French and Corsicans remained on amicable terms, and the inhabitants of the nominally Genoese towns actually sent representatives to the national *consulta* or parliament. In 1767 the Corsicans captured the Genoese island of Capraja, and occupied Ajaccio and other places evacuated by the French as a protest against the asylum given to the Jesuits exiled from France. Genoa now recognized that she had been worsted in the long contest, and on May 15, 1768, signed a treaty selling the sovereignty of the island to France.

The Corsicans, intent on independence, were now faced with a more formidable enemy than the decrepit republic of Genoa. A section of the people, indeed, were in favour of submission; but Paoli himself declared for resistance; and among those who supported him at the *consulta* summoned to discuss the question was his secretary Carlo Buonaparte, father of Napoleon Bonaparte, the future emperor of the French. In the absence of the hoped-for help from Great Britain the issue of the resultant war could not be doubtful; and by the summer of 1769 the French were masters of the island. On June 16 Paoli and his brother with some 400 of their followers embarked on a British ship for Leghorn. On Sept. 15, 1770, a general assembly of the Corsicans was called, the deputies swearing allegiance to King Louis XV.

Corsica and the Revolution of 1789.—For 20 years Corsica, while preserving many of its old institutions, remained a dependency of the French Crown. Then came the Revolution, and the island was incorporated in France as a separate department. Paoli, recalled from exile by the National Assembly on the motion of Mirabeau, after a visit to Paris, where he was acclaimed as "the hero and martyr of liberty," returned in 1790 to Corsica, where he was received with immense enthusiasm as 'father of the country." With the new order in the island, however, he was in little sympathy. In the towns branches of the Jacobin Club had been established, and these tended to usurp the functions of the regular organs of government and to introduce a new element of discord into a country which it had been Paoli's life's work to unify. Suspicions of his loyalty to revolutionary principles had been spread at Paris so early as 1791; yet in 1792 he was appointed lieutenant-general of the forces and governor (*capo comandante*) of the island. With the men and methods of the Terror, however, he was wholly out of sympathy. Called, in 1793, to the bar of the Convention, he replied by summoning the representatives of the communes to meet in diet at Corte on May 27, when he stated that he was rebelling, not against France, but against the dominant faction of whose actions the majority of Frenchmen disapproved. In consequence Paoli and his sympathizers were declared by the Convention *hors la loi* (June 26).

Paoli had already made up his mind to raise the standard of revolt against France. But though the *consulta* at Corte elected him president, Corsican opinion was by no means united. Napoleon Bonaparte indignantly rejected the idea of a breach with France, and the Bonapartes were henceforth ranked with his enemies. Paoli now appealed for assistance to the British Government, which despatched a considerable force. By the summer of 1794, after hard fighting, the island was reduced, and in June the Corsican assembly formally offered the sovereignty to King George III. The British occupation lasted two years, the island being administered by Sir Gilbert Elliot. Paoli, whose presence was considered inexpedient, was invited to return to England, where he remained till his death. In 1796 Bonaparte, after his victorious Italian campaign, sent an expedition against Corsica. The British, weary of a somewhat thankless task, made no great resistance, and in October the island was once more in French hands. It was again occupied by Great Britain for a short time in 1814, but in the settlement of 1815 was restored to the French Crown. Its history henceforth was part of that of France.

Corsica remained under the jurisdiction of Vichy France after the German occupation of France, until 1943, when troops of Gen. Charles de Gaulle, aided by a powerful revolt of native resistance elements, overwhelmed the axis garrison and established Allied control of the island.

CORSICANA, a city of Texas, U.S.A., the county seat of Navarro county, 55 mi. S. by E. of Dallas. It is on federal highways 75 and 287 and state highways 31 and 22, and is served by the Saint Louis Southwestern, the Southern Pacific, the Fort Worth and Denver and the Cotton Belt railways. Pop. (1940) 15,232. There are many "stripper" oil wells in the vicinity producing about $1,000,000 annual income; cotton production ranges about 60,000 bales annually. The county is noted for its Hereford beef cattle breeders. Small grains, fruit, sheep, poultry and dairy cattle are other sources of income. A cotton mill, an oil well machinery company, a chili manufacturing plant and two machine shops are among the city's largest industries. The Corsicana Fair and Rodeo is an annual exhibition. A state orphans' home and an Oddfellows' orphans' home are there. Corsicana was settled in 1848, incorporated as a village in 1850 and chartered as a city in 1871. The name was given by J. Antonio Navarro, pioneer statesman, to honour his father, who came from the isle of Corsica.

CORSINI, a Florentine princely family, of which the founder is said to be Neri Corsini, who flourished about the year 1170. The emperor Charles IV created the head of the house a count palatine in 1371; in 1730 Lorenzo Corsini was elected pope as Clement XII, and conferred the rank of Roman princes and the duchy of Casigliano on his family, and in 1732 they were created grandees of Spain.

CORSSEN, WILHELM PAUL (1820–1875), German philologist, was born at Bremen on Jan. 20, 1820, and studied at Berlin under Böckh and Lachmann. From 1846 to 1866 he lectured in the royal academy at Pforta (commonly called Schulpforta). In 1854 his work on the pronunciation and accent of Latin, *Über Aussprache, Vocalismus, und Betonung der lateinischen Sprache* (1858–59) gained the prize offered by the Royal Prussian Academy of Sciences. He died on June 18, 1875.

CORT, CORNELIS (1536–1578), Dutch engraver, was born at Horn in Holland and studied engraving under Hieronymus Cockx of Antwerp. About 1565 he went to Venice, where he executed for Titian the well-known copperplates of St. Jerome in the Desert, the Magdalen, Prometheus, Diana and Actaeon, and Diana and Calisto. From Venice he proceeded to Bologna and Rome, where he produced engravings from all the great masters of the time. At Rome he founded the school in which, as Bartsch tells us, the simple line of Marcantonio was modified by a brilliant touch of the burin, afterwards imitated and perfected by Agostino Carracci in Italy and Nicolas de Bruyn in the Netherlands. Before visiting Italy, Cort had been content to copy Michael Coxcie, F. Floris, Heemskerk, G. Mostaert, Bartholomäus Spranger, and Stradan. In Italy he gave circulation to the works of Raphael, Titian, Polidoro da Caravaggio, Baroccio, Giulio Clovio, Muziano, and the Zuccari. Cort is said to have engraved upwards of 151 plates. In Italy he was known as Cornelio Fiammingo.

CORTE, capital of an arrondissement of central Corsica, 52 mi. N.E. of Ajaccio by rail. Pop. (1936) 5,674. The upper town is situated on a precipitous rock on the summit of which stands a citadel built by Vincentello d'Istria (*see* CORSICA). Other interesting buildings are the house in which Pasquale Paoli lived while Corte was the seat of his government (1755 to 1769), and the house of another patriot, Giampietro Gaffori, whose wife defended it from the Genoese in 1750. The town has a subprefecture and a tribunal of first instance. There are marble quarries in the vicinity, and the town has trade in wine. In the 18th century Corte was the centre of the resistance to the Genoese, and the seat of a university erected by Paoli.

CORTE-REAL, JERONYMO (1533–1588), Portuguese epic poet, came of a noble Portuguese stock. Of the same family were Gaspar Corte-Real, who in 1500 and 1501 sailed to Labrador and the Arctic seas, and his brothers Miguel and Vasco. Their voyages opened the way for important Portuguese fisheries on the Newfoundland coast (*see* Henry Harisse, *Les Corte-Real et leurs voyages au Nouveau-Monde,* and *Gaspar Corte-Real; la date exacte de sa dernière expedition au Nouveau-Monde,* 1883). In his youth Jeronymo fought in Africa and Asia, according to the custom of noblemen in that age. In 1578 he volunteered for the fatal expedition to Africa, but King Sebastian dispensed him from the journey (it is said) on account of his age, and in 1586 we find him acting as *provedor* of the *Misericordia* of Evora. Corte-Real was painter as well as soldier and poet, and one of his pictures is still preserved in the church of S. Antão at Evora. His *O Segundo cerco de Diu* (pr. 1574), an epic in 21 cantos, deals with the historic siege of that Indian island-fortress of the Portuguese. *Austriada* (pr. 1578), an epic in 15 cantos celebrating the victory of Don John of Austria over the Turks at Lepanto, was written in Spanish and dedicated to Philip II. of Spain. *Naufragio de Sepulveda,* an epic in 17 cantos, was published posthumously and was translated into Spanish and French. Except the *Naufragio de Sepulveda,* which is highly considered in Portugal, Corte-Real's poetry has hardly stood the test of time.

See *Subsidios para a biographia do poeta Jeronymo Corte-Real* (Evora, 1899); also Ernesto do Canto's Memoir on the family in Nos. 23 and 24 of the *Archivo dos Azores,* and F. M. Sousa Viterbo's *Trabalhos nauticos dos Portuguezes,* ii. 153 *et seq.* (1900).

CORTES, HERNAN or **HERNANDO** (1485–1547), Spanish soldier, conqueror of Mexico, born at Medellin, Estremadura, in 1485. He studied law at the University of Salamanca, but returned home in 1501 resolved to seek a life of adventure. Accidents frustrated his first attempts to see foreign service, but in 1504 he went to San Domingo. There Ovando, who was in command, kept him in his service till 1511, when he accompanied Diego Velasquez in his expedition to Cuba, where he was alcalde of Santiago. Juan Grijalva, who had just discovered Mexico, had not attempted to effect a settlement, so Velasquez entrusted Cortes with the conquest of the country. On Nov. 18, 1518, Cortes set out with 11 vessels, 600 foot, 16 horse and some artillery. In spite of the almost instant cancellation of his commission by Velasquez, he went on, and on March 4, 1519, landed in Mexico. He took possession at once of the town of Tabasco. His artillery, his ships and his horses, all new to the natives, filled them with awe; they regarded the Spaniards as gods, and sent them ambassadors with presents. From them Cortes learnt something of the empire he was to conquer, and its ruler Montezuma. He founded Vera Cruz, had himself elected captain-general of the new colony, and burnt his ships behind him. He then set out for the interior and started operations by allying himself with several caciques hostile to Montezuma. The republic of Tlaxcala, which was at war with Montezuma, resisted him. He defeated its army, dictated a moderate peace, and enlisted it as an ally. With 600 natives as well as his small force of Spaniards he reached the capital, the city of Mexico. He was believed to be a descendant of the sun, and Montezuma received him with great honour. Bernal Díaz, who accompanied Cortes, gives a vivid picture of the wealth of the city, the horrors of its human sacrifices, and the magnificence of the emperor. Cortes had just fortified himself in one of the palaces when news reached him that the emperor had sent one of his generals secret orders to attack Vera Cruz. The head of one of the Spaniards was sent to the capital. This shattered the legend of their immortality and instantly made Cortes' position critical. He accordingly acted boldly and at once. Going with his officers to the palace he seized Montezuma and extorted from him the surrender of the force which had attacked Vera Cruz. These men he had burned alive before the palace gates. Meanwhile Cortes loaded Montezuma with irons and forced him to acknowledge the sovereignty of Charles V. and ransom himself with an enormous sum in gold and jewels. At this point Cortes heard of the arrival of a Spanish force under Narvaez sent by Velasquez to deprive him of his command. Leaving 200 men at Mexico city, he marched against Narvaez, defeated him and enlisted his army in his own forces. On his return he found that the Mexicans had revolted. Montezuma, attempting to address the Mexicans, was killed, and under a new emperor they attacked Cortes' headquarters and drove him out of the city with the loss of his whole rear guard. After six days of retreat, during which the Spaniards suffered severely, the Mexicans offered battle in the plain of Otumba. The battle was fought on July 7, 1520 and resulted in a decisive victory for Cortes. He recruited an auxiliary army of natives from Tlaxcala, subdued the neighbouring provinces, and recaptured the city of Mexico after a stubborn defence on Aug. 13, 1521.

The fame that Cortes was achieving in Spain as a result of these conquests overshadowed the irregularity of his methods; Charles V., in deference to public opinion, overruled Velasquez and appointed Cortes governor of Mexico and made him marquis of Oaxaca (1529). But the methods he followed in consolidating his conquests reduced the natives to despair and revolt. The revolt was crushed and the leaders publicly executed with great cruelty. Meanwhile, the court of Madrid, fearing his ambition and popularity, was doing its best to thwart his efforts; his goods were seized by order of the Council of the Indies and his retainers imprisoned. Cortes returned to Spain to appeal to the emperor. He was received honourably, and returned to Mexico with new honours and diminished authority, having a viceroy put in charge of the civil administration. This division of powers frustrated his later enterprises. In 1536 he discovered the peninsula of Lower California and surveyed part of the gulf between it and Mexico.

Tired of struggling with adversaries that the court encouraged, he returned to Europe again, to be received coldly. He attended the emperor assiduously, and served as volunteer in his disastrous expedition against the pirates of Algiers in 1541, which Cortes' advice, if followed, might have converted into a success. After this he was completely neglected. There is a story that he forced his way through the crowd round the emperor's carriage and mounted the doorstep. Charles asked who he was. "I am a man," Cortes replied, "who has given you more provinces than your ancestors left you cities." This is not the way to ingratiate oneself with princes. Eventually he retired from court and died near Seville on Dec. 2, 1547.

The only writings of Cortes are five letters on the subject of his conquests, which he addressed to Charles V. The best edition of them is that of Don Francisco Antonio Lorenzana, archbishop of Mexico, entitled *Historia de Nueva-España escrita por su esclarecido conquistador, Hernan Cortes, aumentada con otros documientos y notas* (Mexico, 1770, 4to), a work the noble simplicity of which attests the truth of the recital it contains. An English translation of the letters, edited by Francis A. MacNutt, was published in 1908. The conquests of Cortes have been described by Antonio de Solis in his *Historia de la conquista de Mejico* (1684), and by Bernardo Diaz del Castillo in his work under the same title (1632); trans. by Prof. Maudslay, "The Broadway Travellers," (1928). *See* also Sir Arthur Helps's *Life of Hernando Cortes* (1871); F. A. MacNutt's *Fernando Cortes*, "Heroes of the Nations" Series (1909); H. D. Sedgwick, *Cortes the Conqueror* (1927); and bibliography to MEXICO.

CORTES, a Spanish term literally signifying the "courts," and applied to the states, or assembly of the states, of the kingdom. (*See* SPAIN and PORTUGAL.)

CORTEX (derived from the Latin, meaning *bark*). In botany, the bark of an exogenous plant, as the bark of a tree. In physiology, the outer layers of tissue, or outside section of a part of the brain, or of some internal organ, or gland. The cerebral cortex is the corresponding portion of the cerebellum. The grey matter of both brain and spinal cord is chiefly characterized by synaptic connections between different neurones, and systems of neurones. Hence the cerebral cortex has been generally regarded as the principal "switchboard," or central correlation area for nervous impulses. In acerebrate human monsters (children born without cerebral hemispheres), the cortex of the suprarenal glands has also been found missing (W. Timme, *Lectures on Endocrinology*). The suprarenal cortex in man is about nine times the size of the suprarenal medulla; while in lower animals the suprarenal cortex is notably smaller in proportion to the medulla than in man. The cerebral cortex, correspondingly, in man, is much more highly developed than in the lower animals.

CORTI, LODOVICO, COUNT (1823–1888), Italian diplomatist, was born at Gambarano on Oct. 28, 1823. Early involved with Benedetto Cairoli in anti-Austrian conspiracies, he was exiled to Turin, where he entered the Piedmontese foreign office. After serving in the campaign of 1848, he was in 1850 appointed secretary of legation in London, whence he was promoted minister to various capitals, and in 1875 ambassador to Constantinople. Called by Cairoli to the direction of foreign affairs in 1878, he took part in the Congress of Berlin, but declined Lord Derby's offer for an Anglo-Italian agreement in defence of common interests. At Berlin he sustained the cause of Greek independence, but in all other respects remained isolated, and excited the wrath of his countrymen by returning to Italy with "clean hands." In 1881 he was again sent to Constantinople by Cairoli, where he presided over the futile conference of ambassadors upon the Egyptian question. In 1886 he was transferred to the London embassy, but was recalled by Crispi in the following year through a misunderstanding. He died in Rome on April 9, 1888.

CORTLAND, a city of New York, U.S.A., midway between Syracuse and Binghamton, on the Tioughnioga river, at the meeting-point of seven valleys; the county seat of Cortland county. It is on Federal highway 11, and is served by the Lackawanna and the Lehigh Valley railways. The population in 1930 was 15,043; and in 1940 was 15,881 by the federal census. Dairying and the breeding of Holstein cattle are the principal industries of the surrounding country.

The city has important manufactures, notably wire cloth and wire netting. A State normal and training school (established 1869) is located here. The site of Cortland was part of the Phelps and Gorham purchase. It was settled in 1792. The city was chartered in 1900.

CORTONA, a town and episcopal see of Italy, in the province of Arezzo, 18m. S. by E. from the town of Arezzo by rail. Pop. (1936) 3,736 (town), 31,518 (commune). The highest point of Cortona, a mediaeval castle (Fortezza), is 2,130ft. above sea-level on a hill commanding a splendid view. It is surrounded by fairly well-preserved Etruscan walls constructed of parallelepipedal blocks of limestone, finely jointed and arranged in regular courses which vary in size in different parts. Near the north-west angle some of the blocks are 7 to 8½ft. long and 2½ft. high. Within the town are various Etruscan walls in good masonry, of uncertain nature, under modern buildings and a concrete ruin called the "Bagni di Bacco." A reservoir about 60ft. square is the only building of Roman date now visible. The museum of the Accademia Etrusca (a learned body founded by Ridolfino Venuti in 1726), in the Palazzo Pretorio, contains a magnificent bronze lamp with 16 lights, of remarkably fine workmanship. The cathedral, originally a Tuscan Romanesque building of the 11th–12th centuries, is now a fine Renaissance basilica restored in the 18th century, containing some paintings by Luca Signorelli, a native of the place. Opposite is the baptistery, with three fine pictures by Fra Angelico. Other works by Signorelli are to be seen elsewhere in the town, especially in S. Domenico. Pietro Berettini (Pietro da Cortona, 1596–1669) is hardly represented here at all. Below the town is the massive tomb chamber (originally subterranean, but now lacking the mound of the earth which covered it) known as the Grotta di Pitagora (grotto of Pythagoras). To the east is the church of S. Maria del Calcinaio, by Francesco di Giorgio Martini of Siena, with fine stained glass windows. Cortona appears in history as one of the strongholds of the Etruscan power; but in Roman times it is hardly mentioned.

See G. Mancini, *Cortona* (Bergamo, Arti Grafiche, 1909), well illustrated; A. Neppi Modona, *Cortona* (Florence, 1925).

CORT VAN DER LINDEN, PIETER WILLEM ADRIAN (1846–1935), Dutch politician, until 1897 followed an academic career, mainly interesting himself in economics. In that year he became minister of justice and he retained this post until 1901, when he was appointed a member of the State Council. In 1913, after the Social Democrats had refused to co-operate with the Liberal parties, thus creating a parliamentary deadlock, Dr. Cort van der Linden formed an extra-parliamentary cabinet, which during the World War assumed the character of a national cabinet. In virtue of this he succeeded in bringing about a revision of the Constitution, which put an end to both the electoral "war" and the schools "war," which for half a century had dominated politics in the Netherlands. Bills were passed providing for proportional representation, universal manhood suffrage, which gave a prospect of extending the franchise to women. A bill was also passed by which denominational schools were placed upon an equal financial basis with the schools provided by public authority. After his cabinet had resigned in 1918 Dr. Cort van der Linden was again appointed a member of the State Council.

CORUMBÁ, a town and river port in the state of Mato Grosso, Brazil, on the right bank of the Paraguay river near the Bolivian frontier. The population of the *município* (1940) was 30,051, of whom perhaps not more than one-half live in the town. Corumbá is the leading commercial city in Mato Grosso. The surrounding country is devoted principally to cattle raising, and the chief exports of Corumbá are hides and xarque (jerked beef). Steamers run to Pôrto Esperança on the Paraguay river, where connection is made with the North-Western railway leading to São Paulo, and the town is served regularly by transcontinental planes.

CORUNDUM, a mineral of the composition Al_2O_3, remarkable for its hardness and forming in its finer varieties a valuable gem-stone (Germ. *Korund*, Fr. *Corindon*). The name is believed to be derived from *Kurund* (Hindi) or *Kurundam* (Tamil), the native name of the stone in India whence specimens were first sent to England. The transparent coloured varieties are known as ruby and sapphire, whilst the impure massive forms are known as emery (*q.v.*). Corundum crystallizes in the rhombohedral system and shows some variety of habit, the commonest being acute hexagonal bipyramids, sometimes in barrel-shaped forms, or tabular owing to the predominance of the basal plane. Corundum has no true cleavage but a parting parallel to the base and the rhombohedron, the latter a plane of lamellar twinning, sometimes secondarily developed due to pressure.

Next to diamond, corundum is the hardest known mineral (9 on Mohs' scale), this property being sufficient to distinguish it from all other minerals. The pure mineral is colourless, small quantities of impurities (iron, chromium, titanium) being responsible for the wide range of colours observed in natural crystals. Alteration products such as gibbsite, diaspore, margarite and bauxite often accompany corundum. It is used largely for watch jewels, bearings in electrical apparatus and, as emery, extensively as a polishing substance. Corundums fit for gem-stones come principally from Ceylon, Burma, Siam and Montana; they are largely recovered from gravels and residual surface deposits. Crystalline Al_2O_3 is dimorphous, a second hexagonal form βAl_2O_3 occurring as a phase in investigations on the system $MgO-Al_2O_3$. βAl_2O_3 is not convertible into corundum (αAl_2O_3).

Alumina melts have a great power of crystallization, rendering it difficult to preserve glasses of this composition. The melting point of the artificial corundum is 2,050° C. As substitutes for natural gems, synthetic rubies and sapphires are manufactured, many of which are distinguishable only by the expert.

Corundum is of widespread distribution and occurs both in igneous and metamorphic rocks.

CORUNDUM, ARTIFICIAL. Artificial corundum (H. 9+; G. 3·95) is known by various trade-names such as alundum, aloxite, lionite, borolon and oxaluma. Probably the most important advance in the abrasive field was the development of artificial corundum or manufactured aluminous abrasive, which is essentially crystalline alumina (Al_2O_3). After small scale experiments by Henri Moissan and others, the early development of artificial corundum can be followed through patents granted to the following inventors: Ivan Werlein of France in 1894; Franz Hasslacher of Germany in 1896; C. B. Jacobs of New Jersey, U.S.A., in 1900; and C. M. Hall of Niagara Falls, N.Y., U.S.A., in 1901.

Artificial corundum is made by melting calcined bauxite (*q.v.*), with coke and iron borings, in an electric arc furnace at a temperature of about 2,200° C. Hanging carbon or graphite electrodes are used to carry the electric current into the melt. The power used is about 500kw. at 100 volts, alternating current. Most of the furnaces are operated on a periodic basis and consist of a removable conical steel shell on a flat carbon lined car.

The shell is cooled and protected from the molten material by a spray of water which runs down the outside. The function of the coke in the mixture is to reduce or deoxidize the major portion of the impurities to the elementary form. The carbon is eliminated as carbon monoxide (CO) which burns to carbon dioxide (CO_2) as it leaves the furnace. The reduced metals unite with the added iron to form a magnetic alloy called ferrosilicon, which settles to the bottom of the melt, leaving the alumina in a purified condition. By close control of the mixture and furnace operation the composition of the alumina product is maintained as follows: alumina 95%, silica 1·5%, iron oxide 0·5% and titania 3%. In about 24 hours, when the furnace is full of melted material, the electrodes are withdrawn. A few hours later the shell can be lifted off and the 5-ton ingot set aside to cool. As the alumina solidifies it crystallizes into a solid structure of crystals of irregular shape. After cooling the material for at least a full week the ingot is broken up and cleaned. Some abrasive manufacturers make for special uses an artificial corundum containing over 99% alumina by melting chemically purified alumina.

The lump abrasive is passed through jaw crushers, then through a series of rolls or some other type of crushing equipment until it has been reduced to the desired grain sizes. The grains are run over powerful electromagnetic machines which remove any of the metallic alloy left in the abrasive, and are then usually roasted in a rotary cylinder of the cement kiln type in order to prepare better the grains for the various types of bonding. The product is then washed, dried and graded into upwards of 24 grain sizes ranging from 8 to 240 meshes per inch and even finer. This sifting operation is done on a series of flat screens of silk or wire of the desired mesh agitated by eccentrics. The wire screens are ordinarily used for the coarser sizes only.

Artificial corundum is commonly reddish brown and translucent, but the special pure varieties are white to pink. In addition to being very hard it is the strongest abrasive with the single exception of steel shot. It fractures in such a way that new and sharp cutting points are formed when the original points are dulled through use. These properties adapt it particularly to the working of materials of high tensile strength, such as the various steels, which is the largest and most important use for abrasives. The grains are used extensively in all kinds of grinding and polishing wheels, coated paper, cloth and disks, and to a less extent as loose grains. The specific applications of these are far too numerous to catalogue completely, but include automatic and hand-grinding operations such as snagging steel castings, surface grinding, cylindrical grinding, internal grinding and honing, tool and cutter-grinding, polishing articles such as ploughs and cutlery, and in preparing automobile bodies for painting. The loose grains are used to polish plate-glass.

See F. B. Jacobs, *The Abrasive Handbook* (1928). (R. MacD.)

CORUNNA (*La Coruña*), a province in northwest Spain, forming part of Galicia, and bounded on the east by Lugo, south by Pontevedra, west and north by the Atlantic ocean. Pop. (1940) 883,090; area, 3,051 sq.mi. The coast of Corunna is broken by a series of promontories separated by bays and estuaries which often extend for many miles inland. These afford sites for sheltered ports but the coast, though well lighted, is dangerous owing to frequent gales and fogs in winter and spring. The chief headlands are Cape Ortegal and Cape de Vares, the most northerly points in Spain, and Capes Finisterre and Toriñana in the west. The principal bays are those of Santa Marta, Ferrol and Corunna, on the north; Corcubión, Muros y Noya and Arosa, on the west. The interior of the province, though mountainous, is not high and the climate is singularly mild and equable, but the rainfall is very heavy. The slopes are covered with woods and pastures and in the valleys beans, onions, potatoes and fruit are grown for export. The broken nature of the country discourages cereal growing, but in limited areas heavy crops of maize, wheat and rye are obtained.

The wines of Corunna are heady and of inferior flavour. Cattle-breeding is important, though the export of livestock, once considerable, declined, owing to foreign competition. Along the coast there are valuable fisheries of sardines, lobsters, hake and other fish. A little tin, tungsten, iron and copper are mined. The chief exports ordinarily are farm produce and fish; the imports, coal and manufactured goods from England, petroleum from the United States, salt fish from Norway and Newfoundland, and timber, hides, colonial produce and salt. Means of communication are very inadequate. A main railway line links Corunna with Lugo and Madrid, with a branch to El Ferrol in the north and a line running south through Santiago to Vigo and Oporto. Elsewhere inhabitants are dependent on indifferent roads. Corunna was occupied by insurgent troops early in the Civil War (1936–39).

The principal ports are Corunna (pop. 1940, 92,189) and El Ferrol (40,664); the chief inland towns, Santiago de Compostela (30,127), Ortigueira (1,479), Ribeira (mun., 18,760), Carballo (1,584). These are described in separate articles. Muros (2,045), Noya (3,149), Serantes are minor trading and fishing ports and Corcubión (1,073) is a small coaling station. (For a description of the peasantry, who are distinguished in many respects from those inhabiting other parts of Spain, *see* Galicia.)

CORUNNA (Span. *La Coruña;* Fr. *La Corogne;* Eng. formerly often *The Groyne*), capital of the Spanish province described above; on Corunna bay, an inlet of the Atlantic ocean and connected by rail with Madrid and Oporto. Pop. (1940) 92,189 (mun., 104,220). It consists of an upper and a lower town, built respectively on the S.E. slope of a small peninsula, and on the low isthmus connecting the peninsula with the mainland. The old, closely-built upper town overlooks the harbour formed by the bay east of the peninsula and was once strongly fortified. With the growth of the port, however, it became too restricted and the population expanded over the former fishing settlement of La Pescadería, now a modern, fairly well built town on the shores of the harbour. Corunna has an electric tram service, two hospitals, theatres, a school of navigation, a school of agriculture, an arsenal and barracks. A characteristic feature of the houses, especially those overlooking the harbour, is their balconies enclosed with glazed windows for protection against the wind. In the old quarter there are convents and the churches of Santiago and the Colegiata, dating respectively from the 12th and 13th centuries. The walls have largely been demolished and the harbour forts dismantled as useless in modern times, being overlooked by a hill behind the town. That on San Anton island is now a prison and San Diego on the mainland has been converted into a factory. The so-called tower of Hercules on the north is now a lighthouse. Corunna, owing to its position near a great sea route between north-west Europe and South and Central America, the Mediterranean and beyond, is one of the chief ports of north Spain. The sheltered harbour, facing north-east and protected by a breakwater, has an easy entrance and is deep and safe, accommodating vessels of 22ft. draught, with an inner dock for smaller ships. Many foreign merchant and mail steamers call here and it is the chief Spanish port for passengers for Cuba and South America. Corunna is a great fishing centre for sardines, herrings, haddock and conger-eels with an important salting and canning industry. It exports agricultural products, especially onions and potatoes, and fish, and imports coal, colonial produce, salt and manufactured goods. It has a state tobacco factory and yards for building sailing vessels and steam trawlers.

Corunna, possibly at first a Phoenician settlement, is usually identified with the ancient *Ardobrica.* Its present name is probably derived from that of *Caronium* by which it was known in the Middle Ages, rather than from the Latin Columna. The harbour has always been of considerable importance, but it is only in comparatively modern times that it has made a figure in history. In 1588 it gave shelter to the Armada; in 1598 it was burned by the British under Drake and Norris. Nationalist troops captured it early in the Civil War of 1936–39. (X.)

CAMPAIGN OF 1808

For the objects and early course of Sir John Moore's campaign in 1808, *see* PENINSULAR WAR. Having, by his bold thrust at the French line of communication, through Burgoe, drawn Napoleon from his intended advance against Lisbon and Andalusia, Moore with his small force of 25,000 men began, on Dec. 25, to fall back upon his new base at Corunna. Napoleon, with 70,000 followed hard upon his trail but his advanced cavalry reached the vital crossings of the Esla only in time to see the bridges destroyed by the British rear-guard. Moore had 36 hours' start; it should have been enough, but at Astorga he found the town full of demoralized Spaniards, so that the billeting of the troops and the issue of supplies were thrown into confusion; infuriated by the irritation of countermarching and the disappointment of retreat, his men broke through the thin shell of their discipline, burst open the wine stores, and within a short time a large part of the army was in no condition to move. With great difficulty the bulk of the drunkards were collected and driven forward by the rearguard, Paget's Reserve Division, who throughout the retreat combined that duty with the less irksome one of repelling the enemy. It must be remembered that the majority of British regiments at this period were not bound by the "tradition of discipline" that obtains to-day. The officers were often ill-chosen and badly trained and, worst of all, the system of supply and transport was hopelessly inadequate. At Astorga, on Jan. 1, 1809, Napoleon, believing Moore's army to be beyond his grasp, handed over the command to Soult and returned to Paris. Day by day the two armies, pursuers and pursued, plodded doggedly westward through the bitter winter weather, the British losing hundred of prisoners by sickness and straggling every day. At Lugo Moore made a stand, hoping to revive the *moral* of his troops by action. Instantly the spirits of his men responded to the prospect, but Soult would not attack and the retreat began again, discipline breaking down more completely than before. Supplies now were terribly scarce; boots were worn out, so that men and even officers marched barefoot over the rough mountain roads. The cold became even more intense, so that many died from this cause alone. Straggling increased daily and bands of soldiers wandered into the mountains, plundering the villages for food and loot. Amidst all this demoralization a few units maintained their discipline throughout: the guards, alone among the main body; the Light Brigades of Craufurd and Alten, which acted as left flank guard on the Orense road, and Paget's Reserve Division, which had successfully held off the pursuit in a series of fierce rearguard actions. At last, on Jan. 11, Moore reached Corunna, only to find that the fleet had not arrived. After embarking his sick in such ships as were in the harbour, the British commander turned his attention to the battle that was now inevitable. Two miles south of the harbour and astride the road by which Soult must approach lay a ridge known as the Monte Mero; Moore chose this as his main position. Its left was protected by the estuary of the river Mero, but its right was open and could easily be turned. On this ridge Moore stationed the divisions of Baird and Hope, with Paget echeloned to their right rear in the valley of the Monelos at Oza and Frazer farther back still on the heights of Santa Margarita above the town; about 15,000 men in all. On Jan. 14 Soult was in touch with this position and on the 16th he attacked it, employing 16,000 men and 20 guns. He concentrated his attack on Monte Mero, Delaborde's division on the right being directed along the main road, Merle's in the centre against the summit of the hill, and Mermet on the left against the village of Elvina on its western slopes. La Houssaye's cavalry protected Mermet's left flank and a second cavalry division under Longe was in reserve. Baird, on the right of the Monte Mero position, had the brigades of Bentinck and Manning up in the front line, with the Guards Brigade in reserve; Hope, on the left, had Leith and Hill in front, and Craufurd in reserve. Mermet's advance soon drove the British skirmishers out of Elvina and, overlapping Bentinck's right, threatened to turn his flank. To meet this danger Moore brought Paget up the valley of the Monelos and ordered Baird to retake Elvina. By this time Merle and Delaborde had joined in the attack on the right of Mermet, the action becoming general. Baird now sent forward two of Bentinck's battalions, which retook Elvina and even advanced beyond it. Had Moore remained in command it is probable that he would have pressed this advantage to its fullest extent, for he had already ordered up a Guards battalion to join in the counter-attack, while Paget's advance was beginning to make itself felt on the French left. Unfortunately, at this critical moment Moore's left arm was carried away by a round shot and, knowing his wound to be mortal, he handed over the command to Hope and allowed himself to be carried from the field. The change of command and weakness on the part of Bentinck resulted in the failure of the British counter-stroke. The French retook Elvina but were again checked before the main position, Merle and Delaborde on the right also failing to make any impression upon Manningham, Leith and Hill. By this time darkness was beginning to fall and the fight gradually flicked out. Neither side could claim a victory (each had lost about 900 men), but the British were able to embark next day unmolested in the fleet which had at last arrived. At the dawn of that day, Sir John Moore, his task accomplished, was buried on the ramparts of Corunna; a monument in the Jardin de San Carlos commemorates his death.

The town joined the revolutionary movement of 1820, but in 1823 it was forced to capitulate by French troops. In 1836 it was captured by the Carlists. Corunna suffered heavily when Spain was deprived of Cuba and Porto Rico by the Spanish-American War of 1898, for it had hitherto had a thriving trade with these colonies. (H. L. A.-F.; X.)

CORVALLIS, a city in the western part of Oregon, U.S.A., at the head of navigation on the Willamette river, 75 mi. S. by W. of Portland; the county seat of Benton county. It is served by the Southern Pacific railway. The population in 1930 was 7,585; in 1940 it was 8,392 by federal census.

The fertile Willamette valley produces large quantities of small fruits and berries. Among the city's industries are canneries, flour and sawmills, sash and door factories. It is the seat of the state agricultural college (established 1868) which gives degrees in ten technical schools and had an enrolment in 1940–41 of 3,100 men and 1,300 women in the regular session and 1,050 in the summer school. The instruction includes courses in logging engineering, home economics, journalism, physical education, teacher training, architecture, music, lumber manufacture and commercial canning. The college campus and farms at Corvallis occupy 547 ac. and 814 ac. in addition are leased for institutional purposes. The school of forestry has an arboretum of 341 ac. besides 75,000 ac. of state forest which is under its scientific management. The agricultural experiment station maintains branches at seven points in the state, on lands of 1,221 acres. Corvallis was settled in 1846 and incorporated in 1857.

CORVÉE, in feudal law, the term used to designate the unpaid labour due from tenants, whether free or unfree, to their lord; hence any forced labour, especially that exacted by the State, the word being applied both to each particular service and to the system generally. Though the corvée formed a characteristic feature of the feudal system, it was, as an institution, much older than feudalism, and was already developed in its main features under the Roman empire. Thus, under the Roman system, personal services (*operae*) were due from certain classes of the population not only to the State but to private proprietors. Apart from the obligations (*operae officiales*) imposed on freedmen as a condition of their enfranchisement, which in the country usually took the form of unpaid work on the landlord's domain, the semi-servile *coloni* were bound, besides paying rent in money or kind, to do a certain number of days' unremunerated labour on that part of the estate reserved by the landed proprietor. The State also exacted personal labour (*operae publicae*), in lieu of taxes, from certain classes for such purposes as the upkeep of roads, bridges and dikes; while the inhabitants of the various regions were responsible for the maintenance of the posting system (*cursus publicus*), for which horses, carts or labour would be requisitioned.

Under the Frankish kings, who in their administration followed the Roman tradition, this system was preserved. The economic revolution which between the 6th and 10th centuries converted the Gallo-Roman estates into the feudal model, and the political conditions under which the officials of the Frankish empire developed into hereditary feudal nobles, who evolved the system of the corvée as it existed throughout the middle ages and, in some countries, survived far into the 19th century.

In his *Manuel,* p. 346, Luchaire divides all corvées into two broad categories, (1) corvées properly so called, (2) military services. The second of these, so far as the obligation to serve in the host (*Hostis et equitatus*) is concerned, was common to all classes of feudal society; though the obligation of villeins to keep watch and ward (*gueta, warda*) and to labour at the building or strengthening of fortifications (*muragium, munitio castri*) are special corvées. We are, however, mainly concerned with the first category, which may again be subdivided into two main groups, (1) personal service of men and women (*manoperae, manuum operae,* Fr. *manoeuvres,* manual labour), (2) carriage (*carroperae, carragia, carrata,* etc., Fr. *charrois*), *i.e.,* service rendered by means of carts, barrows or draught animals. These again were divided into fixed services (*operae rigae*) and exceptional services, demanded when the others proved insufficient. To these latter was given in the 8th century the name of *operae corrogatae* (*i.e.,* requisitioned works, from *rogare,* to request). From this term, corrupted to *corvatae, curvadae, corveiae,* etc., is derived the word corvée, which was gradually applied as a general term for all the various services.

FEUDAL LORDS AND FORCED LABOUR

As to the nature of these corvées it must be noted that in the middle ages the feudal lords had replaced the centralized state for all administrative purposes, and the services due to them by their tenants and serfs were partly in the nature of rent in the form of labour, partly those which under the Roman and Frankish monarchs had been exacted in lieu of taxes, and which the feudal lords continued to impose as sovereigns of their domains. To the former class belonged the service of personal labour in fields, of repairing buildings, felling trees, threshing corn, and the like, as well as the hauling of corn, wine or wood; to the latter belonged that of labouring on the roads, of building and repairing bridges, castles and churches, and of carrying letters and dispatches. Corvées were further distinguished as *real; i.e.,* attached to certain parcels of land, and *personal; i.e.,* due from certain persons.

In spite of the fact that the corvées were usually strictly defined by local custom and by the contracts of tenancy, and that, in an age when currency was rare, payment in personal labour was a convenience to the poor, the system was open to obvious abuses. With the growth of communal life in the towns the townsmen early managed to rid themselves of these burdensome obligations either by purchase, or by exchanging the obligation of personal work for that of supplying carts, draught animals and the like. In the country, however, the system survived all but intact; and, so far as it was modified, was modified for the worse. Whatever safeguards the free cultivators may have possessed, the serfs were almost everywhere—especially in the 10th and 11th centuries—actually as well as nominally in this respect at the mercy of their lords (*corvéables à merci*), there being no limit to the amount of money or work that could be demanded of them. The system was oppressive even when the nobles to whom these services were paid gave something in return, namely, protection to the cultivator, his family and his land; they became intolerable when the development of the modern state deprived the land-owners of their duties, but not of their rights.

In the case of France, in the 17th century the so-called *corvée royale* was added to the burden of the peasants; *i.e.,* the obligation to do unpaid labour on the public roads, an obligation made general in 1738; and this, together with the natural resentment of men at the fact that the land which their ancestors had bought was still subject to burdensome personal obligations in favour of people whom they rarely saw and from whom they derived no benefit, was one of the most potent causes of the Revolution. By the Constituent Assembly personal corvées were abolished altogether, while owners of land were allowed the choice of continuing real corvées or commuting them for money. The corvée as an incident of land tenure has thus disappeared in France. The *corvée royale* of repairing the roads, however, abolished in 1789, was revived, under the name of *prestation,* under the Consulate, by the law of 4 Thermidor an X., modified by subsequent legislation in 1824, 1836 and 1871. Under these laws the duty of keeping the roads in repair is still vested in the local communities, and all able-bodied men are called upon either to give three days' work or its equivalent in money to this purpose. It is precisely the same system as that in force under the Roman empire, and if it differs from the corvée it is mainly in the fact that the burden is equitably distributed, and that the work done is of actual value to those who do it. The introduction of this system into the African colonies has since been subjected to some criticism.

SURVIVAL OF CORVÉE

As regards other countries, the corvée was everywhere, sooner or later, abolished with the serfdom of which it was the principal incident (*see* SERFDOM). It survived longest in the Austrian empire, being finally abolished by the revolution of 1848.

See Du Cange, *Glossarium inf. et med. Lat. s.v.* "Corvatae"; A. Luchaire, *Manuel des institutions françaises* (Paris, 1892), pp. 346–49; *La Grande Encyclopédie, s.v.* with bibliography. For further works *see* the bibliography to the article SERFDOM.

CORVIDAE: *see* CROW; JAY; MAGPIE.

CORVINUS, JÁNOS (JOHN) (1473–1504), illegitimate son of Matthias Hunyadi, king of Hungary. He took his name from the raven (*corvus*) in his father's escutcheon. Matthias, on losing all hope of offspring from his consort, Queen Beatrice, determined, towards the end of his life, to make the youth his successor on the throne. He publicly declared him his successor, created him a prince with vast apanages in Silesia, and made the commandants of all the fortresses of the kingdom take an oath of allegiance to him. His sudden death left the recognition of János as prince royal of Hungary by the emperor Frederick still pending, and the young prince suddenly found himself alone in the midst of enemies. After being made to resign his claim to the Crown, he was robbed of the royal treasures, which Matthias had confided to him. He accepted the election of Vladislav of Bohemia as king of Hungary (July 15, 1490), but his enemies poisoned the king's mind against him, and he lost nearly all his estates. In 1496 Corvinus married Beatrice, the daughter of Bernard Frangepan. His prospects now improved, and in 1498 he was created perpetual *ban* of Croatia and Slavonia. From 1499 to 1502 he successfully defended Bosnia against the Turks, and in the following year aspired to the dignity of palatine, but was defeated by a combination of Queen Beatrice and his other enemies. He died on Oct. 12, 1504, leaving one son, Prince Christopher, who died on March 17, 1505. (*See* HUNGARY: *History*).

See Gyula Schönherr, *János Corvinus Hunyadi* (Hung.) (Budapest, 1894).

CORVUS, MARCUS VALERIUS (*c.* 370–270 B.C.), Roman general. According to the legend a raven settled on his helmet during his combat with a gigantic Gaul, and distracted the enemy's attention by flying in his face. He was twice dictator and six times consul, and occupied the curule chair (*see* CURULE) 21 times. In his various campaigns he defeated successively the Gauls, the Volscians, the Samnites, the Etruscans and the Marsians. His most important victory (343) was over the Samnites at Mount Gaurus.

See Livy vii. 26–42, x. 2–11.

CORWEN ("the white choir"), a market town and civil parish of Merionethshire, Wales, on the Dee, a little below its confluence with the Alwen, 10 mi. W. of Llangollen. Pop. (1931) 2,534. The Berwyn range rises steeply to the south, so that the town is confined between wooded cliffs and the swift-flowing Dee. Telford's Holyhead road through the Bala cleft, the successor of hillside tracts of prehistoric date, opens up the district to tourists. The town is also a favourite angling centre. There are many associations with the Welsh chieftain, Owen Glendower; it was here that he had his headquarters before the battle of Shrewsbury (1403). The much-restored parish church dates in part from the 13th century. At Corwen the L.M.S.R. from Denbigh joins the G.W.R. from Llangollen to Dolgelley.

CORWIN, THOMAS (1794–1865), American statesman and orator, was born in Bourbon county, Ky., on July 29, 1794. In 1798 his father, Matthias Corwin (1761–1829), removed to what later became Lebanon, O., where the son worked on a farm, read much, and in 1817 was admitted to the bar. As an advocate he was at once successful, but after 1831 he devoted his attention chiefly to politics, identifying himself first with the Whig and after 1858 with the Republican Party. He was a member of the National House of Representatives in 1831–40; governor of Ohio in 1840–42; served in the United States Senate 1845–50; was secretary of the Treasury in the cabinet of President Fillmore in 1850–53; was again a member of the National House of Representatives in 1859–61. As a legislator he spoke seldom, but always with great ability, his most famous speech being that of Feb. 11, 1847 opposing the Mexican War. He died at Washington, D.C., Dec. 18, 1865.

See the *Life and Speeches of Thomas Corwin* (Cincinnati, 1896), edited by Josiah Morrow; and an excellent character sketch, *Thomas Corwin* (Cincinnati, 1881), by A. P. Russell. *See* also L. Belle Hamlin (ed.), "Selections from the William Greene Papers, Letters of Thos. Corwin to William Greene, 1841–51," *Hist. and Philos. Soc. of Ohio, Surv. Publ.*, vol. xiii., No. 1 (1918).

CORY, WILLIAM JOHNSON (1823–1892), English schoolmaster and author, son of Charles Johnson of Torrington, Devonshire. He was educated at Eton and at King's college, Cambridge, where he gained the chancellor's medal for an English poem on Plato in 1843, and the Craven Scholarship in 1844. In 1845 he was made an assistant master at Eton, where he remained for some 26 years. He has been called "the most brilliant Eton tutor of his day." In 1872, having inherited an estate at Halsdon and assumed the name of Cory, he left Eton. He married late in life, and after four years spent in Madeira he settled in 1882 at Hampstead. He proved his genuine lyrical power in *Ionica* (1858), which was republished with some additional poems in 1891. Other works are: *Lucretilis* (1871), on the writing of Latin verses; *Iophon* (1873), on Greek Iambics; and *Guide to Modern History from 1815 to 1835* (1882). Extracts from the *Letters and Journals of William Cory,* which contain much paradoxical and suggestive criticism, were edited by F. W. Cornish and published by private subscription in 1897.

CORYATE, THOMAS (1577?–1617), English traveller and writer, was born at Odcombe, Somersetshire, where his father, the Rev. George Coryate, prebendary of York cathedral, was rector. Educated at Westminster school and at Oxford, he became a kind of court fool, eventually entering the household of Prince Henry, the eldest son of James I. In 1611 he published an account of a prolonged walking tour undertaken in 1608, under the title of *Coryate's Crudities hastily gobbled up in Five Months' Travels in France, Italy, etc.*

At the command of Prince Henry, verses in mock praise of the author were added to the volume. These commendatory verses, written in a number of languages, and some in a mixture of languages, by Ben Jonson, Donne, Chapman, Drayton and others, were afterwards published (1611) by themselves as the *Odcombian Banquet.* The book is now very rare, and the copy in the Chetham Library, Manchester, is said to be the only perfect one. In the same year was published a second volume of a similar kind, *Coryats Crambe, or his Coleworte twice Sodden.* In 1612 he set out on another journey, which also was mostly performed on foot. He visited Greece, the Holy Land, Persia and India; from Agra and Ajmir he sent home an account of his adventures.

Some of his letters were published in 1616 under the title of *Letters from Asmere, the Court of the Great Mogul, to several Persons of Quality in England,* and some fragments of his writings were included in *Purchas his Pilgrimes* in 1625. Coryate acquired a knowledge of Turkish, Persian and Hindustani in the course of his travels, and on being presented by the English ambassador, Sir Thomas Roe, to the Great Mogul, he delivered a speech in Persian. He says that he spent only £3 between Aleppo and Agra, and often lived "competently" for a penny a day. Coryate died at Surat in 1617.

BIBLIOGRAPHY.—*Coryate's Crudities,* with his letters from India, was reprinted from the edition of 1611 in 1776, and at Glasgow University Press (1905). The *Odcombian Banquet* was ridiculed by John Taylor, the Water Poet, in his *Laugh and be Fat, or a Commentary on the Odcombian Banket* (1613) and two other satires.

CORYBANTES, spiritual powers, with the same relation to the Asiatic Great Mother of the Gods as the Curetes bear to Zeus. From their first appearance in literature, they are already often identified or confused with them, and are distinguished only by their Asiatic origin and by the more pronouncedly orgiastic nature of their rites. Various accounts of their origin are given: they were earth-born, sons of Cronus, sons of Zeus and Calliope, sons of Rhea, of the Great Mother and a mystic father, of Apollo and Thalia, of Athena and Helios. Their names and number are vague, and vary from one authority to another. We know that they had a mystic cult, and that a prominent feature of their ritual was a wild dance, which was claimed to have powers of healing mental disorder. It seems possible that originally they were priests or medicine-men of ancient times, later thought of as superhuman.

In art the Corybantes appear, usually not more than two or three in number, fully armed and executing their orgiastic dance.

CORYDON, a town of southern Indiana, U.S.A., on Indian creek, 20 mi. W. by S. of Louisville, Ky.; the first capital of the state and the county seat of Harrison county. It is served by the Louisville, New Albany and Corydon railway, which connects at Corydon Junction, 8 mi. N., with the Southern railway. The population in 1940 was 1,865. Wheat, fruit and dairy cattle are raised in the region. Natural gas is available, and there are lumber mills and valuable quarries near by. Wyandotte cave is about 10 mi. west. The town has chicken hatcheries, glass, refrigerator, furniture and wagon factories. Corydon was settled about 1805, and was the capital of Indiana Territory (1813–16) and of the state until 1824. The convention which framed the first state constitution met there in June 1816. The original statehouse, a two-story stone building, has been bought by the state, to be preserved as a memorial. The town was captured by the Confederates during Gen. Morgan's raid on July 9, 1863.

COS or **STANKO,** an island not far from the southwestern corner of Asia Minor, the second largest of the Dodecanese. Area 111 sq.mi. Pop. (1936) 19,731, nearly all Greek. The island consists of three regions, an abrupt limestone ridge (anc. Prion, "the saw" from its jagged profile) along the eastern half of the south coast, a rugged peninsula (Kephala) at the west end, and a central lowland of fertile marls prolonged along the north coast to the ancient capital facing the mainland. Along the north slope of the Prion ridge copious deep-seated springs provide water for the town and for extensive irrigation. The Cos lettuce is well known. The principal resources of Cos are its vineyards, figs and olives; wheat, barley and maize are grown, though a considerable proportion of the arable land is left untouched. Melons, grapes and other summer fruits are exported in large quantities to Egypt, mostly in local sailing boats. Cotton, tobacco, sesame and silk are grown in small quantities. The capital, Cos, pop. (1936) 9,852, was, under Italian administration, seat of an autonomous municipality and of a civil and penal tribunal of first instance and of the regent representing the governor residing in Rhodes.

The mediaeval harbour is fit only for quite small vessels, but the roadstead is safe in most weathers and steamers call here. The ancient and mediaeval town round the harbour has a well-preserved fortress, founded by the Knights of Rhodes: in its walls are interesting architectural fragments. The famous plane-tree in the market-square has a circumference of about 30 ft., and its huge branches have to be supported by pillars. Of its age there is no certain knowledge; the popular tradition connects it with Hippocrates. The town is supplied by an aqueduct, about 4 m. in length from the fine ancient wellhouse of Borinna high on Mt. Prion. The village of Pyli has the fine Greek tomb of Charmylos, and at Kephala is an outlying castle of the knights of St. John: numerous inscriptions prove that it occupies the site of the ancient township of Isthmos. The prosperous village of Antimachia is the corn-market of the central lowland. The precinct of Asclepius (excavated in 1900–1904) about 2 m. from the town of Cos, consists of three terraces, containing temples, an altar, porticoes and other buildings and a medicinal spring; below is a large enclosure with porticoes. The earliest buildings on the middle terrace date from the 6th century B.C. The temple on the upper terrace, with an imposing flight of steps, is of the 2nd century B.C. After a destructive earthquake, the whole site was remodelled by Xenophon, the physician who poisoned the emperor Claudius. The sanctuary was desolated by the earthquake of A.D. 554.

History.—Cos was settled by Dorian colonists from Epidaurus who worshipped Asclepius, whose sanctuary became a health-resort and the first school of scientific medicine. In the 5th century it joined the Delian League. Usually its government was aristocratic, but in 366 a democracy was instituted. In 357–355 it resisted Athenian aggression; then fell for a few years into the power of Mausolus, prince of Halicarnassus. In the Hellenistic age Cos owed its prosperity to the friendship of the Greek dynasty of Egypt, who valued it as a naval outpost. As a seat of learning it was adopted for the education of Ptolemaic princes; amongst its most famous men were the physician Hippocrates, the painter Apelles, the poets Philetas and Theocritus (*q.v.*). Like its neighbour Rhodes, Cos generally supported the Romans. In A.D. 53 it was made a free city. In A.D. 1315 it was occupied by the Knights of St. John, its castle, with that at Halicarnassus (Budrum) serving as outer-guard to Rhodes; in 1523 it passed under Ottoman sway and in 1912 was occupied by Italy during the Tripoli war. The full sovereignty of Cos and other Aegean islands was formally ceded to Italy by Turkey in the Treaty of Lausanne, 1924.

Head, *Historia Numorum* (Oxford, 1887), pp. 535–537; *Archäol. Anzeiger*, 1905, i.

COSA, an ancient city of Etruria, on the south-west coast of Italy, close to the Via Aurelia, 4½m. E.S.E. of the modern town of Orbetello on a promontory above the sea. Evidence of the occupation of the site in prehistoric times has recently come to light. When it became a Roman colony in 273 B.C., the town was strongly fortified and the walls, about a mile in circuit, with three gates, and seventeen projecting rectangular towers at intervals, are preserved in places to a height of over 30ft. on the outside, and 15 on the inside. Within the city no remains are visible. The place was approached by a branch road which diverged from the Via Aurelia at the post station of Succosa, at the foot of the hill on which the town stood. The harbour was of some importance. In the 5th century we hear of it as deserted. There is a remarkable Etruscan cutting through the east end of the promontory, for the purpose of draining an adjacent lagoon.

See D. Levi in *Studi Etruschi* i. 477, and references.

COSENZ, ENRICO (1812–1898), Italian soldier, born at Gaeta on Jan. 12, 1812, served in the Neapolitan artillery against the Austrians in 1848. Subsequently he aided in the defence of Venice, and in 1859 became commander of a Garibaldian regiment. In the following year he led the third Garibaldian expedition to Sicily, defeated two Neapolitan brigades at Piale (Aug. 23), and marched upon Naples, where he was appointed minister for war and helped to organize the *plebiscite*. During the war of 1866 he commanded a division. He became chief of the general staff in 1881, and held that post until shortly before his death at Rome on Aug. 7, 1898.

COSENZA, a town and archiepiscopal see of Calabria, Italy (anc. *Consentia*), capital of a province, 755 ft. above sea-level, 43 mi. S.W. of Sibari, on the East coast railway and 37 mi. S.E. of Paola on the west coast line. Pop. (1936) 30,038 (town), 40,032 (commune). It is on the slope of a hill between the Crati and Busento, just above the junction, and is commanded by a castle (1,250 ft.). The ancient Consentia is first named as the burial place of Alexander of Epirus in about 330 B.C. In 204 it became Roman, though it was more under the influence of Greek culture. It is mentioned by Strabo as the chief town of the Bruttii, and frequently spoken of in classical authors as an important place. It lay on the Via Popilia. Varro speaks of its apple trees which gave fruit twice in the year and Pliny praises its wine. Cosenza became an archbishopric in the 11th century. The Gothic cathedral, consecrated in 1222, goes back to French models in Champagne, and is unique in Italy. It contains the Gothic tomb of Isabella of Aragon, wife of Philip III. of France, and also the tomb of Louis III., duke of Anjou. In 1461 Cosenza was taken by Roberto Orsini, and suffered severely. It was the home of a scientific academy founded by the philosopher Bernardino Telesio (1509–88). In 1555–61 it was the centre of the persecution by the Inquisition of the Waldenses who had settled there towards the end of the 14th century. The Palazzo del Tribunale (law courts) is a fine building, and the upper town contains several good houses. Railways run south-east from Cosenza into the Sila district, to Decollatura (44 m.) and San Pietro in Guarano (19 m.). There is some trade in wool.

COSGRAVE, WILLIAM THOMAS (1880–), Irish politician, was born in Dublin, and educated at a school of the Christian Brothers. His father, Thomas Cosgrave, was at one time a town councillor and poor-law guardian. William Cosgrave entered the grocery trade at an early age, and there was nothing in his life to indicate a career of importance. But, like most thoughtful young Irishmen who came of age about the turn of the century, he was attracted by the Sinn Fein movement. In 1913 he won a seat on the Dublin corporation in the Sinn Fein interest. Here he distinguished himself on the financial side and in 1916 was chosen chairman of the finance committee.

In 1913 he became a member of the Irish Volunteers, and when that body divided in Aug. 1914, he was with the minority who refused to follow John Redmond. At the Easter rising, 1916, he was again in an extremist minority, for he joined the section which, against the order of Prof. MacNeill, then head of the organization, went out to fight under Pearse. Afterwards, with other prisoners, he was detained at Frongoch in Wales until the general liberation in July 1917.

Mr. de Valera having, immediately on his release, won a seat vacant in Clare, another vacancy soon occurred in Kilkenny city. Mr. Cosgrave was nominated and elected by a large majority. Re-elected in Dec. 1918, this time for Kilkenny co., he was a member of the first Dail Eireann which declared for an Irish republic and was Minister for Local Government in the first Republican Ministry. During the struggle with the British, his task was to organize the refusal of local bodies to co-operate with Dublin Castle. Like all other members of this illegal Ministry, he was the object of pursuit by the law and was more than once in prison.

During the debate in the Dail in Dec. 1921, on the newly signed treaty with Great Britain, Cosgrave's speech was one of the few that attracted attention. Later he became Minister of

Local Government in the newly formed Provisional Government. In the summer of 1922 President Griffith, obliged to go to London for the negotiations concerning the treaty clauses, appointed Cosgrave as his deputy, and when, on Aug. 12, Griffith suddenly died and Collins was chosen President in his place, Cosgrave became acting chairman of the Provisional Government. Ten days later Collins was shot, and Cosgrave, a simple Dublin business man, was placed by force of circumstances at the head of a state fighting for bare life. Never was promotion more sudden or more accidental. Griffith and Collins had, in their different ways, a strong hold on the popular mind; Cosgrave was unknown as a personality and barely recognized as a name.

As soon as the newly elected Dail could be summoned, and it could meet only behind closed doors and strongly guarded entrances, he made clear his view that the day of individual leadership was over and team work must take its place. In that anxious period he left much of the work, especially the carrying of the draft constitution through the House, to younger and more brilliant subordinates. But he captained his team, and was always ready to shoulder responsibility. When tempers were roused he introduced a conciliatory spirit. He showed both breadth of view and a sense of humour, and endeavoured to make the Protestant minority at home in the Free State. The appointments made by his Government, especially to judicial office and the first Senate, recognized merit and capability irrespective of either politics or religion.

As President of the Irish Free State he represented Ireland when she first appeared at a conference of the Dominions in Oct. 1923; and a month earlier he was welcomed as her first spokesman at the Assembly of the League of Nations. He saw the country pass from anarchy to a state of complete order. The Ministry of Finance, which he took over at the outset, was transferred in 1923 to Mr. Blythe who proved a success; the Ministry of Defence, which he took over in April 1924, in face of a threatened mutiny in the army, was handed over easily and without comment a few months later to a new minister. In his political career Cosgrave has not been ambitious. He has never sought to thrust his personality into the forefront, but in Ireland, as well as overseas, he has won a reputation for good sense and moral courage.

Under his guidance the country moved steadily to settled order; great industrial enterprises were launched with State aid, of which the Shannon electricity scheme was chief. In the Dail there was no serious opposition, since the party headed by Mr. de Valera which refused to accept the Treaty abstained from attendance. But neither Cosgrave nor his ministry enjoyed much popularity. Order is not enforced after a revolution without drastic measures, and the taxation was heavy and sharply collected. Cosgrave seemed secure of a long tenure only because there was no alternative in sight. In July 1927, shortly before a general election was due, the assassination of Mr. O'Higgins, the Vice President, produced a crisis. Very severe legislation against political associations of an unconstitutional character was introduced and a bill declaring that no candidature for the Dail should be accepted unless the candidate declared himself willing to sit and to take the oath of allegiance. The result of this measure was that de Valera and his party decided to come in and, since this revolutionized the parliamentary situation, Cosgrave obtained leave to dissolve. The new election in Oct. 1927 left his party numerically the largest in the Dail but liable to defeat by a combination of the rest. A coalition with the Farmers' group followed, but even after this Cosgrave had only a majority of a few votes in the full House. Nevertheless he carried on confidently and at the opening of 1928 made a journey to America, where he was received in the most flattering manner by the President of the United States, was invited to address the Senate at Washington, and, on the urgent request of the Dominion Government, extended his tour to Canada. His return to Dublin was triumphant and marked for himself a degree of general recognition which he had never before attained: for it was now plain even to the most unwilling minds that Ireland's place as one of the free nations in the British Commonwealth was recognized throughout the world. Cosgrave remained president until his party's defeat in 1932. (S. G.)

COSHOCTON, a city of Ohio, U.S.A., 70 mi. E.N.E. of Columbus, at the confluence of the Tuscarawas and the Walhonding rivers which form the Muskingum; the county seat of Coshocton county. It is served by the Pennsylvania and the Wheeling and Lake Erie railways. Pop. in 1930 was 10,908; in 1940, 11,509 by federal census. The city is built on a series of four broad terraces, rising to 824 ft. above sea level and commanding fine views of the valley. It ships coal, grain, flour, livestock and wool in large quantities, and has important manufactures, especially of advertising novelties. The factory output in 1937 was valued at $9,312,364. Coshocton occupies the site of an Indian village of the same name which was destroyed by the whites in 1781. It was founded in 1801; became the county seat in 1811; and was incorporated in 1833. Until 1811 it was called Tuscarawas.

COSIN, JOHN (1594–1672), English divine, born in Norwich on Nov. 30, 1594, was educated at Norwich grammar school and Caius college, Cambridge. In 1624 he became prebendary of Durham and in the following year archdeacon of the East Riding of Yorkshire. His *Collection of Private Devotions* (1627), which he is said to have prepared by command of Charles I., and his known friendship for Laud brought him under suspicion with the Puritan party.

Cosin was appointed master of Peterhouse, Cambridge (1634), vice-chancellor of the university (1640), and dean of Peterborough (Oct. 1640). While he had been prebendary of Durham he had in 1628 taken part in the prosecution of a brother prebendary, Peter Smart, for delivering a sermon against High Church practices. Smart had been deprived. On Cosin's presentation to the deanery of Peterborough Smart petitioned the Long Parliament against the new dean, and early in 1641 Cosin was sequestered from his benefices. Articles of impeachment were presented against him, but he was dismissed on bail. In 1642 he was deprived of the mastership of Peterhouse, and joined the royal family in France, where he remained until the Restoration. He was then raised to the see of Durham (Dec. 1660). He was one of the revisers of the Prayer Book (1661). He died in London on Jan. 16, 1672.

Among his writings (most of which were published posthumously) are a *Historia Transubstantiationis Papalis* (1675), *Notes and Collections on the Book of Common Prayer* (1710) and *A Scholastical History of the Canon of Holy Scripture* (1657). A collected edition of his works, forming 5 vols. of the Oxford *Library of Anglo-Catholic Theology*, was published between 1843 and 1855; and his *Correspondence* was edited by Canon Ornsby for the Surtees Society (1868–70). *See* P. H. Osmond, *Life of John Cosin* (1913).

COSMAS, of Alexandria, surnamed from his maritime experience *Indicopleustes*, merchant and traveller, flourished during the 6th century A.D. In his earlier days he had sailed on the Red sea and the Indian ocean, visiting Abyssinia and Socotra and apparently also the Persian gulf, western India and Ceylon. He subsequently became a monk, and about 548, in the retirement of a Sinai cloister, wrote a work called *Topographia Christiana*. Its chief object is to denounce the false and heathen doctrine of the rotundity of the earth, and to vindicate the scriptural account of the world. According to Cosmas the earth is a rectangular plane, covered by the vaulted roof of the firmament, above which lies heaven. In the centre of the plane is the inhabited earth, surrounded by ocean, beyond which lies the paradise of Adam. The sun revolves round a conical mountain to the north—round the summit in summer, round the base in winter, which accounts for the difference in the length of the day. Cosmas is supposed by some to have been a Nestorian. The *Topographia* contains some curious information. Especially to be noticed is the description of a marble seat discovered by him at Adulis (Zula) in Abyssinia, with two inscriptions recounting the heroic deeds and military successes of Ptolemy Euergetes and an Axumitic king. It also contains in all probability the oldest Christian maps. From allusions in the *Topographia* Cosmas seems to have been the author of a larger cosmography, a treatise on the motions of the stars, and commentaries on the Psalms and Canticles.

The *Topographia* will be found in Migne, *Patrologia Graeca*, lxxxviii.; ed. with geographical notes by Winstedt (1909). *See* H. Gelzer, "Kosmas der Indienfahrer," in *Jahrbücher für protestantische*

Theologie, ix. (1883) and C. R. Beazley, *The Dawn of Modern Geography*, i. (1897). There is an English translation, with introduction and notes, by J. W. McCrindle (1897), published by the Hakluyt Society.

COSMAS, of Prague (1045–1125), dean of the cathedral and the earliest Bohemian historian. His *Chronicae Bohemorum libri iii.*, which contains the history and traditions of Bohemia up to nearly the time of his death, has earned him the title of the Herodotus of his country.

See A. Potthast, *Bibliotheca Hist. Med. Aevi;* J. Loserth, *Studien zu Cosmas von Prag* (Vienna, 1880, etc.).

COSMATI, the name of a Roman family, seven members of which, for four generations, were skilful architects, sculptors, and workers in mosaic. The following are known from existing inscriptions:—

Lorenzo (born in the second half of the 12th century).
|
Jacopo (dated works 1205 and 1210).
|
Cosimo (dated works 1210–1235).

Luca	Jacopo	Adeodato	Giovanni
(1231 and 1235).	(1231–1293).	(1294).	(1296 and 1303).

Their principal works in Rome are: ambones of S. Maria in Ara Coeli (Lorenzo); door of S. Saba, 1205, and door with mosaics of S. Tommaso in Formis (Jacopo); chapel of the Sancta Sanctorum, by the Lateran (Cosimo); pavement of S. Jacopo alla Lungara, and (probably) the magnificent episcopal throne and choir-screen in S. Lorenzo fuori le Mura, of 1254 (Jacopo the younger); baldacchino of the Lateran and of S. Maria in Cosmedin, *c.* 1294 (Adeodato); tombs in S. Maria sopra Minerva (*c.* 1296), in S. Maria Maggiore, and in S. Balbina (Giovanni). The chief signed works by Jacopo the younger and his brother Luca are at Anagni and Subiaco. A large number of other works by members and pupils of the same family, but unsigned, exist in Rome. These are mainly altars and baldacchini, choir-screens, paschal candlesticks, ambones, tombs, and the like, all enriched with sculpture and glass mosaic of great brilliance and decorative effect.

Besides mosaic patterns and architectural decoration, they also produced mosaic pictures and sculpture of very high merit, especially the recumbent effigies, with angels standing at the head and foot, in the tombs of Ara Coeli, S. Maria Maggiore and elsewhere. One of their finest works is in S. Cesareo; this is a marble altar richly decorated with mosaic in sculptured panels. The magnificent cloisters of S. Paolo fuori le Mura, built about 1285 by Giovanni, the youngest of the Cosmati, are one of the most beautiful works of this school, whose style is Gothic in its main lines. The equally magnificent cloisters of the Lateran, of about the same date, are very similar in design; both have slender marble columns, twisted or straight, richly inlaid with bands of glass mosaic in delicate and brilliant patterns. The shrine of the Confessor at Westminster is a work of this school, executed about 1268.

An excellent account of the Cosmati is given by Boito, *Architettura del medio evo* (1880), pp. 117–182.

COSMETICS. Substances of diverse origin scientifically compounded and used (1) to cleanse, (2) to allay skin troubles, (3) to cover up imperfections and (4) to beautify. They have been used in crude forms by both men and women since the earliest times. It is quite probable that cosmetics had their origin in the East, but it is necessary to turn to Egypt for the earliest records of these substances and their application.

The 1st (Thinite) dynasty is variously placed at 3,500 to 5,000 years B.C., when it was customary to bury comforts and luxuries with the dead kings. Toilet articles and unguents were included in these luxuries, and in the British Museum there are many beautifully carved unguent vases in alabaster which authorities have dated about 3500 B.C. Other interesting specimens are: Mirrors used in the 6th dynasty 2800 B.C.; kohl vases in glass and stibium pencils used in the 18th dynasty 1500 B.C.; papyrus showing men and women having lumps of nard fixed on top of the head—1500 B.C. The opening by Mr. Howard Carter of the tomb of Tutankhamun, who ruled about 1350 B.C., has brought to light many excellent specimens of the early art of the cosmetician. According to eye-witnesses, the unguent vases, exquisitely executed in alabaster, contained quantities of aromatics which were still elusively fragrant.

On other monuments and tombs in Egypt there is still ample evidence of past great esteem for these substances. For instance, on the large granite tablet inserted in the breast of the Sphinx, King Thothmes IV. (about 1600 B.C.) is portrayed making an offering of incense and of fragrant oil or unguent. At this period it is probable that the priests made most of these compounds; they were therefore the perfumers of their time, and the pursuit was considered a mysterious and much esteemed art. The containers were beautifully executed in all kinds of valuable materials. Ivory and alabaster were the principal substances used, while frequently carved wood, onyx and porphyry were fashioned into pots and vases. The constituents were naturally comparatively limited in both numbers and variety. For instance, some were grown in Egypt, while the greater proportion were most probably imported from Arabia. Amongst the former may be mentioned thyme and origanum, together with a substance called *balanos* which appears to have been extracted from the shells of some unidentified fruit, while of the latter, myrrh, frankincense and spikenard were of great importance. Sesame oil appears to have been one of the most favoured vehicles for the aromatics, although both almond and olive oils were undoubtedly used.

The ancient Egyptians were probably the inventors of the artificial bath, which habit, in later years, was treated on a much more elaborate scale by the Greeks and Romans. This form of ablution was probably necessitated by the terrific heat of the Egyptian land; it was followed by the liberal application of perfumed oils and unguents. Doubtless these were employed to give the skin more elasticity, as well as to impart a balmy and pleasing effect. The use of cosmetics had not escaped the attention of the Egyptian ladies, who enhanced their personal beauty by the employment of somewhat crude paints. These practices reached their zenith in the time of Cleopatra. It seems probable, from discoveries in Egyptian tombs, that the highest degree of cosmetic art was attained in the embellishment of the eyes. This effect was produced by painting the under side of the eye green, and the lid, lashes and eyebrows black by the application of *kohol*—the product being made from antimony (sulphide?) and applied with an ivory or wooden stick. Combs and polished metal mirrors were also used by the Egyptian ladies. Henna was, and still is, much favoured for dyeing the finger nails, palms of the hands and soles of the feet. Good and well preserved specimens can be seen to-day in the British Museum.

Cosmetics were also used by Jewish women, for it is written (II Kings ix. 30) that "when Jehu was come to Jezreel, Jezebel heard of it; and *she painted her face,* and tired her head, and looked out at a window." This is explained more clearly in the following passage: "Thou didst wash thyself, paintedst thine eyes (probably with kohol), and deckedst thyself with ornaments" (Ezek. xxiii. 40, and *see* also Jer. iv. 30). In the Koran aromatics play an important part. The use of eye paint is suggested by *Sura* lvi., "And theirs shall be the Houris with *large dark eyes* like pearls hidden in their shells."

The Romans, during their early history, showed very little interest in enhancing their personal appearance, and it was only after their migrations into Southern Italy, then occupied by the Greeks, that they acquired a more intimate knowledge of the aesthetic side of life. Nero became emperor of Rome in A.D. 54, and by this time both cosmetics and perfumes had assumed an important rôle at his court. He personally used cosmetics liberally, and his wife, Poppaea, made no secret of the artificiality of her toilet. Among the many things they used were white lead, and chalk to whiten the skin; Egyptian kohol for the eyelids and lashes; *fucus,* a sort of rouge, for the cheeks and lips; *psilotrum,* a species of depilatory; barley-flour and butter as a cure for pimples and skin eruptions; and pumice-stone for whitening the teeth. The ultra-fashionable ladies of the Roman Court devised a method for bleaching their hair by means of a kind of soap which came from Gaul. The Romans made all sorts of pretty containers for their perfumes and cosmetics, of which there were three principal kinds: (1) solid unguents or *ledysmata;* (2) liquid unguents or *stymmata;* (3) powder perfumes or *diapasmata.* The solid unguents were generally of one specific perfume such as almond, rose or quince. The liquid unguents were most frequently compounds containing flowers, spices and gums, these substances being digested in either olive, ben or sesame oil. (Frangipanni was invented by one of the Roman nobles.)

The early inhabitants of Britain appear to have derived much pleasure from the use of crude cosmetics. Importation of toilet articles from the East dates from the time of the Crusades when the knights brought back many of the cosmetics prized by ladies of the harem. Until the reign of Queen Elizabeth these substances became more and more popular. The toilet preparations employed by the ladies of the court were kept in strongly perfumed boxes called "sweet coffers." These were considered a necessary part of the furniture of their bedrooms. A recipe for making a beautiful complexion at the time of Elizabeth was to take first a very hot bath to induce excessive perspiration, and to follow this up by washing the face with plenty of wine, to make it fair and ruddy. This latter treatment was even in those days fairly expensive, and Mary Queen of Scots is alleged to have even *bathed* in wine, on which account she applied for an increased allowance. This luxurious habit was not uncommon with the elder ladies of the court, but the younger ones had to be content with milk! Both sexes adorned themselves with cosmetics at the court and powder and patches were fancied. With the advent of the Commonwealth all these luxuries were discarded, but as soon as Charles II. was restored to the throne they became popular again. Milk baths were indispensable to beauty, and in later years the ladies of the Court adapted a new practice of powdering their hair, but this soon fell into disuse. By the 17th century cosmetics were used to such an extent by nearly all classes that in 1770, according to G. V. Septimus Piesse in his "Art of Perfumery" (1879), a bill was introduced into the English Parliament which contained the following drastic provision:—"That all women of whatever age, rank, profession, or degree, whether virgins, maids, or widows, that shall, from and after such Act, impose upon, seduce, and betray into matrimony, any of His Majesty's subjects, by the scents, paints, cosmetic washes, artificial teeth, false hair, Spanish wool, iron stays, hoops, high heeled shoes, bolstered hips, shall incur the penalty of the law in force against witchcraft and like misdemeanors and that the marriage, upon conviction, shall stand null and void."

This vogue was not confined to England, but spread equally quickly throughout France and Italy. Cosmetics were much favoured at the court of Louis XIII. and one of the greatest users was the beautiful Anne of Austria. From Spain were imported creams of vanilla and cacao and almond paste, all being used liberally to whiten the skin of the fair ladies of the court. Louis XIV. did not approve of the artificial enhancement of the courtesans and consequently cosmetics fell into disuse, but were again revived under the Regency when the "Poudre à la Maréchale" was in vogue. The Emperor Napoleon I. was very susceptible to the artistic refinements of his time, and the Empress Josephine brought from Martinique cosmetics which she always continued to use. The French at this period made a definite move to place the manufacture of these artistic aids to beauty upon a scientific basis, and to-day throughout both Europe and America the production of cosmetics is one of the most interesting, scientific and remunerative businesses.

MODERN ASPECT

Cosmetics are used mainly to finish artistically what nature has left undone, and while the indifferent products of a few years ago were shunned owing to their crude colours and texture, they are now of such great purity and artistic finish that there are preparations to suit all types of skins and colourings. Harmful raw materials are eliminated by the chemist, and it is true to say that the best makes of cosmetics are prepared under scrupulously clean and antiseptic conditions, and that there is practically no risk of damaging even the most delicate skin by using them. The old argument that it is unhealthy to clog the pores of the skin no longer holds water, because, just as a man removes with soap and water the dirty dust of the street, so a lady removes clean cosmetics from her skin with creams a few hours after their application. Moreover, while they are in use they form an excellent protecting agent against adverse atmospheric conditions. Facial massage is much appreciated by those who desire to retain a clean, supple and unwrinkled complexion, but modern surgical science has evolved a treatment known as *face lifting,* by which wrinkles can be removed or filled up, the shape of the nose improved, and defects of the chin or ears eliminated. The operation is performed with local anaesthetics, under highly antiseptic conditions, and without danger. This method of rejuvenescence does not, however, pretend to dispense with the use of cosmetics, since plastic surgery only improves contour.

Bath preparations consist mainly of crystalline carbonate or sesquicarbonate of soda together with borax, sodium phosphate and bay salt. Water softeners contain the dried carbonates of soda and of ammonia. They are fragrantly perfumed, and when added to the bath make the ablutions more pleasant, and by softening the water make soap lather more easily.

Dental preparations comprise tooth powders and pastes together with liquid dentrifices. The former contain among other substances precipitated chalk, calcium phosphate, magnesium carbonate, soap and pumice. The pastes are made from the powders by the addition of glycerine and water. The antiseptic substances include thymol, eucalyptus oil and carbolic acid. The liquid preparations contain these antiseptics, together with tinctures of myrrh and rhatany.

Hair preparations are more numerous. Bay rum is made from oil of bay, rum and industrial alcohol. Brilliantines contain liquid paraffin or a good vegetable oil, and the solid ones a substance akin to vaseline. Non-greasy hair fixers generally contain tragacanth, glycerine and water. Depilatories are based upon the sulphides of the alkaline earths. Hair tonics contain jaborandi, cantharides or quinine. Shampoos contain soap and borax, together with henna (for brunettes) or camomile (for blondes).

Lipsticks are quite harmless when made from almond oil, lanoline, white paraffin jelly and cocoa butter. The colouring matters vary, but are generally carmine with one or other of the harmless lakes.

Manicure preparations include nail polishes; the solid blocks contain tin oxide and waxes, and the liquid enamels celluloid with a solvent and colour.

Rouges contain carmine, eosine or one of the harmless lakes, together with starch, kaolin or zinc oxide.

Shaving preparations are based upon soap (with brush) or stearic acid (without brush). Shaving powders contain Castile soap and starch. Shaving blocks are either potash alum or fused boracic acid.

Skin creams cover a very wide selection. Cold cream is a finely divided emulsion of oil and wax with water. Vanishing creams are largely stearic acid emulsified with soap, and sometimes containing glycerine or lanoline. Massage creams may be prepared from "skinned" milk; virginal milk from tincture of benzoin and glycerine of borax. Astringent lotions are based upon alum and alcohol. Sunburn lotions contain calamine and zinc oxide. Mud packs are made from fuller's earth, glycerine and benzoin.

Smelling salts contain liquid ammonia or its carbonate.

Soaps are made by boiling tallow, coconut oil or palm-kernel oil to neutralization with an alkali. The resultant soap is salted out and converted into chips. These are milled by passing through granite or steel rollers, when they become strips and are subsequently forced through a plodder at tremendous pressure. The long bars which come out are automatically cut into sizes, and are stamped by machines into the dainty tablets used in the bath-room.

Toilet powders are of diverse composition, but generally contain zinc oxide, talcum, one of the starches and a stearate of magnesium. The colouring matter in face powders may be of either organic or inorganic origin (yellow ochre, etc.). Talcum powders contain a much higher percentage of French chalk, and sometimes a little boracic acid. They are all sieved through very fine-mesh silk.

All the above cosmetics are perfumed, but this aspect of the subject is dealt with in the article: PERFUMES.

UNITED STATES

The history of the use of cosmetics in America closely parallels that of Europe. Amongst the aboriginal Indians we observe a widespread and highly developed technique of body painting and knowledge of dyes and pigments. Branegan (*Jour. of Chem. Education*), points out that "some of the (Indian) dyes were very fast, particularly when a metallic mordant, such as iron salts (from fruit juices and oxides of iron), was used in conjunction with vegetable extracts." These dyes were for the most part utilized for facial and bodily adornment; "war paint," in particular, being an essential component of the brave's military equipment. However, the significance of this form of decoration has doubtless been over-estimated, especially by early students; certainly the purposes of symbolism were never so assiduously served as those of simple decoration. And, after due consideration, Eugene Rimmel wrote (*Book of Perfumes,* 3rd ed., London, 1865) more than 60 years ago that "some *pretend* there is a certain symbolism in the various colours they use."

In the same place Rimmel calls our attention to another Indian cosmetic custom which has a definite survival amongst civilized people. The Indians, he says, "greased the whole body with fat to serve as a ground for the paint." It seems evident that cold creams were used in Europe, where they had been manufactured since the 1st century A.D., almost exclusively in connection with massage or as cleansing agents. Their use, not only as a foundation for "make-up," but also as a protection against cold weather, would appear to have originated amongst the North American Indians.

There is no reason to suppose that European cosmetics did not make their first appearance in America with the first women colonists. During colonial times, and later, the use and ethics of cosmetics varied enormously, from Puritan New England to cavalier Virginia. In the southern colonies cosmetics flourished. Even in Quaker Pennsylvania, which occupied a middle ground between the "liberal" South and the "puritan" North, cosmetics were in use; and we find on the statute books of that colony the notorious act of 1770, by virtue of which a marriage might be annulled if it could be proven that the wife had, in courtship, deceived and misled her prospective husband by using cosmetics. Even where there was no social ban on them, but where living conditions made them too great a luxury, cosmetics were not unknown. Some of these early subterfuges and substitutes still survive in rural America. Powdered chalk and fresh cut beetroot are used to enhance the complexion; and there is a superstition that the juice of the petals of certain varieties (dependent on the locality) of roses will impart a permanent rose bloom to the cheeks and lips.

With the growth of population and wealth, cosmetics have played an ever increasingly important rôle in America. The fundamental reason for this can be found in the climate. American women require more cosmetics than Europeans because the brilliant sunlight of the Western continents tends to burn all the colour out of the skin.

Hence American women will try almost any kind of preparation in the hope that it will improve their complexions. As one consequence of this, it is far easier to introduce a novelty in America than in Europe. Some idea of the significance of this craving for novelty may be gathered from the fact that there are over a thousand different "brands" of face powder registered with the national trade association and the trade-mark bureau at Washington. However, a consideration of the history of cosmetics in America must be made—with due allowance for the factors of climate and the American proclivity to "try anything once"—in the light of the fact that American cosmetic habits and usages are, in the main, identical with those of Europe. Europe has always set the styles in cosmetics in America; and the conviction persists throughout America that European cosmetics are innately and inherently superior to those of domestic manufacture. While this is true of perfumes, it is not so of cosmetics.

The keystone of the cosmetics industry is face powder (rouge is only face powder with deeper colouring). In the early days of the republic face powders were made, occasionally, with bases of lead or arsenic salts, but most commonly with a bismuth base. Bismuth was preferable for hygienic reasons. But it was disadvantageous in that it would discolour grey or brown in the fumes of candle or gas light, and it was expensive. In 1866 new impetus was given the industry, not only in America but all over the world, by Henry Tetlow's discovery that oxide of zinc made a satisfactory face powder base. It is harmless when applied externally (*cf.* "zinc ointment"), it will not discolour with oxidization, and, compared to bismuth, it is cheap—cheap enough to put face powder and rouge within the reach of every pocketbook. This formula remains the formula of most reputable face powders in the world to-day. It is the accepted formula of the British and United States pharmacopoeias.

There were no further important developments in the field of American cosmetics until the appearance of talcum powder in the last decade of the last century. Talcum powder is simply powdered magnesium silicate, perfumed and put up in tins. It is used for dusting and drying the body, either after bathing or independently of the bath. Again, the climatic factor favoured the reception of the article. Enormous quantities of talcum powder are consumed in the Americas, yet talcum powder has never attained a vogue in Europe.

The outbreak of the World War found the American cosmetics industry prepared to take advantage of the unusual situation. It can hardly be said that European importations into America declined in the war years; but the tremendous increases in wages and number of female wage earners, together with the inflation of money and the concurrent tendency to extravagance, opened a market for American cosmeticians many times greater than that which existed before the war. Pre-war census statistics of the industry are apt to be misleading, as they were not very carefully analysed and classified. It is safe to assume, however, that the annual pre-war turn-over in cosmetics of all kinds, exclusive of soaps, was never more than 24 million dollars a year. The latest census bulletin issued by the Department of Commerce (*Census of Manufactures, 1925: The Drug Industries,* Washington, 1927), gives a comprehensive view of the development of the industry since the war. *See* table on p. 487.

It must be borne in mind that considerable weight is given these figures by the fact that several important foreign manufacturers whose goods enjoyed a wide sale in the United States have, since the war, to escape the high import tariffs, set up their own manufactories in America, thus bringing their output under the registration of the U.S. census. To this indeterminate extent the figures quoted above do not represent either increased consumption or price rises.

Exportations, begun 70 years ago, but scarcely important prior to the World War, have increased proportionately. American exporters of cosmetics find Great Britain and the Colonies their best market. The growth of this trade with South and Central American countries has been greatly handicapped by high and, in some instances, preferential import tariffs.

Various efforts have been made to "regulate" the cosmetics industry in America. As a large user of industrial alcohol it has always come under the surveillance of the Internal Revenue Department. Since the passage of the 18th Amendment, the Volstead Act, and the various State "enforcement" acts, its difficulties under this head have increased; although, in 1928, a certain level of order and stability has been reached. Cosmetics were brought, quite ineffectually, under the Pure Food and Drug Act of 1906. In the two years, 1926 and 1927, more attention has been given cosmetics by State legislatures. This interest can be attributed to (*a*) the example of New Hampshire, whose legislators first tried to pass a law prohibiting the use of certain cosmetics within the State, and (*b*) to the studies of the compositions of cosmetics conducted by the American Medical Association, with a view to determining what effects, harmful or otherwise, they might have. (H. T.)

COSMIC, pertaining to the universe, universal or orderly. (From Gr. κόσμος, order or universe.) In ancient astronomy, the word "cosmical" means occurring at sunrise, and designates especially the rising or setting of the stars at that time. "Cosmical physics" is a term broadly applied to the totality of those branches of science which treat of cosmical phenomena and their explanation by the laws of physics. It includes terrestrial magnetism, seismology, the tides, meteorology as related to cosmical causes, the aurora, meteoric phenomena and the physical constitution of the heavenly bodies generally.

COSMIC RADIATION: *see* ELECTRICITY, ATMOSPHERIC.

COSMOGONY is in common language a theory, hypothesis or speculation as to the origin of the earth, sun, moon and stars. Such speculations are frequently produced by primitive races in their myth-making stage of development, and may be subsequently expanded and systematized by poets, priests and philosophers. In more scientific language cosmogony is the science which studies the formation of the earth, sun, moon and stars under the action of natural laws. Astronomy gathers information as to the structure of the heavens and the present state of the heavenly bodies; the province of cosmogony is to explain how these heavenly bodies come to be where they are and as they are; it takes the still photograph presented by astronomy and tries to develop it into a cinematograph film which shall exhibit the universe being born, developing, passing through its present stage, ageing and decaying before our eyes, the relation of each picture to the succeeding one being that of cause and effect.

Ancient Cosmogonies.—In contrast with modern scientific cosmogony, the crude cosmogonies of primitive races generally contain no conception of gradual or evolutionary change. For the most part they postulate a simple creative act; a crow or a raven or a tortoise or a magnified old man takes raw material and, as the result of a single effort, fashions the earth and the heavenly bodies in precisely the shape and form in which they exist to-day. At the best the act of the creator is merely that of shaping, carving and building; at the worst it may be even less than this, as for instance in the cosmogony of the Thlinkit Indians, where the creator-hero steals the sun, moon and stars out of a box in which they had lain hidden, and hangs them up so that they illuminate the earth. In the cosmogonies of more reflective races, especially those of India, the act of creation may be accomplished by a mere thought of the creator; from being a vision in his mind the world suddenly bursts into being as a material fact. The Iranian account of creation was especially interesting and somewhat akin to that in Genesis.

We owe to the Greeks the most beautiful, richest and most imaginative cosmogony that existed before science came to replace poetic imaginings by an effort to unravel the actual facts of creation. Uranus, the most ancient of all the gods, founded a dynasty in heaven, and he and his sons and his sons' sons through three generations took part in creating the world and peopling it with the minor immortals whose function was to help the world on its way in the events of everyday life.

Six centuries before Christ, Thales of Miletus challenged this mythology, which he derided as being too anthropomorphic, and cosmogony passed from the province of the poets and mystics to that of the philosophers. Two centuries later Empedocles taught that all things were formed out of the union in different proportions of the four eternal, indestructible and unchangeable elements of fire, air, earth and water, and Plato wrote that the heavenly bodies, the earth, sun, moon and stars, as well as all animals and plants, have been created out of those four absolutely inanimate elements, "not from any action of mind or of any god, or by any art, but by the action of chance and of the forces arising out of certain inherent affinities among the natural bodies, hot tending to combine with cold, dry with moist, soft with hard and so on."

Newton's Cosmogony.—Cosmogony advanced but little beyond the stage of philosophic speculation until Newton taught to the world the meaning of the universal applicability of natural laws. The force which causes the apple to fall to the ground also keeps the moon in its orbit, and the forces which govern the simple phenomena of our daily lives must have acted at, and may alone have sufficed for, the creation of the earth and the heavenly bodies. In 1692 we find him writing to Bentley, Master of Trinity college, Cambridge, as to the possible influence of gravitation in the formation of worlds:

"It seems to me that if the matter of our sun and planets, and all the matter of the universe, were evenly scattered throughout all the heavens, and every particle had an innate gravity towards all the rest, and the whole space throughout which this matter was scattered was finite, the matter on the outside of this space would, by its gravity, tend towards all the matter on the inside, and by consequence fall down into the middle of the whole space, and there compose one great spherical mass. But if the matter were evenly disposed throughout an infinite space, it could never convene into one mass, but some of it would convene into one mass and some into another, so as to make an infinite number of great masses, scattered great distances from one another throughout all that infinite space. And thus might the sun and fixed stars be formed, supposing the matter were of a lucid nature."

Kant's Cosmogony.—In 1755 Kant followed Newton in regarding a limitless waste of chaotic primordial matter as the raw material out of which the universe has been formed, as also in supposing gravity to be the agency through which this formation took place. He imagined that, as a result of their mutual gravitational attractions, the primaeval atoms continually fell in upon one another, and in so doing became hotter just as the bullet becomes hot on striking the target.

This is in keeping with modern scientific knowledge, but Kant's next step was not. For he imagined that the collisions of his atoms generated not only heat but also rotation. As the atoms collided the nebula not only got hotter and hotter, but also, he thought, began to rotate and spun faster and faster until at last splashes of matter were thrown off from its equator much in the manner in which splashes of mud are thrown off a bicycle wheel. These splashes of matter formed a continuous rotating ring which encircled the nebula just as Saturn's rings encircle Saturn. The ring finally condensed into a planet and by many repetitions of the process the sun's family of planets was born out of his body.

Laplace's Nebular Hypothesis.—In 1796 Laplace propounded the system of cosmogony which, under the general name of the "nebular hypothesis," held the field for a full century. Laplace's cosmogony may be briefly described as that of Kant with the mistakes left out. Apart from these, the two theories are almost identical, although Laplace seems to have written in complete ignorance of the earlier speculations of Kant. Avoiding Kant's error of imagining that rotation could be generated out of no rotation, Laplace took as his raw material a nebula which was already endowed with a certain amount of rotation. He imagined this nebula to be continually emitting radiation, and therefore to cool and to shrink as it cooled. By a well-known scientific principle, "the Conservation of Angular momentum," a body which is spinning and at the same time shrinking in size must spin faster as it shrinks, at any rate unless some outside agency is at work checking or inhibiting the increase in its rate of spin. Laplace accordingly supposed the nebula to rotate ever faster and faster about its axis.

The theory of the dynamics of rotating bodies makes it clear that a mass of either liquid or gas in rotation cannot rest in the spherical shape which it would assume if it were not rotating. Under slow rotation such a mass assumes the shape of a slightly flattened oblate spheroid, or, if we prefer so to describe it, a body which differs from a sphere only in bulging a bit round its equator and being a bit flattened at its poles—an orange-shaped figure. The shape is that of the earth and the other planets, which have assumed this shape precisely on account of their rotation. A ship at the earth's equator is farther from the centre of the earth than a ship at the north pole, and if the earth's rotation were suddenly checked, the path from equator to pole would be seen to be a downhill path, down which not only ships, but also oceans, cities and continents would start to slide, and would continue sliding until the earth's equatorial bulge disappeared and the earth's shape had become entirely spherical. Thus it is the earth's rotation which keeps its equatorial bulge in existence.

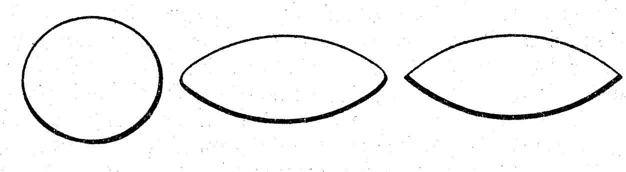
In the same way if the earth's present speed of rotation were increased, ice, water, earth and other bodies would start to slide from the poles to the equator, thereby increasing the equatorial bulge, so that the earth's figure would become more flattened than it now is. Mathematical analysis shows that any increase in the speed with which a gravitating mass of liquid or gas rotates increases its flatness of figure. So long as the rotation is slow, this figure has the shape of an oblate spheroid such as the earth, but with faster rotation the spheroidal shape is lost.

When this occurs, it can be shown that the increased rotation produces changes which are of the same general nature in all bodies, provided only that their mass is sufficiently condensed towards the centre. As the spheroidal shape is departed from, the equator of such bodies pulls out into a pronounced edge which ultimately becomes perfectly sharp, so that the body acquires the shape of a double convex lens. The sequence of figures is shown in figs. 1–3.

Mathematical theory further shows that when once the lens-shaped figure has been attained, any further increase in the speed of rotation results in matter being thrown off from the sharp equator. The mass is now rotating so fast that its gravitational attraction is inadequate to retain the outermost particles on the equator against the centrifugal tendency set up by rotation, and they are thrown off into space. No matter how much the rotation is increased, the sequence of events remains the same. At each stage the sharp edge acts like a safety-valve, ejecting just so much matter as is necessary in order that the remainder may be able to rotate as a lenticular mass with a sharp edge.

A fair analogy is to be found in the sequence of events when a tumbler partially filled with water is placed on a rotating table, which is then made to spin faster and faster. As the speed of rotation increases the water creeps up the side of the glass until it reaches the rim, after which any further increase of rotation is accommodated by the water spilling over the edge of the glass. In the cosmogonical problem the lens-shaped figure corresponds to the glass with water exactly up to its rim; the matter ejected from the sharp equator of the lens is the matter spilled out when the rotation became too great for all the matter to stay inside the lens-shaped boundary. After this spilling-out process has once begun the sequence of figures is that shown on p. 490, fig. 4, which is identical with the previous fig. 3, being repeated for the sake of continuity.

Laplace believed that stars such as the sun which have given birth to families of planets had at some stage of their existence passed through the sequence of configurations just described, and supposed the planets to have been formed by the condensation



FIGS. 1–3.—EFFECT OF ROTATION ON A SPHERE OF GAS

of the matter which had been spilled out in the equatorial plane. This, of course, explained why the planets all moved in approximately the same plane and revolved in the same direction round the sun. He further supposed that when once the planets had condensed and been set free as independent bodies they went through precisely the same process in their turn, thus becoming surrounded with families of satellites, which necessarily revolved in the equatorial planes of the planets in the same direction in which they themselves revolved round the sun.

For a long time this hypothesis appeared to give the most likely explanation of the origin of the solar system, but to-day the available evidence both of observational astronomy and of mathematical theory is unfavourable to the explanation. The sky provides a great number of examples of the fate awaiting stars which rotate too fast for safety; it is not to found a family but to break in two. And when the mathematician follows out the details of the process imagined by Laplace with reference to the special case of the solar system, he finds that there is nothing wrong with the general mathematical theory, but that its application to the solar system leads to numerical values which cannot possibly be reconciled with those observed. Thus there is a consensus of opinion that Laplace's hypothesis must be abandoned as an explanation of the origin of the solar system, not because it is wrong in theory, but because it fails in practice.

If, however, the process imagined by Laplace is correct in theory it may be that it occurs elsewhere in the universe; if it has not formed the solar system it may perchance have been responsible for some other formation known to the astronomer. In actual fact it seems almost certain that the process imagined by Laplace is continually in progress, but on a stupendous scale which is incomparably greater than any of which Laplace ever dreamed.

Gravitational Instability.—Let us return to Newton's conception of an enormous mass of nebular matter scattered, in the first instance, uniformly through space. Newton conjectured that distinct condensations would form in such a medium, and that in time all the nebular matter would settle round these condensations under the influence of gravity. The problem has been discussed mathematically by Jeans, who has confirmed the general accuracy of Newton's conjecture, and has also obtained a formula from which it is possible to calculate the average distance apart at which the condensations will form in any given nebular medium, and the average mass that will ultimately settle down round each.

When a disturbance is produced in the earth's atmosphere, as for instance by firing a gun, waves of sound carry the energy of the disturbance to great distances in the form of waves of alternate condensation and rarefaction, the rate of travel being the same for waves of all wave-lengths. Let us now imagine an atmosphere or other mass of gas extending for millions of millions of miles, and disturbances of wave-length millions and millions of times as great as that of terrestrial sounds—let us, in brief, imagine phenomena on the astronomical instead of on the terrestrial scale of magnitude. The gravitational attraction of the various parts of the atmosphere on one another now becomes very important, and shows its importance by causing waves of different wave-lengths to travel at different speeds. The waves of short wave-length all travel at the same speed, this being the speed at which they would travel if gravitation were non-existent, but the longer waves find their speed of travel retarded by the gravitational forces produced by the waves themselves; wherever there is a condensation of the atmosphere the gravitational forces are stronger than elsewhere and resist the spreading out of the condensation. Finally waves whose length is greater than a certain calculable length do not travel at all; the gravitational forces resulting from the accumulation of matter in one neighbourhood are so great as to draw more and more matter in from outside, so that a small accumulation tends to form into a big one, and the whole medium tends to condense round clots or condensations. The medium may appropriately be described as being "gravitationally unstable" for all waves whose length is greater than the critical calculable length.

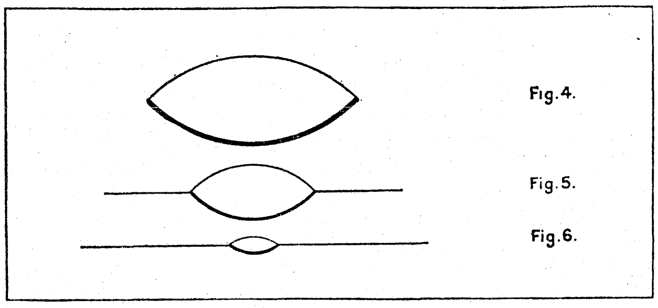
The average distance apart of the clots which will form in such a medium is equal to the wave-length of the shortest waves which are gravitationally unstable. This distance can be calculated when two quantities are known, namely, the density and the temperature of the gaseous or nebular medium. Now if, as Newton imagined, "all the matter of the universe were evenly scattered throughout the heavens," we should obtain a medium whose density Dr. Edwin Hubble of Mount Wilson observatory has recently estimated would be of the order of 10^{-31} grammes per cu. centimetre, a density at which there would only be about one molecule to every 1,000cu.yd. The principle of gravitational instability shows that such a medium would condense into clots, but if the gas were initially at a fairly high temperature the average amount of matter in each clot would be hundreds or even thousands of millions of times as great as the amount of matter in the sun or in the average star.

The process cannot, then, result as Newton thought in the formation of the sun and fixed stars; it must produce bodies on an altogether grander scale.

Spiral and other Extra-galactic Nebulae.—The astronomer is familiar with bodies of the required size; they are the spiral and other extra-galactic nebulae. The sun and all the stars we can see with the naked eye belong to a single colony of stars, the "galactic system," which is bounded by the milky way altogether. Outside this system lie the bodies known as "extra-galactic nebulae," at distances so great that light from even the nearest of them, although covering 186,000m. every second of its journey, takes something like 1,000,000 years to reach us. The masses of these nebulae are of the order of 100 or 1,000 million times the mass of the sun, and so are of precisely the magnitude required by the hypothesis that they have been formed by gravitational instability out of a continuous primaeval gaseous medium. Their dimensions are comparable with the dimensions of the whole galactic system, and are so enormous that, in spite of their immense distance, the astronomer can study their shapes and photograph their general appearance with comparative ease. A selection of photographs is shown in Plate II.

It will be seen that the sequence of figures shown in the first four examples is precisely that shown in the theoretical figs. 4 to 6. The series could easily be extended to include observed nebulae of the shapes shown in the theoretical diagrams 1 and 2, but such nebulae are not interesting objects photographically. Statistical researches by Hubble make it highly probable that there is a continuous sequence of nebulae having the shapes shown in the theoretical diagrams 1 to 6, only the last half of this series being exemplified by the photographs shown in Plate I. The last photograph of all on this plate shows a nebula of the same general type viewed from another angle; there is little room for doubt that this nebula is physically very similar to that shown in fig. 5, the difference in appearance arising solely from the different angle of view.

The parallelism in the two sets of figures is so marked that it seems clear that the extra-galactic nebulae must be rotating masses of the general type discussed by Laplace, except for being on an immeasurably greater scale. This interpretation is confirmed by the fact that a number of these nebulae have been found observationally to be in rotation about their shorter axes,



FIGS. 4–6.—MODE OF BREAK-UP OF A ROTATING MASS OF GAS

precisely as demanded by theory. We may suppose that the original primaeval nebular medium was not completely at rest but was disturbed by currents; as it condensed into detached nebulae the motion of the currents would persist in the form of rotation of the nebulae, the different shapes of the present nebulae representing different degrees of rotation.

The Birth of Stars.—The amount of rotation of some of the nebulae is so great that, at some stage of their shrinkage, matter was spilled out into their equatorial plane and has remained in this plane ever since; *see* Plate II. for a number of instances of this formation. The matter left behind in this way would at first form a continuous nebular medium, a sort of counterpart of the parent medium out of which all the nebulae were formed, except that its density must have been some 10,000 million times as great, being of the order of 10^{-21} instead of 10^{-31} grammes per cubic centimetre. The process of gravitational instability must operate in this medium also, but as a consequence of the far greater density, the masses of the resulting condensations must be far less. Calculation indicates that the amount of matter in each condensation must be about equal to that in a newly-born star.

This suggests very forcibly that the outer regions of the nebulae are the birth-places of the stars. Condensations in process of forming may be seen in the outer regions of the nebulae shown in Plate I., and at various times actual unmistakable stars have been photographed in the outer regions of the nearer of the extra-galactic nebulae, although it is significant that all efforts to find them in the inner regions of the same nebulae have failed.

The Development of Rotating Stars.—The sequence of events after a star has come into being is still a matter of debate (*see* STELLAR EVOLUTION). There is, however, general agreement that a newly-born star must contract. According to Jeans, this contraction must continue until a comparatively firm unyielding base has been formed at the centre of the star, through the atoms, nuclei and electrons being so congested that the ordinary gas laws are entirely out of operation; he finds that in the central regions at least of the star, the density of matter must be so great that its state approximates more nearly to the liquid than to the gaseous state.

The first products of gravitational instability, the extra-galactic nebulae, proved to be incomparably greater in size than Laplace's imaginary rotating nebula, but each of the smaller masses of gas formed by condensation out of the outlying parts of these nebulae is in effect a gaseous nebula of just about the size and mass imagined by Laplace. If, then, the younger generation of nebulae, as they rotate and shrink, meet with the same sequence of experiences as their parents before them, we have the course of events postulated by Laplace taking place on the scale imagined by Laplace, and we need not look farther for the mode of birth of the solar system. But mathematical theory prohibits such a simple solution to the problem.

The gas set free from a nozzle in the laboratory does not form

BY COURTESY OF THE MT. WILSON OBSERVATORY

TYPES OF REGULAR-SHAPED NEBULAE

1. Regular-shaped nebula. This nebula (N.G.C. 3115) is similar to a great number of observed nebulae, which have the shape of a huge mass of gas in rotation

2. Regular-shaped nebula with dark matter on equator. The appearance of this nebula (N.G.C. 5866) suggests that the equatorial ejection of matter is beginning in accordance with the mathematical theory

3. Regular-shaped nebula with ring of dark matter surrounding equator. This nebula (N.G.C. 4594) appears to be a rotating mass, in which the equatorial ejection of matter is well advanced

4. Nebula with condensation in equatorial plane. This nebula (N.G.C. 5746) is similar to that shown in Fig. 3, except that the gas in the equatorial plane has begun to break up into condensations

condensations under its own gravitation, the reason being that the mass of matter involved is so small that the gravitational attraction of the matter on itself is inappreciable; it is only when matter is set free on a colossal scale that gravitational instability can come into operation. The scale of the galactic nebulae is amply big enough, but that of jets of gas in the laboratory is too small. Calculation shows that any ejection of gas from the equator of a rotating star is also on too small a scale for gravitational instability to get any grip, so that the ejected gas must just scatter into space like gas out of a tap.

When the star has shrunk so far that its centre approximates to the liquid state, a new set of factors comes into play. The behaviour of a mass of shrinking and rotating liquid has formed the subject of investigations by many of the most eminent of mathematicians, including Maclaurin, Jacobi, Kelvin, Poincaré and G. H. Darwin, and the sequence of events is now well-known. So long as the speed of rotation is low, the mass assumes the flattened orange shape already discussed. With increasing rotation the degree of flattening increases, until a stage is reached at which the shortest axis is only seven-twelfths of the longer axes. Beyond this, further shrinkage does not accentuate the flattening; instead the mass assumes the shape of an ellipsoid with three unequal axes (Jacobian ellipsoid) which continually elongates until it is shaped almost like a cigar, its length being nearly three times its shortest diameter. After passing this stage, violent fluctuations are found to be set up in the mass. It develops a waist somewhere near, but not quite at, the middle of its figure, and after a succession of oscillations in which this waist alternately expands and contracts, the mass ends by breaking into two.

The sequence of events is indicated in figs. 7–11, although it must be added that the last two of these figures are largely conjectural, and take us entirely beyond the reach of exact mathematics. But there would seem to be little room for doubt that the final product of a liquid star which has shrunk while rotating is a system of two liquid stars which revolve about each other in nearly circular orbits.

Binary Stars.—Many binary systems of this type are known to astronomers, and provide confirmation of the sequence of events predicted by theory. The mere existence of systems which have broken up in the way described may be taken as evidence that the parent star was largely in a liquid state before fission occurred, since Jeans has shown that a purely gaseous star could not divide by fission into a binary system. The further development of such a binary system can be calculated theoretically and can also be traced observationally. Three separate tendencies are at work, each acting in the direction of increasing

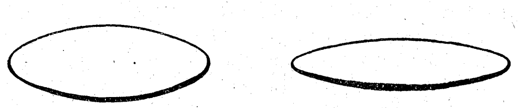

FIG. 7 FIG. 8

FIGS. 7–8.—EFFECT OF ROTATION ON A MASS OF LIQUID
Fig. 7 shows the Maclaurin spheroid, or flattened-orange, configuration for a rotating liquid; fig. 8 shows the Jacobian ellipsoid, so elongated as to be almost cigar-shaped

the size of the orbit. In the first place, so long as the two components are fairly near to each other, each raises substantial tides on the other, and G. H. Darwin showed that the inter-action of these tides must cause the two masses to recede from each other. Simultaneously with this, the emission of radiation from the two stars is accompanied by a loss of mass to each, and Jeans has shown that the effect of this also is to increase the dimensions of the orbit. Neither of these two agencies can produce more than a strictly limited increase in the size of the orbit. A third agency, to whose activities there is almost no limit, consists of the gravitational forces from passing stars. These tend to increase the size of orbit of the binary, at any rate until it is of the order of 100,000,000m. or so in diameter.

The Ages of the Stars.—This last agency acts very slowly, but its effects are cumulative, and given sufficient time, it so easily overpowers the two first mentioned, that they may be disregarded by comparison. Knowing the density with which stars are scattered in the sky, it is easy to calculate the rate at which their gravitational pulls increase the orbits of binary stars, so that the size of the orbit of a binary star gives a rough indication of its age. For most of the binaries which have been formed by fission in the way just described, this age must be reckoned in millions of millions of years.

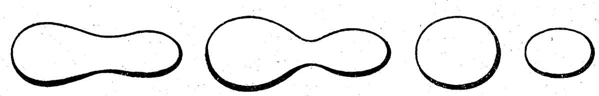

FIG. 9 FIG. 10 FIG. 11

FIGS. 9–11.—THE MODE OF BREAK-UP OF A ROTATING MASS OF LIQUID
The pear-shaped form of figure 9 is produced by furrowing the cigar-shaped form shown in figure 8. Figures 10 and 11 exhibit its further development into two detached masses

The binary systems which can be said with fair certainty to have been formed by fission due to rapid rotation are mainly of the class known as spectroscopic binaries. The telescope generally shows these as a single point of light, but the evidence of the spectroscope reveals the fact that the apparent point of light really represents two stars describing orbits about one another. Another class of binary systems, which outnumbers these by perhaps 20 to one, consists of pairs of stars which describe orbits about each other and show visually as two distinct points of light. These are known as visual binaries. The dimensions of the orbits of many of these are so great that they can hardly have been formed by the fission of a single star and it is more likely that they are the remains of independent but adjacent condensations in the nebula from which they were born. These visual binaries provide evidence as to their ages which is in general agreement with the story told by the spectroscopic binaries.

As a rule the more massive constituent of a binary is not only brighter than the smaller constituent, but also emits more light in proportion to its mass. It is easily shown that this results in a tendency for the two masses to equalize as they diminish together under their emissions of radiation. Actually it is found that the constituents of older binaries approximate more closely to equality of mass than the constituents of younger binaries, and the observed ratio of mass in different types of systems gives an indication of their actual ages. Again calculation shows that average stellar ages must be reckoned in millions of millions of years.

THE GENESIS OF THE SOLAR SYSTEM

The various transformations of astronomical matter which have so far been discussed have given no clue to the origin of the solar system. The sun and planets can hardly represent the remains of independent condensations in a primaeval nebula, their masses being too unequal to admit of any such explanation. For the same reason they can hardly be the remains of a single star which has broken up by rotational fission. The greatest observed inequality of mass in the constituents of binary stars is about four to one, whereas the sun has more than 1,000 times the mass of the largest planet (Jupiter) and something like 8,000,000 times the mass of the smallest (Mercury), even when the asteroids, of smaller mass still, are left out of account. Moreover, as Babinet first pointed out, the total rotational momentum in the whole solar system is so slight that it is practically inconceivable that this amount of rotation could have caused it to break up. For these and other reasons there is now fairly general agreement that excess of rotation cannot have caused the birth of the solar system.

The stars are so remote from one another that in general the influence of a star even on its nearest neighbour is entirely infinitesimal. The moon on account of its extreme nearness raises tides on the earth which are a few feet in height, this being, roughly speaking, a 10,000,000th part of the earth's radius. But the star Proxima Centauri does not raise tides of this height on the surface of the sun, or even of a 1,000,000th or 1,000,000-1,000,000th part of this height; the average height of tide which Proxima Centauri raises on the sun is about one-50th of the radius of an electron. If, however, as we have to suppose, the sun has wandered at random among the stars for a period measured in millions and millions of years, it must at times have had nearer neighbours than Proxima Centauri, and we are free to imagine that at times stars must have passed so near to it as to have raised tides of substantial height on its surface.

The Tidal Theory.—According to the tidal theory, which at present seems to hold out most promise of explaining the origin of the solar system, the planets and their satellites owe their existence to an exceptionally close approach between our sun, then a normal single star unaccompanied by planets, and a passing star. The closer the approach of a wandering star, other things being equal, the higher would be the tides raised on the surface of the sun; but unless the approach was very close indeed, the tides would subside as the star which caused them receded. Jeans, who has studied the question mathematically, has however found that if the passing star came to within a distance of a few radii, generally about three, of the sun, the tides would take the form of two long arms of gas ejected from opposite points of the sun's surface, and these would not necessarily subside as the disturbing star receded. Under the action of gravitational instability, condensations would form in these long gaseous arms, and calculation shows that the masses of these condensations would be of just about the order of magnitude of the observed masses of the planets.

If a tidal cataclysm of this kind can explain the birth of the planets it can obviously, in general terms at least, explain the birth of satellites out of these planets. For immediately upon the birth of any planet, say Jupiter, the original situation recurs but on a miniature scale. Jupiter now plays the part originally played by the sun, while the sun, or possibly the sun and the wandering star in conjunction, plays the tide-raising part originally assigned to the wandering star. Again we can imagine the ejection of tidal filaments of gas, and again the formation of condensations in these filaments, each condensation ultimately forming a satellite.

So long as the matter is discussed in general terms, it may look as though the process just described might continue endlessly through generation after generation. But actually the question of scale is found again to intervene and fix a limit. Bodies below a certain size cannot be born by condensation, again for the reason that small amounts of gas do not condense at all, but scatter into space like a puff of gas out of a gas-tap. Calculation indicates that the smallest of the known satellites can only have escaped this fate by liquefying or solidifying immediately after birth, and makes it clear that there is no room for a generation junior to the satellites of the planets.

Not all the gas which is ejected at a tidal disruption will immediately condense into planets and satellites. Some at least must remain scattered in space, forming a resisting medium which will impede the motions of the planets and satellites. The effect of resistance of this kind is to make an orbit assume a circular shape, and in this way the approximate circularity of the orbits, both of the planets and their satellites, is readily accounted for. Ultimately this stray gas would either fall back into the sun or condense round the planets or scatter into space, leaving interplanetary space clear of matter.

Jeffreys has calculated that this whole process would require a period of the order of 7,000 million years. As regards order of magnitude, this is in general agreement with Holmes's estimate, made from a study of the composition of radioactive rocks, that 1,500 million years have elapsed since the solidification of the earth. Quite possibly, the interplanetary medium has not yet entirely disappeared; the particles which reflect the zodiacal light may well be its last surviving vestiges.

While the theory just sketched out shows many points of agreement with observation, it cannot be denied that it also encounters formidable difficulties. Still, compared with other theories which have so far been suggested, it may fairly be said to show the greatest capacity for accounting for observed facts, and to be free, so far as is at present known, from any insuperable objections.

The Earth-moon System.—Whatever hypothesis we hold as to the origin of the solar system, the earth-moon system presents a rather special problem, since the ratio of the masses of the earth and the moon (about 81 to one) is nearer to equality than any other ratio of masses in the system. Mathematical discussion of the tidal theory shows that the more liquid a planet is when a satellite is born, the greater will be the mass of the satellite in proportion to that of the planet; a satellite born out of a wholly liquid planet would have a mass comparable with that of the planet itself. Thus on the tidal theory the abnormal ratio of mass in the earth-moon system can be explained merely by supposing that the earth was rather more liquid at the time of the birth of the moon than the other planets were when their satellites were born.

An alternative suggestion, put forward by G. H. Darwin, is that the natural period of vibration of the earth was in some past epoch exactly equal to the period of its revolution round the sun, so that, as a result of resonance, the sun raised enormous tides in the earth, which ultimately caused it to divide into two parts. Jeffreys, who has studied this hypothesis in some detail, finds that it gives a reasonable explanation of the existence of the earth-moon system. G. H. Darwin also studied the separation of the earth and moon under the influence of the forces arising from the lunar tides, and found that these were adequate to account for the present distance between the earth and the moon.

Although these alternative rather special hypotheses are available, it remains simplest and most natural to suppose that the moon was born out of the earth in the general cataclysm which tore the planets out of the sun, and the other satellites out of the planets around which they revolve.

Frequency of Genesis of Solar Systems.—The tidal theory of the genesis of the solar system which has just been explained, postulates a very close meeting of two stars in space. A quite simple discussion shows that meetings of the required closeness are necessarily very rare occurrences, and that even in the lifetime of millions of millions of years which we have found it necessary to allot to the stars, only a very few stars can have experienced such close encounters. A calculation which allows as best we can for all the factors within our knowledge suggests that the proportion can hardly be greater than about one in a million. It follows that very few stars can be surrounded by systems of planets as our sun is, so that the solar system is somewhat of the nature of a "freak-formation."

This brings about a reversion from the view somewhat widely held last century that every star was the centre of a family of planets; it now seems more likely that for every star which is attended by planets, 1,000,000 or more aimlessly radiate light and heat into vacant space. The possible abodes of life in the universe are correspondingly restricted, and terrestrial life is seen to form a larger proportion of the total life of the universe than was at one time imagined.

Our sun is a member of a colony of some thousands of millions of stars, the galactic stellar system. We do not know much about the number or arrangement of stars in the outlying parts of this system, but only in the dense central regions are stars at all likely to pass close enough to one another to produce planets. And here calculation shows that under present conditions planetary systems are only likely to be produced at the rate of about one in 6,000 million years. Thus our solar system with its age of only a few thousand million years is very possibly the youngest planetary system in the whole colony. Our terrestrial civilization, with only some 6,000 years of existence behind it, is almost certainly the youngest civilization.

COSMOLOGY means a theory of the world or of the world-order. The term "cosmos" is mostly used in the sense of an orderly world, or a world-order, in contrast with chaos or disorder. Sometimes the expression cosmology is used as a variant for cosmogony (*q.v.*) to denote an account of the origin of the world or of its development out of an original chaos. It is more usual, however, to restrict the term cosmogony to early mythological accounts, which are of anthropological or historical interest, rather than of scientific or philosophical value. "Cosmology," on the other hand, is applied more extensively to any kind of rational attempt to deal with the ultimate problems of Nature. It includes such attempts as that of Descartes to show how an orderly world like ours might have evolved out of an original chaotic collocation of matter and motion, such speculations as those of Herschel, Kant and Laplace about the origin of the solar system, and more generally all that is usually included under the name of philosophy of Nature (as distinguished from natural philosophy, which is only another name for physics). The extravagances of Schelling (*q.v.*) in the early part of the 19th century tended to discredit the philosophy of Nature by trespassing rashly on the domain of physics. Cosmological speculations have, indeed, not been entirely abandoned, and are not likely to be so long as there is such a thing as philosophy at all. One may instance the speculations of Samuel Alexander about the "emergence" of our world-order out of a more primitive space-time matrix, and the neutral monism of J. Dewey and others. In the main, however, the prevailing tendency in present-day cosmology as a philosophy of Nature is to make explicit and to examine critically all the concepts and assumptions which are employed in the popular and scientific accounts (whether merely descriptive or explanatory) of the phenomena of Nature, using the term Nature in the restricted sense of the material world (as contrasted with the Spinozistic use of the term for the entire universe, in its spiritual as well as in its material character). A. E. Taylor (*Elements of Metaphysics,* book 3, ch. i.) regards the following as the fundamental problems of cosmology: (1) The real nature of material existence, *i.e.,* the ultimate significance of the distinction between physical and mental or spiritual existence, and the possibility of reducing them to one; (2) the justification for the distinction between mechanical and teleological processes, and for the conception of the physical order as rigidly conforming to uniform law; (3) the leading difficulties of the conception of space and time, and their bearing on the degree of reality to be ascribed to the physical order; (4) the philosophical implications of the application of the idea of evolution to the events of the physical order; (5) finally, the problem of the real position of descriptive physical science as a whole. (*See* COSMOGONY; PHILOSOPHY, HISTORY OF.)

COSMOPOLITAN, of or belonging to a "citizen of the world" (Gr. κόσμος, world, and πολίτης, citizen), *i.e.,* one whose sympathies, interests and culture are not confined to his own race or country.

COSMOS, a genus of tropical American herbs of the family Compositae, comprising about 20 species chiefly Mexican. They are late-flowering annuals or perennials with long-stalked showy flower-heads borne singly or in clusters. Several species are in cultivation as ornamental annuals. Of these the best known is the common cosmos (*C. bipinnatus*), 7 ft. to 10 ft. high, extensively grown in gardens. It has a smoothish stem bearing much-cut, narrowly-lobed leaves and flower-heads with a yellow centre (disk) encircled by pink, crimson or white rays. The plant thrives best in sandy, not too rich, soil and germinates readily; in the northeastern United States the best results are attained by sowing the seed indoors in April and transplanting when danger of frost is past.

COSNE, a town of central France in the department of Nièvre, on the Loire at its junction with the Nohain, 37 mi. N.N.W. of Nevers by the P.L.M. railway. Pop. (1936) 6,988. It is mentioned in the Antonine Itinerary under the name of *Condate,* but it was not till the middle ages that it rose into importance as a military post. In the 12th century the bishop of Auxerre and the count of Nevers agreed to a division of the supremacy over the town and its territory. The church of St. Aignan (12th cent.) was restored in the 16th and 18th centuries; the only portions in the Romanesque style are the apse and the northwest portal. It formerly belonged to a Benedictine priory depending on the abbey of La Charité (Nièvre). The chief industries are the manufacture of files and flour milling.

COSSA, FRANCESCO DEL (*c.* 1435–1477), Italian painter, born in Ferrara, a leading master of the Ferrarese school during the middle of the 15th century, and the founder of the old Bolognese school of painting. His name first occurs in 1456 in a contract, by which he undertook to decorate the wall around the high altar of the cathedral of Ferrara with a representation of the "Pieta" and with paintings imitating marble. This document was signed by his father Cristofano, who was a builder. Cossa's chief works at Ferrara were frescoes painted in the Palazzo Schifanoia, a summer residence of Borso d'Este. They form part of a series intended to represent the blissful state of a country ruled by a benevolent sovereign. In three superimposed zones, which originally went all round the chief hall of the palace, these frescoes set forth the twelve months, figured in signs of the zodiac and allegorical figures, and illustrated in the occupations of men and women, with scenes from the daily life of Borso, in which he is glorified as the ideal ruler of his people. The whole scheme was evidently devised by one of the humanists of the court, probably by Pellegrino Prisciano, astrologer and poet. When first recovered from under whitewash in 1840 the frescoes were attributed to Cosimo Tura, Cossa's contemporary, with whom he exhibits affinities of style. The frescoes on one of the walls are now given to Cossa, for authentic proof was found in a letter addressed to Duke Borso by the artist stating that he painted the three fields representing March, April and May, that is the whole eastern wall, and complaining of the inadequate payment received. The letter is dated March 25, 1470, and as Borso's answer was in effect that he must be contented with the tariff fixed, it may be assumed that he left Ferrara for Bologna soon after. Here he found employment under the Bentivoglios. In 1472 he was asked to restore a miraculous Madonna fresco (by Lippo Dalmasio?) in the church of Madonna del Baraccano. The most noteworthy production of Cossa at Bologna and in many respects his most important work is the altar-piece painted in 1474 by order of Domenico de Amorini and Alberti de Catanei for the Mercanzea. This picture is now in the Pinacoteca at Bologna. It represents the Virgin and Child Enthroned with two saints and a Portrait of a Donor. It is a balanced composition, stately and austere. The tendency is realistic, the types are somewhat grim, the forms are searchingly defined, and the modelling is plastic, relief being obtained by light and shade and the play of reflections. The folds of drapery are heavy and tortuous; the colour of the Corte Vecchia and Sant Agostino is strong and fine.

Besides the pictures mentioned above the following are generally recognized as works of Cossa. The National Gallery, London, possesses the centre panel of an altar-piece representing "Vincent Ferrer," a Dominican saint, of which the wings, with "St. Peter" and "John the Baptist," are in the Brera at Milan; and the predella, representing the miracles of the saint, is in the Vatican Gallery. The Dresden Gallery has an "Annunciation," the Metropolitan Museum, the "Profile of a Boy," formerly in the Drury Lowe Collection; the Berlin Museum, "Allegory of Autumn"; the Budapest Gallery, "Two Angels," wings of an organ.

In the entrance wall of San Giovanni in Monte at Bologna is a circular window with a representation of St. John at Patmos, bearing Cossa's signature; and in the south aisle of the same church a window with the Virgin and Child with angels also by Cossa.

Morelli, *Italian Masters in German Galleries* (1883); Edmund Gardner, *The Painters of the School of Ferrara* (1911).

COSSA, PIETRO (1830–1881), Italian dramatist, was born at Rome. After fighting for the Roman republic in 1849, he emigrated to South America, but soon returned to Italy, and lived precariously as a literary man until 1870, when his reputation was established by the unexpected success of his first acted tragedy, *Nerone.* From this time to his death in 1881 Cossa continued to produce a tragedy a year, always upon some historical subject. His last piece, *I Napolitani nel 1799,* was produced in 1880.

COSSACK POST, a military term to indicate a small party of mounted men, usually three to six, under a non-commissioned officer or senior soldier, which supplies its own sentries.

COSSACKS, the name given to considerable portions of the population of the Russian empire, endowed with certain special privileges, and bound in return to give military service, all at a certain age, under special conditions (Russ. Kazak, perhaps from the Turki, *quzzāq,* adventurer). They constituted 11 separate *voiskos,* settled along the frontiers: Don, Kuban, Terek, Astrakhan, Ural, Orenburg, Siberian, Semiryechensk, Amur, Usuri and Zabaykalye. The primary unit of this organization was the *stanitsa,* or village, which held its land as a commune. The assembly of all householders in villages of less than 30 households and of 30 elected men in villages having from 30 to 300 households (one from each 10 households in the more populous ones), constituted the village assembly. Military service was obligatory for all men, for 20 years, beginning with the age of 18.

The cohesion and solidarity among the Cossack armies in the various regions was perhaps damaged by the Statute of 1869, which endowed the officers and civil servants with landed property. The rank and file remained under the communal system, the legal owners of the land being the various degrees of the community, from the *stanitsa* up to the region. The allotments were larger than those of the ordinary peasants, and outsiders, tenants of Cossack land (*inogorodnie*), or peasant owners, were envious and eager for equal opportunities. The decree of Dec. 12, 1917, had already altered the terms of military service. The decree of June 1, 1918, levelled the Cossack community with the rest of the population. But the land tenure introduced by the Soviet Government was much the same as that familiar to the Cossacks, combining individual management with State ownership. During the civil war 1919–21 the Bolshevik power revived extinct Cossack traditions in the Ukraine, forming red (*chervonny*) Cossack units. Elsewhere the Cossacks fought on both sides and about 30,000 left Russia with the remainder of the defeated white army. Information about the Cossack peoples in the various regions which have become merged into ordinary administrative divisions under Soviet rule is very scarce. (*See* also Poland: *History;* Razin, Stenka; Mazepa-Koledinsky, Ivan Stepanovich.

Svatikov, *History of the Don Cossacks* (Russ.; Vienna, 1924); R. Fox, *People of the Steppes* (1925). *See* also E. Brockhaus and I. A. Ephron, *Russian Encyclopaedia.*

COSSIMBAZAR or **KASIMBAZAR,** a decayed town on the river Bhagirathi in the Murshidabad district of Bengal, India, now included in the Berhampore municipality. Though the history of the place cannot be traced back earlier than the 17th century, it was of importance long before Murshidabad was made the capital of Bengal. In that century it became the great trading centre of Bengal. In 1658 an English factory was established at Cossimbazar, which soon became the chief commercial agency of the East India company in Bengal. French and Dutch factories were also set up in the second half of the 17th century, and the Armenians had a settlement in a suburb of the town. The proximity of the English factory to Murshidabad, the Mohammedan capital, while it was the main source of its wealth and political importance, exposed it to constant danger. Thus, in 1757, it was the first to be taken by Siraj-ud-daula, the nawab of Bengal; and the resident, with his assistant (Warren Hastings), were taken as prisoners to Murshidabad.

After the famine of 1770 the cultivated area in its neighbourhood shrank and the greater part of the surrounding country was described as "a wilderness inhabited only by beasts of prey." In 1813 its ruin was completed by a sudden change in the course of the Bhagirathi, which formed a new channel 3m. from the old town. Virulent epidemics broke out which swept away three-fourths of the inhabitants, and loss of population was followed by dilapidation of buildings. The first wife of Warren Hastings was buried at Cossimbazar, where her tomb, with its inscription, still remains.

COSTA, GIOVANNI (1826–1903), Italian painter, was born in Rome. He became known as a landscape-painter of remarkable originality, and of great influence in the return to minute observation of nature. He had many English friends and followers, notably Matthew Ridley Corbet (1850–1902), and Lord Carlisle, and was closely associated with Corot and the Barbizon school. An exhibition of his pictures was held in London in 1904, and he is represented in the Tate Gallery. He died in Rome in 1903.

See Madame Agresti's *Giovanni Costa* (1904).

COSTA, LORENZO (1460–1535), Italian painter, was born at Ferrara, but went in early life to Bologna and ranks with the Bolognese school. In 1488 he painted his famous "Madonna and Child with the Bentivoglio family," and other frescoes, on the walls of the Bentivoglio chapel in San Giacomo Maggiore, and he followed this with many other works. He was a great friend of Francia, who was much influenced by him. In 1509 he went to Mantua, where his patron was the Marquis Francesco Gonzaga, and he eventually died there. His "Madonna and Child enthroned" is in the National Gallery, London, but his chief works are at Bologna. His sons, Ippolito (1506–61) and Girolamo, as well as Girolamo's son, Lorenzo the younger (1537–1583), were also painters.

COSTA, SIR MICHAEL ANDREW AGNUS (1808–1884), was the leading conductor in England and a notable figure in the musical life of his day. Born at Naples, he settled in London (1830), conducted the opera at Her Majesty's from 1832 till 1846, then seceded to the Italian Opera at Covent Garden; conducted the Philharmonic Society from 1846 to 1854, the Sacred Harmonic Society from 1848, and the Birmingham festival from 1849. Meanwhile he had conducted the Bradford (1853) and Handel festivals (1857–80), and the Leeds festivals from 1874 to 1880. As a composer he produced a number of operas and oratorios of no importance. He became a naturalized Englishman and received the honour of knighthood in 1869. He died at Brighton April 29, 1884.

COST ACCOUNTING. A system of accounting designed to show the actual cost of each separate article produced or service rendered from time to time, as distinguished from the ordinary system of accounting which aims only at showing the working results of a business as a whole, or sometimes of each separate department of a business. The two systems of accounting are usually compiled independently of each other by different staffs, but if satisfactory results are to be reached these must work in co-operation, and the results produced must be reconcilable and mutually explanatory.

Early History.—The origin of cost accounting, like the origin of book-keeping itself, is unknown; but possibly the first attempts in this direction were made in connection with the tin mines of Cornwall, as under the ancient Stannary courts of Cornwall tin-mining companies were formed, called *cost book companies,* a form of organization very similar to the *no-liability company* still extant in Australia. However that may be, systematic costing was usual in mining concerns long before anyone thought of extending it to manufacture generally.

Necessity of Costing.—The necessity for cost accounting arose out of the direction in which ordinary accounting methods developed to meet the growing requirements of modern business. In mediaeval times trade consisted mainly of a series of separate ventures, or voyages, for each of which a separate account was kept, so that at the end the actual result of that particular venture or voyage was shown by the account. When commerce assumed the form of continuous trading, however, the method adopted was to merge everything into a single *trading account* which showed the results of the trading as a whole, but no details. In the nature of things, such a method of accounting could only be satisfactory so long as it was reasonable to assume that all the business undertaken contributed *pro rata* to the final result. In some cases (*e.g.*, in many department stores and wholesale warehouses) this assumption may be sufficiently near the truth for practical purposes, but it is never even approximately true in a manufacturing concern. Indeed, it seems safe to say that in almost every business some lines are more profitable than others, and that (whether it be recognized or not) some lines are quite unprofitable. Hence the need for a system of accounting that will give detailed information as to the exact cost of each separate thing sold, or each service rendered, especially in cases where the selling price has of necessity to be determined in advance.

Costing Methods.—Because cost accounting is in the main a search for detailed information, it follows that the most convenient and suitable methods will be found to vary in almost each individual case. Accordingly, only the barest outline of a system of cost accounting can be indicated here. The first step is to determine the number of separate cost accounts that are to be kept. In some businesses where production is continuous, these individual cost accounts would also be continuous and balanced periodically like *trading accounts*, but in the case of contract work the number of accounts will vary from time to time according to the number of contracts then in progress. Each separate cost account may be (and often is) sub-divided, so as to show the work performed by each separate department thereon. The other broad basis of division is to separate the outlays chargeable against each separate cost account (or sub-account) into (*a*) labour, (*b*) materials, (*c*) overhead. Each of these will again be subject to sub-division.

Labour Costs.—*Labour* represents the cost of work done directly for, and in connection with, any particular cost account. It is not, therefore, quite the same thing as wages paid; as lost time, time occupied upon spoilt work, idle time, and cost of supervision are not directly chargeable against any particular piece of work, and have therefore to be transferred to overhead charges. (Loss arising from spoilt work should be treated as part of the overhead charges of the department where the "spoil" occurs.) Everything that has been paid away has to be charged up somewhere, and an agreement of totals is an essential part of a satisfactory costing system. If suitable office machinery be employed it is quite practicable to effect this agreement before the wages are paid, and therefore in time to prevent any overpayment of wages.

Materials Costs.—*Materials* represents the cost of all materials directly used in connection with work for which any cost account is opened. Some of these materials will be purchased specially for a particular job and can therefore be charged direct to that job, others will be issued from store; but the total value of materials charged against cost must agree with the total value credited to suppliers of direct purchases and to the stores department. In connection with the stores records a great deal of detailed work is necessarily involved, and here again office machinery is essential in a concern of any magnitude. In order to reach really satisfactory results, stores records should be kept in both quantities and money values, otherwise no effective check on quantities is available. The same exact agreement of totals that was practicable as regards wages is not practicable as regards stores, partly because of discrepancies in weight, etc., owing to inevitable waste or alterations in atmospheric conditions; partly because when materials have been in store for a considerable time it does not at all follow that their original cost is a fair price at which to charge them out against current jobs. Such discrepancies, as well as the general expenses of the stores department, are usually included in the overhead, but they need careful watching. *Labour* and *materials* together constitute *prime cost.*

Overhead Costs.—*Overhead* consists of every kind of working cost not comprised in one or other of the previous headings. According to the nature of the business it may be anything between (say) 5% and 80% of the total cost, but in any event it represents outlays which by their nature cannot be regarded as directly chargeable against any particular item of output. The total must therefore be spread over the whole output as equitably as possible, according to some preconceived formula. Herein lies the weakness of many costing systems. Formerly, overhead used to be dealt with by adding a pre-arranged percentage to prime cost. This of course assumes that the actual use made by the different jobs of the services comprised under "overhead" is, in fact, in proportion to their respective prime costs. In fact, it is quite as often in an inverse ratio. No treatment of overhead can ever be satisfactory that does not aim at sub-dividing the overhead as a whole into the overhead of each separate department; the burden of the overhead expenses of each department may then be distributed over the output of that department week by week, or month by month, with some approach to fairness. But even then, the method of distribution should be elastic rather than rigid; that is to say, week by week, or month by month, someone in authority with a knowledge of the facts should approve the proposed distribution before it is given effect to. It is moreover important to see that the total amount distributed is reconcilable with the total amount of expenses incurred; otherwise, the aggregate costing results at the end of the year cannot agree with the results shown by the *profit and loss account.*

Absolute agreement is impracticable, but a reconciliation of the two totals is at least essential. Absolute agreement may be impracticable because, in order to arrive at the true cost, it may be necessary to include items which have not in fact had to be paid away. For instance, the fact that a manufacturer owns the freehold of his works is no reason why a fair charge for the rent of those works should not be included as part of his working costs; the fact that a manufacturer is paying interest on borrowed money because he is working with insufficient capital is no reason for saying that his operative costs are therefore higher; the fact that a manufacturer has for prudential reasons written down his plant and machinery far below their true value is no reason why a proper figure, representing the actual depreciation for the current period, should not be charged against the current output. Similarly, such items as bad debts, interest on investments, etc., while necessarily coming into the profit and loss account, have no bearing upon the practical working of the business, and are therefore quite properly omitted from the costing records.

Uses of Cost Accounts.—To sum up, it may be said that a satisfactory system of cost accounting assists the management to reduce working costs by pointing out waste and avoidable delay; to select its output wisely, and to vary the quantity of output as circumstances may require; to choose wisely between alternative methods of operation or production; to check quotations, by comparing estimates of cost made in advance with actual costs as subsequently ascertained. Cost accounting also provides the only reliable means of estimating the value of work in progress; of determining the extent to which sub-contracting is desirable; of deciding when to buy and when to manufacture where each alternative is possible. In addition, a proper system of cost accounts provides an effective check upon the stores department, and upon each operative department. It is the best possible safeguard against wages frauds or leakages of any kind, because every outlay has to be charged up to some cost account, and every cost account is being closely watched by interested parties who may be relied upon to challenge any but the most trifling overcharges. Every cost account (or sub-account) represents the results achieved by someone, be he works manager or foreman, or someone intermediate, who may be relied upon to see that his results are not belittled by improper charges. If manufacturers were to pool their results, a comparison of the working costs of similar undertakings would undoubtedly be generally beneficial; but, outside of public service undertakings, such comparisons are not at present available.

Bibliography.—In the nature of things the most useful books on cost accounting deal with its application to one particular set of

circumstances, and are of but little use elsewhere. The chief books dealing with general principles are: Dicksee, *The Fundamentals of Manufacturing Costs* (1917); Dicksee, *Book-keeping for Accountant Students* (1921); Dicksee, *Advanced Accounting* (1921); Cathles, *The Principles of Costing* (1924); Hawkins, *Cost Accounts* (1927); A. H. Church, *Manufacturing Costs and Accounts* (1917); E. M. Taylor, *The Principles of Cost Accounting* (1936). (L. R. D.)

UNITED STATES

Some features of Cost Accounting which have been developing rather rapidly in the United States are: (1) retail cost accounting; (2) bank cost accounting; (3) sales cost accounting; (4) uniform cost accounting; and (5) standard costs.

Retail Cost Accounting.—This is a term applied particularly in department stores where probably the most important problem of management is that of determining the profitableness of each of the departments. The department store being similar to a collection of individual stores, it is particularly essential that each be conducted so as to return a profit on the capital invested in it. The problem of cost accounting in this connection is essentially that of the distribution of overhead expenses. The merchandise accounts, sales and purchases are segregated by departments in order to give the proper control over merchandising activities. Similarly the salaries of assistants whose time is employed fully by a given department are without difficulty segregated as charges against that department. Practically no other costs can be charged directly to a department because they are for the most part shared jointly by several; *e.g.*, the general expenses of the buying department are incurred for the benefit of the entire store, stock clerks may serve several departments, all of the general housing expenses—light, heat, janitor service, repairs, rent, etc.—are for the benefit of all departments, as are the stores' delivery service costs and the newspaper advertising and other publicity expenses, which include the operating expenses of the advertising department; as well as the general administrative expense covering the management of the store as a whole. If accurate profit results are to be computed for each department, all of these expenses must be prorated on some equitable basis over the departments receiving the benefit of the service. Some of the bases adopted for the distribution of these expenses are as follows: buying expenses are prorated on the basis of the net purchases in each department; the space advertising on the basis of space used by each department; general advertising, general selling expenses, and general administrative expense of the whole organization on the basis of the sales of each department; delivery expense on the percentage of packages delivered for each department; rent, maintenance and operation on the basis of floor area occupied by each. In this way the net profit operating results of each department are determined on very much the same basis as would be the case were each an independent unit.

Bank Cost Accounting.—The banks have long recognized that the services rendered customers growing out of the bank's deposit function are quite costly to the bank and are of real value to customers. Only recently has any attempt been made to evaluate the cost of these services as compared with the value of the customer's deposit to the bank. In attacking the problem the bank has been desirous of determining the minimum balance which it should require each depositor to maintain, in order to cover the cost of the bank's services rendered to that depositor. The problem is a particularly complicated one because of the difference in activity of the various depositors' accounts, some depositors drawing many cheques during the month, others only a few. The more active accounts, requiring the handling of more cheques naturally are more expensive to the bank than the inactive. Similarly, from the deposit standpoint, the customer who makes many deposits in his account, many being cheques which his own bank will have to collect, receives more service from the bank than the one who is relatively inactive in this regard. No entirely satisfactory solution of this cost accounting problem in the bank has yet been reached. Working methods are, however, being employed by a great many banks to the extent, at any rate, that most have adopted a minimum balance which must be maintained by all depositors in order to entitle them to free service, those customers whose balances fall below this being charged a service fee.

Sales Cost Accounting.—As distribution costs increase, manufacturers and wholesalers give them an increasing amount of attention, the problem being investigated along two main lines. In the first place an attempt is being made to discover an equitable basis for pro-rating over the product the general selling expenses, which is essentially the same problem as the distribution of overhead expenses in the factory. In order to determine the full cost of placing the product in the hands of the customer it is necessary to distribute on an equitable basis the selling expense incurred. Sales salaries, travelling expense, entertainment, advertising, both national and local, delivery expenses, general head office selling expense, including the salaries of sales manager and his staff, clerical expenses and supplies—all of these things must be distributed over the various products sold before it is known which are profitable and which are not. An investigation of this kind will have a direct bearing on the sales policies of the company as indicating the products the sale of which should be pushed and those which should be entirely cut off, or be carried merely as a convenience to customers with a recognition of what such a policy costs. The second line of investigation, viz., the determination of which customers are profitable, is closely related to this. It has been found, for example, in a given manufacturing concern that 90% of its total sale volume was sold to 10% of the total customers at a cost of 5% of its total selling expense. This means that 10% of its total sales volume was sold to 90% of its customers and that the cost of increasing its sales volume by this 10% was 95% of its entire selling expense. Certainly had no effort been made to sell to these customers—90% of the total number—the net profit of the company would have been much larger. An investigation of this kind requires a very careful allocation of selling expenses on the basis of the business done with each customer rather than on the basis of the unit or kind of products sold, although a knowledge of the manufacturing and selling cost of each may be necessary in determining the profitableness of the business done with each customer. Investigations of this kind are very enlightening and absolutely necessary, in order to give a factual basis for the formulation of intelligent sales policies.

Uniform Cost Accounting.—Reference is made under BALANCE SHEET to a trend toward the development of uniform systems of accounting in trade association work. Particularly in those trades where competition is keen and net profit results from the point of view of the marginal unit of business are apt to be unsatisfactory, it is essential for a business man to know his costs. The trade association has recognized this and has tried to bring sharply to the attention of all of its members the absolute necessity of a system of accounts which will give him the necessary information to determine a selling price adequate to cover all costs and leave a margin of profit. Many trade associations have secured the co-operation of a large proportion of their members in reporting their business costs under the uniform accounting titles adopted by the association; these have been handled confidentially and from them averages have been built up sometimes for the trade as a whole and frequently also in classified groups by businesses, localities, etc. These averages have provided norms or standards by comparison with which the individual merchant or manufacturer is able to judge his relative efficiency. Some of these uniform systems of accounting have been developed through accounting committees within the organization itself, while in other cases the professional services of public accountants have been utilized.

Standard Costs.—The standard costs system, also known as predetermined or budget costs, is one of the most recent movements in cost accounting; its chief point is estimating the cost of the product before it is produced. This estimate is frequently made by the engineering department, and consists of estimates of the cost of materials to be used, of the direct labour involved, and of the overhead expenses. For proper efficiency these estimates should be made in very great detail, in accordance with the plan or process of manufacture of the product. The costs of actual manufacture are then gathered by the accounting system under the same titles as were used in the making of the estimate; these are compared with the estimated or standard costs and the variations, or variances, as they are usually called, are noted and the attention of the responsible executive is given particularly to those items where these are greatest. In this way, so long as the costs of manufacture fall within the limits set by the estimated manufacturing standards, the results are considered satisfactory and no special attention from executives will be required, and hence they can devote their undivided attention to conditions shown to be unsatisfactory. As yet there is no uniform accounting technique for this method, but its basic idea has gained rather wide acceptance owing to its great value from the standpoint of management.

The National Association of Cost Accountants, which operates through some 30 or more chapters in manufacturing centres of the United States, is the leading professional society in this field. *See* also Scientific Management.

COSTANZO, ANGELO DI (*c.* 1507–1591), Italian historian and poet, was a Neapolitan. He was an ardent admirer of the beautiful poetess Vittoria Colonna (*q.v.*). He spent over 40 years on his great work, *Le Istorie del regno di Napoli dal 1250 fino al 1498* (Naples, 1572; completed work, Aquila, 1581). It is still one of the best histories of Naples, and the style is clear, simple and elegant.

See B. Croce, *Vomini e cose della vecchia Italia* (Bari, 1927).

COSTA RICA, a republic of Central America, lying between Nicaragua and Panama and between the Caribbean sea and the Pacific ocean, and known chiefly in the markets of the world for its high quality of coffee and, politically for its record of peace and general prosperity. Costa Rica's boundaries are, on the north, Nicaragua, on the east, the Caribbean sea, on the south-east and east, Panama, on the west, the Pacific ocean.

The total area of Costa Rica is approximately 23,000 sq.mi., its population (*see* below) being about 26.4 to the square mile. The coast line, on the Caribbean sea is about 181 mi., and on the Pacific, which is broken by deep bays and many inlets, about 360 miles.

Physical Description.—The larger portion of the territory of Costa Rica is an elevated table-land of from 3,000 to 6,000ft. above the sea. The country is traversed by the main cordillera of the American continent, with its two characteristic ranges with the wide plateau between. The chief mountains are mostly volcanic, rising above the main ranges of the cordillera, the highest peaks being Chirripo Grande, 11,485ft., Irazú, 11,200ft., Turrialba, 11,350ft., Buena Vista, 10,820ft., Pico Blanco, 9,645ft., and Poás, 8,895 feet. The slopes to the Caribbean and Pacific shores are sharp, and the lowlands narrow on the Pacific and fairly broad on the Caribbean littoral. However, while the Caribbean shore is broken by relatively few inlets or rivers, and even the salt water lagoons that skirt the other Central American countries and Panama are less in evidence, the Pacific shore is broken by great bays and swift rivers. These include three gulfs and bays of prime importance, the Gulf of Nicoya, the Golfo Dulce, and Coronada bay. The Gulf of Nicoya is a charming, landlocked bay filled with tiny islands and dominated by the hills rising sharply behind it on the mainland. The Golfo Dulce, on the other hand, is sharply cut, averaging 100 fathoms in depth and entirely without islands.

The chief river of Costa Rica is the San Juan, which has its origin in Lake Nicaragua and, flowing for most of its length through Nicaragua, forms the international boundary for a considerable distance. The Río Colorado, the most important of its many mouths, lies wholly within Costa Rican territory. The Reventazón, called the Parisimina through a part of its course, is the chief river entirely within Costa Rica. Rising in the foothills around the volcano Irazú, it flows through the central plateau and coastal lowlands to the Caribbean. Its picturesque valley is the route of the old Spanish highway from the coast, and, now, of the railway which connects the capital, San José, with the country's chief port, Puerto Limón. The Río Frío flows northward into Lake Nicaragua. On the Pacific slope, the Tempisque runs in a southerly direction into the Gulf of Nicoya. The Tarcoles, like the Reventazón, rises on the slopes of Irazú, the tip of the watershed between the Pacific and the Caribbean, and flows westward into the Pacific at the head of the Gulf of Nicoya. Toward the southeast, on the Pacific slope are the Río Naranjos, rising near the volcano Chirripo Grande, and beyond it the Río Grande de Terraba empties into Coronada bay. The latter river has its headwaters in the mountains near the border of Panama. None of the rivers is long, nor is any one of them, except the San Juan, navigable for boats of any size.

The flora, fauna, and the general geological features are similar to those of the other countries of Central America.

Cocos Island.—Included under Costa Rican sovereignty is Cocos island, a jungly uninhabited tropical island lying in latitude 5° 32′ N., longitude 87° 2′ W. in the Pacific some 300m. from the mainland. For over a century Cocos has been frequently visited by treasure-hunters seeking gold bullion buried there in 1821. Cocos is about 4m. long and 2m. wide, and has two fair harbours. The highest elevation is 2,788 feet. In recent years, particularly since 1939, there has been agitation in the United States for the lease or purchase of Cocos from Costa Rica for use in strengthening the Panama canal defences.

Climate.—The climate of Costa Rica differs but little from that of other Central American countries. There are sharp contrasts, however, due to altitude and the uncertainty of the winds at this point on the earth's surface, and to the fact that some authorities hold that the thermal equator in reality passes through or near San José de Costa Rica. The highland climate of the plateau renders the weather cool and refreshing, however, and San José has been becoming more and more the summer resort, or the resort for relief from the continued heat, to the foreign residents of Panama and the Canal Zone, which is only 24 hours by sea and rail from the capital of Costa Rica. On the plateau the altitude is from 3,000 to 5,000ft. and the mean temperature is 68° F. On the coasts, the mean annual temperature is around 82° F. In both the coastal regions and the highlands the rainy season is generally expected from April or May to December, although the Caribbean coast often has rain during the dry season when the trade-winds bring rain clouds out of the Atlantic and precipitation on their coming in contact with the cooler air currents from the highlands of Costa Rica.

Costa Rican woman going to market

Inhabitants—The population was officially estimated at 656,129 on Dec. 31, 1940. The overwhelming bulk of the residents of the highlands are of almost pure Spanish descent, little affected by immigration since the close of the colonial period a century ago, and yet steadily increasing in numbers and apparently losing little if any vigour under the tropical sun. The original stock was largely from Galicia and Andalusia, and this peasantry now makes up the bulk of the small property owners and also of the labouring classes on the coffee plantations. The next most important element in the population is the Negro, although this is confined almost entirely to the Caribbean coast. There, imported labourers from the British West Indies have formed the bulk of the workers on the banana plantations founded and operated by large American companies, a single one of these companies employing over 6,000 of these Negroes, many of whom are accompanied by their families. The Negroes virtually never penetrate to the highlands. There is, also, a very small proportion of other foreigners, the total probably not exceeding 8,000. Mosquito Indians come every summer to fish off the Atlantic Coast.

The chief centres of population are on the central plateau in four cities within a few miles of one another. These four cities are the capital, San José, with 68,465 inhabitants; Cartago, with 8,786, Alajuela, with 9,232 and Heredia, with 9,610. Puntarenas, the chief port on the Pacific, possessed 7,722 inhabitants; Puerto Limón, on the Caribbean sea, has grown rapidly and in 1940 numbered 9,129 inhabitants.

Government.—Costa Rica is governed by its Constitution of 1871, one of the oldest in Spanish America, and the third adopted by the country. It describes the government as "popular, representative, alternative and responsible," vesting the authority in the three usual branches, executive, legislative and judicial. Civil rights are guaranteed, but subject to suspension by the legislature or by the executive in time of war; there is freedom of worship, although the Roman Catholic Apostolic religion is that of the State and is supported by the Government. There is a single legislative chamber, called the Constitutional Congress, consisting of 44 deputies, one for every 15,000 inhabitants, elected for four years, half being renewed every two years. The president is elected by direct vote for four years and is eligible for another term after one term has intervened. His council of ministers may attend the meetings of congress and take part in the deliberations, although without vote. The judiciary consists of a supreme court of eight members elected by congress, and appellate and inferior courts whose judges are named by the supreme court. The administration of the country is divided into seven provinces, which in turn comprise cantons and districts. The governors of the provinces are appointed by the president, but the capitals of the provinces are self-governing municipalities with officers elected by the inhabitants.

The functioning of the government in Costa Rica follows closely the constitutional provisions set down, and the popular suffrage, which in some countries on the Caribbean region is more an ideal than a reality, functions smoothly and effectively in Costa Rica. There is a high standard of public trust; the courts are independent of the executive; the highest offices are, in practice, confined closely to a group of the capable aristocracy and there is a very high feeling of public duty in the men holding such offices.

Education.—The concentration of population in the highlands favours a centralized and efficient school system, with the result that Costa Rica ranks among the leading nations of the world in public education. Illiteracy is the lowest in Hispanic America (less than 23%). The educational system is administered by the secretary of public education, aided by technical supervisors, 640 provincial and district boards of education, and local boards.

HOME OF A NEGRO LABOURER ON A BANANA PLANTATION

Elementary education, which is compulsory for children between the ages of 7 and 14 years, is offered by 671 public elementary schools, with an enrolment of 64,594 children (1939). Pre-school education is available through several elementary schools which have opened kindergarten classes, and at the normal school at Heredia, and several private institutions. A five-year course is offered by eight secondary schools enrolling over 2,000 students. The normal school, which in 1937 had an enrolment of nearly 500 students, offers a curriculum of teacher training, and usually meets the demands of the communities for teachers. Professional education is offered in the fields of law, pharmacy, dentistry, nursing, engineering and agriculture. The budget for 1937 allotted $921,816 for education, out of a total of $7,080,000.

San José is the site of a handsome opera house and of a national museum, where much of the prehistoric and recent Indian work of the aborigines is on exhibition, and where the collection of ancient pottery and of the fine gold ornaments for which Costa Rica is famous is a thoroughly representative one. A zoological exhibit is maintained in connection with the museum.

WOMAN CARRYING THE "METATE" OF BLACK VOLCANIC STONE ON WHICH SHE GRINDS LYE-SOAKED MAIZE FOR BREAD

Finance.—The currency unit is the colón. This was formerly stabilized at 24.97¢ U.S., but since 1932 has gradually shaded off in terms of U.S. money. The average exchange value through the year 1939 was 17.61¢ U.S. Its value is regulated through exchange control.

National revenues are derived from customs, liquor taxes, export taxes on coffee and bananas, State monopolies, including the Pacific railway, and miscellaneous sources. Customs receipts account for around 40% of the total, liquor taxes around 15%.

The 1939 budget called for a total expenditure of 31,299,000 colones, with an estimated deficit of 549,000 colones. Public works and agriculture were allotted 22%; education, 17%; public security, 9%; debt service, 17·9%; miscellaneous, 34·1%.

The public debt was $25,696,000 (1939), including an external debt of $8,131,720, £1,513,177, and 5,811,000 French francs. The external debt was in default beginning in 1932 and 1933. Government offers of a readjustment have been made, the last in March 1939, but have been rejected as unsatisfactory. Approximately $11,000,000 value of the Costa Rican national bonds was estimated to be held in the U.S. in 1939. U.S. direct investments in Costa Rica were estimated at $20,000,000 in 1933.

The Banco Internacional has resources totalling 28,259,890 colones, and a capital of 2,792,471 colones. The Banco de Costa Rica, founded in 1877, has a capital of 2,000,000 colones and resources of 16,679,479 colones. The Banco Anglo-Costarricense, founded in 1863, has a capital of 1,200,000 colones and resources of 4,110,000 colones.

Defence.—Costa Rica has constitutional provisions for the compulsory service of all able-bodied male citizens between 18 and 50, in time of war. Its army numbers some 2,500, but the militia has an active service branch, and the national guard includes all able-bodied males. This is estimated to number about 36,000 on a war footing. There is a naval unit and a skeleton navy on paper.

Agriculture.—Coffee, bananas, and cacao are the basic agricultural products, and comprise around 95% of the country's exports. The total area devoted to agriculture is estimated at over a million acres. A distinctive feature of Costa Rican agriculture is the prevalence of small landholdings.

Costa Rican coffee is regarded as being the highest quality, and commands a better price than do the coffees of most other countries. It is grown in the highland areas. The greater part of it, until very recently, was exported to Great Britain. Until the beginning of the present century coffee was the country's leading product, but with the development of bananas it fell to second place. More recently it has regained a precarious leadership, due to a decline in banana production. The 1938–39 coffee crop was officially valued at $4,644,301.

Costa Rica was the first Central American country to produce bananas for export, and formerly it was the leading producer in the Western Hemisphere. Development of plantations elsewhere and, since the 1920's, the ravages of the Panamá disease, which attacks the banana plant, reduced export production from a record of 11,170,812 stems in 1913 and 8,500,000 in 1926 to 3,000,000 in 1935. In 1938 5,011,000 stems were exported, and 3,429,787 in

1939. Recent increase is due to extensive development of new plantations on the Pacific slope, supplementing those on the Caribbean. The latter, however, still produce the great bulk of the supply. Plantations are located on the coastal lowlands.

Cacao production is still relatively small despite considerable recent impetus. Many abandoned banana plantations have been turned to cacao. Production in 1939 was 7,672,375kg. (1938, 5,533,016kg.).

Subsidiary crops are sugar cane, corn, beans, potatoes, and rice. Some miscellaneous tropical fruits are raised in small quantities.

Government policy is to encourage agricultural improvement by admitting new seeds and plants free of customs duty, and through scientific study. The cattle industry has been given similar encouragement. Cattle are raised chiefly for dairying purposes.

Mining and Manufacturing.—Mining is almost the only industry besides agriculture. Gold is by far the most important mineral, although some silver, manganese, mercury, and sulphur exist. Late in 1937 discovery of rich and extensive additional deposits of manganese was made in Guanacaste, the most westerly part of the country. The greater part of mining activity is in Guanacaste, where the important Abangárez gold fields are located. In 1934 the value of the gold produced was $436,510; and by 1938 it was in excess of $500,000. The mining industry is encouraged by the Government, which permits the importation of machinery, tools, and other equipment free of duty.

Some indications of petroleum have been found near Talamanca and Tilarán in the southern part of the country.

Manufacturing is confined almost entirely to articles of domestic consumption. There are approximately 6,500 industrial establishments, nearly all of them small. Their products include furniture and fine woodwork, tobaccos, and miscellaneous articles.

Foreign Trade.—The most important exports are, in order, coffee, bananas, and cacao. In 1938 total exports were $10,145,614 (U.S.), including 21,873,891kg. of coffee, $4,938,053; 5,033,424 stems of bananas, $2,808,547; 5,533,016kg. cacao, $829,955. Great Britain was formerly the heaviest purchaser of Costa Rican goods, taking an average of slightly over half in the period 1931–33, but the proportion of British purchases has now declined to an average of 20 to 25%.

Costa Rica's total imports in 1938 were valued at $12,621,000, with 49·1% from the United States and 19·8% from Germany. Great Britain's proportion, which was 15% in 1926, was 6·6%. Foodstuffs (largely wheat flour), textiles, and miscellaneous manufactured goods make up the bulk of the imports.

Foreign Trade of Costa Rica, 1931–33, 1937, and 1938
(values in 000's of dollars)

Country of origin or destination	Imports			Exports		
	1931–33 (average)	1937	1938	1931–33 (average)	1937	1938
United States	3,476	5,048	6,195	3,441	5,189	4,628
Germany	780	2,748	2,496	1,291	2,240	1,945
United Kingdom	806	927	831	5,739	2,306	2,477
France	179	159	165	55	299	113
Italy	161	301	286	25	228	..
Japan	113	977	782	..	72	119
Other countries	1,310	1,719	1,866	611	1,178	864
Total	6,825	11,879	12,621	11,162	11,512	10,146

Under pressure of wartime conditions exports in 1939 dropped to $9,086,000 (United States, 45·6%; Germany, 25·1%; Great Britain, 16·9%), while imports rose to $16,885,000 (United States, 58·8%; Germany, 17·7%; Japan, 5·1%; Great Britain, 4%).

Communications.—There are two principal ports, Puerto Limón on the Caribbean, centre of the banana traffic and terminus of the Costa Rica railway, and Puntarenas, on the Pacific, terminus of the electrified Pacific railway. Puerto Limón handles 60% of the export and 45% of the import traffic.

There are two principal railroad systems, the Northern, which controls the Costa Rica through lease, and the Pacific. The main line of the Northern system, the Costa Rica, connects Puerto Limón with San José, the capital, a distance of 103 miles. Various branches serve principally the banana area. The Pacific Electric railway, built and owned by the Government, provides communication from San José to the Pacific at Puntarenas, 73m. away.

In common with other countries of Central America, Costa Rica has been putting emphasis on highways during recent years. More than 1,800m. of roads serve to link together various parts of the country and are of increasing importance in the transportation of produce.

Important not only as an aid to transportation of goods, but for the possibilities it offers for a development of tourist trade, is the Inter American highway, which traverses the country. The highway, much of it at an elevation of around 10,000ft., is in process of improvement and completion. In 1939, 47m. were paved, and 66m. open during dry weather. An additional 243m. was still unimproved trail.

Air transport service to foreign countries is provided by the Pan American Airways system. Within the country regular lines connect San José with Puerto Limón, Puntarenas, and other cities.

The telegraphs are operated by the Government and reach virtually every town of the country, and connect with the services of the other countries of Central America, which can be communicated with at the low domestic rate. The Tropical Radio Corporation has a station at Puerto Limón, and the All America Cable reaches San José via both Puerto Limón and Puntarenas. There is an efficient telephone service in San José and between San José and Puntarenas. One of the banana companies maintains a private telephone line between San José and Puerto Limón and the local telephone service in the latter city.

History.—Costa Rica was discovered and probably named by Christopher Columbus, on his fourth and last voyage to America. On the Caribbean shore of Costa Rica the Spaniards found the first traces of the gold they sought, in the ear-rings and other ornaments of gold worn by the natives—ornaments that are still prizes for archaeologists and the subject of a long controversy as to origin and design. A settlement was planned, and a small group of Spaniards, headed by Bartholomew Columbus, brother of Christopher, was landed. It remained only a short time, however, and after attack by the Indians and the loss of a number of men, set sail and joined Columbus farther down the coast. The name of the country, Costa Rica, or "Rich Shore," was possibly the result of Columbus's discovery of gold, or of ear-rings, as a corruption of *Costa de oreja* might, as suggested by Col. G. E. Church (*q.v.*), well be the origin of the phrase "Costa Rica."

Costa Rica was, however, first called Nueva Cartago, prior to becoming a province of the captaincy-general of Guatemala, but, by 1540, the name Costa Rica had been generally adopted. The country had been conquered and pacified by the Spaniards by 1530, became a province in 1540, and its limits were surveyed and fixed between 1560 and 1573, under Juan Vásquez de Coronado, one of the few able and conscientious Spanish governors in the long history of the province. During the Spanish régime Costa Rica did not prosper, for the search for gold went on, and the Indians, enslaved and ill-used, died off rapidly.

Costa Rican independence dates from Sept. 15, 1821, and follows the general history of Central America in this regard, as in the various efforts at union (*see* CENTRAL AMERICA). The only serious external problems of Costa Rica since the independence have been its boundary disputes with its two neighbours. That with Nicaragua was finally submitted to the arbitration of the president of the United States in 1888, and the lines were finally settled by treaty in 1896 on the basis of his award. The charges of Costa Rica that the Bryan-Chamorro treaty between the United States and Nicaragua in 1916 violated its rights to the San Juan river (*see* CENTRAL AMERICA and NICARAGUA) were not based on a question of boundary lines but on Costa Rica's feeling that its rights to the river had not been taken into consideration when the United States paid Nicaragua alone the sum of $3,000,000 (U.S. cy.) for an option to a canal site utilizing that river. The boundary with Panama (originally with Colombia) is still in strong dispute. An arbitration award by the President of France in 1900, confirmed by the Chief Justice of the United States in 1914, was generally favourable to Costa Rica, but was rejected by Panama, which continued to hold part of the disputed area.

Finally, in 1921, Costa Rica attempted forcible occupation of the Coto region (on the Pacific coast), which had been adjudicated to her. Large scale hostilities were averted only by the intervention of the United States in support of Costa Rica's claim. Panama thereupon evacuated the Coto area, but relations between the two countries were broken until 1928, and the dispute continued. A treaty of settlement was made in 1938, but opposition in Costa Rica was so strong that it was withdrawn from congressional consideration unratified.

The internal political situation of Costa Rica has been almost uniformly peaceful, the exception being in 1917–19. In January of the former year, Federico Tinoco, by a *coup d'état,* forced out of office President Alfredo González, whose election had been so close that it had been decided by the congress. A new constitution was promulgated in June 1917 and Tinoco assumed the presidency under this new constitution. His Government severed relations with Germany September 21, and declared war in the following April. The United States, however, consistently refused to recognize the Tinoco Government, holding such action to be contrary to the Washington conference treaty of 1907, which pledged nonrecognition of revolutionary governments, and succeeded in having Costa Rica barred from the League of Nations for a time.

In 1919 a counter-revolution overthrew Tinoco. Julio Acosta was chosen president at the succeeding election, and was promptly accorded recognition by the United States. Under Acosta and subsequent presidents, Costa Rica acquired the reputation of being the most democratic and orderly republic of Central America, and one of the most democratic in the Americas. In 20th century Costa Rica, in striking contrast to other Central American States, military men as presidents have been the decided exception. President Acosta was followed in orderly succession by Dr. Ricardo Jiménez Oreamuno (1924–28), who had served one previous term, Cleto Gonzales Víquez (1928–32), Dr. Jiménez for a third term (1932–36), Dr. León Cortés (1936–40), and Rafael Calderón Guardia (1940–44). A literacy test for voters was adopted in 1920 and the secret ballot in 1925. At the outbreak of the European War in 1939, Costa Rica proclaimed her neutrality, but on Dec. 7, 1941, declared war on Japan, and followed on Dec. 11 with declaration of war against Germany and Italy.

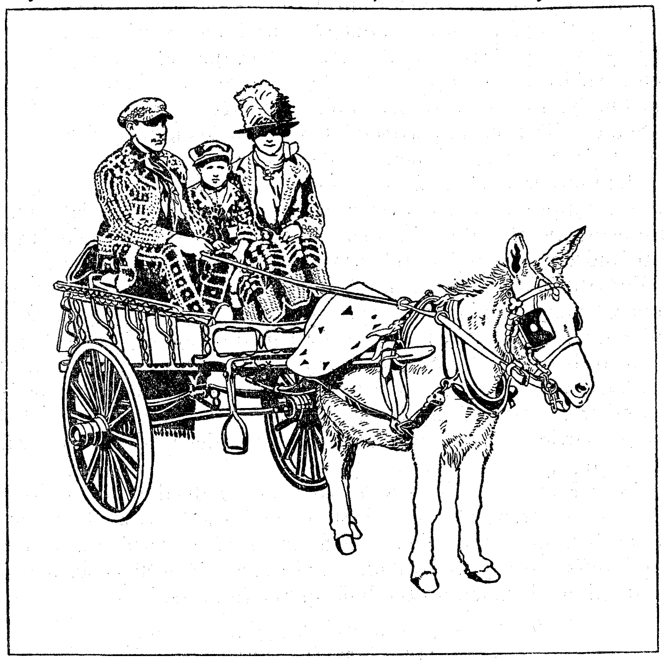
COSTELLO, LOUISA STUART (1799–1870), author and miniature painter, was born in Ireland in 1799. Her father died while she was young, and Louisa, who removed to Paris with her mother in 1814, helped to support her mother and brother by her skill as an artist. At 16 she published *The Maid of the Cyprus Isle, and other Poems,* and in 1825 *Songs of a Stranger.* Ten years later appeared her *Specimens of the Early Poetry of France,* illustrated by beautifully executed illuminations. In this she had the assistance of her brother, DUDLEY COSTELLO (1808–65), a well-known journalist and the author of several novels and books of travel.

It was dedicated to Tom Moore, and procured her his friendship as well as that of Sir Walter Scott. Among her numerous works are: *The Rose Garden of Persia* (1845), a series of translations from Persian poets, with illuminations by herself and her brother; *Clara Fane* (1848), a novel, and many excellent books of travel. She died in Boulogne April 24 1870.

COSTER, CHARLES THEODORE HENRI DE (1827–1879), Belgian writer, was born at Munich on Aug. 20, 1827. His father, Augustin de Coster, was a native of Liége, who was attached to the household of the papal nuncio at Munich, but soon returned to Belgium. Charles studied at the University of Brussels. Believing that Flemish manners and speech could not be rendered faithfully in modern French, he wrote his best works in the old tongue. The success of his *Légendes flamandes* (1857, 2nd ed., with preface by E. Deschanel, 1861) was increased by the illustrations of Félicien Rops and other friends (Eng. trans. by H. Taylor with wood cuts by Albert Destanche, 1920). In 1861 he published his *Contes brabançons,* in modern French. His masterpiece is his *Légende de Thyl Uylenspiegel et de Lamme Goedzak* (1867), a 16th-century romance, in which Belgian patriotism found its fullest expression. Uylenspiegel (Eulenspiegel) has been compared to Don Quixote, and even to Panurge. He is the type of the 16th-century Fleming, and the history of his resurrection from the grave itself was accepted as an allegory of the destiny of the race. The exploits of himself and his friend form the thread of a semi-historical narrative, full of racy humour, in spite of the barbarities that find a place in it. This book also was illustrated by Rops and others. There are English translations by G. Whitworth (1918) and by F. M. Atkinson (1922). In 1870 de Coster became professor of general history and of French literature at the military school. He died on May 7, 1879, at Ixelles, Brussels.

See C. Potvin, *Charles de Coster. Sa biographie, lettres à Elisa* (1894); H. Liebrecht, *La Vie et le rêve de Charles de Coster* (1927). In 1927 *Stephanie,* a drama in 5 acts, by De Coster, was published for the first time, with a preface by Camille Huysmans; it is dated 1878, but was probably a revision of an early play *Crescentius,* written in 1853.

COSTERMONGER, a street-trader who usually displays his wares on a barrow, but who sometimes uses a cart or "donkey-shay." In the London street markets, which are many and varied,



LONDON COSTERMONGER FAMILY OF THE VICTORIAN AGE
These costumes, with their rich embroidery of pearl buttons or "pearlies," are now used rarely, and only on festive occasions

the goods sold by costermongers cover a very wide range, including fruit, vegetables, fish, flowers, crockery, glassware, ironmongery, and even clothing and furs. In 1927 a licensing system was introduced to prevent abuses.

In familiar parlance, a costermonger is a "coster." The derivation is from costard-monger, one who in the old days sold costards, a species of large ribbed apple.

COST OF LIVING. Until recently the phrase "Cost of Living" was used only loosely by economists when the relation between movements of wages and prices was in question, but from 1914 onwards during the World War the need of a measurement of the rise of prices gradually resulted in making the expression prominent in industrial and statistical discussions. It has frequently been assumed that the term "Cost of Living" has a unique and definite meaning, and that accurate measurements can be applied to it, but in fact the meaning is vague and the statistical methods appropriate to it are complex and lead to results whose precision is not of a high order.

The phrase may be regarded as an abbreviation for "the cost in a defined region to persons of a defined social or industrial class of goods of a kind usually purchased at frequent intervals, by the consumption of which a certain standard of economic welfare is reached." We may usefully distinguish four cases:—(*a*) Where the standard is the physiological minimum necessary to maintain life, health and strength; (*b*) where some customary or average budget of expenditure is taken and the cost of the items in it is measured at different times or places; (*c*) where the items are varied but the whole contents of the budget result in an unchanged standard of welfare; (*d*) where both the contents of the budget are modified and the standard is raised or lowered. Case (*b*) is that which has in recent years been the subject of measurement, but case (*c*) is that which is in reality appropriate to the problem of measuring or adjusting real wages. Case (*d*) confuses two factors, the change of price and the change of standard.

I. GENERAL CONSIDERATIONS

The Physiological Minimum.—(Case *a.*)—Attention was directed by Mr. Seebohm Rowntree (*Poverty, A Study of Town Life,* 2nd ed. 1902) to the cost of obtaining in York (England) and elsewhere food, clothing, heat, light and shelter sufficient for a family to maintain itself in health and efficiency for work, when all possible economy was practised, subject to the availability of commodities and the legal requirements for housing, decency, etc. The minimum of food was computed in relation to the quantity of calories (or units of energy produced by the digestion of food), carbohydrates (heat-giving compounds), and protein (body-building compounds) calculated by Atwater and others as necessary for maintaining health and vigour under various conditions of life, and dietaries were drawn up which contained the necessary constituents at the minimum aggregate cost; to this cost was added the expenditure on clothing, fuel, cleansing materials, etc., and rent, which was found to be customary among persons in regular work at the lowest rates of wages for adult men. The most natural meaning of the cost of living is perhaps the cost of maintaining the minimum standard thus described, or a similarly computed minimum in other countries.

The standard is, however, not scientifically definite; apart from questions as to the validity and applicability of the measurement by calories, it is clear that there must be a great difference between the amount of food necessary for work of low and of high efficiency. For example, the Indian, Chinese and Japanese peasants live on a sparser diet and produce a lower output than English or American workmen. Two definable points are where efficiency is a maximum, which needs a more liberal diet than that considered by Mr. Rowntree, and where the value of additional efficiency exactly equals the cost of the additional food, etc., necessary, for whose ascertainment there are no observations; and Atwater's standard is in fact lacking in precision of definition, an arbitrary one (*see* Bowley, *Measurement of Social Phenomena,* chap. viii., 1915). If we drop the word "minimum" and speak of Mr. Rowntree's as a convenient and intelligible standard for demarcating poverty, we can properly measure the change in the cost of living at this standard (if the facts are ascertainable). The varying cost of the official civilian rations, computed in Germany *circa* 1919, gave a measurement similar to that described. The cost of Mr. Rowntree's standard, and one modified by Bowley, so as to correspond more closely with the dietary ordinarily followed by urban workmen (without increasing the "calorie" value) was worked out for certain English towns in 1913 (*Livelihood and Poverty*), 1915 and 1924 (*Has Poverty Diminished?* 1925). A legal minimum wage could be based on a standard thus defined, but in fact it is generally related to a higher conventional standard.

The Customary or Average Budget.—(Case *b.*)—The usual method of measuring the change of cost of living during and since the World War has been as follows: Detailed statements of expenditure having been obtained from a number of working-class households (in most countries at some date prior to 1914), an average budget is formed showing so many pounds of meat, bread, etc., with the prices and expenditure in considerable detail. The average prices of the same foods are ascertained from time to time, and the expenditure necessary to purchase the former quantities at the new prices is computed. The cost of living (so far as food is concerned) is then taken as having increased or decreased in the same ratio as this standard budget. In many countries a standard of the same kind is established for clothing, fuel, light, rent, cleansing materials and some other articles, and the cost of the aggregate, including food, is computed from time to time. The result obtained (if the process were complete) would be the relative cost of maintaining a defined standard constant in every detail. It is generally expressed as a percentage; thus if the costs were 25s. and 30s. at the two dates, the ratio is 100: 120, the index number at the second date is 120 and the percentage increase 20.

This method cannot be carried out in its entirety for two reasons, namely, lack of information and change of quality of the commodities in the market. In most countries data of expenditure and prices are only obtained for principal commodities (meat, bread, etc.), and not for those on which little is spent (currants, pepper, etc.), or in which the unit is variable (fruit, vegetables, etc.); but unless owing to shortage of supplies there is a run on the articles not included, these omissions cannot affect the result significantly. In some countries the expenditure is not known, but only prices; then the resulting calculation is generally valueless; and in others currency has been so variable that the computation has been meaningless. In nearly all cases there is no sufficient knowledge of expenditure on clothing either in total or in detail, and it is often difficult to obtain adequate data for fuel and light or for miscellaneous items. The sums included in the calculations, in fact, account for only a part of ordinary household expenditure, but where most care has been given to the question the part is a large proportion of the whole. Classes of expenditure that are not strictly necessary, such as amusements, tobacco, alcohol, etc., are generally omitted, as are occasional expenses (doctors, purchase of furniture, etc.), but in some cases subscriptions to trade unions, etc., insurance payments and travelling to work are included. The miscellaneous expenses omitted become a larger proportion of total expenditure as we go up the scale of incomes.

The difficulty due to the change of quality of goods which has been so marked since 1914 is even more fundamental. Over any long period the actual constituents and quality of a pound of bread, a cut of meat, a pair of boots, change considerably. From some points of view these gradual changes are not important; during the war, however, substitution of one commodity or ingredient for another was sudden and common, and the pre-War quality was unobtainable at any price, or if obtainable had a quite altered position in domestic economy. Consequently the prices included in the calculations were frequently not for the same things at different dates, and the precision of the measurement was greatly diminished. After the Armistice there was some return to former qualities, but the change has been sufficient to undermine the foundation of the numbers, and it is very desirable that a new investigation should be made to ascertain what modification in the basis is expedient.

It should be added that separate budgets ought to be formed (and in some countries have been formed) for different grades of income and for different classes of occupation, and also for single persons and for married persons with dependants.

The structure of the index-numbers of the cost of living on this basis may be illustrated by the details of the retail food index-number of Great Britain, whose origin and method are described in Section II., p. 503. In the table on p. 502 the first two columns give the commodities and quantities in the weekly budget which forms the basis, and the third column the basic prices. The next column (E) shows the cost of these quantities (Q) at these prices (P). The next (p) are the prices at a later date, which applied to the original quantities (Q) give the cost (e) of the same quantities at the new prices.

The total of the column E is the whole cost of the budget in July 1914, viz.: 216·4d.; the total of the column e is the cost of the same budget at the prices of October 1927, viz.: 343·3d. Since $\frac{343\cdot3}{216\cdot4}\times 100 = 159$ approximately, the latter cost is 159 per cent. of the former, that is 59 per cent. greater. The food index number for October 1927 is written 159, and frequently quoted as $\times$ 59.

The method is clearly exhibited by algebraic symbols. Write

			216·4d.		343·3d.		1·000	158·6

Some of the entries above are approximate, and the Ministry of Labour also includes fish, whose price ratio (r) was 2·16, and arrives at the index-number 161 (to the nearest integer)

$Q, Q_2 \ldots$ for the number of lbs. of British beef, imported beef . . . , and $P_1P_2 \ldots$ for the number of pence per lb. Then $Q_1 \times P_1, Q_2 \times P_2 \ldots$ are the numbers of pence spent on these commodities, and $E = Q_1 \times P_1 + Q_2 \times P_2 + \ldots = 16{\cdot}2 + 16{\cdot}2 + \ldots = 216{\cdot}4$ pence is the total expenditure in 1914. Similarly, if $p_1, p_2 \ldots$ are the price in pence in 1927, $e = Q_1 \times p_1 + Q_2 \times p_2 + \ldots = 24{\cdot}6 + 20{\cdot}0 + \ldots = 343{\cdot}3$ pence is the total expenditure in 1927. Then $(e \div E) \times 100$ is the index-number (158·6). In fact the number is more readily computed by working in price-percentages, r. Express p_1 as a percentage of P_1, thus $r_1 = 100p_1 \div P_1$ and so for each commodity. Also express each item of the expenditure in 1914 proportionately to a total 1, so that the column E is obtained, where the first entry is $16{\cdot}2 \div 216{\cdot}4 = {\cdot}075 = E_1$, the second $16{\cdot}2 \div 216{\cdot}4 = E_2$, etc.

Then the index-number $\frac{e}{E} \times 100 = \frac{Q_1 \times 100p_1 + Q_2 \times 100p_2 + \ldots}{Q_1 \times P_1 + Q_2 \times P_2 +}$.

But $100p_1 = P_1 \times r_1$, $100p_2 = P_2 \times r_2 \ldots$ $\therefore$ The index-number $=$

$$\frac{Q_1 \times P_1 \times r_1 + Q_2 \times P_2 \times r_2 + \ldots}{Q_1 \times P_1 + Q_2 \times P_2 + \ldots} = \frac{E_1 \times r_1 + E_2 \times r_2 + \ldots}{E} =$$

$$E_1 \times r_1 + E_2 \times r_2 + \ldots = 158{\cdot}6, \text{ since } \frac{E_1}{E} = \frac{16{\cdot}2}{216{\cdot}4} = E_1, \text{ etc.}$$

By this method the quantities $E'_1, E'_2 \ldots$ are computed once and for all, and the price-percentages being obtained for each month the index number is very rapidly calculated.

In the official measurement in Great Britain only the quantities E′ and r are in fact used; this method is very convenient in dealing with rent (for which there is no natural unit of quantity) and with clothing (for which a general price ratio is obtained without any definition of unit). The general theory of weighted averages shows that a considerable roughness in the estimation of the smaller expenditures is smoothed out in the process of averaging, but that it is important to obtain precision in the case of large items, such as clothing, treated in a single entry, and rent. It is important, however, that the r's should be accurately known when they differ much from one another, and the quality of the commodities that are priced should be the same at both dates.

The index number for the second date is $\frac{e}{E} \times 100$, and the percentage increase is $\left(\frac{e}{E} - 1\right) \times 100$.

Variation in Detail on an Unchanged Standard.—(Case *c.*)—It must be granted that when the cost of living is compared at two places or at two dates we ought not to assume that it is possible to purchase the same quantities of commodities of precisely the same quality in both cases, and in order to make a strict numerical comparison we need a test of equality of standard, and it is also expedient to devise a method of measuring the relation between two standards. The problem so stated has not yet been completely solved. A measurement could be made on a strictly nutritive basis and the cost of purchasing in the most economic way the amount of calories (including the necessary protein) considered proper to health and efficiency could be ascertained in both countries or at both periods; but this would only give a theoretic solution, since it ignores the influence of custom and taste in diet, and, in fact, in developed countries relatively few people have been compelled to purchase their nutriment in the cheapest possible way. The actual practical question in Britain in 1921 was, what was the cost of maintaining the pre-War standard of living in nutritive power and in satisfaction or pleasure derived from food and clothing, allowance being made for changes in prices and available qualities. This statement introduces the vague word *satisfaction,* which it is not practicable to define exactly, though some mathematical methods based on economic principles have been suggested for ascertaining its equality in two cases.

One method would be to frame a new budget of goods obtainable and in fact purchased by housekeepers with the same skill of adjusting purchases to desires as in the case of the earlier budgets. This would mean obtaining from representative working-class women a budget which in their opinion would now give the same variety and pleasure as a selected budget of 1914, care being taken that the energy value is the same. The result would be a new conventional budget, the ratio of whose cost to that of the pre-War budget would give a rough measure of the cost of living (*cf.* Bowley, "Measurement of cost of living," *Journal of the Royal Statistical Society,* May 1919, p. 354; and "Cost of living and wage determination," *Economic Journal,* March 1920, p. 117).

Another method was used in the British Board of Trade's investigation into the cost of living in Great Britain, United States, France, Belgium and Germany, which was initiated in 1905 (*cf.* official papers Cd. 3864, Cd. 4032, Cd. 4512, Cd. 5065, Cd. 5609). A comparison was made of the cost of living in Great Britain and in each other country on a double basis as follows: It was found that an English housewife purchasing in 1909 in the United States a week's supply of food as customary in England, would have spent 38% more in the first-named country, the ratio of the costs of living being on this basis 100:138; on the other hand, an American housewife purchasing in England a week's supply of food as customary in the United States would have found her expenses reduced in the ratio 125:100 (Cd. 5609, pp. lxvi., lxvii.). If these ratios had been reciprocal either would measure the differences in the cost of living (so far as food is concerned); as it is, their divergence illustrates the want of definiteness in the problem.

Another method gives, perhaps, the most practical solution, and its theoretic basis is shown in the *Economic Journal,* June, 1928 (Notes on Index Numbers). Obtain typical budgets of expenditure at two dates; compile a new or mean standard of quantities which, item by item, are the averages of the entries in the budgets. Thus, if in one the consumption of 33 lb. of bread is stated, in the other 35 lb., enter 34 lb. in the mean standard; now find the cost of the mean standard at each date and take the ratio of these costs as the measurement of the change in the cost of living.

If all prices rose in the same ratio the methods now described would necessarily yield the same results; the need for choice arises from inequalities of increase, which in some cases are very wide. Now if at one date purchases are made so as to maximise the satisfaction in the outlay of the week's housekeeping allowance, as we may reasonably assume, and prices rise irregularly, it is evident that somewhat less will be bought of the commodities which have risen most and more of those which have risen least if a maximum is still obtained, and that consequently the increase in the expenditure necessary to obtain the same satisfaction as before is less than the increase if exactly the same quantities had been purchased. For example, if oranges are doubled in price and bananas increased only one-half, more bananas and fewer oranges will be purchased.

Variations in Content and in Standard.—(Case *d.*)—The problem with which many countries were faced in 1920 and 1921 was in reality not that of preserving a standard of living on the level of 1914, but of adapting themselves to a lower average standard, whatever the fortunes of favoured classes. This may be illustrated by the arrangement of the salaries of civil servants in England in Feb. 1920. At that date the official measurement (on method *b*) of the increase in the cost of living over 1914 was 130%. The full increase of 130% was awarded to persons with a wage of 35s. weekly (£91 5s. per annum) or less, 60% was added to any excess of salary up to £200, and 45% to any excess over £200. Thus a man whose salary was £400 on the pre-War basis received an addition of £273⅞ (130% on £91 5s. = £118⅝, 60% on £108 15s. = £65¼, 45% on £200 = £90), about 68% in all. This increment was increased or decreased by one twenty-sixth part for every complete movement of five points in the official index number averaged over certain periods. It appears to have been assumed on the one hand that the expenses of the middle class had not increased so much as indicated by the index number based on working-class expenditure, and on the other that the standard of living must be lowered—the higher the income the greater the fall. A similar scale was adopted at nearly the same date for railway officials.

In this way we are led to consider a conventional standard of living which changes from time to time. When there is no reference to a physiological minimum, the cost of living may be regarded as the cost of maintaining the standard customary to the social or occupational class concerned at a given time and place. In this sense the cost of living of Chinese labourers is lower than that of the Americans, though they pay the same prices for commodities. When "cost of living" is used in this sense it should always be accompanied by a description of the standard attained. Thus the British Committee on the Cost of Living in 1918 (Cd. 8980) estimated the average expenditure of working-class families in 1914 and 1918, and at the same time reported on the change of standard. In some of the statistics quoted below a conception of this kind is involved in the figures.

II. CONDITIONS IN VARIOUS COUNTRIES

Great Britain.—Throughout Great Britain the basis of the official measurement of the cost of living is that of finding the cost of a standard budget of expenditure at various dates (see *Report on Working-Class Rents and Retail Prices,* Cd. 6955 of 1913, pp. 299, *et seq.,* and *Labour Gazette,* Feb. 1921). The standard budget was obtained from a collection of 1,944 records of weekly expenditure made in 1904; the average weekly family expenditure was 36s. 10d., of this 22s. 6d. was spent on food, and of the food 18s. 6d. is accounted for in the standard used prior to the War. A somewhat altered basis was taken in 1914. Rice, tapioca, oatmeal, pork, coffee, cocoa, jam, treacle, marmalade, currants and raisins (the expenditure on all of which was about 2s. 1d. in 1904) were omitted and fish and margarine added (an addition equivalent to 6d. in each case). It was assumed that, though prices had increased between 1904 and 1914, the relative expenditure (which alone enters into the computation) on the different commodities was unchanged; this assumption is too rigid but not unreasonable, and the facts otherwise known about price movements and consumption show that the error introduced is insignificant.

Relative importance being determined, the next step was to ascertain the movement of prices. Prior to 1914 the records were obtained exclusively for London, but it was shown (Cd. 6955, pp. 299 and 306) that from 1907 to 1912 the average movement was very nearly the same in provincial towns as in London. From Aug. 1914 statements of prices were obtained for 650 towns and villages.

The index numbers of the cost of living, so far as food is concerned, were then obtained by the method *b* described above; prior to 1914, the year 1900 was taken as base, and the prices then equated to 100; from the beginning of the War, July 1914 was taken as base.

There are certain weaknesses in the method. It is assumed, without explicit evidence, that expenditure on meat was in the proportion 2s. on beef to 1s. on mutton, and that British and foreign meat were of equal importance, while the price ratios taken for meat are for four selected joints only; during the period 1915 to 1919, when the relative quantities available varied and relative prices were altered, these assumptions affect the index numbers. The weight assigned to margarine is arbitrary. The number of eggs consumed (about 12 per household per week) is based on summer records and is no doubt higher than the average for the year.

Rent, Clothing, etc.—Next in importance to food comes rent. The figure included in the index number allows for such increases for rates, repairs, etc., as are legally permissible and is accurate for persons who by remaining in the same house since 1914 have the benefit of the Rents Restriction Acts; the increase for those who have moved must have been variable and for it no estimate is available.

The cost of clothing, which ranks next to rent in expenditure, is always awkward to measure owing to the difficulty of defining the garments or stuffs purchased, and of assigning their relative importance in the budget, and also there was great variability in the qualities in the shops during the period 1921. The difficulties can be understood by comparing the estimates and method of the Cost of Living Committee (*loc. cit.,* pp. 21–3) with those of the official index number described in the *Labour Gazette,* April 1921, pp. 178–79; the former found an increase of 96% between July 1914 and the summer of 1918, the latter reached increases of 210% in June and 240% in Sept. 1918. The differences are partly attributable to the great variability of the increases among the articles in consequence of which the relative importance given to each has great effect, and in this respect the committee's measurement was the more systematic; and partly due to the difficulty of obtaining quotations for the same qualities of goods or in allowing for substitution. The question is too intricate to discuss here; it can only be suggested that the results have little precision, and that the process of obtaining an estimate based on a new budget in which modifications of custom are allowed for is even more necessary than in the case of food.

Fuel and light present little difficulty when a general average for the country is in question since the retail prices of coal and of gas are ascertainable. The variations from north to south in price and consumption and that between winter and summer are not very important, since where coal is dear gas is used for cooking, and in working-class households one fire is necessary throughout the year for cooking and this also provides heat.

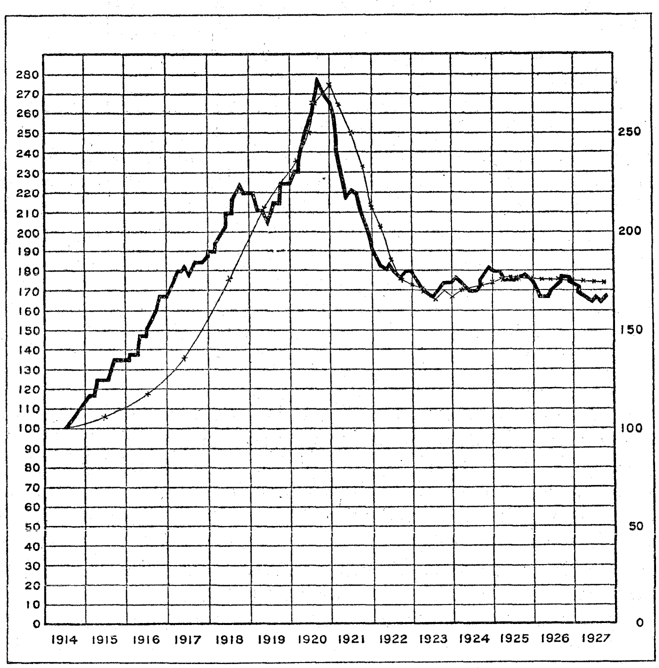
The official index number allows only one-twelfth of the weekly expenditure for all items not already included, or about 1s. 6d.

TABLE II.—*Structure of Cost of Living Index-number. October 1927*

	Relative importance.	Index-numbers October 1927 (July 1914=100).	Products.	Illustrative working in money. Weekly expenditure in 1914.	Per cent increase.	Weekly expenditure in 1927.
				s. d.		s. d.
Food	60	161	9,660	22 6	61	36 2½
Rent	16	151	2,416	6 0	51	9 1½
Clothing	12	215	2,580	4 6	115	9 8
Fuel and light	8	170	1,360	3 0	70	5 1
Sundries	4	180	720	1 6	80	2 8
	100	167	16,736	37 6	67·4	62 9

per household in 1914. This sum is exhausted by cleansing materials with a very small margin for tobacco, newspapers, household replacements and fares. Insurance and trade-union subscriptions are not included, nor is alcohol.

The five classes of expenditure now named are combined in



COST OF LIVING AND WAGE-RATES IN GREAT BRITAIN, 1914–1927
The heavy line shows the Ministry of Labour's cost of living index-number. The light line represents approximate index-numbers of average rates of wages for the normal week. Actual earnings, including overtime and other additional payments, rose more than wage-rates during the war

the following proportions, stated for clearness on the basis of a pre-War urban weekly expenditure of 37s. 6d. Food 22s. 6d., rent (including rates) 6s., clothing 4s. 6d., fuel and light 3s., sundries 1s. 6d. Here the proportions on food, rent and light rest on good evidence; that on clothing, for which the expenditures vary greatly according to the income and personnel of the family and for which there has never been a satisfactory investigation, is little more than a guess based on vague estimates; that on sundries is the residuum when other expenses are met and is probably too low.

The results for selected dates are as follows:—

*Not stated separately at these dates.
The statistics are for the beginning of each month.

These numbers, corresponding to those in the last column month by month are shown in the diagram, and with them a rough index of average wage movements. The latter differs in many ways from a complete account of earnings, which should allow for many other factors, but serves to show the relation of the movements of time-wages (and some price-earnings) in the normal working week.

It is probable that the increase in cost was exaggerated, at least to the end of 1920, owing to evasion of the higher prices by the substitution of cheaper articles, without lowering the general standard obtained. From 1921, however, supplies have been adequate and the final change in the composition of the budget can hardly have reduced the number effectively by more than five points. The winter is higher than the summer number, partly owing to seasonal dearness, partly owing to the assumption that eggs, etc., are bought in the same quantities winter and summer. On the average the July number is about 2% below the average for the year. For fine measurements this variation should be taken into account, but in fact the index-number is not

*Fuel and lighting included. †These numbers refer to the Jan. following. **For June.

precise within, say, five points, even for the most general purposes, and still less is it a perfectly accurate measurement of the change in the cost of living in particular localities or occupations.

Other Countries.—It is only possible in the space available to state without analysis the official statistics of the movements of retail prices of food. In other countries, the numbers are subject to the same want of precision as in Great Britain and are compiled in a similar way. They represent the cost of purchasing from time to time a defined and unchanged ration estimated as typical of pre-War working-class consumption. These numbers are currently summarised in the *Ministry of Labour Gazette* (London), the *Labor Review* (Washington), and the *International Labour Review* (Geneva), and for each country in its official publication.

The prices are, of course, strongly affected by the relative value of the currencies in the countries. The result of expressing them on a gold basis may be illustrated as follows, July 1920 being selected as near the date of the maximum of prices:—

TABLE V.—*Retail Food Index Numbers*

	July 1920.			July 1927.		
	Index in Currency.	Currency as % of par.	Index in gold.	Index in Currency.	Currency as % of par.	Index in gold.
Great Britain	258	76·6	198	167	100	167
Paris	373	39·4	146	557	20·3	113
Milan	445	27·6	123	524	29·0	152
Sweden	297	79	234	151	100	151
United States	215	100	215	150	100	150

Thus, if an American had gone to Paris in July 1927 with $113 he could have converted them into as many francs as would buy the food that cost $100 in Paris in July 1914. In New York he would have needed $150 to purchase food that cost $100 in July 1914. The great variation in the index from country to country, even after conversion to a gold basis, is noticeable. The increase is generally the less the greater the depreciation of currency. (*See* INDEX NUMBERS; PRICES; WAGES.) (A. L. B.)

UNITED STATES

History.—The first comprehensive cost of living study made in the United States was carried out by the U.S. Bureau of Labor in 1890 (see *Sixth Annual Report of the Commissioner of Labor, 1890*, Washington, D.C., 1891). Information relating to incomes and expenditures was collected from 3,260 families, including 16,581 persons. The heads of the families studied were employed in the iron, steel and related industries. In the year 1891 another cost of living study was carried out by the bureau (see *Seventh Annual Report of the Commissioner of Labor, 1891*, Washington, D.C., 1892). This study included 5,284 families, with 27,577 members. The cotton, woollen and glass industries were covered. In 1901 and 1902 the U.S. Department of Labor, as it was then called, made another study of the cost of living, dealing with 25,440 workingmen's families, with 124,188 members. The leading industries in all the principal industrial centres of 33 States were covered.

During the first half of 1916, the Bureau of Labor Statistics, by direction of Congress, made a study of the cost of living of wage earners in the District of Columbia. The results of this study, showing incomes and expenditures of workers' families and of single women workers, were published in a series of articles appearing in the *Monthly Labor Review* of the U.S. Bureau of Labor Statistics, Oct. 1917 to April 1918. The latest comprehensive study of the cost of living by the bureau was begun in 1917 for the Emergency Fleet Corporation of the U.S. Shipping Board. This study covered 35 ship-building centres, and was extended during 1918 and 1919, for the use of the War Industries Board, to include 92 cities and towns in 42 States. The results of these latest studies by the bureau were published as soon as completed in the *Monthly Labor Review* (March 1918 to Aug. 1919). *Bulletin No. 357* of the bureau gives the tabulations of incomes and expenditures by income groups for 12,096 families of 59,270 persons. The quantity as well as the cost of every item purchased by each family for an entire year was obtained. The average quantity of each item purchased was computed for all families in all the cities.

These average quantities, classified into six major groups, constitute the average quantity family budget for the 92 cities studied in 1917–19. This quantity budget was and still is the basis for calculating the bureau's index numbers of costs of living and changes therein.

In 1934 to 1938 the bureau completed two country-wide studies of incomes and expenditures of wage earners and lower-salaried workers. One included some 16,000 families in 55 cities; the other covered more comprehensively 32 cities. Only three cities were included in both studies. Several important special studies of expenditures and budget costs have also been made. In 1935 the bureau co-operated with the Works Progress Administration in compiling the monograph, *Intercity Differences in Costs of Living*, based on the pricing of a theoretical "maintenance budget" in 59 cities. These later studies have apparently been used to supplement, not to supersede, the studies of 1917–18. The bureau still uses, with some necessary modifications, the average quantities of 1917–18.

The aim is to price a list of goods as nearly identical as possible at different times so as to show by index numbers relative changes in *costs* of goods and not relative changes in *quantities, qualities* and *kinds* of goods.

However, new qualities of goods are substituted for those displaced and new articles, such as automobiles, radios, electric refrigerators, rayon garments, are added to bring the workers' budget up to date.

During and immediately following the World War, many companies established systems of wage adjustments on the basis of changes in the cost of living. Some of these companies made more or less complete surveys periodically in order to determine the extent of changes in the cost of living. Since the crisis and depression of 1920–21, most of these cost of living wage systems were given up, partly because of the difficulty of persuading the workers that the cost of living had fallen and that therefore their wage rates should be correspondingly reduced, but principally because employers felt that "wages should be deflated" and that wage rates could again be determined by "supply and demand" with little regard for cost of living. One of the most successful of these wage adjustment plans based on cost of living was established in 1925 for the employees of the Philadelphia Rapid Transit company and operated satisfactorily for several years.

Methods of Collection.—Both the intensive method and the extensive method have been employed to gather cost of living data. (1) By the intensive method a small number of families is selected and their incomes and expenditures are studied with great particularity over a few weeks or, at most, a month or two. (2) By the extensive method a large number of families are included, and an estimate of their expenditures for different items over a period of an entire year is secured so as to get the variations in expenditures from season to season.

The first method has the great advantage of greater intimacy of contact and therefore greater accuracy for each budget. Its great disadvantage is that it is unavoidably very limited in the number taken as a sample to represent the whole. It is likely to misrepresent the incomes and expenditures of the classes and occupations it purports to represent, not only because the number studied is small but also because the period covered by the study is so short. Families which are willing and able to report detailed information over a considerable period are hardly typical of workers or any other class. The advantages of the second method consist in the larger numbers included and the longer period of time covered by the budgets. The different classes and occupations in the community and country are, therefore, better represented, as also the variations in incomes and expenditures in winter as compared with spring, summer and autumn. The great disadvantage of this method is the impossibility of securing accurate records of expenditures over so long a period as one year. There is no apparent reason why errors in estimates of expenditures should counterbalance each other. Intensive studies and checks made by the U.S. Bureau of Labor Statistics, however, show that these errors do cancel to a large extent, so that the results shown by the extensive budget studies made by that bureau may be taken with confidence as truly representative of the incomes and expenditures of working-class families of the income groups specified in the different cities studied.

Purposes.—The earlier cost of living studies, in America as elsewhere, were made primarily for the purpose of ascertaining the actual amounts expended by workers' families for food, clothing, rent and other necessaries and comforts; the degree of well-being enjoyed by the workers, and the adequacy or inadequacy of the wages of the principal bread-winner to pay for the things needed to maintain his family at the standard of comfort commonly accepted by the workers in his craft or class. The "fair living wage" was the goal sought by all these investigations. In the United States the competition of various races caused a good deal of attention to be directed to the study of differences in racial standards of consumption. These studies showed what was already known, that a living wage to a foreign-born family was not a living wage to an American family and that the living standards of the earlier immigrant races were higher than those of the later arrivals.

The cost of living studies made before the World War supplied some valuable information as to the conditions of life among the labouring classes. Above all, they blazed the trail and made possible the more detailed and specific studies which have followed. The obvious criticism which applies to them all is that the information obtained was inadequate for the accurate determination of the degree of comfort and well-being enjoyed by the workers in the different income groups. Furthermore, these early studies supplied the quantities and descriptions of things consumed only in the case of foods. It was, therefore, impossible to calculate accurately changes in the cost of living. An average cost of living budget, expressed in dollars instead of physical units of quantity, is of little value for determining whether the lot of the workers has improved or sunk lower with changing prices, wage rates and incomes. In fact, very little use was made of these studies in wage disputes.

During the period of rising prices from 1897 onward, the demands of the workers for increased wages to offset increases in prices were frequently met by the statement that the workers' difficulties in making both ends meet were due not so much to the "high cost of living" as to the "cost of high living." This assertion that family expenditures were increasing because of the growing and extravagant demands of the workers and their families could not be answered by any cost of living data at that time existing. In the study made by the U.S. Bureau of Labor in 1900 and 1901, the food budget was itemized and the actual quantities purchased by each family were ascertained for nearly 80% of the total spent for food. From these facts a quantity food budget for the average workingman's family was compiled. Beginning with 1904 retail prices of food commodities have been published by the Bureau of Labor. These prices were weighted by the quantities of each article consumed by the average family as shown by the 1901 study. Thus a fairly accurate measure of the change in the cost of the food budget as it existed in 1901 was obtained.

The other items of the family budget, however, were not given quantitatively, so that changes in the cost of living could only be estimated from changes in the cost of the food budget alone. In making such estimates, some assumed that the cost of all items in the family budget changed in the same degree and in the same direction as food prices; others assumed that only food prices changed and that all other items in the worker's family budget remained stationary; still others assumed that food prices increased more rapidly than the prices of other articles of consumption, and compromised by assuming that all items other than food increased only half as much as food.

The Quantity Budget.—As a result of the price upheavals of the World War, measurement of changes in the cost of living became of first importance. As a foundation from which to calculate these changes, it was necessary, of course, to make a new budget study which would give, accurately enough for statistical purposes, actual quantities of the different kinds of food, clothing, houses, fuel and lighting, furniture and house furnishings and miscellaneous items consumed by workers' families in the different income groups. Starting with this quantity budget representing consumption by the average worker's family, it is possible to calculate the effect upon the cost of the total budget of changes in the prices of the various items which constitute this budget.

The facts were gathered through personal visits by experienced agents. The schedules of inquiry listed the articles of family consumption in minutest detail. Quantities, costs and prices were obtained for all articles, so far as possible. The costs of clothing, furniture and other durable articles were distributed over the entire lifetime of the articles and the annual costs computed. For example, a suit of clothes costing $30.00, estimated to last three years, would be entered as an annual charge of $10.00. The food schedule contained approximately 150 separate articles of food. Annual rents or costs of occupancy of all varieties of dwellings were obtained. Probably not less than 40 different types of house or flat were scheduled. One hundred and forty-four types of articles of wearing apparel were listed on the schedule of inquiry. Of course a much larger number of specific grades and qualities were recorded by the agents in the survey. The quantities and costs of all kinds of fuel and lighting consumed were scheduled. Probably not less than 20 specific varieties of coal, coke, wood, gas and electricity were included. Sixty-two classes of household furniture and furnishings were designated in the schedule. The cost of probably more than 150 different grades and qualities of these articles was obtained. Sixty-two different items were included in the miscellaneous schedule. The cost of many of these items can be expressed only as a lump sum of money. No quantity figure is obtainable. For example, school expenses, medicines and most other expenses for health, vacations, travel, church, charity and various kinds of contributions can be expressed only as specific sums of money or fractional parts of the total expenditure of a family.

All told, the prices, quantities consumed, and annual costs were obtained for approximately 550 to 600 different grades or descriptions of articles and services consumed in 12,096 workers' families.

Changes in the Cost of Living.—It is not necessary to make a new budget study in order to ascertain percentage changes in the cost of living. Once a representative average quantity budget is established, it is theoretically easy to compute changes in the cost of such a budget by collecting, for a given date, the retail prices of all the articles making up the budget, weighting each price by the quantity of the article consumed and adding these products to get the cost of the total budget for the given date. Practically, there are many difficulties. First, the cost in time and money would be prohibitive if retail prices of every article in the budget were to be obtained. Hence, only the more important articles in each group are selected to represent family consumption for the whole group. For example, prices of 84 standard articles of food, weighted by expenditure for 126 different foods, are now taken to represent the food budget; only 68 different articles of clothing represent more than 140 types of clothing used. Instead of going to the expense of pricing some 600 separate budget items, it has been found sufficient to gather prices for only 218 items, exclusive of rentals.

The price of each of these representative articles is weighted by the quantities which the given article represents in the total average family budget.

Second, it is not practical, because of expense, to include all of the 92 cities and towns covered by the budget survey of 1918. Food prices are obtained from 51 cities while prices of other budget items are obtained from only 32 cities. To obtain group aggregates, the average cost of each of the six groups, as found by the periodic retail price surveys, is multiplied by the percentage which the given group bears to the cost of the complete budget of 1917–19. These six group aggregates are totaled to obtain the aggregate average cost of the entire budget as of the date of the retail price survey. These budget aggregates are converted into cost of living index numbers on the base 1923–25, by dividing each aggregate by the aggregate for 1923–25.

Revised Methods of Computation.—To make the budget more representative of present day consumption by workers, the bureau in 1935 introduced certain changes in the method of computing cost of living indexes based on the obsolete data gathered 20 years ago under war conditions. (See *Monthly Labor Review*, September 1935, pp. 819–837.)

First, the food budget has been revised by securing retail prices for some additional foods, mostly fruits and vegetables. An improvement has also been made in the method of distributing the consumption weights of the entire 1917–19 food budget (consisting of 126 items) among the 84 foods priced in the monthly retail price survey.

Second, the weights ascribed to the six major groups have been revised with the view of representing more accurately the percentage distribution of the cost of each group in the year 1913, the base year for the cost of living indexes.

The percentages for the several groups are computed from the aggregate costs of the articles in the groups. The old and the new weights are given in Table VI.

TABLE VI.—*Percentage Distribution of Cost of Goods Purchased by Wage Earners and Lower-Salaried Workers in the United States*

	Percentage distribution of cost of goods purchased in—	
	1913[1]	1917–19[2]
Food	34·8	38·2
Clothing	13·7	16·6
Rent	21·2	13·4
Fuel and light	5·6	5·3
House-furnishing goods	4·0	5·1
Miscellaneous items	20·7	21·3
All items	100·0	100·0

[1]Computed from expenditures shown by the investigation of 1917–19 and changes in costs between 1913 and the time of that investigation.

[2]As previously used in weighting the cost-of-living indexes.

Compiled from *Monthly Labor Review*, Sept. 1935, p. 826.

Third, a new and commendable system of weighting costs for different geographical areas according to the population of each area was introduced. Aggregate costs for each group are computed for the principal cities and these group costs are multiplied by figures representing the population, not of the particular city, but of the adjacent area in which prices are assumed to move similarly. The base period of reference has been changed from 1913 to the period 1923–25.

Table VII gives the revised indexes. Between 1913 and 1938 the food index advanced 25%; clothing, 48%; fuel and light, 61%; house furnishings, 77%, miscellaneous, 77%; rents only 13%, and the entire budget, 45%.

These average changes in the cost of the different groups and of the entire budget have all the demerits of averages made from such divergent data. The accuracy of the calculations is unquestioned. Whether any one series of indexes based on data collected from only 32 cities can be assumed to represent costs of living in such a vast and variegated area as the United States may well be questioned.

The Minimum Quantity Health and Decency Budget.—Very soon after wage adjustments began to be made on the basis of changes in the cost of living, calculated as above outlined, the workers began to demand higher standards of living. In order to ascertain whether the workers' demands were just and reasonable it became necessary to set up a more precise standard of measurement of changes in the cost of living. A budget made by averaging the total incomes of all workers' families, the sources from which the incomes are derived, the amounts expended for different items, and the surpluses saved or the deficits incurred, tells us little or nothing as to the adequacy of the income received by any worker's family.

TABLE VII.—*Estimated* Annual Average Indexes of Cost of Goods Purchased by Wage Earners and Lower-Salaried Workers in 32 Large Cities Combined, 1913 Through 1938*

[Average 1923–25 = 100]

Year	All items	Food†	Clothing	Rent	Fuel and light	House-furnishing goods	Miscellaneous
1913	57·4	63·1	55·7	61·4	53·9	47·7	50·1
1914	58·2	64·6	56·1	61·4	54·3	49·0	51·2
1915	58·8	63·9	57·4	61·9	54·5	51·3	52·8
1916	63·2	71·7	62·9	62·6	56·6	57·2	55·5
1917	74·4	92·4	75·6	62·1	63·0	66·9	64·2
1918	87·2	106·2	102·5	63·2	73·3	85·9	76·7
1919	101·1	120·2	135·7	68·4	79·4	108·2	86·3
1920	116·2	133·1	161·6	80·4	93·1	132·8	99·1
1921	103·6	101·6	124·4	92·4	99·3	111·8	102·8

**Monthly Labor Review*, June 1939, p. 1358.

†Covers 51 cities since June 1920.

In order to determine whether workers' incomes are sufficient to buy the right kinds, quantities, and qualities of food, housing, clothing, fuel, etc., it is necessary to establish a standard quantity budget which will be adequate to maintain the average family in health and efficiency.

Accordingly, in 1919 and 1920, the Bureau of Labor Statistics, in co-operation with experts from the Department of Agriculture, worked out standard minimum quantity budgets sufficient to maintain a single man, a single woman and the average worker's family in health and decency.

The standard minimum quantity family budget so compiled did not differ very much from the actual average budget purchased by families in the \$1,800–\$2,100 income group in the year 1918. These minimum quantity budgets were published in the *Monthly Labor Review* of the U.S. Bureau of Labor Statistics, Dec. 1919, Jan. 1920 and June 1920.

The value of a standard minimum quantity budget is apparent. The actual consumption of workingmen's families may be quite inadequate or ill-adapted to support them in health and efficiency. It may be that they expend more than they should for certain items of food, clothing or amusements. It is much more likely that they are unable to expend enough on the right kinds and qualities of food, clothing, medical care, education and insurance.

With such a minimum standard quantity budget as a guide, any unreasonable demand by workers for a wage increase or by employers for a wage cut would be made at once apparent. However, neither employers nor workers accepted the standard quantity budget as a base from which to measure changes in the cost of living. Instead, they agreed to the theoretically less precise method of measuring changes in the cost of the average family budget and obtaining the new wage rate by multiplying the old rate by the cost of living index number so calculated.

This method was used during the war and was employed in many establishments for several years thereafter. Imperfect as it is, industrial peace was furthered thereby and more reasonable wage rates were maintained.

Wage Adjustments.—As indicated above, the cost of living studies made by the U.S. Bureau of Labor Statistics have been extensively used in the adjustment of wage disputes. The study of 1917 was begun for the express purpose of furnishing the Labor

Adjustment Board of the Emergency Fleet Corporation with the facts necessary for settling the ship-building workers' demands for increased wages. Later, the scope of the study was greatly extended at the request of the War Labor Board. Nearly every award made by Federal wage boards from 1918 to the present was based upon the cost of living indexes compiled by the U.S. Bureau of Labor Statistics. State arbitration commissions and minimum wage commissions, as a matter of course, take account of changes in the cost of living in making their decisions. Miss Elma B. Carr ("The Use of Cost-of-Living Figures in Wage Adjustments," U.S. Bureau of Labor Statistics, *Bull. No. 369,* p. 432, Washington, D.C., 1925) estimates that cost-of-living figures had been used to adjust wages in industries employing directly $5\frac{1}{2}$ million workers, and that the number of workers indirectly affected was even greater. As a means of maintaining peace in industry, cost of living studies have amply justified themselves.

Changes in Consumption.—The study made by the Bureau of Labor in 1901–02 gave the quantities consumed for more than 80% of the food budget; consequently, the kinds and quantities of food consumed in 1901 can be compared quite accurately with 1918. In 1901 the food budget absorbed 43% of the total expenditures, while in 1918 only 38% was spent for food. It should not be too hastily assumed that the decrease in the proportion spent for food indicates a higher degree of well-being. If all of the groups of items making up the family budget increased in price uniformly, it would be fair to assume that a decrease in the percentage of expenditure for food would connote increased expenditures for things other than prime necessities and, therefore, a higher degree of well-being. But, during this period, clothing increased in price more than twice as much as food, so that the food expenditures had to be curtailed to eke out the clothing which otherwise would have become inadequate. Furniture and house furnishings also rose in price about twice as much as food, and competed hard for the family dollars. The quantities of meats, poultry, eggs and fish consumed in 1918 were less than in 1901, while the quantities of milk, fruit, and vegetables increased from 1901 to 1918. The amount of sugar eaten also decreased. The 1918 food budget appears to be better balanced and more healthful than the 1901 budget. The changes in food consumption were probably due to price changes and the economy program of the Food Administration during the war, rather than to any permanent improvement in eating habits. A study in 1939 would doubtless show much greater changes in food consumption than occurred between 1901 and 1918. Changes in clothing, housing and miscellaneous consumption are still more marked. The average family budgets of 1918, being war-time budgets, became obsolete after the industrial crisis of 1920 and the fall of prices, and incomes.

The most reasonable policy would be to discard the 1917–19 country-wide budget and construct a series of new cost of living budgets, making use of the consumption data obtained in the 1935–38 surveys, to represent different geographical sections.

COST OF PRODUCTION. In economics, the cost of production is the sum-total of the labour expended and wealth consumed in producing a commodity. The amount of money which has to be paid to call out these efforts and sacrifices is termed the expenses of production. The sum so paid, expressed per unit of output, is termed the supply price of the commodity; that is, the price which has to be paid to induce production. The term "expenses of production" thus covers the whole of the producer's outlays and includes the producer's remuneration. Unless the producer's expenses, thus defined, amount to a supply price per unit of output not higher than the effective demand price, production must either cease or be carried on at a loss.

COSTON LIGHT, a pyrotechnic light designed for night signalling between vessels at sea and between sea and shore. The signal is made in the form of a cartridge containing slow-burning chemicals which produce an intense light, in various colour combinations. The cartridge is mounted on a cylindrical wooden base adapted to be inserted in a holder equipped with a brass ferrule to receive it, and a plunger for igniting the signal by means of a percussion cap, in much the same manner as a shell is exploded by the trigger of a gun. In clear weather these signals can be seen for a distance as great as 15mi. and have exceptional penetration in mist or fog. The signals are so constructed that they will show successively various colours—blue, green, red, yellow and white—and various combinations of these are extensively used by steamship lines as distinguishing night signals. This signal was adopted by the U.S. Life-Saving Service (now Coast Guard) in 1873, for use by the beach patrol at night and in thick weather to give notice upon discovery of a wreck or vessel in distress that they are seen and help is at hand, and to warn vessels running dangerously near the shore.

COSTUME DESIGN, THEATRICAL. The early history of theatrical costume can no more be separated from that of religious and ceremonial costume than the early history of drama as a whole can be separated from the history of religion, which merges by slow degrees into drama. The first steps away from religion proper are usually taken in the direction of comedy, many gods becoming the clowns of future generations. The Etruscan devil dancer may easily be the descendant of a powerful god to whom bloody offerings once were made; yet the lineal descendant of this god played a clown's part as recently as 50 years ago in a Hungarian mystery play.

Where religion and drama interweave, it is difficult to determine to what extent the costumes of the priests and members of secret societies may be considered theatrical. How far the Egyptian gods portrayed in bronze and stone represent priests dressed in the usual costume of the early dramatized gods remains largely a matter of conjecture. However, it seems logical that masked priests played a part in certain Egyptian mysteries. In the last few years numerous collections have been brought together of masks and costumes representing gods and demi-gods from different mystery plays of almost all nations, including European countries. The frequent occurrence of these masks over the civilized world suggests that they were also used by the Egyptians.

At the beginning of drama in each country one finds masked religious figures, gods or heroes. Long before the Javanese *wajang wong* there was the masked pantomime *topeng* dance. Long before the *Nō* performances in Japan existed, performances were given, within the temple, of the masked *kagura* dances. In China, in Mexico, in Greece and Central Europe, everywhere in fact, one comes across traces of the old religious costume in the drama of a more secular nature of much later date, so much so that it seems safe to regard the purely religious costume as the prototype of the more fantastic costumes in the secular and commercial theatre. Thus the temple dance in Japan through the *Nō* dramatic festival and the temple dance entertainment finally influenced the *kabuki* or popular theatre. Thus the religious images of the mediaeval church influenced the costuming of the municipal plays in the Low Countries during the 15th and early 16th centuries.

Oriental.—The Japanese *Nō* costumes and masks are largely preserved as temple treasures. They are among the most beautiful stage costumes ever made. As the *Nō* actor is held in popular esteem among the Japanese, whereas the actors in the popular theatre are regarded almost as outcasts, so the maker of the *Nō* masks is a highly esteemed artist who proudly signs his name to his work. Although the *Nō* dates from the 14th or early 15th century, the masks that one sees usually are of a much later date. Besides the carved wooden lacquered masks the costumes consist of gorgeous brocades which are specially woven with large mediaeval patterns, of beautifully wrought accessories, jewellery and fans. The combination of all these temple treasures, if worn by a fully apparelled *Nō* actor when he approaches with cadenced motions on the highly polished floor of the *Nō* stage, makes a spectacle

A RUSSIAN THEATRE COSTUME DESIGN FOR "JENGHIZ KHAN"

This design, distinctly Russian in style, was conceived by A. Stschekotikina, a modernist who carried on the work of stage symbolism established by Bakst. It achieves a fantastic effect expressive of Jenghiz Khan, the "perfect warrior," who terrorized the Eastern World in the 12th century by his conquest of China and bordering nations. The colours are used symbolically. Gold indicates wealth; red, passion; and yellow, Chinese imperialism, while the blue background below adds a note of mystery and terror.

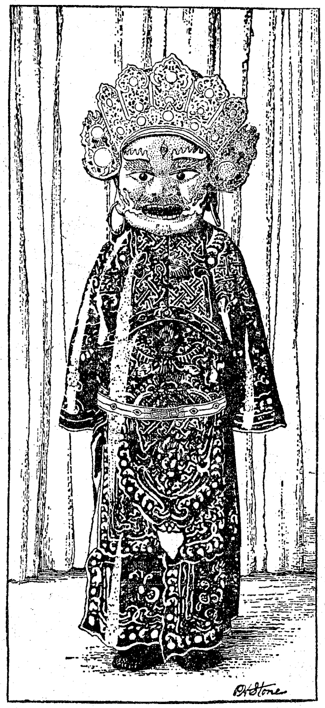
never to be forgotten. The costume here, as in ancient Greece, China and Java, indicates through traditional accessories not only the rank or position of the actor but even the sex of the character he is to represent, as only men are permitted to take part in the performances.

The costumes worn in China are usually of embroidered silks and in a religious or semi-religious play they are even to-day of antique cut, with false jewellery and metal-work to make them look rich at a distance. In some of the congratulatory plays in China, where masks are worn, the number of masks is prescribed by tradition. There are four guardians, 28 patriarchs, 28 lunar gods, eight female fairies of such poetic names as Cinnamon Blossom, Pear Blossom, Lotus Flower, Spring Breeze, etc. In the commercial theatre the masks have been done away with, traditional make-up taking their place. The costumes also have been changed somewhat, the best known characters to Western eyes being the generals who are indicated by numbers of small flags which are arranged in a kind of halo on their backs. The prescribed make-up closely resembles the painted scroll work one sees on the masks, which are used to indicate ancestral heroes.



CHINESE ACTOR, T'ANG PERIOD, A.D. 618–900, WITH A HEADDRESS OF ANCIENT GREEK CHARACTER

In Tibet the lamas produce mystery plays at certain festivals which include among the most characteristic figures a kind of buffoon, looking for all the world like a half decayed corpse. The type of masks and costumes used in the Tibetan mystery plays closely resembles that of the Chinese. In Siam and Cambodia the masks worn by the ballet have a religious meaning. The costumes themselves are provided with the most elaborate jewellery. In Java a strange influence has been exerted on the costumes in the *wajang wong* drama by the prototype of this form of entertainment, viz., the cut leather shadow marionette performance. It was only in the 18th century that the plays belonging to this type of shadow theatre started to be enacted by men. The plays are all borrowed from Hindu sources, the heroes being represented with a curious kind of wings of pierced and gilded leather similar to the minutely cut golden filigree work of the leather shadow marionettes. Animals play an important part in the performances given by the native princes on festive occasions. The animal costumes are made of painted cloth on a bamboo frame-work. In the original *topeng* dances, which antedate the other performances by centuries, old court costumes are worn but all actors are masked to indicate the character and rank. It is only very recently that women have acted in the Javanese drama and then only in the commercial theatre, often in groups without men, which custom has also been introduced in China. The ballet dresses worn by the *corps de ballet* at the native courts do not differ from the regulation court dress, except for the addition of a very long brilliantly coloured scarf which is not usually worn by other women. The ballets given by these troupes are always private and the costumes are therefore designed to appear well at close range, just as the modern ball-room performers usually wear the conventional dress, or the geishas of Japan wear fantastic costumes with no particular stage value.

HERMIONE'S COSTUME IN GRANVILLE BARKER'S "WINTER'S TALE," DESIGNED BY ROTHENSTEIN

Classical.—The ancient Greeks instead of using make-up availed themselves of masks to indicate the character of the actor like the Chinese and Japanese. Besides the mask there were various attributes by which one could recognize the character's position in the drama. As in the traditional make-up of the Chinese, colour played a large part in this symbolism. A typical part of the Greek actor's costume was a kind of stilt or wooden clog called the *cothurnus,* with which the actor's height was increased by several inches, and the introduction of which was credited to Aeschylus. To increase his height further, a conical wig was arranged on top of the mask, this addition being called the *onkos.* In comedy the *cothurnus* was replaced by a different kind of shoe.

ACTORS OF A SATYRIC DRAMA, "DIONYSUS AND ARIADNE," IN NAPLES

Everything about the costumes was traditional. If the play was a tragedy the actor wore an underdress or *chiton,* over that a draped gown, also a gold embroidered overdress. In addition to the dress proper, there were various hand properties, crowns, etc., which made it possible to distinguish the characters one from another. Dionysus is reported to have worn a yellow overdress, a shoulder strap with flowers and a thyrsus. Other gods had their own attributes. If a character were supposed to be unfortunate he used dingy clothes, grey or faded blue, black or murky yellow. Queens were supposed to wear white and purple, other ladies saffron or frog green, these costumes being lavishly embroidered with gold. Satyrs wore goat skins, real or imitation panther skins, phallic attributes and red overdresses. The sileni wore, besides their tails, a curious underdress. In comedies the actors wore the *chlamys* over a plain white underdress, together with travelling hats and hair bands, and had properties such as bows, spears, knives, staffs, etc., to complete the costume. The number of masks were regulated by the Greeks also, apparently in a much more arbitrary way than among the Chinese. According to Pollux there were six old men, eight young men, three attendants and 11 women, making 28 in all. In the New Comedy there seem to have been nine old men, 11 young men, seven slaves, three old women, 14 young women. The costumes also were very conventional. The richness of the costumes, especially of the chorus, depended much on the wealth and good will of the *choragus,* who financed the performance sometimes as a civic duty which was laid upon rich citizens, but much more often for the glory which a successful production brought to the backer.

A COSTUME WORN BY MME. GEORGE IN "LA GUERRE DES SERVANTES"

Although most of the performances were given by groups of actors living near the large theatre, travelling was done even into the distant colonies. As an offshoot of the orthodox theatre in Greece a kind of theatre called the *phlyakes* seems to have been established in southern Italy in the 3rd century B.C. Judging from

the evidence on vases, we know that the costumes were caricatures of the gods of Greece and indicate that the plays were of a comic, popular nature. It is in this type of stage that some people see the ancestor of the *commedia dell'arte,* tracing the costumes of harlequin and other characters to the costumes worn by some of the actors in these comedies.

Roman tragedy costumes followed the Greek precedent. They were usually rich like the Greek costume but were slightly changed to conform to local Roman dress. The tendency of the Roman theatre was toward a greater and greater elaboration and realism. Horace mentions plays in which regiments of cavalry and even elephants took part. Probably these elaborate performances were emulated by the princes of Italy in the Renaissance period when the court masques became the vogue. Realism on the Roman stage certainly ran riot when the Emperor Domitian staged a real crucifixion at the end of one of the productions which he offered to the people of Rome, using a prisoner as a substitute for the actor who played the part of the victim. Great luxury was displayed also in the Roman pantomimes. The character of the costumes worn in the pantomimes was objected to by reformers, on the ground of their being made of very transparent materials. The objections, however, seem to have been just as much to the nature of the performance itself as to the costume. The mimic scenes in their costuming were probably very like the *phlyakes* scenes. The costumes used in the mimes were gradually made to resemble more and more the ordinary Roman dress. The actor also abandoned the mask as the object of the plays became realistic. In the Atellan farces masks seem to have been used, however.

Mediaeval.—There is a certain connection between the drama of ancient Rome and the drama of the middle ages in northern Europe, but to what degree the costumes which the clergy used for the performances of the early plays in the churches and within the church precincts were influenced by the costume of the ancient theatre it is difficult to determine. There may have been some type of aboriginal costume which was adapted into the devil costume of the mystery play. In the few documents which are known the devils wear masks and fantastic costumes. Some of the actors wear a costume almost identical with the costume of the period, while the sacred personages are attired in the type of costume one sees in contemporary ecclesiastical paintings and sculpture. The works of art of the 15th century, as Van Eyck's "Adoration of the Lamb," appear to be adaptations of scenes from the drama of that time. The elaborate costumes of God the Father, the angels and other persons would portray those of the actors of the day. Even if this should not be entirely true it is safe to say that the costumes used in the ecclesiastical drama must have been very like the ones shown in these paintings, as the people who painted them were engaged by the clergy to help in staging the plays.

AN 18TH CENTURY OPERA COSTUME, DESIGNED BY F. BOUCHER
16th century influences are visible

Certain pictures which have come from Italy show types of angel costumes with unmistakable stage tricks in their construction, the halo on some of them being fastened to a headdress, for instance. As the drama was gradually separated from the church and the larger part of the action was devoted to the shepherds and burghers rather than to the divine personages, the bulk of the costumes more and more resembled the local everyday dress. The later the period the better documented the drama becomes, and in the 16th century we find a number of engravings and other material which illustrate the theatrical costumes worn at that time.

Renaissance.—The Italian Renaissance naturally brought about a radical change in stage costume. To the mediaeval tournaments were usually added some dramatic interludes which gradually were given greater and greater importance. During the 15th and early 16th centuries this type of entertainment became more and more developed into a display of wealth in costumes and scenery which was only equalled by the Romans in their most spendthrift days. These court masques made much use of symbolic costumes and semi-classical draperies, suitable for the dressing of gods and goddesses of ancient times, dryads, nymphs and satyrs. The drama at that time began to be divided into the tragic, comic and satyric, and with the classical influence becoming so strong, the older Gothic costumes disappeared even from the stages in the northern countries, France, the Netherlands and England. But the classical costumes which became the vogue should not be confused with the antique Greek and Roman theatrical costumes; they should be thought of as resembling the classical figures seen in the paintings of Mantegna, Botticelli and other painters of the quattro-cento.

VITALE MASCARDI, PARTICIPANT IN THE QUADRILLE AT CARDINAL BARBERINI'S FEAST, ROME, 1634

Serlio, one of the most quoted sources of information on the drama of the Italian Renaissance, in his second book of architecture published in the middle of the 16th century, while speaking of the satyric scene, addresses the stage designers of the period as follows: "I would tell you of the superb costumes of certain shepherds made of rich cloth of gold and of silk, lined with the finest of wild animal furs. I would also tell of certain fishermen whose dresses were not less rich than the others, whose nets were of fine golden thread, and of all their other implements, all of them gilded. I would tell of some shepherdesses and nymphs, whose robes were made regardless of cost. But I leave it to the intelligence of the judicious architects to do such things when they shall find the patrons who are agreeable to their wishes and who give them full power with generous hands, to execute all which they desire."

AN 18TH CENTURY PIERROT COSTUME, DESIGNED BY ANTOINE WATTEAU

Court Performances.—As the financial control of the drama passed from ecclesiastical hands into those of the princes, it was used more and more as an aggrandizement of the courts. The costuming and mounting of the plays became more and more elaborate, one monarch trying to outdo the other in the splendour of the entertainments offered. Marriages, coronations, the birth of heirs to the throne, even funerals were made an excuse for great display of costumes and pageantry. The cities were required to give great feasts when the monarchs of the realm visited them. On the temporary stages erected for such occasions, *tableaux vivants* were posed in costumes rich in symbolic devices and emblems. Practically all the well-known painters, such as Albrecht Dürer, Velazquez, Rubens, Van Dyck, designed costumes and paraphernalia for entertainments of this kind during the 16th and early 17th centuries. In these tableaux the clothing of some of the characters was reduced to almost nothing, a fact which caused as much alarm among the reformers of those days as it had done during Roman times. Whether it is due to the number of engravings which have been preserved or not, Antwerp seems to have been one of the cities where the most elaborate of these entrance festivities were given, among them those of Philip II. in 1549, of the Archduke Ernest in 1594, and of Albert and Isabella in 1602.

The Flemish rhetoric drama was costumed in a Dutch version of the Italian classical period, and so were the court entertainments in England. Inigo Jones, who together with Ben Jonson produced several masques, studied in Italy, and followed the Italian fashion rather closely. A few drawings of his are preserved at Oxford, among them some of the very few drawings of costumes of characters in Shakespeare's plays. In some of the productions in the London theatres of the early 17th century the costumes were probably imitations on a more modest scale of those worn in the court productions. In others the costumes, judging by some woodcuts which have come down to us, were like the everyday dress. Ben Jonson thus describes the costumes in the masque of queens: "The habits had in them the excellency of all devices and riches and were worthily varied by his invention," *i.e.,* Inigo Jones's invention.

There was a regular stock of legendary characters which were costumed so that they would be easily recognized by the public: virtues and vices; curiosity covered with eyes; error with serpents and snakes; credulity with ears. There was the earth with oak leaves, plants and flowers. There was water with dolphins and fishes, and the air with eagles and other birds. There was fire with fiery salamanders between the flames, and there were signs of the zodiac, the winds, nymphs, dryads and witches, all in their proper symbolic costumes. These masques and other court entertainments later on developed into the court opera. Of the costumes of the intervening period we get probably a good idea from the floral costume in the painting by Rembrandt, which is similar to the costumes in several other paintings by men of the period.

Opera and Comedy.—From Italy also come the costumes of the *commedia dell'arte,* of harlequin, pantalone, pierrot and columbine and all the other characters so dear to everyone who loves the theatre. This type of theatre is supposed to be the

ITALIAN AND FRENCH MASQUE COSTUMES (PRAGUE, 1817)

lineal descendant of the Roman classical drama. Its costuming seems to be almost entirely of the Italian 16th century except that of harlequin which might be traced quite easily to Roman prototypes. The exaggerations of certain parts of the body are also a classical trick. Later these costumes became definitely established and changes in them were made only rarely. Perhaps this was due to the method of production used in the *commedia dell'arte,* which only makes use of a certain number of characters, who reappear in all the different scenarios. In the course of the years new characters appeared, but on the whole the Italian comedy changed no more than harlequin's costume.

Poorly as the Shakespearian period is represented by documentary material, the opera is elaborately recorded. As a court entertainment, it received all the attention usually given to the exploits of the princes of the 16th and 17th centuries, to their ballets, their carousals, their tournaments and other dramatic enterprises. With the growing preponderance of France in European politics one may trace the growing aesthetic influence of France. As at first Italy influenced France in the drama as well as the other arts, so France now began to influence Italy. When designers such as Berain and Le Pautre originated a new set of costumes for a court entertainment, echoes could be heard all over Europe. As the masque was supplanted by the opera the costume gradually changed, the lines becoming more and more like the exaggerated court dress of the period.

Entirely different was the costuming of the comedy stage which usually was of a realistic nature with a sprinkling of *commedia dell'arte* motives. The comedy often employed music, and sometimes comedies were made as skits on the operatic stage, called by such names as *Peasant's Opera,* the famous Dutch *Kloris and Roosje,* or *Beggar's Opera,* Gay's famous English entertainment, both of the early 18th century. The costuming of these farcical operas, in fact of all comedy of that time, seems to follow rather closely the fashions of the period. Of course, fantastic plays called for a different kind of costumes and presumably followed the court performers in the same way as the popular Japanese theatre in certain plays follows the *Nō* theatre precedents, using more showy material and designs but adhering closely to the original type.

Modern Design.—Towards the end of the 18th century the classical movement began in the theatre and within a few years the stage costume changed from the ample gowns of the 18th century court dresses to draperies of soft woollens and clinging gauzes. The Viganos, in their ballets, adapted subjects like Diana and Endymion, and used for the portrayal of these characters dresses of the lightest and most transparent materials. Some years earlier Lady Hamilton had given performances in classical draperies only. With the advent of the romantic movement, the costumes which became the fashion were stage adaptations of period costumes. After the romantic Gothic revival one period after another seems to have come to the fore. The Gothic costumes of 1840, however, are entirely different from the Gothic costumes of the '80s. In each period only those parts of the original dresses were adapted which were not too incompatible with contemporary taste in form and colour. The modern dress designer for the stage has gone so far as to imitate the technique of pottery, sculpture, engraving and painting. Several modern designers also use old fashions as a source of motives, using them perhaps with a little more freedom than the original designers.

THE COSTUME OF MLLE. MARS AS DOÑA SOL IN "HERNANI," BY VICTOR HUGO, 1830

From the time when Henry Irving employed artists of fame to design the costumes and scenery for some of his productions there has been a strong competition among managers, one trying to outdo the other in the artistic excellence of the costuming of the plays which he produces. Of course, the results vary enormously. The famous Meiniger troupe prided themselves on the historical accuracy of their costumes. Men of the type of Alma-Tadema combine historical accuracy with a definite attempt to secure artistic harmony. Others, like the Russian Bakst, sacrifice historical accuracy to the artistic conception, being chiefly concerned with the composition in colour, form and line. Attempts have been made to reduce the actor to a two dimensional figure by means of lighting, and even to annihilate him, as far as his value in the composition is concerned, and use him as an intelligent machine, animating the abstract composition of colour and form which he carries by way of dress. It is curious to notice how one of the best known of the modern painters, Pablo Picasso, resorts to the same methods which were used by the 16th and 17th century designers in their emblematic costumes. The only difference lies in the artistic approach to the emblems combined to form the costume.

Technically, there are a few points in the construction of theatrical costumes which make them entirely different from ordinary everyday dress. First, the artistic meaning of the costume is usually exploited at the expense of any adherence to fashion. In the ordinary drama, where motions of the actors are not different from those of everyday life, the differences in construction usually limit themselves to simplicity in fastening and the choice of the materials, which are selected to appear well under the stage lights and from a distance. In costumes designed for dancers, acrobats, etc., the method of construction becomes of supreme importance to the artistic conception of the costumes. A ballet dancer can use skirts only of a certain length, an acrobat will have to protect certain parts of his body, others he must leave uncovered for the sake of free motion. It is probably on account of this difficulty of making the costumes of special artists of this kind artistically important that the managers have developed the expedient of the show girl, these girls being selected entirely for their good looks and their ability to wear and display elaborate stage costumes.

THE COSTUME OF WAGNER AS ORTRUD IN "LOHENGRIN," IN 1859

Materials.—The materials employed in the construction of stage costumes are often the same as those used for conventional dress, but usually the extremes in brilliancy are popular with the designer as this brilliancy is the only means by which he can avail himself of tonal and also of colour value. Often substitutes for expensive materials can be used which give an equally elaborate effect and are equally serviceable. The distance at which the costumes are usually seen not only makes these changes possible but sometimes even makes them necessary. This is especially true of all materials which are decorated with patterns or have been embroidered, for it is much easier to get an effect with the painted or appliquéd metal surfaces in an imitation brocade than it would be to get a similar effect out of a woven fabric. Some painters treat their costumes as if they were a part of the stage scenery, and by using mat surfaces only, produce a certain paint-like quality even in the dresses. The materials most commonly used for indicating more costly fabric are muslin, satin, cambric, cotton, flannel, terry cloth, oilcloth and the like. In Goethe's day glazed chintzes seem to have been a common substitute for silks, he himself advertising the use of them. In the middle ages a great deal of use was made of printed linens brightened with gold. Among the Javanese extensive use is made of the batik technique which has also found favour with a great many contemporary Western designers. To-day, as at all times, appliqué work is very popular with costume designers as well as the more showy kinds of embroidery. In stage embroidery liberal use is made of small mirrors, spangles, braided straw, chenille and similar materials; curled ostrich feathers have always been a favourite material.

AN EMBLEMATIC COSTUME, BY CHRISTOPHER WHALL, 1899

The materials used for the making of masks have been leather, papier mâché and wood, and for larger masks cloth stretched over a skeleton of bamboo, ratan or wire; even leaves have been used. Most of the modern masks are made of papier mâché over a base of modelling wax or plaster of Paris in much the same way as the *commedia dell'arte* masks were made from leather over a wooden mould. When a great number of the same masks are desired the usual method is to reverse the process, the mask being made of papier mâché inside a form, the resultant cast then being painted or lacquered in the same manner as the other masks are finished. The Japanese *Nō* masks and the Javanese *topeng* masks are made of lacquered wood; the Chinese and Tibetan masks are made of papier mâché, which material the Chinese use for the construction of entire costumes, making the actors resemble lacquered statuary, as for instance in the case of the Kwan Yin costume now in the Field museum in Chicago.

Legal Regulation.—From time to time ordinances have been passed to regulate theatrical costuming, but they have usually failed. During the 18th century a certain conformance with local custom was considered necessary by the management of the theatre, and the actors and actresses were instructed to dress according to the rules of etiquette. Actresses who portrayed ladies could not wear simple short-waisted dresses but had to wear at least *demi-parure,* or if several ladies took part in the scene they were to wear *grande parure* and no hats. Soubrettes were to wear no hats except when travelling, and no rings; only simple dresses possibly of appliquéd atlas. Young girls of the bourgeoisie were to wear skirts and jackets but never made of white material, at least never when the first lady was wearing white. The Javanese, Chinese and Japanese costumes are also stringently regulated, but even if regulations were not made, common sense would reach the same results. Who for instance would attract attention to one of the minor characters by dressing him in a vivid colour at the expense of more important players in the same scene? The dimensions of the human body and the motions which are natural to it have, of course, determined the form of costumes more than any other factor. Costumes peculiar to certain types of actors seem to persist through the centuries, and if these traditional forms are changed by intense artistic endeavour or even by political ordinances from time to time, they will presently reappear. The English Christmas pantomime costumes of clowns and harlequins are not different from the costumes used by the artists in the *commedia dell'arte* or even by the comedian who acted in the Greek and Roman farces. What determines the form of a costume most is the actor and his work. If certain motions which the actor is to make look best when made in certain costumes, these costumes will naturally persist.

ENGLISH PANTOMIME CLOWNS, SECOND HALF OF THE 19TH CENTURY

MODERN

There are various ways of regarding costumes in the theatre. Costumes may be a realistic period clothing for the actors, in which case they are of little interest beyond being an example of historical data. They may be an elaborate and ornate fantasy, designed purely for the purpose of pleasing the eye and forming a picture, sometimes actually derived and adapted from paintings and sculptures of certain schools. Costumes may however play a far more important part in the theatrical production: namely as a psychological study of the characters individually and of the spectacle as a whole. It is this third, or what might be termed the more modern, development of this art that is of greater importance in the theatre to-day and therefore requires more consideration than is usually given it. A progress of this kind may possibly, at some future date, result in a uniform for actors, differing one from the other only in colour pattern to show the status or relative value of the figures clad.

Artists are always searching for the new, striving step by step for what they think is right, toward an ultimate goal of self-expression and interpretation. In the theatre, the furthest point so far reached is a stylization of individuality ranging from design to the actual material used in the execution of the clothes. There is one great hindrance to an actual and far-reaching progress in designing for the theatre of to-day. It is the paucity of theatrical productions which give the artist sufficient scope for creation.

The stage reached the climax of a glamorous and overdecorated period in 1914. That was the height of a certain baroque style in the theatre. It was unnecessary to go any further along those lines, anything of the same type that came later could only be compared with or be an exaggeration of the original. It was an easy form of spectacle to understand and tremendously effective.

"The play's the thing." Next should come the *régisseur;* the actor third and the decoration last. The decoration should be completely under the direction of the *régisseur,* who should guide the entire production, not merely direct a play and, which is worse, direct it badly, as is so often the case, but actually lead the performance like the conductor of an orchestra. He should always be a man of authority, culture and taste, combining all the arts: as such he would create a fine production. Nothing should be done without his word. A director of actors should be under his guidance, since it is not necessary for the *régisseur* himself to direct their every move; except for giving the final touches.

This manner of directing, which is not by any means new, is the only possible road toward a truly fine result. The *régisseur* should always bear in mind the relative values as given above: if one of the branches oversteps its own importance, there is the danger of the entire production being overbalanced. If the scenery, for example, is too ornate, it will of necessity interfere with the visual background of the actor. If the costumer loads down his poor patients beneath head-dresses and bejewelled clothes of impossible sizes and weight, the acting will suffer accordingly.

Importance of Simplicity.—An actor should be clothed as simply yet as appropriately in colour, texture and design as necessary. The costumes of the principal actors should be an asset to them, a help, an interpreter of their character, an aid in their movements; they should free them in order that the artists may give all that is in their power without being hampered in any way. Moreover a player acting an important part should be in complete contrast to the background, so that his motions always appear clear and well defined. Supposing, as a rather crude example, that the scenery is black, the leading actor or actress should be in white. The people of intermediary classification of parts would be clothed in the corresponding scale of colour according to their importance, the quite unimportant characters finally going so far as to melt into the background and actually become part of the decoration.

This theory was realized with great success in Reinhardt's performance of *King Lear* in Vienna, when at regular intervals across the backdrop of a huge but perfectly simple grey wall stood knights in dull silver armour, on pedestals, leaning on their tremendous shields and thus forming decorative pilasters. Even in that instance there was colour only in the pattern (coat-of-arms) on their shields. Their silver armour blended into the silvery walls, resulting in a suggestion rather than in a reality, which never interfered with the action. In fact, costumes should never over-attract attention; they should pass utterly unnoticed, if they are to be right. The same should be the case with scenery. No matter what the decorative scheme may be, the setting should always come second to the costumes, be of relative value and of the necessary simplicity to form an adequate background for them and therefore naturally for the artists wearing them. What is worse than to go to see a favourite artist play a famous part and not be able to see the face or body, for the lack of lighting, or on account of the brilliance of the costuming, or, worse than everything, because of a background which is so crowded with pattern and design that one cannot concentrate on anything else? At the Théâtre Français the superb acting of a well-known star was actually invisible owing to an over brilliantly lighted crystal chandelier which hung in the middle of the stage and drew all the attention, though of absolutely no interest or import to the plot.

One should revert to the "Primitive" idea of staging, as in the other arts, to attain the greatest beauty. Just as those six stationary knights in *King Lear* denoted the castle, a garden for instance would be represented by a tree of a decorative design if a general impression only is wanted, or a tree of a particular kind, to suggest the garden's geographical situation; *e.g.*, a palm tree would suggest Africa, a stone pine southern Italy, a cypress Tuscany, an elm New England, and so forth. Moreover unless the tree literally plays a part in the production (in other words, unless it becomes an "actor") it should be merely suggested, in outline or in tone; it should never be realistic. If a tree is called for in the plot and is vital to the action, it might be represented by a human being, in order to give the necessary movement and play of nature, the wafting to and fro, the trembling and bending by the wind.

The stage should be alive. Only the things which really matter and are of importance to the plot and action should be shown; the rest left to the imagination. Everything actual should play its part. *Macbeth, Hamlet, Lear, Medea, Oedipus,* or *Electra* are all plays of a cosmic nature, possible to interpret in a hundred different ways. Thus Reinhardt alone has staged *A Midsummer Night's Dream* in something like 15 various styles. His original production was staged realistically. Another was done by Granville Barker with gilded fairies; yet another by Reinhardt in the manner of Botticelli. In New York it has been given an 18th century setting like a fresco by the Venetian Tiepolo. In order to render the full effect of his style, the costumes were actually made out of painted canvas, but there were no actual designs or patterns on them. The folds were accentuated with high lights and shadows; otherwise there was no detail whatsoever which would attract unnecessary attention.

Use of Rubber.—One of the most extraordinary instances of successful designing was in Reinhardt's production of *King Lear* in Vienna. The costumes were made of rubber sheeting. On the opening night the unusual use of this material passed unnoticed save that the critics praised the beauty of the performance as a whole. A few days later the rubber was a sensation. The reason for using that material was that Reinhardt wished the characters in *Lear* to look as though they had been sculptured out of stone. This was not in itself a new idea. It had been done with the figure of the Madonna in *The Miracle* in New York. In this particular instance however when the statue came to life the actress was obliged to step forth out of her cement robe, rather like a chicken breaking through an egg shell. The mantle was made out of some rigid and stiff preparation which would of course have been quite unsatisfactory for an entire cast of actors. Oilcloth was rejected as an impossible medium, being paperlike and clumsy. Rubber sheeting was chosen. It was found that when stationary it falls in magnificent and completely sculpturesque folds, and when in motion it is altogether supple and moves with an easy grace that clings to and follows every movement of the actor. It was painted in tones of greys, terracotta, pastel blues and mauves, mixed with silver and gold which gave it the glimmer and vitality of stone. The result was amazing.

This material was also used in Salzburg in von Hofmannsthal's *The Great World Theatre,* when by slightly different weight and treatment it successfully represented painted wooden figures. The scene was a vast and towering church altar in three stages, one above the other, connected by invisible steps and inclines. On the lower level were niches wherein stood the allegorical figures of Beauty, Wisdom, Wealth, etc. These were dressed in brilliant colours. Above them stood Holy People in variously toned shades of copper, brass and steel. At the top, rising to a summit in the centre, were the angels, all in armour, one mass of glittering gold and silver. The rubber when painted with metal pigments takes on a shiny and resplendent quality which is unequalled in any other material. Furthermore, in order to keep a consistency throughout the scene, even the Beggar, in his torn and drab rags, was clothed in rubber; it may appear like old moth-eaten cloth carved out of wood when so desired. The stained-glass window effect which was produced when the various coloured lights were turned on the upper figures covered with the shiny metal rubber was an unforgettable impression; so successful indeed that Reinhardt used this idea again in New York for the angels in the final tableau of *Jedermann* (Every man). In this instance they were not clad in armour but in the flowing golden folds of early Gothic statues. They wore no tinsel haloes, but wigs of little gilded curls, also made of rubber.

A very important factor in costumes of unusual material hand-painted to resemble carved wooden images, statues of marble and metal, etc., is the "make-up" of the people wearing them. This can be no ordinary stage grease paint with rouge and mascara. The "mask" must suit the costume, look just as wooden as a figure carved from oak, as stony as a statue sculptured out of marble; and still be the movable face and skin itself, capable of every expression and pantomime. In shadows and high lights it should follow the lines of the clothes, in colour equal their intensity, tones and shades. This naturally applies to wigs and head-dresses as well. In *King Lear,* for example, certain of the actors volunteered to make up their own hair without being obliged to wear wigs. This meant actually painting lights and shadows in colours and metal. This would of course be impossible anywhere but in a theatre where plays are given on the repertory system. One could hardly expect the actors to make up in this manner twice in one day as is the custom where plays are put on for "runs." The result, however, starting as it did from the normal and actual nature of hair, was even finer and more successful than the completely stylized quality of a wig. The women in *Lear* and *The Great World Theatre* wore head-dresses which concealed the hair, with the exception of tresses long or looped up, which were made of lightly padded, woven and plaited rubber. Cordelia in *King Lear* was completely shrouded in a pleated nun-like veil of the same material so that no hair was visible. For her costume white rubber sheeting was used, painted in grey with shadows of jade green and pastel blue, which gave her the pallor and transparency of ice, like the Madonna in a certain famous Crucifixion where she seems frozen to stone in the agony of her suffering. The evil sisters, on the other hand, were clothed in colours of moss-covered rocks and topaz, green and brown, yellow and orange. In spite of the many different tones, the general scheme of the entire production was grey, as though carved out of stone, with the lights giving the variety. Each individual had his or her own scale of colour: the King himself wore gold and purple combined with a replica of ermine, but the manner was always subtle, merely a suggestion. That is what is meant by a psychological study of the characters individually and of the spectacle as a whole.

Rubber must not be judged as an invention, nor as a criterion for new costuming In these productions it merely served a purpose and may be used in various other ways, not only for entire costumes. Jewellery has been made of it; the reason being that any sparkling stones attract too much attention to themselves and therefore interfere with the consistency of the stage picture. One of the many interesting advantages of using rubber is that its brilliancy may be regulated according to the necessity. Helmets, spears, armour in general, may be made shiny or dull at will by merely adding gold or silver paint and polishing or painting over. Even soldiers' plate-armour has been made of little circular scales of rubber superimposed and painted steel colour and blue, the edge of each flecked with silver. The helmets, built on a buckram form, were covered entirely with the rubber sheeting, the high lights painted in polished silver, thereby giving an effect of shiny steel without the dazzling and disturbing reflection of real armour. This method enables an actor's face to be at all times clear and visible.

In *Kwan Yin,* a Chinese opera performed in New York, rubber was used as a decoration on the costumes. The excessively ornate clothes of the Chinese actors have as a rule a tinsel quality, which to Westerners is a trifle vulgar and certainly foreign to the new tendency toward simplicity in our theatres. Therefore the designs, instead of being embroidered with metal threads and sequins were painted on a comparatively inexpensive material. The heavily embossed parts and the thick, rolled edges were executed in rubber stuffed with cotton batting and painted with metal pigments, polished or left dull according to the result desired. Even the little mirrors so often used on Chinese costumes could be faithfully reproduced without giving the disturbing sparkle. The result was more like a Chinese painting of a drama than an actual Chinese theatre.

It must be remembered that the stage is always extremely deceiving, tricky and utterly unrealistic. The most exquisite and magnificent brocade may lose every vestige of its value once it is seen "across the footlights"; and it is also very costly to acquire. On the other hand, a piece of cheesecloth, treated and painted in the right manner, may look like the finest tissue from Tyre. Cloth of gold may look dark and drab, gilded rubber worth a king's ransom. The point is to find what material, combined with treatment and paint, will give the best result.

Often strong contrasts are desired. This is only attainable by means of a great variety in the stuffs used. In order to give the feeling of the storm in *King Lear,* Reinhardt wished to have a continual movement on the stage throughout the heath-scenes, though the simple grey-blue cyclorama and the lack of any realism on the stage in the way of trees or rocks, proved a difficult problem for the designer. True, there were moving clouds and other light effects, sounds of wind and rain, the roaring of thunder and vivid flashes of lightning; but yet not enough movement. Veils were used, of every conceivable thickness, size and weight; not, however, as scenery. They were worn as costumes, carried, wafted to and fro, dragged across the stage by girls, who themselves were shrouded in these mists of blues and greys, with streaks of silver painted on them to catch the light as they passed, tearing across the back like ragged bits of fog driven hither and thither by the storm. The contrast of these light and airy muslin veils with the heavy rubber folds of the stonelike figures of the actors can well be imagined. Lear stood like a monument hewn out of rock, braving the elements.

Reinhardt's "Midsummer Night's Dream."—In Reinhardt's production of *A Midsummer Night's Dream* in the Tiepolo manner, the costumes were made out of canvas, in order to resemble as closely as possible the actual paintings of an old master. There was, however, another and possibly more important reason for employing the material. In this comedy of Shakespeare's there are two strongly opposed factors: on the one side, the human being of Theseus' court and on the other, Nature, as represented by the forest and the Fairies. Puck is the meeting point of the two. The whole has a dreamlike quality and therefore even the human beings may be costumed as fantastically and imaginatively as becomes entertaining. Moreover, to many people the play has a rather childish mood and certainly the classic Greek attire is wearisome at best. Accordingly, the 18th century interpretation of mythological characters was selected, which gave Theseus and

Hippolyta waving plumes and tremendous robes of heavy silks and satins, and the other members of the palace rich and ornate brocades. In order to produce this effect and further accentuate the stiffness of the Court, with all its pomp and forced rigidity, nothing could have been as satisfactorily hard and unbending as thick painters' canvas. Not even the plumes could be made of feathers, because they would have been too realistic. They were therefore made of thick muslin, gathered and drawn close on wires, and then painted and sprayed to look like feathers sketched by a master technician.

The result of those Court scenes was truly magnificent. There was no actual scenery. The backdrop was designed as two gigantic tapestries surrounding the stage in a semicircle. The main opening was in the centre. For the fairy forest scenes, these curtains could be lighted from the back and became translucent. An elevation in the centre of the stage consisted of inclines running in circles to different points and altitudes and leading to exits above and below the stage level. At the same time, this entire structure was joined together in the middle by one long flight of steps, down which the wedding procession came in the last scene. The figures looked as though they might be stepping forth out of the very tapestries, so unreal and exotic did they seem. Around the back of the stage to the top of the staircase on either side stood living candelabra: people clothed in armour wrought in wondrous shapes of "gold and precious stones" and holding a thousand lights.

How airy and slight, exquisitely dainty and youthful seemed, by such a complete contrast, the springtime smilax, the fern-like veils and transparent muslins of the fairies. It was Nature unloosened in a moonlight night of fantasy, far removed from the rigour and severity of a bombastic court. The forest became the human element. Bushes moved and mists floated by. Through a fog, in a cloud of mystery, Oberon and Titania appeared like two white and radiant blossoms in the dusk. Their costumes, consisting though they did of veils and gauzes, were in no way realistic copies of flowers. Rather were they, in design, of the very same 18th century period, both in shape and form. The important difference and complete contrast lay in the fact that they were executed in transparent silky veilings in contrast to the heavy canvas of the court costumes. When Titania lay asleep on the mound, a graceful silver birch watched over her from above, gently waving her tender and fragile arms with muslin leaves in the dream-like breeze of imagination. Later on, she beckoned to other silver birches to join her to gaze upon the strange spectacle of their queen making love to an ass's head; until at last the stage seemed full of youthful trees, a grove of birches shining silver in the night. Dawn appeared and dispersed the moonbeams; ferns, trees and bushes slowly vanished. The heavy rustling of the canvas robes, stiff and rigid, together with the metallic sound of trumpets and horns, ushered in the court once more.

Of such combinations and contrasts have Reinhardt's performances consisted; whether always successful in the carrying out of the ideas is of little or no importance. The chief reason for this elaboration of a production, which in fact simplifies it, is that it brings a play to life. Furthermore, it does not interfere with the acting. If Theseus and Hippolyta had been obliged to move about freely they would not have been clothed in stiff materials. As it is, the poet intended them merely to stand, look handsome and declaim. When the lovers fled to the woods, away from the pomp and dignity of the court, they, quite naturally, shed their stiff and cumbersome outer garments and head-dresses and were free to move, run, lie down, etc., in no way hampered by their clothes. Puck was in tights. Absolutely nothing interfered with his pranks, leaps, jumps, bounds and somersaults. He was painted from head to toe; in front, in brilliant colours and gold to resemble the courtiers; on the back, in greens and silver to suggest the fairies. Thus when he turned about, he could become almost invisible by the colours of his back melting into the woodland scene. Puck is the actor in *A Midsummer Night's Dream* who requires the greatest freedom of movement; therefore he could not have been impeded by any unnecessary materials and had to resort to his ingenuity of make-up to bring about the desired meeting point between mortals and the realm of the unreal.

Shadow Costuming.—An interesting project for a music drama has long been under consideration, in which the characters on a lower stage would be the singers clad in rich and elaborate costumes. They would sing without acting, merely forming a picture representing the period desired and set the mood. Upon an upper platform would be cast shadows, either from below against a solid background, or in silhouette through a translucent "drop." (Both of these might be used simultaneously.) These shadows, freed from decoration and merely clothed in tights, would play the scene which in song would be told about below. Their every movement would be visible and clear, undisturbed by hanging sleeves or trains; moreover, by arrangements of the lights and background, the figures on the upper level could be enlarged or reduced according to importance or desire, resembling the "close-ups" in a cinematograph.

Another possibility of this sort of shadow costuming would be to have the actors playing on a level above the mob and unimportant characters. Above and behind the principal actors would be cast the shadows of the people in their thoughts and imagination. As an example of this, Medea standing high above the Greek Chorus is plotting the death of her children. In shadow, above her, stripped of all earthly and unnecessary clothing, she sees herself in the act of killing them. Or, in other scenes, the chorus might be shown in shadows only, so as not to interfere with the concentration on the principal actors. At a climax, like Mark Antony's speech in *Julius Caesar,* the Roman mob could be just as realistic and seem far vaster in number, if only dimly seen in silhouette below the speaker. Antony would stand alone and impressive in the brilliancy of a central spotlight.

There are so very many ways and means of gaining truly wonderful effects, even on our stages of to-day, and yet how often do we see the same old-fashioned scenes and costumes, lighted in the same conventional manner. The fact remains that design in costuming is not the most important part. It is invention, creation, flights of imagination and ideas, which denote progress in the art of staging. It is not necessary to go so far as to put people in wheels and ladders, pieces of machinery, motor horns and sheets of music. These may look like effective attempts at post-impressionism and cubism when sketched on paper, but they are not and never can be an adequate clothing for actors, if we are to consider the theatre as an art centre for dramas in which the play and acting are the most important items.

For the most part, theatrical producers and even the public seem to imagine that designing costumes for a production means an artist drawing pretty sketches, usually in water colours, and having dressmakers carry out the designs by matching the colours and trying to decipher what material was meant, whether velvet or Chinese silk or organdy; pictures these, sometimes actual masterpieces, records of old time periods which, framed and hung in museums, will go down to posterity. That is not progress in costuming. Just as there has been a slow but astounding change, during this century, in the mechanism of the stage, scene shifting, theatre architecture and, above all, lighting, so there is also in costuming. What a startling difference there is between an old operatic production of *La Gioconda* dressed in the realistic costumes of velvets, paste jewellery and gilded lace, and Reinhardt's *King Lear,* clothed entirely in rubber. One was realism, the other art. Realism, the imitative portrayal of the real, without the intermediary of poetry and genius, can at best only breed confusion, which excludes it from the realm of art. *Lear* is a product of genius with a dominant idea throughout; so also in *décor* and costumes there should be a simplification of means, thereby directing the attention to the great purpose of the play. The highest mission of the theatre is to present creative ideas. The field is so new that unfortunately there have been few pioneers who have been equipped with the necessary financial backing, combined with the creative instinct, to develop these new ideas in costuming.

(E. DE W.)

COSWAY, RICHARD (*c.* 1742–1821), English miniature painter, was baptized in 1742; his father was master of Blundell's school, Tiverton, where Cosway was educated. His success in miniature painting is said to have been started by his clever portrait of Mrs. Fitzherbert, which brought Cosway his earliest great patron, the prince of Wales. He speedily became one of the most popular artists of the day, and his residence at Schomberg house, Pall Mall, was a well-known aristocratic rendezvous. In 1791 he removed to Stratford place, where he lived in a state of great magnificence till 1821, when he went to reside in Edgware road. He died on July 4, 1821, and was buried in Marylebone New church.

Cosway, who married Maria Hadfield in 1781, had one child who died young. She is the subject of one of his most celebrated engravings. He painted miniatures of very many members of the royal family, and of the leading persons who formed the court of the Prince Regent. Perhaps his most beautiful work is his miniature of Mme. du Barry, painted in 1791.

Cosway's work is of great charm and of remarkable purity, and he is certainly the most brilliant miniature painter of the 18th century.

For a full account of the artist and his wife, see *Richard Cosway, R.A.*, by G. C. Williamson (1905).

COTA DE MAGUAQUE, RODRIGO (d. before 1495), Spanish poet, was born at Toledo. Little is known of him save that he was of Jewish origin and abjured his religion. He is the author of the *Diálogo entre el amor y un viejo,* a striking dramatic poem first printed in the *Cancionero general* of 1511, and of a burlesque epithalamium written in 1472 or later.

His *Obras* have been edited by R. Foulché-Delbosc, in the *Cancionero Castellano del siglo xv.* (1915).

CÔTE-D'OR, a department of eastern France, formed of the northern region of the old province of Burgundy, bounded north by the department of Aube, north-east by Haute-Marne, east by Haute-Saône and Jura, south by Saône-et-Loire, and west by Nièvre and Yonne. Area, 3,393 square mi. Pop. (1936) 334,386. The plateau de Langres, consisting chiefly of Jurassic rocks, runs from north-east to south-west through the centre of the department and separates the basin of the Seine from that of the Saône. In the north-west is the wooded district of Châtillonais drained by the Seine and the Ource, both fed by the abundant springs characteristic of Burgundy. Spurs from the granitic mountains of Morvan occupy the south-west where the Arroux, a tributary of the Loire, the Armançon and other affluents of the Yonne are the chief rivers. The western slopes of the department are well watered and provide good pasture for sheep and cattle. The eastern side is drier and warmer and is famous for its vineyards, especially those of the Côte-d'Or which comprise the three main groups of Beaune, Nuits and Dijon. The Tertiary rocks of the Saône valley provide good agricultural land. The chief cereals are wheat, oats and barley; potatoes, hops, beetroot, rape-seed, colza and some tobacco are also produced. The department has anthracite mines and produces freestone, lime and cement. Manufactures include iron, steel, nails, tools, machinery and other iron goods, paper, earthenware, tiles and bricks, leather goods, biscuits and mustard, and there are flour-mills, distilleries, oil and vinegar works and breweries. Coal is the principal import; there is an active export trade in wine, brandy, cereals and live stock and in manufactured goods. The P.L.M. railway main line passes through Dijon. The canal of Burgundy, connecting the Saône with the Yonne, has a length of 94 mi. in the department, while that from the Marne to the Saône has a length of 24 mi.

Côte-d'Or is divided into the arrondissements of Dijon, Beaune and Montbard, with 37 cantons and 717 communes. It forms the diocese of the bishop of Dijon, and part of the archiepiscopal province of Lyons and of the 8th military region. Dijon is the seat of the educational circumscription (*académie*) and court of appeal to which the department is assigned. Châteauneuf has a château of the 15th century, St. Seine-l'Abbaye, a fine Gothic abbey church, and Saulieu, a Romanesque abbey church of the 11th century. The château of Bussy Rabutin (at Bussy-le-Grand), founded in the 12th century, has an interesting collection of pictures. Montbard, the birthplace of the naturalist Buffon, has a keep of the 14th century and other remains of a castle of the dukes of Burgundy. The remarkable Renaissance chapel (1536) of Pagny-le-Château, belonged to the château destroyed in 1768. At Fontenay, near Marmagne, a paper-works occupies the buildings of a well-preserved Cistercian abbey of the 12th century. At Vertault there are remains of a theatre and other buildings marking the site of the Gallo-Roman town of Vertilium.

CÔTES-DU-NORD, a maritime department of the north-west of France, formed in 1790 from the northern part of the province of Brittany, and bounded north by the English Channel, east by the department of Ille-et-Vilaine, south by Morbihan, and west by Finistère. Pop. (1936) 531,840. Area, 2,787 sq.mi. It consists of much denuded Devonian, Silurian and Cambrian rocks with granitic intrusions. The higher parts in the interior form the watershed between the rivers running respectively to the Channel and to the Atlantic ocean. The rivers of the Channel slope are the Rance, Arguenon, Gouessan, Gouet, Frieux, Tréguier and Léguer, while the Blavet, Meu, Oust and Aulne belong to the southern slope. In the southeast are the Landes du Menez which run in a northwesterly direction, while further west the watershed bifurcates to form the Montagnes Noires in the southwest and the Monts d'Arrée in the west of the department. Both these lines are continued into Finistère. Exposure to strong rain-bearing winds from the Atlantic and a thin soil limit agriculture on the interior plateaus which pasture cattle and horses. Seaweed manure promotes coastal agriculture with wheat, oats and buckwheat as the chief crops, also potatoes, flax, mangels, apples, plums, cherries and honey. Paimpol equips a large fleet which sets out annually for the Icelandic fishing grounds. Sardines are caught locally and large quantities are preserved. The department produces slate, building-stone, lime and china-clay. Flour-mills, saw-mills, sardine factories, tanneries, iron-works, manufactories of polish, boat-building yards and rope-works employ many people and cloth, agricultural implements and nails are manufactured. The chief imports are coal, wood and salt. Exports include agricultural products (eggs, butter, vegetables, etc.), horses, flax and fish. The chief commercial ports are Le Légué and Paimpol. The department is served by the Ouest-État railway; its chief waterway is the canal from Nantes to Brest which traverses it for 73 mi.

Côtes-du-Nord is divided into the four arrondissements of St. Brieuc, Dinan, Guingamp and Lannion which contain 48 cantons and 390 communes. Bas Breton is spoken in the arrondissements of Guingamp and Lannion, and in part of that of St. Brieuc. The department belongs to the ecclesiastical province, the *académie* (educational division), and the appeal court of Rennes, and is in the region of the X army corps. Extensive remains of an abbey of the Premonstratensian order, dating chiefly from the 13th century, exist at Kerity; and Lehon has remains of a priory of the same period. The churches of Ploubezre (12th, 14th and 16th centuries), Perros-Guirec (12th century), Plestin-les-Grèves (16th century) and Lanleff (12th century) are of interest. The church of St. Mathurin at Moncontour, a place of pilgrimage, contains stained glass of the 16th century, and the mural paintings of the chapel of Kermaria-an-Isquit near Plouha, which belongs to the 13th and 14th centuries, are well known. Near Lannion is the ruined castle of Tonquédec, built in the 14th century. At Corseul there is a temple and other Roman remains. (*See* also DINAN; GUINGAMP; LAMBALLE; TRÉGUIER.)

COTGRAVE, RANDLE (d. 1634?), English lexicographer, of a Cheshire family, was educated at Cambridge, entering St. John's college in 1587. He became secretary to Lord Burghley, and in 1611 published the first French-English dictionary (1611) a work which has great historical value for the study of both languages. He was still alive in 1632, when he issued the 2nd ed. of his dictionary.

CÖTHEN, a town of Germany, in the *Land* of Anhalt, on the Ziethe, 42 mi. N.W. of Leipzig by rail. Pop. (1939) 34,000.

Cöthen was a Slav settlement destroyed by the German king Henry I. in 927. In 1300 it was burned by the margrave of Meissen. In 1547 the town was taken from its prince, and given by the emperor Charles V. to the Spanish general and painter, Felipe Ladron y Guevara (1510–1563), but was soon repurchased.

Hahnemann, the founder of homoeopathy, lived and worked in Cöthen. From 1603 to 1847 Cöthen was the capital of the principality, later duchy, of Anhalt-Cöthen. It consists of an old and a new town with four suburbs. The former palace of the dukes of Anhalt-Cöthen, in the old town, contains the ornithological collection of Johann Friedrich Naumann (1780–1857). The Lutheran Jakobskirche (called the cathedral), a Gothic building, has some fine old stained glass. The industries include iron-founding and the manufacture of agricultural and other machinery, malt and beet-root sugar; there is trade in grain and cattle.

COTMAN, JOHN SELL (1782–1842), English landscape-painter and etcher, son of a well-to-do silk mercer, was born at Norwich, on May 16, 1782. He was sent to London to study art, where he became the friend of Turner, T. Girtin and other artists. He died in London on July 24, 1842. Cotman's work was not considered of much importance in his own day, and his pictures only procured small prices; but he now ranks as one of the great figures of the Norwich school. His sons, Miles Edmund (1810–58) and Joseph John (1814–78), were landscape-painters of merit; and his younger brother Henry's son, Frederic George Cotman (1850–1920), was a water-colour artist.

See G. A. Stephen, *Norfolk Artists* (1915); H. M. Cundall, *The Norwich School* (1920).

COTONEASTER, a genus of the rose family (Rosaceae), containing about 50 species of shrubs and small trees, natives of Europe, north Africa and temperate Asia. *C. vulgaris* was a native on the limestone cliffs of the Great Orme in north Wales but is now extinct. Several species are grown in shrubberies and borders, or as wall plants, mainly for their clusters of bright red or yellow berry-like fruits. Plants are easily raised by seeds, cuttings or layers, and grow well in ordinary soil.

COTOPAXI, a highland province of Ecuador situated a short distance S. of the equator; area 1,780 sq.mi., pop. (1944 est.) 202,385, capital, Latacunga (est. pop. 20,357). The people of Cotopaxi, for the most part pure Indian, are concentrated in a moderately fertile and well watered plateau basin (Basin of Latacunga), which lies at an average elevation of 8,000 ft. between the two towering and closely spaced ranges of the Ecuadoran Andes. Economic activity is confined largely to the intensive cultivation of cool temperate crops (potatoes, barley, wheat, corn and beans) and the grazing of cattle and sheep. Most of the products of the region are consumed locally. The Macuchi mines (gold-copper-silver), operated by the Cotopaxi Exploration Co., are located 50 mi. W. of Latacunga at an elevation of 6,000 ft. on the west slope of the Cordillera Occidental. (R. W. RD.)

COTOPAXI, a mountain of the Andes, in Ecuador, South America, 35m. south-south-east of Quito, remarkable as the loftiest active volcano in the world. The earliest outbursts on record took place in 1532 and 1533; and since then the eruptions have been both numerous and destructive. Among the most important are those of 1744, 1746, 1766, 1768 and 1803. In 1744 the thunderings of the volcano were heard at Honda on the Rio Magdalena, about 500m. distant; in 1768 the quantity of ashes ejected was so great that it covered all the lesser vegetation as far as Riobamba; and in 1803 Humboldt reports that at the port of Guayaquil, 160m. from the crater, he heard the noise day and night like continued discharges of a battery. There were considerable outbursts in 1851, 1855, 1856, 1864 and 1877.

In 1802 Humboldt made a vain attempt to scale the cone, and pronounced the enterprise impossible; and the failure of Jean Baptiste Boussingault in 1831, and the double failure of M. Wagner in 1858, seemed to confirm his opinion. In 1872, however, Dr. Wilhelm Reiss succeeded in reaching the top on Nov. 28; in the May of the following year the same feat was accomplished by Dr. A. Stübel, and he was followed by T. Wolf in 1877, M. von Thielmann in 1878 and Edward Whymper in 1880.

Cotopaxi is one of the most beautiful mountain masses of the world, rivalling the celebrated Fujiyama of Japan in its symmetry of outline, but overtopping it by more than 7,000ft. It is more than 15,000ft. higher than Vesuvius, more than 7,000ft. higher than Teneriffe, and nearly 2,000ft. higher than Popocatepetl. Its slope, according to Orton, is 30°, according to Wagner 29°, the north-western side being slightly steeper than the south-eastern. The apical angle is 122° 30′. The snowfall is heavier on the eastern side of the cone, which is permanently covered, while the western side is usually left bare, a phenomenon occasioned by the action of the moist trade winds from the Atlantic. Its height, according to Whymper, is 19,613ft., and its crater is 2,300ft. in diameter from north to south, 1,650ft. from east to west, and has an approximate depth of 1,200ft.

It is bordered by a rim of trachytic rock, forming a black coronet above the greyish volcanic dust and sand which covers its sides to a great depth. Whymper found snow and ice under this sand.

On the southern slope, at a height of 15,059ft., is a bare cone of porphyritic andesite called *El Picacho,* "the beak," or *Cabeza del Inca,* "the Inca's head," with dark cliffs rising fully 1,000ft., which according to tradition is the original summit of the volcano blown off at the first-known eruption in 1532. The summit of Cotopaxi is usually enveloped in clouds; and even in the clearest month of the year it is rarely visible for more than eight or ten days. Its eruptions produce enormous quantities of pumice; and deep layers of mud, volcanic sand and pumice surround it on the plateau. Of the air currents about and above Cotopaxi, Wagner says (*Naturw. Reisen im trop. Amerika,* p. 514): "On the Tacunga plateau, at a height of 2,600 metres, the prevailing direction of the wind is meridional, usually from the south in the morning, and frequently from the north in the evening; but over the summit of Cotopaxi, at a height of 18,000 ft., the north-west wind always prevails throughout the day.

"The gradually widening volcanic cloud continually takes a south-eastern direction over the rim of the crater; at a height, however, of about 21,000 ft. it suddenly turns to the north-west, and maintains that direction till it reaches a height of at least 28,000ft.

"There are thus from the foot of the volcano to the highest level attained by its smoke-cloud three quite distinct regular currents of wind."

COTSWOLDS or **COTTESWOLDS,** a range of hills in the western midlands of England. The greater part lies in Gloucestershire, but the system also extends into Worcestershire, Warwickshire, Oxfordshire, Wiltshire and Somersetshire. It lies on a line from north-east to south-west, forming a part of the great Oolitic belt. On the west the hills are steeply scarped by the vales of Evesham, Gloucester and Berkeley (valleys of the Worcestershire Avon and the Severn). On the east they slope more gently towards the basins of the upper Thames and the Bristol Avon. The watershed lies close to the western line, except where the Stroud valley, with the Frome, draining to the Severn, strikes deep into the heart of the hills. The principal valleys are those of the Windrush, Lech, Coln and Churn, feeders of the Thames, the Thames itself, and the Bristol Avon which forms the southern boundary of the hills. The crest-line from Bath, in the south, to Meon Hill, in the north, measures 57m. The breadth varies from 6m. in the south to 28 towards the north, and the area is some 300 sq.m. The features are rolling plateaux or wolds and bare limestone uplands, rich in remains of prehistoric times, alternating with deep narrow valleys, well wooded and traversed by shallow, rapid streams. The average elevation is about 600ft., but Cleve Cloud, above Cheltenham, and Broadway Hill, in the north, are well over 1,000ft. The hills are famous for the breed of sheep which takes its name from them. The wealth accruing from wool from the 14th to the 17th centuries is preserved in the wonderful Perpendicular churches of the area, *e.g.,* at Chipping Campden. Near this town the once famous Cotswold games were founded by Robert Dover in the 17th century.

COTTA, the name of a family of German publishers of noble Italian descent, and at the time of the Reformation settled in Eisenach in Thuringia.

JOHANN GEORG COTTA (1) (1631–1692), the founder of the publishing house of J. G. Cotta, married in 1659 the widow of the university bookseller, Philipp Braun, in Tübingen, and took over the management of his business, thus establishing the firm which was subsequently associated with Cotta's name. On his death, in 1692, the undertaking passed to his only son, Johann Georg

(2); and on his death in 1712, to the latter's eldest son, also named Johann Georg (3), while the second son, Johann Friedrich (*see* below), became the distinguished theologian.

Although the eldest son of Johann Georg (3), Christoph Friedrich Cotta (1730–1807), established a printing-house to the court at Stuttgart, the business languished, and it was reserved to his youngest son, Johann Friedrich, Freiherr Cotta von Cottendorf (1764–1832), who was born at Stuttgart on April 27, 1764, to restore the fortunes of the firm. He entered the university of Tübingen and after graduating spent a considerable time in Paris. In December 1787 he took over the publishing business and in 1794 the *Allgemeine Zeitung,* of which Schiller was to be editor, was planned. Schiller was compelled to withdraw on account of his health, but his friendship with Cotta deepened every year. In 1795 Schiller and Cotta founded the *Horen,* a periodical very important to the student of German literature. The *Horen* brought Goethe and Schiller into intimate relations with each other and with Cotta; and Goethe, while regretting that he had already promised *Wilhelm Meister* to another publisher, contributed the *Unterhaltung deutscher Ausgewanderten,* the *Roman Elegies* and a paper on "Literary Sansculottism." Fichte sent essays from the first, and the other brilliant German authors of the time were also represented. In 1798 the *Allgemeine Zeitung* appeared at Tübingen, being edited first by Posselt and then by Huber. Soon the editorial office of the newspaper was transferred to Stuttgart, in 1803 to Ulm and in 1810 to Augsburg; it is now in Munich. In 1799 Cotta was sent to Paris by the Württemberg estates as their representative. Here he made friendships which proved very advantageous for the *Allgemeine Zeitung.* In 1801 he paid another visit to Paris, also in a political capacity, when he carefully studied Napoleon's policy.

In 1810 he removed to Stuttgart; and from that time till his death he was loaded with honours. State affairs and an honourable commission from the German booksellers took him to the Vienna Congress; and in 1815 he was deputy-elect at the Württemberg diet. In 1819 he became representative of the nobility; then he succeeded to the offices of member of committee and (1824) vice-president of the second chamber. In 1828–29 appeared the famous correspondence between Schiller and Goethe. In addition to his standing as a publisher, Cotta was a scientific agriculturist and promoted many reforms in farming. He was the first Württemberg landholder to abolish serfdom on his estates. In politics he was throughout his life a moderate Liberal. In 1824 he set up a steam printing press in Augsburg, and, about the same time, founded a literary institute at Munich. In 1825 he started steamboats on Lake Constance, and introduced them in the following year on the Rhine. In 1828 he was sent to Berlin by Bavaria and Württemberg. He died on Dec. 29, 1832.

His son, Johann Georg (4), Freiherr Cotta von Cottendorf (1796–1863) greatly extended the connections of the firm by purchase, in 1839, of the publishing business of G. J. Göschen in Leipzig, and in 1845 of that of Vogel in Landshut; while, in 1845, "Bible" branches were established at Stuttgart and Munich. He was succeeded by his younger son, Karl, and by his nephew, Hermann Albert von Reischach. Under their joint partnership, the before-mentioned firms in Leipzig and Landshut and an artistic establishment in Munich passed into other hands, leaving, on the death of Herman Albert von Reischach in 1876, Karl von Cotta the sole representative of the firm until his death in 1888. In 1889 the firm of J. G. Cotta passed by purchase into the hands of Adolf and Paul Kröner, and in 1899 the business was converted into a limited liability company.

See Albert Schäffle, *Cotta* (1895); *Verlags-Katalog der J. G. Cotta'schen Buchhandlung, Nachfolger* (1900); Lord Goschen's *Life and Times of G. J. Göschen* (1903); *Briefe an Cotta: Das Zeitalter Goethes und Napoleons, 1794–1815* edited by Maria Fehling (1925).

Johann Friedrich Cotta (1701–1779), the theologian, was born on March 12, 1701, the son of Johann Georg Cotta (2). After studying theology at Tübingen he began his public career as lecturer in Jena university. He became professor at Tübingen in 1733. In 1736 he removed to the chair of theology in the University of Göttingen. In 1739 he returned as extraordinary professor of theology to his Alma Mater, and died, as chancellor of Tübingen university, on Dec. 31, 1779. His chief works are his edition of Johann Gerhard's *Loci Theologici* (1762–77) and the *Kirchenhistorie des Neuen Testaments* (1768–73).

COTTA, BERNHARD VON (1808–1879), German geologist, was born near Eisenach, on Oct. 24, 1808. He was educated at Freiburg and Heidelberg, and from 1842 to 1874 he held the professorship of geology in the Bergakademie of Freiburg. He was one of the earliest to use the microscope in determining the structure of fossil plants. Later on he studied ore-deposits, rocks and metamorphism. Cotta died at Freiburg on Sept. 14, 1879. Among his many works may be mentioned *Geologie der Gegenwart* (1866).

COTTA, GAIUS AURELIUS (*c.* 124–73 B.C.), Roman statesman and orator. In 92 B.C. he defended his uncle P. Rutilius Rufus, unjustly accused of extortion in Asia. He was intimate with M. Livius Drusus, who was murdered in 91. Shortly afterwards he was prosecuted under the *lex Varia,* directed against all who had supported the Italians against Rome, and went into exile. He did not return until 82, during the dictatorship of Sulla (*q.v.*). In 75 he was consul and carried a law that abolished the Sullan disqualification of the tribunes from holding higher magistracies. In 74 Cotta obtained the province of Gaul, but died suddenly on his return. According to Cicero, P. Sulpicius Rufus and Cotta were the best speakers of the young men of their time. Cotta's successes were chiefly due to his searching investigation of facts. He is introduced by Cicero as an interlocutor in the *De oratore* and *De natura deorum* (iii).

See Cicero, *De oratore,* iii. 3, *Brutus,* 49, 55, 90, 92; Sallust, *Hist. Frag.;* Appian, *Bell. Civ.* i. 37.

His brother, Lucius Aurelius Cotta, when praetor in 70 B.C., brought in a law by which the jurors were to be chosen, not from the senators only as limited by Sulla, but from senators, equites and *tribuni aerarii* (*see* Aerarii). In 66 Cotta and L. Manlius Torquatus successfully accused the consuls-elect for the following year of bribery at the elections, and were chosen in their places. Cotta proposed a public thanksgiving for Cicero's services in suppressing the Catilinarian conspiracy, and after Cicero had gone into exile, maintained that the law of banishment (introduced by Clodius, *q.v.*) was legally worthless. He afterwards attached himself to Caesar, and it was reported that he intended to propose that Caesar should receive the title of king. After Caesar's murder he retired from public life.

See Cicero, Orelli's *Onomasticon;* Sallust, *Catiline,* 18; Suetonius, *Caesar,* 79; Livy, *Epit.* 97; Vell. Pat. ii. 32; Dio Cassius xxxvi. 44, xxxvii. 1.

COTTABUS, a game of skill for a long time in great vogue at Ancient Greek drinking parties, especially in the 4th and 5th centuries B.C. (Gr. κότταβος). It is frequently alluded to by the classical writers of the period, and not seldom depicted on ancient vases. The object of the player was to cast a portion of wine left in his drinking cup in such a way that, without breaking bulk in its passage through the air, it should reach a certain object set up as a mark, and there produce a distinct noise by its impact. Both the wine thrown and the noise made were called λάταξ. The thrower, in the ordinary form of the game, was expected to retain the recumbent position that was usual at table, and, in flinging the cottabus, to make use of his right hand only. To succeed in the aim no small amount of dexterity was required.

Various modifications of the original principle of the game were gradually introduced, but for practical purposes we may reckon two varieties. (1) In the Κότταβος δι' ὀξυβάφων shallow saucers (ὀξύβαφα) were floated in a basin or mixing-bowl filled with water; the object was to sink the saucers by throwing the wine into them, and the competitor who sank the greatest number was considered victorious, and received the prize, which consisted of cakes or sweetmeats. (2) Κότταβος κατακτός, is not so easy to understand. (The epithet κατακτὸς [let down] may refer to the rod, which might be raised or lowered as required; to the lower disk, which might be moved up and down the stem; to the moving up and down of the scales, in the supposed variety of the game mentioned below). There is little doubt as to the apparatus, which consisted of a ῥάβδος or bronze rod; a πλάστιγξ, a small disk or basin, resembling a scale-pan; a larger disk (λεκανίς); and (in most cases) a small bronze figure called μάνης. The discovery (by Professor Helbig in 1886) of two sets of actual apparatus near Perugia, and various representations on vases help to elucidate the somewhat obscure accounts of the method of playing the game contained in the scholia and certain ancient authors who, it must not be forgotten, wrote at a time when the game itself had become obsolete, but much still remained uncertain.

The game, so far as we know, seems to have been of Sicilian origin, but it spread through Greece from Thessaly to Rhodes, and was especially fashionable at Athens. Dionysius, Alcaeus, Anacreon, Pindar, Bacchylides, Aeschylus, Sophocles, Euripides, Aristophanes, Antiphanes, make frequent and familiar allusion to the κότταβος; but in the writers of the Roman and Alexandrian period such references as occur show that the fashion had died out. In Latin literature it is almost entirely unknown.

See "Kottabos" in Daremberg and Saglio's *Dictionnaire des antiquités,* and L. Becq de Fouquières, *Les Jeux des anciens* (1873); English readers may be referred to an article by A. Higgins on "Recent Discoveries of the Apparatus used in playing the Game of Kottabos" *Archaeologia,* li. (1888). *See* also C. Sartori, *Das Kottabos-Spiel der alten Griechen* (1893), in which a full bibliography of ancient and modern authorities is given.

COTTENHAM, CHARLES CHRISTOPHER PEPYS, 1st Earl of (1781–1851), lord chancellor of England, was born in London on April 29, 1781. He was the second son of Sir William W. Pepys, a master in chancery, who was descended from John Pepys, of Cottenham, Cambridgeshire, a great-uncle of Samuel Pepys, the diarist. Educated at Harrow and Trinity college, Cambridge, Pepys was called to the bar at Lincoln's Inn in 1804. He practised at the chancery bar and was made a K.C. in 1826. He sat in parliament, successively, for Higham Ferrars and Malton, was appointed solicitor-general in 1834, and in the same year became master of the rolls. On the formation of Lord Melbourne's second administration in April 1835, the great seal was for a time in commission, but eventually Pepys, who had been one of the commissioners, was appointed lord chancellor (Jan. 1836) with the title of Baron Cottenham. He held office till the defeat of the ministry in 1841. In 1846 he again became lord chancellor in Lord John Russell's administration. Shortly before his retirement in 1850 he had been created Viscount Crowhurst and earl of Cottenham. He died at Pietra Santa, Italy, on April 29, 1851.

Both as a lawyer and as a judge, Lord Cottenham, though an indifferent speaker, was remarkable for his mastery of the principles of equity. His only important contribution to the statute-book was the Judgments Act, 1838, which amended the law for the relief of insolvent debtors.

Bibliography.—E. Foss, *The Judges of England* (1848–64); J. Campbell, *Lives of the Lord Chancellors* (1869); E. Manson, *Builders of our Law* (1904); J. B. Atlay, *The Victorian Chancellors* (1906).

COTTET, CHARLES (1863–1925), French painter, was born on July 12, 1863, at Puy. He studied at the École des Beaux-Arts, and under Puvis de Chavannes and Roll. He travelled and painted in Egypt, Italy, and on the Lake of Geneva, but he made his name with his sombre and gloomy, firmly designed, severe and impressive scenes of life on the Brittany coast. His signal success was achieved by his triptych, "Au pays de la mer," at the Luxembourg. The Lille gallery has his "Burial in Brittany." He died on Sept. 25, 1925.

COTTII REGNUM, a district in Liguria, Italy, including much of the important road over the pass (6,119ft.) of the Alpis Cottia (Mont Genèvre) into Gaul. This route was certainly in use about 100 B.C. In 58 B.C. Caesar met with some resistance on crossing it, but afterwards entered into friendly relations with Donnus, the king of the district; he refers to it as the shortest route. Donnus's son Cottius erected a triumphal arch at his capital Segusio, the modern Susa, in honour of Augustus. Under Nero, after the death of the last Cottius, it became the province of "Alpes Cottiae," governed by a *procurator Augusti.*

COTTIN, MARIE (called Sophie) (1770–1807), French novelist, *née* Risteau, was born in Paris in 1770. *Élisabeth, ou les exilés de Sibérie,* her last and most famous tale, was published in 1806. Its subject was treated later with an admirable simplicity by Xavier de Maistre. She died at Champlan (Seine et Oise) on April 25, 1807.

A complete edition of her works, with a notice by A. Petitot, was published, in five volumes, in 1817.

COTTINGTON, FRANCIS COTTINGTON, Baron (1578–1652), English lord treasurer and ambassador, was appointed English agent in Spain during the recall of the ambassador, Sir Charles Cornwallis, from 1609 to 1611. In 1612, he became consul at Seville, and in 1616 ambassador to Spain, making in 1618 James's proposal of mediation in the dispute with the elector palatine. After Charles's accession Buckingham brought him into disfavour; but on the duke's assassination he regained his position, being made a privy councillor in 1628, chancellor of the exchequer in 1629, and two years later Baron Cottington of Hanworth, Middlesex. The unpopularity caused by his exactions as master of the court of wards and by his declaration that for the Scottish war the king might levy money without Parliament led him to give up the court of wards in 1641 and the chancellorship of the exchequer in 1642. He rejoined the king in 1643, took part in the proceedings of the Oxford parliament, and was made lord treasurer, in Oct. 1643. He signed the surrender of Oxford in 1646 and, being excepted from the indemnity, retired abroad, joining Prince Charles at The Hague in 1648. He went to Spain to obtain help for the royal cause but, receiving no response, settled there and died on June 19, 1652.

COTTON, SIR ARTHUR THOMAS (1803–1899), English engineer, tenth son of Henry Calveley Cotton, entered the Madras engineers in 1819, served in the first Burmese war (1824–26), and in 1828 began his life-work on the irrigation works of southern India. He constructed works on the Cauvery, Coleroon, Godavari and Kistna rivers, making anicuts (dams) on the Coleroon (1836–38) for the irrigation of the Tanjore, Trichinopoly and South Arcot districts; and on the Godivari (1847–52) for the irrigation of the Godivari district. He also projected the anicut on the Kistna (Krishna), which was carried out by other officers. Before the beginning of his work Tanjore and the adjoining districts were threatened with ruin from lack of water; on its completion they became the richest part of Madras, and Tanjore returned the largest revenue of any district in India. He was the founder of the school of Indian hydraulic engineering, and carried out much of his work in the face of opposition and discouragement from the Madras government; though, in the minute of May 15, 1858, that government paid an ample tribute to the genius of Cotton's "master mind." He was knighted in 1861.

See Lady Hope, *General Sir Arthur Cotton* (1900).

COTTON, CHARLES (1630–1687), English poet, the translator of Montaigne, was born at Beresford in Staffordshire on April 28, 1630. His father, Charles Cotton, was a man of marked ability, and counted among his friends Ben Jonson, John Selden, Sir Henry Wotton and Izaak Walton. Cotton travelled in France and perhaps in Italy, and at the age of 28 he succeeded to an estate greatly encumbered by lawsuits during his father's lifetime. The rest of his life was spent chiefly in country pursuits, but from his *Voyage to Ireland in Burlesque* (1670) we know that he held a captain's commission and was ordered to that country. His friendship with Izaak Walton began about 1655. Walton's initials made into a cipher with his own were placed over the door of his fishing cottage on the Dove; and to the *Compleat Angler* he added "Instructions how to angle for a trout or grayling in a clear stream." He married in 1656 his cousin Isabella, who was a sister of Colonel Hutchinson. His wife died in 1670 and in 1675 he married the dowager countess of Ardglass. He was buried in St. James's church, Piccadilly, on Feb. 16, 1687. Cotton's reputation as a burlesque writer may account for the neglect with which the rest of his poems have been treated. Their excellence was not, however, overlooked by good critics. Coleridge praises the purity and unaffectedness of his style in *Biographia Literaria,* and Wordsworth (*Preface,* 1815) gave a copious quotation from the "Ode to Winter." The "Retirement" is printed by Walton in the second part of the *Compleat Angler.* His masterpiece in translation, the *Essays of M. de Montaigne* (1685–86, 1693, 1700, etc.), has often been reprinted.

His other works include *The Scarronides,* or *Virgil Travestie* (1664–70), a gross burlesque of the first and fourth books of the *Aeneid,* which ran through 15 editions; *Burlesque upon Burlesque . . . being some of Lucian's Dialogues newly put into English fustian* (1675); *The Moral Philosophy of the Stoicks* (1667), from the French of Guillaume du Vair; *The History of the Life of the Duke d'Espernon* (1670), from the French of G. Girard; the *Commentaries* (1674) of Blaise de Montluc; the *Planter's Manual* (1675), a practical book on arboriculture, in which he was an expert; *The Wonders of the Peake* (1681); the *Compleat Gamester* and *The Fair one of Tunis,* both dated 1674, are also assigned to Cotton.

William Oldys contributed a life of Cotton to Hawkins's edition (1760) of the *Compleat Angler.* His *Lyrical Poems* were edited by J. R. Tutin in 1903, from an unsatisfactory edition of 1689. His translation of Montaigne was edited in 1892, and in a more elaborate form in 1902, by W. C. Hazlitt. *See* also J. Beresford, *Poems of Charles Cotton, 1630–87,* with introduction, notes and portrait, (1923); and *Poems from the Works of Charles Cotton,* Newly decorated by Claud Lovat Fraser. (1922).

COTTON, GEORGE EDWARD LYNCH (1813–1866), English educationist and divine, was born at Chester on Oct. 29, 1813. He was educated at Westminster school, and at Trinity college, Cambridge. He graduated B.A. in 1836, and became an assistant-master at Rugby. Here he worked devotedly for 15 years, inspired with Arnold's spirit, and heartily entering into his plans and methods. He became head master at Marlborough college in 1852, and in his six years of rule raised it to a high position. In 1858 Cotton was offered the see of Calcutta, which, after much hesitation about quitting Marlborough, he accepted. Cotton established schools for British and Eurasian children, did much to improve the position of the chaplains, and was unwearied in missionary visitation. On Oct. 6, 1866, he was drowned at Kushtea on the Ganges.

A memoir of his life with selections from his journals and correspondence, edited by his widow, was published in 1871.

COTTON, SIR HENRY JOHN STEDMAN (1845–1915), Anglo-Indian administrator, son of J. J. Cotton of the Madras civil service, was educated at Magdalen college school and King's college, London. He entered the Bengal civil service in 1867, and became chief secretary to the Bengal Government (1891–96), acting home secretary to the Government of India (1896), and chief commissioner of Assam (1896–1902). He retired in 1902, and became known as the leading English champion of the Indian nationalists. In 1906 he entered parliament as Liberal member for East Nottingham. He was the author of *New India* (1885; rev. 1904–7).

His brother, JAMES SUTHERLAND COTTON (1847–1918), was born in India and educated at Magdalen college school and Trinity college, Oxford. For many years he was editor of the *Academy;* he published various works on Indian subjects, and was the English editor of the revised edition of the *Imperial Gazetteer of India* (1908).

COTTON, JOHN (1585–1652), English and American Puritan divine, sometimes called "The Patriarch of New England," born in Derby, England, on Dec. 4, 1585. He was educated at Trinity college, Cambridge, and became a fellow of Emmanuel college, Cambridge, then a stronghold of Puritanism. In June 1612 he became vicar of the parish church of St. Botolph in Boston, Lincolnshire, where he remained for 21 years. Becoming more and more a Puritan in spirit, he ceased, about 1615, to observe certain ceremonies prescribed by the legally authorized ritual, and in 1632 action was begun against him in the high commission court. He thereupon escaped, disguised, to London, lay in concealment for several months, and eluding the watch set for him at the various English ports, in July 1633 emigrated to the colony of Massachusetts Bay, arriving at Boston early in September. On Oct. 10 he was chosen "teacher" of the First Church of Boston, of which John Wilson (1588–1667) was pastor, and here he remained until his death on Dec. 23, 1652. In the newer, as in the older Boston, his popularity was almost unbounded, and his influence, both in ecclesiastical and in civil affairs, was probably greater than that of any other minister in theocratic New England. He was a man of great learning and was a prolific writer. His writings include: *The Keyes to the Kingdom of Heaven and the Power thereof* (1644), *The Way of the Churches of Christ in New England* (1645), and *The Way of Congregational Churches Cleared* (1648), these works constituting an invaluable exposition of New England Congregationalism; and *Milk for Babes, Drawn out of the Breasts of Both Testaments, Chiefly for the Spirituall Nourishment of Boston Babes in either England, but may be of like Use for any Children* (1646), widely used for many years, in New England, for the religious instruction of children.

See the quaint sketch by Cotton Mather, John Cotton's grandson, in *Magnalia* (London, 1702), and a sketch by Cotton's contemporary and friend, Rev. Samuel Whiting, printed in Alexander Young's *Chronicles of the First Planters of the Colony of Massachusetts Bay from 1623 to 1636* (Boston, 1846); also A. W. McClure's *The Life of John Cotton* (Boston, 1846), a chapter in Arthur B. Ellis's *History of the First Church in Boston* (Boston, 1881), and a chapter in Williston Walker's *Ten New England Leaders* (1901). (W. W.)

COTTON, SIR ROBERT BRUCE, BART. (1571–1631), English antiquary, the founder of the Cottonian library, born at Denton, Huntingdonshire, on Jan. 22 1571, was a descendant, as he delighted to boast, of Robert Bruce. He was educated at Westminster school under William Camden the antiquary, and at Jesus college, Cambridge, where he graduated in 1585. His antiquarian tastes were early displayed in the collection of ancient records, charters and other manuscripts, which had been dispersed from the monastic libraries in the reign of Henry VIII.; and throughout the whole of his life he was an energetic collector of books, manuscripts and coins from all parts of England and the continent. In 1600 he visited the north of England with Camden in search of Pictish and Roman monuments and inscriptions. On the accession of James I. he was knighted, and in 1608 he wrote a *Memorial on Abuses in the Navy,* that resulted in a navy commission, of which he was made a member. He also presented to the king an historical *Inquiry into the Crown Revenues,* in which he speaks freely about the expenses of the royal household, and asserts that tonnage and poundage are only to be levied in war time, and to "proceed out of good will, not of duty." In this paper he supported the creation of the order of baronets, each of whom was to pay the crown £1000; and in 1611 he himself received the title.

Cotton helped John Speed in the compilation of his *History of England* (1611), and was regarded by contemporaries as the compiler of Camden's *History of Elizabeth.* It seems more likely that it was executed by Camden, but that Cotton exercised a general supervision, especially with regard to the story of Mary, Queen of Scots. The presentation of his mother's history was naturally important to James I., and Cotton himself took a keen interest in the matter. He had had the room in Fotheringay, where Mary was executed, transferred to his family seat at Connington. Meanwhile he was enlarging his collection of documents. In 1614 Arthur Agarde left his papers to him, and Camden's manuscripts came to him in 1723. In 1615 Cotton, as the intimate of the earl of Somerset, whose innocence he always maintained, was placed in confinement on the charge of being implicated in the murder of Sir Thomas Overbury; he confessed that he had acted as intermediary between Sarmiento, the Spanish ambassador, and Somerset, and had altered the dates of Somerset's correspondence. He was released after about eight months' imprisonment without formal trial, and obtained a pardon on payment of £500. From Charles I. and Buckingham Cotton received no favour; his attitude towards the court had begun to change, and he became the intimate friend of Sir John Eliot, Sir Simonds d'Ewes and John Selden. He had entered parliament in 1604 as member for Huntingdon; in 1624 he sat for Old Sarum; in 1625 for Thetford; and in 1628 for Castle Rising, Norfolk. The publication of his political tract entitled *The Danger in which the Kingdom now standeth,* and the circulation of another, known as the *Proposition to bridle Parliament,* the original of which was found in Cotton's library, led to his imprisonment in 1629 and the sealing up of his library by the king. Cotton was himself released the next month; but the library was not restored to him. He died on May 6, 1631, and was buried in Connington church, Huntingdonshire, where there is a monument to his memory. Many of Cotton's pamphlets were widely read in manuscript during his lifetime, but only two of his works were printed, *The Reign of Henry III.* (1627) and *The Danger in which the Kingdom now standeth* (1628). His son, Sir Thomas (1594–1662), added considerably to the Cottonian library; and Sir John, the fourth baronet, presented it to the nation in 1700. In 1753 it was transferred to the British Museum.

See the article LIBRARIES, and Edwards's *Lives of the Founders of the British Museum,* vol. i. Several of Cotton's papers have been printed under the title *Cottoni Posthuma;* others were published by Thomas Hearne.

COTTON AND THE COTTON INDUSTRY. Cotton in 1940 continued king, even though its rule was being threatened as never before. It was without question the leading textile raw material, but new fibres were competing for its position. Cotton still played a greater part in the economy and politics of the world than did any other commodity, but its participation was by 1940 an increasingly stormy one.

Cotton agriculture and the cotton industry throughout the world were buffeted by an amazing interplay of impulses during the two decades following the World War of 1914–18. The most serious was the post-war adjustment itself. This had by no means been completed when the development of a new European crisis and the outbreak of a new war destroyed what little stabilization had been achieved. Ranking probably second to war as a factor contributing to the cotton chaos was the dislocation of cotton production throughout the world, and of the cotton industry not only throughout the world but within many individual countries. Third in importance based on results up to 1940—but probably first in its potentialities—was the competition from other fibres.

Statistically, the latter impulse made only a limited impression. In 1930, the world production of the four major fibres was approximately: cotton 82%, wool 14%, silk 1%, rayon 3%. In 1939, the break-down had changed to approximately: cotton 75%, wool 12%, silk 1%, rayon 12%. Thus, cotton still led by what appeared to be an overwhelming margin. However, new trends were under way which threatened to speed up this statistical shift. The necessities of the so-called nationalistic countries—even in peace-time, and more acutely so in time of war—forced substitution of synthetic for natural raw materials. The result was a tremendous increase in the production and consumption of rayon staple fibre in Germany, Italy, and Japan—and the outlook at the start of the new decade in 1940 was for an intensification of this change. Then, too, entirely new types of synthetic fibres were being announced in rapid succession during the last years of the preceding decade: fibres made from spun glass, from skimmed milk, from soybeans, from synthetic resins, and from a synthesis of coal, air and water—not to mention a whole collection of other sources, many of which would undoubtedly develop into commercial realities. Coupled with this competition from new fibres was a challenge from old materials. Paper, for example, had been encroaching upon many of the household uses in which cotton formerly held undisputed sway. Against this barrage the cotton industries in many countries used as a defence the offensive measure of seeking new uses, or expansion of existing uses, for cotton. This served to lessen the blow, but did not alter the fact that cotton was on the defensive—and probably would continue to be.

The factor of dislocation of cotton agriculture and industry was a continuing one, and therefore threatened to be more far-reaching in its effects than war. In essence, this dislocation amounted to decentralization. New countries, and new sections of individual countries, have reached for their share of the production of this vital raw material, and of the processing of cotton into yarns and fabrics. Cotton has the distinction, and at the same time the weakness, of being the forerunner in industrial change. Its manufacture, by power, was the opening gun in the industrial revolution of some two centuries ago in England, which started the transition from hand-craft to mechanization. Similarly, cotton is the fibre which first engages the attention of hitherto backward countries which decide to enter the industrial lists. Almost without exception, the first industry which these newly aroused nations undertake is cotton manufacture. The effect is obvious. Older industrial nations, geared up to supply far-flung markets, find those markets taken away from them by local industries or by other nations seeking their share in the world trade in cotton products.

Great Britain felt this world impulse first and most acutely. Its cotton industry was essentially an exporting industry. The growth of a home industry in countries such as India reduced that export outlet. But that was not all. Countries like Japan, particularly, intruded upon hitherto invulnerable markets, by way of low wage-scales and low production costs. The results in both these directions can be illustrated and dramatized by these two comparisons: In 1913, Great Britain exported 3,057,000,000 yards of cotton goods to British India; in 1935 she exported 498,000,000 yards to that same country. In 1924, Great Britain's total export of cotton goods to all countries was 4,444,000,000 yards, while Japan's export was 997,000,000 yards; by 1936 Great Britain's export had shrunk to 1,917,000,000 yards while Japan's had expanded to 2,708,000,000 yards.

The results of these shifts can also be measured in terms of cotton spindles in place in the principal producing countries. In the two decades from 1920 to 1940, the United Kingdom lost well over one-third of its spindles, by liquidation; the United States lost nearly one-third of its spindles by the same route; Japan tripled its spindleage, and India increased its spindleage by 50%.

But within a given country, as previously indicated, this same process of decentralization took its toll. The United States is the best example of this trend. New England, like Old England, was geared up to supply far-flung needs for cotton products. It was the cotton manufacturing centre of the United States. And yet, in less than two decades (1923–38) a shift developed whereby, from a position where New England housed more than 50% of the spindles of the country, the South drew up to an ownership of practically 75% of the spindleage, against 25% in New England. And the productive capacity of the southern equipment, new and modern, made its advance more dramatic than these cold figures indicate.

That leads to a discussion of another vital factor in the shifting ways of the world's cotton industry. Technological development has been progressing at a dizzy rate. Introduction of single-process picking, of long-draft roving and spinning, of automatic preparatory machinery, of higher-speed looms, and of rapid innovation of new finishes, has favoured the new industrial countries, and the new industrial sections of a given country, against the old. Here again a statistical comparison dramatizes this change. Despite the fact that Great Britain led the world in 1940 in number of spindles, a study showed the United States well ahead in productive capacity of its lesser number of spindles, due of course to greater potential output per spindle. The study cited the total number of cotton spindles in the United Kingdom as 41,400,000 (in 1936) against 28,200,000 in the United States, but after reducing both figures to similar types of spindles, and multiplying by a "machine working-time factor" based on relative productivity in the two countries, it showed that the "mechanical-equivalent-commercially available" spindles in the United Kingdom corresponded to only 29,200,000 as against 47,700,000 in the United States.

The same holds true further along the line, in weaving capacity. Greater use of automatic looms in the United States and in Japan, for example, have placed those countries well ahead of older manufacturing nations, like Great Britain, in output per loom.

Cotton Agriculture.—To turn from cotton manufacture to cotton agriculture, even more revolutionary shifts were under way by 1940: more revolutionary, because they involved the destinies of great masses of people dependent upon the growing of cotton for a livelihood. For the dwindling demand for the products of Manchester's cotton industry in England—serious as that has been in its effect upon the employed personnel of that area—was of relative unimportance compared with the threatened shift in cotton production, so far as it affected the Southern States of the United States. The latter country at various times produced from one-half to practically all of the world's raw cotton. Since 1933, the percentage of United States' production in relation to world output, steadily decreased through 1939 with the exception of one year. This has been due partly to the crop control of that country, and partly—although to some extent this is a result rather than a cause—to the increased production of other countries such as Brazil and Russia, for example. This whole question is tied up with that of governmental policies, not only in the United States but in other countries. In the United States, these policies included crop control, as noted above, and also other devices such as Government loans on cotton and an export subsidy on cotton.

Cotton growing was in 1940 an important part of the economy of approximately 60 different countries—and in many of them one of the most vital phases. The number of people in the world dependent upon cotton agriculture, either directly or indirectly in 1940, was incalculable but certainly ran into many, many millions. In fact the major cotton textile industry alone, in the principal producing countries, employed over 5,000,000 workers—and those engaged in agriculture constitute a far greater group than the employees of the industry. Consequently, the world-wide currents mentioned have affected the lives of a considerable percentage of the world's population.

Despite the new forms of competition, mentioned previously, both production and consumption reached record heights in the latter part of the decade of the '30s. This in itself, however, affords no ground for security. To hold its own, cotton must advance, in a world whose needs per capita are increasing constantly.

In view of all the circumstances—the historical significance of cotton; the dependence of millions of people on it for their livelihood; the interplay of competition between cotton and other fibres; the decentralization of both the growth and manufacture of cotton in new countries and new sections; the political implications of cotton control, and a myriad of other cross-currents—it is particularly important to set down in the pages that follow, a moving rather than a static picture of this industry, and in the following phases:

I. Botany and Cultivation:—
- A. The Cotton Plant.
- B. Cotton Cultivation.
- C. Pests and Diseases of the Cotton Plant.

II. Raw Cotton:—
- A. Ginning, Baling, Transportation.
- B. The World's Cotton Supplies.
- C. Marketing, Exchanges, Futures, etc.

III. Cotton Spinning and Manufacture:—
- A. Invention and Development.
- B. The World's Cotton Spindles.
- C. The World's Cotton Power Looms.
- D. Varieties of Cotton Cloth.

IV. Cotton Trade and Organization:—
- A. Cotton Yarn Output.
- B. Commerce in Cotton Yarns.
- C. World Trends in the Cotton Industry.

V. The Distribution of Cotton Textiles:—
- A. World Commerce in Cotton Manufactures.
- B. Post-War Reconstruction of the Textile Markets.
- C. Organization of Cotton Textile Distribution.

VI. Cotton Machinery:—
- A. Cotton-Ginning Machinery.
- B. Cotton-Spinning Machinery.
- C. Cotton-Weaving Machinery.
- D. Cotton-Finishing Machinery.

VII. Cotton Industry in the United States. (D. G. Wo.)

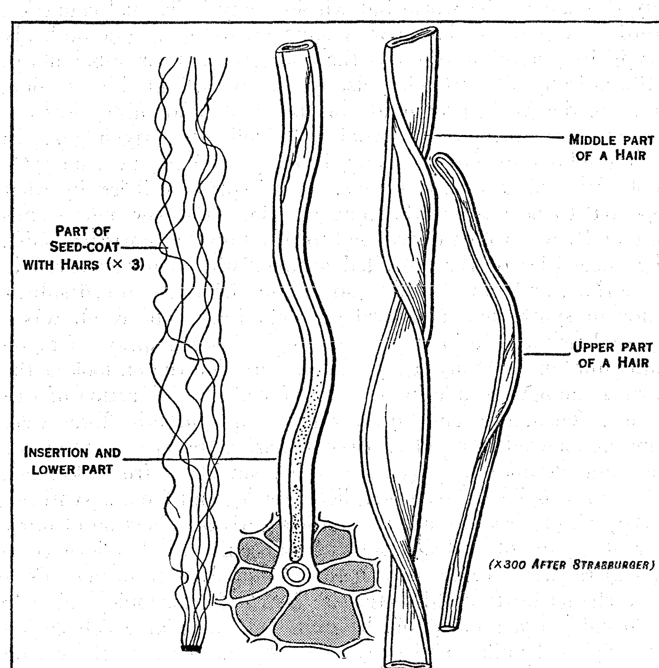
I. BOTANY AND CULTIVATION

A. THE COTTON PLANT

"What a royal plant it is! The world waits in attendance on its growth; the shower that falls whispering on its leaves is heard around the world; the sun that shines on it is tempered by the prayers of all the people; the frost that chills it and the dew that descends from the stars are noted; and the trespasses of a little worm upon its green leaf is more to England than the advance of a hostile army on her Asian outposts. It is gold from the instant it puts forth its tiny shoot. Its fibre is current in every bank, and when, loosing its fleeces to the sun, it floats a sunny banner that glorifies the fields of the humblest farmer that man is marshalled under a flag that will compel the allegiance of the world and bring a subsidy from every nation," once wrote Henry W. Grady. He voiced, in an exaggerated form, the sentiments of cotton growing and consuming peoples from earliest times; for cotton, the white fluff consisting of a mass of unicellular hairs which grow attached to the seed on all types of cotton plants, has been from time immemorial a valued article of trade.

The derivation of the word cotton, from the Arabic *qutun*, or *kutun*, locates it early in that section of the Old World. We know too that it was in India before Alexander; samples found in tombs there date it back to 3,000 B.C. It was certainly grown and spun by the ancient Egyptians; Chinese wise men wrote of it; it has been found in pre-historic pueblo ruins of Arizona; and the most ancient cotton fabrics now existent are the grave cloths of pre-Inca Peru. It was mentioned in a Hindu Rig-Veda hymn 15 centuries before Christ, and it was the subject of legend and myth during the Middle Ages. It was in the search for additional sources of supply of this fibre that many of the great exploration expeditions of the 15th and 16th centuries were undertaken.

The commercial fibre we know today as cotton is the result of many hundreds of years of the melting pot. For this fibre,—of the genus *Gossypium*—a branch of the Mallow or Malvaceae family—



FROM STRASBURGER "LEHRBUCH DER BOTANIK" BY COURTESY OF GUSTAV FISCHER

FIG. 1.—SEED HAIRS OF COTTON, GOSSYPIUM HERBACEUM, WHICH CONSIST OF FLAT TWISTED FIBRES ATTACHED TO THE SEEDS

in its present physical structure is the result of civilization and seed selection. All of this has aimed to make the plant more adaptable to climatic and soil conditions and to make the lint better for spinning purposes. And yet, despite the various stages of evolution, the fibre of cotton remains fundamentally the same.

A single hair of mature cotton, viewed under a microscope, is seen to be a flattened tube with spiral convolutions, the length of the fibre being from 1,000 to 3,000 times its diameter. The various species of cotton govern the diameter and number of twists the respective fibres have: the more twists—the better spinning qualities. The spirality of a cotton fibre distinguishes it from all other fibres, and gives it superior value for spinning. No other natural fibre has this feature and none of the man-made fibres can imitate it. It is the spirality of cotton fibre which gives it elasticity and makes it an excellent medium for craftsmanship.

The cotton plant has adapted itself to its various homes. For instance, in the tropics the plant is a perennial, some species attaining a height of 15 to 20ft. and being known as tree cottons. However, it is generally treated as an annual to insure the production of cotton of the best quality, and to keep insect and fungoid pests in check. In the United States and other commercial growing countries the plant is an annual, a soft-stemmed shrub, multi-branched and varying in height from 2 to 6 feet.

Botanical Classifications.—The genus *gossypium* is considered to be a difficult one taxonomically. The primary reason for this is due to faulty foundation by Linnaeus who based descriptions of some of the most important species on cultivated plants and those descriptions were not full enough to clearly define the various species. Secondary reasons are that a large section of the tropics in which cotton plants are found most abundantly has not been adequately explored by botanists; and for many centuries cultivated plants have been transferred from one country to another for commercial purposes and these species have undergone considerable crossing and hybridizing. This hybridizing has been accidental as well as intentional, but evidences of it are noted in the lack of stability in practically every variety with frequent reversions to ancestral type. Therefore, it is impossible to establish definitely the origin of many of the cultivated species and still more difficult to give the land of their origin. However, for practical purposes it is possible to define the most important cultivated varieties into particular species.

1. *G. barbadense,* Linnaeus.—Sea Island cotton owes its trade name to the fact that it has flourished on the islands along the coast of South Carolina and Georgia (U.S.A.) and the West Indies. Its cultivation along the coastal region of the United States declined from 1914 through the next 20 years, the crop dropping from an annual 100,000 bale production to a minimum production of 7 bales in 1933. However, a successful revival of Sea Island cultivation has been under way since 1934 in south Georgia and north Florida (U.S.A.) with an annual increase in production and a crop in 1938 of about 3,000 bales. The staple of Sea Island is long, fine, and silky with a lustre unequalled by any other variety. Its staple length ranges from 1½in. to 2¼in. and it is especially valuable for all spinning purposes requiring high breaking yarns.

The Egyptian crop, while usually regarded as being of the *Barbadense* strain, may be, according to Watt, in some cases hybrids of *G. Braziliense.* About two-thirds of the crop is Uppers, or Ashmouni, planted in the Upper Egypt valley, and Zagora, the same seed but planted in the Delta. Both types run in staple from 1³⁄₃₂in. to 1³⁄₁₆ inches. Almost all varieties of Egyptian cotton, other than Uppers, are grown in the Nile delta. They are listed according to spinning qualities as follows: Giza 26, Sakellaridis, Sakha 4, Maarad, Giza 7, Giza 12.

Strains of Egyptian cotton are also being cultivated in the Sudan, near Khartoum and the Kassala district and Tokar. In the two latter districts a type of cotton is produced similar to Sakellaridis, before it began deteriorating.

Egyptian cotton is also grown under irrigation in the United States, particularly in Arizona, Oklahoma and California. The first strain developed from planting Sakellaridis seed is *Pima.* About 1928 another strain was derived from cross-breeding of Pima and Sakellaridis seed. This is known as SXP. It is slightly whiter in colour and shorter in staple than Pima, which runs from $1\frac{7}{16}$ in. to $1\frac{5}{8}$ inches.

2. *G. braziliense,* Macf.—This species is generally thought to be a native of Brazil although it has been found growing wild in certain sections of South Africa, and it grows both wild and cultivated in China, Japan, India, Central America and the West Indies. The fibre is generally white, fine and silky but lacks spirality found in most cottons. It, however, seems adapted for mixing with wool. The staple varies from 1 to 1½ inches.

3. *G. purpurascens,* Poiret.—This species resembles very closely *G. Taitense* Parl. and is known only in a state of cultivation. It has been grown in Egypt, East Africa, Madagascar, Siam, India, South America and on islands in the Atlantic, Indian and Pacific oceans. Its lint is white, soft and silky.

4. *G. hirsutum,* Linn.—This species is widely used in cultivation and is the source of American Upland cotton. It is to be found throughout the American cotton belt, entirely rain-fed, and it is also known in Africa, India, Java, China, Persia and Europe. Its origin and ancestry are uncertain but it is not found in a wild state. Watt states that this is a cultivated form of *G. Punctatum* Sch. and Thon. It is considered that practically all of the American Upland cottons, some Mexican varieties, Dharwar cotton in India, Hindi cotton in Egypt, and American varieties in China and Africa are derived from this species. Its lint is medium fine to medium coarse and varies from ¾in. to 1¼in. in length.

G. hirsutum, Linn., var. *religiosa,* Watt. This variety is a sacred cotton. A type very similar to *G. hirsutum* and according to Watt is classified as hirsutum. However, it is not the true hirsutum since it has slender trailing branches instead of ascending and spreading branches and because of its rust coloured lint from which it derives its name of Khaki.

5. *G. peruvianum,* Cavanilles.—Watt considers this cotton indigenous to the equatorial regions in the Andes. It grows in Peru and other parts of South America, Central America, Africa and other cotton growing countries. Some authorities feel that present day Egyptian cottons may trace their ancestry to this line.

6. *G. herbaceum,* Linn.—Widely grown in Asia and also formerly grown in South Europe. Its origin was probably Arabia and Asia Minor. It is said that this was one of the first cottons grown in America, but was later displaced by other varieties. At any rate, it is the parent of many Asiatic varieties which are grown extensively although they are not the most desirable types. Levant cotton, one of the most important cottons derived from *G. herbaceum,* is grown in Arabia, Asia Minor and southern Europe. Some Indian varieties are also traced to this species. Its lint is coarse and grayish white.

7. *G. nanking,* Meyen.—This species is unknown except in the cultivated state. According to Watt it is cultivated in China, Japan, Malaya, Siam, Burma, India, Central Asia, Arabia, Madagascar and Africa. Certainly a considerable portion of the native cultivated cottons of China and Japan are of this variety and it is thought that it is prominent in India and other portions of Asia. Its lint is white with a tendency to become rufous.

8. *G. arboreum,* Linn.—It is not known in its original wild state but was probably the first species cultivated and was known centuries ago in a cultivated state in India, Arabia and Africa. It is now a garden plant of the Orient. However, some branches of this cotton are important for field planting. Bengal, Jari, Deshi, Dacca and Garo Hill cottons are among these varieties. The lint is white in its cultivated state.

B. COTTON CULTIVATION

Cotton, one of the most important of the world money-crops is cultivated in more than 60 countries within a zone between 35° and 40° north and south latitudes. The trend in cotton acreage and production in all countries was upward steadily from 1895 until 1933. After 1933 and to date (1940) United States production has decreased under Government control but production has continued to increase in all other countries.

Although cotton is almost a universal crop, there are certain fundamental requirements: an approximate six month growing season; sufficient moisture during the growing season (either from rainfall or irrigation) but also plenty of sunshine; and a dry period when the cotton reaches maturity.

Since methods of cultivation are at variance in each cotton growing country a summary of cultural methods in each of the most important is given below:

Cultivation in the United States.—That the United States leads every country in the production of cotton is due to both soil and climatic conditions. It is grown on about 2,000,000 farms in its southern cotton belt, where a growing season of 200 to 260 days is enjoyed. However, because of the prevalence of the boll weevil early maturing varieties of cotton have necessarily been developed which will mature the boll beyond the weevil damage in 110 days.

Considering the cultivation of cotton throughout the entire United States cotton belt cultural practices followed are poorer than those used in growing other top ranking agricultural crops. And yet they are more advanced in the United States than in other countries. Improved methods have made it possible to produce in an ordinary year, in the United States, an average yield of about 210lb. of cotton per acre as compared to 165lb. in 1925. Increased yield per acre is particularly true in certain sections such as the Mississippi delta, parts of Texas and South Carolina where excellent farming practices are followed.

Most of the land to be planted in cotton is flat broken or broken by listing and bedding prior to the middle of April. Bedding is extensively practiced throughout the cotton belt. The work is done with one-, two-, three-, or four-horse turning ploughs or with heavy disc, sulky or gang ploughs, the type and size of the plough depending upon the section of the country, topography of the land, and financial status of the farmer. For instance, on the flat level prairies of Texas and Oklahoma and low flat Mississippi delta, where cotton farmers plant several hundred or thousand acres, large ploughs and two to four-row equipment drawn by heavy teams or tractors are widely used, but in the rolling or hilly sections of the Carolinas, Georgia, Alabama and Mississippi and on small farms smaller one-horse turning ploughs are generally used.

In making a cotton crop in the United States the usual custom is to obtain a firm but well pulverized seed bed by thoroughly pulverizing the soil some weeks before planting, letting it rest until a good rain has settled it and then rebreaking the surface with a light harrow. Planting dates in the United States range from March 1 for southern Texas to June 1 in North Carolina. The general method of planting is in drills with a one-horse mechanical planter which opens the small furrow, drops the seeds and covers them. A few farmers drop seed by hand; other wide-scale operators use two- or four-row planters. Depth of one inch is generally sufficient for seed germination. To be sure of a good stand a large quantity of seed is planted, about one bushel per acre. Then, when the plants are up, those not wanted are thinned out or "chopped."

There is a close relation between the yield of cotton and the number of cultivations received. Experiments show that cotton worked four or five times yielded 763lb. of seed compared to a yield of 1,012lb. when the cotton was worked eight or nine times. On the whole the United States cotton crop is well cultivated. A one-horse plough is the system generally used in southern States. The second step in cultivation is chopping or hoeing. Although attempts have been made to perfect a mechanical chopper so far such devices have proved unsatisfactory and the best results are obtained by hand labour. In chopping the worker scrapes all the land in the row left unploughed and chops out unnecessary plants leaving two or more in hills the desired distance apart. Cultivation is continued until plants are matured or have put on a good crop of bolls. Cultivation usually ceases about the first of August in the central part of the cotton belt and earlier in the southern part and likewise later in the northern part.

The rate of growth of cotton plants and of development of flowers varies considerably with seasonal weather conditions as well as geographical differences. In the central part of the United States cotton belt cotton planted in mid-April usually shows young flower buds, or squares, in 35 to 45 days. Bolls require a maturation period of 45 to 65 days and picking of the lint gets under way as early as August in some sections and continues until the crop is harvested, usually around November 1.

The crop is harvested almost entirely by hand, although stripping is sometimes practiced in some parts of Texas when both cotton and labour are at a premium. Stripping, however, produces cotton of very low grade. Although mechanical cotton pickers are generally improved they are still in the experimental stage and have not yet become an economic factor in cotton cultivation. The Rust cotton picker, the International Harvester machine, and the Berry cotton picker all operate ably in the field, picking cotton on the rotating spindle theory with great rapidity. However, it has been found that the grade of mechanically picked cotton is lowered to some extent through inclusion of bolls and leaves plus discolouration by leaf stain.

Careful seed selection is employed by the majority of cotton farmers, and in some sections of the belt we find "one-variety communities," a program established to keep seed pure, which includes planting one variety, ginning the crop and assembling it in even-running bales which are sold through a central agency.

Cotton growers of America are becoming more and more familiar with the use of stable manure, motes, and cover crops as fertilizers; methods to prevent soil erosions have been generally practiced since 1933 under the Government's agricultural program. Commercial fertilizers are used to some extent, but mostly in States east of the Mississippi river.

Although most of the cotton belt is rain-watered, the lower Rio Grande valley in Texas and the cotton sections of Oklahoma, California and Arizona are irrigated.

Cotton Cultivation in India.—Four-fifths of India's cotton is grown in black soil, or regur, although there are three distinct classes of soil. In rank of importance they are: regur, Indo-Gangetic and red. Regur does not respond well to irrigation; the other two give good yields under irrigation. Since 1934–35 irrigated acreage has increased to 19% of the total cotton acreage, compared to 15% in 1925–26, with the provinces of Sind and Punjab alone accounting for a net increase in irrigated acreage of 1,136,000. The area planted in cotton increased from 654,000 and 2,884,000 acres in 1934–35 to 982,000 and 3,692,000 respectively in 1936–37.

Considerable progress has been made in India in cultivation systems, although the use of machines other than the ordinary indigenous agricultural implements and a few improved and remodelled types of such implements is rare. The economic condition of the peasantry as a whole does not permit the development of mechanical cultivation. Holdings are small for individual ownership of the expensive machines and co-operative ownership has not yet come into practice there. However, trials with tractor ploughing on a large scale have been successfully carried out and found to be economical. There is great demand for tractor ploughing on the contract system by big landholders in connection with opening up of new lands, and the Department of Agriculture has been helpful in this direction.

The general cultivation method, however, remains that of the plough, drawn by bullock, with drill sowing in most instances, and the practice of crop rotation, spacing cotton with wheat, sugar cane, gram and berseem. Fertilizers consist mainly of somewhat sparse manuring. Nowhere in India is the use of artificial fertilizers common.

Great irrigation systems are part of the cotton growing programs in India. The Indo-Gangetic plain, made up of alluvial soil has large irrigation projects which very greatly increase cotton acreage cultivation. The Punjab possesses the greatest irrigation system in the world with 92% total cotton crop irrigated, and in Sind irrigation has increased since opening of the Lloyd Barrage canal system from 250,000ac. in 1923–33 to 804,171ac. in 1935–36. An additional increase of 25% over the present area is anticipated. In the United Provinces one-third of the cotton acreage is irrigated.

In the vast cotton areas of the Malwa plateau, the Herbaceum and Oomras tracts are rain-fed and there are few irrigation systems of any importance in these tracts. In South India on red soils, about 40% to 60% Cambodia cotton is irrigated.

In India there has been no effort on the part of cultivators to keep cotton seed from deteriorating in quality, but the Depart-

ment of Agriculture has adopted the "Wave" system which provides for voluntary agreement to gin cotton under department supervision, returning all seed to the department. Under this system a continuous supply of pure seed is available to a large number of cultivators.

Cultivation in Egypt.—The agricultural area of Egypt is confined to the lands of the valley and delta of the Nile. Climate conditions are favourable to the cotton which is planted in the alluvial soil of those regions in February, March and April, and harvested during the fall months without ever being in danger of frost. The Egyptian crop is entirely an irrigated one. Until about 1925 most of the cotton crop was watered by land being river flooded twice a year. Now more dependable and regular irrigation is properly rotated to each grower in each district through a system of canals developed by the British Government.

About two-thirds of the cotton acreage is farmed by small 10 to 15ac. farmers, who find cotton their only cash crop and on these small farms primitive methods of cultivation, with the water buffalo as beast of burden, prevail. The other one-third of the agricultural section is held by extensive landholders—wealthy families or large agricultural companies; but on these places also (with the exception of tractor ploughing) hand labour, which is cheap and plentiful, is used.

Government control of seed is very strict, all seed sold for planting being required to have an approval test and certification by the Government. Through such systematic methods Egyptian seed supply is kept remarkably pure.

Cultivation in Brazil.—Brazilian cotton acreage is divided into two distinct districts: northeastern States and southern States. Soil and climatic factors in the two districts are very different and cotton in each is distinctly different both in type and quality. Southern Brazil produces cotton of American Upland type, while northeastern Brazil produces its famous tree cotton.

Southern Brazil with an area about equal to the United States cotton belt west of the Mississippi river cultivates less than 35% of it. The climate of southern Brazil is well adapted to cotton growing considering both rainfall and temperature, despite the fact that occasionally rainy weather extends into picking season. In the plateau districts of northeastern Brazil favourable temperatures are found and their periodic droughts will be overcome by the several irrigation systems now under construction.

Due mainly to the fact that the coffee and cotton harvests occur at the same time Brazil has a labour shortage, although in recent years large numbers of Portuguese, Spaniards, Italians and Japanese have immigrated to the southern part of Brazil to become tenant farmers or independent producers. It is estimated that at least 42% of the cotton grown in Sao Paulo during 1933–34 was produced by Japanese labour. A great number of large cotton plantations in that State are owned by Japanese operating companies.

In an effort to improve the quality of their cotton the Brazilian Federal Government and State Governments have encouraged experiment-station activities, upheld Federal and State gin inspections with State control of seed distribution. Better ginning equipment operated by competent engineers has greatly assisted in making Brazilian cotton of the southern Brazilian States a factor in the world market.

The few problems that handicap Brazil's cotton growing industry are shortage of labour supply, inadequate transportation facilities, shortage of modern machinery, and lack of an organized system of credit for producers.

Cultivation in Soviet Union.—In the Soviet, the Government manages a highly systematized type of agricultural control. Since 1936 cotton growing districts have been grouped into fairly well defined regions, based on soil and climate, and the system of central breeding stations and sub-stations for seed selection has been inaugurated.

The Government closely supervises growing of cotton by peasants who are for the most part organized into collective farms. In addition, the Government owns and operates farms of its own. Out of 4,827,000ac. planted to cotton in 1935, 4,300,000 or 89% were in collective farms.

Each collective farm grows cotton under Government contract according to terms of which the agronomic division of the county civic administration has power of command over all farm methods although the actual routine work of directing the farming activities of collective farms is done by agronomic sections of the local machine-tractor station. Each collective farm is small, about 632ac. for 70 to 80 households, or about 8 to 9ac. of crops per family, but each agronomist supervises work done on 4,000 to 7,000 acres. The stations, collaborating with the Commissariat of Light Industry, determine which collectives should grow cotton, fields to be planted, acreage and all other details.

These Government-owned and Government-operated stations are powerful factors in agricultural policies. Each station is divided into three units: agronomic, political and mechanical. The latter contracts with collective farms to do their ploughing, harrowing, seeding and cultivation, etc., the farm paying wages of the tractor driver plus a share of the crop per acre for each operation. The work done by the stations is supplemented by each farm's own draught animals and implements. In some instances, because of the topography of the land, machine-tractor stations are unable to serve the farms. In 1935 there were 452 stations specializing in cotton, compared to 17 stations in 1930. A light universal-type tractor has been found best suited for work done by these stations.

Considerable progress has been made in tillage methods in the Soviet since 1930. All cotton land is shallow ploughed after harvesting the crop. Late in the fall it is again ploughed 8 to 10 inches deep by power-drawn ploughs. Application of fertilizer and intertillage cultivation is practiced on collective farms.

Cotton opens in September and is almost entirely hand-picked. Although extensive experiments have been made in mechanical picking in the Soviet, it has not been adopted to any great extent, as a result of the custom of planting narrow rows.

The cotton crop as it is picked by hand is classed by the picker according to seed cotton grades established by the Government, the picker's apron having pockets for each grade. In actual practice, however, cotton harvesting in the Soviet is not efficient and great losses have been sustained due to delayed picking, poor storing and drying facilities.

All cotton is delivered to the warehouse at a specified procurement point. None is kept by the producer or the tractor station. Final payment is made in cash on the basis of percentage of seed cotton grades in total amount delivered.

Cultivation in China.—China has greatly increased its production since 1920. Most of this expansion has taken place in North China, one of two distinct cotton producing regions, the other being the Yangtze valley. In these two regions climate, soils and cropping systems are very different. In the Yangtze valley the farmer can depend to a great degree upon adequate rainfall, while in North China approximately 50% of the farmers have irrigation wells.

Chinese cotton is raised in low altitudes and is largely produced on alluvial soil of good texture but low in fertility and organic matter. Planting and harvesting in both the Yangtze valley and North China occur at approximately the same dates—planting being done around May 1. In the Yangtze valley the general practice is to broadcast seed in the wheat or barley crop, which when harvested leaves young cotton plants about 2 to 3 inches high. In North China cotton fields are spring-ploughed and harrowed and the seed is planted by hand in rows. The principal cultivation is hoeing by hand. Various fertilizers are used: barnyard manure, canal and pond mud, ashes and some oilseed cakes.

The North China irrigation system requires considerable labour as the water from the wells is generally brought up by an endless chain of small buckets which is operated by a power wheel pulled by a donkey, horse or cow.

Earliest maturing cotton opens August 1 and though several pickings are made each season about 70% of the crop is harvested during September, and the crop is completely harvested by early October.

C. PESTS AND DISEASES OF THE COTTON PLANT

Insect Pests.—The cotton plant probably has more destructive insect enemies than any other cultivated crop, for it has several points of attraction. On the midrib on the under side of each leaf, at the base of each bract on the outside of the square, and inside the flower near the base of the petals are small nectaries, cup shaped structures which hold a drop of sweet fluid. The flowers are heavy in pollen, and the plant itself is succulent and rich in nutrient materials. These attributes urge insects to feed on the plant, or even to take up residence in its tissues. Of these the boll weevil, the pink boll worm, the cotton leaf caterpillar, and the boll worm do most damage, although others listed are of grave importance.

The Mexican boll weevil (*Anthonomus grandis*, Boh.) is a native of Central America or Mexico. It is known as a cotton pest from Mexico southward to Costa Rica and in Cuba, and in the cotton belt of the United States where it first appeared in Texas in 1892, spreading year by year until by 1921 it had covered the entire belt. In some years in the United States it has caused a loss in the cotton crop of more than $200,000,000, but due to planting of faster maturing types of cotton, adoption of cleaner farming practices, and more intelligent use of insecticides losses from boll weevil have shown a downward trend since 1929. The adult insect, a small grayish or brownish weevil, winters in sheltered places. The survivals of the winter emerge from hibernation from March 1 to about July 1, and attack both squares and young bolls, puncturing them with their snouts for feeding and for egg-laying. The favourite food of the boll weevil is the pollen of the unopened flower-bud, or square; for that reason the female weevil prefers to deposit her eggs in the square in the small puncture, made with her snout, which is sealed with a plug. If squares are scarce bolls are used. The egg hatches in about three days into a stout white larva which becomes full grown in seven to twelve days, remains three to five days in the pupa stage, and emerges a full grown beetle which in five to seven days begins a new generation. The life cycle of the boll weevil is from 18 days to four weeks or longer, depending upon the weather. Warm weather hastens development, hot dry weather increases mortality. The boll weevil multiplies so rapidly that the offspring of a single pair, if all survive, would total several millions in one season. The migration season begins about August 1 and a weevil may travel 100mi. or so before hibernating.

The fight against boll weevil infestation is a great one on the part of the farmer. As soon as 10% of the squares in a field are found infested the war is on.

The most approved method of direct control is to dust cotton plants with calcium arsenate at the rate of 4 to 6lb. per acre, applied when the air is reasonably calm and plants moist. Generally this is at night or just at dawn. After the first application others must be made, three or more, at five-day intervals. Small farmers growing a few acres of cotton may use hand dusters to good advantage. Cotton planters growing a few hundred acres of cotton may use five and six-row power dusters with good results, whereas planters growing thousands of acres of cotton will find aeroplane dusting more satisfactory. Regular companies are organized for the purpose and have planes especially built for dusting. A farmer contracts at so much per acre per season for the work. It has many advantages and costs no more than dusting with ground machinery.

Another method of poisoning the boll weevil, which is used most successfully on Sea Island cotton, is application with a hand mop direct to the plant of a mixture of molasses, calcium arsenate and water at the rate of one gallon per acre. It is a laborious and expensive method, however, and only the premium paid for this long staple justifies expenses involved.

The pink boll worm (*Pectinophora gossypiella,* Saunders) probably originated in India, and today is found throughout practically all cotton producing regions of the world.

The pink boll worm is the larval stage of a small brown moth, somewhat resembling the common clothes moth. The female moth lays her eggs on the green bolls or in the flowers of cotton. The eggs hatch in four to twelve days and the larva immediately bores into the boll and eats the seed. Often a larva hollows out two adjacent seeds and webs them together, forming the characteristic double seeds which furnish a quick method of determining whether or not a lot of seed is infected. The pink boll worm has been known to remain alive in a quiescent condition as long as 31 months. It has been found alive in cotton bales 18 months after the bales have been stored. It has been introduced from country to country in shipments of cotton-seed.

The most important methods of control are fumigation of cotton-seed, strict quarantine laws, and cleaning up cotton fields.

The cotton leaf worm or army worm (*Alabama argillacea,* Hubn.) a native of tropical America, migrates northward each spring and generally enters the United States through Texas, multiplies on cotton and spreads throughout the main cotton belt, sometimes by late summer reaching the northern States and even into Canada. The moth deposits eggs on the under side of the cotton leaf, where they hatch in three to 20 days, the larva feeding voraciously on the younger leaves. In ten days to three weeks the larva is mature and webs itself in a rolled up leaf and pupates. The pupal stage is one to four weeks. From the pupa is hatched a tawny-coloured moth with wing spread of about 1in. and the cycle of life goes on. The army worm is controlled by poisoning with calcium arsenate or Paris green.

The boll worm (*Heliothis obsoleta,* Fab.) feeds on some 70 plants but is most destructive to corn, cotton, tomatoes and tobacco. The caterpillars attack flowers of cotton plants or bore into squares or bolls, eating the inside. It can be poisoned by dusting, as for the boll weevil.

The cotton flea hopper (*Psallus seriatus,* Reut.) punctures the very tiny squares which turn black and fall from the plant. The affected part of the stalk shows an abnormal growth and branching which is very erratic, having many suckers. The hopper is a very small green flea about $\frac{1}{8}$in. in length. Dusting with sulphur (about 10lb. per acre) is advised for destroying this pest as well as the tarnished plant bug and rapid plant bug which attack cotton plants in the same manner.

The red spider (*Tetranychus telarius,* L.) is a mite barely visible to the naked eye. It works on the under side of cotton leaves laying its eggs there, spinning delicate webs and sucking sap from the leaves, eventually covering the leaves with minute punctures. This pest has been from time to time one of the most destructive of cotton's insect enemies particularly in the south-east section of the United States cotton belt. The spider does not limit his operations to the cotton plant but has been found on 200 species of garden and field crops and ornamental plants and seeds. About 17 generations a year is the life cycle of this insect. Preventive measures consist of a spray of potassium sulphide, kerosene emulsion, or flour paste solution. Dusting with sulphur is also recommended and it is particularly important to cut and burn all weeds and underbrush near the cotton fields.

Many other insects attack the cotton plant. Among the less important are the cotton square borer, the cotton stainer, the cotton dauber, the garden web worm, the salt marsh caterpillar, the cotton leaf perforator, the cotton aphid, the thurberia weevil, cotton wire worms and southern grass worms.

A new pest, the white-fringed beetle, has recently been found in several localities in the south-eastern portion of the cotton belt of the United States. This insect is considered dangerous because in the larval stage it eats the roots and in the adult stage it eats the foliage from many species of plants. Cotton is among its favoured food plants.

Diseases of the Cotton Plant.—The damage to cotton plants caused by bacteria and fungus diseases comes to an annual loss of many millions of dollars. In the United States alone it is estimated that an annual loss of $30,000,000 to $40,000,000 is entailed from cotton plant diseases, the damage varying, of course, with the season, since a warm rainy season is more conducive to diseases of this sort than a hot dry season.

The most troublesome of cotton plant diseases are wilt, anthracnose, root knot and angular leaf spot.

Fusarium wilt (*F. Vasinfectum,* Atk.), also known as "frenching," attacks cotton plants which may be stunted and the yield may be reduced considerably, or they may show little external evidences of the disease and still produce a very reduced yield. The first sign of the wilt disease is a yellowing of the lower leaves which later shrivel and fall leaving the stem and branches bare. If one should examine the interior of the stem or root or leaf blades one should find the woody parts brown and darkened. Although cotton plants only a few days old have been observed to be victims of the wilt disease, it generally attacks plants when they are about one foot high.

The cause of this disease is a fungus which lives in the soil and enters the plants through the roots. Once in the plant the fungus forms a poisonous chemical which causes the plant to wilt.

The fungus may live saprophytically in infected soil for years. Also soil may easily become infected by the fungus being transferred from one field to another through dirt on ploughs and other implements or even the feet of men and animals, by infected manure and other means.

Cotton wilt seems to be little affected by climate conditions, and rotated planting is not helpful in its control.

The most effective means of fighting the wilt disease is to plant wilt resistant varieties of cotton, many of which have been developed.

Anthracnose (*Colletotrichum gossypii*, South) or pink boll rot has been known since 1890 when it was first described by a member of the U.S. Department of Agriculture. This disease is widespread in most cotton growing regions of the world and entails an annual loss to cotton farmers of millions of dollars. It may kill young plants either just before or just after they break the ground or it may cause the bolls to rot or infect others to the point where the lint, if not destroyed, is badly damaged. This disease is particularly virulent during rainy seasons in humid regions.

The disease attacks all parts of the cotton plant except roots of the very large plants. The chief source of infection is diseased cotton-seeds and the best control measure is to plant the seed from non-infected fields using seed preferably two years old, the adoption of crop rotation, and the practice of fall ploughing. Also, some disease-resisting varieties may be planted.

Root knot [*Heterodera radicicola* (Greef) Muell] is caused by a small eel-like worm or nematode which is found in most areas where cotton wilt is in evidence. It abounds most frequently in light sandy soil. The nematode enters the roots of cotton plants, multiplies rapidly, and causes swelling of the root which later develops into a thick-walled cyst.

Plants infected with root knot are generally dwarfed in appearance, with a sickly colour. They also tend to wilt even with abundant moisture.

Soil is easily infected and effective eradication measures have been found of no practical value. A control measure recommended is the use of chemical fertilizers in order to stimulate plants to increased growth and strength.

Angular leaf spot (*Pseudomonas malvacearum*, E.F.S.) is a disease of considerable economic importance and is widely distributed throughout the cotton growing sections.

Although the leaves are generally attacked, the greatest damage is to the bolls.

When the disease attacks the leaves it causes dark green spots on the under surface. These later show up on the upper surface and turn dark brown. Badly infected leaves curl up and drop off. When it attacks the branches or the stalk the infected portions turn black. When the disease attacks the bolls soft, dark green water-soaked spots appear, gradually enlarge, and turn black in the centre. The locks of the boll may be so injured that they fail to open.

This is an infection which results from year to year from bacteria which have survived the winter on cotton-seeds and attached lint.

The only satisfactory control measure known is the use of non-infected seed, although treating the seed has given some fair results.

Among other diseases attacking the cotton plant are Texas root rot, boll rot, rust, smut, red leaf, sore shin, etc.

II. RAW COTTON

A. GINNING, BALING, TRANSPORTATION

Before cotton can become commercially valuable it must go through the process of ginning—the separation of seed from the lint. Baling and shipping are the other two steps which link the individual farmer's crop with the world market. Each is of utmost importance, for the failure to meet certain standards in any of these steps penalizes the farmer, the ginner, the shipper and the consumer.

In the United States, roller gins are used only for ginning Pima cotton and Sea Island cotton while the bulk, American Upland, crop is ginned by saw-gins. In the United States cotton belt ginning has become "big business" with a total investment in cotton gins in 1938 of over $200,000,000.

Easily reached by excellent highways and farm-to-market roads, large public gins located in central points and equipped with the most up-to-date machinery have supplanted the small individual plantation ginneries. In 1933 the number of active gins in the United States was 13,543 compared to 18,262 in 1925. Although the trend is to fewer gins, the larger gins are better equipped, and the crop can be ginned better and faster than formerly.

In the United States when a truck or wagon load of seed cotton pulls up before the gin the load is automatically weighed, the seed cotton is drawn by a suction pipe out of the conveyance and carried mechanically through cleaner, distributor and feeders to the saws. From the saws the lint is blown to condensers which drop it into the press box, while the seed is carried by a mechanical conveyor to a storage bin or, if requested, back to the grower's wagon or truck. Most growers, however, sell their seed to the commercial ginner at prevailing prices, for "seed money" is an important part of the tenant's financial life.

When the lint is dropped into the press box it is packed by mechanical trampers and pressed into a bale of oblong shape, weighing approximately 500lb., measuring about 54x27x46in., with a density of 12½lb., approximately, per cubic foot. The jute bagging and ties in which the bale is wrapped weigh about 21lb., and if the bale should be wrapped in cotton bagging, as many are under a subsidy program inaugurated by the Government in 1938, the tare weighs about 7lb. less.

The farmer pays the ginner 30 cents to 40 cents per 100lb. for seed cotton, plus a charge of $1.25 to $1.50 per bale for bagging and ties, or a total cost of $5.00 to $7.00. Modern American saw-gins can gin a bale of cotton in from 5 to 30 minutes. The average time is 15min. from the lowering of the suction pipe to the wagon-load of seed cotton to ejection of the finished bale from the press.

Cotton bales may be compressed for shipping purposes to a density somewhat above 22½lb. per cu.ft., at a charge of 55 cents to 75 cents per bale. Compressed bales have an irregular and ragged appearance but twice as many compressed bales can be placed in a railway car, and freight differentials make compression necessary on rail shipments.

The use of round bales is becoming more and more popular in the United States, particularly in Arkansas, Oklahoma and Texas. Fully 75% to 85% of round bales put up in the United States are exported. Anderson, Clayton & Company own all of the round bale presses in the United States, furnishing them to independent ginners who operate them under a lease arrangement. The round bale is about 25in. in diameter, weighs about 250lb., and has a density of 33lb. per cubic foot. One or two round bale presses are in operation in Mexico, two have been installed in China, and one in Indo-China. The American flat bale does not compare favourably in appearance with bales of other countries, but the round bale is very neat.

Cotton cultivated and harvested with care, ginned under best conditions, representing a full year's income to the grower, cannot be actually evaluated in dollar-return unless it finds a way to the world market. Therefore, the last step between months of labour and out-of-pocket expense and a possible profitable income is of greatest importance. Much of the cotton crop must travel considerable distances from the gins or compresses to the consumer mills. The most economical route must be chosen. In the United States excellent transportation facilities are to be had in trucking systems which are in great competition with railroads. In the western section cotton hauls of several hundred miles are made via modern highways to concentration points, and combination truck and rail hauls are also used. East of the Mississippi river rail is most generally used for long hauls, and trucks for short hauls. Most cotton for export is shipped by rail, truck, or river barge, or combination of two or all three to Houston and Galveston in Texas, and New Orleans in Louisiana where compresses capable of caring for $1\frac{1}{2}$ to 2 million bales are located. Some 60-odd steamship lines operate from these ports with approximately 150 foreign destinations. Other ports along the Gulf coast and Atlantic seaboard get their share, too, of export business.

In Egypt roller-gins are used exclusively. This process is a more gentle one than saw-ginning, and is more satisfactory for the long staple crop of Egypt, the lint pulling easily from the seed.

The gins are substantial concerns, run either independently or controlled by cotton exporters. The ginneries are well equipped and efficiently managed. Strict laws prevail as to cotton-seed which is not allowed to be mixed at the gin; each lot of seed sold for planting must bear a tag stating it has been approved and tested, and other facts.

The larger portion of the Egyptian crop is sold by the grower as seed cotton at the gin, the ginner—in turn—selling the various lots to the exporters. The gin-bales averaging around 800lb. are shipped to Alexandria, the bottle-neck through which the entire Egyptian crop passes. There they are stored until sold. When exported each bale is torn apart in the farara, or warehouse, and a blend is made from as many as a dozen lots of country bales in order to prepare and press one lot of export bales. This gives the exporter, and the purchaser, an even running blend equal to a specified type prepared for individual spinners. When a sufficient quantity of a blend is prepared and done up loosely in bags, it is pressed in steam presses into the neat, highly compressed, 750-lb. burlap wrapped bale, peculiar to Egyptian cotton.

In addition to America, France, and Lancashire, England, Egyptian cotton is exported to Japan, India, Rumania, Yugoslavia and other countries.

In Brazil the cotton ginner has always been the primary buyer, buying the seed cotton from growers and then ginning all his cotton together, regardless of type or quality. After it was ginned it was sold to larger merchants who in turn sent it to the coast, where at seaports the bales were broken open and classed, the method of classing being by sight, the classer determining types by colour differences. Crude and approximate, it resulted in great losses in waste because of lack of uniformity in the cotton.

In 1934, a Brazilian Federal decree requiring annual registration and licensing of all cotton gins and presses was passed. This also provided for annual inspection of gins and after Sept. 1, 1935 all gin machinery had to conform to prescribed standards. Enforcement of this latter provision increased imports of American gin machinery from $68,000 in 1933 to $847,000 in 1935. It tapered off to $555,000 in 1938. As a result of Government requirement since 1931 of official classification of all cotton destined for export, plus the excellent new gins, Brazilian cotton is able to compete in world markets on a quality basis.

The Brazilian Government, through its ministry of agriculture, has established nine grades for each of the various types of cotton grown in the country. Of these, physical standards for five grades and descriptive standards for four have been promulgated.

Transportation facilities of the north-eastern Brazilian States are poor. Railroads extend only short distances from the seacoast and the equipment is not modern or kept up. The service is slow and expensive. Highways are not hard-surfaced and are almost impassable at times. The farmer is dependent in most instances on the ox-cart or on mule pack trains to transport his crop to the nearest railway. A road building program is underway, however, under the Government's drought-relief program. In the southern Brazilian States' cotton districts transportation facilities are good although there are still large areas in which transportation is still a major problem.

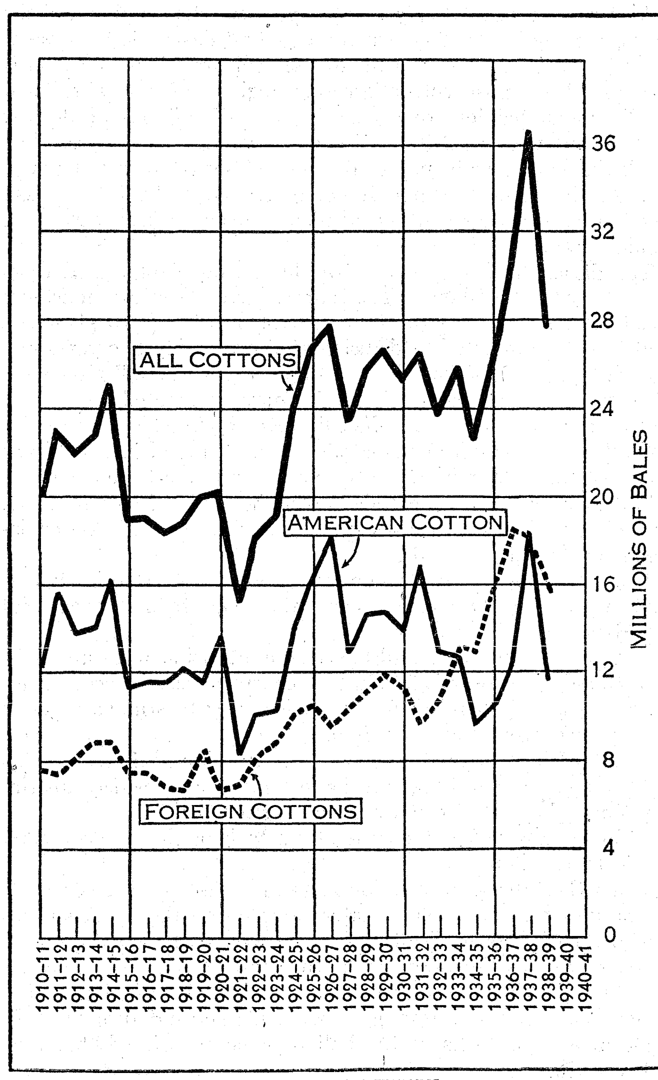
In China marketing of cotton requires considerable hand labour, for methods are relatively inefficient. In remote places seed is still separated from the lint by hand, but most of the cotton is ginned in the home during fall and winter—when the farmer has more leisure time—by means of a spike-gin operated by the foot.

Near some of the cotton centres farmers sell their seed cotton to a central gin. The majority sell their ginned cotton to a local buyer, who, in turn, sells to a visiting middleman who ships it to some concentration point. It is conveyed from the interior in baskets, bags, hand-pressed bales, straw-bales, jute-bales and press-packed bales.

The only Chinese cotton which is known in the world markets is put up in the Tientsin bale which weighs about 530lb. and has a density of 52lb. per cu.ft.; is wrapped in close-meshed jute and carries three ties. (M. G. B.)

B. THE WORLD'S COTTON SUPPLIES

World Production.—During the five years from 1935 to 1939 inclusive the annual production of commercial cotton in the world averaged approximately 30,000,000 bales. This figure is for actual bales of American cotton—these bales averaging about 490lb. net weight—and for equivalent 478lb. net weight bales of



FROM COTTON YEARBOOK OF THE NEW YORK COTTON EXCHANGE

FIG. 2.—PRODUCTION OF COMMERCIAL COTTON IN THE WORLD

(Actual bales for American cotton. Equivalent 478-lb. bales for non-American growths.)

non-American cottons. Figures for non-American cottons are not usually given in terms of actual bales because those cottons are put up in bales of widely varying weights, some foreign cotton bales weighing less than 100lb. and others around 750 pounds. The equivalent 478lb. net weight bale has been adopted as the unit for statistics for non-American cottons because a bale of that weight has been looked upon as the standard bale of American cotton—although, as stated, American bales currently average a little heavier. The term "commercial cotton" refers to cotton which enters commercial channels by being processed mechanically in mills, as distinguished from cotton which is processed by hand-spinning, used for stuffing mattresses or padding clothing, or otherwise utilized outside of mills.

The approximate average world crop of 30,000,000 bales is the combined output of about 60 countries. Of these 60 countries, approximately two-thirds are in the northern hemisphere. Most of the larger cotton growing countries are north of the equator. Consequently, 85% to 90% of all the cotton grown in the world is produced in the northern hemisphere. This is important from the standpoint of the timing of the annual output of the staple, for it means that the bulk of each of the world's cotton crops comes onto the world market in the second half of the calendar year. The output of southern hemisphere countries has increased substantially in the decade, 1930–39, and consequently the volume of newly produced cotton which enters commercial channels in the first half of the year has expanded appreciably, but it is still relatively small.

The United States produces far more cotton than any other country. Up to a few years ago it produced well over one-half of all of the commercial cotton grown in the world, but this is no longer true, since the United States has reduced its average output substantially in recent years while numerous other countries have increased theirs. At the close of the decade of the '30s about 90% of the world's commercial cotton production was furnished by six countries, these being the United States with an average output of about 12,500,000 bales, India 5,000,000, Russia 3,600,000, China 2,000,000, Brazil 2,000,000, and Egypt 1,900,000. Most of the balance of the world crop was turned out by nine countries, these being, in order, Peru with an average output of close to 400,000 bales, Mexico with about 300,000, Argentina, Uganda and the Anglo-Egyptian Sudan with about 275,000 each, Turkey, Chosen and the Belgian Congo with 175,000 to 200,000 each, and Iran with 150,000. Approximately 45 other countries produced a total of about 750,000 bales, but none of them produced as much as 100,000 on an average, and most of them produced less than 50,000. All of the foregoing figures for non-American cottons are in terms of equivalent 478-lb. bales.

While the increase of cotton growing in numerous widely separated countries and the decrease of it in the United States has tended to make the world output more stable, world cotton crops still fluctuate greatly. Taking the 12 months from August 1 of one year to July 31 of the next as constituting the world cotton season—this being the 12-month period which is best adapted to that purpose—world production of commercial cotton increased from approximately 26,100,000 bales in the 1935–36 season to about 30,800,000 in the 1936–37 season; it increased further to about 36,800,000 in the 1937–38 season, but it then dropped to about 27,400,000 in the 1938–39 season. The increase from 1935–36 to 1936–37 was about 18%, and from 1936–37 to 1937–38 was about 19%. The decrease from 1937–38 to 1938–39 was about 26%. Such wide variations in outturn are due chiefly to changes in yield per acre, and only to a relatively small degree to changes in acreage. In some parts of the world yields are greatly reduced at times by severe droughts, in others they are often lowered by excessive rains. Insect damage tends strongly to vary with weather conditions. It is chiefly because of the impossibility of controlling weather conditions and resultant yields per acre that the United States Government has encountered great difficulties in its efforts to control production by controlling acreage.

Many of the cotton growing countries of the world consume the larger portion or practically all of their output of the staple. Many others, on the other hand, export the larger portion or practically all of their output. Among the countries which consume the larger portion or most of their output are the United States, Russia, China, Chosen, Turkey and Mexico. Among those which export the larger portion or most of their output are India, Egypt, Brazil, Peru, Argentina, Anglo-Egyptian Sudan, Uganda, Belgian Congo and Iran. The great majority of the small cotton growing countries export most or all of their output. The greater portion of the cotton which is exported by cotton growing countries goes to Great Britain, countries of the continent of Europe, Canada, Japan and China. Great Britain, most countries of the continent of Europe, and Canada do not grow cotton, and Japan produces only a negligible quantity, since those parts of the world have too cool temperatures for producing the staple. In consequence of the facts just stated, roughly 40% of the world output of cotton moves in international trade. Cotton is one of the most important commodities in international commerce.

Notwithstanding the world-wide disruption of trade and industry and the curtailment of world buying power in the decade of the '30s, in consequence of the economic debacle early in that decade and the subsequent political confusion, and, notwithstanding, also, the phenomenal expansion in the use of rayon products during that decade, world production and world consumption of cotton reached record high levels in that period. Scores of millions of agricultural and industrial workers of the world were unable to make normal purchases of cotton goods. In certain countries, notably Germany and Japan, consumption of cotton was substantially reduced as a result of Government regulations requiring the use of rayon staple fibre in direct substitution for cotton. In other countries expansion of the use of cotton was restrained by the fact that rayon staple fibre was used in place of cotton for certain purposes for purely commercial reasons. In the face of these adverse factors, cotton growers of the world as a whole increased their output of the staple, and the world responded by finding new uses for the staple in the older areas and larger outlets in newer areas. One of the outstanding trends in world consumption of cotton in the decade indicated was the increase in the use of the staple in the more recently industrialized countries, such as India, Brazil and Argentina, and, until the outbreak of the Sino-Japanese war, in Japan and China. Peak world production of cotton was reached in the 1937–38 season, at approximately 36,800,000 bales. Peak world consumption was reached in the 1936–37 season, at approximately 30,600,000 bales.

In considering world supplies of cotton, it should not be assumed that all cotton has the same physical characteristics, and that, hence, any given kind of cotton is adapted to the manufacture of all kinds of cotton manufactured products. There are hundreds of commercially recognized varieties of cotton, and of each variety there are many commercially recognized qualities. The physical characteristics in cotton which are of chief importance from a commercial standpoint are length of staple, *i.e.*, length of fibre; amount and character of intermingled leaf, twigs and other foreign matter; colour, strength, smoothness, silkiness, adherence of fibres to each other and resiliency. Different cottons which are more or less similar with respect to these characteristics may be used interchangeably for the manufacture of a given product, but cottons which are not similar may not be so used. Consequently, while the various cottons produced in the world are to a large degree interchangeable and hence they compete with one another, such interchangeability and competition are subject to limitations. To be specific, certain kinds of cotton produced in volume in the United States compete directly with certain kinds produced in volume in India, but most cotton produced in Egypt has only a remote competitive relationship with most cotton produced in India.

The commercial cottons of the world vary in length of staple from about $\frac{3}{8}$in. to about $1\frac{3}{4}$in. or more. The longest cottons include the longer varieties of Egyptians, Peruvians, and Sudans; Sea Island cotton, long staple American Upland cotton, and a variety grown in the United States known as Pima. The shortest cottons include the shorter varieties of Indian and Chinese cottons, and numerous unimproved varieties grown in the smaller producing countries. Roughly 60% to 65% of all the cotton grown in the world is in the range of length from $\frac{7}{8}$in. to $1\frac{3}{32}$ inches. About 25% to 30% is in the range from about $\frac{3}{8}$in. to $\frac{27}{32}$ inches. About 10% is in the range from $1\frac{1}{8}$in. to about $1\frac{3}{4}$ inches. Of the cotton produced in the United States, exclusive of the very small amounts of Pima and Sea Island, 85% or more is in the range from $\frac{7}{8}$in. to $1\frac{3}{32}$ in., 7% to 9% is $1\frac{1}{8}$in. or longer, and 5% to 8% is under $\frac{7}{8}$ inch.

The American Crop.—For the most part, the production of cotton in the United States is spread over a tremendous area in the southern portion of the country, commonly called the cotton belt. In its greatest dimensions this area stretches 1,500mi. east to west, from the South Atlantic seaboard to the eastern section of the State of New Mexico, and 700mi. north to south, from the northern boundaries of Texas and Oklahoma to southernmost Texas. It is larger than France, Germany, Italy and Spain combined. In addition, cotton is grown in volume in the Far West, in the States of California and Arizona. Practically all of the cotton produced in the cotton belt is rain-grown, the chief exception being a small amount that is produced by irrigation in New Mexico. The cotton grown in the Far West is produced by irrigation. Over the vast territory comprising the cotton belt there are many widely varying types of soils, many types of topography, and great variations in weather. Seasonal changes come at different times in the southern and northern portions of the belt, necessitating differences of timing in the various operations of cotton growing. Mid-summer heat comes to southern Texas while Oklahoma, Arkansas and other northern cotton growing areas are unable to start farm operations because of actual or threatened frosts.

Planting usually begins early in March in the southernmost part of Texas, around the first of April in the middle of the belt, and toward the end of April in the northern portion of the belt. In any given district it is usually completed in two to four weeks. Picking usually starts around the first of July in southern Texas, about the middle of August in the middle portion of the belt, and about the first of September in the northern areas. Picking is spread over three to four months in each section. Consequently, picking is not completed in the northernmost areas until about the end of the calendar year, or even later if it is delayed by cold or wet weather. Notwithstanding the great expanse of the cotton belt, the belt-wide average yield per acre is subject to large variation from year to year, because of differences in weather and insect infestation. In the western part of the belt the yield is often reduced by prolonged drought. In the eastern part it is often cut down by excessive rains. The principal insect pest is the boll weevil. That pest, however, has done much less damage to the crops than formerly. The crop is heavily fertilized in the eastern portion of the belt, less fertilized in the central portion, and mostly not fertilized in the western portion. Average yields per acre have shown a pronounced upward trend. It is not possible to give any significant figure for the average cost of growing cotton in the United States, since most of the growers raise their crops by their own labour and that of members of their families, the recompense for which labour consists simply of that portion of the returns from the sale of the cotton and cotton-seed which is left after other costs have been met.

Almost all of the cotton grown in the United States is of the botanical type known as "Upland." The very small balance consists of Pima cotton, grown in Arizona, and Sea Island cotton, grown in Florida and the southern part of Georgia. Upland cotton varies in length from about $\frac{3}{4}$in. to about $1\frac{3}{8}$in., the bulk of it being in the range from $\frac{7}{8}$in. to $1\frac{1}{16}$ inches. The longer Upland cotton is grown in the areas adjacent to the Mississippi river and in a limited area in South Carolina. Pima and Sea Island cottons are very long, mostly $1\frac{1}{2}$in. or longer. Pima cotton was originally developed from Egyptian seed, and hence is often referred to as American-Egyptian. Sea Island cotton was formerly produced in fairly large volume in the south-eastern portion of the belt, but for some years practically none was raised because of its vulnerability to the boll weevil. Recently the production of it has been revived, on a very small scale. The U.S. Department of Agriculture issues periodical reports during each harvesting season on the grade and staple of the cotton produced, based on samples taken at the gins. Governmental and private agencies have devoted a great deal of effort during the '30s to raising the quality of U.S. cotton, particularly as to its staple length, and they have accomplished much in that direction.

The United States produces far more cotton than it consumes, although it consumes much more than any other country. Consequently, a large portion of each crop has to be merchandised abroad. The bulk of the cotton produced in the eastern portion of the cotton belt, and part of that produced in the central portion, are taken by domestic mills located in the south-eastern part of the country. The bulk of the cotton produced in the western portion of the belt, and part of that produced in the central portion, are exported. A substantial amount of cotton, particularly from the central and western portions of the belt, goes to mills in the north-eastern States. Cotton of a given quality in the eastern portion of the belt may be worth one cent a pound more than cotton of the same quality in the north-western portion of the belt, because of differences in the cost of transportation to domestic mills and to ports. Cotton exported by the United States goes, in peace-times, principally to Great Britain, countries on the continent of Europe, Japan, China and Canada. American cotton competes only very indirectly with foreign growths in the domestic market, because of transportation costs incurred in moving foreign cottons to the United States, but it competes very directly and very keenly with foreign growths in foreign markets, particularly in Great Britain, on the continent of Europe, and in Japan and China.

Since 1929 the United States Government has pursued many programs, or lines of action, designed to maintain or raise the price of American cotton. These may be broadly classified in three categories, namely, programs designed to restrain the flow of cotton to market, programs designed to limit production, and a program designed to stimulate exports. The programs designed to restrain the flow of cotton to market have taken the form of price-supporting loans to the growers, such loans being made directly by, or guaranteed by, the Government. The loan programs have resulted in the growers putting tremendous quantities of cotton into the loan stocks, instead of selling such cotton. The programs designed to limit production have taken the form of induce-

Note: Seasons run from August 1 in one year to July 31 in the next. The ten markets from which prices have been taken and averaged for this chart are Norfolk, Augusta, Savannah, Montgomery, Memphis, Little Rock, Dallas, Houston, Galveston and New Orleans

ments to growers to reduce the amount of land devoted to cotton growing, such inducements being partly in the form of payments in compensation for compliance with the programs and partly in the form of penalties for non-compliance with them. The production control programs have included requirements that the growers plant land diverted from cotton to soil-building crops or engage in other soil-building practices. The production control programs have led the growers to reduce their cotton acreages drastically, this, however, being partially offset by increases in average yields per acre. The program designed to stimulate exports has consisted of the granting of a Government subsidy on exports of cotton, together with quotas on imports. This program was put into effect just before the outbreak of the European war in 1939, and the results of it were obscured, at the outset at least, by the repercussions of that conflict.

The Government loan programs were initiated with loans made by the Federal Farm Board, a Government agency, in 1929. When the Farm Board made its first loans, the basic quality of cotton, middling $\frac{7}{8}$in., was selling for about 18 cents a pound, and the Board loaned 16 cents. The price subsequently declined to a point far below the loan level. In 1930 the Farm Board made further loans at rates averaging about 9 cents. Again the price dropped to a point far below the loan level. By 1932 cotton was selling for about 5 cents a pound. Roughly 3,600,000 bales of cotton were pledged against Farm Board loans, part of which was sold at great losses and part given to the Red Cross. The Farm Board's total loss on its cotton loan programs was estimated at $150,000,000. In 1933 a new series of Government cotton loan programs was begun, with loans by the Commodity Credit Corporation, a new Government agency. That agency made loans at the rate of 10 cents a pound in 1933, 12 cents a pound in 1934, 10 cents a pound in 1935, 9 cents a pound in 1937, and 8.3 cents a pound in 1938. For the most part, the Commodity Credit Corporation had the same experience as the Farm Board had had. The price of cotton fell below the Government loan rate in periods in which economic conditions called for such decline, and the Commodity Credit Corporation was left with huge stocks of loan cotton which it was unable to sell except at a loss. In 1936 and 1937 the Corporation released some of its cotton to the borrowing growers at a loss, in 1939 it disposed of a further quantity at a loss under a cotton-rubber barter deal with the United Kingdom, and late in 1939 it still held about 10,250,000 bales in which it had invested far more than it could recover from the sale of the cotton at current prices. The actual losses taken by the Commodity Credit Corporation plus its potential losses on cotton held were comparable with the losses of the Federal Farm Board.

TABLE II.—*Acreage, Yield per Acre, Production and Price of Cotton in the United States*

Year	Planted Acreage (Acres)	Harvested Acreage (Acres)	Yield per Acre (Pounds)	Production (500-lb. Gross Weight Bales)	Season-Average Price of Middling ⅞″ Spot Cotton* (Cents per Pound)

1936	30,627,000	29,755,000	199·4	12,399,000	12·70
1937	34,090,000	33,623,000	269·9	18,945,000	8·66
1938	25,018,000	24,248,000	235·8	11,944,000	8·70

*Prices given are averages for 12-month periods from August 1 in year indicated to July 31 in following year. For seasons from 1902–03 to 1914–15, inclusive, they are for spot cotton at New Orleans; for subsequent seasons they are averages for spot cotton at 10 southern markets.

†Average for about 10 months from Sept. 23, 1914 to July 31, 1915.

The Government production control programs were initiated in 1933 with the ploughing-up of about one-fourth of the acreage planted to cotton in that year. The 1933 program took that form because the law which provided for it was not enacted until the growers had seeded the current crop. In subsequent years the programs consisted of the non-planting of cotton on certain percentages of the land usually devoted to the staple. There were such programs in all years beginning with 1934. The land withheld from cotton ranged roughly from 25% to 40% of the theoretical full acreage. Most of the growers co-operated in these programs. However, since the growers left their poorer land out of production and planted their best, since they cultivated their smaller acreages more intensively, and since they built up the fertility of their soils by soil-building practices provided for in the Government programs, yields per acre rose to unprecedented levels and crops were not reduced in ratio with the decreases in acreage. In 1937 the Government control program was completely nullified by a phenomenal yield per acre in consequence of exceptionally favourable growing conditions, the crop of that year being the largest ever raised. Still, on an average, production was sharply reduced by the control programs.

To understand why the Government adopted the export subsidy program, to stimulate exports, one must observe the broad effects of the loan and production control programs on the American cotton trade.

These effects were a large increase in production of cotton by other cotton growing countries, a large displacement of American cotton by foreign cottons in foreign consuming countries, and, hence, a great shrinkage in exports of cotton by the United States. Foreign cotton growing countries increased their output because, largely as a result of the United States Government programs, foreign prices of cotton were held at such levels that cotton growing was more profitable than other agricultural activities. Foreign cotton consuming countries switched from American to foreign cottons because, largely as a result of the United States Government programs, American cotton was priced out of line with foreign growths. It was to meet this situation that the United States Government began in 1939 to pay a subsidy at the rate of $1\frac{1}{2}$ cents a pound on exports of cotton.

The Indian Crop.—Since India extends approximately 2,000 mi. from north to south and the same distance from east to west, and cotton is grown in roughly three-fourths of it, the planting and harvesting seasons for Indian cotton are naturally spread over many months of the year. Cotton is planted in northern India in May and June, in central India in June and July, and in southern India in September and October. It is harvested in northern India in October to January, in central India in November to February, and in southern India in February to April. In India as a whole, as will be noted, planting is spread over the months from May to October, and harvesting is distributed over the months from October to April. Thus the planting and harvesting periods for Indian cotton are several months later than those for American cotton, and Indian cotton largely comes onto the world market at a different time of the year than American cotton. A large portion of the cotton produced in India is much shorter than most American cotton, and consequently a large portion of the Indian crop is not directly competitive with the bulk of the American crop. However, a very substantial portion of Indian cotton is of such length that it competes very directly and keenly with certain qualities of the American staple. Many mills in Europe and the Orient use mixtures of Indian and American cotton, and such mills change the percentage of each growth in their mixtures when relative prices make it advantageous to do so. Other mills, which use American or Indian cotton straight, switch from one growth to the other when market conditions justify their doing so.

Cotton grown in India is commonly classified in the Indian cotton trade into long staples, medium staples, and short staples. In considering these classifications, it should be noted that cotton which is called "long staple" in India would be called only "medium staple" in the United States, while cotton which is called "medium staple" in India would be called "short staple" in the United States. Indian cotton which measures 1 in. to $1\frac{1}{16}$ in. is classified in India as long staple, that which measures from $\frac{7}{8}$ in. to $\frac{31}{32}$ in. is classified as medium staple, and that which measures less than $\frac{7}{8}$in. is classified as short staple. By these classifications roughly 5% of Indian cotton is long staple, 30% to 35% is medium staple, and 60% to 65% is short staple. The most important commercial varieties of Indian cotton are those which are grouped in the classifications known as American Seed, Oomra and Bengal-Sind. Each of these classifications embraces a number of more or less distinct varieties. Other important varieties include Broach, Western-Northern, Dhollerah, Compta-Dharwar, Surti, Southerns and Mathia. American Seed cottons are mostly medium and long staple, Oomras are fairly short or very short, and Bengal-Sinds are distinctly short, according to Indian length classifications.

While Indian cotton crops show irregular changes from season to season because of variations in yield per acre due to differences in growing conditions, the trend of production in India was definitely upward in the decades of the '20s and the '30s. In the five seasons from 1934–35 to 1938–39 the average commercial crop was about 6,200,000 actual bales of about 400lb. each, compared with about 5,500,000 in each of the two quinquenniums immediately previous and 5,000,000 in the third quinquennium previous. These figures cover only cotton produced for domestic mill consumption and exportation. In addition, India produces a quantity of cotton, variously estimated from 350,000 to 750,000 400-lb. bales per year, for household use within the country. Most of the increase in production has been absorbed by the mills of India, which greatly increased their output of cloth in the years indicated. Exports of cotton by India have fluctuated with the crops and with the changes in price relationships between Indian and non-Indian cottons, but they have not shown any pronounced trend either upward or downward. The greater portion of the cotton exported by India normally goes to Japan and China, but a very large portion goes to countries of Europe, chiefly Great Britain, Germany, France, Belgium and Italy.

Although India ranks second among the countries of the world both in the production and in the exportation of cotton, it imports substantial quantities of the staple. In the last half of the decade of the '30s, its imports in individual seasons ranged from about 250,000 to about 650,000 equivalent bales of 478lb. each. The imports by India are chiefly from Kenya, Egypt, the Anglo-Egyptian Sudan and, in occasional years, from the United States. India imports principally long staple cotton, of which it does not produce enough to supply the requirements of its mills, although it produces a large exportable surplus of short cotton.

TABLE III.—*Production of Commercial Cotton in World* (*New York Cotton Exchange figures*)

(American cotton in actual bales. Other cottons in equivalent 478-lb. bales, 000's omitted)

The table below includes only cotton entering commercial channels, *i.e.*, it does not include large amounts grown in India, China, and other countries for consumption in the homes of the people of those countries. For the United States, figures are given both for the actual ginnings from each crop, as reported by the Bureau of Census, and for the total production in the statistical season. The adjustment applied in arriving at the total production in the statistical season is computed by: (a) deducting from the actual ginnings from each crop the ginnings before the opening of the statistical season; (b) adding those ginnings from the next crop which are made before the beginning of the next statistical season; (c) adding an allowance for city crop, *i.e.*, rebaled samples, pickings from cotton damaged by weather and fire, etc.; and (d) adding imports of Mexican cotton into the United States. Imports of Mexican cotton into the United States are included in the figures on production by the United States because such cotton loses its identity on entering the United States and is counted with American cotton in returns on consumption and exports of the United States. Mexican cotton imported into the United States is excluded from figures on production outside of the United States, to avoid duplication. Figures for Indian cotton are computed from consumption in India, exports by India, and changes in stocks in India.

The Egyptian Crop.—Cotton is produced in Egypt chiefly in a narrow strip of country bordering on the Nile and in the broad delta of that river. The narrow cultivated area along the Nile varies in width from only one or two miles to a maximum of only 20 to 25mi., and it fringes the river for a distance of approximately 500 miles. The delta is roughly in the form of a triangle, approximately 100mi. to each side. Cotton growing is confined to these areas because, due to lack of rainfall, the staple can be grown only in districts which may be irrigated by the waters of the Nile. The crops are planted in the months from February to May, and are harvested in the months from August to December. Thus Egyptian cotton enters world markets at about the same time of the year as American cotton. Since the soil in which cotton is grown in Egypt is a rich alluvial deposit, the average yield per acre is exceptionally high.

Practically all Egyptian cotton is what the world classifies as long staple, *i.e.*, $1\frac{1}{8}$in. or over, and the Egyptian crop constitutes the principal supply of such cotton. It is also finer, stronger and silkier than most other growths. Egyptian cotton is much longer than most American cotton and, hence, it competes only very indirectly with most of the cotton grown in the United States. The competition with American cotton is further restricted by the fact that the United States maintains a high tariff duty on imports of such cotton as Egypt grows, with the result that only a small amount of Egyptian cotton is taken by the United States and the United States exports little cotton of a sort which is directly competitive with Egyptian. Because of its superior quality, Egyptian cotton commands substantial premiums over most cotton grown in the United States and over the bulk of the cotton produced elsewhere in the world. It is used chiefly in the manufacture of those yarns, threads and fabrics in which fineness or strength, or both, are requisite qualities.

There are some 10 to 12 principal varieties of Egyptian cotton. These varieties are commonly grouped in the Egyptian cotton trade in the classifications of long staple, long medium staple, and medium staple. The long staple varieties include Giza 7, Sakellaridis, Maarad, and Sakha 4; the long medium include Giza 12, Fouadi, Giza 26, and Giza 3; and the medium include Ashmouni and Zagora, these latter being known as Uppers. The long staple varieties generally measure $1\frac{3}{8}$in. or over, the long medium from $1\frac{1}{4}$in. to $1\frac{11}{32}$ in., and the medium from $1\frac{1}{8}$in. to $1\frac{7}{32}$ inches. The long staples and the long medium staples are produced almost exclusively in the delta of the Nile, this area being known as Lower Egypt. The larger portion of the medium staples is produced on the borders of the Nile above the delta, this area being known as Upper Egypt. However, a large portion of the medium staples is produced in the delta. The history of cotton growing in Egypt discloses that numerous varieties of the staple have come and gone, as new and better varieties have been developed and have degenerated or have been superseded by still better varieties.

Egypt exports most of the cotton that it produces. Practically all of the exports of the staple go out of the country through Alexandria, the very small balance being exported through Port Said. Great Britain takes much more Egyptian cotton than any other country. Other countries which took (before 1939) large quantities include Germany, France, Italy, Switzerland and Japan. Countries of the Continent other than those named, and the United States, India and China take varying quantities which total to a large quantity in the aggregate. Consumption of cotton in Egypt has increased, but it still aggregates only 6% to 7% of the crop. Because of the fact that most of the Egyptian crop passes through Alexandria, that city is the great market for it, and the prices established there are recognized as the measures of world values of the Egyptian staple. At the end of most seasons there is very little cotton left in the interior of Egypt, and consequently the receipts at Alexandria closely approximate the total production of the country from season to season.

Production of cotton in Egypt showed a pronounced upward trend in the decades of the '20s and the '30s. In the five seasons from 1934–35 to 1938–39 the average crop was approximately 1,200,000 actual bales of about 750lb. each, compared with 990,000 in the first previous quinquennium, 1,020,000 in the second previous, and 760,000 in the third previous. This expansion of output was due primarily to increases in average yield per acre for the acreage devoted to cotton in Egypt showed little net change in these 20 years.

The Brazilian Crop.—Cotton is grown in two fairly well defined sections of Brazil, commonly referred to as north Brazil and south Brazil. North Brazil plants chiefly in April to June and harvests chiefly in August to January. South Brazil plants chiefly in September to November and harvests chiefly in March to June. At the beginning of the decade of the '30s, south Brazil grew only a very small portion of the total output of the country, but it subsequently increased its production very rapidly. The chief stimulus to this expansion was the fact that world prices of cotton were prevented by United States Government cotton programs from declining to a parity with prices of other agricultural products, while prices of coffee, the chief crop of south Brazil, fell to very low levels notwithstanding the efforts of the Brazilian Government to sustain market values of that commodity. At the end of the decade, south Brazil was producing roughly two-thirds of the greatly enlarged cotton crop of the entire country. North Brazil also increased its output of the staple during this decade, but by very much less than south Brazil. Brazil as a whole ap-

Note: Totals for all cottons do not equal sums of detail figures for American, Indian, Egyptian, and other cottons, because of differences in bale weights.

proximately quadrupled its output during the decade, raising its annual crop from about 500,000 to about 2,000,000 equivalent 478lb. bales. The State of Sao Paulo took the leadership in the growing of the staple, and at the end of the decade it produced more than all other States combined.

Cotton grown in north Brazil is of three varieties, called Mattas, Sertao and Serido. Mattas cotton averages about $\frac{29}{32}$in., Sertao about 1in., and Serido about $1\frac{3}{16}$ inches. Cotton grown in south Brazil averages about one full inch. Since Serido cotton constitutes only about 5%, or less, of the total production of Brazil, fully 95% of the total output of that country consists of cotton averaging around $\frac{29}{32}$ in. to one full inch, and such cotton is directly competitive with the bulk of the cotton grown in the United States. Brazil consumes only about 35% to 40% of the cotton that it produces, and so exports 60% to 65%. In recent seasons (late '30s) its exports have gone chiefly to Great Britain, Germany, Japan and China, but numerous other countries have taken smaller quantities. Since south Brazil, from which section the greater portion of the exports move, harvests its crop chiefly in the second quarter of the calendar year, Brazilian cotton enters the world market largely at the time of the year when American cotton is not being offered in volume.

Chinese and Russian Crops.—The cotton crops of China and the U.S.S.R. are normally much larger than those of Egypt and Brazil, but they are here treated more briefly because they enter (1940) world commerce to a far less degree. China has never exported more than a few hundred thousand equivalent 478-lb. bales in any one season, and the U.S.S.R. has in most seasons exported only negligible quantities. Furthermore, Chinese growers use a large portion of the cotton that they raise for hand-spinning, padding clothing, and other household uses. Consequently most Russian cotton and a large portion of Chinese cotton do not compete directly with other growths. However, there is a large degree of actual or potential indirect competition between these cottons and other cottons. This is shown by the facts that the quantity of cotton that China imports is largely determined by the quantity of cotton that it produces, and the U.S.S.R. imported substantial quantities of cotton in years before it increased its output to a level equal to its domestic requirements.

Since both China and the U.S.S.R. are northern hemisphere countries, they both plant cotton in the early months of the calendar year and harvest it in the late months. Chinese growers plant in April and May and harvest in August to October. Russian growers plant in April to June and harvest in August to December. There are two principal cotton growing areas in China, a northern area which lies chiefly in the basin of the Yellow river and a southern which lies in the basin of the Yangtze river. The bulk of the cotton grown in China is shorter than $\frac{7}{8}$in., some being only $\frac{1}{2}$in. or less. Some of it is of a harsh, rough character, this being used largely in mixture with wool in the manufacture of blankets. The cotton growing regions of the U.S.S.R. are Kazakstan in Central Asia, Transcaucasia, and the southern portion of European Russia. It is understood that most Russian cotton is in the length range from about $\frac{7}{8}$in. to $1\frac{1}{32}$ inches.

During the latter half of the decade of the '30s the total growth of cotton in China reached an estimated peak of about 3,900,000 equivalent 478-lb. bales, but the commercial crop of the country reached only about 3,000,000 bales. Subsequently, during the Sino-Japanese war, production declined to less than half of the peak output. In the same period Russian crops ranged from about 3,400,000 to about 3,800,000 equivalent 478-lb. bales.

Other Crops.—There remain to be considered the nine crops which are usually in the range from 150,000 to 400,000 equivalent 478-lb. bales and the approximately 45 crops which are usually less than 100,000 equivalent 478-lb. bales. These crops are of different types, and they come to market at different times of the year.

The Peruvian crop is of special interest for several reasons. Peru grows practically all of its cotton in mountain river valleys, by irrigation. The cotton plants make satisfactory yields for two or three years. Yields per acre are exceptionally high, running in line with those obtained in Egypt. Because of differences in the incidence of the seasons from region to region, planting and harvesting are spread out over most of the year. Cotton is raised chiefly on large plantations, many of them being 2,000 to 4,000ac., and a few as large as 7,500 to 10,000 acres. About 85% of the cotton grown in Peru is of the variety known as Tanguis, which averages about $1\frac{3}{16}$ inches. About 7% is Pima, which averages about $1\frac{1}{2}$ inch. The small remaining portion consists partly of American type long staple cotton and partly of moderately rough native varieties, these cottons being mostly in the range from $1\frac{1}{8}$in. to $1\frac{3}{16}$ inches. Peruvian cotton is noted for its whiteness, and is usually of high grade. Because of its length and other desirable qualities it is one of the best cottons grown. Peru exports approximately 90% of its crop.

Argentina, being a southern hemisphere country, plants cotton in September to November and harvests in March to July. Due to variations in weather conditions, yields per acre and, hence, total production in Argentina are subject to wide fluctuations. Most Argentine cotton is of about one full inch staple. Argentina consumes roughly half of what it produces in good years, and exports the balance. Mexico, being situated immediately south of the United States, plants and harvests its crop at about the same times as the southernmost portion of the United States. Its planting period is from February to April and its harvesting period from August to November. Most Mexican cotton is in the length range from $\frac{7}{8}$in. to $1\frac{1}{32}$ inches. Mexican mills consume the bulk of the crop, but in some seasons about one-third of it is exported. The Anglo-Egyptian Sudan plants in the months from May to September and harvests from November to May. The bulk of the cotton grown in the Sudan is of around $1\frac{5}{8}$in. staple, and hence it ranks among the long staple cottons of the world. The Sudan exports all cotton that it produces. Uganda plants from April to September and harvests from December to May. The greater portion of the crop of Uganda is of medium length, and the balance is long staple. Uganda exports all of its cotton.

Since Turkey, Iran and Chosen are in the northern hemisphere they plant in the months from February to May and harvest in the months from July to November. In the Belgian Congo, the northern crop is planted in May and June and harvested in December to March, but the southern crop is planted in November and December and harvested from June to September. These countries grow medium or short staple cottons. Turkey, Iran and Chosen consume a large portion of their output, but the Belgian Congo exports all that it produces.

The approximately 45 countries of the world which produce less than 100,000 equivalent 478-lb. bales each are scattered over the five continents and adjoining islands. Small cotton growing areas in North America and adjacent islands include Salvador, Nicaragua, Haiti and the British West Indies. In South America there are Colombia, Venezuela, Ecuador and Paraguay. In Europe there are Spain, Italy, Greece, Bulgaria, Yugoslavia and Rumania. In Asia cotton is grown in relatively small volume in Syria, Iraq, Cyprus, Burma, Siam, French Indo-China, Dutch East Indies and Manchoukuo. In Africa it is grown in French West Africa, Togoland, Nigeria, French Equatorial Africa, Kenya, Tanganyika, Angola, Nyasaland, Portuguese East Africa and the Union of South Africa. Australia also contributes a small crop. Some of these smaller producing countries consume all that they raise, but most of them export most or all of their output.

Supply and Distribution.—The most fundamental facts as to the statistical situation in any growth of cotton in any given season are: (*a*) The total stock of that cotton in all hands and in all positions in the world at the beginning of the season, this being termed the "carry-over"; (*b*) The new crop produced in the season; (*c*) The total supply for the season, this consisting of the carry-over at the beginning of the season plus the new crop; (*d*) The world consumption of the cotton in question during the season; and (*e*) The total quantity of that cotton left in all hands and in all positions in the world at the end of the season, this obviously equalling the total supply for the season less the consumption during the season and constituting the carry-over into the next season.

Such calculations are commonly made for American cotton, Indian cotton, Egyptian cotton, other cottons in the aggregate, and all cottons combined. The 12 months from August 1 in one year to July 31 in the next constitute the period which is commonly accepted as the cotton season for statistics for American cotton, and it is used also for statistics for all cottons in the aggregate. For statistics for various non-American cottons, other 12-month periods are commonly taken as constituting the cotton season, but when the statistics for such other cottons are combined with those for American cotton to arrive at statistics for all cottons in the aggregate the statistics for the other cottons are adjusted to the August 1–July 31 season basis.

All who are interested in cotton watch closely the changes in the statistical situation of American and non-American cottons, with respect to the basic facts just stated, because they have found by experience that there is a relationship between the changes in these facts and the changes in the price level of the staple. The changes in prices of cotton cannot be correlated with the changes in the statistical situation of the staple with mathematical precision, for various reasons, but, broadly speaking, and subject to the absence of other factors of an offsetting character, the price of cotton rises when the supply for a season is found to be small relative to the consumption, and it declines when the reverse is the case. One offsetting factor which may prevent a correlation between the price and the supply-consumption ratio is a change in the buying power of money as reflected in a change in the commodity price level. Another factor—one which was operative during much of the decade of the '30s—may be the diversion of American cotton from commercial channels to United States Government loan stocks, or the releasing of such cotton from those stocks. The diversion and the release of such cotton have temporary effects on price levels of the staple, but they do not change the average, long-term price level.

The cotton trade follows not only the basic statistics for carryover, new production, total supply and consumption, but also numerous other series of statistics which point the way to changes in the fundamental facts of supply and distribution. To some degree—although less than in former times—traders watch weekly statistics on what is termed the "movement into sight" of American cotton. The figures for movement into sight constitute a rough measure of the marketing of cotton by the growers and other first hands. Weekly figures on forwardings of American cotton to domestic and foreign mills and on exports by the United States command widespread interest, as rough measures of the takings of the American staple by domestic and foreign spinners and foreign importers. Statistical records available at weekly intervals for non-American cottons are not so comprehensive as those for the American staple, but they throw light on the trends of production, consumption and stocks.

At monthly intervals during the summer and fall the U.S. Department of Agriculture issues certain cotton statistical reports which command widespread interest not only throughout the cotton trade of the world but also throughout general commercial channels in the United States and abroad. These reports contain estimates of the acreage and forecasts of the production of cotton in the United States. Reports containing estimates of acreage are issued on or about the eighth of July, September and December. Reports containing forecasts of production are issued on or about the eighth of each month from August to December inclusive. These reports often cause changes in world prices of cotton, because of the predominating importance of the American crop in world production of cotton, the substantial changes often occurring in the United States cotton acreage from year to year and in the American cotton crop prospect from month to month during the growing season, and the high degree of confidence of the world cotton trade in the soundness and integrity of the crop reporting work of the U.S. Department of Agriculture. Periodical estimates for cotton crops of other countries are issued by the various governments, but they are not the subject of such general interest as those issued by the United States Government for the American crop, largely because of the smaller size of the crops of other countries but in some cases because of the unreliability of their estimates.

The world cotton trade is undoubtedly better supplied with dependable statistics than many other important commodity trades. The New York Cotton Exchange, on which there is conducted the leading futures market for American cotton, compiles and publishes comprehensive statistical reports on all the basic phases of supply and distribution of American and foreign cottons. It is the only organization which does such a comprehensive statistical

work for all growths of cotton in the world, and its statistics are accepted and republished by the United States Government. Statistics on these subjects in the accompanying tables are from that source. The International Federation of Master Cotton Spinners' and Manufacturers' Associations, with headquarters at Manchester, England, has for many years done a highly important work in the collection of statistics on world consumption and world mill stocks of American and foreign cottons, but the Federation's reports do not cover production nor stocks outside of mills. The New Orleans Cotton Exchange has for years issued statistical reports for American cotton. The Department of Agriculture of the United States, as already indicated, issues vitally important reports during the domestic crop growing season on the acreage and production of cotton in that country, and the Department of Commerce of the United States issues monthly reports on domestic consumption and domestic mill and warehouse stocks. Various cotton trade organizations abroad, notably the cotton exchanges at Liverpool, England; Alexandria, Egypt and Bombay, India, and many foreign governments issue important reports relating to the cotton trade in the countries in which they are located.

C. MARKETING, EXCHANGES, FUTURES, ETC.

There are literally millions of growers of cotton in the various cotton producing countries of the world—over 2,000,000 in the United States alone. There are several thousand mills which consume the staple. Many mills—notably those in the south-eastern section of the United States and many in India and China—are located in cotton growing areas and manufacture such types of goods that they can utilize locally produced cotton. Others are either located thousands of miles from cotton fields or they manufacture such types of goods that they must look to cotton growing areas thousands of miles away for their raw material. For economical transportation, the bulky, loosely packed bales in which the cotton is put up initially in many producing areas have to be recompressed into smaller, tightly packed bales before they are shipped great distances. Most cotton growers sell in lots ranging from one, two, or three bales up to 10 to 15 bales. Spinners usually buy in quantities ranging from 100 bales up to several thousand bales. Growers generally sell their cotton in lots consisting of bales of various qualities. Spinners generally buy cotton only in lots in which the bales are of uniform quality.

Since cotton is an annually produced agricultural product, the crop from any producing area is harvested within a few months each year, but the consumption of it is spread over the full year. The result is that millions of bales of cotton have to be stored, insured and financed for long periods of time, ranging from a few months up to a year or more. Growers receive payment for their cotton in the currencies of the countries in which they produce the cotton, but, in the case of that great quantity of cotton which annually moves in international trade, the spinners pay for the cotton which they buy in the currencies of the countries in which they operate their mills. The exchange values of the various currencies are subject to great fluctuations. Prices of cotton are subject to large variations, sometimes rising or falling 10% to 15% within one or two days. In consequence, holders of cotton have to assume large risks of loss on their holdings, unless they operate in such a manner that they avoid or minimize those risks.

It will be readily seen from the foregoing that the handling of the world cotton crops is a great undertaking, calling for participation by many different kinds of operators and many different interests, performing many types of services, and providing many different forms of facilities. Thousands of compresses are required to pack the bales, and thousands of warehouses are utilized for the storage of them. Railroads, trucks, river boats and ocean steamships are called upon to move this great product. Countless banks participate in financing it, and countless insurance companies join in the insurance of it against loss by fire and other hazards. There is of necessity an army of dealers in cotton, including local operators in small country markets, domestic shippers who buy from growers or other first hands and sell to spinners in the producing countries, exporters in producing countries, importers in consuming countries, great international firms which do a world-wide business, brokers, and buying and selling agents who operate on a commission basis. There are a number of highly organized exchanges on which cotton is sold and bought for future delivery, primarily for the transference of the price risks which are inherent in merchandising cotton, rather than for disposing of or acquiring the staple.

The cotton markets of the world are of two classes, "spot markets" and "futures markets." These two kinds of markets are very different in character and purpose.

Spot markets are centres in which cotton is sold and bought primarily for the purpose of moving it along the road from producers to consumers. The spot markets consist of country markets and central markets in producing countries and importing and mill markets in consuming countries. In those markets growers sell to dispose of the cotton that they produce, dealers buy and sell as intermediate distributors of cotton, and spinners buy to acquire cotton for consumption. Purchase and sale contracts made in spot markets are normally fulfilled by deliveries of cotton against them. The contracts made include commitments for immediate delivery and commitments for forward delivery, and they contain whatever specifications the buyers and sellers may agree upon.

Futures markets are centres in which cotton is sold and bought primarily for the purpose of transferring price risks, rather than for merchandising the staple. Handlers of cotton—including growers' co-operative associations and the larger individual growers, domestic shippers, exporters, importers and spinners—trade in the futures markets to free themselves of price risks on cotton bought or sold in spot markets, and speculative traders, within or outside of the industry, buy and sell in the futures markets to assume price risks. Producers do not as a rule look to the futures markets for outlets for their crops, and spinners do not as a rule look to those markets for cotton for consumption. All of the contracts made on the futures markets call for future deliveries, and hence those contracts are called "futures." All futures contracts for any given growth or variety of any growth carry identical terms except as to the price and month of delivery. Hence contracts of sale may be offset by contracts of purchase, and vice versa, and most futures contracts are liquidated in that manner, rather than by actual deliveries.

Among the leading spot markets of the world are Dallas, Tex., Houston, Tex., Memphis, Tenn. and New Orleans, La., for American cotton in the United States; Alexandria, for Egyptian cotton in Egypt; Bombay and Karachi, for Indian cotton in India; Shanghai, for Chinese and other cottons in China; Osaka, for various growths of cotton in Japan; Sao Paulo, for Brazilian cotton in Brazil; Liverpool, England, Le Havre, France, Bremen, Germany, and Milan, Italy, for various growths of cotton in Europe. There are thousands of other spot markets, including the large number of small country markets in the producing countries and the many importing and mill markets in consuming countries.

The principal futures markets of the world are on the New York Cotton Exchange, the New Orleans Cotton Exchange, the Liverpool Cotton Exchange, the Bombay Cotton Exchange and the Alexandria Cotton Exchange. On the exchanges at New York and New Orleans the futures trading is in American cotton only. On the Liverpool exchange there is futures trading in American, Egyptian, and Empire and miscellaneous cottons. On the Alexandria exchange the trading is in Egyptian cotton only, and on the Bombay exchange the trading is in Indian cotton only. There are a number of smaller cotton futures markets, including one at Chicago for American cotton, at Sao Paulo for Brazilian cotton, at Buenos Aires for Argentine cotton, at Le Havre for American cotton, and at Bremen for American cotton. The New York Cotton Exchange is recognized as the leading cotton futures market of the world, since it is the chief futures market for American cotton, which is the principal growth of the staple.

The classification of cotton is a highly important phase of cotton merchandising, for differences in staple length, amount of foreign matter, colour, and other physical properties greatly affect its spinning utility. The poorest quality of cotton of any given variety may be worth less than half as much as the best quality of that variety. Consequently, every bale of cotton has to be put into its own quality category.

In the cotton trade the term "grade" means a given classification of cotton from the standpoint of foreign matter and colour; it does not cover length of staple, strength, or other characteristics. For American cotton there are nine grade classifications for white cotton, these being, in order from highest to lowest, middling fair, strict good middling, good middling, strict middling, middling, strict low middling, low middling, strict good ordinary, and good ordinary. American cotton of a colour other than white, such as extra white, blue stained, gray, spotted, yellow tinged, light yellow stained or yellow stained, is graded into classifications carrying the same names, but the range of grade classifications for cotton of colours off white is not so broad as that for white cotton. Non-American growths of cotton are similarly classified for grade, but the grade classifications of other growths and the names of such classifications are different from those for American cotton.

The subject of the merchandising of cotton in general covers such a large and varied field that the remainder of this discussion must be limited to American cotton. However, the merchandising system, methods, and practices for American cotton are largely representative of those for other growths, and, hence, the following outline indicates in a general way how the cotton trade of the world as a whole is conducted.

THE MARKETING OF THE AMERICAN COTTON CROP

Trading in Country Markets.—In its movement from farms to mills, the bulk of the American cotton crop passes first through country markets. To those markets the great majority of the growers take their cotton, and there they sell it to various classes of buyers.

Most growers over the larger part of the belt have their cotton ginned before they sell it, and hence they offer the lint cotton and the cotton-seed separately in the country markets. Many in north-western Texas and in Oklahoma, however, sell their cotton unginned, and, hence, they sell the lint and the seed together. Growers who pursue the common practice of having their cotton ginned before they sell it generally put their bales in warehouses or in cotton yards in the country markets, have the bales sampled there, and then offer the cotton in those markets by submitting samples to the prospective buyers. A substantial percentage of the growers, however, still follow the old-time practice of taking their bales into the market places in the country towns on their wagons, and offer them to street buyers who draw samples from the bales as the bales lie on the wagons. There are various classes of buyers in the country markets. Generally over the belt, the country market buyers include local men who either buy and sell cotton as a side-line to other business or who make a specialty of it, country storekeepers who buy cotton from farmer customers in order to collect from them money which the latter owe for goods bought by them on credit, resident or travelling buyers of large merchants in central markets, and receiving agents of co-operative associations. In the eastern belt markets, there are also resident or travelling buyers for mills, and in western belt markets there are also ginner buyers.

Growers generally desire to sell their cotton, or at least a good part of it, when they harvest it or very soon afterward. In years when it appears that prices will advance, some growers hold part or all of their crops for expected higher prices, but such growers always constitute a minority. A large percentage of the growers have no choice with reference to when they will sell, for they are obliged to sell at harvest time to pay off loans which mature at that time. They are forced to negotiate during the growing season to meet living expenses and production costs. The growers obtain most of such credit from Government sources, the country banks, and the country merchants. For the most part, the growers sell their cotton in nearby country markets, usually not over a few miles away. They demand and obtain immediate payment for their cotton on selling it.

While there are numerous classes of buyers in the country markets, operating in different ways, it may be broadly said that perhaps three-fourths of that portion of the crop which passes through the country markets is taken by local dealers. The term "local dealers" is here used to mean operators who buy cotton from the growers in the country markets and sell the cotton locally. These operators sell on the spot to the local buyers of the larger merchants who are in the central markets or to local mills, or they sell by long-distance communication to a limited number of distant merchants, or, possibly even to a few distant spinners with whom they have special contacts. The local dealers in the country markets do not generally hold cotton very long. Generally they sell toward the end of each day all cotton bought earlier in the day. However, when the prevailing market sentiment is bullish, the dealers may hold considerable cotton, for varying lengths of time.

Buyers in country markets buy cotton in three ways, known respectively as individual bale buying, hog-round buying, and basis middling buying. In individual bale buying, the buyer and the seller agree on a price per pound for each individual bale, the buyer usually ascertaining the quality of each bale by examining a sample from it and setting his price accordingly. In hog-round buying, the buyer agrees with the seller on only one price per pound, this being the average price applying to the entire lot; the buyer ordinarily arrives at this average price by inspecting samples from the bales offered, to determine the quality of each bale, and by computing for his own guidance the price that he will pay for each bale. In basis middling buying, the buyer agrees with the seller on a basic price for middling ⅞in. cotton, premiums for grades better than middling and for staples longer than ⅞in., and discounts for poorer grades and shorter staples. When a buyer purchases cotton on basis middling terms, he does not class the cotton before he buys it, but arranges with the seller for the classing of it later, and he agrees with the seller that the ultimate settlement is to be determined on the basis of such later classing.

Shippers and Their Operations.—The bulk of the American crop—perhaps 80% of it—normally passes from the growers and the first hands in the country markets to a class of operators known as shippers. That portion of the crop which is not handled by the shippers is bought from the growers or other first hands by mills in the cotton growing areas or is handled by the cotton growers' co-operative associations. Most of the shippers have their head offices in the larger interior markets or in the port markets. They are generally organized as unincorporated, partnership firms, and there are roughly 300 such firms.

The shippers are the domestic and international merchants of the United States cotton trade, and they render the broad merchandising services required for the distribution of American cotton to domestic and foreign mills. They buy cotton in lots of mixed qualities from growers and country dealers, classify the cotton in those mixed lots and put it up in lots of uniform qualities, and sell the cotton in even-running lots to domestic spinners, foreign importers, and foreign spinners. They compress the relatively large, loosely packed country bales into smaller, tightly packed bales for economical transportation, and have the cotton moved over land and over seas to points specified by those to whom they sell. They solicit sales of American cotton in foreign markets in competition with those who offer foreign growths. They carry millions of bales of American cotton—storing, financing, and insuring it—from the time when growers and other first hands sell it to the time when domestic and foreign spinners and foreign importers will buy it. They make forward sales to spinners and foreign importers, often for periodical deliveries running a year or more ahead and from crops not grown when the sales are made. As will be seen later, the shippers utilize the futures markets extensively to protect themselves from losses arising from adverse price changes on unsold cotton which they carry in stock and on uncovered forward commitments.

Shipping firms differ greatly in scope of operations, form of organization, and volume of business. The very large firms buy all over the belt and sell in all parts of the world where American cotton is used. Moderate-sized firms generally buy in only certain sections of the belt—perhaps three or four States—and while they may endeavour to sell in all or most of the principal cotton consuming countries they do the bulk of their business in certain sections of the world spinning industry, such as the United States, Great Britain, certain countries of the Continent, or the Orient. Small firms usually buy in only very limited territories, some of them only within a radius of 100 to 200mi., and they sell only to domestic mills or to buyers in only one or two foreign markets. The annual volume of business per shipping firm ranges all the way from perhaps 5,000 bales or less to 1,000,000 to 2,000,000 bales or more. One cotton shipping firm has been known to turn over approximately 3,000,000 bales in one season, but that was in the days before the United States reduced its output.

Selling in Domestic Mill Markets and Foreign Markets.—The shippers sell cotton to domestic mills chiefly through independent brokers or through their own selling agencies in the mill markets. The brokers sell cotton for the shippers on a commission basis. Some of them also buy some cotton from growers and local dealers in nearby towns and sell such cotton to the mills on their own account. The selling agencies for some of the large shippers operate more or less as independent shipping organizations, buying cotton in country markets in the territories in which they operate and selling such cotton to the mills. In New England mill markets much cotton is handled by local firms which operate as quick-turnover dealers. Such dealers buy cotton from the shippers and sell it to the mills on their own account, but do not carry stocks. In the important domestic mill markets there are selling agencies of the cotton growers' co-operative associations. The manufacturers generally buy cotton at their mill offices.

American cotton is merchandised in foreign markets in several different ways, but these may be summarized briefly. In Liverpool there are three main classes of cotton dealers, namely, c.i.f. agents, importing merchants, or importers, and mill buying brokers. The c.i.f. agents are intermediaries between the exporting shippers in the United States and the buyers in Liverpool, and as such they operate on a commission basis. The importing merchants, except those who have branch offices in the United States, buy American cotton chiefly through the c.i.f. agents, and they sell chiefly to the spinners, operating as principals. The mill buying brokers buy cotton for the spinners, on a commission basis. Some large American shippers have their own affiliated importing organizations in Liverpool. At Le Havre there are c.i.f. agents, importing merchants, local commission merchants, and local brokers. The local commission merchants buy from the importers, chiefly on orders from spinners, for commissions. The local brokers act as intermediaries between the merchants. At Bremen there are c.i.f. agents, local importing merchants, and German importing firms which are affiliated with exporting shippers in the United States. In Milan most American cotton is handled by selling agencies of exporters in the United States. In Osaka a very large portion of the American cotton imported is handled by Japanese firms which have buying agencies in the United States. Most of the rest of it is handled by the selling agencies of large exporting shippers in the United States.

Trading in Futures.—The trading in American cotton in the futures markets—chiefly on the New York Cotton Exchange, the New Orleans Cotton Exchange, and the Liverpool Cotton Exchange—runs parallel with and supplements the trading in the spot markets, as the latter has just been described. The essential function of these futures markets is to provide media through which handlers of American cotton, including shippers in the United States, growers' co-operative associations, foreign importers, and domestic and foreign spinners, may carry stocks of cotton or make commitments for the forward sale of cotton without incurring risks of large losses through adverse price changes. The cotton futures markets are used, also, by handlers of cotton yarns and cotton cloths to obtain similar protection against losses from adverse price changes on stocks and forward sales of such cotton manufactures. By reducing the risks of large losses from price changes, the futures markets make it possible for those who handle cotton and cotton manufactures to operate more economically, as well as more safely, and thus they reduce the margins between the prices received by the growers for their raw cotton and the prices paid by ultimate consumers for cotton goods.

The trading method by which handlers of cotton and cotton manufactures obtain protection from losses arising from adverse price changes through operations in the futures market—a method used in many of the great commodity trades of the world—is called "hedging." The fundamental principle of hedging, in dealings in any commodity, is the establishment of an even or balanced market position by a sale for future delivery on a futures exchange against an unsold holding of the commodity or by a purchase for future delivery on a futures exchange against an uncovered forward sale of the commodity in merchandising channels. Hedging operations in any commodity trade are based on the fact that there is a substantial degree of parallelism between price movements in the futures markets and price movements in the spot markets. There is necessarily this high degree of parallelism between the price movements in the two classes of markets since any great divergence between them would lead traders to buy in the markets of one class and sell in the markets of the other class, and make or call for deliveries against such transactions, and such trading would bring the prices in the two classes of markets back to normal relationship with each other.

If a cotton shipper carries a stock of cotton without having on his books a forward sale of a quantity equal to that stock, he is obviously not in a balanced market position. He runs the risk of incurring a loss on the stock by having to sell it later at a lower price in the event of a decline of market values for cotton. In the absence of an opportunity to sell the cotton advantageously to a spinner or other buyer in a spot market, the shipper achieves a balanced market position by making a sale of an equivalent quantity of cotton for future delivery in a futures market. When he does so, he, in the parlance of the cotton trade, hedges his holding. On the other hand, if a shipper makes a forward sale of cotton to a spinner without having in hand a quantity of cotton equal to the quantity that he sells, he is obviously not in a balanced market position. He runs the risk of incurring loss by having to pay a higher price for the cotton, when he buys it, in consequence of an advance in cotton values, than the spinner agreed to pay him. If, in the absence of an opportunity to buy the cotton advantageously in a spot market, the shipper buys an equivalent quantity in a futures market, for future delivery to himself, it is said that he "hedges" his sale to the spinner.

A shipper who hedges a holding of cotton by making an equivalent sale for future delivery in a futures market does not as a rule deliver his holding on the sale contract in that market. He subsequently sells his holding to a spinner or other buyer in a spot market, and on doing so he buys in the futures market the same quantity as he previously sold there. Since his futures market commitments balance, he neither makes nor receives delivery in the futures market. A shipper who hedges an uncovered forward sale of cotton to a spinner by buying an equivalent quantity of cotton for future delivery to himself in a futures market does not as a rule take delivery on his purchase contract in the futures market. He subsequently buys in a spot market the cotton that he has to deliver to the spinner, and on doing so he sells in the futures market the same quantity as he previously bought there. Since his futures market commitments balance, he neither receives nor makes delivery in the futures market.

In both cases, the transactions in the futures market protect the shipper from large losses arising from broad price movements which are adverse to him with respect to his transactions in the spot markets, for broad price movements which are adverse to the shipper with respect to his transactions in the spot markets are favourable to him with respect to his transactions in the futures market, and hence he derives from his transactions in the futures market profits which approximately offset his losses from his transactions in the spot markets. If the broad price movements are favourable to the shipper with respect to his transactions in the spot market, they are adverse to him with respect to his transactions in the futures market, and under those circumstances the shipper incurs a loss in the futures market which largely offsets his profit in the spot markets, but the shipper who hedges gives up opportunities for large profits in order to avoid the risks of large losses. Broadly speaking, and on an average, the losses incurred by the shipper in one type of market do not fully offset the profits that the shipper realizes in the other type of market. In each transaction the shipper endeavours so to operate that his profits from one market will be greater than his losses from the other market, and if he succeeds in doing this he realizes a net profit. He does this, so far as he can, by buying cotton in the country markets a little lower relative to the price at which he sells in the futures market than he sells cotton to the spinners relative to the price at which he buys in the futures market.

An illustration of a hedging operation by a shipper will make the matter clearer. It may be assumed that in October of a given year a shipper buys a certain lot of cotton in a country market for 10.00 cents a pound. Since, it is assumed, he cannot find a spinner buyer for that cotton immediately, he sells an equal quantity of cotton in a futures market—such as the New York Cotton Exchange—for delivery in the following March, the price in his futures sale contract being 10.50 cents. Thus the shipper buys the cotton for 0.50 cent a pound less than the price that he realizes for the March delivery which he sells in the futures market. The following January, it may be assumed, the shipper finds a spinner who will buy the cotton that he is carrying, but at that time the market price for the cotton is only 8.25 cents. The market price for March deliveries in the futures market, it may be assumed, is 8.00 cents. The shipper sells the cotton to the spinner for 8.25 cents a pound, and on doing so he buys the same quantity of cotton in the futures market for 8.00 cents a pound. Thus the shipper sells the cotton for 0.25 cent a pound more than the price that he pays for the March delivery in the futures market.

The shipper lost 1.75 cents a pound, before costs, on the cotton transactions in the spot markets, since he bought the cotton in the country market for 10.00 cents and he sold it to the spinner for 8.25 cents. If it be assumed that his costs for compressing, transporting, storing, insuring, financing, and handling the cotton totaled 0.60 cent a pound, the shipper lost a total of 2.35 cents a pound on the cotton. However, the shipper realized a profit of 2.50 cents a pound on the transactions in the futures market, since he sold the March delivery for 10.50 cents and bought it for 8.00 cents. Hence, he realized a net profit of 0.15 cent a pound. It is to be understood that, in this case, as usually, the shipper neither made nor received delivery of cotton in the futures market, since his initial sale of cotton for March delivery was subsequently offset by his purchase of cotton for March delivery.

Spinners use the cotton futures markets extensively for hedging their holdings of cotton, yarn and cloth, and their forward sales of yarn and cloth, buying and selling in those markets to protect themselves from losses on such holdings and such commitments. However, the spinners utilize the futures markets to a much greater extent in an indirect manner, namely, by buying their cotton "on call," rather than "at fixed price." When a spinner buys cotton from a shipper on call, the absolute price is not agreed upon at the time of such purchase. Agreement is reached only on the point that the price is to be a certain premium on or a certain discount off the price of a given future delivery in a given futures market, and the shipper gives the spinner the right to establish the absolute price by applying that premium or that discount to the price of that future delivery prevailing at any time within a specified period. For example, a spinner may buy a certain quality of cotton from a shipper for a premium of 0.50 cent a pound on the March delivery on the New York Cotton Exchange, and if the spinner applies that premium when the March delivery is selling for 9.50 cents the absolute price of the cotton is fixed at 10.00 cents. The bulk of the American crop is merchandised to spinners by such pricing method. Shippers can sell cotton in this way because they hedge their operations in the futures markets, and so they protect themselves from large losses arising from price declines.

In the merchandising of cotton—non-American as well as American—the futures markets are fully as important as the spot markets. The pricing of cotton is, in fact, largely centred in or based on the futures markets, and buyers and sellers of cotton and cotton goods throughout the world accept the prices established on those markets as measures of world values of the staple. This is so because the futures markets are free, open markets on which converge all of the forces of supply and demand for cotton from all quarters of the globe. Trading by hedgers on these markets is necessarily supplemented by trading by speculative operators, for speculators are needed to assume the price risks from which the hedgers free themselves by their hedging. The speculative traders endeavour to forejudge future changes in supply and demand conditions and operate accordingly, and to the extent that they correctly anticipate future conditions their operations tend to smooth out the cotton price movement. By inter-market straddling, the speculators also help to keep the various cotton markets of the world in sound relationship to one another. In brief, the cotton futures markets utilize speculation—inherent in the cotton trade under any merchandising system—in such a manner that it serves the interests of the trade, thereby making it possible for cotton to be merchandised more economically and more safely and making cotton prices more continuously and more fully responsive to world supply and demand conditions.

III. COTTON SPINNING AND MANUFACTURE

A. INVENTION AND DEVELOPMENT

During thousands of years the spinning of yarn and the weaving of cloth persisted as a manual operation. At the outset primitive appliances were used which through the centuries were developed and refined until highly productive and efficient devices were evolved. Their proper employment was still dependent on the skill and manipulation of the operator and, therefore, production remained comparatively small. From India and Asia the knowledge of the manipulation of cotton to produce yarn or thread spread throughout Europe. Legend has it that the Indian spinners could produce a yarn of such extreme fineness that when woven into a piece of muslin the fabric could easily be passed through a ring. Although perhaps not so fine as the legendary fabric a piece of muslin brought from India about the year 1786 proved conclusively that the hand workers of that country could produce a yarn and fabric of exquisite fineness. Comparing the yarn with the standards of to-day the counts were 250s. Cotton counts are estimated in the following way: if one hank or skein of cotton yarn weighs 1lb. avoirdupois then the counts of the yarn are 1s. So that where the counts of yarn are 250s it follows that 250 hanks of 840yd. each hank, weigh one pound. Approximately the length of 1lb. of this yarn would be 119mi., which will give an idea of its extreme fineness.

It is certainly true that even if this excellence of manipulation was not passed on from India to Europe the spinners and weavers

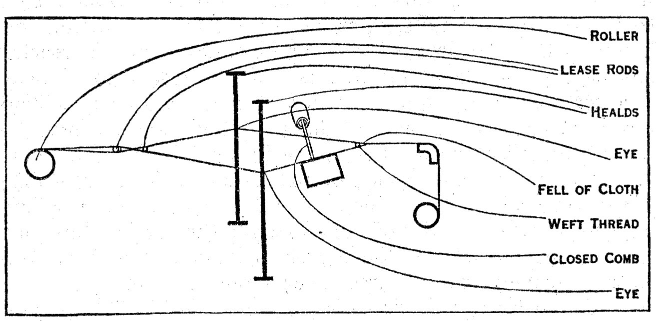

FIG. 4.—DIAGRAM ILLUSTRATING, FROM LEFT TO RIGHT, THE THREE MAIN OPERATIONS: THE DIVISION OF THE WARP YARNS, THE INSERTION OF THE WEFT OR FILLING YARNS, AND THE BEATING-UP OF THE LAST WEFT YARN TO THE "FELL OF CLOTH"

of the mediaeval ages possessed considerable ability as is evidenced by the fabrics that have been preserved from that period. Time occupied in the production of fabric must have been an important factor. Certainly the operatives worked much longer hours and were satisfied with much less return for their labour. It is well to remember that at the outset cotton clothing did not altogether find favour and the extension of its use was slow. Linen and woollen fabrics were more in demand.

Hand Appliances.—Crude forms of spinning wheels were used by the Indian spinners and most certainly the principle of construction was maintained until such wheels were deposed by power-driven mechanism. Similarly there are early examples of hand looms which in character and appearance resemble closely

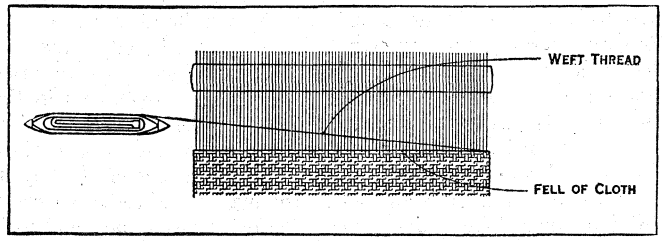

FIG. 5.—DIAGRAM SHOWING THE LENGTHWISE OR WARP YARNS, THE FELL OF CLOTH OR FABRIC PROPER, AND THE SHUTTLE CONTAINING THE WEFT OR FILLING IS SEEN TO THE LEFT

those that were in general use during the early part of the 18th century.

By 1800, however, new types of spinning machines developed in England had superseded the spinning wheel and power looms had begun to replace hand looms. Spinning and weaving mills had been built and put into operation. The textile industry had been born.

To appreciate fully the changes effected by the inventions of textile machinery in the 18th century it is necessary to understand the machinery then existent. The spinning wheel had been improved but still remained a manually operated device. It is recorded that in 1519 Leonardo da Vinci invented a flyer which, consisting of a ∩ shaped device the legs of which extended on either side of the spinning spindle, facilitated the operations of twisting and winding the thread on the said spindle. Also, in 1530 there is a record of Johann Jurgen making a wooden flyer. Later the Brunswick spinning wheel was invented in 1533. From that date onwards it is conceivable that improvement followed advancement in craftsmanship and knowledge until we come to the quite excellent spinning wheels of the early days of the 18th century.

Weaving Operations.—The hand loom had also been refined although in principle it remained the same as that used in the 4th and 5th centuries. Essentially there are three main operations in weaving. They are the division of the warp or lengthwise yarns of the fabric so the weft or filling yarns may be interwoven crosswise between them; the insertion of the weft or filling; and the beating up of the last inserted weft yarn to the "fell of the cloth" or the fabric proper. Simple diagrams illustrate this point (fig. 4). The warp or lengthwise yarns are wound on a beam or roller and are drawn forward, being divided by lease rods before they pass through the eyes of guides known as healds or heddles. Each heald frame supports a number of cords or wires intermediate in the length of which is an eye through which an individual yarn is drawn. By raising one heald frame and lowering the other, division of the warp yarns is secured. What is termed a shed is formed, and through this opening the shuttle containing the weft or filling is passed from side to side. When this has been accomplished, the weft yarn is forced or beaten up to the fell of the cloth by means of a closed comb, or reed suitably supported, and between the teeth of which the individual warp yarns pass. There are other secondary motions in weaving, such as winding up the woven cloth, but of primary motions there are but three.

It will be readily conceived that a simple method of operating the heald is that shown in the line illustration herewith (fig. 6). The upper heald frames are connected together by a strap or cord passing over or attached to a revolvable roller. The lower heald frames are connected to treadles. By depressing one treadle, one heald frame is lowered and the other raised in order to divide the warp yarns. Modifications and additions were made to hand looms in order to secure greater variety of weave than the

2. High-speed winders
3. A high-speed spooler and warper
4. Warpers running at 900yd. per minute from automatic-spooler creels
5. Slashers, on which the warps are run through a sizing compound to give them added strength on the looms
6. Drawing-in. Here the warp threads are drawn into the heddles preparatory to the weaving process

simple plain cloth which was the original product. But up to 1733 the method of passing the shuttle carrying the weft from one side of the warp to the other by hand still obtained. It was in that year that John Kay invented his "flying" shuttle and inaugurated that great inventive epoch which before the end of the century was to revolutionize the whole of the cotton industry of England and eventually of the world.

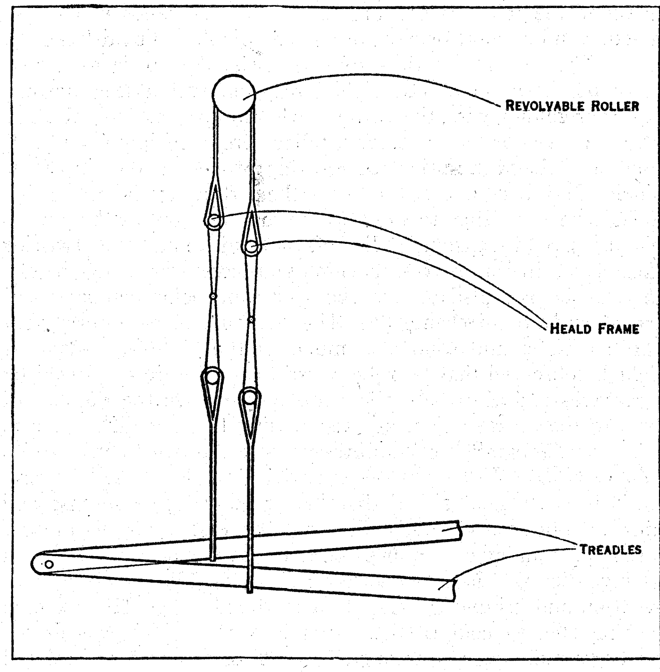

FIG. 6.—DIAGRAM SHOWING METHOD OF OPERATING HEALD OR HEDDLE
The upper heald frames are connected by a cord passing over a roller, and the lower frames connected to treadles. By depressing one treadle, one heald frame is raised and the other lowered, separating the warp yarns for the passage of the shuttle, carrying the weft from one side to the other

Kay's "Fly" Shuttle.—It will be appreciated that the method of operation of "picking" described above was slow. Kay's invention was of great value and will be more readily appreciated from examination of the illustration (fig. 7). To the lathe, now called slay or lay, Kay added two small boxes, one on either side, the lower face of the boxes being in correct alignment with the race board or upper face of the lathe. These boxes were for the reception of the shuttle, and, in each, spindles were fixed. On each spindle a piece of wood or leather was threaded, this being known as a picker. The two pickers were connected together with fly cords which the weaver when at work held in his hand by a small handle, called in the old days a fly pin. It will be readily understood that a shuttle having been placed in one box, by a sharp jerk or flick of the fly pin in a direction across the loom the weaver could project the shuttle through the shed from box to box. The right hand being wholly used for the purpose, the left hand was free to operate the lathe to beat up the weft, thus materially increasing the speed of weaving and naturally increasing production.

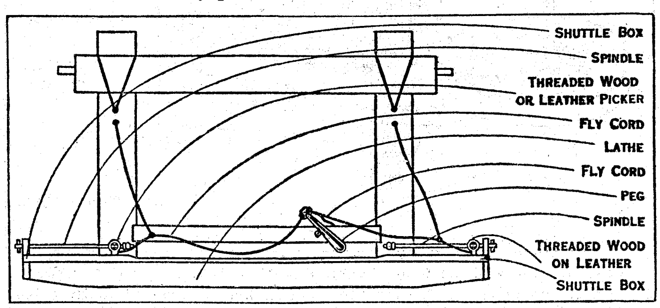

FIG. 7.—KAY'S FLY SHUTTLE SHOWING PARTS, INVENTED IN 1733 BY JOHN KAY

State of the Industry.—It is essential at this point to consider the state of the industry fully to appreciate the effect of Kay's invention and the later developments which were so considerable. There was quite an organized industry in existence in the early part of the 18th century. In Manchester, England, there were factors or merchants who bought largely the fabrics made in certain villages and small townships of Lancashire. In fact, very much as it is to-day, the Manchester of those days was a trading rather than a manufacturing centre. In the villages surrounding Bolton and Rochdale the weavers had their habitation and their looms. They secured yarn from the factors or merchants, who took in return the cloth they wove and paid to them the difference. It is no doubt true that some of the weavers were independent workers and after having bought their own yarn and woven it into cloth could afford to wait for their returns until they sold the product. Merchants had their own weavers working for them, although such weavers were probably not all in one village or town. Figures are available which show what wages were paid to men, women and children about 1750. The return varied, but a man on the average earned about 6*s.* a week. A woman averaged slightly less, about 5*s.* 6*d.* per week, while children earned an average of 2*s.* 6*d.* These were weavers. Among spinners—who were mostly women—the wages earned varied from 2*s.* to 5*s.* per week and girls from six to 12 years of age could earn from 1*s.* to 1*s.* 6*d.* per week. The following figures give the imports of cotton "wool" (as it was then termed) into England during the early years of the 18th century:

Year.	lb.	Year.	lb.
1701.	1,985,868	1720.	1,972,805
1710.	715,008	1730.	1,545,472

An interesting comparison can be made here between the imports of 1730 and 1937 which will demonstrate clearly the enormous development of the industry. In the former year as shown 1,545,472lb. of all sorts of cotton were imported into Great Britain; in 1937 the amount was approximately 16,000,000,000 pounds.

Effect of Kay's Invention.—Kay was a luckless inventor. As has been stated the weaver by using the fly shuttle could increase the production of the loom. Fearing that through this increase they would be thrown out of employment the weavers rose and attacked Kay's house, all his machines and effects being destroyed. He emigrated to France, where he eventually died. Kay's invention did not put the weavers out of work, but it did bring about a shortage in yarn supply. The hand spinning wheels were not able to cope with the demand made upon them, and although in 1761, 1765 and 1767 a number of inventions were introduced which were intended to improve their productive capacity, there was still a shortage of yarn for the weavers. The time was undoubtedly ripe for the production of a mechanical spinning device which would be at least semi-automatic in its action and operation.

Principles of Spinning.—To appreciate fully what was required from the inventor it is essential to understand the principles of cotton spinning and what is involved. From a matted mass of material—individual fibres which are lying in all directions—it is necessary, in order to produce yarn, first to arrange the fibres in parallel order, and secondly to reduce the number of fibres to the cross-section to such a degree that a comparatively fine yarn may be spun. The manual operative spinner drew the fibres out by hand as the revolving spindle twisted them and then allowed the twisted yarn to wind round the spindle.

It is curious that the inventors who attacked the problem of finding improved methods of spinning did not at the outset concern themselves with the earlier or preparation machines; that is, those which open out the matted mass of fibre, clean it and to a certain extent parallelize the fibres. Their efforts were directed to finding a machine that would give them an increased production over the best hand spinning wheels then in existence. There is evidence of considerable inventive activity throughout England from 1740–50 and undoubtedly in many directions men were busily engaged in experimental work. Considerable controversy has since arisen as to who really invented many of the mechanisms which have been embodied in cotton spinning machinery from that time. News would travel slowly owing to the inadequate transport facilities and there can be no doubt that a number of men were working along precisely similar lines.

The Early Inventors.—At this date it matters little whether Wyatt or Lewis Paul invented the method of drafting or attenuating by the use of rollers. The invention is credited to the latter and it was in 1738 that he took out his patent. His invention was of extreme importance because it made the subsequent machines of Hargreaves, Arkwright and Crompton possible. Lewis Paul's own words extracted from his patent specification explain his invention quite clearly:

"The wooll or cotton being thus prepared, one end of the mass, rope, thread or sliver, is put betwixt a pair of rowlers cillinders or cones or some such movements, which being turned round by their motion, draws in the raw mass of wooll or cotton to be spun, in proportion to the velocity given to such rowlers, cillinders or cones; as the prepared mass passes regularly through or betwixt those rowlers, cillinders or cones a succession of other rowlers, cillinders or cones moving proportionably faster than the first, draw the rope, thread or sliver into any degree of fineness which may be required."

Here we have in a few words the whole principle of drafting or attenuating the sliver or untwisted rope of fibres in order to reduce the number of such fibres in the cross-section and thus enable the spinning of a yarn of comparative fineness. The invention was the first real step towards emancipation from the production of yarn by hand.

Hargreaves' Invention.—There is some doubt about the exact date of Hargreaves' invention of the spinning jenny. Baines, in his *History of the Cotton Manufacture,* gives it as his opinion that the machine was invented in 1764. As he points out, Hargreaves, who was only a weaver at Stand Hill near Blackburn, had to work hard for his living and no doubt spent years in perfecting his machine.

It was both perfected and proved when Hargreaves went to Nottingham in 1768, which somewhat discredits Arkwright's statement that the machine was first invented in 1767. It is interesting to note that Hargreaves is said to have received the original idea of his machine from seeing a one-strand hand-spinning machine overturned on the floor, when both the wheel and the spindle continued to revolve. The spindle was thus thrown from a horizontal to a vertical position and the thought seems to have struck him that if a number of spindles were placed upright several strands might be spun at once. The illustration herewith (fig. 8) will assist the following description. A frame was made in one part of

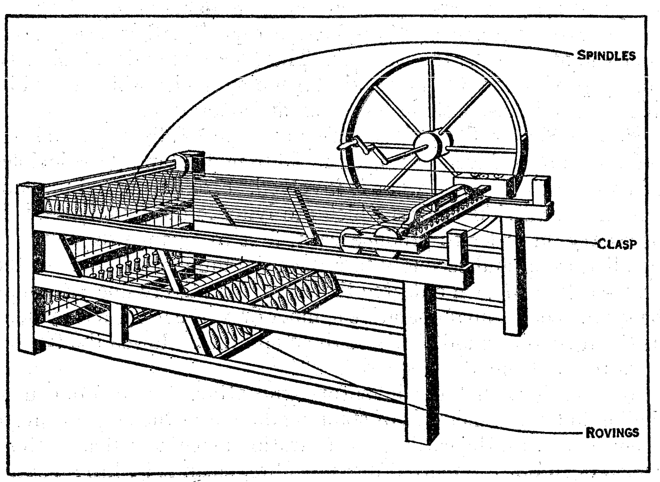

FIG. 8.—HARGREAVES' SPINNING JENNY, INVENTED IN 1764, WHICH WAS THE FIRST ATTEMPT TO SPIN SEVERAL STRANDS OF YARN AT ONCE, AND CONTAINING ALL THE ELEMENTS, EXCEPT ROLLERS, OF THE MODERN SPINNING MULE, BUT OPERATED BY HAND

which were placed rovings in a row, and in another part a row of spindles. The rovings, when extended to the spindles, passed between two horizontal bars of wood forming a clasp which opened and shut in a like manner to a parallel ruler. When pressed together the clasp or clamp held the strands fast. A certain portion of roving being extended from the spindles to the wooden clasp, the latter was closed and was then drawn along the horizontal frame to a considerable distance from the spindles, by which the strands were lengthened out and reduced, as Baines says, "to the proper tensity."

The spinner's left hand was occupied in this work, while his right hand turned a wheel which, by a band, rotated a roller. Passing round the roller were a number of endless bands which also passed round a whorl or wharve on the spindles, thus driving the latter. The roving was thus spun or twisted into yarn and by return of the clasp to its original position and letting down a presser or guiding wire, the yarn was wound upon the spindle. The presser, or, as it is termed to-day, faller wire, is of importance. It maintained the yarn during the twisting process at the tip of the spindle. It will be appreciated that the latter, revolving rapidly, would have a tendency to wind up the material, but as the yarn is held at the tip, it constantly slips off the said tip and thus twisting takes place. In Hargreaves' machine you have practically the elements of the present-day mule, the operations being manually performed and not mechanically. The machine is an intermittent drafter, twister and winder-on much as the mule is to-day. It might be observed that no rollers for drafting were employed by Hargreaves and also that rollers not only reduce the number of fibres to the cross-section, but also, owing to their differences in rate of speed, parallelize the fibres passing through them.

Arkwright's Invention.—Arkwright, in the "case" he presented to parliament stated that "after many years intense and painful application he invented, about the year 1768, his present method of spinning cotton, but upon very different principles from any invention that had gone before it." Arkwright knew of Paul's invention and utilized the idea in a modified form. His spinning machine (fig. 9) comprised a drum or wheel which was driven by a horse, subsequently through the medium of a water wheel and bevel gearing—hence the name water frame. A belt conveyed the motion of the wheel to the whole machine. A vertical shaft connected to the small drum drove the wheel and through it the four pairs of rollers. The part of the roller through which the cotton

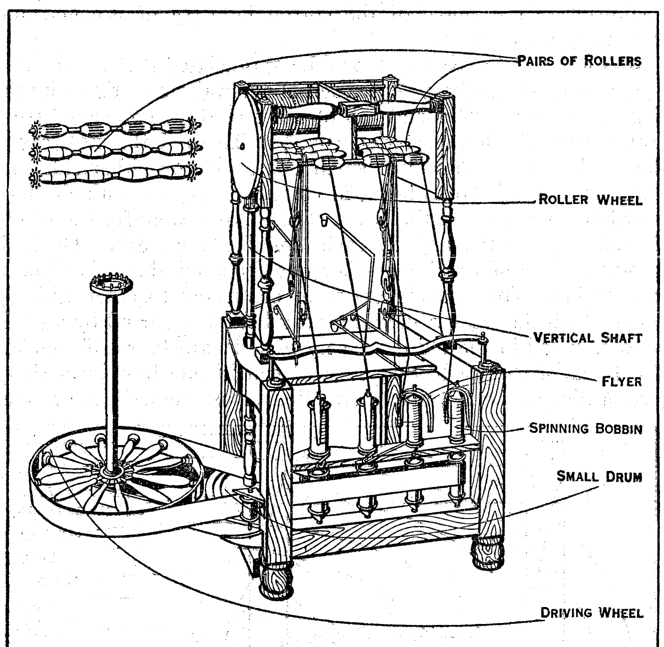

FIG. 9.—ARKWRIGHT'S SPINNING FRAME, INVENTED ABOUT 1768
The wheel was driven by a horse, the motion being conveyed to the whole machine. The rovings passed through the rollers and the strands were twisted between the last two rollers and the flyers

passed, was covered with wood, the top roller with leather and the bottom one fluted. The pairs of rollers moved at different rates of speed. The rovings were arranged horizontally in the illustration and the strands passed through the rollers to flyers having small wires on the side. The flyers were mounted on the spindles and wire yarn guides were fastened to their sides. The twisting of the strand took place between the nip of the last pair of rollers and the yarn guide on the flyer. In essence that is the principle of ring spinning to-day, the twist being inserted immediately the roving issues from the last pair of rollers, and whatever thick or thin places happen to be in the rovings such are twisted into the yarn, while in mule spinning the length of the draw or stretch is such and the operation of twisting is so distinct from winding-on that the thick places disperse through the yarn. That is the fibres in a thick place run along the other fibres and fill up the thin places.

Crompton's "Mule."—Crompton practically combined Hargreaves' and Arkwright's invention and the cross was termed a "mule." It is interesting to note how they name the frames. Owing to the fact that the flyer of Arkwright's frame gave out a whistling sound like a thrush singing it was called a "throstle frame." It was also called a "jack frame," and later, when operated by water power, it was called a "water frame." Some writers have said that the word "mule" was applied to Crompton's invention because it was a cross between the "jack" and the "jenny"; others stated that it was because it spun yarn fine enough to be used in weaving muslin and that the original name was the "muslin" wheel, afterwards corrupted into "mule."

It is inferred that he commenced to make his machine in 1774 and completed it in 1779, combining principles of the two earlier inventions. For example, Crompton took Arkwright's system of spindles without bobbins, which in combination with the faller or presser wire gave the twist to the yarn. The said yarn in this type of machine is stretched and spun at the same time as it was in Hargreaves', but the action is automatic and involves the stoppage of the rollers when a sufficient length of roving has been paid out. The most noteworthy feature of the machine invented by Crompton is the movable carriage which carries the spindles. The carriage was in Crompton's machine, drawn out for a distance of from 54in. to 56in. from the roller beam—this is known as the draw—in order to stretch and twist the yarn. It will be remembered Hargreaves moved his clasp out by hand, his spindles being stationary. When twisting is complete the carriage moves back towards the roller beam, the yarn winding on to the spindles in the process.

It will be recognized that within a comparatively short time from 1738 to 1779, many considerable and far-reaching improvements had been made. The productive capacity of the spinner was multiplied many times, and, moreover, the quality of the yarn was immensely improved. It might be stated here that the alteration in movement of direction of the mule carriage had to be governed by hand. It was Roberts, in 1830, who invented the self-acting mule which removed the onus of government from the spinner and put it on the machine.

Preparatory Machines.—The cotton received in bale form is in a matted tangled condition, charged with dust, twig, broken leaf, broken seed and other foreign matter which must be removed before actual spinning can take place. The fibres must be cleaned, disentangled and arranged in parallel order to facilitate the production of yarn or thread. Crude hand-operated devices were originally used, but with the advent of the spinning machinery it was recognized that the enormously increased production capacity of such machines necessitated revolutionary changes in the preparation processes. The invention of Lewis Paul rendered the production of one important preparatory machine a comparatively easy matter and led also to the production of three others. The machines referred to are the "drawing" or "drafting" frame which essentially comprises successive pairs of rollers running at increased speeds, and the three subsequent machines known to-day as the "slubber," "intermediate" and "speeder," all of which embody the same idea. The object of such frames is to reduce the number of fibres to the cross-section and to parallelize them. A machine was devised to open the matted dirty cotton taken from the bale, such machine comprising a hopper or bin into which lumps of cotton were fed, and within which a roller having a number of projecting spikes was caused to revolve. The spikes came in contact with the cotton and tore it apart, while a strong air current induced by a powerful fan freed it from most of the dust and seed it contained. In 1797, Snodgrass, then resident in Glasgow, invented a further cleaning machine which remains practically the same to-day. It was termed a "scutcher" or "picker" and comprised three or four metallic blades revolving at a speed of from 4,000 to 7,000 revolutions per minute. The material to be opened was presented to the rapidly revolving blades over the edge of a metallic feed plate, and as the cotton was broken up the dust, leaf, seed and other foreign matter was beaten out and dropped through grids into a dust chamber. A further machine of similar type was employed and with it was combined a lapping machine whereby the cotton in the form of an endless sheet was rolled round a central spindle or core. From the final scutcher the "lap," as it is termed, proceeds to the carding engine or card. The early hand card consisted of brushes with short pieces of wire arranged at a certain angle. The cotton was laid upon the back of one hand card while it was combed or brushed with the teeth of another. It was a simple evolution to increase the size of the cards to make one fixed and to suspend the other by a movable cord and pulley from the ceiling thus materially increasing production. It was Lewis Paul in 1748 who conceived the idea of a rotary cylinder covered with card clothing or wire teeth and a set of stationary "flats" or strips of wood fitted with card clothing placed below the cylinder. This was the genesis of our present-day card, the chief difference being that the flats are now placed above the cylinder, are formed in an endless chain and travel at a slow rate of speed over the cylinder, which is running at a high rate of speed.

Ring Spinning.—In 1828 Charles Danforth, of Paterson, N.J., and John Thorp, of Providence, R.I., took out separate patents on cap spinning devices. At present cap spinning is used only for worsted, but, when originally introduced, was used for cotton also. In the same year Thorp was granted the first ring-spinning patent. The most important improvement made in ring-spinning was the invention of the traveller. There is some doubt as to who was the inventor of the traveller, but the first patent now available which shows the traveller in its present form was granted to Thorp in 1844. The invention of the ring and traveller resulted in a great saving in initial cost of construction of spinning machines, as well as in power as compared to the flier, and permitted much higher spinning speeds. In the latter half of the 19th century many improvements were made in spinning machines, particularly in the types of spindles. In the United States practically all cotton yarn is now spun on ring frames. In Great Britain mules are still used to a greater extent than are spinning frames.

Most important recent development in cotton spinning has been the introduction of high-draft or long-draft spinning. Several types of long-draft systems are now in use, the first successful method having been developed about 1904 by Fernando Casablancas, of Sabadell, Spain. In 1938, less than 15 years after long-draft spinning had been introduced in the United States, approximately 30% of the cotton spindles installed were operating on some system of long draft.

In conventional methods of cotton spinning the draft is in the range of 8 to 15; that is, in spinning roving into yarn, the strand is drawn out or drafted to 8 to 15 times its original length. In high-draft spinning, the usual draft is in the range of 15 to 30. The major advantage of high draft is that it permits a reduction in the number of preparatory operations previous to spinning and thus results in a saving in labour and equipment.

Loom Development.—We come now to the invention of the power loom by Dr. Edmund Cartwright in 1786. Cartwright mechanized the operations of weaving as previously performed by hand. His early looms were not successful, but improvements were speedily made and eventually the power loom became a commercial and practical success. Continued use and the development of the machine industry brought about rapid and effective refinement of the loom and its development as a more accurate and precise weaving machine. It was not, however, until 1800 that the power loom was a definite commercial success, and it will be interesting at this stage to examine the industry and indicate its position in regard to spindles and looms.

Early Mill Census.—It may be fairly assumed that by the year 1811 the spinning mill of that time could be fitted with a full equipment of preparatory and spinning machinery, while the weaving shed was provided with power looms, practical and, in comparison with hand looms, highly productive. It was estimated that in 1811 over 5,000,000 spindles were at work of which 310,500 were of the Arkwright—or "throstle" frame—principle, while no fewer than 4,600,000 were mule spindles of Crompton's invention and there still remained at work 156,000 spindles of Hargreaves' "jenny" type. In 1820 the number of power looms at work in England and Scotland was 14,500, but in 1829 the number had risen to 55,500 and in 1833 to 100,000. Hand loom weaving had by no means died out, for in 1834 before the Commons committee on the hand loom weaver it was stated that in Scotland alone there were 45,000 to 50,000 of them at work, and it has been estimated that at least 200,000 hand weavers were still at work in England.

The first successful cotton mill in the United States was put into operation in the year 1790 in Pawtucket, R.I., under the management of Samuel Slater, a young Englishman. Up to 1814 weaving in the United States was largely a household industry, most of the mills confining their activities to spinning. In 1813 the Waltham Company was formed, and on the Charles river at Waltham, Mass., was erected the first power-driven cotton mill in the world where all processes of manufacture of raw cotton into cotton cloth were carried out in the same structure.

In the first half of the 19th century erection of cotton mills continued both in Great Britain and in the United States. The early plants were built at locations where water power was available for driving the machines.

Development by Watt of the steam engine permitted the building of textile mills where water power was not available or inadequate, giving an impetus to cotton manufacturing in coastal locations; for example, in Fall River and New Bedford, Massachusetts. Again, textile manufacturers who originally ran their mills by water power installed auxiliary steam plants as the mills grew in size.

Cotton mills were pioneers in the use of electricity for power, mills in Columbia and Pelzer, S.C., being driven exclusively by electric motors as early as 1895. Some textile mills generate all their electric power; others purchase it from public utility companies; still others generate part of their power and purchase the rest.

Effect of Machines on Operatives.—An endeavour will now be made to trace the effect of machine production upon the operatives, particularly in regard to their remuneration. In 1769, Arthur Young examined the question of wages paid in England for spinning and weaving cotton cloth. Men weavers received an average of 7*s.* 6*d.* per week, women 6*s.* per week, and children 2*s.* 6*d.* per week. Quite a variety of goods were woven, the prices naturally varying in accordance with the character and quality of the fabric. Spinners who were women and girls averaged about 3*s.* 6*d.* per week for the former and from 1*s.* to 1*s.* 6*d.* for the latter. Daniels states that in 1800 the amount paid for weaving a piece of cambric which required a week for its performance was 25*s.* Later there was quite a decline, and by 1829 the price had fallen away to 5*s.* 6*d.* In 1835 a certain quality of cambric 24yd. long cost 6*s.* when woven on a hand loom and 2*s.* when woven on a power loom. The difference between hand loom production and that of the power loom was, even in these early days, most marked, for the hand loom weaver could only produce one piece a week, while the power loom operator turned out four.

Operatives Employed.—It was from 1835 onwards that we have details of the operatives employed in cotton mills in the United Kingdom, and the early figures are interesting. A comparison has been made between the years 1835, 1856, 1872, 1895, 1924, and 1936.

	1835	1856	1872	1895
Male and female under 13, half-timers (per cent)	13·2	6·5	14·0	5·8
Male 13 to 18 "	12·5	10·3	8·0	7·9
Male over 18 "	26·4	27·4	24·1	27·6
Female over 13 "	47·9	59·8	53·9	58·7
Totals	218,000	379,300	479,600	538,900

	1924	1936
Male	180,990	160,968
Female	320,831	273,800
Totals	501,821	434,768

With regard to hours, an enquiry in 1819 in reference to 325 cotton spinning mills showed that 98 worked from $72\frac{1}{2}$ or $73\frac{1}{2}$ to 82 or 93 hours a week, while the remaining 227 ran from 66 to 72 hours a week. The pernicious system of farming out children in batches from the poorhouse was in existence, and in many cases where double shifts were in vogue, the children going off got into the same beds as those just awaking to work their turn. It was by an Act of 1844 that night work was killed because it made it illegal for any operatives who were not adult males to practise it. The large proportion of children and women essential to maintain the balance of effective operation were thus excluded and night work became commercially unremunerative. During the 19th century many acts were passed which were beneficial to the operatives. The age at which children could commence work in the factory was constantly advanced. Finally we come to the more recent act which reduced the hours in cotton mills to 48.

In the United States, when the cotton spinning industry was first established, the employees—mostly children from 8 to 14 years old—received from 80 cents to $1.40 a week. In 1817 weavers in Fall River were paid $2.50 a week; work began at 5 A.M. in summer and as soon as it was light at other times and stopped at 7:30 P.M. In 1937 the average number of workers in the cotton manufacturing industry was 435,428; wages paid totalled $324,083,030. On Oct. 24, 1939, a minimum wage of $32\frac{1}{2}$ cents per hour and a maximum work-week of 42hr. for the workers in the cotton industry were established under the so-called wage-hour law (Fair Labor Standards Act of 1938).

B. THE WORLD'S COTTON SPINDLES

The continuous growth of the population of the world and the improvement of the standard of living in most countries naturally produce an increase in the demand for cotton for clothing, home furnishings and for use in the products of industry. It is true that the competitive position of cotton is constantly subjected to greater and greater pressure by the products of chemistry, namely, rayon and paper, but nevertheless cotton still holds its place as the world's principal textile fibre and except for years of general business depression the use of it steadily expands.

But this increase in the use of cotton has not resulted in any increase in the world's cotton spindles. In fact spindleage equipment has shrunk. Every year between 1928 and 1938 witnessed a diminished number of spindles in place. Prior to 1928, however, there was a steady year to year growth in the world's cotton spindles.

The contrast between expanding cotton consumption and decreasing cotton spindles is exhibited in Table VII.

As can be seen from this table, the consumption of cotton was higher during the three years ended July 1939 than in any year during the preceding two decades, but the number of spindles in the world, after increasing between 1920 and 1928 from 153,056,000 to 165,103,000, declined steadily thereafter to 147,153,000 in 1938. The decrease continued in 1939 for the reason that in

TABLE VII.—*Comparison of World Cotton Mill Consumption and Spindles in Place, 1913 and 1921 to 1939 Inclusive*

Cotton, Year Ended July 31	World consumption of cotton (equivalent 478-lb. Bales)*	World's cotton spindles†	Bales consumed per spindle in place

the United States there was a shrinkage in spindles between July 1938 and Aug. 1939 of over 1,100,000. One has to go back to 1914 in order to find a year when the spindleage equipment of the world approximated the 1938 total.

It is evident from the foregoing record that the 1938 cotton spindle produced much more than the spindle of 10 or 20 years earlier. There are several reasons for this development, among them (1) longer hours of spindle operation, (2) substitution for the slow producing mule spindles of the faster producing ring spindles, and (3) increasing speeds of the ring spindle.

Conditions in the United States illustrate these changes. The adoption of the 40-hour work-week in 1933, as part of the Cotton Textile Code, caused a great many mills to run two shifts of 40 hours in place of a single shift ranging from 48 to 60 hours a week. The natural result was longer hours of operation per spindle.

Concrete figures that pertain to the two most active years that

TABLE VIII.

	Total cotton consumption in the United States		Total spindle hours (millions)	Total active spindles in the United States (monthly average)	Average hours run per active spindle in year	Raw cotton processed per spindle hour (in pounds)
	Bales	Millions of pounds				
1927	7,405,021	3,587.7	104,450	32,547,119	3,209	.0343
1937	7,417,991	3,657.1	95,591	24,079,936	3,970	.0382

Source: United States Bureau of the Census.

the cotton industry in the United States had in the 20 years prior to 1938, namely 1937 and 1927, are illuminating. In those two years, the output of cotton mills was almost identical, their processing of raw cotton amounting to 7,400,000 bales in both years. But in 1937, the average running time per active spindle amounted to 3,970 hours and in 1927 to 3,209 hours. In other words, the 1937 spindle ran nearly 25% more hours than the 1927 spindle. Also, the 1937 spindle with its more rapid rate of production processed an average of .038lb. of cotton per spindle per hour against .034lb. in 1927. This is a production increase of 12% due to greater efficiency alone, distinct from longer hours of operation. These fundamental changes can be more easily visualized in the comparison in Table VIII.

The United Kingdom continued up to 1939, as it has since the industrial revolution, to lead the world in cotton spindleage equipment. The United States was second and Japan third. Japan's position, however, was only slightly in advance of Germany, Russia, France and India.

Table IX gives the distribution among the principal cotton manufacturing countries.

The record below of nearly two decades brings out the shifts that have taken place in the distribution of world cotton spindles. In the United Kingdom, the number dropped from 58,692,000 in 1920 to 36,879,000 in 1938, a loss of over 20,000,000 spindles. Similarly, in the United States the number dropped from a peak of 37,804,000 in 1924 to 26,376,000 in 1938, a loss of over 10,000,000 spindles. On the other hand, cotton spindles in Japan increased over threefold between 1920 and 1938 while in France and Germany the number has been almost stationary; India's increase was 50% during this period. Within the United States a decided change occurred between 1923 and 1938 in the concentration of spindles as between different sections of the country. The number in the New England States decreased sharply; the number in the cotton growing States increased. The reasons generally ascribed

The general term "spindles" covers two basically different types of machinery—the ring spindle and the mule spindle. Generally speaking, it may be assumed that ring spindles produce the comparatively coarser sizes of yarns and the mule the finer sizes. There are, of course, important exceptions to this generalization, for it is an established fact that ring spindles are producing some of the finest commercial sizes of cotton yarn. Nevertheless, the division of the spindles of any country between ring and mule will give a broad measure of the degree to which the cotton industry

in that country is engaged upon fine or coarse work. Table XI shows this division.

Spindles on Egyptian cotton are included in Table XI for the reason that any spindle, either ring or mule, running on long staple cotton from that country is in the main, turning out fine yarns.

The ring spindle is the more modern invention, and is more easily operated than the mule; as against the high degree of skill required by the mule spindle, the ring spindle may be operated by comparatively unskilled labour provided that supervision of superiors is constant and close.

There is, therefore, a fundamental difference between the cotton spindle equipment of the United Kingdom on the one hand and the United States and Japan on the other. Countries in which the cotton industry was established relatively early, such as the principal European countries, had in 1936 a substantial number of mule spindles, while in those areas where the industry's development occurred largely in the 20th century, the ring spindle is used almost exclusively. The United Kingdom's possession of more mule spindles than any other country in the world and its access to an abundant supply of long staple Egyptian cotton, which is especially suited to mule spinning, enables the United Kingdom to control the export market of the world for fine cotton yarns and fabrics made therefrom.

At one time, the New England States had a substantial number of mule spindles. In 1914, they constituted 12% of the United States' total spindle equipment and 24% of New England's equipment. The number has dwindled every year since that date until in 1938, the New England States had only about 200,000 mule spindles or less than 1% of the total spindles in the United States. Japan had 37,000 mule spindles in 1928 or less than 1% of the total. Ten years later the number was reduced to 9,000.

It should be said in this connection that the great bulk of the world's business in cotton goods is in the class of medium and coarse goods. Statistics indicative of the relative proportion of

coarse, medium and fine yarn produced—available for four important countries—are shown in the Table XII.

Great Britain and the United States produce about an equal quantity of fine yarn but the former exports a very important part of its fine yarn whereas practically all of the latter's fine yarn is used for knitting and weaving. Japan and India likewise are evenly matched in the fine yarn field.

Although there has been, as observed in a foregoing tabulation, a steady decline in the number of spindles in the United States, it should be said that a certain amount of new installation goes on continually. The year-to-year decline in the number of spindles is a net figure representing the difference in the number of old spindles that have been discarded and the additions and replacements. The cotton ring spinning spindle, which is not a single machine but always installed on heavy frames containing 200 or 300 separate spindles, is a long lived machine. The additions and replacements each year represent only a small proportion of the total number in place as will be noted in Table XIII.

Thus of the 26,000,000 spindles in place at the end of 1938 about 5,000,000 or 18% were less than 15 years old and the balance ranged in age upwards from that figure to perhaps 40 to 50 years.

In addition to installations of new spindles to take the place of those that are worn out, a fundamental change has been going on since about 1926 in the spinning operation itself. This change embraces what is known as long draft spinning. Most new frames are so equipped but the system also can be introduced into spinning frames that have already been installed by means of an attachment. Among the advantages that long draft spinning contributes are ability to use shorter staple cotton than in the case of ordinary spinning, improved yarn strength and a very substantial reduction in the number of steps required in the preparation of the fibre in the average cotton mill prior to spinning the yarn. One-third to one-half of the spindles in the United States in 1939 were said to be long draft or equipped with the long draft attachment.

In mills where fine yarns are manufactured to an important extent long draft spinning does not offer the same advantage as in the case of medium and coarse yarns, and for that reason the introduction of long draft spinning in European countries has not proceeded to the same extent as in the United States and Japan.

The International Labour Office in its study entitled "The World Textile Industry," prepared for the Tripartite Technical Conference on the Textile Industry held in Washington, D.C., in April 1937, presents an ingenious analysis of actual spindle capacity which allows for different types of spindles, and their normal operating time in various countries. This comparison shows the capacities of the various cotton manufacturing countries to produce cotton yarn, irrespective of coarseness or fineness. Naturally, from this standpoint the United Kingdom has a much lower capacity than the aggregate of its spindles shown in Table IX would suggest.

A statement from *The World Textile Industry* introduces this illuminating analysis and is followed by the analysis itself:

"In reducing actual to equivalent ring spindles, it may be assumed that ring spindles operate at an appreciably higher level of mechanized technique than do mule spindles, at least to the extent that both types are employed for similar manufacturing purposes. In reducing equivalent ring spindles to their actual (commercially feasible) capacities, it has been assumed that various economic and social factors hold down spinning activities in all countries below the theoretical maximum of 168 hours weekly. Custom, collective agreement, law, or all three combined, assign limits which vary among countries to the maximum labour week and to the number of daily operating shifts. It should be stressed that the conversions in question have had to neglect the extremely important factors of relative obsolescence and relative machine speed. Moreover, no adjustment has been made for variations in average yarn counts produced by different countries. Despite these important limitations, the results obtained would appear to approximate much more closely to the actual relative capacities than do mere numbers of spindles in place. The results obtained are presented (in millions of spindles) in Table XIV."

TABLE XIV

Country	Actual number of spindles*	Equivalent ring spindles†	Machine working-time factor‡	Mechanical equivalent—commercially available spindles
Germany	10·1	8·8	1·0	8·8
China	5·0	5·0	3·0	15·0
France	9·9	8·9	0·9	8·0
India	9·7	9·5	2·6	24·7
Japan	10·9	10·9	2·3	25·1
United Kingdom	41·4	29·2	1·0	29·2
United States	28·2	28·0	1·7	47·7

*As of July 31, 1936.

†Computed by weights as follows: mule spindles, 0.6; ring spindles, 1.0. The weights used are more or less conventional. In actual practice, the spread in productivity between ring and mule spindles varies considerably with yarn count. The spread is at its maximum for the coarse counts (one ring spindle equals about two mule spindles), and falls as count rises (for counts over 60's one ring spindle equals somewhat less than one-and-a-half mule spindles).

‡Computed by assuming *maximum* man-hour weeks as follows: Germany, 48; China, 71; France, 40; India, 54; Japan, 55; United Kingdom, 48, and United States, 40; and by assuming average daily shifts numbering: Germany, 1; China, 2; France, 1.1; India, 2.3; Japan, 2; United Kingdom, 1, and United States, 2.

The spindles in the United States are assigned a capacity 60% in excess of the capacity of the United Kingdom notwithstanding its smaller equipment of actual spindles. Also, on a capacity basis, Japan and India are both rated close to the United Kingdom although these countries have barely one-quarter as many spindles as has the United Kingdom. This comparison serves to emphasize the danger of regarding a spindle as a yardstick of production.

BIBLIOGRAPHY.—Bulletins of the International Federation of Master Cotton Spinners' and Manufacturers' Associations, Manchester, England, contain data as to each country's spindles on a semi-annual basis beginning with 1913.

Publications of the Bureau of the Census show activity of spindles in the United States by months and for the important manufacturing States since 1921.

The Bombay (India) and Japan (Osaka) Cotton Associations also publish monthly statistics relating to spinning mill activity in their respective countries.

C. THE WORLD'S COTTON POWER LOOMS

Data as to the aggregate number of looms in the different countries that manufacture cotton goods were not regularly compiled until this work was undertaken by the International Federation of Master Cotton Spinners' and Manufacturers' Associations in 1930. Since then, at three-year intervals, the Federation has taken a census of the cotton power looms in all the cotton manufacturing countries of the world. The results of the 1936 survey showing a grand total of almost 3,000,000 looms in place are given in Table XV.

Great Britain and the United States of America together had in 1936 about one-third of the world's total looms. Ten years earlier these two countries had about half of the total in the world. As is also the case with cotton spinning spindles there is wide variation both with respect to normal operating time and relative output of looms in various countries. Looms differ as to the speed at which they may be operated, the width of cloth they can produce and in the amount of attention required from the operative or weaver. The automatic loom makes it possible, in the manufacture of standard cotton fabrics such as narrow sheetings, for a weaver, with some assistance, to tend as many as 60 looms or more whereas only four looms is the customary assignment of the non-automatic type. Most of the European countries whose cotton textile industries were established during the latter part of the 19th century continue to have a very large proportion of non-automatic looms. The automatic loom, although invented by an Englishman, has not been widely accepted in Lancashire because of labour problems and for other reasons, but it is extensively used in North America and Japan. In the latter country, a particular type of automatic loom called the "Toyoda" loom, is said to rival all others including non-automatic looms in its speed of operation. This loom has become the model loom of the Orient. On the other hand, the Toyoda type of loom would be uneconomical for use in American mills as it requires more battery hands than American looms which adds to the labour cost at the considerably higher American wage scales.

*No returns. Figures estimated from trade sources. †No returns. 1933 totals given. ‡No separate figures given for Automatic and Automatic Attachments. ¶Includes 109,000 looms only 15 in. wide. §Figures for U.S.A. adjusted to conform with 1937 Census report.

The advantages to be gained by the use of highly mechanized equipment seem to be largely confined to the medium and coarse range of cotton textile products on a mass production basis. When an abundance of highly skilled labour is available and wherever such skilled labour is required as in the manufacture of fine goods, for example, the saving in cost on short runs obtained by the use of automatic looms is much smaller proportionately than is the saving when coarse goods are woven because of slower rate of production of fine goods and other manufacturing delays. This has often been given as the explanation for the ability of Great Britain to continue more or less to monopolize the fine goods export markets of the world in spite of her non-automatic weaving equipment.

From a mechanical standpoint there are two broad and distinct types of looms—plain and fancy—leaving out of consideration as relatively unimportant the narrow fabric looms weaving tapes, labels, webbing, etc. The great bulk of the world's cotton power looms come under the first classification and are used in the manufacture of plain, twill and satin weaves with variations and combinations of these weaves. In the second category are included the dobby, box and Jacquard looms that weave respectively geometric designs, two or more colours or kinds of weft or filling and floral or other intricate patterns. Unfortunately detailed statistics giving the numbers of these different kinds of looms are available only for the United States which makes it impossible to give international comparisons. It is a known fact, however, that some countries, *i.e.* Belgium, Italy and the region formerly known as Czechoslovakia, specialize in Jacquard weaving and must, therefore, have a substantial number of Jacquard looms. In 1935, according to the U.S. Census of Manufactures, there were 385,894 plain looms, 75,210 dobby looms, 21,571 box looms and 10,784 Jacquard looms in place out of a total of 493,459 cotton looms.

The relationships that exist between spindles and looms in the cotton textile industries of the various countries offer a means for analyzing each country's position in the international picture. In some countries such as Great Britain, China and Japan spinning and weaving are carried on to a large extent as separate sections of cotton manufacturing. Fundamentally the development of the industry followed similar courses in each of these three countries, but it has progressed to a more highly organized form in Great Britain than in the Orient. The machine spinning of cotton yarn was originally designed to supply the requirements of local hand weavers. Later when power looms were invented separate establishments were built for weaving. So also were finishing plants developed and a non-integrated industry was thus established.

Using the data for looms in place on Dec. 31, 1936 given in Table XV and the number of spindles in place on the nearest date from the same source, the ratio of spindles to looms is indicated in the tabulation in Table XVI.

A cotton mill is said to be in balance if its spindles can produce just enough yarn to supply its looms when both types of

TABLE XVI.—*Comparison of Spindles per Loom in the Principal Cotton Manufacturing Countries of the World*

Country	Number of spindles per loom	Country	Number of spindles per loom

machinery are operated an equal length of time: in other words when there is no surplus equipment. This balance depends upon the size of the yarn that is spun and the relative closeness (*i.e.* threads per inch or yard) of the weave. In the average mill making coarse bagging fabrics, 30 ring spindles to the loom would be a balanced arrangement. In the case of medium weight carded dress fabrics and shirtings, a ratio of 40 spindles to the loom would be considered satisfactory and 50 spindles would be needed to supply yarn for each loom in the average mill making fine combed dress fabrics. These ratios, when compared with the ratios in the above table, give a rough indication of the kind of woven goods produced in the various countries. There are, however, certain other qualifying factors which must be considered in appraising these relationships. If a country such as the United Kingdom specializes in manufacturing yarn for export or for a large knitting industry, there will be many more spindles in place than are normally required to supply yarn for weaving. In the case of India and China where hand weaving continues on a very large scale the number of power looms in place is only part of the weaving equipment supplied by the spindles. There are literally millions of hand looms in India and China. Included in Japan's weaving equipment are approximately 109,000 power looms 15 inches wide. These looms manufacture exclusively for the home market. They are in small family shops and their efficiency is, therefore, relatively low. Moreover, Japan's spindles customarily operate two shifts as against a single shift in most of the small weaving establishments. Consequently the ratio indicated for Japan showing 36 spindles per loom is somewhat deceptive in view of the fact that there is also a substantial number of hand looms in Japan.

Owing to the meagreness of the data available, it is not possible to trace with accuracy the development in the use of cotton power looms in the world as a whole. Some statistics are available for the eight most important cotton manufacturing countries and they are arranged for convenient comparison in Table XVII.

TABLE XVII.—*Number of Cotton Looms in Place in the Eight Most Important Cotton Manufacturing Countries of the World for Selected Years* 1899–1937*

*Where .. is shown no comparable figure is available. In some cases the figure given applies to one year later than that indicated.

Based on figures from: International Federation of Master Cotton Spinners; Tattersall's *Cotton Trade Review;* Worrall's *Cotton Spinners' and Manufacturers' Directory;* Comtelburo, Ltd.; United States Bureau of the Census.

In Great Britain and the United States, it will be noted, there was a more or less steady growth in the number of looms up until 1914. Following the World War (1914–18) the number began to decline in Great Britain but the peak in the United States was not reached until 1925. This year also coincides with the time when the greatest number of spindles was recorded. The decline from 1925 to 1937 followed the same trend in both countries so much so that it would seem that they were affected by similar economic forces. This would be true if it could be said that old inefficient nonautomatic looms were unable to meet competition from modern high speed automatic looms. England's competition, however, was in her export trade with the Orient whereas in the United States there was an inter-regional shift of production caused by a rapid decline and liquidation of equipment in the older manufacturing region of New England as the manufacture of cotton goods was transferred to the lower cost mills of the southern States with their newer automatic looms and lower-paid workers not handicapped by restrictive labour legislation.

The other three European countries, for which data are given in the table, display mixed trends. Russia and Germany both lost some of their textile mills after the war of 1914–18. Since 1928 Russia has been trying to rebuild its cotton industry by means of various 5-year plans in conjunction with expanding production of raw cotton. Germany has turned more and more to the substitution of rayon for cotton under its program of national self-sufficiency which probably accounts for some of the decline in looms accompanied by the natural obsolescence of looms that have been in use for 40 years or more. In the case of France the transfer from Germany of 50,300 looms in the Alsace-Lorraine district in 1919 accounted for most of the increase between 1914 and 1925. From 1931 to 1937 a downward trend has prevailed not only in France and Germany, but also in many other European countries not shown in Table XVII with the notable exception of Russia.

On the other hand a steady growth is evident in the number of looms installed in the mills of the Orient. The largest absolute increase was in Japanese mills but not all of this expansion represents new equipment. An indeterminate number of second-hand looms were brought from the United States, Great Britain and elsewhere during the ten years ended in 1937. It is a corollary in the development of the Oriental textile industry that wherever relatively low-paid labour is employed the need and importance of labour-saving and otherwise efficient machinery is greatly minimized. The expansion in India's looms between 1928 and 1937 naturally does not reflect the movement similar to the United States migration away from Bombay to lower cost areas of a substantial volume of production. It is extremely significant that in a similar way Japan's cotton textile industry was also beginning to feel the pressure of higher costs and starting in 1939 there began an exodus of surplus Japanese spindles and looms to the areas of North China which at the time were being industrialized by Japanese capital. The development of power weaving in China was slow in getting started but rapid progress was made between 1931 and 1937. Although the conflict between Japan and China that started in the latter year was responsible for the destroying of many Japanese-owned cotton mills many of these mills have been rebuilt and the world may well look to China for the next great expansion in the cotton textile industry.

BIBLIOGRAPHY.—The sources mentioned in the bibliography under section "The World's Cotton Spindles" also contain data as to looms. For additional information the following reports should be consulted: Cabinet Committee Report (U.S.), *Cotton Textile Industry* (Senate Document No. 126, 74th Congress, 1st session) 1935; Committee on Industry and Trade (Great Britain), *Survey of Textile Industries* (1928); International Labour Office, *World Textile Industry* (1937); Charles K. Moser, *Cotton Textile Industry of Far Eastern Countries* (1930). (P. B. H.)

D. VARIETIES OF COTTON CLOTH

Cotton Fabrics.—In the American, Canadian and British cotton cloth markets there are three broad divisions: (*a*) *gray cloths* —those woven of unbleached yarns—in some cases used in this state; (*b*) *finished or converted cloths*—which are gray cloths converted by bleaching, dyeing, printing and finishing; (*c*) *woven coloured yarn cloths*—woven and finished ready for use by the mills making them, known as mill finished cloths.

There are many fabric names used. These include (*a*) basic cloth names which are usually the same in both the gray or finished state; (*b*) cloths named after the finishes used on them.

A large number of fabrics are made in the British cotton cloth trade especially for export markets and suitable only for their particular purpose.

The following cloths are generally standard in British (home and colonial) and/or American markets:

Aeroplane Fabric.—Strong, plain woven, usually 2-ply combed yarns (mercerized or plain). Single combed yarns also used. Made of Sea Island type cotton, Egyptian, Pima or other long staple American cottons. Square thread construction. One of the strongest cloths for its weight made. Uses, covering of wing, tail and fuselage of aircraft, tow targets. Also bleached and dyed and used for shirtings, boys' wash suits, etc.

Albert Twill.—See Beatrice Twill.

Awning Fabric.—Strong, closely woven, bright coloured striped fabrics. Either yarn dyed or oil painted stripes (one side only). Plain woven, ply yarn, army duck fabric used for better qualities. Single yarn flat ducks, drills used for cheaper painted awnings. Uses, awnings, canopies, beach chairs, hammocks, umbrellas, window blinds, garden, beach tents.

Balloon Fabric.—Plain woven, high thread count, combed, usually single yarn cloths of selected extra strength, long stapled cotton. About the strongest cloth for its weight made. Uses, gas cells in airships, balloons. Bleached, dyed, mercerized, used for men's shirtings, shorts, underwear, rubberized raincoat fabric. Similar but higher thread count fabrics called typewriter ribbon cloths.

Batiste.—(*a*) Highly mercerized, soft finished, light weight, combed yarn, converted, lawn type fabric, bleached, dyed, printed. Uses, women's and children's lingerie, nightgowns, summer dresses, infants' wear, linings. (*b*) In the corset trade (American) strong, heavy, plain woven poplin type fabric. Also has Jacquard designs, all carded, all combed yarns, cotton warp and rayon filling, dyed flesh colour. Uses, corsets, brassieres.

Beach Cloth.—Strong cotton fabric chiefly used for flag bunting. Two ply, carded yarn, loose texture. Used in white, red, navy, etc. for signal flags by railroads, army, navy. Also base for embroidery, men's suitings, draperies.

Beatrice Twill (British) or *Albert Twill* (American).—Five harness weft (filling) face twill usually of combed yarns. Dyed fast black, given highly lustrous mercerized and Schreinered finishes. Used for vests, coat linings, umbrellas. Albert is similar twill (American), made with 4 (or 5) harnesses.

Bedford Cord.—Fabric with lengthwise prominent raised cord effects similar to warp pique but coarser. Heavier qualities usually have additional coarse warp (wadding) yarns, along back of cloth only, to help to raise cords. Sometimes napped on back for softness, bulk, warmth. Uses, riding breeches, hunting clothes, summer slacks, uniforms. Wide widths used for car upholstery. Piece dyed, printed stripes, checks given plain, mercerized, preshrunk finishes.

Broadcloth.—(American name for British fine poplin.) Has a very fine rib across the width. Is plain woven with about twice as many ends as picks. Has higher thread count than regular poplin, always has more picks. Usually combed, ply or single yarns used. Cheapest qualities made with carded print cloth yarns. Uses, shirtings, pajamas, shorts, summer dresses, beachwear, etc.

Brocade.—Elaborate, compound, Jacquard woven, upholstery fabric, made of dyed yarns (mercerized, ply cotton warp yarns, silk or rayon filling). Filling yarns float to form the designs which stand out in relief and include multicolour, small floral effects, similar to upholstery damask except that finer yarns, higher thread count and more than one colour filling used. Lighter British brocade is made of fine single, combed yarns, piece mercerized and dyed. Used for dress goods, linings, etc. Other brocaded fabrics of different weights and colourings are made expressly for corset trade, men's necktie trade.

Calico.—An old term given to plain woven, white, dyed or printed medium weight fabrics in general household use for aprons, house dresses, playsuits, pillow cases, etc. Same fabrics in different finishes also referred to as domestic, printed percale, chintz, cambric, muslin, cretonne, etc.

Cambric.—Smooth, lustrous, finished, plain woven cloth. Usually white, also dyed, soft or slight starched finish. Finer cambrics are converted from heavier lawn type cloths. Cheap cambric qualities converted from carded yarn print cloths are backfilled with China-clay and starched for weight and appearance. English cambrics are usually converted from finer yarn lawns only. Uses, cheaper carded cambrics—trimmings, bindings, linings, quilted pads, toys. Softer and finer yarn cambrics—infants', children's wear, underwear.

Casement Cloth.—Flat, lustrous, British curtain fabric, plain woven, combed or super-carded yarns with larger number of picks of heavy yarns than ends which are finer. Mercerized, bleached, dyed ecru and other colours. With higher thread count also known as Limbric (British).

Chambray, Work Chambray, Dress Chambray.—Shirting fabric, plain woven, all dyed warp yarns—woven with unbleached (white after bleaching) filling. Work chambrays have carded yarns, more ends than picks, dyed warp yarns and unbleached filling yarns. Blue warp yarn generally used (also gray) is a starched mill finished fabric. Dress chambrays have combed yarns with almost square thread count, are always bleached and often pre-shrunk. When made with alternating white and coloured warp ends known as end-and-end madras or end-and-end chambray. Fancy chambrays also made with small designs over chambray ground. Used for dress shirts, women's, children's wear. Bleached, given plain, mercerized, pre-shrunk finishes.

Cheese Cloth or Tobacco Cloth.—Loosely woven, soft, light weight low thread count plain woven fabric, also called hospital gauze. In bleached soft finish used for surgical dressings, bandages, tea bags, cleaning and wiping cloths. In stiff starched finish used for interlinings, hat shapes (also called crinoline). Also used for base or backing for paper. When unbleached used for wrapping meats, cheeses. In 36in. called tobacco cloth.

Chintz.—A highly lustrous, firm, plain woven, brightly coloured, printed summer drapery fabric with a glazed (friction calendered) finish. Small colourful patterns are generally used, also solid drapery colours. Chintz fabrics are generally converted from gray print cloths (or printers).

Covert.—American covert cloth is a widely used mill finished work clothing fabric. Has a characteristic mottled or flecked appearance made of mock twist single warp yarns spun from white and coloured rovings. Heavier black filling yarns are used. Usually are closely woven 3-harness warp face twills. Light weights used for work shirts, smocks, work caps; heavy weights, trousers, uniforms. Cheapest qualities are plain woven.

British made coverts generally are closely woven topcoat or raincoat fabrics made with "grandrelle" warp yarns. These are mottled 2-ply yarns, one white and one coloured.

Cottonade.—Strong, 3-harness warp faced twill mill finished work clothing fabric with coloured yarns made in oxford gray and black over stripes, and in all dark oxford gray. Grayish white blended warp and heavy black filling yarns used. Given a firm starched finish, sometimes napped on back. Used for work trousers. Usually heavier than covert.

Coutil.—Three-harness warp faced herringbone twill, closely woven, of strong carded yarns. Piece dyed flesh, or pink. Made especially for the corset trade.

Crash.—Finished, plain woven, heavy coarse yarn cloth. Bleached, dyed, also printed. Often given lustrous, mercerized and chased finishes to imitate linen crash, plain and backfilled finishes. Sheeting and osnaburgs are used in converting.

Crepe.—A rough, pebbly surfaced fabric obtained by using high twisted crepe yarns. These when wet out immediately contract pulling in or creping the cloth with it. Different warp tensions used in weaving also produce crepe effects found in seersucker or crimp (British) fabrics. Crepe effects are also formed in finishing by caustic soda printing and by embossing with crepe design rollers. A crepe or oatmeal effect is obtained by weaving fine warp and coarse filling (weft) yarns in granite or mock Leno weaves. These are called momie crepes (in American market).

Croydon.—Name of a British firm-finished, smooth-faced, bleached plain woven fabric. Printers and sheeting type fabrics used for converting. Cheaper qualities often have a back filled finish.

Damask.—Jacquard woven elaborate decorative fabrics. (*a*) Table damask, flat reversible patterns, changeable light and shadow effects formed by contrasting light reflections of (horizontal) weft yarn satin floats over (vertical) warp yarn satin floats. Bleached white, also dyed, also made with white and coloured yarns, given plain, mercerized or special "no lint" finishes. (*b*) Drapery-Upholstery damask, heavier, coloured yarn, lustrous decorative fabrics usually of rayon (warp-twist) and cotton filling (weft). The pattern which is slightly raised is formed by floats of spiral, ratine or other novelty filling (weft) yarns on a warp satin rayon background. Also made of all rayon and piece-dyed.

Denim.—Also known as dungaree cloth. Is the most important work clothing fabric made. A 3-harness, strong warp faced twill woven coloured yarn fabric. Usually made with indigo blue dyed warp (twist) yarns, unbleached filling (weft) yarns and known as white back denim. Also made with brown warp yarns and also in solid blue. Largely used for overalls, jackets, caps, etc. Similar fabrics are made with white and blue stripes and known as hickory stripes, pin stripes, also pin checks. Used for butchers' aprons, mechanics' overalls, caps, etc. Women's sportswear trade uses denims made with light shades of blue, tan, red, green, and known as faded denims. Usually given a firm starched finish and often a pre-shrunk finish. Denims are mill finished fabrics.

Diaper Cloth.—Or bird's eye cloth. A carded dobby woven fabric with a diamond design. The warp yarn is finer than the filling (weft) which, being softer and bulkier makes the fabric very absorbent. Another diaper cloth is the diaper flannel. A soft, absorbent, napped sheeting having a soft, twisted filling (weft) yarn. Usually bleached and given a pure absorbent finish. Uses, diapers, towels.

Dimity.—A combed yarn, sheer fabric, with distinctive fine warp cords. Formed by grouping or crowding of warp ends on plain woven ground. Also made with check effects. Usually bleached, mercerized and given a firm starched "lawn" finish. Also printed. Used for women's, children's blouses, waists, summer dress wear.

Drill.—British term generally applied to all warp faced cloths, twill woven, irrespective of the number of harnesses, *i.e.* florentine drill (4-harness warp twill). When single yarns are used they are made with left hand twill, running up toward selvage. Weft faced twill woven cloths are generally called twill (Beatrice twill, 5-harness).

Drill, American.—Always 3-harness, warp faced twill, medium and heavy weight strong fabric of carded yarns. Used in the gray state for pocketings, box spring covers, sailcloth, bags, base for coated fabrics. When bleached, dyed or printed, used for shoe linings, overalls, pants, uniforms, printed mattress ticking, summer trousering, painted awnings.

Duck.—Strong, heavy, closely woven carded yarn cloth usually made of ply yarns, also known as canvas. Made in many qualities and has dozens of uses in gray or converted state where utility and service are required. Two chief types made are, (*a*) wide number duck, army duck (made in narrower widths only), plain woven, ply yarns (2 or more ply); (*b*) Single filled, flat duck, double filled, flat duck. These always have single warp yarns woven in pairs (or double ends). Where filling yarns are single, known as single filled duck. If 2 ply, called double filling duck. Varieties of ducks include sail duck, hose duck, tent duck, shoe duck, army duck, enamelling duck. In the gray state used for folding cots, chairs, hammocks, mail bags, truck covers, overalls, base for coated fabrics. Bleached white, dyed, printed and used for work pants, washable clothing of all kinds, shoe linings, summer trouserings, bookbindings, painted awnings, army tents (khaki dyed).

Flannel-Flannelette.—Plain woven, soft, fleecy, warm, cotton fabrics resembling wool flannels. Made with fine warp yarn and soft spun filling (weft) yarns. The low twisted filling yarns are easily raised or napped. Bleached, dyed and printed. Also made with coloured yarn, plain and twill woven stripes, bright plaids. When printed also called flannelettes. Used for nightgowns, pajamas, linings, pocketings, baby blankets and diapers, dolls.

Flannel, Canton.—A 4-harness fine warp yarn left twill with heavy, soft, twisted filling. Has a soft, long, fleecy finish on back. Unbleached, used for work gloves; lighter weights are bleached, dyed and used for linings, bathrobes, pocketings.

Flannel, Outing.—American name for a plain woven, coloured yarn, striped short nap flannel. Plain, bleached flannels are also known as domett flannels. Used largely for sleeping garments, children's underwear.

Flannel, Suede.—A fine, smooth, flat, felted finish on one (or both) sides. After napping the nap is sheared down close to the ground of the cloth and the fibres "felted" into the ground of the cloth. Used for sport shirtings, linings, sleeping bags.

Flannelettes.—Similar napped soft, fleecy cloths made in Great Britain are called flannelettes. These are plain or twill woven and made with soft twisted weft. All white, printed, piece dyed, and woven with coloured yarn stripes and checks. Same uses as flannel.

Florentine (Drill).—British, heavy, strong, serviceable, carded, left hand, 4-harness warp faced 3/1 twill. American name is 4-leaf (harness) warp twill. Bleached, dyed khaki or other suitable shades for army uniforms, hunting outfits, tents, light tan shades for tropical uniforms, shorts. Piece dyed, printed and used for semi-dress slacks, summer camp clothing.

Gabardine-Gaberdine.—A steep angle, heavy, prominent 11- to 15-harness warp faced twill woven fabric, single or ply, carded or combed yarns. All white, piece dyed, printed, mercerized pre-shrunk finishes. Uses, riding habits, summer suits, slacks, sportswear. Single warp yarn gabardines generally have a left hand twill. Ply warp yarn gabardines have a right hand twill (running upwards to selvage).

Galatea.—British, 3-harness drill (warp face) woven with white and fast coloured yarn stripes, usually on solid blue ground. An old term used in American market for a converted Jean or warp sateen, with white and printed coloured stripes—also solid colours. Uses, shirts, nurses' uniforms.

Gingham.—Medium, lightweight, plain woven with carded or combed yarns. Woven on box looms with white and coloured yarns in balanced check and plaid effects, stripes and fancy weaves. Also known as apron checks, nurses' gingham. Fine combed yarn ginghams also known as Madras ginghams. Finest ginghams are made in Scotland. Uses, women's, children's wear, house dresses, aprons, pajamas, curtains, dolls, shirts.

Grandrelle Yarn Shirtings.—British shirting fabric, strong, long wearing, closely woven with stripes of both solid colour yarn and mottled Grandrelle yarn (one coloured and one white yarn plied together). White single soft twist weft yarns are used; twill or sateen woven.

Harvard.—A British shirting fabric usually made with a reversible 2/2 twill. Also made with fancy stripes and figures. Fine, coloured warp yarns and heavier soft white weft yarns. Has a soft texture.

Holland.—A firm coated, smooth, glazed finished window shade cloth. Print cloths and light-weight sheetings used as basic cloths; also made with corded effects. Heavily filled with starch and China-clay. Also painted with oil paints.

Hopsacking.—American cloth, name given to coarse, heavy, open, loose texture men's summer sportswear fabric. Similar to osnaburg but cleaner, lower thread count. Best qualities have 2-ply spiral yarns. Given a soft finish. Unbleached, also dyed, generally pre-shrunk.

Huckaback.—A narrow width huck towelling fabric made with a huckaback weave in which the heavier, softer, absorbent (weft) filling yarn floats to form the pattern. Bleached white, dyed pastel shades, also printed.

Jean.—Strong, closely woven 3-harness warp twill, finer yarn, higher thread count than American drill. Bleached—used for middy blouses, dyed—used for work shirts, semi-dress shirts, corset and shoe linings, camp clothing.

Jeanette.—British name for lighter weight, weft faced twill with almost square construction. Also made with more picks than ends. Similar American cloth is called 3-leaf filling twill, made of print cloth yarns, dyed and given friction calendered finish for "Silesia" lining finish. Also dyed khaki, used for work shirts.

Lappet.—Name of an embroidered, decorative design woven in the loom over a plain woven lawn type fabric. Design is formed by the weaving of extra (heavier) warp yarns by needles, in warpwise direction. The floats of these heavier warp yarns produce the pattern, which is repeated across the width of the cloth and also in the length of the cloth. Usually bleached or piece dyed, used for summer dress wear.

Lawn.—Basic, fine, combed yarn, plain woven gray fabrics of various qualities used in the converting of fine, closely woven and sheer fabrics used for dresses, uniforms, underwear, infants' wear. They are bleached, dyed, printed and often mercerized. Converted fabrics of this type include crisp lawn, stiff organdy (finish), muslin, lining plissé crepe, nainsook. Lawn is also the name of a starched, crisp finish. These finished lawns have various names such as India lawn, Victoria lawn and Persian lawn (which is the finest made). Handkerchief lawn is usually high thread count lawn with a soft finish.

Leno.—Also called gauze weave, in which cross weaving of warp yarns produces an open weave porous texture and prevents slipping or the displacement of the filling yarns. Used on mesh cloths, marquisettes, etc.

Limbric.—Flat, lustrous dress goods; curtain fabric (British) like casement cloth, has much finer warp yarn than weft, and usually has a higher thread count. Similar to cotton pongee (American) but has heavier yarns.

Longcloth.—Name of a finished, medium or fine thread count cloth in a pure finish. Heavier than lawns, cambric, muslin fabrics. Printers, print cloths and finer yarn plain woven cloths used for converting. Used for pillow cases, children's underwear, household uses, collars, hospital uniforms.

Madras.—Combed, single yarn shirting fabric, lighter weight than broadcloth, almost square thread count with dobby or Jacquard woven designs of fancy stripes or all-over patterns in all white or white and coloured yarns.

Curtain Madras or Curtain Grenadine.—An open texture fabric with leno woven ground cloth, usually a marquisette of fine yarns. On the face is a decorative design at spaced intervals, woven with extra picks of heavy white roving. In between the pattern repeats, the roving floats along the back of the cloth and is afterwards clipped or sheared off as closely as possible. Produces a "lace" effect. Dyed yarns often used for ground.

Marquisette.—Sheer, leno woven, open texture, curtain fabric. Best qualities made with combed mercerized and gassed ply yarns. Leno weave prevents slippage of filling yarns. Made with strong, closely woven wide tape selvages. Cheap qualities made with carded print cloth yarns (30s to 40s). Mostly dyed ecru and given plain or mercerized finishes.

Moleskin.—Also called Imperial sateen (in British market). Strong, smooth face, heavy, coarse yarn filling face twill (or sateen) has about twice as many picks as ends. Dyed and duplex printed (on both sides) to imitate woven striped suitings. Largely used for men's work trousers. Solid colours used for sheepskin-lined winter coats. Napped on back for bulk, warmth and softness. Given short close suede finish on face and used for windbreakers, suede jackets, winter shirts. This fabric belongs to the old British Fustian type of fabric.

Mull.—Very bright, pure starched, finished, plain woven, lightweight combed yarn, bleached fabric of lawn type. Finish similar to nainsook, muslin or batiste. Also known as Swiss mull, India mull. Largely used in Far Eastern markets.

Muslin.—Soft, pure, finished, plain woven cloth of the lawn type. Bleached, dyed or printed. In American market muslin is also a white piece goods finish. Staple bed sheetings are given a pure muslin finish. Somewhat dull and "clothy," cheaper qualities have back filling. Gray print cloths and lighter weight sheetings also called unbleached muslin.

Nainsook.—Bleached, also dyed pastel shades, soft finished, light weight, usually combed yarn, plain woven lawn type fabric, slight lustre, no sizing used. British nainsooks also known by general term of white shirtings in export markets. Embroidered, used for nightgowns, infants' dresses, underwear.

Organdy.—Very light, transparent, stiff, wiry, finished, plain woven, open texture, finer yarn, lawn type fabric. Is about the finest and sheerest fabric made. Generally bleached, also dyed, printed. Usually mercerized and given very crisp permanent Swiss organdy finish or a firm starched organdy finish. Same cloths also converted into a crisp blister crepe, a soft, Swiss, "cloudy" opal finish or lustrous mull finish.

Osnaburg.—Rough coarse uneven yarn, low thread count, plain woven gray cloth made of all low grade cotton or part waste cotton. When unbleached has dirty appearance due to presence of motes (particles of seed). Converted by bleaching, dyeing, printing and known as crash, suiting. Given mercerized and chased finishes. Has linen-like appearance. Largely used in unbleached state for bags, embroidery purposes. Similar but cleaner, lower count, soft finish, unbleached and dyed single and 2-ply yarn cloths called hopsacking.

Oxford.—Shirting fabric, heavier than broadcloth made of fine warp, heavy filling yarn. Every pair of warp ends runs together (or double ends) and weaves as one with each pick. Usually has twice as many ends as picks per inch. Generally bleached or dyed shirting shades. Also made with dyed warp yarns and white filling—known as chambray oxford. British oxfords also made with fancy stripes and checks. If made with single ends are known as single end oxfords.

Percale.—When applied to bed sheeting, an all combed, plain woven high thread count, smooth, soft finished fabric. Cheaper quality, called light percale, is lighter weight, carded yarn, lower thread count cloth. Is finer than muslin type sheeting. Percale sheetings never have less than 180 threads per square inch.

Percale (Printed).—In American market a widely used, plain woven, carded yarn printed fabric usually converted from standard print cloths, by bleaching and printing with designs suitable for dresses (house, street), pajamas, children's wear, sportswear, etc.

Pique.—American carded or combed yarn fabrics are always warp piques with narrow raised cords or wales running warpwise (lengthwise). Very narrow cord called pin wale. Pique is a lighter made Bedford cord. Better qualities have additional coarser warp ends woven along back only under each cord to help raise it.

Pique.—British, weft fabrics with distinct cords, also called Toilet Welts, similar in appearance to Bedford cords except cords or welts always run widthwise. Fancy piques are compound fabrics made with quilted or puffed designs also known as Vestings. Face fabric has closely woven fine yarn design. In places where both fabrics are separate, design has raised or embossed appearance. Plain corded piques and fancy piques are used for white dress shirts, shirt fronts, white waistcoats, dress goods, etc. Made all white and white with coloured yarns.

Poplin.—Plain woven fabric with ribs (running widthwise), in all white, solid colour, printed or yarn dyed stripe effects. Best qualities have ply or single combed yarns, also made with single carded yarns. Finer yarn and higher thread count poplins with finer ribs are called broadcloths (in American market only). Poplins have about twice as many ends as picks, the fewer spaced weft yarns producing the characteristic rib effect. This is more pronounced when heavier weft yarns are used. Light weight poplins used for shirtings, summer sportswear; heavier weights for raincoats, ski-wear, and sportswear.

Print Cloth.—American basic carded yarn, plain woven medium weight staple fabrics using yarns from 28s to 42s. In the American market the most widely used cotton fabrics for converting. Given many different kinds of finishes for various trades and uses, having different names. Often used as substitutes for better cloths of same name. Names of finished cloths include printed percale, cambric, lawn, organdy, printed shirting, muslin, crepe, lining, canvas, chintz, interlining, bias binding.

Printers.—British fabrics—known as Cheshire or Burnley printers. Basic gray cloths which are similar to print cloths. Bleached, dyed, printed for home, colonial, export markets. Finished cloths include printed shirtings, printed dress goods, drapery fabrics and a group of finished cloths referred to as white shirtings.

Pile Fabrics.—General name for velveteens, corduroys, cotton velvets, plush or velour having a cut pile surface. The pile is formed by extra warp or filling yarns which float on face and are afterwards cut, producing a surface of soft brush-like hairs which stand upright from ground of cloth. Pile can be an all-over effect as in velveteen or in cord effects warpwise as in corduroy. Pile fabrics can also have uncut loops as in turkish towelling or terry cloth.

(*a*) *Velveteen.*—This name always applies to a cotton or rayon filling pile fabric. British term for cheaper qualities of cotton velvets.

(*b*) *Plush or Velour.*—A warp pile fabric with a higher or longer pile than velvet or velveteen, made from a double (plush) fabric in which two fabrics are woven face to face and afterwards split producing two separate pile fabrics.

(*c*) *Velvet.*—British name for best qualities filling pile fabrics. In American market name for a warp pile fabric which is first woven double and then cut to form two separate velvets in similar manner to plush.

(*d*) *Corduroys.*—Filling pile fabric in which pile is in form of narrow or wide wales or cords running lengthwise. Pile fabrics are made of all cotton, rayon face, mohair face, silk face. The better qualities of pile fabrics have a twill back and a dense deep pile.

An old British term for heavy weft face cloths of either cut pile or flat woven fabrics was Fustian (*q.v.*).

Pongee.—Cotton pongee is smooth, flat, very lustrous, plain woven, usually made of combed yarns. Bleached, dyed ecru, other colours. Usually, mercerized and chased or mercerized and Schreinered for a high lustre. American pongee (also called soisette) is made with more picks than ends. Filling yarns are heavier than the warp, producing a very flat lustrous finished cloth. British pongees are usually made with heavier warp yarns than weft. They often have more ends than picks and also are made in square thread count construction.

Quilt Fabrics.—Dobby or Jacquard woven fabrics in all bleached white, or white and coloured yarns with quilted, raised or flat designs used for spreads, counterpanes. British-made quilt fabrics include Patent satin or Mitcheline, Toilet, Marseilles, Alhambra, Crochet, Honeycomb. Mitcheline or Patent satin, Marseilles and Toilet are heavy compound fabrics. Finer yarns are generally used for design on face cloth and heavy yarns for back cloth. Alhambra, Honeycomb and Crochet quilt fabrics are cheaper, lighter.

(*a*) *Mitcheline,* named after D. Mitchell, is a heavy double fabric made of white and coloured yarns in which the design is in solid colour. Also made all gray and bleached white.

(*b*) *Satin or Patent Satin.*—Very similar to and really an improvement or a modification of Mitcheline. All bleached white also white or coloured figures on a coloured ground. No satin weaves are used, however.

(*c*) *Toilet.*—A heavy, double woven, fancy woven, pique type fabric, all bleached white, has embossed or raised figures on face (plain woven fine yarns) on coarser rough plain woven ground cloth.

(*d*) *Marseilles.*—Double woven fabric, heavy, firm texture. Reversible quilted or raised patterns.

(*e*) *Alhambra.*—Has white and coloured large decorative designs. Lighter weight.

(*f*) *Honeycomb.*—Soft, loose texture, ply warp, soft twist weft yarns, lighter weight, raised and depressed patterns, resembling honeycomb or waffle effects. All bleached white.

(*g*) *Crochet.*—A medium weight, dobby or jacquard woven with fine crochet or lace like designs. All bleached white, lighter weight.

American-made quilt fabrics include a number of white and coloured yarn quilt fabrics of various weights made with flat or quilted designs which are referred to generally as Jacquard bedspreads or according to type of pattern used such as Colonial, Peasant, Dimity, Crinkle stripe, etc.

(*h*) *Ratine.*—Plain woven, bulky, soft, spongy texture fabric. Made of different size yarns irregularly plied. Also known as Eponge. British name for the type of yarn used is Gimp yarn.

(*i*) *Repp* (Weft or Filling).—Woven cloth with prominent ribs running widthwise. Heavy weights made for upholstery, drapery purposes; lighter weights for shirtings, dress goods. Has from two to three times more ends than picks. Similar to heavy poplin but has more prominent rib. Very coarse rib known as Grosgrain. Rib effects are formed by the use of fewer number of coarse ply filling yarns. Finer rib shirting repp made by tension and slack weaving of warp ends, with low number of picks, known as tension repp.

(*j*) *Warp Repp.*—British cloth. Has about half as many ends as picks with ribs running lengthwise. Also made with figured effects, also called Moreen.

Sateens, Cotton Satins, Satin Drills.—British fabrics of this type if formed by warp are called warp satins, satin drills. If formed by the weft are called weft satins, weft sateens or Italians (high count). American fabrics are called warp sateens, filling sateens. They are flat, smooth-faced cotton fabrics made with a satin weave, the third foundation weave. Made with 5 harnesses either warp faced or weft faced. In weaving a warp sateen each warp yarn floats over four weft yarns and interlaces with the fifth weft yarn (weft satins are made vice versa). The bindings or interlacings are as far apart as possible to obtain a smooth face and to avoid a diagonal line effect. Because of their smooth flat surface, especially the weft satins, they take a highly lustrous finish when mercerized and Schreinered. Usually dyed black and colours. Used for linings, underwear, umbrellas. Warp faced satins generally are stronger, firmer cloths of heavier carded yarns. British cloths of this type are called satin drills. Bleached firm finish used for tropical suitings, washable clothing. Dyed and used for outdoor sportswear, uniforms. Printed, used for mattress ticking, draperies. Light weight soft, silky fine combed yarn warp sateens when highly mercerized and Schreinered are called charmeuse satins or sateens. A twill faced weft sateen is also made by having repeat of weave run in same direction as that of twist in the weft yarn—also known as "French Twill Sateen." Eight-harness, warp satin called Venetian.

Scrim.—Plain woven, loose, open texture, curtain fabric of ply combed yarns woven with strong wide tape selvage, sometimes has fancy woven border. Heavier ply yarn (combed) fabric is also known as Hardanger cloth.

Seersucker.—Also called Crimp (British). Summer dress and suiting fabric with characteristic woven crinkle stripes formed by slack and tension weaving of alternating sections of warp ends. Made all white, white alternating with coloured stripes, checks. Given plain finish, pre-shrunk finishes.

Serge.—A reversible 2/2 or similar even sided cotton twill. When made with 2-ply yarns they resemble worsted serges in appearance. Very fine ply yarn, high thread count serge twills are used for highest grade raincoats (dyed and given water repellent finish). Dyed, printed, used for suitings; coarser yarn serges are napped for flannel effects.

Sheeting.—British sheetings are made in plain or twill weaves. The regular plain woven narrow sheetings are strong, serviceable cloths. Generally given a white Croydon finish. Medium weight narrow British sheetings also called domestics.

Wide bed sheetings usually have a high thread count. Twill woven sheetings usually have heavy condenser weft yarns which have a low twist giving the fabric a soft texture. Warp yarns used are generally finer and stronger. American sheetings are always plain woven, mostly of carded yarns. Narrow sheetings up to 40in. are largely used for converting into several standard finished cloths known by various names according to use or finish. These include canvas, cretonne, suiting, crash. Also used in unbleached state for grain, feed bags, base for coated fabrics, covers for mattresses, cushions.

(*a*) *Wide Bed Sheetings.*—Strong, higher thread count than narrow sheetings. Bleached and given a muslin finish. Cheaper, lower thread count qualities, are backfilled. Sold in unbleached state as brown sheeting. Standard muslin sheeting constructions are 68x72 and 64x64 threads per inch.

(*b*) *Percale Sheeting* is a combed yarn, fine, smooth texture sheeting having approximately 200 threads per square inch. Lighter weight, carded yarn, lower count sheeting also called lightweight percale, has a finer yarn and a higher thread count than the best muslin sheetings. Percale sheeting never has less than 180 threads per square inch. Sheetings generally have a balanced or square thread count.

Shirting.—General name for plain and fancy woven fabrics used for shirting purposes such as broadcloth, poplin, oxford, harvard, grandrelle. Given mercerized, chased, pre-shrunk finishes. White shirtings is also a general British term for white finished fabrics which include longcloths, cambrics, muslins, various pure sized and back filled finishes used in foreign export markets.

Ticking (*Bed Ticking*).—(*a*) Woven design ticking, (*b*) converted ticking. Strong, closely woven fabrics used for the covering of mattresses filled with hair, feathers, cotton, etc. Best tickings are closely woven, warp faced fabrics made in satin and twill weaves with coloured yarn warp stripes in various weights and constructions. Also made in elaborate Jacquard panel designs. Plain woven, coloured warp, white filling, lighter weight pillow ticking is known as Bohemian ticking.

Tickings, Converted.—Some of these are cheaper type tickings. Warp sateens, drills and light weight narrow sheetings are used. Usually printed with floral designs. The lower thread count qualities are given a backfilled finish to fill up the interstices and to add weight.

Twill is the second foundation weave. A warp twill is formed when the warp yarn floats over two or more weft yarns before interlacing [and vice versa for a weft (filling) twill]. These floats produce diagonal line effects which run upwards to left or to right selvage. Names of twills vary according to number of harnesses used, their origin, use, etc. To obtain most prominence the diagonal line in a twill usually runs in the same direction as the twist in the yarn. If warp yarn forming twill has Z or warp twist twill will run upward to left selvage. British twilled cloths are generally called drills if formed by warp and twills if formed by weft yarns.

Velvet-Velveteen.—See *Pile Fabrics.*

Venetian.—Strong, heavy, very lustrous, smooth surface, 8-harness warp faced satin. Usually made of combed 2 ply warp yarns with ZZ twist (ply yarn is twisted same direction as single), and combed or carded single weft yarn. Bleached, dyed, and given mercerized and Schreinered finishes. Used for overcoat linings, dress goods, drapes, cushion covers.

Voile.—Clear, open texture, wiry yarn, plain woven, combed yarn, square construction fabric. Best qualities made with combed, mercerized and gassed ply yarns which have ZZ twist. American voiles are usually combed single yarns with hard, medium or slack twist. British single yarn voile also called voilette.

IV. COTTON TRADE AND ORGANIZATION

A. COTTON YARN OUTPUT

Yarn.—Cotton yarn used as an article of commerce is made from raw cotton which has been prepared by carding, combing (in combed yarns only), drawing and spinning to form a compact single yarn strong enough for its particular use. Cotton yarns are made for weaving, knitting, plaiting operations and for conversion into thread, twine or cordage. There are two main divisions, carded and combed yarns.

Carded Yarn is made from cotton fibres cleaned of most of their impurities by carding, drawn out and evened up by drawing and doubling, twisted into yarn by spinning. Carded yarns generally run from 1s to 50s, American; up to 120s, British.

Combed Yarn is made from finer, longer fibres than used for carded yarn. In addition to being carded the fibres are combed to remove all short fibres, motes and all other impurities, drawn out and evened up by drawing and doubling, twisted into yarn by spinning. Combed yarns can be made in all counts. They are generally made from 10s up to 200s and for special purposes as fine as 300s. Most cotton yarns are spun from unbleached cotton. Three systems of cotton spinning are used: mule, ring, condenser.

Mule Spun Yarn.—In this system cotton fibres in the form of fine roving are drawn out finer, twisted or spun into yarns and wound onto bobbins—all three operations being intermittent. Produces a fuller, more even, rounder and a finer yarn from the same cotton spun on the ring frame. All numbers of yarn can be spun on the mule frame (up to 300s). Fine yarns (above 120s) can only be spun on it. Coarse, lofty, soft spun, bulky cotton waste yarns are also spun on the woollen mule and are called wool spun yarns.

Ring Spun Yarn.—On the ring frame the cotton (roving) is drawn out finer, spun into yarn and wound onto bobbins. All three operations being continuous. The ring frame has a greater production than the mule frame. Used for coarse, medium and fine yarns up to approximately 120s.

Cotton Waste Spun Yarn.—In the spinning of cotton waste yarn a coarse, heavy, soft, low twist, roving type yarn is produced. Because of the short fibres used (card and comber waste) they are not given the usual drawing operations. Also, depending upon which kind of waste used two different methods of carding are used: (*a*) where low grades of waste and fibres of mixed length are used they can only be carded on the wool card; (*b*) where better grades of cotton waste are used they are given regular cotton carding treatment. After carding, the card sliver is spun on one of the fly frames into heavy roving yarn—the drawing processes are left out. The later spinning frame operations also are omitted except for finer counts, *i.e.* 8s to 10s. Wool carded cotton waste yarns known as wool spun waste yarn are softer and fuller. Cotton carded waste yarns are cleaner, less even, but stronger. Some of the better cotton waste yarns are often superior in colour, cleanliness, etc., to some weaving yarns, *i.e.* used in Osnaburgs. Waste yarns are made from 1s to 6s and largely used in 4 to 6 ply for mops and for packing and for cheaper insulation purposes. Coloured waste yarns are made 1s to 10s used in 3, 4 ply for carpet yarns, hosiery.

Yarn Numbering.—Yarn is known by its number or counts. Method of numbering is universal. The number of hanks (each 840yd.) which equal 1lb. denotes the yarn number, *i.e.* in one pound of No. 10 cotton yarn (or 10s counts) there are 10 hanks or 8,400 yards. Cotton yarns generally start from 1s and are made as fine as 300s commercially.

Yarn Twist.—The number of twists or turns per inch given the yarn at the spinning frame depends upon its use—weaving, knitting, plaiting, cordage, etc. Constants are used which when multiplied by the square root of the yarn number give the number of twists per inch to be inserted, *i.e.* 9s warp yarn $\sqrt{9}=3\text{x}4{\cdot}75$ (warp constant) $= 14\frac{1}{4}$ turns per inch. Different constants are used for various types of yarn.

The direction of twist in the yarn is referred to in the American market as Z or S. Z twist is also called regular, warp twist or "twist way" (British). It has an oblique line or spiral (when held vertically) which runs from lower left to upper right as the up and down line in letter Z. S twist also called reverse twist or "weft way" (British) has a spiral line (when held vertically) from lower right to upper left as the up and down line in the letter S. American weaving yarns used in both warp and filling are generally spun with Z twist. British weaving yarns generally have Z twist for warp and S twist for weft.

Varieties of Cotton Yarns

Single Yarn.—A continuous length of compact twisted fibres in yarn form, strong enough for its particular use. Practically all American spun yarns have Z twist. S twist is used for special purposes only. British spun yarn when used for the warp has Z twist and is called "twist" yarn. Yarn for the filling is called "weft" yarn and is generally S twist unless otherwise specified.

Warp or "Twist" Yarn.—Weaving yarn given a determined number of twists per inch for strength in weaving. Constants used vary from 3·50 to 4·75. Has Z twist.

Filling or "Weft" Yarn.—Weaving yarn which generally has less twists than warp yarn and therefore a softer, fuller yarn and as a rule not as strong. Constants used vary from 3·00 to 4·25. Has S twist.

Soft Twist Filling or "Weft" Yarn.—Weaving yarn used in special twills and sheetings. Has a low number of twists per inch so that cloth can be easily given a raised nap, Flannel type finish. Constants used vary from 2·50 to 3·00.

Part Wool (Spun) Yarn made with (new) short staple China and some Indian cottons and wool fibres. Because of their harsh wiry nature these cottons are more easily run on the wool system of carding and spinning (mule). Varying percentages of wool fibres are generally mixed with these cottons for part wool mixture yarns for use in blankets, hosiery, etc.

Condenser Waste Yarns.—British waste yarns used for weft yarn in blankets, sheetings, twills, etc., (for napping) are made from: (*a*) soft waste (card and comber waste), (*b*) hard waste (cotton yarn or thread waste torn up into fibres, and treated with soft soap and water for processing). The waste fibres are carded, rubbed between leather covered rings into cylindrical or sliver form on a "condenser card" and without any drawing processes is spun on "condenser mule" into 1s to 12s yarns.

Knitting-Hosiery Yarns are carded or combed. Coarse, medium and fine count single and ply yarns made with "knitting" twist, softer than that used for weaving. Constants used 2·50 to 3·00. Yarns include 6s, 12s up to 50s single carded, 20s to 80s single combed, 36/2 to 120/2 ply combed, plain or mercerized.

Heather Carpet Yarns.—Blended coloured waste fibres from card strips mixed with good white cotton made 4, 5, 6s singles and then into ply yarns of 3, 4, or 5 ply.

Roving Yarn.—Heavy, soft, cotton waste roving yarn. Usually is flyer spun from carded sliver on one of the fly frames (slubber, intermediate or roving frames), with sufficient twist for strength for weaving. Higher grades are sometimes made from new cotton but generally roving yarn utilizes unbleached or coloured cotton waste. Used when plied for mop, some candlewick yarns, and for warp or filling yarn decorations, coloured (or unbleached) in curtain and drapery fabrics.

Multiple End Yarn.—Two or more single or ply yarns wound parallel alongside each other without twist. Used for maximum coverage for insulation purposes in wrap spinning of electrical copper wiring or flat or tubular braiding.

Ply Yarn (American), Folded Yarn (British).—Two or more ends (yarns) twisted together by plying or doubling. In the plying of Z twist yarns, S twist is generally used (or ZS). (2/80 is British, 80/2 is American way of expressing ply.) Majority of ply yarns made are 2-ply. Largely used where strength is required—in heavy, wide or number duck or canvas, army ducks. Also in finer cloths as aeroplane cloth, voiles, broadcloths.

Voile Yarn.—British voile yarns are fine, smooth, round, wiry yarns, hard twisted, mercerized, and gassed, 80/2 to 220/2. If Z twist is used in single, Z twist is also used in the ply so that yarn has "twist on twist" in it (or ZZ twist). In the American market, single hard twist or medium hard twist voile yarns are chiefly used. Single voile yarns in English market are known as "mock voile."

Crepe Twist Yarn.—Extra hard twisted cotton yarns, single or ply yarn, twisted so much that when woven into a fabric and wet out in finishing, considerable contraction takes place, creping the fabric permanently. Twist constants run up to 7. Made with both Z and S twist. In weaving, alternating pairs of each twist are used in both warp and filling for a balanced crepe fabric.

Multiple Ply Yarn.—A large number, *i.e.* up to 72 ends folded or plied together. Specialty ply yarns used for wrapping twine, cordage purposes. Polished butcher twine is made of 8s/72.

Cable Yarns.—These are made of two or more ply yarns twisted together. Several varieties are made for cordage, tying twine, fish nets, etc. When cable yarn is made with ZSZ twists it is known as cable twist. When cable yarn is made with ZZS or SSZ twists it is called Hawser twist and is a tighter, wiry yarn.

Cable Twist Yarn when made in 8/2/2 usually coloured, is sold as "Sea Island Twine." Made in 23/5/3 is a tire yarn used in rubber cord tires.

Hawser Twist Yarn when made 20/2/2 or 20/2/3 used for core of safety fuse.

Seine Net Twine.—Both cable and hawser twist yarns are used in making of fishing nets. In machine manufactured nets they are used alternately to balance the shrinkage or contraction. 10s single yarns are always in the first ply and these vary from 2 up to 32 ends used. In the second plying 3 plies are used. Always sold by a number which indicates the actual number of single yarns used. Starting with No. 6, in which 10/2/3 or a total of 6 singles are used, up to No. 96 in which 10/32/3 (or 96 singles) are used. Made in medium and hard textures (more twist used in latter).

Tobacco Twine.—Largely used for tying tobacco plant leaves. 8/3 or 8/4 ply used (put up 6 balls to a pound, 30 balls packed in 5lb. bags).

Thread or Spool Cottons.—Used for sewing and embroidery purposes, are specially twisted and processed, combed, ply or cable yarns. They are gassed, waxed and polished and in some cases mercerized. Only the finest and strongest cottons are used: Sea Island, various grades of Egyptian. Single yarns used vary from 32s up to 150s. These are twisted into 2-ply yarns, called 2-thread or 2-cord, 3 or 4-ply called 3-cord, 4-cord. These yarns are made with ZS twists. Sewing thread is also made in 6 cord thread. This is made 2-ply, and three of these are then plied together to make a cable yarn. Twists used are ZZS. In twisting the yarns, dry or wet doubling is used. In wet twisting the yarns are passed through a water trough. This sets the twist in the yarn and gives it smoothness and strength. After twisting, the yarn is gassed to remove projecting fibres, and is bleached or dyed or used in the natural. If no finish is given the thread it is termed soft finish. Most sewing thread is given a waxing treatment for "silk," polished or "glace" finishes. Thread is also mercerized for strength and lustre. The numbering or ticketing of thread is arbitrary. Where the term 2 thread is used the single yarns used are approximately 50% heavier, *i.e.* in 70 two thread 36s/2 are used. Where the term 3-cord is used the number often (but not always) indicates the actual yarn number used in the singles, *i.e.* in 30 three cord, three ends of 30s are used. Where the term 6-cord is used the number used is in some cases approximately twice as fine as the single yarns used, *i.e.* in 36 6-cord, 6 ends of 70s are used, in No. 50 6-cord, 6 ends of 100s are used. In No. 100, 6-cord, however, 150/6 are used. These variations in the counts of the single yarns used occur when strength of thread is specified, the yarns often being changed to meet this requirement. Also where silk or polished finishes are used the yarn is stretched, made harder and thinner and actually is a lighter yarn than the original.

Crochet Thread.—These are soft twist ply yarns of two, three or four ends, usually combed, also carded. In plying, the twist used is the reverse to that of the single. They are given a soft finish or a mercerized finish. Yarns include 3/2, 8/3, 12/4. Crochet thread is also made in 6-cord cable twist (50/2/3).

Lace Thread.—Combed and gassed hard twisted super combed yarns of Sea Island, Egyptian, fine American cottons 60/2, 100/2 up to 300/2, used for plaiting into fine nets, laces. (They are known as Brass Bobbin yarns which are flattened for use on Levers and Nottingham lace machines). Combed single yarns are also used. Carded yarns are used for the heavier laces: 12/2, 20/2, 30/2 up to 50/2 in both soft twist and hard twist.

Lisle Thread.—Combed, gassed, smooth, mercerized ply yarns of Egyptian and fine American cottons with harder twist than used as weaving yarns (from 50/2 to 80/2). The name lisle was originally applied to mercerized hosiery yarn made in Lisle, France.

Coloured Yarns.—Generally single yarns dyed in solid colours. They also can be made from stock dyed cotton fibres.

Blended or Mixture Yarns.—These are single yarns made from contrasting or white and coloured fibres blended to form Oxford grays, heather mixtures, etc. Fibres are stock dyed.

Mottled or Two-Tone Yarns.—These are single yarns of half white, half colour or of two contrasting colours. Spun from two rovings, one white, one coloured roving or two different coloured rovings. Called mock twist or mock grandrelle (British), used mostly in coverts, mottled flannels, etc.

Flecked or Random Yarn.—A single yarn throughout which appear flecks of coloured fibres. These are added at the delivery end of the card (or later processes) to form a coloured flecked white yarn. White fibres are also added to stock dyed cotton to form a white flecked coloured yarn.

Printed Yarn.—In which roving or single or ply yarn is printed with a pattern of one or more colours throughout. Used in warp for decorations, in flannels, shirtings, tie fabrics, warp printed cretonnes.

Resist Yarn.—Used as decoration, stripes, etc. in woven fabrics, clocks, in hosiery. Also known as immunized yarn. White or dyed yarns (or cotton fibres) chemically treated so that in dyeing of goods the ground cloth is dyed but resist-treated yarn is not affected.

Grandrelle Yarns.—British name for 2-ply shirting yarns, 1 white, 1 coloured yarn plied together. Also made with contrasting colours.

Novelty Yarns.—Are usually ply yarns with special effects formed by the plying or doubling of contrasting sizes of yarns, variations in speeds in feeding the yarns in plying. Usually referred to by number of yards per pound *i.e.* 1,600yd. per pound.

Spiral.—Two different size single yarns, one soft and heavy, one fine, plied together. In plying, the heavy yarn, called the effect yarn, is fed in excess of the fine yarn causing the heavy yarn to wind around the fine yarn in a spiral formation; are usually twist on twist.

Corkscrew.—Heavy and fine single and ply yarns plied evenly give similar effect to spiral yarn but effect is more pronounced. Yarns used may or may not be of opposite twists.

Seed Yarn.—Also called nub yarn. Has bunches of knots at regular intervals half-inch apart or more. A core yarn of 2 ply white yarns and one to three different coloured fine single yarns are used. Where three coloured yarns are used they are first evenly plied with the core yarn then one of the coloured yarns is fed in excess of the others, causing it to collect and form a knot or seed effect. All three yarns are then plied evenly with the core yarn, after which a seed effect of another colour is formed in the same way as before. This is repeated so that three different coloured seeds are formed, each successive seed effect being of a different colour.

Chenille Yarn.—This is not a spun yarn but is a yarn cut from a specially woven cloth known as chenille weft fabric. Made with fine, ply warp yarns Leno or plain woven in groups (with spaces in between) and soft twisted heavy filling yarns, carded or combed. The chenille yarn is produced by cutting the fabric lengthwise in between each group of warp ends. The cut yarn has projecting tufts (cut weft yarns) along its sides, held tightly in place by the firm woven warp ends. Chenille yarn is designated as 3-cut, 6-cut, etc. These represent number of cuts per inch—the more cuts, the finer the chenille yarn.

Ratine Yarn.—Uneven yarn with loop effects throughout. Made of three or more different size yarns, unevenly plied together. Where three yarns are used (6s, 20s, 20s) one of 20s, known as the core yarn and the 6s are plied together. The heavy, softer 6s yarn is plied in excess, causing it to wind itself in a loose loop formation around the core yarn. The other 20s is then plied evenly with the first ply to bind it (otherwise the loops would slip). The third yarn (20s) is called the binder or tie yarn. Coloured ratine yarns used in drapery, upholstery fabrics. Also made natural (unbleached) and used as warp and filling yarns or filling only in ratine fabric, already described in *Cotton Fabrics.*

Bouclé Yarn.—Similar to spiral yarn but has more of a spiral. A ply yarn of two fine yarns and one coarse yarn are twisted together (twists used are generally twist on twist). The heavier yarn is fed so that it winds in a very definite spiral around the outside of the ply yarn.

Slub Yarn (*Himalaya, Shantung, Cloud or Snowflake Yarn*).—Also called flake yarn. Usually single yarn which has thick places throughout, other places being regular spun yarn. Effect produced at spinning frame by special attachments or gears which cause variations in feeding. The heavy parts of the yarn are not twisted as much as the regular spun, thinner parts. Flake, snowflake, cloud or shantung is short, heavy slub. Himalaya slub is usually long continuous, heavy slub—as much as 36in. long and longer. Slub yarns are generally used for filling only in broadcloths, Osnaburgs, drapery fabrics. Slub yarns are also plied evenly with a single yarn for strength.

Bourette.—Variation of a slub yarn. Made from single or ply core yarn to which is added at the spinning frame, at intervals, pieces or portions of heavy roving yarn. Heavy places or slubs are formed wherever the pieces of extra roving have been combined with the core yarn. Natural or coloured rovings are used. Similar (British) yarn to which bunches of coloured fibres are added is called Knickerbocker or Knicker yarn.

Core Yarn.—Yarn made with a single cotton yarn as a core plied with a heavy, bulky cotton yarn (usually China or Indian cotton) covering the core. Used as filling yarn in blankets, which when napped retains most of its strength. Woollen or cotton and woollen mixture yarns are also made with cotton core.

Rubber Core Yarn.—These yarns have a round or flat rubber core of varying sizes around which are wound cotton yarns used for covering. A fine, single combed yarn (80s, 100s) is wound around the rubber core first in one direction and a second yarn is then wound in an opposite direction, giving complete coverage. Referred to by number of yarns to the pound *i.e.* 1,600yd. yarn.

Union or Mixed Yarn.—Single cotton yarns made of cotton and wool or other fibre mixed or blended together. Part wool yarns are made with varying percentages of wool and cotton for hosiery, underwear, etc. Other fibre mixtures used with cotton are linen, cut rayon fibres and silk fibres. The British name for fine wool and cotton mixture yarns is Angola.

Bump Yarn.—British local term for coarse, heavy blanket yarn, usually heavier than No. 1, and referred to in yards per ounce *i.e.* 50s bump yarn (or 50yd. per ounce). Also used for wadding yarns in heavy quilt fabrics. (J. He.)

B. COMMERCE IN COTTON YARNS

The term "cotton yarn" means yarn produced by spinning companies for sale to consumers who either finish it for further sale or manufacture the yarn into finished goods. The cotton sales-yarn business has been on the decline since 1926, due to an over-expansion in the industry during the decade just previous to 1926, and, in great measure, to the swing from cotton to silk and synthetic fibres in wearing apparel styles. In the United States, for example, in 1929 647,725,439lb. of yarn was produced for sale. This was 22% of the total yarn produced. But in 1937 (a "good" year) only 534,000,000lb. or 17% of the total production was manufactured for sale. Yarn is sold to the weaving, knitting, mercerizing, braid, narrow fabrics, wire-insulating, lace and other yarn consuming trades. Yarn may be carded or combed, single or ply. Combed yarn is of a higher quality than carded yarn, having been spun from longer staple cotton (usually 1⅛in. or longer) of strict middling grade. It goes through a process, beyond that necessary in manufacturing carded yarns, which combs out all the short fibres of cotton not taken out by the card machine. Combed yarn has high tensile strength, durability, lustre and smoothness—all brought about through the numerous doublings throughout the process of manufacture. Combed yarn in a fine number such as 100s has been doubled 1,500,000 times,—and numbers as high as 400s have been spun on mule-spinning in Great Britain. (The number of yarn denotes the size and is based upon the formula No. 1 yarn contains 840yd. and weighs one pound—No. 10 yarn weighs one pound and contains 10 times 840 yards.) Single yarn is one strand, plied yarn may be two or more strands twisted together to form one thread.

The problems of commerce in cotton yarns are multitudinous, mainly due to unintelligent competition either on the part of the mills selling the yarn or agencies through which yarn is bought and sold. To attempt an understanding of the yarn marketing problems we should know something about the set-up of the yarn producing industry. The two principal cotton yarn manufacturing countries of the world are Great Britain with 10,751,-

000 ring and 28,002,000 mule spindles; and the United States with 26,488,000 ring and 500,000 mule spindles (1935 figures). These spindles include those manufacturing all yarns. The United Kingdom is especially equipped for export trade and was in 1936 the largest exporter of cotton goods, in terms of value, in the world. It sold that year ten times as much yarn and piece goods in foreign markets as did the United States. This may be due in some degree to the lower labour costs in Great Britain.

The over-production of cotton yarns and a declining consumer demand since 1921 have affected the markets in the United States and Great Britain in much the same way. An intensive price-cutting era prevailed in both countries. Great Britain has done more to remedy the trouble in its industry than has the U.S.

In Manchester the average spinning mill has 60,000 to 80,000 spindles. About 25% of the total spindleage is located near Bolton, the section which spins Egyptian cotton entirely. The remaining 75%—which uses American Upland cotton, is centred near Oldham. Every mill is represented on the Manchester Royal Exchange and the entire yarn production is sold directly by the manufacturer or through agents on the floor of the exchange.

The Redundant Spindle Act, a "gentleman's agreement" on the part of 80% of the spinners to uphold prices, and finally the Enabling Act were efforts in solution of marketing problems of British spinners. Under the Enabling Act, passed 1939, the following things are aimed at: standardization of mill efficiency, price control, and research. Every mill is registered and those who do not adhere to standards set by the bill find their licenses revoked. Under the Enabling Act no one may sell second-hand machinery to anyone else. They may sell it, however, to a Central Committee (which the bill provides for) at a standard price and then the committee disposes of the redundant machinery as it sees fit. Also, under the bill a small levy is placed on every mill, and out of this fund approximately $450,000 per year will be available for research and advertisement. Price standards are arrived at by using differentials based on the price of cotton, plus half the legitimate depreciation, plus interest on capital of a reasonably priced mill—or in other words, depreciation and replacement value. This bill controls production and price policies to such an extent that commerce in British yarns may be on a completely new basis.

In the United States there are two distinct yarn manufacturing sections: New England and the southern States. In New England mills are large units, average 50,000 to 60,000 spindles, but in the South mills are for the most part small, 10,000 to 20,000 spindle plants. Mills in the United States sell to their customers either direct through their own sales organizations, or through selling agents and brokers. The great majority of yarn mills sell through agents. This is mainly because small units are unable to maintain adequate sales forces of their own. The commission or selling agent charges a flat 5% of the sales value of the yarn for his services, but in this case he also is supposed to guarantee accounts receivable. In other instances the broker may charge only 2%—the mill assuming the credit risk.

In determining prices yarn mills must take into consideration labour, office expenses, depreciation, power, taxes, upkeep of mill village (if the mill is in the South), packing costs, freight, supplies, repairs, percentage of cotton waste, raw cotton, insurance (including social security), fuel, interest. The object of the game is to pay all these expenses and add a profit in to the price figure. Under the price cutting era practices, somewhere along the line costs had to be cut. Up until the Federal Wage and Hour Bill was enacted (1938) the cutting generally came out of labour costs. Under the Wage-Hour Law labour costs are pretty well stabilized throughout the industry. Raw cotton is always the same price for the same quality to domestic consumers. The result is, with those two major cost items on a level for mills, buyers should look to quality standards. The determination of quality standards involve the number of yarn; grade and staple of cotton; finish of yarn (for it may be gassed, mercerized, bleached or dyed); and put-up which may be on ball-warps, warps, cones, tubes, perforated tubes for dyeing, skeins, cops, quills. The put-up is governed generally by the trade to which yarn is sold.

Yarn manufactured for sale goes to: weavers who buy it on section beams, or warps, which carry about 400 ends, or threads, to the warp. Several of these are put on the slasher and run onto a loom warp which will hold about 4,000 ends, each being from 12,000 to 22,000yd. long depending upon the number of the yarn. The weaver also buys yarn for filling, put up on cones which they quill onto a cop, or they buy it ready quilled or copped.

The mercerizing trade buys combed yarn from the mills for finishing purposes: mercerizing, gassing, bleaching, dyeing. Mercerizers buy yarn on ball warps. They finish it, quill it or wind it on cones and re-sell it to knitters and to some weavers.

A large percentage of yarn, both combed and carded, is sold direct to knitters, on cones. This yarn is knit into underwear, hosiery, outerwear, and for industrial uses such as meat coverings.

The sewing thread trade buys yarn which they bleach, dye, mercerize, glaze, or wax. It is wound on cones and tubes when re-sold to the manufacturers of sewed goods, and on wooden spools when it is for the retail or home-sewing trade.

Carded and combed yarns go into wire-insulating, and converters dye, glaze and re-sell it for this purpose. It is wound on tubes but instead of one thread, several threads are wound on the tube together, which is a special process in itself.

Commercial dyers, who buy sales yarn on warps, skeins, perforated tubes, and perforated cones, re-sell it after dyeing it to knitters, weavers, etc.

The braid trade which manufactures shoe laces, corset laces, etc., takes quantities of yarn, as do the narrow-fabrics manufacturers who convert yarn into tapes and ribbons. Some of the finest yarns spun go to the lace manufacturers who make curtains and embroidery laces. This yarn is especially put-up on prepared brass bobbins made to fit the lace machines. Its production in America is a recent development in the fancy goods field.

Both selling and merchandising of yarn are weak spots in the American textile industry. Selling, other than through the mill's own organization, has not proved satisfactory and the malpractices developed by various type agencies have undermined the entire market structure, until at times it is chaotic. For instance: short-selling is practiced by agents when they act as merchants and offer considerable quantities of the yarn of a given mill under the market price which the mill authorizes, in the belief that they can obtain the yarn at a lower price in time for delivery. The agent runs the risk that the mill will refuse the order. If the mill refuses, the agent may lose his commission or more. The agent protects himself against such an outcome by reserving the right to deliver to the customer equivalent yarn from one or two other mills. Again, a mill may be asking a certain figure for a certain yarn when one of its representatives quotes to a customer at a figure less, and accepts the customer's order withholding it from the mill for a time hoping that the mill price will weaken to fit his order. In the meantime he is hammering at the mill to weaken. Whether the mill takes that price or not, its original price has been broken without its consent, and the result is a depressant in the market. This type of selling seldom occurs when the mill has its own sales force.

Another serious evil in marketing yarn is the speculative buying of yarn in large quantities, with the hope that the market will advance and reap a profit to the purchaser. Often this purchaser is none other than the selling agent who is gambling at the mill's expense. If the mill takes such an order, which generally is "blanket" with counts and poundage per count unspecified, then it must deliver the low priced order, if the market advances, losing a chance to take higher priced business or if the market falls, the order must remain on the mill's books for an indefinite period.

In order to abolish this and other serious malpractices in the sales yarn business mills manufacturing yarn for sale (both combed and carded) in the South, the Carded Yarn Group, and the Southern Combed Yarn Spinners Association, and the members of the Association of Cotton Yarn Distributors, adopted a set of rules in 1938 which aim toward fair trade practices. This tends, at least, to make yarn contracts through most of the American yarn selling industry uniform.

Voluntary production control programs undertaken by some groups, and practiced with notable success by one yarn manufacturing group, have helped in marketing by stabilizing inventories and keeping the group in good statistical position.

Several causes lie behind merchandising weakness. The main reason is that operations are so split up among the various participants that the responsibility for the quality of the final retailed product rests on nobody's shoulders. There is such a keen competitive market that somewhere along the line between the manufacturer of yarn and the buyer of a finished product some processor or several may be tempted to skimp just a bit. To eliminate this, the Federal Trade Commission is undertaking to protect the consumer through proper labelling. In the yarn field garments labelled made of cotton yarn must specify whether the yarn is carded or combed. Other non-Federal agencies are undertaking a similar project. An outstanding job has been done by the Durene Association—a branch of the Mercerizers Association of America—in consumer education, thereby protecting purchasers through labelling. Garments made of mercerized cotton yarns of certain standard specifications are labelled "This garment is made of Durene mercerized yarn." Each garment is accompanied by a printed folder setting forth the good qualities contained in Durene, a combed cotton mercerized yarn.

Although in the United States anti-trust laws prohibit any effort at price control on the part of industry, movements toward consumer education, production control and stabilized inventory, plus adoption of selling rules, are steps in the right direction to bring order out of the demoralized yarn market. Other efforts such as industry-wide research programs and advertising should be vigorously promoted, for no industry can continue to survive unsound marketing policies. (M. G. B.)

C. WORLD TRENDS IN THE COTTON INDUSTRY

The purpose of this article is to isolate the most significant trends in the cotton industries of certain of the major countries. In every cotton manufacturing nation, sharp changes have occurred since the World War (1914–18), but in certain of these the potential effect of such change has been particularly important so far as the rest of the world is concerned. It is this type of change to which this article specifically refers.

The two decades immediately following the World War (1914–18) were featured by more drastic economic shifts in the cotton industries of the world than was probably any similar period heretofore. Then, at the end of those two decades came the outbreak of a new war in Europe, and the fierce rush of events which followed. Change was piled upon change, with the result that world trends in cotton manufacture which seemed clear prior to 1940 became obscured by the uncertainties surrounding the national and governmental fate of so many of the countries involved. No categorical statement can be made concerning the trends of the textile industries of the belligerent countries in the European war of 1939.

There are, however, very definite trends in certain of the countries outside of Europe—principally China, India, Japan, and the countries of South America. A consideration of the textile advance made in those countries forms one of the important parts of this article.

United States.—A detailed study of the cotton industry in the United States is given in another section of this article. Consequently, only brief reference is necessary here, to orient trends in the United States to world trends.

The economic revolution in the world textile industry during the two decades after the World War (1914–18), noted above, had a major influence upon the destiny of the United States industry. Not only were export markets involved, but the stirring chain of world events that started in the fall of 1939 was the signal for a major defence program in the United States, in which the textile industry naturally has a great stake. The prospect that, for years ahead, defence plans were to occupy a good part of the thinking and acting of industrialists in the United States completely changed the picture.

Generally speaking, there are no serious bottlenecks in textile production. The industry is equipped to produce as much, and as quickly, as any apparent need would create. There are some problems in raw materials, but these are being worked out. One was the question of possible substitutes for silk in parachute cloth. Successful experiments have been conducted with fine cotton cloth, and nylon and other synthetics have also been used. Incidentally, if there ever should be a shortage of cotton, the great growth of the synthetic fibre industry would rob such shortage of any national seriousness.

For details concerning the United States, see *Cotton Industry in the United States*. (D. G. Wo.)

Great Britain.—To Great Britain the world owes the cotton textile industry of today, for there the first textile power machines were invented, the first cotton textile mills built—two centuries ago. The modern machines of the industry are simply improvements upon or combinations of those early inventions.

A textile industry made up of hand spinners and hand weavers was already well established in England at the turn of the 18th century. So important had it become to Britain's economy that a mandate forbade the importation of India's more desirable cotton goods. But when the first mechanical devices were introduced in England, fear of labour displacement caused hysterical mobs to attack the inventors, and, over the first half-century of machine development (1733–85), many had to flee the country. But their inventions were there to stay and by the close of the 18th century power machines had been developed for each process of textile manufacture. In no industry has a half-century been more productive, for in 1733 Kay invented his fly-shuttle; in 1764 Hargreaves invented his jenny—the first practical spinning machine; and Wyatt invented his rollers in the same period. In 1769 Arkwright perfected his water-power spinning frame, and in 1771 built his cotton mill—the first factory employing mechanical devices for the spinning of cotton yarn. Other English inventions followed: Crompton's mule (1779), which was a combination of Wyatt's roller, Hargreaves' jenny, and Arkwright's horse-power frame. Cartwright's power loom in 1785 was the last to be added to this imposing list. With only two exceptions—Jacquard's pattern loom and Paul's carding machine—all the mechanical cotton manufacturing inventions of the time were created by Englishmen.

From these early beginnings of the cotton textile industry England attained, and held until 1933, eminence in that field. In 1913 the United Kingdom exported 210,000,000lb. of yarn and 7,000,000,000yd. of piece goods, representing a value of £126,500,000. However, since that year British cotton goods exports have steadily declined and in 1938 England exported only 122,000,000lb. of yarn, not quite 1,500,000,000yd. of piece goods, with a total monetary value of £49,000,000. This was the lowest level British exports of cotton goods had reached since 1850.

The fact that the British industry has suffered is shown by the following table from the Census of Production, which testifies to the industry's shrinkage in all fields:

	1924	*1930*	*1935*
Firms engaged in cotton spinning	1,114	911	818
Firms engaged in cotton weaving	1,456	1,123	1,057
Firms engaged in textile finishing	783	813	857

The British cotton textile industry has four outstanding characteristics: geographical segregation of each section of the industry; strong inclination to keep its industry in specialized fields, *i.e.*, spinning, weaving, finishing, with no attempt at vertical integration; widely scattered ownership of the plants; extreme individualism in management. Each of these factors has helped Britain to lose her export markets, as her industry could never, under the above circumstances, be a closely co-ordinating one.

When British cotton manufacturers awakened to the fact that their foreign markets had slipped away from them, frantic efforts were made to remedy the situation. A review of these efforts is interesting as a trend of the two decades—1920–40; but their failure, it must be acknowledged, is due to lack of complete industry organization as well as to outside forces.

The first type of regulation attempted took the form of various

LATER PROCESSES IN COTTON MANUFACTURE

1. Kier boiling, whereby impurities are removed from the cotton cloth as the first step in the finishing processes
2. Printing machines, which print patterns on cotton cloth
3. Sanforizing, an important process for pre-shrinking of cotton cloth
4. Finishing calenders, which impart the desired mechanical finish to cloth
5. The final stage in the mill where cloth is doubled, put on rolls and packaged

"gentlemen's agreements" which were entered into from time to time to stabilize prices. But one after another of these broke down due to lack of co-operation of a minority who preferred to practice individualism in their marketing policies.

In the latter part of the 1920s the industry experimented with another plan—this one having the financial backing of one of the largest banks in Great Britain. In theory it was to accept prevailing prices, but to cut costs of production by merging plants. The mergers were on a rather stupendous scale and unwieldy. For instance, one textile firm attempted to acquire 10,000,000 spindles in the section of the industry spinning American cotton, while another tried to merge 3,000,000 spindles in the section using Egyptian cotton. However, the mergers, based on weak financial structures and being composed of plants having outmoded physical equipment, failed to operate profitably and had to undergo further reorganization. The merger plan failed so completely to accomplish its purpose among large holdings that mergers among the small units were not attempted.

Upon realization that the mergers would not solve the industry's problems, still another type of solution was proposed. The formation of the Eastern Textile Association for the purpose of restoring the export trade by manufacture, by members of the association, of standard-construction cloths to be pooled and marketed on competitive terms with foreign producers was the result. Consignment stocks and extensive credits to foreign countries were the bait, but this plan failed also. The passage of the Import Duties Act, in 1932, the Ottawa Agreements, and the establishment of colonial quotas were the next steps. But coming during a world depression they were of no appreciable benefit to a very sick industry.

In 1934 the Cotton Manufacturing Act was passed by Parliament. This act was to fix, upon entire sections of the industry, wage rates and terms of employment arrived at by agreement between representatives of the trade unions and employer organizations. This act, intended to prevent wage cutting as a means of lowering costs of production, was, however, applied in actual practice only to the weaving section of the industry.

In a really desperate situation the industry again called upon Parliament and in 1936 the Redundant Spindles Act was passed. The purpose of this Act was to retire from the industry 10,000,000 spindles, the owners to be compensated out of a fund raised by an annual levy of $1\frac{1}{2}$d. per mule spindle on all spindles remaining in place.

After the passage of the Redundant Spindles Act another type of agreement was entered into by the yarn spinners. This one had legal enforcement behind it. About 80% of the Lancashire spinners signed the agreement, which was purely for price-fixing purposes, under which an administrative authority fixed margins between the price of raw cotton and yarns from time to time. The great bulk of British yarn was priced under this agreement, but the "20% group" not in agreement rendered it ineffective.

The net result of all these troubles was the passage by Parliament, in 1939, of the Cotton Industry Reorganization Bill. (Although passed, enactment was suspended until close of the European war.) Under this bill internal reorganization and mobilization of the industry are dealt with. It provides for regulation of prices, open competition in the interest of profits, retirement of redundant machinery and the promotion of trade. To carry out the latter an Export Development Committee and a Research Fund were provided. The Reorganization Bill, or Enabling Act, authorizes formation of a Cotton Industry Board of 15 members appointed by the Board of Trade. An advisory committee of 3 assists the board in making decisions. Any plan, approved by the advisory committee, regarding any section of the industry will be voted upon by the section concerned. If approved by that section of the industry the plan will then go to Parliament and if not rejected there, in a limited time, will become statutory.

Under this Act registration of all persons or firms in the textile industry is mandatory and those who do not co-operate in reports and operations will have their licenses revoked.

On the surface the Reorganization Act seems meritorious, but only time can prove its ability to help Great Britain compete with other countries which continue to export bulk cotton goods in greater volume at a lower price.

It must be emphasized that all statements made concerning the British industry are tentative in view of the cataclysmic world events which started in the fall of 1939. The future trends in that country, particularly, depend upon international developments.

Japan.—Of the three countries participating in the revolutionary Far Eastern expansion of the textile industry since 1920, China, India and Japan, the most successful expansion has been that of Japan. Among all cotton manufacturing countries it ranked (in 1940) third in number of spindles, second in quantity of cotton consumed and first in amount of cloth exported.

The first cotton mill was established in Japan in 1866, but not until 20 years later, when a protective tariff was placed on imported cotton yarn and the Japanese currency was stabilized, did any noticeable progress in the industry become evident. The World War (1914–18), which left the Orient and Asia free from European and American competition, and the international depression of the '30s, which enlarged the world's demand for low-priced bulk cloth, both gave considerable impetus to the growth of the Japanese industry. But the real impetus came from the industry itself, which through industry-organization, improved methods of operation, and other measures of industry-rationalization reduced production costs, and at the same time raised productive-efficiency of the workers. For instance, during the years 1925–33 the workers' productive-efficiency increased by 71% in the spinning section and 133% in the weaving industry, while at the same time labour costs per unit of production decreased by 60% and 68% respectively.

Such results were accomplished because the Japanese industry is a closely held one. A total of 71 companies, with 276 plants, are responsible for the entire yarn output. More and more the industry is being concentrated in the hands of a few through mergers and combines. For example, three mill combines control 60% of the industry, with five others controlling 20%—a concentration of 80% of the industry in less than 10% of the mills. The trend toward vertical integration is very evident in the most progressive spinning companies: another method by which costs are reduced.

The Japanese Cotton Spinners Association, representing 98% of the spindleage or 10,769,360 ring spindles, and 30% of the industry's weave capacity, or 92,416 looms, is actually the control-centre of the Japanese textile industry. Although it includes a minority of the looms, its control of the majority of the spindleage automatically governs cloth production. In addition to the looms included in the Japanese Cotton Spinners Association, it is estimated that 280,000 looms established in 50,000 small weave-units, employing not more than 10 persons each, supply about 40% of Japan's cloth production. These establishments necessarily buy yarn from members of the Spinners' Association.

The Japanese Cotton Spinners Association regulates production, prices, contracts, working conditions (including wages and employer-employee relations), quantity of goods and expansion of output capacity of its member mills. It also regulates trading details on raw cotton transactions. For instance, agreements entered into between the Association, raw cotton merchants and steamship companies transporting raw cotton prohibit merchant or shipping agencies from delivering cotton to non-Association members. Such agreements make membership in the Association mandatory for yarn spinning mills. The Association also has an agreement with the Japan Federation of Cotton Yarn Merchants Association whereby it exercises drastic control of sales, even to the point of limiting the number of dealers in yarn and cloth.

Far Eastern labour conditions are at their best in Japanese mills, where a high type of industrial relations is practiced. About 90% of the cotton mill workers in Japan are girls, between the ages of 14 to 17, drawn from farming areas. These girls generally work two or three years in order to build up their dowries and obtain an education. It is considered a meritorious achievement for a farm girl to obtain a job in a cotton mill, for the labour supply is plentiful and the personnel is very carefully chosen. Men are employed only in a supervisory capacity, or to act as mechanics.

The girls live, rent free, in dormitories in the mill compound. They are required to attend school two hours each day when they are taught Japanese and English grammar, history, mathematics, flower arrangements and tea ceremony. Recreational facilities are furnished, as well as free medical attention.

The Japanese Factory Law limits the work day to 9½hr., but all the mills run two shifts, seven days a week. Each operative is allowed two rest-days a month.

The average daily wage for a girl operative is 0.73 yen (21 cents)—1935 figures. Meals are furnished by the mill at a cost to the employee of about 4 cents a day, which leaves about 17 cents net daily income.

Because of the rapid turn-over in labour vigilant training is required and full-time instructors are part of the personnel of the mill.

The low labour costs in Japan, plus improved machinery and installation of mechanical labour devices not found in mills of other countries, have reduced the daily wage expenditure between 1922–35 per 10,000 spindles by 54%. The reduction per 100 looms was 56%. It is estimated, according to the International Institute of Agriculture, 1936, that "labour costs per bale in England are about 2½ times as high and in the United States about 3½ times as high as in Japan."

It is easy to see that the increase of cotton piece goods exported by Japan from 412,000,000yd. in 1913 to 2,382,520,000yd. in 1939 is no accident. While European nations and the United States were struggling in the World War (1914–18) Japan was getting a strong foothold in new market territories. When other nations again sought their old export fields Japan's low priced goods remained predominant and each year gained new importance. Smooth management, ability to get good results from cotton of a lower grade than that used by their competitors and the unusual Japanese industrial combination of cheap labour and high productive-efficiency, enable Japan to produce and sell cotton goods at a cheaper rate than any other exporting country. That formula is its simple secret of success.

In 1933 it passed the United Kingdom in exports, and since then Japan has remained the world's largest exporter; this despite heavy restrictions placed upon its goods by importing countries. Its danger to other manufacturing countries had become so obvious by 1936 that 78 of the 127 countries to which Japan exported cotton goods had placed restrictive measures on Japanese imports. For example, the United States had never imported an appreciable amount of Japanese goods until 1933, when due to a very low national income, plus increased operating costs resulting from the United States legislative program known as NRA, Japanese imports to the United States came to about 1,000,000 lineal yards, but by 1936, just three years later, Japanese imports to the United States amounted to 75,000,000sq.yd. and, during the month of Dec. 1936, orders were placed for 1937 delivery to the United States of 150,000,000 square yards.

The tremendous influx of Japanese cotton goods into the United States markets stagnated American cotton piece goods manufacturing. Existing rates of American tariff were completely inadequate in the face of the situation. After the breakdown of an attempt on the part of the United States and Japanese governments to establish a limitation agreement, tariff rates were raised, by President Roosevelt, on certain textile items as much as 42%. At this point Dr. C. T. Murchison, president of The Cotton-Textile Institute, Inc. (U.S.A.), and a group of members of the Institute went to Japan and met with a similar group from the Japan Spinners Association. As a result a two-year gentlemen's agreement was entered into which placed a quota limitation on Japanese imports to the United States at 155,000,000sq.yd. for 1937, and 100,000,000sq.yd. for 1938, with the option allowed the Japanese to transfer one-fourth of 1938's quota to 1937 if desired. This agreement simply amounted to pegging importations of Japanese goods at their highest level. It is problematical whether the agreement was of any benefit to American industry, although it was renewed by both groups at its expiration.

But all has not been smooth sailing for the Japanese. The increased restrictions placed on its goods by importing countries, along with its own "control system" inaugurated right after the beginning of the (1937) Sino-Japanese trouble, worked hardship on the industry. The control system was set up by the government to control imports and foreign exchange. Domestic consumption of cotton goods was limited and the Japanese Cotton Control Committee was placed in charge of raw cotton import permits and cotton stocks. In 1938 the system was improved by revision which attempted to balance the financial relations of exports of cotton textiles and imports of raw cotton. However, in this move attainment of volume of export seemed more desirable than actual value received, for often goods were sold below actual cost.

In Jan. 1939 the government's basic control system was reinforced by the formation of a Textile Distributing Council empowered to set quotas for mills producing all textiles except silk. Domestic consumption quotas were set up and production quotas were assigned the mills. A Yarn Distributing Control Ordinance was also passed Jan. 1939 in an effort to eliminate illegal transactions. Although price control on yarn for export was abolished the same month, prices of cotton yarn for authorized domestic use remained under control, according to an Ordinance of May 1938.

In April 1939, organization of a Cotton Yarn and Piece Goods Export Promotion Guild was perfected. It carried compulsory membership of all mills in the export trade. The object was to regulate production by withholding raw cotton import permits from members if they exported more than their allotted quota of gray cloth. Upholding prices is one of the chief functions of the guild and cotton goods offered for export at below cost prices are bought by the Guild, which has the privilege of buying and selling cotton goods for export on its own account.

Japan is certainly one of the most dominant factors in the international cotton textile situation. Its closely held industry, working under drastic regulations, and its ability to produce a tremendous volume of goods at lower costs than any other nation, has given its expansion an impetus which has worked detrimentally to all other volume producers, particularly Great Britain and the United States. With a new European situation created by the European war of 1939, there is a strong probability that Japan's eminence in the textile world may become even more important in the decade of 1940–50.

China.—A wheel within a wheel is the Chinese textile industry, for 43% of the total spindleage in that country is owned and operated by the Japanese, while only 53% is Chinese-owned. The remaining 4% represents three British-owned mills. This paradoxical situation is strange in many ways, and in order to understand the set-up of the textile industry in China one must study in a comparative manner both groups of mills: Chinese-owned and Japanese-owned.

The cotton textile industry is a relatively new one in China, for the first cotton mill was built there in 1890. After the Sino-Japanese War of 1894 foreigners were allowed to build cotton mills in treaty ports, and British, German and United States interests built mills in Shanghai. Up to 1913 the industry totalled only 1,000,000 spindles and China remained a great market for imports of cheap cotton goods.

After the World War, from 1918–25, the Chinese industry rapidly expanded, increasing its spindleage from 1,600,000 to 3,300,000—but of this increase 1,239,156 spindles were Japanese-owned. By the end of 1936 China had 151 cotton mills with a total of 5,120,000 spindles, but with nearly half of them owned and operated by the Japanese. The influx of Japanese capital and Japanese management was for two reasons: to sidestep the high protective tariff rates imposed by the Chinese Government on cotton imports, and to evade regulations of the Japanese Cotton Spinners Association in their own country.

Although the protective tariff was imposed at the request of Chinese mill men, after six successive increases on both yarn and piece goods in the period 1919–39, the net result has been increasing encroachment on the Chinese industry by Japanese capital plus Japanese efficiency.

The remarkable expansion of the cotton textile industry in China is simply a part of the industrial expansion throughout the Far East since the World War (1914–18). China, like India, experienced a parallel agricultural expansion and has become almost totally self-sufficient in that it is no longer an important importer of either raw cotton or cotton goods. The availability of Chinese short staple cotton from which is woven the bulk of piece goods used in Chinese markets, the abundance of cheap labour, and the pressing domestic demand for both yarn and cloth were the chief factors in the growth of the Chinese industry from 1918–38. Actually at the beginning of 1937 cotton manufacturing was China's greatest industry. It represented an investment of $160,000,000; it employed 200,000 workers; and the physical capacity of the industry included 5,000,000 spindles and 58,000 power looms. The production in yarn alone was over 1,500,000,000lb. annually.

Although China's industrial expansion has been spectacular, handicraft is still a dominant factor. The power looms in the mill centres are augmented by countless numbers of hand looms and foot looms in homes and very small factories in the agricultural regions of the interior. China is the only large nation where hand weaving still predominates over machinery work. It is estimated that in China hand looms using machine spun yarn still supply 75% of the total cloth output.

In matters of management, labour and profits in the Chinese mills and the Japanese-owned mills in China, the industry has a dual personality with the profitless Chinese on one hand and the financially successful Japanese-owned mills on the other. The reasons why the Chinese group seems decadent with few solvent plants, while at the same time the Japanese-owned mills are models of efficiency, are probably as follows:

The basic weakness in the set-up of the Chinese group seems to be lack of modern, streamlined methods of doing business. It has strangled itself through adhering to the easy-going Chinese philosophy of living.

However, specific weaknesses are: (*a*) lack of working capital; (*b*) high cost of raw material; (*c*) poorly trained management; (*d*) low productive efficiency of labour. Japanese mills have none of these difficulties, as is shown by the following comparative picture.

(*a*) *Lack of working capital.* Loans for operating expenses of Chinese mills are obtained only at exorbitant interest rates, 8% to 12% per annum. While on the other hand, Japanese-owned mills seem to be unhampered financially.

(*b*) *High cost of raw material.* Although the raw material is a domestic product its cost to Chinese mills is out of proportion, since often the cotton passes through several hands, each carrying an excess brokerage charge, before reaching the mill. Japanese-owned mills have solved this cost problem through more direct dealing methods. Similarly, the Japanese are better merchandisers of finished goods.

(*c*) *Poorly trained management.* While some Chinese mills are well managed the large majority operate on a hereditary managership basis with the job of manager being passed from one member of a family to another, or from family to friend, with no consideration of personal ability. These managers are paid relatively high salaries although few have been trained for the position they occupy. The result of this on the part of the majority tends to jeopardize the profit element of the entire Chinese-owned group. On the other hand, Japanese managers who draw lower salaries than Chinese managers are highly trained in managing efficiency, able to get the best results at the lowest cost to their mill.

(*d*) The final problem is the *low average productive efficiency of labour.* Drawn from an illiterate class, with women predominating and children making up 6% of the labour element, Chinese textile labour costs run high although wages are low. For instance, with two shifts of 11hr. each and monthly wage rates as follows:

	Men	Women	Children
Spinning	$6·40	$5·24	$3·38
Weaving	$9·86	$7·58	$4·90

it is shown by the Chinese Cotton Control Committee's study that in 1935 it cost a Chinese owner $16.00 to produce a bale of 20's yarn compared with Japanese-owned mill costs of $7.46 for the same goods, although wages in Japanese-owned mills are somewhat higher. This is due to more efficient machinery in the Japanese mills; and, most important, the well trained Japanese foremen, skilled in labour management, who have the knack of extracting greatest productive efficiency from mill workers. For instance, a worker in a Japanese-owned mill operates 24 spindles to a Chinese mill worker's 16, and, similarly, a worker in a Japanese-owned mill weaves more cloth; 786·38 pieces per year compared with a Chinese mill weaver's 261·73 pieces.

What the future holds for the Chinese mills under the present system seems to be eventual absorption by Japanese-owned mills, although government regulations are making a weak effort to stem the tide. During the 1937 Sino-Japanese hostilities discriminating levies were placed on Japanese-owned mills. But despite this they have continued to operate profitably while their neighbour Chinese mills operated at a loss.

India.—The story of the textile industry in India reminds one of the Mother Goose rhyme—"The King of France marched up the hill . . . and then he marched right down again." Centuries before power machinery was invented India's hand weavers and spinners had developed remarkable skill and technique in the production of rare and beautiful cotton fabrics. With the growth of trade the fame of these fabrics spread throughout the world and Indian prints and calicoes were much sought after, in the 16th and 17th and early 18th centuries, with Great Britain becoming one of India's most important markets. However, in the mid-18th century, with a budding cotton textile industry at stake, Great Britain restricted importations of India's fabrics. With the development and growth of power machinery India, in the course of time, found itself one of Britain's chief customers as machine-made, cotton piece goods from the United Kingdom flooded the country.

Just prior to the World War (1913–14) India imported 60% of its cotton cloth requirements, 3,104,000,000yd., practically every yard coming from Great Britain. In 1940 India's cotton textile industry, in a new cycle, has swung away from importations and has established itself again as a great textile producer in the Far Eastern industrial revolution which has taken place since 1918.

India's textile industry was a slow grower from the time of the founding of its first power mill in the 1850s to the outbreak of the World War (1914–18). But by 1920 India had 7,000,000 spindles and 120,000 power looms. Since then the spindleage has increased to 10,000,000 (1936) and power looms to 200,000

TABLE XVIII.—*India Cotton Cloth Production and Imports, 1913–14 and 1936–37**

Item	April		March

†From *Monthly Statistics of Cotton Spinning and Weaving in Indian Mills.*

‡Hand-loom production estimated on the basis of total yarn available for sale, *i.e.*, yarn production minus total mill consumption (total woven goods produced), minus exports and re-exports and plus imports. Final figure obtained by assuming 4yd. of cloth per pound of yarn estimated as available for sale.

§From *Annual Statement of the Sea-Borne Trade of British India.*

*Table from *U.S. Bureau of Agricultural Economics*, Vol. 11, No. 4.

(1936). The same year it was estimated that India also had 2,500,000 hand looms in operation, producing annually about 1,200,000,000yd. or 20% of the total cloth available for consumption.

It would seem that India's cotton textile industry should have an open road to prosperity. With an estimated population of 350,000,000 consuming 5,500,000,000yd. of cotton piece goods annually, Indian mills have right at hand one of the largest markets of cottons in the world. Its raw material costs should be low, for the coarse type piece goods used by the Indian native is manufactured almost entirely from Indian cotton—⅞in. and shorter.

That India is supplying its domestic market with domestic goods, displacing to a large extent cotton piece goods imports, is shown by Table XVIII.

Yet India's cotton textile industry is an unprofitable one, with two principal contributing causes: the managing-agency system and poor labour-efficiency. And from available evidence it seems that the former contributes heavily to the latter.

The custom of employing managing-agencies to conduct one's business is one of long standing in India, but indications are that the agency system has outlived its usefulness and has simply degenerated into a system of exploitation of industry. When the textile industry was trying to get a foothold in India many of the mills were capitalized by a managing-agency and no doubt the latter was a strong moving force behind the industry's founding and early growth. The agencies work on a long-term agreement—generally extending over 30 to 40 years, and in many cases such a contract develops into a permanent arrangement. Theoretically the agency furnishes operating capital, handles the purchase of raw material and actually manages the plant itself. For this service it receives a commission of 10 to 12½% of the gross annual profit; and sometimes in addition exacts a commission on the production of the mill. Naturally, the more production the higher the commission. Much evidence exists that rebates, or secret commissions, are taken by the managing-agency for additional services rendered.

Sometimes the managing-agencies actually enter speculative cotton deals by which any losses incurred are charged up to the mills, but any profits which accrue are kept by the agencies.

Poorly trained or untrained personnel seems to be the average in the managerial field of Indian cotton mills. In 1927 the Indian Tariff Board said that, in Bombay alone, out of 175 managers only 11 had received practical training. Often one agency may manage many mills or it may have more business than it can adequately handle, with consequent negligence to all of it. Therefore, it seems that the managing-agency system, by furnishing inefficient management for the mills and by "bleeding" the mills through excess commissions and other pieces of chicanery, has kept them in a precarious financial position.

In India, as in China, we find coupled with poor management, the problem of high production costs due to inefficient labour—and for the same reasons. The Indian cotton mill worker is drawn from the illiterate mass of people who know only the lowest standards of living. If anything, conditions in India, among the 418,000 mill labourers, are worse than in China. The day is shorter. For instance, the work day is 9hr. compared with China's 11, with a work week of 54 hours. But for this operation time the average monthly wage for a weaver runs from $5.63 to $6.75 if he watches one loom. If he tends two the wages are doubled. For all other workers the average monthly wage is less than $9.00. Since most of the workers are men, it is assumed a family must be supported on that wage. The managing-agencies, working on the theory that paid employees make a floating population, habitually keep wages a month to six weeks in arrears. The workers then are victimized by money lenders who charge 75% to 150% interest per annum. Topping this, monthly commissions have to be paid by the workers to the men who "hired" them, or in case of absence, or for other reasons, fines. Such a labour situation naturally results in low productive efficiency. It is not surprising that the total labour cost per pound of yarn of average count of 16's exceeds the cost of the same product in a Japanese mill by over 60%! Such a comparison was issued by the Indian Tariff Board, which also estimates that the labour cost per loom per day on gray cloth in a Bombay mill is over three times the cost of the same goods produced in a Japanese mill. No wonder that despite a protective tariff of 11% Japanese piece goods offer strongest competition in the Indian markets.

Such competition became so great that Japanese imports to India were finally put on a quota basis. However, neither quotas nor tariffs can dispel the weakness of structure of India's textile industry, which has expanded, but in an unhealthy manner.

(M. G. B.)

South America.—The cotton textile industry of South America has developed rapidly in some of the countries below the equator, a forerunner of general industrial development inevitable in coming years.

Historically, the manufacture of cotton fabrics in South America is not new. Indians were spinning and weaving cotton, indigenous in several countries, long before Columbus arrived in the Americas. These same fabrics, made on crude hand looms, can be seen under construction in remote parts of the interior. However, with the exception of Brazil, which has had an established industry for at least 50 years, it is generally true that most of the cotton textile mills in South America have been built in recent years.

Brazil, Argentina and Colombia are the three most important countries from the standpoint of cotton manufacturing at the present time (1940), although Venezuela, Chile, Peru and others are getting the industry under way. Growth has been particularly pronounced during the last few years as nationalistic trends have grown stronger.

Viewing the cotton textile industry of South America, it is necessary to consider each country individually because of geographic and political differences. Also, it is essential to study the size and condition of the mills rather than the number shown in trade lists.

Brazil, the largest country in South America, is the most important in cotton textile manufacturing. There are in Brazil perhaps 500 textile plants of all kinds—cotton, wool, rayon, silk, etc.—about 40% of the total in South America. Of these, it is estimated that 350 mills with over 2,500,000 spindles and 85,000 looms are engaged in the production of cotton textiles. Many of these mills are small and unimportant, but there are quite a few which would be considered large in either the United States or Great Britain.

Here and there can be found a mill modern and efficient mechanically, but these are the exception. It is estimated that at least 70% of the productive equipment in Brazil is obsolete, either from being in use for many years or because it was bought second-hand. Automatic looms, for example, are practically unknown.

Under normal conditions, many Brazilian mills consistently show substantial earnings, despite worn-out equipment and inefficient management according to American standards. This apparent paradox of profit from obsolete machinery is possible because of the large margin between manufacturing costs and the selling price of finished goods. Labour is as cheap in dollars as it is in Japan, taxes and power costs are reasonable, and most of the mills many years ago wrote depreciation of equipment off their books entirely. Savings in many instances are effected by selling directly to the retailer instead of paying a commission to a middleman. There is an ample supply of cheap domestic cotton and wool; some rayon and a little silk are produced at low cost.

Weak domestic exchange is another factor in the low cost of production.

On the other side of the picture, the Brazilian cotton textile industry has found itself more frequently undergoing what is known locally as a "crisis." This is described in manufacturing circles as the result of underconsumption and in Government circles as a simple case of overproduction brought on through a practice of operating 16 to 24 hours a day. Whatever the reason, there is no doubt that the domestic market since 1937 has been flooded with poor-quality goods priced too high.

Market conditions in Brazil are very disorganized, and most mills are forced to manufacture literally hundreds of different kinds of goods. This means that mass production is not common in the textile industry. Further, there is difficult competition for the legitimate manufacturer from small, family-operated plants with virtually no overhead and little conception of manufacturing costs. The industry is saddled with Government restrictions and regulations which are often changed several times a year.

Labour laws are complicated. The work week is restricted to 48 hours, which seems to be more or less standard in most South American countries. Payment ranging from 25% to 75% must be made for overtime. Each employee who has worked a year is entitled to a 15-day vacation with pay. There is a social security or pension law for industrial workers. A minimum-wage law has been proposed. Two-thirds of the employees of a foreign concern must be Brazilian. Companies employing more than 500 persons are supposed to provide medical clinics, cafeterias, rest rooms, etc. All of these laws were on the books in 1939, but there is considerable question as to how thoroughly they are enforced, especially in outlying areas.

Despite the "advanced" social laws of Brazil, the economic status of the textile labourer is not too good. He earns in industrial centres perhaps 5 cents an hour or $10 a month; 2 cents to 3 cents an hour in the interior. It is reported that wages are even lower than this in the north near Recife. However, such wages will buy about three times as much in Brazil as in the United States, and living costs are extremely low. Due to the low wages, no premium is placed on efficiency. The average Brazilian worker runs about 25% of the equipment run by the U.S. worker, although he is mentally and physically capable of handling a much larger job load.

There are no real labour unions in Brazil, although there are organizations of employees said to be more or less regulated by the Government. Occasionally there are local strikes, but not often.

There were restrictions on importation of productive machinery until fairly recently when this was repealed. Brazilians attempted to make their own machinery during this period, but with little success.

Sooner or later internal competition is going to force the majority of Brazilian mills to modernize their equipment or go out of business, and the more forward-looking companies for some time have been installing new machinery. Before outbreak of the European war in 1939 most of the new machinery bought was British and German, with American equipment increasing in popularity. The war naturally has caused an increase in the purchase of American equipment, although price is still a retarding factor.

Brazil produces all the cheaper grades of cotton cloth necessary for domestic consumption and exports a small quantity to other Latin American countries. Domestic production is protected by a high tariff wall, and relatively few textiles come into the country other than fine yarns and quality products—except when a bilateral or barter trade agreement dumps goods in the market.

The textile industry of Argentina, in contrast to that of Brazil, was in 1940 new, lusty and virile. Most of the spindles and productive equipment were installed within the last 10 or 15 years, and more than a few of the plants are comparable to those of the United States in efficiency. The industry is growing rapidly and there is room for further expansion, to possibly twice the present number of spindles.

The cotton textile industry of Argentina consists of some 20 plants, with a total of 350,000 spindles. The next census is expected to show at least 450,000 spindles. There are a few large plants, but the majority are small. Many are known as "faconiers"—one or two looms in a basement or barn.

The industry had a bad year in 1938 due to competition from Japan and Italy, but the situation improved in 1939 up to the outbreak of the European war. The outlook at the present writing (1940) is very uncertain. However, under normal conditions and with reasonable tariff protection, the industry is profitable.

One of the greatest concerns of the industry has been the fact that Argentina must keep its tariffs low in order to export agricultural products, which means that local manufacturers are never quite sure as to just what sort of competition they are going to have from other textile producing countries. There is considerable competition among the mills themselves and it is obvious that this competition is going to become more intensified as the market begins to approach the saturation point. The haphazard attitude toward old machinery that exists in Brazil is not in evidence in Argentina, and old equipment has a hard time competing.

Argentina is not a low-wage country in the sense of Brazil. Ordinary textile operatives in Buenos Aires earn $1.50 to $2.50 a day; skilled labourers more. Efficiency of the Argentine workers, many of whom are of Italian descent, is very high in comparison with other Latin American countries, especially those in warmer climates.

Argentina has its share of social laws, including a famous statute on the books known as "No. 11-7-29," which makes it practically impossible to discharge an employee without paying a substantial separation wage; guarantees employees in the larger plants a two-weeks' vacation with pay; requires the mill to furnish at least nine months employment each year; grants sick leave with pay, etc. Complications and penalties connected with this law are great.

Labour unions exist in Argentina, but are considered rather impotent.

Market conditions are complicated and demand a great many different styles in relatively small quantities, which intensifies production problems. There are a few commission merchants, but many of the mills sell directly to the retail trade.

Argentina produces all cotton used domestically and exports a part of the crop each year. Mills which agree to manufacture only Argentine cotton are given special tariff concessions concerning importation of machinery, which means that domestic cotton is used almost exclusively.

The foregoing gives some idea of the development of the cotton textile industry in the two leading countries of South America. In most of the other countries development of the industry has been on a smaller scale. For example, in 1939 the cotton textile industry of Chile consisted of less than 50,000 spindles and about 2,000 looms concentrated largely in two plants of importance. The Chilean industry is bound to develop further, but it is limited by the small population and low buying-power of the country. The same thing is true of several of the other smaller countries.

The immediate future of the cotton textile industry in South America depends obviously on the outcome of the European war of 1939. (W. G. As.)

V. THE DISTRIBUTION OF COTTON TEXTILES

A. WORLD COMMERCE IN COTTON MANUFACTURES

Commerce in Ancient Times.—In days gone by one of the chief evidences of the attainment of civilization was skill in fabric weaving and decoration. Although all the ancient civilizations produced textiles of one kind or another, from the earliest twines of the primitive savage down to the beautifully decorated woven fabrics of the Oriental and Inca civilizations, the arts of fine fabric production tended to be centred in small areas. In some instances this arose because of the development of special skills in a given locality, and in others from the availability of raw material. When commerce between areas and nations did begin, textiles and textile raw materials accordingly became one of the principal articles of trade, so that the early history of world commerce is, in many respects, also the history of world trade in textiles.

Cotton had been cultivated and cotton textiles produced in India for centuries before Alexander invaded India or the Roman Empire had even been thought of. During the Pax Romana cotton was grown on the shores of the Mediterranean, and cotton fabrics were produced under the slave economy of the time. It also seems likely that considerable trade in cotton textiles was carried on with India, continuing down into the post-Roman era when unsettled conditions in the Mediterranean interrupted trade in fabrics of local production. Even this trade, however, declined when the wealth of the Roman Empire was destroyed through the repeated barbaric invasions from the East, and by the close of the Roman era the ancient world commerce in cotton and its manufactures had almost wholly disappeared.

Not until the spread of the Saracens over the Mediterranean area and as far east as India during the 7th and 8th centuries did trade in cotton fabrics again attain substantial volume. The Arab merchants reopened the avenues of trade, established new caravan routes and linked together many peoples of the Near and Far East in a broad and comprehensive international commerce. It was these same Saracens who were responsible for the first recorded introduction of cotton cultivation into the western Mediterranean. During their occupancy of Spain cotton fabrics of the finest artistry in decoration were produced from cotton grown in Spain. Between Moorish Spain and the rest of Europe, however, there was little trade because of the constant religious warfare, and when the Mohammedans were expelled from Spain, their crafts were lost, and with them, the cultivation and manufacture of cotton.

The Beginning of Modern Commerce.—The Crusades (1096–1270) for the first time brought the peoples of Europe generally into touch with the arts and products of the East. During the period when the Crusaders held the land of Palestine, the exchange of goods between the Phoenician ports on the coast and the West helped stimulate the growth of the great trading centres of Genoa and Venice. Cotton had been cultivated in the Levant on a small scale since the Roman era, and now came to be produced for shipment to these cities where it was made into cloth for export to western and central Europe. Thus were begun the textile industries of northern Italy and southern France.

India the Leading Exporter.—With the increase in world trade during the 13th and 14th centuries, usually associated with the Hanseatic League, cotton and cotton textiles became more and more important as articles of world commerce. Most of the finer fabrics and all the printed calicoes consumed in Europe came from India itself, over the caravan routes through Baghdad and other Middle Eastern trading centres made famous and prosperous by the ever-growing trade of the Arab and Italian merchants.

The geographical basis for this trade was a century or two later undermined by the closing of the overland trade routes to the East. The great Mogul empire in Central Asia, which had looked with favour upon this commerce, was succeeded in 1368 by the Ming Dynasty. In 1453 Constantinople was captured by the Turks. Shortly after the Genoese route by way of the Golden Horn was shut off, the spread of the Turks into Syria and Egypt cut off the Venetian route to the East and reduced to a mere trickle the volume of goods that could be brought by caravan from the East.

The necessity for finding an all-water route to India started the remarkable series of voyages of trade and discovery that led Columbus to America and Vasco da Gama around the Cape of Good Hope and across the Indian ocean to Calcutta in 1497. Taking advantage of the new trade routes, the Portuguese built up a large and profitable trade in cotton with the Indies which amounted practically to a monopoly so far as European trade was concerned and lasted almost a century. The Dutch traded with Lisbon, and in this way Antwerp, Bruges, and Haarlem became the most important cotton ports of northern Europe. With the raw cotton for domestic spinning into coarser fabrics came the fine and richly coloured chintzes and calicoes it was impossible to duplicate in Europe and for which, partly because of their very scarcity, an insatiable demand sprang up.

The power of Spain in the 16th century made it difficult for the northern European countries to send their own merchant vessels to India and what trade the English and Dutch had with the East was surreptitious. With the defeat of the Armada in 1588 and the collapse of the Spanish power all obstacles from that quarter were removed. Shortly thereafter the great Oriental trading companies were founded: the British East Indies Company in 1600, the Dutch East Indies Company in 1602, and the French East Indies Company in 1664. Starting primarily as importers of Indian calicoes and similar products of the East for which European demand was steadily rising, these companies later assumed military and political aspects which led to the establishment of the Eastern empires of these three nations.

Britain Becomes the World's Leading Exporter.—Meanwhile textiles of all kinds were being manufactured in Great Britain on a growing scale. The religious wars on the Continent, especially the conflicts in the Low Countries, and the revocation of the Edict of Nantes in 1685, had led to the migration of many thousands of Protestant artisans to England, who brought with them the highest skill in weaving and designing known on the Continent. As Britain's trade with India grew, her domestic manufacturing industry expanded until by the end of the 17th century she had actually become an exporter of cotton fabrics. Europe was still dependent upon India for printed cotton goods, however, and not until after 1690, when the first British textile printing plant was built, did England begin to establish her leadership in the type of goods for which India had hitherto been the sole source.

In a sense the 17th century formed a bridge between the tradition of artistry in textiles of the Middle Ages, characterized by production on the handicraft system for one's own use or for the local market, and factory-made production for a world market. The discovery of the all-water route to the East, which during the 16th century had let in a flood of printed cottons from India, had opened the road. The mediaeval organization of production around local guilds began to give way, and by 1700 textile production in England was to a certain extent organized in terms of a national and even an international market. Cotton manufacturing had to overcome the resistance of the wool interests which keenly resented the intrusion of this new fibre and even succeeded in obtaining from the mercantilist Government in 1700 a law prohibiting the sale of cotton goods in England. Such resistance quite naturally only whetted the desire of everyone to wear cotton, and in 1736 the law was amended under the statute known as the Manchester Act which enabled Manchester to establish itself as the centre of the cotton manufacturing industry of Great Britain.

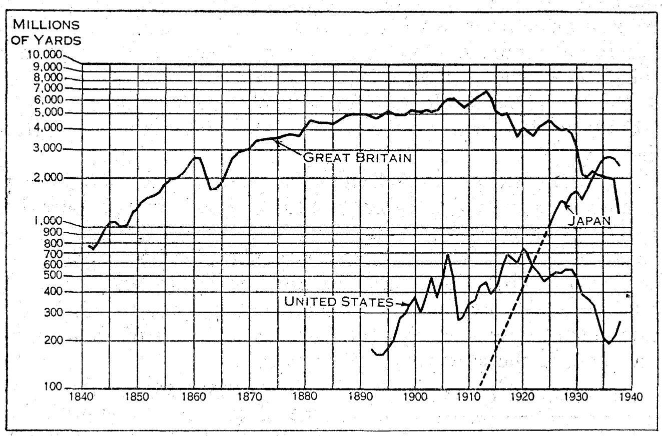
The economic history of the second half of the 18th century in Britain is bound up inseparably with the calico trade. The wave of inventions, which has come to be characterized as the Industrial Revolution and which completely transformed methods of production throughout industry, gathered its momentum in the series of textile machinery inventions that arose out of the inability of home spinners to produce enough cotton yarn to supply the growing demands of the British export market for cotton goods.

Beginning of the Industry in the United States.—Although the growing of cotton had early been introduced into the colonies of Virginia and the Carolinas, production had not, prior to the American Revolution reached a point where any volume of cotton was exported to the mother country. During the 18th century Britain obtained almost three-fourths of her cotton supply from the British West Indies and the rest from India, the Levant and Brazil. (Brazil had early been a source of raw cotton, the Portuguese importing the fibre to Europe as early as 1570.) Some cotton was grown in the American colonies but almost wholly for home use under the colonial handicraft system. One reason why American Upland cotton, the variety that had become predominant in the South through hybridization and soil and climatic conditions, was not used more widely was that the fibres clung tenaciously to the seeds. Cleaned by laborious hand pulling, this cotton could not compete with foreign varieties. The invention of the cotton gin in 1793 by Eli Whitney provided an easier method of preparing it for use, and cotton growing soon spread throughout the South for export to Britain. Consumption of cotton by the British cotton textile industry in 1791 amounted to about 23,000,000lb., being limited chiefly by the world supply of cotton. The total production of cotton in that year in the United States amounted to only about 2,000,000lb., practically all of which was consumed at home. By 1800 United States exports of cotton to England had increased to 18,000,000lb., and by 1811, 18 years after the invention of the cotton gin, to 62,000,000 pounds.

The construction of the first successful cotton mill in the United States in 1790 by Samuel Slater at Pawtucket, R.I., coincided with the period of textile machinery invention in Great Britain. When the Boston Manufacturing Company mill was built at Waltham, Mass., in 1814, it was able to use power-driven machinery throughout. Thus, the American industry began its rise about a quarter century after the great technical inventions in England.

The institution of a protective tariff on cotton goods in 1814, at the request of the American cotton textile industry, more or less drew a dividing line between the American and the British branches of the world cotton industry. Under its protective tariff the American industry continued to expand for a full century but was never quite able to meet the entire requirements of its domestic market, while the British cotton textile industry set out to capture for itself all the cotton textile markets of the world outside the United States.

The Supremacy of Lancashire.—For two centuries, or roughly from 1700 to 1914, the supremacy of Lancashire as the world's primary source of supply for cotton goods was unchal-



SOURCE: U.S. DEPT. OF AGRICULTURE, THE WORLD COTTON SITUATION (TWO-YEAR MOVING AVERAGE)

FIG. 10.—EXPORTS OF COTTON GOODS, GREAT BRITAIN, UNITED STATES AND JAPAN

lenged. This is brought out vividly in the accompanying chart, which shows comparative figures of cotton goods exported by the three principal exporting countries during the last century: Great Britain, the United States and Japan. The steady rise in the British export curve from 791,000,000yd. in 1840 to 7,080,000,000 in 1913, together with freedom from violent year-to-year fluctuation, illustrates forcibly the dependence of the world upon Lancashire. Even the American Civil War, which stopped raw cotton exports from the South to Great Britain, caused only a 40% decline in the total volume of her cloth exports.

The United States' position in the export market has never been of real importance compared with that of Great Britain. To begin with, the United States industry was occupied in meeting the needs of a rapidly expanding domestic market. A high protective tariff on cotton goods, furthermore, tended to keep prices for U.S. cotton goods on a higher level than British textiles sold in the world market. Forced to expand almost entirely out of earnings because of the sharp competition for capital in a new developing country, its rate of growth was slower prior to 1890 than that of Lancashire, which had access to large accumulated earnings of the industry itself, plus the reservoir of the investment capital of the British Empire. As late as 1890 the total *output* of the American cotton textile industry amounted to only 3,002,761,000 sq.yd. as compared with British *exports* of 4,912,000,000 square yards.

The era of British supremacy in the world markets for cotton textiles, which was brought to a close by the World War of 1914–18, was a period of expanding markets in which the first comer, once he had established himself, had a pronounced advantage. The industry's attention was necessarily focused on problems of production, of getting more sources for raw cotton, of opening new markets through the application of imperialist national policies, rather than upon distribution as the term has come to be used in the last two decades. World population was increasing at a rate exceeding anything previously known. The application of steam power to transportation was opening up hitherto untouched markets for the industry of Lancashire, markets that seemed to expand fully as fast as the industry itself grew. Furthermore, the technical progress of the industry kept reducing prices at a rate that made possible a gradual rise in living standards for the whole world, accompanied by a freeing of purchasing power to buy additional goods.

B. THE POST-WAR RECONSTRUCTION OF THE COTTON TEXTILE MARKETS

The World War Ushers in a New Era.—The World War of 1914–18 marked a turning point in consumer demand for textiles, which together with the launching of local textile industries in former importing countries, especially India and Japan, led to a radical transformation in world textile markets.

Population Trends.—Since the demand for textiles of most kinds tends to be proportional to the number of people in a given area, changes in population trends have a direct bearing upon textile demand. It is highly significant, therefore, that the rapid increase in population of the western countries which characterized the 19th century, has ceased. In the United States, population doubled about every 30 years from the founding of the republic until the World War, thereby practically doubling the market for textiles. In 1940 the rate of population increase was much lower, and it is expected that by 1960 or 1970 the United States will have reached the peak of its population, after which it will start to decline, as is already happening in Western European countries. This decline in the rate of population growth will retard the rate of increase in the size of the market for cotton goods.

Changes in Way of Living.—Demand for cotton textiles has been greatly affected also by changes in the way of living brought about by the automobile, motion pictures, improved methods of heating and heat insulation in buildings, the greater freedom achieved by women during the World War of 1914–18, and the increased importance of leisure resulting from shortened hours of work for the average person. All these together have created a different pattern of life than that known before, with different requirements as to amounts and types of clothing, of household textiles and textiles for industrial use.

Until rather recently these changes were most apparent in women's apparel. Before the War of 1914–18 costumes for almost all purposes followed a single fashion. The employment of women in industrial occupations during the World War encouraged the simplification of clothing and provided part of the stimulus toward the revolution in women's dress that characterized the early '20s. A more active mode of life demanded quite different clothes than those worn in pre-War times. It has been estimated that the young woman of modern times wears, at one time, no more than a third or a fourth the yardage of cloth worn by her mother. In weight it is even less, owing to improvements in heating of houses and public buildings.

The curtailment in yardage volume in the women's fabric markets brought about by this change in mode of dress has been made up in considerable part by the expansion of women's wardrobes. The development of the cutting trades, plus technological improvements in the textile industries, has made available a greatly increased assortment of apparel at much lower prices than ever before. Consequently, frequent change with less stress on durability and more stress on style has become economically feasible for the average consumer. Rayon and the use of more silk helped to shrink the market for cotton fabrics in women's apparel. Yet for all fibres as a whole, the women's apparel markets in the United States, for example, allowing for population increase, did not diminish more than 30% from 1918 to 1938.

In men's apparel the trend toward functionalization of clothing *i.e.*, making the design fit the needs of a specific use, has been much slower than in women's wear. Only since about 1935, when men's fashion magazines began to be popular, has the concept of varied and specialized types of men's apparel begun to take hold in the volume apparel markets. The chief stimulus has been the greater leisure of the average man which has created new needs and broader markets, particularly in specialized types of sports apparel.

Modern types of decoration, particularly the use of colour in the home, together with the growth of power laundries in place of home laundering, have radically altered the household textile markets. Higher standards of living in the home have resulted in doubling the consumption of sheets in the decade 1928–38, with similarly increased consumption of towels, blankets, bedspreads and related items.

To a certain degree these same trends have been evident in other western countries, varying in proportion to their own standards of living and the extent to which they have been influenced by mass production and distribution methods, by widespread popular ownership of automobiles, and by the American way of living as portrayed in American motion pictures. American standards of dress and decoration as shown in the films have been publicized throughout the world and will undoubtedly have a tremendous cumulative effect upon the use of textiles in all countries during the next generation.

Changes in Standard of Living.—With these changes in the way of living there has also been the culmination of a century-long rise in standards of living for the average man throughout the western world. For the first time in human history men have ceased to fear that their food supply might be curtailed, and no longer look upon food as a luxury or as a primary source of pleasure. A larger margin of income has thus become available for clothing and other former semi-luxuries at a time when technological advances have reduced the cost of machine-made textiles to levels where they are available even to those with lowest incomes.

For a relatively large number of families in both the United States and Great Britain, well-made, well-fitted, attractively styled clothing in good condition has ceased to be a luxury and is as much a necessity as food. For such elements of the population, the rate of increase in consumption of textiles will in the future be relatively small. Although there is not the upper limit to per capita consumption of textiles that there is to food, there is a limit determined in part by actual needs, and more important, by competition from alternative uses for the margin of income available after strict necessities have been taken care of. In terms of actual yards of textiles consumed, per capita consumption of this group of the population maintains a degree of stability that is comparable to the food consumption of the bulk of the population.

Nevertheless, a large part of the population even in the western world, because of low incomes, is unable to purchase enough textiles to bring it to this level. The total amount of textiles consumed varies from year to year with fluctuations in incomes.

Already, by the changes in the standard of living during the post-War (1914–18) period, textile consumption by this group of the population has risen. Reductions in costs due to competition, to technological advances, to the growth of the cutting trades, and to mass low-cost distribution through chain and similar organizations have reduced prices to consumers to an extent that has enabled this largest group of consumers to increase its purchases of textiles nearer to its actual needs. Further progress in this direction through continued lowering of costs and prices, which will enable the great masses of the population to increase their purchases of cotton textiles, represents the greatest hope for future expansion of the cotton goods markets.

Growth of Cotton Manufacturing in Former Importing Countries.—It was, of course, inevitable that other importing nations than the United States should eventually see the value of establishing their own cotton manufacturing industries and should take steps to encourage their growth. That greater progress had not been made prior to 1914 seems surprising today. Great Britain's foreign trade was so well organized, however, through her judicious purchase of the products of her customers in exchange for British cotton goods that few importing countries attempted to challenge Britain's position as their prime supplier of cotton goods.

The World War of 1914–18, however, seriously disrupted Great Britain's foreign trade. From 7,080,000,000yd. in 1913, British exports of cotton goods dropped to an average of about 5,000,000,000yd. in the first three years of the War and to only 3,700,000,000yd. in 1918. The United States picked up less than 10% of this loss. Its exports rose from about 450,000,000yd. in the years immediately preceding the war to an average of about 700,000,000yd. in the later years of the war.

The largest part of the shortage of cotton textiles resulting from Great Britain's preoccupation with the war was made up by increased production of cotton goods in former importing countries. What textile industries they had were operated at capacity and with high profits, so that they were able to expand out of earnings. By the end of the World War of 1914–18, the productive capacity in these former agricultural countries was definitely larger, and, most important, many of them had made an important start toward industrialization which they became determined to foster. India, China and Japan are the most striking examples of this trend, although it was also evident in Latin American countries and elsewhere.

Japan seized the opportunity presented by Great Britain's inability to supply Eastern markets to double her cotton manufacturing capacity and enter upon a career that has made her the world's largest exporter (1940).

While no yardage figures are available to trace the growth of Japan's production during the war, the installed spindle statistics show an increase from 2,300,000 in 1914 to 3,700,000 in 1920 and to 12,550,000 in 1938—almost a six-fold increase since before the war.

Relative Standing of Leading Producers in 1935.—The immediate effects of the World War of 1914–18 were to prove less crippling to the world leadership of Lancashire than the train of events it set in motion, which resulted in the world economic collapse of 1929. The sharp drop in commodity and security prices made it impossible for debtor nations to sell enough of their products to be able to service their debts or to buy manufactured goods freely. As the depression deepened, country after country either instituted exchange restrictions or embarked on a commercial policy based upon further protection for their own industries. As a result the total export market for cotton textiles shrunk despite increase in world population, forcing former exporting nations to reduce the size of their industries as well as develop their home markets on a larger scale.

At the same time other manufacturing countries, particularly Japan, but also the Soviet Union in some degree, succeeded in expanding the quantity of their cotton cloth exports despite the world crisis. Finally, a further factor that has influenced the structure of the cotton goods export market has been the evolution of new commercial devices and policies, such as barter, as a result of which existing channels of trade have been radically modified.

India.—In both India and China production on hand looms in the villages still accounts for a large part of domestic requirements. Part of this is made from home spun yarn, and part from machine spun yarn, of either domestic or foreign origin, sold to the peasants through regular distribution channels. Both countries have accordingly been important markets for yarn for home consumption as well as of cloth, both gray and finished.

In India production of cotton textiles has increased to a point where the volume of imported cloth is less than a third of what it was before the World War of 1914–18. For what India does import, Japan has supplanted Great Britain as the principal source of supply.

TABLE XX.—*The Indian Cotton Cloth Market, 1913–35*

China.—A country which some years ago was one of the greatest world import markets for cotton piece goods and cotton yarns, China had prior to the outbreak of the war with Japan in 1937 become able to supply almost the full effective home demand for cotton cloth. The extent of reduction of cotton goods imports is indicated in Table XXI.

From the high ratio of spindles to looms, 107 compared with about 40 in the United States, it is evident that a large part of the product of the Chinese spinning industry is sold as yarn for home weaving.

Japan.—From 1924 to the end of 1935, the volume of cotton cloth exports from Japan expanded without interruption in a market that was shrinking because of cyclical and structural developments. Most of these exports have been to regions lowest in the income scale: South Asia, the Far East, colonial Africa, etc. Thus between 1931 and 1935, Japanese shipments of cotton goods to colonial Africa multiplied threefold, shipments to India and Ceylon rose 40%, the decline in shipments to China was more than made up for by a greater than twofold increase in exports to other parts of the Far East. In part this has arisen from an actual expansion in the use of factory-made cloth made possible by the availability of cotton goods produced at costs and for sale at prices more nearly proportionate to other elements in the standard of living of these people. It has come also through replacement of low grade fabrics of British manufacture by Japanese goods made under wage scales both absolutely and relatively much lower.

As the volume of production rose, the quality of the Japanese product was gradually improved to a point where it was so nearly comparable to British and American goods as to be able to displace the products of those two countries in Latin American and other markets. Japanese bleached cotton goods even invaded the United States and took over the largest part of the market for that type of goods from American manufacturers despite the high tariff. Finally, in 1934, as shown on the chart (fig. 10), Japan passed Great Britain as the world's leading exporter of cotton goods.

That year marked also the beginning of restrictions upon the flow of Japanese cotton goods into her new markets. The vigorous campaign of Japan for exports, forced upon her by the collapse in the price of silk during the depression and the pressing need to obtain foreign credits to offset the deficit balance in her trade with the United States, led to the building up of unbalanced trade with other countries, whereby Japan exported cotton goods to them but took not nearly as large a volume of goods in exchange. This was in direct contrast to the type of foreign trade Great Britain had developed during the 19th century with these same markets and, had it been allowed to continue, would have had disastrous effects upon their economy.

In 1934, the first important restriction upon Japanese cotton goods exports was made by India in a new agreement between the two countries scaling the amount of Japanese cotton cloth that could be imported in proportion to the Japanese purchase of India raw cotton. In May of that same year the United Kingdom imposed quotas on imports of cotton and rayon piece goods into all the Crown colonies, which, because of the base years selected, fell chiefly on Japanese goods.

These were followed by further restrictions in the Netherlands Indies, the Philippines, Australia and, up to June 1936, in 56 markets out of 106 distinguished in Japanese export statistics. In 40 markets the restriction took the form of a quantitative limitation, while in the other 16 restriction took the form of a tariff preference in favour of Japan's principal competitor, the United Kingdom. The quantity of trade affected by the restriction was about 67% of total Japanese piece goods exports in 1935.

Latin America.—The expansion of cotton manufacturing in Latin America has proceeded slowly, but each year shows some slight expansion in one country or another. Brazil has the largest cotton textile industry in South America as well as being the largest producer of raw cotton. Today the industry is about twice as large as before the World War (1914–18), with the likelihood of expanding still more as raw cotton acreage is enlarged.

C. ORGANIZATION OF COTTON TEXTILE DISTRIBUTION

Although the woven product of the cotton textile industry is all collectively referred to as cloth, it is important to distinguish from the standpoint of distribution between three types, according to the last stage of manufacture through which the cloth has passed—gray goods, the immediate product of the weaving mill, often referred to as unbleached cloth; finished goods, including bleached, dyed and printed fabrics; and fabricated products, such as sheets, towels, blankets, made by textile mills and sold from the mill ready for use in the home.

Gray Goods.—A large volume of cotton goods is used in the gray state, although in western countries this is almost wholly confined to industrial uses, as in bags and for similar purposes where the application of some specific finish to the goods is not required. Fifty or more years ago many consumers in the United States purchased gray goods, or "brown" sheeting, as certain types were called, which they bleached themselves by wetting and spreading out on the grass in the sun. This was a survival of the handicraft methods used on fabrics spun and woven in the home prior to their replacement by low-priced machine-made goods.

The use of factory-bleached and coloured goods is still not possible for a large proportion of the low income population of the Orient. For that matter a large part of the people in those countries live under a subsistence rather than an exchange economy, and are unable to sell enough of the products of their labour to be able to buy the products of industry. Consequently a large part of the textile requirements of those countries is met by handicraft production starting in some cases with the raw cotton, which may be spun into yarn according to primitive hand spinning methods, or with factory-made yarn which is then woven into cloth in the home. Thus there are markets in those countries for yarn for sale to consumers for home weaving, for gray goods for home finishing, and for finished goods, *i.e.*, bleached, dyed and printed cotton goods.

Of Japan's total exports of 2,643,000,000 sq.yd. in 1937, 1,291,000,000 sq.yd., or 49%, consisted of gray goods. For Great Britain, unbleached cotton goods amounted to 317,000,000 sq.yd. out of a total of 1,921,000,000yd., or 16%. For the United States, the proportion of unbleached was 28%, or 88,000,000yd. out of 320,000,000.

Except for these export sales of gray goods to consumers and for sales to domestic industrial users, the largest part of all gray goods produced is sold in a gray goods market to converters. In both Great Britain and the United States the function of selecting appropriate patterns, colours and finishes for gray goods is performed not by weaving mills or by finishing plants as such, but by a group of specialists in styling, known as converters. In some instances, in the United States, converting establishments are operated as part of a vertical mill organization, or as an adjunct to a finishing plant, but more frequently they are independent. Converters are accordingly buyers of gray goods from weaving mills and constitute one of the most important demand elements in the market for gray goods.

The existence of a gray goods market is a natural corollary of an industry structure whereby the producer of the cloth is unwilling to take the final responsibility for its merchandising as finished goods, and is willing to dispose of his product in an unfinished state to specialist converters. This tendency toward performing the successive processes in textile manufacturing and fabrication by separate firms is somewhat more pronounced in Great Britain than in the United States. In the former it is carried to the point where most spinners of yarn dispose of their product in a yarn market to mills performing only the weaving operations, whereas in the United States these two processes are almost universally integrated within a single mill.

The needs of both buyers, who require an adequate number of sources of supply, and sellers desiring to maintain a uniform rate of operation in their mills, have inevitably tended toward the development of standard constructions of cloth in the more common types used by the converting trade and by industrial users of gray cloth. The greater the demand for a given type of cloth, the more inevitable it has been for the trade to standardize upon a relatively few constructions.

A further reason for concentrating upon standard constructions is indicated by the function of the gray goods markets in making price adjustments. A common illustration is found in the wide print cloth division of the cotton goods industry. As of a given day the four major print cloth constructions may be quoted as follows:

TABLE XXIII.—*Major Print Cloth Constructions*

Width	Yarn count, warp filling	Weight, linear yards per pound	Price, cents per yard
39in. . . .	80 x 80	4·00	$6\frac{3}{8}$
39in. . . .	68 x 72	4·75	$5\frac{1}{4}$
$38\frac{1}{2}$in. . . .	64 x 60	5·35	$4\frac{1}{2}$
$38\frac{1}{2}$in. . . .	60 x 48	6·25	$3\frac{7}{8}$

It will be noted that there is a steady downward progression of prices as one proceeds from heavier (fewer yards to the pound) to lighter constructions. This makes it possible for the cutting-up and retail trades to adjust for raw material price fluctuations by shifting from one standard construction to another without the necessity of changing the retail price of the finished article. A rise in the price of 80x80 gray cloth, for example, from $7\frac{1}{2}$ to 10 cents per yard would throw printed percales made from this construction out of the range the dollar dress cutter could pay. After the supply of goods he had purchased in anticipation of that price rise had been exhausted, he would be obliged to turn to the next cheaper construction of percales for his dollar dress line, *i.e.*, 68x72's and so on. Since 1925 all these constructions have been used for the dollar dress at one time or another.

Where the particular requirements of different uses vary widely so that different specifications are required in the construction of fabrics for each use, trading tends away from standard constructions to the purchase of fabrics on contract by specification. This is particularly true in the case of novelty weaves, where patterns are woven into the cloth as in fancy dress goods, clipped spot marquisettes, and similar goods where each pattern is a separate construction.

Efficiency in operation of the gray cloth market, in the absence of any formal organization, is achieved through concentration of the actual marketing in the hands of relatively few selling agents and brokers. It has been estimated that in the largest of the United States gray cloth markets, about 20 selling houses represent by far the largest part of the total product, and in some markets the number is less than half-a-dozen. Gray cloth markets are thus essentially brokers' markets. There are no list prices. Quotations are on a bid and asked basis, and the market price is the price at which a sale is made.

Finished Goods.—Finished cotton goods are more familiar to the average consumer than gray goods. They consist of two broad types: converted gray goods, and fabrics that reach the point of sale for the first time as finished goods. Under the first type are included all bleached, dyed and printed goods; under the second, all coloured yarn cotton goods, such as denims, chambrays, ginghams, and specialties like tapestries, pile fabrics and narrow fabrics. To these two groups might be added composition fabrics, in which the fabric is combined with other substances to produce a finished fabric with entirely new properties. Examples of this type are pyroxylin-coated and rubberized fabrics and oilcloth.

All types of finished goods have one thing in common—standardization of constructions is less prominent than in the preceding levels of production. This applies less to such fabrics as denims, which resemble gray goods more nearly than finished goods because (1) finished goods contain decoration which can impart to the cloth a wide range of values both intrinsic and subjective quite irrespective of the value of the cloth itself, (2) the finishing process tends to blur the construction of the cloth as it was woven so that it is difficult to determine from a finished sample just what the original construction may have been. A further cause for lessening the importance of standard constructions in finished goods lies in the changes that occur in cloth during the finishing process. As cloth is woven on the looms it is naturally under considerable tension both as to warp and filling. During the finishing operation, this stretch may be increased warpwise due to pulling the cloth through the finishing processes in rope form with resulting shrinkage in the filling. Also, if the cloth is woven with highly twisted yarn, such as crepe twist yarn, the resulting shrinkage may be very great. Even if the cloth is put through a pre-shrinking process to remove normal shrinkage, the resulting count of ends and picks per inch may have no readily determinable relation to the original gray construction of the cloth. Nevertheless, while not satisfactory in many respects, the only way by which finished goods can be identified as to construction is on the basis of the gray constructions from which they were derived.

Since 1920 important changes have occurred in the types of finished goods used by consumers. The change in women's apparel, and the introduction of first silk and then rayon for women's intimate wear, greatly reduced the size of the market for bleached cotton goods. Similarly the perfection by dyestuff manufacturers during the '20s of fast dyestuffs in a wide range of colours stimulated the use of more plain shade and printed fabrics, to the point where they almost completely replaced ginghams in the United States market. Since about 1930 the vogue for sportswear, beach apparel, and playsuits has further changed the women's cotton fabric markets by creating a demand for other types of fabrics. In men's apparel the perfection of pre-shrinking processes has revolutionized the work and sports clothing business, making possible the expansion of cotton fabrics into semi-dress apparel and tailored summer clothing. The growth of the leisure and sports apparel field has similarly created a demand for new types of fabrics. In household textiles, the greatly increased use of sheets, towels and similar articles has created a broader market for bleached goods, which has in part taken the place of what was lost of the bleached goods market in the women's apparel field.

Changes of this sort between the various types of finished goods are continually occurring.

Because the gray goods mill must be able to sense such changes in consumer demand and act in accordance with them, it is frequently proposed that the two processes of weaving gray goods and converting finished goods should be integrated. In the United States there are numerous mill organizations of this kind, although they represent a smaller part of the finished goods market than the independent converters. In Great Britain they are quite infrequent.

The findings of a research study of vertical integration in the textile industries, conducted under a grant from the Textile Foundation, indicate that the basis for deciding whether integration of weaving and converting is practicable is the effect it will have upon the flexibility of both the mill and the converting organization. The advantage of not being integrated lies in the complete freedom of each to operate as it pleases; for the gray mill to sell its product wherever it can and at the best price it can get; for the converter to handle whatever type of goods he expects to be able to sell at the highest profit and to buy from the mill that can make and sell them at the lowest price. Integration necessarily reduces this flexibility.

However, by partial integration, this flexibility may be maintained while at the same time bringing to each unit the combined advantages of a gray mill profit and close contact with the finished goods market. By this is meant the avoidance of complete balance between the two units, by either having the finished goods unit much larger than the gray mill or vice versa. In the first case the converting unit can operate the mill at capacity and still produce only part of its requirements, while in the second the mill can use its surplus capacity to produce lines that can be sold as gray goods which will not compete with the product of the converting unit. Other factors, of course, enter into the situation, such as the point at which style is introduced into the fabric, whether in the weaving of the cloth or in the finishing operation.

The finished goods selling organization, it is evident, tends to be quite different in character from that of a gray goods mill. Gray goods consist largely of standard constructions which may be sold through a broker by description. Customers are largely converters or large industrial users. Finished goods, on the other hand, are specialty products in that each converter's offering has different patterns which express the style ability of the designer and which must be sold to the cutter or wholesaler or retailer.

Also, because of the relatively large number of users who must be approached, a different type of selling organization must be employed.

Prior to the World War of 1914–18 the average consumer in the United States and Great Britain purchased a fairly large proportion of her textile requirements as finished goods. Most articles of women's apparel as well as textile articles for the home were either made in the home or by seamstresses or dressmakers. Ready-made articles in men's apparel, such as shirts, collars and suits were already widely worn, but the mass movement toward ready-made clothing did not get under way until after the war. As a result of this fundamental change in textile distribution the importance of consumer purchases of piece goods greatly diminished. Consumers now buy ready-to-wear, and converters sell less and less to wholesalers and retailers, and more to cutters of all kinds.

Fabricated Textile Products.—Today most textiles reach consumers as fabricated products. The term is used here to designate the product of a final manufacturing operation in which definite shape, size and design are imparted to it to fit it for a specific use. Textile fabricated products consist basically of two types: made-up articles produced by textile mills which combine in some way the fabricating process with preceding manufacturing operations; and made-up articles produced by the cutting trades. This is essentially a difference arising from integration of the fabricating process with cloth manufacture, although in some cases, such as hosiery manufacture, the operations of cloth formation and product fabrication are performed simultaneously.

VI. COTTON MACHINERY

This section deals with the machinery used in the various departments of the cotton industry, beginning with cotton ginning machines and passing successively to cotton spinning machinery, cotton weaving machinery and cotton finishing machinery. Reference should also be made to the articles Spinning; Weaving; Carding; Combing.

A. COTTON-GINNING MACHINERY

Any method of separating cotton-seed from lint is known as ginning. The earliest machine for this purpose was the primitive "churka" gin used in India centuries ago, and still used there and in China to some extent. Several types of roller gins were developed prior to Eli Whitney's saw-gin, but it is to his invention in 1793 that we owe the development of the raw cotton industry, for almost all of the world's cotton crop is ginned today by improved adaptations of Whitney's principle. The large amount of machinery necessary in a modern gin is used, mostly, to clean seed cotton, carry it to the saws, and convey the lint cotton away from the saws.

Although ginning is a specialized process necessary to put cotton into a marketable condition, unless the cotton farmer has done his part, the ginner—no matter how efficient his plant—cannot deliver a bale of cotton up to standard. Care in harvesting and handling seed cotton on the farm is as necessary as care in ginning. For instance, the average gin, adequately maintained and efficiently operated, can only do a good job of ginning on dry, carefully picked clean cotton. Green, damp, or wet cotton, if ginned without drying, gives rough preparation and grade penalties that amount to as much as $1 to $10 or more, per bale, depending on moisture content and staple length of cotton and prevailing price. If the seed cotton is long staple, even a slight excess of moisture will cause gin-damage.

Wide varieties in harvesting practices have caused manufacturers of ginning machinery to make great strides in design and construction of cleaning and extracting machinery. Gins established in sections where cotton is "snapped" find it essential to incorporate excellent cleaning units. (During 1928–35 an average of 12% American crop was snapped.) The recent development of the Centrifugal Gin (Watson) was an effort toward better cleaning, but it is still in the experimental stage. Certainly better cleaning of cotton at the gin is the missing link between harvesting and a clean crop.

Since 1930 cotton ginning in the United States has undergone material modernization. The outstanding item in this has been the introduction of cotton conditioning apparatus at the gins which, under processes publicly patented by the United States Department of Agriculture, have decreased the moisture content of the cotton and improved the ginning and grade of cotton without impairment of the other fibre qualities. Designs of gins have changed to include higher saw speeds and associated looser seed roll operation, and improved designs of gin saw teeth, and the consequent smoother ginning. Power seed-handling systems have also been introduced into the gins to aid in guaranteeing purity of special planting seed and to avoid detrimental mixing which occurs in old style gins. Remarkable improvement has been made in the development of unit-extractor-feeder machinery for simplification of the cleaning and extracting of cotton at gins. Some of the best gins now have seed cleaners operating in conjunction with the ginning processes, and utilize chemical seed treatment along with them. All-steel construction, with simplified driving mechanism has also developed, helping to make the modern cotton gin a trim, neat, light, airy, fire-proof institution.

A modern saw gin contains from two to eight "gin stands." When the seed cotton is brought to the gin it is drawn by pneumatic elevators from the wagon or truck; suction tubes 10 to 12in. in diameter convey the cotton first to a drier, if the gin is so equipped, then to a cleaner where the cotton is thrown against a wire screen which action shakes some dirt and trash from the lint, then spiked rollers shake and tear the cotton apart, throwing it again against a wire screen which permits dirt to fall through.

Moisture in seed cotton is an important factor affecting the operation of a gin and quality of ginned cotton. The United States Cotton Ginning Laboratories have developed the vertical drier for seed cotton. The number of driers installed in commercial gins since 1931, when the drier was perfected, has increased from 15, which handled 25,000 bales, to 800 in 1938, which handled over 1,000,000 bales. In gins where driers are installed the cotton is dried and cleaned in joint process.

From the cleaner, or cleaner-drier, the cotton is automatically placed on a conveyor belt which supplies the feeders which in turn supply the stands with the proper amount of cotton. From the feeder the cotton is dropped into the gin-breast where it comes in contact with the saws.

Some gins are built with a lower roll-box or huller fronts into which fall bolls, hull, etc. This type of gin is used in ginning "bollies" or snapped cotton. At least 80% of central cotton belt gins and 100% of Western gins are so equipped. Gin saws are steel disks 10 to 12in. in diameter. The saw teeth on the circumference of the disks are hook-like in shape, to give maximum strength but with a minimum amount of damage to the cotton fibres. Saw teeth must be kept sharp and clean. The proper speed for 12in. saws approximates 400 revolutions per minute. One gin stand contains about 70 saws.

The lint may be removed from the saws by brushes or by air-blast. More than one-third of the gins in the United States were equipped with air-blast machinery during 1935. It is estimated that these gins took care of one-third of the United States crop, or 3,500,000 bales that year. Air-blast gins, properly gauged, can be operated economically and efficiently and are becoming increasingly popular.

Lint, after it is removed from the saws, goes to the condenser where the cotton is pressed into layers of compact "bats." It drops from the condenser into the press box where it is packed by mechanical trampers. When the box is filled pressure is applied, and the bale, over which bagging has been drawn, is securely tied with iron bands.

United States gin machinery is considered the most efficient the world over. Its export in great quantities would indicate that up-to-date and efficient methods throughout cotton growing countries of the world are similar to that described above.

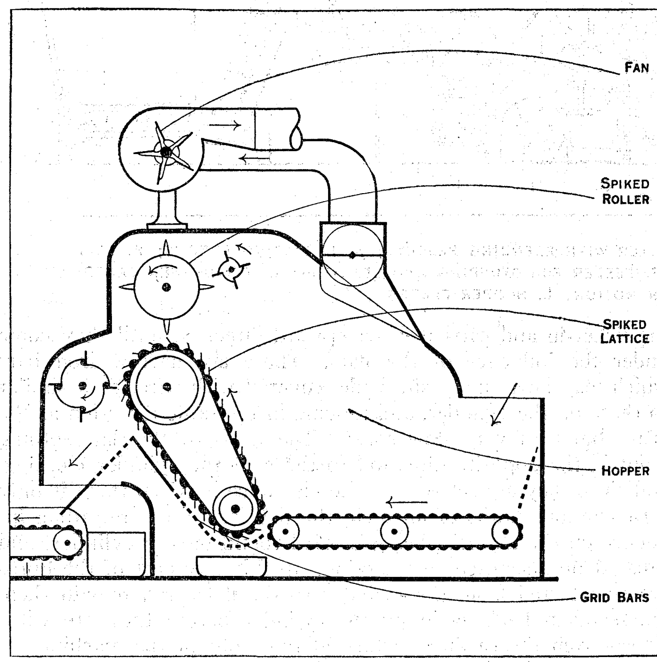
The modern roller gin is used exclusively in Egypt, and is employed for ginning the American Pima and Sea Island crops. It is small and simple in construction but it is power-driven. It consists of a leather covered roller and a large knife which is set so that its edge is parallel with the surface of the roller and barely touches it. Mechanical feeders carry the seed cotton to the rollers which pick it up, carrying it to the knife. The lint clinging to the roller goes under the knife, and thereby is pulled from the seed which falls to the floor. The long fibres of the strains of cotton ginned on roller gins slip readily from the seed leaving them quite clean. This type of ginning is slow and expensive, as only 50 to 80lb. of lint cotton are obtained per hour, per gin stand, but saw gins nep up extra long fibres and they become gin-cut and damaged. (M. G. B.)

B. COTTON-SPINNING MACHINERY

The functions of the processes in the mill are as follows: (1) to reduce the highly compressed cotton from the bales into the greatest possible state of division, *i.e.*, to the ultimate fibre, and at the same time to remove sand, leaf, broken seed and short fibres; (2) to form the fibres into a rope, or sliver, which can be attenuated by stages until it is thin enough to form the required thread; (3) to parallelize the fibres by drawing between rollers or by combing, and, at the same time, by combining and attenuating several slivers, to increase the regularity of the material; (4) to insert sufficient twist into the product of the final attenuation in order to make a firm thread; (5) where required, to combine one or more single threads into a folded yarn; and (6) to finish and prepare the yarn for transport. The fineness of a yarn is expressed by its count, which is the number of hanks (840yd.) of that yarn which weigh one pound. The principal machines are: bale breakers, openers and scutchers or pickers; carding engines or cards; drawframes or drawing frames, and, for high quality yarns, combers; flyer frames; ring frames or mules, and where folded or plied yarns are produced, winders and doublers or twisters, cleaning and gassing frames; reels and bundling presses.

The Bale Breaker.—The bale breaker, in the great majority of cases, is of the hopper type (fig. 11). The raw material in the form of hard, compressed slabs from the bale is fed by hand into the hopper, where it is then lifted by the spiked lattice until it comes under the influence of the spiked evener roller above.

The latter allows only a small portion to proceed, and throws the rest back into the hopper for further treatment; while the dust freed by the consequent agitation of the cotton is drawn off to a dust chamber by the fan. The tearing action of the two sets of spikes thus reduces the material into a fairly fluffy state, so that in passing over the grid bars some of the loosened heavy impurities are able to fall out. The cotton is then conveyed



FROM TAGGART, "COTTON SPINNING" (MACMILLAN)

FIG. 11.—HOPPER BALE BREAKER FOR THE TEARING UP OF HARD, MATTED LUMPS OF COTTON FROM THE BALE INTO SMALLER PIECES

either by lattices or by pneumatic trunks to the opener machine which follows. This usually is of the vertical type.

Owing to its great variability, cotton from suitably chosen bales of different grades is mixed in the bale breaker in order to maintain a consistent quality of yarn, and for ordinary purposes, treatment by the subsequent machines is relied upon to make the mixture complete. In some cases, however, principally in mills spinning fine yarns, mixing is assisted by building up a stack of cotton from the breaker in horizontal layers, and after leaving it for two

or three days to become aerated, pulling it down in vertical layers to be fed to the opener.

The Vertical Opener.—The opener (fig. 12) has a conical-shaped casing *C* of screens and grid bars, in which there is a rapidly revolving beater *B*. Cotton enters at the bottom in thick lumps and, as it is fluffed up by the beater, due to the shape of the beater and the arrangement of its fingers, the stock rises to the top. Dirt passes out through the screens and grid bars. Air is furnished by a fan in the condenser section. As the cotton rises to the top of the opener it passes through a condenser section to a horizontal cleaner.

FIG. 13.—SECTIONAL VIEW OF A HORIZONTAL CLEANER WITH FEED APRON; A, FEED APRON; B, BEATER; C, GRID BARS

The Horizontal Cleaner.—The horizontal cleaner (fig. 13) has a rapidly revolving beater with flat strikers surrounded by grid bars. Dirt and impurities are thrown out through the grid bars and the cotton passes out through a trunk line to the picker.

The Single-Process Picker.—Since about 1925 single-process pickers have to a great extent superseded two- and three-process pickers in the United States. The picker is usually in the form of a combination of several machines. Its functions are, broadly speaking, the same as those of the bale breaker, opener and cleaner, by which treatment the cotton is still further opened up, freed from the greater part of its impurities, and made into the form of a rolled up sheet or lap, of about the thickness of a heavy blanket, ready for the next process. A typical example of a single-process picker is shown in fig. 14. The cotton is first fed to a hopper feeder, which serves to present it in the form of a sheet to a three-blade beater. The latter is about 20in. in diameter and revolves at a speed of about 800 revolutions per minute. The stock is flung by the blades against the grid bars through which a portion of the impurities are discarded. The beaten flakes of material are then withdrawn from the beater by pneumatic suction generated by the fan and, after passing over further grid bars, are deposited on the wire mesh cages, through the near surfaces of which the air is exhausted. The cotton then passes through a second beater and condenser section, a cleaning and blending reserve, and an evener motion, a third beater and condenser section, feed rolls, and heavy calender rolls, which, after a threefold compressing action, pass it on to be rolled up into a lap.

As the cotton enters the cleaning and blending reserve, it is carried by the elevating aprons *A* to the feed rolls *B* which feed it to a six-blade beater *C*, which removes impurities and passes the stock into the reserve chamber *E*. The amount of cotton allowed to accumulate in the reserve chamber is controlled by the feeler *F*.

The evener motion consists of a series of levers, 2 to 2½in. wide, arranged side by side across the width of the machine on a common fulcrum arm. The short arms or pedal noses are kept in contact with the feed roll by a weight hung at the end of a series of links which connect the long arms together. This arrangement of links integrates the movements of pedals and is connected to

a cone belt drive, by which the speed of the feed roll can be varied. Thus, if an unusually large bulk of material is passing under the feed roll, the total amount of depression of the pedal noses is increased, and the consequent raising of the link mechanism acts through the cone pulleys to reduce the rate of delivery. In this way the uniformity of the thickness of the lap is improved.

The Card.—In the carding process, the final deliberate cleaning takes place by the elimination of such impurities as have survived the previous processes; a certain amount of the short, broken and immature fibres are removed, and the heavy sheet or lap from the picker is reduced to a comparatively light and thin sliver. The revolving flat card which is the type used in cotton industry for all but very coarse yarns is shown in fig. 15. The sheet of cotton is unwound from the lap by the roller and is presented by the slow revolution of the feed roller to the action of the taker-in roller or licker-in. The latter is composed of a series of fine-toothed circular saws mounted side by side on a shaft, and has a surface speed of roughly 1,000ft. per minute. Its action is to tear away small portions of the fringe projecting from under the feed roller and carry them round in the direction of the arrow until they are acted upon by the surface of the cylinder, which is uniformly covered with closely set steel wire teeth secured in a cloth and rubber foundation. The cylinder has a surface speed of about 2,000ft. per min., so that the fibres are stripped from the licker-in and carried in an upward direction until they come under the influence of the flats. These are narrow iron bars which may be 1⅜in. to 2in. wide, covered with wire teeth similar to those on the cylinder, and moving in the same direction as the latter but at a very slow speed. The wires of the flat clothing point in the opposite direction to those of the cylinder clothing, and since they are set so that the clearance between them is only 6 to 10-thousandths of an inch, the flats exercise a retarding influence on the material being carried round on the cylinder, and thus set up a semi-combing action. In this way part of the fibres are transferred from the cylinder to the flats, and remain there unless taken back again by the cylinder before they are withdrawn from the carding surface at the front of the machine.

On leaving the influence of the flats, the fibres on the cylinder, now in fairly parallel order and uniformly distributed over its surface, are taken off in a continuous sheet by the doffer, which is also clothed with wire points, facing into those of the cylinder, but which has only about 1/25 the surface speed. The sheet is removed by means of the doffer comb and gathered together in the form of a sliver which is coiled into the cylindrical can by the coiler mechanism. The sliver is almost entirely free from impurities and its weight is some 100 to 120 times less than that of the picker lap.

After the carding process, the treatment of the material depends

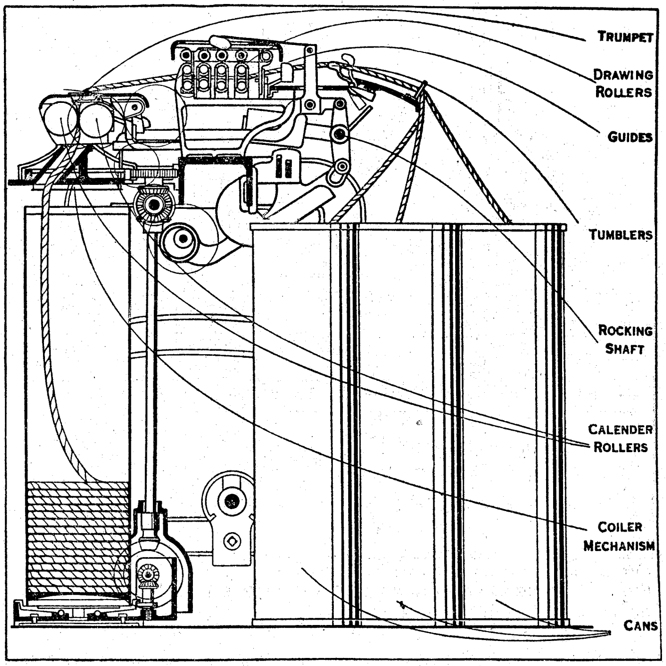
FIG. 15.—REVOLVING FLAT CARDING ENGINE, A MACHINE THAT SERVES A THREE-FOLD PURPOSE. IT CONVERTS THE THICK SHEET OF COTTON FROM THE SCUTCHER LAP INTO THE FORM OF A ROPE OF FIBRES, KNOWN AS SLIVER; REMOVES IMPURITIES AND OBTAINS MAXIMUM FIBRE SEPARATION

on the class of yarn to be spun. For counts of 60s and upwards, and for extra quality yarns of coarser count the cotton is subjected to a combing process whereby the shorter fibres are removed to the extent of some 15% to 20% of the total weight, according to the quality desired and the cotton being used. In other cases the card sliver is passed through two or three passages of drawing frames whose functions are to parallelize the fibres and increase the regularity of the weight per unit length of the material.



BY COURTESY OF PLATT BROTHERS & CO., LTD.

FIG. 16.—SECTION OF THE DRAWFRAME, A MACHINE WHICH PLACES THE FIBRES OF COTTON MORE PARALLEL, MAKING THE SLIVER AS UNIFORM AS POSSIBLE IN THICKNESS

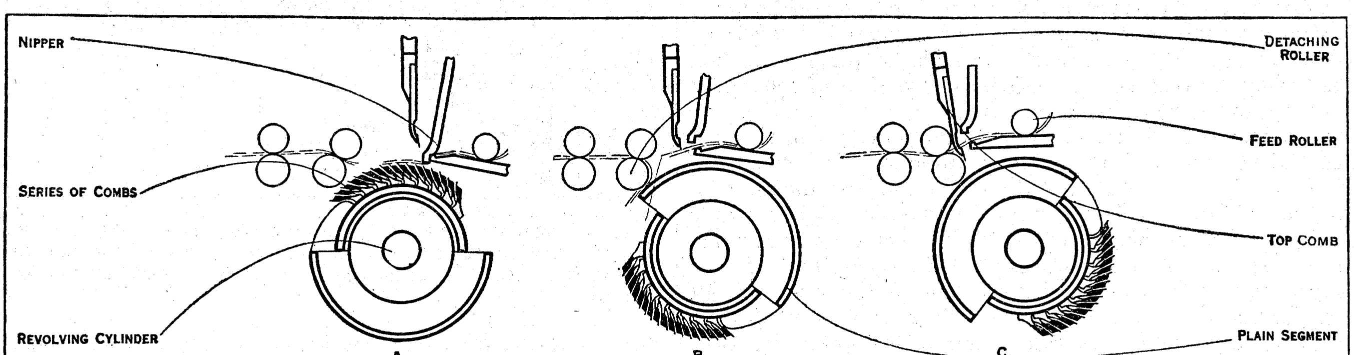
The Drawing Frame (fig. 16).—Four, six, or eight slivers from the cans are passed side by side over tumblers or spoons and through guides to four successive pairs of rollers suitably spaced and driven in such a way that the surface speed of each pair is greater than that of the preceding pair. In this way material passing from the grip of one pair to the next is stretched between them, thereby creating what is known as a draft. If the surface speed of the front pair of rollers is six times that of the back pair, there is constituted a total draft of six. The bottom rollers are of steel, longitudinally fluted, and positively driven by gearing, while the top ones, either fluted steel or leather covered, are driven by surface contact, being loaded by heavy weights hung on their bosses. If six slivers are fed in at the back, then the draft of the machine is arranged to be six or slightly less; so that throughout the drawing process the issuing drawframe slivers are only slightly more in weight per unit length than the original card slivers; but owing to the drawing or drafting action of the rollers the fibres are gradually drawn out into parallel order, and by making one sliver out of six, the regularity of the material is greatly increased. The material as it emerges from the nip of the front rollers is in the form of a narrow sheet which is drawn by the calender rollers through the trumpet and coiled in the can by the coiler mechanism. A section of a drawframe is shown in fig. 16. The products of the first passage of drawframes are then treated in a similar way in the second passage: and so on, until the requisite amount of regularizing and parallelizing has been accomplished.

Combing.—Cotton which has to be combed requires to be in the form of a lap which may vary from 7½in. to 12in. in width. Moreover, to avoid unnecessary waste, the fibres must be in parallel formation. To obtain these conditions there are two methods of procedure. One is to pass sliver which has been processed by one head of drawframes, through a sliver lap machine. The latter, in its functions, is identical with the drawframe except that the issuing sheet of cotton is rolled straight up into a lap instead of being formed again into a sliver by being drawn through a trumpet. In addition, the sheet is thicker, since the number of slivers fed together at the back of the frame may be as many as 20. The other method is to take the sliver straight from the card through a sliver lap machine to a ribbon lap machine, where six sliver laps are separately drafted by an arrangement of drawing rollers, superimposed and rolled up ready for combing. Whichever method is adopted the final product is known as a comber lap.

The Comber.—The comber is one of the most complicated and intricate pieces of mechanism used in the spinning processes, but while the settings and speeds of the various parts have to be regulated with the greatest care, the principle of its method of treating the cotton is relatively simple. The essential parts of the machine are: a device for feeding forward a fringe of comber lap at regular intervals; an arrangement of combs which at the right time pass through the fringe; and means for piecing up the successively combed fringes. Either the Heilmann comber or the development of it, the Nasmith comber, is used. Fig. 17 shows a Nasmith type comber. In a complete machine there are usually six deliveries of combed fibres, each of which is drawn through a funnel, and, by further drafting between rolls, combined with the other five to form a comber sliver. The slivers from the combers are then subjected to one or two passages of drawing, in continuation of the principle of making the material as regular as possible.

Flyer Frames.—Following on the last head of drawframes the process becomes one principally of attenuation. To this end the material is passed through two, three or four passages of machines collectively known as flyer frames, in which again the operation is carried out by means of drawing or drafting rolls. Up to this point the slivers have held together by virtue of the natural cohesive properties of the fibres; but any further attenuation makes it necessary to insert twist in order to maintain the material in the form of a continuous length. Hence the utilization of a revolving bobbin and flyer (fig. 18) which gives to these machines their names.

In the first of these frames, known as the slubbing frame or



BY COURTESY OF JOHN HETHERINGTON AND SONS, LTD.

FIG. 17.—MAIN FUNCTIONS OF A NASMITH COMBER IN THREE POSITIONS. A SHOWS THE COMBING OPERATION; B, THE BEGINNING OF THE PIECING-UP; C, THE BEGINNING OF THE SEPARATION OF THE COMBED FRINGE FROM THE MAIN BODY OF THE LAP

slubber, cans of sliver from the last drawframe are arranged behind the machine. Each sliver is drawn out by means of three pairs of rollers, and as it emerges from the front pair is drawn through a hole in the top of the flyer, down the hollow leg of the latter, shown on the left of the figure, and on to the bobbin. The flyer is attached to, and driven by, the spindle at a uniform speed, and inserts the amount of twist necessary to make the strand hang together. This twist, however, must be the minimum required for its purpose, since too much will make it impossible to continue the process of attenuation in the subsequent machines. The bobbin is loosely mounted upon, but driven independently of, the spindle, so that the difference between their respective speeds effects the winding on. This is done in closely wound spirals and in successive layers, by suitably raising and lowering the bobbin relative to the spindle.

The other machines of this group, known respectively as the intermediate, speeder and jack frames, differ from the slubbing frame in only three respects. First, instead of having cans of sliver put at the back, racks or creels of suitable size are provided to carry the bobbins on which the material is now wound. Secondly, the dimensions of all the frame parts, including bobbins and flyers, are reduced at each stage as the roving becomes more and more attenuated. And thirdly, it is usual to arrange for the strands from two bobbins to be fed together to the drawing rollers and combined into one at the front, thereby assisting to maintain the uniformity of the roving. The amount of attenuation effected by these machines, and, therefore, the number of stages in which it is done, depends on the count of yarn subsequently to be spun. For coarse yarns, the slubbing and intermediate frames only may be used, whereas for very fine yarns the work is carried out in the four stages finishing with the jack frame. In all cases the final product of this group of machines is known generally as roving.

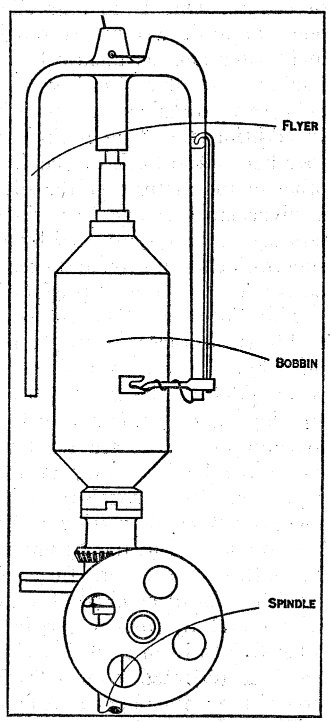


FIG. 18.—FLYER FRAME DIAGRAM
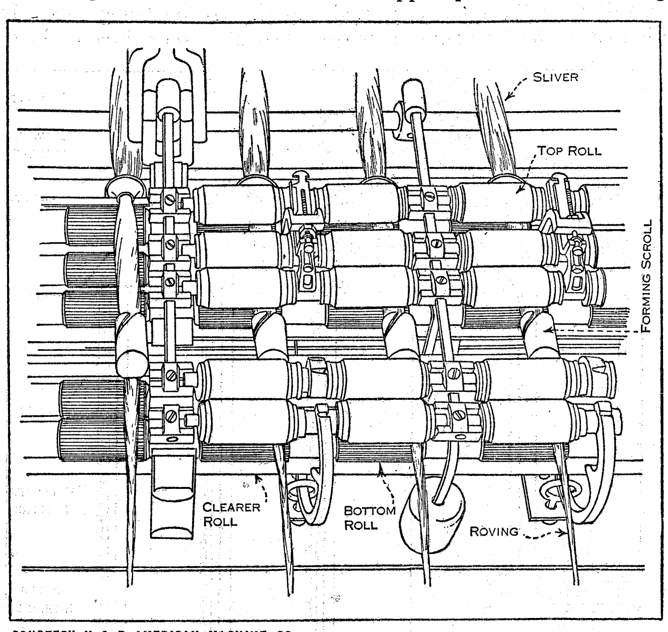
This machine twists the fibres of the roving axially and coils the twisted strand upon the bobbin

Within recent years a type of flyer frame known as high-draft or long-draft frames has come into widespread use. Only one or two stages of roving are required with these frames, since the amount of attenuation at each stage is much greater. They differ from the conventional frames mainly in the drafting section. This may consist of either four or five pairs of rolls, one or more of which may vary from the standard type drafting roll. In addition, usually there is some kind of roving guide or forming trumpet. One type of drafting section consisting of five pairs of rolls and a forming scroll is shown in fig. 19.

Spinning.—It only remains now to carry the attenuation one stage farther and to convert the drawn-out roving into a yarn by the insertion of sufficient twist to prevent any further slippage between the constituent fibres. The machine employed may be either a ring spinning frame or a mule. On the ring spinning frame (fig. 20), the processes consist of twisting and winding the yarn upon a bobbin simultaneously and continuously, as with the flyer frames. Here, however, the flyer is substituted by a smooth annular ring formed with a flange at its upper edge, over which is sprung a light C-shaped piece of wire known as a traveller. The spindle, to which the bobbin is firmly attached, projects vertically through the ring, and is supported on a fixed rail by a self-aligning and automatically lubricated bearing. Rotary motion is derived from the tin roller or cylinder by a band passing round the wharve or whorl, which is fixed to a sleeve on the spindle over the bolster or upper part of the bearing.



COURTESY H & B AMERICAN MACHINE CO.
FIG. 19.—LONG-DRAFT ROVING SECTION WITH FIVE PAIRS OF DRAFTING ROLLS AND A FORMING SCROLL

After it has passed through the rolls, the roving is twisted into a yarn which passes first through a guide-eye and then through the traveller onto the bobbin. As the latter revolves, the traveller is dragged round the ring by the yarn, and so inserts the necessary twist. The speed of the traveller, however, is less than that of the bobbin, owing to the lag which is permitted by the constant delivery of roving from the front roller. In this way the bobbin, acting through the traveller, not only inserts the twist but winds the material on to itself, the deposition of the coils being determined by the vertical movement of the rail which carries the

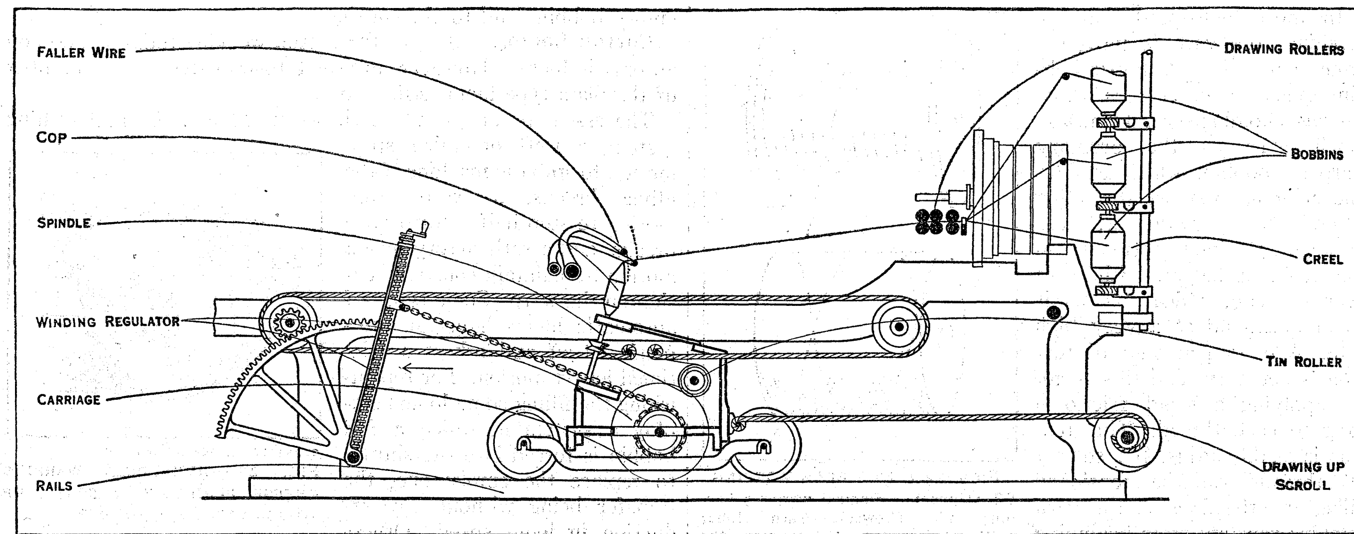

FIG. 21.—SECTION OF MULE USED FOR INTERMITTENT SPINNING. THE ROVINGS PASS FROM THE CREEL TO THE SPINDLES, WHERE THEY ARE TWISTED INTO YARN ON THE OUTWARD RUN OF THE CARRIAGE AND WOUND ON TO THE NOSE OF THE COP DURING THE RUN IN

ring.

The drafting section on most of the modern ring spinning frames is some form of the long- or high-drafting type, in which four pairs of drafting rolls or two pairs of drafting rolls and a pair of travelling aprons are used. These travelling aprons consist of two endless leather bands revolving about a pair of rolls and a two-armed part called the tensor (fig. 20).

In the mule (fig. 21) the action, unlike that of the ring frame, is intermittent; *i.e.*, first, a certain length of roving is drawn out and twisted, and then twisting ceases and winding-on takes place. The resulting cop of yarn is built upon the bare spindle in successive conical layers. At any instant during the twisting process, therefore, a portion of the already spun yarn is coiled in spiral fashion from the nose of the partly built cop to the top of the spindle: and, in order that no winding-on shall take place at the same time, the spindles are inclined slightly towards the rollers, thereby enabling the top coil to slip off at each revolution. Following the material through the machine: the roving from bobbins, mounted in the creel, is passed in the usual way through the drawing rollers and then between two faller wires to the spindle which is mounted on a carriage whose wheels run on rails called slips.

Spinning commences with the carriage close up to the rollers. As the attenuated roving is delivered by the latter the carriage moves away and the spindle, being rapidly revolved by bands passing from the tin roller, inserts the desired amount of twist into the regularly increasing stretch of material between the rollers and the spindle tip. The distance the carriage travels may be from 54in. to 66in., and is known as the draw or stretch. At the end of the stretch the mechanism driving the spindles during the outward journey is disengaged, the direction of rotation is reversed and backing-off takes place. In this operation the yarn coiled around the exposed part of the spindle is unwound and the "slack" produced by the added length of yarn is taken up by the operation of the faller wires. It then remains for the spindle but to reverse once more and, while the carriage moves back rapidly towards the rollers, to wind the spun thread in another layer on the cop. The upper faller wire shown in the figure is responsible for guiding the yarn in the correct manner, and is for that purpose controlled by a special cop-shaping device. All the motions of the mule are governed automatically and are regulated to succeed each other in their proper order, the termination of one operation being the initiation of the next. The foregoing is but a brief outline of the functions and possibilities of the machine.

Doubling or Twisting.—Where it is desired to combine two or more strands from the spinning machine to make the product more suited to a particular purpose, the single yarns from the cops or bobbins, as the case may be, are subjected to a process of doubling or twisting. To prepare the strands it may be necessary to wind the required number side by side upon a flanged bobbin, or upon a straight or a tapering spool, before twisting them into one. The twist may be inserted in fundamentally the same way as it is in the ring spinning frame. No attenuation is required: hence drawing rollers are substituted by feed rollers. The strands may be twisted in a dry condition, or may be moistened in some suitable manner so as to produce a firmer and smoother yarn.

Finishing and Making-up.—Yarns which are required to have a maximum of lustre and smoothness are subjected to a process of gassing or singeing. The yarn is passed several times through a bunsen flame at such a speed that the fibres projecting from the surface are burned off without injury to the rest. Such yarns may also be polished by repeated calenderings between a pair of heavily loaded rollers.

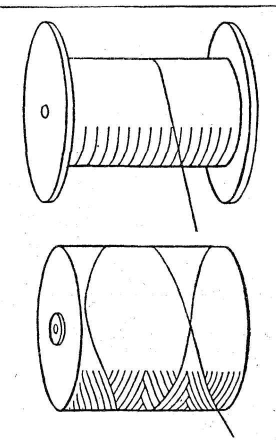
C. COTTON-WEAVING MACHINERY

The methods described under Weaving (*q.v.*) are by far the most widely used for the preparation of cotton warps, especially in Lancashire, but some modifications are used in other centres of the industry, and more productive methods are coming into use, particularly for the preparation of warps for gray or natural coloured cloth.

The beam warping process has been the subject of much experimental work, and in many places high-speed warping machines are in use by means of which the speed of warping is from 500 to 950yd. per minute. The chief difficulty in the ordinary system lies in the varying tension on the yarn during unwinding, and particularly when starting and stopping the machine. Neither the flanged warpers' bobbins (fig. 22), which are most commonly used, nor tubes (fig. 23) are very satisfactory when mounted in the creel and rotated by the drag of the unwinding yarn. The speed of the bobbin or tube, when nearly empty, is very high; the comparatively heavy bobbins overrun at a stoppage and throw stress on the yarn when restarting; tubes, on the other hand, become too light and are liable to bounce out of the creel, whilst the quick side-to-side traverse of the yarn on the tube is an additional cause of trouble. In American beam warping machines the speed of warping is gradually reduced as the beam fills and the bobbins empty, in order to reduce these variations in tension, but this means some loss of production.

In most high-speed warping machines the yarn is unwound from cones (fig. 24), bottle bobbins (fig. 25), or cheeses, these packages holding several times as much yarn as the ordinary warper's bobbin, which enables one creeling to suffice for filling several beams. Moreover, these packages are kept stationary in the creel and the yarn withdrawn over the end, which enables it to be unwound at a very high rate. A certain amount of tension is necessary and this is got by applying a small frictional drag to each thread. This tension is readily adjustable, so that all threads can be tensioned alike, and the drag on the yarn remains constant from beginning to end of the package. Also, when the machine stops, there are no bobbins to overrun and slacken the threads. An alternative system is to have the yarn wound on large cheeses, about 9in. in diameter, the cheeses rotating in the creel on ball-bearing spindles. Overrunning of these cheeses is prevented when the machine has to be stopped suddenly, by electrically controlled brakes which are applied to each cheese at the same time that the beam is braked.



FIGS. 22 & 23.—BEAM WARPING
22 (Upper).—Flanged warper's bobbin; 23 (Lower).—Yarn tube; neither being very satisfactory, as the first is apt to over-run when the machine stops, and the second to jump out of the creel

The drying of the warp yarn after sizing in the slasher sizing machine is sometimes done by passing it through a drying chamber instead of over steam-heated cylinders. The latter are used almost altogether in America. Many of these are equipped with various automatic control instruments.

Rewinding of gray weft yarn in cotton weaving is the exception rather than the rule, but when automatic looms are used, rewinding of the weft or filling on to pirns or quills is common. These pirns hold much more yarn than the cops or bobbins from the spinning frames, and this, together with the removal of faulty places, makes them much more suitable for automatic weaving. Modern pirn winding machines usually have horizontal spindles on which the pirns or tubes are held and driven by friction. The spindles rotate at a speed of 2,000–3,000 revolutions per minute, and, as the spindle speed is generally constant, the rate of winding the yarn is continually varying as the guider moves across the chase or traverse of the pirn (fig. 27). This varying rate of winding causes a considerable amount of trouble, due to the variation in yarn tension that it causes, and tensioning devices have to be used to counteract the changing speed.

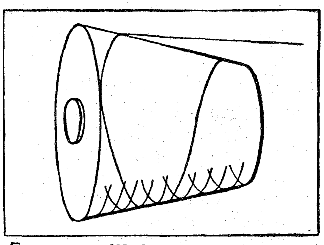


FIG. 24.—HIGH SPEED WARPING; WHEN THE YARN IS UNWOUND AT HIGH SPEED FROM THIS CONE IT GIVES THE THREAD A CONSTANT TENSION DURING ALL OF THE UNWINDING

Since about 1935, at least three types of automatic pirn or filling winders have been developed, and, shortly after their development, began being used in both Europe and the United States. These machines automatically remove full bobbins and start winding on empty bobbins without assistance from the operator. The spindle is stopped momentarily for doffing and loading the new bobbins from a magazine. Thus the duties of the operator are simply to keep the magazine filled with empty bobbins and to change the cones.

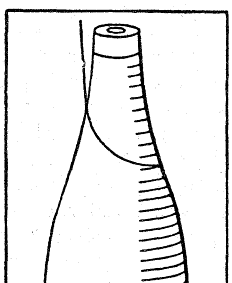

FIG. 25.—A BOTTLE-SHAPED BOBBIN

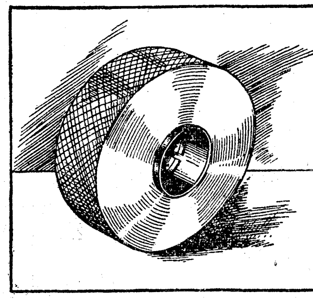
Cotton Looms.—Most of the cotton weaving today is done on automatic looms. However, in Great Britain there are a number of the plain type looms still in use.

The essentials of an automatic loom are a filling replenishing system, a weft or filling stop-motion to stop the machine if the filling breaks, a warp stop-motion to stop it if a warp yarn breaks, and a satisfactory let-off motion to maintain constant tension on the warp. Some types of automatic looms have an automatic let-off and others a frictional let-off motion. For replenishing the filling some looms employ a system in which a full bobbin is forced into the shuttle to replace the empty one, the transfer being without any reduction in loom speed. Others use some type of shuttle-changing system in which the loom is generally stopped for sufficient time to allow for the change from empty to full shuttle.



COURTESY BARBER-COLMAN CO.
FIG. 26.—HIGH-SPEED WARPING CHEESE, PERMITS YARN SPEEDS UP TO 950 YARDS PER MINUTE

Looms have undergone a great many refinements in recent years, especially since about 1930. Due to developments in metallurgy, the frames, gears and other metal parts are of better quality in both material and workmanship. Whereas these were formerly made of cast iron, they now are made of machined steel. The speeds of these looms over the older looms are considerably increased, normal operating speed for some types being approximately 200 picks per minute. Operating efficiencies of as high as 95% are not uncommon. (For further information and bibliography, *see* WEAVING.)

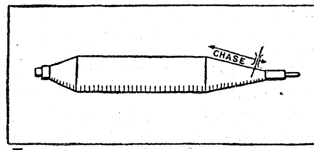


FIG. 27.—AUTOMATIC WEAVING, SHOWING ONE TYPE OF PIRN OR QUILL HELD ON HORIZONTAL SPINDLES WHICH ROTATE AT 2000–3000 REVOLUTIONS PER MINUTE

D. COTTON-FINISHING MACHINERY

Only a relatively small percentage of woven cloth is sold to the actual consumer in the condition in which it leaves the weave shed; *i.e.*, in the "loom state" or the "gray." Much of it is bleached, dyed or printed, and subjected to various finishing treatments. There is no standard finishing procedure, the exact routine depending on the construction of the fabric and the use for which it is intended. Following is a brief outline of some of the more important of the operations and equipment commonly employed in finishing cotton woven fabrics. The gray goods usually are received from the weaver in lengths of 120 or 240 yards. The pieces are inspected for imperfections, marked with a lot number for identification purposes, and sewn end-to-end to permit processing in continuous lengths. They are then passed over a gas or electric singeing machine, where the short fibres protruding from the surface of the cloth are burned off. The goods may next go to a desizing machine, where the starch employed in sizing the warp yarns before weaving is removed.

Bleaching and Mercerizing.—Previous to bleaching, cotton piece-goods are usually boiled for several hours with dilute caustic soda solution in a closed tank, called a "kier," to remove the natural oils and waxes and other impurities from the fibre. Next the goods are removed from the kier, rinsed, "soured" in a dilute solution of sulphuric or hydrochloric acid, rinsed, "chemicked" by passing through a solution of sodium hypochlorite, piled in bins to permit the bleaching action to take place, rinsed, passed through a solution of sulphurous acid or other "anti-chlor" to remove the last traces of chlorine, again rinsed, passed through a water mangle to squeeze out excess water, and dried on a set of revolving steam-heated cylinders or dry cans. Bleaching can also be carried out in the kier by means of an alkaline solution of hydrogen peroxide, after which the cloth is rinsed and dried.

Mercerizing of cotton piece-goods with a solution of caustic soda having a concentration of about 25% imparts a permanent lustre to the cloth and gives it a greater degree of affinity for certain classes of dyes. Two types of mercerizing machines are in common use, both of which are designed to exert tension on the fabric and thus prevent it from shrinking during the caustic soda treatment.

Dyeing and Printing.—Dyeing of cotton fabrics is carried out by the batch method in jigs or in dye becks or by the continuous method on padders or continuous dyeing machines. Fabrics which are to be dyed in light or medium shades are bleached before dyeing. Bleaching is frequently omitted if the fabrics are to be dyed in dark shades.

Printing of cotton fabrics is usually carried out on roller printing machines, although some fabrics are screen printed. In the machine method engraved copper rollers impart the design to the fabric. After printing with some classes of colours, the fabric is passed through an ager and then through a continuous washer before drying.

Finishing.—After dyeing or printing, the goods are dried on dry cans or in air driers, and are then ready for finishing. Aside from the chemicals employed to produce water-repellent, flameproof, crease-resisting, and other special finishes, the finishing agents commonly employed include starches, dextrines, gums, talc, China-clay, and sulphonated oils and fats. More recently various types of synthetic resins, water- and alkali-soluble cellulose derivatives, fatty alcohol sulphates, quaternary ammonium compounds and other new finishing materials have become increasingly important. The various finishing compounds are employed alone or in combination with one another to impart stiffness, softness, body, flexibility, or other desired characteristics to the fabric. Two types of equipment used for applying the finishing agents are starch mangles and backfilling machines, the latter type being designed to apply the finish to one side of the cloth only. After the finishing agents have been applied, the cloth is partially dried, then passed over a stenter or tenter where drying is completed and the fabric is stretched to the desired width.

Calendering.—Various types of calenders are employed to give smooth, lustrous, or embossed effects, as desired. The machines consist essentially of metal, paper, or fibre rolls through which the cloth is passed. A linen-like appearance is obtained by use of a beetle—a machine which subjects the cloth to the hammering action of wooden fallers.

Preshrinking machines of various types are employed to counteract the stretching effect of preceding operations and thus to prevent the fabric from shrinking upon laundering. Certain fabrics, such as cotton blankets, are run over a napping machine to produce a nap or pile.

The functions of folding and inspecting machines are evident from the name. (W. W. Ch.)

VII. COTTON INDUSTRY IN THE UNITED STATES

The birth of the cotton manufacturing industry in the United States about 1790, in New England, marked the real origin of the industrial era of that country. During the relatively slow development of industry from that time until about 1870, and through the spectacular boom during the last quarter of the 19th century and the first quarter of the 20th century, the cotton industry was a leader in this progress. Before the first quarter of this century had run out, however, cotton manufacture engaged upon a private depression of its own, antedating the general crash of 1929 by several years. During the 15 years following 1925, it went through a series of depressions, with intermittent revivals, but with the general trend downward.

The best way to visualize this rise and fall of an industry is by means of a comparison of the number of establishments, the number of wage earners, the wages paid, and the value of products, from 1850 through 1937. This comparison is shown in Table XXIV.

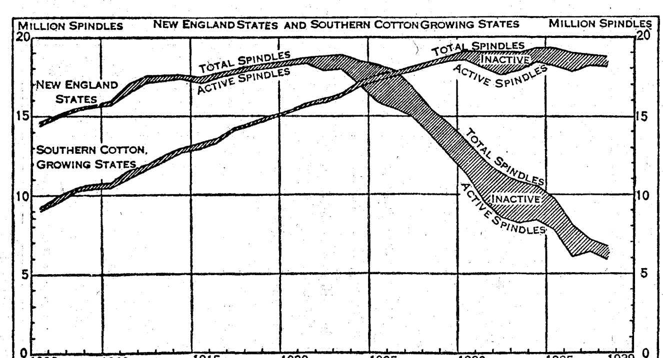
Confining an analysis of this table to the 20th century, the following facts stand out: Number of establishments increased 40% from 1899 to the peak in 1923, but then dropped to a low

TABLE XXIV.—*Cotton Industry in U.S.A.: Number of Establishments, Wage Earners, Wages Paid, Value of Products, 1850–1937*

Year	Mills	Wage earners (average for the year)	Wages paid	Value of products
1850 . .	1,094	92,286	$ 16,275,000	$ 65,502,000
1860 . .	1,091	122,028	23,940,000	115,682,000
1870 . .	956	135,369	39,044,000	177,490,000
1880 . .	756	172,544	42,041,000	192,090,000
1889 . .	905	218,876	66,025,000	267,982,000
1899 . .	973	297,929	85,126,000	332,806,000
1904 . .	1,077	310,458	94,378,000	442,451,000
1909 . .	1,208	371,182	129,790,000	615,218,000
1914 . .	1,179	379,366	146,130,000	676,569,000
1919 . .	1,288	430,966	355,475,000	2,125,272,000
1921 . .	1,328	412,058	328,227,000	1,278,221,000
1923 . .	1,375	471,503	396,603,000	1,901,126,000
1925 . .	1,366	445,184	353,883,000	1,714,368,000
1927 . .	1,347	467,596	380,910,000	1,567,401,000
1929 . .	1,281	425,916	324,289,000	1,524,177,000
1931 . .	1,140	329,962	219,680,000	305,792,000
1933 . .	1,057	379,445	216,384,000	861,170,000
1935 . .	1,042	369,062	236,339,000	983,572,000
1937 . .	1,072	422,310	312,488,000	1,227,713,471

in 1935, during which drop 75% of the original gain was lost. There was a slight recovery in 1937 but the number was still nearly 25% below the peak. Number of wage earners increased 60% from 1899 to the peak in 1923, and then dropped to a low in 1931, losing about 80% of the previous gain in that drop. Good recovery was made subsequently so that in 1937 the number of wage earners was only 10% below the peak in 1923. Wages paid advanced spectacularly—about 365% increase—to a peak in 1923 but nearly 60% of this gain was lost in the drop to a low in 1933. Subsequent recovery brought wages paid in 1937 to a point only 20% below the peak of 1923. Value of products also made a sensational spurt from 1899 to a peak in 1919—the advance amounting to 540%. (1919 was the first post-war year.) The subsequent drop was equally spectacular and by the low year of 1931 approximately 75% of this advance had been lost. Despite the recovery in 1937, the value of products that year was still more than 40% below the high of 1919. (These figures are taken from the *Biennial Census of Manufactures* and refer to what was known prior to 1935 as the cotton goods industry, comprising cotton woven goods over 12in. in width, and cotton yarn and thread.)

A more detailed picture of the decline and partial recovery of the cotton textile industry during the 15 years following 1925 is shown in Table XXV, based on statistics compiled by the Association of Cotton Textile Merchants of New York.



FROM GOVERNMENT PUBLICATION "WAGES IN COTTON-GOODS MANUFACTURING," BULLETIN NO. 663 OF U.S. DEPT. OF LABOR

FIG. 28.—TOTAL ACTIVE AND INACTIVE COTTON SPINDLES 1906–38

This table shows that during the period from 1925 to 1939, nearly 12,000,000 spindles were liquidated. Despite this liquidation, the production in square yards in 1938 was approximately the same as that in 1925. The answer is obvious. Longer operating time for machinery, and technological improvements made the productive capacity per spindle materially greater. For example

*These figures are complete and not abbreviated.

it will be noted that in 1925 the hours run per average active spindle were 2,988, which advanced to a peak of 3,970 in 1937.

North-to-South Shift.—Turning from a picture of the industry as a whole, to that of the shift from one section of the country to another, fig. 28 shows dramatically the changed position as between the New England States and the southern cotton-growing States commencing approximately in 1925. (This is from "Wages in Cotton Goods Manufacturing," a publication of the U.S. Department of Labor.) The most interesting feature of this shift of so large a part of the cotton manufacturing industry from the North to the South is the fact that it reflected, in a relatively limited area, the world trend of decentralization of industry which was responsible for so much of the economic instability in cotton manufacture during the two decades following the end of the World War (1914–18). In fact, even if there had not been specialized causes for what might be called the stampede of cotton mills from the North to the South, commencing in the early 1920s, it is safe to state that sooner or later the South would have demanded and gotten its share of industry. It has been increasingly evident to the world that no section or country can long hold its monopoly in the manufacture of any type of goods. Its erstwhile customers sooner or later become industrially conscious and turn to the creation of a new industry as a means toward economic advancement. That was the impulse underlying the North-to-South shift in cotton manufacture. However, there were several circumstances which greatly accelerated this trend—and in fact probably anticipated by several decades what might have been the course of normal decentralization. The most important of these immediate causes was differential in labour costs. The northern mills were located to a considerable extent in congested areas where living costs were high and where the threat of unionization to some extent held up wage levels. The South, on the other hand, offered an apparently unlimited supply of labour, practically of pure Anglo-Saxon type, from the mountains, at relatively lower wage levels than those prevailing in the North, with immeasurably lower living costs, and with little threat of unionization at the time.

Coupled with this attractive differential in wage costs, was a definitely lower cost of construction and taxation in the South as compared with the North. Consequently, during the period of expansion in the cotton industry which followed the World War of 1914–18, it was natural and inevitable that more and more companies turned to the South as the locale for their new plants or for the establishment of entirely new organizations.

As these mills came into operation, another factor asserted itself. Although some of the plants were equipped with second-hand machinery moved from other sections, a great deal of the southern industry contained equipment newer and more efficient than the average equipment in the North. This, obviously, added to the manufacturing differential between the two sections. The result is shown in fig. 28, previously mentioned. Incidentally, the layman will possibly wonder why the above analysis did not include reference to a factor which was popularly supposed to have been the real reason for the North-to-South shift. Probably nine out of ten people believed that the proximity to the raw material was the chief attraction—and visualized cotton manufacture moving to the cotton fields. This was of extremely limited importance in the shift. In fact there were cases where this was a liability rather than an asset because it sometimes cost more to ship cotton by rail from one point in the South to another point in that section, than by water from a southern port to a New England mill.

The use of the phrase "North-to-South shift" makes this industrial dislocation seem more simple than it was, and is. There was not merely the competition between two sections of the United States. Increasingly, there developed competition among different areas within one section, and particularly within the South itself. When the first period of expansion in the 1920s had been completed, a great deal of the cotton manufacturing area in the Piedmont section of North Carolina, for example, had experienced sharp rises in living costs, construction costs, taxation, etc. Mills in that section saw the differential between their total costs and the costs in northern mills shrink. They also saw other mills in more rural areas in Georgia and Alabama, for example, present competition to North Carolina approximate to that which the latter had at first presented to the North. Similarly, new areas in States like Mississippi, particularly with the organized encouragement of the State Government, presented new types of competition to Georgia and Alabama. This successive shift toward new sections which get what might be termed the industrial bug is the most fascinating, and potentially the most important, phase of this whole trend toward industrial decentralization.

The Southern Mill Village.—The shift of a considerable part of the nation's cotton manufacturing to the South brought with it an extension of the southern mill village system which was significant not only from the sociological standpoint but also from its economic bearing on the most controversial phase in the cotton industry of the United States during the post-World War period.

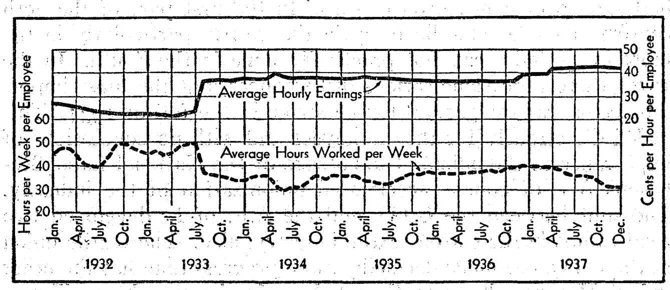
As most of the new plants in the South were built in rural areas, and as a good portion of the prospective employees had to be secured from mountain areas—as previously noted—the average southern cotton manufacturing company found it necessary to build and maintain practically a complete community. It was first forced to build homes for the workers, and then to add the other elements of life—such as stores, schools, churches, recreation centres, etc. Since these facilities were made available to employees far below cost, they represented a material burden upon the plant operating budget. The amount of this burden differed widely among different sections and different plants within one section. During the height of the North-South trek, the cost per week per employee was figured at \$3.36 by a particular manufacturer. This was in the high zone but all mills had costs probably ranging from \$1.00 or \$1.50 per week per employee and higher.

Always a difficulty in view of the fact that wage envelopes in southern mills could not contain the full amount of the payments made to employees, this mill village cost became a most active irritant in the establishment of wage minima under two governmental agencies: (1) the National Recovery Administration (NRA) from 1933 until its invalidation by the Supreme Court in 1935; and (2) the Wage-Hour Division of the Department of Labor, under the Fair Labor Standards Act passed in 1938.

Wage and Hour Trends.—One of the most radical adjustments in wage and hour standards was that experienced by the cotton manufacturing industry in the United States during the years following the start of the NRA in 1933. Under the leadership of the Cotton-Textile Institute, the industry took the lead and voluntarily offered to reduce its work week to 40 hours and to accept a minimum wage determined under the new law. The result was it received NRA Code No. 1. Prior to the code, mills in certain States were limited to 48 hours per week, but in others the work week ran as high as 55 hours or above. A voluntary acceptance of a 40-hour maximum work week was therefore a very radical change for a great many mills and their employees. In addition, the industry accepted in Code No. 1, after hearings before the Administrator in Washington, a minimum wage of \$12.00 a week (or 30 cents an hour) in the South and \$13.00 a week (or $32\frac{1}{2}$ cents an hour) in the North. Final settlement of this differential of \$1.00 per week or $2\frac{1}{2}$ cents per hour between the North and the South represented the conclusion of the most difficult phase of code-making for the cotton textile industry.

The effect of this change in labour standards is best shown by a simple statistical comparison. Average hourly earnings in the cotton goods industry in the pre-NRA year, 1932, amounted to 23.9 cents. In the first full year under the NRA (1934) this advanced to 37.8 cents—an increase of nearly 60% of the average hourly earnings of the worker. Despite the invalidation of the NRA, the standards were kept voluntarily thereafter, with the result that the average for 1935 was 37.6 cents and for 1936 it was 36.8 cents. In 1937, due to improved business conditions it reached a high level of 41.3 cents—or an increase of nearly 75% from the low point in 1932. This advance is shown, graphically, in fig. 29.

After the general business boom of 1937, followed by the collapse in the latter part of that year and in 1938, the need for the re-establishment of some agency for the maintenance of labour standards was evident, and the Fair Labor Standards Act of 1938 was passed. As was true under the NRA, the cotton textile industry became the first guinea-pig under the new act. This was logical, in that labour costs represent such a material part of total cotton manufacturing costs, and also because wages have always



COURTESY "TEXTILE WORLD," BASED ON COTTON-TEXTILE INSTITUTE FIGURES

FIG. 29.—CURVES PREPARED BY COTTON-TEXTILE INSTITUTE FROM GOVERNMENT FIGURES SHOWING WAGES-AND-HOURS TREND (JULY 1933 MARKS THE START OF NRA)

been the principal competitive battleground in that industry. Cotton manufacturers and their organizations co-operated with the Administrator of the new act. However, when the final recommendation was made—a minimum wage of $32\frac{1}{2}$ cents an hour, which corresponded to that established for the North under the NRA, failure to set up a differential for the South created dissension in the industry. Certain southern mills instituted suits to enjoin the Wage-Hour Administration from putting the proposed minimum into effect. Just about that time, in 1939, however, war broke out in Europe and a wave of buying set in in the United States which, temporarily at least, diverted industry attention away from the problem of the wage-hour law.

The effect of both these governmental agencies, and of the experience of the cotton textile industry under them, has been to raise the status of employees materially and to curtail the possibilities of wage chiselling as a form of competition. Some observers feel that the decrease in hours and advance in wages in cotton manufacture have been too sharp and the adjustment too sudden, but all agree that the advance has represented most important sociological progress. In fact, the socializing influence of the cotton industry, particularly in the South, has been of major significance.

Employer-Employee Relationships.—From what has been said previously with regard to the origin of the southern cotton mill village, it will be readily evident that the relationship between employers and employees was based at the start, at least, upon a more or less paternalistic attitude. This was not a choice on the part of management, but rather the result of necessity. Forced to provide for the physical, mental and spiritual needs of the workers, the average manufacturer recognized and accepted a sense of responsibility toward them which inevitably verged on the paternalistic. This was particularly inevitable in connection with the first generation that came down from the mountains. However, as new generations arose, and as the educational processes, set into motion by the manufacturers themselves, began to take effect, both the need for and the receptivity toward paternalistic activities decreased. Some manufacturers were slow to adjust themselves to this change but the far-seeing ones planned ahead to meet it. Thus, there was a gradual abatement of so-called "welfare" plans—and a tendency to leave activities, other than those connected with the job proper, more and more to the employees themselves—or at least, to limit management support of such activities to those for which there was a conscious demand on the part of the workers, and a continuing support. The most recent manifestation of this change of attitude was the decision on the part of many mill organizations in the South to sell their mill villages to their employees. At first it was difficult to work out a formula for this, since rents had been on such a low basis that there was no particular incentive toward home ownership. This was gradually corrected and in 1938 a great many mills made sales arrangements with their workers—and this tendency has been on the increase. It is felt that this will eventually mean more stable labour conditions, and the shedding of the last vestiges of paternalism.

The above has to do with relations between employers and employees within individual plants. So far as relations between management and organized labour are concerned, unionization has had slow growth in cotton textiles. In the first part of the 20th century it made some headway in the North, particularly in the more congested areas, but practically none in the South. In the 1920s there were some serious disturbances, but the most important crisis was the general textile strike in the fall of 1934. This ended disastrously for the employees and with no concessions of importance to the union. The passage of the National Labor Relations Act, of course, accelerated unionization of the industry. The split between the C.I.O. and the A.F. of L. developed two rival camps in the cotton textile industry, also. The textile union of the C.I.O. has made decidedly more progress than has the other union. However, by 1940, the number of union members still represented a very small minority.

Textile Education.—The textile industry has an unchallenged position in specialized education. No other industry in the United States has developed anything approaching the highly organized group of textile schools which supply their graduates for the filling of top management and operating executive jobs. Since many of these schools are located in primarily cotton manufacturing areas, the cotton division is without question the most important part of textile education. There are 12 major textile schools: A. French Textile school of Georgia School of Technology, Atlanta, Ga.; Department of Textile Engineering of Alabama Polytechnic institute, Auburn, Ala.; Clemson Textile school of Clemson Agricultural college, Clemson, S.C.; Bradford-Durfee Textile school, Fall River, Mass.; Lowell Textile institute, Lowell, Mass.; Textile department of Massachusetts Institute of Technology, Cambridge, Mass.; New Bedford Textile school, New Bedford, Mass.; Philadelphia Textile school, Philadelphia, Pa.; North Carolina Textile school of North Carolina State college, Raleigh, N.C.; Rhode Island School of Design, Providence, R.I.; Textile Engineering department of Texas Technological college, Lubbock, Texas; and Textile department of Texas Agricultural and Mechanical college, College Station, Texas. In addition, there are textile public high schools throughout the country—notably the Straubenmuller Textile High school in New York, and other associated branches of textile education.

Most of the textile schools proper were organized for the primary purpose of developing overseers for textile mills. Consequently their courses emphasized the purely technical phases of textile manufacture. As the industry became more and more complicated, however, and as the economic necessities of cotton manufacture began even to supersede the technical phases in urgency, the schools found themselves called upon more and more to extend their courses into the fields of management and economics. Commencing in 1933, an organized approach to the filling of this need was made under the auspices of the Textile Foundation which sponsored a survey of textile education. The report was submitted in 1934, and was the forerunner of a continuing program of industry-wide co-ordination and improvement of its textile educational institutions. Regular meetings of the deans of the textile schools help greatly to make this program an effective one.

Textile Research.—The economic emergency which the cotton textile industry experienced during the 1920s developed a recognition of the need for organized research into both the technique and the economics of the industry. Two organizations with that end in view were launched in 1930: the United States Institute for Textile Research and the Textile Foundation. There was no connection between the creation of the two. The United States Institute for Textile Research is a private organization which has sponsored several special technical studies on such problems as warp sizing, drying, etc.; and whose Economic Research committee has supervised the conduct of several studies in economics. The Textile Foundation is a semi-public organization, created by an Act of Congress in 1930. Its program in the first ten years of its existence included such undertakings as the textile education survey mentioned previously in this article; the establishment of a large number of fellowships for scientific research; and the financing of several investigations into economic trends, all of which were proposed and supervised by the Committee on Economic Research of the United States Institute for Textile Research. In that way, and in the production of the institute's publication *Textile Research,* the Foundation and the Institute participated jointly in certain enterprises. Students of the industry recognized that the research program represented by these two organizations, and by some specialized bodies such as the American Association of Textile Chemists and Colorists, is not a final answer to the industry's need, but rather an approach to the fulfilment of that need. It is also recognized that the Textile Foundation, through its sponsoring of broad-gauged projects, has done much to arouse and keep alive the research attitude among individual manufacturers.

Textile Associations.—Just as the cotton textile industry is highly organized from the standpoint of textile education, so is its associational structure an effective one. The two major associations, representing the two important geographical sections of the industry are the National Association of Cotton Manufacturers in Boston, Mass., representing the New England mills, and the American Cotton Manufacturers Association in Charlotte, N.C., representing the southern mills. In addition to these broad geographical units, there are many State or other sectional associations, especially in the South, including the Alabama Cotton Manufacturers Association, Montgomery, Ala.; Cotton Manufacturers Association of Georgia, Atlanta, Ga.; Cotton Manufacturers Association of North Carolina, Charlotte, N.C.; Cotton Manufacturers Association of South Carolina, Clinton, S.C.; Southern New England Textile Club, Providence, R.I. Then there are group organizations, representing specialized divisions of the industry, rather than geographical sections of the country, such as the Association of Cotton Textile Merchants of New York; Association of Cotton Yarn Distributors, Philadelphia; Cotton Thread Institute, New York; Durene Association of America, New York; Mercerizers Association of America, New York; National Association of Finishers of Textile Fabrics, New York; Narrow Fabrics Institute, New London, Conn.; Southern Combed Yarn Spinners Association, Gastonia, N.C.; Textile Fabrics Association, New York (representing the converters); Textile Export Association of United States, New York. Operating executives also have what might be termed technical organizations, such as the Southern Textile Association, Charlotte, N.C., and the Textile Operating Executives of Georgia and of Alabama. Then there are associations in specific cities, such as the Fall River Cotton Manufacturers Association, Fall River, Mass., and the New Bedford Cotton Manufacturers Association, New Bedford, Mass.

A top organization, enjoying the co-operation of most of these groups, is the Cotton-Textile Institute, New York, which was formed in 1926 to attempt to effect a measure of stabilization in an industry which needed it badly. This did not supersede the old-line associations but on the contrary was aided by the latter. Under the leadership of the Cotton-Textile Institute, a great many of the outstanding accomplishments between 1926 and 1940 were realized. These included the voluntary elimination of night employment of women and minors; the initial reduction of the work week to a maximum of 55 hours on day shift and 50 hours at night; the further reduction of the work week to 40 hours under the NRA; the development and efficient administration of NRA Code No. 1, covering cotton textiles; the development of a new uses program and a general promotional activity; and finally the development of greater co-ordination among the various units of the industry. This latter took the form, in 1939, of the formation of the National Council of Textile Industries, New York, under the sponsorship of the Institute, which is composed of several associations touching upon the cotton textile industry. Here again the individual associations are not superseded but the council acts as an effective co-ordinating group for them. The Cotton-Textile Institute has had the successive leadership of Walter D. Hines, general administrator of railroads during the war; George A.

Sloan, who led the industry through the NRA code-making days; Goldthwaite H. Dorr, counsel for the Institute and a partner of Mr. Hines during the latter's life; and Dr. Claudius T. Murchison, formerly of the faculty of the University of North Carolina, and also formerly director of the Bureau of Foreign and Domestic Commerce of the Department of Commerce, Washington, D.C.

Under the direction of all of these various associations, the cotton textile industry has experienced a type of self-government which has done much to avert far more serious consequences which might have come to it under the textile depression in the '20s and the '30s had it not been so organized. (D. G. Wo.)

COTTON BELT, a name applied to that region of the United States in which the bulk of the cotton crop of that country is produced. Cotton is grown extensively in this area because of its warm climate, moderate amount of summer and fall rain, long growing season and fertile soil. The area includes south-eastern Virginia, the eastern three-fourths of North Carolina, South Carolina, Georgia, northern Florida, Alabama, Mississippi, western Tennessee, south-eastern Missouri, Arkansas, most of Louisiana, most of Oklahoma, the greater portion of Texas and south-eastern New Mexico. In 1939 this area produced 94·5% of the total cotton crop of the United States and 39·4% of the commercial cotton crop of the world. Most of the remaining 5·5% of the total for the United States in 1939 was produced in south-western Arizona and southern California. (A. H. Ge.)

COTTON CONTROL BOARD, THE. The Cotton Control Board, which controlled the Lancashire cotton industry during the later phases of the War of 1914–18, was appointed by the Board of Trade in June 1917. For some time previously imports of cotton from the United States had been drastically curtailed by the shipping authorities, in order to conserve tonnage for more urgent needs; and an acute shortage of American cotton had developed. To deal with the problems arising from this situation, the Control Board was set up, a body representative of the various organized trade interests, the employers and trade unions in spinning and weaving, the Liverpool Cotton Association and the Manchester Chamber of Commerce, together with two representatives of the Board of Trade. The dominating figure in determining the Board's policy was its chairman, Sir Herbert Dixon, who, though the largest employer in the industry, commanded in a remarkable degree the confidence of the operatives.

The problems before the board were twofold. First, it must prevent a chaotic scramble for the limited supplies of raw material, and secure for each concern a fair and steady share. This was a problem with which many "war controls" in other industries had also to deal. But the peculiarities of the cotton industry gave rise to a second important problem. The reduced scale of production which was inevitable would throw out of work a large number of operatives, who could not readily be absorbed in war-time employment, on account of the highly-localized character of the industry.

The main features of the scheme of control were as follows: Spinners and manufacturers were forbidden to work more than a certain percentage of their machinery except under licence from the Control Board. After some months licences were required to work any machinery at all. These licences were granted only on payment of "levies" of so much per spindle or per loom; and the funds which were raised in this way were used to finance a system of unemployment benefits. The details of the scheme varied from time to time as conditions changed with a prevailing tendency, as shipping difficulties became more acute, to more drastic curtailment of output. At first, spinners of American cotton were restricted to 70% of their machinery, while manufacturers and spinners of Egyptian cotton were allowed (on payment of the levies) to work 100% if they desired. But by March 1918, spinners in the American section had been cut down to 50% and manufacturers to 60%; while in June compulsory short-time was added to these restrictions, with the result that production in the American section was reduced to less than 40% of its normal. Under these conditions of restricted supply, the trade became extremely profitable. While the price of raw cotton was limited by the enforcement of maximum prices, no control was exercised over the prices of yarn and cloth, which soared to unprecedented heights; and the profits reaped by spinners and manufacturers during 1918, though they were to pale before those of the post-armistice boom, were the highest recorded hitherto.

The system of unemployment benefits was worked on lines which made it extremely popular with the operatives. The trade-unions were entrusted with the task of paying the money out in accordance with rules laid down by the Control Board. The scale of benefits was, by all previous standards, high. At the outset, the scale was 25*s.* for a man, 15*s.* for a woman, and 12*s.* for young persons; and these benefits were soon supplemented by allowances of one shilling a week for dependent children. In Aug. 1918, the whole scale was increased by 20%. But the most popular feature was the so-called "rota system" which became established in the greater part of the industry. The "rota system" meant that none of the workpeople, to whom it applied, were unemployed in the ordinary sense, but all took it in turn to "play off" for periods of a week. Thus, in a mill which had only work for 75% of its available operatives, each operative would work three weeks, and for the fourth week would "play off" and receive the Control Board benefit. This system was naturally highly congenial to the operatives; it had the effect of turning unemployment from a hardship into a positive blessing; and the rota week, breaking the monotony of factory life, became a cherished institution.

This arrangement was, however, open to the objection that it served to check the tendency for surplus cotton operatives to obtain other work; and this objection, at a time of national emergency and shortage of labour for urgent tasks, was formidable. In May 1918, accordingly, the Control Board decided to abolish the rota system. This decision which took effect in August, caused widespread resentment among the operatives, and dissipated a large part, though by no means the whole, of the remarkable popularity which the Control Board enjoyed among them. It led indeed to a strike on the part of the spinners which lasted for a week.

The Control Board exercised its authority by virtue of orders made from time to time by the Board of Trade under the Defence of the Realm Regulations. In Feb. 1919, these orders were revoked, and the Cotton Control Board ceased to exist as such, being converted into an advisory council under the name of the Cotton Reconstruction Board. When the system of levies and unemployment benefits came to an end, the Control Board had accumulated a large surplus—it had budgeted to meet the possibility of grave developments—of no less than £1,500,000. This money was converted into a special fund, the Cotton Trade War Memorial Fund, administered by a body of trustees appointed by the Board of Trade to be used for purposes of general benefit to the cotton trade and its employees. (H. D. H.)

COTTON DUTIES (INDIAN). The controversy with regard to these duties dates back to 1894 when the Government of India, finding itself in financial difficulties as the result of the position of the exchanges, wished to reimpose the customs tariff which had been dropped since 1882, but decided to omit cotton yarns and fabrics from the new list of dutiable articles. This exception provoked a great deal of criticism in India where it was maintained that the exclusion of cotton goods and yarns was intended to favour Lancashire to the prejudice of the Indian budget. After two years' discussion a further act was passed in Jan. 1896 which imposed an import duty of $3\frac{1}{2}$% (as opposed to the general rate of 5%) on all cotton piece goods, but not yarns; but in order to prevent the new duties having a protective effect on the growing cotton mill industry in India, an equivalent excise duty was imposed on all cotton goods manufactured in the Indian mills, and it was these excise duties that later became the focus of criticism. India maintained that they were intended to give protection to Lancashire against Indian producers, while Lancashire maintained that they were merely intended to prevent the Indian industry protecting itself against Lancashire.

The agitation against the duties never quite died down, and in 1916 it broke out afresh, partly as the result of the tariff reform movement in England. At the same time the position of the Indian mills was being rendered more difficult by the competition of the Japanese mills, not only in India but also with Indian products in China. In 1917 the question came to a head in connection with India's contribution towards the cost of World War I. In order to raise the additional revenue required, further taxation was necessary and it was proposed to raise the import duty on cotton goods from $3\frac{1}{2}\%$ to $7\frac{1}{2}\%$, but leaving the excise duty at the previous figure of $3\frac{1}{2}\%$, thus giving the Indian mills protection to the extent of the difference of 4%. This proposal aroused great protests in Lancashire, but it was carried through parliament with the support of the opposition on the understanding that it would be reconsidered at the end of the war. In 1921, the import duty was raised to 11%, with 5% on yarns (1922). In 1925–26, however, the position of the Indian budget having become more favourable, the general duty was reduced to 5% and the excise duty first suspended and then abolished altogether. In 1927 the import duty of 5% was modified in the case of the cheaper yarns worth less than 30 annas per lb. to a specific duty of $1\frac{1}{2}$ annas per lb. which was said to be an attempt to differentiate against the cheaper imported yarns from Japan.

COTTON FAMINE, 1861–1865. Never in the history of modern industry has such a cataclysm overtaken any great trade as the cotton famine which devastated the Lancashire cotton industry during the years 1861–65 as the result of the American Civil War, when the supply of American cotton, which then formed 85% of its total consumption of raw material, was almost entirely cut off.

The years 1859 and 1860 had been a period of great activity in the cotton trade. There was a boom which was probably in sight of its inevitable termination when the Civil War began. Large stocks of cotton had been imported and the stocks of yarns and manufactured goods were unusually large. Had there been no war it is probable that the trade would have been compelled to face a reaction involving a severe spell of depression and short time, for it appears that even in those days periods of overproduction had already been reached in the cotton trade.

Blockade of 1861.—It was not therefore till well into the autumn of 1861 (the blockade of the southern ports was established in July of that year) that the pinch first began to be felt in Lancashire. The rise in the price of cotton, which had been the first effect of the war, had enabled the spinners and manufacturers to dispose of large stocks of goods, and it was probably the cessation of demand rather than the lack of supplies of the raw material which first began to produce stagnation in the trade. In the opening weeks of 1862 the trouble really became acute. Widespread appeals for contributions were sent out with very satisfactory results.

The total amount spent in relief of the distressed was for those days colossal. In all nearly £1,750,000 was distributed by the various relief committees, not including contributions in kind (which were estimated at about £112,000 in value) and relief granted by the boards of guardians.

In three years the latter spent just under £2,000,000. The total loss incurred by the whole trade in wages, profits, etc., is incalculable, but must have exceeded £10,000,000.

By the time that the large pre-famine stocks had disappeared (some cotton was actually reshipped to the northern states where the shortage was, of course, equally bad) other supplies especially from India were coming into the country, though in comparatively small quantities. The Indian crop, which at one time had supplied a large proportion of Lancashire's needs, had fallen off very badly both in quantity and quality; and when it became practically the only alternative, difficulty was at first experienced in getting large quantities of Indian cotton. The quality also proved exceedingly unsatisfactory, involving a great loss both in time and in waste, while it required much readjustment of the machinery. For a time, however, it was almost the only new supply available, as the blockade soon began to prove unpleasantly efficient, and it was some time before the organization of a fleet of small but fast steamships as blockade runners developed to such an extent as to produce any satisfactory quantity. The rise of the price of cotton from below *7d.* in the early months of 1861 to $31\frac{3}{4}$*d.* in 1864 naturally proved a great stimulus to the growing of cotton in other countries, as well as its extension in India.

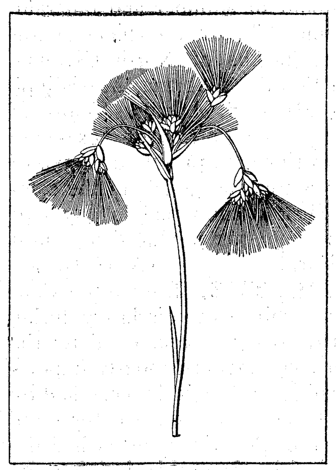
The greatest success was achieved in Egypt, where, though the quantity was comparatively small, the quality proved better even than American (except Sea Island).

The stimulus extended, however, to practically every potential cotton-growing country in the world, *e.g.*, Australia, Brazil, and various parts of the Turkish empire, but at best the total supplies were never more than enough to keep the industry running about half-time. Even after the conclusion of peace in April 1865 it was a long time before supplies reached anything like normal.

(J. A. T.; X.)

See R. A. Arnold, *History of the Cotton Famine* (1864).

COTTON-GRASS or **COTTON-SEDGE** is the name applied to species of *Eriophorum*, a genus of the sedge family (Cyperaceae). There are 15 species, four being British and 10 North American. They are generally found on wet and boggy moors. The flowers are massed together into heads and each has four or more hair-like bristles at the base. After fertilization these grow out into long conspicuous cottony hairs which serve to distribute the seed which is contained in a small dry achene. The alpine cotton-grass (*E. alpinum*) and the slender cotton-grass (*E. gracile*) occur both in Great Britain and in North America. The Virginia cotton-grass (*E. virginicum*), with dingy-brown, rarely white, hairs, grows from Newfoundland to Manitoba and southward to Florida and Nebraska. The sheathed cotton-grass (*E. callithrix*), found from Newfoundland to Pennsylvania and Wisconsin and northward to the Arctic, and also in Asia, forms in Alaska the summer food of reindeer.



COTTON-GRASS (ERIOPHORUM POLYSTACHION), ABOUT ⅓ NATURAL SIZE, SHOWING MATURE FLOWER-CLUSTERS CLOTHED WITH WHITE COTTONY HAIRS

COTTONSEED. The seed of the cotton plant is egg-shaped, measuring about three-eighths of an inch in length and three-sixteenths of an inch in width. In weight, cottonseed averages about 3,500 to the pound. For each pound of fibre, cotton plants yield approximately two pounds of seed. The commercial importance of cottonseed lies in the four principal products which can be obtained from it through processing—namely, oil, cake or meal, linters, and hulls.

Although cotton fibre has been a product of commerce for centuries, large-scale commercial utilization of cottonseed is a comparatively recent development. In ancient times the Chinese and Hindus used cottonseed oil as a medicine and in lamps and developed crude methods for its recovery, but it was not until the production of cotton began its rapid increase following the invention of the cotton gin in 1794 that systematic and continuing efforts were made to develop machinery for the commercial processing of cottonseed. Even as late as 1875 the principal use of cottonseed was for planting purposes, while the remainder over and above these requirements was regarded mainly as a waste product which was frequently disposed of by burning or dumping into streams near the cotton gins. This practice created a serious health problem, and several states passed laws making it a punishable offense to accumulate seeds around gins to the detriment of the health of the nearby inhabitants, or to dump cottonseed into streams which were used by inhabitants for drinking or fishing.

The history of the development of the cottonseed industry is almost wholly a history of the development of the industry in the United States. In the 18th century, various individuals and organizations recognized the potential value of cottonseed as a source of oil and other products and urged producers to develop feasible methods for obtaining these products. Among the first in the United States was a Dr. Otto of Bethlehem, Penn. In

1768 he presented the American Philosophical society with samples of oil he had obtained from cottonseed. In 1783, the Society for the Encouragement of Arts, Manufactures and Commerce, in England, offered a gold medal to any planter in the West Indies who was able to express one ton of oil and produce 500 lbs. of cake from cottonseed. Two years later, a premium was offered by the South Carolina Agricultural society in an effort to encourage the expressing of oil from cottonseed. There is no record that either of these awards was ever claimed.

Between 1800 and 1825 several cottonseed oil mills were built in various parts of the south in the U.S., but they were all financial failures and none of them was very long in operation. The first mill which could be called successful was established in Natchez, Miss., about 1833, and continued in operation for nearly ten years.

Beginning about 1850 a number of improvements were made in cottonseed processing machinery which led to a more successful operation of the mills. By 1860 there were seven active mills crushing a total of approximately 50,000 tons of seed annually. Progress was stopped by the Civil War, but in the years following the industry again began to expand. By 1870 there were 26 active mills and in 1940 the industry had expanded to 446 mills.

In 1876, only 5% of the cottonseed crop was crushed for oil and other products, but after 1910, 80% of the crop reached the oil mills. No cottonseed is now wasted. The 20% not crushed remains on the farms and is used for planting and as fertilizer for crops and as farm feeds. In 1876, 98,000 tons of seed were crushed while the annual crush since 1910 has averaged 4,500,000 tons. The sale of cottonseed provides American cotton farmers with an average annual cash income of more than $100,000,000, while one-half of the total United States production of edible vegetable oils, one-third of the total production of protein meal feeds, and practically all of the highest grades of industrial cellulose are obtained from cottonseed.

Processing.—The processing of cottonseed consists essentially of (1) cleaning, (2) removal of linters, (3) separation of the oil-bearing kernels from the hulls, (4) flaking and cooking of the kernels to facilitate oil recovery, and (5) expressing or extracting the oil from the flaked and cooked kernels which then become known as cottonseed cake. The oil is further processed to remove impurities.

When cottonseed are received at the oil mills they contain a considerable amount of trash. In the cleaning process they are passed over revolving screens to remove the larger trash and over shaker screens to remove the smaller particles. Suction fans or blowers are frequently used to aid in the cleaning and magnets are often used to remove metallic substances.

The seed are then fed to a delinter machine, which is very similar to a cotton gin but with much finer teeth in the saws. This machine removes most of the short fibres which remain on the seed after the ginning process. When the linters are all removed in one passage through the delinter they are known as the "mill-runs." When they are removed in two successive cuts they are known as "1st-cuts" and "2nd-cuts." Each type has different industrial uses.

The delinted seed are next conveyed to the hullers where a series of knives cuts the hulls and loosens them from the kernels. Beaters and shakers complete the separation of the hulls from the kernels. Lack of an efficient hulling process was a major handicap in early attempts at establishing a cottonseed oil industry. The kernels go next to the press room where they are processed to recover the oil which they contain.

In order to obtain maximum recovery of oil, the kernels are first flaked and cooked. Flaking is accomplished by passing the kernels through heavy steel rollers which reduces the stock to an average thickness of about .007 inch. Cooking is done in steam-jacketed kettles operated at a temperature of about 235° F. and equipped with mechanical agitators to ensure uniform heating. Cooking time is from 30 to 90 min.

For recovery of oil the hydraulic press method is the one most generally used in the United States. The flaked and cooked kernels are wrapped in a thick haircloth and formed in molds to fit the steel press boxes. The hydraulic press consists essentially of a number of these boxes, with perforated bottoms, set one above the other. A hydraulic ram, which pushes upward when pressure is applied, forces each box, containing the cloth-wrapped oil-bearing stock, against the one above and the top box against a head plate. The expressed oil flows out through the cloth wrappings and down into a collecting pan from which it is piped to tanks. For some markets the pressed meats are broken up into smaller pieces and sold as cottonseed cake but most of it is ground and sold as meal.

Many oil mills use the expeller process, a continuous screw process introduced into the industry shortly after 1900. With the expeller process cooking is eliminated, although some method of preheating is often employed. The use of haircloth is eliminated and there is also a saving of time and labour, since the process is continuous and almost automatic. The flaked and preheated stock is fed into a slotted cage or barrel made up of steel bars set a few thousandths of an inch apart. A revolving screw carries the stock along inside the barrel. High temperatures and a pressure of from 5 to 10 tons per square inch are built up as the stock moves to the discharge end. The oil flows out through the openings between the bars and is collected in a receiving chamber beneath the press while the cake is discharged at the end of the barrel.

Oil is the most valuable product obtained from cottonseed and as a consequence considerable attention has been given to improved methods for its recovery. Although both the hydraulic press and the expeller produce oil of acceptable quality, both processes leave from 5% to 7% of oil in the cake. It has been shown that by solvent extraction the residual oil content of the cake can be reduced to about 1%; and in view of this consideration, attempts have been made to develop a satisfactory solvent extraction process for use with cottonseed. Solvent extraction has been successfully applied to the processing of soybeans, but owing to certain physical properties of the cottonseed kernel, efforts to adapt this process to the commercial extraction of cottonseed oil had not been successful up to 1943.

The crude cottonseed oil as it comes from the presses is dark red in colour and has many constituents which must be removed before it can be used for edible purposes. These substances are removed by refining, bleaching, winterizing, and deodorizing processes.

On reaching the refinery, the crude oil is sampled for analysis and then pumped to large conical kettles where it is treated with sodium hydroxide and gradually raised to a temperature of about 150° F. The free fatty acids combine with the sodium hydroxide to form a soap stock and settle to the bottom after standing for 12 to 24 hrs. The oil is drawn off and washed with water to remove any remaining soap particles.

A newer, quicker, and more efficient refining process, which is also widely used in the industry, is based on the centrifuge principle. In this process the crude oil is fed to a high-speed mixer along with the proper proportion of sodium hydroxide and then passed through a tubular heater operating at a temperature of about 150° F. The emulsion of oil and sodium hydroxide remains in the heater about two minutes and passes from there to a high speed centrifuge which separates the soap stock from the oil continuously. The refined oil is then mixed with water for washing and subsequently separated from the water by another centrifuge followed by vacuum drying.

When the oil is to be used as a salad or cooking oil, it is further purified by bleaching, winterization, and deodorization. The principal bleaching agents are fuller's earth and acid activated bleaching clays, the latter sometimes being used in combination with activated charcoal. Filtering removes the bleaching agents and the absorbed colouring substances. Winterization is a process by which a portion of the refined and bleached oil is solidified by chilling and filtered off. The process is slow, requiring about five days for each batch. Deodorization is accomplished by distilling off the odoriferous substances which have a different boiling point from the oil. Deodorization is generally a batch process but after 1937 a number of refineries installed continuous deodorizers.

By far the most important use for cottonseed oil is in shortening and margarine products. For this use the oil is put through a process known as hydrogenation, which converts the oil from a liquid into a solid with a melting point of any desired temperature up to about 140° F. The hydrogenation reaction is effected by passing hydrogen gas into the oil in the presence of a nickel catalyst. The hydrogenation process was discovered about 1900 and from 1910 onward its adaptation by the cottonseed oil industry was rapid.

Utilization of Cottonseed Products.—The relative amounts of cottonseed products obtained from each ton of seed varies from season to season, from one locality to another, and with the variety of the cotton. During the five years ending with 1939 an average of 309 lbs. of oil, 905 lbs. of cake and meal, 515 lbs. of hulls, and 148 lbs. of linters was obtained per ton of seed crushed, with a waste and manufacturing loss of 123 lbs. For the ten crop years ending with 1942, cottonseed oil mills produced annually an average of 1,400,000,000 lbs. of oil valued at $92,-700,000, 2,000,000 tons of cake and meal valued at $51,200,000, 1,000,000 bales of linters valued at $20,100,000, and 1,100,000 tons of hulls valued at $8,100,000, or products with a total annual average value of $172,000,000. Cottonseed products from the 1932–33 crop had a total value of $87,300,000 as compared with a value of $260,100,000 from the crop of 1941–42.

Oil.—Cottonseed oil accounts for slightly more than half of the total value of cottonseed products. During early attempts to establish a cottonseed oil industry, producers were mainly interested in the oil as an illuminant, but with the rise of the petroleum industry efforts along this line were abandoned. About 1850, interest was shifted to the use of cottonseed oil as a food product and since that time the industry has grown largely on that basis. In 1942, 52% of the cottonseed oil produced went into the manufacturing of shortening, 13% into margarine products, 28% into salad oil, salad dressing, mayonnaise, cooking oils, and other edible products, and 7% into inedible products such as soap, paint, and varnishes. The use of cottonseed oil in inedible products is limited mostly to off-grade oils and foots. Since 1931, cottonseed oil has encountered increasing competition from soybean oil in shortening and mayonnaise.

Cake and Meal.—Cake and meal rank second in order of value of cottonseed products, accounting for about 30% of the total. Its principal use is for cattle feed where its high, easily digestible protein content makes it ideal for mixture with roughage or as an ingredient of mixed feeds. Cottonseed meal is also used to some extent as fertilizer and small quantities are used in making starch-free flour for human consumption.

Hulls.—Hulls, which represent about 5% of the value of cottonseed products, are used almost exclusively as a livestock feed, either alone, in which case they have a feeding value comparable to dry Johnson grass and Bermuda hay, or in mixture with cottonseed meal. A small proportion of the total hulls produced is further processed to recover what is known as "hull fibre." This is the fibre remaining on the seed after the delintering operation. Hull fibre has properties similar to those of low grade linters and goes into similar uses.

Linters.—Although linters represent only about 10% of the total value of cottonseed products, they provide important raw materials for many other industries. First-cut linters are used in making high-quality mattresses and in the manufacture of coarse cotton yarns. The automotive and furniture industries use large quantities of mill-run linters as a padding material. Second-cut linters, after mechanical and chemical purification, are used in the manufacture of cellulose acetate rayon and plastics, ethyl cellulose, cuprammonium rayon, high-strength viscose rayon, lacquers, smokeless powder, sausage casings, and other cellulose products in which high quality cellulose is required.

(D. F. J. L.)

COTTON SPINNERS AND MANUFACTURERS' INTERNATIONAL FEDERATION. The International Federation of Master Cotton Spinners' and Manufacturers' Associations was established in 1904 to watch over and protect the common interests of the cotton industry of the world, and to advise the affiliated associations of actions to be taken against any common danger. The means employed in peacetime for carrying out this purpose are:—

(1) The holding of congresses of delegates representing all countries affiliated with the federation.

(2) The appointment of a committee of management, which controls the work and expends the moneys of the federation under the instruction of the congress, distributes information of practical value in improving the conditions of the cotton trade, and assists in the formation, strengthening and assimilating of associations in all spinning and manufacturing centres.

The following countries were affiliated with the Federation in Aug. 1939 (headquarters: 26 Cross Street, Manchester): Bohemia and Moravia, Denmark, Britain, France, Germany, Holland, Hungary, India, Italy, Norway, Poland, Spain, Sweden, Switzerland, Belgium, Finland, China, Egypt, Estonia, Greece and Yugoslavia. Thus the greater part of the world's cotton industry was represented.

The principal questions of mutual interest to all the cotton countries are those connected with the supply of raw cotton. To stimulate cotton-growing, missions have visited, under the auspices of the federation, the United States, India, Egypt, Sudan, Brazil and Colombia. The federation's half-yearly statistics on cotton-mill consumption and stocks are recognized throughout the world. It is of special interest to add that panels of arbitrators to deal with disputes arising out of yarn or cloth transactions have been set up; a significant international trade development. Eighteen international cotton congresses had been held down to 1939 under the auspices of the federation. The *International Cotton Bulletin* is published quarterly.

COTTONTAIL, the common name in America for several species of rabbit (*q.v.*) of the genus *Sylvilagus.*

COTTON WASTE. Every process in cotton manufacturing, from the picker room through the spinning room and the weaving shed, results in some form of cotton waste. These wastes, including thirty-odd different types, are sold by the mills as by-products of their cotton manufacturing. The sales value of a cotton mill's waste often represents the difference between a profit and a loss for the mill, and waste has become of such commercial importance that the business of merchandising waste is one of the largest allied with the cotton spinning industry.

The principal raw cotton consuming countries—the United States, Japan, India, the United Kingdom and the U.S.S.R.—are naturally the greatest waste producing countries. Although high grade comber noils and card strips from Egyptian Sak cotton are imported by the United States from the United Kingdom, and vast quantities of willowed fly and picker waste are supplied to the United States by the Orient, a very valuable export business is done by the United States, its most important customers in cotton waste being Germany, Canada and the United Kingdom. A comparative table follows:

TABLE I.—*Cotton Waste:* Summary of United States production, imports and exports, by crop years, 1935–36 to 1938–39

(Quantity in thousands of pounds)

Cotton Crop, Year Beginning Aug. 1	Estimated production	Imports	Exports
	Total cotton waste		
1935–36	536,673	89,208	56,899
1936–37	671,782	113,124	75,599
1937–38	485,671	13,662	88,912
1938–39*	579,691	14,803	75,365

*Preliminary.

It is estimated that on a basis of an annual world cotton consumption of 12,000,000,000lb. of cotton, the world production of cotton waste is approximately 2,000,000,000lb., of which three-fourths would be spinnable waste, and, it is estimated that all recoverable cotton waste in carded yarn mills amounts to about 16% to 17% of the total cotton consumption, while the total recoverable waste in combed yarn mills is over 30 per cent.

Broadly speaking, cotton waste is divided into two groups: spinnable and unspinnable waste. The former class, including card strips, comber, lap, sliver and roving, is waste from cotton manufacturing processes after the cleaning has been done, the waste accruing from the twisting and spinning processes. Unspinnable waste, including motes, fly and sweepings, is made up of items from cleaning processes and has comparatively small commercial value. Approximately 70% of the production of waste is in spinnable grades. Of these, comber noils and card strips are commercially the most important types.

The quality of spinnable waste is governed by the grade and staple length of the cotton from which it is derived and on the percentage of the original fibre taken out in the carding and combing processes. Spinnable wastes are directly competitive with low grade and short staple cotton and for that reason its prices are based on spot cotton markets, while lesser grades are sold on a flat rate per pound.

A ten-year average annual price, 1928–38, for No. 1 grade Peeler Comber waste was from 80% to 99% of the average annual New York spot price of Middling $\frac{7}{8}''$ cotton for the same period. The average annual price during the same time for No. 1 Upland Card Strips was from 65% to 82% of New York spot price Middling $\frac{7}{8}''$ cotton. (Beginning Aug. 1, 1940, however, prices are based on New York spots on Middling 15/16″ cotton.)

TABLE II.—*Cotton Waste:* Dealers' average selling prices, f.o.b. shipping points, of specified kinds of cotton waste (in cents per lb. and in percentages of New York spot prices of Middling ⅞″ cotton).*

Period	New York spot price, Middling ⅞″ cotton	No. 1 Peeler Comber	No. 1 Upland Strips	Ratio of price of waste to New York spot price of Middling ⅞″ cotton: No. 1 Peeler Comber	Ratio of price of waste to New York spot price of Middling ⅞″ cotton: No. 1 Upland Strips
	Cents per pound			Percent	
Crop years					
1928–29	19.73	16.96	14.88	86	76
1929–30	16.60	13.49	11.19	82	68
1930–31	10.38	8.82	6.98	85	67
1931–32	6.34	5.70	4.58	92	73
1932–33	7.37	7.28	6.03	99	82
1933–34	11.09*	12.03	9.85	80*	65*
1934–35	12.44*	13.83	11.97	84*	73*
1935–36	11.75*	11.97	10.70	90*	80*
1936–37	12.93	11.38	9.90	88	76
1937–38	8.75	7.46	6.07	85	69
1938–39	8.99	7.16	6.52	80	73

*(From August 1933 to January 1936 raw cotton processed was subject to a tax of 4.2 cents per pound. The New York prices here shown do not include the tax; the actual cost to the mill was the price, plus the tax. Percentage grades of cotton waste continued to be quoted on the basis of New York spot cotton quotations, without tax, and as the cotton waste was not subject to the tax, the percentage ran over 100. The percentages here shown for that period have been recalculated on the basis of the New York spot price, plus the tax, in order to reflect more exactly the competitive position between cotton waste and raw cotton.)

Ways in which cotton waste may be utilized are innumerable. A break-down of the more important items and uses of each is as follows:

Comber Noils and Card Strips: When bleached and cleaned make absorbent cotton for medicinal purposes; but in their natural state used for wadding, padding for fine upholstery, bed quilts, etc. A new use is for insulation purposes in building construction after the waste has been chemically treated for inflammability. These items also have high re-spinning value

Roving: When broken up and garnetted it has high re-spinning value and is used for manufacture of twines, cordages, osnaburgs and cheap fabrics.

Thread Waste: Single thread waste is garnetted and mixed with Indian cotton and re-spun for use in the manufacture of flannelette and cotton blankets. Ply thread waste is used primarily as a wiping and polishing material, for packing journal boxes and for automobile oil filters.

Clearer Waste: Is used primarily for a cheap grade of absorbent cotton.

Card Fly: After being willowed is used as padding in the mattress and upholstery trade.

Motes: After being willowed is used for stuffing in upholstery and mattress trade; the waste from the willowing process is sold for fertilizer.

Short Remnants and Mill Ends or Rags: Are used for wiping and polishing cloths and in the manufacture of fine bond paper. Large remnants or mill ends are sold at heavy discounts to the wholesale and retail dry goods trade. (Anything short of a full bolt, or approximately 50 yards, is considered a "mill end.")

Sweepings: From the floor of the mill are used primarily in the manufacture of composition roofing. (M. G. B.)

COTTONWOOD: *see* POPLAR.

COTYS, king of Thrace from 383 to 360 B.C., disputed with the Athenians the possession of the Thracian Chersonese. He was assisted by the Athenians, Iphicrates and Charidemus, to the former of whom he had given his daughter in marriage. On the revolt of Ariobarzanes from Persia, Cotys opposed him and his ally, the Athenians. In 358 he was murdered.

See Cornelius Nepos, *Iphicrates, Timotheus;* Xenophon, *Agesilaus;* Demosthenes, *Contra Aristocratem.*

COUCY, LE CHÂTELAIN DE, French *trouvère* of the 12th century. He is probably the Guy de Couci who was castellan of the castle of that name from 1186 to 1203. Some 26 songs are attributed to him, and about 15 or 16 are undoubtedly authentic. They are modelled very closely on Provençal originals, but are saved from the category of mere imitations by a grace and simplicity peculiar to the author. The legend of the love of the Châtelain de Coucy and the Lady of Fayel, in which there figures a jealous husband who makes his wife eat the heart of her lover, has no historical basis, and dates from a late 13th century romance by Jakemon Sakesep. It is worth noting that the story, which seems to be Breton in origin, has been also told of a Provençal troubadour, Guilhem de Cabestaing, and of the minnesinger Reinmar von Brennenberg. Pierre de Belloy, who wrote some account of the family of Couci, made the story the subject of his tragedy *Gabrielle de Vergy.*

The songs of the Châtelain de Coucy were edited by Fritz Fath (Heidelberg, 1883). For the romance see Gaston Paris, in the *Hist. litt. de la France* (vol. 28, pp. 352–360).

COUCY-LE-CHÂTEAU-AUFFRIQUE, a village of northern France, in the department of Aisne, 18 m. W.S.W. of Laon on a branch of the Northern railway. Pop. (1936), 855. It had extensive remains of fortifications of the 13th century, the most remarkable feature of which was the Porte de Laon. It also had a church of the 15th century, preserving a façade in the Romanesque style. The importance of the place was due, however, to the ruins of a feudal fortress (*see* CASTLE), which was bombarded and destroyed in 1917 and 1918.

Coucy gave its name to the sires de Coucy, a famous feudal house. The founder of the family was Enguerrand de Boves, who, at the end of the 11th century, seized the castle of Coucy by force. Later his son, Thomas de Marle, succeeded him in 1115 and was subdued by King Louis VI. in 1117. Enguerrand III., the Great, fought at Bouvines under Philip Augustus (1214), but was accused of aiming at the crown of France, and took part in disturbances which arose during the regency of Blanche of Castile. These early lords of Coucy remained till the 14th century in possession of the land from which they took their name. Enguerrand IV., sire de Coucy, died in 1320 without issue and was succeeded by his nephew Enguerrand, son of Arnold, count of Guines, and Alix de Coucy, from whom is descended the second line of the house of Coucy. Enguerrand VI. had his lands ravaged by the English in 1339 and died at Crécy in 1346. Enguerrand VII. was sent as a hostage to England, where he married Isabel, the eldest daughter of King Edward III. Wishing to remain neutral in the struggle between England and France, he went to fight in Italy. He took part in the crusade of Hungary against the Sultan Bayezid, during which he was taken prisoner, and died shortly after the battle of Nicopolis (1397). His daughter Marie sold the fief of Coucy to Louis, duke of Orleans, in 1400. The Châtelain de Coucy did not belong to the house of the lords of Coucy, but was castellan of the castle of that name.

COUÉ, EMILE (1857–1926), French psychotherapeutist, was born at Troyes, France, on Feb. 26, 1857. From 1882 to 1910 he was a chemist at Troyes, and studied hypnotism and suggestion from 1901 onwards with Bernheim and Liébault. He then developed his own psychotherapeutical method of healing. In 1910 he established a free clinic at Nancy and there put his theories into practice. Coué's system of therapeutics deals principally with the power of imagination as opposed to that of the will, and he claimed that by means of auto-suggestion ideas which tend to cause illness and disease may be eliminated from the will. He further claimed to have effected organic changes. Coué invariably stated with emphasis that he was not primarily a healer, but one who taught others to heal themselves. His teaching and methods became widely known and he delivered lectures in England and the United States. His famous formula, "Every day, and in every way, I am becoming better and better," is now proverbial (*see* PSYCHOTHERAPY). He died at Nancy on July 2, 1926. *See* C. Baudouin, *Suggestion and Auto-suggestion* (1920).

COUES, ELLIOTT (1842–1899), American naturalist, was born in Portsmouth, N.H., Sept. 9, 1842. He was graduated in 1861 from Columbian (now George Washington) University, Washington, D.C., and from the Medical School of that institution in 1863. In 1864 he was appointed assistant surgeon in the U.S. Army. At the age of 30, he published his *Key to North American Birds,* which, with its revisions (1884 and 1901), and his revision of *New England Bird Life* (Stearns), has done much to promote the systematic study of ornithology in America. This was one of the first works to introduce the "key" method of botanical manuals into zoölogy and it is beyond criticism for its accuracy and completeness of citation and the convenience of its concise descriptions. In 1873–76 Coues was attached to the United States Northern Boundary commission, and in 1876–80 to the United States Geological and Geographical Survey of Territories, the publications of which he edited. His journeys enabled him to publish admirably annotated editions of the Lewis and Clark expedition (1804–06), and of Zebulon Pike's exploration of the upper Mississippi and Rocky Mountain regions (1805–07). He was a lecturer on anatomy in the Medical School of the Columbian University in 1877–82, and professor of anatomy there in 1882–87. He resigned from the Army in 1881 to devote himself entirely to scientific research. He was a founder of the American Ornithologists' Union and edited its organ, *The Auk,* and several other ornithological periodicals.

In addition to ornithology he did valuable work in mammalogy; his book, *Fur-Bearing Animals* (1877) being distinguished by the accuracy and completeness of its description of species. He attained eminence in several literary fields. He worked on the *Century Dictionary* for several years, was associate editor of the magazine of ornithology, *The Osprey,* and edited journals of exploration. It has been said that his beneficent influence on North American ornithology has never been excelled. He died in Baltimore, Md., Dec. 25, 1899.

A complete bibliography of his writings, which include more than 500 titles, dealing almost exclusively with the birds of North America, will be found in the *Biographical Memoirs of the National Academy of Science,* pp. 426–446.

See J. A. Allen, *Biographical Memoirs of the National Academy of Science,* vol. 6, pp. 397–425.

COULISSE, a term for a groove in which a gate of a sluice, or the side-scenes in a theatre, slide up and down, hence applied to the space on the stage between the wings, and generally to that part of the theatre "behind the scenes" and out of view of the public.

It is also a term of the Paris Bourse, derived from a *coulisse,* or passage in which transactions were carried on without the authorized *agents de change.* The name *coulissier* was thus given to unauthorized *agents de change,* or "outside brokers" who, after many attempts at suppression, were finally given a recognized status in 1901. They bring business to the *agents de change,* and act as intermediaries between them and other parties. (*See* STOCK EXCHANGE: *Paris.*)

COULOMB, CHARLES AUGUSTIN (1736–1806), French physicist, was born in Angoulême on June 14, 1736. He was a military engineer, and after spending nine years in the West Indies he returned to France with his health much impaired. In 1789, on the outbreak of the Revolution, he retired to a small estate at Blois and devoted himself to scientific research. In 1802 he was appointed an inspector of public instruction; he died in Paris on Aug. 23, 1806.

Coulomb designed the torsion balance independently of Michell in 1777. He published papers on friction as applied to machinery (1779); on windmills (1781), and on the torsional elasticity of metal and silk fibres (1784). His electrical papers were published in the *Mémoirs de l'Académie royale des sciences* between 1785 and 1789; these formed the basis of the mathematical theory of electricity of Poisson. The first three memoirs appeared in 1785, the following numbers in 1786, 1787, 1788 and 1789. In these memoirs Coulomb gave an account of his work with the torsion balance in verifying Priestley's law of electrical repulsions. He extended the case to include attractions and finally stated that the force is proportional to the product of the charges and inversely proportional to the square of the distance between them. He also verified the inverse square law for particles of magnetic fluid; he believed in the two-fluid theory, but assumed that the magnetic fluids could not be separated but that the electric fluids were separable. In the fourth memoir Coulomb showed that an electric charge is confined to the surface of a conductor and he compared the distribution of charge on the surface of conductors. He virtually established the result that the electric force near a conductor is proportional to the surface density of electrification (this was later proved by Poisson); he also stated that in the case of action at a distance the intervening medium played no part. Cavendish had anticipated Coulomb in the statement of the inverse square law, but this work was unpublished until many years after his death.

COULOMMIERS, a town of northern France, in the department of Seine-et-Marne, 45 mi. E. of Paris by rail. Pop. (1936), 6,687. It is situated in the fertile district of Brie, in a valley watered by the Grand-Morin. The disused church of St. Denis dates from the 13th and 16th centuries. The town suffered considerably during the campaigns of 1914. Printing is the chief industry and trade is in agricultural products, especially in cheeses named after the district.

COULTER, JOHN MERLE (1851–1928), American botanist, was born at Ningpo, China, on Nov. 20, 1851. He graduated at Hanover college, Hanover, Ind., in 1870 and pursued further study there and at Indiana university, receiving from the latter in 1882 the degree of doctor of philosophy. After serving as botanist with the U.S. geological survey in the Rocky Mountains in 1872–73, he was professor of natural sciences in Hanover college in 1874–79, professor of biology in Wabash college in 1879–91, president and professor of botany in Indiana university in 1891–93 and president of Lake Forest university in 1893–96. From 1896 to 1925 he was professor and head of the department of botany in the University of Chicago. In 1923 he was made a member of the national research council and in 1925 became adviser of the Boyce Thompson institute of plant research at Yonkers, New York. For more than a half-century he was an active botanical investigator and educator, producing early in his career valuable manuals for the study of Rocky Mountain and Texan plants and later building up an important graduate department in botany in which many leaders of plant research in America were trained. In 1875 he founded the *Botanical Gazette,* of which for more than 50 years he was editor. He died at Yonkers, N.Y., Dec. 23, 1928. His longer works include: *Manual of Rocky Mountain Botany* (1885); *Botany of Western Texas* (1891–94); *Plant Relations* (1899); *Plant Structures* (1899); *Morphology of Gymnosperms* (1901, ed. 3, 1910) and *Morphology of Angiosperms* (1903), both with C. J. Chamberlain; *New Manual of Botany of the Central Rocky Mountains,* with A. Nelson (1909); *Funda-*

mentals of Plant Breeding (1914); *Evolution of Sex in Plants* (1914); *Plant Genetics* (1918); and *When Evolution and Religion Meet,* with Merle C. Coulter (1924).

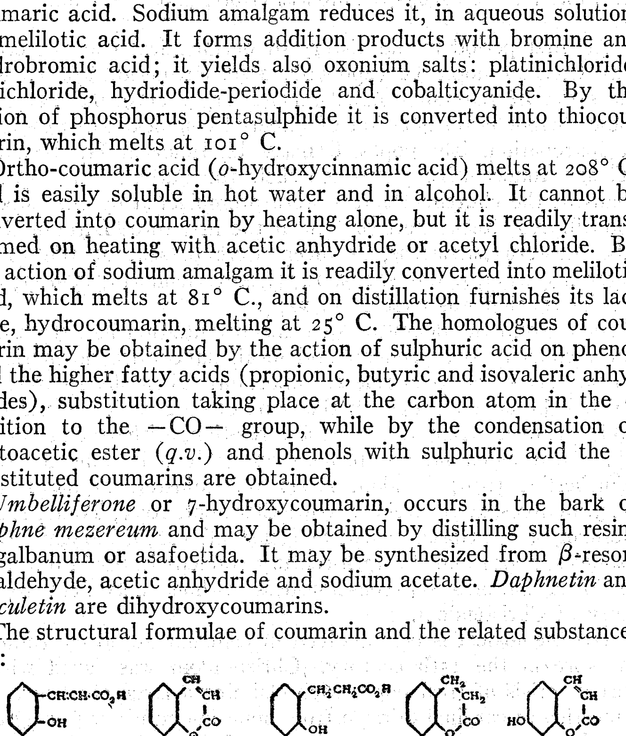
See *Bot. gaz.*, vol. lxxxvii (1929).

COUMARIN, an odorous substance which occurs in sweet woodruff (*Asperula odorata*), in the tonka bean and in yellow melilot (*Melilotus officinalis*); it can be obtained from the tonka bean by extraction with alcohol. Coumarin, $C_9H_6O_2$, is prepared artificially by the action of acetic anhydride and sodium acetate on salicyl aldehyde (W. H. Perkin, Sr. 1875). It can also be prepared by heating a mixture of phenol and malic acid with sulphuric acid. It forms rhombic crystals (from ether) melting at 67° C. and boiling at 290° C., which are readily soluble in alcohol, and moderately soluble in hot water. It is applied in perfumery for the preparation of the *Asperula* essence. On boiling with concentrated caustic potash coumarin yields the potassium salt of ortho-coumaric acid. Sodium amalgam reduces it, in aqueous solution, to melilotic acid. It forms addition products with bromine and hydrobromic acid; it yields also oxonium salts: platinichloride, aurichloride, hydriodide-periodide and cobalticyanide. By the action of phosphorus pentasulphide it is converted into thiocoumarin, which melts at 101° C.

Ortho-coumaric acid (*o*-hydroxycinnamic acid) melts at 208° C. and is easily soluble in hot water and in alcohol. It cannot be converted into coumarin by heating alone, but it is readily transformed on heating with acetic anhydride or acetyl chloride. By the action of sodium amalgam it is readily converted into melilotic acid, which melts at 81° C., and on distillation furnishes its lactone, hydrocoumarin, melting at 25° C. The homologues of coumarin may be obtained by the action of sulphuric acid on phenol and the higher fatty acids (propionic, butyric and isovaleric anhydrides), substitution taking place at the carbon atom in the α position to the $-CO-$ group, while by the condensation of acetoacetic ester (*q.v.*) and phenols with sulphuric acid the β substituted coumarins are obtained.

Umbelliferone or 7-hydroxycoumarin, occurs in the bark of *Daphne mezereum* and may be obtained by distilling such resins as galbanum or asafoetida. It may be synthesized from β-resorcylaldehyde, acetic anhydride and sodium acetate. *Daphnetin* and *aesculetin* are dihydroxycoumarins.

The structural formulae of coumarin and the related substances are:



Orthocoumaric acid. Coumarin. Melilotic acid. Hydrocoumarin. Umbelliferone

COUMARONE or BENZOFURAN, a colourless liquid which boils at 171°–172° C., and is readily volatile in steam, but is insoluble in water and in solutions of potassium hydroxide. It has the molecular formula C_8H_6O and the structure $C_6H_4\langle{}^{CH}_{O}\rangle CH.$ It occurs in the fraction of coal tar that boils at 160°–200° C., and it is converted by sulphuric acid into coumarone resin (*see* RESINS: *Synthetic Resins*). It may be obtained also by the distillation of coumarilic acid with lime, this acid being prepared from bromocoumarin by the action of alcoholic potassium hydroxide. (G. W. WD.)

COUNCIL (L. *concilium,* a meeting; from *cum,* together, and *calare,* to call), a convocation, assembly, meeting; specifically, like synod (Gk. σύνοδος), an assembly of ecclesiastics called together to discuss and decide on disputed questions of doctrine, discipline and (sometimes) relations with secular authority. The meaning of the word has varied by reason of the confusion between *concilium* and *consilium* (counsel). Thus a council of state (F. *conseil d'état*) is ordinarily advisory only, but the council of state appointed by the British parliament in 1649 was executive. The A.V. rendering of Matt. xii, 14, "held a council," (corrected in the R.V. to "took counsel") was a mistaken translation of συμβούλιον ἔλαβον, influenced by the Vulgate, *consilium faciebant.* (*See* the Oxford dictionary, *s.v.* Council, for such uses as Great Council, Privy Council, Town Council, etc.)

Ecclesiastical synods and councils have been distinguished as diocesan, endemic (σύνοδοι ενδημοῦσαι), provincial, patriarchal, primatial, national, mixed, plenary, general, oecumenical; but the meanings of some of these words have been far from uniform. A diocesan synod is today a purely advisory board. Formerly, provincial councils, presided over by metropolitan bishops exercised independent authority over the daughter churches in wide areas. From 1589, in Roman Catholic canon law, the decisions of such provincial councils as those of Baltimore (1829), Paris (1849), Lyons (1850), Westminster (1852), Vienna (1858) and Cologne (1860) have been valid only after correction and confirmation by a Roman commission.

The meaning of the word plenary has varied greatly. Today a plenary council (*e.g.*, the Plenary Councils of Baltimore of 1852, 1866, 1884) is a provincial council under the presidency of a papal legate. A general council is sometimes loosely distinguished from an oecumenical council by the fact that the decisions of the former fail to gain universal acceptance, while those of the latter are so accepted. Thus the council of Constantinople (381) was convoked as a general council of the east (without any representation of the west), but it was later reckoned as oecumenical in so far as its decisions were accepted by other oecumenical councils and by the pope. In current canon law an oecumenical council is one that is summoned by papal authority, presided over by the supreme pontiff in person or by his delegates, and whose decrees, after papal confirmation, bind the whole church. In the middle ages, mixed councils of bishops and barons were common. Thus the council of Clarendon (1164) issued a number of famous constitutions dealing with the relations of church and state. National councils often served an important historical function in fostering national unity.

A prototype of the later councils may be found in the assemblies mentioned in the Acts of the Apostles. Thus, "the twelve called the multitude of the disciples unto them" (Acts vi, 2), for the purpose of discussing and instituting the new ministry of deacons. The reunion described in Acts xv has even more the appearance of the later councils. J. D. Mansi, editor of the *Sacrorum conciliorum nova et amplissima collectio,* enumerates four such apostolic councils (vol. i, 21 *ff.*). Theologians find in Matt. xviii, 20 ("where two or three are gathered together in my name, there am I in the midst of them") the germinal idea of conciliar authority.

The continuous history of ecclesiastical councils begins in the second half of the 2nd century. Bishop Apollinaris of Hierapolis (*Mansi* i, 691) is recorded as convoking a synod to deal with the doctrinal difficulties arising from the Montanist heresy. Certain of the early synods of the east were convoked at the suggestion of Pope Victor (189 A.D.–198 A.D.) to deal with the disciplinary question of the dating of Easter. In the 3rd century the calling of councils became frequent and widespread. The historian Eusebius (*Ecclesiastical History*, v, 16, 23) speaks as though annual and even semiannual synods were of regular occurrence. The letters of St. Cyprian of Carthage (*e.g.*, i, xvi, xvii, xix, lxx, lxxi, lxxii, lxxiii) are full of references to the councils of North Africa. Thus the council of Carthage of 256 A.D. brought together no less than 87 bishops, together with a number of presbyters and deacons and certain of the laity. As the system of synodal legislation became more organized, only bishops (or the delegates of bishops) were considered constituent members with decisive votes. Thus at the council of Elvira in 305, priests were present but only the bishops signed the decrees.

The rise of the Donatist schism in North Africa was the occasion for introducing the secular element of imperial authority into the conciliar system. The Emperor Constantine, not yet baptized, and, therefore, without any rights in the Christian society of the church, convoked a council in Rome in 313, to settle the rival claims of Caecilian and Majorinus, the Donatist, to the see of Carthage. Though the decision of the council was made under the presidency of Pope Melchiades, the right of the emperor to convoke the synod passed unchallenged. It was Constantine who convoked the larger council of Arles in 314, to which bishops from distant Britain were summoned. Most important of all it was an emperor who convoked each of the first eight oecumenical councils: Nicaea I (325), Constantinople I (381), Ephesus (431), Chalcedon (451), Constantinople II (553), Constantinople III (680), Nicaea II (787), Constantinople IV (869).

The first of the oecumenical councils, that of Nicaea in 325, became a model for many that followed. It was oecumenical in the sense that bishops were summoned from the whole inhabited world (ἡ οἰκουμένη). It was oecumenical in the more technical sense that its decisions were meant to be binding on all Christians, and not merely on those of this or that diocese or patriarchate. It was called in the face of the special crisis arising from the spread of the Arian heresy. It was conducted by means of free debate; but when the decisions were reached (*e.g.,* to define Jesus Christ as "true God of true God, begotten not made, of one substance with the Father"), the bishops who were recalcitrant were subject to ecclesiastical excommunication and political exile. Although the emperor convoked the council, paid the expenses, was present at some of the sessions and punished the recalcitrants, it seems to have been understood that he had acted with the consent of the bishops (Rufinus, *Ecclesiastical History,* i, 1) and, particularly, of Pope Sylvester (*Liber Pontificalis* xxxiv).

The precise relations of pope and emperor to the first eight oecumenical councils have been a matter of debate among the historians and canonists. It is generally agreed, after the careful demonstration by Franz-Xavier Funk ("Die Berufung der ökumenischen Synoden des Altertums" in *Kirchengeschichtliche Abhandlungen und Untersuchungen* pp. 30–86, Paderborn, 1897) that, historically speaking, the writs of convocation to all these councils went out in the name of the emperor, and not in the name of the pope. On the other hand, it is no less clear that the canonical necessity of papal co-operation was never lost sight of. Thus at Ephesus (431) the president of the council, St. Cyril of Alexandria, is described by the acts of the council as taking "the place of Celestine, the most holy and most sacred archbishop of the Romans." At Chalcedon (451) the legates of Pope Leo, Paschasinus, Lucentius and Boniface, were the acknowledged leaders among the constituent members of the council, even though Emperor Marcian or his commissioners ranked as honorary presidents. So, too, at Constantinople III (680), the legates of Pope Agatho, Theodore, George and John, were the acknowledged leaders. At Nicaea II (787), the legates of Adrian I presided. What is more important, from the point of view of canonical oecumenicity, all the dogmatic decisions of the early councils were either antecedently formulated or subsequently accepted by papal authority (Funk, "Die päpstliche Bestätigung der acht ersten allgemeinen Synoden," in *op. cit.,* pp. 87–121). Even in the case of the fifth oecumenical council (Constantinople II, 553), which was convoked by Emperor Justinian against the will of Pope Vigilius, the decrees were subsequently accepted by the papal *Constitutum* of 554.

A special interest attaches to the first four oecumenical councils, Nicaea (325), Constantinople (381), Ephesus (431) and Chalcedon (451), by reason of the fact that the dogmatic definitions regarding the persons of the Trinity are shared by Roman Catholic, Greek Orthodox and Protestant Christians. Latins, Greeks and many Anglicans accept the decrees of the first seven oecumenical councils. The Greeks, after the Photian schism, repudiated the eighth council (Constantinople IV, 869–70), except during brief periods of reunion with Rome. Modern Roman Catholic canonists and theologians recognize 20 councils as oecumenical. They are listed for reference. (For details *see* separate articles, NICAEA, etc.)

Place	Date (A.D.)	Principal matters discussed
1. Nicaea I	325	Arian heresy; dating of Easter
2. Constantinople I	381	Divinity of Holy Spirit
3. Ephesus	431	Nestorianism; Mary as Mother of God
4. Chalcedon	451	Two natures in Christ
5. Constantinople II	553	"Three Chapters"; errors of Origen
6. Constantinople III	680	Divine and human wills in Christ
7. Nicaea II	787	Veneration of holy images
8. Constantinople IV	869	Schism of Photius
9. Lateran (Rome) I	1123	Lay investiture; crusade
10. Lateran II	1139	Errors of Arnold of Brescia
11. Lateran III	1179	Albigensians; Waldensians
12. Lateran IV	1215	Confession of faith; reform
13. Lyons I	1245	Deposition of Frederick II; crusade
14. Lyons II	1274	Reunion of east; papal elections
15. Vienne	1311–12	Knights Templars; Fraticelli
16. Constance (in part)	1414–18	Schism; Hus and Wyclif
17. Basel (in part)-Ferrara-Florence	1431–45	Reunion; peace; reform
18. Lateran V	1512–17	Pragmatic Sanction of 1438; crusade
19. Trent	1545–63	Doctrinal definitions; reform
20. Vatican	1869–70	Modern errors; papal infallibility

The first period in the history of oecumenical councils ended with Constantinople IV (869–70); a second period opened with the series of Lateran Councils, 1123, 1139, 1179 and 1215. In these there was no question of imperial convocation, presidency or approbation. The popes, Calixtus II, Innocent II, Alexander III and Innocent III, exercised their full authority as supreme heads of the church. Decrees were promulgated by the pope in council. No Greeks were present at the first three Lateran councils. Eastern patriarchs, however, were present at the fourth Lateran (1215), Lyons (1245, 1274) and Vienne (1311–12); and a brief reunion was effected in 1274.

Apart from the definition of transubstantiation in 1215, mediaeval councils, both general and local, have little dogmatic interest. Their historical rolè is important. Their decisions throw much light on mediaeval methods of dealing with ecclesiastical problems of doctrine, discipline and relations with secular authority. Great assemblies of bishops and abbots in England (*e.g.,* Winchester, 1076; London, 1102; Westminster, 1138), France (*e.g.,* Bourges, 1031; Reims, 1049; Clermont, 1095; Tours, 1229), Germany (*e.g.,* Goslar, 1019; Seligenstadt, 1027), Hungary (*e.g.,* Szoboles, 1092) and the 13th-century councils in Spain did much to foster national self-consciousness without detriment to the unity of Christendom.

The theological issues involved in conciliar authority came to the fore in the 15th century. Christendom was faced with a chronic crisis of rival popes each claiming a large obedience. At a meeting of cardinals, drawn from opposing curias, it was agreed, in July 1408, to call an assembly to heal the schism. The council which met at Pisa in 1409 declared itself (May 18) to be canonically convoked and oecumenical in authority, deposed the rival popes, Benedict XIII and Gregory XII, and empowered the cardinals at Pisa to proceed to the election of a new pope. The outcome was that Christendom had three popes instead of two. The efforts of Emperor Sigismund led to the convocation of another council at Constance in 1414. This assembly declared itself to have authority directly from God over all Christians including the pope. The schism was happily ended by the election of Pope Martin V; and the new pope, by accepting a number of decisions, gave the character of oecumenicity to certain decrees of the earlier sessions, and to all the decrees of the 42nd to 45th sessions. Although the council assembled at Basel in 1431 declared itself superior to the pope, Eugenius IV did not dissolve it until a quarrel arose as to the place for effecting a reunion with the Greeks. While a rump council remained in session at Basel, the legitimate council at Ferrara and Florence worked out agreements with Armenians, Jacobites, Maronites and others. Canonical opinion today admits as oecumenical only those decrees of the first 25 sessions of Basel which concern heresy, reform and the peace of Christendom.

The fifth Lateran council (1512–17) proved of little significance in its main purpose of reform; but it approved the declaration that the pope has full authority to convoke, transfer and dissolve general councils. The other 16th-century oecumenical council, that of Trent (1545–63), attempted to deal with the issues in doctrine and discipline raised by the Protestant revolt. The precision of its canons and decrees exerted a marked influence on Roman Catholic thought and action during the last four centuries. Nevertheless, the "conciliar theory" found expression in the Gallican Assembly of 1682 and in the synod of Pistoia of 1786.

The last of the oecumenical councils, that of the Vatican, was assembled on December 8, 1869 and was prorogued in July 1870. It has never been formally dissolved. (For details *see* VATICAN COUNCIL, THE.) It brought into clear light all the implications of the papal headship of the church and, in particular, the relations of the pope to the council. The council was convoked by the pope, was presided over by the pope, and its decisions were promulgated in the name of the pope, "the bishops of the whole world being assembled and judging with us." In the light of the Vatican decrees a more precise theological connotation attaches to the term oecumenical council. It is considered to be one that acts not merely in the name, but with the whole authority, of the teaching body (*magisterium*) instituted by Jesus Christ. Since the pope is the head of that body, the members, without his co-operation, cannot have oecumenical authority. Nor can there be a juridical convocation, obliging all bishops to attend and constituting those who come into a council competent to deal with affairs beyond the jurisdiction of any of the individual members, unless it issue from the successor of Peter in the primacy. Still less can there be any legitimate presidency of an oecumenical council save that of the pope or his legates. Least of all, can the decisions have oecumenical validity unless accepted by the pope. On the other hand, papal infallibility does not diminish the infallibility of an oecumenical council in which a great majority of the episcopate should bear unequivocal witness to the faith of the church. Such a clear witness would not, in fact, need confirmation; and could not, by the very nature of the pope's office, be opposed by him.

The mode of conducting conciliar business and debate has varied throughout the centuries. A number of novel techniques were introduced in the 15th century; and some of these were further developed at Trent. In the case of the Vatican Council rules of procedure were carefully prepared in advance, and not left to the determination of the council itself. Before the council met, seven commissions (*congregationes*) of theologians had prepared the drafts of decrees to be discussed. When the council assembled, these prepared drafts (*schemata*) were amended in the light of objections by a number of elected committees (*deputationes*). Final drafts were voted on in general congregations. Not until the final public sessions, were definitive votes taken. The right to vote in these sessions was limited to cardinals, bishops and generals of religious orders.

Protestant Councils.—The churches of the Reformation have all had a certain measure of synodal life. The Church of England has maintained its ancient provincial synods or convocations, though for the greater part of the 18th and the first part of the 19th centuries they transacted no business. In the Lutheran Churches of Germany there was no strong agitation in favour of introducing synods until the 19th century, when a movement, designed to render the churches less dependent on the governmental consistories, won its way, until at length Prussia itself fell into line (1873 and 1876). As the powers granted to the German synods were very limited, many of their advocates were disillusioned; but the Lutheran Churches of America, being independent of the state, have developed synods both numerous and potent. In the Reformed Churches outside Germany, synodal life is vigorous; its forms were developed by the Huguenots in days of persecution, and passed from there to Scotland and other Presbyterian countries. Even many of the churches of congregational polity have organized national councils (*see* CONGREGATIONALISM); but here the principle of the independence of the local church prevents the decisions from binding those congregations which do not approve of the decrees. Moreover, in the last decade of the 19th century a growing desire for a rapproachement between the Free Churches in Great Britain as a whole led to the annual assembly of the Free Church council for the consideration of all matters affecting them. This body has no executive or doctrinal authority and is rather a conference than a council. In general it may be said that synods are becoming more and more powerful in Protestant lands, and that they are destined to still greater prominence because of the growing sentiment for Christian unity (*see* REUNION, CHURCH).

BIBLIOGRAPHY.—The most convenient general collection is that of J. D. Mansi, *Sacrorum conciliorum et decretorum nova et amplissima collectio* (Florence 1759–67, Venice 1769–98, 31 vols.); facsimile reproduction by Welter (Paris, 1900 *ff.*) with additional volumes and Index and a continuation, *Collectio conciliorum recentiorum Ecclesiae universae*, ed. by J. B. Martin and L. Petit. The earlier collection, *Conciliorum collectio regia maxima*, ed. by Jean Hardouin (Paris 1715) is still much used. The best collection of modern councils (1682–1870) is that edited by the Jesuits of Maria-Laach (referred to as the *Collectio Lacensis*), *Acta et decreta sacrorum conciliorum recentiorum* (Freiburg, 1870 *ff.*, 7 vols.) A. W. Haddan and W. Stubbs, *Councils and Ecclesiastical Documents relating to Great Britain and Ireland*, 4 vols. (Oxford, 1869 *ff.*); J. Quick, *Synodicon in Gallia reformata*, 2 vols. (London, 1692). The best general history of the councils is that of C. J. von Hefele, *Conciliengeschichte*, in the French translation by H. Leclercq, *Histoire des conciles*, 8 vols. (Paris 1907 *ff.*); with the continuations, vol. 9, *Le concile de Trente* by P. Richard and vol. 10, *Les decrets du concile de Trente*, by A. Michel. For the canonical and theological questions connected with councils, Wernz, *Jus Decretalium* (Rome, 1899); P. Hinschius, *System des Katolischen Kirchenrechts*, vol. iii (Berlin, 1869); F. Bliemetzrieder, *Das Generalkonzil im grossen abendländischen Schisma* (Paderborn, 1904). *See* also VATICAN COUNCIL, THE.

COUNCIL BLUFFS, a city of southwestern Iowa, U.S.A., on the east bank of the Missouri river, opposite Omaha; county seat of Pottawattamie county. Fifth largest railroad centre in the United States and located at the conflux of the major highways of the midwest. Eight main trunk lines serve the city with 64 passenger and 72 freight trains daily. Railroads comprise the Burlington, Chicago-Milwaukee, Chicago and North Western, Chicago Great Western, Illinois Central, Union Pacific, Rock Island and Wabash. Highways include federal 75, 39, 6 and 275. Population (1940 census) was 41,439, with 83% native white, 14% foreign-born white and 3% Negroes. The city has a land area of 15.3 sq.mi. and lies 980 ft. above sea level, on the broad flood plain of the Missouri river, at the foot of high loess bluffs.

The site upon which Council Bluffs has grown was first recorded in the report of the Lewis and Clark expedition, when in 1804 they stopped at a hill-surrounded spot overlooking the Missouri river to hold council with the Indians. This spot became known as council-hill or council-bluff. In 1846 the Mormons settled on the site and built a town they called Kanesville, but after the majority of the Mormons had left, in 1853, the name was changed to Council Bluffs. During the California gold rush of 1849–50 it became one of the chief outfitting points for gold-seekers. Abraham Lincoln visited Council Bluffs in 1859 and was so impressed by the possibilities for transportation that he later designated the city as eastern terminus of the Union Pacific railroad. A wholesale and retail centre with industrial plants manufacturing a host of items, including oils, truck bodies, car wheels, baskets, playground and floodlighting equipment, cereals and batteries. Elevators with 10,000,000-bu. storage capacity make Council Bluffs a leading grain centre, while greenhouses with 1,500,000 sq.ft. under glass produce some of the world's finest flowers. It was incorporated as a city in 1853.

COUNCIL OF NATIONAL DEFENCE, U.S., a peacetime advisory body, "established for the co-ordination of industries and resources, for the national security and welfare, and the creation of relations which will render possible in time of need the immediate concentration and utilization of the resources of the nation." Although a Council of National Defence was recommended to the House by the General Staff of the Army as early as 1910, no definite action resulted until six years later, when the Council was created under the Army Appropriation Act of Aug. 29, 1916 (39 Stat. 619). This Act provided for a Council with a membership of seven, composed of the secretaries of War, Navy, Interior, Agriculture, Commerce and Labour, and the appointment of an advisory committee of seven to the council, each of whom should be a specialist in "some industry, public utility, or development of some natural resource or otherwise specifically qualified for the duties." That the council was intended as a peace-time advisory body is evidenced by the provision that not more than half of the general staff should be in Washington at one time and that the appropriation for its activities was limited to $200,000. The Council met for the first time on Dec. 7, 1916, and soon thereafter appointed an advisory committee on transportation and communication; raw materials, minerals and metals; munitions, manufacturing and industrial relations; supplies; engineering and education; labour; medicine and surgery.

Although hampered by lack of funds and executive powers, and presumably undertaking a peace-time explorative and experimental task, it had achieved a quite definite and comprehensive programme for the nation's defence by April 6, 1917, the date of the official declaration of war with Germany. It then became, in effect, a war emergency cabinet directing the intensive and extensive organization and mobilization of the nation's resources. From its committees and subordinate bodies emerged the War Industries Board, the War Labor, Food and Fuel Administrations, the Aircraft Production Board, and other war-time bureaux, to which Congress granted executive powers explicitly denied to the Council of National Defence. Building up a field machinery of State, county, community and municipal councils of defence throughout the United States, the council became the medium through which the war needs and measures of the National Government were made known to the people, and the varying moods and reactions of the different sections of the country were registered in Washington. The appointment of a Woman's Committee of the Council of National Defence on April 21, 1917, "to co-ordinate the woman's preparedness movement" resulted in a nation-wide organization of State and local units of women for war work. After the signing of the Armistice, the council, through its field machinery, took up the problems of readjustment, and after 1920 was engaged in the development of a permanent peace-time procedure and in research on national problems.

COUNCILS OF ORANGE. The most important of these is the council of 529, when fifteen bishops, under the presidency of Caesarius of Arles, assembled primarily to dedicate a church, the gift of Liberius, the lieutenant of Theodoric, in Gaul, at what proved to be one of the most important councils of the 6th century. Caesarius had sought the aid of Rome against semi-Pelagianism, and in response Pope Felix IV. had sent certain *capitula* concerning grace and free-will, drawn chiefly from the writings of Augustine and Prosper. These to the number of twenty-five the synod subscribed, and adopted a supplementary statement, reaffirming the Augustinian doctrines of corruption, human inability, prevenient grace and baptismal regeneration. Its acts were confirmed by Boniface II. on the "25th of January 530," a date which is open to question.

See F. H. Woods, *Canons of the Second Council of Orange* (Oxford, 1882).

COUNSEL AND COUNSELLOR. The term "counsel" is employed in England as a synonym for a barrister (*q.v.*). Counsellor or, more fully, counsellor-at-law, is an obsolete term in England, but is still in use in Ireland as an equivalent to barrister. In the United States, a counsellor-at-law is, specifically, an attorney admitted to practice in all the courts; but as there is no formal distinction of the legal profession into two classes, as in England, the term is more often used loosely in the same sense as "lawyer," *i.e.,* one who is versed in, or practises law.

COUNT, the English translation of foreign titles equivalent generally to the English "earl." In Anglo-French documents the word *counte* was at all times used as the equivalent of earl, but, unlike the feminine form "countess," it did not find its way into the English language until the 16th century, and then only in the sense defined above. The title of earl, applied by the English to the foreign counts established in England by William the Conqueror, is dealt with elsewhere (*see* EARL). The present article deals with (1) the office of count in the Roman empire and the Frankish kingdom, (2) the development of the feudal count in France and under the Holy Roman empire, (3) modern counts.

1. The Latin *comes* meant literally a companion or follower. In the early Roman empire the word was used to designate the companions of the emperor (*comites principis*) and so became a title of honour. The emperor Hadrian chose senators as companions on his travels and to help him in public business. They formed a permanent council, and Hadrian's successors entrusted these *comites* with the administration of justice and finance, or placed them in military commands. The designation *comes* thus developed into a formal official title of high officers of State, some qualification being added to indicate the special duties attached to the office in each case. Thus in the 5th century, among the *comites* attached to the emperor's establishment, we find, *e.g.,* the *comes sacrarum largitionum* and the *comes rei privatae;* while others, forming the council, were styled *comites consistorii.* Others were sent into the provinces as governors, *comites per provincias constituti;* thus in the *Notitia dignitatum* we find a *comes Aegypti,* a *comes Africae,* a *comes Belgicae,* a *comes Lugdunensis* and others. Two of the generals of the Roman province of Britain were styled the *comes Britanniae* and the *comes littoris Saxonici* (count of the Saxon shore).

At Constantinople in the later Roman empire the Latin word *comes* assumed a Greek garb as κόμης and was declined as a Greek noun (gen. κόμητος); the *comes sacrarum largitionum* (count of the sacred bounties) was called at Constantinople ὁ κόμης τῶν σακρῶν λαριγιτιώνων and the *comes rerum privatarum* (count of the private estates) was called κόμης τῶν πριβάτων. The count of the sacred bounties was the lord treasurer or chancellor of the exchequer, for the public treasury and the imperial fisc had come to be identical; while the count of the private estates managed the imperial demesnes and the privy purse. In the 5th century the "sacred bounties" corresponded to the *aerarium* of the early empire, while the *res privata* represented the fisc. The officers connected with the palace and the emperor's person included the count of the wardrobe (*comes sacrae vestis*), the count of the residence (*comes domorum*), and, most important of all, the *comes domesticorum et sacri stabuli* (graecized as κόμης τοῦ στάβλου). The count of the stable, originally the imperial master of the horse, developed into the "illustrious" commander-in-chief of the imperial army (Stilicho, *e.g.,* bore the full title as given above), and became the prototype of the mediaeval constable (*q.v.*).

An important official of the second rank (*spectabilis,* "respectable" as contrasted with those of highest rank who were "illustrious") was the count of the East, who appears to have had the control of a department in which 600 officials were engaged. His power was reduced in the 6th century, when he was deprived of his authority over the Orient diocese, and became civil governor of Syria Prima, retaining his "respectable" rank. Another important officer of the later Roman court was the *comes sacri patrimonii,* who was instituted by the emperor Anastasius. In this connection it should be observed that the word *patrimonium* gradually changed in meaning. In the beginning of the 3rd century *patrimonium* meant crown property, and *res privata* meant personal property: at the beginning of the 6th century *patrimonium* meant personal property, and *res privata* meant crown property. It is difficult to give briefly a clear idea of the functions of the three important officials *comes sacrarum largitionum, comes rei privatae* and *comes sacri patrimonii;* but the terms have been well translated by a German author as *Finanzminister des Reichsschatzes* (finance minister of the treasury of the empire), *F. des Kronschatzes* (of the Crown treasury), and *F. des kaiserlichen Privatvermögens* (of the emperor's private property).

The Frankish kings of the Merovingian dynasty retained the Roman system of administration, and under them the word *comes* preserved its original meaning; the *comes* was a companion of the king, a royal servant of high rank. Under the early Frankish kings some *comites* did not exercise any definite functions; they were merely attached to the king's person and executed his orders. Others filled the highest offices, *e.g.,* the *comes palatii* and *comes stabuli* (*see* CONSTABLE). The kingdom was divided for administrative purposes into small areas called *pagi* (*pays,* Ger. *Gau*), corresponding generally to the Roman *civitates* (*see* CITY). At the head of the *pagus* was the *comes,* corresponding to the German *Graf.* The *comes* was appointed by the king and removable at his pleasure, and was chosen originally from all classes, sometimes from enfranchised slaves. His essential functions were judicial and executive, and in documents he is often described as the king's agent (*agens publicus*) or royal judge (*judex publicus* or *fiscalis*). As the delegate of the executive power he had the right to military command in the king's name and to take all the measures necessary for the preservation of the peace, *i.e.,* to exercise the royal "ban" (*bannus regis*). He was at once public prosecutor and judge, was responsible for the execution of the sentences of the courts, and as the king's representative exercised the royal right of protection (*mundium regis*) over churches, widows, orphans and the like. He enjoyed a triple wergeld, but had no definite salary, being remunerated by the receipt of certain revenues, a system which contained the germs of discord, on account of the confusion of his public and private estates. He also retained a third of the fines which he imposed in his judicial capacity.

Under the early Carolings the title count did not indicate noble birth. A *comes* was generally raised from childhood in the king's palace, and rose to be a count through successive stages. The count's office was not yet a dignity, nor hereditary; he was not independent nor appointed for life, but exercised the royal power by delegation, as under the Merovingians. While, however, he was theoretically paid by the king, he seems to have been himself one of the sources of the royal revenue. The counties were, it appears, farmed out; but in the 7th century the royal choice became restricted to the larger landed proprietors, who gradually emancipated themselves from royal control, and in the 8th century the term *comitatus* begins to denote a geographical area, though there was little difference in its extent under the Merovingian kings and the early Carolings. The count was about to pass into the feudatory stage. Throughout the middle ages, however, the original official and personal connotation of the title was never wholly lost; or perhaps it would be truer to say, with Selden, that it was early revived with the study of the Roman civil law in the 12th century. The unique dignity of count of the Lateran palace, bestowed in 1328 by the emperor Louis IV. the Bavarian on Castruccio de' Antelminelli, duke of Lucca, and his heirs male, was official as well as honorary, being charged with the attendance and service to be performed at the palace at the emperor's coronation at Rome (Du Cange, *s.v. Comites Palatii Lateranensis;* Selden, *op. cit.* p. 321). This instance, indeed, remained isolated; but the personal title of "count palatine," though honorary rather than official, was conferred on officials—especially by the popes on those of the Curia—had no territorial significance, and was to the last reminiscent of those early *comites palatii* whose relations to the sovereign had been purely personal and official (*see* PALATINE). A relic of the old official meaning of "count" still survives in Transylvania, where the head of the political administration of the Saxon districts is styled count (*comes, Graf*) of the Saxon Nation.

2. The process by which the official counts were transformed into feudal vassals almost independent is described in the article FEUDALISM. In the confusion of the period of transition, when the title to possession was usually the power to hold, designations which had once possessed a definite meaning were preserved with no defined association. In France, by the 10th century, the process of decomposition of the old organization had gone far, and in the 11th century titles of nobility were still very loosely applied. That of "count" was, as Luchaire points out, "equivocal" even as late as the 12th century; any castellan of moderate rank could style himself *comte* who in the next century would have been called *seigneur* (*dominus*). Even when, in the 13th century, the ranks of the feudal hierarchy in France came to be more definitely fixed, the style of "count" might imply much, or comparatively little. In the oldest register of Philip Augustus counts are reckoned with dukes in the first of the five orders into which the nobles are divided, but the list includes, besides such almost sovereign rulers as the counts of Flanders and Champagne, immediate vassals of much less importance—such as the counts of Soissons and Dammartin—and even one mediate vassal, the count of Bar-sur-Seine. The title was still in fact "equivocal," and so it remained throughout French history. In the official lists it was early placed second to that of duke (Luchaire, *Manuel,* p. 181, note 1), but in practice at least the great *comtes-pairs* (*e.g.,* of Champagne) were the equals of any duke and the superiors of many. Thus, too, in modern times royal princes have been given the title of count (Paris, Flanders, Caserta), the heir of Charles X. actually changing his style, without sense of loss, from that of duc de Bordeaux to that of comte de Chambord. From the 16th century onwards the equivocal nature of the title in France was increased by the royal practice of selling it, either to viscounts or barons in respect of their fiefs, or to rich *roturiers.*

In Germany the change from the official to the territorial and hereditary counts followed at the outset much the same course as in France, though the later development of the title and its meaning was different. In the 10th century the counts were permitted by the kings to divide their benefices and rights among their sons, the rule being established that countships (*Grafschaften*) were hereditary, that they might be held by boys, that they were heritable by females and might even be administered by females. The *Grafschaft* became thus merely a bundle of rights inherent in the soil; and, the count's office having become his property, the old counties or *Gauen* rapidly disappeared as administrative units, being either amalgamated or subdivided. By the second half of the 12th century the official character of the count had quite disappeared; he had become a territorial noble, and the foundation had been laid of territorial sovereignty (*Landeshoheit*). The first step towards this was the concession to the counts of the military prerogatives of dukes, a right enjoyed from the first by the counts of the marches (*see* MARGRAVE), then given to counts palatine (*see* PALATINE) and, finally, to other counts, who assumed by reason of it the style of landgrave (*Landgraf, i.e.,* count of a province). At first all counts were reckoned as princes of the empire (*Reichsfürsten*); but since the end of the 12th century this rank was restricted to those who were immediate tenants of the Crown, the other counts of the empire (*Reichsgrafen*) being placed among the free lords (*barones, liberi domini*). Counts of princely rank (*gefürstete Grafen*) voted among the princes in the imperial diet; the others (*Reichsgrafen*) were grouped in the *Grafenbänke*—originally two, to which two more were added in the 17th century—each of which had one vote. In 1806, on the formation of the Confederation of the Rhine, the sovereign counts were all mediatized (*see* MEDIATIZATION). Even before the end of the empire (1806) the right of bestowing the title of count was freely exercised by the various German territorial sovereigns.

3. Any political significance which the feudal title of count retained in the 18th century vanished with the changes produced by the Revolution. It is now simply a title of honour and one, moreover, the social value of which differs enormously, not only in the different European countries, but within the limits of the same country. In Germany, for instance, there are several categories of counts: (1) the mediatized princely counts (*gefürstete Grafen*), who are reckoned the equals in blood of the European sovereign houses, an equality symbolized by the "closed crown" surmounting their armorial bearings. The heads of these countly families of the "high nobility" are entitled (by a decree of the federal diet, 1829) to the style of *Erlaucht* (illustrious, most honourable); (2) Counts of the empire (*Reichsgrafen*), descendants of those counts who, before the end of the Holy Roman empire (1806), were *Reichsständisch; i.e.,* sat in one of the *Grafenbänke* in the imperial diet, and entitled to a ducal coronet; (3) Counts (*a*) descended from the lower nobility of the old empire, titular since the 15th century, (*b*) created since; their coronet is nine-pointed (*cf.* the nine points and strawberry leaves of the English earl). The difficulty of determining in any case the exact significance of the title of a German count, illustrated by the above, is increased by the fact that the title is generally heritable by all male descendants, the only exception being in Prussia, where, after 1840, the rule of primogeniture prevailed and the bestowal of the title was dependent on a rent-roll of £3,000 a year. The result is that the title is very widespread and in itself little significant. The style *Altgraf* (old count), occasionally found, is of some antiquity, and means that the title of count has been borne by the family from time immemorial.

In mediaeval France the significance of the title of count varied with the power of those who bore it; in modern France it varies with its historical associations. It is not so common as in Germany or Italy; because it does not by custom pass to all male descendants. The title was, however, cheapened by its revival under Napoleon. By the decree of March 1, 1808, reviving titles of nobility, that of count was assigned *ex officio* to ministers, senators and life councillors of state, to the president of the Corps Législatif and to archbishops. The title was made heritable in order of primogeniture, and in the case of archbishops through their nephews. These Napoleonic countships, increased under subsequent reigns, have produced a plentiful crop of titles of little social significance, and have tended to lower the status of the counts deriving from the *ancien régime*. The title of marquis, which Napoleon did not revive, has risen proportionately in the estimation of the Faubourg St. Germain. As for that of count, it is safe to say that in France its social value is solely dependent on its historical associations.

Of all European countries Italy has been most prolific of counts. Every Italian prince, from the pope downwards, created them for love or money; and, in the absence of any regulating authority, the title was also widely and loosely assumed, while often the feudal title passed with the sale of the estate to which it was attached. Casanova remarked that in some Italian cities all the nobles were *baroni*, in others all were *conti*. An Italian *conte* may or may not be a gentleman; he has long ceased, *qua* count, to have any social prestige, and his rank is not recognized by the Italian government. As in France, however, there are some Italian *conti* whose titles are respectable, and even illustrious, from their historic associations. The prestige belongs, however, not to the title but to the name. As for the papal countships, which are still freely bestowed on those of all nations whom the holy see wishes to reward, their prestige naturally varies with the religious complexion of the country in which the titles are borne. They are esteemed by the faithful, but have small significance for those outside. In Spain, on the other hand, the title of *conde,* the earlier history of which follows much the same development as in France, is still of much social value, mainly owing to the fact that the rule of primogeniture exists, and that, a large fee being payable to the state on succession to a title, it is necessarily associated with some degree of wealth. The Spanish counts of old creation, some of whom are grandees and members of the upper house, naturally take the highest rank; but the title, still bestowed for eminent public services or other reasons, is of value. The title, like others in Spain, can pass through an heiress to her husband. In Russia the title of count (*graf,* fem. *grafinya*), a foreign importation, had little social prestige attached to it, being given to officials of a certain rank. In the British empire the only recognized counts are those of Malta, who are given precedence with baronets of the United Kingdom.

Luchaire, *Manuel des institutions françaises* (1892); Brunner, *Deutsche Rechtsgeschichte,* Band ii. (Leipzig, 1892); P. Guilhiermoz, *Essai sur l'origine de la noblesse en France au moyen âge* (1902).

COUNTERFEIT MONEY. The imitation of money for gain has been practised by unscrupulous persons ever since representatives of value supplanted material of value such as food, clothing and other articles used in simple barter.

The constitution of the United States expressly provides in Section 8, paragraph 6, that "The Congress shall have power to provide for the punishment of counterfeiting the securities and current coin of the United States." The federal agency charged with the suppression of counterfeiting in the United States is the United States secret service, a division of the treasury department, which was established July 5, 1865. (*See* SECRET SERVICE, U.S.)

Records of amounts of counterfeit money seized during those early years are not available, but for the year ended June 30, 1876, the representative value of counterfeit coins and bills captured by the secret service approximated $232,000. At that time the government and the people themselves were handicapped in the suppression of counterfeiting because of the great number of national banks on which notes were issued, and the variations in the engraved designs. New notes placed in circulation were quickly counterfeited before the public became acquainted with the appearance of the genuine, and when counterfeits drawn on one national bank began to be widely detected, the counterfeiters would circulate new issues under the name of some other bank.

Crime Prevention Through Education.—During the four peak fiscal years 1933 to 1936, inclusive, victims of passers of counterfeit notes in the United States lost an average of $771,000 yearly. Although banks were all warned to be on the alert for certain dangerous counterfeit bills, there was no concerted effort to warn retail merchants or others about such counterfeits, and the general policy of the secret service with regard to counterfeiting was one of secrecy, since it was feared that alarms about extensive circulation of counterfeits would tend to shake the faith of some of the people in the currency of their country.

In 1937, when Henry Morgenthau, Jr., appointed Frank J. Wilson as chief of the secret service, the secretary requested that strenuous efforts be made to reduce to a minimum the losses suffered by victims of counterfeiters. As a departure from the age-old methods of investigation, prosecution and imprisonment, Chief Wilson decided to fight the crime of counterfeiting by teaching the public how to detect bogus money. In a trial of this idea, the secret service printed and distributed to banks and retail stores hundreds of thousands of warning circulars bearing descriptions of counterfeit bills currently in circulation. These warning notices bore diagrams showing the denomination and type of the counterfeit described, the particular defects to aid in checking a suspected bill and directed attention to the "check letter" and "face plate number" appearing in the lower right corner of the face of the bill.

As has already been stated, the average yearly losses suffered by victims of counterfeiters from 1933 to 1936 were $771,000. For the fiscal year 1937 these losses were reduced to $519,366, and it was evident that the dissemination of the secret service descriptive warnings had had some good effect. Chief Wilson decided to pursue his idea further and early in 1938 sent a picked group of secret service agents to New York city, where they made a door-to-door canvass of some 100,000 retail stores and taught merchants and employees how to tell the difference between good and bad money. For the fiscal year 1938, losses to victims of counterfeiters fell to $407,320.

In 1938–39, secret service agents began a series of instructive lectures to retailers, bankers and others in all parts of the country. For the fiscal year ended June 30, 1939, counterfeiting losses had dropped to $294,057, and the secret service decided to intensify its efforts. Late in 1939 the secret service began a campaign against the counterfeiter, under the slogan "Know Your Money." Secret service agents produced a sound motion picture entitled *Know Your Money,* which graphically portrayed methods of detecting counterfeit bills and coins and the *modus operandi* of passers of counterfeit bills. The federal laws prohibit the photographing of United States money in whole or in part, but Henry Morgenthau, Jr., secretary of the treasury, granted special permission to the secret service to film genuine and counterfeit bills and portions thereof, for this educational campaign.

To supplement the motion picture, the secret service produced millions of copies of a four-page leaflet telling how to detect counterfeit money, and arranged to give one leaflet to every person who saw the picture, and to distribute copies to banks and business houses for their information and protection. More millions of the pamphlets were reprinted by banks and stores for distribution to their customers.

For the fiscal year 1940, counterfeiters' victims lost only $145,644, and the secret service decided to make its campaign a long-range program of crime prevention through education, with a three-fold purpose: (1) to remove from the youth of the country the temptation to engage in "easy money" criminal careers through counterfeiting; (2) to bring to a minimum the losses suffered by victims of counterfeit money, and (3) to reduce the load carried by the American taxpayer by decreasing the public costs for court trials, prosecutions and imprisonments, including the maintenance of offenders while confined in penal institutions.

In Sept. 1940 the secret service produced a 32-page *Know Your Money* booklet, illustrated with pictures of counterfeit bills, and telling in detail how to detect bogus notes and coins. Having

in mind its first objective of removing temptation from the youth of the country to engage in criminal careers, the service inaugurated efforts to have this booklet adopted by high schools in all parts of the country as a part of their regular curricula. This was a productive effort, and by 1942 many schools were instructing their students in the detection of counterfeit money.

With the crime prevention program in full swing, the victims of counterfeit note passers lost only $48,000 during the fiscal year ended June 30, 1942—an impressive drop of 93% compared with the 1933–36 yearly average.

How to Detect Counterfeit Bills.—Years of experience have proved to the secret service that the best detector of counterfeit money is the properly trained human eye. The person who is best able to see the difference between the bogus bill and one that is genuine must know just what a genuine bill looks like. The only way such knowledge can be gained is through a careful examination of all parts of a genuine bill, and it is such a study that is advocated by the secret service to help Americans defend themselves against the counterfeiter.

The average individual can and does look at a bill without really seeing it. He does not realize that genuine United States paper money is produced by the combined efforts of several craftsmen, all masters of their respective types of work. The plate from which good bills are printed is not made by one man. At the bureau of engraving and printing in Washington, D.C., where paper money is produced, one engraver makes the portrait, one engraves the denominational numerals, one does the lettering, and so on. After each engraver completes the work assigned to him the individual impressions are transferred to a steel roll or die in their proper places, until the entire impression of the note is complete. The roll is then hardened and under heavy pressure is used to roll the complete impression on a flat plate, preparatory to printing. Since each engraver is a master at his particular type of work, the finished plate represents the very finest example of the engraver's art, far beyond the ability of a counterfeiter to reproduce accurately.

The logical point raised by persons who are interested in acquiring a knowledge of money is that they do not know what should be studied. The answer is simple—they should study all parts of any genuine bill. The portion most difficult of good reproduction is the portrait on the face of every note. The portraits of famous Americans on United States paper money identify the denominations of the bills on which they appear, as follows:

$1	Washington
$2	Jefferson
$5	Lincoln
$10	Hamilton
$20	Jackson
$50	Grant
$100	Franklin
$500	McKinley
$1,000	Cleveland
$5,000	Madison
$10,000	Chase

The genuine portraits are lifelike and distinct, and the shading which characterizes the facial features consists of numerous delicately executed dots and dashes. The oval background surrounding each portrait comprises a series of tiny squares, formed by the crossing of very fine vertical and horizontal lines. On most counterfeits, the portraits are defective in the shading in the face, and many of the little squares in the background are filled with ink or are flecked with white where the vertical and horizontal lines are broken (Pl., figs. 1, 2). In the genuine portrait, the eyes are always clear and expressive, but in most counterfeits they are dull, distorted or otherwise executed so that they do not compare favourably with the genuine (Pl., figs. 3, 4).

These differences alone between the genuine and counterfeit portraits prompt the secret service advice to the individual to compare any questionable bill with another of the same type known to be genuine. Such a comparison will make evident any differences between the two to such an extent that if one is a counterfeit it can be classified as such.

As of 1942 there were only three types of currency issued by the United States—(1) silver certificates, (2) United States notes and (3) federal reserve notes. Part of the design of every genuine bill includes the treasury seal, a small circle edged with sharp points like the teeth of a saw, enclosing an angle square under which is a key and over which is a balance scale, all mounted upon a dotted white shield within the circle. Surrounding the design are the Latin words *Thesaur. Amer. Septent. Sigil.*, representing the "Seal of the Treasury of North America." On silver certificates, the seal and the serial numbers are printed in blue; on United States notes they are in red, and on federal reserve notes, in green. Thus, the type of any bill may be quickly determined merely by the colour of the treasury seal and the serial numbers. In addition, the words "Silver Certificate," "United States Note," or "Federal Reserve Note," as the case may be, are engraved at the top centre of the face of a bill.

On many counterfeits, the sharp points around the outer edge of the treasury seal are blunt or broken. Here again, a comparison of the seal on a questionable bill with the seal on a genuine bill will show the difference (Pl., figs. 7, 8).

The serial numbers on genuine United States paper money are printed in a distinctive type style, and numbering blocks of the kind used for this purpose cannot be obtained except by the bureau of engraving and printing. Therefore, in producing a counterfeit, the counterfeiter must either use numbers unlike the genuine, or must try to copy the genuine numerals. In the first instance a comparison will show the difference in the style, and in the second instance the copies or imitated numbers are usually poorly spaced or crookedly aligned, so that a comparison will indicate they are not authentic.

The border design of every genuine bill includes an intricate lace-like network of fine white lines. The patterns for these lines are produced by a machine known as a geometric lathe, and the lines are technically called geometric lathework. In a genuine bill these lines are clear and unbroken, but on most bogus notes the border is too dark because many of the spaces between the lines are filled with black ink due to inferior etching, or perhaps too light because the white lines are thicker than the genuine, creating a bleached appearance (Pl., figs. 5, 6).

It is believed by some that rubbing a bill on a piece of paper will prove whether it is genuine or counterfeit, through removal of the colour. This is definitely a fallacy, because the ink can be rubbed from a good bill as well as a bad one.

How to Detect Counterfeit Coins.—The manufacture of spurious coins does not involve losses as great as those suffered by victims of counterfeit bills. This is due, of course, to the fact that there is a wide margin of difference between the value of metal money and the representative value of paper money.

The passer of counterfeit coins depends upon the carelessness of his victims in the same way as does the passer of counterfeit bills. Genuine silver coins have a corrugated outer edge, known as the reeding. Consisting of evenly spaced ridges, this feature was included on silver coins originally to prevent unscrupulous persons from cutting or filing from the edges of the coins small bits of silver, which they would then sell for the intrinsic value of the metal so derived. Later, however, the reeded edges of silver coins formed considerable protection against counterfeiting, since the corrugations on most bogus coins are only partially executed, or unevenly spaced, or entirely missing in places. Thus, a comparison of a questionable coin with one known to be genuine, or even a careful scrutiny of the ridges around a questionable coin, will usually indicate whether it is good or bad (Pl., fig. 9).

Most counterfeit coins are made of metal alloy which does not ring as clearly as genuine coins when dropped on a hard surface, and which is usually much softer than silver. Therefore, questionable coins should be dropped on a hard surface to test their ring, and should be cut with a knife to test their quality. If a coin sounds dull or is easily cut, it is undoubtedly a counterfeit.

It is also a fact that most counterfeit coins feel greasy, so it is wise to feel all coins, and if one feels slippery or greasy it should be further examined for defects in the reeding or other characteristics.

Bogus silver coins may be detected with a mixture of ingredients in a liquid solution, the formula for which is as follows:

Nitrate of silver	10 grains
Nitric acid	1 c.c.
Distilled water	30 c.c.

This "silver test" may be obtained for a few cents in any drug store. A drop applied to a counterfeit coin which does not have a high silver content will turn black. The solution will not discolour a genuine silver coin, and will not react on a counterfeit coin which is made of silver, or which contains a great deal of silver, but since most counterfeits are made of base metal the acid will detect them. It cannot be used to detect counterfeit nickels, or gold coins.

Stamps.—Secret service agents have arrested makers and users of counterfeit United States internal revenue tax stamps, which were usually affixed to bottles of taxable alcoholic beverages in an effort to evade the required tax payments. Such counterfeiting is now negligible, but the stamps described are issued by the government and are protected by the laws which provide for the suppression of counterfeit money.

The secret service, in co-operation with post office inspectors, has also captured plants for the manufacture of counterfeit United States war savings stamps and postage stamps, but this type of counterfeiting is somewhat unusual and has never been very extensive.

If You Receive Counterfeit Money:

1. Do not return it.
2. Notify police at once.
3. Try to delay the passer under some natural excuse.
4. Avoid argument. If necessary, say the police will handle the matter.
5. If the passer leaves, write down his description.
6. Write down the licence number of any automobile used by the passer or his accomplices.

Confiscation of Counterfeits.—The federal laws for the protection of obligations of the United States provide that anyone having custody or control of any counterfeits of such obligations who shall fail or refuse to surrender them to an authorized agent of the treasury department, shall be fined not more than $100, or imprisoned not more than one year, or both. All banking institutions are authorized agents of the treasury department within the meaning of this statute, and as such are legally authorized to confiscate counterfeit money from their customers or other persons who present it.

Penalties For Counterfeiting.—Counterfeiting is a felony. The laws of the United States provide that any person who has knowledge of the commission of a felony recognized by the federal courts, and who does not at once make such knowledge known to the authorities, shall be fined not more than $500, or imprisoned not more than three years, or both. Therefore, one who has any knowledge of counterfeiting activities should, for his own protection, promptly report such knowledge to the secret service. (Section 286, title 18, U.S. code.)

The manufacture or passing of counterfeit bills is punishable by a fine of not more than $5,000 and imprisonment not to exceed 15 years. (Sections 264 and 265, title 18, U.S. code.)

The punishment for the manufacture or possession of dies or moulds for counterfeit coins is a maximum fine of $5,000 and imprisonment for not more than ten years. (Section 283, title 18, U.S. code.)

(F. J. W.)

Great Britain.—The statute law against offenses relating to the coin was codified by the Coinage Offenses act, 1861 (England) which provides that whoever falsely makes or counterfeits any coin resembling or apparently intended to resemble or pass for any current gold or silver coin of the realm, or gilds, silvers, washes, cases over or colours with materials capable of producing the appearance of gold or silver a coin or a piece of any metal or mixture of metals, or files or alters it, with intent to make it resemble or pass for any current gold or silver coin, or who buys, sells, receives or pays a false gold or silver coin at a lower rate than its denomination imports, or who receives into Great Britain any false coin knowing it to be counterfeit, or who, without lawful authority or excuse, knowingly makes or mends, buys or sells, or has in his custody or possession, or conveys out of the royal mint any coining moulds, machines or tools, is guilty of felony. The punishment for such offenses is either penal servitude for life or for not less than three years, or imprisonment for not more than two years, with or without hard labour. Whoever impairs, diminishes or lightens current gold or silver coin, with intent to pass same, is liable to penal servitude for 14 years, and whoever has in his possession filings or clippings obtained by impairing or lightening current coin is liable to penal servitude for seven years. The statute also makes provision against tendering or uttering false gold or silver coin, which is a misdemeanour, punishable by imprisonment with or without hard labour. Provision is also made with respect to falsely making, counterfeiting, tendering or uttering copper coin, exporting false coin, or defacing current coin by stamping names or words on it, and counterfeiting, tendering or uttering coin resembling or meant to pass as that of some foreign state. The act of 1861 applies to offenses with respect to colonial coins as well as to those of Great Britain. Making or selling medals or coins resembling current coin is made a misdemeanour by the Counterfeit Medal act, 1883.

COUNTERFORT. A form of buttress used for the strengthening of walls of mediaeval fortifications. It was found that with the introduction of cannon as siege weapons in the 15th century, the ordinary types of masonry walls backed with earth were not sufficiently strong to stand battering by artillery. They were therefore strengthened with buttresses or counterforts from the inside of the wall. Later the counterfort often took the form of an arched gallery, built behind the wall under the rampart. (*See* further FORTIFICATION AND SIEGECRAFT.)

COUNTER-GUARD. An outwork of a system of fortifications built in front of the face of a bastion or ravelin to protect it from breaching fire (Fr. Contre-garde). A counter-guard usually consisted of a V-shaped work with two ramparts meeting at an angle and an open gorge. (*See* further FORTIFICATION AND SIEGECRAFT.)

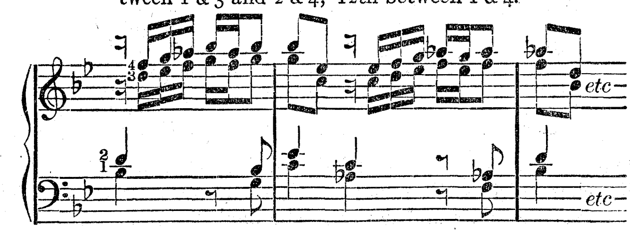
COUNTERPOINT, in music, the art defined by Sir Frederick Gore Ouseley as that of "combining" melodies (Lat. *contrapunctus,* "point counter point," "note against note"). This neat definition is not quite complete. Classical counterpoint is the conveying of a mass of harmony by means of a combination of melodies. Thus the three melodies combined by Wagner in the *Meistersinger* prelude do not make classical counterpoint, for they require a mass of accompanying harmony to explain them. That accompaniment explains them perfectly and thereby proves itself to be classical counterpoint, for its virtue lies in its own good melodic lines, both where these coincide with the main melodies and where they diverge from them. From this it will be seen that current criticism is always at fault when it worries as to whether the melodies are individually audible in a good piece of counterpoint.

What is always important is the peculiar life breathed into harmony by contrapuntal organization. Both historically and aesthetically "counterpoint" and "harmony" are inextricably blended; for nearly every harmonic fact is in its origin a phenomenon of counterpoint. Instrumental music develops harmony in unanalyzed lumps, as painting obliterates draughtsmanship in

I. *Double Counterpoint in the 8ve, 10th and 12th*

(a) BACH. *Das Wohltemperirte Klavier* II 16.

(b) Combination of all inversions; 8ve between 2 & 3; 10th between 1 & 3 and 2 & 4; 12th between 1 & 4.



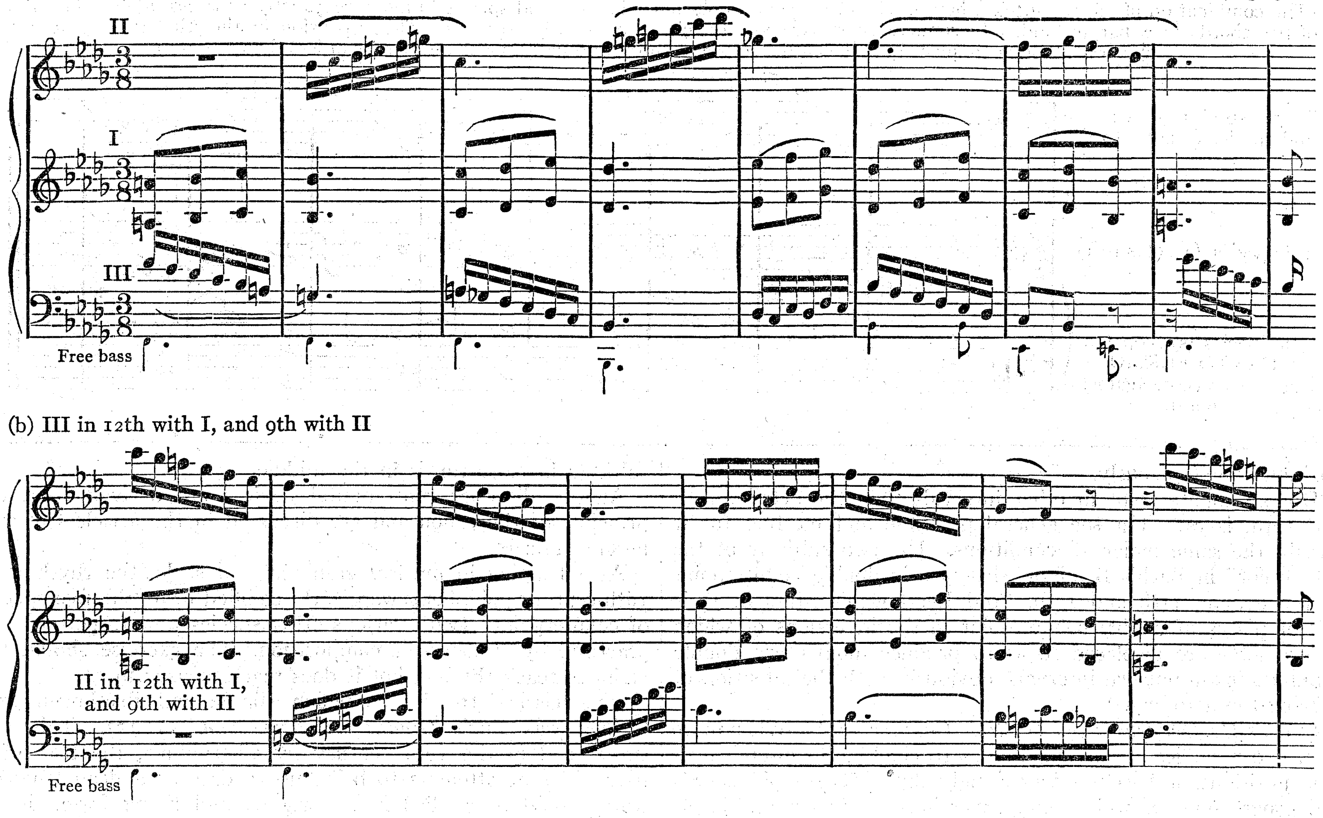
masses of colours; but the underlying concepts of counterpoint and draughtsmanship remain.

In so far as the laws of counterpoint are derived from harmonic principles—that is to say, derived from the properties of concord and discord—their origin and development are discussed in the article HARMONY. In so far as they depend entirely on melody they are too minute and changeable to admit of general discussion; and in so far as they show the interaction of melodic and harmonic principles it is more convenient to discuss them under the head of harmony. All that remains, then, for the present article is the explanation of certain technical terms.

(1) *Canto Fermo* (*i.e.,* plain chant) is a melody in long notes given to one voice while others accompany it with quicker counter-

II. *Triple Counterpoint in the 12th and incidentally the 9th*

(a) BRAHMS, op. 56



points (the term "counterpoint" in this connection meaning accompanying melodies). In the simplest cases the canto fermo has notes of equal length and is unbroken in flow. When it is broken up and its rhythm diversified, the gradations between counterpoint on a canto fermo and ordinary forms of polyphony, or indeed any kind of melody with an elaborate accompaniment, are infinite and insensible.

(2) *Double Counterpoint* is a combination of melodies so designed that either can be taken above or below the other. When this change of position is effected by merely altering the octave of either or both melodies (with or without transposition of the whole combination to another key), the artistic value of the device is simply that of the raising of the lower melody to the surface. The harmonic scheme remains the same, except in so far as some of the chords are not in their fundamental positions, while others, not originally fundamental, have become so. But double counterpoint may be in other intervals than the octave; that is to say, while one of the parts remains stationary, the other may be transposed above or below it by some other interval, thus producing an entirely different set of harmonies.

Double Counterpoint in the 12th has thus been made a powerful means of expression and variety. The artistic value of this device depends not only on the beauty and novelty of the second scheme of harmony obtained, but also on the change of melodic expression produced by transferring one of the melodies to another position in the scale. Two of the most striking illustrations of this effect are to be found in the last chorus of Brahms's *Triumphlied* and in the fourth of his variations on a theme of Haydn. Inversion in the 12th also changes the concord of the 6th into the discord of the 7th; a property used with powerful effect by Bach in Fugue 16 of Bk. II. of *Das Wohltemperirte Clavier*.

Double Counterpoint in the 10th has the property that the inverted melody can be given in the new and in the original

III. *Quintuple Counterpoint; capable of 120 permutations.*

(a) MOZART. Finale of "Jupiter" Symphony

IV. *Scholastic Exercise in the Five Species of Counterpoint.*

(The combination of all five species, here used to save space, does not allow the 2nd species to move conjunctly as is desirable. The use of two chords in a bar, forbidden by some teachers, is good if the chords are clearly expressed. The suspension in the 7th bar (4–3 over a $^6_4$ chord), though frequent in 16th century music, is considered licentious in an exercise of less than 6 parts.)

positions simultaneously.

Double counterpoint in other intervals than the octave, 10th and 12th, is rare, but the general principle and motives for it remain the same under all conditions. The two subjects of the "Confiteor" in Bach's B minor Mass are in double counterpoint in the octave, 11th and 13th. And Beethoven's Mass in D is full of pieces of double counterpoint in the inversions of which a few notes are displaced so as to produce momentary double counterpoint in unusual intervals, obviously with the intention of varying the harmony.

(3) *Triple, Quadruple and Multiple Counterpoint.*—When more than two melodies are designed so as to combine in interchangeable positions, it becomes increasingly difficult to avoid chords and progressions of which some inversions are incorrect. Triple counterpoint is normally possible only at the octave; for it will be found that if three parts are designed to invert in some other interval this will involve two of them inverting in a third interval which will give rise to incalculable difficulty. This makes the fourth of Brahms's variations on a theme of Haydn appear almost miraculous. The whole variation beautifully illustrates the melodic expression of inversion at the 12th; and during eight bars of the second section a third contrapuntal voice appears, which is afterwards inverted in the 12th, with natural and smooth effect. But this involves the inversion of two of the counterpoints with each other in the almost impracticable double counterpoint in the 9th. Brahms probably did not figure this out at all but profited by the luck which goes with genius.

Quadruple Counterpoint is not rare with Bach; and the melodically invertible combination intended by him in the unfinished fugue at the end of "Die Kunst der Fuge" requires one of its themes to invert in the 12th as against the others. (*See* D. F. Tovey's edition published by the Oxford University Press.)

Quintuple Counterpoint is admirably illustrated in the finale of Mozart's "Jupiter symphony," in which everything in the successive statement and gradual development of the five themes conspires to give the utmost effect to their combination in the coda. Of course Mozart has not room for more than five of the 120 possible combinations, and from these he, like all the great contrapuntists, selects such as bring fresh themes into the outside parts, which are the most clearly audible.

Sextuple Counterpoint may be found in Bach's great double chorus, "Nun ist das Heil," in the finale of his concerto for three claviers in C, and probably in other places.

(4) *Added Thirds and Sixths.*—This is merely the full working out of the sole purpose of double counterpoint in the 10th, namely, the possibility of performing it in its original and inverted positions simultaneously. The "Pleni sunt coeli" of Bach's "B minor Mass" is written in this kind of transformation of double into quadruple counterpoint; and the artistic value of the device is perhaps never so magnificently realized as in the place, at bar 84, where the trumpet doubles the bass three octaves and a third above while the alto and second tenor have the counter subjects in close thirds in the middle.

Almost all other contrapuntal devices are derived from the principle of the canon and are discussed in the article CONTRAPUNTAL FORMS.

As a training in musical grammar and style, the rhythms of 16th-century polyphony were early codified into "the five species of counterpoint" (with various other species now forgotten) and practised by students of composition. The exercise should not claim to teach rhythm, but it does teach measurement.

The classical treatise on which Haydn and Beethoven were trained was Fux's *Gradus ad Parnassum* (1725). This was superseded in the 19th century by Cherubini's, the first of a long series of attempts to bring up to date as a dead language what should be studied in its original and living form. R. O. Morris has thoroughly exposed the humbug and illustrated the true severe scholarship in *Contrapuntal Technique in the 16th Century* (Oxford University Press). (D. F. T.)

COUNTERPOISE, in wireless, a system of wires or other conductors in a radio circuit, forming the lower capacity area of an antenna of the condenser type (*see* ANTENNA). The counterpoise conductors are elevated above and insulated from the ground and are substantially as extensive as the aerial.

COUNTERSCARP (="opposite scarp," Fr. *contrescarpe*) a term used in fortification for the outer slope of a ditch; *see* FORTIFICATION and SIEGECRAFT.

COUNTERSIGN, a military term for a sign, word or signal previously arranged and required to be given by persons approaching a sentry, guard or other post as a means of establishing that they are not hostile or unauthorized. In some armies the "countersign" is strictly the reply of the sentry to the password given by the person approaching.

COUNTERVAILING DUTIES. The underlying idea of a countervailing duty is one which is imposed for the purpose of setting off or compensating some other duty. The form in which it was first used was that of a duty imposed on goods imported into the country, where similar goods produced in the country had to pay an excise or other inland revenue duty, the idea being to put the producers of the home-made goods on exactly the same footing as the importers of the foreign goods. The idea was so carefully applied that the amount of the import duty was not necessarily exactly the same as the amount of the inland duty. Thus while spirits made in Britain were charged 10/6d. per proof gal., the duty on similar spirits imported was 10/10d., the extra 4d. being supposed to compensate the home producer for the loss and inconvenience caused to him by having to carry on his trade under the regulations of an excise duty, which interfered with the free conduct of the trade and resulted in additional expense. Under the commercial treaty with France in 1860 this additional duty was fixed at 2d.; it was later raised to 5d., and then reduced to 4d. (see 28th report, Commissioners of Inland Revenue), and after the War again raised to 2s.10d. Similar duties were imposed on imported articles containing spirits; but in the case of methylated spirits, which paid no duty but were manufactured under regulations, only the countervailing duty of 4d. was levied.

In all cases the idea was that the countervailing duty must be no more than just what was required to place the home producer on an exactly equal footing with the importer of the foreign goods.

The name of countervailing duty has also been applied where articles made in a country without duty were also imported from other countries where they were subject to some fiscal assistance; *e.g.,* in the form of a bounty. Thus when the Continental beet sugar system was found to result in a bounty to the producers, enabling them to send these bounty-fed sugars into Britain at less than cost, it was argued that such imported sugar should be subject to a countervailing duty in Britain in order to equalize their cost with that of the home-produced article. The World War stopped the British import of beet sugar, and since then the situation has been complicated by the imposition of war duties on sugar, and later by the adoption of a subsidy system on beet sugar grown in England, the subsidy amounting between 1931 and 1938 to £21,164,399.

From the close of the War, however, until the coming into force on March 1, 1932 of the Import Duties Act, 1932, as modified by the Ottawa Agreement, the entire absence in the British system of protective duties gave place to a policy under which they were regarded as a defensive measure justified by the abnormal conditions of post-war times. In this sense, the term "countervailing duties" sometimes included duties on imports intended as a set-off against the fact that the foreign producer was in some way more favourably placed than the home manufacturer; *e.g.* by the position of the foreign exchanges or the existence of a lower level of wages, or some other item in the cost of production.

Countervailing duties have also been levied to check the tendency of strongly organized industries to sell goods in foreign markets at rates below the price in the home market; as when in 1904 Canada levied a countervailing duty on steel rails imported from the United States.

COUNTRY, an extent of land, a region with some peculiar character, *e.g.,* the "black country," "fen country," etc. (Late Lat. *contrata,* a tract of land spread out to view in the foreground, from *contra,* opposite, over against); hence it came to mean the land inhabited by a particular nation or race. It is used, also, in the sense of land not occupied by large towns, whence such expressions as "country house," "country town," etc. The word appears in many phrases, in the sense of the whole population of a country, especially the general body of electors, as in the expression "go to the country," for the dissolution of Parliament preparatory to a general election.

COUNTRY DANCE, a popular English dance of earlier centuries, which gave its name in due course, though in a corrupted form, to the French *contredanse* and the German *contretanz.* In the matter of its steps and figures it seems to have varied greatly, being sometimes of the "round" character, sometimes "up and down," sometimes introducing "realistic" figures, and so on, while as regards its music equal latitude prevailed, so that it could be danced to almost any kind of popular air of a brisk character and well-marked rhythms. A well-known collection of such tunes is that contained in Playford's *English Dancing Master* (1651).

COUNTY, the Norman equivalent of the old English "shire" (*q.v.*), which has survived as its synonym, though occasionally also applied to divisions smaller than counties, *e.g.,* Norhamshire, Hexamshire and Hallamshire.

In the period preceding the Norman Conquest two officers appear at the head of the county organization. These are the ealdorman and the *scirgerefa* or sheriff (*q.v.*). The shires of Wessex appear each to have had an ealdorman, whose duties were to command its military forces, to preside over the county assembly (*scirgemot*), to carry out the laws and to execute justice. The ealdorman gave away to the earl, probably under Danish influence, in the first half of the 11th century, and it is probable that the office of sheriff came into existence in the reign of Canute (1017–35), when the great earldoms were formed and it was no longer possible for the earl to perform his various administrative duties in person in a group of counties. After the Norman Conquest the earl was occasionally appointed sheriff of his county, but in general his only official connection with it was to receive the third penny of its pleas, and the earldom ceased to be an office and became merely a title. In the 12th century the office of coroner (*q.v.*) was created, two or more of them being chosen in the county court as vacancies occurred. In the same century verderers were first chosen in the same manner for the purpose of holding inquisitions on vert and venison in those counties which contained royal forests. The county was from an early period regarded as a community, and approached the king as a corporate body, while in later times petitions were presented through the knights of the shire. It was also an organic whole for the purpose of the conservation of the peace. The assessment of taxation by commissioners appointed by the county court developed in the 13th century into the representation of the county by two knights of the shire elected by the county court to serve in parliament, and this representation continued unaltered save for a short period during the Protectorate, until 1832, when many of the counties received a much larger representation, which was still further increased by later Acts.

The royal control over the county was strengthened from the 14th century onward by the appointment of justices of the peace (*q.v.*). This system was further developed under the Tudors, while in the middle of the 16th century the military functions of the sheriff were handed over to a new officer, the lord-lieutenant, who is now more prominently associated with the headship of the county than is the sheriff. The lord-lieutenant now usually holds the older office of *custos rotulorum* (*q.v.*). The justices of the peace are appointed upon his nomination, and until lately he appointed the clerk of the peace. The latter appointment is now made by the joint committee of quarter sessions and county council. The Tudor system of local government received little alteration until the establishment of county councils by the Local Government Act of 1888 handed over to an elected body many of the functions previously exercised by the nominated justices of the peace. For the purposes of this Act the ridings of Yorkshire, the divisions of Lincolnshire, east and west Sussex, east and west Suffolk, the soke of Peterborough, London, the Isle of Ely and the Isle of Wight are counties, making 62 administrative counties of England and Wales. Between 1373 and 1692 the Crown granted to certain cities and boroughs the privilege of being counties of themselves. There were in 1835 eighteen of these counties corporate, Bristol, Chester, Coventry, Gloucester, Lincoln, Norwich, Nottingham, York and Carmarthen, each of which had two sheriffs, and Canterbury, Exeter, Hull, Lichfield, Newcastle-upon-Tyne, Poole, Southampton, Worcester and Haverfordwest, each of which had one sheriff. All these boroughs, with the exception of Carmarthen, Lichfield, Poole and Haverfordwest, which remain counties of themselves, and 47 others, were created county boroughs by the Local Government Act 1888, and are entirely dissociated from the control of a county council. The City of London is also a county of itself, whose two sheriffs are also sheriffs of Middlesex, while for the purposes of the Act of 1888 the house-covered district which extends for many miles round the City constitutes a county.

Chadwick, *Studies on Anglo-Saxon Institutions* (1905), and *The Victoria History of the Counties of England.* (G. J. T.)

COUNTY CLERK, in the United States, the chief clerical official of the county. He is elected by the qualified voters of the county for a term, provided by the State Constitution or statute, of two, three or four years. He is eligible for re-election. The county clerk acts as custodian of records of the county court and sometimes of the circuit and district courts for such terms as are held in the county for which he is chosen. He also acts as secretary of the county board of commissioners or supervisors and keeps minutes of their proceedings. In most States other than those of New England, he issues marriage, hunting and other licences, and in many he acts as recorder of legal instruments. The county clerk ordinarily has one or more deputies whom he appoints, often partly because of political work performed on his behalf. Occasionally his assistants are under civil service regulations.

See H. G. James, *Local Government in the United States* (1921).

COUNTY COURT, in England, a local court of civil jurisdiction. The county court, it has been said, is at once the most ancient and the most modern of English civil tribunals. The Saxon Curia Comitatus, maintained after the Norman Conquest, was a local court and a small debts court. It was instituted by Alfred the Great, its jurisdiction embracing civil, and, until the reign of William I., ecclesiastical matters. The officers of the court consisted of the earldorman, the bishop and the sheriff. The court was held once in every four weeks, being presided over by the earl, or, in his absence, the sheriff. The suitors of the court, *i.e.,* the freeholders, were the judges, the sheriff being simply a presiding officer, pronouncing and afterwards executing the judgment of the court. The court was not one of record. The appointment of judges of assize in the reign of Henry II., as well as the expensive and dilatory procedure of the court, brought about its gradual disuse. Accordingly, with the view of making justice cheaper and more accessible the County Courts Act 1846 was passed. This act had the modest title of "An Act for the Recovery of Small Debts and Demands in England." The original limit of the jurisdiction of the new courts was £20, extended in 1850 to £50 in actions of debt, and in 1903 (by an act which came into force in 1905) to £100. Thirteen amending acts were passed, which were consolidated with some amendments in the year 1888. This is now the code or charter of the county courts.

The grain of mustard-seed sown in 1846 has grown into a goodly tree, with branches extending over the whole of England and Wales; and they embrace within their ambit a more multifarious jurisdiction than is possessed by any other courts in the kingdom. England and Wales were mapped out into 59 circuits (not including the city of London).

Circuits are divided into districts, in each of which there is a court, with a registrar and bailiffs. The City of London court, though not strictly a county court, has the same jurisdiction (County Courts Act 1867 and §185 of the act of 1888) and constitutes the county court for the City of London. It was amalgamated with the mayor's court by the Mayor's and City of London Court Act 1920.

The ordinary jurisdiction of the county courts may be thus tabulated:—

Subject matter	*Pecuniary limit of jurisdiction*
Common-law actions, with written consent of both parties	Unlimited
Actions founded on contract (except for breach of promise of marriage, unless remitted from the High Court under S. 65)	£100
Actions founded on tort (except libel, slander, and seduction, unless remitted from the High Court under S. 65 or 66)	£100
Counter claims (unless plaintiff gives written notice of objection)	Unlimited
Ejectment or questions of title to realty . .	£100 annual value
Equity jurisdiction	£500
Probate jurisdiction	£200 personalty and £300 realty
Admiralty jurisdiction	£300
Bankruptcy jurisdiction	Unlimited
Replevin	Unlimited
Interpleader transferred from High Court . .	£500
Actions in contract transferred from High Court	£100
Actions in tort transferred from High Court .	Unlimited
Companies (winding up), when the paid-up capital does not exceed	£10,000

The above table is not by any means an exhaustive statement of the jurisdiction of the county courts. For many years it has been the practice of parliament to throw on the county court judges the duty of acting as judges or arbitrators for the purpose of new legislation relating to social subjects. A list of all the acts will be found in the *Yearly County Courts Practice*. A county court judge may determine all matters of fact as well as law, but either party may as a rule apply to have his case tried by jury. The number of jurymen is eight. There is an appeal from the county courts on matters of law to a divisional court of the High Court (*see* APPEAL). The County Courts Act of 1888 was amended by the Acts of 1903, 1919 and 1924.

In all of the States in the United States, there is a county court, which however, in some jurisdictions, such as Pennsylvania, is called the district court. Generally it is known as the county court. In many cases it is a court of general original jurisdiction, but in others it is limited as to the amount in civil cases, and to misdemeanours in criminal cases. The judge ordinarily is elected by the voters of the county.

See *County Courts Practice* (annual); also Sir T. W. Snagge, "Fifty Years of the English County Courts," in *Nineteenth Century,* Oct. 1897.

COUNTY FARM, POOR FARM, COUNTY HOME, POOR HOUSE or **ALMSHOUSE** are public institutions maintained as shelters for the aged poor. "Almshouse" is generally used as the generic term covering these institutions. Though in name almshouse means a shelter for the aged poor, the inmates are, in many States, a heterogeneous group of insane, feeble-minded, epileptics, blind, deaf-mutes, orphans, and deserted children as well as the aged poor. In 1923 there were 2,183 publicly owned almshouses with a population of 78,090 persons. There is no comparable data since that date. The almshouse is the oldest public welfare institution in America, the theory of institutional relief having been incorporated into the constitution of several of the early States, particularly in New England. As of 1929 there were almshouses in every State except one. Responsibility for the administration of almshouse care rested with the county in most States, though in New England control was vested in the town. The growth of almshouses, and later the institutions designed to care for special groups of dependents, gave rise to State supervisory agencies, forerunners of the modern State public welfare departments. These State agencies, however, had little actual authority and their rights were generally limited to inspection and recommendation, with administrative responsibility remaining nearly exclusively local. In general, almshouses operated under two systems: (1) direct management by local officials; (2) contract system. Under the first system which controlled the majority of the institutions, a superintendent was employed at a specified salary to manage the almshouse. The farm produce belonged to the institution, and the proceeds of any unused surplus reverted to the local treasury or to the almshouse. Under the contract system, the farm and almshouse were leased to an operator for the care of the poor, while the proceeds of any unused surplus produce reverted to the lessee.

There have been few changes since 1929, save that in some instances State supervision over almshouse administration has been strengthened. In general, however, there has been no significant alteration in the number, population, administration or function of almshouses. Public attention, focused for a period on almshouse problems following a study of the cost of almshouses made in 1923 by the U.S. Department of Labor, shifted soon after that date to the more urgent problems of unemployment relief and programs of outdoor assistance which have entirely overshadowed almshouse care. It was thought that the introduction of the old age assistance program might reduce the number of almshouses and their population, but this has not markedly occurred. The increasing use of almshouses to provide medical and nursing care for the chronically ill and destitute, and the consolidation in some States of almshouses into institutions providing such care and serving a wider area, are recent trends. *See* POOR LAW: *U.S.*

Labor Statistics, *Bul.* No. 386 (Washington, 1925); Harry C. Evans, *The American Poorfarm and Its Inmates* (Mooseheart, 1926); Helen G. Tyson, "Homes and Almshouses," *Social Work Year Book* (1939). (H. Fs.)

COUP D'ÉTAT, a French phrase denoting a sudden and violent action by which power is seized by a member or section of a dominant class or party, in defiance of the constitution of the country. The *coup d'état* of Nov. 9, 1799 (18 *Brumaire*), when Napoleon (*q.v.*) overthrew the Directory and became First Consul, and that of Dec. 2, 1851, when Louis Napoleon (*see* NAPOLEON III.) dissolved the Assembly of the Second Republic, are famous instances in French history. Cromwell's forcible dissolution of the Long Parliament (April 20, 1653) is a comparable example in English history.

COUPÉ, a small closed carriage of the brougham type, with four wheels and seats for two persons; the term is also used of the front compartment on a *diligence* or mail-coach on the continent of Europe, and of a compartment in a railway carriage with seats on one side only. In the United States the name is used to designate a type of automobile having one fixed cross seat in an enclosed single-compartment body. Two or three persons can be accommodated in the main seat, and often additional passengers may be accommodated in an open "rumble-seat" in the rear, or in an auxiliary seat behind the driver in the closed compartment. Two doors, one on each side, with movable glass windows, a permanent roof and a rear-end luggage compartment make up the conventional body of the coupé. Among variations is the cabriolet, the chief distinguishing feature of which is a folding top of canvas or similar material.

COUPERIN, FRANÇOIS (1668–1733), French composer, was the most famous member of a family of musicians which may be traced from the generation born in 1626 to the death of Mlle. Céleste Couperin, organist at St. Gervais, 1850.

François Couperin (dubbed "le grand") is the chief of the many French clavecinists whose ranks include a greater composer, Rameau (*q.v.*). The clavecin works and chamber-music of Couperin have earned the reward of an art which, undertaking to satisfy natural desires, sets itself the narrowest possible limits and within these limits finishes its work to the utmost perfection. The natural desires which Couperin satisfies are those for melody and beautiful playing; the limits he sets himself are those of self-repeating four-bar and eight-bar tunes; and the perfection of the music is translated to sight by the exquisite engraving of the first edition of his four books of *Pièces de Clavecin* of which the proof-reading of the first book occupied him a whole year. Bach's admiration for Couperin is shown in his frequent use of the cross-rhythmed French Courante which occurs as often in his suites as the easier Italian kinds. His rondo-form is Couperin's (*see* RONDO); and some of Couperin's rondos exist in Bach's handwriting, sometimes to the confusion of editors.

Couperin's chamber-music is written for combinations of soft instruments (*e.g.*, gamba instead of violoncellos) with harpsichord and it borrows freely from the *Pièces de Clavecin* or vice-versa. The fantastic titles of his pieces represent a prevailing fashion among French court composers and could probably be interpreted by infinite research as a mass of compliment and persiflage aimed at and around personages at court.

Couperin's treatise, *L'art de toucher le clavecin,* is disappointing. The *Pièces de Clavecin,* in spite of their frequent references "Voyez ma methode, p. 76" shed more light on the method than the method sheds on them. The career of Couperin was an uneventful affair of court appointments; he was 25 when he became *organist du roi* in 1693; and in 1717 he was *Ordinaire de la musique de la chambre du roi* till his death in 1733.

Brahms co-operated enthusiastically with Chrysander in a careful edition of all four books of the *Pièces de Clavecin,* with all the ornaments as Couperin (who left no detail to discretion or chance) wrote them. It is indispensable to musicians who wish to understand the harpsichord music of Bach's age. (D. F. T.)

COUPERUS, LOUIS (1863–1923), Dutch writer, was born at The Hague. His life as a boy was spent in the Dutch East Indies, where his father was a prominent government official. His first novel *Eline Vere,* written under the influence of Tolstoy, appeared in 1889, and was followed by *Noodlot* (*The Footsteps of Fate*) in 1894 and *Extaze,* the first of his novels to be translated into English (1892). He next produced some imaginative and idealistic works, such as *Majesteit* (1895) and several volumes of prose poems. The work by which he is best known to the English-speaking world is the series of "Books of the Small Souls," four novels entitled *Die Kleine Zielen* (*The Small Souls*), *Het Late Leven* (*The Later Life*), *Zielen-schemering* (*The Twilight of the Soul*), *Het Helge Weten* (Eng. version *Dr. Adriaan*), which together with *Van Oude Menschen, de dingen de voorbijgaan* (*Old People and the Things that Pass*, Eng. version, 1919) raised him to the first rank of European novelists. Couperus travelled much in Greece and Italy and embodied his classical researches in historical romances such as *De Berg van Licht* (*The Mountain of Light*), *De Komedianten* (*The Comedian*) and mythological romances such as *Dionyzos* (1905) and *Herakles* (1913), as well as volumes of essays, sketches and short stories. The greater part of his work has been rendered into English by A. Teixeira de Mattos. His historical novel *Iskander* (concerning Alexander the Great) appeared in 1920. He died at De Steeg, near Arnhem, Holland, July 16, 1923.

COUPLE, a tie, ligament, a pair, in buildings a principal rafter, a chevron. In mechanics (*q.v.*) two parallel forces equal in intensity but opposite in direction acting at different points in a body constitute a *couple.*

COUPLER, in a radio circuit, an apparatus used to transfer radio-frequency power from one circuit to another, by associating together portions of these circuits. Couplers are of three types, inductive, capacitive and resistance.

COUPLET, a pair of lines of verse, which are welded together by an identity of rhyme. In rhymed verse two lines which complete a meaning in themselves are particularly known as a couplet. Thus, in Pope's *Eloisa to Abelard*:—

> Speed the soft intercourse from soul to soul,
> And waft a sigh from Indus to the Pole.

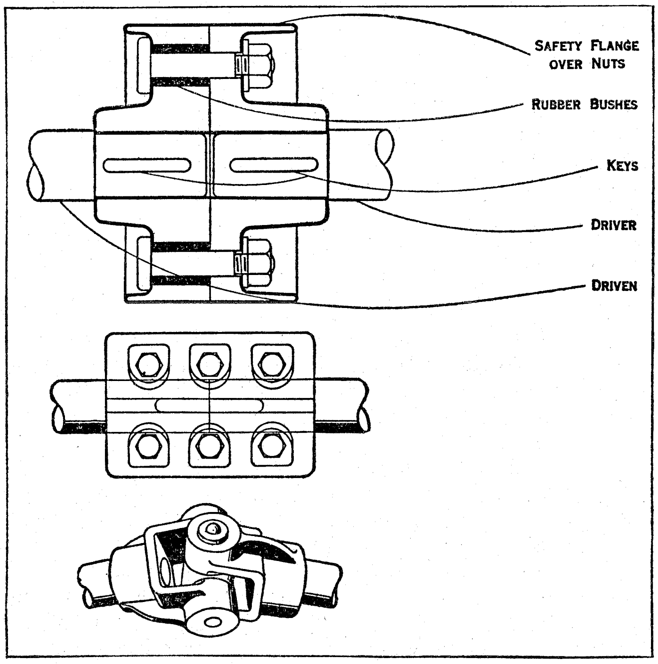
In French literature, the term couplet is not confined to a pair of lines, but is commonly used for a stanza. A "square" couplet in French, for instance, is a strophe of eight lines, each composed of eight syllables. In this sense it is employed to distinguish the more emphatic parts of a species of verse which is essentially gay, graceful and frivolous, such as the songs in a vaudeville or a comic opera. In the 18th century, Le Sage, Piron and even Voltaire did not hesitate to engage their talents on the production of couplets, which were often witty, if they had no other merit, and were well fitted to catch the popular ear. This signification of the word *couplet* is not unknown in England, but it is not customary; it is probably used in a stricter and a more technical sense to describe a pair of rhymed lines, whether serious or merry. The normal type, as it may almost be called, of English versification is the metre of ten-syllabled rhymed lines designated as *heroic couplet.* This form of iambic verse, with five beats to each line, is believed to have been invented by Chaucer, who employs it first in the Prologue *The Legend of Good Women,* the composition of which is attributed to the year 1385. That poem opens with the couplet:—

> A thousand times have I heard men tell
> That there is joy in heaven and pain in hell.

This is an absolutely correct example of the heroic couplet, which ultimately reached such majesty in the hands of Dryden and such brilliancy in those of Pope.

COUPLING. When lengths of shafting have to be joined up, in factories or ships, couplings are employed, as they are also to connect a prime mover to a machine. Usually the coupling connection is permanent; if frequent disconnections are required, a clutch has preference. Flange couplings are the most often used, the end of the shaft being forged into a flange, or a flange being keyed on and united to a companion one by bolts. Split muff couplings fit over each end of the shaft and are contracted by bolts, while the split compression type is also quick to apply and remove, being tightened by three bolts. These draw hoods together over the tapered exterior of a split sleeve causing the latter to grip the shaft ends and drive without need for keys. When one shaft has to assume various angular relations, a universal joint coupling is preferred, having two pivots located at right angles, and connected either through a steel member or a composition plate (*see* MOTOR CAR). Huge universal couplings of a rather elaborate kind are needed in rolling-mill drives, to compensate for the varying heights of the rolls.

Flexible couplings on shafts are extensively utilized. They protect engines, electric motors, or machines, against the shocks due to variations in the driving power or in the loads; and their flexibility also allows for slight irregularities in the alignments of shafts. A favourite class is the flange coupling above alluded to, but with leather or rubber bushings surrounding the bolts in one flange, and sometimes with soft washers interposed between the faces of the flanges. Another kind has rims with interlocking lugs; these do not touch, but the drive is transmitted by rubber blocks, or a long leather belt is interwoven between the lugs so as to take



TYPES OF COUPLINGS, DEVICES THAT COUPLE TOGETHER ADJACENT PARTS

Above: The flange flexible coupling, which is keyed onto each shaft; Centre: The split muff coupling, with key and clamping bolts; Below: The universal joint coupling, providing free horizontal and vertical movement

the drive flexibly without any metal-to-metal contact occurring. These also electrically insulate the motor from the machine which is coupled to it. Steel springs in some instances perform a like service.

A coupling is employed to join up the ends of hose, being either a screw type with nut turned by a spanner, or a hand instantaneous grip, for fire-hose or the brake-hose of trains. The railway carriage and wagon coupling is either of hand-tightened screw type, or automatic in action.

COUPON. A certificate entitling its owner to some payment, share or other benefit; more specifically, one of a series of interest certificates or dividend warrants attached to a bond running for a number of years. The word coupon (a piece cut off) possesses an etymological meaning so comprehensive that, while on the Stock Exchange it is only used to denote such an interest certificate or a certificate of stock of a joint-stock company, it may be as suitably, and elsewhere is perhaps more frequently, applied to tickets sold by tourist agencies and others.

The coupons by means of which the interest on a bond or debenture is collected are generally printed at the side or foot of that document, to be cut off and presented for payment at the bank or agency named on them as they become due. The last portion, called a "talon," is a form of certificate, and entitles the holder, when all the coupons have been presented, to obtain a fresh coupon sheet. They pass by delivery, and are as a rule exempt from stamp duty. Coupons for the payment of dividends are also attached to the share warrants to bearer issued by some joint-stock companies. The coupons on the bonds of most of the principal foreign loans are payable in London in sterling as well as abroad. The word is originally French, meaning "a piece cut off" (from *couper,* to cut)

A coupon is also that part of an advertisement which contains spaces for the name and address of the prospective purchaser, who fills in these details, clips the advertisement from the page, and sends it by mail to the advertiser, thus obviating the necessity of writing a letter. Coupons have been used in American advertising since about 1895. The addition of well prepared coupons has been known to triple the response to an advertisement.

COURANTE, a dance in 3–2 time much in vogue in France in the 17th century (*see* DANCE). It is also a musical term for a movement or independent piece based on the dance. In a suite it followed the Allemande (*q.v.*), with which it is contrasted in rhythm.

COURAYER, PIERRE FRANÇOIS LE (1681–1776), French Roman Catholic theologian, was born in Rouen on Nov. 17, 1681. While canon regular and librarian of the abbey of St. Geneviève at Paris he corresponded with Archbishop Wake on the subject of episcopal succession in England and so gained material for his *Dissertation sur la validité des ordinations des Anglais* . . . (Brussels, 1723; Eng. trans. by D. Williams, London, 1725; reprinted Oxford, 1844, with memoir of the author), which tried to prove the apostolic succession of the English clergy. Being persecuted he fled to England, where the doctorate was conferred on him at Oxford. In 1736 he published a French translation of Paolo Sarpi's *History of the Council of Trent,* and later, one of Sleidan's *History of the Reformation.* He died in London on Oct. 17, 1776. In his will of 1774 he declared himself still a Roman Catholic.

COURBET, GUSTAVE (1819–1877), French painter, was born at Ornans (Doubs) on June 10, 1819. He went to Paris in 1839 and worked at the studio of Steuben and Hesse; but he preferred to work out his own way by the study of Spanish, Flemish, and French painters. He painted his own portrait with his dog and "The Man with a Pipe," both of which were rejected by the jury of the Salon; but the younger school of critics, the neo-romantics and realists, loudly sang the praises of Courbet. The Salon of 1850 found him triumphant with the "Burial at Ornans," the "Stone-Breakers," and the "Peasants of Flazey." Though Courbet's realistic work is not devoid of importance, it is as a landscape and sea painter, especially as a painter of forest scenes, that he will be most honoured by posterity. When Courbet had made a name as an artist he tried to promote democratic and social science, and under the Empire he wrote essays and dissertations. He refused the cross of the Legion of Honour offered to him by Napoleon III., and in 1871 was elected a member of the Paris Commune. Thus it happened that he was responsible for the destruction of the Vendôme column. A council of war, before which he was tried, condemned him to pay the cost of restoring the column, 300,000 francs (£12,000). Courbet went to Switzerland in 1873 and died at La Tour du Peilz, on Dec. 31, 1877.

See Champfleury, *Les Grandes Figures d'hier et d'aujourd'hui* (1861); Mantz, "G. Courbet," *Gaz. des beaux-arts* (1878); Zola, *Mes Haines* (1879); C. Lemonnier, *Les Peintres de la Vie* (1888); J. Meier-Gräfe, *Corot und Courbet* (Stuttgart, 1906).

COURBEVOIE, a town of northern France, in the arrondissement of Saint-Denis, department of Seine, 5 mi. W.N.W. of Paris on the railway to Versailles. Pop. (1936) 58,638. It is a residential suburb of Paris, and has a fine avenue opening on the Neuilly bridge, and forming with it a continuation of the Champs Elysées. It carries on bleaching and the manufacture of drugs and biscuits.

COURCI, JOHN DE (d. 1219?), Anglo-Norman conqueror of Ulster, was a member of a celebrated Norman family of Oxfordshire and Somersetshire. It appears that he accompanied William FitzAldelm to Ireland when the latter, after the death of Strongbow, was sent thither by Henry II., and that he immediately headed an expedition from Dublin to Ulster, where he took Downpatrick, the capital of the northern kingdom. De Courci ultimately established his power over that part of Ulster comprised in the modern counties of Antrim and Down. After the accession of Richard I., de Courci in conjunction with William de Lacy seems to have offended the king by his proceedings in Ireland. De Lacy made his peace with Richard, while de Courci defied him; and the subsequent history of the latter consisted mainly in the vicissitudes of a lasting feud with the de Lacys. In 1204 Hugh de Lacy took de Courci prisoner, but after his release he again appeared in arms on hearing that Hugh de Lacy had obtained a grant of Ulster with the title of earl; and in alliance with the king of Man he ravaged the territory of Down. He was routed by Walter de Lacy, and disappeared from the scene till 1207, when he obtained permission to return to England. In 1210 he was in favour with King John, from whom he received a pension, and whom he accompanied to Ireland. Both de Courci and his wife Affreca were benefactors of the Church, and founded several abbeys and priories in Ulster.

See J. H. Round, "Courci, John de," in *Dict. Nat. Biog.*

COURIER, PAUL LOUIS (1773–1825), French Hellenist and political writer, was born in Paris on Jan. 4, 1773. Brought up on his father's estate of Méré in Touraine, he would never take the name "de Méré," to which he was entitled, lest he should be thought a nobleman. At the age of 15 he was sent to Paris to complete his education; his father's teaching had already inspired him with a passionate devotion to Greek literature, and although he showed considerable mathematical ability, he continued to devote all his leisure to the classics. He entered the school of artillery at Châlons, however, and in Sept. 1793 joined the army of the Rhine. He served in various campaigns of the Revolutionary wars, especially in those of Italy in 1798–99 and 1806–07, and in the German campaign of 1809. He became *chef d'escadron* in 1803.

In 1803 appeared his *Éloge d'Hélène,* a free imitation rather than a translation from Isocrates, which he had sketched in 1798. Courier resigned his commission in the autumn of 1808, but he attached himself to the staff of a general of artillery for the campaign of 1809. He was horror-struck by the carnage at Wagram (1809), refusing from that time to believe that there was any art in war. He hastily quitted Vienna, escaping the formal charge of desertion because his new appointment had not been confirmed. After leaving the army he went to Florence and discovered in the Laurentian library a complete manuscript of Longus's *Daphnis and Chloe,* an edition of which he published in 1810. The rest of his life was spent on his estate at Véretz (Indre-et-Loire), with frequent visits to Paris.

After the second restoration of the Bourbons the career of Courier as political pamphleteer began. He had before this time waged war against local wrongs in his own district. He now became one of the most dreaded opponents of the Government of the Restoration. In 1819–20 he wrote a series of political letters of extraordinary power, published in *Le Censeur Européen,* advocating a liberal monarchy. The proposal, in 1821, to purchase the estate of Chambord for the duke of Bordeaux called forth from Courier the *Simple Discours de Paul Louis, vigneron de la Chavonnière,* one of his best pieces. For this he was fined and imprisoned. His *compte rendu* of his trial had a still larger circulation than the *Discours* itself. In 1823 appeared the *Livret de Paul Louis,* the *Gazette de village,* followed in 1824 by his famous *Pamphlet des pamphlets,* called by his biographer, Armand Carrel, his swan-song. Courier published in 1807 his translation from Xenophon, *Du commandement de la cavalerie et de l'équitation,* and had a share in editing the *Collections des romans grecs.* In the autumn of 1825, on a Sunday afternoon (Aug. 18), Courier was found shot in a wood near his house. The murderers, who were servants of his own, remained undiscovered for five years.

The writings of Courier have solid historical value, and their curious style, derived partly from his Hellenism and partly from his loving study of the French writers of the 16th century, gives them an enduring literary interest.

A *Collection complète des pamphlets politiques et opuscules littéraires de P. L. Courier* appeared in 1826. *See* edition of his *Oeuvres* (1848), with an admirable biography by Armand Carrel, which is reproduced in a later edition, with a supplementary criticism by F. Sarcey (1876–77); also three notices by Sainte-Beuve in the *Causeries du lundi* and the *Nouveaux Lundis;* and A. Lelarge, *Origine et fortune de sa famille* (1925).

COURIER. Properly, a running messenger, who carried despatches and letters (O.Fr. *courier,* a runner); a system of couriers, mounted or on foot, formed the beginnings of the modern post office (*see* Post and Postal Services). The despatches which pass between the Foreign Office and its representatives abroad, and which cannot be entrusted to the postal service or the telegraph, are carried by special couriers, styled, in the British service, King's Messengers. "Courier," more particularly, is applied to a travelling attendant, whose duties are to arrange for the carrying of the luggage, obtaining of passports, settling of hotel accommodation, and generally to look to the comfort and facility of travel. The name "courier" and the similar word *courant* (Ital. *coranto*) have often been used as the title of a newspaper or periodical (*see* Newspapers); the *Courier,* founded in 1792, was for some time the leading London journal.

COURLAND or **KURZEME,** a coastal district of Latvia, lying between 56° and 57° 45′ N. and 21° and 23° E. It is bounded east by the district of Zemgale, north by the Gulf of Riga, west by the Baltic and south by Lithuania. In World War II, it passed alternately under German and Russian control. The surface is part of the northern Baltic lowland, with boulder clay soil, low and undulating, and coastlands flat and marshy. The interior has wooded dunes, covered with pine, fir, birch and oak, with swamps and lakes, and fertile patches between. The surface nowhere rises more than 700 ft. above sea-level.

The Windau river flows diagonally across the district northwestwards and is navigable in parts. The chief towns are Ventspils (Windau), Kuldiga (Goldingen), Talsi (Talsen) and Aizpute (Hazenpot). The climate is damp and often foggy, and the winter severe. Agriculture is the chief occupation, the principal crops being rye, barley, oats, wheat, flax and potatoes. Courland before 1917 was one of the Baltic provinces of Russia with an area of 10,435 square miles.

Anciently Courland was inhabited by the Cours or Kurs, a Lettish tribe, who were subdued and converted to Christianity by the Brethren of the Sword, a German military order, in the first quarter of the 13th century. In 1237 it passed under the rule of the Teutonic Knights owing to the amalgamation of this order with that of the Brethren of the Sword. Under the increasing pressure of Russia (Muscovy) the Teutonic Knights in 1561 found it expedient to put themselves under the suzerainty of Poland, the grandmaster Gotthard Kettler (d. 1587) becoming the first duke of Courland. But by the marriage in 1710 of Kettler's descendant, Duke Frederick William (d. 1711), to the princess Anne, niece of Peter the Great and afterwards empress of Russia, Courland came into close relation with the latter state. The celebrated Marshal Saxe was elected duke in 1726, but only managed to maintain himself by force of arms till the next year. The last Kettler, William, titular duke of Courland, died in 1737, and the empress Anne bestowed the dignity on her favourite Biren, who held it from 1737 to 1740 and again from 1763 till his death in 1772. Eventually in 1795 the assembly of the nobles placed it under the Russian sceptre. In Nov. 1918 Courland was incorporated in the new Latvian Republic. (*See* Latvia.)

COURNOT, ANTOINE AUGUSTIN (1801–1877), French economist and mathematician, was appointed assistant professor at the Academy of Paris in 1831, professor of mathematics at Lyons in 1834, rector of the Academy of Grenoble in 1835, inspector-general of studies in 1838, rector of the Academy of Dijon and honorary inspector-general in 1854, retiring in 1862. Cournot was the first economist who, with a competent knowledge of both subjects, endeavoured to apply mathematics to the treatment of economic questions. His *Recherches sur les principes mathématiques de la théorie des richesses* (Eng. trans. by N. T. Bacon, with bibliography of mathematics of economics by Irving Fisher, 1897) was published in 1838. The foundations of the mathematical treatment of economic questions laid by Cournot, provided the essential basis of much of the work of later economists. He was concerned primarily with an analysis of partial market equilibrium, based on the assumption that participants in the process of exchange are producers, or merchants whose end is the maximization of money profit. He, therefore, ignores the concept of utility. His most important contributions were his discussions of supply and demand functions and of the establishment of equilibrium under conditions of monopoly, duopoly and perfect competition; his analysis of the shifting of taxes which he treated as changes in cost of production and his discussion of problems of international trade. Although his chief contributions were in the field of mathematical economics, he was a fruitful philosopher.

In this latter field he was preeminently a protagonist of the theory of chance occurrences.

His works include: *Traité élémentaire de la théorie des fonctions et du calcul infinitésimal* (1841); *Exposition de la théorie des chances et des probabilités* (1843); *De l'origine et des limites de la correspondance entre l'algèbre et la géometrie* (1847); *Traité de l'enchaînement des idées fondamentales dans les sciences et dans l'histoire* (1861); and *Revue sommaire des doctrines économiques* (1877).

Bibliography.—Irving Fisher, "Cournot and Mathematical Economics," *Quarterly Journal of Economics,* Vol. xii (1897–98), pp. 119–138.

COURSING. It is known that coursing is one of the most ancient of British sports, and there is evidence to show that it must have been practised in other countries before the history of Great Britain began; but its actual origin is lost in obscurity. In its earliest stages it apparently comprised the hunting of various animals with dogs bearing a strong resemblance to the modern greyhound, which confines its hunting to the hare. The sport became very popular during the reign of Queen Elizabeth, and at some time in this period the first known set of rules was drawn up by the duke of Norfolk. The "Laws of the Leash," as they were called, were 16 in number, and apart from their quaint phraseology they laid down very clearly and simply the principles upon which the sport has since been based. In 1776 the first known club came into existence at Swaffham, through the enterprise of Lord Orford. This was followed by the Ashdown Park club in 1780 and the Malton club in 1781; but there appear to have been no others until the beginning of the 19th century. Then a considerable number sprang into existence, including the Altcar club (1825), founded by Viscount Molyneux on the estates of his father, Lord Sefton, near Liverpool, where regular meetings have been carried on ever since. With clubs increasing rapidly the need of an authoritative governing body was felt, and when in 1858 the National Coursing Club was formed for this purpose it received the ready support of all classes of coursers. It was composed of two representatives from every club which had not less than 24 members, and its constitution remains practically the same to-day. It drew up revised laws, and its rulings were universally accepted; though in 1923 the Irish Coursing Club severed its connection with the parent body and established itself as a separate governing body for Ireland.

Coursing received a somewhat serious setback with the passing of the Ground Game Act in 1880, which led to the number of hares being so depleted in some districts that many of the smaller clubs were driven out of existence. This gave a stimulus to enclosed coursing, which had been introduced at Plumpton in 1877, and it enjoyed some popularity for a few years. It has long since died out in England but has remained in Ireland, chiefly owing to the difficulties of preserving hares there. Scotland used to boast many notable clubs, but since 1880 the sport has declined until it has almost disappeared. On the other hand, coursing has flourished in Australia and other British territories, as well as in many foreign countries.

Conduct of Meetings.—The coursing season lasts about six months, beginning in the middle of September. Before any greyhound may be entered for a meeting under National Coursing Club rules, it must be registered, with its pedigree, in the Greyhound Stud Book, which was instituted in 1882. Irish dogs were included in the Stud Book until 1923, when a separate Stud Book was established by the Irish Coursing Club. Meetings usually extend over one, two, or three days; and the number of stakes to be competed for, and the number of entries to be accepted for each stake, will vary according to local conditions. The dogs are run in couples which are drawn by lot. The winner of the first course meets the winner of the second, and so on until the last two dogs left in compete for victory; but if two or more dogs belong to the same owner, they are "guarded" (that is, kept from competing against one another, by re-arranging the ties) as far as possible. The hares may be either driven by a staff of beaters towards a pre-arranged running ground, as in the Waterloo Cup and other big meetings, or the dogs may be walked over a selected area until a hare is disturbed naturally, as at meetings of most of the smaller clubs. In any case the hare must be given a clear run of not less than from 60 to 80 yards before the dogs are released. The slipper releases them simultaneously by means of specially devised slip collars attached to a single lead.

The Dogs.—In the years immediately prior to the outbreak of the World War, coursing had shown a remarkable increase of prosperity and popularity, and in 1914 the number of registrations in the Greyhound Stud Book, 5,443, was the highest recorded since 1883, the year after the Stud Book was founded. The sport was kept alive by a few clubs throughout the war but breeding was badly affected, with the result that there was a shortage of high class greyhounds when the war ended, and extraordinary competition for them took place at public sales. Prices soared to previously unheard-of heights, and at a sale in April 1920 a first season dog named "A," which had reached the semi-final round in the Waterloo Cup that year, was sold for 620 guineas, only to die from distemper shortly after reaching the kennels of his purchaser, Sir Woodman Burbidge. These prices were further enhanced in 1927 by the sudden popularity of greyhound racing with a mechanical hare.

The Waterloo Cup.—The Waterloo Cup meeting, held usually in February, is the Derby of coursing, and, like the Derby, arouses annual interest among many thousands of people who in the ordinary way take little account of coursing. Named from the Waterloo Hotel, Liverpool, where the first promoters met, the event was first held in 1836, when eight greyhounds competed for the Cup. From that modest beginning the meeting grew rapidly in importance. In 1837 the number of entries was increased to 16, and in 1838 to 32. In 1856 the number was again doubled, and there have been 64 entries each year ever since. The only break in the continuity of annual meetings occurred in 1917, when the event was discontinued until 1920 owing to the war. To be elected as one of the 64 nominators of dogs to run for the Cup is in itself regarded as an honour by greyhound owners, and the meeting has a very large influence in the propagation of the best blood in breeding. For the best type of greyhound the competition provides a very exacting test, and generally speaking luck plays a bigger part in it than in most other sporting events. It is noteworthy that very few dogs have succeeded in winning the Cup more than once; but two famous winners stand out in the history of the event—Master M'Grath, which won the trophy in 1868, 1869 and 1871; and Fullerton, which divided the honour of victory with another dog belonging to the same owner, Col. J. T. North, in 1889, and went on to win outright in 1890, 1891, and 1892. The Waterloo Cup of 1927 provided something of a record, for Golden Seal, the winner, was the youngest dog ever to have won the trophy, being a puppy less than 20 months old, whelped late in June, 1925.

Bibliography.—Coursing was fully described in Arrian's *Cynegeticus,* translated by the Rev. W. Dansey (1831); and among the earlier books were T. Goodlake, *Courser's Manual* (1828), containing a history of the sport and chief clubs, and records of greyhounds; T. Thacker, *Courser's Companion and Breeder's Guide* (1835); T. Thacker, *Courser's Annual Remembrancer* (1849–51); D. P. Blaine, *Encyclopaedia of Rural Sports* (3rd ed. 1870); and J. H. Walsh's, *The Greyhound* (3rd ed. 1875). Other books include the *Coursing Calendar* (since 1857), the official record of the season's results; *Coursing and Falconry* (Badminton Library, 1892); *The Hare* ("Fur and Feather" series, 1896); and *The Greyhound Stud Book* (since 1882); L. Hall, *Fifty-six Waterloo Cups* (1922) containing recollections of Waterloo meetings from 1863 to 1921. (F. I. W.)

COURT, ANTOINE (1696–1760), French Protestant divine, known as the "Restorer of Protestantism in France," was born in Villeneuve-de-Berg (Ardèche). At the time of the suppression of the Camisard revolt he was a child of eight and was taken to the secret meetings of the persecuted Calvinists. When he was 17 he began to exhort the scattered congregations, but after a time he came to the conclusion that some of the inspired persons of the persecuted church were in fact dupes and that the small communities must be organized into churches. On Aug. 21, 1715, he called a meeting of all the preachers in the Cevennes and Lower Languedoc at Monoblet. At this synod elders were appointed, prophecy and the preaching of women were forbidden, and it was arranged to send Pierre Corteiz to Zürich to seek ordination. From him Court himself received ordination. He then began to address small prayer meetings "in the desert" in Languedoc, the Vivarais and Dauphiné. The persecuted Calvinists were gradually reorganized, and, although in 1724 Louis XV. again prohibited the most secret exercise of the reformed religion, Court was able to address in 1744 meetings of 10,000 people. In the meantime a price had been set on Court's head. He escaped in 1730 to Lausanne and there created the theological college of which he was director for the last 30 years of his life. At this seminary the ministers of the Reformed Church in France were educated down to the days of the First Empire.

Court died in Lausanne on June 13, 1760. His principal work is *Histoire des troubles des Cevennes ou de la guerre des Camisards* (1760), and he left materials, which are preserved in the public library at Geneva, for a history of Protestantism.

Bibliography.—For details of his life see Napoléon Peyrat's *Histoire des pasteurs du désert* (1842; Eng. trans. 1852); Edmond Hugues, *Antoine Court, histoire de la restauration du protestantisme en France au XVIIIe siècle* (2nd ed. 1872), *Les Synodes du désert* (1885–86), *Mémoires d'Antoine Court* (1885); E. and E. Haag, *La France protestante*, vol. iv. (1884 ed.); H. M. Baird, *The Huguenots and the Revocation of the Edict of Nantes*, vol. ii. (1895); cf. *Bulletin de la société de l'histoire du protestantisme français* (1893–1906).

COURT, a word originally denoting an enclosed place, and so surviving in its architectural sense (courtyard, etc.). It is aptly used as a term for judicial tribunals, which originally were in fact enclosures within which sat the judges and their officials, whilst counsel, attorneys and the general public stood outside. At first these enclosures were temporary structures in the open field; later, fixtures in a large room or hall.

Before the separation of judicial from legislative and administrative functions, the king and his chief councillors sat in his palace for the exercise of all these functions and so the household of the king was also called "the court." And since all judicial authority is derived from the king, his presence is assumed in all the courts, which were not any part of the *curia regis*, but the *curia regis* itself.

Their history affords a remarkable illustration of the continuity characterizing English institutions. It might perhaps be too much to say that all the courts now sitting in England may be traced back to a common origin, but at any rate the higher courts are all offshoots from the Curia Regis; *see* Exchequer; Common Pleas, Court of; King's Bench, Court of; Chancery; Star Chamber; High Commission, Court of; Privy Council, Judicial Committee of.

The courts exercising jurisdiction in England are divided by certain features which may here be briefly indicated. We may distinguish between (1) superior and inferior courts. The former are the courts of common law and the court of chancery, now high court of justice. The latter are the local or district courts, county courts, etc. (2) Courts of record and courts not of record. "A court of record is one whereof the acts and judicial proceedings are enrolled for a perpetual memory and testimony, which rolls are called the records of the court, and are of such high and supereminent authority that their truth is not to be called in question. For it is a settled rule and maxim that nothing shall be averred against a record, nor shall any plea or even proof be admitted to the contrary. And if the existence of the record shall be denied it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. All courts of record are the courts of the sovereign in right of the crown and royal dignity, and therefore any court of record has authority to fine and imprison for contempt of its authority" (Stephen's *Blackstone*). (3) Courts may also be distinguished as civil or criminal. (4) A further distinction is to be made between courts of first instance and courts of appeal. In the former the first hearing in any judicial proceeding takes place; in the latter the judgment of the first court is brought under review. Of the superior courts, the high court of justice in its various divisions is a court of first instance. Over it is the court of appeal, and over that again the House of Lords. The high court of justice is (through divisional courts) a court of appeal for inferior courts. (5) There is a special class of local courts, which do not appear to fall within the description of either superior or inferior courts. Some, while administering the ordinary municipal law, have or had jurisdiction exclusive of their superior courts; such were the common pleas of Durham and Lancaster. Others have concurrent jurisdiction with the superior courts; such are the lord mayor's court of London, the passage court of Liverpool, etc.

The distribution of judicial business among the various courts of law in England may be exhibited as follows:

Criminal Courts.—(1) The lowest is that of the justice of the peace (*q.v.*), which has jurisdiction over certain minor offences. (2) The justices in quarter sessions are commissioned to determine felonies and other offences (*see* Quarter Sessions, Court of). The corresponding court in a borough is presided over by a recorder. (3) The more serious offences are reserved for the judges of the superior courts sitting under a commission of oyer and terminer or gaol delivery for each county (*see* Circuits). In London, the central criminal court was established by the Central Criminal Court Act 1834. (4) The court of criminal appeal, to which all persons convicted on indictment may appeal, was established by the Act of 1907. (*See* Criminal Law.)

Civil Courts.—In certain special cases, civil claims of small importance may be brought before justices or stipendiaries. Otherwise, and excepting the special and peculiar jurisdictions above mentioned, the civil business of England and Wales may be said to be divided between the county courts (taking small cases) and the high court of justice (taking all others).

The effect of the Judicature Acts on the constitution of the superior courts may be briefly stated. There is now one supreme court of judicature, consisting of two permanent divisions called the high court of justice and the court of appeal. The former inherits the jurisdiction of the court of chancery, the three common law courts, the courts of admiralty, probate, and divorce, the courts of pleas at Lancaster and Durham, and the courts created by commissions of assize, oyer and terminer, and gaol delivery. The latter inherits the jurisdiction of the court of appeal in chancery (including chancery of Lancaster), the court of the lord warden of the stannaries, and of the exchequer chamber, and the appellate jurisdiction in admiralty and heresy matters of the judicial committee; and power is given to the sovereign to transfer the remaining jurisdiction of that court to the court of appeal. By the Appellate Jurisdiction Act of 1876 the House of Lords is enabled to sit for the hearing of appeals from the English court of appeal and the Scottish and Irish courts during the prorogation and dissolution of parliament. The lords of appeal (*q.v.*), of whom three must be present, are the lord chancellor, the lords of appeal in ordinary, and peers who have held "high judicial office" in Great Britain or Ireland.

There are also many obsolete or decayed courts, of which the most noticeable are the court Baron, court Leet, etc. (*qq.v.*).

United States.—The Federal judicial system of the United States is made by the Constitution independent both of the legislature and of the Executive. It consists of the Supreme Court, the circuit courts, and the district courts.

The Supreme Court is created by the Constitution, and consisted in 1928 of nine judges, who are nominated by the President and confirmed by the Senate. They hold office during good behaviour, *i.e.*, are removable only by impeachment, thus having a tenure even more secure than that of English judges. The court sits at Washington from Oct. to July in every year. The sessions of the court are held in the Capitol. A rule requiring the presence of six judges to pronounce a decision prevents the division of the court into two or more benches; and while this secures a thorough consideration of every case, it also retards the despatch of business. Every case is discussed twice by the whole body, once to ascertain the view of the majority, which is then directed to be set forth in a written opinion; then, again, when the written opinion, prepared by one of the judges, is submitted for criticism and adoption by the court as its judgment.

The other Federal courts have been created by Congress under a power in the Constitution to establish "inferior courts." The circuit courts consist of 34 circuit judges, acting in nine judicial circuits, while to each circuit there is also allotted one of the justices of the Supreme Court. Circuit courts of appeals, established to relieve the Supreme Court, consist of three judges (two forming a quorum), and are made up of the circuit and district judges of each circuit and the Supreme Court justice assigned to the circuit. Some cases may, however, be appealed to the Supreme Court from the circuit court of appeals, and others directly from the lower courts. The district courts number (1928) 114, in most cases having a single justice. There is also a special tribunal called the court of claims, which deals with the claims of private persons against the Federal government. It is not strictly a part of the general judicial system, but is a creation of Congress designed to relieve that body of a part of its own labours.

The jurisdiction of the Federal courts extends only to those cases in which the Constitution makes Federal law applicable. All other cases are left to the State courts, from which there is no appeal to the Federal courts, unless where some specific point arises which is affected by the Federal Constitution or a Federal law. The classes of cases dealt with by the Federal courts are as follows:—

1. Cases in law and equity arising under the Constitution, the laws of the United States, and treaties made under their authority;
2. Cases affecting ambassadors, other public ministers and consuls;
3. Cases of admiralty and maritime jurisdiction;
4. Controversies to which the United States shall be a party;
5. Controversies between two or more States, between a State and citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State or the citizens thereof and foreign States, citizens or subjects (*Const.*, Art. III., s. 2).

Part of this jurisdiction has, however, been withdrawn by the 11th amendment to the Constitution, which declares that "the judicial power of the United States shall not be construed to extend to any suit commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State."

The jurisdiction of the Supreme Court is original in cases affecting ambassadors, and wherever a State is a party; in other cases it is appellate. In some matters the jurisdiction of the Federal courts is exclusive; in others it is concurrent with that of the State courts.

As it frequently happens that cases come before State courts in which questions of Federal law arise, a provision has been made whereby due respect for the latter is secured by giving the party to a suit who relies upon Federal law, and whose contention is overruled by a State court, the right of having the suit removed to a Federal court. The Judiciary Act of 1789 (as amended by subsequent legislation) provides for the removal to the Supreme Court of the United States of "a final judgment or decree in any suit rendered in the highest court of a State in which a decision could be had, where is drawn in question the validity of a treaty or statute of, or an authority exercised under the United States, and the decision is against their validity; or where is drawn in question the validity of a statute of, or an authority exercised under, any State, on the ground of their being repugnant to the Constitution, treaties or laws of the United States, and the decision is in favour of their validity; or where any title, right, privilege or immunity is claimed under the Constitution, or any treaty or statute of, or commission held, or authority exercised under the United States, and the decision is against the title, right, privilege or immunity specially set up or claimed by either party under such Constitution, treaty, statute, commission or authority." If the decision of the State court is in favour of the right claimed under Federal law or against the validity or applicability of the State law set up, there is no ground for removal, because the applicability or authority of Federal law in the particular case could receive no further protection from a Federal court than has in fact been given by the State court.

The power exercised by the Supreme Court in declaring statutes of Congress or of State legislatures (or acts of the Executive) to be invalid because inconsistent with the Federal Constitution, has been deemed by many Europeans a peculiar and striking feature of the American system. There is, however, nothing novel or mysterious about it. As the Federal Constitution, which emanates directly from the people, is the supreme law of the land everywhere, any statute passed by any lower authority (whether the Federal Congress or a State legislature), which contravenes the Constitution, must necessarily be invalid in point of law, just as in Great Britain a railway by-law which contravened an act of parliament would be invalid. Now, the functions of judicial tribunals—of all courts alike, whether Federal or State, whether superior or inferior—is to interpret the law, and if any tribunal finds a Congressional statute or State statute inconsistent with the Constitution, the tribunal is obliged to hold such statute invalid. A tribunal does this not because it has any right or power of its own in the matter, but because the people have, in enacting the Constitution as a supreme law, declared that all other laws inconsistent with it are *ipso jure* void. When a tribunal has ascertained that an inferior law is thus inconsistent, that inferior law is therewith, so far as inconsistent, to be deemed void. The tribunal does not enter any conflict with the legislature or Executive. All it does is to declare that a conflict exists between two laws of different degrees of authority, whence it necessarily follows that the weaker law is extinct. This duty of interpretation belongs to all tribunals, but as constitutional cases are, if originating in a lower court, usually carried by appeal to the Supreme Court, men have grown accustomed to talk of the Supreme Court as in a special sense the guardian of the Constitution.

The Federal courts never deliver an opinion on any constitutional question unless or until that question is brought before them in the form of a lawsuit. A judgment of the Supreme Court is only a judgment on the particular case before it, and does not prevent a similar question being raised again in another lawsuit, though of course this seldom happens, because it may be assumed that the court will adhere to its former opinion. There have, however, been instances in which the court has virtually changed its view on a constitutional question, and it is understood to be entitled so to do.

COURTAULDS, LIMITED. This British joint-stock company has had a continuous existence since 1825, and the old firm of Samuel Courtauld and Company, Limited, the predecessors of the present company, had a wide reputation for mourning crepes manufactured from natural silk. In 1904 the company commenced the manufacture of rayon yarns by the viscose process at Coventry.

The company produces not only yarn but fabrics; the productions range from delicate natural silk georgette and crêpe-de-Chine to furnishing brocades for upholstery purposes. The weaving mills are situated in Essex at Braintree and Halstead, in Yorkshire at Halifax, and in Lancashire at Leigh. The dyeing of both yarn and fabrics is conducted in Essex and Lancashire.

For the manufacture of rayon yarns, the company operates two large mills at Coventry, two at Flint, and two at Wolverhampton; an up-to-date unit at Preston in Lancashire was ready for production in 1939. Processing of yarns is also carried out in special mills at Coventry, Nuneaton and Flint. Rayon staple fibre is produced on a large scale at Greenfield, near Holywell. Courtaulds also own chemical works at Trafford Park, Manchester. Abroad Courtaulds (Canada) Ltd. have rayon yarn mills at Cornwall, Ont., and there are yarn processing works in Spain and India. The head offices are in St. Martin's-le-Grand, London.

The capital of the concern is £32,000,000, consisting of 24,000,000 ordinary shares of £1 each and 8,000,000 5% preference shares of £1.

COURT BARON, an English manorial court dating from the middle ages. According to Maitland it means *curia baronis, "la court de seigneur,"* and there is no evidence for there being more than one court. His conclusion is that the "court baron" was not even differentiated from the "court-leet" (*q.v.*) at the close of the 13th century, but that there was a distinction of jurisdictional rights, some courts having only feudal rights, while others had regalities as well. When the court-leet was differentiated the court baron remained with feudal rights alone. These rights he was disposed to trace to a lord's jurisdiction over his men rather than to his possession of the manor, although in practice, from an early date, the court was associated with the manor. Its chief business was to administer the "custom of the manor" and to admit fresh tenants who had acquired copyholds by inheritance or purchase, and had to pay, on so doing, a "fine" to the lord of the manor. It is mainly for the latter purpose that the court was kept. The steward of the manor, a lawyer, usually presided, and the proceedings were recorded on "the court rolls."

See *Select Pleas in Manorial and other Seignorial Courts,* vol. i., and *The Court Baron* (Selden Society). (J. H. R.)

COURT DE GEBELIN, ANTOINE (1728–1784), French scholar, son of Antoine Court (*q.v.*), was born at Nîmes, and became, like his father, a pastor of the Reformed Church. After long years of research, he published in 1775 the first volume of his encyclopaedic work, *Le Monde primitif, analysé et comparé avec le monde moderne.* The ninth volume appeared in 1784, leaving the work still unfinished. In 1760 he published a work entitled *Les Toulousaines,* advocating the rights of the Protestants. He co-operated with Franklin and others in the periodical work entitled *Affaires de l'Angleterre et de l'Amérique* (1776 *seq.*), which was devoted to the support of American independence. He died in Paris on May 10, 1784.

See C. Dardier, *Court de Gebelin* (Nîmes, 1890).

COURTENAY, the name of a famous English family. French genealogists head the pedigree of this family with one Athon or Athos, who is said to have fortified Courtenay in Gâtinois about 1010. His great grandson, Renaud, was one of the magnates who followed Louis le Jeune to the Holy Land and the last lord of Courtenay of the line of Athon. Elizabeth, his elder daughter, carried Courtenay to her husband Pierre, youngest son of the French king, Louis VI. the Fat. Among the lines of the royal Courtenays, sprung from Pierre of France, were the short-lived dynasty of emperors of Constantinople, which ended in 1261, and the lords of Champignolles, Janlai, Yerre, Bleneau, La Ferté Loupière and Chevillon. Roger de Courtenay, abbé des Eschalis, who died in 1733, was the last recognized member of this royal line. A younger branch of the first house of Courtenay came from Josselin, second son of Josselin, son of Athon. This Josselin, a notable crusader, was the first count of Edessa.

In England a house of Courtenay has flourished with varying fortunes since the reign of the first Angevin king, and that it probably sprang from a younger son of Josselin I. of Courtenay is suggested by the name Reinaud, borne by the first known ancestor of the English house. Reinaud de Courtenay was a favourite with Henry II., who gave him Berkshire lands at Sutton, still known as Sutton Courtenay. His son, Robert, died childless in 1209. Of his second son, Reynold, little is known save that he was a married man in 1178 when he and his wife, Hawise, were given by the pope a licence for a free chapel at Okehampton. Reynold's son, Robert, married Mary, daughter of William de Vernon, earl of Devon and of the Isle of Wight. He was succeeded in 1242 by his son John, who by Isabel, a daughter of Hugh de Vere, earl of Oxford, had issue Hugh, whose wife was Eleanor, daughter of the earl of Winchester. The son of this marriage, another Hugh, became known as earl of Devon. Hugh, his son, the second earl, a warrior who drove the French back from their descent on Cornwall in 1339, made another of the brilliant marriages of this family, his wife being Eleanor, granddaughter of Edward I. Their eldest son, Sir Hugh de Courtenay, shared in the honours of Crécy and Calais, and was one of the knights founders of the order of the Garter, the stall-plate of his arms being yet in St. George's chapel, Windsor. This knight died in the lifetime of the earl, who was therefore succeeded by his grandson, Edward (son of Edward, his third son), earl marshal of England in 1385. Hugh, a second son of Earl Edward, succeeded as fourth earl of the Courtenay line. By his wife, a sister of the renowned Talbot, earl of Shrewsbury, he had issue Thomas the fifth earl, a partisan of Henry VI., whose wife was Margaret Beaufort, daughter of John, earl of Somerset. Both sons of this marriage fell in the Wars of the Roses, Thomas, the sixth earl, being taken at Towton by the Yorkists and beheaded at York in 1462, his younger brother, Henry, having the same fate at Salisbury in 1466.

The earldom being extinguished by attainder, Sir Humphrey Stafford was created earl of Devon in 1469, but in the same year, having retired with his men from the expedition against Robin of Redesdale, another earl of Devon suffered at the headsman's hands, his patent being afterwards annulled by a statute of Henry VII. On the restoration of Henry VI., John Courtenay, only surviving brother of Thomas and Henry, was restored to the earldom by the reversal of attainder. He, too, died in the Lancastrian cause in 1471. Beside him at Tewkesbury died his cousin, Sir Hugh Courtenay of Boconnoc, son of Hugh, a younger brother of Earl Edward, leaving a son Edward, who thus became the heir male of the house, though not its heir general. By a patent of 1485 he was created earl of Devon with remainder to the heirs male of his body, and by an act of 1485 he was restored to all honours lost in his attainder by the Yorkist parliament. He defended Exeter against Warbeck's rebels and was a knight of the Garter in 1489, dying 20 years later, when the earldom became again forfeit by his son's attainder. That son, William Courtenay, had drawn the jealousy of Henry VII. by a marriage with Catherine, sister of the queen and daughter of King Edward IV., the Yorkist sovereign, whose hand had been so heavy on the Courtenays. After the queen's death Henry sent his wife's brother-in-law to the Tower on a charge of corresponding with Edmund Pole, an attainder following. But on the accession of Henry VIII. the young king released his uncle, who although styled an earl was not fully restored in blood at his death in 1511. His son, Henry Courtenay, obtained from parliament in 1512 a reversal of his father's attainder, thus succeeding to the earldom of his grandfather. But Cromwell was his enemy, the royal strain in his blood a dangerous thing. Involved in correspondence with Cardinal Pole, he was sent to the Tower with his wife and his young son, and in 1538 he was beheaded as a traitor. Queen Mary took the son into favour, created him earl of Devonshire by a patent of 1553, and restored him in blood. But, disappointed in his hopes, he formed some wild plans for marrying the Lady Elizabeth and making her queen, the result being that he was sent back to the Tower and thence to Fotheringhay. At Easter of 1555 he was released on parole and exiled, dying suddenly at Padua in 1556. His heir male was Sir William Courtenay, his sixth cousin once removed, head of a knightly line of Courtenays whose seat was Powderham Castle. Sir William, who is said to have been killed at St. Quintin in 1557, was succeeded by his son, another Sir William, one of the undertakers for the settling of Ireland, where the family obtained great estates. William Courtenay of Powderham, was created a baronet by writ of privy seal in 1644, the patent being never enrolled. His great grandson, Sir William Courtenay, was on May 6, 1762, ten days before his death, created Viscount Courtenay of Powderham Castle.

Since the death at Padua in 1556 of Edward, earl of Devon, that ancient title had been twice revived. Charles Blount, Lord Mountjoy, who was created earl of Devon in 1603, died without lawful issue in 1606. In 1618 Sir William Cavendish, son of the famous Bess of Hardwick, was given the same title, which is still among the peerage honours of the ducal house descending from him. For the Courtenays, who had without protest accepted a baronetcy and a viscounty, their earldom was dead. In the reign of William IV. the third and last Viscount Courtenay was living unmarried in Paris, an exile who for sufficient reasons was keeping out of the reach of the English criminal law. In the name of this man, his presumptive heir male, William Courtenay, clerk assistant of the parliament, succeeded in persuading the House of Lords that the Courtenay earldom under the patent of 1553 was still in existence, the plea being that the terms of the remainder—to him and his heirs male for ever—did not limit the succession to heirs male of the body of the grantee. After the death of the exile in 1835 the clerk of the parliament succeeded him as an earl by force of the House of Lords decision of March 1831. His second son, the Rev. Henry Hugh Courtenay (1811–1904), succeeded, as 13th earl, a nephew whose extravagance had impoverished the estates. He in turn was followed, as 14th earl, by his grandson, Charles Pepys Courtenay (b. 1870). There is now no other recognized branch of this house, once so widely spread in the western counties.

Round's *Peerage Studies; Calendars of State Papers;* Machyn's *Diary* (Camden Society); Chronicles of Capgrave, Wavrin, Adam of Usk, etc.

COURTENAY, PETER (d. 1492), a grandnephew of Richard Courtenay (*q.v.*), attained high position in the English Church. Educated at Exeter college, Oxford, he became dean of Windsor, then dean of Exeter; in 1478 bishop of Exeter; and in 1487 bishop of Winchester in succession to William of Waynflete. With Stafford, duke of Buckingham, and others he attempted a rebellion in 1483, and fled to Brittany when this failed. Courtenay was restored to his dignities in 1485 by Henry VII., whom he had accompanied to England. He died Sept. 23, 1492.

COURTENAY, RICHARD (d. 1415), English prelate, was a son of Sir Philip Courtenay of Powderham castle, near Exeter, and a grandson of Hugh Courtenay, earl of Devon (d. 1377). Educated at Exeter college, Oxford, Courtenay held several prebends, was dean of St. Asaph and then of Wells, and became bishop of Norwich in 1413. As chancellor of Oxford university in 1407 and again in 1410, Courtenay asserted the independence of the university against Thomas Arundel, archbishop of Canterbury, but the archbishop, supported by Henry IV. and Pope John XXIII., eventually triumphed. Courtenay was a personal friend of Henry V., who, in 1413, made him treasurer of the royal household. He went twice on diplomatic errands to France, and was also employed by Henry on public business at home. He died on Sept. 15, 1415.

COURTENAY, WILLIAM (*c.* 1342–1396), English prelate, son of Hugh Courtenay, earl of Devon (d. 1377), and great-grandson of Edward I., studied law at Stapledon Hall, Oxford, and became chancellor of the university in 1367. Having been made prebendary of Exeter, of Wells and of York, he was consecrated bishop of Hereford in 1370, translated to the see of London in 1375, and became archbishop of Canterbury in 1381. From the first Courtenay opposed John of Gaunt, duke of Lancaster; he upheld the rights of the English Church, and was eager to root out Lollardry. In 1373 he declared in convocation that he would not contribute to a subsidy until the evils from which the Church suffered were removed; in 1375 he incurred the displeasure of the king by publishing a papal bull against all Florentines; and in 1377 his decided action during the quarrel between John of Gaunt and William of Wykeham ended in a temporary triumph for the bishop. Wycliffe was another cause of difference between Lancaster and Courtenay. In 1377 the reformer appeared before Archbishop Sudbury and Courtenay, when an altercation between the duke and the bishop led to the dispersal of the court, and during the ensuing riot Lancaster probably owed his safety to the good offices of his foe. Having become archbishop of Canterbury in 1381, Courtenay summoned a council which condemned the opinions of Wycliffe; he then attacked the Lollards at Oxford, and urged the bishops to imprison heretics. He was for a short time Chancellor of England during 1381. He upheld the papal authority in England, although not to the injury of the English Church. He protested against the confirmation of the statute of provisors in 1390, and he was successful in slightly modifying the statute of praemunire in 1393. In 1386 he was one of the commissioners appointed to reform the kingdom and the royal household. Courtenay died at Maidstone on July 31, 1396, and was buried in Canterbury cathedral.

See W. F. Hook, *Lives of the Archbishops of Canterbury,* vol. iv. (1860–76); and W. Stubbs, *Constitutional History,* vols. ii. and iii. (1895–96).

COURTESY, manners that suit a court, politeness. The expression "by courtesy" is used where something is granted out of favour and not of right, hence "courtesy" titles, *i.e.,* those titles in the British peerage given to the eldest sons of dukes, marquesses and earls, and to the younger sons and the daughters of dukes and marquesses. Another form of the word "curtsey," once confined to the expression of courtesy by a gesture, is now used only of the reverence made by a woman. *See* Forms of Address.

In English law, courtesy (curtesy) was the life interest which a husband had in certain events in the lands of which his wife was in her lifetime actually seised for an estate of inheritance. The requisites for tenancy by the curtesy were: (1) a legal marriage; (2) an estate in possession of which the wife must have been actually seised; (3) issue born alive, capable of inheriting as heir to the wife, while (4) the title to the tenancy vested only on the death of the wife. Curtesy was finally abolished by the Administration of Estates Act, 1925, and the Copyhold Act (Law of Property), 1922; but like dower, it still obtains in some colonies, while in others it has been superseded by the Homestead Acts. Curtesy still survives in some States of the United States, but it is usually limited to lands of which the wife is seised at her death.

See Pollock and Maitland, *Hist. Eng. Law;* Goodeve, *Real Property.*

COURTHOPE, WILLIAM JOHN (1842–1917), English writer and historian of poetry, whose father was rector of South Malling, Essex, was born on July 17, 1842, and died on April 10, 1917. From Harrow school he went to New College, Oxford, where he gained many honours. His most important works were the continuation of the edition of Pope's works, begun by Whitwell Elwin (1816–1900), which appeared in ten volumes from 1871–89, and his elaborate *History of English Poetry* (6 vols., 1895–1910) which arose out of his tenure of the chair of poetry at Oxford (1895–1901). He was a civil service commissioner from 1887 onwards. In 1911 he was Warton lecturer on poetry.

COURT LEET, an English petty criminal court for the punishment of small offences. It has been usual to make a distinction between court baron (*q.v.*) and court leet as being separate courts, but in the early history of the court leet no such distinction can be drawn. At a very early time the lords of manors exercised or claimed certain jurisdictional franchise. Of these the most important was the "view of frankpledge" and its attendant police jurisdiction. Some time in the later middle ages the court baron when exercising these powers gained the name of *leet,* and, later, of "court leet." The *quo warranto* proceedings of Edward I. established a sharp distinction between the court baron, exercising strictly manorial rights, and the court leet, depending for its jurisdiction upon royal franchise. The court leet was a court of record, and its duty was not only to view the pledges, but to present by jury all crimes committed within the jurisdiction, and punish the same. The steward of the court acted as judge, presiding wholly in a judicial character, the ministerial acts being executed by the bailiff. The court leet began to decline in the 14th century, being superseded by the more modern courts of the justices, but in many cases courts leet were kept up until nearly the middle of the 19th century. Indeed, it cannot be said that they are now actually extinct, as many still survive for formal purposes, and by s. 40 of the Sheriffs Act, 1887, they are expressly kept up.

COURT-MARTIAL, a court for the trial of offences against military or naval discipline, or for the administration of martial law. In England courts-martial have inherited part of the jurisdiction of the old *Curia militaris,* or court of chivalry, in which a single marshal and at one time the high constable proceeded "according to the customs and usages of that court, and, in cases omitted according to the civil law, *secundum legem armorum*" (Coke, 4 *Ins.* 17). The modern form of the courts was adopted by ordinance in the time of Charles I. It is first recognized by statute in the first Mutiny Act of 1689. The Mutiny Act and the statutory articles of war continued until 1879, when they were codified in the Army Discipline and Regulation Act 1879, which was, in turn, superseded by the Army Act 1881. This act is re-enacted annually by the Army (Annual) Act.

Naval Courts-Martial.—In 1645 an ordinance and articles concerning martial law were passed for the government of the navy. Under this ordinance Blake, Monk and Penn issued instructions for the holding of general and ship courts-martial with written records. Under an act of 1661 the high admiral again received power to issue commissions for holding courts-martial—a power which continues to be exercised by the board of Admiralty. During the 18th century the jurisdiction was greatly extended. The Naval Articles of War have always been statutory, and the whole system now rests on the Naval Discipline Act 1866, as amended by the Naval Discipline Act 1922. Under the acts a court-martial must consist of from five to nine officers of a certain rank, and must be held publicly on board of one of H.M. ships of war, or in certain cases at a port at such convenient place on shore as the admiralty or the officer who ordered the court-martial shall direct. A judge-advocate attends, and the procedure resembles that of military courts. The sentence, if not one of death, does not require the confirmation of the commander-in-chief abroad or of the Admiralty at home. The board of Admiralty have, under the Naval Discipline Acts, a general power of suspending, annulling and modifying sentences which are not capital. The jurisdiction extends to all persons belonging to the Navy, to land forces and other passengers on board, ship-wrecked crews, spies, persons borne on the books of H.M. ships in commission, and civilians on board who endeavour to seduce others from allegiance. The definition of the jurisdiction by locality includes harbours, havens or creeks, lakes or rivers, in or out of the United Kingdom; all places within the jurisdiction of the admiralty; all places on shore out of the United Kingdom; the dockyards, barracks, hospitals, etc., of the service wherever situated; all places on shore in or out of the United Kingdom for all offences punishable under the Articles of War except those specified in section 45 of the Naval Discipline Act which are punishable by ordinary law. The Royal Marines, while borne on the books of H.M. ships, are subject to the Naval Discipline Acts, and, by an order in council 1882, when they are embarked on board ship for service on shore; otherwise they are under the Army Acts.

Royal Air Force Courts-Martial.—These proceedings are governed by the principles laid down in the Manual of Air Force Law (Air Publication 804) in compliance with the Air Force Act, the Rules of Procedure, and the King's Regulations and Air Council Instructions for the Royal Air Force.

BIBLIOGRAPHY.—Simmons, *On the Constitution and Practice of Courts-Martial;* Clode, *Military and Martial Law;* Stephens, Gifford and Smith, *Manual of Naval Law and Court-Martial Procedure.* The earlier writers on courts-martial are Adye (1796), M'Arthur (1813), Maltby (Boston, 1813), James (1820), D'Aguilar (1843), and Hough, *Precedents in Military Law* (1855).

UNITED STATES

The extraordinary jurisdiction of courts-martial is conferred by the Constitution which makes the President commander-in-chief of the Army and Navy, empowers Congress to make rules for the government and regulation of the land and naval forces and exempts from the requirement for presentment or indictment of a grand jury "cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger." Courts-martial are not part of the Federal judiciary, and are not, *proprio vigore,* governed by constitutional limitations or statutory enactments applicable to the Federal civil courts. The proceedings and sentences of courts-martial, acting within their judicial powers and in accordance with law, are free from control or revision by the civil courts.

The jurisdiction of courts-martial is wholly criminal. The specific objective of the courts is to insure discipline in the armed forces. The jurisdiction embraces members of the Army and Navy and in certain cases civilians closely connected with these services (such as retainers to the camp outside the territorial jurisdiction of the United States) or interfering with their operation (such as spies). Jurisdiction is not limited by the place of the offence or by the locality of the offender. Courts-martial are primarily distinguishable through non-use of the traditional grand and petit juries. Otherwise their composition and processes are patterned after civil tribunals and are designed to safeguard fundamental procedural and substantive rights of accused persons, such as the right to a thorough and impartial investigation before trial and to a speedy trial by an unbiased court, and the right to protection from double jeopardy, compulsory self-crimination and unreasonable searches and seizures. Courts-martial are governed with respect to procedure and punishments by special enactments of Congress, those applicable to the Army being called Articles of War, and those applicable to the Navy, Articles for the Government of the Navy. These statutes are supplemented by a detailed Manual for Courts-Martial for the Army and a manual for the Navy entitled Naval Courts and Boards. The articles and prescribed procedure are in general similar to corresponding British enactments and regulations. The original articles, enacted in 1775, were patterned after those governing the British Army and Navy at that period. On June 4, 1920, the Articles of War were substantially amended and re-enacted. The Articles for the Government of the Navy, in effect Dec. 1, 1873, were codified as of that date as section 1624, Revised Statutes.

The articles of War provide three types of Army courts-martial —general, special and summary. General courts-martial are composed of not less than five officer members, including a law member specially versed in the law, a prosecutor designated as trial judge advocate, and a defence counsel. Their jurisdiction as to persons (subject to military law), offences and punishments, is unlimited. Special courts-martial are composed of not less than three officer members, a judge advocate and a defence counsel. They have jurisdiction over all persons subject to military law and over all offences not punishable by death. They may not adjudge sentences to dishonourable separation from the service or to confinement in excess of six months, etc. Summary courts-martial, consisting of one officer, are limited in jurisdiction to the trial of enlisted men. They may not adjudge sentences in excess of confinement for one month, etc. Generally corresponding to these courts, in the order as described, are Navy general and summary courts-martial and deck courts.

Courts-martial are of transitory nature, called into being by the commanding officer authorized by law to appoint them and dissoluble at the will of the appointing authority. A sentence adjudged may not be carried into execution until approved by the appointing authority or his successor in command, and, in some cases, until confirmed by higher authority. The approving or reviewing authority and confirming authority thus become parts of the courts on whose proceedings they pass judgment. Appellate review, automatic in operation, is provided in cases involving serious punishment, with power in the War and Navy departments and in the President to take remedial action. In the War department a board of review composed of officers trained in law, acting in collaboration with the judge advocate general, is vested with statutory powers of a final court of appeals with respect to the administration of military justice. Powers of mitigation, suspension and remission of sentences, extending, in appropriate cases, to honourable restoration to the colours of persons sentenced to dishonourable discharge or dismissal, are afforded by the articles and regulations.

COURTNEY, LEONARD HENRY COURTNEY, 1ST BARON (1832–1918), British statesman and man of letters, eldest son of J. S. Courtney, a banker, was born at Penzance on July 6, 1832. He won a sizarship at St. John's college, Cambridge, graduated second senior wrangler, and became a fellow of his college. Called to the bar at Lincoln's Inn in 1858, he devoted himself to economics and journalism, and in 1865 became leader-writer on *The Times* under Delane. He was professor of political economy at University college, London, from 1872 to 1875. He entered the House of Commons for Liskeard, Cornwall, in 1876, and sat continuously for that district until 1900. Courtney belonged to the Radical school of Chamberlain and Dilke. He held under-secretaryships in the Gladstone Government of 1880, but resigned in 1884 because the new Franchise bill did not include provision for proportional representation, of which principle he was a lifelong advocate. Courtney separated from Gladstone on the introduction of the Home Rule bill in 1886, but as time went on he found himself less and less in sympathy with his Unionist colleagues on other than Irish questions. On Gladstone's nomination he had become chairman of committee and deputy-speaker of the House of Commons in 1886. He retired in 1892, and his opposition to the Boer War led to his defeat at Liskeard in 1900. On the Liberal victory in 1906 Courtney was made a peer. In the House of Lords he sat on the Liberal benches, and frequently spoke on imperial and foreign questions. He distrusted the foreign policy of Sir Edward Grey, and during the progress of the World War continually urged the search for any avenue of peace. He died on May 11, 1918, six months before the Armistice, and up to the time of his death pleaded for a peace of reconciliation. Courtney married in 1883 Miss Catherine Potter, who, like her husband, was a prominent member of the peace movement. Much of his best work was given to the periodical press; among his separate publications may be mentioned *The Working Constitution of the United Kingdom* (1901).

See G. P. Gooch, *Life of Lord Courtney* (1920).

COURTNEY, WILLIAM LEONARD (1850–1928), British journalist, was born at Poona on Jan. 5, 1850, and was educated at Bath and at University college, Oxford. He was elected fellow of Merton college in 1872 and of New college in 1876. In 1890 he left Oxford and joined the editorial staff of *The Daily Telegraph*, London, where he spent many years as literary editor and dramatic critic, retiring in 1924. He edited *Murray's Magazine* for a short time in 1890–91 and became editor of *The Fortnightly Review* in 1894. He died in London, Nov. 1, 1928.

Courtney's numerous works include *Studies on Philosophy* (1882); *Life of John Stuart Mill* (1889); *Kit Marlowe* (a drama in blank verse produced at the St. James's Theatre, London, in 1893); *The Passing Hour* (1925).

COURTOIS, JACQUES (1621–1676) and **GUILLAUME** (1628–1679). The two French painters who bore these names are also called by the Italian equivalents Giacomo (or Jacopo) Cortese and Guglielmo Cortese. Each of the brothers is likewise named, from his native province, Le Bourguignon, or Il Borgognone.

Jacques Courtois was born at St. Hippolyte, near Besançon, in 1621. His father, whose pupil he became, was a painter. Towards 1640 he went to Bologna, and studied under Guido; thence he proceeded to Rome, where he entered upon his own characteristic style of art, that of battle-painting, in which he has been accounted to excel all other old masters. Prince Matthias of Tuscany employed Courtois on some striking works in his villa, Lappeggio, representing with much historical accuracy the prince's military exploits. In Venice the artist executed for the senator Sagredo some remarkable battle-pieces. In Florence he entered the Society of Jesus, taking the habit in Rome in 1655. As a Jesuit, Courtois painted many works in churches and monasteries of the society. He lived piously in Rome, and died there on May 20, 1676 (some accounts say 1670 or 1671).

Guillaume Courtois, born likewise at St. Hippolyte, came to Italy with his brother. He went at once to Rome, and entered the school of Pietro da Cortona. He studied also the Bolognese painters and Giovanni Barbieri. He painted the "Battle of Joshua" in the Quirinal gallery and the "Crucifixion of St. Andrew" in the church of that saint on Monte Cavallo; he also executed some etchings. Guillaume Courtois died on June 15, 1679.

COURTRAI, an important and once famous town (Flemish, *Kortrijk*) of west Flanders, Belgium, situated on the Lys. Pop. (est. 1939) 41,320. It is best known for its fine linen, which is retted in the Lys, "the golden river," whose waters possess chemical properties which artificial processes have not yet satisfactorily copied. The lace factories are also important. The prosperity of modern Courtrai cannot compare with what it was in the middle ages, when the population numbered 200,000.

Courtrai, the *Cortracum* of the Romans, ranked as a town from the 7th century onwards. It was destroyed by the Normans, but was rebuilt in the 10th century by Baldwin III. of Flanders, who endowed it with market rights and laid the foundation of its industrial importance by inviting the settlement of foreign weavers.

The Broelbrug, with its towers at either end of the bridge, is a characteristic monument of ancient Flanders. The 16th century town hall, restored in 1846, contains two elaborately carved chimney-pieces. The church of St. Martin (15th century) was practically rebuilt after a fire in 1862. The most important building at Courtrai is the church of Our Lady, which was begun by Count Baldwin IX. in 1191 and finished in 1211. In the chapel behind the choir, which is an 18th century reconstruction, is one of Van Dyck's masterpieces, "The Erection of the Cross." Attached to the church is the chapel of the counts (1373) which contains mural paintings (restored) of the counts and countesses of Flanders.

Battle of Courtrai.—In mediaeval and military history Courtrai is famous for the battle of July 11, 1302, and because of the defeat there inflicted by the despised Flemish burghers upon the chivalry of France. Earlier than the earliest of the victories of the Swiss pikemen, earlier than the triumph of the Scottish pikemen at Bannockburn, still earlier than the successes of English bowmen over French knights in the Hundred Years' War, the experience of Courtrai was so novel and startling as to send a quiver of shocked surprise through the knightly ranks of western Europe. The battle bears a striking resemblance to Bannockburn (*q.v.*). It came about through the French king's action in imprisoning and confiscating the estates of Guy, count of Flanders. The latter's Flemish subjects rose in revolt, but as their levy had only a slight leaven of knights it appeared an easy target for the powerful army which Robert of Artois brought to crush the revolt. On his approach the Flemish army took up a position to cover their siege of Courtrai. This position, as at Bannockburn, was aptly chosen, for the Groeninghebeke covered the front, the Lys guarded the left flank and marshy ground lay on the right. On the other hand, with Courtrai lying on the rear, it gave the Flemings no hope of retreat in case of defeat.

After a preliminary duel across the stream by the rival cross-bowmen, the French vaward, or first line, of cavalry was launched to a frontal attack. The passage through their own cross-bowmen, through the stream and then up the slope beyond disordered the ranks of the men-at-arms. Before they could either reach their enemy or reknit their ranks, the heavy mass of Flemish pikemen was launched forward against them and rolled them backwards. Robert of Artois strove to stop the ebb by infusing his second line. But this also lost impetus and order during its advance and, in the mêlée, suffered such a disadvantage that the horsemen, unseated or with their horses disembowelled, fell easy victims. The Flemings gave no quarter to any knight, and Robert of Artois was himself among the slain, with 63 nobles and 700 knights. When the wreckage was hurled back into the brook, the intact third line and the French foot retired from the field. Legends of all varieties were propagated to explain this defeat of mail-clad knights by mere burghers, but by obscuring the truth of their stupid storm tactics against an enemy who ably used ground, these legends helped to pave the way for the greater disaster of Crécy (*q.v.*).

After the battle as many as 700 pairs of golden spurs were collected on the field from the bodies of French knights and hung up as an offering in an abbey church—which has long disappeared—of the town.

COURTSHIP OF ANIMALS. When we see a peacock spreading his beautiful train to the full, and, occasionally vibrating the quills to produce a rustling sound, turning from side to side before his mate, or a barn-door cock with drooped wing and special call circling close round a hen, we are witnessing familiar examples of animal courtship.

Courtship may be defined to include all forms of action executed by members of one sex to stimulate members of the other sex to sexual activity. Such actions include the display of bright colours, or adornments such as crests; special tactile contacts; dances or other antics; pursuit; music, vocal or instrumental; the discharge of scents and perfumes; and the presentation of prey or of inedible but otherwise stimulating objects.

It is unfortunate that "courtship" is the only term available to denote these activities, since in our own species courtship is usually taken to mean only such as occur before marriage, in

COURTSHIP DISPLAYS OF VARIOUS ANIMALS

1. Elephant seal and females in the breeding season. In the foreground the male is roaring, with proboscis inflated. 2. Mutual display of kagu. Both sexes are alike and display by drooping the wings and raising the crest. 3. Louisiana heron relieving its mate on the nest. 4. Courtship in Spider Astia. The brightly coloured male is posturing on the right before the less brilliant female. 5. Male grasshopper warbler, without brilliant colour for display, bringing an oak-leaf for nest material to the female. 6. Display of male great bustard (*Otis tarda*). The neck is inflated and the white wing-feathers are fully spread. 7. Argus pheasant making display. He spreads his wings and throws them upward and forward to show eye spots and wing quills. 8. Courtship of scorpions. The male and female dance around, holding each other by the claws. After mating, the female usually devours her mate. 9. Nest relief of the brown pelican. The incoming bird is advancing, waving uplifted bill. The bird on the nest points bill downward, flits the wings slowly and utters a low grunting note. 10. Mutual display of adelie penguin. The female stands in a nest. Both drop their flippers and point the head upwards. 11. Courtship in the calobatas fly. While the male (on right) swings his abdomen to one side, the female throws back her head, waiting to be fed

PHASES OF COURTSHIP BEHAVIOUR OF THE GREAT CRESTED GREBE

Two of the characteristic manifestations of the elaborate courtship of the crested grebe, *Podiceps cristatus*, are shown in the foreground of the illustration. The pair of birds on the right are performing the headshaking ceremony, while those on the left are indulging in the "penguin dance," which is not frequently seen. The behaviour of the birds in the background is normal and is observed at all seasons where the species is found

other words those which conduce to the finding of a more or less permanent mate. In most animals, however, marriage (in the sense of the living together of one or more males with one or more females in sexual association for considerable periods of time) does not exist, and in many birds "courtship" displays do not begin until after the selection of mates has taken place. Courtship, in the biological sense, primarily leads up to the act of pairing; where some form of marriage exists, courtship may also, or even primarily, be connected with the choice of mates.

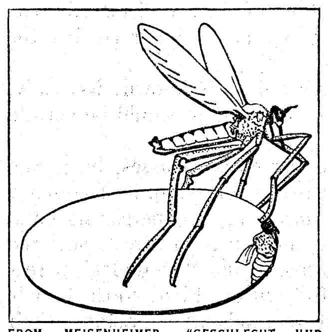
By no means all organisms show even the most primitive form of courtship. It is not present in plants, or in any of the lower groups of animals. A few instances of rudimentary courtship occur in annelid worms, but otherwise it is confined to the vertebrates, the molluscs, and the Arthropods. Even here it is absent from many of the lower sub-divisions of these groups. This becomes intelligible when the function of courtship is more closely looked into. No organism without a nervous system and sense-organs can be expected to show courtship. In other forms, the union of the sexual cells is either entirely a matter of chance; or of simultaneous ripening and discharge (as when all sea-urchins over a wide area discharge eggs and sperm at one time); or of passive transference, as in flower pollination; or of purely reflex reactions. Courtship will only be needed where the active co-operation of the sexes is needed for fertilization to be effected; and this will only be the case where the eggs and sperms are not blindly discharged, but are economized, either by means of internal fertilization or by being discharged in close proximity. Further, courtship will not be required where the nervous organization is so simple that pairing is a simple reflex action; but only when the reflex machinery of pairing is under the control of higher centres in the brain, and the nerve-processes of these centres and their emotional accompaniments need to be stimulated in a particular way before pairing can occur.

Courtship of Invertebrates.—The most primitive type of action which can be called courtship is found in certain marine annelids (bristle-worms) related to the common sandworm *Nereis.* At the breeding season these gather together and the males indulge in extraordinary contortions. These actions, whether by sight, touch, or smell, appear to stimulate the females to shed their eggs, upon which the males discharge their sperm. Certain land snails are among the few molluscs which show courtship; and this in spite of the fact that they are hermaphrodite. They possess a structure called the dart, or *spiculum amoris,* secreted by a special sac. This is discharged with some violence during the preliminaries of mating, and appears to stimulate the other animal, whose skin it may pierce. It might be expected that the highly organized Cephalopods (*q.v.*) would have a striking courtship, but in spite of their peculiar method of fertilization, the meagre reports available do not bear this out.

Although almost all Crustacea have well-developed special sense-organs and internal fertilization, pursuit and forcible capture is usually the only preliminary to mating. In the semi-terrestrial fiddler crabs, however, the males have one enormously enlarged claw, often brilliantly coloured, and this is employed—not as at first surmised, in fights between rival males, or forcibly carrying off females, but in a primitive form of courtship. In the breeding season, if a mature female passes near a sexually eager male, he stands on tiptoe and brandishes his claw in the air. As Pearse says, "the males appear to be proclaiming their maleness." The fiddler crab reacts to three main types of situation—feeding, danger, and reproduction. The brandishing of the male's claw is to the female the visible symbol of the reproductive situation.

A similar proclamation of a "sexual situation" appears also to be the main function of the courtship of male spiders. This, in certain of the hunting spiders (*e.g., Lycosidae, Attidae*), which possess good vision, consists in dances or contortions in which brightly coloured parts are prominently displayed. Web-spinning spiders, however, have poor vision; accordingly in some of them the courting male vibrates a strand of the web in a peculiar way. The importance to the males and to the race of inducing a sexual reaction in the female is here very great, since the female's normal reaction to any small animal would be to attack and devour it. The female does actually sometimes attempt to seize the male as prey, but gradually desists as the courtship proceeds. The male in spiders is occasionally devoured after fertilization. This appears to be the rule in scorpions, in which courtship takes the form of a dance with inter-locked claws.

Insects.—In insects, courtship is not infrequent. In many flies (*e.g., Drosophila, q.v.*) the male vibrates his wings in a special way. Some male butterflies, including the Blues (*Lycaenidae*), have scent-scales on their wings. The most remarkable of scent-producing courtships is that of *Hepialus.* Here the last pair of legs are transformed into organs rather like a powder-puff, normally kept inserted in a pair of pouches lined with scent-producing glands. In courtship the "powder-puffs" are used to throw scent towards the female. The sound-producing organs of grasshoppers and crickets (interesting because they probably produced the first not merely accidental and functionless sounds in the history of life) serve mainly to bring the sexes together; but they doubtless also help to generate a sexual situation. The male of the tree-cricket *Oecanthus* has a unique structure on his back, consisting of a gland capable of secreting a sweet liquid; during courtship he offers this secretion to the female.



FROM MEISENHEIMER, "GESCHLECHT UND GESCHLECHTER IM TIERREICHE" (FISCHER)

COURTSHIP FLIGHT OF EMPIS

In courtship, the males of these small flies present the females with animal prey embedded in a "balloon" of glistening bubbles

Special food of a protein nature is needed by many female insects if their eggs are to undergo their final ripening. Accordingly we find that a number of male insects present animal prey to the females as a part of courtship. In this way, two birds are killed with one biological stone. In some species of little flies of the family *Empidae,* the proffered prey is embedded in a "balloon" of glistening bubbles secreted by the male, and usually larger than himself, which renders him and his gift very conspicuous. In other species a strange modification of this habit has taken place. The balloon is still made and carried, but in place of the prey, bright objects such as flower-petals are placed in it, and the flies will avail themselves of coloured paper if this is provided. This utilization of foreign objects in courtship is only paralleled elsewhere by the bower-birds and man.

Courtship of Vertebrates.—In vertebrates, no courtship appears to exist in Cyclostomes, nor in the majority of fishes. Definite courtship, with striking adornments displayed by the males, is only found in a few fish species with internal fertilization or with peculiar breeding habits. In the Cyprinodonts fertilization is internal; and here the males are often brightly coloured and armed with special prolongations of ventral fin or tail; *e.g.,* in the swordtail (*Xiphophorus*) the handsome breeding males swim excitedly round the females, occasionally giving them a dig with their long tail.

In the sticklebacks there are violent combats between males for the possession of nesting territory, but it is not certain whether display of the bright colours assumed by breeding males has any sexually stimulating effect on the females.

In amphibia the most specialized group (frogs and toads) have no display-courtship, since the males' habit of embracing the females and waiting thus until the eggs are shed, when they discharge their sperm, renders it unnecessary. However, the meeting of the sexes is facilitated by the croaking of the males, which is often very loud owing to the development of huge vocal sacs. Here again possibly, though by no means certainly, the croaking has also a sexually stimulating function. If the chirping of male grasshopper-like insects was the first deliberate sound produced by life, the croaking of male frog-like amphibia was almost certainly life's first vocal music. In the Urodeles, or tailed amphibia, fertilization is internal, and here courtship is not infrequent. It usually consists in the male's rubbing himself against the female, at the same time discharging the secretion of special scent-glands.

It reaches its highest pitch in the European newts—*Molge* (*Triton*) and related genera—where the breeding males are usually brightly coloured, and dance round the females in striking postures while fanning scent from special glands upon them with their tails. The sexually stimulating function of this performance is here very definite. The males of these genera deposit their sperm in a packet or spermatophore, and this must be actually picked up by the female for fertilization to occur. It has been shown that females are quite irresponsive to the presence of isolated spermatophores, but will pick them up when stimulated by the male's performance.

Of reptilian courtship comparatively little is known; its study, especially in the more active lizards and snakes, would be certain to yield many interesting facts.

Mammals.—The two remaining vertebrate classes, birds and mammals, differ considerably in regard to courtship, its frequency and intensity being much greater among birds, whereas its complete or almost complete absence, not infrequently associated with male combat, is commoner in mammals. The biological reasons for this appear to be the following: First, most female mammals, owing to their special method of nourishing their embryonic young, have their reproductive activity very strictly controlled by means of hormones. At certain definite periods the uterus is ready for the embryo's implantation and one or more ova are shed from the ovary; simultaneously, the sexual instincts are strongly stimulated, and the female will readily mate with almost any male, at the same time becoming an object of the males' strong sexual desire owing to an odour specially produced at this period. In other words, the sexual attractiveness of the female and still more her readiness to mate are in the main chemically controlled, the intensity of sexual emotion during the period of "heat" or oestrus being in general very high. In birds, on the other hand, although the sex hormones produced in the breeding female predispose her to sexual emotion, their activity is neither so limited in time nor so intense, while in addition the males are more helpless than in most groups to enforce their desires on an unwilling female. (*See* REPRODUCTION, PHYSIOLOGY OF.)

In most mammals, the cyclical production of female sex hormones thus automatically ensures mating. As a result, both definite courtship and secondary sexual adornments are rare. Since female preference counts for so little, the winning of females by battle will secure them as mates, and consequently size and strength, as of the elephant seal, offensive weapons like stags' antlers or stallions' canines, and defensive weapons like the lion's mane or the baboon's "cape" of long hair are the chief secondary male characters.

In monkeys and apes there appears the tendency, which reaches its climax in civilized man, of emancipating the female's sexual emotions from the strict cyclical control of hormones, and allowing them free play at other times than at oestrus. The mating season is extended over more of the year, and the animals become ready to pair at other periods of the menstrual cycle than oestrus. In such circumstances it would be expected that stimulation by courtship and display would once more become of biological importance, and in point of fact primates do show a number of striking sexual adornments, such as beards, moustaches, or whiskers; bright coloured hair on the face; or brilliantly coloured patches of bare skin on the face and buttocks. Detailed studies of simian courtship would be of great interest. In man, of course, courtship is highly developed, and obviously plays an important biological role; but it cannot be discussed in a purely zoological article.

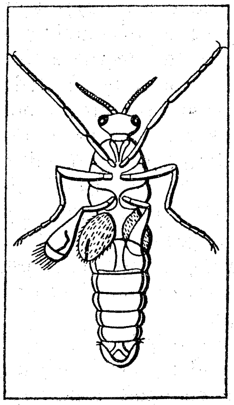
The Courtship of Birds.—It is in birds that courtship is most universal and striking, and its details and its biological significance have been here most thoroughly investigated. Consequently, we can lay down certain general rules as regards the form which courtship takes in birds of different modes of life and reproduction.

(1) The racial function of the male bird may be confined to fertilization (ruff, black grouse); or he may also mount guard during the female's incubation (most ducks); or may also share in feeding the young (most passerines and hawks); or also in incubation (grebes, herons, etc.) The more duties he executes for the good of the offspring, the greater is what may be called his racial value. To kill a male ruff immediately after fertilization has no deleterious effects on the next generation, whereas the death of a male grebe or heron at the same period seriously imperils the chances of the eggs and young.

(2) The "marriage systems" of birds vary from permanent monogamy (parrots, ravens), through monogamy for one season (most monogamous birds) or one brood (some wrens), to polygamy of the "small harem" type (jungle fowl, many pheasants), or of the promiscuous type (ruff, blackcock, probably some birds of paradise).

(3) The need for protection by means of protective coloration and inconspicuous habits varies considerably. Birds which nest gregariously in general need less protection at the nest-site than do birds nesting solitarily.

(4) The need for a continuous supply of food to the naked young of most passerine birds has resulted in the adoption by species of the system of "food-territory" in which the male and later the pair defend from intruders an area of some extent round their nest. (*See* BIRDS: *Reproductive Habits.*)



FROM MEISENHEIMER, "GESCHLECHT UND GESCHLECHTER IM TIERREICHE" (GUSTAV FISCHER)

MALE HISPIALUS HECTUS FROM BELOW

Courtship is modified in various ways with reference to these facts. In general, the less the share of the male in the care of eggs and young, the greater the difference between the sexes in plumage, and the more striking the (exclusively male) courtship behaviour. This is owing to the greater need for sober colouring and inconspicuous behaviour in the female, on whom the whole fate of the brood depends, and the lesser need in the male.

The greater the degree of polygamy, the greater in general the intensity of courtship and the exaggeration of display characters. This is due to the fact that with polygamy the successful males transmit their characters to many offsprings, while the less successful do not transmit their characters at all. Thus the premium on success in mating is greater.

Per contra, where the male plays a part closely similar to that of the female in incubation and care of the young, both sexes tend to be similar in plumage, and often both develop display-characters (crest of crested grebe, plumes of herons), and for the exclusively male courtship to give place to what may be called mutual courtship, in which both sexes take part.

Mutual courtship is often prolonged until the young are no longer under parental care (divers, egrets, grebes, albatrosses). In such cases it is probable that courtship, in addition to its function in raising the level of sexual emotion, has a secondary function as an emotional bond which helps to keep the pair together for the sake of the young.

Then, the greater the need for protection, the less will be the development of bright colours and display-characters. In extreme cases, as in European warblers, the sexes are practically identical in coloration, although the male alone displays in courtship.

In solitary birds with concealed nests, it is rare for courtship to take place near the nest, for fear of revealing its site. When this danger is not of importance, courtship may occur at the nest (*e.g.*, in the rook). It is especially noticeable in gregarious birds with mutual courtship (*e.g.*, pelicans, herons) when a joint ceremony is often performed when one bird relieves its mate on the nest.

Finally, where food-territory exists, many sexual activities are related with the territorial system, and not, as was originally thought, with true courtship. For instance, the song of all our common singing birds is mainly an advertisement to females of the presence of a male in possession of territory, and a warning notice to other males to keep out.

There is often a recrudescence of courtship in a mild form in early autumn when the birds are released from family cares and are still warm and well fed. In some gregarious forms this appears to blend with the remarkable social performances of this season (*e.g.,* stone-curlew). In the oyster-catcher, the same performance is employed both in courtship and to demonstrate sexual or territorial jealousy. When these two motives reinforce each other, this performance may be joined in by a number of birds and assumes in a rudimentary way a social character, as of a human dance.

In courtship, grebes and divers present weeds to their mates, penguins stones, herons sticks, warblers twigs or leaves. In all such cases the objects presented constitute nesting material; it appears that some association occurs between the two pleasurable breeding activities of nest-building and courtship.

Occasionally non-sexual actions are incorporated in courtship. Grebes often give a useless (one might say "ritual") imitation of preening their wings during courtship, and swans behave somewhat similarly. The psychological explanation of this is not easy.

An interesting psychological transference has been noted in the Adelie penguin. The males may present nesting material (stones) not only, as is normal, to the females as part of courtship, but to other organisms which interest them, such as explorers and dogs.

Another type of transference has been observed in a captive male Argus pheasant. The courtship of this species is given to a stationary female. The female with which this male was confined belonged to another species, and would not stand still. The male, after repeated attempts to display before the female, gave up and proceeded to display before his water-trough!

Almost as a matter of course, the mode of life is reflected in courtship. As part of courtship, the males of the fast-flying falcons fly straight at their mates; the golden-eye drake raises a jet of water with his feet; grebes, divers, and various diving ducks use their diving powers to appear from below the surface in striking display-poses close to their mates and so forth.

Bower-Birds.—In some ways the most remarkable courtship known is that of the bower-birds (*q.v.*). These birds clear playgrounds, in which special bowers (quite unlike nests) are constructed by some species. In the playground (if a bower is made opposite its entrance) is deposited a collection of bright objects. The objects differ with the species; they may include silvery leaves, flowers, shells, berries, bones, etc. When the female visits the playground, the male pursues her amorously round it (through the bower, when present). Here it appears that the bright objects collected serve instead of the brilliant plumage of other male birds to stimulate the female.

The details of courtship vary enormously from species to species; a number of special types are figured in the plates. They all have in common two facts. First, the display presents the bird in an unusual aspect; and presumably stimulates by its very unusualness. Secondly, when bright colours or special plumage exists only in one sex, or only during the breeding season, these are in the great majority of cases made specially conspicuous in courtship. Often such characteristics are normally concealed, but made visible only by display.

A great deal still remains to be discovered about courtship, and amateur naturalists can render considerable service to biology by recording the results of intensive observation of the whole courtship period even of quite common species. (*See* SELECTION: *Sexual Selection;* BIRDS; PSYCHOLOGY, COMPARATIVE.)

COUSIN, JEAN (1500–1590), French painter, was born at Soucy, near Sens, and began as a glass-painter, his windows in the Sainte Chapelle at Vincennes being considered the finest in France. As a painter of subject pictures he is ranked as the founder of the French school, as having first departed from the practice of portraits. His "Last Judgment," influenced by Parmigiano, is in the Louvre, and a "Descent from the Cross" (1523) in the museum at Mainz is attributed to him. He was known also as a sculptor and an engraver, both in etching and on wood, his woodcuts for Jean le Clerc's Bible (1596) and other books being his best known work. He also wrote a *Livre de perspective* (1560), and a *Livre de portraiture* (1571).

See Ambroise Firmin-Didot, *Étude sur J. Cousin* (1872), and *Recueil des oeuvres choisies de J. Cousin* (1873).

COUSIN, VICTOR (1792–1867), French philosopher, was born in Paris, in the Quartier St. Antoine, on Nov. 28, 1792. He was educated at the Lycée Charlemagne, and at the age of 18 passed to the Normal School, where he later lectured on Philosophy. In 1815–16 he was assistant to Royer-Collard in the chair of history of modern philosophy. In these early years the influences to which he owed most were those of Laromiguière, who taught the philosophy of Locke and Condillac, Royer-Collard, who introduced him to the Scottish philosophy, and Maine de Biran, on the psychological side. He then began to study German philosophy, especially that of Schelling, whose influence can also be traced in his work. In 1817 he met Hegel at Heidelberg, and in 1818, going to Munich, he met Schelling and Jacobi.

Political changes deprived him of his offices in 1821–22, and he went again to Germany; in Berlin in 1824 he was imprisoned, on some political charge, for six months, and continued under suspicion for three years. During this period of enforced abandonment of teaching his philosophy took definite shape, and in 1826 he published the *Fragmens Philosophiques,* which contains most that is distinctive in his thought. To this period also belong his edition of Proclus (1820–27), and of Descartes (11 vols. 1826), and the beginning of the translation of Plato (13 vols.), which occupied him from 1825–40. In 1828 Cousin and Guizot were recalled to the university, and the three years that followed were the period of his greatest triumph as a lecturer. The hall of the Sorbonne was crowded, and a taste for history revived in France to an extent unknown since the 17th century. Guizot's ministry then made him a member of the Council of Public Instruction, and in 1832 he ceased to lecture. In 1840 he became minister of public instruction under Thiers, remaining at the same time director of the normal school and virtual head of the university.

The most important work he accomplished at this time was the organization of primary education. Owing to his efforts, France followed in this matter the example of Prussia, which he regarded as affording the best example of organized national education. In 1831 he visited Germany to study the system, and his results were published as "Rapport sur l'état de l'instruction publique . . . en Prusse." Then followed the law of primary instruction, which, in the words of the *Edinburgh Review* (July 1833) "marks an epoch in the progress of national education." During this period he also published revised editions of his lectures and studies of various periods in the history of philosophy. In 1854 he published *Du vrai, du beau, et du bien.* At the close of the reign of Louis Philippe he retired from public life. He occupied a suite of rooms in the Sorbonne, and died at Cannes on Jan. 13, 1867.

The three distinctive points in Cousin's philosophy are method, the results of the method, and its application to the history of philosophy. The method is that of observation, analysis and deduction, applied to the facts of consciousness, supplemented by inferences about the nature of reality necessitated by the data of consciousness; this gives us psychology as the basis of metaphysics or ontology. The results to which this method leads are sensibility, activity or liberty and reason. His doctrine of liberty contains a distinction between the spontaneous and reflective activity of the will, while the distinctive point of his theory of reason is the doctrine of the impersonality of reason, which he thought Kant missed by putting necessity as the criterion of the principles of knowledge, and thus making them relative to the human intelligence, and therefore incapable of revealing substantial reality. The primary principles of reason are cause and substance, and by means of these we pass from psychology to ontology, the knowledge of objective reality. From the reciprocally limitative ideas of the *me* and the *not-me* we reach that of the absolute, which is the cause of both.

Finally, he applies the three stages he has discovered, the spontaneous, the reflective and the recognition of the relation of the finite and infinite to the history of philosophy.

Cousin's gifts lay in the direction of observation and generalization rather than analysis or original speculation. He left no distinctive permanent principle of philosophy. But his eclecticism, proceeding as it did from an appreciation of nearly every system of philosophy ancient and modern, was a valuable influence in the direction of toleration and width of view.

Dubois, *Cousin, Jouffroy, Damiron* (1902).

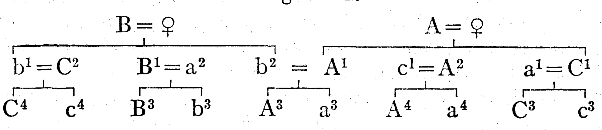
COUSIN, a term of relationship (Late Lat. *cosinus*, perhaps an abbreviation of the classic Latin *consobrinus*). Children of brothers and sisters are to each other first cousins, or cousins-german; the children of first cousins are to each other second cousins; the child of a first cousin is to the first cousin of his father or mother a first cousin once removed.

The word cousin has also, since the 16th century, been used by sovereigns as an honorific style in addressing persons of exalted, but not equal, sovereign rank, the term "brother" being reserved as the style used by one sovereign in addressing another.

COUSIN MARRIAGE. Though among some primitive peoples the marriage of first cousins is strongly deprecated, many consider it the most suitable union and even demand that a man's first wife shall be so related to him. This preference for cousin marriage is found in many parts of Australia, Oceania, Africa and Asia. In North America it is not enjoined, but is freely permitted. There is no conclusive evidence that such peoples suffer in any way from this inbreeding or are inferior physically to those who regard the marriage of first or even more distant cousins as injurious, though the latter aver that such unions result in sterility or the production of weakly children. This disapprobation may even extend to classificatory cousins, as in parts of East Africa, where a man may not take as wife any woman of his mother's clan.

Cross-cousin Marriage.—In European societies all first cousins are regarded as being equally close relatives. Primitive peoples commonly distinguish the offspring of two brothers or two sisters from the offspring of a brother and a sister respectively. The former are technically called parallel or ortho-cousins, the latter cross-cousins. A few tribes do not differentiate between these two for purposes of marriage, but generally, where cousin marriage is enjoined, this refers to *cross-cousins* while *ortho-cousins* are strictly forbidden to mate. In a society based upon the clan organization (*see* RELATIONSHIP TERMS) such a prohibition on one set of ortho-cousins is intelligible for they would belong to the same clan. But this does not explain the *tabu* on both sets, which though not very widespread is found. It may be due to the clan of mother and father being equally important, due possibly to a change in the mode of reckoning descent; or to survival of a time when society contained only two exogamous groups. (*See* diagram I. and art. DUAL ORGANIZATION.)

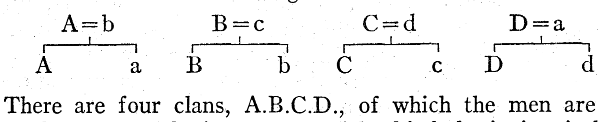
Diagram I.



There are three clans A.B.C. of which the men are represented by A1; A2; . . . the women by a1; a2. . . . Descent is patrilineal. If we take the brother and sister A3, a3, their *cross-cousins* are B3, b3 and C3, c3; while their *ortho-cousins* are A4, a4 and C4, c4. But were there only two clans instead of three their mother's sister, b1 must have married a man of clan A, and her children also would then have belonged to the same clan as A3, a3.

A further distinction is often made between the two types of cross-cousin, the daughters of the father's sister and those of the maternal uncle. Not uncommonly, though marriage with one of these is compulsory, marriage with the other is forbidden. Of the two, it is more usual for the paternal aunt's daughter to be prohibited, though in parts of India, she is the orthodox wife. Owing to the wide expansion of relationship prevalent among those who have the clan organization (*see* RELATIONSHIP TERMS) it is often not clear whether, where cousin-marriage is encouraged, the real or classificatory cousin is usually selected. In the majority of cases a first cousin by genealogical reckoning is preferred, though, failing such an one, a second or a classificatory cousin would be allowed. Thus in a society composed only of three clans, all are directly related; if there are more than three they will still be all linked together though the connection will be indirect. (*See* diagram II.) Cross-cousin marriage is often associated with the Dual Organization of Society (*q.v.*), but it can never bring it about. Cross-cousin marriage which is also associated with marriage by exchange, however, does tend to unite pairs of clans within the community. (*See* EXCHANGE MARRIAGE.)

Diagram II.



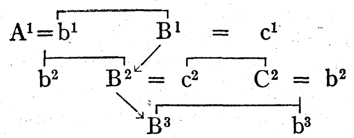
There are four clans, A.B.C.D., of which the men are A.B. . . . the women a. b. A can marry *either* his father's sister's daughter d., *or* his maternal uncle's daughter, b. Similarly B can marry a. *or* c., etc. But A can never take a wife from Clan C nor B one from clan D etc. Where only one cross-cousin is permitted the women of clan A will marry into one clan, *e.g.* D.; the men into the other *e.g.* B.

These inter-clan alliances function clearly in economic and ceremonial life. For instance, in a tribe in Assam which enjoins marriage with the maternal uncle's daughter and prohibits it with the father's sister's daughter, during the death ceremonies the clan of the deceased, that of his wife and that of his sister's husband, each has its appointed part to perform. In Australia marriage is almost entirely conditioned by relationship, not on clan membership, a man's wife being either his mother's brother's daughter or the daughter's daughter of his mother's maternal uncle (real or fictive), which enjoined marriages appear in some tribes to have divided society into four and eight sections respectively.

Though cross-cousin marriage, wherever enjoined, links together both groups and individuals, it cannot be regarded as a single sociological phenomenon. Among some peoples it is an institution for the benefit of the man; in others it safeguards the position of the woman; while in others again it is a duty which both owe for the sake of their respective groups. Where marriageable women are scarce, due to polygyny or female infanticide, or where heavy gifts have to be made for a bride, the difficulty of obtaining a wife is relieved if it is a recognized custom for a man to have preferential right to one of his cousins; and in many parts of the world, especially among patrilineal peoples a father may claim one of his sister's daughters for his son. This does not always imply that the young man can get a wife without giving any bride-price for her, though this happens sometimes, but usually less will be demanded of him, and he may have the power to veto his cousin's marriage to any other man. Elsewhere the institution may chiefly benefit the woman by ensuring her a husband to father her children, and provide her with protection and economic support. In many places however, cross-cousin marriage is enforced for the benefit of the group rather than the individual, for it strengthens the ties between related families or clans, and also prevents the weakening of a group through the loss of its members.

Its most important effect is on the transmission of property. Amongst a matrilineal people a man's heirs are his sister's sons. His own children can receive nothing, however much he may wish them to do so. A partial solution of this conflict between paternal inclination and social duty is obtained by the marriage of his heir with his daughter, which, since he is legal guardian to the former, is generally possible. In this way his daughter will benefit from his wealth. If his son marries his sister's daughter, then his own grandchildren will eventually inherit it. (*See* diagram III.)

Diagram III.



The property passes from B^1 to his sister's son B^2; and if his own son C^2 marries B^2's sister, b^2, it will revert on B^2's death to B^1's grandson B^3.

In parts of the west Pacific where cross-cousin marriage is favoured this desire on the part of a man to provide for his children is given by the natives themselves as the reason for the practice. Similarly, where property is held by the clan constant intermarriage between two or three clans prevents their wealth from being dispersed. The advantages resulting from the customary marriage of cross-cousins, both to the individuals and to society as a whole might have given rise to it in different parts of the world. The least satisfactory theory derives it from a society in which there are two exogamous groups. Where this is found all the women available to a man as a wife belong to the group which contains his cross-cousins and, if matrilineal, his father's sister, or if patrilineal, his mother, and all those who, according to the classificatory system of nomenclature, are included with them. It has been argued that, since a man will tend to choose some one of his own generation, cross-cousin marriage will result. This is purely hypothetical, since a woman of his generation may be many years his senior or his junior, while a woman of the generation above or below may be his contemporary. In a patrilineal community the former might be denied him because classed with his mother, but this would not hold in a matrilineal one. But the strongest argument against this theory is that while it might explain marriage with a classificatory cross-cousin, it does not explain why almost always it is the first cousin who is the prescribed mate. To account for the custom in the west Pacific Dr. Rivers believed that in former times the old men were in the habit of appropriating the young girls as wives for themselves. To provide a mate for his sister's son a man gave him one of his own wives, and later substituted his daughter. This again is hypothetical, though there is some evidence for the practice of marriage with the maternal uncle's wife or widow in this area.

Sir James Frazer argues that a common method of acquiring a wife is for two men to exchange sisters. The children of these two unions would then be cross-cousins. When the boys of the second generation sought for mates, a second exchange of sisters would be effected, thus bringing about a marriage between people who were doubly cross-cousins. (*See* EXCHANGE MARRIAGE.) This cannot be proved, but it affords an explanation of the conditions in many parts of Australia. Nevertheless there are many tribes, such as those of Torres straits and part of New Guinea who practise marriage by exchange, but prohibit the marriage of first cousins.

Ortho-cousin Marriage.—The marriage of ortho-cousins is incompatible with the clan organization, but is enjoined among certain patrilineal peoples who are not so organized, particularly in the form of marriage with the father's brother's daughter. (There is no record of any people who enjoin marriage with the daughter of the maternal aunt.) It is most prominent among the Arabs and is approved by Mohammedans generally, and has been recorded from the Basuto of South Africa. Among the Arabian Bedouins a man has a right to his paternal uncle's daughter. The bride-price he pays for her is less than would be demanded of another man and her father cannot bestow her hand elsewhere without his nephew's consent. It also seems that according to Mohammedan law this type of marriage is something of a duty, to perform which confers religious merit. Two main reasons are put forward for encouraging ortho-cousins to marry. One is a desire to "keep the blood pure" and this is considered especially important among the better class families. The other reason is to prevent property from leaving the family; bride-price and dowry may change hands but the wealth remains within the group of bride and bride-groom. This is probably the reason for the prescribed marriage with the father's brother's daughter in Madagascar, where, though descent is matrilineal and marriage with the mother's sister's daughter therefore incestuous, inheritance is patrilineal. The Arabs maintain that this form of marriage makes for domestic happiness, since the character of the girl is known beforehand, and further, if she should prove refractory her husband will have the support of her father and brothers in quelling her. These reasons are, however, probably rationalizations rather than originators of the custom. For the latter we must look to considerations of family pride and economics.

COUSINS, SAMUEL (1801–1887), English mezzotint engraver, was born at Exeter, May 9, 1801. He was pre-eminently the interpreter of Sir Thomas Lawrence. During his apprenticeship to S. W. Reynolds he engraved many of the best amongst the 360 little mezzotints illustrating the works of Sir Joshua Reynolds. In the finest of his numerous transcripts of Lawrence, such as "Lady Acland and her Sons," "Pope Pius VII." and "Master Lambton," the distinguishing characteristics of the engraver's work, brilliancy and force of effect in a high key, corresponded exactly with similar qualities in the painter. After the introduction of steel for engraving purposes about the year 1823, Cousins and his contemporaries were compelled to work on it, because the soft copper previously used for mezzotint plates did not yield a sufficient number of fine impressions to enable the method to compete commercially against line engraving. The painter-like quality which distinguished the 18th century mezzotints on copper was wanting in his later works, because the hardness of the steel on which they were engraved impaired freedom of execution and richness of tone, and so enhanced the labour of scraping that he accelerated the work by stipple, etching the details instead of scraping them out of the "ground" in the manner of his predecessors. To this "mixed style," previously used by Richard Earlom on copper, Cousins added heavy roulette and rocking-tool textures, tending to fortify the darks, when he found that the "burr" even on steel failed to yield enough fine impressions to meet the demand. The effect of his prints in this method after Reynolds and Millais was mechanical and out of harmony with the picturesque technique of these painters, but the phenomenal popularity which Cousins gained for his works at least kept alive and in favour a form of mezzotint engraving during a critical phase of its history. He died in London, unmarried, on May 7, 1887.

See Algernon Graves, *Catalogue of the Works of Samuel Cousins, R.A.,* (1888); George Pycroft, M.R.C.S.E., *Memoir of Samuel Cousins, R.A., Member of the Legion of Honour* (1899); and Alfred Whitman, *Samuel Cousins* (1904), which contains a catalogue, good illustrations, and much detail useful to the collector and dealer.

COUSTOU, the name of a famous family of French sculptors.

NICOLAS COUSTOU (1658–1733) was the son of a wood-carver at Lyons, where he was born. At 18 he removed to Paris, to study under C. A. Coysevox, his mother's brother, president of the recently established Academy of Painting and Sculpture; and at 23 he gained the Colbert prize, which entitled him to four years' education at the French academy at Rome. He afterwards became rector and chancellor of the Academy of Painting and Sculpture. From 1700 he was an active collaborator with Coysevox at the palaces of Marly and Versailles. His most famous works are "La Seine et la Marne," "La Saône," the "Berger Chasseur" in the Tuileries gardens, the bas-relief "Le Passage du Rhin" in the Louvre, and the "Descent from the Cross" placed behind the choir altar of Notre Dame at Paris.

His younger brother, GUILLAUME COUSTOU (1677–1746), also gained the Colbert prize; but refusing to submit to the rules of the academy, he wandered homeless, through the streets of Rome. At length he was befriended by the sculptor Legros, under whom he studied. Returning to Paris, he was in 1704 admitted into the Academy of Painting and Sculpture, of which he afterwards became director; and, like his brother, he was employed by Louis XIV. His finest works are the famous group of the "Horse Tamers," originally at Marly, now in the Champs Elysées at Paris, the colossal group "The Ocean and the Mediterranean" at Marly, the bronze "Rhône," which formed part of the statue of Louis XIV. at Lyons, and the sculptures at the entrance of the Hôtel des Invalides partly destroyed during the Revolution and subsequently restored.

Another GUILLAUME COUSTOU (1716–1777), the son of Nicolas, was also a sculptor.

See Louis Gougenot, *Éloge de M. Coustou le jeune* (1903); Arsène Houssaye, *Histoire de l'art français au XVIIIe siècle* (1860); Lady Dilke, *Gazette des beaux-arts*, vol. xxv. (1901).

COUTANCES, WALTER OF (d. 1207), bishop of Lincoln and archbishop of Rouen, commenced his career in the chancery of Henry II., was elected bishop of Lincoln in 1182, and in 1184 obtained, with the king's help, the see of Rouen. Throughout his career he was much employed in diplomatic and administrative duties. He started with Richard I. for the Third Crusade, but was sent back from Messina to investigate the charges which the barons and the official class had brought against the chancellor, William Longchamp. The archbishop of Rouen sided with the barons and John, and sanctioned Longchamp's deposition. The Great Council now recognized the archbishop as chief justiciar, and he remained at the head of the government till 1193, when he was replaced by Hubert Walter. The archbishop did good service in the negotiations for Richard's release, but subsequently quarrelled with his master and laid Normandy under an interdict, because the border stronghold of Château Gaillard in the Vexin had been built on his land without his consent. After Richard's death the archbishop accepted John as the lawful heir of Normandy and consecrated him as duke. The archbishop accepted the French conquest of Normandy with equanimity (1204), although he kept to his old allegiance while the issue of the struggle was in doubt.

H. Round, *Commune of London* (1899), and the French poem on *Guillaume le Maréchal* ed. P. Meyer (Soc. de l'Histoire de France, 1891–1901).

COUTANCES, a town of north-western France, capital of an arrondissement of the department of Manche, 7 mi. E. of the English Channel and 58 mi. S. of Cherbourg on the Western railway. Pop. (1936) 6,465. It is beautifully situated on the right bank of the Soulle on a protruding core of granite crowned by the celebrated cathedral of Notre Dame with its three conspicuous towers. The cathedral of Notre Dame is mainly 13th century Gothic, retaining only some pier-bases of the first church consecrated on the site *c.* 1090. The slender turrets massed round the western towers and the octagonal central tower, which forms a lantern within, are conspicuous features. In the interior, which comprises the nave with aisles, transept and choir with ambulatory and side chapels, there are fine rose-windows with stained glass of the 14th century. The church of St. Pierre, rebuilt in the Renaissance, has a graceful dome and an octagonal tower. There is an aqueduct of the 14th century to the west of the town.

Coutances, the ancient Cosedia, was one of the chief pre-Roman towns in the country of the Unelli. In the 3rd century its name was changed to *Constantia,* in honour of the emperor *Constantius Chlorus* by whom it was fortified. It became the capital of the *pagus Constantinus* (*Cotentin*), and in the middle ages was the seat of a viscount, with a long list of sieges from the time of the Conqueror onwards. It has been an episcopal see since the 5th century. In the 17th century it was the centre of the revolt of the *Nu-pieds,* caused by the imposition of the salt-tax (*gabelle*). Coutances is a quiet town with winding streets and pleasant boulevards bordering it on the east. The town is the seat of a bishop, a court of assizes and a sub-prefect, and has tribunals of first instance and of commerce. Leather-dressing and wool-spinning are carried on and there is trade in live-stock and agricultural produce.

COUTHON, GEORGES (1755–1794), French revolutionist, was born in Orcet, Puy-de-Dôme, and was admitted advocate at Clermont in 1785. On the outbreak of the Revolution, Couthon, who was then a member of the municipality of Clermont-Ferrand, published his *L'Aristocrate converti,* advocating constitutional monarchy. He became president of the tribunal of the town of Clermont in 1791, and in September of the same year was elected deputy to the legislative assembly. In Sept. 1792 Couthon was elected member of the national convention, and at the trial of the king voted for the sentence of death without appeal. After some hesitation he joined Robespierre, and became his staunch friend and adherent. He was the first to demand the arrest of the proscribed Girondists. On May 30, 1793, he became a member of the committee of public safety, and in August was sent as one of the commissioners of the convention attached to the army before Lyons. Impatient at the slow progress made by the besieging force, he decreed a *levée en masse* in the department of Puy-de-Dôme, collected an army of 60,000 men, and himself led them to Lyons. When the city was taken, Oct. 9, 1793, although the convention ordered its destruction, Couthon did not carry out the decree, and showed a certain moderation which led to his recall on Oct. 29. The wholesale massacre in the city began only after the arrival on Nov. 3, 1793, of Collot d'Herbois. Couthon returned to Paris and on Dec. 21 was elected president of the convention. He shared in the prosecution of the Hébertists, and promoted the law of the 22nd Prairial, which in the case of trials before the revolutionary tribunal deprived the accused of the aid of counsel or of witnesses for their defence. During the crisis preceding the 9th Thermidor, Couthon remained in Paris, in order, as he wrote, that he might either die or triumph with Robespierre and liberty. Arrested with Robespierre and Saint-Just, his colleagues in the triumvirate of the Terror, he was taken to the scaffold on the same cart with Robespierre on July 28, 1794 (10th Thermidor).

See Fr. Mège, *Correspondance de Couthon . . . suivie de "l'Aristocrate converti," comédie en deux actes de Couthon* (1872), and *Nouveaux Documents sur Georges Couthon* (Clermont-Ferrand, 1890); also F. A. Aulard, *Les Orateurs de la Législative et de la Convention,* ii. 425–443 (1885–86).

COUTTS, THOMAS (1735–1822), English banker and founder of the banking house of Coutts & Co., was born on Sept. 7, 1735. He was the fourth son of John Coutts (1699–1751), lord provost of Edinburgh in 1742, who carried on a business in corn and negotiated bills of exchange. Soon after the death of John Coutts the business was divided into two branches, one carried on in Edinburgh, the other in London. The banking business in London was in the hands of James and Thomas Coutts, sons of John Coutts. From the death of his brother in 1778, Thomas, as surviving partner, became sole head of the firm; and under his direction the banking house was firmly established. He died in London on Feb. 24, 1822.

See C. Rogers, *Genealogical Memoirs of the Families of Colt and Coutts* (1879); and R. Richardson, *Coutts & Co.* (1900).

COUTURE, THOMAS (1815–1879), French historical and *genre* painter, was born at Senlis (Oise), and studied under Baron A. J. Gros and Paul Delaroche, winning a Prix de Rome in 1837. His masterpieces were his "Romans in the Decadence of the Empire" (1847), now in the Luxembourg, and his "Love of Money" (1844), at Toulouse.

COUVADE, a custom so called in Béarn (literally a "brooding," from Fr. *couver,* to hatch), requiring that the father, at and sometimes before the birth of his child, shall retire to bed and fast or abstain from certain kinds of food, receiving the attentions generally shown to women at their confinements. The existence of the custom in ancient classical times is testified to by Apollonius Rhodius, Diodorus (who found it among the Corsicans), and Strabo (who noticed it among the Spanish Basques, by whom, as well as by the Gascons, it has been said to be observed, though the most recent researches entirely discredit this). Marco Polo relates its observance in Chinese Turkistan. It is found in China, India, Assam, Borneo, Siam, Africa and the Americas. In certain of the Baltic provinces of Russia the husband, on the lying-in of the wife, takes to his bed and groans in mock pain. In East Anglia, a curiously obstinate belief survives (the prevalence of which in earlier times is proved by references to it in Elizabethan drama) that the pregnancy of the woman affects the man, and the young husband who complains of a toothache is assailed by pleasantries as to his wife's condition.

In explanation of the custom, E. B. Tylor traced in it the transition from the matriarchal to the patriarchal system of tribe-organization. Thus, the couvade arose in the father's desire to emphasize the bond of blood between himself and his child. In some countries the father has to purchase the child from its mother; and in the Roman ceremony of the husband raising the baby from the floor we may trace the savage idea that the male parent must formally proclaim his acceptance of and responsibility for the offspring. The explanation of the American Indians, as indeed of many peoples who practise it, is that if the father engaged in any hard or hazardous work, *e.g.* hunting, or was careless in his diet, the child would suffer and inherit the physical faults and peculiarities of the animals eaten. Obviously as Professor Westermarck shows there is the idea "that there is an intimate relationship" between father and child such that the activities of the father affect the child. Tabus of this nature are found both in matrilineal and in patrilineal groups.

Enthoven, 1926).

COVE. A small inlet or sheltered bay in a coast-line. In English dialect a cave or recess in a mountain-side. The use of the word was first confined to a small chamber or inner recess in a room or building. Hence the particular application in architecture (*q.v.*) to any kind of concave moulding. The term "coving" is given in half-timbered work to the curved soffit under a projecting window, or carrying the gutter of a house. The slang use of "cove" for any male person, like a "fellow," "chap," is found in the form "cofe" in T. Harman's *Caveat for Cursetors* (1587) and other early quotations, *cf.* the Scots word "cofe," a pedlar, hawker.

COVED, an architectural term applied to the concave curved juncture of two surfaces: thus a coved ceiling is one which is flat or nearly flat in the centre, but joins the walls by means of a concave sweep. A coved moulding, or cove, is any small moulding with a concave profile, particularly when the profile approximates a quarter circle.

COVELLITE, a mineral species consisting of cupric sulphide, CuS, crystallizing in the hexagonal system. It is of less frequent occurrence in nature than chalcocite, the orthorhombic cuprous sulphide. Crystals are rare, the mineral being usually found as compact and earthy masses or as a blue coating on other copper sulphides. The dark indigo-blue colour is a characteristic feature, and the mineral was early known as indigo-copper (Ger. *Kupferindig*). The name covellite is taken from N. Covelli, who in 1839 observed crystals of cupric sulphide encrusting Vesuvian lava, the mineral having been formed here by the interaction of hydrogen sulphide and cupric chloride, both of which are volatile volcanic products. Covellite is, however, more commonly found in copper-bearing veins, where it has resulted by the alteration of other copper sulphides, especially chalcopyrite. It is found in many copper mines. (L. J. S.)

COVENANT, a mutual agreement of two or more parties, or an undertaking made by one of the parties. In Old Testament theology the word connotes a strongly-binding agreement, *e.g.*, the covenant between Abimelech and Isaac; even more particularly a covenant between God and man (Gen. xv. 17).

The word is used by Johannes Cocceius (*q.v.*) to describe his "covenant" or "federal" theology, based on the two covenants of works or life made by God with Adam, on condition of obedience, and of grace or redemption, made with Christ. In Scottish ecclesiastical history, covenant appears in the two agreements signed by the members of the Scottish Church in defence of their religious and ecclesiastical systems (*see* COVENANTERS).

The Ulster Covenant was a solemn pledge undertaken throughout the province of Ulster in Ireland on Sept. 27, 1912, by the followers of Sir Edward (Lord) Carson (*q.v.*) in his opposition to Home Rule (*see* IRELAND: *History*).

Covenant is also in English law a word which has been used in a variety of senses. In its strict sense, covenant means an agreement *under seal,* that something has or has not already been done, or shall or shall not be done hereafter (Shep. *Touchstone,* 160, 162). The person who makes, and is bound to perform, the promise or stipulation is the covenantor: the person in whose favour it is made is the covenantee.

A covenant is said to be *express* when it is created by the express words of the parties to the deed declaratory of their intention. It is not indispensable that the word "covenant" should be used. Any word which clearly indicates the intention of the parties to covenant will suffice. An *implied* covenant, or *covenant in law,* "depends for its existence on the intendment and construction of law. There are some words which of themselves do not import an express covenant, yet, being made use of in certain contracts, have a similar operation and are called covenants in law; and they are as effectually binding on the parties as if expressed in the most unequivocal terms" (Platt on *Covenants,* p. 40). The Conveyancing Act 1881 (now ss. 76 and 77 of the Law of Property Act 1925) provides that in conveyances for valuable consideration, certain covenants are to be implied, although not specified in the instrument. All these statutory implied covenants "run with the land" (*see* LANDLORD AND TENANT). The distinction between *real* and *personal* covenants is that the former do, while the latter do not, run with the land. When a covenant relates to an act already done, it is usually termed a covenant *executed;* where the performance is future, the covenant is termed *executory.* The *covenant for seisin* was an assurance to the grantee that the grantor had the estate which he purported to convey. In England it is now included in the covenant for right to convey; but it is still in separate use in several States in the United States. The *covenant to stand seised to uses* was an assurance by means of which, under the Statute of Uses [1536], a conveyance of an estate might be effected. It is now obsolete, the Statute of Uses having been repealed by the Law of Property Act 1925.

The term "covenant" is unknown to Scots law. But its place is filled to some extent by the doctrine of "warrandice." Many of the British colonies have legislated, as to the implication of covenants for title, on the lines of the English Conveyancing Act 1881. *See* Burgés, *Colonial and Foreign Laws,* 2nd ed., vol. ii. pl. ii.

As to covenants in restraint of trade *see* RESTRAINT.

In the United States, some of the states have abolished the distinction between sealed and unsealed instruments, and where such has been done, an action of covenant may be brought upon any writing operating as a deed, or where debt or assumption might have been maintained before the abolition of such distinction. Statutory modifications have been made in many of the states as to the method of bringing the action. (*See* further LEAGUE OF NATIONS.)

COVENANTERS. Covenants or bands of a secular character, binding the subscribers to common action, were a feature of Scottish history previous to the Reformation. The first religious covenant dates from Dec. 1557, when the leading adherents of the Reformation bound themselves to maintain the evangelical movement in Scotland. A quarter of a century later (1581) another, drawn up by John Craig and largely signed, was the outcome of a widespread fear of a Romanist reaction. Its renewal in 1638, under the name of the National Covenant, was occasioned by the determination of Charles I. in the previous year to impose a new liturgy on the Church of Scotland without asking the consent of the Scottish parliament or the General Assembly. His action aroused a storm of opposition and Johnston of Warriston suggested the revival of the Covenant of 1581 with additions to meet the special situation. As thus expanded it condemned all recent and previous ecclesiastical innovations as subversive of the Reformation and the laws and liberties of the kingdom, and bound its subscribers to forbear the practice of, and resist them until they had been considered in a free parliament and assembly.

The consequence was the abolition of episcopacy by the General Assembly, which met at Glasgow in November in spite of the prohibition and withdrawal of the royal commissioner, the marquess of Hamilton. In the face of this drastic defiance of the royal authority, Charles determined to repress the movement by force, but his attempt to overawe the army of the Covenanters miscarried and he was fain to negotiate and agree to withdraw the service book and ratify whatever a new General Assembly should decree (June 18, 1639). The Assembly renewed the abolition of episcopacy and the Parliament, under the leadership of the earl of Argyll, not only abetted its action, but passed measures materially limiting the royal authority. An invasion of England in the summer of 1640 to enforce acceptance compelled Charles to summon the Long Parliament, and thus the Covenanters, by their resolute action against his arbitrary rule in Scotland, contributed to initiate the great struggle against this rule in England. In this struggle they ultimately intervened on the side of the parliament on the basis of the Solemn League and Covenant, which stipulated that the constitution of the Anglican Church should be reformed according to the Word of God and the example of the best Reformed Churches (Sept. 1643).

On this condition the covenanting army took an active part in the great civil war which resulted in the surrender of Charles to it in May 1646. On his refusal to accept the Solemn League and Covenant the Scots handed him over to the commissioners of the English parliament. Ultimately he went the length of agreeing in the "Engagement" to the provisional establishment of Presbyterianism in England as the price of securing their intervention in his favour, but the concession was nullified by Cromwell's defeat of the Scottish army at Preston in 1648. After his execution in 1649 the Covenanters transferred their allegiance to Charles II. on condition of his subscribing the Solemn League and Covenant. But Cromwell's conquest of Scotland put an end to his kingship for the time being and greatly weakened the covenanting régime.

The Restoration of 1660 was followed by the abrogation of all the acts in favour of Presbyterianism, the restoration of episcopacy, and the execution of its most obnoxious opponents. Thereafter came 25 years of brutal repression, during which the more extreme Covenanters several times rose in rebellion and ultimately in a couple of declarations renounced allegiance to a tyrannic king. So embittered and fanatic did a section of them become that they refused to recognize the ecclesiastical settlement of the revolution of 1689, which re-established the Presbyterian Church government but did not renew the Covenants. Though narrow and doctrinaire in the maintenance of their religious convictions, they deserve the credit of defending civil liberty throughout those years of arbitrary and despotic government.

COVENT GARDEN, a site north of the Strand, London, England, occupied by the principal flower, fruit and vegetable market in the metropolis. This was originally the so-called "convent garden" belonging to the abbey of St. Peter, Westminster. In the first half of the 17th century the garden was laid out as a square by Inigo Jones, with a piazza on two sides; this garden is mentioned in Restoration plays as a fashionable resort. The first stalls and sheds were set up there about 1656. Covent Garden Theatre (1858) is the chief seat of grand opera in London. The site has carried a theatre since 1733, but earlier buildings were burnt in 1809 and 1856.

COVENTRY, SIR JOHN (d. 1682), grandson of Thomas, Lord Keeper Coventry, was returned to the Long Parliament in 1640 as member for Evesham. During the Civil War he served for the king, and at the Restoration was knighted. In 1667, and in the following parliaments of 1678, 1679 and 1681, he was elected for Weymouth, and opposed the government. On Dec. 21, 1670, owing to his jest in the House of Commons on the subject of the king's amours, Sir Thomas Sandys and others, by the order of Monmouth, and (it was said) with the approval of the king himself, waylaid him as he was returning home and slit his nose to the bone. The outrage led to the passing of the "Coventry Act" declaring assaults accompanied by personal mutilation a felony without benefit of clergy.

COVENTRY, THOMAS COVENTRY, 1ST BARON (1578–1640), lord keeper of England, entered Balliol college, Oxford, in 1592, and was admitted at the Inner Temple in 1594. He became recorder of London in 1616. Returned to parliament for Droitwich in 1621, he became attorney-general, and in 1625 lord keeper of the great seal. It thus fell to him to deliver to the Commons the famous reprimand of March 29, 1626, in which the king declared that parliament had "liberty of counsel" but not "liberty of control." Coventry was raised to the peerage in 1628. At the opening of parliament in that year he threatened the use of the royal prerogative if the Commons withheld supplies. On the whole, however, he showed moderation in presenting the king's policy; but he was better as a judge than as a statesman, and in the Star Chamber he prevented many illegal and tyrannical practices. He must be remembered, for instance, for having prevented the hanging of men for resistance to the pressgangs, pointing out that the men were not under martial law until they were actually enlisted. Coventry died on Jan. 14, 1640.

BIBLIOGRAPHY.—S. R. Gardiner, *History of England 1603–1642,* 10 vol. (1883–84); Earl of Clarendon, *History of the Rebellion,* vol. i. (6 vol. ed. W. Dunn Macray, 1888).

COVENTRY, SIR WILLIAM (*c.* 1628–1686), British statesman and son of Thomas, Lord Coventry, entered Queen's college, Oxford, but during the Civil War went to France where he vainly attempted to secure foreign assistance for the royalists. In 1660 he was appointed secretary to James, duke of York, lord high admiral of England, and headed the royal procession when Charles entered London in triumph. He was returned to the parliament of 1661 for Great Yarmouth, became commissioner for the navy in 1662 and in 1663 was made D.C.L. of Oxford. While his ability and energy did little to avert the naval collapse, which was due chiefly to mismanagement and ill-advised appointments, Coventry repudiated the charges of corruption and of responsibility for the Dutch War of 1665 made by the old chancellor Clarendon, and Pepys in his diary supports this repudiation. In 1665 Coventry was knighted and made a privy councillor, and was subsequently admitted to the committee on foreign affairs. His speeches in the House of Commons led to Clarendon's resignation on Aug. 31, 1667, but two days later, he himself left the duke's service and terminated his connection with the navy. Clarendon was succeeded by the brilliant but unscrupulous and incapable duke of Buckingham, who soon brought about the exclusion of Coventry from the cabinet council, and in 1669, his expulsion from the privy council and the Treasury. The real cause of his dismissal was clearly the final adoption by Charles of the policy of subservience to France and desertion of Dutch and Protestant interests. However, Coventry still retained his ascendancy in the Commons. He retired in 1679 and died unmarried on June 23, 1686.

Coventry's writings include *England's Appeal from the Private Cabal at Whitehall to the Great Council of the Nation . . .* published anonymously in 1673 and reflecting his opinion on the French entanglement; *A Letter to Dr. Burnet giving an Account of Cardinal Pool's Secret Powers . . .* (1685); and a number of papers now among the Ashburnham mss. and the Longleat mss.

See A. C. Foxcroft: *Life of Geo. Saville, Marquis of Halifax* (1898); *Hist. mss. Comm. Rep.* iv., v., vi.; Clarendon's *Life and Continuation* (Oxford, 1857); *Calendar of Clarendon Papers;* Wood's *Athenae;* and Pepys's *Diary* and *Pepysiana* (ed. Wheatley, 1903).

COVENTRY, a city, county and parliamentary borough of Warwickshire, England; 94 mi. N.W. of London, on L.M.S.R. Pop. (1938) 213,000. Area 30 sq.mi. Coventry stands on a small hill with higher ground to the west, at the confluence of the Sherbourne and the Radford brook, tributaries of the Avon. Of its ancient fortifications two gates and some portions of the wall are still extant. The German air raids of November 1940 and April 1941 caused vast destruction in Coventry. The centre of the town was laid waste, and about 70,000 houses were damaged. St. Michael's, the cathedral church, a fine Perpendicular building, was ruined except for the 303 ft. steeple. Likewise, all that remained of modern Christ church was the ancient spire of Grey Friars church, to which it was attached. The early 16th century, half-timbered Ford hospital was also seriously damaged. Buildings left standing were Holy Trinity church, a Perpendicular cruciform structure with a lofty steeple; St. John's or Bablake church, which is nearly a parallelogram on the ground plan, but is cruciform in the clerestory, with a central tower; and St. Mary's hall, which was erected by the united guilds in the early 15th century. The principal chamber, above a fine crypt, has a carved oak roof.

Coventry (*Coventreu, Coventre*) owed its existence to the foundation of a Benedictine monastery by Earl Leofric and his wife Godgyfu (Lady Godiva [*q.v.*]), in 1043. The manor, which in 1066 belonged to the latter, descended to the earls of Chester and to Robert de Montalt, and from him passed to Isabella, queen of Edward II, and the crown.

Ranulf, earl of Chester, granted the earliest extant charter to the town in 1153. This, with further privileges, was confirmed by Henry II in 1177, and by nearly every succeeding sovereign until the 17th century. In 1345, Edward III gave Coventry a corporation. It first sent two representatives to parliament in 1295. The prior's market on Fridays was probably of Saxon origin; a second market was granted in 1348, while fairs were obtained in 1217, 1348 and in 1442. As early as 1216 Coventry was important for its trade in wool, cloth and caps, its guilds later being particularly numerous and wealthy.

In 1568 Flemish weavers introduced new methods, but the trade was destroyed in the wars of the 17th century. The arrival of the Flemish weavers, who often had strong religious views, helped to make Coventry in the subsequent centuries a stronghold of Puritanism.

The popular phrase "to send to Coventry" (*i.e.,* to refuse to associate with a person) is of uncertain derivation. Clarendon (*History of the Great Rebellion,* 1647) states that the citizens of Birmingham rose against certain small parties of the king's supporters, and sent the prisoners they captured to Coventry. Coventry acquired such a reputation for its dyeing that the expression "as true as Coventry blue" became proverbial. Existing industries are the making of motor cars, cycles and their accessories, for which Coventry is one of the chief centres in Great Britain; ribbons, watches, cotton, elastic web, trimmings and alpaca and coach laces are also important. There are extensive iron foundries and brickworks.

After 1910 a great manufactory of artificial silk and electrical apparatus grew up. During World Wars I and II the making of munitions and war material took precedence over other manufactures.

The free grammar school, now a secondary school, founded in the reign of Elizabeth, is in modern buildings (1885). There are a technical school, a school of art, endowed charity schools and many charitable foundations. Swanswell and Spencer parks were opened in 1883, and a recreation ground in 1880. The boundaries of Coventry were considerably extended in 1932. Many street improvements were carried out, a new by-pass road being opened in 1939, while a city airport was established in 1936. A county of itself from 1452 to 1842, the town became a county borough in 1888. The parliamentary borough returns one member. In 1894 a suffragan bishopric of Coventry was established under the see of Worcester, but was for a time discontinued until Coventry was created a separate diocese in 1918.

See *Victoria County History, Warwick;* William Dugdale, *The Antiquities of Coventre, illustrated from records* (Coventry, 1765).

COVENTRY, a town of Kent county (R.I.), U.S.A., 15 mi. S.W. of Providence, on Flat river, and served by the New York, New Haven and Hartford railroad. The population in 1940 (federal census) was 6,998. Cotton and woollen goods are manufactured. Coventry was settled about 1700, and was set off from the town of Warwick in 1742.

COVER. In speculative stock and share transactions, a term employed to signify a "deposit made with a broker to secure him from being out of pocket in the event of the stocks falling against his client and the client not paying the difference" (*In re* Cronmire, 1898, 2 Q.B. 383). It is a mode of speculation engaged in almost entirely by persons who wish to limit their risk to a small amount, and, generally, the transactions are carried out in England with "outside" brokers, *i.e.* those dealers in securities who are not members of the Stock Exchange. The deposit is so much per cent. or per share; in the United States it is referred to as the margin. Cover is not money deposited to abide the event of a wager, but as security against a debt which may arise from a gaming contract, and it may be recovered if unappropriated. (*See* BUCKET-SHOP.)

Cover, in military language, is any means, natural or artificial, of concealment from view or protection from fire. For covered way *see* FORTIFICATION AND SIEGECRAFT.

COVERDALE, MILES (1488?–1569), English translator of the Bible and bishop of Exeter, was born of Yorkshire parents about 1488, studied philosophy and theology at Cambridge, was ordained priest at Norwich in 1514, and then entered the convent of Austin friars at Cambridge. Here he came under the influence of the prior, Robert Barnes, made the acquaintance of Sir Thomas More and of Thomas Cromwell, and began a thorough study of the Scriptures. He was one of those who met at the White Horse tavern to discuss theological questions, and when Barnes was arrested on a charge of heresy, Coverdale went up to London to assist him in drawing up his defence. Soon afterwards he left the convent, assumed the habit of a secular priest, and began to preach against confession and the veneration of images. In 1531 he graduated bachelor of canon law at Cambridge, but from 1528 to 1534 he prudently spent most of his time abroad. No corroboration has, however, been found for Foxe's statement that in 1529 he was at Hamburg assisting Tyndale in his translation of the Pentateuch. In 1534 he published two translations of his own, the first Dulichius's *Vom alten und newen Gott,* and the second a *Paraphrase upon the Psalms,* and in 1535 he completed his translation of the Bible. The venture seems to have been projected by Jacob van Meteren, who apparently employed Coverdale to do the translation, and Froschover of Zürich to do the printing. No perfect copy is known to exist, and the five or six which alone have title-pages give no name of publisher or place of publication. The volume is dedicated to the king of England, where Convocation at Cranmer's instance had, in Dec. 1534, petitioned for an authorized English version of the Scriptures. As a work of scholarship it does not rank particularly high. Some of the title-pages state that it had been translated out of "Douche" (*i.e.,* German) and "Latyn": and Coverdale mentions that he used five interpreters, which are supposed to have been the Vulgate, the Latin version of Pagninus, Luther's translation, the Zürich version, and Tyndale's Pentateuch and New Testament. There is no definite mention of the original Greek and Hebrew texts; but it has considerable literary merit, many of Coverdale's phrases are retained in the authorized version, and it was the first complete Bible to be printed in English. Two fresh editions were issued in 1537, but none of them received official sanction. Coverdale was, however, employed by Cromwell to assist in the production of the Great Bible of 1539, which was ordered to be placed in all English churches. The work was done at Paris until the French Government stopped it, when Coverdale and his colleagues returned to England early in 1539 to complete it. He was also employed in the same year in assisting at the suppression of superstitious usages, but the reaction of 1540 drove him once more abroad. His Bible was prohibited by proclamation in 1542, while Coverdale himself defied the Six Articles by marrying Elizabeth Macheson, sister-in-law to Dr. John MacAlpine.

For a time Coverdale lived at Tübingen, where he was created D.D. In 1545 he was pastor and schoolmaster at Bergzabern in the duchy of Pfalz-Zweibrücken. In March, 1548 he was at Frankfurt, when the new English Order of Communion reached him; he at once translated it into German and Latin and sent a copy to Calvin, whose wife had befriended Coverdale at Strassburg. Calvin, however, does not seem to have approved of it so highly as Coverdale.

Coverdale was already on his way back to England, and in Oct. 1548 he was staying at Windsor Castle, where Cranmer and some other divines, inaccurately called the Windsor Commission, were preparing the First Book of Common Prayer. His first appointment had been as almoner to Queen Catherine Parr, then wife of Lord Seymour; and he preached her funeral sermon in Sept. 1548. He was also chaplain to the young king and took an active part in the reforming measures of his reign. He was one of the most effective preachers of the time. A sermon by him at St. Paul's on the second Sunday in Lent, 1549, was immediately followed by the pulling down of "the sacrament at the high altar." A few weeks later he preached at the penance of some Anabaptists, and in Jan. 1550 he was put on a commission to prosecute Anabaptists and all who infringed the Book of Common Prayer. In 1549 he wrote a dedication to Edward for a translation of the second volume of Erasmus's *Paraphrases;* and in 1550 he translated Otto Wermueller's *Precious Pearl,* for which Protector Somerset, who had derived spiritual comfort from the book while in the Tower, wrote a preface.

Perhaps it was his gift of oratory which suggested his appointment as bishop of the refractory men of Devon and Cornwall. He had already, in Aug. 1549, at some risk, gone down with Lord Russell to turn the hearts of the rebels by preaching and persuasion, and two years later he was appointed bishop of Exeter by letters patent, on the compulsory retirement of his predecessor, Veysey, who had reached an almost mythical age. He was an active prelate, and perhaps the vigorous Protestantism of the West in Elizabeth's reign was partly due to his persuasive powers. He sat on the commission for the reform of the canon law, and was in constant attendance during the parliaments of 1552 and 1553. On Mary's accession he was at once deprived on the score of his marriage, and Veysey in spite of his age was restored. Coverdale was called before the privy council on Sept. 1, and required to find sureties; but he was not further molested, and when Christian III. of Denmark at the instance of Coverdale's brother-in-law, MacAlpine, interceded in his favour, he was in Feb. 1555, permitted to leave for Denmark with two servants, and his baggage unsearched; one of these "servants" is said to have been his wife. He declined Christian's offer of a living in Denmark, and preferred to preach at Wesel to the numerous English refugees there, until he was invited by Duke Wolfgang to resume his labours at Bergzabern. He was at Geneva in Dec. 1558, and is said to have participated in the preparation of the Geneva version of the Bible.

In 1559 Coverdale returned to England and resumed his preaching at St. Paul's and elsewhere. Clothed in a plain black gown, he assisted at Parker's consecration, in spite of the facts that he had himself been deprived, and did not resume his bishopric, and that his original appointment had been by the uncanonical method of letters patent. Conscientious objections were probably responsible for his non-restoration to the see of Exeter, and his refusal of that of Llandaff in 1563. He objected to vestments, and at his living of St. Magnus close to London Bridge, which he received in 1563, he took other liberties with the Act of Uniformity. His bishop, Grindal, was his friend, and his vagaries were overlooked until 1566, when he resigned his living rather than conform. He still preached occasionally, and always drew large audiences. He died in Feb. 1568, and was buried on the 19th in St. Bartholomew's behind the Exchange. When this church was pulled down in 1840 to make room for the new Exchange, his remains were removed to St. Magnus.

Coverdale's works, most of them translations, number twenty-six in all; nearly all, with his letters, were published in a collected edition by the Parker Soc. (1846). An excellent account is given in the *Dict. Nat. Biog.* of his life, with authorities, to which may be added R. W. Dixon's *Church History,* Bishop and Gasquet's *Edward VI. and the Book of Common Prayer;* Acts of the Privy Council; Letters and Papers of Henry VIII.; *Lit. Rem. of Edward VI.* (Roxburghe Club); Whittingham's *Brief Discourse of Troubles at Frankfurt;* Pocock's *Troubles connected with the Prayer-Book* (Camden Soc.).

(A. F. Po.)

COVERING FIRE, a military term to express small arm or artillery fire by one unit of troops or arm (*q.v.*) to distract the enemy's attention, and, if possible, subdue his fire, in order that another unit or arm may advance or retire with minimized loss.

COVERLEY, SIR ROGER DE, a name taken by Steele (*q.v.*) from the north country tune "Roger of Coverley" and applied to the country member of the club where his Spectator studied human nature. In the second number of the *Spectator* he is introduced as "a gentleman of Worcestershire of ancient descent. His great-grandfather was the inventor of that famous country dance which is named after him. He is now in his 56th year, cheerful, gay and hearty, rather beloved than esteemed." But Addison soon took the character into his own hands and developed it with subtler observation and humour than Steele ever had at command. The knight became less hearty and, if equally beloved, more estimable. Of the 30 papers in which his character and surroundings are pictured 20 are by Addison, eight by Steele, two by Budgell. In his courtesy and simplicity he shows some kinship with Don Quixote (*q.v.*) but his politics and churchmanship, like his paternal activity as master, landlord and magistrate are native. The creation of Sir Roger marks and probably assisted the evolution of the boorish, hard-living Stuart squire into the benevolent, well-mannered and cultivated country gentleman which was the 18th century ideal. In *Tom Jones* and again in *Rob Roy* the two types are shown in sharp contrast, and the great popularity of Addison as a moralist may have contributed to the victory of the humaner and more civilized way of life.

COVERTURE, a term in English law applied to the condition of a woman during marriage, when she is supposed to be under the cover, influence and protection of her husband. (*See* further HUSBAND AND WIFE.)

COVILHÃ, a town of Portugal on the eastern slope of the Serra da Estrella, and on the Abrantes-Guarda railway. Pop. (1940) 19,213. Covilhã, which has been often compared with a collection of swallows' nests clinging to the rugged granitic mountain side, is shaped like an amphitheatre of closely crowded houses, overlooking the river Zezere and its wild valley from a height of 2,180ft. Over 4,000 operatives are employed in the manufacture of *saragoça,* a coarse brown cloth worn by the peasantry throughout Portugal.

COVILHAM (COVILHÃO, COVILHÃ), **PERO** or **PEDRO DE,** Portuguese explorer and diplomatist (*fl.* 1487–1525), was a native of Covilhã in Beira. In early life he had gone to Castile and entered the service of Alphonso, duke of Seville; later, when war broke out between Castile and Portugal, he returned to his own country and attached himself to King Alphonso V. and his successor John II. On May 7, 1487, he was despatched, in company with Affonso de Payva, on a mission of exploration in the Levant and adjoining regions of Asia and Africa, with the special object of learning where "cinnamon and other spices could be found," as well as of discovering the land of Prester John, by "overland" routes. Bartholomeu Diaz (*q.v.*) at this time was seeking the same country by sea (*see* GEOGRAPHY). The explorers started from Santarem and travelled by the way of Barcelona to Naples; thence they went to Rhodes, and so to Alexandria and Cairo, where they posed as merchants. In company with certain Moors from Fez and Tlemçen they went by way of Tor to Suakin and Aden, where they parted, Covilham proceeding to India and Payva to Ethiopia—agreeing to meet again in Cairo. Covilham thus arrived at Cannanore and Calicut, whence he retraced his course to Goa and Ormuz, the Red Sea and Cairo, making an excursion on his way down the East African coast to Sofala, which he was probably the first European to visit. At Cairo he heard of Payva's death, and met Rabbi Abraham of Beja and Joseph, a shoemaker of Lamego, who had been sent by King John with letters for Covilham and Payva. By Joseph of Lamego, Covilham replied with an account of his Indian and African journeys, and of the observations on the cinnamon, pepper and clove trade at Calicut, together with advice as to the ocean way to India. This he truly represented as quite practicable. The first objective in the eastern ocean, he added, was Sofala or the Island of the Moon, our Madagascar—"from each of these lands one can fetch the coast of Calicut." With this information Joseph returned to Portugal, while Covilham, with Abraham of Beja, again visited Aden and Ormuz. At the latter he left the rabbi, and himself came back to Jidda, the port of the Arabian holy land, and penetrated even to Mecca and Medina. Finally, by Mt. Sinai, Tor and the Red Sea he reached Zeila, whence he struck inland to the court of Prester John (*i.e.*, Abyssinia). Here he was honourably received but he was not permitted to leave. When the Portuguese embassy under Rodrigo de Lima, including Father Francisco Alvarez, entered Abyssinia in 1520, Covilham wept with joy at the sight of his fellow-countrymen. It was then 40 years since he had left Portugal, and over 30 since he had been a prisoner of state in "Ethiopia." Alvarez praises his power of vivid description "as if things were present before him," and his extraordinary knowledge of "all spoken languages of Christians, Moors and Gentiles." His services as an interpreter were valuable to Rodrigo de Lima's embassy; but he never succeeded in escaping from Abyssinia.

See Francisco Alvarez, *Verdadera Informaçam das terras do Preste Joam.* esp. chs. 73, 89, 98, 102, 103, 105 (pp. 177, 224, 254, 264, 265–270, 275, of the Hakluyt Society's English edition, *The Portuguese Embassy to Abyssinia . . . 1520–1727,* 1881); an abstract of this, with some inaccuracies, is given in Major's *Prince Henry the Navigator,* pp. 339–340 (1868).

COVIN, a term used in English law for a secret agreement between persons to cheat and defraud. The word has been superseded by "collusion" or "conspiracy to cheat and defraud."

COVINGTON, the second largest city of Kentucky, U.S.A., on the Ohio river at the mouth of the Licking, opposite Cincinnati; one of the county seats of Kenton county. It is on federal highways 25 and 42, is served by the Chesapeake and Ohio and the Louisville and Nashville railways, and by river steamers. The population was 65,252 in 1930 (native white population 59,870) and was 62,018 by federal census, 1940. The city is built on a plain, partly surrounded by hills, and has many fine residences and spots of scenic beauty. It is the seat of a Roman Catholic bishopric; the cathedral (St. Mary's) contains one of the largest stained-glass windows in the world. Beautiful Devou park extends over 550 ac. The suspension bridge across the Ohio, built between 1856 and 1866, is 2,252 ft. long. Across the Licking river is Newport (*q.v.*). Covington is the trade centre of an extensive district engaged in agriculture, the chief crops being tobacco, corn, wheat and alfalfa, and stock-raising (including thoroughbred horses).

It has substantial manufactures, notably of X-ray machinery, cigars and tobacco, cigar boxes, textiles, cordage, architectural iron, steel, iron fence, boilers, safes and locks, machinery, furniture, Christmas tree ornaments and paper products. It has several breweries, and wines are produced.

Covington is under the commission form of government. A settlement was made there in 1812, and in 1815 a town was laid out, and named after Gen. Leonard Covington (1768–1813) who was mortally wounded at Chrystler's field during the War of 1812. The city was chartered in 1834.

COVINGTON, a town in the western part of Virginia, U.S.A., is the county seat of Alleghany county. It is on federal highways 60 and 220, and the Chesapeake and Ohio railway. Pop. (1920) 5,623 (1,136 Negroes); (1930) 6,538; (1940) 6,300 not including suburbs, which would raise the total population to 12,000. It has a pulp and paper plant employing 1,750 men, a rayon plant employing 1,200, a weaving mill and other industries. The town was settled about 1822 and was incorporated in 1842. It has a city-manager form of government.

COWANS, SIR JOHN STEVEN (1862–1921), British general, was born on March 11, 1862, at Carlisle, passed through Sandhurst and the Staff college, and held many important staff positions in England and India. In 1912 he became quartermaster-general, and in 1913 was created K.C.B. The outbreak of the World War thus found Cowans in charge of the provision of food, housing, transport and equipment of troops. This task assumed gigantic dimensions as the war went on and the armies grew. He continued to direct the department until March 1919. In that year he was promoted general, and received the G.C.M.G. and G.C.B. He died at Mentone on April 16, 1921.

See O. Rutter, *General Sir John Cowans* (1924).

COWARD, NOEL (1899–), English playwright and actor, was born at Teddington on Dec. 16, 1899, and was educated privately. He made his stage debut as a child, and developed into a competent actor. As a playwright his skilful management of dialogue and his frank avowal of certain modern tendencies quickly won him recognition as one of the most brilliant of the younger dramatists.

Among Coward's most successful plays have been *Fallen Angels* and *Hay Fever* (1925); *Easy Virtue* (1926); *Private Lives* (1930); *Design for Living* (1933).

Cavalcade (1932), a historical play, differs from most of his other work, and proved, perhaps, his greatest success. Coward's extraordinary versatility is further evidenced by a number of musical plays and revues, for some of which he composed the music. Such productions include *This Year of Grace* (1928), *Bitter Sweet* (1929), and *Words and Music* (1932). His autobiography, *Present Indicative,* appeared in 1937.

COWBANE: *see* Water Hemlock.

COWBIRD, applied to the species of the genus *Molothrus* and especially to the migratory N. American *M. ater.* They belong to the passerine family Icteridae and, like the old world cuckoos, are parasitic and lay their eggs in the nests of other birds. From southern Texas to southern California there is a smaller subspecies, the dwarf cowbird (*M. a. obscurus*) while northward to Manitoba and British Columbia ranges the Nevada cowbird (*M. a. artemisiae*). The bronzed cowbird (*Tangavius aeneus*) is found in Arizona and Mexico; its subspecies, the red-eyed cowbird (*T. a. involucratus*), glossy black with brassy reflections, is abundant from southern Texas to Panamá. The bay-winged cowbird (*M. badius*) of Argentina builds a nest of its own.

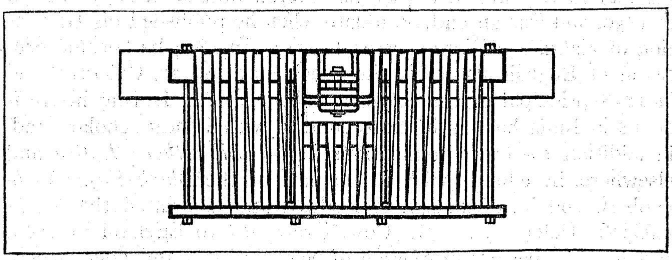
COWBRIDGE, a market town and municipal borough of Glamorganshire, Wales, with a station on the G.W.R. branch from Llantrisant to Aberthaw, 12 mi. W. of Cardiff and 7 mi. S.E. of Bridgend; pop. (est. 1938) 1,036. Area, .1 sq.mi. The town lies in a wide valley at a bridging of the Thaw, probably on the Roman road from Cardiff westwards.

After the Norman conquest Cowbridge grew up as an appanage of the castle of St. Quentin, half a mile S.W. It was walled round before the 13th century, and the south wall and gateway still remain.

During the Tudor and Stuart periods Cowbridge was almost the chief town of Glamorgan. A borough by prescription until 1682, the town was then incorporated by Charles II. The corporation was dissolved in 1883, but a new charter was granted in 1887. From 1536 to 1832 it was a contributory parliamentary borough, and from 1832 to 1918 returned a member contributorily with Cardiff and Llantrisant.

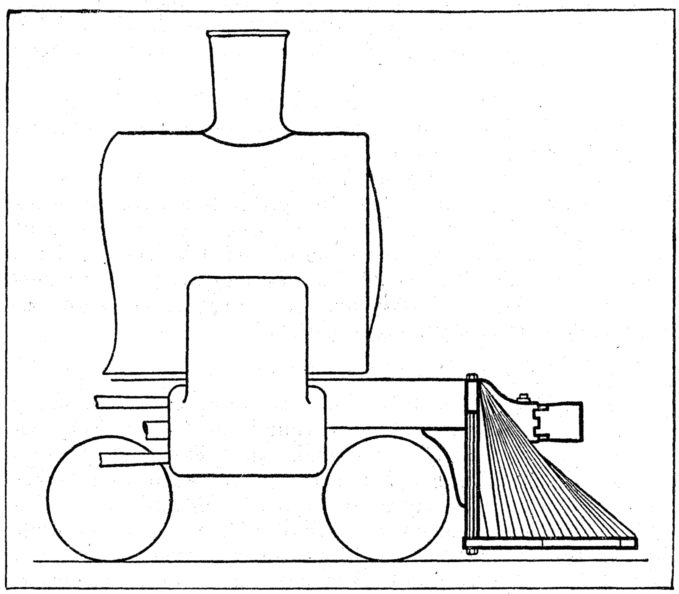
Since 1918 it has been included in the Pontypridd parliamentary area. The buildings of the grammar school, re-founded in 1685, were erected in 1847 by Jesus college, Oxford, by which body the school is administered. St. Mary's church, of early English style, has a fine embattled tower. The town is now wholly agricultural, and has good markets and cattle fairs.

COWCATCHER, also termed a cattle-guard or pilot, a steel framework which is V-shaped in plan and attached to the



Detail of a cowcatcher from the front

front beam of a locomotive or rail-coach. It is necessary in countries where the lines are unfenced or unprotected. The diagram shows the construction, with a central coupling. Tramcars are also fitted thus in some countries, and the idea has been adopted to a slight extent for motor-vehicles. The ordinary guard in European designed locomotives is just two steel bars hanging down from the framing to within a couple of inches or so of the line; in the case of bogies the guards, of course, are attached to their frames. American locomotives which are not stream-lined ordinarily have V-shaped extensions from the drop frame.



SIDE ELEVATION SHOWING COWCATCHER ON FRONT OF ENGINE

COWDENBEATH, a small burgh, Fifeshire, Scotland, $5\frac{3}{4}$ mi. N.E. of Dunfermline by the L.N.E.R. Pop. (est. 1938) 12,440. The principal industry is coal mining, with which its prosperity has been linked. Meetings in connection with the adoption and promulgation of the Covenant were held in the old parish church of Beath. It is included with Dunfermline, Inverkeithing and Lochgelly in the Dunfermline group of burghs, returning one member to parliament.

COWDRAY, WEETMAN DICKINSON PEARSON, 1st VISCOUNT (1856–1927), was born at Shelley Woodhouse (Yorks.), July 15, 1856, and educated privately at Harrogate. He entered the family firm of S. Pearson & Co., contractors, ultimately becoming its head. Under him the firm greatly extended, undertaking many important contracts and acquiring large interests in Mexico and South America. In 1895 he was elected Liberal member for Colchester, holding his seat until 1910. In 1894 he was created a baronet, and in 1910 was raised to the peerage. He was in 1917 made president of the Air Board, and the same year was created a viscount. He was elected lord rector of Aberdeen university in 1918. He died on May 1, 1927.

COWELL, EDWARD BYLES (1826–1903), English Sanskrit scholar, was born at Ipswich on Jan. 23, 1826. He entered the business of his father, who was a merchant and maltster, employing his leisure in oriental and other studies. He was a friend and correspondent at this period of Edward Fitzgerald (*q.v.*). He was already married when he entered Magdalen hall, Oxford, in 1850, and was an undergraduate when he published his translation of Kālidāsa's *Vikramorvasī* (1851). In 1854 he became professor of English history in the Presidency college, Calcutta, and in 1858 principal of the Sanskrit college there. During his residence in India he was in close contact with Hindu scholars and, in addition to many publications in the *Bibliotheca Indica* and elsewhere, he edited (with Roer) part of the *Black Yajur Veda* (vols. i. and ii., 1858–64), and edited and translated the *Kusumāñjali* (Calcutta, 1864). Cowell returned to England in 1864, and in 1867 became professor of Sanskrit at Cambridge, where he lived until his death (Feb. 9, 1903).

Among Cowell's works are: A translation, with A. E. Gough, of the *Sarva-Darśana-Saṃgraha* (1882); an edition, with R. A. Neil, of the *Aśvaghosha* (1893, trans. 1894); a translation, with F. W. Thomas, of the *Harṣacarita of Bāna* (1897).

See G. Cowell, *Life and Letters of Edward Byles Cowell* (1904), where a full bibliography of his works is given; and a notice by F. W. Thomas in the *Dict. Nat. Biog.* (*Supplement* for 1901–11).

COWELL, JOHN (1554–1611), English jurist, was born at Ernsborough, Devonshire. He was educated at Eton, and King's College, Cambridge, ultimately becoming professor of civil law and master of Trinity Hall. In 1607 he compiled a law dictionary, *The Interpreter,* in which he exalted the king's prerogative so much that he was prosecuted before the House of Commons by Sir Edward Coke, and saved from imprisonment only by the interposition of James I. His book was burnt by order of the House of Commons. Dr. Cowell also wrote *Institutiones Iuris Anglicani.* He died at Oxford on Oct. 11, 1611.

COWEN, SIR FREDERIC HYMEN (1852–1935), composer, was born at Kingston, Jamaica, on Jan. 29, 1852. At the age of four he was brought to England, where his father became treasurer to the opera at Her Majesty's theatre and private secretary to the earl of Dudley. His first teacher was Henry Russell, and his first published composition appeared when he was but six years old. He studied the piano with Benedict, and composition with Goss; in 1865 he was at Leipzig under Hauptmann, Moscheles, Reinecke and Plaidy. Returning home on the outbreak of the Austro-Prussian War, he had an overture played at the Promenade Concerts at Covent Garden in September 1866. In the following autumn he went to Berlin, where he was under Kiel, at Stern's conservatorium. A symphony and a piano concerto were given in St. James's Hall in 1869, and thenceforward his claims as a composer were generally recognized. His cantata, *The Rose Maiden,* which enjoyed great popularity in its day, was given in London in 1870, his second symphony by the Liverpool Philharmonic Society in 1872, and his first festival work, *The Corsair,* in 1876 at Birmingham. In that year his opera, *Pauline,* was given by the Carl Rosa Company, but with only moderate success. In 1884 he conducted five concerts of the Philharmonic Society, and in 1888, on the resignation of Arthur Sullivan, he became, till 1892, the regular conductor of the society, this being one of many posts which he subsequently occupied. He received a knighthood in 1911.

Cowen's works include:—Operettas: *Garibaldi* (1860) and *One Too Many* (1874); operas: *Pauline* (1876), *Thorgrim* (1890), *Signa* (Milan, 1893), and *Harold* (1895); oratorios: *The Deluge* (1878), *St. Ursula* (1881), *Ruth* (1887), *Song of Thanksgiving* (1888), *The Transfiguration* (1895); choral works: *The Rose Maiden* (1870), *The Corsair* (1876), *The Sleeping Beauty* (1885), *St. John's Eve* (1889), *The Water Lily* (1893), *Ode to the Passions* (1898), *The Veil* (1910), besides short cantatas for female voices; a large number of songs, ranging from the popular "ballad" to more artistic lyrics, anthems, part-songs, duets, etc.; six symphonies, among which No. 3, the "Scandinavian," has had the greatest success; four overtures; suites, *The Language of Flowers* (1880), *In the Olden Times* (1883), *In Fairyland* (1896); four English dances (1896); a concerto for piano and orchestra, and a fantasia for the same played by M. Paderewski (1900); a quartet in C minor, and a trio in A minor, both early works; pianoforte pieces, etc.

COWEN, JOSEPH (1831–1900), English orator, politician and journalist, son of a Northumberland mine-owner, Sir Joseph Cowen, was educated at Edinburgh university. From an early age he showed rare gifts of eloquence and enthusiasm on behalf of advanced democracy at home and liberty abroad. He sympathized with the Chartists and his close friendship after 1848, "the year of revolutions," with Kossuth, Mazzini, Garibaldi, Herzen, with the Polish exiles and the Irish Nationalists, was the chief influence on his life. He made generous and sometimes daring efforts to help what he thought the righteous conspiracies in Europe and revolts against oppression. Accordingly he was intensely anti-tsarist and his subsequent course was, in him, consistent. He entered the House of Commons in 1874 for Newcastle-on-Tyne. His eloquence was impassioned and vivid if too ornate, but his independence soon became disturbing. He caused consternation amongst the Liberals by championing, against Gladstone, Disraeli's policy towards Russia in the Eastern crisis. His differences with the Liberal Party extended to other questions and became irreconcilable. Though he always called himself a radical he was a strong individualist. He was both an ardent pioneer of Imperial Federation and an advocate of Home Rule for Ireland long before the same position was taken up by Cecil Rhodes. After the Home Rule split in the Liberal Party he retired from parliament, but continued to play an important part in politics through his newspaper, *The Newcastle Daily Chronicle,* which he made famous among provincial journals, and by his strong personal influence in northern England. His non-party orations in this period were his best, and as a journalist his style, unlike his earlier elaborate speaking, was as remarkable for simplicity as for force and phrase. He died on Feb. 18, 1900.

See E. R. Jones, *Life and Speeches of J. Cowen* (1885); W. Duncan, *Joseph Cowen* (1904); *Joseph Cowen's Speeches* ed. by his daughter (1909).

COWES, a seaport and watering place in the Isle of Wight, England, 11 mi. S.S.E. of Southampton. West Cowes is separated from East Cowes by the picturesque estuary of the river Medina, the two towns (which were combined as an urban district in 1933) lying on opposite sides of its mouth at the apex of the northern coast of the island. Pop. (1938) 15,440. Area 8.7 sq.mi. The port between them is the chief on the island, and is the headquarters of the Royal Yacht squadron (founded in 1812); it is in regular steamship communication with Southampton and Portsmouth and Ryde. West Cowes is served by the S.R. A steam ferry across the Medina, here 600 yards broad, unites the towns. Higher up the river is a floating bridge. The towns owe their origin to two forts built on each side of the mouth of the Medina by Henry VIII. in 1540 for coast defense. There are shipbuilding yards and engineering works. On the opposite side of the Medina is East Cowes castle, an 18th century mansion, and beyond it Osborne House, built in 1845 by Queen Victoria.

COWL (O.E. *cufle,* Med. Lat. *cucullа,* from Lat. *cucullus,* a hood; Dutch *keuvel*), a mantle with a hood, worn by monks; hence the phrase "to take the cowl," signifying entry upon the religious life. The word is also used for the hood alone, which in some orders is detached from the cloak. The early Egyptian anchorites wore a cowl covering only head and neck; but the two cowls (thick in winter and thin in summer) which St. Benedict prescribed for his monks (*c.* 530) were hooded cloaks, the length of which was restricted by St. Benedict of Aniane (d. 821) to two cubits. The council of Vienne (1311) defined the cowl (*cuculla*) as "a habit long and full without sleeves," as distinct from the wide-sleeved frock (*floccus*).

The word "cowl" is also applied to a hood-shaped covering to a chimney or ventilating shaft (*see* VENTILATION).

COWLES, HENRY CHANDLER (1869–1939), American botanist, was born in Kensington, Conn., on Feb. 27, 1869. He graduated at Oberlin college in 1893 and pursued further study at the University of Chicago, from which in 1898 he received the degree of doctor of philosophy. He was instructor in botany from 1902 to 1907, assistant professor from 1907 to 1911, and associate professor from 1911 to 1915, when he was made professor, at the University of Chicago, in which in 1925 he became chairman of the department of botany. He was one of the foremost pioneer investigators in plant ecology in America, and made valuable researches in physiographic and comparative ecology, especially the ecological relations of dune vegetation. He also made important contributions on the floristics of the Chicago region and on trees as indicators of past topographic conditions. His writings include *Vegetation of Sand Dunes of Lake Michigan* (1899); *Plant Societies of Chicago* (1901); *Textbook of Plant Ecology* (1911); *Plant Societies of Chicago and Vicinity* (1913). He was editor of *Botanical Gazette* 1925–34.

COWLEY, ABRAHAM (1618–1667), English poet, was born in the City of London, the son of a stationer. While he was still at Westminster school, his poetical *Blossoms,* containing some remarkable work, appeared. He went up to Trinity College, Cambridge, and in his first year there produced a Latin comedy. On March 12, 1641, his comedy *The Guardian,* recast and printed in 1663 as *The Cutter of Colman Street,* was acted at Trinity before Prince Charles, afterwards Charles II. About this time he wrote his *Davideis* (printed in 1656), an epic in rhymed heroic verse.

Cowley became a fellow of Trinity College, Cambridge, but was ejected by the Parliamentarians in 1643. He made his way to Oxford, where he enjoyed the friendship of Lord Falkland, and obtained the personal confidence of the royal family. After the battle of Marston Moor he followed the queen to Paris, and the exile so commenced lasted 12 years. On behalf of the Stuarts he performed several dangerous journeys into Jersey, Scotland, Flanders and Holland. He ciphered and deciphered with his own hand the greater part of all the letters that passed between Henrietta Maria and Charles I. In 1647 a collection of his love verses, entitled *The Mistress,* was published, and in the next year a spurious volume of satires, *The Four Ages of England,* was brought out under his name. On his return to England in 1656, he published a volume of his collected poetical works, which included the *Pindarique Odes,* the *Davideis, The Mistress,* and some *Miscellanies.* Among the latter are to be found Cowley's most vital pieces. This section of his work opens with the famous aspiration:

> What shall I do to be for ever known,
> And make the coming age my own?

It contains elegies on Wotton, Vandyck, Falkland, William Hervey and Crashaw, the last two being among Cowley's finest poems; the amusing ballad of *The Chronicle,* giving a fictitious catalogue of his supposed amours; various gnomic pieces; and some charming paraphrases from Anacreon. The *Pindarique Odes* contain weighty lines and passages. The long cadences of the Alexandrines with which most of the strophes close, continued to echo in English poetry from Dryden down to Gray, but the *Odes* themselves, which were found to be obscure by the poet's contemporaries, immediately fell into disesteem. *The Mistress* was the most popular poetic reading of the age, and is now the least read of all Cowley's works. It was the last and most violent expression of the amatory affectation of the 17th century.

Soon after his return to England he was seized in mistake for another person, and only obtained his liberty on a bail of £1,000. Late in 1658 Cowley took advantage of the confusion after the death of Cromwell to escape to Paris, where he remained until the Restoration brought him back in Charles's train. He published in 1663 *Verses upon several occasions,* in which *The Complaint* is included.

Through his friend, Lord St. Albans, Cowley obtained a property near Chertsey, and here, devoting himself to the study of botany, and buried in his books, he lived in comparative solitude until his death. He took a great and practical interest in experimental science, and his pamphlet on *The Advancement of Experimental Philosophy* (1661) advocated the foundation of the Royal Society, to which body Cowley, in March 1667, at the suggestion of Evelyn, addressed an ode which is the latest and one of the strongest of his poems. He died in the Porch House, in Chertsey, on July 28, 1667, and was buried in Westminster Abbey. His *Poëmata Latina,* including six books "Plantarum," were printed in 1668.

As a prose writer, and especially as an essayist, he holds, and will not lose, a high position in literature; as a poet Johnson justly said of him that "if he left versification yet improveable, he left likewise from time to time such specimens of excellence as enabled succeeding poets to improve it."

BIBLIOGRAPHY.—The works of Cowley were collected in 1668, when Thomas Sprat, afterwards bishop of Rochester, brought out a splendid edition in folio, to which he prefixed a life of the poet. A *Second Part* containing the early works was added in 1681. There were many reprints of this collection, which formed the standard edition till 1881, when A. B. Grosart edited Cowley's works in two volumes, for the Chertsey Worthies library. Cowley's *Poems* and *Essays* were edited by A. R. Waller (1905 and 1906); other partial editions are: A. B. Gough, *Essays and other prose writings* (1915); *Essays,* ed. J. Rawson Lumby, revised by A. Tilley (1923); *The Mistress, with other select poems,* ed. J. Sparrow (1926); *Anacreon done into English, by A. Cowley and S.B.* (1923).

COWLEY, HANNAH (1743–1809), English dramatist, and poet, daughter of Philip Parkhouse, a bookseller at Tiverton, Devonshire, was born in 1743 and died at Tiverton, March 11, 1809. She married a captain in the East India Dock Company's service, who died in 1797. Between 1776 and 1795 she wrote 13 plays, of which *The Belle's Stratagem* (1782) for many years kept the stage.

COWLEY, HENRY WELLESLEY, 1st Earl (1804–1884), British diplomatist, eldest son of the 1st Baron Cowley and nephew of the duke of Wellington, was born on June 17, 1804. After holding various diplomatic posts he succeeded the 1st marquess of Normandy as ambassador in Paris in 1852. This post he held for 15 years. He conducted the negotiations on the Eastern question which preceded and followed the Crimean War, and assisted Cobden in the negotiation of the commercial treaty of 1860 between France and England. He received an earldom in 1857, and died on July 15, 1884.

COWLEY FATHERS, the name commonly given to the members of the Society of Mission Priests of St. John the Evangelist, an Anglican religious community, the headquarters of which are in England, at Cowley St. John, close to Oxford. The society was founded in 1865 by the Rev. R. M. Benson "for the cultivation of a life dedicated to God according to the principles of poverty, chastity and obedience."

COWPENS, a town of Spartanburg county, S.C., U.S.A., in the N. part of the state. Pop. (1930) 1,115; (1940) 1,343. It is served by the Southern railway. In colonial days cattle were rounded up and branded here—whence the name. Seven miles N. of the town is the field of the battle of Cowpens, fought on Jan. 17, 1781, during the Revolutionary war, between the Americans under Gen. Daniel Morgan and the British under Col. (later Gen. Sir) Banastre Tarleton, the British being defeated. A monument was erected on the battlefield in 1859, but was defaced during the Civil War. A second, larger monument was erected in June 1932. The town was founded in 1876, and incorporated in 1880.

COWPER, WILLIAM (1731–1800), English poet, was born in the rectory (now rebuilt) of Great Berkhamsted, Herts., on Nov. 26 (O.S. 15), 1731. His father, the Rev. John Cowper, was rector of the parish as well as a chaplain to George II., and his mother, Ann Donne, belonged to the same family as John Donne, the poet. His grandfather was that Spencer Cowper who, after being tried for his life on a charge of murder, lived to be a judge of the court of common pleas, and whose elder brother became lord chancellor and Earl Cowper, a title which became extinct in 1905.[1]

On his mother's death, when he was six, William Cowper was sent to boarding-school, to a Dr. Pitman at Markyate, a neighbouring village. From 1738 to 1741 he was placed in the care of an oculist, as he suffered from inflammation of the eyes. In the latter year he was sent to Westminster school. Among his most intimate friends seems to have been Sir William Russell. To one of his masters, Vincent Bourne, he was much attached. Later, he translated Bourne's Latin verses into English. It was at the Markyate school that he suffered the tyranny that he commemorated in *Tirocinium.* His days at Westminster, Southey thinks, were "probably the happiest in his life." Much of his time was spent in reading Homer, Milton, and Cowley. He left Westminster in 1748, and in 1749 entered a solicitor's office in Ely place, Holborn. Here he had Thurlow, the future lord chancellor, as a fellow-clerk. The years in Ely place were rendered happy by frequent visits to his uncle Ashley's house in Southampton row, where he fell deeply in love with his cousin Theodora Cowper. At 21 he took chambers in the Middle Temple, where we first hear of the melancholies that accompanied him periodically through manhood. He was called to the bar in 1754. In 1759 he removed to the Inner Temple and was made a commissioner of bankrupts. His attachment to his cousin Theodora ended unhappily. Her father, possibly influenced by Cowper's melancholy tendencies, perhaps possessed by prejudices against the marriage of cousins, interposed, and the lovers were separated —as it turned out for ever. During three years he was a member of the Nonsense Club with his two schoolfellows from Westminster, Charles Churchill and Robert Lloyd, and wrote sundry verses and made a translation (no longer extant) of two books of Voltaire's *Henriade.* A crisis occurred in Cowper's life when his cousin Major Cowper nominated him to a clerkship in the House of Lords. It involved a preliminary appearance at the bar of the house. The prospect drove him insane; he attempted suicide and all but succeeded. His friends were informed, and he was sent to a private lunatic asylum at St. Albans, where he remained for 18 months under the charge of Dr. Nathaniel Cotton, the author of *Visions.* Upon his recovery he removed to Huntingdon (June 1765) in order to be near his brother John, who was a fellow of St. Benet's college, Cambridge. His illness had cut him off from all his old friends save only his cousin Lady Hesketh, Theodora's sister; but new acquaintances were made, the Unwins being the most valued. This family consisted of Morley Unwin (a clergyman), his wife Mary, and his son (William) and daughter (Susannah). The son struck up a warm friendship, which his family shared. Cowper entered the circle as a boarder in November (1765). All went serenely until in July 1767 Morley Unwin was thrown from his horse and killed. A short time before this event the Unwins had received a visit from the Rev. John Newton, the evangelical curate of Olney in Buckinghamshire, with whom they became friends. Newton suggested that the widow and her children with Cowper should take up their abode in Olney. This was achieved in the closing months of 1767. Here Cowper lived for 19 years. His residence in the market place was converted into a Cowper museum 100 years after his death, in 1900. Here his life went on its placid course, interrupted only by the death of his brother in 1770, until 1773, when he again became deranged. This second attack interrupted the contemplated marriage of Cowper with Mary Unwin, whose daughter had married a Mr. Powley. The fact of the engagement was kept secret in later years in order to spare the feelings of Theodora Cowper, who thought that her cousin had remained as faithful as she had done to their early love.

On this second attack of melancholy Cowper was moved to the vicarage, and again treated by Dr. Cotton. As soon as he recovered he returned to his home at Orchard Side, and in 1776 was perfectly normal, recommencing his correspondence with his friends. In 1779 appeared the *Olney Hymns,* written in conjunction with Newton, Cowper's verses being indicated by a "C." Newton had left Olney in 1780. He had exercised a profound influence on Cowper, who had helped him in visiting the sick and in parish work, which was undoubtedly a strain on the poet's nerves. It was only after Newton's removal that he turned to secular poetry, at the suggestion of Mrs. Unwin. It is evident that the release from the religiosity of the Newton circle had improved his mental health. In 1782, when he was 51 years old, there appeared *Poems of William Cowper of the Inner Temple, Esq.; London, Printed for J. Johnson, No. 72 St. Paul's Churchyard.* The volume contained "Table Talk," "The Progress of Error," "Truth," "Expostulation," and much else that survives to be read in our day by virtue of the poet's finer work. This finer work was partly the outcome of his friendship with Lady Austen, a widow who, on a visit to her sister, the wife of the vicar of the neighbouring village of Clifton, made the acquaintance of Cowper and Mrs. Unwin. The three became great friends. Lady Austen determined to give up her house in London and to settle in Olney. She suggested *The Task* and inspired *John Gilpin* and *The Royal George.* But in 1784 the friendship was at an end, doubtless through Mrs. Unwin's jealousy of Lady Austen. Cowper's second volume appeared in 1785: *The Task: A Poem in Six Books. By William Cowper of the Inner Temple, Esq.; To which are added by the same author An Epistle to Joseph Hill, Esq., Tirocinium or a Review of Schools, and the History of John Gilpin: London, Printed for J. Johnson, No. 72 St. Paul's Churchyard; 1785.* His first book had been a failure, one critic even declaring that "Mr. Cowper was certainly a good, pious man, but without one spark of poetic fire." This second book was an instantaneous success, and indeed marks an epoch in literary history. But before its publication—in 1784—the poet had commenced the translation of Homer.

In 1786 his life at Olney was cheered by Lady Hesketh taking up a temporary residence at the vicarage there. The cousins met after an interval of 23 years, and Lady Hesketh was to be Cowper's good angel to the end, even though her letters disclose a considerable impatience with Mrs. Unwin. At the end of 1786

[1]An ancestor, John Cooper, an alderman of London (d. 1609) thus spelt his name, and all the family from that day to this, including the poet, have so pronounced it.

a removal was made to Weston Underwood, the neighbouring village which Cowper had frequently visited as the guest of his Roman Catholic friends the Throckmortons. This was to be his home for yet another ten years. Here he completed his translation of Homer, materially assisted by Mr. Throckmorton's chaplain Dr. Gregson. There are six more months of insanity to record in 1787. In 1790, a year before the *Homer* was published, commenced his friendship with his young cousin John Johnson, known to all biographers of the poet as "Johnny of Norfolk." Johnson also aspired to be a poet and visited his cousin armed with a manuscript. Cowper discouraged the poetry but loved the writer, and the two became great friends. New friends were wanted, for in 1792 Mrs. Unwin had a paralytic stroke and henceforth she was a hopeless invalid. A new and valued friend of this period was Hayley, famous in his own day as a poet and in history for his association with Romney and Cowper. He was drawn to Cowper by the fact that both were contemplating an edition of "Milton," Cowper having received a commission to edit, write notes and translate the Latin and Italian poems. The work was never completed. In 1794 Cowper was again insane, and though he recovered, the best of his working life was over. Mainly through Hayley's efforts he received in this year a pension of £300 per annum. In the following year a removal took place into Norfolk under the loving care of John Johnson. Johnson took Cowper and Mary Unwin to North Tuddenham, thence to Mundesley, then to Dunham Lodge, near Swaffham, and finally in Oct. 1796 they moved to East Dereham. In December of that year Mrs. Unwin died. In 1799 Cowper completed the revision of his *Homer*. He died of dropsy on April 25, 1800, and was buried near Mrs. Unwin in East Dereham church.

Cowper brought a new spirit into English verse and redeemed it from the artificiality and the rhetoric of many of his predecessors. With him began the "enthusiasm of humanity" that was afterwards to become so marked in the poetry of Burns and Shelley, Wordsworth and Byron. With him began the renewal of the deep sympathy with nature and love of animal life, which was to characterize the work of the romantic school.

Cowper had what is a rare quality among English poets, the gift of humour, which was very singularly absent from others who possessed many other of the higher qualities of the intellect. Certain of his poems, moreover—for example, "To Mary," "The Receipt of my Mother's Portrait," and the ballad "On the Loss of the Royal George"—will, it may safely be affirmed, continue to be familiar to each successive generation in a way that pertains to few things in literature. He ranks among the half-dozen greatest letter-writers in the English language.

BIBLIOGRAPHY.—The first important life of Cowper was Hayley's *Life and Letters of William Cowper* (1803–06); it was reprinted in 1809 and 1812. It was again printed by the Rev. T. S. Grimshawe with the correspondence in 8 vols. in 1835. Robert Southey's much more valuable *Life and Letters* appeared in 15 vols. in 1834–37; this remains the standard edition. *The Private Correspondence*, edited by John Johnson, appeared in 2 vols. in 1824 and again in 1835. The *Correspondence* (4 vols.) ed. by Thomas Wright, was published in 1904, but more correspondence appeared in *Notes and Queries*, July, Aug., and Sept. 1904, and in *The Poems of William Cowper*, ed. J. C. Bailey (1905). Edward Dowden discovered new correspondence with William Hayley (*The Atlantic Monthly*, 1907). Several short lives of Cowper have appeared, from Thomas Taylor's (1833) to Goldwin Smith's in the "English Men of Letters" series (1880); a brief biography is attached to the Globe edition of Cowper's *Works*. Essays by Leslie Stephen, Stopford Brooke, Whitwell Elwin, George Eliot, and Walter Bagehot deserve attention. A good modern edition of the *Poetical Works* with a bibliography of the early editions, the text collected from the mss. is that by H. S. Milford (1907, 3rd ed. 1926). *See* also Sainte Beuve, *Causeries du Lundi*, vol. xi. (1868); Rev. Josiah Bull, *John Newton* (1868); John Neave, *A Concordance to the Poetic Works of William Cowper* (1887); Caroline Gearey, *Cowper and Mary Unwin* (1900); *Letters of Lady Hesketh to John Johnson* (1901); *Selection from Letters*, ed. E. V. Lucas, notes M. L. Milford (1911); *The Unpublished and Uncollected Letters of W. Cowper*, ed. T. Wright (1925); *Selected Letters*, Everyman Series (1926); and Hugh I'Anson Fausset, *Cowper* (1928).

COWPER, WILLIAM COWPER, 1ST EARL (*c.* 1665–1723), lord chancellor of England, was the son of Sir William Cowper, Bart., of Ratling Court, Kent, a Whig member of parliament of some mark in the two last Stuart reigns. Educated at St. Albans school, Cowper was called to the bar in 1688; having promptly given his allegiance to the prince of Orange on his landing in England, he was made recorder of Colchester in 1694, and at various times represented Hertford and other constituencies in parliament. He enjoyed a large practice at the bar, and had the reputation of being one of the most effective parliamentary orators of his generation. It was in 1705 that he was appointed lord keeper of the great seal, and took his seat on the woolsack without a peerage. In the following year he conducted the negotiations between the English and Scottish commissioners for arranging the union with Scotland. In November of the same year (1706) he succeeded to his father's baronetcy; and on Dec. 14 he was raised to the peerage as Baron Cowper of Wingham, Kent.

When the union with Scotland came into operation in May 1707 the queen in council named Cowper lord high chancellor of Great Britain, he being the first to hold this office. He presided at the trial of Dr. Sacheverell in 1710, but resigned the seal when Harley and Bolingbroke took office in the same year. On the death of Queen Anne, George I. appointed Cowper one of the lords justices for governing the country during the king's absence, and a few weeks later he again became lord chancellor. A paper which he drew up for the guidance of the new king on constitutional matters, entitled *An Impartial History of Parties*, marks the advance of English opinion towards party government in the modern sense. It was published by Lord Campbell in his *Lives of the Lord Chancellors*. Cowper supported the impeachment of Lord Oxford for high treason in 1715, and in 1716 presided as lord high steward at the trials of the peers charged with complicity in the Jacobite rising. He warmly supported the septennial bill in the same year. On March 18, 1718, he was created Viscount Fordwich and Earl Cowper, and a month later he resigned office on the plea of ill-health, but probably in reality because George I. accused him of espousing the prince of Wales's side in his quarrel with the king. He died at Colne Green, built by himself on the site of the present mansion of Panshanger, on Oct. 10, 1723.

Cowper was not a great lawyer, but Burnet says that "he managed the court of chancery with impartial justice and great despatch"; one or two of his judgments settled important points in real property law. He was twice married. His brother, Spencer Cowper (1669–1728), was grandfather of William Cowper, the poet.

See *Private Diary of Earl Cowper*, edit. E. C. Hawtrey for the Roxburghe club (Eton, 1833); *The Diary of Mary, Countess Cowper*, edit. the Hon. C. Spencer Cowper (1864); John, Lord Campbell, *Lives of the Lord Chancellors and Keepers of the Great Seal* (8 vols. 1845–69); Edward Foss, *The Judges of England* (9 vols. 1848–64); Gilbert Burnet, *History of his Own Time* (6 vols. 1833); T. B. Howell, *State Trials*, vols. xii.–xv. (33 vols. 1809–28).

COWPER STOVE. In blast furnace practice it is economical to heat the air supplied to the furnace. This is effected by causing the furnace to heat its own supply of air, as is now always done save in the case of cold blast furnaces employed to produce certain qualities of iron. The first economical appliance invented to heat the blast was the invention of E. A. Cowper in 1860; hence the name "Cowper stove."

The Cowper stove consists of a large vertical steel shell, containing a combination chamber and a number of narrow vertical flues, built in brickwork, which are heated by the waste furnace gas. When sufficient heat has been absorbed through the flues, the fuel gas is shut off and the air for the blast heated by being driven through the hot flues on its path to the furnace. So the operation proceeds, the Cowper stove being alternately "on gas" and "on wind," first heated, and then cooling as it imparts heat to the blast. (*See* IRON AND STEEL.)

COWRY, the name given to the *Cypraeidae*, a family of marine gastropod molluscs. More than 150 living species are known. They live in shallow water, and are found principally in the Indo-Pacific region. A small cowry, *Trivia europaea*, is found in European waters. They have a striking appearance when seen alive. The edges of the mantle are folded over the shell, covering a large part of its surface, and are provided with branched appendages. A marked difference is found between the shells of young and adult cowries. In the young form the shell is like that of a normally coiled snail, the lip of the aperture being simple and the spire acute and prominent. In the adult the outer lip is very large, the shell is inrolled so that the spire is nearly hidden, and the internal wall between the various whorls is resorbed.

The shells of *Cypraea moneta* are used by certain African tribes as money (*see* SHELL-MONEY) and those of other species are

TIGER COWRY (CYPRAEA TIGRIS)

(A) Dorsal side, (B) Ventral side

widely employed as ornaments. *Cypraea aurantium* (the orange cowry) is worn as a symbol of rank in the Fiji and the Friendly islands. (G. C. R.)

See G. W. Tryon, *Manual of Conchology,* vol. vii. (1885).

COWSLIP: *see* PRIMROSE; MARSH-MARIGOLD.

COW-TREE or **MILK-TREE,** *Brosimum utile* (family Moraceae), a native of Venezuela. As in other members of the order, the stem contains a milky latex, which flows out in quantities when a notch is cut in it. The "milk" is sweet and pleasant tasting. Another species, *B. Alicastrum,* the bread-nut tree, a native of Central America and Jamaica, bears an edible fruit. The bread-fruit (*Artocarpus*) is an allied genus of the same family. The milk-tree of Brazil, *Mimusops huberi,* produces a latex that "exudes in abundance when the bark is cut; it has about the consistence of thick cream" (A. R. Wallace, *Travels on the Amazon and Rio Negro*) and is used as milk and as glue. The timber of this tree is valuable and the fruit is edible. It belongs to the *sapodilla* family (Sapotaceae).

COX, DAVID (1783–1859), English painter, born April 29, 1783, in Deritend, near Birmingham. Joseph Cox, his father, was both blacksmith and whitesmith, and David was early taken from school and set to the anvil. Later, he became an art teacher, and secured fame in London in 1835–40, years which mark the period of his highest powers. On leaving London, he settled down in his home at Harborne, near his native town, where he died June 7, 1859. The British museum and the Victoria and Albert museum, London, possess a large number of his water-colour drawings. (*See* Hall, *Biography of David Cox* [1881].)

COX, SIR GEORGE WILLIAM (1827-1902), English miscellaneous and historical writer, was born on Jan 10, 1827, at Benares, India, and died at Walmer on Feb. 9, 1902. Educated at Rugby and Trinity college, Oxford, he was ordained in 1850, and succeeded to the baronetcy in 1877. He wrote *Aryan Mythology* (1870), and an *Introduction to the Science of Comparative Mythology* (1881) besides other works.

COX, JACOB DOLSON (1828–1900), American general, political leader and educationalist, was born on Oct. 27, 1828 in Montreal, Canada. He was reared in New York city, and studied in a law office in 1842–44. Working in a broker's office in 1844–46, he came under the influence of Charles G. Finney, whose daughter he afterwards married. In New York city he also prepared himself for the ministry. He graduated at Oberlin college in 1851, having given up his theological studies in rebellion against Finney's dogmatism.

In 1851–53 he was superintendent of schools at Warren (O.); in 1853 was admitted to the Ohio bar, being at that time an anti-slavery Whig; and in 1859 was elected to the State senate. Appointed by Governor Dennison one of three brigadiers general of militia in 1860, he studied tactics, strategy and military history.

He raised troops for the Union service in 1861, enlisted himself in spite of poor health and a family of six children, and was commissioned a brigadier general, U.S. Volunteers. He took part in the West Virginia campaign of 1861, served in the Kanawha region, in supreme command after Rosecrans's relief in the spring, until August 1862, when his troops were ordered to join Burnside's 9th Corps in Virginia. During Antietam, Cox commanded the corps, and at the close of the campaign (Oct. 6, 1862) he was appointed major general, U.S.V., but the appointment was not confirmed. In April-December 1863 he was head of the department of Ohio. In 1864 he took part in the Atlanta campaign, as a corps-commander. He led an expedition following Sherman into the Carolinas and fought two successful actions with Bragg at Kinston (N.C.). As governor of Ohio in 1866-67, he advocated colonization of the freedmen in a restricted area, sympathized with President Johnson's programme of reconstruction and worked for a compromise between Johnson and his opponents. In 1868 he was chairman of the Republican national convention which nominated Grant. He was secretary of the interior in 1869–70; opposed the confirmation of the treaty for the annexation of Santo Domingo; introduced the merit system in his department, and resigned in Oct. 1870 because of political pressure.

He took up legal practice in Cincinnati, became president of the Toledo and Wabash and Western in 1873, and until 1877 was receiver of that company. In 1877–79 he was a representative in Congress. From 1881 to 1897 he was dean of the Cincinnati law school, and from 1885 to 1889 president of the University of Cincinnati. He died at Magnolia (Mass.), on Aug. 4, 1900. A successful lawyer, and in his later years a prominent microscopist, he is best known as one of the great "civilian" generals of the Civil War, and, with the possible exception of J. C. Ropes, one of the outstanding American authorities of his time on military history, particularly the history of the Civil War.

He wrote *Atlanta* (1882) and *The March to the Sea, Franklin and Nashville* (1882), both in the series *Campaigns of the Civil War; The Second Battle of Bull Run, as Connected with the Fitz-John Porter Case* (Cincinnati, 1882); and the valuable *Military Reminiscences of the Civil War* (1900), published posthumously.

See J. R. Ewing, *Public Services of Jacob Dolson Cox* (Washington, 1902), a Johns Hopkins university dissertation; and W. C. Cochran, "Early Life and Military Services of General Jacob Dolson Cox," in *Bibliotheca Sacra,* vol. 58 (Oberlin, O., 1901).

COX, JAMES MIDDLETON (1870–), American politician, was born near Jacksonburg (O.), on March 31, 1870. After being educated in the common schools he worked in a newspaper office, and for a short time was a country school teacher. Later he became a reporter on the Cincinnati *Enquirer.* In 1898 he purchased the Dayton *News* and five years later the Springfield *Press-Republic,* subsequently named the *Daily News.* In 1923 he purchased the Canton *Daily News* and the Miami (Fla.) *Metropolis,* which later became the Miami *Daily News.* From 1909–13 he was a member of Congress for the Dayton district. He was governor of Ohio 1913–15 and 1917–21. His career as governor was notable. Among the reforms introduced under his guidance were a workmen's compensation law; the elimination of the sweatshop; the establishment of a State industrial commission for dealing with questions of labour and capital; the provision of a minimum wage and a nine-hour day for women; mothers' pensions; a blue-sky law (*q.v.*) protecting investors from unscrupulous promoters; the initiative and referendum; the establishment of a State tuberculosis hospital and the extension of safety devices on railways and in mines. He was energetic in suppressing violence in connection with strikes, his general policy being to hold local authorities responsible without recourse to the State militia. He favoured the abolition of the Federal inheritance tax, believing that the State alone should have jurisdiction over inheritances. He was a strong supporter of President Wilson's policies and especially of the League of Nations. He was charged with opposing prohibition, but repeatedly declared that all laws must be enforced. At the Democratic national convention in 1920 he received the presidential nomination, but was overwhelmingly defeated by Harding, the Republican nominee. The electoral vote was 404 for Harding and 127 for Cox. The popular vote was 16,152,200 for Harding and 9,147,353 for Cox

The vote in Ohio, the home State of both candidates, was 1,182,022 for Harding and 780,037 for Cox.

COX, KENYON (1856–1919), American painter, was born at Warren (O.), on Oct. 27, 1856, the son of Gen. Jacob Dolson Cox. He was a pupil of Carolus-Duran and of J. L. Gérôme in Paris from 1877–82, when he returned to New York, subsequently teaching with much success in the Art Students' League. It was in mural decorative work that he achieved prominence. Among the better-known examples of his work are the frieze for the court room of the Appellate Court, New York, and decorations for the Walker Art Gallery, Bowdoin College; for the Capitol at St. Paul (Minn.), and elsewhere. He also wrote with much authority on art topics, and was the author of *Old Masters and New* (1905), *Painters and Sculptors* (1907), *The Classic Point of View* (1912), *Artist and Public* (1914), *Winslow Homer* (1914), and *Concerning Painting* (1917), besides some poems. He became a National Academician in 1903, and in 1910 was awarded the medal of honour for mural painting by the Architectural League. His wife, *née* Louise H. King (1865–1945), whom he married in 1892, also became a figure and portrait-painter of note. Kenyon Cox died in New York on March 17, 1919.

COX, SIR PERCY (1864–1937), British administrator, was born on Nov. 20, 1864, educated at Harrow and Sandhurst, and entered the army in 1884, serving in the 2nd battalion of the Cameronians until 1889. He gained his very great knowledge of and experience in Eastern politics and diplomacy first in the Indian political department, and then in a series of consular appointments in the Persian gulf, where he became political resident in 1909. He was chief political officer to a section of the Indian Expeditionary Force in 1914. He was appointed British ambassador to Tehran from 1918 to 1920, and high commissioner in Mesopotamia in the critical years 1920 to 1923. For the history of his administration *see* 'IRAQ. Sir Percy Cox also represented the British Government in the Mosul boundary negotiations with Turkey. He was the recipient of many honours, including the G.C.M.G. (1922), and was a member of many learned societies.

COX, RICHARD (1500?–1581), dean of Westminster and bishop of Ely, was born at Whaddon, Buckinghamshire, educated at the Benedictine priory of St. Leonard.Snelshall near Whaddon, at Eton, and at King's college, Cambridge, where he graduated in 1524. At Wolsey's invitation he became a member of the cardinal's new foundation at Oxford, was incorporated B.A. in 1525, and created M.A. in 1526. In 1530 he was engaged in persuading the more unruly members of the university to approve of the king's divorce. He was then appointed master of the royal foundation at Eton. In 1533 he appears as author of an ode on the coronation of Anne Boleyn. In 1540 he was one of the 15 divines to whom were referred crucial questions on the sacraments and the seat of authority in the church; his answers (printed in Pocock's *Burnet,* iii. 443–496) indicate a mind tending away from Catholicism, but susceptible to "the king's doctrine"; and, indeed, Cox was one of the divines by whom Henry said the "King's Book" had been drawn up when he wished to impress upon the Regent Arran that it was not exclusively his own doing. Cox subscribed the divorce of Anne of Cleves in 1540, and in that year became archdeacon and prebendary of Ely and canon of Westminster.

After Edward's accession, Cox's opinions took a more Protestant turn, and he became one of the most active agents of the Reformation. He was consulted on the compilation of the Communion office in 1548, and the first and second books of Common Prayer, and sat on the commission for the reform of the canon law. As chancellor of the University of Oxford (1547–52) he promoted foreign divines such as Peter Martyr, and was a moving spirit of the two commissions which sought with some success to eradicate everything savouring of Romanism from the books, mss., ornaments and endowments of the university, and earned Cox the sobriquet of its cancellor rather than its chancellor. He received other preferments, which he lost on Mary's accession, and was for a fortnight in Aug. 1553 confined to the Marshalsea. He remained in obscurity until after the failure of Wyatt's rebellion, and then in May 1554 escaped in the same ship as the future archbishop Sandys, to Antwerp. Thence in March 1555 he made his way to Frankfort, where the English and Scottish exiles had, under the influence of Knox and Whittingham, adopted Calvinistic doctrine and a form of service far more Puritanical than the Prayer Book of 1552. Cox stood up for that service, and the exiles were divided into Knoxians and Coxians. Knox attacked Cox as a pluralist, Cox accused Knox of treason to the emperor Charles V. This proved the more dangerous charge: Knox and his followers were expelled, and the Prayer Book of 1552 was restored.

In 1559 Cox returned to England, and was elected bishop of Norwich, but the queen changed her mind and Cox's destination to Ely, where he remained 21 years. He was an honest, but narrow-minded ecclesiastic, who held what views he did hold intolerantly, and was always wanting more power to constrain those who differed from him (*see* his letter in *Hatfield mss.* i. 308). While he refused to minister in the queen's chapel because of the crucifix and lights there, and was a bitter enemy to the Roman Catholics, he had little more patience with the Puritans. He was grasping, or at least tenacious of his rights in money matters, and was often brought into conflict with courtiers who coveted episcopal lands. The queen herself intervened, when he refused to grant Ely House to her favourite, Sir Christopher Hatton; but the well-known letter beginning "Proud Prelate" and threatening to unfrock him seems to be an impudent forgery which first saw the light in the *Annual Register* for 1761. It hardly, however, misrepresents the queen's meaning, and Cox was forced to give way. These and other trials led him in 1580 to resign his see, which remained vacant 19 years. Cox died on July 22, 1581.

BIBLIOGRAPHY.—Voluminous details about Cox's life are given in T. Strype, *Works,* Parker Soc. Publ., and C. H. and T. Cooper, *Athenae Cantab,* i. 437–445 (1858–1913). *See* also T. Gairdner, *Letters and Papers of Henry VIII.* (1862 etc.); *Acts of the Privy Council* (1542–1890); *Calendar State Dom. Papers* (1856–71); *Cal. Hatfield mss.* (1883 etc.); *Lit. Remains of Edward VI.,* ed. J. G. Nichols (1857); W. Whittingham, *Troubles at Frankfort* (1575, 1907); J. Le Neve, *Fasti* (1716); B. Willis, *Cathedrals* (1718–19); J. Bentham, *Ely* (1771); H. Machyn, *Diary* (1848); G. Burnet's *History of the Reformation,* ed. N. Pocock (1865).

COX, SAMUEL (1826–1893), English Baptist divine, was born in London on April 19, 1826. He worked in the London docks and then entered the Baptist college at Stepney. In 1851 he became pastor of a Baptist church at Southsea, removing in 1855 to Ryde and in 1863 to Nottingham. He was president of the Baptist Association in 1873. Cox was the founder and first editor of *The Expositor* (1875–84). His works include: *Salvator Mundi* (1877), *A Commentary on the Book of Job* (1880), *The Larger Hope* (1883).

COXCIE, MICHAEL (1499–1592), Flemish painter, was born at Malines, and studied under Bernard van Orley. At Rome in 1532 he painted the chapel of Cardinal Enckenvoort in the church of Santa Maria dell' Anima. Coxcie's principal occupation was designing for engravers; and the fable of Psyche in 32 sheets by Agostino Veneziano and the Master of the Die are favourable specimens of his skill. His productions were long concealed under an interlaced monogram M.C.O.K.X.I.N. Coxcie returned in 1539 to Malines, where he matriculated, and painted for the chapel of the gild of St. Luke the wings of an altar-piece (centre by Mabuse) now in Sanct Veit of Prague. There are large and capital works of his (1587–88) in St. Rombaud, Malines, in Ste. Gudule, Brussels, and in the museums of Brussels and Antwerp. He died at Malines on March 5, 1592.

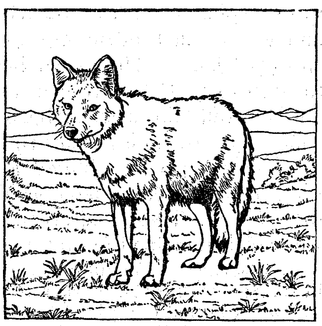
COXE, HENRY OCTAVIUS (1811–81), English librarian and palaeographer, was born at Bucklebury, Berkshire, and educated at Westminster and Worcester college, Oxford. He began work in the manuscript department of the British Museum, became sub-librarian of the Bodleian, at Oxford, in 1838, and was head librarian there, 1860–81. He was sent by the British Government, in 1857, on a tour of inspection of the monastic libraries of the Levant, one of the results being the detection of the forgery attempted by Constantine Simonides.

He published *Rogeri de Wendover Chronica* (1841–44), and *Report on the Greek Manuscripts yet remaining in the Libraries of the Levant* (1858).

COXWELL, HENRY TRACEY (1819–1900), English aeronaut, was born at Wouldham, Kent, on March 2, 1819, the son of a naval officer. In 1848 he became a professional balloonist, making numerous public ascents in the chief continental cities and in London. In 1862 in company with Dr. James Glaisher, he attained the greatest height on record, about 7 miles. His companion became insensible, and he himself, unable to use his frostbitten hands, opened the gas valve with his teeth, and made an extremely rapid but safe descent. The aerial voyages by Coxwell and Glaisher provided important contributions to the science of meteorology. Coxwell was most pertinacious in urging the practical utility of employing balloons in time of war. His last ascent was made in 1885. He died on Jan. 5, 1900.

See his *My Life and Balloon Experiences* (1887).

COYOTE, a North American member of the dog family, also known as the prairie wolf, *Canis latrans*. Ranging from Alaska in the north to Guatemala in the south and frequenting almost every kind of country, especially the plains, the coyote is smaller than the wolf and more jackal-like. The length is about 36 in., the tail being 12 to 15 in.; the general colour grizzled buffy above and whitish below; the legs ochraceous; the tail having a black tip and a dark gland-patch near the root. There is, however, considerable local variation in size and colour.



BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY

THE COYOTE, A JACKAL-LIKE WOLF COMMON TO THE PRAIRIES OF NORTH AMERICA

Coyotes are slinking and stealthy creatures. They live in burrows in the plains and hunt at night. Hares, chipmunks and mice form a large portion of their food; but also the fawns of deer and prongbuck, sage hens and other game birds. A surprising amount of vegetable food is also taken, fruit of prickly pear cactus, rose hips and juniper berries. They dig burrows for themselves, usually on a slope, or take possession of those already made by badgers and prairie dogs. There, in the spring, the half-dozen or more coyote pups are brought forth.

The yapping cry of the coyote is one of the most characteristic notes of the west. (*See* CARNIVORA.) (J. E. HL.)

COYPEL, the name of a French family of painters. Noel Coypel (1628–1707), also called, from the fact that he was much influenced by Poussin, COYPEL LE POUSSIN, was employed by Charles Errard to paint some pictures required for the Louvre. In 1672 he was appointed director of the French academy at Rome. After four years he returned to France; and not long after he became director of the Academy of Painting. The "Martyrdom of St. James" in Notre Dame is perhaps his finest work.

His son and pupil, ANTOINE COYPEL (1661–1722), was more celebrated than his father, with whom he spent four years at Rome. At the age of 18 he was admitted into the Academy of Painting, of which he became professor and rector in 1707, and director in 1714. In 1716 he was appointed king's painter, and he was ennobled in 1717. He was a clever etcher, and engraved several of his own works. His *Discours prononcés dans les conférences de l'Académie royale de Peinture*, etc., appeared in 1741.

Antoine's half-brother, NOEL NICHOLAS COYPEL (1692–1734), was also an exceedingly popular artist; and his son, CHARLES ANTOINE (1694–1752), was painter to the king and director of the Academy of Painting.

COYPU (*Myocastor coypus*), a large South American aquatic rodent. Its size, aquatic habits, partially webbed hind-toes, and the smooth, broad, orange-coloured incisors, are sufficient to distinguish this rodent from the other members of the family Capromyidae. Coypus are abundant in the fresh waters of South America. Although subsisting largely on aquatic plants, these rodents frequently come ashore to feed, especially in the evening. Several young are produced at a birth. The fur is of some commercial value and is known as nutria; its colour is reddish-brown. (*See* FUR-BEARING ANIMALS (LAND); RODENTIA.)

COYSEVOX, CHARLES ANTOINE (1640–1720), French sculptor, was born at Lyons on Sept. 29, 1640, and died at Paris on Oct. 10, 1720. He belonged to a family which had emigrated from Spain, and he studied under Lerambert. He was employed by Louis XIV in producing much of the decoration and a large number of statues for the palaces at Versailles and Marly (subsequently destroyed in the Revolution), and produced statues of most of the celebrated men of his age, including Louis XIV and Louis XV at Versailles, Colbert (at Saint-Eustache), Mazarin (in the church des Quatre-Nations), Condé the Great (in the Louvre), Bossuet (in the Louvre) and many others. Among the pupils of Coysevox were Nicolas and Guillaume Coustou.

See Henry Jouin, *A. Coysevox, sa vie, son oeuvre* (1883); Jean du Seigneur, *Revue universelle des arts*, vol. i (1855), pp. 32 *et seq.*

COZENS, JOHN ROBERT (*c.* 1752–1797), English landscape painter in watercolours, born in London. His father, Alexander Cozens, said to have been the natural son of Peter the Great and an Englishwoman from Deptford, after having studied art in Italy, came to England in 1746, was drawing master at Eton from 1763 to 1768 and published several treatises on art. The watercolours of J. R. Cozens are spirited impressionist sketches, rendering fine atmospheric effects by means of a few monochrome tints. They are free from the traditional laws of composition, which governed the art of that time. J. R. Cozens was, therefore, a precursor of Girtin and Turner in the British school of watercolour painting. Turner confessed to have learned more from Cozens' "Landscape with Hannibal in his March over the Alps, showing his Army the Fertile Plains of Italy," exhibited at the Royal Academy in 1776, than from any other picture. Cozens visited Italy twice, in 1776, and again in 1782 with William Beckford. On these trips he executed numerous sketches in pen and monochrome wash. He died in 1797, having spent the last three years of his life in a lunatic asylum. A collection of his watercolours is at the Victoria and Albert Museum; others in private ownership were exhibited at the Grafton Gallery in 1911. The British Museum has 54 drawings by Alexander Cozens, which were lost on his journey from Italy to England, and were recovered by his son in Florence 30 years later.

CRAB, a name applied to the Crustacea of the section Brachyura of the order Decapoda, and to other forms, especially of the section Anomura, which may resemble them in appearance and habits.

Brachyura, or true crabs, are distinguished from the long-tailed lobsters and shrimps by the small abdomen or tail, folded up under the body. In most the body is transversely oval or triangular in outline and more or less flattened, and is covered by a hard shell, the carapace. There are five pairs of legs. The first pair end in nippers or chelae and are usually much more massive than the others which are used in walking or swimming. The eyes are set on movable stalks and can be withdrawn into sockets in the front part of the carapace. There are six pairs of jaws and foot jaws (maxillipedes) enclosed within a "buccal cavern," the opening of which is covered by the broad and flattened third pair of foot jaws. The abdomen is usually narrow and triangular in the males, but in the females it is broad and rounded and bears appendages to which the eggs are attached after spawning.

As in most Crustacea, the young of nearly all crabs, when newly hatched, are very different from their parents. The first larval stage, known as zoea, is a minute transparent organism, swimming at the surface of the sea. It has a rounded body, armed with long spines, and a long segmented tail. The eyes are not stalked, the legs not yet developed, and the foot jaws form swimming paddles. After casting its skin several times as it grows in size, the young crab passes into a stage known as the Megalopa, in which the body and limbs are more crablike, but the abdomen is large and not folded up. After a further moult the animal assumes a form very similar to that of the adult. There are a few crabs, especially those living in fresh water, which do not pass through a metamorphosis but leave the egg as miniature adults.

Most crabs live in the sea; even the land crabs, which are abundant in tropical countries, visit the sea occasionally and pass through their early stages in it. The river crab of southern Europe

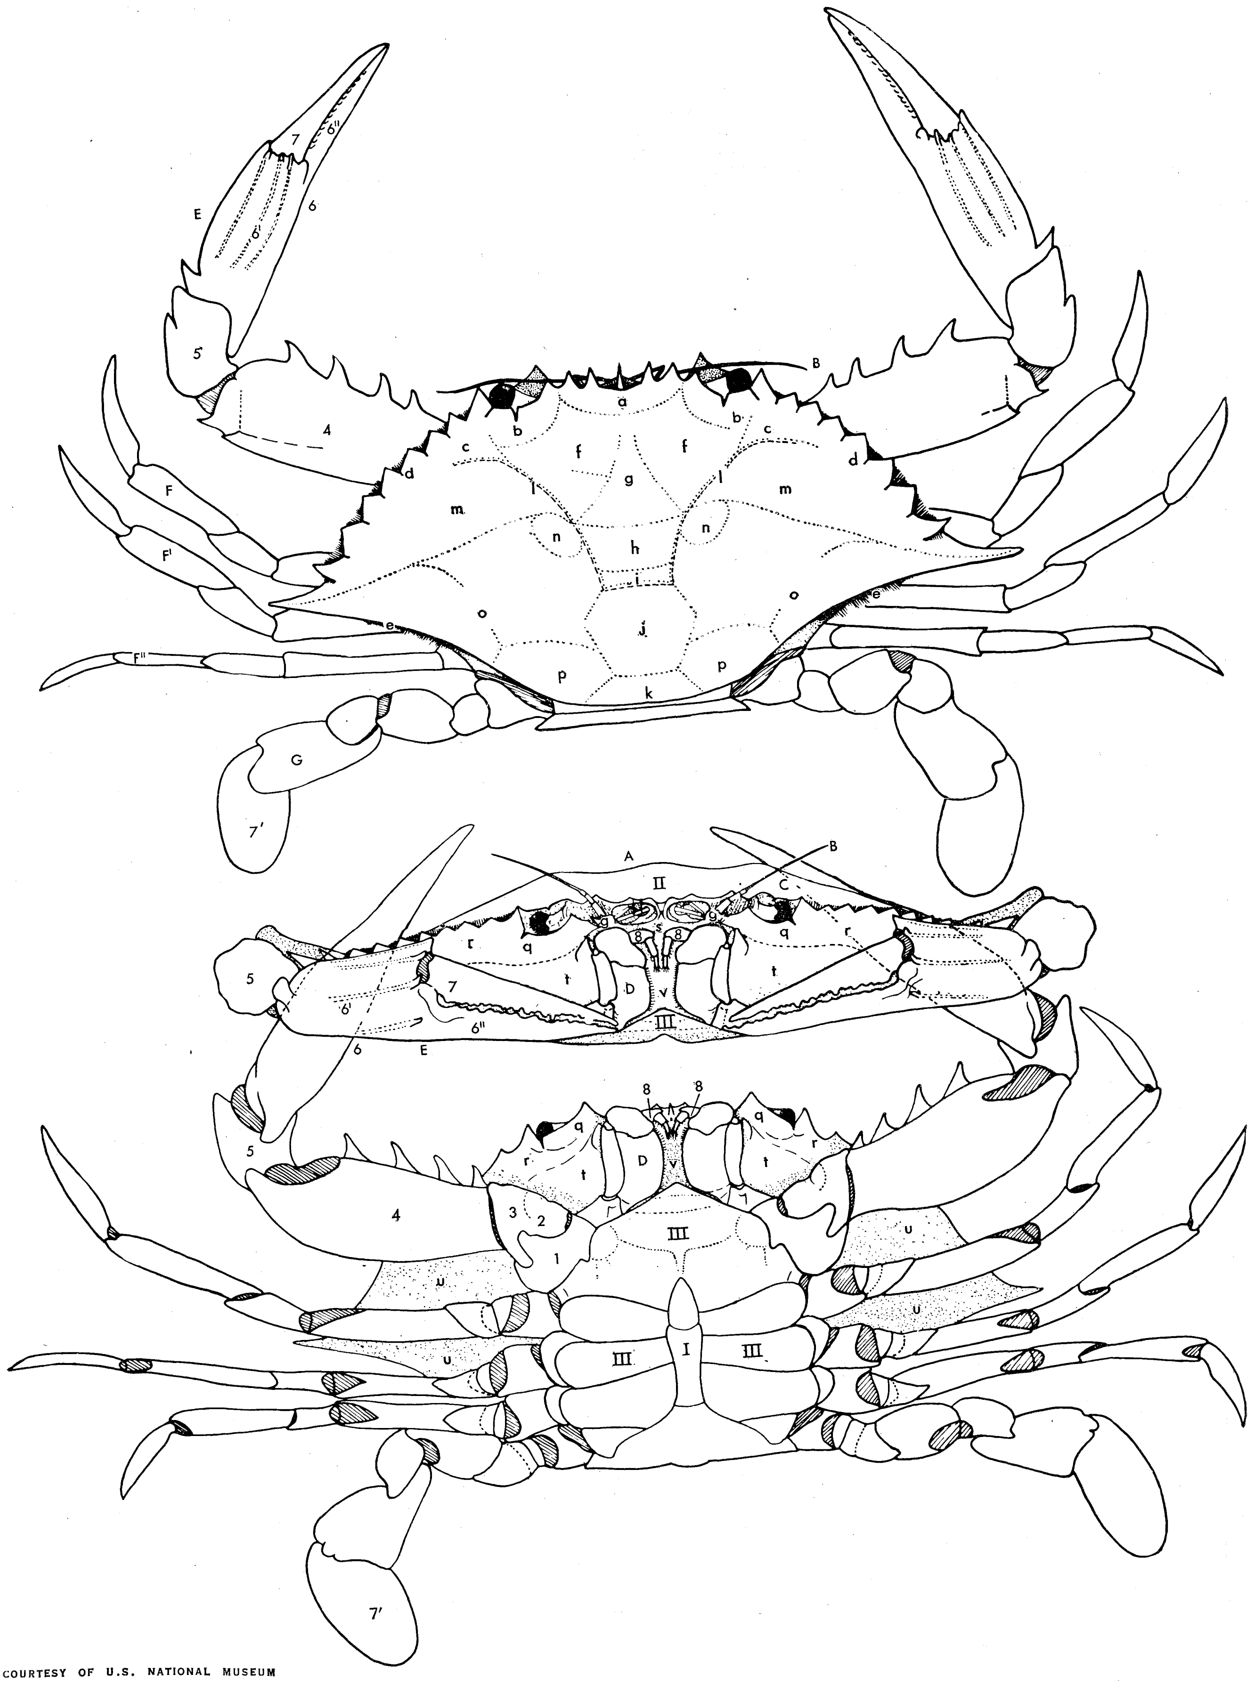
CRABS (Eucarida, Order Decapoda, Reptantia)

1. The giant crab of Japan, *Macrocheira kaempferi* (Section Brachyura), much reduced as can be seen from the 5 ft. rule. Largest specimen of record spans 12½ ft. across the outstretched chelipeds
2. *Pseudocarcinus gigas* (Section Brachyura), giant crab of Tasmania. Found in deep water off the Australian coast. The shell or carapace attains a width of 16 in. Specimens of 30 lb. in weight have been taken
3. The coco-nut or robber crab, *Birgus latro* (Section Anomura), climbing trunk of palm tree. Much reduced in size. Large specimens will grow to be as much as 18 in. in length of body

CRAB



Conventionalized swimming crab, illustrating terms used in description (dorsal, anterior, and ventral views). Body: I, Abdomen; II, Carapace or shell; III, Thoracic sternum. *Regions, areolations, and margins of carapace:* Dorsal view, a, Frontal; b, Orbital; c. Hepatic; d, Antero-lateral; e, Posterolateral; f, Protogastric; g, Mesogastric; h, Metagastric; i, Urogastric; j, Cardiac; k, Intestinal; l, Cervical groove; m, Epibranchial; n, Branchial lobe; o, Mesobranchial; p, Metabranchial. Anterior and ventral views, q, Suborbital; r, Subhepatic; s, Epistome; t, Pterygostomian; u, Subbranchial; v, Buccal cavity. *Appendages:* A, Antennule; B, Antenna; C, Eye on stalk; D, 3rd or outer maxilliped; E, Cheliped or Pincer; F, F′, F″, 1st to 3rd periopods, ambulatory or walking legs; G, Swimming leg. *Parts of Appendages:* 1, Coxa; 2, Basis; 3, Ischium; 4, Merus or arm; 5, Carpus or wrist; 6, Propodus with 6′, manus, hand, or palm, and 6″, fixed or immovable finger; 7, Dactylus or movable finger; 7′, Dactylus or paddle of swimming foot; 8, Palp of maxilliped or Lenten crab (*Potamon edulis,* better known as *Thelphusa fluviatilis*) is an example of the fresh-water crabs which are abundant in most of the warmer regions of the world. As a rule, crabs breathe by gills, which are lodged in a pair of cavities at the sides of the carapace, but in the true land crabs the cavities become enlarged and modified so as to act as lungs for breathing air.

Walking or crawling is the usual mode of locomotion, and the peculiar sidelong gait familiar to most people in the common shore crab, is characteristic of most members of the group. The crabs of the family Portunidae, and some others, swim with great dexterity by means of their flattened paddle-shaped feet.

Like many other Crustacea, crabs are often omnivorous and act as scavengers, but many are predatory in their habits and some are content with a vegetable diet.

Though no crab, perhaps, is truly parasitic, some live in relations of commensalism with other animals. The best known examples of this are the little mussel crabs (Pinnotheridae) which live within the shells of mussels and other bivalve molluscs and share the food of their hosts. Another small but intriguing species is the coral-gall crab (*Hapalocarcinus*), which in some fashion irritates the growing tips of certain corals so that they grow to enclose the female in a stony prison from which there is no escape but which provides an enduring shelter for the mother and successive broods of young. Many of the sluggish spider crabs (Maiidae) have their shells covered by a forest of growing seaweeds, zoophytes and sponges, which are planted there by the crab itself, and which afford it a very effective disguise. The giant crab of Japan (*Macrocheira kaempferi*) and the huge Tasmanian crab (*Pseudocarcinus gigas*) are the largest known Crustacea. The former, over its laterally extended chelipeds, will measure 12½ ft., while specimens of *Pseudocarcinus* of 30 lb. in weight and 16 in. in width have been taken from the deep waters about Australia at 75 to 100 fathoms.

Many crabs are sought as food by man. The most important and valuable are the edible crab of British and European coasts (*Cancer pagurus*), the blue crab (*Callinectes sapidus*) of the Atlantic coast and the Dungeness crab (*Cancer magister*) of the Pacific coast of North America. The latter is fished throughout its productive range from San Francisco to southeastern Alaska. In 1940 nearly 17,000,000 lb. were taken in American waters and 772,000 lb. (1942) on the coast of British Columbia. The blue crab fishery, centering largely in Chesapeake Bay, yielded 72,513,000 lb. of hard and 4,390,000 lb. of soft (recently moulted) crabs (1940). The *Cancer* fishery of Europe ranks next in importance to its lobster industry. The crustacean fisheries of India, for which only partial figures are available, outweigh in quantity and value the yield of all other fisheries of that large and populous country, the crabs being outranked only by the shrimps in importance. The swimming crabs, *Scylla* and *Neptunus,* related to the American blue crab, are among the most important sources of sea food throughout the entire Indo-Pacific region. *Scylla serratus* reaches a large size, 8 to 12 in. in width, exceptionally 18 in. in the brackish waters of Chilka Lake, India.

The commercially valuable Anomura are the lithodid, literally "stone," crabs, of which the so-called king crab of Japan, the Bering Sea, and Alaskan waters (*Paralithodes camtschatica*) is the most important. This species constituted by far the greater part of the 13,507,000 lb. of canned crab meat, valued at $4,582,000, imported into the United States in 1939, chiefly from Japan (78%). A related species (*Lithodes antarctica*), known in Latin America as the "centolla," is the basis of a considerable fishery in southern Chile and the Straits of Magellan.

Better known Anomura are the hermit crabs which live in empty shells of gasteropod molluscs, which they carry about with them as portable dwellings. As the crab grows it changes its abode from time to time, often having to fight with its fellows for the possession of an empty shell. In tropical countries the hermit crabs of the family Coenobitidae live on land, often at considerable distances from the sea to which they must return to hatch out their spawn. The large robber or coconut crab of the Indo-Pacific islands (*Birgus latro*), which belongs to this family, has given up the habit of carrying a portable dwelling, and the upper surface of its abdomen has become covered by shelly plates. It climbs palm trees to get the fruit.

(W. T. C.; W. L. St.)

CRAB-APPLE, the name applied to the fruits or plants of various species of *Malus,* the apple genus; also to certain crosses of such species with improved cultivated types, which give small-size, tart fruits. The genus *Malus,* the apples (included by some botanists in *Pyrus,* the pear genus) includes approximately 25 species indigenous in temperate regions of North America, Europe and Asia. In general, they resemble the cultivated apple in flowers and foliage but have more slender trunks, stiffer and more or less spiny branches, and much smaller, usually very acid fruits. They are extensively used as ornamental shrubs or small trees. The blossoms of many of the crab-apples are extremely showy in the spring and many are characterized by brightly coloured fruit which may hang on well into the winter. Species most widely used as ornamentals include *Malus spectabilis,* the Chinese flowering crab-apple; *M. baccata,* Siberian crab; *M. Sieboldi,* Toringo crab; *M. floribunda,* the Japanese flowering crab-apple; and *M. pumila* var. *niedwetzkyana,* the redvein crab-apple. The American crab-apples include the following: *M. coronaria,* indigenous from western New York and southern Ontario to Wisconsin and southward to North Carolina and Missouri, a beautiful tree when in blossom in April or May and cultivated to some extent as an ornamental. The fruit is delicately scented but very acid, 1 to 1½ in. in diameter. *M. angustifolia,* the southern crab-apple, is native from southern Virginia to southern Illinois and southward to Florida and Louisiana. It produces fruit ¾ to 1 in. in diameter. *M. ioensis,* the prairie crab-apple, is indigenous from Wisconsin and Minnesota southward to Nebraska, Kansas and Missouri. The Oregon crab-apple, *M. fusca,* is found along the Pacific coast from Alaska to California. The fruit is oblong, ½ in. or less in diameter. Fruits of all the crab-apples may be used for jelly and other culinary purposes. The Siberian crab is rather widely grown for fruit, which is used mainly for jelly and for preserving and pickling. Most of the crab-apple species can be crossed with standard apple varieties and many such crosses have been made, particularly in Canada, to secure very hardy, early ripening apples adapted to severe weather conditions. In general, the progeny are intermediate in size and quality between the parents.

In Europe many horticultural varieties producing small, highly-acid fruit are grown primarily for cider making and are commonly referred to as crab-apples or cider apples. Many of these may have originated as crosses between the *Malus* species and cultivated apples. They represent a large proportion of the apple production, particularly of France.

(J. R. Mag.)

CRABBE, GEORGE (1754–1832), English poet, was born at Aldeburgh, Suffolk, the son of a customs officer. His father wanted to make his clever boy a doctor, and Crabbe became an apothecary's assistant at Wickham Brook, near Newmarket, and then a surgeon's assistant at Woodbridge, where he met Sarah Elmy, his future wife and a good friend to him during the hard years ahead. For some time Crabbe worked as a day-labourer at Aldeburgh; he then sought to establish a surgery, which, during his absence for nine months in London for the study of midwifery, was not successful. A period of want followed, but in 1780 a local magnate gave him £5 with which to seek his fortune in London. He had already published at Ipswich his first poem, *Inebriety,* in 1775, and he took with him to London many mss., none of which he was able to place except *The Candidate.* But in March 1781 he was received by Edmund Burke, who read his mss., advised him, and helped him with the publication of *The Library* (1781), and sought the interest of others whereby he could enter the church. Crabbe was ordained in 1781 and became curate at Aldeburgh. The Aldeburgh parishioners were not disposed to respect a curate whom they had known as a day-labourer, and in 1782 Burke persuaded the duke of Rutland to appoint Crabbe as his chaplain at Belvoir castle. The duke gave him two small livings in Dorsetshire. Crabbe then married Sarah Elmy (Dec. 1783). Earlier in the year was published *The Village,* which on Burke's advice had been completed and revised. *The Village* is a poem which has none of the romantic atmosphere of Goldsmith's *Deserted Village* or Gray's *Elegy.* Crabbe had a passion for truth, naked and unashamed. If he laid more stress on the seamy side of village life, it was because that side of it was more familiar to him. His descriptions of nature revealed an intimate and concise knowledge of flora and fauna. The poem, written in heroic couplets, made a deep impression. Scott read it with such attention that ten years later he still knew it by heart.

For 20 years after the publication of *The Village* Crabbe published nothing. He received various preferments, and in 1814, the year after his wife's death, the living of Trowbridge, Wiltshire, where the rest of his life was spent.

Those last years were the most prosperous of his life. He was a frequent visitor to London, and a friend of all the literary celebrities of the time. He proposed marriage to one of his parishioners, Charlotte Ridout, and was accepted in 1814, but broke off the engagement in 1816. He proposed to yet another friend, Elizabeth Charter, somewhat later. In his visits to London Crabbe was the guest of Samuel Rogers, in St. James's place, and was a frequent visitor to Holland House, where he met his brother poets Moore and Campbell. In 1817 his *Tales of the Hall* were completed, and John Murray offered £3,000 for the copyright, Crabbe's previous works, *The Parish Register* (1807), *The Borough* (1810), and *Tales in Verse* (1812) being included. The offer, after much negotiation, was accepted, but Crabbe's popularity was then on the wane.

In 1822 Crabbe went to Edinburgh on a visit to Sir Walter Scott. The adventure, complicated as it was by the visit of George IV. about the same time, is most amusingly described in Lockhart's biography of Scott. Crabbe died at Trowbridge on Feb. 3, 1832, and was buried in Trowbridge church.

Never was any poet so great and continuous a favourite with the critics, and yet so conspicuously ignored by the public. The works of his contemporaries, such as Cowper, Scott, Byron, and Shelley in particular, had been reprinted again and again. With Crabbe it was for long quite otherwise. His works were collected into eight volumes in 1832, the first containing a biography by his son. It was also intended to publish some of his prose writings, but the reception of the eight volumes was not sufficiently encouraging. A reprint, however, in one volume was made in 1847, and it has been reproduced several times since. It was not until the end of the century that sundry volumes of "selections" from his poems appeared; one by Edward FitzGerald (privately printed, 1879), and others by Bernard Holland (1899), C. H. Herford (1902), and Deane (1903). The *Complete Works* were published by the Cambridge University Press in three volumes, edited by A. W. Ward, in 1906.

Crabbe's poems have been praised by many competent critics, by Edward FitzGerald in his *Letters,* by Cardinal Newman in his *Apologia,* and by Sir Leslie Stephen in his *Hours in a Library* most notably. His verses consoled the last hours of Charles James Fox and Sir Walter Scott, while Thomas Hardy has acknowledged their influence on the realism of his novels. But Crabbe's works have ceased to command a wide public interest. He just failed of being the artist in words who is able to make the same appeal in all ages. Yet his poems will well repay perusal. His stories are profoundly poignant and when once read live long in the memory. They reveal him as one of the great realists of English fiction and make fascinating reading. There is true poetry in Crabbe's works although his most distinctively lyric note was attained when he wrote under the influence of opium, to which he became much addicted in his later years.

See *The Life of the Rev. George Crabbe, LL.B., by his son the Rev. George Crabbe, A.M.* (1834); *George Crabbe and His Times, 1754–1832; A Critical and Biographical Study,* by René Huchon, translated from the French by Frederick Clarke (1907); also the brief biographies by T. H. Kebbel ("Great Writers" series) and by Canon Ainger ("English Men of Letters" series).

CRAB GRASS, finger grass, the name for various species of *Digitaria,* especially *D. sanguinalis* and *D. ischaemum,* both natives of Europe widely naturalized as weeds in eastern North America. They are very troublesome in lawns and in late summer in cultivated fields.

BY COURTESY OF THE IOWA EXPERIMENTAL STATION

CRAB GRASS, A WEED, INTRODUCED FROM EUROPE INTO AMERICA

CRACKER, something which "cracks" (Ger. *Krachen*); a firework which explodes with several reports and jumps at each explosion (*see* FIREWORKS); a roll of coloured and ornamented paper containing sweets, etc., together with a strip of card with a fulminant which explodes on being pulled. In America, the general name for a biscuit. In the southern states of America "cracker" is a term of contempt for the "poor" or "mean whites" of Georgia and Florida; the term dates back to the Revolution, and is supposed to be derived from the "cracked corn" which formed the staple food of the class to whom the term refers.

CRACKING PROCESS: *see* PETROLEUM.

CRACOW, a province of Poland, bounded north by the province of Kielce, east by the province of Lwow, west by Polish Silesia and south by Czechoslovakia; occupied by Germany in 1939.

Cracow covers 6,736 square miles. It is drained by the Vistula and its tributaries, the Dunajec and Wisloka. The north region is a fertile plain, but the main portion consists of highlands stretching up to the Carpathian mountains. The mountain chain reaches from the West Beskids to the Low Beskids, but in the valley of the Dunajec the province extends to the lofty Tatry heights (more than 7,900 ft.). Population (1931) 2,296,842, mainly Poles, with 7.8% classed as other than Polish mother tongue.

The Poles speak the same dialect as their neighbours in the provinces of Kielce and Lublin, but the mountain area is inhabited by the Gorale or Highlanders with their picturesque costume and local dialects.

The province is divided into 24 districts, the chief towns being the capital, Cracow (*q.v.*), Tarnów (pop. 1931, 45,235) and Nowy Sacz (pop. 1931, 30,278). Rye, oats, wheat and vegetables are produced.

The peasants, who enjoyed economic liberty after 1848 and political liberty after 1867, are better educated than the peasants of the provinces formerly under Russia, and the peasants' parties originating in this region played an important part in the constitutional life of Poland. Industry, however, suffered from the competition of the factories of Austria and Bohemia.

The salt mines of Bochnia and Wieliczka (*q.v.*) have been famous from the earliest times. The greater part of the province was occupied by Austria at the first partition of Poland, and was known as West Galicia till 1918. The province was overrun by German armies in the first week of World War II.

CRACOW (Krah-kow′, Polish Krah′kuf), the fourth city of Poland, capital of the province of the same name, an industrial centre 212 mi. W. by N. of Lemberg (Lwow) by rail; it was occupied by Germany in 1939. Polish name Kraków. Pop. (1931) 221,260, of whom 172,866 were Poles; (est. 1939) 259,000. No other Polish town contains so many historic buildings and national relics. It is the intellectual centre of Poland.

Cracow is in a fertile plain on the left bank of the Vistula (which becomes navigable here) and occupies a position of great strategical importance. It consists of the old inner town and seven suburbs. The only relics of the fortifications of the old town, now replaced by shady promenades, are the Florian's Gate and the Rondel, a circular structure, built in 1498. Cracow has 39 churches—about half the number it formerly had—and 25 convents for monks and nuns. Of these the most important is the Stanislaw cathedral, in Gothic style, consecrated in 1359, and built on the Wawel, the rocky eminence to the south-west of the old town. Here the kings of Poland were crowned, and this church is also the Pantheon of Poland, the burial place of its kings, of John Sobieski, Thaddaeus Kosciuszko, Joseph Poniatovski, Adam Mickiewicz and Joseph Pilsudski. Here also are conserved the remains of St. Stanislaw, the patron saint of the Poles, who, as bishop of Cracow, was slain before the altar by King Boleslaw in 1079. The cathedral is adorned with many valuable objects of art, paintings and sculptures, by such artists as Veit Stoss, Guido Reni, Peter Vischer, Thorwaldsen, etc. Part of the ancient Polish regalia is also kept there. The Gothic church of St. Mary, founded in 1223, rebuilt in the 14th century, with several chapels added in the 15th and 16th centuries, was restored in 1889–1893, and decorated with paintings from the designs by Matejko. It contains a huge high altar, executed 1477–89, the masterpiece of Veit Stoss, who was a native of Cracow; a colossal stone crucifix of the end of the 15th century, and several sumptuous tombs from the 16th and 17th centuries. The royal castle (*Zamek Królewski*), a huge building, begun in the 13th century, and successively enlarged by Casimir the Great and by Zygmunt I. Jagiello (1510–1533), is situated on the Wawel, and was until 1610 the residence of the Polish kings. It suffered much from fires and other disasters, and from 1846 onward was used as a barracks and a military hospital; it has now, however, been cleared out and restored. The Jagellonian university, housed in a Gothic building of 1881–1887, is the second oldest university in central Europe—the oldest being that of Prague—and was famous during the 15th and 16th centuries. It was founded by Casimir the Great in 1364, and completed by Wladislaw Jagiello in 1400. Its rich library is housed in the old 15th century university buildings, in the beautiful Gothic court of which a bronze statue of Copernicus was placed in 1900. The Polish academy of science, founded in 1872, was housed in the new university buildings. In the Ring-Platz, or the principal square, opposite the church of St. Mary, is the cloth-hall (Pol. *Sukiennice*), a building erected in 1257, several times renovated and enlarged, most recently in 1879, which contains the Polish national museum of art. Behind it is a Gothic tower, the only relic of the old town hall, demolished in 1820. The Czartoryski museum contains a rich library and a precious collection of manuscripts, relating to the history of Poland.

Among the manufactures of the town are machinery, agricultural implements, chemicals, soap, tobacco, etc. But Cracow is more important as a trading than as an industrial centre. Its position on the Vistula and at the junction of several railways makes it the natural mart for the exchange of the products of the adjacent territories. Cracow's trade in timber, salt, textiles, cattle, wine and agricultural produce of all kinds is very considerable. In the neighbourhood of Cracow there are mines of coal and zinc, and, not far away lies the village of Krzeszowice with sulphur baths. About $2\frac{1}{2}$ mi. N.W. lies the Kosciuszko hill, a mound of earth 100 ft. high, thrown up in 1820–23 on the Borislava hill (1,093 ft.), in honour of Thaddaeus Kosciuszko, the hero of Poland. On the opposite bank of the Vistula, united to Cracow by a bridge, lies the town of Podgorze (pop. 18,142); near it is the Krakus hill, smaller than the Kosciuszko hill, and a thousand years older than it, erected in honour of Krakus, the founder of Cracow. About 8 mi. S.E. of Cracow is situated Wieliczka (*q.v.*), with its famous salt mines.

History.—Tradition assigns the foundation of Cracow to the mythical Krak, a Polish prince who is said to have built a stronghold there about A.D. 700. In the latter part of the 10th century it was annexed to the Bohemian principality, but was recaptured by Boleslaus Chrobry, who made it the seat of a bishopric, and it became the capital of one of the most important of the principalities into which Poland was divided from the 12th century onwards. The city was practically ruined during the first Tatar invasion in 1241, but the introduction of German colonists restored its prosperity, and in 1257 it received "Magdeburg rights," *i.e.*, a civic constitution modelled on that of Magdeburg. The town passed through many vicissitudes until, in 1305, the Polish king, Ladislaus Lokietek, made it his capital, and from that time until 1764 it remained the coronation and burial place of the Polish kings. In 1795 Austria took possession of Cracow; but in 1809 Napoleon incorporated it with the duchy of Warsaw. In the campaign of 1812 the emperor Alexander made himself master of this and the other territory which formed the duchy of Warsaw. At the general settlement of Europe in 1815 Cracow and the adjoining territory were formed into a free state. In Feb. 1846, an insurrection broke out in Cracow, apparently a ramification of a widely spread conspiracy throughout Poland. The senate and the other authorities of Cracow were unable to subdue the rebels or to maintain order, and, at their request, the city was occupied by a corps of Austrian troops. Russia, Austria and Prussia made this a pretext for extinguishing this independent state; and, as the outcome of a conference at Vienna (Nov. 1846), the three courts, contrary to the assurance previously given and in opposition to the British and French governments, decided to incorporate Cracow with the dominions of Austria. At the conclusion of World War I, Cracow was included in the Polish republic. In World War II it fell to Germany Sept. 6, 1939.

CRADDOCK, CHARLES EGBERT (1850–1922), the pen-name of MARY NOAILLES MURFREE, American author, who was born near Murfreesboro, Tenn., Jan. 24 1850. She was crippled in childhood by paralysis, but attended school in Nashville and Philadelphia. During her summers in the mountains of eastern Tennessee, she came to know the primitive people there whom her writings portray. She contributed to *Appleton's Journal*, and, first in 1878, to the *Atlantic Monthly*. No one, apparently, suspected that the author of these tales was a woman, and her identity was not disclosed until after the publication of her first volume of short stories, *In the Tennessee Mountains* (1884). She deals mainly with the narrow, stern life of the mountaineers, who, left behind in the advance of civilization, live amid traditions and customs and speak a dialect peculiarly their own. Her work abounds in effective descriptions of scenery. Among her other books are: *Where the Battle Was Fought* (1884), a novel dealing with the old aristocratic southern life; *Down the Ravine* (1885) and *The Story of Keedon Bluffs* (1887) for young people; *The Prophet of the Great Smoky Mountains* (1885); *In the Clouds* (1886); *The Despot of Broomsedge Cove* (1888); and *His Vanished Star* (1894), novels; *The Mystery of Witch Face Mountain* (1895); *The Phantoms of the Footbridge* (1895); *The Young Mountaineers* (1897); *The Bush Whackers* (1899), short stories. Her later books, *The Fair Mississippian* (1908) or *The Story of Dulciehurst* (1914) are inferior to those written when the local colour movement was at its height. She died at Murfreesboro (Tenn.), July 31 1922.

CRADLE, a child's bed of wood, wicker or iron, with enclosed sides, slung upon pivots or mounted on rockers (of uncertain etymology, possibly connected with "crate" and "creel," *i.e.*, basket). It is a very ancient piece of furniture, but the date when it first assumed its characteristic swinging or rocking form is by no means clear. A miniature in an illuminated *Histoire de la belle Hélaine* in the Bibliothèque Nationale in Paris (end of the 14th or beginning of the 15th century) shows an infant sleeping in a tiny four-post bed slung upon rockers. In its oldest forms the cradle is an oblong oak box without a lid—originally the rockers appear to have been detachable—but, like all other household appliances, it has been subject to changes of fashion alike in shape and adornment. It has been panelled and carved, supported on Renaissance pillars, inlaid with marqueterie or mounted in gilded bronze. The original simple shape persisted for two or three centuries—even the hood made its appearance very early. In the 18th century, however, cradles were often very elaborate—indeed in France they had begun to be so much earlier, but the richly carved and upholstered examples were used chiefly for purposes of State, being in fact miniature *lits de parade*. In modern times they have become lighter and simpler, the old hood being very often replaced by a draped curtain hanging from a carved or shaped upright. By analogy, the word "cradle" is also applied to various sorts of framework in engineering, and to a rocking-tool used in engraving.

CRADOCK, a town in South Africa, 32° 10′ S., 25° 37′ E. Altitude 2,856 ft. Pop. (1936) 9,260: Europeans 3,690; natives 3,569; coloured 1,951; Asiatics 50. It is in the upper valley of the Great Fish river, 183 mi. from Port Elizabeth. A large trade is done in wool and mohair. In the surrounding district 30,000 ac. are irrigated from the Great Fish and Paul's rivers. and lucerne and fruit are grown. The district has an area of 3,048 sq.mi. The town has a reputation as a health resort. The air is dry and bracing, especially in winter; the rainfall is 14.5 inches. Three miles to the north are hot sulphur baths, which are used for the treatment of rheumatism. The town dates from the beginning of the 19th century, and is named after Sir John Cradock, governor of the Cape 1811–13. In the neighbourhood some zebra still survive, protected by the game laws.

CRAFT, a word confined in English to intellectual power, and used as a synonym of "art" (Ger. *Kraft,* strength, power). It also means skill or ingenuity, especially in the manual arts, hence its use in the expression "Arts and Crafts" (*q.v.*); it is thus applied to an association of workmen of a particular trade, a trade gild, and in particular to Freemasons. The word appears also in words such as "handicraft" or "craftsman." Skill applied to outwit or deceive gives the common sense of cunning or trickery, and it is this meaning which is implied in such combined words as "priestcraft," "witchcraft" and the like. A more particular use of the word is in the nautical sense of vessels of transport by water; this is probably a colloquially shortened form either of "vessels of a fisherman's, lighterman's craft," etc., or of "vessels of a heavier or lighter craft."

CRAFTON, a borough of Allegheny county (Pa.), U.S.A. 6 mi. W. of Pittsburgh, on the Pennsylvania railroad. The population in 1930 was 7,004; in 1940, 7,163 by federal census.

CRAG, a steep rock. The word (of Celtic origin, *cf.* Gael. *creag,* Manx *creg,* and Welsh and Modern Scots *craig*) appears in many place-names in north Britain, and is probably connected with "carrick," of similar meaning, which also occurs in place-names. In geology, the term is applied to strata in which a shelly sand deposit is found, and, in the expression "crag and tail," to a glaciated land form in which one side of a hill is precipitous and lofty and the other slopes or "tails" gradually away, as in the Castle Rock on which Old Town Edinburgh was built.

CRAGGS, JAMES (1657–1721), English politician, who, after following various callings in London, entered the service of the duchess of Marlborough, through whose influence he became in 1702 member of parliament for Grampound, retaining his seat until 1713. He was in business as an army clothier and held several official positions, becoming joint postmaster-general in 1715. Craggs also increased his enormous wealth by mixing in the affairs of the South Sea Company, but after his death an act of parliament confiscated all the property which he had acquired since Dec. 1719. He died on March 16, 1721.

His son, James Craggs the younger (1686–1721), was born on April 9, 1686. In 1713 he became member of parliament for Tregoney, in 1717 secretary for war, and in 1718 one of the principal secretaries of state. Craggs was implicated in the South Sea Bubble, but not so deeply as his father, whom he predeceased on Feb. 16, 1721.

CRAIG, EDWARD GORDON (1872–), English stage-designer and writer on the art of the theatre, was born on Jan. 16, 1872. He began life as an actor, appearing first in 1889 at the Lyceum theatre, London, under the direction of Sir Henry Irving. As a young man he designed several stage productions in which he approached the problem of stage scenery from a point of view entirely different from that current at the time. Among these productions were Purcell's opera, *Dido and Aeneas; Bethlehem,* a nativity play by Laurence Housman; *The Vikings,* by Ibsen; and *Much Ado About Nothing,* in which his mother, Ellen Terry, appeared.

Feeling that the contemporary London theatre gave no opportunity for that creative experiment which he felt necessary, Craig founded his school for the Art of the Theatre in Florence in 1913. He had already published his famous book *On the Art of the Theatre* (1911), and commenced issue (1908) of *The Mask,* a journal in which appeared a large number of essays and illustrations revealing his philosophy of theatre art and the practical applications thereof so far as they could be expressed through drawing and letterpress. These and later publications had wide influence in Europe, and the effect of Craig's teaching and example is to be seen, implicit or explicit, in the work of most of the best modern schools of stage design in Europe. The school in Florence did not fulfil Craig's hopes. His most important productions out of England are:—*Rosmersholm,* designed for Eleonora Duse in Florence in 1906; *Hamlet,* for Stanislavsky at the Moscow Art Theatre (1908 or 09); and *The Pretenders,* at the Theatre Royal, Copenhagen. It has been suggested that Craig's practical example has been a far-reaching influence, but it may be that he has most affected posterity by the large body of his writings which provide an effective theory of stage art. Among his later works are *Books and Theatres* (1925), *Henry Irving* (1930), *Fourteen Notes* (1931) and *Ellen Terry and Her Secret Self* (1931).

His sister, Edith Craig (1869–), studied music in London and Berlin, and has been mainly occupied in stage-management and production.

CRAIG, JOHN (1512?–1600), Scottish reformer, the son of Craig of Craigston, Aberdeenshire, was educated at St. Andrews and became a Dominican. He came under suspicion of heresy, and made his way in 1536 to England and then to Italy, where by the influence of Cardinal Pole, he became master of the novices in the Dominican convent at Bologna. His heretical tendencies were revived by the reading of Calvin's *Institutes.* He was condemned to be burnt, but escaped during the riot which broke out on the death of Paul IV. (Aug. 18, 1559), when the prison of the Inquisition was burst open. Returning to Scotland in 1560 he was ordained (1561) minister of Holyrood, and in 1562 became Knox's colleague in the High Church. At first he refused to publish the banns of marriage between Mary and Bothwell, but yielded in the end. He helped to draw up the National Covenant in 1580 and prepared (1581) the "King's Confession" which became the basis of the Covenant of 1638. He died on Dec. 12, 1600.

See T. G. Law, Preface to *John Craig's Catechism* (1885); Hew Scott, *Fasti Ecclesiae Scoticanae* (1915, ed. J. Warwick, 1921).

CRAIG, SIR THOMAS (*c.* 1538–1608), Scottish jurist and poet, was born about 1538, a member of the Craigfintray family. He was educated at St. Andrews, where he took the B.A. degree in 1555. From St. Andrews he went to France, to study the canon and the civil law. He returned to Scotland about 1561, and was admitted advocate in Feb. 1563. In 1564 he was appointed justice-depute by the justice-general, Archibald, earl of Argyll; in 1573 he was appointed sheriff-depute of Edinburgh, and in 1606 procurator for the church. In 1604 he came to London on the commission regarding the union of the two kingdoms. It is said that he wished to refuse the knighthood the king desired to give him, but he has always been styled and reputed a knight. His eldest son, Sir Lewis Craig (1569–1622), was raised to the bench in 1604. Sir Thomas died on Feb. 26, 1608.

Except his poems, the only one of Craig's works which appeared during his lifetime was his *Ius feudale* (1603; ed. R. Burnet, 1655; Leipzig, 1716; ed. J. Baillie 1732). The object of this treatise was to assimilate the laws of England and Scotland, but, instead of this, it was an important factor in building up the law of Scotland into a separate system. Other works were *De unione regnorum Britanniae tractatus, De iure successionis regni Angliae* and *De hominio disputatio.* Translations of the last two have been published, and in 1910 an edition of the *De Unione* appeared, with translation and notes by C. S. Terry. Craig's first poem, an *Epithalamium* in honour of the marriage of Mary, queen of Scots, and Darnley, appeared in 1565. Most of his poems have been reprinted in the *Delitiae poëtarum Scotorum.*

See P. F. Tytler, *Life of Craig* (1823); Life prefixed to Baillie's edition of the *Jus feudale.*

CRAIGAVON, JAMES CRAIG, 1st Viscount (1871–1940), the first prime minister of Northern Ireland, was born Jan. 8, 1871, a son of James Craig of Craigavon, Co. Down. He was educated at Merchiston school, Edinburgh, and served in the South African War of 1899–1902 in the Royal Irish Rifles

He won back for the Unionist party one of the seats in his native county of Down in 1906. In and out of parliament he was in the confidence of Sir Edward Carson, and when, in 1914, it was decided to offer armed resistance to what Ulster Unionists regarded as the threatened destruction of their rights of citizenship in Great Britain, he shouldered a prominent share of the work and the risk (*see* CARSON, EDWARD HENRY CARSON).

During World War I Colonel Craig recruited and organized the 36th (Ulster) Division. In the Coalition Government of 1916, he was treasurer of the household. In 1919 he was parliamentary secretary to the Ministry of Pensions, and in 1920 financial secretary to the Admiralty. When the Government of Ireland Act, 1920, came into force, he resigned and became prime minister of Northern Ireland. In 1918 he was created a baronet, and in 1927 a viscount, taking the title of Viscount Craigavon of Stormont. He continued as prime minister until his death Nov. 24, 1940. (*See* IRELAND, NORTHERN.)

CRAIGIE, PEARL MARY TERESA (1867–1906), Anglo-American novelist and dramatist, who wrote under the pen-name of "JOHN OLIVER HOBBES," was born at Boston, U.S.A., on Nov. 3, 1867, and died in London on Aug. 13, 1906. She was the elder daughter of John Morgan Richards, and in 1887 married Reginald Walpole Craigie, by whom she had one son, John Churchill Craigie; but the marriage proved an unhappy one, and was dissolved on her petition in July 1895. She was brought up as a Nonconformist, but in 1892 was received into the Roman Catholic Church.

Her first little book, the brilliant and epigrammatic *Some Emotions and a Moral,* was published in 1891 in Mr. Fisher Unwin's "Pseudonym Library," and was followed by *The Sinner's Comedy* (1892), *A Study in Temptations* (1893), *A Bundle of Life* (1894), *The Gods, Some Mortals, and Lord Wickenham. The Herb Moon* (1896), a country love story, was followed by *The School for Saints* (1897), with a sequel, *Robert Orange* (1900). Mrs. Craigie had already written short pieces, when her successful play, *The Ambassador,* was produced at the St. James's theatre in 1898. She was part author of *The Bishop's Move* (Garrick theatre, 1902). Among her later works were *The Vineyard* (1904), and *The Dream and the Business* (1906).

CRAIK, DINAH MARIA (1826–1887), author of *John Halifax, Gentleman,* was the daughter of Thomas Mulock, an eccentric religious enthusiast of Irish extraction, and was born on April 20, 1826 at Stoke-upon-Trent, Staffordshire. *John Halifax, Gentleman* (1857), placed her in the front rank of the women novelists of her day. *A Life for a Life* (1859), though inferior, maintained a high position, but she afterwards wrote little of importance except some very charming tales for children. She married Mr. G. L. Craik, a partner in the house of Macmillan and Company, in 1864, and died at Shortlands, near Bromley, Kent, on Oct. 12, 1887.

CRAIK, GEORGE LILLIE (1798–1866), British man of letters, the son of a schoolmaster, was born at Kennoway, Fifeshire. He studied at the university of St. Andrews with the intention of entering the church, but became the editor of a local newspaper, and went to London in 1824 to devote himself to literature. In 1844 he published his *History of Literature and Learning in England from the Norman Conquest to the Present Time,* illustrated by extracts. Craik is best known for his abridged version of this work, *The History of English Literature and the English Language* (1861), which passed through several editions and for his *Spenser and his Poetry* (1845). In 1849 he obtained the chair of history and English literature at Queen's College, Belfast, a position which he held till his death.

CRAIL (formerly *Karel*), a royal and small burgh, Fifeshire, Scotland, 2 mi. from Fifeness, the most easterly point of the county, and 11 mi. S.E. of St. Andrews by the L.N.E.R. Pop. (est. 1938), 1,025. It is said to have been a town of some note as early as the 9th century; its castle, of which there are hardly any remains, was the residence of David I. and other Scottish kings. It was constituted a royal burgh by a charter of Robert Bruce in 1306, and had its privileges confirmed by Robert II. in 1371, by Mary in 1553, and by Charles I. in 1635. Of its priory, dedicated to St. Rufus, a few ruins exist. The ancient church is dedicated to Maelrubha, the patron saint of Crail. Many of the houses are massive and picturesque. The public buildings include an unusual town hall with a Dutch tower. The chief industry is fishing, especially for crabs. Crail is in favour as a summer resort.

Balcomie castle, about 2 m. to the north-east, dates from the 14th century. Here Mary of Guise landed in 1538, a few days before her marriage to James V. in St. Andrews cathedral. The East Neuk is a term applied particularly to the country round Fifeness, and more generally to all of the peninsula east of an imaginary line drawn from St. Andrews to Elie.

CRAILSHEIM, a town of Germany, in the *Land* of Württemberg, on a tributary of the Neckar. Population, 6,391.

It was incorporated as a town in 1338, passed later into the possession of the burgraves of Nürnberg, and came in 1791 to Prussia, in 1806 to Bavaria and in 1810 to Württemberg. There are tanneries and machine workshops, and trade is in wine.

CRAIOVA, the capital of the department of Dolj, in Rumania, situated near the left bank of the river Jiu, and on the main railway from Verciorova to Bucharest. Pop. (1939) 55,444. A branch railway runs to Calafat. Craiova is the chief commercial town west of Bucharest; the surrounding uplands are very rich in grain, pasturage and vegetable products, and contain extensive forests. The town has rope and carriage factories, and manufactories of belting, candles, leather, soap and terra-cotta, and grain and flour mills. Close by is a large tannery worked by convict labour and supplying the army. The principal trade is in cattle, cereals, fish, linen, pottery, glue and leather. In the town, which is the headquarters of the I. Army Corps, there are military and commercial academies, an appeal court and a chamber of commerce, besides many churches.

Craiova, which occupied the site of the Roman Castra Nova, was formerly the capital of Little Walachia. Its ancient *bans* or military governors were, next to the princes, the chief dignitaries of Walachia, and the district is still styled the banat of Craiova. Among the holders of this office were Michael the Brave (1593–1601), and several members of the celebrated Bassarab family (*q.v.*). The bans had the right of coining money stamped with their own effigies, and hence arose the name of *bani* (centimes). The Rumanian franc, or *leu* ("lion"), so called from the image it bore, likewise came from Craiova.

CRAM, RALPH ADAMS (1863–1942), American architect, was born at Hampton Falls (N.H.), on Dec. 16, 1863. He was educated at the Westford (Mass.) academy and the Exeter (N.H.) high school. He studied architecture, and in 1889 opened an architect's office in Boston. Recognized as an authority on mediaeval architecture and an able advocate of the Gothic style, he was appointed architect for the Cathedral of St. John the Divine, New York, in 1911, and consulting architect for the Washington and San Francisco cathedrals. He was professor of architecture at the Massachusetts Institute of Technology, 1914–1921, and was the first chairman of the Boston city planning board, 1915–22. Cram died Sept. 22, 1942.

BIBLIOGRAPHY.—His numerous writings include *Church Building* (1901); *The Ruined Abbeys of Great Britain* (1905); *Impressions of Japanese Architecture and The Allied Arts* (1905); *The Gothic Quest* (1907); *The Ministry of Art* (1914); *Heart of Europe* (1915); *The Substance of Gothic* (1916, Lowell lectures); *The Nemesis of Mediocrity* (1918); *The Great Thousand Years* (1918); *The Sins of the Fathers* (1919); *Walled Towns* (1919); *Gold, Frankincense and Myrrh* (1919); *My Life in Architecture* (1936); *The End of Democracy* (1937).

CRAMBO, an old rhyming game which, according to Strutt (*Sports and Pastimes*), was played as early as the 14th century under the name of the *ABC of Aristotle.* Crambo, or capping the rhyme, is played by one player thinking of a word and telling the others what it rhymes with, the others not naming the actual word they guess but its meaning. Thus one says "I know a word that rhymes with *bird.*" A second asks "Is it ridiculous?" "No, it is not absurd." "Is it a part of speech?" "No, it is not a word." This proceeds until the right word is guessed.

In *Dumb Crambo* the guessers, instead of naming the word, express its meaning by dumb show, a rhyme being given them as a clue.

CRAMER, JOHANN BAPTIST (1771–1858), naturalized English musician, of German extraction, was born in Mannheim. Son of Wilhelm Cramer (1743–1799), a famous London violinist and musical conductor, one of a numerous family who were identified with the progress of music during the 18th and 19th centuries, he was brought to London as a child, and it was in London that the greater part of his musical career was passed. From 1782 to 1784 he studied the pianoforte under Muzio Clementi, and soon became known as a professional pianist both in London and on the continent; he enjoyed a world-wide reputation, and was particularly esteemed by Beethoven. He died in London. Cramer's compositions were numerous, mostly for the piano, but all have been long since forgotten with the exception of his splendid *Études* for the training of pianists, which rank still among the finest works of their class ever produced. His name is also still preserved as one of the principal founders of the London music publishing house of Cramer & Co.

CRAMP, CHARLES HENRY (1828–1913), American shipbuilder, was born in Philadelphia, May 9, 1828, the eldest of eleven children of William Cramp (1807–1869), who in 1830 established shipyards on the Delaware river, near Philadelphia. He became his father's partner in 1849. His inventive capacity and resourcefulness soon gave him high rank as an authority on shipbuilding, and made his influence in that industry widely felt. During the Civil War he designed and built several ironclads for the United States navy, notably the "New Ironsides" in 1862, and the light-draught monitors used in the Carolina sounds; and after 1887 constructed wholly or in part from his own designs many of the most powerful ships in the "new" navy. In the transformation from sail to steam, and from wood to iron and steel, Cramp had a prominent part. He built warships for several foreign navies, among others the "Retvizan" and the "Variag" for the Russian Government. He died in Philadelphia June 6, 1913.

See A. C. Buel, *Memoirs of C. H. Cramp* (Philadelphia, 1906).

CRAMP, a painful spasmodic contraction of muscles, commonest in the limbs, but also affecting certain internal organs. This disorder is probably of reflex nervous origin. Cramp in the limbs comes on suddenly, often during sleep, the patient being roused by agonizing pain in the calf of the leg or back of the thigh. During the paroxysm the muscular fibres affected form a hard knot. The attack in general lasts but a few seconds, and suddenly departs, but relief may come more gradually during a period of minutes or even hours. A liability to cramp is often associated with a rheumatic or gouty tendency. Exposure to cold will also bring it on and to this is probably to be ascribed its occurrence in swimmers. Cramp of the extremities is one of the most distressing accompaniments of cholera, and is common in parturition, just before delivery.

Writer's Cramp, or *Scrivener's Palsy,* is a special example of functional spasm affecting certain muscles when engaged in the performance of acts, the result of education and long usage, but not occurring when the same muscles are employed in acts of a different kind.

The symptoms are in the first instance a gradually increasing difficulty in making the movements required for the work in hand. Taking, for example, the case of writers, the pen cannot be moved with freedom. At an early stage of the disease the difficulty may largely be overcome by persevering efforts, but ultimately, the muscles of the fingers, and even those of the forearm, are seized with cramp, and writing is impossible. Sometimes the fingers, instead of being cramped, move in a disorderly manner and the pen cannot be grasped, while in other rare instances a kind of paralysis affects the muscles of the fingers, and they are powerless to make the movements necessary for holding the pen. It is only in the act of writing that these phenomena present themselves; for all other movements the fingers and arms possess their natural power. The same symptoms are observed and the same remarks apply *mutatis mutandis* in the case of musicians, artists, compositors, seamstresses, tailors and many mechanics in whom this affection may occur. Indeed, although actually a rare disease, no muscle or group of muscles in the body which is specially called into action in any particular occupation is exempt from liability to this functional spasm.

The pathology of writer's cramp is unknown, but it is believed that the disease is not a local one of muscles or nerves, but is an affection of the central nervous system. It never occurs under thirty years of age, and is more frequent in males than females. In its treatment the first requisite is absolute cessation from the employment which caused it.

CRAMP-RINGS, rings anciently worn as a cure for cramp and "falling-sickness," or epilepsy. The legend is that the first one was presented to Edward the Confessor by a pilgrim on his return from Jerusalem, its miraculous properties being explained to the king. At his death it passed into the keeping of the abbot of Westminster, by whom it was used medically and was known as St. Edward's Ring. The belief grew that the successors of Edward inherited his powers, and that the rings blessed by them worked cures. Hence arose the custom for the successive sovereigns of England each year on Good Friday to bless a number of cramp-rings. The ceremony survived to the reign of Queen Mary, but the belief in the curative powers of similar circlets of sacred metal has lingered on even to the present day.

See F. G. Waldron, *The Literary Museum* (1792); *see* also *Notes and Queries*, vol. vii., 1853; vol. ix., 1878.

CRANACH, LUCAS (1472–1553), German painter, was born at Cronach, in upper Franconia, and learnt the art of drawing from his father. He attracted the attention of the elector of Saxony, who gave him a position in his court in 1504. The only clue to Cranach's settlement previous to his Wittenberg appointment is afforded by the knowledge that he owned a house at Gotha, and that Barbara Brengbier, his wife, was the daughter of a burgher of that city.

Of his skill as an artist we have sufficient evidence in a picture dated 1504. After that date we find him active in several branches of his profession, producing portraits and altar-pieces, designing on wood, engraving copperplates, and acting as draughtsman for the dies of the electoral mint. Before 1508 he had painted several altar-pieces for the Schlosskirche at Wittenberg in competition with Dürer, Burgkmair, and others; the duke and his brother John were portrayed in various attitudes, and a number of the best woodcuts and copperplates were published. Great honour accrued to Cranach when he went in 1509 to the Netherlands and took sittings from the emperor Maximilian and the boy who afterwards became Charles V. Till 1508 Cranach signed his works with the initials of his name. In that year the elector gave him the winged snake as a motto, and this motto or *Kleinod* (jewel), as it was called, superseded the initials on all his pictures after that date. Cranach was at an early period with the reformers. The first engraved portrait of Luther by Cranach represents an Augustinian friar, and is dated 1520. Five years later the friar dropped the cowl, and Cranach was present as "one of the council" at the betrothal festival of Luther and Catherine Bora. Cranach died on Oct. 16, 1553, at Weimar, where the house in which he lived still stands in the market-place.

The oldest extant picture by Cranach, the "Rest of the Virgin during the Flight into Egypt," marked with the initials L. C., and the date of 1504, is one of the most graceful creations of his pencil. His copperplates and woodcuts furnish splendid examples of his art; and the earlier they are in date the more conspicuous is their power. Striking evidence of this is the "St. Christopher" of 1506, or the plate of "Elector Frederick praying before the Madonna" (1509). His first woodcut (1505) represents the Virgin and three saints in prayer before a crucifix. Later on he composes the marriage of St. Catherine, a series of martyrdoms, and scenes from the Passion. After 1517 he illustrates occasionally the old gospel themes, but he also gives expression to some of the thoughts of the reformers. In a picture of 1518 at Leipzig, where a dying man offers "his soul to God, his body to earth, and his wordly goods to his relations," the soul rises to meet the Trinity in heaven, and salvation is clearly shown to depend on faith and not on good works. Again sin and grace become a familiar subject of delineation as in the two examples in the galleries of Gotha and Prague, both of them dated 1529. One of the latest pictures with which the name of Cranach is connected is the altar-piece which Cranach's son completed in 1555, and which is now in the *Stadtkirche* (city church) at Weimar. Cranach sometimes composed gospel subjects with feeling and dignity. "The Woman taken in Adultery" at Munich is a favourable specimen of his skill. But he was not exclusively a religious painter. He was equally successful, and often comically naïve, in mythological scenes, as where Cupid, who has stolen a honeycomb, complains to Venus that he has been stung by a bee (Weimar, 1530; Berlin, 1534), or where Hercules sits at the spinning wheel mocked by Omphale and her maids. Humour and pathos are combined at times with strong effect in pictures such as the "Jealousy" (Augsburg, 1527; Vienna, 1530). In a lost canvas of 1545 he depicted hares catching and roasting sportsmen. In 1546, possibly under Italian influence, Cranach composed the "Fons Juventutis" of the Berlin gallery, executed by his son.

Cranach's chief occupation was that of portrait painting, and we are indebted to him chiefly for the preservation of the features of all the German reformers and their princely adherents. But he sometimes condescended to depict such noted followers of the papacy as Albert of Brandenburg, archbishop elector of Mainz, Anthony Granvelle, and the duke of Alva. A dozen likenesses of Frederick III and his brother John are found to bear the date of 1532. It is characteristic of Cranach's readiness, and a proof that he possessed ample material for mechanical reproduction, that he received payment at Wittenberg in 1533 for "sixty pairs of portraits of the elector and his brother" in one day. Among existing likenesses we should notice as the best that of Albert, elector of Mainz, in the Berlin museum, and that of John, elector of Saxony, at Dresden.

Cranach had three sons, all artists—JOHN LUCAS, who died at Bologna in 1586; HANS CRANACH, whose life is obscure; and LUCAS CRANACH (1515–1586) "the younger." He was born at Wittenberg on Oct. 4, 1515, and died at Weimar on Jan. 25, 1586. He studied under his father and worked with him on many of his pictures. In 1565 he was burgomaster of Wittenberg.

Cranach der ältere* (Leipzig, 1902).

CRANBERRY, the fruit of several small plants the more important of which are allied to the blueberries.

The northern cranberry (*Vaccinium oxycoccos*) is found in marshy land in northern Asia, northern and central Europe and northern North America. Its stems are wiry and creeping; the leaves are evergreen, ovate or elliptical in shape and less than half an inch long; the flowers, which appear in June, are small and have a four-lobed, rose-tinted corolla; the berries ripen in September, are mostly round, about the size of currants, crimson in colour and often spotted, with an acid taste.

The American cranberry (*V. macrocarpon*) is found wild from Newfoundland to the Carolinas and westward to Minnesota and Arkansas. It is much like *V. oxycoccos,* but is coarser and bears bigger and finer berries, which are round, oblong or pear-shaped, and vary from pink to very dark red or may be mottled red and white. It is cultivated on acid soils of peat or vegetable mould, free from loam and clay, cleared of turf and with a surface layer of sand. It is grown extensively in Massachusetts, New Jersey and Wisconsin and near the coast of Washington and Oregon. Early Black and Howes are the main varieties in the east, McFarlin and Searls in Wisconsin, and McFarlin in the far west. False blossom is a very harmful, though easily controlled, virus disease. The vines are protected from winter injury and from frost by flooding. The picking of the berries begins early in September and continues till late October. Over 2,000,000 bu. are often produced annually. They are much used in pies, as a sauce-relish for meats, and in making a beverage and are consumed mostly in the United States and Canada. Over one-third of the crop of the country is now canned or dried commercially.

The cowberry or foxberry (*Vaccinium vitis-idaea*), called mountain or rock cranberry in the eastern United States, is used extensively in northern Europe and by Scandinavians in U.S. cities. The southern cranberry (*V. erythrocarpum*) is indigenous in the mountains from Virginia to Georgia and is remarkable for the fine flavour of its dark red berry. The fruit of the cranberry tree or highbush cranberry (*Viburnum americanum*) is sometimes used as a substitute for true cranberries in Canada and the northern United States. The Tasmanian and the Australian cranberries are the produce respectively of *Astroloma humifusum* and *Lissanthe sapida,* plants of the family Epacridaceae.

See *Bulletins* 332 (1936) and 371 (1940) of the Mass. Agricultural Experiment Station. (H. J. FN.)

CRANBROOK, GATHORNE GATHORNE-HARDY, 1ST EARL OF (1814–1906), British statesman, was born at Bradford on Oct. 1, 1814. After graduating at Oxford he was called to the bar. In 1856 he was returned for Leominster, and in 1865 defeated Mr. Gladstone at Oxford. In 1866 he became president of the Poor Law board in Lord Derby's new administration. When in 1867 Walpole resigned, from dissatisfaction with Disraeli's Reform bill, Hardy succeeded him at the Home office. In 1874 he was secretary for war and four years later succeeded Lord Salisbury at the India office, being raised to the peerage as Viscount Cranbrook. At the same time he had assumed the additional family surname of Gathorne, which had been that of his mother.

In Lord Salisbury's administrations of 1885 and 1886 Lord Cranbrook was president of the council, and upon his retirement from public life concurrently with the resignation of the cabinet in 1892 he was raised to an earldom. He died on Oct. 30, 1906.

See *Gathorne-Hardy, 1st earl of Cranbrook, a memoir with extracts from his correspondence,* edited by the Hon. A. E. Gathorne-Hardy (1910).

CRANBROOK, a small town, south Kent, England, 40 mi. S.E. of London on a branch of the Southern railway. Pop. of rural district (1938) 13,250. Cranbrook lies on the Crane brook, a feeder of the river Beult, in a hilly and wooded district. The church (mainly Perpendicular) is dedicated to St. Dunstan, and has some ancient stained glass.

As the agricultural centre of the Kentish Weald, it trades in malt, hops and general goods; but from the 14th to the 17th century, it was one of the principal seats of broadcloth manufacture.

Cranbrook public school was founded in 1520.

CRANBROOK, a town of British Columbia in the Kootenay valley between the Selkirk range and the Rocky Mountains. Population (1941) 2,568.

The town is a divisional point on the C.P.R. (Crow's Nest branch). The district is the seat of fruit farming, lumbering and mining operations.

CRANDALL, PRUDENCE (1803–1890), American schoolteacher of Quaker parentage, was born at Hopkinton, R.I., Sept. 3, 1803. She was educated in the Friends' school at Providence, taught at Plainfield, Conn., and in 1831 established a private academy for girls at Canterbury, Conn. Although the school was recognized as one of the best in the state, by admitting a Negro girl she lost her white patrons, and in March 1833, on the advice of William Lloyd Garrison and Samuel J. May, she opened a school for "young ladies and little misses of colour." For this she was persecuted, boycotted and socially ostracized; measures were taken in the Canterbury town meeting to break up the school, and finally in May 1833 the state legislature passed the notorious Connecticut "Black law," prohibiting the establishment of schools for nonresident Negroes in any city or township of Connecticut without the consent of the local authorities. Miss Crandall, refusing to submit, was arrested, tried and convicted in the lower courts, whose verdict, however, was reversed on a technicality by the court of appeals in July 1834. Thereupon the local opposition to her redoubled, and she was finally in Sept. 1834 forced to close her school. She married the Rev. Calvin Philleo. She died at Elk Falls, Kan., on Jan. 28, 1890.

See J. C. Kimball's *Connecticut Canterbury Tale* (Hartford, Conn., 1889) and S. J. May's *Recollections of Our Anti-Slavery Conflict* (Boston, 1869).

CRANE, STEPHEN (1871–1900), American author, the 14th child of Jonathan Crane, Methodist pastor, was born in Newark (N.J.), on Nov. 1, 1871. Crane attended Lafayette and Syracuse universities but took no degree. He began newspaper work at an early age. He published his first book, *Maggie: A Girl of the Streets,* under a pseudonym at his own expense. This novel attracted no attention but Crane's next work, *The Red Badge of Courage* (1895), a remarkable study of the psychology of courage, laid in the American Civil War, immediately made him famous and has been widely imitated. Ambrose Bierce said of it: "This young man has the power to feel. He knows nothing of war, yet he is drenched in blood. Most beginners who deal with this subject spatter themselves with ink." When Crane published this story he had never witnessed a battle, but his pictures of soldiers were so veracious and convincing that he was at once engaged as a war correspondent by various American and later by English periodicals. He served with a Cuban filibustering expedition, in the Graeco-Turkish War and in the Spanish-American War. On the filibustering expedition the vessel that carried Crane was shipwrecked, and he suffered great hardships on his way back to Florida. His privations undermined his health and led to his early death, but they furnished the material for *The Open Boat,* an account of his experiences that H. G. Wells called "the finest short story in the English language."

For several years Crane lived in England, at Brede in Sussex, and became a friend of Joseph Conrad. He was preparing to visit St. Helena as a special writer for the London *Morning Post* when he was seized with his fatal illness. He died of consumption in Baden, on June 5, 1900, and was buried in the cemetery of Elizabeth, New Jersey. His birthplace in Newark, acquired as a memorial by the Stephen Crane Association, is marked with a tablet. Crane was described as "typically American, long and spare, with very straight hair and features, and long, quiet hands and hollow eyes, moving slowly, smiling and speaking slowly."

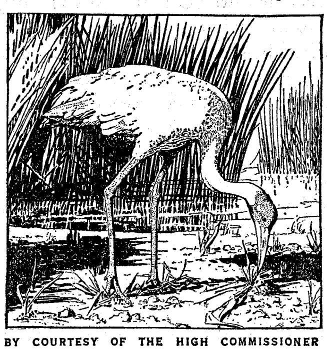
His work falls into three groups—novels, short stories and sketches, and verse. In his fiction he was one of the earliest of American realists. Among his short stories *The Blue Hotel* and a series of tales of American boys, the *Whilomville Stories,* are particularly memorable. Crane was a pioneer in writing free verse, and his epigrammatic tang in *Black Riders* and *War Is Kind* has rarely been equalled. Of his work as a whole Arnold Bennett has said, "In my opinion Crane must rank with the best writers that America has produced, and as one of the finest descriptive experts of modern times." Some of his other books are: *George's Mother* (1896); *The Little Regiment* (1896); *The Open Boat and Other Tales of Adventure* (1898); *The Monster* (1899).

See Vincent Starrett, *Bibliography of Stephen Crane* (Philadelphia, 1923); Thomas Beer, *Stephen Crane* (1923); *Complete Works,* 12 vols. edit. Wilson Fottett (1925–26); also biographical introduction to the new edition of *The Red Badge of Courage* (1925). (M. J. H.)

CRANE, WALTER (1845–1915), English artist, second son of Thomas Crane (1808–1859), portrait painter and miniaturist, was born in Liverpool on Aug. 15, 1845. The family soon removed to Torquay (where the boy gained his early artistic impressions), and, when he was 12 years old, to London. He early came under the influence of the Pre-Raphaelites, and was a diligent student of Ruskin. He was apprenticed for three years (1859–1862) to William James Linton, the wood-engraver. As a wood-engraver he had abundant opportunity for the minute study of the contemporary artists whose work passed through his hands, of Rossetti, Millais, Tenniel and F. Sandys, and of the masters of the Italian Renaissance; he was also greatly influenced by the Elgin Marbles in the British Museum. A further and important element in the development of his talent, was the study of Japanese colour-prints, the methods of which he imitated in a series of toy-books, which started a new fashion. In 1862 his picture, "The Lady of Shalott," was exhibited at the Royal Academy, but the Academy steadily refused his maturer work; and after the opening of the Grosvenor gallery in 1877 he ceased to send pictures to Burlington house. In 1864 he began to illustrate for Mr. Edmund Evans, the colour printer, a series of sixpenny tóy-books of nursery rhymes, displaying admirable fancy and beauty of design, though he was limited to the use of three colours. He was allowed more freedom in a delightful series begun in 1873 *The Frog Prince,* etc., which showed markedly the influence of Japanese art, and of a long visit to Italy following on his marriage in 1871. *The Baby's Opera* was a book of English nursery songs planned in 1877 with Mr. Evans, and a third series of children's books with the collective title *A Romance of the Three R's,* provided a regular course of instruction in art for the nursery. In his *Lady of Shalott* the artist had shown his preoccupation with unity of design in book illustration by printing the words of the poem himself, as he considered that this union of the calligrapher's and the decorator's art was one secret of the beauty of the old illuminated books. He followed the same course in *The First of May: A Fairy Masque* by John R. Wise, text and decoration being in this case reproduced by photogravure. The "Goose Girl" illustration taken from his *Household Stories from Grimm* (1882) was reproduced in tapestry by William Morris, and is now in the South Kensington museum. *Flora's Feast: A Masque of Flowers* had lithographic reproductions of Crane's line drawings washed in with water-colour; he also decorated in colour *The Wonder Book* of Nathaniel Hawthorne, and Margaret Deland's *Old Garden;* in 1894 he collaborated with William Morris in the page decoration of *The Story of the Glittering Plain,* published at the Kelmscott press, which was executed in the style of 16th century Italian and German woodcuts; but in purely decorative interest the finest of his works in book illustration is Spenser's *Faerie Queene* (1894–96) and the *Shepheard's Calendar.* The poems which form the text of *Queen Summer* (1891), *Renascence* (1891), and *The Sirens Three* (1886) are by the artist himself.

In the early '80s under Morris's influence he was closely associated with the socialist movement. He did as much as Morris himself to bring art into the daily life of all classes. With this object in view he devoted much attention to designs for textile stuffs, for wall-papers, and to house decoration; but he also used his art for the direct advancement of the socialist cause. For a long time he provided the weekly cartoons for the socialist organs *Justice* and *The Commonweal.* Many of these were collected as *Cartoons for the Cause* (1896). He devoted much time and energy to the work of the Art Workers' Guild, and to the Arts and Crafts Exhibition Society, founded by him 1888.

A portrait of Walter Crane by G. F. Watts is in the National Portrait Gallery. There is a comprehensive and sumptuously illustrated book on *The Art of Walter Crane* (1902) by P. G. Konody; a monograph (1902) by Otto von Schleinitz in the *Künstler Monographien* series (Bielefeld and Leipzig); and an account of himself *An Artist's Reminiscences* (1901).



BY COURTESY OF THE HIGH COMMISSIONER FOR AUSTRALIA

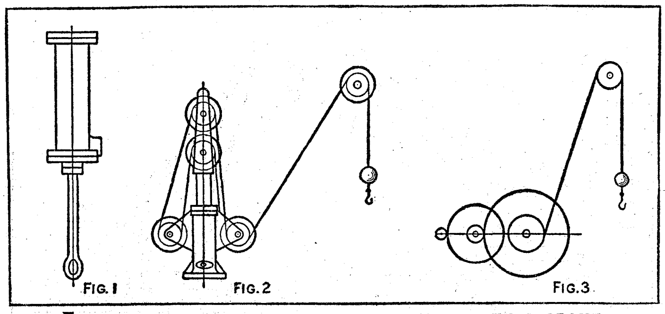
THE NATIVE COMPANION CRANE, DISTRIBUTED OVER THE GREATER PART OF AUSTRALIA

CRANE, a large wading bird. Formerly inhabiting England, the crane (*Megalornis grus*) breeds in the marshes of Spain, Turkey, Russia, N. Germany and Scandinavia, migrating in large flocks in autumn to Africa and India. The nest is formed on the ground and the same spot is utilized year after year. The eggs are brown with dark spots and two in number. The young, which are able to run soon after they are hatched, are clothed in tawny down. The adult plumage is grey, with black, white and red (the last due to bare skin) on the head and neck. The crane has a loud trumpeting call, correlated with the formation of the trachea, which is received into a hollow space formed by the walls of the keel of the sternum, where it makes three turns before running upwards and backwards to the lungs. The crane and its allies form the family *Gruidae,* whose nearest allies are probably the bustards (*q.v.*); they are an ancient group, species of the *Grus* occurring in the Miocene of France and Greece. At the present time, cranes inhabit all the great zoo-geographical regions except the Neotropical. The demoiselle crane (*Anthropoides virgo*), distinguished by its white ear-tufts, inhabits S. Europe, Asia and Africa and allied species occur in other parts of Asia and Africa. In Australia there is *G. australis*, the "native companion," and four species are found in N. America, of which the little brown crane (*G. canadensis*) and the sandhill crane (*G. mexicana*) are widely distributed. The whooping crane (*G. americana*) is on the verge of extinction. The African crowned cranes (*Balearica*) have a tuft of slender yellow feathers on the head. The food of the cranes consists of small animals of all kinds.

CRANES, machines by means of which heavy bodies may be lifted, and also displaced horizontally, within certain defined limits (so called from the resemblance to the long neck of the bird, *cf*. Gr. γέρανος, Fr. *grue*). Strictly speaking, the name alludes to the arm or jib from which the load to be moved is suspended, but it is now used in a wider sense to include the whole mechanism by which a load is raised vertically and moved horizontally. Machines used for lifting only are not called cranes, but winches, lifts or hoists, while the term elevator or conveyor is commonly given to appliances which continuously, not in separate loads, move materials like grain or coal in a vertical, horizontal or diagonal direction. (*See* CONVEYORS.) The use of cranes is of great antiquity, but it is only since the great industrial development of the 19th century, and the introduction of other motive powers than hand labour, that the crane has acquired the important and indispensable position it now occupies. In all places where finished goods are handled, or manufactured goods are made, cranes of various forms are in universal use.

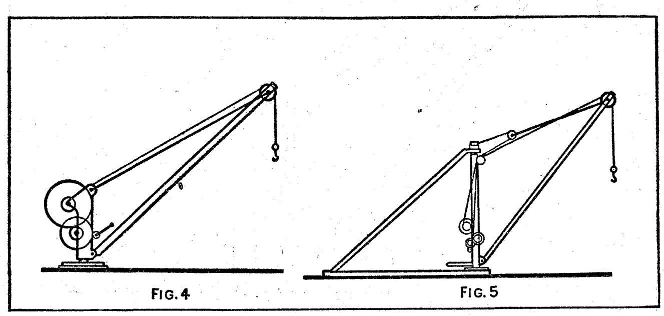
Classification of Motive Power.—Cranes may be divided into two main classes—revolving and non-revolving. In the first the load can be lifted vertically, and then moved round a central pivot, so as to be deposited at any convenient point within the range. The type of this class is the ordinary jib crane. In the second class there are, in addition to the lifting motion, two horizontal movements at right angles to one another. The type of this class is the overhead traveller. The two classes represent respectively systems of polar and rectangular co-ordinates. Jib cranes can be subdivided into fixed cranes and portable cranes; in the former the central post or pivot is firmly fixed in a permanent position, while in the latter the whole crane is mounted on wheels, so that it may be transported from place to place.

The different kinds of motive power used to actuate cranes—manual, steam, hydraulic, electric—give a further classification. Hand cranes are extremely useful where the load is not excessive and the quantities to be dealt with are not great, also where speed is not important and first cost is an essential consideration. The net effective work of lifting that can be performed by a man turning a handle may be taken, for intermittent work, as being on an average about 5,000 ft.-lb. per minute; this is equivalent to one ton lifted about $2\frac{1}{4}$ft. per minute, so that four men can by a crane raise one ton 9ft. in a minute or nine tons 1ft. per minute. It is at once evident that hand power is only suitable for cranes of moderate power, or in cases where heavy loads have to be lifted only very occasionally. This point is dwelt upon because the speed limitations of the hand-crane are often overlooked by engineers. Steam is an extremely useful motive power for all cranes that are not worked off a central power station. The steam crane has the immense advantage of being completely self-contained. It can be moved (by its own locomotive power if desired) long distances without requiring any complicated means of conveying power to it; and it is rapid in work, fairly economical and can be adapted to the most varying circumstances. Where, however, there are a number of cranes all belonging to the same installation, and these are placed so as to be conveniently worked from a central power station, and where the work is rapid, heavy and continuous, as is the case at large ports, docks and railway or other warehouses, experience has shown that it is best to produce the power in a generating station and distribute it to the cranes. Down to the closing decades of the 19th century hydraulic power was practically the only system available for working cranes from a power station. The hydraulic crane is rapid in action, very smooth and silent in working, easy to handle and not excessive in cost or upkeep—advantages which have secured its adoption in every part of the world. Electricity as a motive power for cranes is of more recent introduction. The electric transmission of energy can be performed with an efficiency not reached by any other method, and the electric motor readily adapts itself to cranes. When they are worked from a power station the great advantage is gained that the same plant which drives them can be used for many other purposes, such as working machine tools and supplying current for lighting. For dock-side jib cranes the use of electric power is making rapid strides. For overhead travellers in workshops, and for most of the cranes which fall into our second class, electricity as a motive power has already displaced nearly every other method. Cranes driven by shafting, or by mechanical power, have been largely superseded by electric cranes, principally on account of the much greater economy of transmission. For many years the best workshop travellers were those driven by quick running ropes; these performed admirable service, but they have given place to the more modern electric traveller.



FIGS. 1 TO 3.—THREE METHODS OF LIFTING WITH A CRANE
1.—Direct pull by a piston-rod under power, giving short range of lift only
2.—Indirect pull from piston through pulley system, used in hydraulic cranes
3.—Indirect pull through winding rope on rotating barrel

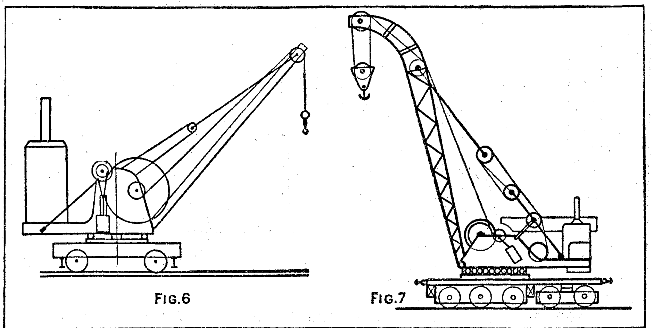
Lifting mechanisms.—The principal motion in a crane is naturally the hoisting or lifting motion. This is effected by slinging the load to an eye or hook, and elevating the hook vertically. There are three typical methods: (1) A direct pull may be applied to the hook, either by screws, or by a cylinder fitted with piston and rod and actuated by direct hydraulic or other pressure, as shown diagrammatically (fig. 1). These methods are used in exceptional cases, but present the obvious difficulty of giving a very short range of lift. (2) The hook may be attached to a rope or chain and the pulling cylinder connected with a system of pulleys around which the rope is led; by these means the lift can be very largely increased. Various arrangements are adopted; the one indicated (fig. 2) gives a lift of load four times the stroke of the cylinder. This second method forms the basis of the lifting gear in all hydraulic cranes. (3) The lifting rope or chain is led over pulley to a lifting barrel, upon which it is coiled as the barrel is rotated by the source of power (fig. 3). Sometimes, especially in the case of overhead travelling cranes for very heavy loads, the chain is a special pitch chain, formed of flat links pinned together, and the barrel is reduced to a wheel provided with teeth, or "sprockets," which engage in the links. In this case the chain is not coiled, but simply passes over the lifting wheel,



FIGS. 4 AND 5.—TYPES OF HAND CRANES USED BY RAILROAD COMPANIES
4.—The weight of the jib is carried by the central steel post, the load weight being taken by the rollers
5.—The superstructure is pivoted at the base, and the head by means of diagonal supporting legs

the free end hanging loose. All the methods in this third category require a rotating lifting or barrel shaft, and this is the important difference between them and the hydraulic cranes mentioned above. Cranes fitted with rotating hydraulic engines may be considered as coming under the third category.

When the loads are heavy the above mechanisms are supplemented by systems of purchase blocks suspended from the jib



FIGS. 6 AND 7.—TWO TYPES OF STEAM CRANE IN WHICH THE BOILER HELPS TO SERVE AS COUNTERWEIGHT, AND THE LOAD IS LIFTED BY MEANS OF A STEEL WIRE ROPE COILED ON A BARREL
6.—A portable steam crane of the type n general use
7.—A railway breakdown crane

or the traveller crab; and in barrel cranes trains of rotating gearing are interposed between the motor, or manual bar, and the barrel (fig. 3).

Hand Cranes.—Typical examples are illustrated in figs. 4 and 5. A large number are still used for places where the work is only occasional. Both these types are largely used by railway companies and small ports. In fig. 4 the weight of the revolving part or superstructure is carried on the top of a forged steel or cast iron post, the overturning moment of the load being taken on rollers carried at the bottom of the superstructure, which roll round the part of the post immediately above the bed of the crane. In fig. 5 the superstructure is carried on rollers which revolve on a turned path on the bed or truck. Sufficient ballast is carried in the tail of the superstructure to keep the centre of gravity of the revolving portion inside this roller path.

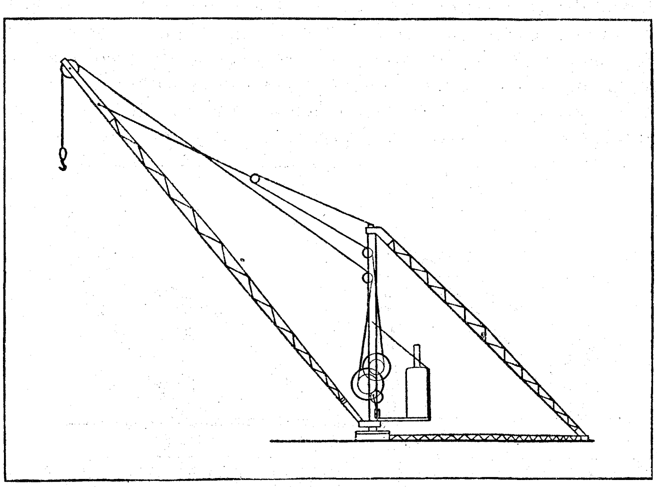


FIG. 8.—THE SCOTCH DERRICK, A STATIONARY STEAM (OR ELECTRIC) CRANE, WITH LIMITED ROTATING MOVEMENT, MUCH USED IN BUILDING CONSTRUCTION

Steam Cranes.—Two well-known types are shown in figs. 6 and 7. The former is the standard type of portable steam crane which can be constructed to run on any gauge or on road wheels or on a caterpillar track. Fig. 7 shows a railway breakdown crane. This is fitted with a large number of axles in order to reduce the axle loads for running on the main line, and has one bogey to enable it to negotiate the curves. It is fitted with standard railway buffers and draw gear and vacuum brakes.

In both of these types the motions provided for are those of hoisting the load, slewing or revolving the superstructure about a perpendicular axis through the centre of the truck, travelling the crane along the line, and lifting and lowering the jib. This latter motion is known as derricking or luffing. The boiler is mounted on the tail girders at the back of the revolving superstructure. In this position it acts as a counterweight, which, together with cast-iron ballast underneath, serves to balance off the forward moment of the load and jib. Two cylinders are mounted one on either side of the crane. These may be either vertical, horizontal or inclined. They drive direct on to a transverse horizontal shaft from which the various motions are taken. The lifting mechanism is of the type illustrated (fig. 3), and is operated by a pinion which slides on its shaft so that the load can be lowered, under control of a band brake on the barrel, without revolving the engine shaft. The crane revolves on rollers carried on pins fixed to the bed of the revolving superstructure. A circular path for these rollers is fixed to the top of the truck. For large cranes a live ring of rollers is often used. This consists of a number of rollers the pins of which are all carried by either one or two rings. Thus the live ring revolves on the truck at half the rate of revolution of the superstructure. The live ring is thus a large roller thrust bearing and makes the slewing very free besides giving a good distribution of load. A circular steel curb ring fitted with teeth is mounted on the top of the truck, the teeth of which engage with a vertical pinion mounted on a shaft which is carried by the superstructure. This shaft is revolved through a train of spur gearing by friction cones which are keyed to the engine shaft and drive down through bevel gears. The motions of travelling and derricking are also taken from the engine shaft, the former being operated by a vertical shaft which passes down into the truck through the middle of the centre post or pin about which the crane revolves. From there the motion is taken on to the axles through bevel gear and longitudinal shafts. The jib is supported by a rope or ropes which pass over sheaves at the top of the superstructure, and are coiled on the derricking barrel. The latter is driven from the engine shaft, usually through a worm and wheel which are made so that the motion will not reverse under the weight of the jib and load. This is done for safety so that the derricking clutch can be withdrawn without allowing the jib to run out.

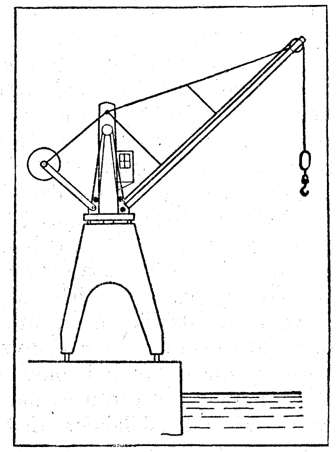

FIG. 9.—HYDRAULIC CRANE
The load is lifted by a ram, and the crane can be slewed by chains wrapped round the revolving central mast

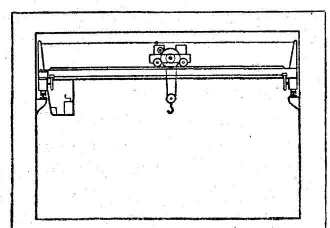

FIG. 10.—ELECTRIC OVERHEAD TRAVELLING CRANE

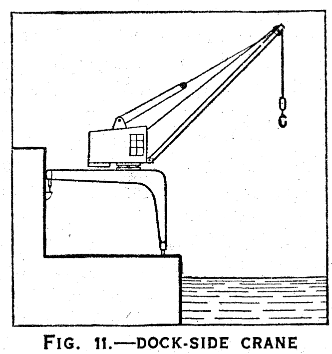

FIG. 11.—DOCK-SIDE CRANE
This type is generally mounted on a gantry, which travels along the quay

Another familiar form of steam crane, and one much used for building construction, is the Scotch derrick (fig. 8). It operates much as described above, except that it does not travel, and can only slew through part of a circle. It is often mounted on steel framed towers so as to get extra height of lift. Scotch derricks are also often operated by electric motors.

Hydraulic Cranes.—A common type of hydraulic crane is illustrated in fig. 9. The load is lifted by means of a ram (fig. 2). Similar rams are mounted horizontally at the top of the gantry,

BY COURTESY OF THE CLEVELAND CRANE & ENGINEERING CO.

OVERHEAD CRANES IN INDUSTRIAL PLANTS

1. All-welded powerhouse crane with 105-ft. span, used to transport heavy electrical equipment. The two overhead girders are more than 8 ft. deep in the middle and weigh 45 tons each. The entire crane weighs 178 tons
2. Ten-ton, all-welded magnet handling crane in a large steel mill. In the background is a 15-ton crane
3. Small motor-driven tram-rail gantry crane, controlled from a push-button station attached to a rigid arm. This type is often employed under a large overhead crane to relieve the latter of lighter, time-consuming work

MODERN STEEL POWER CRANES FOR INDUSTRIAL USES

1. Modern installation of dockside cranes for transferring cargoes to and from ocean vessels. Cranes reach warerooms and holds of vessels. **2.** Kearsarge type crane in U.S. navy yard. Mounted on battleship hull, this crane can be towed to sea for use in raising or rescuing vessels. **3.** Transporter travelling cranes, 12-ton capacity, unloading ore from steamer to blast furnaces; used in handling coal, ore and raw materials. **4.** Steam breakdown crane, 120-ton capacity, for railroad use. Mounted on special trucks, has self-contained power plant, geared for propulsion. **5.** Hammerhead crane, 200-ton capacity. Horizontal "head" turns in a circle on vertical base. Power plant is located in housing at left. **6.** Locomotive lifting crane, 200-ton capacity, in railroad shops. Four hoists and framework are controlled by operator in car at right or non-revolving portion of the crane. These rams pull on chains which are wrapped round the revolving mast and give the crane the motion of slewing. A further ram is mounted on the back of the superstructure and is used to luff the jib in and out. Hydraulic cranes are usually travelled by hand power, but sometimes revolving hydraulic engines are fitted for this purpose.

Electric Cranes.—The two types of electric cranes most generally used are those shown in figs. 10 and 11. The former shows the common type of overhead traveller. It consists of two main or bridge girders the ends of which are attached to end carriages which travel on the longitudinal gantry girders or runway. The main girders may be of the single joist construction for small cranes, or lattice or plate girders for large cranes. The hoisting winch is carried on a frame mounted on wheels called the crab or jenny. This crab moves on either the top or bottom booms of the main girders and carries a separate motor for this motion of "cross traversing." The controllers for all these motions are in the driver's cage at one or other end of the main girders. Sometimes a revolving jib crane is mounted on the jenny (fig. 12). Such a type is useful where it is required to pick up loads outside the shop runway rails, but it has the disadvantage of taking up valuable headroom. Allowance must be made in designing the gantry girders for the eccentric load.

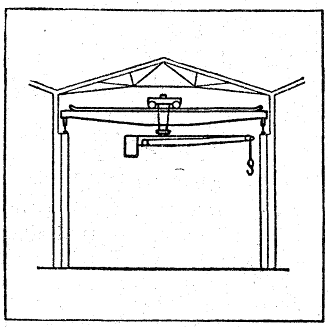

FIG. 12.—OVERHEAD TRAVELLING CRANE WITH JIB, USEFUL FOR PICKING UP LOADS OUTSIDE THE AREA ENCLOSED BY RUNWAYS

Dockside cranes (fig. 11) are a very important class. They are usually of the revolving type, and are either mounted on the roof of the warehouse or on a gantry on the quay. This latter may be of the half portal type as illustrated, or the full portal type where both crane rails are on the quay. They have four motions, that of lifting the load, slewing, luffing or derricking the jib, and travelling along the quay or roof. They vary in capacity from $1\frac{1}{2}$ to 5 tons, which are handled at a radius of from 25 to 90ft.

Special Purpose Cranes.—The cranes described so far have been roughly classified according to the motive power which operates them, but it is obviously not possible always to follow this plan, as a crane can be designed for any special duty and worked by the motive power which is most conveniently available at site. Figs. 13 to 22 show a number of these.

Fig. 13 shows a useful type of steam crane for reclaiming coal from a store at a power station. It is mounted on a caterpillar truck, and operates a grab. The latter picks up $2\frac{3}{4}$ tons of coal per lift and weighs, empty, $2\frac{1}{4}$ tons. The boiler has a steaming capacity of 1,400lb. per hour, and the crane will handle coal at the rate of 600 tons per hour without losing steam. For this purpose a steam crane has the advantage of mobility, but is handicapped by its output being limited by its boiler capacity. The whole crane with ballast and load weighs 59 tons, and has a maximum track pressure of 2·3 tons per square foot with the jib across the corner of one track.

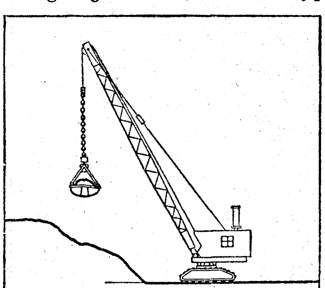

FIG. 13.—MOVING STEAM CRANE FOR USE IN CLEARING DUMPS

Fig. 14 shows an electric crane for discharging coal from ships by means of a grab. The coal is deposited into a hopper in front of the gantry, from whence it passes through a weighing machine and on to a belt conveyor. The latter discharges the coal through the rear of the gantry on to another conveyor, not shown in the fig., into the boiler house bunkers. It will be noted that the motions most used are those of lifting and luffing.

Fig. 15 shows another method of carrying out a similar duty by means of an electric transporter crane. Here the front apron girder or boom is hinged at the rear end to allow ships to be brought in. The boom is thus lowered out over the hatch, and the trolley moves backwards and forwards on it. The trolley carries the lifting and cross traversing machinery and the driver's cabin. The lifting machinery revolves on a large ball race, and carries a jib from the end of which the grab is suspended. This machine

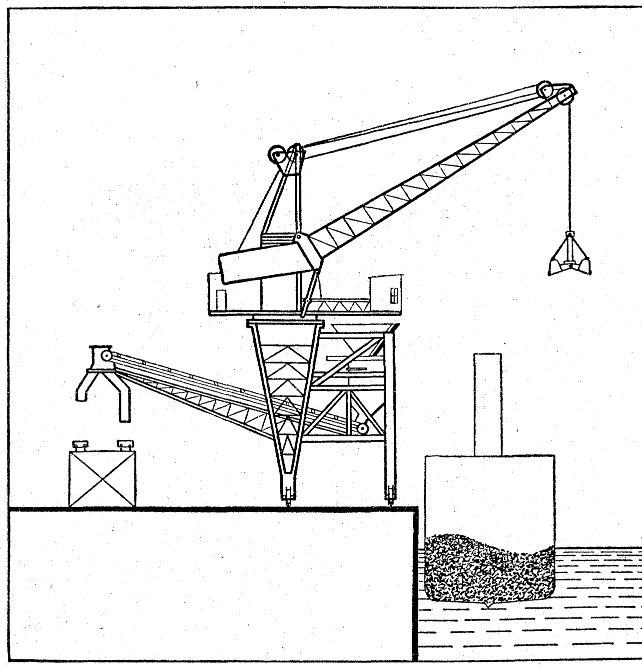

FIG. 14.—ELECTRIC CRANE DISCHARGING COAL FROM A SHIP
The coal is discharged into a hopper, from which it passes through a weighing machine, and thence by means of conveyors to the boiler-house bunkers

was designed to give a rate of discharge of 150 tons per hour through the ship. It is important in unloading bulk cargo to make sufficient allowance for the time lost in cleaning up nearly empty hatches and in shifting to new hatches. In this transporter the

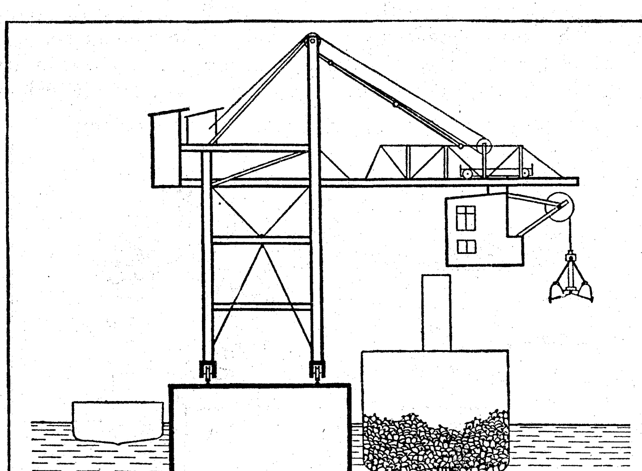

FIG. 15.—ELECTRIC TRANSPORTER CRANE FOR DISCHARGING COAL
In this type the front boom is first raised to permit the entry of the ship; the trolley and control cabin then move out till over the ship's hatch

rate of discharge with a fairly full hatch was 230 tons per hour, but the average rate throughout a ship holding 2,700 tons of coal was 160 tons per hour.

Fig. 16 shows a similar machine for unloading iron ore. It has a capacity of 300 tons per hour without making the allowances mentioned above. The gross weight of grab and contents is 18 to 19 tons, according to the class of ore handled. There are two hoisting motors and two winches, one for closing the grab or digging, and the other for holding the head of the grab while discharging. Each motor has a capacity of 155 b.h.p. on a one-hour rating, and 200 b.h.p. on a half-hour rating. After the grab has been filled both winches lift together. The crane can also be used for handling loaded 20-ton wagons. The whole of the hoisting gear revolves on a circular roller path, and the ropes are led direct from the barrels to the grab, no jib being used as in fig. 15. This arrangement allows the grab to be turned by means of slewing gear in the crab, so as to pick up the ore at the most suitable angle. The speed of lifting is 220ft. per minute,

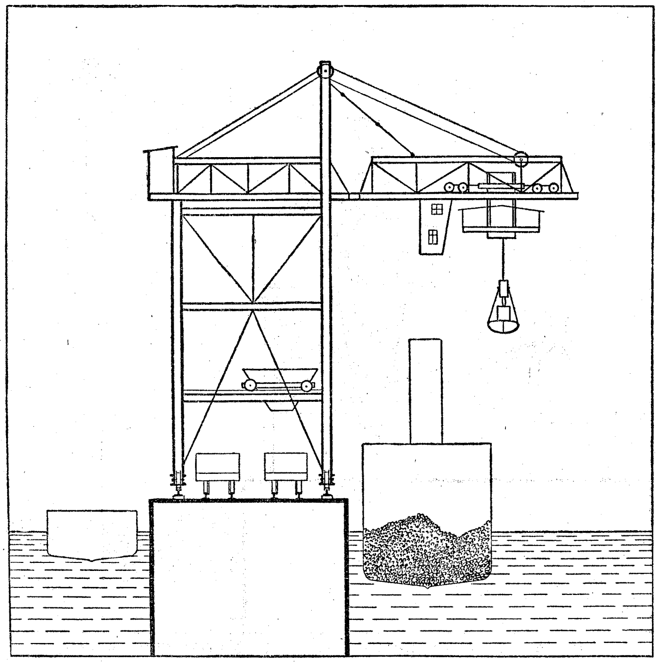

FIG. 16.—DIAGRAM OF TRANSPORTER CRANE FOR UNLOADING IRON ORE
This type can lift 19 tons; no jib is fitted, and gear is employed to slew the grab to a convenient position for picking up the ore

cross traverse of crab 300ft. per minute with two 40 h.p.motors, slewing three revolutions per minute with one 12 h.p. motor, travelling along the quay 40ft. per minute with a 40 h.p. motor. The overall dimensions of the grab are 7ft. 6in. long by 14ft. 6in. wide when open. These figures are given in some detail because they show that the rate of discharge is limited, and cannot be increased very much unless the sizes of hatches are increased so

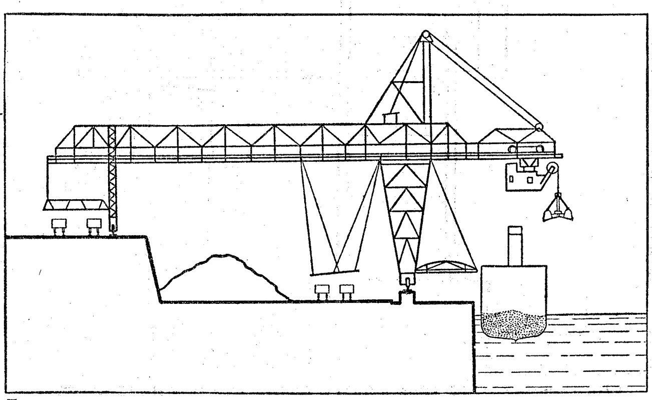

FIG. 17.—LONG TRANSPORTER CRANE WITH A GRAB OF 5 TONS' CAPACITY. IT CAN TRAVEL 260 FT. AT 800 FT. A MINUTE

as to allow of the use of larger grabs. For the heaviest duties a transporter has some advantage over a crane, as higher speeds can be used for the cross traverse than are possible with the slewing or luffing motions of a crane, owing to the fact that the length of rope above the load is not so great and consequently the inertia of stopping and starting does not produce such a swing on the grab. It must always be remembered that control of the load is as important for quick working as the actual speed of any particular motion, and future development of this class of machinery will probably be more with the object of getting better control than of increasing either the load or the speeds. Fig. 17 shows a similar machine for unloading iron ore. The grab has a capacity of five tons, and discharges either on to the quay or into a bunker at the rear end. The crab travels a distance of 260ft. at a speed of 800ft. per minute.

Fig. 18 shows the "hammer-headed" crane which is used for loads up to 250 tons. It is used for lifting heavy machinery, either for construction or repair, into and out of ships. The general arrangements are similar to those described above, but all the motions are much slower. The heavy lifting machinery is fixed at the tail of the crane, as is also the racking machinery. The jenny is pulled in and out by ropes, and only carries the sheaves over which the hoist ropes pass. Fig. 19 shows a very usual form of graving dock crane having a capacity of 30 tons at 85ft. radius. It is used for ship repair work. The superstructure revolves on a live ring of rollers, and the arrangement of machinery is similar though much larger than that of the dockside cranes described above.

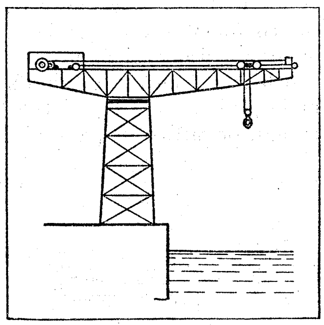

FIG. 18.—HAMMER-HEADED CRANE

Where a graving dock is not available, and for general work in a harbour where large lifts are required at different places, it is usual to mount a crane on a large pontoon (fig. 20). This floating crane revolves on a base fixed to the deck, and the jib is supported by screws, which enables the jib to be luffed in and out. Another type of floating crane is shown (fig. 21). Three such cranes, operated by steam, are commonly mounted on a hopper barge, one being at the bow and two at the stern. They are used for dredging, each crane having a capacity up to about 200 tons of silt per hour.

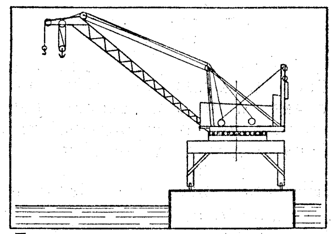

FIG. 19.—GRAVING DOCK CRANE USED FOR SHIP REPAIR WORK

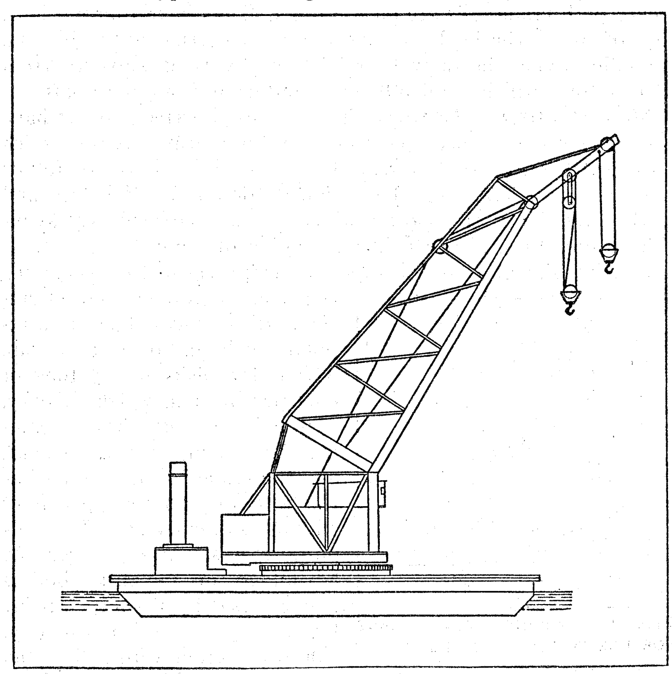

FIG. 20.—FLOATING CRANE FOR GENERAL HARBOUR WORK, MOUNTED ON A PONTOON

A special form of jib crane, designed to meet a particular purpose, is the Titan (fig. 22), largely used in the construction of piers and breakwaters. It contains all the essential elements of the hammer-head crane, of which it may be considered to be the parent; in fact, the only essential difference is that the Titan is portable, and the hammer-head crane fixed. The Titan was the first type of large portable crane in which full use was made of a truly horizontal movement of the load; for the purpose for which the type is designed, viz., setting concrete blocks in courses, the motion is almost a necessity. A simple form of crane for lifting heavy loads is shown in fig. 23. This shows the shear legs.

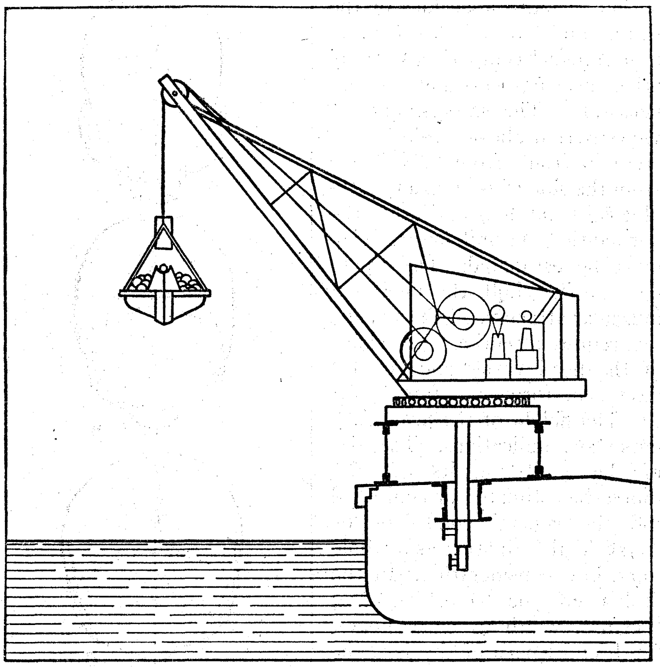

FIG. 21.—STEAM CRANE MOUNTED ON A BARGE, USED FOR DREDGING. IT HAS A CAPACITY OF 200 TONS PER HOUR

Here the place of the jib is taken by two inclined legs joined together at the top and pivoted at the bottom; a third back leg is connected at the top to the other two, and the bottom leg is coupled to a nut which runs along a long horizontal screw. This movement allows the front legs to fold back over the quay so that a load can be taken out of a vessel and deposited on the quay wall.

Methods of Control.—The importance of methods of control in the handling of bulk cargo in grabs has already been mentioned. Speed of working is, however, equally important in handling mixed cargo so that the ship can be turned round in the least possible time. The growth in the size of ships has necessitated much longer radius cranes than were formerly used, *i.e.*, up to about 90ft. radius instead of about 50 feet. It has been found that not much, if any, time is saved by increasing the speeds of the various motions beyond about 250ft. p.m. for lifting, 400ft. p.m. for lowering, 600ft. p.m. for slewing and 180ft. p.m. for luffing. These speeds are higher than those commonly used. They have, however, been exceeded. That rate at which a ship can be loaded or discharged can be increased by improvements in two directions; firstly, by better arrangements of the positions of the sheds and cranes relative to the quays, so that more cranes can work at one hatch at the same time without getting in each other's way, and, secondly, by improving the electrical controls so that high speeds can be utilized where a clear run for the load occurs, at the same time enabling the driver to slow down, and to creep where necessary to avoid swinging the load into the sides of hatches and other obstructions. The former is the direction in which most improvement is taking place. It may be said that the arrangement of a number of cranes situated on the roof of a quay enables several cranes to work in the same hatch. In this case the cranes work almost entirely by lifting and luffing, instead of by lifting and slewing, the cargo being worked from, or to, either the quay itself or platforms projecting from the various floors. With regard to electrical control it may be said that much has been done recently, but that the problem has by no means been solved. It is complicated by the introduction of alternating current in place of direct.

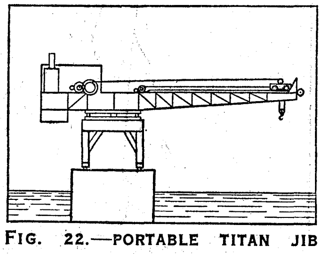

FIG. 22.—PORTABLE TITAN JIB CRANE EMPLOYED IN PIER CONSTRUCTION

Brakes.—When a load is lowered the work which it does in falling has to be absorbed, and the dissipation is effected partly by the friction of the gear and moving parts, but mostly either by the heat produced through the mechanical brakes, or by the current generated when the lifting motor is driven by the load and acts as a dynamo. Friction accounts for only about 15–20%, so that a considerable amount of energy is absorbed by the brake or the dynamotor. One of the simplest forms of braking is to disengage the barrel from the motor and gearing by means of a coil clutch, and control the load entirely on foot brake. This system has the great advantage of enabling the driver to control the speed of lowering within any limits he desires, and for dockside cranes up to about five tons lifting capacity is used fairly extensively. Many engineers, however, prefer a system which does not allow the load to run away if the driver makes a mistake, and to meet this many systems of electrical braking have been devised, by which the regenerated current is used to control the speed of lowering through the controller. In addition to one or other of the above methods it is usual to fit a holding brake on the motor armature shaft which is held in by a weight and released by a solenoid. A hand release can be fitted to this brake so that the load can be eased down gently on to the ground for the last few inches.

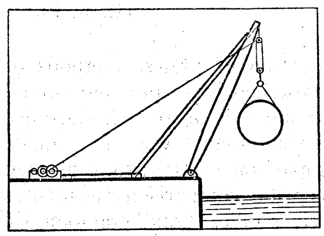

FIG. 23.—SIMPLE CRANE FOR LIFTING HEAVY LOADS

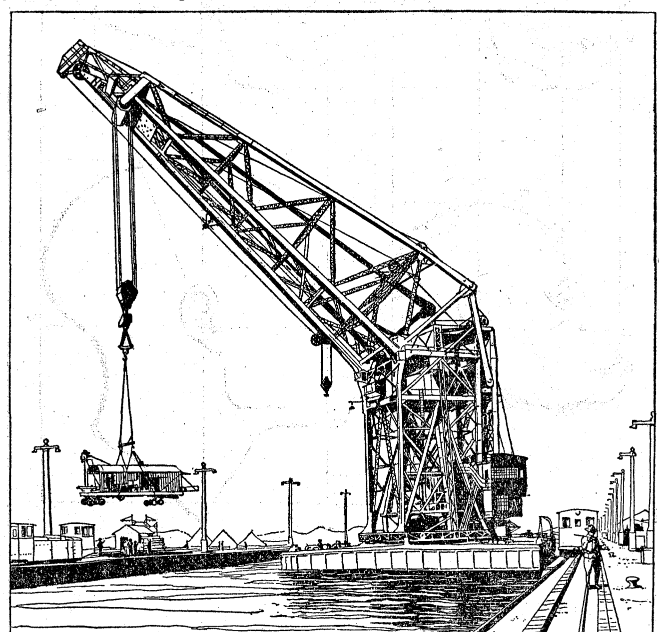

BY COURTESY OF THE WASHINGTON OFFICE OF THE PANAMA CANAL

FIG. 24.—THE FLOATING CRANE "HERCULES" TRANSFERRING EQUIPMENT ACROSS THE GATUN LOCKS, PANAMA CANAL

Luffing Gear.—We have spoken of the growing importance of luffing, and it is largely owing to the improvements in this gear and consequent increased speed of luffing that this motion is so much more used than formerly. This has been brought about by the introduction of various arrangements by which the load is neither lifted nor lowered during the process of luffing the jib in and out. There are many ways of providing for this which are covered by patents. They are too numerous to describe here but have been summarized in an article in *The Engineer* dated Aug. 26 and Sept. 2, 1927. With any of these systems it will be seen that the power taken for luffing is only that necessary to overcome friction or to lift the weight of the jib itself. The latter can be avoided by balancing off the jib either by means of a counterweight supported by ropes or ties, or by projecting the jib backwards and fixing the counterweight direct on to its rear end.

CRANIOMETRY. The application of precise methods of measurement in craniometry, a comprehensive expression for all methods of measuring the skull (cranium) is of great importance in anthropological studies. The measurements were first made with a view to elucidating the comparison of the skulls of men with those of other animals. This wide comparison constitutes the first subdivision of craniometric studies. And craniometric methods have rendered the results of comparison clear and comprehensible. Among the first measurements employed angular determinations occur, and the "facial angle" invented by Camper

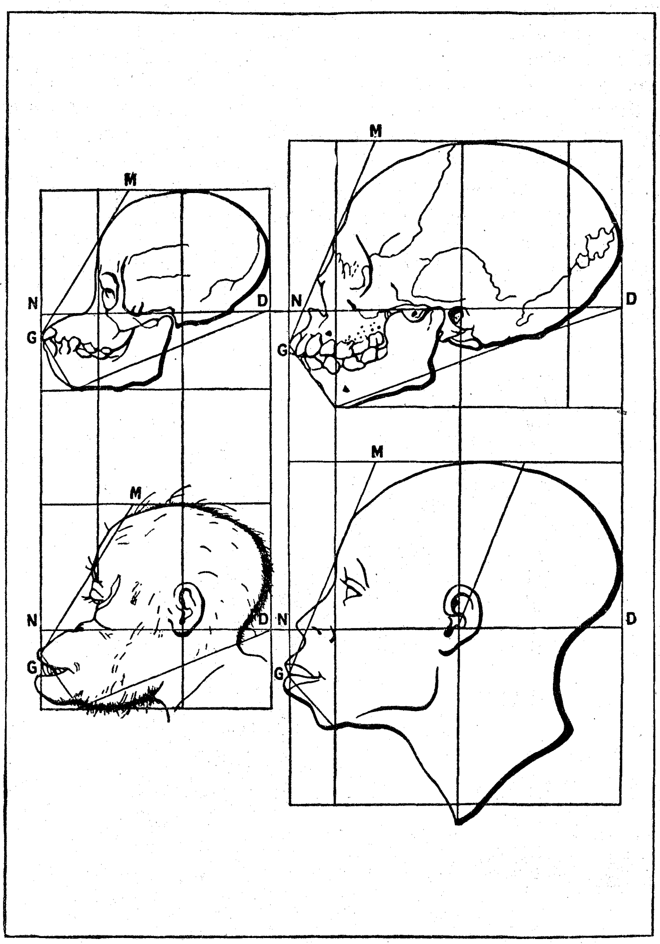

FIG. 1.—LEFT, SKULL AND HEAD OF YOUNG ORANG-UTAN, SHOWING THE FACIAL ANGLE FORMED BY LINES MG-ND TO BE LESS THAN 70°, AND ON RIGHT, SKULL AND HEAD OF NEGRO, SHOWING THE SAME ANGLE TO BE 70°

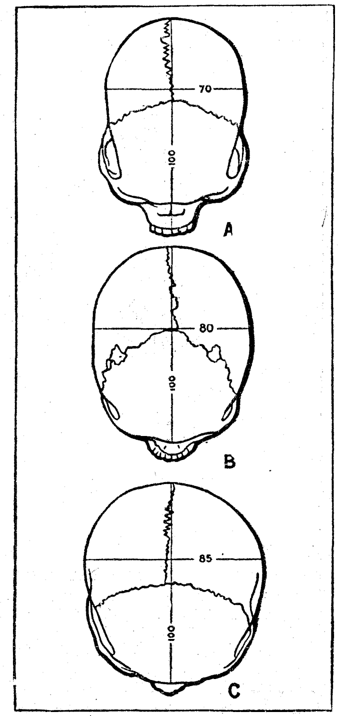
(fig. 1), was employed for comparative purposes, as will appear from the following extract from the translation of the original work: "The two extremities of the facial line are from 70 to 80° from the negro to the Grecian antique: make it under 70, and you describe an ourang or an ape: lessen it still more, and you have the head of a dog. Increase the minimum, and you form a fowl, a snipe for example, the facial line of which is nearly parallel with the horizon." (Camper's Works, p. 42, translated by Cogan, 1821.) The International Anthropological Association at its meeting in 1882 established a plane now known as the Frankfort plane or horizontal, and in general use, despite serious defects when dealing with imperfect skulls.

The second division of craniometric studies includes those in which the skulls of the races of mankind are compared and classified. And in this domain, the advent of accurate numerical methods of recording observations brought about great advances, completed by a system of comparing various dimensions of the skull, and of a classification based on such comparisons. Many other measurements and data are necessary. The skull should be viewed from above, from below, from in front, from behind and from the side (figs. 2, 3, 4). Pathological conditions and other abnormalities, natural or artificial, must be estimated. The thickness of the skull, the points of muscular attachment, the age and sex, require attention. The shape of the head varies and six distinct type-forms are found (fig. 5). The height of the head gives important indications. The size of the skull and its capacity should be estimated or computed and the general conditions of the skeletal formation as a whole come into consideration. In the skull itself, the eye-orbits, nasal aperture, width of cheek-bones, depth and length of the jaw, the proportions of its attachment, the relative position and size and proportions of the elements of the bony structure of the skull are capable of measurement and therefore are valuable for the purpose of classification by advanced mathematical and statistical processes. (*See* Anthropometry.)

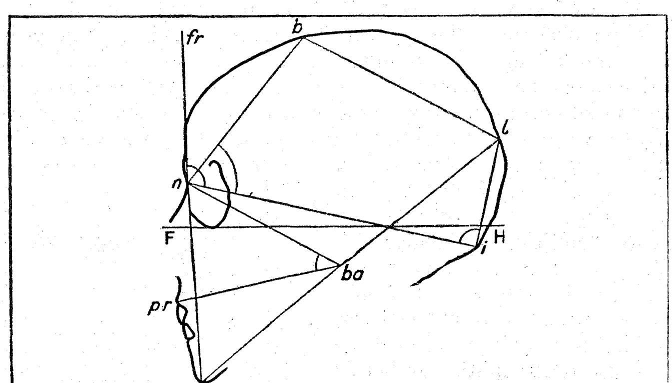


FROM TYLOR, "ANTHROPOLOGY" (MACMILLAN)

FIG. 2.—SKULLS, FROM ABOVE

Measured by the cephalic index, the greatest width compared with greatest breadth is; A. Negro, index 70, dolichocephalic; B. European index 80, mesaticephalic; C. Samoyed, index 85, brachycephalic

Endocranial casts afford precious indications of the conformation of the brain itself. No one feature, no single index, can be held sufficient by itself for definitive classification. Many of the data yielded by craniometry can be contrasted usefully with analogous measurements on living subjects which allow information yielding further criteria (*see* Races of Mankind). The contours and angles of the elements of the skull may be recorded and



FROM WILDER, "LABORATORY MANUAL OF ANTHROPOMETRY" (BLAKISTON'S SON & CO.)

FIG. 3.—PRINCIPAL POINTS OF FRANKFORT PLANE

FH.-Frankfort horizontal or plane; fr.-tangent to FH through n, the nasion, or upper end of the nasal suture; b.-Bregma, where the coronal and sagittal sutures meet; l.-Lambda, where the sagittal and lambdoidal meet; i.-inion, the occipital protuberance; fr.-n-i.-Frontal angle; b-n-i.-Frontal inclination angle; l-i-n.-Occipital inclination angle; n-ba-pr.-Superior facial length angle; ba.-The middle point (basion) of the anterior margin of the occipital foramen pr.-The lowest point of the intermaxillary suture measured by the diagraph and goniometer.

The third subdivision of craniometric researches is one in which the field of comparison is still further narrowed. For herein the various sub-racial types such as the dark and fair Europeans are brought together for the purposes of comparison or contrast. But although the range of research is thus narrowed and restricted, the guiding principles and the methods remain unchanged. By the method of expressing as a formula two cranial dimensions which have been measured are compared, one skull may be so proportioned that its greatest width measures 75% of its greatest length (*i.e.*, its width is to its length as three to four).

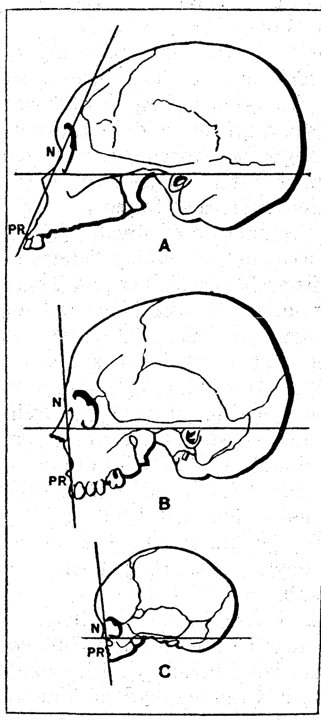


FIG. 4.—THE FACIAL ANGLE OF THE FRANKFORT AGREEMENT IS SHOWN IN THE CRANIA OF: A. A NEW GUINEA NATIVE (MALE) 75°; B. A EUROPEAN (WOMAN) 93°; C. A NEW BORN INFANT 93°

This ratio (of 75%) is termed the cephalic or breadth-index. A skull providing a breadth-index of 75 possesses different proportions from one with an index of 85.

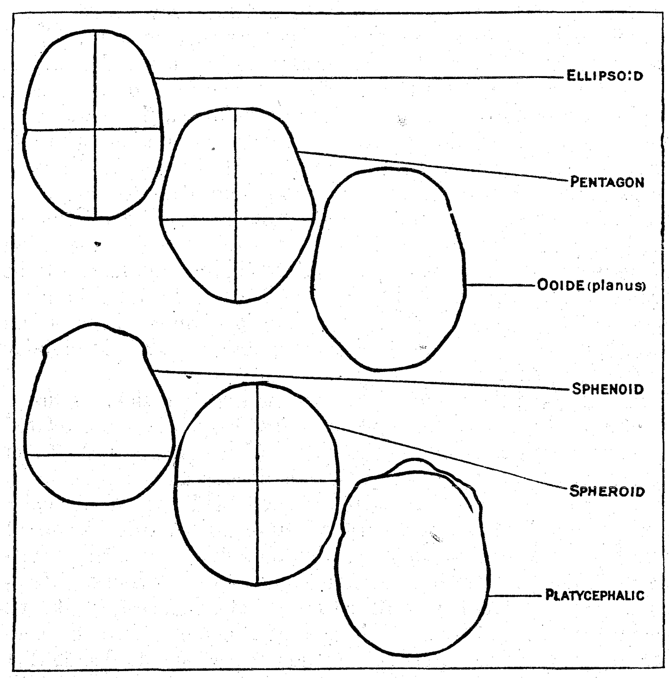
The fourth subdivision of craniometry deals with the comparison of the prehistoric and the recent types of mankind. The methods resemble those employed in the comparison of living races; but in some particular instances where the prehistoric individual is represented only by a comparatively minute portion of the skull, special modifications of the usual procedures are needed.

The complexity of craniometric studies has inevitably increased. International agreements for the unification of the various measurements have been established, and the application of the methods of statistical science in dealing with large numbers of craniometric data has been greatly developed. (*See* ANTHROPOMETRY.) These systems of measurement, and the methods of dealing with them on statistical principles have been extended to the study of large numbers of the skulls of domestic and feral animals, such as white rats or the varieties of the horse. In 1927 an international committee of anatomists was organized to collect accurate information about the variations of human structure and the different races of mankind. These investigations will surely yield material of the highest value.

Duckworth, *International Agreements for the Unification (a) of Craniometric and cephalometric measurements (b) of Anthropometric measurements to be made on the living subject* (1913); H. H. Wilder, *A Laboratory Manual of Anthropometry* (1921); and *Pedigree of the Human Race,* n.d.; Sir Arthur Keith, *The Antiquity of Man* (1925).

CRANK. In mechanics, a crank is a device by which reciprocating motion is converted into circular motion or vice versa, consisting of a crank-arm, one end of which is fastened rigidly at right angles to the rotating shaft or axis, while the other end bears a crank-pin projecting from it at right angles and parallel to the shaft. When the reciprocating part of a machine, as the piston and piston-rod of a steam engine, is linked to this crank by a crank-rod or connecting rod, one end of which works on the crank-pin and the other on a pin in the end of the reciprocating part, the to-and-fro motion of the latter imparts a circular motion to the shaft and vice versa. The crank, instead of being made up as described above, may be formed by bending the shaft to the required shape, as sometimes in the handle of a winch. A bell-crank, so called because of its original use in bell-hanging to change the direction of motion of the wires from horizontal to vertical or vice versa, consists of two arms rigidly connected at an angle, say of 90°, to each other and pivoted on a pin placed at the point of junction.

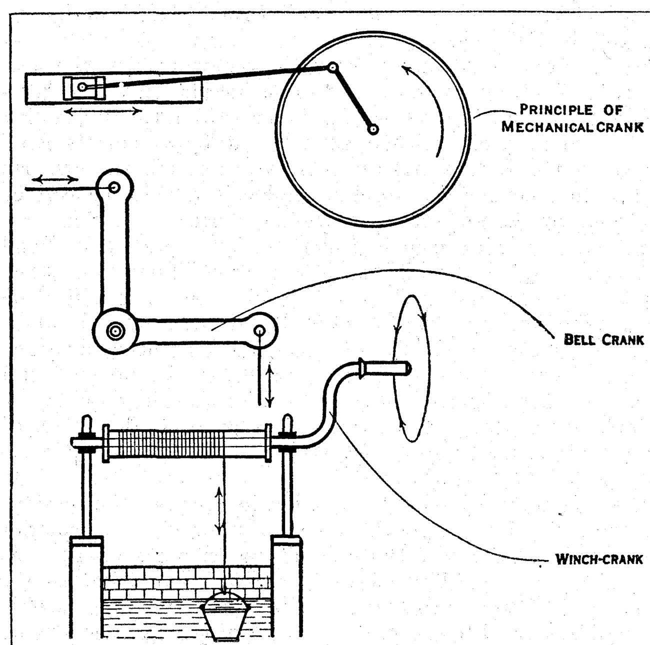
Crank is also the name given to a labour machine once used in prison as a means of punishment (*see* TREADMILL). Other uses



FROM SERGI, "THE VARIETIES OF THE HUMAN SPECIES" (SMITHSONIAN INSTITUTION)

FIG. 5.—SKULLS ARE ACCURATELY CLASSIFIED BY A SCIENTIFIC COMPARISON OF CERTAIN DIMENSIONS OF THE CRANIUM, AND SIX DISTINCT TYPE FORMS, AS SHOWN ABOVE, ARE FOUND

of the word, connected with the primary meaning, are for a crooked path, a crevice or chink, and a freakish turn of thought or speech, as in Milton's phrase "quips and cranks." It is also used



MECHANICAL, BELL AND WINCH CRANKS SHOWING HOW CHANGE OF APPLIED FORCE IS EFFECTED. AS IN THE MECHANICAL CRANK, HORIZONTAL MOVEMENT IS CONVERTED INTO CIRCULAR; IN THE BELL CRANK, VERTICAL BECOMES HORIZONTAL, AND IN THE WINCH CRANK, CIRCULAR MOVEMENT IS CHANGED INTO VERTICAL

as a slang expression, American in origin, for a harmless lunatic, or a faddist, whose enthusiasm for some one idea or hobby becomes a monomania. "Crank" or "crank-sided" is a nautical term used of a ship which by reason of her build or from want of balance is liable to overturn.

CRANMER, THOMAS (1489–1556), archbishop of Canterbury, born at Aslacton or Aslockton in Nottinghamshire on July 2, 1489, was the second son of Thomas Cranmer and of his wife Anne Hatfield. He received his early education, according to Morise his secretary, from "a marvellous severe and cruel schoolmaster." The same authority tells us that he was initiated by his father in those field sports, such as hunting and hawking, which formed one of his recreations in after life. To early training he also owed the skilful horsemanship for which he was conspicuous. At the age of 14 he was sent by his mother, who had in 1501 become a widow, to Cambridge. He became a fellow of Jesus college in 1510 or 1511, but had soon after to vacate his fellowship, owing to his marriage to "Black Joan," a relative of the landlady of the Dolphin inn. He was reinstated on the death of his wife, which occurred in childbirth before the lapse of the year of grace allowed by the statutes. He was ordained in 1523, and soon after took his doctor's degree in divinity; he was lecturer in divinity at his own college and public examiner in divinity to the university.

In Aug. 1529 the plague known as the sweating sickness drove Cranmer with two of his pupils named Cressy, who were related to him through their mother, to their father's house at Waltham in Essex. The king (Henry VIII.) happened at the time to be visiting in the immediate neighbourhood, and two of his chief counsellors, Gardiner, secretary of State, afterwards bishop of Winchester, and Edward Fox, the lord high almoner, afterwards bishop of Hereford, were lodged at Cressy's house. Meeting with Cranmer, they were naturally led to discuss the king's meditated divorce from Catherine of Aragon. Cranmer suggested that if the canonists and the universities should decide that marriage with a deceased brother's widow was illegal, and if it were proved that Catherine had been married to Prince Arthur, her marriage to Henry could be declared null and void by the ordinary ecclesiastical courts. The necessity of an appeal to Rome was thus dispensed with, and this point was at once seen by the king, who, when Cranmer's opinion was reported to him, is said to have ordered him to be summoned in these terms: "I will speak to him. Let him be sent for out of hand. This man, I trow, has got the right sow by the ear."

At their first interview Cranmer was commanded by the king to lay aside all other pursuits and to devote himself to the question of the divorce. He was to draw up a written treatise, stating the course he proposed, and defending it by arguments from Scripture, the Fathers and the decrees of general councils. He was further commended to Anne Boleyn's father, the earl of Wiltshire, in whose house at Durham Place he resided for some time; the king appointed him archdeacon of Taunton and one of his chaplains; and he also held a parochial benefice. When the treatise was finished Cranmer was called upon to defend its argument before the universities of Oxford and Cambridge, which he visited, accompanied by Fox and Gardiner. Immediately afterwards he was sent to plead the cause before a more powerful if not a higher tribunal. An embassy, with the earl of Wiltshire at its head, was despatched to Rome in 1530, that "the matter of the divorce should be disputed and ventilated," and Cranmer was an important member of it.

Cranmer returned in Sept. 1530, but in Jan. 1531 he received a second commission from the king appointing him "Conciliarius Regius et ad Caesarem Orator." In the summer of 1531 he accordingly proceeded to Germany as sole ambassador to the emperor. He was also to sound the Lutheran princes with a view to an alliance, and to obtain the removal of some restrictions on English trade. At Nuremberg he became acquainted with Osiander, whose somewhat isolated theological position he probably found to be in many points analogous to his own. Both were convinced that the old order must change; neither saw clearly what the new order should be to which it was to give place. They had frequent interviews, which had doubtless an important influence on Cranmer's opinions. In 1532 Cranmer married Osiander's niece, Margaret. Hook finds in the fact of the marriage corroboration of Cranmer's statement that he never expected or desired the primacy; and it seems probable enough that, if he had foreseen how soon the primacy was to be forced upon him, he would have avoided a disqualification which it was difficult to conceal and dangerous to disclose.

Expected or not, the primacy was forced upon him within a very few months of his marriage. In Aug. 1532 Archbishop Warham died, and the king almost immediately afterwards intimated to Cranmer, who had accompanied the emperor in his campaign against the Turks, his nomination to the vacant see. Cranmer's conduct was certainly consistent with his profession that he did not desire, as he had not expected, the dangerous promotion. The papal bulls of confirmation were dated Feb. and Mar. 1533, and the consecration took place on Mar. 30.

In the last as in the first step of Cranmer's promotion Henry had been actuated by one and the same motive. The business of the divorce—or rather, of the legitimation of Anne Boleyn's expected issue—had now become very urgent, and in the new archbishop he had an agent who might be expected to forward it with the needful haste. Cranmer after securing decisions favourable to the king in Convocation wrote a letter to the king, praying to be allowed to remove the anxiety of loyal subjects as to a possible case of disputed succession, by finally determining the validity of the marriage in his archiepiscopal court. There is evidence that the request was prompted by the king, and his consent was given as a matter of course. Queen Catherine was residing at Ampthill in Bedfordshire, and to suit her convenience the court was held at the priory of Dunstable. Declining to appear, she was declared contumacious, and on May 23, the archbishop gave judgment declaring the marriage null and void from the first. The Act of Appeals had already prohibited any appeal from the archbishop's court. Five days later he pronounced the marriage between Henry and Anne—which had been secretly celebrated about Jan. 25, 1533—to be valid. On June 1 he crowned Anne as queen, and on Sept. 10 stood godfather to her child, the future Queen Elizabeth.

In 1536 Cranmer was required to revise his own sentence in favour of the validity of Henry's marriage with Anne Boleyn, and on May 17, the marriage was declared invalid. With Anne's condemnation by the House of Lords Cranmer had nothing to do. He interceded for her in vain with the king, as he had done in the cases of Fisher, More and the monks of Christchurch. His share in the divorce of Anne of Cleves was less prominent than that of Gardiner, though he did preside over the Convocation in which nearly all the dignitaries of the church signified their approval of that measure.

Meanwhile Cranmer was actively carrying out the policy which has associated his name more closely, perhaps, than that of any other ecclesiastic with the Reformation in England. Its most important feature on the theological as distinct from the political side was the endeavour to promote the circulation of the Bible in the vernacular, by encouraging translation and procuring an order in 1538 that a copy of the Bible in English should be set up in every church in a convenient place for reading. Only second in importance to this was the readjustment of the creed and liturgy of the church, which formed Cranmer's principal work during the latter half of his life. Both in parliament and in the convocation he opposed the Six Articles of 1539, but he stood almost alone. During the period between 1540 and 1543 the archbishop was engaged at the head of a commission in the revision of the "Bishop's Book" (1537) or *Institutions of a Christian Man*, and the preparation of the *Necessary Erudition* (1543) known as the "King's Book," which was a modification of the former work in the direction of Roman Catholic doctrine. In June 1545 was issued his Litany, which was substantially the same as that now in use, and shows his mastery of a rhythmical English style.

Cranmer was present with Henry VIII. when he died (1547). By the will of the king he was nominated one of a council of regency composed of 16 persons, but he acquiesced in the arrangement by which Somerset became lord protector. He officiated at the coronation of the boy king Edward VI., and is supposed to have instituted a sinister change in the order of the ceremony, by which the right of the monarch to reign was made to appear to depend upon inheritance alone, without the concurrent consent of the people. But Edward's title had been expressly sanctioned by act of parliament, so that there was no more room for election in his case than in that of George I., and the real motive of the changes was to shorten the weary ceremony for the frail child.

During this reign Cranmer was enabled without let or hindrance to complete the preparation of the church formularies, on which he had been for some time engaged. In 1547 appeared the *Homilies* prepared under his direction. Four of them are attributed to the archbishop himself—those on salvation, faith, good works and the reading of scripture. His translation of the German catechism of Justus Jonas, known as Cranmer's catechism, appeared in the following year. Important, as showing his views on a cardinal doctrine, was the *Defence of the True and Catholic Doctrine of the Sacrament,* which he published in 1550. The first prayer book of Edward VI. was finished in November 1548, and received legal sanction in March 1549; the second was completed and sanctioned in April 1552. The archbishop did much of the work of compilation personally. The 42 articles of Edward VI. published in 1553 owe their form and style almost entirely to the hand of Cranmer. The last great undertaking in which he was employed was the revision of his codification of the canon law, which had been all but completed before the death of Henry. The task was one eminently well suited to his powers, and the execution of it was marked by great skill in definition and arrangement. It never received any authoritative sanction, Edward VI. dying before the proclamation establishing it could be made, and it remained unpublished until 1571, when a Latin translation by Dr. Walter Haddon and Sir John Cheke appeared under the title *Reformatio legum ecclesiasticarum.* It laid down the lawfulness and necessity of persecution to the death for heresy in the most absolute terms; and Cranmer himself condemned Joan Bocher to the flames. But he naturally loathed persecution, and was as tolerant as any in that age.

Cranmer stood by the dying bed of Edward as he had stood by that of his father, and he there suffered himself to be persuaded to take a step against his own convictions. He had pledged himself to respect the testamentary disposition of Henry VIII. by which the succession devolved upon Mary, and now he violated his oath by signing Edward's "device" of the crown to Lady Jane Grey. On grounds of policy and morality alike the act was quite indefensible; but it is perhaps some palliation of his perjury that it was committed to satisfy the last urgent wish of a dying man, and that he alone remained true to the nine days' queen when the others who had with him signed Edward's device deserted her.

On the accession of Mary he was summoned to the council—most of whom had signed the same device—reprimanded for his conduct, and ordered to confine himself to his palace at Lambeth until the queen's pleasure was known. He refused to follow the advice of his friends and avoid the fate that was clearly impending over him by flight to the continent. Any chance of safety that lay in the friendliness of a strong party in the council was more than nullified by the bitter personal enmity of the queen, who could not forgive his share in her mother's divorce and her own disgrace. On Sept. 14, 1553, he was sent to the Tower where Ridley and Latimer were also confined. The immediate occasion of his imprisonment was a strongly worded declaration he had written a few days previously against the mass, the celebration of which, he heard, had been re-established at Canterbury. In Nov. with Lady Jane Grey, her husband, and two other Dudleys, Cranmer was condemned for treason. Renard thought he would be executed, but so true a Romanist as Mary could scarcely have an ecclesiastic put to death in consequence of a sentence by a secular court, and Cranmer was reserved for treatment as a heretic by the highest of clerical tribunals, which could not act until parliament had restored the papal jurisdiction. Accordingly in March 1554 he and his two illustrious fellow-prisoners, Ridley and Latimer, were removed to Oxford, where they were confined in the bocardo or common prison. Ridley and Latimer were unflinching, and suffered bravely at the stake on Oct. 16, 1555. Cranmer had been tried by a papal commission, over which Bishop Brooks of Gloucester presided in Sept. 1555. Brooks had no power to give sentence, but reported to Rome, where Cranmer was summoned, but not permitted, to attend. On Nov. 25, he was pronounced contumacious by the pope and excommunicated, and a commission was sent to England to degrade him from his office of archbishop. This was done with the usual humiliating ceremonies in Christ church, Oxford, on Feb. 14, 1556, and he was then handed over to the secular power. About the same time Cranmer subscribed the first two of his "recantations." His difficulty consisted in the fact that, like all Anglicans of the 16th century, he recognized no right of private judgment, but believed that the State, as represented by monarchy, parliament and Convocation, had an absolute right to determine the national faith and to impose it on every Englishman. All these authorities had now legally established Roman Catholicism as the national faith, and Cranmer had no logical ground on which to resist. His early "recantations" are merely recognitions of his lifelong conviction of this right of the State. But his dilemma on this point led him into further doubts, and he was eventually induced to revile his whole career and the Reformation. This is what the government wanted. Northumberland's recantation had done much to discredit the Reformation, Cranmer's, it was hoped, would complete the work. Hence the enormous effect of Cranmer's recovery at the final scene. On Mar. 21 he was taken to St. Mary's church, and asked to repeat his recantation in the hearing of the people as he had promised. To the surprise of all he declared with dignity and emphasis that what he had recently done troubled him more than anything he ever did or said in his whole life; that he renounced and refused all his recantations as things written with his hand, contrary to the truth which he thought in his heart; and that as his hand had offended, his hand should be first burned when he came to the fire. As he had said, his right hand was steadfastly exposed to the flames. The calm cheerfulness and resolution with which he met his fate show that he felt that he had cleared his conscience, and that his recantation of his recantations was a repentance that needed not to be repented of.

It was a noble end to what, in spite of its besetting sin of infirmity of moral purpose, was a not ignoble life. The key to his character is well given in what Hooper said of him in a letter to Bullinger, that he was "too fearful about what might happen to him." This weakness was the worst blot on Cranmer's character. As a theologian it is somewhat difficult to class him. As early as 1538 he had repudiated the doctrine of transubstantiation; by 1550 he had rejected also the real presence (Pref. to his *Answer to Dr. Richard Smith*). But here he used the term "real" somewhat unguardedly, for in his *Defence* he asserts a real presence, but defines it as exclusively a spiritual presence; and he repudiates the idea that the bread and wine were "bare tokens." His views on church polity were dominated by his implicit belief in the divine right of kings (not of course the divine *hereditary* right of kings) which the Anglicans felt it necessary to set up against the divine right of popes. He set practically no limits to the ecclesiastical authority of kings; they were as fully the representatives of the church as the State, and Cranmer hardly distinguished between the two. Church and State to him were one.

Gairdner's *History of the Church,* 1485–1558; *Letters and Papers of Henry VIII.* vols. iv–xx.: *Acts of the Privy Council,* 1542–1556; *Cal. of State Papers, Dom. and Foreign;* Foxe's *Acts and Monuments;* Strype's *Memorials of Cranmer* (1694); *Anecdotes and Character of Archbishop Cranmer,* by Ralph Morice, and two contemporary biographies (Camden Society's publications); *Remains of Thomas Cranmer,* by Jenkyns (1833); *Lives of Cranmer,* by Gilpin (1784); Todd (1831); Le Bas, in Hook's *Lives of the Archbishops of Canterbury,* vols. vi. and vii. (1868), by Canon Mason (1897), A. D. Innes (1900) and A. F. Pollard (1904); Froude's *History;* Bishop Cranmer's *Recantacyons,* ed. Gairdner (1885). R. E. Chester Waters's *Chesters of Chicheley* (1877) contains a vast amount of genealogical information about Cranmer which has been used by only one of his biographers.

CRANNOG, the term applied in Scotland and Ireland to the stockaded islands so numerous in ancient times in the lochs of both countries.

They have little in common, structurally, with the Swiss lake-dwellings, except that they are placed in lakes. Few examples are known in England or Wales, although over 150 have been examined in Ireland, and more than half that number in Scotland.

As a rule they have been constructed on islets or shallows in the lochs, which have been adapted for occupation, and fortified by single or double lines of stockaded defences drawn round the margin.

From their common feature of a substructure of brushwood and logs built up from the bottom, the crannogs have been classed as fascine-dwellings, to distinguish them from the typical pile-dwellings of the earlier periods in Switzerland, whose platforms are supported by piles driven into the bed of the lake. Among the few remains of lacustrine settlements in England and Wales, some are suggestive of the typical crannog structure. The most important of these is the Glastonbury lake village excavated by A. Bulleid and H. St. George Gray, and discovered by the first named antiquary in 1892. It consists of some 70 or more separate dwellings, grouped within a triangular palisaded defence, 3½ acres in extent, and built in the midst of a Somerset marsh now reclaimed. The substructure was formed of logs and brushwood, helped by masses of bracken, rush, peat and stone, covered with layers of clay. The dwellings were circular, 18 to 35ft. in diameter, the walls 6 to 7ft. in height made of wattle and daub, with supporting uprights arranged 12 to 18in. apart. The floors were of clay, with a raised circular area near the centre, sometimes paved for a hearth. Both floors and hearths were renewed from time to time on account of subsidence. As many as 13 superimposed hearths have been discovered in a single dwelling. In many huts the stump of the central post remained which had supported the roof, and in others the doorstep or entrance pavement. The occupation must be dated within the Iron Age, and is likely pre-Roman, as little evidence of contact with Roman civilization has been discovered. Besides the implements and weapons of iron there are finger rings, fibulae and brooches of bronze, weaving combs and spindle-whorls, a bronze mirror and tweezers, quantities of pottery chiefly hand-made ornamented with late Celtic patterns, a bowl of thin bronze decorated with bosses, portions of the nave of a wooden wheel with holes for 12 spokes and a dug-out canoe. In 1895 another lake village of similar date and construction was discovered near Meare, some three miles north-west of Glastonbury; the site is undergoing examination by the Somerset Archaeological Society and the relics discovered are exhibited at Taunton museum. The implements and weapons found in the Scottish and Irish crannogs are usually of iron, or, if objects of bronze and stone are found, they are commonly such as were in use in the Iron Age. Crannogs are frequently referred to in the Irish annals. In the register of the privy council of Scotland, April 14, 1608, it is ordered that "the haill houssis of defence, strongholds, and *crannokis* in the Yllis (the western isles) pertaining to Angus M'Conneill of Dunnyvaig and Hector M'Cloyne of Dowart sal be delyverit to His Majestie." Judging from the historical evidence of their late continuance, and from the character of the relics found in them, the crannogs may be included among the latest prehistoric strongholds, reaching their greatest development in early historic times, and surviving through the middle ages.

Little lake dwelling research has taken place in Ireland or Scotland since 1910. The excavation of Lochpaire Crannog near Tuam, Ireland (1914), and the investigation of the artificial island in Loch Kinellan, Strathpeffer, Scotland (1916), have been the chief explorations. (*See* LAKE DWELLINGS.)

CRANSTON, a city of Providence county, Rhode Island, U.S.A., adjoining the city of Providence on the south; served by the New York, New Haven and Hartford railroad. The population in 1920 was 29,407, of whom 7,516 were foreign-born white (2,641 from Italy); and in 1940 federal census 47,085. Within its land area of 28.7 sq.mi. are a water front on Narragansett bay; farms, nurseries and market gardens; and several villages with important manufactures, including cotton print goods, winding machinery and automatic fire extinguishers. The total assessed valuation for 1940 was $76,175,800. In the southern part of the city is a state farm of 667 ac. (P.O. Howard), on which are several state institutions for the dependent and the delinquent and also the county jail.

Cranston was settled as a part of Providence about 1640 by associates of Roger Williams. It was incorporated as a separate town in 1754. In 1868, 1873 and 1892 portions of it were re-annexed to Providence. In 1910 it was chartered as a city. It was named after Samuel Cranston, governor of Rhode Island 1698–1727.

CRANTOR, a Greek philosopher of the Old Academy, was born, probably about the middle of the 4th century B.C., at Soli in Cilicia. He was the first commentator on Plato. He is said to have written some poems which he sealed up and deposited in the temple of Athens at Soli (Diog. Laërtius, iv. 5. 25). Of his celebrated work *On Grief* (Περὶ πένθους), a letter of condolence to his friend Hippocles on the death of his children, numerous extracts have been preserved in Plutarch's *Consolatio ad Apollonium* and in the *De consolatione* of Cicero, who speaks of it (*Acad.,* ii. 44. 135) in the highest terms. Crantor's ethical theory arranged "good" things in the following order—virtue, health, pleasure, riches.

See F. Kayser, *De Crantore Academico* (1841); M. H. E. Meier, *Opuscula academica,* ii. (1863); F. Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit,* i., p. 118 (1891).

CRANWORTH, ROBERT MONSEY ROLFE, BARON (1790–1868), lord chancellor of England, elder son of the Rev. E. Rolfe, was born at Cranworth, Norfolk, on Dec. 18, 1790. Educated at Bury St. Edmund's, Winchester, and Trinity College, Cambridge, he was called to the bar at Lincoln's Inn in 1816, and attached himself to the chancery courts. He represented Penryn and Falmouth in parliament from 1832 till his promotion to the bench as baron of the exchequer in 1839. In 1850 he was appointed a vice-chancellor and created Baron Cranworth, and in 1852 he became lord chancellor in Aberdeen's ministry. He continued to hold the chancellorship in the administration of Palmerston until the latter's resignation in 1857. He was not reappointed when Palmerston returned to office in 1859, but on the retirement of Lord Westbury in 1865 he accepted the great seal for a second time, and held it till the fall of the Russell administration in 1866. Cranworth died in London on July 26, 1868. His name is associated in the statute book with a measure of conveyancing. He left no issue and the barony became extinct on his death.

See E. Foss, *The Judges of England* (1848–64); *The Times* (July 27, 1868); E. Manson, *The Builders of our Law* (1904); J. B. Atlay, *Lives of the Chancellors,* vol. ii. (1908).

CRAPE, a silk fabric of a gauzy texture, having a peculiar crisp or crimpy appearance. It is woven of hard spun silk yarn "in the gum" or natural condition. There are two distinct varieties of the textile—soft, Canton or oriental, crape, and hard or crisped crape. The wavy appearance of Canton crape results from the peculiar manner in which the weft is prepared, the yarn from two bobbins being twisted together in the reverse way. The fabric when woven is smooth and even, having no *crêpé* appearance, but when the gum is subsequently extracted by boiling it at once becomes soft, and the weft, losing its twist, gives the fabric the waved structure which constitutes its distinguishing feature. Canton crapes are used, either white or coloured, for ladies' scarves and shawls, bonnet trimmings, etc. The Chinese and Japanese excel in the manufacture of soft crapes.

The crisp and elastic structure of hard crape is not produced either in the spinning or in the weaving, but is due to processes through which the gauze passes after it is woven. What the details of these processes are is known to only a few manufacturers, who so jealously guard their secret that, in some cases, the different stages in the manufacture are conducted in towns far removed from each other. Commercially they are distinguished as single, double, three-ply and four-ply crapes, according to the nature of the yarn used in their manufacture. They are almost exclusively dyed black and used in mourning dress, and among Roman Catholic communities for nuns' veils, etc. In Great Britain hard crapes are made at Braintree in Essex, Norwich, Yarmouth, Manchester and Glasgow. The crape formerly made at Norwich was made with a silk warp and worsted weft, and is said to have afterwards degenerated into bombazine. A very successful imitation of real crape is made in Manchester of cotton yarn.

CRASH. A technical textile term applied to a species of narrow towels, from 14 to 20in. wide. The name is probably of Russian origin, the simplest and coarsest type of the cloth being known as "Russian crash." The latter is made from grey flax or tow yarns, and sometimes from boiled yarns. The simple term "crash" is given to all these narrow cloths, but the above distinction is very convenient, as also are the following: grey, boiled, bleached, plain, twilled and fancy crash. A large variety obtains with and without fancy borders, while of late years cotton has been introduced as warp, as well as mixed and jute yarns for weft. After the cloth has passed through all the finishing operations, it is cut up into lengths of about three yds., the ends are sewn together and it is then ready to be placed over a suspended roller; for this reason it is often termed "roller towelling."

CRASHAW, RICHARD (1613?–1649), English poet, styled "the divine," was born in London about 1613. He was the son of a strongly anti-papistical divine, Dr. William Crashaw (1572–1626). Richard Crashaw was educated at Charterhouse, and at Pembroke college, Cambridge, where he took the degree of B.A. in 1634. The publication of Herbert's *Temple* in 1633 seems to have finally determined the bias of his genius in favour of religious poetry, and next year he published his first book, *Epigrammatum sacrorum liber,* a volume of Latin verses. In 1636 he removed to Peterhouse, was made a fellow of that college in 1637, and proceeded M.A. in 1638. About this time began his lasting friendship with Abraham Cowley. He was also on terms of intimacy with the Anglican monk Nicholas Ferrar, and frequently visited him at Little Gidding. In 1641 he is said to have gone to Oxford, but only for a short time; for when in 1643 Cowley left Cambridge to seek a refuge at Oxford, Crashaw remained behind, and was forcibly ejected from his fellowship in 1644. In the confusion of the civil wars he escaped to France, where he finally embraced the Catholic religion.

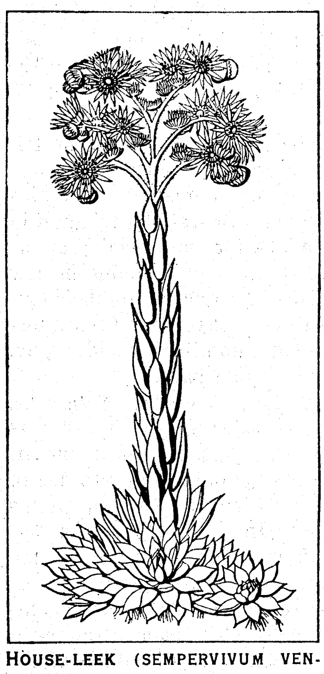
During his exile his religious and secular poems were collected by an anonymous friend, and published under the title of *Steps to the Temple* and *The Delights of the Muses,* in one volume, in 1646. The first part includes the hymn to St. Teresa and the version of Marini's *Sospetto d'Herode.* This same year Cowley found him in great destitution at Paris, and induced Queen Henrietta Maria to give him introductions in Rome, where he became attendant to Cardinal Palotta. In 1648 he published two Latin hymns at Paris. He remained until 1649 in the service of the cardinal, to whom he had a great personal attachment; but his retinue contained persons whose violent and licentious behaviour was a source of ceaseless vexation to the sensitive English mystic. He was sent by the cardinal in 1649 to Loretto, where he was made a canon of the Holy House. In less than three weeks, however, he sickened of fever, and died on Aug. 25, not without grave suspicion of having being poisoned. He was buried in the Lady chapel at Loretto. A collection of his religious poems, entitled *Carmen Deo nostro,* was brought out in Paris in 1652, dedicated to the countess of Denbigh. The book is illustrated by 13 engravings after Crashaw's own designs.

Crashaw excelled in all manner of graceful accomplishments; besides being an excellent Latinist and Hellenist, he had an intimate knowledge of Italian and Spanish; and his skill in music, painting and engraving was no less admired in his lifetime than his skill in poetry. Cowley embalmed his memory in a very fine elegy.

Crashaw's verse is studded with fiery beauties and sudden felicities of language, unsurpassed by any lyrist between his own time and Shelley's. There is no religious poetry in English so full at once of gross and awkward images and imaginative touches of the most ethereal beauty, and these peculiarities can be studied nowhere to more advantage than in the *Hymn to Saint Teresa.* Among the secular poems of Crashaw the best are *Music's Duel,* which deals with strife between the musician and the nightingale, and *Wishes to his supposed Mistress.* In his latest sacred poems, included in the *Carmen Deo nostro,* the mysticism has become more pronounced, and the ecclesiastical mannerism more harsh and repellent.

Crashaw's works were first collected, in one volume, in 1858, by W. B. Turnbull. In 1872 an edition, in 2 volumes, was printed for private subscription by the Rev. A. B. Grosart. A complete edition was edited (1904) for the Cambridge University Press by Mr. A. R. Waller. *See* also L. C Martin, *The Poems, English, Latin and Greek, of Richard Crashaw* (1927).

CRASSULACEAE, in botany, a family of dicotyledons, containing 33 genera and 1,400 species; of cosmopolitan distribution, but most developed in South Africa. The plants are herbs or small shrubs, generally with thick fleshy stems and leaves, adapted for life in dry, especially rocky places. The fleshy leaves are often reduced to a more or less cylindrical structure, as in the stonecrops (*Sedum*), or form closely crowded rosettes as in the houseleek (*Sempervivum*). Correlated with their life in dry situations, the bulk of the tissue is succulent, forming a water-store, which is protected from loss by evaporation by a thickly cuticularized epidermis covered with a waxy secretion which gives a glaucous appearance to the plant. The flowers are generally arranged in terminal or axillary clusters, and are markedly regular with the same number of parts in each series. This number is, however, very variable, and often not constant in one and the same species. The sepals and petals are free or more or less united, the stamens as many or twice as many as the petals; the carpels, usually free, are equal to the petals in number, and form in the fruit follicles with two or more seeds. The means of vegetative propagation are general. Many species spread by means of a creeping much-branched rootstock or, as in house-leek, by runners that perish after producing a terminal leaf-rosette. In other cases small portions of the stem or leaves give rise to new plants by budding, as in *Bryophyllum,* where buds develop at the edges of the leaf and form new plants.



HOUSE-LEEK (SEMPERVIVUM VENUSTUM), SHOWING BASAL ROSETTE OF SUCCULENT LEAVES; NATIVE TO SOUTH AFRICA AND CULTIVATED FOR ITS SHOWY FLOWERS

The family is almost absent from Australia and Polynesia, and has but few representatives in South America; it is otherwise generally distributed. The largest genus, *Sedum,* contains about 200 species in the temperate and colder parts of the northern hemisphere; nine occur wild in Britain, including *S. Telephium* (orpine) and *S. acre* (common stonecrop). The species are very easily cultivated and will thrive in almost any soil. *Crassula* has about 150 species, chiefly at the Cape. *Cotyledon,* a widely distributed genus with about 100 species, is represented in the British Isles by *C. umbilicus,* pennywort, or navelwort, which takes its name from the succulent peltate leaves. It grows profusely on dry rocks and walls, especially on the western coasts, and bears a spike of drooping greenish cup-shaped flowers. The *Echeveria* of gardens is included in this genus. *Sempervivum* has about 50 species in the mountains of central and southern Europe, in the Himalayas, Abyssinia and the Canaries and Madeira; *S. tectorum,* common house-leek, is seen often growing on tops of walls and house-roofs. The hardy species will grow well in dry sandy soil, and are suitable for rockeries, old walls or edgings.

In North America some 40 representatives of the family are found, most numerous from the Rocky Mountains westward, 20 occurring in California, mostly species of *Sedum* and *Cotyledon*.

The family is closely allied to Saxifragaceae, from which it is distinguished by its fleshy habit and the larger number of carpels.

See A. Berger, *Crassulaceae;* Engler and Prantl, *Die Natürlichen Pflanzenfamilien* 18a:352–483, fig. 183–212 (1930).

CRASSUS (literally "dense," "thick," "fat"), a family name in the Roman gens Licinia (plebeian).

1. Publius Licinius Crassus, surnamed *Dives Mucianus,* Roman statesman, orator and jurist, consul, 131 B.C. A friend of Tiberius Gracchus, he was chosen after his death to take his place on the agrarian commission (*see* Gracchus, Tiberius Sempronius [163–133 B.C.]). In 131 when Crassus was consul with L. Valerius Flaccus, Aristonicus, a pretender, laid claim to Pergamum, which had been bequeathed by Attalus III to Rome. Both consuls were anxious to obtain the command against him; Crassus secured it, despite the rule which forbade him, as pontifex maximus, to leave Italy. Nothing is known of his military operations. But in the following year, when he was preparing to return, he was surprised near Leucae, and taken prisoner by a Thracian band and put to death.

See Cicero, *De oratore,* i. 50; *Philippics,* xi. 8; Plutarch, *Tib. Gracchus,* 21; Livy, *Epit.* 59; Val. Max. iii. 2. 12, viii. 7. 6; Vell. Pat. ii. 4; Justin xxxvi. 4; Orosius v. 10.

2. Lucius Licinius Crassus (140–91 B.C.), the orator, of unknown parentage. At the age of 19 (or 21) he made his reputation by a speech against G. Papirius Carbo, the friend of the Gracchi. The law passed by him and his colleague Q. Mucius Scaevola, during their consulship (95), to prevent those passing as Roman citizens who had no right to the title, was one of the prime causes of the Social War (Cicero, *Pro Balbo,* xxi., *De Officiis,* iii. 11). During his censorship Crassus suppressed the newly founded schools of Latin rhetoricians (Aulus Gellius xv. 11). Crassus is one of the chief speakers in the *De Oratore* of Cicero, who has also preserved a few fragments of his speeches.

3. Publius Licinius Crassus, called Dives, father of the triumvir. During his consulship (97) the practice of magic arts was condemned by a decree of the senate, and human sacrifice was abolished. He was governor of Spain and celebrated a triumph in 93 for successes over the Lusitanians. After the Social War, as censor with L. Julius Caesar, he had the task of enrolling in new tribes certain of the Latins and Italians as a reward for their loyalty to the Romans, but the proceedings seem to have been interrupted by certain irregularities. Crassus committed suicide in 87, to avoid falling into the hands of the Marian party.

See Plutarch, *Crassus,* 4; Aulus Gellius ii. 24; Macrobius, *Saturnalia,* ii. 13; Livy, *Epit.* 80; Pliny, *Nat. Hist.* xxx. 3; Appian, *Bell. Civ. i.* 72

4. Marcus Licinius Crassus (*c.* 115–53 B.C.), the triumvir, Roman financier. Cinna's proscription (87) obliged him to flee to Spain, but he returned to Italy with Sulla, and was one of his officers during the campaign of 83–82. In the proscriptions that followed he laid the foundation of his immense wealth by buying at nominal prices the confiscated estates of the proscribed. This fortune he increased by traffic in slaves, usury and other means, until he became the richest man in Rome. The power of the purse made him a force to be reckoned with in the corrupt politics of the day. In 71, when praetor, he was given the command against Spartacus, and succeeded in crushing the revolt which had kept Italy in terror for three years. Pompey, wishing to coerce the senate, now made a pact with Crassus, and the two, by exerting their influence with knights and people, were elected consuls for 70. But their relations soon became strained, and in 67, when Pompey left Rome, a pact was made between Crassus and Caesar, the object of which was to counteract the influence of Pompey. It is likely that they were behind the conspiracy of Autronius (66–65), and the early plans of Catiline (*q.v.*), whose candidature they supported in 64. In 65 Crassus was censor, but resigned owing to quarrels with his colleague. In 60, the refusal of the senate to ratify Pompey's Eastern settlement brought about the coalition between Caesar, Pompey and Crassus known as the First Triumvirate. After Caesar's departure for Gaul, Crassus remained in Rome, and the jealousy between him and Pompey seems to have broken out afresh. But at the conference of Luca (56) Caesar managed to compose their differences; and in 55 Pompey and Crassus became consuls once more, and a law was passed assigning them the provinces of Spain and Syria respectively for five years. In November, Crassus, greedy of wealth, and jealous of Pompey's military renown, set out for the East, determined to make war on the Parthians, although they had given Rome no provocation. He spent the summer of 54 in ravaging Mesopotamia; next year, after wintering in Syria, and plundering the temple at Jerusalem, he invaded Parthia once more; his army was destroyed at Carrhae and Crassus himself captured and put to death. The defeat of Crassus, in a war which he had provoked, forced upon Rome the Parthian question which was to trouble her for many years to come; his death left his two colleagues face to face, and hastened the inevitable conflict for the mastery of the empire.

See Plutarch, *Crassus;* also Caesar, Gaius Julius; Pompey; Rome, *Ancient History.*

CRATER, the cavity at the mouth of a volcanic duct, usually funnel-shaped or presenting the form of a bowl, whence the name, from the Gr. κρατήρ, a bowl. (*See* Volcano.) Also the cavity in the carbon (or electrode) of an arc light. When an alternating current is employed, a crater is formed in both electrodes.

CRATER MOUND (long known as Coon Butte), perhaps the most mysterious geological feature in western United States, is located about 10m. S. of Sunshine, Arizona. Viewed from a distance, the mound appears as a low ridge, but on near approach this ridge is found to be circular and to enclose a great hole 4,000ft. in diameter and 600ft. deep. The encircling ridge is from 100 to 150ft. high, and consists of loose fragments of rock and sand, evidently blown out of the hole. The cause of this great hole has not been satisfactorily determined. Several geologists believe that it was made by a great meteor, but no evidences were revealed by the tests made. Others suggest that it is due to an explosion of steam from volcanic sources below. The latter theory would account for the somewhat upturned and broken strata of the rim.

CRATERS OF THE MOON NATIONAL MONUMENT, a tract of about 39 sq.m. in south-central Idaho, U.S.A., set apart in 1924 as a Government reservation. It is a region of cones and craters formed by volcanoes which have probably been extinct for only a few centuries, and the name of the reservation was suggested by its resemblance to the surface of the moon. While the black lava and cinders allow only the scantiest flora and quickly absorb the very light rainfall, water is to be found in tunnels which were formed by eruptions through a partly formed crust. Lava stalactites and stalagmites in red and blue are striking features of these tunnels.

CRATES, Athenian actor and author of comedies, flourished about 470 B.C. He was regarded as the founder of Greek comedy proper, since he abandoned political lampoons on individuals and introduced more general subjects and a well-developed plot (Aristotle, *Poëtica,* 5). He is stated to have been the first to represent the drunkard on the stage (Aristophanes, *Knights,* 37 ff.).

Fragments in Meineke, *Poëtarum Comicorum Graecorum fragmenta,* i.

CRATES, the name of two Greek philosophers.

1. Crates, of Athens, successor of Polemo as leader of the Old Academy.

2. Crates, of Thebes, a Cynic philosopher of the latter half of the 4th century B.C. He was the pupil of Diogenes, and the last great representative of cynicism. He gave up his fortune in accordance with Cynic principles, and devoted his life to the attainment of virtue and the teaching of self-control. He married Hipparchia, of a wealthy Thracian family, against her father's wishes. He seems to have lived into the third century. According to Diogenes Laërtius, he was the author of a number of letters on philosophical subjects; but those extant under the name of Crates (R. Hercher, *Epistolographi Graeci,* 1873) are spurious. Diogenes Laërtius credits him with a short poem, Παίγνια, and several

philosophic tragedies. Plutarch's life of Crates is lost. The great importance of Crates' work is that he formed the link between Cynicism and the Stoics, Zeno of Citium being his pupil.

See N. Postumus, *De Cratete Cynico* (1823); F. Mullach, *Frag. Philosophorum Graecorum,* ii. (1867); E. Wellmann in Ersch and Gruber's *Allgemeine Encyklopädie;* Diog. Laërt. vi. 85–93, 96–98.

CRATES, of Mallus in Cilicia, a Greek grammarian and Stoic philosopher of the 2nd century B.C., leader of the literary school and head of the library of Pergamum. He was the chief representative of the allegorical theory of exegesis, and maintained that Homer intended to express scientific or philosophical truths in the form of poetry. About 170 B.C., he visited Rome as ambassador of Attalus II., king of Pergamum, where he delivered lectures which gave the first impulse to the study of grammar and criticism among the Romans (Suetonius, *De grammaticis,* 2). His chief work was a critical and exegetical commentary on Homer.

See C. Wachsmuth, *De Cratete Mallota* (1860), containing an account of the life, pupils and writings of Crates; J. E. Sandys, *Hist. of Class. Schol.* i. 156 (1906).

CRATINUS (Gr. *kră-tē-nŏs*) (*c.* 520–423 B.C.), Athenian dramatist, chief representative of the old comedy. Hardly anything is known of his life, and only fragments of his works have been preserved. But a good idea of their character can be gained from the opinions of his contemporaries, especially Aristophanes. His comedies were notable for their vigorous political satire, a marked exception being the burlesque Ὀδυσσεῖς, probably written while a law was in force forbidding all political references on the stage. Persius calls the author "the bold," as in the *Nemesis* and *Archilochi,* he attacks Pericles, then at the height of his power. The *Panoptae* was a satire on the sophists and speculative philosophers of the day. Of his last comedy the plot has come down to us. Aristophanes and others taunted him with being a doting drunkard. Cratinus was roused to put forth all his strength, and in 423 B.C. produced the Πυτίνη, or *Bottle,* which defeated the *Clouds* of Aristophanes. In this comedy, Cratinus represents the comic muse as the faithful wife of his youth. His guilty fondness for a rival—the bottle—has aroused her jealousy. She demands a divorce from the archon; but her husband returns penitent to her side. In Grenfell and Hunt's *Oxyrhynchus Papyri,* iv. (1904), containing a further instalment of their edition of the Behnesa papyri discovered by them in 1896–97, is the argument of a play by Cratinus—the *Dionysalexandros* (*i.e.,* Dionysus in the part of Paris), aimed against Pericles. The style of Cratinus has been likened to that of Aeschylus; and Aristophanes, in the *Knights,* compares him to a rushing torrent. According to the statement of a doubtful authority, which is not borne out by Aristotle, Cratinus increased the number of actors in comedy to three. He wrote 21 comedies and gained the prize nine times.

BIBLIOGRAPHY.—Fragments in Meineke, *Fragmenta Comicorum Graecorum,* or Kock, *Comicorum Atticorum fragmenta.* A younger Cratinus flourished in the time of Alexander the Great. It is considered that some of the comedies ascribed to the elder Cratinus were really the work of the younger. *See* G. Thieme, *Quaestionum Comicarum ad Periclem pertinentium, Capita Tria* (1908).

CRATIPPUS (fl. *c.* 375 B.C.), Greek historian. There are only three or four references to him in ancient literature, but he has been identified by several scholars (*e.g.* Blass) with the author of the historical fragment discovered by Grenfell and Hunt, and published by them in *Oxyrhynchus Papyri,* vol. v. It may be regarded as a fairly certain inference from a passage in Plutarch (*De Gloria Atheniensium,* p. 345 E, ed. Bernardakis, ii. p. 455) that he was an Athenian writer, intermediate in date between Thucydides and Xenophon, and that his work continued the narrative of Thucydides, from the point at which the latter historian stopped (410 B.C.) down to the battle of Cnidus (394 B.C.).

The fragments are published in C. Müller's *Fragmenta Historicorum Graecorum.* For authorities *see* under THEOPOMPUS.

CRATIPPUS, of Mitylene (1st century B.C.), Peripatetic philosopher, contemporary with Cicero, whose son he taught at Athens, and by whom he is praised in the *De officiis* as the greatest of his school. He shared Pompey's flight after Pharsalia. Brutus, while at Athens, after the assassination of Caesar, attended his lectures. The freedom of Rome was conferred upon him by Caesar, at the request of Cicero. In 44 B.C. the Areopagus invited him to succeed Andronicus of Rhodes as scholarch. He seems to have held that, while motion, sense and appetite cannot exist apart from the body, thought reaches its greatest power when most free from bodily influence, and that divination is due to the direct action of the divine mind on that faculty of the human soul which is not dependent on the body. A work on divination is attributed to him.

Cicero, *De divinatione,* i. 3, 32, 50, ii. 48, 52; *De officiis,* i. 1, iii. 2; Plutarch, *Cicero,* 24.

CRAU, a region of southern France, in the department of Bouches-du-Rhône, lying east of the eastern arm of the Rhône between the chain of the Alpines and the Mediterranean, west and northwest of the Étang de Berre. It is a low-lying plain, about 80 sq.mi. in area, practically desert. Its surface is formed of pebbles (whence the name, from a Celtic root meaning "stone") of all sizes; these, mixed with a proportion of fine soil, overlie a subsoil of stones cemented into a hard mass by deposits of calcareous mud, beneath which lie loose stones, once the sea bed. Naturally sterile, the Crau is adapted for agriculture by the process of warping, carried out by means of the Canal de Craponne, which dates from the 16th century; about one-quarter of the region in the north and east has thus been covered by the rich deposits of the waters of the Durance, to which the Crau is said to owe its natural surface. Land which before supplied only rough pasture for sheep has thus been made to grow the vine and olive; where irrigation is practicable, water meadows have been formed. In the uncultivated parts the mirage is said to occur.

CRAUCK, GUSTAVE (1827–1905), French sculptor, was born and died at Valenciennes, where a special museum for his works was erected in his honour. At Paris his "Coligny" monument is in the rue de Rivoli, his "Victory" in the Place des Arts et Métiers, and "Twilight" in the Avenue de l'Observatoire. Among his finest works is his "Combat du Centaure," on which he was engaged for 30 years, the figure of the Lapith having been modelled after the athlete, Eugene Sandow.

CRAUFURD, QUINTIN (1743–1819), British author, was born at Kilwinning and entered the service of the East India Company. Returning to Europe before the age of 40, he settled in Paris, where he formed a good library and collection of paintings, coins, and other objects of antiquarian interest. Craufurd was on intimate terms with the French court, especially with Marie Antoinette, and was one of those who arranged the flight to Varennes. He escaped to Brussels, but in 1792 he returned to Paris in the hope of rescuing the royal prisoners. He lived among the French *émigrés* until the peace of Amiens made it possible to return to Paris. Through Talleyrand's influence he was able to remain in Paris after the war was renewed, and he died there on Nov. 23 1819.

BIBLIOGRAPHY.—Among his works are *The History, Religion, Learning, and Manners of the Hindus* (1790), *History of the Bastille* (1798), *Secret History of the King of France and his Escape from Paris* (first published in 1885), *Notice sur Marie Antoinette* (1809).

CRAUFURD, ROBERT (1764–1812), British major-general, one of the quickest and most brilliant of Wellington's lieutenants in the Peninsular War, was born at Newark, Ayrshire, on May 5, 1764, and entered the 25th Foot in 1779. He saw service in the campaigns against Tippoo Sahib (1790–92); with the Austrian armies in 1793; in 1797 with Lake in the suppression of the Irish rising of that year; as British commissioner at Russian headquarters in Suvórov's Swiss campaign 1799; and in the Buenos Aires expedition of 1807. Craufurd held a brigade command in the Corunna campaign of 1808, and next year was sent to Spain in command of the brigade (43rd, 52nd and 95th battalions), soon to be famous throughout Europe as the "Light Brigade." Craufurd found himself three marches in the rear of Wellesley's army when the news that a battle was in progress at Talavera reached him. He reached the front on the day after the battle, the brigade having covered 62 miles in 26 hours. Starting with this record, Craufurd's brigade covered itself with glory at Busaco, at Fuentes d'Onoro, and at the storming of Ciudad

Rodrigo, where their commander was mortally wounded (Jan. 19, 1812) while directing the attack. He died on the 24th and was buried in the breach his men had made.

Craufurd's elder brother, Lieut.-Gen. SIR CHARLES CRAUFURD (1761–1821), was British commissioner at the Austrian army headquarters in Flanders in the campaign of 1793, and in western Germany in 1795–96. He was severely wounded at Amberg and invalided home. He was promoted lieutenant-general in 1810, and received the G.C.B. in 1821. He died on March 26, 1821. Craufurd published nothing except a translation of Tielke's book on the Seven Years War, but he was an acute observer, and his papers on the campaigns in which he shared, preserved in the Record Office, London, form invaluable material for the military historian.

CRAVAT, the name given by the French in the reign of Louis XIV. to the scarf worn by the Croatian soldiers enlisted in the royal Croatian regiment (Fr. *cravate,* a corruption of "Croat"). Made of linen or muslin with broad edges of lace, it became fashionable, and the name was applied both in England and France to various forms of neckerchief, from the loosely tied lace cravat with long flowing ends, called a "Steinkirk" after the battle of 1692, to the elaborately folded and lightly starched linen or cambric neckcloth worn in the late 18th and early 19th centuries. The modern cravat is a necktie.

CRAVEN, PAULINE (1808–1891), French author, was born in London on April 12, 1808, daughter of the comte Auguste de la Ferronaye, diplomatist, and for a short time foreign minister under Charles X. She married in 1834 Augustus Craven, who was at that time an attaché in the British embassy at Naples. Her most famous work, *Récit d'une soeur* (1866, Eng. trans. 1868), crowned by the Académie Française, was drawn from her own family history. Other novels followed, and in 1888 *Lady Georgiana Fullerton, sa vie et ses oeuvres.* She died in Paris on April 1, 1891. Her husband (d. 1884), translated the correspondence of Lord Palmerston and of the Prince Consort into French.

See *Memoir of Mrs. Augustus Craven* (1894), by her friend Mrs. Mary Catherine Bishop; also *Paolina Craven,* by T. F. Ravaschieri Fieschi (1892). There is a biography of Mrs. Craven's father, "En Émigration," in Étienne Lamy's *Témoins des jours passés* (1907).

CRAVEN, WILLIAM CRAVEN, EARL OF (1608–1697), eldest son of Sir William Craven, lord mayor of London, matriculated at Trinity college, Oxford, in 1623, and joined the Middle Temple in 1624. He served under the princes of Orange, and then in 1632 joined Frederick, the exiled king of Bohemia, in an attempt to recover the Palatinate. In a second expedition (1637) he was taken prisoner, but was ransomed in 1639. He joined Elizabeth, queen of Bohemia (*q.v.*), in her exile in Holland. He also gave large financial assistance to Charles I. and to Charles II., whom he accompanied on his return to England. He received the queen of Bohemia at his house in Drury lane, London, in 1661. In 1664 he was created viscount and earl of Craven, and held many offices under Charles II. and James II. Craven was a patron of letters and a member of the Royal Society. He died unmarried on April 9, 1697, when the earldom became extinct, the barony passing by special remainder to his cousin William, 2nd Baron Craven; the present earl of Craven (the earldom being revived in 1801) is descended from John, a younger brother of the latter. The first Lord Craven's brother John, who was created Baron Craven of Ryton, Shropshire, and died in 1648, was the founder of the Craven scholarships at Oxford and Cambridge, of which the first was awarded in 1649.

Dom.*

CRAWFORD, EARLS OF. The house of Lindsay, of which the earl of Crawford is the head, traces its descent to the barons of Crawford who flourished in the 12th century. Sir James Lindsay (d. 1396), 9th lord of Crawford, in Lanarkshire, was descended from Sir Alexander Lindsay of Luffness (d. 1309), who obtained Crawford and other estates in 1297 and who was high chamberlain of Scotland. Froissart tells of the wanderings of the 9th lord after the battle of Otterburn. His cousin and successor, Sir David Lindsay (*c.* 1360–1407), who married a daughter of Robert II., was made earl of Crawford. The 4th earl of Crawford (d. 1454), one of the most powerful of the Scottish nobles, took arms against King James II., but submitted in 1452. His son David the 5th earl (*c.* 1440–95) was lord high admiral and lord chamberlain; he went as ambassador to England, and in 1488 was created duke of Montrose, though the title did not descend to his son. Montrose fought for James III. at Sauchieburn, and his son John, the 6th earl (d. 1513), fell at Flodden. David Lindsay, 8th earl (d. 1542), whose son Alexander was sentenced to death for attempting to kill his father, conveyed the earldom to his kinsman, David Lindsay of Edzell, at whose death in 1558 the earldom came back with the consent of the Crown to the elder line of the Lindsays, *i.e.,* to Alexander's son David. The 10th earl, David Lindsay (d. 1574), supported Mary, queen of Scots. His son and successor, David, a grandson of Cardinal Beaton, took part in the risings under James VI., was converted to Roman Catholicism and communicated with Spain about an invasion of England. Ludovic Lindsay, 16th earl (1600–52), took part in the strange plot of 1641 to overthrow Argyll. He joined Charles I. during the Civil War. In 1644 the Scottish parliament declared his earldom forfeited and gave it to John Lindsay, 1st earl of Lindsay. Ludovic was imprisoned, but was released in 1645 by Montrose, under whom he served until the king's surrender. He died without issue, probably in France. The earl of Lindsay (17th earl of Crawford), who thus supplanted his kinsman, belonged to the family of Lindsay of the Byres, a branch descended from Sir David Lindsay of Crawford, grandfather of the 1st earl of Crawford. A leader of the Covenanters, he marched with the Scottish army into England in 1644; in the same year he became lord high treasurer of Scotland, and in 1645 president of the parliament. Later he changed sides and signed the "engagement" for the release of Charles I. in 1647, losing all his offices by the act of classes when his enemy, the marquess of Argyll, obtained the upper hand. In 1661 he was restored to his dignities, but his refusal to abjure the covenant compelled him to resign them in 1663. His son William, 18th earl of Crawford, also an ardent Covenanter, was president of the Convention parliament in 1690. William's grandson, John Lindsay, 20th earl of Crawford and 4th earl of Lindsay (1702–49), served against the Turks in the Russian army, and also under Prince Eugene. He also served at Dettingen and Fontenoy, and against France in the Netherlands.

At the death of George, 22nd earl (1758–1808), without issue, the earldoms of Crawford and Lindsay were separated, George's kinsman, David Lindsay (d. 1809), a descendant of the 4th Lord Lindsay of the Byres, becoming 7th earl of Lindsay. Both he and his successor Patrick (d. 1839) died without sons, and in 1878 the House of Lords decided that Sir John Trotter Bethune, bart. (1827–94), also a descendant of the 4th Lord Lindsay of the Byres, was entitled to the earldom. The earldom of Crawford remained dormant from 1808 until 1848, when the House of Lords adjudged it to James Lindsay, 7th earl of Balcarres. His son, Alexander William Crawford Lindsay, 25th earl of Crawford (1812–80), wrote *Lives of the Lindsays* (3 vols., 1849); *Letters on Egypt, Edom and the Holy Land* (1838); *The Earldom of Mar during 500 years* (1882), and other works.

His only son, James Ludovic Lindsay, 26th earl of Crawford and 9th earl of Balcarres (1847–1913), was an astronomer and orientalist. He was elected president of the Royal Astronomical society in 1882, and at his death he bequeathed to the British museum his great collection of stamps and many valuable mss. to the John Rylands library, Manchester and the free library of Wigan. He was succeeded as 27th earl by his son David (1871–1940), who was a member of Lloyd George's Coalition Cabinet (1916–22). Robert Alexander Lindsay (1900–), succeeded his father as 28th earl of Crawford and 11th earl of Balcarres in 1940.

See Lord Lindsay (25th earl of Crawford), *Lives of the Lindsays*

(1849); A. Jervise, *History and Traditions of the Land of the Lindsays* (1882); H. T. Folkard, *A Lindsay Record* (1899); and Sir J. B. Paul's edition of the *Scots Peerage* of Sir R. Douglas, vol. iii. (1906).

CRAWFORD, FRANCIS MARION (1854–1909), American author, was born at Bagni di Lucca, Italy, Aug. 2, 1854, being the son of the American sculptor, Thomas Crawford (*q.v.*), and the nephew of Julia Ward Howe, the American poet. The cosmopolitanism of his work is foreshadowed by his early training at St. Paul's school, Concord, N.H.; Trinity college, Cambridge; Heidelberg, and Rome. In 1879 he went to India, where he studied Sanskrit and edited the Allahabad *Indian Herald.* Returning to America he continued to study Sanskrit at Harvard university for a year, contributed to various periodicals, and in 1882 produced his first novel, *Mr. Isaacs,* a brilliant sketch of modern Anglo-Indian life mingled with a touch of Oriental mystery. This book had an immediate success, and its author's promise was confirmed by the publication of *Dr. Claudius* (1883). After a brief residence in N.Y. city and Boston and travelling in Turkey and elsewhere, Crawford in 1883 returned to Italy, where he made his permanent home and about which he wrote numerous novels, including the excellent series *Saracinesca* (1887), *Sant' Ilario* (1889) and *Don Orsino* (1892). His interest in his adopted country is also revealed in his historical works, *Ave Roma Immortalis* (1898), *Rulers of the South* (1900)—renamed *Sicily, Calabria and Malta* in 1904—and *Gleanings from Venetian History* (1905), in which his intimate knowledge of local Italian history combines with the romanticist's imaginative faculty to excellent effect. He was exceptionally prolific and treated with vividness and accuracy widely varying periods and countries. Among the most celebrated of his novels are: *A Roman Singer* (1884), *A Tale of a Lonely Parish* (1886), *Paul Patoff* (1887), *The Witch of Prague* (1891), *Via Crucis* (1899), *In the Palace of the King* (1900), and *The White Sister* (1909). In his American novels, such as *An American Politician* (1884), he was probably least successful. Nevertheless, he was always a gifted narrator, and his romances, with their picturesque backgrounds and dramatic characterizations, were very popular. His belief that the novel should be "a pocket-stage" for entertainment only, he set forth in *The Novel—What Is It?* (1893). It was but natural, therefore, that *A Cigarette-Maker's Romance* (1890) should be effective on the stage, and that in 1902 an original play from his pen, *Francesca da Rimini,* should be produced in Paris by Sarah Bernhardt. He died at Sorrento April 9, 1909.

For criticism and bibliography *see* F. J. Cooper, *Some American Story Tellers* (1911).

CRAWFORD, ISABELLA VALANCY (1850–1887), Canadian poetess, the daughter of an Irish physician, was born in Dublin on Dec. 25, 1850, and died in Toronto on Feb. 12, 1887. In 1858 Dr. Crawford and his family emigrated to Canada and settled in Ontario. After her father's death Isabella supported herself and her mother by journalistic writing in Toronto. In 1884 she published a small volume of poems. But recognition of her work was slow, and, worn out by the struggle for a livelihood, she died of heart disease at the age of 36. Her best known poems are *Old Spookeses Pass* and *Malcolm's Katie.*

See K. Hale, *Isabella Valancy Crawford* (1923), which contains a memoir and full bibliography.

CRAWFORD, THOMAS (1814–1857), American sculptor, was born in New York on March 22, 1814. He showed at an early age great taste for art, and learned to draw and carve in wood. In the summer of 1835 he went to Rome and became a pupil of Thorwaldsen. The first work which made him generally known as a man of genius was his group of "Orpheus entering Hades in Search of Eurydice," executed in 1839, followed by the "Babes in the Wood," "Flora," "Hebe and Ganymede," "Sappho," "Vesta," the "Dancers" and the "Hunter." Among his statues and busts are especially noteworthy the bust of Josiah Quincy, in the Boston Athenaeum, the equestrian statue of Washington at Richmond (Va.), the statue of Beethoven in the Boston music hall, statues of Channing and Henry Clay, and the colossal figure of "Armed Liberty" for the Capitol at Washington. For this building he executed also the figures for the pediment and began the bas-reliefs for the bronze doors, which were afterwards completed by W. H. Rinehart. The groups of the pediment symbolize the progress of civilization in America. Crawford's works include a large number of bas-reliefs of Scriptural subjects taken from both the Old and the New Testaments. He made Rome his home, but he visited America several times—first in 1844 (in which year he married Louisa Ward), in 1849 and in 1856. He died in London on October 10, 1857.

See *Das Lincoln Monument, eine Rede des Senator Charles Sumner,* to which are appended the biographies of several sculptors, including that of Thomas Crawford (Frankfurt a. M., 1868); Thomas Hicks, *Eulogy on Thomas Crawford* (1865).

CRAWFORD, WILLIAM HARRIS (1772–1834), American statesman, was born in Amherst county, Va., Feb. 24, 1772. He studied at Carmel academy for two years, was principal of one of the largest schools in Augusta, and in 1798 was admitted to the bar. With Horatio Marbury, he prepared a digest of the laws of Georgia from 1755 to 1800. From 1803 to 1807 he was a member of the State House of Representatives. From 1807 to 1813 he was a member of the U.S. Senate, of which he was president *pro tempore* from March 1812 to March 1813. In 1813 he declined the offer of the post of secretary of war, and until 1815 was minister to the court of France. He was secretary of war in 1815–1816, and secretary of the Treasury from 1816 to 1825. In 1816 in the congressional caucus which nominated James Monroe for the Presidency. Crawford was a strong opposing candidate having, at first a majority, but when the vote was finally cast 65 were for Monroe and 54 for Crawford.

In 1824, when the congressional caucus was fast becoming extinct, Crawford, being prepared to control it, insisted that it be held, but of 216 Republicans only 66 attended; of these, 64 voted for Crawford. Three other candidates, however, Andrew Jackson, John Quincy Adams and Henry Clay, were otherwise put in the field. During the campaign Crawford was stricken with paralysis, and when the electoral vote was cast Jackson received 99, Adams 84, Crawford 41 and Clay 37. Adams became president through Clay's influence in the House of Representatives. Crawford was invited by Adams to continue as secretary of the treasury, but declined. He recovered his health sufficiently to become (in 1827) a circuit judge in his own State, but died while on circuit, in Elberton, Ga., on Sept. 15, 1834.

In his day he was undoubtedly one of the foremost political leaders of the country, but his reputation has not stood the test of time. He was of imposing presence and had great conversational powers; but his inflexible integrity was not sufficiently tempered by tact and civility to make him generally popular. Although a skilful political organizer, he incurred the bitter enmity of other leaders of his time—Jackson, Adams and Calhoun. He won the admiration of Albert Gallatin and others by his powerful support of the movement in 1811 to recharter the Bank of the United States; he earned the condemnation of posterity by his authorship in 1820 of the four-years-term law, which limited the term of service of thousands of public officials to four years, and did much to develop the "spoils system." He was a Liberal Democrat, and advised the calling of a Constitutional Convention as preferable to nullification or secession.

CRAWFORD NOTCH, a deep defile through the White mountains, dividing the great New Hampshire group near its centre. The notch proper, about 3m. in length, is formed by Mts. Willard and Willey on the west and Mts. Webster and Jackson on the east. The pass at its highest point attains an altitude of 1,914ft., and above it the granite walls rise boldly on either side for approximately an equal elevation, the peaks being still higher, but generally not visible from the highway. Fantastic figures carved in the rocky heights, several cascades and the dashing Saco river all lend charm to this naturally beautiful place. The State of New Hampshire has set apart about 6,000ac. of the notch as a State forest.

CRAWFORDSVILLE, a city of Indiana, U.S.A., 40m. N.W. of Indianapolis, on Sugar creek; the county seat of Montgomery county. It is served by the Monon Route, the Big Four, and the Pennsylvania railways. The population in 1930 was 10,355, in 1940 it was 11,089. It is a trading and distributing centre for an important stock-raising region. There are many shippers and breeders of pedigree cattle, pigs, sheep and poultry in the county. Leading manufacturing products are building bricks, nails, wire specialties, sheet metal products, water tanks, poultry houses and brooders, steel culverts, lift trucks and skid platforms, water softener, spark arresters, gray iron castings, caskets, milk processing products, roof tile machines and bottle caps and metal lithographing. There are printing plants and large wholesale houses dealing mostly in field and garden seeds. The municipality owns its electric power and light plant and serves many outlying towns and the surrounding farm area. Montgomery county was the first in the U.S.A. to establish consolidated rural schools, and the first to have free delivery of mail in the rural districts. Wabash college for men, occupying 40 ac. in the heart of the city, was founded here in 1832 by four pioneer Presbyterian missionaries. The enrolment is limited to about 500. The town was laid out in 1822, and was chartered as a city in 1863. It was the home of Gen. Lew Wallace and of Maurice Thompson, and the birthplace of Meredith Nicholson and of Kenyon Nicholson.

CRAYER, GASPARD DE (1582–1669), Flemish painter, was born at Antwerp, Nov. 18, 1582, and was a pupil of Raphael Coxcie. He matriculated in the guild of St. Luke at Brussels in 1607, resided in the capital of Brabant till after 1660, and finally settled at Ghent. Among the numerous pictures which he painted in Ghent, one in the museum represents the martyrdom of St. Blaise, and bears the inscription A° 1668 aet. 86. His pictures abound in the churches and museums of Brussels and Ghent; and there is scarcely a country chapel in Flanders or Brabant that cannot boast of one or more of his works. Some important pictures are to be found at Aix in Provence and at Amberg in the Upper Palatinate. Crayer died at Ghent on Jan. 27, 1669. His best works may be seen in the galleries of Brussels, Ghent, the Louvre, the Munich Pinakothek, and the Belvedere at Vienna. His portrait by Van Dyck was engraved by P. Pontius.

CRAYFISH, or crawfish, are fresh-water crustacea closely allied to and resembling the lobsters and, like them, belonging to the order Decapoda. They range in length from 1 or 2 in. to 16 in. and may attain a weight of 8 lb. (*Astacopsis gouldi* of Tasmania). So-called marine crawfish are more correctly spiny or rock lobsters; large fresh-water shrimp of the genus *Macrobrachium,* with the second pair of legs developed into powerful pincers, are mistakenly called crawfish. Crayfish frequent rivers, streams and other bodies of water, swamps or marshy places, and subterranean watercourses, sheltering under stones or constructing burrows. Wherever they are abundant, crayfish are used as food by man, to a greater extent in the old world than in the new. The "Murray river lobster," a crayfish rivalling the Tasmanian species in size, if not maximum weight, is much esteemed as food.

Crayfish are an important item in the diet of many animals, such as the river otter, water rat, mink, raccoon, opossum, bears, alligators, wading birds, ducks, and fish. They are omnivorous themselves, killing and eating other crustacea, insects, worms, snails, frogs, fish and other animals, devouring any carrion encountered and partaking of vegetable food. One species (*Cambarus hagenianus*) is so destructive to young crops as to interfere with the successful production of cotton and corn over 1,000 sq.mi. of moist lime-soil lands in Mississippi and adjacent Alabama. It lives in deep burrows, never visiting ponds or streams. On rainy spring nights these crayfish, which can go eight to nine months without food, destroy entire fields of corn and cotton. The recommended countermeasure is the application of creosote stock dip to their burrows by means of compressed air sprayers.

The crayfish are classified into three families, the Astacidae inhabiting the northern hemisphere and in the southern hemisphere, the Parastacidae and Austroastacidae, the latter confined to Victoria, Australia. The crayfish of England, Ireland and Europe belong to the genus *Astacus,* ranging as far east as Turkestan. Farther east a gap occurs in the distribution and no crayfish are met with until the basin of the Amur is reached, where a group of species occurs, by some authorities considered a subgenus of *Astacus, Cambaroïdes,* which extends into northern Japan. In North America, west of the Rocky Mountains the genus *Astacus* again appears, but east of the watershed it is replaced by the genus *Cambarus,* which is represented by numerous species ranging from the Great Lakes to Mexico. The American Cambari are divided into six subgenera or full genera, according to the authority consulted. A number of blind species have been described, of which the best known is *Cambarus* (*Orconectes*) *pellucidus,* found in Mammoth Cave, Ky., and the most recently described (1942) is *Troglocambarus maclanei,* from Gum Cave and "Squirrel Chimney," Fla. (*See* CRUSTACEA; LOBSTER; MALACOSTRACA.) (W. L. ST.)

CRAYON, a black or coloured material for drawing, generally in the form of pencils, but sometimes in powdered form. Obtainable, to some extent, from native earthy and other compact and friable mineral substances, crayons are, for the most part, artificially prepared mixtures of a base of pipe or china clay with Prussian blue, chrome yellow, vermilion, ochres, umbers and other pigments cemented together by the introduction of some weak adhesive, usually gum tragacanth. Calcined gypsum, talc and compounds of magnesium, bismuth and lead are occasionally used as bases. The required shades of tints are obtained by adding varying amounts of colouring matter to a given quantity of the base. The use of chalks, especially red earth, is of ancient origin as testified by surviving examples, and Horace's *rubrica picta aut carbone* would show that the conflicts of the famous gladiators were delineated in red chalk as well as charcoal. It is, however, with the use of the medium in more modern ages that we are now mainly concerned, especially when, in the 16th century, the artists used black chalk on white paper, and when, as the century advanced, they began more and more to employ it together with other mediums for the purpose of suggesting colour. First black chalk heightened with white, on a tinted paper, then black and red crayon, heightened with white, on papers of various tonality. With the specific use, however, of red crayon, in *sanguine,* as the French call it, draughtsmanship seemed to extend its scope and capacity, as we see particularly in the exquisite drawings of Watteau, done in infinite numbers, not only as notes and studies for pictures, but for the sheer joy of drawing, with all their inexpressible sense of grace and vitality inherent in the just emphasis of the accents of every figure, and the rhythmic significance of every line, and a general expression of animation. *"C'est de la sanguine qui contient de la pourpre"* wrote Edmond de Goncourt *à propos* the incomparable Watteau, *"c'est du crayon noir qui a un velouté à mul autre pareil; et cela mélangé de craie avec la pratique savante et spirituelle de l'artiste, devient, sur du papier chamois, de la chair blonde et rose."* There is little in the use of crayon that we could not learn from the inimitable drawings of Watteau if only we had the wit to divine the magic of his art. How to commingle the red, black and white strokes with the tone of the paper so as to suggest the illusion of a natural garment of colour, how to rub the vermilion chalk on the black with the finger or a stump or a rag, so that a lovely tone shall evolve, how to draw those expressive lines that positively sparkle with the living accent, how to judge the exact tones of white that shall lighten the contours and the shadows, which the paper always shows between as a half tone; in all these is the secret of Watteau's pre-eminence. This secret was never quite shared, for all their talent and charm, with Boucher, Greuze, Lagonard, Lancret, Baudouin or Chardin, who put their touch in *sanguine* to the test of unconscious rivalry.

Most of the old masters used chalk for their drawings at one time or another, giving it preference in many instances to pencil, or reed, pen and ink, or sepia wash, as for instance in the 15th century Gentile Bellini did a self-portrait in black chalk, and Francesco Morone a "Virgin enthroned with Saints" in red. There were, however, certain outstanding masters whose expressive lines in red and black chalk reflected a clear vision of character inherent in the contours. There were the Clouets, Jean and François, successively court painters to Francis I. whose crayon drawings, almost in outline, were so peculiarly distinguished for their psychological truth, and there was Holbein, whose series of portrait drawings at Windsor, is one of our glorious possessions. To obtain a full effect of colour he would variously tint the

CRAYONS AND PASTELS, 16TH–19TH CENTURIES

1. Pierre Bouguer, crayon portrait by Jean Baptiste Perronneau (1731–83). The original is in the Louvre
2. Crayon studies for the Libyan Sybil, by Michelangelo (1475–1564), for the ceiling of the Sistine Chapel, in the Vatican, Rome
3. Girl with cherries, pastel by John Russell (1745–1806). The Louvre
4. Crayon studies for a mural, by Pierre C. Puvis de Chavannes (1824–98)
5. Landscape in crayon by Thomas Gainsborough (1727–88)
6. Girl with a monkey, pastel by Rosalba Carriera of Venice (1675–1757)

paper, and rub the tint away where light was wanted, or he would add white, the drawing being done with red or black chalk, the essential character of the face and head being exactly defined, and the chalk then rubbed to soften the tone suggestively, and a supplementary line or so of silver point being introduced for accent. The magnificently rich drawings of Rubens were done with black chalk heightened with white, or with the red crayon, while Van Dyck used chalk on a blue or brown paper, the choice of paper, by the way, influencing very much the effect of the chalks in the drawing. Titian and Tintoretto drew in black and white on blue paper, and Fra Bartolommeo on salmon pink or yellowish paper, while Correggio used red chalk with washes of red bistre heightened with white, Leonardo caressed the toned paper, so to speak, with his exquisite enfolding lines in red, and Piero di Cosimo, among others, reflected his influence. The black or red crayon was used characteristically with individual powers and finesse by Michelangelo, Raphael, Andrea del Sarto, Pontorno, Carpaccio, Lorenzo di Credi, Dürer and Lucas van Leyden, Rembrandt, Ruisdael, Esias van de Velde, Claude Loraine, Callot, Gravelot. Of English artists, Richard Wilson used chalk for classic landscape studies with beautiful effect, but the supreme master of the crayon in English art was Gainsborough, who, with the softening influence of the stump, made nature speak pictorially with grace, beauty and vivacity as well in landscape as in the human figure. A notable series of drawings in red chalk is that by Alfred Stevens, the famous sculptor, but among the moderns Whistler's manner of using coloured chalks was most lovely and distinguished. A new invention of oil colours in crayon form, purporting to be used as a substitute for brush painting, was invented at the beginning of the century by I. F. Raffaelli, the French painter and etcher, who painted many pictures with the new medium. The colours, however, are said to have soon lost their brilliancy. *See* also PASTEL. (M. C. S.)

CREAMERIES are factories where the main concern is the making of butter from cream gathered from a number of farms. In the United States the idea of associated dairying was first applied to cheese making, and for some time it was quite common to have creameries equipped to make both butter and cheese. Although several earlier instances were locally successful, the creamery built by Alanson Slaughter near Wallkill, Orange county, N.Y., in 1861 is usually regarded as the example that others followed. The system spread slowly across New York and westward to the upper Mississippi valley and on to California. Minnesota, Iowa and Wisconsin became the main centre of creamery butter production. In Denmark the depressed condition of agriculture following the loss of Schleswig-Holstein in 1864 and the establishment of direct trade with Great Britain led to attempts to use the creamery system, but it remained for the successful co-operative creamery established at Hjedding in western Jutland in 1882 to pioneer and point the way for the Danish dairy industry. In Ireland Canon Bagot established a joint-stock creamery at Hospital in County Limerick in 1884, but the main development in Ireland came after Sir Horace Plunkett began to organize co-operatives in 1889. The introduction of creameries in Canada parallels that of the United States, but development in New Zealand and Australia was somewhat later.

Several factors influenced the shift from farm butter making to the factory system. Probably the most important was its relatively greater economy in many phases of the work. A second factor was superior efficiency; a creamery could produce a larger volume of butter of more uniform grade, and this possibility became important as soon as the volume of production in a given community increased to the point where it had to look for markets beyond its borders. The factory system also enabled dairymen to specialize in milk production, and to increase it considerably beyond the amount they would have been able to manufacture into butter on farms.

Although the dates and details vary according to community and country, the creamery system can be described in terms of periods of development. At first the farmers delivered whole milk to creameries where it was set over night in shallow vats (the Schwartz system) or in deep cans immersed in cold water (the Cooley system) for creaming by gravity. Then the cream was skimmed from the top of the milk and churned and worked into butter. With bad weather and poor roads, farmers found it difficult to make daily deliveries, and households that produced better than average butter were reluctant to believe that they could not get more for their product by following the old system. At another stage, the farmers used pans or cans on their farms in setting the milk and then delivered the cream or had the creamery send a hauler along a regular route to gather it. The invention of the centrifugal cream separator by Carl Gustaf Patrik de Laval in Sweden in 1878 and its gradual introduction in creameries led to a return to the daily delivery of whole milk to creameries. In 1888 Nicholas Gerber of Switzerland and in 1890 Stephen Moulton Babcock of Wisconsin invented the butterfat testers that came into common use in Europe and the English-speaking countries respectively. Until then, the creameries had no simple but scientific method of determining the exact butterfat content of milk or cream with a view to paying farmers in accordance with quality. The use of testers, together with the introduction of hand separators on farms after 1895, facilitated the return to the practice of gathering cream from the farms. Throughout this early history, the manufacturers of equipment and supplies took a leading part in promoting the organization of creameries. Later the improvement of roads and the increasing use of motor transportation enabled the creameries to draw cream from areas of sparse milk production and thus greatly increased their volume of business. In most communities and countries the first creameries were usually individual enterprises, but often within a decade the more successful were organized and operated as co-operatives. The creameries ultimately found it advantageous to federate for the purchase of supplies and for marketing their products.

Every country with advanced agriculture has creameries, and the requirements and equipment are roughly similar. A considerable volume of cream is necessary if the operating expense per pound of butter is to be kept down. Surveys indicate that a local creamery should have the produce of from 900 to 1,000 cows within a 7-mile radius. It must have efficient business management, a skilled operator, and a well planned building with drainage. About $10,000 is needed for the basic equipment which includes a combined churn and butter worker, a pasteurizing vat, a starter can (except for sweet-cream butter), machinery for washing, sterilizing and drying cans, weighing scales, a butterfat tester, and facilities for refrigeration, either by mechanical means or natural ice.

See U.S. Dept. of Agriculture, *1899 Yearbook*, p. 381–402; and *Miscellaneous Publication 37* (1930); T. R. Pirtle, *History of the Dairy Industry* (1926); Arthur W. Farrall, *Dairy Engineering* (1942). (E. E. Es.)

CREASY, SIR EDWARD SHEPHERD (1812–1878), English historian, was born at Bexley in Kent, and educated at Eton and King's college, Cambridge. He was called to the bar at Lincoln's inn in 1837. In 1840 he was appointed professor of modern and ancient history in the University of London, and in 1860 became chief justice of Ceylon and a knight. He died in London on Jan. 27, 1878. Creasy's most popular work is his *Fifteen Decisive Battles of the World* (Marathon, Syracuse, Arbela or Gaugamela, the Metaurus, the defeat of Varus, Châlons, Tours, Hastings, Joan of Arc's victory at Orleans, the Spanish Armada, Blenheim, Poltava, Saratoga, Valmy and Waterloo), which, first published in 1851, has passed through many editions. He also wrote *History of England* (1869–70); *Rise and Progress of the English Constitution* (1853); etc.

CREATION, EPIC OF. The Babylonian Epic of Creation consisted originally of six books or tablets, the longest being tablet I, 161 lines, and the shortest, tablet II, 129 lines; latterly a hymn on the divine titles of Marduk, the hero of the epic, in 142 or more lines was added as tablet VII. The composition is a product of the priests of Babylon, in which the local god Marduk is glorified as the only deity who was able to defeat Tiamat, dragon of chaos and personification of the primeval salt water seas. The legend states that in the beginning only two entities existed: Apsû, the deity of fresh water, and the female dragon Tiamat, whose waters were mingled in a chaos, but from their union sprang the gods of heaven and earth, who rebelled and sought to create an orderly universe. This version attributed the defeat of the male deity of chaos, Apsû, to the god Nudimmud, or Ea, who then became the deity of fresh water. But in the great conflict with the female dragon, Tiamat, both Anu, the heaven god, and Ea, the water god, fled before her and only Marduk, son of Ea, went forth to battle with Kingu, leader of Tiamat's hosts, and then with Tiamat herself. There is a long description of the birth of Marduk in Book I. The Assyrian version substitutes Ashur for Marduk but this revision is not consistently carried out in the Assyrian copies. In her determination to destroy the gods of light and order Tiamat created 11 monsters, and Kingu, her husband, was their leader. These 11 monsters were identified later with constellations, Hydra, Leo, Scorpio, etc., after they had been bound by Marduk and chained to the stars.

Marduk, who was at first an inferior deity, had to be raised to the rank of a great god in the divine assembly, whereby he acquired the power to decree fates and to work miracles. He then defeated Tiamat and her host and bound Kingu and the 11 monsters. The body of Tiamat he divided and with half of it he made the canopy of heaven, and with the other half the abode of the Apsû. Tablet V. contains an astronomical poem, in which Marduk fixed the movements of the planets in the ecliptic, the motions of the moon, and the positions of the signs of the zodiac. The sixth tablet describes the creation of man by Ea, from the blood of the slain Kingu, the assigning of the various spheres of influence to the gods, the building of Babylon and its temples, and the institution of the Babylonian New Year's festival.

In certain other sources there are references to an older Sumerian legend of the primeval conflict of the dragons of darkness and the gods of light and order, in which not Marduk, but the war god Ninurta was the champion of the gods, and the bird-god, *Zu*, called the "Storm-bird" was the dragon of chaos, who is identified with both Pegasus and Scorpio. There are also obscure references to Kingu and the dragons having been bound and cast into hell fire by Marduk, a legend which has been compared with the burning of the beast in Daniel 7 and in the Apocalypse of John 20. The recitation of the Epic of Creation formed part of the ceremony of the New Year's festival at Babylon. In its present form it cannot antedate the period of the first Babylonian dynasty (2169–1870), when it was probably written. The texts are all from the late Babylonian and Assyrian period. The epic had more influence upon the rituals and theological views of the Semitic races of Western Asia than any other Babylonian literary work.

Ebeling, *Das Babylonische Weltschöpfungslied* (1921); and the same scholar gives a new translation in Hugo Gressman's *Altorientalische Texte und Bilder*, 2nd ed. (Tübingen, 1926); *Babylonian Penitential Psalms*, Tablets I. and VI. from Kisk (1927).

(S. L.)

CREATIONISM AND TRADUCIANISM. Traducianism is the doctrine about the origin of the soul which was taught by Tertullian in his *De anima*—that souls are generated from souls in the same way and at the same time as bodies from bodies: creationism is the doctrine that God creates a soul for each body that is generated. The Pelagians taunted the upholders of original sin with holding Tertullian's opinion, and called them Traduciani (from *tradux: vid.* Du Cange *s. vv.*), a name which was perhaps suggested by a metaphor in *De an.* 19, where the soul is described "velut surculus quidam ex matrice Adam in propaginem deducta." Hence we have formed "traducianist," "traducianism," and by analogy "creationist," "creationism." Augustine denied that traducianism was necessarily connected with the doctrine of original sin, and to the end of his life was unable to decide for or against it. His letter to Jerome (*Epist. Clas.* iii. 166) is a most valuable statement of his difficulties. Jerome condemned it, and said that creationism was the opinion of the Church, though he admitted that most of the Western Christians held traducianism. The question has never been authoritatively determined, but creationism, which had always prevailed in the East, became the general opinion of the mediaeval theologians, and Peter Lombard's *creando infundit animas Deus et infundendo creat* was an accepted formula. Luther, like Augustine, was undecided, but Lutherans have as a rule been traducianists. Calvin favoured creationism.

Modern biological and psychological studies have modified the conditions of the problem. By insisting upon the close union between body and soul, and the continuity in the development of both from the parents, they may seem to lend support to traducianism. Yet this need not carry with it any materialistic consequence; for the soul, or psychical element in man's nature, may be as important as the body, or physical element, in the development which takes place; and the evolutionary process itself may be creative.

See, for the history, indices to *Augustine*, vol. xi., and *Jerome*, vol. xi., in Migne's *Patrologia, s.v.* "Anima"; A. Harnack, *History of Dogma* (*see* Index).

CREATIVE EVOLUTION is an expression introduced by H. Bergson (*q.v.*), and intimately connected with his philosophy (*Creative Evolution*, Eng. trans., 1922). It is intended to draw attention to the moment of spontaneous originality in nature, and especially in certain activities and experiences of mankind. The work of a great poet or painter clearly cannot be explained by merely mechanical forces. It cannot even be accounted for by explicitly conscious plans and purposes, for the great artist does not as a rule know in advance what the result will be, but is led to it gradually, step by step. This kind of activity, unfettered by mechanical forces *a tergo* or by explicitly preconceived ends *a fronte*, and yet resulting in something new, is typical of creative evolution. A somewhat similar trend of thought, at all events in respect of its opposition to purely mechanistic accounts of natural phenomena, has been maintained and made familiar in England by C. Lloyd Morgan under the term Emergence (*q.v.*).

CRÉBILLON, PROSPER JOLYOT DE (1674–1762), French tragic poet, was born at Dijon, where his father, Melchior Jolyot, was notary-royal. In 1705 he produced *Idoménée;* in 1707 his *Atrée et Thyeste* was repeatedly acted at court; *Electre* appeared in 1709; and in 1711 he produced his finest play, the *Rhadamiste et Zénobie*, which held the stage for a long period, although the plot is so complicated as to be almost incomprehensible. But his *Xerxes* (1714) was only once played, and his *Sémiramis* (1717) was an absolute failure. In 1707 Crébillon married a girl without fortune, who died leaving him two young children. Oppressed with melancholy, he removed to a garret, where he surrounded himself with a number of dogs, cats and ravens, which he had befriended; he became utterly careless of cleanliness or food, and solaced himself with constant smoking. But in 1731, in spite of his long seclusion, he was elected member of the French Academy; in 1735 he was appointed royal censor; and in 1745 Mme. de Pompadour presented him with a pension of 1,000 francs and a post in the royal library. He returned to the stage in 1726 with a successful play, *Pyrrhus;* in 1748 his *Catilina* was played with great success before the court; and in 1754, when he was 80 years old, appeared his last tragedy, *Le Triumvirat.* The enemies of Voltaire maintained that Crébillon was his superior as a tragic poet, and Voltaire then took subjects of no less than five of Crébillon's tragedies—*Sémiramis, Electre, Catilina, Le Triumvirat, Atrée*—as subjects for tragedies of his own. The so-called *Éloge de Crébillon* (1762), really a depreciation, which appeared in the year of the poet's death, is generally attributed to Voltaire, though he strenuously denied the authorship.

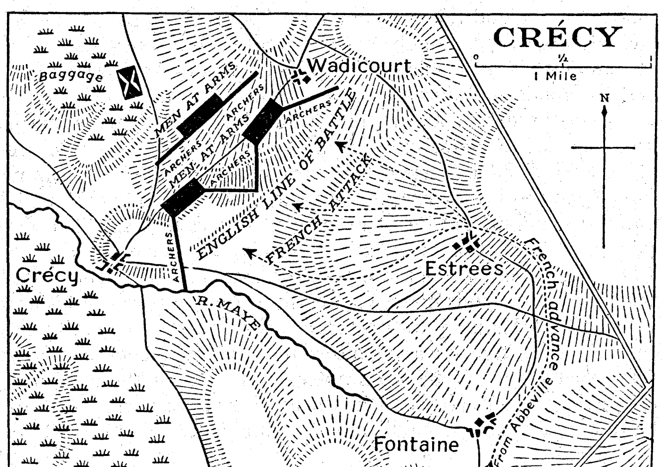
There are numerous editions of Crébillon's works, among which may be noticed: *Oeuvres* (1772) with preface and "éloge" by Joseph de la Porte; *Oeuvres* (1828), containing D'Alembert's *Éloge de Crébillon* (1775); and *Théâtre complet* (1885) with a notice by Auguste Vitu. A complete bibliography is given by Maurice Dutrait, in his *Étude sur la vie et le théâtre de Crébillon* (1895).

His only son, Claude Prosper Jolyot Crébillon (1707–1777), French novelist, was born in Paris, where his life was almost entirely spent, but the publication of *L'Écumoire, ou Tanzaï et Neadarné histoire japonaise* (1734), which contained veiled attacks on the bull *Unigenitus*, the cardinal de Rohan and the duchesse du Maine, led to imprisonment, followed by five years' exile in the provinces. With Alexis Piron and Charles Collé he founded in 1752 the gay society which met regularly to dine at the famous "Caveau," where many good stories were elaborated. From 1759 onwards he was to be found at the Wednesday dinners of the Pelletier, at which Garrick, Sterne and Wilkes were sometimes guests. He married in 1748 an English lady of noble family, Lady Henrietta Maria Stafford, who had been his mistress from 1744. The most celebrated of his numerous novels are: *Les Amours de Zéokinizul, roi des Kofirans* (1740), in which "Zéokinizul" may be translated Louis XIV., and *Le Sopha, conte moral* (1740), where the moral is supplied in the title only.

His *Oeuvres Complètes* were collected and printed in 1772. *See* a notice of Crébillon prefixed to O. Uzanne's edition of his *Contes dialogués* in the series of *Conteurs du XVIII^e^ siècle.*

CRÈCHE: *see* DAY NURSERIES.

CRÉCY (Cressy), a town of France, in the department of Somme, on the Maye, 12 mi. N. by E. of Abbeville by road. Pop. (1936) 1,232. It is famous for the victory gained here on Aug. 26, 1346, by the English under Edward III over the French of King Philip of Valois. After landing near Cherbourg, on July 12, and making a pillaging march through Normandy, Edward decided, in view of reports of the gathering French forces, to retire towards his allies the Flemings. If this merely meant a continuance of his actual direction of march, it also meant that he had to find feasible crossings over the Seine and Somme. For the first he had to go upstream almost to Paris, and the second, after being thwarted four times, he eventually achieved near the rivermouth. His line of retreat at last secure, he decided to halt and face his pursuers on a well-chosen site, to this end encamping, on Aug. 25, at Crécy, the French king in the meantime marching from Abbeville on Braye. Early on the 26th Edward's army took up its position for battle, while the French army continued their pursuit, in a straggling column and in much disorder. The English lay on the forward slope of a hillside, with their right in front of the village of Crécy, their left resting on Wadicourt. Two of the three divisions, or "battles," were in first line, that of the young prince of Wales (the Black Prince) on the right, that of the earls of Northampton and Arundel on the left; the third, under the king's own command, in reserve, and the baggage was packed to the rear. Each battle consisted of a centre of dismounted knights and men-at-arms and two wings of archers. The total force was at most 3,900 men-at-arms, 11,000 English archers, and 5,000 Welsh light troops (Froissart, first edition; the second gives a lower estimate). The French were far stronger, having at least



PLAN OF THE BATTLE OF CRÉCY, AUGUST 26, 1346

12,000 men-at-arms, 6,000 mercenary crossbowmen (Genoese), perhaps 20,000 of the *milice des communes,* besides a certain number of foot of the feudal levy. Along with these served a Luxemburg contingent of horse under John, king of Bohemia, and other feudatories of the Holy Roman Empire.

The day was far advanced when the French came unsuspectingly upon the English position. Philip, near Estrées, decided to halt and bivouac, deferring the battle until the army was better closed up; but the independence and indiscipline of his feudal lords committed him to an immediate action, and he ordered forward the Genoese crossbowmen, while a line of men-at-arms deployed for battle behind them; the rest of the army was still marching in an irregular column of route along the road from Abbeville. A sudden thunderstorm caused a short delay, then the archers and the crossbowmen opened the battle. Here, for the first time in Continental warfare, the English long-bow proved its worth. After a brief contest the crossbowmen, outranged and outmatched, were driven back with enormous loss. Thereupon the first line of French knights behind them charged down upon the "faint-hearted rabble" of their own fugitives, and soon the first two lines of the French were a mere mob of horse and foot struggling with each other. The archers did not neglect the opportunity, and shot coolly and rapidly into the helpless target in front of them. The second attack was made by another large body of knights which had arrived, and served but to increase the number of the casualties though here and there a few charged up to the English line and fell near it, among them the blind king of Bohemia, who with a party of devoted knights penetrated, and was killed amongst, the ranks of the prince of Wales's men-at-arms.

The battle was now one long series of desperate but ill-conducted charges, a fresh onslaught being made as each new corps of troops appeared on the scene. The English archers on the flanks of the two first-line battles had been wheeled up, the centres of dismounted men-at-arms held back, so that the whole line resembled a "herse" or harrow with three points formed by the archers (*see* sketch). Each successive body of the French sought to come to close quarters with the men-at-arms, and exposed themselves therefore at short range to the arrows on either flank. Under these circumstances there could be but one issue of the battle. Though 16 distinct attacks were made, and the fighting lasted until long after dark, no impression was made on the English line. At one moment the prince was so far in danger that his barons sent to the king for aid. Even then Edward was not disquieted and he sent a mere handful of knights to the prince's battle, saying, "Let the boy win his spurs." The left battle of the English, hitherto somewhat to the rear, moved up into line with the prince and the French attack slackened. By midnight the army of France had practically annihilated itself; 1,542 men of gentle blood were left dead on the field and counted by Edward's heralds, the losses of the remainder are unknown. Some 50 of the victors fell in the battle, which established England as a great military power, helped to ring the curfew on the long day of cavalry supremacy, proved the value of fire-power as represented in the long-bow, and revealed the magic defensive properties of a tactical combination of ground, archery-fire and the stability afforded by steady spearmen. As the long-bow had been acquired from the Welsh wars, so the new tactical combination had been learnt from the Scottish wars. But all that the French learnt was to dismount their cavalry when making attacks! The story that the Black Prince adopted from the fallen king of Bohemia the crest and motto now borne by the princes of Wales lacks foundation (*see* JOHN, King of Bohemia). A memorial to the French and their allies was erected, by public subscription in France, Luxemburg, and Bohemia, in 1905.

See H. B. George, *Battles of English History* (1895), and C. W. C. Oman, *A History of the Art of War in the Middle Ages* (1924). *See* also BANNOCKBURN; HALIDON HILL, BATTLE OF.

CREDENCE or **CREDENCE TABLE,** originally a small side-table placed near the high table, in royal or noble houses, for the tasting of food and drink for poisons by an official of the household called the *praegustator* or *credentiarius.* The name (from Med. Lat. *credentia,* Ital. *credenza,* Fr. *crédence*), survived after the disuse of this precautionary ceremony, and the table developed into the buffet (*q.v.*). In the Roman Catholic Church the credence table is a small table of wood or stone, placed near the wall on the south side of the altar, to hold the cruets containing the wine and water, the chalice, acolytes' candlesticks and other objects to be used in the Mass. The use of such a table appears to have arisen after the disuse of personal presentation of oblations at the Mass. In some English churches the old stone credence tables still exist (*e.g.,* at St. Cross near Winchester), most frequently as a stone shelf near the piscina; some carved wooden ones also survive. The use of the credence table has been revived in the English Church, and has been pronounced legal.

CREDENTIALS (*lettres de créance*), a document which ambassadors, ministers plenipotentiary and chargés d'affaires hand to the government to which they are accredited, for the purpose, chiefly, of communicating to the latter the envoy's diplomatic rank. It also contains a request that full credence be accorded to his official statements. Until his credentials have been presented and found in proper order, an envoy receives no official recognition. The credentials of an ambassador or minister plenipotentiary are signed by the chief of the state, those of a chargé d'affaires by the foreign minister.

CREDI, LORENZO DI (1457–1537), Italian artist, whose surname was Barducci, was born at Florence. He was the least gifted of three artists who began life as journeymen with Andrea del Verrocchio. The other two were Leonardo da Vinci and Perugino, of whom he was the companion and friend. Credi had a respectable local practice at Florence. He was consulted on most occasions when the opinion of his profession was required on public grounds, *e.g.* in 1491 as to the fronting, and in 1498 as to the lantern of the Florentine cathedral, in 1504 as to the place due to Michelangelo's "David." At rare intervals he produced large ecclesiastical pictures. The greater part of his time was spent on easel pieces, upon which he expended minute and patient labour. But he worked with such industry that numbers of his Madonnas exist in European galleries. The best of his altar-pieces is that which represents the Virgin and Child with Saints in the cathedral of Pistoia. A fine example of his easel roundels is in the gallery of Mainz. In his old age he withdrew on an annuity into the hospital of Santa Maria Nuova, where he died on Jan. 12, 1537. The National gallery, London, has two pictures of the Virgin and Child, and a portrait of Costanza de' Medici by Credi.

CREDIT. In commerce, the sale of goods or the transfer of property upon promise of deferred payment. Generally, belief or trust (Lat. *credere,* to believe). The term is also commonly used to express the reputation of an individual or institution, as in "a man of credit." In bookkeeping, the side of the account in which payments are entered is termed "credit" or "Cr."; hence, sometimes, the name is applied to the payments themselves. The confidence of traders in each other and in the commercial or monetary system in which they perform their functions has so much to do with profitable work and enterprise that economists have given much attention to the part which credit plays in the production and exchange of wealth. (*See* ECONOMICS.)

In a highly civilized community the use of credit money becomes possible. Paper promises to pay money become currency if backed by gold (*e.g.* a Bank of England note), or by accepted credit (*e.g.* a cheque) and greatly facilitate trading operations. The cheque has become the currency of British and American internal trade and a cheque is a draft on credit backed by commodities. (*See* BANKING AND CREDIT; MONEY.)

CREDIT, INSOLVENCY OR BAD DEBT INSURANCE. It was not until the last decade of the 19th century that attempts were made to provide insurance against bad debts. Since then two British companies have underwritten such risks profitably. In America insurance against bad debts has been provided by the American Foreign Credit Underwriters, Incorporated, which has its headquarters in New York city. Credit policies only indemnify an insured for losses due to the insolvency of his customer. Insolvency is generally defined as "an adjudication of bankruptcy or composition with creditors in legal form, or execution of an assignment for the benefit of creditors, or, in the case of a limited company, an order that the company be liquidated voluntarily, compulsorily or with supervision."

After World War I universal interest was aroused in this subject and schemes were established in Germany as regards exports to Russia; in Italy the government was searching for a satisfactory basis of action; while Austria, Czechoslovakia, Switzerland and Sweden showed signs of activity. Policies are issued to traders either as regards a single transaction, in respect of an open account, or on the basis of annual turnover. Such insurance appeals not only to large traders, who in their normal experience are prepared to risk a certain amount in bad debts and who are now enabled to increase their accounts, but also to the small trader whose capital is insufficient to warrant participating in any transaction involving the slightest element of risk of loss of capital.

Certain fundamental principles apply in common with most other classes of insurance. There must be the utmost good faith (*uberrima fides*) between the parties, and the onus is thrown upon the proposer to disclose all material information to the insurer which may affect his view of the risk as regards acceptance, declinature or rating. The proposer must possess an insurable interest, or in other words must bear some relation to the transaction to be insured, recognized by law, by which he stands to benefit by its completion or to be prejudiced by its non-fulfilment. The principle of indemnity must also be observed and in no circumstances must the insured be able to obtain profit by virtue of the policy. In the event of a loss the insured must, as far as possible, and subject to the limitations of the particular contract, be placed in that position which he would have occupied had the loss not occurred. Fire risks are universally insured, but credit risks are usually insured only when some element of doubt exists in the mind of the proposer as to the stability of his customer. It is therefore an established practice that the insured must bear some proportion of each and every loss himself. If it is worth a trader's while to accept a risk then a credit insurance company will generally undertake a proportion unless the transaction is obviously a gamble. In England an increasing business is written on home and foreign accounts. Domestic business inevitably proves the simpler in operation since debts are more easily collected at home than abroad, and confidential information is more readily obtainable. An increase in the number of companies transacting the business in various countries will make it easier to procure information and foreign guarantees will be granted with greater facility. Proposal forms are required to be completed in every case and full particulars as to the name of the firm to be guaranteed, its standing, the class and extent of the account and terms of payment must be stated. The reason for the guarantee is often sought, particularly when additional security has never been required before.

Policies are issued in respect of individual open accounts and often in respect of all the accounts on a trader's books. The policy provides for the payment of a proportion of the net loss to the insured due to the insolvency of any trader admitted by the policy. In England the percentage paid by the company does not generally exceed 75% of the net loss limited to the sum set against the name in the schedule to the policy. Losses are restricted to those on goods sold during the period of insurance which are delivered to the debtor and invoiced and debited to him in the insured's books. Renewal policies are so endorsed that the insured is not prejudiced in respect of transactions entered into immediately prior to the expiry of the policy. Another form of policy guarantees individual bills of exchange, subject to a specified date upon which the bill must be met or insolvency occur.

The exports credit guarantee scheme established by the British government in 1926 is dissimilar to any form of insurance hitherto devised. The trader is protected against the debtor's failure to meet his obligation on a definite date from whatever cause. In most cases the guarantee does not exceed 75% of the amount of the credit granted, although in certain instances a guarantee for the full amount of the credit may be obtained. (A. G. M. B.)

IN THE UNITED STATES

Credit insurance in the United States was first written by The U.S. Credit System company, organized in 1888 in Newark, N.J.; the first policy issued late in 1889. The premium was divided into expense, guarantee and reserve and the business written on the Tontine plan with 650 policies of $5,000 each making a series, a total of $3,250,000 at risk to a series. Each series paid its own losses, since the funds of one series could not be diverted to another series unless a profit was made, which profit had to apply to the liquidation of any deficit of prior series. This plan proved unsatisfactory and was discontinued by amending the original charter granted by New Jersey, so that all funds were available to pay any losses incurred. Original policies provided for payment of premium and required the insured to sustain agreed percentage of loss on gross annual sales before the company was liable. This percentage, based on applicant's previous credit loss experience, was termed "initial" or "own" loss. The initial loss determined governed the policy's amount and the limit of individual coverage, the policy issued for twice the amount of the largest debtor's limit, in turn double the amount of initial loss. The excess of the amount agreed to be borne by the insured was the policy amount, subject to debtor's limits and the face of the policy, hence the "Excess Bad Debt Insurance." Amounts insured on individual debtors were based on ratings of a mercantile agency selected by the policyholder when the policy was applied for. The meaning of insolvency was confined to that arising from bankruptcies, receiverships, absconding debtors with no assets or a judgment that the debtor was unable to pay in full.

Companies were organized to write this form of insurance only, but their underwriting experience was generally unprofitable, owing to lack of knowledge of carrying costs and of other requirements for safeguarding the company's and the policyholder's interests. After the great financial depression in 1893 the Ocean Accident and Guarantee Corporation, Ltd., took up the business, modernized policy forms, improved underwriting conditions and stabilized the business so as to gain and retain the insuring public's confidence. A number of larger casualty companies followed this pioneer lead. This branch of insurance has since been successfully and increasingly underwritten in the United States. It is now called credit insurance. The fundamental principles of the original idea still operate in broadened scope.

The most modern credit insurance policy covers the policyholder's annual shipments, operates in a dual capacity, provides adequate guarantee against loss due to insolvency of debtors and assists in minimizing the insured hazards. The most comprehensive credit insurance now protects against abnormal or unexpected loss from delinquent, dilatory debtors sold in the ordinary course of business, the policy undertaking to collect from such debtors or pay when "normal loss" is exceeded. In credit granting there is generally some loss during the business year. "Normal loss" is loss understood as inherent to the risk, fixed by class statistics and individual experience. In this essential, credit insurance differs from fire, marine, tornado, burglary and other branches of property indemnity. The coverage in these lines is against a happening considered less certain than credit loss. Overhead can provide for known or normal loss, only insurance for the abnormal or catastrophe loss.

Diverse forms are issued for varying needs but generally "insolvency" includes bankruptcy or insolvency petition, assignment, receivership, compromise, attachment, execution, death or insanity of sole debtor, chattel mortgage, absconding, confession of judgment, transfer or sale of stock in bulk, a debtor's business taken over by a committee. Besides these insolvency definitions collection policy forms provide for assigning accounts as insolvent, after becoming due and payable under original terms of sale. Under this form accounts can be filed as an insolvency when they become past due on original terms of sale or, at the policyholder's option, within an agreed number of days after original due date.

Original underwriting conditions have greatly improved. Original policies limited coverage to $10,000. In 1938, $100,000 could be had on a single account. Principal credit insurance companies pooled loss statistics for a period of years, resulting in experience normal loss tables showing average experience on any given sales basis in over 400 different businesses. The larger proportion of U.S. credit insurance policies cover the policyholder's annual sales volume, but the demand for coverage on individual debtors is met by single credit account policies, though this particular underwriting experience is still developing. Considerable hazard attends credit insurance underwriting, including future business conditions, reasonable expectancy of business depression in cycles, when credit losses reach large proportions, and the especially important factor of moral hazard, the control of the insured hazard being in the policyholder's hands to a greater extent than in other insurances. It therefore demands of underwriters a broad general knowledge of business and of local conditions, acquaintance with different specific hazards and keen judgment of human nature obtained only through wide experience over a number of years.

See J. G. Legg, *Loss of Profits Insurance* (1938).

CREDIT, LETTER OF: *see* LETTER OR BILL OF CREDIT.

CRÉDIT FONCIER DE FRANCE.—The Crédit Foncier de France was originally founded as Banque Foncière de Paris by decree of Louis Napoléon in 1852. It went through a number of reorganizations after its foundation as a mortgage loan bank. Its functions were extended in 1860 and 1862 when it was authorized to lend with or without mortgage to local governments, public and semi-public institutions and institutions of "public interest" such as hospitals or chambers of commerce. At that time it was also authorized to operate in Algeria, in later years in all of French North Africa, until in 1929 it received authority for the entire French empire inclusive of all protectorates and mandates. The charter of the bank was renewed in 1881 for a period of 99 years. In the 1940s it existed as a joint stock company under government control, the governor and the two deputy governors being appointed by decree.

During its evolution the Crédit Foncier expanded its field of activity every few years into new types of lending. Its power, however, declined as time went on, because as its operations became more diffused its monopolistic position decreased, and new competing public and semi-public institutions came into being. The procedures of all loans granted by the Crédit Foncier are carefully prescribed by rules and regulations. It is authorized to grant both long and short term loans, repayable usually by annuity, sometimes drawable by lot. It is, however, also authorized to engage in certain commercial banking operations.

The loans are of two main types: (1) mortgage loans on first mortgages and "maritime" loans on ocean-going vessels; (2) loans to municipalities, *départements,* public or semi-public bodies and non-profit making establishments "of public interest."

The Crédit Foncier has a legal monopoly on mortgage loans. It issues debentures in the open market, but no direct lien connects an individual "obligation foncière" with any particular property. All the mortgages are pooled, and together form the guarantee for each and all individual debentures.

The "obligations communales" which represent the loans to local governments and other approved institutions are also sold in the open market. They are guaranteed by an elaborate system of revenue pledges. Municipal councils have to vote the assignment of specific taxes to be pledged for the fulfilment of the obligation contracted between the municipality and the Crédit Foncier. As in the case of mortgage debentures all pledges are pooled together to guarantee each and all outstanding debentures. There is therefore no direct connection between an individual debenture and the individual pledge as far as the purchaser of the debenture is concerned.

The Crédit Foncier never enjoyed a legal monopoly on local loans in the manner in which it controlled mortgage loans. Up to the 1930s, however, it had a quasi-monopoly because smaller communities rarely issued loans directly in the open market and even large cities were reluctant to do so, and rather used the services of the Crédit Foncier. The local governments' advantage in borrowing from the Crédit Foncier was that large loans could be repaid in small instalments over extended periods of time. The government supported the dominating position of this institution and in the 1920s it actually prohibited for some time another public credit agency (the Caisse des Dépots et Consignations) from granting loans to local governments at rates lower than those charged by the Crédit Foncier. This policy was changed during the 1930s. The central government began to give active support to other institutions engaged in lending to local authorities at reduced rates. The Caisse de Crédit aux Départements et aux Communes was especially founded for that purpose in 1935 and became in the ensuing years a powerful competitor for the Crédit Foncier. It was to become the government lending establishment in charge of regulation and co-ordination of credit granted to local governments.

Traditionally the Crédit Foncier had been considered as an intermediary between the investing public on one hand and the mortgage borrowers, local governments and approved institutions on the other hand. The system had long been used in a number of European countries. With the introduction of modern fiscal planning it might provide the means for the integration of local lending policy with national fiscal policy, and thus give the central government more power in the influencing of monetary developments. It had often been charged in France that the Crédit Foncier exploited its monopolistic position by charging excessive interest rates. To counteract this policy, the French government, on at least one occasion in 1936, advanced money to the institution under the explicit condition that the proceeds be used for the granting of low interest loans to local governments and mortgage borrowers and that the rates charged on outstanding as well as new loans be reduced. (H. S. Bh.)

CREDIT MANAGER, a title used in business organization, especially in the U.S.A., to denote the individual charged with responsibility for determining when and where credit will be extended and with supervision over the collection of outstanding accounts and notes receivable. He is usually responsible to the chief financial executive of the company and works in close cooperation with the sales departments. In large organizations, the credit manager may direct a number of widely scattered credit men. In such cases, he lays down the credit policies and adjusts them to the varying requirements of the territorial subdivisions. He should receive from sales and collection departments detailed data regarding markets, risks and local economic changes affecting the business as a whole. The credit manager also depends to a considerable degree upon the exchange of information with other credit men. In the United States this is done through the National Association of Credit Men, which has for its major purposes the protection of credit, the establishment of a bureau for collection and adjustment and the maintenance of a credit exchange bureau. It furnishes credit information in the United States and foreign countries, and carries on a continuous program of education and research. The organization also conducts courses in credit management and issues news letters and periodicals.

CRÉDIT MOBILIER OF AMERICA, a construction company whose operations in connection with the building of the Union Pacific railroad gave rise to one of the most serious political scandals in the history of the United States congress. The company was originally chartered as the Pennsylvania Fiscal agency in 1859. In March 1864 a controlling interest in the stock was secured by Thomas Durant, vice-president of the Union Pacific Railroad company, and the Pennsylvania legislature authorized the adoption of the name Crédit Mobilier of America. Durant proposed to utilize it as a construction company, pay it an extravagant sum for the work, and thus secure for the stockholders of the Union Pacific, who now controlled the Crédit Mobilier, the bonds loaned by the United States government. The net proceeds from the government and the first mortgage bonds issued to the construction company were $50,863,172.05, slightly more than enough to pay the entire cost of construction. According to the report of the Wilson Congressional committee, the Crédit Mobilier received in addition, in the form of stock, income bonds, and land grant bonds, $23,000,000—a profit of about 48%. The work extended over the years 1865–67. During the winter of 1867–68, when adverse legislation by congress was feared, it is alleged that Oakes Ames (*q.v.*), a representative from Massachusetts and principal promoter of the Crédit Mobilier, distributed a number of shares among congressmen and senators to influence their attitude. As the result of a lawsuit between Ames and H. S. McComb, some private letters were brought out in Sept. 1872, which gave publicity to the entire proceedings. The house appointed two investigating committees, the Poland and the Wilson committees, and on the report of the former (1873) Ames and James Brooks of New York were formally censured by the house. Charges were also made against Schuyler Colfax, then vice-president but speaker of the house at the time of the transaction, and several other members either of the house or of the senate. The senate later appointed a special committee to investigate the charges against its members. This committee, on Feb. 27, 1873, recommended the expulsion from the senate of James W. Patterson, of New Hampshire. The evidence was exaggerated by the Democrats for partisan purposes, but the investigation showed clearly that many of those accused were at least indiscreet if not dishonest.

See J. B. Crawford, *The Crédit Mobilier of America* (Boston, 1880), and R. Hazard, *The Crédit Mobilier of America* (Providence, 1881), both of which defend Ames; also the histories of the Union Pacific Railroad company by J. P. Davis (Chicago, 1894) and H. K. White (Chicago, 1895); and for a succinct and impartial account, James Ford Rhodes, *History of the United States*, vol. vii (1906).

CREDIT NOTE. In commerce, an invoice acknowledging that a sum of money is due from the issuing person or firm as debtor to the receiver as creditor. It is usual to issue a credit note in respect of such matters as overcharges, breakages, goods accepted returnable, allowances for faulty work, etc.; a matter of the kind is thus placed on proper and formal record in account.

CREDITON, market town of Devonshire, England, 7½ mi. N.W. of Exeter by the S.R. Pop. of urban district (1938) 3,719. Area, 1.7 sq.mi. It is situated in the narrow vale of the Creedy near its junction with the Exe, between two steep hills, and is divided into the east or old town and the west or new town.

Crediton (*Credington, Cryditon, Kirton*) is traditionally the birthplace of Boniface, following whom it was for a while a bishop's seat. In 1049 Leofric, bishop of Crediton, requested Leo IX to transfer the see to Exeter, as Crediton was "an open town and much exposed to the incursions of pirates." In 1231 the bishop obtained a fair, still held, on the vigil, feast and morrow of St. Lawrence. This was important as the wool trade was established by 1249 and certainly continued until 1630, when the market for kersies is mentioned in conjunction with a saying "as fine as Kirton spinning." Agricultural trades with the making of cider and some confectionery superseded the former woollen and serge industries. In 1897 Crediton was made the seat of a bishopric suffragan in the diocese of Exeter.

CREE, an Algonkin Indian tribe, or loose aggregation of bands, holding a large territory south of Churchill river and from Hudson bay west into Manitoba and Assiniboia. The name is an abbreviation from Cristineaux or Kinisteneaux. Essentially a forest people, as shown by the resemblance of their dialect to Ojibwa (*q.v.*), part of the Cree became bison hunters and have been known as Plains Cree. When the Assiniboin broke away from the Dakota, they moved into Cree territory, with the result that the two groups became allied against the Dakota and Blackfoot; the latter ancient relatives of the Cree. The culture of the Cree is essentially of eastern woodland type, but lacking the maize agriculture which their habitat forbade. There are some 15,000, including mixed breeds, which was probably about their original number. (A. L. K.)

CREEDS. From the times of the early church till the present day, definitely formulated confessions of faith have played a large part both in the liturgy and in the theology of all Christian denominations. We find them in the early church predominantly as baptismal confessions, *i.e.,* as formulae which are spoken by the candidate at the sacrament of baptism or confirmed by him in response to a question put by the person baptising him (*see* Baptism). Since the Council of Nicaea (325), however, they have served concurrently as formulae for dogmatic decisions of ecclesiastical councils; and in the early middle ages they also began in Spain and Gaul to be recited ceremonially in the Sunday worship, a custom introduced also into the Roman mass by Pope Benedict VIII in about the year 1020 at the wish of the Emperor Henry II. Since that time the Creed has been an established part of the Roman liturgy and has passed thence into the new-formed liturgies of the churches of the Reformation.

The oldest creed of the kind is the confession of the Roman Church which we have in its Greek form in a letter of Bishop Marcellus of Ancyra written in 340 and in Latin in several manuscripts.

It runs:

I believe in God, the Father, the Almighty.

And in Christ Jesus, his only begotten Son, our Lord,
who was born of the Holy Ghost and the Virgin Mary

who was crucified under Pontius Pilate and was buried, on the third day rose from the dead, ascended into heaven, is seated at the right hand of the Father, whence he will come to judge the living and the dead.
And in the Holy Ghost, the holy Church, the forgiveness of sins, the resurrection of the flesh.

A careful examination of the text, yields the result that the Greek form is the original, the Latin the translation: and as Greek was the official ecclesiastical language in the Roman community only till the middle of the third century, we can draw the conclusion that the formulation of this creed must have taken place before 250. The Latin translation, however, will already have been made at a very early date and it spread from Rome throughout the West. All Latin creeds of the West, from Africa, Spain, Gaul, Britain, Germany, are derived from the Latin form of the Roman creed, which they took over as a whole and developed further in its details by minor alterations or additions. For the middle ages and the modern age the so-called *Apostolicum* (or "Apostle's Creed") has attained the greatest importance among these descendants of the old Roman creed. We find it already in the seventh century in Gaul, whence it spread both to Ireland and to Spain and Germany. It is connected in origin with a form of the creed which we find associated with Bishop Niceta of Remesiana (to-day Bela Palanka on the Serbian-Bulgarian frontier) about 400. The official text of the Apostolicum runs:

I believe in God the Father, the Almighty, creator of heaven and earth.
And in Jesus Christ, his only son, our Lord, who was conceived by the Holy Ghost, born of the Virgin Mary, suffered under Pontius Pilate, crucified, dead and buried, descended to hell, the third day rose again from the dead, ascended into heaven, seated at the right hand of God the Father Almighty, whence he will come, to judge the living and the dead.
I believe in the Holy Ghost, a holy catholic Christian Church, communion of saints, forgiveness of sins, resurrection of the flesh, and an everlasting life. Amen.

Whilst, therefore, we can prove the existence in the West since the 4th century of a single form of the creed preserved, although with numerous variations, through the centuries without a break till the present day, for the East a wealth of creed forms is characteristic, differing widely from one another. Of special importance is the creed of the first ecumenical synod of Nicaea (325), which was formulated in defence against Arianism. It runs:

We believe in one God, the Almighty Father, creator of all things visible and invisible.
And in one Lord Jesus Christ, the son of God, who alone was begotten of the Father [that is of the substance of the Father] God of God, Light of Light [very God of very God, begotten, not made, of one substance with the Father], through whom all was made that is in heaven and on earth, who for us men and for our salvation came down and became flesh, became man, suffered and rose on the third day, is ascended to heaven and will come to judge the living and the dead.
And in the Holy Spirit.

In this formula of the synod we have an ancient eastern baptismal confession into which the clauses marked [. . .] have been inserted as dogmatic formulas in defence against Arius. Similar confessions are preserved to us in ever changing forms, from Palestine, Syria and Egypt. With the forms beloved in the Jerusalem district is closely related the creed which in its Latin form is customary in the western liturgy and is used to the present day in the liturgy of the mass. It also is commonly called the Nicene, although it arose later and is officially attributed by the Byzantine Church to the second ecumenical synod of Constantinople (381). Its wording is:

We believe in one God the Father Almighty, maker of heaven and earth, and of all things visible and invisible:
And in one Lord Jesus Christ, the only-begotten Son of God, begotten of his Father before all worlds, God of God, Light of Light, very God of very God, begotten not made, being of one substance with the Father, by whom all things were made: who for us men and for our salvation came down from heaven, and was incarnate by the Holy Spirit of the Virgin Mary, and was made man, and was crucified also for us under Pontius Pilate. He suffered and was buried, and the third day he rose again according to the scriptures, and ascended into heaven, and sitteth on the right hand of the Father. And he shall come again to judge both the living and the dead: whose kingdom shall have no end.
And we believe in the Holy Spirit, the Lord and giver of life, who proceedeth from the Father, and with the Father and the Son together is worshipped and glorified, who spake by the prophets. And we believe one catholic and apostolic Church. We acknowledge one baptism for the remission of sins. And we look for the resurrection of the dead and the life of the world to come.

In these two examples already can be seen the variety of the oriental creeds and their freedom in large and small alterations of the text. We add to them an Egyptian confession, which is attributed to Macarius (about 370):

I believe in one God the Almighty Father.
And in the Logos of one substance with him, through whom he made the world, who at the end of the times took his dwelling in flesh for the destruction of sin, which he prepared for himself out of the Holy Virgin Mary, crucified and dead and buried and risen the third day and seated at the right hand of the Father, and who comes again in the world to come to judge the living and the dead.
And in the Holy Ghost, who is of one substance with the Father and his Logos. We believe also in the resurrection of the soul and of the body, as the apostle says: 'It is sown a natural body, it is raised a spiritual body.'

In spite of all this variability of the creed, due to the liturgical freedom of the East, the attempt can be made to construct a common archetype out of which the eastern confessions grew. It may perhaps have run:

I believe in one God, the Father, the Almighty, the creator of all things visible and invisible.
And in one Lord Jesus Christ, the only begotten Son of God,
who was born of the Father before all aeons, through whom all came into being,
who (for our salvation) became man, suffered and rose the third day and is ascended into the heavens and will come again (in glory), to judge the living and the dead.
And in the Holy Ghost.

From this arises the problem concerning the origin of the creed. Have Rome and the East a common root, or is one of the great centres of Christendom the original home of the creed, and have the others borrowed it from these? And at what time may the oldest formulated creed have arisen? This problem has been discussed with special eagerness in Norway by C. P. Caspari, in Germany by A. v. Harnack and F. Kattenbusch, in England by A. E. Burn; in particular the fundamental work of Kattenbusch has become of determining influence in the method of the enquiry. In numerous ecclesiastical writers of the first centuries occur single clauses or longer discussions which show relationship, both in form and in content, with the clauses of the creed. All these passages have been regarded as allusions to the confession of faith, and the attempt has been made to reconstruct out of them the creed familiar to the writer in question. In this attempt the presupposition is always that the type which finds expression in the Roman and eastern creeds must lie at the basis also of all earlier confessions of faith, and that it is therefore only necessary to piece together according to the known scheme the scattered allusions of the writer examined in order more or less to recover his creed. In this way for instance a creed of Justin Martyr's, who worked in Rome about 150, can be restored:

I believe in the Father of all things and the Lord God.
And in our Lord Jesus Christ, the first-born Son of God, according to the Father's will born through a virgin and become passible man and crucified under Pontius Pilate and dead and risen from the dead and ascended into heaven, and will come again in the glory as judge of all men.
And in the Holy Spirit of prophecy.

We should have here a primitive form of the Roman creed discussed above and should thus be in a position to trace back the history of its origin to the year 150 and establish as highly probable that the very first formulation of the creed is due to Rome, and that from thence it entered upon its victorious progress through the whole of Christendom. Other scholars, above all A. Seeberg and later P. Feine, have even thought it possible by help of the allusions to work back to the New Testament period and to put the date of the origin of the creed back into apostolic times. The numerous accordances in the New Testament with all the clauses of the creed provide rich material for this hypothesis, though indeed always on the presupposition that underlying these separate scattered expressions is the type of a confession composed of three articles with a fuller treatment of the expressions about Christ in the second article. But it is just that which cannot be proved for the New Testament period and the beginning of the second century; hence the justification of this whole construction is open to question. A. v. Harnack already more than once pointed out that, in addition to a three-fold confession of faith in Father, Son and Holy Spirit, there existed a fully developed confession of Christ; and that the form of the creed familiar to us was the outcome of the insertion of that Christological confession into the second article of a trinitarian creed which thus developed into the form of which we have evidence in the old Roman symbol. And in 1922 Reinhold Seeberg proposed the hypothesis that the original form of creed known to us from Rome arose about the year 140 in Jerusalem through the conflation of a christological and a trinitarian formula.

The study of the creeds, which had been undisturbed since the appearance of Kattenbusch's great work (1900), received a new shock from an enquiry which Karl Holl laid before the Berlin Academy in the year 1919. He pointed out that, in the Greek original text of the Roman creed, as in its old Latin translation, the clauses fell clearly into groups (*see* the text as printed above). After the words, "and in Christ Jesus, his only-begotten Son, our Lord" follow two expressions parallel in form, the first of which expounds the title "his only-begotten Son" according to Lk. i. 35 as he who is born of the Holy Spirit and the Virgin Mary, whilst the second describes in the manner of Phil. ii. 5–11 how Jesus obediently enters upon his passion and thereafter is exalted to the right hand of God and confessed as "Lord" by the whole world: so that in this way the second title "our Lord" is explained. A. v. Harnack recognized at once in this observation of Holl's a confirmation of his theory and drew the conclusion that thus the oldest form of the Roman creed did not have those explanatory sections and consisted of three equally-balanced articles, each of which was composed of three elements. H. Lietzmann then pointed out that this ninefold creed suspected by Harnack was actually preserved in the Egyptian Church and that there was evidence for it in not a few passages; and to this he joined a new hypothesis of the origin of the creed. The Egyptian creed runs:

I believe in God, the Father, the Almighty,
And in Christ Jesus, his only-begotten Son, our Lord,
And in the Holy Spirit, the holy Church, the resurrection of the flesh.

Thus it is only necessary to delete in the Roman creed the two expository clauses of the second article to obtain the Egyptian form, which research had hitherto regarded as an abbreviation of the Roman text. Now it became clear that on the contrary the development was from the shorter to the longer form, and new perspectives were thereby opened to research. As soon, namely, as it is inferred that the numerous confessional utterances of early Christian literature should be regarded, not as "allusions" to a creed lying behind them, but as actual confessions, there emerges the conception of a development moving from single utterances and brief forms to the creed formulas we know, and this is in itself inherently probable.

In the early period are to be mentioned first of all the *one-clause* confessions of *Jesus*. Paul says in 1 Cor. xii. 3. "No man can say 'Lord Jesus,' except by the Holy Spirit," and in Rom. x. 9: "if thou shalt confess with thy mouth the "Lord Jesus" and shalt believe in thine heart that God raised him from the dead, thou shalt be saved." Here the confession runs quite simply: "Jesus is the Lord," and in Rom. x. 9 we can already observe the tendency to add the clause that God raised him from the dead. From this kernel was developed the formula, known to us from numerous sources and above all from the symbol of the fish: "Jesus Christ, Son of God, the Saviour." The chance circumstance that the first letters of these five words when read together make the Greek word for fish (*icthys*) made the fish the emblem of the early Christians. In many other passages of New Testament and early Christian literature we meet with confessions of Christ: Rom. i. 3; 2 Tim. ii. 8; 1 Cor. xv. 3–4; 1 Pet. iii. 13–22 and the famous passage Phil. ii. 5–11 which celebrates in hymn-like form the saving work of Christ.

For by confession ought not to be understood only some kind of formula expressing obligation, and not only at baptism does the Christian confess his faith, but early Christian usage speaks of "confessing" wherever the great truths of religion are uttered to the laud and praise of God or proclaimed to the hostile powers for the confusion of the demons. Thus we find, especially in the central prayer of the Eucharist in the oldest form of the western rite, the ceremonial confession of the saving work of Jesus. In the oldest Roman liturgy this prayer runs:

We thank thee God through thy beloved servant Jesus Christ, whom thou hast sent us in the last times as saviour and redeemer and messenger of thy counsel, the Logos proceeding from thee, through whom thou madest all things whom thou wast pleased to send from heaven into the womb of the virgin, and in her body he became flesh and was shown as thy Son, born of the Holy Spirit and the virgin. To fulfil thy will and to prepare a holy people, he stretched out his hands, for he suffered that he might release from evil those who have believed in thee.

And when he delivered himself up to voluntary suffering, to loose death and to break asunder the bands of the devil and to tread down hell and to illuminate the righteous and to set up the boundary stone and to reveal the resurrection, he took a loaf, gave thanks and spake: "Take, eat, this is my body, which is broken for you," etc.

The relationship of this prayer with passages like Phil. ii. 5–11 on the one side and to the second article of the formulated creed on the other side is obvious. And the connection with the creed is no less clear in the early Church forms for exorcising evil spirits, *e.g.*: "I exorcise thee in the name of our Lord Jesus Christ of Nazareth, who became flesh in the virgin Mary, under whom the Father hath set all that is in heaven and on earth."

By the side of this one-clause confession of Christ we find already in the earliest period a two-fold confession of God and Christ. Paul says in 1 Cor. viii. 6:

One God the Father, from whom is all and we are to him.
And one Lord Jesus Christ, through whom is all and we are through him.

And in Tim. vi. 12 we read:

of the good confession before many witnesses,
Before God, who has called all into life
And Christ Jesus, who under Pontius
Pilate witnessed the good confession.

We meet also with such two-fold confessions in early Christian writing again and again. Even so do Syrian martyrs make confession at a later time:

We know no other God besides the
God who made the heaven and the earth,
and the sun and the moon and
all that is visible and invisible.
And we believe in his Son Jesus, who is called the Nazarene.

Or an official confession of the leader of the community of Smyrna about 200 runs:

we know truly of one God,
we know of Christ, we know of the Son,
who suffered as he suffered, died as
he died and rose on the third day
and is at the right hand of God
and will come to judge the living and the dead.

These are no "allusions" to a three-fold creed, but actual two-fold formulas of confession.

The oldest three-fold formula meets us in 2 Cor. xiii. 13: "The grace of the Lord Jesus Christ and the love of God and the fellowship of the Holy Spirit be with you all." And what we see here as a liturgical formula of salutation, meets us as a baptismal formula in Mt. xxviii. 19: "Baptise ye in the name of the Father, and of the Son, and of the Holy Spirit." The letter of the Roman community dating from the end of the first century which goes by the name of the first epistle of Clement also knows this formula: "have we not one God and one Christ and one Spirit of grace which is poured out upon us and on calling in Christ?" (1 Clem. xlvi. 6). This simple trinitarian formula was variously expanded just as was the two-fold one: the way is not far to the nine-fold Egyptian creed discussed above. Instructive in this connection, however, is a confession which occurs in the recently discovered so-called "Letter of the Apostles" preserved in Ethiopic and hence of second century origin. The five loaves of the miraculous feeding of Mt. xiv. 17 are being discussed, and they are interpreted as a symbol of Christian faith:

in the Father, the ruler of the whole world
and in Jesus Christ our Saviour
and in the Holy Spirit, the Paraclete,
and in the holy Church
and in the forgiveness of sins.

We should say that here the third article of the trinitarian confession is expanded: but the author states clearly that he takes this formula of confession as a five-fold formula.

A four-fold formula meets us about the same period in bishop Irenaeus of Lyons (I. 10). He there speaks of the faith:

In one God, the Father, the Almighty, who made the heaven and the earth and the sea and all that is in them (Ps. cxlv. 6),
and in one Christ Jesus, the Son of God, who became flesh for our salvation,
and in the Holy Spirit, who foretold through the prophets
the working of God and the coming and the birth of a virgin and the passion and the resurrection from the dead and the bodily ascension to heaven of the beloved Christ Jesus our Lord and his coming again out of the heavens in the glory of the Father to collect all together (Eph. i. 10) and to raise up all flesh that he created, to give righteous judgement over all, etc.

Here can be plainly seen how a trinitarian confession to Father, Son and Spirit and a one-clause confession to Christ with extensive exposition of his saving work have grown together, but not in the form familiar to us from the Roman creed, but so that the confession to Christ-confession is added as a fourth article to the third one.

The abundant available material from the first three centuries teaches us above all that the early period of Christianity still possessed no definitely formulated confession, but gave to the Christian belief, which in content remained constant, the greatest variety of expression. And then when, in the 4th century and still later, as was acknowledged above, we find throughout the East a variety of confessional formulations to us almost amazing, we shall recognize in it the continuation of the early Christian freedom. A complete parallel to this is afforded by the development of the liturgy which likewise retained in the eastern Churches what to the Westerner is an almost incredible variety and freedom. And this parallel is no accidental one, for the creed also has its root in the liturgy and is nothing else than the liturgical expression of Christian faith. The trinitarian formula of confession especially belonged to the baptismal liturgy, whilst the fully elaborated Christ-confession was developed and fostered preferably in the central prayer of the Eucharist (*see* the example given above). In the West, and indeed predominantly in Rome, we can observe quite early the preference for fixed formulations, and this too in the field of the creedal confession; and analogously the liturgy there became stereotyped much earlier and more rigidly.

The creed is, therefore, by its origin a piece of the liturgy. It arose from the need to sum up the fundamental truths of salvation in ceremonial form and to utter them aloud before the face of God; and this because the pious heart so desires it, because the solemnity of the hour demands it, because the celebration of the sacrament reaches in it its emotional climax or the assaults of the evil one are effectually withstood if rebuked in the very words of the faith. Whether also the exclusion of foreign errors exercised influence in the formation of individual clauses is an open question, which to-day will no longer be so confidently answered in the affirmative as would till recently have been the case. The determining impulses to the formation of the creed were in any case motives acting from within Christianity and the Church, *i.e.* the history of the creed and its formulations would not appear *essentially* different if there had been no heresies. It is with the council of Nicaea first that creeds enter our horizon compiled demonstrably and deliberately in defence against heretical opinions. But even after the 4th century this motive did not finally gain the upper hand, and the creed has remained through the middle ages to the present day an act of liturgical worship.

A typical example of creed formation for the purpose of confuting heretics is the so-called "Athanasian Creed," named after its opening word the *Quicumque*. Neither in content nor formally has it anything to do with the type discussed so far, but is a compendium, compiled in forty theses, of the doctrines of the Trinity and the Incarnation. There is a variety of evidence of its liturgical use since the Carolingian period, and to be sure in the hourly services of the monks as a part of Prime. Opinions about the date of its origin differ very widely. There is only agreement on the one point that this creed, which is unknown to the Greek Church, cannot come from S. Athanasius. Accordingly an author has been sought for in the West, and a great number of theologians have been suggested. Whilst earlier research, under the determining influence of Swainson, ascribed the work to the Carolingian period, A. E. Burn has with great learning argued for the thesis, often adopted before, that it originated in the 5th century, and he has looked for its author in Gaul. Finally in 1909 the acute Jesuit Brewer attempted to render probable the authorship of S. Ambrose, and won agreement from not a few competent scholars. In one of the last of his essays Burn also withdrew his earlier opinion and accepted the 4th century date and the probability of Brewer's hypothesis.

MODERN CONFESSIONS OF FAITH

1. **New Motives and Forms.**—The form of the confessions of the modern period cannot be understood without glancing back for a moment at the middle ages. From the condemnation of Pelagius onwards the western Church reached numerous doctrinal decisions of its own. They have, in part universal validity (*e.g.*, the dogma of Transubstantiation), in part particular validity (the theology of universities and orders). This increasing body of obligatory doctrine was indeed in part embodied in particular obligations (*e.g.*, the oaths in the universities), but formally these obligations were legal in character. The expansion of existing confessions or the formulation of new ones did not take place. The obligatory doctrine had therefore to be collected from a large and not precisely limited series of single doctrinal decisions. Thus side by side with the great extension of obligatory doctrine there is, oddly enough, a standstill in confessional formulation.

Three elements in this development have been important for the confessional formulation of the modern period: (1) The connection of obligatory doctrine with the taking of oaths. Examples from the Roman Church: Professio fidei Tridentinae 1564 and the oath of the Doctores in s. scriptura 1910; from the Lutheran Church: the Wittenberg doctor's oath (probably of 1532); from the Church of England the oath in conformity with the Test Act of 1673. (2) The formulation of obligatory doctrine in separate articles. Any Reformation confession will serve as an example, and so too the Tridentine decrees. (3) The detailed elaboration of the separate points of theological doctrine. Yet where these mediaeval elements alone are present the peculiar character of the confession, as a comprehensive whole exhaustive of its kind, is lacking. The inducement for this first arose through the Reformation and the consequent contrast between the newly formed Churches and the Roman Church. Here were contrasts involving the whole system. Here too the conscious return to the sources of obligatory doctrine (scripture alone in the newly formed Churches, scripture and tradition in the Roman Church), and the reflexion upon the points of doctrine fundamental for the whole system, were a determining incentive to confessional formulation.

The new confessions which now arose had to be much lengthier than those of the ancient Church, in the face of both the development of a systematic and scientific theology and of the elaboration of the doctrinal details of the contrasting positions. Hence the primitive form of an expanded and explicated baptismal confession was insufficiently subdivided to yield the appropriate divisions. Luther attempted to revive it in his personal confession (*Works,* Weimar ed. xxvi., 500–9), but then himself adopted another course. Thus new forms of the confession arise:

I. Articles of Confession.—In form this is the stringing together of a larger or smaller number of articles, which deal either with doctrine alone or with both doctrine and ceremonial together. In the genuine articles of confession they together attempt to present a conspectus of scriptural doctrine and scriptural rites in sharp contrast with all that is anti-scriptural. This aim of providing a comprehensive system makes the articles of confession a true confession. Where articles of confession deal only with single questions, they are a real confession only when they are understood as expanding existing confessions.

II. The Catechism.—This is the exposition of definite things which concern every layman, like the Decalogue, the Apostles' Creed, the Lord's Prayer, and also the sacramental words of Baptism and the Eucharist. It endeavours to further the education of the laity in the confession of the Church and is therefore consciously confined to what is simple and universally intelligible. It had in the 16th and 17th centuries in fact the significance which the expanded baptismal confessions possessed in the early eastern Church.

Common to both forms is the exclusion of merely academic questions. They limit themselves to what is essential and important according to the new Reformation conceptions of pure evangelical doctrine and faith. Although, however, each is in its own way a complete whole, they are not, either separately or together, the complete basis of the new order. They are that rather in connection with the *orders of service.* The division between the orders of service and the articles of confession was originally indefinite. There is therefore in the orders of service of the continent something really corresponding to the fact that the Church of England regards as the foundation of its new order not the Thirty-Nine Articles alone but also its Book of Common Prayer.

In this account, however, the Church liturgies and rites will not be dealt with. Moreover little need be said of the Roman Church, for it did little in the way of credal formulation. The Tridentine decrees learned certainly from the Reformation practice of embodying the whole system and excluding the purely academic; yet in general they follow the older type of doctrinal decision. The same holds true of the *Vatican Decree.* The Catechismus Romanus of 1566, important as a standard of instruction, follows certainly the new form of the confession; it is a counterpart to Luther's larger Catechism.

Of the Eastern Church it will suffice to mention, that in 1642 it adopted in opposition to the ideas of the Reformation its Confessio orthodoxa.

2. **The Lutheran Churches.**—(i.) *The Augsburg Confession* (*Confessio Augustana*), read before the emperor in the Augsburg Diet in the name of the majority of the Evangelical deputies and presented in writing (Latin and German) on June 25, 1530, has become the common confession uniting the Lutheran Churches—not indeed in exactly the form presented to the Emperor, but in a form differing little from it (the Latin text that of the editio princeps of 1531). It bears the subsidiary title of the "Invariata" (unaltered) in contrast to the materially altered form of 1540, the so-called "Variata," which is not recognized by the Lutheran Churches. The C. Augustana owes its great importance to the possibility, along with the Wittenberg Concord of 1536, of uniting the German Evangelical deputies, and to the imperial recognition which depended upon this. Till the dissolution of the old Romano-Germanic Empire the existence of the Evangelical Churches depended, formally and legally, upon the C. Augustana. Except that since 1648 the reformed German Churches which accepted only the "Variata" expressly shared this legal protection.

The earlier history of the C. Augustana goes back to the year 1525 and has recently had light thrown upon it by H. v. Schubert and Gussman. Of direct importance for its first part (Faith and Doctrine) are the so-called Schwabach Articles, and the Marburg Articles giving an abbreviated form of them, both of 1529 and for the latter the so-called Torgau Articles of April 1530, composed by the theologians of the Electorate of Saxony together and in part by Luther himself. The work of composing a common Evangelical Confession out of these materials fell to Melanchthon. He achieved it by moderating as far as possible the contrast with the ancient Church, *e.g.,* the articles on the Pope and Purgatory are omitted. The opposition to the dogma of transubstantiation is similarly dropped in article 10; the teaching about the invisible Church is removed; even the Evangelical doctrine of Justification finds only brief expression, requiring explanation. Hence the C. Augustana, though always highly honoured, very soon no longer sufficed for the growing Lutheran Churches as an expression of their confession and it was supplemented by other confessions.

Contents: I. *Faith and Doctrine.* 1 God (Trinity); 2 Original Sin; 3 The Son of God (Incarnation and Redemption); 4 Justification; 5 Preaching; 6 The new obedience; 7 and 8 Church; 9 Baptism; 10 The Lord's Supper; 11 Confession; 12 Penance; 13 Use of the Sacraments; 14 Church Government; 15 Liturgies; 16 Civil Government; 17 Christ's Return to Judgement; 18 Free Will; 19 The Cause of Sin; 20 Faith and Good Works; 21 Worship of Saints. II. *Abuses* (with reference to both forms of the Sacrament, the Marriage of Priests, the Mass, Distinction of Meats, Monastic Vows, Authority of Bishops; in all seven articles).

For the understanding of the C. Augustana it is necessary, owing to the brevity of its formulations, first to refer to the Schwabach articles and secondly to consider the Apology for the C. Augustana of September 1530. The *Apology* is a defence of Melanchthon's, directed against the Confutatio Pontificia in which the Emperor in August 1530 declared the C. Augustana refuted, and it soon attained the authority of a confession.

(ii.) Next to the C. Augustana the most important German Lutheran confession is the *Schmalkaldic Articles,* composed by Luther himself. When pope Paul III. summoned the council to Mantua in June 1536, the C. Augustana did not at first appear suited to discussion. So Luther in conjunction with Elector John Frederick wrote for it what were later called the Schmalkaldic Articles (Dec. 1536). They were subscribed by the Wittenberg theologians, and were to have been made the common confession of all Evangelical deputies and theologians at the session at Schmalkalden (Feb. 1537). Melanchthon, furthered by an illness of Luther's, prevented this, and secured that both his own writings (C. Augustana and Apology) together with an explanatory tract on the papacy should be selected as the official confession. The theologians present only subscribed Luther's articles privately. Luther then issued his articles in 1538 as his personal confession, which were to rank also as his witness after his death. Owing to their content they very soon became the official confession of all the German Lutheran Churches.

The Schmalkaldic Articles are the jewel among the Lutheran confessions. Even their construction is lucidly clear. The *first part* contains the fundamental tenets of the ancient Church, which are common to the newly formed Churches and to the Roman Church (Trinity and Christology). The *second part* introduces the great issues connected with the doctrine of redemption, round which the strife turned and on which no compromise was possible: justification by faith only and the rejection of the sacrifice of the mass, monastic vows, and papal authority. The *third part* contains the particular theological problems in which the consequences of the fundamental issue find expression, and on which learned discussion is possible. For Lutheran Christians the Schmalkaldic Articles are still to-day the point of departure in every exploration of relations with the Roman Church. They will therefore still possess considerable importance in the movement for reunion. At the same time it is in them, more than in any other German Reformation confession, that the pathos of confession in the early Christian sense is most evident. In Luther's manuscript they bear the motto: hic satis est doctrinae pro vita aeterna.

(iii.) The large and the small Catechisms, both issued by Luther in 1529, cannot be considered in detail here. Suffice it to mention that the German Lutheran Church reckons them also among its confessions, and that the small Catechism became of special importance in this respect in the 19th century.

(iv.) In addition to these confessions, which won their way everywhere in German Lutheranism, a number of other writings, which cannot here be enumerated, attained the rank of confessions, mostly for a time only, but some also permanently. The sifting and collection of these writings in Books of Confession (Corpora doctrinae) was influenced by the disputes which rent the German Evangelical Churches after the "Interim" of 1548, being concerned with the differences between Melanchthon's and Luther's theology. The great majority of the German Churches learned during these conflicts consciously to feel as Lutherans. In Corpora doctrinae collected by them since 1563 in opposition to a Corpus doctrinae representing purely Melanchthon's position, the writings mentioned under (i.) and (ii.) won their way as confessions. The variety of the centres from which these books of confession arose, on the one side, and the need for an end of disputes, on the other, led to the "Book of Concord" of 1580, which contains, in addition to the classic creeds of antiquity and the confessions mentioned in (i.) to (iii.) above, the "Formula of Concord" completed in 1577. Although a few Lutheran districts, especially in North-west Germany, did not accept the Formula of Concord and the Book of Concord, the two became the characteristic confession of the Lutheran Church. The divergence of the remaining Corpora doctrinae, apart from the failure of the Formula of Concord itself, is of little importance.

This Formula of Concord is the most extensive confessional document of Lutheranism. It deals with a series of twelve controversial points of doctrine in a twofold form, in an "Abstract" (Epitome) and in a "Fundamental exposition" (Solida declaratio). It has become of decisive importance for the course of Lutheran theology for two reasons: (a) through its acceptance of the doctrine of ubiquity (the doctrine of the omnipresence of the risen Christ according to his manhood), and (b) through its mediation between the doctrines of Predestination of Melanchthon and Luther (the sole-efficacy of grace is clearly maintained, but predestination nevertheless made milder).

(v.) Lutheranism outside Germany formed its own confessions as need arose (C. Hafnica in Denmark, 1530), but sooner or later reached confessional union with German Lutheranism by the adoption of the German Lutheran confessions. In Denmark and Norway under the influence of Christian V. (1670–95) only the C. Augustana and the smaller Catechism, apart from the early Christian creeds, became confessions; but in Sweden the C. Augustana in 1593 and the whole Book of Concord in 1686. American Lutheranism is at one with the strictest German. Lutheranism therefore is, even formally, confessionally very well defined, and national differences play a small part; the C. Augustana and the smaller Catechism at least are of world wide validity.

3. **The "Reformed" (Non-Lutheran) Churches.**—The non-Lutheran "Reformed" Churches are distinguished from the Lutheran in the matter of confessional formulation in two respects. First, they are formally less well defined. The fundamental confession is different in each national Church. Secondly, they know no Corpora doctrinae. Most of the national Churches have only *one* fundamental confession. The Dordrecht Decisions of 1619 alone are common to many national Churches and rank as an expansion of their national confessions. An enumeration even of all the important confessions is therefore impossible here. For these the list given in E. F. Carl Müller, *Die Bekenntnisschriften der reformierten Kirche,* Leipzig 1903, p. ix.–xi., should be consulted.

Zwingli's *Fidei ratio ad Carolum quintum* of 1530 is a well-defined theological system of so markedly individual a character that it is not adapted to be the confession of a Church. Of all the pre-Calvinist confessions only one is important, the *Confessio Helvetica prior,* originating early in 1536 in a general consultation of all the Evangelical Swiss Cantons. It possesses two features characteristic of most of the later non-Lutheran "Reformed" confessions. First it contains extensive explanations about Holy Scripture as the only source of doctrine, and secondly it has a separate article on the doctrine of Predestination.

Two writings of Calvin must be mentioned among the "Reformed" confessions. A. *The Geneva Catechism,* composed probably in 1541, printed in 1545. It has never been an official confession of a "Reformed" Church, but yet has in practice been one of the most formative influences in "Reformed" doctrine. The duty of man is to give glory to God; but true worship of God embraces four things: (*a*) to believe in him, (*b*) to obey him, (*c*) to call upon him, (*d*) to recognise him as the source of all good. Therein is contained the underlying idea and division of the Catechism, except that the four points, where more precisely developed, are divided into two parts, the Word of God and Sacraments. Calvin arranged the two parts of the Catechism as a complete whole, but the whole is not a system of doctrine, but has a practical religious purpose. B. *The Confessio Gallicana* of 1559, the fundamental confession of the French "Reformed" Church, which was accepted at the national synod in Paris in 1559, somewhat expanded at La Rochelle in 1571, and is based, according to recent research, upon Calvin's own draft. In 1603 a national synod attempted to add to article 31 a supplement which explained that the Pope was Antichrist; the Catholic government prevented it. Owing to the destruction of the public Evangelical Church in France (1685), the C. Gallicana fell out of use in the "Church of the Wilderness," and it did not regain its old position in the 19th century. So to-day it is only an honoured historical document, the pattern of many other "Reformed" confessions. What is valuable in it, apart from its lucid, systematic, construction and its clear language, which make it the best outline of Calvin's theology, is the full development of all the elements of the doctrines of Justification and of the Church.

Contents. 1 General Idea of God; 2 Revelation; 3–6 Holy Scripture; 7 Trinity; 8 and 9 Creation and Providence; 10 and 11 Original Sin; 12 Double Predestination; 13–17 Christ's Person and Work; 18–24 Justification by Faith Only; 25–33 Church and Word of God; 34–38 Sacraments; 39 and 40 Secular Authority. (Arts. 1–9=Institutio Bk. I.; Arts. 10–17=Bk. II.; Arts. 13–24=Bk. III.; Arts. 25–40=Bk. IV.)

Of the remaining reformed confessions the *Heidelberg Catechism,* composed by Olevianus and Ursinus, and adopted by the Palatinate synod at Heidelberg in 1563, is still very distinctive. It arranges the material of the Catechism in a systematic whole of three parts (Questions 3–11 Of man's sin and misery, Questions 12–85 Of man's redemption, Questions 86–127 Thankfulness). This arrangement shows that older German Reformation theology has had great influence; it is not Calvinism that is the formative principle, Predestination is not dealt with expressly. Of all the "Reformed" confessions of the continent the Heidelberg Catechism is to-day the most living and operative; a fact accounted for by the penetrating simplicity of its formulation.

4. **The Church of England.**—The *Thirty-Nine Articles* have become the great fundamental confession of the English Church; they were adopted by the united convocations in 1563 and confirmed by Queen Elizabeth. They became law by act of Parliament in 1571 in their final redaction, as somewhat altered about 1563. Since 1571 the English Church has made no changes in them. The first step towards them was the *Ten Articles* of Henry VIII. of 1536, the first still tentative expression of the English Reformation movement; these are in part verbally dependent upon the C. Augustana, but still more cautious and reserved, and they do not comprise a complete confession, but only touch the points of chief practical importance. Still nearer to the C. Augustana stand the *Thirteen Articles* of 1538, an outcome of conversations with theologians of the Electorate of Saxony, which indeed were never published, but have nevertheless great importance as the decisive foundation of what followed. When under King Edward VI. the Swiss and Genevan Reformation gained influence in England, the *Forty-Two Articles* were drawn up upon this foundation under the guidance of Cranmer and Ridley; these still stand close to the Wittenberg Reformation, but in their doctrine of the Sacraments, and, with some reserve, also in their doctrine of Predestination, have moved nearer to

that of Geneva. The government of catholic Queen Mary abolished the *Forty-Two Articles.* Under Elizabeth they were not simply restored, but worked over by Archbishop Parker together with Bishops Cox and Guest, in which process renewed Lutheran influences (especially the Confessio Wirtembergica of 1551, composed by Brenz) co-operated. Through this re-working arose the Thirty-Nine Articles.

There are two interpretations of the Thirty-Nine Articles, an older which expounds them in the sense of the theologians whose work they are, and a newer which understands them from the standpoint of the development of the Church of England towards a strictly catholic position. The older, as the more original and in fact historical, must be represented here. According to it the Thirty-Nine Articles are a true and exhaustive expression of the Reformation ideas of the 16th century. Judged according to the articles on Predestination and Sacraments, they belong with the Calvinist confessions, except that they are much milder in expression. In the other articles they reproduce excellently the common convictions of Lutherans and "Reformed" in close association with the language of the German Reformers. The doctrine of Justification is rendered in Lutheran phrasing. The opposition to the Roman Church is altogether more clearly and definitely expressed than in the C. Augustana. The peculiar spirit of the English Reformation betrays itself, apart from the references to the Books of Homilies, particularly clearly in article 37, which denies chief government in the Church to the Pope, and ascribes it to the King's Majesty of England.

CONTENTS. 1 Arts. 1–5 Universally recognized fundamental truths of the Christian religion; 2 Arts. 6–8 Standards of faith; 3 Arts. 9–18 Sin and Grace; 4 Arts. 19–36 Church and Sacraments; 5 Arts. 37–9 Civil order.

Owing to the completeness of the Thirty-Nine Articles the need for their expansion has not been pressing. In the puritan conflicts attempts were made to expand the Thirty-Nine Articles by stricter articles on Predestination (1595 and 1603–04); they fell through. In the confusion of the great English revolution the Thirty-Nine Articles were for the time put aside even in the Church of England in favour of the Westminster Confession. The Restoration restored them unchanged. Owing to the extension of the English Church overseas, especially in the 19th century, the Thirty-Nine Articles have become the confession of a worldwide community. Next to the C. Augustana, the Thirty-Nine Articles have the greatest number of adherents of all the Evangelical confessions of the 16th century. And this all the more as the Methodist communities have retained a considerable part of the Thirty-Nine Articles, at least in a redaction of Wesley's (omitting the article on the ancient creeds, that on Predestination, and others besides).

5. **The Remaining English-speaking Churches.**—The Scottish Reformation, which is independent of the English, produced two confessions of its own. (*a*) The *first Scottish confession* of 1560, composed by John Knox, confirmed in the same year by the Scottish Parliament (not by Queen Mary) and the General Assembly of the Scottish Church, the foundation of the new Reformation order of the Scottish Church, embracing 25 extensive articles; and (*b*) the so-called second Scottish confession, the *Covenant of 1581,* a brief ceremonial confession, to which King and people bound themselves by oath. Both are strongly Calvinist in character. But neither of these has become the permanent confession of the Scottish Church; instead it has been the *Westminster Confession* which was completed by the Westminster Assembly of the first English revolution of 1645–6 under strong Scottish influence, and presented to the English Parliament on April 29, 1647, and passed by it in March 1648. It became the confession of the Scottish Church, in the form in which it still exists, by act of the Scottish General Assembly on August 27, 1647; in 1690 it was finally confirmed for Scotland by Parliament. The two Catechisms which belong with the Westminster Confession were adopted by the Scottish General Assembly in 1648.

The Westminster Confession has an importance extending far beyond Scotland. The English and American Presbyterians received it as their confession, and it has become fundamental for the Congregationalist communities also, at all events with the modifications and the *Platform* which were agreed to by the Savoy Synod in 1658. Thereby the Westminster Confession was originally the Confession of the most influential of the American communities. To-day that is so no longer. For, first, the remaining American communities for which the Westminster Confession, even so far as they are Calvinist, possesses no official importance, have greater importance to-day than in North America's colonial period; and, secondly, Presbyterians and Congregationalists have to-day separated themselves from the old unchanged Westminster Confession. For the Presbyterians decisive for the most part are the decisions of 1903, which moderated the doctrine of Predestination and appended two new articles (34 Holy Ghost, 35 Missions). The Congregationalists have since 1883 procured a brief new confession. So one can speak of a constant influence, but only in a limited sense of an enduring validity, of the Westminster Confession in North America. This course of events is explained by the nature of the Westminster Confession. In itself a master-piece of theological precision and clarity and so far of great weight, it is yet, owing to its length, more closely interwoven with the theological work of the century of orthodoxy than any other modern confession, and it does not shrink from the deliberate accentuation of its conceptions, even to the wounding of natural feeling, if clarity makes this desirable.

Of the confessions of the other English and American communities nothing can here be said, owing to their bewildering variety.

6. **The Present Position.**—With the beginning of the Enlightenment, or of Deism, confessional formulation or transformation came everywhere to a standstill. As, however, theology did not stand still, but underwent great change as a result of scientific study and contact with the spiritual movements of the modern period, the question of the relation of the theology of a Church to the confession of that Church became acute; that, indeed, did not happen everywhere at the same time (North America was first seriously disturbed by it during the last generation or so), but no Church is any longer quite unaffected by it.

The 18th century produced three temporary solutions favourable to the Church. *I. Moderated Teaching.* This pre-supposes the distinction between fundamental and non-fundamental articles, but fixes the limits between them more boldly and freely than was possible in the 17th century. It presupposes further, that theology must retain certain of the fundamentals of the old confessions, especially the revelation of God in Christ. *II. The distinction between public and private teaching.* The official of the Church must conform to the confession of the Church in his official capacity, but as student and writer he is free to express his own convictions. This presupposes the "theory of accommodation," which regards the confessional form of doctrine as a pictorial expression of real truths suited to the naïve ideas of the people, and allows the use of this expression for the purposes of practical instruction, or even regards it as a duty. *III. The emphasis of the right and duty of private judgment concerning the content of Scripture.* All the Evangelical confessions emphasize that they intend to reproduce Scriptural truth and possess no authority of their own; the Christian must convince himself that the confession is Scriptural. This has been understood to mean that the confessions only claim to be binding so far as private judgment endorses them as Scriptural, and that they are certainly not so completely. The ecclesiastical admissibility of this theory is subject to the limitation that private judgment shall at least be in the position to perceive an agreement between Scripture and confession on the points vital for religion.

There were crises in the 18th century also; the severest was the Deistic crisis in England. Nevertheless with the help of one or more of these solutions peace in the Church was then painfully preserved. Theology sought the way of agreement. In the 19th century the solutions described were certainly further used in practice, especially the third. But the contrasting positions in theology and Church became so acute, owing to the revival of the religious life and the clearer definition of ecclesiastical groups, that confessional disputes led to serious crises. In this conflict there is everywhere the desire for a final and clear decision, but this desire does not always follow the same line. Four different endeavours can be distinguished. (1) The abolition of the confession is demanded. This endeavour has been successful, *e.g.*, in the Churches of Switzerland. (2) The revision and simplification of the confession is demanded. This was attempted in 1846 in the Church of the old Prussian union, but it did not succeed. The American Churches have in part adopted this course, as already mentioned. (3) The confession shall be left unaltered, but regarded as binding only according to its "idea and spirit," not according to its letter. The attempt is consequently made to express the spirit of Evangelical Christendom in the simplest and most inwardly convincing way possible, so that, for all the differences, fellowship of faith with the fathers of the confession may be apparent. This is the course that German theology, in many of its best representatives, has taken again and again. (4) The unaltered confession shall retain its unaltered and strict validity, *i.e.*, there shall be an unconditional renewal of the old Lutheran or "Reformed" orthodoxy. No Church is without a section which desires this.

The position therefore is not cleared up; so much only would seem to be clear, that most of the European Evangelical Churches retain their confessions in some form. Curiously enough events have shown that in the valuation of confessions much keener interest is shown in the ancient creeds than in those to which the Reformation gave rise, and this too in good Reformation circles. It is from this standpoint that the peculiar development of the confessional problem in England is most readily understood. In the English Church, since Newman's *Tract XC.* of 1841, a movement has won its way which, strongly attached to the Church, and holding closely to the ancient creeds, accepts also the Thirty-Nine Articles, but so interprets their sense that they allow a departure from the Reformation doctrine and a return to the ancient catholic position.

The movement for the reunion of the Christian Churches added in the 19th century a new motive for confessional formulation, and it has become powerful in the 20th. This movement commonly seeks to establish a new form, side by side with the creeds of the early Church, which expresses the common convictions of all Churches seeking brotherly feeling with one another. The confession of the evangelical alliance of 1846 was already a first attempt. The latest step in this direction is the message of the Churches to the world which was, not indeed accepted, but received at the Lausanne Conference in 1927.

(E. Hir.)

CREEK. This, the most important native people of Muskogi (*q.v.*) lineage, was resident in Georgia and Alabama. Comprising a series of local tribal leagues in the days of de Soto and other Spanish 16th century explorers, they had formed themselves by the 18th century into a confederacy of about 50 towns with a population approaching 20,000, divided into the Upper Creeks or Kusa and Lower or Kawita. This confederacy remained consistently hostile to the Spaniards and friendly with the English settlers. They fought against the Americans in the war of 1812–15, and were defeated by Andrew Jackson. Twenty-five years later they removed to Indian Territory, now Oklahoma, where they formed a semi-autonomous "nation," one of the "five civilized tribes." While still an independent confederacy, the Creek absorbed weakened or wasted Muskogian tribes, like the Hitchiti and the Alibamu-Koasati, as well as alien groups such as Yuchi and Natchez. They also held negro slaves, and as a people now contain considerable African and Caucasian blood, by adoption as well as by intermarriage. In 1904, 15,400 persons were officially recognized as Creeks. The Seminole (*q.v.*) are an off-shoot from the Creeks in the historic period.

See Swanton, *Bur. Am. Ethn.* Bull. 73, 1922. (A. L. K.)

CREEK, a small inlet on a low coast or in the lower reaches of a river at the mouth of a small tributary, also applied to a shallow narrow harbour for small vessels. In America and Australia especially there are many long shallow streams intermittent in flow and navigable only at their tidal estuaries, yet of great economic importance. They form complete river-systems, and are the only supply of surface water for considerable areas. Though sometimes a mere chain of "water-holes," occasionally they are strongly flooded. Explorers, advancing up such narrow inlets or "creeks," used the same word for the tributaries.

CREEPER, BROWN, the name given to the North American subspecies of the small brown forest bird known in Great Britain as the tree-creeper (*q.v.*). In the eastern states the form is *Certhia familiaris americana;* the Mexican creeper (*C. f. albescens*); the Rocky Mountain creeper (*C. f. montana*); the California creeper (*C. f. occidentalis*); the Sierra creeper (*C. f. zelotes*), are very similar in colour and habits.

CREEPING BARRAGE. A military term denoting the system (introduced in 1916) whereby infantry advance and the artillery fire are regulated by a time-table, the barrage, or curtain of shells, moving forward a stated number of yards every minute and the infantry following behind it. The limitation of the standing barrage was that the curtain of shells did not move with the troops; and whilst a *creeping barrage* made short bounds of 50 to 100 yards, a *jumping barrage* made longer ones, and was in fact no more than a series of short standing barrages. A *rolling barrage* only differed from a creeping in that the moving forward of the shell curtain was continuous from opening of fire onwards, no definite bounds of fire being made.

CREETOWN, a seaport and county district of Kirkcudbrightshire, Scotland. The village is near the head of Wigtown bay, 18 mi. W. of Castle-Douglas, and is served by railway to Stranraer and Dumfries. Pop. (1931) of district, 3,120; of village, 759. The village dates from 1785. There are important granite quarries in the vicinity, the stone for the Liverpool docks having been obtained from them. Sir Walter Scott laid part of the scene of *Guy Mannering* in this neighbourhood, and Dr. Thomas Brown, the renowned metaphysician (1778–1820), was a native of the parish (Kirkmabreck) in which the modern Creetown lies.

CREEVEY, THOMAS (1768–1838), English politician, son of William Creevey, a Liverpool merchant, was born in that city in March 1768. He went to Queen's college, Cambridge, and graduated as seventh wrangler in 1789. The same year he became a student at the Inner Temple, and was called to the bar in 1794. In 1802 he entered parliament through the duke of Norfolk's nomination as member for Thetford, and married a widow with six children, Mrs. Ord, who had a life interest in a comfortable income. Creevey was a Whig and a follower of Fox, and his active intellect and social qualities procured him a considerable intimacy with the leaders of this political circle. In 1806, when the brief "All the Talents" ministry was formed, he was given the office of secretary to the Board of Control; in 1830, when next his party came into power, Creevey, who had lost his seat in parliament, was appointed by Lord Grey treasurer of the ordnance; and subsequently Lord Melbourne made him treasurer of Greenwich hospital. After 1818, when his wife died, he had very slender means of his own. Creevey died in February 1838, and is remembered through the *Creevey Papers,* published in 1903 and again in 1905 under the editorship of Sir Herbert Maxwell, which, consisting partly of Creevey's own journals and partly of correspondence, give a lively and valuable picture of the political and social life of the late Georgian era, and are characterized by an almost Pepysian outspokenness. They are a useful addition and correction to the *Croker Papers,* written from a Tory point of view. For thirty-six years Creevey had kept a "copious diary," and had preserved a vast miscellaneous correspondence with such people as Lord Brougham, and his step-daughter, Elizabeth Ord, by keeping his letters to her, had assisted him in compiling material avowedly for a collection of Creevey Papers in the future. At his death it was found that he had left his mistress, with whom he had lived for four years, his sole executrix and legatee, and Greville notes in his *Memoirs* the anxiety of Brougham and others to get the papers into their hands and suppress them. Brougham may have succeeded in this, for the diary did not survive and the papers from which Sir Herbert Maxwell made his selection came into his hands from Mrs. Blackett Ord, whose husband was the grandson of Creevey's eldest step-daughter.

CREFELD or **KREFELD-URDINGEN,** a town of Germany, in the Prussian Rhine province, on the left side of and 3 mi. distant from the Rhine, 32 mi. N.W. from Cologne, and 15 mi. N.W. from Düsseldorf. Pop. (1939) 169,485. The town is one of the finest in the Rhine provinces, being well and regularly built. The inner section forms a large rectangle, enclosed by wide boulevards. This rare feature is due to the fact that Crefeld was always an "open place," and therefore the circular form of a fortress town did not develop.

Crefeld is first mentioned in records of the 12th century. It received market rights in 1361 and the status of a town in 1373. It belonged to the counts of Mörs, and was annexed to Prussia, with the countship, in 1702. It remained of little importance until the 17th century, when religious persecution drove to it a number of Calvinists and Separatists from Jülich and Berg who introduced the manufacture of linen. Immigration further increased in the 18th century, when the silk industry was introduced from Holland and the town rapidly developed. The French occupation in 1795 interfered for a time with the prosperity of its new trade which, however, grew in importance during the 19th century. The town is famous for its technical schools which give instruction in textile manufactures. The Friedenskirche is Gothic in style. The town possesses a town hall and a museum.

Among the public monuments there is one to Karl Wilhelm, the composer of *Die Wacht am Rhein.*

Crefeld specializes in silk and velvet manufactures. A special feature is the manufacture of silk for coverings for umbrellas. The other industries of the town, notably dyeing, stuff-printing and stamping, are very considerable, and there are also engineering and machine shops, chemical, soap and other factories. It is an important railway centre and was therefore bombed by the British R.A.F. many times and very heavily during World War II.

CREIGHTON, MANDELL (1843–1901), English historian and bishop of London, was born at Carlisle on July 5 1843. He was educated at Durham grammar school and at Merton College, Oxford, where in 1866 he became tutor and fellow. He was ordained priest in 1873; and during 1872 he had married Louise von Glehn, herself a writer of several text books of history. In 1875 he became vicar of Embleton, Northumberland, with an ancient and beautiful church and a fortified parsonage house, and within reach of the fine library in Bamburgh Keep. Here he planned and wrote the first two volumes of his chief historical work, the *History of the Papacy;* and in 1884 he was appointed to the newly-founded Dixie professorship of ecclesiastical history at Cambridge, where he went into residence early in 1885. At Cambridge his influence at once made itself felt, especially in the reorganization of the historical school. In 1886 he combined with other leading historians to found the *English Historical Review,* of which he was editor for five years. Meanwhile the vacations were spent at Worcester, where he had been nominated a canon residentiary in 1885. In 1891 he was made canon of Windsor; but he never went into residence, being appointed in the same year to the see of Peterborough. He became the first president of the Church Historical Society (1894), and continued in that office till his death.

In 1897, on the translation of Dr. Temple to Canterbury, Bishop Creighton was transferred to London. During Dr. Temple's episcopate ritual irregularities of all kinds had grown up, which left a very difficult task to his successor. His studied fairness did not satisfy partisans on either side; and his efforts towards conciliation laid him open to much misunderstanding. He strained every nerve to induce his clergy to accept his ruling on the questions of the reservation of the Sacrament and of the ceremonial use of incense in accordance with the archbishop's judgment in the Lincoln case; but when, during his last illness, a prosecutor brought proceedings against the clergy of five recalcitrant churches, the bishop, on the advice of his archdeacons, interposed his veto. In accordance with a vote of the diocesan conference, the bishop arranged the "Round Table Conference" between representative members of various parties, held at Fulham in October 1900, on "the doctrine of the Holy Eucharist and its expression in ritual," and a report of its proceedings was published with a preface written by him. As he was a historian before he became a bishop, so it was his historical sense which determined his general attitude as a bishop. It was this, together with a certain native taste for ecclesiastical pomp, which made him—while condemning the unhistorical extravagances of the ultra-ritualists—himself a ritualist. He was the first bishop of London, since the Reformation, to "pontificate" in a mitre as well as the cope, and though no man could have been less essentially "sacerdotal" he was always careful of correct ceremonial usage. He died on Jan. 14 1901, and was buried in St. Paul's Cathedral.

Bishop Creighton's principal published works are: *History of the Papacy during the Period of the Reformation* (5 vols., 1882–97, new ed.); *History of the Papacy from the Great Schism to the Sack of Rome* (6 vols. 1897); *The Early Renaissance in England* (1895); *Cardinal Wolsey* (1895); *Life of Simon de Montfort* (1876, new ed. 1895); *Queen Elizabeth* (1896). He also edited the series of *Epochs of English History,* for which he wrote "The Age of Elizabeth" (13th ed., 1897); *Historical Lectures and Addresses by Mandell Creighton, etc.,* edited by Mrs. Creighton, were published in 1903.

See *Life and Letters of Mandell Creighton, etc.,* by his wife (2 vols., 1904); and the article "Creighton and Stubbs" in *Church Quarterly Review* for Oct. 1905.

CREIL, a town of northern France, in the department of Oise, 32 mi. N. of Paris on the Northern railway, on which it is an important junction. Pop. (1936) 10,493. The church (12th to 15th centuries) is in the Gothic style. There are some traces of a castle in which Charles VI. resided during the period of his madness. The manufacture of machinery, heavy iron goods and nails, and copper and iron founding, are important industries, and the Northern railway has workshops there. The town was bombarded in 1918.

CRELL or **KRELL, NICHOLAS** (*c.* 1551–1601), chancellor of the elector of Saxony, was born in Leipzig and educated at the university of his native town. About 1580 he entered the service of Christian, the eldest son of Augustus I., elector of Saxony, and when Christian succeeded his father as elector in 1586 became his most influential counsellor. Crell's religious views were Calvinistic or Crypto-Calvinistic, and both before and after his appointment as chancellor in 1589 he sought to substitute his own form of faith for the Lutheranism which was the accepted religion of electoral Saxony. In foreign politics, also, he sought to change the traditional policy of Saxony. These proceedings made the chancellor very unpopular, and when the elector died in October 1591 he was deprived of his offices and thrown into prison by order of Frederick William, duke of Saxe-Altenburg, the regent for the young elector Christian II. His trial dragged on for ten years until he was sentenced to death and executed at Dresden on Oct. 9, 1601.

See A. V. Richard, *Der kurfürstliche sächsische Kanzler Dr. Nicholas Krell* (Dresden, 2 vols., 1859); F. Brandes, *Der Kanzler Krell, ein Opfer des Orthodoxismus* (Leipzig, 1873); B. Bohnenstädt, *Das Prozessverfahren gegen den kursächsischen Kanzler Dr. Nikolaus Krell* (Halle, 1901).

CRELLE, AUGUST LEOPOLD (1780–1855), German mathematician, was born at Eichwerder, Wriezen, on March 17, 1780. Crelle was a man of many interests and great organizing ability, and worked for the advancement of the exact sciences.

By profession he was an "Oberbaurat" (civil engineer), and built the first railroad in Germany, but was interested in educational matters, and in 1828 he left the technical institute in which he was employed to take up service with the ministry of ecclesiastical affairs and public education. He was the author of many mathematical papers, mostly unimportant; his great service to mathematics was the founding of the *Journal für die reine und ungewandte Mathematik,* now known as *Crelle's Journal.* Abel and Steiner encouraged Crelle in this venture, and were the chief contributors to the first numbers; Jacobi was another early contributor. Without Crelle's generous encouragement, some of Abel's greatest work might never have been completed and published. In 1829 Crelle started the *Journal für Baukunst.* The Berlin-Potsdam railway was built in 1838–40 according to his plans. Crelle died on Oct. 6, 1855, at Berlin.

CREMA, a town and episcopal see of Lombardy, Italy, province of Cremona, 26 mi. N.E. by rail from the town of Cremona. Pop. (1936) 13,541 (town); 25,163 (commune). It is on the bank of the Serio, 240 ft. above sea level, in the centre of a rich agricultural district. The cathedral has a fine Lombard Gothic façade of the second half of the 14th century, and a campanile; the rest of the church has been restored in Baroque. The clock tower opposite dates from the period of Venetian dominion. Crema was the chief place of the territory of Isola Fulcheria in the 10th century. In the 12th, Cremona attacked it and Milan sided with it; Barbarossa sacked it in 1160, but it was rebuilt in 1185; it fell under the Visconti in 1338, joined the Lombard republic in 1447, and was taken by Venice in 1449, remaining under that Power till 1797, save for the period 1509–29.

CREMATION, the burning of human corpses. This method of disposal of the dead was the general practice of the ancient world, with the important exceptions of Egypt, where bodies were embalmed, Judaea, where they were buried in sepulchres, and China, where they were buried in the earth. Cremation is still practised over a great part of Asia and America, but not always in the same form. Thus, the ashes may be stored in urns, or buried in the earth, or thrown to the wind, or (as among the Digger Indians) smeared with gum on the heads of the mourners.

There can be little doubt that the practice of cremation in modern Europe was at first stopped, and has since been prevented in great measure, by the Christian doctrine of the resurrection of the body; partly also by the notion that the Christian's body was redeemed and purified. It is, however, in the ultimate resort, really a sanitary one. The objectionable results of pit-burial and burial in churches and churchyards, made cemeteries necessary. But cemeteries are equally liable to overcrowding, and are often nearer to inhabited houses than the old churchyards.

In 1874, a congress called to consider the matter at Milan resolved to petition the Chamber of Deputies for a clause in the new sanitary code, permitting cremation under the supervision of the syndics of the commune. It was Sir Henry Thompson, however, who first brought the question prominently before the English public. Thompson's problem was—"Given a dead body, to resolve it into carbonic acid, water and ammonia, rapidly, safely and not unpleasantly." In a reverberating furnace used by him a body, weighing 144lb., was reduced in 50 minutes to about 4lb. of lime dust. The noxious gases, which were undoubtedly produced during the first five minutes of combustion, passed through a flue into a second furnace and were entirely consumed. In the ordinary Siemens regenerative furnace (which was adapted by Reclam in Germany for cremation, and also by Sir Henry Thompson) only the hot-blast was used, the body supplying hydrogen and carbon; or a stream of heated hydrocarbon mixed with heated air was sent from a gasometer supplied with coal, charcoal, peat or wood—the brick or iron-cased chamber being thus heated to a high degree before cremation begins.

Steps were at once taken (1874) to form an English society to promote the practice of cremation. On account of difficulties and prejudices the council of the society was unable to purchase a freehold until 1878, when an acre was obtained at Woking, not far distant from the cemetery. The next important development was an application to the council in 1882 to undertake the cremation of two deceased persons who had left express instructions to that effect. The Home Secretary was applied to, and refused. In 1883 a cremation was performed in Wales by a man on the body of his child, and legal proceedings were taken against him. Mr. Justice Stephen, in Feb. 1884, delivered his well-known judgment at the assizes there, declaring cremation to be a legal procedure, provided no nuisance were caused thereby to others. The council of the society at once publicly offered to perform cremation, laying down strict rules for careful enquiry into the cause of death in every case. They stated that they were fully aware that the chief practical objection to cremation was that it removed traces of poison or violence which might have caused death and adopted a system of very stringent enquiry. At present two death certificates signed by independent medical practitioners are required in England before cremation can be carried out.

On March 26, 1885, the first cremation at Woking took place, the subject being a lady. In 1888 it became necessary, nearly 100 bodies having been by this date cremated, to build a large hall for religious service, as well as waiting-rooms, in connection with the crematorium there. The number of cremations slowly increased year by year, and the total at the end of 1900 was 1,824. Many were persons of distinction.

The Cremation act 1902 (2 ed. VII. ch. 8) and the regulations made thereunder by the Home Secretary have laid down a code of laws applicable and binding where cremation is resorted to.

Undoubtedly in populous communities and in crowded districts the burial of dead bodies may be dangerous to the living, particularly in the case of deaths from contagious disease. In a report by Edwin Chadwick (London, 1843) the existence of such a danger was strikingly demonstrated, and intramural interments were in consequence made illegal. All decaying animal remains emit gases which, ultimately, become converted into vegetable growth of some kind—trees, crops, garden produce, grass, etc. It may be taken as certain that the gaseous products arising from a cremated body—amounting, although invisible, to no less than 97% of its weight, 3% only remaining as solids, in the form of a pure white ash—become in the course of a few hours integral and active elements in some form of vegetable life. The result of this reasoning has been that, by slow degrees, crematoria have been constructed at many of the populous cities in Great Britain and abroad (see *Statistics* below).

The subject of employing cremation for the bodies of those who die of contagious disease is important. Such diseases include small-pox, scarlet fever, diphtheria, tuberculosis, enteric, relapsing and puerperal fevers, the annual number of deaths from which in the United Kingdom in 1926 was upwards of 94,000. In cremation complete disinfection takes place by means of the high temperature to which the body is exposed. At the present day it is compulsory to report any case in the foregoing list of diseases to the local medical officer of health; and it is customary to disinfect the rooms, clothes and furniture used by the patient; but in case of death, the body, which is the source and origin of the evil, and loaded with infectious germs, is left with all the danger attached to its preservation in that condition, when buried in a fit or unfit soil or situation.

The process of preparing a body for cremation requires a brief notice. The plan generally adopted is to place it (in the usual shroud) in a light pine shell, discarding all heavy oak or other coffin, and to introduce it into the furnace in that manner. Thus there is no handling or exposure of the body after it reaches the crematorium. The type of furnace in general use is on the reverberatory principle, the body being consumed in a separate chamber heated to over 2,000° by a coke fire. In a few instances a furnace burning ordinary illuminating gas is used.

Statistics.—The following statistics show the history of modern cremation and its progress at home and abroad. In 1906 in the United Kingdom there were 13 crematoria and 739 cremations took place; in Italy the figures were 28 and 440; Germany, 14 and 2,507; Denmark, 1 and 77; Sweden 2 and 70; Switzerland 4 and 524; France, 4 and 6,906 (including stillbirths); in Tokyo (Japan) alone there are no fewer than 22 crematoria and the numbers of cremations and burials in earth are about equal. In the United States crematoria have been established in more than fifty cities, and about 10,000 cremations take place each year. The movement in favour of cremation is undoubtedly gaining strength. In 1926, in the United Kingdom there were 16 crematoria and 2,877 cremations took place; in Italy the figures were 36 and 18,020; Germany 77 and 40,066; Switzerland, 18 and 3,788; France 5 and 4,600; United States 87 and 17,000; Denmark, 3 and 1,223.

CREMATION CERTIFICATE, in the United States, a certificate, signed by duly authorized persons, such as trustee, committee, etc., stating that they have witnessed the total destruction by fire of the papers or securities therein named. It is customary to burn retired securities and to retain a cremation certificate as evidence of the destruction.

CRÉMAZIE, OCTAVE (1827–1879), Canadian poet, was born at Quebec on April 16, 1827, and educated at the Seminary of Quebec. An extraordinarily learned man, he started a bookshop with his two brothers, Jacques and Joseph, which became the centre of a literary circle including Etienne Parent, F. Garneau, Louis Fréchette among others. This club published a magazine, *Les Soirées Canadiennes,* with the object of perpetuating the old folklore of French Canada before it could be forgotten. Crémazie also published poems in the *Journal de Quebec* from about 1854 onwards. Unfortunately he became involved in business difficulties, and to escape their consequences, he departed in 1862 for France, where he spent the rest of his life in great poverty, under the assumed name of Jules Fontaines. During this time he wrote the gloomy poem, *Promenade des trois morts,* and a journal *Siège de Paris,* describing the siege of 1870, which he witnessed. His poetry was characterized by a patriotic love of Canada and Canadian nature, shown especially in the *Chant du vieux soldat canadien.*

His *Oeuvres Complètes* have been collected, with an introduction by H. R. Casgrain (Montreal, 1883).

CRÊME DE MENTHE, a peppermint liqueur, usually of a beautiful dark green colour. By a series of distillations the essence of the mint, the scent of it, is separated from oils and impurities. That essence is used in the making of crême de menthe. In former days the French manufacturers came regularly to England to buy their supplies of mint, plantations of which flourished at Mitcham, in Surrey. They regarded it as the finest mint procurable. Some makers use plain natural spirit in the making of the liqueur; but the best manufacturers use good Cognac brandy. The best of these liqueurs are exported from France with an age certificate of not less than five years. The colouring should be, and in the best makes always is, pure vegetable matter. (J. V. M.)

CREMER, JAKOBUS JAN (1827–1880), Dutch novelist, born at Arnhem, started life as a painter. His first tales (*Betuwsche Novellen* and *Overbetuwsche Novellen*), published about 1855—reprinted many times since, and translated into German and French—made his reputation. These short stories of Dutch provincial life are written in the quaint dialect of the Betuwe, the large flat Gelderland island, formed by the Rhine, the name recalling the presumed earliest inhabitants, the Batavi. In his later novels Cremer abandons both the dialect and the slight love-stories of the Betuwe. The principal are: *Anna Rooze* (1867), *Dokter Helmond en zijn Vrouw* (1870), *Hanna de Freule* (1873), *Daniel Sils,* etc. Cremer's *Romantische Werke* were collected in 1887–88 (Leiden, 12 vols.).

CREMER, SIR WILLIAM RANDAL (1838–1908), English pacifist, was born at Fareham, Wilts., on March 18, 1838, and at 12 years of age went to work in a shipyard. He was then apprenticed as a carpenter, and was one of the founders of the Amalgamated Society of Carpenters and Joiners (1860). He was secretary of the British section of the First International (*see* INTERNATIONAL), but resigned owing to dissensions with Robert Applegarth and because the pacifist programme which he advocated was turned down at the Geneva Conference of 1866. Cremer's first piece of definitely pacifist work was done in 1870–71 when he formed a working men's committee for the advocacy of neutrality in the Franco-German War. This committee developed, after this emergency was past, into the Workmen's Peace Association, of which Cremer was secretary until his death, in London, on July 22, 1908. He was M.P. for Haggerston, London, from 1885 to 1895, and from 1900 to 1908. He was secretary of the Interparliamentary Union from 1889 onwards. Cremer received the Nobel Peace Prize in 1903. Of the £8,000 awarded he gave £7,000 in trust to the International Arbitration League.

See Howard Evans, *Sir Randal Cremer* (1911).

CREMERA, a small stream in Etruria (mod. *Fosso della Valchetta*), which falls into the Tiber about 6m. N. of Rome. The identification with the Fosso della Valchetta is assured by Livy's statement that the Saxa Rubra were not far off, and this we know to be the Roman name of the post station of Prima Porta, 9m. from Rome on the Via Flaminia. It is famous for the defeat of the three hundred Fabii, who had established a fortified post on its banks. (*See* FIDENAE.)

CRÉMIEUX, ISAAC MOÏSE ("ADOLPHE") (1796–1880), French lawyer and politician, was born of Jewish parents at Nîmes on April 30, 1796, and died in Paris on Feb. 10, 1880. After practising at the bar of his native city, he went to Paris in 1830, and from that time played a considerable part in politics. He was minister of justice in the provisional revolutionary government of 1848 and in that of 1870–71. As minister of justice in 1870–71 he secured the franchise for the Jews in Algeria by a decree known as the *Décret Crémieux.* Crémieux was president of the Universal Israelite Alliance. He published a *Recueil* of his political cases (1869).

CREMONA, LUIGI (1830–1903), Italian mathematician, was born at Pavia, and fought as a volunteer in the abortive north Italian rising of 1848–49. After studying under Francesco Brioschi at the University of Pavia he became elementary mathematical master at the gymnasium and lyceum of Cremona, and afterwards at Milan. In 1860 he became professor of higher geometry at Bologna, and in 1866 professor of higher geometry and graphical statics at the higher technical college of Milan. In 1873 he became professor of higher mathematics at Rome, and organized the college of engineering. Cremona's reputation was now European. In 1879 he became a corresponding member of the British Royal Society, and a senator of the kingdom of Italy. His life was devoted to the reform of higher mathematical teaching in Italy. Cremona was a prolific contributor to mathematical journals of Italy and Europe, and some of his books have been translated into English; *e.g.,* his manual on *Graphical Statics* and his *Elements of Projective Geometry* (tr. C. Leudesdorf). His reputation mainly rests on his *Introduzione ad una teoria geometrica delle curve piane,* which proclaims him a follower of the Steinerian or synthetical school of geometricians.

CREMONA, a city and episcopal see of Lombardy, Italy, the capital of the province of Cremona, situated on the north bank of the Po, 155ft. above sea-level, 60m. by rail S.E. of Milan. Pop. (1936) 54,564 (town); 64,019 (commune). It is oval in shape, and retains its mediaeval fortifications. The line of the streets is as a rule irregular.

The finest building is the cathedral, in the Lombard Romanesque style, begun in 1107 and consecrated in 1190. The wheel window of the main façade dates from 1273. The transepts, added in the 13th and 14th centuries (before 1370), have picturesque brick façades, with fine terra-cotta ornamentation. The great Torrazzo, a tower 397ft. high (the highest in Italy) which stands by the cathedral, and is connected with it by a series of galleries, dates from 1267–1291. It is square below, with an octagonal summit of a slightly later period. The main façade of the cathedral was largely altered in 1491–1501. The interior is fine, and is covered with frescoes by Cremonese masters of the 16th century

(Boccaccio Boccaccino, Romanino, Pordenone, the Campi, etc.). The choir has fine stalls of 1490. Adjacent to the cathedral is the octagonal baptistery of 1167, 92ft. in height and 75ft. in external diameter, also in the Lombard Romanesque style. The so-called Campo Santo, close to the baptistery, contains a 12th century mosaic pavement with emblematic figures. Of the other churches, S. Michele has a simple and good Lombard Romanesque 13th-century façade, and a plain interior of the 10th century; and S. Agata a good campanile in the former style. Many of them contain paintings by the later Cremonese masters, especially Galeazzo Campi (d. 1536) and his sons Giulio and Antonio. The latter are especially well represented in S. Sigismondo, 1½m. outside the town to the east. On the side of the Piazza del Comune opposite to the cathedral are two 13th century Gothic palaces in brick, the Palazzo Comunale and the former Palazzo dei Giureconsulti. In the Piazza is a statue of the composer Amilcare Ponchielli. The Palazzo Fodri, now the Monte di Pietà, has a beautiful 15th century frieze of terra-cotta bas-reliefs, as have some other palaces in private hands.

Cremona was founded by the Romans in 218 B.C. (the same year as Placentia) as an outpost against the Gallic tribes. It soon became one of the most flourishing towns of upper Italy. It remained prosperous (we may note that Virgil came here to school from Mantua) until it was taken and destroyed by the troops of Vespasian after the second battle of Betriacum in A.D. 69; the temple of Mefitis alone being left standing. One of the bronze plates which decorated the exterior of the war-chest of the *legio III. Macedonica,* one of the legions which had been defeated at Betriacum, has been found near Cremona. Vespasian ordered its immediate reconstruction, but it never recovered its former prosperity, though its position on the north bank of the Po, at the meeting point of roads from Placentia, Mantua (the Via Postumia in both cases), Brixellum (where the roads from Cremona and Mantua to Parma met and crossed the river), Laus Pompeia and Brixia, still gave it considerable importance. It was destroyed once more by the Lombards under Agilulf in A.D. 603, and rebuilt in 615, and was ruled by dukes; but in the 9th century the bishops of Cremona began to acquire considerable temporal power. The commune of Cremona is first mentioned in a document of 1098, recording its investiture by the countess Matilda with the territory known as Isola Fulcheria. In the war of the Lombard League against Barbarossa, Cremona, after having shared in the destruction of Crema, in 1160 and Milan in 1162, finally joined the League, but took no part in the battle of Legnano, and thus procured itself the odium of both sides. In the Guelph and Ghibelline struggles Cremona took the latter side, and defeated Parma decisively in 1250. It was during this period that Cremona erected its finest buildings. There was, however, a Guelph reaction in 1264; the city was taken and sacked by Henry VII. in 1311, and was a prey to struggles between the two parties, until Galeazzo Visconti took possession of it in 1322: it then rebelled, and surrendered to Azzone in 1334. In 1406 it fell under the sway of Cabrino Fondulo, who received with great festivities both the emperor Sigismund and Pope John XXIII., the latter on his way to the council at Constance; he, however, handed it over to Filippo Maria Visconti in 1419. In 1499 it was occupied by Venetians, but in 1512 it came under Massimiliano Sforza. In 1525 it fell under Spanish domination, and was compelled to furnish large money contributions. The population fell to 10,000 in 1668. The surprise of the French garrison on February 2, 1702, by the Imperialists under Prince Eugene, was a celebrated incident of the War of the Spanish Succession. The Imperialists were driven from Cremona after a sharp struggle, but captured Marshal Villeroi, the French commander. Hence the celebrated verse:

> Français, rendons grâce à Bellone;
> Notre bonheur est sans égal;
> Nous avons conservé Cremone,
> Et perdu notre général.

In the 18th century the prosperity of Cremona revived. In the Italian republic it was the capital of the department of the upper Po. Like the rest of Lombardy it fell under Austria in 1814, and became Italian in 1859.

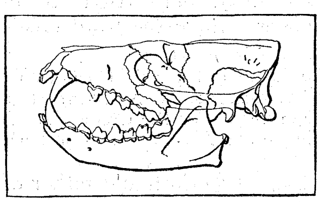
CREMORNE GARDENS, formerly a popular resort by the Thames in Chelsea, London, England. The earl of Huntingdon (*c.* 1750), built a mansion here, which passed into the hands of Thomas Dawson, Baron Dartrey and Viscount Cremorne (1725–1813), who greatly beautified it. It was sold and converted into a place of entertainment, being popular as such from 1845 to 1877. It was later closed down and the site of the gardens was built over. The name survives in Cremorne Road.

CRENELLE, a term specifically designating an embrasure of a battlement, but also commonly applied to the whole system of defence by battlements. In mediaeval times no one could "crenellate" a building without special licence from his supreme lord.

CREODONTA. An extinct suborder of primitive Carnivora characteristic of the older Tertiary. The creodonts were the flesh-eating animals of the northern continents during the Eocene, and included a number of families of diverse or partly parallel specialization, from one of which, the Miacidae, were descended the various families of modern Carnivora. They are distinguished by certain primitive characters, the small brain, separate scaphoid and lunar bones of the carpus, and lack of ossification of the tympanic bulla. Except in the family Miacidae they lack the specialization of $\frac{p^4}{m1}$ as "carnassials" characteristic of the fissiped Carnivora; but another pair of teeth may be enlarged and specialized instead ($m\frac{1}{2}$ in Oxyaenidae, $m\frac{2}{3}$ in Hyaenodontidae). They are distinguished from Insectivora and associated with the modern Carnivora by the enlargement of the canines into powerful laniary teeth, reduction of incisors, the more sectorial characters of the cheek teeth, heavier muzzle and jaws with strong zygomatic arches, also by a number of other characters: in the feet (astragalar trochlea narrower with inner keel imperfect, astragalar foramen present, phalanges more elongate and curved, etc.).

The earliest Creodonta are the *Arctocyonidae* of the Paleocene, with primitive tritubercular teeth, the molars subequal, none of them enlarged as carnassials. These gave rise to a number of different specialized families of creodonts during the Eocene. The *Arctocyoninae* had flattened bearlike teeth and were plantigrade, with sharp compressed claws like the bears.

The Miacidae include a considerable variety of small or medium-sized creodonts with more or less tuberculo-sectorial molars, the first molar the largest of the three and progressively specialized along with the fourth premolar of the upper jaw into enlarged shearing teeth or carnassials. The teeth behind the carnassial are in some genera (*Vulpavus, Oödectes*) of similar shearing type but smaller size; in other genera they are flattened crushing teeth, two in number (*Didymictis, Viverravus*), or three (*Miacis, Uintacyon, Vassacyon*). In the Upper Eocene the Miacidae gave rise to the fissiped carnivores of modern type and they could be classified in the suborder Fissipeda just as well as among the generally more primitive Creodonta.



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

SKULL OF HYAENODON, A CREODONT OF EARLY TERTIARY AGE, WHICH IN SIZE AND STRUCTURE WAS SOMEWHAT SIMILAR TO THE WOLF

The Oxyaenidae included larger predacious types, *Oxyaena* resembling a wolverine, *Patriofelis* reaching the size of a bear with massive hyenalike teeth, *Palaeonictis* of more feline characters, the smaller *Limnocyon,* analogous in teeth, proportions and probable habits, to modern weasels and martens.

The Hyaenodontidae include many and various types in North America, Europe, Asia and Africa. In the earliest forms, *Sinopa, Proviverra, Tritemnodon,* of the Lower and Middle Eocene, the teeth are tuberculo-sectorial, the molars not very different in size, and the skull is long and slender, the proportions of body and limbs like those of the modern viverrids (civet family) except for the very long and heavy tail. In *Pterodon* and *Hyaenodon* of the Upper Eocene and Oligocene, the teeth are more completely sectorial, the size larger and proportions of skull and limbs are more like those of wolves. Widespread in the Upper Eocene and Oligocene, late survivors occur in the Indian Pliocene.

The most peculiarly specialized group of the creodonts is the Mesonychidae, distinguished by the loss of any shearing action of the teeth, the cusps becoming high, round, blunt-tipped, adapted probably for crushing and piercing some hard, shelly food. The muzzle and jaws are elongate, the limbs and feet in some species slender and cursorial as in the wolf, while others attain large size and massive proportions comparing with the larger bears. The toes are tipped with flattened hoofs instead of claws. These are found in the Eocene of western North America, western Europe and central Asia. Several of them equalled or exceeded the largest living Carnivora in size of skull, and in the Upper Eocene of Mongolia the gigantic *Andrewsarchus* has a skull three feet long, the largest known carnivore, even allowing for the probability that the skull was relatively large in proportion to the skeleton. (W. D. M.; X.)

CREOLE, a word used originally (16th century) to denote persons born in the West Indies of Spanish parents, as distinguished from immigrants direct from Spain, aboriginals, negroes or mulattos (from the Fr. form of *criollo,* a West-Indian corruption of Span. *criadillo,* cognate with Lat. *creare,* to create). It is now used of the descendants of non-aboriginal races born and settled in the West Indies, in various parts of the American mainland and in Mauritius, Réunion and some other places colonized by Spain, Portugal, France, or (in the case of the West Indies) by England. In a similar sense the name is used of animals and plants. The use of the word by some writers as necessarily implying a person of mixed blood is totally erroneous; in itself "creole" has no distinction of colour; a creole may be a person of European, negro or mixed extraction—or even a horse.

Local variations occur in the use of the word as applied to people. In the West Indies it designates the descendants of any European race; in the United States the French-speaking native portion of the white race in Louisiana, whether of French or Spanish origin. The French Canadians are never termed creoles, nor is the word now used of the South Americans of Spanish or Portuguese descent, but in Mexico whites of pure Spanish extraction are still called creoles. In all the countries named, when a non-white creole is indicated the word negro is added. In Mauritius, Réunion, etc., on the other hand, creole is commonly used to designate the black population, but is also occasionally used of the inhabitants of European descent. The difference in type between the white creoles and the European races from whom they have sprung, a difference often considerable, is due principally to changed environment—especially to the tropical or semi-tropical climate of the lands they inhabit. The many patois founded on French and Spanish, and used chiefly by creole negroes, are spoken of as creole languages, a term extended by some writers to include similar dialects spoken in countries where the word creole is rarely used.

See G. W. Cable, *The Creoles of Louisiana* (1884); A. Coelho, "Os Dialetos romanicos on neo latinos na Africa, Asia e America," *Bol. Soc. Geo. Lisboa* (1884–86), with bibliography. For the Creole French of Haiti *see* an article by Sir H. H. Johnston in *The Times* (London), April 10, 1909.

CREON (1) son of Lycaethus, king of Corinth and father of Glauce or Creüsa, the second wife of Jason (*q.v.*).

(2) *See* OEDIPUS.

CREOPHYLUS of Samos, one of the earliest Greek epic poets. According to an epigram of Callimachus (quoted in Strabo xiv. p. 638) he was the author of a poem called *The Capture of Oechalia.* He was said to have been a friend of Homer, who, according to another tradition, was himself the author of the *Capture,* and presented it to Creophylus.

See F. G. Welcker, *Der epische Cyclus* (1865–82).

CREOSOTE or **KREOSOTE.** In 1832 Reichenbach applied the term "kreosote" to a substance possessing powerful antiseptic properties and derived from wood tar. Shortly afterwards, Runge discovered carbolic acid in coal tar and showed that it possessed many of the characteristics of "kreosote." The isolation of similar products from various sources, however, has led to the adoption of the term "creosote" as signifying the mixture of phenol and phenoloid substances derived indifferently from coal, wood, blast furnace, and other tars and from shale and bone oils. In pharmaceutical circles, however, the term "creosote" is still restricted to the product isolated from wood tar, but in industry it is loosely applied to designate that fraction of oils distilling at 200°–300° C. and derived from coal tar. Owing to their distinctive character, the creosotes from wood tar and from blast-furnace tar are known as "wood-tar creosote" and "blast-furnace creosote."

Wood-tar Creosote.—By the distillation of wood tar, particularly of that derived from the carbonization of beechwood, a fraction heavier than water is obtained, from which, after redistillation to remove last traces of acetic acid, a complex mixture of phenolic substances can be isolated by a treatment similar to that described for the extraction of phenol from coal tar. (*See* CARBOLIC ACID or PHENOL.)

Wood-tar creosote, a colourless, transparent, highly refractive oil of specific gravity 1·037 to 1·087 distils between 205° and 225°C and burns with a very smoky flame. It dissolves in 200 parts of water. A powerful antiseptic, it is non-poisonous and much less caustic than carbolic acid. It dissolves sulphur, resins and phosphorus. It is composed of monohydric phenols and the methyl ethers of di- and tri-hydric phenols. Phenol, the cresols and xylenols occur in small quantities, but the major constituents are guaiacol and methylguaiacol. Small amounts of dimethylpyrogallol, the dimethyl ether of methylpyrogallol and other ethers are also present. Propylguaiacol, or coerulignol, is often present in the crude product. This substance possesses such astringent properties that a single drop placed on the tongue causes bleeding. Purified creosote, especially for medicinal purposes, should be free from this compound which may be detected by the blue coloration produced by barium hydroxide. The proportions in which these constituents occur vary with the conditions under which the wood is carbonized. (*See* TARS, LOW TEMPERATURE.).

The distinctive properties of wood-tar creosote are due to the guaiacols. It is insoluble in absolute glycerol and is thus sharply distinguished from coal-tar acids which are completely soluble. It dissolves completely in an ethereal solution of collodion, whereas carbolic acid gives an immediate precipitate.

Purified wood-tar creosote is extensively used for pharmaceutical purposes. Beechwood creosote alone should be used in medicine, as its composition renders it much more valuable than other creosotes. Its constituents circulate unchanged in the blood and are excreted by the lungs. Carbolic acid has no value in the treatment of phthisis (pulmonary tuberculosis) or any other bacterial affection of the lungs; but creosote, being powerfully antiseptic and non-poisonous, is very valuable in this direction. It is administered either suspended in mucilage or in capsules. Like carbolic acid, wood-tar creosote, owing to its local antiseptic and anaesthetic action, is often useful in relieving gastric pain due to ulcer or cancer and in afflictions due to gastric irritation. When inhaled it brings considerable relief to sufferers from bronchitis, bronchopneumonia, lobar pneumonia and other bacterial lung diseases.

In many applications creosote has been replaced by creosotal (creosote carbonate), a mixture of the carbonates of the phenols present in creosote and prepared by the action of phosgene gas on a solution of beechwood creosote in caustic soda solution. It is a viscous, yellow liquid, insoluble in water but soluble in organic solvents. It is odourless, tasteless and non-irritant in its action on mucous membrane and is therefore used in bronchial affections, phthisis and pneumonia, particularly in children. Other salts of creosote used in medicine are the phosphate (phosphote), phosphite (phosphotal) and valerianate (eosote).

Wood-tar creosote is also used as a source of pure guaiacol, the residue being used as a preservative for wood.

Coal-tar Creosote consists mainly of a mixture of liquid hydrocarbon oils with naphthalene obtained in the distillation of coal tar. The content of naphthalene varies, in some cases being so small that the oils are able to hold it all in solution, whilst in others it is so high that the oils are solid at ordinary temperatures. Phenolic compounds (tar acids), to which the fraction owes its disinfectant and preservative qualities, are present to the extent of 8 to 10%; but a creosote much richer in phenols can be obtained by a partial distillation which removes the naphthalene, leaving a residue in which the phenolic content is as high as 30%. The creosote fraction is often mixed with the anthracene oils, owing to the circumstance that the demand for anthracene has practically vanished and that the isolation and purification of this hydrocarbon has become unremunerative and is rendered more difficult by the introduction of vertical-retort tar, which contains paraffinoid substances. The addition of the anthracene oil to the creosote is not altogether a disadvantage, since the specifications for creosote for the preservation of timber demand a certain percentage of high oils. Unfortunately, the creosote storage tank in many places is becoming the refuse pit for all manner of non-marketable oils and tars, such as blast-furnace tar, water-gas tar, etc. It is, therefore, somewhat difficult to assign a definite composition to coal-tar creosote; but a good sample should have a specific gravity of 1·03 to 1·08, be quite clear at 15° C and distil between 200° and 300° C. The phenolic content should be in the region of 10%. For the uses of coal-tar creosote *see* COAL TAR.

Other Creosotes.—The oils derived from low-temperature coal tar and corresponding in boiling point with coal-tar creosote are characterized by the presence of paraffins, the complete absence of naphthalene, a specific gravity less than unity and a high content of tar acids containing a very small amount of phenol. Vertical-retort tar, particularly if steam has been employed in the carbonization of the coal, yields a creosote fraction resembling that from low-temperature tar in many respects, although it usually contains naphthalene. Creosote from producer-gas tar contains large quantities of high-boiling tar acids and paraffins, whilst that from water-gas tar is characterized by the absence of tar acids, richness in paraffins and low specific gravity.

Blast-furnace creosote, sometimes known also as "phenoloid," resembles vertical-retort tar and low-temperature tar creosotes in its content of paraffins and tar acids and its specific gravity. It is noteworthy, however, for the presence of guaiacol and methyl-guaiacol amongst the phenols, which amount to 20 to 35% of the fraction. From this creosote a new antiseptic called "neosote" has been prepared. It is less caustic than carbolic acid, and when freshly prepared is almost colourless and bears a close resemblance to wood-tar creosote.

(D. D. P.)

CREOSOTE-BUSH (*Larrea tridentata* or *Covillea glandulosa*), a North American shrub of the caltrop family (Zygophyllaceae), called also greasewood, native to hot arid regions in the southwestern United States and adjacent Mexico. It is an evergreen, rank-smelling, diffusely-branched shrub, 2 ft. to 5 ft. high, with brittle stems and very leafy branches. The small, olive-green, copiously resinous leaves emit a strong tarry odor. The bright yellow flowers, a half-inch across, appearing in early spring, are followed by small densely white-woolly globose seed-vessels. At low altitudes and sometimes up to 3,000 ft. the creosote-bush is often a very abundant shrub, forming, in the Mohave, Colorado, Gila and similar deserts, a characteristic zone of vegetation called the "*Larrea* belt."

CREPE DE CHINE. A very light and fine plain woven dress fabric, produced either with a fine warp and weft of all-silk, or else with a silk warp and hard-spun worsted weft. As the name implies, a crepe de Chine texture has a slightly crepe character, a feature which is developed entirely from the employment of weft yarn spun with the twist running in reverse directions and known as "right-hand" and "left-hand" twist, respectively, and as also observed in the manufacture of voile textures (*q.v.*). Thus, during weaving, the picks of weft are inserted in the order of "two-and-two," *i.e.,* with two picks of weft with a "right-hand" twist, and two picks with a "left-hand" twist, uniformly, throughout the fabric.

Hence, during the finishing operation, owing to the abnormal amount of twist in the picks of weft, these tend to untwist and recover their normal condition.

They thereby cause the characteristic effect of typical crepe de Chine.

Crepe de Chine textures of artificial silk are now common and are often difficult to distinguish from the true silk.

CREPUSCULUM: *see* TWILIGHT.

CRÉQUY, CHARLES I. DE BLANCHEFORT, MARQUIS DE, prince de Poix, duc de Lesdiguières (1578–1638), marshal of France, was a member of a French noble house which took its name originally from a small lordship in the Pas-de-Calais. He saw his first fighting before Laon in 1594, and was wounded at the capture of Saint Jean d'Angély in 1621. In the next year he became a marshal of France. He served through the Piedmontese campaign in aid of Savoy in 1624 as second-in-command to the constable, François de Bonne, duc de Lesdiguières, whose daughter Madeleine he had married in 1595. He inherited in 1626 the estates and title of his father-in-law, who had induced him, after the death of his first wife, to marry her half-sister Françoise. He was also lieutenant-general of Dauphiné. In 1633 he was ambassador to Rome, and in 1636 to Venice. He fought in the Italian campaigns of 1630, 1635, 1636 and 1637, when he helped to defeat the Spaniards at Monte Baldo. He was killed in an attempt to raise the siege of Crema, a fortress in the Milanese. He had a quarrel extending over years with Philip, the bastard of Savoy, which ended in a duel fatal to Philip in 1599; and in 1620 he defended Saint-Aignan, who was his prisoner of war, against a prosecution threatened by Louis XIII. Some of his letters are preserved in the Bibliothèque Nationale in Paris, and his life was written by N. Chorier (Grenoble, 1683).

CRÉQUY, FRANÇOIS, CHEVALIER DE, marquis de Marines (1625–1687), marshal of France, grandson of the preceding, took part as a boy in the Thirty Years' War. At the age of 26 he was made *maréchal de camp,* and lieutenant-general before he was thirty. He won the favour of Louis XIV. by his fidelity to the court during the second Fronde. In 1667 he served on the Rhine, and in 1668 he commanded the covering army during Louis XIV.'s siege of Lille, after the surrender of which the king made him marshal. In 1670 he overran the duchy of Lorraine. Shortly afterward, Turenne, his old commander, was made marshal-general, and all the marshals were placed under his orders. Créquy went into exile rather than serve under Turenne. After the death of Turenne and the retirement of Condé, he became the most important general officer in the army. He was defeated at Conzer Brücke on the Moselle (1675) by the duke of Lorraine and was taken prisoner. After his release he took the field again in 1676 in Lorraine, and showed himself again a cool, daring and successful commander. (*See* DUTCH WARS.)

The marshal had two sons. The elder, François Joseph, marquis de Créquy (1662–1702), already held the grade of lieutenant-general when he was killed at Luzzara; and Nicolas Charles, sire de Créquy, was killed before Tournai in 1696 at the age of twenty-seven.

For a detailed genealogy of the family and its alliances *see* Moreri, *Dictionnaire historique; Annuaire de la noblesse française* (1856 and 1867). There is much information about the Créquys in the *Mémoires* of Saint-Simon.

CRÉQUY, RENÉE CAROLINE DE FROULLAY, MARQUISE DE (1714–1803), née de Froullay, was born on Oct. 19, 1714, at the château of Monfleaux (Mayenne). She married in 1737 Louis Marie, marquis de Créquy, who died four years after the marriage. In 1755 Madame de Créquy began to receive in Paris, among her intimates being D'Alembert and J. J. Rousseau. She presently became extremely religious with inclinations to Jansenism. D'Alembert's visits ceased when she adopted religion, and she was nearly 70 when she formed the great friendship of her life with Sénac de Meilhan, whom she met in 1781, and with whom she carried on a correspondence (edited by Édouard Fournier, with a preface by Sainte-Beuve in 1856). She was arrested in 1793 and imprisoned in the convent of Les Oiseaux until the fall of Robespierre (July 1794). The *Souvenirs de la marquise* *de Créquy* (1710–1803) (1834–35), purporting to be addressed to her grandson, Tancrède de Créquy, was the production of a Breton adventurer, Cousin de Courchamps.

See the notice prefixed by Sainte-Beuve to the *Lettres;* Quérard, *Supercheries littéraires, s.v.* "Créquy"; *L'Ombre de la marquise de Créquy aux lectuers des souvenirs* (1836) exposes the forgery of the *Mémoires.*

CRESCAS, HASDAI BEN ABRAHAM (1340–1410), Jewish philosopher, was born at Barcelona and lived all his life in Spain. He is best known for his "Or Adonai" (the Light of the Lord), which is of importance as having affected Spinoza, especially in the distinction between attributes and properties and on the subjects of creation and free-will. It was written deliberately to free Judaism from the domination of Aristotle under which it had been brought by Maimonides, and its most important part is a criticism of the Aristotelian propositions on the nature of God. Crescas also wrote a *Refutation of the Cardinal Principles of the Christians* in Spanish.

See C. E. G. Hirsch in the *Jewish Encyclopaedia* (iv.) 350; Joël, *Zur. Genesis Der Lehre Spinozas* (Breslau, 1871); P. Bloch, *die Willensfreiheit von Chasdai Crescas* (Munich, 1879); "Philosophy of Don Hasdai Crescas" in Columbia University *Oriental Studies,* vol. xvii. (1920).

CRESCENDO (It.) means literally merely "growing," but as used in the familiar musical direction—*cresc.*—implies always increasing in loudness. The sign $<$ expresses the same meaning.

CRESCENT, originally the waxing moon, hence a name applied to the shape of the moon in its first quarter. The crescent is employed as a charge in heraldry, with its horns vertical; when they are turned to the dexter side of the shield, it is called increscent, when to the sinister, decrescent. In modern armory a crescent is used as a difference to denote the second son of a house; thus the earls of Harrington place a crescent upon a crescent, as descending from the second son of a second son. An order of the crescent was instituted by Charles I. of Naples and Sicily in 1268, and revived by René of Anjou in 1464. A Turkish order or decoration of the crescent was instituted by Sultan Selim III. in 1799, in memory of the diamond crescent which he had presented to Nelson after the battle of the Nile, and which Nelson wore on his coat as if it were an order.

The crescent is the military and religious symbol of the Ottoman Turks. Ala ud-din, the Seljuk sultan of Iconium (1245–54), and Ertoghrul, his lieutenant and the founder of the Ottoman branch of the Turkish race, assumed it as a device, and it appeared on the standard of the janissaries of Sultan Orkhan (1326–60). Since the new moon is associated with special acts of devotion in Turkey—where, as in England, there is a popular superstition that it is unlucky to see it through glass—it may originally have been adopted in consequence of its religious significance. According to Professor Ridgeway, however, the Turkish crescent, like that seen on modern horse-trappings, has nothing to do with the new moon, but is the result of the base-to-base conjunction of two claw or tusk amulets, an example of which was brought to light during the excavations of the site of the temple of Artemis Orthia at Sparta (see *Athenaeum,* March 21, 1908). There is nothing distinctively Turkish in the combination of crescent and star: it is also doubtful whether any opposition between crescent and cross, as symbols of Islam and Christianity, was ever intended by the Turks and it is an historical error to attribute the crescent to the Saracens of crusading times or the Moors in Spain.

Crescent is also the name of a Turkish musical instrument. In architecture, a crescent is a street following the arc of a circle; the name in this sense was first used in the Royal crescent at Bath.

CRESCIMBENI, GIOVANNI MARIO (1663–1728), Italian critic and poet, was born at Macerata on Oct. 9, 1663. In 1690, in conjunction with 14 others, he founded in Rome the academy of the Arcadians to combat the affectations of the school of Marini. Crescimbeni was secretary to the Arcadians for 38 years. He died on March 8, 1728, shortly after his admission as a member of the order of Jesus. His principal work is the *Istoria della volgar poesia* (1698), an estimate of all the poets of Italy, past and contemporary. The most important of his numerous other publications are the *Commentarij* (5 vols., 1702–11), and *La Bellezza della volgar poesia* (1700).

CRESILAS, a Cretan sculptor of Cydonia. He was a contemporary of Pheidias, and the sculptor of one of the Amazons in the famous competition at Ephesus (*see* GREEK ART) about 450 B.C. As his Amazon was wounded (*volnerata;* Pliny, *Nat. Hist.* xxxiv. 75), we may perhaps identify it with the figure, of which several copies are extant, represented as drawing back her chiton from a wound under the right breast. Another work of Cresilas of which copies survive is the portrait of Pericles, the earliest Greek portrait which has been with certainty identified, and which fully confirms the statement of ancient critics that Cresilas was an artist who idealized and added nobility to men of noble type. An extant portrait of Anacreon is also derived from Cresilas.

See H. Stuart Jones, *Ancient Writers on Greek Sculpture,* § 148 (1895); E. A. Gardner, *Handbook of Greek Sculpture,* pp. 350–352, 370 (1915); A. Furtwängler (trans. E. Sellars), *Masterpieces of Greek Sculpture,* p. 115 ff. (1895).

CRESOLS or **METHYL PHENOLS.** The three isomeric cresols are found in the tar obtained in the destructive distillation of coal, beech-wood and pine. The crude cresol obtained from tar boils from 185 to 205° and constitutes the "cresylic acid" of commerce (*see* COAL TAR). The formula is $CH_3 \cdot C_6H_4 \cdot OH$, and the proportions of the three isomerides are approximately 35% ortho-, 40% meta- and 25% para-cresol.

Ortho-cresol, $CH_3(1).C_6H_4.OH(2)$, may be prepared by fusion of ortho-toluenesulphonic acid with sodium hydroxide, or by the action of phosphorus pentoxide on carvacrol. It is a crystalline solid, which melts at 30° C. and boils at 190.8° C. Being more volatile than the other two cresols it may be separated by fractional distillation.

Meta-cresol, $CH_3(1).C_6H_4.OH(3)$, is formed when thymol (6-isopropyl-3-methylphenol) is heated with phosphorus pentoxide. Propylene is liberated during the reaction, and the phosphoric acid ester of meta-cresol which is formed is then fused with potassium hydroxide. Meta-cresol can be solidified at temperatures below 3°–4° C. It boils at 202.8° C. Its aqueous solution is coloured bluish-violet by ferric chloride. The mixture of meta- and para-cresols is converted by 94% sulphuric acid into mono-sulphonic acids; the *p*-sulphonate or its sodium salt is then separated by crystallization, after which the two cresols are regenerated by hydrolysing their respective sulphonic acids with superheated steam.

Para-cresol, $CH_3(1).C_6H_4.OH(4)$, may be prepared by the fusion of para-toluene-sulphonic acid with sodium hydroxide; by the action of nitrous acid on para-toluidine; or by heating parahydroxy-phenylacetic acid with lime. It crystallizes in prisms which melt at 36° C. and it boils at 201.8° C. It is soluble in water, and the aqueous solution gives a blue coloration with ferric chloride. Para-cresol is produced during the putrefaction of albumen, and occurs as sulphate in the urine of the horse.

CRESPI, DANIELE (1590–1630), Italian historical painter, was born near Milan, and studied under Giovanni Battista Crespi and Giulio Procaccini. His best work, a series of pictures from the life of Saint Bruno, is in the monastery of the Carthusians at Milan. Other paintings of his are at Brera and at Pavia.

CRESPI, GIOVANNI BATTISTA (1557–1633), called Il Cerano, Italian painter, sculptor and architect, was born at Cerano in the Milanese. He was head of the Milanese academy, founded by Cardinal Frederigo Borromeo, and was the teacher of Guercino. He is best known as a painter.

CRESPI, GIUSEPPE MARIA (1665–1747), Italian painter, called "Lo Spagnuolo" from his fondness for rich apparel, was born at Bologna, and was trained under Angelo Toni, Domenico Canuti and Carlo Cignani. He was a clever portrait-painter and a brilliant caricaturist; and his etchings after Rembrandt and Salvator are in some demand. His greatest work, a "Massacre of the Innocents," is at Bologna; but the Dresden gallery possesses twelve examples of him, among which is his celebrated series of the Seven Sacraments.

CRESS (*Lepidium sativum*). An annual garden plant (family Cruciferae), known in the cultivated state in North America, Europe, North Africa, western Asia and India, but of obscure origin. It is used in salads, the young plants being cut and eaten while still in the seed-leaf, forming, along with plants of the white mustard in the same stage of growth, what is commonly called "small salad." The "golden" or "Australian" cress is a dwarf, yellowish-green, mild-flavoured sort, which is cut and eaten when a little more advanced in growth but while still young and tender. The "curled" or "Normandy" cress is very hardy and of good flavour. In this, which is allowed to grow like parsley, the leaves are picked for use while young, and, being finely cut and curled they are well adapted for garnishing.

CRESSENT, CHARLES (1685–1768), French furniture maker, sculptor and *fondeur-ciseleur,* was born at Amiens on Dec. 16, 1685, and died in Paris on Jan. 10, 1768. As the second son of François Cressent, *sculpteur du roi,* and grandson of Charles Cressent, a furniture maker and sculptor of Amiens, he inherited the tastes and aptitudes which were likely to make a finished designer and craftsman. He was a pupil of André Charles Boulle. Cressent's earlier work had affinities with the school of Boulle, while his later pieces were full of originality. He was an artist in the widest sense of the word. He not only designed and made furniture but created the magnificent gilded enrichments which are so characteristic of his work. Cressent made for the regent one of the finest examples of French furniture of the 18th century—the famous *médaillier* now in the Bibliothèque Nationale, Paris. His bronze mounts were executed with a sharpness of finish and a grace and vigour of outline which were hardly excelled by his great contemporary Jacques Caffieri. His female figures placed at the corners of tables are among the most delicious achievements of the great days of the French metalworker. The Louvre, Paris, and the Wallace collection, London, are especially rich in Cressent's work, his commode in the latter collection, with gilt handles representing Chinese dragons, is perhaps his most elaborate piece.

See F. de Salverté, *Les Ébenistes du xviii Siècle, leurs oeuvres et leurs marques* (1927).

CRESSWELL, SIR CRESSWELL (1794–1863), English judge, was a descendant of an old Northumberland family and was born at Newcastle in 1794. He was educated at the Charterhouse and at Emmanuel college, Cambridge. He took his degree in 1814, studied at the Middle Temple and was called to the bar in 1819, joining the northern circuit. In 1837 he entered parliament as Conservative member for Liverpool, and he soon gained a reputation as an acute and learned debater on all constitutional questions. In January 1842 he was made a judge of the court of common pleas, being knighted at the same time; and this post he occupied for 16 years. When the new court for probate, divorce and matrimonial causes was established (1858), Sir Cresswell became its first judge. He died of heart disease, July 29, 1863.

See Foss's *Lives of the Judges;* E. Manson, *Builders of our Law* (1904).

CRESSY, HUGH PAULINUS DE (*c.* 1605–1674), English Benedictine, was born at Thorpe-Salvin, Yorkshire. In 1626 he became a fellow of Merton college, Oxford, and later dean of Leighlin, Ireland, and canon of Windsor. In 1646, during a visit to Rome, he joined the Roman Catholic Church and in 1649 became a Benedictine. He died on Aug. 10, 1674. His *Exomologesis,* or account of his conversion, appeared at Paris in 1647, but his chief work is *The Church History of Brittanny or England, from the beginning of Christianity to the Norman Conquest* (1st vol. only published, 1668). This gives an exhaustive account of the foundation of monasteries during the Saxon heptarchy and asserts that they followed the Benedictine rule, differing in this respect from many historians. The work was much criticized by Lord Clarendon but defended by Antony Wood in his *Athenae Oxoniensis,* who supports Cressy's statement that it was compiled from original mss. and from the *Annales Ecclesiae Britannicae* of Michael Alford, *Dugdale's Monasticon* and the *Decem Scriptores Historiae Anglicanae.* The unpublished part of the history was discovered at Douai in 1856. To Roman Catholics Cressy's name is familiar as the editor of Walter Hilton's *Scale of Perfection* (1659), of Father A. Baker's *Sancta Sophia* (1657) and of Julian of Norwich's *Sixteen Revelations on the Love of God* (1670).

For a complete list of Cressy's works *see* J. Gillow's *Bibl. Dict. of Eng. Catholics.*

CREST, a town of southeastern France, in the department of Drôme, on the right bank of the Drôme, 20 mi. S.S.E. of Valence by rail. Pop. (1936) 4,120. On the rock which commands the town stands a huge keep, the sole survival of a castle (12th century) which made Crest important in the middle ages and the religious wars. The rest of the castle was destroyed in the 17th century, after which the keep was used as a state prison. Crest ranked for a time as the capital of the duchy of Valentinois, and so belonged before the Revolution to the prince of Monaco. The communal charter, graven on stone and dating from the 12th century, is preserved in the public archives. Crest is a busy little town, carrying on silk-worm breeding, silk-spinning and small manufactures of woollens, paper and leather. Ten miles southeast of Crest is the picturesque Forest of Saou, lying in a girdle of limestone peaks.

CRESTING, in architecture, a decorative termination for the top of a wall, or other architectural member, in which the decoration lies primarily in a vertical plane and achieves its effect by serration of the edge with a band of pierced work or rich carving below.

CRESTLINE, an incorporated village of Crawford county, Ohio, U.S.A., 75 mi. S.W. of Cleveland, on federal highway 30N and served by the Big Four and Pennsylvania railroads. Pop. (1940) 4,337. The county produces chiefly wheat, corn and oats. There are railroad shops in the village, and factories making steel ranges, furnaces, sewer pipe, grain and seed cleaners, pumps and road-making machinery. It was incorporated in 1854.

CRESTON, a city of Iowa, U.S.A., 60 mi. S.W. of Des Moines, at an altitude of 1,310 ft., on the crest of the watershed between the Mississippi and the Missouri basins; the county seat of Union county. It is on federal highway 34 and is served by the Burlington railway. Pop. (1940) 8,033. It is a shipping and trading point for a rich farming and stock-raising region. The town was founded in 1869, when the railroad selected this as the site for its shops. It was chartered as a city in 1871.

CRESWELL, JOHN ANGEL JAMES (1828–1891), lawyer, U.S. congressman, and postmaster general from 1869–1874, brought about many reforms in the postal service: postal laws were codified; one-cent postal cards were introduced; postal treaties with foreign countries were revised; ocean carriage of mail to foreign countries was speeded and cost was lowered; free delivery of mail was extended.

CRESWICK, THOMAS (1811–1869), English landscape painter, was born at Sheffield on Feb. 5, 1811, and educated at Hazelwood, near Birmingham. He was a pupil of J. Vincent Barker at Birmingham. In 1842 he was elected an associate, and in 1850 a full member of the royal academy. English and Welsh streams formed his favourite subjects, and generally British rural scenery. Creswick was industrious and extremely prolific; he produced, besides paintings, numerous illustrations for books. He died at his house in Bayswater, Linden Grove, on Dec. 28, 1869. Frith for figures, and Ansdell for animals, occasionally worked in collaboration with Creswick. In 1873 T. O. Barlow, the engraver, published a catalogue of Creswick's works.

CRETACEOUS SYSTEM, the group of rocks which normally occupies a position above the Jurassic system and below the Tertiary. In many areas, the system (from Lat. *creta,* white chalk, a characteristic rock type of the Upper Cretaceous in N.W. Europe) falls naturally into two divisions; the lower is sometimes regarded as a separate system (the Comanchean) in North America, where the unconformity between the two divisions is well marked. The names of the stages and some of the zones, as generally accepted in England, are given in Table I, which shows also the position in the system of the more important strata in the British Isles. Table II, with Table III for

TABLE I. *Cretaceous in the British Isles*

Division	Zone	Argyll and Mull	Antrim	Devon	Dorset	South England	Central England	Lincs. and Yorks.

N. America, gives the stages and substages, and an approximate correlation of the better known Cretaceous strata of the world; for correlation over wide areas, the Ammonoidea are (as usual in the Mesozoic) the most satisfactory group of fossils. It should be remembered that the names of the divisions of the Cretaceous given in these tables have been interpreted in widely different senses in the past, and that there is by no means general agreement in their usage even now. The Albian is often regarded as the lowest stage of the Upper Cretaceous.

British Isles.—The Wealden beds, a thick and variable series of estuarine and fresh-water deposits, are found in the Weald, the Isle of Wight, the Isle of Purbeck and the Boulonnais. The lower beds are usually sandy, the upper argillaceous; limestones occur rarely. The Wealden passes conformably down into the Purbeck, which it closely resembles; it is accordingly sometimes regarded as Jurassic. The fossils include fish, reptiles, plants and estuarine and freshwater Mollusca; and the Wealden was evidently deposited in a lagoon or estuary which probably did not extend far beyond the present limits of its outcrop. The beds of the same age found in Norfolk, Lincolnshire and Yorkshire are marine, and their fauna in part is closely allied with that of similar deposits in Russia. The Spilsby Sandstone and lower part of the Speeton Clay are often regarded as Jurassic. Between the Wealden area and Norfolk, the Neocomian is missing, and a barrier of Palaeozoic rocks (now buried under later deposits beneath London) probably separated the estuarine and marine areas.

The Aptian strata are everywhere marine, the Wealden area having been invaded by the sea. The Aptian is well developed in the Weald and the Isle of Wight, where it is usually argillaceous in the lower part and sandy in the upper; the sandstones are occasionally green through the presence of glauconite. It rests conformably on the Wealden, but thins to the westward and overlaps the Wealden in Wiltshire. Between Wiltshire and Norfolk, it is represented by thin sandstones (such as the Faringdon Sponge Bed of Berkshire), resting on Jurassic beds, often with a basal conglomerate. The Snettisham Clay of Norfolk and the Tealby Limestone of Lincolnshire are sometimes considered Neocomian.

The Albian is represented by three facies or types of deposit: a blue clay with phosphatic nodules (Gault); a glauconitic sandstone (Upper Greensand); and a hard red limestone, often with small pebbles (Red Chalk). Since these three rock-types were

Cenomanian from Le Mans (*Cenomanum*), France.
Albian from Aube, France.
Gargasian from Gargas, near Apt, France.
Bedoulian from la Bedoule, Var.
Aptian from Apt, Vaucluse, France.
Barremian from Barrême, Basses Alpes.
Hauterivian from Hauterive, Lake Neuchâtel.
Valanginian from Château de Valangin, Neuchâtel.
Neocomian from Neuchâtel (*Neocomum*), Switzerland.

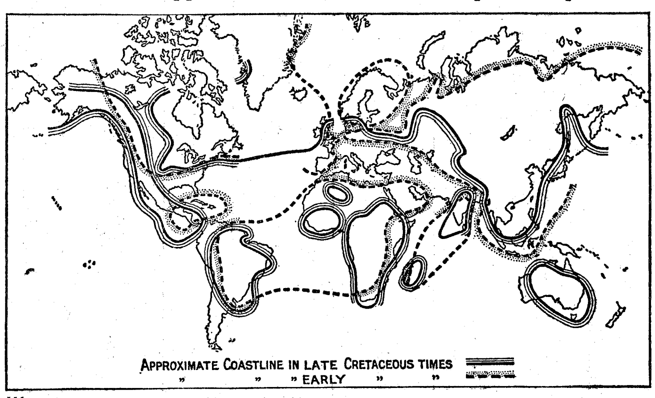
each laid down under different conditions, their faunas are different; but ammonoids are found in each and enable a correlation to be made. The Red Chalk of Norfolk passes laterally into the Gault of Cambridgeshire; and the Gault of the east Weald passes westwards into Upper Greensand which overlaps the Aptian into Devon. The Gault rests upon the Palaeozoic ridge under London, showing that the Albian sea had submerged this barrier.



WORLD MAP SHOWING THE COASTLINES IN EARLY AND LATE CRETACEOUS TIMES. THE COASTLINES ARE GENERALIZED. THE ISLANDS THAT EXISTED IN THE MEDITERRANEAN AREA ARE OMITTED FOR CLEARNESS

The rest of the Cretaceous is represented by the Chalk formation, which stretches from Flamborough Head in Yorkshire to the coast of Dorset (forming the Yorkshire and Lincolnshire Wolds and the Chilterns), encircles the Weald as the North and South Downs, underlies the Tertiary beds round London and Hampshire, and is found in north France. Where it rests upon the Gault, the lower part of the Cenomanian is an argillaceous chalk (Chalk Marl); where on Upper Greensand, a glauconitic sandy limestone (Chloritic Marl); where on Red Chalk, a pure white limestone (Chalk). In Devon, Antrim, Argyll and Mull, it is represented by glauconitic sandstones, indicating the nearness of land. In Cambridgeshire, at the base of the Cenomanian is a glauconitic conglomerate, the Cambridge Greensand, with phosphatic nodules in part derived by erosion from the Gault. Otherwise, the Chalk formation is composed almost entirely of chalk, a white limestone with from 95% to 99% of calcium carbonate. Flints are common in the upper Middle Chalk of East Anglia and the north, and in the Upper Chalk throughout. Marly bands occur sparsely, and nodular beds (such as the Chalk Rock) are more common, especially in the lower Middle Chalk (Melbourn Rock). The top of the Cretaceous is everywhere missing: the Danian may be represented by the *Ostrea lunata* beds of Trimingham, Norfolk. The Tertiary rests unconformably upon the Chalk. Thus in the British Isles, the invasion of the Wealden estuary or lagoon by the Aptian sea; the submergence of the Palaeozoic ridge by the Albian sea; the thinning out of the Lower Cretaceous sediments in the south of England to the west, and to the north against the Palaeozoic ridge; the extension of the upper deposits beyond the limits of the lower into Dorset and Devon, and into Ireland and Scotland: all these facts point to a gradual encroachment of the Cretaceous sea. Igneous activity is unknown, and earth movement is gentle and relatively unimportant—such as the minor folding which led to the removal of the top of the Gault and deposition of the Cambridge Greensand in Cambridgeshire.

Relations of the Cretaceous Strata.—The upper and the lower limits of the Cretaceous system are often sharply defined by unconformities. Since the Cretaceous beds in many areas are transgressive over older formations, the lowest Cretaceous being missing, the lower unconformity is well marked. In the Alps and Himalayas there is sometimes an apparent continuity from Jurassic into Cretaceous marine sediments; a similar continuity in non-marine beds is seen in the south of England and north-west Germany (Wealden), and in Australia (Walloon series). The plant-bearing deposits of the Atlantic coast region of the United States (Potomac series) and Japan (Rhyôseki series) may be in part Jurassic. The lacustrine and fluviatile Laramie formation of the western interior of the United States helps to bridge the gap between the vertebrate faunas of the Cretaceous and the Eocene; the chalky limestones, of Malmö (Fennoscania) and Faxe (Denmark), in which two typical Mesozoic groups (the ammonoids and belemnites) are not found, have been regarded as Tertiary but are usually included in the Cretaceous. (Table II.)

Physiographical Conditions, Earth Movements and Igneous Activity.—Non-marine sediments are found, for the most part, either at the beginning, or, to a less extent, at the end of the period. As examples of Neocomian terrestrial, fluviatile or estuarine deposits may be cited the Wealden of England, the Boulonnais, the Franco-Belgian coalfield and Hanover; the lower part of the Uitenhage series (Enon Beds, Variegated Marls and Wood Beds) of the Cape Province of South Africa; the Potomac, Kootenay and Morrison series of the United States; the upper part of the Walloon series of Australia; and the Rhyôseki series of Japan. The sea invaded some of these areas in Neocomian times, depositing, for instance, the upper part of the Uitenhage series (Sunday's River Beds) in Cape Province, and the Monogebawa series (in part Albian) in Japan. In Australia, the marine Aptian (Roma series and Maryborough Beds) are in part overlapped by the marine Albian (Tambo series). In north-west Europe a similar transgression of the sea continued with minor interruptions from Aptian into Senonian times, invading the Armorican massifs in Ireland, Brittany, Spain and the Ardennes; and chalk practically free from material derived from existing land masses was laid down in the British Isles, northern France, extra-alpine Germany, south Scandinavia, Denmark and Russia. In the Tethys sea, which extended along the Mediterranean area across the site of the Himalayas, the western part of the southern margin—the north of Africa—was also invaded by the sea. In the shallow waters of the Tethys flourished the rudists, with gasteropods and reef-building corals; a similar facies is found in Texas, Alabama, Mexico and the West Indies. The lamellibranch faunas of the sublittoral Neocomian deposits of the south Andes, south Africa and Tanganyika Territory are very similar to each other, and distinct from those of the northern hemisphere: they afford evidence for the hypothetical South Africa—Brazil Cretaceous continent. A similar Neocomian fauna is found in Cutch, Madagascar and New Caledonia; the southern Cretaceous land-masses are often regarded as parts of the hypothetical Permo-Carboniferous Gondwanaland. Evidences of a marine Cenomanian transgression are seen in Brazil and peninsular India.

The unconformity between the Upper and the Lower Cretaceous of North America, and the dissimilarity in the areas of deposition, indicate important earth-movement in mid-Cretaceous times. The more wide-spread unconformity at the end of the Cretaceous and beginning of the Tertiary was due to a more general withdrawal of the sea accompanied by important deformative earth-movements and igneous activity. The folding and elevation of the Cordilleras and the Appalachians date in part from this period. The most important igneous activity was the formation of the Deccan traps. These basic lavas, erupted from fissures, cover 200,000 sq. miles and are from 4,000 to 6,000 feet thick.

Economic Products.—In the British Isles, local limestones of the Wealden (Sussex Marble) and Hythe Beds (Kentish Rag) have been used as building stones. Fuller's earth occurs in the Sandgate Beds, and glass-sands in the Lower Greensand. More important is the manufacture of bricks and tiles from the Gault, and of lime and cement from the Chalk. The clay ironstones of the Wadhurst Clay were once the main source of the English iron supply, and more recently the phosphatic nodules of the Cambridge Greensand have been exploited.

Perhaps the most important economic product of the Cretaceous is coal. The Laramie formation, in the western interior of the United States, contains lignite and also, in places, anthracite. Lower Cretaceous coal seams are known in Dakota, Alaska and New Zealand; in the Senonian may be mentioned the coal-bearing Urakawa series of Japan.

The Cretaceous Fauna and Flora.—The flora is best known from the United States, especially from the Potomac formation of Maryland and Virginia. That of the lower divisions (Patuxent and Arundel series) is very similar to the Upper Jurassic flora; it consists chiefly of ferns, conifers and the now extinct Bennettitales (usually grouped with the modern Cycadales), often well-preserved and known in considerable detail: leaves of an angiosperm type occur very rarely. Similar floras of Lower Cretaceous age are found in the English Wealden, in Belgium and Germany, in the Uitenhage series of South Africa and the Rhyôseki series of Japan, in west Greenland and Spitzbergen. In the third division of the Potomac formation (the Patapsco series), there is a sudden development of angiosperm leaves. In the Upper Cretaceous, the angiosperms are the dominant group, replacing the Bennettitales; the flora is wide-spread, ranging from Alaska to Argentina and occurring in west Greenland, western Europe and Japan; many of the species are referred to modern genera, and the whole has a subtropical aspect (*see* PALAEOBOTANY: *Mesozoic*).

The smaller Foraminifera such as *Globigerina* and *Cristellaria* are important, forming for instance on the average 10% of the Upper Chalk in England; of the larger, the orbitolines (Lower Cretaceous and Cenomanian) and the orbitoids (Campanian to Tertiary) have been used for correlation in deposits of the Mediterranean region. Sponges are locally abundant (*Siphonia, Ventriculites*); calcareous forms are more characteristic of shallow-water deposits, such as the Faringdon Greensand (Aptian) of Berkshire (*Peronidella, Barroisia, Rhaphidonema*). Corals are relatively rare. The widely distributed, free-swimming crinoids, *Uintacrinus* and *Marsupites,* characterise the Santonian. Sea-urchins are especially abundant, both regular (*Cidaris, Salenia, Phymosoma*) and irregular (*Echinocorys, Holaster* and true heart-urchins). The genus *Micraster* in the Upper Turonian and Lower Senonian of England supplies some of the best evidence of evolution by slow continuous change that palaeontology affords (*see* PALAEONTOLOGY). Brachiopods are represented chiefly by terebratulids and rhynchonellids. Polyzoa are abundant. Lamellibranchs are important; *Aucella,* characteristic of the northern Lower Cretaceous, and *Inoceramus,* almost universal in the Upper Cretaceous, are both useful for correlation. More important as time-indices throughout the Cretaceous, to which they are confined, are the massive, sessile, aberrant lamellibranchs, the group of rudists (*Monopleura, Requienia, Toucasia, Hippurites, Radiolites* and *Caprina*), characteristic of a shallow-water facies of the Tethys and Central America. Gastropods are common in the same facies. The ammonoids afford the best means of correlation over wide areas. As in the Jurassic, the Phylloceratidae and Lytoceratidae persist with but little change; it has been suggested that these thin-shelled forms, characteristic of the deeper parts of the Tethys, were the parent stocks, which, by acquisition of ornament and modification (usually simplification) of suture-line, supplied successive groups of short-lived thick-shelled forms which populated surrounding areas. Characteristic genera are *Spiticeras, Polyptychites, Simbirskites* (Neocomian); *Parahoplitoides, Cheloniceras* (Aptian); *Leymeriella, Douvilleiceras, Hoplites, Pervinquieria* (Albian); *Schloenbachia, Acanthoceras* (Cenomanian); *Pachydiscus, Prionotropis* (Turonian); *Mortoniceras, Parapuzosia* (Senonian). With these "normal" ammonites, coiled into a closed plane spiral, are found many abnormal, "uncoiled" types; such forms occur throughout the Mesozoic, but become common only in the Cretaceous (*Crioceras, Baculites, Scaphites, Turrilites*). There is also in some stocks a tendency for the suture-line to become simplified, and occasionally (*Tissotia*) it mimics the type seen in the Triassic *Ceratites.* Of the belemnites, *Belemnitella* is wide-spread in northern seas in the Upper Senonian, and *Actinocamax* in the Senonian of north-west Europe undergoes progressive changes which render it useful as a time-index; the irregularly-shaped *Duvalia* is characteristic of the Mediterranean Neocomian, and *Cylindroteuthis* of the Boreal. Both the ammonoids and the belemnites became extinct at the end of the Cretaceous.

Of the five classes of the Vertebrata, the mammals and birds are of infrequent occurrence in the Cretaceous, but the reptiles and fishes are represented by many genera and species; the Amphibia are not definitely known. Generally, the vertebrates of the Lower Cretaceous are closely allied to Jurassic types, while the higher beds of the Upper Cretaceous are distinguished by the appearance of forms ancestral to those which flourished in the early Tertiary. Thus the fishes may be divided into two groups: a Lower Cretaceous group, characterised by forms closely allied to Jurassic genera; and an Upper Cretaceous group, in which both the bony and the cartilaginous fishes show a marked resemblance to their modern representatives which are found in the ocean depths. Nearly complete skeletons of cartilaginous fishes occur in the Upper Cretaceous of Westphalia and Mt. Lebanon; in the English Cretaceous are found representatives of the dogfishes (Scyllidae), the sharks (Lamnidae) and skates (*Ptychodus*, a gigantic, primitive and extinct form). The bony fishes are represented in the English Wealden (*Lepidotus*), and are known in the uppermost Cretaceous beds of south Scandinavia, northern France, Persia, India and Brazil. As a whole, the Upper Cretaceous fish fauna appears to be more closely allied to the modern fauna than are the mammals, birds and reptiles.

The Mesozoic is often termed the "Age of Reptiles," and in the Cretaceous the reptiles are still the dominant vertebrates, although not so prolific in species and individuals as in the Jurassic period. The dinosaurs (*see* DINOSAURIA) are the most powerful group of Cretaceous animals; they often attain a length of 30 feet, but possess extremely small brain-cavities. Both herbivorous and carnivorous forms are found. The herbivorous dinosaur, *Iguanodon,* occurs in the Lower Cretaceous of England, and nearly complete skeletons have been obtained from the Wealden of Bernissart, Belgium. Dinosaurs are also very abundant in the Cretaceous of North America; they include *Tyrannosaurus,* a predaceous form armed with sabre-like teeth and sharp claws; *Trachodon,* duck-billed and probably living in shallow, muddy waters; *Stegosaurus,* with a median row of plates and spines along its back; and *Triceratops,* with head armed with horns and a massive bony frill. The majority of the remaining reptiles are aquatic forms. The "sea-serpents" are extremely elongated forms, with powerful flippers and long tails. Ichthyosaurs and plesiosaurs are less common than in the Jurassic. The pterosaurs (*Ornithocheirus*), the remarkable flying lizards, attain their maximum development; one digit of each "hand" is prolonged, probably serving as a support for the flying membrane (*see* PTERODACTYL). The crocodiles (*Goniopholis*) show many similarities to present day forms, and the marine turtles are in their external structure definitely modern in type. Lizard-like animals (*Dolichosaurus*) are known, and true snakes appeared towards the later part of the period.

Birds are represented by the well-known toothed forms *Hesperornis* (a giant diving bird) and *Ichthyornis* (built for powerful flight); both are found in the Upper Cretaceous of Kansas.

Mammals are rare. The most primitive forms are the multituberculate mammals; they were probably very small, and are known only by diminutive teeth and fragmentary jaws from the Wealden of Sussex and the Upper Cretaceous of North America. The marsupials are represented by opossum-like creatures, which occur in the Upper Cretaceous of Wyoming and Patagonia. The higher mammals are unknown in Cretaceous rocks.

See PALAEONTOLOGY; MULTITUBERCULATA; ORNITHOLOGY; MAMMALIA; REPTILES. (A. G. B.)

CRETE (ancient *Kefti*), after Sicily, Sardinia and Cyprus the largest island in the Mediterranean, situated between 34° 50′ and 35° 40′ N. lat. and between 23° 30′ and 26° 20′ E. long. Its northeastern extremity, Cape Sidero, is distant about 110 mi. from Cape Krio in Asia Minor, the interval being partly filled by the islands of Carpathos and Rhodes; its northwestern, Cape Grabusa, is within 60 mi. of Cape Malea in the Morea. Crete thus forms the natural limit between the Mediterranean and the Archipelago. The area is 3,199 sq.mi. Pop. in 1938 (estimate) was 441,687:

Department	Chief Town
Canea 126,654	Canea (Khania) 36,810
Herakleion 162,978	Herakleion (Candia) 43,550
Rhethymnon 76,141	Rhethymnon 11,850
Lasithion (Lassithi) 75,914	Hagios-Nicholaos 2,020

The island is of elongated form; its length from east to west is 160 m., its breadth from north to south varies from 35 to 7½ m. The northern coast-line is much indented. On the west two narrow mountainous promontories, the western terminating in Cape Grabusa or Busa (ancient Corycus), the eastern in Cape Spada, shut in the Bay of Kisamos; beyond the Bay of Canea, to the east, the rocky peninsula of Akrotiri shelters the magnificent natural harbour of Suda (8½ sq.m.), the only completely protected anchorage for large vessels which the island affords. Farther east are the bays of Candia and Mallia, the deep Mirabella Bay and the Bay of Sitia. The south coast is less broken, and possesses no natural harbours, the mountains in many parts rising almost like a wall from the sea; in the centre is Cape Lithinos, the southernmost point of the island, partly sheltering the Bay of Mesará on the west. Immediately to the east of Cape Lithinos is the small bay of Kali Liménes or Fair Havens, where the ship conveying St. Paul took refuge (Acts xxvii. 8). Of the islands in the neighbourhood of the Cretan coast the largest is Gavdo (ancient Clauda, Acts xxvii. 16), about 25 m. from the south coast at Sphakia, in the middle ages the see of a bishop. On the north side the small island of Dia, or Standia, about 8 m. from Candia, offers an inconvenient shelter against northerly gales. Three small islands on the northern coast—Grabusa at the north-west extremity, Suda, at the entrance to Suda harbour, and Spinalonga, in Mirabella Bay—remained for some time in the possession of Venice after the conquest of Crete by the Turks. Grabusa, long an impregnable fortress, was surrendered in 1692, Suda and Spinalonga in 1715.

Natural Features.—The greater part of the island is occupied by ranges of mountains which form four principal groups. In the western portion rises the massive range of the White Mountains (*Aspra Vouna*), directly overhanging the southern coast with spurs projecting towards the west and north-west (highest summit, Hagios Theodoros, 7,882 ft.). In the centre is the smaller, almost detached mass of Psiloriti (ʽΥψιλορειτίον, ancient Ida), culminating in Stavros (8,193 ft.), the highest summit in the island. To the east are the Lassithi mountains with Aphenti Christos (7,165 ft.), and farther east the mountains of Sitia with Aphenti Kavousi (4,850 ft.). The Kophino mountains (3,888 ft.) separate the central plain of Messará from the southern coast. The isolated peak of Iuktas (about 2,700 ft.), nearly due south of Candia, was regarded with veneration in antiquity as the burial-place of Zeus. The principal groups are for the greater part of the year covered with snow, which remains in the deeper clefts throughout the summer; the intervals between them are filled by connecting chains which sometimes reach the height of 3,000 ft. The largest plain is that of Monofatsi and Messará, a fertile tract extending between Mt. Psiloriti and the Kophino range, about 37 m. in length and 10 m. in breadth. The smaller plain, or rather slope, adjoining Canea and the valley of Alikianú, through which the Platanos (ancient Iardanos) flows, are of great beauty and fertility. A peculiar feature is presented by the level upland basins which furnish abundant pasturage during the summer months; the more remarkable are the Omalo in the White Mountains (about 4,000 ft.) drained by subterranean outlets (κτάβοθρα), Nida (εἰς τὴν Ἴδαν) in Psiloriti (between 5,000 and 6,000 ft.), and the Lassithi plain (about 3,000 ft.), a more extensive area, on which are several villages. Another remarkable characteristic is found in the deep narrow ravines (φαράγγια), bordered by precipitous cliffs, which traverse the mountainous districts; into some of these the daylight scarcely penetrates. Numerous large caves exist in the mountains; among the most remarkable are the famous Idaean cave in Psiloriti, the caves of Melidoni, in Mylopotamo, and Sarchu, in Malevisi, which sheltered hundreds of refugees after the insurrection of 1866, and the Dictaean cave in Lassithi, the birth-place of Zeus. The so-called Labyrinth, near the ruins of Gortyna, was a subterranean quarry from which the city was built. The principal rivers are the Metropoli Potamos and the Anapothiari, which drain the plain of Monofatsi and enter the southern sea east and west respectively of the Kophino range; the Platanos, which flows northwards from the White Mountains into the Bay of Canea; and the Mylopotamo (ancient Oaxes) flowing northwards from Psiloriti to the sea east of Retimo.

Geology.—The metamorphic rocks of western Crete form a series some 9,000 to 10,000 ft. in thickness, of very varied composition. They include gypsum, dolomite, conglomerates, phyllites and a basic series of eruptive rocks (gabbros, peridotites, serpentines). Glaucophane rocks are widely spread. In the centre of the folds fossiliferous beds with crinoids have been found, and the black slates at the top of the series contain *Myophoria* and other fossils, indicating that the rocks are of Triassic age. It is, however, not impossible that the metamorphic series includes also some of the Lias. The later beds of the island belong to the Jurassic, Cretaceous and Tertiary systems. At the western foot of the Ida massif calcareous beds with corals, brachiopods (*Rhynchonella inconstans*, etc.) have been found, the fossils indicating the horizon of the Kimmeridge clay. Lower Cretaceous limestones and schists, with radiolarian cherts, are extensively developed; and in many parts of the island Upper Cretaceous limestones with *Rudistes* and Eocene beds with nummulites have been found. All these are involved in the earth movements to which the mountains of the island owe their formation, but the Miocene beds (with *Clypeaster*) and later deposits lie almost undisturbed upon the coasts and the low-lying ground. With the Jurassic beds is associated an extensive series of eruptive rocks (gabbro, peridotite, serpentine, diorite, granite, etc.); they are chiefly of Jurassic age, but the eruptions may have continued into the Lower Cretaceous. The arrangement of the rocks is further complicated by a great thrust-plane which has brought the Jurassic and Lower Cretaceous beds upon the Upper Cretaceous and Eocene beds.

The structure of Crete is best understood as a part of the great mountain arc, or scheme of arcs which stretches southward in the Dinaric Alps and fingers out into the southward projecting peninsulas of Greece. Some of these are conjecturably related to the Capes on the western part of the north coast of Crete, the islands of Cerigo and Cerigotto forming intermediate links. Within the island apparently the directive lines curve into the west-east direction, represented in two chains, one running from the west end north of the Mesara plain and the other stretching eastward between that plain and the southern coast. They are to be looked upon as overlapping fragments of mountain-arcs linked, eastwards, with Karpathos, Rhodes and the Lycian Taurus. The Graeco-Creto-Asiatic curve, together with the Lycian-Cypriote-Tauric curve farther east form the southward projecting Tauro-Dinaric arc of the Alpine system, one of a great series of arcs all projecting in the same way on the southern flank of the Alpine system. The others are the Arc of the south side of the west Mediterranean, the Iranian Arc, the crushed-in Hindu-Kush Arc, the Himalayan Arc and the Malayan Arc. South of these, usually beyond a depression of some kind, are the old blocks of Africa, Arabia, the Deccan and Australia. The Aegean Sea is essentially a sinking, in a relatively recent geological period, of the area within the Cretan arc. The occurrence of remains of the small Hippopotamus Pentlandi in Crete in recent deposits shows that the island must still have been connected with the mainland in Pliocene times and that the hippopotamus long survived, in the island, in a dwarfed form; the analogy of the dwarf elephants of Malta may be recalled.

Climate.—The temperature in January may retain an average of 50° or even nearly 54° in the lowlands while the summer on the Mesaran plain is hot and malarious. The relief of Crete is, however, so marked that on the heights snow may fall in autumn and lie till the beginning of the next July. The steppe-winds from the north may blow with such force across the Aegean Sea as to prevent in many exposed places any growth of trees. The winds from the African land mass also blow across to Crete affecting its southern side. In winter the commonest winds at Candia are northerly and southerly; in summer, winds with a westerly component are important.

The mean temperatures at Candia are:

January	51°	May	68°	September	75°
February	52°	June	75°	October	67°
March	55°	July	78°	November	61°
April	61°	August	79°	December	55

with a mean maximum (daily) of 83·5°, and one of 86° for Canea, occurring most often in July and August, the mean maximum (monthly) being as high as 97·5° (recorded for June) in which month a record of 101·8° has been made. The mean minimum (monthly) varies from 40° in February to 68° in August with a record of 33° in February. The temperature range (monthly) is greatest in spring and autumn when it may reach 32°; it is down to 20° in August.

The mean rainfall at Candia is as follows:

January	3·39	May	0·48	September	0·78
February	3·23	June	0·09	October	1·81
March	1·97	July	0·12	November	3·58
April	0·63	August	0·35	December	3·98

Vegetation.—The forests which once covered the mountains have for the most part disappeared and the slopes are now desolate wastes. The cypress still grows wild in the higher regions; the lower hills and the valleys, which are extremely fertile, are covered with olive, and in some parts with carobs. Oranges and lemons also abound, and are of excellent quality. Chestnut woods are found in the Selino district, and forests of the valonia oak in that of Rhethymnon. Pears, apples, quinces, mulberries and other fruit-trees flourish, as well as vines. Though the Madeira vineyards have been twice planted with stock from Malavisi province, the modern Cretan wines no longer enjoy the reputation of mediaeval "Malvoisie." Tobacco and cotton succeed well in the plains and low grounds, though not at present cultivated to any great extent.

Animals.—Of the wild animals of Crete, the wild goat or *agrimi* (*Capra aegagrus*) alone need be mentioned; it is still found in considerable numbers on the higher summits of Psiloriti and the White Mountains. The same species is found in the Caucasus and Mount Taurus, and is distinct from the ibex or bouquetin of the Alps. Other animals of interest are the moufflon, said to be an ancestor of the domestic sheep, and the porcupine. Crete, like several other large islands, enjoys immunity from dangerous serpents—a privilege ascribed by popular belief to the intercession of Titus, the companion of St. Paul, who according to tradition was the first bishop of the island, and became in consequence its patron saint. Wolves also are not found in the island, though common in Greece and Asia Minor. The native breed of mules is remarkably fine.

Population.—The population of Crete under the Venetians was estimated at about 250,000. After the Turkish conquest it greatly diminished, but afterwards gradually rose, till it was supposed to have attained to about 260,000, of whom about half were Mohammedans, at the time of the outbreak of the Greek revolution in 1821. The ravages of the war from 1821 to 1830, and the emigration that followed, caused a great diminution, and the population was estimated by Pashley in 1836 at only about 130,000. In the next generation it again materially increased; it was calculated by Spratt in 1865 as amounting to 210,000. According to the census taken in 1881, the complete publication of which was interdicted by the Turkish authorities, the population of the island was 279,165, or 35·78 to the square kilometre. Of this total, 141,602 were males, 137,563 females; 33,173 were literate, 242,114 illiterate; 205,010 were orthodox Christians, 73,234 Muslims, and 921 of other religious persuasions. The Muslim element predominated in the principal towns, of which the population was—Candia, 21,368; Canea, 13,812; Retimo, 9,274. In June 1900 a Greek census registered a population of 301,273, the Christians having increased to 267,266, while the Muslims had diminished to 33,281. Both Muslims and Christians are of Greek origin and speak Greek. Pop. (est. 1938) 441,687.

Towns.—The three principal towns are on the northern coast and possess small harbours suitable for vessels of light draught. Candia, pop. 43,550, former capital, see of the archbishop of Crete, officially styled Herakleion, is surrounded by remarkable

Venetian fortifications and possesses a museum with a valuable collection of objects found at Cnossus, Phaestus, the Idaean cave and elsewhere. Canea (mod. Gk. *Chaniá*), the seat of government after 1840 (pop. 36,810), is built in the Italian style; its walls and interesting galley-slips recall the Venetian period. The residences of the governor and of the foreign consuls are in the suburb of Halepa. Rhethymnon (Ρέθυμνος) is, like Canea, the see of a bishop (pop. 11,850). The other towns, Hierapetra, Sitia, Kisamos, Selino and Sphakia, are unimportant.

Production and Industries.—Owing to the volcanic nature of its soil, Crete is probably rich in minerals. Modern experiments led to the conclusion that iron, lead, manganese, lignite and sulphur exist in considerable abundance. Copper and zinc have also been found. A large number of applications for mining concessions were received after the establishment of the more civilized government. Olive production, always the principal source of wealth, was increased considerably after the island was annexed to Greece by the planting of young trees and improved methods of cultivation which the government endeavoured to promote. The orange and lemon groves formerly suffered considerably, but new varieties of the orange tree were introduced, and an impulse was given to the export trade in this fruit by removal of the restriction on its importation into Greece. Agriculture is still in a primitive condition; notwithstanding the fertility of the arable land the supply of cereals is far below the requirements of the population. A great portion of the central plain of Monofatsi, the principal grain-producing district, long lay fallow owing to the exodus of the Moslem peasantry. The cultivation of silk cocoons, formerly a flourishing industry, greatly declined in the 20th century, although efforts were being made to revive it.

There are few manufactures. Soap is produced at numerous factories in the principal towns, and there are distilleries of cognac at Candia.

Constitution and Government.—During the 19th century the affairs of Crete repeatedly occupied the attention of Europe. Owing to the existence of a strong Mussulman minority among its inhabitants, the warlike character of the natives, and the mountainous configuration of the country, which enabled a portion of the Christian population to maintain itself in a state of partial independence, the island had constantly been the scene of prolonged and sanguinary struggles in which the numerical superiority of the Christians was counterbalanced by the aid rendered to the Moslems by the Ottoman troops. This unhappy state of affairs was aggravated and perpetuated by the intrigues set on foot at Constantinople against successive governors of the island, the conflicts between the Palace and the Porte, the duplicity of the Turkish authorities, the dissensions of the representatives of the great powers, the machinations of Greek agitators, the rivalry of Cretan politicians, and prolonged financial mismanagement. A long series of insurrections—those of 1821, 1833, 1841, 1858, 1866–1868, 1878, 1889 and 1896 may be especially mentioned—culminated in the general rebellion of 1897, which led to the interference of Greece, the intervention of the great powers, the expulsion of the Turkish authorities, and the establishment in 1899 of an autonomous Cretan government under the suzerainty of the sultan, with Prince George of Greece as high commissioner of the protecting powers. After his resignation in 1906, the modified constitution of February 1907 dispensed with exceptional legislative and administrative powers. An elected chamber exercised complete financial control, and two councillors responsible to the chamber formed a kind of cabinet. After the cession of Crete by Turkey to Greece in 1912, the island was administered as a province of the Greek kingdom with a governor-general. Almost all the Moslem natives emigrated, or became "Tripolitan protected subjects" of Italy, or became merged in the orthodox population; their only coherent settlements now were in the islands of Cos and Rhodes.

On the other hand, Crete received its full share of the Greeks expelled from Asia Minor in 1922, and they greatly increased the production of sultana raisins.

For administrative purposes the Turkish departmental divisions were retained. There were 4 prefectures (formerly *sanjaks*) each under a prefect; these were Canea, Rhethymnon, Herakleion (Candia) and Lasithion. These in turn were divided into 23 eparchies (formerly *kazas*). For municipal and communal government, the island was divided into 86 communes, each with a mayor, an assistant-mayor, and a communal council elected by the people. The councils assessed the communal taxes and maintained roads and bridges. This governmental organization was entirely disrupted by the German occupation of May 1941.

Religion and Education.—The vast majority of the population belongs to the Orthodox (Greek) Church, which is governed by a synod of eight bishops under the presidency of the metropolitan of Candia. Education is nominally compulsory. Improved communications are much needed for the transport of agricultural produce, but Greek finances did not admit of adequate expenditure on road-making and other public works. The prosperity of the island depends on the development of agriculture.

ARCHAEOLOGY

History of Excavations.—The archaeological importance of Crete lies chiefly in its prehistoric remains, which attest the development in the island during the Aegean Bronze age of a culture at least equal in aesthetic and material achievement to the contemporary civilizations of Mesopotamia and Egypt. This Cretan culture extended in its maturity to the whole of Greece, and exercised considerable influence in more distant regions of Europe. Ancient literary records had led several scholars to look to Crete for the origin of the Mycenaean art which Heinrich Schliemann and others had revealed in Greece in the second half of the 19th century, but the disturbed political condition of the island at that time was an obstacle to methodical excavation. Schliemann visited Crete in 1886 and recognized a Mycenaean palace at Knossos, but was restrained from indulging his enthusiasm in the excavation of that difficult site by his inability to come to a financial agreement with the proprietors. An Italian mission, actively directed by Federigo Halbherr, and supported after 1893 by the Archaeological Institute of America, had explored and excavated in many districts since 1884, but with no special interest in any period of antiquity.

The first investigator who went to Crete with the purpose of defining its place in Aegean civilization was Arthur Evans, of the University of Oxford. He made his first visit in 1894, in search of a class of sealstones engraved with pictographic characters which he had identified as Cretan, and in the same year acquired part ownership of the land at Knossos. But it was not till 1900, when the provisional Greek Government was established, that Evans was able to complete the purchase of the palace site and to begin his excavations. Since that time the work at Knossos has not stood still. Later in the same year Halbherr initiated the excavation of Phaistos. A small palace at Hagia Triada, between Phaistos and the southern sea, was also dug by the Italian mission. The American Exploration Society, an organization affiliated to the University of Pennsylvania, sent an expedition to the district of Siteia, which excavated town-sites at Gournia and Vasiliki in 1901. The work in this district was ably carried on by Richard Seager until his premature death in Crete in 1925.

With the support of American universities and museums and of the American School of Classical Studies at Athens, he excavated houses and tombs in the islands of Pseira and Mochlos in the Gulf of Mirabella, and tombs at Pachyammos on the isthmus of Hierapetra. Other important cemeteries were explored by Americans in the same district at Sphoungaras and Vrokastro. The British School of Archaeology at Athens excavated houses and tombs at Knossos, cave-sanctuaries at Psychro and Kamares, and towns at Zakro and Palaikastro, at the eastern end of the island. It is an unexplained fact that no prehistoric remains have yet been identified in the western half of Crete.

The field-work of the Greek authorities has been active and efficient. but the Government has liberally allowed foreign workers to undertake the more extensive excavations, using its own resources mainly to deal with the numerous accidental finds of tombs or buildings and the rapid accumulation of material in the Cretan Museum at Herakleion (Candia). The nucleus of this unique collection had been formed by the local archaeological society, the *Syllogos,* in the difficult times of Turkish rule. It was housed by the Greek Government in the old barracks until the new museum was built in 1908, but this commodious edifice was not designed to resist earthquakes, which are a source of frequent and sometimes catastrophic destruction in Crete. In a slight shock, in June 1926, considerable, though not irreparable, damage was done to pottery and fresco-paintings by the fall of plaster ceilings. It is more than likely, so long as the building stands in its original form, that its total collapse will some day bury the collection. Since all important objects found in Crete are bound by Greek law to be kept in this museum, it is fortunate that most of them have been duplicated by mechanical reproductions, which are housed in many museums of Europe and America. The first Cretan ephor of antiquities and director of the Museum was Joseph Khatzidakis, who had been president of the Syllogos. His discoveries include two palaces, a small one at Tylissos, west of Knossos, which he excavated, and a large one at Mallia, on the east, which he transferred to the French School of Archaeology. His successor, Stephanos Xanthoudidis, explored houses at Khamaizi and Nirou Khani, an ossuary cave at Pyrgos, and an important series of early beehive-tombs in the Mesara plain.

Nomenclature and Chronology.—In order to mark a distinction between the pure Cretan culture and its colonial (Mycenaean) form, which may be supposed, at least in its latest phases, to contain some Mainland (*Helladic*) elements, Evans proposed the name *Minoan* for the Cretan Bronze age. The term has no particular reference to the legendary Minos, thalassocrat of an Aegean empire and judge in Hades; indeed tradition seems to point to at least two kings of that name, which may have been a dynastic title. Evans' chronological scheme is a symmetrical framework of nine periods. There are three main periods, Early, Middle and Late Minoan, representing the main artistic phases in the pottery viewed as the index of Aegean art. Each main period is divided into three numbered phases, I., II., III., on the natural principle of its rise, maturity and decline. The names of the nine periods are ordinarily abbreviated to their initial letters and the numerals: E.M.I., etc. Absolute chronology rests upon reciprocal contacts with foreign countries, chiefly with Egypt. The synchronisms and dates of the nine Minoan periods are as follows:

Crete	*Egypt*	*Years B.C.*
E.M. I.	Dyn. I.–III.	3400–2800
E.M. II.	„ IV.–VI.	2800–2400
E.M. III.	„ VII.–XI.	2400–2100
M.M. I.	„ XI.–XII.	2100–1900
M.M. II.	„ XII.–XIII.	1900–1700
M.M. III.	„ XIV.–XVII.	1700–1580
L.M. I.	„ XVIII. (to Thatmosis III.)	1580–1450
L.M. II.	„ XVIII. (to Amenhotef III.)	1450–1375
L.M. III.	„ XVIII.–XX.	1375–1100

It has been found possible to classify the M.M. and L.M. material into earlier and later phases of each period, M.M. I.*a*, M.M. I.*b*, etc.

Egyptian Contacts.—Contact with Egyptian art is visible throughout the Cretan prehistoric age. Neolithic and E.M. stone vases reflect Predynastic and Old Kingdom types. Devices cut on M.M. seals resemble those of Middle Kingdom scarabs, L.M. architectural and ceramic painting was strongly influenced by Nilotic motives, and in several Theban tombs of early Dyn. XVIII. are pictures of Cretan envoys bearing vessels of L.M. I. style. More definite synchronisms are afforded by finds of foreign products on Cretan sites, and of Minoan pottery in Egypt. Fragments of predynastic stone bowls have been found in Neolithic deposits at Knossos. M.M. II.*b* pottery has been found in Egypt in Dyn. XII. rubbish heaps at Lahun and in Dyn. XII. graves at Abydos and Harageh. An alabaster lid bearing the cartouche of the Hyksos king, Khyan, occurred in a M.M. III.*a* context in the palace of Knossos, and part of an inscribed diorite statuette of Dyn. XII.–XIII. was associated there with the M.M. II.*b* stratum. L.M. I. and L.M. II. painted vases have been excavated from Dyn. XVIII. graves and houses at Sakkara and Gurob, and a peculiarly cogent contact is the presence of numerous L.M. III.*a* potsherds (probably of Mycenaean fabric) in remains of the city of Amenhotep IV. (Akhenaten) at El Amarna, which existed only from 1375 to 1350 B.C. Minoan pottery has not been found in Egypt in contexts later than Rameses II. Its absence is doubtless due to political disturbances in the Aegean about that time, which are noted in the Egyptian records. The same disturbances appear to have caused the downfall of the Minoan power and culture, and to have closed the period of the Greek Bronze age.

Palaces and Towns: Architecture.—The most notable monuments are the palaces, and the palace of Knossos is the largest, best preserved, and most thoroughly investigated. The general aspect of a Minoan palace is a vast conglomeration of buildings around a square courtyard, with certain regular details, but no general symmetry of design.

This effect may be largely accidental, the result of long-continued habitation and rebuilding, but it is partly due to a predilection for irregular sites, a peculiarity also of Minoan town-planning. There was sometimes a difference of several storeys between the ground-floors in one building. Skilful use was made of varying levels to admit light and air to interior rooms, one roof serving as a terrace to the apartments next behind it. The ordinary system of interior lighting was through colonnades, or windows opening into small deep courts or shafts. Long porticos, borne by massive square or circular pillars, gave shade and shelter in the great courtyards.

The courts are paved with flag-stones and cement, and are traversed by slightly raised foot-paths. Wide flights of steps mount from one courtyard to another, and an odd arrangement of another flight, set at right angles to the first but leading nowhere, forms a kind of theatre or reception area. The palace entrances were square porticos with a single central column in front, and two doorways behind giving access to a corridor and a porter's lodge.

A typical internal feature is a range of doorways with doors folding back into square jambs. Inside the rooms, round columns carried the ceiling in the alignment of these piers. From such a scheme, by which the open doors convert an outer wall into a colonnade, the Greek *megaron,* with its anteroom and portico, may well have been derived. The columns tapered downwards; they were made of wood, and had variegated stone bases which are still in place. The columns have decayed, but in some instances their forms were moulded in the surrounding earth. In a large house (the Little Palace) at Knossos a shaft had left the impression of its convex fluting.

Columns were often set on stone balustrades. This device appears in its most elaborate form in the grand staircase of Knossos, and its simplest application is seen in small apartments with sunk floors approached by steps, which are a constant feature of all palaces. They were once thought to be baths, but it is likely that they were lustral chambers in which oil or water had some ritual use. Where columns stood in upper rooms the floors were supported by massive pillars at the same points in the rooms below. This was indeed a necessary method of construction where upper floors were made of stone and joists could only be of wood, but it became a sort of fetish, through the extension of baetylic cult to the pillars of the house, with very real significance in a land of earthquakes. The pillar-crypt was a domestic sanctuary. Vats for libation-offerings are sunk in the stone floors, and double-axes set on pedestals beside the pillars. The stones of pillars in such crypts at Knossos and Mallia are incised with the sign of the double-axe, in reference to their sacred function. But the double-axe was one of many mason's marks, and was used in other places where its religious meaning is not evident.

Interior walls were usually built of rubble, set with mortar in a timber frame, and were finished with a plaster face. The outer walls were solid stone, or had stone facing. The heaviest and finest ashlar masonry is found in the earliest portions of the palace structures (M.M. I.), but even here there was a tendency to use timber courses, particularly on the lines of window heads and sills. The stone-faced walls have thin orthostatic slabs set opposite each other on a solid plinth and clamped together crosswise with wooden bars, the space between them being filled with rubble. But even the stone veneer bears traces of external plaster.

Knossos, Plan.—The palace of Knossos lies on a low hill in the broad valley of the river Kairatos. The top of the hill, which is largely formed by Neolithic settlements of great antiquity, was levelled to make the central court. This is a long rectangle running north and south, and entirely enclosed by buildings. Outside the palace on the west is another paved court-yard. The area covered by the courts and buildings is about six acres. The only direct entrance to the central court is in the middle of the short north side. On the east the hill slopes sharply to the river, and here some ground-floor rooms have been preserved entire, together with the last four flights of the grand staircase that led down to them. This was the domestic quarter, with cool secluded rooms and no direct approach from outside. On the opposite side of the central court were public halls and offices, their further walls bordering the west court. The outer ground-floor contained the magazines, a range of narrow rooms, originally 22 in number, opening from one side of a corridor 200 ft. long. The lower walls here have been preserved for half their height. Large earthenware jars still stand along the walls, and in the stone floors of magazines and corridor are rows of square cists. Some of these have traces of lead linings, and fragments of gold foil bear witness to the storage of treasure at some time; but their heavily charred stone edges show that at the moment of their final passing out of use they were filled with oil. On the other side of the long corridor, facing the central court, is the throne room, an apartment evidently used for royal ceremonies. It takes the name from a high-backed gypsum chair which stands in the middle of one wall. On either side of the throne are stone benches, and the wall was painted with large griffins. On the opposite side of the room is a lustral chamber with sunk floor behind a balustrade. An earlier lustral chamber lies at the outer north-west corner of the palace.

It is not known if both these sanctuaries were in use at the same time, but their existence points to a continuous association of this quarter with the priestly functions of the king. An entrance to the south-west quarter, opening from the west court, seems to have served his secular state. The processional corridor, lined with fresco-paintings of youths bearing ceremonial vessels, began at this porch, and turned left at the angle of the palace to an inner propylaeum, from which a wide staircase led to the principal hall of the west wing. In the east wing the north end contained the industrial and service quarter. Here were found quantities of fine painted pottery, stone vases in the making and unworked Laconian porphyry, and several magazines with storage-jars. The royal apartments are sunk in a deep cutting in the natural slope of the hill. Problems of drainage were complicated here by the difference of ground-floor levels. The living-rooms lie far below the central court, from which they are approached by the grand staircase. Stone shafts and ducts and terracotta pipes led the storm-water safely and even usefully from roofs and courts and terraces to rain-spouts in the outer walls. Each pipe is tapered and fits into the next with a collar-joint. It is thought that the tapered channel would give a thrust to the water and prevent accumulation of sediment. Beside a secondary staircase, stone ducts conveyed the water gently downhill in a series of convex curves. A latrine on the ground-floor was connected with the main drain and flushed with rain-water. A bathroom in the same suite has a cemented floor and an oval earthenware tub.

More illuminating than any description are the names which the excavator has given to some of these apartments: the Hall of the Colonnades, the Queen's Megaron, the Court of the Distaff, the Room of the Plaster Couch. The stone floor above this quarter lies in its original position. Like the steps and balustrades of the grand staircase it was held up by bricks and timber which fell down from the ruin of the upper storeys, and in the course of excavation the decayed beams were replaced by iron girders. On the upper terrace level, at the south-end of the east wing, is a domestic shrine, in its present condition belonging to the latest period of the palace, but probably occupying the site of the original chapel. Its furniture was found in place, crude terracotta idols of a goddess, her doves and votaries, vessels for offerings, and sacred horns for holding double-axes. Similar, but earlier and richer relics of another shrine, were found in two large cists (the temple repositories) in the floor of a room in the west wing. These are coloured faience statuettes of a snake-goddess and two priestesses, with votive robes and ornaments.

Knossos, History.—The chronology of the palace has been defined by observation of successive floor-levels, styles of building and deposits of pottery. It is clear that the existing plan was formed in its main outlines at the beginning of M.M. I. All identifiable remains of the E.M. period were cut away when the site was levelled for this structure. In its earliest form it seems to have consisted of a number of separate blocks built round the central court, some at least of which were fortified. The massive masonry seen, for instance, in the northern entrance belongs to these early works. In the course of M.M. I. the original island blocks were united in a single circuit wall; the gangways between them became corridors, and the entrances and general disposition of the existing quarters were laid out. The final consolidation of the building seems to have been achieved in M.M. II.*a.* It was then that the eastern slope was cut away to admit an enlargement of the residential quarter. At the end of M.M. II. the palace seems to have been partly destroyed. Signs of a similar catastrophe are visible at Phaistos, and the event was connected, at least in time, with the collapse of the Middle Kingdom in Egypt and the beginning of Hyksos raids. The political condition of Crete at the time is not known.

There was, however, no break in the continuity of Minoan culture, nor any diminution of material prosperity at Knossos or Phaistos. Both palaces were rebuilt at once and on a grander scale. The final arrangements of the domestic quarters date from this epoch (M.M. III.*a*), and its grand staircase then received its present form. Another structural catastrophe occurred at the end of the period (M.M. III.*b*) involving the destruction by fire of a large part of the west wing, and plundering of its treasure-cists. The buildings on the east slope were not so severely damaged, but in the rebuilding at the beginning of L.M. I. a good deal of work was done on each side of the cutting. There is reason for supposing that these destructions were primarily due to earthquakes. The L.M. rebuilding was competent and thorough, but shows in many places a reduction in extent. Much of the existing decoration naturally belongs to the latest phase of the palace as a whole, the so-called Palace period (L.M. II.) which is marked by highly decorative art and extreme technical facility. At its end there came another destruction, from which the palace never fully recovered. The whole building was burnt, and all the other palaces and towns of Crete were destroyed at the same time. In L.M. III. *a* there was a partial reoccupation of most of the ruined sites, but with only a shadow of their former grandeur, and with some new elements which seem to have come from Mainland Greece. It looks as if the conquerors of the Minoan mother-country were the Mycenaean colonists. The continual reconstruction of the palace is the reason of its complexity. Blocks originally separate were connected by corridors, which became more and more tortuous as halls and staircase were altered or added, and the process of adaptation ultimately produced a truly labyrinthine plan.

Viaduct, Road, and Caravanserai.—The most drastic changes which followed the catastrophe of M.M. III. are seen at the south end of the palace. At the south-east angle some huge blocks of masonry were found 20 ft. out of place, having been hurled to that distance by the earthquake shock, demolishing a house in their fall. This house, and another that collapsed with it, were not rebuilt, but were filled in after a religious sacrifice had been offered on the spot to propitiate the earth-shaking power. Relics of the rite were found in skulls of long-horned bulls and fragments of tripod-altars. At the same time the most magnificent entrance to the palace, at the south-west corner, was destroyed and not rebuilt, but its place was taken in the following period by private houses, which thus encroached upon the palace site. The

CRETAN CIVILIZATION DURING THE MIDDLE AND LATE MINOAN PERIODS (2100–1100 B.C.)

1. Caravanserai excavated at Knossos, on the road which probably served as the general line of traffic to the north from Lybia and Egypt during the first part of the Late Minoan period (1580–1450 B.C.). 2. A Shrine of later squatters, among remains excavated at Knossos by Sir Arthur Evans. 3. A Magazine in the palace of Knossos, showing huge vats and cists used for the storage of the treasures of the kings. These vessels were probably in use during the whole occupancy of the palace (2100–1375 B.C.) from its early building in the first part of the Middle Minoan period to its fall, Late Minoan. 4. Paved main street of Palaikastro, a Cretan seaport town of the Middle and Late Minoan periods. 5. Vase (oenochoe) with papyrus flowers, found at Palaikastro. 6. Lower flight of the grand staircase in the Hall of Colonnades, palace of Minos. This staircase was constructed in its present form in the last third of the Middle Minoan period (1700–1580 B.C.). 7. Vase (front and side views), found at Palaikastro. Middle Minoan period (1700–1580 B.C.). The octopus design, as well as other marine forms, was frequently used in the decoration of Cretan pottery. 8. Four-sided bead seal of green jasper with conventionalized pictographic script. From Xida near site of Lytos. Style of the period from 1700–1580 B.C. 9. Throne room in the palace of Minos, showing gypsum throne and gypsum bench. About 2000 B.C. 10. Impression of a seal stone. Lion seizing a bull. 11. Gold seal ring. Female votaries before a pillar shrine. Mycenean, 16th century B.C. 12. Pair of wild goats on gold seal ring from Mycenae tomb. *c.* 1400 B.C. 13. Gold ring. Goddess with attendants at sacred tree. Mycenean, 16th century B.C. 14. Impression of seal stone. Bull with figure eight shield and sacred palm tree

original entrance was approached by a stepped portico, which climbed the bank of a stream that feeds the Kairatos. In connection with it, on the further bank, there stand the piers of a colossal viaduct by which the southern road was led across the bed of the torrent. Stepped intervals between the piers, like the spillways of a modern dam, gave passage to the water. Sections of the road itself have been traced across the island, over the low watershed of the central mountains and through the Mesara plain to the Libyan sea. It is visible in ancient cuttings, in retaining-walls, and in guard-houses, residences and shrines along its route. Its terminal port was at Komo, near Phaistos, which it also linked with Knossos, but it doubtless served as the general line of traffic to the north from Libya and Egypt. At the Knossian road-head, near the viaduct, Evans also found a caravanserai. It had a front yard backed with stables and store-rooms, and upper storeys built of brick. There is a refectory in the form of a stepped porch, adorned with a painted frieze of partridges and hoopoes. Attached to this is a smaller porch containing a sunk basin for foot-washing. A small spring-chamber near the caravanserai was choked with gypsum incrustation, but when this was cleared the water again rose in its ancient place, and the whole system was restored to working order.

Phaistos and Hagia Triada.—Phaistos has an imposing position on a mountain spur in the Mesara, 300 ft. above the plain. The palace occupies one summit, on two others were buildings of the town. It is more spacious though smaller than Knossos, and its plan is less complex, because the visible remains belong mostly to one period. The original palace, built in M.M. I. was destroyed as Knossos was in M.M. II., but less use was made of early elements in the M.M. III. rebuilding. After the general destruction at the end of L.M. II. it was not reoccupied. The existing plan is laid out on four slightly different levels. The central court measures about 50 yd. by 25, and has a portico on each long side. The colonnaded hall of state is approached by a noble stairway. The surviving furniture and wall-decorations are not remarkable, but a single find of unique importance was made in one of the magazines, a clay disc bearing pictographic inscriptions. At Hagia Triada, on a lower height of the same ridge, 2 m. from Phaistos and about halfway to the sea, there stands a small palace or villa, which is thought to have been a summer residence of the Phaestian king. It is finely built of ashlar masonry, and the walls stand higher than is usual on Minoan sites, but it was a short-lived structure, built in M.M. III. and destroyed in L.M.I. There was no earlier palace on its site, and nothing replaced it until the Reoccupation period (L.M. III.*a*), when a smaller Mycenaean building was imposed upon its ruins. But its premature destruction was the means of preserving some of the choicest works of Minoan art that exist, particularly some naturalistic fresco-paintings and three carved stone vases.

Mallia, Tylissos, Nirou Khani.—Palaces exist on the north coast at Mallia and Tylissos. That of Mallia is an extensive building with a colonnaded court in the monumental style of M.M. I. The remains at Tylissos belong rather to a large house or houses, but their decoration and contents were in true palatial style. A large house was also found at Nirou Khani, mid-way between Tylissos and Mallia. In one of its rooms were four gigantic double-axes of bronze, and in another were 40 or 50 tripod-altars. It must have been an emporium for religious furniture.

Towns and Houses.—Many houses have been found at Knossos, but the town, as a whole, has not been explored. Indeed, its site is too large for exhaustive excavation, and the Greek and Roman occupations have doubtless destroyed much of the Minoan city. Some of the houses are exceedingly well built, and differ from the structures of the palace only in size. Those which encroached upon the palace area after the M.M. III. earthquake had several storeys. A large house on the west side, connected by a paved road with the west court, has been called the Little Palace. It contains a lustral chamber and a pillar-crypt, and in it was found a magnificent libation-vessel in the shape of a bull's head, half life-size, carved in black steatite, with gilt horns, muzzle inlaid with white shell and enamelled crystal eyes. Another palatial house is the so-called Royal villa, which is probably one of a row of summer residences that stood on the river-bank below the domestic quarter of the palace. Even in some ordinary houses the decorations were not inferior to those of the royal halls; such are the wall-paintings from the House of the Frescos at Knossos.

The perfect type of the provincial town is Gournia. It lies on a low oval hill, to which the houses cling regardless of the slope; some are approached from the street by steps, others had one storey in front and two or three behind. An enclosing road on each side leads to a small palace, which occupies about 12 times the floor-space of an ordinary house. It is built like Knossos, even to the magazines and a court with stepped reception-area, but in humbler style. The streets of the town are about 5 ft. wide, stone-paved, and the houses crowd up to their edges. Some of the cross-streets climb the hill in steps. There is no circuit-wall and the houses are set closely round the palace. In the middle of the town is a built shrine, with furniture of pottery vessels and cult idols. The city flourished in L.M. I. and was partially reoccupied after the general destruction at the end of L.M. II. Its oldest houses are of M.M. date. The palace and some of the larger houses have ashlar masonry, but the ordinary material was rubble.

A few Neolithic structures are known. At Magasa near Palaikastro are a walled rock-shelter and a free-standing house of simple rectangular plan. The floors of two more complex houses were found beneath the pavement of the central court at Knossos. These had fixed hearths, a feature that does not appear again in Crete until L.M. III. An oval house of M.M. I. exists at Khamaizi, but this singular form is more likely to represent an adaptation to the contours of its site than the survival of a primitive plan. Vasiliki has E.M. houses built in the mature Minoan manner, with brick or rubble walls set on stone footings, stiffened with timber framework and plastered with clay and lime. Their roofs were wattled. The clay-plaster is even painted red, foreshadowing later fresco decoration.

No household furniture has survived except pots and pans of earthenware and bronze. Braziers of various kinds were used instead of fixed hearths. A heavy shallow dish supported by three short legs seems most suitable for warming rooms and cooking, and is often associated with sacrificial cult. More easily portable are broad-brimmed bowls with long poke-handles, largely used in tombs for fumigation, and fire-boxes, perforated globes sometimes joined to tripod-stands.

Arts: Pottery.—Much of the household pottery is rough unpainted ware and looks unattractive beside the painted vases which represent Minoan culture in museums. But decorated ware is abundant, and has a special scientific use apart from its aesthetic interest, since the style of decoration adds to the evidence of shape and fabric numerous distinctive features that make a reliable index of culture and chronology. The Cretan series has been accurately classified in reference to the chronological systems of the Neolithic and Bronze ages. The Neolithic deposit at Knossos has been divided into Lower, Middle and Upper Strata. The Lower pottery is plain dark-coloured ware, in its latest phase approximating to the burnished and incised fabrics of the Middle period, the typical Cretan Neolithic style. The decorative patterns are simple rectilinear figures, zig-zags, herring-bones and groups of parallel lines and rows of dots often grouped in triangles. The Upper Neolithic pottery is better fired, showing red or light brown surface, and less elaborately ornamented, both in burnish and incision. With the coming of copper in E.M.I. the pottery kept a sub-Neolithic character, but its fabric was often inferior. A closely-incised *bucchero* is the best product of the period.

Painting began in E.M. II. with rectilinear figures in red-black ferruginous glaze on a natural clay ground. Besides the simple forms of hemispherical bowls and cylindrical cups, flat plates, ladles and little globular pots, with pierced lugs for tie-on lids, which had persisted with slight variation from Neolithic times, some sophisticated and even fantastic forms appear, beaked jugs with loop-handles, and jars with long tubular spouts, which may have been copied from Egyptian or Mesopotamian prototypes in metal. In E.M. III. the mode of decoration was inverted, and the patterns were applied in white paint on a ground of black glaze. In this and the previous period the vase was sometimes covered with the glaze, and fired so as to oxidize in more or less irregular patches of black and red (Vasiliki ware). Curvilinear patterns began in E.M. III., notably the spiral coil, which was apparently introduced from the Cyclades. The potter's wheel was not known in the E.M. age. The manufacture of stone vases was perfected at this time, evidently under influence of Egyptian methods and models, but Minoan stone vessels have the same graceful and elaborate shapes as the pottery, and differ also from their Egyptian relatives in their gay colouring. They are mostly made of breccias and veined marbles, in which the bands of colours are disposed to fit the contours of the pots.

The best examples came from tombs at Mochlos, where a unique series of gold jewels of this early period was also found. These coloured stones, particularly a black marble veined with red and white, seem to have led the vase-painters to the invention of a polychrome style. In many instances the variegated stones were directly imitated, but the normal early types of ornament were simple festoons and bands, together with some rare and strongly stylized naturalistic motives, done in white and various shades of red and yellow on a lustrous black-glaze ground. This is the so-called Kamares ware, a style that is characteristic of all three M.M. periods. Its most brilliant phase was in M.M. I. *b*. and M.M. II. *a*. M.M. I. *a* contains the elements of the style; M.M. II. *b* displays a loss of vigour and some incipient changes. M.M. III. *a* shows artistic decadence, following the political catastrophe, and M.M. III. *b* developed a naturalistic impulse which finally destroyed the style.

At the culminating moment in M.M. II. *a*, the potter's craft was also at its best, just before the introduction of the quick wheel. The clay was worked to eggshell fineness. Waved rims and fluted bodies were copied from delicate metal cups, and heavier vessels had encrusted surfaces. The quick wheel brought industrial uniformity, and put an end to fanciful modelling. In M.M. II. *b* the first approach to faithful rendering of nature is seen in some groups of crocuses on a vase from the Kamares cave. An octopus on a companion vase is very strongly stylized. There was a growing tendency to arrange designs in horizontal bands; another imprint of the quick wheel, and the ornament itself became attenuated, its colouring less rich. The artistic decadence of M.M. III. *a* is represented in large quantities of meagrely decorated vases, in which some shapes were extravagantly elongated, a feature which belongs to Egyptian vessels of the same date. New forms were inspired by ostrich eggs mounted with tips and feet of metal or faience. Polychromy almost vanished, and the ordinary type of decoration consists of conventional coils and scrolls in thin white pigment on a faded black ground, or sprinklings of minute white dots in feeble imitation of mottled stone. A still more humble source of inspiration was the accidental trickle made by hasty painting or spilled contents. In M.M. III. *b* the painters turned definitely to naturalistic subjects, and their first essays of simple leaves and grasses mark the beginning of a new artistic era.

But the new subjects demanded more articulate expression than the old technique allowed. The L.M. age brought a complete return to the original method of painting, which, indeed, had never been quite lost, using the black glaze medium for drawing on the natural clay. Its revival now involved an exceedingly fine finish of the pot. No separate slip was applied, except to large vases of coarse substance, but the clay was smoothed and fired so as to produce a lustrous yellow or pale brown surface. The glaze was also improved in body and lustre, and was fired to a variety of tones from its normal black through brown to red and yellow. Touches of white and red paint were added in L.M. I., but did not long survive. The new exuberance of ornament attached itself to the old geometric motives, sprays of leaves or flowers springing from outer curves of spiral coils or occupying their centres.

Architectural ornaments were adapted from wall-decoration rows of discs and crescents, chequers and triglyphs, mottling and graining in imitation of stone and wood. Animals are never represented (though the bull's head occurs), birds rarely, but sea-creatures were favourite subjects in L.M. I. *b* and later, particularly octopods, argonauts and shells among rocks and seaweed. This was the beginning of the Mycenaean style. Its immediate development was back to formalism. The style of the Palace period (L.M. II.) is very decorative but often pompous. Large jars with rigid schemes of palm-trees or papyrus, and with painted bands and panels imitating stone and metal mouldings, are a common form. Minoan flowers are seldom true to nature, even in the direct and vigorous renderings of L.M. I. Nilotic lotus and papyrus types were freely blended with the native lily. The lesser pottery of L.M. II. has the formalism of this style without its grandeur, and is a stage on the way to the conventional reminiscences that comprise the repertory of L.M. III. This is the pottery of the Reoccupation period on Cretan sites. It consists of two varieties, the native Cretan (Minoan) style, which reflects the heavy formalism of L.M. II., and a simpler Mainland (Mycenaean) fabric, which is rather an atrophied derivative of L.M. I. The latter is the El Amarna style (1350 B.C.). There is no certain explanation of the co-existence of these two styles in Crete, but they suggest that the great destruction which preceded the reoccupation was the work of Mainland colonists. In the latest phases, L.M. III. *b* and sub-Mycenaean, it is no longer possible to differentiate Cretan and Mainland pottery.

Fresco-painting.—The decoration of pottery was closely bound to the greater art of fresco-painting, with the notable difference that human and animal figures, usual in the wall-paintings, were not until the very latest epoch reproduced on vases. Painted walls and floors were universal in Minoan houses, even on surfaces exposed to weather. The process was true fresco on lime plaster. Some E.M. house-walls at Vasiliki (where the plaster contained a large proportion of brick-earth) were painted red. It is probable that the earliest designs were reproductions of structural forms, grained timber friezes and pilasters, courses of discs representing ends of joists, veined and mottled wainscots imitating stone veneer. Such schemes persisted in the mature periods, and pictorial panels and friezes were inserted in these architectural frames.

The earliest known figure-subject is the Saffron Gatherer of Knossos, a blue-painted boy or girl gathering flowers into Kamares bowls in a rocky landscape (M.M. II.). Its style is still archaic, but before the end of the next period the painters had attained full freedom in their art. The masterpieces of the naturalistic phase (M.M. II. *b*–L.M. I. *a*) are landscapes from Hagia Triada, with cats stalking pheasants between rocks and flowers. Similar landscapes came from the House of the Frescoe at Knossos. There, on one fragment, amid luxuriant foliage and delicate flowers is a fountain-jet, on others a blue bird and a Sudanese monkey. Seascapes are represented by a frieze of dolphins from the Queen's Megaron, and by flying-fish from Phylakopi in Melos. A curious subject, of which several examples exist, is the summary representation in miniature of crowds of men and women in the vicinity of sacred buildings; probably spectators at a bull-fight or similar public shows. A small panel from Knossos contains a complete picture of the ceremonial sport of bull-leaping, the human sacrifice offered to the Minotaur in his Labyrinth, the "Place of the Axe." The performers are two girls (white-painted) and a boy. Human figures are represented elsewhere on a larger scale and in elaborate detail.

Painting was also combined with modelling in relief, as in the bust of a woman (Pseira), a bull's head, and a noble figure of a king or god wearing plumes and a lily-crown, who was leading a griffin in a land of flowers and butterflies (Knossos). These belong to L.M. I., as does an important historical subject from the House of the Frescoes, a Minoan officer leading negro soldiers. Processional figures were frequent; one of these is the Cup-bearer, the first great find that was made at Knossos. Landscapes of the closing period are represented by excerpts on large burial-chests. They reproduce the hybrid water-plants and stylized birds of contemporary Egypt.

Sculpture.—Sculpture of large size is poorly represented. That it existed is proved by the stucco reliefs in Crete and the lions of the gateways and two gypsum reliefs from Mycenae, which are purely Minoan. Small works in steatite or ivory are comparatively numerous. The earliest is a long-legged dog on a steatite vase-lid from Mochlos (E.M. II.). The finest pieces in the round are an ivory statuette of a boy leaping, probably from a bull-fight (Knossos), the black steatite bull's head from the Little Palace, and a gold and ivory snake-goddess in the Museum of Fine Arts at Boston. Another ivory statuette in an English collection represents a boy with arms raised in adoration, and may have been the companion figure to the Boston ivory in a group of the goddess and her son-consort. The snake-goddess, with her priestesses and sacred animals from Knossos, is modelled in faience, and lacks the fine finish of carved work. The same heaviness is seen in cast-bronze statuettes, male votaries from Tylissos and elsewhere, a woman from the Troad and another from Hagia Triada, and a group of a man and bull. Three superb examples of sculpture in relief are the Chieftain cup, the Boxer vase, and the Harvester vase from Hagia Triada. They are carved in black steatite, and were, perhaps, plated with gold foil.

Metal Work.—With them must be classed the two gold cups from the Vapheio tomb in Laconia, with *repoussé* designs of men handling wild and domesticated cattle. A peculiar and effective process of Minoan metal-work can only be illustrated from Mainland and Cycladic finds. This is flat inlay of light and dark gold and black alloy, best seen in bronze dagger-blades from the shaft-graves at Mycenae (cats hunting birds beside a river, men hunting lions, etc.). (*See* also BRONZE AND BRASS ORNAMENTAL WORK; SILVERSMITHS' AND GOLDSMITHS' WORK.)

Seal-engraving.—A lesser kind of sculpture, seal-engraving, was practised extensively from the very earliest times and developed to perfection in the M.M. period. The early subjects are pictographs and decorative devices, maeanders, coils and scrolls, often showing Egyptian affinities, and were mostly cut in ivory and steatite. But the process was soon applied to crystal, jasper and other hard stones, and the gem-engravers were, perhaps, the first Minoan artists to exploit naturalistic subjects. By M.M. II. they were producing animal figures with facility and truth, and gems of the finest style (M.M. III.–L.M. I.) are engraved with subtle and powerful studies of birds in flight, wild animals in action and repose, and human subjects. There was, however, a tendency on the one side to reproduce conventional linear designs, which must have had some amuletic meaning, and on the other to invent fantastic monsters. The latter are best seen in a series of clay sealings from Zakro. The human subjects were most frequently engraved on oval bezels of gold signet-rings, and often in religious contexts. There are some elaborate scenes of worship, from which much of the knowledge of Minoan ritual is derived.

Writing.—The earliest script, known only from the sealstones, is pictographic. But before the end of M.M. I. a linear form had been developed (Linear Script, Class A). The use of hieroglyphs seems not to have survived the catastrophe of M.M. II. at Knossos. Another linear script (Class B) is Late Minoan. About one-third of the linear signs can be connected with the pictographs, and only half the characters of Class B are found in Class A. The linear scripts were written with ink on pottery (and doubtless on perishable materials), engraved on stone and metal, and incised in clay. The greatest number of existing documents are flat clay slips or tablets, of which some two thousand have been found at Knossos. They are mostly inventories, bearing ideograms of the property to which they refer (arms and armour, chariots, men and women, and edible stores), together with a simple decimal notation. The script has not been interpreted, nor has the language been identified; but it is generally supposed that the former is preserved to some extent in the Hellenic syllabary of Cyprus, and that the latter was a non-Aryan tongue, which has survived in many names, and in some unintelligible inscriptions in the Greek alphabet found at Praisos. The most remarkable literary document that has come from a Minoan site is the Phaistos disc. This is made of clay, and bears on both sides a long series of pictographic characters impressed with separate stamps. The signs show no relationship with Minoan hieroglyphs, and it is thought (largely on account of a plumed head that occurs among them) that they belong to the south-west coast of Asia Minor. The characters are printed along a spiral line dividing the face of the disc into five coils. A similar arrangement of a Minoan inscription appears on the circular bezel of a gold signet-ring found in a tomb at Knossos (Mavro Spelio).

Physical Type and Dress.—Costumes, religion, and burial customs must join their scanty clues to that of language in the quest for the racial origins of the prehistoric Cretans. The general inference from all considerations is that Minoan affinities were African and Asiatic rather than European, or more definitely Libyan and Anatolian. Human remains are badly preserved in Crete, but about a hundred skulls have been measured, and the great majority of these are dolichocephalic. The male stature is computed by measurements of other bones to have been about 5 ft. 4 in., at least 2 in. below the present average in the island. The size of sword-hilts also indicates a small-boned race. Minoan dress was originally a sort of kilt, persisting with men as a tight loin-cloth, with which they often wore a more or less voluminous sash, perhaps as part of the same garment. Women wore a long wide skirt, sometimes extravagantly flounced, and an open bodice. The aprons worn by the faience snake-goddess and her votaries may have had a ritual significance, and may have been a survival of a single garment originally worn by both sexes. High boots, a tight belt (perhaps a permanent metal cincture) and a penis-sheath completed the simple costume of the men. The only representation of an overcoat occurs on the Harvester vase, where it is worn by the bearded leader and looks like a ceremonial cope. The hair was ordinarily worn long, beard and moustaches shaved.

Religion.—The chief Minoan deity is represented in the image of a woman and in the aniconic form of a pillar. The goddess has as many aspects as nature itself. She is associated in art with trees and rocks, with moon and stars, with birds and snakes, with real and monstrous animals and water-demons, with sea-shells, bulls' heads and sacred horns, with shields and battle-axes, and with holy vessels and vestments. There seems to be no function left for any other deity. Yet the mother-goddess had a consort, who was probably her son and is represented as a youth descending from the sky. There is doubtless a record of their history in the Hellenic cult of Rhea and the infant Zeus in Crete, and the death and burial of Zeus on Iuktas. Connection is evident with the numerous female deities and their youthful and semi-mortal consorts and sacred animals, and with the wide-spread baetylic cults of Syria and Asia Minor. The cult of pillars had a special significance on the domestic side, and the kings seem to have combined priestly functions with their secular powers, and to have been the living representatives of the gods. The bull-sports of the palace were a religious service. On the chthonic side a painted stone sarcophagus from Hagia Triada gives valuable information. A dead man standing at the doorway of his tomb receives offerings of a ship and cattle from male votaries wearing skirts of hide. A woman similarly clad pours a libation into a large vessel set between two pillar-trees on which are double-axes and birds. Another man plays a harp.

Shrines have been found in towns and palaces and are pictured in the frescoes. Built sanctuaries have also been excavated at Petsofas near Palaikastro and on Mount Iuktas. But the ordinary place of public worship was a natural cleft or hollow in the ground. Such are the Kamares cave on Mount Ida, another, perhaps the Dictaean cave, at Psychro, and a small one at Arkalokhori, near Lyttos. These sanctuaries contained offerings of curiously different kinds: at Petsofas were terra cotta statuettes of men and animals and votive limbs; at Kamares, painted pottery; at Psychro, bronze animals and implements, particularly miniature double-axes stuck in stalagmitic pillars; at Arkalokhori, chiefly dagger-blades.

Burial Rites.—Great variety is also found in modes of burial, beyond the constant fact that there was no cremation in the Minoan age. E.M. are single interments in cist-graves (Mochlos and Pseira) and in clay oval coffins of the Mesopotamian type (Pachyammos, Pyrgos and Sphoungaras), and communal burials in caves (Pyrgos), rock-shelters and rectangular enclosures (Mochlos), and in built beehive tombs (*tholoi,* in the Mesara plain). The latter are an important series. They have megalithic doorways and in some instances rectangular antechambers, and were in use during the whole E.M. period. The beehive vaults and square antechambers occur in certain tombs of North Africa, where an origin for the form is indicated in the tents of Libyan nomads. On the other side these early Cretan *tholoi* are the ancestors of the stately Mycenaean tombs, which first appeared in Mainland Greece with the Cretan intrusion at the end of M.M. III. M.M. coffins were usually large household jars, some of which bear splendid decoration (Pseira, Sphoungaras, Pachyammos). Hewn chamber-tombs with entrance passages were in use by the middle of this epoch (M.M. II.: Knossos, Mavro Spelio). Jar-burials also belong to L.M. I., but in the mature L.M. age, and particularly in L.M. III., the oval bath-tub came back to favour, together with rectangular clay chests with gabled lids (*larnakes*), copied from Egyptian wooden models and often painted with Egyptian floral motives. These receptacles were buried singly in shaft-graves or deposited in chamber-tombs. In the latter case they often served for generations of successive burials. No beehive tombs of the finest period have yet been found in Crete, though they are known in the earliest and latest times. The so-called Royal tomb of Isopata, near Knossos, belongs to the same date and style of building as the great Mainland treasuries (L.M.I.), and had a similarly vaulted roof, but its ground-plan is rectangular. Rich funeral furniture was deposited with the dead, weapons and domestic implements, jewellery and personal trinkets, stone and metal vases and painted pottery. But the chamber-tombs which were in constant use, seldom contain intact interments. For the same reason these tombs are often filled with cremation-burials of the Hellenic destroyers of Minoan civilization.

Transition to Iron Age.—The transition from the Bronze to the Iron age, and from Minoan to Hellenic culture, is best illustrated in tombs at Vrokastro. Both funeral rites occur, inhumation in chamber-tombs and cremation-burials in the same tombs and in bone-enclosures. The style of the pottery in the chamber-tombs is sub-Mycenaean or Proto-Geometric; that in the bone-enclosures is solely Geometric. Different types of bronze brooches (*fibulae*) are associated with the pottery; iron weapons were found with both kinds of burials, and in a chamber-tomb there was a bronze tripod of a type that has been found with Transitional material in Cyprus and in Greece. Six Egyptian faience seals were found with the tripod, but are not precisely dated. But it is clear that the Vrokastro finds cover the period between 1200 and 800 B.C., and display the stages by which Hellenic art displaced Minoan, without however offering an historical explanation of the process.

Greek and Roman Periods.—Hellenic structural remains are scanty. Town-walls are visible at Aptera, Itanos and elsewhere. The massive fortifications of Goulas are probably the oldest, and attest the insecure political conditions of the new era. But the few finds of lesser archaeological material that have been made, fragments of sculpture, pottery and inscriptions, are singularly important. They show conclusively that Crete was prominent, if not foremost, in the renascence that produced the art of archaic Greece, a fact of which there is historical record in the traditions of the master-craftsman, Daidalos, and the works of his pupils, Dipoinos and Skyllis. The prominence of Crete in the new movement was partly due to the revival of Minoan elements, but more to the position of the island in regard to Egypt and the Syrian coast, from which had come the inspiration of Minoan culture, and from which the elements of Hellenic art were drawn when contact was again established.

Archaic Painting and Sculpture.—Though the orthodox Geometric style of vase-painting was as much at home in Crete as on the Greek mainland, Minoan decorative survivals soon showed through it, and with them came strong Oriental influences, immediately derived perhaps from Cyprus. Geometric pottery illustrating these developments has been found abundantly in tombs at Knossos, and a remarkable series of archaic orientalizing vases comes from the site of Arkadia (Afrati) in Lasithi. Some of the foreign products by which the Cretan artists were guided are represented in a deposit of hammered and engraved bronze shields and bowls, found in a sacred cave near Anoia on Mount Ida (the Idaean cave) in 1884. Their actual origin has not been established, but there is little doubt that they are examples of the hybrid Egypto-Assyrian art that was broadcast through southern Mediterranean lands about 800 B.C. by Phoenician traders. With them were found some statuettes and other cast bronzes of local fabric. The Cretan types thus indicated are easily identified elsewhere, as in a bronze statuette found at Delphi, a nude youth wearing a tight belt and wig-like hair, and a stone figure of a woman in the Louvre. The date of these pieces is about 600 B.C. To the same period belongs a unique series of temple-sculptures from Prinias, a frieze of horsemen armed with spears and shields, and a free-standing stone beam from a door-head, carved with relief of animals and surmounted at each end by a seated goddess. A somewhat similar but later frieze, in terracotta, with figures of armed men and chariots, comes from the temple of Dictaean Zeus at Palaikastro. Other finds on this site were Phoenician bronze shields like those in the Idaean cave, and a fragmentary inscription containing an archaic hymn to Zeus.

Inscriptions.—Several inscriptions in the Eteocretan language were found in a sanctuary at Praisos. They have not been read. At Gortyna is the famous legal code, inscribed on the inner side of a curved wall which stood, at the time of its discovery, in a mill-stream. The first copy of the text was made by Halbherr in 1884, but it was not till 1912 that the Italian Mission got authority to divert the stream and clear the building to which the wall belongs. It is an archaic Greek structure of circular plan, which was converted into an Odeum in Roman times. It stood in the *agora* of the city.

Roman Gortyna.—Gortyna is the only Roman site that has been excavated. It was one of the three great cities of Crete in the Imperial age, and its remains show that it conformed to the metropolitan pattern in art and architecture. Among its public buildings are an amphitheatre and a theatre, two Nymphaea, an aqueduct and baths, a Basilica or Praetorium, temples of Apollo (the Pythion), Isis and Serapis, and other deities. A great deal of Graeco-Roman statuary belonging to their decoration has survived.

Greek art of the classical period is rare in Crete. The island had then lost its place in international commerce, and its culture was not affected by external influences. The character of the local art is illustrated in the coinage, which contains, besides some bold Greek types, a number of strange pictorial subjects and many lapses into a state of barbarism. It is an archaeological echo of the Cretan heresies that shocked Hellenic theologians.

HISTORY

ANCIENT

In classical times nothing remained of the Minoan Civilization except a tradition that the first "thalassocracy" or sea-power was that of a Cretan king Minos. The island played no part in Greek history commensurate with its size. It took practically no share in the Persian or Peloponnesian wars.

It was dotted with independent cities which dissipated their energies in internecine wars. For the rest of Greece it was chiefly of importance as a recruiting ground for mercenary soldiers, especially archers; promises of assistance from states, such as caused the fruitless Athenian expedition in 429 against the Peloponnesian war, were generally found to be fallacious. The reputation of the Cretans was low: "all Cretans are liars" (Κρῆτες ἀεὶ ψεῦσται) was the beginning of a popular poem which is the origin of Porson's "Hermann's a German."

Their chief cities were Gortyna, Cydonia and Knossus. Important towns of the second rank, generally to be found in alliance with one or other of the three chief towns were: Phaestus, Rhaucus, Lyttus, Polyrrhenia, Aptera, Eleutherna, Axus, Lappa, Elyrus, Praesus, Itanus and Hierapytna, which was the sole port facing towards Africa. The population was exceedingly mixed. The *Odyssey* (xix., 175) in a passage whose date is of course uncertain, enumerates the inhabitants as Achaeans, Cydonians, Dorians, Pelasgians and Eteocretans. The last named are the most interesting. There is much reason to believe that these were the original, non-Hellenic inhabitants of the island. They were chiefly to be found in the eastern end of the island. There are several of their inscriptions surviving, all—at present—incomprehensible. In historical times the domination of Crete had fallen wholly into the hands of one of these races, the Dorians, whose numbers had been increased by later immigrations. The names of the three tribes, Hylleis, Dymanes and Pamphyli, which always accompanied Dorian migrations, are to be traced in many Cretan cities.

Cretan Constitutions.—The chief interest of Crete, for us as for the ancients, lies in its system of laws; and the great Gortyna inscription discovered in 1884 (*see* GREEK LAW) is our most extensive monument of Greek Law. The constitutions of the Cretan towns, which appear to have all approximated to one model, are a simpler and possibly earlier form of the Spartan constitution.

The population consisted of two classes, citizens and serfs. The citizens were all warriors, and the serfs were of two kinds, state-owned (*μνωῖται*) and private owned (*ἀφαμιῶται*). The serfs seem to have been better treated than the Spartan helots—we hear of no revolts—but they were rigorously excluded from the privileges of the citizens, arms-bearing and exercise in the gymnasia. The kings, who survived in Sparta, had disappeared: their place was taken by ten *kosmoi* who were chosen from certain specified aristocratic clans. They had all executive functions; advised by a council of elders (*γερουσία*) the citizen assembly had the right to say *yes* or *no* to the proposals laid before it, but it had no right to propose reductions or to debate.

The training of the Cretan boy as a warrior began at about 17 when he was admitted into the "herds" supported by the State. He had already learnt to read and write, and to sing certain selected patriotic songs; he now spent his days in military exercises. He was bound to marry but could not live with his wife until he became a full man. He took his dinners in common, at public dining halls like the Spartan *phiditia*.

This constitution appears to have shared the fate of the Spartan (*see* SPARTA). At the end of the classical period Crete, continually at civil war, has become chiefly a recruiting ground for armies. Its wealth and civic organization has declined, and it no doubt shared in the economic depression of all Greece in the Hellenistic age.

See *Cambridge Ancient History,* vol. iii. (1925); J. B. Bury, *History of Greece* ch. ii. (1913); Pauly-Wissowa, *Realencyc. s. vv.* Kosmoi, Kreta; Aristotle's *Politics* Bk. ii. (X.)

MEDIAEVAL AND MODERN PERIODS

Though torn by civil dissensions, the island maintained its independence of the various Macedonian monarchs by whom it was surrounded; but having incurred the enmity of Rome, first by an alliance with the great Mithridates, and afterwards by taking active part with their neighbours, the pirates of Cilicia, the Cretans were at length attacked by the Roman arms, and, after a resistance protracted for more than three years, were finally subdued by Q. Metellus, who earned by this success the surname of Creticus (67 B.C.). The island was now reduced to a Roman province, and subsequently united for administrative purposes with the district of Cyrenaica; until it was incorporated by Constantine in the prefecture of Illyria. Crete formed part of the Byzantine empire until it fell into the hands of the Saracens (823). It then became a formidable nest of pirates and a great slave mart; it defied all the efforts of the Byzantine sovereigns to recover it till 960, when it was reconquered by Nicephoros Phocas. After the capture of Constantinople by the Latins in 1204, Crete was allotted to Boniface, marquis of Montferrat, but sold by him to the Venetians, to whom it continued subject for more than four centuries.

Under the Venetian government Candia, a fortress originally built by the Saracens, and called by them "Khandax," became the seat of government and capital of the island, to which it gave its name. The Venetian administration secured the island external tranquillity, and did much to provide material prosperity and encourage commerce and industry; under it Crete was probably more prosperous than at any other time. But the system was arbitrary and oppressive, and gave rise to many insurrections. Daru mentions 14 between the years 1207–1365, the most important being that of 1361–64, when the Venetian colonists rose against the republic. Disappointed in the hope of a Genoese occupation, the Cretans turned to the Turks. The Turks made no serious attempt to conquer the island until 1645; but in that year they landed an army of 50,000 men and soon reduced Canea. Retimo fell the following year, and in 1648 the Turks laid siege to Candia. After a siege of more than 20 years the city surrendered in Sept. 1669, and its fall was followed by the submission of the island. Venice was allowed to retain possession of Grabusa, Suda and Spinalonga on the north, but in 1691 Grabusa, and in 1715 the other two strongholds fell to the Turks, and the island was finally lost to Venice.

Period of Turkish Rule.—Under the Ottoman rule many of the Cretans embraced Mohammedanism, and thus secured the chief share in the administration of the island. But this did not benefit the population, and in 1837 Crete was considered the worst governed province of the Turkish empire. In 1770 an abortive attempt at revolt, the hero of which was "Master" John, a Sphakiot chief, was repressed with great cruelty. In 1813 the ruthless severity of the governor general, Haji Osman, who obtained the co-operation of the Christians, broke the power of the janissaries; but after Osman had fallen a victim to the suspicions of the sultan, Crete again came under their control. When in 1821 the revolution broke out in continental Greece, the Cretans, headed by the Sphakiots, revolted, and occupied all the open country, while the Turks and Muslims took refuge in the fortified cities. The island was reduced to submission in 1824 by Mohammed Ali, pasha of Egypt, whose help the sultan had asked. The allied powers (France, Great Britain and Russia) decided that Crete should not be included amongst the islands annexed to the kingdom of Greece; but obtained from the sultan Mahmud II., its cession to Egypt, which was confirmed by a firman of Dec. 20, 1832. This change of masters brought some relief to the Cretans; the enlightened government of Mustafa Pasha, an Albanian like Mohammed Ali (1832–52), who encouraged agriculture, improved the roads, introduced an Albanian police, and put down brigandage, has been called the "golden age" of Crete.

In 1840 Crete was taken from Mohammed Ali and replaced under the dominion of the Turks, but Mustafa retained his governorship until appointed grand vizier in 1852. In Feb. 1856 an insurrection broke out, owing to the violation of the provisions of an imperial decree whereby liberty of conscience and equal rights and privileges with Muslims had been conferred upon Christians. The promised concessions were confirmed in July 1858, but again repudiated. A petition to the sultan in 1864 elicited only an injunction to obedience. A general insurrection which broke out in 1866 was put down with great severity, but the "Organic Statute" granted by the sultan in 1868 brought some reforms and a kind of constitutional government.

Constitutional Experiments.—Under this instrument which was afterwards proposed under Article XXIII., in the Berlin Treaty (*q.v.*), as a basis for reforms in other parts of the Ottoman empire, various privileges already acquired by the Christian population were confirmed; a representative general council was brought into existence, composed of deputies from every district; mixed tribunals were introduced, together with a highly elaborate administrative system, under which all the more important functionaries, Christian and Muslim, were provided with an assessor of the opposite creed. The new constitution, however, proved costly and unworkable, and failed to satisfy either section of the population. In 1878 the Greek government, finding Hellenic aspirations ignored by the Treaty of San Stefano, gave the signal for agitation in the island. An insurrection followed, accompanied by the usual barbarities on both sides. Eventually the Cretan chiefs invoked the mediation of Great Britain, which Turkey, exhausted by her struggle with Russia, accepted, and the "Pact of Halepa" was drawn up in 1878 under the auspices of Mr. Sandwith, the British consul, and Adossides Pasha, both of whom enjoyed the confidence of the Cretan population. The privileges conferred by the Organic Statute were confirmed; the judicial and administrative systems maintained; the judges were declared independent of the executive, and an assembly composed of 49 Christians and 31 Muslim deputies took the place of the former general council. The ensuing party government was a mere scramble for office and its rewards. In 1889 a crisis occurred, when the "Conservative" leaders, finding themselves in a minority, took up arms and withdrew to the mountains. The latent fanaticism of both creeds was aroused, and the island again became a scene of devastation. The Porte seized the occasion to proclaim martial law and abrogate many important provisions of the Halepa Pact. The Christians boycotted the elections under the new system, and for the next five years Crete was governed by a succession of Mohammedan valis; the deficit in the budget increased, the gendarmerie, which received no pay, became insubordinate, and crime multiplied. In 1894 the Porte, at the instance of the powers, nominated a Christian, Karatheodory Pasha, to the governorship, and the Christians agreed to take part in the assembly which soon afterwards was convoked; no steps, however, were taken to remedy the financial situation. The refusal of the Porte to refund considerable sums illegally diverted from the Cretan treasury, or even to sanction a loan to meet immediate requirements, caused great exasperation, which was increased by the recall of Karatheodory (March 1895). Before that event an *Epitropé*, or "committee of reform," had appeared in the mountains. The *Epitropé* was at first nothing more than a handful of discontented politicians, but its membership swelled rapidly, and in April 1896 it invested the garrison town of Vamos. Civil war began. Serious disturbances broke out at Canea on May 24 and were only quelled by the arrival of foreign warships. Despite the intervention of the foreign consuls, the sultan proceeded to crush the rising by force. The resulting devastation, and the excitement it aroused in Greece, quickened the energies of the powers. Austria proposed an international blockade of the island, but Great Britain rejected this. At the representations of the powers, the sultan restored the Pact of Halepa, the troops were withdrawn from the interior, financial aid was promised, a Christian governor general was appointed, the assembly was summoned, and an imperial commissioner was despatched to negotiate an arrangement. The Christian leaders proposed a moderate scheme of reforms, based on the Halepa Pact, which, with a few exceptions, was approved by the powers and eventually sanctioned by the sultan.

The Revolt of 1897.—On Sept. 4, 1896, the assembly formally accepted the new constitution and declared its gratitude to the powers. The Muslim leaders acquiesced in the arrangement, which the powers undertook to guarantee. It soon became evident, however, that the Porte was endeavouring to obstruct the execution of the reforms. The indignation of the Christians increased, a state of insecurity prevailed, and the Muslim peasants refused to return to their homes. Hitherto the Greek government had loyally co-operated with the powers in their Cretan policy, but towards the close of the year a secret society known as the *Ethniké Hetairia* began to arrogate to itself the direction of Greek foreign policy. Its aim was war with Turkey with a view to the acquisition of Macedonia, and it found ready allies in the Cretan Christians. Emissaries of the society appeared in Crete, large consignments of arms were landed, and at the beginning of 1897 the island was practically in a state of insurrection. On Jan. 21 the Greek fleet was mobilized. A series of conflicts took place at Canea on Feb. 4; the Turkish troops fired on the Christians, a conflagration broke out in the town, and thousands of Christians took refuge on the foreign warships. The Greek government now despatched an ironclad and a cruiser to Canea, which were followed a few days later by a torpedo flotilla commanded by Prince George. The prince soon retired to Melos, but on the night of Feb. 4 a Greek force landed at Kolymbari, near Canea, and its commander, Col. Vassos, proclaimed the occupation of the island in the name of King George. This move caused immense excitement among the Christian population, who indulged in terrible massacres of the Muslim peasantry. The powers, however, occupied Canea, and afterwards Candia and other towns, blockaded the coast, and bombarded the insurgents' position. They then presented collective notes to the Turkish and Greek governments announcing their decision that (1) Crete could in no case in present circumstances be annexed to Greece; (2) in view of the delays caused by Turkey in the application of the reforms Crete should be endowed with an effective autonomous administration under the suzerainty of the sultan. Cretan autonomy was proclaimed March 20, the Greek force left on May 9, and the insurgent assembly, under its president, Dr. Sphakianakis, cooperated with the international commanders to maintain order. After Germany and Austria had withdrawn from the European Concert (April 1898) the remaining powers divided the island into four departments, which they severally undertook to administer. The last Turkish soldiers quitted the island on Nov. 14, 1898.

Union with Greece.—On Nov. 26 the powers nominated Prince George of Greece as high commissioner for three years. He landed on Dec. 21. Order prevailed, but the Muslims, reduced to great distress by the prolonged insurrection, emigrated in large numbers. On April 27, 1899, a new autonomous constitution was voted by a constituent assembly, and in the following June Cretan officials took over the local administration. Prince George's appointment was prolonged in 1901 and his extensive powers increased. The arbitrary methods of the government awoke strong opposition, led by M. Venizelos, who had played an important part in the insurrection, but had been dismissed from his post of councillor in 1901. In March 1905 M. Venizelos, with the moral support of Dr. Sphakianakis, led a revolt at Theriso in the White Mountains, and proclaimed the union of the island with Greece, and this example was speedily followed by the assembly at Canea. The powers, however, reiterated their decision to maintain the *status quo,* and increased their military and naval forces; the Greek flag was hauled down at Canea and Candia, and some desultory engagements with the insurgents took place, the international troops co-operating with the native gendarmerie. In the autumn M. Venizelos and his followers, having obtained an amnesty, laid down their arms. On July 25, 1906, the powers announced a series of reforms, including the reorganization of the gendarmerie and militia under Greek officers, as a preliminary to the eventual withdrawal of the international troops, and the extension to Crete of the system of financial control established in Greece. On Sept. 25 Prince George left the island. His successor, M. Alexander Zaimis, a former and later prime minister of Greece, arrived in Crete on Oct. 1.

On Feb. 22, 1907 M. Zaimis, as high commissioner, took the oath to the new constitution elaborated by the national assembly. His position was one of singular difficulty. Apart from the rivalry of the factions within the assembly, there was the question of the Muslim minority, reduced to 40,000 but still a force to be reckoned with. M. Zaimis showed great skill and studied impartiality, and his administration was a marked success. Order was restored, and M. Zaimis having called the attention of the powers to the fact that the conditions they had laid down as preliminary to evacuation—(1) the organization of a native gendarmerie, (2) the maintenance of the tranquillity of the island, (3) the complete security of the Muslim population—had now been fulfilled, the powers informed him on May 11, 1908, of their intention to begin the evacuation at once and complete it within a year. The first withdrawal of the troops (July 27), hailed joyfully by the Cretan Christians, led to rioting by the Muslims, who believed themselves abandoned to their fate.

Meanwhile M. Zaimis had made a further advance towards the annexation of the island to Greece by a visit to Athens, where he arranged for a loan with the Greek National Bank and engaged Greek officers for the new gendarmerie. The issue was precipitated by news of the revolution in Turkey. On Oct. 12 the Cretan Assembly once more voted the union with Greece, and in the absence of M. Zaimis, elected a committee of five to govern the island in the name of the king of Greece.

On July 26, 1906, the powers withdrew their remaining troops. The Cretans hoisted a Greek flag; the Turkish Government adopted a minatory tone to Greece, and the powers cut down the offending flagstaff; war was postponed, but the humiliation was not forgotten. On Oct. 14, 1912, the eve of the first Balkan War, M. Venizelos, then Greek premier, admitted the Cretan deputies to the Greek Chamber; S. Dragoumes was sent to Crete as general administrator. Art. 4 of the Treaty of London (1913) ceded Crete to Greece. After that time its history was merged in that of Greece (*q.v.*).

Crete occupied world attention in May 1941 when the Germans, after the conquest of the Greek mainland, attacked the island by air-borne troops. The remnants of the Greek army and a New Zealand division resisted valiantly, but after a struggle lasting from May 19 to June 1, the British had to withdraw their troops to Egypt. Crete was then completely occupied by the Germans, although guerrilla fighting continued for some time. After Germany's surrender, May 8, 1945, Crete was restored to Greek rule. (*See* WORLD WAR II.)

(J. D. B.; W. M.; X.)

CRETINISM, the term given to a chronic disease, either sporadic or endemic, arising in early childhood, and due to absence or deficiency of the normal secretion of the thyroid gland. It is characterized by imperfect development both of mind and body.

The endemic form of cretinism prevails in the valleys of central Switzerland, Tirol and the Pyrenees. In Great Britain cretins have been found in many places but particularly in Derbyshire. The disease is not confined to Europe, but occurs in North and South America, Australia, Africa and Asia. Wherever endemic goitre is present, endemic cretinism is present also, and it has been constantly observed that when a new family moves into a goitrous district, goitre appears in the first generation, cretinism in the second. The causation of goitre has now been shown to be due to drinking certain waters, though the particular impurity in the water which gives rise to this condition has not been determined (*see* GOITRE). The causation of the sporadic form of cretinism is obscure. In goitre and cretinism, however, there is deficiency of iodine in the thyroid tissue.

Cretinism is usually unrecognized until the child reaches some 18 months or two years, when its lack of mental development and uncouth bodily form attracts attention. Occasionally the condition develops later, any time up to puberty. The essential point in the morbid anatomy of cretinism is abnormality of the thyroid gland (*see* METABOLIC DISEASES). It may be congenitally absent, atrophied, or the seat of a goitre, though this last condition is very rare in cases of sporadic cretinism. The skeleton shows arrested growth, most marked in the case of the long bones. The skull in the endemic form is usually brachycephalic, but in sporadic cases it is more commonly dolichocephalic. When fully grown the cretin's height rarely exceeds 4ft., and is often less than 3ft. The skin feels doughy from thickening of the subcutaneous tissues, and it hangs in folds over the abdomen and the bends of the joints. Very frequently there is an umbilical hernia. The hair is sparse and coarse and is usually absent on the body of an adult cretin. The temperature is subnormal, and the exposed parts tend to become blue in cold weather. The blood often contains less than half the normal amount of haemoglobin. The mental capacity varies within narrow limits; an intelligent adult cretin may reach the intellectual development of a child of from three to four years of age, though more often the standard attained is even below this. The child cretin learns neither to walk nor talk at the usual time. Often it is unable even to sit without support. Some years later a certain power of movement is acquired, but the gait is waddling and clumsy. Speech is long delayed, or in bad cases may be almost entirely lacking. The voice is usually harsh and unpleasant. Of the senses smell and taste are but slightly developed, more or less deafness is generally present, and only the sight is fairly normal. In the adult the genital organs remain undeveloped. If the cretin is untreated he rarely has a long life, 30 years being an exceptional age. Death results from some intercurrent disease.

Cretinism differs clinically from the state of a Mongolian idiot, in whom there is no thickening of the subcutaneous tissues and much greater alertness of mind; from achondroplasia, in which condition there is usually no mental impairment; and from infantilism, which covers a group of symptoms whose only common point is that the primary and secondary sexual characteristics fail to appear at the proper time.

Before 1891 there was no treatment for this disease. The patients lived in hopeless imbecility until their death. But in that year Dr. George Murray published his discovery of the effect of hypodermic injections of thyroid gland extract in cases of myxoedema (*q.v.*) a disease manifestly related to cretinism. In the following years Drs. Hector Mackenzie, E. L. Fox of Plymouth, and Howitz of Copenhagen, each working independently, showed the equally potent effect of the gland administered by the mouth. The remedy was soon after applied to cretinism. It has to be used, however, with care and discrimination, since personal idiosyncrasy seems to be a very variable factor. Even small doses, if beyond the patient's power, may produce fever, excitement, headache, insomnia and vomiting. The administration must be persisted in throughout life, otherwise myxoedematous symptoms appear. The first most apparent result is growth. Once started, 4 to 6in. may be gained in stature in the first year's treatment, but is usually in inverse ratio to the age of the patient, and also diminishes in later stages of treatment. Mackenzie recorded the case of a cretin aged 11 years in 1893, when thyroid treatment was started. He grew very rapidly and became a normal child, passed through school, and in 1908 was at one of the universities.

CRETONNE, the name of a class of printed cotton fabrics used chiefly for furniture upholstery, hangings, window drapery, many other household purposes, and are also made into smocks, fancy overalls, etc. The finer and lighter textures of cretonnes are also made into fancy overalls and other garments for women and children. The name is said to be derived from Creton, a village in Normandy where linen was made. (*See* also CALICO PRINTING.)

CREUSE, a department of central France, comprising the greater portion of the old province of Marche, together with portions of Berry, Bourbonnais, Auvergne, Limousin and Poitou. Area, 2,165 sq.mi. Pop. (1936) 201,844. It is bounded north by the departments of Indre and Cher, east by Allier and Puy-de-Dôme, south by Corrèze and west by Haute-Vienne. It lies on the north-west border of the Plateau Central and the highest land is in the south-east where some heights exceed 3,000 ft. The principal river is the Creuse, which rises on the border of

Corrèze, and passes through the department, receiving the Petite Creuse from the right, and afterwards flowing on to join the Vienne. The valleys of the head-streams of the Cher and of its tributary the Tardes, occupy the eastern side; those of the heads of the Vienne and its tributary the Thaurion, and of the Gartempe joining the Creuse, are in the west of the department. These rivers have entrenched themselves along lines of weakness and have dissected the plateau of crystalline schists and intrusive granites into blocks which occupy the northern half of the department. Thin soil and a cold, damp climate limit activities on these moorlands to sheep-breeding, with cattle-rearing in more sheltered parts. Agriculture is confined to the valleys, especially where they widen out in the extreme north, but is much handicapped by the scarcity of labour due to emigration. The produce of cereals, chiefly rye, wheat, oats and buckwheat, is not sufficient for home consumption. The chestnut abounds in the north and west; hemp and potatoes are also grown.

Coal is mined in the basin of Ahun. Évaux, in the east, has thermal springs and remains of Roman baths. There are manufactories of carpets and hangings, dyeworks at Aubusson and Felletin, also saw-mills and manufactures of wooden shoes and hats. The Orléans railway line from Montluçon to Périgueux traverses Creuse from east to west. It is divided into the two arrondissements of Guéret and Aubusson, with 25 cantons and 266 communes. With Haute-Vienne, Creuse forms the diocese of Limoges, where also is its court of appeal. It forms part of the académie (educational division) of Clermont and of the region of the XII Army Corps. The principal towns are Gueret and Aubusson. La Souterraine, Chambon-sur-Voueize and Bénévent-l'Abbaye possess fine churches of the 12th century. At Moutier-d'Ahun there is a church, which has survived from a Benedictine abbey. The nave of the 15th century with a fine portal, and the choir with its carved stalls of the 17th century, are of considerable interest. The small industrial town of Bourganeuf has remains of a priory.

CREUTZ, GUSTAF FILIP, Count (1731–1785), Swedish poet, was born in Finland and educated at Åbo. He received a post in the court of chancery at Stockholm in 1751. Here he met Count Gyllenborg, with whom his name is indissolubly connected. They were closely allied with Fru Nordenflycht, and their works were published in common. Creutz's greatest work is contained in the 1762 volume, the idyll of *Atis och Camilla;* the exquisite little pastoral entitled "Daphne" was published at the same time, and Gyllenborg was the first to proclaim the supremacy of his friend. In 1763 Creutz practically closed his poetical career; he went to Madrid as ambassador, and after three years to Paris in the same capacity. In 1783 Gustavus III. recalled him and heaped honours upon him. He died on Oct. 30, 1785. *Atis och Camilla* was long the most admired poem in the Swedish language. Creutz introduced a melody and grace into the Swedish tongue which it lacked before, and he has been styled "the last artificer of the language."

See *Creutz och Gyllenborgs Vitterhetsarbeten* (Stockholm, 1795); A. Hultin, *Gustaf Filip Creutz, hans leovnad och vittra skrifter* (Helsingfors, 1886 etc.). Selections of Creutz's work are also to be found in E. P. L. Meyer, *Svenska Parnassen,* vol. 2 (1889) and O. Levertin, *Sverizes National-Litteratur, 1500–1900,* vol. 3 (1907, etc.).

CREUZER, GEORG FRIEDRICH (1771–1858), German philologist and archaeologist, was born on March 10, 1771 at Marburg, the son of a bookbinder. He was professor of philology and ancient history at Heidelberg for nearly 45 years, with the exception of a short time spent at the University of Leyden. He died on Feb. 16, 1858. Creuzer's first and most famous work was his *Symbolik und Mythologie der alten Völker, besonders der Griechen* (1810–12), in which he maintained that the mythology of Homer and Hesiod came from an Eastern source through the Pelasgians, and was the remains of an ancient revelation.

See the autobiographical *Aus dem Leben eines alten Professors* (Leipzig and Darmstadt, 1848), to which was added in the year of his death *Paralipomena der Lebenskizze eines alten Professors* (Frankfort, 1858); Starck, *Friederich Kreuzer, sein Bildungsgang und seine bleibende Bedeutung* (Heidelberg, 1875); Rohde, *Friedrich Creuzer und Karoline von Gunderode, Briefe und Dichtungen* 1896.

CREVASSE (Fr.), a fissure in a glacier, may be transverse or longitudinal, brought about by tension due to unequal rates of movement, the central part generally moving faster than the margins, and (or) movement over an uneven surface. Irregular pinnacles of ice between crevasses of great magnitude on steep slopes are known as *seracs* (*see* Glacier). The word *crevasse* is also applied to wide cracks in the raised banks of rivers and canals, *e.g.,* in the levees of the Mississippi.

CRÈVECOEUR, MICHEL-GUILLAUME JEAN DE (1735–1813), commonly called Hector St. John, was born near Caen, France, Jan. 31, 1735, of an old Norman family. One of America's first "back to nature" writers, he lives through his *Letters from an American Farmer,* perhaps the most delightful book of the American colonial period.

After being educated at the local Jesuit school, he spent some time in England before emigrating to America. It is possible that he served in the Canadian army before going to the Colonies; that he engaged in trade in Pennsylvania, and acted as a surveyor, travelling widely. But after an act of naturalization for him was passed in 1765, he purchased a farm near the present Chester, N.Y., and settled there with his wife, Mehetable Tippet of Yonkers.

His life, that of any ambitious and industrious farmer, he painted in idyllic colours as he did that of the fishermen and whalers at Nantucket and Martha's Vineyard. The only sombre colouring is in the "Description of Charles-Town," with its terrible indictment of slavery, and in the closing letter depicting the "Distresses of a Frontier-man" in war time.

Crèvecoeur himself suffered in the Revolution, being imprisoned for several months before he was allowed to sail for Europe, and having his home burned while he was away. In France he won the patronage of Mme. d'Houdetot and the duke de la Rochefoucauld, who aided him in the French translation and publication of his letters and secured for him the post of consul at New York.

He returned in Nov. 1783 and, in spite of shattered health, became active in trying to cement the friendship between his two countries, working zealously for the packet service between the two, distributing news items and learned publications, recommending suitable exports to French merchants, etc.

Because of his health, Crèvecoeur was given leave of absence during 1785–87, and in the spring of 1790, from which, owing to the troubled conditions in France and his continued ill health, he never returned. His last years were spent in comparative seclusion at his father's home, at a small estate at Lesches, and at Munich, where his son-in-law had a diplomatic post. He died Nov. 12, 1813. His *Letters from an American Farmer* was first published in England in 1782, and in France in 1784. It is the most charming of his books. His picturesque *Voyage dans la haute Pensylvanie et dans l'État de New York* (3 vols. Paris, 1801) was published in German (1802). An edition of the *Letters,* with a prefatory note by W. P. Trent and an introduction by Ludwig Lewisohn was published in 1904. In 1925 appeared his *Sketches of Eighteenth Century America,* edited by Henri L. Bourdin, R. G. Gabriel and S. T. Williams. Julia P. Mitchell's *St. Jean de Crèvecoeur* (New York, 1916) and Robert de Crèvecoeur's *Saint John de Crèvecoeur, sa vie et ses ouvrages* (Paris, 1883) are good biographies.

CREVILLENTE, a town of eastern Spain, in the province of Alicante, and on the Murcia-Alicante railway. Pop. (1940) 10,145 (mun., 11,403). Crevillente is situated in the eastern foothills of the Sierra de Crevillente, amid orange, palm and aloe groves broken by great rocky masses. Careful irrigation has allowed the district, naturally sterile, to produce much oil, wine, esparto and fruit, especially melons, for which it is famous. Crevillente makes coarse cloth and esparto fabrics.

CREW, NATHANIEL CREW, 3rd Baron (1633–1721), bishop of Durham, was born on Jan. 31, 1633, and educated at Lincoln college, Oxford. After holding various ecclesiastical appointments, he became bishop of Oxford in 1671, of Durham in 1674, and, under James II., dean of the Chapel Royal. After Compton's suspension Crew shared the administration of the See of London with Spratt, bishop of Rochester. During the last years of James's power he made a bid for the favour of the new government by voting for the motion that James had abdicated. He was excepted from the General Pardon of 1690, but afterwards was allowed to retain the See of Durham. In 1697 Crew succeeded his brother Thomas as 3rd Baron Crew. He died on Sept. 18, 1721, when the barony became extinct.

CREWE, ROBERT OFFLEY ASHBURTON CREWE-MILNES, 1st Marquess of (1858–1945), English statesman and writer, born Jan. 12, 1858, being the son of Lord Houghton (*q.v.*), and was educated at Harrow and Trinity, Cambridge. He inherited his father's literary tastes, and published *Stray Verses* in 1890, besides other miscellaneous literary work. A Liberal in politics, he became private secretary to Lord Granville when secretary of State for foreign affairs (1883–84), and in 1886 was made a lord-in-waiting. In the Liberal administration of 1892–95 he was lord-lieutenant for Ireland, having John (afterwards Lord) Morley as chief secretary. In 1895 he was created 1st earl of Crewe, his maternal grandfather, the 2nd Baron Crewe, having left him his heir. In 1905 he became lord president of the council in the Liberal government; and in 1908, in the Asquith cabinet, he became secretary of State for the colonies and he acted as Liberal leader in the Lords until Dec. 1916.

He succeeded Lord Morley at the India Office in Nov. 1910, and attended, as secretary of State, the King and Queen on their visit to India in the winter of 1911-12. He was responsible for the high acts of policy announced at the Delhi durbar; the removal of the capital of India from Calcutta to Delhi, and the reunion of the two Bengals under a governor-in-council. At the coronation of King George V he was created a marquess. In the first Coalition Government he was Lord President of the Council, but he followed Asquith in declining to take office under Lloyd George and continued for six years to lead the independent Liberal opposition in the Lords. In Nov. 1922 he quitted active party politics, accepting from Bonar Law the post of British ambassador in Paris. For a number of years before his death, he was again active in politics as leader of the Liberal party and of the Liberals in the lords. He resigned from both positions in Dec. 1944 due to failing health. He died at Leatherhead in Surrey on June 20, 1945.

CREWE, a municipal borough in the Crewe parliamentary division of Cheshire, England, 158 mi. N.W. of London, on the main line of the L.M.S.R. Pop. (1938) 45,830. Area, 6.9 sq.mi. The town was built on an estate called Oak farm in the parish of Monk's Coppenhall, and takes its name from the original station's having been placed in the township of Crewe, in which the seat of Lord Crewe is situated. It is a great railway junction where lines converge from London, Manchester, north Wales and Holyhead, north Stafford and Hereford, and is inhabited principally by employees of the L.M.S.R. company, who practically created the town at a point where in 1841 only a farmhouse stood in open country. Crewe is not only one of the busiest railway stations in the world, but has one of the largest locomotive and rolling stock works. They cover an area of 130 ac., of which 42½ are covered, and employ about 6,500 hands.

CREWKERNE, a market town and urban district of Somersetshire, England, on the S.R., 8 mi. S.W. of Yeovil. Pop. (1938) 3,450. Area 2 sq.mi. It is in the upper valley of the river Parret. The fine church of St. Bartholomew is Perpendicular; the west front is especially notable. The grammar school dates from 1499.

CRIBBAGE, a game of cards. A very similar game called "Noddy" was formerly played, the game being 15 or 21 up, marked with counters, occasionally by means of a noddy board. Cribbage seems to be an improved form of Noddy. According to John Aubrey (*Brief Lives*) it was invented by Sir John Suckling (1609–1642).

A complete pack of 52 cards is required, and a cribbage board for scoring, drilled with 60 holes for each player and one hole (called "the game hole") at each end, the players usually scoring from opposite ends. Each player has two scoring pegs. The game is marked by inserting the pegs in the holes, one after the other, as the player makes a fresh score, commencing with the outer row at the game-hole end and going up the board. When the 30th hole is reached the player comes down the board, using the inner row of holes, until he places his foremost peg in the game-hole. If the losing player fails to obtain half the holes, his adversary wins a "lurch," or double game.

The game may be played by two players, five or six cards being dealt to each, and each putting out two for what is called "crib"; or by three players (with a triangular scoring board), five cards being dealt to each, each putting out one for crib, and a card from the top of the pack being dealt to complete the crib; or by four players (two being partners against the other two, sitting and playing as at whist, and one partner scoring for both), five cards being dealt to each, and each putting out one card for crib.

Two-handed five-card cribbage was formerly considered the most scientific game, but this verdict has now been reversed in favour of the six-card game. In six-card cribbage both hands and the crib contain four cards, and 121 holes are scored.

The players cut for deal, the lowest dealing. If more than one game is played, the winner of the last game deals. The cards rank from king (highest) to the ace (lowest). At the two-handed five-card game, the non-dealer scores three holes (called "three for last") at any time during the game, but usually while the dealer is dealing the first hand. This is not part of the six-card game, which we take as our example.

The dealer deals six cards to each, singly. The undealt cards are placed face downwards on the table. The players then look at their hands and "lay out," each putting two cards face downwards on the table, on the side of the board nearest to the dealer, for the "crib." A player must not take back into his hand a card he has laid out if the cards have been covered, nor must the crib be touched during the play of his hand.

After laying out, the non-dealer (when more than two play, the player to the dealer's left) cuts the pack, and the dealer turns up the top card of the lower packet, called the "start," or "turn-up." If this is a knave, the dealer marks two "for his heels." This score is forfeited if not marked before the dealer plays a card.

The non-dealer plays first by laying face upwards on the table on his side of the board any card from his hand; the dealer then does the same, and so on alternately. When more than two play, the player to the leader's left plays the second card, and so on. As soon as the first card is laid down the player calls out the number of pips on it; if a picture card, ten. When the second card is laid down, the player calls out the sum of the pips on the two cards played, and so on until all the cards are played, or until neither player can play without passing the number 31. If one player has a card or cards that will come in and the other has not, he is at liberty to play them; at the six-card game he must play as long as they can come in, and he can score runs or make pairs, etc., with them. If one player's cards are exhausted, the adversary plays out his own, and can score with them. When more than two play, the player next in rotation is bound to play, and so on until no one can come in. At the two-handed five-card game, when neither can come in the play stops; at the other games the cards are played turned down, and the remainder of the cards are played in rotation, and so on until all are played out.

The object of the play is to make *pairs, fifteens, sequences* and the *go,* and to prevent the adversary from scoring.

Pairs.—If a card is put down of the same denomination as the one last played, the player pairing scores two holes. If a third card of the same denomination is next played, a "pair royal" (abbreviated to "prial") is made, and the maker scores six holes. If a fourth card of the same denomination is next played, twelve holes are scored for the "double pair royal." Kings pair only with kings, queens with queens, and so with knaves and tens, notwithstanding that they all count ten in play.

Fifteens.—If either player during the play reaches fifteen exactly, by reckoning the values of all the played cards, he marks two.

Sequences.—If during the play of the hand three or more cards are consecutively played which make an ascending or descending sequence, the maker of the sequence marks one hole for each card forming the sequence or run. King, queen, knave and ten reckon in sequence in this order, notwithstanding that they are all tenth cards in play; the other cards according to the number of their pips. The ace is not in sequence with king, queen. If one player obtains a run of three, his adversary can put down a card in sequence and mark four, and so on. And, if there is a break in the sequence, and the break is filled up during the play, without the intervention of a card not in sequence, the player of the card that fills the break scores a run. Thus the cards are played in this order: A-4, B-3, A-2, B-ace, A gets a run of three, B a run of four. Had B's last card been a five, he would similarly have scored a run of four, as there is no break. Had B's last card been a four, he would have scored a run of three. The cards need not be played in order. Thus the cards being played in this order, A-4, B-2, A-5, B-3, A-6, A-4, B-2, A-5, B-3, A-5, B-6, B takes a run of four for the fourth card played, but there is no run for any one else, as the second five intervenes. Again, if the cards at six-card cribbage are thus played, A-4, B-2, A-3, B-ace, A-5, B-2, A-4, B-ace, A takes a run of three, B a run of four, A a run of five. B then playing the deuce has no run, as the deuce previously played intervenes.

The "*go*," end hole or last card is scored by the player who approaches most nearly to thirty-one during the play, and entitles to a score of one. If thirty-one is reached exactly, it is a *go* of two instead of one. After a *go* no card already played can be counted for pairs or sequences.

Compound Scores.—More than one of the above scores can be made at the same time. Thus a player pairing with the last card that will come in scores both pair and go. Similarly a pair and a fifteen, or a sequence and a fifteen, can be reckoned together.

When the play is over, the hands are shown and counted aloud. The non-dealer has first show and scores and marks first; the dealer afterwards counts, scores and marks what he has in hand, and then takes what is in crib. In counting both hands and crib the "start" is included, so that five cards are involved.

The combinations in hand or crib which entitle to a score are fifteen, pairs or pairs royal, sequences, flushes and "his nob."

Fifteens.—All the combinations of cards that, taken together, make fifteen exactly, count two. For example, a ten (King, Queen, Knave or Ten) card and a five reckon two, called as "fifteen two." Another five in the hand or turned up would again combine with the ten card, and entitle to another fifteen ("fifteen four"); if the other cards were a two and a three, two other fifteens would be counted ("fifteen six," "fifteen eight")—one for the combination of the three and two with the ten card, and one for the combination of the two fives with the three and two. Similarly two ten cards and two fives reckon eight; a nine and three threes count six; and so on for other cards.

Pairs.—Pairs are reckoned as in play.

Sequences.—Three or more cards in sequence count one for each card. If one sequence card can be substituted for another of the same denomination, the sequence reckons again. For example, 3, 4, 5, and a 3 turned up reckon two sequences of three; with another 3 there would be three sequences of three, and so on.

Flushes.—If all the cards in hand are of the same suit, one is reckoned for each card. If the start is also of the same suit, one is reckoned for that also. In crib, no flush is reckoned unless the start is of the same suit as the cards in crib.

His Nob.—If a player holds the knave of the suit turned up for the start he counts one "for his nob."

A dialogue will illustrate the technical conversation of the game, in a game at six-card cribbage. The cards for crib having been discarded, A holds knave of hearts, a four and a pair of twos: B holds a pair of nines, a six and a four. Two of hearts is turned up by B. The hand might be played thus: A lays down a two and says "Two": B plays a nine and says "Eleven": A follows with a four, saying "Fifteen two"; pegging two holes at once: B plays his four and says "Nineteen; two for a pair," and pegs: A putting on his knave, "Twenty-nine": B says "Go." A lays down his two, his last card, and says "Thirty-one; good for two." B plays his nine and six, saying "Fifteen two, and one for my last—three." The points are marked as they are made. A then counts his hand aloud. "Six for a pair-royal" or "Three twos—good for six," and "One for his nob—seven," and throws down his hand for B's inspection. B, "Fifteen two, fifteen four, fifteen six, fifteen eight, and a pair are ten." B then looks at his crib and counts it. It contains, say, king, eight, three, ace and the "start" is also reckoned. B counts "Fifteen two and a run of three—five."

After the points in hand and crib are reckoned, the cards are shuffled and dealt again, and so on alternately until the game is won.

The highest possible score in hand is 29—three fives and a knave, with a five, of the same suit as the knave, turned up.

Bibliography.—Berkeley, *Bézique and Cribbage* (1890); Cavendish, *Pocket Guide to Cribbage* (De la Rue, 1924); Rawdon Crawley, *Cribbage* Goodall's Handbooks of Card Games (1925); *Cribbage and Bézique,* Fleetgate Publications (1927).

CRICCIETH, a watering place, urban district and contributory parliamentary borough of Caernarvonshire, Wales, on Cardigan bay, served by the G.W.R. Pop. (est. 1938) 1,462. Area, 2.3 sq.mi. The ruined castle, perched on a green hill projecting into the sea, was repaired in the time of Edward I; portions of two towers are on the verge of the rock, and a double fosse and vallum, with the outer and inner court lines, can be traced. The view includes a wide sweep of Cardigan bay, backed by the Lleyn peninsula and the Merionethshire hills, with Harlech castle on the margin of the bay. Criccieth forms a good centre for excursions and offers facilities for sea-bathing.

CRICHTON, JAMES (1560?–1582), commonly called the "Admirable Crichton," was the son of Robert Crichton, lord advocate of Scotland in the reign of Mary and James VI., and of Elizabeth, daughter of Sir James Stewart of Beath, through whom he claimed royal descent. He was born probably at Eliock in Dumfriesshire in 1560, and when ten years old was sent to St. Salvator's college, St. Andrews, where he took his B.A. in 1574 and his M.A. in 1575. In 1577 Crichton was undoubtedly in Paris, but his career on the Continent is difficult to follow. That he displayed considerable classical knowledge, was a good linguist, a ready and versatile writer of verse, and above all that he possessed an astounding memory seems certain, not only from the evidence of men of his own time but from the fact that even Joseph Scaliger (*Prima Scaligerana,* p. 58, 1669) speaks of his attainments with the highest praise. It is known that for two years Crichton served in the French army and that in 1579 he arrived in Genoa. The latter event is proved by a Latin address (of no particular merit) to the doge and senate entitled *Oratio J. Critonii Scoti pro Moderatorum Genuensis Reipubl. electione coram Senatu habita . . .* (Genoa, 1579). The next year Crichton was in Venice, and won the friendship of Aldus Manutius by his Latin ode *In appulsu ad urbem Venetam de Proprio statu J. Critonii Scoti Carmen ad Aldum Manuccium . . .* (Venice, 1580). The best contemporary evidence for Crichton's stay in Venice is a handbill printed by the Guerra press in 1580 (and now in the British Museum), giving a short biography and an extravagant eulogy of his powers. This work is undoubtedly by Manutius, as it was reprinted with his name in 1581 as *Relatione della qualità di . . . Crettone,* and again in 1582 (reprinted Venice, 1831).

In Venice Crichton met and vanquished all disputants except Giacomo Mazzoni, was followed from place to place by crowds of admirers, and won the affection of the humanists Lorenzo Massa and Giovanni Donati. In March 1581 he went to Padua, where he held two great disputations. In the first he extemporized in succession a Latin poem, a daring onslaught on Aristotelian ignorance, and an oration in praise of ignorance. In the second, which took place in the church of St. John and St. Paul, and lasted three days, he undertook to refute innumerable errors in Aristotelians, mathematicians and schoolmen, to conduct his dispute either logically or by the secret doctrine of numbers, etc. According to Aldus, who attended the debate and published an account of it in his dedication to Crichton prefixed to Cicero's "Paradoxa" (1581), the young Scotsman was completely successful. In June Crichton was once more in Venice, and while there wrote two Latin odes to his friends Lorenzo Massa and Giovanni Donati, but after this date the details of his life are obscure. Urquhart states that he went to Mantua, became the tutor of the young prince of Mantua, Vincenzo di Gonzaga, and was killed by the latter in a street quarrel in 1582. Aldus in his edition of Cicero's *De universitate* (1583), dedicated to Crichton, laments July 3 as the fatal day; and this account is apparently confirmed by the Mantuan State papers recently unearthed by Douglas Crichton (*Proc. Soc. of Antiquaries of Scotland,* 1909). Sir Sidney Lee (*Dict. Nat. Biog.*) argued against this date, on the ground that in 1584 and 1585 Crichton was alive and in Milan, as certain works of his published in that year testified, and regarded it as probable that he died in Mantua *c.* 1585–86. But these later works seem to have been by another man of the same name. The epithet "admirable" (*admirabilis*) for Crichton first occurs in John Johnston's *Heroes Scoti* (1603).

Bibliography.—Sir Thomas Urquhart's *Discovery of a most excellent jewel* (1652) is reprinted in the Maitland club's edition of Urquhart's works in 1834. *The Life of Crichton,* by P. Fraser Tytler (2nd ed., 1823), contains many extracts from earlier writers; *see* also Douglas Crichton, *James Crichton of Eliock* (St. Andrews, 1911).

CRICKET. The origin of the word, as applied to the most important of British games, is still the subject of much dispute. The *New English Dictionary* (vol. v. 1893) somewhat hesitatingly identifies it with the French "criquet," first met with in a manuscript dated 1478 which reads—"Le suppliant arriva en ung lieu ou on jouit a la boulle près d'une atache on criquet:" this "criquet," Jusserand, in his *Les Sports dans l'ancienne France,* defines as "un bâton planté en terre, qui servait de but dans une des formes du jeu." The conclusion of the *New English Dictionary* seems based on the argument that no reference to cricket so early as this was to be found in our own literature, and that in cricket one certainly did bowl at a mark. The *Century Dictionary* adopts the same view, and as long ago as 1671 Stephen Skinner, in his *Etymologicae Lingua Anglicanae* had explained cricket as "Ludos, a Franco Gallico 'crosser,' hoc ludo exerceri, 'crosse,' baculus ille obliquus quo pueri ludunt." Against this view it may be said (i.) that an *argumentum e silentio* is never convincing; (ii.) that in all the major and many varieties of club-ball, *e.g.,* hockey, golf, bandy, even in the Frenchman's own La Crosse, the game takes its name from the striking implement and not the mark; (iii.) that the Latin peoples adopted and developed the racket as opposed to the club variety of ball games (the crosse is itself a modification of the racket); and finally (iv.), that even if in the 15th century the French were playing at cricket in our sense of the term, it is at least as possible that in the four centuries' intimate contact between the two peoples, they should have learnt it from the English, as the English from them.

It seems better to follow Dr. Johnson, himself probably following Junius (1589–1678), in deriving cricket from "cryce, Sax. —a stick," though his definition of the game as "A sport at which the contenders drive a ball with sticks in opposition to one another" is less worthy of respect. Gouldman (1664), Strutt (1742–1802) and Skeat (1835–1912) also subscribe to this derivation. There was certainly in the parent Nordic tongue a syllable beginning with "cr," ending with a hard "c," having for its middle letter every variety of vowel, and meaning a staff or stick: *cf.* the Psalterium Davidis version of verse 4, Ps. xxiii., "Gird thin and *cricc* thin me frefredon"; the word still survives in Cornwall and Devon in the sense of hedge sticks. The termination "et" is itself a common enough diminutive suffix, *cf.* pocket, and tippet; the game would then, in harmony with golf, hockey, billiards, bandy, take its name from its weapon of attack, a little staff, stick or bat (*cf.* the Parliament of Bats and Wycliffe's version "Then came they with swerdis and battis"): a "little" bat for a reason that will appear later.
